

■ REAR COMBINATION LIGHT

- The stop light bulbs and tail light bulbs have been changed to LEDs (Red). Accordingly, the power consumption of the stop lights and tail light have been reduced.
- The back of the reflector, which is placed in front of the LEDs, has been partially plated through aluminum vapor deposition. As a result, the entire stoplight and the taillight sparkle evenly, due to the light directly lit by the LEDs and the light reflected by the plated area.
