

BODY

BODY STRUCTURE

■ LIGHTWEIGHT AND HIGHLY RIGID BODY

- High strength sheet steel is used as shown in the following illustration in order to achieve a lightweight body.

0140BO01C

- A brace is installed between the front attachment area of the rear suspension member and the front floor reinforcement, maintaining torsional rigidity. By connecting the braces with a pipe brace, the tendency of the tunnel in the floor to flex is reduced, thus enhancing transverse rigidity.
