*1	When Applied
*2	When Cut Off

NOTICE:

Confirm that the valve moves freely and does not stick in any position.

If necessary, replace the camshaft timing oil control valve assembly.

HINT:

Accumulation of foreign matter can cause minor pressure leaks. Minor pressure leaks will cause the camshaft to advance or retard, and this will cause a DTC to be set.

INSTALLATION

1. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

(a) Apply a light coat of engine oil to a new O-ring and install it onto the camshaft timing oil control valve assembly.

NOTICE:

Do not twist the O-ring.

T

(b) Install the camshaft timing oil control valve assembly and wire harness bracket with the bolt.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

(c) Connect the camshaft timing oil control valve assembly connector.

2. INSPECT FOR OIL LEAK

3. INSTALL NO. 2 CYLINDER HEAD COVER INFO

COMPONENTS

REMOVAL

1. REMOVE REAR NO. 2 FLOOR BOARD (for Separate Type) INFO

2. REMOVE REAR DECK FLOOR BOX INFO

3. REMOVE REAR NO. 3 FLOOR BOARD INFO

4. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected INFO.

5. SEPARATE RADIATOR WITHOUT CAP RESERVE TANK ASSEMBLY

(a) Remove the 2 bolts and separate the radiator without cap reserve tank assembly.

6. REMOVE ECM

(a) Remove the No. 1 relay block cover.

(b) Disconnect the 3 wire harness connectors.

(c) Disengage the 2 claws, push up the engine room wire harness and separate it from the engine room relay block.

c

c

(d) Disengage the 2 claws and push up the side cover to remove it.

c

(e) Loosen the bolt and separate the No. 2 engine room wire.

(f) Disconnect the 2 ECM connectors.

(1) Disconnect the 2 wire harness clamps.

(2) Push the locks on the 2 levers, then raise the levers, and disconnect the 2 ECM connectors.

NOTICE:

After disconnecting the connectors, make sure that dirt, water or other foreign matter does not contact the connecting parts of the connectors.

(g) Separate the 2 wire harness clamps.

(h) Remove the 2 bolts and ECM with 2 ECM brackets.

INSTALLATION

1. INSTALL ECM

(a) Install the ECM with the 2 bolts.

Torque: **13 N·m (133 kgf·cm, 10ft·lbf)**

(b) Install the 2 wire harness clamps.

(c) Connect the 2 ECM connectors.

(1) Connect the 2 ECM connectors and lower the 2 levers.

- When connecting the connectors, make sure that dirt, water or other foreign matter does not get caught between the connectors and other parts.
- Make sure that the 2 levers are securely locked.

(2) Install the 2 wire harness clamps.

(d) Install the No. 2 engine room wire with the bolt.

Torque: **8.3 N·m (85 kgf·cm, 73in·lbf)**

c

c

(e) Slide the side cover down and engage the 2 claws to install it.

(f) Slide the engine room wire harness down and engage the 2 claws to install it.

c

(g) Connect the 3 wire harness connectors.

(h) Install the No. 1 relay block cover.

2. INSTALL RADIATOR WITHOUT CAP RESERVE TANK ASSEMBLY

(a) Install the radiator without cap reserve tank assembly with the 2 bolts.

Torque: **18 N·m (184 kgf·cm, 13ft·lbf)**

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected **INFO**.

4. INSTALL REAR NO. 3 FLOOR BOARD **INFO**

5. INSTALL REAR DECK FLOOR BOX **INFO**

6. INSTALL REAR NO. 2 FLOOR BOARD (for Separate Type) **INFO**

7. PERFORM INITIALIZATION

HINT:

Initialization cannot be completed by only disconnecting and reconnecting the cable of the negative (-) battery terminal.

(a) Perform Initialization when replacing the ECM **INFO**.

REMOVAL

1. REMOVE EGR WITH COOLER PIPE SUB-ASSEMBLY

(a) Remove the EGR with cooler pipe sub-assembly INFO.

2. REMOVE RADIATOR WITHOUT CAP RESERVE TANK ASSEMBLY INFO

3. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

(a) Disconnect the engine coolant temperature sensor connector.

(b) Remove the engine coolant temperature sensor.

c

INSPECTION

1. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Condition	Specified Condition
Approximately 20°C (68°F)	2.32 to 2.59 kΩ
Approximately 80°C (176°F)	0.310 to 0.326 kΩ

NOTICE:

When checking the engine coolant temperature sensor in water, keep the terminals dry. After the check, dry the sensor.

If the resistance is not as specified, replace the engine coolant temperature sensor.

INSTALLATION

1. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

c

(a) Install the engine coolant temperature sensor through a new gasket.

Torque: **20 N·m (200 kgf·cm, 14ft·lbf)**

(b) Connect the engine coolant temperature sensor connector.

2. INSTALL RADIATOR WITHOUT CAP RESERVE TANK ASSEMBLY INFO

3. INSTALL EGR WITH COOLER PIPE SUB-ASSEMBLY

(a) Install the EGR with cooler pipe sub-assembly INFO.

COMPONENTS

REMOVAL

1. REMOVE NO. 2 ENGINE UNDER COVER

(a) Remove the 4 clips and No. 2 engine under cover.

2. REMOVE HEATED OXYGEN SENSOR

(a) Disconnect the heated oxygen sensor connector.

(b) Remove the grommet and pull the sensor connector out of the cabin through the floor panel.

(c) Remove the wire harness clamp bracket and disconnect the wire harness clamp.

(d) Using SST, remove the heated oxygen sensor.

SST: 09224-00010

INSPECTION

1. INSPECT HEATED OXYGEN SENSOR

Text in Illustration

*1

*1	Component without harness connected (Heated Oxygen Sensor)
----	---

(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
(HT) - (+B)	20°C (68°F)	11 to 16 Ω
(HT) - (E)	-	10 k Ω or higher

If the result is not as specified, replace the heated oxygen sensor.

INSTALLATION

1. INSTALL HEATED OXYGEN SENSOR

(a) Using SST, install the heated oxygen sensor onto the front exhaust pipe.

Text in Illustration

*1	Fulcrum Length
*2	30 mm

SST: 09224-00010

without SST - Torque: **44 N·m (449 kgf·cm, 32ft·lbf)**

with SST - Torque: **40 N·m (408 kgf·cm, 30ft·lbf)**

- This torque value can be obtained by using a torque wrench with a fulcrum length of 300 mm (11.81 in.) and SST with a length of 30 mm (1.18 in.) **NFC**.
- This torque value is effective when SST is parallel to the torque wrench.

c

ON-VEHICLE INSPECTION

1. CHECK IGNITION COIL ASSEMBLY AND PERFORM SPARK TEST

(a) Check for DTCs **INFO**.

NOTICE:

If any DTC is present, perform troubleshooting in accordance with the procedure for that DTC.

(b) Check that spark occurs.

(1) Remove the ignition coils and spark plugs **INFO**.

(2) Disconnect the 4 fuel injector connectors.

(3) Set the vehicle to the inspection mode **INFO**.

(4) Install the spark plug into the ignition coil, and then connect the ignition coil connector. (step 4)

(5) Ground the spark plug. (step 5)

(6) Check that spark occurs while the engine is being cranked. (step 6)

HINT:

Repeat steps 4 to 6 for each spark plug and ignition coil.

NOTICE:

- Ground the spark plugs when checking them.
- Replace any ignition coils that have been subjected to a physical impact.
- Do not crank the engine for more than 2 seconds.

If spark does not occur, perform the following procedure for the malfunctioning cylinder.

(c) Perform the following spark test procedure.

(1) Check that the ignition coil connector is securely connected.

Result:

Result	Action
NG	Connect securely
OK	Go to next step

(2) Perform a spark test.

1. Replace the ignition coil with a known good one.
2. Set the vehicle to the inspection mode .
3. Perform the spark test again.

Result:

Result	Action
NG	Go to next step
OK	Replace ignition coil

(3) Perform a spark test.

1. Replace the spark plug with a known good one.
2. Set the vehicle to the inspection mode .
3. Perform the spark test again.

Result:

Result	Action
NG	Go to next step
OK	Replace the spark plug

(4) Check the power supply.

Text in Illustration

*1	Front view of wire harness connector (to Ignition Coil)
----	--

1. Turn the power switch on (IG).
2. Measure the voltage according to the value(s) in the table below.

*1

Standard Voltage:

Tester Connection	Condition	Specified Cond
1 (+B) - 4 (GND)	Power switch on (IG)	11 to 14 V

Result:

Result	Action
NG	Check wiring between battery and ignition coil and check g circuit
OK	Replace the ECM INFO

(5) Connect the 4 fuel injector connectors.

(6) Install the ignition coils and spark plugs INFO.

2. INSPECT SPARK PLUG

(a) Check the electrode.

Text in Illustration

*1	Ground
----	--------

(1) Using a megohmmeter, measure the resistance.

Standard Resistance:

10 MΩ or more

If the result is 10 MΩ or less, clean the plug and measure the resistance again.

HINT:

If a megohmmeter is not available, perform the following simple inspection instead.

(b) Alternative inspection method:

P

- (1) Quickly accelerate the engine to 4000 rpm 5 times.
- (2) Remove each spark plug.
- (3) Visually check the spark plug.

If the electrode is dry, the spark plug is functioning properly. If the electrode is damp, proceed to the next step.

(c) Check the spark plug for any damage to its threads and insulator.

If there is any damage, replace the spark plug.

Recommended Spark Plug

Manufacturer	Spark Plug Type
DENSO	SC20HR11

(d) Check the spark plug electrode gap.

Text in Illustration

*1	Spark Plug Electrode Gap
----	--------------------------

P

Maximum Electrode Gap for Used Spark Plug:

Electrode Gap
1.3 mm (0.0512 in.)

If the gap is greater than the maximum, replace the spark plug.

Electrode Gap for New Spark Plug:

Electrode Gap
1.0 to 1.1 mm (0.0394 to 0.0433 in.)

(e) Clean the spark plugs.

If the electrode has traces of wet carbon, clean the electrode with a spark plug cleaner and then dry it.

Standard air pressure:

588 kPa (6.0 kgf/cm², 85 psi)

Standard duration:

20 seconds or less.

HINT:

Only use the spark plug cleaner when the electrode is free of oil. If the electrode has traces of oil, use gasoline to clean off the oil before using the spark plug cleaner.

REMOVAL

1. REMOVE NO. 1 RELAY BLOCK COVER

2. REMOVE NO.1 INTEGRATION RELAY

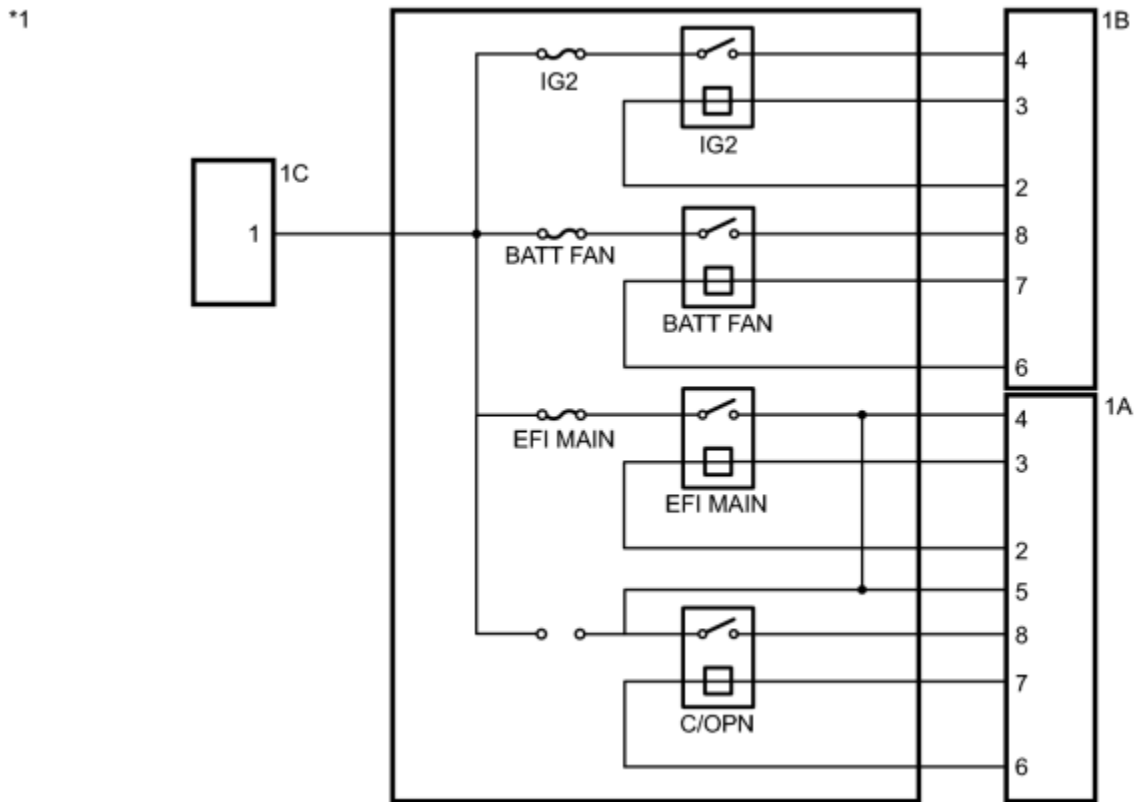

(a) Using a screwdriver with its tip wrapped in protective tape, disengage the 2 claws and disconnect the integration relay.

(b) Disconnect the 3 connectors and remove the integration relay.

INSPECTION

1. INSPECT INTEGRATION NO.1 RELAY

Text in Illustration

*1	Integration Relay	-	-
----	-------------------	---	---

(a) IG2 RELAY:

(1) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1

H

*1	Integration Relay
----	-------------------

Standard Resistance:

Tester Connection	Condition	Specified Condition
Integration relay (1C-1) - Integration relay (1B-4)	Battery voltage is not applied between terminals 1B-3 and 1B-2	10 kΩ or higher

Integration relay (1C-1) - Integration relay (1B-4)	Battery voltage is applied between terminals 1B-3 and 1B-2	Below 1 Ω
--	--	-----------

If the resistance is not as specified, replace the integration relay.

(b) EFI MAIN RELAY:

(1) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Integration Relay
----	-------------------

*1

Standard Resistance:

H

Tester Connection	Condition	Specified Condition
Integration relay (1C-1) - Integration relay (1A-4)	Battery voltage is not applied between terminals 1A-2 and 1A-3	10 kΩ or higher
Integration relay (1C-1) - Integration relay (1A-4)	Battery voltage is applied between terminals 1A-2 and 1A-3	Below 1 Ω

If the resistance is not as specified, replace the integration relay.

(c) C/OPN RELAY:

(1) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Integration Relay
----	-------------------

*1

Standard Resistance:

H

Tester Connection	Condition	Specified Condition
Integration relay (1A-5) - Integration relay (1A-8)	Battery voltage is not applied between terminals 1A-6 and 1A-7	10 kΩ or higher
Integration relay (1A-5) - Integration relay (1A-8)	Battery voltage is applied between terminals 1A-6 and 1A-7	Below 1 Ω

If the resistance is not as specified, replace the integration relay.

(d) BATT FAN RELAY:

(1) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Integration Relay
----	-------------------

*1

H

Standard Resistance:

Tester Connection	Condition	Specified Condition
Integration relay (1C-1) - Integration relay (1B-8)	Battery voltage is not applied between terminals 1B-7 and 1B-6	10 kΩ or higher
Integration relay (1C-1) - Integration relay (1B-8)	Battery voltage is applied between terminals 1B-7 and 1B-6	Below 1 Ω

If the resistance is not as specified, replace the integration relay.

INSTALLATION

1. INSTALL NO.1 INTEGRATION RELAY

(a) Connect the 3 connectors.

(b) Attach the integration relay to the engine room relay block.

2. REMOVE NO. 1 RELAY BLOCK COVER

ON-VEHICLE INSPECTION

NOTICE:

- Perform the mass air flow meter inspection in accordance with the following procedure.
- Replace the mass air flow meter only when foreign matter adheres to the sensor and the MAF value in the Data List (with the engine stopped) is not within the normal operating range.

1. INSPECT MASS AIR FLOW METER

(a) Read the values using the Techstream (MAF).

NOTICE:

- Perform the inspection with the vehicle indoors and on a level surface.
- Perform the inspection of the mass air flow meter while it is installed into the air cleaner case (installed on the vehicle).
- During the test, do not use an exhaust air duct on the exhaust pipe.

(1) Connect the Techstream to the DLC3.

(2) Turn the power switch on (IG) (do not run the engine).

(3) Turn the Techstream on.

(4) Enter the following menus: Powertrain / Engine and ECT / Data List / MAF.

(5) Wait 30 seconds, and read the values on the Techstream.

Standard Condition:

Tester Display	Condition	Standard Condition
MAF	<ul style="list-style-type: none">• Engine not running• 30 seconds after power switch is turned on (IG)	Less than 0.25 g/sec

- If the result is not as specified, replace the mass air flow meter.
- If the result is within the specified range, remove and inspect the mass air flow meter .

REMOVAL

1. REMOVE NO. 2 CYLINDER HEAD COVER INFO

2. REMOVE MASS AIR FLOW METER

(a) Disconnect the mass air flow meter connector.

(b) Remove the 2 screws and the mass air flow meter.

INSPECTION

1. INSPECT MASS AIR FLOW METER

(a) Perform a visual check for any foreign matter on the platinum hot wire (heater) of the mass air flow meter shown in the illustration.

Text in Illustration

*1	Platinum Hot Wire (Heater)
----	----------------------------

Result:

There is no foreign matter.

If the result is not as specified, replace the mass air flow meter.

(b) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Mass Air Flow Meter
----	---------------------

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (THA) - 2 (E2)	-20°C (-4°F)	13.6 to 18.4 kΩ
	20°C (68°F)	2.21 to 2.69 kΩ
	60°C (140°F)	0.49 to 0.67 kΩ

INSTALLATION

1. INSTALL MASS AIR FLOW METER

(a) Install the mass air flow meter with the 2 screws.

NOTICE:

Make sure that the O-ring is not cracked or does not jump out of position during installation.

(b) Connect the mass air flow meter connector.

2. INSTALL NO. 2 CYLINDER HEAD COVER INFO

PRECAUTION

1. PRECAUTIONS FOR INSPECTING HYBRID CONTROL SYSTEM

(a) Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.

NOTICE:

After removing the service plug grip, turning the power switch on (READY) may cause a malfunction. Do not turn the power switch on (READY) unless instructed by the repair manual.

(b) After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

c

2. NOTICE FOR HYBRID CONTROL SYSTEM ACTIVATION

(a) When the warning light is illuminated, or the auxiliary battery has been disconnected and reconnected, attempting to turn the power switch on (READY) may not start the system (the system may not enter the READY-on state) on the first attempt. If so, turn the power switch off and reattempt to start the hybrid system.

3. FOR USING TECHSTREAM

CAUTION:

Observe the following items for safety reasons:

- Before using the Techstream, read the instruction manual.
- Prevent the Techstream cable from being caught on the pedals, shift lever or steering wheel when driving with the Techstream connected to the vehicle.
- When driving the vehicle for testing purposes using the Techstream, 2 persons are required. One is for driving the vehicle, and the other operates the Techstream.

4. DISCONNECTING AND RECONNECTING NEGATIVE BATTERY CABLE

(a) Before performing work on electronic components, disconnect the cable from the negative (-) battery terminal to prevent damage to the electrical system or electrical components.

Text in Illustration

*1	Negative (-) Battery Terminal
*2	Cable

(b) Before disconnecting and reconnecting the battery cable, turn the power switch off and the headlight switch off. Then loosen the terminal nut completely. Do not damage the cable or terminal.

(c) When the battery cable is disconnected, the clock and radio settings and stored DTCs are cleared. Therefore, before disconnecting the battery cable, make a note of them.

- When the cable is disconnected from the negative (-) battery terminal, initialize the following system(s) after the cable is reconnected.

System Name	See Procedure
Advanced Parking Guidance System	INFO

DEFINITION OF TERMS

Term	Definition
Monitor Description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).
Related DTCs	A group of diagnostic trouble codes that are output by the ECM based on the same malfunction detection logic.
Typical Enabling Condition	<p>Preconditions that allow the ECM to detect malfunctions.</p> <p>With all preconditions satisfied, the ECM sets DTCs when monitored value(s) exceeds malfunction threshold(s).</p>
Sequence of Operation	<p>Order of monitor priority, applied if multiple sensors and components are involved in a single malfunction detection process.</p> <p>Each sensor and component is monitored in turn, when previous detection operation has completed.</p>
Required Sensor/Components	The sensors and components used by the ECM to detect each malfunction.
Frequency of Operation	<p>The number of times the ECM checks for each malfunction during each driving cycle.</p> <p>"Once per driving cycle" means ECM only performs checks for that malfunction once during a single driving cycle.</p> <p>"Continuous" means the ECM performs checks for that malfunction whenever enabling conditions are met.</p>
Duration	Minimum time for which the ECM must detect a continuous deviation in monitored value(s) in order to set a DTC. Timing begins when Typical Enabling Conditions met.
Malfunction Thresholds	The value beyond which the ECM determines malfunctions exist and sets DTCs.
MIL Operation	<p>Timing of MIL illumination after a malfunction is detected.</p> <p>"Immediate" means the ECM illuminates the MIL as soon as a malfunction is detected.</p> <p>"2 driving cycle" means the ECM illuminates the MIL if the same malfunction is detected a second time during the next sequential driving cycle.</p>

CHECK FOR INTERMITTENT PROBLEMS

HINT:

Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with the Techstream when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. Clear DTCs INFO.
2. Switch the ECM from normal mode to check mode using the Techstream INFO.
3. Perform a simulation test INFO.
4. Check and wiggle the harness(es), connector(s) and terminal(s) INFO.

BASIC INSPECTION

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when troubleshooting the engine.

1.	CHECK BATTERY VOLTAGE
----	-----------------------

NOTICE:

Carry out this check with the engine stopped and the power switch off.

CHECKING MONITOR STATUS

The purpose of the monitor result (mode 06) is to allow access to the results for on-board diagnostic monitoring tests of specific components/systems that are not continuously monitored. Examples are the catalyst, evaporative emission (EVAP) and thermostat.

The monitor result allows the OBD II scan tool to display the monitor status, test value, minimum test limit and maximum test limit. These data are displayed after the vehicle has been driven to run the monitor.

When the test value is not between the minimum test limit and maximum test limit, the ECM (PCM) interprets this as a malfunction. When the component is not malfunctioning, if the difference of the test value and test limit is very small, the component will malfunction in the near future.

Perform the following instruction to view the monitor status. Although these instruction reference the Toyota diagnostic tester, it can be checked using a generic OBD II scan tool. Refer to your scan tool operator's manual for specific procedures.

1. PERFORM MONITOR DRIVE PATTERN

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear DTCs .
- (e) Run the vehicle in accordance with the applicable drive pattern described in Readiness Monitor Drive Pattern . Do not turn the power switch off.

NOTICE:

The test results will be lost if the power switch is turned off.

2. ACCESS MONITOR RESULT

- (a) Enter the following menus: Powertrain / Engine and ECT / Monitor / Result. The monitor status appears after the component name.
 - Pass: The component is functioning normally.
 - Fail: The component is malfunctioning.
- (b) Confirm that the component is either Pass or Fail.
- (c) Select the component and press ENTER. The accuracy test value appears if the monitor status is either Pass or Fail.

3. CHECK COMPONENT STATUS

- (a) Compare the test value with the minimum test limit (MIN LIMIT) and maximum test limit (MAX LIMIT).

(b) If the test value is between the minimum test limit and maximum test limit, the component is functioning normally. If not, the component is malfunctioning. The test value is usually significantly higher or lower than the test limit. If the test value is on the borderline of the test limit, the component will malfunction in the near future.

HINT:

The monitor result might on rare occasions be PASS even if the malfunction indicator lamp (MIL) is illuminated. This indicates the system malfunctioned on a previous driving cycle. This might be caused by an intermittent problem.

4. MONITOR RESULT INFORMATION

If you use a generic scan tool, multiply the value by the scaling value listed below.

Advance Intake Side

Monitor ID	Test ID	Scaling	Unit	Description
\$35	\$81	Multiply by 0.01	Second	Forced movement of oil control valve time

Exhaust Gas Recirculation System

Monitor ID	Test ID	Scaling	Unit	Description
\$31	\$BD	Multiply by 0.01	kPa	Delta Manifold Absolute Pressure

Air Fuel Ratio Sensor (Sensor 1)

Monitor ID	Test ID	Scaling	Unit	Description
\$01	\$8E	Multiply by 0.001	V	Air fuel ratio sensor deterioration level
\$01	\$91	Multiply by 0.004	mA	Air fuel ratio sensor current

Heated Oxygen Sensor (Sensor 2)

Monitor ID	Test ID	Scaling	Unit	Description
\$02	\$07	Multiply by 0.001	V	Minimum sensor voltage
\$02	\$08	Multiply by 0.001	V	Maximum sensor voltage
\$02	\$8B	Multiply by 0.001	Seconds	0.35 - 0.2 V sensor switch time
\$02	\$8D	Multiply by 0.001	Seconds	Duration that sensor voltage drops to 0.2 V during fuel-cut
\$02	\$8F	Multiply by 0.0003	g	Maximum oxygen storage capacity

Catalyst

Monitor ID	Test ID	Scaling	Unit	Description
\$21	\$A9	Multiply by 0.0003	No dimension	Oxygen storage capacity of catalyst

EVAP

Monitor ID	Test ID	Scaling	Unit	Description
\$3D	\$C9	Multiply by 0.001	kPa	Test value for small leak (P0456)
\$3D	\$CA	Multiply by 0.001	kPa	Test value for gross leak (P0455)
\$3D	\$CB	Multiply by 0.001	kPa	Test value for leak detection pump OFF stuck (P2401)
\$3D	\$CD	Multiply by 0.001	kPa	Test value for leak detection pump ON stuck (P2402)
\$3D	\$CE	Multiply by 0.001	kPa	Test value for vent valve OFF stuck (P2420)
\$3D	\$CF	Multiply by 0.001	kPa	Test value for vent valve ON stuck (P2419)
\$3D	\$D0	Multiply by 0.001	kPa	Test value for reference orifice low flow (P043E)
\$3D	\$D1	Multiply by 0.001	kPa	Test value for reference orifice high flow (P043F)
\$3D	\$D4	Multiply by 0.001	kPa	Test value for purge VSV close stuck (P0441)
\$3D	\$D5	Multiply by 0.001	kPa	Test value for purge VSV open stuck (P0441)
\$3D	\$D7	Multiply by 0.001	kPa	Test value for purge flow insufficient (P0441)

Misfire

Monitor ID	Test ID	Scaling	Unit	Description
\$A1	\$0B	Multiply by 1	Time	Total EWMA misfire count of all cylinders in last ten driving cycles EWMA: Exponential Weighted Moving Average
\$A1	\$0C	Multiply by 1	Time	<ul style="list-style-type: none"> When power switch on (IG), total misfire count of all cylinders in last driving cycle is displayed. While engine is running, total misfire count of all cylinders in current driving cycle is displayed.
\$A2	\$0B	Multiply by 1	Time	Total EWMA misfire count of cylinder 1 in last ten driving cycles
\$A2	\$0C	Multiply by 1	Time	<ul style="list-style-type: none"> When power switch on (IG), total misfire count of cylinder 1 in last driving cycle is displayed. While engine is running, total misfire count of cylinder 1 in current driving cycle is displayed.
\$A3	\$0B	Multiply by 1	Time	Total EWMA misfire count of cylinder 2 in last ten driving cycles
\$A3	\$0C	Multiply by 1	Time	<ul style="list-style-type: none"> When power switch on (IG), total misfire count of cylinder 2 in last driving cycle is displayed. While engine is running, total misfire count of cylinder 2 in current driving cycle is displayed.
\$A4	\$0B	Multiply by 1	Time	Total EWMA misfire count of cylinder 3 in last ten driving cycles
\$A4	\$0C	Multiply	Time	<ul style="list-style-type: none"> When power switch on (IG), total misfire count of cylinder 3 in

Monitor ID	Test ID	Scaling	Unit	Description
		by 1		<p>last driving cycle is displayed.</p> <ul style="list-style-type: none"> While engine is running, total misfire count of cylinder 3 in current driving cycle is displayed.
\$A5	\$0B	Multiply by 1	Time	Total EWMA misfire count of cylinder 4 in last ten driving cycles
\$A5	\$0C	Multiply by 1	Time	<ul style="list-style-type: none"> When power switch on (IG), total misfire count of cylinder 4 in last driving cycle is displayed. While engine is running, total misfire count of cylinder 4 in current driving cycle is displayed.

READINESS MONITOR DRIVE PATTERN

1. PURPOSE OF READINESS TESTS

- The On-Board Diagnostic (OBD II) system is designed to monitor the performance of emission related components, and indicate any detected abnormalities using DTCs (Diagnostic Trouble Codes). Since various components need to be monitored during different driving conditions, the OBD II system is designed to run separate monitoring programs called Readiness Monitors.
- To view the status, enter the following menus: Powertrain / Engine and ECT / Monitor / Status2.
- When the status of a Readiness Monitor reads Complete, the necessary conditions have been met for running the performance tests for that Readiness Monitor.
- A generic OBD II scan tool can also be used to view the Readiness Monitor status.

HINT:

Many state Inspection and Maintenance (I/M) programs require the status of vehicle Readiness Monitors to show Complete before beginning emission tests.

- The Readiness Monitors will be reset to Incomplete if:
 - The ECM has lost battery power or blown a fuse.
 - DTCs have been cleared.
 - The conditions for running the Readiness Monitor have not been met.
- If a Readiness Monitor status shows Incomplete, follow the appropriate Readiness Monitor Drive Pattern to change the status to Complete.

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

NOTICE:

These drive patterns represent the fastest method of satisfying all conditions necessary to achieve complete status for each specific Readiness Monitor.

In the event of a drive pattern being interrupted (possibly due to factors such as traffic conditions), the drive pattern can be resumed. In most cases, the Readiness Monitor will still achieve complete status upon completion of the drive pattern.

To ensure completion of the Readiness Monitors, avoid sudden changes in vehicle load and speed (driving up and down hills and/or sudden acceleration).

2. CATALYST MONITOR (ACTIVE AIR FUEL RATIO CONTROL TYPE)

(Note: Even when vehicle stops during drive pattern, test can be resumed.)

(a) Preconditions

- The monitor will not run unless:
 - The MIL is OFF.

(b) Drive Pattern

- (1) Connect the Techstream to the DLC3.
- (2) Turn the power switch on (IG).
- (3) Turn the Techstream on.
- (4) Clear DTCs (if set) INFO.
- (5) Put the engine in inspection mode INFO.
- (6) Start the engine and warm it up [A].
- (7) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes [B].

(c) Monitor Status

Check the Readiness Monitor status displayed on the Techstream.

If the status does not switch to Complete, extend the driving time.

3. EVAP SYSTEM MONITOR (KEY OFF TYPE)

(a) Preconditions

- The monitor will not run unless:
 - The fuel tank is less than 90% full.
 - The altitude is less than 8000 ft. (2438 m).
 - The vehicle is stationary.
 - The engine coolant temperature is between 4.4°C and 35°C (40°F and 95°F).
 - The intake air temperature is between 4.4°C and 35°C (40°F and 95°F).
 - The vehicle was driven in a city area (or on a free-way) for 10 minutes or more.

(b) Monitor Conditions

- (1) Turn the power switch off and wait for 5 to 10 hours.

HINT:

Do not start the engine until checking Readiness Monitor status. If the engine is started, the step described above must be repeated.

(c) Monitor Status

- (1) Connect the Techstream to the DLC3.
 - (2) Turn the power switch on (IG).
 - (3) Turn the Techstream on.
 - (4) Check the Readiness Monitor status displayed on the Techstream.
- If the status does not switch to Complete, restart the engine, make sure that the preconditions have been met, and then perform the Monitor Conditions again.

4. AIR FUEL RATIO AND HEATED OXYGEN SENSOR MONITORS (ACTIVE AIR FUEL RATIO CONTROL TYPE)

Monitor Drive Pattern

Engine Coolant Temperature: 75°C or more

P

(a) Preconditions

- The monitor will not run unless:
 - 2 minutes or more have elapsed since the engine was started.
 - The engine coolant temperature is 75°C (167°F) or more.
 - Cumulative driving time at a vehicle speed of 30 mph (48 km/h) or more exceeds 6 minutes.
 - Air fuel ratio feedback control is performed.

(b) Drive Pattern for front air fuel ratio sensor and heated oxygen sensor

- (1) Connect the Techstream to the DLC3.
- (2) Turn the power switch on (IG).
- (3) Turn the Techstream on.
- (4) Clear DTCs INFO.
- (5) Put the engine in inspection mode INFO.
- (6) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) [A].
- (7) Drive the vehicle at between 38 mph (60 km/h) and 75 mph (120 km/h) for at least 10 minutes [B].
- (8) Move the shift lever to B [C].

(9) Accelerate the vehicle to 40 mph (64 km/h) or more by depressing the accelerator pedal for at least 10 seconds [D].

(10) Soon after performing step [D] above, release the accelerator pedal for at least 8 seconds without depressing the brake pedal, in order to execute fuel-cut control [E].

(11) Allow the vehicle to decelerate until the vehicle speed declines to less than 6 mph (10 km/h) [F].

(12) Repeat steps from [D] through [F] above at least 3 times in one driving cycle [G].

(c) Monitor Status

(1) Check the Readiness Monitor status displayed on the Techstream.

(2) If the status does not switch to Complete, make sure that the preconditions have been met, and then perform steps from [A] through [G] in Drive Pattern above.

5. AIR FUEL RATIO AND HEATED OXYGEN SENSOR HEATER MONITORS (FRONT AIR FUEL RATIO AND REAR HEATED OXYGEN SENSOR TYPE)

Y

(a) Preconditions

- The monitor will not run unless:
 - The MIL is OFF.

(b) Drive Pattern

(1) Connect the Techstream to the DLC3.

(2) Turn the power switch on (IG).

(3) Turn the Techstream on.

(4) Clear DTCs (if set) .

(5) Put the engine in inspection mode .

(6) Start the engine [A].

(7) Allow the engine to idle for 10 minutes or more [B].

(8) Drive the vehicle at 25 mph (40 km/h) or more for at least 2 minutes [C].

(c) Monitor Status

(1) Check the Readiness Monitor status displayed on the Techstream.

If the status does not switch to Complete, make sure that the preconditions have been met, and repeat steps [A] to [C] described in the Drive Pattern above.

PROBLEM SYMPTOMS TABLE

HINT:

- Use the table below to help determine the cause of problem symptoms. If multiple suspected areas are listed, the potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.
- Inspect the fuses and relays related to this system before inspecting the suspected areas below.

TERMINALS OF ECM

HINT:

The standard normal voltage between each pair of the ECM terminals is shown in the table below. The appropriate conditions for checking each pair of the terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of the terminals, and displayed in the "Specified Condition" column. The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A57-20 (BATT) - D28-104 (E1)	R - BR	Battery (for measuring battery voltage and for ECM memory)	Always	11 to 14 V
A57-2 (+B) - D28-104 (E1)	B - BR	Power source of ECM	Power switch on (IG)	11 to 14 V
A57-1 (+B2) - D28-104 (E1)	B - BR	Power source of ECM	Power switch on (IG)	11 to 14 V
A57-3 (+BM) - D28-104 (E1)	GR - BR	Power source of throttle actuator	Always	11 to 14 V
D28-108 (IGT1) - D28-104 (E1)	GR - BR	Ignition coil assembly (ignition signal)	Idling	Pulse generation (see waveform 1)
D28-107 (IGT2) - D28-104 (E1)	W - BR			
D28-106 (IGT3) - D28-104 (E1)	G - BR			
D28-105 (IGT4) - D28-104 (E1)	Y - BR			
D28-23 (IGF) - D28-104 (E1)	L - BR	Ignition coil assembly (ignition confirmation signal)	Power switch on (IG)	4.5 to 5.5 V
			Idling	Pulse generation

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
				(see waveform 1)
D28-74 (NE+) - D28-120 (NE-)	B - W	Crankshaft position sensor	Idling with warm engine	Pulse generation (see waveform 2)
D28-76 (G2+) - D28-122 (G2-)	B - W	Camshaft position sensor	Idling with warm engine	Pulse generation (see waveform 2)
D28-85 (#10) - D28-109 (E01)	Y - BR	Fuel injector assembly	Power switch on (IG)	11 to 14 V
D28-84 (#20) - D28-109 (E01)	B - BR			
D28-83 (#30) - D28-109 (E01)	L - BR		Idling	Pulse generation (see waveform 3)
D28-82 (#40) - D28-109 (E01)	R - BR			
D28-18 (HA1A) - D28-46 (E04)	Y - W-B	Air fuel ratio sensor (sensor 1) heater	Power switch on (IG)	11 to 14 V
			Idling with warm engine	Pulse generation (see waveform 4)
D28-103 (A1A+) - D28-104 (E1)	Y - BR	Air fuel ratio sensor (sensor 1)	Idling	3.3 V*1
D28-126 (A1A-) - D28-104 (E1)	BR - BR	Air fuel ratio sensor (sensor 1)	Idling	3.0 V*1
D28-41 (HT1B) - D28-86 (E03)	BR - BR	Heated oxygen sensor (sensor 2) heater	Power switch on (IG)	11 to 14 V
			Idling	Below 3.0 V
D28-125 (OX1B) - D28-102 (O1B-)	L - P	Heated oxygen sensor (sensor 2)	Engine speed maintained at 2500 rpm for 2 minutes after warming up engine	Pulse generation (see waveform 5)
D28-87 (KNK1) - D28-110 (EKNK)	B - W	Knock control sensor	Engine speed maintained at 4000 rpm after warming up engine	Pulse generation (see waveform 6)
D28-64 (THW) -	P - BR	Engine coolant temperature	Idling, Engine coolant	0.2 to 1.0 V

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
Body ground	Body ground			
D28-86 (E03) - Body ground	BR - Body ground	Ground	Always	Below 1 Ω
D28-46 (E04) - Body ground	BR - Body ground	Ground	Always	Below 1 Ω
A57-32 (EC) - Body ground	W-B - Body ground	Ground	Always	Below 1 Ω
D28-22 (GE01) - D28-104 (E1)	W-B - BR	Shield earth (ground) circuit of throttle actuator	Always	Below 1 V
A57-42 (VPMP) - D28-104 (E1)	B - BR	Vent valve (built into canister pump module)	Power switch on (IG)	11 to 14 V
A57-34 (MPMP) - D28-104 (E1)	L - BR	Leak detection pump (built into canister pump module)	Leak detection pump OFF	Below 3 V
			Leak detection pump ON	11 to 14 V
D28-113 (VCP) - D28-112 (EPPM)	GR - LG	Power source for canister pressure sensor (specific voltage)	Power switch on (IG)	4.5 to 5.5 V
D28-114 (PPMP) - D28-112 (EPPM)	W - LG	Canister pressure sensor (built into canister pump module)	Power switch on (IG)	3 to 3.6 V

HINT:

*1: The ECM terminal voltage is constant regardless of the output voltage from the sensor.

1. WAVEFORM 1

Igniter IGT Signal (from ECM to Igniter) and Igniter IGF Signal (from Igniter to ECM)

ECM Terminal Name	Between IGT (1 to 4) and E1
Tester Range	Between IGF and E1
Condition	2 V/DIV., 20 ms./DIV.
	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.

2. WAVEFORM 2

Crankshaft Position Sensor and Camshaft

Position Sensor Signal

ECM Terminal Name	Between NE+ and NE- Between G2+ and G2-
Tester Range	5 V/DIV., 20 ms./DIV.
Condition	Idling with warm engine

HINT:

The wavelength becomes shorter as the engine speed increases.

3. WAVEFORM 3

No. 1 (to No. 4) Fuel Injector Assembly Signal

ECM Terminal Name	Between #10 (to #40) and E01
Tester Range	20 V/DIV., 20 ms./DIV.
Condition	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.

4. WAVEFORM 4

Air Fuel Ratio Sensor (Sensor 1) Heater Signal

ECM Terminal Name	Between HA1A and E04
Tester Range	5 V/DIV., 10 ms./DIV.
Condition	Idling with warm engine

HINT:

The wavelength varies in accordance with the engine operating condition.

5. WAVEFORM 5

Heated Oxygen Sensor (Sensor 2) Signal

ECM Terminal Name	Between OX1B and O1B-
Tester Range	0.2 V/DIV. 200 ms./DIV.
Condition	Engine speed maintained at 2500 rpm for 2 minutes

after warming up engine

HINT:

In the Data List, the items O2S B1 S2 show the values input to the ECM from the heated oxygen sensor.

6. WAVEFORM 6

Knock Control Sensor Signal

ECM Terminal Name	Between KNK1 and EKNK
Tester Range	1 V/DIV., 1 ms./DIV.
Condition	Engine speed maintained at 4000 rpm after engine warming engine

- The wavelength becomes shorter as the engine speed increases.
- The waveforms and amplitudes displayed differ slightly depending on the vehicle condition.

T

7. WAVEFORM 7

5 V/DIV. Throttle Actuator Positive Terminal Signal

ECM Terminal Name	Between M+ and ME01
Tester Range	5 V/DIV., 1 ms./DIV.
Condition	Idling with warm engine

HINT:

The duty ratio varies depending on the throttle actuator operation.

T

8. WAVEFORM 8

Throttle Actuator Negative Terminal Signal

ECM Terminal Name	Between M- and ME01
Tester Range	5 V/DIV., 1 ms./DIV.

Condition	Idling with warm engine
-----------	-------------------------

HINT:

The duty ratio varies depending on the throttle actuator operation.

T

9. WAVEFORM 9

Purge VSV

ECM Terminal Name	Between PRG and E1
Tester Range	10 V/DIV., 20 ms./DIV.
Condition	Idling, under purge control

HINT:

If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

Y

10. WAVEFORM 10

Camshaft Timing Oil Control Valve Assembly Signal

ECM Terminal Name	Between OC1+ and OC1-
Tester Range	5 V/DIV., 1 ms./DIV.
Condition	Idling

T

11. WAVEFORM 11

CAN Communication Signal (Reference)

ECM Terminal Name	Between CANH and E1, CANP and E1
Tester Range	1 V/DIV., 10 μ sec./DIV.
Condition	Engine stopped and power switch on (IG)

HINT:

The waveform varies depending on the CAN communication signal.

T

12. WAVEFORM 12

CAN Communication Signal (Reference)

ECM Terminal Name	Between CANL and E1, CANN and E1
Tester Range	1 V/DIV., 10 μsec./DIV.
Condition	Engine stopped and power switch on (IG)

HINT:

The waveform varies depending on the CAN communication signal.

T

13. WAVEFORM 13

Water Pump Assembly Signal (from ECM to Water Pump Assembly)

ECM Terminal Name	Between WPO and E1
Tester Range	5 V/DIV., 20 ms./DIV.
Condition	Idling with warm engine

HINT:

The wavelength becomes shorter as the water pump speed increases.

14. WAVEFORM 14

Water Pump Assembly Signal (from Water Pump Assembly to ECM)

ECM Terminal Name	Between WPI and E1
Tester Range	5 V/DIV., 20 ms./DIV.

Condition	Idling with warm engine
-----------	-------------------------

5 V/DIV.

HINT:

The wavelength becomes shorter as the water pump speed increases.

20 V/DIV.

15. WAVEFORM 15

EGR Valve Assembly Signal

ECM Terminal Name	Between EGR1 and E1, EGR2 and E1, EGR3 and E1, EGR4 and E1
Tester Range	20 V/DIV., 50 ms./DIV.
Condition	Idling with warm engine

16. WAVEFORM 16

5 V/DIV.

Camshaft Revolution Signal from ECM to Power Management Control ECU and Inverter with Converter Assembly (MG ECU)

ECM Terminal Name	Between G20 and E1
Tester Range	5 V/DIV., 20 ms./DIV.
Condition	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.

DIAGNOSIS SYSTEM

1. DESCRIPTION

- When troubleshooting OBD II (On-Board Diagnostics) vehicles, an OBD II scan tool (complying with SAE J1987) must be connected to the DLC3 (Data Link Connector 3) of the vehicle. Various data in the vehicle ECM (Engine Control Module) can be then read.
- OBD II regulations require that the vehicle on-board computer illuminates the MIL (Malfunction Indicator Lamp) on the instrument panel when the computer detects a malfunction in:

- a. The emission control system and components.
 - b. The powertrain control components (which affect vehicle emissions).
 - c. The computer itself.
- In addition, the applicable DTCs prescribed by SAE J2012 are recorded in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.
 - To check the DTCs, connect the Techstream to the DLC3. The Techstream displays DTCs, freeze frame data, and a variety of the engine data. The DTCs and freeze frame data can be cleared with the Techstream. In order to enhance OBD function on vehicles and develop the Off-Board diagnosis system, Controller Area Network (CAN) communication is used in this system. CAN is a network which uses a pair of data transmission lines spanning multiple computers and sensors. It allows for high speed communications between the systems and simplification of the wire harness connections.

2. NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent problems (the Techstream only).

3. 2 TRIP DETECTION LOGIC

- When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the subsequent drive cycle, the MIL is illuminated (2nd trip).

4. DLC3 (Data Link Connector 3)

- (a) Check DLC3  .

5. FREEZE FRAME DATA

- The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

6. BATTERY VOLTAGE

Standard voltage:

11 to 14 V

- If voltage is below 11 V, replace or recharge the battery.

7. MIL (Malfunction Indicator Lamp)

(a) The MIL illuminates when the power switch is first turned on (IG) (the engine is not running).

(b) The MIL should turn off when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL does not illuminate when the power switch is first turned on (IG), check the MIL circuit .

8. ALL READINESS

HINT:

- With "ALL READINESS", you can check whether or not the DTC judgment has been completed by using the Techstream.
- You should check "ALL READINESS" after simulating malfunction symptoms or for validation after finishing repairs.

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear DTCs .

(e) Turn the power switch off and wait for 30 seconds.

(f) Turn the power switch on (IG) and turn the Techstream on.

(g) Perform the DTC judgment driving pattern to run the DTC judgment.

(h) Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

(i) Input the DTCs to be confirmed.

(j) Check the DTC judgment result.

Techstream

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">• DTC judgment completed• System normal
ABNORMAL	<ul style="list-style-type: none">• DTC judgment completed• System abnormal
INCOMPLETE	<ul style="list-style-type: none">• DTC judgment not completed• Perform the driving pattern after confirming the DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">• Unable to perform DTC judgment• Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

DTC CHECK / CLEAR

NOTICE:

When the diagnosis system is changed from normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

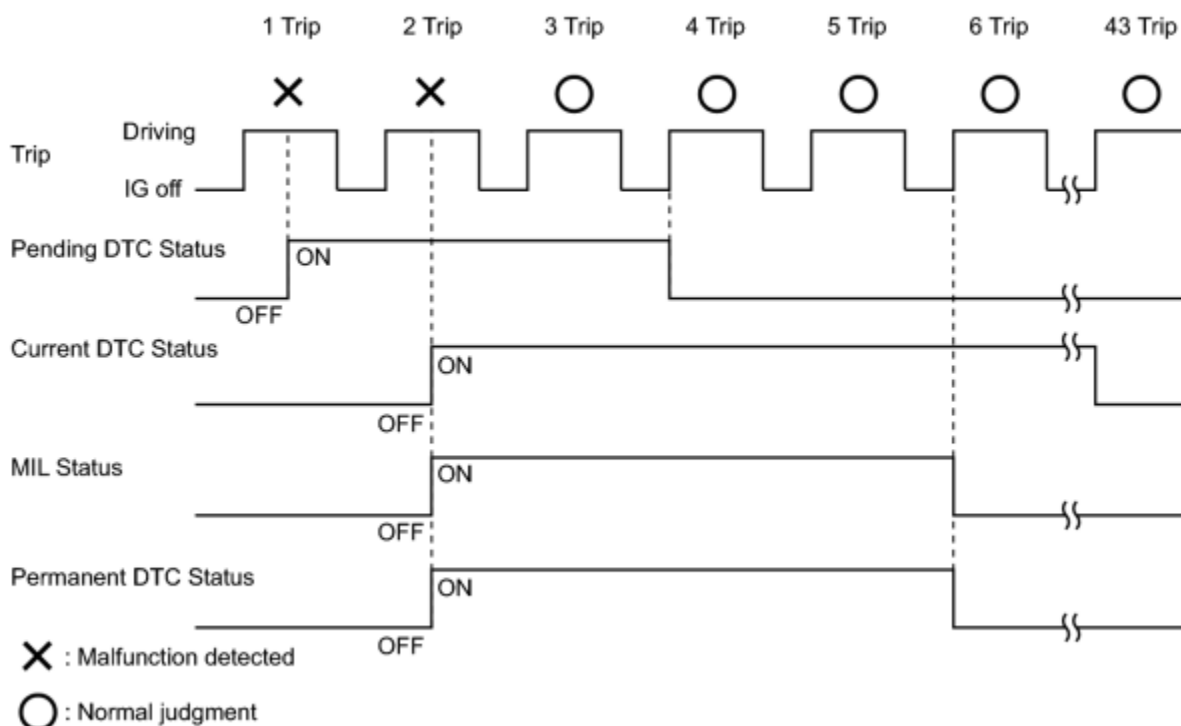

- DTCs which are stored in the ECM can be displayed on the Techstream. The Techstream can display the current, pending and permanent DTCs.
- If a malfunction is detected during the current driving cycle, current and permanent DTCs are stored.
- Some DTCs are not stored if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.
- Current and pending DTCs can be cleared by using the Techstream or by disconnecting the cable from the negative battery terminal. However, permanent DTCs cannot be cleared using either of these two methods.
- After clearing current DTCs using the Techstream (or by disconnecting the cable from the negative battery terminal), permanent DTCs can be cleared when the system is determined to be normal for the relevant DTCs and then the universal trip is performed. The driving pattern to obtain a normal judgment is described under the "Confirmation Driving Pattern" for the respective DTC.

2 Trip Detection Examples

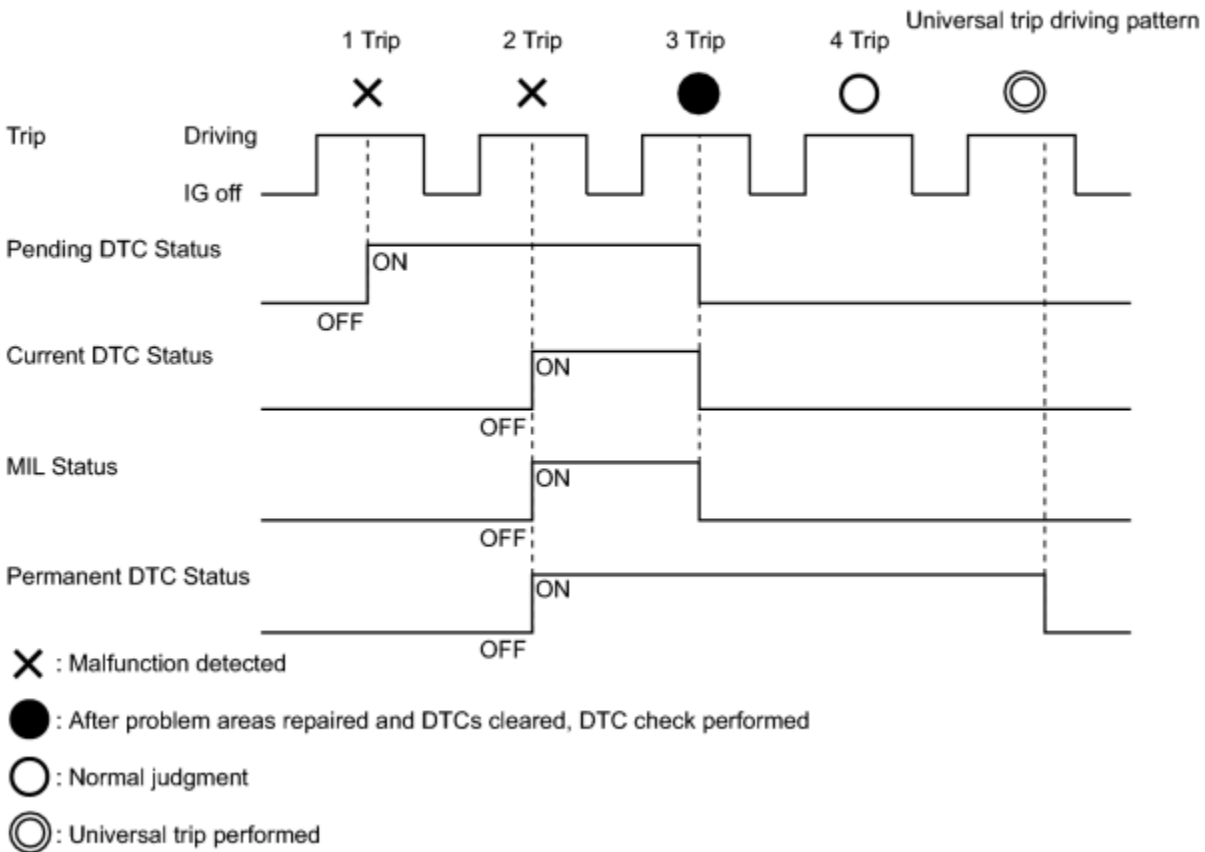

Pending DTC	Store condition	Malfunction detected
	Clear condition	System determined to be normal or DTCs cleared using Techstream or Cable disconnected from negative (-) battery terminal
Current DTC	Store condition	Malfunction detected (2nd trip)
	Clear condition	No malfunctions in 40 driving cycles or DTCs cleared using Techstream or Cable disconnected from negative (-) battery terminal
Permanent	Store	Malfunction detected (2nd trip)

DTC	condition	
	Clear condition	<p>Power switch turned to on (IG) after normal judgment obtained in 3 consecutive driving cycles</p> <p>or</p> <p>After DTCs cleared using Techstream or cable disconnected from negative (-) battery terminal, normal judgment obtained and universal trip performed (not for misfire and fuel system DTCs)</p> <p>or</p> <p>After DTCs cleared using Techstream or cable disconnected from negative (-) battery terminal, malfunction not detected when universal trip driving performed (misfire and fuel system DTCs)</p>
MIL	ON	Malfunction detected (2nd trip)
	OFF	<p>Power switch turned to on (IG) after normal judgment obtained in 3 consecutive driving cycles</p> <p>or</p> <p>DTCs cleared using Techstream</p> <p>or</p> <p>Cable disconnected from negative (-) battery terminal</p>

2 Trip Detection Examples

2 Trip Detection Examples (Instance when DTCs were cleared midway through by using the Techstream or by disconnecting the cable from the negative battery terminal)

HINT:

- Obtaining a normal judgment and performing a universal trip driving pattern can be done in the same driving cycle or in different driving cycles.
- It is unnecessary to obtain a normal judgment if the DTCs are misfire or fuel system DTCs.

1. CHECK DTC

- Connect the Techstream to the DLC3.
- Turn the power switch on (IG).
- Turn the Techstream on.
- Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- Check the DTC(s) and freeze frame data, and then write them down.
- Check the details of the DTC(s) INFO.

2. CLEAR DTC (Pending and Current DTC)

- Connect the Techstream to the DLC3.

- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Clear the DTCs.

3. CLEAR DTC (Pending and Current DTC without using Techstream)

- (a) Perform either of the following operations:
 - (1) Disconnect the cable from the negative (-) battery terminal for more than 1 minute.
 - (2) Remove the EFI MAIN and ETCS fuses from the engine room relay block located inside the engine compartment for more than 1 minute.

4. CLEAR PERMANENT DTC

HINT:

Even if the following procedure is not performed, permanent DTCs are cleared by obtaining a normal judgment during 3 consecutive driving cycles.

Universal Trip Driving Pattern

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(e) Check if permanent DTCs are stored.

HINT:

If permanent DTCs are not output, it is not necessary to continue this procedure.

(f) Clear DTCs.

(g) Perform the respective confirmation driving patterns in order to obtain a normal judgment for the output DTCs.

HINT:

- Confirmation driving patterns do not need to be performed for misfire and fuel system DTCs.
- For the confirmation driving pattern, refer to the procedures for the relevant DTC INFO.

(h) Perform the universal trip.

HINT:

The driving pattern to obtain a normal judgment and the universal trip driving can be performed consecutively in the same driving cycle.

1. Put the engine in inspection mode INFO.
2. Idle the engine for 30 seconds or more.
3. Drive the vehicle at 25 mph (40 km/h) or more for a total of 5 minutes or more.

HINT:

It is possible to complete the drive pattern even if the vehicle decelerates to less than 25 mph (40 km/h) during the driving cycle provided that the vehicle is driven at 25 mph (40 km/h) or more for a total of 5 minutes.

4. Allow 10 minutes or more to elapse from the time the engine is started.

(i) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(j) Check that the permanent DTCs have been cleared.

HINT:

The permanent DTCs are cleared when the universal trip is completed.

FREEZE FRAME DATA

1. DESCRIPTION

- The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was moving or stationary, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

HINT:

If it is impossible to replicate the problem even though a DTC is detected, confirm the freeze frame data.

- The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the Techstream, five separate sets of freeze frame data, including the data values at the time when the DTC was set, can be checked.

- 3 data sets before the DTC was set.
- 1 data set when the DTC was set.
- 1 data set after the DTC was set.

2. LIST OF FREEZE FRAME DATA

Tester Display	Measurement Item	Diagnostic Note
Vehicle Speed	Vehicle speed	Speed indicated on speedometer
Engine Speed	Engine speed	-
Calculate Load	Calculated load by ECM	-
Vehicle Load	Vehicle load	Load percentage in terms of maximum intake air flow amount
MAF	Air flow rate from mass air flow meter sub-assembly	If value approximately 0.0 gm/sec: <ul style="list-style-type: none"> Mass air flow meter sub-assembly power source circuit open VG circuit open or short

Tester Display	Measurement Item	Diagnostic Note
		If value 271.0 gm/sec or more: <ul style="list-style-type: none"> E2G circuit open
Atmosphere Pressure	Atmosphere pressure	-
MAP	Intake manifold pressure	-
Coolant Temp	Engine coolant temperature	<ul style="list-style-type: none"> If value -40°C (-40°F): sensor circuit open If value 140°C (284°F): sensor circuit shorted
Intake Air	Intake air temperature	<ul style="list-style-type: none"> If value -40°C (-40°F): sensor circuit open If value 140°C (284°F): sensor circuit shorted
Engine Run Time	Engine run time	-
Initial Engine Coolant Temp	Initial engine coolant temperature	Service data
Initial Intake Air Temp	Initial intake air temperature	Service data
Battery Voltage	Battery voltage	-
Throttle Sensor Volt %	Throttle sensor positioning	Recognition value for throttle opening angle on ECM
Throttl Sensor #2 Volt %	Absolute throttle sensor positioning #2	Recognition value for throttle opening angle on ECM
Throttle Sensor Position	Throttle sensor positioning	Recognition value for throttle opening angle on ECM
Throttle Motor DUTY	Throttle actuator	-
Injector (Port)	Injection direction for cylinder 1	-
Injection Volum (Cylinder1)	Injection volume (Cylinder 1)	Quantity of fuel injection volume for 10 times
Fuel Pump/Speed Status	Fuel pump/status	Active Test support data
Vacuum Pump	Key-off EVAP system leak detection pump status	Active Test support data
EVAP (Purge) VSV	Purge VSV control duty ratio	Order signal from ECM
Evap Purge Flow	Ratio of evaporative purge flow to intake air volume	Service data
Purge Density Learn Value	Learning value of purge density	Service data

Tester Display	Measurement Item	Diagnostic Note
EVAP System Vent Valve	Key-off EVAP system vent valve status	Active Test support data
EVAP Purge VSV	Purge VSV status for EVAP control	Active Test support data
Purge Cut VSV Duty	Purge cut vacuum switching valve duty ratio	-
Target Air-Fuel Ratio	Ratio compared to stoichiometric level	-
AF Lambda B1S1	Short-term fuel trim associated with bank 1 sensor 1	-
AFS Voltage B1S1	Air fuel ratio sensor output voltage for bank 1 sensor 1	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensors
AFS Current B1S1	Air fuel ratio sensor output current for bank 1 sensor 1	Value becomes higher when fuel-cut executed under high engine speed
A/F Heater Duty #1	Air fuel ratio sensor heater duty ratio	-
O2S B1S2	Heated oxygen sensor output voltage for bank 1 sensor 2	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensors
O2S Impedance B1S2	Heated oxygen sensor impedance (bank 1 sensor 2)	-
O2 Heater B1S2	Heated oxygen sensor operation	-
O2 Heater Curr Val B1S2	Heated oxygen sensor current	-
Short FT #1	Short-term fuel trim of bank 1	Short-term fuel compensation used to maintain air fuel ratio at stoichiometric air fuel ratio
Long FT #1	Long-term fuel trim of bank 1	Overall fuel compensation carried out in long-term to compensate continual deviation of short-term fuel trim from central value
Total FT #1	Total fuel trim	-
Fuel System Status #1	Fuel system status (bank 1)	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using air fuel ratio sensor as feedback for fuel control • OLDrive: Open loop due to driving conditions (fuel enrichment) • OLFault: Open loop due to detected system fault • CLFault: Closed loop but air fuel ratio sensor, which

Tester Display	Measurement Item	Diagnostic Note
		is used for fuel control, malfunctioning
Fuel System Status #2	Fuel system status (bank 2) (Unused)	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using air fuel ratio sensor as feedback for fuel control • OLDrive: Open loop due to driving conditions (fuel enrichment) • OLFault: Open loop due to detected system fault • CLFault: Closed loop but air fuel ratio sensor, witch is used for fuel control, malfunctioning
IGN Advance	Ignition timing advance for cylinder 1	-
Knock Feedback Value	Feedback value of knocking	Service data
Knock Correct Learn Value	Correction learning value of knocking	Service data
Target EGR Position	Target EGR position	-
EGR Step Position	EGR step position	-
VVT Control Status #1	VVT control (bank 1) status	Active Test support data
Catalyst Temp B1S1	Catalyst temperature (associated sensor 1)	-
Catalyst Temp B1S2	Catalyst temperature (associated sensor 2)	-
Closed Throttle Position SW	Closed throttle position switch	-
Fuel Cut Condition	Fuel cut condition ON or OFF	-
TC Terminal	TC terminal status	-
Time after DTC Cleared	Time since DTCs cleared	-
Distance from DTC Cleared	Distance traveled since DTCs cleared	-
Warmup Cycle Cleard DTC	Warm-up cycles since DTCs cleared	Number of warm-up cycles since DTCs cleared
Dist Batt Cable Disconnect	Accumulated distance from battery cable disconnected	-

Tester Display	Measurement Item	Diagnostic Note
IG OFF Elapsed Time	Cumulative time after power switch off	-
TC and TE1	TC and CG (TE1) terminals of DLC3	Active Test support data
Ignition Trig. Count	Ignition counter to calculated misfire count	-
Cylinder #1 Misfire Count	Misfire count for cylinder 1	-
Cylinder #2 Misfire Count	Misfire count for cylinder 2	-
Cylinder #3 Misfire Count	Misfire count for cylinder 3	-
Cylinder #4 Misfire Count	Misfire count for cylinder 4	-
All Cylinders Misfire Count	All cylinders misfire count	-
Misfire RPM	Average engine speed when misfire occurs	-
Misfire Load	Average engine load when misfire occurred	-
Electric Fan Motor	Electric cooling fan motor	Active Test support data
Idle Fuel Cut Prohibit	Prohibition of fuel cut at idle	-
Idle Fuel Cut	Fuel cut idle	ON: When throttle valve fully closed and engine speed over 2800 rpm
FC TAU	FC TAU	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
Communication with HV	Status of the communication with power management control ECU	-
Communication with Brake	Status of the communication with skid control ECU	-
Comm with Air Conditioner	Status of the communication with air conditioning amplifier assembly	-
Requested Engine Torque	Requested engine torque	Flag information for hybrid vehicle
HV Target Engine Speed	HV target engine speed	Flag information for hybrid vehicle
Actual Engine Torque	Actual engine torque	Flag information for hybrid vehicle
Engine Run Time	Engine run time	Flag information for hybrid vehicle
Request Engine	Request engine run time	Flag information for hybrid vehicle

Tester Display	Measurement Item	Diagnostic Note
Run Time		
Judge Time Engine Ignition	Judgment time for engine ignition	Flag information for hybrid vehicle
Judge Time Engine Output	Judgment time for time until engine output	Flag information for hybrid vehicle
ISC Learning	Idle speed control learning	Flag information for hybrid vehicle
F/C for Engine Stop Req	Fuel cut for engine stop request	Flag information for hybrid vehicle
Engine Independent	Engine independent operation	Flag information for hybrid vehicle
Racing Operation	Racing operation	Flag information for hybrid vehicle
Request Warm-up	Request engine warm up	Flag information for hybrid vehicle
Engine Independent Control	Engine independent control operation	Flag information for hybrid vehicle
Elec Water Pump Target Spd	Electronic water pump target speed	-
Elec Water Pump Spd	Electronic water pump speed	-
ISC Learning Value	Idle speed control leaning value	Flag information for hybrid vehicle

CHECK MODE PROCEDURE

Compared to normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect malfunctions that cannot be detected in normal mode.

NOTICE:

All the stored DTCs and freeze frame data are cleared if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the power switch is turned from on (IG) to on (ACC) or off while in check mode. Before changing modes, always check and note any DTCs and freeze frame data.

1. CHECK MODE PROCEDURE

(a) Check and ensure the following conditions:

- (1) Battery voltage 11 V or more.
- (2) Throttle valve fully closed.
- (3) Push the P position switch.
- (4) A/C switch off.

(b) Turn the power switch off.

(c) Connect the Techstream to the DLC3.

(d) Turn the power switch on (IG).

(e) Turn the Techstream on.

(f) Enter the following menus: Powertrain / Engine and ECT / Utility / Check Mode.

(g) Switch the ECM from normal mode to check mode.

(h) Make sure that the MIL flashes as shown in the illustration.

(i) Turn the power switch on (READY).

(j) Make sure that the MIL turns off.

(k) Simulate that the conditions of the malfunction described by the customer.

(1) Check DTCs and freeze frame data using the Techstream.

FAIL-SAFE CHART

If any of the following DTCs are set, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily or stops fuel injection.

DTC	Component	Fail-safe Operation	Fail-safe Deactivation Condition
P0031 P0032 P101D	Air fuel ratio sensor heater	ECM turns off air fuel ratio sensor heater	Power switch off
P0037 P0038 P102D	Heated oxygen sensor heater	ECM turns off heated oxygen sensor heater	Power switch off
P0102 P0103	Mass air flow meter sub-assembly	ECM calculates ignition timing according to engine speed and throttle valve position	Pass condition detected
P0106 P0107 P0108	Manifold absolute pressure sensor	ECM turns off EGR valve operate	Pass condition detected
P0112 P0113	Intake air temperature sensor	ECM estimates intake air temperature to be 20°C (68°F)	Pass condition detected
P0115 P0117 P0118	Engine coolant temperature sensor	ECM estimates engine coolant temperature to be 80°C (176°F)	Pass condition detected
P0120 P0121 P0122 P0123 P0220 P0222 P0223	Electronic throttle control system	ECM cuts off throttle actuator current and throttle valve returns to the 5.5° throttle position by return spring The ECM stops the engine and the vehicle can be driven using solely the hybrid system *1	Pass condition detected and then power switch turned off

DTC	Component	Fail-safe Operation	Fail-safe Deactivation Condition
P0604			
P0606			
P0607			
P060A			
P060B			
P060E			
P0657			
P2102			
P2103			
P2111			
P2112			
P2118			
P2119			
P2135			
P0327 P0328	Knock control sensor	ECM sets ignition timing to maximum retard	Power switch off
P0351 to P0354	Ignition coil assembly (Igniter)	ECM cuts fuel	Pass condition detected
P0401	EGR valve assembly	ECM assumes that EGR valve is closed, so that ignition timing controlled to a safe value	Pass condition detected
P0403	EGR valve assembly	ECM assumes that EGR valve is closed, so that ignition timing controlled to a safe value	Pass condition detected
P216B	Water pump assembly	Output duty ratio of the WPO terminal repeats a cycle of 0% for 30 seconds and then 85% for 5 seconds*2	Power switch off
P261C	Water pump assembly	Output duty ratio of the WPO terminal remains at 0%*2	Power switch off
P261D	Water pump assembly	Output duty ratio of the WPO terminal remains at 0%*2	Power switch off

HINT:

- *1: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly.
- *2: When the coolant temperature reaches 105°C (221°F), the engine is stopped and the hybrid system is solely used to driving vehicle.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

Using the Techstream to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

In the table below, the values listed under Normal Condition are reference only. Do not depend solely on these values when determining whether or not a part is faulty.

- (a) Warm up the engine.
- (b) Turn the power switch off.
- (c) Connect the Techstream to the DLC3.
- (d) Turn the power switch on (IG).
- (e) Turn the Techstream on.
- (f) Enter the following menus: Powertrain / Engine and ECT / Data List.
- (g) According to the display on the Techstream, read the Data List.

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Vehicle Speed	Vehicle speed: Min.: 0 mph (0 km/h), Max.: 159 mph (255 km/h)	Actual vehicle speed	Speed indicated on speedometer

Initial Intake Air Temp	Initial intake air temperature: Min.: -40°C (-40°F), Max.: 119.3°C (246.8°F)	Intake air temperature when engine started	Service data
Battery Voltage	Battery voltage: Min.: 0 V, Max.: 65.535 V	11 to 16 V: Idling	-
Throttle Sensor Volt %	Throttle valve opening percentage according to throttle position sensor: Min.: 0%, Max.: 100%	10 to 22%: Accelerator pedal released	Value calculated based on the voltage at terminal VTA1
Throttl Sensor #2 Volt %	Throttle valve opening percentage according to throttle position sensor No. 2: Min.: 0%, Max.: 100%	42 to 62%: Accelerator pedal released	Value calculated based on the voltage at terminal VTA2
System Guard	System guard: ON or OFF	-	Electronic throttle control system service data
Throttle Idle Position	Whether or not throttle position sensor detecting idling: ON or OFF	<ul style="list-style-type: none"> • ON: Accelerator pedal released • OFF: Accelerator pedal fully depressed 	-
Throttle Require Position	Required throttle position: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Idling	-
Throttle Sensor Position*1	Throttle position sensor:	0%: Accelerator pedal released	Recognition value for throttle opening angle on ECM

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	Min.: 0%, Max.: 100%		
Throttle Position No. 1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.98 V	-	Electronic throttle control system service data
Throttle Position No. 2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 4.98 V	-	Electronic throttle control system service data
Throttle Position No. 1	Throttle position sensor No. 1: Min.: 0 V, Max.: 5 V	<ul style="list-style-type: none"> 0.5 to 1.1 V: Accelerator pedal released 0.6 to 1.4 V: Fail-safe operating 	-
Throttle Position No. 2	Throttle position sensor No. 2: Min.: 0 V, Max.: 5 V	<ul style="list-style-type: none"> 2.1 to 3.1 V: Accelerator pedal released 2.1 to 3.1 V: Fail-safe operating 	-
Throttle Position Command	Throttle position command value: Min.: 0 V, Max.: 4.9804 V	0.5 to 4.8 V	-
Throttle Sens Open Pos #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.9804 V	0.6 to 1.4 V	Electronic throttle control system service data
Throttle Sens Open Pos #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.9804 V	1.7 to 2.5 V	Electronic throttle control system service data
Throttle Motor Current	Throttle actuator current:	0 to 3.0 A: Idling	Electronic throttle control system service data

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	Min.: 0 A, Max.: 20 A		
Throttle Motor DUTY	Throttle actuator: Min.: 0%, Max.: 100%	10 to 22%: Idling after engine warmed up	Electronic throttle control system service data
Throttle Motor Current	Throttle actuator current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
Throttle Motor Open Duty	Throttle actuator open duty ratio: Min.: 0%, Max.: 255%	0 to 40%: Idling	When accelerator pedal depressed, duty ratio increased
Throttle Motor Close Duty	Throttle actuator close duty ratio: Min.: 0%, Max.: 255%	0 to 40%: Idling	When accelerator pedal released quickly, duty ratio increased
Throttle Motor Duty (Open)	Throttle actuator duty ratio (open): Min.: 0%, Max.: 255%	0 to 40%: Idling	Electronic throttle control system service data
Throttle Motor Duty (Close)	Throttle actuator duty ratio (close): Min.: 0%, Max.: 255%	0 to 40%: Idling	Electronic throttle control system service data
Throttle Fully Close Learn	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 1.0 V: Accelerator pedal released	-
+BM Voltage	+BM voltage: Min.: 0, Max.: 19.92 V	11 to 16 V: Power switch on (IG) and system normal	Electronic throttle control system service data
Actuator Power Supply	Actuator power supply ON or OFF	ON: Idling	-
Injector (Port)	Injection duration for	1000 to 3000 μ s: Idling	-

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	cylinder 1: Min.: 0 μ s, Max.: 65535 μ s		
Injection Volum (Cylinder1)	Injection volume (Cylinder 1): Min.: 0 ml, Max.: 2.047 ml	0.03 to 0.13 ml: Idling	Quantity of fuel injection volume for 10 times
Fuel Pump/Speed Status	Fuel pump status: ON or OFF	-	Active Test support data
Vacuum Pump	Key-off EVAP system leak detection pump status: ON or OFF	-	Active Test support data
EVAP (Purge) VSV	EVAP (Purge) VSV control duty: Min.: 0%, Max.: 100%	0 to 50%: Idling, under purge control	Order signal from ECM
Evap Purge Flow	Ratio of evaporative purge flow to intake air volume: Min.: 0%, Max.: 399.9%	0 to 10%: Idling	Service data
Purge Density Learn Value	Learning value of purge density: Min.: -200, Max.: 199.993%	-40 to 10: Idling	Service data
Vapor Pressure Pump	Vapor pressure: Min.: 0 kPa (0 mmHg), Max.: 1441.77 kPa (10815.979 mmHg)	Approximately 100 kPa (750 mmHg) (absolute): Power switch on (IG)	EVAP system pressure monitored by canister pressure sensor
Vapor pressure (calculated)	Vapor pressure (calculated): Min.: -720.896 kPa (- 5408.072 mmHg),	Approximately 100 kPa (750 mmHg) (absolute): Power switch on (IG)	EVAP system pressure monitored by canister pressure sensor

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	Max.: 720.874 kPa (5407.070 mmHg)		
EVAP System Vent Valve	Key-off EVAP system vent valve status: ON or OFF	-	Active Test support data
EVAP Purge VSV	Purge VSV status for EVAP control: ON or OFF	-	Active Test support data
Purge Cut VSV Duty	Purge cut VSV duty: Min.: 0%, Max.: 399.9%	-	-
Target Air-Fuel Ratio	Ratio compared to stoichiometric level: Min.: 0, Max.: 1.99	0.8 to 1.2: Idling	-
AF Lambda B1 S1	Short-term fuel trim associated with bank 1 sensor 1: Min.: 0, Max.: 1.99	<ul style="list-style-type: none"> Value less than 1 (0.000 to 0.999) = Rich Stoichiometric air fuel ratio = 1 Value greater than 1 (1.001 to 1.99) = Lean 	-
AFS Voltage B1 S1	Air fuel ratio sensor output voltage for bank 1 sensor 1: Min.: 0 V, Max.: 7.99 V	2.6 to 3.8 V: Idling, engine warmed up	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensors
AFS Current B1 S1	Air fuel ratio sensor output current for bank 1 sensor 1: Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling, engine warmed up	Value becomes higher when fuel-cut executed under high engine speed
A/F Heater Duty #1	Air fuel ratio heater duty ratio for bank 1: Min.: 0%, Max.: 399.9%	0 to 100%	-

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0.0 to 0.9 V: Driving at 44 mph (70 km/h)	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensors
O2S Impedance B1S2	Heated oxygen sensor impedance (bank 1 sensor 2): Min.: 0 ohm, Max.: 21247.67 ohm	5 to 15000 ohm: After driving for 10 minutes or more in urban area	-
O2 Heater B1S2	Heated oxygen sensor heater for bank 1 sensor 2: Not Act or Active	-	-
O2 Heater Curr Val B1S2	Heated oxygen sensor current for bank 1 sensor 2: Min.: 0 A, Max.: 4.9 A	-	-
Short FT #1	Short-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-20 to 20%	Short-term fuel compensation used to maintain air fuel ratio at stoichiometric air fuel ratio
Long FT #1	Long-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-20 to 20%	Overall fuel compensation carried out long-term to compensate continual deviation of short-term fuel trim from central value
Total FT #1	Total fuel trim of bank 1 Average value for fuel trim system of bank 1: Min.: -0.5, Max.: 0.496	-0.28 to 0.2: Idling	-
Fuel System Status #1	Fuel system status (bank 1): OL or CL or OLDrive or OLFault or CLFault	CL: Idling after warming up	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using air

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
			<p>fuel ratio sensor as feedback for fuel control</p> <ul style="list-style-type: none"> • OLDrive: Open loop due to driving conditions (fuel enrichment) • OLFault: Open loop due to detected system fault • CLFault: Closed loop but air fuel ratio sensor, which used for fuel control malfunctioning
Fuel System Status #2	Fuel system status (bank 2): OL or CL or OLDrive or OLFault or CLFault	Unused	<ul style="list-style-type: none"> • OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using air fuel ratio sensor as feedback for fuel control • OLDrive: Open loop due to driving conditions (fuel enrichment) • OLFault: Open loop due to detected system fault • CLFault: Closed loop but air fuel ratio sensor, which used for fuel control malfunctioning
IGN Advance	Ignition timing advance for No. 1 cylinder: Min.: -64 deg., Max.: 63.5 deg.	BTDC 0 to 16 deg.: Idling	-
Knock Feedback Value	Feedback value of knocking: Min.: -1024 CA, Max.: 1024.0 CA	-20 to 0°C: Driving at 44 mph (70 km/h)	Service data

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Knock Correct Learn Value	Correction learning value of knocking: Min.: -1024 CA, Max.: 1024.0 CA	0 to 22°C: Driving at 44 mph (70 km/h)	Service data
Target EGR Position	Target EGR position: Min.: 0%, Max.: 100%	0%: Idling	-
EGR Step Position	EGR step position: Min.: 0 step, Max.: 120 step	0 step: Idling	-
VVT Control Status #1	VVT control (bank 1) status: ON or OFF	-	Active Test support data
VVT Aim Angle #1*2	VVT aim angle (bank 1): Min.: 0%, Max.: 399.9%	0 to 100%	VVT duty signal value during intrusive operation
VVT Change Angle #1*2	VVT change angle (bank 1): Min.: 0 DegFR, Max.: 639.9 DegFR	0 to 56 DegFR: Idling	Displacement angle during intrusive operation
VVT OCV Duty #1*2	VVT camshaft timing oil control valve assembly operation duty: Min.: 0%, Max.: 399.9%	0 to 100%	Requested duty value for intrusive operation
VN Turbo Type	Variable nozzle turbo type: Not Avl or Commo or Vacuum or CAN Com	Not Avl (Unused)	-
Catalyst Temp B1 S1	Catalyst temperature (associated with sensor 1): Min.: -40°C (-40°F), Max.: 6513.5°C	Close to catalyst inlet temperature	-

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	(11756.3°F)		
Catalyst Temp B1 S2	Catalyst temperature (associated with sensor 2): Min.: -40°C (-40°F), Max.: 6513.5°C (11756.3°F)	Close to catalyst outlet temperature	-
Closed Throttle Position SW	Closed throttle position switch: ON or OFF	<ul style="list-style-type: none"> ON: Throttle fully closed OFF: Throttle open 	-
Fuel Cut Condition	Fuel cut determination flag: ON or OFF	-	-
Check Mode	Check mode: ON or OFF	ON: Check mode ON

MIL	MIL status: ON or OFF	ON: MIL ON	-
MIL ON Run Distance	Distance traveled since MIL turned ON: Min.: 0 km (0 mile), Max.: 65535 km (40724 mile)	Distance since DTC detected	-
Running Time from MIL ON	Running time since MIL turned ON: Min.: 0 min, Max.: 65535 min	Equivalent to running time since MIL turned on	-
Time after DTC Cleared	Time since DTCs cleared: Min.: 0 min, Max.: 65535 min	Equivalent to time since DTCs cleared	-
Distance from DTC Cleared	Distance traveled since DTCs cleared: Min.: 0 km (0 mile), Max.: 65535 km (40724 mile)	Equivalent to distance driven since DTCs cleared	-
Warmup Cycle Cleard DTC	Warm-up cycles since DTCs cleared: Min.: 0, Max.: 255	-	Number of warm-up cycles since DTCs cleared
Dist Batt Cable Disconnect	Distance from battery cable disconnected: Min.: 0 km (0 mile), Max.: 65535 km (40724 mile)	-	-
IG OFF Elapsed Time	Time after power switch off: Min.: 0 min, Max.:	-	-

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	655350 min		
OBD Requirements	OBD requirement	OBD2	-
Number of Emission DTC	Emission related DTCs Min.: 0 Max.: 127	-	Number of emission related DTCs
TC and TE1	TC and CG (TE1) terminals of DLC3: ON or OFF	-	Active Test support data
Ignition Trig. Count	Ignition counter for calculated misfire rate: Min.: 0, Max.: 65535	0 to 400	-
Cylinder #1 Misfire Count	Misfire count of cylinder 1: Min.: 0, Max.: 255	0	-
Cylinder #2 Misfire Count	Misfire count of cylinder 2: Min.: 0, Max.: 255	0	-
Cylinder #3 Misfire Count	Misfire count of cylinder 3: Min.: 0, Max.: 255	0	-
Cylinder #4 Misfire Count	Misfire count of cylinder 4: Min.: 0, Max.: 255	0	-
All Cylinders Misfire Count	All cylinders misfire count: Min.: 0, Max.: 255	0	-
Misfire RPM	Average of engine speed when misfire occurs: Min.: 0 rpm, Max.: 6375 rpm	0 rpm: Misfire 0	-
Misfire Load	Average of engine load when misfire	0 g/rev: Misfire 0	-

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	occurred: Min.: 0 g/rev, Max.: 3.98 g/rev		
Electric Fan Motor	Electric cooling fan motor: ON or OFF	ON: Electric cooling fan motor operating	Active Test support data
Idle Fuel Cut Prohibit	Idle fuel cut prohibit: ON or OFF	-	-
Idle Fuel Cut	Fuel cut idle: ON or OFF	ON: Fuel cut operating	Idle Fuel Cut = "ON" when throttle valve fully closed and engine speed over 2800 rpm
FC TAU	Fuel cut TAU (Fuel cut with very light load): ON or OFF	ON: Fuel cut operating	Fuel cut being performed during very light load to prevent incomplete engine combustion
Communication with HV	Status of communication with the power management control ECU: Comm or No Comm	Comm: Power switch on (IG)	-
Communication with Brake	Status of communication with the skid control ECU: Comm or No Comm	Comm: Power switch on (IG)	-
Comm with Air Conditioner	Status of communication with the air conditioning amplifier assembly: Comm or No Comm	Comm: Power switch on (IG)	-
Model Code	Model code	-	Identifies model code: ZVW3##
Engine Type	Engine type	-	Identifies engine type: 2ZRFXE
Cylinder Number	Cylinder number:	-	Identifies number of cylinders:

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
	Min.: 0, Max.: 255		4
Destination	Destination	-	Identifies destination: A (America)
Model Year	Model year: Min.: 1900, Max.: 2155	-	Identifies model year: 2010
System Identification	System identification	-	Identifies engine system: HV (Hybrid)
Engine Speed of Cyl #1	Engine speed for cylinder 1: Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression performed using Active Test 51199 rpm: Active Test not performed
Engine Speed of Cyl #2	Engine speed for cylinder 2: Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression performed using Active Test 51199 rpm: Active Test not performed
Engine Speed of Cyl #3	Engine speed for cylinder 3: Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression performed using Active Test 51199 rpm: Active Test not performed
Engine Speed of Cyl #4	Engine speed for cylinder 4: Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression performed using Active Test 51199 rpm: Active Test not performed
Av Engine Speed of All Cyl	Engine speed for all cylinders: Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression performed using Active Test 51199 rpm: Active Test not performed
Requested Engine Torque	Requested engine torque: Min.: 0 kW, Max.: 16383.75 kW	0 to 73 kW	Flag information for hybrid vehicle

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
HV Target Engine Speed	Hybrid target engine speed: Min.: 0 rpm, Max.: 6375 rpm	0 to 5200 rpm	Flag information for hybrid vehicle
Actual Engine Torque	Actual engine torque: Min.: -32768 Nm, Max.: 32768 Nm	Actual engine torque	Flag information for hybrid vehicle
Engine Run Time	Engine run time: Min.: 0 s (seconds), Max.: 255 s (seconds)	0 to 255 s	Flag information for hybrid vehicle
Request Engine Run Time	Request engine run time: Min.: 0 s (seconds), Max.: 25.5 s (seconds)	0 to 25.5 s	Flag information for hybrid vehicle
Judge Time Engine Ignition	Judgment time for complete explosion of ignition: Min.: 0 s (seconds), Max.: 25.5 s (seconds)	0 to 25.5 s	Flag information for hybrid vehicle
Judge Time Engine Output	Judgment time for time until engine output: Min.: 0 s (seconds), Max.: 25.5 s (seconds)	0 to 25.5 s	Flag information for hybrid vehicle
ISC Learning	Idle speed control learning: Compl or Incmpl	-	Flag information for hybrid vehicle
F/C for Engine Stop Req	Fuel cut for engine stop request: ON or OFF	-	Flag information for hybrid vehicle
Engine Independent	Engine independent operation: Not Opr or Operate	-	Flag information for hybrid vehicle
Racing Operation	Racing operation: Not Opr or Operate	-	Flag information for hybrid vehicle

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Request Warm-up	Request engine warm up: Not Req or Request	-	Flag information for hybrid vehicle
Engine Independent Control	Engine independent control operation: Not Opr or Operate	-	Flag information for hybrid vehicle
Elec Water Pump Target Spd	Electronic water pump target speed Min.: 0 rpm, Max.: 6375 rpm	-	-
Elec Water Pump Spd	Electronic water pump speed Min.: 0 rpm, Max.: 6375 rpm	-	-
ISC Learning Value	Idle speed control learning value: Min.: 0 L/s, Max.: 79.998 L/s	0.5 to 6.1 L/s	Flag information for hybrid vehicle

HINT:

- Normal condition: If no idling conditions are specified, the shift lever should be in N or P, and the A/C switch and all accessory switches should be off.
- *1: Excluding throttle valve opening percentage due to Idle Speed Control (ISC).
- *2: Values are only displayed when performing the Active Tests: Control the VVT Linear (Bank1). For other Active Tests, the value will be 0.

2. ACTIVE TEST

HINT:

Using the Techstream to perform the Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

(a) Warm up the engine.

(b) Turn the power switch off.

(c) Connect the Techstream to the DLC3.

(d) Turn the power switch on (IG).

(e) Turn the Techstream on.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test.

(g) According to the display on the Techstream, perform the Active Test.

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Injection Volume	Change injection volume	-12.5 to 24.8%	<ul style="list-style-type: none"> All injectors tested at the same time Perform test at less than 3000 rpm Injection volume can be changed in 1% graduations within control range
Control the Injection Volume for A/F Sensor	Change injection volume	Lower by 12.5% or increase by 25%	<ul style="list-style-type: none"> Perform test at less than 3000 rpm Control the Injection Volume for A/F Sensor enables checking and graphing of air fuel ratio sensor and heated oxygen sensor voltage outputs When conducting the test, select the following items: Active Test / Control the Injection Volume for A/F Sensor / Data List / AFS Voltage B1S1 and O2S B1S2
Control the EGR Step Position	Open or close EGR valve	From 0 to 110 steps	<ul style="list-style-type: none"> EGR valve fully closed at step position 0, and fully open at step position 110 Amount of EGR gas, flowing into intake manifold, varies in accordance with EGR valve opening angle
Activate the VSV for Evap Control	Activate purge VSV control	ON/OFF	-
Control the Fuel Pump / Speed	Activate fuel pump (C/OPN Relay)	ON/OFF	<p>Test possible when following conditions met:</p> <ul style="list-style-type: none"> Power switch on (IG) Engine is stopped
Connect the TC and TE1	Turn on and off TC and CG (TE1) connection	ON/OFF	<ul style="list-style-type: none"> ON: TC and TE1 connected OFF: TC and TE1 disconnected

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Idle Fuel Cut Prohibit	Prohibit idling fuel cut control	ON/OFF	Idling fuel-cut turned ON when throttle valve fully closed and engine speed over 2800 rpm
Control the Electric Cooling Fan	Control electric cooling fan motor	ON/OFF	-
Control the ETCS Open/Close Slow Speed	Throttle actuator	Closed/Open	Test possible when following conditions met: <ul style="list-style-type: none"> • Power switch on (IG) • Engine is stopped • Accelerator pedal fully depressed (Accelerator pedal position: 58 degrees or more)
Control the ETCS Open/Close Fast Speed	Throttle actuator	Closed/Open	
Control the VVT Linear (Bank1)	Control VVT (bank 1)	Between -128 and 127% This value added to present camshaft timing oil control valve control duty 100%: Maximum advance -100%: Maximum retard	<ul style="list-style-type: none"> • Engine stall or rough idle when VVT actuator operated by 100%. • Test possible during idle.
Control the VVT System (Bank1)	Turn on and off intake camshaft timing oil control valve assembly	ON/OFF	<ul style="list-style-type: none"> • Engine stalls or idles roughly when camshaft timing oil control valve assembly turned on • Normal engine running or idling when camshaft timing oil control valve assembly off • Test possible during idle.
Activate the Vacuum Pump	Leak detection pump	ON/OFF	-
Activate the VSV for Vent Valve	Vent valve	ON/OFF	-
Control the Cylinder #1 Fuel Cut	Cylinder #1 injector fuel cut	ON/OFF	Test possible while vehicle stopped and engine idling
Control the Cylinder #2 Fuel Cut	Cylinder #2 injector fuel cut	ON/OFF	
Control the	Cylinder #3 injector	ON/OFF	

Tester Display	Test Part	Control Range	Diagnostic Note
Cylinder #3 Fuel Cut	fuel cut		
Control the Cylinder #4 Fuel Cut	Cylinder #4 injector fuel cut	ON/OFF	
Control the All Cylinder Fuel Cut	All cylinder fuel cut	ON/OFF	
Check the Cylinder Compression*	Check the cylinder compression pressure (measure engine speed for each cylinder)	ON/OFF	Fuel injection and ignition stop in all cylinders
Activate the Electric Water Pump	Water pump assembly speed control	0 to 44800 rpm	Test possible when either of the following condition is met: <ul style="list-style-type: none"> • Engine coolant temperature is Below 100°C (212°F) • Not in inspection mode.

HINT:

*: While the Active Test item Check the Cylinder Compression is being performed, if one cylinder's speed is higher than the others, that cylinder's compression pressure can be concluded to be lower than the others.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode .
4. Start the engine and warm it up.
5. Turn the power switch off.
6. Turn the power switch on (IG) and turn the Techstream on.
7. Put the engine in inspection mode .

HINT:

Do not start the engine.

8. Enter the following menus: Powertrain / Engine and ECT / Active Test / Check the Cylinder Compression.

HINT:

If the results are not displayed normally, select the display items from the Data List before performing the Active Test. Enter the following menus: Powertrain / Engine and ECT / Compression / Engine Speed of Cyl #1 to #4 and Av Engine Speed of All Cyl.

9. While the engine is not running, press the RIGHT or LEFT button to change the Check the Cylinder Compression to ON.
10. Start the engine.
11. Monitor the engine speed (Engine Speed of Cyl #1 to #4, Av Engine Speed of All Cyl) displayed on the Techstream.

HINT:

At first, the Techstream display will show each cylinder's engine speed measurement to be extremely high. After the engine started, each cylinder's engine speed measurement will change to the actual engine speed.

NOTICE:

- When the Check the Cylinder Compression Active Test is ON and the engine will start.
- If the Check the Cylinder Compression Active Test needs to be performed after it is turned ON and performed once, press EXIT to return to the Active Test menu screen. Then perform the Check the Cylinder Compression Active Test again.
- Use a fully-charged battery.

3. SYSTEM CHECK

HINT:

Performing a System Check in the Utility menu enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system.

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Utility.
- (e) Perform the System Check by referring to the table below.

Tester Display	Test Part	Control Range	Diagnostic Note
Evaporative System Check (Automatic Mode)	Perform 5 steps in order to operate EVAP key-off monitor automatically	35°C (95°F) or less	<ul style="list-style-type: none"> • If no DTCs in Pending after performing this test, system functioning normally • Refer to EVAP System 
Evaporative System Check (Manual Mode)	Perform 5 steps in order to operate EVAP key-off monitor manually	35°C (95°F) or less	<ul style="list-style-type: none"> • Used to detect malfunctioning parts • Refer to EVAP System 

DIAGNOSTIC TROUBLE CODE CHART

HINT:

Parameters listed in the chart may not be exactly the same as your readings due to the type of instrument or other factors. If a trouble code is displayed during the DTC check, inspect the trouble areas listed for that code. For details of the code, refer to the "See page" below.

*1: The MIL flashes when a catalyst damaging misfire is detected

*2: Only for MEXICO models

DESCRIPTION

The VVT (variable valve timing) system adjusts the intake valve timing to improve driveability. The engine oil pressure turns the VVT controller to adjust the valve timing.

The camshaft timing oil control valve assembly is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies the 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

N

DTC No.	DTC Detection Condition	Trouble Area
P0010	Open or short in camshaft timing oil control valve assembly circuit (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in camshaft timing oil control valve assembly circuit • Camshaft timing oil control valve assembly • ECM

MONITOR DESCRIPTION

This DTC is designed to detect open or short circuits in the camshaft timing oil control valve assembly circuit. If the camshaft timing oil control valve's duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and set the DTC.

MONITOR STRATEGY

Related DTCs	P0010: Camshaft timing oil control valve range check (bank 1)
Required Sensors/Components (Main)	Camshaft timing oil control valve assembly
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediately
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
All of the following conditions are met	A, B, C and D
A. Starter	OFF
B. Power switch	On (IG)
C. Time after power switch off to on (IG)	0.5 seconds or more
D. Either of the following condition is met	(a) or (b)
(a) All of the following conditions are met	1, 2 and 3
1. Battery voltage	11 to 13 V
2. CPU commanded duty	Less than 70%
3. Current cut status	Not cut
(b) All of the following conditions are met	4, 5 and 6
4. Battery voltage	13 V or more
5. CPU commanded duty	Less than 80%
6. Current cut status	Not cut

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if

the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	PERFORM ACTIVE TEST USING TECHSTREAM (OPERATE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode  .
- (e) Start the engine.
- (f) Warm up the engine.
- (g) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1).
- (h) Check the engine speed while operating the camshaft timing oil control valve assembly using the Techstream.

Result:

Techstream Operation	Specified Condition
OFF	Normal engine speed
ON	Engine idles roughly or stalls (soon after camshaft timing oil control valve assembly switched from OFF to ON)

HINT:

If the result is not acceptable, cool the engine and perform the Active Test again.

- (i) Start the engine when the engine coolant temperature is 30°C (86°F) or less.
- (j) Turn the Techstream on.
- (k) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1).
- (l) Check the engine speed while operating the camshaft timing oil control valve assembly (for intake camshaft) using the Techstream with the engine coolant temperature is 50°C (122°F) or less.

Result:

Techstream Operation	Specified Condition
OFF	Normal engine speed
ON	Engine idles roughly or stalls (soon after camshaft timing oil control valve assembly switched from OFF to ON)

OK ► REPLACE ECM

DTC	P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)
DTC	P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)

DESCRIPTION

Refer to DTC P0010 .

DTC No.	DTC Detection Condition	Trouble Area
P0011	Valve timing is not adjusted in valve timing advance range (1 trip detection logic)	<ul style="list-style-type: none"> • Valve timing • Camshaft timing oil control valve assembly • Oil control valve filter • Camshaft timing gear assembly • ECM
P0012	Valve timing is not adjusted in valve timing retard range (2 trip detection logic)	

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft timing oil control valve assembly and the VVT controller. The ECM sends a target duty-cycle control signal to the camshaft timing oil control valve assembly. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.

If the difference between the target and actual intake valve timing is large, and changes in the actual intake valve timing are small, the ECM interprets this as a VVT controller stuck malfunction and sets a DTC.

- Example:
- A DTC is set when the following conditions "A" and "B" are met:
 - a. It takes 5 seconds or more to change the valve timing by 5°C (Condition "A").
 - b. After the above condition is met, the camshaft timing oil control valve is forcibly activated for 10 seconds (Condition "B").
- The monitor will run if all of the following conditions are met:
- DTC P0011 (Advanced Cam Timing) is subject to 1 trip detection logic.
- DTC P0012 (Retarded Cam Timing) is subject to 2 trip detection logic.
- These DTCs indicate that the VVT controller cannot operate properly due to camshaft timing oil control valve assembly malfunctions or the presence of foreign objects in the camshaft timing oil control valve assembly.
 - The engine is warm (the engine coolant temperature is 75°C (167°F) or more).
 - The vehicle has been driven at 47 mph (75 km/h) or more.
 - The engine has idled for 30 seconds or more.

MONITOR STRATEGY

Related DTCs	P0011: Advanced camshaft timing P0012: Retarded camshaft timing
Required Sensors/Components (Main)	Camshaft timing oil control valve and VVT controller
Required Sensors/Components (Related)	Crankshaft position sensor Camshaft position sensor Engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	Within 10 seconds
MIL Operation	Advanced camshaft timing: Immediately Retarded camshaft timing: 2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	P0010 (Camshaft timing oil control valve assembly Bank 1) P0016 (VVT System Bank 1 - Misalignment) P0102, P0103 (Mass Air Flow Meter sub-assembly) P0107, P0108 (Manifold Absolute Pressure) P0115, P0117, P0118 (Engine Coolant Temperature Sensor) P0125 (Insufficient Engine Coolant Temperature for Closed Loop Fuel Control) P0335 (Crankshaft Position Sensor)
Battery voltage	11 V or more
Engine RPM	500 to 4000 rpm
Engine coolant temperature	75 to 100°C (167 to 212°F)

TYPICAL MALFUNCTION THRESHOLDS

Advanced Camshaft Timing

All of the following conditions are met	-
Deviation of actual valve timing and target valve timing	More than 5°CA (crankshaft angle)
Valve timing	No change at advanced valve timing

Retarded Camshaft Timing

All of the following conditions are met	-
Deviation of actual valve timing and target valve timing	More than 5°CA (crankshaft angle)
Valve timing	No change at retarded valve timing

If the difference between the target and actual camshaft timing is greater than the specified value, the ECM operates the VVT actuator (camshaft timing oil control valve assembly).

Then, the ECM monitors the camshaft timing change for 10 seconds.

MONITOR RESULT

Refer to Checking Monitor Status INFO.

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.

HINT:

- P0011 is output:
Clear the DTC without using the Techstream.
- P0012 is output:

Clear the DTC with using the Techstream.

4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode .
7. Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more [B].
8. Accelerate the vehicle to 47 mph (75 km/h) or more for 10 seconds or more [C].
9. Idle the engine for 30 seconds or more [D].
10. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
11. Read the pending DTC [E].
12. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P0011 or P0012.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [F] through [H].
16. Accelerate the vehicle to 47 mph (75 km/h) or more for 10 seconds or more [F].
 17. Idle the engine for 30 seconds or more [G].
 18. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 19. Input the DTC: P0011 or P0012.

20. Check the DTC judgment result again [H].

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

21. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs **INFO**.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to DTC P0010 **INFO**.

INSPECTION PROCEDURE

NOTICE:

DTC P0011 or P0012 may be set when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain set even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011 OR P0012)
----	---

- Connect the Techstream to the DLC3.
- Turn the power switch on (IG).
- Turn the Techstream on.
- Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- Read the DTCs.

Result:

Result	Proceed to
DTC P0011 or P0012 is output	A
DTC P0011 or P0012 and other DTCs are output	B

HINT:

If any DTCs other than P0011 or P0012 are output, troubleshoot those DTCs first.

DTC

P0016

Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft timing oil control valve assembly and the VVT controller (camshaft timing gear assembly). The ECM sends a target duty-cycle control signal to the camshaft timing oil control valve assembly.

This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.

DTC No.	Detection Condition	Trouble Area
P0016	Deviation in crankshaft position sensor signal and camshaft position sensor signal (2 trip detection logic)	<ul style="list-style-type: none"> • Valve timing • Camshaft timing oil control valve assembly • Oil control valve filter • Camshaft timing gear assembly (for intake camshaft) • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of specified range in consecutive driving cycles, the ECM illuminates the MIL and sets the DTC P0016.

This DTC indicates that the intake camshaft has been installed toward the crankshaft at an incorrect angle, caused by factors such as the timing chain having jumped a tooth.

This monitor begins to run after the engine has idled for 5 minutes.

MONITOR STRATEGY

Related DTCs	P0016: Camshaft Timing Misalignment at idling
Required Sensors/Components (Main)	VVT actuator
Required Sensors/Components (Related)	Camshaft position sensor Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	Within 60 seconds
MIL Operation	2 driving cycles

Sequence of Operation	None
-----------------------	------

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	P0010 (VVT Oil Control Valve Bank 1) P0102, P0103 (Mass Air Flow Meter Sub-assembly) P0115, P0117, P0118 (Engine Coolant Temperature Sensor) P0125 (Insufficient Engine Coolant Temperature for Closed Loop Fuel Control) P0335 (Crankshaft Position Sensor)
Engine RPM	900 to 1100 rpm

TYPICAL MALFUNCTION THRESHOLDS

One of the following conditions is met	-
VVT learning value at maximum retarded valve timing	Less than 22°CA (crankshaft angle)
VVT learning value at maximum retarded valve timing	More than 47°CA (crankshaft angle)

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.

5. Turn the power switch on (IG) and turn the Techstream on [A].

7. ADJUST VALVE TIMING

HINT:

There are no marks on the cylinder head to match-up for the purpose of checking valve timing. Valve timing can only be inspected by lining up the colored plates on the timing chain with the marks on the pulleys. It may be necessary to remove and reinstall the chain to match-up the alignment marks **INFO**.

8. CHECK WHETHER DTC OUTPUT RECURS (DTC P0016)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs **INFO**.

(e) Put the engine in inspection mode **INFO**.

(f) Start the engine and warm it up.

(g) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.

(h) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

(i) Read the pending DTCs.

Result:

Result	Proceed to
DTC is not output	A
DTC P0016 is output	B

B ▶ REPLACE ECM

A ▶ END

DTC	P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)
DTC	P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)
DTC	P101D	A/F Sensor Heater Circuit Performance Bank 1 Sensor 1 Stuck ON

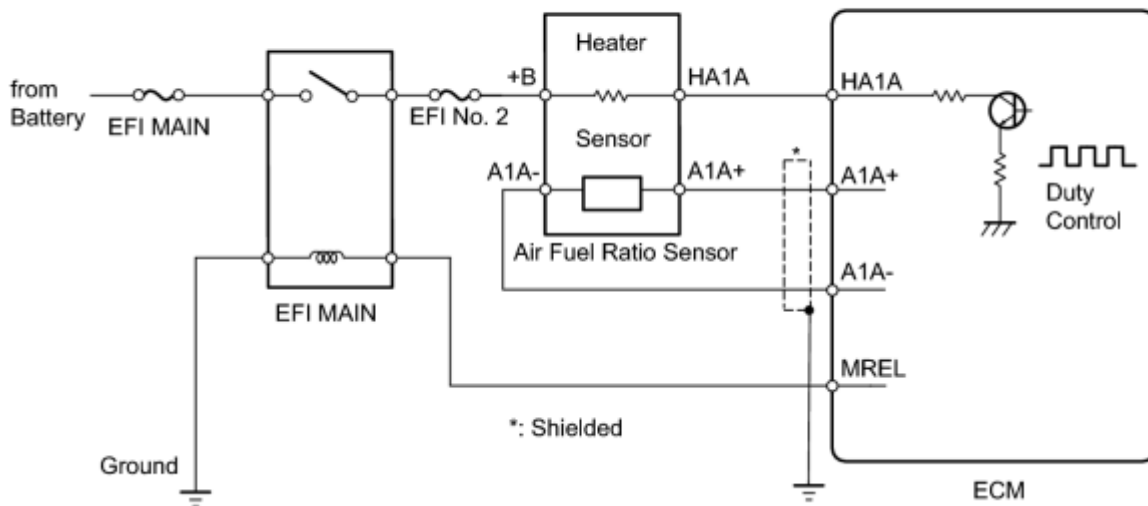

DESCRIPTION

Refer to DTC P2195 [INFO](#).

HINT:

- When either of these DTCs is set, the ECM enters fail-safe mode. The ECM turns off the air fuel ratio sensor heater in fail-safe mode. Fail-safe mode continues until the power switch is turned off.
- Although the DTC titles say the oxygen sensor, these DTCs relate to the air fuel ratio sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-way catalytic converter and located near the engine assembly.
- The ECM uses pulse width modulation to adjust the current through the heater. The air fuel ratio sensor heater circuit uses a relay on the +B side of the circuit.

Reference (System Diagram of Sensor 1):

DTC No.	DTC Detection Condition	Trouble Area
P0031	The heater current is less than the specified value while the heater is operating (1 trip detection logic).	<ul style="list-style-type: none"> • Open in air fuel ratio sensor (sensor 1) heater circuit • Air fuel ratio sensor heater (sensor 1) • ECM
P0032	An air fuel ratio sensor heater current failure (1 trip detection logic).	<ul style="list-style-type: none"> • Short in air fuel ratio sensor (sensor 1) heater circuit • Air fuel ratio sensor heater (sensor 1)

DTC No.	DTC Detection Condition	Trouble Area
		<ul style="list-style-type: none"> ECM
P101D	The heater current is higher than the specified value while the heater is not operating (1 trip detection logic).	ECM

HINT:

- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The ECM uses information from the air fuel ratio sensor to regulate the air fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the three-way catalytic converter to purify the exhaust gases.

The air fuel ratio sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.

The air fuel ratio sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the air fuel ratio sensor becomes inaccurate, as a result, the ECM is unable to regulate air fuel ratio properly.

When the current in the air fuel ratio sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

- | | |
|----|---|
| 1. | INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE) |
|----|---|

*1

- (a) Disconnect the air fuel ratio sensor connector.

- (b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

Text in Illustration

DTC	P102D	O2 Sensor Heater Circuit Performance Bank 1 Sensor 2 Stuck ON

DESCRIPTION

Refer to DTC P0136 [INFO](#).

HINT:

- Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.
- When any of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the heated oxygen sensor heater in fail-safe mode. Fail-safe mode continues until the power switch is turned off.
- The ECM uses pulse width modulation to adjust the current through the heater. The heated oxygen sensor heater circuit uses a relay on the +B side of the circuit.

Reference (System Diagram of Sensor 2):

DTC No.	DTC Detection Condition	Trouble Area
P0037	The heater current less than the specified value while the heater is operating (1 trip detection logic).	<ul style="list-style-type: none"> • Open in heated oxygen sensor (sensor 2) heater circuit • Heated oxygen sensor (sensor 2) heater • ECM
P0038	The heater current is higher than the specified value while the heater is operating (1 trip detection logic).	<ul style="list-style-type: none"> • Short in heated oxygen sensor (sensor 2) heater circuit • Heated oxygen sensor (sensor 2) heater

DTC No.	DTC Detection Condition	Trouble Area

P0141	The cumulative heater resistance correction value exceeds the threshold (2 trip detection logic).	<ul style="list-style-type: none"> Open or short in heated oxygen sensor (sensor 2) heater circuit Heated oxygen sensor (sensor 2) heater ECM
P102D	The heater current is higher than the specified value while the heater is not operating (1 trip detection logic).	ECM

HINT:

- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The sensing portion of the heated oxygen sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated Oxygen Sensor Heater Range Check (P0037, P0038 and P102D):

- The ECM monitors the current applied to the heated oxygen sensor heater to check the heater for malfunctions.

If the heater current is outside the normal range, the signal transmitted by the heated oxygen sensor becomes inaccurate. When the current in the heated oxygen sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.

Heated Oxygen Sensor Heater Performance (P0141):

- After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM determines that there is a malfunction in the heated oxygen sensor heater and stores DTC P0141.

Mass Air Flow Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0102 .

DTC No.	DTC Detection Condition	Trouble Area
P0101	<p>Conditions (a), (b), (c), (d) and (e) continue for more than 10 seconds (2 trip detection logic):</p> <p>(a) Engine running</p> <p>(b) Engine coolant temperature 70°C (158°F) or higher</p> <p>(c) Throttle position sensor voltage 0.2 to 2 V</p> <p>(d) Average engine load value ratio less than 0.829, or more than 1.153 (varies with estimated engine load)</p> <p>Average engine load value ratio = Average engine load based on mass air flow meter output / Average engine load estimated from driving conditions</p> <p>(e) Average air fuel ratio less than -20%, or more than 20%</p>	<ul style="list-style-type: none"> • Mass air flow meter sub-assembly • Intake system • PCV hose connections • EGR valve assembly

MONITOR DESCRIPTION

The mass air flow meter sub-assembly is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and to provide an appropriate air fuel ratio. Inside the mass air flow meter sub-assembly, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a specific temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to the mass air flow meter sub-assembly. The voltage level is proportional to the air flow through the sensor, and the ECM uses it to calculate the intake air volume.

The ECM monitors the average engine load value ratio to check the mass air flow meter sub-assembly for malfunctions. The average engine load value ratio is obtained by comparing the average engine load calculated from the mass air flow meter sub-assembly output to the average engine load estimated from the driving conditions, such as the engine speed and the throttle opening angle. If the average engine load value ratio is below the threshold value, the ECM determines that the intake air volume is low, and if the average engine load value ratio is above the threshold value, the ECM determines that the intake air volume is high.

If this is detected in 2 consecutive driving cycles, the MIL is illuminated and the DTC is set.

11. Read the pending DTC [C].
12. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P0101.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.

16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

17. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

18. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0101)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0101 is output	A
DTC P0101 and other DTCs are output	B

HINT:

If any DTCs other than P0101 are output, troubleshoot those DTCs first.

B ► GO TO DTC CHART

A

2. CHECK INTAKE SYSTEM

- (a) Check the intake system for vacuum leaks .

OK:

No leaks from the intake system.

NG ► REPAIR OR REPLACE INTAKE SYSTEM

OK

3. CHECK PCV HOSE CONNECTIONS

- (a) Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG ► REPAIR OR REPLACE PCV HOSE

OK

4. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode  .
- (e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.
- (g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

B ▶ [REPLACE MASS AIR FLOW METER SUB-ASSEMBLY](#)

A

5.	INSPECT EGR VALVE ASSEMBLY
----	----------------------------

(a) Remove the EGR valve assembly .

(b) Check if the EGR valve is stuck open.

OK:

EGR valve is tightly closed.

(c) Reinstall the EGR valve assembly .

NG ▶ [REPLACE EGR VALVE ASSEMBLY](#)

OK

6.	REPLACE MASS AIR FLOW METER SUB-ASSEMBLY
----	--

(a) Replace the mass air flow meter sub-assembly .

NEXT

7.	CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTC .

(e) Turn the power switch off and wait for 30 seconds.

(f) Turn the power switch on (IG) and turn the Techstream on.

(g) Put the engine in inspection mode .

(h) Start the engine and warm it up.

(i) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.

(j) Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

(k) Input the DTC: P0101.

(l) Check the DTC judgment result.

NEXT  **END**

DTC	P0102	Mass or Volume Air Flow Circuit Low Input
DTC	P0103	Mass or Volume Air Flow Circuit High Input

DESCRIPTION

The mass air flow meter sub-assembly is a sensor that measures the amount of air flowing through the throttle valve.

The ECM uses this information to determine the fuel injection time and to provide the appropriate air fuel ratio.

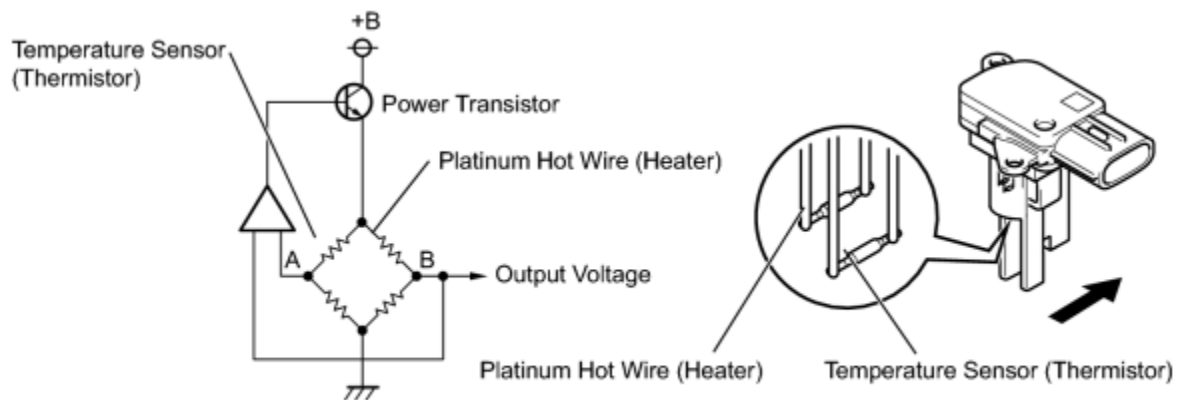

Inside the mass air flow meter sub-assembly, there is a heated platinum wire which is exposed to the flow of intake air by applying a specific electrical current to the wire.

The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant temperature value of the hot wire, current is applied to these components in the mass air flow meter sub-assembly. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.

The circuit is constructed so that the platinum hot wire and the temperature sensor create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When either of these DTCs are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P0102	Mass air flow meter voltage less than 0.2 V for 3 seconds (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in mass air flow meter sub-assembly circuit • Mass air flow meter sub-assembly • ECM

DTC No.	DTC Detection Condition	Trouble Area
P0103	Mass air flow meter voltage more than 4.9 V for 3 seconds (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in mass air flow meter sub-assembly circuit • Mass air flow meter sub-assembly • ECM

HINT:

When any of these DTCs are set, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / MAF.

Mass Air Flow Rate (gm/sec)	Malfunction
Approximately 0.0	<ul style="list-style-type: none"> • Open in mass air flow meter sub-assembly power source circuit • Open or short in VG circuit
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the mass air flow meter sub-assembly or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the mass air flow meter sub-assembly circuit and sets a DTC.

Example:

When the sensor output voltage remains less than 0.2 V, or more than 4.9 V, for more than 3 seconds, the ECM sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 3 seconds after the engine is next started.

MONITOR STRATEGY

OK ► REPLACE ECM

DTC

P0106

Manifold Absolute Pressure / Barometric Pressure Circuit Range / Performance Problem

DESCRIPTION

The manifold absolute pressure sensor detects pressure inside the intake manifold as an absolute pressure with a built-in sensor and outputs a voltage. Based on the voltage from the manifold absolute pressure sensor, the ECM controls the EGR, purge VSV, and detects errors in the pressure sensor using the changes in pressure.

Output Voltage

DTC No.	DTC Detection Condition	Trouble Area
P0106	Difference between the intake manifold pressures after and before the engine start remains more than -3kPa (-22.5 mmHg) for 6 seconds or more (2 trip detection logic).	<ul style="list-style-type: none"> Intake system Manifold absolute pressure sensor

MONITOR DESCRIPTION

The manifold absolute pressure sensor detects the intake manifold pressure as a voltage using a built-in sensor. The ECM calculates intake manifold pressure based on this voltage and also calculates the EGR valve and purge VSV opening amount according to changes in the intake manifold pressure. When the atmospheric pressure drops below the intake manifold pressure by 3 kPa (22.5 mmHg) or more, the ECM interprets this as a malfunction in the manifold absolute pressure sensor and sets P0106.

MONITOR STRATEGY

DTC	P0107	Manifold Absolute Pressure / Barometric Pressure Circuit Low Input
DTC	P0108	Manifold Absolute Pressure / Barometric Pressure Circuit High Input

DESCRIPTION

The manifold absolute pressure sensor detects pressure inside the intake manifold as an absolute pressure with a built-in sensor and outputs a voltage. Based on the voltage from the vacuum sensor, the ECM controls the EGR, purge VSV, and corrects any errors in the pressure sensor due to changes in pressure.

Output Voltage

DTC No.	DTC Detecting Condition	Trouble Area
P0107	The output voltage from the manifold absolute pressure sensor less than 0.5 V for 0.5 seconds. (1 trip detection logic)	<ul style="list-style-type: none"> Open or short in manifold absolute pressure sensor circuit Manifold absolute pressure sensor ECM
P0108	The output voltage from the manifold absolute pressure sensor more than 4.5 V for 0.5 seconds. (1 trip detection logic)	<ul style="list-style-type: none"> Open or short in manifold absolute pressure sensor circuit Manifold absolute pressure sensor ECM

HINT:

- DTC P0107 and P0108 are detected when the power switch is on (IG) for approximately 5 seconds.
- When DTC P0107 or P0108 is detected, check the manifold absolute pressure by selecting Powertrain / Engine and ECT / Data List / MAP on the Techstream.

Manifold Absolute Pressure (kPa)	Malfunction
Approximately 0	<ul style="list-style-type: none"> PIM circuit short
130 or more	<ul style="list-style-type: none"> VC circuit open or short PIM circuit open E2 circuit open

Manifold Absolute Pressure (kPa)	Malfunction
	<ul style="list-style-type: none"> ECM

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the manifold absolute pressure. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the manifold absolute pressure sensor and sets a DTC.

Example:

When the sensor output voltage remains less than 0.5 V, or more than 4.5 V for 0.5 seconds, the ECM sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

c

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. READ VALUE USING TECHSTREAM (MAP)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Data List / MAP.
- (e) Read the MAP value.

OK:

Same value as the actual atmospheric pressure.

HINT:

- Standard atmospheric pressure is 101 kPa. For every 100 m (328 ft.) increase in altitude, pressure drops by 1 kPa. The pressure also varies due to the weather (high atmospheric pressure, low atmospheric pressure).
- Also, check "Atmosphere Pressure" in the Data List.

 A END

DESCRIPTION

Fig. 1:

- The intake air temperature sensor, mounted in the mass air flow meter sub-assembly, monitors the intake air temperature. The intake air temperature sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the intake air temperature becomes low, the resistance of the thermistor increases. When the temperature becomes high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
- The intake air temperature sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R which is located inside the ECM.
- Resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes, according to changes in the intake air temperature, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

DTC No.	DTC Detection Condition	Trouble Area
P0111	<p>When either of following conditions are met (2 trip detection logic):</p> <ul style="list-style-type: none"> • In duration between engine warmed up and next engine starts, change in intake air temperature sensor output below threshold • During engine warming up after cold engine starts, change in intake air temperature sensor output below threshold 	Mass air flow meter sub-assembly

MONITOR DESCRIPTION

After warm engine stopped

The ECM monitors the intake air temperature variation in the period from when the engine was warmed up on the previous trip until the next engine start. If the change in the intake air temperature sensor output is less than the threshold, it is determined that a malfunction has occurred in the intake air temperature sensor. When this is detected, the MIL is illuminated and the DTC is set.

After a cold engine in started

The monitor runs when the engine is started cold after 5 hours or more have elapsed since the engine stopped. If the intake air temperature sensor output variation until the engine has warmed up completely is less than the threshold, it is determined that a malfunction has occurred in the intake air temperature sensor. When this is detected in 2 consecutive driving cycles, the MIL is illuminated and the DTC is set.

MONITOR STRATEGY

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.

4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or higher [B].
8. Idle the engine for 5 minutes or more [C].

HINT:

During steps [A] through [C], if the change in the intake air temperature is below 1°C (2°F), the intake air temperature sensor (mass air flow meter sub-assembly) is malfunctioning. It is not necessary to continue this procedure.

9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
10. Read the pending DTC [D].
11. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0111.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [E] and [F].

15. Drive the vehicle at 25 mph (40 km/h) or more for a total of 5 minutes or more [E].
16. Check the DTC judgment result again [F].
17. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
18. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
19. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs INFO.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0111)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0111 and other DTCs are output	A
DTC P0111 is output	B

HINT:

If any DTCs other than P0111 are output, troubleshoot those DTCs first.

B REPLACE MASS AIR FLOW METER SUB-ASSEMBLY

A ▶ GO TO DTC CHART

DTC	P0112	Intake Air Temperature Circuit Low Input
DTC	P0113	Intake Air Temperature Circuit High Input

DESCRIPTION

Fig. 1:

- The intake air temperature sensor, mounted in the mass air flow meter sub-assembly, monitors the intake air temperature. The intake air temperature sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the intake air temperature becomes low, the resistance of the thermistor increases. When the temperature becomes high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).
- The intake air temperature sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R which is located inside the ECM.
- Resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes, according to changes in the intake air temperature, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When either DTC P0112 or P0113 is set, the ECM enters fail-safe mode. During fail-safe mode, the intake air temperature is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
---------	-------------------------	--------------

DTC No.	DTC Detection Condition	Trouble Area
P0112	Short in intake air temperature sensor circuit for 0.5 seconds (1 trip detection logic)	<ul style="list-style-type: none"> • Short in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter sub-assembly) • ECM
P0113	Open in intake air temperature sensor circuit for 0.5 seconds (1 trip detection logic)	<ul style="list-style-type: none"> • Open in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter sub-assembly) • ECM

HINT:

When any of these DTCs are set, check the intake air temperature by entering the following menus: Powertrain / Engine and ECT / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F)	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the intake air temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the intake air temperature sensor and sets a DTC.

Example:

If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the intake air temperature sensor circuit, and sets DTC P0113. Conversely, if the output voltage is less than 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0112.

If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

DTC	P0115	Engine Coolant Temperature Circuit Malfunction
DTC	P0117	Engine Coolant Temperature Circuit Low Input
DTC	P0118	Engine Coolant Temperature Circuit High Input

DESCRIPTION

A thermistor, whose resistance value varies according to the engine coolant temperature, is built into the engine coolant temperature sensor.

The structure of the sensor and its connection to the ECM are the same as those of the intake air temperature sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are set, the ECM enters fail-safe mode. During fail-safe mode, the engine coolant temperature is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P0115	Open or short in engine coolant temperature sensor circuit for 0.5 seconds (1 trip detection logic)	<ul style="list-style-type: none"> Open or short in engine coolant temperature sensor circuit Engine coolant temperature sensor ECM
P0117	Short in engine coolant temperature sensor circuit for 0.5 seconds (1 trip detection logic)	<ul style="list-style-type: none"> Short in engine coolant temperature sensor circuit Engine coolant temperature sensor ECM
P0118	Open in engine coolant temperature sensor circuit for 0.5 seconds (1 trip detection logic)	<ul style="list-style-type: none"> Open in engine coolant temperature sensor circuit Engine coolant temperature sensor ECM

HINT:

When any of these DTCs are set, check the engine coolant temperature by entering the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or more	Short circuit

MONITOR DESCRIPTION

The engine coolant temperature sensor is used to monitor the engine coolant temperature. The engine coolant temperature sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature becomes low, the resistance in the thermistor increases. When the temperature becomes high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the engine coolant temperature sensor circuit and sets a DTC.

Example:

If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the engine coolant temperature sensor circuit, and sets DTC P0118. Conversely, if the voltage output is less than 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0117.

If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

DTC

P0116

Engine Coolant Temperature Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0115 .

DTC No.	DTC Detection Condition	Trouble Area
	<p>When either of the following conditions is met (2 trip detection logic):</p> <ul style="list-style-type: none"> • During engine warm up after cold engine starts, change in engine coolant temperature sensor output is below threshold • In duration between warmed engine stopped and next cold engine starts, change in engine coolant temperature sensor output below threshold 	<ul style="list-style-type: none"> • Water inlet with thermostat sub-assembly • Engine coolant temperature sensor
P0116	<p>For Mexico Models:</p> <p>Case 1:</p> <p>Engine coolant temperature between 35°C and 60°C (95°F and 140°F) when engine started, and conditions (a) and (b) met (2 trip detection logic)</p> <ul style="list-style-type: none"> • (a) Vehicle driven at varying speeds (accelerated and decelerated) • (b) Engine coolant temperature remains within 3°C (5.4°F) of initial engine coolant temperature <p>Case 2:</p> <p>Engine coolant temperature more than 60°C (140°F) when engine started, and conditions (a) and (b) met (6 trip detection logic)</p> <ul style="list-style-type: none"> • (a) Vehicle driven at varying speeds (accelerated and decelerated) • (b) Engine coolant temperature measurements remain within 1°C (1.8°F) of initial engine coolant temperature on 6 successive occasions 	<ul style="list-style-type: none"> • Water inlet with thermostat sub-assembly • Engine coolant temperature sensor

MONITOR DESCRIPTION

Engine Coolant Temperature Sensor Cold Start Monitor

The monitor runs when the engine is started cold. If the change in engine coolant temperature sensor output until the engine warmed up completely is less than the threshold, it is determined that a malfunction has occurred in the engine coolant temperature sensor. When this is detected in 2 consecutive driving cycles, the MIL is illuminated and the DTC is set.

Engine Coolant Temperature Sensor Soak Monitor

The ECM compares the engine coolant temperature when the warmed engine is stopped and when the engine is started on the next trip when more than 5 hours has elapsed since the engine was stopped. If the change in engine coolant temperature sensor output is less than the threshold, it is determined that a malfunction has occurred in the engine coolant temperature sensor. When this is detected in 2 consecutive driving cycles, the MIL is illuminated and the DTC is set.

Engine Coolant Temperature Sensor High Side Stuck Monitor (only for Mexico models)

The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. If the sensor voltage output deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the engine coolant temperature sensor and sets the DTC.

Examples:

- Upon starting the engine, the engine coolant temperature is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the engine coolant temperature remains within 3°C (5.4°F) of the starting temperature, the DTC is set (2 trip detection logic).
- Upon starting the engine, the engine coolant temperature is over 60°C (140°F). If after driving for 250 seconds, the ECM remains within 1°C (1.8°F) of the starting temperature, the DTC is set (6 trip detection logic).

MONITOR STRATEGY

Related DTCs	P0116: Engine coolant temperature sensor cold start monitor P0116: Engine coolant temperature sensor soak monitor

COMPONENT OPERATING RANGE

Engine coolant temperature	Engine coolant temperature sensor value changes in accordance with actual engine coolant temperature
----------------------------	--

CONFIRMATION DRIVING PATTERN

HINT: Start the engine when the engine coolant temperature is 60°C (140°F) or less

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.
4. Check that the engine coolant temperature is 60°C (140°F) or less.
5. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
6. Turn the power switch off and wait for 30 seconds.
7. Turn the power switch on (IG) and turn the Techstream on [A].
8. Start the engine and idle it for 5 minutes or more [B].

HINT:

If the engine coolant temperature does not change by 5°C (9°F) or higher, the engine coolant temperature sensor is malfunctioning. It is not necessary to continue this procedure.

9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
10. Read the pending DTC [C].
11. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0116.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal

Techstream Display	Description
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [D] and [E].
15. Drive the vehicle at 25 mph (40 km/h) or more for a total of 5 minutes or more [D].

HINT:

In the event of the drive pattern being interrupted (possibly due to factors such as traffic conditions), the drive pattern can be resumed.

16. Check the DTC judgment result again [E].

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
17. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0117, P0118 or P0125 is set simultaneously with DTC P0116, the engine coolant temperature sensor may have an open or a short circuit. Troubleshoot those DTCs first.

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0116 is output	A
DTC P0116 and other DTCs are output	B

HINT:

If any DTCs other than P0116 are output, troubleshoot those DTCs first.

B ▶ GO TO DTC CHART

2.	INSPECT WATER INLET WITH THERMOSTAT SUB-ASSEMBLY
----	--

- (a) Remove the water inlet with thermostat sub-assembly INFO.
- (b) Measure the valve opening temperature of the water inlet with thermostat sub-assembly.

Standard value:

80 to 84°C (176 to 183°F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

(c) Reinstall the water inlet with thermostat sub-assembly .

NG  REPLACE WATER INLET WITH THERMOSTAT SUB-ASSEMBLY

OK  **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

DTC	P011B	Engine Coolant Temperature / Intake Air Temperature Correlation
-----	-------	---

DESCRIPTION

The engine has two temperature sensors, an engine coolant temperature sensor and an intake air temperature sensor, to detect the temperature while the engine is operating. A thermistor, whose resistance value varies according to the temperature, is built into each sensor. When the temperature is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes. Based on these temperature signals output from the sensors, the ECM determines the fuel injection duration and the ignition timing to control the engine.

DTC No.	DTC Detection Condition	Trouble Area
P011B	<ul style="list-style-type: none"> • All of following conditions are met: (2 trip detection logic) <ul style="list-style-type: none"> a. Battery voltage 10.5 V or more b. 7 hours or more elapsed from engine stops on previous trip c. 15 seconds after water pump operates d. Minimum intake air temperature after engine starts more than -10°C (14°F) e. Average engine coolant temperature before engine starts more than -10°C (14°F) f. Difference between readings of engine coolant temperature and intake air temperature greater than 20°C (36°F) 	<ul style="list-style-type: none"> • Intake air temperature sensor • Engine coolant temperature sensor • ECM

Difference Between Engine Coolant Temperature and Intake Air Temperature

HINT:

- Waiting is required to prevent the temperature of the engine from affecting the readings. If the engine has been operated recently, it will not be possible to accurately compare the readings.
- For diagnosis, in order to duplicate the detection conditions of the DTC, it is necessary to park the vehicle for 7 hours. Parking the vehicle for 7 hours ensures that the actual temperature of the engine coolant temperature and intake air temperature are very similar. When the vehicle has been parked for less than 7 hours, differences in the readings may exist, this does not necessarily indicate a fault.

MONITOR DESCRIPTION

The ECM monitors the difference between the engine coolant temperature and the intake air temperature when the engine is started cold to detect the engine temperature conditions accurately. The monitor runs when the engine started cold after 7 hours or more has elapsed since the engine was stopped (power switch turned off) on the previous trip. If the difference between the engine coolant temperature and the intake air temperature on a cold start exceeds 20°C (36°F), the ECM interprets this as a malfunction in the engine coolant temperature sensor circuit and intake air temperature sensor circuit, and sets the DTC.

MONITOR STRATEGY

Related DTCs	P011B: Engine coolant temperature / Intake air temperature sensor correlation

UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [A] through [C] again.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

17. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P011B)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(e) Read the DTCs.

Result:

Result	Proceed to
DTC P011B is output	A
DTC P011B and other DTCs are output	B

HINT:

If any DTCs other than P011B are output, troubleshoot those DTCs first.

B ► GO TO DTC CHART

A
▼

2.	READ VALUE USING TECHSTREAM (INTAKE AIR TEMPERATURE)
----	--

(a) Leave the vehicle for 7 hours or more.

HINT:

It is necessary to leave the vehicle for 7 hours or more to allow conditions similar to the DTC detection conditions.

(b) Connect the Techstream to the DLC3.

(c) Turn the power switch on (IG).

(d) Turn the Techstream on.

(e) Enter the following menus: Powertrain / Engine and ECT / Intake Air.

(f) Read the value displayed on the Techstream.

OK:

The difference between the intake air temperature and the actual outside air temperature is within 10°C (18°F).

HINT:

Temperature readings on the vehicle's outside temperature gauge (if equipped) are not suitable for comparing to the intake air temperature reading. The outside temperature gauge has a significant delay built in to prevent temperature swings from being displayed on its display. Use an accurate thermometer to determine the outside air temperature.

NG ► REPLACE MASS AIR FLOW METER SUB-ASSEMBLY

OK

3.	READ VALUE USING TECHSTREAM (COOLANT TEMPERATURE)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Coolant Temp.
- (e) Read the value displayed on the Techstream.

OK:

The difference between the coolant temperature and the actual outside air temperature is within 10°C (18°F).

HINT:

If the result is not as specified, check if there are heat sources such as a block heater in the engine compartment.

NG ► REPLACE ENGINE COOLANT TEMPERATURE SENSOR

OK ► REPLACE ECM

DTC	P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input
DTC	P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

DESCRIPTION

HINT:

- These DTCs relate to the throttle position sensor.

The throttle position sensor is mounted on the throttle body assembly, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme conditions.

The throttle position sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.

As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power enrichment correction and fuel-cut control.

*: During fail-safe control

Note:

The throttle valve opening angle detected by the sensor terminal VTA1 is expressed as a percentage.

Between 10% and 22%: Throttle valve fully closed

Between 64% and 96%: Throttle valve fully open

Approximately 18.6%: Fail safe angle (5.5°)

Features of sensor output:

The difference in voltage between VTA1 and VTA2 x 0.8 is approximately 1.11 V.

(VTA2 × 0.8 is approximately equal to VTA1 + 1.11 V)

MONITOR DESCRIPTION

P0120, P0122, P0123, P0220, P0222, P0223, P2135

The ECM uses the throttle position sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the throttle position sensor.

- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor circuit, and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

P0121

This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. The ECM performs several checks to confirm the proper operation of the throttle position sensor and VTA1.

For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction in the throttle position sensor. The ECM illuminates the MIL and stores the DTC.

If the malfunction is not repaired successfully, the DTC is stored 2 seconds after the engine is next started.

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine.
8. With the vehicle stationary, fully depress and release the accelerator pedal [B].
9. Idle the engine for 2 seconds or more [C].
10. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
11. Read the DTC [D].
12. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P0120, P0121, P0122, P0123, P0220, P0222, P0223 or P2135.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [B] and [C] again.

16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

17. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

18. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to electronic throttle control system malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 5.5° throttle angle by the return spring. The ECM stops the engine and the vehicle can be driven using solely the hybrid system. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.

Fail-safe mode continues until a pass condition is detected, and the power switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- DTC P0121 is stored when the voltages output from VTA1 and VTA2 are not consistent with the characteristics of the sensors. Therefore, check the Freeze Frame Data when this DTC is output. Use the following formula to confirm relative fluctuations in voltage.

Features of sensor output:

$VTA2 \times 0.8$ is approximately equal to $VTA1 + 1.11 \text{ V}$

VTA1: Throttle Position No. 1

VTA2: Throttle position No. 2

- If DTC P0121 is output, proceed to "CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)".
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)
----	--

(a) Disconnect the throttle body assembly connector.

*1

*2

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D4-5 (VC) - D28-88 (VCTA)	Always	Below 1 Ω
D4-6 (VTA) - D28-90 (VTA1)	Always	Below 1 Ω
D4-4 (VTA2) - D28-89 (VTA2)	Always	Below 1 Ω
D4-3 (E2) - D28-111 (ETA)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D4-5 (VC) or D28-88 (VCTA) - Body ground	Always	10 k Ω or higher
D4-6 (VTA) or D28-90 (VTA1) - Body ground	Always	10 k Ω or higher
D4-4 (VTA2) or D28-89 (VTA2) - Body ground	Always	10 k Ω or higher

DTC

P0125

Insufficient Coolant Temperature for Closed Loop Fuel Control

DESCRIPTION

Refer to DTC P0115 .

DTC No.	DTC Detection Condition	Trouble Area
P0125	Engine coolant temperature does not reach closed-loop enabling temperature for 20 minutes (this period varies with engine start engine coolant temperature) (2 trip detection logic)	<ul style="list-style-type: none"> • Cooling system • Engine coolant temperature sensor • Water inlet with thermostat sub-assembly

MONITOR DESCRIPTION

The resistance of the engine coolant temperature sensor varies in proportion to the actual engine coolant temperature. The ECM supplies a constant voltage to the sensor and monitors the signal output voltage of the sensor. The signal output voltage varies according to the changing resistance of the sensor. After the engine is started, the engine coolant temperature is monitored through this signal. If the engine coolant temperature sensor indicates that the engine is not yet warm enough for closed-loop fuel control, despite a specified period of time having elapsed since the engine was started, the ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

Example:

The engine coolant temperature is 5°C (41°F) at engine start. After about 1 minute running time, the engine coolant temperature sensor still indicates that the engine is not warm enough to begin closed-loop fuel (air fuel ratio feedback) control. The ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0125: Insufficient engine coolant temperature for closed-loop fuel control
Required Sensors/Components (Main)	Engine coolant temperature sensor Thermostat Cooling system
Required Sensors/Components (Related)	-
Frequency of Operation	Once per driving cycle

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.

18. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

19. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

20. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs INFO.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to DTC P0115 INFO.

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0116, P0117 or P0118 is set simultaneously with DTC P0125, the engine coolant temperature sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0125)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream ON.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to

2. INSPECT WATER INLET WITH THERMOSTAT SUB-ASSEMBLY

- (a) Remove the water inlet with thermostat sub-assembly .
- (b) Check the valve opening temperature of the water inlet with thermostat sub-assembly.

Standard value:

80 to 84°C (176 to 183°F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

- (c) Reinstall the water inlet with thermostat sub-assembly .

NG  REPLACE WATER INLET WITH THERMOSTAT SUB-ASSEMBLY

OK

3. CHECK COOLING SYSTEM

(a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or any modifications.

NG▶ REPAIR OR REPLACE COOLING SYSTEM

OK▶ **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)
-----	-------	--

DESCRIPTION

HINT:

- This DTC relates to the water inlet with thermostat sub-assembly.

This DTC is set when the engine coolant temperature does not reach 75°C (167°F) despite sufficient engine warm-up time having elapsed.

DTC No.	DTC Detection Condition	Trouble Area
P0128	<ul style="list-style-type: none"> • Conditions (a), (b) and (c) are met for 5 seconds (2 trip detection logic): • (a) Cold start • (b) Engine warmed up • (c) Engine coolant temperature less than 75°C (167°F) 	<ul style="list-style-type: none"> • Water inlet with thermostat sub-assembly • Cooling system • Engine coolant temperature sensor • ECM

MONITOR DESCRIPTION

Y

The ECM estimates the engine coolant temperature based on the starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual engine coolant temperature. When

the estimated engine coolant temperature reaches 75°C (167°F), the ECM checks the actual engine coolant temperature. If the actual engine coolant temperature is less than 75°C (167°F), the ECM interprets this as a malfunction in the water inlet with thermostat sub-assembly or the engine cooling system and sets the DTC.

MONITOR STRATEGY

Battery voltage	11 V or more
Either of the following conditions 1 or 2 is met:	-
1. All of following conditions are met:	(a), (b) and (c)
(a) Engine coolant temperature at engine start - Intake air temperature at engine start	-15 to 7°C (-27 to 12.6°F)
(b) Engine coolant temperature at engine start	-10 to 56°C (14 to 133°F)
(c) Intake air temperature at engine start	-10 to 56°C (14 to 133°F)
2. All of the following conditions are met:	(d), (e) and (f)
(d) Engine coolant temperature at engine start - Intake air temperature at engine start	More than 7°C (12.6°F)
(e) Engine coolant temperature at engine start	56°C (133°F) or less
(f) Intake air temperature at engine start	-10°C (14°F) or more
Accumulated time at 80 mph (128 km/h) or more	Less than 20 seconds

TYPICAL MALFUNCTION THRESHOLDS

Duration that both of the following conditions (a) and (b) are met	5 seconds or more
(a) Estimated engine coolant temperature	75°C (167°F) or more
(b) Engine coolant temperature sensor output	Less than 75°C (167°F)

CONFIRMATION DRIVING PATTERN

- Engine coolant temperature when engine started: 56°C or less
- Intake air temperature when engine started: 0 to 35°C
- Heater set to MAX HOT with fresh air mode selected and A/C off

1. Stop the engine and allow it to cool down.
2. Connect the Techstream to the DLC3.
3. Turn the power switch on (IG) and turn the Techstream on [A].
4. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
5. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp and Intake Air.
6. Check if "Coolant Temp" is 56°C (133°F) or less and "Intake Air" is between 0 and 35°C (32 and 95°F).
7. Put the engine in inspection mode INFO.
8. Set the heater to MAX HOT with fresh air mode selected and turn the A/C off.
9. Start the engine and drive the vehicle at 50 mph (80 km/h) for 15 minutes [B].

HINT:

- Data can be captured relatively easily by using the snapshot function in the Data List.
 - Enter the following menus: Data List / Function / Snap-shot configuration / Record time / 5 min.
 - Data capture can be started by using the target point. For example, setting the target point to an Accel of 90% and then racing the engine, etc. to raise the engine speed to a speed of 2500 rpm or more will cause data capture to start.
10. After driving the vehicle at 50 mph (80 km/h) and "Coolant Temp" stabilizes, check that "Coolant Temp" is 75°C (167°F) or higher [C].

HINT:

If "Coolant Temp" is below 75°C (167°F) while driving the vehicle at 50 mph (80 km/h), inspect the cooling system and thermostat.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0128)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.

3.	INSPECT WATER INLET WITH THERMOSTAT SUB-ASSEMBLY
----	--

- (a) Remove the water inlet with thermostat sub-assembly **INFO**.
- (b) Measure the valve opening temperature of the water inlet with thermostat.

Standard value:

80 to 84°C (176 to 183°F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

(c) Reinstall the water inlet with thermostat sub-assembly **NFC**.

NG ▶ REPLACE WATER INLET WITH THERMOSTAT SUB-ASSEMBLY

OK ▶ REPLACE ECM

DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
DTC	P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)
DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)
DTC	P0139	Oxygen Sensor Circuit Slow Response (Bank 1 Sensor 2)

DESCRIPTION

HINT:

Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbons (HC) and nitrogen oxide (NOx) components in the exhaust gas, a three-way catalytic converter is used. For the most efficient use of the three-way catalytic converter, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric air fuel level. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.

The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three-way catalytic converter air fuel ratio is lean (low voltage, i.e. less than 0.45 V).

Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three-way catalytic converter air fuel ratio is rich (high voltage, i.e. more than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.

MONITOR DESCRIPTION

1. Active Air Fuel Ratio Control

The ECM usually performs air fuel ratio feedback control so that the air fuel ratio sensor output indicates a near stoichiometric air fuel level. This vehicle includes active air fuel ratio control in addition to regular air fuel ratio

control. The ECM performs active air fuel ratio control to detect any deterioration in the three-way catalytic converter and heated oxygen sensor malfunctions (refer to the diagram below).

Active air fuel ratio control is performed for approximately 15 to 25 seconds while driving with a warm engine. During active air fuel ratio control, the air fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is set.

2. Abnormal Voltage Output of Heated Oxygen Sensor (DTC P0136)

While the ECM is performing active air fuel ratio control, the air fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the heated oxygen sensor voltage does not decrease to less than 0.21 V or does not increase to more than 0.59 V during active air fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTCs P0136.

Heated Oxygen Sensor Circuit Malfunction (P0136: Abnormal Voltage)

Y

3. Open or Short in Heated Oxygen Sensor Circuit (DTCs P0137 or P0138)

During active air fuel ratio control, the ECM calculates the oxygen storage capacity * of the three-way catalytic converter by forcibly regulating the air fuel ratio to become rich or lean.

If the heated oxygen sensor has an open or short, or the voltage output of the sensor noticeably decreases, the oxygen storage capacity indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air fuel ratio to become rich or lean, the heated oxygen sensor output does not change.

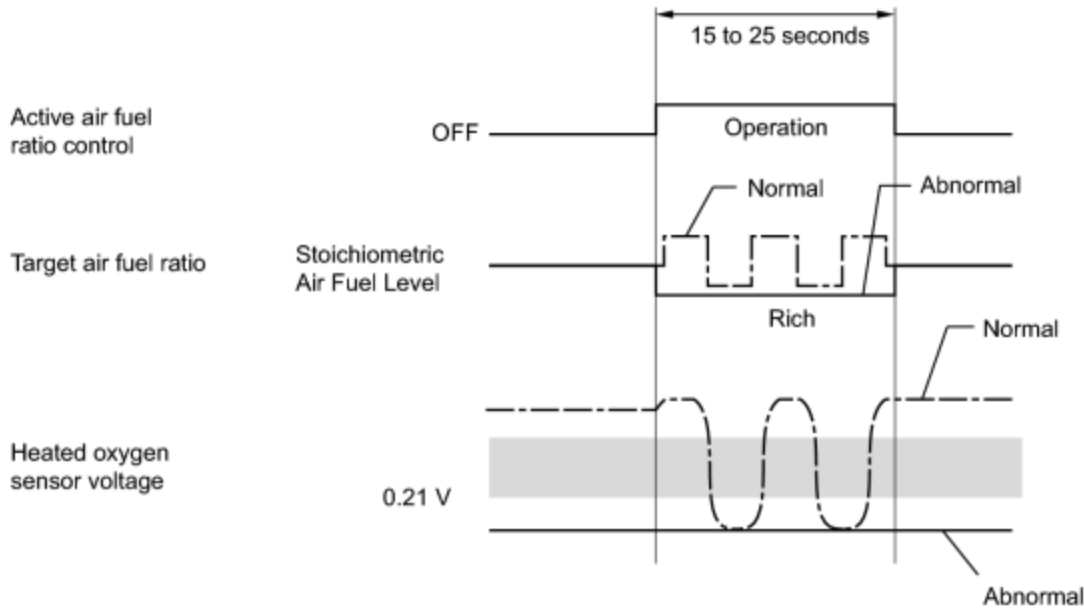

While performing active air fuel ratio control, when the target air fuel ratio is rich and the heated oxygen sensor voltage output is less than 0.21 V (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137. When the target air fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138.

HINT:

DTC P0138 is also set if the heated oxygen sensor voltage output is more than 1.2 V for 10 seconds or more.

*: The three-way catalytic converter has the capability to store oxygen. The oxygen storage capacity and the emission purification capacity of the three-way catalytic converter are mutually related. The ECM determines whether the catalyst has deteriorated, based on the calculated oxygen storage capacity value INFO.

Heated Oxygen Sensor Circuit Low Voltage (P0137: Open)

Heated Oxygen Sensor Circuit High Voltage (P0138: Short)

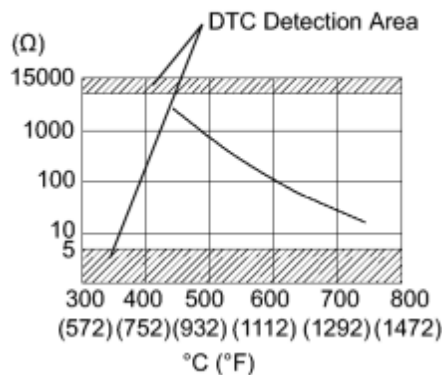

Y

4. High or Low Impedance of Heated Oxygen Sensor (DTCs P0136 or P0137)

During normal air fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variation of the heated oxygen sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured

Relationship between element temperature and impedance:

impedance deviates from the standard range.

*: The effective resistance in an alternating current electrical circuit.

- The impedance cannot be measured using an ohmmeter.
- DTC P0136 indicates the deterioration of the heated oxygen sensor. The ECM sets the DTCs by calculating the impedance of the sensor when the typical enabling conditions are satisfied (2 driving cycles).
- DTC P0137 indicates an open or short circuit in the heated oxygen sensor (2 driving cycles). The ECM sets the DTCs when the impedance of the sensor exceeds the threshold of 15 kΩ.

5. Abnormal Voltage Output of Heated Oxygen Sensor During Fuel-cut (DTC P0139)

The sensor output voltage drops to below 0.2 V (extremely lean status) immediately when the vehicle decelerates and fuel cut is operating. If the voltage does not drop to below 0.2 V for 6 seconds or more, or the voltage does not drop from 0.35 to 0.2 V for 1 second, the ECM determines that the sensor response has deteriorated, illuminates the MIL and sets a DTC.

Heated Oxygen Sensor Output Voltage (Output Voltage, High Voltage and Low Voltage)

Active air fuel ratio control	Performing
Active air fuel ratio control begins when all of the following conditions are met:	-
Battery voltage	11 V or more
Engine coolant temperature	75°C (167°F) or more
Idling	OFF
Engine speed	Less than 4000 rpm
Air fuel ratio sensor status	Activated
Fuel system status	Closed loop
Fuel cut	OFF
Engine load	10 to 70%

Heated Oxygen Sensor Impedance (Low Impedance)

Battery voltage	11 V or more
Estimated sensor temperature	Less than 700°C (1292°F)
ECM monitor	Completed
DTC P0607	Not set

Heated Oxygen Sensor Impedance (High Impedance)

Battery voltage	11 V or more
Estimated sensor temperature	450 to 750°C (842 to 1382°F)
DTC P0607	Not set

Heated Oxygen Sensor Output Voltage (Extremely High)

Battery voltage	11 V or more
Time after engine start	2 seconds or more

Heated Oxygen Sensor Voltage During Fuel-cut

Engine coolant temperature	75°C (167°F) or more
Estimated catalyst temperature	400°C (752°F) or more
Fuel cut	ON

TYPICAL MALFUNCTION THRESHOLDS

Heated Oxygen Sensor Output Voltage (Output Voltage)

Either of the following conditions is met:	1 or 2
1. All of the following conditions (a), (b) and (c) are met	-
(a) Commanded air fuel ratio	14.3 or less
(b) Heated oxygen sensor voltage	0.21 to 0.59 V
(c) Oxygen storage capacity of catalyst	2.1 g or more
2. All of the following conditions (d), (e) and (f) are met	-
(d) Commanded air fuel ratio	14.9 or more
(e) Heated oxygen sensor voltage	0.21 to 0.59 V
(f) Oxygen storage capacity of catalyst	2.1 g or more

Heated Oxygen Sensor Output Voltage (Low Voltage)

All of the following conditions (a), (b) and (c) are met	-
(a) Commanded air fuel ratio	14.3 or less
(b) Heated oxygen sensor voltage	Less than 0.21 V
(c) Oxygen storage capacity of catalyst	2.1 g or more

Heated Oxygen Sensor Output Voltage (High Voltage)

All of the following conditions (a), (b) and (c) are met	-
(a) Commanded air fuel ratio	14.9 or more
(b) Heated oxygen sensor voltage	More than 0.59 V
(c) Oxygen storage capacity of catalyst	2.1 g or more

Heated Oxygen Sensor Impedance (Low Impedance)

Duration of following condition	30 seconds or more
Heated oxygen sensor impedance	Less than 5 Ω

Heated Oxygen Sensor Impedance (High Impedance)

Duration of following condition	90 seconds or more
Heated oxygen sensor impedance	15 k Ω or more

Heated Oxygen Sensor Output Voltage (Extremely High)

Duration of following condition	10 seconds or more
Heated oxygen sensor output voltage	1.2 V or more

Heated Oxygen Sensor Voltage During Fuel-cut

One of the following conditions is set	-
Duration until rear heated oxygen sensor voltage drops to 0.2 V during fuel cut	6 seconds or more
Duration that rear heated oxygen sensor voltage drops from 0.35 to 0.2 V during fuel cut	1 second or more

COMPONENT OPERATING RANGE

Duration of following condition	30 seconds or more
Heated oxygen sensor voltage	Varies between 0.1 V and 0.9 V

MONITOR RESULT

Refer to Checking Monitor Status INFO.

CONFIRMATION DRIVING PATTERN

P0136, P0137 and P0138

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or higher [B].
8. Drive the vehicle at 47 to 75 mph (75 to 120 km/h) for 10 minutes or more [C].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
10. Read the pending DTC [D].

11. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

13. Input the DTC: P0136, P0137 or P0138.

14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [C] again.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

17. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

P0139

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or higher [B].
8. Drive the vehicle at 47 mph (75 km/h), and then decelerate the vehicle by releasing the accelerator pedal for 6 seconds or more to perform the fuel-cut [C].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
10. Read the pending DTC [D].
11. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0139.
14. Check the DTC judgment result.

UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, move the shift lever to B and then perform step [C] again.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Check the judgment result.

HINT:

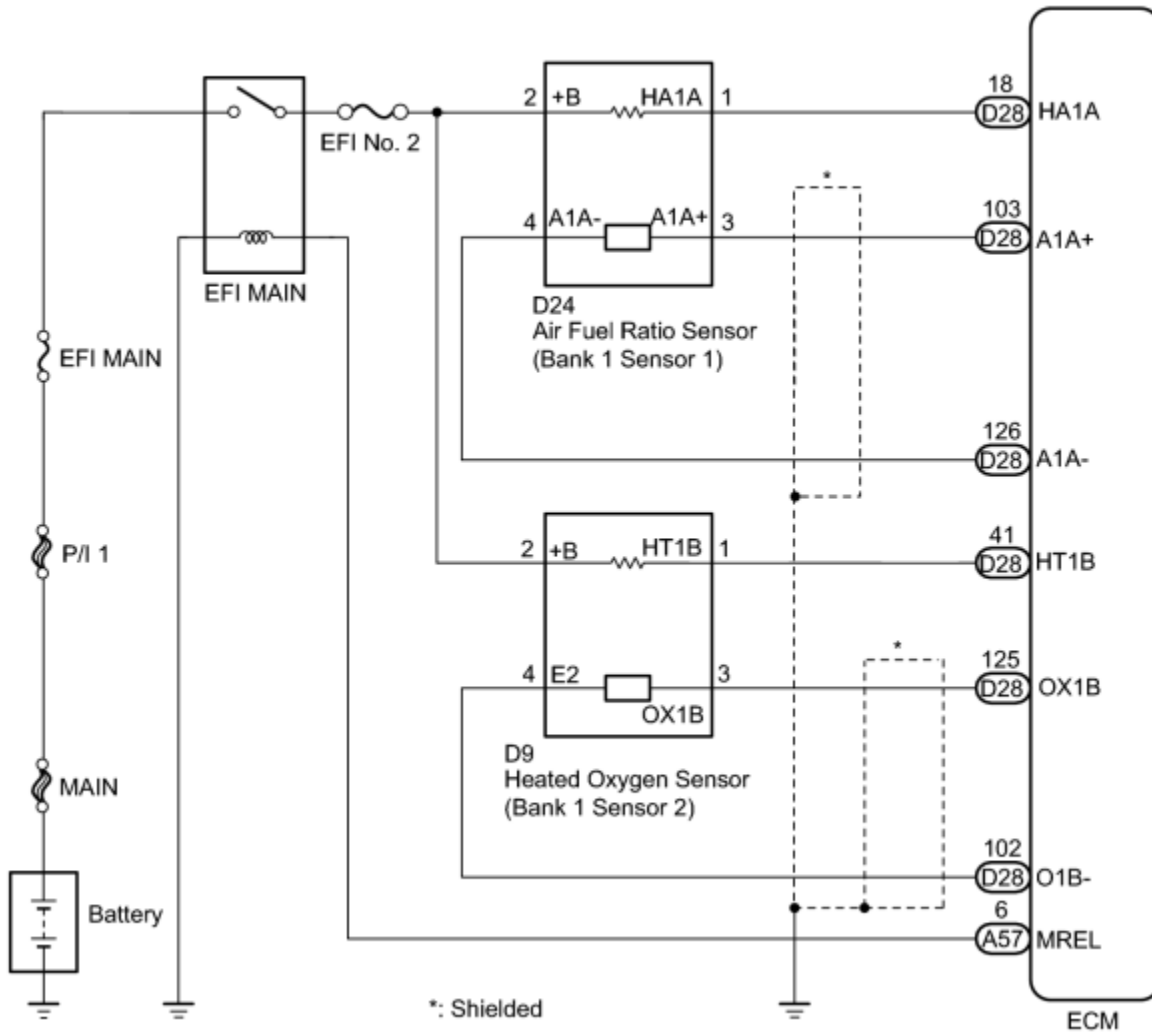

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

17. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode INFO.
4. Start the engine.
5. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

6. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
7. Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
8. Monitor the voltage outputs of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

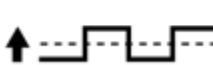

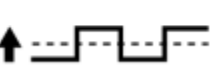

HINT:

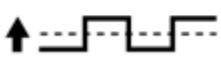

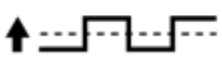

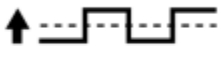

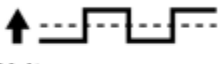

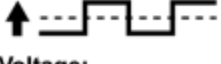

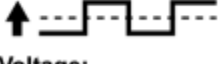

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V OK</p> 	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V OK</p> 	
2			<ul style="list-style-type: none"> ○ Air fuel ratio sensor ○ Air fuel ratio sensor heater ○ Air fuel ratio sensor

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V</p>  <p>OK</p>	circuit
3	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V</p>  <p>OK</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<ul style="list-style-type: none"> ○ Heated oxygen sensor ○ Heated oxygen sensor heater ○ Heated oxygen sensor circuit ○ Exhaust gas leaks

- Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2.

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

- If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be set.

PROCEDURE

1.	READ DTC OUTPUT (DTC P0136, P0137, P0138 OR P0139)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0138 is output	A
DTC P0137 is output	B
DTC P0136 is output	C
DTC P0139 is output	D

▼

2.	READ VALUE USING TECHSTREAM (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.
- (e) Allow the engine to idle.
- (f) Read the heated oxygen sensor output voltage while idling.

Result:

Result	Proceed to
1.0 V or more	A

Result	Proceed to
Less than 1.0 V	B

B ▶ [PERFORM ACTIVE TEST USING TECHSTREAM \(INJECTION VOLUME\)](#)

A
▼

3. INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

- (a) Disconnect the heated oxygen sensor connector.
- (b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

*1

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	Always	10 kΩ or higher
2 (+B) - 3 (OX1B)		

Text in Illustration

*1	Component without harness connected (Heated Oxygen Sensor)
----	---

- (c) Reconnect the heated oxygen sensor connector.

NG ▶ [REPLACE HEATED OXYGEN SENSOR](#)

OK
▼

4. CHECK HARNESS AND CONNECTOR

- (a) Turn the power switch off and wait for 5 minutes or more.
- (b) Disconnect the ECM connector.
- (c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Short):

N

Tester Connection	Condition	Specified Condition
D28-41 (HT1B) - D28-125 (OX1B)	Always	10 kΩ or higher

Text in Illustration

*1	Front view of wire harness connector (to ECM)
----	--

(d) Reconnect the ECM connector.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR (HEATED OXYGEN SENSOR - ECM)

OK 

5.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

NG  [INSPECT EGR VALVE ASSEMBLY](#)

OK  REPLACE ECM

6.	INSPECT EGR VALVE ASSEMBLY
----	----------------------------

(a) Remove the EGR valve assembly .

(b) Check if the EGR valve is stuck open.

OK:

EGR valve is tightly closed.

(c) Reinstall the EGR valve assembly .

NG  REPLACE EGR VALVE ASSEMBLY

OK  REPLACE ECM

7.	PERFORM ACTIVE TEST USING TECHSTREAM (INJECTION VOLUME)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

(g) Change the fuel injection volume using the Techstream and monitor the voltage output of air fuel ratio and heated oxygen sensors displayed on the Techstream.

HINT:

- Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.
- The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the Techstream.
- The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Result:

Techstream Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (Air fuel ratio)	Alternates between more and less than 3.3 V	OK
	Remains at more than 3.3 V	NG
	Remains at less than 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or more than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG [▶ REPLACE AIR FUEL RATIO SENSOR](#)

OK

8.	INSPECT AIR FUEL RATIO SENSOR
----	-------------------------------

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut. When the sensor is normal, the sensor current will indicate below 3.0 mA in this test.

- Connect the Techstream to the DLC3.
- Turn the power switch on (IG).
- Turn the Techstream on.
- Clear the DTCs [INFO](#).
- Drive the vehicle according to the drive pattern listed below:

- (1) Put the engine in inspection mode INFO.
- (2) Warm up the engine until the engine coolant temperature reaches 75°C (167°F) or more.
- (3) Drive the vehicle at 47 mph (75 km/h) or more and decelerate the vehicle for 6 seconds or more.
- (4) Repeat the deceleration above at least 3 times.

- (f) Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details.
- (g) Confirm that RANGE B1S1 is either Pass or Fail. If the Techstream shows Incomplete, re-check RANGE B1S1 after performing the drive pattern.
- (h) Select the RANGE B1S1.
- (i) Read the Test Value.

Standard current:

Less than 3.0 mA

HINT:

If the Techstream shows Incomplete again, add the vehicle speed and move the shift lever to B to decelerate the vehicle.

NG [▶ REPLACE AIR FUEL RATIO SENSOR](#)
 OK [▶ REPLACE HEATED OXYGEN SENSOR](#)

9.	READ VALUE USING TECHSTREAM (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

(g) Change the fuel injection volume using the Techstream and monitor the voltage output of heated oxygen sensor displayed on the Techstream.

HINT:

- Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.
- The heated oxygen sensor is displayed as O2S B1S2 on the Techstream.
- The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Standard:

Fluctuates between 0.4 V or less and 0.55 V or more.

NG  [CHECK EXHAUST GAS LEAK](#)

OK

10.	PERFORM ACTIVE TEST USING TECHSTREAM (INJECTION VOLUME)
-----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

(g) Change the fuel injection volume using the Techstream and monitor the voltage output of air fuel ratio and heated oxygen sensors displayed on the Techstream.

HINT:

- Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.
- The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the Techstream.
- The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Result:

Techstream Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (Air fuel ratio)	Alternates between more and less than 3.3 V	OK
	Remains at more than 3.3 V	NG
	Remains at less than 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or more than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG ► [REPLACE AIR FUEL RATIO SENSOR](#)

OK

11. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode INFO.
- (e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

NG  [INSPECT EGR VALVE ASSEMBLY](#)

OK  CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR ASSEMBLY, FUEL PRESSURE, GAS LEAK FROM SYSTEM)

12.	INSPECT EGR VALVE ASSEMBLY

13. CHECK EXHAUST GAS LEAK

(a) Inspect for exhaust gas leaks from the exhaust manifold sub-assembly and exhaust pipes.

OK:

No gas leaks.

NG ► REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

14. INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

*1

(a) Disconnect the heated oxygen sensor connector.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

Text in Illustration

*1	Component without harness connected (Heated Oxygen Sensor (Sensor 2))
----	--

(c) Reconnect the heated oxygen sensor connector.

NG ► REPLACE HEATED OXYGEN SENSOR

OK

15. CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

(a) Disconnect the heated oxygen sensor connector.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D9-1 (HT1B) - D28-41 (HT1B)	Always	Below 1 Ω
D9-3 (OX1B) - D28-125 (OX1B)		
D9-4 (E2) - D28-102 (O1B-)		

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D9-1 (HT1B) or D28-41 (HT1B) - Body ground	Always	10 kΩ or higher
D9-3 (OX1B) or D28-125 (OX1B) - Body ground

DTC	P0171	System Too Lean (Bank 1)
DTC	P0172	System Too Rich (Bank 1)

DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection duration. The fuel trim consists of both the short-term and long-term fuel trim.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air fuel ratio at stoichiometric levels. The signal from the air fuel ratio sensor indicates whether the air fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.

If both the short-term and long-term fuel trim are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0171	With warm engine and stable air fuel ratio feedback, fuel trim considerably in error to lean side (2 trip detection logic)	<ul style="list-style-type: none"> • Intake system • Fuel injector assembly • Mass air flow meter sub-assembly • Engine coolant temperature sensor • Fuel pressure • Gas leaks from exhaust system • Open or short in air fuel ratio sensor (sensor 1) circuit • Air fuel ratio sensor (sensor 1) • PCV valve and hose • PCV hose connections • EGR valve assembly • ECM
P0172	With warm engine and stable air fuel ratio feedback, fuel trim considerably in error to rich side (2 trip detection logic)	<ul style="list-style-type: none"> • Fuel injector assembly • Mass air flow meter sub-assembly • Engine coolant temperature sensor • Ignition system • Fuel pressure • Gas leaks from exhaust system • Open or short in air fuel ratio sensor (sensor 1) circuit • Air fuel ratio sensor (sensor 1) • EGR valve assembly • ECM

HINT:

- When DTC P0171 is set, the actual air fuel ratio is on the lean side. When DTC P0172 is set, the actual air fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air fuel ratio is lean and DTC P0171 may be set. The MIL then illuminates.
- When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C (167°F)), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, a fuel injection volume that deviates from that estimated by the ECM causes changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim value. Deviations from the ECM's estimated fuel injection volume also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air fuel ratio). If the average fuel trim learning value exceeds a malfunction threshold, the ECM interprets this a fault in the fuel system and sets a DTC.

Example:

The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.

7. Start the engine and warm it up (until the engine coolant temperature is 75°C (167°F) or higher) with all the accessories switched off [B].
8. With the engine warmed up, idle the engine for 2 minutes or more [C].
9. Drive the vehicle at between 47 and 75 mph (75 and 120 km/h) and at an engine speed of between 1400 and 3200 rpm for 5 minutes or more [D].
10. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
11. Read the pending DTC [E].
12. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P0171 or P0172.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [C] through [D] again.

16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
17. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

18. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs **INFO**.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to DTC P2195 **INFO**.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode **INFO**.
4. Start the engine.
5. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
6. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
7. Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
8. Monitor the voltage outputs of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V

Techstream Display (Sensor)	Injection Volume	Status	Voltage
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

- Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2.

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low air fuel ratio sensor voltage could be caused by a rich air fuel mixture. Check for conditions that would cause the engine to run rich.
- A high air fuel ratio sensor voltage could be caused by a lean air fuel mixture. Check for conditions that would cause the engine to run lean.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171 OR P0172)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0171 or P0172 is output	A
DTC P0171 or P0172 and other DTCs are output	B

HINT:

If any DTCs other than P0171 or P0172 are output, troubleshoot those DTCs first.

B ▶ GO TO DTC CHART

A
▼

2. CHECK PCV HOSE CONNECTIONS

(a) Inspect the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG ▶ REPAIR OR REPLACE PCV HOSE

OK
▼

3. CHECK INTAKE SYSTEM

(a) Check the intake system for vacuum leaks **INFO**.

OK:

No leaks in intake system.

NG ▶ REPAIR OR REPLACE INTAKE SYSTEM

OK
▼

4. PERFORM ACTIVE TEST USING TECHSTREAM (AIR FUEL RATIO CONTROL)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG) and turn the Techstream on.

(c) Put the engine in inspection mode **INFO**.

(d) Start the engine.

(e) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

(g) Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

(h) Monitor the voltage outputs of the air fuel ratio sensor and the heated oxygen sensor (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.
- The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Standard:

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (air fuel ratio)	+25%	Rich	Less than 3.1 V
	-12.5%	Lean	More than 3.4 V
O2S B1S2 (heated oxygen)	+25%	Rich	More than 0.55 V
	-12.5%	Lean	Less than 0.4 V

Result

DESCRIPTION

Text in Illustration

*1	Camshaft Position Sensor
*2	Crankshaft Position Sensor
*3	ECM

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the three-way catalytic converter temperature, which may cause damage to the three-way catalytic converter. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the three-way catalytic converter reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The camshaft position sensor is used to identify any misfiring cylinders and the crankshaft position sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, and could cause emission control system performance deterioration, the ECM illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0300	When one of following conditions below is detected (2 trip detection logic):	<ul style="list-style-type: none"> Open or short in engine wire harness Connector connection

DTC No.	DTC Detection Condition	Trouble Area
	<ul style="list-style-type: none"> • High temperature misfire occurs in three-way catalytic converter (MIL blinks) • Emission deterioration misfire occurs (MIL illuminates) • Simultaneous misfiring of several cylinders occurs 	<ul style="list-style-type: none"> • Vacuum hose connections • Ignition system • Fuel injector assembly • Fuel pressure • Mass air flow meter sub-assembly
P0301 P0302 P0303 P0304	<p>When one of following conditions below is detected (2 trip detection logic):</p> <ul style="list-style-type: none"> • High temperature misfire occurs in three-way catalytic converter (MIL blinks) • Emission deterioration misfire occurs (MIL illuminates) • Misfiring of specific cylinder occurs 	<ul style="list-style-type: none"> • Engine coolant temperature sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Intake system • EGR valve assembly • ECM

When DTCs for misfiring cylinders are randomly set, but DTC P0300 is not set, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only set when several misfiring cylinders are detected at the same time.

MONITOR DESCRIPTION

The ECM illuminates the MIL and sets a DTC when either one of the following conditions, which could cause emission control system performance deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 20 to 50 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 20 to 50 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.

The ECM flashes the MIL and sets a DTC when either one of the following conditions, which could cause the three-way catalytic converter damage, is detected (2 trip detection logic).

HINT:

If a catalyst damage misfire occurs, the monitor informs the driver by blinking the MIL (1 trip).

- In every 200 crankshaft revolutions at a high engine speed, the threshold misfiring percentage is recorded once.
- In every 200 crankshaft revolutions at a normal engine speed, the threshold misfiring percentage is recorded 3 times.

Misfire Monitor for Mexico Models

The ECM illuminates the MIL and sets a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 1000 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 500 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.

The ECM flashes the MIL and sets a DTC when the following condition, which could cause the three-way catalytic converter damage, is detected (2 trip detection logic).

- A catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.

MONITOR STRATEGY

Related DTCs	P0300: Multiple cylinder misfire P0301: Cylinder 1 misfire P0302: Cylinder 2 misfire P0303: Cylinder 3 misfire P0304: Cylinder 4 misfire
Required Sensors/Components (Main)	Crankshaft position sensor Camshaft position sensor
Required Sensors/Components (Related)	Engine coolant temperature sensor Intake air temperature sensor Mass air flow meter sub-assembly
Frequency of Operation	Continuous
Duration	1000 to 4000 crankshaft revolutions: Emission related misfire 200 to 600 crankshaft revolutions: Catalyst damaging misfire
MIL Operation	2 driving cycles: Emission related misfire MIL flashes immediately: Catalyst damaging misfire
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Misfire

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG).
3. Turn the Techstream on.
4. Record the DTC(s) and freeze frame data.
5. Put the engine in inspection mode INFO.
6. Using the Techstream, switch the ECM from normal mode to check mode INFO.
7. Read the misfire counts of each cylinder, Cylinder #1 Misfire Count to Cylinder #4 Misfire Count, with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
8. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, using the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	4 minutes or more
1000	4 minutes and 30 seconds or more
2000	2 minutes and 30 seconds or more
3000	1 minute and 30 seconds or more

9. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the power switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

10. Record the DTC(s), freeze frame data and misfire counts.
11. Turn the power switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.
- If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.
- If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors is considered to be a possible cause of the problem:
 - a. There was insufficient fuel in the tank.
 - b. Improper fuel is used.
 - c. The spark plugs have been contaminated.
 - d. The problem requires further diagnosis.
- After finishing repairs, check the misfire counts of the cylinders Cylinder #1 Misfire Count to Cylinder #4 Misfire Count.
- Be sure to confirm that no misfiring cylinder DTCs are set again by conducting the confirmation driving pattern after finishing repairs.
- When one of Short FT #1 or Long FT #1 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).
- When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire has occurred only while warming up the engine.

- An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs detection.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE DTCS)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

HINT:

Write down the indicated DTCs.

Result:

Result	Proceed to
DTC P0300, P0301, P0302, P0303 and/or P0304 are output	A
DTC P0300, P0301, P0302, P0303 and/or P0304 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303 and/or P0304 are output, troubleshoot those DTCs first.

B ► GO TO DTC CHART

A
▼

2.	CHECK PCV HOSE (HOSE CONNECTIONS)
----	-----------------------------------

- (a) Check the PCV hose connections.

OK:

PCV hose is correctly connected and is not damaged.

NG ► REPAIR OR REPLACE PCV HOSE

OK
▼

3.	READ VALUE USING TECHSTREAM (MISFIRE RPM AND MISFIRE LOAD)
----	--

- (a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire RPM and Misfire Load.

(e) Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.	READ VALUE USING TECHSTREAM (CYLINDER #1 MISFIRE COUNT, #2, #3 AND #4)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Enter the following menus: Powertrain / Engine and ECT / Data List / Cylinder #1 (to #4) Misfire Count.

(f) Read each value for Cylinder #1 (to #4) Misfire Count displayed on the Techstream. If no misfire counts occur in any cylinders, perform steps [A] and [B], and then check the misfire counts again.

(g) Drive the vehicle with the Misfire RPM and Misfire Load noted in the read value using the Techstream (Misfire RPM and Misfire Load) procedures above [A].

(h) Read Cylinder #1 (to #4) Misfire Count or the DTCs displayed on the Techstream [B].

Result:

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.
- If the freeze frame data record of the engine coolant temperature is below 75°C (167°F), it may only be possible to detect the misfire when the engine is cold.
- If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.

5.	INSPECT SPARK PLUG
----	--------------------

(a) Remove the ignition coil assembly and the spark plug of the misfiring cylinder.

(b) Check the electrode for carbon deposits.

Recommended Spark Plug

Manufacturer	Product
DENSO	SC20HR11

(c) Measure the spark plug electrode gap.

Maximum Electrode Gap for Used Spark Plug:

1.3 mm (0.0512 in.)

If the gap is greater than the maximum, replace the spark plug.

Electrode Gap for New Spark Plug:

1.0 to 1.1 mm (0.0394 to 0.0433 in.)

P

(d) Reinstall the ignition coil assembly and spark plug.

NG ▶ [REPLACE SPARK PLUG](#)

OK
▼

6.	CHECK FOR SPARK (SPARK TEST)
----	------------------------------

(a) Perform spark test **INFO**.

CAUTION:

Always disconnect all fuel injector assembly connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

OK:

Spark jumps across electrode gap.

NG ▶ [CHANGE TO KNOWN GOOD SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER](#)

OK

7.	CHECK CYLINDER COMPRESSION PRESSURE OF MISFIRING CYLINDER
----	---

(a) Measure the cylinder compression pressure of the misfiring cylinder INFO.

NG CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.	CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)
----	---

*1

(a) Disconnect the fuel injector assembly connectors.

N

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D14-1 - Body ground	Power switch on (IG)	11 to 14 V
D15-1 - Body ground	Power switch on (IG)	11 to 14 V
D16-1 - Body ground	Power switch on (IG)	11 to 14 V
D17-1 - Body ground	Power switch on (IG)	11 to 14 V

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)
DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)

DESCRIPTION

A flat type knock control sensor is used. Flat type knock control sensors (non-resonant type) have a structure that can detect vibrations over a wide band of frequencies: between approximately 6 kHz and 15 kHz.

Knock control sensors are fitted onto the engine block to detect engine knocking.

The knock control sensor contains a piezoelectric element which generates a voltage when it becomes deformed.

The voltage is generated when the engine block vibrates due to knocking. Occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC No.	DTC Detection Condition	Trouble Area
P0327	Output voltage of knock control sensor less than 0.5 V for 1 second or more (1 trip detection logic)	<ul style="list-style-type: none"> • Short in knock control sensor circuit • Knock control sensor • ECM
P0328	Output voltage of knock control sensor more than 4.5 V for 1 second or more (1 trip detection logic)	<ul style="list-style-type: none"> • Open in knock control sensor circuit • Knock control sensor • ECM

HINT:

When either DTC P0327 or P0328 is set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the power switch is turned off.

Reference: Inspection using an oscilloscope

T

The correct waveform is as shown.

ECM Terminal Name	Between KNK1 and EKNK
Tester Range	1 V/DIV., 1 ms./DIV.
Condition	Engine speed maintained at 4000 rpm after warming up engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.

The monitor for DTCs P0327 and P0328 begins to run when 5 seconds have elapsed since the engine was started.

If the malfunction is not repaired successfully, DTC P0327 or P0328 is set 5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0327: Knock sensor (bank 1) range check (Low voltage) P0328: Knock sensor (bank 1) range check (High voltage)
Required Sensors/Components (Main)	Knock control sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediately
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Battery voltage	10.5 V or more
Time after engine start	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Knock Sensor Range Check (Low Voltage) P0327

Knock sensor voltage	Less than 0.5 V
----------------------	-----------------

Knock Sensor Range Check (High Voltage) P0328

Knock sensor voltage	More than 4.5 V
----------------------	-----------------

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and wait 10 seconds.
8. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
9. Read the DTC [B].
10. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

11. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
12. Input the DTC: P0327 or P0328.
13. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, idle the engine for 5 minutes.
14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 15. Check the judgment result [C].

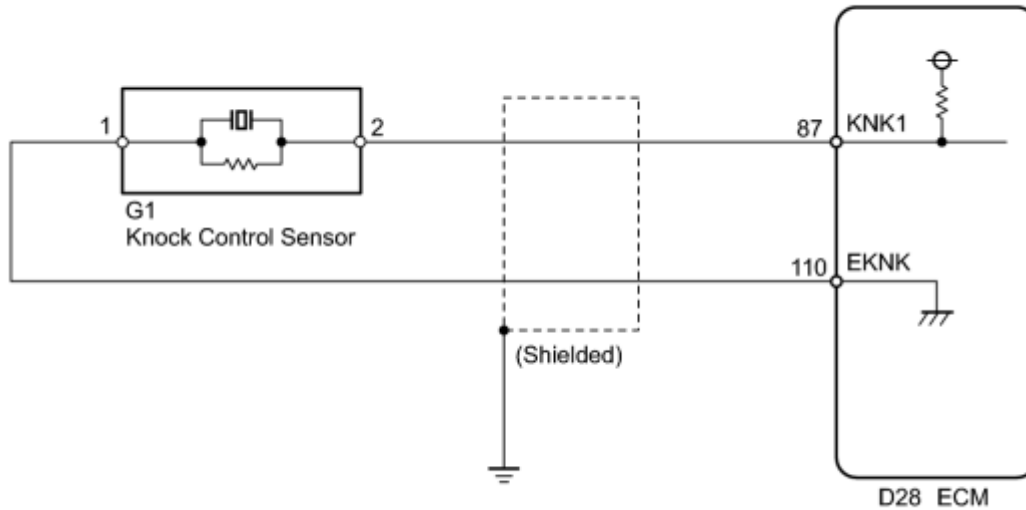

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
16. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Y

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1. READ VALUE USING TECHSTREAM (KNOCK FEEDBACK VALUE)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) and turn the Techstream on.
- (c) Put the engine in inspection mode INFO.
- (d) Start the engine.
- (e) Warm up the engine.
- (f) Enter the following menus: Powertrain / Engine and ECT / Knock Feedback Value.
- (g) Read the value while driving the vehicle.

OK:

The value changes.

Malfunction does not occur	Knock Feedback Value changes
Malfunctions occur	Knock Feedback Value does not change

HINT:

The knock feedback value change can be confirmed by running the engine with a high load, for example, by activating the air conditioning system and racing the engine.

NG [INSPECT ECM \(KNK1 VOLTAGE\)](#)

OK **CHECK FOR INTERMITTENT PROBLEMS**

2.	INSPECT ECM (KNK1 VOLTAGE)
----	----------------------------

*1

(a) Disconnect the knock control sensor connector.

N

(b) Turn the power switch on (IG).

DTC

P0335

Crankshaft Position Sensor "A" Circuit

DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pickup coil.

The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes by the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC No.	DTC Detection Condition	Trouble Area
P0335	When either of following conditions are met: (1 trip detection logic) <ul style="list-style-type: none"> • Missing crankshaft position sensor signal despite camshaft position sensor signal inputs normal after engine cranked • No crankshaft position sensor signal to ECM 	<ul style="list-style-type: none"> • Open or short in crankshaft position sensor circuit • Crankshaft position sensor • No. 1 crankshaft position sensor plate • ECM

- Reference: Inspection using an oscilloscope.

HINT:

- The correct waveform is as shown.
- G2+ is camshaft position sensor signals, and NE+ is the crankshaft position sensor signal.
- A failure of the ground for the shielding of the wiring may result in noisy waveforms.

ECM Terminal Name	Between NE+ and NE- Between G2+ and G2-
Tester Range	5 V/DIV., 20 ms./DIV.

Condition	Idling with warm engine
-----------	-------------------------

MONITOR DESCRIPTION

If there is no signal from the crankshaft position sensor despite the engine rotating, the ECM interprets this as a malfunction of the sensor.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0335: Crankshaft position sensor verify pulse input P0335: Crankshaft position sensor range check or rationality

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.

5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode .
7. Start the engine.
8. Idle the engine for 20 seconds or more [B].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
10. Read the DTC [C].
11. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0335.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.
15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 16. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
17. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

- If no problem is found through this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.
- Check the engine speed. The engine speed can be checked using the Techstream. To check, follow the operation below:
 - a. Connect the Techstream to the DLC3.
 - b. Turn the power switch on (IG) and turn the Techstream on.
 - c. Put the engine in inspection mode .
 - d. Start the engine.
 - e. Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	READ VALUE USING TECHSTREAM (ENGINE SPEED)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode .
- (e) Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.
- (f) Start the engine.
- (g) Read the values displayed on the Techstream while the engine is running.

OK:

Correct values are displayed.

HINT:

- To check the engine speed change, display the graph on the Techstream.
- If the engine does not start, check the engine speed while cranking.
- If the engine speed indicated on the Techstream remains at zero (0), there may be an open or short in the crankshaft position sensor circuit.

NG **INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)**

OK **CHECK FOR INTERMITTENT PROBLEMS**

2. INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)

*1

(a) Disconnect the crankshaft position sensor connector.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (NE) - 2 (NE-)	Cold	1630 to 2740 Ω
1 (NE) - 2 (NE-)	Hot	2065 to 3225 Ω

HINT:

"Cold" and "Hot" mean the temperature of the coils themselves. "Cold" is from -10 to 50°C (14 to 122°F) and "Hot" is from 50 to 100°C (122 to 212°F).

If the resistance is not as specified, replace the sensor.

Text in Illustration

DTC	P0340	Camshaft Position Sensor Circuit Malfunction
DTC	P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)
DTC	P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)

DESCRIPTION

The camshaft position sensor for intake camshaft (G2 signal sensor) consists of a magnet and MR element.

The camshaft has a timing rotor for the camshaft position sensor. When the camshaft rotates, changes occur in the air gaps between the timing rotor and MR element, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The camshaft position sensor converts the camshaft rotation data to pulse signals, and uses the pulse signals to determine the camshaft angle, which it sends to the ECM. Then the ECM uses this data to control fuel injection time and injection timing.

DTC No.	DTC Detection Condition	Trouble Area
P0340	When either of following conditions is met: <ul style="list-style-type: none"> No camshaft position sensor signal to ECM at engine speed 600 rpm or more (1 trip detection logic) Missing camshaft position sensor signal despite crankshaft position sensor inputs normal at engine speed of 600 rpm or more (1 trip detection logic) 	<ul style="list-style-type: none"> Open or short in camshaft position sensor circuit Camshaft position sensor Intake camshaft Jumped tooth of timing chain for intake camshaft ECM
P0342	Output voltage of camshaft position sensor less than 0.3 V for 4 seconds (1 trip detection logic)	<ul style="list-style-type: none"> Open or short in camshaft position sensor circuit Camshaft position sensor Intake camshaft Jumped tooth of timing chain for intake camshaft ECM
P0343	Output voltage of 4.7 V for 4 seconds (1 trip detection logic)	<ul style="list-style-type: none"> Open or short in camshaft position sensor circuit Camshaft position sensor Intake camshaft Jumped tooth of timing chain for intake camshaft ECM

HINT:

DTC P0340 indicates a malfunction relating to the camshaft position sensor circuit (the wire harness between the ECM and camshaft position sensor, and the camshaft position sensor itself).

Reference: Inspection using an oscilloscope .

MONITOR DESCRIPTION

If no signal is transmitted by the camshaft position sensor despite the engine revolving, or the rotation of the camshaft and the crankshaft is not synchronized, the ECM interprets this as a malfunction of the sensor.

If the malfunction is not repaired successfully, the DTC is set 10 seconds after the engine is next started.

DTC	P0351	Ignition Coil "A" Primary / Secondary Circuit
DTC	P0352	Ignition Coil "B" Primary / Secondary Circuit
DTC	P0353	Ignition Coil "C" Primary / Secondary Circuit
DTC	P0354	Ignition Coil "D" Primary / Secondary Circuit

DESCRIPTION

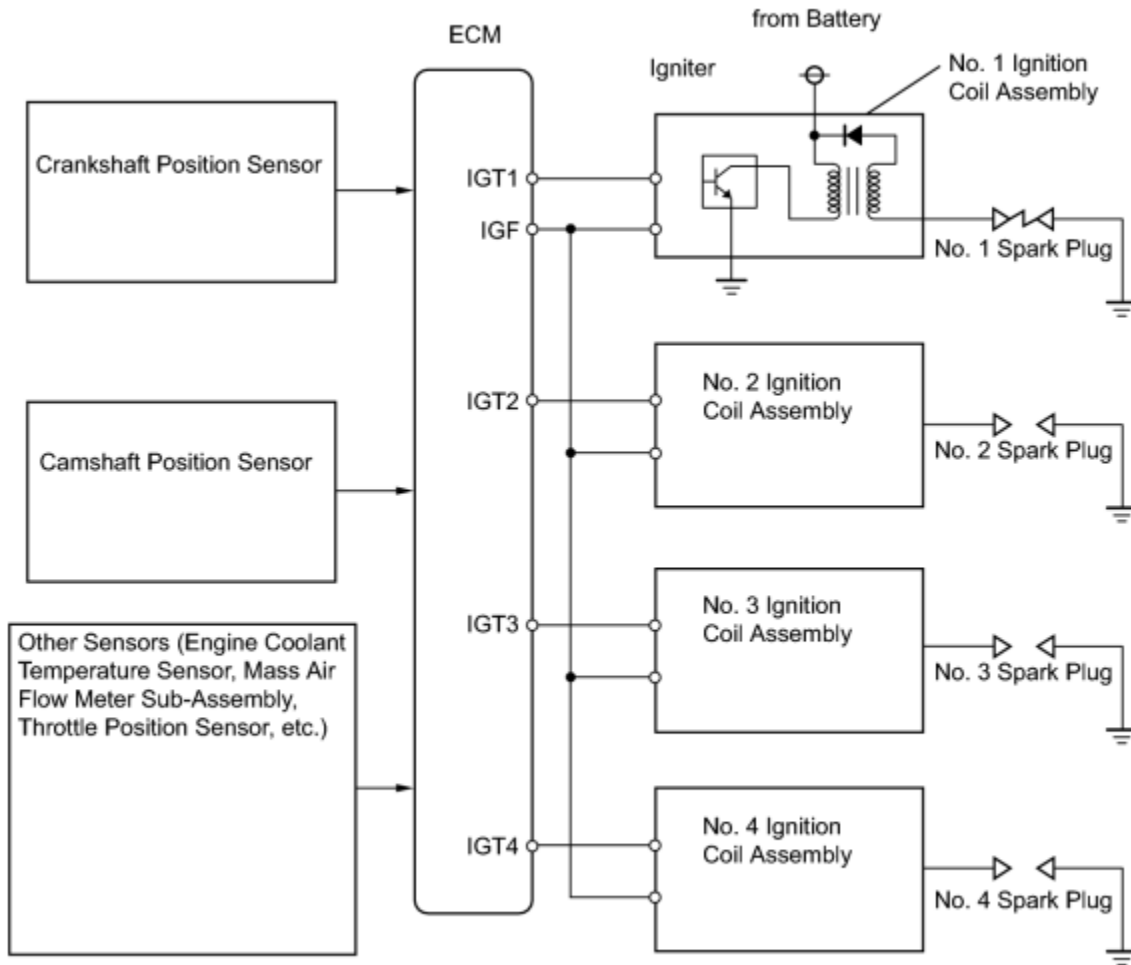

HINT:

- These DTCs indicate malfunctions relating to the primary circuit.
- If DTC P0351 is set, check the No. 1 ignition coil assembly circuit.
- If DTC P0352 is set, check the No. 2 ignition coil assembly circuit.
- If DTC P0353 is set, check the No. 3 ignition coil assembly circuit.
- If DTC P0354 is set, check the No. 4 ignition coil assembly circuit.

A Direct Ignition System (DIS) is used on this vehicle.

The DIS is an ignition system in which each cylinder is ignited by its own ignition coil assembly and spark plug. The secondary wiring of each ignition coil generates a powerful voltage which is applied directly to each spark plug. The spark passes from the center electrode of the spark plug to the ground electrode.

The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM, for each cylinder ignition.

Y

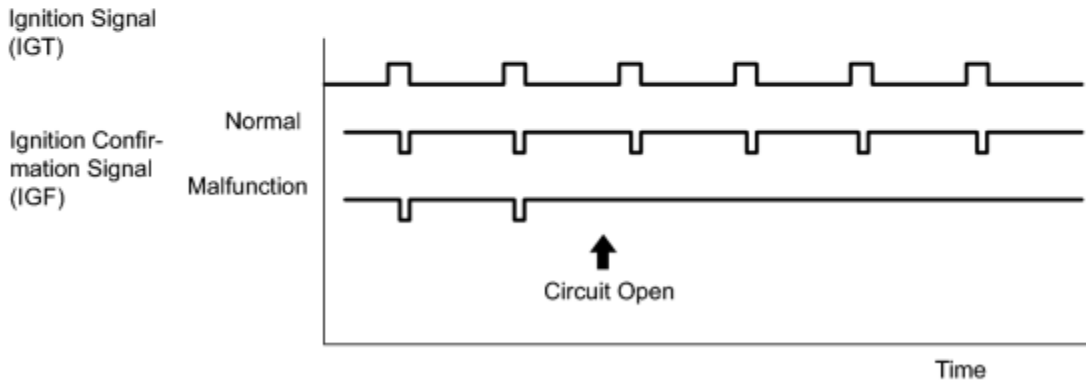

DTC No.	DTC Detection Conditions	Trouble Areas
P0351	No IGF signal to ECM while engine running (1 trip detection logic)	<ul style="list-style-type: none"> • Ignition system • Open or short in IGF or IGT circuit (1 to 4) between ignition coil assembly and ECM • No. 1 to No. 4 ignition coil assemblies • ECM
P0352		
P0353		
P0354		

- Reference: Inspection using an oscilloscope.
- While cranking or idling the engine, check the waveform between terminals IGT (1 to 4) and E1, and IGF and E1 of the ECM connector.

ECM Terminal Name	Between IGT (1 to 4) and E1 Between IGF and E1
Tester Range	2 V/DIV., 20 ms./DIV.
Condition	Idling

MONITOR DESCRIPTION

Y

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 1 second after the engine is next started.

MONITOR STRATEGY

(b) Battery voltage	6 V or more
D. All of the following conditions (c), (d) and (e) are met	-
(c) Engine speed	More than 500 rpm
(d) Battery voltage	10 V or more
(e) Number of sparks after CPU reset	5 sparks or more
Lost communication with power management control ECU (U0293)	Not detected

TYPICAL MALFUNCTION THRESHOLDS

All of the following conditions are met	Conditions A, B and C
A. Ignition signal fail counter	More than 2 times
B. Time after condition A is met	0.256 seconds or more
C. Ignition signal fail count after condition B is met	More than 2 times

COMPONENT OPERATING RANGE

Confirmed ignition signal input when ignition signal is ON to OFF	2 times
---	---------

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine.
8. Idle the engine for 10 seconds or more [B].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
10. Read the DTC [C].
11. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0351, P0352, P0353 or P0354.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

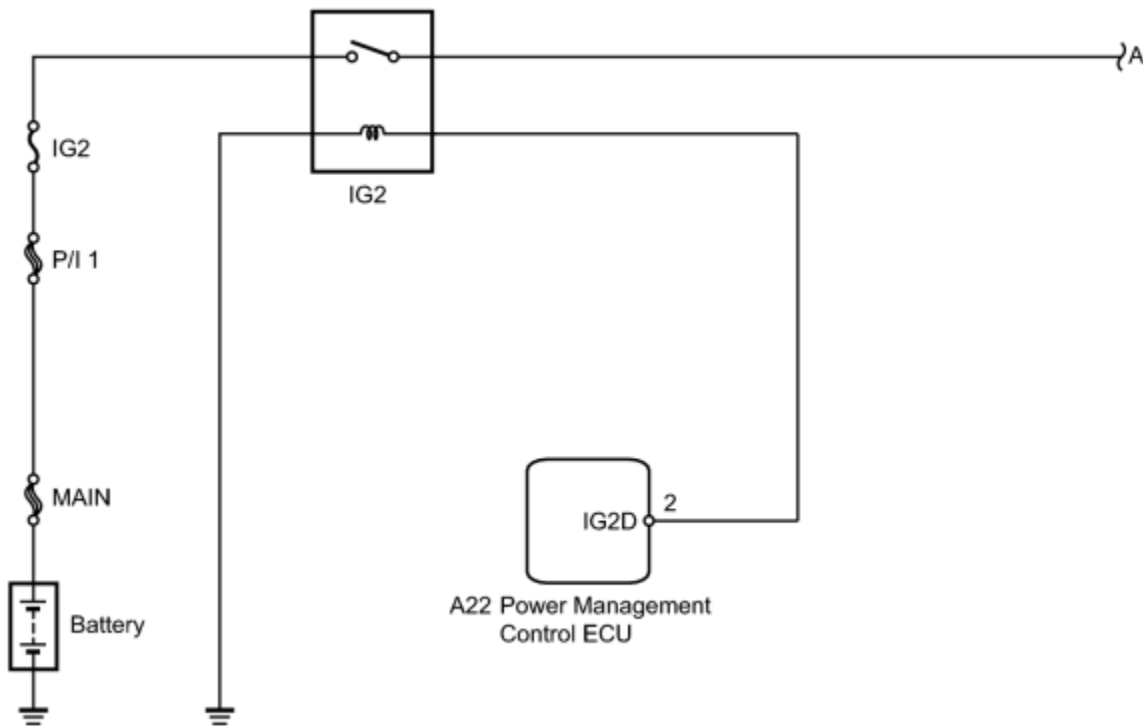

17. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

- | | |
|----|--|
| 1. | CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - BODY GROUND) |
|----|--|

(a) Disconnect the ignition coil assembly connectors.

*1

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D23-4 (GND) - Body ground	Always	Below 1 Ω
D22-4 (GND) - Body ground	Always	Below 1 Ω
D21-4 (GND) - Body ground	Always	Below 1 Ω
D20-4 (GND) - Body ground	Always	Below 1 Ω

Text in Illustration

*1	Front view of wire harness connector (to Ignition Coil Assembly)
----	---

(c) Reconnect the ignition coil assembly connectors.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (IGNITION COIL ASSEMBLY - BODY GROUND)

OK ▼

2.	INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)
----	---

(a) Disconnect the ignition coil assembly connectors.

*1

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
D23-1 (+B) - D23-4 (GND)	Power switch on (IG)	11 to 14 V
D22-1 (+B) - D22-4 (GND)	Power switch on (IG)	11 to 14 V
D21-1 (+B) - D21-4 (GND)	Power switch on (IG)	11 to 14 V
D20-1 (+B) - D20-4 (GND)	Power switch on (IG)	11 to 14 V

Text in Illustration

*1	Front view of wire harness connector (to Ignition Coil Assembly)
----	---

(d) Reconnect the ignition coil assembly connectors.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (IGNITION COIL ASSEMBLY - IG2 RELAY)

OK

3.	CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)
----	--

(a) Disconnect the ignition coil assembly connectors.

*1

*2

N

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D23-2 (IGF) - D28-23 (IGF)	Always	Below 1 Ω
D22-2 (IGF) - D28-23 (IGF)	Always	Below 1 Ω
D21-2 (IGF) - D28-23 (IGF)	Always	Below 1 Ω
D20-2 (IGF) - D28-23 (IGF)	Always	Below 1 Ω

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D23-3 (IGT1) - D28-108 (IGT1)	Always	Below 1 Ω
D22-3 (IGT2) - D28-107 (IGT2)	Always	Below 1 Ω
D21-3 (IGT3) - D28-106 (IGT3)	Always	Below 1 Ω
D20-3 (IGT4) - D28-105 (IGT4)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D23-2 (IGF) or D28-23 (IGF) - Body ground	Always	10 k Ω or higher
D22-2 (IGF) or D28-23 (IGF) - Body ground	Always	10 k Ω or higher
D21-2 (IGF) or D28-23 (IGF) - Body ground	Always	10 k Ω or higher
D20-2 (IGF) or D28-23 (IGF) - Body ground	Always	10 k Ω or higher

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D23-3 (IGT1) or D28-108 (IGT1) - Body ground	Always	10 kΩ or higher
D22-3 (IGT2) or D28-107 (IGT2) - Body ground	Always	10 kΩ or higher
D21-3 (IGT3) or D28-106 (IGT3) - Body ground	Always	10 kΩ or higher
D20-3 (IGT4) or D28-105 (IGT4) - Body ground	Always	10 kΩ or higher

4.	CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353 OR P0354)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTCs .
- (e) Shuffle arrangement of the ignition coil assemblies (among No. 1 to No. 4 cylinders).

NOTICE:

Do not shuffle the connectors.

- (f) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.
- (g) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (h) Read the DTCs.

Result:

Result	Proceed to
Same DTC output	A
Different ignition coil DTC output	B

B  REPLACE IGNITION COIL ASSEMBLY

A ▶ REPLACE ECM

DTC	P0401	Exhaust Gas Recirculation Flow Insufficient Detected
-----	-------	--

DESCRIPTION

Based on the driving conditions, the ECM regulates the volume of exhaust gas that is recirculated to the engine's combustion chambers and thus lowers the combustion temperature to reduce NOx emissions. The ECM monitors signals such as engine speed, coolant temperature, electric load, and vehicle speed. When the EGR permission conditions are fulfilled, the ECM controls the opening of the EGR valve linearly through signals to the EGR step motor.

DTC No.	DTC Detection Condition	Trouble Area
P0401	Change in intake manifold pressure is small when the EGR valve is opened and closed during idle fuel cut operation. (2 trip detection logic)	<ul style="list-style-type: none"> • EGR valve assembly • EGR passage • EGR with cooler pipe sub-assembly • Manifold absolute pressure sensor • ECM

MONITOR DESCRIPTION

The ECM monitors the pressure inside the intake manifold while opening and closing the EGR valve during fuel cut operation. If there is no change in the manifold absolute pressure sensor value, the ECM interprets this as a malfunction in the EGR valve assembly, illuminates the MIL and stores the DTC (2 trip detection logic).

MONITOR STRATEGY

Related DTC	P0401: EGR valve high flow rate / low flow rate
Required sensors / components (Main)	EGR valve assembly, manifold absolute pressure sensor
Required sensors / components (Related)	Engine coolant temperature sensor, vehicle speed sensor
Frequency of operation	Continuous
Duration	3 seconds
MIL operation	2 driving cycles
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Time after engine started	3 seconds or more
Time after engine fuel cut	2000 msec or more
Engine speed	950 to 1600 rpm
Vehicle speed	12.5 mph (20 km/h) or more

Engine speed change	-20 to 20 rpm
Time after engine load becomes stable (HVAC, Brake, Lockup)	More than 1.2 sec
Engine coolant temperature	70°C (158°F) or more
Battery voltage	11 V or more
Intake air temperature	-10°C (14°F) or more
Atmospheric pressure	76 kPa or more

TYPICAL MALFUNCTION THRESHOLDS

Manifold pressure change	Less than 1.0 kPa
At engine speed	1050 rpm

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and warm it up until the engine coolant temperature reaches 70°C (158°F) or more [B].

HINT:

The A/C switch and all accessory switches should be off and shift lever in P or N.

8. Drive the vehicle at 25 to 37 mph (40 to 60 km/h) for 5 minutes or more [C].
9. Idle the engine for 30 seconds or more [D].

10. Accelerate the vehicle to 25 to 37 mph (40 to 60 km/h) with the shift lever in B [E].
11. Perform fuel cut operation for 5 seconds or more, with the accelerator pedal fully released [F].

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

When fuel cut is operating "Idle Fuel Cut" in Data List is ON.

12. Enter the following menus: Powertrain / Engine and ECT / Monitor / Exhaust Gas Recirculation/VVT / Status2 [G].
13. Check that the Exhaust Gas Recirculation/VVT / Status2 monitor is Complete.

HINT:

If the monitor is Incomplete, perform the driving pattern again.

14. Enter the following menus: Powertrain / Engine and ECT / Monitor / Exhaust Gas Recirculation/VVT/Details.
15. Check the Details (EGR FLOW INSUFFICIENCY).

HINT:

Make sure that the value is between MIN and MAX.

16. If the monitor is still Incomplete, perform the following procedure.
17. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
18. Read Pending DTCs.
19. If a pending DTC is output, the system is malfunctioning,

HINT:

If a pending DTC is not output, perform the following procedure.

20. Enter the following menus: Power train / Engine and ECT / Utility / All Readiness.
21. Input the DTC: P0401.
22. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgement result shows NORMAL, the system is normal.
 - If the DTC judgment result is INCOMPLETE or UNKNOWN and no pending DTC is output, accelerate the vehicle again at 25 to 37 mph (40 to 60 km/h) with the shift lever in B, perform fuel cut operation for 5 seconds or more with the accelerator pedal fully released, and check the DTC judgment result.
23. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

- By using the Control the EGR Step Position Active Test, the operation of the EGR valve can be checked.
- When the engine is idling steadily with the EGR valve fully closed, if the EGR valve is normal and it is opened using the Active Test, the Data List value changes as follows.

Data List	Change in Data List when Number of Steps is Increased Using Control the EGR Step Position Active Test
Engine Speed	Idle becomes rough
MAP	Pressure rises

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P0401)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTC.

Result:

Result	Proceed to
DTC P0401 is output	A
DTC P0401 and other DTCs are output	B

B ► GO TO DTC CHART

A
▼

2. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode **INFO**.
- (e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off and shift lever in P or N.

- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.
- (g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position as follows.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling or engine stalls
MAP (Data List)	-	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

NG [▶ REPLACE EGR VALVE ASSEMBLY](#)

OK

3.	INSPECT EGR VALVE ASSEMBLY
----	----------------------------

(a) Check if the EGR valve are clogged with deposits.

(b) Check if the EGR valve is closed.

OK:

EGR valve is closed and no deposits.

Result:

Result	Proceed to
NG	A

HINT:

If the pending DTC is not output and the DTC judgment result is INCOMPLETE or UNKNOWN, drive the vehicle again at 25 to 37 mph (40 to 60 km/h) with the shift lever in B, perform fuel cut operation for 5 seconds or more with the accelerator pedal fully released, and check the DTC judgment result.

NEXT  END

DTC	P0403	Exhaust Gas Recirculation Control Circuit
-----	-------	---

DESCRIPTION

Refer to DTC P0401 INFO.

DTC No.	DTC Detection Condition	Trouble Area
P0403	Open or short in EGR valve circuit (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in EGR circuit • EGR valve assembly • ECM

HINT:

DTC P0403 is set when the power switch is on (IG).

MONITOR DESCRIPTION

This DTC is designed to detect an open or short in the EGR valve assembly circuit.

Example:

- If the EGR1, EGR2, EGR3 or EGR4 terminal output voltage is excessively low, but the step motor is still operating, the ECM determines that there is a short in the EGR valve assembly circuit, and sets the DTC.
- If the EGR1, EGR2, EGR3 or EGR4 terminal output voltage is excessively low, and the step motor is not operating, the ECM determines that there is an open in the EGR valve assembly circuit, and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0403: EGR valve circuit range check
Required sensors / components (Main)	EGR valve assembly
Required sensors / components (Related)	-
Frequency of operation	Continuous
Duration	0.5 seconds
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Engine	Running
Battery voltage	10.5 V or more

Time after power switch off to on (IG)

More than 0.5 seconds

TYPICAL MALFUNCTION THRESHOLDS

One of the following conditions is met:	Conditions A, B, C or D
A. All of the conditions are met:	Conditions 1 and 2
1. EGR1 output terminal voltage	Low voltage
2. Either of the following conditions is met:	Condition (a) or (b)
(a) Step motor	Driving
(b) EGR1	Not operating
B. All of the following conditions are met:	Conditions 3 and 4
3. EGR2 output terminal voltage	Low voltage
4. Either of the following conditions is met:	Condition (c) or (d)
(c) Step motor	Driving
(d) EGR2	Not operating
C. All of the following conditions are met:	Conditions 5 and 6
5. EGR3 output terminal voltage	Low voltage
6. Either of the following conditions is met:	Condition (e) or (f)
(e) Step motor	Driving
(f) EGR3	Not operating
D. All of the following conditions are met:	Conditions 7 and 8
7. EGR4 output terminal voltage	Low voltage
8. Either of the following conditions is met:	Condition (g) or (h)
(g) Step motor	Driving
(h) EGR4	Not operating

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine and warm it up [B].
8. Drive the vehicle at 12 mph (20 km/h) or more for 10 minutes [C].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
10. Read the DTCs [D].
11. If the DTC P0403 is output, the system is malfunction.

HINT:

If a DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P0403.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system has a normal.
15. If the test result is INCOMPLETE or UNKNOWN, drive the vehicle at 12 mph (20 km/h) or more for 10 minutes, and check the DTC judgment result.

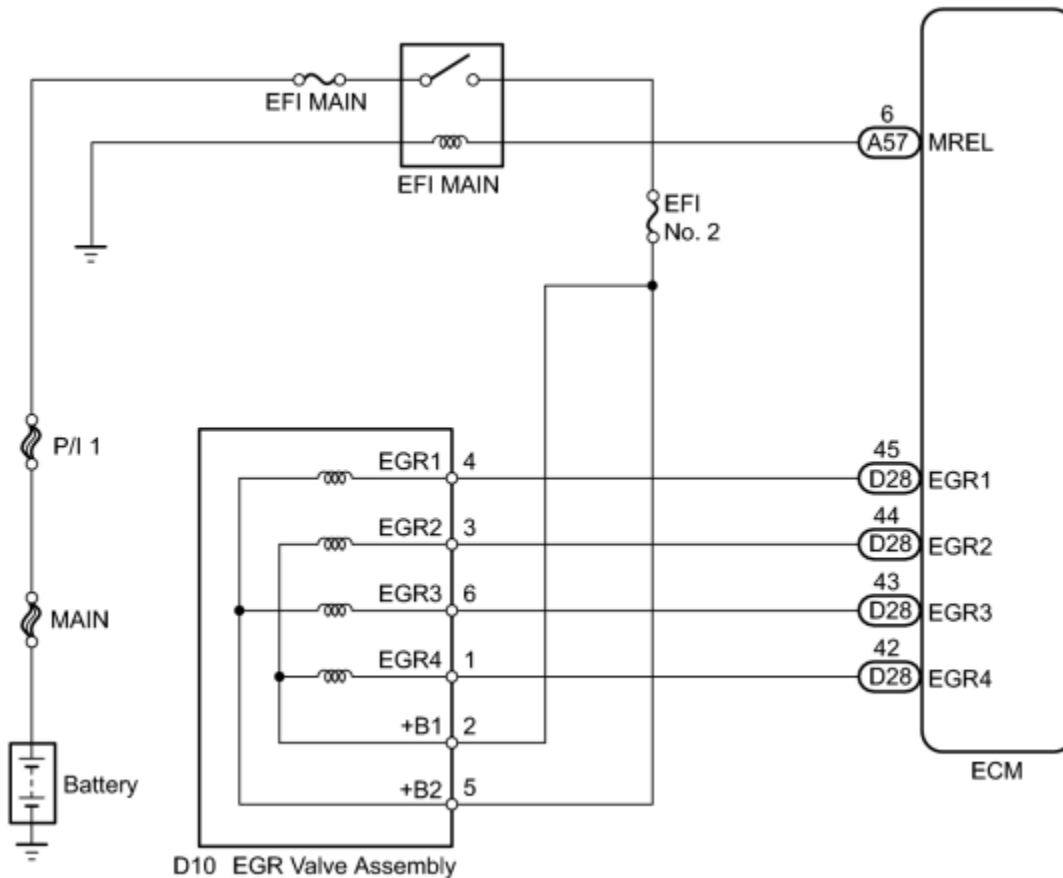

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system has a normal.
16. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Within standard range	A
Outside of standard range	B

B [INSPECT EGR VALVE ASSEMBLY](#)

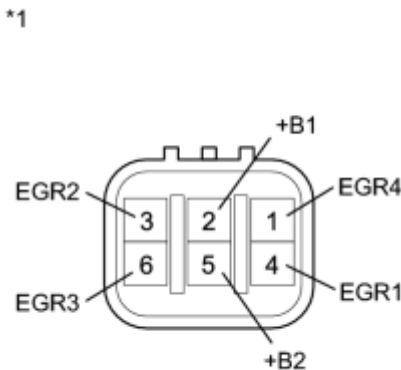

A ► CHECK FOR INTERMITTENT PROBLEMS

2. INSPECT EGR VALVE ASSEMBLY

- (a) Disconnect the EGR valve assembly connector.
- (b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B1) - 3 (EGR2)	20 °C (68 °F)	20 to 22 Ω
2 (+B1) - 1 (EGR4)		
5 (+B2) - 4 (EGR1)		
5 (+B2) - 6 (EGR3)		

Text in Illustration

*1	Component without harness connected (EGR Valve Assembly)
----	---

- (c) Reconnect the EGR valve assembly connector.

NG ► REPLACE EGR VALVE ASSEMBLY

OK

3. INSPECT EGR VALVE ASSEMBLY (+B1 OR +B2 VOLTAGE)

- (a) Disconnect the EGR valve assembly connector.
- (b) Turn the power switch on (IG).
- (c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D10-2 (+B1) - Body ground	Power switch on (IG)	11 to 14 V
D10-5 (+B2) - Body ground		

Text in Illustration

*1	Front view of wire harness connector (to EGR Valve Assembly)
----	---

(d) Reconnect the EGR valve assembly connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (EGR VALVE ASSEMBLY - EFI MAIN RELAY)

OK ↓

4. CHECK HARNESS AND CONNECTOR (ECM - EGR VALVE ASSEMBLY)

- (a) Disconnect the EGR valve assembly connector.
- (b) Disconnect the ECM connector.
- (c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D28-45 (EGR1) - D10-4 (EGR1)	Always	Below 1 Ω
D28-44 (EGR2) - D10-3 (EGR2)		
D28-43 (EGR3) - D10-6 (EGR3)		
D28-42 (EGR4) - D10-1 (EGR4)		

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D28-45 (EGR1) or D10-4 (EGR1) - Body ground	Always	10 kΩ or higher
D28-44 (EGR2) or D10-3 (EGR2) - Body ground		
D28-43 (EGR3) or D10-6 (EGR3) - Body ground		
D28-42 (EGR4) or D10-1 (EGR4) - Body ground

P0420

Catalyst System Efficiency Below Threshold (Bank 1)

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the three-way catalytic converter to monitor its efficiency.

The first sensor, the air fuel ratio sensor, sends pre-catalyst information to the ECM. The second sensor, the heated oxygen sensor, sends post-catalyst information to the ECM.

In order to detect any deterioration in the three-way catalytic converter, the ECM calculates the oxygen storage capacity of the three-way catalytic converter. This calculation is based on the voltage output of the heated oxygen sensor while performing active air fuel ratio control.

The oxygen storage capacity value is an indication of the oxygen storage capacity of the three-way catalytic converter. When the vehicle is being driven with a warm engine, active air fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air fuel ratio to lean or rich levels. If the cycle of the waveform for the heated oxygen sensor is long, the oxygen storage capacity is great. There is a direct correlation between the heated oxygen sensor and the oxygen storage capacity of the three-way catalytic converter.

The ECM uses the oxygen storage capacity value to determine the state of the three-way catalytic converter. If any deterioration has occurred, it illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0420	Oxygen storage capacity value smaller than standard value under active air fuel ratio control (2 trip detection logic)	<ul style="list-style-type: none"> • Gas leaks from exhaust system • Air fuel ratio sensor (sensor 1) • Heated oxygen sensor (sensor 2) • Front exhaust pipe assembly (TWC: Front and rear catalyst) • EGR valve assembly

HINT:

- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR RESULT

Refer to Checking Monitor Status .

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(HINT: Even if vehicle stops during driving pattern, test can be resumed)

P

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG).
3. Turn the Techstream on.
4. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
5. Turn the power switch off.
6. Turn the power switch on (IG) and turn the Techstream on.
7. Enter the following menus: Powertrain / Engine and ECT / Monitor.
8. Check that Catalyst Efficiency / Status2 is Incomplete.
9. Put the engine in inspection mode INFO.
10. Start the engine and warm it up (until the engine coolant temperature is 75°C (167°F) or higher) [A].
11. Drive the vehicle at between 47 and 75 mph (75 and 120 km/h) for at least 10 minutes or more [B].
12. Those items will change to Complete after completing the driving pattern.
13. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
14. Check if any DTCs (pending DTCs) are set.

HINT:

If Catalyst does not change to Complete, and no pending DTCs are stored, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the air fuel ratio sensor and heated oxygen sensor. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

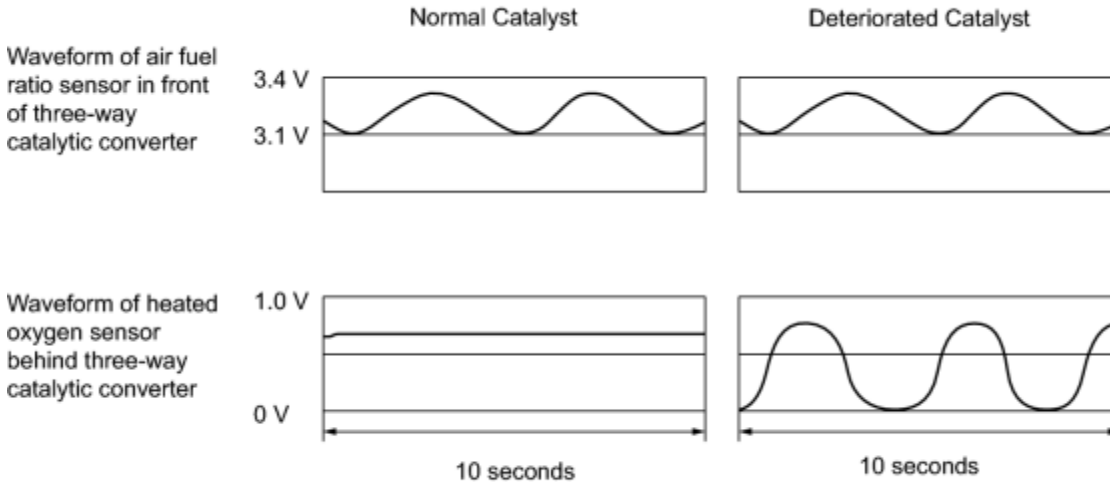

P

- (a) Connect the Techstream to the DLC3 [A].
- (b) Turn the power switch on (IG) and turn the Techstream on [B].
- (c) Put the engine in inspection mode INFO [C].
- (d) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes [D].
- (e) Run the engine at an engine speed of between 2500 rpm for at least 3 minutes [E].
- (f) While running the engine at 2500 rpm for 2 seconds and 1500 rpm for 2 seconds, check the waveforms of the air fuel ratio and heated oxygen sensors using the Techstream [F].

HINT:

- If either of the voltage outputs of the air fuel ratio or heated oxygen sensor does not fluctuate, or there is noise in the waveform of either sensor, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air fuel ratio may be extremely lean or rich. In such cases, perform the Active Test operation by entering the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
- If the three-way catalytic converter has deteriorated, the heated oxygen sensor (located behind the three-way catalytic converter) voltage output fluctuates up and down frequently, even under normal driving conditions (active air fuel ratio control is not performed).

Voltage output when active air fuel ratio control not performed

Y

INSPECTION PROCEDURE

1. AIR FUEL RATIO CONTROL

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) and turn the Techstream on.
- (c) Put the engine in inspection mode INFO.
- (d) Start the engine.
- (e) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
- (g) Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

(h) Monitor the voltage outputs of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

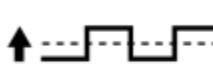

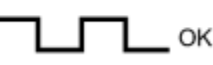

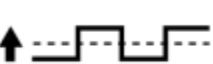

HINT:

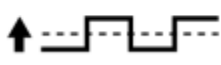

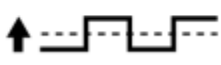

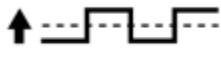

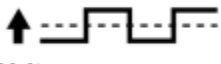

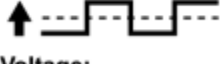

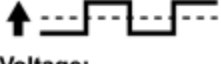

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

- Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420)
----	--

- (a) Connect the Techstream to the DLC3.

- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0420 is output	A
DTC P0420 and other DTCs are output	B

HINT:

If any DTCs other than P0420 are output, troubleshoot those DTCs first.

A
▼

2.	PERFORM ACTIVE TEST USING TECHSTREAM (AIR FUEL RATIO CONTROL)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) and turn the Techstream on.
- (c) Put the engine in inspection mode .
- (d) Start the engine and warm it up.
- (e) Run the engine at an engine speed of 2500 rpm for approximately 90 seconds.
- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
- (g) Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
- (h) Monitor the voltage outputs of the air fuel ratio sensor and heated oxygen sensor (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

- The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Standard:

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
	-12.5%	Lean	Less than 0.4 V

Result:

Status AFS Voltage B1S1	Status O2S B1S2	Air Fuel Ratio Condition and Air Fuel Ratio and Heated Oxygen Sensors Condition	Misfire	Main Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	<ul style="list-style-type: none"> ○ Three-way catalytic converter ○ Gas leaks from exhaust system 	A
Lean	Lean/Rich	Air fuel ratio sensor malfunction	-	<ul style="list-style-type: none"> ○ Air fuel ratio sensor 	B
Rich	Lean/Rich	Air fuel ratio sensor malfunction	-	<ul style="list-style-type: none"> ○ Air fuel ratio sensor 	
Lean/Rich	Lean	Heated oxygen sensor malfunction	-	<ul style="list-style-type: none"> ○ Heated oxygen sensor ○ Gas leaks from exhaust system 	C
Lean/Rich	Rich	Heated oxygen sensor malfunction	-	<ul style="list-style-type: none"> ○ Heated oxygen sensor ○ Gas leaks from exhaust system 	
Lean	Lean	Actual air fuel ratio lean	May occur	<ul style="list-style-type: none"> ○ Extremely rich or lean actual air fuel ratio ○ Gas leaks from exhaust system 	D
Rich	Rich	Actual air fuel ratio rich	-	<ul style="list-style-type: none"> ○ Extremely rich or lean actual air fuel ratio ○ Gas leaks from exhaust system 	

Lean: During Control the Injection Volume for A/F sensor, the air fuel ratio sensor output voltage (AFS Voltage) is consistently more than 3.4 V, and the heated oxygen sensor output voltage (O2S) is consistently less than 0.4 V.

Rich: During the AFS Voltage is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.

Lean/Rich: During Control the Injection Volume for A/F sensor of the Active Test, the output voltage of the heated oxygen sensor alternates correctly.

- The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

P2401	Leak detection pump stuck off				
P2402	Leak detection pump stuck on				
P2419	Vent valve stuck open (vent)				

HINT:

The 0.02 inch orifice is located inside the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System [INFO](#).

INSPECTION PROCEDURE

Refer to the EVAP System [INFO](#).

MONITOR DESCRIPTION

5 hours*1 after the power switch is turned off, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

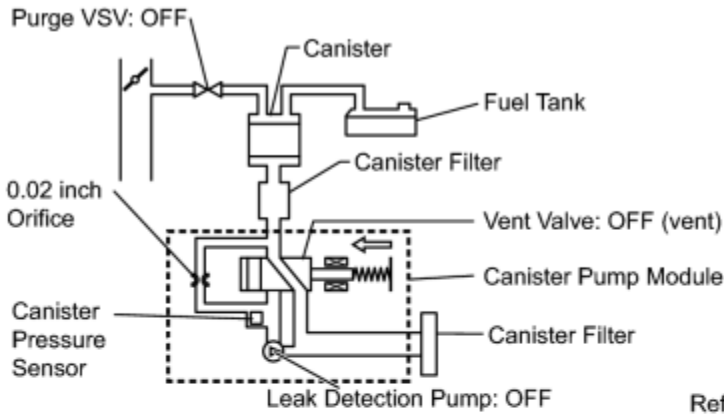

HINT:

*1: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the power switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the power switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer, 5, 7 or 9.5 hours after power switch turned off.	-
A	Atmospheric pressure measurement	Vent valve is turned off (vent) and EVAP system pressure is measured by ECM in order to register atmospheric pressure. If pressure in EVAP system is not between 70 kPa and 112 kPa (525 mmHg and 840 mmHg), ECM cancels EVAP system monitor.	60 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, leak detection pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if leak detection pump and vent valve operate normally.	360 seconds
C	EVAP system pressure measurement	Vent valve is turned on (closed) to shut EVAP system. Negative pressure (vacuum) is created in EVAP system, and EVAP system pressure is then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*2
D	Purge VSV monitor	Purge VSV is opened and then EVAP system pressure is measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	After second 0.02 inch leak pressure measurement, leak check is performed by comparing first and second 0.02 inch leak pressure standards. If stabilized system pressure is higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system is leaking.	60 seconds
F	Final check	Atmospheric pressure is measured and then monitoring result is recorded by ECM.	-

*2: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement

Operation B, E:

0.02 inch Leak Pressure Measurement

Operation C: EVAP System Pressure Measurement

Operation D: Purge VSV Monitor

c

EVAP Pressure during EVAP key-off monitor

Y

The leak detection pump creates negative pressure through the reference orifice. When the system is normal, the EVAP pressure is in 724 to 752 mmHg* and saturated within a minute.

If not, the ECM interprets this as a malfunction. The ECM will illuminate the MIL and set DTC if this malfunction is detected in consecutive driving cycle.

*: Typical value

MONITOR STRATEGY

Related DTCs	P043E: 0.02 inch reference orifice low-flow (built-in canister pump module) P043F: 0.02 inch reference orifice high-flow (built-in canister pump module) P2401: Leak detection pump stuck off P2402: Leak detection pump stuck on P2419: Vent valve stuck open (vent)
Required Sensors / Components	Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Atmospheric pressure	70 to 112 kPa (525 to 840 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Power switch	OFF
Time after key off	5, 7 or 9.5 hours
Canister pressure sensor malfunction (P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of the following conditions are met before key off:	Conditions 1 and 2
1. Duration that vehicle has been driven	5 minutes or more
2. EVAP purge operation	Performed
Engine coolant temperature	4.4 to 35°C (40 to 95°F)
Intake air temperature	4.4 to 35°C (40 to 95°F)

TYPICAL MALFUNCTION THRESHOLDS

One of the following conditions is met:	-
EVAP pressure just after reference pressure measurement start	More than -0.25 kPa (-1.875 mmHg)
Reference pressure	Less than -4.85 kPa (-36.384 mmHg)
Reference pressure	-1.057 kPa (-7.929 mmHg) or more
Reference pressure	Not saturated within 60 seconds
Difference between first reference pressure and second reference pressure	0.9 kPa (6.751 mmHg) or more

CONFIRMATION DRIVING PATTERN

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine during this operation.
- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode [A].

7. After the Evaporative System Check is completed, check for All Readiness by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
8. Read the Pending DTC [B].
9. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All readiness.
11. Input the DTC: P043E, P043F, P2401, P2402 or P2419.
12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform step [A] again.
13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 14. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
15. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

MONITOR RESULT

Refer to Checking Monitor Status .

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow

P0441	Purge VSV stuck closed	<p>After EVAP leak check is performed, purge VSV is turned on (open), and atmospheric air is introduced into EVAP system. 0.02 inch leak pressure standard is measured at the start and end of leak check.</p> <p>If pressure does not return to near atmospheric pressure, ECM determines that purge valve is stuck closed.</p>		While power switch off	2 trip
P0441	Purge flow	<p>While engine running, the following conditions are successively met:</p> <ul style="list-style-type: none"> • Negative pressure is not created in EVAP system when purge VSV is turned on (open) • EVAP system pressure change is less than 0.15 kPa (1.13 mmHg) when vent valve is turned on (closed) • Atmospheric pressure change before and after purge flow monitor is less than 0.1 kPa (0.75 mmHg) 		While power switch off	2 trip

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System .

INSPECTION PROCEDURE

Refer to the EVAP System .

MONITOR DESCRIPTION

The 2 monitors, key-off and purge flow, are used to detect malfunctions relating to DTC P0441. The key-off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours*1 after the power switch is turned off. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

5 hours*1 after the power switch is turned off, the electric leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

*1: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the power switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the power switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer, 5, 7 or 9.5 hours after power switch turned off.	-
A	Atmospheric pressure measurement	Vent valve is turned off (vent) and EVAP system pressure is measured by ECM in order to register atmospheric pressure. If pressure in EVAP system is not between 70 kPa and 112 kPa (525 mmHg and 840 mmHg), ECM cancels EVAP system monitor.	60 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, leak detection pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if leak detection pump and vent valve operate normally.	360 seconds
C	EVAP system pressure measurement	Vent valve is turned on (closed) to shut EVAP system. Negative pressure (vacuum) is created in EVAP system, and EVAP system pressure is then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*2
D	Purge VSV monitor	Purge VSV is opened and then EVAP system pressure is measured by ECM. A large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure	After a second 0.02 inch leak pressure measurement, leak check is performed by comparing first and second 0.02 inch leak pressure	60 seconds

Sequence	Operation	Description	Duration
	measurement	standards. If stabilized system pressure is higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system leaking.	
F	Final check	Atmospheric pressure is measured and then monitor result is recorded by ECM.	-

*2: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

c

(a) Purge VSV stuck open

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The EVAP system pressure is then measured by the ECM using the canister pressure sensor. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2], the ECM interprets this as the purge VSV being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Purge Stuck Open:

Y

HINT:

*: DTC P0441 may be stored if the hose between the purge VSV and canister is disconnected during evaporative emission control system operation.

(b) Purge VSV stuck closed

In operation D, the canister pressure sensor measures the EVAP (Evaporative Emission) system pressure. The pressure measurement for purge VSV monitor begins when the purge VSV is turned on (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa (2.25 mmHg) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Purge VSV Stuck Closed:

Y

2. PURGE FLOW MONITOR

The purge flow monitor consists of the 2 step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

EVAP Pressure During Purge Flow Monitor:

Y

- The 1st monitor

While the engine is running and the purge VSV is on (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.

- The 2nd monitor

The vent valve is turned on (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa (3.75 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

MONITOR STRATEGY

Techstream Display	Description
	memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [B] and [D].
25. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
26. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
27. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs INFO.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

MONITOR RESULT

Refer to Checking Monitor Status INFO.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0441)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.

(d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(e) Read the DTC.

Result:

Result	Proceed to
DTC P0441 is output	A
DTC P0441 and other DTCs are output	B

B ► GO TO DTC CHART

A
▼

2.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

B ► GO TO EVAP SYSTEM

A
▼

3.	INSPECT EGR VALVE ASSEMBLY
----	----------------------------

(a) Remove the EGR valve assembly INFO.

(b) Check if the EGR valve is stuck open.

OK:

EGR valve is tightly closed.

(c) Reinstall the EGR valve assembly INFO.

NG ► REPLACE EGR VALVE ASSEMBLY

OK ► GO TO EVAP SYSTEM

DESCRIPTION

HINT:

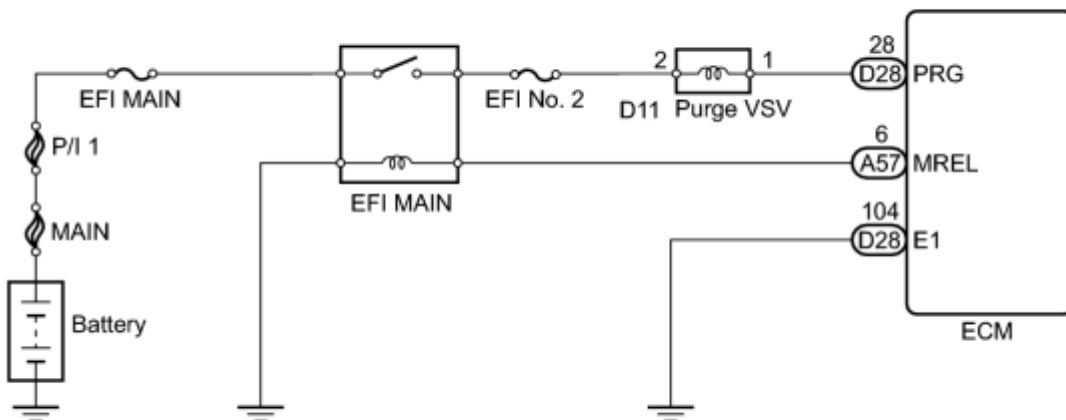

This DTC P0443 is applicable to Mexico models only.

To reduce hydrocarbons (HC) emissions, evaporated fuel from the fuel tank is routed through the canister to the intake manifold for combustion in the cylinders.

The ECM changes the duty signal to the purge VSV so that the intake quantity of hydrocarbons (HC) emissions is appropriate for the driving conditions (engine load, engine speed, vehicle speed, etc.) after the engine is warmed up.

DTC No.	DTC Detection Condition	Trouble Area
P0443	<p>All of the following conditions (a) and (b) are met (1 trip detection logic)</p> <p>(a) The target control value and actual control value do not match for 10 seconds or more.</p> <p>(b) The target control value and actual control value is detected 80 times or more</p>	<ul style="list-style-type: none"> • Open or short in purge VSV circuit • Purge VSV • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. PERFORM ACTIVE TEST USING TECHSTREAM (PURGE VSV)

(a) Connect the Techstream to the DLC3.

(b) Remove the canister side vacuum hose from the purge VSV.

(c) Turn the power switch on (IG) and turn the Techstream on.

(d) Put the engine in inspection mode **INFO**.

(e) Start the engine.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Activate the VSV for Evap Control.

(g) Check if air is sucked into the port when operating the purge VSV using the Techstream.

OK:

Techstream Operation	Specified Condition
Purge VSV is on	Suction of air
Purge VSV is off	No suction of air

NG [INSPECT PURGE VSV](#)

OK **CHECK FOR INTERMITTENT PROBLEMS**

2. INSPECT PURGE VSV

(a) Inspect the purge VSV INFO.

NG ▶ REPLACE PURGE VSV

OK

3.	INSPECT PURGE VSV (POWER SOURCE)
----	----------------------------------

*1

(a) Disconnect the purge VSV connector.

N

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D11-2 - Body ground	Power switch on (IG)	11 to 14 V

Text in Illustration

*1	Front view of wire harness connector (to Purge VSV)
----	--

(d) Reconnect the purge VSV connector.

HINT:

The canister pressure sensor is built into the canister pump module.

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System .

MONITOR DESCRIPTION

Canister Pressure Sensor Specification:

HINT:

Standard atmospheric pressure is 101.3 kPa

1. DTC P0451: Canister pressure sensor abnormal voltage fluctuation

If the canister pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as the canister pressure sensor voltage fluctuating, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.

(Malfunction is detected by 2 trip detection logic.)

2. DTC P0452: Canister pressure sensor voltage low

If the canister pressure sensor voltage output (pressure) is below 0.45 V (42.11 kPa (316 mmHg)), the ECM interprets this as an open or short circuit in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

3. DTC P0453: Canister pressure sensor voltage high

If the canister pressure sensor voltage output (pressure) is 4.9 V (123.761 kPa (928.5 mmHg)) or more, the ECM interprets this as an open or short circuit in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

CONFIRMATION DRIVING PATTERN

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine during this operation.
- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Enter the following menus: Powertrain / Engine and ECT / Data List / Intake Air.
4. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
5. Turn the power switch off and wait for 30 seconds.
6. Turn the power switch on (IG) and turn the Techstream on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode [A].
8. After the Evaporative System Check is completed, check for All Readiness by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
9. Read the pending DTC [B].

10. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

11. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

12. Input the DTC: P0451, P0452 or P0453.

13. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [A] again.

14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

15. Check the judgment result.

HINT:

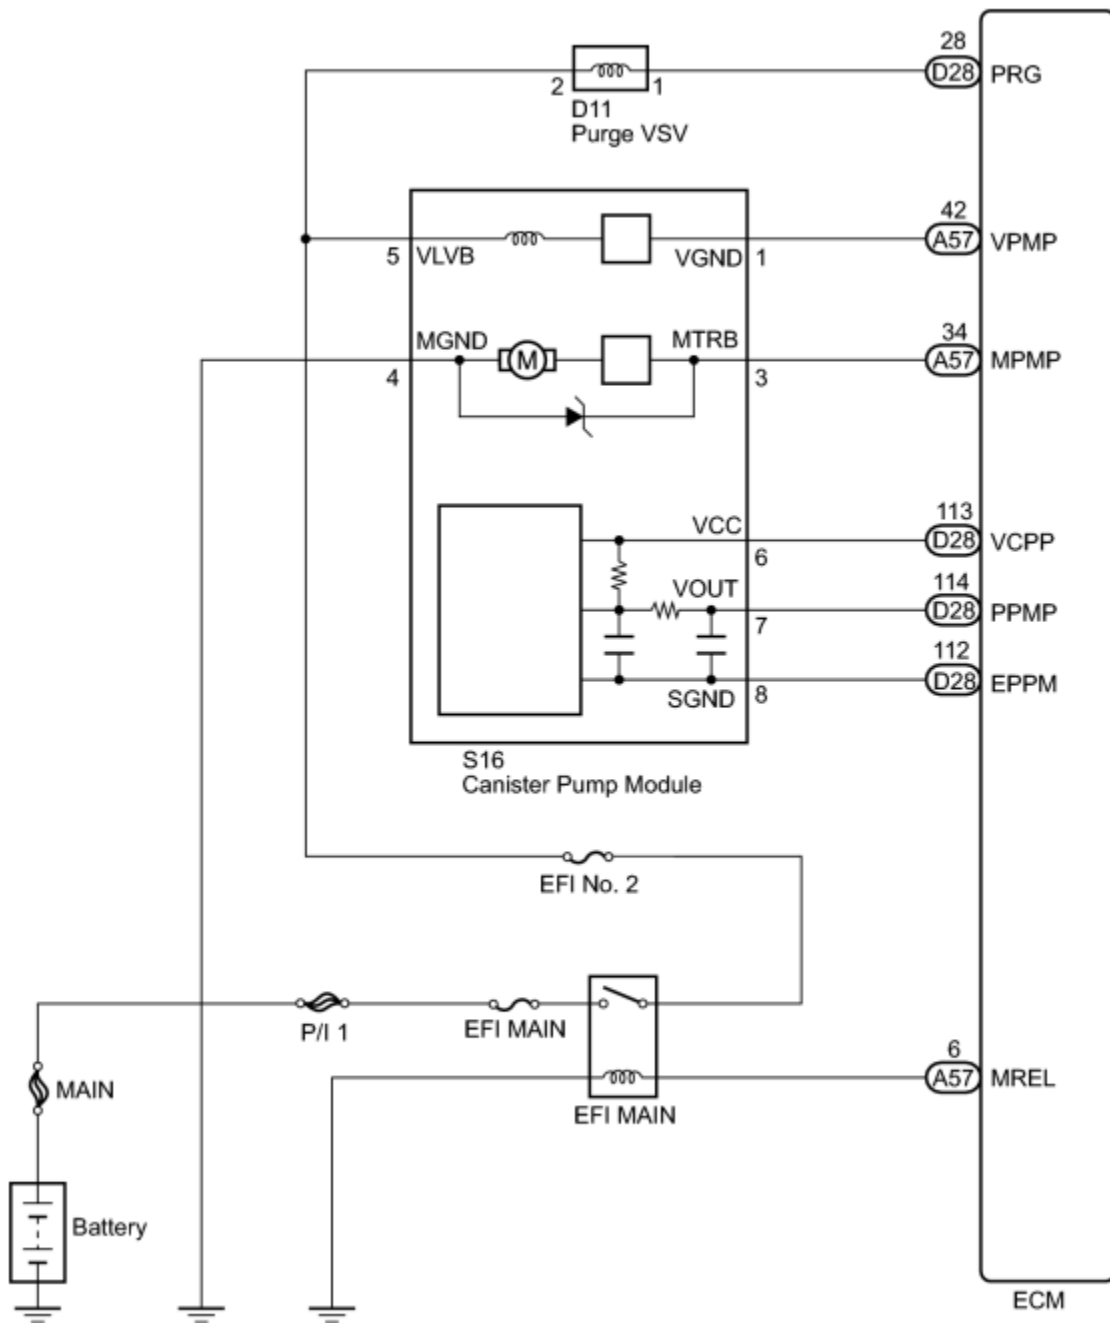

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

16. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

c

INSPECTION PROCEDURE

NOTICE:

- When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel cap.
- Do not disassemble the canister pump module.

- The Techstream is required to conduct the following diagnostic troubleshooting procedure.

PROCEDURE

1.	CONFIRM DTC AND EVAP PRESSURE
----	-------------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) (do not start the engine).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.
- (f) Enter the following menus: Powertrain / Engine / Data List / Vapor Pressure Pump.
- (g) Read the EVAP (Evaporative Emission) pressure displayed on the Techstream.

Result:

Display (DTC Output)	Test Result	Suspected Trouble Area	Proceed to
P0451	-	Canister pressure sensor	C
P0452	Less than 45 kPa (338 mmHg)	<ul style="list-style-type: none"> • Wire harness/connector (ECM - canister pressure sensor) • Canister pressure sensor • Short in ECM circuit 	A
P0453	More than 120 kPa (900 mmHg)	<ul style="list-style-type: none"> • Wire harness/connector (ECM - canister pressure sensor) • Canister pressure sensor • Open in ECM circuit 	B

C ▶ GO TO EVAP SYSTEM

B ▶ [CHECK HARNESS AND CONNECTOR \(CANISTER PUMP MODULE - ECM\)](#)

A
▼

2.	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)
----	--

- (a) Turn the power switch off.

*1

N

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Front view of wire harness connector (to ECM)

P0456	EVAP small leak	<p>Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure is measured. 0.02 inch leak pressure standard measured at start and end of leak check.</p> <p>If stabilized pressure is higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system has a small leak.</p>		While power switch off	2 trip

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System [INFO](#).

INSPECTION PROCEDURE

Refer to the EVAP System [INFO](#).

MONITOR DESCRIPTION

5 hours*1 after the power switch is turned off, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

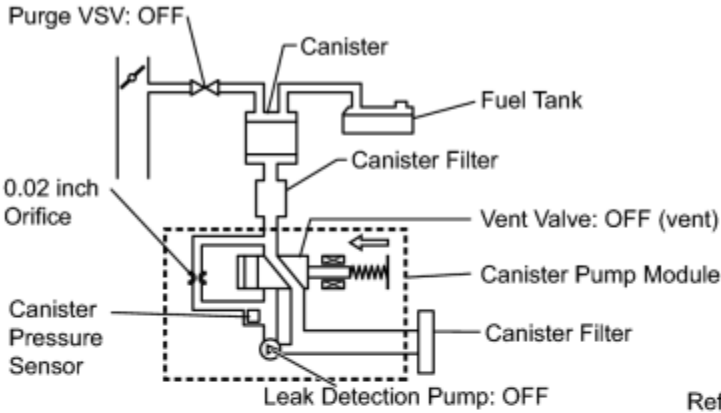

HINT:

*1: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the power switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the power switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer, 5, 7 or 9.5 hours after power switch is turned off.	-
A	Atmospheric pressure measurement	Vent valve is turned off (vent) and EVAP system pressure is measured by ECM in order to register atmospheric pressure. If pressure in EVAP system is not between 70 kPa and 112 kPa (525 mmHg and 840 mmHg), ECM cancels EVAP system monitor.	60 seconds
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, leak detection pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if leak detection pump and vent valve operate normally.	360 seconds
C	EVAP system pressure measurement	Vent valve is turned on (closed) to shut EVAP system. Negative pressure (vacuum) is created in EVAP system, and EVAP system pressure is then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*2
D	Purge VSV monitor	Purge VSV is opened and then EVAP system pressure is measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	After second 0.02 inch leak pressure measurement, leak check is performed by comparing first and second 0.02 inch leak pressure standards. If stabilized system pressure is higher than second 0.02 inch leak pressure standard, ECM determines that EVAP system is leaking.	60 seconds
F	Final check	Atmospheric pressure is measured and then monitoring result is recorded by ECM.	-

*2: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement

Operation C: EVAP System Pressure Measurement

Operation B, E:

0.02 inch Leak Pressure Measurement

Operation D: Purge VSV Monitor

c

1. P0455: EVAP (Evaporative Emission) gross leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second 0.02 inch leak pressure standard x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leak, illuminates the MIL and sets the DTC (2 trip detection logic).

2. P0456: EVAP very small leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than second 0.02 inch leak pressure standard, the ECM determines that the EVAP system has a small leak, illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when EVAP System Leaks:

Monitor runs whenever following DTCs are not present	None
Atmospheric pressure	70 to 112 kPa (525 to 840 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Power switch	OFF
Time after key off	5, 7 or 9.5 hours
Canister pressure sensor malfunction (P0452 and P0453)	Not detected

Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of the following conditions are met before key off:	Conditions 1 and 2
1. Duration that vehicle has been driven	5 minutes or more
2. EVAP purge operation	Performed
Engine coolant temperature	4.4 to 35°C (40 to 95°F)
Intake air temperature	4.4 to 35°C (40 to 95°F)

TYPICAL MALFUNCTION THRESHOLDS

P0455: EVAP gross leak

EVAP pressure when vacuum introduction is complete	Higher than reference pressure x 0.2
--	--------------------------------------

P0456: EVAP 0.02 inch leak

EVAP pressure when vacuum introduction is complete	Between reference pressure and reference pressure x 0.2
--	---

CONFIRMATION DRIVING PATTERN

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.

- Do not run the engine during this operation.
- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode [A].
7. After the Evaporative System Check is completed, check for All Readiness by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
8. Read the pending DTC [B].
9. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
11. Input the DTC: P0455 or P0456.
12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal

INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform step [A] again.
13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 14. Check the judgment result.

HINT:

- If the judgment result shows **ABNORMAL**, the system has a malfunction.
 - If the judgment result shows **NORMAL**, the system is normal.
15. If the test result is **INCOMPLETE** or **UNKNOWN** and no pending DTC is output, perform a universal trip and check for permanent DTCs **INFO**.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

MONITOR RESULT

Refer to Checking Monitor Status **INFO**.

DTC

P0505

Idle Control System Malfunction

DESCRIPTION

The idle speed is controlled by the electronic throttle control system. The electronic throttle control system is comprised of: 1) the one valve type throttle body; 2) a throttle actuator, which operates the throttle valve; 3) a throttle position sensor, which detects the opening angle of the throttle valve; 4) an accelerator pedal position sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the electronic throttle control system. Based on the target idle speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC No.	DTC Detection Condition	Trouble Area
P0505	Idling speed continues to vary greatly from target idling speed (2 trip detection logic)	<ul style="list-style-type: none"> • Electronic throttle control system • Intake system • PCV hose connections • EGR valve assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the idle speed and idle air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the idle speed control system is malfunctioning if the following conditions apply:

- The learned idle air flow volume remains at the maximum or minimum volume for 5 seconds or more during a drive cycle.
- After driving at a vehicle speed of 34.175 mph (55 km/h) or more, the actual engine idle speed varies from the target idle speed by less than -100 rpm or 150 rpm or more, 5 times or more during a driving cycle, the ECM illuminates the MIL and sets the DTC.

Engine	Running

TYPICAL MALFUNCTION THRESHOLDS

Either of the following conditions is met	Condition 1 or 2
1. Frequency that both of the following conditions (a) and (b) are met	5 times or more
(a) Engine rpm - Target engine rpm	Less than -100 rpm, or 150 rpm or more
(b) Vehicle condition	Stop after vehicle was driven at 34.375 mph (56 km/h) or more
2. Frequency that both of the following conditions (a) and (b) are met	Once
(a). Engine rpm - Target engine rpm	Less than -100 rpm, or 150 rpm or more
(b) Idle air control flow rate learning valve	0.5 L/sec or less, or 6.1 L/sec or more

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.
4. Make sure that the coolant temperature is 60°C (140°F) or less [A].

HINT:

If the coolant temperature is 60°C (140°F) or more, the engine may stop when idling. Make sure to keep the coolant temperature at 60°C (140°F) or less during the driving pattern.

5. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
6. Put the engine in inspection mode INFO.
7. Start the engine and drive the vehicle until the coolant temperature reaches 70°C (158°F) [B].
8. Stop the vehicle (0 mph (0 km/h)) [C].
9. Accelerate the vehicle to 34 to 37 mph (55 to 60 km/h) or more, and then idle the engine [D].

HINT:

If the vehicle speed reaches more than 37 mph (60 km/h), the engine may stop while decelerating.

10. Stop the vehicle (0 mph (0 km/h)) [E].
11. Repeat steps [D] and [E] for 5 times or more.
12. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
13. Read the pending DTC [F].
14. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Input the DTC: P0505.

17. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, repeat steps [D] and [E] for 5 times or more.

18. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

19. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

20. If the test result is INCOMPLETE or UNKNOWN, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If a permanent DTC is not output, the system is normal.

INSPECTION PROCEDURE

HINT:

- The following conditions may also cause DTC P0505 to be set:
 - a. The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.
 - b. The accelerator pedal being not fully released.

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P0505 is output	A
DTC P0505 and other DTCs are output	B

HINT:

If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B ▶ GO TO DTC CHART

A
▼

2.	CHECK PCV HOSE CONNECTIONS
----	----------------------------

- (a) Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG ▶ REPAIR OR REPLACE PCV HOSE

OK
▼

3.	CHECK INTAKE SYSTEM
----	---------------------

- (a) Check the intake system for vacuum leaks INFO.

OK:

No leaks from the intake system.

NG ► REPAIR OR REPLACE INTAKE SYSTEM

OK

4.	INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)
----	--

(a) Check for contamination between the throttle valve and the housing and then check that the throttle valve moves smoothly.

OK:

Throttle valve is not contaminated with foreign objects and moves smoothly.

NG ► REPLACE THROTTLE BODY ASSEMBLY

OK

5.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

B ► [REPLACE ECM](#)

A
▼

6.	INSPECT EGR VALVE ASSEMBLY
----	----------------------------

(a) Remove the EGR valve assembly INFO.

(b) Check if the EGR valve is stuck open.

OK:

EGR valve is tightly closed.

(c) Reinstall the EGR valve assembly INFO.

NG ► REPLACE EGR VALVE ASSEMBLY

OK
▼

7.	REPLACE ECM
----	-------------

(a) Replace the ECM INFO.

NEXT

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTC .
- (e) Turn the power switch off and wait for 30 seconds.
- (f) Turn the power switch on (IG) and turn the Techstream on.
- (g) Put the engine in inspection mode .
- (h) Start the engine and warm it up.
- (i) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.
- (j) Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
- (k) Input the DTC: P0505.
- (l) Check the DTC judgment result.

NEXT  **END**

DTC	P050A	Cold Start Idle Air Control System Performance
-----	-------	--

MONITOR DESCRIPTION

This monitor will run when the engine is started at an engine coolant temperature of -10 to 50°C (14 to 122°F). The DTC can be set after the engine idles for 13 seconds (2 trip detection logic).

The DTC is designed to monitor the idle air control at cold start. When the engine is started at an engine coolant temperature of lower than 50°C (122°F), the ECM measures the accumulated mass air flow at idle. If it does not reach the specified level within 10 seconds, the ECM interprets this as a malfunction. The MIL is illuminated and a DTC is set when the malfunction is detected in consecutive driving cycles (2 trip detection logic).

The electronic throttle control system controls the idle speed. The electronic throttle control system operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idle speed.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the idle speed control (ISC) learned values are cleared. Idle speed control learning needs to be performed before this DTC can be stored. To perform idle speed control learning, the engine must be warmed up by allowing it to idle for 5 minutes. For idle speed control learning to be successful, when the engine is started to warm it up, there must be at least 10 seconds of idling with the coolant temperature below 50°C (122°F) before allowing it to continue running for the 5 minute learning period.

HINT:

The idle speed control learning is performed when the engine is warmed up and has been idling for 5 minutes.

P050A Detection Logic:

DTC No.	DTC Detection Condition	Trouble Area
P050A	Insufficient mass air flow at cold start (2 trip detection logic)	<ul style="list-style-type: none"> • Throttle body assembly • Mass air flow meter sub-assembly • PCV system • Air cleaner filter element sub-assembly • Intake system • VVT system • EGR valve assembly • ECM

MONITOR STRATEGY

Related DTCs	P050A: Idle speed control problem at cold
Required Sensors/Components (Main)	Mass air flow meter sub-assembly
Required Sensors/Components (Related)	Engine coolant temperature sensor, throttle position sensor, vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

Battery voltage	8 V or more
Time after engine start	0 second or more
Starter	OFF
Engine coolant temperature at engine start	-10°C (14°F) or more
Engine coolant temperature	-10 to 50°C (14 to 122°F)
Engine idling time	3 second or more
Fuel-cut	OFF
Vehicle speed	Less than 37.5 mph (60 km/h)
Atmospheric pressure	76 kPa (570 mmHg) or more

TYPICAL MALFUNCTION THRESHOLDS

Accumulated mass air flow

Less than 42.5 g (varies with engine coolant temperature)

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.
7. Check that "Coolant Temp" in the Data List is within the range of -10 to 50°C (14 to 122°F).
8. Put the engine in inspection mode INFO.
9. Start the engine and warm it up until the coolant temperature is the same as the coolant temperature in the freeze frame data.
10. Idle the engine for 1 minute or more [B].
11. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
12. Read the pending DTC [C].
13. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
15. Input the DTC: P050A.
16. Check the DTC judgment result.

Techstream Display	Description
NORMAL	○ DTC judgment completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, idle the engine for 3 minutes, let the engine cool down, and then perform steps [A] through [B].

17. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

18. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

19. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P050A)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P050A is output	A
DTC P050A and other DTCs are output	B

HINT:

If any DTCs other than P050A are output, troubleshoot those DTCs first.

B ► GO TO DTC CHART

A
▼

2.	READ VALUE USING TECHSTREAM (FUEL TRIM)
----	---

HINT:

Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter sub-assembly.

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Data List / Short FT #1 and Long FT #1.
- (e) Read the values displayed on the Techstream.
- (f) Add together the Short FT #1 and Long FT #1 values to obtain the total Fuel Trim.

OK:

Total of Short FT #1 and Long FT #1 values is between -20% and 20%.

NG ► [CHECK PCV HOSE](#)

OK
▼

3. INSPECT THROTTLE BODY ASSEMBLY

(a) Check that there are no deposits around the throttle valve.

OK:

No deposits around the throttle valve.

NG [▶ REPAIR OR REPLACE THROTTLE BODY ASSEMBLY](#)

OK

4. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR VALVE STEP POSITION)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling	Steady idling	Idling changes from steady to rough idling

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
condition		
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

NEXT  **END**

DTC

P050B

Cold Start Ignition Timing Performance

DESCRIPTION

This monitor will run when the engine is started at -10 to 50°C (14 to 122°F) of the engine coolant temperature. The DTC can be set after the engine idles for 13 seconds or more (2 trip detection logic).

The DTC is designed to monitor the idle air control at cold start. When the engine is started at lower than 50°C (122°F) of the engine coolant temperature, the ECM measures the accumulated mass air flow at idle. If it does not reach the criteria within 10 seconds, the ECM interprets this as a malfunction. The MIL is illuminated and a DTC is set when the malfunction is detected in consecutive driving cycles (2 trip detection logic).

The electronic throttle control system controls the idle speed. The electrical throttle control system operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idle speed.

NOTICE:

When the negative (-) battery terminal is disconnected during inspection or repairs, the idle speed control learned values are cleared. Idle speed control learning is performed when the engine has been warmed up and idled for 5 minutes because this DTC cannot be set after the idle speed control learned values are cleared.

DTC No.	DTC Detection Condition	Trouble Area
P050B	Ignition timing retard value insufficient for 5 seconds or more for 10 seconds of P050A monitoring duration at cold start (2 trip detection logic)	<ul style="list-style-type: none"> • Throttle body assembly • Mass air flow meter sub-assembly • Intake system • PCV hose connections • VVT system • Air cleaner filter element sub-assembly • EGR valve assembly • ECM

TYPICAL MALFUNCTION THRESHOLDS

Accumulated time when ignition timing retard is cut off	5 seconds or more
---	-------------------

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.
7. Check that "Coolant Temp" in the Data List is within the range of -10 to 50°C (14 to 122°F).
8. Put the engine in inspection mode INFO.
9. Start the engine and warm it up until the coolant temperature is the same as the coolant temperature in the freeze frame data.
10. Idle the engine for 1 minute or more [B].
11. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
12. Read the pending DTC [C].
13. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
15. Input the DTC: P050B.
16. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal

Techstream Display	Description
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, idle the engine for 3 minutes, let the engine cool down, and then perform steps [A] through [B].
17. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
18. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
19. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

- DTC P050B may be set when the engine shows the symptom as listed below. If necessary, check the trouble area as listed below.

Symptom	Factor	Trouble Area
Low idle speed at engine cold.	Excessive engine friction	Engine oil deterioration
Rough idle at engine cold.	Abnormal combustion	Fuel quality

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P050B)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following the menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P050B is output	A
DTC P050B and other DTCs are output	B

HINT:

If any DTCs other than P050B are output, troubleshoot those DTCs first.

 GO TO DTC CHART

A

2. READ VALUE USING TECHSTREAM (FUEL TRIM)

HINT:

Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter sub-assembly.

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) and turn the Techstream on.
- (c) Put the engine in inspection mode .
- (d) Start the engine.
- (e) Enter the following menus: Powertrain / Engine and ECT / Active Test / Short FT #1 and Long FT #1.
- (f) Read the values displayed on the Techstream at engine idle.
- (g) Add together the Short FT #1 and Long FT #1 values to obtain the total fuel trim.

OK:

Total of Short FT #1 and Long FT #1 values is between -20 % and 20 %.

NG ▶ [CHECK PCV HOSE \(HOSE CONNECTIONS\)](#)

OK

3.	CHECK THROTTLE BODY ASSEMBLY
----	------------------------------

(a) Check for deposits around the throttle valve and throttle valve condition.

OK:

No deposits around throttle valve and throttle valve moves smoothly.

NG ▶ [REPAIR OR REPLACE THROTTLE BODY ASSEMBLY](#)

OK

4.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)
---	--

	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

8.	CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED (DTC P050B)
----	--

NOTICE:

In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTCs .
- (e) Turn the power switch off and wait for 30 seconds.
- (f) Turn the power switch on (IG) and turn the Techstream on.
- (g) Put the engine in inspection mode .
- (h) Start the engine and warm it up.
- (i) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.
- (j) Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
- (k) Input the DTC: P050B.
- (l) Check the DTC judgment result.

NEXT  END

9.	CHECK PCV HOSE (HOSE CONNECTIONS)
----	-----------------------------------

- (a) Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG  [REPAIR OR REPLACE PCV HOSE](#)

OK

10.	CHECK INTAKE SYSTEM
-----	---------------------

- (a) Check the intake system for vacuum leaks .

OK:

No leaks in intake system.

NG ► [REPAIR OR REPLACE INTAKE SYSTEM](#)

OK

11. CHECK AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

(a) Visually check that the air cleaner filter element sub-assembly is not excessively contaminated with dirt or oil.

OK:

Air cleaner filter element sub-assembly is not excessively contaminated with dirt or oil.

NG ► [REPLACE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY](#)

OK

12. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

B [PERFORM ACTIVE TEST USING TECHSTREAM \(OPERATE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY\)](#)

A
▼

13.	INSPECT EGR VALVE ASSEMBLY
-----	----------------------------

(a) Remove the EGR valve assembly .

(b) Check if the EGR valve is stuck open.

OK:

EGR valve is tightly closed.

(c) Reinstall the EGR valve assembly .

NG [REPLACE EGR VALVE ASSEMBLY](#)

OK
▼

14.	PERFORM ACTIVE TEST USING TECHSTREAM (OPERATE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY)
-----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine.

(f) Turn the Techstream on.

(g) Warm up the engine.

(h) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1).

(i) Check the engine speed while operating the camshaft timing oil control valve assembly using the Techstream.

Result:

Techstream Operation	Specified Condition
OFF	Normal engine speed
ON	Engine idles roughly or stalls (soon after camshaft timing oil control valve assembly switched from OFF to ON)

HINT:

If the result is not acceptable, cool the engine and perform the Active Test again.

(j) Start the engine when the engine coolant temperature is 30°C (86°F) or less.

(k) Turn the Techstream on.

(l) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1).

(m) Check the engine speed while operating the camshaft timing oil control valve assembly using the Techstream with the engine coolant temperature at 50°C (122°F) or less.

Result:

Techstream Operation	Specified Condition
OFF	Normal engine speed
ON	Engine idles roughly or stalls (soon after camshaft timing oil control valve assembly switched from OFF to ON)

NG  [CHECK AND REPAIR VVT SYSTEM](#)

OK

15.	REPLACE MASS AIR FLOW METER SUB-ASSEMBLY
-----	--

(a) Replace the mass air flow meter sub-assembly .

(a) Check and repair the VVT system.

NEXT

21. CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED (DTC P050B)

NOTICE:

In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs INFO.

(e) Turn the power switch off and wait for 30 seconds.

(f) Turn the power switch on (IG) and turn the Techstream on.

(g) Put the engine in inspection mode INFO.

(h) Start the engine and warm it up.

(i) Drive the vehicle in accordance with the driving pattern described in the Confirmation Driving Pattern.

(j) Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

(k) Input the DTC: P050B.

(l) Check the DTC judgment result.

NEXT ▶ END

DTC	P0560	System Voltage
-----	-------	----------------

MONITOR DESCRIPTION

The battery supplies electricity to the ECM even when the power switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. The next time the engine is started, the ECM illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0560	Open in ECM back up power source circuit (1 trip detection logic)	<ul style="list-style-type: none"> • Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

HINT:

If DTC P0560 is set, the ECM does not store other DTCs or the data stored in the ECM may be partly cleared.

MONITOR STRATEGY

Related DTCs	P0560: ECM system voltage
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediately (MIL illuminated after next engine start)
Sequence of Operation	None

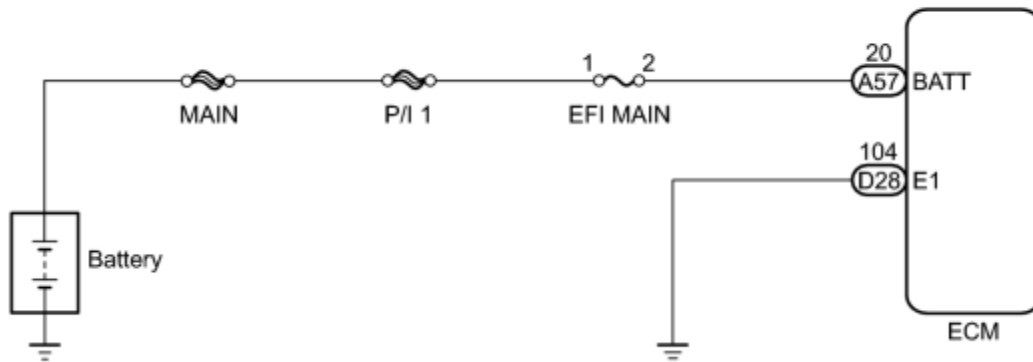

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
--	------

TYPICAL MALFUNCTION THRESHOLDS

ECM power source	Less than 3.5 V
------------------	-----------------

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Wait 5 seconds or more [A].
7. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
8. Read the DTC [B].
9. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

11. Input the DTC: P0560.

12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [A] again.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

14. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

15. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK HARNESS AND CONNECTOR (ECM - EFI MAIN FUSE)
----	---

(a) Disconnect the negative battery terminal.

(b) Disconnect the positive battery terminal.

(c) Remove the EFI MAIN fuse from the engine room relay block.

(d) Disconnect the ECM connector.

(e) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) - A57-20 (BATT)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) or A57-20 (BATT) - Body ground	Always	10 kΩ or higher

Text in Illustration

*1	Engine Room Relay Block	*2	Front view of wire harness connector (to ECM)
----	-------------------------	----	--

- (f) Reinstall the EFI MAIN fuse.
- (g) Reconnect the ECM connector.
- (h) Reconnect the positive battery terminal.
- (i) Reconnect the negative battery terminal.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - EFI MAIN FUSE)

OK

2.	INSPECT BATTERY
----	-----------------

- (a) Check that the battery is not discharged or weak.

OK:

Battery is not discharged or weak.

NG ► CHARGE OR REPLACE BATTERY

OK

3.	CHECK BATTERY TERMINAL
----	------------------------

- (a) Check that the battery terminals are not loose or corroded.

OK:

Battery terminals are not loose or corroded.

OK

4.	CHECK WHETHER DTC OUTPUT RECURS
----	---------------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTCs .

- (e) Turn the power switch off and turn the Techstream off.
- (f) Turn the power switch on (IG) and turn the Techstream on.
- (g) Wait for 5 seconds.
- (h) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (i) Read the DTCs.

Result:

Result	Proceed to
DTC P0560 is output	A
DTC is not output	B

B ▶ CHECK FOR INTERMITTENT PROBLEMS

A ▶ REPLACE ECM

DTC	P0604	Random Access Memory (RAM)
-----	-------	----------------------------

MONITOR DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. It is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standards, the ECM will illuminate the MIL and set the DTC immediately.

DTC No.	DTC Detection Condition	Trouble Area
P0604	ECM RAM errors	ECM

MONITOR STRATEGY

Related DTCs	P0604: ECM RAM error
Required sensors/Components (Main)	ECM
Required sensors/Components (Related)	None
Frequency of operation	Continuous
Duration	6 times
MIL operation	Immediately
Sequence of operation	None

A  END

DTC	P060A	Internal Control Module Monitoring Processor Performance
-----	-------	--

MONITOR DESCRIPTION

The main CPU and sub CPU of the ECM communicate with each other. The main CPU monitors the communications and WDC pulses from the sub CPU. When the signal malfunctions below deviate, the DTC is stored.

DTC No.	DTC Detection Condition	Trouble Area
P060A	ECM sub CPU error	ECM

MONITOR STRATEGY

Related DTCs	P060A: ECM CPU error
Required sensors/Components (Main)	ECM
Required sensors/Components (Related)	-
Frequency of operation	Continuous
Duration	Within 1 second
MIL operation	Immediately
Sequence of operation	None

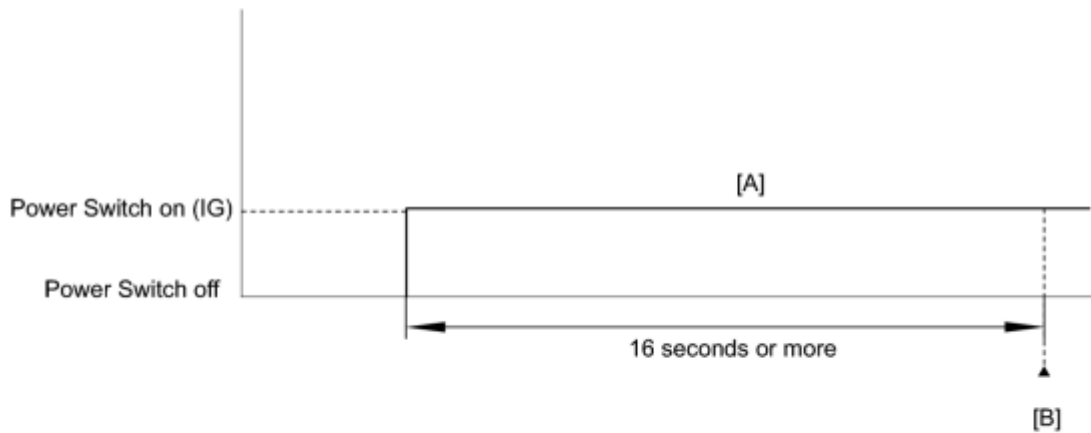

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
--	------

TYPICAL MALFUNCTION THRESHOLDS

Either of the following conditions is met	Condition 1 or 2
1. All of the following conditions are met	Condition (a), (b) and (c)
(a) CPU reset	1 time or more
(b) Leaned throttle position	2.6 V or more
(c) Electronic throttle actuator	OFF
2. CPU reset	2 times or more
Either of the following conditions is met	Condition 3 or 4
3. DMA communication error	Detected
4. Watching from Monitoring Processor not toggle	0.88 seconds or more

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Wait 16 seconds or more [A].
7. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
8. Read the DTC [B].
9. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
11. Input the DTC: P060A.
12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [A] again.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

14. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

15. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

PROCEDURE

1.	READ OUTPUT DTC (DTC P060A)
----	-----------------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTC .

(e) Turn the power switch off and turn the Techstream off.

(f) Disconnect the Techstream.

(g) Disconnect the cable from the battery negative (-) terminal and wait for 1 minute.

(h) Connect the cable to the battery negative (-) terminal.

(i) Connect the Techstream to the DLC3.

(j) Turn the power switch on (IG).

(k) Wait 16 seconds or more.

(l) Turn the Techstream on.

(m) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(n) Read the DTCs.

Result:

Result	Proceed to
DTC is not output	A

B ▶ REPLACE ECM

A ▶ CHECK FOR INTERMITTENT PROBLEMS

DTC	P060B	Internal Control Module A/D Processing Performance
-----	-------	--

DESCRIPTION

This DTC is output when a communication error occurs in the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P060B	ECM main CPU communication error	ECM

MONITOR STRATEGY

Related DTCs	P060B: ECM main CPU communication error
Required sensors/components (Main)	ECM
Required sensors/components (Related)	-
Frequency of operation	Continuous
Duration	2 times: AD converter 30 times: Knock control circuit
MIL operation	Immediately
Sequence of operation	None

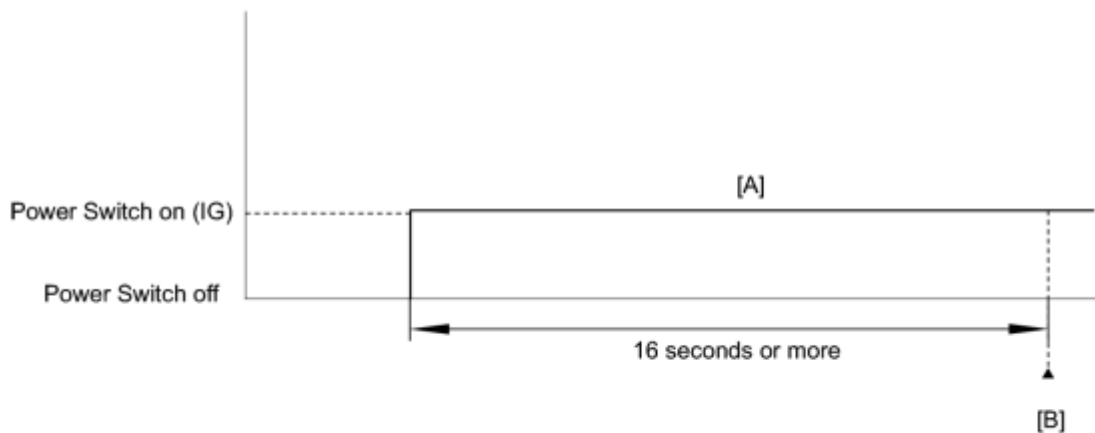

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
--	------

TYPICAL MALFUNCTION THRESHOLDS

One of the following conditions is met:	(a) or (b)
(a) AD converter	Fail
(b) Knock sensor circuit	Fail

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Wait 16 seconds or more [A].
7. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
8. Read the DTC [B].
9. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
11. Input the DTC: P060B.
12. Check the DTC judgment result.

Techstream Display	Description
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [A] again.
14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
15. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
16. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs INFO.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	READ OUTPUT DTC (DTC P0657)
----	-----------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTCs INFO.
- (e) Turn the power switch off and turn the Techstream off.

- (f) Disconnect the Techstream.
- (g) Disconnect the cable from the battery negative (-) terminal and wait for 1 minute.
- (h) Connect the cable to the battery negative (-) terminal.
- (i) Turn the power switch on (IG) for 10 seconds.
- (j) Turn the power switch off.
- (k) Connect the Techstream to the DLC3.
- (l) Turn the power switch on (IG).
- (m) Wait 5 seconds or more.
- (n) Turn the Techstream on.
- (o) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (p) Read the DTCs.

Result:

Result	Proceed to
DTC is not output	A

DTC

P106A

Evaporative Emission System Pressure Sensor - Manifold Absolute Pressure Correlation

DESCRIPTION

DTC No.	DTC Detection Condition	Trouble Area
P106A	The difference between the pressure of the canister pressure sensor (Vapor Pressure Pump*) and manifold absolute pressure sensor (MAP*) is 7 kPa (52.50 mmHg) or more (2 trip detection logic)	<ul style="list-style-type: none"> • Canister pressure sensor (canister assembly) • Manifold absolute pressure sensor

HINT:

*: Data List Name

MONITOR DESCRIPTION

This DTC is designed to detect a deviation in the output characteristics of a pressure sensor.

The pressure of the canister pressure sensor and manifold absolute pressure sensor is monitored 55 minutes after the power switch is turned off. If there is a difference in the pressures, the MIL is illuminated (2 trip detection logic).

HINT:

Correct judgment may not be possible when the altitude is 13124 ft (4000 m) or more.

MONITOR STRATEGY

Related DTC	P106A: Absolute pressure sensor rationality
Required sensors/Components (Main)	Canister pressure sensor Manifold absolute pressure sensor
Required sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 65 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	P0106, P0107, P0108 (Manifold Absolute Pressure)
--	--

	P0401 (EGR System (Closed)) P0452, P0453 (Evaporative Emission System Pressure Sensor)
Arrive at after engine stop	50 minutes
Time after ECM started by soak-timer	60 seconds or more
Battery voltage	10.5 V or more
Intake air temperature	-10°C (14°F) or more
Engine coolant temperature sensor	-10°C (14°F) or more

TYPICAL MALFUNCTION THRESHOLDS

Difference between EVAP pressure and manifold absolute pressure	7.442 kPa (55.83 mmHg) or more
---	--------------------------------

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the Clear DTC procedure) INFO [A].
4. Put the engine in inspection mode INFO.
5. Start the engine and Idle for 10 seconds [B]
6. Turn the power switch off and wait for 30 seconds.
7. Leave the power switch off for 55 minutes [C]
8. Connect the Techstream to the DLC3.
9. Turn the power switch on (IG) and turn the Techstream on.
10. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
11. Read the pending DTC [D].
12. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P106A.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [B] through [C].
16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 17. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
18. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P106A)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result

Result	Proceed to
DTC P106A is output	A
DTC P106A and other DTCs are output	B

HINT:

If any DTCs other than P106A are output, troubleshoot those DTCs first.

B ▶ GO TO DTC CHART

A
▼

2.	READ VALUE USING TECHSTREAM (VAPOR PRESSURE PUMP AND MAP)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Data List / Vapor Pressure Pump and MAP.
- (e) Compare the Vapor Pressure Pump and MAP data from the Data List with day's atmospheric pressure*.

HINT:

- *: Standard atmospheric pressure is 101 kPa (760 mmHg) at sea level. The atmospheric pressure decreases by approximately 1 kPa (7.5 mmHg) for every 100 m of elevation increase. Atmospheric

pressure is also affected by weather conditions. The Atmosphere pressure listed in the Data List cannot be used as a reference for this check.

- If you do not know the atmospheric pressure refer to the Vapor Pressure Pump value of other vehicles in the workshop and check the difference in pressure.

Result

Result	Proceed to
If the Vapor Pressure Pump value differs from the atmospheric pressure by +/- 3.5 kPa (+/- 26.25 mmHg) or more	A
If the MAP value differs from the atmospheric pressure by +/- 3.5 kPa (+/- 26.25 mmHg) or more	B

(a) Replace the manifold absolute pressure sensor .

NEXT

5.	CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG) and the Techstream on.

(c) Enter the following menus: Powertrain / Engine and ECT / Data List / MAP and Vapor Pressure Pump.

(d) Confirm that the difference between Vapor Pressure Pump and MAP are 3.5 kPa (+/- 26.25 mmHg) or less.

NEXT ► **END**

DTC	P2102	Throttle Actuator Control Motor Circuit Low
DTC	P2103	Throttle Actuator Control Motor Circuit High

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.

The opening angle of the throttle valve is detected by the throttle position sensor, which is mounted on the throttle body assembly. The throttle position sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This electronic throttle control system does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2102	Both of the following conditions continue for 2 seconds (1 trip detection logic): (a) Throttle actuator duty ratio is 80% or more (b) Throttle actuator current is below 0.5 A	<ul style="list-style-type: none"> • Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Either condition is met (1 trip detection logic): <ul style="list-style-type: none"> • Hybrid IC diagnosis signal fails • Hybrid IC current limiter port fails 	<ul style="list-style-type: none"> • Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores a DTC.

Example:

- When the electrical current is below 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores a DTC.
- If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high engine speed several times after the engine has idled for 5 seconds after engine start.

MONITOR STRATEGY

Related DTCs	P2102: Throttle actuator current (low current) P2103: Throttle actuator current (high current)

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine.
8. With the vehicle stationary, fully depress the accelerator pedal and quickly release it [B].
9. Check that 16 seconds or more have elapsed from the instant when the accelerator pedal is first depressed.
10. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
11. Read the DTC [C].
12. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
14. Input the DTC: P2102 or P2103.
15. Check the DTC judgment result.

Techstream Display	Description
NORMAL	○ DTC judgment completed

Techstream Display	Description
	<ul style="list-style-type: none"> ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.

16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

17. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

18. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

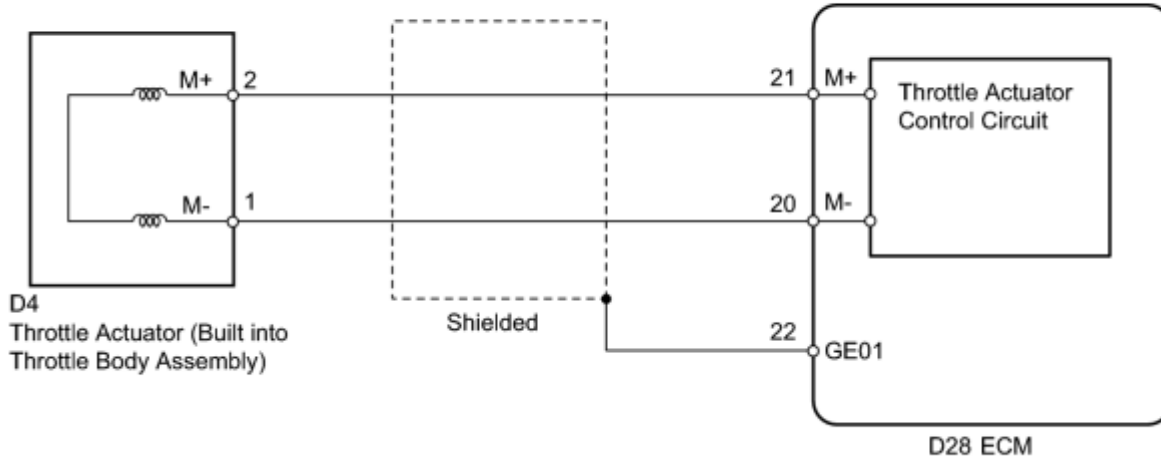

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to electronic throttle control system malfunctions is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 5.5° throttle angle by the return spring. The ECM stops the engine and the vehicle can be driven using solely the hybrid system. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.

Fail-safe mode continues until a pass condition is detected, and the power switch is then turned off.

WIRING DIAGRAM

Y

INSPECTION PROCEDURE

HINT:

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Duty (Open) / Throttle Motor Duty (Close)) can be read using the Techstream. However, the ECM shuts off the throttle actuator current when the electronic throttle control system malfunctions.

PROCEDURE

- | | |
|----|--|
| 1. | INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR) |
|----|--|

*1

- (a) Disconnect the throttle body assembly connector.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

Text in Illustration

*1	Component without harness connected (Throttle Body Assembly)
----	---

(c) Reconnect the throttle body assembly connector.

NG ▶ REPLACE THROTTLE BODY ASSEMBLY

OK

2.	CHECK HARNESS AND CONNECTOR (THROTTLE BODY ASSEMBLY - ECM)
----	--

(a) Disconnect the throttle body assembly connector.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D4-2 (M+) - D28-21 (M+)	Always	Below 1 Ω
D4-1 (M-) - D28-20 (M-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D4-2 (M+) or D28-21 (M+) - Body ground	Always	10 kΩ or higher
D4-1 (M-) or D28-20 (M-) - Body ground	Always	10 kΩ or higher

Text in Illustration

---	--

(d) Reconnect the ECM connector.

(e) Reconnect the throttle body assembly connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (THROTTLE BODY ASSEMBLY - ECM)

OK

3. INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

(a) Check for foreign objects between the throttle valve and the housing.

OK:

No foreign objects between throttle valve and housing.

NG ► REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY ASSEMBLY

OK

4. INSPECT THROTTLE BODY ASSEMBLY (THROTTLE VALVE)

(a) Check if the throttle valve opens and closes smoothly.

OK:

Throttle valve opens and closes smoothly.

NG ► REPLACE THROTTLE BODY ASSEMBLY

OK ► REPLACE ECM

DTC	P2111	Throttle Actuator Control System - Stuck Open
DTC	P2112	Throttle Actuator Control System - Stuck Closed

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the throttle position sensor, which is mounted on the throttle body assembly. The throttle position sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This electronic throttle control system does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2111	The ECM signals the throttle actuator to close, but the actuator is stuck (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle actuator • Throttle body assembly • Throttle valve • ECM
P2112	The ECM signals the throttle actuator to open, but the actuator is stuck (1 trip detection logic)	<ul style="list-style-type: none"> • Throttle actuator • Throttle body assembly • Throttle valve • ECM

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the electronic throttle control system when the throttle valve remains at the fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

MONITOR STRATEGY

Refer to DTC P2102 INFO.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)
-----------	---

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body assembly. And check that the throttle valve moves smoothly.

OK:

Throttle valve is not contaminated with foreign objects and moves smoothly.

NG  REPLACE THROTTLE BODY ASSEMBLY

OK

2.	CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)
-----------	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs .

(e) Put the engine in inspection mode .

(f) Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

(g) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(h) Read the DTCs.

Result:

Result	Proceed to
DTC is not output	A
DTC P2111 or P2112 is output	B

B  REPLACE ECM

A  CHECK FOR INTERMITTENT PROBLEMS

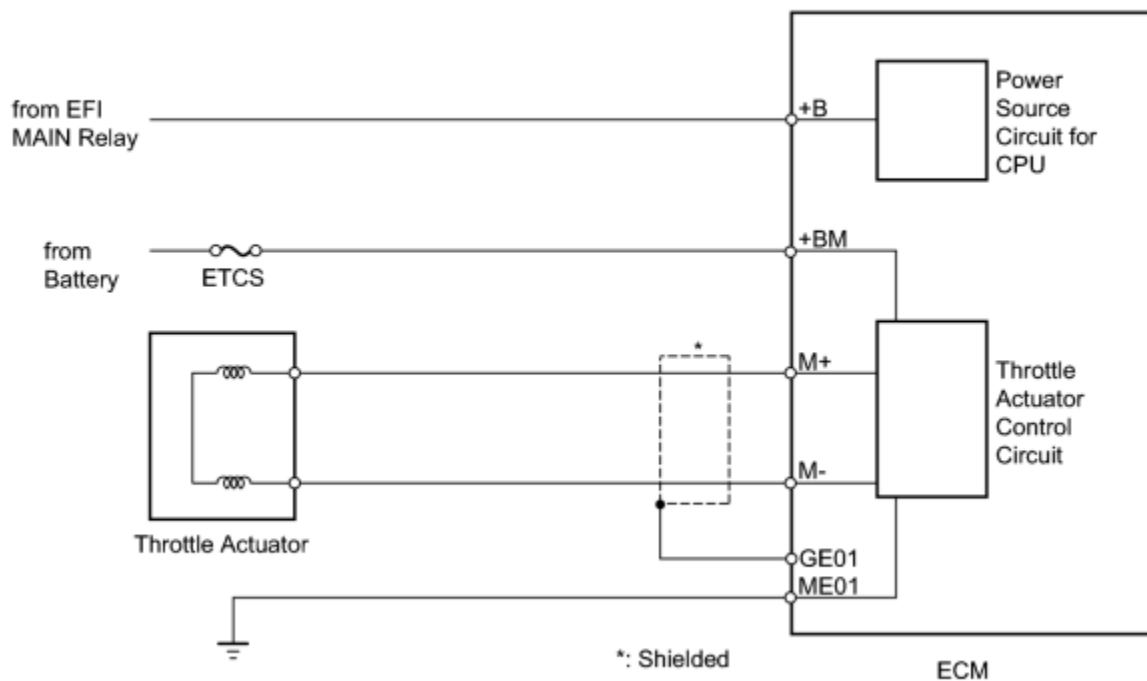

DESCRIPTION

The electronic throttle control system has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (below 4 V), the ECM determines that there is a malfunction in the electronic throttle control system and cuts off the current to the throttle actuator.

When the voltage becomes unstable, the electronic throttle control system itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the power switch off. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

HINT:

This electronic throttle control system does not use a throttle cable.

Y

DTC No.	DTC Detection Condition	Trouble Area
P2118	An open in electronic throttle control system power source (+BM) circuit (1 trip detection logic)	<ul style="list-style-type: none"> • Open in electronic throttle control system power source circuit • Battery • Battery terminals • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.

When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and stores the DTC.

If the malfunction is not repaired successfully, the DTC is stored 5 seconds after the engine is next started.

MONITOR STRATEGY

(d) Reconnect the ECM connectors.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - BATTERY, BODY GROUND)

OK  REPLACE ECM

DTC

P2119

Throttle Actuator Control Throttle Body Range / Performance

DESCRIPTION

The electronic throttle control system is composed of the throttle actuator, throttle position sensor, accelerator pedal position sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The throttle position sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P2119	Throttle valve opening angle continues to vary greatly from the target opening angle (1 trip detection logic)	<ul style="list-style-type: none"> Electronic throttle control system ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the throttle position sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these 2 values is outside the standard range, the ECM interprets this as a malfunction in the electronic throttle control system. The ECM then illuminates the MIL and stores the DTC.

If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by depressing the accelerator pedal (fully open the throttle valve).

MONITOR STRATEGY

Related DTCs	P2119: Electronic throttle control system malfunction
Required Sensors / Components (Main)	Throttle actuator (throttle body assembly)
Required Sensors / Components (Related)	-

A ▶ END

DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)
DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DESCRIPTION

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the air fuel ratio sensor.
- Sensor 1 refers to the sensor mounted in front of the three-way catalytic converter and located near the engine assembly.

The air fuel ratio sensor generates a voltage* that corresponds to the actual air fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air fuel ratio. The ECM determines the deviation from the stoichiometric air fuel ratio level, and regulates the fuel injection time. If the air fuel ratio sensor malfunctions, the ECM is unable to control the air fuel ratio accurately.

The air fuel ratio sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbons (HC) and nitrogen oxide (NO_x) components in the exhaust gas, a three-way catalytic converter is used. For the most efficient use of the three-way catalytic converter, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the air fuel ratio sensor is a current output element, the current is converted into a voltage inside the ECM. Any measurements taken at the air fuel ratio sensor or ECM connectors will show a constant voltage.

c

DTC No.	DTC Detection Condition	Trouble Area

DTC No.	DTC Detection Condition	Trouble Area
		<ul style="list-style-type: none"> • Fuel pressure • Fuel injector assembly • EGR valve assembly • ECM
	While fuel-cut operation performed (during vehicle deceleration), air fuel ratio sensor current is less than 1.0 mA for 3 seconds (2 trip detection logic)	<ul style="list-style-type: none"> • Air fuel ratio sensor (sensor 1) • EGR valve assembly • ECM

HINT:

- When any of these DTCs are set, check the air fuel ratio sensor voltage output by entering the following menus on the Techstream: Powertrain / Engine and ECT / Data List / All Data / AFS Voltage B1S1.
- Short-term fuel trim values can also be read using the Techstream.
- The ECM regulates the voltages at the A1A+ and A1A- terminals of the ECM to a constant level. Therefore, the air fuel ratio sensor voltage output cannot be confirmed without using the Techstream.
- If an air fuel ratio sensor malfunction is detected, the ECM sets a DTC.

MONITOR DESCRIPTION

Sensor Voltage Detection Monitor

Under the air fuel ratio feedback control, if the air fuel ratio sensor voltage output indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the air fuel ratio sensor. The ECM illuminates the MIL and stores a DTC.

Example:

If the air fuel ratio sensor voltage output is below 2.8 V (very rich condition) and heated oxygen sensor output voltage falls from 0.59 V or more to less than 0.21 V for 5 seconds, the ECM stores DTC P2196. Alternatively, if the air fuel ratio sensor voltage output is higher than 3.8 V (very lean condition) and heated oxygen sensor output voltage rises from less than 0.21 V to 0.59 V or more for 5 seconds, DTC P2195 is stored.

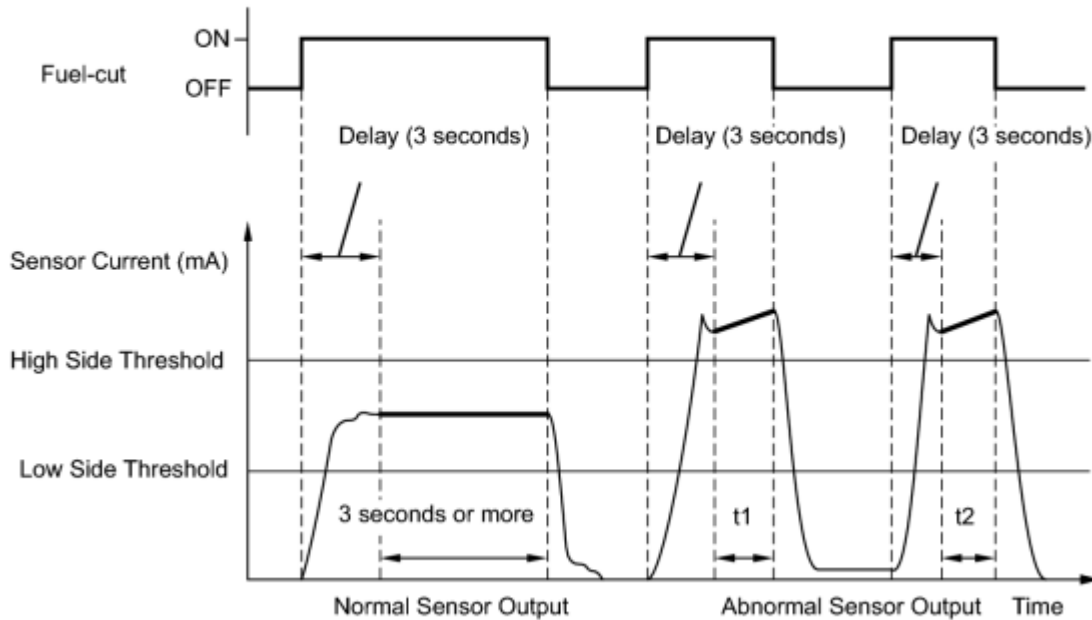

Sensor Current Detection Monitor

A rich air fuel mixture causes a low air fuel ratio sensor current, and a lean air fuel mixture causes a high air fuel ratio sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the air fuel ratio sensor current during fuel-cut and detects any abnormal current values.

If the air fuel ratio sensor output is 3.6 mA or higher for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the air fuel ratio sensor and stores DTC P2195 (stuck on high side). If the air fuel ratio sensor output is below 1.57 mA for more than 3 seconds of cumulative time, the ECM stores DTC P2196 (stuck on low side).

Air Fuel Ratio Sensor Current Monitor

Cumulative Time "t" = t1 + t2 = 3 seconds or more

N

MONITOR STRATEGY

Related DTCs	P2195: Air fuel ratio sensor (Bank 1) signal stuck lean P2196: Air fuel ratio sensor (Bank 1) signal stuck rich
Required Sensors/Components (Main)	Air fuel ratio sensor
Required Sensors/Components (Related)	Heated oxygen sensor
Frequency of Operation	Continuous
Duration	5 seconds: Sensor voltage detection monitor 3 seconds: Sensor current detection monitor
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

ALL

Sensor Voltage Detection Monitor (Lean Side Malfunction P2195)

Time after engine start	30 seconds or more
Fuel system status	Closed-loop

Sensor Voltage Detection Monitor (Rich Side Malfunction P2196)

Time after engine start	30 seconds or more
Fuel system status	Closed-loop

Sensor Current Detection Monitor (P2195, P2196)

Battery voltage	11 V or more
Atmospheric pressure	76 kPa (570 mmHg) or higher
Air fuel ratio sensor status	Activated
Engine coolant temperature	75°C (167°F) or more
Continuous time of fuel cut	3 to 10 seconds
Delay time after EGR valve closed	2 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Sensor Voltage Detection Monitor (Lean Side Malfunction P2195)

Heated oxygen sensor output voltage	Rises from less than 0.21 V to 0.59 V or more
Air fuel ratio sensor voltage	More than 3.8 V

Sensor Voltage Detection Monitor (Rich Side Malfunction P2196)

Heated oxygen sensor output voltage	Falls from 0.59 V or more to less than 0.21 V
Air fuel ratio sensor voltage	Less than 2.8 V

Sensor Current Detection Monitor (High Side Malfunction P2195)

Air fuel ratio sensor current	3.6 mA or more
-------------------------------	----------------

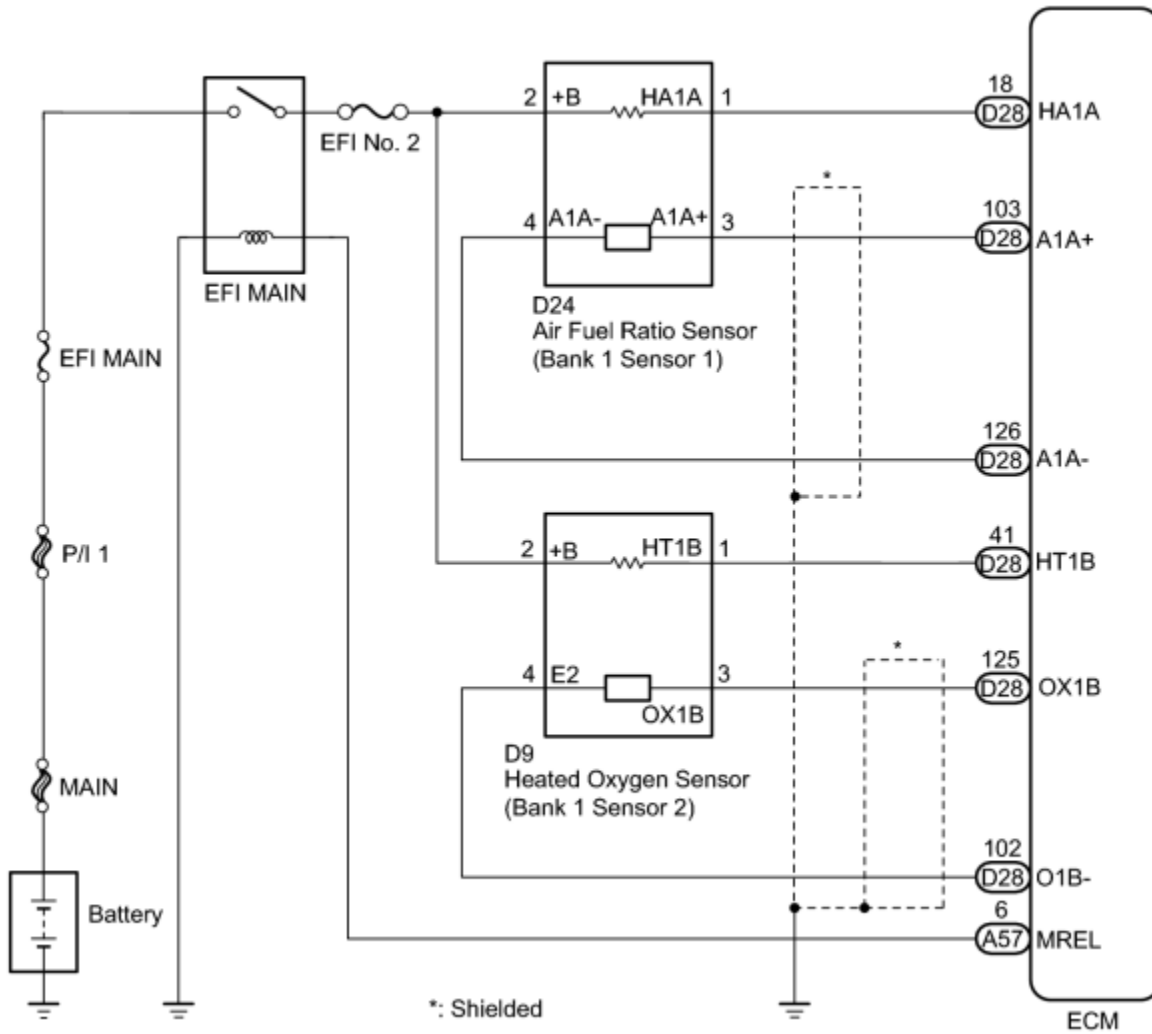

Sensor Current Detection Monitor (Low Side Malfunction P2196)

Air fuel ratio sensor current	Less than 1.57 mA
-------------------------------	-------------------

MONITOR RESULT

Refer to Checking Monitor Status INFO.

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

Engine Coolant Temperature: 75°C or more

N

Driving Pattern Detail for [C] through [F]:

Cumulative Detection Period "t" = t1 + t2 + t3 = 3 seconds or more

N

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG).
3. Turn the Techstream on.
4. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
5. Turn the power switch off and wait for 30 seconds.
6. Turn the power switch on (IG) and turn the Techstream on.
7. Put the engine in inspection mode INFO.
8. Start the engine, and warm it up until the engine coolant temperature reaches 75°C (167°F) or higher [A].
9. On the Techstream, enter the following menus to check the fuel-cut status: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
10. Drive the vehicle at between 47 and 75 mph (75 and 120 km/h) for at least 10 minutes [B].

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

11. Move the shift lever in B [C].
12. Accelerate the vehicle to 47 mph (75 km/h) or more by depressing the accelerator pedal for at least 10 seconds [D].
13. Soon after performing step [D] above, release the accelerator pedal for at least 8 seconds without depressing the brake pedal in order to execute fuel-cut control [E].

HINT:

Fuel-cut is performed when the following conditions are met:

- Accelerator pedal is fully released.
 - Engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).
14. Allow the vehicle to decelerate until the vehicle speed decreases to less than 6 mph (10 km/h).
 15. Repeat steps [C] through [E] above at least 3 times in one driving cycle.
 16. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
 17. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
 18. Read the pending DTC [F].
 19. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

20. Input the DTC: P2195 or P2196.
21. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System normal
ABNORMAL	<ul style="list-style-type: none">○ DTC judgment completed○ System abnormal
INCOMPLETE	<ul style="list-style-type: none">○ DTC judgment not completed○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none">○ Unable to perform DTC judgment○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [B] through [E].
22. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
23. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
24. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode .
4. Start the engine.
5. Turn the Techstream on.
6. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
7. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
8. Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
9. Monitor the output voltages of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

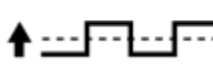

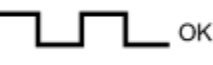

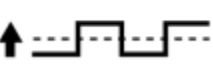

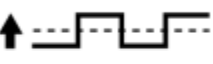

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases in the fuel injection volume.

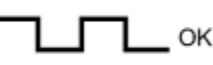

Techstream Display (Sensor)	Injection Volume	Status	Voltage
--------------------------------	------------------	--------	---------

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V</p>  <p>OK</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V</p>  <p>OK</p>	
2	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction</p>  <p>NG</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V</p>  <p>OK</p>	<ul style="list-style-type: none"> • Air fuel ratio sensor • Air fuel ratio sensor heater • Air fuel ratio sensor circuit
3			<ul style="list-style-type: none"> • Heated oxygen sensor • Heated oxygen sensor heater • Heated oxygen sensor circuit

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V</p>  <p>OK</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction</p>  <p>NG</p>	<ul style="list-style-type: none"> Exhaust gas leaks
4	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction</p>  <p>NG</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction</p>  <p>NG</p>	<ul style="list-style-type: none"> Fuel pressure Exhaust gas leaks <p>(Air fuel ratio extremely lean or rich)</p>

- Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2.

HINT:

- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low air fuel ratio sensor voltage could be caused by a rich air fuel mixture. Check for conditions that would cause the engine to run rich.
- A high air fuel ratio sensor voltage could be caused by a lean air fuel mixture. Check for conditions that would cause the engine to run lean.

PROCEDURE

1. CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195 OR P2196)

- Connect the Techstream to the DLC3.
- Turn the power switch on (IG).
- Turn the Techstream on.
- Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(e) Read the DTCs.

Result:

Result	Proceed to
DTC P2195 or P2196 is output	A
DTC P2195 or P2196 and other DTCs are output	B

HINT:

If any DTCs other than P2195 and P2196 are output, troubleshoot those DTCs first.

B ► GO TO DTC CHART

A
▼

2.	CONFIRM IF VEHICLE HAS RUN OUT OF FUEL IN PAST
----	--

(a) Has the vehicle run out of fuel in the past?

NO ► [READ VALUE USING TECHSTREAM \(TEST VALUE OF AIR FUEL RATIO SENSOR\)](#)

YES ► **DTC CAUSED BY RUNNING OUT OF FUEL**

3.	READ VALUE USING TECHSTREAM (TEST VALUE OF AIR FUEL RATIO SENSOR)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs **INFO**.

(e) Put the engine in inspection mode **INFO**.

(f) Allow the vehicle to drive in accordance with the drive pattern described in the Confirmation Driving Pattern.

(g) Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Status 2.

(h) Check that the Status 2 of O2 Sensor is Complete.

If the status is still Incomplete, perform the drive pattern increasing the vehicle speed and using the second gear to decelerate the vehicle.

(i) Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1 S1.

(j) Check the test value of the air fuel ratio sensor output current during fuel-cut.

Result:

Result	Proceed to
Within normal range (1.57 mA or higher, and below 3.6 mA)	A
Outside normal range (Below 1.57 mA, or 3.6 mA or higher)	B

B ▶ [REPLACE AIR FUEL RATIO SENSOR](#)

A
▼

4.	READ VALUE USING TECHSTREAM (OUTPUT VOLTAGE OF AIR FUEL RATIO SENSOR)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG) and turn the Techstream on.
- (c) Put the engine in inspection mode INFO.
- (d) Start the engine.
- (e) Warm up the air fuel ratio sensor at an engine speed of 2500 rpm for 90 seconds.
- (f) Enter the following menus: Powertrain / Engine and ECT / Data List / AFS Voltage B1S1 and Engine Speed, then press the Record button.
- (g) Check the air fuel ratio sensor voltage 3 times, when the engine is in each of the following conditions:
 - (1) While idling (check for at least 30 seconds) (Step "A").
 - (2) At an engine speed of approximately 2500 rpm (without any sudden changes in engine speed) (Step "B").
 - (3) The engine speed is raised to 2500 rpm and then the accelerator pedal is quickly released so that the throttle valve is fully closed (Step "C").

Standard Voltage:

Condition	Air Fuel Ratio Sensor Voltage Variation	Reference
Steps "A" and "B"	Changes at approximately 3.3 V	Between 3.1 V and 3.4 V
Step "C"	Increases to 3.8 V or higher	This occurs during engine deceleration (when fuel-cut performed)

HINT:

For more information, see the diagrams below.

Normal Condition:

Malfunction Condition:

N

HINT:

- If the output voltage of the air fuel ratio sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the air fuel ratio sensor may have an open circuit. (This will also happen if the air fuel ratio sensor heater has an open circuit.)
- If the output voltage of the air fuel ratio sensor remains at either approximately 3.8 V or higher, or below 2.8 V (see Malfunction Condition diagram) under any conditions, including those above, the air fuel ratio sensor may have a short circuit.
- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the air fuel ratio sensor output voltage.
- When the vehicle is driven:

The output voltage of the air fuel ratio sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The air fuel ratio sensor is functioning normally.

- The air fuel ratio sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the air fuel ratio sensor or ECM will show a constant voltage result.

- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
- (e) Read the Pending DTCs.

Result:

Result	Proceed to
DTC P2195 or P2196 is output	A
DTC is not output	B

B ► END

A

10. PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode .
- (e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.
- (g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

DTC	P2253	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 1 Sensor 1)

DESCRIPTION

HINT:

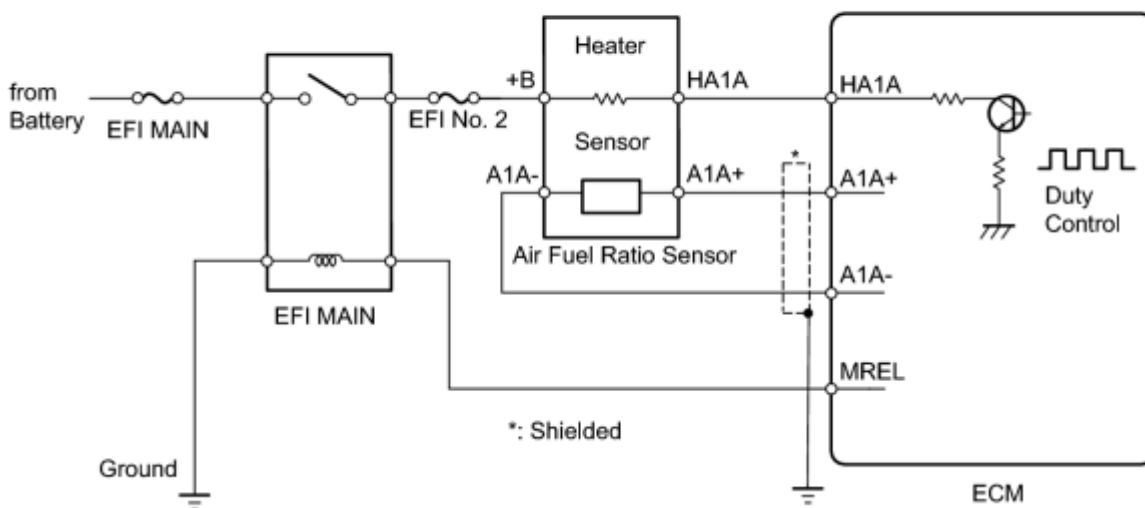

- Although the DTC titles say oxygen sensor, these DTCs relate to the air fuel ratio sensor.
- Sensor 1 refers to the sensor mounted in front of the three-way catalytic converter and located near the engine assembly.

The air fuel ratio sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.

Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater and the sensor ground is controlled by the ECM using a duty ratio.

The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

	(2 trip detection logic)	<ul style="list-style-type: none"> • Air fuel ratio sensor (sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the air fuel ratio sensor circuit, or if air fuel ratio sensor output drops. To detect these problems, the voltage of the air fuel ratio sensor is monitored when turning the power switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the air fuel ratio sensor is between 0.5 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the air fuel ratio sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

	<ul style="list-style-type: none"> ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, idle the engine for 3 minutes.
14. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
15. Check the judgment result [C].

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
16. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs INFO.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to DTC P2195 INFO.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode INFO.
4. Start the engine.
5. Warm up the engine at 2500 rpm for approximately 90 seconds.

6. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
7. Perform Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
8. Monitor the output voltages of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

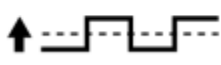

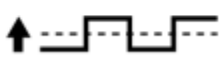

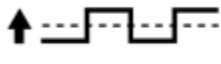

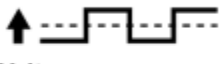

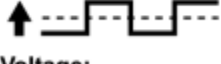

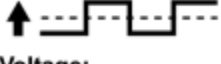

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases and decreases in the fuel injection volume.

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V</p>  <p>OK</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V</p>  <p>OK</p>	
2			<ul style="list-style-type: none"> • Air fuel ratio sensor

Case	Air Fuel Ratio Sensor (Sensor 1) Output Voltage	Heated Oxygen Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 0.55 V Less than 0.4 V</p>  <p>OK</p>	<ul style="list-style-type: none"> • Air fuel ratio sensor heater • Air fuel ratio sensor circuit
3	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>More than 3.4 V Less than 3.1 V</p>  <p>OK</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<ul style="list-style-type: none"> • Heated oxygen sensor • Heated oxygen sensor heater • Heated oxygen sensor circuit • Exhaust gas leaks
4	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<p>Injection Volume:</p> <p>+25% ↑ -12.5%</p>  <p>Output Voltage:</p> <p>Almost no reaction ————— NG</p>	<ul style="list-style-type: none"> • Fuel pressure • Exhaust gas leaks <p>(Air fuel ratio extremely lean or rich)</p>

- Performing Control the Injection Volume for A/F Sensor enables technicians to check and graph the output voltages of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / AFS Voltage B1S1 and O2S B2S1.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK HARNESS AND CONNECTOR (AIR FUEL RATIO SENSOR - ECM)
----	---

- (a) Disconnect the air fuel ratio sensor connector.

*1

*2

N

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D24-1 (HA1A) - D28-18 (HA1A)	Always	Below 1 Ω
D24-3 (A1A+) - D28-103 (A1A+)		
D24-4 (A1A-) - D28-126 (A1A-)		

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D24-1 (HA1A) or D28-18 (HA1A) - Body ground	Always	10 k Ω or higher
D24-3 (A1A+) or D28-103 (A1A+) - Body ground		
D24-4 (A1A-) or D28-126 (A1A-) - Body ground

DTC	P2420	Evaporative Emission System Switching Valve Control Circuit High
-----	-------	--

DTC SUMMARY

DTC No.	Monitoring Item	DTC Detection Condition	Trouble Area	Detection Timing	Detection Logic
P2420	Vent valve stuck open (vent)	<p>The following condition is met during key-off EVAP monitor</p> <ul style="list-style-type: none"> EVAP pressure change when vent valve is closed (ON) less than 2.3 mmHg 	<ul style="list-style-type: none"> Canister pump module (0.02 inch orifice, vacuum pump, vent valve) Connector/wire harness (canister pump module - ECM) ECM 	Power switch off	2 trip

HINT:

The vent valve is built into the canister pump module.

DESCRIPTION

The circuit description can be found in the EVAP (Evaporative Emission) System [INFO](#).

INSPECTION PROCEDURE

Refer to the EVAP System [INFO](#).

MONITOR DESCRIPTION

5 hours*1 after the power switch is turned off, the leak detection pump creates negative pressure (vacuum) in the EVAP (Evaporative Emission) system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

HINT:

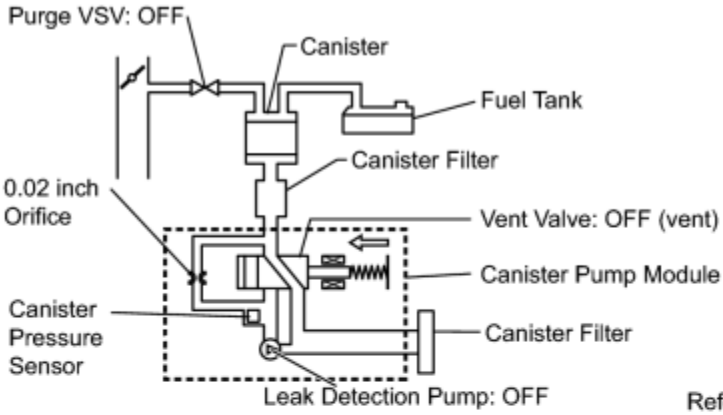

*1: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the power switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the power switch is turned off, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer, 5 hours (7 or 9.5 hours) after power switch is turned off.	-
A	Atmospheric pressure measurement	<p>Vent valve is turned off (vent) and EVAP system pressure is measured by ECM in order to register atmospheric pressure.</p> <p>If pressure in EVAP system is not between 70 kPa and 112 kPa</p>	60 seconds

Sequence	Operation	Description	Duration
		(525 mmHg and 840 mmHg), ECM cancels EVAP system monitor.	
B	First 0.02 inch leak pressure measurement	In order to determine 0.02 inch leak pressure standard, vacuum pump creates negative pressure (vacuum) through 0.02 inch orifice and then ECM checks if vacuum pump and vent valve operate normally.	360 seconds
C	EVAP system pressure measurement	Vent valve is turned on (closed) to shut EVAP system. Negative pressure (vacuum) is created in EVAP system, and then EVAP system pressure is measured. Write down measured value as they will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*2
D	Purge VSV monitor	Purge VSV is opened and then EVAP system pressure is measured by ECM. Large increase indicates normal.	10 seconds
E	Second 0.02 inch leak pressure measurement	After second 0.02 inch leak pressure measurement, leak check is performed by comparing first and second 0.02 inch leak pressure standards. If stabilized system pressure is higher than second 0.02 inch leak pressure standard, ECM determines that there is a leak in EVAP system.	60 seconds
F	Final check	Atmospheric pressure is measured and then monitoring result is recorded by ECM.	-

*2: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement

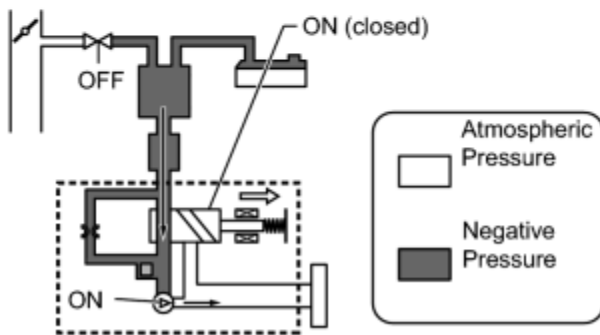

Operation B, E:

0.02 inch Leak Pressure Measurement

Operation C: EVAP System Pressure Measurement

Operation D: Purge VSV Monitor

c

P2420: Vent valve stuck open (vent)

In operation C, the vent valve turns on (closed) and the EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve is open, the ECM interprets this as the vent valve being stuck open. The ECM illuminates the MIL and sets the DTC.

EVAP Pressure when Vent Valve Stuck OFF:

Y

MONITOR STRATEGY

Related DTC	P2420: Vent valve stuck open
Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Atmospheric pressure	70 to 112 kPa (525 to 840 mmHg)
Battery voltage	10.5 V or more
Vehicle speed	Below 2.5 mph (4 km/h)
Power switch	OFF
Time after key off	5, 7 or 9.5 hours
Canister pressure sensor malfunction (P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool

Leak detection pump	Not operated by scan tool
Both of the following conditions are met before key off	Conditions 1 and 2
1. Duration that vehicle has been driven	5 minutes or more
2. EVAP purge operation	Performed
Engine coolant temperature	4.4 to 35°C (40 to 95°F)
Intake air temperature	4.4 to 35°C (40 to 95°F)

TYPICAL MALFUNCTION THRESHOLDS

EVAP pressure change after vent valve on	Less than 0.3 kPa (2.25 mmHg)
--	-------------------------------

MONITOR RESULT

Refer to Checking Monitor Status INFO.

CONFIRMATION DRIVING PATTERN

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine during this operation.
- When the temperature of the fuel is 35°C (95°F) or higher, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode [A].
7. After the "Evaporative System Check" is completed, check for All Readiness by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
8. Read the pending DTC [B].
9. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
11. Input the DTC: P2420.
12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
 - If the judgment result shows NORMAL, the system is normal.
 - If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B].
13. If the test result is UNKNOWN, enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
 14. Read Pending DTCs.

HINT:

If a pending DTC is output, the system is malfunctioning.

15. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

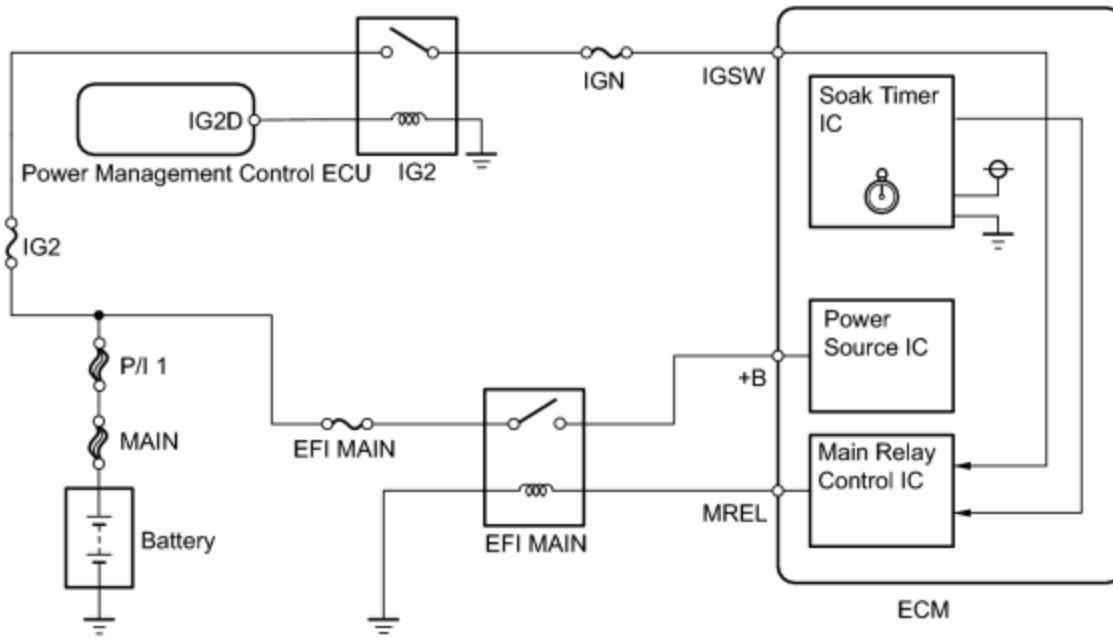

DTC	P2610	ECM / PCM Internal Engine Off Timer Performance
-----	-------	---

DTC SUMMARY

DTC No.	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

DESCRIPTION

The soak timer operates after the power switch is turned off. When a certain amount of time has elapsed after turning the power switch off, the soak timer activates the ECM to perform malfunction checks which can only be performed after the engine is stopped. The soak timer is built into the ECM.

MONITOR DESCRIPTION

If the soak timer activates the ECM even though only a short amount of time has elapsed since the power switch was turned off, or if the soak timer does not activate the ECM even though a considerable amount of time has elapsed since the power switch was turned off, the ECM determines that the soak timer is malfunctioning, illuminates the MIL and stores a DTC the next time the power switch is turned on (IG).

While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Internal engine OFF timer (elapsed time from engine stop)	10 minutes or more
Battery voltage	8 V or more
Power switch	On (IG)

Case 3:

Internal engine OFF timer (elapsed time from engine stop)	10 minutes or more
Battery voltage	8 V or more
Power switch	On (IG)

TYPICAL MALFUNCTION THRESHOLDS

Case 1:

Internal engine OFF timer (elapsed time from engine start)	Less than 7 minutes, or more than 13 minutes
--	--

Case 2:

ECM had the started record by internal engine OFF timer

Yes

Case 3:

ECM had the started record by internal engine OFF timer

No

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on [A].
6. Put the engine in inspection mode INFO.
7. Start the engine.
8. Idle the engine for 10 minutes or more [B].
9. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
10. Read the pending DTC [C].
11. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

12. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
13. Input the DTC: P2610.
14. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform step [B] again.

15. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

16. Check the judgment result.

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

17. If the test result is INCOMPLETE or UNKNOWN and no pending DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is required.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1. REPLACE ECM

(a) Replace the ECM .

NEXT

2. CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs .

(e) Put the engine in inspection mode .

(f) Start the engine and wait for 10 minutes or more.

(g) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

(h) If no pending DTC is displayed, the repair has been successfully completed.

NEXT  END

DTC	P261B	Coolant Pump "B" Control Malfunction
DTC	P261C	Short in Coolant Pump "B" Control Circuit
DTC	P261D	Open in Coolant Pump "B" Control Circuit

DESCRIPTION

The ECM controls the water pump assembly by calculating the necessary amount of coolant flow based on engine coolant temperature, engine speed and vehicle speed information. The speed of the water pump assembly is controlled steplessly using duty cycle signal sent from the ECM. This optimal control enhances warm-up performance and reduces cooling losses, thus reducing the specific fuel consumption of the engine.

DTC No.	DTC Detection Condition	Trouble Area
P261B	Water pump speed is less than 900 rpm while the water pump assembly is operating (1 trip detection logic)	<ul style="list-style-type: none"> • Open or short in water pump assembly circuit • Water pump assembly • ECM
P261C	Water pump output voltage is less than specified value while the water pump assembly is operating (1 trip detection logic)	<ul style="list-style-type: none"> • Short in water pump assembly circuit • Water pump assembly • ECM
P261D	Water pump output voltage is higher than specified value while the water pump assembly is operating (1 trip detection logic)	<ul style="list-style-type: none"> • Open in water pump assembly circuit • Water pump assembly • ECM

MONITOR DESCRIPTION

The ECM calculates the speed of the water pump assembly using a duty cycle signal sent from the water pump assembly. When the speed of the water pump assembly becomes less than 900 rpm while it is operating, the ECM detects the malfunction and stores DTC P261B.

The water pump assembly operates steplessly based on a duty cycle signal sent from the ECM. The ECM monitors the current of the water pump assembly. If actual drive duty cycle ratio does not correspond to the target drive duty cycle, the ECM detects the malfunction and stores DTC P261C and P261D.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

HINT:

Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

- | | |
|----|---|
| 1. | PERFORM ACTIVE TEST USING TECHSTREAM (ACTIVATE THE ELECTRIC WATER PUMP) |
|----|---|

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode INFO.
- (e) Start the engine.
- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Activate the Electric Water Pump.
- (g) Touch the water pump and check that the pump is operating (vibrating).

OK:

The water pump is operating (vibrating).

NG ▶ [CHECK WATER PUMP ASSEMBLY \(POWER SOURCE\)](#)

OK

2.	CHECK HARNESS AND CONNECTOR (WATER PUMP ASSEMBLY - ECM)
----	---

HINT:

Confirm a good connection at the water pump assembly and ECM connectors.

- (a) Disconnect the water pump assembly connector.

- (b) Disconnect the ECM connector.
- (c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
D13-2 (NWP) - A57-11 (WPI)	Always	Below 1 Ω

Tester Connection	Condition	Specified Condition
D13-4 (SWP) - A57-10 (WPO)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
D13-2 (NWP) or A57-11 (WPI) - Body ground	Always	10 kΩ or higher
D13-4 (SWP) or A57-10 (WPO) - Body ground	Always	10 kΩ or higher

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)
-----	-------	--

DESCRIPTION

HINT:

- Refer to DTC P2195 INFO.
- Sensor 1 refers to the sensor mounted in front of the three-way catalytic converter and located near the engine assembly.

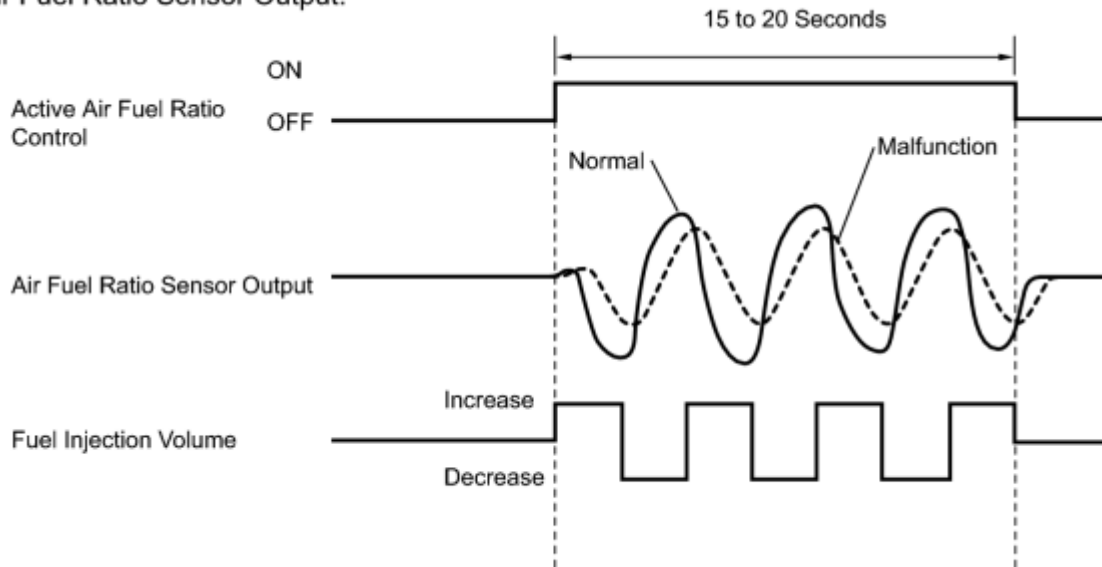

DTC No.	DTC Detection Condition	Trouble Area
P2A00	Calculated value for air fuel ratio sensor response rate deterioration level is less than threshold (2 trip detection logic)	<ul style="list-style-type: none"> • Air fuel ratio sensor • Air fuel ratio sensor heater • EGR valve assembly • ECM

MONITOR DESCRIPTION

After the engine is warmed up, the ECM performs air fuel ratio feedback control to maintain the air fuel ratio at the stoichiometric level. In addition, active A/F control is performed for approximately 15 to 20 seconds after preconditions are met in order to measure the air fuel ratio sensor response rate. During active A/F control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air fuel ratio learned during normal air fuel ratio control, and measures the air fuel ratio sensor response rate. The ECM receives a signal from the air fuel ratio sensor while performing active A/F control and uses it to calculate the air fuel ratio sensor response rate deterioration level.

If the value for air fuel ratio sensor response rate deterioration level is beyond the threshold, the ECM interprets this as a malfunction and sets the DTC.

Air Fuel Ratio Sensor Output:

Y

CONFIRMATION DRIVING PATTERN

HINT:

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

Performing this confirmation pattern will activate the air fuel ratio sensor response monitor.

P

1. Connect the Techstream to the DLC3.
2. Turn the power switch on ((IG)).

3. Turn the Techstream on.
4. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) **INFO**.
5. Turn the power switch off and wait for 30 seconds.
6. Turn the power switch on (IG) and turn the Techstream on.
7. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor.
8. Check that the Status2 of O2 Sensor is Incomplete.
9. Put the engine in inspection mode **INFO**.
10. Start the engine and warm it up (until the engine coolant temperature is 75°C (167°F) or higher) [A].
11. Drive the vehicle at a constant speed of between 47 and 62 mph (75 and 100 km/h) for 10 minutes [B].
12. Those items will change to Complete after completing the drive pattern.
13. If the values indicated on the Techstream do not change, perform Readiness Monitor Drive Pattern for the air fuel ratio sensor and heated oxygen sensor **INFO**.
14. Check the monitor result values on the Techstream by entering the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1S1.
15. Note the value of the Monitor Result.
16. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
17. Read the pending DTC [C].
18. If a pending DTC is output, the system is malfunctioning.

HINT:

If a pending DTC is not output, perform the following procedure.

19. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
20. Input the DTC: P2A00.
21. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal

WIRING DIAGRAM

Refer to DTC P2195 INFO.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the air fuel ratio sensor, heated oxygen sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the Techstream.

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Put the engine in inspection mode INFO.
4. Start the engine.
5. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
6. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
7. Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
8. Monitor the output voltages of the air fuel ratio and heated oxygen sensors (AFS Voltage B1S1 and O2S B1S2) displayed on the Techstream.

HINT:

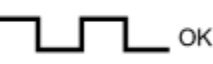

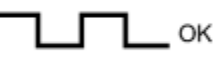

- The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- Each sensor reacts in accordance with increases in the fuel injection volume.

Techstream Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 (Air fuel ratio)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 (Air fuel ratio)	-12.5%	Lean	More than 3.4 V
O2S B1S2 (Heated oxygen)	+25%	Rich	More than 0.55 V
O2S B1S2 (Heated oxygen)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The air fuel ratio sensor has an output delay of a few seconds and the heated oxygen sensor has a maximum output delay of approximately 20 seconds.

- Performing Control the Injection Volume for A/F Sensor enables technicians to check and graph the voltage outputs of both the air fuel ratio and heated oxygen sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2.

HINT:

- DTC P2A00 may also be set when the air fuel ratio remains rich or lean.
- A low air fuel ratio sensor voltage could be caused by a rich air fuel mixture. Check for conditions that would cause the engine to run rich.

- A high air fuel ratio sensor voltage could be caused by a lean air fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result:

Result	Proceed to
DTC P2A00 is output	A
DTC P2A00 and other DTCs are output	B

HINT:

If any DTCs other than P2A00 are output, troubleshoot those DTCs first.

B ▶ GO TO DTC CHART

- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Clear the DTCs.
- (e) Put the engine in inspection mode .

(f) Drive the vehicle referring to the Confirmation Driving Pattern.

NEXT

8.	CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00)
----	---

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.
- (e) Read the Pending DTCs.

Result:

Result	Proceed to
DTC P2A00 is output	A
DTC is not output	B

B ▶ END

A

9.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Put the engine in inspection mode INFO.
- (e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

- (f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.
- (g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.

- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

DTC	P3190	Poor Engine Power
DTC	P3191	Engine does not Start
DTC	P3193	Fuel Run Out

DESCRIPTION

From the power management control ECU, the ECM receives data such as power output required for the engine (required output), estimated torque produced by the engine (estimated torque), engine speed of control target (target speed), and whether the engine is in start mode or not. Then, based on the required output and target speed, the ECM calculates a target torque that is to be produced by the engine and compares it with the estimated torque. If the estimated torque is very low compared with the target torque, or the engine start mode continues for the specific duration calculated by the coolant temperature, an abnormal condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P3190	<p>Following conditions continue at a fixed engine speed or a fixed length of time (1 trip detection logic):</p> <ul style="list-style-type: none"> • Communication with power management control ECU is normal • Engine speed is a fixed value or more • Engine start mode is not active • Target torque is a fixed value • Ratio of estimated torque against target torque is less than 20% 	<ul style="list-style-type: none"> • Intake system • Throttle body assembly • Fuel pressure • Engine • Mass air flow meter sub-assembly • Out of fuel • Engine coolant temperature sensor • Crankshaft position sensor • Camshaft position sensor • EGR valve assembly • ECM
P3191	<p>Following conditions continue at a fixed engine speed or a fixed length of time (1 trip detection logic):</p> <ul style="list-style-type: none"> • Communication with power management control ECU is normal • Engine speed is a fixed value or more • Engine start mode is active • Engine start no-determination for 100 engine revolutions or more, and 6 seconds or more 	<ul style="list-style-type: none"> • Intake system • Throttle body assembly • Fuel pressure • Engine • Mass air flow meter sub-assembly • Out of fuel • Engine coolant temperature sensor • Crankshaft position sensor • Camshaft position sensor • EGR valve assembly • ECM
P3193	<p>Following conditions are met (1 trip detection logic):</p> <ul style="list-style-type: none"> • Fuel low level signal input into ECM • Detection condition for P3190 or P3191 is satisfied 	<ul style="list-style-type: none"> • Out of fuel • ECM

MONITOR DESCRIPTION

The ECM and power management control ECU are connected by a communication line called CAN. The ECM sends engine speed data and other data to the power management control ECU while the power management control ECU sends the information such as a requirement for the engine power to the ECM using the CAN communication line. When the communication between the ECM and power management control ECU is normal and the following items become a specified condition, the ECM illuminates the MIL and sets a DTC.

1. Engine speed
2. Target torque
3. Ratio of target torque against estimated torque
4. Fuel level

MONITOR STRATEGY

Related DTCs	P3190: Poor engine power P3191: Engine does not start
Required sensors/components	Main sensors: Crankshaft position sensor Related sensors: Power management control ECU
Frequency of operation	Continuous
Duration	100 engine revolutions or 6 seconds
MIL operation	Immediately (MIL illumination)
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Fuel cut operation	Not operated
Engine speed	650 rpm or more (varies with engine coolant temperature)
Communication with power management control ECU	No malfunction

TYPICAL MALFUNCTION THRESHOLDS

P3190

Time for low engine torque	100 engine revolutions or more, and 6 seconds or more (varies with engine coolant temperature)
Fuel level	Not empty

P3191

Engine start no-determination time (receive from power management control ECU)	100 engine revolutions or more, and 6 seconds or more (varies with engine coolant temperature)
Fuel level	Not empty

INSPECTION PROCEDURE

HINT:

- Repeating this inspection for symptom confirmation may cause the SOC to drop, preventing the system from entering the READY-on state. In this case, use the THS charger to charge the HV battery.
- Cranking the engine once causes the SOC to drop approximately 1%.
- Charging the HV battery once (10 minutes) using the THS charger restores the SOC approximately 2%.
- Charging the HV battery using the THS charger takes approximately 10 minutes when the battery temperature is 25°C (77°F) or approximately 30 minutes when the battery temperature is 0°C (32°F).
- The THS charger is a supplemental charging device that charges the HV battery enough to enable the engine to start (the vehicle can enter the READY-on state).
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

PROCEDURE

1.	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P3190, P3191 AND/OR P3193)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch ON (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Read the DTCs.

Result

Result	Proceed to
DTC P3190, P3191 and/or P3193 are output	A
DTC P3190, P3191 and/or P3193, and other DTCs are output	B

HINT:

If any other codes besides P3190, P3191 and/or P3193 are output, perform troubleshooting for those DTCs first.

B ▶ GO TO DTC CHART

A
▼

2. CHECK ANY OTHER DTC OUTPUT BY HYBRID CONTROL SYSTEM

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch ON (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

A
▼

14.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE EGR STEP POSITION)
-----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Put the engine in inspection mode .

(e) Start the engine and warm it up until the engine coolant temperature reaches 75°C (167°F) or more.

HINT:

The A/C switch and all accessory switches should be off.

(f) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the EGR Step Position.

(g) Confirm the Throttle Idle Position is ON and check the engine idling condition and MAP values in the Data List while performing the Active Test.

HINT:

- Do not leave the EGR valve open for 10 seconds or more during the Active Test.
- Be sure to return the EGR valve to step 0 when the Active Test is completed.
- Do not open the EGR valve 30 steps or more during the Active Test.

OK:

MAP and idling condition change in response to EGR step position when Throttle Idle Position is ON in Data List.

Standard:

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps

-	EGR Step Position (Active Test)	
	0 Steps	0 to 30 Steps
Idling condition	Steady idling	Idling changes from steady to rough idling
MAP (Data List)	MAP value is 20 to 40 kPa (150 to 300 mmHg) (EGR valve is fully closed)	MAP value is at least +10 kPa (75 mmHg) higher than when EGR valve is fully closed

HINT:

During Active Test, if the idling condition does not change in response to EGR step position, then there is probably a malfunction in the EGR valve.

Result:

Result	Proceed to
Outside of standard range	A
Within standard range	B

OK **▶** REPLACE FUEL PUMP

DTC	U0293	Lost Communication with HV ECU
-----	-------	--------------------------------

MONITOR DESCRIPTION

The Controller Area Network (CAN) is a serial data communication system for real-time application. It is a multiplex communication system designed for on-vehicle use that provides a superior communication speed of 500 kbps and a capability to detect malfunctions. Through the combination of the CANH and CANL bus lines, the CAN is able to maintain communication based on differential voltage.

DTC No.	DTC Detection Condition	Trouble Area
U0293	Communication with power management control ECU is interrupted (1 trip detection logic)	<ul style="list-style-type: none"> • Wire harness • Power management control ECU

MONITOR STRATEGY

Related DTCs	U0293: Lost communication with power management control ECU
Required Sensors/Components (Main)	ECM
Frequency of Operation	Continuous
Duration	0.576 seconds
MIL Operation	Immediately
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	None
Battery Voltage	10.5 V or more (0.5 seconds or more)
Power switch	On (IG) (0.5 seconds or more)

TYPICAL MALFUNCTION THRESHOLDS

Communication signal	No signal from power management control ECU
----------------------	---

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure) INFO.
4. Turn the power switch off and wait for 30 seconds.
5. Turn the power switch on (IG) and turn the Techstream on.
6. Wait 5 seconds or more [A].
7. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
8. Read the DTC [B].
9. If a DTC is output, the system is malfunctioning.

HINT:

If a DTC is not output, perform the following procedure.

10. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
11. Input the DTC: U0293.
12. Check the DTC judgment result.

Techstream Display	Description
NORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System normal
ABNORMAL	<ul style="list-style-type: none"> ○ DTC judgment completed ○ System abnormal
INCOMPLETE	<ul style="list-style-type: none"> ○ DTC judgment not completed ○ Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	<ul style="list-style-type: none"> ○ Unable to perform DTC judgment

Techstream Display	Description
	<ul style="list-style-type: none"> ○ Number of DTCs which do not fulfill DTC preconditions has reached ECU's memory limit

HINT:

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.
- If the judgment result shows INCOMPLETE or UNKNOWN, perform steps [B] again.

13. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

14. Check the judgment result.

HINT:

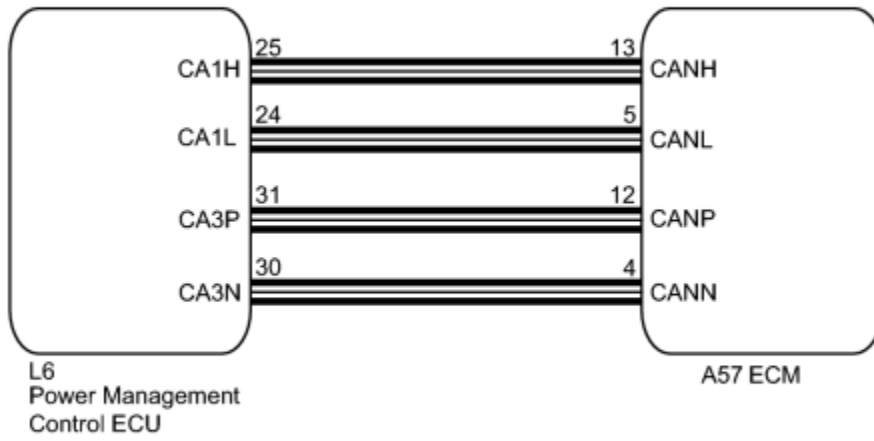

- If the judgment result shows ABNORMAL, the system has a malfunction.
- If the judgment result shows NORMAL, the system is normal.

15. If the test result is INCOMPLETE or UNKNOWN and no DTC is output, perform a universal trip and check for permanent DTCs .

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

*9	ECM	*10	Canister Filter
*11	Soak Timer	*12	Canister Pump Module
*13	Fuel Cap	*14	No. 2 Canister Filter

NOTICE:

In this vehicle's EVAP system, turning on the vent valve does not seal off the EVAP system. To check for leaks in the EVAP system, disconnect the air inlet vent hose and apply pressure from the atmospheric side of the canister.

While the engine is running, if a predetermined condition (closed-loop, etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged into the intake manifold. The ECM changes the duty cycle of the purge VSV to control purge flow volume.

The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when negative pressure (vacuum) is applied to the canister.

The following two monitors run to confirm the appropriate EVAP system operation.

1. Key-off monitor

This monitor checks for EVAP (evaporative emission) system leaks and canister pump module malfunctions. The monitor starts 5 hours* after the power switch is turned off. At least 5 hours are required for the fuel to cool down to stabilize the EVAP pressure, thus making the EVAP system monitor more accurate.

The leak detection pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the canister pump module and purge VSV based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the power switch is turned off, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the power switch is turned off, the monitor check starts 2.5 hours later.

2. Purge flow monitor

The purge flow monitor consists of the 2 monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor

While the engine is running and the purge VSV (Vacuum Switching Valve) is on (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.

- The 2nd monitor

The vent valve is turned off (open) and the EVAP pressure is measured. If the variation in the pressure is less than 0.15 kPa (1.13 mmHg), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:

In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after the purge flow monitor, is measured by the ECM.

Component	Operation
Canister	Contains activated charcoal to absorb EVAP (evaporative emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank is 100% full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle (current-carrying time) (Open: on; Closed: off).
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours (+/-15 min) after power switch is turned off. This allows fuel to cool down, stabilizing EVAP pressure. When approximately 5 hours elapsed, ECM activates (refer to fig. 3).
Canister pump module	Consists of (a) to (d) below. Canister pump module cannot be disassembled.

Component	Operation
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve on, EVAP system is closed. When ECM turns valve off, EVAP system is vented. Negative pressure (vacuum) is created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closing it) and operating leak detection pump (refer to fig. 1).
(b) Canister pressure sensor	Indicates pressure as voltage. ECM supplies regulated 5 V to canister pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig. 2).
(c) Leak detection pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) Reference orifice	Has opening with 0.02 inch diameter. Vacuum is produced through orifice by closing purge VSV, turning off vent valve and operating leak detection pump to monitor reference pressure. Reference pressure indicates small leak of EVAP.

INSPECTION PROCEDURE

NOTICE:

- Inspect the fuses for circuits related to this system before performing the following inspection procedure.
- The Techstream is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using Techstream monitor results enables the EVAP (evaporative emission) system to be confirmed.
- Read freeze frame data using the Techstream. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

PROCEDURE

1.	CONFIRM DTC
----	-------------

- (a) Turn the power switch off and wait for 10 seconds.
- (b) Turn the power switch on (IG).
- (c) Turn the power switch off and wait for 10 seconds.
- (d) Connect the Techstream to the DLC3.
- (e) Turn the power switch on (IG).
- (f) Turn the Techstream on.
- (g) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (h) Confirm DTCs and freeze frame data.

If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.

NOTICE:

If the reference pressure difference between the first and second checks is greater than the specification, all the DTCs relating to the reference pressure (P043E, P043F, P2401, P2402 and P2419) are stored.

Malfunctioning Areas	DTCs										
	P043E P043F	P0441	P0451	P0452	P0453	P0455	P0456	P2401 P2402	P2419	P2420

2.	PERFORM EVAPORATIVE SYSTEM CHECK (AUTO OPERATION)
----	---

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine during this operation.
- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs .

(e) Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode.

(f) After the Evaporative System Check is completed, check for pending DTCs by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

HINT:

If no pending DTCs are displayed, perform the Monitor Confirmation (see "Diagnostic Help" menu). After this confirmation, check for pending DTCs. If no DTCs are displayed, the EVAP system is normal.

NEXT

3. PERFORM EVAPORATIVE SYSTEM CHECK (MANUAL OPERATION)

Evaporative System Check

NOTICE:

- In the Evaporative System Check (Manual Mode), perform the series of 5 Evaporative System Check steps manually using the Techstream.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine during this operation.

- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the Evaporative System Check, keep the fuel temperature below 35°C (95°F).

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

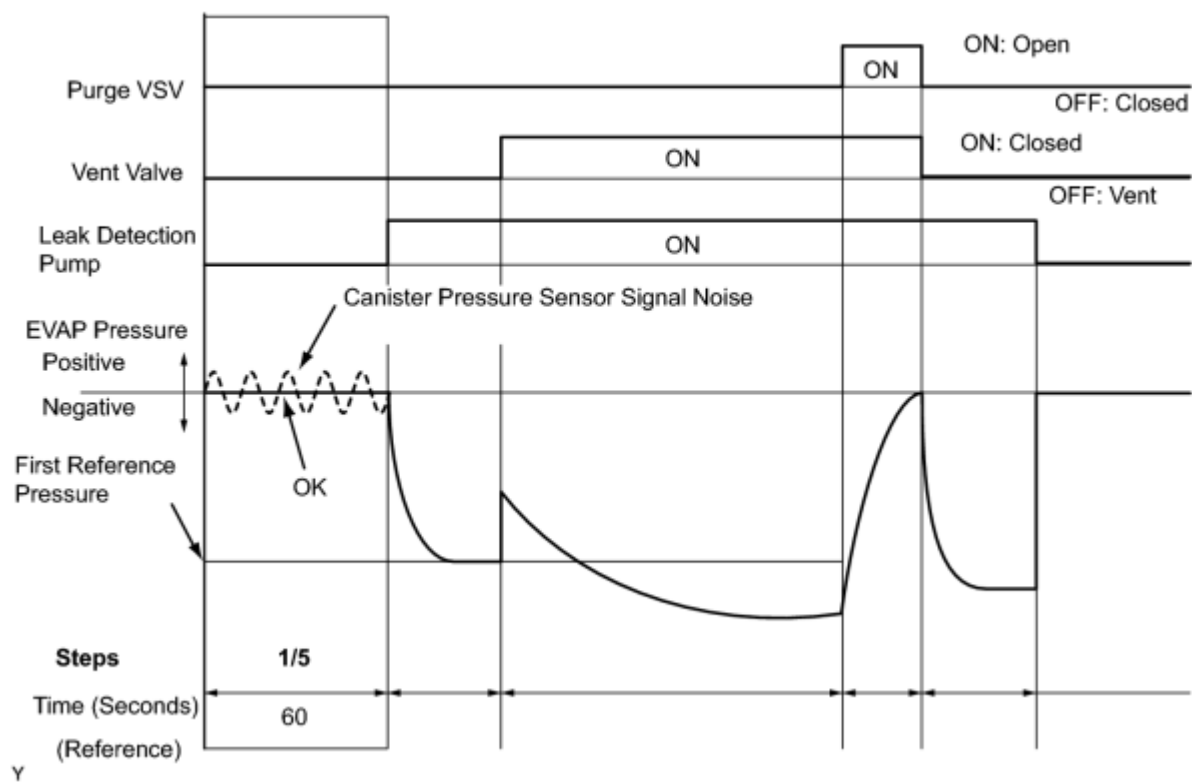

(d) Clear the DTCs INFO.

(e) Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Manual Mode.

NEXT

4. PERFORM EVAPORATIVE SYSTEM CHECK (STEP 1/5)

(a) Check the EVAP pressure in step 1/5.

Result:

DTC*	Test Result	Suspected Trouble Area	Proceed to
-	Virtually no variation in EVAP pressure	Not yet determined	A

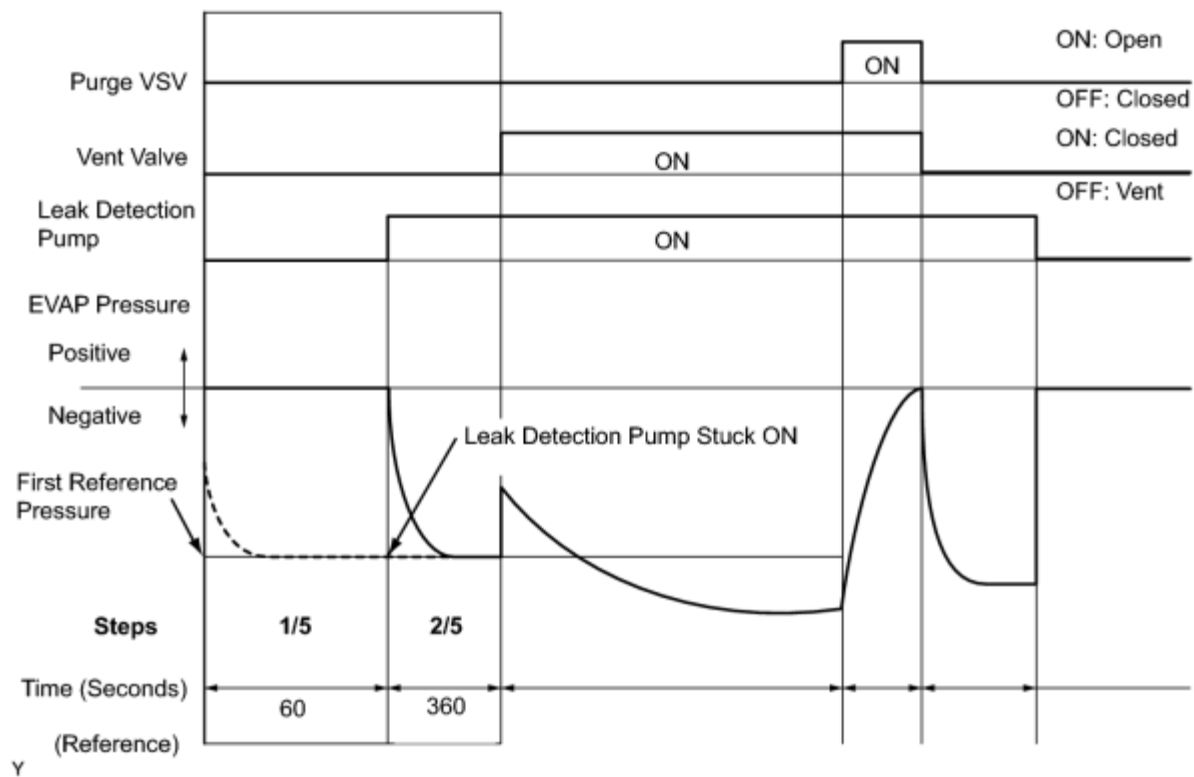

DTC*	Test Result	Suspected Trouble Area	Proceed to
P0451	EVAP pressure fluctuates by +/-0.3 kPa (2.25 mmHg) or more	Canister pressure sensor signal noise	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "Confirm DTC" procedure above.

B [▶REPLACE CANISTER](#)

A
▼

5.	PERFORM EVAPORATIVE SYSTEM CHECK (STEP 1/5 TO 2/5)
----	--

(a) Check the EVAP pressure in steps 1/5 and 2/5.

Result:

DTC*	Test Result	Suspected Trouble Area	Proceed to
-	Virtually no variation in EVAP pressure during step 1/5. Then decreases to reference pressure	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Leak detection pump stuck ON	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "Confirm DTC" procedure above.

HINT:

The first reference pressure is the value determined in step 2/5.

B ▶ PERFORM ACTIVE TEST USING TECHSTREAM (ACTIVE THE VACUUM PUMP)

A

6.	PERFORM EVAPORATIVE SYSTEM CHECK (STEP 2/5)
----	---

HINT:

Make a note of the pressures checked in steps A and B below.

- (a) Check the EVAP pressure 4 seconds after the leak detection pump is activated* (Step A).

*: The leak detection pump begins to operate as step 1/5 finishes and step 2/5 starts.

- (b) Check the EVAP pressure again when it has stabilized. This pressure is the reference pressure (Step B).

Result:

DTC*	Test Result	Suspected Trouble Area	Proceed to
------	-------------	------------------------	------------

DTC*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure in step B between -4.85 kPa and -1.057 kPa (-36.38 mmHg and -7.93 mmHg)	Not yet determined	A
P043F and P2401	EVAP pressure in step B -1.057 kPa (-7.93 mmHg) or more	<ul style="list-style-type: none"> Reference orifice high-flow Leak detection pump stuck OFF 	B
P043E	EVAP pressure in step B below -4.85 kPa (-36.38 mmHg)	Reference orifice clogged	C
P2419	EVAP pressure in step A more than -1.057 kPa (-7.93 mmHg)	Vent valve stuck closed	D

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "Confirm DTC" procedure above.

▼

7.	PERFORM EVAPORATIVE SYSTEM CHECK (STEP 2/5 TO 3/5)
----	--

Y

(a) Check the EVAP pressure in step 3/5.

Result:

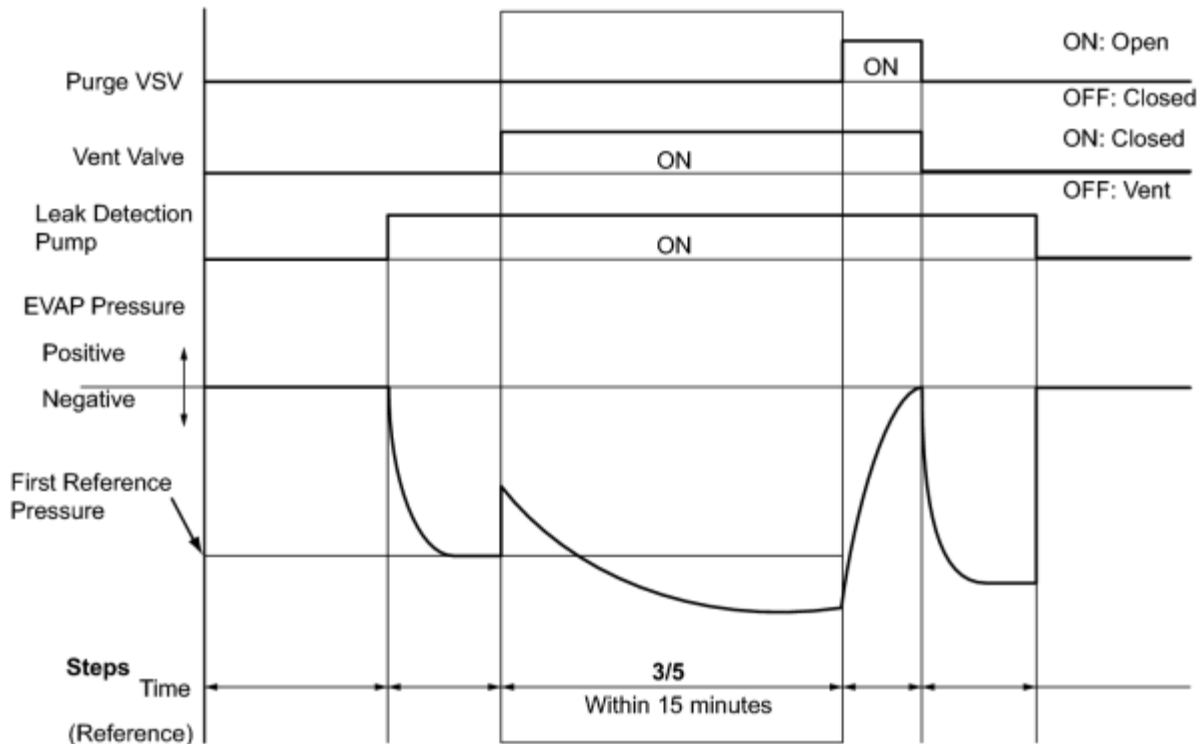

DTC*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "Confirm DTC" procedure above.

B [INSPECT CANISTER PUMP MODULE \(POWER SOURCE FOR VENT VALVE\)](#)

8.	PERFORM EVAPORATIVE SYSTEM CHECK (STEP 3/5)
----	---

(a) Wait until the EVAP pressure change is less than 0.1 kPa (0.75 mmHg) for 30 seconds.

(b) Measure the EVAP pressure and record it.

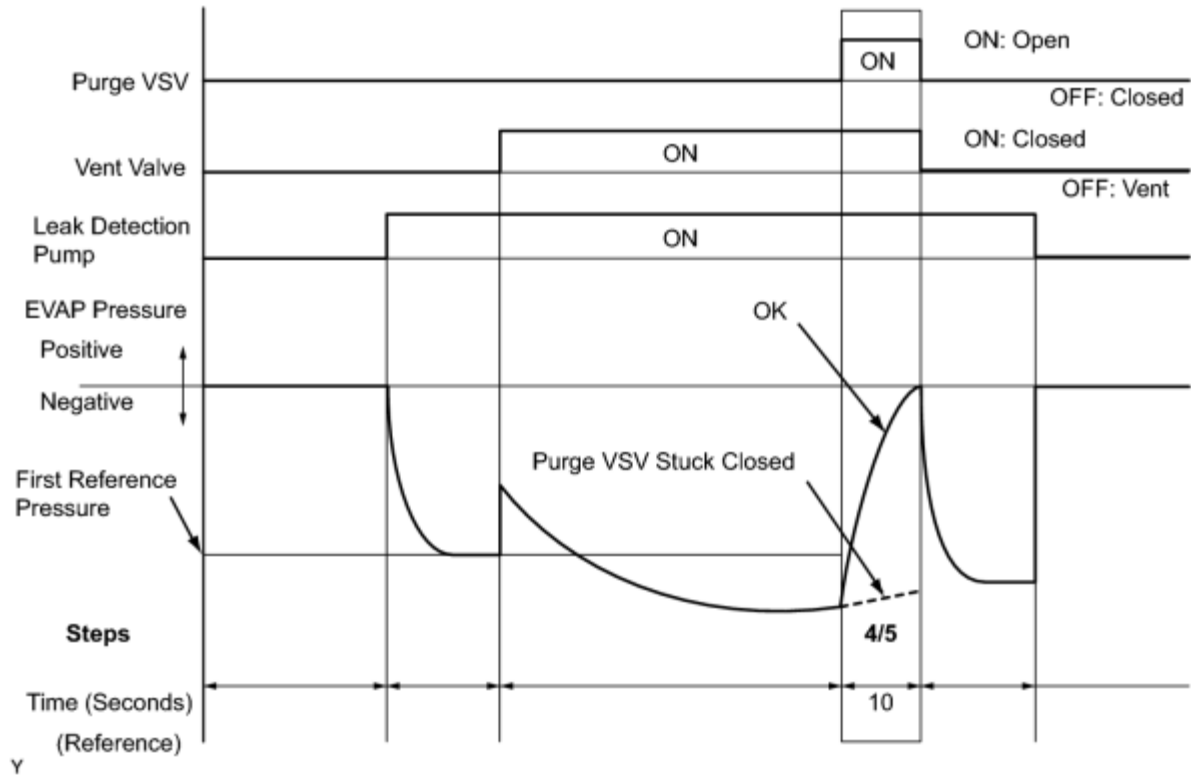

HINT:

A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 15 minutes.

NEXT

9. PERFORM EVAPORATIVE SYSTEM CHECK (STEP 4/5)

(a) Check the EVAP pressure in step 4/5.

Result:

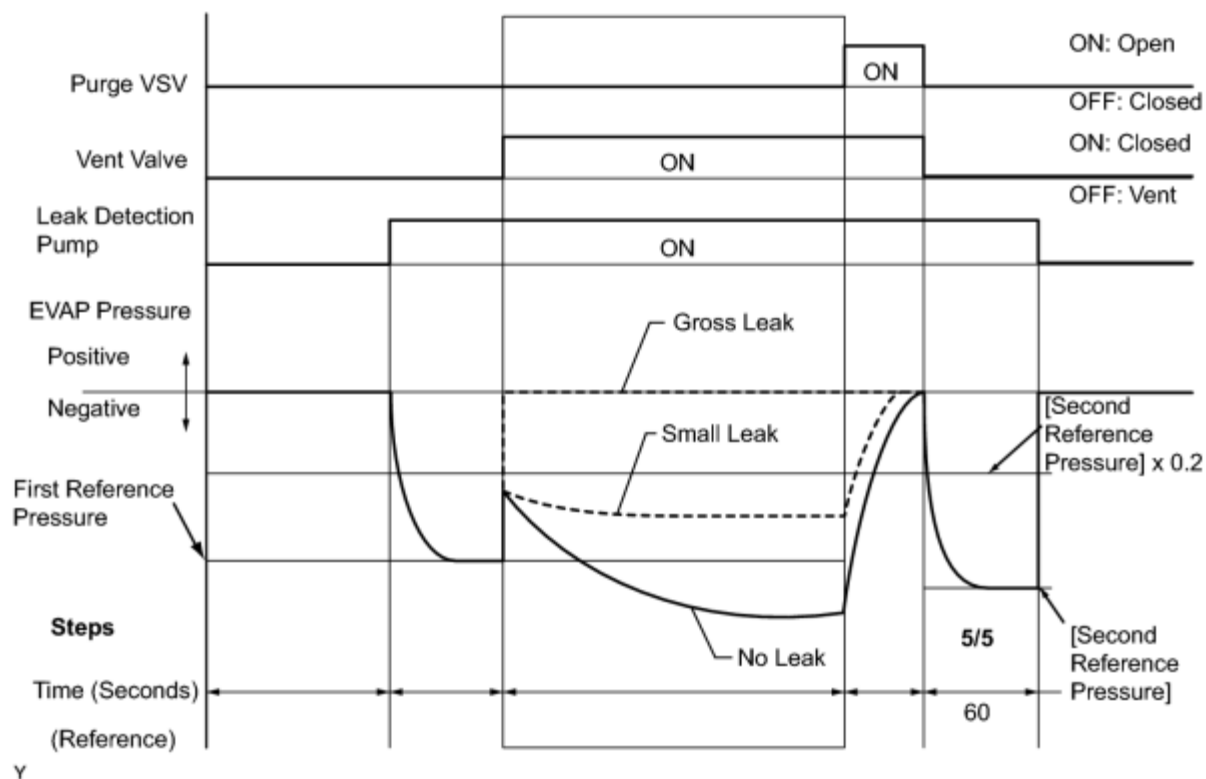

DTC*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa (2.25 mmHg) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between purge VSV and intake manifold	B
P0441	Variation in EVAP pressure less than 0.3 kPa (2.25 mmHg) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "Confirm DTC" procedure above.

(a) Replace the ECM .

NEXT  [PERFORM EVAPORATIVE SYSTEM CHECK \(AUTO OPERATION\)](#)

35. REPAIR OR REPLACE PARTS AND COMPONENTS INDICATED BY OUTPUT DTCS

(a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT

36. PERFORM EVAPORATIVE SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- The Evaporative System Check (Automatic Mode) consists of 5 steps performed automatically by the Techstream. It takes a maximum of approximately 18 minutes.
- Do not perform the Evaporative System Check when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.
- Do not run the engine in this step.
- When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an Evaporative System Check, keep the fuel temperature below 35°C (95°F).

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Clear the DTCs .

(e) Enter the following menus: Powertrain / Engine and ECT / Utility / Evaporative System Check / Automatic Mode.

(f) After the Evaporative System Check is completed, check for pending DTCs by entering the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

HINT:

If no pending DTCs are found, the repair has been successfully completed.

NEXT  COMPLETED

CONFIRMATION DRIVING PATTERN

HINT:

After a repair, check Monitor Status by performing the Key-Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY-OFF MONITOR CONFIRMATION

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway).
- The fuel tank is less than 90% full.
- The altitude is less than 7875 ft. (2400 m).
- The engine coolant temperature is between 4.4°C and 35°C (40°F and 95°F).
- The intake air temperature is between 4.4°C and 35°C (40°F and 95°F).
- The vehicle remains stationary (the vehicle speed is 0 mph [0 km/h]).

(b) Monitor Conditions

1. Put the engine in inspection mode INFO.
2. Allow the engine to idle for at least 5 minutes.
3. Turn the power switch off and wait for 6 hours (8 or 10.5 hours).

HINT:

Do not start the engine until checking Monitor Status. If the engine is started, the steps described above must be repeated.

(c) Monitor Status

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG).
3. Turn the Techstream on.
4. Enter the following menus: Powertrain / Engine and ECT / Monitor / Evaporative System.
5. Check the Monitor Status displayed on the Techstream.

HINT:

If Incomplete is displayed, the monitor did not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

HINT:

Perform this monitor confirmation after the Key-Off Monitor Confirmation shows Complete.

(a) Preconditions

The monitor will not run unless:

- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway).

- The engine coolant temperature is between 4.4°C and 35°C (40°F and 95°F).
- The intake air temperature is between 4.4°C and 35°C (40°F and 95°F).

(b) Monitor Conditions

1. Release the pressure from the fuel tank by removing and reinstalling the fuel cap.
2. Put the engine in inspection mode .
3. Warm the engine up until the engine coolant temperature reaches more than 75°C (167°F).
4. Increase the engine speed to 2500 rpm once.
5. Allow the engine to idle and turn the A/C switch on for 1 minute.

(c) Monitor Status

1. Turn the power switch off (if on (IG) or if the engine is running).
2. Connect the Techstream to the DLC3.
3. Turn the power switch on (IG).
4. Turn the Techstream on.
5. Enter the following menus: Powertrain / Engine and ECT / Monitor / Evaporative System.
6. Check the Monitor Status displayed on the Techstream.

HINT:

If Incomplete is displayed, the monitor did not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

Refer to Checking Monitor Status .

PROCEDURE

1.	CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)
----	---

*1

(a) Disconnect the ECM connector.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
D28-104 (E1) - Body ground	Always	Below 1 Ω

Text in Illustration

*1	Front view of wire harness connector (to ECM)
----	--

(c) Reconnect the ECM connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - BODY GROUND)

OK

2.	INSPECT ECM (IGSW VOLTAGE)
----	----------------------------

(a) Disconnect the ECM connector.

*1

N

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A57-28 (IGSW) - Body ground	Power switch on (IG)	11 to 14 V

Text in Illustration

*1	Front view of wire harness connector (to ECM)
----	--

(d) Reconnect the ECM connector.

NG ► [INSPECT INTEGRATION NO.1 RELAY \(IG2 RELAY\)](#)

OK

3.	INSPECT INTEGRATION NO.1 RELAY (EFI MAIN RELAY)
----	---

(a) Remove the integration relay from the engine room relay block.

*1

(b) Disconnect the integration relay connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied between terminals 1B-2 and 1B-3	10 k Ω or higher
	Battery voltage applied between terminals 1B-2 and 1B-3	Below 1 Ω

Text in Illustration

*1	Component without harness connected (Integration Relay)
----	--

(d) Reconnect the integration relay connector.

(e) Reinstall the integration relay.

NG ► REPLACE INTEGRATION NO.1 RELAY

OK

4.	CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - ECM)
----	--

(a) Remove the integration relay from the engine room relay block.

(b) Disconnect the integration relay connector.

(c) Disconnect the ECM connector.

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
1B-4 - A57-1 (+B2)	Always	Below 1 Ω
1B-4 - A57-2 (+B)	Always	Below 1 Ω
1B-2 - A57-6 (MREL)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
1B-4 or A57-1 (+B2) - Body ground	Always	10 k Ω or higher
1B-4 or A57-2 (+B) - Body ground	Always	10 k Ω or higher
1B-2 or A57-6 (MREL) - Body ground	Always	10 k Ω or higher

Text in Illustration

*3	Front view of wire harness connector	-	-

(to Integration Relay)		
------------------------	--	--

- (e) Reconnect the ECM connector.
- (f) Reconnect the integration relay connector.
- (g) Reinstall the integration relay.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - ECM)

OK

5.	CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - BATTERY)
----	--

*1

*2

(a) Remove the integration relay from the engine room relay block.

- (b) Disconnect the integration relay connector.
- (c) Disconnect the negative battery terminal.
- (d) Disconnect the positive battery terminal.
- (e) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
1C-1 - Battery positive terminal	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
1C-1 or Battery positive terminal - Body ground	Always	10 kΩ or higher

Text in Illustration

*1	Integration Relay
*2	Front view of wire harness connector (to Integration Relay)

(f) Reconnect the integration relay connector.

(g) Reinstall the integration relay.

(h) Reconnect the positive battery terminal.

(i) Reconnect the negative battery terminal.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - BATTERY)

OK

6.	CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - BODY GROUND)
----	--

*1

*2

(a) Remove the integration relay from the engine room relay block.

(b) Disconnect the integration relay connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1B-3 - Body ground	Always	Below 1 Ω

Text in Illustration

*1	Integration Relay
*2	Front view of wire harness connector (to Integration Relay)

(d) Reconnect the integration relay connector.

(e) Reinstall the integration relay.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY (EFI MAIN RELAY) - BODY GROUND)

OK ► PROCEED TO NEXT SUSPECTED AREA SHOWN IN PROBLEM SYMPTOMS TABLE

7.	INSPECT INTEGRATION NO.1 RELAY (IG2 RELAY)
----	--

*1

(a) Remove the integration relay from the engine room relay block.

(b) Disconnect the integration relay connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Text in Illustration

*1	Component without harness connected (Integration Relay)
----	--

(d) Reconnect the integration relay connector.

(e) Reinstall the integration relay.

NG ▶ REPLACE INTEGRATION NO.1 RELAY (IG2 RELAY)

OK

8.	CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY (IG2 RELAY) - ECM)
----	---

(a) Disconnect the ECM connector.

(b) Remove the integration relay from the engine room relay block.

(c) Disconnect the integration relay connector.

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
-------------------	-----------	---------------------

Tester Connection	Condition	Specified Condition
1A-4 - A57-28 (IGSW)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
1A-4 or A57-28 (IGSW) - Body ground	Always	10 k Ω or higher

(e) Reconnect the integration relay connector.

(f) Reinstall the integration relay.

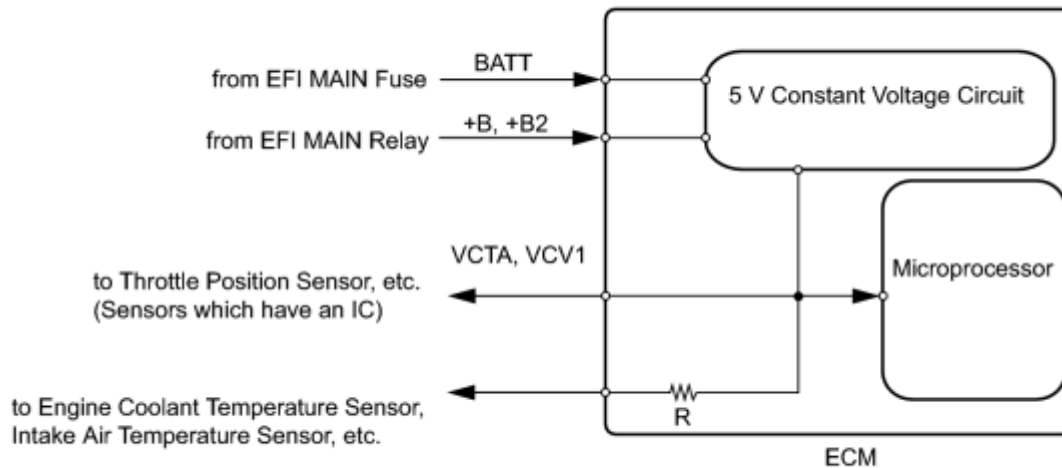

(g) Reconnect the power management control ECU connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (POWER MANAGEMENT CONTROL ECU - INTEGRATION RELAY (IG2 RELAY))

OK ► **CHECK SMART KEY SYSTEM**

DESCRIPTION

The ECM constantly uses 5 V from the battery voltages supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.

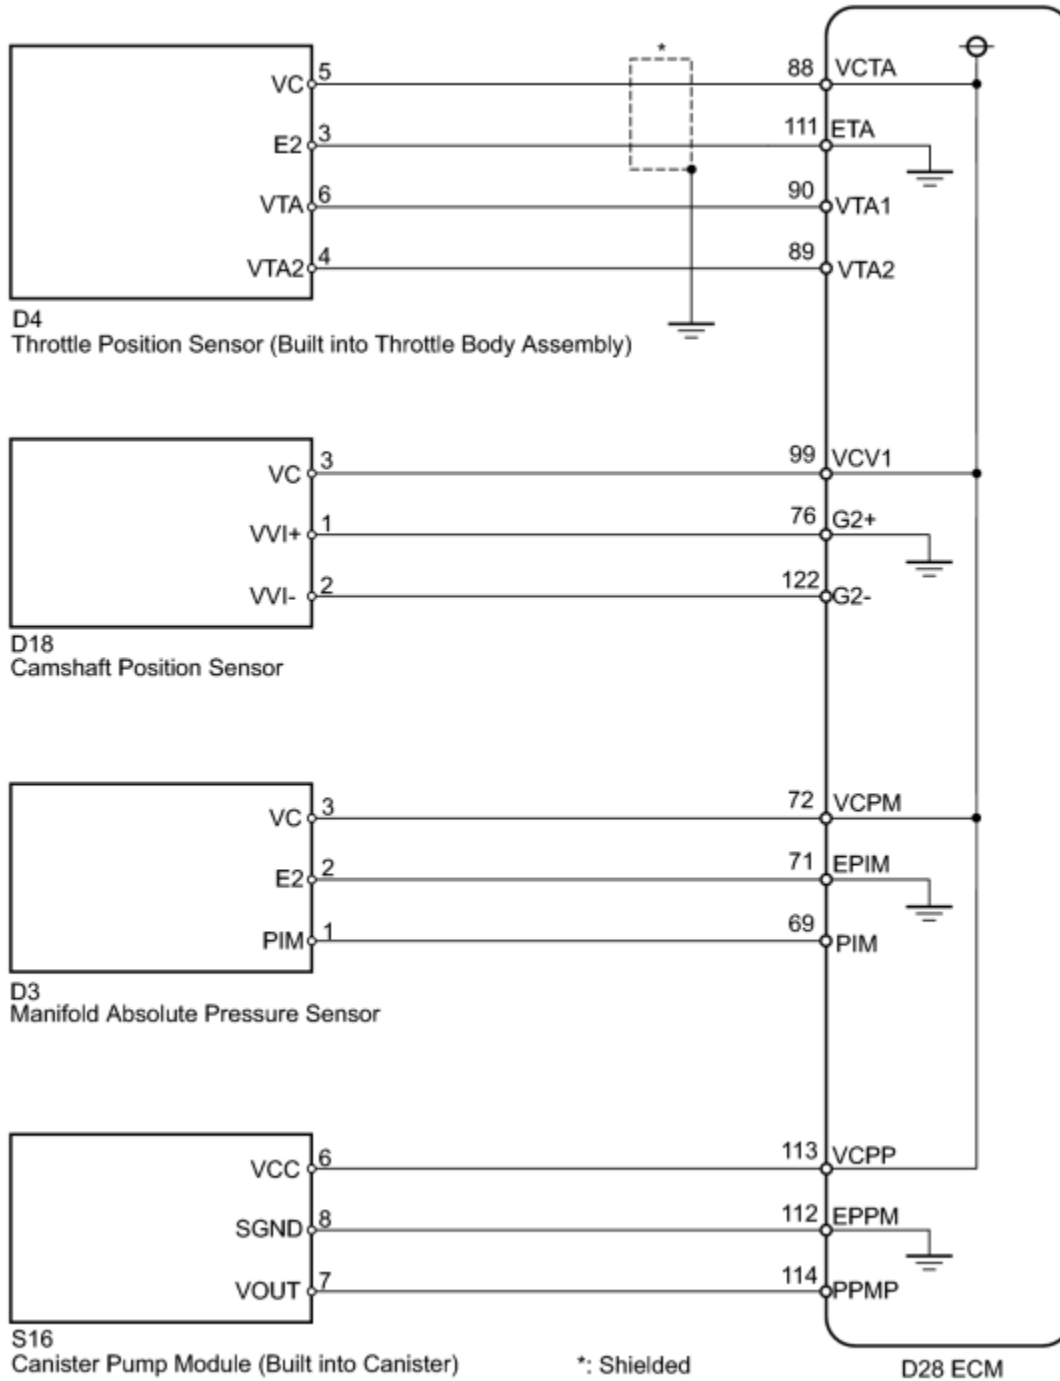

When the VC circuit is shorted, the microprocessor in the ECM and sensors that are supplied power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the power switch is first turned on (IG). The MIL goes off when the engine is started.

WIRING DIAGRAM

INSPECTION PROCEDURE

PROCEDURE

1. CHECK MIL

(a) Check that the Malfunction Indicator Lamp (MIL) illuminates when turning the power switch on (IG).

OK:

MIL lights up.

NG  [CHECK CONNECTION BETWEEN TECHSTREAM AND ECM](#)

OK  **PROCEED TO NEXT SUSPECTED AREA SHOWN IN PROBLEM SYMPTOMS TABLE**

2.	CHECK CONNECTION BETWEEN TECHSTREAM AND ECM
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Check the communication between the Techstream and ECM.

Result:

Result	Proceed to
Communication is possible	A
Communication is not possible	B

A  GO TO MIL CIRCUIT

B

3.	CHECK MIL (THROTTLE POSITION SENSOR)
----	--------------------------------------

(a) Disconnect the throttle position sensor connector.

(b) Turn the power switch on (IG).

(c) Check the MIL.

Result:

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the throttle position sensor connector.

A  REPLACE THROTTLE BODY ASSEMBLY

B

4.	CHECK MIL (CAMSHAFT POSITION SENSOR)
----	--------------------------------------

- (a) Disconnect the camshaft position sensor connector.
- (b) Turn the power switch on (IG).
- (c) Check the MIL.

Result:

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

- (d) Reconnect the camshaft position sensor connector.

A ▶ REPLACE CAMSHAFT POSITION SENSOR

B

5.	CHECK MIL (MANIFOLD ABSOLUTE PRESSURE SENSOR)
----	---

- (a) Disconnect the manifold absolute pressure sensor connector.
- (b) Turn the power switch on (IG).
- (c) Check the MIL.

Result:

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

- (d) Reconnect the manifold absolute pressure sensor connector.

A ▶ REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR

B

6.	CHECK MIL (CANISTER PUMP MODULE)
----	----------------------------------

- (a) Disconnect the canister pump module connector.
- (b) Turn the power switch on (IG).
- (c) Check the MIL.

Result:

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

- (d) Reconnect the canister pump module connector.

A ▶ REPLACE CANISTER

B

7. CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)

- (a) Disconnect the throttle position sensor connector.
- (b) Disconnect the ECM connector.
- (c) Measure the resistance according to the value(s) in the table below.

*1

*2

Standard Resistance:

Tester Connection	Condition	Specified Condition
D28-88 (VCTA) or D4-5 (VC) - Body ground	Always	10 kΩ or higher

*1	Front view of wire harness connector (to Canister Pump Module)	*2	Front view of wire harness connector (to ECM)
----	---	----	--

(d) Reconnect the canister pump module connector.

(e) Reconnect the ECM connector.

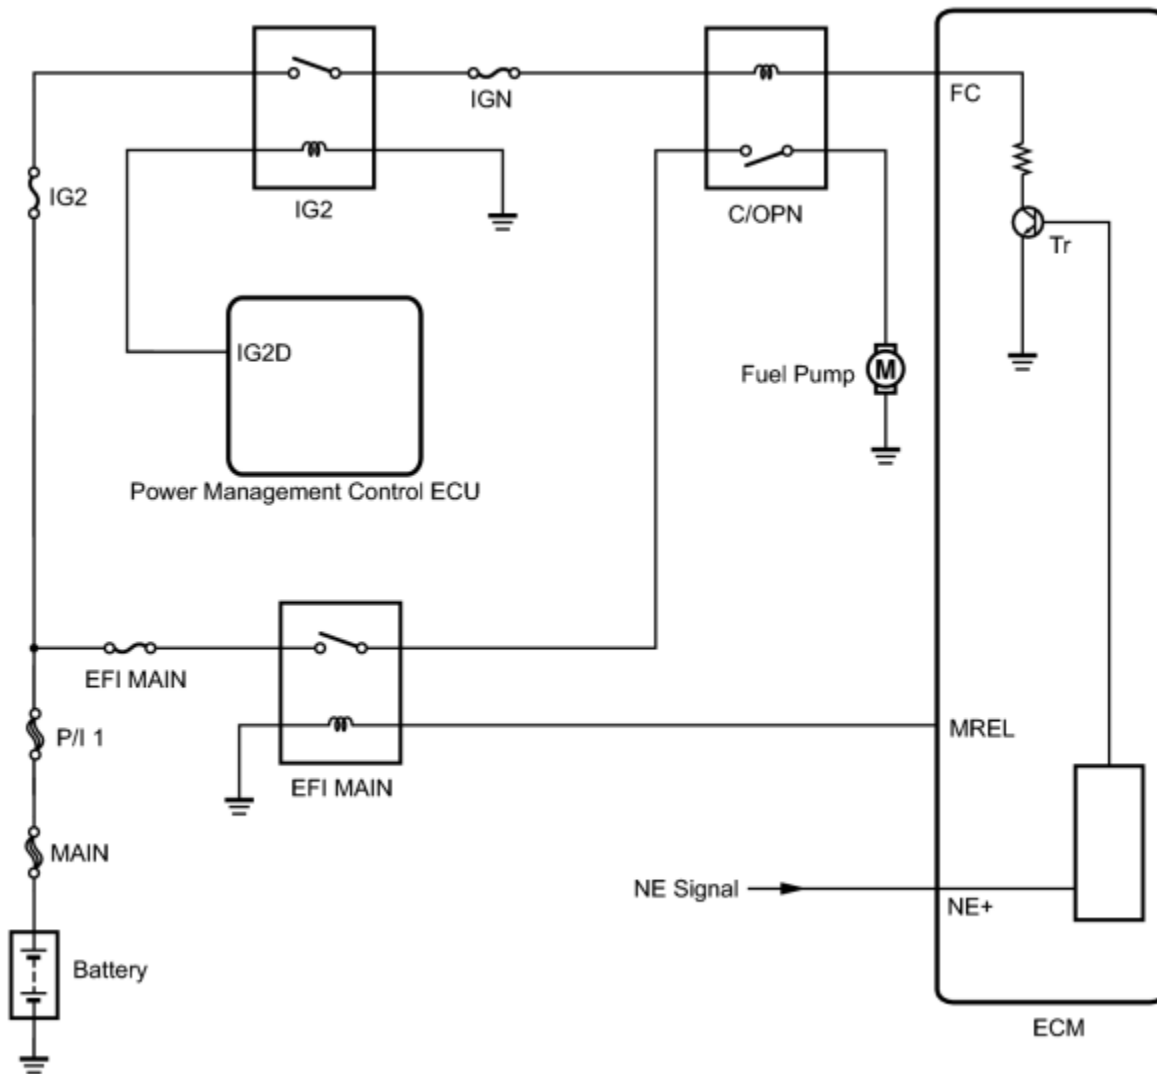

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (CANISTER PUMP MODULE - ECM)

OK  REPLACE ECM

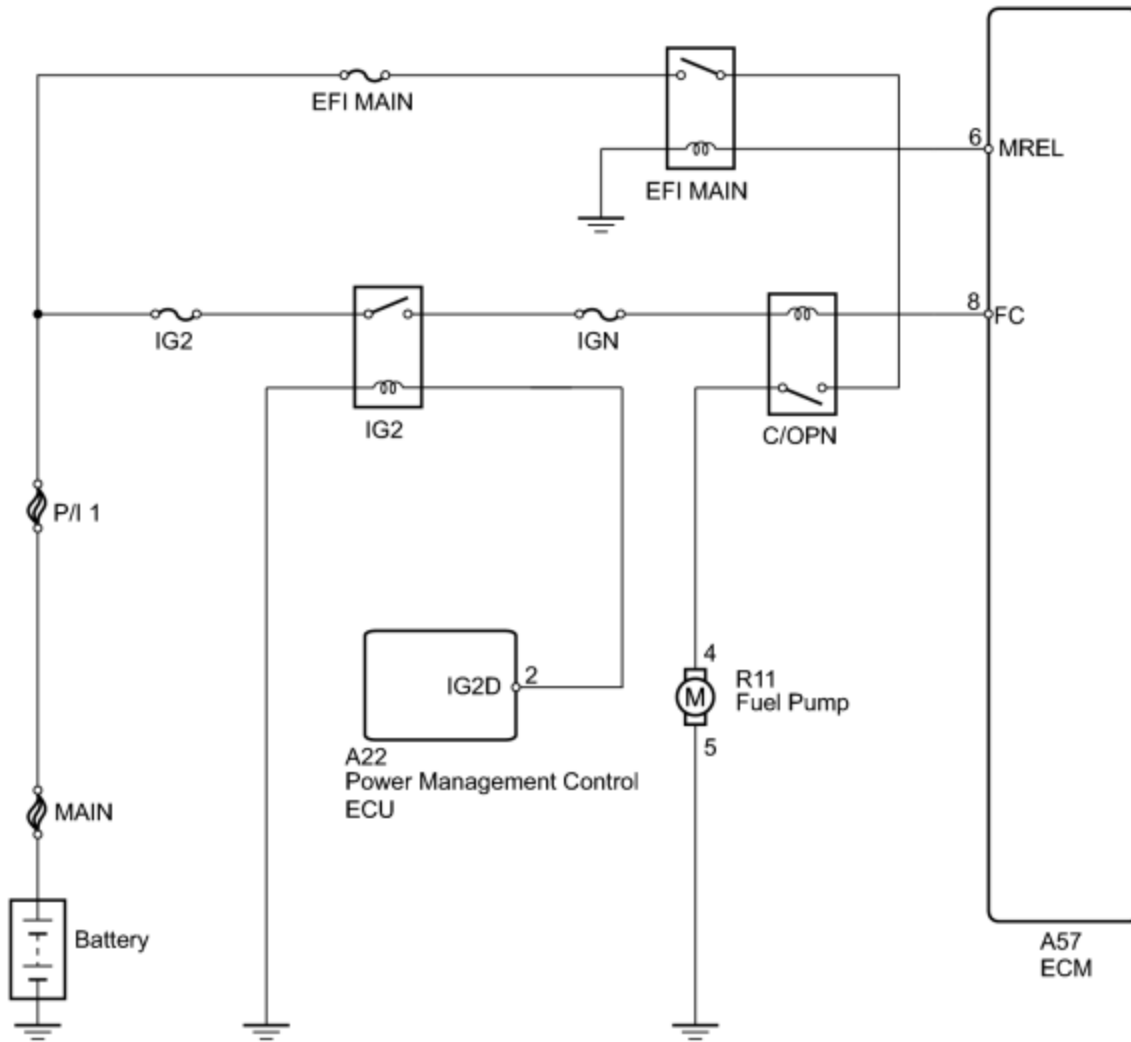

DESCRIPTION

When the NE signal is input to the ECM, Tr is turned on, current flows to the coil of the circuit opening relay, the relay switches on, power is supplied to the fuel pump and the fuel pump operates.

While the NE signal is generated (engine running), the ECM keeps Tr on (circuit opening relay on) and the fuel pump also keeps operating.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

Inspect the fuses for circuits related to this system before performing the following inspection procedure.

PROCEDURE

1.	PERFORM ACTIVE TEST USING TECHSTREAM (OPERATE C/OPN RELAY)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.

(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

(e) Check whether the fuel pump operation sound occurs when performing the Active Test on the Techstream.

OK:

Fuel pump operating sound occurs.

NG  [INSPECT INTEGRATION NO.1 RELAY \(C/OPN RELAY\)](#)

OK  **PROCEED TO NEXT SUSPECTED AREA SHOWN IN PROBLEM SYMPTOMS TABLE**

2.	INSPECT INTEGRATION NO.1 RELAY (C/OPN RELAY)
----	--

*1

(a) Remove the integration relay from the engine room relay block.

(b) Disconnect the integration relay connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1B-4 - 1B-8	No battery voltage applied to terminals 1B-6 and 1B-7	10 k Ω or higher
	Battery voltage applied to terminals 1B-6 and 1B-7	Below 1 Ω

(e) Reconnect the fuel injector assembly connectors.

(f) Reconnect the integration relay connector.

(g) Reinstall the integration relay.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY (IG2 RELAY) - FUEL INJECTOR ASSEMBLY)

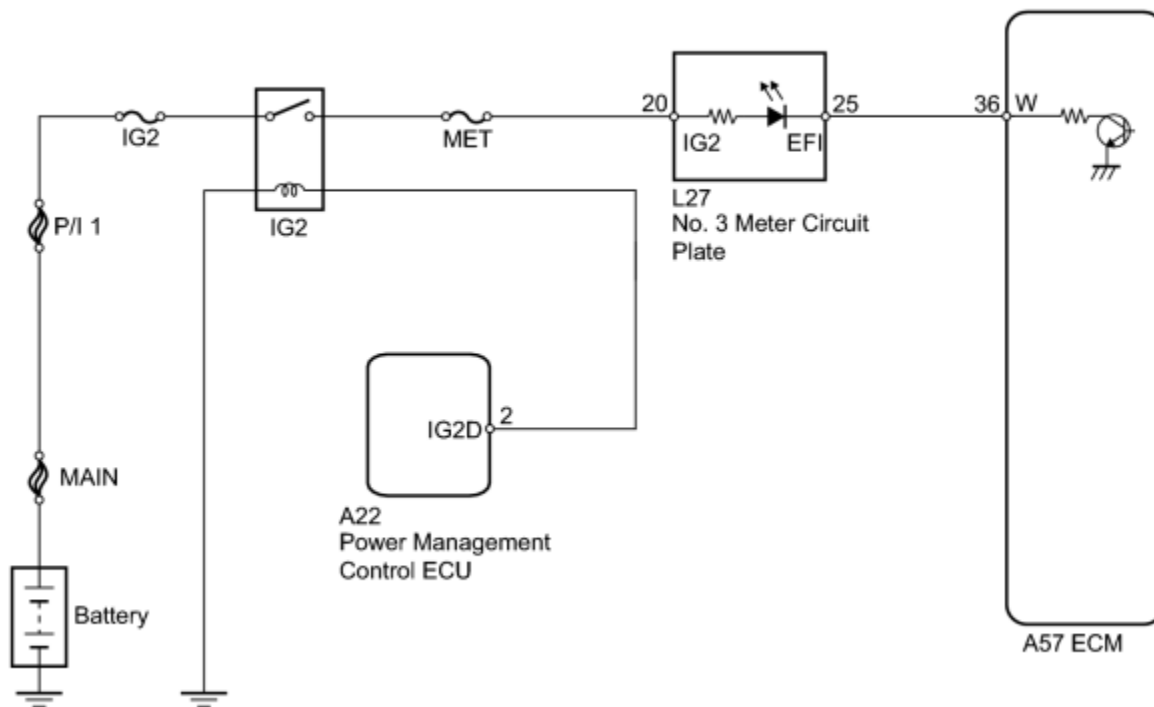

OK  **CHECK ECM POWER SOURCE CIRCUIT**

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detected by the ECM. When the power switch is turned on (IG), power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.

The MIL operation can be checked visually: When the power switch is first turned on (IG), the MIL should illuminate and should then turn off. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the Techstream.

WIRING DIAGRAM

INSPECTION PROCEDURE

PROCEDURE

1. CHECK THAT MIL IS ILLUMINATED

- (a) Turn the power switch on (IG).
- (b) Check the illumination of the MIL.

Result:

Condition	Proceed to
MIL remains illuminated (Even after power switch is turned on (IG) and several seconds have passed, MIL still remains illuminated)	A
MIL remains off (Does not illuminate at all)	B
MIL illuminates for several seconds, but turns off after engine is started	C

C ► SYSTEM OK

B ► [CHECK THAT ENGINE STARTS](#)

A

2.	CHECK WHETHER MIL TURNS OFF
----	-----------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Check if any DTCs have been stored. Note down the DTCs.
- (f) Clear the DTCs .
- (g) Check if the MIL goes off.

OK:

MIL goes off.

NG ► [CHECK HARNESS AND CONNECTOR \(CHECK FOR SHORT IN WIRE HARNESS\)](#)

OK ► **REPAIR CIRCUITS INDICATED BY OUTPUT DTCS**

3.	CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)
----	---

- (a) Disconnect the ECM connector.

*1

N

Text in Illustration

*1	Front view of wire harness connector (to ECM)
----	--

(b) Turn the power switch on (IG).

(c) Check that the MIL is not illuminated.

OK:

MIL is not illuminated.

(d) Reconnect the ECM connector.

NG ► [CHECK HARNESS AND CONNECTOR \(NO. 3 METER CIRCUIT PLATE - ECM\)](#)

OK ► **REPLACE ECM**

4.	CHECK HARNESS AND CONNECTOR (NO. 3 METER CIRCUIT PLATE - ECM)
----	---

(a) Disconnect the No. 3 meter circuit plate connector.

*1

*2

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
L27-25 (EFI) or A57-36 (W) - Body ground	Always	10 kΩ or higher

Text in Illustration

*1	Front view of wire harness connector (to No. 3 Meter Circuit Plate)	*2	Front view of wire harness connector (to ECM)
----	--	----	--

(d) Reconnect the No. 3 meter circuit plate connector.

(e) Reconnect the ECM connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR (NO. 3 METER CIRCUIT PLATE - ECM)

OK ► REPLACE NO. 3 METER CIRCUIT PLATE

5.	CHECK THAT ENGINE STARTS
----	--------------------------

(a) Turn the power switch on (IG).

(b) Put the engine in inspection mode INFO.

(c) Start the engine.

Result:

Result	Proceed to
Engine starts	A
Engine cannot be put in inspection mode* (Engine cannot start)	B

HINT:

*: The Techstream cannot communicate with the ECM.

B ▶ GO TO VC OUTPUT CIRCUIT

A

6.	CHECK HARNESS AND CONNECTOR (ECM TERMINAL VOLTAGE)
----	--

*1

(a) Disconnect the ECM connector.

N

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A57-36 (W) - Body ground	Power switch on (IG)	11 to 14 V

Text in Illustration

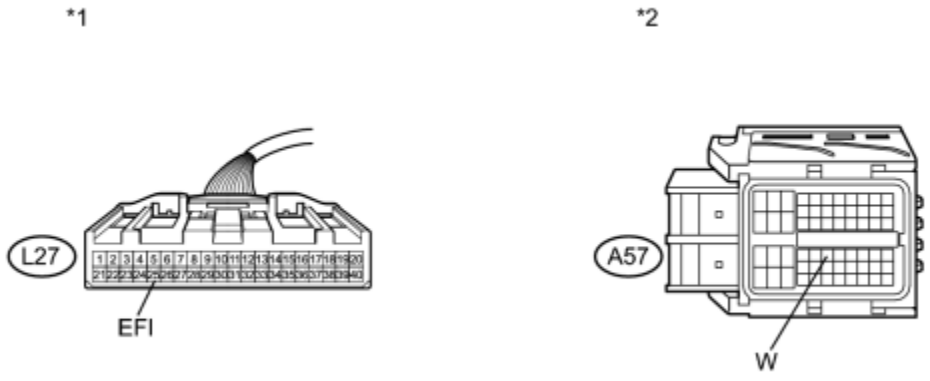

*1	Front view of wire harness connector (to ECM)
----	--

NG ▶ [CHECK HARNESS AND CONNECTOR \(NO. 3 METER CIRCUIT PLATE - ECM\)](#)

OK **REPLACE ECM**

7. CHECK HARNESS AND CONNECTOR (NO. 3 METER CIRCUIT PLATE - ECM)

(a) Disconnect the No. 3 meter circuit plate connector.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
L27-25 (EFI) - A57-36 (W)	Always	Below 1 Ω

Text in Illustration

*1	Front view of wire harness connector (to No. 3 Meter Circuit Plate)	*2	Front view of wire harness connector (to ECM)
----	--	----	--

(d) Reconnect the ECM connector.

(e) Reconnect the No. 3 meter circuit plate connector.

NG **REPAIR OR REPLACE HARNESS OR CONNECTOR (NO. 3 METER CIRCUIT PLATE - ECM)**

OK **REPLACE NO. 3 METER CIRCUIT PLATE**

ILLUSTRATION

ON-VEHICLE INSPECTION

1. INSPECT THROTTLE BODY ASSEMBLY

(a) Check for throttle control motor operating sound.

(1) Turn the power switch on (IG).

(2) When depressing the accelerator pedal, check the operating sound of the motor. Make sure that no friction noises are emitted from the motor. If any friction noise exists, replace the throttle body assembly.

(b) Set the vehicle to the inspection mode  .

(c) Start the engine and check that the MIL is not illuminated. After the engine is warmed up, check that the idle speed is within the specified range when the A/C is switched off.

Standard:

Condition	Engine Idle Speed
A/C switched off	950 to 1050 rpm

NOTICE:

- Be sure to perform this step with all accessories off.
- Make sure that park (P) is selected.

REMOVAL

1. REMOVE NO. 1 ENGINE UNDER COVER

2. DRAIN ENGINE COOLANT (for Engine)_ INFO

3. REMOVE NO. 2 CYLINDER HEAD COVER_ INFO

4. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

(a) Disconnect the mass air flow meter connector.

c

(b) Release the 2 clamps.

c

(c) Loosen the hose clamp and remove the air cleaner cap.

5. REMOVE INLET AIR CLEANER ASSEMBLY

(a) Separate the hose from the hose clamp.

(b) Separate the wire harness clamp from the inlet air cleaner assembly.

(c) Remove the 3 bolts and inlet air cleaner assembly.

6. REMOVE AIR CLEANER CASE

(a) Remove the air cleaner filter element.

(b) Separate the hose from the 3 hose clamps.

(c) Remove the 3 bolts and air cleaner case.

7. REMOVE AIR CLEANER HOSE ASSEMBLY

(a) Loosen the hose clamp and separate the ventilation hose.

c

(b) Unlock the hose clamp and remove the air cleaner hose assembly.

8. REMOVE THROTTLE BODY ASSEMBLY

c

(a) Disconnect the throttle body connector and the 2 water by-pass hoses.

(b) Remove the 2 bolts, 2 nuts and throttle body assembly.

c

(c) Remove the gasket from the intake manifold.

INSPECTION

1. INSPECT THROTTLE BODY ASSEMBLY

(a) Measure the resistance according to the value(s) in the table below.

*1

Text in Illustration

*1	Component without harness connected (Throttle Body)
----	--

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	20°C (68°F)	0.3 to 100 Ω

If the result is not as specified, replace the throttle body assembly.

INSTALLATION

1. INSTALL THROTTLE BODY ASSEMBLY

(a) Install a new gasket onto the intake manifold.

(b) Install the throttle body assembly with the 2 bolts and 2 nuts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

(c) Connect the 2 water by-pass hoses and throttle body connector.

2. INSTALL AIR CLEANER HOSE ASSEMBLY

(a) Install the air cleaner hose assembly and lock the hose clamp.

(b) Connect the ventilation hose.

3. INSTALL AIR CLEANER CASE

(a) Install the air cleaner case with the 3 bolts.

Torque: **7.0 N·m (71 kgf·cm, 62in·lbf)**

c

(b) Install the hose to the 3 hose clamps.

(c) Install the air cleaner filter element.

4. INSTALL INLET AIR CLEANER ASSEMBLY

c

(a) Install the inlet air cleaner assembly with the 3 bolts.

Torque: 7.0 N·m (71 kgf·cm, 62in·lbf)

(b) Connect the wire harness clamp to the inlet air cleaner assembly.

(c) Install the hose to the hose clamp.

5. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

c

(a) Install the air cleaner cap sub-assembly with the 2 clamps.

(b) Tighten the hose clamp.

(c) Connect the mass air flow meter connector.

6. ADD ENGINE COOLANT (for Engine) INFO

7. INSPECT FOR COOLANT LEAK (for Engine) INFO

8. INSTALL NO. 2 CYLINDER HEAD COVER INFO

9. INSTALL NO. 1 ENGINE UNDER COVER

10. PERFORM INITIALIZATION

NOTICE:

Be sure to perform this procedure after reassembling the throttle body assembly, removing and reinstalling any throttle body component or replacing the ECM.

(a) Disconnect the cable from the negative (-) battery terminal. Wait at least 60 seconds and reconnect the cable.

(b) Connect the Techstream to the DLC3 and clear the DTCs INFO.

(c) Set the vehicle to the inspection mode INFO.

(d) Start the engine without operating the accelerator pedal and check that the MIL is not illuminated and that the idle speed is within the specified range when the air conditioning is switched off after the engine is warmed up.

Standard:

Condition	Engine Idle Speed
A/C switched off	950 to 1050 rpm

NOTICE:

- If the accelerator pedal is operated, perform the above steps again.
- Be sure to perform this step with all accessories off.
- Make sure that park (P) is selected.

(e) Perform a road test and confirm that there are no abnormalities.

DTC CHECK / CLEAR

NOTICE:

When the diagnosis system is changed from normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

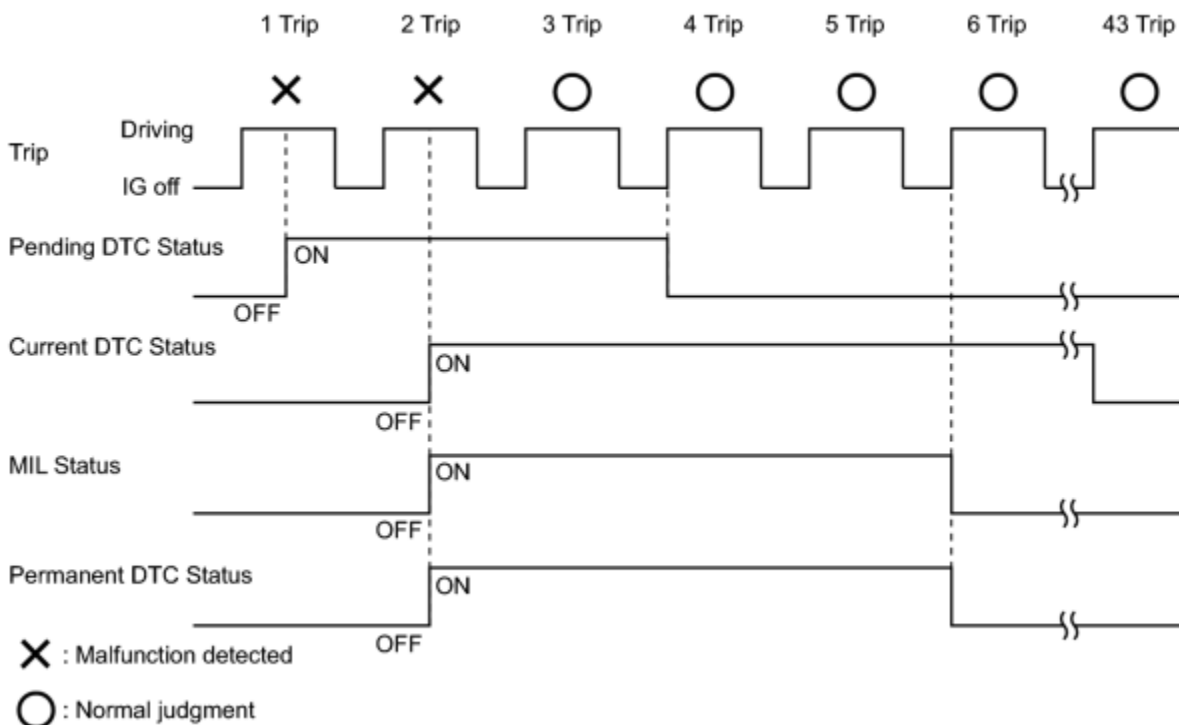

- DTCs which are stored in the ECM can be displayed on the Techstream. The Techstream can display the current, pending and permanent DTCs.
- If a malfunction is detected during the current driving cycle, current and permanent DTCs are stored.
- Some DTCs are not stored if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.
- Current and pending DTCs can be cleared by using the Techstream or by disconnecting the cable from the negative battery terminal. However, permanent DTCs cannot be cleared using either of these two methods.
- After clearing current DTCs using the Techstream (or by disconnecting the cable from the negative battery terminal), permanent DTCs can be cleared when the system is determined to be normal for the relevant DTCs and then the universal trip is performed. The driving pattern to obtain a normal judgment is described under the "Confirmation Driving Pattern" for the respective DTC.

2 Trip Detection Examples

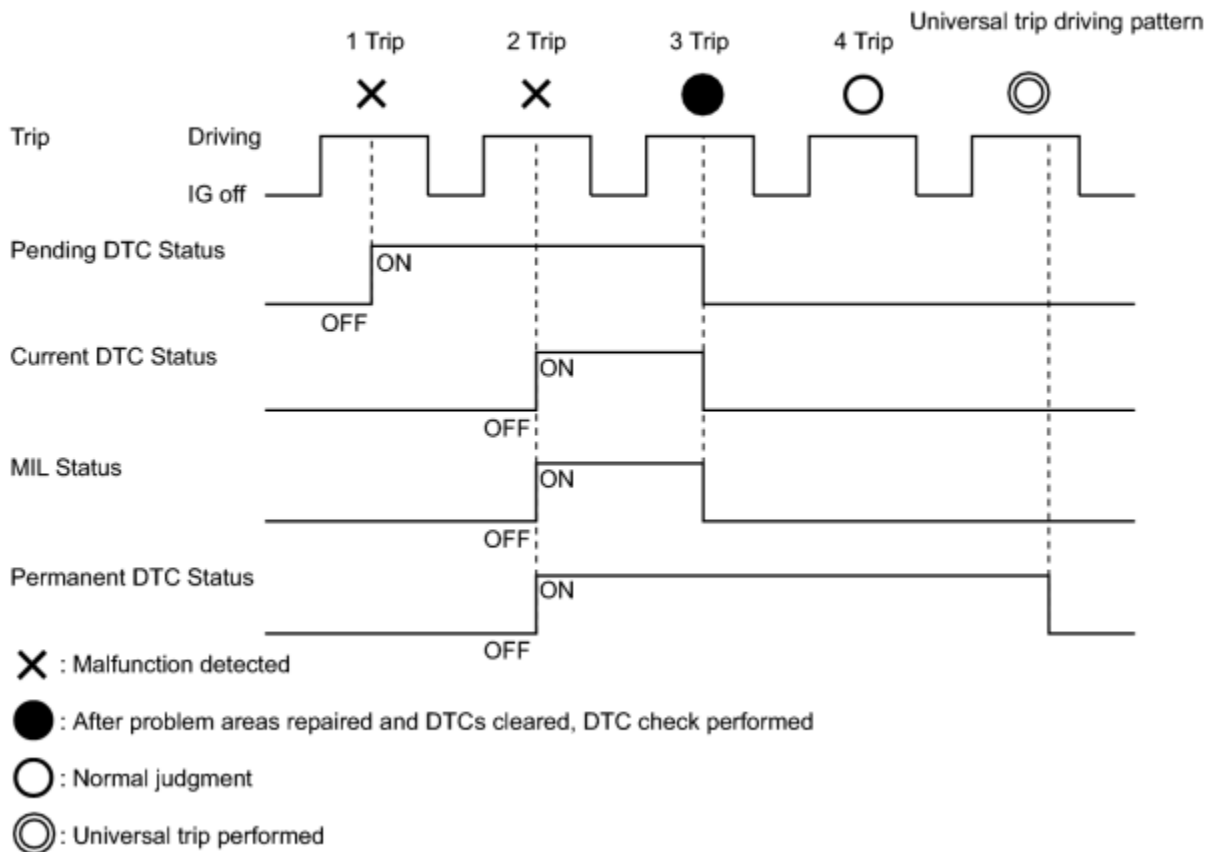

Pending DTC	Store condition	Malfunction detected
	Clear condition	System determined to be normal or DTCs cleared using Techstream or Cable disconnected from negative (-) battery terminal
Current DTC	Store condition	Malfunction detected (2nd trip)
	Clear condition	No malfunctions in 40 driving cycles or DTCs cleared using Techstream or Cable disconnected from negative (-) battery terminal
Permanent	Store	Malfunction detected (2nd trip)

DTC	condition	
	Clear condition	<p>Power switch turned to on (IG) after normal judgment obtained in 3 consecutive driving cycles</p> <p>or</p> <p>After DTCs cleared using Techstream or cable disconnected from negative (-) battery terminal, normal judgment obtained and universal trip performed (not for misfire and fuel system DTCs)</p> <p>or</p> <p>After DTCs cleared using Techstream or cable disconnected from negative (-) battery terminal, malfunction not detected when universal trip driving performed (misfire and fuel system DTCs)</p>
MIL	ON	Malfunction detected (2nd trip)
	OFF	<p>Power switch turned to on (IG) after normal judgment obtained in 3 consecutive driving cycles</p> <p>or</p> <p>DTCs cleared using Techstream</p> <p>or</p> <p>Cable disconnected from negative (-) battery terminal</p>

2 Trip Detection Examples

2 Trip Detection Examples (Instance when DTCs were cleared midway through by using the Techstream or by disconnecting the cable from the negative battery terminal)

HINT:

- Obtaining a normal judgment and performing a universal trip driving pattern can be done in the same driving cycle or in different driving cycles.
- It is unnecessary to obtain a normal judgment if the DTCs are misfire or fuel system DTCs.

1. CHECK DTC

- Connect the Techstream to the DLC3.
- Turn the power switch on (IG).
- Turn the Techstream on.
- Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- Check the DTC(s) and freeze frame data, and then write them down.
- Check the details of the DTC(s) INFO.

2. CLEAR DTC (Pending and Current DTC)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (e) Clear the DTCs.

3. CLEAR DTC (Pending and Current DTC without using Techstream)

- (a) Perform either of the following operations:
 - (1) Disconnect the cable from the negative (-) battery terminal for more than 1 minute.
 - (2) Remove the EFI MAIN and ETCS fuses from the engine room relay block located inside the engine compartment for more than 1 minute.

4. CLEAR PERMANENT DTC

HINT:

Even if the following procedure is not performed, permanent DTCs are cleared by obtaining a normal judgment during 3 consecutive driving cycles.

Universal Trip Driving Pattern

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).

(c) Turn the Techstream on.

(d) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(e) Check if permanent DTCs are stored.

HINT:

If permanent DTCs are not output, it is not necessary to continue this procedure.

(f) Clear DTCs.

(g) Perform the respective confirmation driving patterns in order to obtain a normal judgment for the output DTCs.

HINT:

- Confirmation driving patterns do not need to be performed for misfire and fuel system DTCs.
- For the confirmation driving pattern, refer to the procedures for the relevant DTC INFO.

(h) Perform the universal trip.

HINT:

The driving pattern to obtain a normal judgment and the universal trip driving can be performed consecutively in the same driving cycle.

1. Put the engine in inspection mode INFO.
2. Idle the engine for 30 seconds or more.
3. Drive the vehicle at 25 mph (40 km/h) or more for a total of 5 minutes or more.

HINT:

It is possible to complete the drive pattern even if the vehicle decelerates to less than 25 mph (40 km/h) during the driving cycle provided that the vehicle is driven at 25 mph (40 km/h) or more for a total of 5 minutes.

4. Allow 10 minutes or more to elapse from the time the engine is started.

(i) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

(j) Check that the permanent DTCs have been cleared.

HINT:

The permanent DTCs are cleared when the universal trip is completed.

REMOVAL

1. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Remove the engine assembly with transaxle [INFO](#).

2. INSTALL ENGINE ON ENGINE STAND [INFO](#)

3. REMOVE ENGINE HANGERS [INFO](#)

4. REMOVE THROTTLE BODY ASSEMBLY [INFO](#)

5. REMOVE ENGINE OIL LEVEL DIPSTICK GUIDE [INFO](#)

6. REMOVE EGR PIPE ASSEMBLY [INFO](#)

7. REMOVE EGR VALVE ASSEMBLY [INFO](#)

8. REMOVE EGR WITH COOLER PIPE SUB-ASSEMBLY [INFO](#)

9. REMOVE INTAKE MANIFOLD [INFO](#)

10. REMOVE FUEL VAPOR FEED PIPE [INFO](#)

11. REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY [INFO](#)

12. REMOVE NO. 1 DELIVERY PIPE SPACER [INFO](#)

13. REMOVE FUEL INJECTOR ASSEMBLY [INFO](#)

14. REMOVE IGNITION COIL ASSEMBLY [INFO](#)

15. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY [INFO](#)

16. REMOVE CYLINDER HEAD COVER GASKET [INFO](#)

17. REMOVE SPARK PLUG TUBE GASKET [INFO](#)

18. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Turn the crankshaft pulley until its notch and timing mark "0" of the timing chain cover are aligned.

Text in Illustration

*1	Timing Mark
----	-------------

*2

Timing Notch

(b) Check that timing marks on both the camshaft timing sprocket and camshaft timing gear are facing upward as shown in the illustration.

If not, turn the crankshaft 1 complete revolution (360°) and align the marks as above.

19. REMOVE CRANKSHAFT PULLEY INFO

20. REMOVE NO. 1 CHAIN TENSIONER ASSEMBLY

(a) Remove the 2 nuts, bracket, chain tensioner and gasket.

NOTICE:

Do not turn the crankshaft without the No. 1 chain tensioner installed.

21. REMOVE TIMING CHAIN COVER SUB-ASSEMBLY INFO

22. REMOVE TIMING CHAIN COVER OIL SEAL INFO

23. REMOVE CHAIN TENSIONER SLIPPER

(a) Remove the chain tensioner slipper from the cylinder block.

24. REMOVE NO. 1 CHAIN VIBRATION DAMPER

(a) Remove the 2 bolts and chain vibration damper.

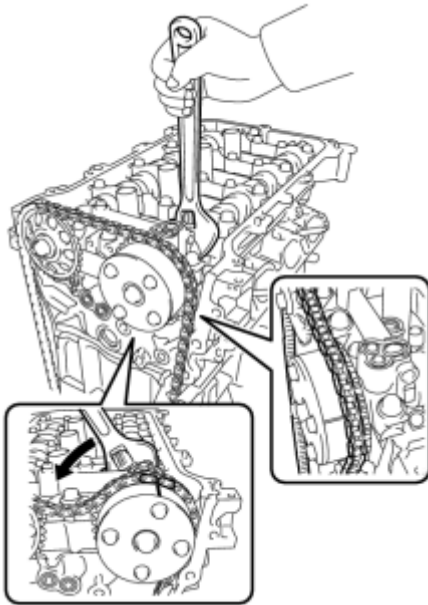

25. REMOVE NO. 2 CHAIN VIBRATION DAMPER

(a) Remove the 2 bolts and No. 2 chain vibration damper.

26. REMOVE CHAIN SUB-ASSEMBLY

(a) Hold the hexagonal portion of the camshaft with a wrench and turn the camshaft timing gear counterclockwise to loosen the chain between the camshaft timing gears.

(b) With the chain loosened, release the chain from the camshaft timing gear and place it on the camshaft timing gear.

HINT:

Be sure to release the chain from the sprocket completely.

(c) Turn the camshaft clockwise to return it to the original position and remove the chain.

27. INSPECT CAMSHAFT TIMING GEAR ASSEMBLY

(a) Inspect the lock of the camshaft timing gear.

(b) After cleaning and degreasing the VVT oil hole on the intake side of the No. 1 camshaft bearing cap, completely seal the oil hole with adhesive tape or equivalent as shown in the illustration to prevent air from leaking.

Text in Illustration

*1	Adhesive Tape
*a	Adhesive Tape Sealing Area
*b	Prick a Hole

NOTICE:

Be sure to cover the oil hole completely because air leaks due to insufficient sealing will prevent the lock pin from being released.

(c) Prick a hole in the tape covering the oil hole as shown in the illustration. (Procedure A)

(d) Apply approximately 150 kPa (1.5 kgf/cm², 22 psi) of air pressure to the hole pricked in procedure A to release the lock pin.

- If air leaks out, reattach the adhesive tape.
- Cover the oil hole with a piece of cloth when applying air pressure to prevent oil from spraying.

(e) Forcibly turn the camshaft timing gear in the advance direction (counterclockwise).

HINT:

Depending on the air pressure applied, the camshaft timing gear may turn in the advance direction without assistance.

(f) Turn the camshaft timing gear within its movable range (26.5 to 28.5°) 2 or 3 times without turning it to the most retarded position. Make sure that the camshaft timing gear turns smoothly.

(g) Remove the adhesive tape from the No. 1 camshaft bearing cap.

28. REMOVE CAMSHAFT TIMING GEAR ASSEMBLY

(a) Remove the flange bolt while holding the hexagonal portion of the camshaft with a wrench, and then remove the camshaft timing gear.

Text in Illustration

*1	Flange Bolt
*a	Do not remove

NOTICE:

- Before removing the camshaft timing gear, make sure that the lock pin has been released.
- Be sure not to remove the other 4 bolts.

- Keep the camshaft timing gear horizontal while removing it from the camshaft.

29. REMOVE CAMSHAFT TIMING SPROCKET

(a) Remove the flange bolt while holding the hexagonal portion of the camshaft with a wrench, and then remove the camshaft timing sprocket.

30. REMOVE CAMSHAFT BEARING CAP

(a) Uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.

(b) Uniformly loosen and remove the 15 bearing cap bolts in the sequence shown in the illustration.

NOTICE:

Uniformly loosen the bearing cap bolts while keeping the camshaft housing level.

(c) Remove the 5 bearing caps.

HINT:

Arrange the removed parts in the correct order.

31. REMOVE CAMSHAFT

(a) Remove the camshaft.

32. REMOVE NO. 2 CAMSHAFT

(a) Remove the No. 2 camshaft.

33. REMOVE NO. 1 CAMSHAFT BEARING

(a) Remove the 2 No. 1 camshaft bearings.

34. REMOVE NO. 2 CAMSHAFT BEARING

(a) Remove the 2 No. 2 camshaft bearings.

T

35. REMOVE CAMSHAFT HOUSING SUB-ASSEMBLY

T

(a) Remove the 2 bolts.

(b) Remove the camshaft housing by prying between the cylinder head and camshaft housing with a screwdriver.

Text in Illustration

*1	Protective Tape
----	-----------------

NOTICE:

Be careful not to damage the contact surfaces of the cylinder head and camshaft housing.

HINT:

Tape the screwdriver tip before use.

INSTALLATION

1. INSTALL NO. 1 CAMSHAFT BEARING

- (a) Clean both surfaces of the bearings.
- (b) Install the 2 No. 1 camshaft bearings.

- (c) Using a vernier caliper, measure the distance between the bearing cap edge and the camshaft bearing edge.

Text in Illustration

*1	Vernier Caliper
----	-----------------

Standard dimension (A - B):

0.7 mm (0.0276 in.) or less

NOTICE:

Position the bearings to the center of the bearing cap by measuring dimensions A and B.

2. INSTALL NO. 2 CAMSHAFT BEARING

- (a) Clean both surfaces of the bearings.
- (b) Install the 2 No. 2 camshaft bearings.

- (c) Using a vernier caliper, measure the distance between the bearing cap edge and the camshaft bearing edge.

Text in Illustration

*1	Vernier Caliper
----	-----------------

Standard dimension (A):

1.05 to 1.75 mm (0.0413 to 0.0689 in.)

NOTICE:

Position the bearings to the center of the bearing cap by measuring dimension A.

3. INSTALL NO. 2 CAMSHAFT

- (a) Clean the camshaft journals.
- (b) Apply a light coat of engine oil to the camshaft journals, camshaft housings and bearing caps.

c

- (c) Install the No. 2 camshaft to the camshaft housing.

4. INSTALL CAMSHAFT

- (a) Clean the camshaft journals.
- (b) Apply a light coat of engine oil to the camshaft journals, camshaft housings and bearing caps.

c

- (c) Install the camshaft to the camshaft housing.

5. INSTALL BEARING CAP

(a) Apply engine oil to the camshaft journals, camshaft housings and bearing caps.

(b) Make sure of the marks and numbers on the camshaft bearing caps and place them in each proper position and direction.

Text in Illustration

*1	Knock Pin
*2	Camshaft

(c) Tighten the 10 bolts in the order shown in the illustration.

Torque: **16 N·m (163 kgf·cm, 12ft·lbf)**

6. INSTALL CAMSHAFT HOUSING SUB-ASSEMBLY

(a) Check that the valve rocker arms are installed as shown in the illustration.

Text in Illustration

*1	Valve Stem Cap
*2	Valve Rocker Arm
*3	Valve Lash Adjuster

(b) Apply seal packing in a continuous line as shown in the illustration.

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard Seal Diameter:

Area	Specified Condition
------	---------------------

Continuous line	3.5 to 4.5 mm (0.138 to 0.177 in.)
A	8.0 mm (0.315 in.)
B	7.0 mm (0.276 in.)

Application Length A and B:

15 mm (0.591 in.)

- Remove any oil from the contact surfaces.
- Install the camshaft housing within 3 minutes and tighten the bolts within 10 minutes of applying seal packing.
- Do not start the engine for at least 2 hours after installation.

(c) Set the camshaft and No. 2 camshaft as shown in the illustration.

(d) Install the camshaft housing with the 17 bolts and tighten them in the order shown in the illustration.

Torque: **27 N·m (275 kgf·cm, 20ft·lbf)**

NOTICE:

- After installing the camshaft housing, make sure that the cam lobes are positioned as shown in the illustration.
- If any of the bolts is loosened during installation, remove the camshaft housing, clean the installation surfaces, and reapply seal packing.
- If the camshaft housing is removed because any of the bolts is loosened during installation, make sure that the previously applied seal packing does not enter any oil passages.
- After installing the camshaft housing, wipe off any seal packing that seeped out from between the housing and cylinder head.

7. INSTALL CAMSHAFT TIMING SPROCKET

(a) Tighten the flange bolt with the camshaft timing sprocket secured in place.

Torque: **54 N·m (551 kgf·cm, 40ft·lbf)**

8. INSTALL CAMSHAFT TIMING GEAR ASSEMBLY

(a) Put the camshaft timing gear and camshaft together with the straight pin and key groove misaligned as shown in the illustration.

Text in Illustration

*1	Straight Pin
*2	Key Groove

NOTICE:

Do not forcefully push in the camshaft timing gear. This may cause the camshaft straight pin tip to damage the installation surface of the camshaft timing gear.

(b) Turn the camshaft timing gear as shown in the illustration while pushing it gently against the camshaft. Push further at the position where the pin fits into the groove.

Text in Illustration

*1	Straight Pin
*2	Key Groove

NOTICE:

Do not turn the camshaft timing gear in the retard direction (clockwise).

(c) Check that there is no clearance between the camshaft timing gear and camshaft flange.

Text in Illustration

*1	Camshaft Timing Gear
*2	Flange
*a	Clearance

*b	No Clearance
----	--------------

(d) Tighten the flange bolt with the camshaft timing gear secured in place.

Torque: **54 N·m (551 kgf·cm, 40ft·lbf)**

(e) Check that the camshaft timing gear can move in the retard direction (clockwise) and is locked in the most retarded position.

Text in Illustration

*a	Lock
----	------

9. INSTALL NO. 1 CHAIN VIBRATION DAMPER

(a) Install the chain vibration damper with the 2 bolts.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

10. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Temporarily install the crankshaft pulley bolt.

Text in Illustration

*1	Timing Gear Key
----	-----------------

(b) Turn the crankshaft to position the timing gear key to the top.

(c) Check that the timing marks on the camshaft timing gear and camshaft timing sprocket are aligned as shown in the illustration.

Text in Illustration

*1	Timing Mark
----	-------------

c

(d) Remove the crankshaft pulley bolt.

11. INSTALL CHAIN SUB-ASSEMBLY

(a) Align the mark plate (orange) with the timing mark as shown in the illustration and install the chain.

Text in Illustration

*1	Mark Plate (Orange)
*2	Timing Mark

- Be sure to position the mark plate at the front of the engine.
- The mark plate on the camshaft side is colored orange.
- Do not pass the chain around the sprocket of the camshaft timing gear. Only place it on the sprocket.
- Pass the chain through the No. 1 vibration damper.

c

(b) Hold the hexagonal portion of the camshaft with a wrench and turn the camshaft timing gear counterclockwise to align the mark plate (orange) and timing mark, and then install the chain.

(c) Hold the hexagonal portion of the camshaft with a wrench and turn the camshaft timing gear clockwise.

HINT:

To tension the chain, slowly turn the camshaft timing gear clockwise to prevent the chain from being misaligned.

(d) Align the mark plate (yellow) and timing mark and install the chain to the crankshaft timing gear.

Text in Illustration

*1	Mark Plate (Yellow)
*2	Timing Mark

HINT:

The mark plate on the crankshaft side is colored pink.

T

12. CHECK NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Check each timing mark at TDC/compression.

c

Text in Illustration

*1	Timing Mark	*2	Mark Plate (Orange)
*3	Mark Plate (Yellow)	-	-

13. INSTALL NO. 2 CHAIN VIBRATION DAMPER

(a) Install the No. 2 chain vibration damper with the 2 bolts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

14. INSTALL CHAIN TENSIONER SLIPPER

(a) Install the chain tensioner slipper to the cylinder block.

15. INSTALL TIMING CHAIN COVER OIL SEAL INFO

16. INSTALL TIMING CHAIN COVER SUB-ASSEMBLY INFO

17. INSTALL CRANKSHAFT PULLEY INFO

18. INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY

(a) Release the cam, and then fully push in the plunger and engage the hook to the pin so that the plunger is in the position shown in the illustration.

Text in Illustration

*1	Cam
*2	Pin
*3	Hook
*a	Push
*b	Raise
*c	CORRECT
*d	INCORRECT

NOTICE:

Make sure that the cam engages the first tooth of the plunger to allow the

hook to pass over the pin.

(b) Install a new gasket, the bracket and chain tensioner with the 2 nuts.

Torque: **12 N·m (122 kgf·cm, 9ft·lbf)**

NOTICE:

If the hook releases the plunger while the chain tensioner is being installed, set the hook again.

(c) Rotate the crankshaft counterclockwise slightly and check that the hook becomes released.

Text in Illustration

*1	Pin
*2	Hook
*a	Push

ILLUSTRATION

N*m (kgf*cm, ft.*lbf): Specified torque

ILLUSTRATION

DISASSEMBLY

1. REMOVE NO. 1 VENTILATION CASE

(a) Remove the 6 bolts and 2 nuts.

(b) Remove the ventilation case by prying between the ventilation case and cylinder block with a screwdriver as shown in the illustration.

Text in Illustration

*1	Protective Tape
----	-----------------

NOTICE:

Be careful not to damage the contact surfaces of the cylinder block and No. 1 ventilation case.

HINT:

Tape the screwdriver tip before use.

2. INSPECT CONNECTING ROD THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the connecting rod cap back and forth.

Standard thrust clearance:

0.160 to 0.342 mm (0.00630 to 0.0135 in.)

Maximum thrust clearance:

0.342 mm (0.0132 in.)

If the thrust clearance is greater than the maximum, replace the connecting rod assemblies as necessary. If necessary, replace the crankshaft.

3. INSPECT CONNECTING ROD OIL CLEARANCE

(a) Check that the matchmarks on the connecting rod and cap are aligned

to ensure correct reassembly.

Text in Illustration

*a	Matchmark
----	-----------

HINT:

The matchmarks on the connecting rods and caps are provided to ensure correct reassembly.

(b) Using SST, uniformly loosen the 2 bolts.

SST: 09205-16011

(c) Using the 2 removed connecting rod cap bolts, remove the connecting rod cap and lower bearing by wiggling the connecting rod cap right and left.

HINT:

Keep the lower bearing inserted in the connecting rod cap.

(d) Clean the crank pin and bearing.

(e) Check the crank pin and bearing for pitting and scratches.

If the crank pin or bearing is damaged, replace the bearings. If necessary, replace the crankshaft.

(f) Lay a strip of Plastigage on the crank pin.

Text in Illustration

*1	Plastigage
----	------------

(g) Check that the front mark of the connecting rod cap is facing forward and install the connecting rod cap.

Text in Illustration

*a	Front Mark
----	------------

T

(h) Apply a light coat of engine oil to the threads and under the heads of the connecting rod cap bolts.

(i) Install the connecting rod cap bolts.

NOTICE:

The connecting rod cap bolts should be tightened in 2 progressive steps.

(j) Step 1:

(1) Using SST, install and alternately tighten the bolts of the connecting rod cap in several steps.

SST: 09205-16011

Torque: **20 N·m (204 kgf·cm, 15ft·lbf)**

NOTICE:

Do not turn the crankshaft.

T

(k) Step 2:

P

Text in Illustration

*a	Paint Mark
→	Engine Front

(1) Mark the front of the connecting rod cap bolts with paint.

(2) Tighten the cap bolts 90° as shown in the illustration.

NOTICE:

Do not turn the crankshaft.

(l) Remove the 2 bolts and connecting rod cap.

HINT:

Keep the lower bearing inserted in the connecting rod cap.

(m) Measure the Plastigage at its widest point.

Text in Illustration

*1	Plastigage
*a	Mark 1, 2 or 3

Standard oil clearance:

0.014 to 0.038 mm (0.000551 to 0.00150 in.)

Maximum oil clearance:

0.070 mm (0.00276 in.)

If the oil clearance is more than the maximum, replace the connecting rod bearings. If necessary, inspect the crankshaft.

NOTICE:

Remove the Plastigage completely after the measurement.

HINT:

If replacing a bearing, replace it with one that has the same number as its respective connecting rod cap. Each bearing standard thickness is indicated by a 1, 2, or 3 mark on its surface.

Standard Connecting Rod Large End Bore Diameter:

Mark	Specified Condition
Mark 1	47.000 to 47.008 mm (1.85039 to 1.85070 in.)
Mark 2	47.009 to 47.016 mm (1.85074 to 1.85102 in.)
Mark 3	47.017 to 47.024 mm (1.85106 to 1.85133 in.)

T

Standard Connecting Rod Bearing Thickness:

Mark	Specified Condition
Mark 1	1.489 to 1.493 mm (0.05862 to 0.05878 in.)
Mark 2	1.494 to 1.497 mm (0.05882 to 0.05894 in.)
Mark 3	1.498 to 1.501 mm (0.05898 to 0.05909 in.)

Standard crankshaft pin diameter:

43.992 to 44.000 mm (1.7320 to 1.7323 in.)

(n) Perform the inspection above for each cylinder.

4. REMOVE PISTON SUB-ASSEMBLY WITH CONNECTING ROD

(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.

(b) Push the piston, connecting rod and upper bearing through the top of the cylinder block.

HINT:

- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.
- Be sure to arrange the removed piston and connecting rod assemblies in such a way that they can be reinstalled exactly as before.

5. REMOVE CONNECTING ROD BEARING

(a) Remove the connecting rod bearings.

HINT:

Arrange the removed parts in the correct order.

6. REMOVE PISTON RING SET

(a) Using a piston ring expander, remove the 2 compression rings.

T

(b) Remove the oil ring and oil ring expander by hand.

HINT:

Arrange the removed parts in the correct order.

7. REMOVE PISTON

T

(a) Using a screwdriver, pry out the 2 snap rings.

Y

(b) Gradually heat each piston to approximately 80 to 90°C (176 to 194°F).

P

(c) Using a plastic-faced hammer and brass bar, lightly tap out the piston pin and remove the connecting rod.

- The piston and pin are a matched set.
- Arrange the pistons, pins, rings, connecting rods and bearings in the correct order.

8. INSPECT CRANKSHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while prying the

crankshaft back and forth with a screwdriver.

Standard thrust clearance:

0.04 to 0.14 mm (0.00157 to 0.00551 in.)

Maximum thrust clearance:

0.18 mm (0.00709 in.)

If the thrust clearance is more than the maximum, replace the thrust washers as a set. If necessary, replace the crankshaft.

HINT:

The thrust washer thickness is 2.43 to 2.48 mm (0.0957 to 0.0976 in.).

T

9. REMOVE CRANKSHAFT

(a) Uniformly loosen and remove the 10 crankshaft bearing cap bolts in the sequence shown in the illustration.

(b) Using the 2 removed crankshaft bearing cap bolts, remove the 5 crankshaft bearing caps and 5 lower bearings.

NOTICE:

Insert the bolts into the caps in turn. Ease the cap out by gently pulling up and applying force toward the front and back sides of the cylinder block, as shown in the illustration. Take care not to damage the contact surfaces of the cap and cylinder block.

- Keep the lower bearing and crankshaft bearing cap together as a set.
- Arrange the crankshaft bearing caps in the correct order.

T

T

(c) Lift out the crankshaft.

(d) Check each crankshaft journal and bearing for pitting and scratches.

If the journal or bearing is damaged, replace the bearings. If necessary, replace the crankshaft.

10. REMOVE UPPER CRANKSHAFT THRUST WASHER

(a) Remove the 2 upper crankshaft thrust washers from the cylinder block.

T

11. REMOVE CRANKSHAFT BEARING

(a) Remove the 5 upper crankshaft bearings from the cylinder block.

HINT:

Arrange the bearings in the correct order.

T

(b) Remove the 5 lower crankshaft bearings from the 5 crankshaft bearing caps.

HINT:

Arrange the bearings in the correct order.

T

12. REMOVE NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Using a 5 mm socket hexagon wrench, remove the 4 bolts and 4 oil nozzles.

T

13. CLEAN CYLINDER BLOCK

NOTICE:

If the cylinder is washed at high temperatures, the cylinder liner will stick out beyond the cylinder block. Always wash the cylinder block at a temperature of 45°C (113°F) or less.

14. REMOVE STUD BOLT

NOTICE:

If a stud bolt is deformed or its threads are damaged, replace it.

INSPECTION

1. INSPECT CYLINDER BLOCK FOR WARPAGE

(a) Using a straightedge and feeler gauge, measure the warpage of the surface that contacts the cylinder head gasket.

Maximum warpage:

0.05 mm (0.00197 in.)

If the warpage is more than the maximum, replace the cylinder block.

T

2. INSPECT CYLINDER BORE

(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A and B in both the thrust and axial directions.

T

Text in Illustration

*a	Thrust Direction
*b	Axial Direction
	Engine Front

Standard diameter:

80.500 to 80.513 mm (3.169 to 3.170 in.)

Maximum diameter:

80.63 mm (3.174 in.)

Measurement Position:

Measurement Position	Cylinder Bore Position
A	10 mm (0.394 in.) from top edge
B	50 mm (1.97 in.) from top edge

If the average diameter of the 4 positions is more than the maximum, replace the cylinder block.

3. INSPECT PISTON

o

(a) Using a gasket scraper, remove the carbon from the piston top.

o

(b) Using a groove cleaning tool or broken ring, clean the piston ring grooves.

(c) Using a brush and solvent, thoroughly clean the piston.

NOTICE:

Do not use a wire brush.

O

(d) Using a micrometer, measure the piston diameter at a position that is 8.0 mm (0.315 in.) from the bottom of the piston (refer to the illustration).

Standard piston diameter:

80.461 to 80.471 mm (3.1677 to 3.1681 in.)

If the diameter is not as specified, replace the piston with pin.

T

4. INSPECT PISTON OIL CLEARANCE

(a) Subtract the piston diameter measurement from the cylinder bore diameter measurement.

Standard oil clearance:

0.009 to 0.042 mm (0.000354 to 0.00165 in.)

Maximum oil clearance:

0.08 mm (0.00315 in.)

If the oil clearance is more than the maximum, replace all the pistons. If necessary, replace the cylinder block.

5. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between a new piston ring and the wall of the ring groove.

Standard Ring Groove Clearance:

Item	Specified Condition
No. 1 Compression Ring	0.02 to 0.07 mm (0.000787 to 0.00276 in.)
No. 2 Compression Ring	0.02 to 0.055 mm (0.000787 to 0.00217 in.)
Oil Ring	0.02 to 0.06 mm (0.000787 to 0.00236 in.)

If the groove clearance is not as specified, replace the piston with pin.

6. INSPECT PISTON RING END GAP

(a) Using a piston, push the piston ring a little beyond the bottom of the ring travel, 50 mm (1.97 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.

Standard End Gap:

Item	Specified Condition
No. 1 Compression Ring	0.20 to 0.30 mm (0.00787 to 0.0118 in.)
No. 2 Compression Ring	0.30 to 0.45 mm (0.0118 to 0.0177 in.)
Oil Ring	0.10 to 0.35 mm (0.00394 to 0.0138 in.)

Maximum End Gap:

Item	Specified Condition
No. 1 Compression Ring	0.50 mm (0.0197 in.)
No. 2 Compression Ring	0.70 mm (0.0276 in.)
Oil Ring	0.70 mm (0.0276 in.)

If the end gap is more than the maximum, replace the piston ring. If the end gap is more than the maximum even with a new piston ring, replace the cylinder block.

7. INSPECT PISTON PIN OIL CLEARANCE

(a) Using a caliper gauge, measure the piston pin bore diameter.

Standard piston pin bore diameter:

20.006 to 20.015 mm (0.78764 to 0.78799 in.)

Item	Specified Condition
Mark A	20.006 to 20.009 mm (0.78764 to 0.78775 in.)
Mark B	20.010 to 20.012 mm (0.78779 to 0.78787 in.)
Mark C	20.013 to 20.015 mm (0.78791 to 0.78799 in.)

If the diameter is not as specified, replace the piston with pin.

(b) Using a micrometer, measure the piston pin diameter.

Standard piston pin diameter:

20.004 to 20.013 mm (0.78756 to 0.78791 in.)

Item	Specified Condition
Mark A	20.004 to 20.007 mm (0.78756 to 0.78768 in.)
Mark B	20.008 to 20.010 mm (0.78771 to 0.78779 in.)
Mark C	20.011 to 20.013 mm (0.78783 to 0.78791 in.)

If the diameter is not as specified, replace the piston with pin.

Measurement Position:

Measurement Position	Piston Pin Position
a	25 mm (0.984 in.) from side edge
b	5 mm (0.197 in.) from side edge

(c) Using a caliper gauge, measure the connecting rod small end bore diameter.

Standard connecting rod small end bore diameter:

20.012 to 20.021 mm (0.78787 to 0.78823 in.)

Item	Specified Condition
Mark A	20.012 to 20.015 mm (0.78787 to 0.78799 in.)
Mark B	20.016 to 20.018 mm (0.78803 to 0.78811 in.)
Mark C	20.019 to 20.021 mm (0.78815 to 0.78823 in.)

If the diameter is not as specified, replace the connecting rod.

(d) Subtract the piston pin diameter measurement from the piston pin bore diameter measurement.

Text in Illustration

*a	Upper Side:
*b	Lower Side:
*c	Front Mark
*d	Piston Pin Bore Diameter Mark
*e	Connecting Rod Small Bore Diameter Mark

Standard oil clearance:

-0.001 to 0.005 mm (-0.0000394 to 0.000197 in.)

Maximum oil clearance:

0.010 mm (0.000394 in.)

If the oil clearance is more than the maximum, replace the connecting rod.
If necessary, replace the piston and piston with pin as a set.

(e) Subtract the piston pin diameter measurement from the connecting rod small end bore diameter measurement.

Standard oil clearance:

0.005 to 0.011 mm (0.000197 to 0.000433 in.)

Maximum oil clearance:

0.014 mm (0.000551 in.)

If the oil clearance is more than the maximum, replace the connecting rod small end bush. If necessary, replace the piston with pin as a set.

8. INSPECT CONNECTING ROD SUB-ASSEMBLY

(a) Using a connecting rod aligner and feeler gauge, check the connecting rod alignment.

(1) Check for misalignment.

Maximum misalignment:

0.05 mm (0.00197 in.) per 100 mm (3.94 in.)

If the misalignment is more than the maximum, replace the connecting rod.

(2) Check for twist.

Maximum twist:

0.15 mm (0.00591 in.) per 100 mm (3.94 in.)

If the twist is more than the maximum, replace the connecting rod.

9. INSPECT CRANKSHAFT

(a) Inspect the circle runout.

(1) Using a dial indicator and V-blocks, measure the circle runout as shown in the illustration.

Maximum circle runout:

0.03 mm (0.00118 in.)

If the circle runout is more than the maximum, replace the crankshaft.

(b) Inspect the main journals.

(1) Using a micrometer, measure the diameter of each main journal.

Standard diameter:

47.988 to 48.000 mm (1.8893 to 1.8898 in.)

If the diameter is not as specified, check the crankshaft oil clearance.

(2) Check each main journal for taper and distortion as shown in the illustration.

Maximum taper and distortion:

0.004 mm (0.000157 in.)

If the taper and distortion are more than the maximum, replace the crankshaft.

Standard Diameter (Reference):

Mark	Specified Condition
0	47.999 to 48.000 mm (1.88972 to 1.88976 in.)
1	47.997 to 47.998 mm (1.88964 to 1.88968 in.)
2	47.995 to 47.996 mm (1.88956 to 1.88960 in.)
3	47.993 to 47.994 mm (1.88948 to 1.88952 in.)
4	47.991 to 47.992 mm (1.88941 to 1.88945 in.)
5	47.988 to 47.990 mm (1.88929 to 1.88937 in.)

(c) Inspect the crank pin.

(1) Using a micrometer, measure the diameter of each crank pin.

Standard diameter:

43.992 to 44.000 mm (1.7320 to 1.7323 in.)

If the diameter is not as specified, check the connecting rod oil clearance.

(2) Inspect each crank pin for taper and distortion.

Maximum taper and distortion:

0.004 mm (0.000157 in.)

If the taper and distortion are more than the maximum, replace the crankshaft.

10. INSPECT CRANKSHAFT OIL CLEARANCE

(a) Check the crankshaft journals and bearings for pitting and scratches.

(b) Install the crankshaft bearings **INFO**.

(c) Install the upper crankshaft thrust washers **INFO**.

(d) Clean each main journal and bearing.

(e) Place the crankshaft on the cylinder block.

(f) Lay a strip of Plastigage across each journal.

Text in Illustration

*1	Plastigage
----	------------

(g) Examine the front marks and numbers and place the bearing caps on the cylinder block.

HINT:

A number is marked on each crankshaft bearing cap to indicate the installation position.

(h) Install the crankshaft bearing cap **INFO**.

NOTICE:

Do not turn the crankshaft.

(i) Remove the crankshaft bearing caps INFO.

(j) Measure the Plastigage at its widest point.

T

Text in Illustration

*1	Plastigage	*a	Number Mark
----	------------	----	-------------

Standard oil clearance:

0.016 to 0.039 mm (0.000630 to 0.00154 in.)

Maximum oil clearance:

0.050 mm (0.00197 in.)

If the oil clearance is more than the maximum, replace the crankshaft bearing. If necessary, replace the crankshaft.

NOTICE:

Remove the Plastigage completely after the measurement.

HINT:

If replacing a bearing, select a new one with the same number. If the number of the bearing cannot be determined, calculate the correct bearing number by adding together the numbers imprinted on the cylinder block and crankshaft. Then select a new bearing with the calculated number according to the chart below. There are 4 sizes of standard bearings, marked "1", "2", "3" and "4" accordingly.

- Example:

Cylinder block "3" + Crankshaft "5" = Total number 8 (Use bearing "3")

Bearing Chart

Cylinder Block + Crankshaft	Bearing to be Used
0 to 2	"1"
3 to 5	"2"
6 to 8	"3"
9 to 11	"4"

Standard Cylinder Block Journal Bore Diameter:

Item	Specified Condition
Mark 0	52.000 to 52.002 mm (2.04724 to 2.04732 in.)
Mark 1	52.003 to 52.004 mm (2.04736 to 2.04740 in.)
Mark 2	52.005 to 52.006 mm (2.04744 to 2.04752 in.)
Mark 3	52.007 to 52.009 mm (2.04752 to 2.04759 in.)
Mark 4	52.010 to 52.011 mm (2.04763 to 2.04767 in.)
Mark 5	52.012 to 52.013 mm (2.04771 to 2.04775 in.)
Mark 6	52.014 to 52.016 mm (2.04779 to 2.04787 in.)

Standard Crankshaft Journal Diameter:

Item	Specified Condition
Mark 0	47.999 to 48.000 mm (1.88972 to 1.88976 in.)
Mark 1	47.997 to 47.998 mm (1.88964 to 1.88968 in.)
Mark 2	47.995 to 47.996 mm (1.88956 to 1.88961 in.)
Mark 3	47.993 to 47.994 mm (1.88948 to 1.88952 in.)
Mark 4	47.991 to 47.992 mm (1.88941 to 1.88945 in.)
Mark 5	47.988 to 47.990 mm (1.88929 to 1.88937 in.)

Standard Bearing Center Wall Thickness:

Item	Specified Condition
Mark 1	1.994 to 1.997 mm (0.07850 to 0.07862 in.)
Mark 2	1.998 to 2.000 mm (0.07866 to 0.07874 in.)
Mark 3	2.001 to 2.003 mm (0.07878 to 0.07886 in.)
Mark 4	2.004 to 2.006 mm (0.07890 to 0.07898 in.)

11. INSPECT CRANKSHAFT BEARING CAP SET BOLT

(a) Using a vernier caliper, measure the length of the crankshaft bearing cap set bolt from the seat to end.

Text in Illustration

*a	Measurement Length
*b	Measurement Area
*c	Distance

Standard bolt length:

84.3 to 85.7 mm (3.32 to 3.37 in.)

Maximum bolt length:

86.7 mm (3.41 in.)

If the length is more than the maximum, replace the crankshaft bearing cap set bolt.

(b) Using a vernier caliper, measure the tension portion diameter of the bolts.

Measurement point:

55.0 mm (0.197 in.)

Standard diameter:

9.77 to 9.96 mm (0.385 to 0.392 in.)

Minimum diameter:

9.1 mm (0.358 in.)

If the diameter is less than the minimum, replace the crankshaft bearing cap set bolt.

12. INSPECT CONNECTING ROD BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolt.

Text in Illustration

*a	Measurement Area
----	------------------

Standard diameter:

6.6 to 6.7 mm (0.260 to 0.264 in.)

Minimum diameter:

6.4 mm (0.252 in.)

If the diameter is less than the minimum, replace the connecting rod bolt.

13. INSPECT NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Push the check valve with a pin to check if it is stuck.

If stuck, replace the No. 1 oil nozzle.

P

(b) Push the check valve with a pin to check if it moves smoothly.

If it does not move smoothly, clean or replace the No. 1 oil nozzle.

(c) Apply air into A. Check that air does not leak through B.

If air leaks, clean or replace the No. 1 oil nozzle.

P

(d) Push the check valve while applying air into A. Check that air passes through B.

If air does not pass through B, clean or replace the No. 1 oil nozzle.

P

REPLACEMENT

1. REPLACE RING PIN

NOTICE:

It is not necessary to remove a ring pin unless it is being replaced.

(a) Using a plastic-faced hammer, tap in the ring pins.

Text in Illustration

*a	Upper Side:
*b	Width
*c	Height
*d	Protrusion Height

Standard Ring Pin:

Item	Height	Width	Protrusion
Ring Pin	14.3 to 14.7 mm (0.563 to 0.579 in.)	12.9 to 13.0 mm (0.508 to 0.512 in.)	7.5 to 8.5 mm (0.295 to 0.335 in.)

T

2. REPLACE STRAIGHT PIN

NOTICE:

It is not necessary to remove a straight pin unless it is being replaced.

(a) Using a plastic-faced hammer, tap in the straight pin.

T

Text in Illustration

*a	Front Side:	*b	Rear Side:
*c	Lower Side:	*d	LH Side:
*e	Width	*f	Height
*g	Protrusion Height	-	-

Standard Straight Pin:

Item	Height	Width	Protrusion
Pin A	36 mm (1.42 in.)	10 mm (0.394 in.)	18.5 to 19.5 mm (0.728 to 0.768 in.)
Pin B	12 mm (0.472 in.)	4 mm (0.156 in.)	5.0 to 7.0 mm (0.197 to 0.276 in.)
Pin C	22 mm (0.866 in.)	10 mm (0.394 in.)	11 to 13 mm (0.433 to 0.512 in.)
Pin D	15 mm (0.591 in.)	8 mm (0.315 in.)	5.0 to 7.0 mm (0.197 to 0.276 in.)
Pin E	12 mm (0.472 in.)	4 mm (0.156 in.)	5.0 to 6.0 mm (0.197 to 0.236 in.)

3. REPLACE CONNECTING ROD SMALL END BUSH

(a) Using SST and a press, press out the connecting rod small end bush.

SST: 09222-30010

(b) Align the oil holes of a new connecting rod small end bush and the connecting rod.

Text in Illustration

*1	Oil Hole
----	----------

(c) Using SST and a press, press in the connecting rod small end bush.

SST: 09222-30010

(d) Using a pin hole grinder, hone the bush to obtain the standard oil clearance between the bush and piston pin.

Standard oil clearance:

0.005 to 0.011 (0.000197 to 0.000433 in.)

(e) Coat the piston pin with engine oil. Push the piston pin into the connecting rod with your thumb to check that the piston pin fits at normal room temperature.

REASSEMBLY

1. INSTALL STUD BOLT

NOTICE:

If the stud bolt is deformed or the threads are damaged, replace it.

*a

(a) Using an E6 "TORX" socket, install the stud bolts as shown in the illustration.

Text in Illustration

*a	LH Side:
----	----------

Torque: **5.0 N·m (51 kgf·cm, 44in·lbf)**

T

2. INSTALL NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Using a 5 mm socket hexagon wrench, install the 4 oil nozzles with the 4 bolts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

T

3. INSTALL PISTON

(a) Using a screwdriver, install a new snap ring at one end of the piston pin hole.

Text in Illustration

*1	Service Hole
----	--------------

HINT:

Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

T

(b) Gradually heat the piston to approximately 80 to 90°C (176 to 194°F).

(c) Align the front marks of the piston and connecting rod, insert the connecting rod into the piston, and then push in the piston pin with your thumb until the pin comes into contact with the snap ring.

Text in Illustration

*a	Front Mark
----	------------

HINT:

The piston and pin are a matched set.

T

(d) Using a screwdriver, install a new snap ring on the other end of the piston pin hole.

HINT:

Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

(e) Check the fitting condition between the piston and piston pin by trying to move the piston back and forth on the piston pin.

T

4. INSTALL PISTON RING SET

(a) Install the oil ring expander and oil ring by hand.

Text in Illustration

*1	Oil Ring Expander
*2	Oil Ring
*3	Coil Joint
*4	Oil Ring End

- Install the expander and oil ring so that their ring ends are at opposite sides.
- Securely install the expander to the inner groove of the oil ring.

(b) Using a piston ring expander, install the 2 compression rings so that the paint marks are positioned as shown in the illustration.

Text in Illustration

*1	No. 1 Compression Ring
----	------------------------

*2	No. 2 Compression Ring
*3	Piston Ring Expander
*a	Code Mark (1R)
*b	Code Mark (2R)
*c	Paint Mark
➔	Upward

NOTICE:

- Install the No. 1 compression ring with the code mark (1R) facing upward.
- Install the No. 2 compression ring with the code mark (2R) facing upward.
- Paint marks can only be checked on new piston rings. When reusing piston rings, check each piston ring profile in order to install them into the correct positions.

(c) Position the piston rings so that the ring ends are as shown in the illustration.

Text in Illustration

*1	No. 1 compression ring and Oil Ring
*2	No. 2 compression ring and Oil Ring Expander
➔	Engine Front

5. INSTALL CRANKSHAFT BEARING

(a) Install the upper bearing (except No. 3 journal).

Text in Illustration

*1	Vernier Caliper
----	-----------------

(1) Install the upper bearing to the cylinder block.

HINT:

Both sides of the oil groove in the cylinder block should be visible through the oil feed holes in the bearing. The amount visible on each side of the holes should be equal.

(2) Using a vernier caliper, measure the distance between the cylinder block edge and the upper bearing edge.

Standard dimension (A):

0.5 to 1.0 mm (0.0197 to 0.0394 in.)

NOTICE:

Do not apply engine oil to the bearings or the contact surfaces.

(b) Install the upper bearing (for No. 3 journal).

Text in Illustration

*1	Vernier Caliper
----	-----------------

(1) Install the upper bearing to the cylinder block.

HINT:

Both sides of the oil groove in the cylinder block should be visible through the oil feed holes in the bearing. The amount visible on each side of the holes should be equal.

(2) Using a vernier caliper, measure the distance between the cylinder block edge and the upper bearing edge.

Standard dimension (A - B):

0.7 mm (0.0276 in.) or less

NOTICE:

Do not apply engine oil to the bearing or the contact surfaces.

(c) Install the lower bearing.

(1) Install the upper bearing to the cylinder block.

HINT:

Both sides of the oil groove in the cylinder block should be visible through the oil feed holes in the bearing. The amount visible on each side of the holes should be equal.

(2) Using a vernier caliper, measure the distance between the bearing cap edge and the lower bearing edge.

Text in Illustration

*1	Vernier Caliper
*a	Mark 1, 2, 3, 4 or 5

Standard dimension (A - B):

0.7 mm (0.0276 in.) or less

NOTICE:

Do not apply engine oil to the bearings or the contact surfaces.

6. INSTALL UPPER CRANKSHAFT THRUST WASHER

(a) Install the 2 thrust washers to the No. 3 journal position of the cylinder block with the oil grooves facing outward.

Text in Illustration

*1	Oil Groove
----	------------

(b) Apply engine oil to the crankshaft thrust washer.

7. INSTALL CRANKSHAFT

(a) Apply engine oil to the upper bearings and install the crankshaft to the cylinder block.

(b) Apply engine oil to the lower bearings.

(c) Examine the number marks and install the bearing caps to the cylinder block.

T

Text in Illustration

*a	Number Mark
➔	Engine Front

(d) Apply a light coat of engine oil to the threads and under the heads of the bearing cap bolts.

T

(e) Temporarily install the 10 crankshaft bearing cap bolts.

T

(f) Push on the crankshaft bearing caps with your hand until the clearance between the crankshaft bearing caps and cylinder block is less than 5 mm (0.197 in.).

(g) Using a plastic-faced hammer, lightly tap the bearing cap to ensure a proper fit.

T

(h) Install the crankshaft bearing cap bolts.

NOTICE:

The crankshaft bearing cap bolts are tightened in 2 progressive steps.

(i) Step 1:

T

(1) Install and uniformly tighten the 10 crankshaft bearing cap bolts in the sequence shown in the illustration.

Torque: 40 N·m (408 kgf·cm, 30ft·lbf)

(j) Step 2:

(1) Mark the front of the bearing cap bolts with paint.

Text in Illustration

*a	Paint Mark
➔	Engine Front

(2) Tighten the bearing cap bolts 90° in the sequence shown in step 1.

(k) Check that the paint marks are now at a 90° angle to the front.

(l) Check that the crankshaft turns smoothly.

(m) Check the crankshaft thrust clearance INFO.

8. INSTALL CONNECTING ROD BEARING

(a) Install the connecting rod bearings to the connecting rods and connecting rod caps.

(b) Using a vernier caliper, measure the distance between the edges of the connecting rods and connecting cap bearings, and the connecting rod caps and the connecting rod bearings.

Text in Illustration

*1	Vernier caliper
----	-----------------

Standard dimension A - B or B - A:

0 to 0.7 mm (0 to 0.0276 in.)

NOTICE:

Do not apply engine oil to the bearings or the contact surfaces.

9. INSTALL PISTON SUB-ASSEMBLY WITH CONNECTING ROD

(a) Apply engine oil to the cylinder walls, pistons, and the surfaces of the connecting rod bearings.

Text in Illustration

*1	No. 1 compression ring and Oil Ring
----	-------------------------------------

*2	No. 2 compression ring and Oil Ring Expander
	Engine Front

(b) Position the piston rings so that the ring ends are as shown in the illustration.

NOTICE:

Do not align the ring ends.

(c) Using a piston ring compressor, push the correctly numbered piston and connecting rod assembly into the cylinder with the front mark of the piston facing forward.

Text in Illustration

*a	Front Mark
----	------------

- When inserting the piston with connecting rod, do not allow it to make contact with the oil nozzle.
- Match the numbered connecting rod cap with the connecting rod.

T

(d) Check that the front mark of the connecting rod cap is facing in the correct direction.

Text in Illustration

*a	Front Mark
----	------------

T

(e) Apply a light coat of engine oil to the threads and under the heads of the connecting rod cap bolts.

(f) Install the connecting rod cap bolts.

NOTICE:

The connecting rod cap bolts should be tightened in 2 progressive steps.

(g) Step 1:

(1) Using SST, install and alternately tighten the bolts of the connecting rod cap in several steps.

SST: 09205-16011

Torque: **20 N·m (204 kgf·cm, 15ft·lbf)**

(h) Step 2:

(1) Mark the front of the connecting rod cap bolts with paint.

Text in Illustration

*a	Paint Mark
➔	Engine Front

(2) Tighten the cap bolts 90° as shown in the illustration.

(i) Check that the crankshaft turns smoothly.

(j) Check the connecting rod thrust clearance INFO.

10. INSTALL NO. 1 VENTILATION CASE

(a) Apply seal packing in a continuous line as shown in the illustration.

Text in Illustration

*a	Seal Packing
*b	Seal Packing Diameter

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Application Specification:

Seal Packing Diameter	Distance from inside edge of cover to center of seal packing
2.0 to 3.0 mm (0.0787 to 0.118 in.)	3.0 mm (0.118 in.)

- Remove any oil from the contact surface.
- Install the ventilation case within 3 minutes and tighten the bolts and nuts within 15 minutes of applying seal packing.
- Do not start the engine for at least 2 hours after installation.

T

(b) Install the ventilation case with the 6 bolts and 2 nuts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

T

DISASSEMBLY

1. REMOVE INTAKE VALVE

(a) Place the cylinder head on wooden blocks.

(b) Using SST and wooden blocks, compress and remove the valve retainer locks.

SST: 09202-70020

09202-00010

HINT:

Arrange the removed parts in the correct order.

(c) Remove the retainer, valve spring and valve.

HINT:

Arrange the removed parts in the correct order.

2. REMOVE EXHAUST VALVE

(a) Place the cylinder head on wooden blocks.

(b) Using SST and wooden blocks, compress and remove the valve retainer locks.

SST: 09202-70020

09202-00010

HINT:

Arrange the removed parts in the correct order.

(c) Remove the retainer, valve spring and valve.

HINT:

Arrange the removed parts in the correct order.

3. REMOVE VALVE STEM OIL SEAL

(a) Using needle-nose pliers, remove the oil seals.

T

4. REMOVE VALVE SPRING SEAT

(a) Using compressed air and a Magnet Hand, remove the valve spring seats by blowing air onto them.

T

5. REMOVE NO. 2 STRAIGHT SCREW PLUG

NOTICE:

If water leaks from the straight screw plug or the plug is corroded, replace it.

T

(a) Using a 10 mm straight hexagon wrench, remove the 3 screw plugs and 3 gaskets.

6. REMOVE STUD BOLT

NOTICE:

If a stud bolt is deformed or its threads are damaged, replace it.

INSPECTION

1. INSPECT CYLINDER HEAD FOR FLATNESS

(a) Using a precision straightedge and feeler gauge, measure the warpage of the contact surfaces where the cylinder head contacts the cylinder block and manifold.

Text in Illustration

*a	Cylinder Head Lower Side:
*b	Intake Manifold Side:
*c	Exhaust Manifold Side:

Maximum Warpage:

Item	Specified Condition
Cylinder block side	0.05 mm (0.00197 in.)
Intake manifold side	0.10 mm (0.00394 in.)
Exhaust manifold side	0.10 mm (0.00394 in.)

If the warpage is more than the maximum, replace the cylinder head.

*a

*b

*c

T

2. INSPECT CYLINDER HEAD FOR CRACKS

(a) Using a dye penetrant, check the intake ports, exhaust ports and cylinder surface for cracks.

If cracked, replace the cylinder head.

T

3. INSPECT VALVE SEATS

(a) Apply a light coat of Prussian blue to the valve face.

Text in Illustration

*a	Width
----	-------

c

(b) Lightly press the valve face against the valve seat.

HINT:

Do not rotate the valve while pressing the valve.

(c) Check the valve face and valve seat.

(1) Intake Side:

Check that the contact surfaces of the valve seat and valve face are in the middle area of their respective surfaces, with the width between 1.0 and 1.4 mm (0.0433 and 0.0551 in.).

If not, correct the valve seat.

(2) Exhaust Side:

Check that the contact surfaces of the valve seat and valve face are in the middle area of their respective surfaces, with the width between 1.0 and 1.4 mm (0.0433 and 0.0551 in.).

If not, correct the valve seat.

(3) Check that the contact surfaces of the valve seat and valve face are even around the entire valve seat.

If not, correct the valve seat.

4. INSPECT CAMSHAFT THRUST CLEARANCE

(a) Install the camshafts INFO.

(b) Using a dial indicator, measure the thrust clearance while moving the camshaft back and forth.

Standard thrust clearance:

0.06 to 0.155 mm (0.00236 to 0.00610 in.)

Maximum thrust clearance:

T

0.17 mm (0.00669 in.)

If the thrust clearance is greater than the maximum, replace the camshaft housing. If the thrust surface is damaged, replace the camshaft.

5. INSPECT CAMSHAFT OIL CLEARANCE

- (a) Clean the bearing caps and camshaft journals.
- (b) Place the camshafts on the camshaft housing.

- (c) Lay a strip of Plastigage across each of the camshaft journals.

Text in Illustration

*1	Plastigage
----	------------

- (d) Install the bearing caps INFO.

NOTICE:

Do not turn the camshaft.

- (e) Remove the bearing caps INFO.

- (f) Measure the Plastigage at its widest point.

Text in Illustration

*1	Plastigage
----	------------

Standard Oil Clearance:

Item	Specified Condition
Camshaft No. 1 Journal	0.030 to 0.063 mm (0.00118 to 0.00248 in.)
Camshaft Other Journals	0.035 to 0.072 mm (0.00138 to 0.00283 in.)

Maximum Oil Clearance:

Item	Specified Condition
Camshaft No. 1 Journal	0.085 mm (0.00335 in.)

NOTICE:

Completely remove the Plastigage after the inspection.

If the oil clearance is more than the maximum, replace the camshaft. If necessary, replace the camshaft housing.

6. INSPECT COMPRESSION SPRING

(a) Using a vernier caliper, measure the free length of the compression spring.

Standard free length:

53.36 mm (2.10 in.)

If the free length is not as specified, replace the compression spring.

EM0801

(b) Using a steel square, measure the deviation of the compression spring.

Maximum deviation:

1.0 mm (0.0394 in.)

If the deviation is more than the maximum, replace the compression spring.

7. INSPECT INTAKE VALVE

(a) Using a vernier caliper, measure the overall length of the valve.

Text in Illustration

*a	Overall Length
----	----------------

Standard overall length:

109.34 mm (4.30 in.)

Minimum overall length:

108.84 mm (4.29 in.)

T

If the overall length is less than the minimum, replace the valve.

(b) Using a micrometer, measure the diameter of the valve stem.

Standard valve stem diameter:

5.470 to 5.485 mm (0.215 to 0.216 in.)

If the valve stem diameter is not as specified, check the oil clearance.

(c) Using a vernier caliper, measure the valve head margin thickness.

Text in Illustration

*a	Margin Thickness
----	------------------

Standard margin thickness:

1.0 mm (0.0394 in.)

Minimum margin thickness:

0.5 mm (0.0197 in.)

If the margin thickness is less than the minimum, replace the valve.

8. INSPECT EXHAUST VALVE

(a) Using a vernier caliper, measure the overall length of the valve.

Text in Illustration

*a	Overall Length
----	----------------

Standard overall length:

108.25 mm (4.26 in.)

Minimum overall length:

107.75 mm (4.24 in.)

If the overall length is less than the minimum, replace the valve.

(b) Using a micrometer, measure the diameter of the valve stem.

Standard valve stem diameter:

5.465 to 5.480 mm (0.215 to 0.216 in.)

If the valve stem diameter is not as specified, check the oil clearance.

(c) Using a vernier caliper, measure the valve head margin thickness.

Text in Illustration

*a	Margin Thickness
----	------------------

Standard margin thickness:

1.0 mm (0.0394 in.)

Minimum margin thickness:

0.5 mm (0.0197 in.)

If the margin thickness is less than the minimum, replace the valve.

9. INSPECT VALVE GUIDE BUSH OIL CLEARANCE

(a) Using a caliper gauge, measure the inside diameter of the guide bush.

Standard bushing inside diameter:

5.510 to 5.530 mm (0.217 to 0.218 in.)

(b) Subtract the valve stem diameter measurement from the guide bush inside diameter measurement.

Standard Oil Clearance:

Item	Specified Condition
Intake	0.025 to 0.060 mm (0.000984 to 0.00236 in.)
Exhaust	0.030 to 0.065 mm (0.00118 to 0.00256 in.)

Maximum Oil Clearance:

Item	Specified Condition
Intake	0.080 mm (0.00315 in.)
Exhaust	0.085 mm (0.00335 in.)

If the clearance is more than the maximum, replace the valve and guide bush.

REPLACEMENT

1. REPLACE INTAKE VALVE GUIDE BUSH

(a) Heat the cylinder head to 80 to 100°C (176 to 212°F).

(b) Place the cylinder head on wooden blocks.

(c) Using SST and a hammer, tap out the guide bush.

SST: 09201-10000

09201-01050

SST: 09950-70010

09951-07100

(d) Using a caliper gauge, measure the bush bore diameter of the cylinder head.

Standard cylinder bore diameter:

10.285 to 10.306 mm (0.405 to 0.406 in.)

Select New Guide Bush:

Bush Size	Bush Diameter
STD	10.333 to 10.344 mm (0.4068 to 0.4072 in.)
O/S 0.05	10.383 to 10.394 mm (0.4088 to 0.4092 in.)

If the bush bore diameter of the cylinder head is more than 10.306 mm (0.406 in.), machine the bush bore to a diameter of 10.335 to 10.356 mm (0.407 to 0.408 in.) in order to install an O/S 0.05 valve guide bush. If the bush bore diameter of the cylinder head is more than 10.356 mm (0.408 in.), replace the cylinder head.

(e) Heat the cylinder head to 80 to 100°C (176 to 212°F).

(f) Place the cylinder head on wooden blocks.

(g) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.

Text in Illustration

*a	Height
----	--------

SST: 09201-10000

09201-01050

SST: 09950-70010

09951-07100

Standard protrusion height:

9.9 to 10.3 mm (0.390 to 0.406 in.)

(h) Using a sharp 5.5 mm reamer, ream the guide bush to obtain the standard clearance between the guide bush and valve stem.

Standard oil clearance:

0.025 to 0.060 mm (0.000984 to 0.00236 in.)

2. REPLACE EXHAUST VALVE GUIDE BUSH

(a) Heat the cylinder head to 80 to 100°C (176 to 212°F).

(b) Place the cylinder head on wooden blocks.

(c) Using SST and a hammer, tap out the guide bush.

SST: 09201-10000

09201-01050

SST: 09950-70010

09951-07100

(d) Using a caliper gauge, measure the bush bore diameter of the cylinder head.

Standard cylinder bore diameter:

10.285 to 10.306 mm (0.405 to 0.406 in.)

Select New Guide Bush:

Bush Size	Bush Diameter
STD	10.333 to 10.344 mm (0.4068 to 0.4072 in.)
O/S 0.05	10.383 to 10.394 mm (0.4088 to 0.4092 in.)

If the bush bore diameter of the cylinder head is more than 10.306 mm (0.406 in.), machine the bush bore to a diameter of 10.335 to 10.356 mm (0.407 to 0.408 in.) in order to install an O/S 0.05 valve guide bush. If the bush bore diameter of the cylinder head is more than 10.356 mm (0.408 in.), replace the cylinder head.

(e) Heat the cylinder head to 80 to 100°C (176 to 212°F).

(f) Place the cylinder head on wooden blocks.

(g) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.

Text in Illustration

*a	Height
----	--------

SST: 09201-10000

09201-01050

SST: 09950-70010

09951-07100

Standard protrusion height:

11.15 to 11.55 mm (0.439 to 0.455 in.)

(h) Using a sharp 5.5 mm reamer, ream the guide bush to obtain the standard clearance between the guide bush and valve stem.

Standard oil clearance:

0.030 to 0.065 mm (0.00118 to 0.00256 in.)

3. REPLACE RING PIN

NOTICE:

It is not necessary to remove a ring pin unless it is being replaced.

(a) Remove the ring pins.

(b) Using a plastic-faced hammer, tap in a new ring pin to the specified protrusion height.

Text in Illustration

*a	Width
*b	Height
*c	Protrusion Height

Standard Ring Pin:

Item	Height	Width	Protrusion
Ring pin	11.7 to 12.3 mm (0.461 to 0.484 in.)	12.0 mm (0.472 in.)	6.5 to 7.5 mm (0.256 to 0.295 in.)

REASSEMBLY

1. INSTALL SPARK PLUG TUBE

NOTICE:

When using a new cylinder head, the spark plug tubes must be replaced.

(a) Apply adhesive onto the shaded area of a new spark plug tube.

Adhesive:

Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

Standard application width:

1.0 to 3.0 mm (0.0394 to 0.118 in.)

- Install the spark plug tube within 3 minutes of applying adhesive.
- Be careful not to deform the spark plug tube.
- Be careful not to expose the seal to coolant for at least 1 hour after installing the tube.

(b) Using a wooden block and hammer, tap in the spark plug tube to the specified protrusion height.

Text in Illustration

*a Cylinder Head Casting Surface:

Standard protrusion height:

122 mm (4.80 in.)

NOTICE:

To avoid tapping in the spark plug tube too far, measure the protrusion height while tapping it.

*a

T

2. INSTALL STUD BOLT

NOTICE:

If a stud bolt is deformed or its threads are damaged, replace it.

(a) Using an E8 "TORX" socket, install the stud bolts.

*a

*b

T

Text in Illustration

*a	Intake Side:	*b	Exhaust Side:

3. INSTALL NO. 2 STRAIGHT SCREW PLUG

NOTICE:

If water leaks from the straight screw plug or the plug is corroded, replace it.

(a) Using a 10 mm straight hexagon wrench, install 3 new gaskets and the 3 straight screw plugs.

Torque: **44 N·m (449 kgf·cm, 32ft·lbf)**

T

4. INSTALL VALVE SPRING SEAT

(a) Install the valve spring seats to the cylinder head.

5. INSTALL VALVE STEM OIL SEAL

(a) Apply a light coat of engine oil to a new oil seal.

Text in Illustration

*a	Intake Side:
*b	Exhaust Side:
*c	Gray
*d	Black

NOTICE:

Pay close attention when installing the intake and exhaust oil seals. For example, installing the intake oil seal to the exhaust side or installing the exhaust oil seal to the intake side can cause installation problems later.

HINT:

The intake valve oil seal is gray and the exhaust valve oil seal is black.

(b) Using SST, push on the oil seal.

Text in Illustration

*a	CORRECT
*b	INCORRECT

SST: 09201-41020

NOTICE:

Failure to use SST will cause the seal to be damaged or improperly seated.

6. INSTALL INTAKE VALVE

(a) Place the cylinder head on wooden blocks.

(b) Apply engine oil to each valve over an area 30 mm (1.18 in.) or more from its tip, as shown in the illustration.

(c) Install the valve, compression spring and spring retainer to the cylinder head.

NOTICE:

Install the same parts in the same combination to the original locations.

(d) Using SST, compression spring and install the valve retainer locks.

SST: 09202-70020

09202-00010

T

(e) Using a plastic-faced hammer, lightly tap the valve stem tip to ensure a proper fit.

- Be careful not to damage the valve stem tip.
- Be careful not to damage the retainer.

T

7. INSTALL EXHAUST VALVE

(a) Place the cylinder head on wooden blocks.

(b) Apply engine oil to each valve over an area 30 mm (1.18 in.) or more from its tip, as shown in the illustration.

T

(c) Install the valve, compression spring and spring retainer to the cylinder head.

NOTICE:

Install the same parts in the same combination to the original locations.

(d) Using SST, compression spring and install the valve retainer locks.

SST: 09202-70020

09202-00010

T

T

(e) Using a plastic-faced hammer, lightly tap the valve stem tip to ensure a proper fit.

- Be careful not to damage the valve stem tip.
- Be careful not to damage the retainer.

REPAIR

1. REPAIR VALVE SEAT

NOTICE:

- Repair the seat while checking the seating position.
- Keep the lip free from foreign matter.
- Take off the cutter gradually to make the valve seat smooth.

(a) Using a 45° cutter, resurface the valve seat so that the valve seat width is more than the specification.

T

(b) Using 30° and 75° cutters, correct the valve seat so that the valve contacts the entire circumference of the seat. The contact should be in the center of the valve seat, and the valve seat width should be maintained within the specified range around the entire circumference of the seat.

Standard valve seat width:

1.0 to 1.4 mm (0.0394 to 0.0551 in.)

(c) Hand-lap the valve and valve seat with an abrasive compound.

(d) Check the valve seating position.

2. REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR INFO

3. REMOVE MANIFOLD STAY INFO

4. REMOVE EXHAUST MANIFOLD INFO

5. REMOVE NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY INFO

6. REMOVE VALVE LASH ADJUSTER ASSEMBLY INFO

7. REMOVE VALVE STEM CAP INFO

8. REMOVE CYLINDER HEAD SUB-ASSEMBLY

(a) Using a 10 mm bi-hexagon wrench, uniformly loosen and remove the 10 cylinder head bolts and 10 plate washers in several steps in the sequence shown in the illustration.

- Be careful not to drop washers into the cylinder head.
- Head warpage or cracking could result from removing the bolts in the wrong order.

(b) Using a screwdriver with its tip wrapped with tape, pry between the cylinder head and cylinder block, and remove the cylinder head.

NOTICE:

Be careful not to damage the contact surfaces of the cylinder head and cylinder block.

9. REMOVE CYLINDER HEAD GASKET

(a) Remove the cylinder head gasket.

INSTALLATION

1. INSPECT NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY_ [INFO](#)

2. INSPECT VALVE LASH ADJUSTER ASSEMBLY_ [INFO](#)

3. INSPECT CYLINDER HEAD SET BOLT_ [INFO](#)

4. INSPECT CYLINDER HEAD_ [INFO](#)

5. INSTALL CYLINDER HEAD GASKET

(a) Apply seal packing (Diameter 4.0 mm (0.157 in.)) to the cylinder block as shown in the illustration.

Text in Illustration

*1	Cylinder Block
➔	Engine Front

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

Remove any oil from the cylinder block.

(b) Place a new cylinder head gasket on the cylinder block with the Lot No. stamp facing upward.

Text in Illustration

*a	Lot No.
➔	Engine Front

NOTICE:

Install the cylinder head gasket within 3 minutes after applying seal packing.

(c) Apply seal packing (Diameter 4.0 mm (0.157 in.)) to the new cylinder head gasket as shown in the illustration.

Text in Illustration

*1	Cylinder Head Gasket
➔	Engine Front

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent
 2010 Toyota Prius

NOTICE:

- Remove any oil from the cylinder head gasket and cylinder head.
- Install the cylinder head gasket within 3 minutes and tighten the bolts within 15 minutes of applying seal packing.

(d) After tightening the cylinder head bolts, wipe off the seal packing material seeped out from the contact surfaces between the cylinder head and cylinder block.

Text in Illustration

*a	Before wiping off:
*b	After wiping off:

6. INSTALL CYLINDER HEAD SUB-ASSEMBLY

HINT:

The cylinder head bolts are tightened in 3 progressive steps.

(a) Place the cylinder head on the cylinder block.

NOTICE:

- Make sure that no oil is on the mounting surface of the cylinder head.
- Place the cylinder head on the cylinder block gently in order not to damage the gasket with the bottom part of the head.

(b) Install the plate washers to the cylinder head bolts.

(c) Apply a light coat of engine oil to the threads and under the heads of the cylinder head bolts.

(d) Step 1:

(1) Using a 10 mm bi-hexagon wrench, install and uniformly tighten the 10 cylinder head bolts in several steps, in the sequence shown in the illustration.

Torque: **49 N·m (500 kgf·cm, 36ft·lbf)**

NOTICE:

Do not drop the plate washers into the cylinder head.

(e) Step 2:

0

Text in Illustration

*a	Paint Mark
➔	Engine Front

(1) Mark each cylinder head bolt head with paint as shown in the illustration.

(2) Tighten the cylinder head bolts 90° in the sequence shown in step 1.

(f) Step 3:

(1) Tighten the cylinder head bolts another 45° in the sequence shown in step 1.

(g) Check that the paint mark is now at a 135° angle to the front.

7. INSTALL VALVE STEM CAP [INFO](#)

8. INSTALL VALVE LASH ADJUSTER ASSEMBLY [INFO](#)

9. INSTALL NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY [INFO](#)

10. INSTALL EXHAUST MANIFOLD [INFO](#)

11. INSTALL MANIFOLD STAY [INFO](#)

12. INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR [INFO](#)

13. INSTALL CAMSHAFT HOUSING SUB-ASSEMBLY

(a) Install the camshaft housing sub-assembly [INFO](#).

ON-VEHICLE INSPECTION

1. INSPECT COOLANT (for Engine)

HINT: **INFO**.

2. INSPECT ENGINE OIL

HINT: **INFO**.

3. INSPECT AUXILIARY BATTERY

HINT: **INFO**.

4. INSPECT AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

- (a) Remove the air cleaner cap.
- (b) Remove the air cleaner filter element.
- (c) Visually check that the air cleaner filter element is not excessively damaged or oily.

If necessary, replace the air cleaner filter element.

- (d) Install the air cleaner filter element.
- (e) Install the air cleaner cap.

5. INSPECT VALVE AND ADJUSTER NOISE

(a) Put the engine in inspection mode **INFO**.

(b) Rev up the engine several times. Check that the engine does not emit unusual noises. If unusual noises occur, warm up the engine and idle it for over 30 minutes. Then, perform the inspection above again. If any defects or problems are found during the inspection above, perform a lash adjuster inspection **INFO**.

6. INSPECT IGNITION TIMING

(a) Put the engine in inspection mode **INFO**.

- (b) Warm up and stop the engine.
- (c) When using the Techstream:

Check the ignition timing.

(1) Connect the Techstream to the DLC3.

(2) Put the engine in inspection mode **INFO**.

(3) Turn the Techstream on.

(4) Enter the following menus: Powertrain / Engine and ECT / Data List / IGN Advance.

Standard ignition timing:

0 to 16 degrees BTDC

NOTICE:

- Check the ignition timing with the cooling fans off.
- Turn off all electrical systems and the A/ C.
- When checking the ignition timing, the transaxle should be in neutral or park.

HINT:

Refer to the Techstream operator's manual for further details.

(5) Check that the ignition timing advances immediately when the engine speed is increased.

(6) Enter the following menus: Powertrain / Engine and ECT / Active Test / Connect the TC and TE1 / ON.

(7) Monitor IGN Advance of the Data List.

Standard ignition timing:

8 to 12 degrees BTDC

NOTICE:

When checking the ignition timing, the transaxle should be in neutral or park.

HINT:

Refer to the Techstream operator's manual for further details.

(8) Enter the following menus: Connect the TC and TE1 / OFF.

(9) Turn the power switch off.

(10) Turn the Techstream off.

(11) Disconnect the Techstream from the DLC3.

(d) When not using the Techstream:

(1) Using SST, connect terminals 13 (TC) and 4 (CG) of the DLC3.

SST: 09843-18040

- Be sure to connect the terminals correctly. Failure to do this can damage the engine.
- Check the ignition timing with the cooling fans off.
- Turn off all electrical systems and the A/ C.
- When checking the ignition timing, the transaxle should be in neutral or park.

(2) Remove the No. 2 cylinder head cover INFO.

(3) Pull out the wire harness shown in the illustration.

NOTICE:

After checking, wrap the wire harness with tape.

(4) Connect the clip of the timing light to the wire harness.

NOTICE:

Use a timing light that detects the primary signal.

(5) Inspect the ignition timing at idle.

Standard ignition timing:

8 to 12 degrees BTDC

NOTICE:

When checking the ignition timing, the transaxle should be in neutral or park.

HINT:

After running the engine at 1000 to 1300 rpm for 5 seconds, check that it returns to idle speed.

(6) Disconnect terminals 13 (TC) and 4 (CG) of the DLC3.

(7) Inspect the ignition timing at idle.

Standard ignition timing:

0 to 16 degrees BTDC

(8) Confirm that the ignition timing advances when the engine rpm is increased.

(9) Remove the timing light.

(10) Install the No. 2 cylinder head cover .

7. INSPECT ENGINE IDLE SPEED

(a) Put the engine in inspection mode .

(b) Warm up and stop the engine.

(c) Connect the Techstream to the DLC3.

(d) Put the engine in inspection mode .

(e) Turn the Techstream on.

(f) Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.

HINT:

Refer to the Techstream operator's manual for further details.

(g) Inspect the engine idle speed.

Standard idle speed:

950 to 1050 rpm

NOTICE:

- Turn all electrical systems and the A/C off.
- Inspect the idle speed with the cooling fans off.
- When checking the idle speed, the transaxle should be in neutral or park.

(h) Turn the power switch off.

(i) Turn the Techstream off.

(j) Disconnect the Techstream from the DLC3.

8. INSPECT COMPRESSION

(a) Put the engine in inspection mode .

(b) Warm up and stop the engine.

(c) Remove the 4 spark plugs .

(d) Inspect the cylinder compression pressure.

(1) Insert a compression gauge into the spark plug hole.

(2) Connect the Techstream to the DLC3.

(3) Turn the power switch on (IG).

(4) Turn the Techstream on.

(5) Enter the following menus: Powertrain / Hybrid Control / Active Test / Compression Test / ON.

(6) Fully depress the acceleration pedal.

(7) Depress and hold the brake pedal, and turn the power switch on (READY).

NOTICE:

The measurement must be done as quickly as possible.

- Noise may emit from the transmission. However, this is not a malfunction.
- Always use a fully charged battery to obtain an engine speed of 200 rpm or more.

Standard compression pressure:

1373 kPa (14.0 kgf/cm², 199 psi) or more

Minimum pressure:

1079 kPa (11.0 kgf/cm², 157 psi)

Pressure difference between each cylinder:

98 kPa (1.0 kgf/cm², 14.2 psi) or less

- Inspect the other cylinders in the same way.
- Measure the compression as quickly as possible.

(8) If the cylinder compression is low, pour a small amount of engine oil into the cylinder through the spark plug hole, then inspect it again.

- If adding oil increases the compression, the piston rings and/or cylinder bore may be worn or damaged.
- If the pressure stays low, the valve may be stuck or seated improperly, or there may be leaks from the gasket.

(e) Install the 4 spark plugs **INFO**.

NOTICE:

After performing all the procedures, be sure to clear DTCs stored in memory. Then, check that the normal system code is output.

9. INSPECT CO/HC

HINT:

This check determines whether or not the idle CO / HC complies with regulations.

(a) Put the engine in inspection mode **INFO**.

(b) Warm up the engine.

(c) Run the engine at 2500 rpm for approximately 180 seconds.

(d) Insert a CO/HC meter testing probe at least 40 cm (1.3 ft.) into the tailpipe while idling.

(e) Check the CO/HC concentration while idling and when the engine is running at 2500 rpm.

HINT:

When doing a 2 mode (with the engine idling/ running at 2500 rpm) test, the measurement procedures are determined by applicable local regulations.

If the CO/HC concentration does not comply with the regulations, troubleshoot in the order given below.

(1) Check the DTCs **INFO**.

(2) See the table below for possible causes, then inspect the applicable parts and repair them if necessary.

CO	HC	Problem	Possible Cause
Normal	High	Rough idle	<ol style="list-style-type: none">1. Faulty ignition:<ul style="list-style-type: none">○ Incorrect timing○ Fouled, shorted or improperly gapped plugs2. Incorrect valve clearance3. Leaks from intake and exhaust valves4. Leaks from cylinders5. Faulty EGR
Low	High	Rough idle (Fluctuating HC reading)	<ol style="list-style-type: none">1. Vacuum leaks:<ul style="list-style-type: none">○ PCV hoses○ Intake manifold○ Throttle body○ Brake booster line2. Lean mixture causing misfire

CO	HC	Problem	Possible Cause
			3. Faulty EGR
High	High	Rough idle (Black smoke from exhaust)	<ol style="list-style-type: none"> 1. Restricted air cleaner filter element 2. Plugged PCV valve 3. Faulty EFI systems: <ul style="list-style-type: none"> ○ Faulty pressure regulator ○ Faulty engine coolant temperature sensor ○ Faulty mass air flow meter ○ Faulty ECM ○ Faulty injectors ○ Throttle body 4. Faulty EGR

REMOVAL

1. PRECAUTION

HINT: [INFO](#).

2. DISCHARGE FUEL SYSTEM PRESSURE

HINT: [INFO](#).

3. REMOVE REAR NO. 2 FLOOR BOARD (for Separate Type) [INFO](#)

4. REMOVE REAR DECK FLOOR BOX [INFO](#)

5. REMOVE REAR NO. 3 FLOOR BOARD [INFO](#)

6. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected [INFO](#).

7. REMOVE SERVICE PLUG GRIP [INFO](#)

8. ALIGN FRONT WHEELS FACING STRAIGHT AHEAD

9. REMOVE FRONT WHEEL

10. REMOVE REAR ENGINE UNDER COVER LH

11. REMOVE REAR ENGINE UNDER COVER RH

12. REMOVE FRONT SPOILER COVER (w/ Front Spoiler)

13. REMOVE ENGINE UNDER COVER (w/ Cover)

14. REMOVE NO. 1 ENGINE UNDER COVER

15. REMOVE NO. 2 ENGINE UNDER COVER

16. DRAIN ENGINE OIL [INFO](#)

17. DRAIN COOLANT (for Engine) [INFO](#)

18. DRAIN COOLANT (for Inverter) [INFO](#)

19. DRAIN HYBRID TRANSAXLE FLUID [INFO](#)

20. REMOVE FRONT WIPER ARM HEAD CAP_ INFO

21. REMOVE FRONT WIPER ARM AND BLADE ASSEMBLY LH_ INFO

22. REMOVE FRONT WIPER ARM AND BLADE ASSEMBLY RH_ INFO

23. REMOVE COWL SIDE VENTILATOR SUB-ASSEMBLY LH_ INFO

24. REMOVE COWL SIDE VENTILATOR SUB-ASSEMBLY RH_ INFO

25. REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY_ INFO

26. REMOVE WINDSHIELD WIPER MOTOR AND LINK ASSEMBLY_ INFO

27. REMOVE COWL BODY MOUNTING REINFORCEMENT LH_ INFO

28. REMOVE OUTER COWL TOP PANEL SUB-ASSEMBLY_ INFO

29. REMOVE NO. 2 CYLINDER HEAD COVER

(a) Remove the 3 clips and No. 2 cylinder head cover.

- Attempting to disengage both front and rear clips at the same time may cause the cover to break.
- Pull the cover straight up to remove. Attempting to pull the cover forward may cause it to break.

NOTICE:

Attempting to disengage both front and rear clips at the same time may cause the cover to break.

30. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

(a) Disconnect the air flow meter connector.

(b) Disconnect the 2 clamps and hose band, and remove the air cleaner cap sub-assembly.

(c) Remove the air cleaner filter element.

31. REMOVE INLET AIR CLEANER ASSEMBLY

(a) Separate the water by-pass hose from the inlet air cleaner assembly.

(b) Separate the wire harness clamp from the inlet air cleaner assembly.

(c) Remove the 3 bolts and inlet air cleaner assembly.

32. REMOVE AIR CLEANER CASE

(a) Separate the No. 4 water by-pass hose from the air cleaner case.

(b) Remove the 3 bolts and air cleaner case.

33. REMOVE AIR CLEANER HOSE ASSEMBLY INFO

34. REMOVE RADIATOR SUPPORT OPENING COVER INFO

35. REMOVE NO. 1 INVERTER BRACKET INFO

36. DISCONNECT ENGINE ROOM MAIN WIRE INFO

37. REMOVE INVERTER TERMINAL COVER INFO

38. CHECK TERMINAL VOLTAGE_ INFO

39. DISCONNECT FRAME WIRE_ INFO

40. DISCONNECT HIGH VOLTAGE CABLE OF FRONT TRANSAXLE_ INFO

41. DISCONNECT NO. 2 ENGINE WIRE_ INFO

42. INSTALL INVERTER TERMINAL COVER_ INFO

43. DISCONNECT NO. 2 ENGINE ROOM WIRE_ INFO

44. DISCONNECT WATER HOSE_ INFO

45. REMOVE INVERTER WITH CONVERTER ASSEMBLY_ INFO

46. REMOVE INVERTER RESERVE TANK ASSEMBLY

(a) Remove the 2 bolts and inverter reserve tank assembly.

47. REMOVE INVERTER TRAY BRACKET

(a) Separate the 2 clamps.

(b) Remove the 5 bolts and inverter tray bracket.

48. DISCONNECT NO. 1 RADIATOR HOSE

(a) Disconnect the No. 1 radiator hose from the radiator pipe assembly.

49. DISCONNECT NO. 2 RADIATOR HOSE

(a) Disconnect the No. 2 radiator hose from the water inlet.

50. DISCONNECT NO. 4 WATER BY-PASS HOSE

(a) Disconnect the No. 4 water by-pass hose from the radiator pipe assembly.

51. DISCONNECT NO. 3 INVERTER COOLING HOSE

(a) Disconnect the No. 3 inverter cooling hose from the hybrid transaxle assembly.

52. DISCONNECT NO. 5 INVERTER COOLING HOSE

(a) Disconnect the No. 5 inverter cooling hose from the hybrid transaxle

assembly.

53. DISCONNECT OUTLET HEATER WATER HOSE

(a) Disconnect the outlet heater water hose.

54. DISCONNECT INLET HEATER WATER HOSE

(a) Disconnect the inlet heater water hose.

55. DISCONNECT HEATER HOSE

(a) Disconnect the heater hose.

56. DISCONNECT NO. 1 FUEL VAPOR FEED HOSE

(a) Disconnect the No. 1 fuel vapor feed hose.

57. DISCONNECT FUEL TUBE SUB-ASSEMBLY

(a) Release the claw and remove the No. 1 fuel pipe clamp.

(b) Pinch the retainer as illustrated, then pull the fuel tube connector out of the pipe.

- Remove any dirt and foreign matter from the fuel tube connector before performing this work.
- Do not allow any scratches or foreign matter on the parts when disconnecting, as the fuel tube connector has the O-rings that seal the pipe.
- Perform this work by hand. Do not use any tools.
- Do not forcibly bend, kink or twist the nylon tube.
- Protect the disconnected parts by covering them with plastic bags after disconnecting the fuel tube.
- If the fuel tube connector and pipe are stuck, push and pull to release them.

58. SEPARATE ELECTRIC INVERTER COMPRESSOR INFO

59. DISCONNECT WIRE HARNESS

(a) Disconnect the 2 clamps.

(b) Pull up the lever and disconnect the connector of the ECM.

(c) Remove the 2 connectors and clamp from the engine room junction block and disconnect the wire harness.

(d) Disconnect the 3 clamps.

(e) Remove the bolt and disconnect the earth wire.

(f) Disconnect the 2 clamps and wire harness.

60. SECURE STEERING WHEEL [INFO](#)

76. SEPARATE FRONT STABILIZER LINK ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

77. SEPARATE FRONT NO. 1 LOWER SUSPENSION ARM SUB-ASSEMBLY LH_ [INFO](#)

78. SEPARATE FRONT NO. 1 LOWER SUSPENSION ARM SUB-ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

79. SEPARATE FRONT DRIVE SHAFT ASSEMBLY LH_ INFO

80. REMOVE FRONT DRIVE SHAFT ASSEMBLY LH_ INFO

81. SEPARATE FRONT DRIVE SHAFT ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

82. REMOVE FRONT DRIVE SHAFT ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

83. REMOVE FRONT DRIVE SHAFT HOLE SNAP RING LH_ INFO

84. REMOVE FRONT DRIVE SHAFT HOLE SNAP RING RH

HINT:

Perform the same procedure as for the LH side.

85. REMOVE FRONT LOWER ENGINE MOUNTING BRACKET REINFORCEMENT_ INFO

86. REMOVE REAR SIDE RAIL REINFORCEMENT SUB-ASSEMBLY LH_ INFO

87. REMOVE REAR SIDE RAIL REINFORCEMENT SUB-ASSEMBLY RH_ INFO

88. REMOVE FRONT SUSPENSION MEMBER REAR BRACE LH_ INFO

89. REMOVE FRONT SUSPENSION MEMBER REAR BRACE RH

HINT:

Perform the same procedure as for the LH side.

90. REMOVE FRONT SUSPENSION CROSSMEMBER SUB-ASSEMBLY_ INFO

91. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Set the engine lifter.

NOTICE:

Place the engine on wooden blocks or equivalent so that the engine is level.

c

(b) Remove the 4 bolts and front crossmember sub-assembly.

c

(c) Remove the bolt and 2 nuts, and separate the engine mounting insulator RH.

c

(d) Remove the bolt and nut, and separate the engine mounting insulator LH.

(e) Carefully remove the engine with transaxle from the vehicle.

(f) Install the 2 engine hangers with the 2 bolts.

Torque: 43 N·m (438 kgf·cm, 32ft·lbf)

Part Name	Part No.
No. 1 engine hanger	12281-37021
No. 2 engine hanger	12282-37011
Bolt	91552-81050

(g) Attach the sling device to the engine hangers and chain block.

92. REMOVE FRONT CROSSMEMBER SUB-ASSEMBLY

(a) Remove the bolt and nut.

(b) Remove the front engine mounting insulator from the front engine mounting bracket.

93. REMOVE FRONT ENGINE MOUNTING INSULATOR

(a) Remove the 2 bolts and front engine mounting insulator.

94. REMOVE REAR ENGINE MOUNTING INSULATOR

(a) Remove the through bolt, and separate the rear engine mounting

insulator.

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

95. REMOVE ENGINE MOUNTING INSULATOR LH

(a) Remove the 4 bolts and engine mounting insulator LH.

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

96. REMOVE ENGINE MOUNTING INSULATOR SUB-ASSEMBLY RH

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

(a) Remove the 3 bolts and 2 cooler brackets.

(b) Remove the 3 bolts and engine mounting insulator sub-assembly RH.

97. REMOVE RADIATOR PIPE

(a) Separate the No. 3 radiator hose from the cylinder head.

(b) Remove the 2 bolts and radiator pipe.

98. REMOVE FLYWHEEL HOUSING SIDE COVER INFO

99. REMOVE STARTER HOLE INSULATOR INFO

100. REMOVE ENGINE WIRE

101. REMOVE HYBRID VEHICLE TRANSAXLE ASSEMBLY

(a) Remove the hybrid vehicle transaxle assembly INFO.

NOTICE:

Be careful not to apply excess force to the transmission input damper assembly when removing or installing the hybrid vehicle transaxle assembly. If excess force is applied, the transmission input damper assembly may be damaged, or its splines may become misaligned.

102. REMOVE TRANSMISSION INPUT DAMPER ASSEMBLY

(a) Gently place the engine assembly onto wood blocks or equivalent.

NOTICE:

This step should be done while hanging the engine assembly using the engine hangers and a chain block.

(b) Remove the transmission input damper assembly INFO.

103. REMOVE FLYWHEEL SUB-ASSEMBLY

(a) Gently place the engine assembly onto wood blocks or equivalent.

NOTICE:

This step should be done while hanging the engine assembly using the engine hangers and a chain block.

(b) Remove the flywheel sub-assembly .

INSTALLATION

1. INSTALL FLYWHEEL SUB-ASSEMBLY

(a) Gently place the engine assembly onto wood blocks or equivalent.

NOTICE:

This step should be done while hanging the engine assembly using the engine hangers and a chain block.

(b) Install the flywheel sub-assembly .

2. INSTALL TRANSMISSION INPUT DAMPER ASSEMBLY

(a) Gently place the engine assembly onto wood blocks or equivalent.

NOTICE:

This step should be done while hanging the engine assembly using the engine hangers and a chain block.

(b) Install the transmission input damper assembly .

3. INSTALL HYBRID VEHICLE TRANSAXLE ASSEMBLY

(a) Install the hybrid vehicle transaxle assembly .

NOTICE:

Be careful not to apply excess force to the transmission input damper assembly when removing or installing the hybrid vehicle transaxle assembly. If excess force is applied, the transmission input damper assembly may be damaged, or its splines may become misaligned.

4. INSTALL ENGINE WIRE

5. INSTALL STARTER HOLE INSULATOR_ 

6. INSTALL FLYWHEEL HOUSING SIDE COVER_ 

7. INSTALL RADIATOR PIPE

(a) Install the radiator pipe with the 2 bolts.

Torque: **19 N·m (194 kgf·cm, 14ft·lbf)**

(b) Install the No. 3 radiator hose with the clamp.

8. INSTALL ENGINE MOUNTING INSULATOR SUB-ASSEMBLY RH

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

(a) Position the engine mounting insulator sub-assembly RH as shown in the illustration.

(b) Temporarily install bolt A to the engine mounting insulator sub-assembly RH.

(c) Tighten the 3 bolts to the engine mounting insulator sub-assembly RH in the order the bolt B, bolt C and bolt A.

Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

(d) Install the 2 cooler brackets with the 2 bolts.

Torque: **9.8 N·m (100 kgf·cm, 87in·lbf)**

9. INSTALL ENGINE MOUNTING INSULATOR LH

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

(a) Temporarily install bolt A to the engine mounting insulator LH.

(b) Tighten the 4 bolts to the engine mounting insulator LH in the order the bolt C, bolt B, bolt D and bolt A.

Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

10. INSTALL REAR ENGINE MOUNTING INSULATOR

(a) Install the rear engine mounting insulator to the engine mounting bracket with the through bolt.

Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

HINT:

Perform this procedure only when replacement of the engine mounting insulator is necessary.

11. INSTALL FRONT ENGINE MOUNTING INSULATOR

(a) Temporarily install the front engine mounting insulator with the bolt and nut.

12. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE

(a) Set the engine assembly with transaxle on the engine lifter.

NOTICE:

- Install a height adjustment attachment and plate lift attachment onto the engine assembly with transaxle.

- Do not position a height adjustment attachment or plate lift attachment onto the front frame assembly.

HINT:

Place the engine on wooden blocks or equivalents so that the engine is level.

(b) Remove the 2 bolts and 2 engine hangers.

(c) Set the engine assembly with transaxle and front suspension crossmember on the engine lifter.

(d) Operate the engine lifter and lift the engine assembly with transaxle and front suspension crossmember to the position where the engine mounting insulators RH and LH can be installed.

CAUTION:

Do not raise the engine more than necessary. If the engine is raised excessively, the vehicle may also be lifted up.

NOTICE:

- Make sure that the engine is clear of all wiring and hoses.
- While raising the engine into the vehicle, do not allow it to contact the vehicle.

(e) Install the front crossmember with the 4 bolts.

Torque: **96 N·m (979 kgf·cm, 71ft·lbf)**

c

(f) Install the front engine mounting insulator to the front crossmember with the 2 bolts.

Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

c

(g) Install the engine mounting insulator LH with the through bolt and nut.

Torque: **56 N·m (571 kgf·cm, 41ft·lbf)**

NOTICE:

When installing the engine mounting insulator, tighten the nut while holding the bolt.

c

(h) Install the engine mounting insulator RH with the bolt and 2 nuts.

Nut A - Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

Nut B - Torque: **52 N·m (530 kgf·cm, 38ft·lbf)**

Bolt - Torque: **95 N·m (969 kgf·cm, 70ft·lbf)**

c

(i) Tighten the front engine mounting insulator with the bolt and nut.

Torque: **145 N·m (1479 kgf·cm, 107ft·lbf)**

13. INSTALL FRONT SUSPENSION CROSSMEMBER SUB-ASSEMBLY INFO

14. INSTALL FRONT SUSPENSION MEMBER REAR BRACE LH INFO

15. INSTALL FRONT SUSPENSION MEMBER REAR BRACE RH

HINT:

Perform the same procedure as for the LH side.

17. INSTALL REAR SIDE RAIL REINFORCEMENT SUB-ASSEMBLY RH_ INFO

18. INSTALL FRONT LOWER ENGINE MOUNTING BRACKET REINFORCEMENT_ INFO

19. INSTALL FRONT DRIVE SHAFT HOLE SNAP RING LH_ INFO

20. INSTALL FRONT DRIVE SHAFT HOLE SNAP RING RH

HINT:

Perform the same procedure as for the LH side.

21. INSTALL FRONT DRIVE SHAFT ASSEMBLY LH_ INFO

22. INSTALL FRONT DRIVE SHAFT ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

23. INSTALL FRONT NO. 1 LOWER SUSPENSION ARM SUB-ASSEMBLY LH_ INFO

24. INSTALL FRONT NO. 1 LOWER SUSPENSION ARM SUB-ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

25. INSTALL FRONT STABILIZER LINK ASSEMBLY LH_ INFO

26. INSTALL FRONT STABILIZER LINK ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

27. CONNECT TIE ROD END SUB-ASSEMBLY LH_ INFO

28. CONNECT TIE ROD END SUB-ASSEMBLY RH

HINT:

Perform the same procedure as for the LH side.

29. INSTALL FRONT SPEED SENSOR LH [INFO](#)

30. INSTALL FRONT SPEED SENSOR RH

HINT:

Perform the same procedure as for the LH side.

31. INSTALL FRONT AXLE SHAFT NUT LH [INFO](#)

32. INSTALL FRONT AXLE SHAFT NUT RH

HINT:

Perform the same procedure as for the LH side.

33. INSTALL FRONT EXHAUST PIPE ASSEMBLY (w/ Exhaust Heat Recirculation System) [INFO](#)

34. INSTALL FRONT EXHAUST PIPE ASSEMBLY (w/o Exhaust Heat Recirculation System) [INFO](#)

35. INSTALL FRONT CENTER FLOOR BRACE [INFO](#)

36. INSTALL FRONT NO. 3 ENGINE UNDER COVER [INFO](#)

37. INSTALL TAIL EXHAUST PIPE ASSEMBLY [INFO](#)

38. INSTALL NO. 1 STEERING COLUMN HOLE COVER SUB-ASSEMBLY [INFO](#)

39. CONNECT NO. 2 STEERING INTERMEDIATE SHAFT ASSEMBLY [INFO](#)

40. INSTALL COLUMN HOLE COVER SILENCER SHEET [INFO](#)

41. INSTALL WIRE HARNESS

(a) Connect the wire harness with the 2 clamps.

(b) Install the wire harness with the bolt.

c

(c) Connect the wire harness with the 3 clamps.

c

(d) Connect the wire harness to the engine room junction block.

c

(e) Connect the 2 connectors to the engine room junction block.

c

(f) Connect the connector to the ECM with the 2 clamps and lock lever.

42. INSTALL ELECTRIC INVERTER COMPRESSOR INFO

43. CONNECT FUEL TUBE SUB-ASSEMBLY

(a) Connect the fuel tube connector and fuel pipe.

CAUTION:

Align the fuel tube connector with the pipe, then push the fuel tube connector in until the retainer makes a "click" sound. If the connection is tight, apply a small amount of engine oil to the tip of the pipe. After connecting, pull the pipe and connector to make sure that they are securely connected.

(b) Engage the claw and install the No. 1 fuel pipe clamp.

44. CONNECT NO. 1 FUEL VAPOR FEED HOSE

(a) Connect the No. 1 fuel vapor feed hose with the clamp.

45. CONNECT HEATER HOSE

(a) Connect the heater hose with the clamp.

46. CONNECT INLET HEATER WATER HOSE

(a) Connect the inlet heater water hose with the clamp.

47. CONNECT OUTLET HEATER WATER HOSE

(a) Connect the outlet heater water hose with the clamp.

48. CONNECT NO. 5 INVERTER COOLING HOSE

(a) Connect the No. 5 inverter cooling hose with the clamp.

49. CONNECT NO. 3 INVERTER COOLING HOSE

(a) Connect the No. 3 inverter cooling hose with the clamp.

50. CONNECT NO. 4 WATER BY-PASS HOSE

(a) Connect the No. 4 water by-pass hose with the clamp.

c

51. CONNECT NO. 2 RADIATOR HOSE

c

(a) Connect the No. 2 radiator hose with the clamp.

52. CONNECT NO. 1 RADIATOR HOSE

c

(a) Connect the No. 1 radiator hose with the clamp.

53. INSTALL INVERTER TRAY BRACKET

c

(a) Position the inverter tray bracket as shown in the illustration.

(b) Temporarily install bolt B to the inverter tray bracket.

(c) Tighten the 5 bolts to the inverter tray bracket in the order the bolt A, bolt C, bolt D, bolt E and bolt B.

Torque: **18 N·m (184 kgf·cm, 13ft·lbf)**

(d) Connect the 2 clamps to the inverter tray bracket.

54. INSTALL INVERTER RESERVE TANK ASSEMBLY

(a) Temporarily install bolt A to the inverter reserve tank assembly.

(b) Tighten the 2 bolts to the inverter reserve tank assembly in the order the bolt B and bolt A.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

55. INSTALL INVERTER WITH CONVERTER ASSEMBLY_ [INFO](#)

56. CONNECT WATER HOSE_ [INFO](#)

57. CONNECT NO. 2 ENGINE ROOM WIRE_ [INFO](#)

58. REMOVE INVERTER TERMINAL COVER_ [INFO](#)

59. CONNECT NO. 2 ENGINE WIRE_ [INFO](#)

60. CONNECT HIGH VOLTAGE CABLE OF FRONT TRANSAXLE_ [INFO](#)

61. CONNECT FRAME WIRE_ [INFO](#)

62. CHECK HIGH VOLTAGE CABLE CONNECTION_ [INFO](#)

63. INSTALL INVERTER TERMINAL COVER_ [INFO](#)

64. CONNECT ENGINE ROOM MAIN WIRE_ [INFO](#)

65. INSTALL NO. 1 INVERTER BRACKET_ [INFO](#)

66. INSTALL AIR CLEANER HOSE ASSEMBLY_ [INFO](#)

67. INSTALL AIR CLEANER CASE

(a) Install the air cleaner case with the 3 bolts.

Torque: **7.0 N·m (71 kgf·cm, 62 in·lbf)**

(b) Connect the No. 4 water by-pass hose to the air cleaner case with the 3 clamps.

(c) Install the air cleaner filter element.

68. INSTALL INLET AIR CLEANER ASSEMBLY

(a) Install the inlet air cleaner assembly with the 3 bolts.

Torque: **7.0 N·m (71 kgf·cm, 62 in·lbf)**

(b) Connect the wire harness clamp to the inlet air cleaner assembly.

(c) Connect the No. 4 water by-pass hose to the inlet air cleaner assembly with the clamp.

69. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

(a) Install the air cleaner cap sub-assembly with the 2 clamps and hose band.

(b) Connect the air flow meter connector.

70. INSTALL SERVICE PLUG GRIP_ [INFO](#)

71. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected [INFO](#).

72. INSTALL REAR NO. 3 FLOOR BOARD_ [INFO](#)

73. INSTALL REAR DECK FLOOR BOX_ [INFO](#)

74. INSTALL REAR NO. 2 FLOOR BOARD (for Separate Type)_ [INFO](#)

75. ADD HYBRID TRANSAXLE FLUID_ [INFO](#)

76. INSPECT HYBRID TRANSAXLE FLUID_ [INFO](#)

REMOVAL

1. INSTALL ENGINE ON ENGINE STAND

(a) Install the engine onto an engine stand with the bolts.

2. REMOVE ENGINE HANGERS

(a) Remove the 2 bolts and 2 engine hangers.

3. REMOVE THROTTLE BODY ASSEMBLY INFO

4. REMOVE ENGINE OIL LEVEL DIPSTICK GUIDE

(a) Remove the engine oil level dipstick.

(b) Remove the 2 bolts, clamp and engine oil level dipstick guide.

(c) Remove the O-ring from the engine oil level dipstick guide.

5. REMOVE EGR PIPE ASSEMBLY INFO

6. REMOVE EGR VALVE ASSEMBLY INFO

7. REMOVE EGR WITH COOLER PIPE SUB-ASSEMBLY INFO

8. REMOVE INTAKE MANIFOLD INFO

9. REMOVE FUEL VAPOR FEED PIPE

(a) Remove the bolt and fuel vapor feed pipe.

10. REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY_ [INFO](#)

11. REMOVE NO. 1 DELIVERY PIPE SPACER_ [INFO](#)

12. REMOVE FUEL INJECTOR ASSEMBLY_ [INFO](#)

13. REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR_ [INFO](#)

14. REMOVE MANIFOLD STAY_ [INFO](#)

15. REMOVE EXHAUST MANIFOLD_ [INFO](#)

16. REMOVE VENTILATION HOSE

(a) Remove the ventilation hose from the ventilation valve.

17. REMOVE IGNITION COIL ASSEMBLY_ [INFO](#)

DISASSEMBLY

1. REMOVE OIL FILLER CAP SUB-ASSEMBLY

(a) Remove the oil filler cap.

2. REMOVE OIL FILLER CAP GASKET

(a) Remove the oil filler cap gasket.

3. REMOVE ENGINE COVER JOINT BOLT

(a) Remove the 3 engine cover joint bolts.

4. REMOVE WIRING HARNESS CLAMP BRACKET

(a) Remove the bolt and wiring harness clamp bracket.

5. REMOVE SPARK PLUG INFO

6. REMOVE CAMSHAFT POSITION SENSOR

(a) Remove the bolt and camshaft position sensor.

7. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

(a) Remove the bolt and camshaft timing oil control valve.

(b) Remove the O-ring from the camshaft timing oil control valve.

8. REMOVE CRANKSHAFT POSITION SENSOR

(a) Remove the bolt and crankshaft position sensor.

9. REMOVE ENGINE OIL PRESSURE SWITCH ASSEMBLY

(a) Using a 24 mm deep socket wrench, remove the engine oil pressure switch assembly.

10. REMOVE KNOCK SENSOR

(a) Remove the bolt and knock sensor.

11. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

(a) Remove the engine coolant temperature sensor and gasket.

12. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY

(a) Remove the 13 bolts, seal washer and cylinder head cover.

NOTICE:

As gasket may stick to the cylinder head cover, be careful not to drop any of the gaskets into the engine when removing the cylinder head cover.

(b) Remove the 2 gaskets from the camshaft bearing cap.

13. REMOVE CYLINDER HEAD COVER GASKET

(a) Remove the cylinder head cover gasket.

14. REMOVE SPARK PLUG TUBE GASKET

(a) Pry up the 4 claws of the ventilation baffle plate.

NOTICE:

Do not deform the claws of the baffle plate more than necessary.

(b) Remove the 4 gaskets from the cylinder head cover.

HINT:

Prevent the plug tube gaskets from being deformed as much as possible. The removed gaskets will be used when installing new gaskets.

NOTICE:

Be careful not to damage the cylinder head cover.

15. REMOVE OIL FILTER CAP ASSEMBLY [INFO](#)

16. REMOVE INLET WATER SUB-ASSEMBLY

(a) Remove the bolt, 2 nuts, inlet water sub-assembly and gasket.

c

17. REMOVE INLET WATER SUB-ASSEMBLY STUD BOLT

NOTICE:

If a stud bolt is deformed or its threads are damaged, replace it.

18. SET NO. 1 CYLINDER TO TDC/COMPRESSION [INFO](#)

19. REMOVE CRANKSHAFT PULLEY [INFO](#)

20. REMOVE NO. 1 CHAIN TENSIONER ASSEMBLY_ [INFO](#)

21. REMOVE TIMING CHAIN COVER SUB-ASSEMBLY_ [INFO](#)

22. REMOVE TIMING CHAIN COVER OIL SEAL_ [INFO](#)

23. REMOVE CHAIN TENSIONER SLIPPER_ [INFO](#)

24. REMOVE NO. 1 CHAIN VIBRATION DAMPER_ [INFO](#)

25. REMOVE NO. 2 CHAIN VIBRATION DAMPER_ [INFO](#)

26. REMOVE CHAIN SUB-ASSEMBLY_ [INFO](#)

27. REMOVE CRANKSHAFT TIMING SPROCKET_ [INFO](#)

28. REMOVE NO. 2 CHAIN SUB-ASSEMBLY_ [INFO](#)

29. REMOVE NO. 1 CRANKSHAFT POSITION SENSOR PLATE

(a) Remove the crankshaft position sensor plate.

T

30. REMOVE CRANKSHAFT TIMING GEAR KEY

(a) Using a screwdriver, remove the 2 crankshaft timing gear keys.

Text in Illustration

*1	Protective Tape
----	-----------------

HINT:

Tape the screwdriver tip before use.

T

31. INSPECT CAMSHAFT TIMING GEAR ASSEMBLY_ [INFO](#)

32. REMOVE CAMSHAFT TIMING GEAR ASSEMBLY_ [INFO](#)

33. REMOVE CAMSHAFT TIMING SPROCKET_ INFO

34. REMOVE CAMSHAFT BEARING CAP_ INFO

35. REMOVE CAMSHAFT_ INFO

36. REMOVE NO. 2 CAMSHAFT_ INFO

37. REMOVE CAMSHAFT HOUSING STRAIGHT PIN

NOTICE:

It is not necessary to remove a straight pin unless it is being replaced.

38. REMOVE NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY

(a) Remove the 16 valve rocker arms.

HINT:

Arrange the removed parts in the correct order.

39. REMOVE VALVE LASH ADJUSTER ASSEMBLY

(a) Remove the 16 valve lash adjusters from the cylinder head.

HINT:

Arrange the removed parts in the correct order.

40. REMOVE VALVE STEM CAP

(a) Remove the 16 valve stem caps.

HINT:

Arrange the removed parts in the correct order.

41. REMOVE OIL CONTROL VALVE FILTER

(a) Remove the oil control valve filter from the No. 1 camshaft bearing cap.

c

42. REMOVE NO. 1 CAMSHAFT BEARING

(a) Remove the 2 camshaft bearings

c

43. REMOVE NO. 2 CAMSHAFT BEARING

(a) Remove the 2 camshaft bearings.

T

44. REMOVE CAMSHAFT HOUSING SUB-ASSEMBLY_ [INFO](#)

45. REMOVE CYLINDER HEAD SUB-ASSEMBLY_ [INFO](#)

46. REMOVE CYLINDER HEAD GASKET_ [INFO](#)

47. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY

(a) Remove the drain cock plug from the drain cock.

(b) Remove the drain cock from the cylinder block.

48. REMOVE VENTILATION VALVE SUB-ASSEMBLY

(a) Remove the ventilation valve sub-assembly.

49. REMOVE OIL PAN DRAIN PLUG

(a) Remove the drain plug and gasket.

T

50. REMOVE NO. 2 OIL PAN SUB-ASSEMBLY_ INFO

51. REMOVE OIL PUMP ASSEMBLY_ INFO

52. REMOVE STIFFENING CRANKCASE ASSEMBLY

T

(a) Uniformly loosen and remove the 11 bolts.

T

(b) Using a screwdriver, remove the stiffening crankcase by prying between the stiffening crankcase and cylinder block.

Text in Illustration

*1	Protective Tape
----	-----------------

HINT:

Tape the screwdriver tip before use.

NOTICE:

Be careful not to damage the contact surfaces of the crankcase and cylinder block.

53. REMOVE ENGINE REAR OIL SEAL

(a) Remove the engine rear oil seal from the cylinder block.

54. REMOVE NO. 1 TAPER SCREW PLUG

(a) Remove the screw plug.

55. REMOVE STIFFENING CRANKCASE STUD BOLT

NOTICE:

If a stud bolt is deformed or its threads are damaged, replace it.

56. REMOVE STIFFENING CRANKCASE RING PIN

NOTICE:

It is not necessary to remove a ring pin unless it is being replaced.

INSPECTION

1. INSPECT NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY

(a) Turn the roller by hand to check that it turns smoothly.

If the roller does not turn smoothly, replace the No. 1 valve rocker arm sub-assembly.

T

2. INSPECT VALVE LASH ADJUSTER ASSEMBLY

NOTICE:

- Keep the valve lash adjuster free from dirt and foreign matter.
- Only use clean engine oil.

(a) Place the lash adjuster into a container full of new engine oil.

(b) Insert the tip of SST into the lash adjuster plunger and use the tip to press down on the check ball inside the plunger.

Text in Illustration

*1	Plunger
*2	Check Ball
*3	Low Pressure Chamber
*4	High Pressure Chamber
*a	CORRECT
*b	INCORRECT
*c	Taper Part

SST: 09276-75010

T

(c) Squeeze SST and the valve lash adjuster together to move the plunger up and down 5 to 6 times.

(d) Check the movement of the plunger and bleed the air.

OK:

Plunger moves up and down.

NOTICE:

When bleeding high-pressure air from the compression chamber, make sure that the tip of SST is actually pressing the check ball as shown in the illustration. If the check ball is not pressed, air bleeding is not possible.

(e) After bleeding the air, remove SST. Then try to quickly and firmly press the plunger with your fingers.

OK:

Plunger can be pressed 3 times.

If the plunger can still be compressed after pressing it 3 times, replace the valve lash adjuster with a new one.

3. INSPECT CHAIN SUB-ASSEMBLY

(a) Pull the chain with a force of 147 N (15 kgf, 33.0 lbf) as shown in the illustration.

Text in Illustration

*a	Measurement Length
----	--------------------

(b) Using a vernier caliper, measure the length of 15 links.

Maximum chain elongation:

115.2 mm (4.54 in.)

NOTICE:

Perform the measurement at 3 random places. Use the average of the measurements.

If the average elongation is more than the maximum, replace the chain sub-assembly.

4. INSPECT NO. 2 CHAIN SUB-ASSEMBLY

(a) Pull the chain with a force of 147 N (15 kgf, 33.0 lbf) as shown in the illustration.

Text in Illustration

*a	Measurement Length
----	--------------------

(b) Using a vernier caliper, measure the length of 15 links.

Maximum chain elongation:

102.1 mm (4.02 in.)

NOTICE:

Perform the measurement at 3 random places. Use the average of the measurements.

If the average elongation is more than the maximum, replace the No. 2 chain sub-assembly.

5. INSPECT OIL PUMP DRIVE GEAR

(a) Place the chain around the oil pump drive gear.

(b) Using a vernier caliper, measure the diameter of the oil pump drive gear and chain.

Minimum gear diameter (with chain):

48.2 mm (1.90 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the diameter is less than the minimum, replace the chain and oil pump drive gear.

6. INSPECT OIL PUMP DRIVE SHAFT GEAR

(a) Place the chain around the oil pump drive shaft gear.

(b) Using a vernier caliper, measure the diameter of the oil pump drive shaft gear and chain.

Minimum gear diameter (with chain):

48.2 mm (1.90 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the diameter is less than the minimum, replace the chain and oil pump drive shaft gear.

7. INSPECT CAMSHAFT TIMING GEAR ASSEMBLY

(a) Place the chain around the camshaft timing gear assembly.

(b) Using a vernier caliper, measure the diameter of the camshaft timing gear assembly and chain.

Minimum gear diameter (with chain):

96.8 mm (3.81 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the diameter is less than the minimum, replace the chain and camshaft timing gear assembly.

8. INSPECT CAMSHAFT TIMING SPROCKET

(a) Place the chain around the camshaft timing sprocket.

(b) Using a vernier caliper, measure the diameter of the camshaft timing sprocket and chain.

Minimum gear diameter (with chain):

96.8 mm (3.81 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the diameter is less than the minimum, replace the chain and camshaft timing sprocket.

9. INSPECT CRANKSHAFT TIMING GEAR

(a) Place the chain around the crankshaft timing gear.

(b) Using a vernier caliper, measure the diameter of the crankshaft timing gear and chain.

Minimum gear diameter (with chain):

51.1 mm (2.01 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the diameter is less than the minimum, replace the chain and crankshaft timing gear.

10. INSPECT CHAIN TENSIONER SLIPPER

(a) Using a vernier caliper, measure the chain tensioner slipper wear.

Maximum wear:

1.0 mm (0.0394 in.)

If the wear is more than the maximum, replace the chain tensioner slipper.

T

11. INSPECT NO. 1 CHAIN VIBRATION DAMPER

(a) Using a vernier caliper, measure the No. 1 chain vibration damper wear.

Maximum wear:

1.0 mm (0.0394 in.)

If the wear is more than the maximum, replace the No. 1 chain vibration damper.

T

12. INSPECT NO. 2 CHAIN VIBRATION DAMPER

(a) Using a vernier caliper, measure the No. 2 chain vibration damper

wear.

Maximum wear:

1.0 mm (0.0394 in.)

If the wear is more than the maximum, replace the No. 2 chain vibration damper.

T

13. INSPECT CHAIN TENSIONER PLATE

(a) Using a vernier caliper, measure the chain tensioner plate wear.

Maximum wear:

1.0 mm (0.0394 in.)

If the wear is more than the maximum, replace the chain tensioner plate.

T

14. INSPECT NO. 1 CHAIN TENSIONER

(a) Check that the plunger moves smoothly when the cam is raised with your finger.

Text in Illustration

*a	Lock
*b	Move
*c	Raise

(b) Release the cam, then check that the plunger is locked in place by the cam and does not move when pushing with your finger.

If necessary, replace the No. 1 chain tensioner.

15. INSPECT CAMSHAFT

(a) Inspect the camshaft for runout.

(1) Place the camshaft on V-blocks.

(2) Using a dial indicator, measure the circle runout at the center journal.

Maximum circle runout:

0.04 mm (0.00157 in.)

If the circle runout is more than the maximum, replace the camshaft.

(b) Inspect the cam lobes.

(1) Using a micrometer, measure the cam lobe height.

Standard cam lobe height:

41.779 to 41.879 mm (1.6448 to 1.6488 in.)

Minimum cam lobe height:

41.629 mm (1.6389 in.)

If the cam lobe height is less than the minimum, replace the camshaft.

(c) Inspect the camshaft journals.

(1) Using a micrometer, measure the journal diameter.

Standard Journal Diameter:

Journal Position	Specified Condition
No. 1	34.449 to 34.465 mm (1.3563 to 1.3569 in.)
Other	22.949 to 22.965 mm (0.90350 to 0.90413 in.)

If the journal diameter is not as specified, check the oil clearance INFO.

16. INSPECT NO. 2 CAMSHAFT

(a) Inspect the No. 2 camshaft for runout.

(1) Place the No. 2 camshaft on V-blocks.

(2) Using a dial indicator, measure the circle runout at the center journal.

Maximum circle runout:

0.04 mm (0.00157 in.)

If the circle runout is more than the maximum, replace the No. 2 camshaft.

(b) Inspect the cam lobes.

(1) Using a micrometer, measure the cam lobe height.

Standard cam lobe height:

43.346 to 43.446 mm (1.7065 to 1.7105 in.)

Minimum cam lobe height:

43.196 mm (1.7006 in.)

If the cam lobe height is less than the minimum, replace the No. 2 camshaft.

(c) Inspect the camshaft journals.

(1) Using a micrometer, measure the journal diameter.

Standard Journal Diameter:

Journal Position	Specified Condition
No. 1	34.449 to 34.465 mm (1.3563 to 1.3569 in.)
Other	22.949 to 22.965 mm (0.90350 to 0.90413 in.)

If the journal diameter is not as specified, check the oil clearance INFO.

17. INSPECT CYLINDER HEAD SET BOLT

(a) Using a vernier caliper, measure the length of the cylinder head set bolt from the seat to the end.

Text in Illustration

*a	Measurement Length
*b	Measurement Area
*c	Distance

Standard length:

146.8 to 148.2 mm (5.78 to 5.83 in.)

Maximum length:

149.2 mm (5.87 in.)

If the length is more than the maximum, replace the cylinder head set bolt.

(b) Using a vernier caliper, measure the diameter of the elongated thread at the measurement point.

Measurement point:

115 mm (4.53 in.)

Standard diameter:

9.77 to 9.96 mm (0.385 to 0.392 in.)

Minimum diameter:

9.4 mm (0.370 in.)

If the diameter is less than the minimum, replace the cylinder head bolt.

HINT:

If a visual check reveals no excessively thin areas, check the center of the bolt (refer to illustration) and find the area that has the smallest diameter.

18. INSPECT EXHAUST MANIFOLD

(a) Using a precision straightedge and feeler gauge, measure the warpage on the surface that contacts the cylinder head.

Maximum warpage:

0.7 mm (0.0276 in.)

If the warpage is more than the maximum, replace the exhaust manifold.

REASSEMBLY

1. INSTALL STIFFENING CRANKCASE RING PIN

NOTICE:

It is not necessary to remove a ring pin unless it is being replaced.

Text in Illustration

*a	Width
*b	Height
*c	Protrusion Height

(a) Using a plastic-faced hammer, tap in 2 new ring pins until they stop.

Standard Ring Pin:

Item	Protrusion Height	Height	Width
Ring pin	3.0 mm (0.118 in.)	11 mm (0.433 in.)	8 mm (0.315 in.)

2. INSTALL STIFFENING CRANKCASE STUD BOLT

NOTICE:

If a stud bolt is deformed or the threads are damaged, replace it.

(a) Using an E6 "TORX" socket wrench, install the stud bolts as shown in the illustration.

Torque: **5.0 N·m (51 kgf·cm, 44in·lbf)**

T

3. INSTALL STIFFENING CRANKCASE ASSEMBLY

(a) Apply seal packing in a continuous line as shown in the illustration.

Seal packing:

Toyota Genuine Seal Packing Black, Three bond 1207B or equivalent

Standard Seal Diameter:

Area	Specified Condition
------	---------------------

Continuous Line	2.0 to 3.0 mm (0.0787 to 0.118 in.)
A	4.5 to 5.5 mm (0.177 to 0.217 in.)

Application Length A:

56 mm (2.20 in.)

- Remove any oil from the contact surfaces.
- Install the crankcase within 3 minutes and tighten the bolts within 15 minutes of applying seal packing.
- Do not start the engine for at least 2 hours after installing the stiffening crankcase assembly.

T

(b) Install the stiffening crankcase with the 11 bolts in the sequence shown in the illustration.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

Bolt Length:

Item	Specified Condition
Bolt A	138 mm (5.43 in.)
Bolt B	35 mm (1.38 in.)
Bolt C	70 mm (2.76 in.)

(c) Recheck the torque for bolts 1 and 2.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

(d) Wipe off any excess seal packing with a clean piece of cloth.

4. INSTALL OIL PUMP ASSEMBLY INFO

5. INSTALL NO. 2 OIL PAN SUB-ASSEMBLY INFO

6. INSTALL OIL PAN DRAIN PLUG

(a) Install a new gasket and the drain plug.

Torque: **37 N·m (377 kgf·cm, 27ft·lbf)**

T

7. INSTALL ENGINE REAR OIL SEAL INFO

8. INSTALL CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY

(a) Apply adhesive to the threads of the cylinder block water drain cock.

Text in Illustration

*1	Adhesive
----	----------

Adhesive:

Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

(b) Install the drain cock as shown in the illustration.

T

Torque: **25 N·m (255 kgf·cm, 18ft·lbf)**

- Do not rotate the drain cock more than 1 revolution (360°) after tightening it to the specified torque.
- Do not loosen the drain cock to adjust it. If an adjustment is necessary, remove the drain cock and reinstall it.
- Install the drain cock within 3 minutes of applying adhesive.
- Do not start the engine for at least 1 hour after installing the drain cock.

(c) Install the drain cock plug to the drain cock.

Torque: **13 N·m (130 kgf·cm, 9ft·lbf)**

9. INSTALL NO. 1 TAPER SCREW PLUG

(a) Apply adhesive to 2 or 3 threads of the taper screw plug.

Text in Illustration

*1	Adhesive
----	----------

Adhesive:

Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

(b) Install the taper screw plug.

Torque: **43 N·m (438 kgf·cm, 32ft·lbf)**

- Install the plug within 3 minutes of applying adhesive.
- Do not start the engine for at least 1 hour after installation.

10. INSTALL VENTILATION VALVE SUB-ASSEMBLY

(a) Apply adhesive to the threads of the ventilation valve sub-assembly.

Text in Illustration

*1	Adhesive
----	----------

Adhesive:

Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

- Install the ventilation valve sub-assembly within 3 minutes after applying seal packing.
- Do not start the engine for at least 2 hours after installing the ventilation valve sub-assembly.

(b) Install the ventilation valve sub-assembly.

Torque: **20 N·m (204 kgf·cm, 15ft·lbf)**

11. INSTALL CYLINDER HEAD GASKET INFO

12. INSTALL CYLINDER HEAD SUB-ASSEMBLY INFO

13. INSTALL VALVE STEM CAP

- (a) Apply a light coat of engine oil to the valve stem ends.
- (b) Install the 16 valve stem caps to the cylinder head.

NOTICE:

Do not drop the valve stem caps into the cylinder head.

14. INSTALL VALVE LASH ADJUSTER ASSEMBLY

- (a) Inspect each valve lash adjuster before installing it INFO.
- (b) Install the 16 valve lash adjusters to the cylinder head.

NOTICE:

Install the valve lash adjuster to the same place it was removed from.

15. INSTALL NO. 1 VALVE ROCKER ARM SUB-ASSEMBLY

- (a) Apply engine oil to the valve lash adjuster tips and valve stem cap ends.

Text in Illustration

*1	Valve Rocker Arm
*2	Valve Lash Adjuster
*3	Valve Stem
*4	Valve Stem Cap

- (b) Make sure that the No. 1 valve rocker arms are installed as shown in the illustration.

16. INSTALL CAMSHAFT HOUSING STRAIGHT PIN

NOTICE:

It is not necessary to remove a straight pin unless it is being replaced.

- (a) Using a plastic-faced hammer, tap in a new straight pin to the specified protrusion height.

Text in Illustration

*a	Width
*b	Height

*c	Protrusion Height
----	-------------------

Standard Straight Pin:

Item	Protrusion Height	Height	Width
Straight pin	6.5 to 7.5 mm (0.256 to 0.295 in.)	14 mm (0.551 in.)	6.0 mm (0.236 in.)

17. INSTALL NO. 1 CAMSHAFT BEARING [INFO](#)

18. INSTALL OIL CONTROL VALVE FILTER

(a) Check that no foreign matter is on the mesh part of the oil control valve filter.

(b) Install the oil control valve filter.

NOTICE:

Do not touch the mesh when installing the oil control valve filter.

19. INSTALL NO. 2 CAMSHAFT BEARING [INFO](#)

20. INSTALL NO. 2 CAMSHAFT [INFO](#)

21. INSTALL CAMSHAFT [INFO](#)

22. INSTALL CAMSHAFT BEARING CAP [INFO](#)

23. INSTALL CAMSHAFT HOUSING SUB-ASSEMBLY [INFO](#)

24. INSTALL CAMSHAFT TIMING SPROCKET [INFO](#)

25. INSTALL CAMSHAFT TIMING GEAR ASSEMBLY [INFO](#)

26. INSTALL CRANKSHAFT TIMING GEAR KEY

(a) Using a plastic-faced hammer, tap in the 2 crankshaft timing gear keys.

HINT:

Tap in the crankshaft timing gear keys until they contact the crankshaft as shown in the illustration.

27. INSTALL NO. 1 CRANKSHAFT POSITION SENSOR PLATE

(a) Install the crankshaft position sensor plate with the "F" mark facing forward.

T

28. INSTALL NO. 2 CHAIN SUB-ASSEMBLY [INFO](#)

29. INSTALL CRANKSHAFT TIMING SPROCKET [INFO](#)

30. INSTALL NO. 1 CHAIN VIBRATION DAMPER [INFO](#)

31. SET NO. 1 CYLINDER TO TDC/COMPRESSION [INFO](#)

32. INSTALL CHAIN SUB-ASSEMBLY [INFO](#)

33. CHECK NO. 1 CYLINDER TO TDC/COMPRESSION [INFO](#)

34. INSTALL CHAIN TENSIONER SLIPPER [INFO](#)

35. INSTALL NO. 2 CHAIN VIBRATION DAMPER [INFO](#)

36. INSTALL INLET WATER SUB-ASSEMBLY STUD BOLT

NOTICE:

If a stud bolt is deformed or the threads are damaged, replace it.

(a) Using an E5 "TORX" socket wrench, install the stud bolts as shown in the illustration.

Torque: **5.0 N·m (51 kgf·cm, 44in·lbf)**

c

37. INSTALL INLET WATER SUB-ASSEMBLY

(a) Install a new gasket and the inlet water sub-assembly with the bolt and 2 nuts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

c

38. INSTALL TIMING CHAIN COVER SUB-ASSEMBLY_ [INFO](#)

39. INSTALL TIMING CHAIN COVER OIL SEAL_ [INFO](#)

40. INSTALL CRANKSHAFT PULLEY_ [INFO](#)

41. INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY_ [INFO](#)

42. INSTALL OIL FILTER CAP ASSEMBLY_ [INFO](#)

43. INSTALL SPARK PLUG TUBE GASKET

(a) Using a cutter knife, cut off the seal part of the removed gasket.

Text in Illustration

	Part to Cut Off
---	-----------------

(b) Using a hammer and the plug tube gasket which has had the sealing part cut off, uniformly tap in a new plug tube gasket all the way.

Text in Illustration

*1	Plug Tube Gasket without Sealing Part
*2	New Plug Tube Gasket

- Keep the lip free of foreign matter.
- Do not tap in the plug tube gasket.

HINT:

If a plug tube gasket that will be used to install a new gasket is deformed, and cannot be positioned on a new gasket, correct the deformation using pliers.

(c) Return the claws of the ventilation baffle plate to their original positions.

44. INSTALL CYLINDER HEAD COVER GASKET

(a) Install a new cylinder head cover gasket to the cylinder head cover.

Text in Illustration

*1	Cylinder Head Cover
*2	Cylinder Head Cover Gasket

- Remove any oil from the contact surfaces.
- Misalignment between the center of the cylinder head cover rib

and the center of the cylinder head gasket tab is within 4 mm (0.157 in.).

c

45. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY

c

(a) Install 2 new gaskets to the camshaft bearing cap.

(b) Apply seal packing as shown the illustration.

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard diameter:

4.0 mm (0.157 in.)

c

- Remove any oil from the contact surfaces.
- Install the cylinder head cover sub-assembly within 3 minutes and tighten the bolts within 15 minutes of applying seal packing.
- Do not start the engine for at least 2 hours after the installation.

(c) Install the cylinder head cover with a new seal washer and the 13 bolts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

NOTICE:

Misalignment between the contact surfaces of the timing chain cover and the camshaft housing and the center of the cylinder head gasket tab is within 4 mm (0.157 in.).

c

Text in Illustration

*1	Timing Chain Cover
*2	Camshaft Housing
*3	Cylinder Head Cover Gasket

46. INSTALL ENGINE OIL PRESSURE SWITCH ASSEMBLY

(a) Apply adhesive to 2 or 3 threads of the engine oil pressure switch assembly.

Text in Illustration

*1	Adhesive
----	----------

Adhesive:

Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

- Install the oil pressure switch within 3 minutes after applying adhesive.
- Do not start the engine within 1 hour after installation.

(b) Using a 24 mm deep socket wrench, install the engine oil pressure switch assembly.

Torque: **15 N·m (153 kgf·cm, 11ft·lbf)**

47. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

(a) Install a new gasket and the engine coolant temperature sensor.

Torque: **20 N·m (204 kgf·cm, 15ft·lbf)**

48. INSTALL KNOCK SENSOR

(a) Install the knock sensor with the bolt.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

NOTICE:

Make sure that the knock sensor is in the correct position.

49. INSTALL CRANKSHAFT POSITION SENSOR

(a) Apply a light coat of engine oil to the O-ring of the sensor.

(b) Install the crankshaft position sensor with the bolt.

Torque: 10 N·m (102 kgf·cm, 7ft·lbf)

50. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

(a) Apply a light coat of engine oil to a new O-ring and install it to the camshaft timing oil control valve.

P

(b) Install the camshaft timing oil control valve with the bolt.

Torque: 10 N·m (102 kgf·cm, 7ft·lbf)

- Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).
- Be careful that the O-ring is not cracked or moved out of place when installing the oil control valve.

51. INSTALL CAMSHAFT POSITION SENSOR

(a) Apply a light coat of engine oil to the O-ring of the sensor.

P

(b) Install the camshaft position sensor with the bolt.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

NOTICE:

Make sure that the O-ring is not cracked or jammed when installing the sensor.

52. INSTALL SPARK PLUG INFO

53. INSTALL ENGINE COVER JOINT BOLT

(a) Install the 3 engine cover joint bolts.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

54. INSTALL WIRING HARNESS CLAMP BRACKET

(a) Install the wiring harness clamp bracket with the bolt.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

55. INSTALL OIL FILLER CAP GASKET

(a) Install the gasket to the oil filler cap.

T

56. INSTALL OIL FILLER CAP SUB-ASSEMBLY

(a) Install the oil filler cap.

INSTALLATION

1. INSTALL IGNITION COIL ASSEMBLY [INFO](#)

2. INSTALL VENTILATION HOSE

(a) Install the ventilation hose to the ventilation valve.

3. INSTALL EXHAUST MANIFOLD [INFO](#)

4. INSTALL MANIFOLD STAY [INFO](#)

5. INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR [INFO](#)

6. INSTALL FUEL INJECTOR ASSEMBLY [INFO](#)

7. INSTALL NO. 1 DELIVERY PIPE SPACER [INFO](#)

8. INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY [INFO](#)

9. INSTALL FUEL VAPOR FEED PIPE

(a) Install the fuel vapor feed pipe with the bolt.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

10. INSTALL INTAKE MANIFOLD [INFO](#)

11. INSTALL EGR WITH COOLER PIPE SUB-ASSEMBLY [INFO](#)

12. INSTALL EGR VALVE ASSEMBLY [INFO](#)

13. INSTALL EGR PIPE ASSEMBLY INFO

14. INSTALL ENGINE OIL LEVEL DIPSTICK GUIDE

- (a) Apply a light coat of engine oil to a new O-ring.
- (b) Install the O-ring to the engine oil level dipstick guide.

- (c) Install the engine oil level dipstick guide with the 2 bolts.

Bolt A - Torque: **28 N·m (286 kgf·cm, 21ft·lbf)**

Bolt B - Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

- (d) Connect the clamp to the engine oil level dipstick guide.

- (e) Install the oil dipstick.

15. INSTALL THROTTLE BODY ASSEMBLY INFO

16. INSTALL ENGINE HANGERS

- (a) Install the 2 engine hangers with the 2 bolts.

Torque: **43 N·m (438 kgf·cm, 32ft·lbf)**

Part Name	Part No.
No. 1 engine hanger	12281-37021
No. 2 engine hanger	12282-37011
Bolt	91552-81050

17. REMOVE ENGINE ON ENGINE STAND

(a) Remove the bolts and engine on engine stand.

09954-05021

HINT:

If necessary, remove the pulley and pulley bolt using SST.

5. REMOVE TIMING CHAIN COVER OIL SEAL

(a) Using a knife, cut off the lip of the oil seal.

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

Text in Illustration

*a

Cut Position

NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

INSTALLATION

1. INSTALL TIMING CHAIN COVER OIL SEAL

(a) Apply MP grease to the lip of a new oil seal.

NOTICE:

Keep the lip free from foreign matter.

(b) Using SST and a hammer, tap in the oil seal until its surface is flush with the front oil seal retainer edge.

SST: 09223-22010

- Wipe off extra grease from the crankshaft.
- Do not tap the oil seal at an angle.

2. INSTALL CRANKSHAFT PULLEY

(a) Align the pulley set key with the key groove of the pulley.

(b) Using SST, hold the pulley in place and tighten the bolt.

SST: 09213-58014

91551-80840

SST: 09330-00021

c

c

(b) Remove the 8 bolts and the flywheel.

4. REMOVE REAR ENGINE OIL SEAL

(a) Using a knife, cut off the lip of the oil seal.

T

Text in Illustration

*1	Protective Tape
*a	Cut Position

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

INSTALLATION

1. INSTALL REAR ENGINE OIL SEAL

(a) Apply MP grease to the lip of a new oil seal.

NOTICE:

Keep the lip free from foreign matter.

(b) Using SST and a hammer, tap in the oil seal until its surface is flush with the rear oil seal retainer edge.

SST: 09223-15030

SST: 09950-70010

09951-07100

- Wipe any extra grease off the crankshaft.
- Do not tap the oil seal at an angle.

2. INSTALL FLYWHEEL SUB-ASSEMBLY

(a) Using SST, hold the crankshaft.

SST: 09213-58014

91551-80840

SST: 09330-00021

(b) Apply adhesive to the 2 or 3 end threads of the bolts.

Text in Illustration

*1	Adhesive
----	----------

Adhesive:

Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

(c) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.

Torque: **49 N·m (500 kgf·cm, 36ft·lbf)**

c

(d) Mark the front of the bolts with paint.

Text in Illustration

	Paint Mark
---	------------

(e) Retighten the 8 bolts 90° in the same sequence.

(f) Check that the paint marks are now at a 90° angle to the front.

(g) Check that the crankshaft turns smoothly.

3. INSTALL TRANSMISSION INPUT DAMPER ASSEMBLY

(a) Using SST, hold the crankshaft.

SST: 09213-58014

91551-80840

SST: 09330-00021

(b) Install the transmission input damper.

(c) In several steps, uniformly install and tighten the 6 bolts in the sequence shown in the illustration.

Torque: **30 N·m (306 kgf·cm, 22ft·lbf)**

NOTICE:

Take care not to insert the transmission input damper in a wrong direction.

4. INSTALL HYBRID VEHICLE TRANSAXLE ASSEMBLY

(a) Install the hybrid vehicle transaxle assembly INFO.

NOTICE:

Be careful not to apply excess force to the transmission input damper assembly when removing or installing the hybrid vehicle transaxle assembly. If excess force is applied, the transmission input damper assembly may be damaged, or its splines may become misaligned.

3. REMOVE REAR DECK FLOOR BOX **INFO**

4. REMOVE REAR NO. 3 FLOOR BOARD **INFO**

5. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected **INFO**.

6. REMOVE EGR WITH COOLER PIPE SUB-ASSEMBLY

HINT: **INFO**

7. DISCONNECT ENGINE WIRE

(a) Disconnect the 4 fuel injector connectors.

(b) Disconnect the 4 connectors.

(c) Remove the bolt.

(d) Detach the 2 clamps to disconnect the wire harness.

c

8. DISCONNECT FUEL TUBE SUB-ASSEMBLY

(a) Release the claw and remove the No. 1 fuel pipe clamp.

(b) Pinch the tube connector, and then pull the tube connector off of the pipe.

- Check for foreign matter in the fuel tube around the fuel tube connector. Clean it if necessary. Foreign matter can affect the ability of the O-ring to seal the connector and fuel pipe.
- Do not use any tools to separate the connector and pipe.
- Do not forcefully bend, kink or twist the hose.
- Keep the connector and pipe free from foreign matter.
- If the connector and pipe are stuck together, pinch the connector and turn it carefully to disconnect it.
- Put the connector in a plastic bag to prevent damage and contamination.

9. REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY

(a) Remove the bolt.

(b) Remove the 2 bolts and the fuel delivery pipe sub-assembly.

NOTICE:

Be careful not to drop the fuel injectors when removing the fuel delivery pipe.

10. REMOVE NO. 1 DELIVERY PIPE SPACER

(a) Remove the 2 delivery pipe spacers from the cylinder head.

11. REMOVE FUEL INJECTOR ASSEMBLY

(a) Pull the 4 fuel injector assemblies out of the fuel delivery pipe sub-assembly.

(b) Remove the O-ring from each fuel injector.

(c) For reinstallation, attach a tag or label to each injector shaft.

NOTICE:

Prevent entry of foreign objects by covering the fuel injectors with plastic bags.

(d) Remove the 4 injector vibration insulators.

INSPECTION

1. INSPECT FUEL INJECTOR ASSEMBLY

(a) Check the resistance.

(1) Using an ohmmeter, measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	11.6 to 12.4 Ω

If the result is not as specified, replace the injector assembly.

(b) Check the operation.

Inspect the injector injection volume.

CAUTION:

Perform the inspection in a well-ventilated area.

Do not perform the inspection near a naked flame.

(1) Connect SST (fuel tube connector) to SST (hose), then connect them to the fuel pipe (vehicle side).

Text in Illustration

*1	SST (Hose)
*2	Fuel Pipe (Vehicle Side)
*3	SST (Clip)
*4	SST (Fuel Tube Connector)

SST: 09268-31012

95336-08070

09268-41500

NOTICE:

Ensure that the SST connector O-rings are not damaged and are free of

foreign objects as they are used to seal the connections between the fuel tube connector and pipe.

(2) Install a new O-ring onto the fuel injector assembly.

Text in Illustration

*1	SST (Hose)
*2	SST (Clip)
*3	SST (Adapter)
*4	O-ring
*5	SST (Clamp)
*6	Vinyl Tube

(3) Connect SST (adapter and hose) to the injector assembly, and hold the injector assembly and union with SST (clamp).

SST: 09268-31012

09268-41110

09268-41300

90467-13001

95336-08070

(4) Set the injector assembly in a graduated cylinder.

CAUTION:

Install a suitable vinyl tube onto the injector assembly to prevent gasoline from spraying.

(5) Operate the fuel pump .

(6) Connect SST (wire) to the injector assembly and the battery for 15 seconds, and measure the injection volume with the graduated cylinder. Test each injector 2 or 3 times.

SST: 09842-30080

Standard Injection Volume:

Tester Connection	Condition	Specified Condition
Positive terminal - Ground terminal	Per 15 seconds	60 to 73 cc (3.7 to 4.5 cu.in.)

Difference between each injector:

13 cc (0.8 cu.in.) or less

NOTICE:

Always do the switching on the battery side.

If the injection volume is not as specified, replace the injector assembly.

(c) Inspect for leaks.

(1) In the condition above, disconnect the test probes of SST (wire) from the battery and check the fuel leaks from the injector.

Standard fuel drop:

1 drop or less every 25 minutes

If the injection volume is not as specified, replace the injector assembly.

INSTALLATION

1. INSTALL FUEL INJECTOR ASSEMBLY

(a) Install a new insulator and O-ring to each fuel injector assembly.

Text in Illustration

*1	O-ring
*2	Insulator

c

(b) Apply a light coat of gasoline or spindle oil to the contact surfaces of the new O-ring on each fuel injector assembly.

(c) While turning the fuel injector assembly left and right, install it onto the fuel delivery pipe sub-assembly.

- Do not damage the fuel injector assembly or O-ring.
- Do not twist the O-ring.
- After installing each fuel injector, check that it turns smoothly. If not, replace the O-ring with a new one.

c

2. INSTALL NO. 1 DELIVERY PIPE SPACER

(a) Install the 2 No. 1 delivery pipe spacers onto the cylinder head.

NOTICE:

Install the No. 1 delivery pipe spacers in the correct direction.

c

3. INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY

(a) Install the fuel delivery pipe sub-assembly with the 4 fuel injector assemblies and install the 2 bolts.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

- Do not drop the fuel injectors when installing the fuel delivery pipe sub-assembly.

- Check that the fuel injector assemblies rotate smoothly after installing the fuel delivery pipe sub-assembly.

(b) Install the bolt to secure the fuel delivery pipe sub-assembly.

Torque: **21 N·m (214 kgf·cm, 15ft·lbf)**

4. CONNECT FUEL TUBE SUB-ASSEMBLY

(a) Push the tube connector to the pipe until the tube connector makes a "click" sound.

- Before connecting the connector and fuel pipe, check that there is no damage or foreign matter on the connecting part of the fuel pipe.
- After connecting the fuel tube connector and pipe, check that they are securely connected by trying to pull them apart.

(b) Engage the lock claw to install the No. 1 fuel pipe clamp.

5. CONNECT ENGINE WIRE

(a) Install the bolt.

Torque: **10 N·m (102 kgf·cm, 7ft·lbf)**

(b) Connect the 4 fuel injector connectors.

(c) Connect the 4 connectors.

(d) Attach the 2 clamps to connect the wire harness.

c

6. INSTALL EGR WITH COOLER PIPE SUB-ASSEMBLY

c

REMOVAL

1. REMOVE REAR SEAT CUSHION ASSEMBLY INFO

2. REMOVE REAR FLOOR SERVICE HOLE COVER

(a) Remove the rear floor service hole cover.

(b) Disconnect the fuel pump connector.

3. DISCHARGE FUEL SYSTEM PRESSURE

HINT: INFO

4. REMOVE REAR NO. 2 FLOOR BOARD (for Separate Type) INFO

5. REMOVE REAR DECK FLOOR BOX INFO

6. REMOVE REAR NO. 3 FLOOR BOARD INFO

7. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected INFO.

8. REMOVE FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Remove the tube joint clip and disengage the fuel tank main tube clamp, then pull the fuel tube joint out of the plug of the fuel suction tube assembly.

Text in Illustration

*1	Tube Joint Clip
*2	Fuel Tank Main Tube Clamp
*3	Fuel Tube Joint
*4	O-ring

- Check that there is no dirt or other foreign objects around the fuel tube joint before disconnecting it. Clean the joint if necessary.
- It is necessary to prevent mud or dirt from entering the joint. If mud or dirt gets in the joint, the O-rings may not seal properly.
- Only disconnect the joint by hand.
- Do not bend, kink or twist the nylon tubes.
- Protect the contact surfaces by covering it with a plastic bag.

9. REMOVE FUEL PUMP GAUGE RETAINER

(a) Using a 6 mm socket hexagon wrench, set SST to the fuel pump gauge retainer.

SST: 09808-14020

09808-01410

09808-01420

09808-01430

- Engage the SST claws securely with the fuel pump gauge retainer holes to secure SST.
- Install SST while pressing the SST claws toward the fuel pump gauge retainer (towards the center of SST).

(b) Using SST, loosen the fuel pump gauge retainer.

SST: 09808-14020

09808-01410

09808-01420

09808-01430

- Do not use any tools other than specified in this operation. Damage to the fuel pump gauge retainer or the fuel tank may result.

- Loosen the retainer by turning it counterclockwise while holding SST down. Do not allow the claw of the tank suction tube support to slip out of its groove on the fuel tank.

HINT:

The holes on the fuel pump gauge retainer can be fitted into the tips of SST.

(c) Remove the fuel pump gauge retainer while holding the fuel suction tube assembly by hand.

10. REMOVE FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Remove the fuel suction tube assembly with pump and gauge from the fuel tank.

NOTICE:

Make sure that the fuel sender gauge arm does not bend.

(b) Remove the gasket from the fuel tank.

DISASSEMBLY

1. REMOVE FUEL SENDER GAUGE ASSEMBLY INFO

2. REMOVE FUEL PUMP

(a) Disconnect the connector of the fuel pump harness.

(b) Disconnect the fuel pump filter hose.

(c) Using a screwdriver with its tip wrapped in protective tape, disengage the 2 claws, and remove the fuel filter and fuel pump from the fuel sub-tank.

Text in Illustration

*1	Fuel Tube
*2	Fuel Sub-tank

NOTICE:

Do not do anything which may separate the fuel tube from either the fuel suction plate or fuel filter assembly, such as applying excessive force to the tube INFO.

(d) Using a screwdriver with its tip wrapped in protective tape, disengage the 2 claws and remove the No. 1 fuel suction support.

(e) Using a screwdriver with its tip wrapped in protective tape, disengage the 5 claws, and remove the fuel pump filter and fuel pump from the fuel filter.

- Do not damage the fuel pump filter.
- Do not remove the suction filter.
- Do not use either the fuel pump or the suction filter if the suction filter is removed from the fuel pump.

c

(f) Disconnect the fuel pump harness connector.

c

(g) Remove the O-ring and spacer from the fuel pump.

Text in Illustration

*1	O-ring
*2	Spacer

NOTICE:

Be careful not to damage the sealing surface.

HINT:

If the O-ring still remains in the fuel filter, remove it using a wire tip (1 mm diameter) that is formed as shown in the illustration.

c

INSPECTION

1. INSPECT FUEL PUMP

(a) Check the resistance.

(1) Using an ohmmeter, measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	0.2 to 3.0 Ω

If the result is not as specified, replace the fuel pump.

c

(b) Check fuel pump operation.

(1) Apply battery voltage between terminals 1 and 2. Check that the pump operates.

NOTICE:

- These tests must be done quickly (within 10 seconds) to prevent the coil from burning out.
- Keep the fuel pump as far away from the battery as possible.
- Always switch the voltage on and off on the battery side, not the fuel pump side. If the pump does not operate, replace the fuel pump.

If the pump does not operate, replace the fuel pump.

REASSEMBLY

1. INSTALL FUEL PUMP

(a) Apply gasoline to a new O-ring. Then install the O-ring and spacer to the fuel pump.

Text in Illustration

*1	O-ring
*2	Spacer

(b) Connect the fuel pump harness connector.

c

(c) Engage the 5 claws of the fuel pump.

- Make sure that the O-ring is not cut or pinched during the installation.
- Engage the claws securely.
- Do not remove the fuel filter.

c

(d) Engage the 2 claws of the No. 1 fuel suction support.

(e) Engage the 2 claws of the fuel suction support and install the fuel filter and the fuel pump onto the fuel sub-tank.

(f) Align the groove of the fuel pump filter hose with the cutout of the fuel sub-tank and install the hose.

NOTICE:

Do not apply excessive force to the fuel tube or the suction support.

(g) Connect the connector of the fuel pump harness.

2. INSTALL FUEL SENDER GAUGE ASSEMBLY INFO

INSTALLATION

1. INSTALL FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Install a new gasket onto the fuel tank.

(b) Install the fuel suction tube assembly with pump and gauge to the fuel tank.

Text in Illustration

*1	Protrusion
*2	Notch

NOTICE:

Make sure that the fuel sender gauge arm does not bend.

(c) Align the protrusions of the fuel suction tube assembly with pump and gauge with the notches of the fuel tank.

NOTICE:

Ensure that the fuel suction tube gasket is in the correct position.

2. INSTALL FUEL PUMP GAUGE RETAINER

(a) While holding the fuel suction tube assembly with pump and gauge by hand, position the fuel pump gauge retainer and tighten it lightly by hand.

Text in Illustration

*1	Lock Point
----	------------

*2	Mark
*3	Front of Vehicle

NOTICE:

Check that the contact surface of the fuel tank retainer is not scratched or damaged, and prevent the entry of foreign objects.

(b) Using a 6 mm socket hexagon wrench, set SST to the fuel pump gauge retainer.

SST: 09808-14020

09808-01410

09808-01420

09808-01430

- Hold the fuel suction tube assembly upright by hand to ensure that the fuel suction tube gasket is not moved out of position.
- Engage the SST claws securely with the fuel pump gauge retainer holes to secure SST.
- Install SST while pressing the SST claws toward the fuel pump gauge retainer (toward the center of SST).

(c) Using SST, align the marks on the fuel tank and fuel pump gauge retainer.

Text in Illustration

*1	Lock Point
*2	Starting Point
*3	Front of Vehicle

SST: 09808-14020

09808-01410

09808-01420

09808-01430

- Do not use any tools other than specified in this operation. Damage to the fuel pump gauge retainer or the fuel tank may result.
- Tighten the retainer by turning it clockwise while holding SST

down.

3. CONNECT FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Push the fuel tube joint in the plug of the fuel suction plate, then install the tube joint clip.

Text in Illustration

*1	Tube Joint Clip
*2	Fuel Tank Main Tube clamp
*3	Fuel Tube Joint
*4	O-ring
*5	Collars

- Check that there are no scratches or foreign objects around the connected part of the fuel tube joint and plug before performing this work.
- Check that the fuel tube joint is securely inserted to the end.
- Check that the tube joint clip is on the collar of the fuel tube joint.
- After installing the tube joint clip, check that the fuel tank main tube cannot be pushed out.

(b) Connect the fuel pump connector.

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected INFO.

5. INSPECT FOR FUEL LEAK INFO

6. INSTALL REAR FLOOR SERVICE HOLE COVER

(a) Install the rear floor service hole cover with new butyl tape.

c

7. INSTALL REAR SEAT CUSHION ASSEMBLY_ [INFO](#)

8. INSTALL REAR NO. 3 FLOOR BOARD_ [INFO](#)

9. INSTALL REAR DECK FLOOR BOX_ [INFO](#)

10. INSTALL REAR NO. 2 FLOOR BOARD (for Separate Type)_ [INFO](#)

REMOVAL

1. REMOVE FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Remove the fuel suction tube assembly with pump and gauge .

2. REMOVE FUEL SENDER GAUGE ASSEMBLY

(a) Disconnect the 3 harness clamps.

NOTICE:

Do not damage the wire harness.

(b) Remove the 2 harness protectors from the wire harness.

NOTICE:

Do not damage the wire harness.

(c) Disconnect the connector of the fuel sender gauge assembly.

(d) Release the lock as shown in the illustration and slide the fuel sender gauge assembly to remove it.

INSPECTION

1. INSPECT FUEL SENDER GAUGE ASSEMBLY

(a) Remove the fuel sender gauge assembly.

(b) Check that the float moves smoothly between F and E.

(c) Measure the resistance between terminals 1 and 2 of the connector according to the value(s) in the table below.

Standard Resistance:

Float Level	Resistance (Ω)
F	12.0 to 18.0
Between E and F	12.0 to 415.0 (Gradually changes)
E	405.0 to 415.0

If the value is not as specified, replace the fuel sender gauge assembly.

Text in Illustration

*1	Front view of wire harness connector: (to Fuel Sender Gauge Assembly)
*2	Fuel Sender Gauge Assembly

INSTALLATION

1. INSTALL FUEL SENDER GAUGE ASSEMBLY

(a) Install the fuel sender gauge assembly by sliding it downward.

(b) Connect the connector of the fuel sender gauge assembly.

(c) Install the 2 harness protectors.

NOTICE:

Do not damage the wire harness.

(d) Connect the 3 harness clamps.

c

2. INSTALL FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Install the fuel suction tube assembly with pump and gauge INFO.

PRECAUTION

1. PRECAUTIONS

- (a) Before inspecting and repairing the fuel system, disconnect the cable from the negative (-) battery terminal.
- (b) Do not smoke or work near fire when handling the fuel system.
- (c) Keep gasoline away from rubber or leather parts.

2. DISCHARGE FUEL SYSTEM PRESSURE

CAUTION:

- Perform the following procedure to prevent fuel from spilling out before removing any fuel system parts.
- Pressure will still remain in the fuel lines even after performing the following procedure. When disconnecting a fuel line, cover it with a piece of cloth to prevent fuel from spraying or coming out.

- (a) Remove the rear seat cushion assembly **INFO**.

- (b) Remove the rear floor service hole cover.

- (c) Disconnect the fuel pump connector.

- (d) Put the vehicle in the "inspection mode" **INFO**.

- (e) Start the engine.

- (f) After the engine has stopped on its own, turn the power switch off.

HINT:

DTCs P0171/25 may be detected.

(g) Crank the engine again and make sure that the engine does not start.

(h) Disconnect the cable from the negative (-) battery terminal.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected **INFO**.

(i) Connect the fuel pump connector.

(j) Loosen the fuel tank cap, then discharge the pressure in the fuel tank completely.

3. FUEL LINE

(a) When disconnecting a high-pressure fuel line, a large amount of gasoline will spray out. Perform the following procedure:

(1) Discharge fuel system pressure.

(2) Disconnect the fuel tube.

(3) Drain the fuel remaining inside the fuel pump tube into a container.

(4) Cover the disconnected pipe and connector with a plastic bag to prevent damage and contamination.

Text in Illustration

*1	Plastic Bag
----	-------------

(b) Perform the following procedure when disconnecting a fuel delivery pipe (metallic type):

Text in Illustration

*1	Retainer
----	----------

*2	O-ring
*3	Nylon Tube
*4	Housing
*5	Pipe

HINT:

The structure of a fuel tube connector is as shown in the illustration.

(1) Check if there is any damage or foreign objects on the pipe connections.

(2) Remove the No. 2 fuel pipe clamp.

Text in Illustration

*1	No. 2 Fuel Pipe Clamp
----	-----------------------

NOTICE:

Do not reuse the fuel pipe clamp.

c

(3) Find the metallic connector of the fuel tube assembly.

(4) Assemble SST to the connector as shown in the illustration.

SST: 09268-21010

P

(5) Turn SST, align the retainers inside the connector with the SST chamfers and insert SST into the connector.

P

(6) Slide SST and the connector together towards the fuel tube assembly.

(c) Perform the following procedure when connecting a fuel tube connector (metallic type):

(1) Check if there is any damage or foreign objects on the pipe connections.

(2) Match the axis of the connector with the axis of the pipe, and push the pipe into the connector until the connector makes a "click" sound. If the pipe is difficult to push into the connector, apply a small amount of clean engine oil to the tip of the pipe.

(3) After connecting, check if the pipe and the connector are securely connected by pulling on them.

(4) Install a new No. 2 fuel pipe clamp.

Text in Illustration

*1	No. 2 Fuel Pipe Clamp
----	-----------------------

Type A

Type B

c

(5) Check for fuel leaks.

(d) Perform the following procedure when disconnecting a fuel tube connector (quick type A):

c

(1) Release the claw and remove the No. 1 fuel pipe clamp.

(2) Check that there is no dirt or other foreign objects on the pipe and contact surface before disconnecting them. Clean them if necessary.

(3) Disconnect the connector from the pipe by hand.

NOTICE:

Be sure to disconnect the connector by hand.

(4) If the connector and the pipe are stuck, push in and pull on the connector to release them. Pull the connector out of the pipe carefully.

(5) Check that there is no dirt or other foreign objects on the contact surface of the disconnected pipe. Clean them away if necessary.

(6) Cover the disconnected pipe and connector with a plastic bag to prevent damage and contamination.

Text in Illustration

*1	Plastic Bag
----	-------------

P

(e) Perform the following procedure when connecting a fuel tube connector (quick type A):

(1) Check if there is any damage or foreign objects on the pipe connections.

(2) Line up the two parts of the pipes to be connected, and push them together until the connector makes a "click" sound. If the pipe is difficult to push into the connector, apply a small amount of clean engine oil to the tip of the pipe and reinsert it.

(3) After connecting the pipes, check that the pipe and connector are securely connected by pulling on them.

(4) Inspect for fuel leaks INFO.

(5) Engage the lock claw and install the No. 1 fuel pipe clamp.

(f) Perform the following procedure when disconnecting a fuel tube connector (quick type B):

Text in Illustration

*1

Retainer

- (1) Check that there is no damage or foreign matter on the part of the pipe that contacts the connector.
- (2) Detach the 2 claws of the connector retainer. Push down on the connector and disconnect it from the pipe.

HINT:

Be sure to disconnect it by hand.

P

- (3) If the connector and pipe are stuck, pinch the fuel pipe by hand and push or pull the connector to disconnect it.

- (4) Check for foreign matter on the seal surface of the disconnected pipe. Clean it if necessary.

P

- (5) Cover the disconnected pipe and connector with a plastic bag to prevent damage and contamination.

Text in Illustration

*1

Plastic Bag

- (g) Perform the following procedure when connecting a fuel tube connector (quick type B):

P

- (1) Line up the two parts of the pipes to be connected, and fully push the fuel tube connector and pipe together until they are fully seated. Next, push the retainer into the connector until its claws lock. If the pipe is difficult to push into the connector, apply a small amount of clean engine oil to the tip of the pipe and reinsert it.

- (2) After connecting the pipes, check that the pipe and connector are securely connected by pulling on them.

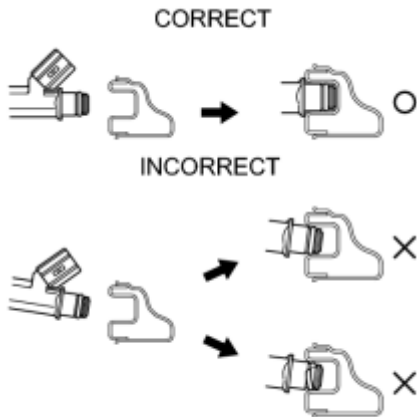

- (3) Inspect for fuel leaks INFO.

(h) Observe the following precautions when handling a nylon tube:

CAUTION:

- Do not twist the connector part of the nylon tube or the quick connector when connecting them.
- Do not bend or twist the nylon tube.
- Do not remove the EPDM protector on the outside of the nylon tube.
- Do not pinch or kink the nylon tubes to prevent fuel leakage.

4. INJECTOR

(a) Observe the following precautions when removing and installing a fuel injector:

(1) Do not reuse an O-ring and insulator.

(2) When placing a new O-ring onto the injector, do not damage the O-ring.

(3) Coat the new O-ring with grease or gasoline before installing it. Do not use engine oil, gear oil or brake fluid.

(b) Install the injector into the delivery pipe and cylinder head as shown in the illustration. Apply grease or gasoline to the contact surfaces of the injector before installing the injector.

Text in Illustration

*1	Delivery Pipe
*2	O-ring
3	Insulator

5. FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Do not disconnect the tube shown in the illustration when disassembling the fuel suction tube assembly with pump and gauge. Doing so will cause reassembly of the fuel suction tube assembly with pump and gauge to be impossible as the tube is welded to the plate.

Text in Illustration

*1	Tube
----	------

6. INSPECT FOR FUEL LEAK

(a) Check that there is no fuel leakage after performing maintenance anywhere on the fuel system .

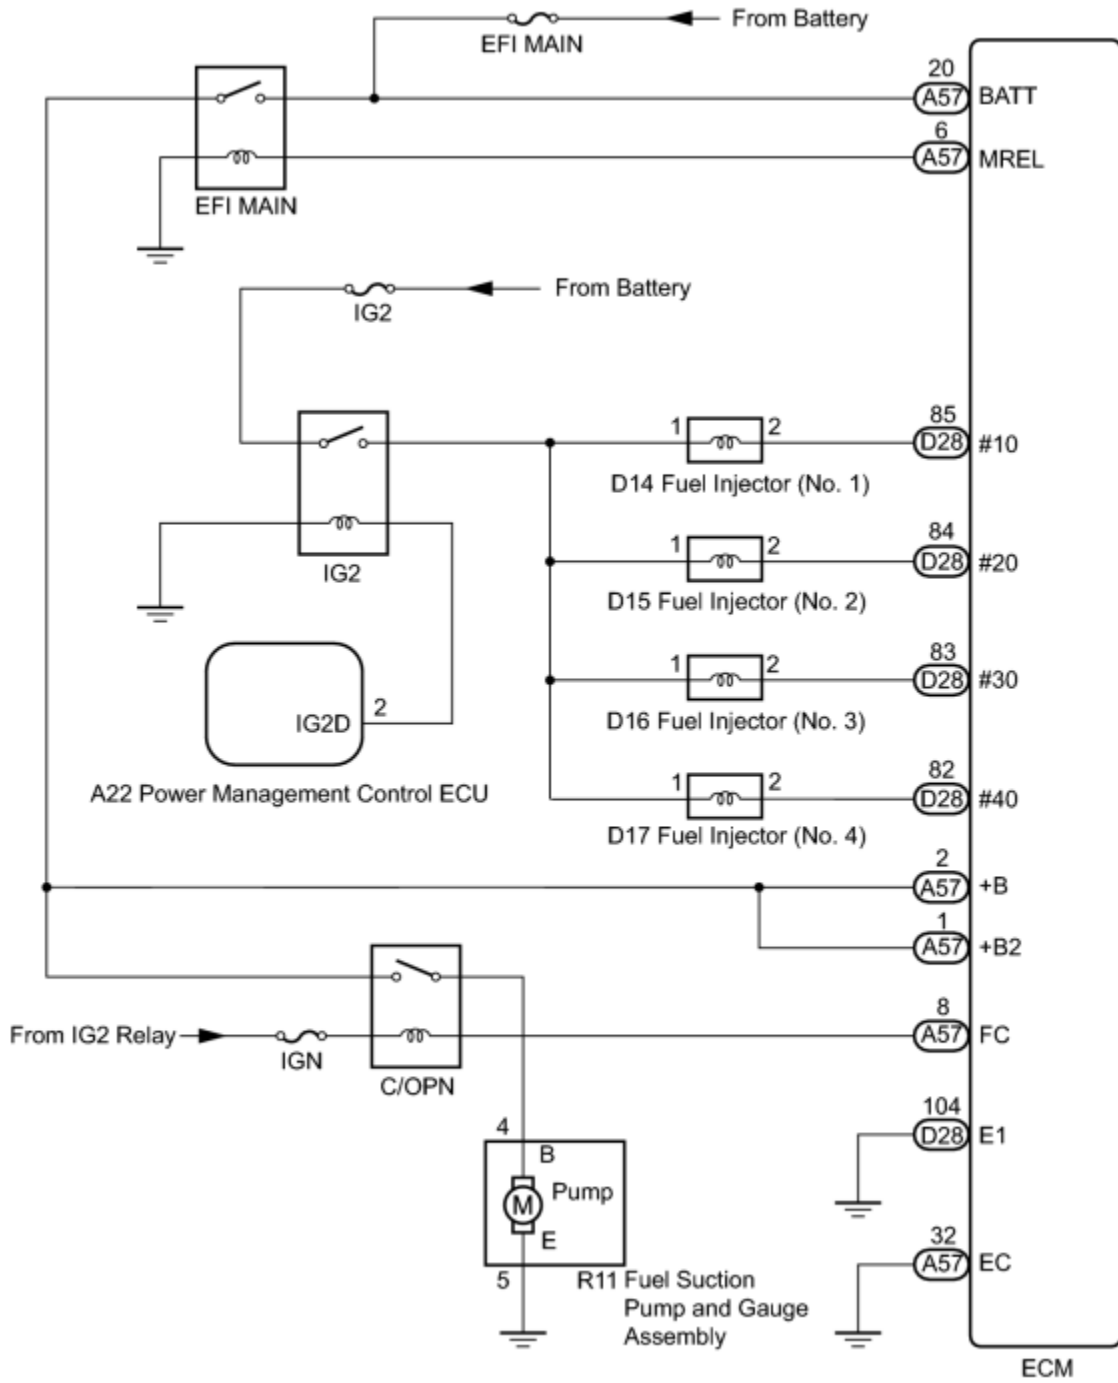

PARTS LOCATION

ILLUSTRATION

c

SYSTEM DIAGRAM

ON-VEHICLE INSPECTION

1. CHECK FUEL PUMP OPERATION AND INSPECT FOR FUEL LEAK

(a) Check fuel pump operation.

(1) Connect the Techstream to the DLC3.

(2) Turn the power switch on (IG).

NOTICE:

Do not start the engine.

(3) Turn the Techstream on.

(4) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump /Speed.

(5) Check for pressure in the fuel inlet tube from the fuel line. Check that sounds of fuel flowing from the fuel tank can be heard. If no sounds can be heard, check the integration relay, fuel pump, ECM and wiring connectors.

(b) Inspect for fuel leaks.

(1) Check that there is no fuel leakage after performing maintenance anywhere on the fuel system. If there is a fuel leak, repair or replace parts as necessary.

(c) Turn the power switch off.

(d) Disconnect the Techstream from the DLC3.

2. CHECK FUEL PRESSURE

(a) Discharge fuel system pressure **INFO**.

(b) Using a voltmeter, measure the battery voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
Positive terminal - Negative terminal	Power switch off	11 to 14 V

(c) Disconnect the cable from the negative (-) battery terminal.

(d) Disconnect the fuel hose from the fuel main tube **INFO**.

(e) Install SST (pressure gauge) using other SST as shown in the illustration.

Text in Illustration

*1	SST (Clip)
*2	SST (T-joint)
*3	SST (Pressure Gauge)
*4	SST (Hose)
*5	SST (Tube Connector)
*6	Fuel Tube

SST: 09268-31012

09268-41500

90467-13001

95336-08070

SST: 09268-45014

09268-41200

09268-41220

09268-41250

(f) Clean up any spilled gasoline.

(g) Connect the cable to the negative (-) battery terminal.

(h) Connect the Techstream to the DLC3.

(i) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump /Speed.

(j) Measure the fuel pressure.

Standard fuel pressure:

304 to 343 kPa (3.1 to 3.5 kgf/cm², 44 to 50 psi)

- If the fuel pressure is greater than the standard value, replace the fuel pressure regulator.
- If the fuel pressure is less than the standard value, check the fuel hoses and connections, fuel pump, fuel filter and fuel pressure regulator.

(k) Disconnect the Techstream from the DLC3.

(l) Put the vehicle in the "inspection mode" .

(m) Start the engine.

(n) Measure the fuel pressure at idle.

Standard fuel pressure:

304 to 343 kPa (3.1 to 3.5 kgf/cm², 44 to 50 psi)

(o) Stop the engine.

(p) Check that the fuel pressure remains as specified for 5 minutes after the engine stops.

Standard fuel pressure:

147 kPa (1.5 kgf/cm², 21 psi) or more

If the fuel pressure is not as specified, check the fuel pump or fuel injector.

(q) After checking the fuel pressure, disconnect the cable from the negative (-) battery terminal and carefully remove SST to prevent gasoline from spraying.

(r) Reconnect the fuel tube to the main fuel tube (fuel tube connector).

(s) Install the No. 1 fuel pipe clamp to the fuel tube connector.

(t) Inspect for fuel leaks (Step 1).

REMOVAL

1. REMOVE FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Remove the fuel suction tube assembly with pump and gauge INFO.

2. DRAIN FUEL

3. REMOVE REAR FLOOR SIDE MEMBER COVER LH (w/ Floor Under Cover) INFO

4. REMOVE REAR FLOOR SIDE MEMBER COVER RH (w/ Floor Under Cover) INFO

5. REMOVE REAR SUSPENSION BRACE SUB-ASSEMBLY INFO

6. REMOVE REAR FLOOR STEP UNDER COVER SUB-ASSEMBLY (w/ Floor Under Cover) INFO

7. REMOVE NO. 1 FUEL TANK PROTECTOR

(a) Remove the 3 bolts and the No. 1 fuel tank protector.

8. DISCONNECT FUEL CUT-OFF TUBE

(a) Disconnect the fuel cut-off tube from the charcoal canister assembly.

Text in Illustration

*1	Retainer
----	----------

HINT:

Do not remove the retainer.

- Remove any dirt or foreign matter on the fuel cut-off tube connector before performing this work.
- Do not allow any scratches or foreign matter on the parts when disconnecting them as the fuel cut-off tube connector has an O-ring that seals the pipe.
- Perform this work by hand. Do not use any tools.
- Do not forcibly bend, twist or turn the fuel cut-off tube.

- Protect the disconnected part by covering it with a plastic bag after disconnecting the fuel cut-off tube.
- If the vent hose connector and pipe are stuck, push and pull to release them.

9. DISCONNECT FUEL TANK BREATHER TUBE

(a) Pinch the tabs of the retainer to remove the lock claws and pull it down as shown in the illustration.

Text in Illustration

*1	Retainer
*2	Quick Connector
*3	Pipe
*4	O-ring

(b) Pull out the fuel tank breather tube.

NOTICE:

- Check that there is no dirt or other foreign objects around the connector before this operation and clean the connector as necessary.
- It is necessary to prevent mud or dirt from entering the connector. If mud or dirt gets in the connector, the O-rings may not seal properly.
- Do not use any tools in this operation.
- Do not bend, kink or twist the nylon tube. Protect the connector by covering it with a plastic bag.
- When the pipe and connector are stuck, push and pull the connector to release and pull the connector out carefully.

10. DISCONNECT FUEL TANK TO FILLER PIPE HOSE

(a) Pull the tabs of the retainer to disengage the lock claws and pull it down as shown in the illustration

Text in Illustration

*1	Retainer
----	----------

c

(b) Pull out the fuel tank to filler pipe hose.

- Check that there is no dirt or other foreign objects around the connector before this operation and clean the connector as necessary.
- It is necessary to prevent mud or dirt from entering the connector. If mud or dirt gets in the connector, the O-rings may not seal properly.
- Do not use any tools in this operation.
- Do not bend, kink or twist the nylon tube. Protect the connector by covering it with a plastic bag.
- When the pipe and connector are stuck, push and pull the connector to release and pull the connector out carefully.

11. REMOVE FUEL TANK MAIN TUBE SUB-ASSEMBLY

Text in Illustration

*1	Retainer
*2	Quick Connector
*3	Pipe
*4	O-ring

c

(a) Pinch the tabs of the retainer to remove the lock claws and pull it down as shown in the illustration.

(b) Pull out and remove the fuel tank main tube sub-assembly.

- Check that there is no dirt or other foreign objects around the connector before this operation and clean the connector as necessary.
- It is necessary to prevent mud or dirt from entering the connector. If mud or dirt gets in the connector, the O-rings may not seal properly.
- Do not use any tools in this operation.

- Do not bend, kink or twist the nylon tube. Protect the connector by covering it with a plastic bag.
- When the pipe and connector are stuck, push and pull the connector to release and pull the connector out carefully.

12. REMOVE FUEL TANK ASSEMBLY

(a) Remove the 2 bolts and disconnect the parking brake cable assembly.

(b) Support the fuel tank using an engine lifter.

(c) Remove the 4 set bolts of the 2 fuel tank bands.

(d) Lower the engine lifter to remove the fuel tank.

NOTICE:

- Slowly operate the engine lifter to lower the fuel tank.
- Do not drop the fuel tank.
- When removing the fuel tank, tilt it slightly to prevent it from interfering with the suspension arm or other surrounding parts.

13. REMOVE FUEL TANK CUSHION

(a) Remove the 3 No. 1 fuel tank cushions and 2 No. 2 fuel tank cushions.

Text in Illustration

*1	No. 1 Fuel Tank Cushion
*2	No. 2 Fuel Tank Cushion

INSTALLATION

1. INSTALL FUEL TANK CUSHION

(a) Install 3 new No. 1 fuel tank cushions and 2 new No. 2 fuel tank cushions as shown in the illustration.

Text in Illustration

*1	No. 1 Fuel Tank Cushion
*2	No. 2 Fuel Tank Cushion

2. INSTALL FUEL TANK ASSEMBLY

(a) Support the fuel tank using an engine lifter.

(b) Raise the engine lifter, then install the fuel tank to the vehicle.

- Do not drop the fuel tank.
- When installing the fuel tank, tilt it slightly to prevent it from interfering with the suspension arm or other surrounding parts.

(c) Tighten the 4 set bolts of the 2 fuel tank bands.

Torque: **39 N·m (400 kgf·cm, 29ft·lbf)**

NOTICE:

First temporarily install the bolts of the tank bracket. Then temporarily install the bolts of the tank bands. Finally, tighten all of the bolts.

(d) Connect the parking brake cable assembly with the 2 bolts.

Torque: **6.0 N·m (61 kgf·cm, 53in·lbf)**

3. CONNECT FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Push in the fuel tank main tube connector to the pipe and push up the retainer so that the claws engage.

Text in Illustration

*1	Retainer
*2	Quick Connector
*3	Pipe
*4	O-ring

- Check that there are no scratches or foreign objects around the connected part of the fuel tube connector and pipe before starting this step.
- After connecting the fuel tank main tube sub-assembly, check that the fuel tank main tube sub-assembly is securely connected by pulling on the fuel tube connector.

4. CONNECT FUEL TANK TO FILLER PIPE HOSE

(a) Push in the hose connector to the filler pipe and install the retainer.

Text in Illustration

*1	Retainer
----	----------

- Before connecting the tube, make sure that it is not damaged. Make sure that there is no dirt present on the connecting surfaces.
- After connecting, check if the fuel tube connector and the pipe are securely connected by pulling on them.

5. CONNECT FUEL TANK BREATHING TUBE

(a) Push in the fuel tank breather tube connector to the pipe and push up the retainer so that the claws engage.

Text in Illustration

*1	Retainer
*2	Quick Connector
*3	Pipe
*4	O-ring

- Check that there are no scratches or foreign objects around the connected part of the fuel tube connector and pipe before starting this step.
- After connecting the fuel tank main tube sub-assembly, check that the fuel tank main tube sub-assembly is securely connected by pulling on the fuel tube connector.

6. CONNECT FUEL CUT-OFF TUBE

- (a) Push in the fuel cut-off tube connector to the charcoal canister and push up the retainer so that the claws engage.

Text in Illustration

*1	Retainer
----	----------

- Check that there are no scratches or foreign matter around the connected part of the fuel cut-off tube connector and pipe before performing this work.
- After connecting the fuel cut-off tube, check that the fuel cut-off tube is securely connected by pulling the fuel cut-off tube connector and the charcoal canister.

7. INSTALL NO. 1 FUEL TANK PROTECTOR

- (a) Install the No. 1 fuel tank protector with the 3 bolts.

Torque: **5.5 N·m (56 kgf·cm, 49in·lbf)**

8. INSTALL REAR FLOOR STEP UNDER COVER SUB-ASSEMBLY (w/ Floor Under Cover)

INFO

9. INSTALL REAR SUSPENSION BRACE SUB-ASSEMBLY_ 

10. INSTALL REAR FLOOR SIDE MEMBER COVER LH (w/ Floor Under Cover)_ 

11. INSTALL REAR FLOOR SIDE MEMBER COVER RH (w/ Floor Under Cover)_ 

12. ADD FUEL

13. INSTALL FUEL SUCTION TUBE ASSEMBLY WITH PUMP AND GAUGE

(a) Install the fuel suction tube assembly with pump and gauge  .

COMPONENTS

ILLUSTRATION

N*m (kgf*cm, ft.*lbf): Specified torque

c

ON-VEHICLE INSPECTION

1. INSPECT ACCELERATOR PEDAL ASSEMBLY

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Hybrid Control / Data List / Accel Pedal Pos #1, Accel Pedal Pos #2.
- (e) Read the Data List.

Result:

Tester Display	Accelerator Pedal Condition	Specified Condition
Accel Pedal Pos #1	Not depressed	(8 to 28%) 0.4 to 1.4 V
	Fully depressed	(62 to 92%) 3.1 to 4.6 V
	Not depressed → Fully depressed → Not depressed (Accelerator pedal should be operated slowly)	Value changes progressively as shown in the illustration
Accel Pedal Pos #2	Not depressed	(20 to 44%) 1.0 to 2.2 V
	Fully depressed	(78 to 100%) 3.9 to 5.0 V
	Not depressed → Fully depressed → Not depressed (Accelerator pedal should be operated slowly)	Value changes progressively as shown in the illustration

Text in Illustration

*1	Accelerator Pedal Position Sensor Output Voltage (V)
*2	Accelerator Pedal Fully Released
*3	Accelerator Pedal Fully depressed
*4	Accelerator Pedal Turning Angle (°)

If the result is not as specified, check the accelerator pedal assembly, wire harness or ECM.

REMOVAL

1. REMOVE ACCELERATOR PEDAL ASSEMBLY

(a) Disconnect the accelerator pedal assembly connector.

(b) Remove the 2 bolts and accelerator pedal assembly.

NOTICE:

- Avoid physical shock to the accelerator pedal assembly.
- Do not disassemble the accelerator pedal assembly.

INSTALLATION

1. INSTALL ACCELERATOR PEDAL ASSEMBLY

NOTICE:

- Avoid physical shock to the accelerator pedal assembly.
- Do not disassemble the accelerator pedal assembly.

(a) Install the accelerator pedal assembly with the 2 bolts.

Torque: **5.4 N·m (55 kgf·cm, 48in·lbf)**

(b) Connect the accelerator pedal assembly connector.

1. REMOVE REAR SEAT CUSHION ASSEMBLY_ [INFO](#)
2. REMOVE REAR NO. 1 FLOOR BOARD SUB-ASSEMBLY_ [INFO](#)
3. REMOVE REAR NO. 2 FLOOR BOARD SUB-ASSEMBLY_ [INFO](#)
4. REMOVE REAR NO. 1 FLOOR BOARD_ [INFO](#)
5. REMOVE REAR FLOOR BOARD SPACER_ [INFO](#)
6. REMOVE NO. 1 HYBRID BATTERY EXHAUST DUCT_ [INFO](#)
7. REMOVE REAR DOOR SCUFF PLATE RH

HINT:

Use the same procedure described for the LH side [INFO](#).

8. REMOVE REAR SIDE SEAT BACK ASSEMBLY RH_ [INFO](#)
9. REMOVE NO. 1 HYBRID BATTERY INTAKE DUCT_ [INFO](#)
10. REMOVE BATTERY COOLING BLOWER ASSEMBLY

NOTICE:

- Be sure not to touch the fan part of the battery cooling blower assemblies.
- Do not lift the battery cooling blower assemblies using the wire harness.

(a) Disconnect the 3 wire harness clamps.

(b) Disconnect the battery cooling blower assembly connector and clamp.

(c) Remove the 2 bolts, nut and battery cooling blower assembly.

INSTALLATION

1. INSTALL BATTERY COOLING BLOWER ASSEMBLY

NOTICE:

- Be sure not to touch the fan part of the battery cooling blower assemblies.
- Do not lift the battery cooling blower assemblies using the wire harness.

(a) Install the battery cooling blower assembly with the 2 bolts and nut.

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

(b) Connect each battery cooling blower assembly connector and clamp.

(c) Connect the 3 wire harness clamps.

2. INSTALL NO. 1 HYBRID BATTERY INTAKE DUCT [INFO](#)

3. INSTALL REAR SIDE SEAT BACK ASSEMBLY RH [INFO](#)

4. INSTALL REAR DOOR SCUFF PLATE RH

HINT:

Use the same procedure described for the LH side [INFO](#).

N*m (kgf*cm, ft.*lbf): Specified torque

REMOVAL

1. REMOVE HYBRID BATTERY JUNCTION BLOCK

HINT:  .

2. REMOVE BATTERY SMART UNIT

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Disconnect the 3 connectors.

(b) Remove the 2 bolts and battery smart unit.

INSTALLATION

1. INSTALL BATTERY SMART UNIT

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Install the battery smart unit with the 2 bolts.

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

(b) Connect the 3 connectors.

NOTICE:

The connectors should be connected securely.

2. INSTALL HYBRID BATTERY JUNCTION BLOCK

HINT: **INFO**.

ON-VEHICLE INSPECTION

1. INSPECT FOR COOLANT LEAK (for Inverter)

(a) Remove the reserve tank cap.

CAUTION:

To avoid the danger of being burned, do not remove the reserve tank cap while the coolant for the inverter is still hot.

(b) Install the radiator cap tester.

(c) Pump the radiator cap tester to 122 kPa (1.2 kgf/cm², 17.7 psi), and then check that the pressure does not drop.

HINT:

If the pressure drops, check the hoses, radiator, water pump, inverter with converter, and hybrid vehicle transaxle assembly for leaks.

(d) Reinstall the reserve tank cap.

2. INSPECT COOLANT LEVEL IN RESERVE TANK (for Inverter)

(a) The coolant should be between the L and F lines when the coolant for the inverter is cold.

HINT:

If the coolant level is low, check for leaks and add TOYOTA Super Long Life Coolant (SLLC) or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology up to the F line.

3. INSPECT COOLANT (for Inverter)

(a) Remove the reserve tank cap.

CAUTION:

To avoid the danger of being burned, do not remove the reserve tank cap while the coolant for the inverter is still hot.

(b) Check for excessive deposits of rust or scale on and around the reserve tank cap and its opening.

HINT:

If excessively dirty, replace the coolant for the inverter.

(c) Reinstall the reserve tank cap.

4. INSPECT RESERVE TANK CAP (for Inverter)

(a) Inspect the reserve tank cap.

Text in Illustration

*1	O-ring
*2	Rubber Packing

(1) If there are water stains or foreign matter on the O-ring, clean it with water and finger scouring.

NOTICE:

Do not use any tools.

(2) Check that the O-ring is not deformed, cracked, or damaged.

(3) Check that the O-ring is not swollen.

(b) Check the reserve tank cap operation.

(1) Apply coolant (for inverter) to the O-ring and rubber packing before using a radiator cap tester.

(2) Install the reserve tank cap to the radiator cap tester.

(3) Pump the cap tester several times, and check the maximum pressure.

Judgment Criterion

Standard value (for brand-new cap)	94 to 122 kPa (1.0 to 1.2 kgf/cm ² , 13.6 to 17.7 psi)
Minimum standard value (for used cap)	94 kPa (1.0 kgf/cm ² , 13.6 psi)
Pump speed	1 pump per second

NOTICE:

When using the cap tester, tilt it 30° or more.

HINT:

If the maximum pressure is less than the minimum standard value, replace the reserve tank cap.

REPLACEMENT

1. REMOVE FRONT SPOILER COVER (for Standard)

2. REMOVE ENGINE UNDER COVER (w/ Cover)

3. DRAIN COOLANT (for Inverter)

NOTICE:

- Do not reuse the drained coolant because it may contain foreign objects.
- Collect the drained coolant and measure its volume to establish a benchmark. When adding coolant, make sure to add more coolant than the measured amount.

(a) Remove the reserve tank cap.

CAUTION:

To avoid the danger of being burned, do not remove the reserve tank cap while the coolant for the inverter is still hot.

(b) Using a hexagon wrench (10 mm), remove the drain plug indicated in the illustration and drain the coolant.

CAUTION:

Use caution when handling coolant immediately after driving or in summer because it may be hot.

(c) Install the plug with a new gasket.

Torque: **39 N·m (397 kgf·cm, 29ft·lbf)**

4. ADD COOLANT (for Inverter)

NOTICE:

- Do not reuse the drained coolant because it may contain foreign objects.
- If the vehicle is driven with air in the inverter cooling system, damage may occur and the following DTCs may be set.

DTC Code	Detection Item
P0A01-726	Motor Electronics Coolant Temperature Sensor Circuit Range / Performance
P0A04-725	Motor Electronics Coolant Temperature Sensor Circuit Intermittent
P0A08-264	DC / DC Converter Status Circuit

DTC Code	Detection Item
P0A78-284	Drive Motor "A" Inverter Performance
P0A78-286	Drive Motor "A" Inverter Performance
P0A7A-322	Generator Inverter Performance
P0A7A-324	Generator Inverter Performance
P0A93-346	Inverter Cooling System Performance
P0A94-553	DC / DC Converter Performance
P0A94-557	DC / DC Converter Performance
P0AEE-277	Motor Inverter Temperature Sensor "A" Circuit Range / Performance
P0AF1-276	Drive Motor Inverter Temperature Sensor "A" Circuit Intermittent / Erratic
P0BCD-315	Generator Inverter Temperature Sensor Circuit Range / Performance
P0BD0-314	Generator Inverter Temperature Sensor Circuit Intermittent / Erratic
P0C39-626	DC / DC Converter Temperature Sensor "A" Range / Performance
P0C3C-625	DC / DC Converter Temperature Sensor "A" Intermittent / Erratic
P0C3E-628	DC / DC Converter Temperature Sensor "B" Range / Performance
P0C41-627	DC / DC Converter Temperature Sensor "B" Intermittent / Erratic
P0C73-776	Motor Electronics Coolant Pump "A" Control Performance

c

(a) Slowly pour coolant into the reserve tank until it reaches the F line.

Coolant quantity:

2.1 liters (2.2 US qts, 1.8 Imp. qts.)

(b) When using the Techstream:

(1) Connect the Techstream to the DLC3.

(2) Turn the power switch on (IG).

(3) On the Techstream, enter the following menus: Powertrain / Hybrid Control / Active Test / Activate the Water Pump.

(4) Keep the coolant at the F line in the reserve tank to compensate for the drop in coolant level when the air bleeds.

Standard:

Air bleeding from the inverter cooling system is completed when the noise made by the water pump becomes smaller and the circulation of coolant in the reserve tank improves.

HINT:

Loud noise made by the water pump and poor circulation of coolant in the reserve tank indicates that there is air in the cooling system.

(c) When not using the Techstream:

(1) Turn the power switch on (READY). [*1]

(2) Turn the power switch off and add coolant to the F line because the coolant level drops as the air bleeds. [*2]

NOTICE:

- Be sure to turn the power switch off before adding SLLC.
- Do not work on the components in the engine compartment while the vehicle is in the READY-on state because the engine is in intermittent operation.

(3) Repeat steps [*1] and [*2] until air bleeding from the cooling system is completed.

Standard:

Air bleeding from the inverter cooling system is completed when the noise made by the water pump becomes smaller and the circulation of coolant in the reserve tank improves.

HINT:

Loud noise made by the water pump and poor circulation of coolant in the reserve tank indicates that there is air in the cooling system.

(d) After the air is completely bled from the cooling system, tighten the reserve tank cap.

(e) Add coolant to the F line of the reserve tank.

c

5. INSPECT FOR COOLANT LEAK (for Inverter) INFO

17. REMOVE REAR FLOOR BOARD SPACER_ INFO

18. REMOVE NO. 1 HYBRID BATTERY EXHAUST DUCT_ INFO

19. REMOVE UPPER HYBRID BATTERY COVER SUB-ASSEMBLY_ INFO

20. DISCONNECT CABLE FROM BATTERY TERMINAL

(a) Remove the connector cover.

(b) Disconnect the 2 clamps, and remove the nut.

(c) Disconnect the 3 wire harness clamps.

21. DISCONNECT HYBRID BATTERY JUNCTION BLOCK

CAUTION:

Wear insulating gloves.

NOTICE:

Insulate the removed terminals with insulating tape.

(a) Remove the 2 nuts, then disconnect the frame wire from the hybrid battery junction block.

(b) Disconnect the clamp and frame wire.

22. REMOVE FRAME WIRE

CAUTION:

Wear insulating gloves.

NOTICE:

Insulate the removed terminals with insulating tape.

(a) Remove the wire harness protector and disconnect the clamp from the floor panel.

(b) Disconnect the 2 wire harness clamps from the floor panel.

(c) Disconnect the 3 claws and push the frame wire out from the floor panel.

c

c

(d) Disconnect the connector from the engine room junction block assembly.

c

(e) Disconnect the 2 clamps shown in the illustration.

c

(f) Disconnect the clamp shown in the illustration.

(g) Disconnect the clamp shown in the illustration.

(h) Remove the nut and heater water pipe sub-assembly.

(i) Remove the nut and 2 clamps shown in the illustration.

(j) Remove the nut and clamp shown in the illustration.

(k) Remove the nut shown in the illustration.

(l) Remove the frame wire and the 4 clamps.

NOTICE:

The clamps are non-reusable parts.

INSTALLATION

1. INSTALL FRAME WIRE

CAUTION:

Wear insulating gloves.

NOTICE:

Insulate the removed terminals with insulating tape.

(a) Install the frame wire with the 4 clamps.

c

(b) Insert the frame wire into the floor panel hole.

HINT:

The arrow should be pointing toward the front of the vehicle.

c

c

(c) Install the nut shown in the illustration.

Torque: **8.4 N·m (85 kgf·cm, 74in·lbf)**

(d) Install the nut and clamp shown in the illustration.

Torque: **8.4 N·m (85 kgf·cm, 74in·lbf)**

(e) Install the nut and 2 clamps shown in the illustration.

Torque: **8.4 N·m (85 kgf·cm, 74in·lbf)**

(f) Install the heater water pipe sub-assembly and nut.

Torque: **9.8 N·m (100 kgf·cm, 87in·lbf)**

(g) Connect the clamp shown in the illustration.

(h) Connect the clamp shown in the illustration.

(i) Connect the 2 clamps shown in the illustration.

(j) Connect the connector to the engine room junction block assembly.

(k) Connect the 2 wire harness clamps to the floor panel.

(l) Install the wire harness protector and connect the clamp to the floor panel.

2. CONNECT HYBRID BATTERY JUNCTION BLOCK

CAUTION:

2010 Toyota Prius

Repair Manual

Wear insulating gloves.

(a) Install the frame wire on the hybrid battery junction block with the 2 nuts.

Torque: **9.0 N·m (92 kgf·cm, 80in·lbf)**

(b) Connect the clamp and frame wire.

NOTICE:

- Make sure that the ends of the frame wire are not crossed over each other.
- Be sure to connect the frame wire to each correct terminal.

3. CHECK HIGH VOLTAGE CABLE CONNECTION_ INFO

4. CONNECT CABLE TO BATTERY TERMINAL

(a) Connect the 3 wire harness clamps.

(b) Install the nut, and connect the 2 clamps.

Torque: **7.6 N·m (77 kgf·cm, 67in·lbf)**

(c) Install the terminal cover.

17. REMOVE REAR DOOR SCUFF PLATE RH

HINT:

Use the same procedure described for the LH side.

18. REMOVE REAR SIDE SEAT BACK ASSEMBLY LH_ INFO

19. REMOVE REAR SIDE SEAT BACK ASSEMBLY RH_ INFO

20. REMOVE REAR NO. 4 FLOOR BOARD_ INFO

21. REMOVE DECK FLOOR BOX LH_ INFO

22. REMOVE DECK TRIM SERVICE HOLE COVER_ INFO

23. REMOVE REAR DECK TRIM COVER_ INFO

24. REMOVE LUGGAGE HOLD BELT STRIKER ASSEMBLY (for LH Side)_ INFO

25. REMOVE TONNEAU COVER HOLDER CAP (for LH Side)_ INFO

26. REMOVE DECK TRIM SIDE PANEL ASSEMBLY LH_ INFO

27. REMOVE TONNEAU COVER HOLDER CAP (for RH Side)

HINT:

Use the same procedure described for the LH side.

28. REMOVE LUGGAGE HOLD BELT STRIKER ASSEMBLY (for RH Side)

HINT:

Use the same procedure described for the LH side.

29. REMOVE DECK TRIM SIDE PANEL ASSEMBLY RH_ INFO

30. REMOVE REAR FLOOR BOARD SPACER

- (a) Remove the 2 clips and rear floor board spacer.

c

31. REMOVE NO. 1 HYBRID BATTERY EXHAUST DUCT

c

(a) Remove the clip and No. 1 hybrid battery exhaust duct.

32. REMOVE UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

CAUTION:

Be sure to wear insulated gloves and protective goggles.

c

(a) Using the service plug grip, remove the battery cover lock striker.

HINT:

Insert the projection part of the service plug grip, and turn the button of the battery cover lock striker counterclockwise, and release the lock.

(b) Remove the 4 nuts and upper hybrid battery cover sub-assembly.

33. REMOVE NO. 1 HYBRID BATTERY INTAKE DUCT

(a) Remove the 2 clips and No. 1 hybrid battery intake duct.

34. REMOVE BATTERY COOLING BLOWER ASSEMBLY

NOTICE:

- Be sure not to touch the fan part of the battery cooling blower assemblies.
- Do not lift the battery cooling blower assemblies using the wire harness.

(a) Disconnect the 3 wire harness clamps.

(b) Disconnect the battery cooling blower assembly connector and clamp.

(c) Remove the 2 bolts, nut and battery cooling blower assembly.

35. REMOVE NO. 7 HYBRID VEHICLE BATTERY UPPER CARRIER BRACKET

(a) Disconnect the wire harness clamp.

(b) Remove the bolt and No. 7 hybrid battery upper carrier bracket.

36. REMOVE CHILD RESTRAINT SEAT ANCHOR BRACKET SUB-ASSEMBLY LH

(a) Remove the 2 bolts and child restraint seat anchor bracket sub-assembly LH.

c

37. REMOVE CHILD RESTRAINT SEAT ANCHOR BRACKET SUB-ASSEMBLY RH

(a) Disconnect the wire harness protector clamp.

c

(b) Remove the 2 bolts and child restraint seat anchor bracket sub-assembly RH.

c

38. REMOVE FRAME WIRE

CAUTION:

- Wear insulating gloves.

- Insulate the removed terminals with insulating tape.

c

(a) Remove the 2 nuts, then disconnect the frame wire from the hybrid battery junction block assembly.

(b) Disconnect the clamp and frame wire.

39. REMOVE HV BATTERY ASSEMBLY

CAUTION:

Wear insulating gloves.

NOTICE:

Since the HV battery is very heavy, 2 people are needed to remove the HV battery. When removing the HV battery, do not damage the parts around it.

c

(a) Disconnect the connector and electrical key oscillator clamp.

c

(b) Disconnect the battery room ventilation hose from the floor panel.

(c) Remove the 4 bolts shown in the illustration.

c

(d) Remove the HV battery.

40. REMOVE HYBRID BATTERY JUNCTION BLOCK

CAUTION:

Wear insulating gloves.

c

(a) Disconnect the 2 connectors from the hybrid battery junction block.

c

(b) Disconnect the 2 connectors from the hybrid battery junction block.

(c) Remove the 3 nuts and hybrid battery junction block.

41. REMOVE BATTERY SMART UNIT

CAUTION:

Wear insulating gloves.

(a) Disconnect the 3 connectors.

(b) Remove the 2 nuts and battery smart unit.

42. REMOVE NO. 1 HYBRID VEHICLE BATTERY CARRIER BRACKET SUB-ASSEMBLY

CAUTION:

Wear insulating gloves.

(a) Disconnect the connector.

(b) Remove the bolt and EV battery plug as shown in the illustration.

(c) Using the service plug grip, remove the battery cover lock striker.

HINT:

Insert the projection part of the service plug grip, and turn the button of the battery cover lock striker counterclockwise, and release the lock.

c

(d) Remove the 3 nuts and No. 1 hybrid vehicle battery carrier bracket sub-assembly.

43. REMOVE NO. 4 HYBRID VEHICLE BATTERY CARRIER BRACKET SUB-ASSEMBLY

CAUTION:

Wear insulating gloves.

(a) Disconnect the 3 wire harness clamps.

c

(b) Remove the 3 bolts and No. 4 hybrid vehicle battery carrier bracket sub-assembly.

(c) Disengage the 2 claws and remove the HV battery thermistor.

c

44. REMOVE NO. 1 HYBRID BATTERY COVER INTAKE DUCT

(a) Remove the 2 clips and No. 1 hybrid battery cover intake duct.

45. REMOVE UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Remove the tape.

Text in Illustration

*1	Tape
----	------

(b) Remove the 5 bolts, 6 nuts and battery cover with the No. 1 hybrid battery shield sub-assembly.

46. REMOVE NO. 1 HYBRID BATTERY PACKING

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Remove the 2 clamps and No. 1 hybrid battery packing.

47. REMOVE HYBRID BATTERY HOSE ASSEMBLY

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Remove the hybrid battery hose assembly from the HV battery.

48. REMOVE NO. 1 HYBRID VEHICLE BATTERY HOSE

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Remove the 2 No. 1 hybrid vehicle battery hoses from the HV battery.

49. REMOVE NO. 2 HYBRID BATTERY PACK WIRE

(a) Disconnect the 2 clamps, then remove the No. 2 hybrid battery pack wire.

c

INSTALLATION

1. INSTALL NO. 2 HYBRID BATTERY PACK WIRE

(a) Connect the 2 clamps and No. 2 hybrid battery pack wire.

2. INSTALL NO. 1 HYBRID VEHICLE BATTERY HOSE

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Install the 2 No. 1 hybrid vehicle battery hoses to the HV battery.

3. INSTALL HYBRID BATTERY HOSE ASSEMBLY

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Install the hybrid battery hose assembly to the HV battery.

4. INSTALL NO. 1 HYBRID BATTERY PACKING

CAUTION:

2010 Toyota Prius

Be sure to wear insulated gloves and protective goggles.

(a) Install the No. 1 hybrid battery packing with the 2 clamps.

c

5. INSTALL UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

CAUTION:

Be sure to wear insulated gloves and protective goggles.

(a) Install the battery cover and No. 1 hybrid battery shield sub-assembly with the 5 bolts and 6 nuts.

Text in Illustration

*1	Tape
----	------

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

c

(b) Install the tape.

6. INSTALL NO. 1 HYBRID BATTERY COVER INTAKE DUCT

(a) Install the No. 1 hybrid battery cover intake duct with the 2 clips.

7. INSTALL NO. 4 HYBRID VEHICLE BATTERY CARRIER BRACKET SUB-ASSEMBLY

CAUTION:

Wear insulated gloves.

(a) Install the HV battery thermistor to the No. 4 hybrid vehicle battery carrier bracket sub-assembly.

c

(b) Install the No. 4 hybrid vehicle battery carrier bracket sub-assembly with the 3 bolts.

Torque: 7.5 N·m (76 kgf·cm, 66in·lbf)

(c) Connect the 3 wire harness clamps.

8. INSTALL NO. 1 HYBRID VEHICLE BATTERY CARRIER BRACKET SUB-ASSEMBLY

CAUTION:

Wear insulated gloves.

(a) Install the No. 1 hybrid vehicle battery carrier bracket sub-assembly

with the 3 nuts.

Torque: 7.5 N·m (76 kgf·cm, 66in·lbf)

c

(b) Install the battery cover lock striker, then push the button to lock it.

(c) Install the electric vehicle battery plug assembly with the bolt as shown in the illustration.

Torque: 7.5 N·m (76 kgf·cm, 66in·lbf)

c

(d) Connect the connector.

NOTICE:

The connector should be connected securely.

9. INSTALL BATTERY SMART UNIT

CAUTION:

Wear insulated gloves.

(a) Install the battery smart unit with the 2 bolts.

Torque: 7.5 N·m (76 kgf·cm, 66in·lbf)

c

(b) Connect the 3 connectors.

NOTICE:

The connectors should be connected securely.

10. INSTALL HYBRID BATTERY JUNCTION BLOCK

(a) Install the hybrid battery junction block with the 3 nuts.

Torque: 7.5 N·m (76 kgf·cm, 66in·lbf)

(b) Connect the 2 connectors to the hybrid battery junction block.

NOTICE:

The connectors should be connected securely.

(c) Connect the 2 connectors to the hybrid battery junction block.

NOTICE:

The connectors should be connected securely.

11. INSTALL HV BATTERY ASSEMBLY

CAUTION:

Wear insulated gloves.

NOTICE:

Since the HV battery is very heavy, 2 people are needed to install the HV battery. When installing the HV battery, do not damage the parts around it.

(a) Install the HV battery to the vehicle with the 4 bolts.

Torque: 19 N·m (194 kgf·cm, 14ft·lbf)

c

(b) Connect the battery room ventilation hose to the floor panel.

Text in Illustration

*1	Correct
*2	Incorrect

c

NOTICE:

Make sure that there is no space or gap between the grommet and the body.

c

(c) Connect the connector and electrical key oscillator clamp.

12. INSTALL FRAME WIRE

CAUTION:

Wear insulating gloves.

(a) Install the frame wire on the hybrid battery junction block assembly

with the 2 nuts.

Torque: **9.0 N·m (92 kgf·cm, 80in·lbf)**

- Make sure that the ends of the frame wire are not crossed over each other.
- Be sure to connect the frame wires to the correct terminals.

c

(b) Connect the clamp and frame wire.

13. CHECK HIGH VOLTAGE CABLE CONNECTION CONDITION

CAUTION:

Wear insulated gloves and protective goggles.

(a) Check that each wire harness is being installed securely.

c

NOTICE:

- Make sure that the end of the frame wire are not crossover each other.
- Be sure to connect the frame wire to the correct terminals as shown in the illustration.
- The connectors should be connected securely.
- The nuts should be fastened securely.
- Make sure that the 4 plastic covers are engaged securely.

14. INSTALL CHILD RESTRAINT SEAT ANCHOR BRACKET SUB-ASSEMBLY LH

(a) Install the child restraint seat anchor bracket sub-assembly LH with the 2 bolts.

Torque: **20 N·m (200 kgf·cm, 14ft·lbf)**

c

15. INSTALL CHILD RESTRAINT SEAT ANCHOR BRACKET SUB-ASSEMBLY RH

(a) Install the child restraint seat anchor bracket sub-assembly RH with the 2 bolts.

Torque: **20 N·m (200 kgf·cm, 14ft·lbf)**

c

(b) Connect the wire harness protector clamp.

c

16. INSTALL NO. 7 HYBRID VEHICLE BATTERY UPPER CARRIER BRACKET

(a) Install the No. 7 hybrid battery upper carrier bracket with the bolt.

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

c

17. INSTALL BATTERY COOLING BLOWER ASSEMBLY

NOTICE:

- Be sure not to touch the fan part of the battery cooling blower assemblies.
- Do not lift the battery cooling blower assemblies using the wire harness.

(a) Install the battery cooling blower assembly with the 2 bolts and nut
Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

(b) Connect each battery cooling blower assembly connector and clamp.

(c) Connect the 3 wire harness clamps.

18. INSTALL NO. 1 HYBRID BATTERY INTAKE DUCT

NOTICE:

Ensure that the duct is installed securely.

(a) Install the No. 1 hybrid battery intake duct with the 2 clips.

19. INSTALL UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

(a) Install the upper hybrid battery cover sub-assembly with the 4 nuts.

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

c

(b) Install the battery cover lock striker, then push the button to lock.

20. INSTALL NO. 1 HYBRID BATTERY EXHAUST DUCT

(a) Insert the No. 1 hybrid battery exhaust duct with the clip.

NOTICE:

Ensure that the duct is installed securely.

c

21. INSTALL REAR FLOOR BOARD SPACER

(a) Install the rear floor board spacer with the 2 clips.

c

22. INSTALL DECK TRIM SIDE PANEL ASSEMBLY LH INFO

23. INSTALL TONNEAU COVER HOLDER CAP (for LH Side) INFO

24. INSTALL LUGGAGE HOLD BELT STRIKER ASSEMBLY (for LH Side) INFO

25. INSTALL DECK TRIM SIDE PANEL ASSEMBLY RH_ [INFO](#)

26. REMOVE TONNEAU COVER HOLDER CAP (for RH Side)

HINT:

Use the same procedure described for the LH side.

27. INSTALL LUGGAGE HOLD BELT STRIKER ASSEMBLY (for RH Side)

HINT:

Use the same procedure described for the LH side.

REMOVAL

1. REMOVE UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

HINT: **INFO**.

2. DISCONNECT FRAME WIRE **INFO**

3. REMOVE HYBRID BATTERY JUNCTION BLOCK

CAUTION:

Be sure to wear insulated gloves.

NOTICE:

Insulate the removed terminals with insulating tape.

(a) Disconnect the 2 connectors from the hybrid battery junction block.

(b) Disconnect the 2 connectors from the hybrid battery junction block.

(c) Remove the 3 nuts and hybrid battery junction block.

INSPECTION

1. INSPECT HYBRID BATTERY JUNCTION BLOCK ASSEMBLY

(a) Inspect SMRB

(1) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
(+) connector - (+) terminal	Auxiliary battery voltage is not applied between terminals 4 (SMRB) and 2 (GND)	10 kΩ or higher
(+) connector - (+) terminal	Auxiliary battery voltage is applied between terminals 4 (SMRB) and 2 (GND)	Below 1 Ω

Text in Illustration

*1	Hybrid Battery Junction Block Assembly
*2	(+) Connector
*3	(+) Terminal

(2) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
4 (SMRB) - 2 (GND)	-40 to 176°F (-40 to 80°C)	19.0 to 35.5 Ω

If the result is not as specified, replace the hybrid battery junction block assembly.

(b) Inspect SMRG

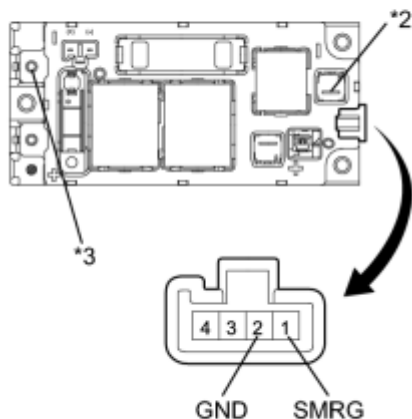

(1) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
(-) connector - (-) terminal	Auxiliary battery voltage is not applied between terminals 1 (SMRG) and 2 (GND)	10 kΩ or higher

*1

(-) connector - (-) terminal	Auxiliary battery voltage is applied between terminals 1 (SMRG) and 2 (GND)	Below 1 Ω
------------------------------	---	-----------

Text in Illustration

*1	Hybrid Battery Junction Block Assembly
*2	(-) Connector
*3	(-) Terminal

c

(2) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (SMRG) - 2 (GND)	-40 to 176°F (-40 to 80°C)	19.0 to 35.5 Ω

If the result is not as specified, replace the hybrid battery junction block assembly.

(c) Inspect SMRP and system main resistor

*1

(1) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
(-) connector - (-) terminal	Auxiliary battery voltage is not applied between terminals 3 (SMRP) and 2 (GND)	10 kΩ or higher
(-) connector - (-) terminal	Auxiliary battery voltage is applied between terminals 3 (SMRP) and 2 (GND)	28.5 to 31.5 Ω

Text in Illustration

*1	Hybrid Battery Junction Block Assembly
----	--

c

*2	(-) Connector
*3	(-) Terminal

(2) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 (SMRP) - 2 (GND)	-40 to 176°F (-40 to 80°C)	112 to 274 Ω

If the result is not as specified, replace the hybrid battery junction block assembly.

INSTALLATION

1. INSTALL HYBRID BATTERY JUNCTION BLOCK

CAUTION:

Be sure to wear insulated gloves.

(a) Install the hybrid battery junction block with the 3 nuts.

Torque: **7.5 N·m (76 kgf·cm, 66in·lbf)**

(b) Connect the 2 connectors to the hybrid battery junction block.

NOTICE:

The connectors should be connected securely.

(c) Connect the 2 connectors to the hybrid battery junction block.

2. CONNECT FRAME WIRE INFO

3. CHECK HIGH VOLTAGE CABLE CONNECTION INFO

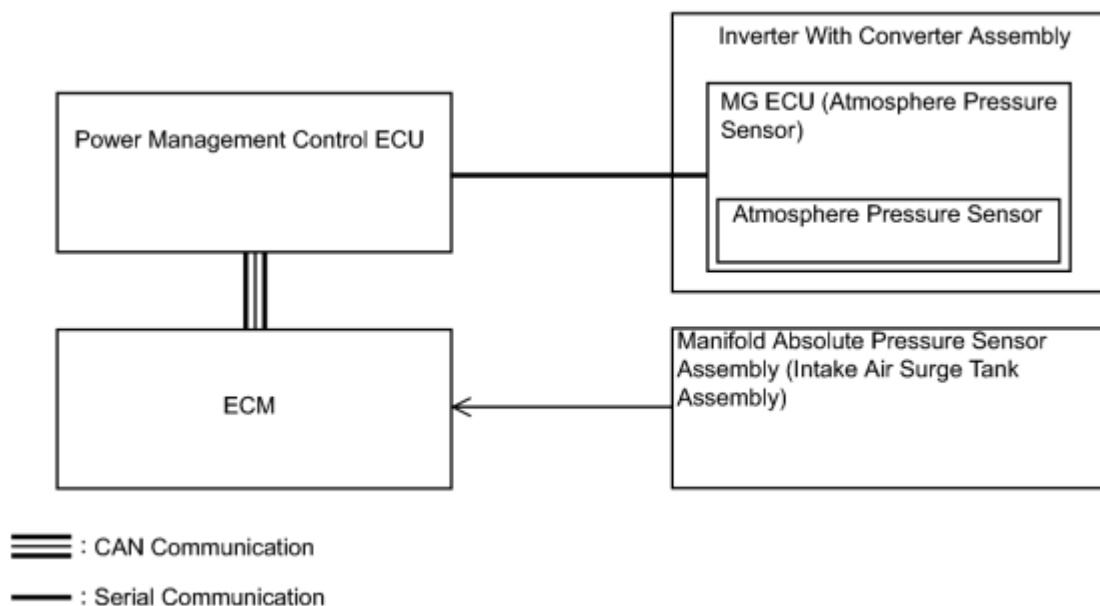

4. INSTALL UPPER HYBRID BATTERY COVER SUB-ASSEMBLY

HINT: INFO.

DTC	P0069-273	Manifold Absolute Pressure - Barometric Pressure Correlation
-----	-----------	--

DESCRIPTION

The atmospheric pressure sensor mounted on the MG ECU circuit board detects the atmospheric pressure. This reading is used to perform system control that considers vehicle usage conditions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0069	273	Difference between the atmospheric pressure value of the atmospheric pressure sensor in the inverter with converter assembly and the manifold absolute pressure sensor (for EGR control) exceeds a specified value. The same condition recurs within 3 hours when driving in EV mode.	<ul style="list-style-type: none"> • Inverter with converter assembly • Manifold absolute pressure sensor • ECM • Wire harness or connector

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (ENGINE CONTROL)
----	-----------------------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (READY).

(c) Fully depress the accelerator pedal for 5 seconds to start the engine and keep it running.

(d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(e) Check if DTCs are output.

Result:

Result		Proceed to
DTCs other than those listed in the following table are output.		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0107	Manifold Absolute Pressure/Barometric Pressure Circuit Low Input	
P0108	Manifold Absolute Pressure/Barometric Pressure Circuit High Input	
P106A	Evaporative Emission System Pressure Sensor - Manifold Absolute Pressure Correlation	

HINT:

P0069-273 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(f) Turn the power switch off.

B ▶ GO TO DTC CHART

A
▼

2.	CHECK DTC OUTPUT (HV)
----	-----------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
P0069-273 only is output.		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0A1A-151, 155, 156, 658, 659	Generator Control Module	
P0A1B-193, 512, 661, 786	Drive Motor "A" Control Module	

DTC No.	Relevant Diagnosis
P0A1D-148	Hybrid Powertrain Control Module
P2228-268	Barometric Pressure Sensor "A" Circuit Low
P2229-269	Barometric Pressure Sensor "A" Circuit High
P2511-149	HV CPU Power Relay Sense Circuit Intermittent No Continuity
P324E-788	MG-ECU Power Relay Intermittent Circuit
U0100-211, 530	Lost Communication with ECM/PCM "A"
U0110 (all INF codes)*1	Lost Communication with Drive Motor Control Module "A"

HINT:

- *1: If any INF codes are output for this DTC, refer to the corresponding diagnostic procedure.
- P0069-273 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

3.	READ VALUE USING TECHSTREAM (MAP, ATMOSPHERE PRESSURE)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Data List / MAP, Atmosphere Pressure.

(d) Using the table, read the normal atmospheric pressure value for the applicable altitude.

7. REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR

(a) Replace the manifold absolute pressure sensor INFO.

NEXT

8. CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
DTC P0069-273 is not output.	A
DTC P0069-273 is output again.	B

(e) Turn the power switch off.

B ▶ REPLACE ECM

A ▶ **END**

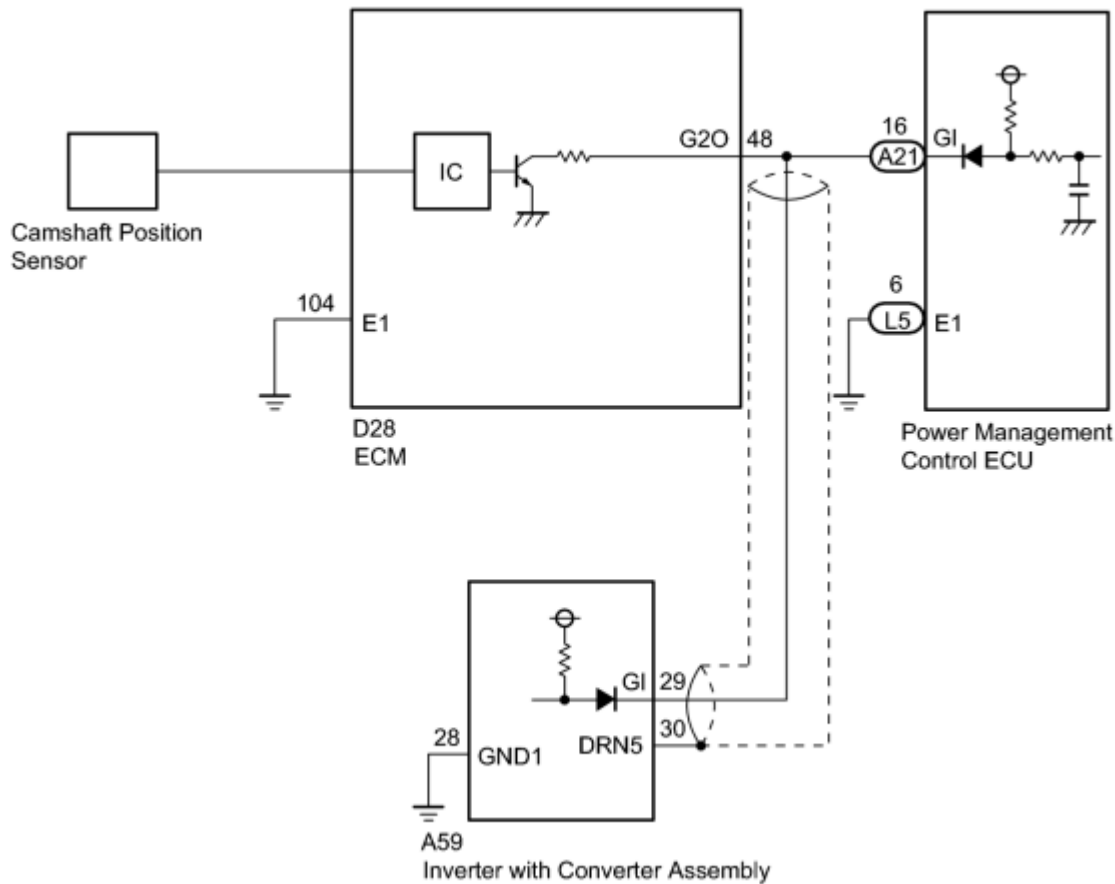

DTC	P0340-886	Camshaft Position Sensor "A" Circuit
-----	-----------	--------------------------------------

DESCRIPTION

The power management control ECU (HV CPU) compares the engine speed sent from the ECM via CAN communication and the engine speed that is indicated by pulses sent from the ECM. If the pulse input is not normal, the power management control ECU (HV CPU) sets this DTC.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0340	886	Malfunction in the engine speed sensor (GI signal) circuit	<ul style="list-style-type: none"> • Wire harness or connector • Camshaft position sensor • Inverter with converter assembly • ECM • Power management control ECU

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1. CHECK DTC OUTPUT (HV)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
DTC P0340-886 only is output.	A
DTC P0343-747 is also output.	B

- (e) Turn the power switch off.

B [CHECK HARNESS AND CONNECTOR \(ECM - POWER MANAGEMENT CONTROL ECU, INVERTER WITH CONVERTER\)](#)

A
▼

4.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR)
----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

NOTICE:

Before disconnecting the connector, confirm that it is properly connected by checking that the locking claws are engaged and that the connector does not pull out.

(b) Check the connection of the low voltage connector of the inverter with

c

converter assembly.

OK:

The connector is connected securely and there are no contact problems.

HINT:

When connecting the connector, insert it with the locking lever in the raised position. Rotate the lever downward and make sure that the connector is pulled into its socket. When the locking lever is in its fully closed position, a click will be heard as its locking claws engage. After the click is heard, pull up on the connector to confirm that it is properly connected.

OK ▶ REPLACE ECM

DTC	P0516-769	Battery Temperature Sensor Circuit Low
DTC	P0517-770	Battery Temperature Sensor Circuit High

DESCRIPTION

• The thermistor assembly (battery temperature sensor) detects the auxiliary battery temperature. The resistance of the thermistor assembly built into the thermistor changes in accordance with changes in the auxiliary battery temperature. The lower the auxiliary battery temperature, the higher the thermistor assembly resistance. Conversely, the higher the temperature, the lower the resistance. The thermistor is connected to the power management control ECU (HV CPU). A voltage of 5 V is supplied to the thermistor assembly from the THB terminal of the power management control ECU (HV CPU) through its internal resistor R. This means that resistor R and the thermistor assembly are connected in series. The voltage at the THB terminal and the resistance value change in accordance with changes in the auxiliary battery temperature. Based on this signal, the power management control ECU (HV CPU) reduces the charging current when the auxiliary battery temperature is high to protect the auxiliary battery.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0516	769	Malfunction in the thermistor assembly (battery temperature sensor) circuit (short to GND)	<ul style="list-style-type: none"> • Thermistor assembly • Wire harness or connector • Power management control ECU
P0517	770	Malfunction in the thermistor assembly (battery temperature sensor) circuit (open or short to +B))	

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- Read the freeze frame data using the Techstream. In the freeze frame data, some information is recorded about the engine conditions at the moment a malfunction occurred. This information can be helpful when troubleshooting.
- Characteristics of the thermistor resistance (reference values) are as follows.

Terminal	THB (with Connector Disconnected)	Resistance	Ambient Temperature
THB - E2	4.5 to 5.5 V	3.00 to 3.75 kΩ	Approximately 50°F (10°C)
		1.60 to 1.80 kΩ	Approximately 77°F (25°C)
		0.80 to 1.00 kΩ	Approximately 104°F (40°C)

PROCEDURE

1.	CHECK CONNECTOR CONNECTION CONDITION (POWER MANAGEMENT CONTROL ECU CONNECTOR). INFO
----	---

NG ▶ CONNECT SECURELY

OK ▼

2.	CHECK CONNECTOR CONNECTION CONDITION (THERMISTOR ASSEMBLY CONNECTOR)
----	--

(a) Check the connection of the thermistor assembly connector.

DTC	P060B-134	Internal Control Module A/D Processing Performance
DTC	P060B-135	Internal Control Module A/D Processing Performance
DTC	P060B-570	Internal Control Module A/D Processing Performance

DESCRIPTION

The power management control ECU (HV CPU) monitors its internal operation and it will set this DTC when it detects an internal malfunction. If this DTC is output, replace the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P060B	134	ECU internal error	Power Management Control ECU
	135	ECU internal error	
	570	ECU internal error	

MONITOR DESCRIPTION

The power management control ECU (HV CPU) performs diagnostic tests to verify proper operation of internal ECU systems. One of these monitors the rationality of internal analog (signal) to digital conversions. The power management control ECU (CPU) monitors the internal A/D (Analog/Digital converter) value. If there is an A/D converter malfunction, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P060B (INF 134/135/570): Internal control module A/D processing performance
Required sensors / components	Power management control ECU
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus : Powertrain / Hybrid Control / Trouble Codes.

(d) Read output DTC.

OK:

DTC P0630-804 is not output.

NG ▶ REPLACE POWER MANAGEMENT CONTROL ECU

OK ▶ **COMPLETED**

DTC	P06A4-209	Sensor Reference Voltage "D" Circuit Low
DTC	P06A5-210	Sensor Reference Voltage "D" Circuit High

DESCRIPTION

The power management control ECU (HV CPU) monitors voltage of 5 V power supply (VC) used for the sensors. If the power management control ECU (HV CPU) detects a malfunction, it will set a DTC.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P06A4	209	VC power-supply voltage is lower than 4.2 V	Power management control ECU
P06A5	210	VC power-supply voltage is higher than 5.8 V	Power management control ECU

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P06A4-209 to P06A5-210 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0516-769	Battery Temperature Sensor Circuit Low
P0517-770	Battery Temperature Sensor Circuit High
P0A2C-247	Drive Motor "A" Temperature Sensor Circuit Low
P0A2D-249	Drive Motor "A" Temperature Sensor Circuit High
P0A38-257	Generator Temperature Sensor Circuit Low
P0A39-259	Generator Temperature Sensor Circuit High
P2120-152	Throttle/Pedal Position Sensor/Switch "D" Circuit
P2122-104	Throttle/Pedal Position Sensor/Switch "D" Circuit Low Input

DTC No.	Relevant Diagnosis
P2123-105	Throttle/Pedal Position Sensor/Switch "D" Circuit High Input
P2125-153	Throttle/Pedal Position Sensor/Switch "E" Circuit
P2127-107	Throttle/Pedal Position Sensor/Switch "E" Circuit Low Input
P2128-108	Throttle/Pedal Position Sensor/Switch "E" Circuit High Input

HINT:

P06A4-209 or P06A5-210 may be set due to a malfunction which also causes DTCs in the preceding table to be set. In this case, first troubleshoot the output DTCs in the preceding table. Then, perform a test to attempt to reproduce the problems, and check that no DTCs are output.

B ▶ GO TO DTC CHART

A ▶ REPLACE POWER MANAGEMENT CONTROL ECU

DTC	P082B-575	Gear Lever X Position Circuit Low

DTC	P181A-596	Gear Lever X Position Circuit "A" / "B" Correlation
DTC	P181B-595	Gear Lever Y Position Circuit "A" / "B" Correlation
DTC	P182B-577	Gear Lever X Position "B" Circuit Low
DTC	P182C-578	Gear Lever X Position "B" Circuit High
DTC	P182E-573	Gear Lever Y Position "B" Circuit Low
DTC	P182F-574	Gear Lever Y Position "B" Circuit High

DESCRIPTION

HINT:

- The electronic shift lever system is a linkless type that does not use a shift cable.
- The shift and select sensors are non-contact type sensors.
- The shift lock control unit assembly (selector lever) is a momentary type, which returns to its home position by spring reaction as the driver's hand is released from the selector lever after shifting.

The shift lock control unit assembly (selector lever) contains a shift sensor and a select sensor to detect the selector lever position (R, N, D or B). Because both sensors operate using Hall elements, they can accurately detect shift positions in a reliable manner. Both sensors contain two detection circuits, a main and a sub circuit.

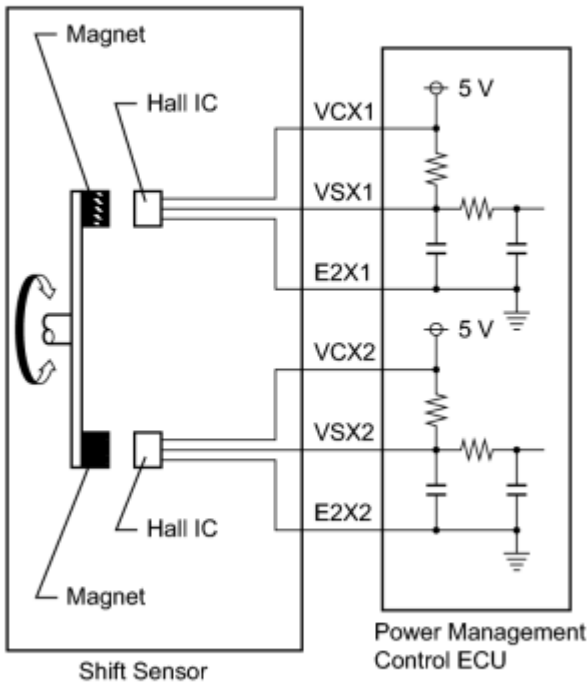

Shift Lock Control Unit Assembly (Selector Lever)

H

- The shift sensor outputs voltage, which varies between 0 and 5 V in accordance with the vertical movement of the selector lever, to the power management control ECU (HV CPU). The power management control ECU (HV CPU) interprets low level voltage input from the shift sensor as the D or B position, middle level voltage as the home or N position, and high level voltage as the R position.

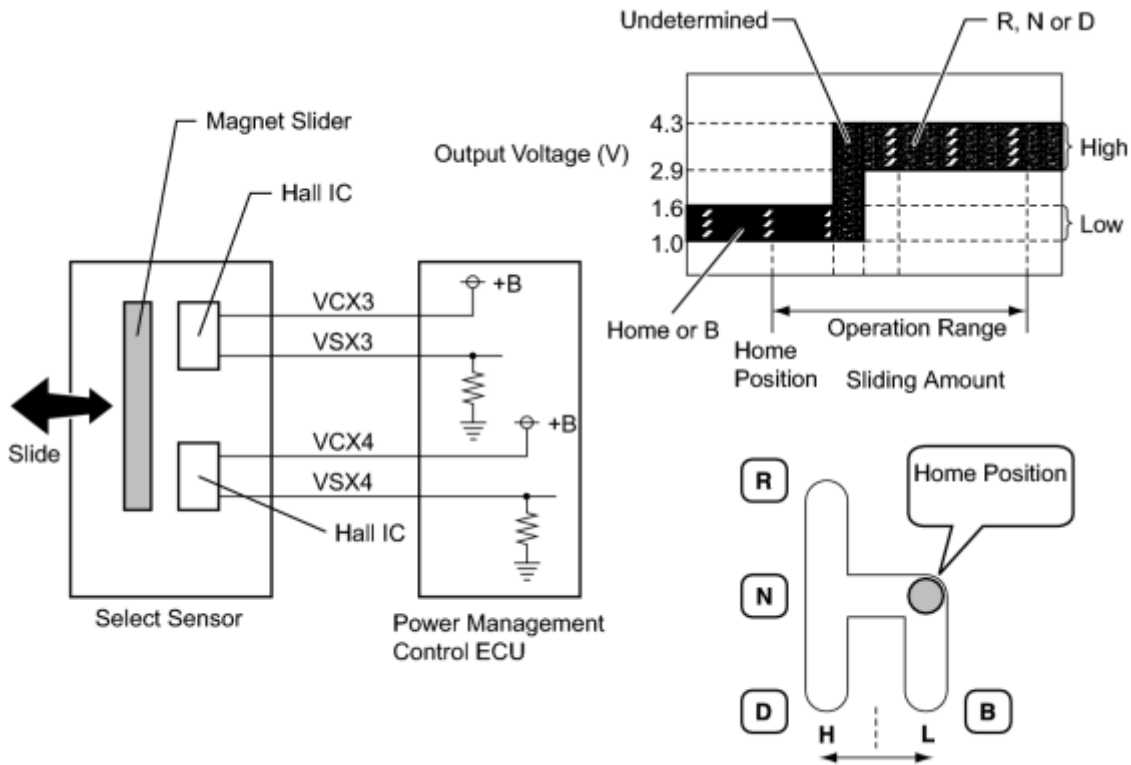

Shift Sensor Output Voltage (V)

H

- The select sensor outputs voltage, which varies between 0 and 5 V in accordance with the horizontal movement of the selector lever, to the power management control ECU (HV CPU). The power management control ECU (HV CPU) interprets low level voltage input from the select sensor as the home or B position, and high level voltage as the R, N, or D position.

The power management control ECU (HV CPU) determines the position of the selector lever in accordance with the combination of the signals from the shift sensor and select sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

PROCEDURE

1. READ VALUE USING TECHSTREAM (SHIFT SENSOR MAIN, SHIFT SENSOR SUB)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Shift Sensor Main, Shift Sensor Sub.
- (d) Read the Data List.

Result:

Tester Display	Condition	Specified Condition
Shift Sensor Main	R position	0.2 to 1.0 V
	Home or N position	2.0 to 3.0 V
	D or B position	4.0 to 4.8 V
Shift Sensor Sub	R position	0.2 to 1.0 V
	Home or N position	2.0 to 3.0 V
	D or B position	4.0 to 4.8 V

- (e) Turn the power switch off.

NG  [CHECK HARNESS AND CONNECTOR \(POWER MANAGEMENT CONTROL ECU - SHIFT SENSOR\)](#)

OK

2. READ VALUE USING TECHSTREAM (SHIFT SENSOR SELECT MAIN, SHIFT SENSOR SELECT SUB)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Shift Sensor Select Main, Shift Sensor Select Sub.
- (d) Read the Data List.

Result:

Tester Display	Condition	Specified Condition
Shift Sensor Select Main	R, N or D Position	2.9 to 4.3 V
	Home or B Position	1.0 to 1.6 V
Shift Sensor Select Sub	R, N or D Position	2.9 to 4.3 V
	Home or B Position	1.0 to 1.6 V

(e) Turn the power switch off.

NG [CHECK HARNESS AND CONNECTOR \(POWER MANAGEMENT CONTROL ECU - SELECT SENSOR\)](#)

OK

3. REPLACE SHIFT LOCK CONTROL UNIT ASSEMBLY

(a) Replace the shift lock control unit assembly .

NEXT

4. CLEAR DTC

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Read and record the DTCs and freeze frame data.

(e) Clear DTCs and freeze frame data.

(f) Turn the power switch off.

NEXT

5. CHECK DTC OUTPUT (HV)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Perform a road test.

(d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(e) Check if DTCs are output.

Result:

Result	Proceed to
No DTCs are output.	A
P082B-575, P082C-576, P082E-571, P082F-572, P181A-596, P181B-595, P182B-577, P182C-578, P182E-573 or P182F-574 is output again.	B

(f) Turn the power switch off.

B▶ REPLACE POWER MANAGEMENT CONTROL ECU

A▶ COMPLETED

6.	CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU - SHIFT SENSOR)
----	---

(a) Disconnect connector L5 from the power management control ECU.

(b) Disconnect connector z6 from the shift sensor.

(c) Turn the power switch on (IG).

(d) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) - Body ground	Power switch on (IG)	Below 1 V
L5-25 (VSX1) - Body ground	Power switch on (IG)	Below 1 V
L5-24 (E2X1) - Body ground	Power switch on (IG)	Below 1 V
L5-21 (VCX2) - Body ground	Power switch on (IG)	Below 1 V
L5-22 (VSX2) - Body ground	Power switch on (IG)	Below 1 V
L5-23 (E2X2) - Body ground	Power switch on (IG)	Below 1 V

*1	Rear view of wire harness connector: (to Power Management Control ECU)
*2	Front view of wire harness connector: (to Shift Sensor)

NOTICE:

Turning the power switch on (IG) with the power management control ECU connectors disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(e) Turn the power switch off.

(f) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for open):

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) - z6-3 (VCX1)	Power switch off	Below 1 Ω
L5-25 (VSX1) - z6-1 (VSX1)	Power switch off	Below 1 Ω
L5-24 (E2X1) - z6-2 (E2X1)	Power switch off	Below 1 Ω
L5-21 (VCX2) - z6-6 (VCX2)	Power switch off	Below 1 Ω
L5-22 (VSX2) - z6-4 (VSX2)	Power switch off	Below 1 Ω
L5-23 (E2X2) - z6-5 (E2X2)	Power switch off	Below 1 Ω

Standard Resistance (Check for short):

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) or z6-3 (VCX1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-25 (VSX1) or z6-1 (VSX1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-24 (E2X1) or z6-2 (E2X1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-21 (VCX2) or z6-6 (VCX2) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-22 (VSX2) or z6-4 (VSX2) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-23 (E2X2) or z6-5 (E2X2) - Body ground and other terminals	Power switch off	10 k Ω or higher

(g) Connect the shift sensor connector.

(h) Connect the power management control ECU connector.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

7. CHECK POWER MANAGEMENT CONTROL ECU (VCX1, VCX2 VOLTAGE)

(a) Disconnect connector z6 from the shift sensor.

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
z6-3 (VCX1) - z6-2 (E2X1)	Power switch on (IG)	4.5 to 5.5 V

*1

z6-6 (VCX2) - z6-5 (E2X2)	Power switch on (IG)	4.5 to 5.5 V
---------------------------	----------------------	--------------

B ▶ REPLACE POWER MANAGEMENT CONTROL ECU

A ▶ **COMPLETED**

DTC	P0851-579	Park / Neutral Switch Input Circuit Low
DTC	P0852-580	Park / Neutral Switch Input Circuit High

DESCRIPTION

- Instead of having a parking position as one of the positions of the conventional selector lever, a transmission shift main switch (P position switch) is provided independently above the selector lever. The switch is a momentary type, in which the button does not lock mechanically.
- The transmission shift main switch (P position switch) contains resistors R1 and R2. When the transmission shift main switch (P position switch) is not pressed, the switch provides a combined resistance of R1 and R2; and when the transmission shift main switch (P position switch) is pressed, the switch provides only the resistance of R1. The voltage at the P1 terminal of the power management control ECU (HV CPU) varies with the changes in the resistance of the switch. The power management control ECU (HV CPU) determines the transmission shift main switch (P position switch) operation according to this resistance signal.

DTC	P0861-597	Gear Shift Control Module "A" Communication Circuit Low
DTC	P0862-598	Gear Shift Control Module "A" Communication Circuit High

DESCRIPTION

When a signal is input from the transmission shift main switch (P position switch) or selector lever, the power management control ECU (HV CPU) transmits a P position control (PCON) signal to the transmission control ECU assembly. Based on this signal, the transmission control ECU assembly actuates the shift control actuator assembly in order to mechanically lock or unlock the counter drive gear in the hybrid vehicle transaxle assembly.

P position state (engaged or released) of the actuator assembly is sent to the power management control ECU (HV CPU) as a P position (PPOS) signal.

NOTICE:

Turning the power switch on (IG) with the power management control ECU connectors disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

- (e) Turn the power switch off.
- (f) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for open):

Tester Connection	Switch Condition	Specified Condition
A22-22 (PCON) - A24-22 (PCON)	Power switch off	Below 1 Ω
A22-28 (PPOS) - A24-23 (PPOS)	Power switch off	Below 1 Ω

Standard Resistance (Check for short):

Tester Connection	Switch Condition	Specified Condition
A22-22 (PCON) or A24-22 (PCON) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-28 (PPOS) or A24-23 (PPOS) - Body ground and other terminals	Power switch off	10 kΩ or higher

(g) Connect the transmission control ECU assembly connector.

(h) Connect the power management control ECU connector.

NG ▶ REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3. CHECK POWER MANAGEMENT CONTROL ECU

(a) Turn the power switch on (IG).

(b) Connect an oscilloscope between the power management control ECU terminals specified in the table below, and measure the waveform.

Item	Content
Terminal	CH1: A22-22 (PCON) - L5-6 (E1) CH2: A22-28 (PPOS) - L5-6 (E1)
Equipment Setting	5V/DIV., 20ms/DIV.
Condition	Power switch on (IG)

Result:

Result	Proceed to
P position control (PCON) signal waveform appears	A
P position control (PCON) signal waveform does not appear	B
P position (PPOS) signal waveform appears	B
P position (PPOS) signal waveform does not appear	A

B ▶ REPLACE POWER MANAGEMENT CONTROL ECU
A ▶ REPLACE TRANSMISSION CONTROL ECU ASSEMBLY

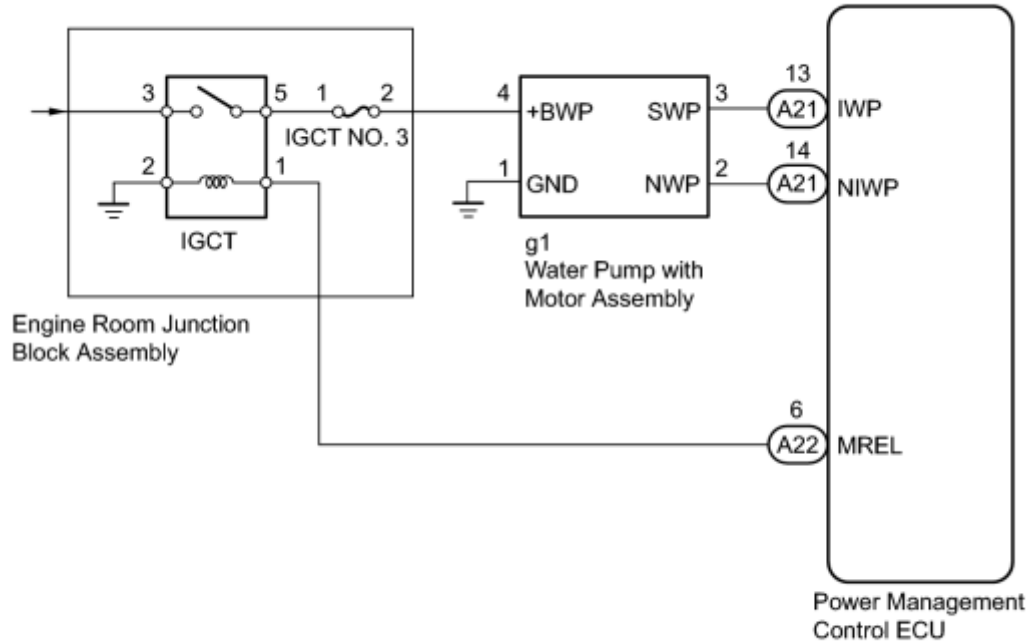

DTC	P0A01-726	Motor Electronics Coolant Temperature Sensor Circuit Range / Performance
DTC	P0A04-725	Motor Electronics Coolant Temperature Sensor Circuit Intermittent

DESCRIPTION

The power management control ECU (HV CPU) detects HV coolant temperature using the coolant temperature sensor built into the inverter with converter assembly. The power management control ECU (HV CPU) uses signals from the coolant temperature sensor to check the effectiveness of the inverter cooling system. If necessary, the power management control ECU (HV CPU) will limit inverter output to help prevent inverter overheating. The power management control ECU (HV CPU) also detects malfunctions in the sensor based on the HV coolant temperature sensor values. The inverter with converter assembly detects malfunctions in the HV coolant temperature sensor and its wiring.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A01	726	Temperature calculated by power management control ECU and actual temperature are different for 10 seconds or more.	<ul style="list-style-type: none"> • Inverter cooling system • Cooling fan system • Power management control ECU • Inverter with converter assembly • Water pump with motor assembly • Wire harness or connector • IGCT No. 3 fuse
P0A04	725	Unusual sudden change in HV coolant temperature sensor output occurs and the offset continues, or unusual sudden change in HV coolant temperature sensor output occurs repeatedly.	

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1. CHECK DTC OUTPUT (HV)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Select the following menu items: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
P0A01-726 or P0A04-725 is output		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0A93-346	Inverter Cooling System Performance	
P0C73-776	Motor Electronics Coolant Pump "A" Control Performance	
P314A-828	Inverter Coolant Pump Speed Signal	

HINT:

P0A01-726 or P0A04-725 may be set due to a malfunction which also causes DTCs in the preceding table to be set. In this case, first troubleshoot the output DTCs in the preceding table. Then, perform a test to attempt to reproduce the problems, and check that no DTCs are output.

B ► GO TO DTC CHART

A
▼

2.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR) <small>INFO</small>
----	---

NG ► CONNECT SECURELY

OK
▼

3.	CHECK QUANTITY OF HV COOLANT
----	------------------------------

(a) Check the coolant level in the inverter reserve tank.

(b) Check for coolant leaks.

Result

Result	Proceed to
Coolant leaks are not evident. A sufficient amount of coolant remains in the inverter reserve tank.	A
Coolant leaks are not evident. No coolant remains in the inverter reserve tank.	B
Coolant leaks are evident.	C

HINT:

After repairing the coolant leaks and adding coolant, perform the "Activate the Water Pump" Active Test (HV Active Test item) and the "Control the Electric Cooling Fan" Active Test (Engine Active Test item) and make sure that there are no malfunctions.

C ▶ INSPECT FOR COOLANT LEAK AND ADD COOLANT

B ▶ ADD HV COOLANT

A
▼

4.	CHECK COOLANT HOSE
----	--------------------

(a) Check if the hoses of the cooling system are kinked or clogged.

NG ▶ CORRECT THE PROBLEM

OK
▼

5.	PERFORM ACTIVE TEST USING TECHSTREAM (ACTIVATE THE WATER PUMP)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Active Test / Activate the Water Pump.

(d) Select Inverter W/P Revolution in the Data List.

(e) While performing the "Activate the Water Pump" Active Test, check Inverter W/P Revolution in the Data List.

Result:

Data List Item	Specified Condition
Inverter W/P Revolution	2250 to 5625 rpm

HINT:

Perform the Active Test with the inverter coolant temperature between 5 to 149°F (-15 and 65°C).

(f) Turn the power switch off.

NG ▶ [CHECK FUSE \(IGCT NO. 3\)](#)

OK
▼

6.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE ELECTRIC COOLING FAN)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Electric Cooling Fan.

(d) Perform the "Control the Electric Cooling Fan" Active Test.

OK:

The cooling fan rotates.

(e) Turn the power switch off.

NG▶CHECK COOLING FAN SYSTEM

OK

7.	CHECK HV COOLANT (CHECK FOR CONDITIONS THAT MAY HAVE CAUSED FREEZING)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Read the freeze frame data Ambient Temperature using the Techstream.

(d) Check if the freeze frame data Ambient Temperature is below freezing.

Result:

Result	Proceed to
Ambient Temperature value is above freezing temperature of the HV coolant	A
Ambient Temperature value is below freezing temperature of the HV coolant	B

HINT:

- HV coolant (SLLC) with a 30% concentration freezes at 5°F (-15 °C) and HV coolant (SLLC) with a 50% concentration freezes at -31°F (-35°C).
- If the HV coolant freezes in the HV radiator or HV water pump, the coolant temperature in the inverter with converter assembly rises because the HV coolant cannot circulate. As a result, a DTC may be set.
- A DTC is set when the water pump impeller cannot rotate due to freezing of the HV coolant.
- If a DTC is set due to freezing of HV coolant, the problem cannot be reproduced. Judge whether freezing of HV coolant occurred according to the freeze point of the HV coolant, HV coolant change history and ambient temperature when the DTC was set.

(e) Turn the power switch off.

B▶[REPLACE HV COOLANT](#)

A▶**REPLACE INVERTER WITH CONVERTER ASSEMBLY**

8.	CHECK FUSE (IGCT NO. 3)
----	-------------------------

(a) Remove the IGCT No. 3 fuse from the engine room junction block assembly.

*1

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IGCT No. 3 fuse	Always	Below 1Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	IGCT No. 3 Fuse

(c) Install the IGCT No. 3 fuse.

NG ► [CHECK CONNECTOR CONNECTION CONDITION \(WATER PUMP WITH MOTOR ASSEMBLY\)](#)

OK

9.	CHECK CONNECTOR CONNECTION CONDITION (WATER PUMP WITH MOTOR ASSEMBLY)
----	---

(a) Check the connection of the water pump with motor assembly connector.

OK:

The connector is connected securely and there are no contact problems.

NG ► CONNECT SECURELY

OK
▼

11. CHECK HARNESS AND CONNECTOR (WATER PUMP WITH MOTOR ASSEMBLY CIRCUIT)

- (a) Remove the IGCT No. 3 fuse from the engine room junction block assembly.
- (b) Remove the IGCT relay from the engine room junction block assembly.
- (c) Disconnect connector A21 from the power management control ECU.
- (d) Disconnect connector g1 from the water pump with motor assembly.
- (e) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Rear view of wire harness connector (to Power Management Control ECU)	*2	Engine Room Junction Block Assembly
*3	IGCT Relay	*4	IGCT No. 3 Fuse
*5	Front view of wire harness connector (to Water Pump with Motor Assembly)	-	-

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
2 (IGCT No. 3 fuse) - g1-4 (+BWP)	Power switch off	Below 1 Ω
1 (IGCT No. 3 fuse) - 3 (IGCT relay)	Power switch off	Below 1 Ω
g1-1 (GND) - Body ground	Power switch off	Below 1 Ω
g1-2 (NWP) - A21-14 (NIWP)	Power switch off	Below 1 Ω
g1-3 (SWP) - A21-13 (IWP)	Power switch off	Below 1 Ω
2 (IGCT No. 3 fuse) or g1-4 (+BWP) - Body ground and other terminals	Power switch off	10k Ω or higher
1 (IGCT No. 3 fuse) or 3 (IGCT relay) - Body ground and other terminals	Power switch off	10k Ω or higher
g1-2 (NWP) or A21-14 (NIWP) - Body ground and other terminals	Power switch off	10k Ω or higher
g1-3 (SWP) or A21-13 (IWP) - Body ground and other terminals	Power switch off	10k Ω or higher

NOTICE:

Do not apply excessive force when using the probes of the tester to perform the inspection. If excessive force is used, the terminals will be damaged.

- (f) Install the IGCT No. 3 fuse.
- (g) Install the IGCT relay.
- (h) Connect the power management control ECU connector.
- (i) Connect the water pump with motor assembly connector.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

12.	CHECK WATER PUMP WITH MOTOR ASSEMBLY
-----	--------------------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Remove the IGCT No. 3 fuse from the engine room junction block assembly.

DTC	P0A02-719	Motor Electronics Coolant Temperature Sensor Circuit Low
DTC	P0A03-720	Motor Electronics Coolant Temperature Sensor Circuit High

DESCRIPTION

Refer to the description for DTC P0A01-726 .

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A02	719	Short to GND in the HV coolant temperature sensor circuit	Inverter with converter assembly
P0A03	720	Open or short to +B in the HV coolant temperature sensor circuit	

INSPECTION PROCEDURE

PROCEDURE

1.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly .

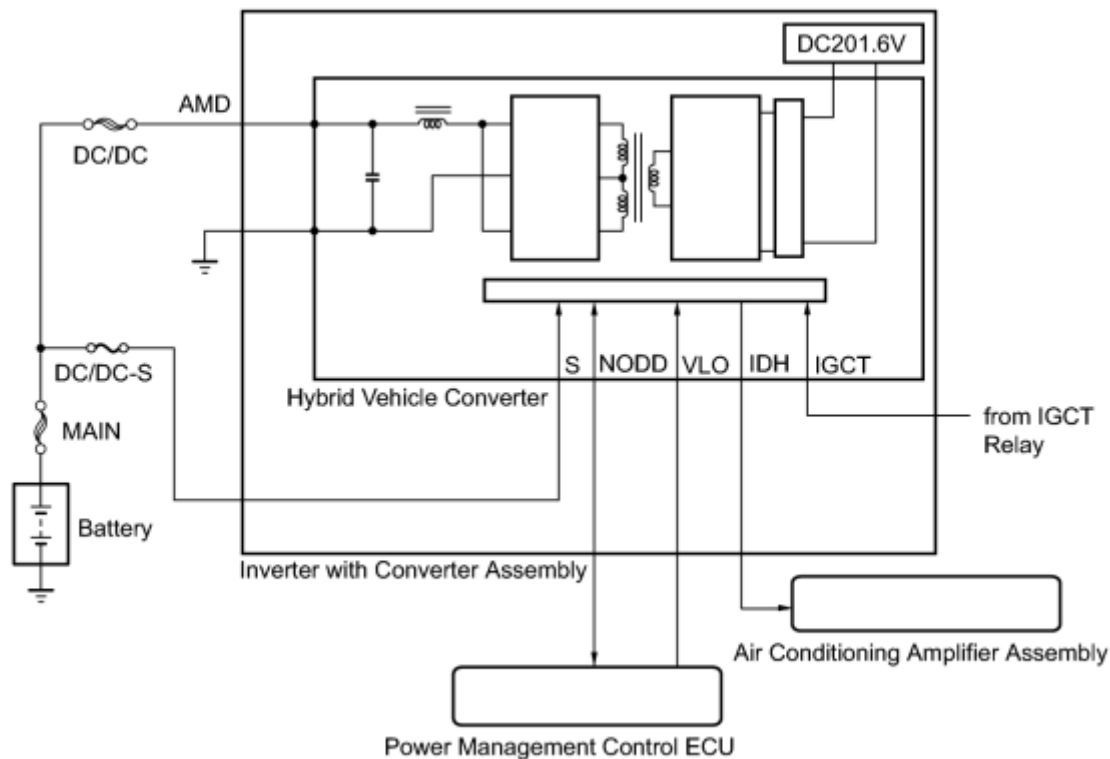

NEXT  **COMPLETED**

DTC	P0A08-264	DC / DC Converter Status Circuit
-----	-----------	----------------------------------

DESCRIPTION

The hybrid vehicle converter (DC/DC converter) converts the DC 201.6 V of the HV battery into DC 12 V in order to supply power to areas such as the vehicle's lighting, audio, and ECU systems. In addition, it charges the auxiliary battery. A transistor bridge circuit initially converts DC 201.6 V into alternating current, and a transformer lowers its voltage. Then, it is rectified and smoothed (into DC) and converted into DC 12 V. The hybrid vehicle converter controls the output voltage in order to keep a constant voltage at the terminals of the auxiliary battery.

The power management control ECU (HV CPU) uses the NODD signal line to transmit a stop command to the hybrid vehicle converter and receive signals indicating the normal or abnormal condition of the 12 V charging system. If the vehicle is being driven with an inoperative hybrid vehicle converter, the voltage of the auxiliary battery will drop, which will prevent the continued operation of the vehicle. Therefore, the power management control ECU (HV CPU) monitors the operation of the hybrid vehicle converter and alerts the driver if it detects a malfunction.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A08	264	DC/DC converter malfunction	<ul style="list-style-type: none"> • Wire harness or connector • Water pump with motor assembly • Inverter cooling system • Hybrid vehicle transaxle assembly • Generator cable

DTC No.	INF Code	DTC Detection Condition	Trouble Area
			<ul style="list-style-type: none"> • Motor cable • Frame wire • Inverter with converter assembly • Fusible link block assembly (MAIN) • Fuse (DC/DC-S, IGCT, IGCT No. 2, IGCT No. 3) • Fusible link block assembly (DC/DC)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector A59 from the inverter with converter assembly.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A59-12 (NODD) - Body ground	Power switch off	120 to 140 kΩ

c

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
----	---

(d) Connect the inverter with converter assembly connector.

13. CHECK DC/DC CONVERTER FUNCTION

HINT:

The current at the AMD terminal cannot be measured directly because of space limitations. Measure the current flowing at the auxiliary battery instead.

- (a) Connect the AC/DC 400 A probe to the positive auxiliary battery line.
- (b) Install the service plug grip.
- (c) Turn the power switch on (READY) and leave the vehicle as it is until the electric current flowing into the auxiliary battery becomes 10 A or less.
- (d) Measure the current flowing from the auxiliary battery with the power switch on (READY), the headlight position switch and blower motor switch in the HI position, and the rear window defogger turned on.

c

c

Standard Current:

Item	Switch Condition	Specified Condition
Current flowing from auxiliary battery	Power switch on (READY) (The headlight position switch and blower motor switch are in the HI position, and the rear window defogger is turned on.)	0 A or less (no current from auxiliary battery)

(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
Auxiliary battery voltage	Power switch on (READY) (The headlight position switch and blower motor switch are in the HI position, and the rear window defogger is turned on.)	13 to 15 V

(f) Turn the power switch off.

DTC	P0A09-265	DC / DC Converter Status Circuit Low Input
-----	-----------	--

DESCRIPTION

Refer to the description for DTC P0A08-264 .

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A09	265	Open or GND short in NODD signal circuit of DC/DC converter	<ul style="list-style-type: none"> • Wire harness or connector • Inverter with converter assembly • Power management control ECU

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A08-264 .

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

DTC	P0A0D-350	High Voltage System Inter-Lock Circuit High
DTC	P0A0D-351	High Voltage System Inter-Lock Circuit High

DESCRIPTION

• When the power management control ECU detects that a safety device is operated, it will prohibit hybrid system operation or shut off the system main relay. There are four safety devices in three different locations. The first safety device is located at the service plug grip. The second one is located at the frame wire that is connected to the inverter with converter assembly. The third one is located at the inverter terminal cover where the motor and generator cables and No. 2 engine wire (air conditioning harness) are connected to the inverter with converter assembly. If the service plug grip, inverter terminal cover, or frame wire is removed, the interlock signal line will be open. If the vehicle is being driven, this condition will be determined to be an open circuit and the system main relays will not be shut off. If the safety devices are re-installed correctly, the system will return to normal when the power switch is turned on (IG).

DTC No.	INF Code	DTC Detection Condition	Trouble Are
P0A0D	350	Operating any of the safety devices with the vehicle stopped (ILK signal is ON) and turning the power switch on (IG)	<ul style="list-style-type: none"> • Wire harness or connector • Power Management Control ECU • Service plug grip • Inverter with converter assembly • Frame wire • Inverter terminal cover
P0A0D	351	Interlock signal line opens (ILK signal is ON) while the vehicle is being driven

(b) Remove the inverter terminal cover from the inverter with converter assembly.

c

(c) Check the condition of the inverter terminal cover interlock.

OK:

Dirt or foreign objects have not entered the connection, and there is no evidence of contamination.

c

(d) Install the inverter terminal cover from the inverter with converter assembly.

NG ▶ REPLACE INVERTER TERMINAL COVER

OK

15.	CHECK FRAME WIRE (FRAME WIRE CONNECTOR)
-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Disconnect the frame wire T1 from the inverter with converter assembly.

(d) Check the frame wire interlock.

OK:

Dirt or foreign objects have not entered the connection, and there is no evidence of contamination.

(e) Connect the frame wire to the inverter with converter assembly.

(f) Install the inverter terminal cover from the inverter with converter assembly.

NG ▶ REPLACE FRAME WIRE

OK ▶ REPLACE INVERTER WITH CONVERTER ASSEMBLY

16.

CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU - INVERTER WITH CONVERTER)

(a) Turn the power switch off.

(b) Disconnect connector A59 from the inverter with converter assembly.

c

*1

(c) Disconnect connector A21 from the power management control ECU.

*2

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A21-32 (ILK) - A59-35 (ILKI)	Power switch off	Below 1 Ω

Text in Illustration

*1	Rear view of wire harness connector (to Power Management Control ECU)

(to Inverter with Converter Assembly)

(e) Connect the power management control ECU connector.

(f) Connect the inverter with converter assembly connector.

NG ▶ REPAIR OR REPLACE HARNESS OR CONNECTOR

OK ▶ **REPLACE POWER MANAGEMENT CONTROL ECU**

DTC	P0A0F-204	Engine Failed to Start
DTC	P0A0F-205	Engine Failed to Start
DTC	P0A0F-206	Engine Failed to Start
DTC	P0A0F-524	Engine Failed to Start
DTC	P0A0F-525	Engine Failed to Start

DESCRIPTION

If an engine malfunction occurs, an engine malfunction signal is sent from the ECM to the power management control ECU (HV CPU) . When the power management control ECU (HV CPU) receives this signal, it sets a DTC and performs fail-safe control.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A0F	204	Signal indicating abnormality input from the ECM (abnormal engine output)	<ul style="list-style-type: none"> • SFI system • Power management control ECU
	205	Signal indicating abnormality input from the ECM (engine is unable to start)	
	206	Signal indicating abnormality input from the ECM (engine component malfunction)	
	524	Signal indicating abnormality input from the ECM (NE signal error)	
	525	Signal indicating abnormality input from the ECM (GI signal error)	

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (ENGINE CONTROL SYSTEM)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
Engine control system DTCs are not output.	A
Engine control system DTCs are output.	B

HINT:

If P0A0F-204, 205, 206, 524, or 525 is output even though the ECM has not detected a malfunction, there is a malfunction in the Power management control ECU.

(e) Turn the power switch off.

B ▶ GO TO DTC CHART

A ▶ REPLACE POWER MANAGEMENT CONTROL ECU

DTC	P0A0F-238	Engine Failed to Start
-----	-----------	------------------------

DESCRIPTION

If the power management control ECU (HV CPU) detects that the engine or transmission gear has seized, the power management control ECU (HV CPU) will perform fail-safe control. Also, if a substance or object is preventing the engine or transmission internal components from rotating, the power management control ECU (HV CPU) will perform fail-safe control.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A0F	238	Engine does not start even though it is being cranked (transaxle input malfunction [engine system])	<ul style="list-style-type: none"> • Hybrid vehicle transaxle assembly • Transmission input damper assembly • Power management control ECU • Engine

INSPECTION PROCEDURE

HINT:

If this DTC is output, the engine or transmission gear may be seized. Be sure to check the level of the engine oil, automatic transmission fluid (ATF), and coolant before inspection.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
P0A0F-238 only is output.	A
P0A1D (hybrid vehicle control ECU circuit malfunction) is output.	B

(e) Turn the power switch off.

B▶ GO TO DTC CHART

A
▼

2.	CHECK CRANKSHAFT PULLEY REVOLUTION (PARK (P) SELECTED)
----	--

(a) Push the P position switch.

(b) Lift up the vehicle.

(c) Turn the crankshaft pulley using hand tools to check if the crankshaft can rotate smoothly.

CAUTION:

Do not turn the power switch on (READY) while performing this inspection. Be sure to turn the power switch off before performing this inspection, to prevent the engine from starting.

NOTICE:

Engine compression causes resistance when turning the crankshaft pulley. Check if the crankshaft rotates smoothly (or if it is locked) by manually applying sufficient torque to turn the crankshaft pulley. The torque required to turn the crankshaft pulley should be the same as for a known good vehicle of the same type.

OK:

The crankshaft rotates smoothly.

NG▶ [CHECK CRANKSHAFT PULLEY REVOLUTION \(SELECTOR LEVER IN N\)](#)

OK
▼

3.	CLEAR DTC (HV)
----	----------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Read and record the DTCs and freeze frame data.

(e) Clear DTCs and freeze frame data.

(f) Turn the power switch off.

NEXT

4.	CHECK ENGINE RACING
----	---------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Push the P position switch.

(d) Enter the following menus: Powertrain / Hybrid Control / Data List / Generator (MG1) Rev, Engine Revolution.

(e) Read the Data List.

(f) Turn the power switch on (READY).

(g) While the READY indicator is on, fully depress the accelerator pedal for 10 seconds.

OK:

Generator (MG1) Rev increases to approximately 3.6 times that of Engine Revolution.

HINT:

Refer to the graph for Data List confirmation of "Generator (MG1) Rev" and " Engine Revolution".

Data List	ENGINE REV	MG1 REV
Reference Value	Approximately 1000 rpm	Approximately 3600 rpm
	Approximately 1500 rpm	Approximately 5400 rpm
	Approximately 2500 rpm	Approximately 9000 rpm

(h) Turn the power switch off.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK

5.	CHECK CREEP MOVEMENT
----	----------------------

- (a) Turn the power switch on (READY).
- (b) Depress the brake pedal, move the selector lever to D, and release the brake pedal.

OK:

The wheels turn (the vehicle creeps forward).

- (c) Turn the power switch off.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK

6.	INSPECT ENGINE SPEED
----	----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Motor (MG2) Revolution, Generator (MG1) Rev, Engine Revolution.
- (d) Read the Data List.
- (e) Fully depress the accelerator pedal to accelerate the vehicle from a stop.

NOTICE:

Perform this test only in an appropriate safe location, in accordance with all local laws.

OK:

The difference between Engine Revolution and $0.28 \times \text{Generator (MG1) Rev} + 0.27 \times \text{Motor (MG2) Revolution}$ is 500 rpm or more and it is maintained for 1 second.

- (f) Turn the power switch off.

NG▶ REPLACE TRANSMISSION INPUT DAMPER ASSEMBLY

OK

7.	SIMULATION TEST
----	-----------------

- (a) Perform steps 2 through 6 again.

OK:

The problem symptom is not reproduced.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK ▶ REPLACE POWER MANAGEMENT CONTROL ECU

8. CHECK CRANKSHAFT PULLEY REVOLUTION (SELECTOR LEVER IN N)

- (a) Lift up the vehicle.
- (b) Turn the power switch on (IG).
- (c) Move the selector lever to N.
- (d) Turn the crankshaft pulley using hand tools to check if the crankshaft can rotate smoothly.

CAUTION:

Do not turn the power switch on (READY) while performing this inspection. Be sure to turn the power switch on (IG) before performing this inspection, to prevent the engine from starting.

NOTICE:

Engine compression causes resistance when turning the crankshaft pulley. Check if the crankshaft rotates smoothly (or if it is locked) by manually applying sufficient torque to turn the crankshaft pulley. The torque required to turn the crankshaft pulley should be the same as for a known good vehicle of the same type.

OK:

The crankshaft rotates smoothly.

NG ▶ REPAIR OR REPLACE ENGINE

OK ▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

DTC	P0A10-263	DC / DC Converter Status Circuit High Input
-----	-----------	---

DESCRIPTION

Refer to the description for DTC P0A08-264 .

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A10	263	Short to +B in the hybrid vehicle converter (DC/DC converter) NODD signal line	<ul style="list-style-type: none"> • Wire harness or connector • Inverter with converter assembly • Power management control ECU

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A08-264 .

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

DTC	P0A1A-658	Generator Control Module
DTC	P0A1A-659	Generator Control Module
DTC	P0A1A-791	Generator Control Module

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1A	151	Run pulse signal cycle deviation or stop	Inverter with converter assembly
	155	A/D converter error	
	156	CPU ROM-RAM error	
	658	ALU error	
	659	Communication error (from MG1 to MG2)	
	791	R/D converter communication error	

MONITOR DESCRIPTION

The MG ECU performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks the result of the generator CPU self-test. If the MG ECU detects a "Fail" from the generator CPU self-test, it will conclude that there is an internal malfunction in the generator CPU. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	<p>P0A1A (INF 151): RUN pulse malfunction</p> <p>P0A1A (INF 155): A/D malfunction (1 MG CPU)</p> <p>P0A1A (INF 156): RAM and ROM destruction</p>

DTC	P0A1A-200	Generator Control Module
DTC	P0A1A-792	Generator Control Module
DTC	P0A1A-793	Generator Control Module

DESCRIPTION

The inverter with converter assembly (MG ECU) monitors its internal operation and detects the following malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1A	200	The difference between the resolver angle for control and estimated resolver angle exceeds the allowable value.	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
	792	Resolver REF signal cycle error	
	793	Resolver REF signal oscillation stop error	

MONITOR DESCRIPTION

The MG ECU performs many diagnostic tests to verify proper operation of internal ECU systems. In this diagnostic monitor, the MG ECU checks for an R/D (Resolver/Digital Converter) malfunction involving the generator resolver. If MG ECU detects an R/D error, it will conclude that there is an internal malfunction involving the generator resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A1A-200, 792, or 793 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A3F-243	Drive Motor "A" Position Sensor Circuit
P0A4B-253	Generator Position Sensor Circuit
P0A4C-513	Generator Position Sensor Circuit Range / Performance
P0A4D-255	Generator Position Sensor Circuit Low

- (e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

2.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY)
----	---

CAUTION:

Be sure to wear insulated gloves.

- (a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

NOTICE:

Before disconnecting the connector, confirm that it is properly connected by checking that the locking claws are engaged and that the connector does not pull out.

c

(b) Check the connection of the low voltage connector of the inverter with converter assembly.

OK:

The connector is connected securely and there are no contact problems.

HINT:

When connecting the connector, insert it with the locking lever in the raised position. Rotate the lever downward and make sure that the connector is pulled into its socket. When the locking lever is in its fully closed position, a click will be heard as its locking claws engage. After the click is heard, pull up on the connector to confirm that it is properly connected.

3.	CHECK HARNESS AND CONNECTOR (INVERTER WITH CONVERTER ASSEMBLY - GENERATOR RESOLVER)
----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Disconnect the low voltage connector D29 from the inverter with converter assembly.

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

*1

Tester Connection	Switch Condition	Specified Condition
D29-11 (GRF) - Body ground	Power switch on (IG)	Below 1 V
D29-12 (GRFG) - Body ground	Power switch on (IG)	Below 1 V
D29-7 (GSN) - Body ground	Power switch on (IG)	Below 1 V
D29-8 (GSNG) - Body ground	Power switch on (IG)	Below 1 V
D29-10 (GCS) - Body ground	Power switch on (IG)	Below 1 V
D29-9 (GCSG) - Body	Power switch on	Below 1 V

ground	(IG)	
--------	------	--

----	---

NOTICE:

Turning the power switch on (IG) with the low voltage connector of the inverter with converter assembly disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(d) Turn the power switch off.

(e) Connect the low voltage connector from the inverter with converter assembly.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.	CHECK GENERATOR RESOLVER
----	--------------------------

(a) Disconnect the low voltage connector D29 from the inverter with converter assembly.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Switch Condition	Specified Condition
D29-11 (GRF) - D29-12 (GRFG)	Power switch off	9.5 to 15.5 Ω
D29-7 (GSN) - D29-8 (GSNG)	Power switch off	15 to 27 Ω
D29-10 (GCS) - D29-9 (GCSG)	Power switch off	14 to 26 Ω

*1

Standard Resistance (Check for Short):

Tester Connection	Switch Condition	Specified Condition
D29-11 (GRF) or D29-12 (GRFG) - Body ground and other terminals	Power switch off	10 k Ω or higher
D29-7 (GSN) or D29-8 (GSNG) - Body ground and other terminals	Power switch off	10 k Ω or higher
D29-10 (GCS) or D29-9 (GCSG) -	Power switch	10 k Ω or

Body ground and other terminals	off	higher
---------------------------------	-----	--------

DTC	P0A1B-661	Drive Motor "A" Control Module
DTC	P0A1B-786	Drive Motor "A" Control Module
DTC	P0A1B-794	Drive Motor "A" Control Module

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	163	IPM positive power source error	Inverter with converter assembly
	164	IPM negative power source error	
	192	A/D converter error	
	193	CPU ROM-RAM error	
	511	Standard voltage for analog signal offset	
	512	Standard voltage for analog signal error	
	661	Communication error (from MG2 to MG1)	
	786	ALU error	
	794	R/D converter communication error	

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks the result of the motor CPU self-test. If the MG ECU detects a "Fail" from the motor CPU self-test, it will conclude that there is an internal

malfunction in the motor CPU. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	<p>P0A1B (INF 163): Motor CPU power malfunction (15V)</p> <p>P0A1B (INF 164): Motor CPU power malfunction (-5V)</p> <p>P0A1B (INF 192): A/D malfunction (2 MG CPU)</p> <p>P0A1B (INF 193): RAM and ROM destruction)</p> <p>P0A1B (INF 511): Motor CPU power malfunction (2.5V)</p> <p>P0A1B (INF 512): Motor CPU power malfunction (5VD)</p> <p>P0A1B (INF 661): 2 MG CPU communication malfunction (2 MG CPU to 1 MG CPU)</p> <p>P0A1B (INF 786): MG CPU ALU malfunction</p> <p>P0A1B (INF 794): RD converter communication malfunction</p>

DTC	P0A1B-168	Drive Motor "A" Control Module
DTC	P0A1B-795	Drive Motor "A" Control Module
DTC	P0A1B-796	Drive Motor "A" Control Module

DESCRIPTION

The inverter with converter assembly (MG ECU) monitors its internal operation and detects malfunctions.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	168	The difference between the resolver angle for control and estimated resolver angle exceeds the allowable value.	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
	795	Resolver REF signal cycle error	
	796	Resolver REF signal oscillation stop error	

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks for an R/D (Resolver/ Digital converter) malfunction involving the motor resolver. If the MG ECU detects an R/D converter error, it will conclude that there is an internal malfunction involving the motor resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

---------------------------------------	---

CONFIRMATION DRIVING PATTERN

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and allow MG2 to rotate at 50 rpm or more for 30 seconds, then turn the power switch off. [A]
6. Repeat [A] 3 times. [B]
7. Turn the power switch on (IG) and turn the Techstream on.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [C]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 INFO.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)

DTC	P0A1B-198	Drive Motor "A" Control Module
-----	-----------	--------------------------------

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	198	R/D converter NM stop error	Inverter with converter assembly

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks for an R/D (Resolver/ Digital converter) malfunction involving the motor resolver. If the MG ECU detects an R/D converter error, it will conclude that there is an internal malfunction involving the motor resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

DTC	P0A1D-162	Hybrid Powertrain Control Module
DTC	P0A1D-821	Hybrid Powertrain Control Module
DTC	P0A1D-822	Hybrid Powertrain Control Module
DTC	P0A1D-823	Hybrid Powertrain Control Module

DESCRIPTION

The power management control ECU (HV CPU) monitors its internal operation, it will set DTCs and perform fail-safe control when it detects the following malfunctions. If any of the following DTCs are output, replace the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1D	162	ECU internal error	Power management control ECU
P0A1D	821	ECU internal error	Power management control ECU
P0A1D	822	ECU internal error	Power management control ECU
P0A1D	823	ECU internal error	Power management control ECU

MONITOR DESCRIPTION

The power management control ECU (HV CPU) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of these tests, the power management control ECU (HV CPU) checks the communication bus off count and the message register of the CAN (Controller Area Network) controller. If the power management control ECU (HV CPU) detects an error in the communication bus off count or message register, it will conclude that there is a malfunction in the power management control ECU (HV CPU). The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

DTC	P0A3F-243	Drive Motor "A" Position Sensor Circuit
DTC	P0A40-500	Drive Motor "A" Position Sensor Circuit Range / Performance
DTC	P0A41-245	Drive Motor "A" Position Sensor Circuit Low

DESCRIPTION

A resolver is a sensor that is used to detect the position of the magnetic poles the rotor of a motor generator. Knowing the position of the poles is indispensable for ensuring precise control of MG2 and MG1.

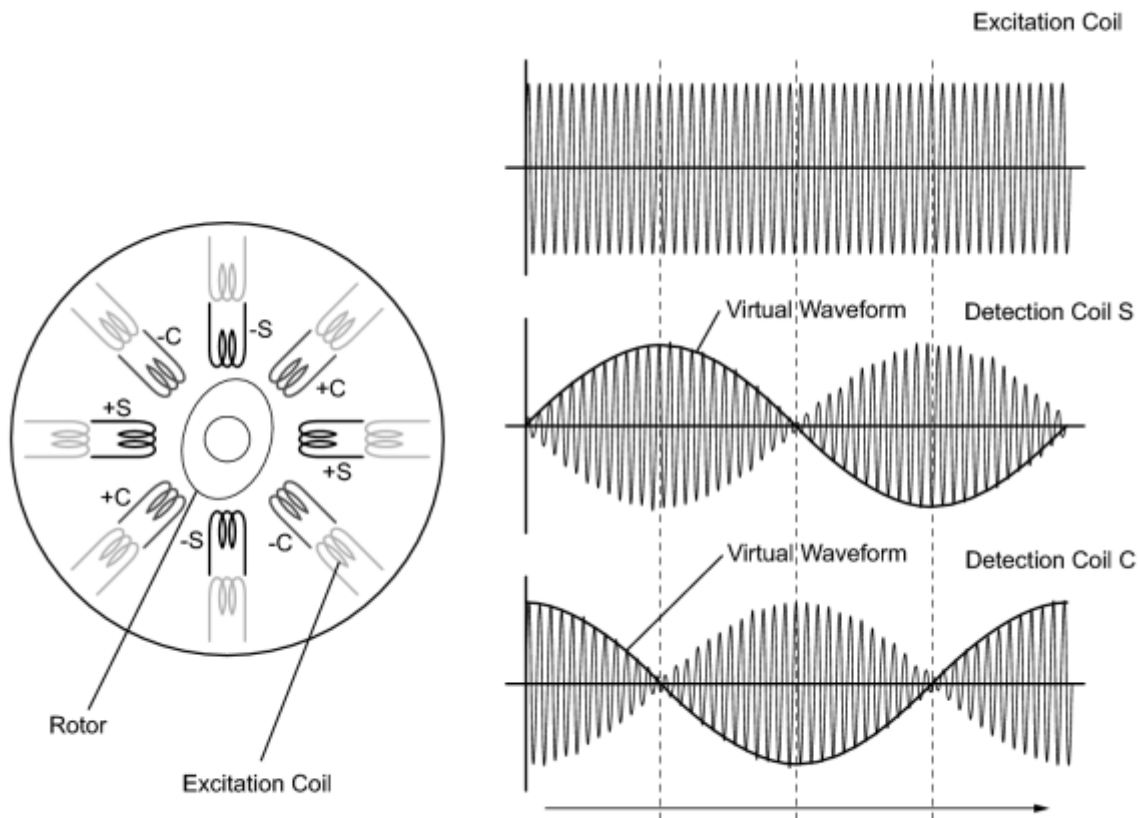

Each resolver contains a stator that has an excitation coil and 2 detection coils (S, C). The gap between the stator and rotor changes as the rotor turns because the rotor is oval shaped. An alternating current with a predetermined frequency flows through the excitation coil, and detection coils S and C output alternating currents in accordance with the sensor rotor position.

The inverter with converter assembly (MG ECU) detects the absolute position of the rotor according to the phases of detection coils S and C and the heights of their waveforms. Furthermore, the CPU calculates the amount of change in the position within a predetermined length of time, in order to use the resolver as a speed sensor.

The MG ECU monitors signals output from the motor resolver and detects malfunctions.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A3F	243	Interphase short in the motor resolver circuit	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
P0A40	500	Motor resolver output is out of the normal range	
P0A41	245	Open or short in the motor resolver circuit	

MONITOR DESCRIPTION

The MG ECU monitors the motor resolver output signal. If the MG ECU detects output signals that are out of the normal range or specification, it will conclude that there is a malfunction in the motor resolver. If a malfunction is detected, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

----------------	---

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and turn the Techstream on.

6. Slowly accelerate from a stop (0 mph (0 km/h)) to 25 mph (40 km/h) several times while using different acceleration patterns.
7. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
8. Check that permanent DTCs are cleared.
9. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 INFO.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

- If INF code 243 is output, there may be an interphase short in the motor resolver due to an intrusion of water into the resolver. If the problem symptom cannot be reproduced, replace the hybrid vehicle transaxle assembly.
- Check for output DTCs again after the repair has been completed. If P0A78-286 or P0A7A-324 is output, replace the inverter with converter assembly.

HINT:

- Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.
- If the problem symptom cannot be reproduced, performing a road test on a road on which the vehicle tends to vibrate will make it easier to reproduce the symptom.

DTC	P0A4B-253	Generator Position Sensor Circuit
DTC	P0A4C-513	Generator Position Sensor Circuit Range / Performance
DTC	P0A4D-255	Generator Position Sensor Circuit Low

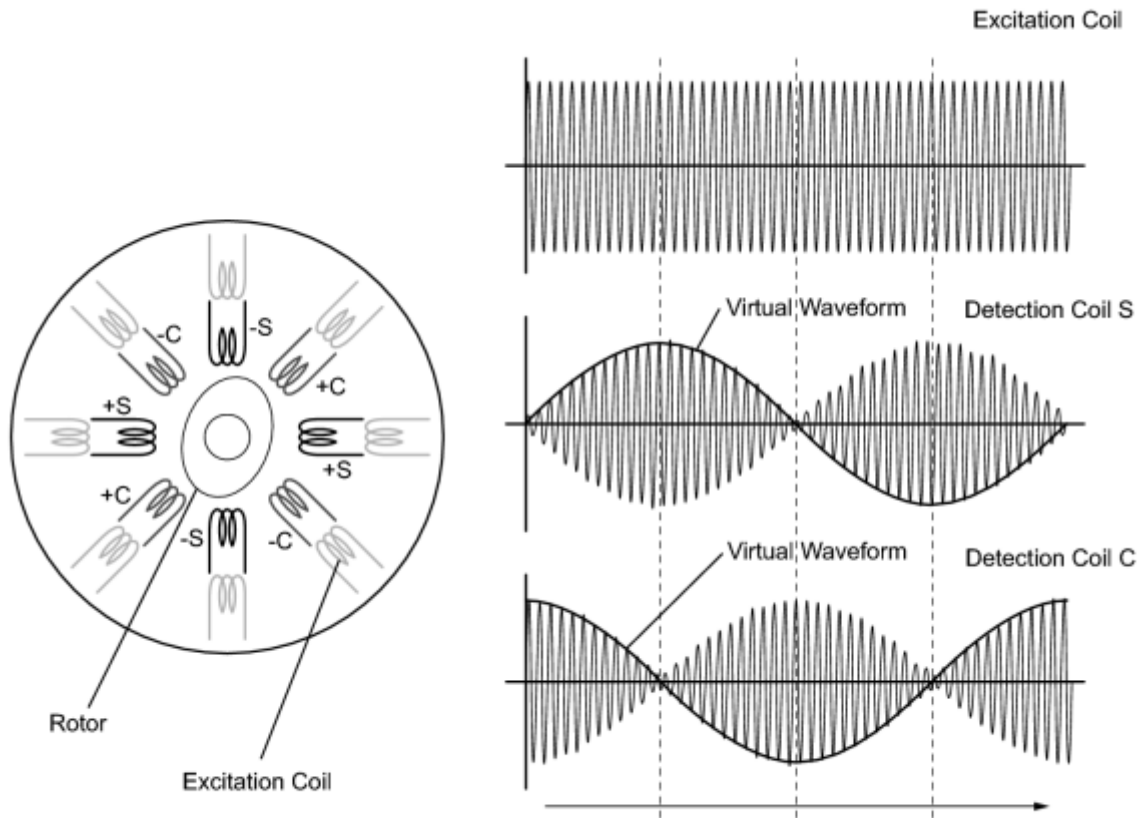

DESCRIPTION

A resolver is a sensor that is used to detect the position of the magnetic poles the rotor of a motor generator. Knowing the position of the poles is indispensable for ensuring precise control of MG2 and MG1.

Each resolver contains a stator that has an excitation coil and 2 detection coils (S, C). The gap between the stator and rotor changes as the rotor turns because the rotor is oval shaped. An alternating current with a predetermined frequency flows through the excitation coil, and detection coils S and C output alternating currents in accordance with the sensor rotor position.

The inverter with converter assembly (MG ECU) detects the absolute position of the rotor according to the phases of detection coils S and C and the heights of their waveforms. Furthermore, the CPU calculates the amount of change in the position within a predetermined length of time, in order to use the resolver as a speed sensor.

The MG ECU monitors signals output from the motor resolver and detects malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A4B	253	Interphase short in the generator resolver circuit	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
P0A4C	513	Generator resolver output is out of the normal range	
P0A4D	255	Open or short in the generator resolver circuit	

MONITOR DESCRIPTION

The MG ECU monitors the generator resolver output signal. If the MG ECU detects output signals that are out of the normal range or specification, it will conclude that there is a malfunction of the generator resolver. If a malfunction is detected, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A4B (INF 253): Short circuit between phases P0A4C (INF 513): Range check
--------------	---

	P0A4D (INF 255): Circuit discontinuity / short circuit
Required sensors / components	Generator resolver
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Generator resolver	DTC P0A4B (INF 253) is not detected DTC P0A4C (INF 513) is not detected DTC P0A4D (INF 255) is not detected
--------------------	---

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.

5. Turn the power switch on (READY) and turn the Techstream on.
6. Slowly accelerate from a stop (0 mph (0 km/h)) to 25 mph (40 km/h) several times while using different acceleration patterns.
7. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
8. Check that permanent DTCs are cleared.
9. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 .

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

- If INF code 253 is output, there may be an interphase short in the generator resolver due to an intrusion of water into the resolver. If the problem symptom cannot be reproduced, replace the hybrid vehicle transaxle assembly.
- Check for output DTCs again after the repair has been completed. If P0A78-286 or P0A7A-324 is output, replace the inverter with converter assembly.

HINT:

- Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.
- If the problem symptom cannot be reproduced, performing a road test on a road on which the vehicle tends to vibrate will make it easier to reproduce the symptom.

DTC	P0A51-174	Drive Motor "A" Current Sensor Circuit
-----	-----------	--

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A51	174	Motor current sensor high resolution circuit signal is out of range or there is a difference between it and the motor current sensor low resolution circuit current value.	Inverter with converter assembly

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A51-174 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A60 (all INF codes)*1	Drive Motor "A" Phase V Current
P0A63 (all INF codes)*1	Drive Motor "A" Phase W Current
P0A78-113, 287, 505, 506	Drive Motor "A" Inverter Performance

HINT:

- *1: If any INF codes are output for this DTC, refer to the corresponding diagnostic procedure.
- P0A51-174 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(e) Turn the power switch off.

B ▶ GO TO DTC CHART

DTC	P0A60-288	Drive Motor "A" Phase V Current
DTC	P0A60-290	Drive Motor "A" Phase V Current
DTC	P0A60-294	Drive Motor "A" Phase V Current
DTC	P0A60-501	Drive Motor "A" Phase V Current
DTC	P0A63-296	Drive Motor "A" Phase W Current
DTC	P0A63-298	Drive Motor "A" Phase W Current
DTC	P0A63-302	Drive Motor "A" Phase W Current
DTC	P0A63-502	Drive Motor "A" Phase W Current

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors the motor inverter current sensors. P0A60 and P0A63 indicate malfunctions in current sensors, and they do not indicate malfunctions in the high-voltage system.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A60	288	Malfunction in motor inverter current sensor (phase V sub sensor)	Inverter with converter assembly
P0A60	290	Malfunction in motor inverter current sensor (phase V main sensor)	
P0A60	294	Malfunction in motor inverter current sensor (performance problem or open phase V)	
P0A60	501	Malfunction in motor inverter current sensor (phase V main and sub sensors offset)	
P0A63	296	Malfunction in motor inverter current sensor (phase W sub sensor)	
P0A63	298	Malfunction in motor inverter current sensor (phase W main sensor)	
P0A63	302	Malfunction in motor inverter current sensor (performance problem or open phase W)	

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A63	502	Malfunction in motor inverter current sensor (phase W main and sub sensors offset)	

MONITOR DESCRIPTION

The power management control ECU (HV CPU) monitors the motor inverter current sensor. If the power management control ECU (HV CPU) detects a fault, it will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A60 (INF 288/290/294/501): Phase V, sub sensor P0A63 (INF 296/298/302/502): Phase W, sub sensor
Required sensors / components	Motor inverter current sensor, motor resolver
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

DTC	P0A78-113	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If the motor inverter overheats, has a circuit malfunction, or has an internal short, the inverter transmits this information to the MG ECU via the motor inverter fail signal line.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	113	Motor inverter fail signal detection (System overcurrent)	<ul style="list-style-type: none"> Hybrid vehicle transaxle assembly Generator cable Motor cable Inverter with converter assembly Power management control ECU PCU fuse Wire harness or connector

MONITOR DESCRIPTION

If over-amperage flows through the motor inverter due to an internal short, the motor inverter transmits an inverter fail signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) illuminates the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 113): MFIV detection (Over current malfunction)
Required sensors / components	Motor inverter

2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 [INFO](#).

Refer to the wiring diagram for DTC P324E-788 [INFO](#).

Refer to the wiring diagram for DTC U0110-159 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).

9.	CHECK INVERTER WITH CONVERTER ASSEMBLY (GENERATOR CABLE CONNECTION CONDITION)
----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Check that the bolts for the generator cable are tightened to the specified torque, the generator cable is connected securely, and there are no contact problems.

Specified Condition:

$T=8.0 \text{ N}\cdot\text{m}$ {82 kgf*cm, 71 in.*lbf}

NOTICE:

Make sure that the tightening torque of the bolts is between 6.4 and 9.6 N*m (65 and 98 kgf*cm, 57 and 85 in.*lbf).

(d) Check for arc marks at the bolts for the generator cable.

Result:

Result		Proceed to
The terminals are connected securely and there are no contact problems.	There are no arc marks.	A
The terminals are not connected securely and there is a contact problem.	There are arc marks.	B
The terminals are not connected securely and there is a contact problem.	There are no arc marks.	C
The terminals are connected securely and there are no contact problems.	There are arc marks.	B

(e) Install the inverter terminal cover.

C ▶ CONNECT SECURELY

B ▶ REPLACE MALFUNCTIONING PARTS

A

10.	CHECK INVERTER WITH CONVERTER ASSEMBLY (MOTOR CABLE CONNECTION CONDITION)
-----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Check that the bolts for the motor cable are tightened to the specified torque, the motor cable is connected securely, and there are no contact problems.

Specified Condition:

T=8.0 N*m {82 kgf*cm, 71 in.*lbf}

NOTICE:

Make sure that the tightening torque of the bolts is between 6.4 and 9.6 N*m (65 and 98 kgf*cm, 57 and 85 in.*lbf).

(d) Check for arc marks at the bolts for the motor cable.

Result:

Result		Proceed to
The terminals are connected securely and there are no contact problems.	There are no arc marks.	A
The terminals are not connected securely and there is a contact problem.	There are arc marks.	B
The terminals are not connected securely and there is a contact problem.	There are no arc marks.	C

11. CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG1)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Disconnect the generator cable and motor cable from the inverter with converter assembly.

(d) Check MG1 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG1 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
f1-2 (U) - f1-3 (V)	Power switch off	87.0 to 96.2 mΩ
f1-3 (V) - f1-1 (W)	Power switch off	87.0 to 96.2 mΩ

f1-1 (W) - f1-2 (U)	Power switch off	87.0 to 96.2 mΩ
---------------------	------------------	-----------------

Text in Illustration

*1	Generator Cable
*2	Shield Ground

HINT:

To correct the variation of the measured resistance due to temperature, use the following formula to calculate the resistance at 68° F (20°C).

$$R_{20} = R_t / \{1 + 0.00393 \times (T - 20)\}$$

The calculation is based on the following:

R₂₀: Resistance at 68° F (20°C) (mΩ)

R_t: Measured resistance (mΩ)

T: Temperature when the resistance is measured (° C)

(e) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
f1-2 (U) - Body ground and shield ground	Power switch off	100 MΩ or higher
f1-3 (V) - Body ground and shield ground	Power switch off	100 MΩ or higher
f1-1 (W) - Body ground and shield ground	Power switch off	100 MΩ or higher

(f) Connect the generator cable and motor cable.

(g) Install the inverter terminal cover.

NG  [CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(GENERATOR CABLE CONNECTION CONDITION\)](#)

OK

12.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG2)
-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Disconnect the generator cable and motor cable from the inverter with converter assembly.

(d) Check MG2 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG2 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e1-2 (U) - e1-3 (V)	Power switch off	154 to 170 mΩ
e1-3 (V) - e1-1 (W)	Power switch off	148 to 164 mΩ
e1-1 (W) - e1-2 (U)	Power switch off	149 to 165 mΩ

Text in Illustration

*1	Motor Cable

-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector A59 from inverter with converter assembly.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A59-28 (GND1) - Body ground	Power switch off	Below 1 Ω
A59-27 (GND2) - Body ground	Power switch off	Below 1 Ω

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
----	---

(d) Turn the power switch on (IG).

(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A59-10 (+B) - Body ground	Power switch on (IG)	11 to 14V
A59-9 (+B2) - Body ground	Power switch on (IG)	11 to 14V

(f) Turn the power switch off.

(g) Connect the inverter with converter assembly connector.

NG ► REPAIR OR REPLACE POWER SOURCE CIRCUIT

OK

15.	CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU - INVERTER WITH CONVERTER)
-----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Turn the power switch off.

(c) Disconnect connector A59 from the inverter with converter assembly.

(d) Disconnect connector A22 from the power management control ECU.

(e) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for open):

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) - A59-8 (HTM+)	Power switch off	Below 1 Ω
A22-25 (HTM-) - A59-18 (HTM-)	Power switch off	Below 1 Ω
A22-30 (MTH+) - A59-7 (MTH+)	Power switch off	Below 1 Ω
A22-29 (MTH-) - A59-17 (MTH-)	Power switch off	Below 1 Ω
A22-33 (REQ+) - A59-6 (REQ+)	Power switch off	Below 1 Ω
A22-32 (REQ-) - A59-16 (REQ-)	Power switch off	Below 1 Ω
A22-21 (CLK+) - A59-5 (CLK+)	Power switch off	Below 1 Ω
A22-20 (CLK-) - A59-15 (CLK-)	Power switch off	Below 1 Ω

Standard Resistance (Check for short):

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) or A59-8 (HTM+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-25 (HTM-) or A59-18 (HTM-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-30 (MTH+) or A59-7 (MTH+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-29 (MTH-) or A59-17 (MTH-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-33 (REQ+) or A59-6 (REQ+) -	Power switch	10 kΩ or

Body ground and other terminals	off	higher
A22-32 (REQ-) or A59-16 (REQ-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-21 (CLK+) or A59-5 (CLK+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-20 (CLK-) or A59-15 (CLK-) - Body ground and other terminals	Power switch off	10 kΩ or higher

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
*2	Rear view of wire harness connector (to Power Management Control ECU)

(f) Turn the power switch on (IG).

(g) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) or A59-8 (HTM+) - Body ground	Power switch on (IG)	Below 1 V
A22-25 (HTM-) or A59-18 (HTM-) - Body ground	Power switch on (IG)	Below 1 V
A22-30 (MTH+) or A59-7 (MTH+) - Body ground	Power switch on (IG)	Below 1 V
A22-29 (MTH-) or A59-17 (MTH-) - Body ground	Power switch on (IG)	Below 1 V
A22-33 (REQ+) or A59-6 (REQ+) - Body ground	Power switch on (IG)	Below 1 V
A22-32 (REQ-) or A59-16 (REQ-) - Body ground	Power switch on (IG)	Below 1 V
A22-21 (CLK+) or A59-5 (CLK+) - Body ground	Power switch on (IG)	Below 1 V
A22-20 (CLK-) or A59-15 (CLK-) - Body ground	Power switch on (IG)	Below 1 V

NOTICE:

Turning the power switch on (IG) with the power management control ECU and inverter with converter assembly connector disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(h) Turn the power switch off.

(i) Connect the power management control ECU connector.

(j) Connect the inverter with converter assembly connector.

NG ▶ REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

16. CHECK POWER MANAGEMENT CONTROL ECU

(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition

DTC	P0A78-121	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	121	Motor inverter overvoltage signal detection (overvoltage due to system malfunction)	<ul style="list-style-type: none"> • Hybrid battery junction block • Inverter with converter assembly • Service plug grip (EV battery fuse) • Frame wire • Hybrid vehicle transaxle assembly • Generator Cable • Motor Cable • Power management control ECU • PCU fuse • Wire harness or connector

MONITOR DESCRIPTION

If the motor inverter detects over-voltage, it transmits an over-voltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) illuminates the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 121): OVH detection (Over voltage malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 121) is not detected
---------------------------------------	-------------------------------------

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 INFO.

Refer to the wiring diagram for DTC P0AE6-225 INFO.

Refer to the wiring diagram for DTC P324E-788 INFO.

Refer to the wiring diagram for DTC U0110-159 INFO.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

12. CHECK INVERTER WITH CONVERTER ASSEMBLY (HIGH VOLTAGE CONNECTOR CONNECTION CONDITION)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Check that the bolts for the frame wire are tightened to the specified

torque, the frame wire is connected securely, and there are no contact problems.

Specified Condition:

T=8.0 N*m {82 kgf*cm, 71 in.*lbf}

NOTICE:

Make sure that the tightening torque of the bolts is between 6.4 and 9.6 N*m (65 and 98 kgf*cm, 57 and 85 in.*lbf).

(d) Check for arc marks at the bolts for the frame wire.

Result:

Result		Proceed to
The terminals are connected securely and there are no contact problems.	There are no arc marks.	A
The terminals are not connected securely and there is a contact problem.	There are arc marks.	B
The terminals are not connected securely and there is a contact problem.	There are no arc marks.	C
The terminals are connected securely and there are no contact problems.	There are arc marks.	B

(e) Install the inverter terminal cover.

13.	CHECK SERVICE PLUG GRIP (CONNECTION CONDITION)
-----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Visually check the connection of the service plug grip to the HV battery. Remove the service plug grip and check for contamination.

OK:

Dirt or foreign objects have not entered the connection, and there is no evidence of contamination.

NG ▶ REPLACE SERVICE PLUG GRIP

OK ▼

14.	CHECK SERVICE PLUG GRIP
-----	-------------------------

(a) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
Service plug grip terminals	Always	Below 1 Ω

Text in Illustration

H

*1	Service plug grip
----	-------------------

NG ▶ REPLACE SERVICE PLUG GRIP

OK

15. CHECK FRAME WIRE

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect the frame wire from the hybrid battery junction block.

(c) Remove the inverter terminal cover from the inverter with converter assembly.

(d) Disconnect the frame wire from the inverter with converter assembly.

c

(e) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

*2

Tester Connection	Switch Condition	Specified Condition
T4-1 - T1-2 (CBI) (Positive terminal)	Power switch off	Below 1 Ω
T3-1 - T1-1 (CEI) (Negative terminal)	Power switch off	Below 1 Ω

Text in Illustration

*1	Frame Wire (Inverter with Converter Assembly Side)
*2	Frame Wire (Hybrid Battery Junction Block Side)

(f) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
T4-1 - Body ground and shielded ground	Power switch off	10 MΩ or higher
T3-1 - Body ground and shielded ground	Power switch off	10 MΩ or higher
T3-1 - T4-1	Power switch off	10 MΩ or higher

(g) Connect the frame wire to the hybrid battery junction block.

(h) Connect the frame wire to the inverter with converter assembly.

(i) Install the inverter terminal cover.

NG ▶ REPLACE FRAME WIRE

OK

16. INSPECT HYBRID BATTERY JUNCTION BLOCK (SMRB)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the hybrid battery junction block.

(c) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
h2 - T4	Auxiliary battery voltage is not applied between terminals c3-4 (SMRB) and c3-2 (GND)	10 kΩ or higher
h2 - T4	Auxiliary battery voltage is applied between terminals c3-4 (SMRB) and c3-2 (GND)	Below 1 Ω

Text in Illustration

*1 Hybrid Battery Junction Block

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
c3-4 (SMRB) - c3-2 (GND)	-40 to 176°F(-40 to 80°C)	19.0 to 35.5 Ω

(e) Install the hybrid battery junction block.

NG ▶ REPLACE HYBRID BATTERY JUNCTION BLOCK

OK

17. INSPECT HYBRID BATTERY JUNCTION BLOCK (SMRG)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the hybrid battery junction block.

(c) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
k2 - T3	Auxiliary battery voltage is not applied between terminals c3-1 (SMRG) and c3-2 (GND)	10 kΩ or higher
k2 - T3	Auxiliary battery voltage is applied between terminals c3-1 (SMRG) and c3-2 (GND)	Below 1 Ω

Text in Illustration

*1	Hybrid Battery Junction Block
----	-------------------------------

c

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
c3-1 (SMRG) - c3-2 (GND)	-40 to 176°F (-40 to 80°C)	19.0 to 35.5 Ω

(e) Install the hybrid battery junction block.

DTC	P0A78-128	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an abnormal amount of current flows through the motor inverter, the MG ECU detects it and sends a signal to inform the power management control ECU (HV CPU) of the malfunction.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	128	Abnormal motor current value detection (System malfunction)	<ul style="list-style-type: none"> • Hybrid vehicle transaxle assembly • Generator cable • Motor cable • Inverter with converter assembly • Power management control ECU • PCU fuse • Wire harness or connector

MONITOR DESCRIPTION

The MG ECU monitors the motor inverter electric current. If the current exceeds the threshold for a specified period of time, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 128): Motor inverter abnormal current
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)

DTC P0A78 (INF 128) is not detected

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 [INFO](#).

Refer to the wiring diagram for DTC P324E-788 [INFO](#).

Refer to the wiring diagram for DTC U0110-159 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A78-202 is not output	A
P0A78-202 is also output	B

NOTICE:

- If P0A78-202 is output, troubleshoot it first. After completing the troubleshooting for P0A78-202, return to perform troubleshooting for this DTC.
- Parts repaired or replaced during troubleshooting for P0A78-202 do not need to be re-inspected in this diagnosis procedure.

- (e) Turn the power switch off.

B ► GO TO DTC CHART

A

2.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

HINT:

- If P0A78-202 was not output in step 1 of this diagnosis procedure, check Table 1 below.
- If P0A78-202 was output in step 1 of this diagnosis procedure, repair that DTC first, then check Table 2 below.

Result:

Result	Proceed to
P0A78-128 only is output.	A
Any of the following DTCs are also output.	B

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

2010 Toyota Prius

Repair Manual

- DTC P0A78-202 is stored after any of DTCs P0A78-113, 128, 284, 286, 287, 505, 506, 806, 807 and 808 are stored. After troubleshooting and repairing DTC P0A78-202, be sure to troubleshoot all the other DTCs.
- Depending on the conditions in which the vehicle is being operated when a short circuit occurs in the inverter with converter assembly, the hybrid vehicle transaxle assembly may be affected. As this DTC is stored if a short circuit occurs in the inverter with converter assembly, it is necessary to perform a road test to check the hybrid vehicle transaxle assembly. If problems are found, replace the malfunctioning parts.
- After completing the repair, including the repair of previously output DTCs, drive the vehicle at a speed of approximately 25 mph (40 km/h) for 1 minute and check that DTC P0A90-251 (Drive Motor "A" Performance) is not output. If DTC P0A90-251 (Drive Motor "A" Performance) is output, replace the hybrid vehicle transaxle assembly.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY INFO
----	---

NG [▶ CHECK MOTOR CABLE](#)

OK

2.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly INFO.

NEXT [▶ CHECK DTC OUTPUT \(HV\)](#)

3.	CHECK MOTOR CABLE INFO
----	---

NG [▶ CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(MG2\)](#)

OK

4.	REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY
----	---

(a) Replace the hybrid vehicle transaxle assembly INFO.

NEXT

5.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly INFO.

NEXT [▶ CHECK DTC OUTPUT \(HV\)](#)

6.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG2)
----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect the motor cable from the hybrid vehicle transaxle assembly.

(c) Check MG2 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG2 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e2-3 (U) - e2-2 (V)	Power switch off	154 to 170 mΩ
e2-2 (V) - e2-1 (W)	Power switch off	148 to 164 mΩ
e2-1 (W) - e2-3 (U)	Power switch off	149 to 165 mΩ

Text in Illustration

*1	Hybrid Vehicle Transaxle Assembly
----	-----------------------------------

HINT:

To correct the variation of the measured resistance due to temperature, use the following formula to calculate the resistance at 68° F (20°C).

$$R_{20} = R_t / \{1 + 0.00393 \times (T - 20)\}$$

The calculation is based on the following:

R₂₀: Resistance at 68° F (20°C) (mΩ)

R_t: Measured resistance (mΩ)

T: Temperature when the resistance is measured (° C)

(d) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e2-3 (U) - Body ground and shield ground	Power switch off	100 MΩ or higher
e2-2 (V) - Body ground and shield ground	Power switch off	100 MΩ or higher
e2-1 (W) - Body ground and shield ground	Power switch off	100 MΩ or higher

(e) Connect the motor cable.

NOTICE:

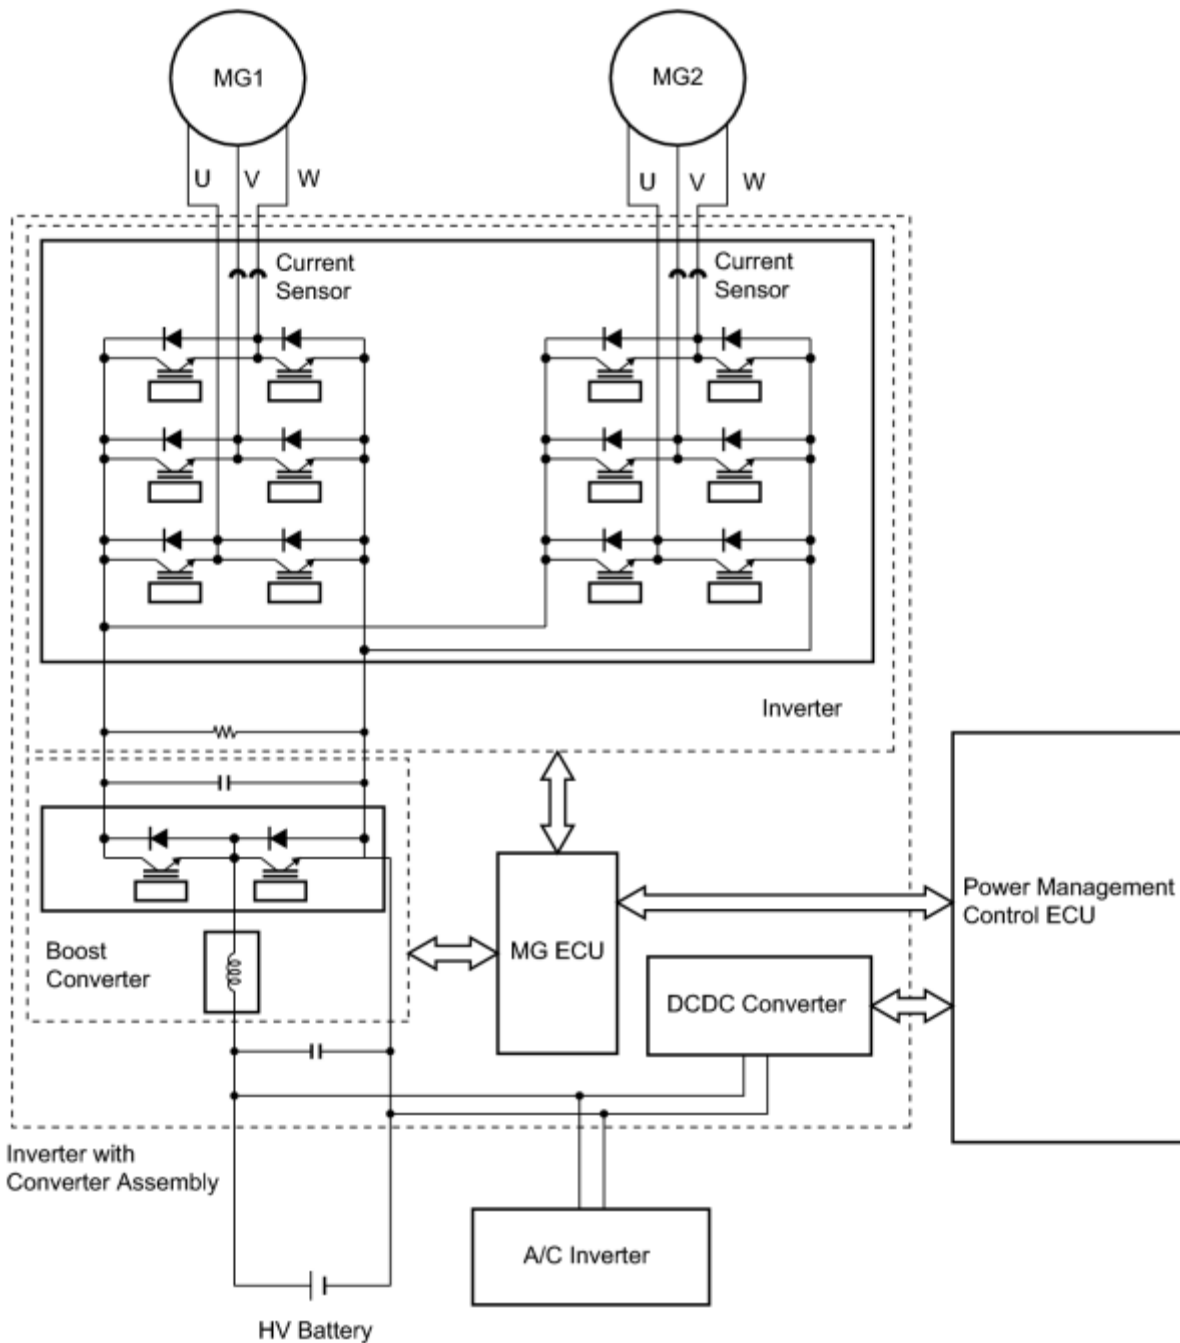

DTC P0A78-202 is stored after any of DTCs P0A78-113, 128, 284, 286, 287, 505, 506, 806, 807 and 808 are stored. After troubleshooting and repairing DTC P0A78-202, be sure to troubleshoot all the other DTCs.

NEXT  **GO TO DTC CHART**

DTC	P0A78-266	Drive Motor "A" Inverter Performance
DTC	P0A78-267	Drive Motor "A" Inverter Performance

DESCRIPTION

The inverter contains a three-phase bridge circuit, which consists of six power transistors (IGBTs) each for MG1 and MG2. The inverter converts high-voltage direct current from the HV battery into three-phase alternating current for MG1 and MG2; it also converts three-phase alternating current supplied by MG1 and MG2 into direct current for the HV battery. The MG ECU controls the actuation of the power transistors (IGBTs). The inverter transmits information necessary for control, such as amperage and voltage, to the MG ECU.

c

The MG ECU uses an inverter voltage sensor, which is built into the inverter, to detect boosted high voltage to allow control of the voltage boost.

The MG ECU monitors the inverter voltage sensor and detects the following malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
---------	----------	-------------------------	--------------

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	266	Short to GND in the inverter voltage (VH) signal line	Inverter with converter assembly
P0A78	267	Open or short to +B in the inverter voltage (VH) signal line	

MONITOR DESCRIPTION

The MG ECU monitors the inverter voltage (VH) sensor circuit. If the MG ECU detects an open or short in the VH sensor circuit, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 266): VH malfunction (GND short malfunction) P0A78 (INF 267): VH malfunction (+B short and disconnection malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 266/267) is not detected
---------------------------------------	---

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and after a few seconds, turn the power switch off. [A]
6. Repeat [A] 3 times. [B]
7. Turn the power switch on (IG) and turn the Techstream on.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [C]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

PROCEDURE

- | | |
|----|--|
| 1. | REPLACE INVERTER WITH CONVERTER ASSEMBLY |
|----|--|

(a) Replace the inverter with converter assembly INFO.

HINT:

The signal line from the inverter voltage (VH) sensor is connected to the MG ECU inside the inverter with converter assembly. If P0A78-266 or P0A78-267 is output, replace the inverter with converter assembly.

NEXT ▶ COMPLETED

DTC	P0A78-279	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	279	Motor inverter overvoltage signal detection (overvoltage (inverter malfunction))	Inverter with converter assembly

MONITOR DESCRIPTION

If the motor inverter detects overvoltage, it will transmit an overvoltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 279): OVH detection (Over voltage malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-

DTC	P0A78-282	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	282	Motor inverter overvoltage signal detection (circuit malfunction)	Inverter with converter assembly

MONITOR DESCRIPTION

If the motor inverter detects a circuit malfunction, it will transmit a motor inverter overvoltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 282): OVH detection (Circuit malfunction)
Required sensors / components	Motor inverter

NG ▶ CONNECT SECURELY

OK ▶ REPLACE INVERTER WITH CONVERTER ASSEMBLY

DTC	P0A78-284	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If the motor inverter overheats, has a circuit malfunction, or has an internal short, the inverter transmits this information to the MG ECU via the motor inverter fail signal line.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	284	Motor inverter fail signal detection (overheat)	<ul style="list-style-type: none"> • Inverter cooling system • Cooling fan system • Power management control ECU • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Generator cable • Motor cable • Water pump with motor assembly • Wire harness or connector • IGCT No. 3 fuse • PCU fuse

MONITOR DESCRIPTION

If the motor inverter overheats, it will transmit an inverter fail signal to the MG ECU. The MG ECU will send information about the malfunction to the power management control ECU (HV CPU). Upon receiving this information, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 284): MFIV detection (Over heat malfunction)

DTC	P0069-273	Manifold Absolute Pressure - Barometric Pressure Correlation
-----	-----------	--

DESCRIPTION

The atmospheric pressure sensor mounted on the MG ECU circuit board detects the atmospheric pressure. This reading is used to perform system control that considers vehicle usage conditions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0069	273	Difference between the atmospheric pressure value of the atmospheric pressure sensor in the inverter with converter assembly and the manifold absolute pressure sensor (for EGR control) exceeds a specified value. The same condition recurs within 3 hours when driving in EV mode.	<ul style="list-style-type: none"> Inverter with converter assembly Manifold absolute pressure sensor ECM Wire harness or connector

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (ENGINE CONTROL)
----	-----------------------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (READY).

(c) Fully depress the accelerator pedal for 5 seconds to start the engine and keep it running.

(d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(e) Check if DTCs are output.

Result:

Result		Proceed to
DTCs other than those listed in the following table are output.		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0107	Manifold Absolute Pressure/Barometric Pressure Circuit Low Input	
P0108	Manifold Absolute Pressure/Barometric Pressure Circuit High Input	
P106A	Evaporative Emission System Pressure Sensor - Manifold Absolute Pressure Correlation	

HINT:

P0069-273 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(f) Turn the power switch off.

B ▶ GO TO DTC CHART

A
▼

2.	CHECK DTC OUTPUT (HV)
----	-----------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
P0069-273 only is output.		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0A1A-151, 155, 156, 658, 659	Generator Control Module	
P0A1B-193, 512, 661, 786	Drive Motor "A" Control Module	

DTC No.	Relevant Diagnosis
P0A1D-148	Hybrid Powertrain Control Module
P2228-268	Barometric Pressure Sensor "A" Circuit Low
P2229-269	Barometric Pressure Sensor "A" Circuit High
P2511-149	HV CPU Power Relay Sense Circuit Intermittent No Continuity
P324E-788	MG-ECU Power Relay Intermittent Circuit
U0100-211, 530	Lost Communication with ECM/PCM "A"
U0110 (all INF codes)*1	Lost Communication with Drive Motor Control Module "A"

HINT:

- *1: If any INF codes are output for this DTC, refer to the corresponding diagnostic procedure.
- P0069-273 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

3.	READ VALUE USING TECHSTREAM (MAP, ATMOSPHERE PRESSURE)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Data List / MAP, Atmosphere Pressure.

(d) Using the table, read the normal atmospheric pressure value for the applicable altitude.

8. CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
DTC P0069-273 is not output.	A
DTC P0069-273 is output again.	B

(e) Turn the power switch off.

B ▶ REPLACE ECM

A ▶ **END**

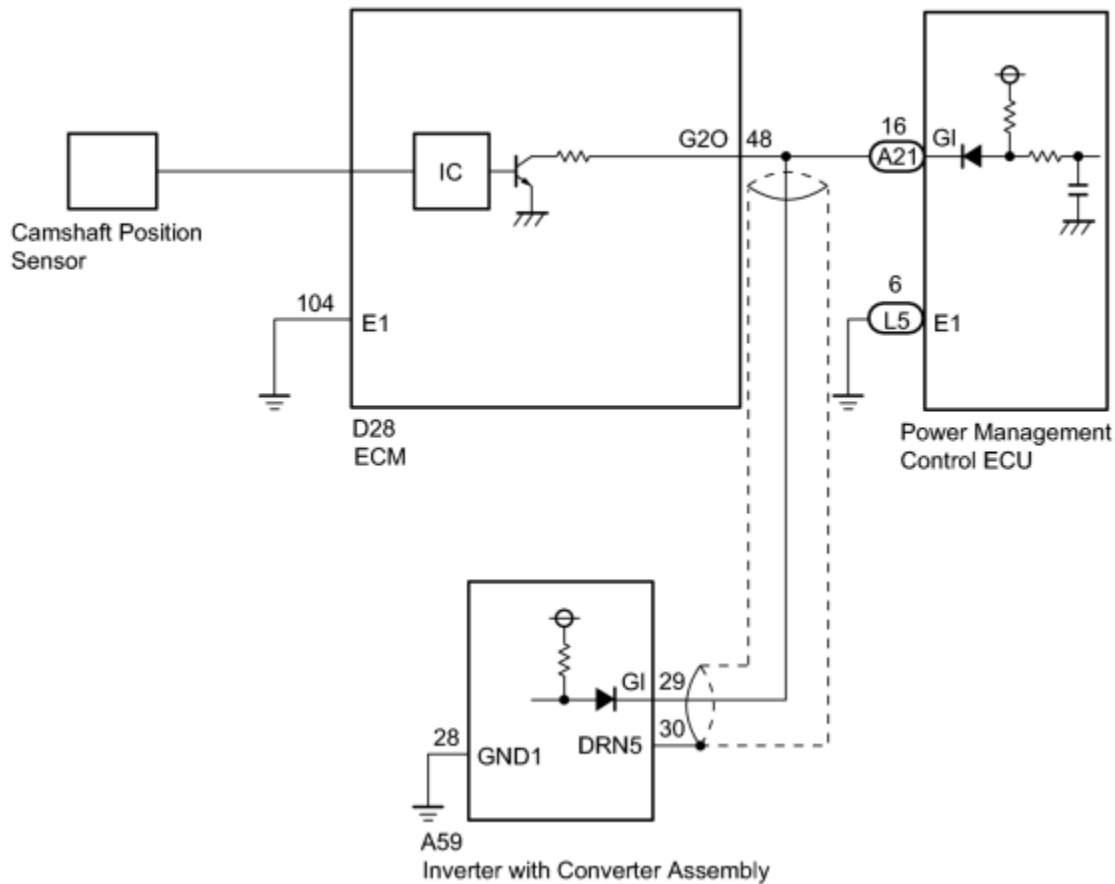

DTC	P0340-886	Camshaft Position Sensor "A" Circuit
-----	-----------	--------------------------------------

DESCRIPTION

The power management control ECU (HV CPU) compares the engine speed sent from the ECM via CAN communication and the engine speed that is indicated by pulses sent from the ECM. If the pulse input is not normal, the power management control ECU (HV CPU) sets this DTC.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0340	886	Malfunction in the engine speed sensor (GI signal) circuit	<ul style="list-style-type: none"> • Wire harness or connector • Camshaft position sensor • Inverter with converter assembly • ECM • Power management control ECU

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1. CHECK DTC OUTPUT (HV)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
DTC P0340-886 only is output.	A
DTC P0343-747 is also output.	B

- (e) Turn the power switch off.

B [CHECK HARNESS AND CONNECTOR \(ECM - POWER MANAGEMENT CONTROL ECU, INVERTER WITH CONVERTER\)](#)

A
▼

2. CHECK CONNECTOR CONNECTION CONDITION (ECM CONNECTOR)

- (a) Check the connections of the ECM connectors.

OK:

The connectors are connected securely and there are no contact problems.

H
NG **CONNECT SECURELY**

OK
▼

3. CHECK CONNECTOR CONNECTION CONDITION (POWER MANAGEMENT CONTROL ECU CONNECTOR)

- (a) Check the connections of the power management control ECU connectors.

OK:

The connectors are connected securely and there are no contact problems.

H
 NG▶ CONNECT SECURELY
 OK
 ▼

4. CHECK POWER MANAGEMENT CONTROL ECU (CHECK WAVEFORM)

(a) Turn the power switch on (READY).

*1

(b) Connect an oscilloscope between the power management control ECU terminals specified in the table below, and measure the waveform.

Item	Content
Terminal	A21-16 (GI) - L5-6 (E1)
Equipment Setting	5 V/DIV., 20 ms./DIV.
Condition	Power switch on (READY) with engine running

Text in Illustration

*1	Component with harness connected (Power Management Control ECU)
----	--

Result:

Result	Proceed to
Normal	A
Waveform is flat, and is stuck on the +B side.	B
Waveform is flat, and is stuck on the GND side.	C

▶ [CHECK HARNESS AND CONNECTOR \(ECM - POWER MANAGEMENT CONTROL ECU,](#)

INVERTER WITH CONVERTER)

B ▶ CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU)

A
▼

5. CHECK FOR INTERMITTENT PROBLEMS

(a) Check for intermittent problems **INFO**.

NG ▶ REPAIR OR REPLACE MALFUNCTIONING PARTS, COMPONENT AND AREA

OK ▶ **REPLACE POWER MANAGEMENT CONTROL ECU**

6. CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU)

(a) Disconnect connector D28 from the ECM.

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D28-48 (G2O) - Body ground	Power switch on (IG)	11 to 14 V

Text in Illustration

*1 Front view of wire harness connector (to ECM)

NOTICE:

Turning the power switch on (IG) with the ECM connectors disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(d) Turn the power switch off.

(e) Connect the ECM connector.

NG ▶ REPAIR OR REPLACE HARNESS OR CONNECTOR

OK ▶ **REPLACE ECM**

7. CHECK HARNESS AND CONNECTOR (ECM - POWER MANAGEMENT CONTROL ECU, INVERTER WITH CONVERTER)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector D28 from the ECM.

(c) Disconnect connector A21 from the power management control ECU.

(d) Disconnect connector A59 from the inverter with converter assembly.

(e) Turn the power switch on (IG).

(f) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D28-48 (G20) - Body ground	Power switch on (IG)	Below 1 V

Text in Illustration

*1	Front view of wire harness connector (to ECM)
----	---

NOTICE:

Turning the power switch on (IG) with the inverter with converter assembly connector, power management control ECU connector and ECM connector disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(g) Turn the power switch off.

(h) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
-------------------	------------------	---------------------

Tester Connection	Switch Condition	Specified Condition
D28-48 (G2O) - Body ground	Power switch off	10 kΩ or higher

- (i) Connect the ECM connector.
- (j) Connect the power management control ECU connector.
- (k) Connect the inverter with converter assembly connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

8.	CHECK POWER MANAGEMENT CONTROL ECU
----	------------------------------------

- (a) Disconnect all the connectors from the power management control ECU.

- (b) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A21-16 (GI) - L5-6 (E1)	Always	10 kΩ or higher

Text in Illustration

NG ► REPLACE INVERTER WITH CONVERTER ASSEMBLY
 OK ► REPLACE ECM

DTC	P0343-747	Camshaft Position Sensor "A" Circuit High Input
-----	-----------	---

DESCRIPTION

Refer to the description for DTC P0340-886 [INFO](#).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0343	747	GI signal is not input for 2 sec. or more while the engine is running.	<ul style="list-style-type: none"> • SFI system • Inverter with converter assembly • ECM • Power management control ECU • Wire harness or connector

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0340-886 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (ENGINE CONTROL SYSTEM)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Engine and ECT/ Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
Engine control system DTCs are not output.		A
Any of the following DTCs are output.		B
DTC No.	Relevant Diagnosis	
P0340	Camshaft Position Sensor Circuit Malfunction	
P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)	
P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)	

(e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

2.	CHECK DTC OUTPUT (HV)
----	-----------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
None of the following DTCs are output.		A
Any of the following DTCs are output.		B
DTC No.	Relevant Diagnosis	
P0A1B (all INF codes)* 1	Drive Motor "A" Control Module	

HINT:

- *1: If any INF codes are output for this DTC, refer to the corresponding diagnostic procedure.
- P0343-747 may be set due to a malfunction which also causes the DTCs in the preceding table to be set. In this case, first troubleshoot the output DTCs in the preceding table. Then, perform a test to attempt to reproduce the problems, and check that no DTCs are output.

(e) Turn the power switch off.

B ▶ GO TO DTC CHART

A
▼

3.	CHECK DTC OUTPUT (HV)
----	-----------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
P0340-886 is not output.	A
P0340-886 is also output.	B

(e) Turn the power switch off.

B ▶ [CHECK CONNECTOR CONNECTION CONDITION \(ECM CONNECTOR\)](#)

A
▼

4.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR)
----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

NOTICE:

Before disconnecting the connector, confirm that it is properly connected by checking that the locking claws are engaged and that the connector does not pull out.

(b) Check the connection of the low voltage connector of the inverter with

c

converter assembly.

OK:

The connector is connected securely and there are no contact problems.

HINT:

When connecting the connector, insert it with the locking lever in the raised position. Rotate the lever downward and make sure that the connector is pulled into its socket. When the locking lever is in its fully closed position, a click will be heard as its locking claws engage. After the click is heard, pull up on the connector to confirm that it is properly connected.

NG  CONNECT SECURELY
OK

5.	CHECK CONNECTOR CONNECTION CONDITION (ECM CONNECTOR)	INFO
----	--	------

NG  CONNECT SECURELY
OK

6.	CHECK HARNESS AND CONNECTOR (INVERTER WITH CONVERTER ASSEMBLY - ECM)
----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect the low voltage connector A59 from the inverter with converter assembly.

(c) Disconnect connector D28 from the ECM.

(d) Turn the power switch on (IG).

(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A59-29 (GI) - Body ground	Power switch on (IG)	Below 1 V

*1

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
*2	Front view of wire harness connector (to ECM)

*2

NOTICE:

Turning the power switch on (IG) with the inverter with converter assembly connector and ECM connectors disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(f) Turn the power switch off.

(g) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Switch Condition	Specified Condition
A59-29 (GI) - D28-48 (G20)	Power switch off	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Switch Condition	Specified Condition
A59-29 (GI) or D28-48 (G20) - Body ground and other terminals	Power switch off	10 k Ω or higher

(h) Connect the ECM connector.

(i) Connect the inverter with converter assembly connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR

OK ► **REPLACE INVERTER WITH CONVERTER ASSEMBLY**

NG ► REPLACE POWER MANAGEMENT CONTROL ECU

OK ► REPLACE ECM

DTC	P0516-769	Battery Temperature Sensor Circuit Low
DTC	P0517-770	Battery Temperature Sensor Circuit High

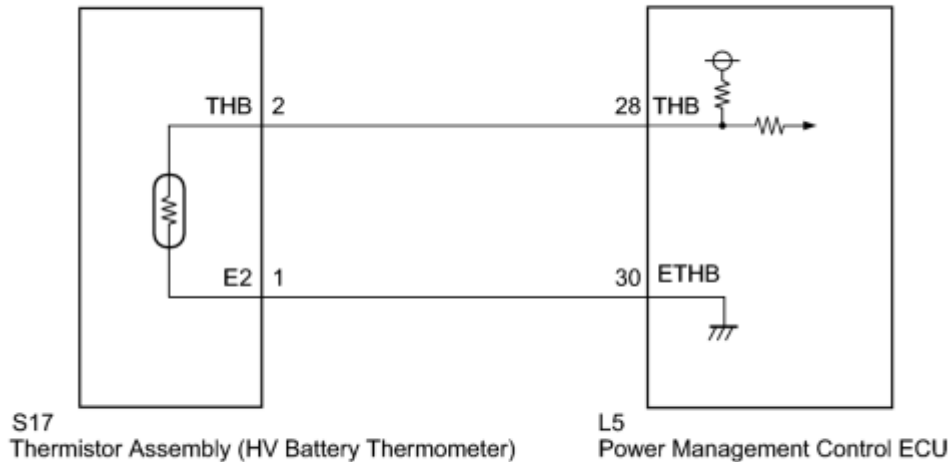

DESCRIPTION

- The thermistor assembly (battery temperature sensor) detects the auxiliary battery temperature. The resistance of the thermistor assembly built into the thermistor changes in accordance with changes in the auxiliary battery temperature. The lower the auxiliary battery temperature, the higher the thermistor assembly resistance. Conversely, the higher the temperature, the lower the resistance. The thermistor is connected to the power management control ECU (HV CPU). A voltage of 5 V is supplied to the thermistor assembly from the THB terminal of the power management control ECU (HV CPU) through its internal resistor R. This means that resistor R and the thermistor assembly are connected in series. The voltage at the THB terminal and the resistance value change in accordance with changes in the auxiliary battery temperature. Based on this signal, the power management control ECU (HV CPU) reduces the charging current when the auxiliary battery temperature is high to protect the auxiliary battery.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0516	769	Malfunction in the thermistor assembly (battery temperature sensor) circuit (short to GND)	<ul style="list-style-type: none"> • Thermistor assembly • Wire harness or connector • Power management control ECU
P0517	770	Malfunction in the thermistor assembly (battery temperature sensor) circuit (open or short to +B))	

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- Read the freeze frame data using the Techstream. In the freeze frame data, some information is recorded about the engine conditions at the moment a malfunction occurred. This information can be helpful when troubleshooting.
- Characteristics of the thermistor resistance (reference values) are as follows.

Terminal	THB (with Connector Disconnected)	Resistance	Ambient Temperature
THB - E2	4.5 to 5.5 V	3.00 to 3.75 kΩ	Approximately 50°F (10°C)
		1.60 to 1.80 kΩ	Approximately 77°F (25°C)
		0.80 to 1.00 kΩ	Approximately 104°F (40°C)

PROCEDURE

DTC	P060B-134	Internal Control Module A/D Processing Performance
DTC	P060B-135	Internal Control Module A/D Processing Performance
DTC	P060B-570	Internal Control Module A/D Processing Performance

DESCRIPTION

The power management control ECU (HV CPU) monitors its internal operation and it will set this DTC when it detects an internal malfunction. If this DTC is output, replace the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P060B	134	ECU internal error	Power Management Control ECU
	135	ECU internal error	
	570	ECU internal error	

MONITOR DESCRIPTION

The power management control ECU (HV CPU) performs diagnostic tests to verify proper operation of internal ECU systems. One of these monitors the rationality of internal analog (signal) to digital conversions. The power management control ECU (CPU) monitors the internal A/D (Analog/Digital converter) value. If there is an A/D converter malfunction, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P060B (INF 134/135/570): Internal control module A/D processing performance
Required sensors / components	Power management control ECU
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

COMPONENT OPERATING RANGE

DTC	P182E-573	Gear Lever Y Position "B" Circuit Low
DTC	P182F-574	Gear Lever Y Position "B" Circuit High

DESCRIPTION

HINT:

- The electronic shift lever system is a linkless type that does not use a shift cable.
- The shift and select sensors are non-contact type sensors.
- The shift lock control unit assembly (selector lever) is a momentary type, which returns to its home position by spring reaction as the driver's hand is released from the selector lever after shifting.

The shift lock control unit assembly (selector lever) contains a shift sensor and a select sensor to detect the selector lever position (R, N, D or B). Because both sensors operate using Hall elements, they can accurately detect shift positions in a reliable manner. Both sensors contain two detection circuits, a main and a sub circuit.

Shift Lock Control Unit Assembly (Selector Lever)

H

- The shift sensor outputs voltage, which varies between 0 and 5 V in accordance with the vertical movement of the selector lever, to the power management control ECU (HV CPU). The power management control ECU (HV CPU) interprets low level voltage input from the shift sensor as the D or B position, middle level voltage as the home or N position, and high level voltage as the R position.

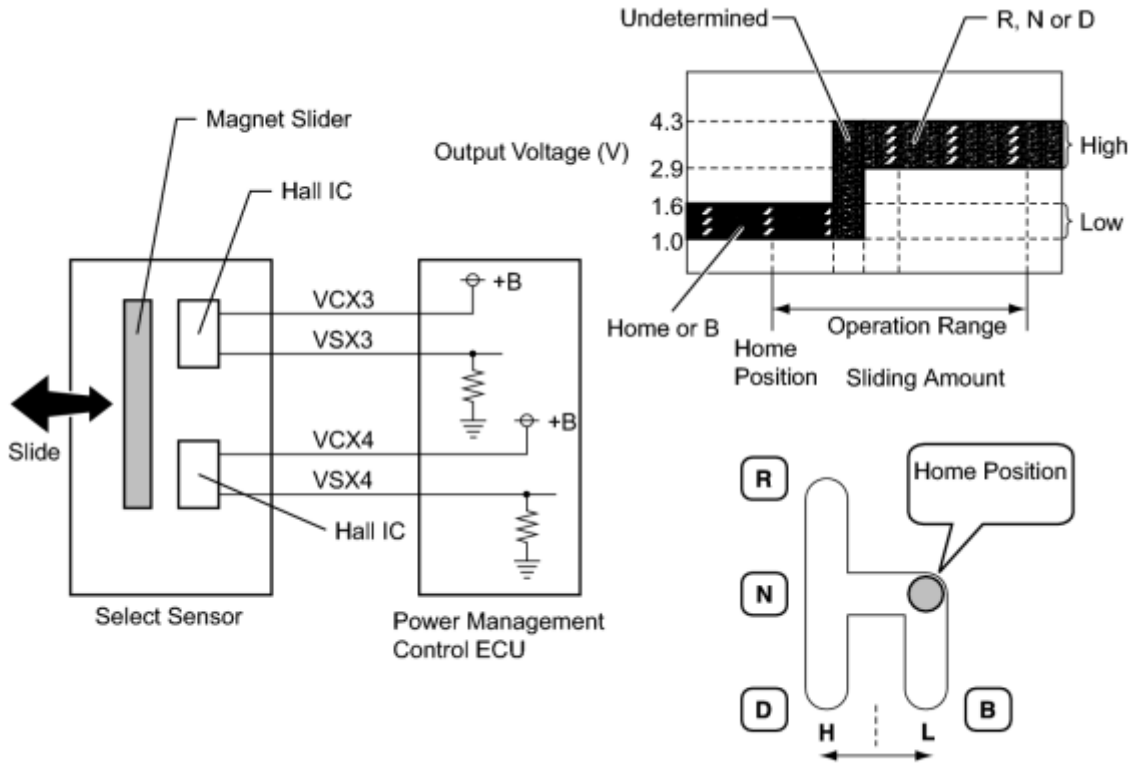

Shift Sensor Output Voltage (V)

H

- The select sensor outputs voltage, which varies between 0 and 5 V in accordance with the horizontal movement of the selector lever, to the power management control ECU (HV CPU). The power management control ECU (HV CPU) interprets low level voltage input from the select sensor as the home or B position, and high level voltage as the R, N, or D position.

The power management control ECU (HV CPU) determines the position of the selector lever in accordance with the combination of the signals from the shift sensor and select sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

PROCEDURE

1. READ VALUE USING TECHSTREAM (SHIFT SENSOR MAIN, SHIFT SENSOR SUB)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Shift Sensor Main, Shift Sensor Sub.
- (d) Read the Data List.

Result:

Tester Display	Condition	Specified Condition
Shift Sensor Main	R position	0.2 to 1.0 V
	Home or N position	2.0 to 3.0 V
	D or B position	4.0 to 4.8 V
Shift Sensor Sub	R position	0.2 to 1.0 V
	Home or N position	2.0 to 3.0 V
	D or B position	4.0 to 4.8 V

- (e) Turn the power switch off.

NG  [CHECK HARNESS AND CONNECTOR \(POWER MANAGEMENT CONTROL ECU - SHIFT SENSOR\)](#)

OK

2. READ VALUE USING TECHSTREAM (SHIFT SENSOR SELECT MAIN, SHIFT SENSOR SELECT SUB)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Shift Sensor Select Main, Shift Sensor Select Sub.
- (d) Read the Data List.

Result:

Tester Display	Condition	Specified Condition
Shift Sensor Select Main	R, N or D Position	2.9 to 4.3 V
	Home or B Position	1.0 to 1.6 V
Shift Sensor Select Sub	R, N or D Position	2.9 to 4.3 V
	Home or B Position	1.0 to 1.6 V

(e) Turn the power switch off.

NG [CHECK HARNESS AND CONNECTOR \(POWER MANAGEMENT CONTROL ECU - SELECT SENSOR\)](#)

OK

3. REPLACE SHIFT LOCK CONTROL UNIT ASSEMBLY

(a) Replace the shift lock control unit assembly .

NEXT

4. CLEAR DTC

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Read and record the DTCs and freeze frame data.

(e) Clear DTCs and freeze frame data.

(f) Turn the power switch off.

NEXT

5. CHECK DTC OUTPUT (HV)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Perform a road test.

(d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(e) Check if DTCs are output.

Result:

Result	Proceed to
No DTCs are output.	A
P082B-575, P082C-576, P082E-571, P082F-572, P181A-596, P181B-595, P182B-577, P182C-578, P182E-573 or P182F-574 is output again.	B

(f) Turn the power switch off.

B ▶ REPLACE POWER MANAGEMENT CONTROL ECU

A ▶ COMPLETED

6.	CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU - SHIFT SENSOR)
----	---

(a) Disconnect connector L5 from the power management control ECU.

(b) Disconnect connector z6 from the shift sensor.

(c) Turn the power switch on (IG).

(d) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) - Body ground	Power switch on (IG)	Below 1 V
L5-25 (VSX1) - Body ground	Power switch on (IG)	Below 1 V
L5-24 (E2X1) - Body ground	Power switch on (IG)	Below 1 V
L5-21 (VCX2) - Body ground	Power switch on (IG)	Below 1 V
L5-22 (VSX2) - Body ground	Power switch on (IG)	Below 1 V
L5-23 (E2X2) - Body ground	Power switch on (IG)	Below 1 V

Text in Illustration

*1	Rear view of wire harness connector: (to Power Management Control ECU)
*2	Front view of wire harness connector: (to Shift Sensor)

NOTICE:

Turning the power switch on (IG) with the power management control ECU connectors disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(e) Turn the power switch off.

(f) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for open):

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) - z6-3 (VCX1)	Power switch off	Below 1 Ω
L5-25 (VSX1) - z6-1 (VSX1)	Power switch off	Below 1 Ω
L5-24 (E2X1) - z6-2 (E2X1)	Power switch off	Below 1 Ω
L5-21 (VCX2) - z6-6 (VCX2)	Power switch off	Below 1 Ω
L5-22 (VSX2) - z6-4 (VSX2)	Power switch off	Below 1 Ω
L5-23 (E2X2) - z6-5 (E2X2)	Power switch off	Below 1 Ω

Standard Resistance (Check for short):

Tester Connection	Switch Condition	Specified Condition
L5-26 (VCX1) or z6-3 (VCX1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-25 (VSX1) or z6-1 (VSX1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-24 (E2X1) or z6-2 (E2X1) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-21 (VCX2) or z6-6 (VCX2) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-22 (VSX2) or z6-4 (VSX2) - Body ground and other terminals	Power switch off	10 k Ω or higher
L5-23 (E2X2) or z6-5 (E2X2) - Body ground and other terminals	Power switch off	10 k Ω or higher

(g) Connect the shift sensor connector.

(h) Connect the power management control ECU connector.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

7.	CHECK POWER MANAGEMENT CONTROL ECU (VCX1, VCX2 VOLTAGE)
----	---

(a) Disconnect connector z6 from the shift sensor.

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
z6-3 (VCX1) - z6-2 (E2X1)	Power switch on (IG)	4.5 to 5.5 V

*1

z6-6 (VCX2) - z6-5 (E2X2)	Power switch on (IG)	4.5 to 5.5 V
---------------------------	----------------------	--------------

B ▶ REPLACE POWER MANAGEMENT CONTROL ECU

A ▶ **COMPLETED**

DTC	P0851-579	Park / Neutral Switch Input Circuit Low
DTC	P0852-580	Park / Neutral Switch Input Circuit High

DESCRIPTION

- Instead of having a parking position as one of the positions of the conventional selector lever, a transmission shift main switch (P position switch) is provided independently above the selector lever. The switch is a momentary type, in which the button does not lock mechanically.
- The transmission shift main switch (P position switch) contains resistors R1 and R2. When the transmission shift main switch (P position switch) is not pressed, the switch provides a combined resistance of R1 and R2; and when the transmission shift main switch (P position switch) is pressed, the switch provides only the resistance of R1. The voltage at the P1 terminal of the power management control ECU (HV CPU) varies with the changes in the resistance of the switch. The power management control ECU (HV CPU) determines the transmission shift main switch (P position switch) operation according to this resistance signal.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0851	579	GND short in P position switch circuit	<ul style="list-style-type: none"> • Wire harness or connector • Transmission shift main switch (P position switch) • Power management control ECU

DTC	P0861-597	Gear Shift Control Module "A" Communication Circuit Low
DTC	P0862-598	Gear Shift Control Module "A" Communication Circuit High

DESCRIPTION

When a signal is input from the transmission shift main switch (P position switch) or selector lever, the power management control ECU (HV CPU) transmits a P position control (PCON) signal to the transmission control ECU assembly. Based on this signal, the transmission control ECU assembly actuates the shift control actuator assembly in order to mechanically lock or unlock the counter drive gear in the hybrid vehicle transaxle assembly.

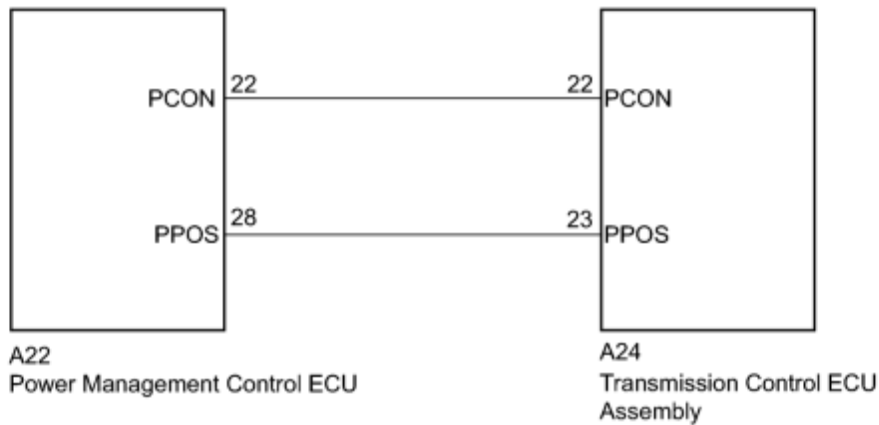

P position state (engaged or released) of the actuator assembly is sent to the power management control ECU (HV CPU) as a P position (PPOS) signal.

H

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P085D	582	P position (PPOS) signal is logically inconsistent	<ul style="list-style-type: none"> • Wire harness or connector • Transmission control ECU assembly • Power management control ECU

DTC	P0A01-726	Motor Electronics Coolant Temperature Sensor Circuit Range / Performance
DTC	P0A04-725	Motor Electronics Coolant Temperature Sensor Circuit Intermittent

DESCRIPTION

The power management control ECU (HV CPU) detects HV coolant temperature using the coolant temperature sensor built into the inverter with converter assembly. The power management control ECU (HV CPU) uses signals from the coolant temperature sensor to check the effectiveness of the inverter cooling system. If necessary, the power management control ECU (HV CPU) will limit inverter output to help prevent inverter overheating. The power management control ECU (HV CPU) also detects malfunctions in the sensor based on the HV coolant temperature sensor values. The inverter with converter assembly detects malfunctions in the HV coolant temperature sensor and its wiring.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A01	726	Temperature calculated by power management control ECU and actual temperature are different for 10 seconds or more.	<ul style="list-style-type: none"> • Inverter cooling system • Cooling fan system • Power management control ECU • Inverter with converter assembly • Water pump with motor assembly • Wire harness or connector • IGCT No. 3 fuse
P0A04	725	Unusual sudden change in HV coolant temperature sensor output occurs and the offset continues, or unusual sudden change in HV coolant temperature sensor output occurs repeatedly.	

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1. CHECK DTC OUTPUT (HV)

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Select the following menu items: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result		Proceed to
P0A01-726 or P0A04-725 is output		A
Any of the following DTCs are also output.		B
DTC No.	Relevant Diagnosis	
P0A93-346	Inverter Cooling System Performance	
P0C73-776	Motor Electronics Coolant Pump "A" Control Performance	
P314A-828	Inverter Coolant Pump Speed Signal	

HINT:

P0A01-726 or P0A04-725 may be set due to a malfunction which also causes DTCs in the preceding table to be set. In this case, first troubleshoot the output DTCs in the preceding table. Then, perform a test to attempt to reproduce the problems, and check that no DTCs are output.

B ▶ GO TO DTC CHART

A
▼

2.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR) <small>INFO</small>
----	---

NG ▶ CONNECT SECURELY

OK
▼

3.	CHECK QUANTITY OF HV COOLANT
----	------------------------------

(a) Check the coolant level in the inverter reserve tank.

(b) Check for coolant leaks.

Result

Result	Proceed to
Coolant leaks are not evident. A sufficient amount of coolant remains in the inverter reserve tank.	A
Coolant leaks are not evident. No coolant remains in the inverter reserve tank.	B
Coolant leaks are evident.	C

HINT:

After repairing the coolant leaks and adding coolant, perform the "Activate the Water Pump" Active Test (HV Active Test item) and the "Control the Electric Cooling Fan" Active Test (Engine Active Test item) and make sure that there are no malfunctions.

C ▶ INSPECT FOR COOLANT LEAK AND ADD COOLANT

B ▶ ADD HV COOLANT

A

4.	CHECK COOLANT HOSE
----	--------------------

(a) Check if the hoses of the cooling system are kinked or clogged.

NG ▶ CORRECT THE PROBLEM

OK

5.	PERFORM ACTIVE TEST USING TECHSTREAM (ACTIVATE THE WATER PUMP)
----	--

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Active Test / Activate the Water Pump.

(d) Select Inverter W/P Revolution in the Data List.

(e) While performing the "Activate the Water Pump" Active Test, check Inverter W/P Revolution in the Data List.

Result:

Data List Item	Specified Condition
Inverter W/P Revolution	2250 to 5625 rpm

HINT:

Perform the Active Test with the inverter coolant temperature between 5 to 149°F (-15 and 65°C).

(f) Turn the power switch off.

NG ▶ [CHECK FUSE \(IGCT NO. 3\)](#)

OK

6.	PERFORM ACTIVE TEST USING TECHSTREAM (CONTROL THE ELECTRIC COOLING FAN)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Electric Cooling Fan.

(d) Perform the "Control the Electric Cooling Fan" Active Test.

OK:

The cooling fan rotates.

(e) Turn the power switch off.

NG ► CHECK COOLING FAN SYSTEM

OK

7.	CHECK HV COOLANT (CHECK FOR CONDITIONS THAT MAY HAVE CAUSED FREEZING)
----	---

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Read the freeze frame data Ambient Temperature using the Techstream.

(d) Check if the freeze frame data Ambient Temperature is below freezing.

Result:

Result	Proceed to
Ambient Temperature value is above freezing temperature of the HV coolant	A
Ambient Temperature value is below freezing temperature of the HV coolant	B

HINT:

- HV coolant (SLLC) with a 30% concentration freezes at 5°F (-15 °C) and HV coolant (SLLC) with a 50% concentration freezes at -31°F (-35°C).
- If the HV coolant freezes in the HV radiator or HV water pump, the coolant temperature in the inverter with converter assembly rises because the HV coolant cannot circulate. As a result, a DTC may be set.
- A DTC is set when the water pump impeller cannot rotate due to freezing of the HV coolant.
- If a DTC is set due to freezing of HV coolant, the problem cannot be reproduced. Judge whether freezing of HV coolant occurred according to the freeze point of the HV coolant, HV coolant change history and ambient temperature when the DTC was set.

(e) Turn the power switch off.

B ► [REPLACE HV COOLANT](#)

A ► **REPLACE INVERTER WITH CONVERTER ASSEMBLY**

8.	CHECK FUSE (IGCT NO. 3)
----	-------------------------

(a) Remove the IGCT No. 3 fuse from the engine room junction block assembly.

*1

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IGCT No. 3 fuse	Always	Below 1Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	IGCT No. 3 Fuse

(c) Install the IGCT No. 3 fuse.

NG [▶ CHECK CONNECTOR CONNECTION CONDITION \(WATER PUMP WITH MOTOR ASSEMBLY\)](#)

OK

9.	CHECK CONNECTOR CONNECTION CONDITION (WATER PUMP WITH MOTOR ASSEMBLY)
----	---

(a) Check the connection of the water pump with motor assembly connector.

OK:

The connector is connected securely and there are no contact problems.

NG [▶ CONNECT SECURELY](#)

OK

10.	CHECK CONNECTOR CONNECTION CONDITION (POWER MANAGEMENT CONTROL ECU CONNECTOR) INFO
-----	--

NG▶ CONNECT SECURELY

OK

11. CHECK HARNESS AND CONNECTOR (WATER PUMP WITH MOTOR ASSEMBLY CIRCUIT)

- (a) Remove the IGCT No. 3 fuse from the engine room junction block assembly.
- (b) Remove the IGCT relay from the engine room junction block assembly.
- (c) Disconnect connector A21 from the power management control ECU.
- (d) Disconnect connector g1 from the water pump with motor assembly.
- (e) Measure the resistance according to the value(s) in the table below.

Text in Illustration

*1	Rear view of wire harness connector (to Power Management Control ECU)	*2	Engine Room Junction Block Assembly
*3	IGCT Relay	*4	IGCT No. 3 Fuse
*5	Front view of wire harness connector (to Water Pump with Motor Assembly)	-	-

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
2 (IGCT No. 3 fuse) - g1-4 (+BWP)	Power switch off	Below 1 Ω
1 (IGCT No. 3 fuse) - 3 (IGCT relay)	Power switch off	Below 1 Ω
g1-1 (GND) - Body ground	Power switch off	Below 1 Ω
g1-2 (NWP) - A21-14 (NIWP)	Power switch off	Below 1 Ω
g1-3 (SWP) - A21-13 (IWP)	Power switch off	Below 1 Ω
2 (IGCT No. 3 fuse) or g1-4 (+BWP) - Body ground and other terminals	Power switch off	10k Ω or higher
1 (IGCT No. 3 fuse) or 3 (IGCT relay) - Body ground and other terminals	Power switch off	10k Ω or higher
g1-2 (NWP) or A21-14 (NIWP) - Body ground and other terminals	Power switch off	10k Ω or higher
g1-3 (SWP) or A21-13 (IWP) - Body ground and other terminals	Power switch off	10k Ω or higher

NOTICE:

Do not apply excessive force when using the probes of the tester to perform the inspection. If excessive force is used, the terminals will be damaged.

- (f) Install the IGCT No. 3 fuse.
- (g) Install the IGCT relay.
- (h) Connect the power management control ECU connector.
- (i) Connect the water pump with motor assembly connector.

NG  REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

12.	CHECK WATER PUMP WITH MOTOR ASSEMBLY
-----	--------------------------------------

- (a) Connect the Techstream to the DLC3.
- (b) Remove the IGCT No. 3 fuse from the engine room junction block assembly.

Text in Illustration

*1	Engine Room junction Block Assembly
*2	IGCT No. 3 Fuse

*1

(c) Turn the power switch on (IG).

(d) Enter the following menus: Powertrain / Hybrid Control / Data List / Inverter W/P Revolution

(e) Apply 12 V to terminal 2 of the IGCT No. 3 fuse holder of the engine room junction block assembly.

(f) Read the Data List.

OK:

Inverter W/P Revolution is between 2250 and 5625 rpm.

NOTICE:

Do not apply excessive force when using the probes of the tester to perform the inspection. If excessive force is used, the terminals will be damaged.

(g) Install the IGCT No. 3 fuse.

NG ▶ REPLACE WATER PUMP WITH MOTOR ASSEMBLY

OK ▶ REPLACE POWER MANAGEMENT CONTROL ECU

DTC	P0A02-719	Motor Electronics Coolant Temperature Sensor Circuit Low
DTC	P0A03-720	Motor Electronics Coolant Temperature Sensor Circuit High

DESCRIPTION

Refer to the description for DTC P0A01-726 [INFO](#).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A02	719	Short to GND in the HV coolant temperature sensor circuit	Inverter with converter assembly
P0A03	720	Open or short to +B in the HV coolant temperature sensor circuit	

INSPECTION PROCEDURE

PROCEDURE

1.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly [INFO](#).

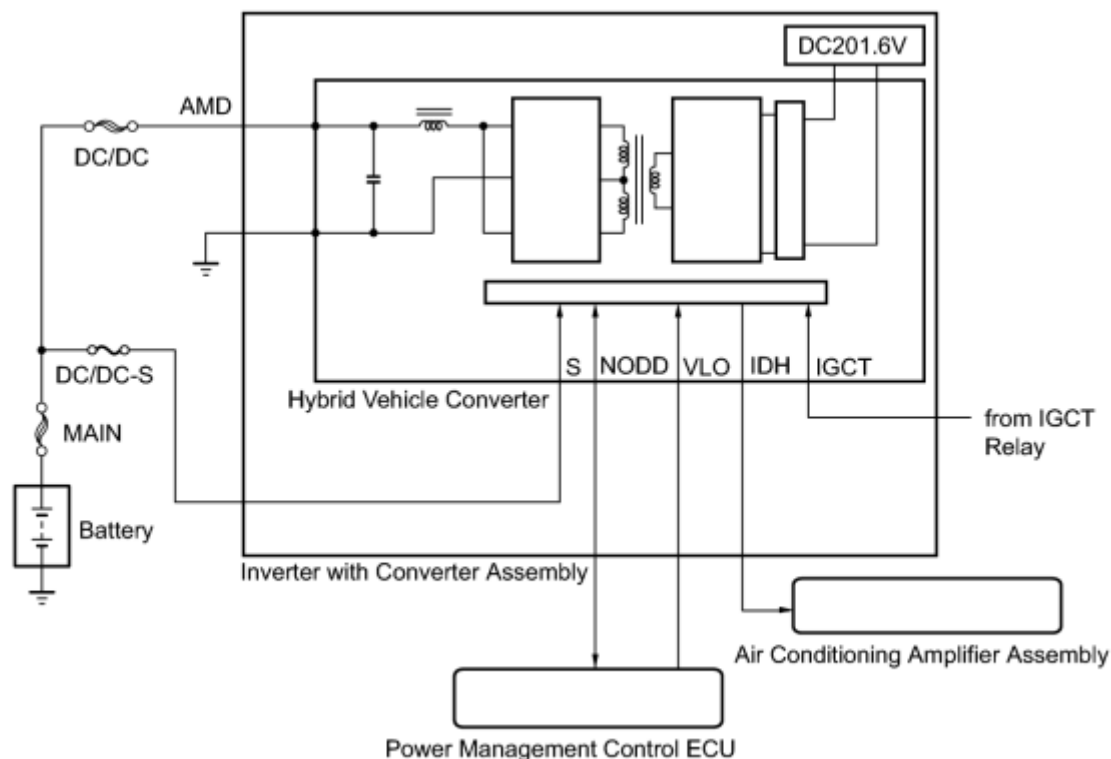

NEXT  COMPLETED

DTC	P0A08-264	DC / DC Converter Status Circuit
-----	-----------	----------------------------------

DESCRIPTION

The hybrid vehicle converter (DC/DC converter) converts the DC 201.6 V of the HV battery into DC 12 V in order to supply power to areas such as the vehicle's lighting, audio, and ECU systems. In addition, it charges the auxiliary battery. A transistor bridge circuit initially converts DC 201.6 V into alternating current, and a transformer lowers its voltage. Then, it is rectified and smoothed (into DC) and converted into DC 12 V. The hybrid vehicle converter controls the output voltage in order to keep a constant voltage at the terminals of the auxiliary battery.

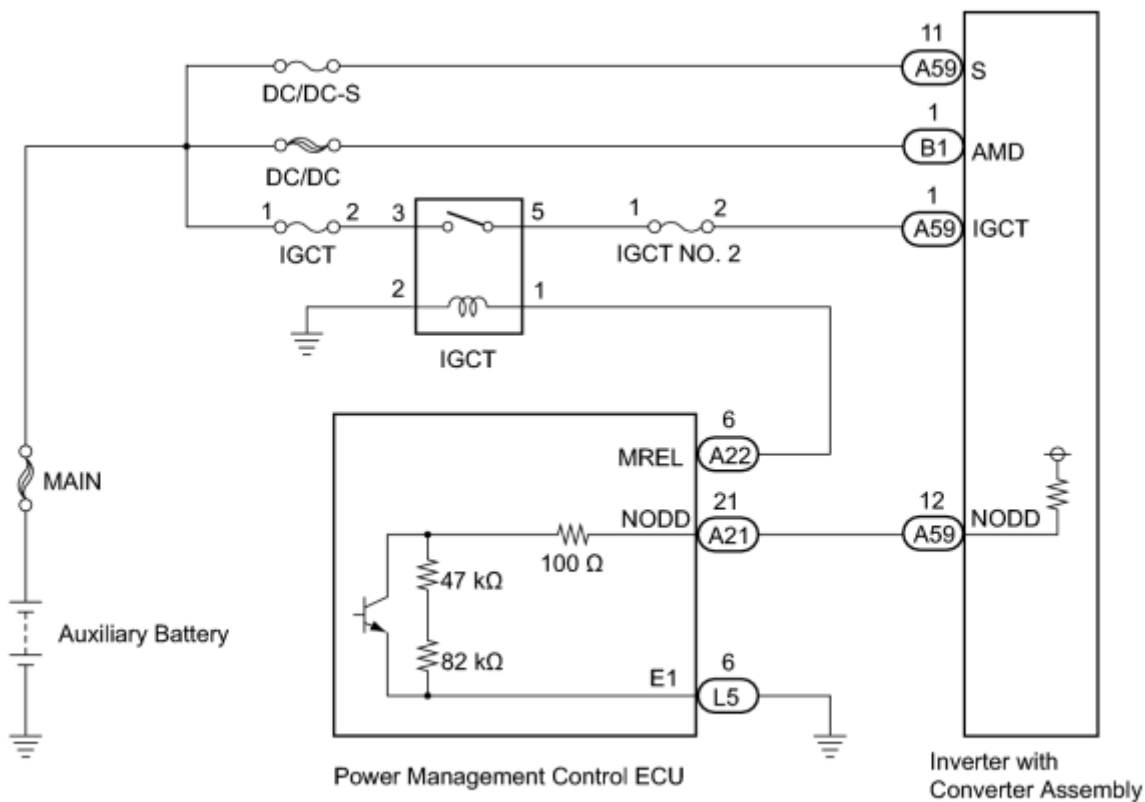

The power management control ECU (HV CPU) uses the NODD signal line to transmit a stop command to the hybrid vehicle converter and receive signals indicating the normal or abnormal condition of the 12 V charging system. If the vehicle is being driven with an inoperative hybrid vehicle converter, the voltage of the auxiliary battery will drop, which will prevent the continued operation of the vehicle. Therefore, the power management control ECU (HV CPU) monitors the operation of the hybrid vehicle converter and alerts the driver if it detects a malfunction.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A08	264	DC/DC converter malfunction	<ul style="list-style-type: none"> • Wire harness or connector • Water pump with motor assembly • Inverter cooling system • Hybrid vehicle transaxle assembly • Generator cable

DTC No.	INF Code	DTC Detection Condition	Trouble Area
			<ul style="list-style-type: none"> • Motor cable • Frame wire • Inverter with converter assembly • Fusible link block assembly (MAIN) • Fuse (DC/DC-S, IGCT, IGCT No. 2, IGCT No. 3) • Fusible link block assembly (DC/DC)

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket

to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.

- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
DTC P0A08-264 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A93-346	Inverter Cooling System Performance
P0A94-547, 548, 549	DC / DC Converter Performance
P0AA6-526, 613	Hybrid Battery Voltage System Isolation Fault
P0ADB-227	Hybrid Battery Positive Contactor Control Circuit Low
P0ADF-229	Hybrid Battery Negative Contactor Control Circuit Low
P0AE6-225	Hybrid Battery Precharge Contactor Control Circuit Low
P0C73-776	Motor Electronics Coolant Pump "A" Control Performance
P3004-131, 803	Power Cable Malfunction

- (e) Turn the power switch off.

B ► GO TO DTC CHART

2.	CHECK FUSE (IGCT NO. 2)
----	-------------------------

- (a) Disconnect the cable from the negative auxiliary battery terminal.
- (b) Remove the IGCT No. 2 fuse from the engine room junction block assembly.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
IGCT No. 2 fuse terminals	Always	Below 1 Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	IGCT No. 2 Fuse

(d) Install the IGCT No. 2 fuse.

NG [CHECK HARNESS AND CONNECTOR \(INVERTER WITH CONVERTER ASSEMBLY - IGCT NO. 2 FUSE\)](#)

OK

3.	CHECK FUSE (DC/DC-S)
----	----------------------

(a) Remove the DC/DC-S fuse from the engine room junction block assembly.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
DC/DC-S fuse terminals	Always	Below 1 Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	DC/DC-S Fuse

(c) Install the DC/DC-S fuse.

NG ► [CHECK HARNESS AND CONNECTOR \(INVERTER WITH CONVERTER ASSEMBLY - DC/DC-S FUSE\)](#)

OK

4.	CHECK FUSE (IGCT)
----	-------------------

(a) Remove the IGCT fuse from the engine room junction block assembly.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
IGCT fuse terminals	Always	Below 1 Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	IGCT Fuse

(c) Install the IGCT fuse.

NG ► [CHECK ENGINE ROOM JUNCTION BLOCK \(IGCT RELAY, IGCT FUSE, IGCT NO. 2 FUSE\)](#)

OK

5.	CHECK FUSIBLE LINK (DC/DC)
----	----------------------------

(a) Disconnect connector 1E from the engine room junction block assembly.

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1E-1 - terminal A	Always	Below 1 Ω

(c) Check the fusible links (DC/DC) in the engine room junction block assembly for improper installation.

OK:

The fusible link is installed securely.

(d) Connect the engine room junction block assembly connector.

NG ▶ REPLACE FUSIBLE LINK (DC/DC)

OK

6.	CHECK CONNECTOR CONNECTION CONDITION (POWER MANAGEMENT CONTROL ECU CONNECTOR)_ <small>INFO</small>
----	--

NG ▶ CONNECT SECURELY

OK

7.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR)_ <small>INFO</small>
----	--

NG ▶ CONNECT SECURELY

OK

8.	CHECK CABLE AND WIRE HARNESS
----	------------------------------

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Using a megohmmeter set to 500 V, measure the insulation resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
f1-3 (V) - Body ground and shield ground	Power switch off	1 MΩ or higher
f1-2 (U) - Body ground and shield ground	Power switch off	1 MΩ or higher
f1-1 (W) - Body ground and shield ground	Power switch off	1 MΩ or higher
e1-3 (V) - Body ground and shield ground	Power switch off	1 MΩ or higher
e1-2 (U) - Body ground and shield ground	Power switch off	1 MΩ or higher
e1-1 (W) - Body ground and shield ground	Power switch off	1 MΩ or higher

*1	Three-phase AC Cable for MG1
*2	Three-phase AC Cable for MG2

HINT:

Perform this inspection while the three-phase AC cable for MG1 and for

MG2 are connected.

(d) Install the inverter terminal cover to the inverter with converter assembly.

NG ▶ [CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(MG1\)](#)

OK

9.	CHECK AMD TERMINAL
----	--------------------

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Check that the nuts for the AMD terminal is tightened to the specified torque, the AMD terminal is connected securely, and there is no contact problem.

Torque:

T=8.3 N*m { 85 kgf*cm, 73 in.*lbf }

Result:

Result		Proceed to
There are no arc marks.	The terminal is connected securely and there is no contact problem.	A
There are no arc marks.	The terminal is not connected securely and there is a contact problem.	B
There are arc marks.	-	C

C ▶ REPLACE MALFUNCTIONING PARTS

B ▶ CONNECT SECURELY

A

10.	CHECK AMD TERMINAL (ENGINE ROOM JUNCTION BLOCK ASSEMBLY SIDE)
-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
AMD terminal (Engine Room Junction Block Assembly side) - Body ground	Power switch off	11 to 14 V

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

11.	CHECK HARNESS AND CONNECTOR
-----	-----------------------------

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector A59 from the inverter with converter assembly.

(c) Turn the power switch on (IG).

HINT:

Turning the power switch on (IG) with the service grip removed causes interlock switch system DTC P0A0D-350 to be output.

(d) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A59-1 (IGCT) - Body ground	Power switch on (IG)	11 to 14 V
A59-11 (S) - Body ground		

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
----	---

(e) Turn the power switch off.

(f) Connect the inverter with converter assembly connector.

NG ► REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

12.	CHECK POWER MANAGEMENT CONTROL ECU
-----	------------------------------------

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector A59 from the inverter with converter assembly.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A59-12 (NODD) - Body ground	Power switch off	120 to 140 kΩ

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
----	---

(d) Connect the inverter with converter assembly connector.

13. CHECK DC/DC CONVERTER FUNCTION

HINT:

The current at the AMD terminal cannot be measured directly because of space limitations. Measure the current flowing at the auxiliary battery instead.

- (a) Connect the AC/DC 400 A probe to the positive auxiliary battery line.
- (b) Install the service plug grip.
- (c) Turn the power switch on (READY) and leave the vehicle as it is until the electric current flowing into the auxiliary battery becomes 10 A or less.
- (d) Measure the current flowing from the auxiliary battery with the power switch on (READY), the headlight position switch and blower motor switch in the HI position, and the rear window defogger turned on.

c

c

Standard Current:

Item	Switch Condition	Specified Condition
Current flowing from auxiliary battery	Power switch on (READY) (The headlight position switch and blower motor switch are in the HI position, and the rear window defogger is turned on.)	0 A or less (no current from auxiliary battery)

(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
Auxiliary battery voltage	Power switch on (READY) (The headlight position switch and blower motor switch are in the HI position, and the rear window defogger is turned on.)	13 to 15 V

(f) Turn the power switch off.

DTC	P0A09-265	DC / DC Converter Status Circuit Low Input
-----	-----------	--

DESCRIPTION

Refer to the description for DTC P0A08-264 .

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A09	265	Open or GND short in NODD signal circuit of DC/DC converter	<ul style="list-style-type: none"> • Wire harness or connector • Inverter with converter assembly • Power management control ECU

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A08-264 .

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR)

DTC	P0A0D-350	High Voltage System Inter-Lock Circuit High
DTC	P0A0D-351	High Voltage System Inter-Lock Circuit High

DESCRIPTION

- When the power management control ECU detects that a safety device is operated, it will prohibit hybrid system operation or shut off the system main relay. There are four safety devices in three different locations. The first safety device is located at the service plug grip. The second one is located at the frame wire that is connected to the inverter with converter assembly. The third one is located at the inverter terminal cover where the motor and generator cables and No. 2 engine wire (air conditioning harness) are connected to the inverter with converter assembly. If the service plug grip, inverter terminal cover, or frame wire is removed, the interlock signal line will be open. If the vehicle is being driven, this condition will be determined to be an open circuit and the system main relays will not be shut off. If the safety devices are re-installed correctly, the system will return to normal when the power switch is turned on (IG).

DTC No.	INF Code	DTC Detection Condition	Trouble Are
P0A0D	350	Operating any of the safety devices with the vehicle stopped (ILK signal is ON) and turning the power switch on (IG)	<ul style="list-style-type: none"> Wire harness or connector Power Management Control ECU Service plug grip Inverter with converter assembly Frame wire Inverter terminal cover
P0A0D	351	Interlock signal line opens (ILK signal is ON) while the vehicle is being driven

DTC	P0A0F-204	Engine Failed to Start
DTC	P0A0F-205	Engine Failed to Start
DTC	P0A0F-206	Engine Failed to Start
DTC	P0A0F-524	Engine Failed to Start
DTC	P0A0F-525	Engine Failed to Start

DESCRIPTION

If an engine malfunction occurs, an engine malfunction signal is sent from the ECM to the power management control ECU (HV CPU) . When the power management control ECU (HV CPU) receives this signal, it sets a DTC and performs fail-safe control.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A0F	204	Signal indicating abnormality input from the ECM (abnormal engine output)	<ul style="list-style-type: none"> • SFI system • Power management control ECU
	205	Signal indicating abnormality input from the ECM (engine is unable to start)	
	206	Signal indicating abnormality input from the ECM (engine component malfunction)	
	524	Signal indicating abnormality input from the ECM (NE signal error)	
	525	Signal indicating abnormality input from the ECM (GI signal error)	

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (ENGINE CONTROL SYSTEM)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
Engine control system DTCs are not output.	A
Engine control system DTCs are output.	B

HINT:

If P0A0F-204, 205, 206, 524, or 525 is output even though the ECM has not detected a malfunction, there is a malfunction in the Power management control ECU.

(e) Turn the power switch off.

B ▶ GO TO DTC CHART

A ▶ REPLACE POWER MANAGEMENT CONTROL ECU

DTC	P0A0F-238	Engine Failed to Start
-----	-----------	------------------------

DESCRIPTION

If the power management control ECU (HV CPU) detects that the engine or transmission gear has seized, the power management control ECU (HV CPU) will perform fail-safe control. Also, if a substance or object is preventing the engine or transmission internal components from rotating, the power management control ECU (HV CPU) will perform fail-safe control.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A0F	238	Engine does not start even though it is being cranked (transaxle input malfunction [engine system])	<ul style="list-style-type: none"> • Hybrid vehicle transaxle assembly • Transmission input damper assembly • Power management control ECU • Engine

INSPECTION PROCEDURE

HINT:

If this DTC is output, the engine or transmission gear may be seized. Be sure to check the level of the engine oil, automatic transmission fluid (ATF), and coolant before inspection.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
P0A0F-238 only is output.	A
P0A1D (hybrid vehicle control ECU circuit malfunction) is output.	B

(e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

2.	CHECK CRANKSHAFT PULLEY REVOLUTION (PARK (P) SELECTED)
----	--

(a) Push the P position switch.

(b) Lift up the vehicle.

(c) Turn the crankshaft pulley using hand tools to check if the crankshaft can rotate smoothly.

CAUTION:

Do not turn the power switch on (READY) while performing this inspection. Be sure to turn the power switch off before performing this inspection, to prevent the engine from starting.

NOTICE:

Engine compression causes resistance when turning the crankshaft pulley. Check if the crankshaft rotates smoothly (or if it is locked) by manually applying sufficient torque to turn the crankshaft pulley. The torque required to turn the crankshaft pulley should be the same as for a known good vehicle of the same type.

OK:

The crankshaft rotates smoothly.

NG ► [CHECK CRANKSHAFT PULLEY REVOLUTION \(SELECTOR LEVER IN N\)](#)

OK
▼

3.	CLEAR DTC (HV)
----	----------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Read and record the DTCs and freeze frame data.

(e) Clear DTCs and freeze frame data.

(f) Turn the power switch off.

NEXT

4.	CHECK ENGINE RACING
----	---------------------

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Push the P position switch.

(d) Enter the following menus: Powertrain / Hybrid Control / Data List / Generator (MG1) Rev, Engine Revolution.

(e) Read the Data List.

(f) Turn the power switch on (READY).

(g) While the READY indicator is on, fully depress the accelerator pedal for 10 seconds.

OK:

Generator (MG1) Rev increases to approximately 3.6 times that of Engine Revolution.

HINT:

Refer to the graph for Data List confirmation of "Generator (MG1) Rev" and " Engine Revolution".

Data List	ENGINE REV	MG1 REV
Reference Value	Approximately 1000 rpm	Approximately 3600 rpm
	Approximately 1500 rpm	Approximately 5400 rpm
	Approximately 2500 rpm	Approximately 9000 rpm

(h) Turn the power switch off.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK

5.	CHECK CREEP MOVEMENT
----	----------------------

- (a) Turn the power switch on (READY).
- (b) Depress the brake pedal, move the selector lever to D, and release the brake pedal.

OK:

The wheels turn (the vehicle creeps forward).

- (c) Turn the power switch off.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK

6.	INSPECT ENGINE SPEED
----	----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Data List / Motor (MG2) Revolution, Generator (MG1) Rev, Engine Revolution.
- (d) Read the Data List.
- (e) Fully depress the accelerator pedal to accelerate the vehicle from a stop.

NOTICE:

Perform this test only in an appropriate safe location, in accordance with all local laws.

OK:

The difference between Engine Revolution and $0.28 \times \text{Generator (MG1) Rev} + 0.27 \times \text{Motor (MG2) Revolution}$ is 500 rpm or more and it is maintained for 1 second.

- (f) Turn the power switch off.

NG▶ REPLACE TRANSMISSION INPUT DAMPER ASSEMBLY

OK

7.	SIMULATION TEST
----	-----------------

- (a) Perform steps 2 through 6 again.

OK:

The problem symptom is not reproduced.

NG▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

OK ▶ REPLACE POWER MANAGEMENT CONTROL ECU

8.	CHECK CRANKSHAFT PULLEY REVOLUTION (SELECTOR LEVER IN N)
----	--

- (a) Lift up the vehicle.
- (b) Turn the power switch on (IG).
- (c) Move the selector lever to N.
- (d) Turn the crankshaft pulley using hand tools to check if the crankshaft can rotate smoothly.

CAUTION:

Do not turn the power switch on (READY) while performing this inspection. Be sure to turn the power switch on (IG) before performing this inspection, to prevent the engine from starting.

NOTICE:

Engine compression causes resistance when turning the crankshaft pulley. Check if the crankshaft rotates smoothly (or if it is locked) by manually applying sufficient torque to turn the crankshaft pulley. The torque required to turn the crankshaft pulley should be the same as for a known good vehicle of the same type.

OK:

The crankshaft rotates smoothly.

NG ▶ REPAIR OR REPLACE ENGINE

OK ▶ REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY

DTC	P0A10-263	DC / DC Converter Status Circuit High Input
-----	-----------	---

DESCRIPTION

Refer to the description for DTC P0A08-264 [INFO](#).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A10	263	Short to +B in the hybrid vehicle converter (DC/DC converter) NODD signal line	<ul style="list-style-type: none"> • Wire harness or connector • Inverter with converter assembly • Power management control ECU

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A08-264 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

DTC	P0A1A-151	Generator Control Module
DTC	P0A1A-155	Generator Control Module
DTC	P0A1A-156	Generator Control Module
DTC	P0A1A-658	Generator Control Module
DTC	P0A1A-659	Generator Control Module
DTC	P0A1A-791	Generator Control Module

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1A	151	Run pulse signal cycle deviation or stop	Inverter with converter assembly
	155	A/D converter error	
	156	CPU ROM-RAM error	
	658	ALU error	
	659	Communication error (from MG1 to MG2)	
	791	R/D converter communication error	

MONITOR DESCRIPTION

The MG ECU performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks the result of the generator CPU self-test. If the MG ECU detects a "Fail" from the generator CPU self-test, it will conclude that there is an internal malfunction in the generator CPU. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	<p>P0A1A (INF 151): RUN pulse malfunction</p> <p>P0A1A (INF 155): A/D malfunction (1 MG CPU)</p> <p>P0A1A (INF 156): RAM and ROM destruction</p>

DTC	P0A1A-166	Generator Control Module
-----	-----------	--------------------------

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1A	166	R/D converter NM stop error	Inverter with converter assembly

MONITOR DESCRIPTION

The MG ECU performs many diagnostic tests to verify proper operation of internal ECU systems. In this diagnostic monitor, the MG ECU checks for an R/D (Resolver/Digital Converter) malfunction involving the generator resolver. If MG ECU detects an R/D error, it will conclude that there is an internal malfunction involving the generator resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

DTC	P0A1A-200	Generator Control Module
DTC	P0A1A-792	Generator Control Module
DTC	P0A1A-793	Generator Control Module

DESCRIPTION

The inverter with converter assembly (MG ECU) monitors its internal operation and detects the following malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1A	200	The difference between the resolver angle for control and estimated resolver angle exceeds the allowable value.	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
	792	Resolver REF signal cycle error	
	793	Resolver REF signal oscillation stop error	

MONITOR DESCRIPTION

The MG ECU performs many diagnostic tests to verify proper operation of internal ECU systems. In this diagnostic monitor, the MG ECU checks for an R/D (Resolver/Digital Converter) malfunction involving the generator resolver. If MG ECU detects an R/D error, it will conclude that there is an internal malfunction involving the generator resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A1A (INF 200): RD converter resolver angle abnormality P0A1A (INF 792): REF malfunction (frequency abnormality) P0A1A (INF 793): REF malfunction (REF signal stop)

- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1. CHECK DTC OUTPUT (HV)

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A1A-200, 792, or 793 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A3F-243	Drive Motor "A" Position Sensor Circuit
P0A4B-253	Generator Position Sensor Circuit

P0A4D-255	Generator Position Sensor Circuit Low

- (e) Turn the power switch off.

B ► GO TO DTC CHART

A
▼

2. CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY)

CAUTION:

Be sure to wear insulated gloves.

- (a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

NOTICE:

Before disconnecting the connector, confirm that it is properly connected by checking that the locking claws are engaged and that the connector does not pull out.

c

(b) Check the connection of the low voltage connector of the inverter with converter assembly.

OK:

The connector is connected securely and there are no contact problems.

HINT:

When connecting the connector, insert it with the locking lever in the raised position. Rotate the lever downward and make sure that the connector is pulled into its socket. When the locking lever is in its fully closed position, a click will be heard as its locking claws engage. After the click is heard, pull up on the connector to confirm that it is properly connected.

NG  CONNECT SECURELY
OK

3.	CHECK HARNESS AND CONNECTOR (INVERTER WITH CONVERTER ASSEMBLY - GENERATOR RESOLVER)
----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Disconnect the low voltage connector D29 from the inverter with converter assembly.

(b) Turn the power switch on (IG).

(c) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

*1

Tester Connection	Switch Condition	Specified Condition
D29-11 (GRF) - Body ground	Power switch on (IG)	Below 1 V
D29-12 (GRFG) - Body ground	Power switch on (IG)	Below 1 V
D29-7 (GSN) - Body ground	Power switch on (IG)	Below 1 V
D29-8 (GSNG) - Body ground	Power switch on (IG)	Below 1 V
D29-10 (GCS) - Body ground	Power switch on (IG)	Below 1 V
D29-9 (GCSG) - Body	Power switch on	Below 1 V

ground	(IG)

DTC	P0A1B-661	Drive Motor "A" Control Module
DTC	P0A1B-786	Drive Motor "A" Control Module
DTC	P0A1B-794	Drive Motor "A" Control Module

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	163	IPM positive power source error	Inverter with converter assembly
	164	IPM negative power source error	
	192	A/D converter error	
	193	CPU ROM-RAM error	
	511	Standard voltage for analog signal offset	
	512	Standard voltage for analog signal error	
	661	Communication error (from MG2 to MG1)	
	786	ALU error	
	794	R/D converter communication error	

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks the result of the motor CPU self-test. If the MG ECU detects a "Fail" from the motor CPU self-test, it will conclude that there is an internal

malfunction in the motor CPU. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

DTC	P0A1B-168	Drive Motor "A" Control Module
DTC	P0A1B-795	Drive Motor "A" Control Module
DTC	P0A1B-796	Drive Motor "A" Control Module

DESCRIPTION

The inverter with converter assembly (MG ECU) monitors its internal operation and detects malfunctions.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	168	The difference between the resolver angle for control and estimated resolver angle exceeds the allowable value.	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
	795	Resolver REF signal cycle error	
	796	Resolver REF signal oscillation stop error	

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks for an R/D (Resolver/ Digital converter) malfunction involving the motor resolver. If the MG ECU detects an R/D converter error, it will conclude that there is an internal malfunction involving the motor resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [C]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 INFO.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)

DTC	P0A1B-198	Drive Motor "A" Control Module
-----	-----------	--------------------------------

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions. If any of the following DTCs are output, replace the inverter with converter assembly.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1B	198	R/D converter NM stop error	Inverter with converter assembly

MONITOR DESCRIPTION

The MG ECU (in the inverter with converter assembly) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of those tests, the MG ECU checks for an R/D (Resolver/ Digital converter) malfunction involving the motor resolver. If the MG ECU detects an R/D converter error, it will conclude that there is an internal malfunction involving the motor resolver. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

DTC	P0A1D-721	Hybrid Powertrain Control Module
DTC	P0A1D-722	Hybrid Powertrain Control Module
DTC	P0A1D-723	Hybrid Powertrain Control Module
DTC	P0A1D-787	Hybrid Powertrain Control Module
DTC	P0A1D-818	Hybrid Powertrain Control Module

DESCRIPTION

The power management control ECU (HV CPU) monitors its internal operation, it will set DTCs and perform fail-safe control when it detects the following malfunctions. If any of the following DTCs are output, replace the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A1D	721	ECU internal error	Power management control ECU
P0A1D	722	ECU internal error	Power management control ECU
P0A1D	723	ECU internal error	Power management control ECU
P0A1D	787	ECU internal error	Power management control ECU
P0A1D	818	ECU internal error	Power management control ECU

MONITOR DESCRIPTION

The power management control ECU (HV CPU) performs many diagnostic tests to verify proper operation of internal ECU systems. In one of these tests, the power management control ECU (HV CPU) checks the result of the ECM self-test. If the power management control ECU (HV CPU) detects a "Fail" from the ECM self-test, it will conclude that there is an internal malfunction in the ECM. The power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

DTC	P0A3F-243	Drive Motor "A" Position Sensor Circuit
DTC	P0A40-500	Drive Motor "A" Position Sensor Circuit Range / Performance
DTC	P0A41-245	Drive Motor "A" Position Sensor Circuit Low

DESCRIPTION

A resolver is a sensor that is used to detect the position of the magnetic poles the rotor of a motor generator. Knowing the position of the poles is indispensable for ensuring precise control of MG2 and MG1.

Each resolver contains a stator that has an excitation coil and 2 detection coils (S, C). The gap between the stator and rotor changes as the rotor turns because the rotor is oval shaped. An alternating current with a predetermined frequency flows through the excitation coil, and detection coils S and C output alternating currents in accordance with the sensor rotor position.

The inverter with converter assembly (MG ECU) detects the absolute position of the rotor according to the phases of detection coils S and C and the heights of their waveforms. Furthermore, the CPU calculates the amount of change in the position within a predetermined length of time, in order to use the resolver as a speed sensor.

The MG ECU monitors signals output from the motor resolver and detects malfunctions.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A3F	243	Interphase short in the motor resolver circuit	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Wire harness or connector
P0A40	500	Motor resolver output is out of the normal range	
P0A41	245	Open or short in the motor resolver circuit	

MONITOR DESCRIPTION

The MG ECU monitors the motor resolver output signal. If the MG ECU detects output signals that are out of the normal range or specification, it will conclude that there is a malfunction in the motor resolver. If a malfunction is detected, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and turn the Techstream on.

6. Slowly accelerate from a stop (0 mph (0 km/h)) to 25 mph (40 km/h) several times while using different acceleration patterns.
7. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
8. Check that permanent DTCs are cleared.
9. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 .

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

- If INF code 243 is output, there may be an interphase short in the motor resolver due to an intrusion of water into the resolver. If the problem symptom cannot be reproduced, replace the hybrid vehicle transaxle assembly.
- Check for output DTCs again after the repair has been completed. If P0A78-286 or P0A7A-324 is output, replace the inverter with converter assembly.

HINT:

- Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.
- If the problem symptom cannot be reproduced, performing a road test on a road on which the vehicle tends to vibrate will make it easier to reproduce the symptom.

DTC	P0A51-174	Drive Motor "A" Current Sensor Circuit
-----	-----------	--

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors its internal operation and it will set DTCs when it detects malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A51	174	Motor current sensor high resolution circuit signal is out of range or there is a difference between it and the motor current sensor low resolution circuit current value.	Inverter with converter assembly

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A51-174 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A60 (all INF codes)*1	Drive Motor "A" Phase V Current
P0A63 (all INF codes)*1	Drive Motor "A" Phase W Current
P0A78-113, 287, 505, 506	Drive Motor "A" Inverter Performance

HINT:

- *1: If any INF codes are output for this DTC, refer to the corresponding diagnostic procedure.
- P0A51-174 may be output due to a malfunction which causes the DTCs in the table above to be output. In this case, first troubleshoot the output DTCs in the table above. Then, perform a reproduction test to check that no DTCs are output.

(e) Turn the power switch off.

B ▶ GO TO DTC CHART

A
▼

2.	CHECK CONNECTOR CONNECTION CONDITION (INVERTER WITH CONVERTER ASSEMBLY CONNECTOR) 
----	---

NG ▶ CONNECT SECURELY

OK ▶ **REPLACE INVERTER WITH CONVERTER ASSEMBLY**

DTC	P0A60-288	Drive Motor "A" Phase V Current
DTC	P0A60-290	Drive Motor "A" Phase V Current
DTC	P0A60-294	Drive Motor "A" Phase V Current
DTC	P0A60-501	Drive Motor "A" Phase V Current
DTC	P0A63-296	Drive Motor "A" Phase W Current
DTC	P0A63-298	Drive Motor "A" Phase W Current
DTC	P0A63-302	Drive Motor "A" Phase W Current
DTC	P0A63-502	Drive Motor "A" Phase W Current

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors the motor inverter current sensors. P0A60 and P0A63 indicate malfunctions in current sensors, and they do not indicate malfunctions in the high-voltage system.

HINT:

The term "drive motor A" indicates MG2.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A60	288	Malfunction in motor inverter current sensor (phase V sub sensor)	Inverter with converter assembly
P0A60	290	Malfunction in motor inverter current sensor (phase V main sensor)	
P0A60	294	Malfunction in motor inverter current sensor (performance problem or open phase V)	
P0A60	501	Malfunction in motor inverter current sensor (phase V main and sub sensors offset)	
P0A63	296	Malfunction in motor inverter current sensor (phase W sub sensor)	
P0A63	298	Malfunction in motor inverter current sensor (phase W main sensor)	
P0A63	302	Malfunction in motor inverter current sensor (performance problem or open phase W)	

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A63	502	Malfunction in motor inverter current sensor (phase W main and sub sensors offset)	

MONITOR DESCRIPTION

The power management control ECU (HV CPU) monitors the motor inverter current sensor. If the power management control ECU (HV CPU) detects a fault, it will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A60 (INF 288/290/294/501): Phase V, sub sensor P0A63 (INF 296/298/302/502): Phase W, sub sensor
Required sensors / components	Motor inverter current sensor, motor resolver
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A60 (INF 288/ 290/ 294/ 501) is not detected DTC P0A63 (INF 296/ 298/ 302/ 502) is not detected
---------------------------------------	--

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and turn the Techstream on.
6. With the vehicle stopped and park (P) selected, move the shift lever to N, wait for 10 seconds and then move the shift lever to D. [A]

NOTICE:

Do not leave the vehicle for an extended time with the shift lever in N.

7. Slowly accelerate from a stop (0 mph (0 km/h)) to 25 mph (40 km/h) several times while using different acceleration patterns. [B]
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(d) Check if DTCs are output.

Result:

Result	Proceed to
P0A60 or P0A63 only is output.	A
P0A78-202 is output.	B

(e) Turn the power switch off.

DTC	P0A72-515	Generator Phase V Current
DTC	P0A75-334	Generator Phase W Current
DTC	P0A75-336	Generator Phase W Current
DTC	P0A75-341	Generator Phase W Current
DTC	P0A75-516	Generator Phase W Current

DESCRIPTION

The MG ECU located in the inverter with converter assembly monitors the generator inverter current sensors. P0A72 and P0A75 indicate malfunctions in the current sensors, and they do not indicate malfunctions in the high-voltage system.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A72	326	Malfunction in generator inverter current sensor (phase V sub sensor)	Inverter with converter assembly
P0A72	328	Malfunction in generator inverter current sensor (phase V main sensor)	
P0A72	333	Malfunction in generator inverter current sensor (performance problem or open phase V)	
P0A72	515	Malfunction in generator inverter current sensor (phase V main and sub sensors offset)	
P0A75	334	Malfunction in generator inverter current sensor (phase W sub sensor)	
P0A75	336	Malfunction in generator inverter current sensor (phase W main sensor)	
P0A75	341	Malfunction in generator inverter current sensor (performance problem or open phase W)	
P0A75	516	Malfunction in generator inverter current sensor (phase W main and sub sensors offset)	

MONITOR DESCRIPTION

The power management control ECU (HV CPU) monitors the generator inverter current sensor. If the power management control ECU (HV CPU) detects a fault, it will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A72 (INF 326/328/333/515): Phase V, sub sensor P0A75 (INF 334/336/341/516): Phase W, sub sensor

DTC	P0A78-113	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If the motor inverter overheats, has a circuit malfunction, or has an internal short, the inverter transmits this information to the MG ECU via the motor inverter fail signal line.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	113	Motor inverter fail signal detection (System overcurrent)	<ul style="list-style-type: none"> Hybrid vehicle transaxle assembly Generator cable Motor cable Inverter with converter assembly Power management control ECU PCU fuse Wire harness or connector

MONITOR DESCRIPTION

If over-amperage flows through the motor inverter due to an internal short, the motor inverter transmits an inverter fail signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) illuminates the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 113): MFIV detection (Over current malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

Power management control ECU (HV CPU)

DTC P0A78 (INF 113) is not detected

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 [INFO](#).

Refer to the wiring diagram for DTC P324E-788 [INFO](#).

Refer to the wiring diagram for DTC U0110-159 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

11. CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG1)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Disconnect the generator cable and motor cable from the inverter with converter assembly.

(d) Check MG1 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG1 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
f1-2 (U) - f1-3 (V)	Power switch off	87.0 to 96.2 mΩ
f1-3 (V) - f1-1 (W)	Power switch off	87.0 to 96.2 mΩ

f1-1 (W) - f1-2 (U)	Power switch off	87.0 to 96.2 mΩ
---------------------	------------------	-----------------

Text in Illustration

*1	Generator Cable
*2	Shield Ground

HINT:

To correct the variation of the measured resistance due to temperature, use the following formula to calculate the resistance at 68° F (20°C).

$$R_{20} = R_t / \{ 1 + 0.00393 \times (T - 20) \}$$

The calculation is based on the following:

R₂₀: Resistance at 68° F (20°C) (mΩ)

R_t: Measured resistance (mΩ)

T: Temperature when the resistance is measured (° C)

(e) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
f1-2 (U) - Body ground and shield ground	Power switch off	100 MΩ or higher
f1-3 (V) - Body ground and shield ground	Power switch off	100 MΩ or higher
f1-1 (W) - Body ground and shield ground	Power switch off	100 MΩ or higher

(f) Connect the generator cable and motor cable.

(g) Install the inverter terminal cover.

NG  [CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(GENERATOR CABLE CONNECTION CONDITION\)](#)

OK 

12.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG2)
-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Disconnect the generator cable and motor cable from the inverter with converter assembly.

(d) Check MG2 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG2 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e1-2 (U) - e1-3 (V)	Power switch off	154 to 170 mΩ
e1-3 (V) - e1-1 (W)	Power switch off	148 to 164 mΩ
e1-1 (W) - e1-2 (U)	Power switch off	149 to 165 mΩ

Text in Illustration

*1	Motor Cable
*2	Shield Ground

HINT:

To correct the variation of the measured resistance due to temperature, use the following formula to calculate the resistance at 68° F (20°C).

$$R_{20} = R_t / \{ 1 + 0.00393 \times (T - 20) \}$$

The calculation is based on the following:

R₂₀: Resistance at 68° F (20°C) (mΩ)

R_t: Measured resistance (mΩ)

T: Temperature when the resistance is measured (° C)

(e) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e1-2 (U) - Body ground and shield ground	Power switch off	100 MΩ or higher
e1-3 (V) - Body ground and shield ground	Power switch off	100 MΩ or higher
e1-1 (W) - Body ground and shield ground	Power switch off	100 MΩ or higher

(f) Connect the generator cable and motor cable.

(g) Install the inverter terminal cover.

NG  [CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(MOTOR CABLE CONNECTION CONDITION\)](#)

OK 

13.	CHECK FUSE (PCU)
-----	------------------

(a) Remove the PCU fuse from the engine room junction block assembly.

*1

(b) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
PCU fuse terminal	Always	Below 1Ω

Text in Illustration

*1	Engine Room Junction Block Assembly
*2	PCU fuse

(c) Install the PCU fuse.

NG [CHECK HARNESS AND CONNECTOR \(INVERTER WITH CONVERTER ASSEMBLY - PCU FUSE\)](#)

OK
▼

14.	CHECK HARNESS AND CONNECTOR (INVERTER WITH CONVERTER ASSEMBLY POWER SOURCE CIRCUIT)
-----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect connector A59 from inverter with converter assembly.

(c) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A59-28 (GND1) - Body ground	Power switch off	Below 1 Ω
A59-27 (GND2) - Body ground	Power switch off	Below 1 Ω

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
----	---

(d) Turn the power switch on (IG).

(e) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A59-10 (+B) - Body ground	Power switch on (IG)	11 to 14V
A59-9 (+B2) - Body ground	Power switch on (IG)	11 to 14V

(f) Turn the power switch off.

(g) Connect the inverter with converter assembly connector.

NG ► REPAIR OR REPLACE POWER SOURCE CIRCUIT

OK

15.	CHECK HARNESS AND CONNECTOR (POWER MANAGEMENT CONTROL ECU - INVERTER WITH CONVERTER)
-----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Turn the power switch off.

(c) Disconnect connector A59 from the inverter with converter assembly.

(d) Disconnect connector A22 from the power management control ECU.

(e) Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for open):

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) - A59-8 (HTM+)	Power switch off	Below 1 Ω
A22-25 (HTM-) - A59-18 (HTM-)	Power switch off	Below 1 Ω
A22-30 (MTH+) - A59-7 (MTH+)	Power switch off	Below 1 Ω
A22-29 (MTH-) - A59-17 (MTH-)	Power switch off	Below 1 Ω
A22-33 (REQ+) - A59-6 (REQ+)	Power switch off	Below 1 Ω
A22-32 (REQ-) - A59-16 (REQ-)	Power switch off	Below 1 Ω
A22-21 (CLK+) - A59-5 (CLK+)	Power switch off	Below 1 Ω
A22-20 (CLK-) - A59-15 (CLK-)	Power switch off	Below 1 Ω

Standard Resistance (Check for short):

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) or A59-8 (HTM+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-25 (HTM-) or A59-18 (HTM-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-30 (MTH+) or A59-7 (MTH+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-29 (MTH-) or A59-17 (MTH-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-33 (REQ+) or A59-6 (REQ+) -	Power switch	10 kΩ or

Body ground and other terminals	off	higher
A22-32 (REQ-) or A59-16 (REQ-) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-21 (CLK+) or A59-5 (CLK+) - Body ground and other terminals	Power switch off	10 kΩ or higher
A22-20 (CLK-) or A59-15 (CLK-) - Body ground and other terminals	Power switch off	10 kΩ or higher

Text in Illustration

*1	Front view of wire harness connector (to Inverter with Converter Assembly)
*2	Rear view of wire harness connector (to Power Management Control ECU)

(f) Turn the power switch on (IG).

(g) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) or A59-8 (HTM+) - Body ground	Power switch on (IG)	Below 1 V
A22-25 (HTM-) or A59-18 (HTM-) - Body ground	Power switch on (IG)	Below 1 V
A22-30 (MTH+) or A59-7 (MTH+) - Body ground	Power switch on (IG)	Below 1 V
A22-29 (MTH-) or A59-17 (MTH-) - Body ground	Power switch on (IG)	Below 1 V
A22-33 (REQ+) or A59-6 (REQ+) - Body ground	Power switch on (IG)	Below 1 V
A22-32 (REQ-) or A59-16 (REQ-) - Body ground	Power switch on (IG)	Below 1 V
A22-21 (CLK+) or A59-5 (CLK+) - Body ground	Power switch on (IG)	Below 1 V
A22-20 (CLK-) or A59-15 (CLK-) - Body ground	Power switch on (IG)	Below 1 V

NOTICE:

Turning the power switch on (IG) with the power management control ECU and inverter with converter assembly connector disconnected causes other DTCs to be stored. Clear the DTCs after performing this inspection.

(h) Turn the power switch off.

(i) Connect the power management control ECU connector.

(j) Connect the inverter with converter assembly connector.

NG ▶ REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

16. CHECK POWER MANAGEMENT CONTROL ECU

(a) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
A22-24 (HTM+) - A22-25 (HTM-)	Power switch off	80 to 170 Ω
A22-30 (MTH+) - A22-29 (MTH-)	Power switch off	80 to 170 Ω
A22-33 (REQ+) - A22-32 (REQ-)	Power switch off	80 to 170 Ω
A22-21 (CLK+) - A22-20 (CLK-)	Power switch off	80 to 170 Ω

OK  **REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY**

DTC	P0A78-121	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	121	Motor inverter overvoltage signal detection (overvoltage due to system malfunction)	<ul style="list-style-type: none"> • Hybrid battery junction block • Inverter with converter assembly • Service plug grip (EV battery fuse) • Frame wire • Hybrid vehicle transaxle assembly • Generator Cable • Motor Cable • Power management control ECU • PCU fuse • Wire harness or connector

MONITOR DESCRIPTION

If the motor inverter detects over-voltage, it transmits an over-voltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) illuminates the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 121): OVH detection (Over voltage malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 121) is not detected
---------------------------------------	-------------------------------------

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 INFO.

Refer to the wiring diagram for DTC P0AE6-225 INFO.

Refer to the wiring diagram for DTC P324E-788 INFO.

Refer to the wiring diagram for DTC U0110-159 INFO.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A78-121 is set before any of the DTCs in the table below are set	A
Any of the DTCs in the table below are set before P0A78-121 is set	B

DTC No.	Relevant Diagnosis

12. CHECK INVERTER WITH CONVERTER ASSEMBLY (HIGH VOLTAGE CONNECTOR CONNECTION CONDITION)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the inverter terminal cover from the inverter with converter assembly.

(c) Check that the bolts for the frame wire are tightened to the specified

torque, the frame wire is connected securely, and there are no contact problems.

Specified Condition:

T=8.0 N*m {82 kgf*cm, 71 in.*lbf}

NOTICE:

Make sure that the tightening torque of the bolts is between 6.4 and 9.6 N*m (65 and 98 kgf*cm, 57 and 85 in.*lbf).

(d) Check for arc marks at the bolts for the frame wire.

Result:

Result		Proceed to
The terminals are connected securely and there are no contact problems.	There are no arc marks.	A
The terminals are not connected securely and there is a contact problem.	There are arc marks.	B
The terminals are not connected securely and there is a contact problem.	There are no arc marks.	C
The terminals are connected securely and there are no contact problems.	There are arc marks.	B

(e) Install the inverter terminal cover.

C ► CONNECT SECURELY

B ► REPLACE MALFUNCTIONING PARTS

13.	CHECK SERVICE PLUG GRIP (CONNECTION CONDITION)
-----	--

CAUTION:

Be sure to wear insulated gloves.

(a) Visually check the connection of the service plug grip to the HV battery. Remove the service plug grip and check for contamination.

OK:

Dirt or foreign objects have not entered the connection, and there is no evidence of contamination.

NG ► REPLACE SERVICE PLUG GRIP

OK
▼

14.	CHECK SERVICE PLUG GRIP
-----	-------------------------

(a) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
Service plug grip terminals	Always	Below 1 Ω

Text in Illustration

H

*1	Service plug grip
----	-------------------

NG ▶ REPLACE SERVICE PLUG GRIP

OK

15. CHECK FRAME WIRE

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect the frame wire from the hybrid battery junction block.

(c) Remove the inverter terminal cover from the inverter with converter assembly.

(d) Disconnect the frame wire from the inverter with converter assembly.

c

(e) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

*2

Tester Connection	Switch Condition	Specified Condition
T4-1 - T1-2 (CBI) (Positive terminal)	Power switch off	Below 1 Ω
T3-1 - T1-1 (CEI) (Negative terminal)	Power switch off	Below 1 Ω

Text in Illustration

*1	Frame Wire (Inverter with Converter Assembly Side)
*2	Frame Wire (Hybrid Battery Junction Block Side)

(f) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
T4-1 - Body ground and shielded ground	Power switch off	10 MΩ or higher
T3-1 - Body ground and shielded ground	Power switch off	10 MΩ or higher
T3-1 - T4-1	Power switch off	10 MΩ or higher

(g) Connect the frame wire to the hybrid battery junction block.

(h) Connect the frame wire to the inverter with converter assembly.

(i) Install the inverter terminal cover.

NG▶ REPLACE FRAME WIRE

OK

16. INSPECT HYBRID BATTERY JUNCTION BLOCK (SMRB)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the hybrid battery junction block.

(c) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
h2 - T4	Auxiliary battery voltage is not applied between terminals c3-4 (SMRB) and c3-2 (GND)	10 kΩ or higher
h2 - T4	Auxiliary battery voltage is applied between terminals c3-4 (SMRB) and c3-2 (GND)	Below 1 Ω

Text in Illustration

*1 Hybrid Battery Junction Block

(d) Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
c3-4 (SMRB) - c3-2 (GND)	-40 to 176°F(-40 to 80°C)	19.0 to 35.5 Ω

(e) Install the hybrid battery junction block.

NG ▶ REPLACE HYBRID BATTERY JUNCTION BLOCK

OK

17. INSPECT HYBRID BATTERY JUNCTION BLOCK (SMRG)

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Remove the hybrid battery junction block.

(c) Measure the resistance according to the value(s) in the table below.

*1

Standard Resistance:

Tester Connection	Condition	Specified Condition
k2 - T3	Auxiliary battery voltage is not applied between terminals c3-1 (SMRG) and c3-2 (GND)	10 kΩ or higher
k2 - T3	Auxiliary battery voltage is applied between terminals c3-1 (SMRG) and c3-2 (GND)	Below 1 Ω

DTC	P0A78-128	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an abnormal amount of current flows through the motor inverter, the MG ECU detects it and sends a signal to inform the power management control ECU (HV CPU) of the malfunction.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	128	Abnormal motor current value detection (System malfunction)	<ul style="list-style-type: none"> • Hybrid vehicle transaxle assembly • Generator cable • Motor cable • Inverter with converter assembly • Power management control ECU • PCU fuse • Wire harness or connector

MONITOR DESCRIPTION

The MG ECU monitors the motor inverter electric current. If the current exceeds the threshold for a specified period of time, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 128): Motor inverter abnormal current
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)

DTC P0A78 (INF 128) is not detected

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

WIRING DIAGRAM

Refer to the wiring diagram for DTC P0A1A-200 [INFO](#).

Refer to the wiring diagram for DTC P324E-788 [INFO](#).

Refer to the wiring diagram for DTC U0110-159 [INFO](#).

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A78-202 is not output	A
P0A78-202 is also output	B

NOTICE:

- If P0A78-202 is output, troubleshoot it first. After completing the troubleshooting for P0A78-202, return to perform troubleshooting for this DTC.
- Parts repaired or replaced during troubleshooting for P0A78-202 do not need to be re-inspected in this diagnosis procedure.

- (e) Turn the power switch off.

B ► GO TO DTC CHART

A

2.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

HINT:

- If P0A78-202 was not output in step 1 of this diagnosis procedure, check Table 1 below.
- If P0A78-202 was output in step 1 of this diagnosis procedure, repair that DTC first, then check Table 2 below.

Result:

Result	Proceed to
P0A78-128 only is output.	A
Any of the following DTCs are also output.	B

Table 1

DTC	P0A78-202	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	202	Malfunction (short circuit) in the motor inverter inside the inverter with converter assembly	<ul style="list-style-type: none"> • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Motor cable

MONITOR DESCRIPTION

The MG ECU monitors the motor inverter electric current. If the current exceeds the threshold for a specified period of time, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 202): MFIV detection (Short circuit malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 202) is not detected
---------------------------------------	-------------------------------------

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

2010 Toyota Prius

Repair Manual

- DTC P0A78-202 is stored after any of DTCs P0A78-113, 128, 284, 286, 287, 505, 506, 806, 807 and 808 are stored. After troubleshooting and repairing DTC P0A78-202, be sure to troubleshoot all the other DTCs.
- Depending on the conditions in which the vehicle is being operated when a short circuit occurs in the inverter with converter assembly, the hybrid vehicle transaxle assembly may be affected. As this DTC is stored if a short circuit occurs in the inverter with converter assembly, it is necessary to perform a road test to check the hybrid vehicle transaxle assembly. If problems are found, replace the malfunctioning parts.
- After completing the repair, including the repair of previously output DTCs, drive the vehicle at a speed of approximately 25 mph (40 km/h) for 1 minute and check that DTC P0A90-251 (Drive Motor "A" Performance) is not output. If DTC P0A90-251 (Drive Motor "A" Performance) is output, replace the hybrid vehicle transaxle assembly.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY	INFO
----	---	----------------------

NG [▶CHECK MOTOR CABLE](#)

OK

2.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly [INFO](#).

NEXT [▶CHECK DTC OUTPUT \(HV\)](#)

3.	CHECK MOTOR CABLE	INFO
----	-------------------	----------------------

NG [▶CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY \(MG2\)](#)

OK

4.	REPLACE HYBRID VEHICLE TRANSAXLE ASSEMBLY
----	---

(a) Replace the hybrid vehicle transaxle assembly [INFO](#).

NEXT

5.	REPLACE INVERTER WITH CONVERTER ASSEMBLY
----	--

(a) Replace the inverter with converter assembly [INFO](#).

NEXT [▶CHECK DTC OUTPUT \(HV\)](#)

6.	CHECK HYBRID VEHICLE TRANSAXLE ASSEMBLY (MG2)
----	---

CAUTION:

Be sure to wear insulated gloves.

(a) Check that the service plug grip is not installed.

NOTICE:

After removing the service plug grip, do not turn the power switch on (READY), unless instructed by the repair manual because this may cause a malfunction.

(b) Disconnect the motor cable from the hybrid vehicle transaxle assembly.

(c) Check MG2 for an interphase short using a milliohmmeter.

(1) Using a milliohmmeter, measure the resistance according to the value(s) in the table below.

HINT:

If the MG2 temperature is high, the resistance will vary greatly from the specification. Therefore, measure the resistance at least 8 hours after the vehicle is stopped.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e2-3 (U) - e2-2 (V)	Power switch off	154 to 170 mΩ
e2-2 (V) - e2-1 (W)	Power switch off	148 to 164 mΩ
e2-1 (W) - e2-3 (U)	Power switch off	149 to 165 mΩ

Text in Illustration

*1	Hybrid Vehicle Transaxle Assembly
----	-----------------------------------

HINT:

To correct the variation of the measured resistance due to temperature, use the following formula to calculate the resistance at 68° F (20°C).

$$R_{20} = R_t / \{1 + 0.00393 \times (T - 20)\}$$

The calculation is based on the following:

R₂₀: Resistance at 68° F (20°C) (mΩ)

R_t: Measured resistance (mΩ)

T: Temperature when the resistance is measured (° C)

(d) Using a megohmmeter set to 500 V, measure the resistance according to the value(s) in the table below.

NOTICE:

Be sure to set the megohmmeter to 500 V when performing this test. Using a setting higher than 500 V can result in damage to the component being inspected.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
e2-3 (U) - Body ground and shield ground	Power switch off	100 MΩ or higher
e2-2 (V) - Body ground and shield ground	Power switch off	100 MΩ or higher

-----	-----------------------

(a) Check the other DTCs that were output together with DTC P0A78-202.

Result:

DTC No.	Relevant Diagnosis
P0A78-113, 128, 284, 286, 287, 505, 506, 806, 807, 808	Drive Motor "A" Inverter Performance

NOTICE:

DTC P0A78-202 is stored after any of DTCs P0A78-113, 128, 284, 286, 287, 505, 506, 806, 807 and 808 are stored. After troubleshooting and repairing DTC P0A78-202, be sure to troubleshoot all the other DTCs.

NEXT  **GO TO DTC CHART**

DTC	P0A78-266	Drive Motor "A" Inverter Performance
DTC	P0A78-267	Drive Motor "A" Inverter Performance

DESCRIPTION

The inverter contains a three-phase bridge circuit, which consists of six power transistors (IGBTs) each for MG1 and MG2. The inverter converts high-voltage direct current from the HV battery into three-phase alternating current for MG1 and MG2; it also converts three-phase alternating current supplied by MG1 and MG2 into direct current for the HV battery. The MG ECU controls the actuation of the power transistors (IGBTs). The inverter transmits information necessary for control, such as amperage and voltage, to the MG ECU.

c

The MG ECU uses an inverter voltage sensor, which is built into the inverter, to detect boosted high voltage to allow control of the voltage boost.

The MG ECU monitors the inverter voltage sensor and detects the following malfunctions.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
---------	----------	-------------------------	--------------

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	266	Short to GND in the inverter voltage (VH) signal line	Inverter with converter assembly
P0A78	267	Open or short to +B in the inverter voltage (VH) signal line	

MONITOR DESCRIPTION

The MG ECU monitors the inverter voltage (VH) sensor circuit. If the MG ECU detects an open or short in the VH sensor circuit, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 266): VH malfunction (GND short malfunction) P0A78 (INF 267): VH malfunction (+B short and disconnection malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 266/267) is not detected
---------------------------------------	---

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and after a few seconds, turn the power switch off. [A]
6. Repeat [A] 3 times. [B]
7. Turn the power switch on (IG) and turn the Techstream on.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [C]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

PROCEDURE

- | | |
|----|--|
| 1. | REPLACE INVERTER WITH CONVERTER ASSEMBLY |
|----|--|

(a) Replace the inverter with converter assembly INFO.

HINT:

The signal line from the inverter voltage (VH) sensor is connected to the MG ECU inside the inverter with converter assembly. If P0A78-266 or P0A78-267 is output, replace the inverter with converter assembly.

NEXT ▶ COMPLETED

DTC	P0A78-279	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	279	Motor inverter overvoltage signal detection (overvoltage (inverter malfunction))	Inverter with converter assembly

MONITOR DESCRIPTION

If the motor inverter detects overvoltage, it will transmit an overvoltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 279): OVH detection (Over voltage malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	Immediately
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Power management control ECU (HV CPU)	DTC P0A78 (INF 279) is not detected
---------------------------------------	-------------------------------------

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (IG) and check that there are no abnormalities (abnormal sounds, coolant leaks, DTC output, etc).
6. Turn the power switch on (READY) and turn the Techstream on. [A]
7. With park (P) selected, wait for several seconds.
8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes. [B]
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform a universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Check if DTCs are output.

Result:

Result	Proceed to
P0A78-279 only is output.	A
Any of the following DTCs are also output.	B

DTC No.	Relevant Diagnosis
P0A1A (all INF codes)*1	Generator Control Module

OK ▶ REPLACE INVERTER WITH CONVERTER ASSEMBLY

DTC	P0A78-282	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If an overvoltage occurs in the motor inverter or generator inverter, the MG ECU detects it and transmits this information to the power management control ECU (HV CPU).

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	282	Motor inverter overvoltage signal detection (circuit malfunction)	Inverter with converter assembly

MONITOR DESCRIPTION

If the motor inverter detects a circuit malfunction, it will transmit a motor inverter overvoltage signal to the MG ECU. Upon receiving this signal, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 282): OVH detection (Circuit malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

DTC	P0A78-284	Drive Motor "A" Inverter Performance
-----	-----------	--------------------------------------

DESCRIPTION

For a description of the inverter, [INFO](#).

If the motor inverter overheats, has a circuit malfunction, or has an internal short, the inverter transmits this information to the MG ECU via the motor inverter fail signal line.

DTC No.	INF Code	DTC Detection Condition	Trouble Area
P0A78	284	Motor inverter fail signal detection (overheat)	<ul style="list-style-type: none"> • Inverter cooling system • Cooling fan system • Power management control ECU • Inverter with converter assembly • Hybrid vehicle transaxle assembly • Generator cable • Motor cable • Water pump with motor assembly • Wire harness or connector • IGCT No. 3 fuse • PCU fuse

MONITOR DESCRIPTION

If the motor inverter overheats, it will transmit an inverter fail signal to the MG ECU. The MG ECU will send information about the malfunction to the power management control ECU (HV CPU). Upon receiving this information, the power management control ECU (HV CPU) will illuminate the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A78 (INF 284): MFIV detection (Over heat malfunction)
Required sensors / components	Motor inverter
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	1 driving cycle
Sequence of operation	None

INSPECTION PROCEDURE

CAUTION:

- Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.
- After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals. After waiting for 10 minutes, check the voltage at the terminals in the inspection point in the inverter with converter assembly. The voltage should be 0 V before beginning work.

NOTICE:

After troubleshooting and repairing all output DTCs, be sure to replace the inverter with converter assembly.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

PROCEDURE

1.	CHECK DTC OUTPUT (HV)
----	-----------------------

- (a) Connect the Techstream to the DLC3.

PRECAUTION

1. PRECAUTIONS FOR INSPECTING HYBRID CONTROL SYSTEM

(a) Before inspecting the high-voltage system or disconnecting the low voltage connector of the inverter with converter assembly, take safety precautions such as wearing insulated gloves and removing the service plug grip to prevent electrical shocks. After removing the service plug grip, put it in your pocket to prevent other technicians from accidentally reconnecting it while you are working on the high-voltage system.

NOTICE:

After removing the service plug grip, turning the power switch on (READY) may cause a malfunction. Do not turn the power switch on (READY) unless instructed by the repair manual.

(b) After disconnecting the service plug grip, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals.

HINT:

Waiting for at least 10 minutes is required to discharge the high-voltage capacitor inside the inverter with converter assembly.

(c) Check the voltage at the terminals in the inspection point in the inverter with converter assembly.

CAUTION:

Be sure to wear insulated gloves.

(1) Remove the 9 bolts and inverter terminal cover. INFO

NOTICE:

Cover the opening with non-residue tape to prevent entry of foreign matter or liquid after removing the connector cover.

(2) Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
Inspection point	10 minutes passed after removing the service plug	0 V

HINT:

Set the tester to DC750 V or more to measure the voltage.

(d) When turning the power switch on (IG) during inspections, do not press the power switch with the brake pedal depressed.

CAUTION:

Pressing the power switch with the brake pedal depressed causes the system to enter the READY-on state. This is very dangerous because high voltage may be applied to the inspection area.

(e) Turn the power switch off, wear insulated gloves, and disconnect the cable from the negative (-) terminal of the auxiliary battery before touching any of the orange-colored wires of the high-voltage system.

(f) Turn the power switch off before performing any resistance checks.

(g) Turn the power switch off before disconnecting or reconnecting any connectors.

(h) When high-voltage connectors are removed, wrap the connectors with insulation tape to prevent them from contacting foreign objects.

2. NOTICE FOR HYBRID CONTROL SYSTEM ACTIVATION

(a) When the warning light is illuminated, or the auxiliary battery has been disconnected and reconnected, attempting to turn the power switch on (READY) may not start the system (the system may not enter the READY-on state) on the first attempt. If so, turn the power switch off and reattempt to start the hybrid system.

3. PRECAUTIONS FOR DISCONNECTING AMD TERMINAL

HINT:

The AMD terminal is connected to the positive terminal of the auxiliary battery. To prevent damage when the AMD terminal is being disconnected, use the following procedure.

(a) Be sure to disconnect the cable from the negative (-) terminal of the auxiliary battery before disconnecting the AMD terminal from the engine room junction block assembly.

(b) After disconnecting the AMD terminal, wrap the terminal with insulation tape.

(c) Be sure to reconnect the AMD terminal to the engine room junction block assembly before reconnecting the cable of the negative (-) terminal of the auxiliary battery.

NOTICE:

A short circuit to ground may occur if the AMD terminal is disconnected before the cable is disconnected from the negative (-) terminal of the auxiliary battery. If a short circuit to ground occurs, it can result in an open circuit in a fusible link or fuse.

4. DISCONNECTING AND RECONNECTING NEGATIVE BATTERY CABLE

(a) Before performing work on electronic components, disconnect the cable from the negative (-) battery terminal to prevent damage to the electrical system or electrical components.

Text in Illustration

*1	Negative (-) Battery Terminal
*2	Cable

(b) Before disconnecting and reconnecting the battery cable, turn the power switch off and the headlight switch off. Then loosen the terminal nut completely. Do not damage the cable or terminal.

(c) When the battery cable is disconnected, the clock and radio settings and stored DTCs are cleared. Therefore, before disconnecting the battery cable, make a note of them.

- When the cable is disconnected from the negative (-) battery terminal, initialize the following system(s) after the cable is reconnected.

System Name	See Procedure
Advanced Parking Guidance System	INFO

DEFINITION OF TERMS

Terms	Definition
Monitor Description	Description of what the power management control ECU (HV CPU) monitors and how to detects malfunctions (monitoring purpose and its details).
Related DTCs	A group of diagnostic trouble codes that are output by the power management control ECU (HV CPU) based on the same malfunction detection logic.
Typical Enabling Condition	<p>Preconditions that allow the power management control ECU (HV CPU) to detect malfunctions.</p> <p>With all preconditions satisfied, the power management control ECU (HV CPU) sets DTCs when the monitored value(s) exceeds malfunction threshold(s).</p>
Sequence of Operation	<p>Order of monitor priority, applied if multiple sensors and components are involved in a single malfunction detection process.</p> <p>Each sensor and component are monitored in turn and subsequent items are not monitored until the previous detection operation completes.</p>
Required Sensor/Components	Sensors and components used by the power management control ECU (HV CPU) to detect each malfunction.
Frequency of Operation	<p>Number of times the power management control ECU (HV CPU) checks for each malfunction during each driving cycle.</p> <p>"Once per driving cycle" means that the power management control ECU (HV CPU) only checks for malfunctions once during a single driving cycle.</p> <p>"Continuous" means that the power management control ECU (HV CPU) checks for malfunctions whenever enabling conditions are met.</p>
Duration	Minimum time for which the power management control ECU (HV CPU) must detect continuous deviation in monitored value(s) in order to set a DTC. Timing begins when typical enabling conditions are met.
Malfunction Thresholds	Value beyond which the power management control ECU (HV CPU) determines malfunctions exist and sets DTCs.
MIL Operation	<p>Timing of MIL illumination after a malfunction is detected.</p> <p>"Immediate" means that the power management control ECU (HV CPU) illuminates the MIL as soon as a malfunction is detected.</p> <p>"2 driving cycles" means that the power management control ECU (HV CPU) illuminates the MIL if the same malfunction is detected again during the next driving cycle.</p>

SYSTEM DIAGRAM

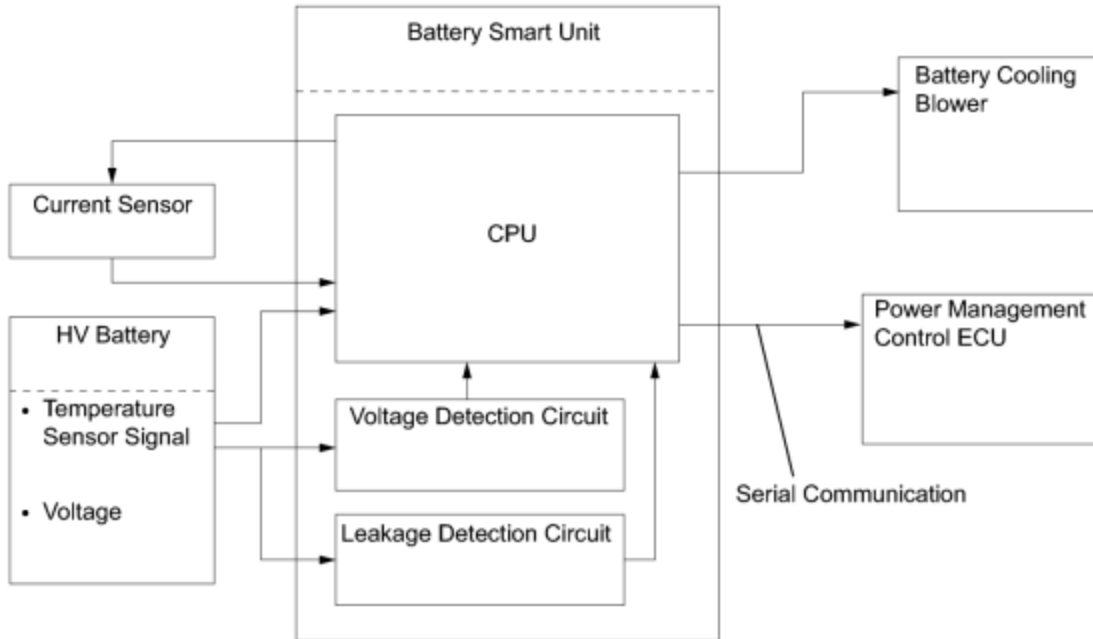

SYSTEM DESCRIPTION

1. BATTERY SMART UNIT CONTROL

- The battery smart unit converts the HV battery condition signals (voltage, current, and temperature), which are needed to determine the charging or discharging values that are calculated by the power management control ECU into digital signals, and transmits them to the power management control ECU via serial communication.
- A leakage detection circuit is provided in the battery smart unit in order to detect any leakage from the HV battery. Furthermore, the battery smart unit detects the voltage of the cooling fan, which is needed by the power management control ECU to effect cooling fan control. The battery smart unit also converts these signals into digital signals and transmits them to the power management control ECU via serial communication.

c

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:

- *: Use the Techstream
- Use the following procedure to troubleshoot the hybrid battery system.

1. VEHICLE BROUGHT TO WORKSHOP

NEXT

2. CUSTOMER PROBLEM ANALYSIS

NEXT

3. CONNECT TECHSTREAM TO THE DLC3*

HINT:

If the display on the tester indicates a communication fault, inspect the DLC3.

NEXT

4. CHECK DTC AND SAVE FREEZE FRAME DATA* INFO

HINT:

- Make sure to save freeze frame data because the data is necessary for a simulation test.
- For the hybrid vehicle control system, there are many DTCs, many of which can be stored due to a single malfunction. As a result, in some of the diagnosis procedures an instruction is provided to check for other DTCs and their corresponding INF codes. By following the diagnosis path based on the combination of output DTCs and INF codes, it is possible to narrow down the problem early and avoid unnecessary diagnosis.

NEXT

5. CLEAR DTC AND FREEZE FRAME DATA* INFO

CHECK FOR INTERMITTENT PROBLEMS

1. CHECK FOR INTERMITTENT PROBLEMS

(a) Perform a simulation test **INFO**.

(1) For the simulation test, reproduce the driving conditions that were present when the trouble occurred. These conditions should be based on the customer's comments and freeze frame data that is recorded with DTCs, such as the opening angle of the accelerator pedal, SOC (state of charge), engine coolant temperature, engine rpm, and MG1/MG2 rpm and torque.

(b) Check the connector(s) and terminal(s) **INFO**.

(c) Wiggle the harness and connector(s) **INFO**.

(d) Heat or cool suspected parts **INFO**.

TERMINALS OF ECU

Text in Illustration

*1	Battery Smart Unit	-	-
----	--------------------	---	---

ECU TERMINAL CHART

Terminal No. (Symbols)	Wiring Color	Terminal Description	Condition	Standard (V)
z17-4 (TB2) - z17-10 (GB2)	L - L	Battery temperature sensor 2	HV battery temperature: - 40 to 194°F (-40 to 90°C)	4.8 (-40°F(-40°C)) to 1.0 (194°F(90°C))
z17-5 (TB1) - z17-11 (GB1)	B - B	Battery temperature sensor 1	HV battery temperature: - 40 to 194°F (-40 to 90°C)	4.8 (-40°F(-40°C)) to 1.0 (194°F(90°C))
z17-6 (TB0) - z17-12 (GB0)	W - W	Battery temperature sensor 0	HV battery temperature: - 40 to 194°F (-40 to 90°C)	4.8 (-40°F(-40°C)) to 1.0 (194°F(90°C))
c1-1 (IB) - c1-6 (GIB)	P - B	Current sensor	Power switch on (READY)	0.5 to 4.5
c1-5 (VIB) - c1-6 (GIB)	G - B	Power source for battery current sensor	Power switch on (IG)	4.5 to 5.5
c1-4 (IGCT) - c1- 8 (GND)	L - W-B	Control signal	Power switch on (READY)	11 to 14
c1-2 (BTH+) - c1-8 (GND)	R - W-B	Serial communication	Power switch on (IG)	Pulse generation (waveform 1)
c1-3 (BTH-) - c1- 8 (GND)	G - W-B	Serial communication	Power switch on (IG)	Pulse generation (waveform 2)
c1-7 (VM) - c1-8 (GND)	V - W-B	Battery cooling blower No. 0 monitor signal	Cooling blower activated	0 to 5
c1-8 (GND) - Body ground	W-B	Ground	Always (continuity check)	Below 1 Ω

1. Oscilloscope waveforms

HINT:

Oscilloscope waveform samples are provided here for informational purposes. Noise and fluttering waveforms have been omitted.

(a) Waveform 1

Item	Content
Terminal	c1-2 (BTH+) - c1-8 (GND)
Equipment Setting	2 V/DIV, 500 μs/DIV
Condition	Power switch on (IG)

HINT:

The waveform will vary depending on the content of the digital

communication (digital signal).

(b) Waveform 2

Item	Content
Terminal	c1-3 (BTH-) - c1-8 (GND)
Equipment Setting	2 V/DIV, 500 μ s/DIV
Condition	Power switch on (IG)

HINT:

The waveform will vary depending on the content of the digital communication (digital signal).

DIAGNOSIS SYSTEM

1. DESCRIPTION

(a) The power management control ECU (HV CPU) has a self-diagnosis system. If the computer, power management control ECU (HV CPU), or a component is not working properly, the ECU records the conditions that relate to the fault. The ECU also illuminates the master warning light in the combination meter and provides other appropriate messages on the multi-information display, such as an HV system warning message, HV battery warning message or discharge warning message.

HINT:

The master warning light will illuminate when the hybrid control system malfunctions and the light will blink when in inspection mode.

- When troubleshooting OBD II (On-Board Diagnostics) vehicles, the Techstream (complying with SAE J1987) must be connected to the DLC3 (Data Link Connector 3) of the vehicle. Various data in the vehicle ECM (Engine Control Module) can then be read.
- OBD II regulations require that the vehicle's on-board computer illuminate the MIL (Malfunction Indicator Lamp) on the instrument panel when the computer detects a malfunction in:

- a. The emission control system components.
- b. The powertrain control components (which affect vehicle emissions).
- c. The computer itself.

In addition, the applicable DTCs prescribed by SAE J2012 are recorded in the power management control ECU (HV CPU) memory. If the malfunction does not recur in 3 consecutive

trips, the MIL turns off automatically but the DTCs remain recorded in the power management control ECU (HV CPU) memory.

- To check for DTCs, connect the Techstream to the DLC3. The Techstream displays DTCs, freeze frame data, and a variety of hybrid control system data. The DTCs and freeze frame data can be cleared with the Techstream. In order to enhance the OBD function on vehicles and develop the Off-Board diagnosis system, Controller Area Network (CAN) communication is used in this system. CAN is a network which uses a pair of data transmission lines spanning multiple computers and sensors. It allows for high speed communications between the systems and simplification of the wire harness connections.

2. 2 TRIP DETECTION LOGIC

- When a malfunction is first detected, the malfunction is temporarily stored in the power management control ECU (HV CPU) memory (1st trip). If the same malfunction is detected during the next drive cycle, the MIL is illuminated (2nd trip).

3. FREEZE FRAME DATA

- The power management control ECU (HV CPU) records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, as well as other data recorded at the time of a malfunction.

4. AUXILIARY BATTERY VOLTAGE

Standard Voltage:

Switch Condition	Specified Condition
Power switch on (IG)	11 to 14 V

- If voltage is below 11 V, replace or recharge the battery.

5. MIL (Malfunction Indicator Lamp)

(a) The MIL is illuminated when the power switch is first turned on (IG), before the READY indicator comes on.

(b) When the READY indicator turns on, the MIL should turn off. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL is not illuminated when the power switch is first turned on (IG), check the MIL circuit .

DTC CHECK / CLEAR

1. CHECK FOR DTCS

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (e) Check the DTCs and freeze frame data, and then write them down.
- (f) Check the details of the DTCs .

2. CHECK FREEZE FRAME DATA AND INFORMATION

- (a) If a DTC is present, select it in order to display its freeze frame data.
- (b) Read the freeze frame data recorded when the DTC was set.

NOTICE:

A 3-digit information code (INF code) will be displayed as the value for one of the Information 1 to Information 5 lines.

- (c) Read the information for the information code.
- (1) Select the item from among Information 1 to Information 5 that has an information code and click the engine icon to view the additional information.

3. CHECK FOR DTCS (SYSTEMS OTHER THAN POWER MANAGEMENT CONTROL ECU (HV CPU))

HINT:

The power management control ECU (HV CPU) maintains communication with other computers, including the ECM, skid control ECU and power steering ECU. Therefore, if the power management control ECU (HV CPU) outputs a warning, it is necessary to check and record the DTCs of all systems.

- (a) If DTCs are present, check the relevant systems.

HINT:

If DTCs for the CAN communication system are present in addition to other DTCs, first troubleshoot and repair any malfunctions in the CAN communication system.

4. CLEAR DTCS

NOTICE:

Clearing the DTCs will also clear the freeze frame data, information **INFO**, and operation history data **INFO**.

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Check that park (P) is selected.
- (e) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (f) Clear DTCs and freeze frame data.

5. CLEAR PERMANENT DTC

HINT:

Even if the following procedure is not performed, permanent DTCs are cleared by obtaining a normal judgment during 3 consecutive driving cycles.

Universal Trip Driving Pattern

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (e) Check if permanent DTCs are stored.

HINT:

If permanent DTCs are not output, it is not necessary to continue this procedure.

(f) Clear the DTCs.

(g) Perform the respective confirmation driving patterns in order to obtain a normal judgment for the output DTCs.

HINT:

- Confirmation driving patterns do not need to be performed for misfire and fuel system DTCs.
- For the confirmation driving pattern, refer to the procedures for the relevant DTC **INFO**.

(h) Perform the universal trip.

HINT:

The driving pattern to obtain a normal judgment and the universal trip driving can be performed consecutively in the same driving cycle.

1. Put the engine in inspection mode **INFO**.
2. Idle the engine for 30 seconds or more.
3. Drive the vehicle at 25 mph (40 km/h) or more for a total of 5 minutes or more.

HINT:

It is possible to complete the drive pattern even if the vehicle decelerates to less than 25 mph (40 km/h) during the driving cycle provided that the vehicle is driven at 25 mph (40 km/h) or more for a total of 5 minutes.

4. Allow 10 minutes or more to elapse from the time the engine is started.

(i) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.

(j) Check that the permanent DTCs have been cleared.

HINT:

The permanent DTCs are cleared when the universal trip is completed.

FREEZE FRAME DATA

1. FREEZE FRAME DATA

HINT:

The power management control ECU (HV CPU) records vehicle and driving condition information as freeze frame data the moment a DTC is stored. It can be used for estimating or duplicating the vehicle conditions that were present when the malfunction occurred. To confirm the details of the hybrid control system, check the detailed information for the DTC information code in the Data List (INF code).

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Turn the Techstream on.
- (d) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (e) Select a DTC in order to display its freeze frame data.
- (f) Check the freeze frame information recorded with the DTC.

HINT:

For the freeze frame data chart, .

DATA LIST / ACTIVE TEST

1. Data List

NOTICE:

- Some Data List values may vary significantly if there are slight differences in the environment in which the vehicle is operating when measurements are obtained. Variations may also occur due to aging of the vehicle. Due to these considerations, it is not always possible to provide definite values to be used for judgment of malfunctions. It is possible that a malfunction may be present even if measured values are within the reference range.
- In the event of a problem with intricate symptoms, collect sample data from another vehicle of the same model operating under identical conditions in order to reach an overall judgment by comparing all the items in the Data List.

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Enter the following menus: Powertrain / Hybrid Control / Data List.

(d) Check the results by referring to the following table.

HINT:

For the data list, .

2. Active Test

Using the Techstream to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data list information can be displayed while performing Active Tests.

NOTICE:

It is necessary to use caution, because if the tester DLC connector becomes disconnected or if a communication error occurs during an Active Test, the vehicle could become inoperative (the READY indicator may go off).

(a) Connect the Techstream to the DLC3.

(b) Turn the power switch on (IG).

(c) Turn the Techstream on. Enter the following menus: Powertrain / Hybrid Control / Active Test.

(d) According to the display on the Techstream perform the appropriate active test.

HINT:

For the active test chart,  .

DTC	P0A7F-123	Hybrid Battery Pack Deterioration
-----	-----------	-----------------------------------

DESCRIPTION

- The battery smart unit and the power management control ECU calculate the SOC (state of charge) of the HV battery through the accumulated amperage in the HV battery. The battery smart unit sends the condition of the HV battery to the power management control ECU. Then the power management control ECU calculates the SOC based on the information and controls HV battery charge and discharge according to the driving condition.

DTC No.	DTC Detection Condition	Trouble Area
P0A7F-123	<ul style="list-style-type: none"> Internal resistance of the HV battery is higher than the standard (1 trip detection) Difference in the capacity between battery blocks is larger than the standard (2 trip detection) 	<ul style="list-style-type: none"> HV battery assembly Battery smart unit

HINT:

P0A7F-123 will not be set unless the vehicle is driven for approximately 10 minutes after clearing the DTC.

MONITOR DESCRIPTION

- The battery smart unit calculates the resistance of the HV battery through amperage and voltage, and uses this resistance to determine the extent of deterioration of the HV battery. If the battery smart unit detects that the resistance of the HV battery has exceeded the standard, it determines that a malfunction has occurred. In addition, the battery smart unit monitors the SOC, and if the difference between the maximum and minimum SOC values exceeds the standard, it determines that a malfunction has occurred. When either of the malfunction detection conditions is met, the power management control ECU (HV CPU) illuminates the MIL and set a DTC.

MONITOR STRATEGY

Related DTCs	P0A7F (INF 123): Battery cell malfunction
Required sensors / components	Main: Battery voltage sensor inside battery smart unit, battery current sensor

	Sub: Battery temperature sensor
Frequency of operation	Continuous
Duration	TMC's intellectual property
MIL operation	TMC's intellectual property
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

The monitor will run whenever the following DTCs are not present	TMC's intellectual property
Other conditions belong to TMC's intellectual property	-

TYPICAL MALFUNCTION THRESHOLDS

TMC's intellectual property	-
-----------------------------	---

COMPONENT OPERATING RANGE

Battery smart unit	DTC P0A7F (INF 123) is not detected
--------------------	-------------------------------------

CONFIRMATION DRIVING PATTERN

c

1. Connect the Techstream to the DLC3.
2. Turn the power switch on (IG) and turn the Techstream on.
3. Clear the DTCs (even if no DTCs are stored, perform the clear DTC procedure).
4. Turn the power switch off.
5. Turn the power switch on (READY) and turn the Techstream on.
6. Turn the power switch on (READY) and wait for 30 seconds or more.
7. Drive the vehicle on urban roads at a speed of 25 mph (40 km/h) or more for a total of at least 10 minutes. [A]

NOTICE:

Avoid abrupt acceleration or braking.

8. Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
9. Check that permanent DTCs are cleared.
10. If the permanent DTCs are not cleared, perform the universal trip, and then check for permanent DTCs again.

HINT:

- If a permanent DTC is output, the system is malfunctioning.
- If no permanent DTC is output, the system is normal.

INSPECTION PROCEDURE

PROCEDURE

1.	CHECK DTC OUTPUT (DTC P0AFC-123 IS OUTPUT)
----	--

- (a) Connect the Techstream to the DLC3.
- (b) Turn the power switch on (IG).
- (c) Enter the following menus: Powertrain / Hybrid Control / Trouble Codes.
- (d) Read output DTCs .

Result:

Result	Proceed to
P0AFC-123 is not output.	A
P0AFC-123 is also output.	B

- (e) Disconnect the Techstream from the DLC3.

B ► GO TO DTC CHART

A
▼

2.	CHECK BATTERY SMART UNIT
----	--------------------------

- (a) Ensure the safety of the areas in front and at the back of the vehicle.
- (b) Connect the Techstream to the DLC3.
- (c) Turn the power switch on (READY).

- (d) Enter the following menus: Powertrain / Hybrid Control / Data List / VB0 to 14 Batt block.
- (e) Fully warm up the engine and turn the air conditioning off.
- (f) Firmly depress the brake pedal with your left foot.
- (g) Move the select lever to D.
- (h) Record each battery block voltage from the data list (V1 to 14 Batt block) while fully depressing the accelerator pedal.
- (i) Compare the battery block voltages (VB0 to 13 Batt block) between the even and odd number groups in each combination shown in the table below.

Even Number Group	Odd number group	Battery block voltages to be compared
V0 BATT BLOCK	V1 BATT BLOCK	VB0 - VB1
V2 BATT BLOCK	V3 BATT BLOCK	VB2 - VB3
V4 BATT BLOCK	V5 BATT BLOCK	VB4 - VB5
V6 BATT BLOCK	V7 BATT BLOCK	VB6 - VB7
V8 BATT BLOCK	V9 BATT BLOCK	VB8 - VB9
V10 BATT BLOCK	V11 BATT BLOCK	VB10 - VB11
V12 BATT BLOCK	V13 BATT BLOCK	VB12 - VB13

- (j) Check the difference in voltage of each combination.

Result

Result	Proceed to
Difference in voltage of each combination is less than 0.3 V.	A
Difference in voltage of each combination is 0.3 V or more.	B

HINT:

If the difference in voltage of each combination is 0.3 V or more, it is due to a battery smart unit internal error.

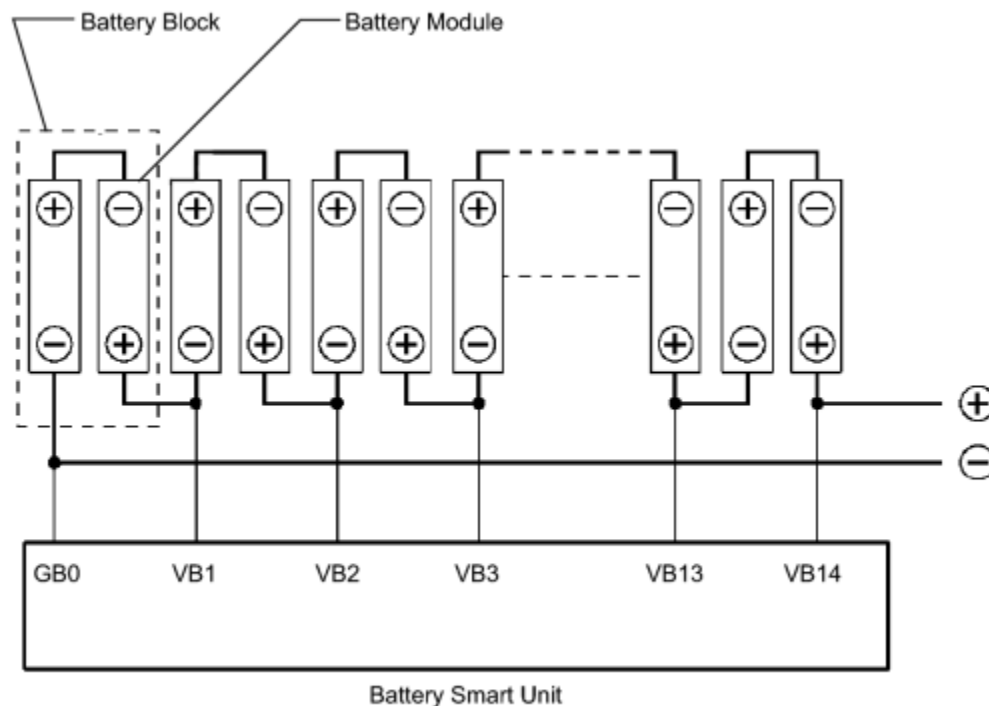

- (k) Turn the power switch off.
- (l) Disconnect the Techstream from the DLC3.

B ▶ REPLACE BATTERY SMART UNIT
A ▶ REPLACE HV BATTERY ASSEMBLY

DTC	P0A80-123	Replace Hybrid Battery Pack
