

Power Back Door

A convenient power back door, which automatically opens or closes the back door through the operation of a switch, is used.

- The power back door can be fully closed or opened automatically through the operation of the power back door opener/closer switch in the instrument panel or the transmitter. Also, it can be fully closed automatically through the use of an internal back door closer switch.
- A power back door main switch that prohibits automatic operation has been provided inside the glove box.
- The automatic operation of the power back door is indicated by the sounding of the buzzer and the blinking of the hazard light.
- A jam protection function is provided. If jamming by an object is detected, this function causes the power back door to move in the reverse direction.
- When the power back door is not operating automatically, it can be opened and closed manually as an ordinary back door.
