

## REAR SUNSHADE SYSTEM

### DESCRIPTION

An electrically operated type rear sunshade system blocks the direct sunlight from entering through the rear window in order to ensure the comfort of the rear seat passengers.

- This system is optional equipment on all models.
- The built-in ECU of the auto curtain controller assembly controls this system.
- This system has the following functions.

| Function                 | Outline                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manual Up/Down           | Moves the rear sunshade up or down in accordance with the rear sunshade switch.                                                                                                                          |
| Reverse-linked Auto-down | Moves the rear sunshade down automatically in accordance with the reverse signal.                                                                                                                        |
| Speed-linked Auto-up     | Moves the rear sunshade up when the shift lever is in the D or S position while driving at 15 km/h (9 mph) or more.<br>This function operates only after the reverse linked auto-down function operates. |
