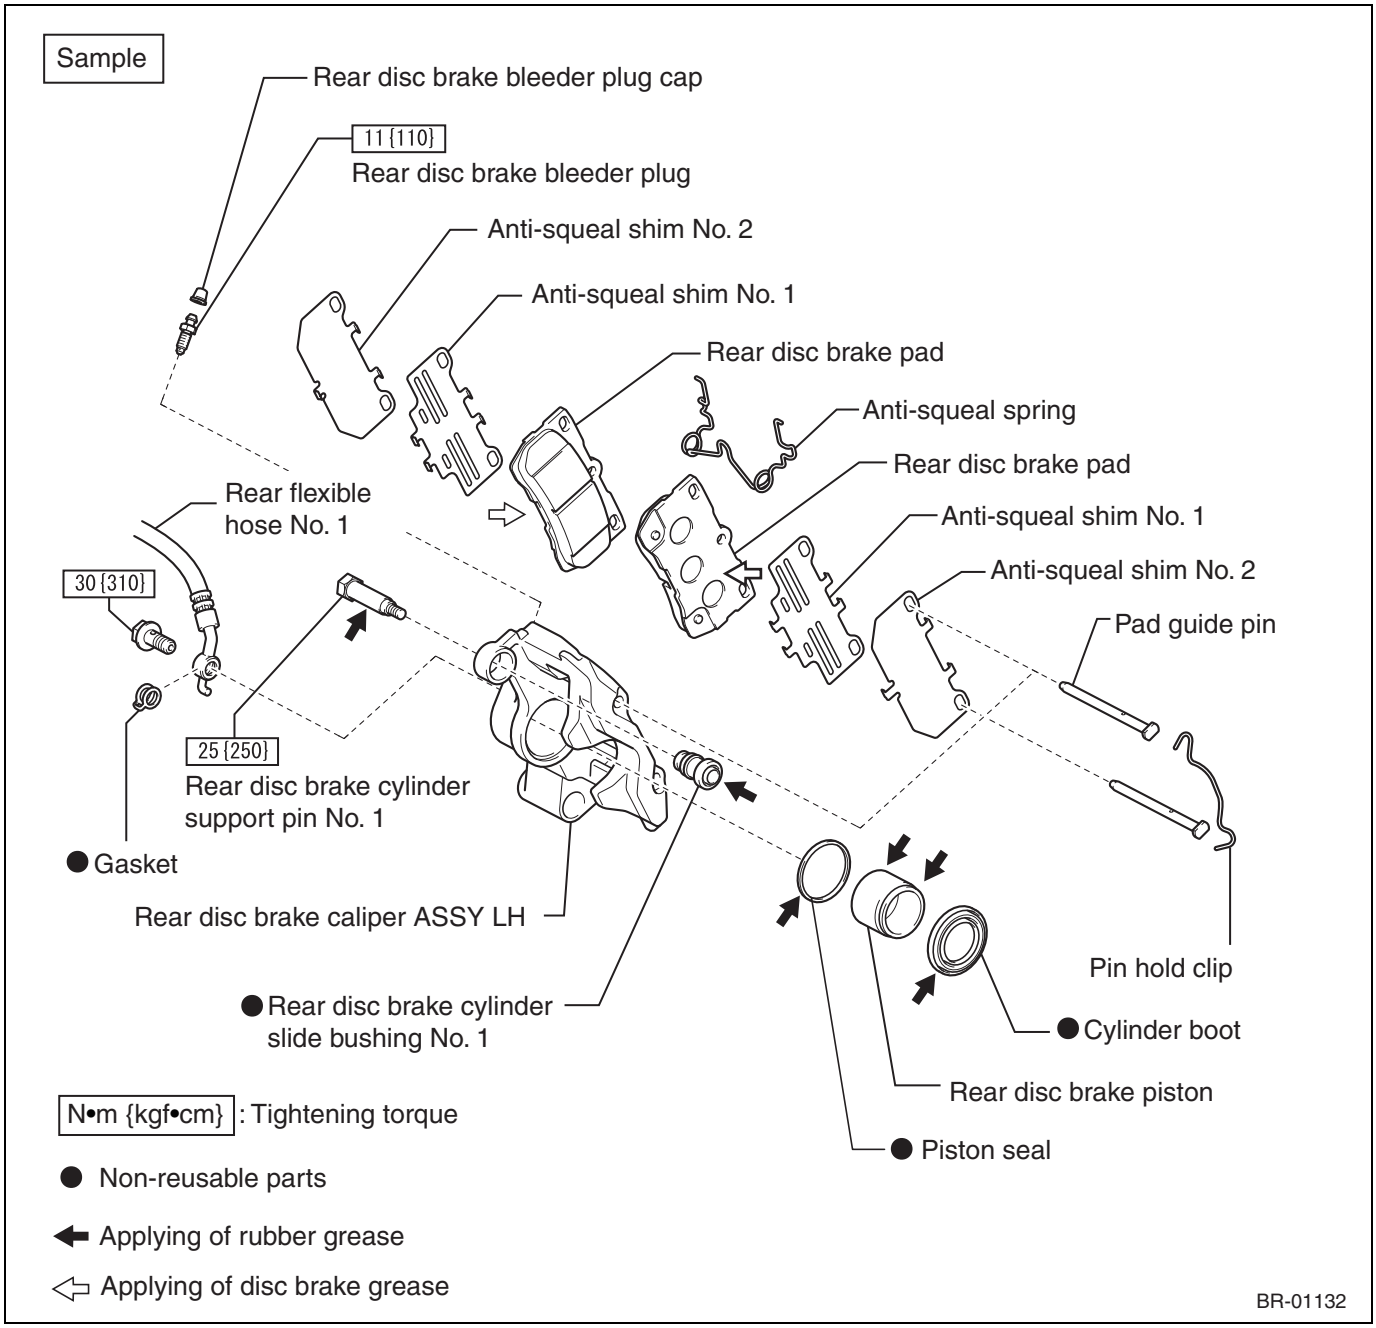
Inspection procedures for electrical circuits and how to perform. . . . . IN-36

**Terminology list**
Abbreviations . . . . . IN-43

# How to read the repair manual

## General items

1. Explanation scope of repair procedures
   (1) The repair procedures are divided into the following three main types of procedures: [Diagnosis], [Removal/Installation, Replacement, Disassembly/Assembly and Inspection/Adjustment], and [Final Inspection].
   (2) Although a description of the following elemental procedures has been omitted from this manual, they should be performed with the actual procedures.
      (a) Jacking and lifting procedures
      (b) Cleaning of removed parts as necessary
      (c) Visual inspection
2. Preparation items
   (1) The preparation items that should be prepared before starting the procedures, such as SSTs, general tools and lubricant are listed in the preparation items section. However, preparation items that are considered to be of general use for repair procedures (such as tool stands, jacks and rigid racks) are omitted.
3. Procedures
   (1) The exploded view shows the corresponding sections and titles as necessary.
   (2) The exploded view includes descriptions of non-reusable parts, grease application locations, pre-coated bolts and tightening torques.



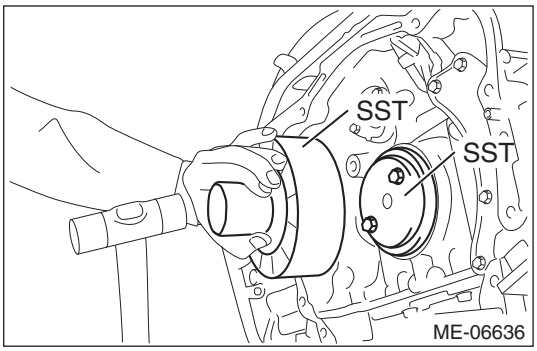
(3) Tightening torque, lubrication locations and non-reusable parts are described as the essential points of the procedures.
CAUTION:
If the above items can only be indicated in an illustration, an exploded view with these essentials is included. In such cases, all information such as torque and lubrication is included within the illustration.

(4) Procedures only describe essential items, with the location and contents of procedures included in an illustration, as well as detailed procedures, standard values, or precautions explained using text.

(5) In some cases, a single illustration is common to various similar models. For that reason, the actual vehicle may differ in their exact details.

Sample

Illustration: Target part and work



Description: Details of work method

Work item

1. Engine rear oil seal: seal installation
   (1) Clean the contact surface of the crankshaft oil seal.
   (2) Apply slight engine oil to the lip of a new engine rear oil seal.
   (3) Using SST, strike in the new engine rear oil seal so that it is flush with the end surface of the engine rear oil seal retainer.

SST 18671AA020, 18657AA030
<Caution> ← SST part number

- Do not strike in the engine rear oil seal obliquely.
- Do not deform the engine rear oil seal.
- Do not strike in the engine rear oil seal excessively.

<Note>
At striking in, the protrusion length of the engine rear oil seal is allowed 0 to -0.5 mm from the end surface of the engine rear oil seal retainer.

IN-03274

4. How to read the repair standard values
   (1) Standard values and limits are printed in bold text.
5. Definitions of terms

| | |
|---|---|
| Standard value | Indicates the tolerance range during inspection and adjustment. |
| Limit | Indicates the maximum or minimum value that cannot be surpassed during inspection and adjustment. |
| Reference value | If the measurement method for determining the standard value is quite difficult, this indicates a standard value for an easy measurement method when there is no possibility that a malfunction will occur. |
| <Warning> | Used to indicate that there is a danger of injury to the personnel performing the procedures or other personnel, and indicate that there is a danger of injury or accident if the instructions are not followed. |
| <Caution> | Used to indicate special precautions that must be taken regarding items and procedures that must be performed because failure to perform them will result in damage to the vehicle or parts. |
| <Note> | Used to indicate supplemental explanations separate from the current text in order to make procedures easier to perform/understand. |

6. SI units
   (1) The units used in this manual are SI units (International System of Units), and are as described in the following format of meters and yards/pounds.
   (Ex.)
   Standard value:T=28N·m {286kgf·cm} {20.7ft·lbf}

SI units conversion factors table

| Item | SI unit | Traditional unit | SI unit conversion factor |
|---|---|---|---|
| Speed | $m/s^2$ | G | 9.80665 |
| Torque, moment | N·m | kgf/cm | 0.0980665 |
| Power | N | kgf | 9.80665 |
| Pressure | MPa | $kgf/cm^2$ | 0.0980665 |
| | kPa | mmHg | 0.133322 |
| Power (work rate), work efficiency | kW | PS | 0.735499 |
| | W | kcal/h | 1.16279 |
| Cubic volume | $cm^3$ | cc | 1 |
| Spring constant | N/mm | kgf/mm | 9.80665 |

SI prefixes

| | | | |
|---|---|---|---|
| M (mega) | $10^6$ | d (deci) | $10^{-1}$=0.1 |
| K (kilo) | $10^3$ | c (centi) | $10^{-2}$=0.01 |
| H (hecto) | $10^2$ | m (milli) | $10^{-3}$=0.001 |

| | | | |
|---|---|---|---|
| Da (deca) | $10^{1}$ | μ(micro) | $10^{-6}$=0.000001 |

# Working precautions and notes

## Precautions

1. SRS airbags and seat-belt pretensioner
   (1) Precautions for handling and procedures
      (a) Failure to properly perform work according to procedures for the SRS airbag and pretensioner system can result in these components operating while handling them and cause a serious life-threatening accident. Additionally, failure to repair this system correctly can result in the inability to function properly. Read the following items carefully before servicing a vehicle (removal/installation, inspection, or replacement of parts) and perform the proper procedures as described in this manual.
   (2) Disconnection of the battery ground terminal
      CAUTION:
      Power windows have an index function that slightly opens/closes window glass when a door is opened/closed. Disconnect the battery ground (negative) terminal with the driver's and passenger's doors opened (window glass lowered to a position where door opening/closing is not a problem). The molding will be damaged if the battery ground terminal is disconnected with the window glass completely closed and a door is opened/closed.
      (a) Procedures consist of checking the diagnostic code, turning the key to IG OFF, disconnecting the battery ground terminal, and waiting 60 seconds or more before starting any other procedure.
         1. An airbag could operate if any procedures are performed within 60 seconds of disconnecting the battery ground terminal because the SRS airbag and pretensioner system is equipped with a backup power source.
         2. Make note of the memory contents of each system before disconnecting the battery ground terminal as the memory of some systems might be deleted when disconnected. Restore the system setting after the service procedure.
   (3) General precautions regarding the SRS airbag and pretensioner system
      (a) Use an electrical tester for electrical inspections.
      (b) Precautions for system surroundings are as indicated on corresponding labels.
      (c) Never disassemble this system.
      (d) Replace any parts with new genuine parts if they have been dropped, cracked, dented, chipped or deformed in any way.
      (e) Never use SRS airbag and pretensioner parts from other vehicles. Be sure to always replace with new parts if replacement is necessary.
      (f) Do not directly expose to high heat or open flame.
      (g) Always inspect using diagnostics even if SRS airbag and pretensioner parts have not operated in a collision.
      (h) Do not allow grease, cleanser, oil, water or other substances to adhere to system parts. If any substance adheres, wipe off immediately using a dry soft cloth.
      (i) Store and handle in locations not subject to high temperature (85°C {185°F} or more) or high humidity, and where less affected by electrical noise.
      (j) Always use the SSTs to make SRS airbag and pretensioner operate when disposing of a vehicle or individual parts.
         NOTE:
         - Disposal of driver's airbag module
         - Disposal of passenger's airbag module
         - Disposal of curtain airbag module
         - Disposal of side airbag module
         - Disposal of seat-belt pretensioner
      (k) Never measure the resistance of SRS airbag and pretensioner parts.
         WARNING:
         Doing so is extremely dangerous as the tester current could result in SRS airbag and pretensioner operation.
      (l) Always inspect the airbag warning light after inspecting, removing/installing or replacing SRS airbags and sensors.
   (4) Precautions regarding disposal of SRS airbag and pretensioner (before operating)
      (a) Never dispose of any parts that have not operated.
      (b) Perform SRS airbag and pretensioner operations outdoors on level ground where safety can be ensured. Try to avoid performing operations in residential and similar areas.
      (c) Before operating, advise all persons nearby as operation of an SRS airbag and pretensioner results in a loud noise.
      (d) Use the corresponding SSTs if operating an SRS airbag and pretensioner, and remain at a distance of five meters or more from the SRS airbag and pretensioner.

(e)Before performing procedures, touch a water pipe or steel frame with a bare hand to discharge any static electricity as it could cause the SRS airbag and pretensioner to operate.
(f) Be careful to prevent the deploying side of an airbag to be operated to face downward.

(5) Precautions regarding disposal of SRS airbag and pretensioner (after operating)
(a)Leave an operated SRS airbag and pretensioner as is for 30 minutes or more as some parts can reach extremely high temperatures (few hundred C° or more).
(b)Do not sprinkle water or otherwise try to cool an operated SRS airbag and pretensioner.
(c)Wear dustproof safety goggles and gloves when handling an operated SRS airbag and pretensioner.
(d)Place an operated SRS airbag and pretensioner in a strong clear vinyl bag and seal the bag before disposal.
(e)Be sure to always wash your hands after performing disposal procedures.

(6) Precautions for driver's, passenger's, side and curtain airbag modules
(a)Always maintain removed airbags with the deployment side facing upward even if removed for a short time.
WARNING:
Operation of an airbag for any reason with the deployment side facing downward can result in a serious life-threatening accident.
(b)When storing, do not place anything on top of an airbag and do not stack airbags on top of each other.

(7) Precautions for seatbelt pretensioners
(a)Do not touch the area around the belt winding parts even if removed for a short time.
WARNING:
Operation of a pretensioner for any reason can cause the belt to be wound resulting in a serious life-threatening accident.
(b)When storing, do not place anything on top of a pretensioner and do not stack pretensioners on top of each other.

(8) Precautions for roll connectors
(a)Always perform roll connector centering when installing a roll connector or removing/installing the steering wheel.
CAUTION:
The roll connector could suffer an open circuit if the steering wheel is operated without performing centering.

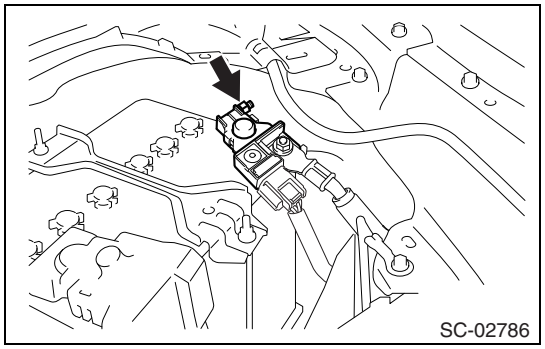
(9) Precautions for airbag CM, front sub-sensor, side airbag sensor ASSY, airbag door sensor, side airbag sensor and satellite safing sensor
(a)Always replace the sensor ASSY (airbag CM, front sub-sensor, side airbag sensor and satellite safing sensor) if an SRS airbag and pretensioner have operated (including if only the SRS airbag or pretensioner has operated) due to collision.

(10) Precautions for wire harnesses and connectors
(a)Wire harnesses have a uniform yellow color except for hidden portion in the engine room.
(b)Be very careful when handling special connectors that have been adopted.

(11) Handling of vehicles that have been in crashes or otherwise subjected to collision
(a)If using electrical welding equipment, remove the SRS airbags and pretensioners before performing any work.
(b)Remove the airbag CM, front sub-sensor, side airbag sensor and satellite safing sensor before performing work if these might be subject an impact.
(c)Do not expose the airbag CM, front sub-sensor, side airbag sensor and satellite safing sensor to high temperatures.
(d)Check surrounding wire harnesses and connectors for damage and melt as an SRS airbag and pretensioner become extremely hot (few hundred °C or more) in some parts when operated.

(12) Cases where it is necessary to inspect an SRS airbag and pretensioner
(a)If a vehicle has been damaged such as due to a collision including cases where the SRS airbags and pretensioners have not operated.
(b)Cases where a diagnostic code for the SRS airbag system has been output.

2. Basic items
(1) Battery terminal removal/installation
CAUTION:
Power windows have an index function that slightly opens/closes window glass when a door is opened/closed. Disconnect the battery ground (negative) terminal with the driver's and passenger's doors opened (window glass lowered to a position where door opening/closing is not a problem). The molding will be damaged if the battery ground terminal is disconnected with the window glass completely closed and a door is opened/closed.



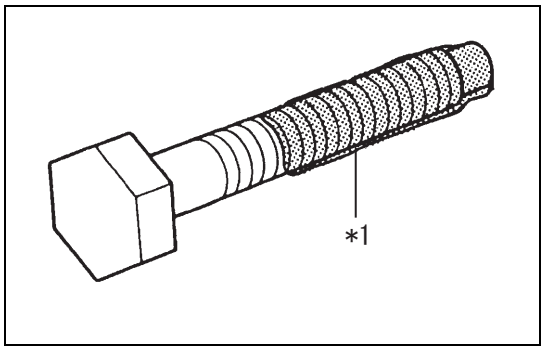
(a)If performing any electric system procedures, disconnect the battery ground terminal before starting in order to prevent burn out caused by short circuit.

(b)If removing/installing the battery ground terminal, turn the key to IG OFF and the lighting switch to OFF, and completely loosen the terminal nut so as not to pry the terminal.

(c)Make note of the memory contents before disconnect the battery ground terminal as doing so deletes the memory of the diagnostic and other systems.

(d)Reconnect the battery ground terminal.

Standard value:T=6.0N·m {61kgf·cm} {4.4 ft·lbf}



(2) Pre-coated bolts

(a)Pre-coated bolts are bolts to which a thread-locking agent has been applied on the bolt thread.

Captions in illustration

| | |
|---|---|
| *1 | Thread-locking agent |

(b)Use the specified adhesive to pre-coat a bolt when re-tightening, loosening or otherwise moving one.

CAUTION:

A torque check is performed using the lower limit value of the tightening torque tolerance range.

(c)If reusing a pre-coated part, remove all old adhesive from bolts and threaded holes, degrease, and dry using compressed air. Apply the specified thread-locking agent to the bolt thread and tighten to the specified torque.

(d)Depending on the thread-locking agent that is applied, some time might be required to allow the agent to harden.

(3) Gasket

(a)Use sealant with gaskets as necessary to prevent leakage.

(4) Bolts, nuts and screws

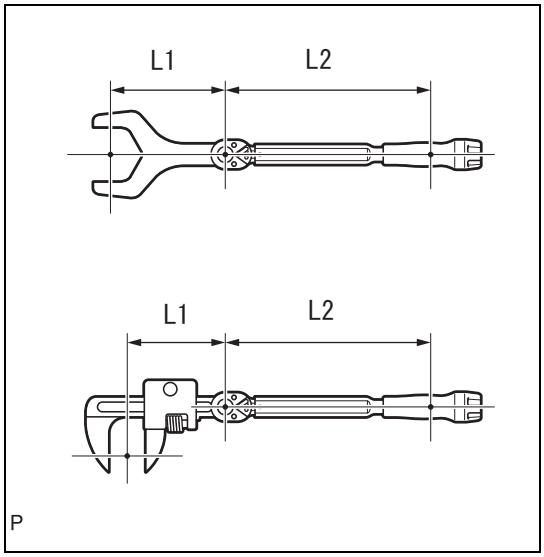
(a)Check the tightening torques of bolts, nuts and screws, and always use a torque wrench to tighten.

(b)Check for foreign material (such as burrs or film) on the tightening seating surface.

(5) Tightening when using a torque wrench extension

(a)If the overall length when tightening is increased due to using a torque wrench in combination with an SST or other tool, the actual torque will be excessive if you tighten it to the specified torque shown on the torque wrench.

(b)This manual only indicates the specified tightening torque. If using an SST or extension, it is necessary to use the following formula to calculate the proper torque wrench reading.



(c) Formula T'=T×L2/(L1+L2)

| | |
|---|---|
| T' | Torque wrench reading [N·m{kgf/cm}] |
| T | Specified tightening torque [N·m{kgf/cm}] |
| L1 | Length of SST or tool [cm] |
| L2 | Torque wrench length [cm] |

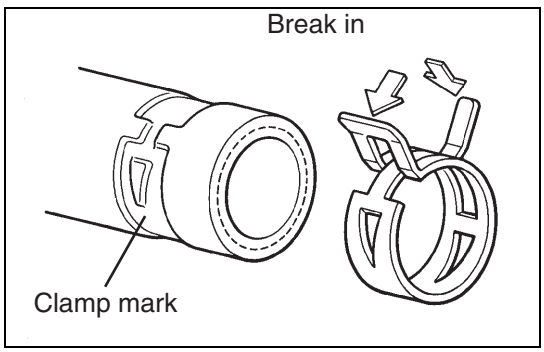
(6) Removal/Installation of fuel system parts

(a) Location for removal/installation of fuel system parts

1. Perform procedures in a location with good ventilation, and where there are no sources of flame/sparks present nearby such as welding equipment, grinders, drill, electric motors or heaters.
2. Do not perform procedures in or near a pit as it can become filled with vaporized fuel.

(b) Removal/Installation of fuel system parts

1. Prepare a fire extinguisher before starting procedures.
2. In order to prevent static electricity discharge, attach a grounding wire to the fuel changer, vehicle, fuel tank or similar part and sprinkle a small amount of water underfoot (not enough to be slippery)
3. Do not use electrical equipment such as an electric pump or work lights, as these can generate sparks or cause high temperature.
4. Do not use a steel hammer or similar tool as these can generate sparks.
5. Keep cloths with fuel adhered separate from other cloths, and then dispose properly.



(7) Hose clamp handling

(a) Before removing a hose, check the hose insertion depth and clamp position so that it can be securely restored.

(b) Replace any deformed or deteriorated clamps with a new part.

(c) After installation of a plate-spring clamp, apply force in the directions of the arrows to make the clamp well fitted.

# Setting procedures at parts replacement and removal / installation

## List of procedures

1. List of replacement procedures

IN

| Replaced parts and procedures | Required procedures | Possible phenomena/unavailable functions (unless required procedure is performed) | Reference pages |
|---|---|---|---|
| Engine control computer | 1. ID code registration | • Engine start inoperable | Refer to "Registration manual for immobilizer" for registration procedures. |
| • Transmission control computer ASSY<br>• Automatic transmission ASSY<br>• Transmission valve body ASSY<br>• Transmission wire<br>• Each solenoid<br>• Engine ASSY | 1. AT learning values initialization | • High revving of engine<br>• Large shift shock | AT - 19 |

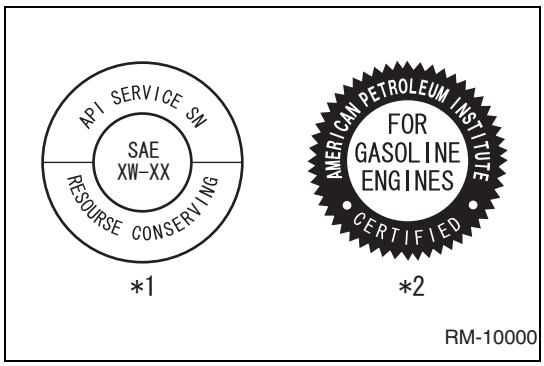
# Oils / Coolants

## Specified oils and amounts



1. Engine oil
   (1) Specified oil

| Viscosity grade | Quality grade |
|---|---|
| 0W-20 (synthetic oil) | For API certified: Products with SN "Resource Conserving" logos. |
| | For ILSAC certified: Products with GF-5 "Starburst mark" displayed on the container. |

Captions in illustration

| | |
|---|---|
| *1 | API mark |
| *2 | Starburst mark |

CAUTION:
- Use 0W-20 (synthetic oil).
- When replacing the oil, it is acceptable to use a different brand oil but Subaru-specified engine oil should be used.

   (2) Amount

| Engine type | Only replacing oil Filling amount (L {US qt, Imp qt}) | Oil and oil filter Filling amount at oil replacement (L {US qt, Imp qt}) |
|---|---|---|
| FA20 | 5.2 {5.5, 4.6} | 5.4 {5.7, 4.8} |

NOTE:
The filling amount at engine oil replacement is the value when oil is drained from the drain plug.

2. Oils/Coolants other than engine oil

CAUTION:
- For AT, using any ATF other than recommended product may cause malfunctions. Be sure to use the recommended product.
- Using a substitute product as the transmission gear oil may cause the function and performance of the transmission to deteriorate.

| Item [Type] | Amount (L {US qt, Imp qt}) (reference value) | Recommended product | Substitute product |
|---|---|---|---|
| Coolant [FA20] | 7.5 {7.9, 6.6} (AT) | SUBARU Super Coolant (Diluted type) | - |
| | 7.2 {7.6, 6.3} (MT) | | |
| Automatic transmission fluid [TX6A] | 7.5 {7.9, 6.6} | Auto fluid WS | - |
| Manual transmission oil [TL70] | 2.2 {2.3, 1.9} | MG gear oil special II (API GL-3, SAE 75W-90) | GL-3 or later (75W-90) |
| Rear differential oil | 1.1 to 1.2 {1.1 to 1.3, 1.0 to 1.1} | Differential gear oil LX (API GL-5, SAE 75W-85) | GL-5 (75W-85 or 75W-90) |
| Clutch fluid | - | FMVSS No.116 DOT3 or DOT4 | - |
| Brake fluid | - | FMVSS No.116 DOT3 or DOT4 | - |
| A/C compressor oil | - | ND-OIL8 | - |

# SPECIFICATIONS

## FA20 ENGINE MECHANICAL

### SERVICE DATA

| | | | |
|---|---|---|---|
| Ignition timing | 2 to 22° BTDC at idle (Transmission in neutral) | | |
| Idle speed | Automatic transmission (in neutral) | | 600 to 800 r/min |
| | Manual transmission | | 550 to 750 r/min |
| Compression | Compression pressure | 1150 to 1750 kPa (11.7 to 17.8 kgf/cm2, 167 to 254 psi) | |
| | Difference between each cylinder | 200 kPa (2.0 kgf/cm$^2$, 29 psi) or less | |
| Cam clearance | Standard (Cold) | Intake | 0.10 to 0.15 mm (0.0039 to 0.0059 in.) |
| | | Exhaust | 0.20 to 0.24 mm (0.0079 to 0.0094 in.) |
| Camshaft | Circle runout | Maximum | 0.020 mm (0.00079 in.) |
| | Cam lobe height | Intake | 40.40 to 40.50 mm (1.5905 to 1.5945 in.) |
| | | Exhaust | 40.72 to 40.82 mm (1.6031 to 1.6071 in.) |
| | | For fuel pump | 38.95 to 39.05 mm (1.5335 to 1.5374 in.) |
| | Cam base circle | Intake | 34.0 mm (1.3386 in.) |
| | | Exhaust | 34.0 mm (1.3386 in.) |
| | Journal diameter | | 25.946 to 25.963 mm (1.02149 to 1.02216 in.) |
| | Thrust clearance | | 0.068 to 0.116 mm (0.00027 to 0.00457 in.) |
| | Oil clearance | | 0.037 to 0.072 mm (0.00146 to 0.00283 in.) |
| Cylinder head sub-assembly | Warpage | Maximum | 0.020 mm (0.00079 in.) |
| | Cylinder head height | Standard | 98.5 mm (3.878 in.) |
| | | Minimum | 98.4 mm (3.874 in.) |
| Intake valve | Overall length | | 104.95 mm (4.1319 in.) |
| | Margin thickness | | 0.8 to 1.2 mm (0.0315 to 0.0472 in.) |
| | Valve stem diameter | | 5.455 to 5.470 mm (0.2148 to 0.2154 in.) |
| | Valve seat width | | 0.8 to 1.6 mm (0.032 to 0.063 in.) |
| Exhaust valve | Overall length | | 97.57 mm (3.8413 in.) |
| | Margin thickness | | 1.0 to 1.4 mm (0.039 to 0.055 in.) |
| | Valve stem diameter | | 5.445 to 5.460 mm (0.21437 to 0.21496 in.) |
| | Valve seat width | | 1.1 to 1.7 mm (0.043 to 0.067 in.) |
| Intake valve guide bush | Inside diameter | | 5.500 to 5.512 mm (0.21654 to 0.21701 in.) |
| | Oil clearance | | 0.030 to 0.057 mm (0.00118 to 0.00224 in.) |
| | Protrusion height | | 11.4 to 11.8 mm (0.449 to 0.466 in.) |
| Exhaust valve guide bush | Inside diameter | | 5.500 to 5.512 mm (0.21654 to 0.21701 in.) |
| | Oil clearance | | 0.040 to 0.067 mm (0.00157 to 0.00264 in.) |
| | Protrusion height | | 11.4 to 11.8 mm (0.449 to 0.466 in.) |

| | | | |
|---|---|---|---|
| Valve adjusting shim | Valve stem end diameter | Intake | 5.455 to 5.470 mm (0.21476 to 0.21535 in.) |
| | | Exhaust | 5.445 to 5.460 mm (0.21437 to 0.21496 in.) |
| | Valve adjusting shim inside diameter | | 5.500 to 5.560 mm (0.21654 to 0.21890 in.) |
| | Oil clearance | Intake | 0.030 to 0.105 mm (0.00118 to 0.00413 in.) |
| | | Exhaust | 0.040 to 0.115 mm (0.00157 to 0.00453 in.) |
| Valve spring | Free length | | 41.06 mm (1.617 in.) |
| | Deviation | Maximum | Less than 1.8 mm (0.0710 in.) |
| | Angle | Maximum | 2.5° |
| Cylinder block | Warpage | Maximum | 0.025 mm (0.00098 in.) |
| | Cylinder block height | Standard | 205.0 mm (8.071 in.) |
| | | Minimum | 204.9 mm (8.067 in.) |
| | Cylinder bore diameter | Mark A | 86.005 to 86.015 mm (3.38602 to 3.38641 in.) |
| | | Mark B | 85.995 to 86.005 mm (3.38562 to 3.38602 in.) |
| | | Maximum (When boring) | 86.505 mm (3.40570 in.) |
| Cylinder bore | Cylindricity | | 0.030 mm (0.00118 in.) |
| | Circularity | | 0.030 mm (0.00118 in.) |
| Piston | Piston diameter | Distance from piston head | 39.4 mm (1.551 in.) |
| | | A grade | 85.985 to 85.995 mm (3.38523 to 3.38562 in.) |
| | | B grade | 85.975 to 85.985 mm (3.38484 to 3.38523 in.) |
| | | 0.25 mm (0.0098 in.) over size | 86.225 to 86.245 mm (3.39468 to 3.39547 in.) |

## ALIGNMENT / HANDLING DIAGNOSIS

SERVICE DATA (Vehicle Height (Unloaded Vehicle))

| Dimension A - Dimension B (mm {in}) | Dimension C - Dimension D (mm {in}) |
|---|---|
| 146 (5.75) | 110 (4.33) |

IN

Measurement points:

A: Dimension A…Center of the front wheel

A: Dimension B…Center of the tip of the front arm ASSY front side bushing mounting bolt

A: Dimension C…Center of the rear wheel

A: Dimension D…Center of the rear end of the rear lower arm No.2 bushing mounting bolt threaded portion

SERVICE DATA (Camber (Unloaded Vehicle))

| - | Camber Inclination | Right-left Difference |
|---|---|---|
| Front | 0 +/- 45' | 30' or less |
| Rear | -1°10' +/- 45' | 45' or less |

SERVICE DATA (Caster (Unloaded Vehicle))

| - | Caster Inclination (Reference) |
|---|---|
| Front | 5°55' (5.90°) |

SERVICE DATA (Wheel Turning Angle (Unloaded Vehicle))

| - | Inside Wheel (Reference) | Outside Wheel (Reference) |
|---|---|---|
| Front | 36°54' | 31°12' |

SERVICE DATA (Toe-in (Unloaded Vehicle))

| - | Specified Condition |
|---|---|
| Front | Toe angle (sum of wheels) : 0°00' +/- 0°15' (0.00° +/- 0.25°) |
| | 0 +/- 3.0 mm (0 +/- 0.12 in.) |
| Rear | Toe angle (sum of wheels) : 0°10' +/- 0°15' (0.16° +/- 0.25°) |
| | 2.0 +/- 3.0 mm(0.08 +/- 0.12 in.) |

SERVICE DATA (Distance between the centers of the 2 installation bolts of the rear No. 2 suspension arm assembly LH and RH)

| - | Standard distance |
|---|---|
| Rear | 457.5 +/- 3 mm (18.01 +/- 0.12 in.) |

SERVICE DATA (Distance between the centers of the 2 installation bolts of the rear No. 2 suspension arm assembly)

| - | Standard distance |
|---|---|
| Rear | 450.9 +/- 2 mm (17.75 +/- 0.08 in.) |

## TIRE / WHEEL

SERVICE DATA (Cold Tire Inflation Pressure)

| Tire Size | Cold Tire Inflation Pressure kPa (kgf/cm$^2$, psi) | |
|---|---|---|
| 215/45R17 87W | 240 (2.4, 35) | 240 (2.4, 35) |

| T135/80D 16 101M | 420 (4.2, 60) | 420 (4.2, 60) |
| T145/70D 17 106M | 420 (4.2, 60) | 420 (4.2, 60) |

| | | |
|---|---|---|
| Maximum wheel runout | Steel wheel | 1.5 mm (0.059 in.) (Vertical and lateral) |
| | Aluminum wheel | 1.0 mm (0.039 in.) (Vertical and lateral) |

| | |
|---|---|
| Maximum wheel imbalance after adjustment | 10.0 g (0.35 oz) |

## BRAKE SYSTEM (OTHER)

SERVICE DATA

| | | |
|---|---|---|
| Brake pedal height from floor mat | for Manual Transmission | 145mm (5.709in.) |
| | for Automatic Transmission | 150mm (5.906in.) |
| Brake pedal free play (when the brake pedal is pushed to move with a force of less than 10 N (1 kgf, 2.2 lbf).) | | 0.5 mm (0.02in.) to 2.7mm (0.106in.) or less |

| | | |
|---|---|---|
| Brake pedal reserve distance from asphalt sheet at 490 N (50 kgf, 110 lbf) | for Manual Transmission | More than 55 mm (2.165 in.) |
| | for Automatic Transmission | More than 55 mm (2.165 in.) |
| Vacuum of the vacuum pump assembly | With the engine idling | More than 93 kPa (698 mmHg, 13.5 psi) of vacuum |

## BRAKE (FRONT)

SERVICE DATA (normal type)

| | | |
|---|---|---|
| Pad lining thickness | Standard | 11.0 mm (0.433 in.) |
| | Minimum | 1.5 mm (0.0591 in.) |
| Disc thickness | Standard | 24.0 mm (0.945 in.) |
| | Minimum | 22.0 mm (0.866 in.) |
| Disc runout | Maximum | 0.05 mm (0.002 in.) |

SERVICE DATA (brembo type)

| | | |
|---|---|---|
| Pad lining thickness | Standard | 8.9 mm (0.350 in.) |
| | Minimum | 1.2 mm (0.047 in.) |
| Disc thickness | Standard | 30.0 mm (1.181 in.) |
| | Minimum | 28.0 mm (1.102 in.) |
| Disc runout | Maximum | 0.075 mm (0.003 in.) |

## BRAKE (REAR)

SERVICE DATA (normal type)

| | | |
|---|---|---|
| Pad lining thickness | Standard | 11.0 mm (0.433 in.) |
| | Minimum | 1.5 mm (0.059 in.) |
| Disc thickness | Standard | 18.0 mm (0.709 in.) |
| | Minimum | 16.0 mm (0.630 in.) |
| Disc runout | Maximum | 0.05 mm (0.002 in.) |

SERVICE DATA (brembo type)

| | | |
|---|---|---|
| Pad lining thickness | Standard | 9.0 mm (0.354 in.) |
| | Minimum | 1.55 mm (0.061 in.) |
| Disc thickness | Standard | 20.0 mm (0.787 in.) |
| | Minimum | 18.0 mm (0.709 in.) |
| Disc runout | Maximum | 0.07 mm (0.003 in.) |

## PARKING BRAKE

SERVICE DATA

| | | |
|---|---|---|
| Parking brake lever travel at 200 N (20 kgf, 45.0 lbf) | | 7 to 8 notches |
| Brake disc inside diameter | Standard | 190 mm (7.48 in.) |
| | Maximum | 191 mm (7.52 in.) |
| Parking brake shoe lining thickness | Standard | 3.5 mm (0.138 in.) |
| | Minimum | 1.5 mm (0.059 in.) |

## STEERING COLUMN

SERVICE DATA

| | |
|---|---|
| Maximum steering free play | 30 mm (1.18 in.) |
| Steering column assembly preload | 1.7 N*m (1.8 kgf*cm, 1.3 ft*lbf) or less |
| Steering intermediate shaft assembly turn torque (rack and pinion power steering gear assembly side) | 6.6 N (0.67 kgf, 1.48 lbf) or less |
| Steering intermediate shaft assembly turn torque (steering column assembly side) | 6.0 N (0.61 kgf, 1.35 lbf) or less |

## STEERING GEAR / LINKAGE

SERVICE DATA

| | |
|---|---|
| Rack and pinion steering gear assembly total preload (turning) | 0.9 to 1.6 N*m (9.2 to 16.3 kgf*cm, 0.66 to 1.18 ft*lbf) |

## FA20 BATTERY / CHARGING

SERVICE DATA

| | |
|---|---|
| Charging circuit without load | Standard amperage: 10 A or less<br>Standard voltage: 10.6 to 16.0 V |
| Charging circuit with load | Standard amperage: 30 A or higher |
| Brush length | Standard length: 22.5 mm (0.885 in.)<br>Minimum exposed length: 5.0 mm (0.196 in.) |
| Battery type | 55D23L/75D23L |

## HEATING / AIR CONDITIONING

SERVICE DATA

| | |
|---|---|
| Refrigerant charge volume | Standard: 390 +/-50 g(13.76 +/-1.76 oz) |

# Troubleshooting procedures for ECM control system

## Explanation of basic diagnostic procedures

NOTE:

Perform troubleshooting according to the following diagnostic procedures. Only the basic procedures are shown here. For details, refer to the most effective procedures for each circuit as described in each system section. Before beginning troubleshooting of the corresponding circuit, check the troubleshooting procedures first.

| 1 | Bring in the car |
|---|---|

Next

| 2 | Customer interview and malfunction analysis |
|---|---|

(1) Check with the customer regarding the status and conditions when the malfunction occurred, and create an check list for interview.

Next

| 3 | Malfunction phenomenon check and diagnostic code (including freeze frame data) inspection |
|---|---|

(1) Measure the battery voltage.
Voltage: 11 to 14 V (engine stopped)
(2) Visually check for any blown out fuses, open or short circuit in the wiring harness, or poor contact of the connectors.
(3) Check the malfunction phenomenon and conditions, and inspect the diagnostic code according to the corresponding chart.
Diagnostic code is present.: Refer to list of diagnostic codes.
No diagnostic code: Refer to symptoms table.

Next

| 4 | Ascertaining vehicle conditions |
|---|---|

(1) As some systems return to the initial conditions when parts are replaced, it is necessary to ascertain the vehicle setting conditions before repairing.
NOTE:
Setting procedures at parts removal ·installation (refer to IN - 10)

Next

| 5 | Circuit/Parts inspection |
|---|---|

(1) Use the list of diagnostic codes or symptom table to check which system circuits and parts should be inspected.

Next

| 6 | Repair malfunction location |
|---|---|

(1) According to Step 5, repair the system or part where the malfunction is found.

Next

| 7 | Confirmation test |
|---|---|

(1) After repair, confirm that the malfunction no longer exists. (If the malfunction recurs, perform the confirmation test again under the same environment and conditions in which the malfunction initially occurred.)
(2) For malfunctions containing diagnostic codes, confirm the results of the diagnostic judgement.

Next

| 8 | Vehicle restoration |
|---|---|

(1) Return all vehicle settings to the vehicle conditions checked in Step 4.
NOTE:
It is necessary to inform the customer of any locations that could not be returned to the original setting.

Next

Complete

## Malfunction analysis using check list for interview

1. In order to identify the malfunction phenomenon correctly and make an appropriate decision, it is important not to introduce any bias into the troubleshooting process. In order to check the malfunction phenomenon, it is extremely important to ask the customer about the conditions when the malfunction occurred.
2. The following five items are valuable points in performing malfunction analysis. Sometimes, malfunction or repair history that seems not related to the current malfunction is useful. When performing troubleshooting, it is necessary to gather such information as much as possible and to correctly know how these troubles are related to the current one. Fill in each system diagnosis section of the check list for interview.

- What: Vehicle model, system name
- When: Date/Time, frequency
- Where: Route conditions
- Conditions: Driving conditions, weather
- What was happening when the malfunction occurred?: Malfunction phenomena
  NOTE:
  The following is a sample check list for interview.

IN

# Engine Diagnosis Checklist for Interview

| | | | | | |
|---|---|---|---|---|---|
| Vehicle model | | Date of vehicle bring-in | | History of bring-in | No / Yes ( times) |
| Frame No. | | Registration date | | Registration No. | |
| | | Occurrence date | | Odometer reading km | |
| Vehicle equipment | | | | | |

| | |
|---|---|
| Vehicle you used in the past | Main area for use / purpose |
| Customer's characteristics | |
| Customer specified content<br><br>Warning light illumination On / Off ( ) | |

Interview result

| System condition | Driving condition | Road surface | Others | Frequency of occurrence |
|---|---|---|---|---|

## Malfunction symptoms and DTC check

NOTE:

The diagnostic system has various functions. When a malfunction occurs in the signal circuit to the ECM, the corresponding code is stored in the ECM memory, and this is output as a diagnostic code during troubleshooting. This diagnostic function has been included so that you can freely use it to rapidly narrow down the scope of the malfunction and perform effective troubleshooting.

It is extremely important to check diagnostic codes in order to determine if the malfunction indicated by the diagnostic code is still occurring, or if the malfunction occurred in the past but now operation has returned to normal. Additionally, it is necessary to check using malfunction phenomenon inspection to determine if the malfunction indicated by the diagnostic code is directly related to the malfunction phenomenon.

For this reason, it is necessary to check the diagnostic code before and after checking the malfunction phenomenon in order to determine the current conditions. Failure to do this results in, depending on the conditions, having to perform unnecessary troubleshooting of systems that might be operating normally, making it difficult to locate the malfunction location and the performance of repairs unrelated to the malfunction. For this reason, it is necessary to always check diagnostic codes in the correct order of the procedure.

NOTE:

- The following is a flowchart that shows how to perform troubleshooting using diagnostic code checking.
- This flowchart indicates how to effectively use diagnostic code checking, and procedures for performing diagnostic code and malfunction phenomenon troubleshooting by carefully checking the results of the diagnostic code check.

| 1 | Malfunction identification (Interview) |
|---|---|

Next

| 2 | DTC check |
|---|---|

(1) Read out all DTCs.

Result

| Result | Go to |
|---|---|
| Diagnostic code is present. | A |
| Cannot read out from all connected ECMs. | B |
| No diagnostic code | C |

B → Bus (communication lines) failure (Refer to NW - 30for CAN bus failure and to NW - 5LIN failure.)

C → Go to Step 7.

A

| 3 | Save diagnostic codes and freeze frame data |
|---|---|

(1) Save output diagnostic codes and freeze frame data.

CAUTION:

- Do not delete before saving. Deleting these will result in the deletion of all diagnostic codes, freeze frame data and history data.
- Write down the panel diagnosis information as it cannot be saved.

NOTE:

- When multiple codes are output, identify the main cause by all diagnostic codes.
- For systems in which ECM data can be checked, use input-period estimation data (data monitor).

- There are output diagnostic codes even if there is no malfunction. (Such as air conditioning sunload sensor and learning not performed after battery disconnection.)

Result

| Result | Go to |
|---|---|
| Communication diagnostics and other diagnostics are present | A |
| Other than communication diagnostics | B |
| Communication diagnostics only | C |

B → Go to Step 5.

C → Bus (communication lines) failure (Refer to NW - 30for CAN bus failure and to NW - 5LIN failure.)

A

| 4 | Isolate malfunction cause |
|---|---|

(1) From all the diagnostic codes, determine whether main cause is in parts or bus (communication line).

NOTE:

It is possible to be tailgating output of communication diagnostics due to a parts malfunction.

Result

| Result | Go to |
|---|---|
| Part failure | A |
| Bus (communication line) failure | B |

B → Bus (communication lines) failure troubleshooting (Refer to NW - 30for CAN communication system and to NW - 5for the large-scale multiplex communication system for vehicle body [LIN].)

A

| 5 | Clear diagnostic codes and freeze frame data. |
|---|---|

Next

| 6 | Driving test, DTC check |
|---|---|

Result

| Result | Go to |
|---|---|
| No diagnostic code | A |
| Diagnostic code is present. | B |

B → Perform troubleshooting according to the flowchart by diagnostic code.

A

Perform simulation test using the simulation procedures of the malfunction phenomenon.

IN

| 7 | Check malfunction phenomenon |
|---|---|

(1) Use the interview results and data monitor to determine whether the customer's indications are malfunction.

NG → Perform troubleshooting according to the flowchart by symptom.

OK

System normal

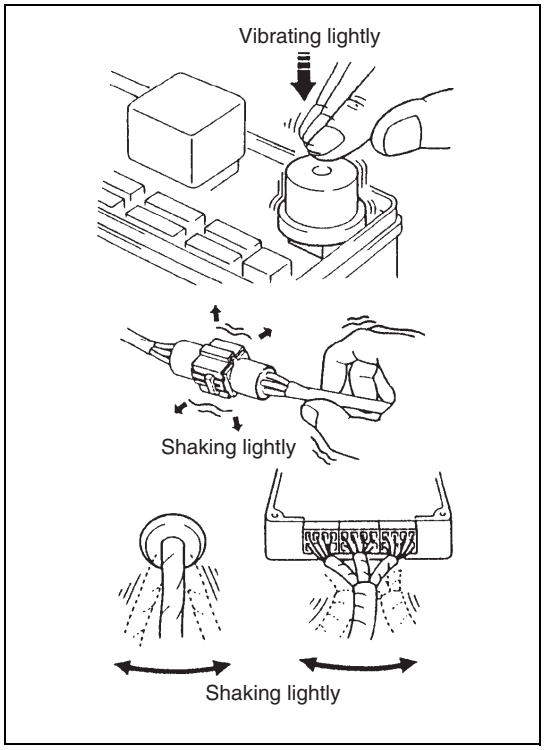
## Procedures for malfunction phenomenon simulation

NOTE:

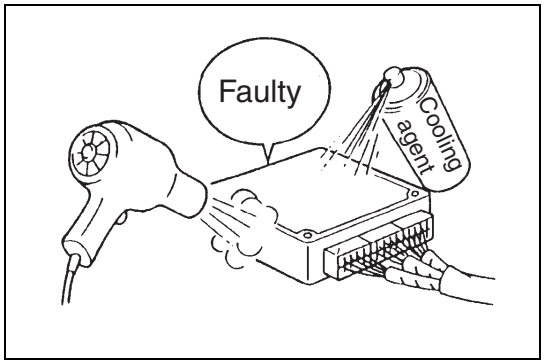
- The most difficult thing in troubleshooting is when there is no appearance of a malfunction phenomenon. In such cases, it is necessary to thoroughly analyze the malfunction information provided by the customer, and recreate the same conditions/ environment of the customer's vehicle that existed when the malfunction occurred. Performing troubleshooting without confirming the malfunction phenomenon results in overlooking important points of repair procedures and making mistakes such that, ultimately, troubleshooting reaches a dead end.
- For example, checking a malfunction that occurs when starting a cold engine with the engine already warmed-up, or checking for a vibration that occurs while driving on the road with the vehicle stopped limit the amount of checking and makes it impossible to identify the malfunction location.
- Although there are malfunction with causes that cannot be reproduced, such as vibration, heat or entrance of water (moisture), the procedures indicated here for malfunction phenomenon reproduction are effective means in terms of providing for external causes when a vehicle is stopped.

Important points of malfunction simulation test

Although it is necessary to check the malfunction phenomenon using malfunction phenomenon reproduction procedures, it is necessary to also find the malfunction scope/location. Doing this requires you to narrow down the circuits containing the malfunction based on the malfunction phenomenon before performing tests and connect the tester beforehand. Afterwards, perform the malfunction reproduction procedures, and determine the circuits that are faulty and those that are normal during the testing while also checking the malfunction phenomenon. Refer to the malfunction phenomenon list for each system to narrow down the cause of the malfunction phenomenon. It is also necessary to use reproduction procedures that are according to the corresponding detection conditions/time of the corresponding diagnostic code in order to reproduce diagnostic code output.

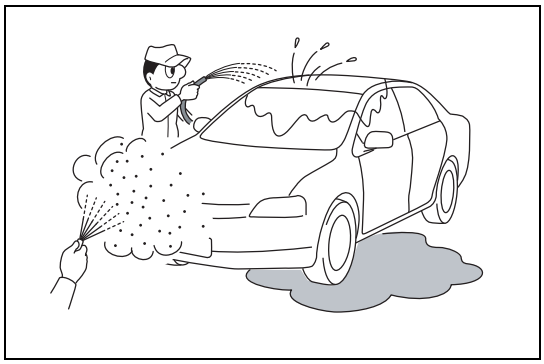


1. Vibration method: For malfunctions thought to be caused by vibration
   (1) Parts and sensors
      (a)Lightly tap by hand on the probable malfunctioning parts or use a similar method to vibrate them, and check if any malfunction occurs.
      NOTE:
      Subjecting relays to a strong impact can cause their points to open.
   (2) Connectors
      (a)Lightly shake the connectors up/down and right/left.
   (3) Wire harnesses
      (a)Lightly shake the wire harnesses up/down and left/right, and check if any malfunction occurs.
      NOTE:
      It is especially important to check the connector bases, vibration fulcrums and areas passing through the body.



2. Cooling/Heating method: For malfunctions thought to occur when cooled or heated
   (1) Heat up or cool down (using a hair drier or coolant) the probable malfunctioning parts, and check if any malfunction occurs.
      CAUTION:
      - If heating: Do not heat by +60°C (can be touched by hand) or more.
      - Do not heat or cool with the cover of the ECM or similar parts open so as to not directly heat or cool any electrical parts.

      NOTE:
      Coolant can be purchased at electrical parts stores.

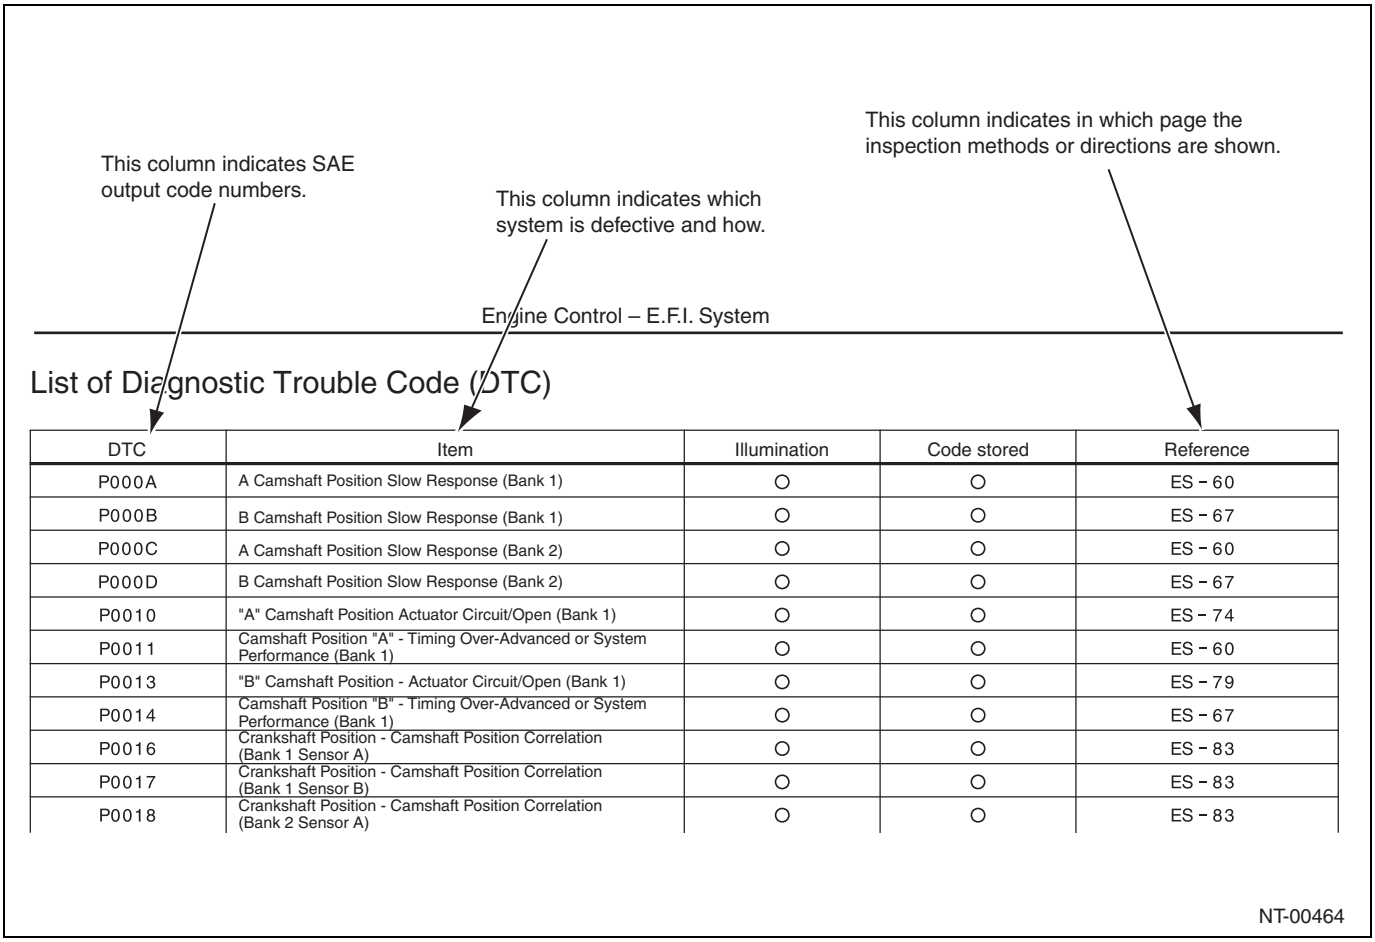


3. Water sprinkling method: For malfunctions thought to occur during rain or high temperature
   (1) Sprinkle water on the vehicle and check if any malfunction occurs.
      CAUTION:
      - Do not sprinkle water directly on the engine room. Spray a fine mist of water to the front surface of the radiator to indirectly change the temperature and humidity.
      - Do not sprinkle water directly on electrical parts.

4. Other: For malfunctions thought to be caused during excessive electrical load
   (1) Create an excessive electrical load by operating various electrical parts such as the heater blower, headlights and rear defogger, and check if any malfunction occurs.

## List of diagnostic codes

This diagnostic codes list is for use with the diagnostic code displayed during diagnostic code checking and allows you to perform accurate and effective troubleshooting. Troubleshooting must be performed based on the inspection procedures of the diagnostic table corresponding to the displayed diagnostic code. Below is an example of the diagnostic codes list of the EFI system.



## Symptom table

The probable malfunctioning circuit and parts corresponding to each malfunction phenomenon are shown below. This table is used for performing troubleshooting when a malfunction is still present although normal codes are displayed during DTC checking. The probable malfunction location indicates the inspection items of circuits and parts that must be checked.

NOTE:

If a malfunction is not detected by the diagnostic system although malfunction symptoms are present, it is thought that the malfunction has occurred in a location outside of the detection scope of the diagnostic system, or in a system other than the diagnostic system.

This column indicates the symptoms except that DTC numbers are shown.

This column indicates the circuits or part names to be inspected according to each faulty condition.

This column indicates the pages that have the flow charts for each circuit and the inspection methods.

## Symptom Table

| Symptoms | Locations to be inspected | Reference |
|---|---|---|
| No cranking | Starter and starter relay | 06 – 82 |
| | Neutral start switch system | 06 – 61 |
| Engine start failure (no initial combustion) | ECM power supply system | 06 – 82 |
| | Igniter system | 06 – 64 |
| | Fuel pump system | 06 – 78 |
| | Fuel injector | 06 – 78 |
| | Crank angle sensor system | 06 – 52 |
| Engine start failure (insufficient combustion) | Fuel pump system | 06 – 78 |
| | Igniter system | 06 – 64 |
| | Fuel injector | 06 – 82 |
| | Crank angle sensor system | 06 – 52 |
| Engine start failure (normal cranking) | Starter system | 06 – 76 |
| | ISCV system | 06 – 61 |
| | Fuel pump system | 06 – 78 |
| | Igniter system | 06 – 64 |
| | Spark plug | 06 – 64 |
| | | |

H

## Inspection flow by DTC system

How to read and use each page is described below.

- Troubleshooting is shown in order of DTC, and separated by systems and symptoms in order to make it easier to diagnose malfunctions and investigate the cause.
- Troubleshooting procedures are described in sections with the following headings: "DTC", "Circuit description", "Detecting conditions", "Circuit figure", and "Inspection steps".

IN

DTC → P0115/22 ; DTC name → Engine coolant temp.

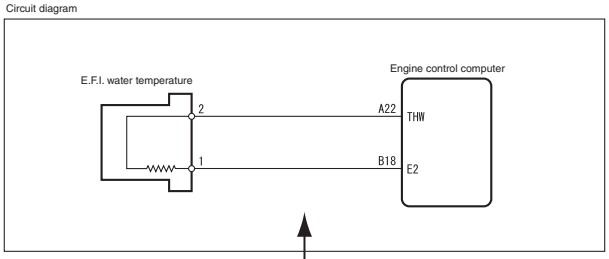
| DTC | P0115/22 | Engine coolant temp. |
|---|---|---|

**Circuit outline**
The resistance value of the thermistor in E.F.I. water temperature changes according to coolant temperature changing. How to connect E.F.I water temperature to engine control computer is the same as the inlet air temperature sensor.

| DTC No. | DTC detection condition<br>1. Diagnostic condition 2. Abnormal status<br>3. Period of abnormality 4. others | Part to be inspected |
|---|---|---|
| P0115/22 | 1. Ignition switch ON<br>2. Open or short circuit in E.F.I. water temperature sensor<br>3. 0.5 sec. or more<br>4. 1 trip | • Wiring harness or connector<br>• E.F.I. water temperature sensor<br>• Engine control computer |

Condition for detection

Circuit diagram



Related circuit diagram

Used to determine whether the circuit is normal or not. If not normal, refer here to locate the faulty location among the sensor, actuator, wiring harness or ECM.

<Note>
• If DTC P0110/24 (Intake air temperature sensor), P0115/22 (Engine coolant temp.) P0120/41 (Throttle sensor) are sequentially output, open circuit in E2 (ground lines) may occur.
• Read the freeze frame data using SST (TaSCAN). Freeze frame data has some records of the engine start condition at occurrence of malfunction. These records help troubleshooting.

**1 TaSCAN data reading (engine coolant temperature)**

SST 09991-70200
(1) Turn the ignition switch to ON to stop the engine, and read the coolant temperature displayed on SST (TaSCAN).

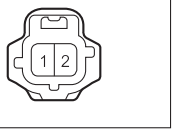
| A | B | C |
|---|---|---|
| -40° C | 140° C | Equivalent to actual coolant temp. |

B → Go to step 4.
C → Inspection for occasional trouble

A

**2 TaSCAN data reading (engine coolant temperature)**

SST 09991-70200, 09843-18040



(1) Disconnect the E.F.I. water temperature sensor connector.
(2) Using SST (diagnosis check wire No. 2), short the vehicle connector terminals of E.F.I. water temperature.
(3) Turn the ignition switch to ON.
(4) Read the coolant temperature displayed on SST (TaSCAN).
**Displayed temperature: 140°C or more**

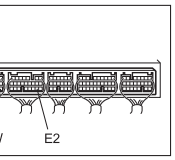
NG → Go to step 3.

OK

**Replacement of E.F.I. water temperature**

**3 TaSCAN data reading (engine coolant temperature)**

SST 09991-70200, 09843-18040



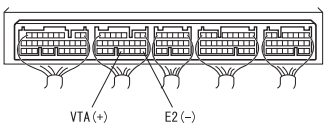
(1) Using SST (diagnosis check wire No. 2), short the circuit between the engine control computer connector A22 (THW) terminal and B18 (E2) terminal. (For terminal arrangement, refer to 06 - 13)
(2) Turn the ignition switch to ON.
(3) Read the coolant temperature displayed on SST (TaSCAN).
**Displayed temperature: 140°C or more**

NG → Inspection and replacement of engine control computer

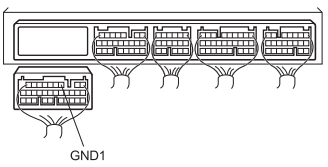
OK

Repair or replacement of wiring harness or connector

Indicates the condition of the inspected ECM connector.



(+), (-) suffixed to terminal names indicates the destination of tester connector. During inspection, connectors are being connected.

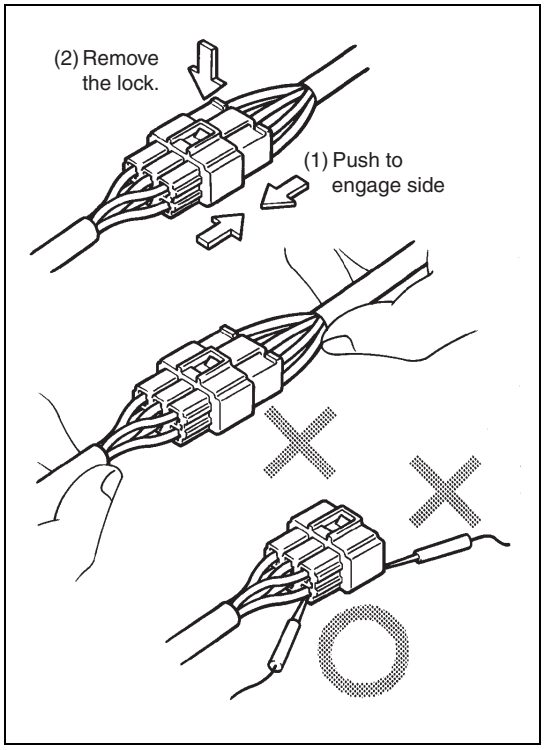


In inspection using chassis ground, ground side is not displayed. During inspection, connectors are being disconnected.

## Inspection procedures for electrical circuits and how to perform

1. Basic inspection
   (1) Resistance inspection conditions for electrical parts

(a)Unless otherwise specified, all resistances are measured under an ambient temperature of 20°C. Wait until the engine has cooled after driving. If measuring right after driving a vehicle at a high ambient temperature, the resistance will not be at the specified value.



(2) Connector handling

(a)To disconnect a connector with a lock, press the connector in the joining direction until the lock tab can be easily moved and release the lock.

(b)When disconnecting a connector, hold the connector only (not pulling the harness).

(c)Before connecting a connector, check that the terminals are not deformed, damaged, missing or similarly defective.

(d)When connecting a connector with a lock, insert securely until a locking sound is heard.

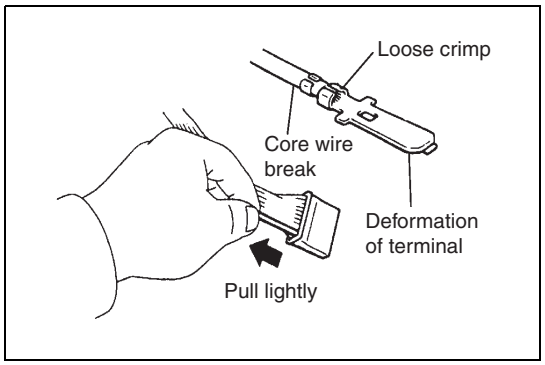
(e)If checking the connector with an electrical tester, use a mini test lead and measure from the rear of the connector (harness side).

CAUTION:

- For waterproof connectors, connect directly to the sub-harness to measure as the measurement is not possible from the rear of a waterproof connector.
- Do not excessively move the inserted tester probe and be careful not to damage any terminals.

(3) Connector inspection procedures

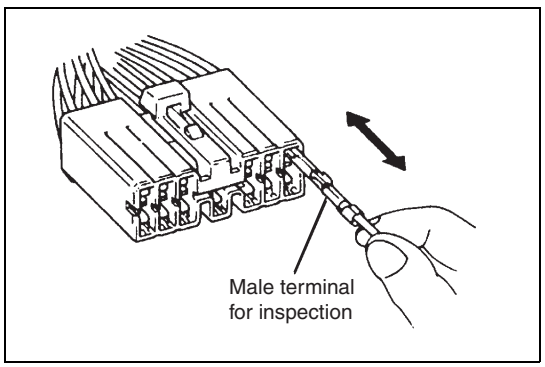
(a)With the connector connected, grasp the connector housing and check the insertion status and lock effectiveness. (engagement status)



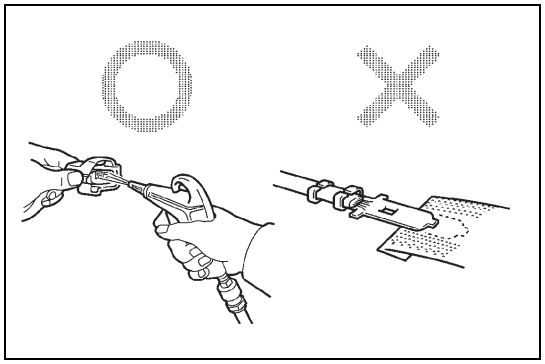
(b)With the connector separated, lightly pull on the wire harness. (missing terminals, terminal swage conditions, broken core) Visually check for presence of rust, metallic fragments, water and bent terminals. (Corrosion, foreign material, terminal deformation)

CAUTION:

If testing female gold-plated terminals, always use a male gold-plated terminal.



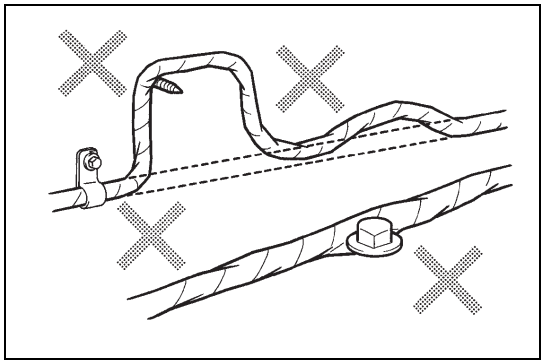
(c)Prepare a terminal similar to the male terminal and insert into the female terminal, and check the terminal contact pressure, engagement status and sliding weight.



(4) Connector terminal repair procedures
(a) If contacts are dirty, clean using an airgun or soft cloth. Never use sandpaper or similar material to polish the contacts as such material will cause the plating to come off if used to polish such parts.
(b) If contact pressure is not normal, replace the female terminals. At this time, use gold-plated terminals for the female terminals if the male terminals of the corresponding part are gold plated (gold color), and use tin-plated if the male terminals are tin-plated (silver color).
(c) If contacts are normal, clean contacts using an airgun or similar method and apply connector grease. (This is to prevent contact oxidation and wear.)

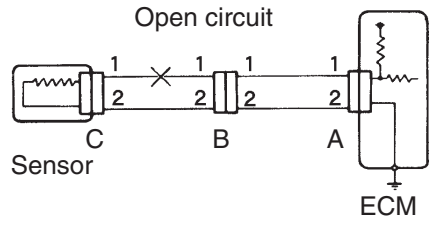
(5) Connector grease
(a) Connectors in locations likely to contact water such as the alternator and headlights are filled with grease (white) that prevents corrosion of terminals.
(b) Fill female terminals with connector grease if the connector grease is insufficient or terminals have been repaired.
CAUTION:
- Make sure that no dust or other foreign material is adhering.
- Do not use a screwdriver or similar tool to fill grease.

(c) Although there is no problem if grease adheres to waterproof connector O-rings and rubber plugs, grease adhering to other rubber parts (such as weather stripping and grommets for wire harnesses) can result in deterioration and discoloration. If grease adheres to such parts, immediately wipe off the grease.



(6) Wire harness handling
(a) If the harness is removed, check wiring and clamp conditions before performing the procedures so that it can be securely restored.
(b) Do not twist or pull harnesses, and allow no more slack than necessary.
(c) Do not allow harnesses to be interfered with by any high-temperature locations, rotating parts, sliding parts, vibrating parts, or parts with sharp angles (such as panel edges and screw tips).
(d) Make sure that harnesses are not pinched when installing parts.
(e) Harness covering must not be damaged. If damaged, replace or repair thoroughly using vinyl tape.

Figure 1



2. Open circuit inspection
   (1) Perform a resistance or voltage test for the open circuits of the wire harness shown in Fig. 1 to determine the location of the cause.

Figure 2

   (2) Measure the resistance.
      (a) Disconnect connectors A and C, and measure the resistance between them.
      Standard value: Less than 1 Ω
      NOTE:
      Measure the resistance while lightly shaking the wire harnesses up/down and left/right.
      (b) For cases shown in Fig. 2, there is an open circuit between terminals 1 of connectors A and C if the resistance between terminals 1 of connectors A and C is 10 kΩ or more (open circuit), and the resistance between terminals 2 of connectors A and C is less than 1 Ω.

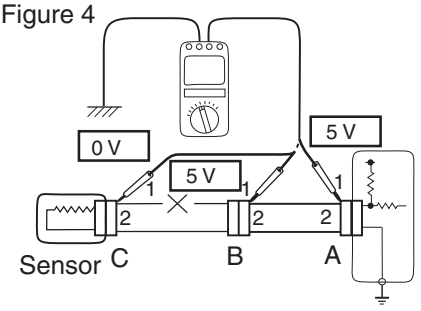
Figure 3

      (c) Disconnect connector B, and measure the resistance between connectors.
      (d) For cases shown in Fig. 3, there is an open circuit between terminals 1 of connectors B2 and C if the resistance between terminals 1 of connectors A and B1 is less than 1 Ω, and the resistance between terminals 1 of connectors B2 and C is 10 kΩ or more (open circuit).

IN

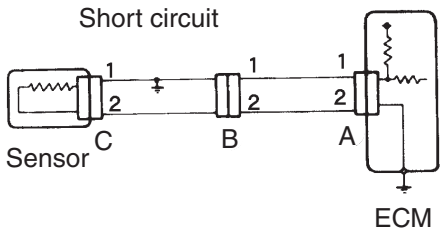
IN

Figure 4



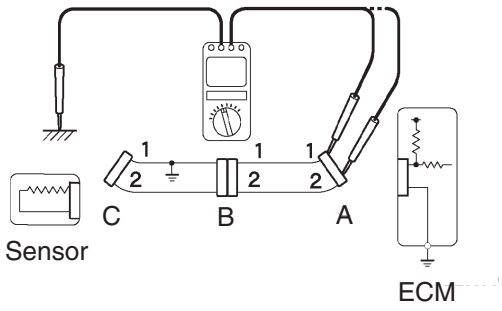
(3) Measure the voltage.
(a) A voltage test is performed to check for open circuits in circuits where voltage is applied to ECM connector terminals.
(b) As shown in Fig. 4, measure the voltage for ECM 5-V output terminal in the following order with all connectors connected. Between chassis ground and terminals 1 of connector A, connector B, and then connector C.
(c) There is an open circuit in the wire harness circuit between terminals 1 of B and C if the measurement results are as follows.
Criteria: Between terminal 1 of connector A and chassis ground: 5 V
Between terminal 1 of connector B and chassis ground: 5 V
Between terminal 1 of connector C and chassis ground: 0 V

Figure 5



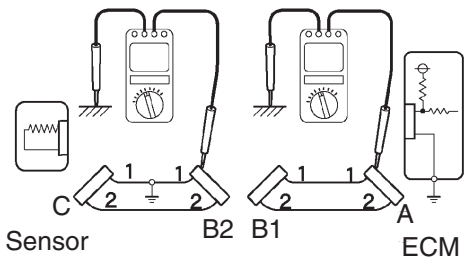
3. Short circuit inspection
(1) As shown in Fig. 5, a "Ground resistance inspection" is performed if there is a short circuit of a wire harness ground to determine the location of the cause.

Figure 6

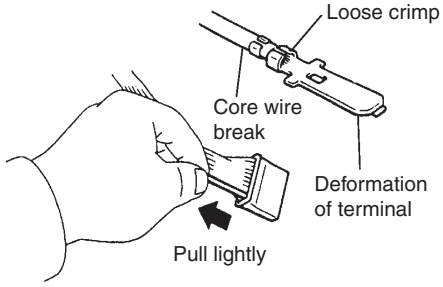


(2) Ground resistance inspection
(a) Disconnect connectors A and C, and measure the resistance between terminals 1 and 2 of connector A, and chassis ground.
Standard value: 10 k Ωor more
NOTE:
Measure the resistance while lightly shaking the wire harnesses up/down and left/right.
(b) For cases shown in Fig. 6, there is a short circuit between terminals 1 of connectors A and C if the resistance is less than 1 Ω(short circuit) between terminal 1 of connector A and chassis ground, and the resistance between terminal 2 of connector A and chassis ground is 10 kΩ or more.

Figure 7



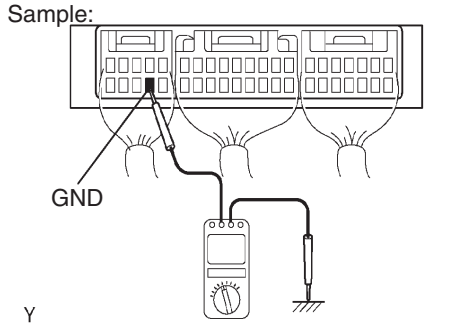
(c) Disconnect connector B, and measure the resistance between terminal 1 of connector A and chassis ground, and between terminal 1 of connector B2 and chassis ground. There is a short circuit between terminals 1 of connectors B2 and C if the resistance is 10 kΩ or more between terminal 1 of connector A and chassis ground, and the resistance between terminal 1 of connector B2 and chassis ground is less than 1 Ω(short circuit).



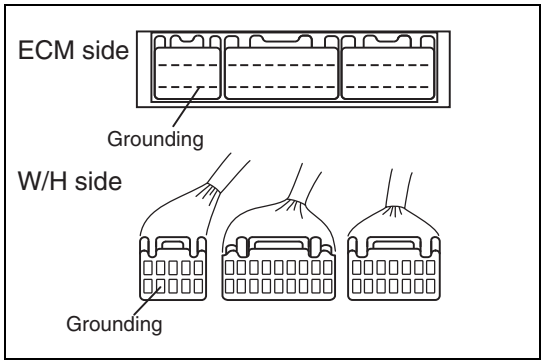
4. Visual and contact pressure inspection
   (1) Disconnect the connectors on both sides.
   (2) Check that there is no rust or foreign material adhering to the connector terminals.
   (3) Check that rounded parts are not loose or damaged, and that the terminal is firmly secured in the lock position.
   NOTE:
   Make sure that the terminal does not release when slightly pulled from the rear.
   (4) Insert a male test terminal into the female terminal and pull it out.
   NOTE:
   If it easier to pull out the test terminal in comparison with other terminals, this indicates that the contact of this part is poor.

5. ECM inspection and replacement
   CAUTION:
   - With the connector connected to the ECM, check from the rear of the connector on the wire harness side.
   - Inspections for which no inspection conditions are indicated, perform with the engine stopped and with IG ON.

Sample:



(1) First test the ECM ground circuit and repair if there is any fault. If normal, it indicates that the ECM is faulty. Replace with a normal ECM and check if there are any malfunction phenomenon present.
(a) Measure the resistance between the ECM ground terminal and chassis ground.
Standard value: Less than 1 Ω



(b)Disconnect the ECM connector, check that there is no bending of the ground terminals on the ECM and wire harness sides, and measure the contact pressure.

# Terminology list

## Abbreviations

| Abbreviation | Unabbreviated word(s) | Description |
|---|---|---|
| ABS | Antilock Brake System | Antilock brake system |

|  ST18632AA010 | 18632AA010 | STAND ASSY | Used for removing and installing engine ASSY. |
|  ST1228138150 | 12281-38150 | ENGINE HANGER NO. 1 | Used for removing and installing engine ASSY. |
| ST9011914120 | 90119-14120 | BOLT | Used for removing and installing engine ASSY. |

## General tool

| Tool name | Remarks |
|---|---|
| Compression gauge | Used for measuring compression. |
| Compression gauge attachment | Used for measuring compression. |
| Thickness gauge | Used for measuring camshaft clearance. |
| Micrometer | Used for measuring camshaft clearance. |
| ANGLE GAUGE | Used for angle tightening. |
| Hexagon wrench (diameter: 2.5 mm {0.0984 in}) | Used for securing chain tensioner NO. 1. |
| Socket hexagon (5 mm {0.197 in}) | Used for removing and installing chain guide. |
| Torx® bit T45 | Used for removing and installing oil pan upper. |
| Torx Plus® socket wrench 40IP | Used for removing and installing fuel pump ASSY. |
| Oil pan seal cutter | Used for removing oil pan. |
| DST-i | Used with the Subaru Select Monitor 4. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| Wire (diameter: approx. 1.3mm {0.05 in}) | — | Chain tensioner NO. 2 |

| Name | Part number | Location of use |
|---|---|---|
| THREE BOND 1217G, THREE BOND 1217H, or equivalent | K0877Y0100 (THREE BOND 1217G) | • Front camshaft cap, intake rear camshaft cap, and exhaust rear camshaft cap<br>• Cam carrier<br>• Cylinder head gasket NO. 2<br>• Rocker cover RH and rocker cover LH<br>• Cylinder head plate RR<br>• Vacuum pump ASSY<br>• Oil pan upper<br>• Oil pan |
| Rope | — | Exhaust pipe ASSY FR |
| Compressor oil (ND-OIL8) | — | Compressor ASSY, suction hose SUB-ASSY |

# Fuel

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST18471AA000 | 18471AA000 | FUEL PIPE ADAPTER | Used for removing fuel. |
|  ST42099AE000 | 42099AE000 | QUICK CONNECTOR RELEASE | Used for disconnecting fuel hose. |
|  ST42099CA000 | 42099CA000 | ST FUEL PUMP | • Used for removing and installing fuel pump ASSY.<br>• Used for removing and installing fuel sender gauge ASSY. |
|  ST0926039020 | 09260-39020 | INJECTOR TOOL SET | Used for installing fuel injector seal. |

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
| STSSM4 | — | Subaru Select Monitor 4 | Used for various settings and diagnosing electrical system failure.<br>NOTE:<br>For detailed operation procedures of the Subaru Select Monitor 4, refer to "PC application help". |

## General tool

| Tool name | Remarks |
|---|---|
| Fuel pressure meter | Used for measuring fuel pressure. |
| Circuit tester | Used for measuring resistance, voltage and current. |
| Union nut wrench (17 mm {0.669 in}) | Used for removing and installing fuel delivery pipe and fuel delivery pipe NO. 2. |
| Torx Plus® socket wrench 40IP | Used for removing and installing fuel pump ASSY. |
| Socket hexagon (6mm {0.236in}) | Used for removing and installing pump drive case ASSY. |
| Transmission jack | Used for removing and installing fuel tank. |
| DST-i | Used with the Subaru Select Monitor 4. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| THREE BOND 1217G, THREE BOND 1217H, or equivalent | K0877Y0100 (THREE BOND 1217G) | Pump drive case ASSY |
| Butyl tape | — | Rear floor service hole cover, rear floor service hole cover NO. 2 |

# Emission control

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
| STSSM4 | — | Subaru Select Monitor 4 | Used for various settings and diagnosing electrical system failure.<br>NOTE:<br>For detailed operation procedures of the Subaru Select Monitor 4, refer to "PC application help". |

## General tool

| Tool name | Remarks |
|---|---|
| Mighty vac | Used for inspecting fuel outlet valve ASSY. |
| Circuit tester | Used for measuring resistance, voltage and current. |
| Deep socket wrench (19 mm {0.748 in}) | Used for removing and installing PCV valve. |
| DST-i | Used with the Subaru Select Monitor 4. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| THREE BOND 1324 or equivalent | 004403042 | PCV valve |

# Intake / exhaust

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST1228138150 | 12281-38150 | ENGINE HANGER NO. 1 | Used for removing and installing exhaust pipe SUB-ASSY FR. |
| ST9011914120 | 90119-14120 | BOLT | Used for removing and installing exhaust pipe SUB-ASSY FR. |
|  ST99099AJ000 | 99099AJ000 | ENGINE HANGER | Used for removing and installing exhaust pipe SUB-ASSY FR. |
|  ST18679AA020 | 18679AA020 | ADJUSTER | Used for removing and installing exhaust pipe SUB-ASSY FR. |

PP

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST18632AA020 | 18632AA020 | STAND ASSY | Used for removing and installing exhaust pipe SUB-ASSY FR. |

# Cooling

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
| STSSM4 | — | Subaru Select Monitor 4 | Used for various settings and diagnosing electrical system failure.<br>NOTE:<br>For detailed operation procedures of the Subaru Select Monitor 4, refer to "PC application help". |
|  ST18355AA000 | 18355AA000 | PULLEY WRENCH | Used for removing and installing water pump pulley. |
|  ST18334AA030 | 18334AA030 | PULLEY WRENCH PIN SET | Used for removing and installing water pump pulley. |

## General tool

| Tool name | Remarks |
|---|---|
| Radiator cap tester | Used for inspecting radiator and radiator cap. |
| Circuit tester | Used for measuring resistance, voltage and current. |
| DST-i | Used with the Subaru Select Monitor 4. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| SUBARU Super Coolant (concentration type) | — | Coolant |
| SUBARU Super Coolant (dilution type) | K0670Y0001 | Coolant |
| Water for dilution (distilled water) | — | Coolant |
| Cooling system conditioner | S0A345001 | — |
| Thermometer | — | Thermostat |
| Caliper gauge | — | Thermostat |

# Lubrication

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST18332AA020 | 18332AA020 | OIL FILTER WRENCH | Used for removing and installing oil filter. |

PP

## General tool

| Tool name | Remarks |
|---|---|
| Oil pressure gauge | Used for measuring oil pressure. |
| Deep socket wrench (24mm {0.945in}) | Used for removing and installing engine oil pressure switch ASSY. |
| Deep socket wrench (19 mm {0.748 in}) | Used for removing and installing engine oil temperature sensor. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| THREE BOND 1324 or equivalent | 004403042 | Engine oil pressure switch ASSY |
| THREE BOND 1217G, THREE BOND 1217H, or equivalent | K0877Y0100 (THREE BOND 1217G) | Chain cover |

# Starting

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST18283AA000 | 18283AA000 | ADAPTER WRENCH | Used for tightening upper mounting bolt of starter ASSY. |

## General tool

| Tool name | Remarks |
|---|---|
| AC/DC probe 400A | Used for measuring starter driving current. |
| Circuit tester | Used for measuring resistance, voltage and current. |

# Cruise control

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
| STSSM4 | — | Subaru Select Monitor 4 | Used for various settings and diagnosing electrical system failure.<br>NOTE:<br>For detailed operation procedures of the Subaru Select Monitor 4, refer to "PC application help". |

## General tool

| Tool name | Remarks |
|---|---|
| Circuit tester | Used for measuring resistance, voltage and current. |
| DST-i | Used with the Subaru Select Monitor 4. |

# Automatic transmission / transaxle

## SST

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST-398527700 | 398527700 | PULLER ASSY | Used for removing extension housing rear oil seal. |
| ST0932540010 | 09325-40010 | TRANSMISSION OIL PLUG | Used for installing extension housing rear oil seal. |
|  ST-498575400 | 498575400 | PRESSURE GAUGE ADAPTER | Used when measuring hydraulic pressure for line pressure. |
|  ST18681AA040 | 18681AA040 | OIL PRESSURE GAUGE ADAPTER | Used when measuring hydraulic pressure for line pressure. |

PP

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST-498897700 | 498897700 | PRESSURE GAUGE ADAPTER SET | Used when measuring hydraulic pressure for line pressure. |
|  ST18750AA010 | 18750AA010 | STOPPER | • Used for removing automatic transmission ASSY from engine and installing it to engine.<br>• Used for preventing torque converter from falling. |
|  ST18355AA000 | 18355AA000 | PULLEY WRENCH | Used for securing crank pulley. |
|  ST18334AA000 | 18334AA000 | PIN SET | Used for securing crank pulley. |

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST1228138150 | 12281-38150 | ENGINE HANGER | Used for removing and installing automatic transmission ASSY. |
| ST9011914120 | 90119-14120 | BOLT | Used for removing and installing automatic transmission ASSY. |
|  ST99099AJ000 | 99099AJ000 | ENGINE HANGER | Used for removing and installing automatic transmission ASSY. |
|  ST18679AA020 | 18679AA020 | ADJUSTER | Used for removing and installing automatic transmission ASSY. |

PP

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST18632AA010 | 18632AA010 | STAND ASSY | Used for removing and installing automatic transmission ASSY. |
|  ST-498247001 | 498247001 | MAGNET BASE | Used for measuring runout, etc. |
|  ST0935132010 | 09351-32010 | TOOL ONE-WAY CLUTCH TEST | Used for unit inspection of torque converter. |
|  ST0935132020 | 09351-32020 | STOPPER STATOR | Used for unit inspection of torque converter. |

| Illustration | Tool number | Name | Remarks |
|---|---|---|---|
|  ST0938700110 | 09387-00110 | CLUTCH COMPRESSION WRENCH | Used for removing and installing NO. 1 clutch balancer. |

| ST98299PA030 | 98299PA030 | Airbag deployment tool | Used for operation process of pretensioner. |
|  ST98299FJ010 | 98299FJ010 | TEST HARNESS ADAPTER AN | Repair kit for replacing the melted connector of test harness adapter D. |
| STSSM4 | — | Subaru Select Monitor 4 | Used for various settings and diagnosing electrical system failure.<br>NOTE:<br>For detailed operation procedures of the Subaru Select Monitor 4, refer to "PC application help". |

## General tool

| Tool name | Remarks |
|---|---|
| Circuit tester | Used for measuring resistance, voltage and current. |
| Hog ring pliers | Used for installing seat cushion pad. |
| DST-i | Used with the Subaru Select Monitor 4. |

# Air conditioner

## General tool

| Tool name | Remarks |
|---|---|
| Circuit tester | Used for measuring resistance, voltage and current. |
| Molding remover | Used for disconnecting defroster nozzle garnish. |
| Wrench | When servicing A/C system, various wrenches are required. These include torque wrenches 7 - 40 N·m (0.7 - 4.1 kgf-m, 5 - 30 ft-lb) and various crowfoot wrenches. To secure a pipe joint or a hose joint, an open-end wrench or a flare-nut wrench is required. |
| Application bottle | Using small application bottles is recommended when applying compressor oil to various parts. These bottles can be purchased at hardware stores, etc. |
| Manifold gauge set (air conditioner tool set) | Manifold gauge set (with hose) can be purchased from coolant suppliers or vehicle parts suppliers. |
| Refrigerant recovery system | Refrigerant recovery system removes contaminants and moisture from refrigerant, and then recover and recycle the refrigerant for the A/C system. |
| Syringe | To replenish oil into the system, a calibrated plastic syringe is required. Syringes can be purchased at pharmacies, etc. |
| Vacuum pump | A vacuum pump is required to provide good working environment. It can be purchased from coolant suppliers or vehicle parts suppliers. |
| Can tap | A can tap can be purchased from vehicle parts suppliers. |
| Wet-and-dry-bulb thermometer | A wet-and-dry-bulb thermometer can be purchased at industrial hardware stores or from coolant suppliers. |
| Electronic leak detector | An electronic leak detector can be purchased from specialty tool suppliers or A/C equipment suppliers. |
| Measuring apparatus | When using a refrigerant receptacle of 13.6 kg (30 lb), a measuring apparatus such as an electronic measure or a scale with digital display is required. |

## Lubricant, etc.

| Name | Part number | Location of use |
|---|---|---|
| Refrigerant HFC-134a (R134a) | — | Cooling system |
| Compressor oil (ND-OIL8) | — | Cooling system |
| SUBARU genuine grease | 72129AJ000 | Main link of air conditioner damper servo SUB-ASSY No. 3 and lever pin No. 1 |

# Instrument panel / body interior

## General tool

| Tool name | Remarks |
|---|---|
| Molding remover | Used for removing instrument panel speaker panel. |

# Glass & window

## SST

# EFI system (FA20)

## Precautions

1. Precautions

   WARNING:

   Observe the following items for the safe usage of SSM4.

   - Before using the SSM4, read the operation manual.
   - When running the vehicle with the SSM4 connected to the DLC3, be careful not to let the cable contact the pedal, shift lever or steering wheel.
   - When running the vehicle with the SSM4 connected to the DLC3, always work in a team of two to avoid driving while operating tools and obey traffic regulations.

   CAUTION:

   - When replacing the engine control computer, perform registration of the identification code. (For registration procedure, refer to "REGISTRATION MANUAL FOR IMMOBILIZER.")
   - After turning the ignition switch to OFF, you may have to wait for a while before disconnecting the battery terminals. Check appropriate precautions for battery terminal disconnection before proceeding. (Refer to IN - 6)

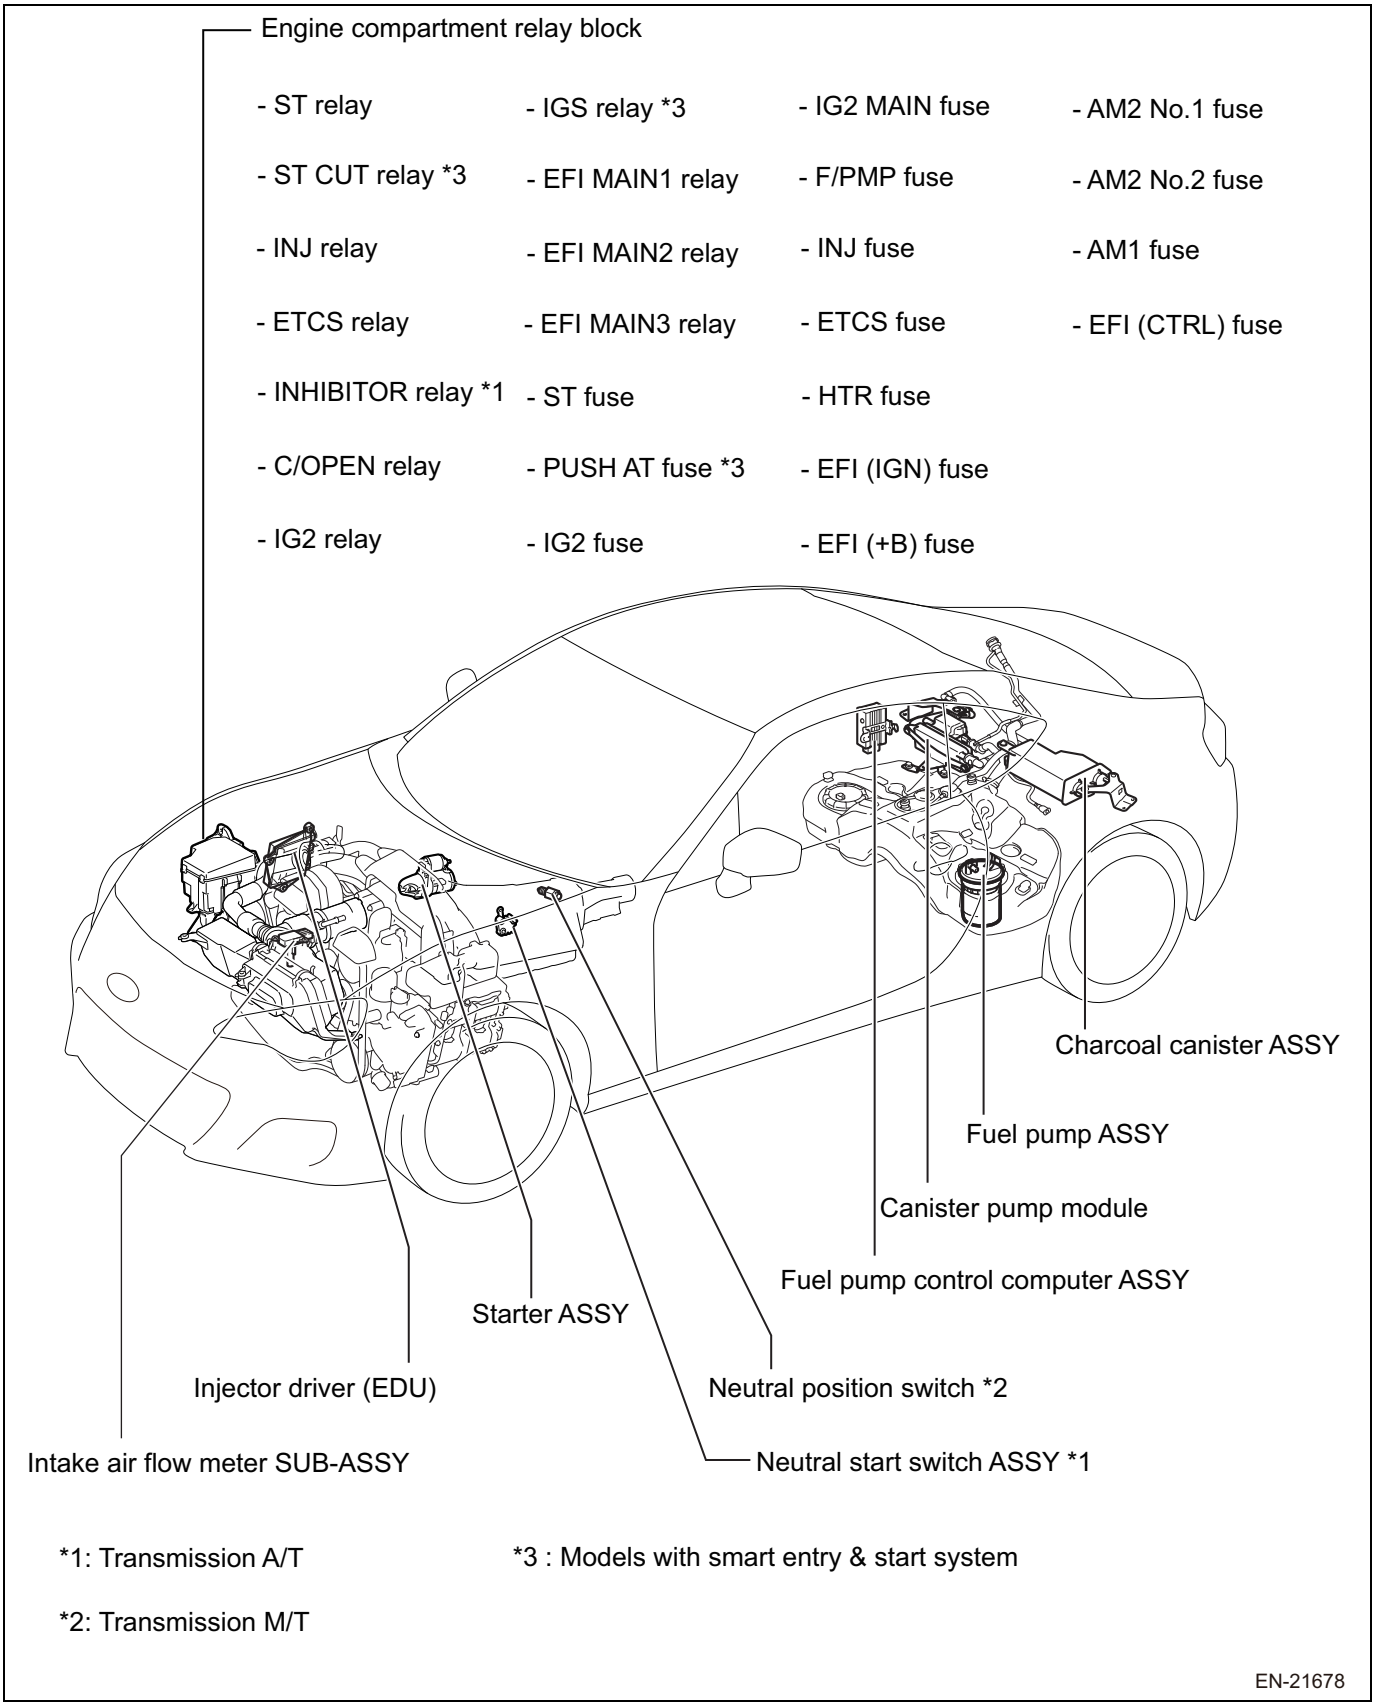
## Basic inspection

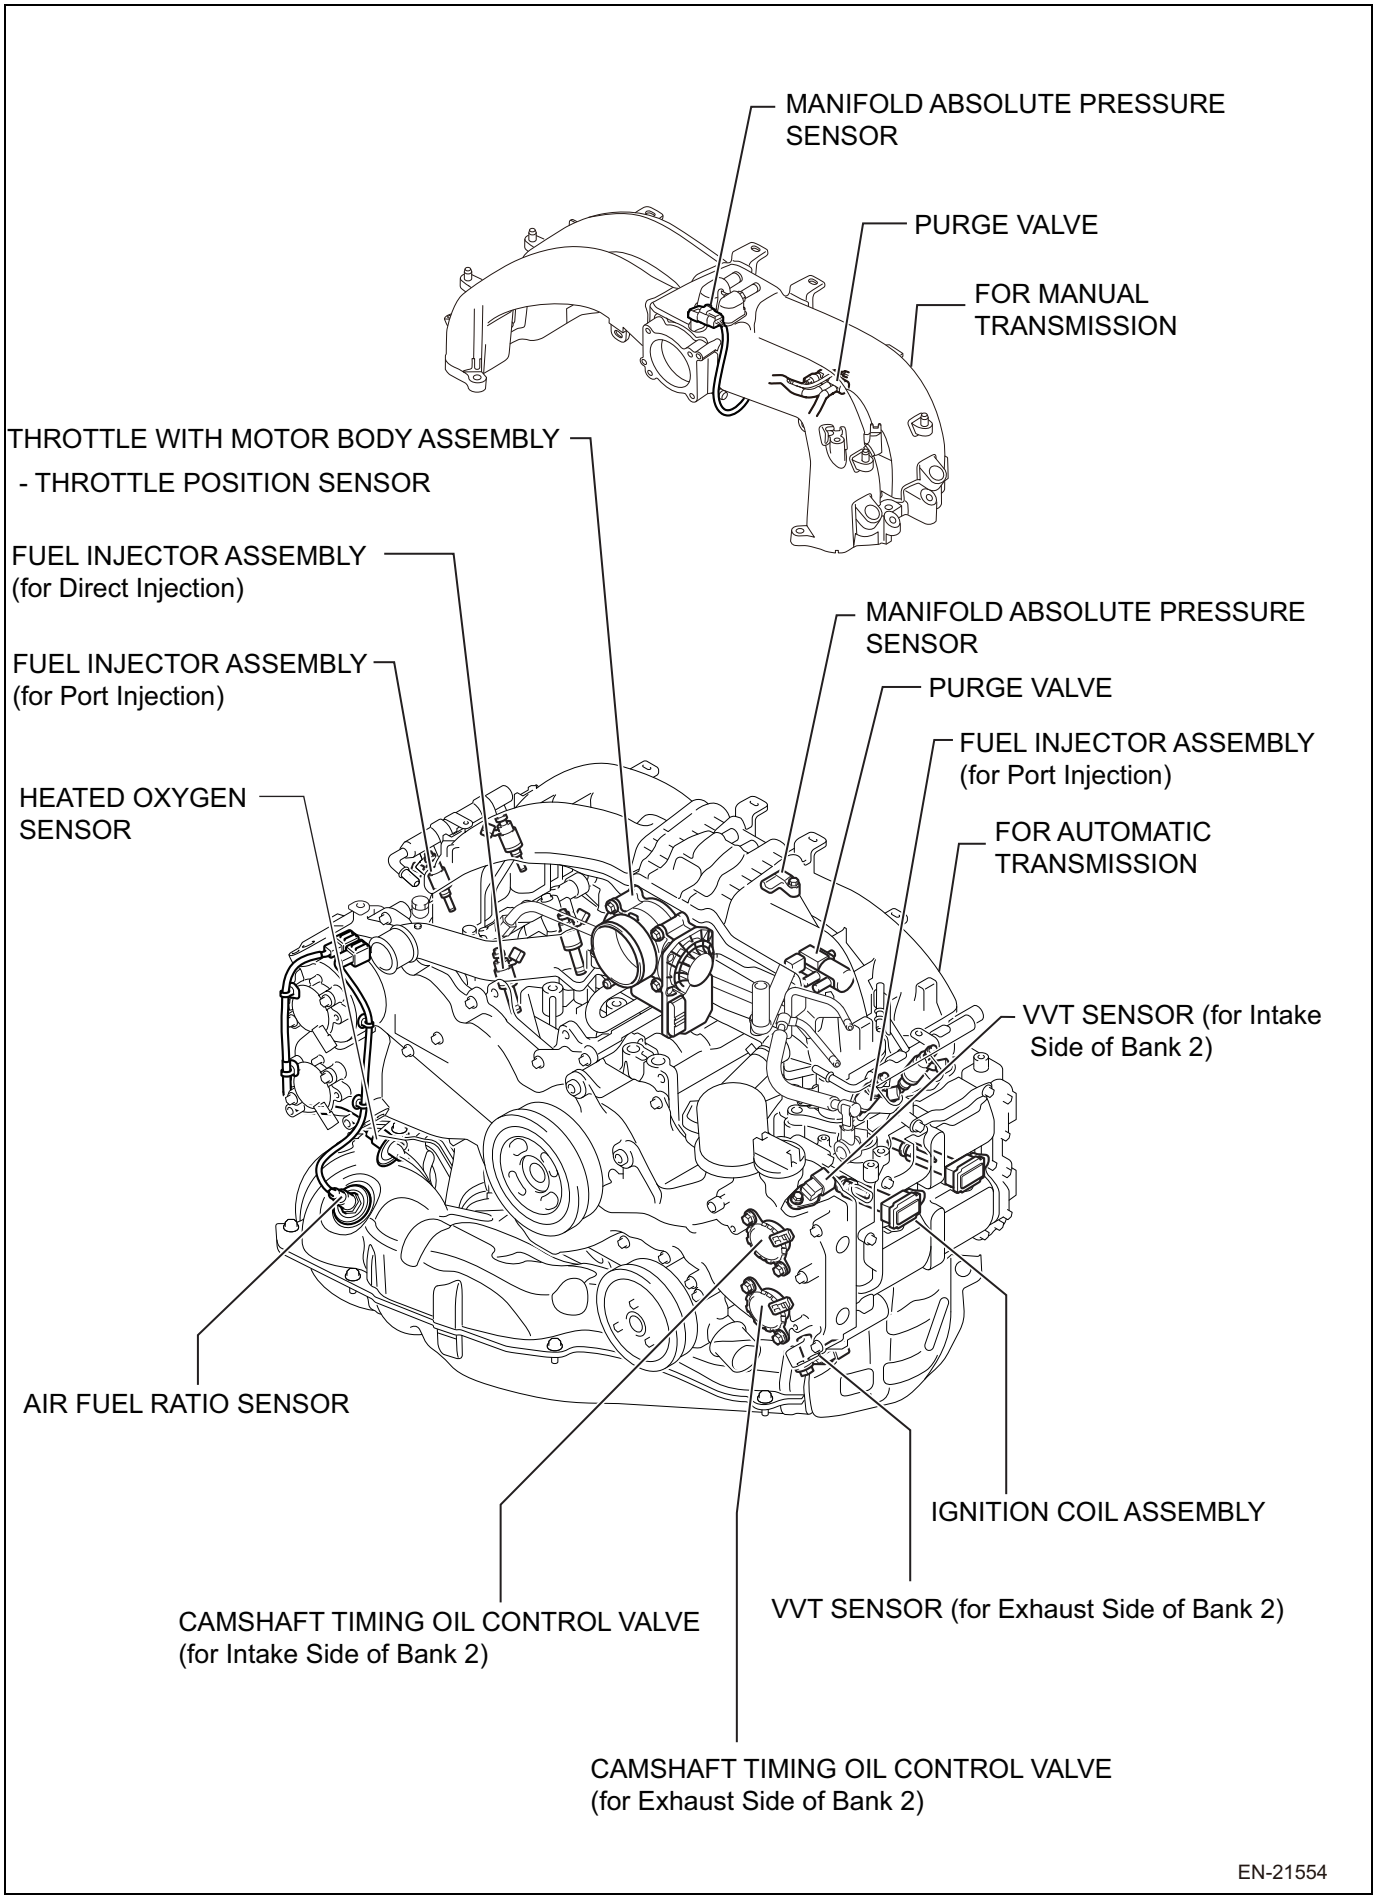
CAUTION:

When it is impossible to locate the defective part after troubleshooting, perform the following basic inspection to determine the problem.

1. Battery check
   (1) Check the battery condition. (Refer to BH - 3)
2. Cranking operation inspection
   (1) Check that the engine is cranked.
   NOTE:
   If not, refer to symptom table. (Refer to ES - 16)
3. Engine starting inspection
   (1) Check that the engine starts.
   NOTE:
   If not, refer to symptom table. (Refer to ES - 16)
4. Air filter inspection
   (1) Check the air filter.
   NOTE:
   When the air filter is dirty, clean or replace it.
5. Idle speed check
   (1) Check the idle speed. (Refer to EM - 2)
6. Ignition timing inspection
   (1) Check the ignition timing. (Refer to EM - 2)
7. Fuel pressure check
   (1) Check the fuel pressure. (Refer to FU - 9)
8. Spark Inspection
   (1) Check the spark. (Refer to ES - 657)
9. Compression inspection
   (1) Check the compression. (Refer to EM - 2)

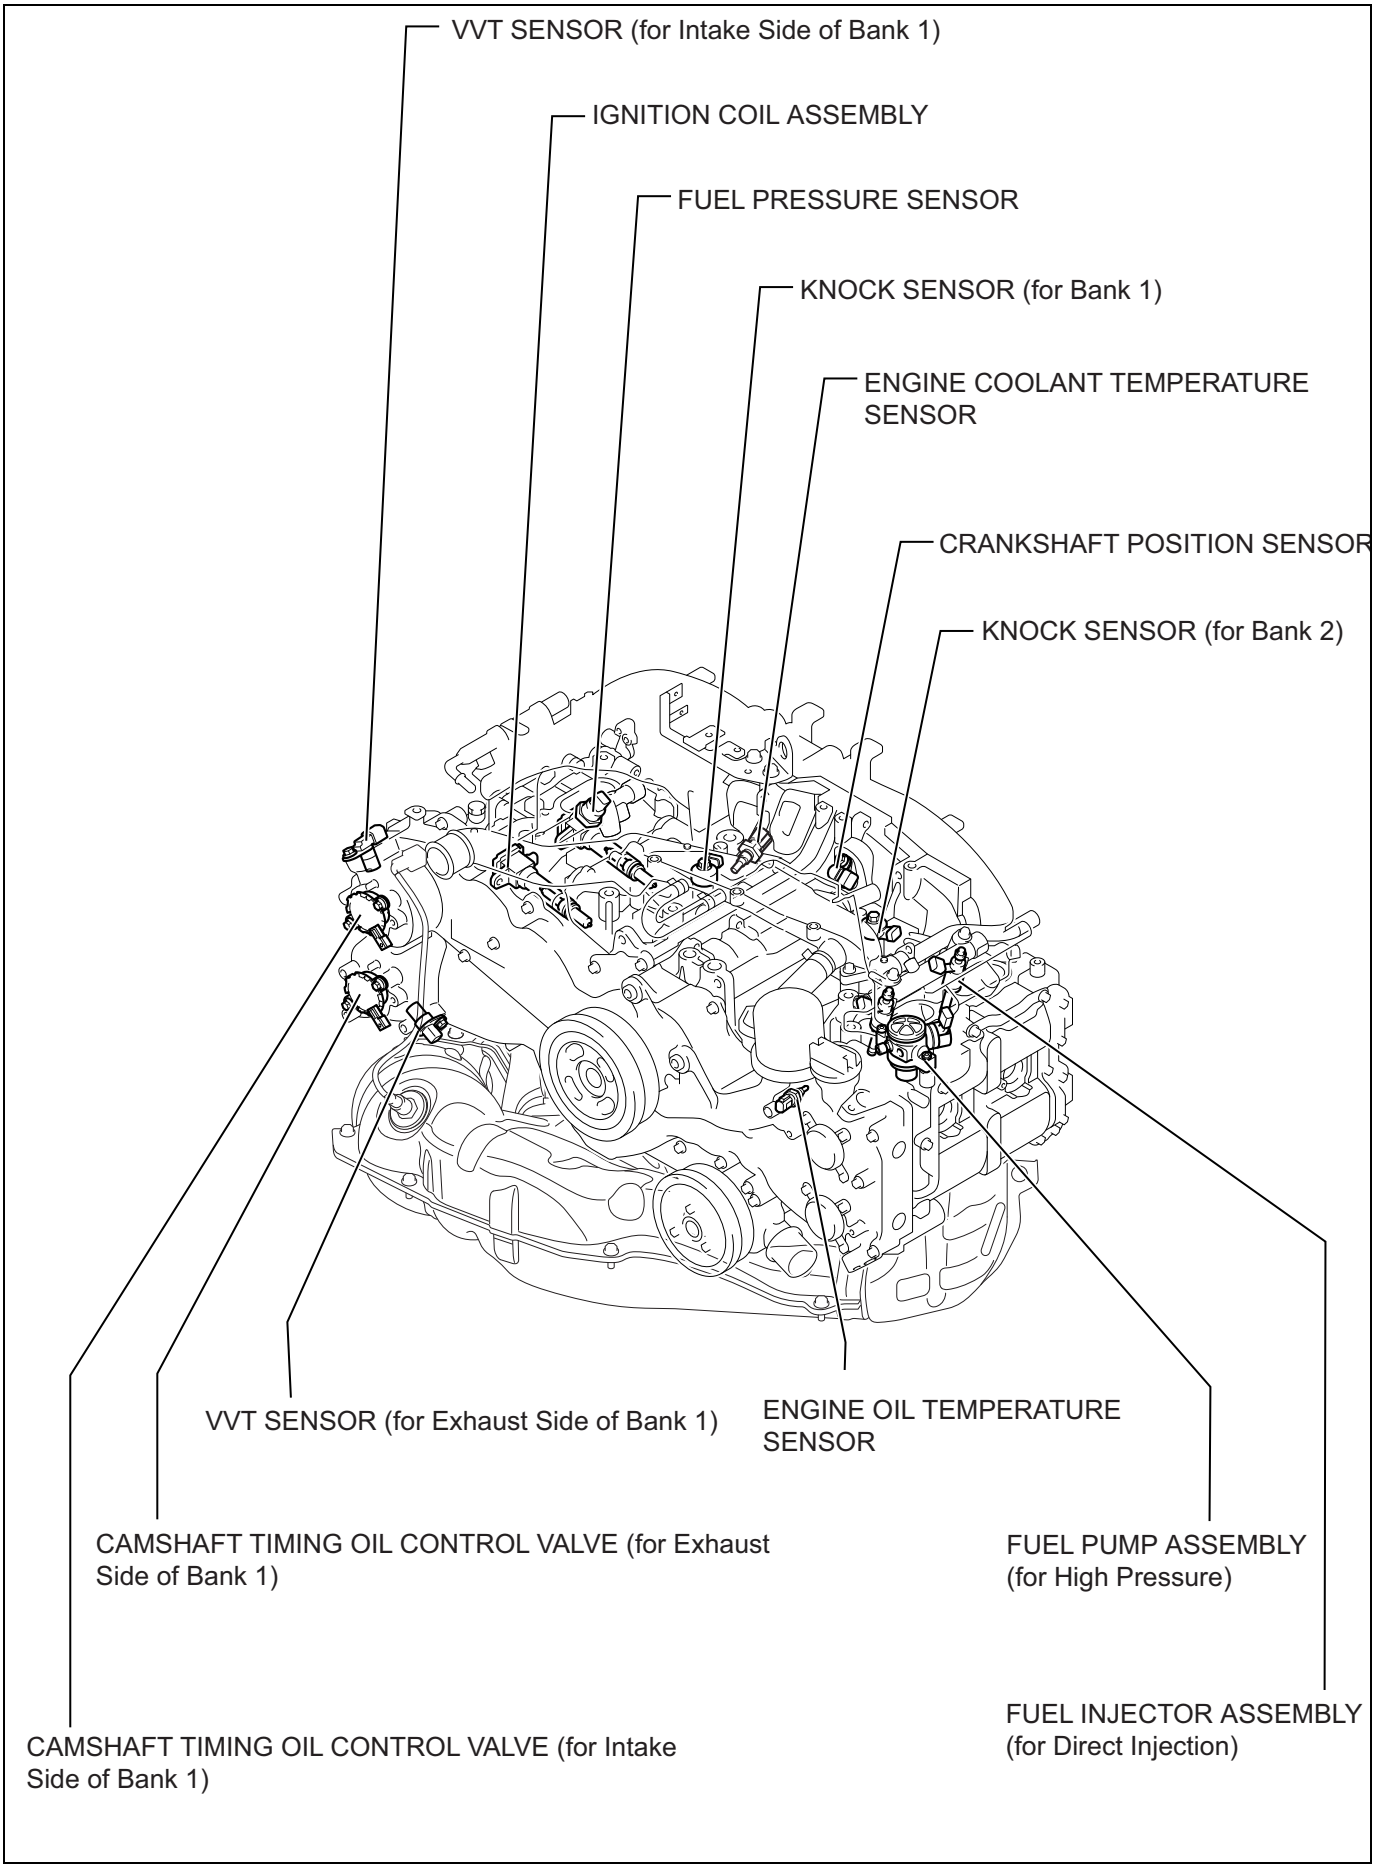
## Parts location



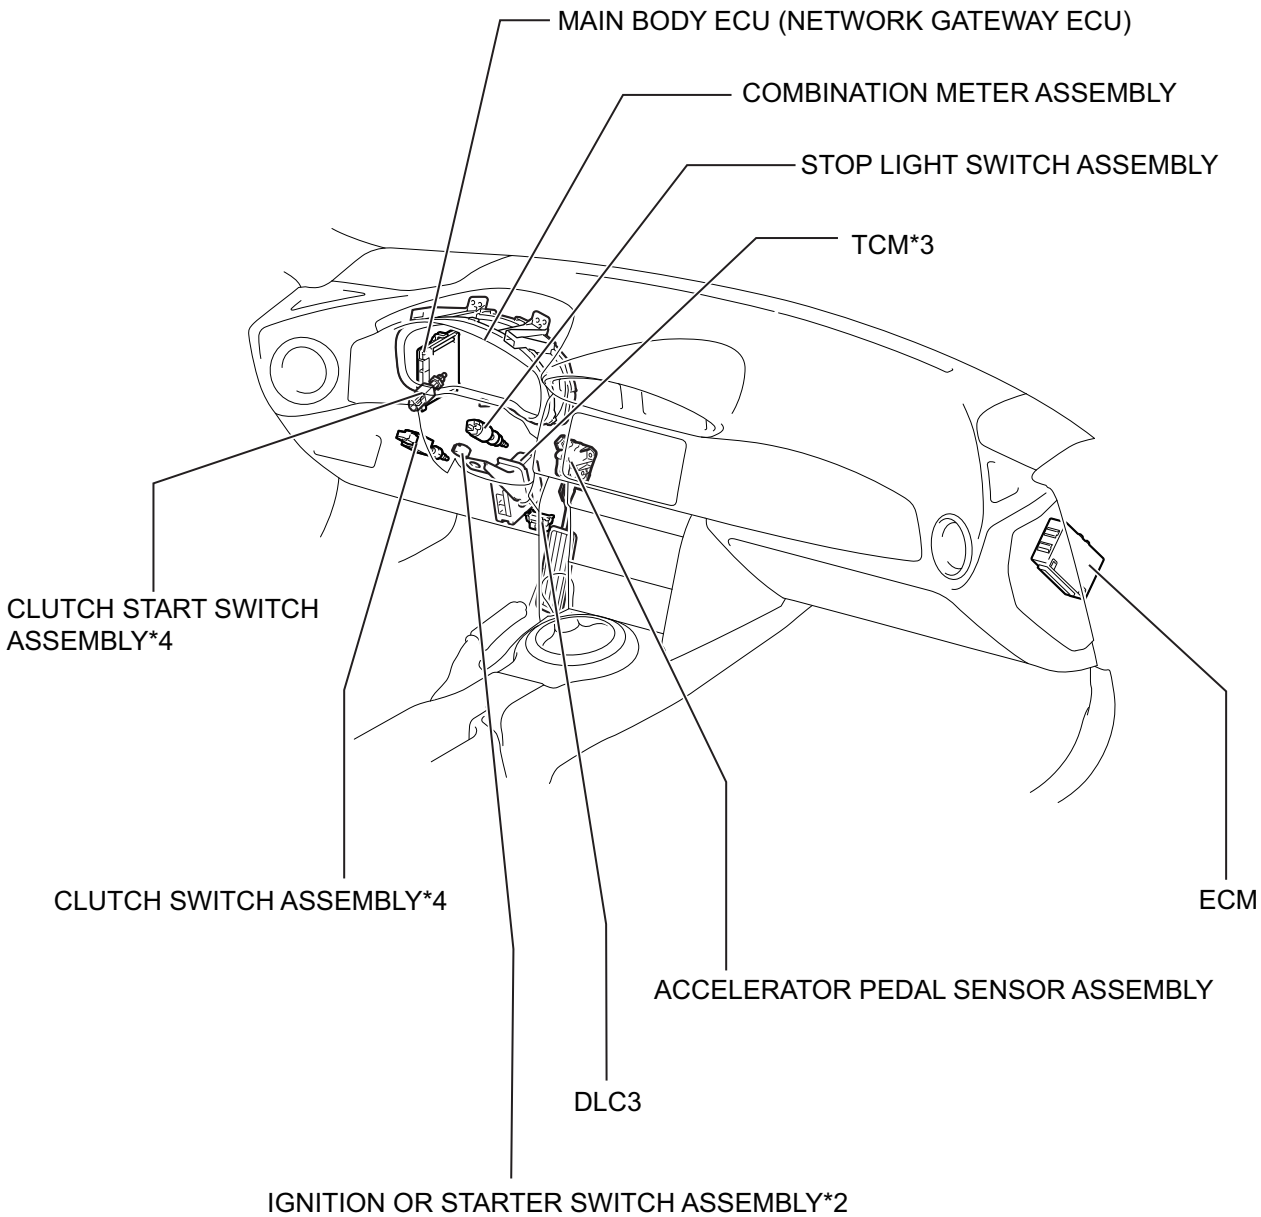


MANIFOLD ABSOLUTE PRESSURE SENSOR
PURGE VALVE
FOR MANUAL TRANSMISSION
THROTTLE WITH MOTOR BODY ASSEMBLY
- THROTTLE POSITION SENSOR
FUEL INJECTOR ASSEMBLY (for Direct Injection)
FUEL INJECTOR ASSEMBLY (for Port Injection)
HEATED OXYGEN SENSOR
MANIFOLD ABSOLUTE PRESSURE SENSOR
PURGE VALVE
FUEL INJECTOR ASSEMBLY (for Port Injection)
FOR AUTOMATIC TRANSMISSION
VVT SENSOR (for Intake Side of Bank 2)
AIR FUEL RATIO SENSOR
IGNITION COIL ASSEMBLY
CAMSHAFT TIMING OIL CONTROL VALVE (for Intake Side of Bank 2)
VVT SENSOR (for Exhaust Side of Bank 2)
CAMSHAFT TIMING OIL CONTROL VALVE (for Exhaust Side of Bank 2)
EN-21554

ES



VVT SENSOR (for Intake Side of Bank 1)
IGNITION COIL ASSEMBLY
FUEL PRESSURE SENSOR
KNOCK SENSOR (for Bank 1)
ENGINE COOLANT TEMPERATURE SENSOR
CRANKSHAFT POSITION SENSOR
KNOCK SENSOR (for Bank 2)
VVT SENSOR (for Exhaust Side of Bank 1)
ENGINE OIL TEMPERATURE SENSOR
CAMSHAFT TIMING OIL CONTROL VALVE (for Exhaust Side of Bank 1)
FUEL PUMP ASSEMBLY (for High Pressure)
FUEL INJECTOR ASSEMBLY (for Direct Injection)
CAMSHAFT TIMING OIL CONTROL VALVE (for Intake Side of Bank 1)



ID CODE BOX (IMMOBILISER CODE ECU)*5

CERTIFICATION ECU (SMART KEY ECU ASSEMBLY)

REFER TO THE “REGISTRATION MANUAL FOR IMMOBILIZER” FOR ATTACHMENT POSITION.

*1: w/ Entry and Start System

*2: w/o Entry and Start System

*3: for Automatic Transmission

*4: for Manual Transmission

*5: w/ ID Code Box

EN-10081

## DTC table

| DTC | Diagnostic items | Light on | Code recording | Reference pages |
|---|---|---|---|---|
| P000A | [A Camshaft Position Slow Response (Bank 1)] | 0 | 0 | ES - 85 |
| P000B | [B Camshaft Position Slow Response (Bank 1)] | 0 | 0 | ES - 99 |
| P000C | [A Camshaft Position Slow Response (Bank 2)] | 0 | 0 | ES - 85 |
| P000D | [B Camshaft Position Slow Response (Bank 2)] | 0 | 0 | ES - 99 |
| P0010 | [A Camshaft Position Actuator Circuit/Open (Bank 1)] | 0 | 0 | ES - 112 |
| P0011 | [Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)] | 0 | 0 | ES - 85 |
| P0013 | [B Camshaft Position - Actuator Circuit/Open (Bank 1)] | 0 | 0 | ES - 116 |
| P0014 | [Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 1)] | 0 | 0 | ES - 99 |

## Symptom table

| Symptom | Suspected Area | See page |
|---|---|---|
| Engine does not crank (Does not start) | Battery | BH - 3 |
| | Starter | ST - 3 |
| | Park/neutral position switch assembly*1 | AT - 189 |
| | Clutch start switch assembly*2 | CL - 31 |
| | Starter signal circuit | ES - 614, ES - 624 |
| No initial combustion (Does not start) | ECM power source circuit | ES - 646 |
| | Crankshaft position sensor | ES - 685 |
| | Ignition system | ES - 656 |
| | Fuel pump control circuit | ES - 606 |
| | Fuel pump | FU - 56 |
| | Fuel injector circuit | ES - 637 |
| | Valve timing | EM - 13 |
| | VC output circuit (ECM 5 V output) | ES - 640 |
| | VVT sensor (for intake side) | ES - 317 |
| | VVT sensor (for exhaust side) | ES - 329 |
| | Starter signal circuit | ES - 614, ES - 624 |
| | Engine immobiliser system | TD - 237 |
| | ECM | ES - 674 |

| Symptom | Suspected Area | See page |
|---|---|---|
| Engine cranks normally but difficult to start | Fuel pump control circuit | ES - 606 |
| | Fuel pump (for high pressure) | FU - 61 |
| | Fuel injector circuit | ES - 637 |
| | Fuel injector assembly (for port injection) | FU - 29 |
| | Fuel injector assembly (for direct injection) | FU - 39 |
| | ECM power source circuit | ES - 646 |

## How to troubleshoot

| | |
|---|---|
| 1 | Bring in the car |

Next

| | |
|---|---|
| 2 | Interview and phenomenon check |

Next

| | |
|---|---|
| 3 | Read DTC |

(1) Check the DTC(s) related to engine and CAN communication system and the freeze frame data.

(2) When DTC is output or freeze frame data is displayed, store it.
CAUTION:
When clearing the DTC and/or freeze frame data, be sure to store the data before clearing it.

Result

| Result | Go to |
|---|---|
| When DTC not related to CAN communication system is output. | A |
| When no DTC is output. | B |
| When DTC related to CAN communication system is output. | C |

| | |
|---|---|
| B | Go to Step 12. |
| C | Go to CAN communication section. (Refer to NW - 30) |

A

| | |
|---|---|
| 4 | Check repeatability of malfunction |

(1) Perform repeatability test, referring to the result of the interview.

Result

| Result | Go to |
|---|---|
| When malfunction is repeated | A |
| When malfunction is not repeated | B |

ES

B → Go to Step 9.

A

| | |
|---|---|
| 5 | List of diagnostic codes (main inspection parts) or troubleshooting for DTC |

(1) Refer to list of diagnostic codes, and perform troubleshooting for DTC. (Refer to ES - 12)

Result

| Result | Go to |
|---|---|
| When faulty points are not determined. | A |
| When faulty points are determined. | B |

B → Go to Step 7.

A

| | |
|---|---|
| 6 | System circuit inspection |

(1) If the faulty parts are not specified after the diagnosis according to the inspection procedure, refer to the inspection method of the electrical circuit, and perform the circuit inspection again. (For system circuit figure, refer to ES - 29.)

## Monitor status check

The purpose of the monitor result (mode 06) is to access the on-board diagnostic monitoring test result in the particular component or system that is continuously monitored. This is applicable to the catalyst and/or evaporative gas (EVAP) system.

ES

Owing to the monitoring result, the monitor status and test value (test lower limit, test upper limit) are displayed on the OBD II scan tool. These data are displayed after the monitor has been turned on by the vehicle.

If the test result value is not within the range of upper limit and lower limit, the ECM (PCM) regards this as an abnormality. If the test result value is at the limit, abnormality is likely to occur in the near future in the relevant component.

For details on particular procedures, refer to the operation manual for the scan tool to be used.

Advance/Retarded Intake Side (for Bank 1)

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $35 | $8B | Multiply by 0.5 | °CA | Delay in VVT response (advanced) |
| $35 | $8C | Multiply by 0.5 | °CA | Delay in VVT response (retarded) |
| $35 | $D3 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation during target mid-lock request) |
| $35 | $D5 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation of target) |

Advance/Retarded Intake Side (for Bank 2)

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $36 | $8B | Multiply by 0.5 | °CA | Delay in VVT response (advanced) |
| $36 | $8C | Multiply by 0.5 | °CA | Delay in VVT response (retarded) |
| $36 | $D3 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation during target mid-lock request) |
| $36 | $D5 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation of target) |

Advance/Retarded Exhaust Side (for Bank 1)

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $35 | $8D | Multiply by 0.5 | °CA | Delay in VVT response (retarded) |
| $35 | $8E | Multiply by 0.5 | °CA | Delay in VVT response (advanced) |
| $35 | $D6 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation of target) |

Advance/Retarded Exhaust Side (for Bank 2)

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $36 | $8D | Multiply by 0.5 | °CA | Delay in VVT response (retarded) |
| $36 | $8E | Multiply by 0.5 | °CA | Delay in VVT response (advanced) |
| $36 | $D6 | Multiply by 0.5 | °CA | VVT system diagnosis (abnormal deviation of target) |

A/F Sensor Bank 1 Sensor 1

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $01 | $84 | Multiply by 0.0000305 | No dimension | Minimum value for air / fuel ratio sensor |
| $01 | $85 | Multiply by 0.0000305 | No dimension | Maximum value for air/fuel ratio sensor |
| $01 | $CF | Multiply by 0.0039062 | No dimension | Increase and decrease in fluctuation for air/fuel ratio sensor |
| $01 | $CD | Multiply by 0.0039062 | No dimension | Increase and decrease in time for air/fuel ratio sensor |
| $01 | $91 | Multiply by 0.0039062 | No dimension | Delay level changes from "rich" to "lean." |
| $01 | $92 | Multiply by 1 | ms | Time ratio for rich/lean status |
| $01 | $A3 | Multiply by 0.0039062 | No dimension | Delay level changes from "lean" to "rich." |
| $01 | $A4 | Multiply by 1 | ms | Time ratio for lean/rich status |
| $01 | $AC | Multiply by 1 | ms | Waiting time on rich side |
| $01 | $AD | Multiply by 1 | ms | Time difference for rich/lean status |
| $01 | $AE | Multiply by 1 | ms | Waiting time on lean side |
| $01 | $AF | Multiply by 1 | ms | Time difference for lean/rich status |

HO2 Sensor Bank 1 Sensor 2

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $02 | $05 | Multiply by 1 | ms | Rich to lean sensor threshold time (calculated) |
| $02 | $06 | Multiply by 1 | ms | Lean to rich sensor threshold time (calculation) |
| $02 | $07 | Multiply by 0.001 | V | Minimum sensor voltage for test cycle (calculated) |
| $02 | $08 | Multiply by 0.001 | V | Maximum sensor voltage for test cycle (calculated) |
| $02 | $A5 | Multiply by 0.001 | V | O2 Sensor Signal Biased Abnormal (Drop) Diagnosis (P-P voltage ) |
| $02 | $D1 | Multiply by 1 | ms | Delayed response from the rich to lean |
| $02 | $D2 | Multiply by 1 | No dimension | Delayed response from the lean to rich |

ES

Catalyst

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $21 | $89 | Multiply by 0.0039062 | No dimension | Oxygen storage capability for catalyst |

EVAP Monitor (0.020")

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $3C | $C1 | Multiply by 0.25 | Pa | 4-1 mode test result |
| $3C | $C2 | Multiply by 0.25 | Pa | 4-2 mode test result |
| $3C | $C3 | Multiply by 0.25 | Pa | 5 mode test result |
| $3C | $C4 | Multiply by 0.25 | Pa | 7 mode test result |
| $3C | $C5 | Multiply by 0.25 | Pa | 8 mode test result |
| $3C | $C6 | Multiply by 10 | ms | 9 mode test result |
| $3C | $C7 | Multiply by 0.25 | Pa | 13 mode test result |
| $3C | $C8 | Multiply by 0.25 | Pa | 15-1 mode test result |
| $3C | $C9 | Multiply by 0.25 | Pa | 15-2 mode test result |
| $3C | $CA | Multiply by 0.25 | Pa | 16 mode test result |

Purge Flow Monitor

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $3D | $E2 | Multiply by 0.25 | Pa | ELCM Purge Flow Diagnosis |

A/F Sensor Heater Bank 1 Sensor 1

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $41 | $9B | Multiply by 1 | Ω | Oxygen sensor heater impedance |

Oxygen Sensor Heater Bank 1 Sensor 2

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $42 | $E5 | Multiply by 1 | Ω | Air/fuel ratio sensor heater performance |

Misfire

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $A1 | $0B | Multiply by 1 | Time | Total number of misfires for EWMA* counted during the last driving cycle in all cylinders |
| $A1 | $0C | Multiply by 1 | Time | • With IG ON, the number of misfire counted during the last driving cycle in all cylinders is displayed.<br>• When the engine is running, the number of misfire counted during current driving cycle in all cylinders is displayed. |
| $A2 | $0B | Multiply by 1 | Time | Total number of misfires for EWMA* counted during the last 10 driving cycles in cylinder #1 |
| $A2 | $0C | Multiply by 1 | Time | • With IG ON, the number of misfire counted during the last driving cycle in cylinder #1 is displayed.<br>• When the engine is running, the number of misfire counted during current driving cycle in cylinder #1 is displayed. |
| $A3 | $0B | Multiply by 1 | Time | Total number of misfires for EWMA* counted during the last 10 driving cycles in cylinder #2 |
| $A3 | $0C | Multiply by 1 | Time | • With IG ON, the number of misfire counted during the last driving cycle in cylinder #2 is displayed.<br>• When the engine is running, the number of misfire counted during current driving cycle in cylinder #2 is displayed. |

| Monitor ID | Test ID | Scaling | Unit | Description |
|---|---|---|---|---|
| $A4 | $0B | Multiply by 1 | Time | Total number of misfires for EWMA* counted during the last 10 driving cycles in cylinder #3 |
| $A4 | $0C | Multiply by 1 | Time | • With IG ON, the number of misfire counted during the last driving cycle in cylinder #3 is displayed.<br>• When the engine is running, the number of misfire counted during current driving cycle in cylinder #3 is displayed. |
| $A5 | $0B | Multiply by 1 | Time | Total number of misfires for EWMA* counted during the last 10 driving cycles in cylinder #4 |
| $A5 | $0C | Multiply by 1 | Time | • With IG ON, the number of misfire counted during the last driving cycle in cylinder #4 is displayed.<br>• When the engine is running, the number of misfire counted during current driving cycle in cylinder #4 is displayed. |

NOTE:

*: EWMA (Exponential Weighted Moving Average) counted during the last 10 driving cycles

Arithmetic expression for obtaining the number of misfires: 0.1 ×(Current times) + 0.9 ×(Previous average) (Previous average) for initial value = 0

Measurement items for each DTC of [VVT monitor bank 1] and [VVT monitor bank 2]

| Monitor ID | Test ID | Scaling | Unit | Description | | |
|---|---|---|---|---|---|---|
| $35 | $8B | Multiply by 0.5 | °CA | + | Intake (bank 1) | Delay in VVT response (advanced) |
| $35 | $8C | Multiply by 0.5 | °CA | - | | Delay in VVT response (retarded) |
| $35 | $8D | Multiply by 0.5 | °CA | + | Exhaust (bank 1) | Delay in VVT response (advanced) |
| $35 | $8E | Multiply by 0.5 | °CA | - | | Delay in VVT response (retarded) |
| $36 | $8B | Multiply by 0.5 | °CA | + | Intake (bank 2) | Delay in VVT response (advanced) |
| $36 | $8C | Multiply by 0.5 | °CA | - | | Delay in VVT response (retarded) |
| $36 | $8D | Multiply by 0.5 | °CA | + | Exhaust (bank 2) | Delay in VVT response (advanced) |
| $36 | $8E | Multiply by 0.5 | °CA | - | | Delay in VVT response (retarded) |

## Check list for interview

1. Ask customers about requested items
   (1) According to the troubleshooting procedure mentioned above, ask the customers reliably about the requested items, referring to this check list for interview.

# Engine Diagnosis Checklist for Interview

| | | | | | |
|---|---|---|---|---|---|
| Vehicle model | | Date of vehicle bring-in | | History of bring-in | No / Yes ( times) |
| Frame No. | | Registration date | | Registration No. | |

## Checking / clearing DTC

1. Checking DTC (reading with SSM4)
   (1) Connect the SSM4 to the DLC3.
   (2) Turn the ignition switch to ON.
   (3) Turn on the SSM4.
   (4) Check diagnostic codes (current malfunction) using SSM4.
   (5) Check diagnostic codes (temporary code) using SSM4.
   NOTE:

ES

| Displayed items | Contents |
|---|---|
| [Present fault] | DTCs that indicate the error |
| [Temporary Diagnostic Code(s)] | • DTCs that indicate the temporary error<br>• Indicates the possibility of error though the error is not confirmed. |
| [Readiness code] | Self-diagnostic status can be monitored concerning the given DTC. |

   - After the test drive, check that the self-diagnosis for the target DTC is completed successfully by confirming [Readiness code], and then check [Present fault] or [Temporary Diagnostic Code(s)].
   - For DTCs (P0171, etc.) that detect error in two trips, the error occurred in the first trip is stored to the engine control computer as temporary error.
   - Present fault stores the freeze frame data.

2. Clearing DTC using SSM4
   (1) Connect the SSM4 to the DLC3.
   (2) Turn the ignition switch to ON.
   (3) Turn on the SSM4.
   (4) Using the SSM4, select the following menu items, and clear the DTC : [Each System] / [Engine Control System] / [Clear Memory].
   CAUTION:
   - When the clearing DTC cannot be performed successfully, turn the ignition switch to OFF, and then retry the operation.
   - Do not clear the DTC using SSM4 until the cause of failure is identified.

   NOTE:
   Initial diagnosis of electronic throttle control is performed after DTC clearance. For this reason, the engine starting after DTC clearance must be performed more than 10 seconds after IG ON.

## Freeze frame data

1. Check freeze data (reading with SSM4)
   NOTE:
   When the DTC is stored, the ECM data which indicates the vehicle status at that time is stored to the engine control computer as freeze frame data.
   (1) Connect the SSM4 to the DLC3.
   (2) Turn the ignition switch to ON.
   (3) Turn on the SSM4.
   (4) Read the freeze frame data using the SSM4.
2. List of freeze frame data
   For the list of freeze frame data, refer to "Data monitor / active test" (ES - 43).

## Inspection for problems that do not normally occur

1. Inspection for problems that do not normally occur
   (1) Clear the DTC. (Refer to ES - 28)
   (2) Perform repeatability test.
   (3) Perform visible inspection and connection inspection of the connector and each terminal.
   (4) Check the wiring harness and connector for excessive force.

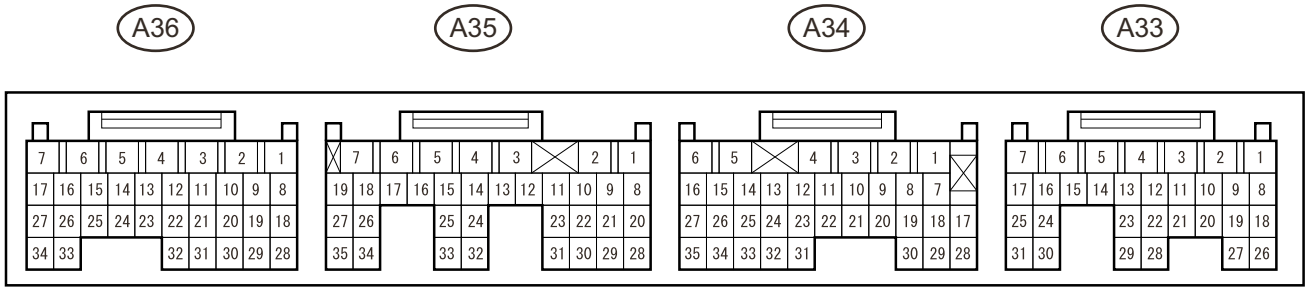
## ECM terminal arrangement



NOTE:

The standard voltages specified for ECM terminals are listed below. Appropriate conditions required for inspection of each terminal are also described. Compare the inspection result with the value in "Standard value." Refer to the figure shown above, and locate the position of the ECM terminal.

| Terminal No. (symbol) | Terminal description | Inspection conditions | Standard value |
|---|---|---|---|
| A33-1 (+B2) - A36-4 (E01) | ECM power supply | IG ON | 12 to 14 V |
| A33-2 (BATT) - A36-4 (E01) | Battery (Prepared for battery voltage measurement, and for ECM memory) | Always | 10 to 13 V |
| A33-3 (ST1-) - A36-4 (E01) | Stop light switch | Brake pedal is depressed | 11 to 14 V |
| | | Brake pedal is released | 0 to 1 V |
| A33-7 (STP) - A36-4 (E01)*1 | Stop light switch | Brake pedal is depressed | 0 to 1 V |
| | | Brake pedal is released | 11 to 14 V |
| A33-8 (ACP) - A36-4 (E01) | Air conditioner pressure sensor | IG ON, A/C ON | 0 to 1 V |
| | | Idling, A/C OFF | 12 to 14 V |
| A33-12 (THA) - A36-29 (E1) | Intake air temperature sensor (Integrated into the intake air flow meter SUB-ASSY) | IG ON | 0.3 to 4.6 V |
| A33-14 (STSW2) - A36-4 (E01)*3 | Starter signal | IG ON | 0 to 1 V |
| | | Cranking | 6 to 13 V |
| A33-15 (CLSW) - A36-4 (E01)*2 | Clutch switch | IG ON, clutch pedal depressed | 0 to 1 V |
| | | IG ON, clutch pedal depressed | 10 to 13 V |
| A33-16 (NSW) - A36-4 (E01) | Neutral switch signal | With IG ON, the shift lever is at P or N position. *1<br>With IG ON, the shift lever is at N position. *2 | 0 to 1 V |
| | | With IG ON, the shift lever is except at P or N position. *1<br>With IG ON, the shift lever is except at N position. *2 | 10 to 13 V |
| A33-17 (STSW2) - A36-4 (E01) | Starter signal *3 *4 | IG ON | 0 to 1 V |
| | | Cranking *3 | More than 6 V |
| | | Cranking *4 | 6 to 13 V |
| A33-18 (CANL) - A36-4 (E01) | CAN communication line | IG ON | Pulse generation (Refer to waveform 1.) |
| A33-19 (CANH) - A36-4 (E01) | CAN communication line | IG ON | Pulse generation (Refer to waveform 2.) |
| A33-20 (HB) - A36-4 (E01)*9 | Blower relay | With IG ON, the blower fan switch is turned to ON. | 0 to 1 V |
| | | With IG ON, the blower fan switch is turned to OFF. | 10 to 13 V |

| Terminal No. (symbol) | Terminal description | Inspection conditions | Standard value |
|---|---|---|---|
| A33-22 (VG) - A33-29 (E2G) | Intake air flow meter SUB-ASSY | Idling, warm-up operation of engine | 0.9 to 4.5 V |
| A33-27 (IGSW) - A36-4 (E01) | IG2 relay | IG ON | 10 to 13 V |
| A34-5 (HA1A) - A36-4 (E01) | Air/fuel ratio sensor (bank 1 sensor 1) heater | Idling, cool-down operation of engine | Pulse generation (Refer to waveform 3.) |
| A34-6 (+B) - A36-4 (E01) | ECM power supply | IG ON | 12 to 14 V |
| A34-9 (FUEL P1) - A36-29 (E1) | Fuel pressure sensor | Idling, warm-up operation of engine | 1.0 to 1.7 V |
| A34-7 (FUEL P2) -A36-29 (E1) | Fuel pressure sensor (sub) | Idling, warm-up operation of engine | |
| A34-11 (IJF1) - A36-4 (E01) | Confirmation signal for direct injection of injector | Idling | Pulse generation (Refer to waveform 4.) |
| A34-13 (FPF) - A36-4 (E01) | High pressure side fuel pump (spill valve) | Idling | Pulse generation (Refer to waveform 5.) |
| A34-14 (EV1+) - A36-4 (E01) | Variable valve timing (VVT) sensor (exhaust side (bank 1)) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 6.) |
| A34-15(VV2+) - A36-4 (E01) | Variable valve timing (VVT) sensor (intake side (bank 2)) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 7.) |
| A34-16 (NE+) - A34-27 (NE-) | Crankshaft position sensor | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 6 or 7.) |
| A34-17 (KNK2) - A36-29 (E1) | Knock control sensor | IG ON | Approx. 2.5 V |
| A34-18 (A1A-) - A36-4 (E01) | Air / fuel ratio sensor | IG ON | 2.4 to 2.7 V |
| A34-19 (A1A+) - A36-4 (E01) | Air / fuel ratio sensor | IG ON | 2.8 to 3.2 V |
| A34-20 (PIM) - A36-29 (E1) | Intake manifold pressure sensor | Idling, warm-up operation of engine | 1.1 to 2.0 V |
| A34-21 (OX1B) - A34-8 (E01) | Oxygen sensor | Idling, warm-up operation of engine | 0 to 0.9 V |
| A34-25 (EV2+) - A36-4 (E01) | Variable valve timing (VVT) sensor (exhaust side (bank 2)) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 6.) |
| A34-26 (VV1+) - A36-4 (E01) | Variable valve timing (VVT) sensor (intake side (bank 1)) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 7.) |
| A34-28 (KNK1) - A36-29 (E1) | Knock control sensor | IG ON | Approx. 2.5 V |
| A34-31 (IJF2) - A36-4 (E01) | Confirmation signal for direct injection of injector | Idling | Pulse generation (Refer to waveform 4.) |
| A34-32 (FPD) - A36-4 (E01) | High pressure side fuel pump (spill valve) | Idling | Pulse generation (Refer to waveform 5.) |
| A34-34 (VCV) - A36-4 (E01) | Camshaft timing oil control valve (OCV) ground | IG ON | 0 to 1 V |
| A35-1 (VPMP) - A36-4 (E01) | Vent valve (integrated into canister pump module) | IG ON | 10 to 13 V |
| A35-5 (IREL) - A36-4 (E01) | IINJ relay | Idling | 10 to 13 V |
| | | IG ON | 0 to 1 V |
| A35-7 (+BM) - A36-4 (E01) | ETCS relay | IG ON | 10 to 13 V |
| A35-8 (MPMP) - A36-4 (E01) | Leak detection pump (integrated into canister pump module) | IG ON | 10 to 13 V |
| | | Leak detection pump ON | 0 to 1 V |
| A35-10 (DI) - A36-4 (E01) | Fuel pump control (Detects malfunction in fuel pump control.) | IG ON | 10 to 12 V |
| A35-11 (FAN1) - A36-4 (E01)*5 | Fan No. 3 relay | IG ON<br>Cooling fan is not operating. | 10 to 13 V |
| | | Cooling fan operates at idling speed, A/C ON or high engine coolant temperature. | 0 to 0.5 V |
| A35-12 (FAN2) - A36-4 (E01) | Fan No. 1 relay *6<br>Fan No. 2 relay *5 | IG ON | 10 to 13 V |
| | | Cooling fan operates at idling speed, A/C ON or high engine coolant temperature. *5 | 0 to 0.5 V |
| | | Cooling fan operates at high engine coolant temperature. *6 | 0 to 0.5 V |
| A35-13 (SSHUT) - A36-4 (E01) | EFI MAIN1 relay | IG ON | 0 to 1 V |
| A35-15 (TACH) - A36-4 (E01)*3 | Engine Speed | Hold the engine speed at 1500 r/min. | Pulse generation (Refer to waveform 8.) |
| A35-17 (MCR) - A36-4 (E01) | ETCS relay | IG ON | 0 to 1 V |

ES

| Terminal No. (symbol) | Terminal description | Inspection conditions | Standard value |
|---|---|---|---|
| A35-19(FPC) - A36-4 (E01) | Fuel pump control | IG ON | Pulse generation (Refer to waveform 9.) |
| A35-20 (PPMP) - A36-4 (E01) | Canister pressure sensor (integrated into canister pump module) | IG ON | 1.5 to 4.0 V |
| A35-21 (VCPA) - A36-4 (E01) | Accelerator pedal position sensor power supply | IG ON | 4.5 to 5.5 V |
| A35-22 (VCP2) - A36-4 (E01) | Accelerator pedal position sensor power supply | IG ON | 4.5 to 5.5 V |
| A35-23 (VPA) - A35-29 (EPA) | Accelerator pedal position sensor (engine control) | With IG ON, the accelerator pedal is fully open. | Approx. 0.7 V |
| | | With IG ON, the accelerator pedal is fully closed. | Approx. 3.1 V |
| A35-26 (STA) - A36-4 (E01) | ST relay | IG ON | 10 to 13 V |
| | | Cranking | 0 to 1 V |
| A35-31 (VPA2) - A35-30 (EPA2) | Accelerator pedal position sensor (for detection of sensor malfunction) | With IG ON, the accelerator pedal is fully open. | Approx. 0.7 V |
| | | With IG ON, the accelerator pedal is fully closed. | Approx. 3.1 V |
| A35-32 (ACCR) - A36-4 (E01)*3 | Request for accessory cutoff | IG ON | 0 to 0.5 V |
| | | Cranking | 12 to 14 V |
| A35-34 (STAR) - A36-4 (E01)*3 | ST Cut Relay | IG ON | 0 to 0.5 V |
| | | Cranking | 8 to 13 V |
| A35-35 (AC) - A36-4 (E01) | HEATER relay | Idling, A/C ON | 0 to 0.5 V |
| | | Idling, A/C OFF | 12 to 14 V |
| A36-1 (M-) - A36-4 (E01) | Throttle actuator | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 10.) |
| A36-2 (M+) - A36-4 (E01) | Throttle actuator | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 10.) |
| A36-5 (OE2) - A36-4 (E01) | Camshaft timing oil control valve (OCV) (exhaust side (bank 2)) | IG ON | 11 to 14 V |
| | | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 11.) |
| A36-6 (HT1B) - A36-4 (E01) | Oxygen sensor heater | IG ON | 11 to 14 V |
| | | Idling, cool-down operation of engine | Pulse generation (Refer to waveform 12.) |
| A36-7 (OE1) - A36-4 (E01) | Camshaft timing oil control valve (OCV) (exhaust side (bank 1)) | IG ON | 11 to 14 V |
| | | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 11.) |
| A36-8 (IGT4) - A36-4 (E01) | Ignition coil (ignition signal) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 13.) |
| A36-10 (IGT2) - A36-4 (E01) | Ignition coil (ignition signal) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 13.) |
| A36-11 (PRG) - A36-4 (E01) | Purge VSV | When one of the following conditions is met:<br>• IG ON<br>• Idling, warm-up operation of engine, purge control in progress | Pulse generation (Refer to waveform 14.) |
| A36-12 (#1) - A36-4 (E01) | Injector for port injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 15.) |
| A36-13 (#4) - A36-4 (E01) | Injector for port injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 15.) |
| A36-14 (#1) - A36-4 (E01) | Injector for direct injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 4.) |
| A36-16 (OC2) - A36-4 (E01) | Variable valve timing (VVT) sensor (intake side (bank 2)) | IG ON | 11 to 14 V |
| | | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 11.) |
| A36-17 (OC1) - A36-4 (E01) | Variable valve timing (VVT) sensor (intake side (bank 1)) | IG ON | 11 to 14 V |
| | | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 11.) |

| Terminal No. (symbol) | Terminal description | Inspection conditions | Standard value |
|---|---|---|---|
| A36-18 (VTA1) - A36-29 (E1) | Throttle position sensor (engine control) | With IG ON, the accelerator pedal is fully open. | Approx. 0.6 V |
| | | With IG ON, the accelerator pedal is fully closed. | Approx. 4.2 V |
| A36-19 (VC) - A36-29 (E1) | Sensor power supply (voltage) | IG ON | 4.5 to 5.5 V |
| A36-20 (OT) - A36-29 (E1) | Oil temperature sensor | Idling | 0.5 to 1.4 V |
| A36-21 (IGT1) - A36-4 (E01) | Ignition coil (ignition signal) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 13.) |
| A36-22 (#2) - A36-4 (E01) | Injector for port injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 15.) |
| A36-23 (#4) - A36-4 (E01) | Injector for direct injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 4.) |
| A36-24 (#3) - A36-4 (E01) | Injector for direct injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 4.) |
| A36-25 (#2) - A36-4 (E01) | Injector for direct injection | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 4.) |
| A36-28 (VTA2) - A36-29 (E1) | Throttle position sensor (for detection of sensor malfunction) | With IG ON, the accelerator pedal is fully open. | Approx. 1.5 V |
| | | With IG ON, the accelerator pedal is fully closed. | Approx. 4.3 V |
| A36-30 (THW) - A36-29 (E1) | E.F.I. water temperature sensor | Idling, engine coolant temperature at 60 to 120°C {140 to 248°F} | 0.8 to 1.8 V |
| A36-31 (IGT3) - A36-4 (E01) | Ignition coil (ignition signal) | Idling, warm-up operation of engine | Pulse generation (Refer to waveform 13.) |

## Data monitor / active test

1. Data monitor

   NOTE:

   By reading the data display with SSM4, the values and conditions for the switch, sensor and actuator can be checked without removing the parts. When performing troubleshooting, reading the information indicated on the data display reduces the diagnosis time.

   (1) Warm up the engine.
   (2) Turn the A/C switch to OFF.
   (3) Turn the ignition switch to OFF.
   (4) Connect the SSM4 to the DLC3.
   (5) Start the engine.
   (6) Check the data monitor using the SSM4.
   (7) Read the data display.

CAUTION:

The normal value described below are just the reference. Therefore, do not perform inspection based on this value.

- List of normal sampling

| Item | Display | Reference (During idling) | Unit |
|---|---|---|---|
| Calculated engine load value | [Calculated load value] | 24% | % |
| Absolute load value | [Absolute Load Value] | 15% | % |
| Intake air amount | [Mass Air Flow] | 1.99g/s | g/s or lb/m |
| Intake manifold absolute pressure | [Mani. Absolute Pressure] | 30 kPa | kPa, mmHg, inHg, or psig |
| Intake air temperature signal | [Intake Air Temp.] | 33°C | °C or °F |
| Atmospheric pressure signal | [Atmosphere Pressure] | 101 kPa | kPa, mmHg, inHg, or psig |
| Engine coolant temperature signal | [Coolant Temp.] | 91°C | °C or °F |
| Engine speed signal | [Engine Speed] | 700 r/min | r/min |
| Vehicle speed signal | [Vehicle Speed] | 0 km/h {0 MPH} | km/h or MPH |
| Elapsed time after starting the engine | [Time Since Engine Start] | - | s |
| Identification value of throttle opening angle on ECM side | [Relative Throttle Pos.] | 2% | % |
| Opening angle of throttle position sensor No. 1 | [Throttle Opening Angle] | 13% | % |
| Opening angle of throttle position sensor No. 2 | [Absolute Throttle Pos.#2] | 30% | % |
| Opening angle of accelerator pedal position sensor No. 1 | [Accelerator Pedal Pos.#1] | 14% | % |
| Opening angle of accelerator pedal position sensor No. 2 | [Accelerator Pedal Pos.#2] | 14% | % |
| Throttle target opening angle | [Target Throttle Opening Angle] | 0% | % |
| Number of warm-ups after DTC clearance | [Number of warm-ups] | - | Times |
| Driving distance after DTC clearance | [Meter since DTC cleared] | - | km |
| Elapsed time after DTC clearance | [Time since DTC cleared] | - | min |
| ECM power supply voltage | [Control module voltage] | 14.226V | V |
| Operation status of air/fuel ratio F/B (feedback) control | [Fuel system for Bank 1] | CLOSE in normal status | - |
| Short-term FT controlled by front oxygen (A/F) sensor | [Short term fuel trim B1] | -0.78% | % |
| Long-term FT controlled by front oxygen (A/F) sensor | [Long term fuel trim B1] | -3.91% | % |
| #1 cylinder ignition timing | [Ignition timing adv. #1] | 12.0° | ° |
| Evaporative purge | [Commanded Evap Purge] | 0% | % |
| Target value for air/fuel ratio control | [Target Equivalence Ratio] | 0.997 times | Times |
| A/F lambda signal (bank 1, sensor 1) | [A/F Sensor #11] | 0.997 times | Times |
| A/F sensor output signal (bank1, senor 1) | [A/F Sensor #11] | 2.191V | V |
| A/F sensor current value (bank1, senor 1) | [A/F Sensor #11] | 0.00mA | mA |

2. Vehicle driving data 1

Vehicle speed

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Vehicle Speed] | • Indicates vehicle speed.<br>• Display range: 0 to 255 km/h {0 to 158 MPH} | Actual vehicle speed | 0 |
| | Remarks:<br>• Actual vehicle speed<br>• Vehicle speed is detected by the wheel speed sensor.<br>[Vehicle Speed] data is displayed a little later than the actual vehicle speed.<br>Therefore, even though the vehicle speed data stored in the freeze frame data is (0 km/h {0 MPH}), it does not necessarily show that the malfunction occurs while the vehicle is stopping. | | |

Engine Speed

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Engine Speed] | • Indicates engine speed.<br>• Display range: 0 to 16383 r/min | 650 to 800 r/min:<br>While engine idling (after warming up) | 0 |
| | Remarks:<br>When the engine speed indicates 0 r/min, the crankshaft position sensor system malfunction may exist. | | |

Calculate Load

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Calculated load value] | • Indicates the load size calculated by the engine control computer.<br>• Display range: 0 to 100% | 15 to 40 %:<br>While engine idling (after warming up) | 0 |
| | Remarks:<br>Calculated based on the intake air amount.<br>Calculate Load = Actual intake air amount / Maximum intake air amount ×100 %<br>(Example: When the actual intake air amount and maximum intake air amount are the same, the engine load value is 100 %.) | | |

Absolute load value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Absolute Load Value] | • Indicates vehicle load.<br>• Display range: 0 to 25700% | - | 0 |
| | Remarks:<br>• Indicates engine charging efficiency.<br>• Absolute load value = Actual intake air amount (g/s {lb/m}) / Maximum intake air amount<br>Maximum intake air amount = Displacement (L) / 2 ×1.2 (g/rev. {lb/rev.})<br>NOTE:<br>Intake air amount per one engine revolution (g/rev. {lb/rev.}) = Intake air amount (g/s {lb/m}) ×60 / Engine speed (r/min)<br>(Intake air amount (g/s {lb/m}): Value that is calculated by the intake air flow meter SUB-ASSY) | | |

Mass air flow

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Mass Air Flow] | • Indicates intake air amount.<br>• Display range: 0 to 655.35 g/s {0 to 86.706 lb/m} | 1.0 to 3.0 g/s {0.13 to 0.40 lb/m}:<br>While engine idling (after warming up) | 0 |
| | | 8 to 13 g/s {1.1 to 1.7 lb/m}:<br>3000 r/min (when vehicle parked) | |
| | Remarks:<br>Value that is calculated by the intake air flow meter SUB-ASSY | | |

Atmospheric pressure

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Atmosphere Pressure] | • Indicates atmospheric pressure.<br>• Display range: 0 to 255 kPa {0 to 1913 mmHg, 0 to 75.3 inHg, 37.0 psi} | Equal to atmospheric pressure:<br>IG ON | 0 |
| | Remarks:<br>• Calculated based on the intake air amount.<br>• Standard barometric pressure: 101 kPa {758 mmHg, 29.8 inHg, 14.6 psi}<br>• Lowers approx. by 1 kPa {7 mmHg, 0.3 inHg, 0.14 psi} as altitude increases by 100 m {328 ft}. (It varies depending on the weather.) | | |

Intake manifold pressure

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Mani. Absolute Pressure] | • Indicates the intake manifold pressure.<br>• Display range: 0 to 255 kPa {0 to 1913 mmHg, 0 to 75.3 inHg, 0 to 37.0 psi} | 80 to 110 kPa {600 to 825 mmHg, 23.6 to 32.5 inHg, 11.6 to 15.9 psi}:<br>Engine stop | 0 |
| | | 20 to 48 kPa {150 to 360 mmHg, 5.9 to 14.2 inHg, 2.9 to 7.0 psi}:<br>While engine idling (after warming up), air conditioner OFF | |
| | Remarks:<br>Value that is calculated by the air pressure sensor ASSY | | |

Engine oil temperature sensor

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Oil Temperature] | • Indicates engine oil temperature.<br>• Display range: -40 to 215°C {-40 to 419°F} | 85°C {185°F} or more:<br>After warming-up | 0 |
| | Remarks:<br>Value that is calculated by the engine oil temperature sensor | | |

Engine coolant temperature

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Coolant Temp.] | • Indicates engine coolant temperature.<br>• Display range: -40 to 215°C {-40 to 419°F} | 75 to 100°C {167 to 212°F} :<br>After warming-up | 0 |
| | Remarks:<br>Indicates engine coolant temperature.<br>NOTE:<br>• Engine coolant temperature after warming up: 75 to 100°C {167 to 212°F}<br>• When it is left for a long time after the engine stopped, the engine coolant temperature, intake air temperature and ambient temperature are almost the same.<br>• When the engine coolant temperature displays -40°C {-40°F} or 215°C {419°F}, open or short circuit in the sensor system may exist. | | |

Intake air temperature

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Intake Air Temp.] | • Indicates intake air temperature.<br>• Display range: -40 to 215°C {-40 to 419°F} | Equal to ambient temperature around intake air flow meter SUB-ASSY:<br>IG ON | 0 |
| | Remarks:<br>Indicates intake air temperature.<br>NOTE:<br>• When it is left for a long time after the engine stopped, the engine coolant temperature, intake air temperature and ambient temperature are almost the same.<br>• When the intake air temperature displays -40°C {-40°F} or 215°C {419°F}, open or short circuit in the sensor system may exist. | | |

Ambient temperature

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Ambient Temperature] | • Indicates ambient temperature.<br>• Display range: -40 to 215°C {-40 to 419°F} | Equal to ambient temperature:<br>IG ON | 0 |
| | Remarks:<br>Indicates ambient temperature.<br>NOTE:<br>When it is left for a long time after the engine stopped, the engine coolant temperature, intake air temperature and ambient temperature are almost the same. | | |

ES

Elapsed time after starting the engine

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Time Since Engine Start] | • Indicates elapsed time after starting the engine (IG ON →OFF).<br>• Display range: 0 to 65535 s | Elapsed time after starting the engine is displayed. | 0 |
| | Remarks:<br>Indicates elapsed time after starting the engine.<br>NOTE:<br>Elapsed time is counted only when the engine is running. | | |

Coolant temperature at engine start

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Initial Engine Coolant Temp] | • Indicates the engine coolant temperature when the ignition switch is turned to ON.<br>• Display range: -40 to 119.3°C {-40 to 246.7°F} | - | 0 |
| | Remarks:<br>Indicates the engine coolant temperature when the ignition switch is turned to ON. | | |

Intake air temperature at engine start

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Initial Intake Air Temp] | • Indicates the intake air temperature when the ignition switch is turned to ON.<br>• Display range: -40 to 119.3°C {-40 to 246.7°F} | - | 0 |
| | Remarks:<br>Indicates the intake air temperature when the ignition switch is turned to ON. | | |

Auxiliary battery voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Control module voltage] | • Indicates battery voltage.<br>• Display range: 0 to 65.535 V | 11 to 14 V:<br>During idling | 0 |
| | Remarks:<br>When the battery voltage is 11 V or less, this may affect other systems. | | |

3. Throttle control

Accelerator opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accel. Opening Angle] | • Indicates the opening angle of accelerator position sensor.<br>• Display range: 0 to 399.9% | Actual accelerator opening angle | × |
| | Remarks:<br>The position where the full close learning has been performed by the accelerator position sensor (sensor output) is 0 %, and the full open position is 100 %. | | |

Accelerator sensor No. 1 voltage ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accelerator Pedal Pos.#1] | • Indicates the opening angle of the accelerator position sensor No. 1.<br>• Display range: 0 to 100% | 10 to 20%:<br>When accelerator pedal is fully closed. | 0 |
| | | 50 to 70%:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>The display of the accelerator sensor No. 1 voltage ratio is converted as 5 V = 100 %.<br>NOTE:<br>When DTC related to accelerator sensor system is not input, the system can be basically judged normal. | | |

Accelerator sensor No. 2 voltage ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accelerator Pedal Pos.#2] | • Indicates the opening angle of the accelerator position sensor No. 2.<br>• Display range: 0 to 100% | 10 to 20%:<br>When accelerator pedal is fully closed. | 0 |
| | | 50 to 70%:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>The display of the accelerator sensor No. 2 voltage ratio is converted as 5 V = 100 %. | | |

Accelerator sensor No. 1 voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accelerator Sensor No1 Voltage] | • Indicates the output voltage of the accelerator position sensor No. 1.<br>• Display range: 0 to 4.980 V | 0.5 to 0.8 V:<br>When accelerator pedal is fully closed. | × |
| | | 2.4 to 3.5 V:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>Indicates the output voltage of the accelerator position sensor No. 1. | | |

Accelerator sensor No. 2 voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accelerator Sensor No2 Voltage] | • Indicates the output voltage of the accelerator position sensor No. 2.<br>• Display range: 0 to 4.980 V | 0.5 to 0.8 V:<br>When accelerator pedal is fully closed. | × |
| | | 2.4 to 3.5 V:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>• Indicates the output voltage of the accelerator position sensor No. 2.<br>• Accelerator sensor No. 2 voltage is used for monitoring the accelerator sensor No. 1 voltage. When the failure occurs in the accelerator sensor No. 1, the engine control computer manages the system using the output voltage of the accelerator sensor No. 2. | | |

Accelerator sensor full closed condition

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Idle switch (APS)] | • Indicates the condition of accelerator position sensor.<br>• Display: ON/OFF | ON:<br>When accelerator pedal is fully closed. | × |
| | Remarks:<br>When the display is ON, the accelerator pedal is fully closed. | | |

Accelerator sensor No. 1 full-close learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accel Fully Close Learn #1] | • Indicates the full-close learning value of the accelerator position sensor No. 1.<br>• Display range: 0 to 124.5° | 2.5 to 6.5°:<br>IG ON | × |
| | Remarks:<br>Indicates the full-close learning value of the accelerator position sensor No. 1. | | |

Accelerator sensor No. 2 full-close learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accel Fully Close Learn #2] | • Indicates the full-close learning value of the accelerator position sensor No. 2.<br>• Display range: 0 to 124.5° | 2.5 to 6.5°:<br>IG ON | × |
| | Remarks:<br>Indicates the full-close learning value of the accelerator position sensor No. 2. | | |

Throttle sensor No. 1 voltage ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Opening Angle] | • Indicates the opening angle of the throttle position sensor No. 1.<br>• Display range: 0 to 100% | 10 to 22%:<br>When accelerator pedal is fully closed. | 0 |
| | | 80 to 90%:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>The display of the throttle sensor No. 1 voltage ratio is converted as 5 V = 100 %. | | |

Throttle sensor No. 2 voltage ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Absolute Throttle Pos.#2] | • Indicates the opening angle of the throttle position sensor No. 2.<br>• Display range: 0 to 100% | 35 to 45%:<br>When accelerator pedal is fully closed. | 0 |
| | | 80 to 90%:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>The display of the throttle sensor No. 2 voltage ratio is converted as 5 V = 100 %. | | |

ST1 input

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ST1 Input Status] | • Brake pedal signal<br>• Display: ON/OFF | ON:<br>Brake pedal is depressed | × |
| | | OFF:<br>Brake pedal is released | |
| | Remarks:<br>Stop light switch signal | | |

Throttle sensor full closed condition

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Idle switch (TPS)] | • Indicates the condition of throttle position sensor.<br>• Display: ON/OFF | ON:<br>When accelerator pedal is fully closed. | × |
| | Remarks:<br>• Engine control computer makes necessary decision.<br>• When the throttle valve is fully closed, the display is ON. When the valve is fully open, the display is OFF. | | |

Throttle request opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Require Position] | • Indicates the throttle valve request opening angle.<br>• Display range: 0 to 4.980 V | 0.5 to 1.1 V:<br>While engine idling (air conditioner OFF, N position) | × |
| | Remarks:<br>Indicates the voltage of the target throttle valve opening angle calculated by the engine control computer. | | |

Throttle opening angle (ECM identification value)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Relative Throttle Pos.] | • Indicates identification value of throttle opening angle on ECM side.<br>• Display range: 0 to 100% | 3 to 5%:<br>When accelerator pedal is fully closed. | 0 |
| | | 65 to 75%:<br>When accelerator pedal is fully open. | |
| | Remarks:<br>• Indicates the throttle valve opening used for the engine control.<br>• Do not refer to the value displayed at IG ON (while engine stops). | | |

Throttle sensor No. 1 voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle sensor No1 Voltage] | • Indicates the output voltage of the throttle position sensor No. 1.<br>• Display range: 0 to 4.980 V | 0.5 to 1.1 V:<br>When accelerator pedal is fully closed. | × |
| | | 3.2 to 4.8 V:<br>When accelerator pedal is fully open. | |
| | | 0.6 to 1.4 V:<br>Fail safe condition | |
| | Remarks:<br>Indicates the output voltage of the throttle position sensor No. 1. | | |

Throttle sensor No. 2 voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle sensor No2 Voltage] | • Indicates the output voltage of the throttle position sensor No. 2.<br>• Display range: 0 to 4.980 V | 1.5 to 2.2 V:<br>When accelerator pedal is fully closed. | × |
| | | 4.0 to 4.5 V:<br>When accelerator pedal is fully open. | |
| | | 1.9 to 2.6 V:<br>Fail safe condition | |
| | Remarks:<br>Indicates the output voltage of the throttle position sensor No. 2. | | |

Throttle opening angle command voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Position Command] | • Indicates the throttle opening angle command voltage.<br>• Display range: 0 to 4.980 V | - | × |
| | Remarks:<br>Same as [Throttle Require Position]. | | |

Throttle sensor No. 1 opener opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Sensor Open Pos #1] | • Indicates the output voltage for the opener opening angle of the throttle position sensor No. 1.<br>• Display range: 0 to 4.980 V | 0.7 to 1.1 V: | × |
| | Remarks:<br>Indicates the output voltage for the opener opening angle of the throttle position sensor No. 1. | | |

Throttle sensor No. 2 opener opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Sensor Open Pos #2] | • Indicates the output voltage for the opener opening angle of the throttle position sensor No. 2.<br>• Display range: 0 to 4.980 V | 0.7 to 1.1 V: | × |
| | Remarks:<br>Indicates the output voltage for the opener opening angle of the throttle position sensor No. 2. | | |

Throttle motor power supply relay

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Motor Power Supply Relay] | • Indicates operation of throttle motor power supply relay.<br>• Display: ON/OFF | ON:<br>IG ON | × |

Target throttle opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Target Throttle Opening Angle] | • Indicates the throttle target opening angle.<br>• Display range: 0 to 100% | 0 to 5%:<br>While engine idling (air conditioner OFF, N position) | 0 |

Throttle motor open-side duty ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Motor Duty (Open)] | • Indicates the throttle motor open-side duty ratio.<br>• Display range: 0 to 255% | 0 to 40 %:<br>While engine idling (air conditioner OFF, N position) | × |
| | Remarks:<br>• Indicates the command value (duty ratio) from the engine control computer that operates the throttle actuator and opens the throttle valve. | | |

Throttle motor closed-side duty ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Motor Duty (Close)] | • Indicates the throttle motor closed-side duty ratio.<br>• Display range: 0 to 255% | 0 to 40 %:<br>While engine idling (air conditioner OFF, N position) | × |
| | Remarks:<br>Command value of engine control computer<br>NOTE:<br>Normally, at idle speed, the throttle opening angle is controlled by [Throttle Motor Duty (Close)]. However, as the accumulation of the carbon increases, the throttle valve may open wider than the opener opening angle (approx. 7°), which may lead to the control by [Throttle Motor Duty (Open)]. | | |

Throttle full-close learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Fully Close Learn] | • Indicates the full-close learning value of throttle sensor.<br>• Display range: 0 to 4.980 V | 0.35 to 0.85 V:<br>IG ON | × |
| | Remarks:<br>• Engine control computer learns the full-close position of the throttle valve.<br>• Learning is performed after the ignition switch is turned to OFF, or turned to ON after the battery terminal has been reconnected. | | |

+BM voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [(+)BM Voltage] | • Indicates the electronic control throttle voltage.<br>• Display range: 0 to 79.998 V | 11 to 14 V:<br>IG ON | × |
| | Remarks:<br>Power supply that operates the electronic control throttle. | | |

Electronic throttle actuator power supply output

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Motor Duty Operation Status] | • Indicates the power supply to the electronic control throttle motor.<br>• Display range: ON/OFF | ON:<br>IG ON | × |
| | Remarks:<br>When the OFF is displayed at IG ON, malfunction may exist in the throttle relay system. | | |

Throttle opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Throttle Opening Angle] | • Indicates the throttle opening angle.<br>• Display range: 0 to 499.99° | - | 0 |
| | Remarks:<br>Do not refer to the value displayed at IG ON (while engine stops). | | |

4. ISC

ISC flow rate

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ISC Flow] | • Indicates the flow rate calculated from information of each sensor.<br>• Display range: 0 to 299.99 g/s | - | 0 |
| | Remarks:<br>Engine stall, start failure, unstable idling detected | | |

ISC opening angle

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ISC Position] | • Indicates the ISC request throttle opening angle.<br>• Display range: 0 to 499.99° | - | 0 |
| | Remarks:<br>Throttle opening angle at idling operation (accelerator pedal not depressed) (Throttle valve opening angle to maintain the ISC flow rate) | | |

ISC feedback amount

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ISC Feedback Value] | • Indicates ISC feedback correction amount.<br>• Display range: -150 to 149.99 g/s | - | 0 |
| | Remarks:<br>Necessary feedback correction amount for reaching the target idle speed<br>NOTE:<br>When the idle speed is out of target, the feedback amount is increased or decreased. When the feedback amount exceeds a certain threshold, it is reflected to the flow rate learning value. | | |

ISC flow rate learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ISC Learning Value] | • Indicates the ISC flow rate learning value.<br>• Display range: -150 to 149.99 g/s | - | 0 |
| | Remarks:<br>Intake air amount necessary for maintaining the idle speed is learned.<br>NOTE:<br>• When the feedback amount exceeds a certain threshold, it is reflected to the flow rate learning value.<br>• ISC flow rate (ISC total air flow rate) = ISC flow rate learning value + ISC feedback amount + Each correction amount | | |

ISC electric load correction amount

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Electric Load Feedback Val] | • Indicates the correction flow rate for the electric load.<br>• Display range: -150 to 149.99 g/s | - | 0 |
| | Remarks:<br>Indicates the ISC correction amount depending on the electric load condition. | | |

ISC air conditioner correction amount

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Air Conditioner FB Val] | • Indicates the correction flow rate for the air conditioner load.<br>• Display range: -150 to 149.99 g/s | - | 0 |
| | Remarks:<br>Indicates the ISC correction amount depending on the air conditioner load condition. | | |

Deposit loss air amount

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Deposit Loss Flow] | • Indicates the deposit loss air amount.<br>• Display range: -150 to 149.99 g/s | - | 0 |
| | Remarks:<br>• Indicates the amount for correcting the decrease in size of the throttle valve passage caused by the deposit.<br>• Referred to when engine stall, start failure or unstable idling is detected.<br>• After ISC learning value has been initialized, immediately learn [Deposit Loss Flow] using the following procedures. Once the update operation has been completed, perform updating operation slowly.<br>– Start the engine when cold, and let it idle.<br>– After warming up the engine (engine coolant temperature at 80°C {176°F} or more), let it idle for another 5 minutes.<br>– Turn the ignition switch to OFF, and wait for 30 seconds.<br>– Restart the engine and let it idle for 5 minutes. | | |

5. Fuel system

Fuel pump duty

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel Pump Duty] | • Indicates the control duty of the fuel pump.<br>• Display range: 0 to 399.99% | 20 % to 70 %:<br>During idling | 0 |
| | Remarks:<br>Indicates the control duty of the fuel pump. | | |

Fuel level sensor resistance

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel level resistance] | • Indicates the fuel level sensor resistance.<br>• Display range: 0 to 415Ω | Fuel receiver gauge at F: 13 to 17 Ω<br>Fuel receiver gauge at E: 406 to 415 Ω | 0 |

Injection period #1 (port)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Final port injection time (Cylinder 1)] | • Indicates the injection period of #1 cylinder injector (port injection side).<br>• Display range: 0 to 65535 µs | 1000 to 2000 µs:<br>While engine idling (after warming up) | 0 |
| | Remarks:<br>Value may be displayed even when fuel is not injected (The last injection period is displayed.). Therefore, check the injection condition together with [Injection method]. | | |

Fuel consumption for 10 injections

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Injection Volume (Cylinder1)] | • Indicates the amount of 10 fuel injections.<br>• Display range: 0 to 2.047 ml | 0.05 to 0.15 ml: | 0 |
| | Remarks:<br>Indicates the integrated value for 10 injections of #1 cylinder. | | |

High pressure target fuel pressure

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Target Fuel Pressure(High)] | • Indicates the target fuel pressure of high pressure fuel pump.<br>• Display range: 0 to 65535 kPa {0 to 491635 mmHg, 0 to 19355.7 inHg, 0 to 9502.5 psig} | 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psig}:<br>During engine idling (after warm-up, air conditioning off, in N position) | 0 |
| | | 7000 to 9000 kPa {52513 to 67517 mmHg, 2067.4 to 2658.1 inHg, 1015.0 to 1305.0 psig}:<br>After warming up, the engine is running at constant speed of 2500 r/min. | |
| | Remarks:<br>When abnormal, fuel system malfunction may exist. | | |

High pressure fuel pump 1 discharge rate

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Requested quantity of high-pressure fuel pump discharge (Pump 1)] | • Indicates the discharge rate of high pressure fuel pump.<br>• Display range: 0 to 2.047 ml | 0.04 to 0.08 ml:<br>After warming up, while engine idling (air conditioner OFF, N position) | 0 |
| | Remarks:<br>When abnormal, fuel system malfunction may exist. | | |

Injection method

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Injection Mode(D4-S)] | • Indicates injection method.<br>• Display: 1/2/3 | - | 0 |
| | Remarks:<br>Indicates injection method. | | |

Main injector injection period #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Direct injection timing (Cylinder 1)] | • Indicates the injection period of the main injector.<br>• Display range: -3277 to 3276.7°CA | 320 to 340°CA:<br>During engine idling (after warm-up, air conditioning off, in N position) | 0 |
| | Remarks:<br>Indicates the injection period of the main injector. | | |

Final injection period #1 (direct injection)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Final Direct injection time (Cylinder 1)] | • Indicates the injection period of #1 cylinder injector (cylinder injection side).<br>• Display range: 0 to 65535 µs | 0 to 2000 µs:<br>During engine idling (after warm-up, air conditioning off, in N position) | 0 |
| | Remarks:<br>Value may be displayed even when fuel is not injected (The last injection period is displayed.). Therefore, check the injection condition together with [Injection method]. | | |

ES

6. EVAP system

ELCM pump

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ELCM pump] | Pump status for key-off type EVAP system: ON/OFF | - | 0 |
| | Remarks:<br>"ON" is displayed during key-off type EVAP monitoring executed approximately 5 hours after IG OFF. (Refer to ES - 599) | | |

7. Purge system

Purge VSV drive duty ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [EVAP (Purge) VSV] | • Indicates the drive duty ratio of the purge VSV.<br>• Display range: 0 to 399.9% | - | 0 |
| | Remarks:<br>• The engine control computer uses this duty ratio to open or close the purge VSV. (When the duty ratio is other than 0 %, the control (*1) is performed.)<br>(*1): Fuel evaporative emission generated in the fuel tank is sent into the cylinder via purge VSV and then combusted.<br>• When the engine is cold or immediately after the engine is started, the duty ratio is 0 %. | | |

Purge ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Evap Purge Flow] | • Indicates the purge ratio.<br>• Display range: 0 to 399.9% | - | 0 |
| | Remarks:<br>The purge ratio is a percentage of purge introduction in relation to the intake air amount.<br>(Purge ratio = Purge introduction amount / Intake air amount ×100 (%)) | | |

Purge density learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Purge Density Learn Value] | • Indicates purge density learning value.<br>• Display range: -200 to 199.993% | - | 0 |
| | Remarks:<br>Determine the purge density from the change in the air fuel ratio F/B correction value when the purge is introduced. Use the following procedures to perform the purge density learning.<br>1. Air fuel ratio learning is completed, and F/B correction value is within 0±2 %.<br>2. Make sure of the change in air fuel ratio F/B correction value when purge is introduced.<br>3. The engine control computer determines the purge introduction ratio (purge ratio) for the intake air amount. Therefore, learn the change amount of F/B correction value for the purge ratio of 1 % as the purge density learning value.<br>4. Based on the purge density learning value and purge ratio, increase and decrease the fuel injection amount, thus controlling it to the stoichiometric air fuel ratio.<br>NOTE:<br>• Normally, purge density learning value is within approx. ±1 %.<br>• 1 %: Purge gas HC density not detected<br>• 0 %: Purge gas HC density almost equal to stoichiometric air fuel ratio<br>• Largely inclined to negative side: Purge gas HC density high | | |

Evaporative system pressure

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Absolute Evap Sys. Pressure] | Vapor pressure pump / Minimum: 0 kPa {0 mmHg, 0 inHg, 0 psig}, Maximum: 327.675 kPa {2458.18 mmHg, 96.7784 inHg, 47.5124 psig} | Approx. 100 kPa {750 mmHg, 29.5 inHg, 14.5 psig}: IG ON | 0 |
| | Remarks:<br>Indicates the EVAP system pressure monitored by the canister pressure sensor.<br>NOTE:<br>• The value is almost equal to barometric pressure excluding the case where the monitoring is being performed.<br>• While the engine is stopped, the pressure of the vapor pump is almost equal to that of the barometric pressure. For this reason, the value can be used to check the canister pressure sensor for malfunction or noise, or to check that the sensor output does not stop at the particular value. | | |

ES

ELCM switching valve

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ELCM switching valve] | Vent valve status for key-off type EVAP system: ON/OFF | ON:<br>Close | × |
| | | OFF:<br>Open | |

8. Air fuel ratio system

Target air fuel ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Target Equivalence Ratio] | • Indicates the target value of air fuel ratio control.<br>• Display range: 0 to 1.999 | 0.8 to 1.2:<br>While engine is idling | 0 |
| | Remarks:<br>• Indicates the target air fuel ratio by the engine control computer.<br>• Target air fuel ratio display is 1.0: Stoichiometric air fuel ratio<br>• Target air fuel ratio display is more than 1.0: Lean control<br>• Target air fuel ratio display is less than 1.0: Rich control<br>• When normal, actual air fuel ratio λB1S1 and target air fuel ratio are almost the same. | | |

Actual air fuel ratio λB1S1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Sensor #11] | • Indicates the air fuel ratio of the air/fuel ratio sensor.<br>• Display range: 0 to 1.999 | 1:<br>Stoichiometric air fuel ratio | 0 |
| | | Less than 1:<br>Rich state | |
| | | More than 1:<br>Lean state | |
| | Remarks:<br>• Calculated based on the air/fuel sensor output.<br>• By performing the fuel injection amount of [Active Test], it is possible to make judgment of sensor by checking the output of the sensors located at the front and rear of the catalytic converter. | | |

AFS Voltage B1S1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Sensor #11] | • Indicates the output of the air/fuel ratio sensor.<br>• Display range: 0 to 7.999 V | Approx. 2.2 V:<br>While engine idling (after warming up) | 0 |
| | Remarks:<br>• Indicates the output voltage of the air/fuel ratio sensor (Terminal voltage of the air/fuel ratio sensor cannot be measured.). Calculation is made by the engine control computer based on the output current of the air/fuel ratio sensor. (For actual air/fuel ratio sensor output, refer to "A/F sensor current B1S1" listed below.)<br>• By performing the fuel injection amount of [Active Test], it is possible to make judgment of sensor by checking the output of the sensors located at the front and rear of the catalytic converter. | | |

A/F sensor current B1S1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Sensor #11] | • Indicates the current of the air/fuel ratio sensor.<br>• Display range: -128 to 127.99 mA | -0.5 to 0.5 mA:<br>During idling | 0 |
| | Remarks:<br>• A/F sensor current B1S1 display is -0.5 to 0.5 mA: Stoichiometric air fuel ratio<br>• When the output of the A/F sensor current B1S1 is not within 0.7 to 2.2 mA during fuel cut control, malfunction may exist in the air/fuel ratio sensor or its circuit. | | |

A/F sensor resistance B1S1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Sensor Impedance B1] | • Indicates the resistance of the air/fuel ratio sensor.<br>• Display range: 0 to 6553.5Ω | Approx. 50 Ω:<br>After warm-up, during idling | 0 |
| | - | | |

A/F heater duty ratio #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Heater Duty] | • Indicates the air/fuel ratio sensor heater duty ratio.<br>• Display range: 0 to 399.9% | 0 to 100 % | 0 |
| | Remarks:<br>A/F heater duty ratio #1 display is not 0 %: Heater is energized. | | |

Oxygen sensor voltage B1S2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Oxygen sensor #12] | • Indicates the oxygen sensor output voltage.<br>• Display range: 0 to 1.275 V | 0 to 0.9 V:<br>During driving at 70 km/h {43 MPH} | 0 |
| | Remarks:<br>• Indicates the oxygen sensor output voltage.<br>• Oxygen sensor voltage B1S2 display is around 0 V: Leaner than stoichiometric air fuel ratio<br>• Oxygen sensor voltage B1S2 display is around 1 V: Richer than stoichiometric air fuel ratio<br>• During air fuel ratio feedback control, the voltage fluctuates between 0 and 1 V.<br>• By performing the fuel injection amount of [Active Test], it is possible to make judgment of sensor by checking the output of the sensors located at the front and rear of the catalytic converter. | | |

Oxygen heater B1S1, B1S2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [O2 Heater B1S1]<br>[O2 Heater B1S2] | • Indicates the oxygen sensor heater.<br>• Display: ON/OFF | - | 0 |

Oxygen heater duty ratio

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [O2 Sensor Heater Duty] | • Indicates the oxygen sensor heater duty.<br>• Display range: 0 to 399.9% | 0 to 100%: | 0 |
| | Remarks:<br>The display is not 0 %: Heater is being energized. | | |

O2 sensor impedance value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [O2 Sensor Impedance] | • Indicates the oxygen sensor resistance.<br>• Display range: 0 to 65535 Ω | Approx. 270 Ωor less<br>After warm-up, during idling | 0 |

Rear oxygen sensor input voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Rear O2 Sensor Input Voltage] | • Indicates the oxygen sensor (+) output voltage.<br>• Display range: 0 to 327.675 V | 2.11 to 3.01 V<br>After warm-up, during idling | 0 |

Rear oxygen sensor offset voltage

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Rear O2 Sensor Offset Voltage] | • Indicates the oxygen sensor (-) output voltage.<br>• Display range: 0 to 327.675 V | 2.11 V<br>After warm-up, during idling | 0 |

F/B learning value bank 1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Long term fuel trim B1] | • Indicates the learning value to correct the air fuel ratio F/B control.<br>• Display range: -100 to 99.2% | -15 to 15% | 0 |
| | Remarks:<br>When F/B correction is performed for a certain period of time, the F/B learning value is used for the control to bring the F/B correction around 0, so that the correction will be made according to the individual difference of engine (caused by aging and/or change in environment of usage).<br>This item can be utilized for judgment of whole system related to air fuel ratio control. Judgment can be performed by adding the values as follows: F/B correction value + F/B learning value<br>NOTE:<br>• +15 % or more: Lean condition may exist.<br>• -15 to +15 %: Air fuel ratio is judged normal.<br>• Less than -15 %: Rich condition may exist.<br>• Air fuel ratio F/B learning value is learned and stored separately in each engine operating zone (engine speed ×load). [Long FT #1] indicates the learning value of current operating zone.<br>The learning value for each zone is [A/F Learn Value Idle #1, #1Dual], [A/F Learn Value Low #1, #1 Dual], [A/F Learn Value Mid1 #1, #1 Dual] and [A/F Learn Value High #1, #1Dual]. The zone indicating the same learning value as the F/B learning value bank 1 is the current operating zone. | | |

F/B operation condition bank 1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel system for Bank 1] | • Indicates the operation status of the air fuel ratio F/B (feedback) control.<br>• Display: [Op_init.] / [Cl_normal] / [Op_drv-con] / [Op_fault] | - | 0 |

9. Ignition system

Ignition timing #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Ignition timing adv. #1] | • Indicates the ignition timing of #1 cylinder.<br>• Display range: -64 to 63.5° | BTDC 2 to 22°:<br>While engine idling (N position) | 0 |

Knock control value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Knock Feedback Value] | • Indicates the knock control value.<br>• Display range: -1024 to 1023.9°CA | - | 0 |
| | Remarks:<br>Indicates the knock retard correction amount determined by the condition of knocking occurrence.<br>Ignition timing = Max. retard value (*1) + Knock correction learning value (*2) + Knock control value (*3)<br>Example: 21°CA = 10°CA + 14°CA - 3°CA<br>(*1): Fixed value determined by engine speed and load<br>(*2): Obtain the value as follows, and perform control with the knock control value of -3°CA.<br>Knock control value is less than -4°CA: Decrease the knock correction learning value gradually.<br>Knock control value is -2°CA or more: Increase the knock correction learning value gradually.<br>(*3): Based on -3°CA, the calculation is made depending on the occurrence and frequency of the knocking condition.<br>Knocking not occurred: Increase the knock control value.<br>Knocking occurred: Decrease the knock control value.<br>NOTE:<br>When the knock control value does not change before and after the knocking occurrence (The value stays around -3°CA.), the engine control computer cannot determine the knocking. This may be caused by the poor sensitivity of knock sensor, the improper installation and/or the defective wiring harness of knock sensor circuit. | | |

Knocking correction learning value

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Knock Correct Learn Value] | • Indicates the knock control correction learning value.<br>• Display range: -1024 to 1023.9°CA | - | 0 |
| | Remarks:<br>• Refer to "Remarks" in the knock control value.<br>• When the knocking and/or insufficient output occurs, compare the following values with another vehicle of the same type.<br>– Engine Speed<br>– Calculate Load<br>– Ignition timing #1<br>– Knock control value<br>– Knocking correction learning value<br>• When the knock correction learning value is large: Knocking does not occur, and advanced ignition control is performed.<br>• When the knock correction learning value is small: Knocking occurs, and retardation is performed with less margin.<br>NOTE:<br>When the knocking occurs continuously and the knock correction learning value is smaller than the reference vehicle of the same type, it is possible that the ignition timing is retarded around to the maximum retard value. This may be caused by the aging due to carbon accumulation (oil dropping, poor-quality gasoline). | | |

Idle stabilization advance angle (#1 cylinder) to (#4 cylinder)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Idle Spark Advn Ctrl #1]<br>[Idle Spark Advn Ctrl #2]<br>[Idle Spark Advn Ctrl #3]<br>[Idle Spark Advn Ctrl #4] | • Indicates individual cylinder advance angle correction amount.<br>• Display range: -16 to 15.875°CA | - | 0 |
| | Remarks:<br>• Indicates the idle stabilization advance angle correction value per cylinder. When some delays occur in the revolution speed in the specific cylinder, the revolution speed is recovered by advancing only the relevant cylinder, thus stabilizing the idle speed.<br>• In some cases, by checking the idle stabilization advance angle, the engine malfunction occurrence in the specific cylinder can be determined. | | |

10. VVT control

Number of cleaning executions for VVT self-recovery

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Number of Cleaning Executions for VVT Self-recovery] | • Indicates the number of cleaning executions for VVT self-recovery<br>• Display range: 0 to 255 | - | 0 |
| | Remarks:<br>Indicates the number of times when the mode to eliminate foreign matter included in the cam timing oil control valve on the intake side is activated. | | |

Number of cleaning executions for Ex VVT self-recovery

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Number of Cleaning Executions for Ex VVT Self-recovery] | • Indicates the number of cleaning executions for exhaust VVT self-recovery<br>• Display range: 0 to 255 | - | 0 |
| | Remarks:<br>Indicates the number of times when the mode to eliminate foreign matter included in the cam timing oil control valve on the exhaust side is activated. | | |

VVT hold duty bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Aim Angle #1]<br>[VVT Aim Angle #2] | • Indicates VVT hold duty (bank 1 or bank 2).<br>• Display range: 0 to 399.9% | - | 0 |
| | Remarks:<br>Indicates OCV drive duty ratio necessary for blocking the oil passage of the camshaft timing oil control valve to hold the advance angle condition of VVT controller. | | |

VVT displacement angle bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Change Angle #1]<br>[VVT Change Angle #2] | • Indicates the actual displacement angle of VVT (bank 1 or bank 2).<br>• -320 to 319.9°FR | - | 0 |
| | Remarks:<br>• Indicates the actual displacement angle of VVT.<br>• If the value for VVT displacement angle does not change when performing [Active Test], malfunction may exist in the camshaft position sensor system. | | |

OCV drive duty ratio bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT OCV Duty #1]<br>[VVT OCV Duty #2] | • Indicates the duty ratio to the VVT OCV (bank 1 or bank 2).<br>• Display range: 0 to 399.9% | - | 0 |

Exhaust VVT hold duty bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Ex Hold Lrn Val #1]<br>[VVT Ex Hold Lrn Val #2] | • Indicates the exhaust VVT hold duty (bank 1 or bank 2).<br>• Display range: 0 to 399.9% | - | 0 |
| | Remarks:<br>Indicates OCV drive duty ratio necessary for blocking the oil passage of the camshaft timing oil control valve to hold the advance angle condition of VVT controller. | | |

Exhaust VVT displacement angle bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Ex Change Angle #1]<br>[VVT Ex Change Angle #2] | • Indicates the actual displacement angle of exhaust VVT (bank 1 or bank 2).<br>• Display range: 0 to 639.9°FR | - | 0 |
| | Remarks:<br>Indicates the actual displacement angle of exhaust VVT. | | |

Exhaust OCV drive duty ratio bank 1, 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Ex OCV Duty #1]<br>[VVT Ex OCV Duty #2] | • Indicates the duty ratio to the exhaust VVT OCV (bank 1 or bank 2).<br>• Display range: 0 to 399.9% | - | 0 |

VVT target displacement angle bank 1, bank 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Target Change Angle #1]<br>[VVT Target Change Angle #2] | • Indicates the VVT target displacement angle (bank 1 or bank 2).<br>• Display range: -320 to 319.9°FR | - | 0 |

Exhaust VVT target displacement angle bank 1, bank 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [VVT Ex Target Change Angle #1]<br>[VVT Ex Target Change Angle #2] | • Indicates the exhaust VVT target displacement angle (bank 1 or bank 2).<br>• Display range: 0 to 639.9°FR | - | 0 |

VVT bank 1 OCV current, VVT bank 2 OCV current

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [OCV Current R]<br>[OCV Current L] | • Indicates the OCV current (bank 1 or bank 2).<br>• Display range: 0 to 1.99 A | 0.55 to 0.85 A:<br>After warm-up, during idling | 0 |

Exhaust VVT bank 1 OCV current, exhaust VVT bank 2 OCV current

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Exh. OCV Current R]<br>[Exh. OCV Current L] | • Indicates the exhaust OCV current (bank 1 or bank 2).<br>• Display range: 0 to 1.99 A | 0.65 to 0.80 A:<br>After warm-up, during idling | 0 |

11. Catalyst

Catalyst temperature B1S1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Catalyst Temperature #11] | • Indicates catalyst temperature.<br>• Display range: -40 to 6513.5°C {-40 to 11756°F} | - | 0 |
| | Remarks:<br>Estimated temperature of the front catalytic converter calculated by the engine control computer | | |

12. Vehicle driving data 2

Starter switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Starter Switch] | • Indicates that the engine is being cranked.<br>• Display: ON/OFF | ON:<br>When cranking | 0 |
| | | OFF:<br>Not cranking | |

Starter cut relay

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Starter cut relay] | • Indicates the starter cut relay operation.<br>• Display: ON/OFF | OFF:<br>When cranking | 0 |

ACC relay

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [ACC Relay Monitor] | • Indicates that the ACC relay is operating.<br>• Display: ON/OFF | ON:<br>IG ON or while cranking | 0 |
| | | OFF:<br>IG OFF or while cranking | |

Neutral start switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Neutral Position Switch] | • Indicates the shift lever P or N position.<br>• Display: ON/OFF | ON:<br>Shift lever N or P | 0 |
| | | OFF:<br>Shift lever N or except for P | |

Clutch switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Clutch Switch] | • Indicates whether the clutch pedal is operated or not.<br>• Display: ON/OFF | ON:<br>Clutch pedal is depressed. | 0 |
| | | OFF:<br>Clutch pedal is released. | |

Stop light switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Stop Light Switch] | • Indicates whether the brake pedal is operated or not.<br>• Display: ON/OFF | ON:<br>Brake pedal is depressed. | 0 |
| | | OFF:<br>Brake pedal is released. | |

Air conditioner switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/C Switch] | • Indicates that the air conditioner is operating.<br>• Display: ON/OFF | ON:<br>A/C ON | 0 |
| | | OFF:<br>A/C OFF | |

Idle switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Idle Switch] | • Indicates that the accelerator pedal is fully closed.<br>• Display: ON/OFF | ON:<br>Accelerator pedal is fully closed. | 0 |
| | | OFF:<br>Accelerator pedal is depressed. | |

Rear defogger switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Rear Defogger SW] | • Indicates the condition of the defogger switch.<br>• Display: ON/OFF | ON:<br>Defogger switch ON | 0 |

Blower fan switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Blower Fan SW] | • Indicates the condition of the blower fan switch.<br>• Display: ON/OFF | ON:<br>Blower fan switch ON | 0 |

Light switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Light Switch] | • Indicates the condition of the lighting switch.<br>• Display: ON/OFF | ON:<br>Lighting switch ON | 0 |

Wiper switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Wiper Switch] | • Indicates the condition of the wiper switch.<br>• Display: ON/OFF | ON:<br>Wiper switch ON | 0 |

IG condition

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Ignition Switch] | • Indicates the condition of the ignition switch.<br>• Display range: ON/OFF | ON:<br>IG ON | 0 |

F/C operation condition

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel Cut Condition] | • Indicates that the fuel cut is operating.<br>• Display: ON/OFF | ON:<br>Fuel cut in progress | 0 |

13. Test result

Monitor information

| Item name | Description/display range | Normal value | Remarks | Freeze frame data output |
|---|---|---|---|---|
| [Component monitoring(Supp)] | • Indicates the monitoring condition of the component.<br>• Display: [Valid/Invalid] | - | * | × |
| [Fuel system monitoring(Supp)] | • Indicates the monitoring condition of the fuel system.<br>• Display: [Valid/Invalid] | - | * | × |
| [Misfire monitoring(Supp)] | • Indicates the condition of the misfire test.<br>• Display: [Valid/Invalid] | - | * | × |
| [EGR system(Supp)] | • Indicates the condition of EGR system test.<br>• Display: [Valid/Invalid] | - | * | × |
| [EGR system(Rdy)] | • Indicates the result of EGR system test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [O2 Heater Diagnosis(Supp)] | • Indicates the condition of oxygen sensor heater test.<br>• Display: [Valid/Invalid] | - | * | × |
| [O2 Heater Diagnosis(Rdy)] | • Indicates the result of oxygen sensor heater test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Oxygen sensor(Supp)] | • Indicates the condition of the oxygen sensor (air/fuel ratio sensor) test.<br>• Display: [Valid/Invalid] | - | * | × |

| Item name | Description/display range | Normal value | Remarks | Freeze frame data output |
|---|---|---|---|---|
| [Oxygen sensor(Rdy)] | • Indicates the result of the oxygen sensor (air/fuel ratio sensor) test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [A/C system refrigerant(Supp)] | • Indicates the condition of A/C system refrigerant test.<br>• Display: [Valid/Invalid] | - | * | × |
| [A/C system refrigerant(Rdy)] | • Indicates the result of A/C system refrigerant test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Secondary air system(Supp)] | • Indicates the condition of secondary air system test.<br>• Display: [Valid/Invalid] | - | * | × |
| [Secondary air system(Rdy)] | • Indicates the result of secondary air system test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Evaporative purge system(Supp)] | • Indicates the condition of evaporative emission system test.<br>• Display: [Valid/Invalid] | - | * | × |
| [Evaporative purge system(Rdy)] | • Indicates the result of evaporative emission system test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Heated catalyst(Supp)] | • Indicates the condition of the heater catalyst test.<br>• Display: [Valid/Invalid] | - | * | × |
| [Heated catalyst(Rdy)] | • Indicates the result of the heater catalyst test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Catalyst Diagnosis(Supp)] | • Indicates the condition of the catalyst test.<br>• Display: [Valid/Invalid] | - | * | × |
| [Catalyst Diagnosis(Rdy)] | • Indicates the result of the catalyst test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Component monitoring(Enable)] | • Indicates the monitoring test of the comprehensive component.<br>• Display: [Valid/Invalid] | - | * | × |
| [Component monitoring(Comp)] | • Indicates the monitoring test of the comprehensive component.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Fuel system monitoring(Enable)] | • Indicates the monitoring test of the fuel system.<br>• Display: [Valid/Invalid] | - | * | × |
| [Fuel system monitoring(Comp)] | • Indicates the monitoring test of the fuel system.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Misfire monitoring(Enable)] | • Indicates the condition of the misfire test.<br>• Display: [Valid/Invalid] | - | * | × |
| [Misfire monitoring(Comp)] | • Indicates the condition of the misfire test.<br>• Display: [Complete/Incomplete] | - | * | × |
| [EGR system(Enable)] | • Indicates the monitoring test of EGR system.<br>• Display: [Valid/Invalid] | - | * | × |
| [EGR system(Comp)] | • Indicates the monitoring test of EGR system.<br>• Display: [Complete/Incomplete] | - | * | × |
| [O2 Heater Diagnosis(Enable)] | • Indicates the monitoring test of the oxygen sensor heater or air/fuel ratio sensor heater.<br>• Display: [Valid/Invalid] | - | * | × |

ES

| Item name | Description/display range | Normal value | Remarks | Freeze frame data output |
|---|---|---|---|---|
| [O2 Heater Diagnosis(Comp)] | • Indicates the monitoring test of the oxygen sensor heater or air/fuel ratio sensor heater.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Oxygen sensor(Enable)] | • Indicates the monitoring test of the oxygen sensor heater or air/fuel ratio sensor heater.<br>• Display: [Valid/Invalid] | - | * | × |
| [Oxygen sensor(Comp)] | • Indicates the monitoring test of the oxygen sensor heater or air/fuel ratio sensor heater.<br>• Display: [Complete/Incomplete] | - | * | × |
| [A/C system refrigerant(Enable)] | • Indicates the monitoring test of the A/C system.<br>• Display: [Valid/Invalid] | - | * | × |
| [A/C system refrigerant(Comp)] | • Indicates the monitoring test of the A/C system.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Secondary air system(Enable)] | • Indicates the monitoring test of secondary air system.<br>• Display: [Valid/Invalid] | - | * | × |
| [Secondary air system(Comp)] | • Indicates the monitoring test of secondary air system.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Evaporative purge system(Enable)] | • Indicates the monitoring test of EVAP system.<br>• Display: [Valid/Invalid] | - | * | × |
| [Evaporative purge system(Comp)] | • Indicates the monitoring test of EVAP system.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Heated catalyst(Enable)] | • Indicates the monitoring test of the heating-type catalyst.<br>• Display: [Valid/Invalid] | - | * | × |
| [Heated catalyst(Comp)] | • Indicates the monitoring test of the heating-type catalyst.<br>• Display: [Complete/Incomplete] | - | * | × |
| [Catalyst Diagnosis(Enable)] | • Indicates the monitoring test of the catalyst.<br>• Display: [Valid/Invalid] | - | * | × |
| [Catalyst Diagnosis(Comp)] | • Indicates the monitoring test of the catalyst.<br>• Display: [Complete/Incomplete] | - | * | × |

*:
[Valid]: The monitoring condition of the vehicle is enabled.
[Invalid]: The monitoring condition of the vehicle is disabled.
[Complete/Incomplete]: When the monitoring was completed once in the past, this item changes from [Incomplete] into [Complete]. Even when the ignition switch is turned to OFF, this item does not change. However, if DTC is cleared or the battery cable is disconnected, it is returned to [Incomplete].

14. Vehicle driving data 3

TC terminal

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [TC Terminal] | • Indicates the condition of the TC terminal.<br>• Display: ON/OFF | - | 0 |

Number of DTC

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Number of Diagnostic Code(s):] | • Indicates the number of DTC recorded.<br>• Display range: 0 to 127 | 0 | × |

Engine warning light

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [MIL Status] | • Indicates the status of the engine warning light.<br>• Display: ON/OFF | - | × |

Driving distance after malfunction occurrence

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Lighted MI lamp history] | • Indicates the driving distance after the engine warning light illuminates.<br>• Display range: 0 to 65535 km | - | × |
| | Remarks:<br>Indicates the driving distance after the engine warning light illuminates. | | |

Engine running time during engine warning light illumination

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Time while MIL lighted] | • Indicates the engine running time after the engine warning light illuminates.<br>• Display range: 0 to 65535 min | - | × |

Elapsed time after DTC clearance

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Time since DTC cleared] | • Indicates elapsed time after clearing DTC.<br>• Display range: 0 to 65535 min | Elapsed time after clearing DTC | 0 |
| | Remarks:<br>Indicates elapsed time after clearing DTC. (Time is not counted with IG OFF.) | | |

Driving distance after DTC clearance

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Meter since DTC cleared] | • Indicates the driving distance after clearing DTC.<br>• Display range: 0 to 65535 km | Driving distance after clearing DTC | 0 |
| | Remarks:<br>Indicates the driving distance after clearing DTC. | | |

Number of warm-ups after DTC clearance

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Number of warm-ups] | • Indicates the number of warm-ups after clearing DTC.<br>• Display range: 0 to 255 | - | 0 |
| | Remarks:<br>Indicates the number of warm-ups (*1) after clearing DTC.<br>NOTE:<br>(*1): After starting the engine, the coolant temperature rises approx. by 20°C {36°F} or more. When the coolant temperature exceeds 70°C {158°F}, the number of warming-up is increased by 1. | | |

Driving distance after battery reconnection

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Distance Battery Cable Disconnect] | • Indicates the driving distance after reconnecting the battery.<br>• Display range: 0 to 65535 km | Driving distance after battery reconnection | 0 |

OBD system

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [OBD System] | • Indicates the on-board diagnostics system.<br>• - | - | × |

ES

15. Misfiring

Misfire counter #1 to misfire counter #4

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Cylinder #1 Misfire Count]<br>[Cylinder #2 Misfire Count]<br>[Cylinder #3 Misfire Count]<br>[Cylinder #4 Misfire Count] | • Indicates the misfire counter for each cylinder.<br>• Display range: 0 to 255 | 0 to 16 | 0 |
| | Remarks:<br>• Indicates the misfire counter for each cylinder.<br>• Misfire counter is incremented by one for every misfire.<br>• The value is reset at every 200 revolution of the engine.<br>• When failure occurs, check this counter to specify the abnormal cylinder. | | |

ES

16. Vehicle driving data 4

Engine speed with starter OFF

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Engine Speed (Starter Off)] | • Indicates the engine speed with starter OFF.<br>• Display range: 0 to 51199 r/min | - | 0 |
| | Remarks:<br>Indicates the engine speed immediately after starting the engine. | | |

Number of ON for current trip starter

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Starter Count] | • Indicates the number of ON for starter after IG OFF →IG ON.<br>• Display range: 0 to 255 | - | 0 |
| | Remarks:<br>Indicates the number of ON for current trip starter | | |

The number of DTCs for which 40 warm-up cycles do not continue in the normal status.

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [# Codes(Include History)] | • The number of DTCs displayed in [Present fault]<br>• Display range: 0 to 255 | 0 | × |
| | Remarks:<br>Indicates the number of DTC that triggers the MIL illumination and does not continue 40 warm-up cycles in the normal status.<br>NOTE:<br>• The DTCs that are not related to exhaust emission such as P1603 and P1604 are not included. As for the DTC requiring two-times performance of diagnosis for determining the malfunction, even if temporary malfunction is determined at first time, this number is not counted in the number of DTC.<br>• Indicates it as [Present fault] until 40 warm-up cycles are completed even if no malfunction is present.<br>• After the DTC has been stored, when 40 warm-up cycles are completed in the normal status, the engine control computer automatically clears the DTC. | | |

Number of all diagnostic codes

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Number Of ALL DTCs] | • The number of DTCs displayed in [Present fault]<br>• Display range: 0 to 255 | 0 | 0 |
| | Remarks:<br>Indicates the total number of DTCs including DTC not related to exhaust emission. As for the DTC requiring two-times performance of diagnosis for determining the malfunction, even if temporary malfunction is determined at first time, this number is counted in the number of DTC. | | |

The number of IG ON times

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Trip Count] | • Indicates the total number of IG ON after building of vehicle.<br>• Display range: 0 to 65534 trip | - | 0 |
| | Remarks:<br>Indicates the total number of IG ON after building of vehicle.<br>NOTE:<br>By checking [Time Count], [Normal sampling], and [Freeze frame data], the information on "How many IG ON operations have been performed since this DTC was recorded?" or "How much time had elapsed after IG ON when the DTC was recorded?" can be obtained. | | |

Count

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Count] | • Indicates the selection of the counter for the integrated unit or the unique engine control computer counter when calculating the elapsed time after IG ON.<br>• Display: [Normal counter] / [Original count] | Normal count | 0 |
| | Remarks:<br>Normal counter indicates the number of IG ON and elapse of time after IG ON by obtaining the count information from the master integrated unit.<br>Original count indicates the number of IG ON and elapse of time after IG ON by the engine control computer when the count information cannot be obtained from the integrated unit for some reasons.<br>When DTC is recorded, time stamp can be checked by confirming [Trip Count] or [Time Count] for freeze frame data. | | |

ES

Elapsed time after IG ON

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Time Count] | • Indicates the elapsed time after IG ON.<br>• Display range: 0 to 1677721500 ms | - | 0 |
| | Remarks:<br>Indicates the elapsed time after IG ON.<br>NOTE:<br>By checking [Trip Count], [Normal sampling], and [Freeze frame data], the information on "How many IG ON operations have been performed since this DTC was recorded?" or "How much time had elapsed after IG ON when the DTC was recorded?" can be obtained. | | |

Driving distance of previous trip

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Run Dist of Previous Trip] | • Indicates the driving distance of previous operation.<br>• Display range: 0 to 655.35 km | - | 0 |
| | Remarks:<br>• [Run Dist of Previous Trip] displays the driving distance for the previous trip until 5 seconds after the engine has started during P1604 detection period. After the period has elapsed, however, the value is once cleared, and the driving distance for the current trip, which is integrated with the driving distance detected from the vehicle speed, is displayed.<br>• The freeze frame data in which P1604 start failure phenomenon is detected displays the driving distance for the previous trip. However, in the freeze frame data and snap shot measurement for DTCs (other than P1604), the driving distance for the current trip is displayed. | | |

Engine start time

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Engine Starting Time] | • Indicates the engine start time.<br>• Display range: 0 to 655350 ms | - | 0 |
| | Remarks:<br>• Indicates the period of time from the starter ON to the engine speed reaching 500 r/min.<br>• The value is reset 5 seconds after starting the engine, and "0 ms" is displayed. | | |

Engine coolant temperature in previous trip

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Previous Trip Coolant Temp] | • Indicates the engine coolant temperature in the previous operation.<br>• Display range: -40 to 215°C {-40 to 419°F} | - | 0 |

Intake air temperature in previous trip

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Previous Trip Intake Temp] | • Indicates the intake air temperature of the previous operation.<br>• Display range: -40 to 215°C {-40 to 419°F} | - | 0 |

Engine oil temperature in previous trip

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Previous Trip Eng Oil Temp] | • Indicates the engine oil temperature in the previous operation.<br>• Display range: -40 to 215°C {-40 to 419°F} | - | 0 |

Ambient temperature in previous trip

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Previous Trip Ambient Temp] | • Indicates the ambient temperature of previous operation.<br>• Display range: -40 to 215°C {-40 to 419°F} | - | 0 |

Start time inferior record

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Starting time of engine failure history] | • Indicates the start time inferior record.<br>• Display: ON/OFF | - | 0 |
| | Remarks:<br>When the engine speed does not reach 500 r/min while cranking, [ON] is displayed. | | |

Low revolution record after engine start

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Low Rev for Eng Start] | • Indicates the low revolution record after engine start.<br>• Display: ON/OFF | - | 0 |
| | Remarks:<br>When the engine speed reduces to 200 r/min or less approx. within 2 seconds after engine start, [ON] is displayed. | | |

Elapsed time after high speed revolution

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel Cut Elps Time] | • Indicates the elapsed time after high speed revolution judgment.<br>• Display range: 0 to 67108 sec | - | 0 |
| | Remarks:<br>Indicates the elapsed time of engine operation after high speed operation (high speed fuel cut speed + 500 r/min or more) occurs. | | |

Engine oil temperature at engine start

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Initial Engine Oil Temp] | • Indicates the engine oil temperature at engine start.<br>• Display range: -40 to 215°C {-40 to 419°F} | - | 0 |

A/F idle learning value #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Idle #1] | • Indicates the air fuel ratio learning value for idle area (during direct injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed in the idle area after warming-up (coolant temperature of 80°C {176°F} or more). | | |

A/F idle learning value #1 (Dual)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Idle #1(Dual)] | • Indicates the air fuel ratio learning value in the idle area (controlled injection).<br>• Display range: -50 to 49.6% | -15 to 15%: | 0 |
| | NOTE:<br>Learning is performed in the idle area after warming-up (coolant temperature of 80°C {176°F} or more). | | |

A/F low load learning value #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Low #1] | • Indicates the air fuel ratio learning value for low load area (during direct injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the low load area of four load areas controlled during driving. | | |

A/F middle load 1 learning value #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Mid1 #1] | • Indicates the air fuel ratio learning value in the middle load area 1 (controlled injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the middle load area of four load areas controlled during driving. | | |

A/F high load learning value #1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value High #1] | • Indicates the air fuel ratio learning value for high load area (during direct injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the high load area of four load areas controlled during driving. | | |

A/F low load learning value #1 Dual

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Low #1(Dual)] | • Indicates the air fuel ratio learning value in the low load area (controlled injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the low load area of four load areas controlled during driving. | | |

A/F middle load 1 learning value #1 Dual

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value Mid1 #1(Dual)] | • Indicates the air fuel ratio learning value in the middle load area 1 (controlled injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the middle load area of four load areas controlled during driving. | | |

A/F high load learning value #1 Dual

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/F Learn Value High #1(Dual)] | • Indicates the air fuel ratio learning value in the high load area (controlled injection).<br>• Display range: -50 to 49.6% | -15 to 15% | 0 |
| | NOTE:<br>Learning is performed after warming-up (coolant temperature of 80°C {176°F} or more) and in the high load area of four load areas controlled during driving. | | |

A/C magnetic clutch relay

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [A/C Compressor Signal] | A/C magnetic clutch relay: ON/OFF | ON:<br>A/C ON | 0 |

Electric fan relay No. 1

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Radiator Fan Relay #1] | • Indicates the operation of the radiator fan relay.<br>• Display: ON/OFF | ON:<br>Radiator fan (LO) operates. | 0 |

Electric fan relay No. 2

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Radiator Fan Relay #2] | • Indicates the operation of the radiator fan relay.<br>• Display: ON/OFF | ON:<br>Radiator fan (HI) operates. | 0 |

ES

Brake override control

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Accel/Brake Pedal Control Status] | • Indicates the brake override control condition.<br>• Display: ON/OFF | ON:<br>Brake override control in progress | 0 |

F/C with idle ON

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Idle Fuel Cut] | • Indicates that the fuel cut is operating.<br>• Display: ON/OFF | ON:<br>Fuel cut in progress | 0 |
| | Remarks:<br>F/C with idle ON: ON<br>• Throttle valve is fully closed.<br>• Engine speed is high. | | |

F/C with low load

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [FC TAU] | • Indicates that the fuel cut is operating with low load.<br>• Display: ON/OFF | ON:<br>Fuel cut in progress | 0 |
| | Remarks:<br>Fuel cut is performed to avoid incomplete combustion. | | |

Immobilizer fuel cut state

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Immobilizer Fuel Cut] | • Indicates the condition of the immobilizer fuel cut.<br>• Display: ON/OFF | - | 0 |

Immobilizer fuel cut record

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Immobilizer Fuel Cut History] | • Indicates the record of the immobilizer fuel cut.<br>• Display: ON/OFF | - | 0 |

Estimated fuel dilution amount

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel dilution quantity estimated value] | • Indicates the estimated fuel dilution amount.<br>• Display range: 0 to 1279.9 ml | - | 0 |

17. Compression

Engine speed of Cyl #1 to #4

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Engine Speed of Cyl #1]<br>[Engine Speed of Cyl #2]<br>[Engine Speed of Cyl #3]<br>[Engine Speed of Cyl #4] | • Indicates the engine speed during fuel cut per cylinder.<br>• Display range: 0 to 51199 r/min | - | 0 |
| | Remarks:<br>• Indicates the engine speed when measurement of engine speed for each cylinder in [Active Test] is performed. (Normally, 0 r/min is displayed.)<br>• The engine speed during cranking is measured for each cylinder.<br>• When compression leakage occurs, the cylinder stop engine speed of the relevant cylinder becomes high.<br>NOTE:<br>If compression leakage occurs in the multiple cylinders, the cylinder stop engine speed becomes high, and it is possible to determine which cylinder has a compression leakage. However, the cylinder with the highest speed is not always the one with the lowest compression. (This is because the poorly-compressed cylinder and well-compressed cylinder have an influence on engine speed of each another.) Therefore, it is necessary to measure the compression actually, and determine which cylinder causes a large compression leakage. | | |

Average engine speed in all cylinders

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Av Engine Speed of All Cyl] | • Indicates the average engine speed of all cylinders.<br>• Display range: 0 to 51199 r/min | - | 0 |
| | Remarks:<br>Indicates the engine speed when measurement of engine speed for each cylinder in [Active Test] is performed. (Normally, 0 r/min is displayed.) | | |

18. Automatic transaxle

Engine warning light illumination request (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [MIL Request Status] | • Indicates the illumination status of the engine warning light.<br>• Display: Lighting instructions/No Lighting instructions | - | 0 |
| | Remarks:<br>When illumination request is received from ECT, [Lighting instructions] is displayed. | | |

Gear position (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Gear Signal] | • Indicates the gear position (shift).<br>• Display range: 0 to 255 speed | Shifted into each gear position:<br>Driving | 0 |
| | Remarks:<br>When abnormal, ECT system malfunction may exist. | | |

Turbine speed (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [AT turbine speed] | • Indicates input speed.<br>• Display range: 0 to 12750 r/min | Almost the same as idle speed:<br>When lock-up | 0 |

Lock-up condition (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [AT Lock up status] | • Indicates the lock-up condition.<br>• Display: ON/OFF | ON:<br>When lock-up | 0 |

Shift position P range

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Shift SW Status (P Range)] | • Indicates the shift lever P position.<br>• Display: ON/OFF | ON:<br>Shift lever P | 0 |

Shift position R range

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Shift SW Status (R Range)] | • Indicates the shift lever R position.<br>• Display: ON/OFF | ON:<br>Shift lever R | 0 |

Shift position N range

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Shift SW Status (N Range)] | • Indicates the shift lever N position.<br>• Display: ON/OFF | ON:<br>Shift lever N | 0 |

Manual switch

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Manual SW] | • Indicates the condition of the transmission control switch (M).<br>• Display: ON/OFF | ON:<br>Shift lever “M” | 0 |

ES

Shift position D range

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Shift SW Status (D Range)] | • Indicates the shift lever D position.<br>• Display: ON/OFF | ON:<br>Shift lever D, M, “+” or “-” | 0 |

Ignition timing retard angle request (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Retard Signal from AT] | • Indicates the ignition timing retard angle request.<br>• Display: ON/OFF | - | 0 |

Fuel cut request (ECT →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Fuel Cut signal from AT] | • Indicates the fuel cut request.<br>• Display: ON/OFF | - | 0 |

Torque down prohibition request (EFI →ECT)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Stop torque decrease with AT] | • Indicates the torque down prohibition request.<br>• Display: [Permission/Prohibition] | - | 0 |

19. Vehicle driving data 5

Torque down request (VSC →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Request Torque Down VDC] | • Indicates the torque down request.<br>• Display: ON/OFF | - | 0 |

Torque up request (VSC →EFI)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Request torque increase with VDC] | • Indicates the torque up request.<br>• Display: ON/OFF | - | 0 |

Torque down prohibition request (EFI →VSC)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Ban of Torque Down] | • Indicates the torque down prohibition request.<br>• Display: [Permission/Prohibition] | - | 0 |

Torque up prohibition request (EFI →VSC)

| Item name | Description/display range | Normal value | Freeze frame data output |
|---|---|---|---|
| [Stop torque increase with VDC] | • Indicates the torque up prohibition request.<br>• Display: [Permission/Prohibition] | - | 0 |

20. Active test

NOTE:

By performing [Active Test] using the SSM4, the vacuum switching valve or actuator can be operated without removing the adjacent parts. When performing [Active Test] in the initial stage of the troubleshooting, the diagnosis time can be reduced.

(1) Warm up the engine.

(2) Turn the ignition switch to OFF.

(3) Connect the SSM4 to the DLC3.

(4) Turn the ignition switch to ON.
(5) Follow the SSM4 on-screen instructions to perform [Active Test].

| Item name | Test contents | Control range | Remarks |
|---|---|---|---|
| Fuel injection volume | Switching of direct injection and port injection, and increase/decrease in fuel injection amount | Port injection/direct injection/control-dependent injection -12.5 to 24.8% | • All injectors can be tested simultaneously.<br>• Perform active test at engine coolant temperature of 80°C {176°F} or more and with the engine speed of less than 3000 r/min.<br>• Fuel injection volume can be changed in a step-by-step manner within the control range.<br>• Statuses of air/fuel ratio sensor and oxygen sensor can be checked by increasing/decreasing the fuel injection volume.<br>• Select [Active Test] - [Cylinder Fuel Rate], and read the voltage in [A/F Sensor #11] and [Oxygen sensor #12].<br>• During performing the active test, the feedback control is disabled. |
| Purge VSV | Purge VSV operation | ON/OFF | • Duty ratio at ON: 30 %<br>• Active test restrictions<br>– IG ON |
| A/C Compressor Relay | A/C relay operation | ON/OFF | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P or N |
| ELCM pump | Pump operation | ON/OFF | • Active test restrictions<br>– Not during requirement for evaporative system leak test |
| ELCM switching valve | Switching valve operation | Open/close | • Active test restrictions<br>– Not during requirement for evaporative system leak test |
| Radiator fan relay | Radiator fan relay operation | ON/OFF | Active test restrictions<br>– IG ON |
| Target fuel pressure | Increase/decrease of fuel pressure | -12.5 to 24.8% | Active test restrictions<br>– Engine speed is 3000 r/min or less. |
| Fuel Injection Period (Injector #1) | Increase/decrease in fuel injection period | -16 to 15.9°CA | Active test restrictions<br>– During idling<br>– Shift position P or N |
| Fuel Injection Period (Injector #2) | Increase/decrease in fuel injection period | -16 to 15.9°CA | Active test restrictions<br>– During idling<br>– Shift position P or N |
| Fuel Injection Period (Injector #3) | Increase/decrease in fuel injection period | -16 to 15.9°CA | Active test restrictions<br>– During idling<br>– Shift position P or N |
| Fuel Injection Period (Injector #4) | Increase/decrease in fuel injection period | -16 to 15.9°CA | Active test restrictions<br>– During idling<br>– Shift position P or N |
| Fuel Injection Period (all injectors) | Increase/decrease in fuel injection period | -16 to 15.9°CA | Active test restrictions<br>– During idling<br>– Shift position P or N |
| ACC cut relay | ACC cut relay operation | ON/OFF | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P or N |
| Control the ETCS Open/Close (Slow) | Throttle Valve Operation (Slow) | Throttle open/throttle closed | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P<br>– Accelerator pedal is fully open |
| Control the ETCS Open/Close (Fast) | Throttle Valve Operation (Fast) | Throttle open/throttle closed | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P<br>– Accelerator pedal is fully open |
| Power balance (injection stop) | Switching of direct injection and port injection for each cylinder, and stop of fuel injection | Port injection/direct injection/control-dependent injection Fuel injection stop Injector #1/Injector #2/ Injector #3/ Injector #4 | Active test restrictions<br>– Engine speed is 3000 r/min or less.<br>– Engine coolant temperature at 80°C {176°F} or more<br>– Shift position P or N |

ES

ES

| Item name | Test contents | Control range | Remarks |
|---|---|---|---|
| Power balance (fuel injection stop) | Switching of direct injection and port injection for each cylinder, and stop of fuel injection and ignition cycle | Port injection/direct injection/control-dependent injection<br>Stop of injection and ignition<br>Injector #1/Injector #2/ Injector #3/ Injector #4 | Active test restrictions<br>– During idling<br>– Shift position P or N<br>– Vehicle speed sensor normal |
| Control the All Cylinders Fuel Cut | Stop of fuel injection to all cylinders | ON | • It is possible to check the ignition system for abnormality by stopping the fuel injection during startup cycle and allowing ignition operation only.<br>• Active test restrictions<br>– During idling<br>– Shift position P or N<br>– Vehicle speed sensor normal |
| Check the Cylinder Compression*1 | Measuring the engine speed during cranking | ON | • When the active test is performed, the fuel injection and ignition for all cylinders are stopped.<br>• Active test restrictions<br>– During idling<br>– Shift position P or N<br>– Vehicle speed sensor normal |
| Alternator control | Increase/decrease in the alternator generation request voltage. | 12.8 to 14.1 V | Active test restrictions<br>– While engine running<br>– Shift position P or N |
| Injection mode change | Switching of injection mode | Control-dependent injection/port injection/direct injection | • Active test restrictions<br>– During idling<br>– Engine coolant temperature at 80°C {176°F} or more<br>– Shift position P or N<br>• Total port injection time: Within 3 minutes |
| Fuel pump duty | Switching of fuel pump duty ratio | 1%/90% | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P or N |
| Starter cut relay | Starter cut relay operation | ON/OFF | Active test restrictions<br>– Engine stop, IG ON<br>– Shift position P or N |
| Target engine speed | Increase/decrease in engine speed | 500 to 2000 r/min | Active test restrictions<br>– Vehicle stop condition<br>– During idling<br>– Vehicle status normal |
| Control the VVT Linear (Bank1)*2 | Oil control valve operation | -27 to 36°CA | • When the active test is performed:<br>Engine stalls, rough idling<br>• Active test restrictions<br>– Vehicle stop condition<br>– During idling |
| Control the VVT Linear (Bank2)*2 | Oil control valve operation | -27 to 36°CA | • When the active test is performed:<br>Engine stalls, rough idling<br>• Active test restrictions<br>– Vehicle stop condition<br>– During idling |
| Control the VVT Exhaust Linear (Bank1) | Oil control valve operation | 0 to 51°CA | • When the active test is performed:<br>Engine stalls, rough idling<br>• Active test restrictions<br>– Vehicle stop condition<br>– During idling |
| Control the VVT Exhaust Linear (Bank2) | Oil control valve operation | 0 to 51°CA | • When the active test is performed:<br>Engine stalls, rough idling<br>• Active test restrictions<br>– Vehicle stop condition<br>– During idling |

NOTE:

- *1: In this active test, fuel injection and ignition for all cylinders are stopped, cranking is performed for approx. 10 seconds, and engine speed for each cylinder is measured.
- *2: This active test is performed after DTC has been cleared. (Refer to ES - 28)

21. Measurement of engine speed for each cylinder
    NOTE:
    Measure the engine speed for each cylinder at engine startup.
    When this active test is performed, the fuel injection and ignition for all cylinders are stopped. Crank the engine for approx. 10 seconds and read the measurement. When the engine speed for one cylinder is higher than the others, failure in compression pressure for the cylinder may occur.
    (1) Warm up the engine.
    (2) Turn the ignition switch to OFF.
    (3) Connect the SSM4 to the DLC3.
    (4) Turn the ignition switch to ON.
    (5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Check the Cylinder Compression]
    (6) When the engine is stopped, select [ON].
    (7) Crank the engine for approx. 10 seconds.
    (8) Read [Engine Speed of Cyl #1 to #4] and [Av Engine Speed of All Cyl] displayed on the SSM4.
        CAUTION:
        - Do not crank the engine for 20 seconds or more.
        - In order to perform the test again after performing the active test, return to the active test menu screen, and perform the test again.
        - Use fully charged battery.
        - Cranked without selecting [ON], the engine starts.
        - When the active test is performed, DTC P1604 (startup failure), etc. may be detected.
        - After performing the active test, be sure to check and clear DTC(s). (Refer to ES - 28)

## VVT initial position learning value display

1. VVT initial position learning value display
   NOTE:
   Displays the VVT initial position learning value used in the self-diagnosis for VVT. This value is also used for calculating the reference value in the troubleshooting of DTC (P0016, etc.).
   Concerning the learning value, the value for the crankshaft position initially input at the production factory is recorded as the normal value, and thereafter it is updated whenever normal judgment occurs. When the timing chain is suddenly displaced during operation or when there is wrong assembly during repair work, this will cause abnormal judgment, and the learning value is not updated.
   (1) Warm up the engine, and let it idle for 5 minutes or more.
   (2) Turn the ignition switch to OFF.
   (3) Connect the SSM4 to the DLC3.
   (4) Turn the ignition switch to ON.
   (5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [VVT Initial Position Learning Value Display]
   (6) Read each learning value.
2. List of VVT initial position learning value display

| Item | Display | Unit |
|---|---|---|
| VVT initial position learning value (bank 1) | [VVT Initial Position Learning Value #1] | °FR |
| VVT initial position learning value (bank 2) | [VVT Initial Position Learning Value #2] | °FR |
| Exhaust VVT initial position learning value (bank 1) | [VVT Ex Initial Position Learning Value #1] | °FR |
| Exhaust VVT initial position learning value (bank 2) | [VVT Ex Initial Position Learning Value #2] | °FR |

## Failsafe list

If any of the following codes is recorded, the ECM enters fail-safe mode.

| DTC | Fail safe operation | Fail safe mode cancel condition |
|---|---|---|
| P000A<br>P000C<br>P0010<br>P0011<br>P0016<br>P0018<br>P0020<br>P0021<br>P0341<br>P0345<br>P0346 | Intake VVT control is fixed in the mid position. | After restored to normal condition, turn IG ON again. |
| P000B<br>P000D<br>P0013<br>P0014<br>P0017<br>P0019<br>P0023<br>P0024<br>P0365<br>P0366<br>P0390<br>P0391 | Exhaust VVT control is fixed at the maximum advanced angle position. | After restored to normal condition, turn IG ON again. |
| P0031<br>P0032<br>P0131<br>P0132<br>P0134 | Air/fuel ratio feedback control is prohibited. | After restored to normal condition, turn IG ON again. |

Circuit description

The VVT system consists of engine control computer, camshaft timing oil control valve ASSY, intake cam sprocket, and exhaust cam sprocket. This VVT system controls the intake cam sprocket and the exhaust cam sprocket in order to provide the best valve timing according to a driving condition. This control is based on various conditions including mass air flow, throttle position, and engine coolant temperature. The engine control computer, based on signals from these sensors, adjusts the camshaft timing oil control valve ASSY. As a result, the optimal relative position of the intake camshaft is obtained, thus providing better fuel effi-

ciency, superior output performance, and better emission performance. Also, the engine control computer detects the actual valve timing through the signal from the camshaft position sensor and performs feedback control to provide the most suitable valve timing.

VVT system:

MONITOR DESCRIPTION

The ECM optimizes intake valve timing using the variable valve timing (VVT) system to control the intake camshaft. The VVT system consists of ECM, cam timing oil control valve ASSY, and the VVT controller (intake cam sprocket). The ECM sends the target duty cycle control signal to the camshaft timing oil control valve ASSY. In response to this control signal, the oil pressure supplied to the VVT controller is adjusted. The VVT controller advances or retards the intake camshaft.

When a difference between the target intake valve timing and the actual intake valve timing is large, and the amount of change in the actual intake valve timing is small, the ECM judges this condition as stuck in VVT controller and stores the DTC.

The DTCs indicate failure in camshaft timing oil control valve ASSY or VVT controller operation failure due to intrusion of foreign objects into the camshaft oil control valve ASSY.

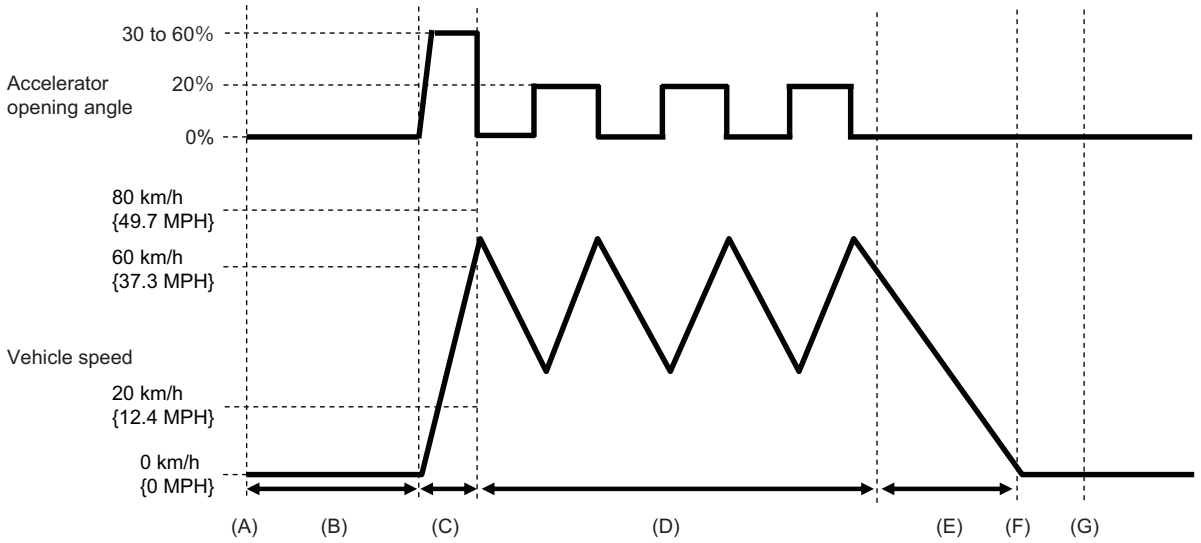
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 70°C {158°F} or more)
9. Perform driving test as follows.

   WARNING:
   - To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
   - When performing this driving test, always observe the applicable traffic laws such as the speed limit.

   NOTE:

   The vehicle may be driven at accelerated/constant speed according to road conditions.

   (a) Start the engine after warming up the engine (coolant temperature of 70°C (158°F) or more). (A)

   (b) Idle the engine for 3 minutes or more. (B)

   (c) Accelerate to 60 km/h {37.3 MPH}. (C)

   (d) While maintaining 60 km/h {37.3 MPH}, repeat the accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) for 20 minutes or more. (D)

   This test requires 2 people. One person operates the reproduction mode while the other one monitors the diagnostic values. Continue monitoring the values as they are not stored.

   (e) Decelerate for 5 seconds or more at the accelerator pedal opening angle 0 %. (E) Leaning is performed during this operation.

   (f) Stop the vehicle. (There are no special restrictions on driving operations until you park at the safe location.) (F)

   (g) Stop the engine. (G)

   NOTE:

   In section (D), you can stop the vehicle according to the traffic conditions. Drive until the cumulative time of accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) exceeds 20 minutes or more.
10. Turn the ignition switch to ON.
11. Turn on the SSM4.
12. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:

| Bank | Abnormal timing advancement |
|---|---|
| Bank 1 (intake side) | P000A<br>P0011 |
| Bank 2 (intake side) | P000C<br>P0021 |

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Reading diagnostic codes |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| Either P000A, P000C, P0011, or P0021 is output. | A |
| Either P000A, P000C, P0011, or P0021 and other diagnostic codes are output. | B |

NOTE:
- If any diagnostic codes other than P000A, P000C, P0011 or P0021 are output, troubleshoot them first.
- When a diagnostic code is output, store the freeze frame data. (Refer to ES - 28)

B → Progress to the relevant diagnosis code chart (Refer to ES - 12)

A

| 2 | Check of engine oil condition |
|---|---|

(1) Check the engine oil condition.
NOTE:
Check the following items.
- Oil quantity within the specified rage
- Occurrence of abnormal contamination
- Solidity due to additive agent
- Use of oil with specified viscosity

NG → Adjustment of oil quantity, or replacement of engine oil and oil filter (Refer to LU - 4) Go to step 3

OK

| 3 | Check of on-board monitor test result |
|---|---|

(1) Replace the camshaft timing oil control valve ASSY (intake side) on the bank where trouble was detected through the diagnostic code. (Refer

to ES - 664)

(2) Connect the SSM4 to the DLC3.

(3) Turn the ignition switch to ON.

(4) Turn on the SSM4.

(5) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)

(6) Perform test drive. (Refer to "Test drive" under "Description of functions")

WARNING:

When performing this driving test, always observe the applicable traffic laws such as the speed limit.

(7) Using SSM4, read [VVT monitor bank 1] and [VVT monitor bank 2] of mode 06. (Refer to ES - 24)

WARNING:

- To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
- When performing this driving test, always observe the applicable traffic laws such as the speed limit.

NOTE:

- When the diagnostic value is 0, the diagnosis is incomplete. Therefore, do not stop the engine, and perform the test driving again.
- The diagnostic value is updated repeatedly. Therefore, keep checking the data constantly during the diagnostic value reading is in progress.

(8) Record the values of the read [VVT monitor bank 1] and [VVT monitor bank 2].

Result

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000A, P0011 | Value of [VVT monitor bank 1] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |
| P000C, P0021 | Value of [VVT monitor bank 2] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |

B → Go to Step 5.

A

| 4 | Check of on-board monitor test result |
|---|---|

(1) Compare the values of [VVT monitor bank 1] and [VVT monitor bank 2] recorded in step 3.

Standard value

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000A, P0011 | Value of [VVT monitor bank 1] | 1000 or less, and larger than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | A |
| | | 1000 or less, and smaller than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | B |

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000C, P0021 | Value of [VVT monitor bank 2] | 1000 or less, and larger by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | A |
| | | 1000 or less, and smaller by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | B |

B → Idle of the engine for 5 minutes and replacement of oil filter and the engine oil (flushing) (Refer to LU - 4) Go to step 16

ES

A

**5** Check of harness and connector

(1) Check the harness and connector for bend, damage and poor contact.
NOTE:
Check the following items.
- Engine control computer (Refer to ES - 674)
- Camshaft timing oil control valve ASSY (Refer to ES - 664)
- Camshaft position sensor (Refer to ES - 682)
- Crankshaft position sensor (Refer to ES - 685)

NG → Repair or replacement of the faulty parts (Refer to ES - 664, ES - 674, ES - 682, and ES - 685) Go to step 6

OK

**6** Check of harness and connector (open circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the camshaft timing oil control valve ASSY (intake side) connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P000A, P0011 | A36-17 (OC1) - C7-2 | Always | Less than 1 Ω |
| P000C, P0021 | A36-16 (OC2) - C24-2 | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 16.

OK

**7** Check of harness and connector (open circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the camshaft position sensor (intake side).
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P000A, P0011 | A34-26 (VV1+) - C12-2 (VV1+) | Always | Less than 1 Ω |
| P000C, P0021 | A34-15 (VV2+) - C26-2 (VV2+) | Always | Less than 1 Ω |

ES

NG → To repair or replace the faulty parts, go to step 16.

OK

**8 Check of harness and connector (open circuit)**

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the crankshaft position sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16(NE+) - C47-1(OUT) | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 16.

OK

**9 Check of engine oil pressure**

(1) Check the engine oil pressure. (Refer to LU - 2)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 12.

A

**10 Check of oil strainer**

(1) Check the oil strainer in the oil pan. (Refer to EM - 75)
Criteria: There is no clogging or adherence of foreign material.

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Replace the chain cover. <Note> When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) Go to step 13

A

ES

| 11 | Cleaning of oil strainer |
|---|---|

(1) Check and clean inside the oil strainer, and remove clogging and adherence of foreign matter.

Next

| 12 | Check of oil passage of chain cover |
|---|---|

(1) Remove the engine unit from the vehicle body. (Refer to EM - 75)
(2) Check the oil passage of the chain cover. (Refer to LU - 13)
NOTE:
Check the O-ring and entrance of foreign matter of the following oil passage.
- Inlet opening of oil pump
- Outlet opening of oil pump
- O-ring of each passage to left/right cylinder head
- Oil control valve ASSY
- Entrance of foreign matter

NG → Replace the faulty parts. Replacement of chain cover in the case of foreign matter entrance (Refer to LU - 13) Go to step 13

OK

| 13 | Check of camshaft condition |
|---|---|

(1) Remove the timing chain. (Refer to EM - 13)
(2) Turn the camshaft with your hand, and compare the rotational resistance of the four camshafts.
NOTE:
Compare the rotational resistance with that of the bank 2 (bank 1) camshaft, and check the bank 1 (bank 2) camshaft for definitive faults such as unsmoothness and rotational resistance.
- Adherence of foreign matter on camshaft
- Damage of camshaft (scratches, galling, wear, etc.)
- Check of influence due to camshaft journal bearing not rotating properly

NG → Replacement of cam carrier and camshaft (Refer to EM - 75, and EM - 31) Go to step 14

OK

| 14 | Check of oil passage between oil pump and camshaft timing oil control valve ASSY |
|---|---|

(1) Visually check the following oil passages between oil pump and camshaft timing oil control valve ASSY, and check for definitive faults such as adherence of foreign matter and clogging.
- Oil passage of cam carrier
- Oil passage on the cylinder head side
- Oil passage at the connection between the cam sprocket and cam shaft
- Oil passage of the cam sprocket back side and at the cam shaft top end with the cam sprocket removed

NOTE:
Refer to the removal procedure of the cam carrier in the service manual. (Refer to EM - 31)

NG → Eliminate the foreign matter. Replacement of oil filer for cam carrier (Do not reuse) (Refer to EM - 75) <Note> •When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) •Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75) <Reference> Let the engine idle for 5 minutes after finishing the procedure, and replace the oil filter and the engine oil (flushing). (Refer to LU - 4) Go to step 16

OK

| 15 | Replacement of cam sprocket |
|---|---|

(1) Replace the cam sprocket. (Refer to EM - 31)
CAUTION:
- When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26)
- Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75)

Next

| 16 | Check of on-board monitor test result |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.
(6) Perform test drive. (Refer to "Test drive" under "Description of functions")
WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.

(7) Using SSM4, read [VVT monitor bank 1] and [VVT monitor bank 2] of mode 06. (Refer to ES - 24)
WARNING:
- To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
- When performing this driving test, always observe the applicable traffic laws such as the speed limit.

NOTE:
- When the diagnostic value is 0, the diagnosis is incomplete. Therefore, do not stop the engine, and perform the test driving again.
- The diagnostic value is updated repeatedly. Therefore, keep checking the data constantly during the diagnostic value reading is in progress.

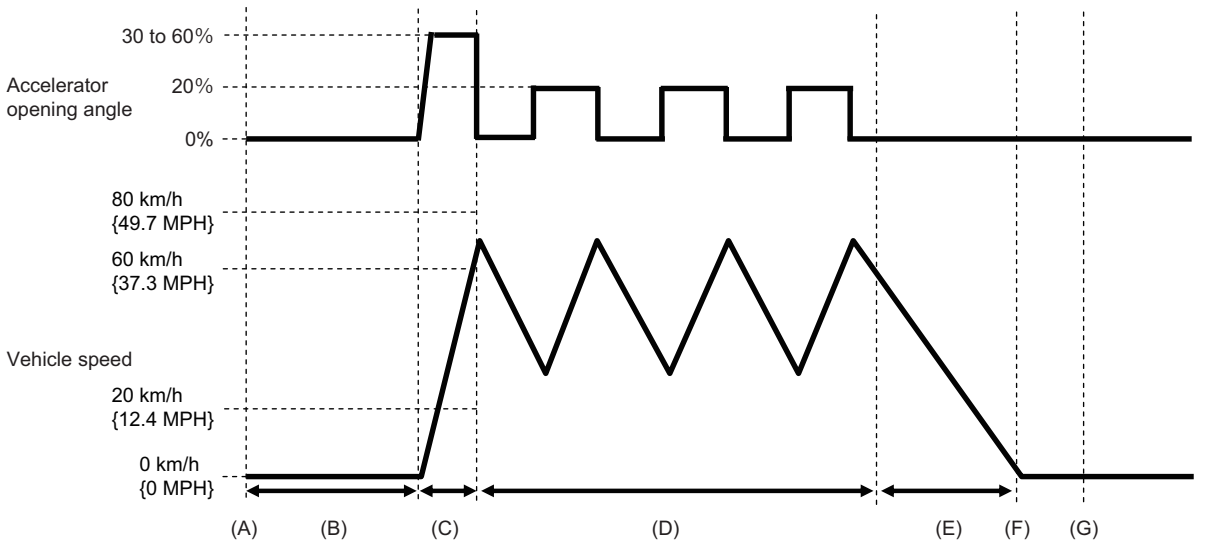
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 70°C {158°F} or more)
9. Perform driving test as follows.

   WARNING:
   - To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
   - When performing this driving test, always observe the applicable traffic laws such as the speed limit.

   NOTE:

   The vehicle may be driven at accelerated/constant speed according to road conditions.

   (a) Start the engine after warming up the engine (coolant temperature of 70°C (158°F) or more). (A)

   (b) Idle the engine for 3 minutes or more. (B)

   (c) Accelerate to 60 km/h {37.3 MPH}. (C)

   (d) While maintaining 60 km/h {37.3 MPH}, repeat the accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) for 20 minutes or more. (D)

   This test requires 2 people. One person operates the reproduction mode while the other one monitors the diagnostic values. Continue monitoring the values as they are not stored.

   (e) Decelerate for 5 seconds or more at the accelerator pedal opening angle 0 %. (E) Leaning is performed during this operation.

   (f) Stop the vehicle. (There are no special restrictions on driving operations until you park at the safe location.) (F)

   (g) Stop the engine. (G)

   NOTE:

   In section (D), you can stop the vehicle according to the traffic conditions. Drive until the cumulative time of accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) exceeds 20 minutes or more.
10. Turn the ignition switch to ON.
11. Turn on the SSM4.
12. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:

| Bank | Malfunction |
|---|---|
| Bank 1 (exhaust side) | P000B<br>P0014 |
| Bank 2 (exhaust side) | P000D<br>P0024 |

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

ES

| 1 | Reading diagnostic codes |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| Either P000B, P000D, P0014, or P0024 is output. | A |
| Either P000B, P000D, P0014, or P0024 and other diagnostic codes are output. | B |

NOTE:
- If any diagnostic codes other than P000B, P000D, P0014 or P0024 are output, troubleshoot them first.
- When a diagnostic code is output, store the freeze frame data. (Refer to ES - 28)

B → Progress to the relevant diagnosis code chart (Refer to ES - 12)

A

| 2 | Check of engine oil condition |
|---|---|

(1) Check the engine oil condition.
NOTE:
Check the following items.
- Oil quantity within the specified rage
- Occurrence of abnormal contamination
- Solidity due to additive agent
- Use of oil with specified viscosity

NG → Adjustment of oil quantity, or replacement of engine oil and oil filter (Refer to LU - 4) Go to step 3

OK

| 3 | Check of on-board monitor test result |
|---|---|

(1) Replace the camshaft timing oil control valve ASSY (exhaust side) on the bank where trouble was detected through the diagnostic code.

(Refer to ES - 664)

(2) Connect the SSM4 to the DLC3.

(3) Turn the ignition switch to ON.

(4) Turn on the SSM4.

(5) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)

(6) Perform test drive. (Refer to "Test drive" under "Description of functions")

WARNING:

When performing this driving test, always observe the applicable traffic laws such as the speed limit.

(7) Using SSM4, read [VVT monitor bank 1] and [VVT monitor bank 2] of mode 06. (Refer to ES - 24)

WARNING:

- To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
- When performing this driving test, always observe the applicable traffic laws such as the speed limit.

NOTE:

- When the diagnostic value is 0, the diagnosis is incomplete. Therefore, do not stop the engine, and perform the test driving again.
- The diagnostic value is updated repeatedly. Therefore, keep checking the data constantly during the diagnostic value reading is in progress.

(8) Record the values of the read [VVT monitor bank 1] and [VVT monitor bank 2].

Result

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000B, P0014 | Value of [VVT monitor bank 1] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |
| P000D, P0024 | Value of [VVT monitor bank 2] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |

B → Go to Step 5.

A

| 4 | Check of on-board monitor test result |
|---|---|

(1) Compare the values of [VVT monitor bank 1] and [VVT monitor bank 2] recorded in step 3.

Standard value

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000B, P0014 | Value of [VVT monitor bank 1] | 1000 or less, and larger than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | A |
| | | 1000 or less, and smaller than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | B |

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000D, P0024 | Value of [VVT monitor bank 2] | 1000 or less, and larger by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | A |
| | | 1000 or less, and smaller by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | B |

B → Idle of the engine for 5 minutes and replacement of oil filter and the engine oil (flushing) (Refer to LU - 4) Go to step 16

ES

A

**5** Check of harness and connector

(1) Check the harness and connector for bend, damage and poor contact.
NOTE:
Check the following items.
- Engine control computer (Refer to ES - 674)
- Camshaft timing oil control valve ASSY (Refer to ES - 664)
- Camshaft position sensor (Refer to ES - 682)
- Crankshaft position sensor (Refer to ES - 685)

NG → Repair or replacement of the faulty parts (Refer to ES - 664, ES - 674, ES - 682, and ES - 685) Go to step 6

OK

**6** Check of harness and connector (open circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the camshaft timing oil control valve ASSY (exhaust side) connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P000B, P0014 | A36-7 (OE1) - C5-2 | Always | Less than 1 Ω |
| P000D, P0024 | A36-5 (OE2) - C23-2 | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 16.

OK

**7** Check of harness and connector (open circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the camshaft position sensor (exhaust side).
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P000B, P0014 | A34-14 (EV1+) - C6-2 (EV1+) | Always | Less than 1 Ω |
| P000D, P0024 | A34-25 (EV2+) - C25-2 (EV2+) | Always | Less than 1 Ω |

ES

NG → To repair or replace the faulty parts, go to step 16.

OK

**8** Check of harness and connector (open circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the crankshaft position sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16(NE+) - C47-1(OUT) | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 16.

OK

**9** Check of engine oil pressure

(1) Check the engine oil pressure. (Refer to LU - 2)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 12.

A

**10** Check of oil strainer

(1) Check the oil strainer in the oil pan. (Refer to EM - 75)
Criteria: There is no clogging or adherence of foreign material.

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Replace the chain cover. <Note> When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) Go to step 13

A

| 11 | Cleaning of oil strainer |
|---|---|

(1) Check and clean inside the oil strainer, and remove clogging and adherence of foreign matter.

Next

| 12 | Check of oil passage of chain cover |
|---|---|

(1) Remove the engine unit from the vehicle body. (Refer to EM - 75)
(2) Check the oil passage of the chain cover. (Refer to LU - 13)
NOTE:
Check the O-ring and entrance of foreign matter of the following oil passage.
- Inlet opening of oil pump
- Outlet opening of oil pump
- O-ring of each passage to left/right cylinder head
- Oil control valve ASSY
- Entrance of foreign matter

NG → Replace the faulty parts. Replacement of chain cover in the case of foreign matter entrance (Refer to LU - 13) Go to step 13

OK

| 13 | Check of camshaft condition |
|---|---|

(1) Remove the timing chain. (Refer to EM - 13)
(2) Turn the camshaft with your hand, and compare the rotational resistance of the four camshafts.
NOTE:
Compare the rotational resistance with that of the bank 2 (bank 1) camshaft, and check the bank 1 (bank 2) camshaft for definitive faults such as unsmoothness and rotational resistance.
- Adherence of foreign matter on camshaft
- Damage of camshaft (scratches, galling, wear, etc.)
- Check of influence due to camshaft journal bearing not rotating properly

NG → Replacement of cam carrier and camshaft (Refer to EM - 75, and EM - 31) Go to step 14

OK

| 14 | Check of oil passage between oil pump and camshaft timing oil control valve ASSY |
|---|---|

(1) Visually check the following oil passages between oil pump and camshaft timing oil control valve ASSY, and check for definitive faults such as adherence of foreign matter and clogging.
- Oil passage of cam carrier
- Oil passage on the cylinder head side
- Oil passage at the connection between the cam sprocket and cam shaft
- Oil passage of the cam sprocket back side and at the cam shaft top end with the cam sprocket removed

NOTE:
Refer to the removal procedure of the cam carrier in the service manual. (Refer to EM - 31)

NG → Eliminate the foreign matter. Replacement of oil filer for cam carrier (Do not reuse) (Refer to EM - 75) <Note> •When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) •Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75) <Reference> Let the engine idle for 5 minutes after finishing the procedure, and replace the oil filter and the engine oil (flushing). (Refer to LU - 4) Go to step 16

OK

| 15 | Replacement of cam sprocket |
|---|---|

(1) Replace the cam sprocket. (Refer to EM - 31)
CAUTION:
- When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26)
- Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75)

Next

| 16 | Check of on-board monitor test result |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.
(6) Perform test drive. (Refer to "Test drive" under "Description of functions")

WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.

(7) Using SSM4, read [VVT monitor bank 1] and [VVT monitor bank 2] of mode 06. (Refer to ES - 24)
WARNING:
- To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
- When performing this driving test, always observe the applicable traffic laws such as the speed limit.

NOTE:
- When the diagnostic value is 0, the diagnosis is incomplete. Therefore, do not stop the engine, and perform the test driving again.
- The diagnostic value is updated repeatedly. Therefore, keep checking the data constantly during the diagnostic value reading is in progress.

(8) Record the values of the read [VVT monitor bank 1] and [VVT monitor bank 2].

Standard value

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000B, P0014 | Value of [VVT monitor bank 1] | Less than 1000 | A |
| | | 1000 or more | B |
| P000D, P0024 | Value of [VVT monitor bank 2] | Less than 1000 | A |
| | | 1000 or more | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

| 17 | Checking diagnostic codes |
|---|---|

(1) Compare the values of [VVT monitor bank 1] and [VVT monitor bank 2] recorded in step 16.

Standard value

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P000B, P0014 | Value of [VVT monitor bank 1] | 1000 or less, and smaller than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | A |
| | | 1000 or less, and larger than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | B |
| P000D, P0024 | Value of [VVT monitor bank 2] | 1000 or less, and smaller by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | A |
| | | 1000 or less, and larger by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

Circuit description
For a circuit description, refer to ES - 85.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0010 | Oil control valve electric current on the intake camshaft circuit is less than 0.306 A for 2 seconds or more (bank 1).<br>(1-trip detection logic) | •Open or short condition in camshaft timing oil control valve ASSY on the intake camshaft circuit (bank 1)<br>•Camshaft timing oil control valve ASSY RH (intake side)<br>•ECM |
| P0020 | Oil control valve electric current on the intake camshaft circuit is less than 0.306 A for 2 seconds or more (bank 2).<br>(1-trip detection logic) | •Open or short condition in camshaft timing oil control valve ASSY on the intake camshaft circuit (bank 2)<br>•Camshaft timing oil control valve ASSY LH (intake side)<br>•ECM |

MONITOR DESCRIPTION
An open or short condition of the camshaft timing oil control valve ASSY on the intake camshaft circuit is detected through this DTC. If a control current for the camshaft timing oil control valve is abnormally low while the engine is running, the ECM turns on the MIL and stores the DTC.

Monitor strategy

Circuit figure
For a circuit figure, refer to ES - 88.

Description of functions
Test drive
Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| | |
|---|---|
| 1 | Clear DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)

Next

| | |
|---|---|
| 2 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| P0010 or P0020 is output. | A |
| No DTC is output. | B |

B → Inspection for problems that do not normally occur (Refer to ES - 28)

A

| 3 | Camshaft timing oil control valve ASSY unit inspection (intake side) |
|---|---|

(1) Perform a unit inspection of camshaft timing oil control valve ASSY. (Refer to ES - 667)

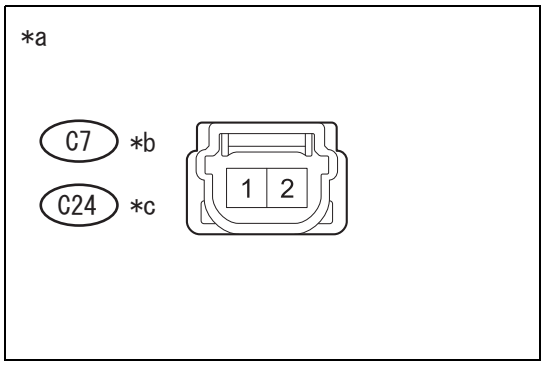
NG → Replacement of camshaft timing oil control valve ASSY (intake side) (Refer to ES - 664)

OK

| 4 | Check wiring harness and connector (camshaft timing oil control valve ASSY (intake side) power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect camshaft timing oil control valve ASSY (intake side) connector.



(2) Measure the voltage between the terminals.
Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C7-1 - chassis ground | IG ON | 11 to 14 V |
| C24-1 - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|

OK

| 5 | Check wiring harness and connector (engine control computer - camshaft timing oil control valve ASSY (intake side)) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect camshaft timing oil control valve ASSY (intake side) connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-17 (OC1) - C7-2 | Always | Less than 1 Ω |
| A36-16 (OC2) - C24-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-17 (OC1) and C7-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-16 (OC2) and C24-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

Replacement of the engine control computer (Refer to ES - 674)

| | |
|---|---|
| 6 | Relay unit inspection (EFI MAIN1 relay) |

(1) Perform unit inspection of EFI MAIN1 relay. (Refer to ES - 717)

NG → Relay replacement (EFI MAIN1 relay)

OK

| | |
|---|---|
| 7 | Check wiring harness and connector (EFI Main 1 relay - camshaft timing oil control valve ASSY (intake side)) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect camshaft timing oil control valve ASSY (intake side) connector.
(2) Remove the EFI MAIN1 relay from the engine compartment relay block.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) - C7-1 | Always | Less than 1 Ω |
| 3 (EFI MAIN1 relay holder) - C24-1 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) and C7-1 - other terminals and chassis ground | Always | 10 k Ωor more |
| 3 (EFI MAIN1 relay holder) and C24-1 - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Inspection of the ECM power supply system (Refer to ES - 646)

NG → Go to Step 6.

OK

| 5 | Check wiring harness and connector (engine control computer - camshaft timing oil control valve ASSY (exhaust side)) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect camshaft timing oil control valve ASSY (exhaust side) connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C36-7 (OE1) - C5-2 | Always | Less than 1 Ω |
| C36-5 (OE2) - C23-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C36-7 (OE1) and C5-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| C36-5 (OE2) and C23-2 - other terminals and chassis ground | Always | 10 k Ωor more |

ES

NG → Repair or replacement of wiring harness or connector

OK

Replacement of the engine control computer (Refer to ES - 674)

| | |
|---|---|
| 6 | Relay unit inspection (EFI MAIN1 relay) |

(1) Perform unit inspection of EFI MAIN1 relay. (Refer to ES - 717)

NG → Relay replacement (EFI MAIN1 relay)

OK

| | |
|---|---|
| 7 | Check wiring harness and connector (EFI MAIN1 relay - camshaft timing oil control valve ASSY (exhaust side)) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect camshaft timing oil control valve ASSY (exhaust side) connector.
(2) Remove the EFI MAIN1 relay from the engine compartment relay block.
(3) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) - C5-1 | Always | Less than 1 Ω |
| 3 (EFI MAIN1 relay holder) - C23-1 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) and C5-1 - other terminals and chassis ground | Always | 10 k Ωor more |
| 3 (EFI MAIN1 relay holder) and C23-1 - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Inspection of the ECM power supply system (Refer to ES - 646)

Circuit description
VVT system consists of engine control computer, camshaft timing oil control valve ASSY, intake cam sprocket, and exhaust cam sprocket. This VVT system controls the intake cam sprocket and the exhaust cam sprocket in order to provide the best valve timing according to a driving condition. This control is based on various conditions including mass air flow, throttle position, and engine coolant temperature. The engine control computer, based on signals from these sensors, adjusts the camshaft timing oil control valve ASSY. As a result, the optimal relative position of the camshaft is obtained, thus providing better fuel efficiency, superior output performance, and better emission performance. Also, the engine control computer detects the actual valve timing through the signal from the camshaft position sensor and performs feedback control to provide the most suitable valve timing.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0016 | When any of the following conditions is met (2 trip detection logic):<br>•Intake side valve timing is off (bank 1).<br>•Intake camshaft position is out of the learning value of basic position (bank 1). | •Valve timing<br>•Camshaft timing oil control valve ASSY RH (intake side)<br>•Oil control valve filter (bank 1)<br>•Intake cam sprocket (bank 1)<br>•ECM |
| P0017 | When any of the following conditions is met (2 trip detection logic):<br>•Exhaust side valve timing is off (bank 1).<br>•Exhaust camshaft position is out of the learning value of basic position (bank 1). | •Valve timing<br>•Camshaft timing oil control valve ASSY RH (exhaust side)<br>•Oil control valve filter (bank 1)<br>•Exhaust cam sprocket (Bank 1)<br>•ECM |

MONITOR DESCRIPTION

In order to monitor the relativity between intake camshaft position and crankshaft position, the ECM checks and compares the VVT neutral position with the VVT learning value during coasting. When the value is out of the specified range for VVT learning value during driving cycle, the ECM illuminates the MIL and records DTC P0016 (bank 1) or P0018 (bank 2).

In order to monitor the relativity between exhaust camshaft position and crankshaft position, the ECM checks and compares the VVT neutral position with the VVT learning value during idling. When the value is out of the specified range for VVT learning value during driving cycle, the ECM illuminates the MIL and records DTC P0017 (bank 1) or P0019 (bank 2).

|---|---|
| Actual angle of camshaft - learning value of basic position | Greater than 10°CA |

P0016 (improper adjustment per 2 teeth)

| | |
|---|---|
| Actual angle of camshaft (bank 1) | Greater than 30°CA or less than 89.4°CA |

P0018 (improper adjustment per 2 teeth)

| | |
|---|---|
| Actual angle of camshaft (bank 2) | Greater than 29.4°CA or less than 87.9°CA |

P0017, P0019 (improper adjustment per 1 tooth)

| | |
|---|---|
| Actual angle of camshaft - learning value of basic position | Greater than 10°CA |

P0017 (improper adjustment per 2 teeth)

| | |
|---|---|
| Actual angle of camshaft (bank 1) | Greater than 62.2°CA or less than 120.7°CA |

P0019 (improper adjustment per 2 teeth)

| | |
|---|---|
| Actual angle of camshaft (bank 2) | Greater than 60.4°CA or less than 119.9°CA |

Circuit figure

For circuit figure of intake side VVT system, refer to ES - 88.

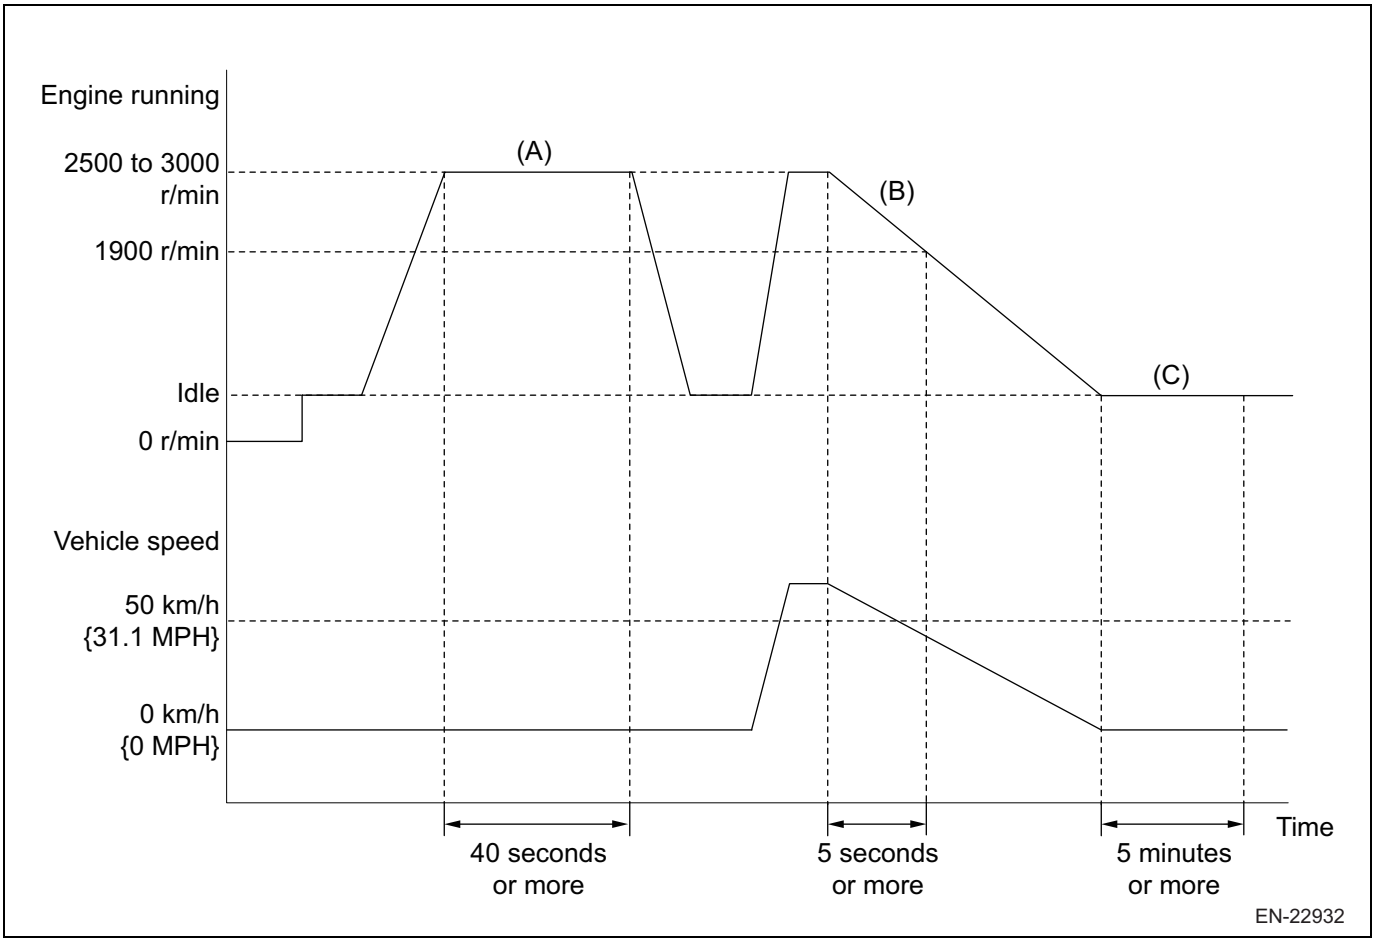
For circuit figure of exhaust side VVT system, refer to ES - 101.

ES

Description of functions

Test drive 1

Perform test drive 1 to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 70°C {158°F} or more)
9. Keep the engine speed between 2500 and 3000 r/min for 40 seconds or more. (A)
10. At 50km/h {31.1MPH} or more, release the accelerator pedal, brake pedal, and clutch pedal, and decelerate without shifting operation. At this time, select the appropriate gear so that the engine speed range between 2500 and 1900 r/min continues for 5 seconds or more. (B)

    WARNING:

    When performing this driving test, always observe the applicable traffic laws such as the speed limit.

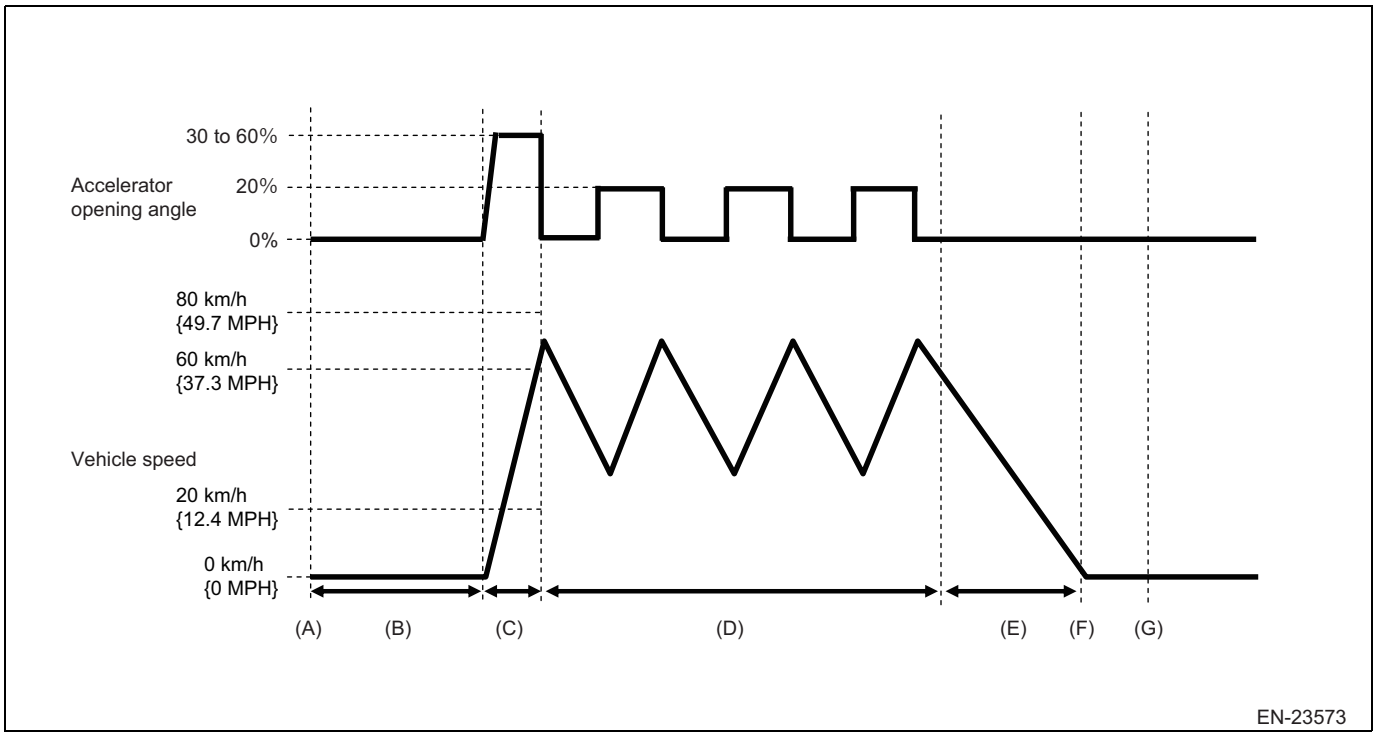
NOTE:

- The vehicle speed is not specified as far as the duration of the engine speed being at between 2500 r/min and 1900 r/min is maintained for 5 seconds or more.
  Ex.) At downhill, the driving test can be performed with a low gear and also at low vehicle speed.
- When the electric load such as A/C is turned OFF, or the vehicle is driven at downhill, the engine speed decreases slowly, and therefore the duration can be obtained easier.

11. Stop the vehicle.
12. Idle the engine for 5 minutes or more. (C)
13. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive 2

Perform test drive 2 to read the values of [VVT monitor bank 1] and [VVT monitor bank 2].



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 70°C {158°F} or more)
9. Perform driving test as follows.

   WARNING:

   When performing this driving test, always observe the applicable traffic laws such as the speed limit.

   NOTE:

   The vehicle may be driven at accelerated/constant speed according to road conditions.

   (a) Start the engine after warming up the engine (coolant temperature of 70°C (158°F) or more). (A)
   (b) Idle the engine for 3 minutes or more. (B)
   (c) Accelerate to 60 km/h {37.3 MPH}. (C)
   (d) While maintaining 60 km/h {37.3 MPH}, repeat the accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) for 20 minutes or more. (D)
   (e) Decelerate for 5 seconds or more at the accelerator pedal opening angle 0 %. (E) Leaning is performed during this operation.
   (f) Stop the vehicle. (There are no special restrictions on driving operations until you park at the safe location.) (F)
   (g) Stop the engine. (G)

NOTE:
In section (D), you can stop the vehicle according to the traffic conditions. Drive until the cumulative time of accelerator pedal opening angle 0 % (5 seconds) ←→20 % (5 seconds) exceeds 20 minutes or more.

10. Turn the ignition switch to ON.
11. Turn on the SSM4.
12. Following the SSM4 screen display, read [VVT monitor bank 1] and [VVT monitor bank 2]. (Refer to ES - 24)

Inspection steps

NOTE:

ES

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Reading diagnostic codes |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| Either P0016, P0017, P0018, or P0019 is output. | A |
| Either P0016, P0017, P0018, or P0019 and other diagnostic codes are output. | B |

NOTE:
- If any diagnostic codes other than P0016, P0017, P0018, or P0019 are output, troubleshoot them first.
- When a diagnostic code is output, store the freeze frame data. (Refer to ES - 28)

B → Progress to the relevant diagnosis code chart (Refer to ES - 12)

A

| 2 | Check of engine oil condition |
|---|---|

(1) Check the engine oil condition.
NOTE:
Check the following items.
- Oil quantity within the specified rage
- Occurrence of abnormal contamination
- Solidity due to additive agent
- Use of oil with specified viscosity

NG → Adjustment of oil quantity, or replacement of engine oil and oil filter (Refer to LU - 4) Go to step 3

OK

| 3 | Check of chain timing |
|---|---|

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF.
(6) Disconnect the connector for camshaft timing oil control valve that is relevant to the diagnostic code. (The diagnostic code is output. However, it does not affect the check.)
(7) Select the relevant menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [VVT Change Angle #1], [VVT Change Angle #2], [VVT Ex Change Angle #1], [VVT Ex Change Angle #2]
(8) Start the engine, and read the values of [VVT Change Angle #1], [VVT Change Angle #2], [VVT Ex Change Angle #1], [VVT Ex Change Angle #2] within 10 seconds.
NOTE:
When 10 seconds or more have elapsed after engine startup, the position after the startup is considered as the standard value and [0] is displayed.
(9) Record the read value, and stop the engine.

Standard value

| Diagnostic codes | Item | Inspection conditions | Result |
|---|---|---|---|
| P0016 | [VVT Change Angle #1] | Within 10 seconds after startup | Within ±10 °FR from the standard value (0 °FR) |
| P0017 | [VVT Ex Change Angle #1] | | |
| P0018 | [VVT Change Angle #2] | | |
| P0019 | [VVT Ex Change Angle #2] | | |

NG → Repair of chain timing. Go to Step 17.

OK

| 4 | Check of on-board monitor test result |
|---|---|

(1) Replace the camshaft timing oil control valve ASSY on the bank where trouble was detected through the diagnostic code. (Refer to ES - 664)
(2) Connect the SSM4 to the DLC3.
(3) Turn the ignition switch to ON.
(4) Turn on the SSM4.
(5) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(6) Perform test drive 2. (Refer to "Test drive 2" under "Description of functions")
WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(7) Using SSM4, read [VVT monitor bank 1] and [VVT monitor bank 2] of mode 06. (Refer to ES - 24)
WARNING:
- To perform this driving test, two people (a driver and checker) should be on the vehicle, and the data should be checked by a checker.
- When performing this driving test, always observe the applicable traffic laws such as the speed limit.

NOTE:
- When the diagnostic value is 0, the diagnosis is incomplete. Therefore, do not stop the engine, and perform the test driving again.
- The diagnostic value is updated repeatedly. Therefore, keep checking the data constantly during the diagnostic value reading is in progress.

(8) Record the values of the read [VVT monitor bank 1] and [VVT monitor bank 2].

Result

ES

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P0016, P0017 | Value of [VVT monitor bank 1] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |
| P0018, P0019 | Value of [VVT monitor bank 2] of the replaced camshaft timing oil control valve ASSY | Less than 1000 | A |
| | | 1000 or more | B |

B → Go to Step 6.

A

| 5 | Check of on-board monitor test result |
|---|---|

(1) Compare the values of [VVT monitor bank 1] and [VVT monitor bank 2] recorded in step 4.

Standard value

| Diagnostic codes | Item | Result | Go to |
|---|---|---|---|
| P0016, P0017 | Value of [VVT monitor bank 1] | 1000 or less, and larger than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | A |
| | | 1000 or less, and smaller than the value of [VVT monitor bank 2] (by the value of [VVT monitor bank 2] ×1.5+100) | B |
| P0018, P0019 | Value of [VVT monitor bank 2] | 1000 or less, and larger by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | A |
| | | 1000 or less, and smaller by (the value of [VVT monitor bank 1] ×1.5+100) compared to the value of [VVT monitor bank 1] | B |

B → Idle of the engine for 5 minutes and replacement of oil filter and the engine oil (flushing) (Refer to LU - 4) Go to step 17

A

| 6 | Check of harness and connector |
|---|---|

(1) Check the harness and connector for bend, damage and poor contact.
NOTE:
Check the following items.
- Engine control computer (Refer to ES - 674)
- Camshaft timing oil control valve ASSY (Refer to ES - 664)
- Camshaft position sensor (Refer to ES - 682)
- Crankshaft position sensor (Refer to ES - 685)

NG → Repair or replacement of the faulty parts (Refer to ES - 664, ES - 674, ES - 682, and ES - 685) Go to step 7

OK

| 7 | Check of harness and connector (open circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the relevant camshaft timing oil control valve ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P0016 | A36-17 (OC1) - C7-2 | Always | Less than 1 Ω |
| P0017 | A36-7 (OE1) - C5-2 | Always | Less than 1 Ω |
| P0018 | A36-16 (OC2) - C24-2 | Always | Less than 1 Ω |
| P0019 | A36-5 (OE2) - C23-2 | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 17.

OK

| 8 | Check of harness and connector (open circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the relevant camshaft position sensor.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Diagnostic codes | Inspection terminals | Inspection conditions | Standard value |
|---|---|---|---|
| P0016 | A34-26 (VV1+) - C12-2 (VV1+) | Always | Less than 1 Ω |
| P0017 | A34-14 (EV1+) - C6-2 (EV1+) | Always | Less than 1 Ω |
| P0018 | A34-15 (VV2+) - C26-2 (VV2+) | Always | Less than 1 Ω |
| P0019 | A34-25 (EV2+) - C25-2 (EV2+) | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 17.

OK

| 9 | Check of harness and connector (open circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the crankshaft position sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16(NE+) - C47-1(OUT) | Always | Less than 1 Ω |

NG → To repair or replace the faulty parts, go to step 17.

OK

| 10 | Check of engine oil pressure |
|---|---|

(1) Check the engine oil pressure. (Refer to LU - 2)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 13.

A

| 11 | Check of oil strainer |
|---|---|

(1) Check the oil strainer in the oil pan. (Refer to EM - 75)
Criteria: There is no clogging or adherence of foreign material.

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Replace the chain cover. <Note> When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) Go to step 14

A

| 12 | Cleaning of oil strainer |
|---|---|

(1) Check and clean inside the oil strainer, and remove clogging and adherence of foreign matter.

Next

| 13 | Check of oil passage of chain cover |
|---|---|

(1) Remove the engine unit from the vehicle body. (Refer to EM - 75)
(2) Check the oil passage of the chain cover. (Refer to LU - 13)
NOTE:
Check the O-ring and entrance of foreign matter of the following oil passage.
- Inlet opening of oil pump
- Outlet opening of oil pump
- O-ring of each passage to left/right cylinder head
- Oil control valve ASSY
- Entrance of foreign matter

NG → Replace the faulty parts. Replacement of chain cover in the case of foreign matter entrance (Refer to LU - 13) Go to step 14

OK

| 14 | Check of camshaft condition |
|---|---|

(1) Remove the timing chain. (Refer to EM - 13)
(2) Turn the camshaft with your hand, and compare the rotational resistance of the four camshafts.
NOTE:
Compare the rotational resistance with that of the bank 2 (bank 1) camshaft, and check the bank 1 (bank 2) camshaft for definitive faults such as unsmoothness and rotational resistance.
- Adherence of foreign matter on camshaft
- Damage of camshaft (scratches, galling, wear, etc.)
- Check of influence due to camshaft journal bearing not rotating properly

NG → Replacement of cam carrier and camshaft (Refer to EM - 75, and EM - 31) Go to step 15

OK

| 15 | Check of oil passage between oil pump and camshaft timing oil control valve ASSY |
|---|---|

(1) Visually check the following oil passages between oil pump and camshaft timing oil control valve ASSY, and check for definitive faults such as adherence of foreign matter and clogging.
- Oil passage of cam carrier
- Oil passage on the cylinder head side
- Oil passage at the connection between the cam sprocket and cam shaft
- Oil passage of the cam sprocket back side and at the cam shaft top end with the cam sprocket removed

NOTE:
Refer to the removal procedure of the cam carrier in the service manual. (Refer to EM - 31)

NG

Eliminate the foreign matter. Replacement of oil filer for cam carrier (Do not reuse) (Refer to EM - 75) <Note> •When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26) •Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75) <Reference> Let the engine idle for 5 minutes after finishing the procedure, and replace the oil filter and the engine oil (flushing). (Refer to LU - 4) Go to step 17

ES

OK

| 16 | Replacement of cam sprocket |
|---|---|

(1) Replace the cam sprocket. (Refer to EM - 31)
CAUTION:
- When assembling the chain cover, excess application of the liquid gasket may cause failure. Always use the type specified in the service manual, and apply proper amount (wire diameter). (Refer to LU - 26)
- Make sure that the oil filter is pushed so that the surface is flush with the cam carrier surface. (Do not push in excessively.) (Refer to EM - 75)

Next

| 17 | Check of current data (learning value abnormal) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.
(6) Turn the ignition switch to ON.
(7) Select the relevant menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the VVT] / [Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)], [Control the VVT Exhaust Linear (Bank1)], [Control the VVT Exhaust Linear (Bank2)]
(8) Check that the sum of the read values of [Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)], [Control the VVT Exhaust Linear (Bank1)] and [Control the VVT Exhaust Linear (Bank2)] and the values of [VVT Change Angle #1], [VVT Change Angle #2], [VVT Ex Change Angle #1] and [VVT Ex Change Angle #2] recorded in step 3 is within the specified range.

Standard value

| Diagnostic codes | Item | Result |
|---|---|---|
| P0016 | Sum of [Control the VVT Linear (Bank1)] and [VVT Change Angle #1] | 52 to 72 |
| P0017 | Sum of [Control the VVT Exhaust Linear (Bank1)] and [VVT Ex Change Angle #1] | 78 to 98 |

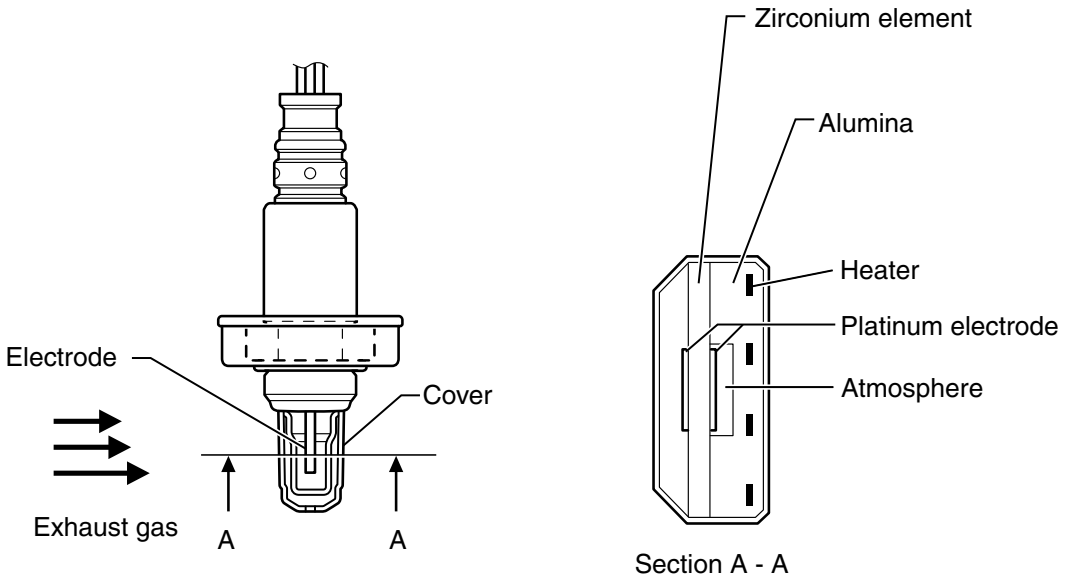
Circuit description

The air/fuel ratio sensor generates a voltage *1 that corresponds to the actual air-fuel ratio. This sensor voltage is sent to the engine control computer as feedback so that the engine control computer can control an air-fuel ratio. The engine control computer, based on this signal, determines a deviation from stoichiometric air-fuel ratio level and controls a fuel injection time. The air/fuel ratio sensor is integrated into a heater that warms up solid electrolyte (Zirconia material). This heater is controlled by the engine control computer. When mass air flow rate is low (exhaust gas temperature is low), an electric current flows into the heater to warm up the sensor. This supports more accurate oxygen content detection. The heat generated by the heater is transferred to the solid electrolyte via alumina, which promotes sensor operation. The three-way catalytic converter is used to purify carbon monoxide (CO), hydrocarbon (HC), and nitrogen oxide (NOx) contained in the exhaust gas for a higher purification rate. Due to effective use of the converter, the air fuel ratio is controlled precisely in order to constantly bring the air fuel ratio into the theoretical level.

*1: The value changes inside the engine control computer. Since the air/fuel ratio sensor is a current output element, the electric current is converted into a voltage within the engine control computer. When the voltage is measured at the air/fuel ratio sensor or the engine control computer connector, a constant voltage reading is shown.

ES

Air/fuel ratio sensor



0

NOTE:

- The DTC names are mentioned as O2 sensor (oxygen sensor). Those DTCs, however, relate the air/fuel ratio sensor.
- Sensor 1 is the sensor that is installed forward of the three-way catalytic converter, near the engine.
- When any one of those DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer turns off the air/fuel ratio sensor heater during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0030 | Impedance of air/fuel ratio sensor is greater than 65 Ωfor 10 seconds or more. (2 trips detection logic) | •Open/short circuits in the air/fuel ratio sensor<br>•Air / fuel ratio sensor<br>•ECM |
| P0031 | Voltage of air/fuel ratio sensor is less than 1.9 V for 1 second or longer. (1 trip detection logic) | |
| P0032 | Voltage of air/fuel ratio sensor is 1.9 V or more for 2 seconds or longer. (1 trip detection logic) | |

MONITOR DESCRIPTION

The ECM adjusts the air/fuel ratio by using air/fuel ratio sensor information to maintain the ratio close to the Stoichiometric air fuel ratio.

Under this condition, the three-way catalytic converter is able to efficiently clean the exhaust gas.

The air/fuel ratio sensor detects oxygen content within the exhaust gas, and this information is sent to the ECM. The inside of the sensor element is in contact with air and the outside is exposed to the exhaust gas. The sensor element is made of platinum plated zirconium, containing integrated heating component.

When the difference between the amount of oxygen in the exhaust gas and the amount of oxygen in air is significant, the zirconium element outputs a small amount of voltage from the platinum plated electrode.

Efficiency of the air/fuel ratio sensor increases significantly when heated. When exhaust gas temperature is low, the sensor cannot generate a useful voltage signal without supplemental heating. In such case, the ECM adjusts supplemental heating based on a duty cycle ratio to adjust an average electric current on the sensor heater element. When the electric current on the heater falls out of the normal range, the signal transmitted from the air/fuel ratio sensor will be inaccurate. If this is the case, the ECM cannot adjust an air/fuel ratio properly.

When the electric current on the air/fuel ratio sensor heater falls out of the normal operation range, the ECM judges this as an abnormal condition and stores DTCs.

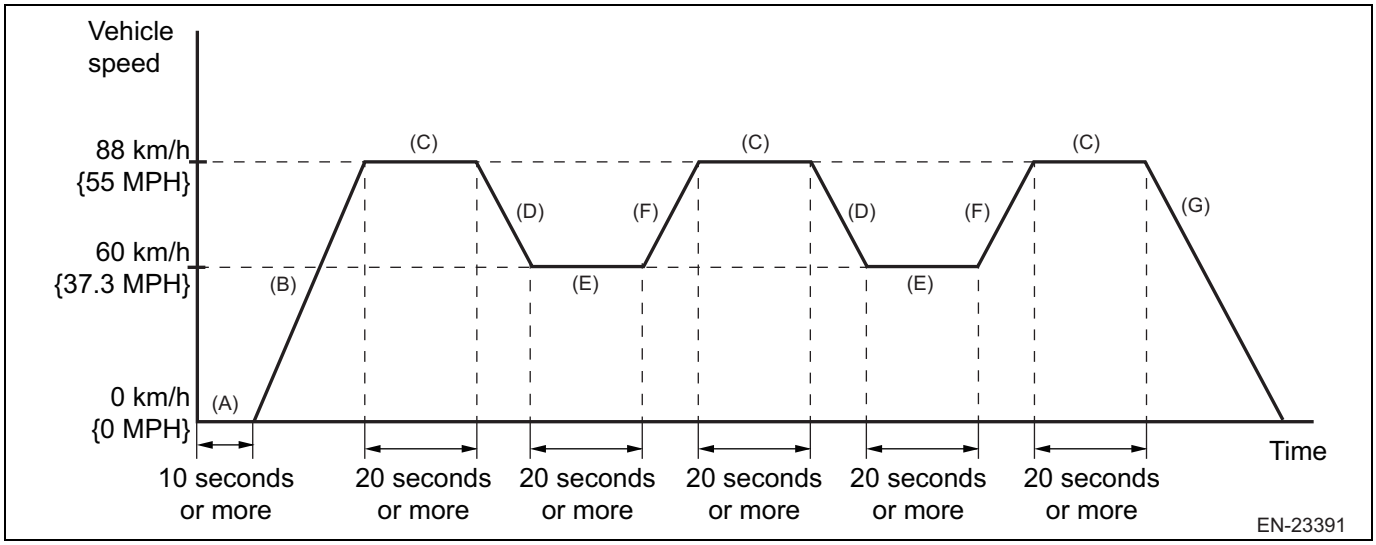
Description of functions

Test drive (P0030)

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Move the select lever to "P" range or move the shift lever to the neutral position, and let the engine idle for 10 seconds or more. (A)
   (b) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (B)
   (c) Drive at 88 km/h {55 MPH} or more for 20 seconds or more. (C)
   (d) Release the accelerator pedal, and decelerate to 60 km/h {37.3 MPH}. (D)
   (e) Drive at 60 km/h {37.3 MPH} or less for 20 seconds or more. (E)
   (f) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (F)
   (g) Release the accelerator pedal, and stop the vehicle. (G)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P0031, P0032)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:
- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- From [Cylinder Fuel Rate] under [Active Test], read the output voltage of the air/fuel ratio sensor when the fuel injection amount is increased or decreased. If the air/fuel ratio sensor output voltage shows little response, the sensor may be at fault. (Refer to ES - 220)

Circuit description

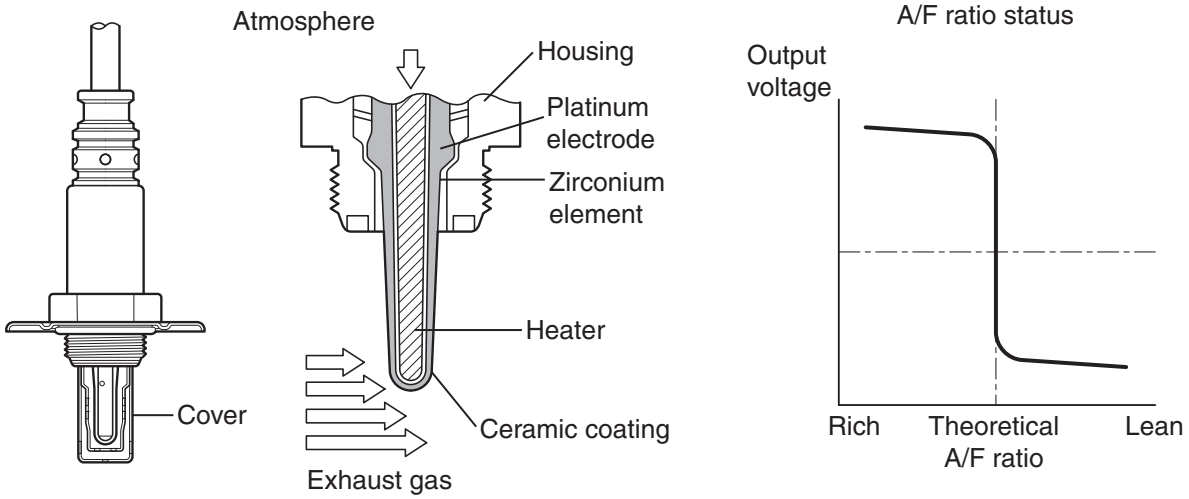
The three-way catalytic converter is used to efficiently purify carbon monoxide (CO), hydrocarbon (HC), and nitrogen oxide (NOx) contained in the exhaust gas. The maximum performance of this three-way catalyst is reached when it functions at near stoichiometric air-fuel ratio. Therefore, unless the engine is precisely controlled to produce near this air fuel ratio, CO, HC, and NOx are not efficiently purified. Oxygen sensors are provided for the purpose of this control. When an oxygen sensor detects an oxygen level within the exhaust gas produced from proper combustion near the stoichiometric air-fuel ratio, its output voltage changes quickly. This characteristic is used to send a signal to the engine control computer for an accurate air/fuel control.

Under a leaner air/fuel ratio, oxygen level within the exhaust gas increases. The oxygen sensor sends this information (lean air/fuel ratio state) to the engine control computer. (works with a small electric power: less than 0.45 V)

Under a richer air/fuel ratio, oxygen level within the exhaust gas decreases. The oxygen sensor sends this information (rich air/fuel ratio state) to the engine control computer. (Works with a large electric power: more than 0.45 V)

A zirconium element is used for the sensor element. The zirconium element is made of platinum plated zirconium, containing integrated heating component. The inside surface of the zirconium element is exposed to the atmospheric air, and the outside surface is exposed to the exhaust gas. When there is a significant difference in oxygen level between the atmospheric air and the exhaust gas, the sensor outputs a small amount of voltage. Efficiency of the oxygen sensor increases significantly when heated. When exhaust gas temperature is low, the oxygen sensor cannot generate a useful voltage signal without supplemental heating. This is the reason why the oxygen sensor is equipped with a heater that heats up its zirconium element. The engine control computer uses the duty cycle approach to control the supplemental heating, adjusting the average electric current supplied to the zirconium element.

Oxygen sensor:



NOTE:
The engine control computer has pulse-width modulation control circuits to adjust a electric current via the heater. The oxygen sensor heater circuit uses the +B side relay of this circuit.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0037 | Oxygen sensor heater voltage is battery voltage ×0.34V or less. (2 trips detection logic) | •Open or short circuit in oxygen sensor heater circuit<br>•Oxygen sensor<br>•ECM |
| P0038 | Oxygen sensor heater current is 12 A or more. (2 trips detection logic) | |
| P0141 | Oxygen sensor heater voltage is less than battery voltage ×0.88 V for 10 seconds or more. 17 (2 trips detection logic) | |

MONITOR DESCRIPTION
A zirconium element is used for the sensor element. The sensor detects an oxygen level within the exhaust gas. When temperature of the zirconium element is normal and the oxygen temperature between the inside and outside of the sensor is large, the zirconium element generates a voltage signal. The sensor is integrated with a heater to help the zirconium element improve performance to detect the oxygen level. This supplemental heating is controlled by the ECM.
The ECM monitors the electric current which is sent to oxygen sensor heaters to check the heaters for malfunction.
When the electric current on the heaters falls out of the normal range, the signal transmitted from oxygen sensors will be inaccurate. When the electric current on the oxygen sensor heater falls out of the normal operation range, the ECM judges this as an abnormal condition and stores DTCs.

Description of functions

Test drive (P0037, P0038)

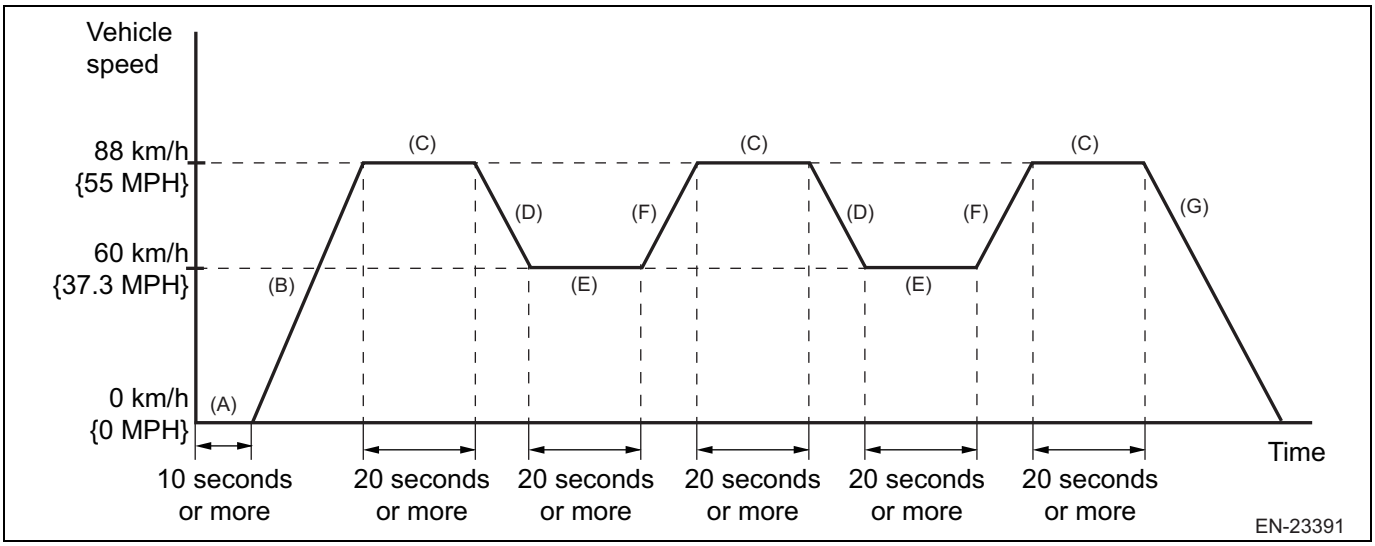
Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.

10. Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

Test drive (P0141)

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Move the select lever to "P" range or move the shift lever to the neutral position, and let the engine idle for 10 seconds or more. (A)
   (b) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (B)
   (c) Drive at 88 km/h {55 MPH} or more for 20 seconds or more. (C)
   (d) Release the accelerator pedal, and decelerate to 60 km/h {37.3 MPH}. (D)
   (e) Drive at 60 km/h {37.3 MPH} or less for 20 seconds or more. (E)
   (f) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (F)
   (g) Release the accelerator pedal, and stop the vehicle. (G)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- From [Cylinder Fuel Rate] under [Active Test], read the output voltage of the oxygen sensor when the fuel injection amount is increased or decreased. If the oxygen sensor output voltage shows little response, the sensor may be at fault. (Refer to ES - 220)

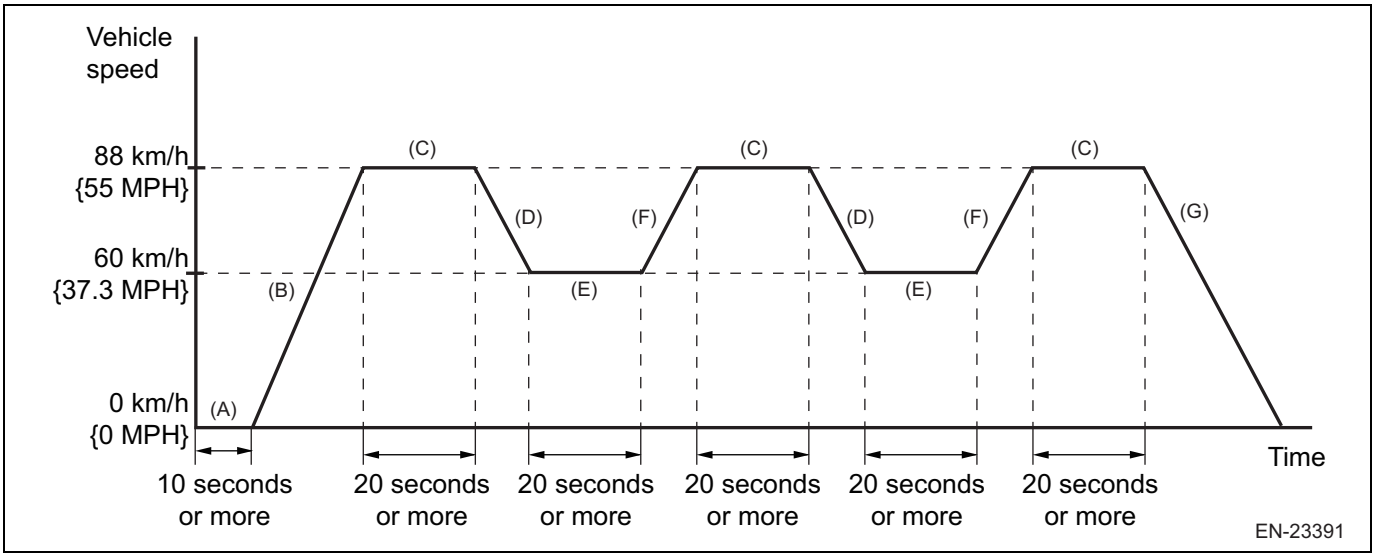
For a circuit figure, refer to ES - 174.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.

   WARNING:

   When performing this driving test, always observe the applicable traffic laws such as the speed limit.

   (a) Move the select lever to "P" range or move the shift lever to the neutral position, and let the engine idle for 10 seconds or more. (A)

   (b) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (B)

   (c) Drive at 88 km/h {55 MPH} or more for 20 seconds or more. (C)

(d) Release the accelerator pedal, and decelerate to 60 km/h {37.3 MPH}. (D)
(e) Drive at 60 km/h {37.3 MPH} or less for 20 seconds or more. (E)
(f) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (F)
(g) Release the accelerator pedal, and stop the vehicle. (G)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
CAUTION:
Before performing troubleshooting, check the fuse for this circuit.
NOTE:
Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Perform test drive. (Refer to "Test drive" under "Description of functions")
WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(5) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |

| DTC | P0087 | Fuel Rail/System Pressure - Too Low |
|---|---|---|

Circuit description

The high pressure fuel system of the direct injection system consists of electromagnetic spill valves that adjust injection amount of high-pressure fuel, camshaft-driven plungers that pressurize fuel, and check valve that mechanically opens and closes path leading to the fuel delivery pipes. Fuel pump ASSY (high-pressure side) is installed to the cylinder head cover, and it is driven by the cam of the intake camshaft in the engine left bank. The pump plunger, driven by the rotating camshaft, moves up and down to pressurize fuel. The pressurized fuel pushes and opens the check valve, and is pumped into the fuel delivery pipes. The engine control computer manages electromagnetic spill valve to adjust the fuel pressure. In order to maintain the target fuel pressure, the engine control computer monitors the pressure with the signal from the fuel pressure sensor. When the fuel pressure of the fuel delivery pipe abnormally rises, the relief valve integrated into the fuel pump ASSY (high-pressure side) opens and allows the fuel to return to the fuel tank.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0087 | Fuel pressure is lower than the target.<br>(1 trip detection logic) | •Fuel leakage<br>•Fuel pipe (fuel tank - high pressure pump [bank 1 or bank 2])<br>•Fuel pipe (high pressure fuel pump - fuel injector [Cylinder injection])<br>•Fuel injector (Cylinder injection)<br>•High pressure fuel pump<br>•Injector driver<br>•Low pressure fuel pump<br>•ECM |

MONITOR DESCRIPTION

If fuel pressure keeps decreasing even after the ECM has commanded the high pressure fuel pump to close the spill control valve, the DTC is displayed.

Description of functions

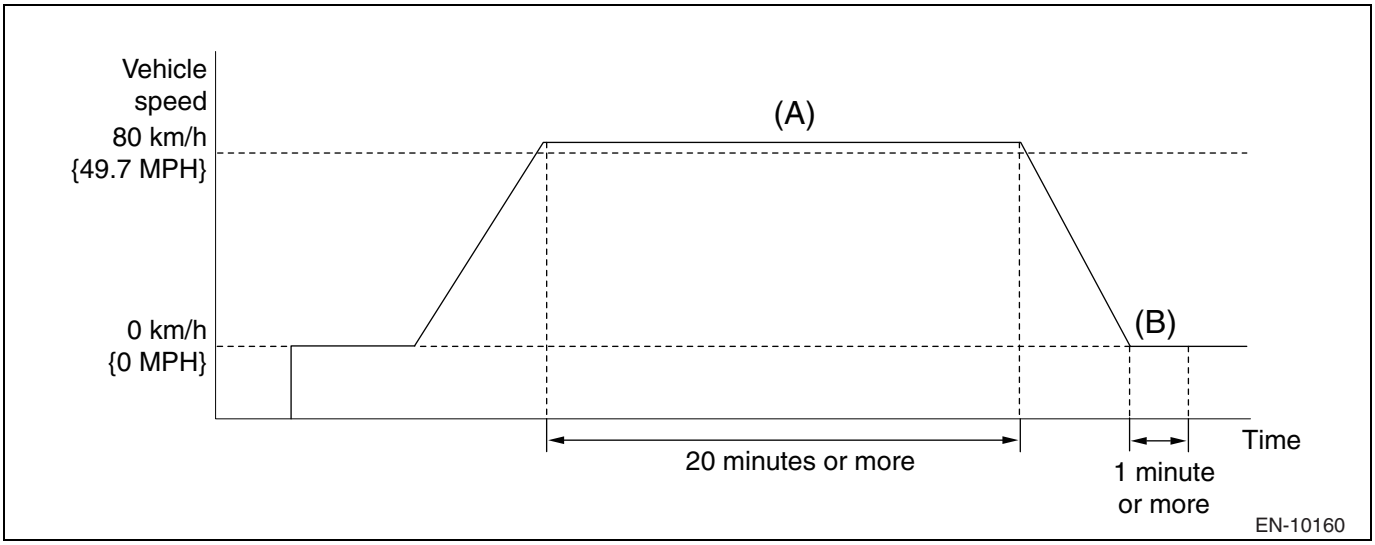
Test drive

Perform test drive to check if the DTC recurs.

NOTE:

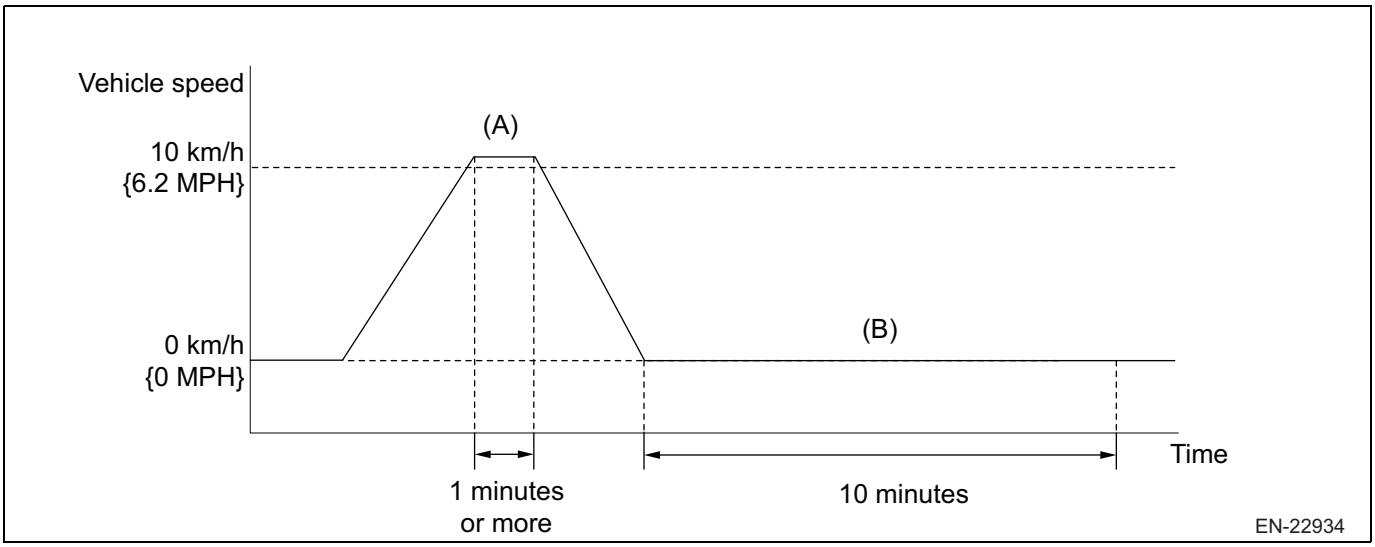
Both of test drive A and B can recur the diagnostic code.

Test drive A



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive B



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.

8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

| P0101 | When any of the following conditions is met (2 trip detection logic):<br>•When the throttle position is at 10° or more, intake air flow meter SUB-ASSY voltage is less than 1.13 V for 5 seconds or longer.<br>•When the throttle position is less than 3.8°, intake air flow meter SUB-ASSY voltage is 1.88 V or more for 10 seconds or longer. | •Intake air flow meter SUB-ASSY<br>•Intake system<br>•PCV hose connection |

MONITOR DESCRIPTION
The intake air flow meter SUB-ASSY is a sensor that measures incoming air flow from the throttle valve. The ECM determines a length of time fuel is injected based on this information to provide an appropriate air/fuel ratio. The intake air flow meter SUB-ASSY is integrated with platinum filament, which is contact with induction air. When a specific amount of voltage is applied from the ECM, it is heated to a predetermined temperature. Also, induction air cools the platinum filaments and the integrated thermistor to cause a change in resistance. In order to maintain an electric current at a constant level, the electric current which is sent to the intake air flow meter SUB-ASSY is adjusted by the ECM. The voltage level is proportional to a flow rate measured by the sensor. The ECM uses this information is used to calculate an amount of induction.
An average engine load value ratio is monitored by the ECM to check the intake air flow meter SUB-ASSY for malfunction. An average engine load value ratio is a result of comparison between an average engine load as calculated from the intake air flow meter SUB-ASSY output and an average engine load as estimated based on operating conditions (such as engine speed and throttle opening angle). When the average engine load value ratio is less than a threshold value, the ECM judges that induction

flow rate is low. On the other hand, when the average engine load value ratio exceeds the threshold value, the ECM judges that induction flow rate is high.
If this condition is detected consecutively in 2 drive cycles, the MIL illuminates and the DTC is stored.

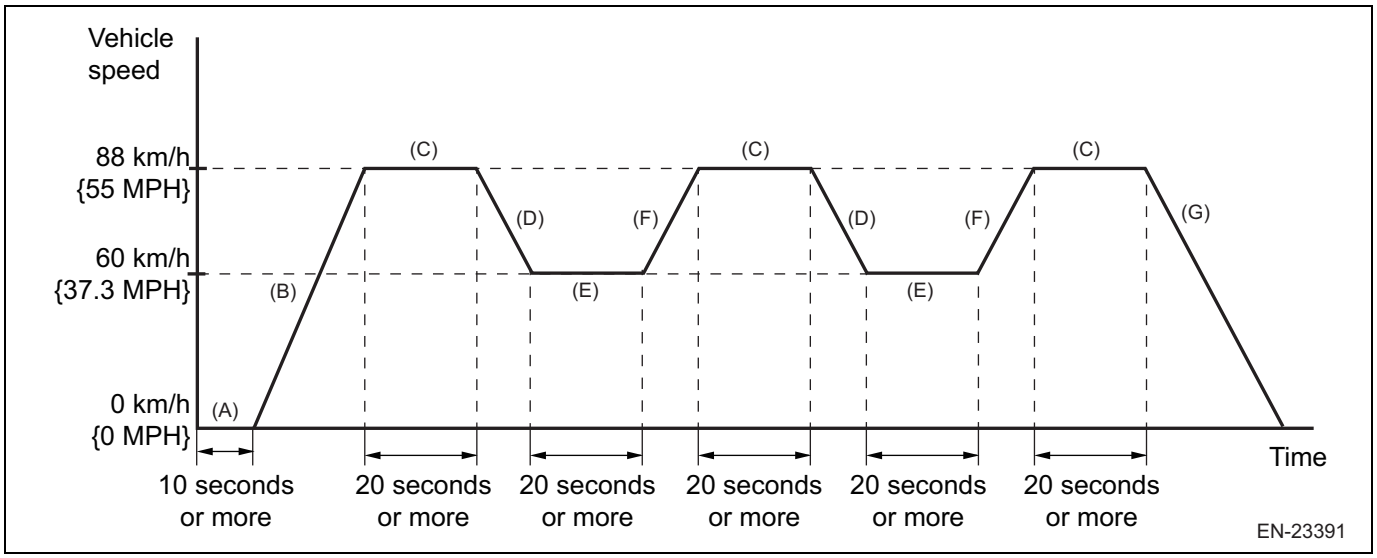
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.

   WARNING:

   When performing this driving test, always observe the applicable traffic laws such as the speed limit.

   (a) Move the select lever to "P" range or move the shift lever to the neutral position, and let the engine idle for 10 seconds or more. (A)
   (b) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (B)
   (c) Drive at 88 km/h {55 MPH} or more for 20 seconds or more. (C)
   (d) Release the accelerator pedal, and decelerate to 60 km/h {37.3 MPH}. (D)
   (e) Drive at 60 km/h {37.3 MPH} or less for 20 seconds or more. (E)
   (f) Depress the accelerator pedal half way, and accelerate to 88 km/h {55 MPH} or more. (F)
   (g) Release the accelerator pedal, and stop the vehicle. (G)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

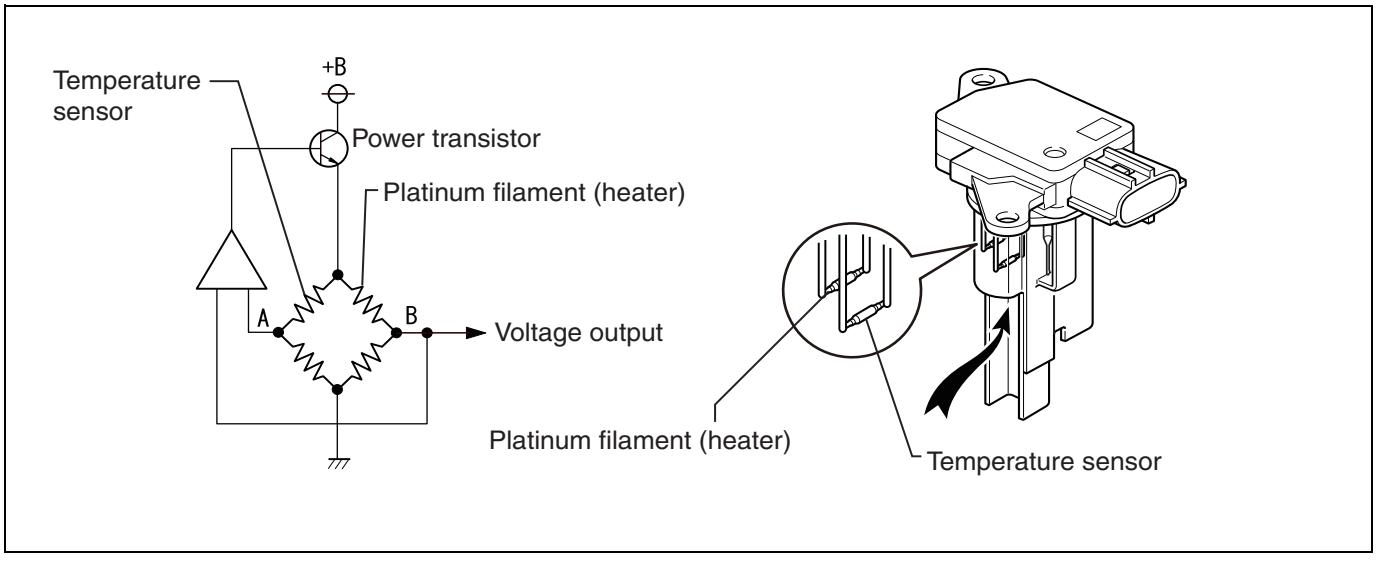
Circuit description

Platinum filament is used for the intake air flow meter SUB-ASSY. This SUB-ASSY consists of a heater made of platinum filament, temperature sensor, and control circuit, which are integrated into a housing. The heater equipped in the bypass flow duct of the housing is cooled by the intake air flow, and the temperature sensor detects the change in temperature. With respect to the circuit configuration, the bridge circuit comprises the heater and temperature sensor. The work of the power transistor to control heater to maintain the predetermined temperature (causing voltage difference between A and B) is measured as the output voltage of the intake airflow meter SUB-ASSY.



NOTE:
When either of these DTCs is stored, the engine control computer enters fail-safe mode. During fail-safe mode, the engine control computer calculates the ignition timing according to engine speed and throttle valve position. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0102 | Intake air flow meter SUB-ASSY voltage is 0.127 V or less for 0.5 seconds or longer. (1-trip detection logic) | •Open or short condition in intake air flow meter SUB-ASSY circuit<br>•Intake air flow meter SUB-ASSY<br>•ECM |
| P0103 | Intake air flow meter SUB-ASSY voltage is 4.723V or more for 0.5 seconds or longer. (1-trip detection logic) | |

NOTE:
After checking diagnostic code outputs, read the following menu items using the SSM4: BRZ inspection / Each system / Engine / Data monitor / [Mass Air Flow]

| Intake air amount (g/s) | Content of malfunction |
|---|---|
| Approx. 0.0 | • Open circuit in intake air flow meter SUB-ASSY power supply circuit<br>• Open or short circuit in VG circuit |
| Approx. 655.35 | • Open circuit in E2G circuit |

CAUTION:
- Place the vehicle on a level surface in the workshop and check it with the engine stopped.
- Perform the inspection with the air cleaner ASSY installed.
- Do not use the exhaust duct to the exhaust tail pipe for suction.

MONITOR DESCRIPTION
When there is a malfunction in the intake air flow meter SUB-ASSY or open/short condition in the circuit, the voltage level falls out of the normal operation range. The ECM identifies this as intake air flow meter SUB-ASSY circuit failure and stores the DTCs.

| DTC | P0111 | Intake temperature sensor characteristic |
|---|---|---|

Circuit description
Inlet temperature sensor, which is built into the intake air flow meter SUB-ASSY, detects intake air temperature. The resistance of the thermistor built into the inlet air temperature sensor changes as the intake air temperature varies. The lower the intake air temperature, the greater the thermistor resistance, and the higher the intake air temperature, the lower the thermistor resistance. The inlet air temperature sensor is connected to the engine control computer. The 5-V power supply voltage is supplied from THA terminal of the computer, and grounded in the computer via the resistor integrated into the inlet air temperature sensor. Therefore, since the resistor and the inlet air temperature sensor are connected in series, the resistance changes as the inlet air temperature changes, and the potential at the THA terminal also changes. Based on this signal, the engine control computer increases the fuel injection amount to improve driveability when the engine is cold.
NOTE:
When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the inlet air temperature at 20°C {68°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0111 | Difference between maximum and minimum values in inlet air temperature sensor voltage is less than 0.02 V.<br>(2 trips detection logic) | Inlet air temperature sensor (integrated into intake air flow meter SUB-ASSY) |

MONITOR DESCRIPTION

The ECM perform OBD II monitoring based on the intake are temperature sensor value. If the sensor value does not vary within the normal range, the ECM cannot perform OBD II monitoring or misdiagnoses the condition as sensor's internal failure. When the ECM finds no changes in the intake air temperature sensor value by performing the monitoring after the ignition is turned ON or the engine is started, this condition will be detected (after short or long period of time).

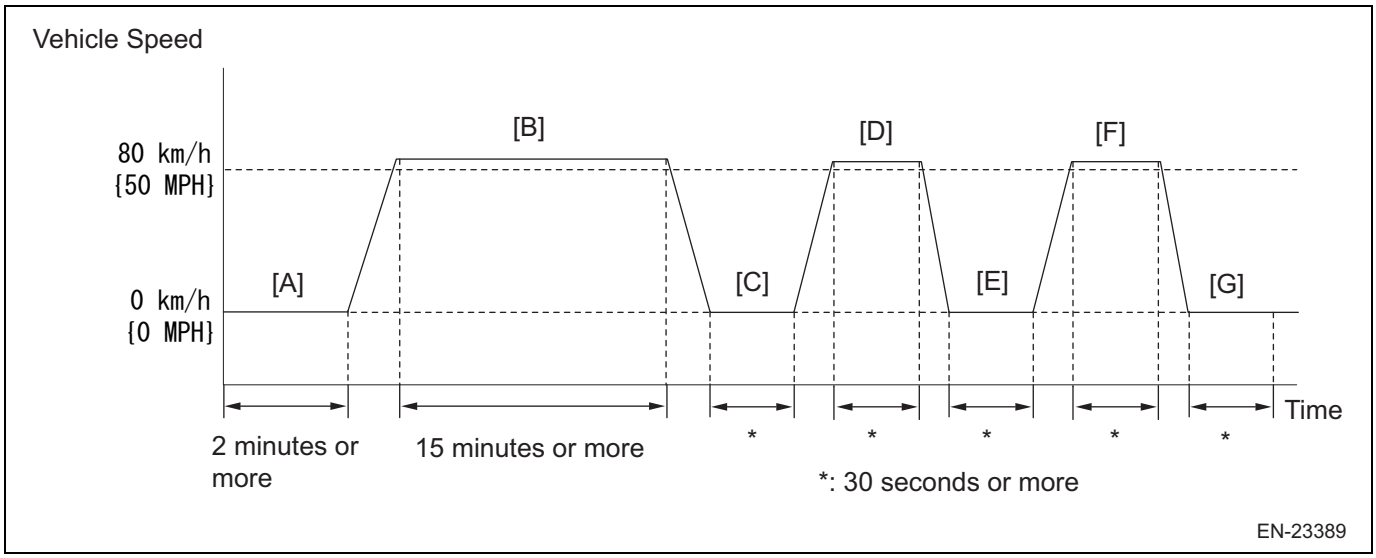
Description of functions

Test drive

Perform test drive to check if the DTC recurs.

NOTE:

- Make sure 6 hours or more pass after you turn the ignition switch to OFF when the vehicle is fully warmed up.
- If the vehicle is equipped with a block heater, make sure 6 hours or more pass without the block heater being activated.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Coolant Temp./ Intake Air Temp.]

9. Confirm that the engine coolant temperature and intake air temperature meet the condition described below.
   Condition: |Engine coolant temperature - intake air temperature| is 5°C {9°F} or less
   NOTE:
   If the condition is not met, turn the ignition switch to OFF, and wait until the condition is met.
10. If the condition is met, perform a driving test as follows.
    WARNING:
    When performing this driving test, always observe the applicable traffic laws such as the speed limit.
    NOTE:
    - In section B, you can decelerate to less than 80 km/h {49.7 MPH} or stop the vehicle according to the traffic conditions. Continue driving for a total of 15 minutes or more at 80 km/h {49.7 MPH} or more.
    - There is no time limit for the transition from idling to constant speed driving or from constant speed driving to idling.
    - If you maintain constant speed only when driving downhill, the engine load decreases, and you may not be able to obtain correct diagnostic results.
    - If you stop the engine during the driving test, restart the procedure from step 8.

    (a) Idle the engine for 2 minutes or more. (A)
    (b) Drive at 80 km/h {49.7 MPH} or more for a total of 15 minutes or more. (B)
    (c) Stop the vehicle and run the engine on idling for 30 seconds or more. (C)
    (d) Drive at a constant speed of 80 km/h {49.7 MPH} or more for 30 seconds or more. (D)
    (e) Stop the vehicle and run the engine on idling for 30 seconds or more. (E)
    (f) Drive at a constant speed of 80 km/h {49.7 MPH} or more for 30 seconds or more. (F)
    (g) Stop the vehicle and run the engine on idling for 30 seconds or more. (G)
11. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

Inspection steps
NOTE:
Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

|---|---|---|

| DTC | P0113 | Intake Air Temperature Circuit High Input |
|---|---|---|

Circuit description

Inlet temperature sensor, which is built into the intake air flow meter SUB-ASSY, detects intake air temperature. The resistance of the thermistor built into the inlet air temperature sensor changes as the intake air temperature varies. The lower the intake air temperature, the greater the thermistor resistance, and the higher the intake air temperature, the lower the thermistor resistance. The inlet air temperature sensor is connected to the engine control computer. The 5-V power supply voltage is supplied from THA terminal of the computer, and grounded in the computer via the resistor integrated into the inlet air temperature sensor. Therefore, since the resistor and the inlet air temperature sensor are connected in series, the resistance changes as the inlet air temperature changes, and the potential at the THA terminal also changes. Based on this signal, the engine control computer increases the fuel injection amount to improve driveability when the engine is cold.

NOTE:

When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the inlet air temperature at 20°C {68°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0112 | The voltage for the inlet air temperature sensor is less than 0.400V for 0.5 seconds or more. (1 trip detection logic) | •Open or short condition in inlet air temperature sensor circuit<br>•Inlet air temperature sensor (integrated into intake air flow meter SUB-ASSY)<br>•ECM |
| P0113 | The voltage for the inlet air temperature sensor is 4.707 V or more for 0.5 seconds or more. (1 trip detection logic) | |

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and use the value for calculating the intake air temperature. When the sensor output voltage falls out of the normal range, the ECM identifies this as an abnormal condition in the intake air temperature sensor circuit and stores DTC.

## DTC P0116 Engine Coolant Temp. Sensor Circuit Range/Performance

Circuit description

The resistance of the thermistor built into the E.F.I. water temperature sensor changes as the engine coolant temperature changes. The E.F.I. water temperature sensor is connected to the engine control computer in the same way the inlet air temperature sensor is connected.

NOTE:

When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the specified engine coolant temperature at 70°C {158°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0116 | The engine coolant does not cool down sufficiently in 6 hours after the ignition is turned off. (2 trips detection logic) | •Thermostat<br>•E.F.I. water temperature sensor |

MONITOR DESCRIPTION

If the E.F.I water temperature value does not change when a warmed-up engine is stopped and then cold-started again, it is judged that a malfunction is occurring. If this condition is detected consecutively in 2 drive cycles, the MIL illuminates and the DTC is stored.

Circuit description

The resistance of the thermistor built into the E.F.I. water temperature sensor changes as the engine coolant temperature changes. The E.F.I. water temperature sensor is connected to the engine control computer in the same way the inlet air temperature sensor is connected.

NOTE:

When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the specified engine coolant temperature at 70°C {158°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0117 | E.F.I. water temperature sensor voltage is less than 0.349V for 0.5 seconds or longer. (1 trip detection logic) | •Short in E.F.I. water temperature sensor circuit<br>•E.F.I. water temperature sensor<br>•ECM |
| P0118 | E.F.I. water temperature sensor voltage is 4.698 V or more for 0.5 seconds or longer. (1 trip detection logic) | •Open in E.F.I. water temperature sensor circuit<br>•E.F.I. water temperature sensor<br>•ECM |

MONITOR DESCRIPTION

The E.F.I. water temperature sensor is used for monitoring a coolant temperature. The resistance of the thermistor integrated into the E.F.I. water temperature sensor changes as the engine coolant temperature changes. The lower the coolant temperature, the greater the thermistor resistance, and the higher the intake air temperature, the lower the thermistor resistance.

The resistance indicates the output voltage from the sensor. The ECM monitors the sensor voltage and use the value for calculating a engine coolant temperature. When the sensor output voltage falls out of the normal operation range, the ECM identifies this as an abnormal condition in the E.F.I. water temperature sensor and stores the DTC.

Circuit description

Throttle position sensor, built-into the throttle body ASSY (with motor), detects throttle valve opening angle. The sensor type used is a non-contact type throttle position sensor. This sensor uses Hall elements which is capable of sensing magnetic field as an electrical signal. As the throttle valve moves, output voltage difference is produced linearly, and this effect is called Hall effect. The throttle position sensor has circuits with 2 different output characteristics (THSM and THSS). The sensor also sends output voltage which corresponds to throttle opening angle to the engine control computer. The engine control computer, in turn, calculates a throttle valve opening angle based on the output voltage to perform operations such as controlling the throttle motor and compensating air/fuel ratio.

MONITOR DESCRIPTION

The ECM uses the throttle position sensor to monitor throttle valve opening angle. Some checks are performed so that the ECM may confirm that the throttle position sensor is properly functioning.

- There is a specified amount of difference between sensor output voltages VTA1 and VTA2, which are used to detect a throttle valve opening angle. If the difference between VTA1 and VTA2 is improper, the ECM identifies this as an abnormal condition in the sensor circuit and stores the DTC.
- VTA1 and VTA2 have each specified voltage range. If output voltages of VTA1 and VTA2 fall out of the normal operation range, the ECM identifies this as an abnormal condition in the sensor circuit and stores the DTC.
- Also, voltage levels of VTA1 and VTA2 should not be close to each other. If the voltage of VTA1 comes close to the voltage of VTA2 and their difference is within 0.02 V or less, the ECM judges that there is a short condition in the sensor circuit and stores the DTC.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:
Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Reading of SSM4 data (throttle sensor No. 1 voltage, throttle sensor No. 2 voltage) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Throttle sensor No1 Voltage], [Throttle sensor No2 Voltage]
(5) Read [Data monitor].

Result

B → Go to Step 5.

A

| 2 | Check wiring harness and connector (engine control computer - throttle body ASSY (with motor)) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the throttle body ASSY (with motor) connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-19(VC) - C15-5(VC) | Always | Less than 1 Ω |
| A36-18 (VTA1) - C15-6 (VTA1) | Always | Less than 1 Ω |
| A36-28 (VTA2) - C15-4 (VTA2) | Always | Less than 1 Ω |
| A36-29(E1) - C15-3(E2) | Always | Less than 1 Ω |

Resistance (short circuit check)

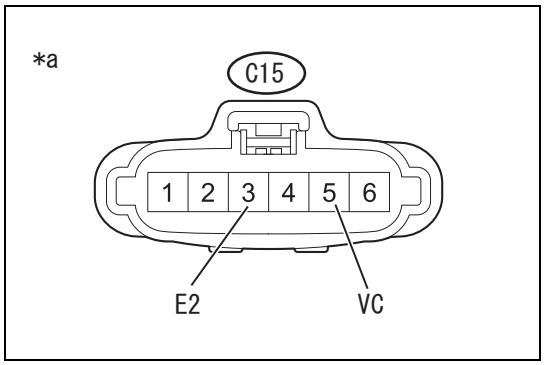
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-19 (VC) and C15-5 (VC) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-18 (VTA1) and C15-6 (VTA1) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-28 (VTA2) and C15-4 (VTA2) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-29 (E1) and C15-3 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| 3 | Check wiring harness and connector (power supply voltage) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the throttle body ASSY (with motor) connector.
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C15-5 (VC) - C15-3 (E2) | IG ON | 4.5 to 5.5 V |

## DTC P0125 Insufficient Coolant Temperature for Closed Loop Fuel Control

Circuit description
For a circuit description, refer to ES - 99.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0125 | Coolant temperature does not reach to 15°C below the temperature required for closed loop air/fuel ratio control within the specified time (120s) or 300s. | •Cooling system<br>•E.F.I. water temperature sensor<br>•Thermostat |

MONITOR DESCRIPTION
The diagnostics system monitors the E.F.I. water temperature sensor functional checks. After the engine is started, if the engine coolant temperature does not reach to the range required for the closed loop air/fuel ratio control within the specified time period, the diagnostics system judges that there is a malfunction in the E.F.I. water temperature sensor and stores the DTC.

Replacement of the E.F.I. water temperature sensor (Refer to ES - 699)

| DTC | P0128 | Thermostat (characteristic) |
|---|---|---|

Circuit description

When the E.F.I. water temperature sensor detects the coolant temperature, at the same time the ECM estimates the engine coolant temperature. If the difference between the estimated coolant temperature and the actual engine coolant temperature exceeds the predetermined setup value, the DTC is stored and thermostat functional fault is reported.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0128 | A fault in thermostat function is detected.<br>(2 trips detection logic) | •Thermostat<br>•Cooling system<br>•E.F.I. water temperature sensor<br>•ECM |

MONITOR DESCRIPTION

The ECM estimates a engine coolant temperature based on the temperature at startup, engine load, and engine speed.
Then, the estimated temperature is compared to the actual engine coolant temperature at the ECM. When the difference between the estimated temperature and the actual engine coolant temperature exceeds a specified value, the ECM identifies this as a malfunction of the thermostat (water inlet) or the cooling system and stores the DTC.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0131 | When either one of following two conditions applied for 1 second or longer (1 trip detection logic):<br>•A1A+voltage is less than 0.4 V.<br>•A1A-voltage is less than 0.4 V.<br>•Difference between A1A+voltage and A1A-voltage is less than 0.1 V, and A1A-voltage is 3.8 V to 4.7 V. | •Open/short circuits in the air/fuel ratio sensor<br>•Air / fuel ratio sensor<br>•ECM |
| P0132 | When either one of following two conditions applied for 1 second or longer (1 trip detection logic):<br>•A1A+voltage is 4.7 V or more.<br>•A1A-voltage is 4.7 V or more. | |
| P0134 | Impedance of air/fuel ratio sensor is 450 Ωor more for 5 seconds or longer.<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

If open/short condition is present in the air/fuel ratio circuit or the air/fuel ratio sensor output decreases, these DTCs are displayed. In order to detect the problem, the air/fuel ratio sensor is monitored when the ignition is turned ON and an admittance (electrical terminology to express how easily a current can flow) is checked when the vehicle is being driven. If the air/fuel ratio sensor voltage stays between 0.6 V and 4.5 V, the condition is considered normal. If the voltage is out of the specified range or the admittance is less than the standard value, the ECM judges that there is a malfunction in the air/fuel ratio sensor. If the same malfunction is detected in the next drive cycle, the ECM turns on the MIL and stores the DTC.

Circuit figure

For a circuit description, refer to ES - 134.

Description of functions

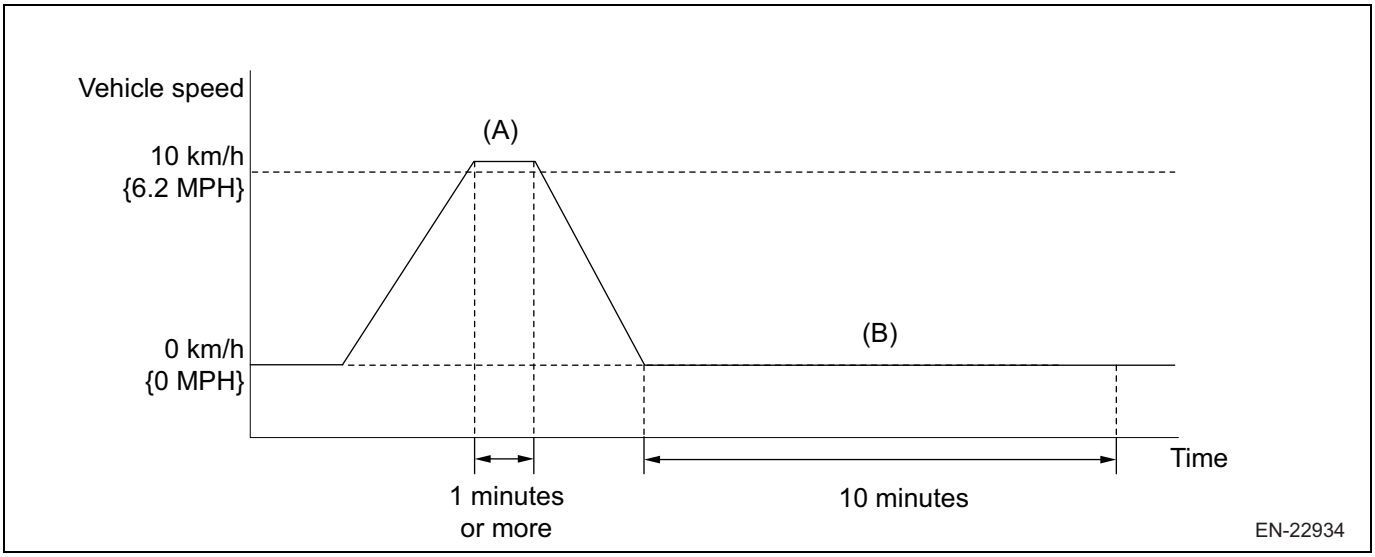
Test drive (P0131, P0132)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P0134)

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

• Check [A/F Sensor #11] data reading. (Refer to ES - 43)

| | |
|---|---|
| 1 | Check wiring harness and connector (engine control computer - air/fuel ratio sensor) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the air/fuel ratio sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-19 (A1A+) - C14-3 (A1A+) | Always | Less than 1 Ω |
| A34-18 (A1A-) - C14-4 (A1A-) | Always | Less than 1 Ω |
| A34-5 (HA1A) - C14-1 (HA1A) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-19 (A1A+) and C14-3 (A1A+) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-18 (A1A-) and C14-4 (A1A-) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-5 (HA1A) and C14-1 (HA1A) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 2 | Air/fuel ratio sensor replacement |

(1) Replace the air/fuel ratio sensor. (Refer to ES - 711)

Next

| | |
|---|---|
| 3 | Clear DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(4) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| | |
|---|---|
| 4 | Perform test drive for operation check |

(1) Perform test drive. (Refer to "Test drive" under "Description of functions")
(2) Check the results.

Result

| Result | Go to |
|---|---|
| Normal | A |
| Malfunction | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

ES

Complete

| DTC | P0137 | Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2) |
|---|---|---|

Circuit description

For a circuit description, refer to ES - 141.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0137 | Oxygen (HO2) sensor voltage. Less than 1.91 V (judgment 1) Less than 1.81 V (judgment 2) Less than -0.22 V (judgment 3) | • Oxygen sensor circuit<br>• Oxygen sensor<br>• Gas leakage from exhaust system |

MONITOR DESCRIPTION

1. Open condition in oxygen (HO2) senor circuit
   Under active air/fuel ratio control, the ECM calculates oxygen storage capacity (OSC)* of the three-way catalytic converter (TWC) through a forced air/fuel ratio adjustment. As the result the ratio is changes from rich to lean.
   If open/short condition is present in the oxygen sensor or the sensor output voltage drops significantly, the OSC value becomes abnormally high. In such case, even if the ECM continues to attempt the air/fuel ratio adjustment to make a rich/lean condition happen, the oxygen sensor output will not change.
   If the target air/fuel ratio is rich and the oxygen sensor output voltage is 0.03 V or less (lean) while active air/fuel ratio control is in progress, the ECM judges that the sensor output voltage is abnormally low and stores DTC P0137.
   NOTE:
   *: The TWC has a specific capacity to store oxygen. OSC and the exhaust gas cleanup function relate to each other. The ECM judges by the calculated OSC value whether the catalyst is deteriorated or not. (Refer to ES - 332)

MONITOR STRATEGY

| Secondary oxygen sensor signal (B) | Less than 1.70V |
| Secondary oxygen sensor signal (B) | 1V or more |

Monitoring result

Refer to [Monitor status check]. (Refer to ES - 24)

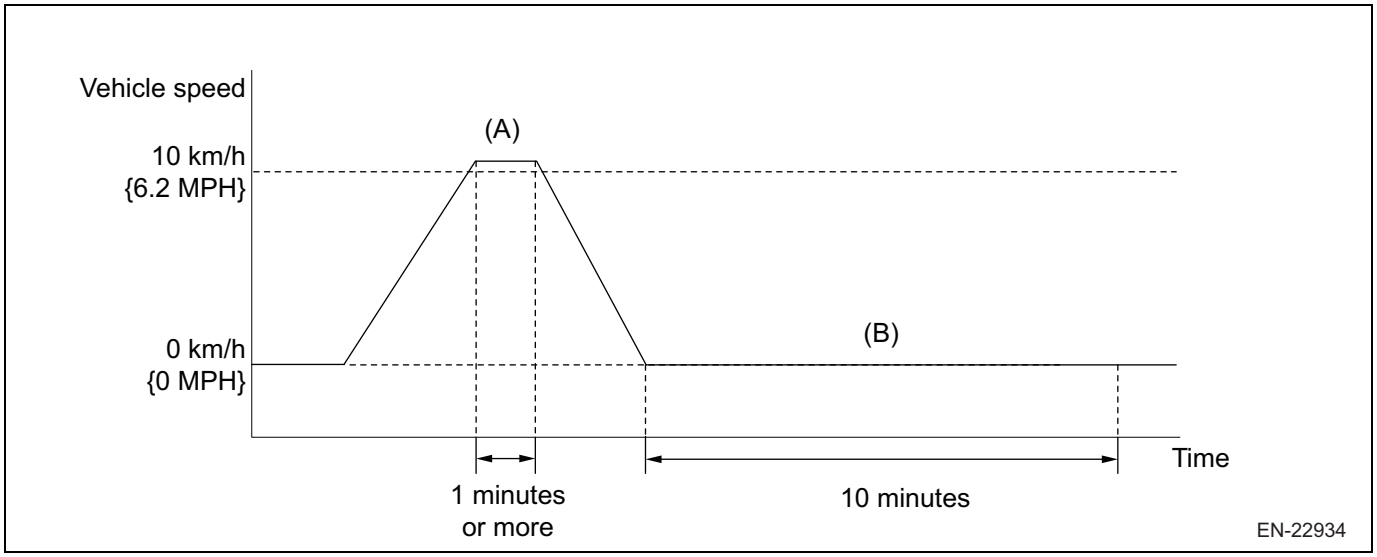
Circuit figure

For a circuit description, refer to ES - 134.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.

7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

Inspection steps

| 1 | Check of oxygen sensor data |
|---|---|

(1) Continue warming up the engine until the engine coolant temperature is more than 75°C (167°F), and maintain the engine speed at 3000 r/min (no longer than 2 minutes).
(2) Maintain the engine speed on idling (for 1 minute).
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Oxygen sensor #12]
(4) Check the value of [Oxygen sensor #12].

Result

| Result | Go to |
|---|---|
| Voltage of the O2 sensor #12 is 0.490 V or more | A |
| Voltage of the O2 sensor #12 is 0.490 V or less | B |

A → Go to Step 5.

B

| 2 | Check of oxygen sensor connector and intermediate connector |
|---|---|

(1) Check oxygen sensor connector and intermediate connector.
Is there ingress of water to the connector?

Result

| Result | Go to |
|---|---|
| There is ingress of water to the connector | A |
| There is no ingress of water to the connector | B |

A → Thoroughly remove water from the connectors.

BK

| 3 | Check of harness between engine control computer and oxygen sensor connector |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connectors from the engine control computer.
(3) Disconnect the oxygen sensor connector.
(4) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance

| Inspection terminals | Standard value |
|---|---|
| A34-18 (A1A-) - C14-4 (A1A-) | Less than 1 Ω |
| A34-19 (A1A+) - C14-3 (A1A+) | Less than 1 Ω |

NG → Repair open circuit of harness between engine control computer and oxygen sensor connector.

OK

ES

| 4 | Check of harness between engine control computer and oxygen sensor connector |
|---|---|

(1) Connect connectors to the engine control computer.
(2) Turn the ignition switch to ON.
(3) Check voltage between the oxygen sensor connector and the chassis ground.

Voltage

| Inspection terminals | Standard value |
|---|---|
| C14-4 (A1A-) - chassis ground | 1.91V or more |

NG → Replace the engine control computer. (Refer to ES - 674)

OK

Replace the oxygen sensors. (Refer to ES - 714)

| 5 | Check the exhaust system. |
|---|---|

(1) Inspection of exhaust system parts
Check the following items.
- Looseness and improper installation of exhaust system parts
- Damage of parts (cracks and holes)
- Looseness and improper installation of parts between the air/fuel ratio sensor and the oxygen sensor

NG → Replace the oxygen sensors. (Refer to ES - 714)

OK

Repair or replace the faulty parts. (Refer to IE - 35)

| DTC | P0138 | Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2) |
|---|---|---|

Circuit description
For a circuit description, refer to ES - 141.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0138 | Oxygen (HO2) sensor voltage is for 1 second or more:<br>more than 2.31 V (judgment 1) more than 3.36 V (judgment 2) more than 1.2 V (judgment 3)<br>(2 trips detection logic) | • Oxygen sensor circuit<br>• Oxygen sensor<br>• Gas leakage from exhaust system |

MONITOR DESCRIPTION

ES

1. Oxygen (HO2) sensor output voltage is abnormally high
   The ECM monitors oxygen sensor output voltage continuously while the engine is running.
   If the oxygen sensor output voltage is 1.2 V or more, DTC P0138 is stored.

MONITOR STRATEGY

Check the following items.
- Looseness and improper installation of exhaust system parts
- Damage of parts (cracks and holes)
- Looseness and improper installation of parts between the air/fuel ratio sensor and the oxygen sensor

NG → Replace the oxygen sensors. (Refer to ES - 714)

OK

Repair or replace the faulty parts. (Refer to IE - 35)

| DTC | P013A | O2 Sensor Slow Response - Rich to Lean (Bank 1 Sensor 2) |
|---|---|---|
| DTC | P013B | O2 Sensor Slow Response - Lean to Rich (Bank 1 Sensor 2) |
| DTC | P013E | O2 Sensor Delayed Response - Rich to Lean (Bank 1 Sensor 2) |
| DTC | P013F | O2 Sensor Delayed Response - Lean to Rich (Bank 1 Sensor 2) |

Circuit description

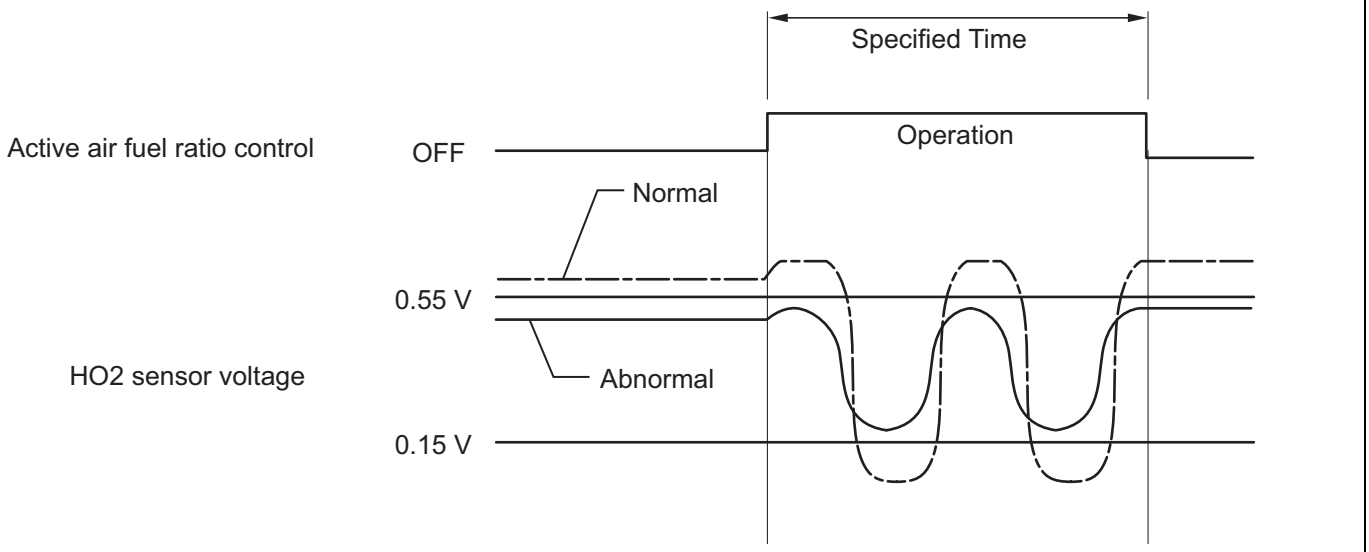
For a circuit description, refer to ES - 138.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P013A | Response time that oxygen sensor voltage reaches from 0.5 V (rich) to 0.2 V (lean) exceeds 0.5 seconds. (2 trips detection logic) | • Oxygen sensor circuit<br>• Oxygen sensor<br>• Gas leakage from exhaust system |
| P013B | Response time that oxygen sensor voltage reaches from 0.3 V (lean) to 0.5 V (rich) exceeds 4 seconds. (2 trips detection logic) | |
| P013E | It takes more than 4 seconds before the oxygen sensor voltage drops to 0.5 V or lower. (2 trips detection logic) | |
| P013F | It takes more than 120 seconds before the oxygen sensor voltage rises to 0.3 V or more. (2 trips detection logic) | |

MONITOR DESCRIPTION

1. Oxygen (HO2) sensor output voltage failure (DTC P013B or P013F)
   If the sensors malfunction, the amount of change in their output voltage becomes smaller. For example, if the oxygen sensor voltage does not drop to less than 0.15 V and not increase to 0.55 V or higher, the ECM judges that sensor output voltage is abnormal and stores DTC P013B or P013F.

HO2 Sensor Circuit Malfunction



Y

2. Oxygen (HO2) sensor output voltage failure under fuel cutoff (DTC P013A or P013E)
When fuel supply is cut off as the vehicle slows down. the sensor output voltage immediately drops to less than 0.2 V (extremely lean condition). If the voltage does not drop to less than 0.5 V for 4 seconds or longer, or the voltage does not decrease from 0.5 V to 0.2 V, the ECM judges that there is a malfunction in sensor repose. In such case, the MIL illuminates and the DTC is stored.

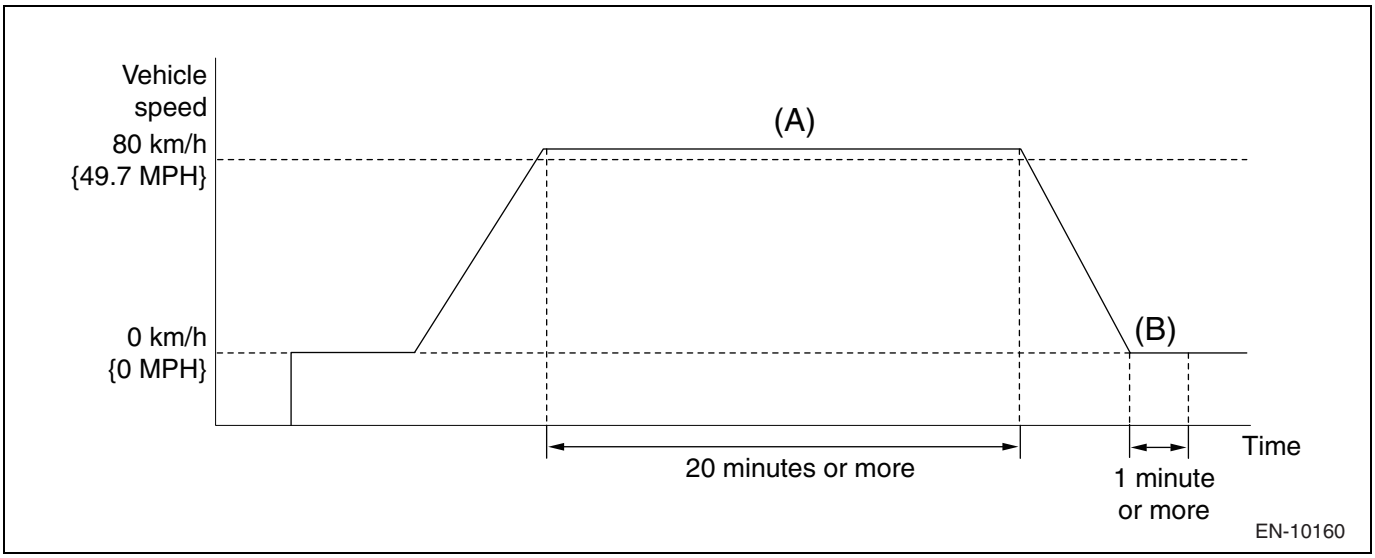
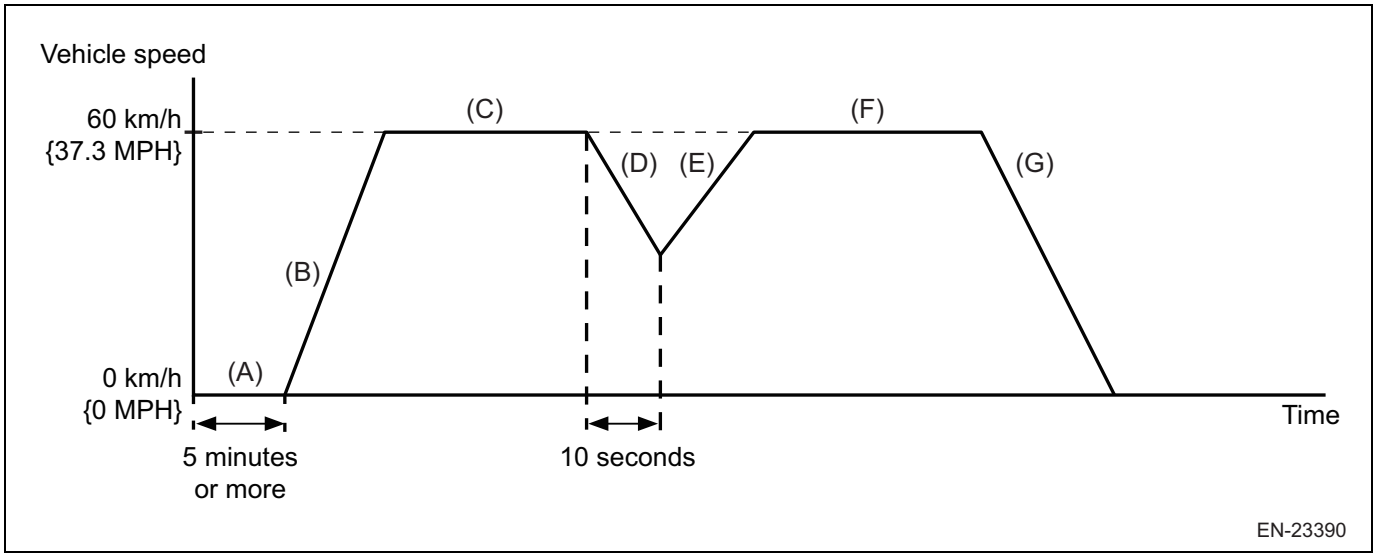
Description of functions
Test drive (P013A, P013E)
Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P013B, P013F)
Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Idle the engine for 5 minutes or more. (A)
   (b) Accelerate to 60 km/h {37.3 MPH}. (B)
   (c) Maintain a constant speed of 60 km/h {37.3 MPH}. (C)
   (d) After maintaining a speed of 60 km/h {37.3 MPH}, change the accelerator opening angle to 0 %, and perform the fuel cut operation for 10 seconds. (D)
   (e) Accelerate to 60 km/h {37.3 MPH}. (E)
   (f) Maintain a constant speed of 60 km/h {37.3 MPH}. (F)
   (g) Decelerate and stop the vehicle. (G)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 80°C {176°F} or more).
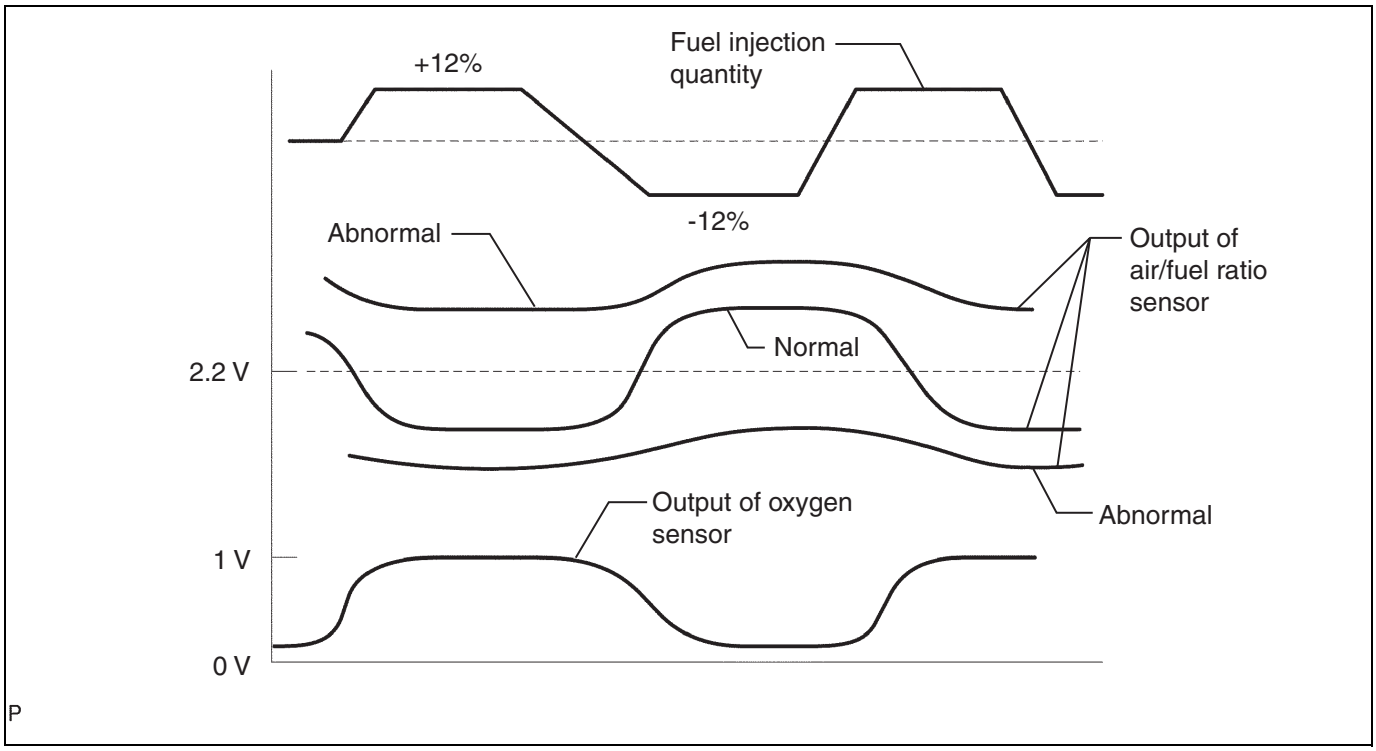
(5) Run the engine at 2500 r/min for approximately 3 minutes to warm up the air/fuel ratio sensor.
(6) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(7) Run the engine on idling, increase and decrease fuel injection amount, and read values of [A/F Sensor #11].
CAUTION:
- Because the air/fuel ratio sensor becomes cold, perform the work after heating the sensor.
- Voltage output of the air/fuel ratio sensor delays a few seconds.

NOTE:
- Change fuel injection volume from -12 % to +12 %.
- If the air/fuel ratio sensor output shows little response, the air/fuel ratio sensor may be at fault.

Result

| Item name | Result | Go to |
|---|---|---|
| [A/F Sensor #11] | Output voltage changes near 2.2 V | OK |
| | Output voltage is 2.2 V or more constantly | NG |
| | Output voltage is 2.2 V or less constantly | NG |



NG → Go to Step 10.

OK

Fix causes of extreme lean or rich conditions (fuel injector ASSY, fuel pressure, exhaust gas leakage, etc.)

| 4 | Exhaust gas leakage check |
|---|---|

(1) Make sure that exhaust gas is not leaking from connections of exhaust pipes and installation areas of sensors.
Criteria: There is no exhaust leakage.

NG → Repair of exhaust gas leakage

OK

| 5 | Oxygen sensor unit inspection |
|---|---|

(1) Perform oxygen sensor unit inspection. (Refer to ES - 716)

NG → Oxygen sensor replacement

OK

| 6 | Check wiring harness and connector (oxygen sensor - engine control computer) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.

(1) Disconnect the oxygen sensor connector.
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (Refer to ES - 36for terminal arrangement.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-6 (HT1B) - C13-1 (HT1B) | Always | Less than 1 Ω |
| A34-21 (OX1B) - C13-3 (OX1B) | Always | Less than 1 Ω |
| B8(E2) - C13-4(E2) | Always | Less than 1 Ω |

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-6 (HT1B) and C13-1 (HT1B) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-21 (OX1B) and C13-3 (OX1B) - other terminals and chassis ground | Always | 10 k Ωor more |
| B8 (E2) and C13-4 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| 7 | Oxygen sensor replacement |
|---|---|

(1) Replace the oxygen sensors. (Refer to ES - 714)

Next

| 8 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 9 | Perform test drive for operation check |
|---|---|

(1) Perform test drive. (Refer to "Test drive" under "Description of functions")
WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(2) Check the results.

B → Replacement of oxygen sensor (Refer to ES - 714)

A

Complete

| DTC | P0140 | Oxygen Sensor Circuit No Activity Detected (Bank 1 Sensor 1) |
|---|---|---|

Circuit description
For a circuit description, refer to ES - 141.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0140 | Oxygen (HO2) sensor voltage.<br>Less than 1.91 V (judgment 1) Less than 1.81 V (judgment 2) Less than -0.22 V (judgment 3) | • Oxygen sensor circuit<br>• Oxygen sensor<br>• Gas leakage from exhaust system |

MONITOR DESCRIPTION

1. Open condition in oxygen (HO2) senor circuit
   Under active air/fuel ratio control, the ECM calculates oxygen storage capacity (OSC)* of the three-way catalytic converter (TWC) through a forced air/fuel ratio adjustment. As the result the ratio is changes from rich to lean.
   If open/short condition is present in the oxygen sensor or the sensor output voltage drops significantly, the OSC value becomes abnormally high. In such case, even if the ECM continues to attempt the air/fuel ratio adjustment to make a rich/lean condition happen, the oxygen sensor output will not change.
   If the target air/fuel ratio is rich and the oxygen sensor output voltage is 0.03 V or less (lean) while active air/fuel ratio control is in progress, the ECM judges that the sensor output voltage is abnormally low and stores DTC P0140.
   NOTE:
   *: The TWC has a specific capacity to store oxygen. OSC and the exhaust gas cleanup function relate to each other. The ECM judges by the calculated OSC value whether the catalyst is deteriorated or not. (Refer to ES - 332)

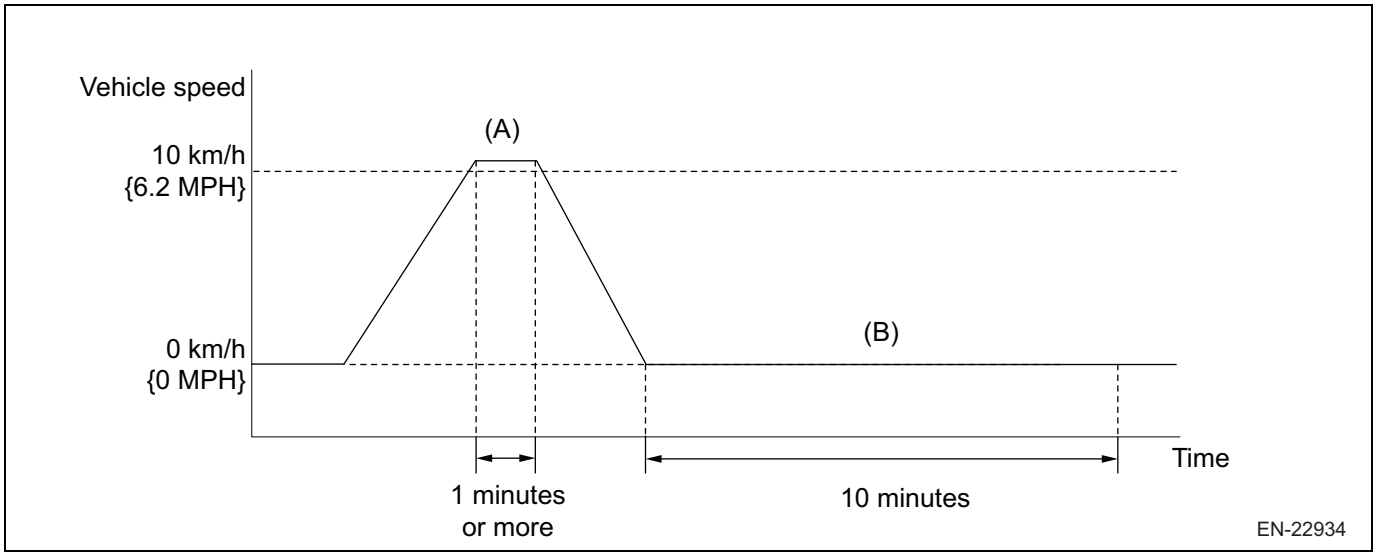
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

| | |
|---|---|
| 1 | Check of oxygen sensor data |

(1) Continue warming up the engine until the engine coolant temperature is more than 75°C (167°F), and maintain the engine speed at 3000 r/min (no longer than 2 minutes).
(2) Maintain the engine speed on idling (for 1 minute).
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Oxygen sensor #12]
(4) Check the value of [Oxygen sensor #12].

Result

| Result | Go to |
|---|---|
| Voltage of the O2 sensor #12 is 0.490 V or more | A |
| Voltage of the O2 sensor #12 is 0.490 V or less | B |

| | |
|---|---|
| A | Go to Step 5. |

B

| 2 | Check of oxygen sensor connector and intermediate connector |
|---|---|

(1) Check oxygen sensor connector and intermediate connector.
Is there ingress of water to the connector?

Result

| Result | Go to |
|---|---|
| There is ingress of water to the connector | A |
| There is no ingress of water to the connector | B |

ES

A → Thoroughly remove water from the connectors.

BK

| 3 | Check of harness between engine control computer and oxygen sensor connector |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connectors from the engine control computer.
(3) Disconnect the oxygen sensor connector.
(4) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance

| Inspection terminals | Standard value |
|---|---|
| A34-18 (A1A-) - C14-4 (A1A-) | Less than 1 Ω |
| A34-19 (A1A+) - C14-3 (A1A+) | Less than 1 Ω |

NG → Repair open circuit of harness between engine control computer and oxygen sensor connector.

OK

| 4 | Check of harness between engine control computer and oxygen sensor connector |
|---|---|

(1) Connect connectors to the engine control computer.
(2) Turn the ignition switch to ON.
(3) Check voltage between the oxygen sensor connector and the chassis ground.

Voltage

| Inspection terminals | Standard value |
|---|---|
| C14-4 (A1A-) - chassis ground | 1.91V or more |

NG → Replace the engine control computer. (Refer to ES - 674)

OK

Replace the oxygen sensors. (Refer to ES - 714)

| | |
|---|---|
| 5 | Check the exhaust system. |

(1) Inspection of exhaust system parts
Check the following items.
- Looseness and improper installation of exhaust system parts
- Damage of parts (cracks and holes)
- Looseness and improper installation of parts between the air/fuel ratio sensor and the oxygen sensor

NG → Replace the oxygen sensors. (Refer to ES - 714)

OK

Repair or replace the faulty parts. (Refer to IE - 35)

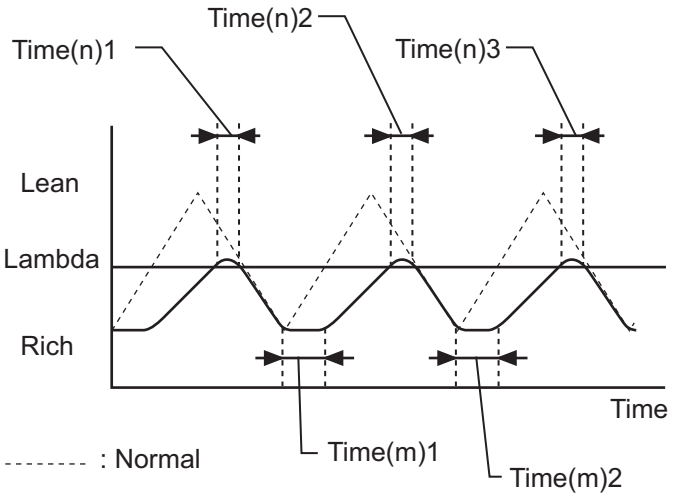
| P015A | [Delay degree from lean to rich*] exceeds normal value.<br>(2 trips detection logic) | |
| P015B | [Delay degree from rich to lean*] exceeds normal value.<br>(2 trips detection logic) | |

*: Calculated by the ECM based on the air/fuel ratio sensor output.

MONITOR DESCRIPTION
P014C, P014D (asymmetric delay response)
The ECM monitors the time the output waveform of the air/fuel ratio sensor is near its maximum and minimum values as time (m) and time (n).

P014C:



n: Local Maximum

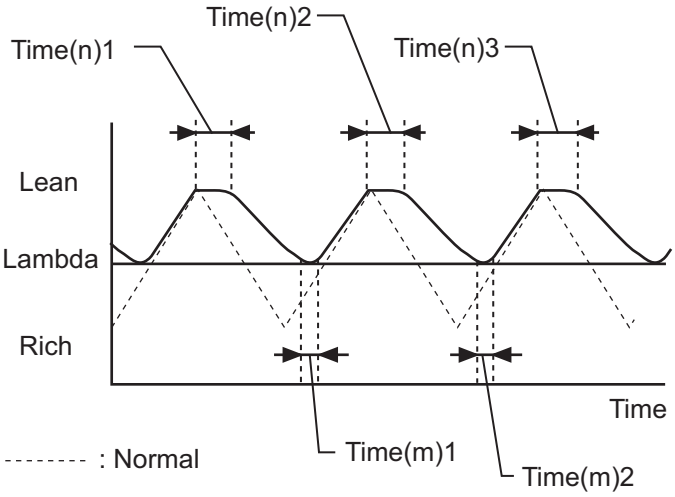
m: Local Minimum

Average of Time(n) = (Time(n)1 + Time(n)2 + ····· / Number of Peaks

Average of Time(m) = (Time(m)1 + Time(m)2 + ····· / Number of Peaks

Malfunction: Average of Time(m) - Average of Time(n) = 0.08 seconds or more

P014D:



n: Local Maximum

m: Local Minimum

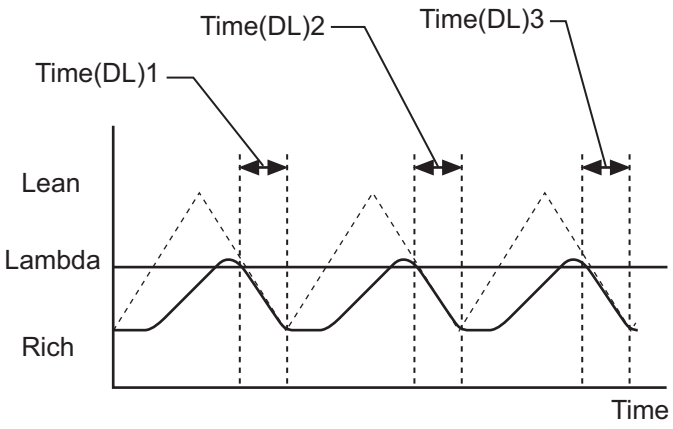
Average of Time(n) = (Time(n)1 + Time(n)2 + ····· / Number of Peaks

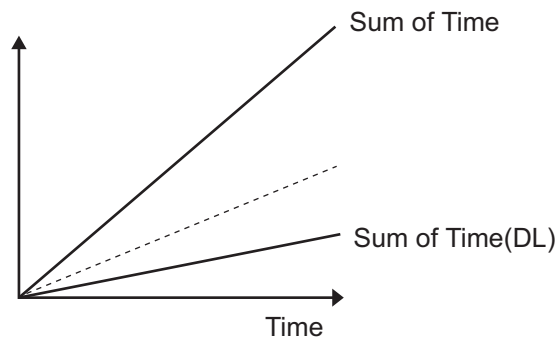
Average of Time(m) = (Time(m)1 + Time(m)2 + ····· / Number of Peaks

Malfunction: Average of Time(n) - Average of Time(m) = 0.1 seconds or more

If the difference between the average of time (m) and the average of time (n) reaches or exceeds the specified value, and, for the air/ratio sensor output accumulation time, the air/ratio sensor's lambda reduction time is low, P014C is recorded. If high, P014D is recorded.

P014C:





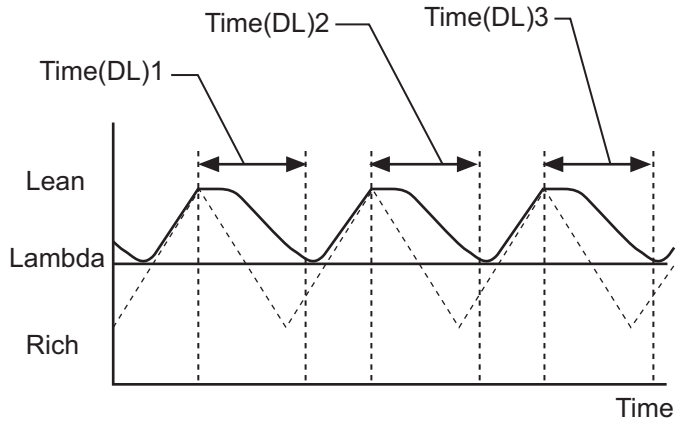
-------- : Normal

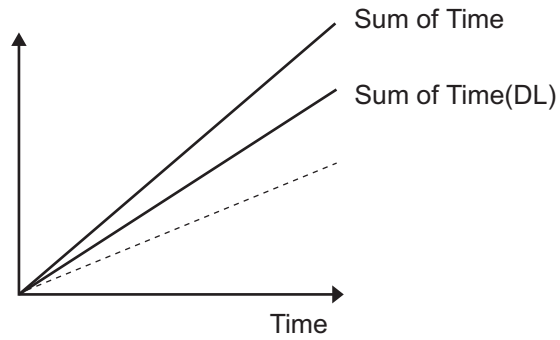
——— : Malfunction

Normal: Sum of Time(DL) / Sum of Time = Approx. 0.5

Malfunction: Sum of Time(DL) / Sum of Time = Less than 0.39

P014D:





-------- : Normal

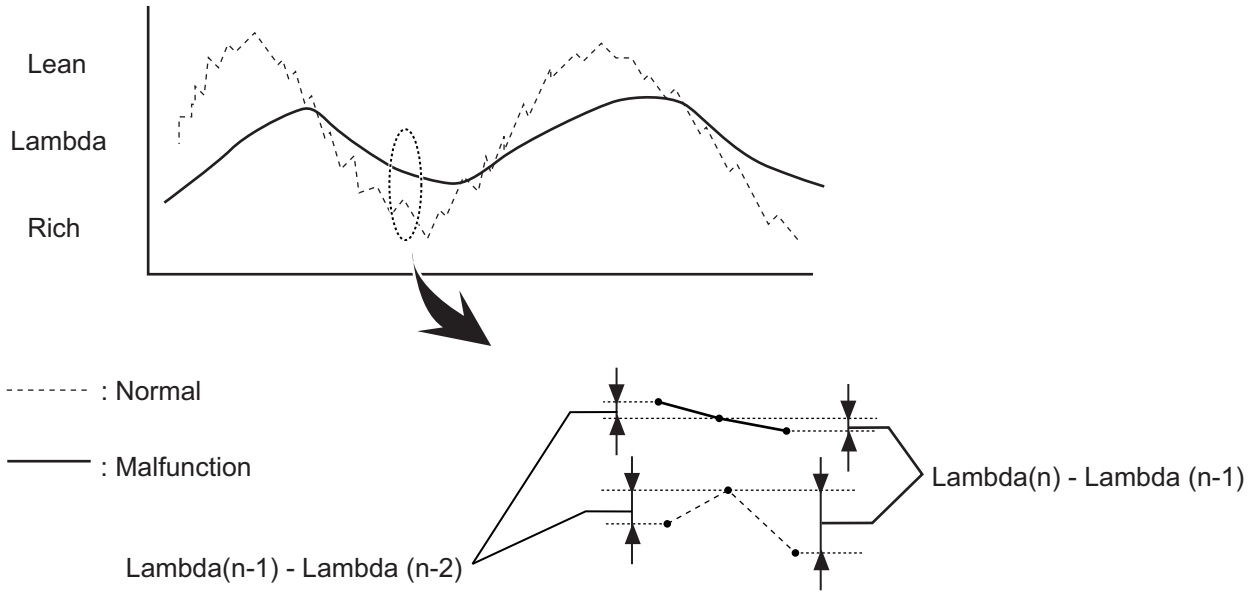
——— : Malfunction

Normal: Sum of Time(DL) / Sum of Time = Approx. 0.5

Malfunction: Sum of Time(DL) / Sum of Time = 0.63 or more

P014C, P014D (symmetric delay response)

The ECM monitors amount of change in the air/fuel ratio sensor output at specified intervals, and if the sum of the amounts of change exceeds the specified value, P014C and P014D are recorded.

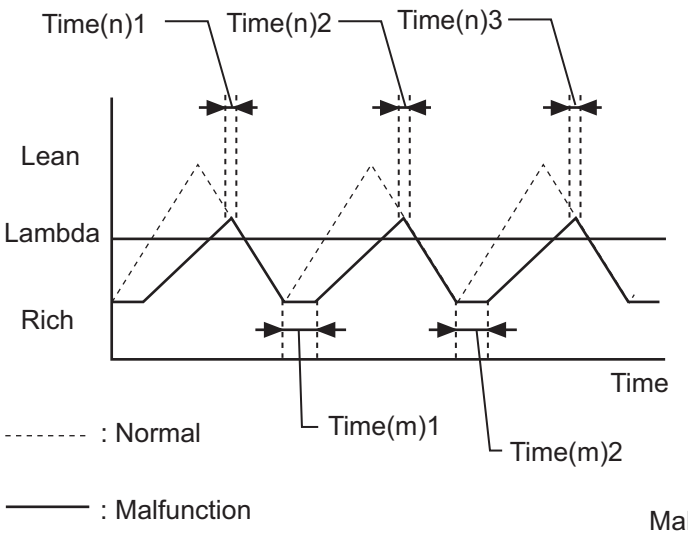


P015A, P015B (asymmetric delay response)

The ECM monitors the time the air/fuel ratio sensor output waveform is at its maximum and minimum values as time (m) and time (n).

If the difference between the average value of time (m) and the average value of time (n) reaches or exceeds the specified value, and time (m) reaches or exceeds the specified value, P015A is recorded. If time (n) reaches or exceeds the specified value, P015B is recorded.

P015A:



n: Local Maximum

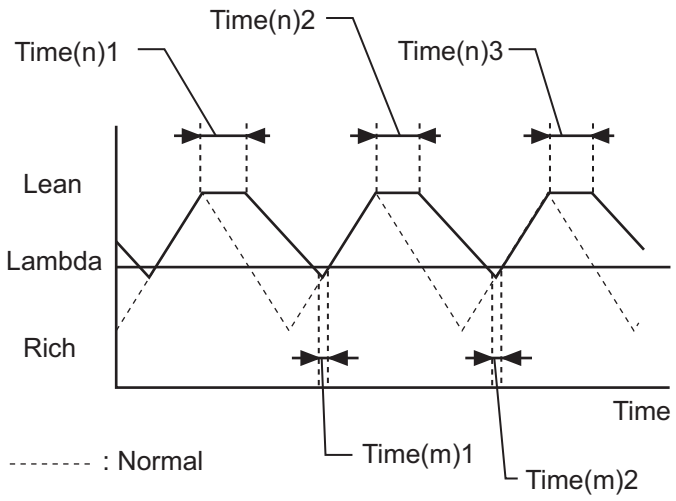
m: Local Minimum

Average of Time(n) = (Time(n)1 + Time(n)2 + ···· / Number of Peaks

Average of Time(m) = (Time(m)1 + Time(m)2 + ···· / Number of Peaks

Malfunction: Average of Time(m) - Average of Time(n) = 0.25 seconds or more

P015B:



n: Local Maximum

m: Local Minimum

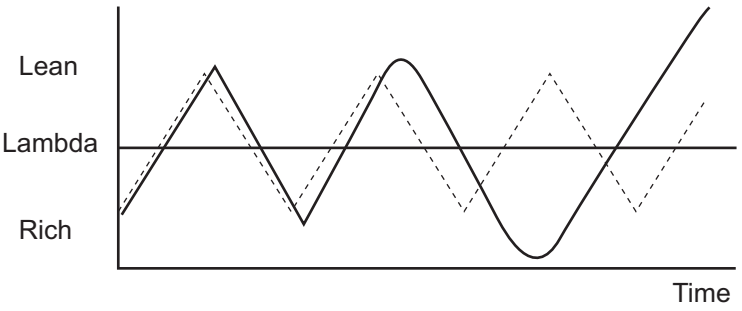
Average of Time(n) = (Time(n)1 + Time(n)2 + ···· / Number of Peaks

Average of Time(m) = (Time(m)1 + Time(m)2 + ···· / Number of Peaks

Malfunction: Average of Time(n) - Average of Time(m) = 0.25 seconds or more

P015A, P015B (symmetric delay response)

If the average value of the maximum and minimum values of lambda reaches or exceeds the specified value, both P015A and P015B are recorded.



Malfunction: Average (Lambda max - Lambda minimum) = 0.08 or more

ES

Circuit description

They are detected when the fuel correction amount from the catalyst upstream air/fuel ratio sensor exceeds a certain value.

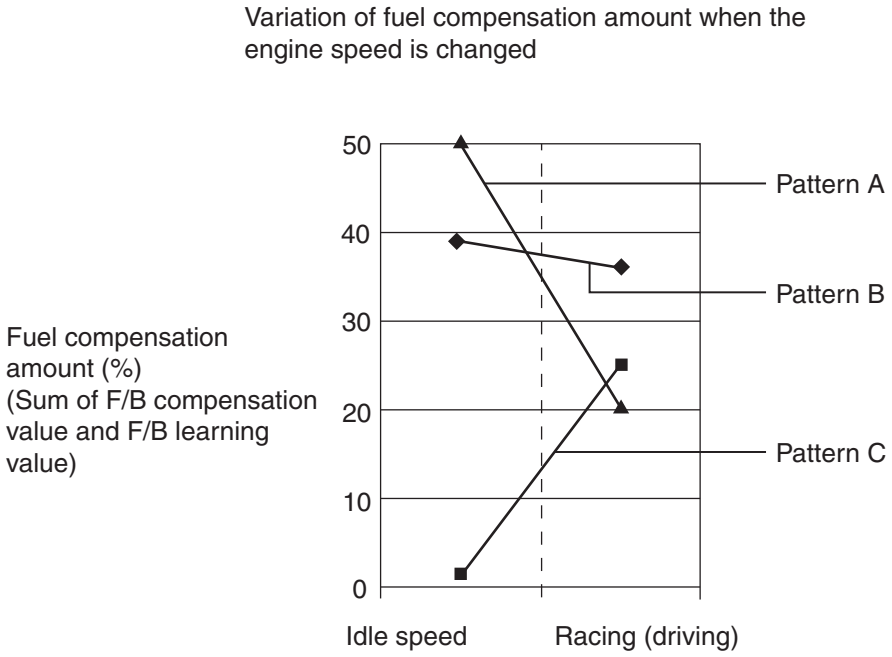
There are 2 types of air/fuel ratio correction: air/fuel ratio correction during normal driving (hereafter called F/B correction) and air/fuel ratio correction under recorded driving conditions (hereafter called F/B learning).

The F/B correction is a type of fuel correction used to maintain a stoichiometric air-fuel ratio. When the engine control computer receives a signal from the air/fuel ratio sensor which indicates that the actual air/fuel mixture has more fuel (hereafter called rich) or less fuel (hereafter called lean) compared to the stoichiometric air-fuel ratio, the engine control computer decreases the fuel injection amount if rich, and increases it if lean.

The F/B learning is a type of control that changes when F/B correction is performed for a specific duration, based on individual engine differences (caused by aging, change in usage environment, etc.), in order to bring the F/B correction closer to the zero region.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0171 | After the engine is warmed up, when the air/fuel ratio feedback has stabilized, the fuel correction becomes extremely rich.<br>(2 trips detection logic) | • Intake system<br>• Fuel injector ASSY (port injection)<br>• Fuel injector ASSY (cylinder injection)<br>• Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor<br>• Fuel pressure<br>• Gas leakage from exhaust system<br>• Open/short circuits in the air/fuel ratio sensor<br>• Air / fuel ratio sensor<br>• PCV valve and hose<br>• PCV hose connection<br>• ECM<br>• Wiring harness or connector |
| P0172 | After the engine is warmed up, when the air/fuel ratio feedback has stabilized, the fuel correction becomes extremely lean.<br>(2 trips detection logic) | • Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor<br>• Fuel injector ASSY (port injection)<br>• Fuel injector ASSY (cylinder injection)<br>• Ignition system<br>• Fuel pressure<br>• Gas leakage from exhaust system<br>• Open/short circuits in the air/fuel ratio sensor<br>• Air / fuel ratio sensor<br>• ECM<br>• Wiring harness or connector |
| P1170 | Regardless of whether a DTC for a rich status or a lean status is recorded, the fuel correction amount during direct injection is normal for 9 seconds.<br>(1 trip detection logic) | • Fuel injector ASSY (port injection)<br>• Fuel pressure<br>• ECM |
| P117B | DTC for a rich status or a lean status is recorded, and the fuel correction amount during port injection is normal for 9 seconds.<br>(1 trip detection logic) | • Fuel injector ASSY (cylinder injection)<br>• Fuel pressure<br>• ECM |

1. Confirming the changing pattern of the fuel correction amount (sum of F/B correction amount and F/B learning values)
   (1) When idling or racing the engine (approx. 2500 r/min), or when the check engine light turns on while driving the vehicle, reproduce the engine load in the freeze frame data by driving the vehicle, then use the SSM4 to check the fuel correction amount data, and analyze the trouble.



N

Result

| Result | Inspection items |
|---|---|
| Pattern A (air induction)<br>Air induction takes a larger fuel correction amount when the engine is idling and the amount decreases when the engine is racing.<br>This is because racing the engine increases the amount of air necessary, and the ratio of problems in air induction relatively decreases. | Intake system |
| Pattern B (trouble in the intake air flow meter SUB-ASSY or a clog in the injector ASSY)<br>Symptoms of trouble in the intake air flow meter SUB-ASSY or a clog in the fuel injector ASSY are very similar; the fuel correction amount is very large during both idling and racing. | • Intake air flow meter SUB-ASSY<br>• Fuel injector ASSY (cylinder and port injection sides) |
| Pattern C (trouble in the intake air flow meter SUB-ASSY)<br>Increase in the fuel correction amount when the engine is racing is significantly larger than when idling.<br>This occurs because it is a unique fault that is different from the pattern B trouble in the intake air flow meter SUB-ASSY. | Intake air flow meter SUB-ASSY |

   (2) After checking the data of the changing pattern, perform the procedures in steps 4 and 5 to check the vehicle trouble phenomenon when a malfunction occurred.

MONITOR DESCRIPTION

When controlling the fuel amount in a closed loop, if the amount of fuel injection differs from the ECM estimated value, it can cause fluctuation in the long-term fuel correction. If there is no change in the deviation of the F/B correction value, long-term fuel correction is regulated. A deviation in the estimated fuel injection amount by the ECM can also effect the average fuel correction learning value, which is a sum of the short-term fuel correction average (F/B correction value) and the long-term fuel correction average (F/B learning value). If the fuel correction learning value average exceeds the malfunction threshold, the ECM determines this to be a malfunction in the fuel system, and the DTC is recorded.

TYPICAL MALFUNCTION THRESHOLDS

P0171

| | |
|---|---|
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | 1.35 or more |

P0172

| | |
|---|---|
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | Less than 0.65 (varies depending on increase of the engine warm-up correction) |

P1170

| | |
|---|---|
| Diagnosis A | |
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | Less than 1.15<br>(varies depending on increase of the engine warm-up correction) |
| Diagnosis B | |
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | 0.85 or more<br>(varies depending on increase of the engine warm-up correction) |

P117B

| | |
|---|---|
| Diagnosis A | |
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | Less than 1.15<br>(varies depending on increase of the engine warm-up correction) |
| Diagnosis B | |
| Diagnostic value (air/fuel ratio sensor short-term fuel correction + air/fuel ratio sensor long-term fuel correction + (measured λ- target λ)) | 0.85 or more<br>(varies depending on increase of the engine warm-up correction) |

Circuit figure

For circuit figure, refer to ES - 134.
For circuit figure, refer to ES - 169.

Description of functions

NOTE:

- When DTC P0171 is recorded, the actual air/fuel ratio is on the leaner side.
- When DTC P0172 is recorded, the actual air/fuel ratio is on the richer side.
- If the vehicle runs out of gas, the fuel correction amount is corrected to the increase side, and P0171 (lean malfunction) may be output.

- When DTC P1170 or P117B is output, in some cases it is not possible to accurately determine if the port injection side or the cylinder injection side is faulty. In this case, perform [Active Test] to determine if the injection system is faulty.

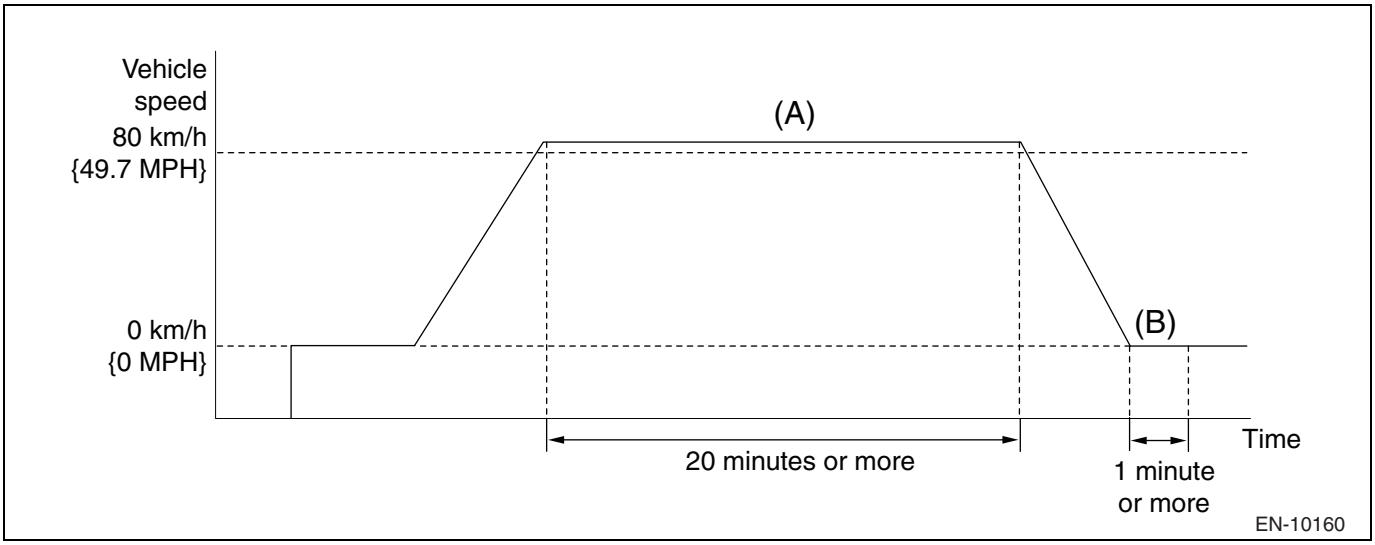
Test drive

Perform test drive to check if the DTC recurs.

NOTE:

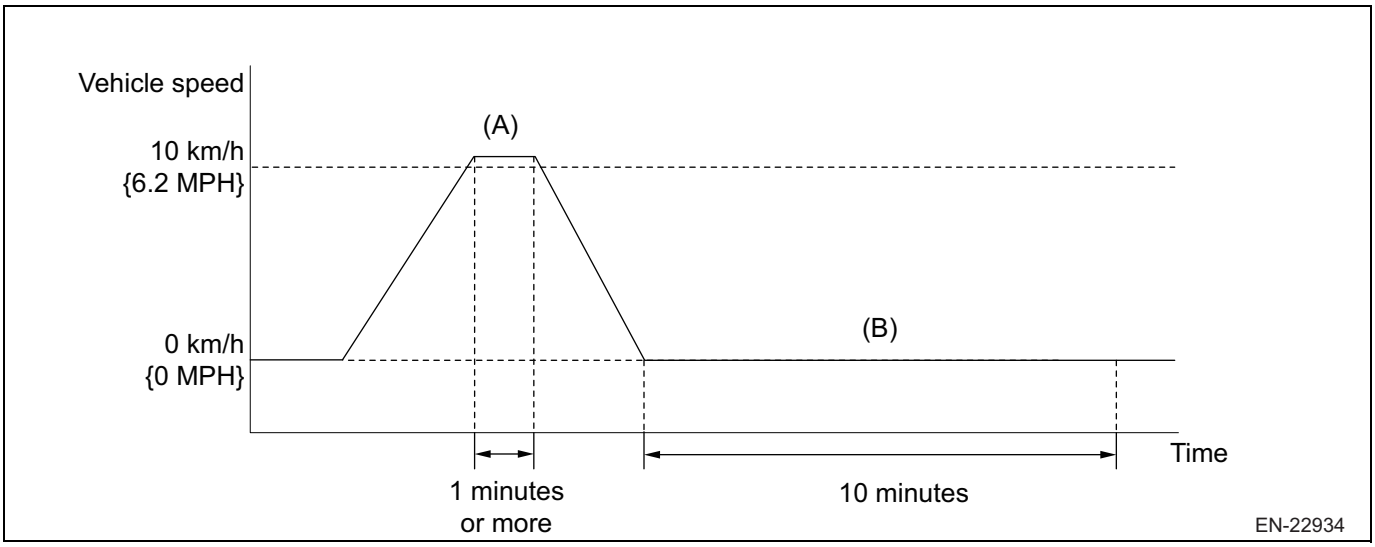
Both of test drive A and B can recur the diagnostic code.

Test drive A



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive B



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting. If the [Coolant Temp.] in the freeze frame data is less than 65°C {149°F} during idling, malfunction may exist in the fuel injector ASSY (port injection side) system.
- After repairing or replacing the faulty part, use the SSM4 to perform [Injection Mode Change/Cylinder injection or Port injection] in the [Active Test], and inspect if [Short term fuel trim B1] and [Long term fuel trim B1] under [Data monitor] are normal.

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | Engine is idling or racing (test drive the vehicle as required) | Within ±20% |

- If the trouble occurred when driving at high-speeds, shift the gear down and match the amount of air intake to the amount when the trouble occurred. Doing so enables measurement at moderate or low speeds.
- When short trips (driving time (distance) from IG ON to OFF is short) are repeated and then engine is warmed up, P0172 may be output due to an increase in blow-by gas caused by fuel evaporation.

WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.

| 1 | Interview |
|---|---|

(1) Refer to the check list for the interview. (Refer to ES - 26)

Next

| 2 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Perform test drive. (Refer to "Test drive" under "Description of functions")
(4) Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)
CAUTION:
If DTCs related to open or short circuits in the sensor system are output, perform the related troubleshooting.

Result

| Result | Go to |
|---|---|
| P0171, P0172, P1170, or P117B is output. | A |

| Result | Go to |
|---|---|
| DTCs other than P0171, P0172, P1170, or P117B are also output. | B |

NOTE:
If any DTCs other than P0171, P0172, P1170, or P117B are output, troubleshoot them first.

B → To corresponding DTC chart (refer to ES - 12)

ES

| | |
|---|---|
| 3 | Performing of SSM4 [Active Test] ([Cylinder Fuel Rate]) |

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Run the engine at 2500 r/min for approximately 90 seconds to warm it up.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(5) Inspect [A/F Sensor #11] and [Oxygen sensor #12] of the data display when running [Active Test].
CAUTION:
- The output voltage for the air/fuel ratio sensor is delayed a few seconds, while the output voltage for the oxygen sensor is delayed for a maximum of approximately 20 seconds.
- Because the sensors become cold, measure the voltage promptly after warming up the sensors.

NOTE:
- Change fuel injection volume from -12 % to +12 %.
- If the air/fuel ratio sensor output shows little response, the air/fuel ratio sensor may be at fault.

Voltage

| Item name | Fuel injection volume | Output voltage of air/fuel ratio sensor and oxygen sensor |
|---|---|---|
| A/F Sensor #11 | +12 % increase | Less than 2.0 V (rich state) |
| | -12 % decrease | 2.4 V or more (lean state) |
| Oxygen sensor #12 | +12 % increase | 0.55 V or more (rich state) |
| | -12 % decrease | Less than 0.4 V (lean state) |

Result

| A/F Sensor #11 | Oxygen sensor #12 | State of air/fuel ratio, air/fuel ratio sensor, and oxygen sensor | Inspection parts | Go to |
|---|---|---|---|---|
| Rich/Lean | Rich/Lean | Normal | - | A |
| Lean | Lean | Lean state | • PCV hose connected<br>• Fuel injector ASSY<br>• Exhaust gas leakage<br>• Intake system<br>• Fuel pressure<br>• Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor | A |

| A/F Sensor #11 | Oxygen sensor #12 | State of air/fuel ratio, air/fuel ratio sensor, and oxygen sensor | Inspection parts | Go to |
|---|---|---|---|---|
| Rich | Rich | Rich state | • Fuel injector ASSY<br>• Exhaust gas leakage<br>• Ignition system<br>• Fuel pressure<br>• Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor | A |
| Lean | Rich/Lean | Malfunction in the air/fuel ratio sensor | Air / fuel ratio sensor | B |
| Rich | Rich/Lean | Malfunction in the air/fuel ratio sensor | Air / fuel ratio sensor | B |

- Lean status: When the active test is performed, the output voltage of the air/fuel ratio is 2.4 V or more, and the output voltage of the oxygen sensor remains at less than 0.4 V.
- Rich status: When the active test is performed, the output voltage of the air/fuel ratio sensor remains at less than 2.0 V, and the output voltage of the oxygen sensor remains at 0.55 V or more.
- Rich/lean status: When the active test is performed, the output voltage of the air/fuel ratio sensor and oxygen sensor are normal.
- For details of [A/F Sensor #11] and [Oxygen sensor #12] data monitor menus, check “Data monitor / Active test”. (Refer to ES - 43)

B → Go to Step 18.

A

| 4 | Checking the freeze frame data |
|---|---|

CAUTION:
Make sure to write down the freeze frame data because it is deleted when DTCs are cleared.

(1) Check the check list for interview and freeze frame data to understand the status of the vehicle when the malfunction occurred.
NOTE:
- With the time-line freeze data, the state of the engine before and after the detection of the DTCs can be checked.
- Check states during idling (gear in the D, P, or N position) and driving (at constant speed or accelerating and decelerating) from the freeze frame data.

Items to check

| | | |
|---|---|---|
| Engine Speed | Fuel system for Bank 1 | Oxygen sensor #12 |
| Calculated load value | Short term fuel trim B1 | Purge ratio |
| Vehicle speed | Long term fuel trim B1 | Gear signal |
| Mass air flow | A/F Sensor #11 | Coolant Temp. |

Next

| 5 | Check trouble phenomenon |
|---|---|

NOTE:
Perform the following procedures to check the vehicle trouble phenomenon when a malfunction occurred.

(1) Remove the EFI (+B) fuse, wait for 60 seconds or more, then connect the fuse.
NOTE:
- Clear the F/B learning value from the engine control computer.
- Initial diagnosis of electronic control throttle is performed after DTCs are cleared. For this reason, the engine starting after DTC clearance must be performed more than 10 seconds after IG ON.

(2) Connect the SSM4 to the DLC3.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(4) Advance the injection amount 1 step to the increase side or the reduce side.
NOTE:
This operation stops the F/B correction and F/B learning so that the trouble phenomenon can be checked.
(5) Start the engine.
(6) Refer to the driving status in the freeze frame data, reproduce the conditions when the malfunction occurred, and check the trouble phenomenon.

Result

| Result | Go to |
|---|---|
| The trouble phenomenon can be checked. | A |
| The trouble phenomenon cannot be checked. | B |

B → Go to Step 10.

A

| 6 | Check trouble phenomenon |
|---|---|

(1) Refer to the vehicle trouble phenomenon shown below to identify faulty part, and inspect and replace parts.
CAUTION:
If the faulty part cannot be identified with only the check light, go to Step 3.

| Faulty part | Trouble phenomenon | Cause | Inspection procedures | Remarks |
|---|---|---|---|---|
| Intake air flow meter SUB-ASSY | • Rough idling<br>• Hesitation at start up<br>• Only the check light | Uncharacteristic intake air flow meter SUB-ASSY | Refer to ES - 680 | - |

| Faulty part | Trouble phenomenon | Cause | Inspection procedures | Remarks |
|---|---|---|---|---|
| Fuel injector ASSY (cylinder or port injection sides) | Only the check light | Clog in the fuel injector ASSY | • For inspection procedures on the port injection side, refer to FU - 29.<br>• For inspection procedures on the direct injection side, refer to FU - 39. | • Extremely long idling<br>• Long driving distance<br>• Regular gasoline being used for a long period of time<br>Using the vehicle under the above conditions may cause a clog in the fuel injector ASSY.<br>The check light turns on many times when driving. |
| | • Engine stalls when stopping the vehicle (can be restarted)<br>• Only the check light | Poor oil-tightness in the fuel injector ASSY | • For inspection procedures on the port injection side, refer to FU - 29.<br>• For inspection procedures on the direct injection side, refer to FU - 39. | • Poor oil-tightness causes rich malfunctions.<br>• If the HC concentration inside the intake manifold after stopping the engine is high, it will cause a rich malfunction.<br>• The smoldering state of the spark plug may indicate a malfunction in the fuel system.<br>• DTC P0088 may be output. |
| Fuel pump (low-pressure side) | • Engine stalls<br>• Poor acceleration | • Fuel pump (low-pressure side) operates poorly<br>• Poor fuel pressure on the low-pressure side<br>• Clog in the low-pressure side fuel system | • For the fuel pump control system (low-pressure side), refer to ES - 606.<br>• For the fuel pressure inspection on the low-pressure side, refer to FU - 9. | - |
| Intake system | • Rough idling<br>• Only the check light | Air intake from the intake manifold gasket area | Inspection of the intake manifold gasket area. | - |
| | | • Damage to the intake system hoses<br>• Vacuum switching valve ASSY is continuously ON. | Start the engine and, while idling, block the hoses connected to the intake manifold 1 at a time, and inspect if the fuel correction amount (sum of F/B correction and F/B learning) changes to the reduce side. | If there is air intake from the hoses, the fuel correction amount (sum of F/B correction and F/B learning) is large but becomes small when the engine is raced. |

ES

| Faulty part | Trouble phenomenon | Cause | Inspection procedures | Remarks |

| Faulty part | Trouble phenomenon | Cause | Inspection procedures | Remarks |
|---|---|---|---|---|
| Air / fuel ratio sensor | Rough idling | Air/fuel ratio sensor is faulty | For the inspection of the air/fuel ratio sensor system, refer to ES - 204. | DTCs for the air/fuel ratio sensor system may be output. |

(2) After repairing the faulty part, check if the vehicle trouble phenomenon has been resolved.

Result

| Result | Go to |
|---|---|
| Vehicle trouble phenomenon is resolved. | A |
| Vehicle trouble phenomenon is not resolved. | B |

B → Go to Step 10.

A

| 7 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON, and follow the SSM4 on-screen display to clear the DTC. (Refer to ES - 28)

Next

| 8 | Reading of SSM4 data ([Short term fuel trim B1] and [Long term fuel trim B1]) |
|---|---|

(1) Start the engine.
(2) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1], [Long term fuel trim B1]
(3) Read [Short term fuel trim B1] and [Long term fuel trim B1] displayed on the SSM4.

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | Vehicle conditions when malfunction occurs (during idling, test drive, etc.) | Within ±20% |

NOTE:
If the trouble occurred when driving at high-speeds, shift the gear down and match the amount of air intake to the amount when the trouble occurred. Doing so enables measurement at moderate or low speeds.

NG → Go to Step 10.

OK

| 9 | System normal |
|---|---|

(1) Check the check list for interview and freeze frame data again, and if there is no malfunction, finish the procedure.
NOTE:
- If the vehicle runs out of gas, the fuel correction amount becomes +35 % or more. When the condition occurs consecutively (2 trips), P0171 (lean malfunction) may be output.

- When short trips (driving time (distance) from IG ON to OFF is short) are repeated and then engine is warmed up, P0172 may be output due to an increase in blow-by gas caused by fuel evaporation.

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1], [Long term fuel trim B1]
(4) Inspect the [Fuel Rail Pressure] displayed on the SSM4.

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| [Fuel Rail Pressure] | During engine idling (after warm-up, air conditioning off, in N position) | 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psi} |

NOTE:
If outside the standard value, there may be a malfunction in the fuel system (high-pressure side).

NG → Check and replacement for the fuel system (high-pressure side)

OK

| 26 | Performing of SSM4 [Active Test] ([Injection Mode Change]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Injection Mode Change] / [Cylinder injection]
(4) Check [Target Fuel Pressure(High)], [Short term fuel trim B1] and [Long term fuel trim B1] data readings during the active test.

Result

| Item name | | Inspection conditions | Go to |
|---|---|---|---|
| [Target Fuel Pressure(High)] | Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | | |
| 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psi} | - | • [Active Test] - [Injection Mode Change] - [Cylinder injection] in progress<br>• Idling<br>• Shift lever is at N or P position<br>• A/C OFF | A |
| 5000 kPa {37509 mmHg, 1476.7 inHg, 725.0 psi} or more | +20% or more | | B |
| | Less than -20% | | C |
| Less than 3000 kPa {22506 mmHg, 886.0 inHg, 435.0 psi} | +20% or more | | C |
| | Less than -20% | | D |

B → Go to Step 26.

C → Replacement of the fuel pressure sensor (Refer to FU - 41)

D → Replacement of the engine control computer (Refer to ES - 674)

A

| 27 | Performing of SSM4 [Active Test] ([Injection Mode Change]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Injection Mode Change] / [Cylinder injection]
(4) Check [Target Fuel Pressure(High)], [Short term fuel trim B1] and [Long term fuel trim B1] data readings during the active test.

Result

| Item name | | Inspection conditions | Go to |
|---|---|---|---|
| [Target Fuel Pressure(High)] | Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | | |
| 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psi} | Less than -25% | • [Active Test] - [Injection Mode Change] - [Cylinder injection] in progress<br>• Idling<br>• Shift lever is at N or P position<br>• A/C OFF | A |
| 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psi} | +30% or more | | |
| 3000 to 5000 kPa {22506 to 37509 mmHg, 886.0 to 1476.7 inHg, 435.0 to 725.0 psi} | -25 to +25% | | B |

ES

B → Inspection for problems that do not normally occur (Refer to ES - 28)

A

Replacement of fuel injector ASSY (direct injection side) (Refer to FU - 31)

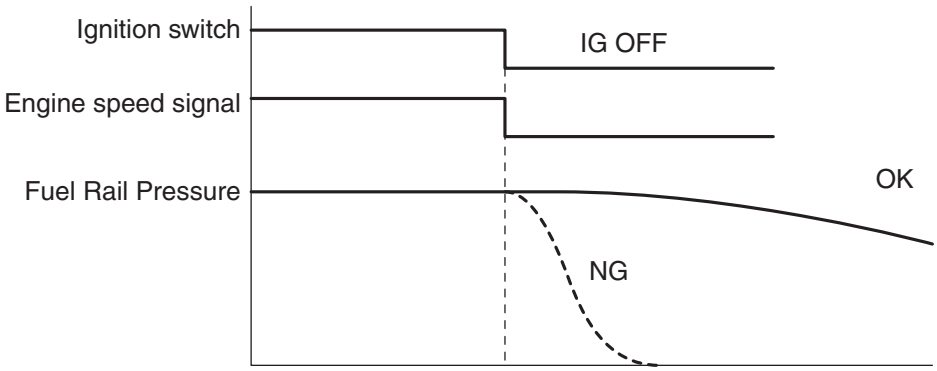
| 28 | Inspection for fuel leaks (high-pressure side) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Fuel Rail Pressure]
  (a) Record the [Fuel Rail Pressure].
(4) Inspect for any fluctuation in the [Fuel Rail Pressure] when the engine is stopped.

Criteria

| Item name | Inspection conditions | Criteria |
|---|---|---|
| [Fuel Rail Pressure] | Engine running →IG OFF →IG ON | Fluctuation in fuel pressure gradually decreases. |

NOTE:
- After turning IG to OFF, immediately turn the ignition switch to ON.
- The pressure drops to 0 kPa in approximately 10 minutes.
- It may rise gradually after IG ON depending on vehicle conditions.



Y

Result

| Result | Go to |
|---|---|
| Fluctuation in fuel pressure increases or decreases gradually. | A |
| Fuel pressure decreases rapidly. | B |

B → Replacement of the fuel pump ASSY (high-pressure side) (Refer to FU - 58)

A

Replacement of fuel injector ASSY (direct injection side) (Refer to FU - 31)

| 29 | Fuel injector ASSY unit inspection (port injection side) |
|---|---|

(1) Perform a unit inspection on the fuel injector ASSY (port injection side). (Refer to FU - 29)

NG → Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

OK

Replacement of the engine control computer (Refer to ES - 674)

| 30 | Inspection of the wiring harness and the connector |
|---|---|

(1) Check the connection state and fit of the wiring harnesses and connectors between the intake air flow meter SUB-ASSY and engine control computer. (Refer to IN - 36)

NOTE:
If there are poor connections or poor fits, replace or repair them.

Next

| 31 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON, and follow the SSM4 on-screen display to clear the DTC. (Refer to ES - 28)

ES

Next

| 32 | Reading of SSM4 data ([Short term fuel trim B1] and [Long term fuel trim B1]) |
|---|---|

(1) Start the engine.
(2) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1], [Long term fuel trim B1]
(3) Check [Short term fuel trim B1] and [Long term fuel trim B1] displayed on the SSM4.

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | Vehicle conditions when malfunction occurs (during idling, test drive, etc.) | Within ±20% |

NOTE:
If the trouble occurred when driving at high-speeds, shift the gear down and match the amount of air intake to the amount when the trouble occurred. Doing so enables measurement at moderate or low speeds.

NG → Go to Step 31.

OK

| Complete |
|---|

| 33 | Check wiring harness and connector (engine control computer - intake air flow meter SUB-ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

ES

| 34 | Replacement of the intake air flow meter SUB-ASSY |
|---|---|

(1) Replace the intake air flow meter SUB-ASSY. (Refer to ES - 679)
NOTE:
If the inspection result in Step 15 is normal, proceed to the next step without replacing the intake air flow meter SUB-ASSY.

Next

| 35 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON, and follow the SSM4 on-screen display to clear the DTC. (Refer to ES - 28)

Next

| 36 | Reading of SSM4 data ([Short term fuel trim B1] and [Long term fuel trim B1]) |
|---|---|

(1) Start the engine.
(2) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1], [Long term fuel trim B1]
(3) Check [Short term fuel trim B1] and [Long term fuel trim B1] displayed on the SSM4.

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | Vehicle conditions when malfunction occurs (during idling, test drive, etc.) | Within ±20% |

NOTE:
If the trouble occurred when driving at high-speeds, shift the gear down and match the amount of air intake to the amount when the trouble occurred. Doing so enables measurement at moderate or low speeds.

NG → Replacement of the engine control computer (Refer to ES - 674)

OK

Complete

| DTC | P0191 | Fuel Rail Pressure Sensor "A" Circuit Range/Performance |
|---|---|---|

Circuit description

The fuel pressure sensor, built into the delivery pipe, converts the fuel pressure into an electric signal and outputs it to the engine control computer. When the output from the fuel pressure sensor is cut off, the engine control computer stops the fuel pump ASSY (high-pressure side), and supplies fuel from the fuel pump (low-pressure side).

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0191 | When the condition where the fuel pressure sensor value was 2.38 kPa {243 kgf/cm$^2$, 3451 psi} or more continued for 2.5 seconds. (2-trip detection logic) | • Open or short circuit in the fuel pressure sensor<br>• Fuel pressure sensor<br>• ECM |

ES

NOTE:

After checking the DTC output, using the SSM4, read the fuel pressure on the [Data monitor] screen.

MONITOR DESCRIPTION

If the output voltage of the fuel pressure sensor is outside specifications, DTC is set. The DTCs indicate open/short condition in the sensor circuits.

If these DTCs are set, the ECM switches to fail-safe mode, and the engine output is limited.

Fail-safe mode continues until the vehicle is turned to IG OFF.

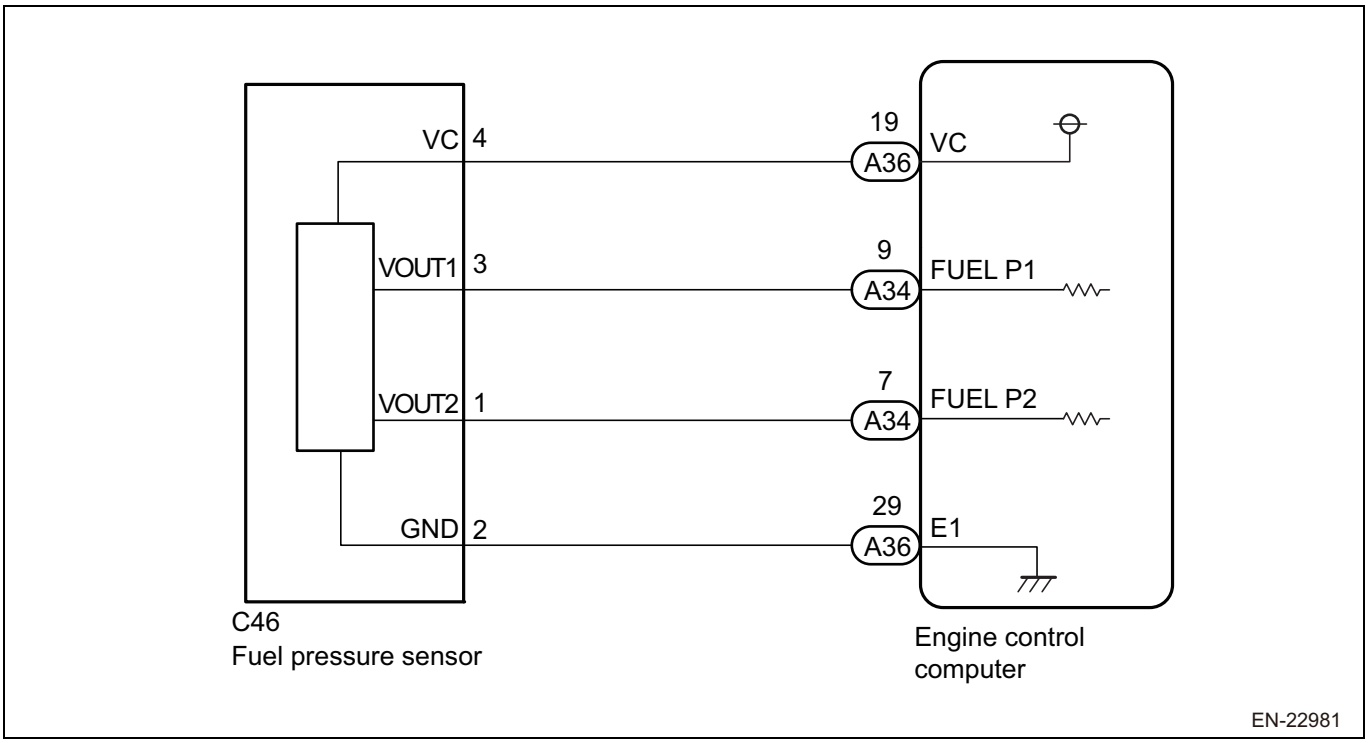
Circuit figure



Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Inspection of the engine control computer |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to clear the DTCs.
(4) Turn the ignition switch to OFF, and wait for 30 seconds.
(5) Start the engine.
(6) After warm-up, let the engine idle.
(7) Measure the voltage between the terminals.

Standard value

| Measuring terminal | Result |
|---|---|
| A34-7 - A36-29 | 0.7 to 1.3V |
| A36-19 - A36-29 | 3.3 to 3.9V |

NG → Replace the fuel pressure sensor. (Refer to FU - 40)

OK

ES

Replace the engine control computer. (Refer to ES - 674)

|---|---|---|

Circuit description

The fuel pressure sensor, built into the delivery pipe, converts the fuel pressure into an electric signal and outputs it to the engine control computer. When the output from the fuel pressure sensor is cut off, the engine control computer stops the fuel pump ASSY (high-pressure side), and supplies fuel from the fuel pump (low-pressure side).

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P1193 | The voltage in the fuel pressure sensor was too high for 2.4 seconds or more.<br>(1 trip detection logic) | • Open or short condition in the fuel pressure sensor circuit<br>• Fuel pressure sensor<br>• ECM |

NOTE:

After checking the DTC output, using the SSM4, read the fuel pressure on the [Data monitor] screen.

| Fuel pressure | Content of malfunction |
|---|---|
| Approx. 0 kPa {0 mmHg, 0 inHg, 0 psi} | • Open circuit in the FUEL P2 circuit<br>• Open circuit in the VC circuit<br>• Open circuit in the E1 circuit<br>• Short circuit between the FUEL P2 circuit and the ground circuit<br>• Short circuit between the FUEL P2 circuit and the E1 circuit |

MONITOR DESCRIPTION

If the output voltage of the fuel pressure sensor is outside specifications, DTC is set. The DTCs indicate open/short condition in the sensor circuits.

If these DTCs are set, the ECM switches to fail-safe mode, and the engine output is limited.

Fail-safe mode continues until the vehicle is turned to IG OFF.

Monitor strategy

|---|---|
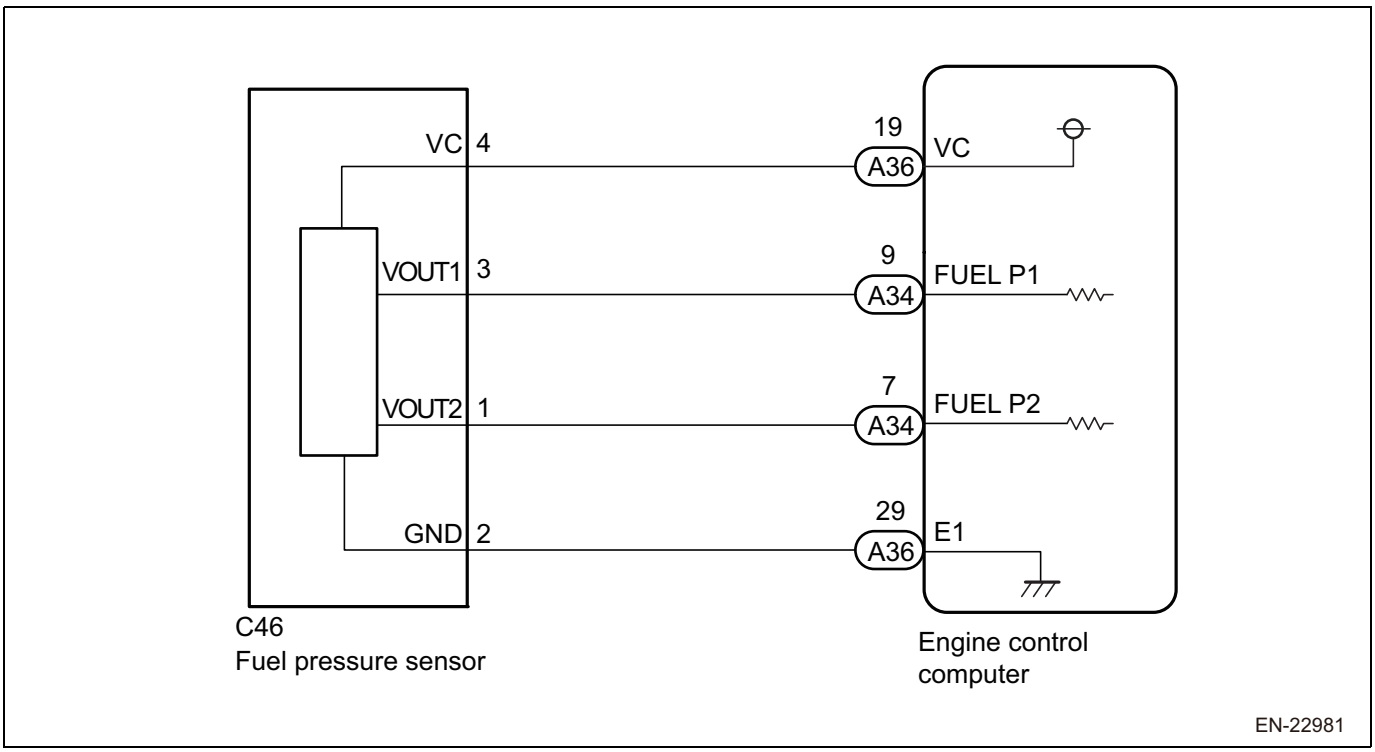
| Voltage of the fuel rail pressure sensor (fuel pressure) | 0.306 to 4.639V [0.00 to 25.87MPa {0 to 263.8kgf/cm$^2$, 0 to 3751psi}] |

Circuit figure



Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Data monitor check |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to clear the DTCs.
(4) Turn the ignition switch to OFF, and wait for 30 seconds.
(5) Start the engine.
(6) Use the Subaru Select Monitor or the general scan tool to read the [Fuel Rail Pressure B] value.

Standard value

| Item name | Standard value |
|---|---|
| Actual fuel pressure 2 | 25 MPa or more |

NG → The circuit returns to normal at this point even if a DTC is detected. Reproduce the faulty condition and perform the diagnosis again. In this case, temporary contact failure of the connector may be present, or the harness may be temporary open or shorted.

OK

| 2 | Check wiring harness and connector (voltage of the fuel pressure sensor) |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connector from the fuel pressure sensor.
(3) Turn the ignition switch to ON.
(4) Measure the voltage between the terminals.

Standard value

| Measuring terminal | Result |
|---|---|
| C46 - 4 (VC) - chassis ground | 4.5 to 5.5V |

NG → Go to Step 5.

OK

| 3 | Wiring harness and connector check |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connectors from the engine control computer.
(3) Disconnect the connector from the fuel pressure sensor.
(4) Measure the resistance between the engine control computer connector and fuel pressure sensor.

ES

Standard value

| Measuring terminal | Result |
|---|---|
| A36-29(E1) - C46-1(VOUT2) | Less than 1 Ω |
| A36-29(E1) - C46-2(GND) | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

| 4 | Check of the power supply for the fuel pressure sensor check |
|---|---|

(1) Connect all connectors.
(2) Turn the ignition switch to ON.
(3) Measure the voltage between the engine control computer connector and chassis ground.

Standard value

| Measuring terminal | Result |
|---|---|
| A34-7 (FUEL P2) - Chassis ground | 5V or more |
| C46 - 1 (VOUT2) - Chassis ground | 5V or more |

NG → Replacement of the fuel pressure sensor (Refer to FU - 40)

OK

Repair or replacement of wiring harness or connector

| 5 | Inspection of the wiring harness and the connector |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connectors from the engine control computer.
(3) Disconnect the connector from the fuel pressure sensor.
(4) Measure the resistance between the terminals.

Standard value

| Measuring terminal | Result |
|---|---|
| A36-19(VC) - C46-4(VC) | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

| 6 | Inspection of the wiring harness and the connector |
|---|---|

(1) Turn the ignition switch to OFF.
(2) Disconnect the connectors from the engine control computer.
(3) Disconnect the connector from the fuel pressure sensor.
(4) Measure the resistance between the terminals.

Standard value

| Measuring terminal | Result |
|---|---|
| A36-19 (VC) - chassis ground | 10 kΩ or more |
| C46 - 4 (VC) - Chassis ground | 10 kΩ or more |

NG → Repair or replacement of wiring harness or connector

OK

Replacement of engine control computer

| DTC | P0196 | Engine Oil Temperature Sensor Range/Performance |
|---|---|---|

Circuit description
The resistance of the thermistor built into the oil temperature sensor changes as the oil temperature changes. The engine oil temperature sensor is connected to the engine control computer in the same way the inlet air temperature sensor is connected.
NOTE:
When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the specified engine oil temperature at 70°C {158°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0196 | When, even though the estimated engine oil temperature is higher than 45°C {113°F}, the value for the engine oil temperature sensor is lower than 45°C{113°F}.<br>(2 trips detection logic) | • Engine oil temperature sensor<br>• ECM |

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.

7. Turn on the SSM4.
8. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Coolant Temp./ Intake Air Temp.]
9. Confirm that the engine coolant temperature and intake air temperature meet the condition described below.
   Condition: |Engine coolant temperature - intake air temperature| is 5°C {9°F} or less
   NOTE:
   If the condition is not met, turn the ignition switch to OFF, and wait until the condition is met.
10. If the condition is met, start the engine, and let it idle for 2 minutes or more.
    NOTE:
    Do not move the select lever from "P" or "N" range while the engine is idling.
11. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

| 1 | Reading diagnostic codes |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Resistance between C21-1 and C21-2 varies when the oil temperature is cooled and warmed. | A |
| Resistance between C21-1 and C21-2 does not vary when the oil temperature is cooled and warmed. | B |

B → Replace the engine oil temperature sensor.

A

Repair a poor contact of ECM connectors.

| DTC | P0197 | Engine Oil Temperature Sensor Low |
|---|---|---|

| DTC | P0198 | Engine Oil Temperature Sensor High |
|---|---|---|

Circuit description

The resistance of the thermistor built into the oil temperature sensor changes as the oil temperature changes. The engine oil temperature sensor is connected to the engine control computer in the same way the inlet air temperature sensor is connected.

NOTE:

When either of these DTCs is stored, the engine control computer enters fail-safe mode. The engine control computer fixes the specified engine oil temperature at 70°C {158°F} during the fail-safe mode operation. The engine control computer continues fail-safe mode operation until the normal condition is restored.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P0197 | The voltage for the engine oil temperature sensor is less than 0.203 V for 0.5 seconds or more.<br>(1 trip detection logic) | • Engine oil temperature sensor<br>• ECM |
| P0198 | The voltage for the engine oil temperature sensor is 4.698 V or higher for 0.5 seconds or higher.<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

P0197, P0198

The ECM observes the sensor voltage, and uses this value in calculating the engine oil temperature. If the sensor output voltage is outside the range of normal operations, the ECM interprets that as trouble with the engine oil temperature sensor, and records a DTC.

Monitor strategy

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Reading of SSM4 data ([Oil Temperature]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Oil Temperature]

(4) With the engine stopped, read the [Oil Temperature] displayed on the SSM4.

Result

| Result | Go to |
|---|---|
| -40°C {-40°F} (open circuit) | A |
| 150°C {302°F} (short circuit) | B |
| Equal to actual oil temperature | C |

NOTE:
- If the SSM4 display is -40°C {-40°F}, there is an open circuit.
- If the SSM4 display is 150°C {302°F}, there is a short circuit.

B → Go to Step 4.

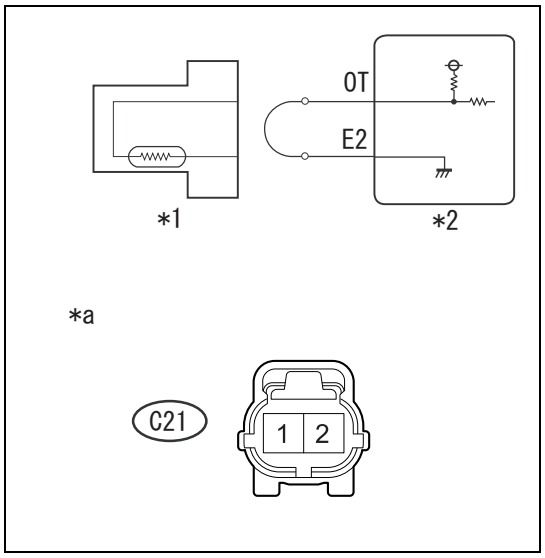
C → Inspection for problems that do not normally occur (Refer to ES - 28)

A

| 2 | Reading of SSM4 data (wiring harness open circuit check) |
|---|---|

SST 09843-18040

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Connect the SSM4 to the DLC3.
(2) Disconnect the connector for the engine oil temperature sensor.
(3) Using SST (diagnostic check wire No. 2), short-circuit between terminals 1 and 2 of the engine oil temperature sensor.
(4) Turn the ignition switch to ON.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Oil Temperature]
(6) Read the [Oil Temperature] displayed on the SSM4.
Displayed temperature: 150°C {302°F}

ES

Circuit description

The D-4S system has the cylinder direct fuel injection method, which directly injects highly pressurized fuel into the combustion chamber, and the port injection method, which injects fuel into the intake port. The D-4S uses one or the other depending on the engine driving status. The engine control computer monitors the port injector's injection control. If a malfunction occurs in a port injector circuit, the injection control for the related cylinder is stopped, and the engine control computer turns on the MIL.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0201 | Consecutively receives diagnosis information (open circuit detection / GND short circuit / +B short circuit or overheating) from the fuel injector IC 10 times or more (No. 1 cylinder)<br>(1 trip detection logic) | • Open / short circuit in the port injection injector<br>• INJ fuse<br>• No. 1 injector ASSY (port injection)<br>• ECM |
| P0202 | Consecutively receives diagnosis information (open circuit detection / GND short circuit / +B short circuit or overheating) from the fuel injector IC 10 times or more (No. 2 cylinder)<br>(1 trip detection logic) | • Open / short circuit in the port injection injector (No. 2 cylinder)<br>• INJ fuse<br>• No. 2 injector ASSY (port injection)<br>• ECM |
| P0203 | Consecutively receives diagnosis information (open circuit detection / GND short circuit / +B short circuit or overheating) from the fuel injector IC 10 times or more (No. 3 cylinder)<br>(1 trip detection logic) | • Open / short circuit in the port injection injector (No. 3 cylinder)<br>• INJ fuse<br>• No. 3 injector ASSY (port injection)<br>• ECM |
| P0204 | Consecutively receives diagnosis information (open circuit detection / GND short circuit / +B short circuit or overheating) from the fuel injector IC 10 times or more (No. 4 cylinder)<br>(1 trip detection logic) | • Open / short circuit in the port injection injector (No. 4 cylinder)<br>• INJ fuse<br>• No. 4 injector ASSY (port injection)<br>• ECM |

MONITOR DESCRIPTION

The ECM monitors the injection control of the port injector. If a malfunction is detected in the port injector circuits, the ECM cancels the cylinder injection control, and turns ON the MIL.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Check fuses in this circuit before performing the troubleshooting.

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- If DTC P0201 is displayed, inspect the fuel injector circuit of the No. 1 cylinder.
- If DTC P0202 is displayed, inspect the fuel injector circuit of the No. 2 cylinder.
- If DTC P0203 is displayed, inspect the fuel injector circuit of the No. 3 cylinder.
- If DTC P0204 is displayed, inspect the fuel injector circuit of the No. 4 cylinder.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and read the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| The DTC for the corresponding abnormal cylinder is output. | A |

Inspection of the ECM power supply system (Refer to ES - 646)

## DTC P0230 Fuel Pump Primary Circuit

Circuit description

The fuel pump circuit consists of the engine control computer, the fuel pump, and the fuel pump control computer ASSY (that operates the fuel pump). The engine control computer determines the operation speed of the fuel pump based on the engine output. The operation speed is converted to a load signal and sent to the fuel pump control computer ASSY. Then, based on the signal sent from the engine control computer, the fuel pump control computer ASSY adjusts the operation speed of the fuel pump from 3 speeds. The fuel pump control computer ASSY also has a self-diagnosis function. Based on the status of the fuel pump circuit, the fuel pump control computer ASSY outputs a diagnosis signal (DI) to the engine control computer. Then, the engine control computer determines if there is some trouble in the fuel pump circuit.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0230 | Open / short circuit in the fuel pump circuit for 2.5 seconds or more<br>(2 trips detection logic) | • Open / short circuit in the fuel pump (low-pressure side)<br>• No. 1 integration relay<br>• Fuel pump (low-pressure side)<br>• Fuel pump control ECM<br>• ECM |

MONITOR DESCRIPTION

For monitoring the fuel pump (low-pressure side) circuit, the ECM checks the fuel pump control signal (FPC) and the diagnosis signal (FPCDG). The FPC voltage fluctuates between approx. 0 - 12 V (duty signal).

Based on the status of the fuel pump control ECM, the FPCDG voltage fluctuates between approx. 0 - 12 V. Therefore, the ECM compares the fluctuations of the FPC voltage and the FPCDG voltage, and determines if there is a malfunction in the fuel pump (low-pressure side) circuit. If the ECM determines that there is a malfunction in the fuel pump (low-pressure side) circuit, then the DTC is immediately recorded.

Monitor strategy

ES

|---|---|
| Related DTCs | P0230: Fuel pump control circuit continuity |
| Required Sensors/Components (Main) | Fuel pump control ECM |
| Required Sensors/Components (Related) | - |
| Frequency of Operation | Continuous |
| Duration | 2.5 seconds |
| MIL Operation | 2 operation cycle |
| Sequence of Operation | None |

TYPICAL ENABLING CONDITIONS

| | |
|---|---|
| Battery Voltage | 8V or more |
| After engine is started | 180 seconds or more |

TYPICAL MALFUNCTION THRESHOLDS

| | |
|---|---|
| Output diagnosis signal of the fuel control ECM | Battery voltage ×0.4 V or less |

NOTE:

When the remaining fuel level is low, be careful of trouble in the remaining amount of fuel and the meter system (DTC B1500), because these are outside the diagnostic detection conditions.

Circuit figure

For circuit figure, refer to ES - 607.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

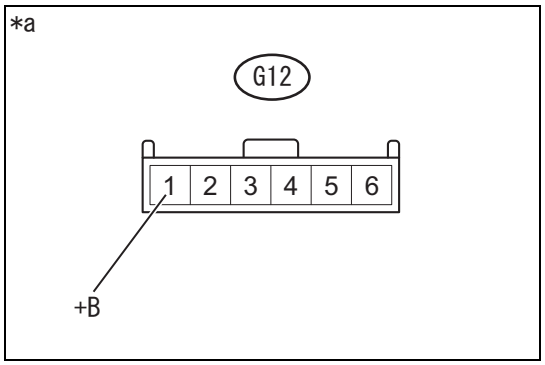
CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:
Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Check wiring harness and connector (fuel pump control computer ASSY power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector for the fuel pump control computer ASSY.
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-1 (+B) - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (connector for the fuel pump control computer ASSY) |

NG → Go to Step 9.

OK

| 2 | Check wiring harness and connector (fuel pump control computer ASSY grounding circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the fuel pump control computer ASSY.
(2) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-4 (E) - chassis ground | Always | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

| 3 | Check wiring harness and connector (engine control computer - fuel pump control computer ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the fuel pump control computer ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A35-10 (DI) - G12-3 (DI) | Always | Less than 1 Ω |
| A35-19 (FPC) - G12-2 (FPC) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A35-10 (DI) and G12-3 (DI) - other terminals and chassis ground | Always | 10 k Ωor more |
| A35-19 (FPC) and G12-2 (FPC) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

ES

| 4 | Inspection of the fuel pump ASSY (low-pressure side) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the fuel pump control computer ASSY.
(2) Measure the resistance between the terminals.

Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-5 (FP-) - G12-6 (FP+) | Always | 0.2 to 3.0 Ω |

NOTE:
The normal range of resistances indicates the motor resistance in the fuel pump ASSY.

NG → Go to Step 8.

OK

| 5 | Replacement of the fuel pump control computer ASSY |
|---|---|

(1) Replace the fuel pump control computer ASSY. (Refer to FU - 63)

Next

| 6 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 7 | Check DTC |
|---|---|

(1) Start the engine.
NOTE:
If the engine cannot be started, crank the engine for 15 seconds or more.
(2) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| No DTC is output | A |
| P0230 is output. | B |

B → Replacement of the engine control computer (Refer to ES - 674)

Complete

| | |
|---|---|
| 8 | Check wiring harness and connector (fuel pump control computer ASSY - fuel pump ASSY (low-pressure side)) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the fuel pump control computer ASSY.
(2) Disconnect the connector for the fuel pump ASSY (low pressure side).
(3) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-5(FP-) - G7-4(FP-) | Always | Less than 1 Ω |
| G12-6(FP+) - G7-3(FP+) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-5 (FP-) and G7-4 (FP-) - other terminals and chassis ground | Always | 10 k Ωor more |
| G12-6 (FP+) and G7-3 (FP+) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

Replacement of the fuel pump ASSY (low-pressure side) (Refer to FU - 47)

| | |
|---|---|
| 9 | Relay unit inspection (C/OPEN relay) |

(1) Perform a unit inspection on the C/OPEN relay. (Refer to ES - 717)

NG → Relay replacement (C/OPEN relay)

OK

| | |
|---|---|
| 10 | Relay operation inspection (C/OPEN relay) |

(1) After turning IG to ON, inspect the operation sound of the relay.

Criteria

| Inspection items | Inspection conditions | Criteria |
|---|---|---|
| C/OPEN relay | IG OFF →IG ON | It makes an operation sound. |

NG → Repair or replacement of wiring harness or connector (C/OPEN relay drive circuit)

OK

ES

| | |
|---|---|
| 11 | Check wiring harness and connector (C/OPEN relay - fuel pump control computer ASSY - chassis ground) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Remove the C/OPEN relay from the engine compartment relay block.
(2) Disconnect the connector for the fuel pump control computer ASSY.
(3) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-1 (+B) - 3 (C/OPEN relay holder) | Always | Less than 1 Ω |
| 2 (C/OPEN relay) - chassis ground | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G12-1 (+B) and 3 (C/OPEN relay holder) - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

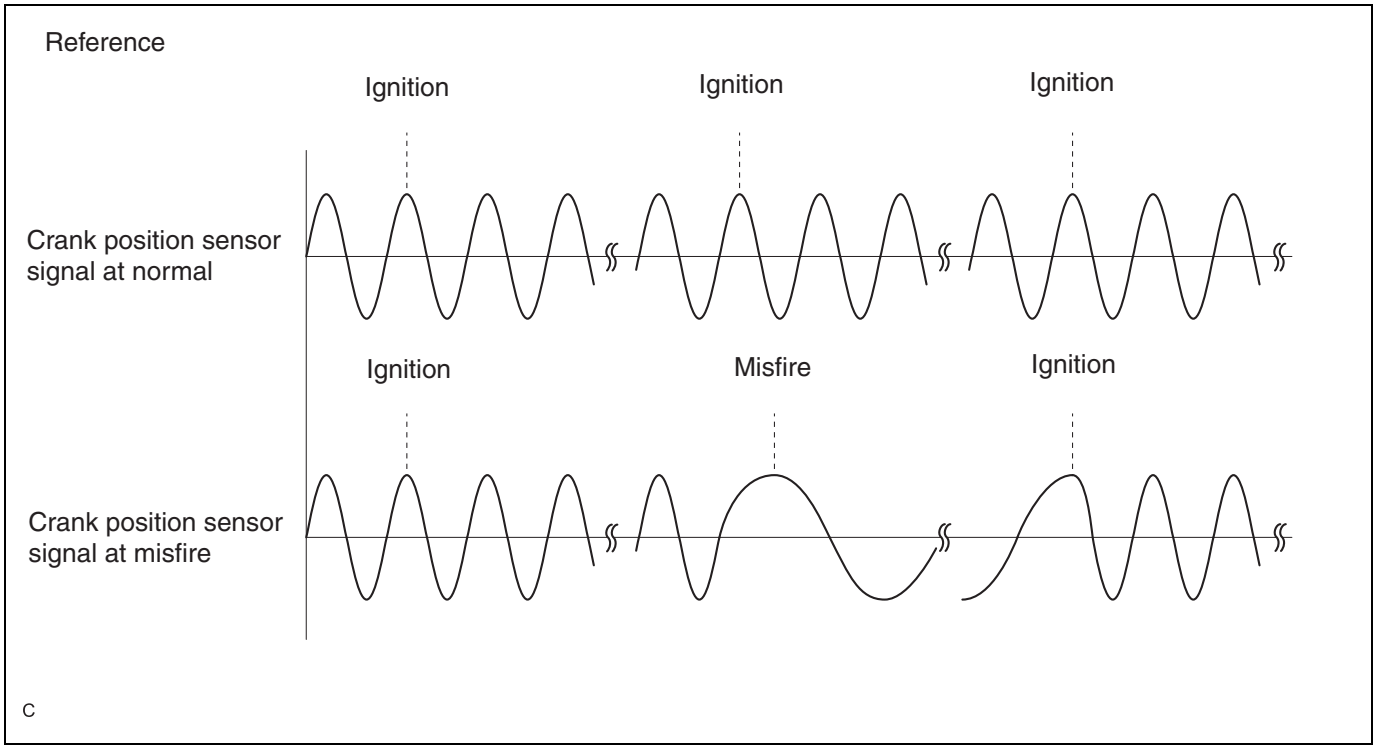
OK

Inspection of the ECM power supply system (Refer to ES - 646)

| | | |
|---|---|---|
| DTC | P0300 | Random/Multiple Cylinder Misfire Detected |
| DTC | P0301 | Cylinder 1 Misfire Detected |
| DTC | P0302 | Cylinder 2 Misfire Detected |
| DTC | P0303 | Cylinder 3 Misfire Detected |
| DTC | P0304 | Cylinder 4 Misfire Detected |

Circuit description
When a misfire occurs in the engine, hydrocarbon (HC) is released into the exhaust gas. If the HC concentration increases, the exhaust emission level deteriorates. At the same time, the increase in HC concentration causes an increase in catalyst tempera-

ture, and may degrade the purification performance of the catalyst. In order to prevent an increase in exhaust emissions and avoid the thermal deterioration of catalysts, the engine control computer monitors the misfire rate (number of misfires divided by number of ignitions). To monitor misfires, the engine control computer uses the camshaft position sensor and crankshaft position sensor. The crankshaft position sensor is used to measure the crankshaft revolution speed. When the variation of crankshaft revolution speeds exceeds the specified value, the engine control computer determines the vehicle is misfiring, and counts the misfire count (total number of misfires).
The camshaft position sensor is used to identify which cylinders are misfiring.



| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0300 | When multiple cylinders misfire simultaneously, and one of the following applies (2 trip detection logic):<br>• Occurrence of a misfire that may damage the three-way catalytic converter (MIL flashes)<br>• Occurrence of a misfire that causes the exhaust amount to deteriorate (MIL illuminates) | • Open / short circuit in the engine wiring harnesses<br>• Connectors connection<br>• Vacuum hose connection<br>• Ignition system<br>• Fuel injector ASSY (port injection)<br>• Fuel injector ASSY (cylinder injection)<br>• Fuel pressure<br>• Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor<br>• Compression pressure<br>• Valve timing<br>• PCV valve and hose<br>• PCV hose connection<br>• Intake system<br>• ECM |
| P0301 | When No. 1 cylinder misfires simultaneously, and one of the following applies (2 trip detection logic):<br>• Occurrence of a misfire that may damage the three-way catalytic converter (MIL flashes)<br>• Occurrence of a misfire that causes the exhaust amount to deteriorate (MIL illuminates) | |
| P0302 | When No. 2 cylinder misfires simultaneously, and one of the following applies (2 trip detection logic):<br>• Occurrence of a misfire that may damage the three-way catalytic converter (MIL flashes)<br>• Occurrence of a misfire that causes the exhaust amount to deteriorate (MIL illuminates) | |
| P0303 | When No. 3 cylinder misfires simultaneously, and one of the following applies (2 trip detection logic):<br>• Occurrence of a misfire that may damage the three-way catalytic converter (MIL flashes)<br>• Occurrence of a misfire that causes the exhaust amount to deteriorate (MIL illuminates) | |
| P0304 | When No. 4 cylinder misfires simultaneously, and one of the following applies (2 trip detection logic):<br>• Occurrence of a misfire that may damage the three-way catalytic converter (MIL flashes)<br>• Occurrence of a misfire that causes the exhaust amount to deteriorate (MIL illuminates) | |

MONITOR DESCRIPTION

FTP 1.5 times misfire

If excessive misfire that may cause the deterioration of the exhaust amount (38 misfires per 1000 crankshaft rotations) is detected, the ECM turns on the MIL and stores DTC.

(2-trip detection logic)

Misfire with catalyst damage

If misfire that may damage the three-way catalytic converter (1 misfire per 200 crankshaft rotations) is detected, the ECM flashes or illuminates the MIL as follows and stores DTC.

(2-trip detection logic)

- 1st driving cycle: Flashes the MIL immediately after the occurrence of misfire mentioned above and stores the temporary code. If the malfunction is resolved in the same driving cycle, however, the MIL goes off.
- 2nd driving cycle: Flashes the MIL immediately after the recurrence of misfire mentioned above and stores the DTC. If the malfunction is resolved in the same driving cycle, however, the MIL illuminates.

| (b2) Engine coolant temperature | 21°C (69.8°F) or more |

TYPICAL MALFUNCTION THRESHOLDS

Observation time for exhaust-related misfires

| | |
|---|---|
| Misfire rate per 1000 revolutions | 1.7% or more |

Observation time for misfires with catalyst deterioration (MIL flashes)

| | |
|---|---|
| Misfire rate per 200 revolutions | 5 % or more (varies depending on the engine speed and mass air flow) |

Monitoring result

Refer to [Monitor Status Check] (Refer to ES - 24)

CAUTION:

Even though multiple DTCs for identifying cylinders (P0301, P0302, P0303, P0304) are recorded, if the DTC for random cylinder misfires (P0300) is not recorded, it indicates that the misfires at each cylinder are detected and recorded at different times.

Circuit figure

- For the intake air flow meter SUB-ASSY system, refer to ES - 169.
- For the ignition coil ASSY system, refer to ES - 323.
- For the fuel injector ASSY (port injection side) system, refer to ES - 282.
- For the fuel injector ASSY (direct injection side) system, refer to ES - 392.

Description of functions

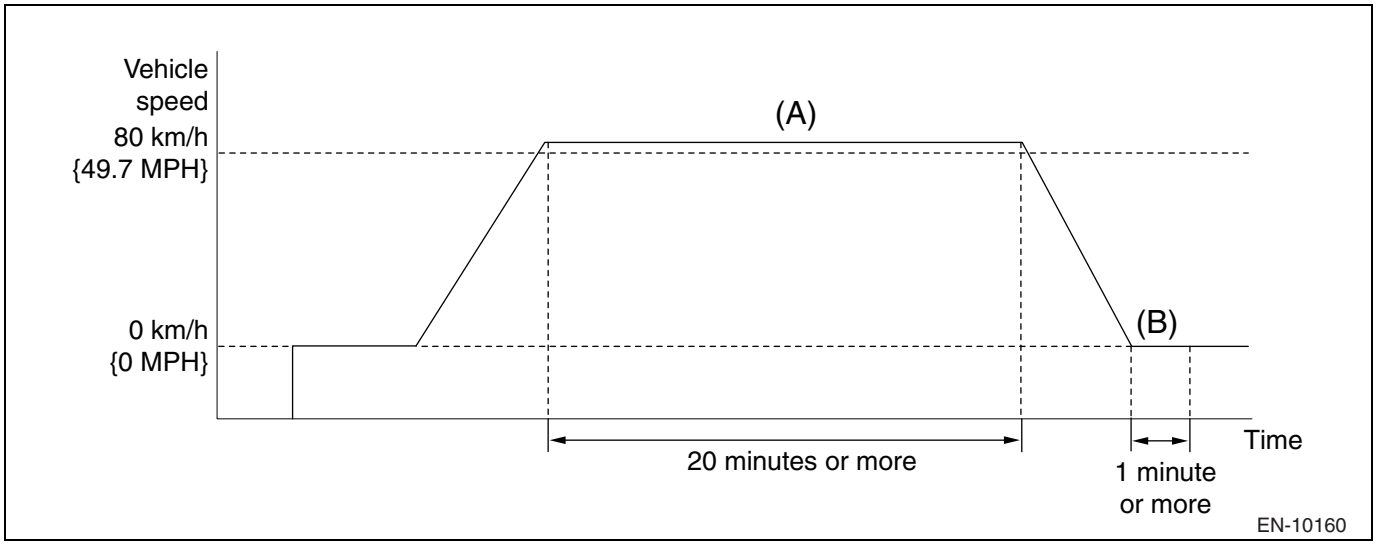
Test drive

Perform test drive to check if the DTC recurs.

NOTE:

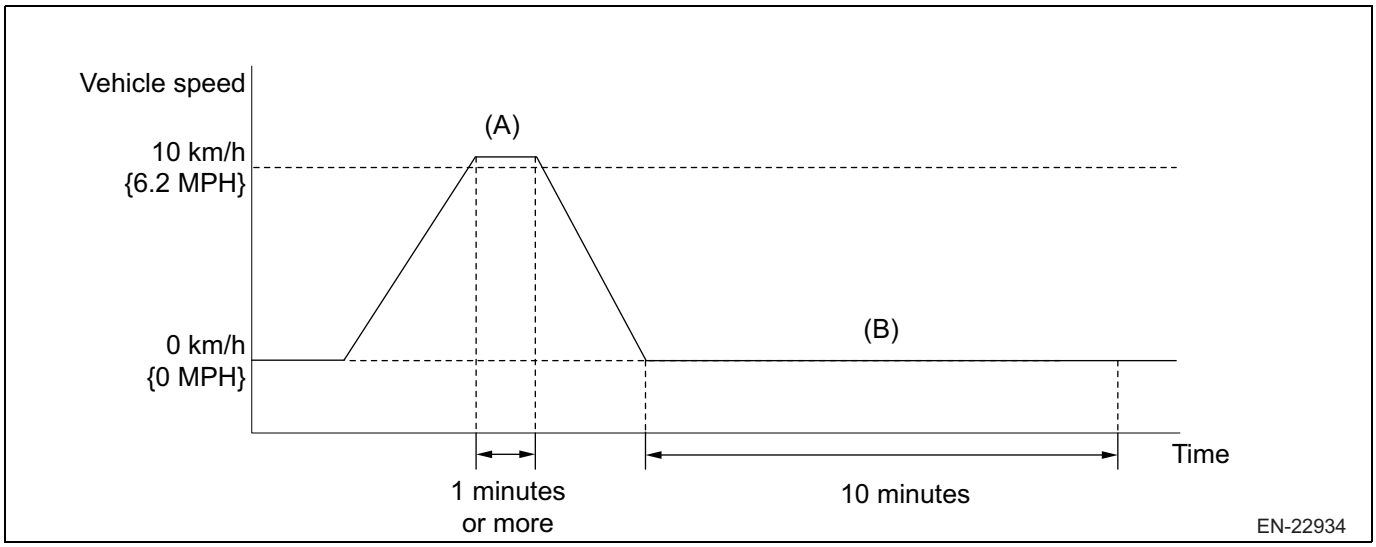
Both of test drive A and B can recur the diagnostic code.

Test drive A



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive B



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.

8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

Inspection steps

NOTE:

- If any DTCs other than misfire-related DTCs are also recorded, repair the latter ones first.
- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- If the phenomenon cannot be confirmed, reproduce the conditions in the freeze frame data.
- If either the [Short term fuel trim B1] or the [Long term fuel trim B1] of the freeze frame data are outside a ±20 % range, the air/fuel ratio may be rich (-20 % or less) or lean (+20 % or more).
- If the [Coolant Temp.] of the freeze frame data is less than 80°C {176°F}, misfires may be occurring only when the engine is warmed up.
- If the misfire cannot be reproduced, a lack of fuel, the use of an incorrect fuel, or dirt on the spark plug may be the cause.
- Once repaired, check the values from [Cylinder #1 Misfire Count] to [Cylinder #4 Misfire Count].
- If the wheel balance of the drive wheels is so off-balance that it causes body vibration, DTCs for misfires may be detected.
- Once repaired, perform test drive to check that DTCs are not output.
- By referring to following contents in the freeze frame data, you can estimate which cylinder was misfiring to what degree.
  – [Cylinder #1 Misfire Count] to [Cylinder #4 Misfire Count] for each cylinder

| 1 | Read DTC |

| DTC | P0327 | Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor) |
| DTC | P0328 | Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor) |
| DTC | P0332 | Knock Sensor 2 Circuit Low (Bank 2) |
| DTC | P0333 | Knock Sensor 2 Circuit High (Bank 2) |

Circuit description

The knock control sensor is installed on the cylinder block, and detects engine knocking. Inside the knock control sensor, there is a sensor that generates voltage when knocking vibrates and deforms the cylinder block. When knocking occurs, the engine control computer delays ignition timing, and suppresses knocking.

NOTE:

When either of these DTCs is stored, the engine control computer enters fail-safe mode. During fail-safe mode operation, the engine control computer delays ignition timing. The engine control computer continues operation in fail-safe mode until the vehicle is turned to IG OFF.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0327 | The knock sensor voltage is less than 0.154 V for 1 second or more (bank 1).<br>(1 trip detection logic) | • Open / short circuit in the knock sensor (bank 1)<br>• Knock sensor (bank 1)<br>• ECM |
| P0328 | The knock sensor voltage 4.838 V or more for 1 second or more (bank 1).<br>(1 trip detection logic) | |
| P0332 | The knock sensor voltage is less than 0.154 V for 1 second or more (bank 2).<br>(1 trip detection logic) | • Open circuit in the knock sensor (bank 2)<br>• Knock sensor (bank 2)<br>• ECM |
| P0333 | The knock sensor voltage 4.838 V or more for 1 second or more (bank 2).<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

If the output voltage sent from the knock sensor stays high or low for 1 second or more, the ECM interprets that as trouble in the sensor circuit, and records a DTC.

Monitor strategy

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

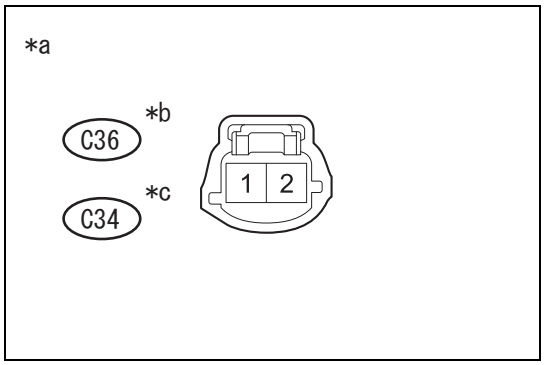
Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Check wiring harness and connector (voltage of terminals KNK1, KNK2) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector for the knock control sensor (bank 1 or bank 2).
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C36-2 - C36-1 | IG ON | 2.4 to 2.6 V |
| C34-2 - C34-1 | IG ON | 2.4 to 2.6 V |

| DTC | P0335 | Crankshaft Position Sensor "A" Circuit |
|---|---|---|

| DTC | P0336 | Crank angle sensor characteristic |
|---|---|---|

Circuit description

Crankshaft position sensor system consists of crankshaft angle sensor plate No. 1 and pickup coil. The crankshaft angle sensor plate, which has 30 teeth (protrusion) and 3 missing teeth (gap) for detecting the top dead center, is installed on the crankshaft. As the engine revolves once, the crankshaft position sensor outputs 30 signals. The engine control computer detects the crankshaft angle and engine speed through the crankshaft position sensor signal.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0335 | The crankshaft position sensor is not sent to the ECM after three or more seconds of cranking.<br>(1 trip detection logic) | • Open/short condition in crankshaft position sensor circuit<br>• Crankshaft position sensor<br>• Crankshaft angle sensor plate (Crankshaft SUB-ASSY)<br>• ECM |

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Troubleshoot DTC P0335 and P0336 first. If any fault is not found, mechanical systems may be faulty.

| | |
|---|---|
| 1 | Reading of SSM4 data ([Engine Speed]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.

(4) Start the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Engine Speed]
(6) Read the value of [Engine Speed] while the engine is running.
Criteria: Values corresponding to the engine speed are output continuously.

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

NOTE:
- Check the engine speed on the line graph display.
- If the engine cannot be started, check the speed during cranking.
- If the engine speed is zero, open or short circuit in the crankshaft position sensor may occur.

B → Inspection for problems that do not normally occur (Refer to ES - 28)

| DTC | P0341 | Camshaft Position Sensor "A" Circuit Range/Performance (Bank 1) |
| DTC | P0345 | Camshaft Position Sensor "A" Circuit (Bank 2) |
| DTC | P0346 | Camshaft Position Sensor "A" Circuit Range/Performance (Bank 2) |

Circuit description

VVT system (intake side) consists of timing rotor integrated into the intake cam sprocket and the magnetic resistance element (MRE) type camshaft position sensor. When the timing rotor (camshaft timing gear) consisting of three protruded sections turns, the magnetic vector (direction of the magnetic field) applied to the MRE (magnetic resistance element) inside the camshaft position sensor changes. This causes a change in the internal resistance of the MRE. This change in resistance is converted to voltage and rectified to square waveform where Hi is approx. 4.8 V and Lo is approx. 0.8 V. The actual camshaft position is detected through this and output to the engine control computer.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0340 | When any of the following conditions is met (1 trip detection logic):<br>• There is no output from the intake side camshaft position sensor when the crankshaft rotates by 1.5 turns. (bank 1)<br>• The intake side camshaft position sensor is not sent to the ECM after three or more seconds of cranking. (bank 1) | • Intake side camshaft position sensor (bank 1) circuit open/shorted<br>• Intake side camshaft position sensor (bank 1)<br>• Intake cam sprocket (bank 1)<br>• Intake camshaft timing chain teeth skipping (bank 1)<br>• ECM |
| P0341 | The intake side camshaft position sensor signal for two crankshaft revolutions has a count that is not 3. (bank 1)<br>(1 trip detection logic) | |
| P0345 | When any of the following conditions is met (1 trip detection logic):<br>• There is no output from the intake side camshaft position sensor when the crankshaft rotates by 1.5 turns. (bank 2)<br>• The intake side camshaft position sensor is not sent to the ECM after three or more seconds of cranking. (bank 2) | • Intake side camshaft position sensor (bank 2) circuit open/shorted<br>• Intake side camshaft position sensor (bank 2)<br>• Intake cam sprocket (bank 2)<br>• Intake camshaft timing chain teeth skipping (bank 2)<br>• ECM |
| P0346 | The count of camshaft position sensor signal per 1 crankshaft rotation is not 3. (bank 2)<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

If no signal is sent from the camshaft position sensor while the engine is running, or the rotation of the camshaft and crankshaft is not in sync, the ECM interprets this as being a sensor malfunction.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.

10. Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

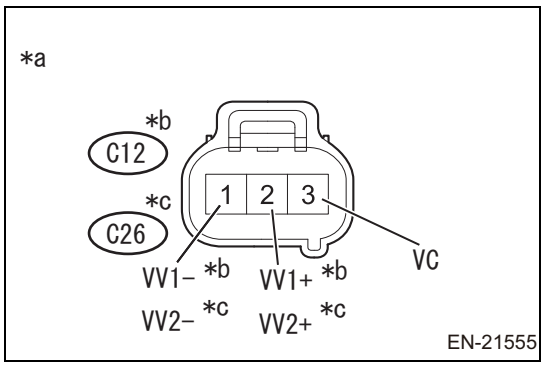
Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- Troubleshoot DTCs P0340, P0341, P0345, and P0346 first. If no fault is found, mechanical systems may be faulty.
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Check wiring harness and connector (camshaft position sensor power supply voltage) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector of the camshaft position sensor (intake side bank 1 or bank 2).
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C12-1 (VV1-) - chassis ground | IG ON | 11 to 14 V |
| C26-1 (VV2-) - chassis ground | IG ON | 11 to 14 V |

NG → Go to Step 9.

OK

| 2 | Check wiring harness and connector (engine control computer - camshaft position sensor (intake side)) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the camshaft position sensor (intake side bank 1 or bank 2).
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-26 (VV1+) - C12-2 (VV1+) | Always | Less than 1 Ω |
| A34-15 (VV2+) - C26-2 (VV2+) | Always | Less than 1 Ω |
| A34-34 (VCV) - C12-3 (VC) | Always | Less than 1 Ω |
| A34-34(VCV) - C26-3(VC) | Always | Less than 1 Ω |

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-26 (VV1+) and C12-2 (VV1+) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-15 (VV2+) and C26-2 (VV2+) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-34 (VCV) and C12-3 (VC) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-34 (VCV) and C26-3 (VC) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

ES

OK

| 3 | Sensor installation area check (camshaft position sensor (intake side)) |
|---|---|

(1) Check the tightening condition of the camshaft position sensor (intake side bank 1 or bank 2) bolts and the installation condition of the sensor.
Criteria: Properly installed.

NG → Repair or replace sensor installation area (camshaft position sensor (intake side))

OK

| 4 | Unit inspection of intake cam sprocket RH |
|---|---|

(1) Check the sensor plate installation area and the condition of the protrusion and gap sections of the intake cam sprocket (bank 1 or bank 2).
Criteria: The protrusion and gap sections of the sensor plate are normal and the plate is properly installed.

NG → Replacement of intake cam sprocket RH (Refer to EM - 16)

OK

| 5 | Valve timing inspection (check for slack and skipping teeth of timing chain) |
|---|---|

(1) Check valve timing. (Refer to EM - 13)

NG → Valve timing adjustment (Refer to EM - 13)

OK

| 6 | Replacement of camshaft position sensor (intake side) |
|---|---|

(1) Replace camshaft position sensor (intake side) on the bank side where trouble was detected through the DTC. (Refer to ES - 682)

| DTC | Installed location |
|---|---|
| P0340, P0341 | Bank 1 |
| P0345, P0346 | Bank 2 |

Next

| 7 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 8 | Perform test drive for operation check |
|---|---|

(1) Perform test drive. (Refer to "Test drive" under "Description of functions")
(2) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| No DTC is output | A |
| Either P0340, P0341, P0345, or P0346 is output. | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

Complete

| 9 | Relay unit inspection (EFI MAIN1 relay) |
|---|---|

(1) Perform unit inspection of EFI MAIN1 relay. (Refer to ES - 717)

NG → Relay replacement (EFI MAIN1 relay)

OK

| 10 | Check wiring harness and connector (EFI MAIN1 relay - camshaft position sensor) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector of the camshaft position sensor (intake side bank 1 or bank 2).
(2) Remove the EFI MAIN1 relay from the engine compartment relay block.
(3) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) - C12-1 | Always | Less than 1 Ω |
| 3 (EFI MAIN1 relay holder) - C26-1 | Always | Less than 1 Ω |

Resistance (short circuit check)

ES

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) and C12-1 - other terminals and chassis ground | Always | 10 k Ωor more |
| 3 (EFI MAIN1 relay holder) and C26-1 - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Inspection of the ECM power supply system (Refer to ES - 646)

| DTC | P0351 | Ignition Coil "A" Primary/Secondary Circuit |

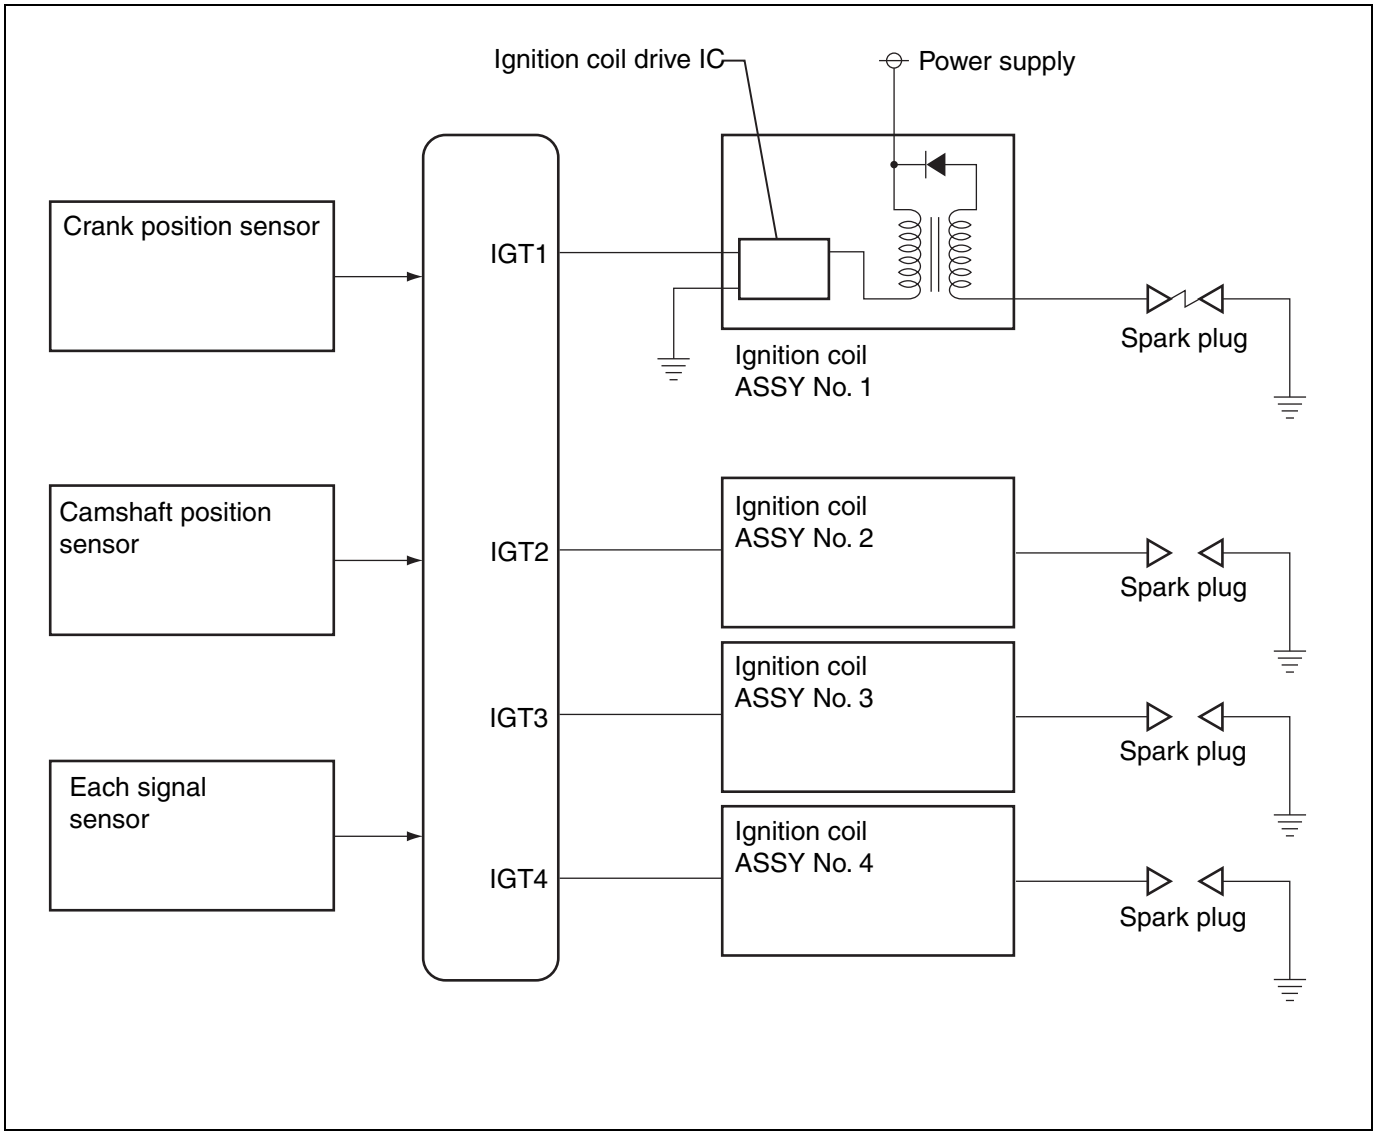
| DTC | P0352 | Ignition Coil "B" Primary/Secondary Circuit |
|---|---|---|

| DTC | P0353 | Ignition Coil "C" Primary/Secondary Circuit |
|---|---|---|

| DTC | P0354 | Ignition Coil "D" Primary/Secondary Circuit |
|---|---|---|

Circuit description

Direct ignition system (S-TDI) is used in this vehicle. In addition to ever precise ignition, S-TDI controls a loss under high voltage condition to improve overall reliability of the ignition system. The S-TDI uses one ignition coil per cylinder for ignition. The engine control computer determines ignition timing and outputs ignition signal (IGT) to individual cylinders. In response to the IGT signal, the ignition drive IC inside the igniter cuts an electric current to the primary coils in the ignition coil. This generates the counter-electromotive force in the secondary coils and ignites the spark plugs.



| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0351 | The ECM driver IC detects the open or short circuit between No.1 ignition coil and ECM (open circuit detection/GND short/+B short).<br>(1 trip detection logic) | • Ignition system<br>• Open/short condition in the IGN circuit (1 to 4) between the ignition coil and ECM.<br>• Ignition coil (Cylinders No.1 to 4)<br>• ECM |
| P0352 | The ECM driver IC detects the open or short circuit between No.2 ignition coil and ECM (open circuit detection/GND short/+B short).<br>(1 trip detection logic) | |
| P0353 | The ECM driver IC detects the open or short circuit between No.3 ignition coil and ECM (open circuit detection/GND short/+B short).<br>(1 trip detection logic) | |
| P0354 | The ECM driver IC detects the open or short circuit between No.4 ignition coil and ECM (open circuit detection/GND short/+B short).<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

When the ECM detects the faulty signal with the driver IC of the ECM, the ECM determines that the short or open circuit is present in the circuit between the ignition coil and the ECM.

5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.

10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

- If DTC P0351 is displayed, check the ignition coil ASSY No. 1 circuit.
- If DTC P0352 is displayed, check the ignition coil ASSY No. 2 circuit.
- If DTC P0353 is displayed, check the ignition coil ASSY No. 3 circuit.
- If DTC P0354 is displayed, check the ignition coil ASSY No. 4 circuit.
- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 2 | Perform test drive for operation check |
|---|---|

(1) Change the position of the ignition coil ASSY and test drive the vehicle. (Refer to "Test drive" under "Description of functions")
CAUTION:
Do not change the position of the ignition coil connectors.
(2) With IG ON, follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |

|---|---|---|

Circuit description

Exhaust VVT system consists of timing rotor integrated into each exhaust camshaft and the magnetic resistance element (MRE) type camshaft position sensor. When the timing rotor (camshaft) consisting of two protruded sections turns, the magnetic vector (direction of the magnetic field) applied to the MRE (magnetic resistance element) inside the camshaft position sensor changes. This causes a change in the internal resistance of the MRE (magnetic resistance element). This change in resistance is converted to voltage and rectified to square waveform where Hi is approx. 4.8 V and Lo is approx. 0.8 V. The actual camshaft position is detected through this and output to the engine control computer.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|

| 3 (EFI MAIN1 relay holder) and C25-1 - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

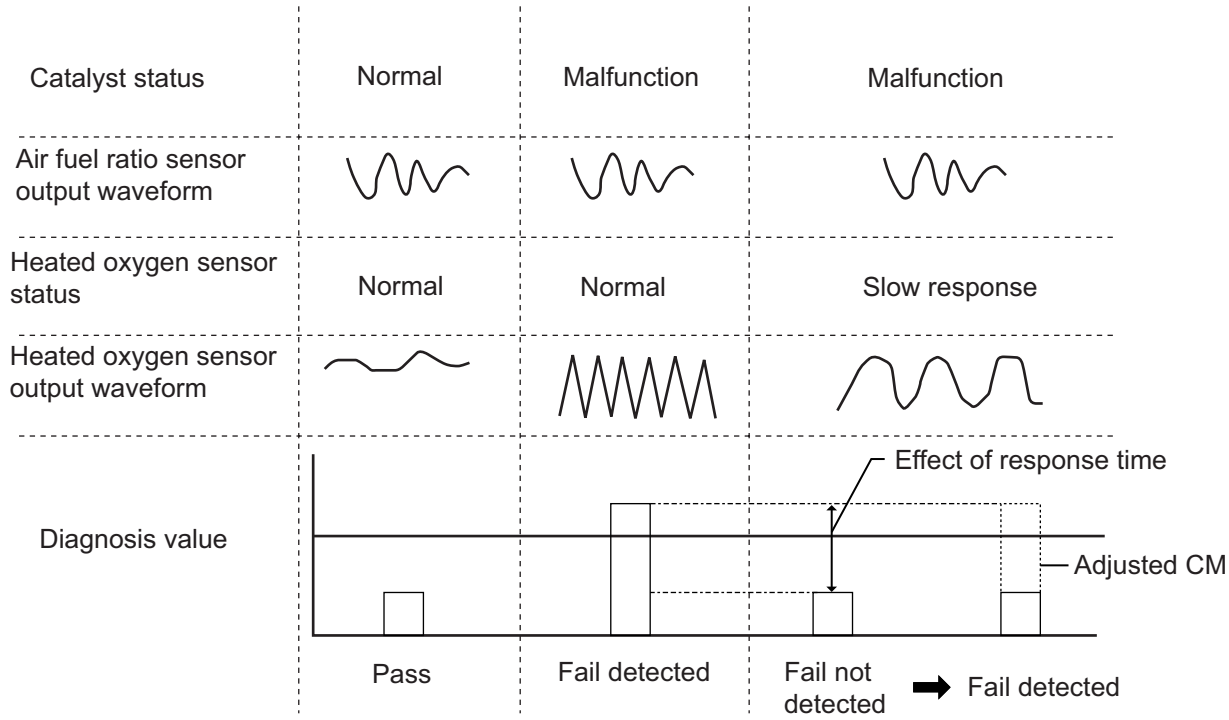
Inspection of the ECM power supply system (Refer to ES - 646)

| DTC | P0420 | Catalyst System Efficiency Below Threshold (Bank 1) |
|---|---|---|

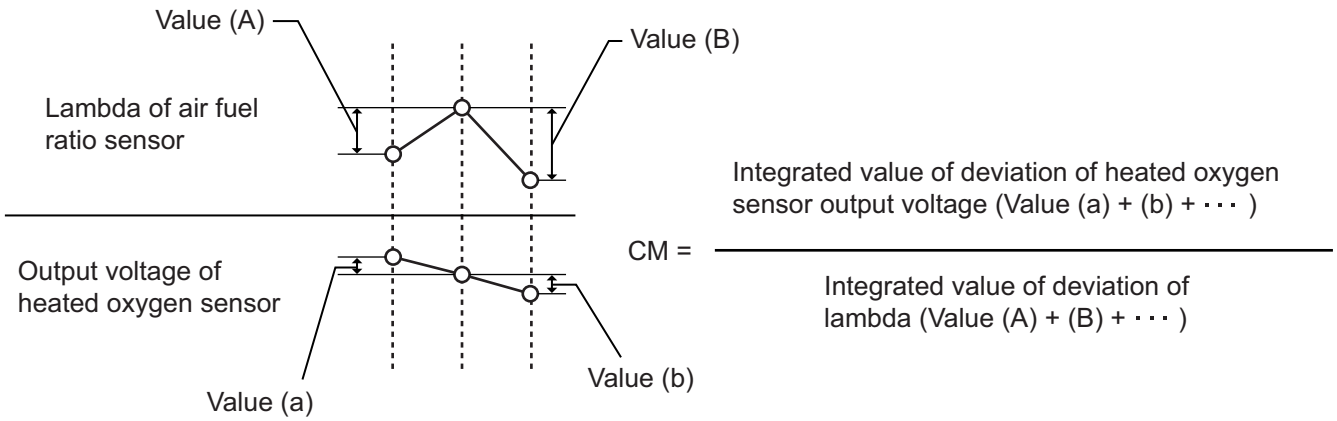
Circuit description
The engine control computer uses two sensors installed on the front and rear of the three-way catalytic converter to monitor the clean-up condition of the catalyst. At the same time, the air/fuel ratio sensor transmits an air/fuel ratio signal at the front of the catalyst to the engine control computer. At the same time, the oxygen sensor transmits an oxygen level signal after catalyst to the engine control computer. The engine control computer uses output voltage of the air/fuel ratio sensor and the oxygen sensor to calculate oxygen storage capacity (hereafter called OSC) and detects deteriorated condition of the catalyst.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0420 | Diagnostic value exceeds the standard value.<br>(2 trips detection logic) | • Gas leakage from exhaust system<br>• Air / fuel ratio sensor<br>• Oxygen sensor<br>• Front exhaust manifold ASSY (TWC front catalyst) and front exhaust pipe ASSY (TWC: Rear catalyst) |

MONITOR DESCRIPTION
The ECM uses the diagnosis value to determine catalyst deterioration. If the diagnostic value exceeds the standard value, the ECM determines that there is catalyst degradation, illuminates the MIL, and stores the DTC.



The diagnosis value is calculated based on the catalyst monitor value (CM) which is determined from the amount of change in the air/fuel ratio sensor lambda value and oxygen sensor value, as well as the reaction rate determined during oxygen sensor reaction time.



*: Diagnosis value = CM ×(1 + Reaction rate)

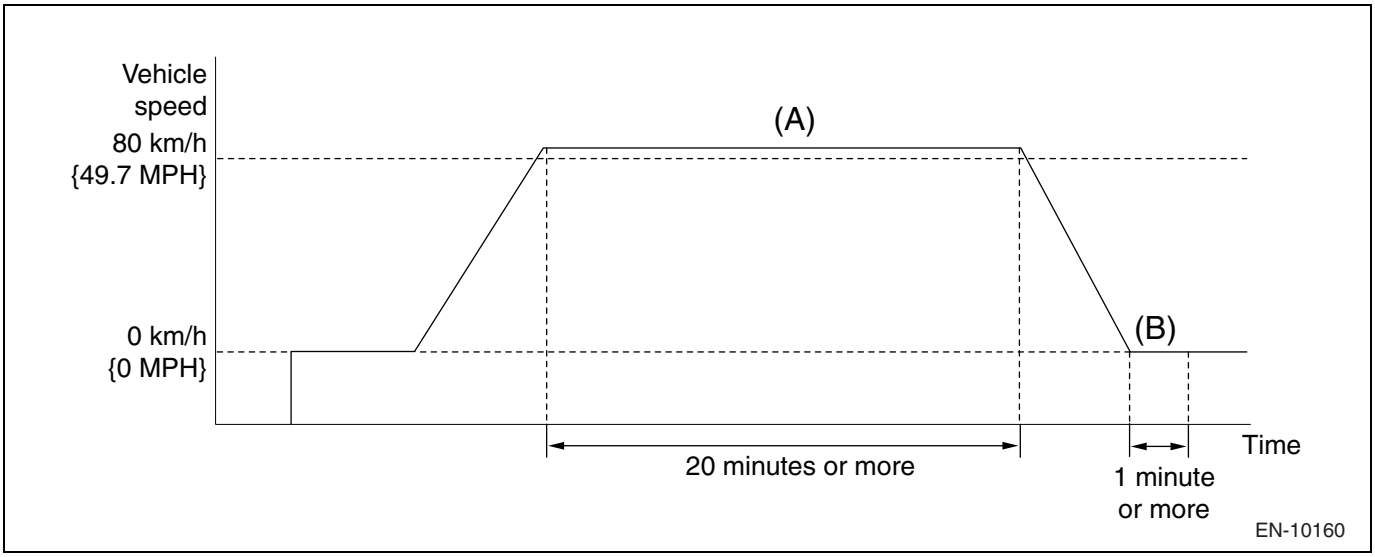
Description of functions

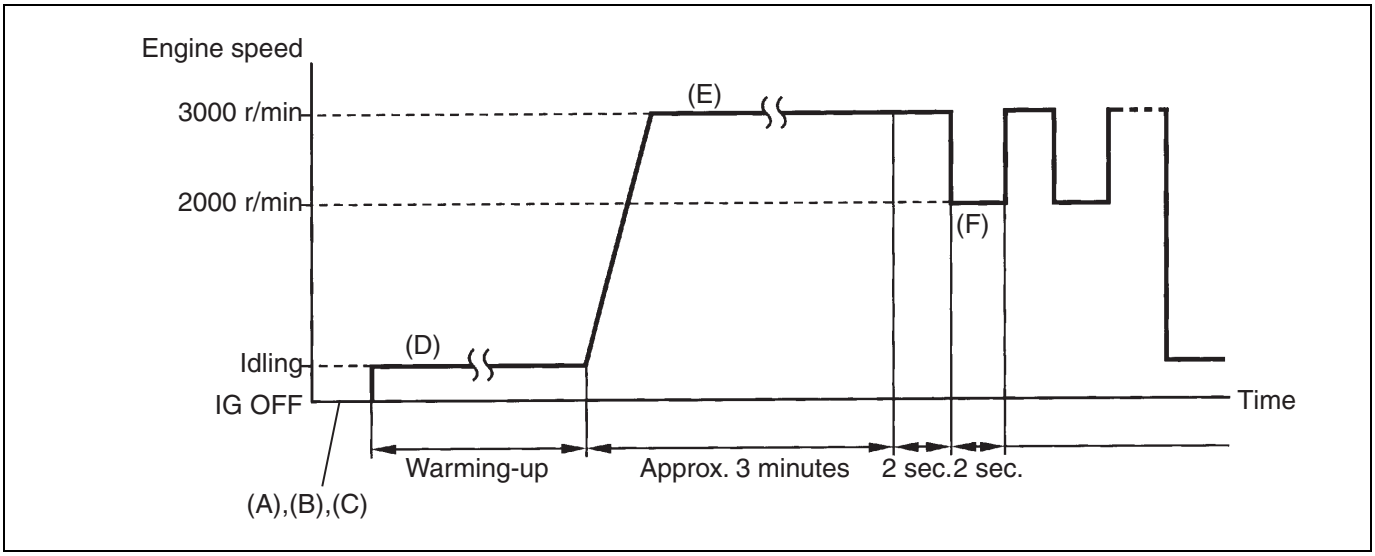
Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Checking output condition of the catalyst deterioration detection sensor



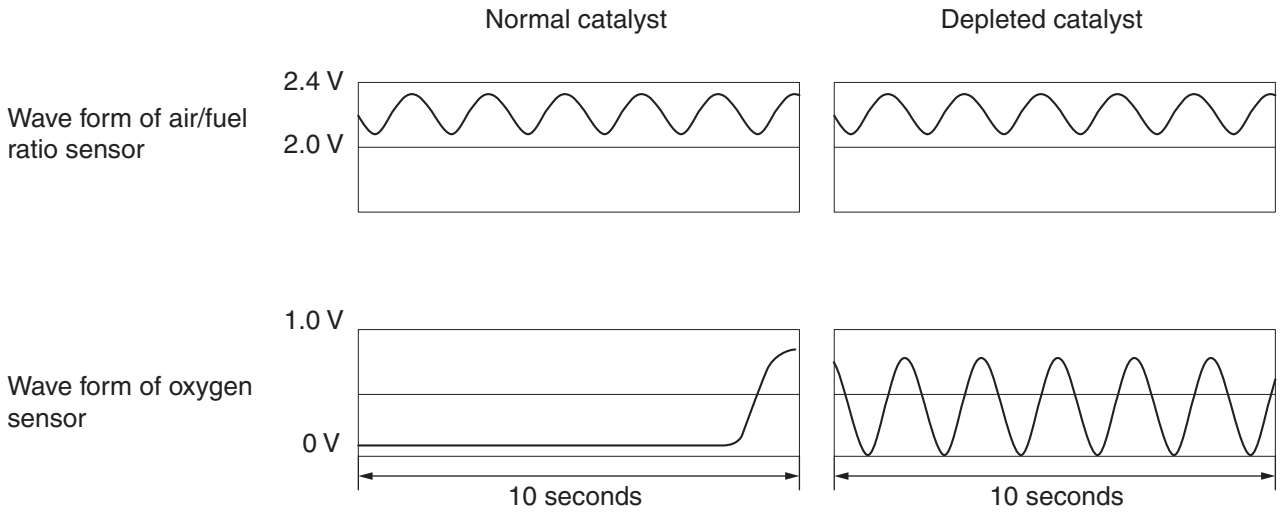
1. Connect the SSM4 to the DLC3. (A)
2. Turn the ignition switch to ON. (B)
3. Turn on the SSM4. (C)
4. Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more) (D)
5. Keep the engine speed between 2500 and 3000 r/min for approximately 3 minutes. (E)

6. After that, keep the engine speed at 3000 r/min for 2 seconds, and then at 2000 r/min for 2 seconds. (F)
7. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [A/F Sensor #11] / [Oxygen sensor #12]
8. Check the data display.

NOTE:

- If output voltage of the air/fuel ratio sensor or the oxygen sensor do not change or noise is emitted, malfunction may exist in the sensors.
- If output voltage of both sensors remain in lean or rich state, air/fuel ratio may be extremely lean or rich.
- When catalyst becomes deteriorated, output voltage of oxygen sensors changes significantly even under normal driving condition.

Output wave form of air/fuel ratio sensor and oxygen sensor



C

Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- [B1S1] indicates [Bank 1 Sensor 1]. Sensor 1 is the sensor that is installed on the upstream (closest to the engine) of the catalyst.
- [B1S2] indicates [Bank 1 Sensor 2]. Sensor 2 is the sensor that is installed on the downstream (far side of the engine) of the catalyst.
- When malfunction cannot be located after troubleshooting DTC P0420, abnormally lean or rich condition may be the cause of malfunction. Perform inspection following the inspection procedures for P0171 (lean abnormal) and P0172 (rich abnormal).

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| Only P0420 is output. | A |

| Result | Go to |
|---|---|
| Diagnostic codes other than P0420 are also output. | B |

NOTE:
If any DTCs other than P0420 are output, troubleshoot them first.

B → To corresponding DTC chart (refer to ES - 12)

ES

| 2 | Performing of SSM4 [Active Test] ([Cylinder Fuel Rate]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 80°C {176°F} or more).
(5) Run the engine at 2500 r/min for approximately three minutes to warm up each sensor.
(6) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(7) Increase and decrease fuel injection volume, and read values of [A/F Sensor #11] and [Oxygen sensor #12].
CAUTION:
- The output voltage for the air/fuel ratio sensor is delayed a few seconds, while the output voltage for the oxygen sensor is delayed for a maximum of approximately 20 seconds.
- Because the sensors become cold, measure the voltage promptly after warming up the sensors.

NOTE:
- Change fuel injection volume from -12 % to +12 %.
- If the air/fuel ratio sensor output shows little response, the air/fuel ratio sensor may be at fault.

Voltage

| Item | Fuel injection volume | Output voltage of air/fuel ratio sensor and oxygen sensor |
|---|---|---|
| [A/F Sensor #11] | +12 % increase | Less than 2.0 V (rich state) |
| | -12 % decrease | 2.4 V or more (lean state) |
| [Oxygen sensor #12] | +12 % increase | 0.55 V or more (rich state) |
| | -12 % decrease | Less than 0.4 V (lean state) |

Result

| [AFS Voltage B1S1] result | [Oxygen Sensor Output Voltage (B1-S2)] result | State of air/fuel ratio, air/fuel ratio sensor, and oxygen sensor | Misfiring | Inspection parts | Go to |

Remove the cause of extremely abnormal lean or rich state (Refer to ES - 236)

| DTC | P0441 | Purge flow |
|---|---|---|

Circuit description
For a circuit description, refer to ES - 599.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0441 | If any of the following conditions continuously apply when the engine is running:<br>• The purge/non-purge pressure difference is less than 0.075 kPa {0.563 mmHg, 0.0222 inHg, 0.0109 psi}.<br>• When purging is carried out when the vent valve is forced ON (Closed), the purge/non-purge pressure difference is less than 0.075 kPa {0.563 mmHg, 0.0222 inHg, 0.0109 psi}. | • Purge VSV<br>• Purge line<br>• Connector/Wiring harness (Purge VSV - ECM)<br>• ECM<br>• Leakage from the EVAP system |

MONITOR DESCRIPTION
This monitor Intrusively performs a functional check to detect incorrect purge flow. the monitor seals the EVAP system (i.e. isolated from the atmosphere) by closing the ELCM switching valve intrusively after recovering from a fuel cut event. In the case of normal conditions and the commanded purge control duty ratio is more than 0%, the ELCM pressure (gauge) will decrease due to engine vacuum and reach to the threshold value.
However, in the case of malfunction conditions (e.g. fuel cap open and purge valve stuck closed, or purge line disconnected or blocked), the monitor determines a malfunction and stores a fault code if the ELCM pressure (gauge) does not reach the threshold within a predetermined time.

MONITOR DESCRIPTION

When 5 hours*1 passes after the ignition switch is turned to OFF, the leak detection pump generates a negative pressure (vacuum) inside the EVAP (evaporative gas) system. The ECM monitors any possible leaks and the actuator functions based on the EVAP pressure.

NOTE:

*: If valid conditions are not satisfied even when 5 hours passes after the ignition switch is turned to OFF, monitor inspection commences after 2 hours.

If valid conditions are not satisfied even when 7 hours passes after the ignition switch is turned to OFF, monitor inspection commences after 2.5 hours.

| Order | Operation | Duration |
|---|---|---|
| A | Leak detection pump monitoring | 7 seconds |
| B | First standard pressure measurement | 350 seconds |
| C | Vent valve monitoring | 12 seconds |
| D | Pipe blockage monitoring | 900 seconds |
| E | Second standard pressure measurement | 50 seconds |
| | Pipe leak monitoring | |

*: When the amount of fuel in the fuel tank becomes low, it can take more time for the EVAP pressure to stabilize.

(a) P0455: EVAP (evaporative gas) gross leak

In operation C, The leak detection pump generates negative EVAP system pressure (vacuum) and measures the EVAP system pressure. When the stabilized system pressure reaches or exceeds the [Second standard pressure ×0.377 - (-45.5)] (approaching atmospheric pressure), the ECM determines that the EVAP system is experiencing a gross leak. It illuminates the MIL and records DTCs. (2 trip detection logic)

(b) P0456: EVAP small leak

In operation C, The leak detection pump generates negative EVAP system pressure (vacuum) and measures the EVAP system pressure. When the stabilized system pressure drops below [Second standard pressure ×0.377 - (-45.5)], the ECM determines that the EVAP system is experiencing a small leak. It illuminates the MIL and records DTCs. (2 trip detection logic)

| Atmospheric pressure | 75.06 kPa (abs) {563.09 mmHg (abs), 22.169 inHg (abs), 10.884 psi (abs)} or more |
| Intake air temperature | 4.4°C {39.9°F} or more |
| Engine oil temperature | 4.4°C {39.9°F} or more |

| | |
|---|---|
| Purge air flow cumulative value for previous driving cycle | 96 g or more (May change depending on engine coolant temperature) |

TYPICAL MALFUNCTION THRESHOLDS

P0455

| | |
|---|---|
| Phase E: Tank pressure | -1785 Pa {-13.39 mmHg, -0.53 inHg, -0.26 psi} or more (varies depending on the reference pressure) |

P0456

| | |
|---|---|
| Phase E: Tank pressure | More than second standard pressure ×0.377 Pa - (-45.5 Pa) and less than -1785 Pa {-13.39 mmHg, -0.53 inHg, -0.26 psi} (varies depending on the reference pressure) |

P1451

| | |
|---|---|
| Phase D: Time required for the standard pressure during function inspection to reach -0.941 kPa or 4.9726 kPa {-7 mmHg or 37 mmHg, -0.3 inHg or 1.5 inHg, -0.1 psi or 0.7 psi} | 27 seconds or less |

P2404

| | |
|---|---|
| When one of the following conditions is met. | Phase A, B, C, or E |
| Phase A: Final pressure in operation A | More than -0.224 kPa {-2 mmHg, -0.07 inHg, -0.03 psi} |
| Phase B: Maximum pressure - minimum pressure in operation B<br>or<br>Standard pressure during the function inspection in operation B<br>or<br>Final pressure in operation B | More than 0.314 kPa {2 mmHg, 0.09 inHg, 0.05 psi}<br><br>Less than -3.9717 kPa {-30 mmHg, -1.2 inHg, -0.58 psi}<br><br>More than 0.9419 kPa {7 mmHg, 0.28 inHg, 0.14 psi} (varies depending on the air pressure) |
| Phase C: Final pressure - standard pressure during the function inspection in operation C | Less than 0.224 kPa {2 mmHg, 0.07 inHg, 0.03 psi} |
| Phase E: Maximum pressure - minimum pressure in operation E<br>or<br>Final pressure in operation E<br><br>or<br>Final pressure - standard pressure during the function inspection in operation B | More than 0.314 kPa {2 mmHg, 0.09 inHg, 0.05 psi}<br><br>Less than -4.536 kPa {-34 mmHg, -1.34 inHg, -0.66 psi} or more than -0.824 kPa {-6 mmHg, -0.24 inHg, -0.12 psi} (varies depending on the air pressure)<br><br>More than 0.941 kPa {7 mmHg, 0.28 inHg, 0.14 psi} |

Monitoring result

Refer to [Monitor Status Check] (Refer to ES - 24)

Circuit figure

For circuit figure, refer to ES - 586.

Description of functions

Test drive

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.

8. Select the following menu items using the SSM4. : [OBD System] / [Each System] / [ECM Engine Control] / [On-Board System Test] / [Evaporative System Leak Test]
9. Click the [OK] button to start the evaporative system leak test.
   CAUTION:
   - When performing the evaporative system leak test continuously, pay attention to the battery condition. If the evaporative system leak test is repeatedly performed without starting the engine, the battery voltage will drop and may cause run-out of the battery.
   - Do not leave the vehicle for a prolonged period with the evaporative system leak test performed. This may cause an early deterioration of the battery or cause a battery discharge.

   NOTE:
   - When performing the evaporative system leak test continuously, drive the vehicle under the following conditions, and release the accumulated evaporative emission. If the evaporative system leak test is continuously performed with the engine stopped, a large amount of evaporative emission is accumulated into the canister, which may prevent correct diagnosis.
     – After warming-up
     – Drive at 48 km/h {30 MPH} or more for 10 minutes or more. (It may be the accumulated driving time.)
   - Observe the following items for operation to obtain correct diagnostic result.
     – Do not refuel the vehicle before performing the evaporative system leak test. Because a large amount of evaporative emission is generated in the fuel tank immediately after refueling the vehicle, the accuracy of the diagnosis may be reduced.
     – Do not shake the vehicle while the evaporative system leak test is being performed. Rocking the vehicle will increase the evaporative emission in the fuel tank, which may reduce the accuracy of the diagnosis.
     – During evaporative system leak test, do not perform any service operation including removal/installation of the parts and connectors. Otherwise, the service operation may affect the related parts, and the accuracy of the diagnosis can be reduced.
10. The display with the message "Conditions have been enabled to control this function. Turn the ignition switch off to terminate the test." will appear. In this display, wait for 30 minutes without clicking the [OK] button.
    NOTE:
    - If you click the [OK] button, it will return to the [Evaporative System Leak Test] display. However, the evaporative system leak test is still being performed.
    - The display of the SSM4 will not change both when the evaporative system leak test is successfully completed and when the test is canceled by turning IG to OFF.
    - If the [Test conditions are not correct] screen is displayed, use the SSM4 to confirm that the [Coolant Temp.] and [Intake Air Temp.] values satisfy the conditions. When the values are within the specification, perform the evaporative system leak test.
11. When 30 minutes has passed after finishing step 9, click the [OK] button.
12. Return to the [OBD Menu] display and select [On-board monitor test result].
13. Check TID $C1 to $CA of MID $3C in [On-board monitor test result].

Result of on-board monitor test

| Display | Details | Remarks |
|---|---|---|
| $0000 is stored in every Val. | The test condition fails to be met during evaporative system leak test, and the test has been cancelled. | Re-run the test after ensuring that the test conditions are met. |
| Any value is stored in every Val. and every Result shows OK. | The evaporative system leak test is completed successfully. | Use the SSM4 to read the temporary code with IG ON. |
| Any one of the results is NG | The evaporative system leak test is completed successfully but there is an error in the results. | Use the SSM4 to read the temporary code with IG ON. |

14. When the evaporative system leak test is completed successfully, read the temporary code with IG ON. When any DTC is recorded, troubleshoot the appropriate DTC.
    NOTE:
    Turning IG to OFF will clear the temporary codes.

Inspection steps

P0455, P0456

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Perform test drive. (Refer to "Test drive" under "Description of functions")
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

| 2 | Inspect the EVAP hose (Canister - Canister pump module) |

(1) Check for any clogging in the drain tube between the canister and the canister pump module.
Criteria: No clogging in the drain tube between the canister and the canister pump module

NG → Go to Step 5.

OK

| | |
|---|---|
| 3 | Inspect the EVAP hose (Canister - Fuel tank) |

(1) Check for any clogging in the fuel tank vent tube between the canister and the fuel tank.
Criteria: No clogging in the fuel tank vent tube between the canister and the fuel tank

OK → Go to Step 4.

NG → Go to Step 5.

| | |
|---|---|
| 4 | Canister replacement |

(1) Replace the canister. (Refer to EC - 7)

CAUTION:

- When replacing the canister, inspect the inside of the canister pump module, as well as any other related pipes for water/fuel/other liquids. If there is any liquid leakage, inspect the connection condition and check for cracking in: 1) The pipe from the canister pump module to the air inlet port, 2) The canister filter, and 3) The fuel tank vent hose.
- Inspect for clogging of the canister internal filter.
  If the canister filter is clogged, replace the canister pump module.

| DTC | P0458 | Evaporative Emission System Purge Control Valve Circuit Low |

| | | |
|---|---|---|
| DTC | P0459 | Evaporative Emission System Purge Control Valve Circuit High |

Circuit description
In order to suppress exhaust gas emissions, fuel evaporative gas from the fuel tank ASSY is sent through the charcoal canister ASSY to the intake air surge tank ASSY and combusted in the cylinder. As the engine control computer controls the opening and closing of the vacuum switching valve ASSY, this allows the flow rate of the canister purge to be varied according to driving conditions.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0458 | The purge VSV circuit voltage is at or below the threshold value for 2.5 seconds or more.<br>(2 trips detection logic) | • The purge VSV circuit is open/shorted<br>• Purge VSV<br>• ECM |
| P0459 | The purge VSV circuit current is at or above the threshold value for 2.5 seconds or more.<br>(2 trips detection logic) | • The purge VSV circuit is open/shorted<br>• Purge VSV<br>• ECM |

MONITOR DESCRIPTION
The ECM monitors the terminal voltage while the purge VSV is operating. Purge VSV duty control is possible by turning the ECM internal FET on and off. If the ECM drive signal and purge VSV terminal voltage do not match, the ECM detects a malfunction, illuminates the MIL, and records DTCs.

Description of functions

Test drive (P0458)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.

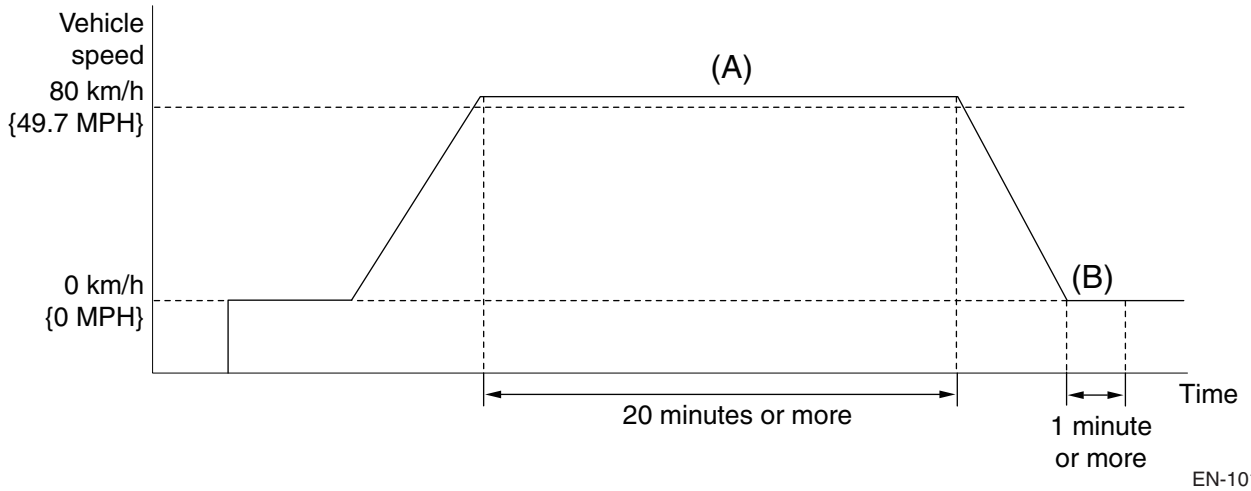
   NOTE:

   If the engine cannot be started, crank the engine for 10 seconds or more.

9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P0459)

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

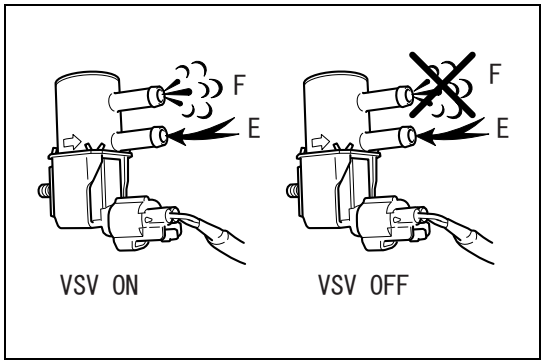
Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

| | |
|---|---|
| 1 | Performing of SSM4 [Active Test] ([Activate the VSV for Evap Control]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Activate the VSV for Evap Control]
(5) Disconnect the 2 vacuum hoses of the vacuum switching valve ASSY.



(6) Activate the vacuum switching valve ASSY and apply positive pressure on E port to check if air is coming to F port.
Criteria

| [Active Test] ([Activate the VSV for Evap Control]) | Criteria |
|---|---|
| ON | Air is coming from E port to F port |
| OFF | No air is coming from E port to F port |

Result

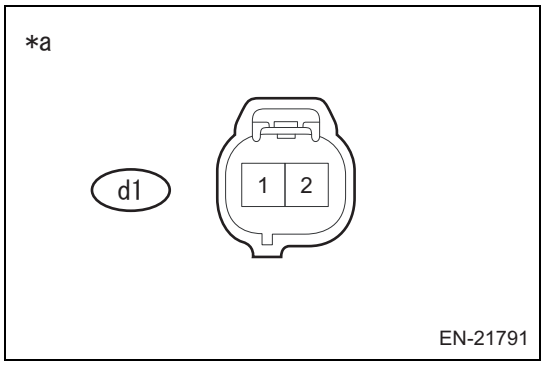
(1) Perform vacuum switching valve ASSY unit inspection. (Refer to EC - 18)

NG → Replacement of vacuum switching valve ASSY (Refer to EC - 16)

OK

| 3 | Check wiring harness and connector (vacuum switching valve ASSY power supply voltage) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the vacuum switching valve ASSY connector.
(2) Measure the voltage between the terminals.
Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| d1-1 - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (Vacuum switching valve ASSY connector) |

NG → Go to Step 7.

OK

| 4 | Check wiring harness and connector (engine control computer - vacuum switching valve ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the vacuum switching valve ASSY connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-11(PRG) - d1-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-11 (PRG) and d1-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| 5 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 6 | Perform test drive for operation check |
|---|---|

(1) Perform test drive. (Refer to "Test drive" under "Description of functions")
WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(2) Follow the SSM4 on-screen instructions to check the DTC.

Result

| Result | Go to |
|---|---|
| No DTC is output. | A |
| P0458 or P0459 is output. | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

Inspection for problems that do not normally occur (Refer to ES - 28)

| 7 | Relay unit inspection (EFI MAIN1 relay) |
|---|---|

(1) Perform unit inspection of EFI MAIN1 relay. (Refer to ES - 717)

NG → Relay replacement (EFI MAIN1 relay)

OK

| 8 | Check wiring harness and connector (Vacuum switching valve ASSY - EFI relay) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the vacuum switching valve ASSY connector.
(2) Remove the EFI MAIN1 relay from the engine compartment relay block.
(3) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) - d1-1 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (EFI MAIN1 relay holder) or d1-1 - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Inspection of the ECM power supply system (Refer to ES - 646)

## DTC P2158 Vehicle Speed Sensor "A"

Circuit description

Skid control computer converts the vehicle speed pulse signal which is output from the ABS speed sensors on each wheel into vehicle speed signal. This signal is input to the engine control computer via CAN communication. The engine control computer determines vehicle speed based on this CAN communication data.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P2158 | Vehicle speed signal from drive wheels is 300 km/h {186.42 MPH} or more for 2.5 seconds or more.<br>(1 trip detection logic) | • Open/short circuit in wheel speed signal circuit<br>• Brake actuator ASSY<br>• ECM |

MONITOR DESCRIPTION

If the vehicle speed signal sent from the skid control ECM exceeds 300 km/h {186.42 MPH}, the ECM judges it as a failure in the vehicle speed signal circuit, turns on the MIL, and records the DTC.

Monitor strategy

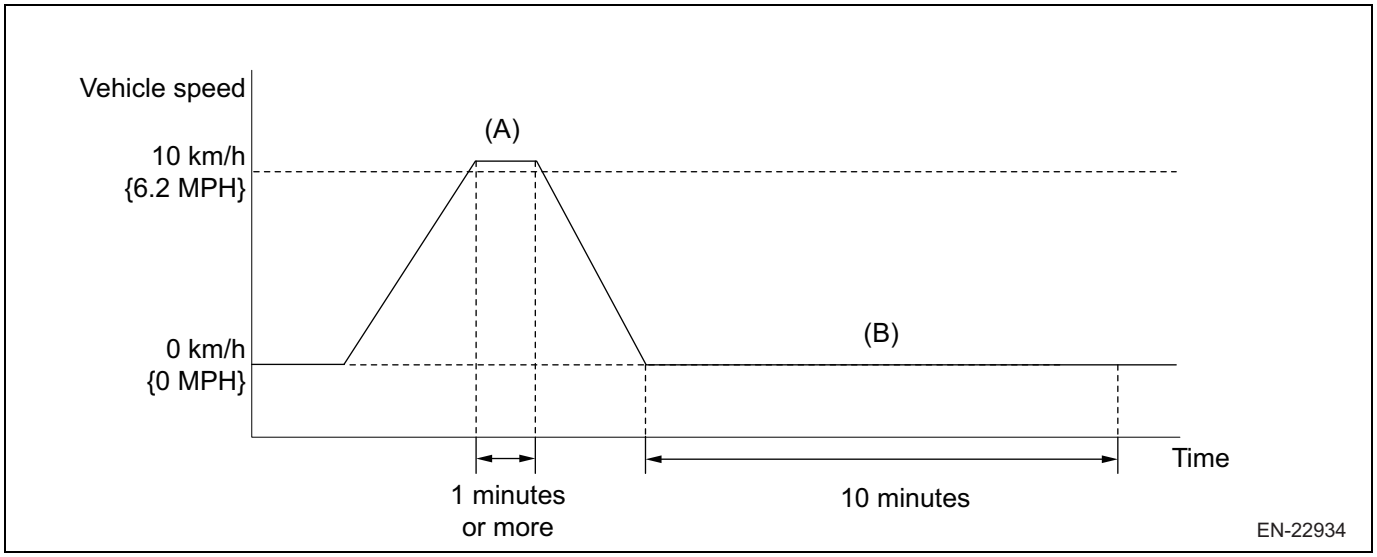
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps
NOTE:
Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Reading of SSM4 data (vehicle speed) |

NOTE:
Make sure that the speed meter operates normally.
(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Vehicle Speed]
(5) Perform test drive. (Refer to "Test drive" under "Description of functions")
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(6) Read the [Vehicle Speed] displayed on the SSM4.
   Standard value: The vehicle speed shown in the data monitor and the actual vehicle speed are the same

NG → Go to Step 2.

OK

Inspection for problems that do not normally occur (Refer to ES - 28)

| 2 | Read DTC (VSC system) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC of the VSC system. (Refer to BC - 13)

Result

| Result | Go to |
|---|---|

|---|---|---|

| DTC | P0507 | ISC valve characteristic {1} High |
|---|---|---|

ES

Circuit description

Idle speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS consists of 1) one-valve-type throttle body, 2) throttle actuator that operates the throttle valve, 3) throttle position sensor that detects the throttle valve opening angle, 4) accelerator pedal sensor that detects the position of the accelerator pedal, and 5) ECM that controls the ETCS. Based on the target idle speed, the ECM controls the throttle actuator so that the throttle valve opening angle is maintained properly.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0506 | Engine speed deviates from the target engine speed for 30 seconds or more (actual engine speed - target engine speed <= -100 r/min)<br>(2 trips detection logic) | • Electronic throttle control system<br>• Intake system<br>• PCV hose connection<br>• ECM |
| P0507 | Engine speed deviates from the target engine speed for 30 seconds or more (actual engine speed - target engine speed >= 200 r/min)<br>(2 trips detection logic) | |

MONITOR DESCRIPTION

The ECM performs idle speed control (ISC) by monitoring the idle speed and airflow at idle. When the difference between the target engine idle speed and actual engine idle speed exceeds the threshold value for 30 seconds or more, the ECM judges it as an ISC system failure.

Monitor strategy

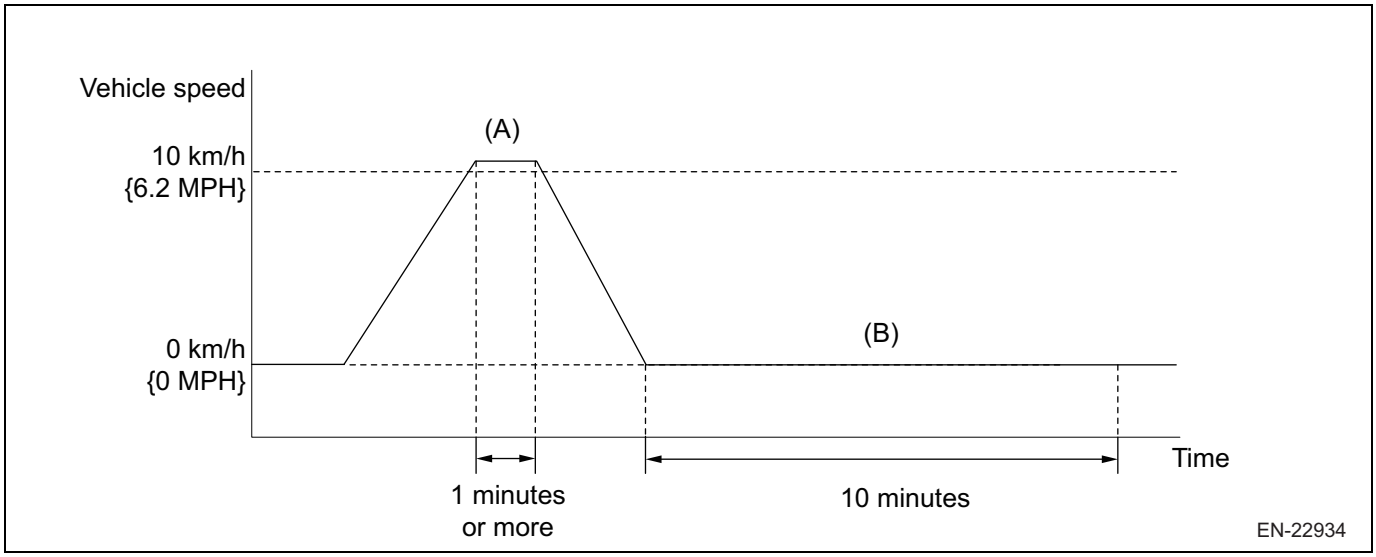
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- The following conditions may cause DTC P0506 or P0507 to be recorded.
  (a) A small section of the floor carpet overlaps with and depresses the accelerator pedal, causing the throttle valve to open a little bit.
  (b) The accelerator pedal is not fully released.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.

Replacement of the engine control computer (Refer to ES - 674)

| DTC | P050A | Cold Start Idle Air Control System Performance |
|---|---|---|

| DTC | P050B | Cold start ignition timing abnormal |
|---|---|---|

Circuit description

The Cold Start Emission Reduction Strategy (CSERS), which shortens the time necessary for the catalyst to warm up after cold start, is used in this vehicle. The CSERS consists of related ignition timing and increased engine idle speed in calibrated time. This monitor detects estimated exhaust gas temperature which has not reached the target value, ignition timing from the ECM, and engine idle speed failure.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P050A | From the cold engine condition, the engine speed not reach the target engine speed within 7 seconds.<br>(2 trips detection logic) | • Throttle body<br>• Intake air flow meter SUB-ASSY<br>• PCV system<br>• Air cleaner filter element<br>• Intake system<br>• VVT system<br>• Wiring harness or connector<br>• ECM |
| P050B | Despite abrupt warming control of the catalyst, ignition timing is not retarded for 7 seconds (to delay ignition timing).<br>(2 trips detection logic) | |

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Coolant Temp./ Intake Air Temp.]
9. Confirm that the engine coolant temperature and intake air temperature meet the condition described below.
   Condition: |Engine coolant temperature - intake air temperature| is 5°C {9°F} or less
   NOTE:
   If the condition is not met, turn the ignition switch to OFF, and wait until the condition is met.
10. If the condition is met, start the engine, and let it idle for 2 minutes or more.
    NOTE:
    Do not move the select lever from "P" or "N" range while the engine is idling.
11. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

CAUTION:

Check fuses of the circuits related to this system before performing the following inspection steps.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |

A

| 2 | Reading by the SSM4 ([Long term fuel trim B1] and [Short term fuel trim B1]) |
|---|---|

NOTE:
Calculate the total fuel correction amount, and check the characteristic deviations of the intake air flow meter SUB-ASSY.

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Long term fuel trim B1] and [Short term fuel trim B1]
(5) Read the value displayed on the SSM4 on idle.
(6) Add the values of [Long term fuel trim B1] and [Short term fuel trim B1] to calculate the total fuel correction amount.
Criteria: Sum of [Long term fuel trim B1] and [Short term fuel trim B1] are between -20 % and 20 %.

NG → Go to Step 5.

OK

| 3 | Throttle body check (throttle valve) |
|---|---|

(1) Check that no deposit is adhered around the throttle valve, and check the condition of the throttle valve.
Criteria: There is no deposit adhered around the throttle valve, and the valve operates smoothly.

OK → Go to Step 14.

NG → Go to Step 4.

| 4 | Repair or replacement of throttle body |
|---|---|

(1) Repair or replace the throttle body. (Refer to ES - 670)

Next → Go to Step 14.

| 5 | Inspection of the PCV hose |
|---|---|

(1) Check the PCV hose for poor connections and damage.
Criteria: The PCV valve and hose are connected properly and not damaged.

NG → Go to Step 10.

OK

| | |
|---|---|
| 6 | Intake system inspection |

(1) Inspect the intake system. (Refer to IE - 4)
Criteria: There is no leakage in the intake system.

NG → Go to Step 11.

ES

OK

| | |
|---|---|
| 7 | Air cleaner filter element SUB-ASSY check |

(1) Visually check the air cleaner filter element for heavy contamination with mud and oil.
Criteria: The air cleaner filter element is not heavily contaminated with mud and oil.

NG → Go to Step 12.

OK

| | |
|---|---|
| 8 | Performing of [Active Test] using the SSM4 ([Camshaft timing oil control valve ASSY operation]) |

(1) Operate the VVT system in [Active Test] and check that the VVT system operates without problem.
(a) By referring to the inspection steps of DTC P0011 (VVT system of the intake camshaft), perform [Active Test]. (Refer to ES - 28)
(b) By referring to the inspection steps of DTC P0014 (VVT system of the exhaust camshaft), perform [Active Test]. (Refer to ES - 28)

NG → Go to Step 13.

OK

|---|---|---|

| DTC | P0617 | Starter Relay Circuit High |
|---|---|---|

| DTC | P081A | Starter cut relay system circuit (Low) |
|---|---|---|

Circuit description

While the engine is being cranked, the starter operation signal is also transmitted to the STSW terminal (for models without smart entry & start system) or STSW2 terminal (for models with smart entry & start system) of the engine control computer. The starter operating signal is primarily used for engine control during startup.

For models with smart entry & start system, when the engine control computer detects engine startup condition during engine cranking, the engine control computer drives the ST CUT relay and stops starter operation.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0512 | The starter signal continues to be input for 30 seconds or more after engine start.<br>(1 trip detection logic) | • Starter system<br>• ST relay circuit<br>• ECM |

Circuit figure

For circuit figure, refer to the starter system (models with smart entry & start system) ES - 614.

For circuit figure, refer to the starter system (models without smart entry & start system) ES - 625.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC.

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Reading of SSM4 data ([Starter Switch]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Starter Switch]
(5) Read [starter switch].

Voltage

| Item name | Inspection conditions | Standard value |
|---|---|---|
| [Starter Switch] | IG ON | OFF |
| | When cranking | ON |

Result

| Result | Go to |
|---|---|
| Abnormal (models without smart entry & start system) | A |
| Abnormal (models with smart entry & start system) | B |
| Normal | C |

ES

B → Go to Step 4.

C → Go to Step 9.

A

**2** Relay unit inspection (ST relay)

(1) Perform ST relay unit inspection. (Refer to ST - 49)

NG → Relay replacement (ST relay)

OK

**3** Check wiring harness and connector (ST relay - engine control computer)

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.

(1) Disconnect the connector for the engine control computer.
(2) Remove the ST relay from the engine compartment relay block.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (ST relay holder) - A33-17 (STSW2) | Always | Less than 1 Ω |
| 1 (ST relay holder) - A35-26 (STA) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (ST relay holder) and A33-17 (STSW2) - other terminals and chassis ground | Always | 10 k Ωor more |
| 1 (ST relay holder) and A35-26 (STA) - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
- When using tester probes to take measurements at a relay holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Starter system check (models without smart entry & start system) (Refer to ES - 624)

| 4 | Reading of SSM4 data ([Starter cut relay]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Starter cut relay]
(5) Read [Starter cut relay].

Voltage

| Item name | Inspection conditions | Standard value |
|---|---|---|
| [Starter cut relay] | IG ON | OFF |
| | When cranking | ON |

NG → Go to Step 7.

OK

| 5 | Relay unit inspection (ST relay) |
|---|---|

(1) Perform ST relay unit inspection. (Refer to ST - 49)

NG → Relay replacement (ST relay)

OK

| 6 | Check wiring harness and connector (ST relay - engine control computer) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.
(1) Disconnect the connector for the engine control computer.
(2) Remove the ST relay from the engine compartment relay block.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (ST relay holder) - A33-14 (STSW2) | Always | Less than 1 Ω |
| 1 (ST relay holder) - A35-26 (STA) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 (ST relay holder) and A33-14 (STSW2) - other terminals and chassis ground | Always | 10 k Ωor more |
| 1 (ST relay holder) and A35-26 (STA) - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a relay holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Starter system check (models with smart entry & start system) (Refer to ES - 614)

| 7 | Relay unit inspection (ST CUT relay) |
|---|---|

(1) Perform ST CUT relay unit inspection. (Refer to ST - 49)

NG → Relay replacement (ST CUT relay)

OK

| 8 | Check wiring harness and connector (ST CUT relay - engine control computer) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.

(1) Disconnect the connector for the engine control computer.
(2) Remove the ST CUT relay from the engine compartment relay block.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 (ST CUT relay holder) - A35-34 (STAR) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 (ST CUT relay holder) and A35-34 (STAR) - other terminals and chassis ground | Always | 10 k Ωor more |

CAUTION:
When using tester probes to take measurements at a relay holder, do not push them hard against the holder. Otherwise the holder could be damaged.

NG → Repair or replacement of wiring harness or connector

OK

Starter system check (models with smart entry & start system) (Refer to ES - 614)

| 9 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.

(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 10 | Perform test drive for operation check |
|---|---|

(1) Perform test drive. (Refer to "Test drive" under "Description of functions")
(2) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

A

Inspection for problems that do not normally occur (Refer to ES - 28)

| DTC | P0560 | Backup Power Supply |
|---|---|---|

Circuit description
The power from the battery is always supplied to the BATT terminal. The power supply is used for storing DTCs.

MONITOR DESCRIPTION
The battery supplies power to the ECM even when the ignition switch is OFF. This power allows the ECM to record data such as DTC history, freeze frame data, and F/B learning values. When the battery voltage falls below the minimum level, memory becomes cleared, and the ECM judges it as a power supply circuit malfunction. When the engine is started subsequently, the ECM turns on the MIL and records the DTC.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P0560 | While the engine is running, the terminal voltage of the back-up power supply is 3.5 V or less for 2.5 seconds or more.<br>(1 trip detection logic) | • Open circuit in back-up power supply circuit<br>• Battery<br>• Battery terminal<br>• ECM |

NOTE:
If DTC P0560 is recorded, the ECM does not record other DTCs, or the data recorded in the ECM becomes partially cleared.

| DTC | P060B | Internal Control Module A/D Processing Performance |
| DTC | P062F | EEPROM Error |

Circuit description

When this DTC is recorded, the engine control computer shuts off electric power supply to the throttle motor, allowing the return spring to act on the throttle valve so that the valve returns to the predetermined opening angle position. If the engine control computer detects a problem, it turns on the MIL and records the diagnostic codes.

Circuit description

The D-4S system has direct fuel injection system that supplies high pressure fuel directly into the combustion chambers, and port fuel injection system that supplies fuel into the intake port. The D-4S uses either of these systems depending on engine operation condition. In the cylinder injection system, the injector drivers (EDU) that activate high-pressure fuel injectors at a high speed are located in the engine compartment. Injection request signal from the engine control computer is converted into high-voltage/high-current injector drive signal to drive the fuel injector ASSY (cylinder injection side).

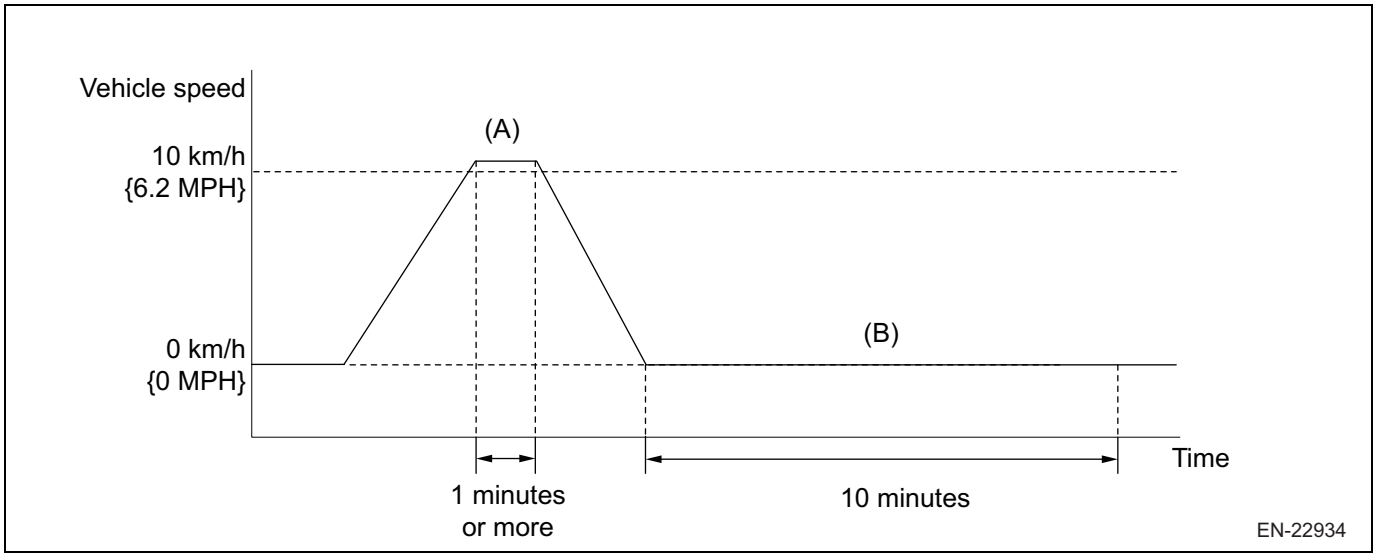
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Check fuses in this circuit before performing the troubleshooting.

NOTE:

- If DTC P1261 is displayed, inspect the fuel injector circuit of the No. 1 cylinder.
- If DTC P1262 is displayed, inspect the fuel injector circuit of the No. 2 cylinder.
- If DTC P1263 is displayed, inspect the fuel injector circuit of the No. 3 cylinder.
- If DTC P1264 is displayed, inspect the fuel injector circuit of the No. 4 cylinder.
- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.

| 2 | Check wiring harness and connector (resistance check) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect injector driver connectors.
(2) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C3-2 (IJ1-) - C3-5 (IJ1+) | 20°C {68°F} | 1.74 to 2.04 Ω |
| C4-1 (IJ2-) - C4-4 (IJ2-) | 20°C {68°F} | 1.74 to 2.04 Ω |
| C3-1 (IJ3-) - C3-4 (IJ3+) | 20°C {68°F} | 1.74 to 2.04 Ω |
| C4-3 (IJ4-) - C4-6 (IJ4+) | 20°C {68°F} | 1.74 to 2.04 Ω |

NOTE:
The standard value indicates the resistance of the fuel injector ASSY.

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C3-2 (IJ1-) and C3-5 (IJ1+) - other terminals and chassis ground | 20°C {68°F} | 1 MΩ or more |
| C4-1 (IJ2-) and C4-4 (IJ2+) - other terminals and chassis ground | 20°C {68°F} | 1 MΩ or more |
| C3-1 (IJ3-) and C3-4 (IJ3+) - other terminals and chassis ground | 20°C {68°F} | 1 MΩ or more |
| C4-3 (IJ4-) and C4-6 (IJ4+) - other terminals and chassis ground | 20°C {68°F} | 1 MΩ or more |

NG → Go to Step 8.

OK

| 3 | Check wiring harness and connector (engine control computer - injector driver) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect injector driver connectors.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-14 (#1) - C1-3 (IJT1) | Always | Less than 1 Ω |
| A36-25 (#2) - C1-12 (IJT2) | Always | Less than 1 Ω |
| A36-24 (#3) - C1-11 (IJT3) | Always | Less than 1 Ω |
| A36-23 (#4) - C1-2 (IJT4) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-14 (#1) and C1-3 (IJT1) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-25 (#2) and C1-12 (IJT2) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-24 (#3) and C1-11 (IJT3) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-23 (#4) and C1-2 (IJT4) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

ES

MONITOR DESCRIPTION

Transmission M/T

Unless the ON/OFF signal is input from the neutral position switch, a DTC will be recorded based on the vehicle speed or the engine speed, regardless of whether the gear position is shifted.

Transmission A/T

When there is a problem in the neutral start switch circuit, a DTC will be recorded.

A DTC will be detected when the signal from the neutral start switch does not match that received from the TCM.

OK

Replacement of the engine control computer (Refer to ES - 674)

| DTC | P1109 | Detected Throttle Deposit |
|---|---|---|

| DTC | P2109 | Throttle angle sensor Closed position error |
|---|---|---|

Circuit description
Idle speed is controlled by the electronic throttle control system.
The electronic throttle control system consists of the throttle motor that drives the throttle valve and the throttle position sensor that detects the throttle valve opening angle.
The engine control computer controls the throttle valve opening angle with the throttle motor so that idle speed is maintained in the target value.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P1109 | The maximum learning amount of the ISC learning value is 95 % or more and the deposit amount of 50 % or more is detected for 10 seconds.<br>(5 trips detection logic) | Throttle body |
| P2109 | When any of the following conditions is met (1 trip detection logic):<br>• The opening angle of the throttle position sensor learned at the fully closed position is less than 9.975° or 20.025° or more.<br>• When the throttle actuator electric current is turned off, the difference between the actual throttle opening angle and the fully closed position angle is less than 1.162°. | |

MONITOR DESCRIPTION

Deposit on the throttle valve increases ISC flow and may cause conditions including engine stall and rough idling. To prevent this, the ISC flow required for idling is maintained by using the ISC learning value and feedback to the engine control computer. When the ISC learning value reaches the limit, the ECM records this DTC.

Replacement of throttle body ASSY (with motor) (Refer to ES - 670)

| DTC | P1160 | Return Spring Failure |
|---|---|---|

| DTC | P2119 | Throttle Control Circuit Range/Performance Problem |
|---|---|---|

Circuit description
The electronic throttle control system consists of the throttle motor, throttle position sensor, accelerator pedal sensor ASSY, and the engine control computer. The engine control computer controls the throttle valve via the throttle motor. The throttle valve opening angle is identified by the throttle position sensor on the throttle body ASSY (with motor), and the data is fed back to the engine control computer.

| DTC No. | DTC detection conditions | Suspected parts |
|---|---|---|
| P1160 | After the throttle valve opens at 40°, the opening angle change after turning off the throttle actuator is less than 2°.<br>(1 trip detection logic) | Throttle body |
| P2119 | The throttle valve opening angle differs greatly from the target angle.<br>(1 trip detection logic) | • Electronic throttle control system<br>• Wiring harness or connector<br>• ECM |

MONITOR DESCRIPTION
P1160
When the ECM shuts off the power supply to the throttle actuator, the throttle valve is pulled by the return spring and returns to the fully closed position. If the throttle valve does not return to the fully closed position when the ETCS relay is off, the ECM judges this condition as carbon buildup on the throttle valve, then turns on the MIL and records the DTC.

P2119

The ECM calculates the actual throttle valve opening angle based on the signal received from the throttle position sensor. The actual opening angle is to be compared with the target opening angle specified by the ECM. When the difference between these two values is not within the range of the specification, the ECM will judge that there is a problem in the electronic control throttle system. Then ECM turns on the MIL and records the DTC.

ES

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- In [Data monitor] / [Active Test], check [Throttle sensor No1 Voltage], [Throttle Motor Duty (Open)], and [Throttle Motor Duty (Close)] data display items. (Refer to ES - 43)

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| P1160 or P2119 is output. | A |
| Either 1160 or P2119, and other DTCs are output. | B |

NOTE:
If any DTCs other than P1160, P2119 are output, troubleshoot them first.

B → To corresponding DTC chart (refer to ES - 12)

A

| | |
|---|---|
| 2 | Clear DTC |

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

Next

| 3 | Reading of SSM4 data ([Throttle sensor No1 Voltage]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Throttle sensor No1 Voltage], [Throttle Require Position]
(5) Read [Throttle sensor No1 Voltage] displayed on the SSM4 when the accelerator pedal is depressed to the floor and released immediately.

Result

| Result | Go to |
|---|---|
| Value of the throttle sensor No. 1 voltage does not change. | A |
| Value of the throttle sensor No. 1 voltage changes. | B |

NOTE:
When DTCs are output, the throttle valve is pulled by the return spring and returns to the predetermined opening angle due to the fail-safe mode. Therefore, if DTCs are output during this inspection, it is necessary to check the previous data.

B → Go to Step 5.

A

| 4 | Throttle body ASSY (with motor) unit inspection |
|---|---|

(1) Perform unit inspection of the throttle body ASSY (with motor). (Refer to ES - 672)

NG → Go to Step 9.

OK

| 5 | Throttle body ASSY (with motor) check (visual and operational check of the throttle valve) |
|---|---|

(1) Check for foreign materials in the area between the throttle valve and the housing.
(2) Make sure the throttle valve smoothly moves from the full open position to the full closed position.
Criteria: There is no foreign materials in the area between the throttle valve and the housing, and the throttle valve moves smoothly.

NG → Go to Step 9.

OK

| | |
|---|---|
| 6 | Clear DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

ES

Next

| | |

| P119E<br>P119F<br>P219A | When any of the following conditions is met (2 trip detection logic):<br>• The air/fuel ratio sensor signal varies during the air/fuel ratio feedback control.<br>• The crank position sensor signal varies during the air/fuel ratio feedback control. | • Fuel injector ASSY<br>• Intake system<br>• Gas leakage from exhaust system<br>• Ignition system<br>• Compression pressure<br>• Air / fuel ratio sensor<br>• ECM |

MONITOR DESCRIPTION

Fuel system air/fuel ratio cylinder unbalance observation

The ECM uses the air/fuel ratio sensor and crank position sensor to observe for variations in the air/fuel ratios inside the cylinders created by variations in the fuel injection volume due to problems or leaks in the cylinders or the intake/exhaust systems. If the cylinder air/fuel ratios become lean or rich compared to one another, the ECM determines there is a trouble symptom, and records a DTC.

Air/fuel ratio sensor observation method (A/F change)

The system determines there is a trouble symptom if it detects an air/fuel ratio deviation between cylinders due to variation in the air/fuel ratio sensor output of 1 engine cycle (2 revolutions of the crank shaft).

ES

When the malfunction is detected by crank position sensor observation method, only DTC P219A is input.

Crank position sensor observation method (revolution change)

The system observes variations in the engine speed, and if those variations become big, the system determines there is a deviation in the air/fuel ratio in the cylinders, in other words, a trouble symptom.

The diagnosis by crank position sensor observation method is performed at idling after warming-up.

Normally, the injection control of the injector is "cylinder injection 100%" at idling after warming-up.

When the malfunction is detected at this time, DTC P219A and P119F are input.

To detect the port injection malfunction, the diagnosis with the injector injection control compulsory set to "port injection 100%" is also performed.

When the malfunction is detected at this time, DTC P219A and P119E are input.

After the diagnosis, the injection control of the injector returns to "cylinder injection 100%".

Occasionally, DTC P219A, P119E and P119F are all input depending on the malfunction condition.

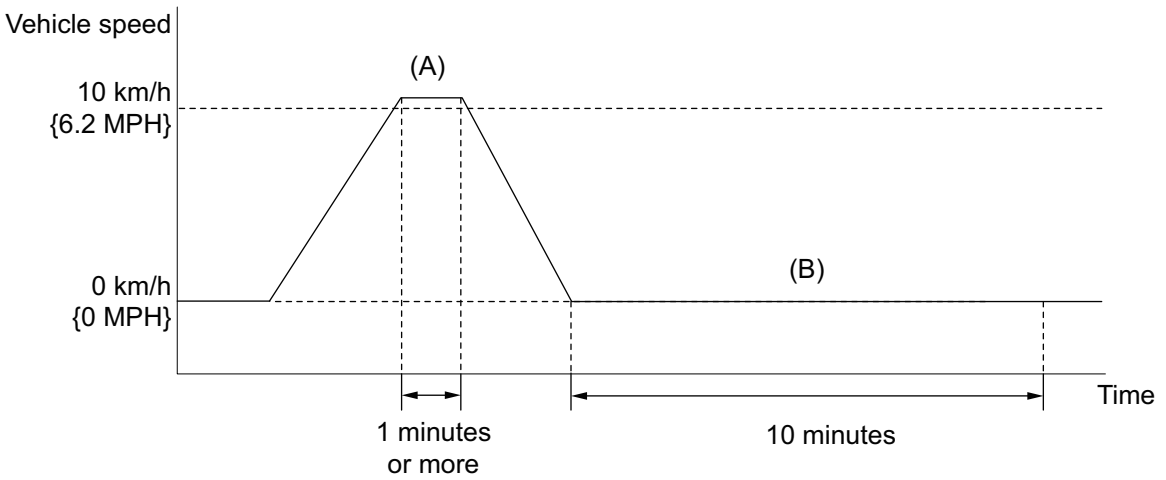
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 24)

Result

| Result | Go to |
|---|---|
| P119E, P119F, or P219A is output. | A |
| DTCs other than P119E, P119F, or P219A are also output. | B |

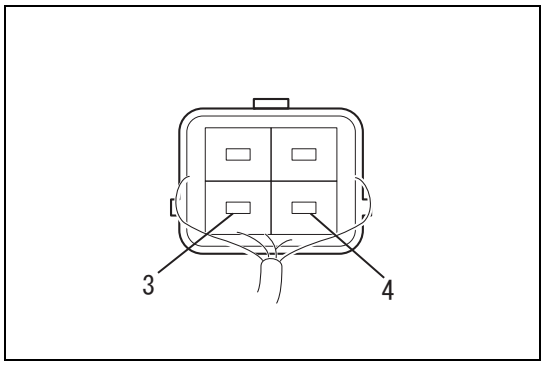
NOTE:

If any DTCs other than P119E, P119F, or P219A are output, troubleshoot them first.

B → To corresponding DTC chart (refer to ES - 12)

A

| 2 | Checking the freeze frame data |
|---|---|



(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Using the SSM4, check the status of the vehicle at the time when the DTC was recorded, which is recorded in the freeze frame data. (Refer to ES - 28)

Freeze frame data entries for DTC P219A

- Vehicle speed
- Engine Speed
- Calculated load value
- [Idle switch (APS)]
- Short term fuel trim B1
- Long term fuel trim B1
- Misfire counter #1 to misfire counter #4

NOTE:

If the sum of [Short term fuel trim B1] of [Long term fuel trim B1] is a positive value, the fuel modulation is lean. If the sum is a negative value, it is rich.

| | |
|---|---|
| DTCs recorded during idling | It can be concluded that trouble was detected because of the [System Too Lean] (which was detected by the speed variation of the crankshaft). |
| DTCs recorded during driving | It can be concluded that trouble was detected because of the [System Too Rich] (which was detected by the air/fuel ratio sensor) |

Next

| 3 | Active test (injection volume) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Turn on the SSM4.
(4) Warm up the engine.
NOTE:
You must turn the A/C switch and all accessory switches to OFF, and put the shift lever in P, N, or neutral.
(5) Check the diagnostic codes using SSM4.
NOTE:
When you have selected the active test for [Cylinder Fuel Rate] (injection volume is 0%), if the misfire counts increase, proceed to step 6, "Intake system inspection".
(6) With the engine idling, run the [Cylinder Fuel Rate].
(7) Check the misfire counts (values for [Cylinder #1 Misfire Count] to [Cylinder #4 Misfire Count] of [Data monitor]) as you reduce the injection volume in increments of 5 %.

CAUTION:
Do not reduce the injection volume in increments of 20 % or more.

Result: Cylinders which did not increase their misfire count can be determined to have rich fuel modulation. Therefore, perform the inspection paying attention to those cylinders.

Next

| 4 | Exhaust gas leakage check |
|---|---|

(1) Make sure that exhaust gas is not leaking from connections of exhaust pipes and installation areas of sensors.
Criteria: There is no exhaust leakage.

NG → Repair of exhaust gas leakage

OK

| 5 | Intake system inspection |
|---|---|

(1) Inspect the intake system. (Refer to IE - 4)

NG → Repair or replacement of intake system

OK

| 6 | Spark plug inspection |
|---|---|

(1) Inspect the spark plug of cylinder causing the unbalance. (Refer to ES - 662)

NG → Replacement of the spark plug (Refer to ES - 691)

OK

| | |
|---|---|
| 7 | Spark Inspection |

(1) Perform the spark inspection. (Refer to ES - 656)
NOTE:
If no malfunction is found in the spark inspection, proceed to the next step.

Next

| | |
|---|---|
| 8 | Compression inspection |

(1) Measure the compression of the misfiring cylinder. (Refer to EM - 2)

NG → Engine inspection to determine the cause of the low compression

OK

| | |
|---|---|
| 9 | Inspection of the fuel injector ASSY (power source) |

NG → See the fuel injector circuit (Refer to ES - 637)

OK

| | |
|---|---|
| 10 | Inspection of wiring harnesses and connectors (fuel injector ASSY - ECM) |

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 11 | Inspection of the fuel injector ASSY of the cylinder causing the unbalance. |

(1) Inspect the injection of the fuel injector ASSY. (Amount of fuel and quality of the injection pattern) (Refer to FU - 29and FU - 39)

| Output DTCs | Fuel injector ASSYs to be inspected |
|---|---|
| P219A only | For port injection and direct injection |
| P119E and P219A | For port injection |
| P119F and P219A | For direct injection |
| P119E, P119F, and P219A | For port injection and direct injection |

NG → Replacement of the fuel injector ASSY (Refer to FU - 21and FU - 31)

OK

| | |
|---|---|
| 12 | Checking cam clearance |

CAUTION:
This step is performed only when the following three patterns of DTCs are input.
- P119E, P219A
- P119F, P219A

• P119E, P119F, P219A

(If any DTCs other than P119E, P119F and P219A are input in step 1, troubleshoot them first.)

(1) Check the cam clearance. (Refer to EM - 9)

NG → Adjust the cam clearance.

OK

ES

| 13 | Checking the cause of the trouble symptom |
|---|---|

(1) If you cannot determine the cause of the trouble symptom even if you perform troubleshooting procedures, perform the following inspection.

(2) Inspect the intake valve for precipitation buildup.

NOTE:

Because precipitation buildup on the intake valve may have caused the DTC to be recorded, remove the cylinder head, and inspect the intake valve.

Next

| 14 | Perform test drive for operation check |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.
(6) Turn the ignition switch to ON.
(7) Turn on the SSM4.
(8) Perform test drive. (Refer to "Test drive" under "Description of functions")
(9) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Criteria: P219A is not output.

Complete

| DTC | P1235 | High-pressure fuel pump abnormal |
|---|---|---|

Circuit description

The high pressure fuel pump is installed on the cylinder head cover with insulator, and driven by the cam on the intake side camshaft (bank 2). In this pump, a solenoid valve is used in the suction side, and a mechanical automatic valve is used in the discharge side. The suction side solenoid valve is duty cycled by the engine control computer to control the discharge rate.

|---|---|
| *a | Connector connected (engine control computer) |
| *b | Normal waveform at FPD terminal |

| Item | Contents |
|---|---|
| Measuring terminal | A34-32 (FPD) - chassis ground |
| Equipment setting | 2 V/DIV, 20 ms/DIV |
| Measuring condition | When cranking |

Result: Normal waveform is output.

NG → Replacement of the engine control computer (Refer to ES - 674)

OK → Replacement of injector driver (Refer to FU - 43)

| DTC | P1449 | Vent control filter clogging |
|---|---|---|

Circuit description
Refer to "EVAP (EVAP emission) system" for details. (Refer to ES - 599)

| DTC No. | Monitoring items | Error detection condition | Suspected parts | Detection timing | Detection logic |
|---|---|---|---|---|---|
| P1449 | Canister filter clogging | Pressure inside the ELCM changes rapidly | • Clogging in the EVAP line (drain tube)<br>• Clogging in the EVAP line (canister pump module - drain separator)<br>• Clogging in the canister pump module (drain separator) | When the ignition switch is ON | 2 trips |

MONITOR DESCRIPTION
The ECM monitors the canister filter of the canister pump module. It checks the pressure every 5 seconds, and if the change in the pressure exceeds the threshold value, it will deactivate the EVAP system monitor. In this case, the ECM turns on the MIL and records the DTC. (2-trip detection logic)

Monitor strategy

| | |
|---|---|
| Related DTCs | P1449: Evaporative Emission System Lid Open Switch Stuck ON |
| Required Sensors/Components (Main) | Purge VSV and canister pump module |

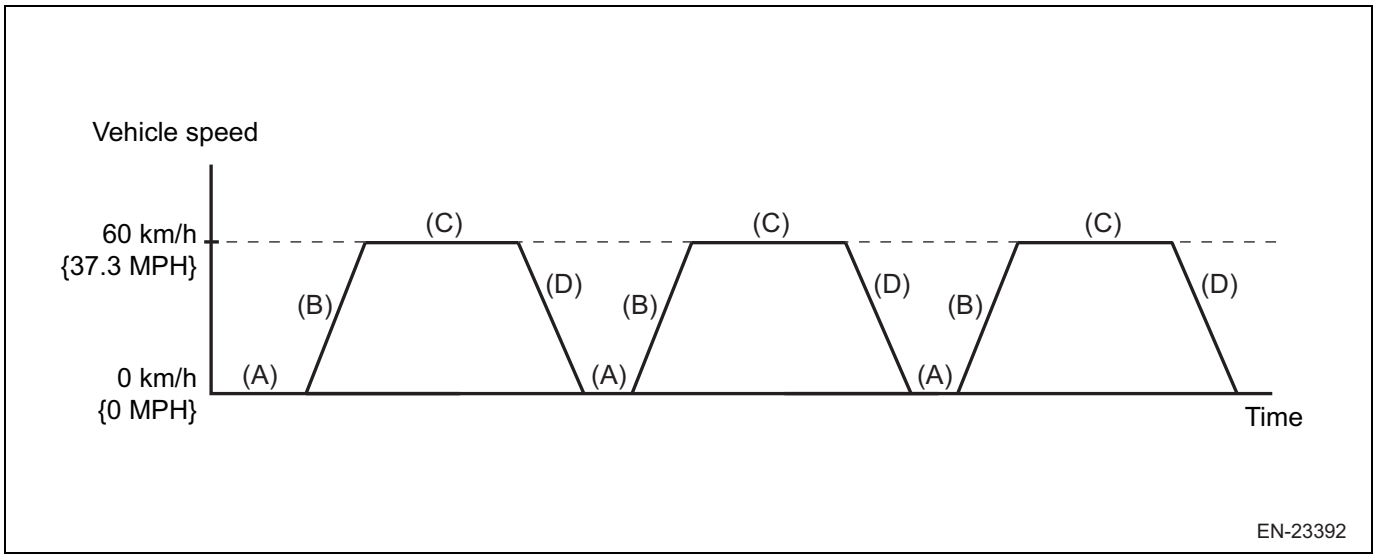
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.

WARNING:
When performing this driving test, always observe the applicable traffic laws such as the speed limit.
(a) Idle the engine for 1 minute. (A)
(b) Accelerate to 60 km/h {37.3 MPH}. (Sudden acceleration not acceptable) (B)
(c) Drive at a constant speed for 3 minutes. (C)
(d) Decelerate and stop the vehicle. (D)
(e) Repeat steps (a) to (d) described above 3 times in total.

10. Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

ES

Inspection steps

| | |
|---|---|
| 1 | EVAP hose check (drain tube C) |

(1) Check the drain tube C for clogging.
Criteria: No clogging in the drain tube C.

NG → Go to Step 4.

OK

| | |
|---|---|
| 2 | EVAP hose check (drain tube A, drain hose, and drain pipe) |

(1) Check the drain tube A, drain hose, and drain pipe for clogging.
Criteria: No clogging in the drain tube A, drain hose, and drain pipe.

NG → Go to Step 5.

OK

| | |
|---|---|
| 3 | Replacement of canister pump module |

(1) Replace the canister pump module. (Refer to EC - 7)

Next → Go to Step 6.

| | |
|---|---|
| 4 | EVAP hose replacement (drain tube C) |

Next → Go to Step 6.

| | |
|---|---|
| 5 | EVAP hose replacement (drain tube A, drain hose, or drain pipe) |

Next → Go to Step 6.

| | |
|---|---|
| 6 | EVAP system check |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.

(6) Turn the ignition switch to ON.
(7) Turn on the SSM4.
(8) Select the following menu items using the SSM4. : [OBD System] / [Each System] / [ECM Engine Control] / [On-Board System Test] / [Evaporative System Leak Test]
(9) Click the [OK] button to start the evaporative system leak test.
(10) The display with the message "Conditions have been enabled to control this function. Turn the ignition switch off to terminate the test." will appear. In this display, wait for 30 minutes without clicking the [OK] button.
(11) When 30 minutes has passed after finishing step 9, click the [OK] button.
(12) Return to the [OBD Menu] display and select [On-board monitor test result].
(13) Check TID $C1 to $CA of MID $3C in [On-board monitor test result].

Result of on-board monitor test

| Display | Details | Remarks |
|---|---|---|
| $0000 is stored in every Val. | The test condition fails to be met during evaporative system leak test, and the test has been cancelled. | Re-run the test after ensuring that the test conditions are met. |
| Any value is stored in every Val. and every Result shows OK. | The evaporative system leak test is completed successfully. | Use the SSM4 to read the temporary code with IG ON. |
| Any one of the results is NG | The evaporative system leak test is completed successfully but there is an error in the results. | Use the SSM4 to read the temporary code with IG ON. |

(14) When the evaporative system leak test is completed successfully, read the temporary code with IG ON. When any DTC is recorded, troubleshoot the appropriate DTC.
NOTE:
Turning IG to OFF will clear the temporary codes.

Next

Complete

| DTC | P1603 | Engine Stall History |
|---|---|---|

Circuit description
After engine startup, if the engine stops due to any other cause than the ignition switch operation, the DTC is output.
The conditions at the time the DTC was output can be checked from the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
It is necessary to check the fuel level before troubleshooting because engine stall due to running out of gas can also be detected.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P1603 | After completing the monitoring of a startup failure (P1604), the engine stops (the engine speed drops to 300 r/min or less) even if the ignition switch is not operated after the engine is started. (1 trip detection logic) | •There is no air leakage in the intake system.<br>•Purge VSV<br>•Brake booster<br>•Intake air flow meter SUB-ASSY<br>•E.F.I. water temperature sensor<br>•Thermostat SUB-ASSY<br>•Power supply circuit (purge VSV, air/fuel ratio sensor, fuel injector ASSY, ignition coil ASSY)<br>•Fuel pump (low-pressure side)<br>•Fuel pump control circuit (low-pressure side)<br>•Fuel line<br>•PCV valve and hose<br>•Camshaft timing oil control valve<br>•Knock control sensor<br>•Ignition system<br>•Air conditioner system<br>•Power steering system<br>•Electric load signal system<br>•Charging system<br>•A/T system<br>•Neutral start switch<br>•ECM<br>•Wiring harness or connector<br>•Engine immobilizer system |

ES

Circuit figure
Refer to DTC P0011. (Refer to ES - 88)
Refer to DTC P0014. (Refer to ES - 101)
Refer to DTC P0030. (Refer to ES - 134)
Refer to DTC P0102. (Refer to ES - 169)
Refer to DTC P0117. (Refer to ES - 188)
Refer to DTC P0201. (Refer to ES - 282)
Refer to DTC P0458. (Refer to ES - 361)

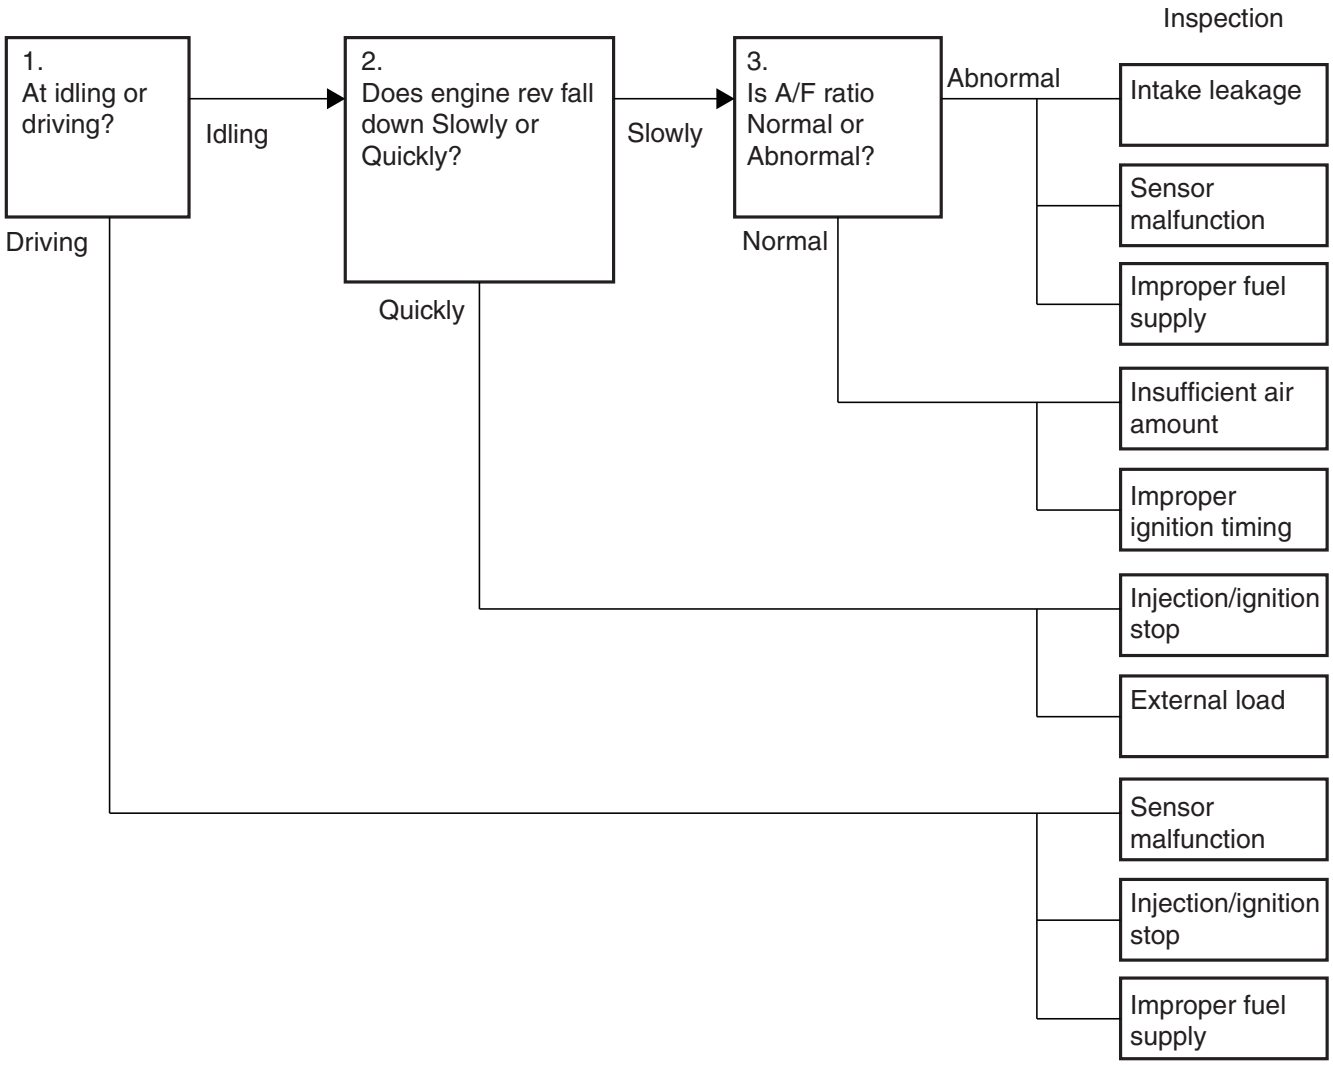
Inspection steps
NOTE:
- DTC P1603 is different from existing diagnosis for parts, circuits, or system failure. When customer complains about situations such as "engine stalls" and "engine does not start", trouble phenomenon and freeze frame data will be evaluated to identify possible failure parts. DTCs may be output and detected due to operation done by the user. Therefore, unless there are customer complaints, do not perform diagnosis work but clear the codes and return the vehicle to the customer even if DTCs are present.
- If any other DTCs are present, troubleshoot the appropriate DTCs first.
- If the result of interview shows conditions at the time the trouble occurs (how engine stopped or restarted), refer to them.

| Symptoms | Possible faulty parts |
|---|---|
| Engine vibrates and stops | Abnormal air/fuel ratio |
| Engine does not vibrate when stops | Trouble in ignition system, stopped injection, external overload |
| Rough idling after startup | Abnormal air/fuel ratio |

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- To check time-line freeze frame data, check 5 data. (Refer to ES - 28)
- If there are more than one items that are applicable to cause of trouble when time-line freeze frame data is checked, perform diagnosis procedure for all the applicable items.

- Drive and stop the vehicle to reproduce the conditions that are closest to those occurred at the time the trouble took place, as recorded in the freeze frame data. Then, check the data and the one obtained during idling (after warm-up, no-load condition with gear in D and N positions), and compare them with the freeze frame data.
- Focus on looking over sign and conditions at the time the trouble took place because the conditions may not recur.
- Wiggle the appropriate wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.

Workflow: First check the conditions when trouble occurred (shown in freeze frame data) and narrow down the check positions.



1 • When the intake air amount is small (at idling, decelerating), there may be reduction of torque caused by improper air-fuel ratio etc.
• When the intake air amount is large (at driving, accelerating), there may be a grave trouble such that no torque can be obtained because of total miss fire with ignition stop or fuel injection stop etc.

2 • When the engine revolution falls down slowly, there may be reduction of torque caused by misproportional air-fuel ratio (approx. 20 to 30%).
• When the engine revolution falls down quickly, there may be external load increased by malfunctions of nearly-total miss fire with ignition stop or fuel injection stop etc (more than 30% of A/F ratio misproportion), and increased by malfunctions of external parts.

3 • When abnormal air-fuel ratio is found, there may be intake leakage, sensor malfunction or insufficient fuel supply.
• When normal, there may be insufficient air amount or improper ignition timing.

| Driving condition | Engine Speed | Possible cause | | Main inspection parts | Step |
|---|---|---|---|---|---|
| During idling or deceleration | Slowly decreases and engine stalls | Ignition system failure | Igniter failure | • Power supply circuit<br>• Ignition coil ASSY<br>• Spark plug | 10, 38, 52 |
| | | Abnormal air/fuel ratio | Air induction | • Intake system connections<br>• Vacuum switching valve ASSY system<br>• Brake booster ASSY | 5 to 9 |
| | | | Sensor failure (misjudged as lean side) | • Intake air flow meter SUB-ASSY<br>• E.F.I. water temperature sensor<br>• Air/fuel ratio sensor system<br>• Thermostat | 11 to 23 |
| | | | Sensor failure (misjudged as rich side) | | 39 to 51 |
| | | | Fuel supply failure | • Fuel pump control system (low-pressure side)<br>• Vacuum switching valve ASSY system<br>• Fuel line<br>• Engine control computer | 24 to 37 |
| | | Intake air failure | Air passage failure | • Intake system connections<br>• Intake air flow meter SUB-ASSY<br>• Brake booster ASSY<br>• PCV system<br>• Vacuum switching valve system | 53 to 55 |
| | | | Excessive valve overlap | • Camshaft timing oil control valve ASSY | 56 to 59 |
| | | Ignition timing out of range | Timing deviates from the target | • Knock control sensor<br>• E.F.I. water temperature sensor<br>• Intake air flow meter SUB-ASSY | 60 to 64 |
| | Abruptly drops and engine stalls* | Ignition/injection stop (failure in power supply system) | Temporarily shut off | • Power supply circuit (fuel injector ASSY (port injection side), ignition coil ASSY) | 65, 66 |
| | | External parts failure | Increase in load | • Air conditioner system<br>• Electric load signal system<br>• Power steering system<br>• Automatic transmission system<br>• Neutral start switch ASSY system | 67 to 69 |
| At startup or acceleration | - | Crankshaft position sensor, camshaft position sensor failure | Temporarily shut off | • Check DTC | 1 |
| | | Intake air flow meter SUB-ASSY | Covered with foreign materials | • Intake air flow meter SUB-ASSY | 70 to 73 |
| | | Ignition/injection stop (failure in power supply system) | Temporarily shut off | • Power supply circuit (fuel injector ASSY (port injection side), ignition coil ASSY) | 74, 75 |
| | | Fuel supply failure | Fuel leakage, clogging | • Fuel pump control system (low-pressure side)<br>• Fuel line (low-pressure side) | 76 to 80 |

* If the engine stalls immediately after the injection method has changed from port injection to direct injection, the injector driver may be faulty.

NOTE:
- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

Result

| Result | Go to |

A

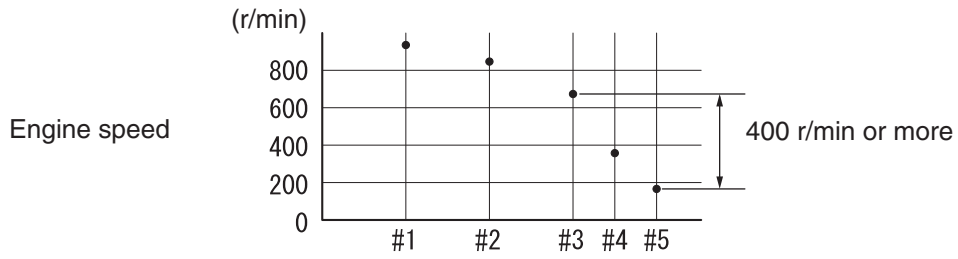
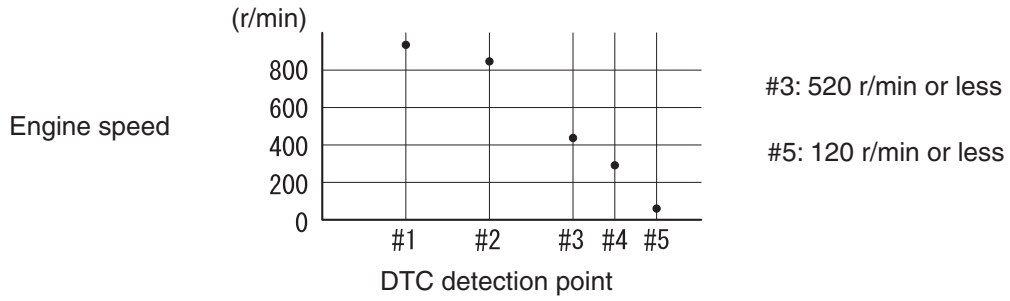
| 4 | Freeze frame data check (Idle Switch, Engine Speed, Short term fuel trim B1, Long term fuel trim B1) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Trouble phenomenon | Time-line freeze frame data item | | | Possible cause | Go to |
|---|---|---|---|---|---|
| | [Idle Switch] | [Engine Speed] | Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | | |
| Engine speed slowly decreases and then engine stalls during idling or deceleration | All cases are ON | Slowly decreases (*1) | All cases are +15 % or more (*2) | • Air induction<br>• Sensor failure (misjudged as lean side)<br>• Fuel supply failure | A |
| | | | At least one case is -15 % or less (*3) | • Sensor failure (misjudged as rich side) | B |
| | | | All cases are from -15 % to +15 % | • Insufficient air induction<br>• Ignition timing out of range | C |
| Engine speed abruptly decreases and then engine stalls during idling or deceleration | | Abruptly decreases (*1) | - | • Injection stop, ignition stop<br>• External load | D |
| Engine stall during startup, acceleration, cruising | At least one case is OFF | - | - | • Sensor failure<br>• Injection/ignition stop<br>• Fuel supply failure | E |





C

NOTE:

- *1: Power supply system failure in common wiring harness to the all cylinders or multiple cylinders, increase in external load, injector driver failure (immediately after the injection method has changed from port injection to direct injection) etc. may be the possible causes of the abrupt drop in engine speed. When one of the followings is applicable, engine speed has abruptly dropped.
  In other cases, an engine speed drop is slow.
  (a) In the freeze frame data, the amount of engine speed drop between #3 and #5 is 400 r/min or more.
  (b) In the freeze frame data, the engine speed is 520 r/min or less at #3 and 120 r/min or less at #5.
- Perform AT check when the vehicle speed is 30km/h {19 MPH} or less and the difference between the engine speed and turbine speed is 100 r/min or less. (When lock-up release is delayed, both an abrupt drop and a slow drop of the engine speed may be considered depending on the deceleration rate.)
- *2: When DTCs are detected, F/B is corrected to positive due to a lean state.
- *3: When DTCs are detected, F/B is corrected to negative due to a rich state.

| | |
|---|---|
| B | Go to Step 38. |
| C | Go to Step 52. |
| D | Go to Step 65. |
| E | Go to Step 70. |

A

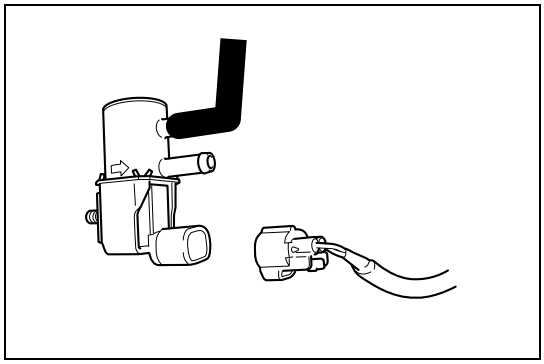
| 5 | Intake system check (connection) |
|---|---|

(1) Make sure there is no air leakage (from disconnected hoses, cracks, gaskets) at each part of the intake system. (Refer to IE - 4)
NOTE:
- Present of air leakage can be easily checked by racing the engine then releasing the accelerator pedal completely because this creates high vacuum that leads to large air induction noise.
- Air may be leaking (sucked in) if F/B correction value and F/B learning value show a larger difference between idling time (smaller mass air flow) and the normal time, and a smaller difference between racing time (larger mass air flow) and the normal time.
  Criteria: Air induction is not present.

NG → Repair or replacement of intake system (connection)

OK

| 6 | Vacuum switching valve ASSY check |
|---|---|



(1) Disconnect the vacuum hose (canister side) of the vacuum switching valve ASSY.
(2) Start the engine.
(3) Idle the engine.
(4) Disconnect the vacuum switching valve ASSY connector.
(5) Check air vent of the vacuum switching valve ASSY.
  Criteria: No air vent

NOTE:
Performing this check may illuminate the MIL. Once the work is done, check and clear the codes. (Refer to ES - 28)

NG → Replacement of vacuum switching valve ASSY (Refer to EC - 16)

OK

| 7 | Freeze frame data check ([Stop Light Switch]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

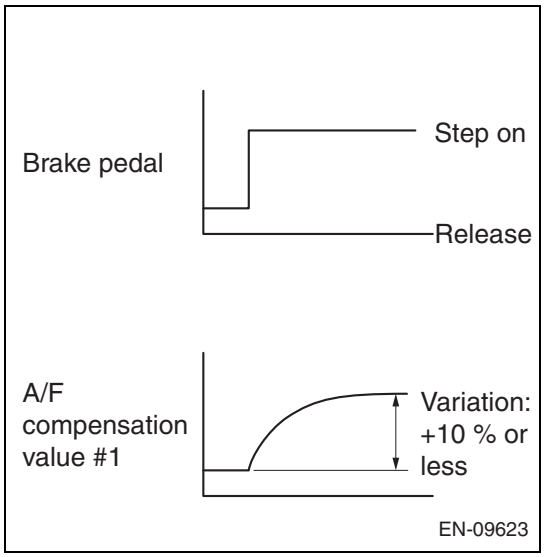
Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Stop Light Switch] | At least 1 case is ON | Air being sucked in from brake booster ASSY | A |
| | All cases are OFF | - | B |

B → Go to Step 10.

A

| 8 | Reading of SSM4 data ([Short term fuel trim B1]) |
|---|---|



(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes.
(4) Idle the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1]
(6) Read [Short term fuel trim B1] displayed on the SSM4 while keep depressing the brake pedal.

Standard value: Change in the value of [Short term fuel trim B1] is +10 % or less

NOTE:
When air is being sucked in, the air/fuel ratio is corrected toward the positive side because it is in a leaner state.

NG → Brake booster ASSY check (Refer to BR - 2)

OK

| 9 | Perform test drive for operation check ([Short term fuel trim B1], [Long term fuel trim B1]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes.
(4) Idle the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Short term fuel trim B1], [Long term fuel trim B1]
(6) Check [Short term fuel trim B1] and [Long term fuel trim B1] displayed on the SSM4.

Standard value

| Item | Inspection conditions | Standard value |
|---|---|---|
| Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | Vehicle conditions when malfunction occurs (during idling, test drive, etc.) | Within ±15% |

NG → Brake booster ASSY check (Refer to BR - 2)

OK

| 10 | Ignition system inspection |
|---|---|

(1) Perform on-board ignition system check. (Refer to ES - 656)

NG → Repair or replace the faulty parts.

OK

| 11 | Freeze frame data check ([Calculated load value], [A/F Sensor #11]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Calculated load value] | Less than 90 % of the normal value (*1) | Intake air flow meter SUB-ASSY | A |
| [A/F Sensor #11] | 2.2 V or more (*2) | • Air / fuel ratio sensor<br>• Wiring harness or connector | B |

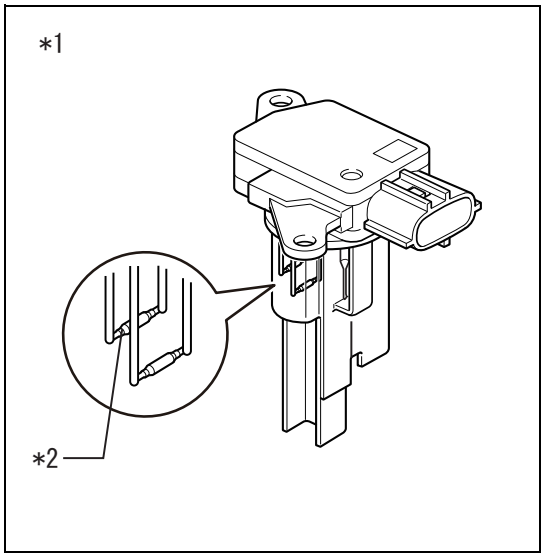
NOTE:
*1: When malfunction occurs in the intake air flow meter SUB-ASSY, the result of the calculation for the mass air flow becomes less than the specification, smaller engine load value is displayed.
*2: When a malfunctioning air/fuel ratio sensor continuously outputs a lean value, the air/fuel ratio is corrected to the richer side and may cause the engine to stall.

B → Go to Step 15.

A

| 12 | Inspection of intake air flow meter SUB-ASSY |
|---|---|

(1) Remove the intake air flow meter SUB-ASSY.



(2) The platinum filament (at heater area) in the flow duct of the intake air flow meter SUB-ASSY is free of foreign materials.

Result

| Result | Go to |
|---|---|
| Visible foreign materials are present | A |
| Visible foreign materials are not present | B |

Captions in illustration

| | |
|---|---|
| *1 | Intake air flow meter SUB-ASSY |
| *2 | Platinum filament (heater) |

B → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

A

| 13 | Check wiring harness and connector (engine control computer - intake air flow meter SUB-ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

ES

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 14 | Perform test drive for operation check (Engine load value) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more).
(3) Idle the engine.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Calculated load value]
(5) Read the [Calculated load value] displayed on the SSM4.

Criteria

| Item | Criteria |
|---|---|
| [Calculated load value] | 90 to 110 % of the normal value |

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

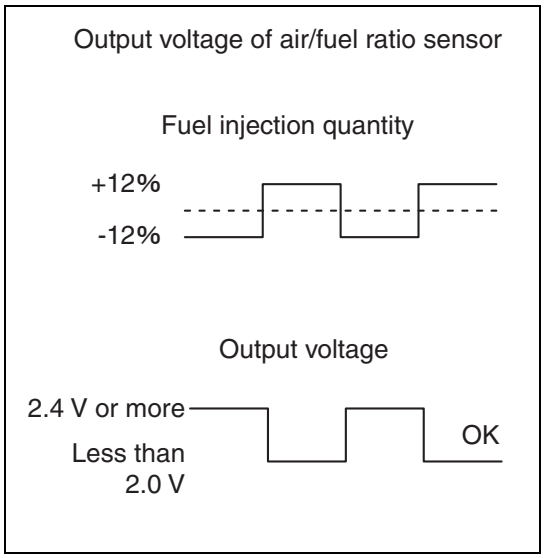
B → Go to Step 18.

A

Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

| 15 | Performing of SSM4 active test (injection volume) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 80°C {176°F} or more).
(3) Run the engine at 2500 r/min for approximately 3 minutes to warm up each sensor.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]



(5) Idle the engine, increase and decrease fuel injection amount, and read values of the air/fuel ratio sensor voltage [A/F Sensor #11].
Voltage

| Tester item | Standard value |
|---|---|
| Fuel injection amount (+12%) | Output voltage of air/fuel ratio sensor is less than 2.0 V. |
| Fuel injection amount (-12 %) | Output voltage of air/fuel ratio sensor is 2.4 V or more. |

CAUTION:
- Voltage output of the air/fuel ratio sensor delays a few seconds.
- Because the sensors become cold, measure the voltage promptly after warming up the sensors.

Result

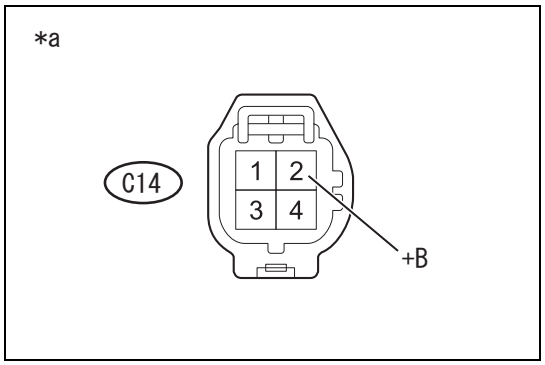
| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 18.

A

| 16 | Check wiring harness and connector (air/fuel ratio sensor power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the air/fuel ratio sensor connector.
(2) Measure the voltage between the terminals.
Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C14-2 (+B) - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (air/fuel ratio sensor connector) |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.

- Make sure an excessive tension is not placed on the wiring harness.

NG → Power supply circuit check (air/fuel ratio sensor power supply circuit) (Refer to ES - 646)

OK

| 17 | Check wiring harness and connector (engine control computer - air/fuel ratio sensor) |
|---|---|

ES

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the air/fuel ratio sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-19 (A1A+) - C14-3 (A1A+) | Always | Less than 1 Ω |
| A34-18 (A1A-) - C14-4 (A1A-) | Always | Less than 1 Ω |
| A34-5 (HA1A) - C14-1 (HA1A) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-19 (A1A+) and C14-3 (A1A+) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-18 (A1A-) and C14-4 (A1A-) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-5 (HA1A) and C14-1 (HA1A) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 18 | Freeze frame data check ([Initial Engine Coolant Temp], [Ambient Temperature], [Initial Intake Air Temp]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Go to |
|---|---|---|
| [Initial Engine Coolant Temp], [Ambient Temperature], [Initial Intake Air Temp] | Difference in temperature for each is less than 10°C {18°F}. (*1) | A |
| | Difference in temperature for each is 10°C {18°F} or more. (*2) | B |

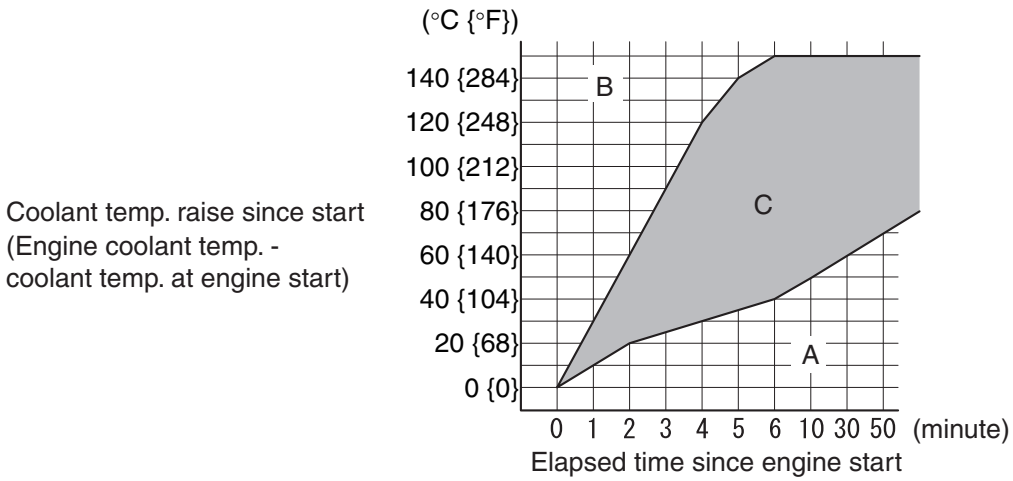
NOTE:
- *1: A long period of time has elapsed after engine was stopped.
- *2: Only short period of time has elapsed after engine was stopped.

B → Go to Step 21.

A

| 19 | Freeze frame data check ([Initial Engine Coolant Temp], [Coolant Temp.], [Time Since Engine Start]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)



Result

| Time-line freeze frame data item | Result | Possible cause | Go to |

B → Go to Step 22.

A

Thermostat replacement (Refer to CO - 36)

| | |
|---|---|
| 21 | Freeze frame data check ([Ambient Temperature], [Coolant Temp.]) |

ES

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Coolant Temp.] | 120°C {248°F} or more | E.F.I. water temperature sensor | A |
| [Coolant Temp.], [Ambient Temperature] | Engine coolant temperature is at least 15°C {27°F} lower than the ambient temperature. | E.F.I. water temperature sensor | |
| Time-line freeze frame data items shown above | Each value is different from those shown above | - | B |

B → Go to Step 24.

A

| | |
|---|---|
| 22 | Unit inspection of the E.F.I. water temperature sensor |

(1) Perform unit inspection of E.F.I. water temperature sensor. (Refer to ES - 700)

NG → Replacement of E.F.I. water temperature sensor (Refer to ES - 699)

OK

| | |
|---|---|
| 23 | Check wiring harness and connector (engine control computer - E.F.I. water temperature sensor) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the E.F.I. water temperature sensor connectors.
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30(THW) - C40-2(THW) | Always | Less than 1 Ω |

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-29(E1) - C40-1(E2) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30 (THW) and C40-2 (THW) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-29 (E1) and C40-1 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

ES

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

**24** Freeze frame data check ([EVAP (Purge) VSV])

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

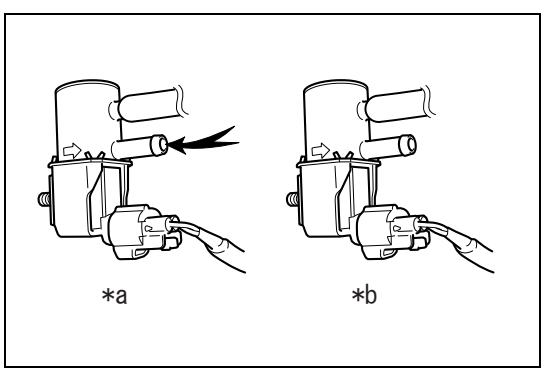
| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [EVAP (Purge) VSV] | At least 1 case is other than 0 % | Vacuum switching valve ASSY | A |
| | All cases are 0 % | - | B |

NOTE:
When the vacuum switching valve ASSY is stuck closed due to a failure, A/F correction is improperly made and a leaner air/fuel ratio is created, and this may cause the engine to stall.

B → Go to Step 33.

A

**25** Performing of SSM4 [Active Test] ([Activate the VSV for Evap Control])



(1) Disconnect the vacuum hose (canister side) of the vacuum switching valve ASSY.
(2) Connect the SSM4 to the DLC3.
(3) Start the engine.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Activate the VSV for Evap Control]
(5) Activate the vacuum switching valve ASSY and check air vent.

Criteria

| [Activate the VSV for Evap Control] | Criteria |
|---|---|
| ON | Air vent present |

| [Activate the VSV for Evap Control] | Criteria |
|---|---|
| OFF | No air vent |

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

Captions in illustration

| | |
|---|---|
| *a | VSV ON (air vent present) |
| *b | VSV OFF (no air vent) |

NOTE:
Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.

B → Go to Step 33.

A

| 26 | Vacuum switching valve ASSY unit inspection |
|---|---|

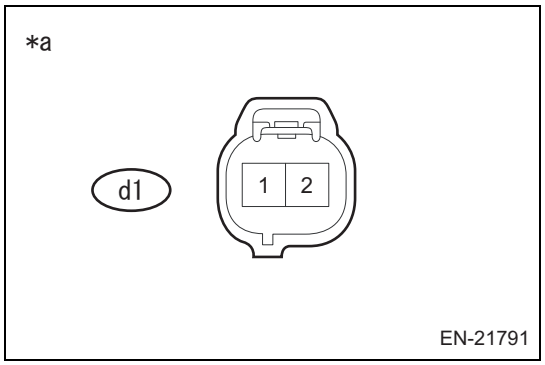
(1) Perform vacuum switching valve ASSY unit inspection. (Refer to EC - 18)

NG → Replacement of vacuum switching valve ASSY (Refer to EC - 18)

OK

| 27 | Check wiring harness and connector (vacuum switching valve ASSY power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the vacuum switching valve ASSY connector.
(2) Turn the ignition switch to ON.
(3) Measure the voltage between terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| d1-1 - chassis ground | IG ON | 11 to 14V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (Vacuum switching valve ASSY connector) |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 28 | Check wiring harness and connector (engine control computer - vacuum switching valve ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the vacuum switching valve ASSY connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-11(PRG) - d1-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-11 (PRG) and d1-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 29 | Clear DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)

Next

| 30 | Reading of SSM4 data ([EVAP (Purge) VSV]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more).
(4) Idle the engine for 15 minutes or more.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Activate the VSV for Evap Control]
(6) Read the [EVAP (Purge) VSV] displayed on the SSM4.
Criteria: Value other than 0 % is displayed.

NOTE:
Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.

B → Inspection for problems that do not normally occur

A

| 32 | Check connection of the engine control computer connectors (power supply system) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Check the connection of the engine control computer connectors.
NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Reconnect the connectors.

OK

Replacement of the engine control computer (Refer to ES - 674)

| 33 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check operation noise of the fuel pump (low-pressure side).

Criteria

| [Control the Fuel Pump Duty] | Criteria |
|---|---|
| 20 % and 80 % | Operating sound is heard. |
| OFF | Operating sound is not heard. |

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure there is no fuel leakage from pipes, a trace of fuel leakage, or fuel odor while [Active Test] is performed.
- When abnormal noise is heard from the fuel pump (low-pressure side), go to step 34.

B → Go to Step 35.

A

| 34 | Fuel pump unit inspection (low-pressure side) |
|---|---|

(1) Perform a unit inspection on the fuel pump (low-pressure side) (Refer to FU - 56)

NG → Replacement of the fuel pump ASSY (low-pressure side) (Refer to FU - 47)

OK

Inspection of fuel pump control system (low-pressure side) (Refer to FU - 9)

| 35 | Fuel system check (function inspection) |
|---|---|

(1) Perform the function inspection of the fuel system. (Refer to FU - 9)
- Fuel pressure check (low-pressure side)

- D4-S inspection (power balance) active test
- Fuel pump operation check and fuel leakage check

Result

| Result | Go to |
|---|---|
| Malfunction | A |

ES

A

| 36 | Fuel system check (check for foreign materials caught in fuel pump) |
|---|---|

(1) Check the area around the fuel pump (low-pressure side) (fuel pump itself, fuel pump filter, and inside the fuel tank ASSY) for an inclusion of foreign materials such as iron chips, and also check the fuel pump (low-pressure side) for any evidence of foreign material intrusion.

Result

| Result | Go to |
|---|---|
| Foreign materials or any evidence of catching them are present | A |
| Neither foreign materials nor any evidence of catching them | B |

NOTE:
Remove foreign materials such as iron chips from the fuel pump (low-pressure side), fuel pump filter, and fuel tank if they are present.

B → Repair or replacement of fuel system

A

| 37 | Fuel system check (function inspection) |
|---|---|

(1) Perform the function inspection of the fuel system. (Refer to FU - 9)
- Fuel pressure check (low-pressure side)
- D4-S inspection (power balance) active test
- Fuel pump operation check and fuel leakage check

NG → Repair or replace the faulty parts.

OK

Complete

| 38 | Ignition system inspection |
|---|---|

(1) Perform on-board ignition system check. (Refer to ES - 656)

NG → Repair or replace the faulty parts.

OK

| 39 | Freeze frame data check ([Calculated load value, A/F Sensor #11]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Calculated load value] | 110 % or more than the normal value (*1) | Intake air flow meter SUB-ASSY | A |
| [A/F Sensor #11] | Less than 2.2 V (*2) | • Air / fuel ratio sensor<br>• Wiring harness or connector | B |
| Time-line freeze frame data items shown above | Each value is different from those shown above | - | C |

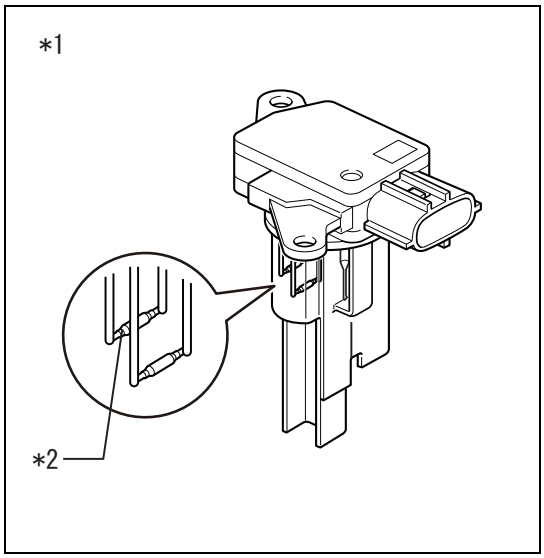
NOTE:
*1: When malfunction occurs in the intake air flow meter SUB-ASSY, the result of the calculation for the mass air flow becomes more than the specification, larger engine load value is displayed
*2: When a malfunctioning air/fuel ratio sensor continuously outputs a rich value, the air/fuel ratio is corrected to the leaner side and may cause the engine to stall.

| B | Go to Step 43. |
|---|---|
| C | Go to Step 46. |

A

| 40 | Inspection of intake air flow meter SUB-ASSY |
|---|---|

(1) Remove the intake air flow meter SUB-ASSY.



(2) The platinum filament (at heater area) in the flow duct of the intake air flow meter SUB-ASSY is free of foreign materials.

Result

| Result | Go to |
|---|---|

| | |
|---|---|
| 41 | Inspection of wiring harnesses and connectors (engine control computer - intake air flow meter SUB-ASSY) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 42 | Perform test drive for operation check ([Calculated load value]) |

(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more).
(3) Idle the engine.
(4) Check DTC using SSM4.
(5) Read the [Calculated load value] displayed on the SSM4.

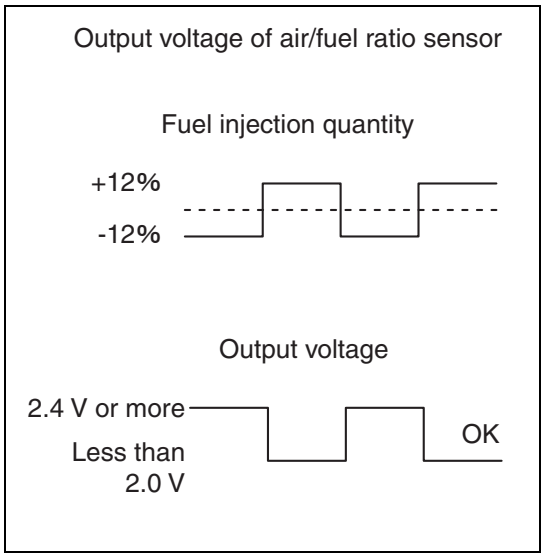
Criteria

| Item | Criteria |
|---|---|
| [Calculated load value] | 90 to 110 % of the normal value |

NG → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

OK

| 43 | SSM4 [Active Test] ([Cylinder Fuel Rate]) |
|---|---|



(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 80°C {176°F} or more).
(3) Run the engine at 2500 r/min for approximately 3 minutes to warm up each sensor.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(5) Run the engine on idling, increase and decrease [Cylinder Fuel Rate], and read values of the air/fuel ratio sensor voltage [A/F Sensor #11].

Voltage

| Tester item | Standard value |
|---|---|
| Fuel injection amount (+12%) | Output voltage of air/fuel ratio sensor is less than 2.0 V. |
| Fuel injection amount (-12 %) | Output voltage of air/fuel ratio sensor is 2.4V or more. |

CAUTION:
- Voltage output of the air/fuel ratio sensor delays a few seconds.
- Because the sensors become cold, measure the voltage promptly after warming up the sensors.

Result

| [Coolant Temp.] | 120°C {248°F} | E.F.I. water temperature sensor | A |
| [Coolant Temp.], [Ambient Temperature] | Engine coolant temperature is at least 15°C {27°F} lower than the ambient temperature. | E.F.I. water temperature sensor | |
| Time-line freeze frame data items shown above | Each value is different from those shown above | - | B |

B → Go to Step 81.

A

| 50 | Unit inspection of the E.F.I. water temperature sensor |
|---|---|

(1) Perform unit inspection of E.F.I. water temperature sensor. (Refer to ES - 700)

NG → Replacement of E.F.I. water temperature sensor (Refer to ES - 699)

OK

| 51 | Check wiring harness and connector (engine control computer - E.F.I. water temperature sensor) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the E.F.I. water temperature sensor connectors.

(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30(THW) - C40-2(THW) | Always | Less than 1 Ω |
| A36-29(E1) - C40-1(E2) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30 (THW) and C40-2 (THW) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-29 (E1) and C40-1 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

Inspection for problems that do not normally occur

| 52 | Ignition system inspection |
|---|---|

(1) Perform on-board ignition system check. (Refer to ES - 656)

NG → Repair or replace the faulty parts.

OK

| 53 | Freeze frame data check ([ISC Learning Value], [ISC Feedback Value]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| Sum of [ISC Learning Value] and [ISC Feedback Value] | Less than 80 % of the current value | Intake air failure | A |
| | 80 % or more than the current value | | B |

B → Go to Step 56.

A

| 54 | Intake system inspection |
|---|---|

(1) Make sure there is no air leakage (from disconnected hoses, cracks, gaskets) at each part of the intake system. (Refer to IE - 4)
NOTE:
- Present of air leakage can be easily checked by racing the engine then releasing the accelerator pedal completely because this creates high vacuum that leads to large air induction noise.
- Air may be leaking (sucked in) if [Short term fuel trim B1] and [Long term fuel trim B1] show a larger difference between idling time (smaller mass air flow) and the normal time, and a smaller difference between racing time (larger mass air flow) and the normal time.

Criteria: No air induction

NG → Repair or replacement of intake system

OK

| 55 | Intake system check (function inspection) |
|---|---|

(1) Check each part of the intake system.
- Brake booster ASSY check (Refer to BR - 2)
- Intake air flow meter SUB-ASSY check (Refer to ES - 680)
- Ventilation hose check (Refer to EC - 3)
- Ventilation valve SUB-ASSY check (Refer to EC - 22)
- Vacuum switching valve ASSY check (Refer to EC - 18)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 60.

A

Repair or replace the faulty parts.

| 56 | Performing of SSM4 [Active Test] ([Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C [167°F] or more)
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)]
(4) Start the engine and idle the engine and check the idle speed under [Active Test].

Criteria

| Inspection conditions | Criteria |
|---|---|
| 0°CA | Normal idle speed |
| Advance or retard the timing between 0°CA ←→100°CA. | Engine stalls, rough idling |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Check the operation noise under [Active Test]. Also check the valves for problems such as failed valve return, stuck valve, and abnormal conditions.
- If the camshaft timing oil control valve ASSY (intake side) is stuck ON, valve overlap increases and internal EGR causes poor combustion, and eventually may lead to rough idling and engine stall.

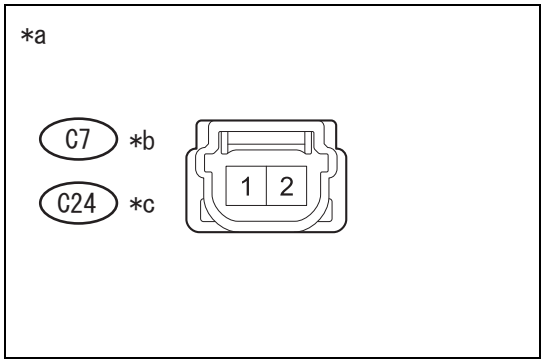
ES

NG → Replacement of camshaft timing oil control valve ASSY (intake side) (Refer to ES - 664)

OK

| | |
|---|---|
| 57 | Check wiring harness and connector (engine control computer - camshaft timing oil control valve ASSY (intake side)) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect camshaft timing oil control valve ASSY (intake side) connector.
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C7-1 - chassis ground | IG ON | 11 to 14 V |
| C24-1 - chassis ground | IG ON | 11 to 14 V |

(3) Disconnect the connector for the engine control computer.
(4) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-17 (OC1) - C7-2 | Always | Less than 1 Ω |
| A36-16 (OC2) - C24-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-17 (OC1) and C7-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-16 (OC2) and C24-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:

- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 58 | Performing of SSM4 [Active Test] ([Control the VVT Exhaust Linear (Bank1)], [Control the VVT Exhaust Linear (Bank2)]) |

(1) Connect the SSM4 to the DLC3.
(2) Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C [167°F] or more)
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Control the VVT Exhaust Linear (Bank1)], [Control the VVT Exhaust Linear (Bank2)]
(4) Start the engine and idle the engine and check the idle speed under [Active Test].

Criteria

| Inspection conditions | Criteria |
|---|---|
| 0°CA | Normal idle speed |
| Advance or retard the timing between 0°CA ←→100°CA. | Engine stalls, rough idling |

NOTE:

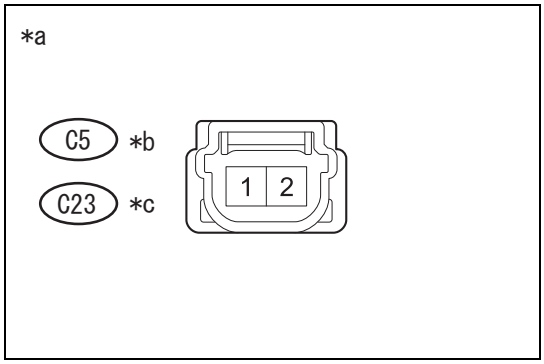
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Check the operation noise under [Active Test]. Also check the valves for problems such as failed valve return, stuck valve, and abnormal conditions.
- If the camshaft timing oil control valve ASSY (exhaust side) is stuck ON, valve overlap increases and internal EGR causes poor combustion, and eventually may lead to rough idling and engine stall.

NG → Replacement of camshaft timing oil control valve ASSY (exhaust side) (Refer to ES - 664)

OK

| | |
|---|---|
| 59 | Check wiring harness and connector (engine control computer - camshaft timing oil control valve ASSY (exhaust side)) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect camshaft timing oil control valve ASSY (exhaust side) connector.
(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C5-1 - chassis ground | IG ON | 11 to 14 V |
| C23-1 - chassis ground | IG ON | 11 to 14 V |

(3) Disconnect the connector for the engine control computer.
(4) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-7 (OE1) - C5-2 | Always | Less than 1 Ω |
| A36-5 (OE2) - C23-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-7 (OE1) and C5-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-5 (OE2) and C23-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 60 | Freeze frame data check ([Ignition timing adv. #1], [Knock Correct Learn Value]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | | Possible cause | Go to |
|---|---|---|---|
| [Ignition timing adv. #1] | [Knock Correct Learn Value] | | |
| Difference from the normal value is 10° or more | Less than 3°CA | • E.F.I. water temperature sensor<br>• Intake air flow meter SUB-ASSY<br>• Knock control sensor | A |
| | 3°CA or more | - | B |
| Difference from the normal value is within 10° | - | - | |

ES

B → Inspection for problems that do not normally occur

A

| | |
|---|---|
| 61 | Unit inspection of the E.F.I. water temperature sensor |

(1) Perform unit inspection of E.F.I. water temperature sensor. (Refer to ES - 700)

NG → Replacement of E.F.I. water temperature sensor (Refer to ES - 699)

OK

| | |
|---|---|
| 62 | Check wiring harness and connector (engine control computer - E.F.I. water temperature sensor) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the E.F.I. water temperature sensor connectors.
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30(THW) - C40-2(THW) | Always | Less than 1 Ω |
| A36-29(E1) - C40-1(E2) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30 (THW) and C40-2 (THW) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-29 (E1) and C40-1 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 63 | Unit inspection of intake air flow meter SUB-ASSY (inlet air temperature sensor check) |
|---|---|

(1) Perform unit inspection of intake air flow meter SUB-ASSY. (Refer to ES - 680)

NOTE:

When a value higher than the normal intake air temperature is output to the engine control computer due to a failure of the intake air flow meter SUB-ASSY (inlet temperature sensor), the timing may be retarded.

ES

NG → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

OK

| 64 | Reading of SSM4 data ([Ignition timing adv. #1], [Knock Correct Learn Value]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C [167°F] or more).
(3) Idle the engine.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Ignition timing adv. #1], [Knock Correct Learn Value]
(5) Read the [Ignition timing adv. #1] and [Knock Correct Learn Value] displayed on the SSM4.

Result

| Item | | Go to |
|---|---|---|
| [Ignition timing adv. #1] | [Knock Correct Learn Value] | |
| Difference from the current value is 10° or more | Less than 3 ° | A |
| | 3° or more | B |
| Difference from the current value is within 10° | - | |

NOTE:

When normal results are obtained in steps 56 through 64, if a sum of [ISC Learning Value] and [ISC Feedback Value] is 120 % or more than the normal value, check the throttle body ASSY for carbon deposit. If carbon deposit is found, replace the throttle body ASSY and complete the work.

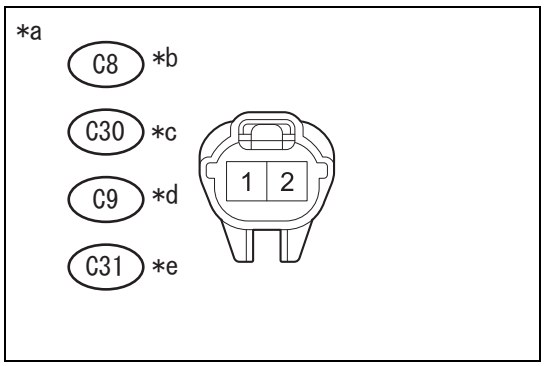
B → Complete

A

Knock sensor circuit check (Refer to ES - 305)

| 65 | Engine control computer check (fuel injector ASSY (port injection side) power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector for fuel injector ASSY (port injection side).
(2) Turn the ignition switch to ON.
(3) Measure the voltage between terminals. (For terminal arrangement, refer to ES - 36.)

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - chassis ground | IG ON | 11 to 14 V |
| C30-1 - chassis ground | IG ON | 11 to 14 V |
| C9-1 - chassis ground | IG ON | 11 to 14 V |
| C31-1 - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| *a | Front side of vehicle wiring harness connector (fuel injector ASSY (port injection side) connectors) |
| *b | No. 1 cylinder |
| *c | No. 2 cylinder |
| *d | No. 3 cylinder |
| *e | No. 4 cylinder |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.
- Trouble in all cylinders or multiple cylinders may be the possible causes of the abrupt drop in engine speed. (Failure in the power supply system of the common wiring harness to all cylinders could be the cause.)

NG → Power supply circuit check (fuel injector ASSY (port injection side)) (Refer to ES - 637)

OK

| 66 | Ignition system inspection |
|---|---|

(1) Perform on-board ignition system check. (Refer to ES - 656)

NG → Repair or replace the faulty parts.

OK

| 67 | Freeze frame data check ([A/C Switch], [Air Conditioner FB Val]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected.

(Refer to ES - 28)

Result

| Time-line freeze frame data item | | Possible cause | Go to |
|---|---|---|---|
| [A/C Switch], [Air Conditioner FB Val] | [Air Conditioner FB Val] | | |
| Reading of [A/C Switch] does not change from OFF, or the reading of [Air Conditioner FB Val] does not increase (20 % or less than [ISC Learning Value] (standard *1)) | - | Other than air conditioner system | A |
| Reading of [A/C Switch] has changed from OFF to ON, or the reading of [Air Conditioner FB Val] has increased (20 % or more than [ISC Learning Value] (standard *1)) | No values are indicated. | | |
| | Values are indicated. | Air conditioner system (automatic air conditioning system) | B |
| | | Air conditioner system (manual air conditioning system) | C |

NOTE:

- *1: The normal value of [ISC Learning Value] is the displacement (liter) ×0.9.
- Even if the results are normal, there is still a possibility of trouble in the air conditioning system. If no fault is found in other parts, inspect the air conditioning system.

B → Air conditioner check (automatic air conditioning system) (Refer to AC - 17)

C → Air conditioner check (manual air conditioning system) (Refer to AC - 74)

A

| | |
|---|---|
| 68 | Freeze frame data check ([Electric Load Feedback Val], [Engine Speed], turbine speed, [Vehicle Speed]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | | | | Possible cause | Go to |
|---|---|---|---|---|---|
| [Electric Load Feedback Val] | | Difference between [Engine Speed] and turbine speed | [Vehicle Speed] | | |
| Reading of [Electric Load Feedback Val] increases *1 (20 % or more than [ISC Learning Value] (standard *2)) | No values are indicated. | All cases are 100 r/min or more | - | - | A |
| | | At least one case is less than 100 r/min (*3) | 30km/h {19 MPH} or more | - | |
| | | | Less than 30km/h {19 MPH} | Automatic transmission system | B |
| | Values are indicated. | - | - | Electric load signal system | C |

| Time-line freeze frame data item | | | | Possible cause | Go to |
|---|---|---|---|---|---|
| [Electric Load Feedback Val] | | Difference between [Engine Speed] and turbine speed | [Vehicle Speed] | | |
| Reading of [Electric Load Feedback Val] does not increase (20 % or less than [ISC Learning Value] (standard *2)) | - | All cases are 100 r/min or more | - | - | A |
| | | At least one case is less than 100 r/min (*3) | 30km/h {19 MPH} or more | - | |
| | | | Less than 30km/h {19 MPH} | Automatic transmission system | B |

ES

NOTE:

- *1: If [Electric Load Feedback Val] is increasing, this may indicate a failure due to a change in electric load. Check the power steering system and generator, and also check the continuity and connectors between generator and engine control computer for improper connection.
- *2: The normal value of [ISC Learning Value] is the displacement (liter) ×0.9.
- *3: When the difference between [Engine Speed] and the turbine speed is small, the engine and turbine are locked up. Because the lock-up is usually released when the vehicle speed is 30 km/h {19 MPH} or less, a faulty automatic transmission system is presumed. (At this time, a delay in [Vehicle Speed] of the freeze frame data should be taken into consideration. The delay is approximately 0.5 seconds when compared to the actual vehicle speed.)
- Even if the results are normal, there is still a possibility of trouble in the electric load signal system and the automatic transmission system. If no fault is found in other parts, inspect the electric load signal system, power steering system, and the automatic transmission system.

B → Automatic transmission check (automatic transmission system) (Refer to AT - 15)

C → Alternator system check (charging system)

A

| | |
|---|---|
| 69 | Freeze frame data check ([Shift SW Status (P Range)], [Shift SW Status (N Range)], [Neutral Position Switch]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | | Possible cause | Go to |
|---|---|---|---|
| [Shift SW Status (P Range)] or [Shift SW Status (N Range)] | [Neutral Position Switch] | | |
| At least one case is OFF | NSW ON when D position or R position is selected | Neutral start switch ASSY system | A |
| | NSW OFF when D position or R position is selected | Automatic transmission system | B |
| All cases are ON | - | - | C |

ES

NOTE:
Even if the results are normal, there is still a possibility of trouble in the neutral start switch ASSY system and the automatic transmission system. If no fault is found in other parts, inspect the neutral start switch ASSY system and the automatic transmission system.

B → Automatic transmission check (automatic transmission system) (Refer to AT - 15)

C → Inspection for problems that do not normally occur

A

Neutral start switch ASSY check (refer to AT - 189)

| 70 | Freeze frame data check ([Relative Throttle Pos.], [Calculated load value]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

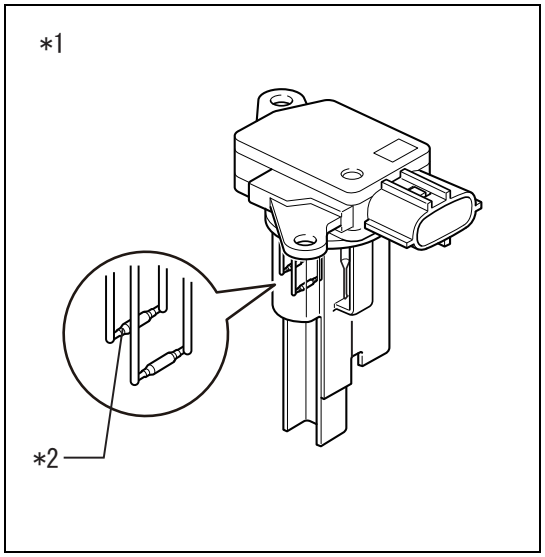
| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Relative Throttle Pos.], [Calculated load value] | Engine load value is decreasing while throttle opening angle is increasing | Intake air flow meter SUB-ASSY | A |
| | Engine load value is not decreasing while throttle opening angle is increasing | - | B |

B → Go to Step 74.

A

| 71 | Inspection of intake air flow meter SUB-ASSY |
|---|---|

(1) Remove the intake air flow meter SUB-ASSY.



(2) The platinum filament (at heater area) in the flow duct of the intake air flow meter SUB-ASSY is free of foreign materials.

Result

| Result | Go to |

B → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

A

| 72 | Inspection of wiring harnesses and connectors (engine control computer - intake air flow meter SUB-ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 73 | Perform test drive for operation check ([Calculated load value]) |
|---|---|

(1) Connect the SSM4 to the DLC3.

(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more).
(3) Idle the engine.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Calculated load value]
(5) Read the [Calculated load value] displayed on the SSM4.

Criteria

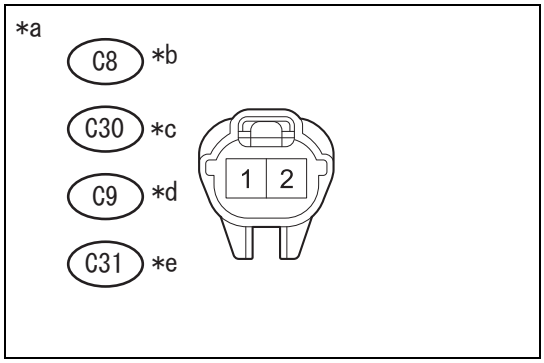
| Item | Criteria |
|---|---|
| [Calculated load value] | 90 to 110 % of the normal value |

NG → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

OK

| 74 | Engine control computer check (fuel injector ASSY (port injection side) power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector for fuel injector ASSY (port injection side).
(2) Turn the ignition switch to ON.
(3) Measure the voltage between terminals. (Refer to ES - 36)

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - chassis ground | IG ON | 11 to 14 V |
| C30-1 - chassis ground | IG ON | 11 to 14 V |
| C9-1 - chassis ground | IG ON | 11 to 14 V |
| C31-1 - chassis ground | IG ON | 11 to 14 V |

| DTC | P1604 | Startability Malfunction |
|---|---|---|

Circuit description
When the engine does not start or it takes a long period of time to startup even though the starter signal has been input, and when the engine speed drops immediately after startup and stalls, this DTC is output.
The conditions at the time the DTC was output can be checked from the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
It is necessary to check the fuel level before troubleshooting because startup failure due to running out of gas can also be detected.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P1604 | When any of the following conditions is met (1 trip detection logic):<br>•When engine speed is less than 500 r/min with the starter signal ON for a certain period of time (differs depending on engine coolant temperature and atmospheric pressure).<br>•When engine speed drops to 300 r/min immediately after the engine is started (with engine speed 500 r/min or more). | •Engine immobilizer system<br>•Engine ASSY (excessive wear, compression leakage)<br>•Starter ASSY<br>•Crankshaft position sensor<br>•Camshaft position sensor<br>•E.F.I. water temperature sensor<br>•Fuel pump<br>•Fuel pump control circuit<br>•Fuel pipe<br>•Fuel injector ASSY (port injection)<br>•Throttle body<br>•Pressure regulator<br>•Battery<br>•Drive plate<br>•Spark plug<br>•Ignition coil circuit<br>•Intake system<br>•Camshaft timing oil control valve ASSY<br>•Intake air flow meter SUB-ASSY<br>•Air / fuel ratio sensor<br>•Valve timing<br>•Fuel<br>•Purge VSV<br>•Intake valve<br>•Exhaust valve<br>•ECM |

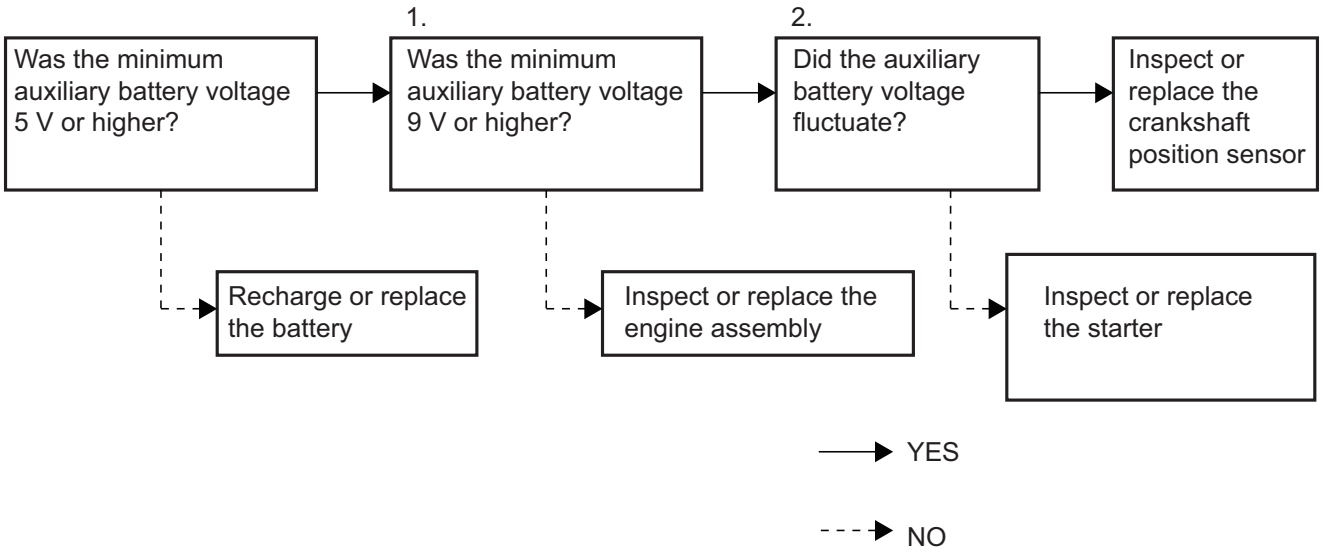
Refer to DTC P0351. (Refer to ES - 323)
Refer to DTC P0365. (Refer to ES - 328)
Inspection steps
NOTE:

- DTC P1604 is different from existing diagnosis for parts, circuits, or system failure. When customer complains about situations such as "engine stalls" and "engine does not start", trouble phenomenon and freeze frame data will be evaluated to identify possible failure parts. DTCs may be output and detected due to operation done by the user. Therefore, unless there are customer complaints, do not perform diagnosis work but clear the codes and return the vehicle to the customer even if DTCs are present.
- If any other DTCs are present, troubleshoot the appropriate DTCs first.
- If the engine cannot be started and P1604 is not output, refer to the symptom table. (Refer to ES - 16)
- If [Immobilizer Fuel Cut] under [Data monitor] shows failure, the engine cannot be started.
- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- To check time-line freeze frame data, check 5 data. (Refer to ES - 28)
- If there are more than one items that are applicable to cause of trouble when time-line freeze frame data is checked, perform diagnosis procedure for all the applicable items.
- Start the engine to reproduce the conditions that are closest to those occurred at the time the trouble took place, as recorded in the freeze frame data. Check the data at that time and compare to the freeze frame data.
- Focus on looking over sign and conditions at the time the trouble took place because the conditions may not recur.
- Wiggle the appropriate wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- If the same check and replacement may be repeated through these steps, they may be omitted the second time.

1. Workflow of inspection steps
   (1) Freeze frame data is present but not reproducible and malfunction condition has not been identified
      (a)Engine speed in freeze frame data is 0 r/min (no cranking)
         NOTE:
         Discharged battery, excessive engine friction, starter ASSY failure, or faulty crankshaft position sensor system may be the cause.
         1. If the battery voltage is 5 V or less, a faulty battery may be the cause.
         2. If the battery voltage is less than 9 V, engine friction may be improper.
         3. If the battery voltage fluctuates during cranking, it is presumed that the engine is actually being cranked. When the engine speed is 0 r/min, faulty cranking position sensor system and the engine control computer may be the cause.

When the engine speed for all 5 sets of freeze frame data is 0 rpm:



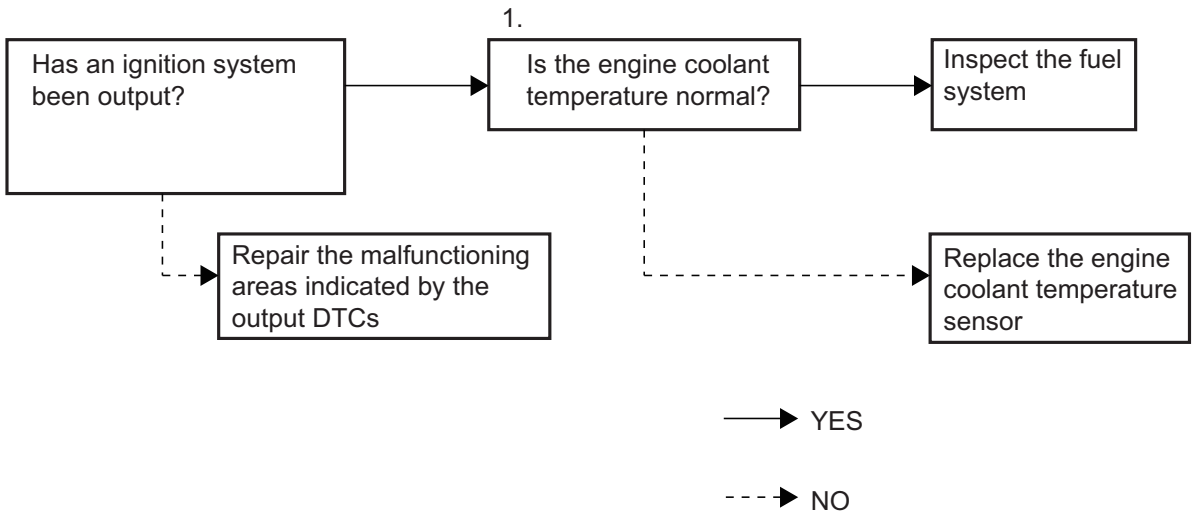
(b) Engine speed in freeze frame data is 100 to 250 r/min (engine cranks but there is no combustion)

NOTE:

When the engine speed is 100 to 250 r/min without initial combustion, faulty wiring harness or perfect failure of the ignition system/fuel system components may be the cause.

1. Malfunctioning water temperature sensor may cause excessive quantities or insufficient amount of fuel injection that can lead to startup failure.

Engine speed is between 100 and 250 rpm:



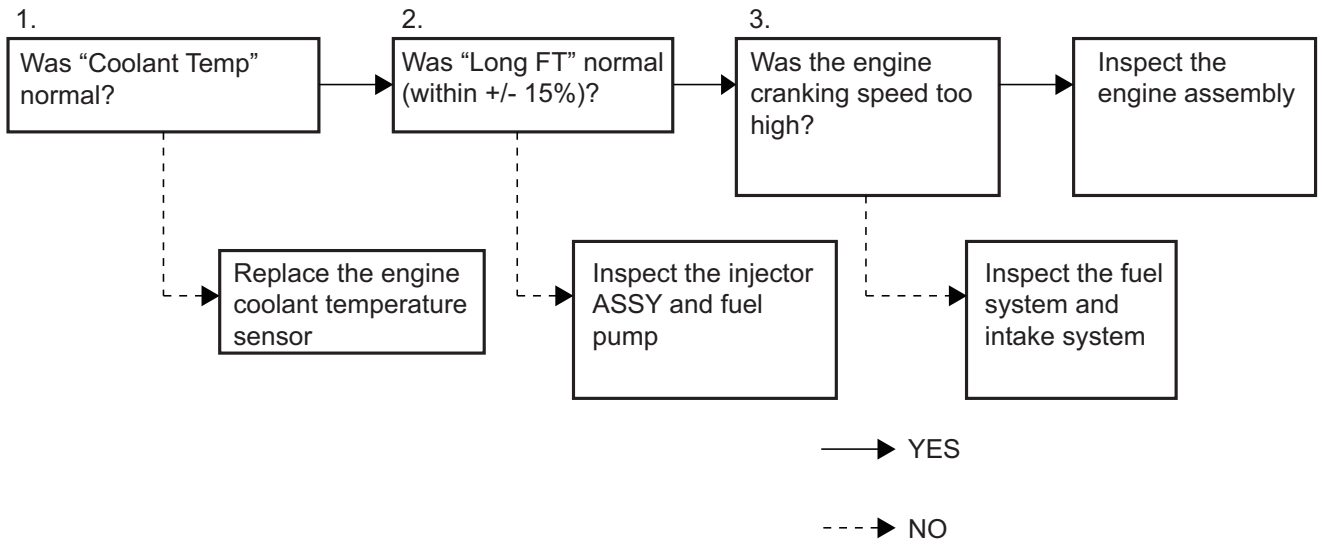
(c) Engine speed in freeze frame data is 250 r/min or more (delay in initial and completion of combustion)

NOTE:

When engine speed is 250 r/min or more (initial and completion of combustion delay), an improper amount of fuel injection (insufficient or excessive) is often the case. This can make troubleshooting difficult.

1. Malfunctioning water temperature sensor may cause excessive quantities or insufficient amount of fuel injection, which leads to startup failure
2. If the F/B learning value is out of the range, insufficient fuel supply due to clogging fuel injector ASSY (port injection side) and fuel pump (low-pressure side) may be the cause.
3. When the cranking speed is high, it may result from poor compression due to carbon buildup on valves.

Engine speed is 250 rpm or higher:



(2) Problem is reproducible or malfunction condition has been identified

When the problem is reproducible or malfunction condition has been identified, perform the diagnosis with symptom. When the cause of the problem has not been identified, perform systematic inspection.

(a)Diagnosis with symptom

1. No cranking

   NOTE:

   When the pop-up sound for the starter pinion gear is heard, the starter ASSY unit is normal. Then the possible cause is discharged battery or excessive engine friction.
2. Cranking speed error

   NOTE:

   When the cranking speed is high, it may result from poor compression due to carbon buildup on valves, etc.
3. No initial combustion

   NOTE:

   When initial combustion is not present, faulty wiring harness or ignition/fuel system failure may be the cause.
4. Engine stalls after complete combustion

   NOTE:

   If the engine stalls after a complete combustion, improper air/fuel ratio and VVT return failure may be the cause. If the engine stalls after the injection method has changed from port injection to direct injection, the injector driver may be faulty.
5. Delay in initial or complete combustion

   NOTE:

   When initial and complete combustion are delayed, improper fuel injection amount (insufficient or excessive) may be the cause.

   NOTE:

   Causes of ignition system failure based on conditions of how trouble occurs

   - Approximately 2 to 3 minutes after engine stopped: Fuel pressure drop due to failure in holding fuel pressure by the fuel pressure regulator ASSY

- Approximately 15 to 120 minutes after engine stopped: Oil-tightness failure of fuel injector ASSY (port injection side)
- A long period of time elapsed after engine stopped: Fuel pressure regulator ASSY fails to open

(b)Systematic inspection

1. Air control system
2. Ignition system
3. Fuel system

(3) Freeze frame data is present but not reproducible and malfunction condition has not been identified

ES

| Time-line freeze frame item | Result | Possible cause | Step |
|---|---|---|---|
| Engine Speed | 0 r/min (no cranking at all) | • Discharged battery<br>• Engine unit (excessive friction)<br>• Starter system<br>• Crankshaft position sensor system<br>• Engine control computer | 4 to 9 |
| | 100 to 250 r/min (cranks but no initial combustion *1) | • Fuel pump control system (low-pressure side)<br>• Ignition system<br>• E.F.I. water temperature sensor<br>• Fuel injector ASSY (port injection side) system | 10 to 14 |
| | 250 r/min or more (there is combustion but initial and complete combustion *2 delay) | • Engine unit (compression drops)<br>• Fuel injector ASSY (port injection side) system<br>• Fuel pump control system (low-pressure side)<br>• E.F.I. water temperature sensor<br>• Fuel pressure regulator ASSY<br>• Throttle body ASSY (with motor)<br>• Intake system connections | 15 to 23 |

NOTE:

- *1: First combustion after cranking
- *2: When the engine speed increases and the starter ASSY is allowed to disengage

(4) Problem is reproducible or malfunction condition has been identified

(a)Diagnosis with symptom

| Trouble phenomenon | Possible cause | Step |
|---|---|---|
| No cranking | • Discharged battery<br>• Starter ASSY (including worn or chipped pinion ring)<br>• Starter system<br>• Engine unit (excessive friction)<br>• Chipped flywheel teeth (transmission M/T)<br>• Worn or chipped drive plate/ring gear SUB-ASSY (transmission A/T) | 26 to 31 |
| Cranking speed error | • Discharged battery<br>• Starter ASSY<br>• Engine unit (excessive friction, compression drop) | 32 to 34 |
| No initial combustion | • Fuel pressure holding by fuel pressure regulator ASSY<br>• Fuel injector ASSY (port injection side) leakage<br>• Fuel injector ASSY (port injection side) system<br>• Fuel leakage from fuel line<br>• Fuel pump control system (low-pressure side)<br>• Fuel pump (low-pressure side)<br>• Spark plug<br>• Crankshaft position sensor system<br>• Ignition coil ASSY system | 35 to 49 |

| Trouble phenomenon | Possible cause | Step |
|---|---|---|
| Engine stalls after complete combustion* | • Intake system connections<br>• Throttle body ASSY (with motor)<br>• Camshaft timing oil control valve ASSY<br>• Intake air flow meter SUB-ASSY system | 50 to 56 |
| Delay in initial or complete combustion | • E.F.I. water temperature sensor<br>• Intake air flow meter SUB-ASSY<br>• Air / fuel ratio sensor<br>• Fuel injector ASSY (Port injection side)<br>• Vacuum switching valve ASSY system<br>• Spark plug<br>• Fuel pressure regulator ASSY<br>• Fuel pump (low-pressure side)<br>• Fuel pump control system (low-pressure side) | 57 to 71 |

* If the engine stalls immediately after the injection method has changed from port injection to direct injection, the injector driver may be faulty.

(b)Systematic inspection

| Systematic troubleshooting | Possible cause | Step |
|---|---|---|
| Fuel system A | • Fuel injector ASSY (Port injection side)<br>• Fuel<br>• Crankshaft position sensor system<br>• Fuel leakage from fuel line<br>• Fuel pump (low-pressure side)<br>• Fuel pressure regulator ASSY | 87 to 94<br>95 to 102 |
| Fuel system B | • Vacuum switching valve ASSY system<br>• Fuel injector ASSY (Port injection side)<br>• Intake valve | 103 to 105 |
| Fuel system C | • Fuel injector ASSY (port injection side) system<br>• Crankshaft position sensor<br>• Camshaft position sensor<br>• Engine control computer | 73 to 76 |
| Air control system | • Engine unit (compression drops)<br>• Valve timing<br>• E.F.I. water temperature sensor<br>• Engine control computer | 84 to 86<br>106 to 108 |
| Ignition system | • Crankshaft position sensor system (with sensor installation)<br>• Camshaft position sensor system (with sensor installation)<br>• Engine control computer | 77 to 83<br>109 to 115 |

NOTE:

- Bank 1 shows the side where No. 1 cylinder is located.
- Bank 2 shows the side where No. 2 cylinder is located.

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| Only P1604 is output. | A |
| Diagnostic codes other than P1604 are also output. | B |

NOTE:
If any DTCs other than P1604 are output, troubleshoot them first.

B → To corresponding DTC chart (refer to ES - 12)

| 2 | Engine immobilizer system check |
|---|---|

(1) Check the engine immobilizer system.
- Models with smart entry & start system (Refer to TD - 237)
- Models without smart entry & start system (Refer to TD - 277)

NG → Engine immobilizer system repair

OK

| 3 | Check trouble phenomenon |
|---|---|

(1) Check the trouble phenomenon.

Result

| Result | Go to |
|---|---|
| The freeze frame data has been input but trouble phenomenon is not reproducible and malfunction condition has not been identified. | A |
| Problem is reproducible or malfunction condition has been identified. | B |

B → Go to Step 25.

A

| 4 | Check freeze frame data ([Engine Speed], [Control module voltage]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | | Possible cause | Go to |
|---|---|---|---|
| [Engine Speed] | [Control module voltage] | | |
| All are 0 r/min (no cranking at all) | Minimum voltage is less than 5 V. | Discharged battery | A |
| | Minimum voltage is 5 V or more. | • Starter ASSY failure<br>• Crankshaft position sensor system<br>• Excessive engine friction<br>• Engine control computer | B |
| 100 to 250 r/min (cranks but no initial combustion) | - | • Fuel pump control system (low-pressure side)<br>• Ignition system<br>• E.F.I. water temperature sensor<br>• Fuel injection system | C |
| 250 r/min or more (there is combustion but initial and complete combustion delay) | - | • Engine unit<br>• Fuel injection system<br>• Fuel pump control system (low-pressure side) | D |

NOTE:
When P1604 is output, either [Starting time of engine failure history]*1 or [Low Rev for Eng Start]*2 in the freeze frame data is switched ON.
When [Low Rev for Eng Start] is switched ON, go to E.
*1: [Starting time of engine failure history] is switched ON when engine speed does has not reached the specified speed within the specified time period when the engine started.
*2: When [Low Rev for Eng Start] is ON, check the following freeze frame data items because operation done by the user may cause the engine to slow down and stall after the engine starts.

- [Immobilizer Fuel Cut]
- [Engine Speed (Starter Off)]
- Gear signal

| | |
|---|---|
| B | Go to Step 5. |
| C | Go to Step 10. |
| D | Go to Step 15. |
| E | Go to Step 50. |

A

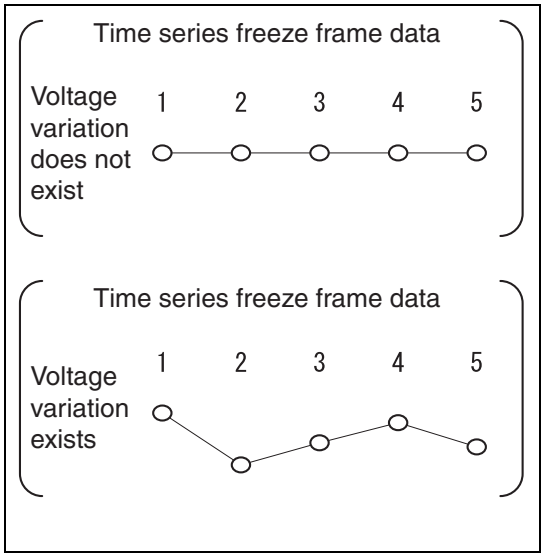
Battery charging or replacement

| | |
|---|---|
| 5 | Check freeze frame data ([Control module voltage]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions and use time-line freeze frame data to check vehicle conditions at the time the DTCs are detected. (Refer to ES - 28)

Result

| Time-line freeze frame data item | Result | Possible cause | Go to |
|---|---|---|---|
| [Control module voltage] | Minimum voltage is 9 V or more and voltage fluctuations occur. *2 and *3 | • Crankshaft position sensor system<br>• Engine control computer | A |
| | Minimum voltage is 9 V or more and voltage fluctuations do not occur. *1 | Starter system (models with smart entry & start system) | B |
| | | Starter system (models without smart entry & start system) | C |
| | Minimum voltage is 5 to 9 V. *4 | Excessive engine friction | D |



NOTE:
- *1: 5 data of [Control module voltage] in the freeze frame data are almost the same.
- *2: 5 data of [Control module voltage] in the freeze frame data vary.
- *3: If the voltage varies, it is presumed that the cranking goes on properly. When the engine speed is 0 r/min, faulty cranking position sensor system and the engine control computer may be the cause.
- *4: Because excessive engine friction is suspected, rotate the crankshaft manually to check if it turns smoothly. Also, because excessive engine friction may have been only a temporal condition, remove the cylinder covers and oil pan and check for foreign materials such as iron chips. Carefully inspect or disassemble parts and inspect them if failure or symptom of trouble is found.

B → Starter system check (models with smart entry & start system) (Refer to ES - 614)

C → Starter system check (models without smart entry & start system) (Refer to ES - 624)

D → Check and repair engine unit

|---|---|
| 6 | Sensor installation area check (crankshaft position sensor) |

(1) Check the tightening condition of the crankshaft position sensor bolt and installation condition of the sensor.
(2) Check installation conditions of the crankshaft position sensor connector.
Criteria: Properly installed.

NG → Repair or replacement of sensor installation area

OK

| | |
|---|---|
| 7 | Crankshaft position sensor check |

(1) Disconnect the crankshaft position sensor connector.
(2) Make sure that the connector terminals are free of oil.
Criteria: Terminals are free of oil.

NG → Replacement of crankshaft position sensor (Refer to ES - 685)

OK

| | |
|---|---|
| 8 | Check wiring harness and connector (engine control computer - crankshaft position sensor) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the crankshaft position sensor connector.

(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16(NE+) - C47-1(OUT) | Always | Less than 1 Ω |
| A34-27(NE-) - C47-2(GND) | Always | Less than 1 Ω |
| A36-19(VC) - C47-3(VCC) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16 (NE+) and C47-1 (OUT) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-27 (NE-) and C47-2 (GND) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-19(VC) - C47-3(VCC) | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 9 | Crankshaft position sensor check |
|---|---|

(1) Replace the crankshaft position sensor and check if the trouble is solved.

NOTE:
- Replacement of crankshaft position sensor (Refer to ES - 685)

Result

| Result | Go to |

| [Coolant Temp.] | Engine coolant temperature is 40°C {104°F} or less. *1 | Fuel pressure regulator ASSY | A |
| | Engine coolant temperature is 40 to 90°C {104 to 194°F}. *2 | Fuel injector ASSY (Port injection side) | B |
| | Engine coolant temperature is 90°C {194°F} or more. *3 | Fuel pressure regulator ASSY | A |

NOTE:
*1: If the engine coolant temperature is 40°C {104°F} or less (a long period of time has elapsed after engine stopped), the fuel pressure regulator ASSY may be stuck open. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.
*2: If the engine coolant temperature is 40 to 90°C {104 to 194°F} (approximately 15 to 120 minutes elapsed after engine stopped), fuel leakage from the fuel injector ASSY (port injection side) is suspected.
*3: If the engine coolant temperature is 90°C {194°F} or more (approximately 2 to 5 minutes have elapsed after engine stopped), a failure in fuel pressure-holding ability of the fuel pressure regulator ASSY is suspected. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.

B → Go to Step 20.

A

| 19 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Attach a fuel pressure gauge and check fuel pressure (low-pressure side) after engine is stopped. (Refer to FU - 9)
Criteria: 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} or more (5 minutes after engine is stopped)
NOTE:
If the engine cannot be started, read the value after cranking.

ES

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 24.

A

Replacement of fuel pressure regulator ASSY (Refer to FU - 47)

| 20 | Fuel injector ASSY check (HC content on port injection side) |
|---|---|

(1) Stop the engine and purge inside the intake air surge tank ASSY with pressurized air.
(2) Wait for 15 minutes and measure HC content inside the intake air surge tank ASSY.

Result

| Result | Go to |
|---|---|
| 4000 ppm or more | A |
| Less than 4000 ppm | B |

NOTE:
When HC content is 4000 ppm or more, air-tightness failure of fuel injector ASSY (port injection side) is suspected.

B → Go to Step 22.

A

| 21 | Fuel injector ASSY unit inspection (port injection side) |
|---|---|

(1) Perform a unit inspection on the fuel injector ASSY (port injection side). (Refer to FU - 29)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal | B |

B → Go to Step 22.

A

Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

| 22 | Throttle body ASSY (with motor) check |
|---|---|

(1) Check the air passage for carbon buildup.

ES

Result

| Result | Go to |
|---|---|
| Carbon buildup on intake valves. | A |
| Intake valves are free of carbon. | B |

B → Go to Step 23.

A

Replacement of throttle body ASSY (with motor) (Refer to ES - 670)

| 23 | Intake system check (connection) |
|---|---|

(1) Make sure there is no air leakage (from disconnected hoses, cracks, gaskets) at each part of the intake system. (Refer to IE - 4)
NOTE:
- Present of air leakage can be easily checked by racing the engine then releasing the accelerator pedal completely because this creates high vacuum that leads to large air induction noise.
- Air may be leaking (sucked in) if F/B correction value #1 and F/B learning value #1 show a larger difference between idling time (smaller mass air flow) and the normal time, and a smaller difference between racing time (larger mass air flow) and the normal time.

Criteria: Air induction is not present.

NG → Repair or replacement of intake system

OK

| 24 | Check trouble phenomenon |
|---|---|

(1) Check if the engine can be started.

Result

| Result | Go to |
|---|---|
| Engine starts. | A |
| Engine does not start. | B |

B → Go to Step 25.

A

Complete

| 25 | Check trouble phenomenon |
|---|---|

(1) Check the trouble phenomenon.

Result

| Trouble phenomenon | Possible cause | Go to |
|---|---|---|
| No cranking | • Discharged battery<br>• Starter ASSY (including worn or chipped pinion ring)<br>• Starter system<br>• Engine unit (excessive friction)<br>• Chipped flywheel teeth (M/T models)<br>• Worn or chipped drive plate/ring gear SUB-ASSY (transmission A/T) | A |
| Cranking speed error | • Discharged battery<br>• Starter ASSY<br>• Engine unit (excessive friction, compression drop) | B |
| No initial combustion (no single combustion during cranking) *1 | • Fuel pressure holding by fuel pressure regulator ASSY<br>• Fuel injector ASSY (port injection side) leakage<br>• Fuel leakage from fuel line<br>• Fuel pump control system (low-pressure side)<br>• Fuel pump (low-pressure side)<br>• Spark plug<br>• Crankshaft position sensor system<br>• Ignition coil ASSY system | C |
| Engine stalls after complete combustion (stalls immediately after engine speed increases once) *2 | • Intake system connections<br>• Throttle body ASSY (with motor)<br>• Camshaft timing oil control valve ASSY<br>• Intake air flow meter SUB-ASSY | D |
| Delay in initial or complete combustion *3 | • E.F.I. water temperature sensor<br>• Intake air flow meter SUB-ASSY<br>• Air / fuel ratio sensor<br>• Fuel injector ASSY (Port injection side)<br>• Vacuum switching valve ASSY system<br>• Spark plug<br>• Fuel pressure regulator ASSY<br>• Fuel pump (low-pressure side)<br>• Fuel pump control system (low-pressure side) | E |

NOTE:

- If the engine hesitates during the initial stage of cranking (cranking speed is slow and combustion occurs at BTDC), an insufficiently charged battery or faulty starter ASSY may be the cause.
- *1: If there is no initial combustion, faulty wiring harness, ignition system, or fuel system is suspected.
- *2: If the engine stalls after a complete combustion, an improper air/fuel ratio or a case where camshaft timing oil control valve ASSY fails to return may be the cause. If the engine stalls after the injection method has changed from port injection to direct injection, the injector driver may be faulty.
- *3: When initial and complete combustion are delayed, improper fuel injection amount (insufficient or excessive) may be the cause.

B → Go to Step 32.

C → Go to Step 35.

D → Go to Step 50.

E → Go to Step 57.

A

ES

| 26 | Check trouble phenomenon |
|---|---|

(1) During cranking, check that the pop-up sound for the starter pinion gear is heard, and check the starter ASSY for spinning.

Result

| Trouble symptom | Possible cause | Go to |
|---|---|---|
| The pop-up sound for the starter pinion gear is heard, and the starter ASSY is not spinning. *1 | • Battery<br>• Excessive engine friction<br>• Starter ASSY | A |
| The pop-up sound for the starter pinion gear is heard, and the starter is spinning. | • Drive plate/ring gear SUB-ASSY<br>• Starter ASSY | B |
| The pop-up sound for the starter pinion gear is not heard. | • Battery<br>• Starter ASSY<br>• Starter system | C |

NOTE:
*1: Discharged battery or excessive engine friction are suspected.

B → Go to Step 29.

C → Go to Step 30.

A

| 27 | Battery unit check |
|---|---|

(1) Perform unit inspection of battery. (Refer to BH - 3)

NG → Battery charging or replacement

OK

| 28 | Engine unit check |
|---|---|

(1) Rotate the crankshaft manually and make sure it turns smoothly.
Criteria: Rotates smoothly.

NOTE:
Because excessive engine friction may have been only a temporal condition, remove the cylinder covers and oil pan and check for foreign materials such as iron chips. Carefully inspect or disassemble parts and inspect them if failure or symptom of trouble is found.

NG → Engine unit repair or replacement

OK

Starter ASSY unit check (Refer to ST - 27)

| 29 | Starter ASSY check (pinion gear) |
|---|---|

(1) Remove the starter ASSY. (Refer to ST - 21)
(2) Make sure that the pinion gear of the starter ASSY is not worn nor chipped.
Criteria: Not worn or chipped.

ES

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal (Transmission M/T) | B |
| Normal (Transmission A/T) | C |

B → Replacement of flywheel SUB-ASSY (Refer to EM - 53)

C → Replacement of drive plate & ring gear SUB-ASSY (Refer to EM - 75)

A

Replacement of starter ASSY (Refer to ST - 21)

| 30 | Battery unit check |
|---|---|

(1) Perform unit inspection of battery. (Refer to BH - 4)

NG → Battery charging or replacement

OK

| 31 | Starter ASSY unit inspection |
|---|---|

(1) Perform unit inspection of the starter ASSY. (Refer to ST - 27)

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal (models with smart entry & start system) | B |
| Normal (models without smart entry & start system) | C |

B → Starter system check (models with smart entry & start system) (Refer to ES - 614)

C → Starter system check (models without smart entry & start system) (Refer to ES - 624)

A

Replacement of starter ASSY (Refer to ST - 21)

| 32 | Check trouble phenomenon |
|---|---|

(1) Check cranking speed.

ES

Result

| Trouble symptom | Probable cause | Go to |
|---|---|---|
| Low cranking speed (100 r/min or less) | • Battery<br>• Starter ASSY<br>• Excessive engine friction | A |
| High cranking speed (300 r/min or more) *1 | Engine compression drop | B |

NOTE:
*1: When the cranking speed is high, a drop in compression is suspected.

B → Check and repair engine unit

A

| 33 | Battery unit check |
|---|---|

(1) Perform unit inspection of battery. (Refer to BH - 3)

NG → Battery charging or replacement

OK

| 34 | Engine unit check |
|---|---|

(1) Rotate the crankshaft manually and make sure it turns smoothly.
Criteria: Rotates smoothly.
NOTE:
Because excessive engine friction may have been only a temporal condition, remove the cylinder covers and oil pan and check for foreign materials such as iron chips. Carefully inspect or disassemble parts and inspect them if failure or symptom of trouble is found.

NG → Engine unit repair or replacement

OK

Starter ASSY unit check (Refer to ST - 27)

| 35 | Fuel injector ASSY check (checking operation sound of port injection side) |
|---|---|

(1) Using a stethoscope or screw driver, check the operation sound of the fuel injector ASSY (port injection side) during cranking.
Criteria: Operation sound of fuel injector ASSY (port injection side) is heard.

NG → Go to Step 48.

OK

| 36 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Check the fuel (low-pressure side). (Refer to FU - 9)

NG → Go to Step 46.

OK

| 37 | Spark Inspection |
|---|---|

(1) Check for spark. (Refer to ES - 657)

NG → Go to Step 41.

OK

| 38 | Check trouble phenomenon |
|---|---|

(1) Check the trouble phenomenon based on interview done to the customer.

Result

| Trouble phenomenon | Probable defective parts | Go to |
|---|---|---|
| Startup failure occurs when a long period of time elapsed after engine is stopped. *1 | Fuel pressure regulator ASSY is stuck open. | A |
| Startup failure occurs between approximately 15 minutes and 120 minutes after engine is stopped. *2 | Fuel injector ASSY (port injection side) leakage | B |
| Startup failure occurs between approximately 2 minutes and 3 minutes after engine is stopped. *3 | Failure in fuel pressure holding by fuel pressure regulator ASSY | A |
| Inconsistency in conditions of problems other than those mentioned above and startup failure | - | C*4 |

NOTE:
*1: Stuck opened fuel pressure regulator ASSY is suspected. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.
*2: Fuel leak from the fuel injector ASSY (port injection side) is suspected.
*3: Failure in fuel pressure-holding ability of the fuel pressure regulator ASSY is suspected. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.
*4: From step 72, check the fuel system troubleshooting C (steps 73 through 76).

B → Go to Step 40.

C → Go to Step 72.

A

| 39 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Attach a fuel pressure gauge and check fuel pressure (low-pressure side) after engine is stopped. (Refer to FU - 9)

Result

| Result (fuel pressure) | Go to |
|---|---|
| Less than 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} (5 minutes after engine is stopped) | A |
| 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} or more (5 minutes after engine is stopped) | B*1 |

ES

NOTE:
- If the engine cannot be started, check the fuel pressure (low-pressure side) after cranking.
- *1: From step 72, check fuel system troubleshooting C (steps 73 through 76).

B → Go to Step 72.

A

Replacement of fuel pressure regulator ASSY (Refer to FU - 47)

| 40 | Fuel injector ASSY check (HC content on port injection side) |
|---|---|

(1) Stop the engine and purge inside the intake air surge tank ASSY with pressurized air.
(2) Wait for 15 minutes and measure HC content inside the intake air surge tank ASSY.

Result

| Result | Go to |
|---|---|
| 4000 ppm or more | A |
| Less than 4000 ppm | B*1 |

NOTE:
- When HC content is 4000 ppm or more, air-tightness failure of fuel injector ASSY (port injection side) is suspected.
- *1: From step 72, check fuel system troubleshooting C (steps 73 through 76).

B → Go to Step 72.

A

Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

| 41 | Spark plug inspection |
|---|---|

(1) Inspect the spark plug. (Refer to ES - 662)
NOTE:
The spark plugs must be replaced for all cylinders even if failure is found in a single cylinder only.

NG → Spark plug replacement (Refer to ES - 691)

OK

| 42 | Reading of SSM4 data ([Engine Speed]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Engine Speed]
(4) Read the value of [Engine Speed] while the engine is running.
Criteria: Values corresponding to the engine speed are output continuously.

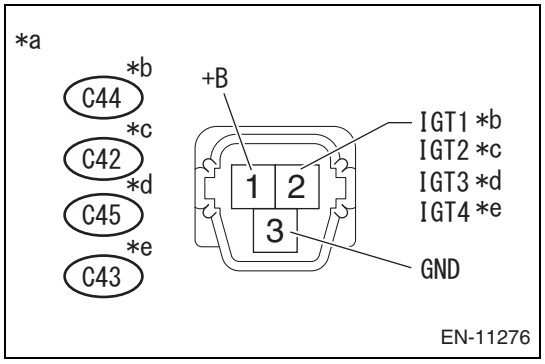
NOTE:
- Check the engine speed on the line graph display.
- If the engine cannot be started, check the cranking speed.
- If the engine speed is zero, open or short circuit in the crankshaft position sensor may occur.

NG → Crankshaft position sensor system check (Refer to ES - 309)

OK

| 43 | Check wiring harness and connector (ignition coil ASSY power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector of the ignition coil ASSY.
(2) Turn the ignition switch to ON.
(3) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C44-1 (+B) - chassis ground | IG ON | 11 to 14V |
| C42-1 (+B) - chassis ground | IG ON | 11 to 14V |
| C45-1 (+B) - chassis ground | IG ON | 11 to 14V |
| C43-1 (+B) - chassis ground | IG ON | 11 to 14V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (ignition coil ASSY connector) |
| *b | No. 1 cylinder |
| *c | No. 2 cylinder |
| *d | No. 3 cylinder |
| *e | No. 4 cylinder |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Power supply circuit check (ignition coil ASSY power supply circuit) (Refer to ES - 320)

OK

| 44 | Check wiring harness and connector (engine control computer - ignition coil ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the ignition coil ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-21 (IGT1) - C44-2 (IGT1) | Always | Less than 1 Ω |
| A36-10 (IGT2) - C42-2 (IGT2) | Always | Less than 1 Ω |
| A36-31 (IGT3) - C45-2 (IGT3) | Always | Less than 1 Ω |
| A36-8 (IGT4) - C43-2 (IGT4) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-21 (IGT1) and C44-2 (IGT1) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-10 (IGT2) and C42-2 (IGT2) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-31 (IGT3) and C45-2 (IGT3) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-8 (IGT4) and C43-2 (IGT4) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 45 | Check wiring harness and connector (ignition coil ASSY - chassis ground) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector of the ignition coil ASSY.
(2) Measure the resistance between the terminals.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C44-3 (GND) - chassis ground | Always | Less than 1 Ω |
| C42-3 (GND) - chassis ground | Always | Less than 1 Ω |

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C45-3 (GND) - chassis ground | Always | Less than 1 Ω |
| C43-3 (GND) - chassis ground | Always | Less than 1 Ω |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.
- When the wiring harness is normal, replace the ignition coil ASSY then check if startup failure recurs. If it recurs, go to step 72 and check ignition system troubleshooting (steps 77 through 83).

NG → Repair or replacement of wiring harness or connector

OK

Replacement of ignition coil ASSY (Refer to ES - 691)

| 46 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check operation noise of the fuel pump (low-pressure side) with 80% of [Control the Fuel Pump Duty].

Criteria

| [Control the Fuel Pump Duty] | Criteria |
|---|---|
| 80% | Operating sound is heard. |

NOTE:
Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.

NG → Inspection of fuel pump control system (low-pressure side) (Refer to ES - 606)

OK

| 47 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check for fuel leakage from the fuel piping with 80% of [Control the Fuel Pump Duty].

Result

| Result | Go to |
|---|---|
| There is fuel leakage, or symptom or trace of fuel leakage. | A |
| There is neither actual fuel leakage, symptom of leakage, nor trace of leakage. | B |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- It is necessary to check the fuel level because startup failure due to running out of gas can also be detected.
- If fuel leakage is not found, check the fuel pump control system (low-pressure side) and then check if startup failure recurs. If it recurs, go to step 72 and check fuel system troubleshooting C (steps 73 through 76).

B → Inspection of fuel pump control system (low-pressure side) (Refer to ES - 606)

A

Repair or replacement of fuel piping

| 48 | Reading of SSM4 data ([Engine Speed]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Engine Speed]
(4) Read the value of [Engine Speed] while the engine is running.
Criteria: Values corresponding to the engine speed are output continuously.

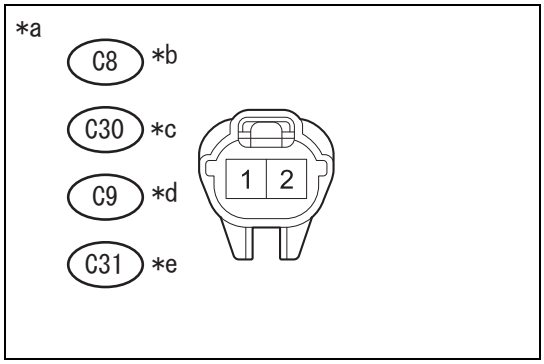
NOTE:
- Check the engine speed on the line graph display.
- If the engine cannot be started, check the cranking speed.
- If the engine speed is zero, open or short circuit in the crankshaft position sensor may occur.

NG → Replacement of crankshaft position sensor (Refer to ES - 685)

OK

| 49 | Engine control computer check (fuel injector ASSY (port injection side) power supply circuit) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect the connector for fuel injector ASSY (port injection side).
(2) Turn the ignition switch to ON.
(3) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - chassis ground | IG ON | 11 to 14 V |
| C30-1 - chassis ground | IG ON | 11 to 14 V |
| C9-1 - chassis ground | IG ON | 11 to 14 V |
| C31-1 - chassis ground | IG ON | 11 to 14 V |

- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Power supply circuit check (fuel injector ASSY (port injection side)) (Refer to ES - 637)

OK

Replacement of the engine control computer (Refer to ES - 674)

| 50 | Inspection of intake air flow meter SUB-ASSY |
|---|---|

(1) Check the intake air flow meter SUB-ASSY. (Refer to ES - 680)

NG → Go to Step 56.

OK

| 51 | Intake system check (connection) |
|---|---|

(1) Make sure there is no air leakage (from disconnected hoses, cracks, gaskets) at each part of the intake system. (Refer to IE - 4)
NOTE:
- Present of air leakage can be easily checked by racing the engine then releasing the accelerator pedal completely because this creates high vacuum that leads to large air induction noise.
- Air may be leaking (sucked in) if [Short term fuel trim B1] and [Long term fuel trim B1] show a larger difference between idling time (smaller mass air flow) and the normal time, and a smaller difference between racing time (larger mass air flow) and the normal time.

Criteria: Air induction is not present.

NG → Repair or replacement of intake system

OK

| | |
|---|---|
| 52 | Throttle body ASSY (with motor) check |

(1) Disconnect the throttle body ASSY (with motor) connector.
NOTE:
Once the connector is disconnected, fail-safe mode takes place and the throttle opening angle is set to the specified value (fail-safe angle).
(2) Crank the engine to check if the engine starts.

Result

| Result | Go to |
|---|---|
| Start the engine. | A |
| Engine does not start. | B |

NOTE:
Performing this check may illuminate the MIL. Once the work is done, check and clear the codes. (Refer to ES - 28)

B → Go to Step 54.

A

| | |
|---|---|
| 53 | Throttle body ASSY (with motor) check |

(1) Check the air passage for carbon buildup.
Criteria: Carbon adhesion is not found.

NG → Replacement of throttle body ASSY (with motor) (Refer to ES - 670)

OK

| | |
|---|---|
| 54 | Performing of SSM4 [Active Test] ([Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C [167°F] or more)
(4) Turn on the air conditioner.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the VVT Linear (Bank1)], [Control the VVT Linear (Bank2)]
(6) Start the engine and idle the engine and check the idle speed under [Active Test].

Criteria

| Inspection conditions | Criteria |
|---|---|
| 0°CA | Normal idle speed |
| Advance or retard the timing between 0°CA ←→100°CA. | Engine stalls, rough idling |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Check the operation noise under [Active Test]. Also check the valves for problems such as failed valve return, stuck valve, and abnormal conditions.

NG → Replacement of camshaft timing oil control valve ASSY (intake side) (Refer to ES - 664)

OK

ES

| | |
|---|---|
| 55 | Performing of SSM4 [Active Test] ([Control the VVT Exhaust Linear (Bank1)], [Control the VVT Exhaust Linear (Bank2)]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C [167°F] or more)
(4) Turn on the air conditioner.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the VVT Exhaust Linear (Bank1)], [Control the VVT Exhaust Linear (Bank2)]
(6) Start the engine and idle the engine and check the idle speed under [Active Test].

Criteria

| Inspection conditions | Criteria |
|---|---|
| 0°CA | Normal idle speed |
| Advance or retard the timing between 0°CA ←→100°CA. | Engine stalls, rough idling |

Result

| Result | Go to |
|---|---|
| Malfunction | A |
| Normal *1 | B |

NOTE:
- *1: If the operation is normal, go to step 72 and check the air control system troubleshooting (steps 84 through 86). If the engine still fails to start, check the fuel system troubleshooting A (steps 87 through 94).
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Check the operation noise under the active test. Also check the valves for problems such as failed valve return, stuck valve, and abnormal conditions.

B → Go to Step 72.

A

Replacement of camshaft timing oil control valve ASSY (exhaust side) (Refer to ES - 664)

| 56 | Check wiring harness and connector (engine control computer - intake air flow meter SUB-ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.
- When the wiring harness is normal, replace the intake air flow meter SUB-ASSY then check if startup failure recurs. If it recurs, go to step 72 and check the air control system troubleshooting (steps 84 through 86). If the engine still fails to start, check the fuel system troubleshooting A (steps 87 through 94).

NG → Repair or replacement of wiring harness or connector

OK

Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

| 57 | Unit inspection of the E.F.I. water temperature sensor |
|---|---|

(1) Perform unit inspection of E.F.I. water temperature sensor. (Refer to ES - 700)
NOTE:
When the E.F.I. water temperature sensor is faulty, replace it and then check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

NG → Replacement of E.F.I. water temperature sensor (Refer to ES - 699)

OK

| 58 | Check wiring harness and connector (engine control computer - E.F.I. water temperature sensor) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the E.F.I. water temperature sensor connectors.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30(THW) - C40-2(THW) | Always | Less than 1 Ω |
| A36-29(E1) - C40-1(E2) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-30 (THW) and C40-2 (THW) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-29 (E1) and C40-1 (E2) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.
- When wiring harness or connectors are faulty, repair or replace them and then check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

NG → Repair or replacement of wiring harness or connector

OK

| 59 | Inspection of intake air flow meter SUB-ASSY |
|---|---|

(1) Check the intake air flow meter SUB-ASSY. (Refer to ES - 680)
NOTE:
When the intake air flow meter SUB-ASSY is faulty, replace it and then check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103

through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

Result

| Result | Go to |
|---|---|
| Normal | A |
| Malfunction | B |

B → Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

ES

A

| | |
|---|---|
| 60 | Check wiring harness and connector (engine control computer - intake air flow meter SUB-ASSY) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector of the intake air flow meter SUB-ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) - C16-5 (VG) | Always | Less than 1 Ω |
| A33-29 (E2G) - C16-4 (E2G) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-22 (VG) and C16-5 (VG) - other terminals and chassis ground | Always | 10 k Ωor more |
| A33-29 (E2G) and C16-4 (E2G) - other terminals and chassis ground | Always | 10 k Ωor more |

NOTE:

- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.
- When wiring harness or connectors are faulty, repair or replace them and then check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 61 | Reading SSM4 data ([Long term fuel trim B1], [Atmosphere Pressure]) |

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Long term fuel trim B1], [Atmosphere Pressure]
(4) Read [Long term fuel trim B1] and [Atmosphere Pressure] displayed on SSM4.

Result

| [Data monitor] item | Result | Possible cause | Go to |
|---|---|---|---|
| [Long term fuel trim B1] | +25% or more, or below -25% | • Air / fuel ratio sensor<br>• Intake air flow meter SUB-ASSY<br>• Fuel injector ASSY (Port injection side)<br>• Engine control computer | A |
| [Atmosphere Pressure] | 80 kPa or less | | |
| All data list items shown above | Each value is different from those shown above | - | B |

B → Go to Step 65.

A

| 62 | Check trouble phenomenon |
|---|---|

(1) Remove the EFI (+B) fuse, wait for 60 seconds or more, then connect the fuse.
NOTE:
Initial diagnosis of electronic control throttle is performed after DTCs are cleared. For this reason, the engine starting after DTC clearance must be performed more than 10 seconds after IG ON.
(2) Start the engine to check if trouble phenomenon has gone away.

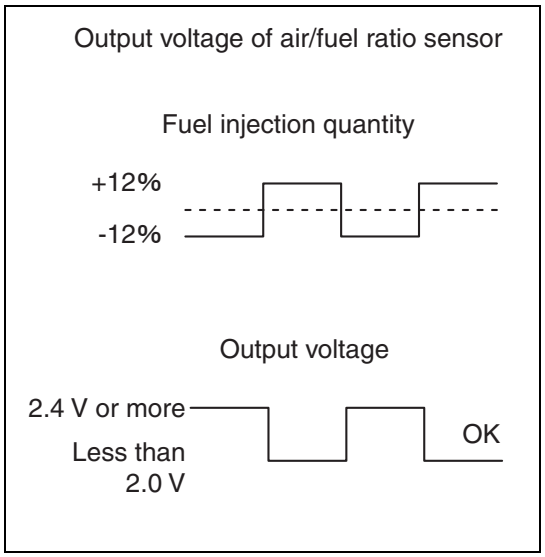
Result

| Result | Go to |
|---|---|
| Engine starts. | A |
| Engine does not start. | B |

B → Go to Step 65.

A

| 63 | Performing of SSM4 [Active Test] ([Cylinder Fuel Rate]) |
|---|---|



(1) Connect the SSM4 to the DLC3.
(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 80°C {176°F} or more).
(3) Idle the engine.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(5) Increase and decrease fuel injection amount, and read values of [A/F Sensor #11].

Voltage

| Tester item | Standard value |
|---|---|
| Fuel injection amount (+12%) | Output voltage of air/fuel ratio sensor is less than 2.0 V. |
| Fuel injection amount (-12 %) | Output voltage of air/fuel ratio sensor is 2.4 V or more. |

CAUTION:
- Voltage output of the air/fuel ratio sensor delays a few seconds.
- Because the sensors become cold, measure the voltage promptly after warming up the sensors.

NOTE:
When the air/fuel ratio sensor is faulty, replace it and then check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

NG → Replacement of air/fuel ratio sensor (Refer to ES - 711)

OK

| 64 | Check trouble phenomenon |
|---|---|

(1) Check if the idle speed after engine startup is stable.
Criteria: Idle speed is stable.

NOTE:
After replacing the fuel injector ASSY (port injection side) or intake air flow meter SUB-ASSY, check if startup failure recurs. If it recurs, replace the engine control computer. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

NG → Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

OK

Replacement of intake air flow meter SUB-ASSY (Refer to ES - 679)

| 65 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Check the fuel pressure (low-pressure side). (Refer to FU - 9)

NG → Go to Step 71.

OK

| 66 | Spark plug inspection |
|---|---|

(1) Inspect the spark plug. (Refer to ES - 662)

Result

| Result | Go to |
|---|---|
| All cylinders are normal. | A |
| Single cylinder is faulty. *1 | B |
| All cylinder are faulty. *2 and *3 | C |

NOTE:

- *1: If a single cylinder is faulty, change the spark plug of the appropriate cylinder, and then check both ignition system and fuel system of that cylinder. Once repaired, check if the startup failure recurs. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).
- *2: If all cylinders are faulty, replace the spark plugs of the all cylinder, then check if startup failure recurs. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).
- *3: Repeating extremely short-distance trips may be causing the startup failure.

B → Replacement of air/fuel ratio sensor (abnormal cylinders) (Refer to ES - 691)

C → Replacement of spark plug (for all cylinders) (Refer to ES - 691)

A

| 67 | Check trouble phenomenon |
|---|---|

(1) Check the trouble phenomenon based on interview done to the customer.

Result

| Trouble phenomenon | Probable defective parts | Go to |
|---|---|---|
| Startup failure occurs when a long period of time elapsed after engine is stopped. *1 | Fuel pressure regulator valve ASSY is stuck open. | A |
| Startup failure occurs between approximately 15 minutes and 120 minutes after engine is stopped. *2 | • Fuel injector ASSY (port injection side) leakage<br>• Vacuum switching valve ASSY closing failure | B |
| Startup failure occurs between approximately 2 minutes and 3 minutes after engine is stopped. *3 | Failure in fuel pressure holding by fuel pressure regulator valve ASSY | A |
| Inconsistency in conditions of problems other than those mentioned above and startup failure | - | C*4 |

NOTE:
*1: Stuck opened fuel pressure regulator ASSY is suspected. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.
*2: Fuel leak from the fuel injector ASSY (port injection side) is suspected.
*3: Failure in fuel pressure-holding ability of the fuel pressure regulator ASSY is suspected. Install a fuel pressure gauge and check pressure-holding ability after engine is stopped.
*4: From step 72, check troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

B → Go to Step 69.

C → Go to Step 72.

A

| 68 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Attach a fuel pressure gauge and check fuel pressure (low-pressure side) after engine is stopped. (Refer to FU - 9)

Result

| Result (fuel pressure) | Go to |
|---|---|
| Less than 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} (5 minutes after engine is stopped) | A |
| 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} or more (5 minutes after engine is stopped) | B*1 |

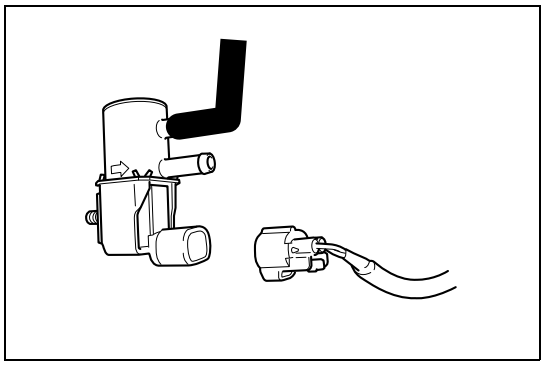
NOTE:
- If the engine cannot be started, check the fuel pressure (low-pressure side) after cranking.
- *1: From step 72, check troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

B → Go to Step 72.

A

Replacement of fuel pressure regulator ASSY (Refer to FU - 47)

| 69 | Vacuum switching valve ASSY check |
|---|---|



(1) Disconnect the vacuum hose (canister side) of the vacuum switching valve ASSY.
(2) Start the engine.
(3) Idle the engine.
(4) Disconnect the vacuum switching valve ASSY connector.
(5) Check air vent of the vacuum switching valve ASSY.
Criteria: No air vent

NOTE:
Performing this check may illuminate the MIL. Once the work is done, check and clear the codes. (Refer to ES - 28)

NG → System check (evaporative purge control system)

OK

| 70 | Fuel injector ASSY check (HC content on port injection side) |
|---|---|

(1) Stop the engine and purge inside the intake air surge tank ASSY with pressurized air.
(2) Wait for 15 minutes and measure HC content inside the intake air surge tank ASSY.

Result

| Result | Go to |
|---|---|
| 4000 ppm or more | A |
| Less than 4000 ppm | B*1 |

NOTE:
- When HC content is 4000 ppm or more, air-tightness failure of fuel injector ASSY (port injection side) is suspected.
- *1: From step 72, check troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

B → Go to Step 72.

A

Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

| 71 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.

(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check for fuel leakage from the fuel piping with 80% of [Control the Fuel Pump Duty].

Result

| Result | Go to |
|---|---|
| There is fuel leakage, or symptom or trace of fuel leakage. | A |
| There is neither actual fuel leakage, symptom of leakage, nor trace of leakage. | B |

ES

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- It is necessary to check the fuel level because startup failure due to running out of gas can also be detected.
- If fuel leakage is not found, check the fuel pump control system (low-pressure side) and then check if startup failure recurs. If the engine still fails to start, go to step 72 and check the troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

B → Inspection of fuel pump control system (low-pressure side) (Refer to ES - 606)

A

Repair or replacement of fuel piping

| 72 | Check trouble phenomenon |
|---|---|

(1) If the trouble is not identified by performing inspection in steps 38, 39, 40, and 47, check the fuel system troubleshooting C (steps 73 through 76).

Result

| Steps where inspection was performed | Systematic troubleshooting | Step | Go to |
|---|---|---|---|
| Steps 38, 39, 40, and 47 | Fuel system troubleshooting C | 73 to 76 | A |

(2) If the trouble is not identified by performing inspection in steps 45, check the ignition system troubleshooting (steps 77 through 83).

Result

| Steps where inspection was performed | Systematic troubleshooting | Step | Go to |
|---|---|---|---|
| Step 45 | Ignition system troubleshooting | 77 to 83 | B |

(3) If the trouble is not identified by performing inspection in steps 55 and 56, check the air control system troubleshooting (steps 84 through 86). If the engine still fails to start, check fuel system troubleshooting A (steps 87 through 94).

Result

| Steps where inspection was performed | Systematic troubleshooting | Step | Go to |
|---|---|---|---|
| Steps 55 and 56 | Air control system troubleshooting | 84 to 86 | C |
| | Fuel system troubleshooting A | 87 to 94 | |

(4) If the trouble is not identified by performing inspection in steps 57, 58, 59, 60, 63, 64, 66, 67, 68, 70, and 71, check troubleshooting in the following order: fuel system troubleshooting A (steps 95 through 102), fuel system troubleshooting B (steps 103 through 105), air control system troubleshooting (steps 106 through 108), and ignition system troubleshooting (steps 109 through 115).

ES

Result

| Steps where inspection was performed | Systematic troubleshooting | Step | Go to |
|---|---|---|---|
| Step 57, 58, 59, 60, 63, 64, 66, 67, 68, 70, 71 | Fuel system troubleshooting A | 95 to 102 | D |
| | Fuel system troubleshooting B | 103 to 105 | |
| | Air control system troubleshooting | 106 to 108 | |
| | Ignition system troubleshooting | 109 to 115 | |

B → Go to Step 77.

C → Go to Step 84.

D → Go to Step 95.

A

**73** Fuel injector ASSY unit inspection (port injection side)

(1) Perform a unit inspection on the fuel injector ASSY (port injection side). (Refer to FU - 29)

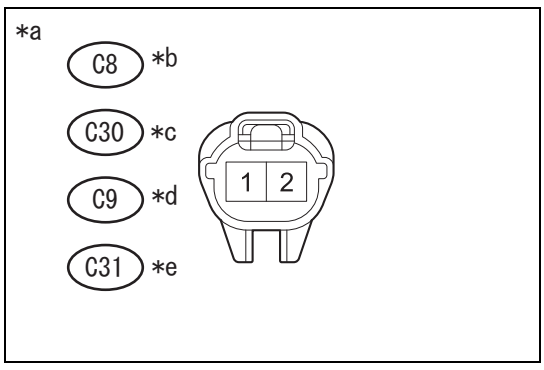
NG → Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

OK

**74** Engine control computer check (fuel injector ASSY (port injection side) power supply circuit)

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for fuel injector ASSY (port injection side).



(2) Turn the ignition switch to ON.

(3) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - chassis ground | IG ON | 11 to 14 V |
| C30-1 - chassis ground | IG ON | 11 to 14 V |
| C9-1 - chassis ground | IG ON | 11 to 14 V |
| C31-1 - chassis ground | IG ON | 11 to 14 V |

| Trouble is solved. | A |
| Trouble is not solved. | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

Complete (trouble caused by camshaft position sensor)

| | |
|---|---|
| 84 | Reading of SSM4 data ([ISC Learning Value]) |

(1) Connect the SSM4 to the DLC3.

(2) Start the engine, turn off all the accessory switches, and wait until the engine warms up and the coolant temperature stabilizes. (at 75°C {167°F} or more).
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [ISC Learning Value]
(4) Read the [ISC Learning Value] displayed on SSM4.

Result

| Data monitor | Result | Possible cause | Go to |
|---|---|---|---|
| [ISC Learning Value] | Displacement (liter) ×0.9 or more | •Valve timing<br>•Compression | A |
| | Displacement (liter) ×less than 0.9 | - | B |

B → Go to Step 86.

A

**85** Compression inspection

(1) Inspect the compression. (Refer to EM - 2)

NG → Engine unit repair or replacement

OK

Valve timing adjustment (Refer to EM - 13)

**86** Unit inspection of the E.F.I. water temperature sensor

(1) Perform unit inspection of E.F.I. water temperature sensor. (Refer to ES - 700)

NG → Replacement of E.F.I. water temperature sensor (Refer to ES - 699)

OK

**87** Fuel pressure inspection (low-pressure side)

(1) Attach a fuel pressure gauge and check fuel pressure (low-pressure side) during cranking and after engine is stopped. (Refer to FU - 9)

Standard value

| Driving conditions | Standard value |
|---|---|
| When cranking | 304 to 343 kPa{3.1 to 3.5 kgf/cm$^2$, 44.1 to 49.7psi} |
| 5 minutes after engine stop | 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} or more |

NG → Go to Step 93.

OK

| 88 | Reading of SSM4 data ([Long term fuel trim B1]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Long term fuel trim B1]
(4) Read [Long term fuel trim B1] displayed on SSM4.

Result

ES

| [Data monitor] | Result | Possible cause | Go to |
|---|---|---|---|
| [Long term fuel trim B1] | -15 % to +15 % | • Wiring harness or connector<br>• Fuel | A |
| | +15 % or more, or below -15 % | Fuel injector ASSY (Port injection side) | B |

B → Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

A

| 89 | Check trouble phenomenon |
|---|---|

(1) After the engine starts, check stability of the present and the past idle speeds.

Result

| Trouble phenomenon | Probable defective parts | Go to |
|---|---|---|
| Idle speed is unstable. | Crankshaft position sensor system | A |
| Idle speed is stable both in the present and the past. | Fuel | B |

NOTE:
Ask your customer for information including type of fuel and gas stations they are using to determines if the trouble is caused by the fuel they are using.

B → Fuel replacement

A

| 90 | Crankshaft position sensor check (sensor installation area) |
|---|---|

(1) Check the tightening condition of the crankshaft position sensor bolt and installation condition of the sensor.
(2) Check installation conditions of the crankshaft position sensor connector.
Criteria: Properly installed.

NG → Repair or replacement of sensor installation area

OK

| 91 | Check wiring harness and connector (engine control computer - crankshaft position sensor) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the crankshaft position sensor connector.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16(NE+) - C47-1(OUT) | Always | Less than 1 Ω |
| A34-27(NE-) - C47-2(GND) | Always | Less than 1 Ω |
| A36-19(VC) - C47-3(VCC) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-16 (NE+) and C47-1 (OUT) - other terminals and chassis ground | Always | 10 k Ωor more |
| A34-27 (NE-) and C47-2 (GND) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-19(VC) - C47-3(VCC) | Always | 10 k Ωor more |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- Make sure an excessive tension is not placed on the wiring harness.

NG → Repair or replacement of wiring harness or connector

OK

| 92 | Crankshaft position sensor replacement |
|---|---|

(1) Replace the crankshaft position sensor and check if the trouble is solved.

NOTE:
Replacement of crankshaft position sensor (Refer to ES - 685)

Result

| Result | Go to |
|---|---|
| Trouble is solved. | A |
| Trouble is not solved. | B |

B → Replacement of the engine control computer (Refer to ES - 674)

A

Complete (trouble caused by crankshaft position sensor)

| 93 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check for fuel leakage from the fuel piping with 80% of [Control the Fuel Pump Duty].

ES

Result

| Result | Go to |
|---|---|
| There is fuel leakage, or symptom or trace of fuel leakage. | A |
| There is neither actual fuel leakage, symptom of leakage, nor trace of leakage. | B |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- In [Active Test], if operating sound of the fuel pump (low-pressure side) is not heard, failure in the fuel pump control system (low-pressure side) is suspected.
- It is necessary to check the fuel level because startup failure due to running out of gas can also be detected.

B → Go to Step 94.

A →

Repair or replacement of fuel piping

| 94 | Perform a unit inspection of fuel pump ASSY (low pressure side) |
|---|---|

(1) Perform a unit inspection on the fuel pump (low-pressure side) (Refer to FU - 56)

NG → Replacement of the fuel pump ASSY (low-pressure side) (Refer to FU - 47)

OK →

Replacement of fuel pressure regulator ASSY (Refer to FU - 47)

| 95 | Fuel pressure inspection (low-pressure side) |
|---|---|

(1) Attach a fuel pressure gauge and check fuel pressure (low-pressure side) during cranking and after engine is stopped. (Refer to FU - 9)

Standard value

| Driving conditions | Standard value |
|---|---|
| When cranking | 304 to 343 kPa{3.1 to 3.5 kgf/cm$^2$, 44.1 to 49.7psi} |

| Driving conditions | Standard value |
|---|---|
| 5 minutes after engine stop | 147 kPa {1.5 kgf/cm$^2$, 21.3 psi} or more |

NG → Go to Step 101.

OK

| 96 | Reading of SSM4 data ([Long term fuel trim B1]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Long term fuel trim B1]
(4) Read [Long term fuel trim B1] displayed on SSM4.

Result

| [Data monitor] | Result | Possible cause | Go to |
|---|---|---|---|
| [Long term fuel trim B1] | -15 % to +15 % | • Wiring harness or connector<br>• Fuel | A |

| There is fuel leakage, or symptom or trace of fuel leakage. | A |
| There is neither actual fuel leakage, symptom of leakage, nor trace of leakage. | B |

NOTE:
- Wiggle the wiring harness and connectors to identify trouble that may not occur constantly for a more accurate check.
- In the active test, if operating sound of the fuel pump (low-pressure side) is not heard, failure in the fuel pump control system (low-pressure side) is suspected.
- It is necessary to check the fuel level because startup failure due to running out of gas can also be detected.

B → Go to Step 102.

A →

Repair or replacement of fuel piping

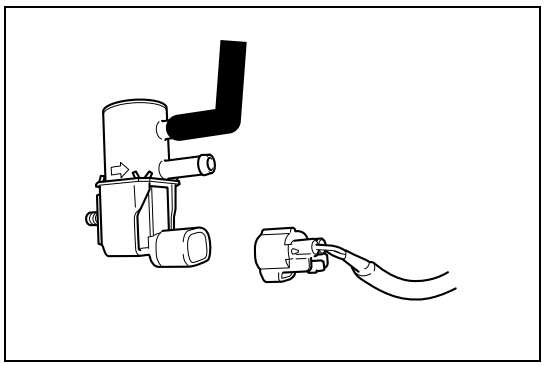
| 102 | Fuel pump unit inspection (low-pressure side) |
|---|---|

(1) Perform a unit inspection on the fuel pump (low-pressure side) (Refer to FU - 56)

NG → Replacement of the fuel pump ASSY (low-pressure side) (Refer to FU - 47)

OK →

| 103 | Vacuum switching valve ASSY check |
|---|---|



(1) Disconnect the vacuum hose (canister side) of the vacuum switching valve ASSY.
(2) Start the engine.
(3) Idle the engine.
(4) Disconnect the vacuum switching valve ASSY connector.
(5) Check air vent of the vacuum switching valve ASSY.
Criteria: No air vent
NOTE:
Performing this check may illuminate the MIL. Once the work is done, check and clear the codes. (Refer to ES - 28)

NG → System check (evaporative purge control system)

OK

| 104 | Fuel injector ASSY check (HC content on port injection side) |
|---|---|

(1) Stop the engine and purge inside the intake air surge tank ASSY with pressurized air.
(2) Wait for 15 minutes and measure HC content inside the intake air surge tank ASSY.

ES

Result

| Result | Go to |
|---|---|
| 4000 ppm or more | A |
| Less than 4000 ppm | B |

NOTE:
When HC content is 4000 ppm or more, air-tightness failure of fuel injector ASSY (port injection side) is suspected.

B → Go to Step 105.

A

Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

| 105 | Intake valve check |
|---|---|

(1) Check the intake valves for carbon buildup.

Result

| Result | Go to |
|---|---|
| Carbon buildup on intake valves. | A |
| Intake valves are free of carbon. | B |

| DTC | P2096 | Sub FB correction amount 1 lean |
|---|---|---|

| DTC | P2097 | Sub FB correction amount 1 rich |
|---|---|---|

Circuit description

Sub fuel correction relates to feedback correction. Not the basic injection period. Sub fuel correction consists of both short term and long term fuel corrections between front catalyst and rear catalyst.

The short term fuel correction indicates the amount of fuel correction which is used to always keep air fuel ratio at the theoretical level. The signal from the air/fuel ratio sensor indicates whether the air fuel ratio is richer or leaner compared to the theoretical level. This leads reduction in fuel injection amount when the air fuel ratio is in rich condition, or increase in fuel injection amount when the air fuel ratio is in lean condition.

By factors including the difference between engines, fatigue period, and change in operation environment, the short term fuel correction varies from the ideal theoretical value. In the long term fuel correction, the whole fuel correction is controlled. By the long term fuel correction, the long term deviation of the fuel correction is corrected from the ideal theoretical value. The long term deviation is acquired as a result of the short term fuel correction.

When both of the long term and short term fuel corrections are leaner or richer than the pre-defined value, it is determined as abnormal and the MIL illuminates, then the DTC is recorded.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P2096 | Sub fuel trim is extremely in rich state with air fuel ratio feedback stable in the warmed up engine. (2 trips detection logic) | •Intake system<br>•Fuel injector ASSY (port injection)<br>•Fuel injector ASSY (cylinder injection)<br>•Intake air flow meter SUB-ASSY<br>•E.F.I. water temperature sensor<br>•Fuel pressure<br>•Gas leakage from exhaust system<br>•Open/short circuits in the air/fuel ratio sensor<br>•Air / fuel ratio sensor<br>•PCV valve and hose<br>•PCV hose connection<br>•ECM<br>•Wiring harness or connector |
| P2097 | Sub fuel trim is extremely in lean state with air fuel ratio feedback stable in the warmed up engine. (2 trips detection logic) | |

ES

NOTE:

- When DTCP2096 is set, the actual air fuel ratio is in lean state. When DTCP2097 is set, the actual air fuel ratio is in rich state.
- If the vehicle runs out of gas, the air fuel ratio becomes lean and DTCP2096 may be set. In this case, the MIL illuminates.

MONITOR DESCRIPTION

During closed loop fuel control, if fuel injection amount is not within the value estimated by ECM, long term fuel correction value may vary. When the deviation of the short term fuel correction value does not change, the long term fuel correction is adjusted. The deviation of fuel injection amount estimated by ECM also has an influence on the average fuel correction learning value which is the sum of the short term fuel correction average (F/B correction value) and long term fuel correction average (air fuel ratio learning value). If the fuel correction learning value average exceeds the abnormal threshold value, ECM determines it as fuel system failure and the DTC is recorded.

Description of functions

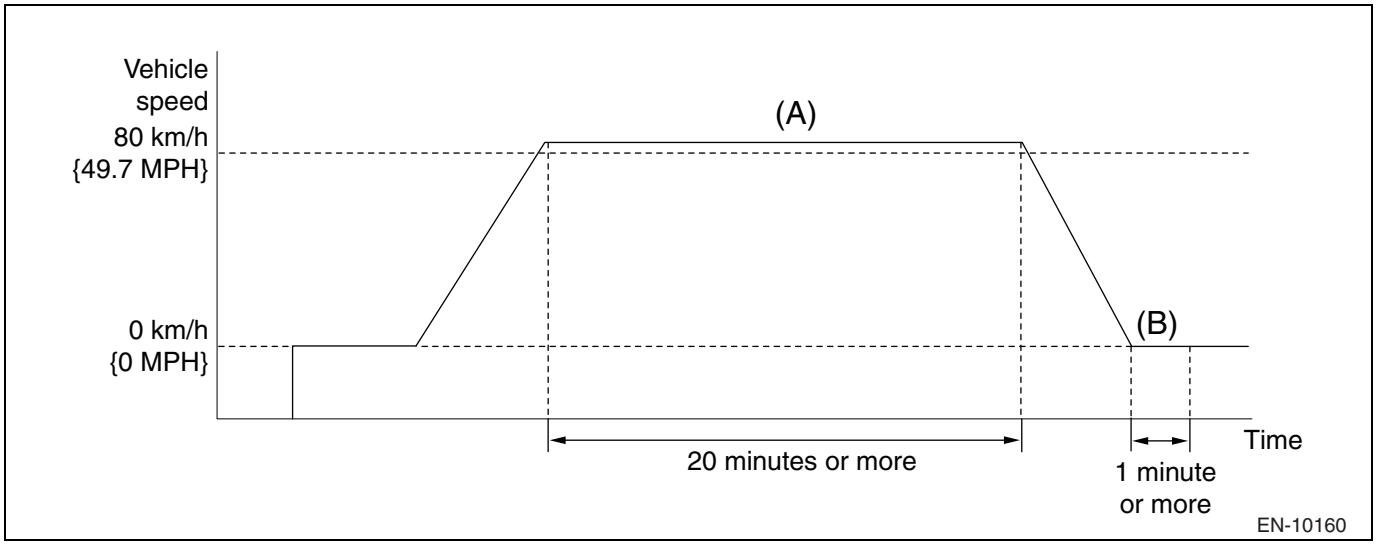
Test drive

Perform test drive to check if the DTC recurs.

NOTE:

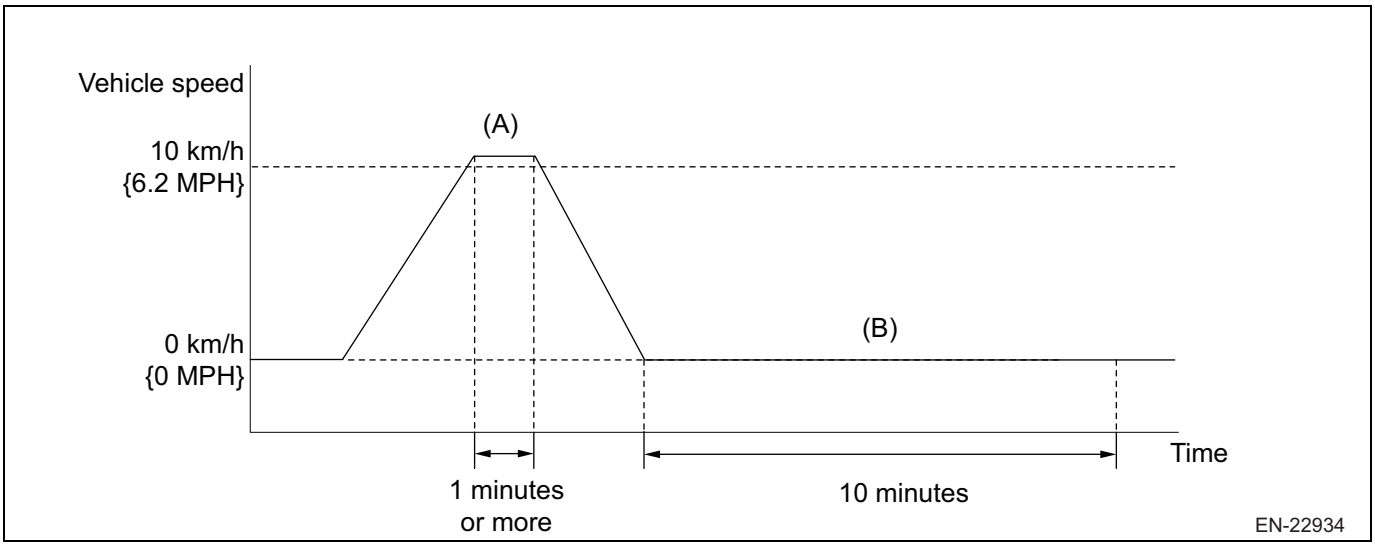
Both of test drive A and B can recur the diagnostic code.

Test drive A



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive B



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 10 km/h {6.2 MPH} or more for 1 minute or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 10 minutes or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

1. Connect the SSM4 to the DLC3.
2. Start the engine.
3. Turn on the SSM4.
4. Warm up the engine at 2500 rpm for approximately 90 seconds.
5. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
6. Execute [Cylinder Fuel Rate] with the engine idling.
7. Inspect [A/F Sensor #11] and [A/F Sensor #12] of the data display when running the active test.

NOTE:

- Fluctuate the fuel injection amount in a range of -12 % to +12 %.
- The sensors respond according to increase/decrease in fuel injection amount.

| Item | Fuel injection volume | Status | Output voltage of air/fuel ratio sensor and oxygen sensor |
|---|---|---|---|
| A/F Sensor #11 | +12% | Rich | Less than 2.0V |
| | -12% | Lean | 2.4V or more |
| Oxygen sensor #12 | +12% | Rich | 0.55 V or more |
| | -12% | Lean | Less than 0.4V |

CAUTION:
There is a delay of a few seconds in the air/fuel ratio sensor voltage output, and there is a maximum delay of approx. 20 seconds in the oxygen sensor voltage output.

| Case | Air/fuel ratio sensor (sensor 1) output voltage | Oxygen sensor (sensor 2) output voltage | Point which may have problems |
|---|---|---|---|
| 1 |  |  | - |
| 2 |  |  | • Air / fuel ratio sensor<br>• Air/fuel ratio sensor heater<br>• Air/fuel ratio sensor circuit |
| 3 |  |  | • Oxygen sensor<br>• Oxygen sensor heater<br>• Oxygen sensor circuit |
| 4 |  |  | • Fuel injector ASSY<br>• Fuel pressure<br>• Gas leakage from exhaust system (air/fuel ratio is in very rich or lean status) |

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- When air/fuel ratio becomes in rich status, the air/fuel ratio sensor voltage may drop. Check the conditions that can cause the engine to be in rich status.
- When air/fuel ratio becomes in lean status, the air/fuel ratio sensor voltage may rise. Check the conditions that can cause the engine to be in lean status.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTCs. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| DTC P2096 or P2097 is output. | A |
| P2096 or P2097 and other DTCs are output. | B |

NOTE:
If any DTCs other than P2096 or P2097 are displayed, troubleshoot them first.

| | |

B → Go to Step 17.

C → Go to Step 22.

D → Go to Step 4.

A

| 3 | Check if the engine has ever stalled due to lack of fuel. |
|---|---|

(1) Has the engine ever stalled due to lack of fuel?

No → Inspection for problems that do not normally occur (Refer to ES - 12)

Yes

The DTC was recorded due to a lack of fuel situation during driving that occurred in the past

| 4 | Inspection of the PCV hose |
|---|---|

(1) Check the PCV hose for poor connections and damage.
Criteria: The PCV valve and hose are connected properly and not damaged.

NG → Repair or replacement of the PCV hose

OK

| 5 | Intake system inspection |
|---|---|

(1) Inspect the intake system. (Refer to IE - 4)

NG → Repair or replacement of intake system

OK

| 6 | Reading of SSM4 data (A/F sensor output signal (bank 1 sensor 1)) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Run the engine at 2500 rpm for approximately 90 seconds for warm-up.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Cylinder Fuel Rate]
(6) Execute [Cylinder Fuel Rate] with the engine idling.
(7) Inspect [A/F Sensor #11] and [Oxygen sensor #12] of the data display when running the [Active Test].
NOTE:
- Fluctuate the fuel injection amount in a range of -12 % to +12 %.
- The output voltage for the air/fuel ratio sensor is delayed a few seconds, while the output voltage for the oxygen sensor is delayed for a maximum of approximately 20 seconds.
- If the sensor output voltage does not fluctuate when running [Active Test] (almost no response), there may be a malfunction in the sensor.

Voltage

| Item | Fuel injection volume | Status | Output voltage of air/fuel ratio sensor and oxygen sensor |
|---|---|---|---|
| [A/F Sensor #11] | 12% | Rich | Less than 2.0V |
| | -12% | Lean | 2.4V or more |

B → Go to Step 10.

A

| | |
|---|---|
| 7 | Reading of SSM4 data ([Coolant Temp.]) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Coolant Temp.]
(5) Read [Coolant Temp.] both when the engine is cold and warmed up.
Criteria:
Engine before warmed up: Equal to ambient temperature

Engine after warmed up: 75 to 100°C {167 to 212°F}

NG → Replacement of E.F.I. water temperature sensor (refer to ES - 699)

OK

| 8 | Reading of SSM4 data ([Mass Air Flow]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Start the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Mass Air Flow], [Coolant Temp.] and [Engine Speed]
(6) Idle the engine until the coolant temperature reaches 75°C {167°F} or more.
(7) Read [Mass Air Flow] with engine speed at 3000 r/min.
Standard value: 8 to 13 g/s {0.28 to 0.46 oz/s} (shift position: N, A/C: OFF)

NG → Go to Step 23.

OK

| 9 | Exhaust gas leakage check |
|---|---|

(1) Make sure that exhaust gas is not leaking from connections of exhaust pipes and installation areas of sensors.

OK → Go to Step 13.

NG → Repair of exhaust gas leakage

| 10 | Unit inspection of the air/fuel ratio sensor |
|---|---|

(1) Perform a unit inspection on the air/fuel ratio sensor. (Refer to ES - 712)

NG → Replacement of the air/fuel ratio sensor (Refer to ES - 711)

OK

| 11 | Inspection of wiring harnesses and connectors (air/fuel ratio sensor - ECM) |
|---|---|

NG → Repair or replacement of wiring harness or connector

OK

| 12 | Replacement of the air/fuel ratio sensor |
|---|---|

(1) Replace the air/fuel ratio sensor. (Refer to ES - 711)

Next

| 13 | Perform test drive for operation check |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn IG to ON and start SSM4.
(3) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(4) Turn the ignition switch to OFF, and wait for 30 seconds.
(5) Turn IG to ON and start SSM4.
(6) Perform test drive. (Refer to "Test drive" under "Description of functions")
WARNING:
When performing this driving test, observe the applicable traffic laws such as the speed limit.
(7) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |

A

| 19 | Performing of SSM4 [Active Test] ([Injection Mode Change]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Start the engine.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Injection Mode Change] / [Cylinder injection]
(4) Check [Target Fuel Pressure(High)], [Short term fuel trim B1] and [Long term fuel trim B1] data readings during [Active Test].

Result

| Item name | | Inspection conditions | Go to |
|---|---|---|---|
| Target Fuel Pressure(High) | Sum of [Short term fuel trim B1] and [Long term fuel trim B1] | | |
| 3 to 5 MPa | Less than -25% | • [Active Test] - [Injection Mode Change] - [Cylinder injection] in progress<br>• Idling<br>• Shift lever is at N or P position<br>• A/C OFF | A |
| 3 to 5 MPa | +30% or more | | |
| 3 to 5 MPa | -25 to +25% | | B |

B → Inspection for problems that do not normally occur (Refer to ES - 28)

A

Replacement of the fuel injector ASSY (direct injection side) (Refer to FU - 31)

| 20 | Misfire count check |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Start the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Injection Mode Change] / [Cylinder injection]
(6) Idle the engine.
(7) Check the values of [Cylinder #1 Misfire Count] through [Cylinder #4 Misfire Count] in the data display while performing [Active Test].
When any cylinder has no misfire counts, perform the following steps.
(a) Shift the shift lever to D position.
(b) Check all misfire rates displayed on SSM4.

Result

| Result | Go to |
|---|---|
| No misfire, random misfires at all cylinders | A |

| Result | Go to |
|---|---|
| Misfire at specific cylinders | B |

B → Replacement of the fuel injector ASSY (direct injection side) (Refer to FU - 31)

A

| 21 | Injector driver check |
|---|---|

(1) Replace the problematic injector with one which has no problem from another vehicle. (Refer to FU - 31)
CAUTION:
Do not disconnect or reconnect the connector with IG SW ON to prevent damage to the injector driver (EDU).
(2) Connect the SSM4 to the DLC3.
(3) Turn the ignition switch to ON.
(4) Turn on the SSM4.
(5) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(6) Turn the ignition switch to OFF, and wait for 30 seconds.
(7) Turn IG to ON and start SSM4.
(8) Start the engine and warm up.
(9) Perform test drive. (Refer to "Test drive" under "Description of functions")
(10) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| P2096 or P2097 is output. | A |
| No DTC is output | B |

B → End (injector driver failure)

A

Replacement of fuel pump ASSY (high-pressure side) (Refer to FU - 58)

| 22 | Unit inspection for the fuel injector ASSY (port injection side) |
|---|---|

(1) Check the fuel injector (port injection side) as a single part. (Refer to FU - 29)

NG → Replacement of the fuel injector ASSY (port injection side) (Refer to FU - 21)

OK

Replacement of the engine control computer (Refer to ES - 674)

| 23 | Check wiring harness and connector (connection of intake air flow meter SUB-ASSY connector) |
|---|---|

(1) Check the connection, engagement, and terminal contact pressure of the wiring harness and connector between the intake air flow meter SUB-ASSY and ECM. (Refer to IN - 36)
NOTE:
If abnormal, repair them.

ES

Next

| 24 | Perform test drive for operation check |

Replacement of the engine control computer (Refer to ES - 674)

| | | |
|---|---|---|
| DTC | P2101 | ETC motor drive circuit |
| DTC | P2102 | ETC motor relay power supply normally OFF |
| DTC | P2103 | ETC motor relay power supply normally ON |

Circuit description
The accelerator pedal sensor ASSY, which is located on the accelerator pedal, sends the accelerator opening angle data to the engine control computer. The engine control computer determines throttle opening angle suitable for a driving condition and drives the throttle motor. The throttle valve opening angle data is fed back to the engine control computer from the throttle position sensor. When this DTC is recorded, the engine control computer shuts off electric power supply to the throttle motor, allowing the

return spring to act on the throttle valve so that the valve returns to the predetermined opening angle position. Also, fuel injection is cut off so that the engine output is adjusted based on the accelerator opening angle to allow the vehicle to go into limp-in mode.

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P2101 | When any of the following conditions is met (1 trip detection logic):<br>• Throttle actuator electric current is 16A or more.<br>• Internal temperature of throttle actuator drive circuit is 175°C {347°F} or more. | •Throttle body<br>•ECM |

ES

MONITOR DESCRIPTION

ECM monitors electrical current via the throttle actuator and detects failure or open circuit in the throttle actuator according to the value. If the current is abnormal, ECM determines that there is a problem in the throttle actuator. Also, if the throttle valve does not operate correctly (such as when intrusion occurs), ECM determines that there is a problem. In this case, the ECM turns on the MIL and records the DTC.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.

3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

ES

Inspection steps

WARNING:

- Before performing troubleshooting, check the fuse for this circuit.
- Never try to clean the throttle body ASSY (with motor).

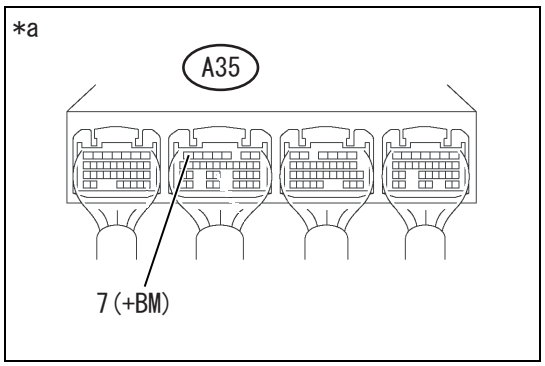
NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| 1 | Check wiring harness and connector (throttle motor power supply voltage) |
|---|---|

NOTE:

For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Measure the voltage between the terminals. (For terminal arrangement, refer to ES - 36.)
Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A35-7 (+BM) - chassis ground | IG ON | 11 to 14 V |
| A35-7 (+BM) - chassis ground | IG OFF | 0 to 1 V |

Captions in illustration

| | |
|---|---|
| *a | Connector connected (engine control computer) |

NG → Go to Step 6.

OK

| 2 | Throttle body ASSY (with motor) unit inspection |
|---|---|

(1) Perform unit inspection of the throttle body ASSY (with motor). (Refer to ES - 672)

NG → Replacement of throttle body ASSY (with motor) (Refer to ES - 670)

OK

| 3 | Check wiring harness and connector (engine control computer - throttle body ASSY (with motor)) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the throttle body ASSY (with motor) connector.
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (Refer to ES - 36for the terminal arrangement)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-2 (M+) - C15-2 (M+) | Always | Less than 1 Ω |
| A36-1 (M-) - C15-1 (M-) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-2 (M+) and C15-2 (M+) - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-1 (M-) and C15-1 (M-) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

| 4 | Throttle body ASSY (with motor) unit inspection (visual inspection of throttle valve) |
|---|---|

(1) Check for foreign materials in the area between the throttle valve and the housing.
Criteria: There are no foreign materials between the throttle valve and the housing.

NG → Removing foreign materials from inside the throttle body

OK

| DTC | P2138 | Accelerator pedal position sensor characteristic |

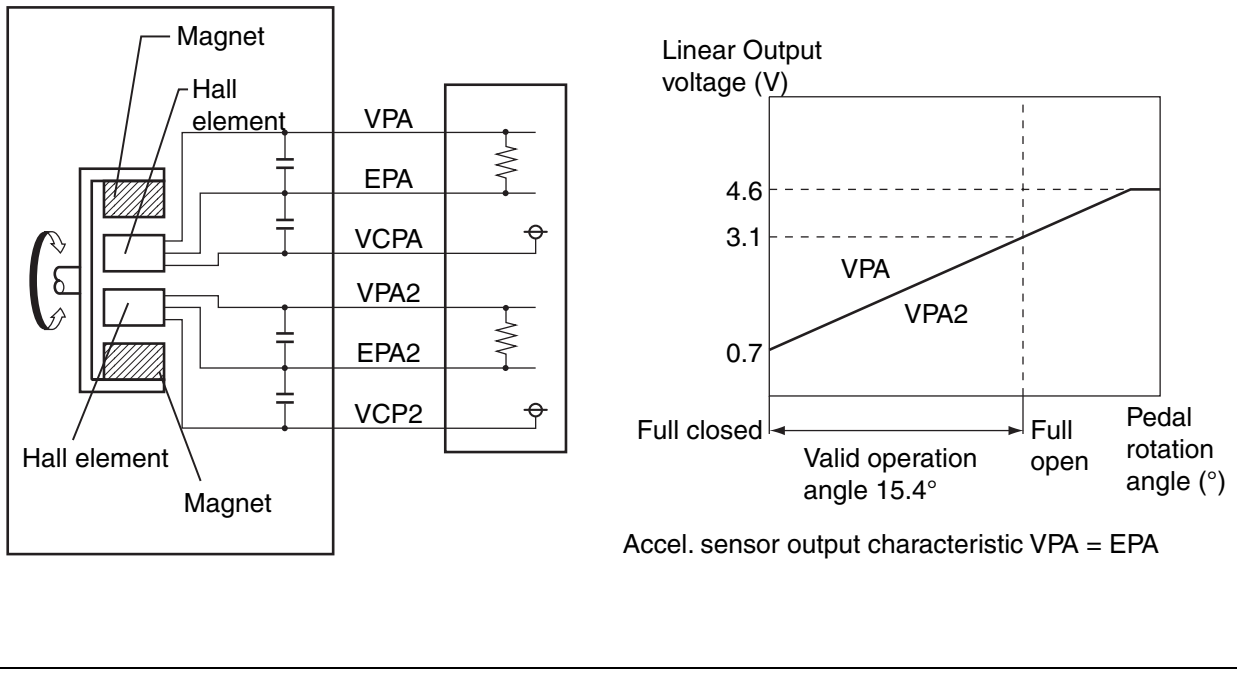
ES

Circuit description

The accelerator pedal sensor ASSY detects an accelerator opening angle. The sensor type used is non-contact type accelerator pedal sensor ASSY. This sensor uses Hall element which is capable of sensing magnetic field as an electrical signal. As the accelerator pedal moves, output voltage difference is produced linearly. This effect is called Hall effect. The accelerator pedal sensor ASSY has circuits with two equal output characteristics (VPA and VPA2). The sensor also sends output voltage which corresponds to accelerator pedal opening angle to the engine control computer. The engine control computer controls the throttle valve based on this output voltage.

NOTE:

This electronic throttle control system does not use throttle cables.



Accel. sensor output characteristic VPA = EPA

| DTC No. | DTC detection condition | Suspected parts |
|---|---|---|
| P2122 | When VPA voltage is less than 0.303V.<br>(1 trip detection logic) | •Open/short circuit in accelerator pedal circuit<br>•Accelerator pedal sensor ASSY<br>•ECM |
| P2123 | When VPA voltage is 4.737 V or more.<br>(1 trip detection logic) | |
| P2127 | When VPA2 voltage is less than 0.303V.<br>(1 trip detection logic) | |
| P2128 | When VPA2 voltage is 4.737 V or more.<br>(1 trip detection logic) | |
| P2138 | When difference between signals from VPA and VPA2 exceeds the threshold value.<br>(1 trip detection logic) | |

MONITOR DESCRIPTION

The accelerator pedal sensor is installed to the accelerator pedal bracket. The accelerator pedal sensor has 2 sensor elements and 2 signal outputs (VPA and VPA2). VPA is used for detecting actual accelerator pedal angle (engine control) and VPA2 is used for detecting VPA problems. If the difference of output voltage between VPA and VPA2 is out of the criteria, ECM determines that there is a problem in the accelerator pedal sensor. In this case, the ECM turns on the MIL and records the DTC.

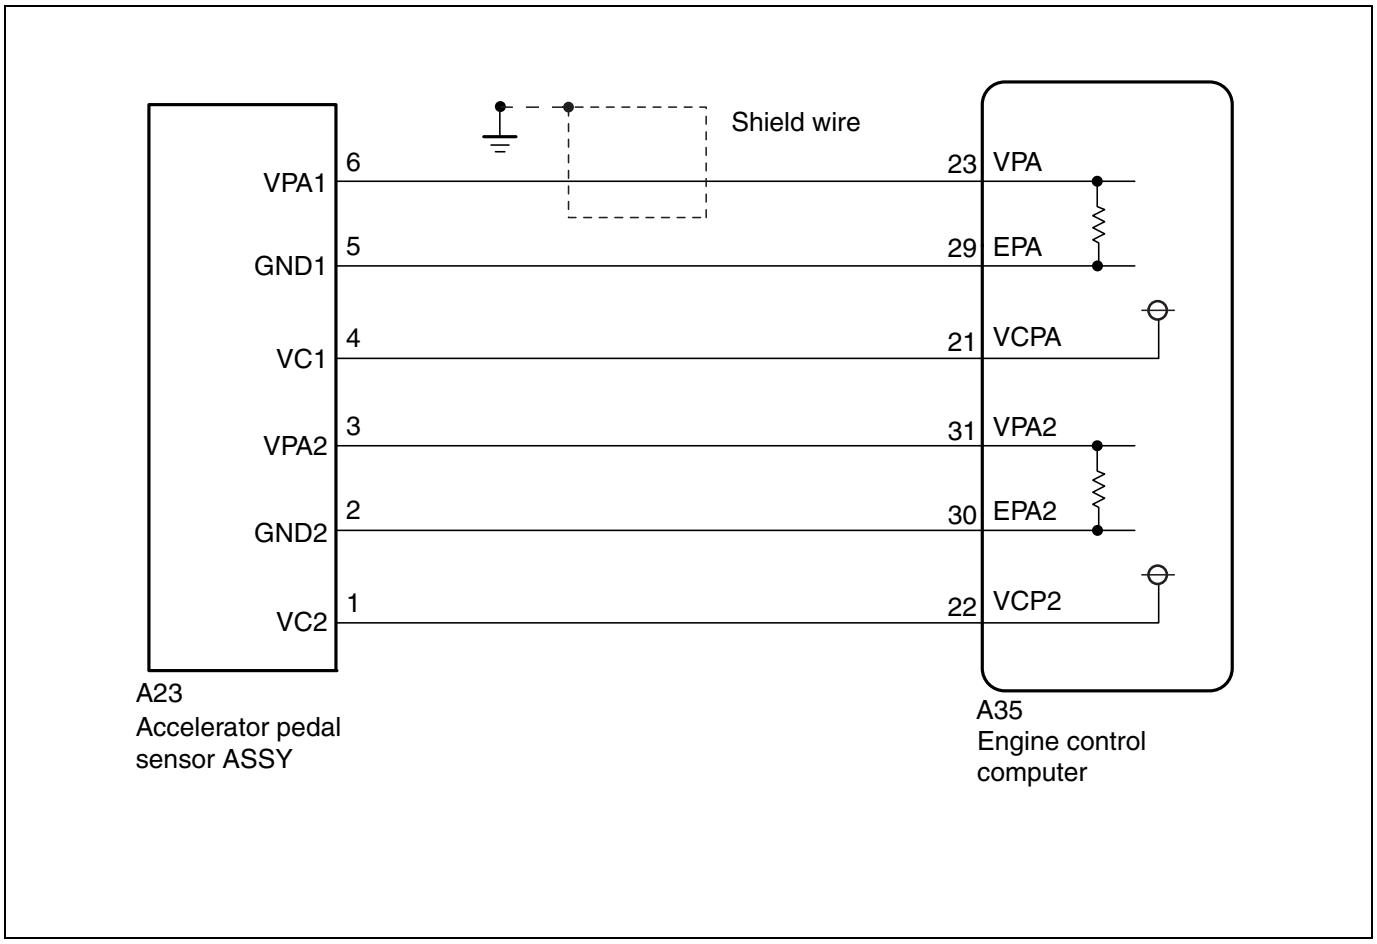
Circuit figure



Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

NOTE:

Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.

| | |
|---|---|
| 1 | Reading of SSM4 data ([Accelerator Sensor No1 Voltage] ·[Accelerator Sensor No2 Voltage]) |

|---|---|---|

Circuit description

NOTE:

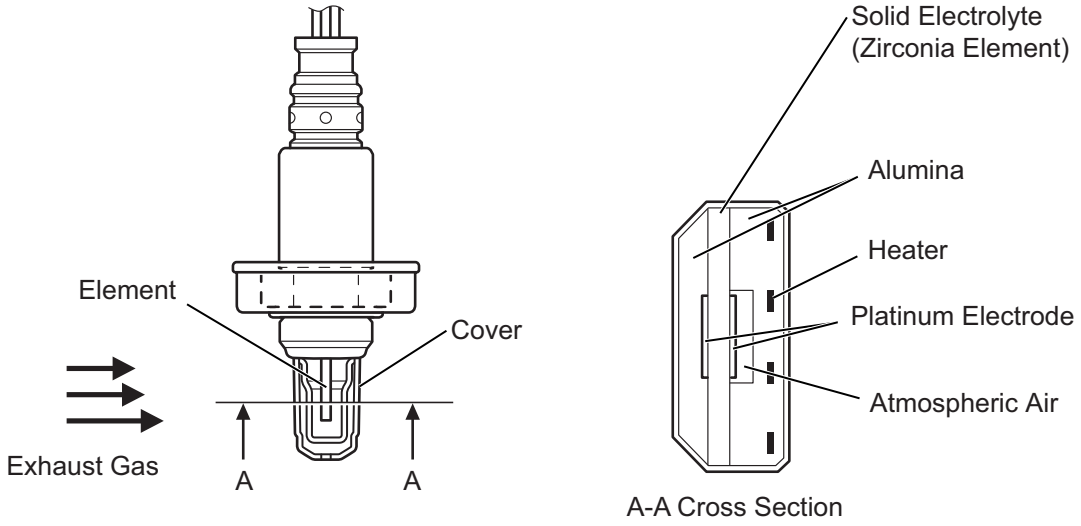
- The oxygen sensor is displayed in the DTCs, but these DTCs are related to the air/fuel ratio sensor.
- Sensor 1 means the sensor that is installed on the upstream (close to the engine) of the catalyst.

The air/fuel ratio sensor creates a voltage that corresponds to the actual air/fuel ratio.* The sensor voltage is used to provide the ECM with feedback for controlling the air/fuel ratio. The ECM determines the deviation from the stoichiometric air/fuel ratio level, and adjusts the fuel injection time. If there is a malfunction in the air/fuel ratio sensor, the ECM can no longer accurately control the air/fuel ratio.

The air/fuel ratio sensor is a planar type, and is one unit with the heater that heats the solid electrolyte (Zirconia material). This heater is controlled by the ECM. When the amount of air intake is low (the temperature of the exhaust gas is low), an electricity current flows to the heater, and the sensor is warmed up. This aids in accurately detecting the concentration of oxygen. Also, the sensor and heater part has become smaller than previous versions. The heat created by the heater is transferred to the solid electrolyte through alumina, and this aids in the sensor's operation.

The three-way catalytic converter is used to increase the purification rate of carbon monoxide (CO), hydrocarbon (HC), and nitrogen oxide (NOx), which are substances contained in the exhaust gas. To most efficiently use the three-way catalytic converter, it is necessary to precisely control the air/fuel ratio so that it is always near stoichiometric levels.

*: Values change inside the ECM. Because the air/fuel ratio sensor is a current output part, this electrical current is converted to voltage in the ECM. Measurements of the air/fuel sensor or ECM connectors display a certain voltage.



0

| DTC No. | DTC detection conditions | Faulty part |
|---|---|---|
| P2195 | When the excess air ratio (lambda) continues to be less than 0.85 for 10 seconds during air/fuel ratio feedback control (2 trips detection logic) | •Open/short circuits in the air/fuel ratio sensor<br>•Air / fuel ratio sensor<br>•Intake system<br>•Fuel pressure<br>•Fuel injector ASSY<br>•ECM |
| P2196 | When the excess air ratio (lambda) continues to exceed 1.15 for 10 seconds during air/fuel ratio feedback control (2 trips detection logic) | |

NOTE:

- If these DTCs are recorded, using the SSM4 menu, check the air/fuel ratio sensor voltage output.
- The short-term fuel trim value can also be read with the SSM4.
- The ECM adjusts the voltage at the A1A+ and the A1A- terminals in the ECM to a certain level. Therefore, the voltage output of the air/fuel ratio sensor cannot be checked without using the SSM4.
- If a malfunction is detected in the air/fuel ratio sensor, the ECM records a DTC.

MONITOR DESCRIPTION

The ECM calculates the lambda (rate of excess air) based on the output voltage of the air/fuel ratio sensor. If the lambda exceeds the threshold for 10 seconds or more, the ECM determines that the air/fuel ratio sensor is stuck, and records a DTC.

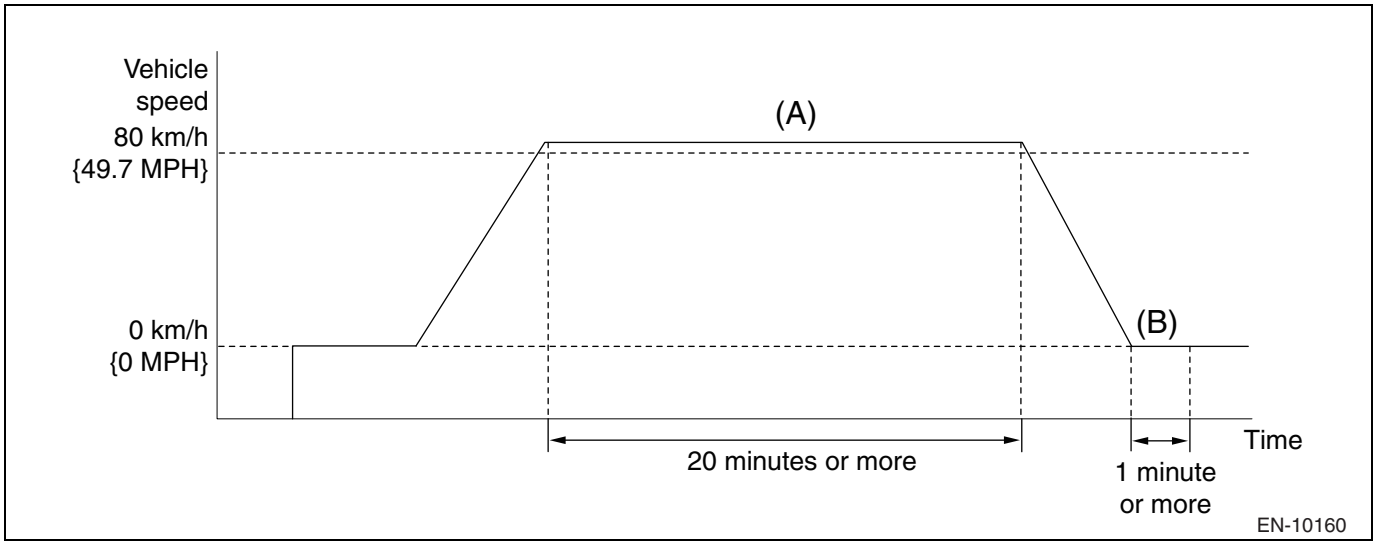
Description of functions

Test drive

Perform test drive to check if the DTC recurs.



1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine and let it warm up until the engine coolant temperature stabilizes. (at 75°C {167°F} or more).
9. Perform driving test as follows.
   WARNING:
   When performing this driving test, always observe the applicable traffic laws such as the speed limit.
   (a) Drive at 80 km/h {49.7 MPH} or more for 20 minutes or more. (A)
   (b) Stop the vehicle.
   (c) Idle the engine for 1 minute or more. (B)
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

NOTE:

- Read the freeze frame data using the SSM4. A part of the engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for troubleshooting.
- When air/fuel ratio becomes in rich status, the air/fuel ratio sensor voltage may drop. Check the conditions that can cause the engine to be in rich status.
- When air/fuel ratio becomes in lean status, the air/fuel ratio sensor voltage may rise. Check the conditions that can cause the engine to be in lean status.

| DTC | P2270 | O2 Sensor Signal Biased/Stuck Lean (Bank 1 Sensor 2) |
|---|---|---|

Circuit description

The three-way catalytic converter is used to efficiently purify carbon monoxide (CO), hydrocarbon (HC), and nitrogen oxide (NOx) contained in the exhaust gas. The maximum performance of this three-way catalyst is reached when it functions at near stoichiometric air-fuel ratio. Therefore, unless the engine is precisely controlled to produce near this air fuel ratio, CO, HC, and NOx are not efficiently purified. Oxygen sensors are provided for the purpose of this control. When an oxygen sensor detects an oxygen level within the exhaust gas produced from proper combustion near the stoichiometric air-fuel ratio, its output voltage changes quickly. This characteristic is used to send a signal to the engine control computer for an accurate air/fuel control.

Under a leaner air/fuel ratio, oxygen level within the exhaust gas increases. The oxygen sensor sends this information (lean air/fuel ratio state) to the engine control computer. (Works with a small electric power: less than 0.45 V)

Under a richer air/fuel ratio, oxygen level within the exhaust gas decreases. The oxygen sensor sends this information (rich air/fuel ratio state) to the engine control computer. (Works with a large electric power: more than 0.45 V)

A zirconium element is used for the sensor element. The zirconium element is made of platinum plated zirconium, containing integrated heating component. The inside surface of the zirconium element is exposed to the atmospheric air, and the outside surface is exposed to the exhaust gas. When there is a significant difference in oxygen level between the atmospheric air and the exhaust gas, the sensor outputs a small amount of voltage. Efficiency of the oxygen sensor increases significantly when heated. When exhaust gas temperature is low, the oxygen sensor cannot generate a useful voltage signal without supplemental heating. This is the reason why the oxygen sensor is equipped with a heater that heats up its zirconium element. The engine control computer uses the duty cycle approach to control the supplemental heating, adjusting the average electric current supplied to the zirconium element.

ES

MONITOR DESCRIPTION

While monitoring the EVAP system, the ECM monitors the status of the leak detection pump and vent valve integrated into the canister pump module.

When the ECM detects any malfunction in operation status of the leak detection pump and vent valve, the ECM illuminates the MIL and stores the DTCs.

Monitoring result

Refer to [Monitor Status Check] (Refer to ES - 24)

Circuit figure

For a circuit figure, refer to ES - 586.

Description of functions

Test drive (P2401, P2419)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P2402, P2420)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Select the following menu items using the SSM4. : [OBD System] / [Each System] / [ECM Engine Control] / [On-Board System Test] / [Evaporative System Leak Test]
9. Click the [OK] button to start the evaporative system leak test.
   CAUTION:
   - When performing the evaporative system leak test continuously, pay attention to the battery condition. If the evaporative system leak test is repeatedly performed without starting the engine, the battery voltage will drop and may cause run-out of the battery.
   - Do not leave the vehicle for a prolonged period with the evaporative system leak test performed. This may cause an early deterioration of the battery or cause a battery discharge.

   NOTE:
   - When performing the evaporative system leak test continuously, drive the vehicle under the following conditions, and release the accumulated evaporative emission. If the evaporative system leak test is continuously performed with the engine stopped, a large amount of evaporative emission is accumulated into the canister, which may prevent correct diagnosis.
     – After warming-up

– Drive at 48 km/h {30 MPH} or more for 10 minutes or more. (Driving time is acceptable for accumulation.)

• Observe the following items for operation to obtain correct diagnostic result.
  – Do not refuel the vehicle before performing the evaporative system leak test. Because a large amount of evaporative emission is generated in the fuel tank immediately after refueling the vehicle, the accuracy of the diagnosis may be reduced.
  – Do not shake the vehicle while the evaporative system leak test is being performed. Rocking the vehicle will increase the evaporative emission in the fuel tank, which may reduce the accuracy of the diagnosis.
  – During evaporative system leak test, do not perform any service operation including removal/installation of the parts and connectors. Otherwise, the service operation may affect the related parts, and the accuracy of the diagnosis can be reduced.

ES

10. [Conditions have been enabled to control this function. Turn the ignition switch off to terminate the test.] is displayed. Wait for 30 minutes without clicking the [OK] button.
    NOTE:
    • Click the [OK] button to return to [Evaporative System Leak Test] screen. However, the evaporative system leak test still continues.
    • The display of the SSM4 will not change both when the evaporative system leak test is successfully completed and when the test is canceled by turning IG to OFF.
    • When [Test conditions are not correct] screen is displayed, using the SSM4, check that the value of [Coolant Temp.] and the value of [Intake Air Temp.] are within the specification. When the values are within the specification, perform the evaporative system leak test.
11. When 30 minutes has passed after finishing step 9, click the [OK] button.
12. Return to [OBD Menu], select {Result of on-board monitor test}.
13. Check TID$C1 to $CA of MID$3C in [Result of on-board monitor test].

Result of on-board monitor test

| Display | Details | Remarks |
|---|---|---|
| $0000 is stored in every Val. | The test condition fails to be met during evaporative system leak test, and the test has been cancelled. | Re-run the test after ensuring that the test conditions are met. |
| Any value is stored in every Val. and every Result shows OK. | The evaporative system leak test is completed successfully. | Use the SSM4 to read the temporary code with IG ON. |
| Any one of the results is NG | The evaporative system leak test is completed successfully but there is an error in the results. | Use the SSM4 to read the temporary code with IG ON. |

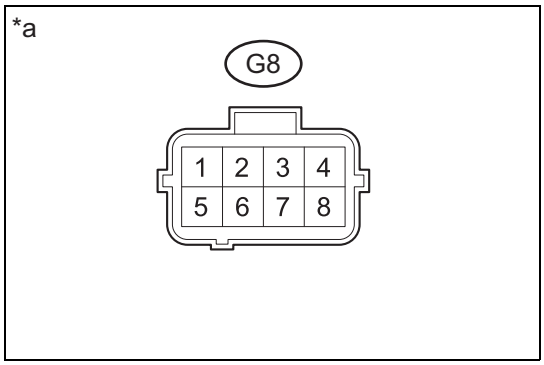
14. When the evaporative system leak test is completed successfully, read the temporary code with IG ON. When any DTC is recorded, troubleshoot the appropriate DTC.
    NOTE:
    Turning IG to OFF will clear the temporary codes.

Inspection steps

CAUTION:

• Do not disassemble the canister pump module.
• Check fuses of the circuits related to this system before performing the following inspection steps.

| 1 | Check canister pump module (power supply) |
|---|---|



(1) Turn the ignition switch to OFF.
(2) Disconnect the canister pump module connector.
(3) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions (switching) | Standard value |
|---|---|---|
| G8-3 - chassis ground | IG ON | 11 to 14V |
| G8-5 - chassis ground | IG ON | 11 to 14V |

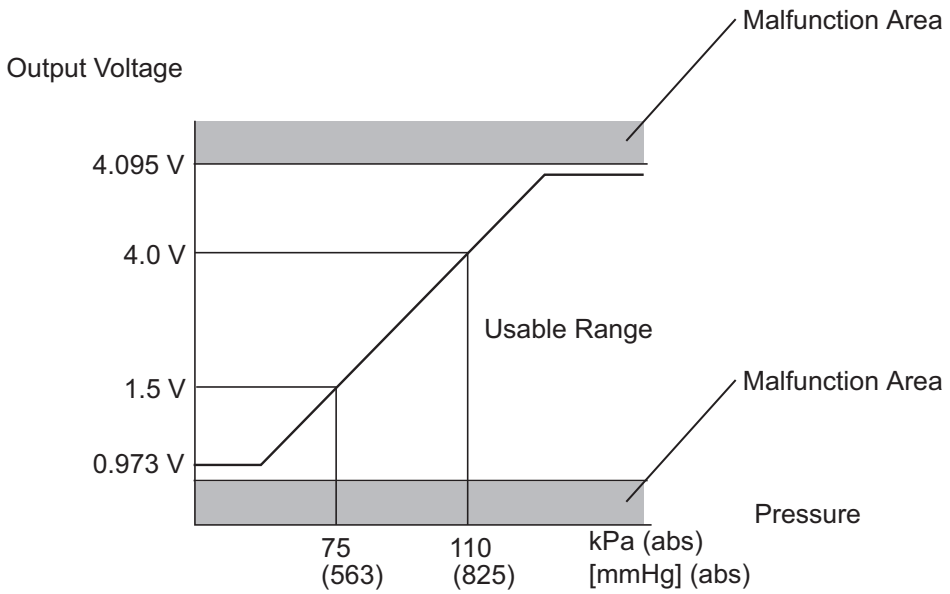
| P24BB | Canister pressure sensor HIGH input | EVAP pressure sensor is 4.095 V or more for one second | | • IG ON<br>• During EVAP monitoring (Ignition switch is OFF) | 1 trip |

NOTE:
The canister pressure sensor is integrated into the canister pump module.

MONITOR DESCRIPTION

Canister Pressure Sensor Specification (fig.2)



HINT:

Standard atmospheric pressure is 101.3 kPa (abs) [760 mmHg (abs)]

1. DTC P24B9: The difference between the canister pressure sensor and the air pressure sensor output values

When the difference in the atmospheric pressures calculated from the canister pressure sensor signal and the vacuum sensor signal exceeds the specified value, the ECM determines that a fault is present in the canister pressure sensor, the MIL is illuminated, and all DTCs are recorded. (2-trip detection logic)

2. DTC P24BA: Canister pressure sensor voltage LOW

   When the canister pressure sensor voltage output (pressure) is 0.973V: 51.71 kPa (abs) [388 mmHg (abs)] or less, the ECM interprets this as being a canister pressure sensor open or short circuit error and stops the EVAP system monitor. In this case, the ECM turns on the MIL and records the DTC. (1-trip detection logic)

3. DTC P24BB: Canister pressure sensor voltage HIGH

   When the canister pressure sensor voltage output (pressure) is 4.095 V: 108.99 kPa (abs) {818 mmHg (abs), 32.2 inHg (abs), 15.8 psi (abs)} or more, the ECM judges this as open/short condition in the canister pressure sensor circuit, and stops the EVAP system monitor. In this case, the ECM turns on the MIL and records the DTC. (1-trip detection logic)

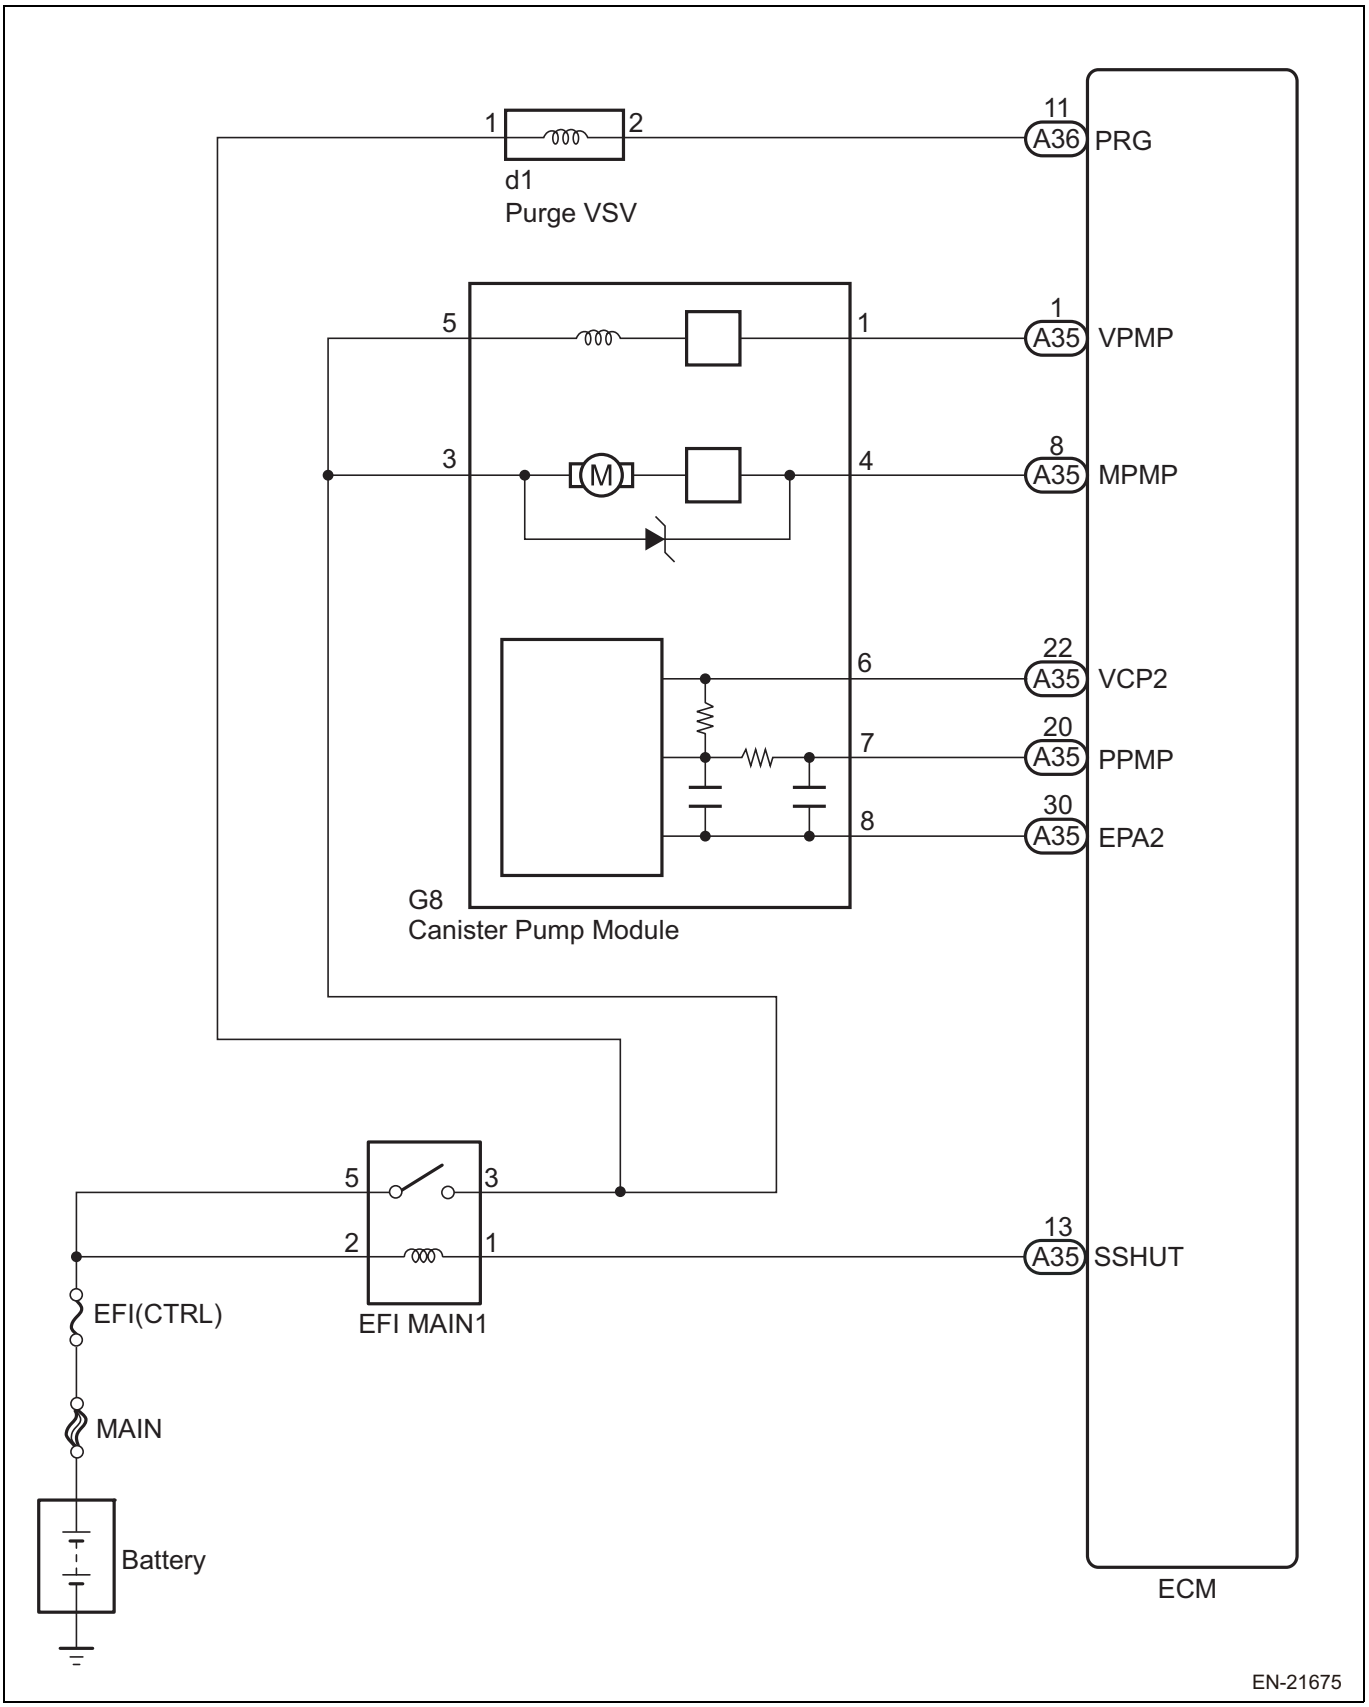
Circuit figure



Description of functions

Test drive (P24B9)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Coolant Temp./ Intake Air Temp.]
9. Confirm that the engine coolant temperature and intake air temperature meet the condition described below.
   Condition: |Engine coolant temperature - intake air temperature| is 5°C {9°F} or less
   NOTE:
   If the condition is not met, turn the ignition switch to OFF, and wait until the condition is met.
10. If the condition is met, start the engine, and let it idle for 2 minutes or more.
    NOTE:
    Do not move the select lever from "P" or "N" range while the engine is idling.
11. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Test drive (P24BA, P24BB)

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

CAUTION:

- Once the car has been brought in, leave it as it is. Be sure that you do not change the vehicle condition. For example, do not tighten the fuel cap.
- Do not disassemble the canister pump module.
- A SSM4 is required for the following diagnosis troubleshooting procedures.
- Check fuses of the circuits related to this system before performing the following inspection steps.

| | |
|---|---|
| 1 | Check the DTC and EVAP pressure |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON. (Do not start the engine)
(3) Turn on the SSM4.
(4) Follow the display on the SSM4 to check the DTC. (Refer to ES - 28)
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Absolute Evap Sys. Pressure]
(6) Read the EVAP (evaporative gas) pressure displayed on the SSM4.

Result

| Display (DTC output) | Inspection results | Possible faulty parts | Go to |
|---|---|---|---|
| P24B9 | - | •Canister pressure sensor<br>•Air pressure sensor | C |

| Display (DTC output) | Inspection results | Possible faulty parts | Go to |

ES

B → Go to Step 5.

C → Go to Step 8.

A

| 2 | Check wiring harness and connector (canister pump module - ECM) |
|---|---|

NOTE:
Refer to IN - 6for inspection procedure and precautions of wiring harness and connector.

(1) Turn the ignition switch to OFF.
(2) Disconnect the ECM connector.
(3) Measure the resistance between the terminals. (Refer to ES - 36)

Result

| Inspection terminals | Inspection conditions | Standard value | Possible faulty parts | Go to |
|---|---|---|---|---|
| A35-20 (PPMP) - Chassis ground | Always | Less than 10 Ω | •Wiring harness/Connector (ECM - Canister pressure sensor)<br>•Canister pressure sensor circuit shorted | A |
| | | 10 k Ωor more | •Wiring harness/Connector (ECM - Canister pressure sensor)<br>•Short circuit in the ECM circuit | B |

B → Go to Step 8.

A

| 3 | Check wiring harness and connector (canister pump module - ECM) |
|---|---|

(1) Disconnect the canister pump module connector.
(2) Disconnect the ECM connector.
(3) Measure the resistance between the terminals. (Refer to ES - 36)

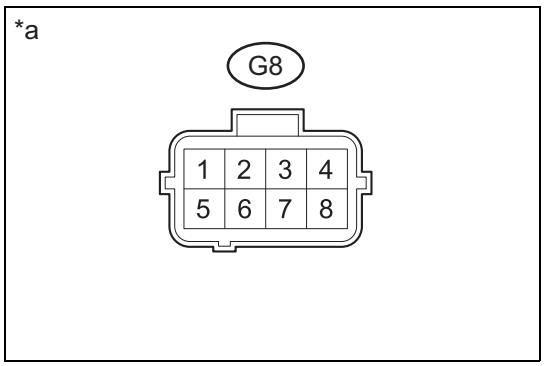
Result

| Inspection terminals | Inspection conditions | Standard value | Possible faulty parts | Go to |
|---|---|---|---|---|
| A36-20 (PPMP) - Chassis ground | Always | 10 k Ωor more | Canister pressure sensor circuit shorted | A |
| | | Less than 10 Ω | Wiring harness/Connector (ECM - Canister pressure sensor) | B |

A → Go to Step 6.

B → Go to Step 7.

| 4 | Check wiring harness and connector (canister pump module - ECM) |
|---|---|



(1) Disconnect the canister pump module connector.
(2) Measure the resistance between the terminals.

Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G8-8 - chassis ground | Always | 100 Ωor less |

(3) Turn the ignition switch to ON.
(4) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| G8-6 - chassis ground | IG ON | 4.5 to 5.5V |
| G8-7 - chassis ground | IG ON | 4.5 to 5.5V |

Result

| Inspection results | Possible faulty parts | Go to |
|---|---|---|
| Voltage and resistance within the standard range | Canister pressure sensor circuit open | A |
| Voltage and/or resistance outside of the standard range | Open circuit in wiring harness/connector (ECM - canister pressure sensor) | B |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (Proceed to "Canister pump module") |

B → Go to Step 7.

A

| 5 | Replacement of canister pump module |
|---|---|

(1) Replace the canister pump module. (Refer to EC - 7)

Next → Go to Step 12.

| 6 | Repair or replacement of wiring harness or connector (Canister - ECM) |
|---|---|

Next → Go to Step 12.

| 7 | Replacement of engine control computer |
|---|---|

(1) Replace the engine control computer. (Refer to ES - 674)

Next → Go to Step 12.

| 8 | Reading of SSM4 data (atmospheric pressure) |
|---|---|

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Atmosphere Pressure]
(5) Compare [Atmosphere Pressure] displayed on the SSM4 with the actual atmospheric pressure.

Result

| Result | Go to |
|---|---|
| Difference between [Atmosphere Pressure] and actual atmospheric pressure is 23.6 kPa {177 mmHg, 7 inHg, 3.4 psi} or less. | A |
| Difference between [Atmosphere Pressure] and actual atmospheric pressure is 23.6 kPa {177 mmHg, 7 inHg, 3.4 psi} or more. | B |

ES

B → Go to Step 10.

A

| 9 | Reading of SSM4 data ([Mani. Absolute Pressure]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Mani. Absolute Pressure]
(5) Compare [Mani. Absolute Pressure] displayed on the SSM4 with the actual atmospheric pressure.

Result

| Result | Go to |
|---|---|

| Difference between [Mani. Absolute Pressure] and actual atmospheric pressure is 23.6 kPa {177 mmHg, 7 inHg, 3.4 psi} or more. | B |

B → Go to Step 11.

A

Inspection for problems that do not normally occur (Refer to ES - 28)

| 10 | Replacement of canister pump module |
|---|---|

(1) Replace the canister pump module. (Refer to EC - 7)

Next → Go to Step 12.

| 11 | Replacement of the pressure sensor ASSY |
|---|---|

(1) Replace the air pressure sensor ASSY. (Refer to ES - 709)

Next → Go to Step 12.

| | |
|---|---|
| 12 | Recheck DTCs (after repair) |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
(5) Turn the ignition switch to OFF, and wait for 30 seconds.
(6) Turn the ignition switch to ON.
(7) Turn on the SSM4.
(8) Perform test drive. (Refer to "Test drive" under "Description of functions")
(9) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)
(10) If there are no pending DTCs, repair has been successfully completed.

Inspection steps

| | |
|---|---|
| 1 | Check ECM connector |

(1) Check the connection of the ECM connector.

Result

| Result | Go to |
|---|---|
| Not connected | A |
| Connected | B |

B → Connect the connector properly.

A

| 2 | Check ECM input voltage. |
|---|---|

(1) Turn the ignition switch to ON.
(2) Measure the voltage between the ECM connector, chassis connector, and chassis ground, while wiggling the harness between the ECM connector and the ignition switch connector (for models without push start) or the harness between the ECM connector and IG relay 1 (for models with push start).

ES

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-27 (IGSW) - chassis ground | IG ON | 8 V or more |

NG → Repair harness, connector, and switch.

OK

System is normal. The circuit returns to normal at this point even if a DTC is detected.

| DTC | P2610 | Soak timer IC error |
|---|---|---|

Circuit description

The soak timer starts to operate after ignition switch has been turned to OFF. After a certain period of time has elapsed since IG SW OFF, the soak timer activates the ECM, and the inspection for malfunction is performed. This process can be executed only after the engine has stopped. The soak timer is integrated into the ECM.

| DTC No. | DTC detection conditions | Faulty part |
|---|---|---|
| P2610 | When any of the following conditions is met (2 trip detection logic):<br>Timer diagnosis<br>•When [(engine ECM counter - soak timer IC counter) / engine ECM counter] is 0.24 or more.<br>Full count diagnosis<br>•When the soak timer IC counter is not 1023.<br>Timer diagnosis<br>•When the setting time written in the soak timer IC is different from the value that was read in. Full count diagnosis during wake-up<br>•When the engine ECM counter is 1.636 seconds or less and the soak timer IC counter is 1023.<br>Wake-up diagnosis<br>•Recorded number of wake-up count is smaller than that of the wake-up command. | ECM |

MONITOR DESCRIPTION

1. After the engine has started, the ECM monitors the synchronization status between the soak timer and CPU clock. If these elements are not synchronized with each other, the ECM judges this status to be abnormal, illuminates the MIL, and then stores the DTCs.
2. If the soak timer activates the ECM although not so long period has passed since ignition switch is turned to OFF, or if the soak timer does not activate the ECM although a great deal of time has passed since ignition switch is turned to OFF, the ECM judges that the malfunction occurs in the soak timer, illuminates the MIL, and stores the DTCs next time ignition switch is turned to ON.

Description of functions

Test drive

Perform test drive to check if the DTC recurs.

1. Connect the SSM4 to the DLC3.
2. Turn the ignition switch to ON.
3. Turn on the SSM4.
4. Follow the SSM4 on-screen instructions to clear the DTCs. (Refer to ES - 28)
5. Turn the ignition switch to OFF, and wait for 30 seconds.
6. Turn the ignition switch to ON.
7. Turn on the SSM4.
8. Start the engine.
   NOTE:
   If the engine cannot be started, crank the engine for 10 seconds or more.
9. Idle the engine for 20 seconds or more.
10. Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Inspection steps

Go to troubleshooting for CAN communication system. (Refer to NW - 30)

NOTE:

- Read the freeze frame data using the SSM4. A part of engine running conditions under which the engine trouble occurred is recorded in the freeze frame data, which is useful for trouble shooting.
- When CAN communication system error occurs, the engine control computer cannot receive the updated information from each controller. Therefore, check of the freeze frame data corresponding to the DTCs related to the controllers is no longer useful for troubleshooting.
- When the diagnostic codes for CAN communication error and the corresponding sensor error are both output simultaneously, the CAN communication error must be restored before troubleshooting the error codes for the sensors.

| | |
|---|---|
| 1 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

| Result | Go to |
|---|---|
| U0073, U0101, U0122, U0155, U0402, U0416, or U0423 is output. | A |

| Result | Go to |
|---|---|
| Either U0073, U0101, U0122, U0155, U0402, U0416, or U0423, and other DTCs are output. | B |

| *13 | Air cleaner | - | - |
| *a | EVAP system circuit | - | - |

CAUTION:
In this vehicle, the EVAP system is not sealed even if the vent valve is turned to ON. In order to check for possible leakage from EVAP system, disconnect the air inlet drain hose, and apply pressure from the barometric pressure side of the canister.
With the engine running, under the specified condition (closed loop, etc.), the ECM opens the purge VSV and purges the fuel vapor accumulated in the canister to the intake manifold. The ECM changes the duty cycle ratio of the purge VSV and controls the purge flow rate.
The purge flow rate is determined by the intake manifold pressure. Pressure in the canister via vent valve ensures the retention of the purge flow when the negative (vacuum) pressure is applied to the canister.
In order to confirm the appropriate operation of the EVAP system, the following 2 monitors work.

1. Purge flow monitor
   The purge flow monitor consists of two monitors. First monitoring is performed every time, and the second monitoring is performed as necessary.
   - First monitoring
     With the engine running, when the purge VSV is ON (open), the ECM monitors the purge flow by measuring the fluctuation in EVAP pressure. If the pressure variation exceeds the threshold value, the ECM initiates second monitoring.
   - Second monitoring
     The vent valve turns to ON (Closed) and EVAP pressure monitoring is carried out. If the pressure fluctuation exceeds the threshold, the ECM judges that the purge VSV is in the stuck close status and illuminates the MIL, and stores DTC P0441 (2 trip detection logic).

Atmospheric pressure measurement:
In order to securely perform a reliable malfunction detection, the ECM measures the fluctuation in barometric pressure (before and after the purge flow monitor).

| *11 | Canister pump module | *12 | Reference orifice (0.02 inch) |
| *a | EVAP purge flow | *b | To the intake manifold |

| Parts | Operation |
|---|---|
| Canister | Contains activated charcoal to absorb the EVAP (evaporative emission) generated in the fuel tank. |
| Cutoff valve | Located in the fuel tank. This valve is designed to prevent the accidental fuel spill when the vehicle overturns. |
| Purge VSV (vacuum switching valve) | Opens and closes the line between canister and intake manifold. The ECM controls the EVAP purge flow by the purge VSV. The ECM opens the purge VSV to release the evaporative emission absorbed by the canister into the intake manifold. Amount of evaporative emission released into the intake manifold controlled by the purge VSV duty cycle (energized time) (Open: ON, Close: OFF) |
| Fuel tank vent valve | Located in the fuel tank. Purges the fuel vapor generated during refueling into the canister. Also detects the highest fuel level in the fuel tank. |
| Soak timer | Integrated into the ECM. In order to ensure the accuracy of the EVAP monitor, 5-hours (+/-15 min.) measurement is performed after ignition switch has been turned to OFF. This will lower the fuel temperature and stabilize the EVAP pressure. After approximately 5 hours have passed, the ECM will start up. (Fig. 3) |
| Canister pump module | Consists of the following components (a, b, c, d). The canister pump module cannot be disassembled. |
| (a) Vent valve | Ventilates and closes the EVAP system. When the ECM turns on the valve, the EVAP system is closed. When the ECM turns off the valve, the EVAP system is ventilated. Closes the purge VSV, turns the vent valve to ON (close), and operates the leak detection pump. In order to inspect for EVAP leakage, build up negative pressure (vacuum) into the EVAP system. (Fig. 1) |

| Parts | Operation |
|---|---|
| (b) Canister pressure sensor | Indicates pressures such as voltage. The ECM applies the adjusted 5 V to the pressure sensor and monitors the EVAP system pressure using the feedback from the sensor. (Fig. 2) |
| (c) Leak detection pump | Builds up the negative pressure (vacuum) in the EVAP system for leak detection. |
| (d) Reference orifice | Equipped with an opening of 0.02-in. dia. In order to monitor the standard pressure, closes the purge VSV, turns the vent valve to OFF, and operates the leak detection pump. Eventually, the negative pressure (vacuum) is built up through the orifice. Standard pressure indicates the small leakage from the EVAP. |

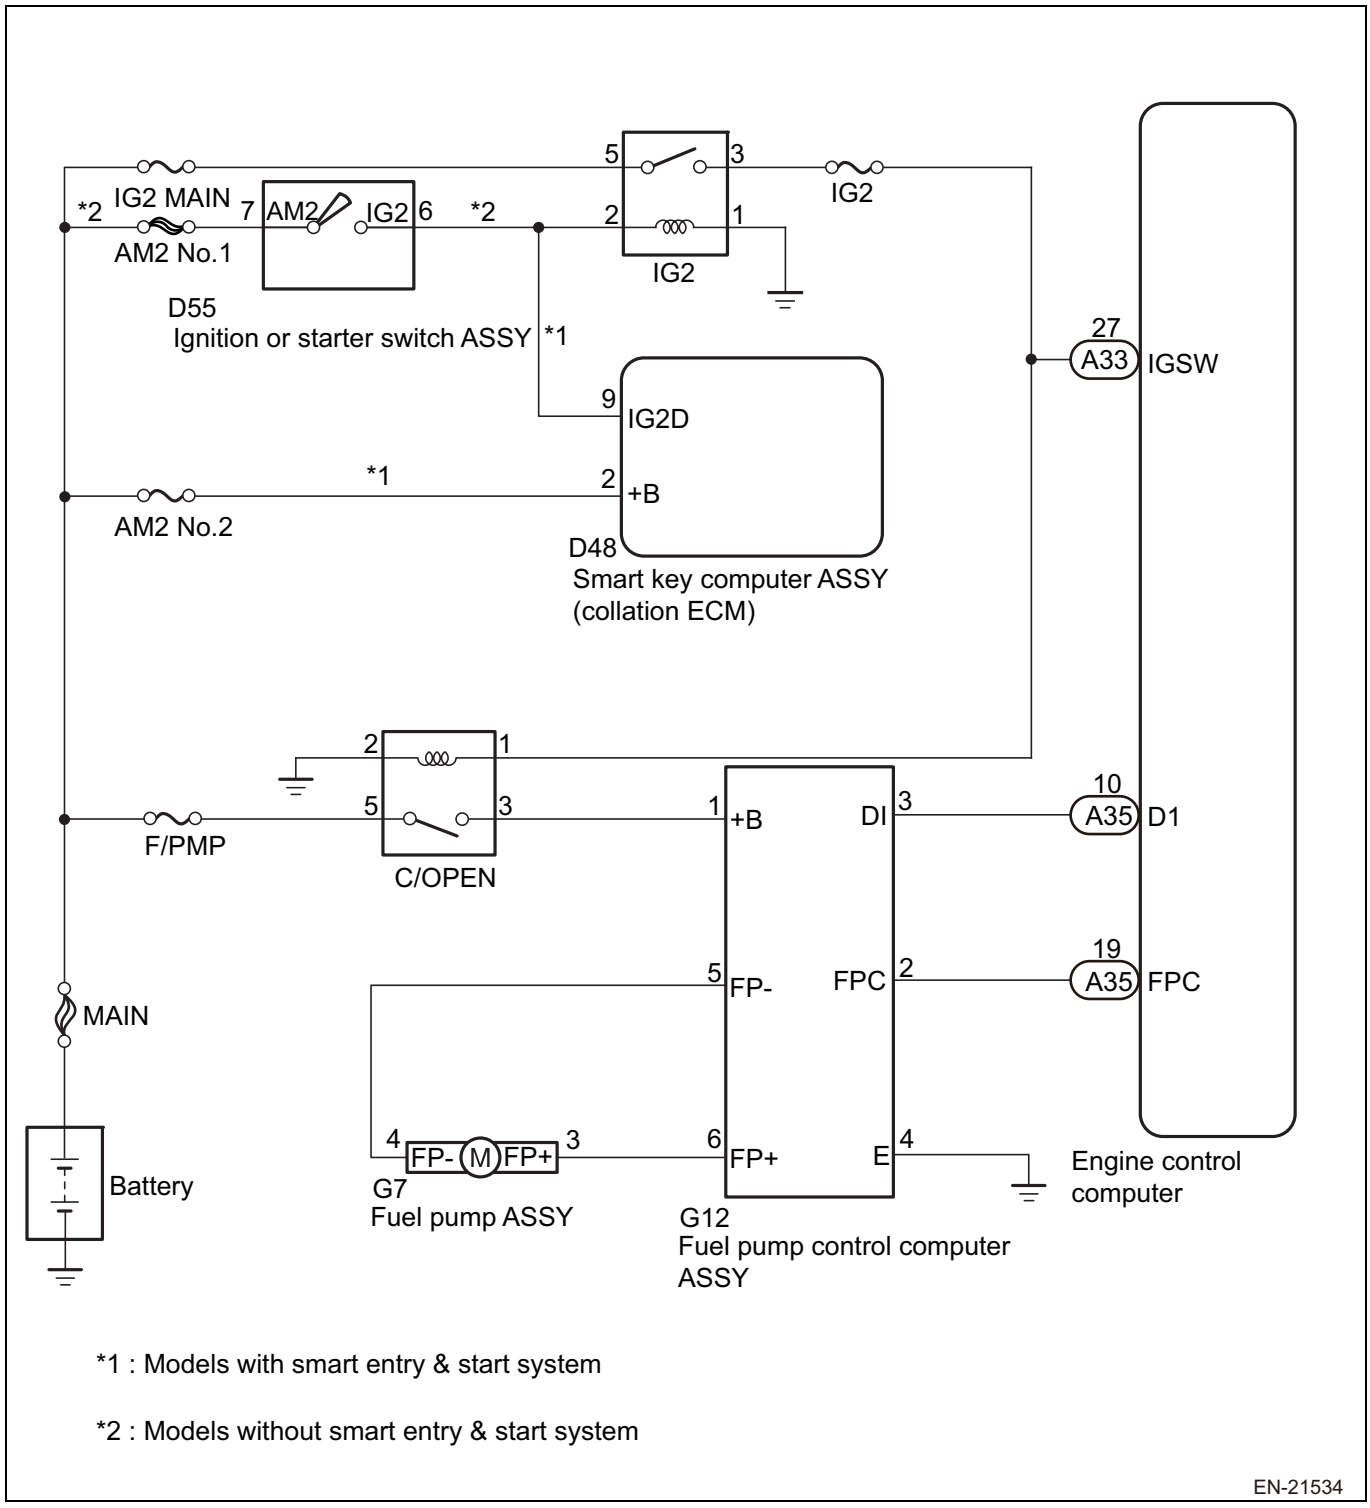
## Fuel pump control system

Circuit description

ES

Fuel pump circuit (low pressure side) consists of engine control computer, fuel pump ASSY (low pressure side) and fuel pump control computer ASSY that operates the fuel pump ASSY (low pressure side). Based on engine output, engine control computer determines the speed of fuel pump ASSY (low pressure side). The speed is converted into the load signal, and the signal is transmitted to the fuel pump control computer ASSY. Based on the signal transmitted from the engine control computer, the fuel pump control computer ASSY adjusts the operating speed of the fuel pump (low pressure side).

Circuit figure



Inspection steps

CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

| | |
|---|---|
| 1 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.

(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(4) In [Active Test], check operation noise of the fuel pump (low-pressure side).

Criteria

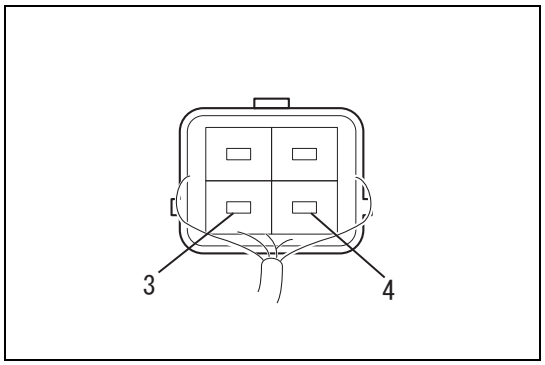
| [Control the Fuel Pump Duty] | Criteria |
|---|---|
| 20 % and 80 % | Operating sound is heard. |
| OFF | Operating sound is not heard. |

ES

NG → Go to Step 8.

OK

| 2 | Performing of SSM4 [Active Test] ([Control the Fuel Pump Duty]) |
|---|---|



(1) Remove the fuel tank ASSY. (Refer to FU - 67)
(2) Remove the fuel pump ASSY (low pressure side) from the fuel tank ASSY.
(3) Completely remove the remaining fuel from the fuel pump ASSY (low pressure side).
(4) Install the connector for the fuel pump ASSY (low pressure side).
WARNING:
Check that no fuel remains inside or around the fuel pump ASSY.
(5) Connect the SSM4 to the DLC3.
(6) Turn the ignition switch to ON.
(7) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(8) Measure the voltage between each terminal when [Active Test] is performed.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 4 | Fuel pump duty: 25% | 3.2 to 4.05 V |
| 3 - 4 | Fuel pump duty: 80% | 8.8 to 12.5 V |

(9) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Work Support] / [Active Test] / [Control the Fuel Pump Duty]
(10) Measure the voltage between each terminal when [Active Test] is performed.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 4 | Fuel pump duty: 90 % | 9.0 to 14.0 V |

NOTE:
- Measure the voltage with all connectors connected.
- Before performing this inspection, check that the battery voltage is 11 to 14 V (battery not discharged).

NG → Go to Step 6.

OK

| 3 | Check wiring harness and connector (engine control computer - fuel pump control computer ASSY) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for the engine control computer.
(2) Disconnect the connector for the fuel pump control computer ASSY.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

ES

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A35-19 (FPC) - G12-2 (FPC) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|

| 1 (C/OPEN relay holder), A33-27 (IGSW) and 3 (IG2 relay holder) - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

Replacement of the engine control computer (Refer to ES - 674)

## Starter system (models with smart entry & start system)

Circuit description

During cranking, the engine control computer detects the starter signal (STSW2 and STA signal) from the starter relay drive circuit and performs the engine control at engine start.

When the start signal is input from the smart key computer ASSY, the engine control computer transmits the operating signal (STA signal) to the ST relay and drives the starter until the complete engine start-up is detected.

OK

Replacement of the engine control computer (Refer to ES - 674)

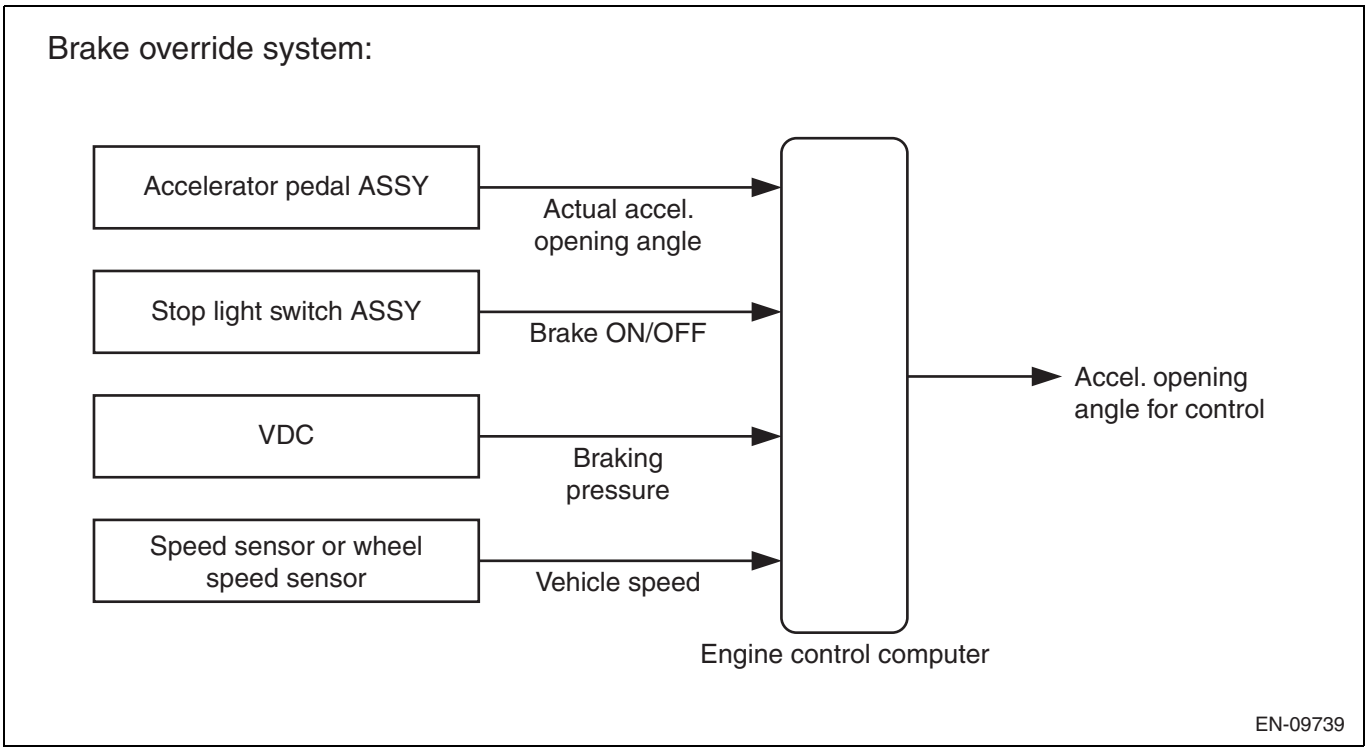
## Brake override system

Circuit description

The brake override system suppresses the driving torque when the brake pedal is depressed with the accelerator pedal depressed while driving. The following describes the control operation condition and the control content.



Control operation condition

– When the vehicle speed exceeds a certain threshold.
– When both accelerator pedal and brake pedal are depressed.
  CAUTION:
  Depending on the relation of the accelerator pedal opening angle and speed, the control operation may not start.

Control content

– Driving torque suppression
  NOTE:
  When this control is established, the accelerator pedal opening angle used for the engine control is forcibly dropped to the constant value. For this reason, the accelerator pedal opening angle in the data monitor is rewritten into constant value regardless of actual accelerator pedal opening angle (accelerator sensor No. 1 voltage ratio).

Restoring condition

– When the stop light switch is turned to OFF or the accelerator opening angle returns by a specified amount or more.

Inspection steps

Drive the vehicle approx. at 10 km/h {6.25 MPH}, and depress the accelerator pedal ASSY by half or by 3/4 of the way.

While holding the depressed accelerator pedal ASSY, depress the brake pedal with your left foot. When the engine speed drops approx. to 1000 r/min at this time, it is possible to determine that the control operates normally.

WARNING:

Perform this test in the place where a drive check can be done safely, and pay special attention to the circumstance of the vehicle. Observe the traffic law such as legal speed limit when driving.

NOTE:

- Normally, the value for the accelerator pedal opening angle in the data monitor changes according to the value for the accelerator sensor No. 1 voltage ratio. (Values are not the same. Refer to ES - 43)
- When the value for the accelerator sensor No. 1 voltage ratio is constant, it is possible to determine that the control operates even if the accelerator pedal opening angle and the accelerator sensor No. 1 voltage ratio in the data monitor differ from each other and the value for the accelerator pedal opening is fluctuating as well. (Using the data storage function of the SSM4, the data obtained during driving can be recorded. The recorded data can be checked after driving.)

- If a concern arises from a customer that the vehicle decelerates when he/she intentionally depresses the accelerator pedal and brake pedal simultaneously, ask the customer not to depress both pedals at the same time. (Example: While operating the accelerator pedal, operate the brake pedal with left foot.)

| 1 | Read DTC |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [DTC]
(4) Check the DTC for the system that has been output.

ES

Result

| Result | Go to |
|---|---|
| No DTC is output | A |
| DTC is output. | B |

B → To corresponding DTC chart

A

| 2 | Reading of SSM4 data ([Stop Light Switch]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Stop Light Switch]
(5) Read the data display.

| Item name | Inspection conditions | Criteria |
|---|---|---|
| [Stop Light Switch] | Brake pedal is depressed. | ON |
| | Brake pedal is released. | OFF |

NG → Stop light circuit check (Refer to LE - 10)

OK

| 3 | Check brake pedal support ASSY |
|---|---|

(1) Check and adjust the brake pedal. (Refer to BR - 18)
NOTE:
When ON operation of the stop light switch ASSY is delayed, the control is also delayed. If the switch is turned on earlier, the operation starts accordingly at an early point. Therefore, check the brake pedal and stop light switch ASSY.

NG → Check and replacement of brake pedal support ASSY

OK

| 4 | Reading of SSM4 data (Accelerator Pedal Pos.#1, Accelerator Pedal Pos.#2) |
|---|---|

(1) Connect the SSM4 to the DLC3.

(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Check DTC using SSM4.
(5) Read the data display.

Criteria

| Inspection conditions | Criteria |
|---|---|
| Accelerator pedal is fully closed →fully open. | Changes continuously. |

NOTE:
Refer to ES - 43for normal value of [Accelerator Pedal Pos.#1] and [Accelerator Pedal Pos.#2] when the accelerator pedal is operated.

ES

NG → Replacement of accelerator pedal sensor ASSY (Refer to ES - 677)

OK

| 5 | Reading of SSM4 data ([Vehicle Speed]) |
|---|---|

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Turn on the SSM4.
(4) Start the engine.
(5) Select the following menu items using the SSM4. : [Each System] / [Engine Control System] / [Data monitor] / [Vehicle Speed]

Criteria

| Inspection conditions | Criteria |
|---|---|
| Vehicle is parked. | 0 km/h {0 MPH} |
| Vehicle is running at a constant speed.<br>(16.1 to 64.4 km/h) {10 to 40 MPH} | Significant fluctuation is not observed in the displayed speed. |

WARNING:
When performing the driving test, always observe the applicable traffic laws such as the speed limit.
NOTE:
Using the data storage function of the SSM4, the data obtained during driving can be recorded. The recorded data can be checked after driving.

NG → Go to meter & gauge system (Refer to ME - 39)

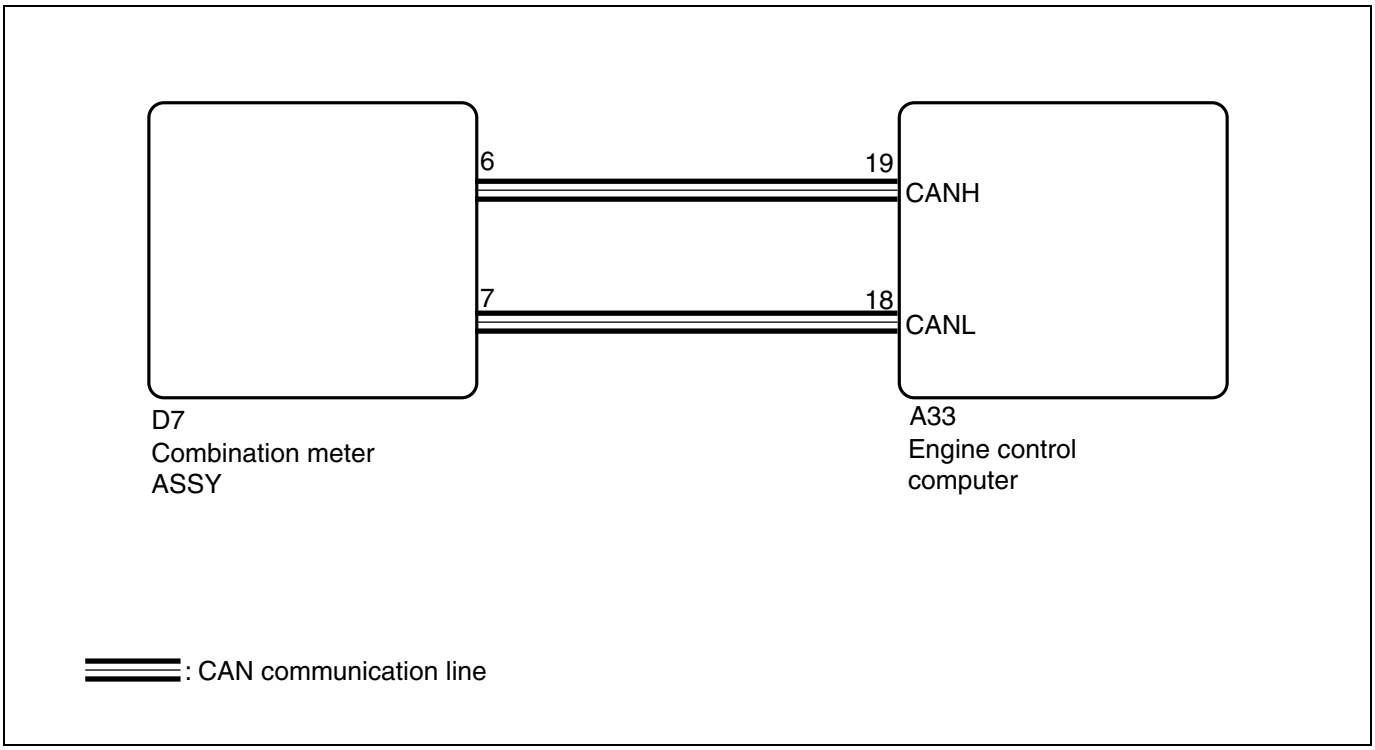
OK

Complete

## MIL circuit

Circuit description
The MIL is used for displaying the vehicle malfunction detected by the engine control computer. When the ignition switch is turned to ON, the MIL circuit is supplied with power, and the MIL illuminates. Operation of the MIL can be visually checked. When the ignition switch is turned to ON, the MIL illuminates. After engine has started, it goes off. When the MIL remains lit or unlit, perform the following troubleshooting.

Circuit figure



ES

Inspection steps

| | |
|---|---|
| 1 | MIL illumination check |

(1) Check the illumination status of MIL.

Result

| MIL | Inspection conditions | Go to |
|---|---|---|
| Always lit. | IG ON →After engine start | A |
| Always unlit. | IG ON →After engine start | B |
| ON →OFF | IG ON →After engine start | C |

B → Go to Step 3.

C → Inspection for problems that do not normally occur (Refer to IN - 32)

A

| | |
|---|---|
| 2 | Read DTC |

(1) Connect the SSM4 to the DLC3.
(2) Turn the ignition switch to ON.
(3) Follow the SSM4 on-screen instructions to check the DTC. (Refer to ES - 28)

Result

| Result | Go to |
|---|---|
| No DTC is output | A |
| DTC is output. | B |

B → To corresponding DTC chart (refer to ES - 12)

A

Go to meter & gauge system (Refer to ME - 19)

| 3 | Engine starting inspection |
|---|---|

(1) Check that the engine starts.
Criteria: The engine starts.

NG → Go to VC power supply circuit inspection (Refer to ES - 640)

OK

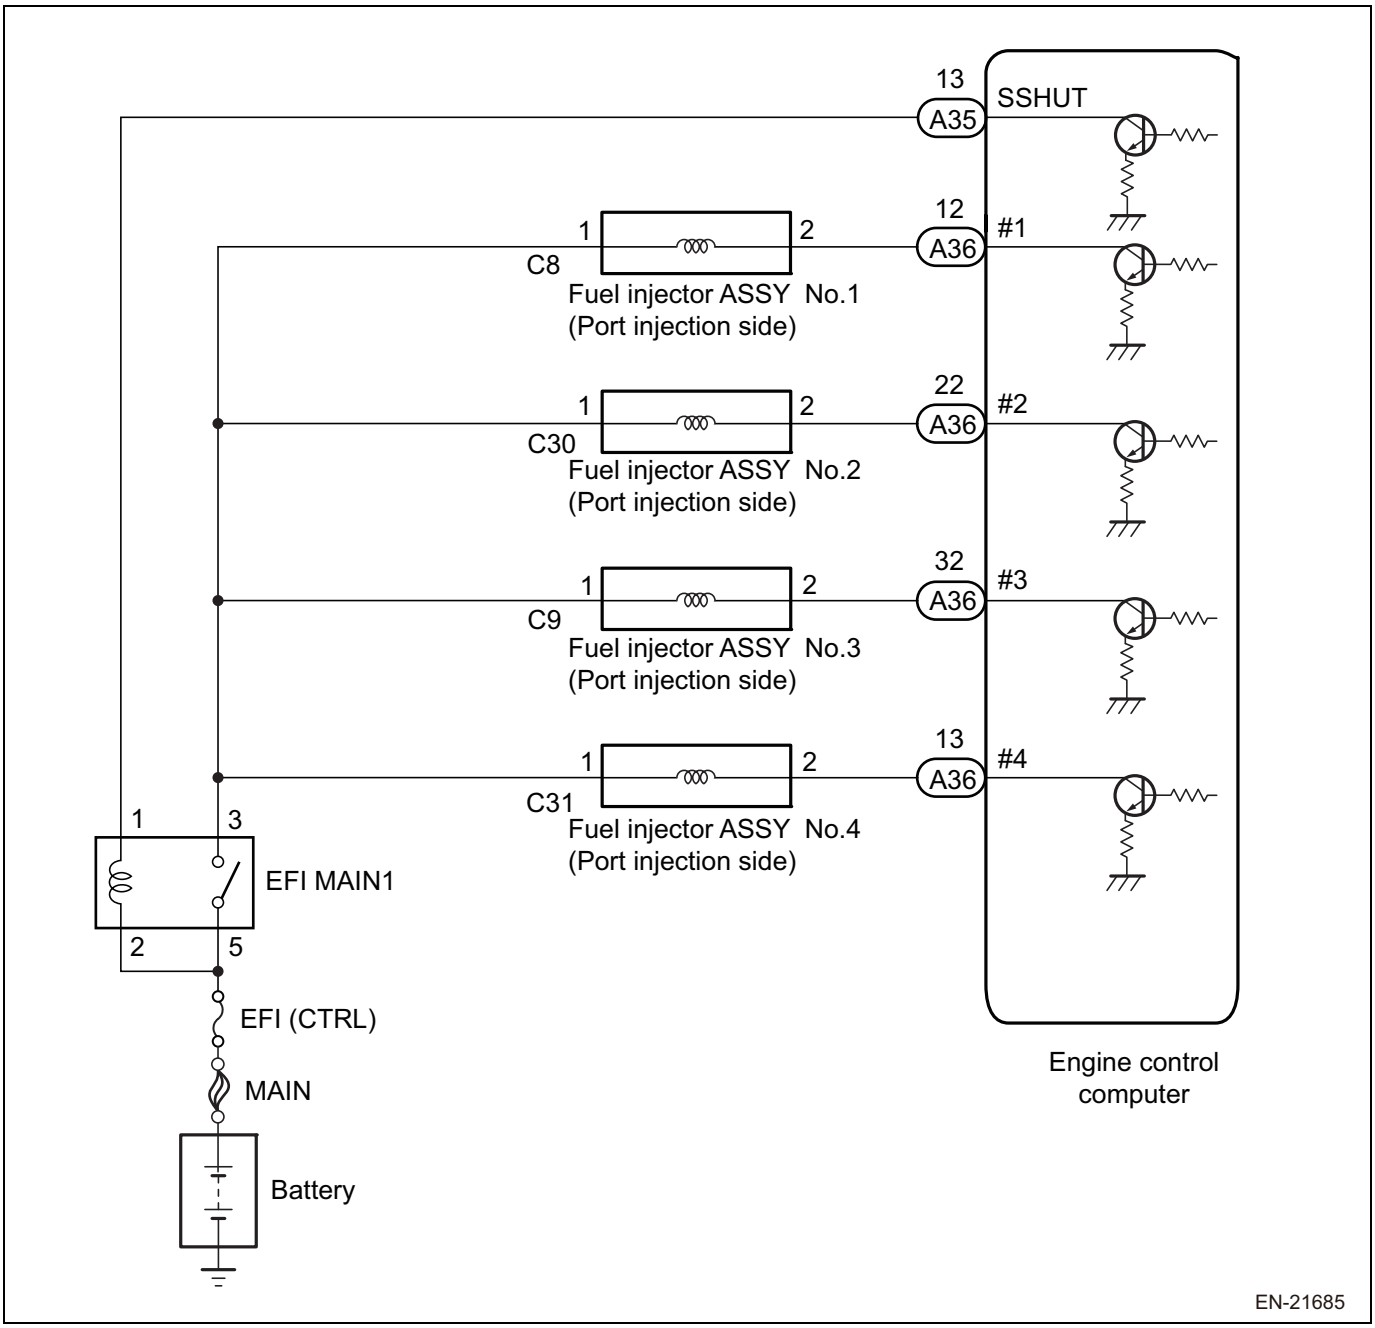
Replacement of the combination meter ASSY (Refer to ME - 63)

## Fuel injector circuit

Circuit description

The fuel injector ASSY (port injection side) is mounted to the intake manifold. Based on the signal transmitted from the engine control computer, the fuel injector ASSY (port injection side) injects the fuel into the intake manifold ASSY.

Circuit figure



Inspection steps

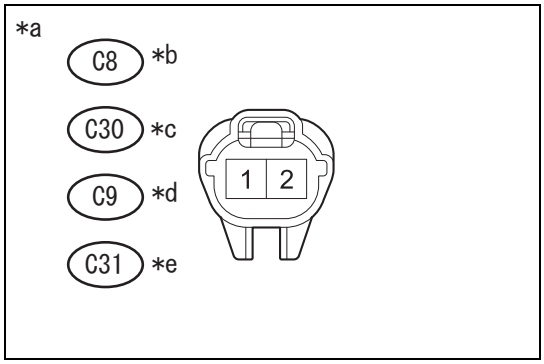
CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

| | |
|---|---|
| 1 | Check wiring harness and connector (fuel injector ASSY (port injection side) power supply circuit) |

NOTE:

For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Disconnect all connectors for fuel injector ASSY (port injection side).
(2) Turn the ignition switch to ON.
(3) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - chassis ground | IG ON | 11 to 14 V |
| C30-1 - chassis ground | IG ON | 11 to 14 V |
| C9-1 - chassis ground | IG ON | 11 to 14 V |
| C31-1 - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (fuel injector ASSY connector) |
| *b | No. 1 cylinder |
| *c | No. 2 cylinder |
| *d | No. 3 cylinder |
| *e | No. 4 cylinder |

NG → Go to Step 4.

OK

| | |
|---|---|
| 2 | Perform a unit inspection of fuel injector ASSY |

Perform a unit inspection on the fuel injector ASSY (port injection side). (Refer to FU - 29)

NG → Replace fuel injector ASSY (Refer to FU - 21)

OK

| | |
|---|---|
| 3 | Check wiring harness and connector (fuel injector ASSY (port injection side) - engine control computer) |

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for fuel injector ASSY (port injection side).
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-12(#1) - C8-2 | Always | Less than 1 Ω |
| A36-22(#2) - C30-2 | Always | Less than 1 Ω |
| A36-32(#3) - C9-2 | Always | Less than 1 Ω |
| A36-13(#4) - C31-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-12 (#1) and C8-2 - other terminals and chassis ground | Always | 10 k Ωor more |

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-22 (#2) and C30-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-32 (#3) and C9-2 - other terminals and chassis ground | Always | 10 k Ωor more |
| A36-13 (#4) and C31-2 - other terminals and chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

ES

OK

Replacement of the engine control computer (Refer to ES - 674)

| 4 | Check wiring harness and connector (fuel injector ASSY - EFI MAIN1 relay) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.

(1) Disconnect the connector for fuel injector ASSY (port injection side).
(2) Remove the EFI MAIN1 relay from the engine compartment relay block.
(3) Measure the resistance between the terminals.
CAUTION:
When using tester probes to take measurements at a relay holder, do not push them hard against the holder. Otherwise the holder could be damaged.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1 - 3 (EFI MAIN1 relay holder) | Always | Less than 1 Ω |
| C30-1 - 3 (EFI MAIN1 relay holder) | Always | Less than 1 Ω |
| C9-1 - 3 (EFI MAIN1 relay holder) | Always | Less than 1 Ω |
| C31-1 - 3 (EFI MAIN1 relay holder) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C8-1, C30-1, C9-1, C31-1 or 3 (EFI MAIN1 relay holder) - other terminals and chassis ground | Always | 10 k Ωor more |

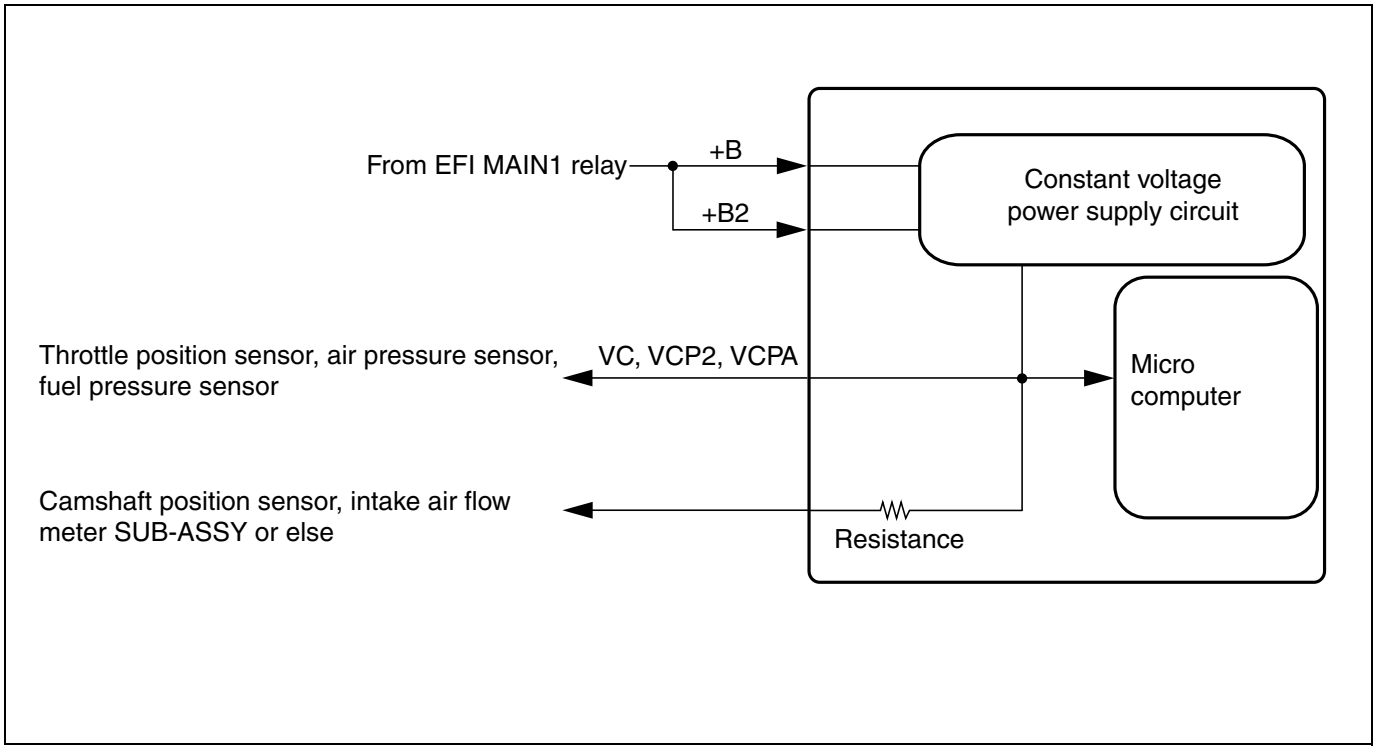
NG → Repair or replacement of wiring harness or connector

OK

Inspection of the ECM power supply system (Refer to ES - 646)

## VC power supply circuit

Circuit description
The engine control computer constantly produces 5 V from the battery voltage applied to +B terminal and +B2 terminal to operate the CPU. In addition, the engine control computer supplies this power to the sensor via VC output circuit.



When the VC circuit is shorted, the power is not supplied from the VC circuit. Because of this, the CPU in the engine control computer and the sensors supplied from the VC circuit are de-energized. In this state, the system is not started, and the MIL does not illuminate even if the system malfunction occurs.

NOTE:

Normally, when the ignition switch is turned to ON for the first time, the MIL illuminates. When the engine has started, the MIL goes off.

|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.
(1) Disconnect the connector for throttle body ASSY.
(2) Disconnect the connector for air pressure sensor ASSY.
(3) Disconnect the connector for the fuel pressure sensor.
(4) Disconnect the connector for accelerator pedal sensor ASSY.
(5) Disconnect the connector for battery current sensor.
(6) Disconnect the connector for the engine control computer.
(7) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A36-19 (VC) - chassis ground | Always | 10 k Ωor more |
| A35-22 (VCP2) - chassis ground | Always | 10 k Ωor more |
| A35-21 (VCPA) - chassis ground | Always | 10 k Ωor more |

NG → Repair or replacement of wiring harness or connector

OK

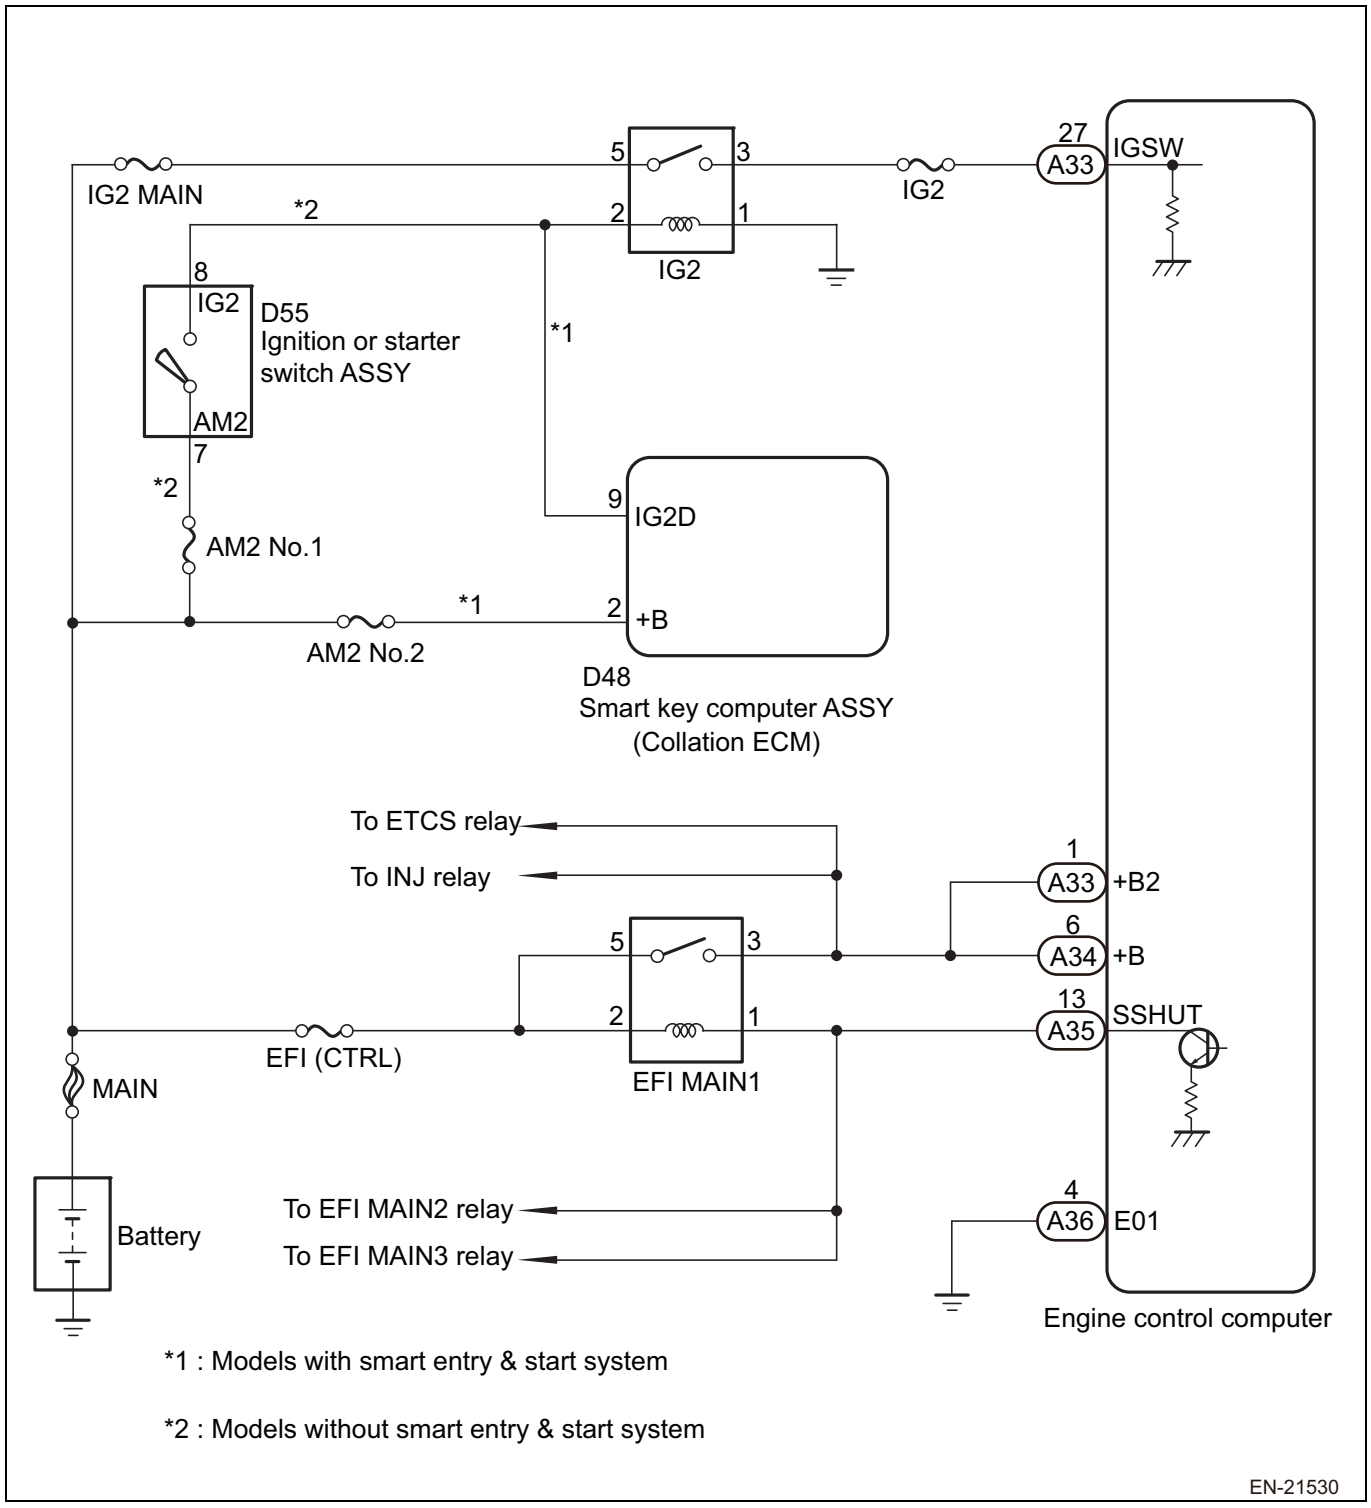
Replacement of the engine control computer (Refer to ES - 674)

## ECM power supply system

Circuit description

When the ignition switch is turned to ON, IGSW signal is input into the engine control computer. As a result, the internal transistor is turned on, an electric current flows through the coil of EFI MAIN1 relay to close the relay contact, and then the power is supplied to +B and +B2 terminals of the engine control computer.

Circuit figure



Inspection steps

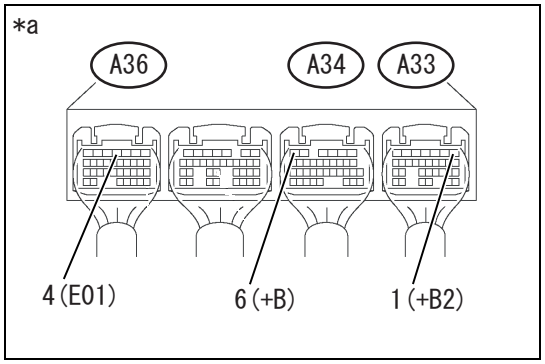
CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

| | |
|---|---|
| 1 | Check engine control computer (inspection of +B and +B2 voltages) |

NOTE:

For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Turn the ignition switch to ON.
(2) Measure the voltage between the terminals. (For terminal arrangement, refer to ES - 36.)

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A34-6(+B) - A36-4(E01) | IG ON | 12 to 14 V |
| A33-1(+B2) - A36-4(E01) | IG ON | 12 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Connector connected (engine control computer) |

NG → Go to Step 4.

OK

| 2 | Check wiring harness and connector (engine control computer - chassis ground) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.

(1) Disconnect the connector for the engine control computer.
(2) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Criteria |
|---|---|---|
| A36-4 (E01) - chassis ground | Always | Less than 1 Ω |

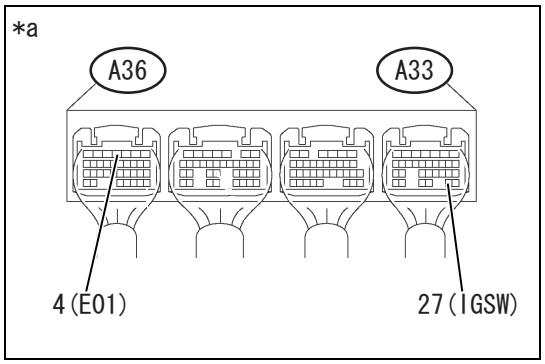
(3) Connect the connector for engine control computer.

NG → Repair or replacement of wiring harness or connector

OK

| 3 | Check engine control computer (IGSW voltage) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.



(1) Turn the ignition switch to ON.
(2) Measure the voltage between the terminals. (For terminal arrangement, refer to ES - 36.)

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A33-27(IGSW) - A36-4(E01) | IG ON | 10 to 13 V |

| | |
|---|---|
| *a | Connector connected (engine control computer) |

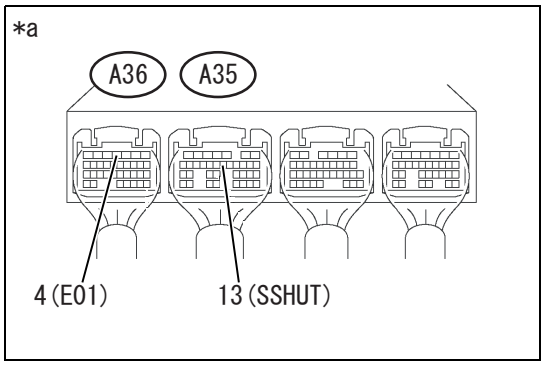
NG → Go to Step 8.

OK

Replacement of the engine control computer (Refer to ES - 674)

| 4 | Check engine control computer (SSHUT voltage) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Turn the ignition switch to ON.
(2) Measure the voltage between the terminals. (For terminal arrangement, refer to ES - 36.)

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| A35-13(SSHUT) - A36-4(E01) | IG ON | Approx. 0 V |

Captions in illustration

| | |
|---|---|
| *a | Connector connected (engine control computer) |

NG → Repair or replacement of wiring harness or connector

OK

| 5 | Relay unit inspection (EFI MAIN1 relay) |
|---|---|

(1) Perform unit inspection of EFI MAIN1 relay. (Refer to ES - 717)

NG → Relay replacement (EFI MAIN1 relay)

OK

| 6 | Check wiring harness and connector (EFI MAIN1 relay - engine control computer) |
|---|---|

NOTE:
Refer to IN - 36for inspection procedure and precautions of wiring harness and connector.

(1) Remove the EFI MAIN1 relay from the engine compartment relay block.
(2) Disconnect the connector for the engine control computer.
(3) Measure the resistance between the terminals. (For terminal arrangement, refer to ES - 36.)
CAUTION:
When using tester probes to take measurements at a relay holder, do not push them hard against the holder. Otherwise the holder could be damaged.

Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 (EFI MAIN1 relay holder) - A35-13 (SSHUT) | Always | Less than 1 Ω |
| 3 (EFI MAIN1 relay holder) - A34-6 (+B) | Always | Less than 1 Ω |
| 3 (EFI MAIN1 relay holder) - A33-1 (+B2) | Always | Less than 1 Ω |

Resistance (short circuit check)

ES

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 (EFI MAIN1 relay holder) and A35-13 (SSHUT) - other terminals and chassis ground | Always | 10 k Ωor more |

|---|---|

(1) Check the ignition OR starter switch ASSY as a single part. (Refer to ST - 46)

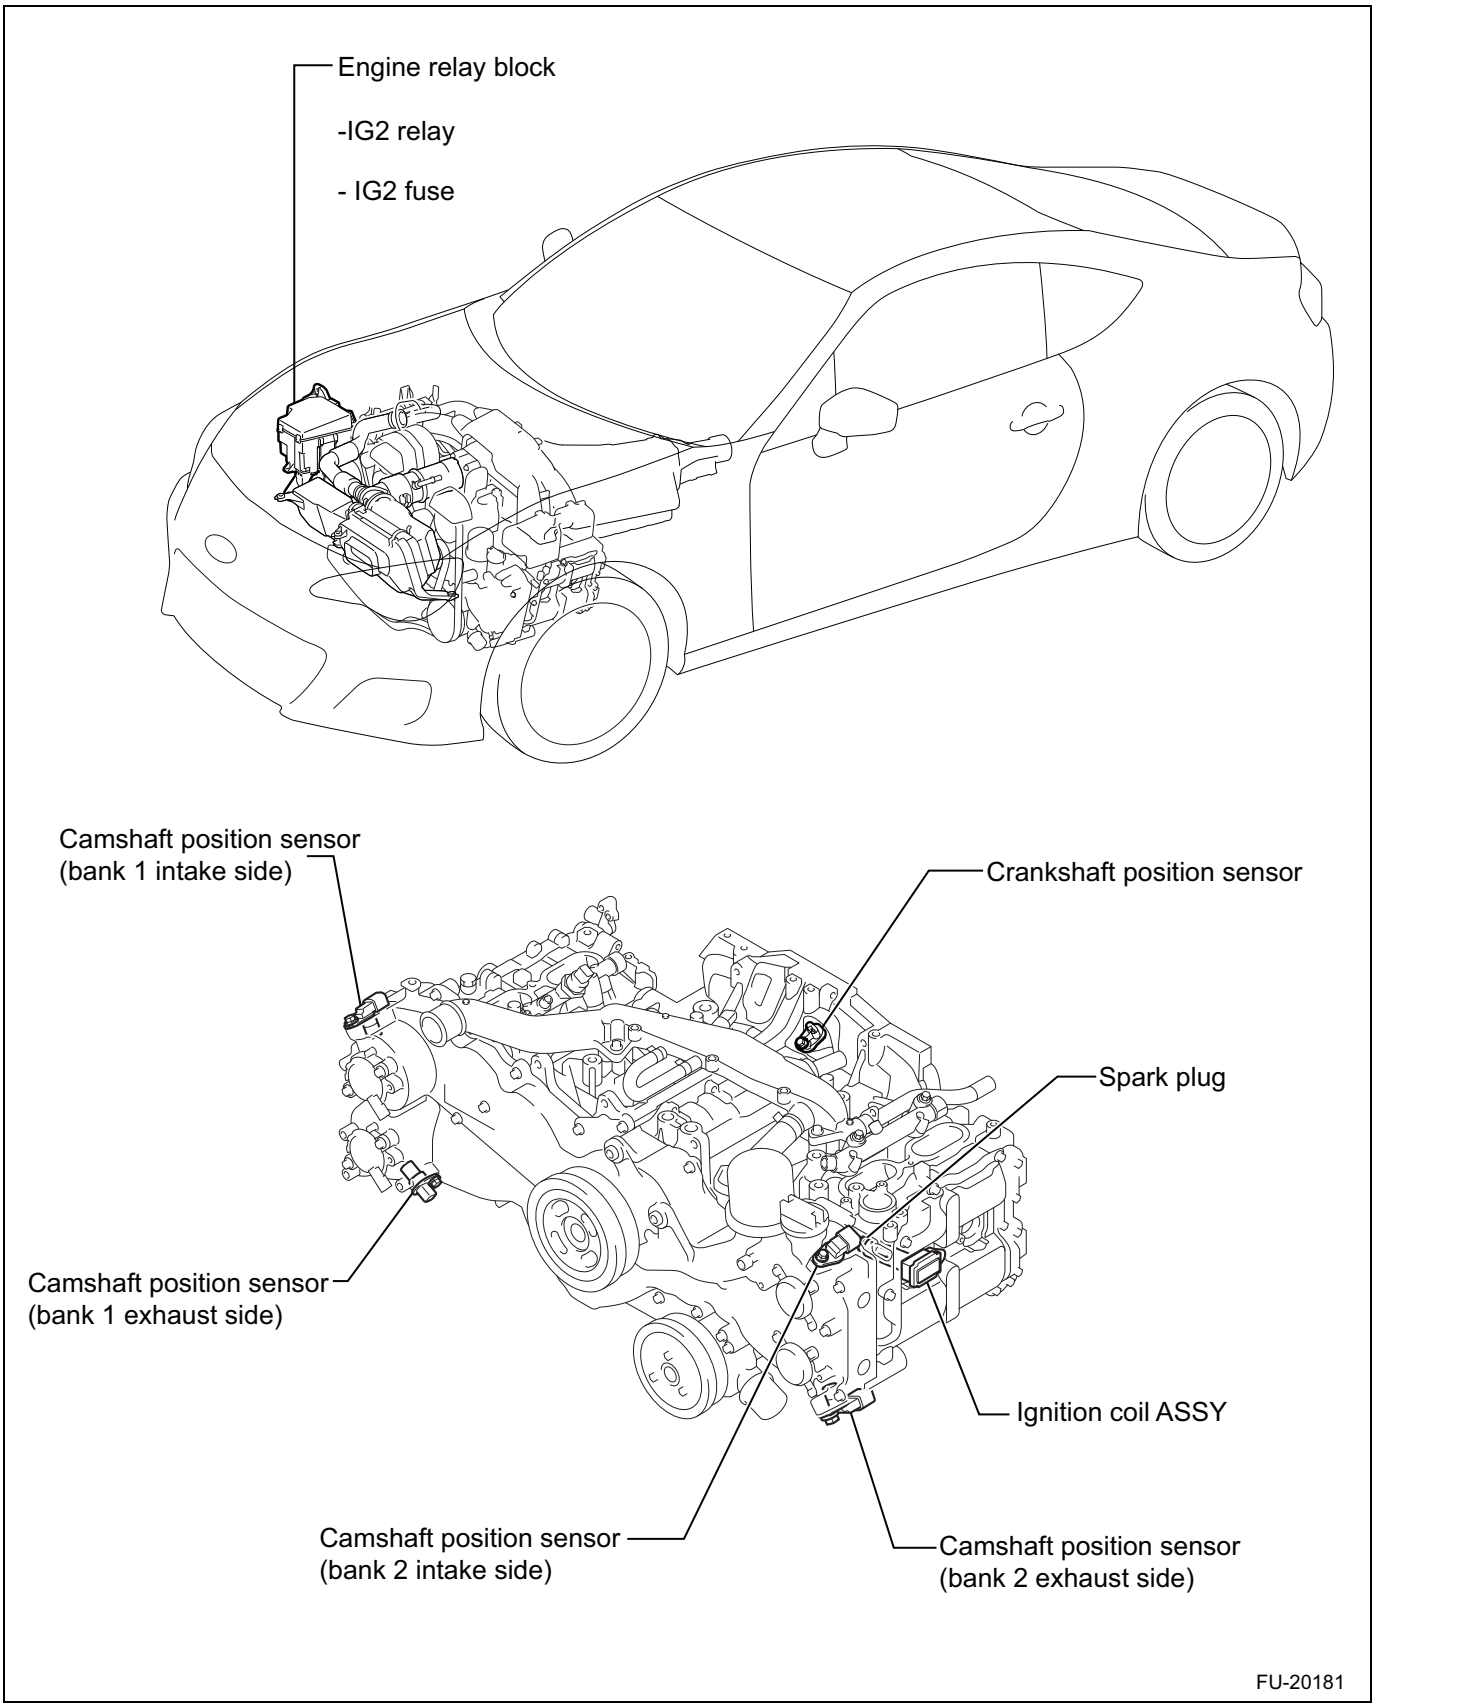
NG → Replacement of ignition or starter switch ASSY (Refer to ST - 45)

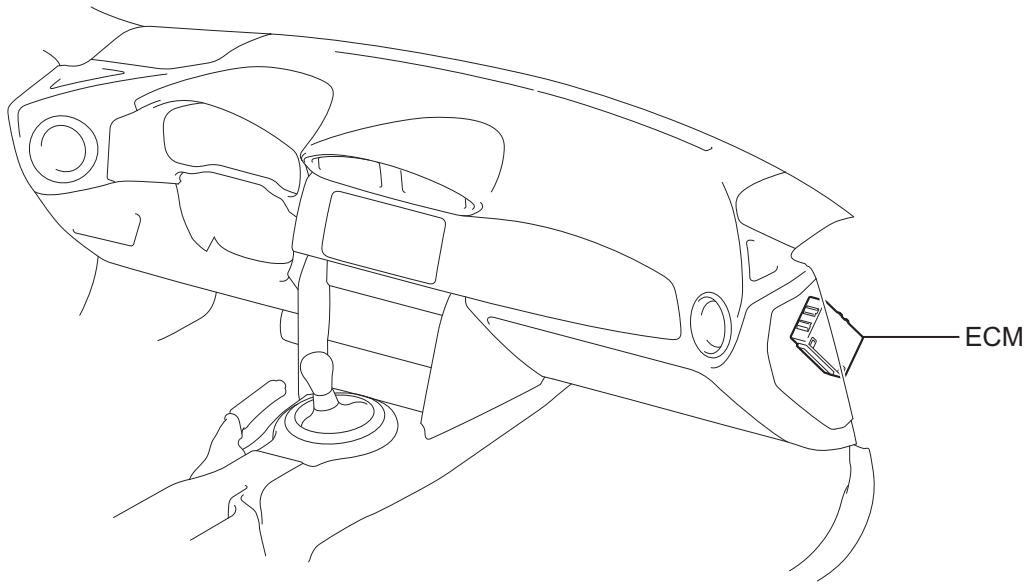
OK

Repair or replacement of wiring harness or connector

# Ignition system (FA20)

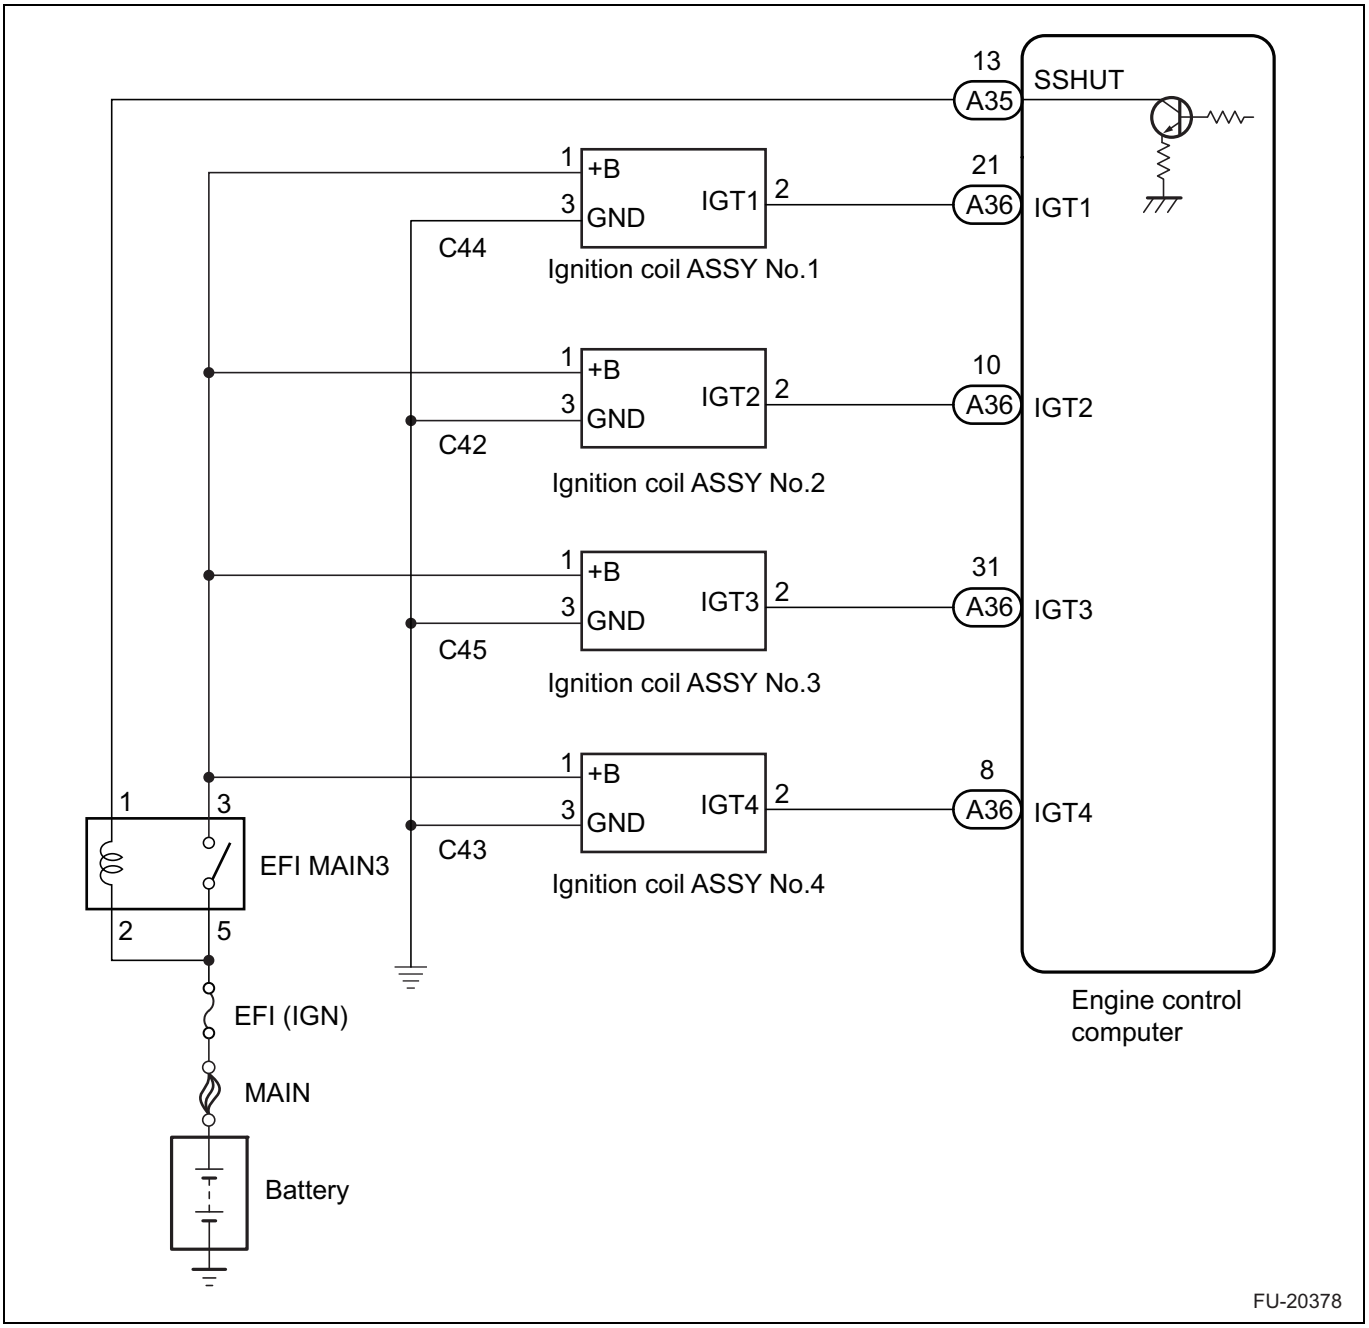
## Parts location



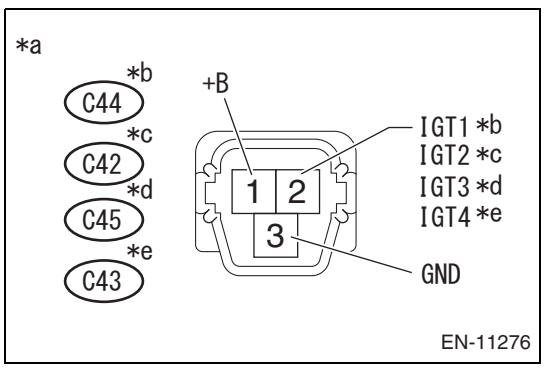


ECM

## Circuit figure



## On-vehicle inspection



1. Ignition coil ASSY inspection
   (1) Input voltage inspection
   (a) Disconnect the connector of the ignition coil ASSY.
   (b) Turn the ignition switch to ON.
   (c) Check the voltage between terminals of the vehicle side connector for the ignition coil ASSY.

Voltage

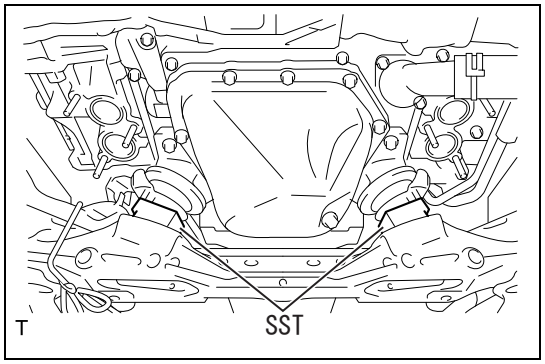
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| C44-1 - chassis ground | IG ON | 11 to 14 V |
| C42-1 - chassis ground | IG ON | 11 to 14 V |
| C45-1 - chassis ground | IG ON | 11 to 14 V |
| C43-1 - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

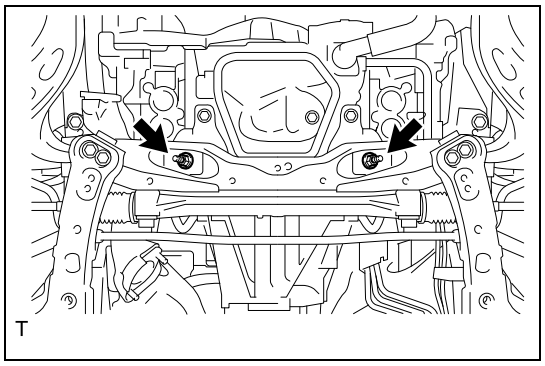
| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (ignition coil ASSY connector) |
| *b | No. 1 cylinder |
| *c | No. 2 cylinder |
| *d | No. 3 cylinder |
| *e | No. 4 cylinder |

(d)Turn the ignition switch to OFF.

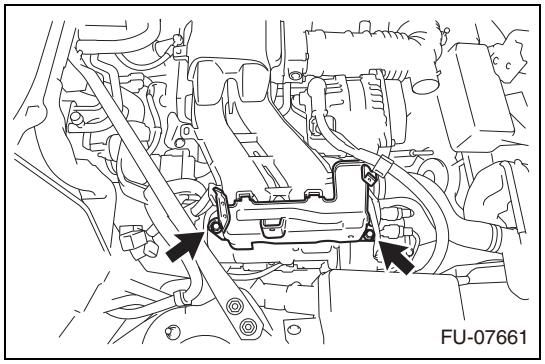
2. Spark Inspection
   (1) Check the DTC. (Refer to IN - 30)
   CAUTION:
   When DTC is detected, perform the troubleshooting for DTC.
   (2) Remove 4 ignition coils and 4 spark plugs. (Refer to ES - 691)
   (3) Use the following procedures to remove the SST.
   (a)Using the SST, lift the engine ASSY.
   SST 99099AJ000, 18679AA020



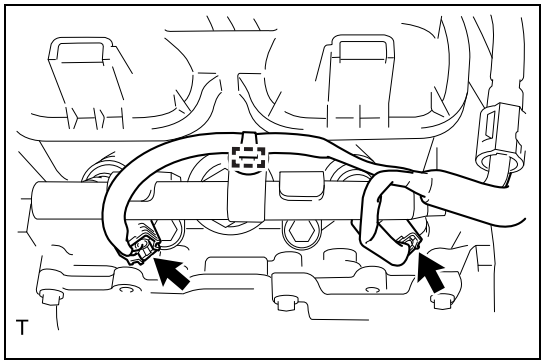
(b)Remove the SST.
SST 18632AA020



(c)Install the two nuts of the new engine mounting.
Standard value:T=60N·m {612kgf·cm} {44.2ft·lbf}



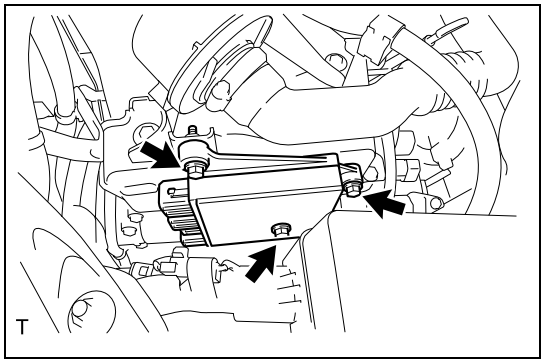
(4) Remove the 2 bolts, and remove the intake manifold protector (bank 1 side).



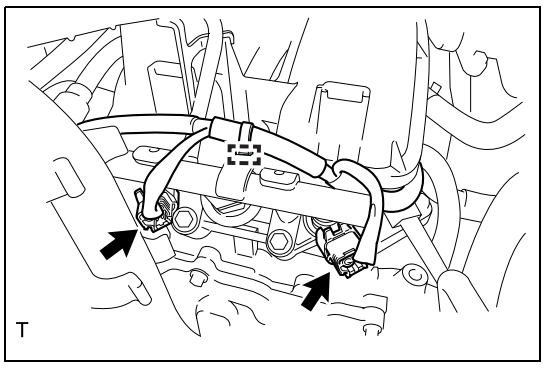
(5) Disconnect 2 connectors for the fuel injector and disconnect the clamp.

ES

(6) Install the intake manifold protector (bank 1 side).



(7) Install the injector driver.
NOTE:
Leave 2 upper connectors disconnected.



(8) Disconnect 2 connectors for the fuel injector and disconnect the clamp.

(9) Reconnect the battery ground terminal.
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

(10) Install the air cleaner case SUB-ASSY.

(11) Attach the spark plug to the ignition coil ASSY, and connect the connector.

(12) Ground the spark plug.

(13) Check that the ignition spark is fired when the engine is cranked.
CAUTION:
- The ground electrode of the spark plug must be checked with the hexagonal part or threaded part grounded.
- When the ignition coil is exposed to physical shock such as dropping, always replace it with a new one.
- Do not crank the engine for 2 seconds or more.
- For models with smart entry & start system, the cranking hold control makes the engine cranking continue for a certain period of time if the engine does not start. When stopping cranking the engine, press the engine switch again.

(14) Check that the connector for the ignition coil ASSY is connected securely.

Result

| Result | Go to |
|---|---|
| NG | Connect the connector securely. |
| OK | Next |

(15) Inspection of ignition coil ASSY

(a) When there is a cylinder in which the ignition does not occur, replace the ignition coil ASSY for abnormal ignition cylinder with that for normal ignition cylinder.

(b)Check that the ignition spark is fired when the engine is cranked.

Result

| Result | Go to |
|---|---|
| OK | Replace the ignition coil ASSY. |
| NG | Next |

(16) Inspection of the spark plug (Refer to ES - 662)

Result

| Result | Go to |
|---|---|
| NG | Replace the spark plug. |
| OK | Next |

(17) Inspection of wiring harness and connector for ignition coil ASSY (power supply circuit) (Refer to ES - 324)

Result

| Result | Go to |
|---|---|
| NG | Repair or replace the harness or connector for the power supply circuit. |
| OK | Next |

(18) Inspection of camshaft position sensor

(a)Inspection of intake side (Refer to ES - 314)

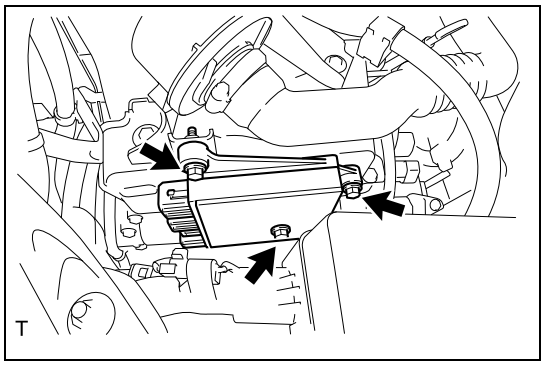
(b)Inspection of exhaust side (Refer to ES - 326)

(19) Inspection of crankshaft position sensor (Refer to ES - 309)

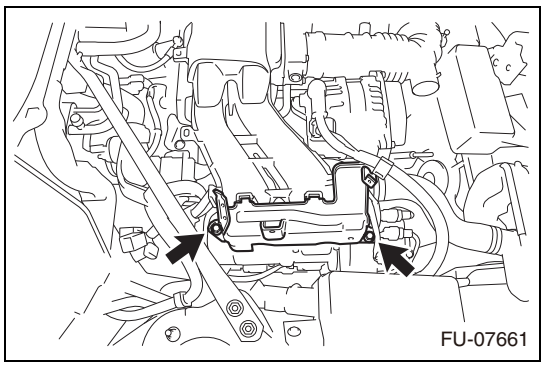
(20) Check the IGT signal system circuit. (Refer to ES - 320)

(21) Disconnect the battery ground terminal.

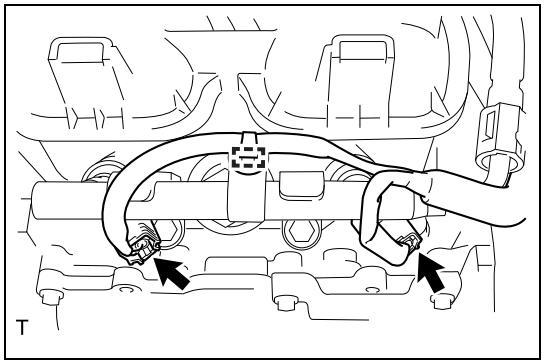
(22) Remove the air cleaner case SUB-ASSY.



(23) Remove the three bolts and remove the injector driver.



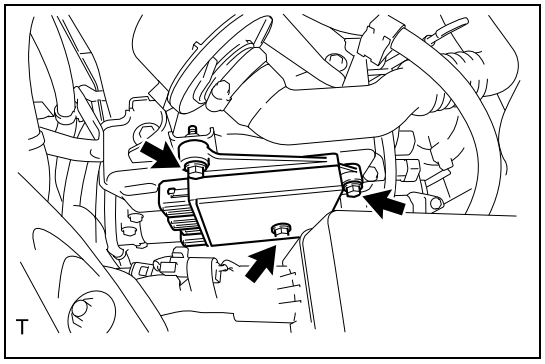
(24) Remove the 2 bolts, and remove the intake manifold protector (bank 1 side).



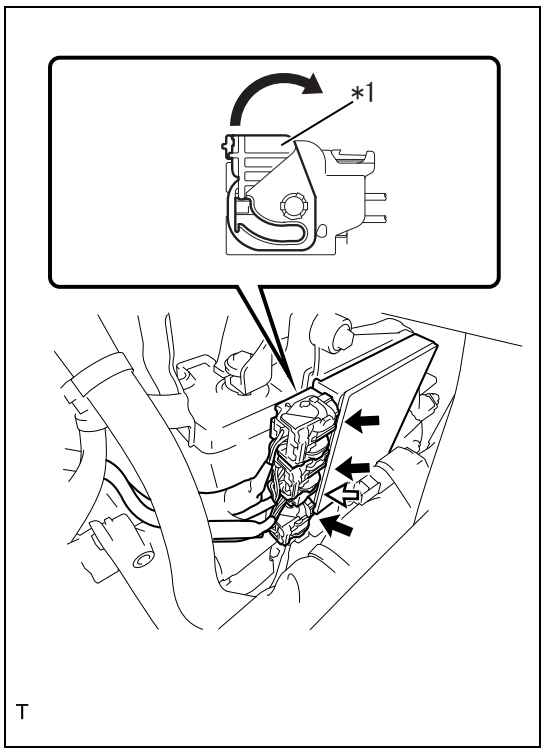
(25) Connect 2 connectors for the fuel injector and connect the clamp.

ES

(26) Using 2 bolts, install the intake manifold protector (bank 1 side).



(27) Install the injector driver with the three bolts.



(28) Connect the three connectors with lock and normal connector to the injector driver and move the lock lever as shown in the figure to lock the three connectors with lock.

Captions in illustration

| | |

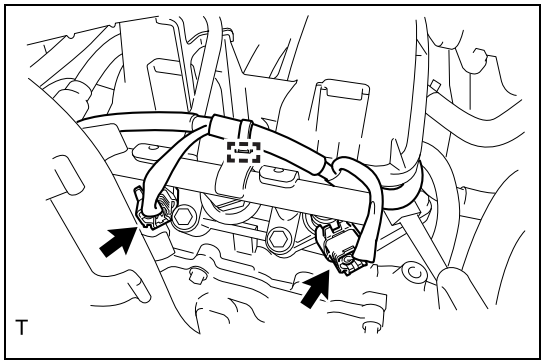
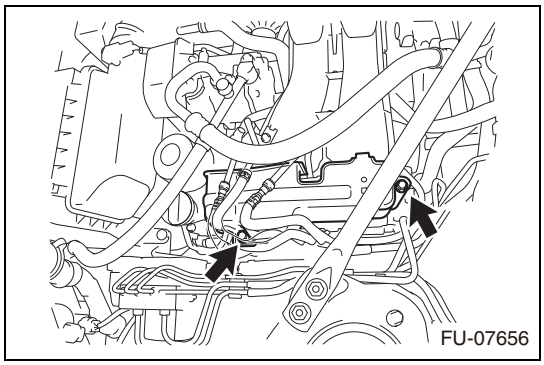
CAUTION:
For connector with lock, connect the connector securely to lock it.

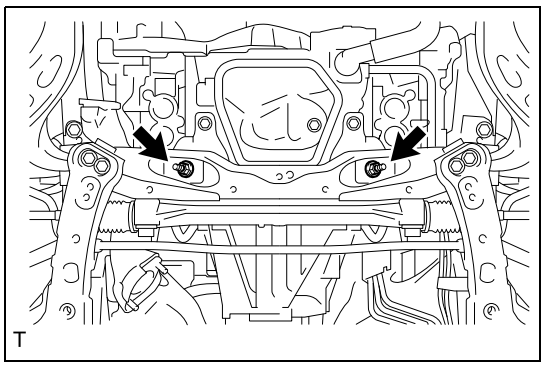


(29) Connect 2 connectors for the fuel injector and connect the clamp.



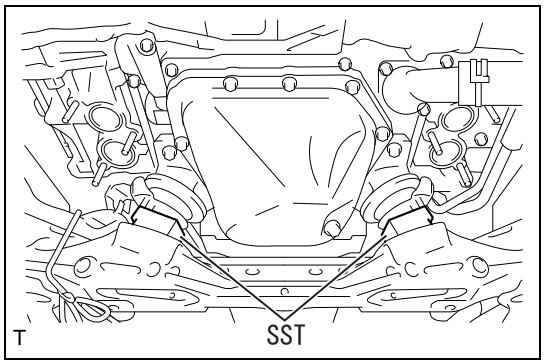
(30) Using 2 bolts, install the intake manifold protector (bank 2 side).

(31) Use the following procedures to install the SST.



(a) Remove 2 nuts on the engine mount.

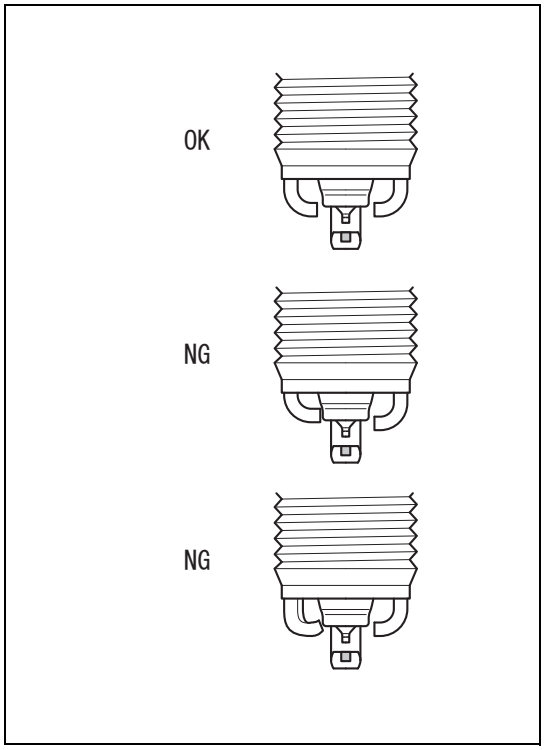
(b) Using the SST, lift the engine ASSY.
SST 99099AJ000, 18679AA020



(c) Install the SST between engine mount and front crossmember.
SST 18632AA020

(32) Install 4 ignition coils and 4 spark plugs. (Refer to ES - 696)

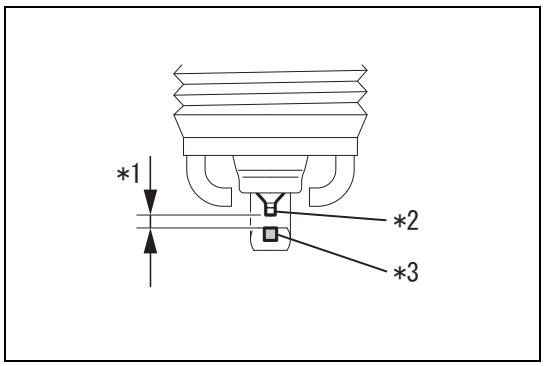
CAUTION:
After the operation is completed, be sure to clear the DTC memory, and then check that no DTCs are detected. (Refer to IN - 30)



3. Spark plug inspection

CAUTION:

- Because the iridium plug is adopted, the gap adjustment is not required.
- Do not scratch the iridium or platinum tip.
- If heavily contaminated with sludge etc., replace the spark plug with a new one.
- When replacing with a new spark plug, do not remove the cap for protecting the tip until the spark plug is installed to the engine.
- If the spark plug is dropped accidentally, replace it with a new one.
- Check the gap visually. Otherwise, the iridium tip may be damaged.
- If damaged, replace the spark plug.



NOTE:

Plug type and gap

| Manufacturer | Type | Reference value [mm {in}] (plug gap [new]) | Reference value [mm {in}] (maximum plug gap [used]) |
|---|---|---|---|
| DENSO | ZXE27HBR8 | 0.7 to 0.8 {0.028 to 0.031} | 1.0 {0.039} |

Captions in illustration

| | |
|---|---|
| *1 | 0.7 to 0.8 mm {0.028 to 0.031 in} |
| *2 | Iridium tip |
| *3 | Platinum tip |

(1) Visual inspection

(a) Start the engine.

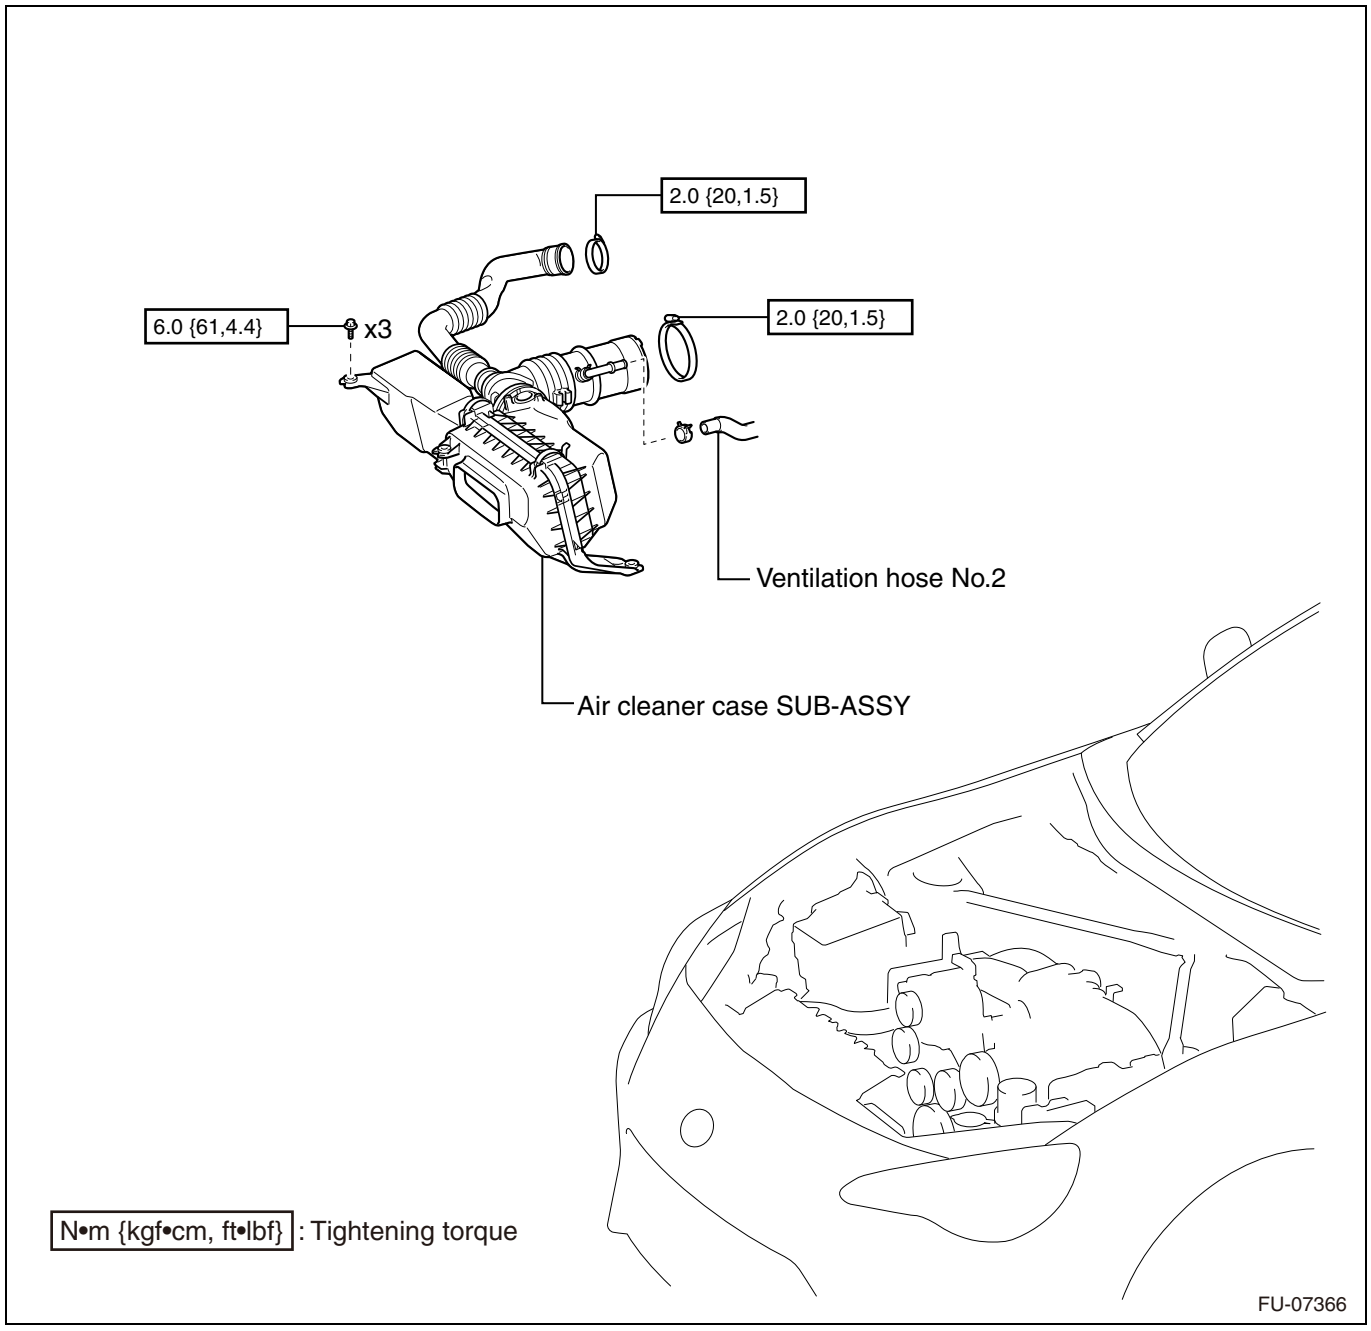
(b) Race the engine 5 times by acceleration and deceleration at high engine speed (4000 r/min).

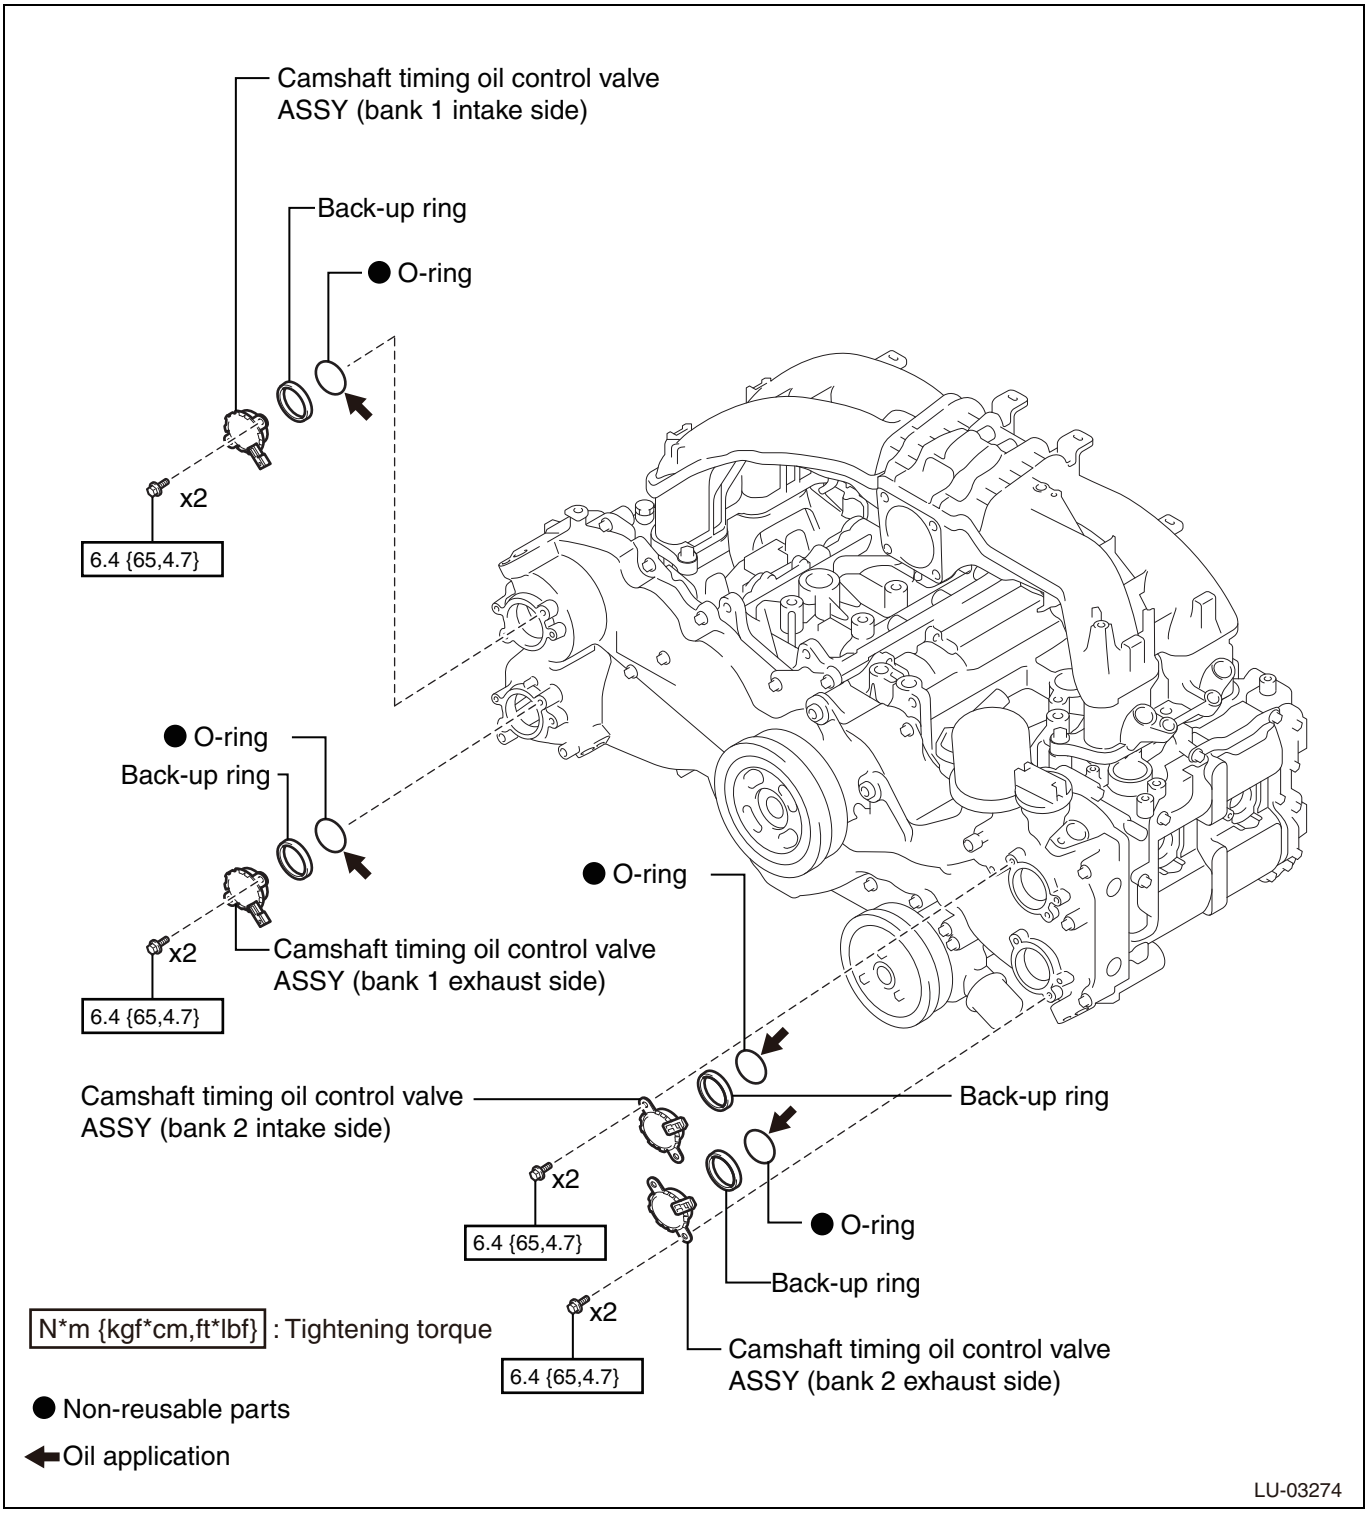
(c) Remove the spark plug.

(d) Check the electrode (iridium, platinum tip), threaded portion and insulator of the spark plug for damage.

# Cam timing oil control valve ASSY (FA20)

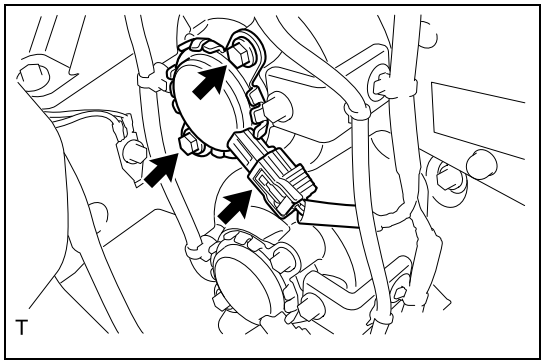
## Exploded view





## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)



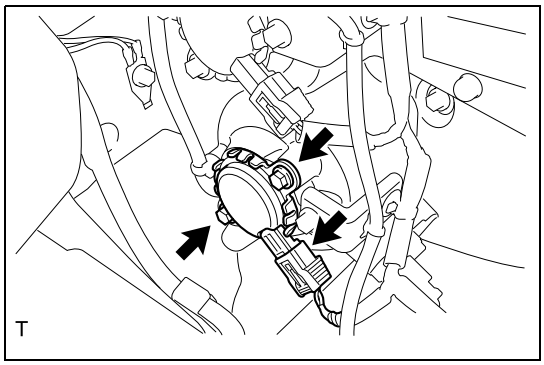
2. Removal of camshaft timing oil control valve ASSY (bank 1 intake side)
   (1) Disconnect the connector for camshaft timing oil control valve ASSY.
   (2) Remove 2 bolts, and remove the camshaft timing oil control valve ASSY.

   (3) Remove the O-ring from the camshaft timing oil control valve ASSY.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Back-up ring |

   (4) Remove the back-up ring from the camshaft timing oil control valve ASSY.



3. Removal of camshaft timing oil control valve ASSY (bank 1 exhaust side)
   (1) Disconnect the connector for camshaft timing oil control valve ASSY.
   (2) Remove 2 bolts, and remove the camshaft timing oil control valve ASSY.

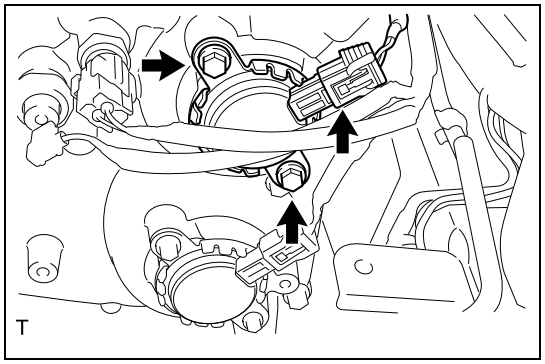
   (3) Remove the O-ring from the camshaft timing oil control valve ASSY.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Back-up ring |

   (4) Remove the back-up ring from the camshaft timing oil control valve ASSY.

4. Removal of air cleaner case SUB-ASSY (Refer to EM - 5)



5. Removal of camshaft timing oil control valve ASSY (bank 2 intake side)
   (1) Disconnect the connector for camshaft timing oil control valve ASSY.
   (2) Remove 2 bolts, and remove the camshaft timing oil control valve ASSY.

   (3) Remove the O-ring from the camshaft timing oil control valve ASSY.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |

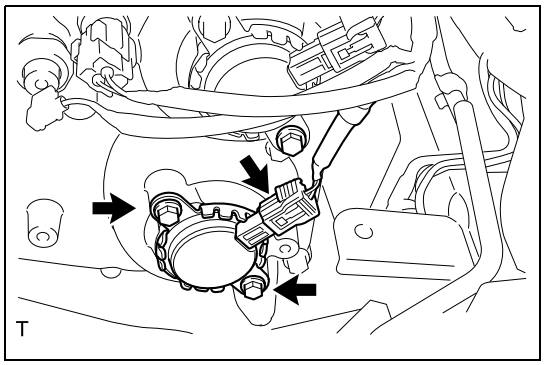
   (4) Remove the back-up ring from the camshaft timing oil control valve ASSY.



6. Removal of camshaft timing oil control valve ASSY (bank 2 exhaust side)
   (1) Disconnect the connector for camshaft timing oil control valve ASSY.
   (2) Remove 2 bolts, and remove the camshaft timing oil control valve ASSY.

   (3) Remove the O-ring from the camshaft timing oil control valve ASSY.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Back-up ring |

   (4) Remove the back-up ring from the camshaft timing oil control valve ASSY.

## Installation

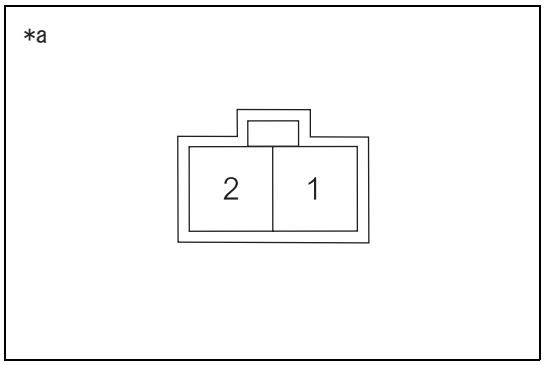
1. Installation of camshaft timing oil control valve ASSY (bank 2 exhaust side)
   (1) Install the back-up ring to the camshaft timing oil control valve ASSY.
   (2) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
   (3) Using 2 bolts, install the camshaft timing oil control valve ASSY.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (4) Connect the connector for camshaft timing oil control valve ASSY.
2. Installation of camshaft timing oil control valve ASSY (bank 2 intake side)
   (1) Install the back-up ring to the camshaft timing oil control valve ASSY.

(2) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
(3) Using 2 bolts, install the camshaft timing oil control valve ASSY.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(4) Connect the connector for camshaft timing oil control valve ASSY.

3. Installation of the air cleaner case SUB-ASSY (Refer to EM - 8)
4. Installation of camshaft timing oil control valve ASSY (bank 1 exhaust side)
(1) Install the back-up ring to the camshaft timing oil control valve ASSY.
(2) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
(3) Using 2 bolts, install the camshaft timing oil control valve ASSY.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(4) Connect the connector for camshaft timing oil control valve ASSY.
5. Installation of camshaft timing oil control valve ASSY (bank 1 intake side)
(1) Install the back-up ring to the camshaft timing oil control valve ASSY.
(2) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
(3) Using 2 bolts, install the camshaft timing oil control valve ASSY.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(4) Connect the connector for camshaft timing oil control valve ASSY.
6. Connection of the battery ground terminal
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

ES

## Unit inspection



1. Inspection of camshaft timing oil control valve ASSY
(1) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F} | 6.85 to 7.65Ω |

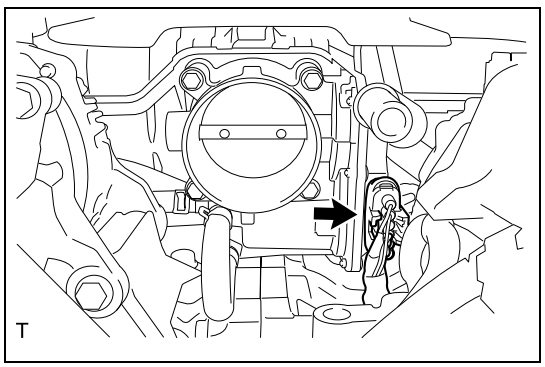
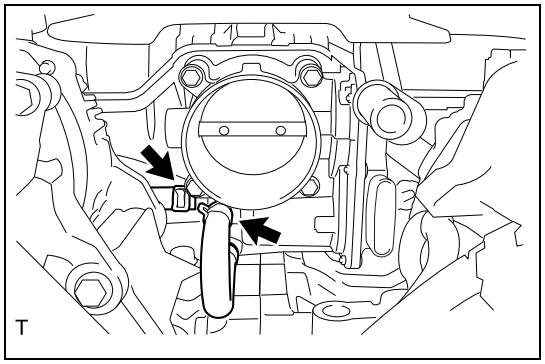
## Removal

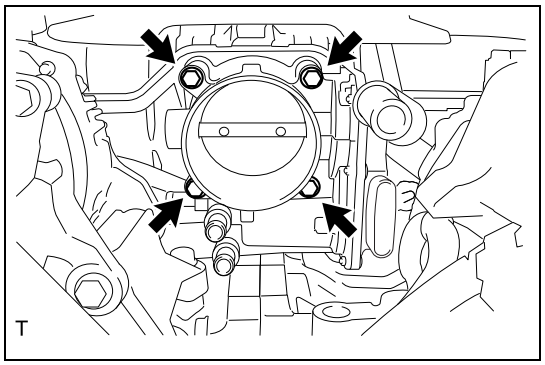
1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
3. Removal of air cleaner case SUB-ASSY (Refer to EM - 5)



4. Removal of throttle body ASSY (with motor)
   (1) Disconnect the connector for the throttle body ASSY (with motor).



(2) Slide 2 clamps, and disconnect the water bypass hose No. 2 and water bypass hose No. 3 from the throttle body ASSY (with motor).



(3) Remove 4 bolts, and remove the throttle body ASSY (with motor) from the intake manifold.
(4) Remove the throttle body gasket from the intake manifold.

## Installation

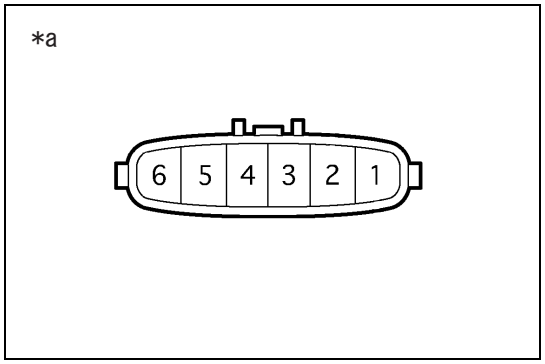
1. Installation of throttle body ASSY (with motor)
   (1) Use a new throttle body gasket, install the throttle body ASSY (with motor) to the intake manifold with 4 bolts.
   Standard value:T=8.0N·m {82kgf·cm} {5.9ft·lbf}
   (2) Using 2 clamps, connect the water bypass hose No. 2 and water bypass hose No. 3 to the throttle body ASSY (with motor).
   (3) Connect the connector for the throttle body ASSY (with motor).
2. Installation of air cleaner case SUB-ASSY (Refer to EM - 8)
3. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
4. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
5. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)
6. Function inspection of throttle body ASSY (with motor) (Refer to ES - 671)

## On-vehicle inspection

1. Function inspection of throttle body ASSY (with motor)
   CAUTION:
   Be sure to perform the function inspection after assembly of the throttle body or removal/installation of the component parts.
   (1) Remove the EFI (+B) fuse (7.5 A) and ETCS fuse (15 A), wait for 60 seconds or more, and then reconnect the fuses.
   (2) After installing the throttle body to the vehicle, turn the ignition switch to ON without operating the accelerator pedal.
   CAUTION:
   If the accelerator pedal is operated by mistake, repeat the steps from the beginning.
   (3) Connect the SSM4 to the DLC.
   (4) Clear the diagnostic code using the SSM4.
   (5) Start the engine, and check that the check engine warning light does not illuminate and that the idle speed is within standard value with A/C OFF after warming up the engine.
   Standard value: 600 to 800 r/min
   CAUTION:
   Perform this check with all accessory switches turned OFF, A/C OFF, electric fan OFF, N or P position selected.
   (6) When the accelerator pedal is depressed rapidly down to the full-open position or around, check that [Data monitor] →[Throttle Opening Angle] value varies smoothly in synchronism with the pedal depression.

(7) Perform the driving test, and check that the feeling of strangeness is not provided.

## Unit inspection



1. Throttle body ASSY (with motor) check
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F} | 0.3 to 10Ω |

Captions in illustration

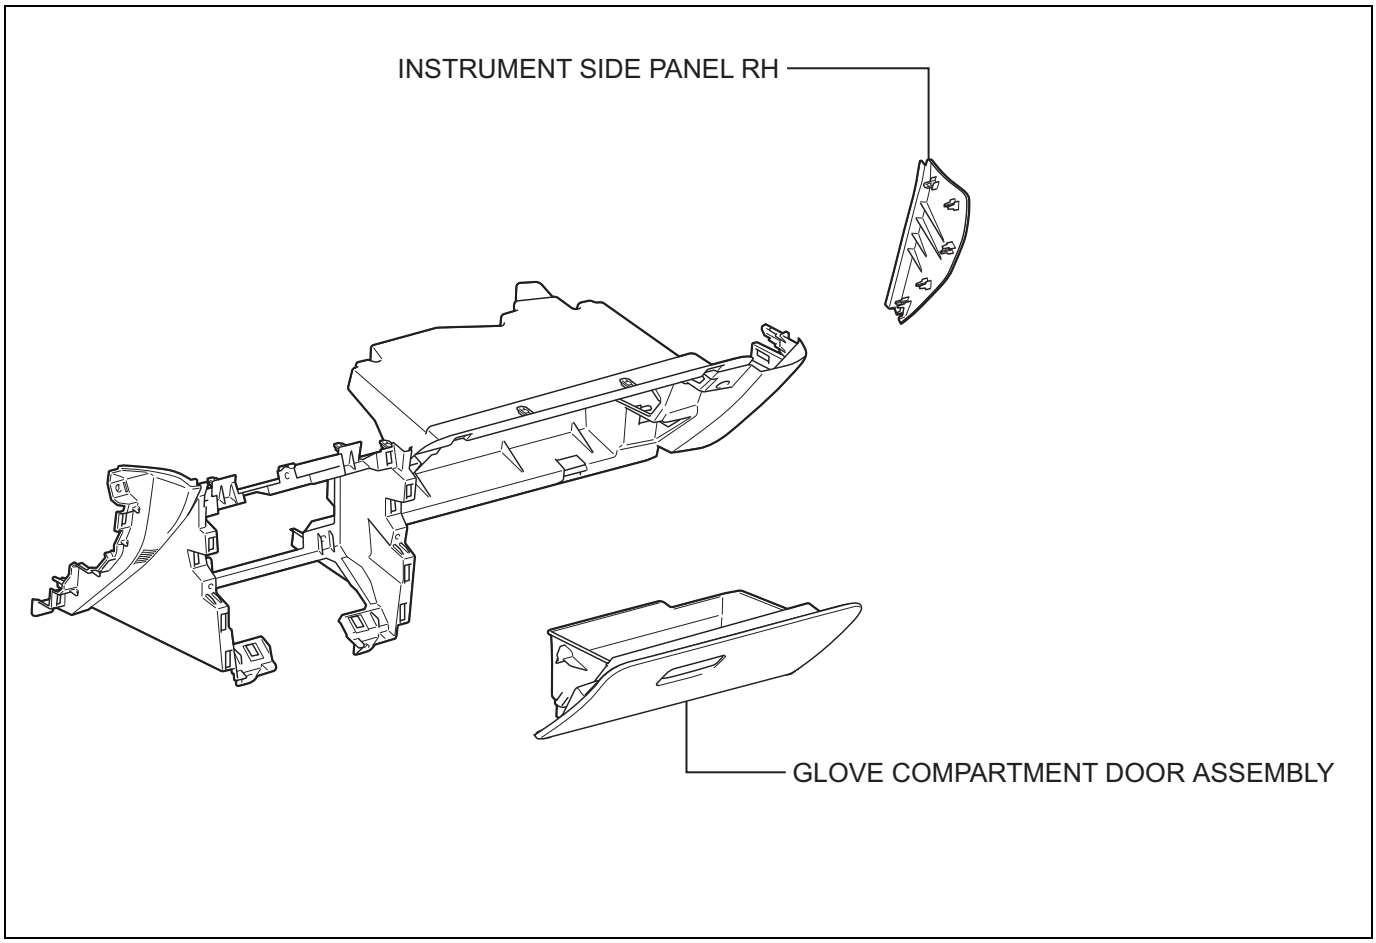
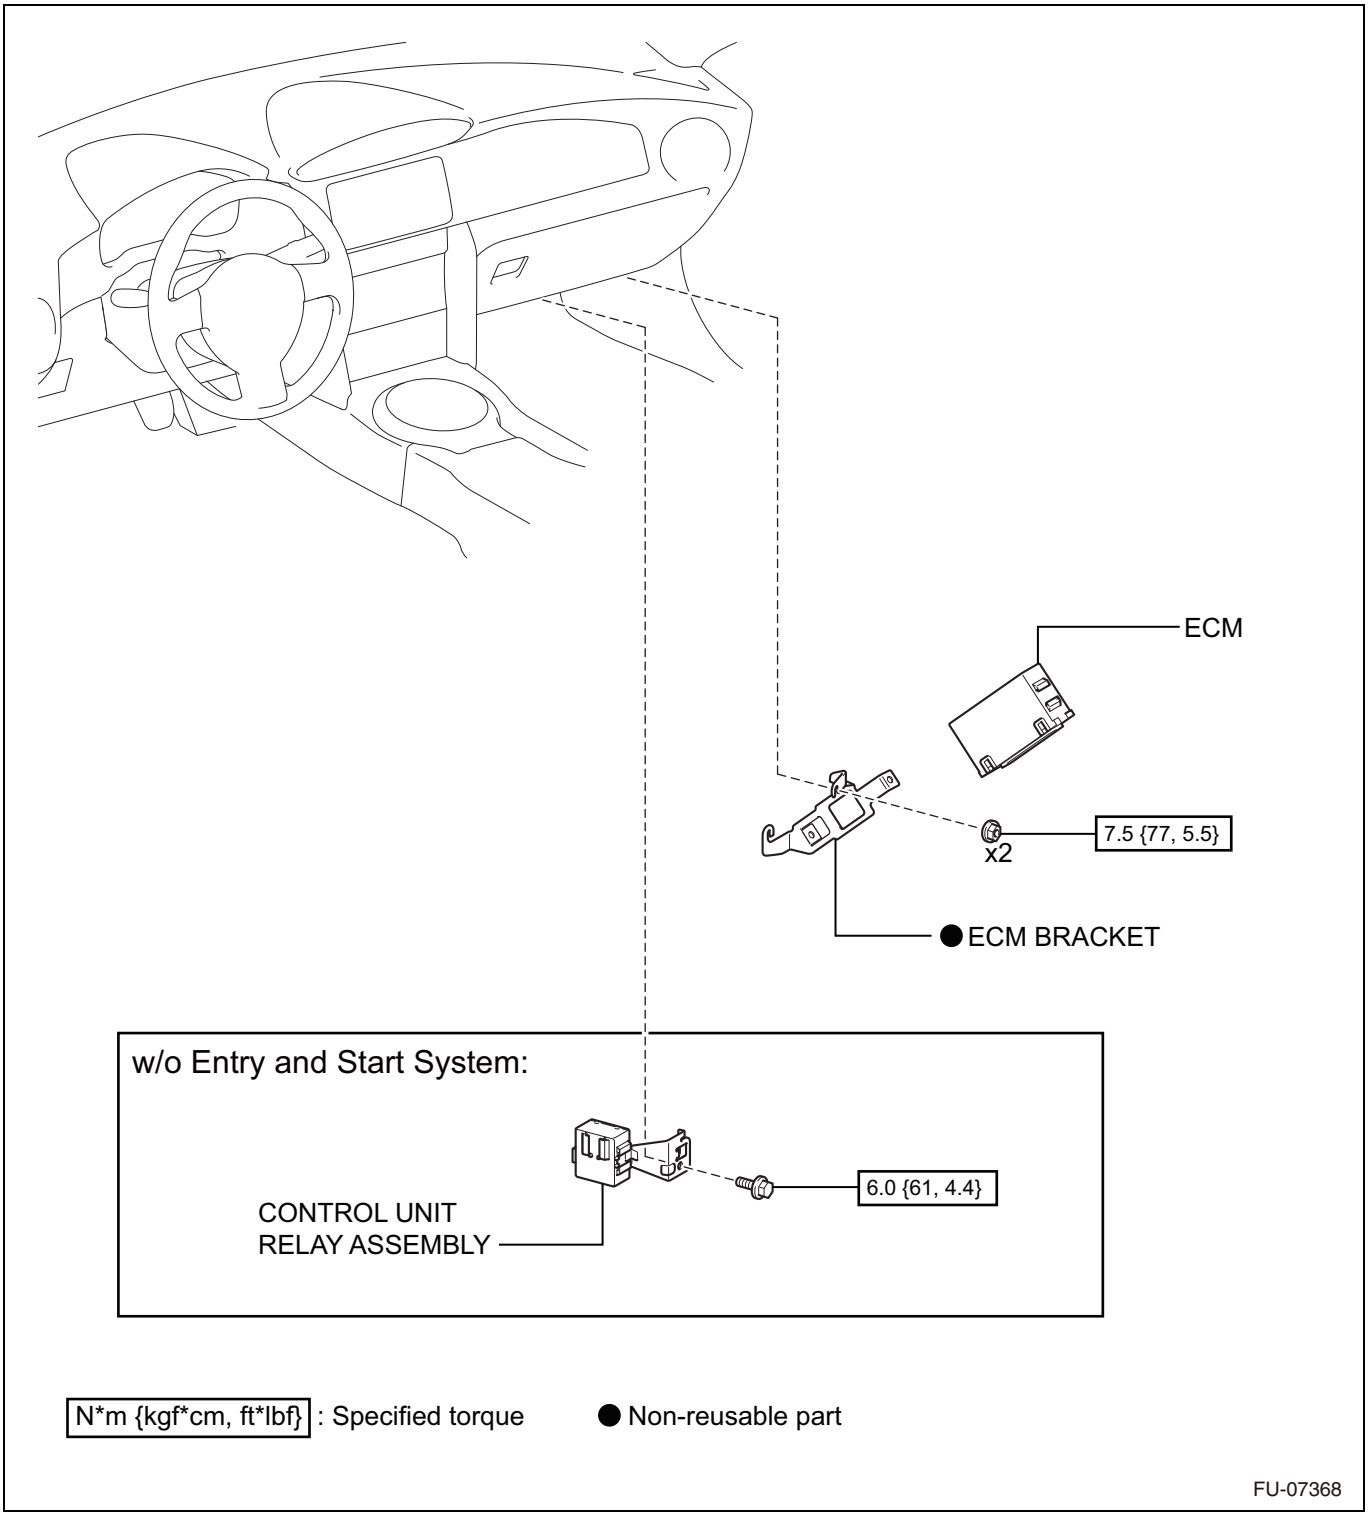
# Engine control computer (FA20)

## Exploded view



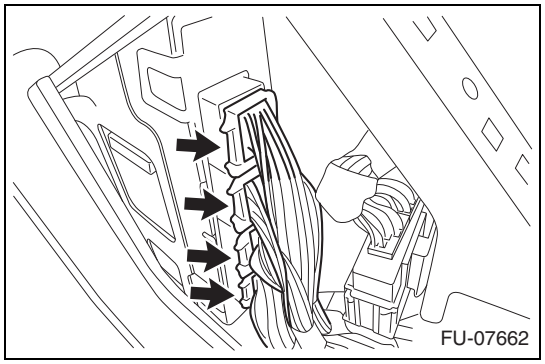
ES



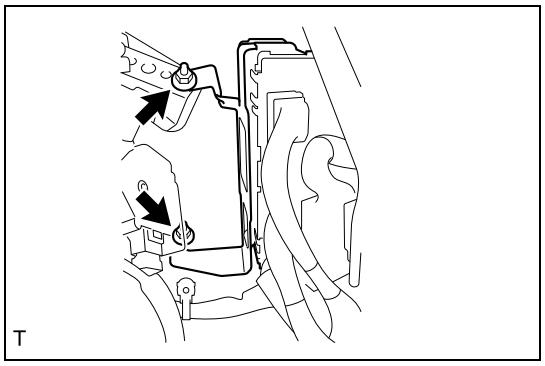
## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Removal of the instrument side panel RH (Refer to IT - 24)
3. Removal of glove compartment door ASSY (Refer to IT - 25)
4. Removal of control module relay ASSY (without smart entry) (Refer to ST - 47)

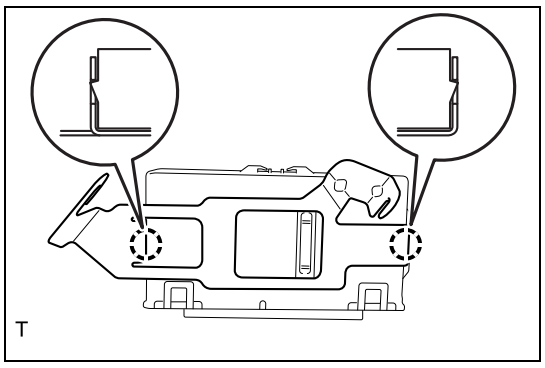
5. Removal of engine control computer



(1) Disconnect 4 connectors for engine control computer.



(2) Remove 2 nuts, and remove the engine control computer.



6. Removal of engine control computer bracket
   (1) Release 2 claws, and remove the engine control computer bracket.

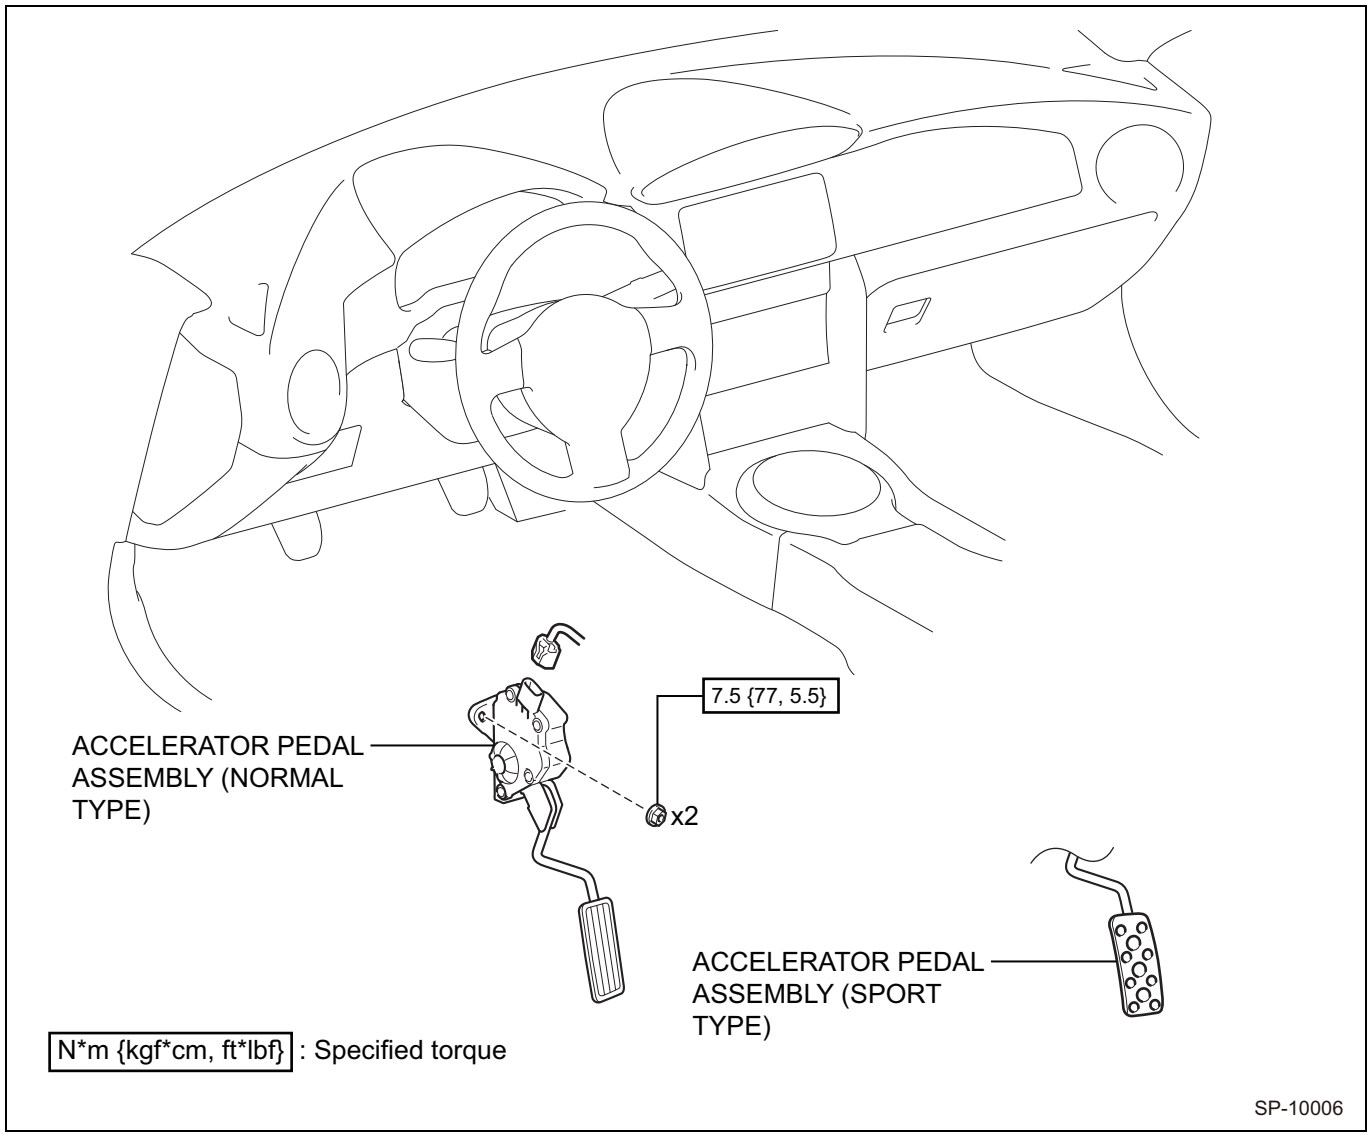
## Installation

1. Installation of engine control computer bracket
   (1) Replace the bracket with a new one, engage 2 claws, and attach the engine control computer bracket to the engine control computer.
   CAUTION:
   - After attaching the engine control computer bracket to the engine control computer, do not remove the engine control computer bracket.
   - If the engine control computer bracket has been installed to the engine control computer in the wrong direction, replace the engine control computer bracket with a new one.
2. Installation of engine control computer
   CAUTION:
   - If the engine control computer for model with immobilizer is replaced, be sure to register the immobilizer system.
   - When replacing the engine control computer, do not use the one with a wrong specification.
   (1) Using 2 nuts, install the engine control computer.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
   (2) Connect 4 connectors for engine control computer.
3. Installation of control module relay ASSY (without smart entry) (Refer to ST - 47)
4. Installation of glove compartment door ASSY (Refer to IT - 29)
5. Installation of the instrument side panel RH (Refer to IT - 29)

6. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

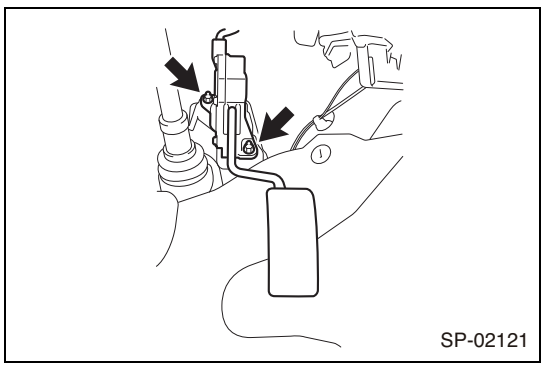
# Accelerator pedal rod ASSY (FA20)

## Exploded view



## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)



2. Removal of accelerator pedal sensor ASSY
   (1) Disconnect the connector for accelerator pedal sensor ASSY.
   (2) Remove 2 nuts, and remove the accelerator pedal sensor ASSY.

## Installation

1. Installation of accelerator pedal sensor ASSY
   (1) Using 2 nuts, install the accelerator pedal sensor ASSY.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}

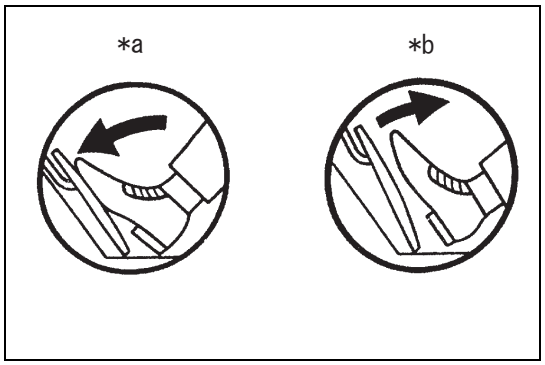
(2) Connect the connector for accelerator pedal sensor ASSY.

2. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## On-vehicle inspection

1. Function inspection of accelerator pedal sensor ASSY
   (1) Connect the SSM4 to the DLC.
   (2) Turn the ignition switch to ON.

ES



(3) According to the display, select [ECU Data Monitor] →[Accelerator Sensor No1 Voltage and Accelerator Sensor No2 Voltage], and check the value when the accelerator pedal is operated.

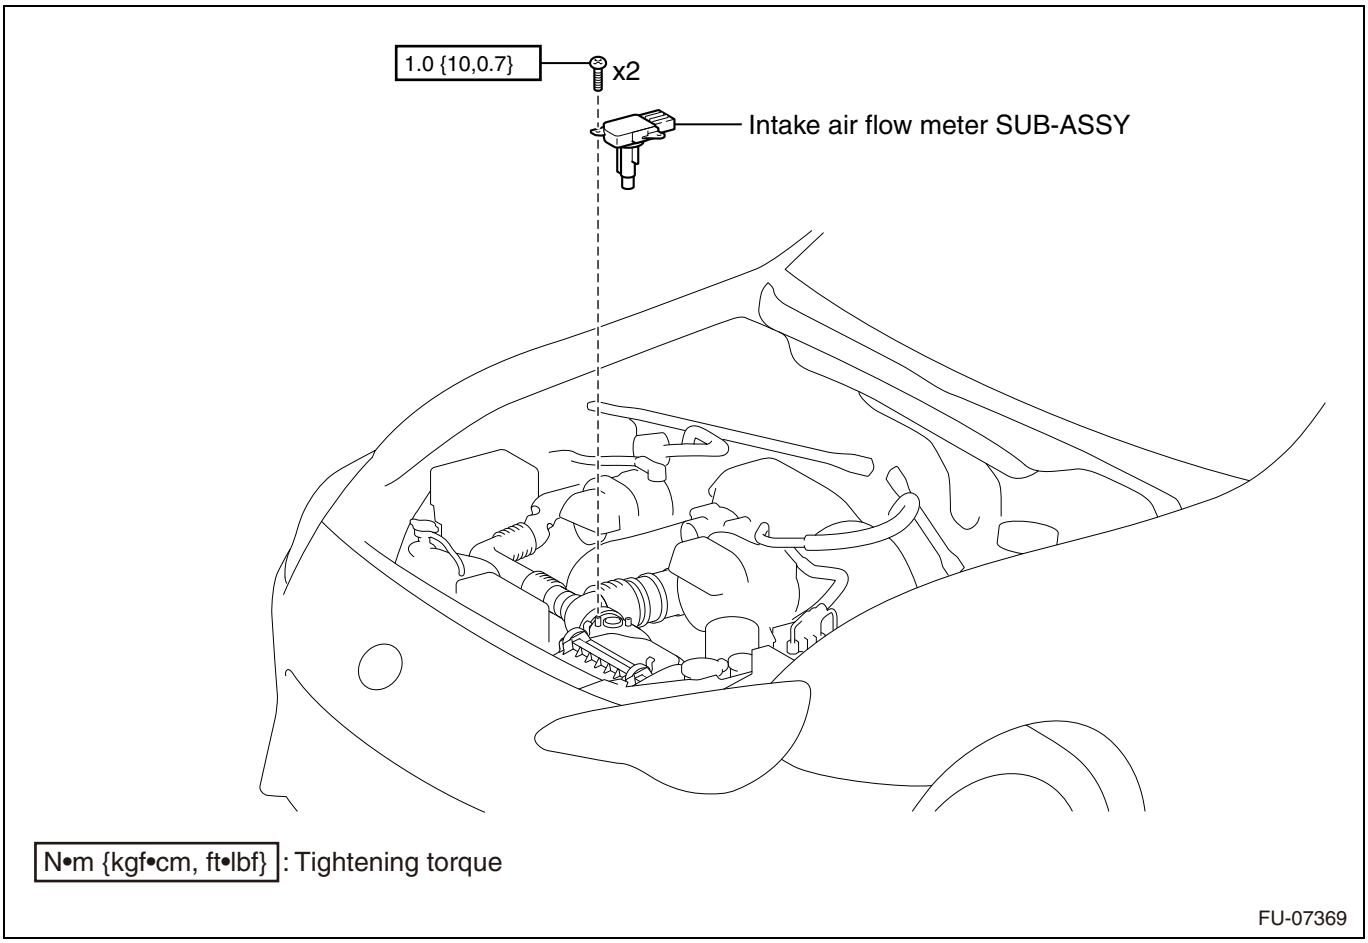
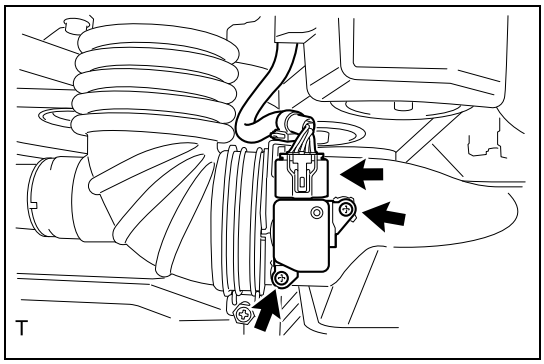
# Intake air flow meter S/A (FA20)

## Exploded view



## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)



2. Removal of intake air flow meter SUB-ASSY
   (1) Disconnect the connector for intake air flow meter SUB-ASSY.
   (2) Remove 2 screws, and remove the intake air flow meter SUB-ASSY.

## Installation

1. Installation of intake air flow meter SUB-ASSY
   (1) Using 2 screws, install the intake air flow meter SUB-ASSY.
   Standard value:T=1.0N·m {10kgf·cm} {0.7ft·lbf}
   (2) Connect the connector for intake air flow meter SUB-ASSY.
2. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## On-vehicle inspection

1. Function inspection of intake air flow meter SUB-ASSY
   (1) Inspection of intake air amount
   CAUTION:
   - Perform inspection with the vehicle on a level surface and engine stopped.
   - Perform the inspection with the air cleaner ASSY installed.
   - Do not suction the exhaust emission from the exhaust tail pipe with the exhaust duct.

   (a) Connect the SSM4 to the DLC.
   (b) Turn the ignition switch to ON, and then wait for 30 seconds.
   (c) According to the display on the SSM4, select [Data monitor] →[Mass Air Flow], and read the intake air amount.

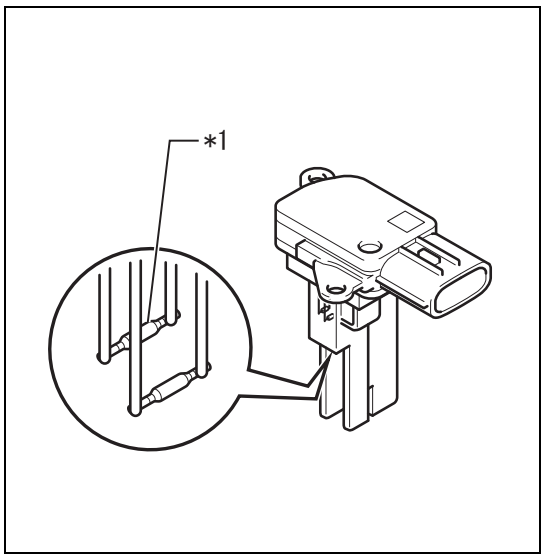
ES

Standard value

| Item name | Inspection conditions | Standard value |
|---|---|---|
| Mass air flow | Engine stops 30 seconds after IG ON | Less than 0.85 g/s |

CAUTION:
- If it is out of standard value, replace the intake air flow meter SUB-ASSY.
- If it is within standard value, check the intake air flow meter SUB-ASSY. (Refer to ES - 680)

## Unit inspection

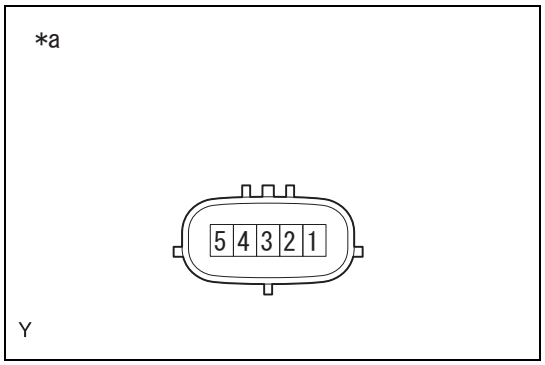


1. Inspection of intake air flow meter SUB-ASSY
   (1) Use a working lamp, visually check the platinum filament (heater) portion of the intake air flow meter SUB-ASSY for foreign matter.

Captions in illustration

| | |
|---|---|
| *1 | Platinum filament (heater) |

Criteria: No foreign matter
NOTE:
If there is a foreign matter on the platinum filament (heater), replace the intake air flow meter SUB-ASSY.



(2) Inspection of intake temperature sensor resistance
   (a) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | -20°C {-4°F} | 13.6 to 18.4kΩ |
| | 20°C {68°F} | 2.21 to 2.69kΩ |
| | 60°C {140°F} | 0.49 to 0.67kΩ |

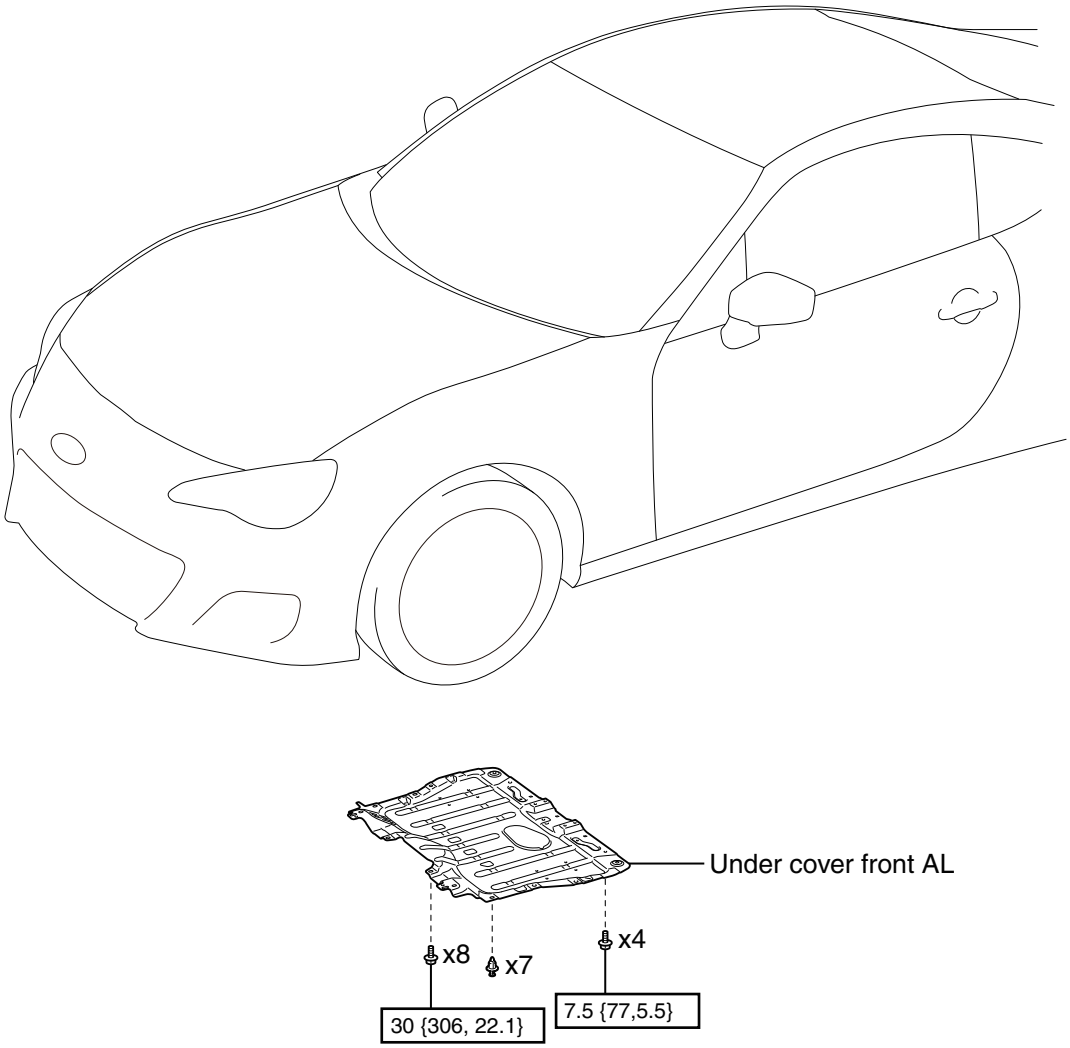
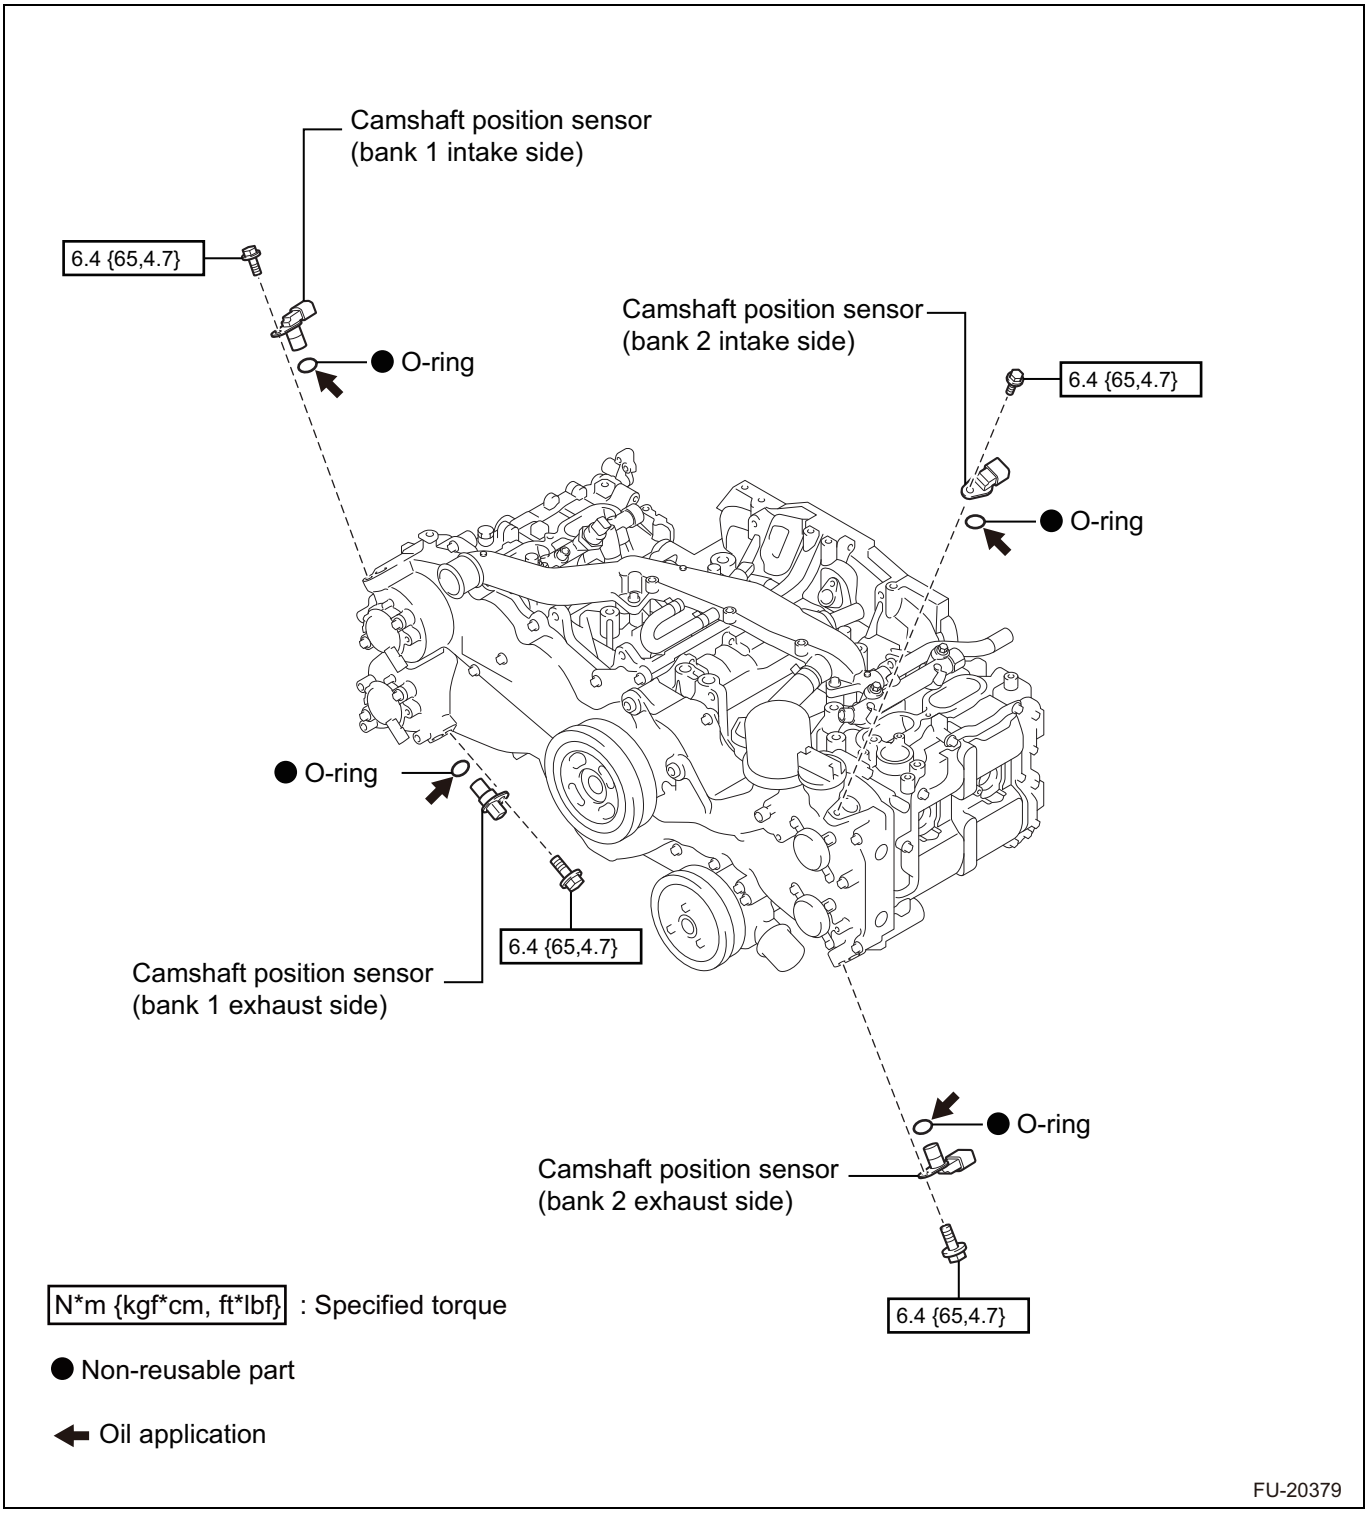
# Camshaft position sensor (FA20)

## Exploded view



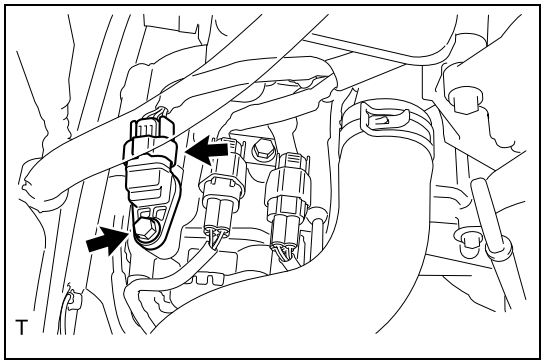
N•m {kgf•cm, ft•lbf}: Tightening torque

FU-07971

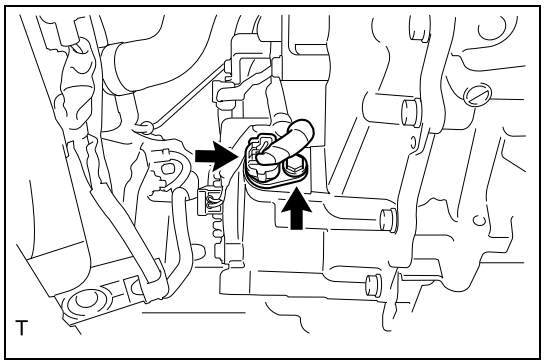


## Removal

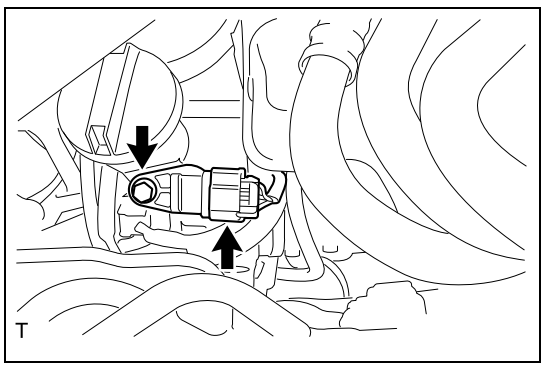
1. Disconnection of the battery ground terminal (Refer to IN - 6)



2. Removal of camshaft position sensor (bank 1 intake side)
   (1) Disconnect the connector for camshaft position sensor.
   (2) Remove the bolt, and remove the camshaft position sensor.
   (3) Remove the O-ring from the camshaft position sensor.

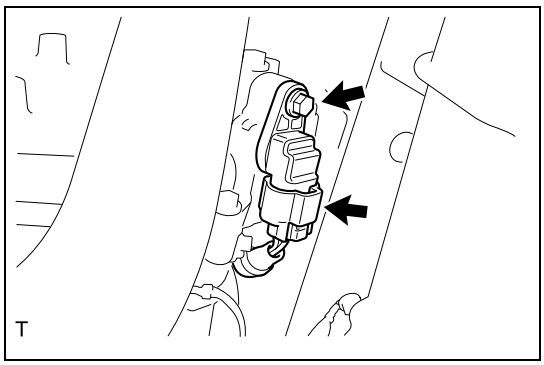


3. Removal of camshaft position sensor (bank 1 exhaust side)
   (1) Disconnect the connector for camshaft position sensor.
   (2) Remove the bolt, and remove the camshaft position sensor.
   (3) Remove the O-ring from the camshaft position sensor.



4. Removal of camshaft position sensor (bank 2 intake side)
   (1) Disconnect the connector for camshaft position sensor.
   (2) Remove the bolt, and remove the camshaft position sensor.
   (3) Remove the O-ring from the camshaft position sensor.

5. Removal of under cover front AL (Refer to IE - 39)



6. Removal of camshaft position sensor (bank 2 exhaust side)
   (1) Disconnect the connector for camshaft position sensor.
   (2) Remove the bolt, and remove the camshaft position sensor.
   (3) Remove the O-ring from the camshaft position sensor.

## Installation

1. Installation of camshaft position sensor (bank 2 exhaust side)
   (1) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
   (2) Using bolt, install the camshaft position sensor.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (3) Connect the connector for camshaft position sensor.
2. Under cover front AL installation (Refer to IE - 46)
3. Installation of camshaft position sensor (bank 2 intake side)
   (1) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.

(2) Using bolt, install the camshaft position sensor.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(3) Connect the connector for camshaft position sensor.

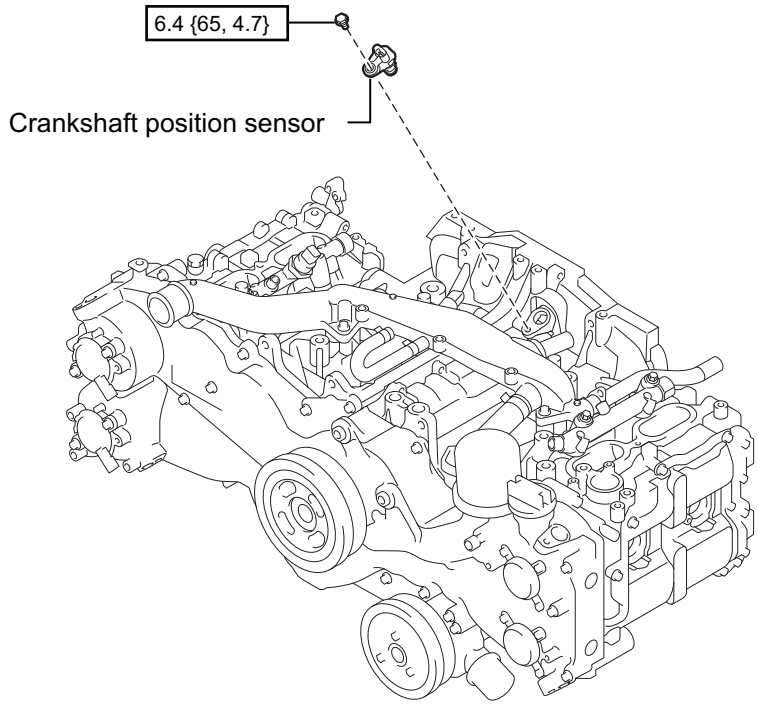
4. Installation of camshaft position sensor (bank 1 exhaust side)
(1) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
(2) Using bolt, install the camshaft position sensor.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(3) Connect the connector for camshaft position sensor.

5. Installation of camshaft position sensor (bank 1 intake side)
(1) Apply new engine oil to a new O-ring, and attach it to the camshaft timing oil control valve ASSY.
(2) Using bolt, install the camshaft position sensor.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
(3) Connect the connector for camshaft position sensor.

6. Connection of the battery ground terminal
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

# Crankshaft position sensor (FA20)

## Exploded view

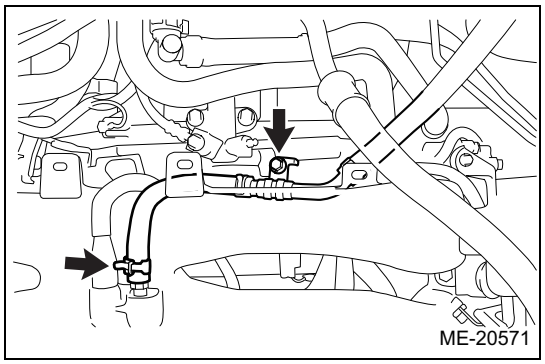


N*m {kgf*cm, ft*lbf}: Tightening torque

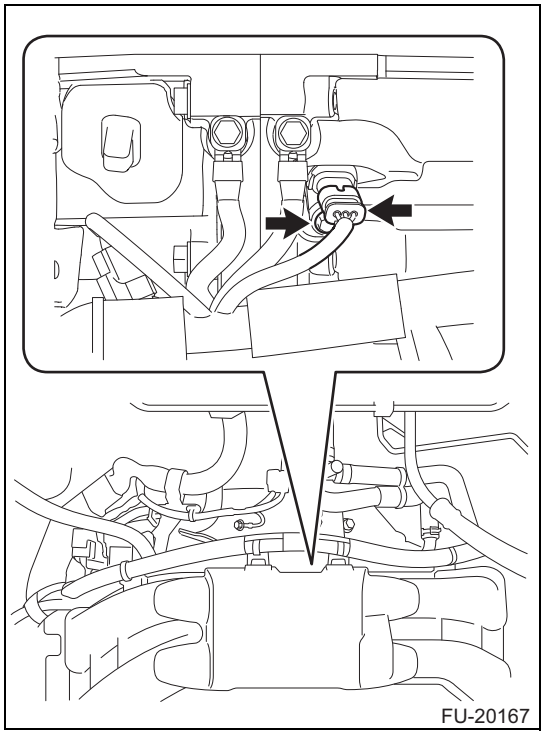
FU-20166

## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)



2. Vacuum tube connector hose disconnection (transmission M/T)
   (1) Move the hose clamp and disconnect the vacuum tube connector hose from the intake manifold ASSY.
   (2) Remove the bolt and disconnect the vacuum tube connector hose.



3. Removal of crankshaft position sensor
   (1) Disconnect the crankshaft position sensor connector.
   (2) Remove the bolt, and remove the crankshaft position sensor.

## Installation

1. Installation of crankshaft position sensor
   (1) Using bolt, install the crankshaft position sensor.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (2) Connect the connector for crankshaft position sensor.
2. Vacuum tube connector hose connection (transmission M/T)
   (1) Install the vacuum tube connector hose with the bolt.
   Standard value:T=18N·m {184kgf·cm}
3. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

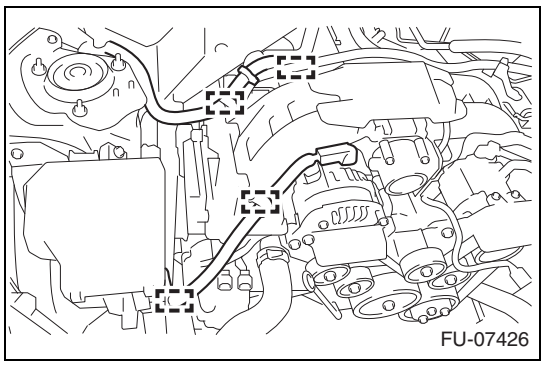
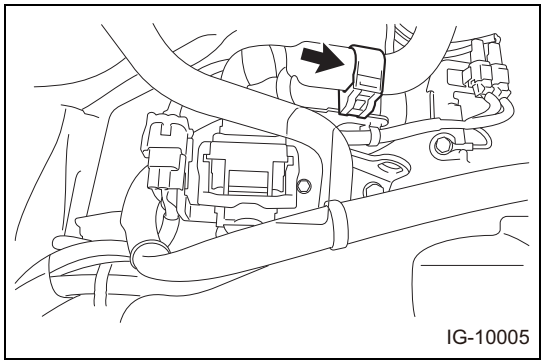
## Removal

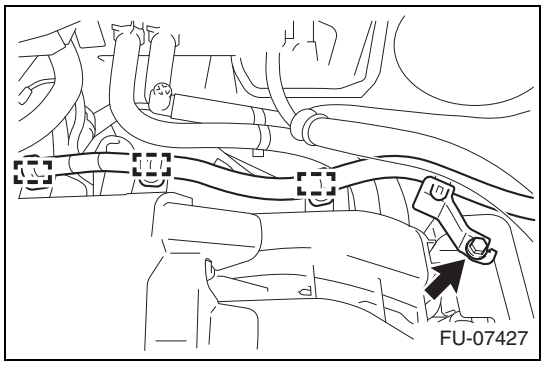
1. Hood SUB-ASSY setting (Refer to EM - 75)
2. Disconnection of the battery ground terminal (Refer to IN - 6)
3. Front strut tower bar LH removal (Refer to FP - 4)
4. Removal of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
5. Front strut tower bar RH removal (Refer to FP - 5)
6. Removal of flexible V-shaped bar RH (tS model) (Refer to FP - 5)
7. Removal of air cleaner case SUB-ASSY (Refer to EM - 75)



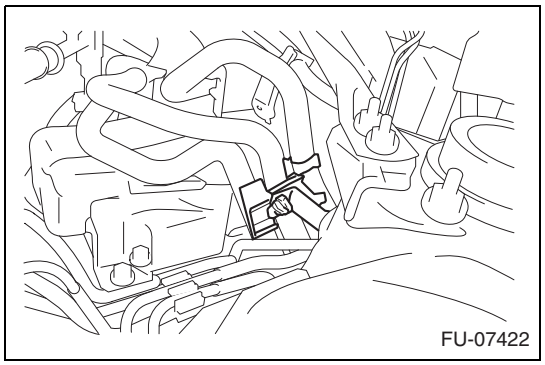
8. Engine wiring disconnection
   (1) Release the four clamps and disconnect the engine wiring.



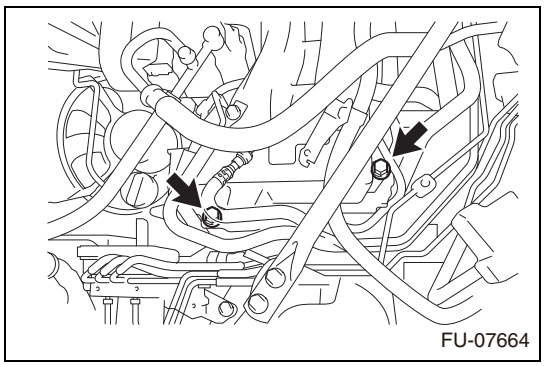
(2) Release the clamp and disconnect the bulkhead harness.



(3) Remove the bolt and three clamps, and then disconnect the engine wiring. (Transmission A/T)



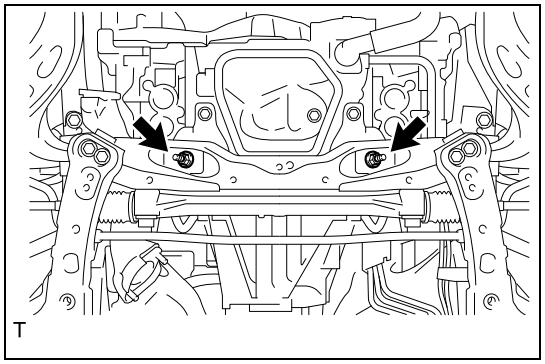
9. Removal of intake manifold protector (bank 2 side)
   (1) Remove the bolt, and disconnect the fuel hose bracket.



(2) Remove 2 bolts, and remove the intake manifold protector (bank 2 side).

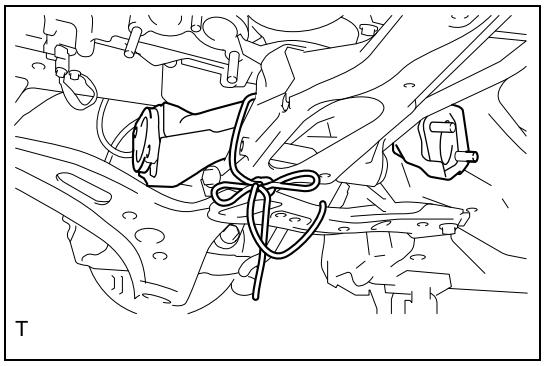
10. Removal of injector driver (Refer to FU - 43)
11. Removal of exhaust manifold (Refer to IE - 35)

12. Disconnection of front crossmember SUB-ASSY

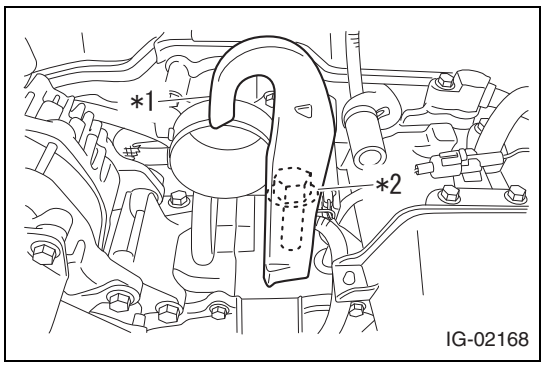


(1) Remove the 2 nuts on the engine mount.

13. Installation of SST



(1) Tie the exhaust pipe SUB-ASSY FR to the front suspension cross-member SUB-ASSY with the rope.
NOTE:
This operation is required to avoid dropping the exhaust pipe SUB-ASSY FR.



(2) Install the SST to the cylinder block.

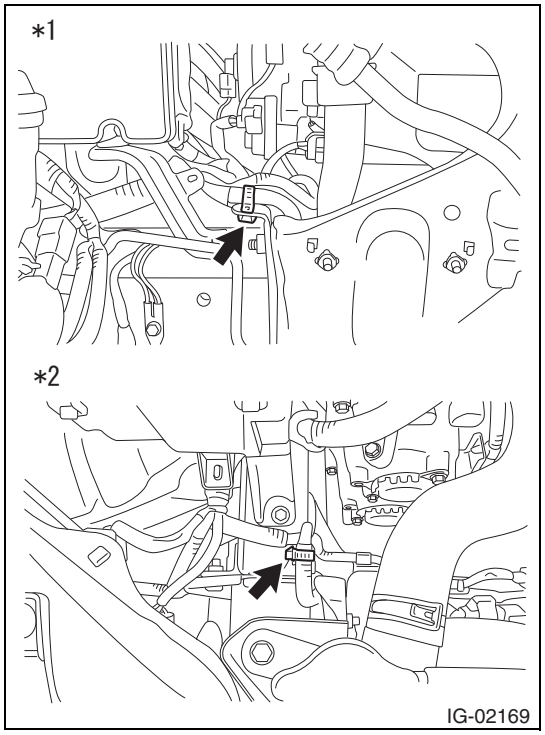
SST 12281-38150, 90119-14120
Standard value:T=43N·m {439kgf·cm} {31.7ft·lbf}



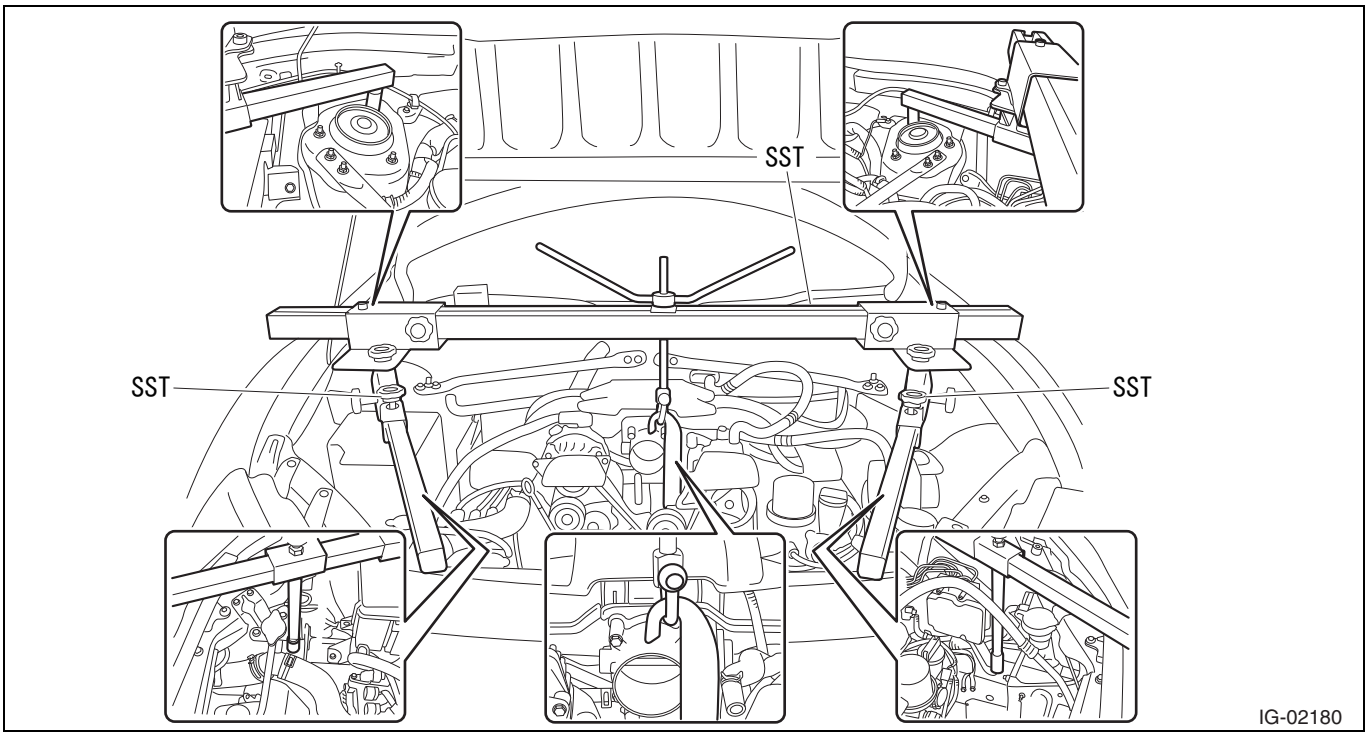
(3) Release the clamp and disconnect the engine wiring.

Captions in illustration

| | |
|---|---|
| *1 | LH |
| *2 | RH |

NOTE:
This procedure is required to prevent the engine wiring from damaging.

(4) Install the SST to the vehicle.

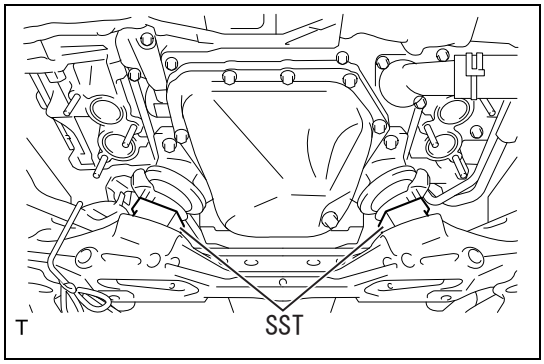


SST 99099AJ000, 18679AA020

CAUTION:
- When installing the SST to the vehicle, do not damage the engine wiring.
- Use a shackle with the load capacity of 250 kg (551 lb) or more.

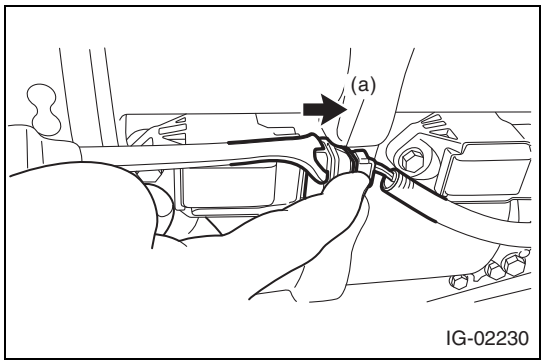
(5) Lift the engine ASSY a little bit at a time until the stud bolt of the engine mount is removed from the front crossmember.

CAUTION:
- To avoid the damage to the SST, apply grease or lubricant to the threaded portion.
- To avoid the damage to the vehicle and parts, perform lifting operation a little bit at a time while checking the clearance in each part.
- Lift the engine until the intake manifold (#4) slightly comes in contact with the A/C suction hose.
- Insert a cloth between the intake manifold (#4) and the A/C suction hose to protect each part.

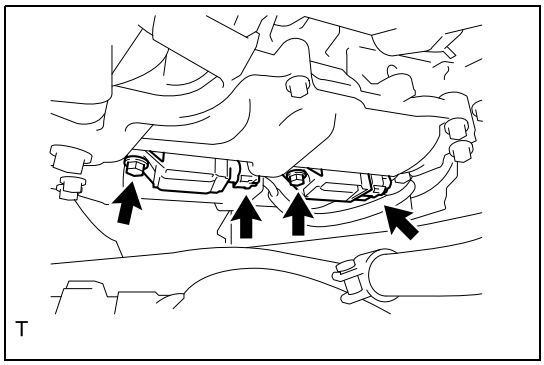


(6) Install the SST between engine mount and front crossmember.
SST 18632AA020

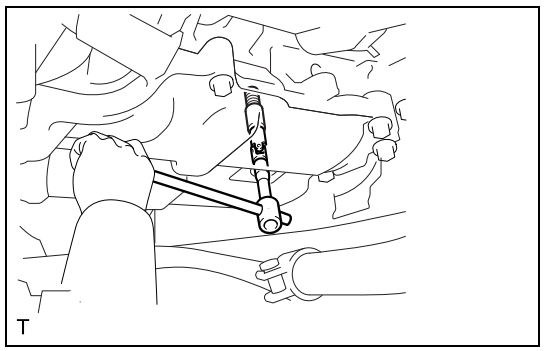
ES



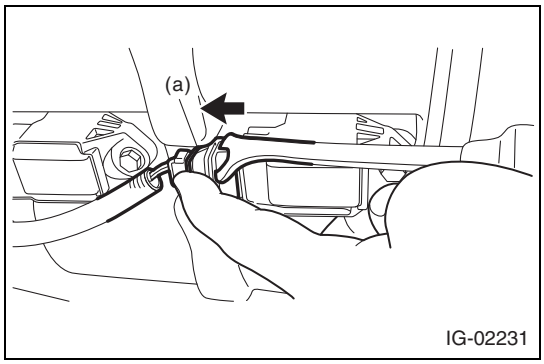
14. Removal of ignition coil ASSY (bank 2 side)
(1) Disconnect 2 connectors for the ignition coil ASSY.
NOTE:
Slide the connectors in the direction of the arrow using a tool such as a clip remover while pressing the spring (a) shown in the figure.



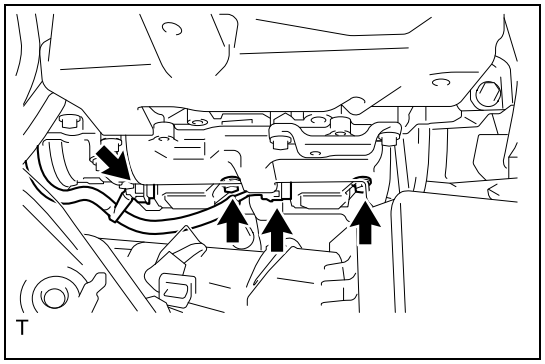
(2) Remove 2 bolts, and remove 2 ignition coil ASSYs.



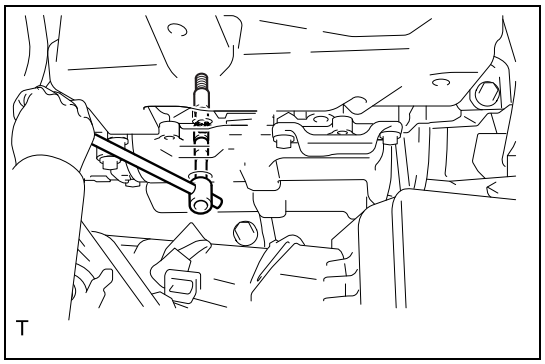
15. Removal of spark plug (bank 2 side)
(1) Remove the two spark plugs.



16. Removal of ignition coil ASSY (bank 1 side)
(1) Disconnect 2 connectors for the ignition coil ASSY.
NOTE:
Slide the connectors in the direction of the arrow using a tool such as a clip remover while pressing the spring (a) shown in the figure.



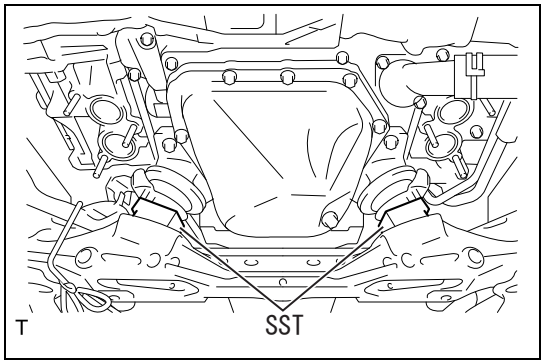
(2) Remove 2 bolts, and remove 2 ignition coil ASSYs.



17. Removal of spark plug (bank 1 side)
    (1) Remove the two spark plugs.

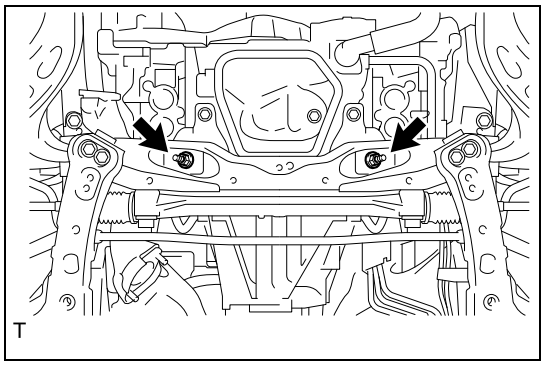
## Installation

1. Installation of spark plug (bank 1 side)
   (1) Install the two spark plugs.
   Standard value:T=17N·m {174kgf·cm} {12.5ft·lbf}
2. Installation of ignition coil ASSY (bank 1 side)
   (1) Using 2 bolts, install the ignition coil ASSY.
   Standard value:T=8.5N·m {87kgf·cm} {6.3ft·lbf}
   (2) Connect 2 connectors of the ignition coil ASSY.
3. Installation of injector driver (Refer to FU - 44)
4. Installation of spark plug (bank 2 side)
   (1) Install the two spark plugs.
   Standard value:T=17N·m {174kgf·cm} {12.5ft·lbf}
5. Installation of ignition coil ASSY
   (1) Using 2 bolts, install the ignition coil ASSY.
   Standard value:T=8.5N·m {87kgf·cm} {6.3ft·lbf}
   (2) Connect 2 connectors of the ignition coil ASSY.
6. Installation of intake manifold protector (bank 2 side)
   (1) Using 2 bolts, install the intake manifold protector (bank 2 side).
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Install the fuel hose bracket.
   Standard value:T=7.5N·m {76kgf·cm} {5.5ft·lbf}
7. Removal of SST
   (1) Using the SST, lift the engine ASSY.
   SST 99099AJ000, 18679AA020



(2) Remove the SST.
SST 18632AA020

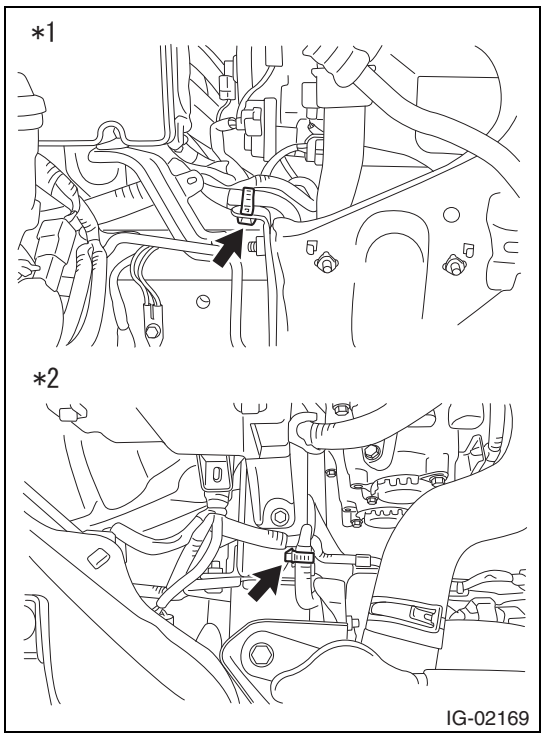
8. Connection of front crossmember SUB-ASSY



(1) Install the two nuts of the new engine mounting.
Standard value:T=60N·m {612kgf·cm} {44.2ft·lbf}

(2) Remove the rope which secures the joint pipe to the front suspension crossmember SUB-ASSY.

9. Removal of SST
   (1) Remove the SST from the vehicle.
   SST 99099AJ000, 18679AA020
   (2) Remove the SST from the cylinder block.
   SST 12281-38150, 90119-14120



(3) Connect the engine wiring with the clamp.

10. Installation of exhaust manifold (Refer to IE - 36)

11. Engine wiring connection
   (1) Connect the engine wiring with the bolt and three clamps. (Transmission A/T)

Standard value:T=11N·m {112kgf·cm} {8.1ft·lbf}

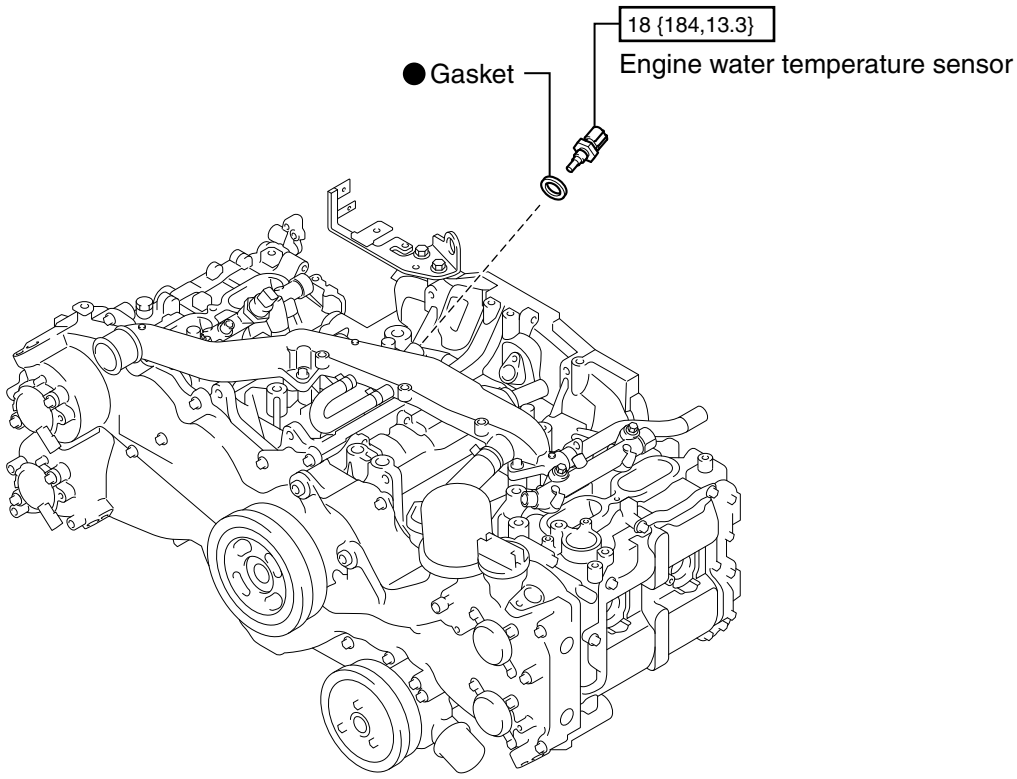
(2) Using the clamp, connect the bulkhead harness.

(3) Using 4 clamps, connect the engine wire.

12. Installation of air cleaner case SUB-ASSY (Refer to EM - 114)
13. Installation of front strut tower bar LH (Refer to FP - 5)
14. Installation of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
15. Installation of front strut tower bar RH (Refer to FP - 5)
16. Installation of flexible V-shaped bar RH (tS model) (Refer to FP - 5)
17. Connection of the battery ground terminal
    Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
18. Shift lever position check (transmission A/T) (Refer to AT - 210)
19. Hood SUB-ASSY setting (Refer to EM - 115)

# Engine coolant temperature sensor (FA20)

## Exploded view

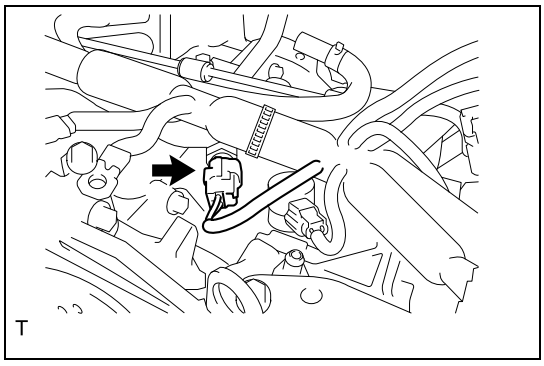


N•m {kgf•cm, ft•lbf} : Tightening torque ● Non-reusable parts

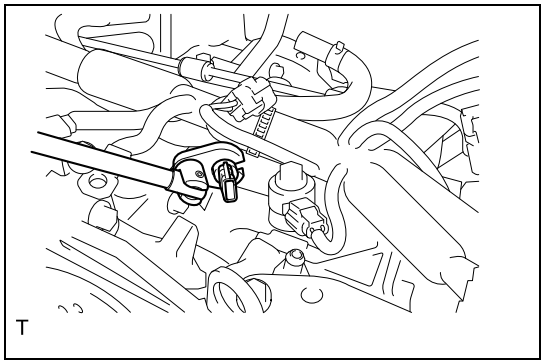
FU-07375

## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
3. Removal of intake manifold (Refer to IE - 17)



4. Removal of engine water temperature sensor
   (1) Disconnect the connector for engine water temperature sensor.



(2) Remove the engine water temperature sensor and gasket.

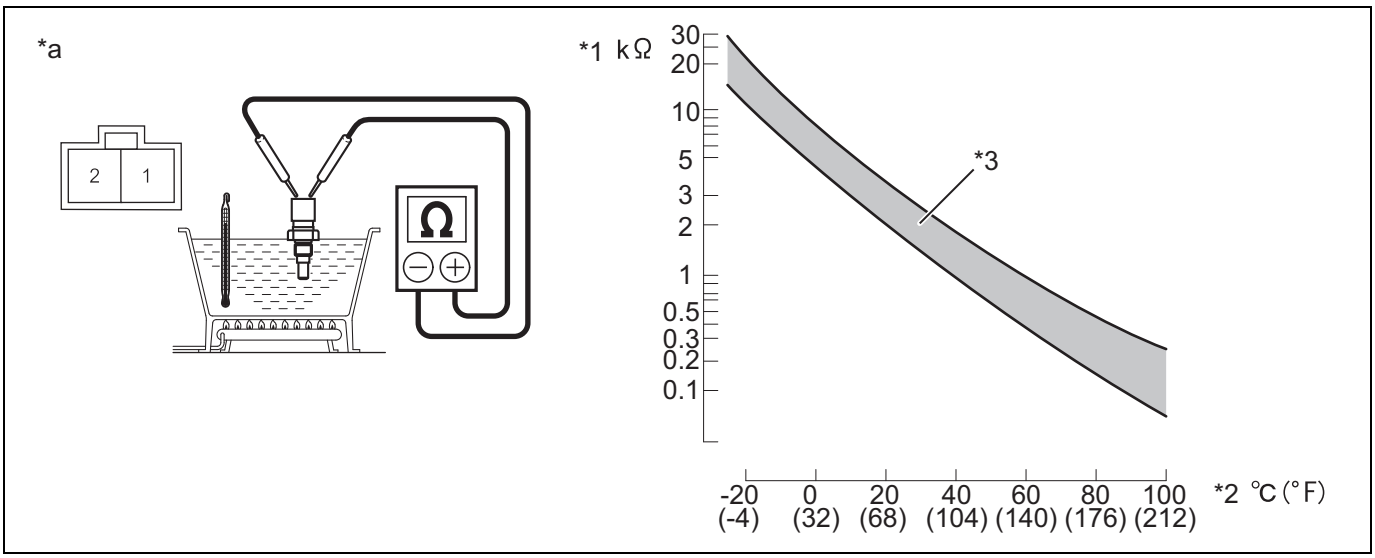
ES

## Installation

1. Installation of engine water temperature sensor
   (1) Using a new gasket, install the engine water temperature sensor.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
   CAUTION:
   The torque wrench may be combined with the union nut wrench to extend its length for tightening operation. In this case, if it is tightened to the specified torque indicated on the torque wrench, the actual tightening torque exceeds the specification. (Refer to IN - 6)
   (2) Connect the connector for engine water temperature sensor.
2. Installation of intake manifold (Refer to IE - 28)
3. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
4. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
5. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)

## Unit inspection

1. Inspection of engine water temperature sensor



Text in Illustration

| | | | |
|---|---|---|---|
| *1 | Resistance | *2 | Temperature |
| *3 | Acceptable | - | - |
| *a | Component without harness connected<br>(Engine Coolant Temperature Sensor) | - | - |

(1) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | Approx. 20°C {68°F} | 2.25 to 2.65kΩ |
| | Approx. 80°C {176°F} | 0.305 to 0.331kΩ |

CAUTION:
When the inspection is performed with the sensor immersed in water, be careful not to allow the ingress of water into the terminal part. After inspection is completed, wipe off the water drops from the sensor.

# Engine oil temperature sensor (FA20)

## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
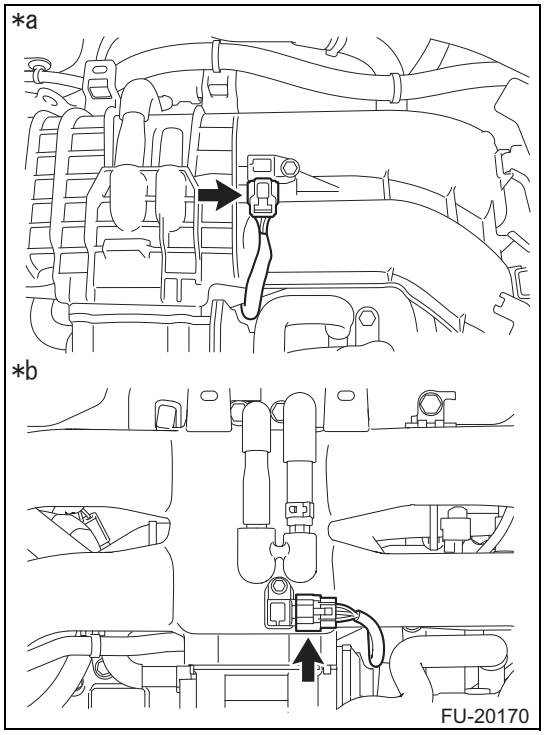
2. Removal of engine cover SUB-ASSY No.1 (Refer to IE - 16)

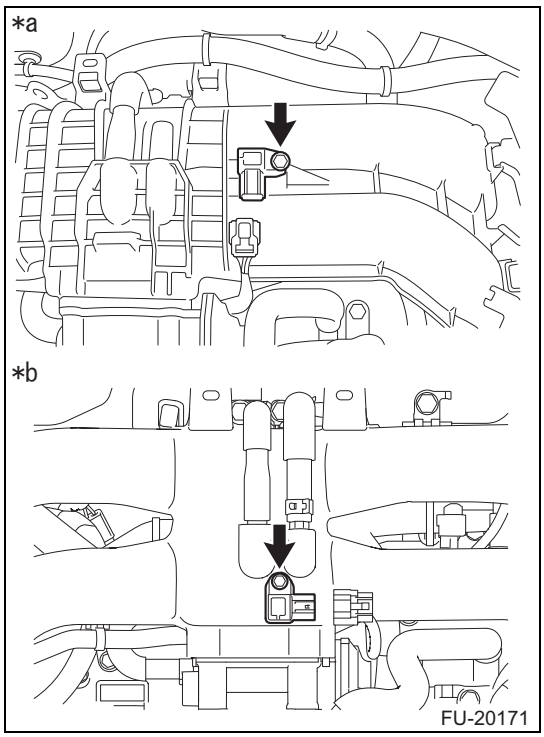


3. Removal of air pressure sensor ASSY

(1) Disconnect the connector for air pressure sensor ASSY.

Captions in illustration

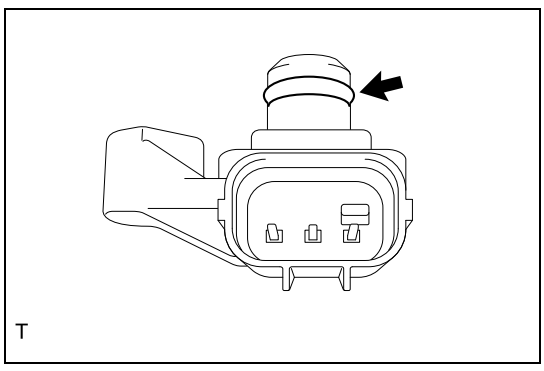
| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



(2) Remove the bolt, and remove the air pressure sensor ASSY.

Captions in illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



(3) Remove the O-ring from the air pressure sensor ASSY.

## Installation

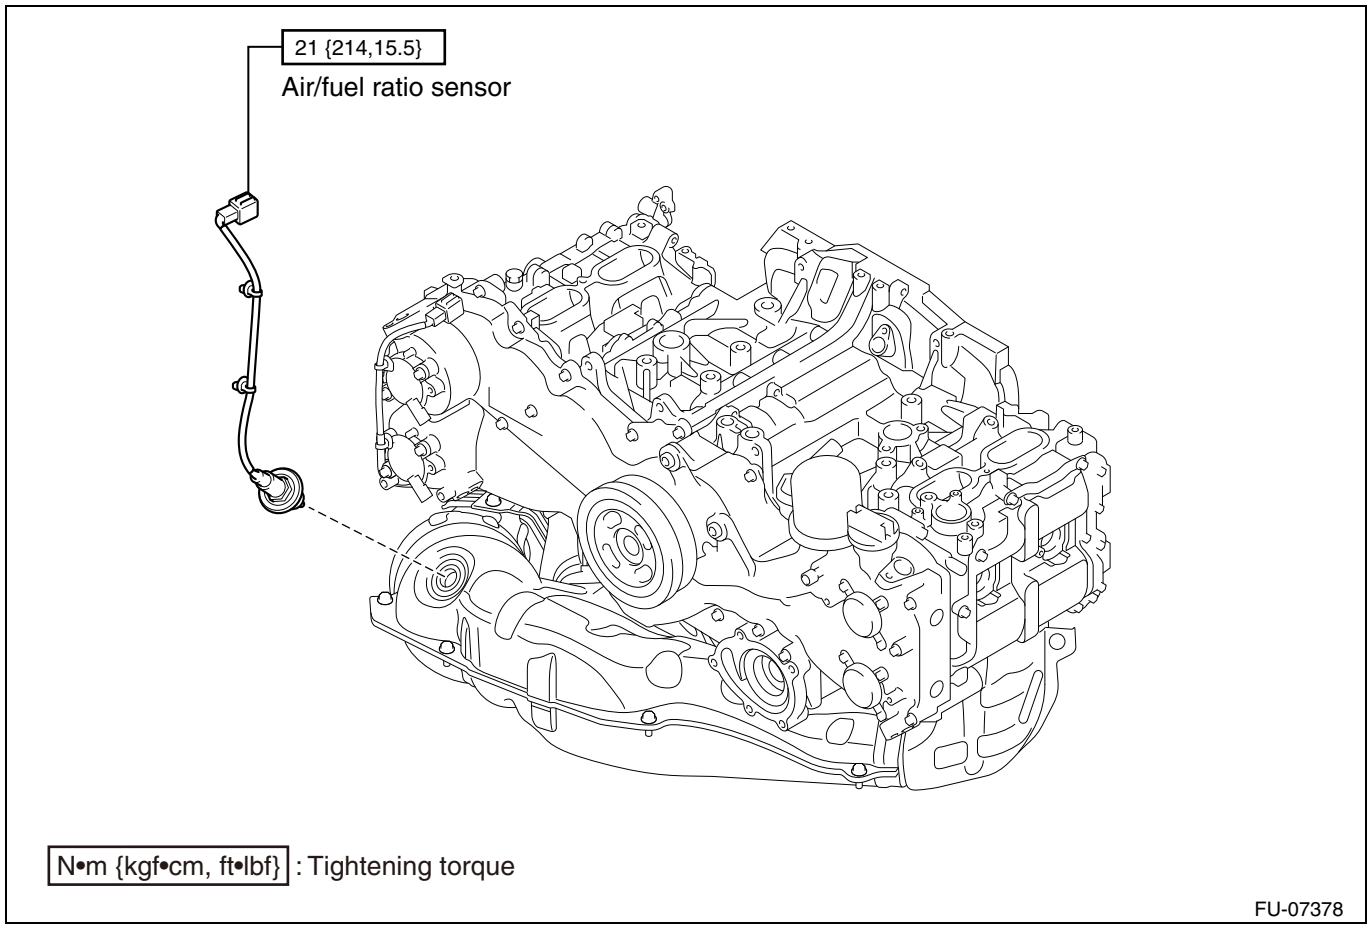
1. Installation of air pressure sensor ASSY
   (1) Attach a new O-ring to the air pressure sensor ASSY.
   (2) Apply engine oil to the O-ring.
   (3) Using bolt, install the air pressure sensor ASSY. (Transmission A/T)
   Standard value:T=4.0N·m {41kgf·cm} {3.0 ft·lbf} (Transmission A/T)
   T=3.4N·m {35kgf·cm} {2.5 ft·lbf} (Transmission M/T)
   (4) Connect the connector for air pressure sensor ASSY.
2. Installation of engine cover SUB-ASSY No. 1 (Refer to IE - 28)
3. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## On-vehicle inspection

1. Inspection of air pressure sensor ASSY
   (1) Connect the SSM4 to the DLC.
   (2) Turn the ignition switch to ON with engine stopped.
   (3) Select the following menu items using the SSM4: [Data monitor] →[Atmosphere Pressure]
   (4) Read the data monitor.
   Criteria: Almost equal to atmospheric pressure
   NOTE:
   - Standard atmospheric pressure is 101 kPa {758 mmHg, 29.8 inHg, 14.6 psig}.
   - Atmospheric pressure decreases by 1 kPa {8 mmHg, 0.3 inHg, 0.1 psig} as the altitude increases by 100 m {328 ft}.
   - Atmospheric pressure varies according to the weather.

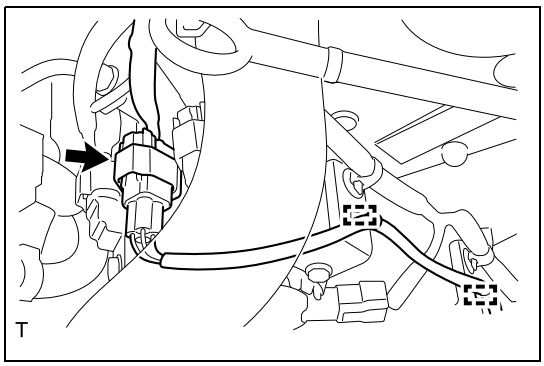
# Air / fuel ratio sensor (FA20)

## Exploded view



## Removal

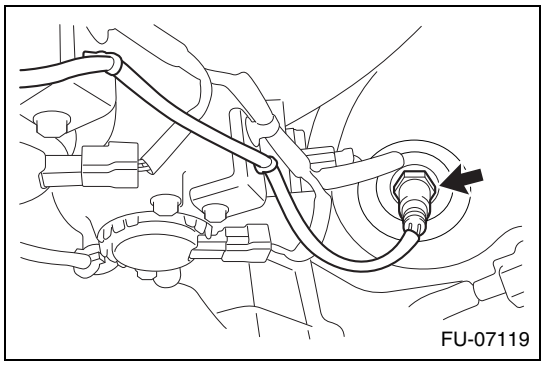
1. Disconnection of the battery ground terminal (Refer to IN - 6)



2. Removal of air/fuel ratio sensor
   (1) Disconnect the connector for air/fuel ratio sensor and the 2 clamps.

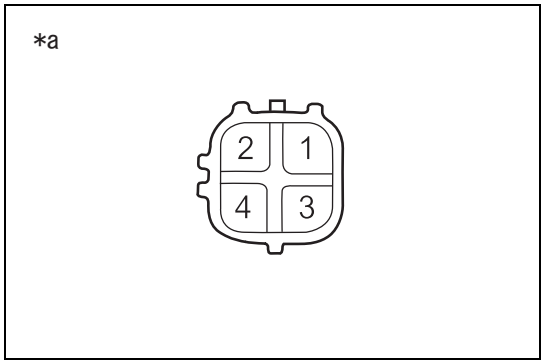
   (2) Remove the air/fuel ratio sensor from the exhaust manifold.

## Installation



1. Installation of air/fuel ratio sensor
   (1) Install the air/fuel ratio sensor to the exhaust manifold.
   Standard value:T=21N·m {214kgf·cm} {15.5ft·lbf}
   (2) Connect the connector for air/fuel ratio sensor and the 2 clamps.
2. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
3. Exhaust gas leakage check (Refer to IE - 46)

## Unit inspection



1. Inspection of air/fuel ratio sensor
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F} | 1.98 to 2.64Ω |
| 1 - 4 | Always | 10 k Ωor more |

Captions in illustration

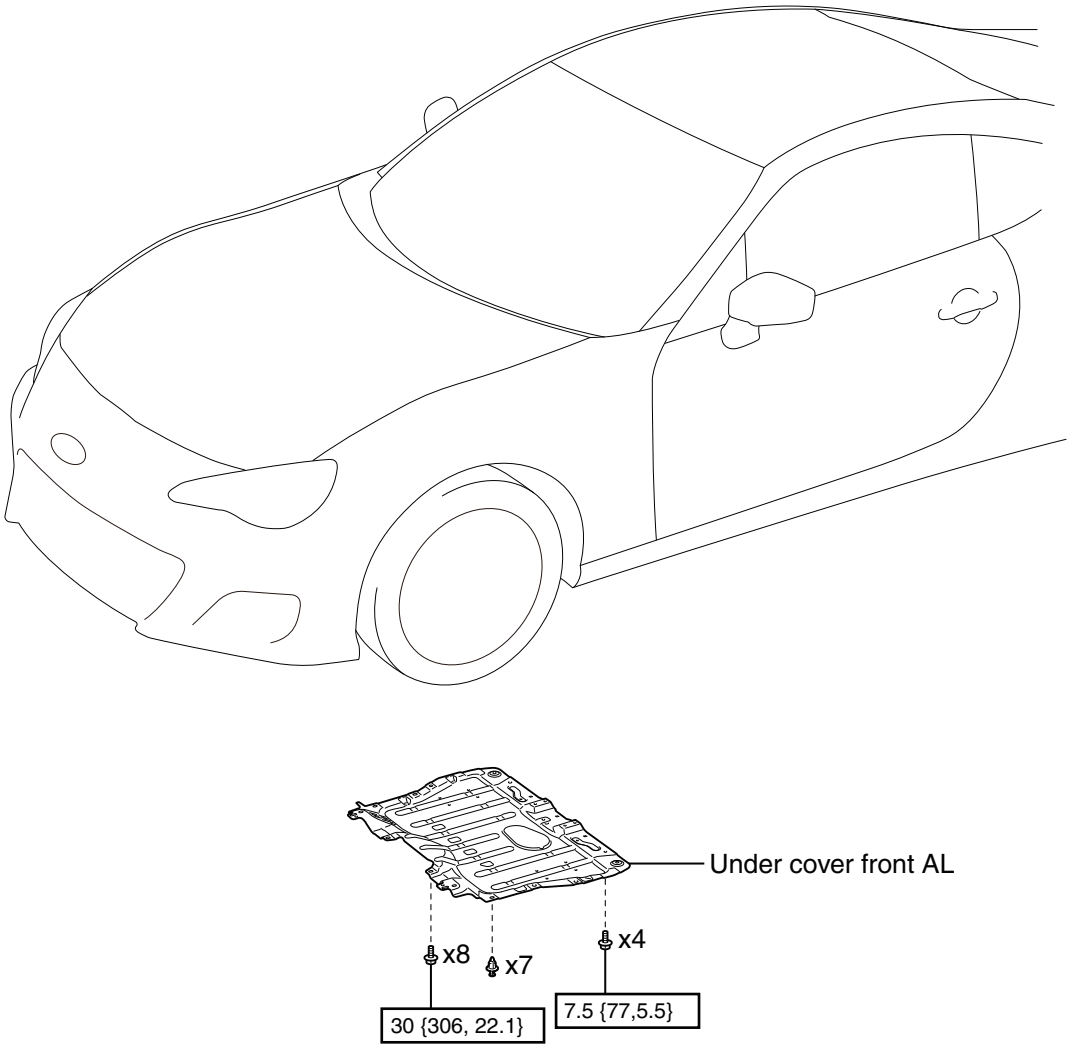
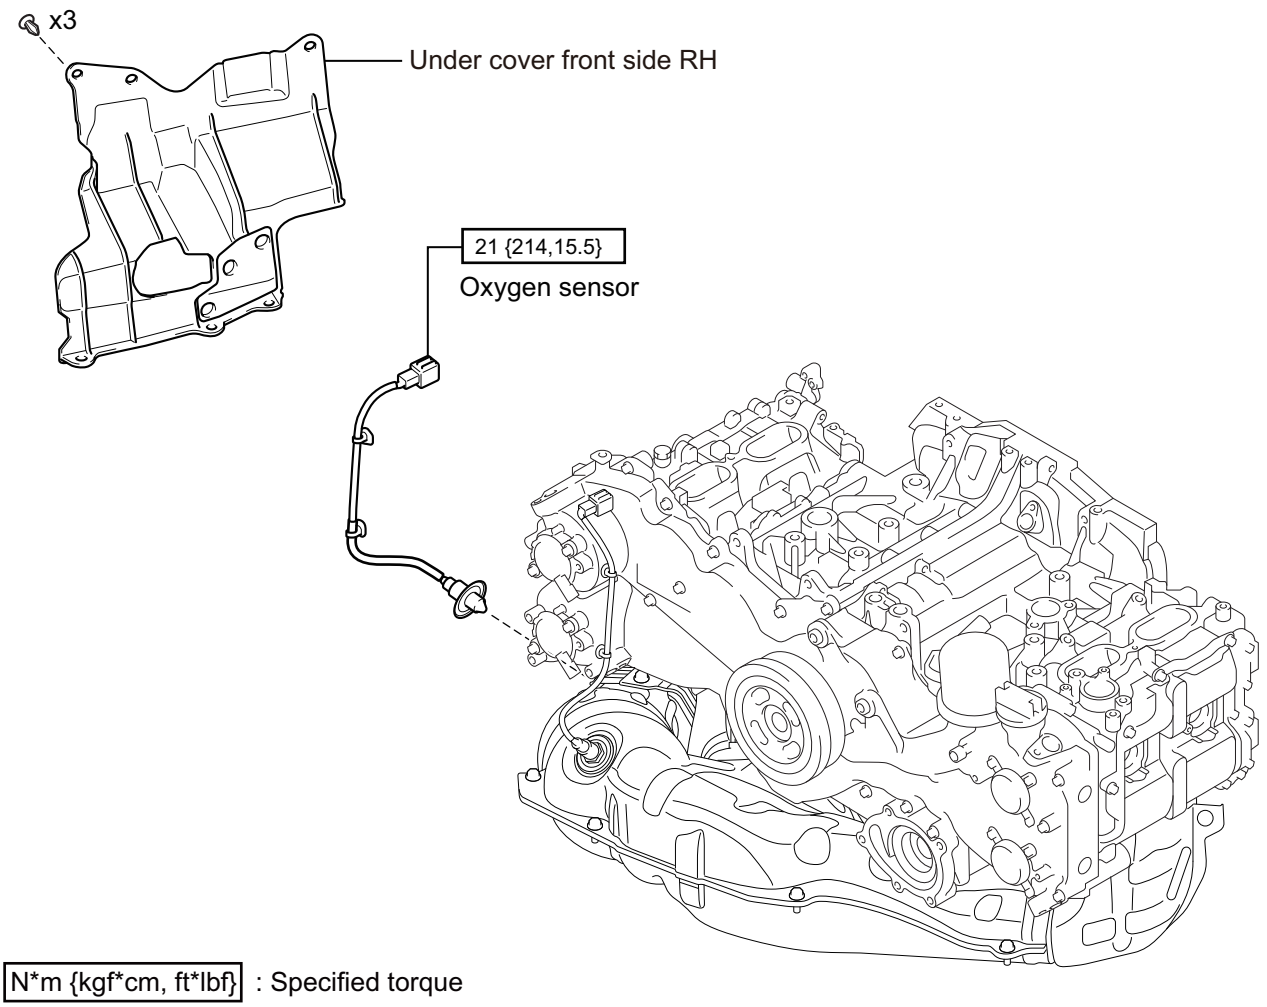
# Oxygen sensor (FA20)

## Exploded view



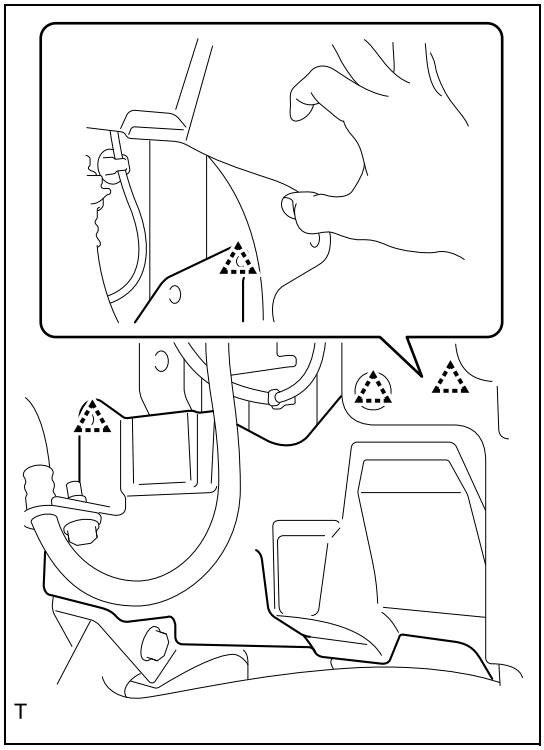
N•m {kgf•cm, ft•lbf}: Tightening torque

FU-07971

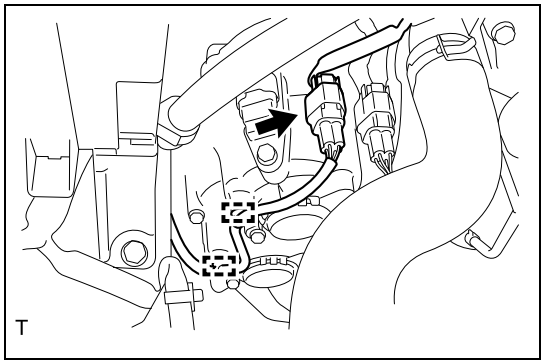


## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Removal of front tire RH
3. Removal of under cover front AL (Refer to IE - 39)



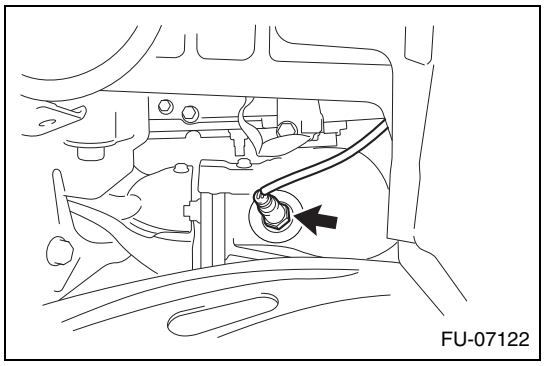
4. Disconnection of under cover front side RH
   (1) Remove 3 clips, and disconnect the under cover front side RH.



5. Removal of oxygen sensor
   (1) Disconnect the connector for oxygen sensor and the 2 clamps.

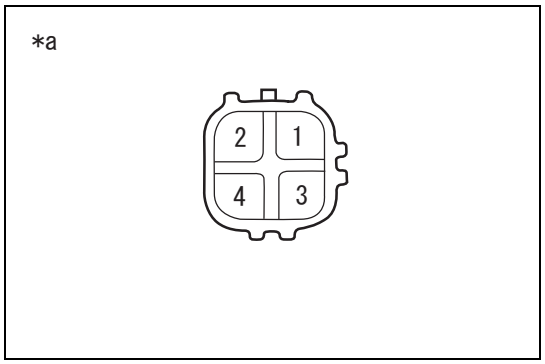
   (2) Remove the oxygen sensor from the exhaust manifold.

## Installation



1. Installation of oxygen sensor
   (1) Install the oxygen sensor to the exhaust manifold.
   Standard value:T=21N·m {214kgf·cm} {15.5ft·lbf}
   (2) Connect the connector for oxygen sensor and the 2 clamps.
2. Exhaust gas leakage check (Refer to IE - 46)
3. Installation of under cover front side RH
   (1) Using 3 clips, install the under cover front side RH.
4. Under cover front AL installation (Refer to IE - 46)
5. Installation of front tire RH (Refer to FB - 21)
6. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## Unit inspection



1. Inspection of oxygen sensor
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F} | 5.0 to 6.4Ω |
| 1 - 4 | Always | 10 k Ωor more |

Captions in illustration

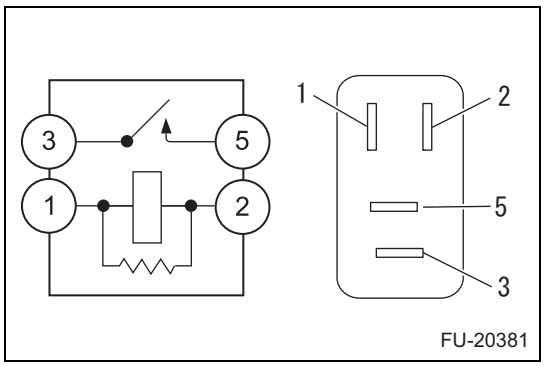
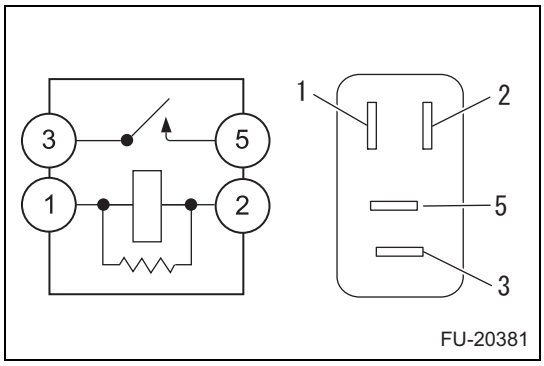
# Relay

## Unit inspection



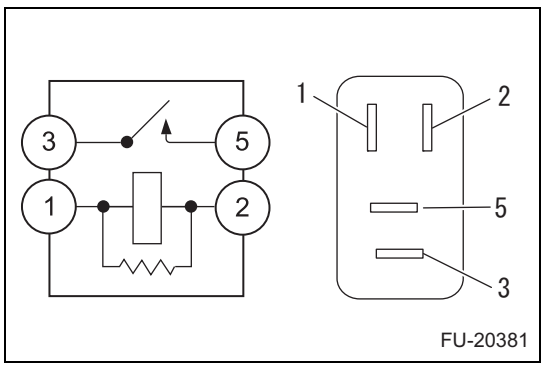
1. Inspection of IG2 relay (IG2)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



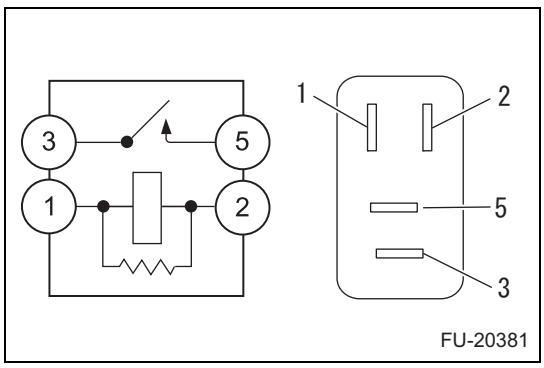
2. Inspection of EFI relay (EFI MAIN1)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



3. Inspection of EFI relay (EFI MAIN2)
   (1) Measure the resistance between the terminals.
   Resistance

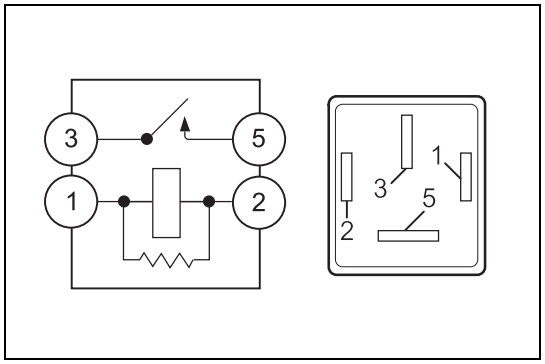
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



4. Inspection of EFI relay (EFI MAIN3)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |

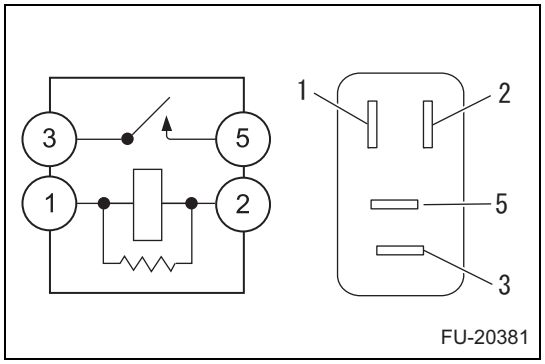
ES



ES

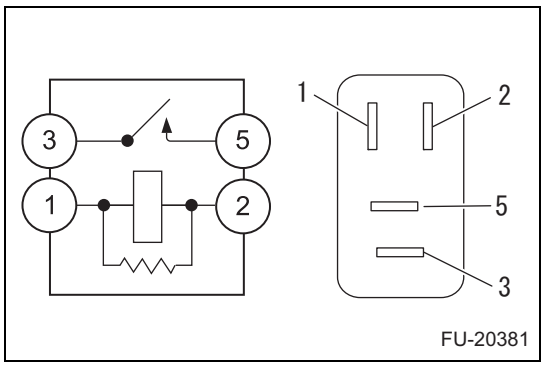
5. Inspection of INJ relay (INJ)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



6. Inspection of ETCS relay (ETCS)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



7. Inspection of F/PMP relay (C/OPEN)
   (1) Measure the resistance between the terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |

# Engine (FA20)

## Function inspection

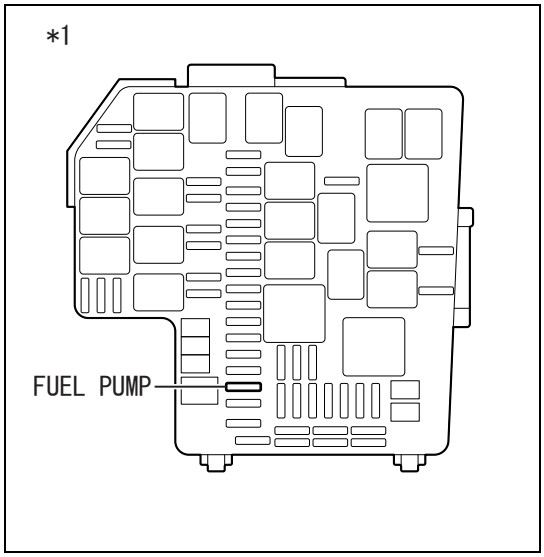
1. Coolant (SUBARU Super Coolant) check (Refer to CO - 2)
2. Engine oil check (Refer to LU - 2)
3. Battery check (Refer to BH - 3)
4. Check of air cleaner filter element SUB-ASSY
   (1) Inspect the air cleaner filter element SUB-ASSY for dirt or clogging.
5. V-ribbed belt tensioner ASSY check
   (1) Remove the V-belt from the belt tensioner pulley.
   (2) Move the V-ribbed belt tensioner ASSY in the both rotational directions to check whether it is caught.
   NOTE:
   Replace the V-ribbed belt tensioner ASSY if faulty.
   (3) Install the V-belt.
6. Ignition timing inspection
   (1) Warm up the engine and stop.
   (2) Connect the SSM4 to the DLC.
   (3) Start the engine.
   (4) Use SSM4 to read the ignition timing. (Refer to ES - 43)
   Standard value: 2 to 22°CA BTDC
   CAUTION:
   Perform this measurement with all accessory switches OFF, A/C OFF, electric fan OFF and shift position N or P.
   (5) Check that the ignition timing advances promptly when the engine speed is increased.
7. Idle speed check
   (1) Warm up the engine and stop.
   (2) Connect the SSM4 to the DLC.
   (3) Start the engine.
   (4) Read the engine speed using the SSM4. (Refer to ES - 43)

Standard value

| Transmission | Idle speed |
|---|---|
| A/T | 600 to 800 r/min |
| M/T | 550 to 750 r/min |

CAUTION:
Perform this measurement with all accessory switches OFF, A/C OFF, electric fan OFF and shift position N or P.

8. Compression inspection
   (1) Check the diagnosis code (Refer to ES - 28).
   (2) Remove the relay block cover UPR.

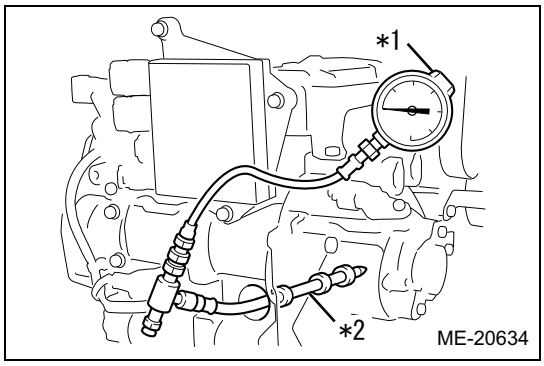


(3) Remove the fuel pump fuse from the engine compartment relay block.

Captions in illustration

| | |
|---|---|
| *1 | Engine compartment relay block |

(4) Start the engine.
(5) Turn the ignition to OFF after the engine stalls by itself.
(6) Crank the engine once and check that it does not start.
(7) Remove the four spark plugs. (Refer to ES - 691)



(8) Set the compression gauge and compression gauge attachment.

Captions in illustration

| | |
|---|---|
| *1 | Compression gauge |
| *2 | Compression gauge attachment |

(9) Install the injector driver. (Refer to FU - 44)
(10) Fully open the accelerator pedal.
(11) With the brake pedal depressed, crank the engine and measure the compression of each cylinder.
Compression: 1150 to 1750 kPa {11.7 to 17.8 kgf/cm$^2$} {167 to 254 psi}
Difference between cylinders: 200 kPa {2.0 kgf/cm$^2$} {29 psi}
CAUTION:
- Perform compression inspection in a short period of time.
- Use a fully charged battery to keep the engine speed at 250 r/min or more.

NOTE:
When the compression pressure is low, pour a small amount of engine oil into cylinders and measure the compression again.
- When the compression increases, it is possible that the piston rings etc. are worn.
- When the compression does not change, it is possible that the valve system is faulty.

(12) Remove the injector driver. (Refer to FU - 43)
(13) Install the four spark plugs. (Refer to ES - 696)
(14) Install the fuel pump fuse.
(15) Install the relay block cover UPR.
(16) Clear the diagnosis code (Refer to ES - 28).
CAUTION:
Be sure to clear the memory of diagnosis code once and then check that no DTCs are output.

9. CO, HC concentration inspection
NOTE:
This check is for determining whether or not the idle CO/HC complies with regulations.

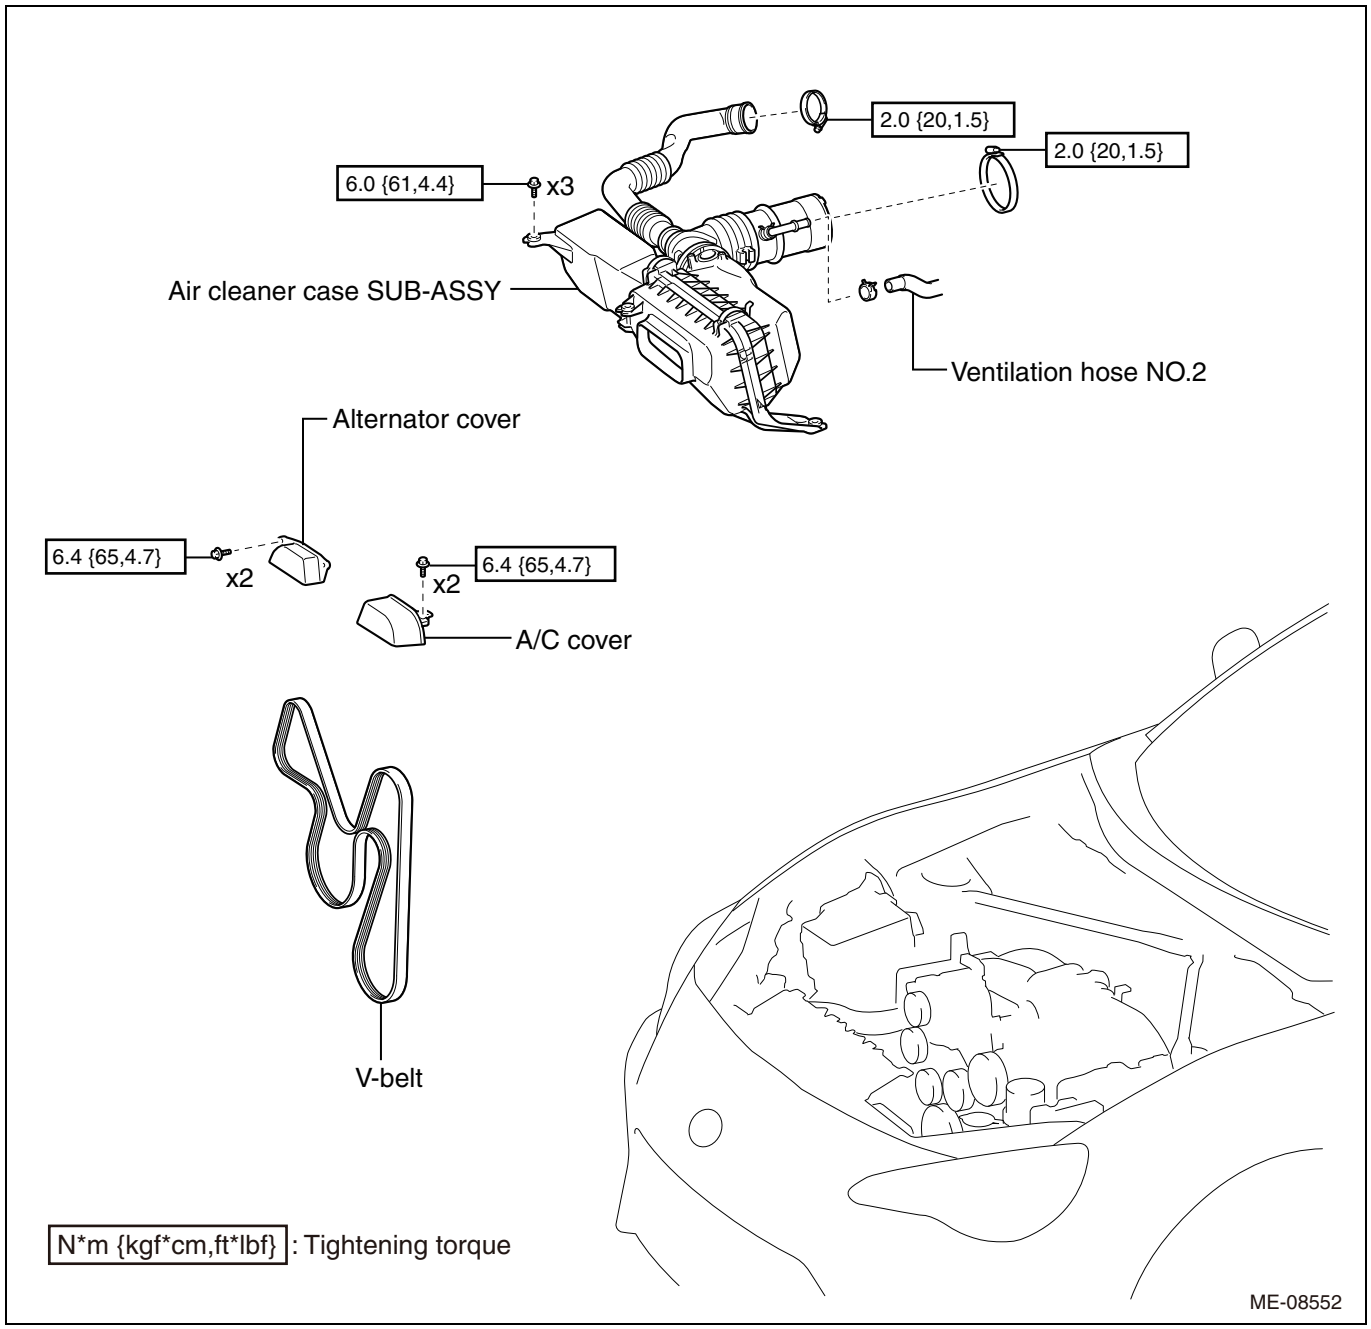
(1) Start the engine.
(2) Maintain the engine speed at 2500 r/min for approximately 180 seconds.
(3) Insert a CO/HC meter testing probe at least 40 cm {15.7 in} into the tailpipe during idling.
(4) Immediately check the CO/HC concentration at idle and/or 2500 r/min.
NOTE:
- When performing the 2 mode (2500 r/min and idle) test, follow the measurement order prescribed by the applicable local regulations.
- If the CO/HC concentration does not comply with regulations, troubleshoot in the order given below.

(a)Check the A/F sensor (See page ES - 712) and heated oxygen sensor (See page ES - 716) operation.
(b)Refer to the table below for the possible cause, and then inspect and correct the applicable causes if necessary.

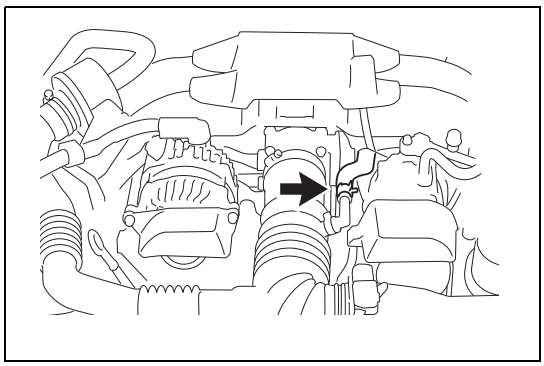
| CO | HC | Trouble | Probable cause |
|---|---|---|---|
| Normal | High | Rough idling | 1. Weak ignition<br>– Defective timing<br>– Faulty plug gap<br>2. Intake/exhaust leakage<br>3. Cylinder compression leakage |
| Low | High | Rough idling (HC unstable) | 1. Vacuum leakage<br>– PCV hose<br>– Intake manifold<br>– Throttle body<br>2. Misfire due to lean fuel mixture |
| High | High | Rough idling (black smoke) | 1. Clogged air cleaner element<br>2. Clogged PCV valve<br>3. Faulty EFI system<br>– Faulty pressure regulator<br>– Faulty engine coolant sensor<br>– Faulty air flow meter<br>– Faulty ECM<br>– Faulty injector<br>– Faulty throttle position sensor |

# V-belt (FA20)

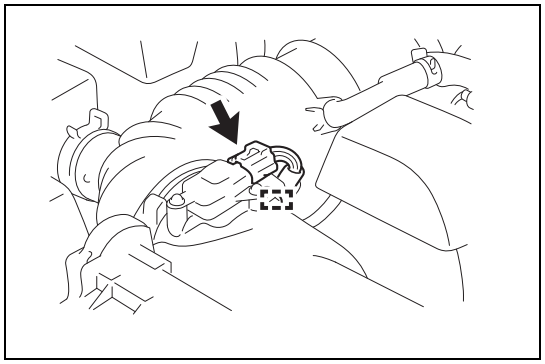
## Exploded view



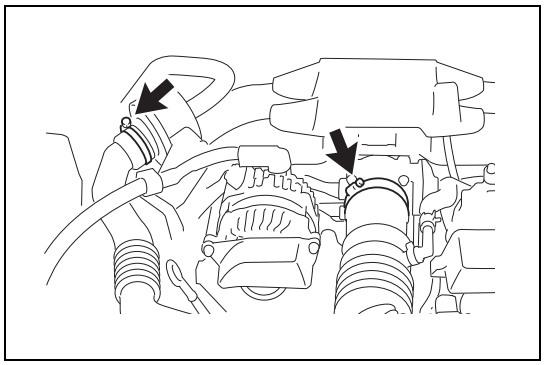
## Removal



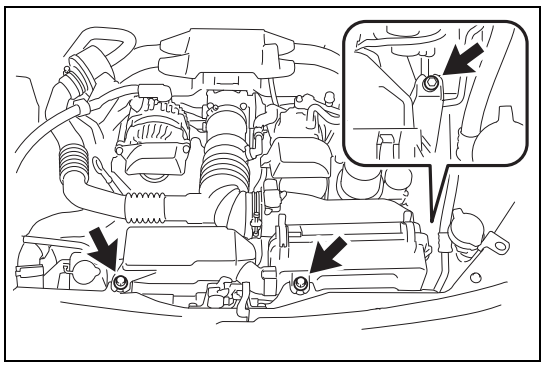
1. Air cleaner case SUB-ASSY removal
   (1) Move the hose clip and disconnect the ventilation hose NO. 2.



(2) Disconnect the connector from the intake air flow meter SUB-ASSY.
(3) Release the clamp and disconnect the wiring harness from the air cleaner cap.

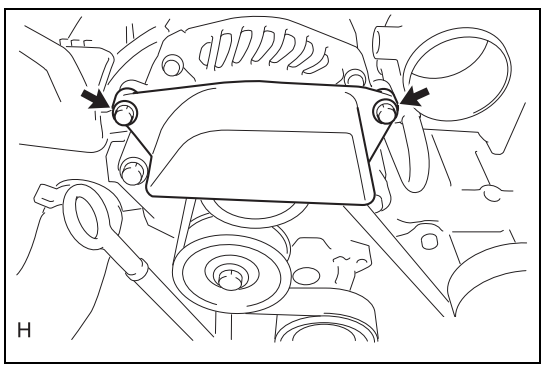


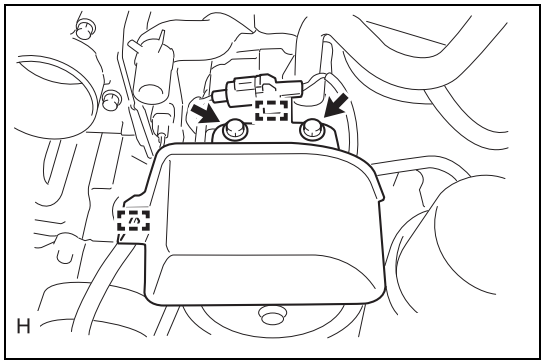
(4) Loosen the two hose clamps and remove the air cleaner duct and air intake boot.



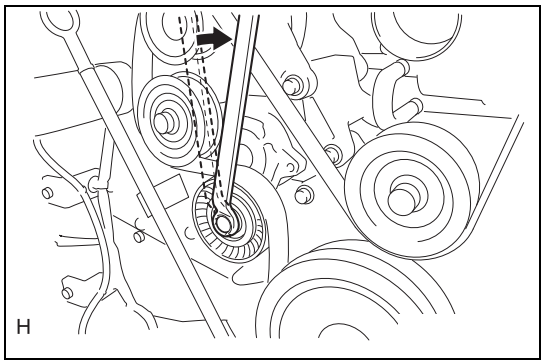
(5) Remove the three bolts and remove the air cleaner case SUB-ASSY.

2. Generator cover removal
(1) Remove the two bolts and remove the generator cover.





3. Removal of A/C cover
   (1) Release the two clamps and disconnect the wiring harness.
   (2) Remove the two bolts and remove the A/C cover.



4. V-belt removal
   (1) Attach the tool to the pulley set bolt of belt tensioner and release the tension by rotating the belt tensioner clockwise to remove the V-belt.

EM

## Installation

1. V-belt installation

   NOTE:

   When reusing the V-belt, check the rib and back side of its entire perimeter for wear or crack, and replace it if the wear or crack reaches its core (at one or more locations) or the rib rubber is chipped (at one or more locations).

   (1) Route the V-belt around the pulleys as shown in the figure.

Captions in illustration

| | |
|---|---|
| *1 | Idler pulley |
| *2 | Generator |
| *3 | V-ribbed belt tensioner ASSY |
| *4 | Water pump |
| *5 | Crankshaft |
| *6 | A/C compressor |

   CAUTION:

   The back side of the V-belt should face to the belt tensioner and the idler pulleys.

   (2) Attach the tool to the pulley set bolt of belt tensioner and turn the belt tensioner clockwise.

   (3) Make sure that the V-belt is properly set on each pulley.

Captions in illustration

| | |
|---|---|
| *a | OK |
| *b | NG |

2. Installation of A/C cover
   (1) Install the A/C cover with the two bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}

(2) Engage the two clamps and connect the wiring harness.

3. Generator cover installation
   (1) Install the generator cover with the two bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}

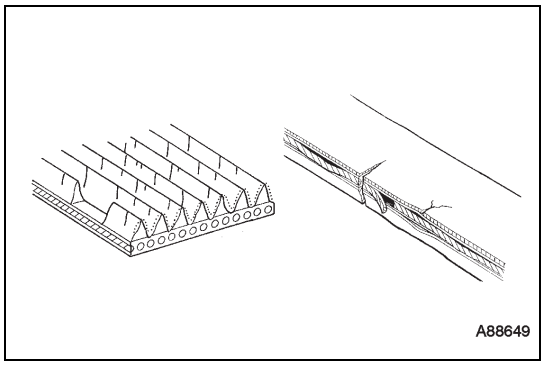
4. Air cleaner case SUB-ASSY installation
   (1) Install the air cleaner case SUB-ASSY with the three bolts.
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
   (2) Install the air cleaner duct and air cleaner intake boot with the two hose clamps.
   Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}
   (3) Engage the clamp and install the wiring harness to the air cleaner cap.
   (4) Connect the connector to the intake air flow meter SUB-ASSY.
   (5) Connect the ventilation hose NO. 2 with the hose clip.

EM

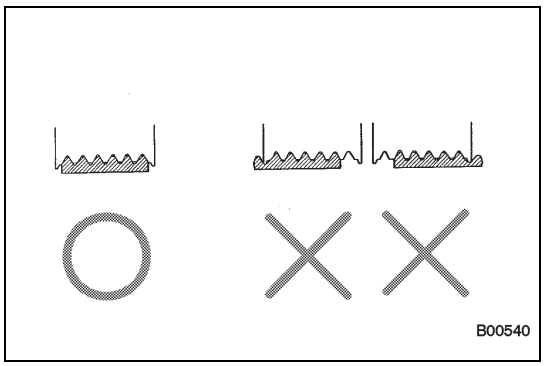
5. V-belt check
   (1) Start the engine and check that the V-belt is rotating smoothly without abnormal noise.

## On-vehicle inspection

1. V-belt check
   NOTE:
   Check the belt when reusing it.



(1) Check the V-belt for wear or cracks.
   NOTE:
   - Replace the belt if it is cracked.
   - Replace the belt if it is worn until its core is exposed.
   - Replace the belt if its rib rubber is chipped.



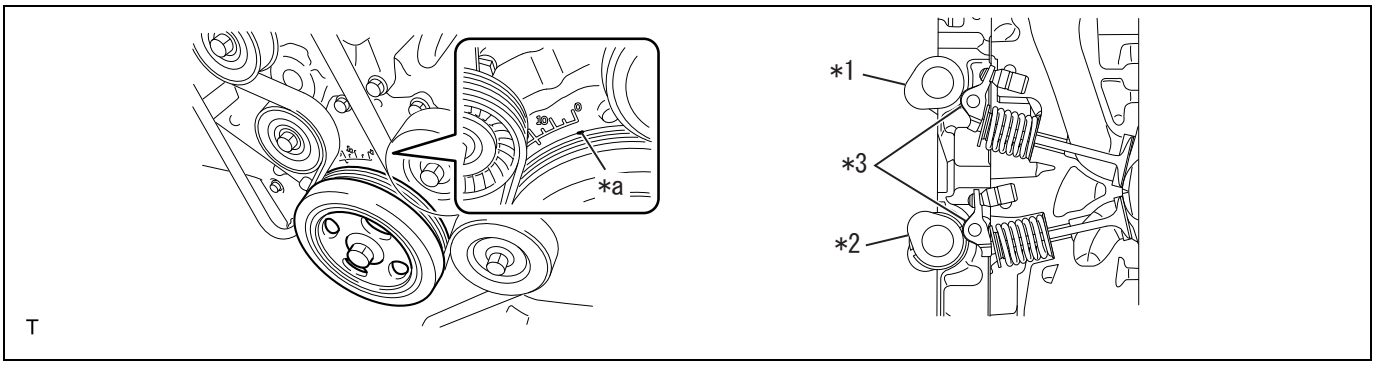
(2) Check that the V-belt fits securely in the rib grooves.
   NOTE:
   - Visually and manually check that the V-belt is properly located on the rib grooves at the lower side of the pulleys.
   - If the V-belt is not located properly, replace with a new part.

2. V-ribbed belt tensioner ASSY check
   (1) Stop the engine from idling speed and check that the V-belt does not protrude from the width of belt tensioner pulley.
   (2) Move the belt tensioner in the both rotational directions to check whether it is caught.
   NOTE:
   Replace the V-ribbed belt tensioner ASSY if faulty.

# Cam clearance (FA20)

## Adjustment

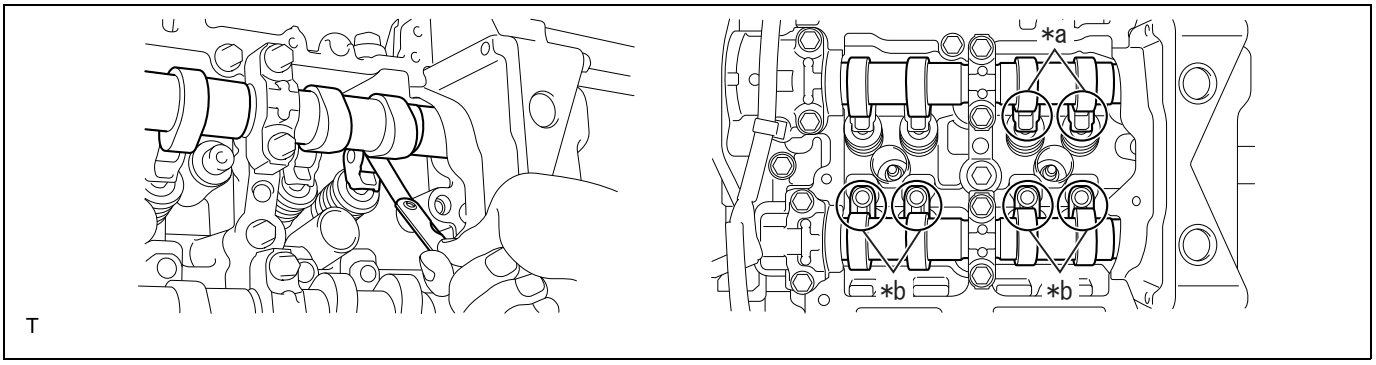
1. Removal of ignition coil ASSY (Refer to ES - 695)
2. Removal of intake manifold protector (bank 1 side) (Refer to FU - 22)
3. Injector driver bracket removal (Refer to EM - 91)
4. Removal of rocker cover RH (Refer to EM - 91)
5. Rocker cover LH removal (Refer to EM - 93)
6. Inspection of cam clearance
   (1) Turn the crankshaft clockwise to set the No. 1 cylinder to the top dead center of compression stroke and align the timing mark (cutout) to 0° position of the chain cover.



Captions in illustration

| | | | |
|---|---|---|---|
| *1 | Intake camshaft | *2 | Exhaust camshaft |
| *3 | Roller rocker arm | - | - |
| *a | Timing mark | - | - |

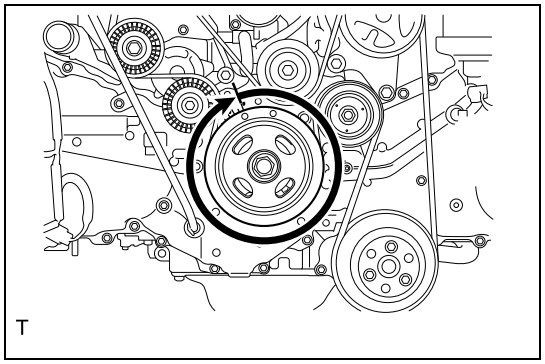
   (2) At this time, make sure that the intake camshaft and exhaust camshaft do not push down the intake side roller rocker arm (intake valve) and exhaust side roller rocker arm (exhaust valve) of NO. 1 cylinder.
   NOTE:
   If the roller rocker arm (valve) is depressed, turning the crankshaft by 360° makes the piston of NO. 1 cylinder at TDC of compression stroke.
   (3) Measure the cam clearance at the positions shown in the figure (#1 intake and exhaust, #3 exhaust).



Captions in illustration

| | | | |
|---|---|---|---|
| *a | Intake side | *b | Exhaust side |

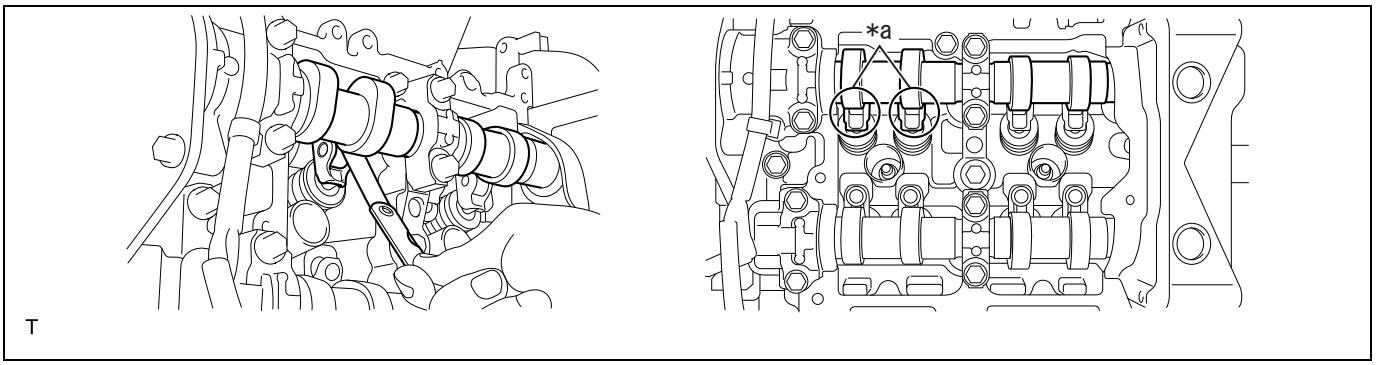
   (4) Measure the roller surface of cam base circle and roller rocker arm using a thickness gauge.
   Standard value (when engine is cold): 0.10 to 0.15 mm {0.0039 to 0.0059 in} (Intake side)
   0.20 to 0.24 mm {0.0079 to 0.0094 in} (Exhaust side)



(5) Turn the crankshaft pulley by 360° clockwise.

EM

(6) Measure the cam clearance at the position shown in the figure (#3 intake).

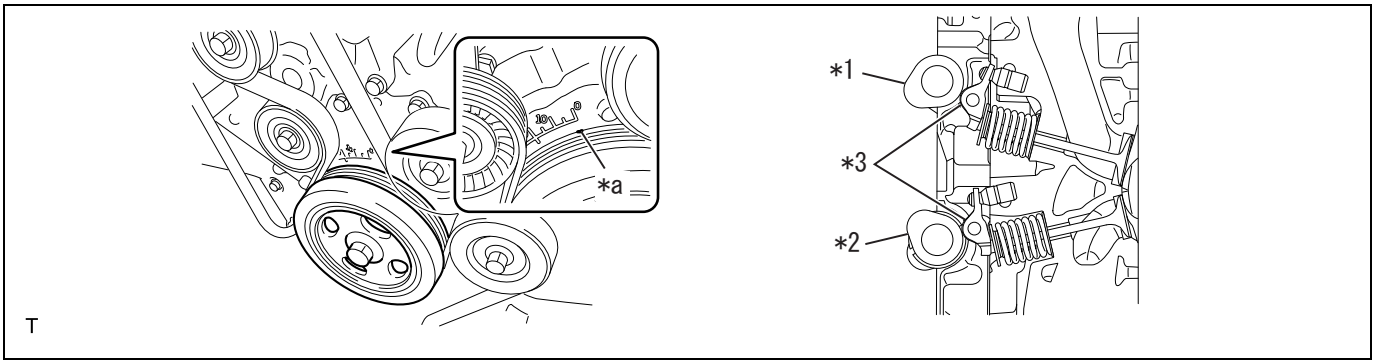


Captions in illustration

| | | | |
|---|---|---|---|
| *a | Intake side | - | - |

(7) Measure the roller surface of cam base circle and roller rocker arm using a thickness gauge.
Standard value (when engine is cold): 0.10 to 0.15 mm {0.0039 to 0.0059 in} (Intake side)

(8) Turn the crankshaft clockwise to set the No. 2 cylinder to the top dead center of compression stroke and align the timing mark (cutout) to 0° position of the chain cover.

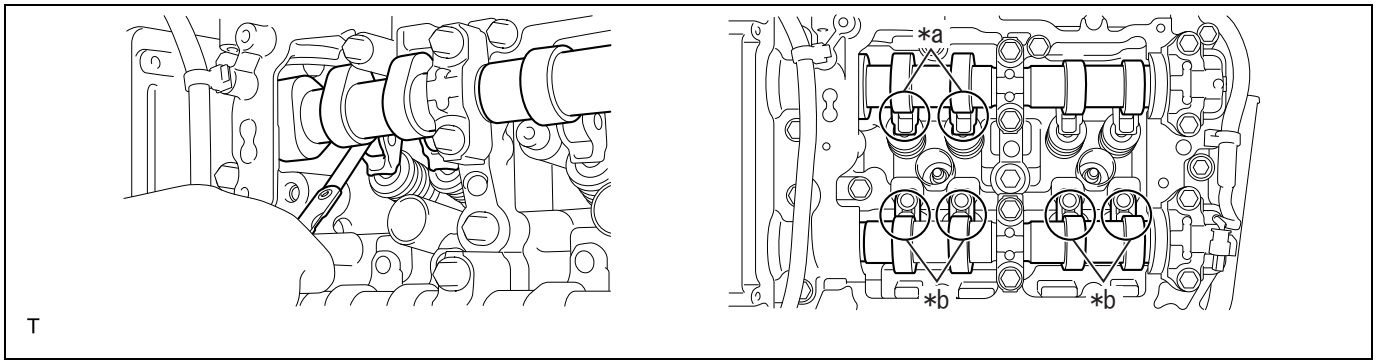


Captions in illustration

| | | | |
|---|---|---|---|
| *1 | Intake camshaft | *2 | Exhaust camshaft |
| *3 | Roller rocker arm | - | - |
| *a | Timing mark | - | - |

(9) At this time, make sure that the intake camshaft and exhaust camshaft do not push down the intake side roller rocker arm (intake valve) and exhaust side roller rocker arm (exhaust valve) of NO. 2 cylinder.
NOTE:
If the roller rocker arm (valve) is depressed, turning the crankshaft by 360° makes the piston of NO. 2 cylinder at TDC of compression stroke.

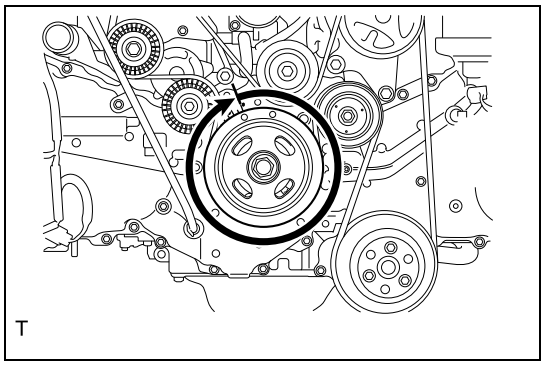
(10) Measure the cam clearance at the positions shown in the figure (#2 intake and exhaust, #4 exhaust).



Captions in illustration

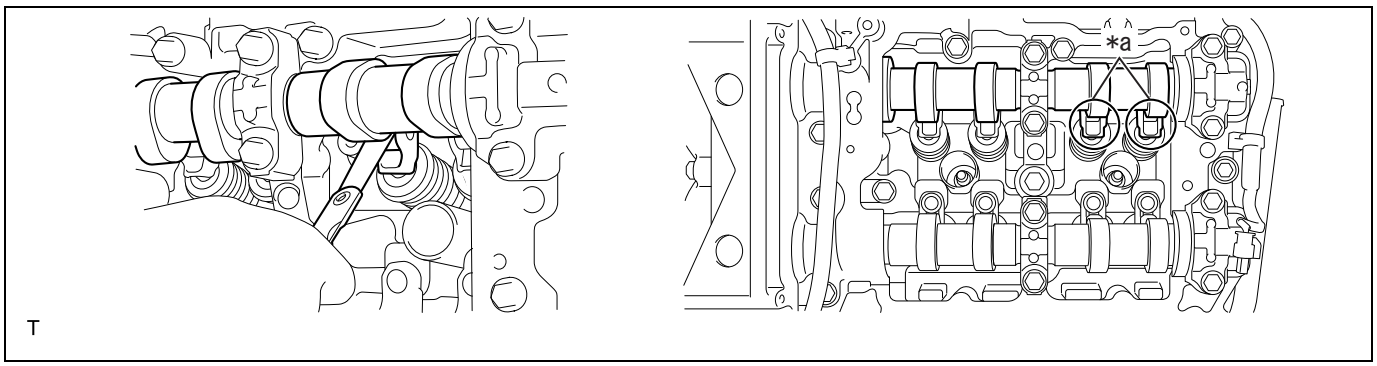
| | | | |
|---|---|---|---|
| *a | Intake side | *b | Exhaust side |

(11) Measure the roller surface of cam base circle and roller rocker arm using a thickness gauge.
Standard value (when engine is cold): 0.10 to 0.15 mm {0.0039 to 0.0059 in} (Intake side)
0.20 to 0.24 mm {0.0079 to 0.0094 in} (Exhaust side)



(12) Turn the crankshaft pulley by 360° clockwise.

(13) Measure the cam clearance at the position shown in the figure (#4 intake).

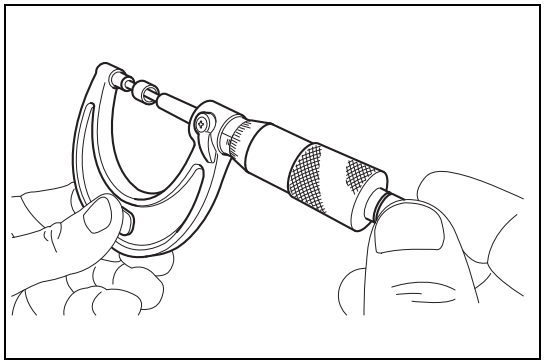


Captions in illustration

| | | | |
|---|---|---|---|
| *a | Intake side | - | - |

(14) Measure the roller surface of cam base circle and roller rocker arm using a thickness gauge.
Standard value (when engine is cold): 0.10 to 0.15 mm {0.0039 to 0.0059 in} (Intake side)

7. Cam clearance adjustment
   (1) Remove the cam carrier. (Refer to EM - 75)
   (2) Remove the valve shim.



(3) Measure the thickness of removed valve shim using a micrometer.

EM

(4) Calculate the thickness of valve shim so that the cam clearance is within the standard value.
Standard value: Intake side: (Selected shim thickness) = (Removed shim thickness) + [(Measured clearance) - 0.13 mm {0.0051 in}] ×1.69
Exhaust side: (Selected shim thickness) = (Removed shim thickness) + [(Measured clearance) - 0.22 mm {0.0087 in}] ×1.87

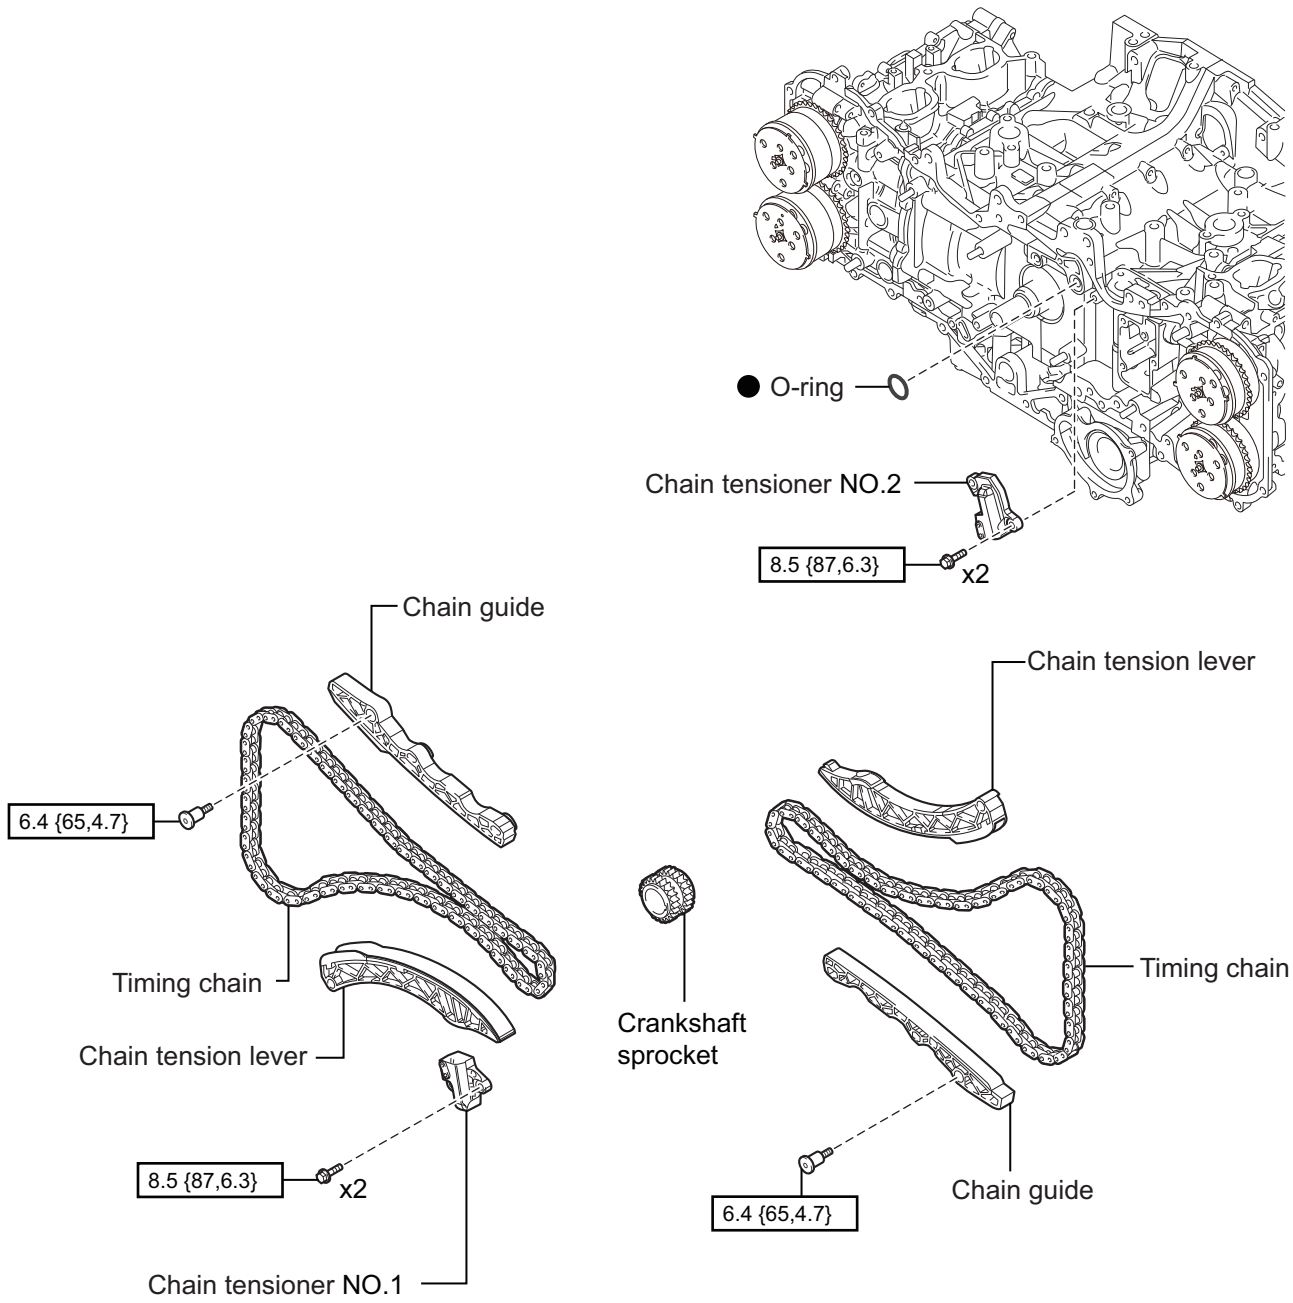
(5) Apply new engine oil to the inner circumference of selected valve shim and install it to the valve.
CAUTION:
After inserting the valve shim, make sure that it turns smoothly.

(6) Install the cam carrier. (Refer to EM - 96)

8. Rocker cover LH installation (Refer to EM - 101)
9. Installation of rocker cover RH (Refer to EM - 105)
10. Injector driver bracket installation (Refer to EM - 106)
11. Installation of intake manifold protector (bank 1 side) (Refer to FU - 28)
12. Installation of ignition coil ASSY (Refer to ES - 696)

# Timing chain (FA20)

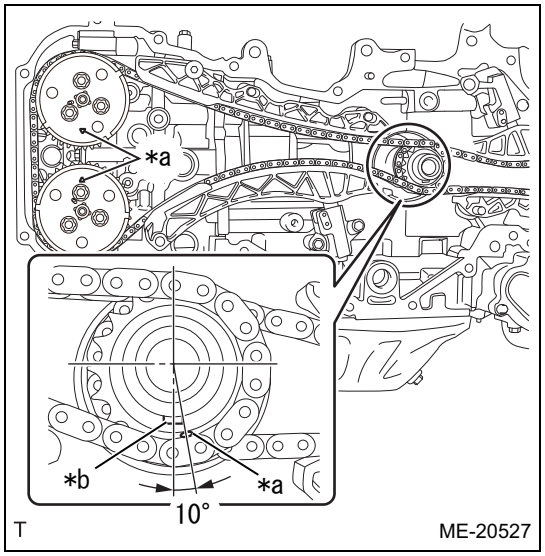
## Exploded view



## Removal

1. Chain cover removal (Refer to LU - 16)

2. Timing chain removal (bank 1 side)
   (1) Attach the SST to the crankshaft.
   SST 18252AA000

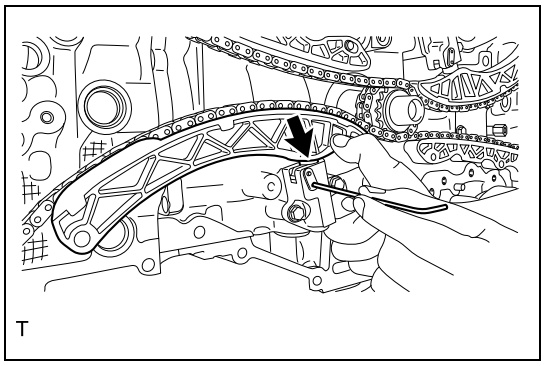


(2) Turn the crankshaft using the SST to align the alignment marks of crankshaft sprocket, intake cam sprocket RH and exhaust cam sprocket RH.

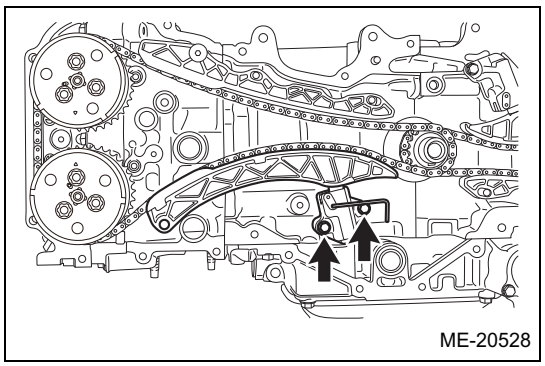
Captions in illustration

| | |
|---|---|
| *a | Alignment marks |
| *b | Key |

NOTE:
At this time, the crankshaft sprocket key faces downward.

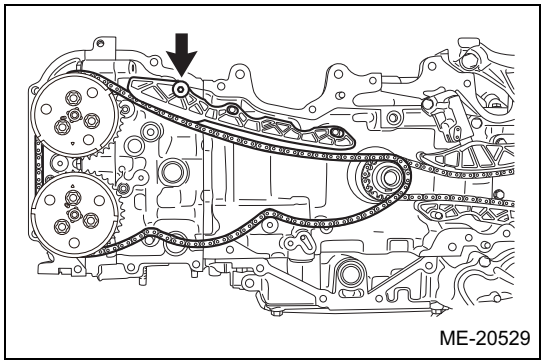


(3) Push down the chain tension lever as shown in the figure and secure the plunger by inserting a 2.5 mm dia. hex wrench into the holes of chain tensioner No. 1 and stopper plate.



(4) Remove the two bolts and chain tensioner No.1.

(5) Remove the chain tension lever.



ME-20529

(6) Remove the bolt, and remove the chain guide.

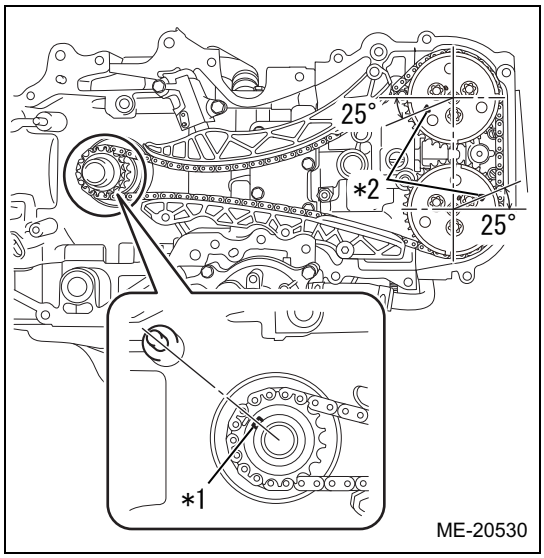
(7) Remove the timing chain.

CAUTION:

When the timing chain is removed, the valve heads contact each other and the valve stems may bend. Do not turn the intake camshaft RH and exhaust camshaft RH to the outside of the range of zero-lift (in range where they can be turned lightly by hand).

NOTE:

The removed parts must be organized by installation location.



ME-20530

3. Timing chain removal (bank 2 side)

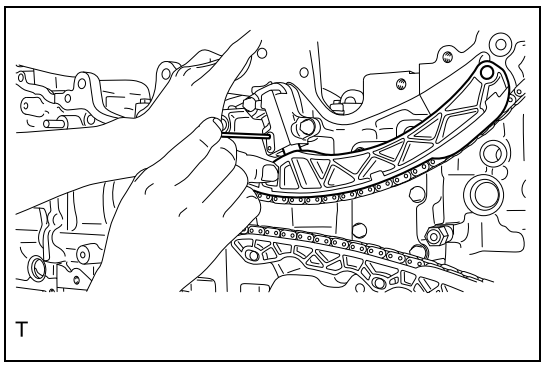
(1) Attach the SST to the crankshaft.

SST 18252AA000

(2) Turn the crankshaft using the SST to align the alignment marks of crankshaft sprocket, intake cam sprocket LH and exhaust cam sprocket LH.

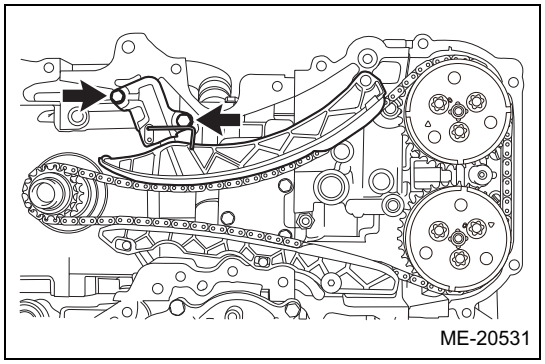
Captions in illustration

| | |
|---|---|
| *1 | Key |
| *2 | Alignment marks |



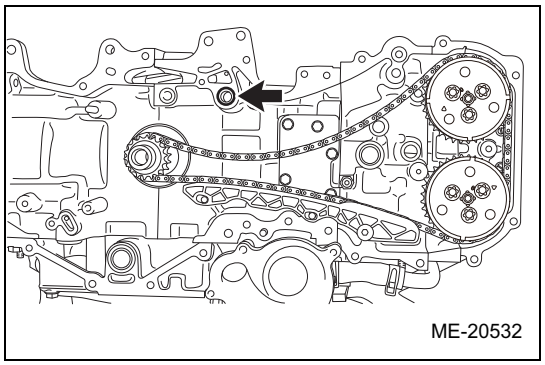
T

(3) Push up the chain tension lever as shown in the figure and secure the plunger by inserting a wire (with a diameter of approx. 1.3mm {0.05 in}) into the holes of chain tensioner No.2 and stopper plate.



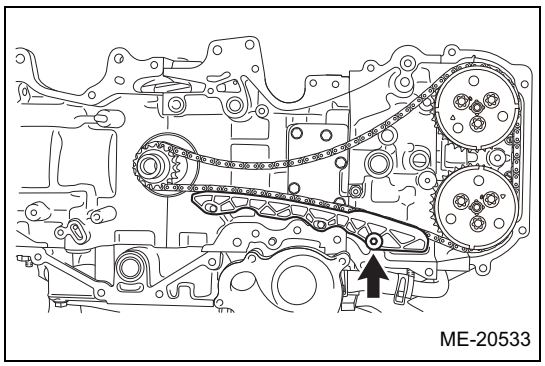
ME-20531

(4) Remove the two bolts and chain tensioner No.2.
(5) Remove the chain tension lever.



ME-20532

(6) Remove the O-ring from the cylinder block (bank 2 side).



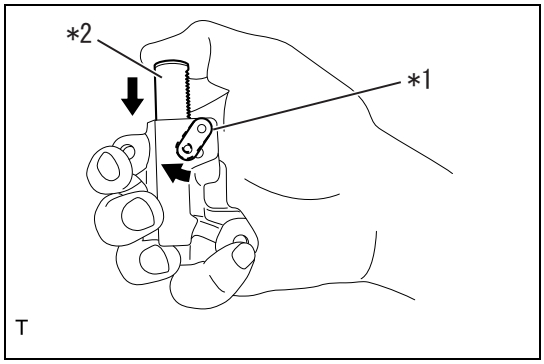
ME-20533

(7) Remove the bolt, and remove the chain guide.
(8) Remove the timing chain.
CAUTION:
- When the timing chain is removed, the valve heads contact each other and the valve stems may bend. Do not turn the exhaust camshaft LH to the outside of the range of zero-lift (in range where they can be turned lightly by hand).
- At this time, the No. 4 piston is located near the TDC of compression stroke. If the intake camshaft LH is turned, the valve and the piston may contact and valve stem may bend. Do not turn the intake camshaft LH.

NOTE:
The removed parts must be organized by installation location.
(9) Remove the SST from the crankshaft.

## Installation

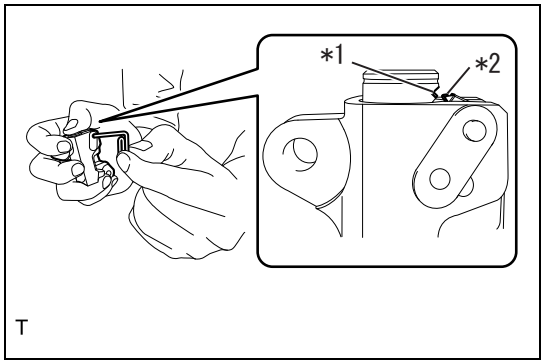
1. Installation of timing chain (bank 2 side)
CAUTION:
Be careful that the foreign matter is not into or onto the assembled component during installation.
NOTE:
Apply new engine oil to all component parts of the timing chain.
(1) Attach the SST to the crankshaft.
SST 18252AA000



(2) Move the link plate in the direction of the arrow and press in the plunger.

Captions in illustration

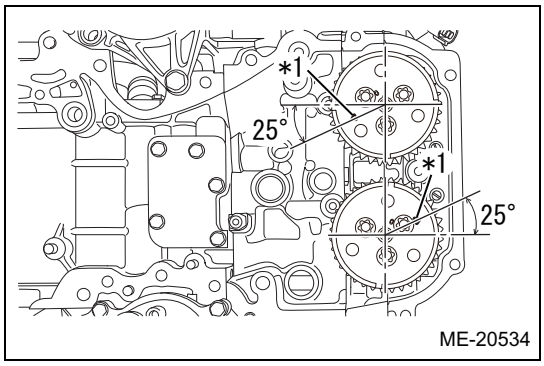
| | |
|---|---|
| *1 | Link plate |
| *2 | Plunger |



(3) Insert a wire (with a diameter of approx. 1.3mm {0.05 in}) into the stopper pin hole to secure the plunger.
NOTE:
If the stopper pin hole on the link plate and the stopper pin hole on the chain tensioner are not aligned, check that the first notch of plunger rack is engaged with the stopper tooth. If not engaged, retract the plunger a little so that the first notch of plunger rack is engaged with the stopper tooth.

Captions in illustration

| | |
|---|---|
| *1 | First notch of rack |
| *2 | Stopper tooth |



(4) Align the alignment marks of intake cam sprocket LH and exhaust cam sprocket LH to the positions as shown in the figure.
CAUTION:
- Pay attention when performing the work, since the SST comes off easily.
- To prevent valve damage, turn the intake cam sprocket LH and exhaust cam sprocket LH only within the range of zero-lift (in range where they can be turned lightly by hand).

Captions in illustration

| | |

(a) The mark plate (blue) of timing chain is aligned to the alignment mark position of crankshaft sprocket.
(b) The mark plate (pink) of timing chain is aligned to the timing mark position of intake cam sprocket LH.
(c) The mark (pink) of timing chain is aligned to the timing mark position of exhaust cam sprocket LH.

(14) Pull out the wire from chain tensioner No.2.
NOTE:
Push up the chain tension lever and press in the plunger of chain tensioner No.2 to pull out the wire.

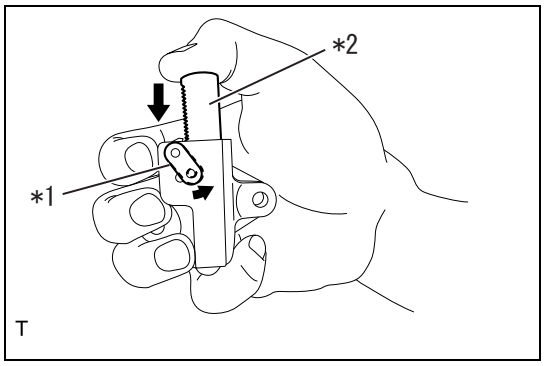
(15) Attach the SST to the crankshaft.
SST 18252AA000

(16) Turn the crankshaft clockwise and make sure that there are no abnormal conditions.
CAUTION:
Always make sure to perform this confirmation.

(17) Remove the SST from the crankshaft.

2. Timing chain installation (bank 1 side)
CAUTION:
Be careful that foreign matter is not into or onto the assembled component during installation.
NOTE:
Apply new engine oil to all component parts of the timing chain.

(1) Attach the SST to the crankshaft.
SST 18252AA000



(2) Move the link plate in the direction of the arrow and press in the plunger.

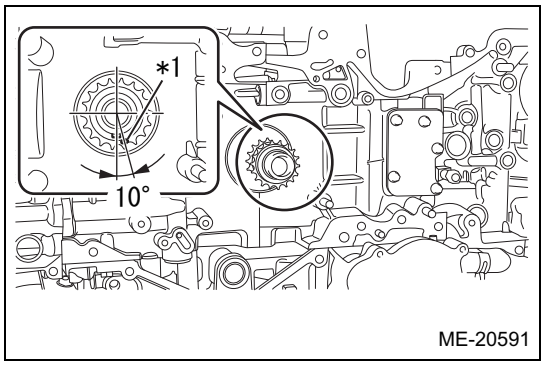
29. Removal of timing chain (bank 2 side) (Refer to EM - 15)

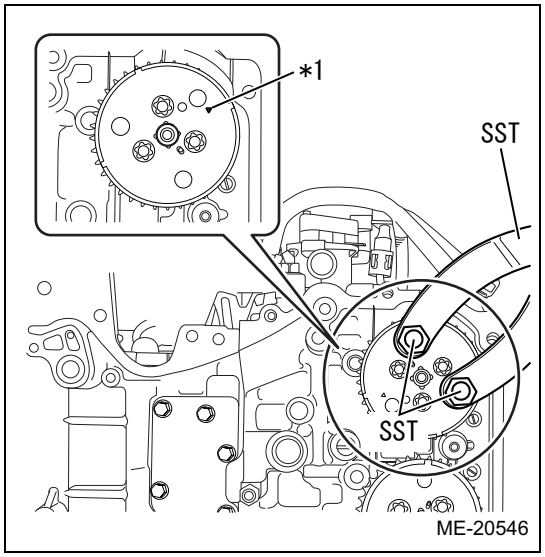


30. Piston and valve damage prevention procedure
    (1) Use the SST to turn the crankshaft approximately 200° clockwise and align the alignment marks of crankshaft sprocket to the position as shown in the figure.
    SST 18252AA000

Captions in illustration

| | |
|---|---|
| *1 | Alignment marks |

CAUTION:
Never turn the crankshaft counterclockwise other than when fine-adjusting the alignment mark position. Otherwise the valve and piston may contact.



(2) Using the SST, turn the intake cam sprocket LH approximately 180° clockwise and align the alignment mark of intake cam sprocket LH to the position (zero-lift position) as shown in the figure.

Captions in illustration

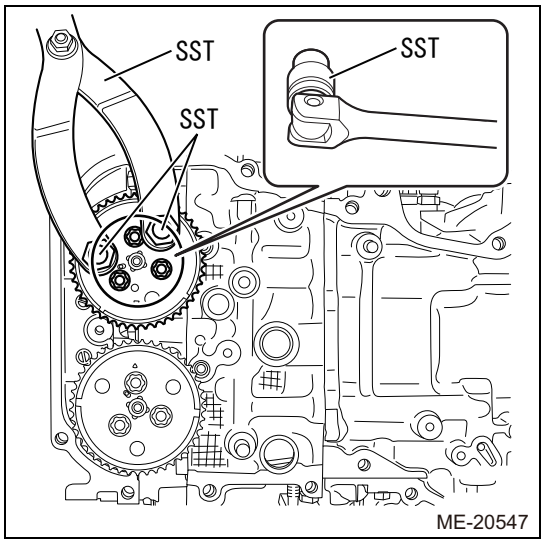
| | |
|---|---|
| *1 | Alignment marks |

SST 18355AA000, 18334AA020

CAUTION:

- Pay attention when performing the work, since the SST comes off easily.
- After this work, when the intake valve and exhaust valve lift at the same time, the valve heads contact each other and valve stems may bend. Do not turn the intake camshaft LH and exhaust camshaft LH to the outside of range of zero-lift (in range where it can be turned lightly by hand).

(3) Remove the SST from the crankshaft.



31. Intake cam sprocket RH removal

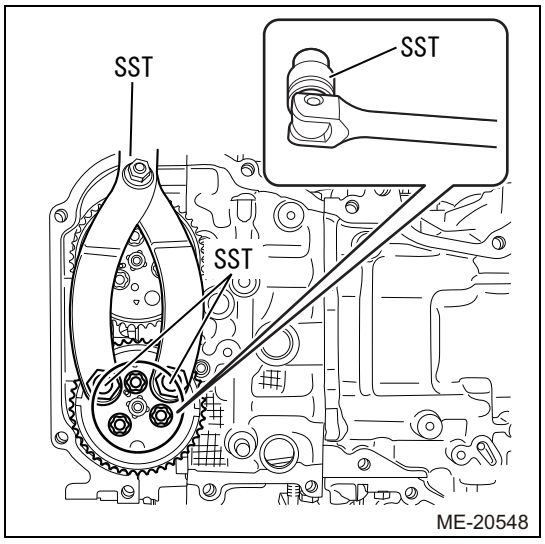
(1) Use the SST to secure the intake cam sprocket RH and remove the three bolts.

SST 18355AA000, 18334AA020, 18270KA010

CAUTION:

Pay attention when performing the work, since the SST comes off easily.

(2) Remove the intake cam sprocket RH.



32. Exhaust cam sprocket RH removal

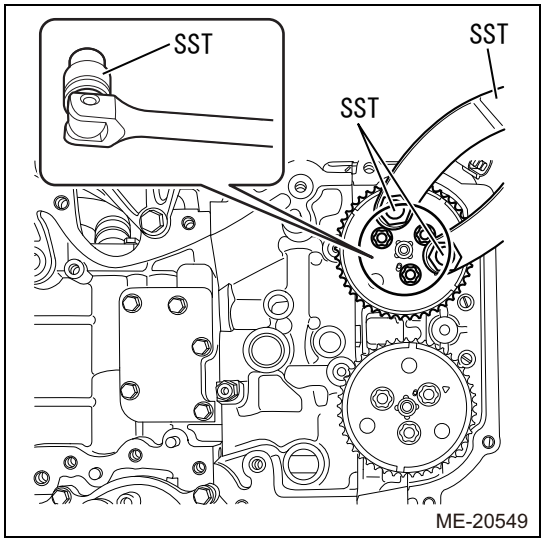
(1) Use the SST to secure the exhaust cam sprocket RH and remove the three bolts.

SST 18355AA000, 18334AA020, 18270KA010

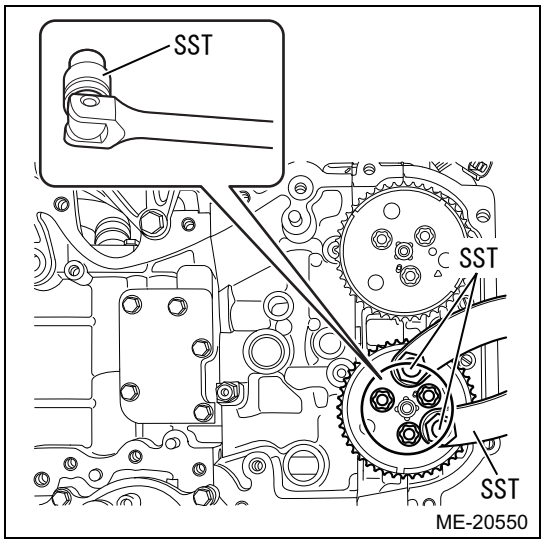
CAUTION:

Pay attention when performing the work, since the SST comes off easily.

(2) Remove the exhaust cam sprocket RH.

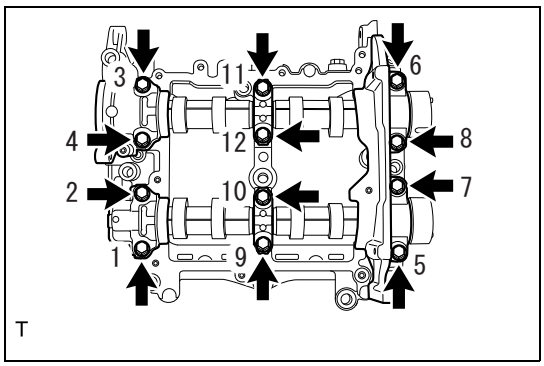


33. Intake cam sprocket LH removal
    (1) Use the SST to secure the intake cam sprocket LH and remove the three bolts.
        SST 18355AA000, 18334AA020, 18270KA010
        CAUTION:
        Pay attention when performing the work, since the SST comes off easily.
    (2) Remove the intake cam sprocket LH.

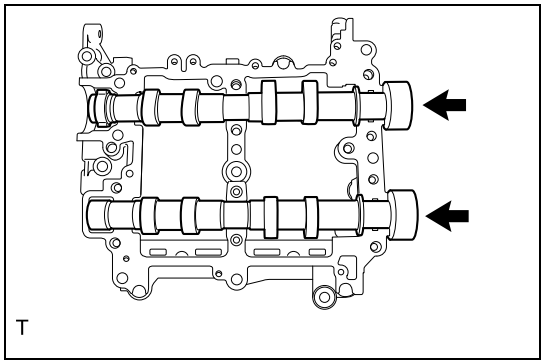


34. Exhaust cam sprocket LH removal
    (1) Use the SST to secure the exhaust cam sprocket LH and remove the three bolts.
        SST 18355AA000, 18334AA020, 18270KA010
        CAUTION:
        Pay attention when performing the work, since the SST comes off easily.
    (2) Remove the exhaust cam sprocket LH.

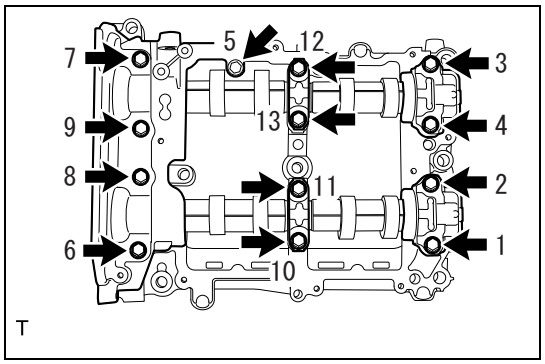
35. Ignition coil ASSY removal (bank 2 side) (Refer to ES - 695)
36. Spark plug removal (bank 2 side) (Refer to ES - 695)
37. Ignition coil ASSY removal (bank 1 side) (Refer to ES - 695)
38. Spark plug removal (bank 1 side) (Refer to ES - 696)
39. Removal of rocker cover RH (Refer to EM - 91)
40. Cam carrier RH removal (Refer to EM - 92)
41. Rocker cover LH removal (Refer to EM - 93)
42. Cam carrier LH removal (Refer to EM - 93)



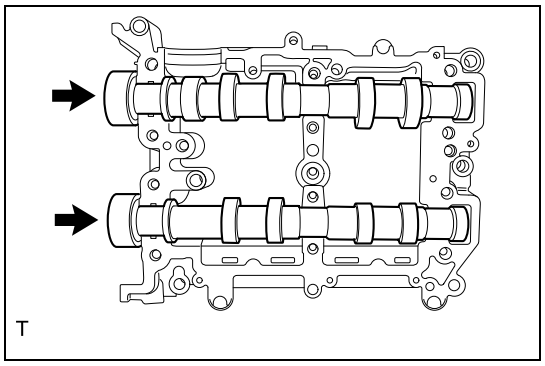
43. Camshaft cap removal (bank 1 side)
    (1) Loosen the 12 bolts a little at a time equally in the order as shown in the figure and remove them to remove the front camshaft cap RH, intake center camshaft cap RH, intake rear camshaft cap RH, exhaust center camshaft cap RH and exhaust rear camshaft cap RH.
        NOTE:
        The removed parts must be organized by installation location.



44. Camshaft removal (bank 1 side)
    (1) Remove the intake camshaft RH and exhaust camshaft RH from the cam carrier RH.



45. Camshaft cap removal (bank 2 side)
    (1) Loosen the 13 bolts a little at a time equally in the order as shown in the figure and remove them to remove the front camshaft cap LH, intake center camshaft cap LH, intake rear camshaft cap LH, exhaust center camshaft cap LH and exhaust rear camshaft cap LH.
    NOTE:
    The removed parts must be organized by installation location.



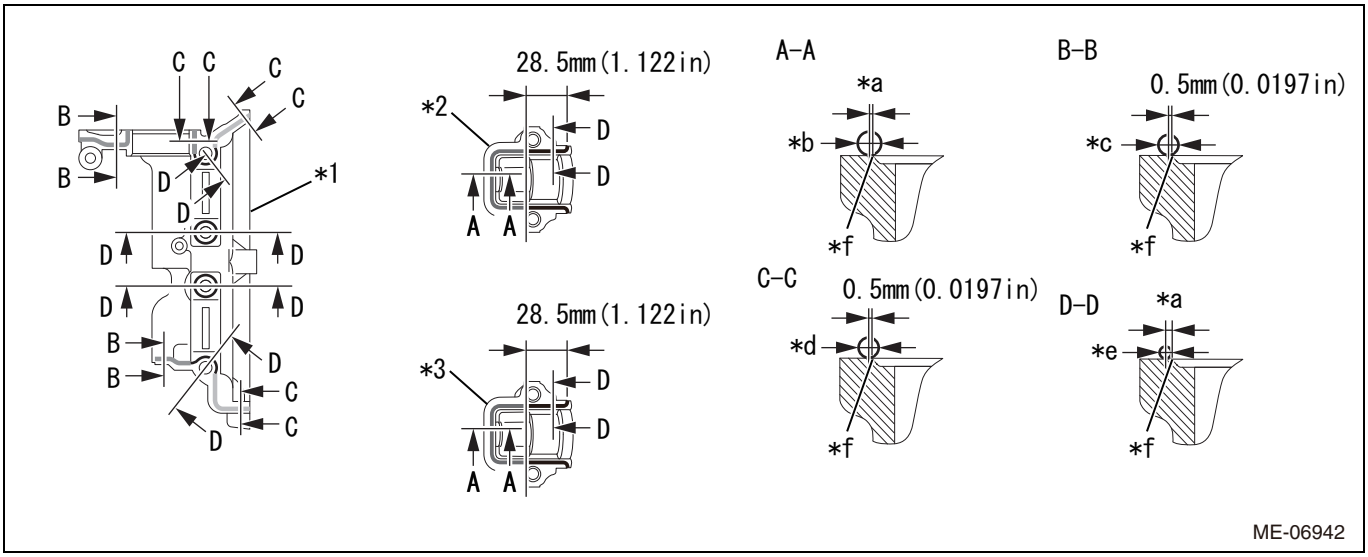
46. Camshaft removal (bank 2 side)
    (1) Remove the intake camshaft LH and exhaust camshaft LH from the cam carrier LH.

## Installation

1. Camshaft installation (bank 2 side)
    (1) Apply new engine oil to the journal of cam carrier LH.

    (2) Install the intake camshaft LH and exhaust camshaft LH to the cam carrier LH.

2. Camshaft cap installation (bank 2 side)
    (1) Apply THREE BOND 1217G/1217H or equivalent to the mating surfaces of front camshaft cap LH, intake rear camshaft cap LH and exhaust rear camshaft cap LH as shown in the figure.



Captions in illustration

| | | | |

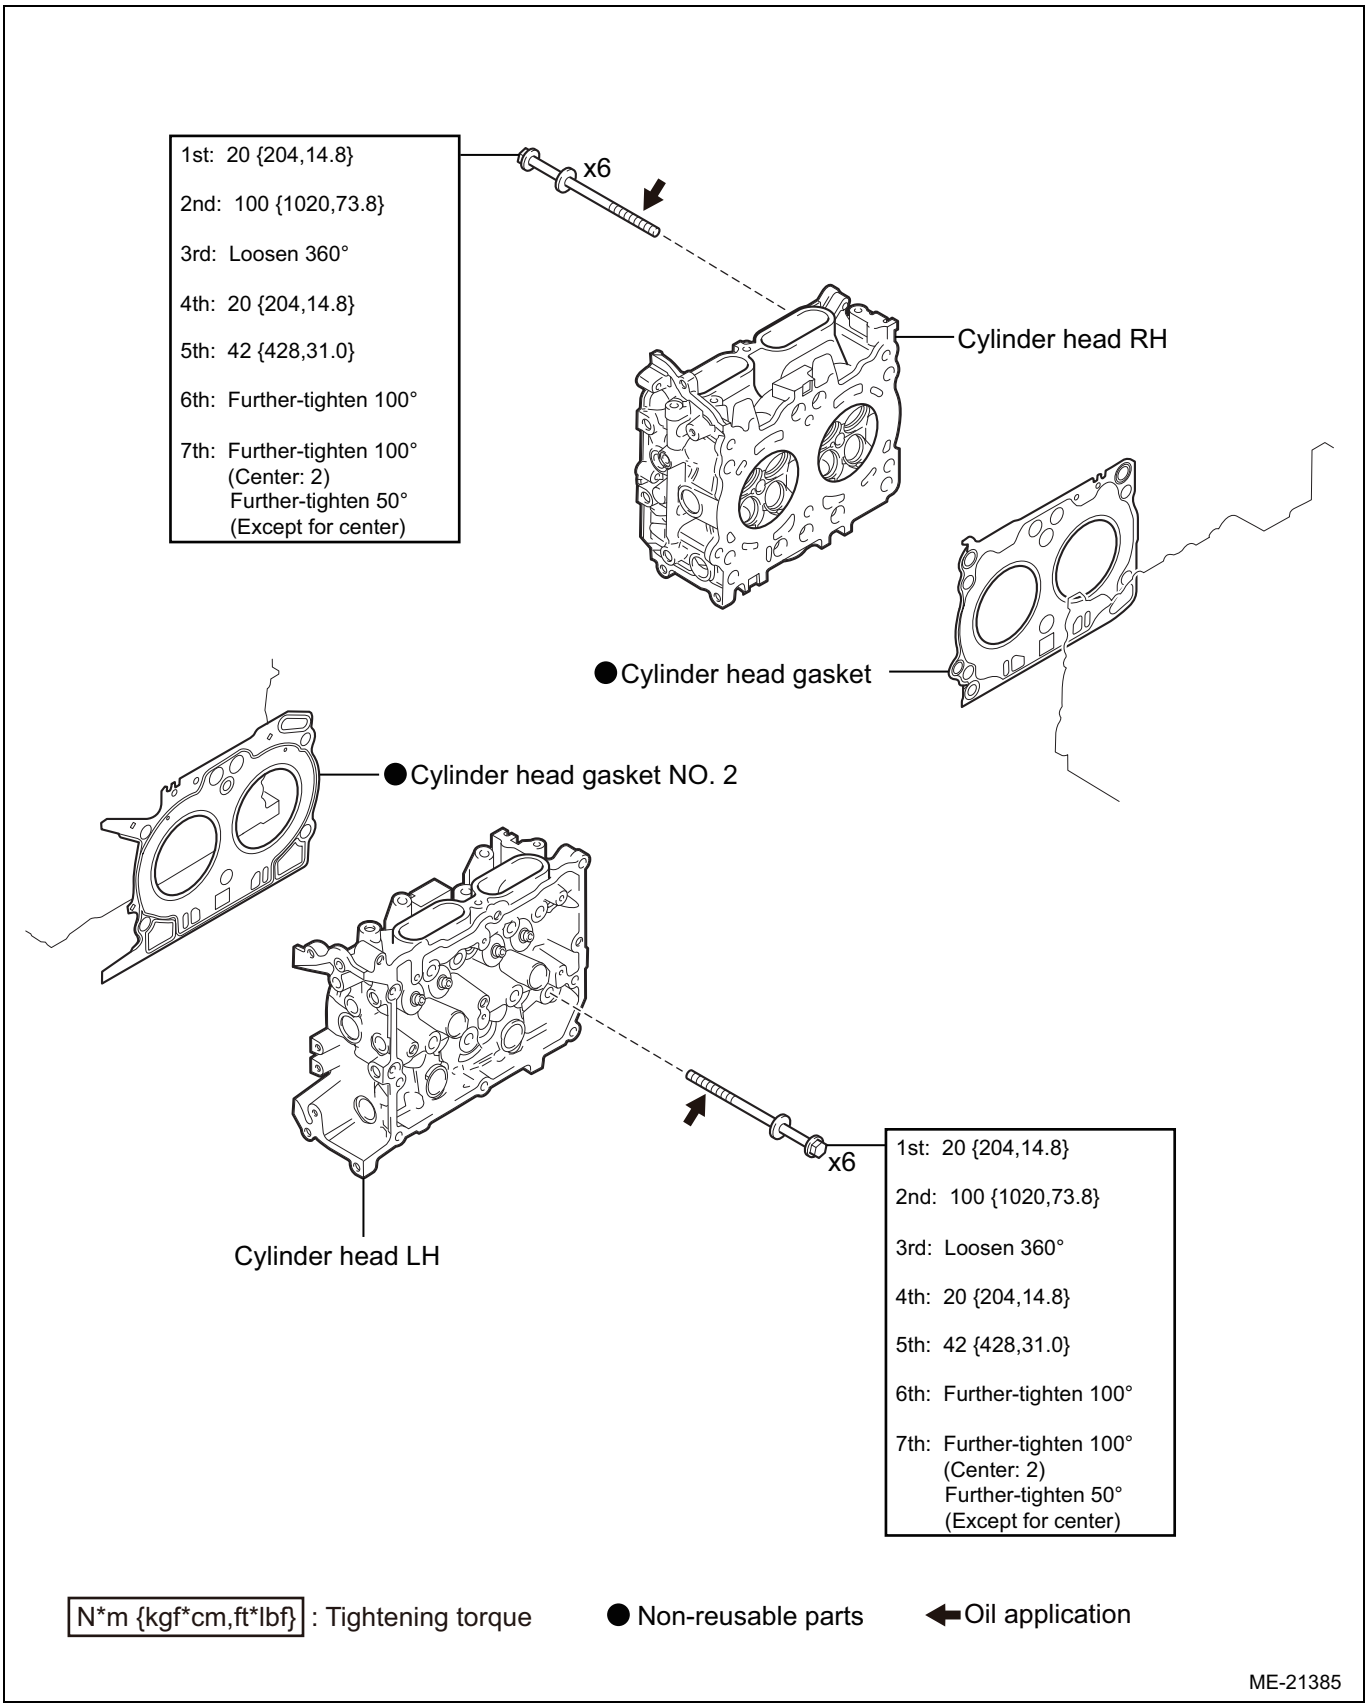
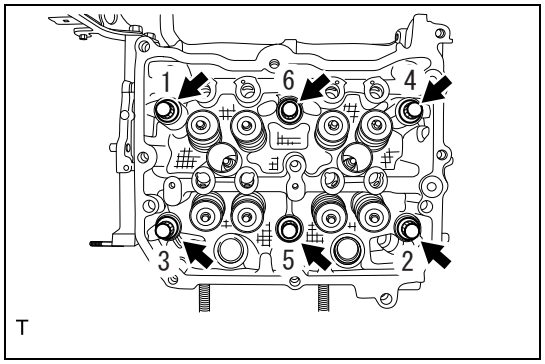
# Cylinder head gasket (FA20)

## Exploded view



## Removal

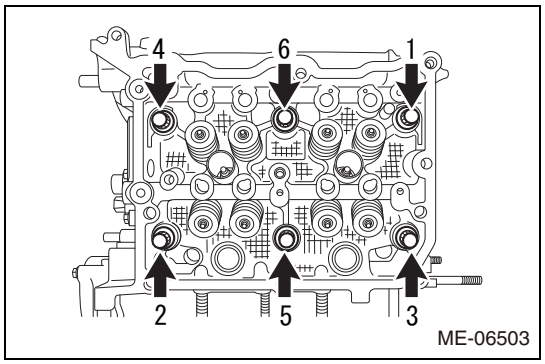
1. Cam carrier RH removal (Refer to EM - 75)



2. Cylinder head RH removal
   (1) Loosen the six cylinder head bolts equally in the order as shown in the figure.
   (2) Tap the cylinder head RH with a plastic hammer to separate it from cylinder block.
   (3) Remove the cylinder head RH.
   CAUTION:
   Be careful not to scratch the mating surface of cylinder head and cylinder block.

EM

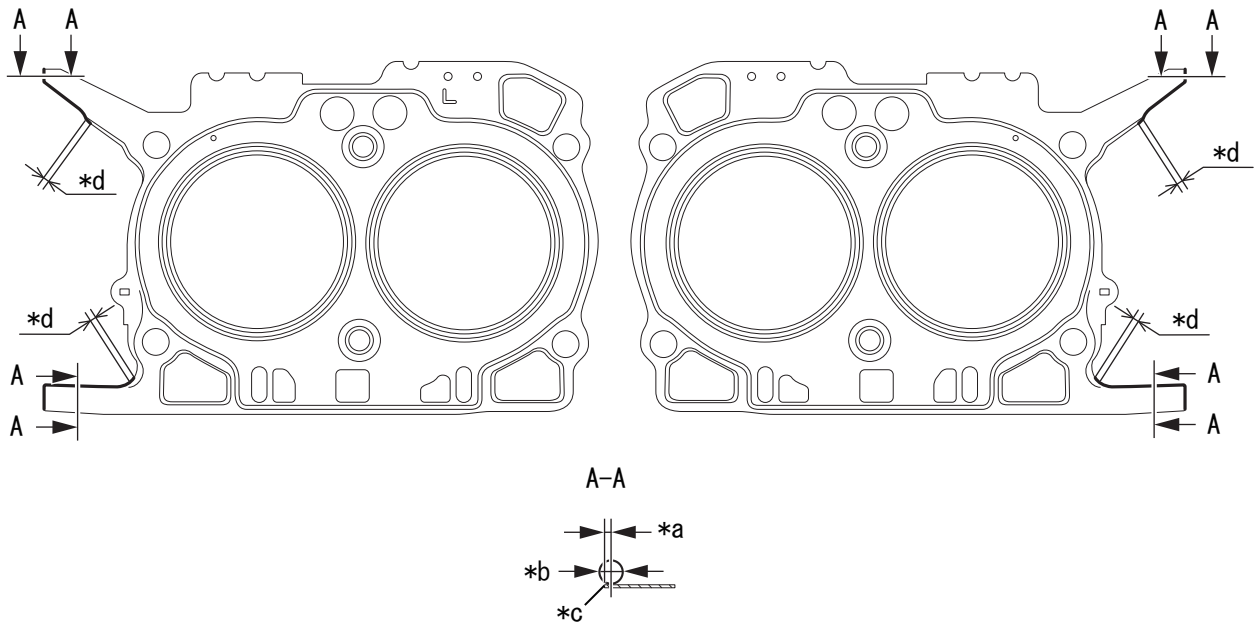
3. Cylinder head gasket removal
   (1) Remove the cylinder head gasket.
4. Cam carrier LH removal (Refer to EM - 75)



5. Cylinder head LH removal
   (1) Loosen the six cylinder head bolts equally in the order as shown in the figure.
   (2) Tap the cylinder head LH with a plastic hammer to separate it from cylinder block.
   (3) Remove the cylinder head LH.
   CAUTION:
   Be careful not to scratch the mating surface of cylinder head and cylinder block.
6. Cylinder head gasket NO. 2 removal
   (1) Remove the cylinder head gasket NO. 2.

## Installation

1. Cylinder head gasket NO. 2 installation
   (1) Operate the engine stand, and make the bank 2 side face upward.
   (2) Clean the bolt holes in the cylinder block (block 2 side).
   CAUTION:
   To avoid erroneous tightening of the bolts, clean out the bolt holes sufficiently by blowing with compressed air to eliminate engine coolant etc.
   (3) Apply THREE BOND 1217G/1217H or equivalent to both sides of a new cylinder head gasket NO. 2 as shown in the figure.



ME-20074

Captions in illustration

| | | | |

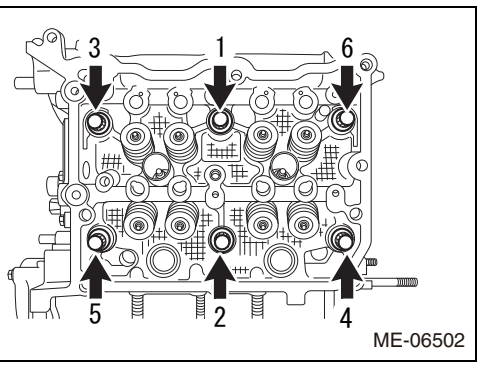
| *a | 0 to 1.0 mm {0 to 0.039 in} | *b | Diameter: 2.0 to 4.0 mm {0.079 to 0.158 in} |
| *c | Gasket edge | *d | Overlap space of bead end and liquid gasket<br>3.0 to 10.0 mm {0.12 to 0.39 in} |

CAUTION:
- Clean and degrease the installation surface.
- Install within 5 min. after applying liquid gasket.

(4) Install the cylinder head gasket NO. 2.

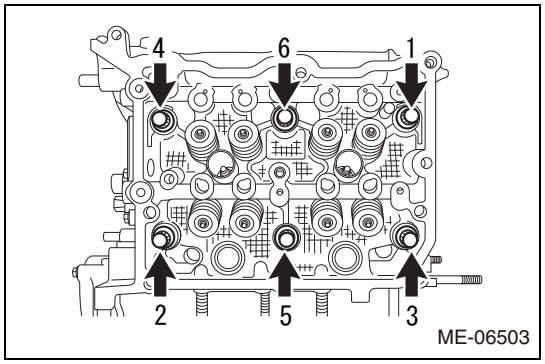
2. Cylinder head LH installation
   (1) Clean the cylinder head bolt threads and apply sufficient new engine oil to the washer and cylinder head bolts threads.
   (2) Set the cylinder block (bank 2 side) on the cylinder head LH.



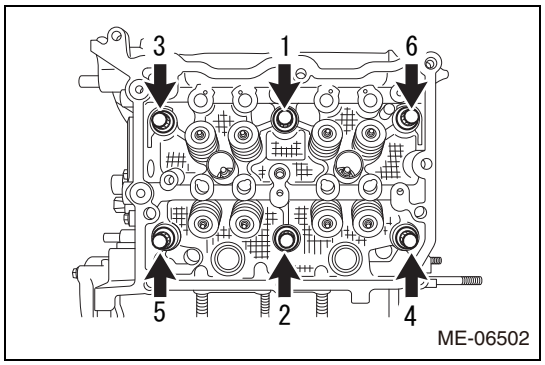
ME-06502

(3) Tighten the six cylinder head bolts in the order as shown in the figure.
Standard value:T=20N·m {204kgf·cm} {14.8ft·lbf}

(4) Retighten the six cylinder head bolts in the same order.
Standard value:T=100N·m {1020kgf·cm} {73.8ft·lbf}
CAUTION:
If the bolt makes stick-slip sound during tightening, clean the bolt holes and installation surface, dry them completely, and then repeat the steps from the application of seal gasket.
NOTE:
When repeating the steps, the cylinder head gasket can be reused.

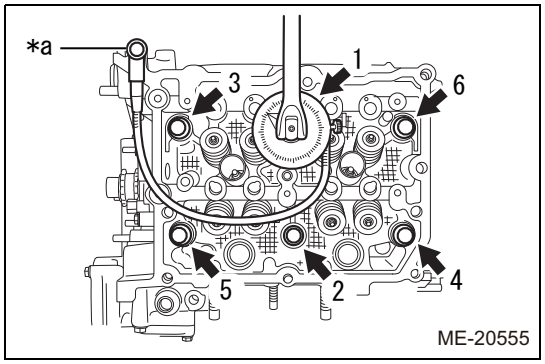


(5) Loosen the six cylinder head bolts by 360° in the order as shown in the figure.



(6) Tighten the six cylinder head bolts in the order as shown in the figure.
Standard value:T=20N·m {204kgf·cm} {14.8ft·lbf}

(7) Retighten the six cylinder head bolts in the same order.
Standard value:T=42N·m {428kgf·cm} {31.0ft·lbf}

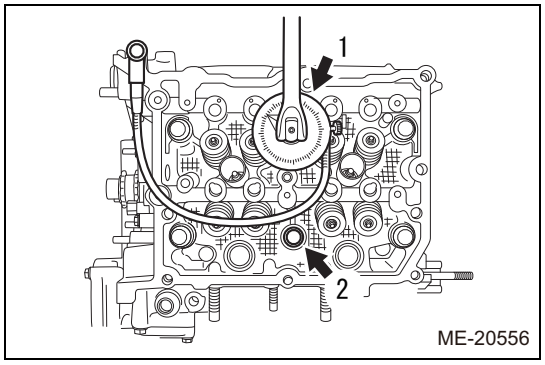


(8) Retighten the six cylinder head bolts by 100° using an angle gauge in the order as shown in the figure.

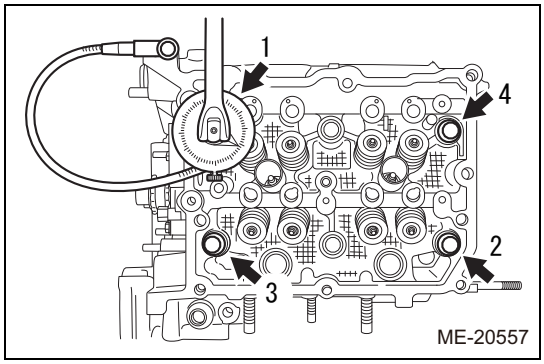
Captions in illustration

| | |
|---|---|
| *a | Temporary bolt |

NOTE:
Install a temporary bolt to secure an angle gauge as required.



(9) Retighten the two cylinder head bolts by 100° using an angle gauge in the order as shown in the figure.



(10) Retighten the four cylinder head bolts by 50° using an angle gauge in the order as shown in the figure.

3. Cam carrier LH installation (Refer to EM - 96)

4. Cylinder head gasket installation
   (1) Operate the engine stand, and make the bank 1 side face upward.
   (2) Clean the bolt holes in the cylinder block (block 1 side).
   CAUTION:
   To avoid erroneous tightening of the bolts, clean out the bolt holes sufficiently by blowing with compressed air to eliminate engine coolant etc.
   (3) Apply THREE BOND 1217G/1217H or equivalent to both sides of a new cylinder head gasket as shown in the figure.

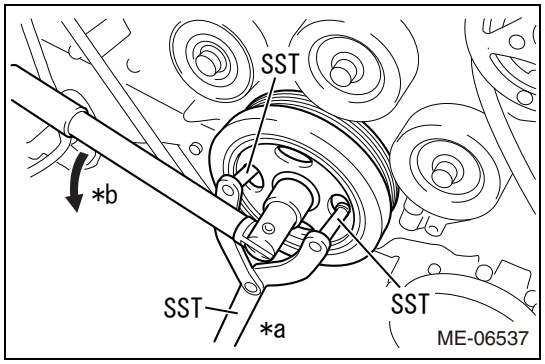
1. Removal of air cleaner case SUB-ASSY (Refer to EM - 5)
2. Removal of alternator cover (Refer to EM - 6)
3. Removal of A/C cover (Refer to EM - 7)
4. Removal of V-belt (Refer to EM - 7)

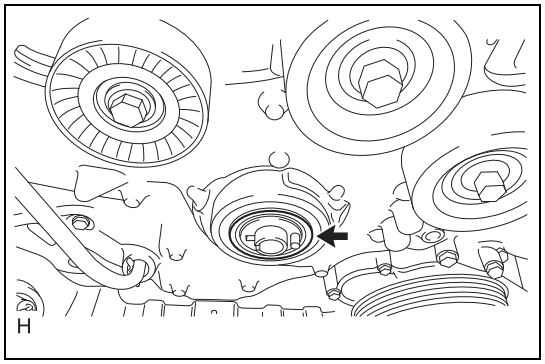


5. Crankshaft pulley removal
   (1) Use the SST to secure the crankshaft pulley.
   SST 18355AA000, 18334AA000

Captions in illustration

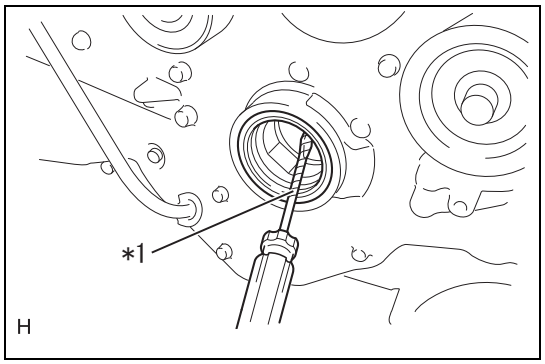
| | |
|---|---|
| *a | Hold |
| *b | Drive |

   (2) Remove the crankshaft pulley set bolt to remove the crankshaft pulley.



(3) Remove the O-ring from the crankshaft pulley boss.
(4) Remove the crankshaft pulley boss.

EM



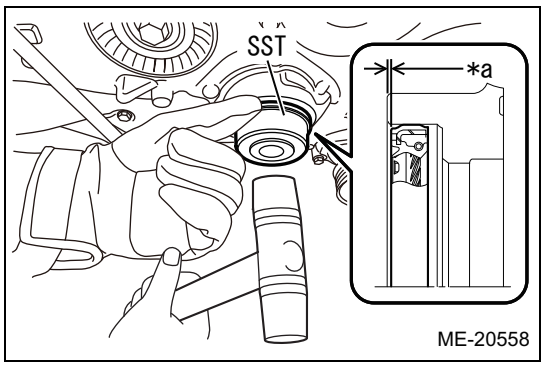
6. Chain cover oil seal removal
   (1) Using a flat tip screwdriver wrapped with protective tape, remove the chain cover oil seal.

Captions in illustration

| | |
|---|---|
| *1 | Protective tape |

CAUTION:
Make sure that there are no scratches in the fitting area of crankshaft and chain cover oil seal.
NOTE:
If the crankshaft is scratched, repair it with sandpaper (# 400).

## Installation



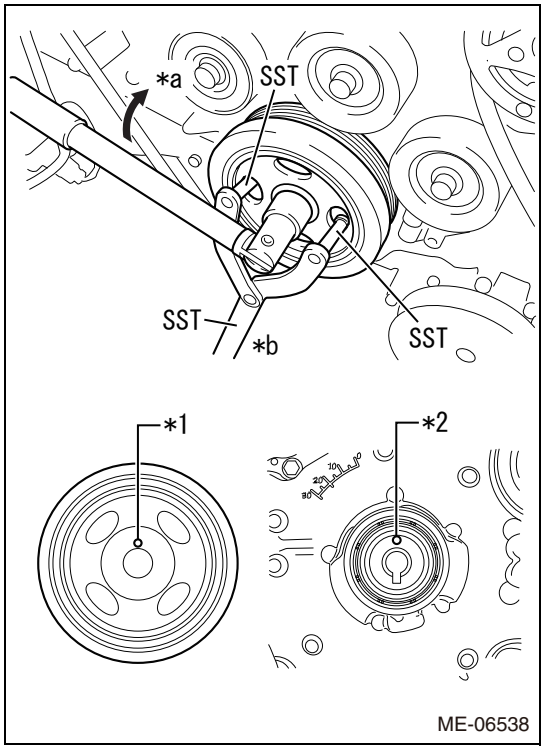
1. Chain cover installation
   (1) Degrease the press-fit portion of chain cover oil seal of the chain cover, and install a new chain cover oil seal to the chain cover using the SST.
   SST 41399FG020

Captions in illustration

| | |
|---|---|
| *a | Chain cover oil seal press-fit position:<br>0 to 1.0 mm {0 to 0.039 in} from the end surface of chain cover |

CAUTION:
To prevent engine oil leakage, do not apply engine oil or similar to the chain cover oil seal and the press-fit portion of chain cover oil seal of the chain cover.

2. Crankshaft pulley installation
   (1) Install the crankshaft pulley boss.
   (2) Install a new O-ring to the crankshaft pulley boss.



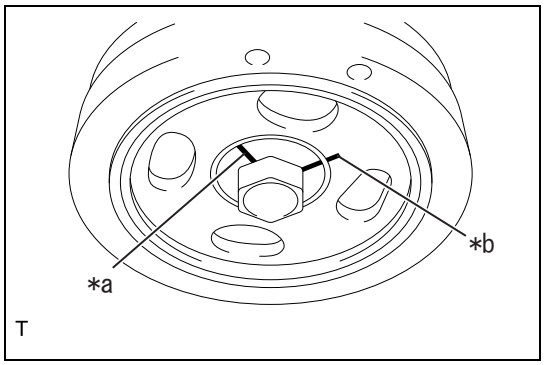
(3) Install the crankshaft pulley while aligning its knock hole to the knock pin of crankshaft pulley boss.

Captions in illustration

| | |
|---|---|
| *1 | Knock hole |
| *2 | Knock pin |
| *a | Drive |
| *b | Hold |

(4) Apply new engine oil to the thread and flange surface of crankshaft pulley set bolt.

(5) Use the SST to secure the crankshaft pulley and tighten the crankshaft pulley set bolt.
SST 18355AA000, 18334AA000
Standard value:T=20N·m {204kgf·cm} {14.8ft·lbf}

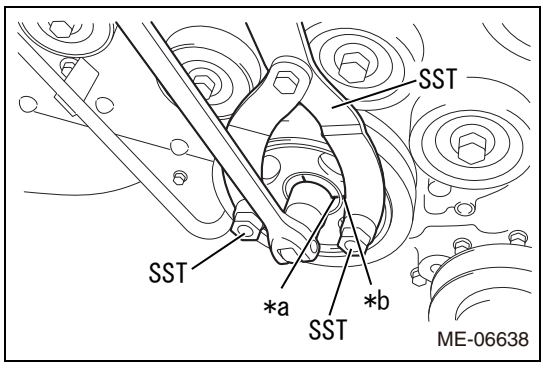


(6) Draw a reference line (A) on the crankshaft pulley set bolt and end line (B) on the crankshaft pulley according to the engraved lines on the bolt using a marker as shown in the figure.

Captions in illustration

| | |
|---|---|
| *a | Reference line (A) |
| *b | End line (B) |

NOTE:
There are engraved lines on the head of crankshaft pulley set bolt every 90°.



(7) Use the SST to secure the crankshaft pulley and retighten the crankshaft pulley bolt by 90° until the reference line (A) and end line (B) are aligned.
SST 18355AA000, 18334AA000

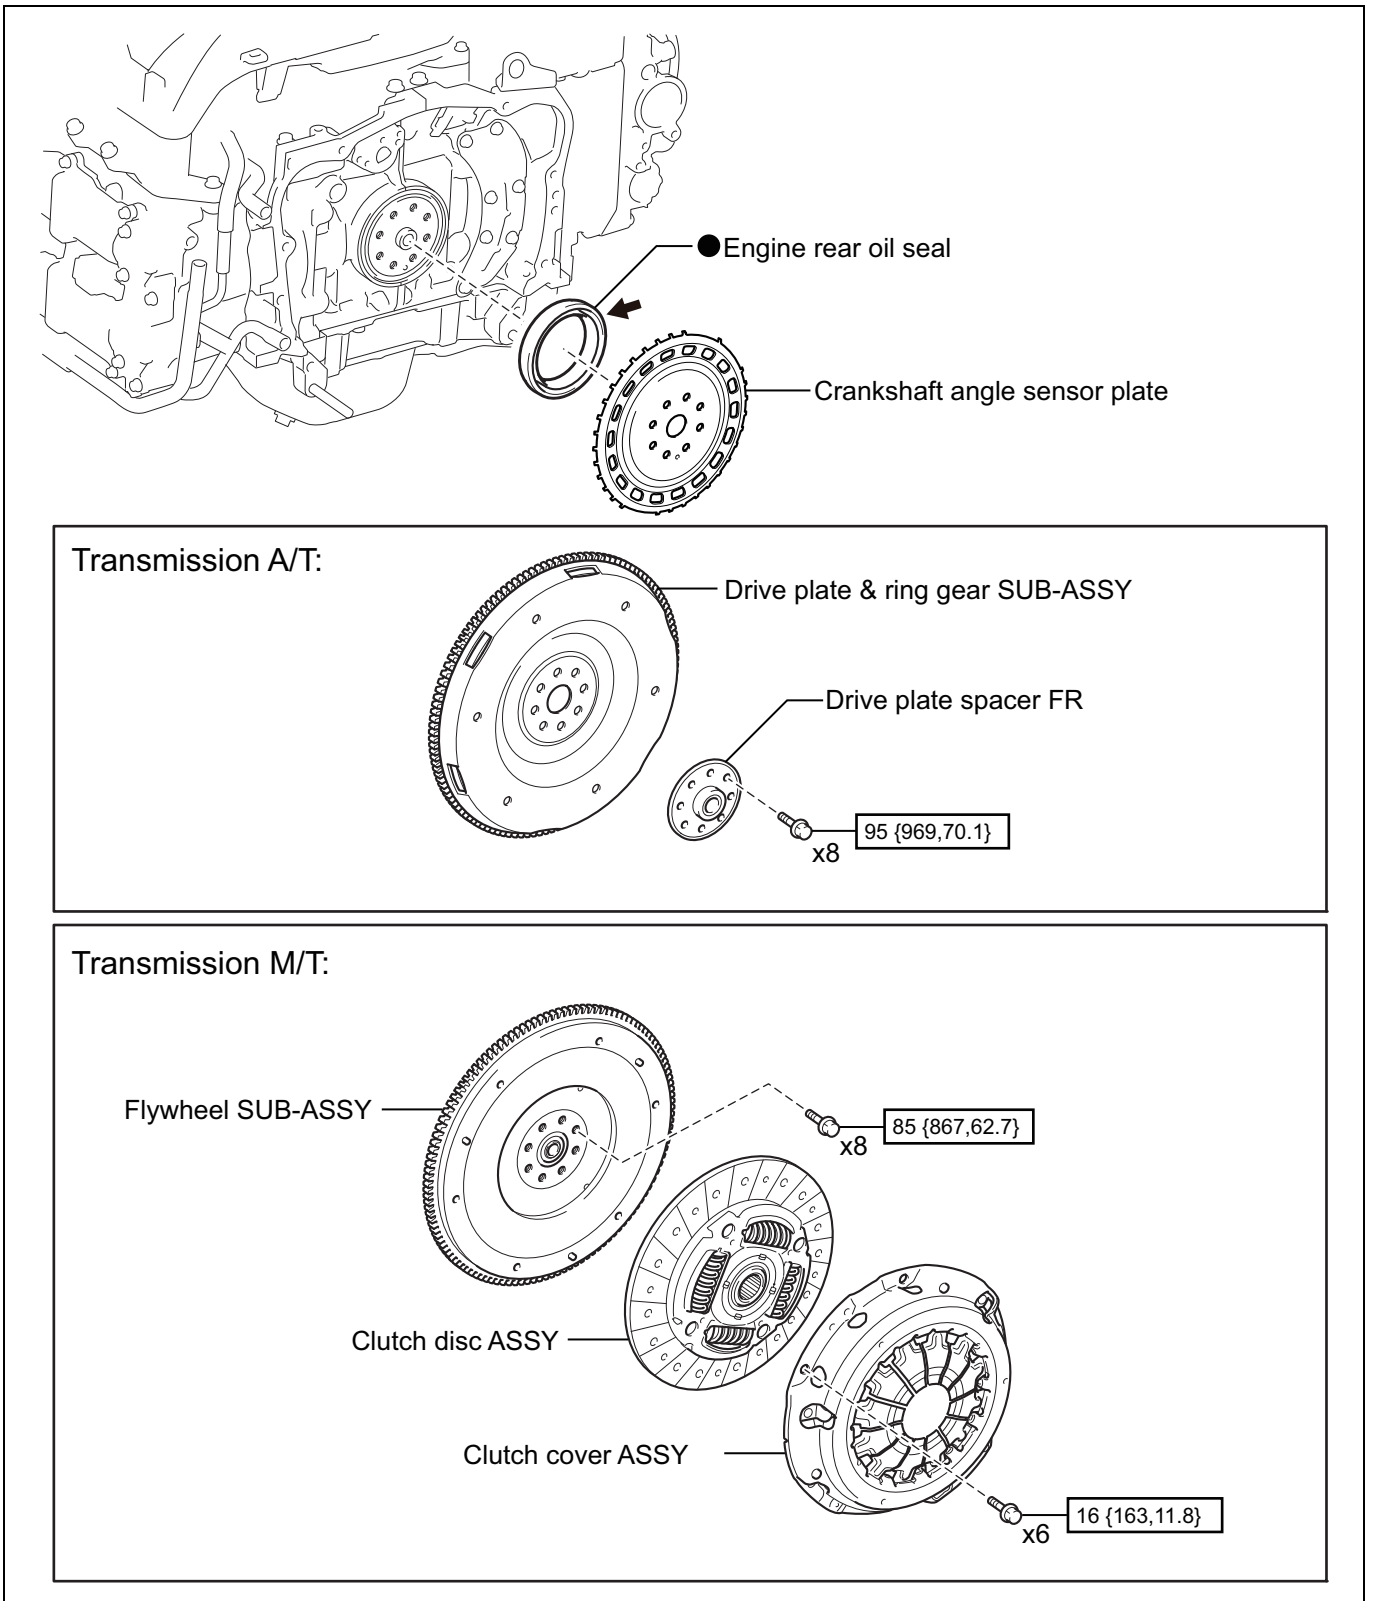
Captions in illustration

| | |
|---|---|
| *a | Reference line (A) |
| *b | End line (B) |

3. V-belt installation (Refer to EM - 7)
4. Installation of A/C cover (Refer to EM - 7)
5. Installation of alternator cover (Refer to EM - 8)
6. Installation of air cleaner case SUB-ASSY (Refer to EM - 8)

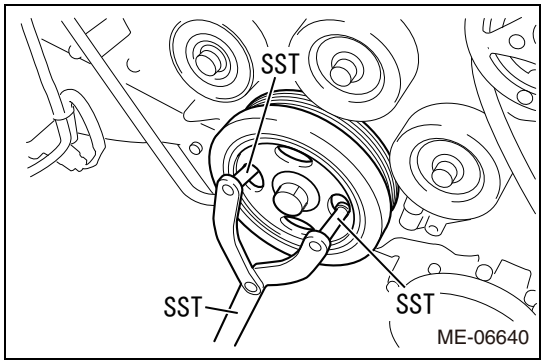
# Engine rear oil seal (FA20)

## Exploded view



## Removal

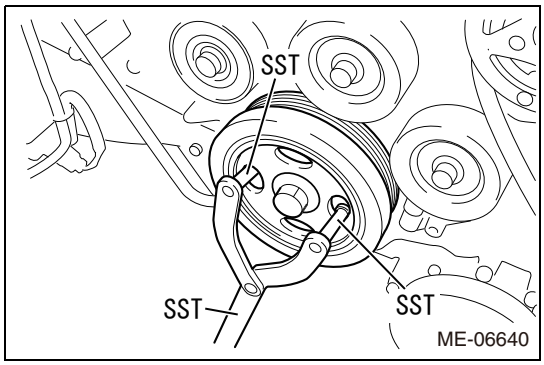
1. Removal of automatic transmission ASSY (transmission A/T) (Refer to AT - 220)
2. Removal of manual transmission ASSY (transmission M/T) (Refer to MT - 18)



3. Drive plate & ring gear SUB-ASSY removal (transmission A/T)
   (1) Use the SST to secure the crankshaft pulley.
   SST 18355AA000, 18334AA000

   (2) Remove the eight bolts to remove the drive plate spacer FR and drive plate & ring gear SUB-ASSY.

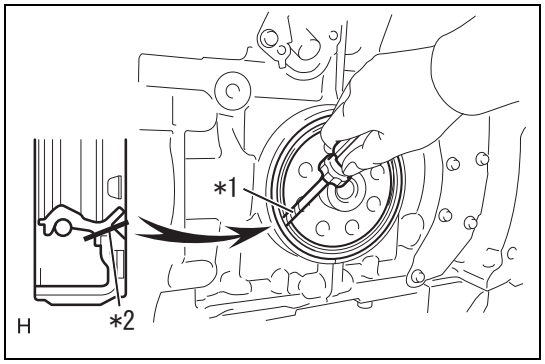
4. Clutch cover ASSY removal (transmission M/T) (Refer to CL - 24)
5. Clutch disc ASSY removal (transmission M/T) (Refer to CL - 24)



6. Flywheel SUB-ASSY removal (transmission M/T)
   (1) Use the SST to secure the crankshaft pulley.
   SST 18355AA000, 18334AA000

   (2) Remove the eight bolts and remove the flywheel SUB-ASSY.

7. Crank angle sensor plate removal
   (1) Remove the crank angle sensor plate.



8. Engine rear oil seal removal
   (1) Make a slit to the oil seal lip using a cutter knife.

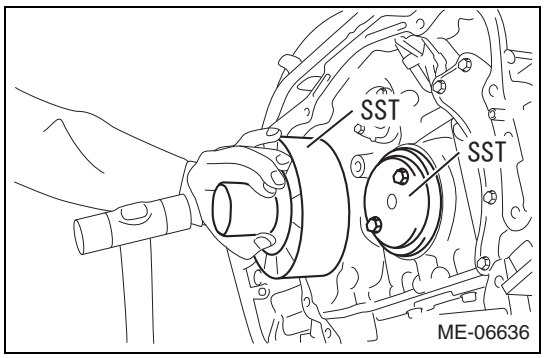
Captions in illustration

| | |
|---|---|
| *1 | Protective tape |
| *2 | Cut line |

   (2) Remove the oil seal using a flat tip screwdriver wrapped with protective tape.
   CAUTION:
   Make sure that there are no scratches in the fitting area of crankshaft and rear oil seal retainer.
   NOTE:
   If the crankshaft is scratched, repair it with sandpaper (# 400).

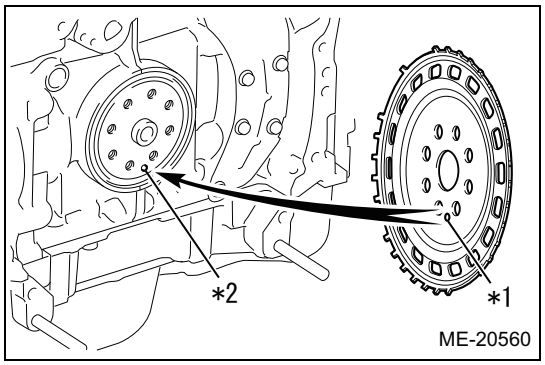
EM

## Installation



1. Engine rear oil seal installation
   (1) Apply a thin coat of new engine oil to the inner and outer peripheries of a new engine rear oil seal.
   (2) Use the SST to drive in the engine rear oil seal equally until it is aligned to the end surface of cylinder block.
   SST 18671AA020, 18657AA030
   CAUTION:
   - Do not drive in the engine rear oil seal at an angle.
   - Do not deform the engine rear oil seal.
   - Do not drive in the engine rear oil seal excessively.

   NOTE:
   The driving distance of engine rear oil seal may be in a range of 0 to 1.0 mm {0 to 0.039 in} from the end surface of cylinder block.



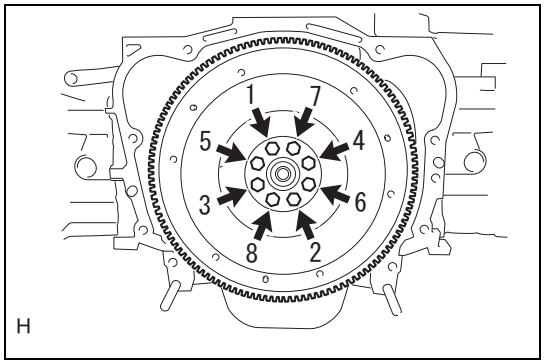
2. Crank angle sensor plate installation
   (1) Install the crank angle sensor plate by aligning the pin hole of the crankshaft and the pin of crank angle sensor plate.

Captions in illustration

| | |
|---|---|
| *1 | Pin hole |
| *2 | Pin |

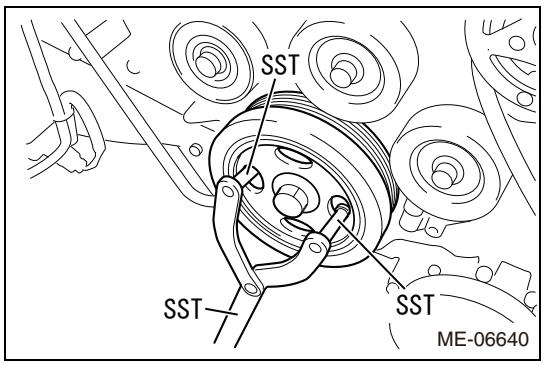
3. Flywheel SUB-ASSY installation (transmission M/T)
   (1) Temporarily tighten the eight bolts to secure the flywheel SUB-ASSY.

   (2) Use the SST to secure the crankshaft pulley.
   SST 18355AA000, 18334AA000

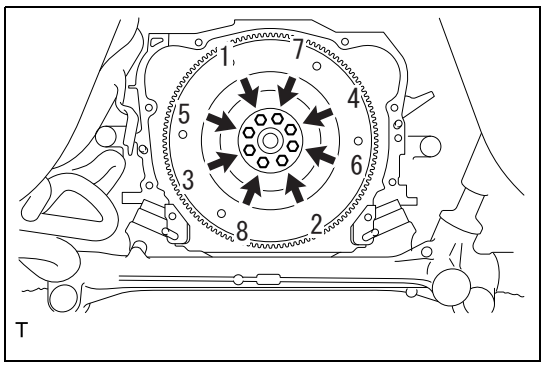


(3) Tighten the eight bolts in the order as shown in the figure.
Standard value:T=85N·m {867kgf·cm} {62.7ft·lbf}

4. Clutch disc ASSY installation (transmission M/T) (Refer to CL - 26)
5. Clutch cover ASSY installation (transmission M/T) (Refer to CL - 27)
6. Drive plate & ring gear SUB-ASSY installation (transmission A/T)
   (1) Temporarily tighten the eight bolts through the drive plate spacer FR to secure the drive plate & ring gear SUB-ASSY.



(2) Use the SST to secure the crankshaft pulley.
SST 18355AA000, 18334AA000



(3) Tighten the eight bolts in the order as shown in the figure.
Standard value:T=95N·m {969kgf·cm} {70.1ft·lbf}

7. Installation of manual transmission ASSY (transmission M/T) (Refer to MT - 18)
8. Installation of automatic transmission ASSY (transmission A/T) (Refer to AT - 227)
9. Engine oil leakage check

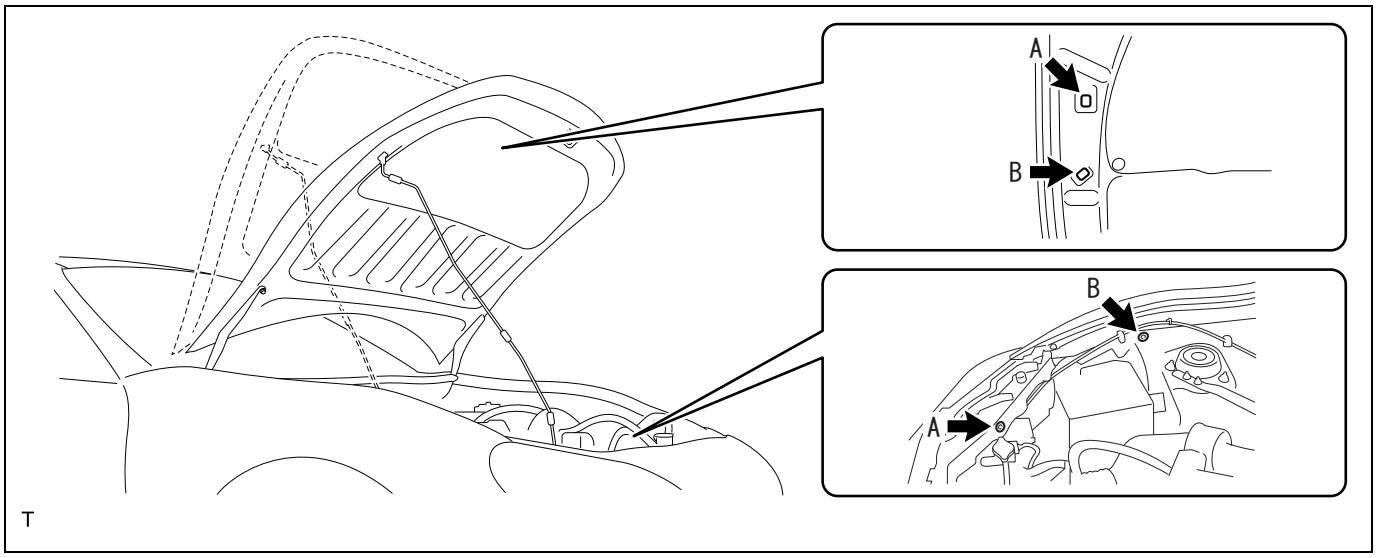
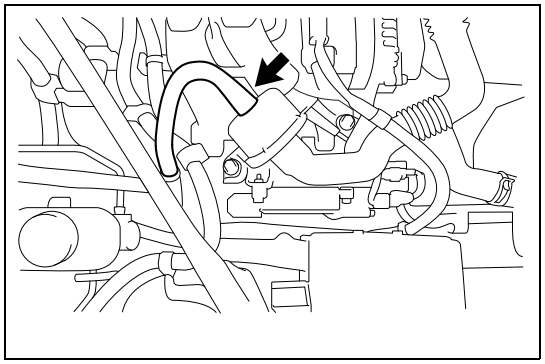
## Removal

1. Hood SUB-ASSY set

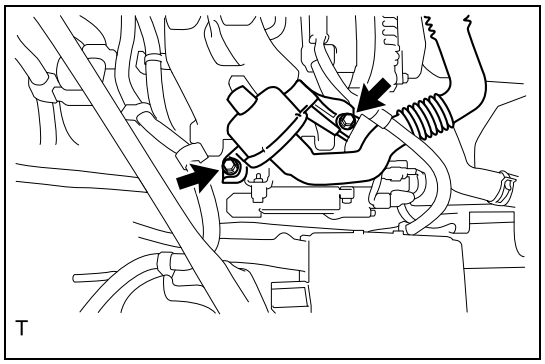


(1) Change the hood stay position from A to B in order to support the hood SUB-ASSY at the position B.

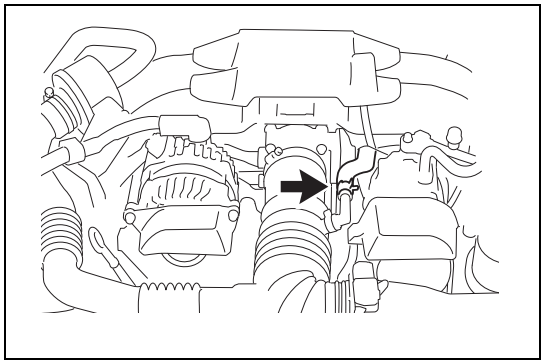
2. Refrigerant draining (Refer to AC - 90)
3. Fuel spill prevention procedure (Refer to FU - 3)
4. Disconnection of the battery ground terminal (Refer to IN - 6)
5. Front strut tower bar LH removal (Refer to FP - 5)
6. Removal of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
7. Front strut tower bar RH removal (Refer to FP - 4)
8. Removal of flexible V-shaped bar RH (tS model) (Refer to FP - 5)



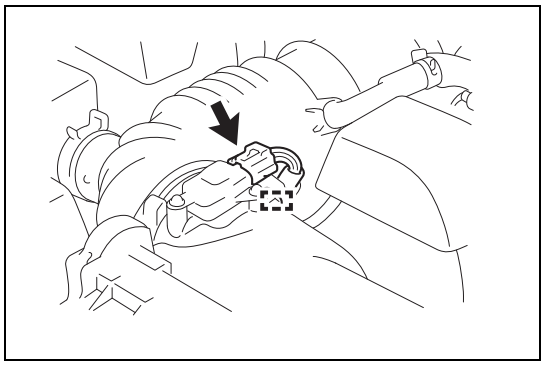
9. Air cleaner case SUB-ASSY removal
   (1) Disconnect the hose from the chamber ASSY.



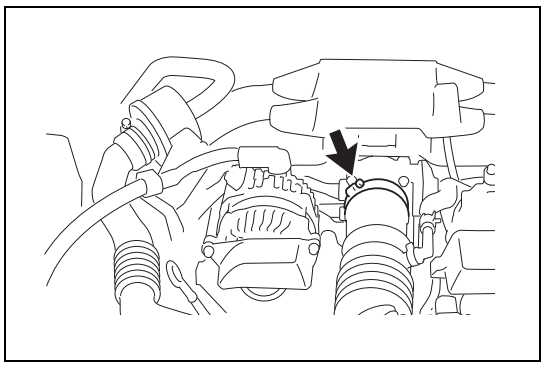
(2) Remove the two bolts and remove the chamber ASSY.



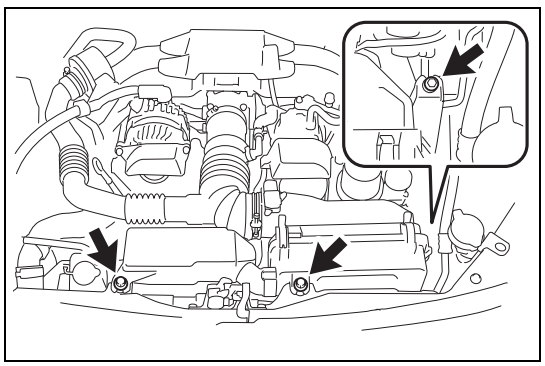
(3) Move the hose clip and disconnect the ventilation hose NO. 2.



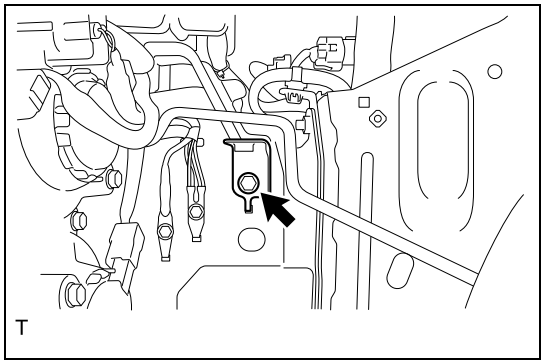
(4) Release the clamp and disconnect the wiring harness from the air cleaner cap.
(5) Disconnect the connector from the intake air flow meter SUB-ASSY.



(6) Loosen the hose clamp.

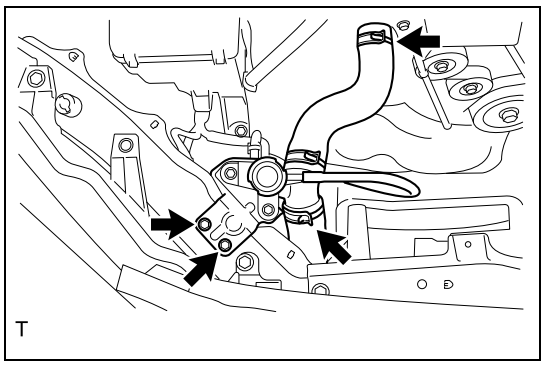


(7) Remove the three bolts and remove the air cleaner case SUB-ASSY.

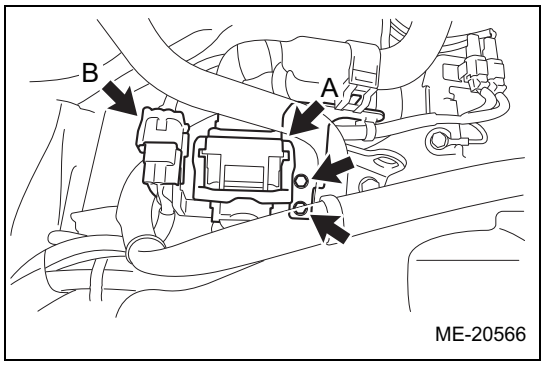


(8) Remove the bolt and remove the stay.

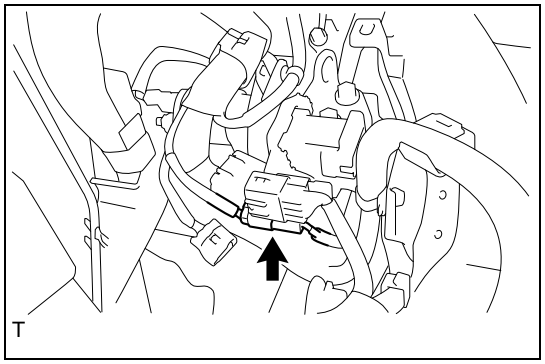
10. Engine oil draining
    (1) Remove the oil filler cap.
    (2) Remove the oil pan drain plug and gasket.
    (3) After draining the oil, install the oil pan drain plug with a new gasket.
    Standard value:T=41.7N·m {425kgf·cm} {30.8ft·lbf}
11. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
12. Removal of radiator reservoir tank ASSY (Refer to CO - 25)



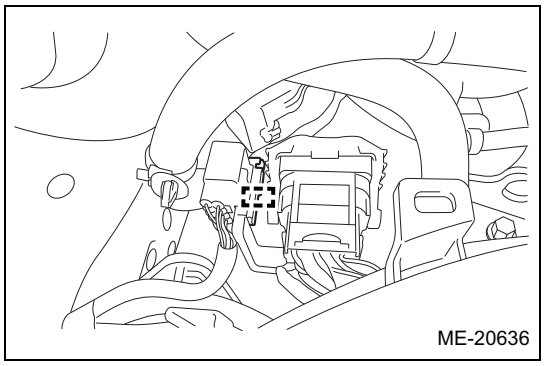
13. Removal of water filler SUB-ASSY
    (1) Remove the two bolts and remove the water filler SUB-ASSY.
    (2) Move the two hose clamps and remove the radiator hose NO. 1 and water filler SUB-ASSY as a unit.
14. Removal of injector driver (Refer to FU - 43)
15. DISCONNECT ENGINE WIRE
    NOTE:
    Fix the disconnected harness components with tape to keep them out of the way.



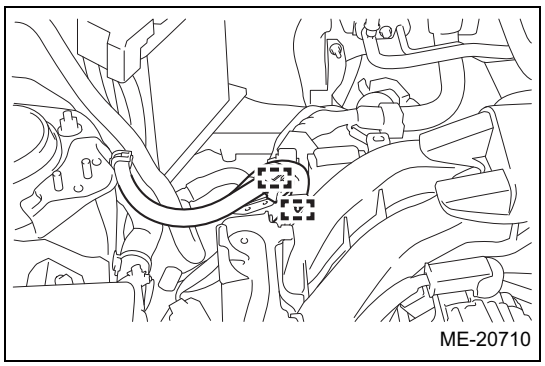
(1) Remove the 2 bolts and wire harness clamp bracket from the No. 2 engine hanger.
(2) Release the lock of connector (A) and disconnect the connector.
(3) Disconnect the connector (B).



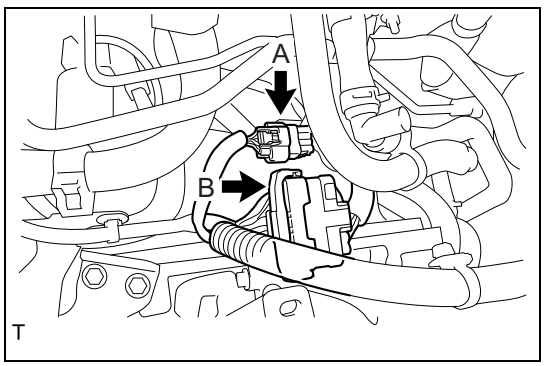
(4) Disconnect the connector.



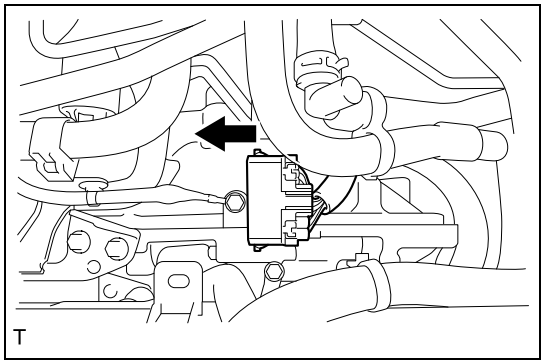
(5) Remove the connector from the engine hanger No. 2.



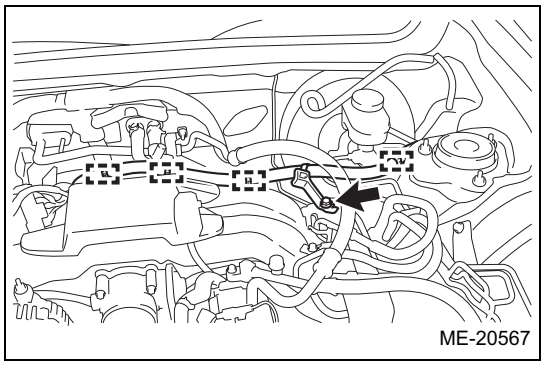
(6) Disconnect the 2 wire harness clamps.



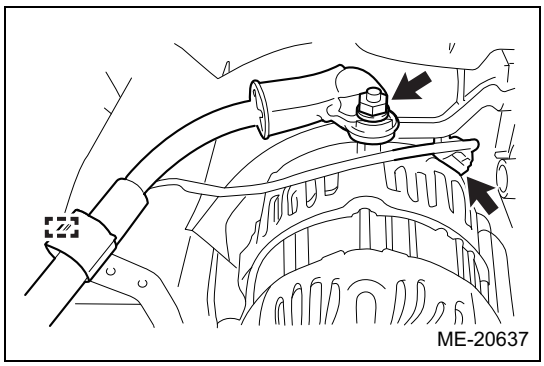
(7) for Automatic Transmission.
(a) Release the lock of connector (A) and disconnect the connector.
(b) Disconnect the connector (B).



(c) Slide the connector in the direction shown in the illustration, and disconnect the wire harness.



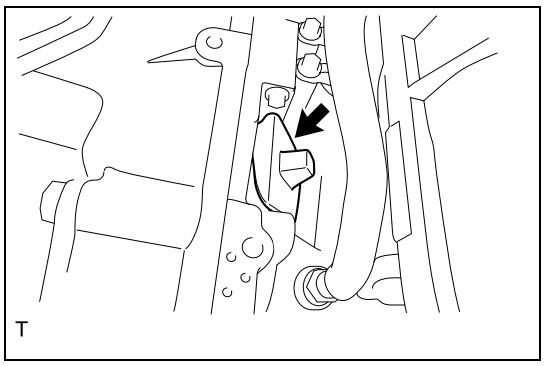
(d) Disconnect the 4 wire harness clamps.
(e) Remove the bolt and wire harness clamp bracket.



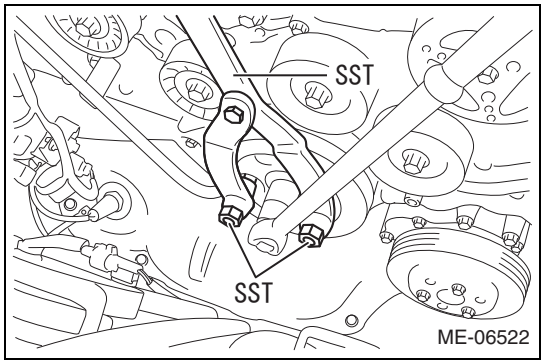
(8) Disconnect the terminal cap.

(9) Remove the nut and disconnect the wire harness from terminal B.
(10) Disconnect the generator connector and disengage the clamp.

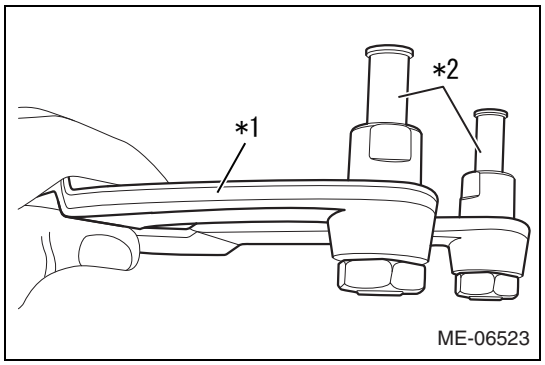
16. Removal of alternator cover (Refer to EM - 6)
17. Removal of A/C cover (Refer to EM - 7)
18. Removal of V-belt (Refer to EM - 7)
19. Removal of engine cover SUB-ASSY No. 1 (transmission A/T) (Refer to IE - 16)



20. Removal of flywheel housing under cover (transmission A/T)
(1) Remove the flywheel housing under cover.

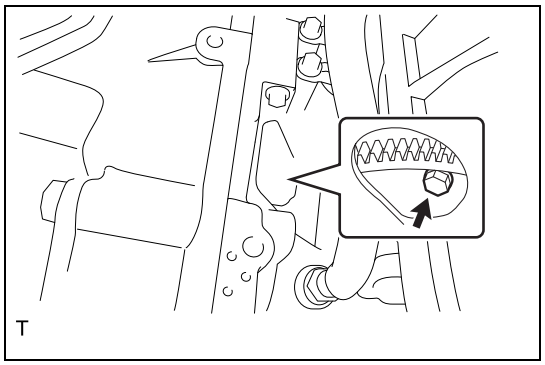


21. Removal of drive plate and torque converter setting bolt (transmission A/T)
    (1) Use the SST to secure the crankshaft pulley.
        SST 18355AA000, 18334AA000

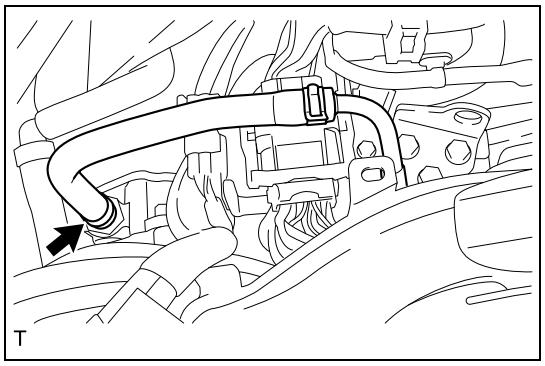


Captions in illustration

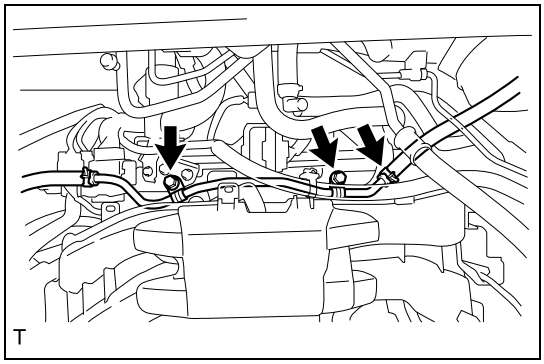
| | |
|---|---|
| *1 | 18355AA000 |
| *2 | 18334AA000 |



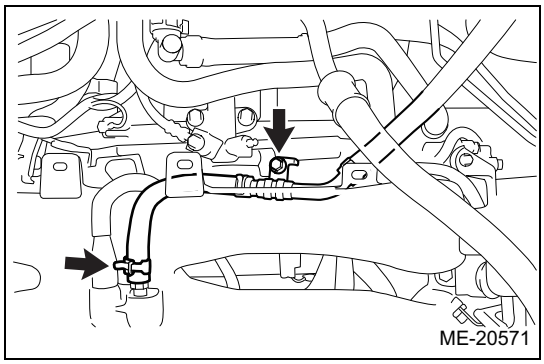
(2) Remove the six drive plate & torque converter setting bolts through the service hole.



22. Vacuum tube connector hose disconnection (transmission A/T)
    (1) Move the clamp and disconnect the vacuum tube connector hose from the vacuum pump ASSY.

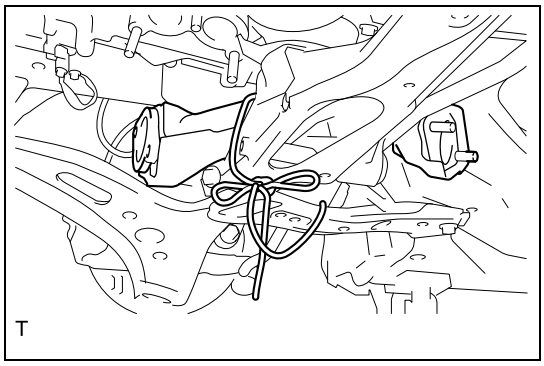


(2) Remove the 2 bolts and disconnect the vacuum tube connector hose.
(3) Loosen the hose clamp and remove the vacuum tube connector hose.

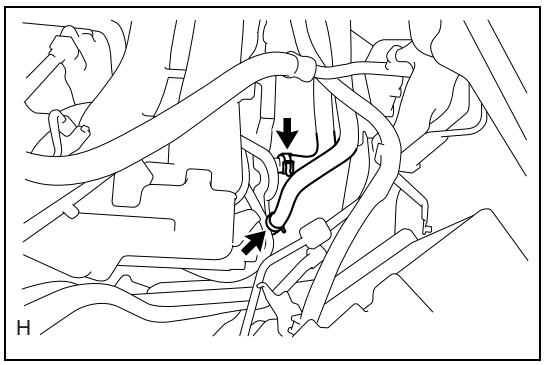


23. Vacuum tube connector hose disconnection (transmission M/T)
(1) Move the hose clamp and disconnect the vacuum tube connector hose from the intake manifold ASSY.
(2) Remove the bolt and disconnect the vacuum tube connector hose.

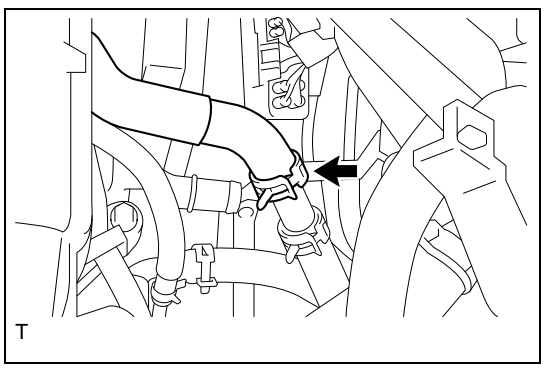
24. Removal of exhaust manifold (Refer to IE - 35)



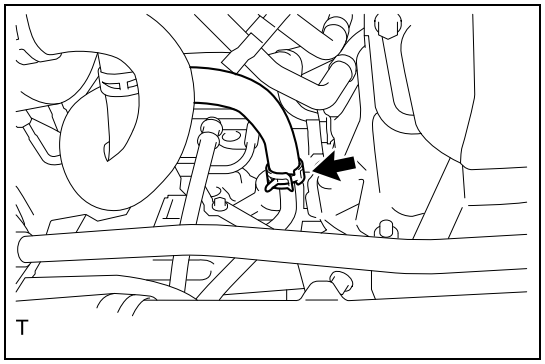
25. Exhaust pipe SUB-ASSY FR fixation (transmission M/T)
(1) Tie the exhaust pipe SUB-ASSY FR to the front suspension cross-member SUB-ASSY with the rope.
NOTE:
This operation is required to avoid dropping the exhaust pipe SUB-ASSY FR.



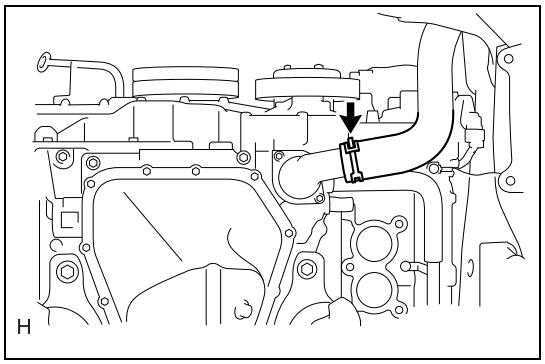
26. Heater water hose disconnection
(1) Move the two hose clamps and disconnect the two heater water hoses.



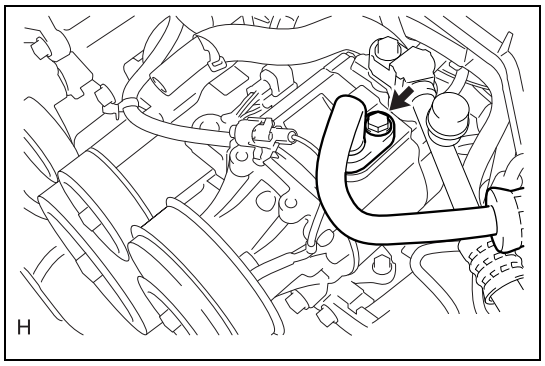
27. Transmission oil cooler hose NO. 3 disconnection (transmission A/T)
(1) Move the hose clamp and disconnect the transmission oil cooler hose NO. 3.



28. Transmission oil cooler hose NO. 1 disconnection (transmission A/T)
    (1) Move the hose clamp and disconnect the transmission oil cooler hose NO. 1.



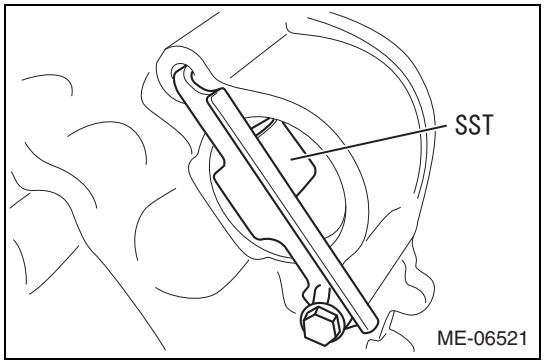
29. Radiator outlet hose disconnection
    (1) Move the hose clamp and disconnect the radiator outlet hose.



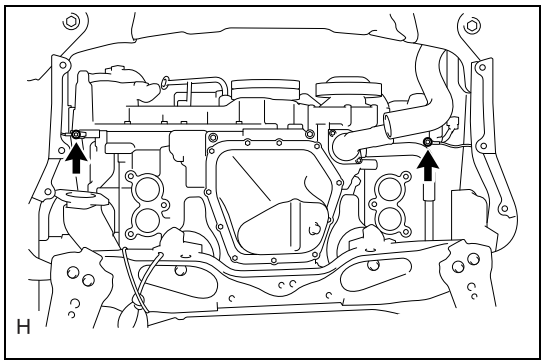
30. Suction hose SUB-ASSY removal
    (1) Remove the bolt and disconnect the suction hose SUB-ASSY.
    (2) Remove the O-ring from the suction hose SUB-ASSY.
    CAUTION:
    Wrap vinyl tape around the fitting areas of disconnected suction hose SUB-ASSY and compressor ASSY (with magnet clutch) to prevent dust, moisture, etc. from entering into them.

    (3) Remove bolts and turn the hook type connector in the direction of the arrow in the figure.
    (4) Remove the nut and disconnect the suction hose SUB-ASSY.
    (5) Remove the O-ring from the suction hose SUB-ASSY.
    CAUTION:
    Wrap vinyl tape around the fitting areas of the disconnected suction hose SUB-ASSY and the unit to prevent entry of dirt or moisture.

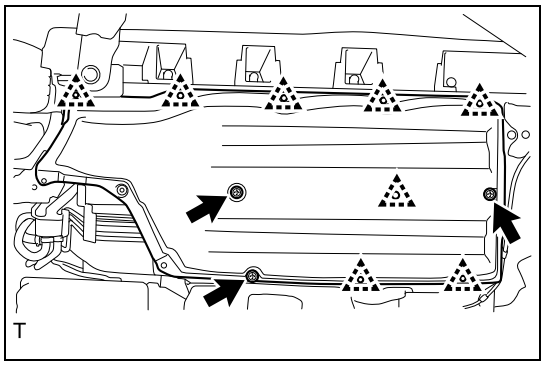
31. Cooler refrigerant discharge hose NO. 1 disconnection (Refer to AC - 144)
32. Removal of starter ASSY (Refer to ST - 21)



33. SST installation (transmission A/T)
    (1) Attach the SST to the starter hole of torque converter clutch case.
    SST 18750AA010

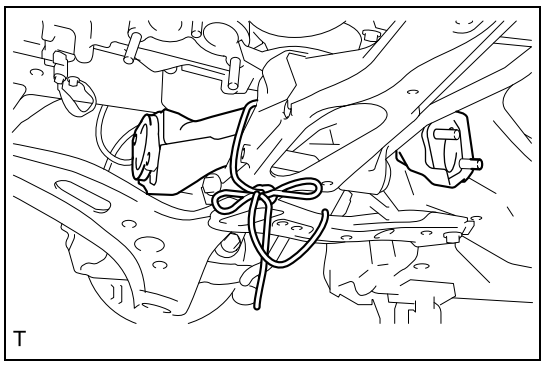


34. Ground cable disconnection
    (1) Remove the two bolts and remove the two ground cables.

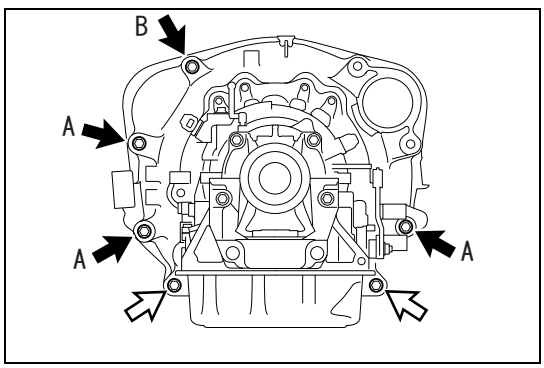


35. Under cover rear LH (with under cover rear LH)
    (1) Remove 3 bolts and 8 clips to remove the under cover rear LH.

36. Removal of stabilizer bar FR (transmission A/T) (Refer to FP - 21)



37. Exhaust pipe SUB-ASSY FR fixation (transmission A/T)
    (1) Tie the exhaust pipe SUB-ASSY FR to the front suspension cross-member SUB-ASSY with the rope.
    NOTE:
    This operation is required to avoid dropping the exhaust pipe SUB-ASSY FR.

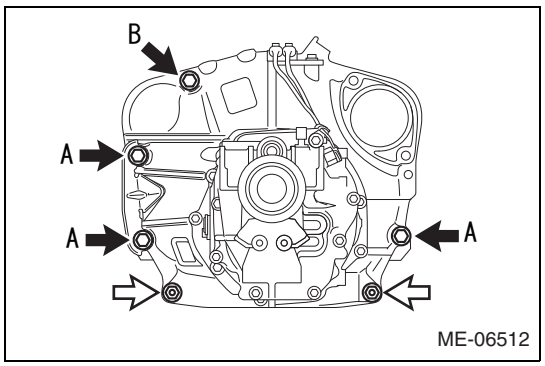


38. Automatic transmission ASSY disconnection (transmission A/T)
    (1) Remove the three bolts A and two nuts.

Captions in illustration

| | |
|---|---|
| ➡ | Bolt |
| ⇨ | Nut |

CAUTION:
Do not remove the bolt B to prevent the ASSY from falling off.

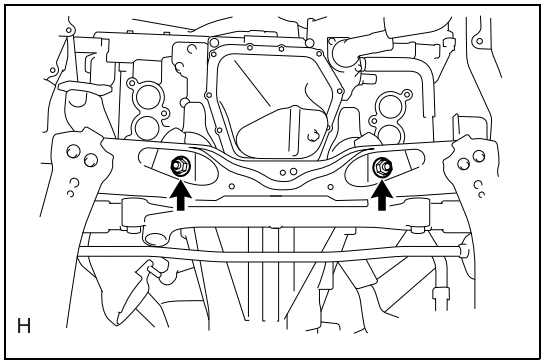


39. Manual transmission ASSY removal (transmission M/T)
    (1) Remove the three bolts A and two nuts.

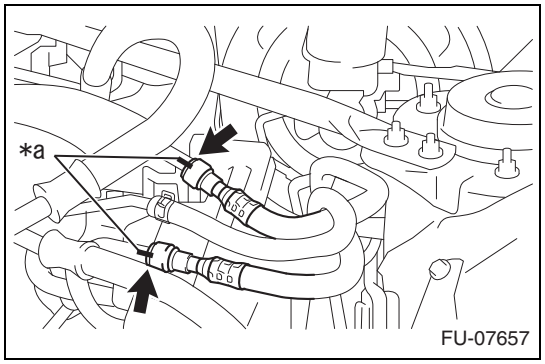
Captions in illustration

| | |
|---|---|
| ➡ | Bolt |
| ⇨ | Nut |

CAUTION:
Do not remove the bolt B to prevent the ASSY from falling off.



40. Disconnection of front crossmember SUB-ASSY
    (1) Remove the two nuts of front crossmember SUB-ASSY.



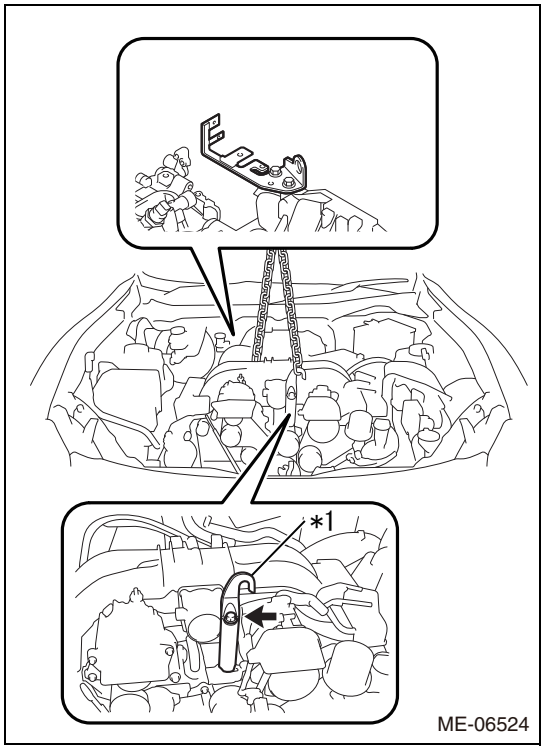
41. SEPARATE FUEL HOSE
    (1) Put alignment marks on the fuel hoses No. 1 and No. 2.

Captions in illustration

| | |
|---|---|
| *a | Alignment marks |

    (2) Using SST, disconnect the fuel hose NO.1 and fuel hose NO.2 from the fuel pipe (See page FU - 3).
    SST 42099AE000

    (3) Remove the clamp and disconnect the purge hose from the fuel pipe.



42. Engine hanger installation
    (1) Install the engine hanger NO. 1 to the position as shown in the figure.
        SST 12281-38150, 90119-14120

Captions in illustration

| | |

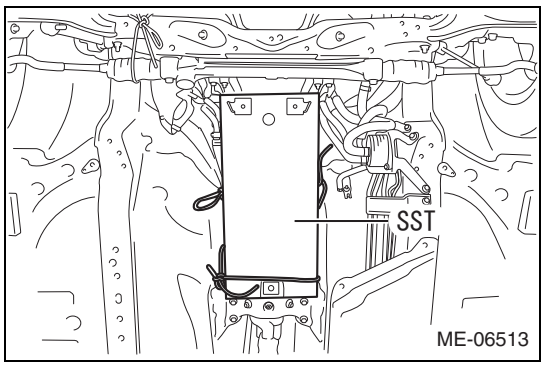
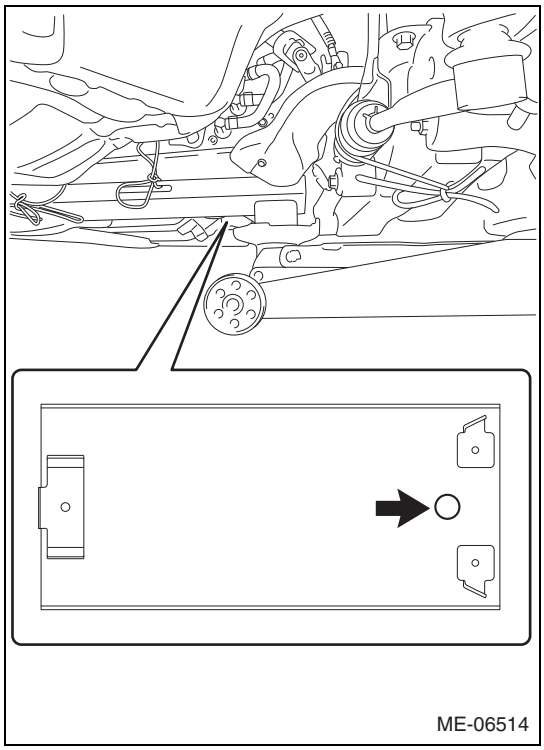
| *1 | Engine hanger NO. 1 |

Standard value:T=43N·m {439kgf·cm} {31.7ft·lbf}

(2) Support the engine with an engine sling device and lifter.



43. Transmission ASSY support (transmission A/T)
    (1) Tie the SST to the transmission ASSY with rope.
        SST 18632AA010

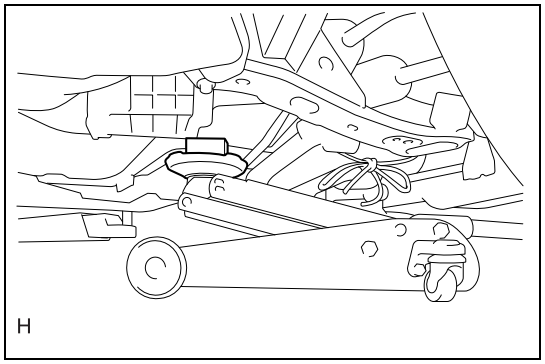


(2) Support the SST with a jack.

Captions in illustration

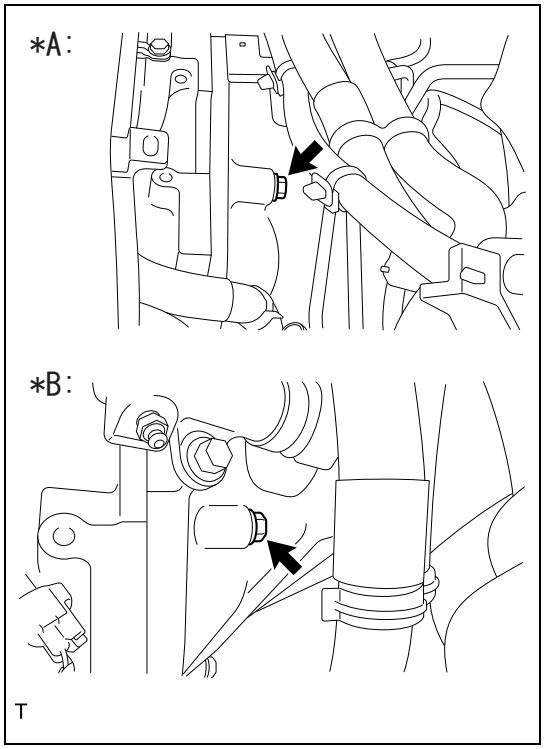
| | |
|---|---|
| ➡ | Center position when supporting with a jack |

CAUTION:
Support the transmission ASSY until the installation of partial engine ASSY is completed.



44. Transmission ASSY support (transmission M/T)
    (1) Support the clutch housing portion of transmission ASSY.
    CAUTION:
    Support the transmission ASSY until the installation of partial engine ASSY is completed.

EM



45. Engine ASSY removal
    (1) Remove the connecting bolt of transmission ASSY.

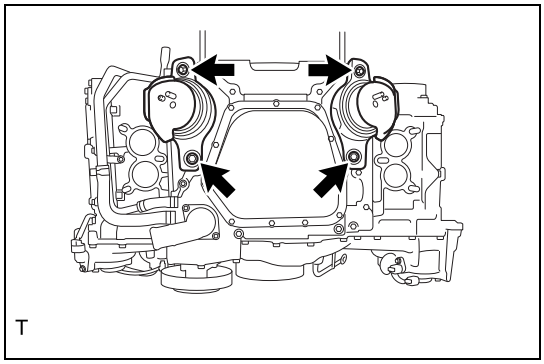
Captions in illustration

| | |
|---|---|
| *A | Transmission A/T |
| *B | Transmission M/T |

    (2) Suspend the partial engine ASSY with an engine sling device and mini-crane.

46. Removal of drive plate & ring gear SUB-ASSY (transmission A/T) (Refer to EM - 53)
47. Clutch cover ASSY removal (transmission M/T) (Refer to CL - 24)
48. Clutch disc ASSY removal (transmission M/T) (Refer to CL - 24)
49. Flywheel SUB-ASSY removal (transmission M/T) (Refer to EM - 53)
50. Crank angle sensor plate removal (Refer to EM - 53)
51. Engine stand installation

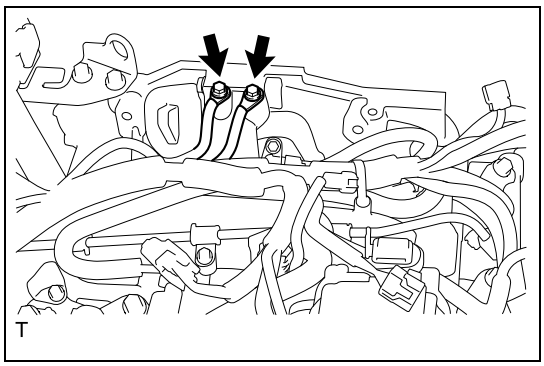
    (1) Use the sections shown in the figure to install the engine ASSY to the engine stand.
    CAUTION:
    - Since the operation with the engine ASSY suspended are danger, never perform it other than when installing the ASSY to the engine stand or removing it from the stand.
    - To prevent damage to the engine, make sure to secure at four positions.



T

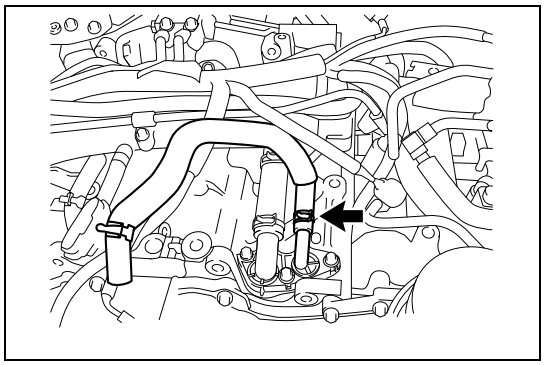
52. Engine mounting insulator FR removal
    (1) Remove the four bolts and remove the two engine mounting insulators FR.

53. Engine hanger removal
    (1) Remove the bolt and remove the engine hanger.
54. Removal of alternator ASSY (Refer to BH - 31)
55. Idler pulley SUB-ASSY NO. 2 removal (Refer to LU - 15)
56. Oil level gauge guide removal (Refer to LU - 15)
57. V-ribbed belt tensioner ASSY removal (Refer to LU - 16)
58. Removal of compressor ASSY (with magnet clutch) (Refer to AC - 144)
59. Removal of intake manifold (Refer to IE - 15)
60. Fuel delivery pipe NO.2 removal (Refer to FU - 31)
61. Fuel delivery pipe removal (Refer to FU - 31)
62. Removal of fuel delivery pipe (bank 2 side) (Refer to FU - 31)
63. Removal of fuel delivery pipe (bank 1 side) (Refer to FU - 32)
64. Fuel injector ASSY removal (Refer to FU - 32)
65. Fuel injector seal removal (Refer to FU - 34)
66. Removal of fuel pump ASSY (Refer to FU - 59)
67. Fuel pump lifter removal (Refer to FU - 59)
68. Pump drive case ASSY removal (Refer to FU - 59)



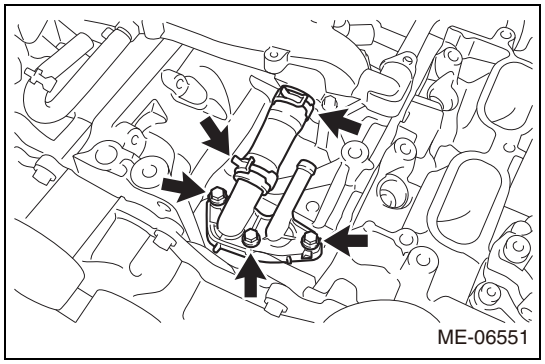
T

69. Engine wiring removal
    (1) Remove the two bolts and disconnect the engine wiring.
    (2) Disconnect each connector and clamp to remove the engine wiring.



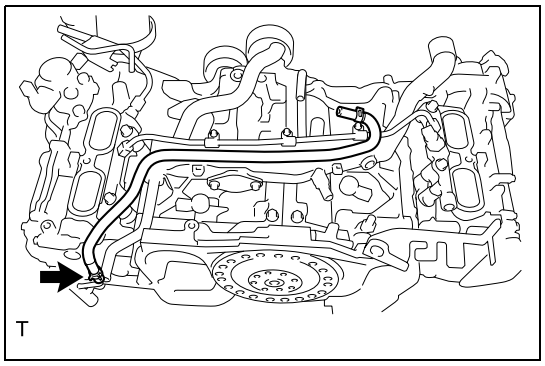
70. Ventilation hose NO. 2 removal
    (1) Move the hose clamp and remove the ventilation hose NO. 2.

EM



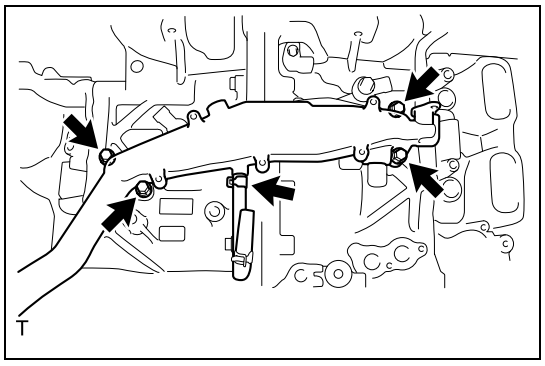
71. PCV hose connector removal
    (1) Remove the three bolts and remove the PCV hose connector.
    (2) Move the hose clamp and disconnect the water by-pass hose NO. 1 from the water pipe ASSY.
    (3) Move the hose clamp and remove the water by-pass hose NO. 1 from the PCV hose connector.

    (4) Remove the two O-rings from the PCV hose connector.

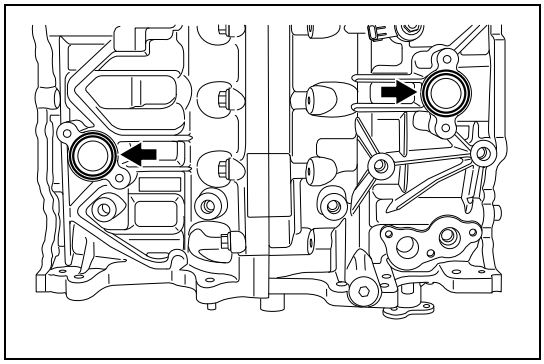


72. Water by-pass hose NO. 2 removal
    (1) Move the hose clamp and remove the water by-pass hose NO. 2.

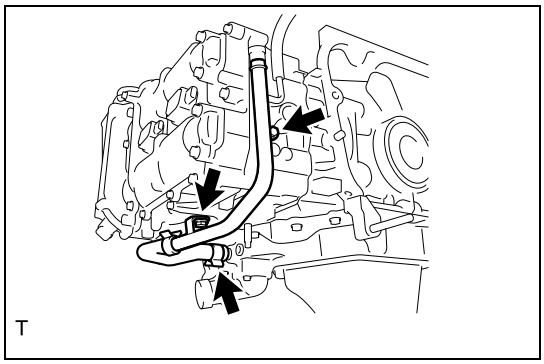
73. Transmission oil cooler hose NO. 3 removal (transmission A/T)
    (1) Move the hose clamp and remove the transmission oil cooler hose NO. 3.



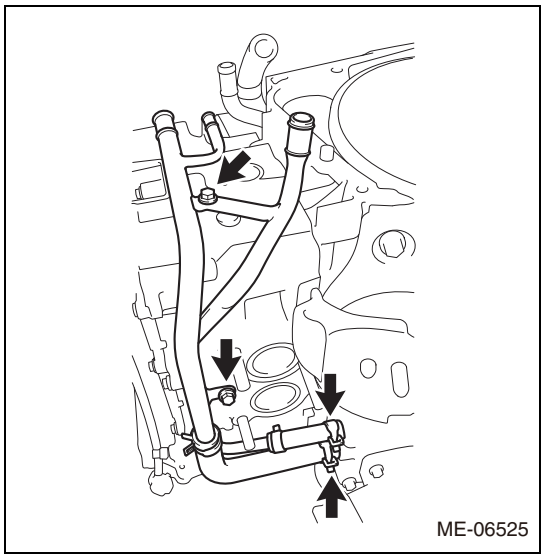
74. Water pipe ASSY removal
    (1) Move the hose clamp and remove the water by-pass hose NO. 3.
    (2) Remove the four bolts, and remove the water pipe ASSY.



(3) Remove the two O-rings from the cylinder block (bank 1 side and bank 2 side).

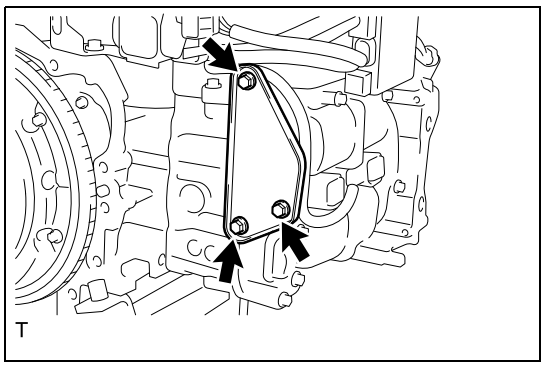


75. Water by-pass pipe NO. 1 removal (transmission M/T)
    (1) Move the hose clamp and disconnect the water by-pass hose NO. 4.
    (2) Remove the two bolts and remove the water by-pass pipe NO. 1.



76. Water by-pass pipe NO. 1 removal (transmission A/T)
    (1) Move the two hose clamps and disconnect the two water by-pass hoses.
    (2) Remove the two bolts and remove the water by-pass pipe NO. 1.

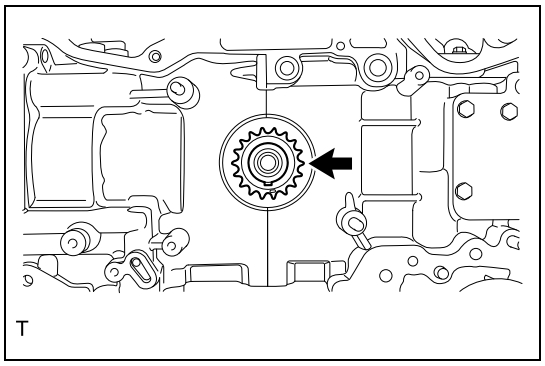
77. Vacuum pump ASSY removal (transmission A/T) (Refer to BR - 34)



78. Cylinder head plate RR removal (transmission M/T)
    (1) Remove the three bolts and remove the cylinder head plate RR from the cam carrier RH.

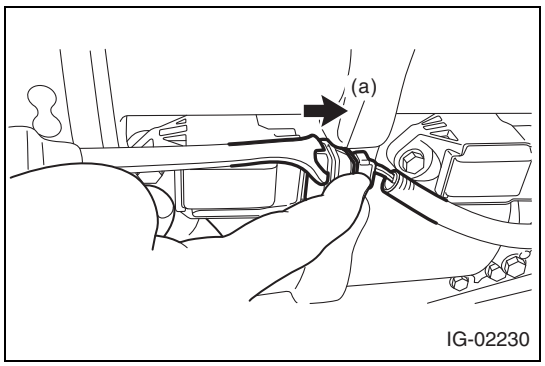
79. Removal of knock control sensor (Refer to ES - 705)
80. Removal of crankshaft position sensor (Refer to ES - 686)
81. PCV valve removal (Refer to EC - 21)
82. Idler pulley SUB-ASSY NO. 1 removal (Refer to LU - 16)

83. Water pump pulley removal (Refer to CO - 19)
84. Engine water pump ASSY removal (Refer to CO - 20)
85. Thermostat cover removal (Refer to CO - 37)
86. Thermostat removal (Refer to CO - 37)
87. Crankshaft pulley removal (Refer to EM - 49)
88. Chain cover oil seal removal (Refer to EM - 50)
89. Chain cover removal (Refer to LU - 16)
90. Removal of timing chain (bank 1 side) (Refer to EM - 14)
91. Removal of timing chain (bank 2 side) (Refer to EM - 15)
92. Piston and valve damage prevention procedure (Refer to EM - 31)

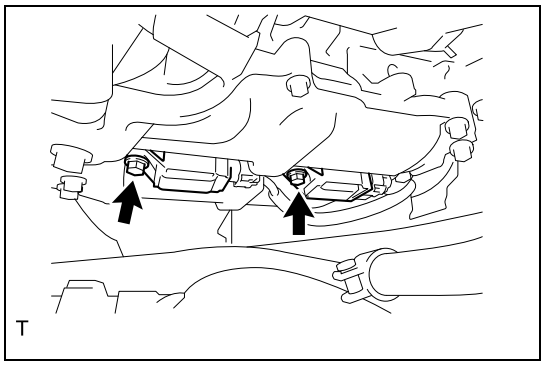


93. Crankshaft sprocket removal
    (1) Remove the crankshaft sprocket.

94. Removal of ignition coil ASSY (bank 2 side)

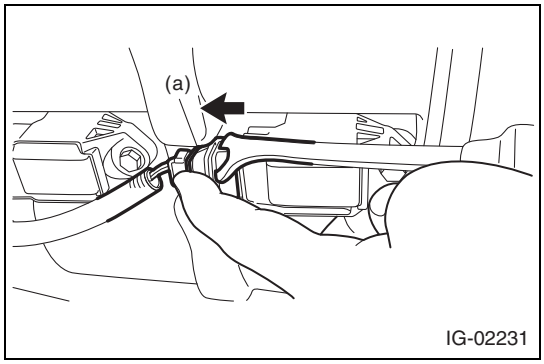


(1) Disconnect 2 connectors for the ignition coil ASSY.
NOTE:
Slide the connectors in the direction of the arrow using a tool such as a clip remover while pressing the spring (a) shown in the figure.

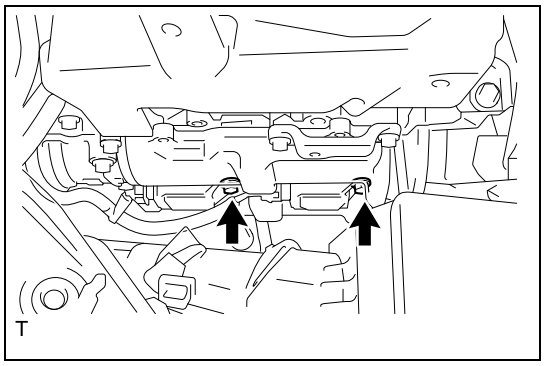


(2) Remove 2 bolts, and remove 2 ignition coil ASSYs.

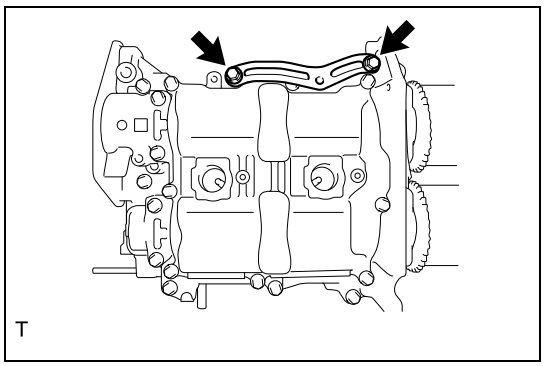
95. Removal of ignition coil ASSY (bank 1 side)



(1) Disconnect 2 connectors for the ignition coil ASSY.
NOTE:
Slide the connectors in the direction of the arrow using a tool such as a clip remover while pressing the spring (a) shown in the figure.

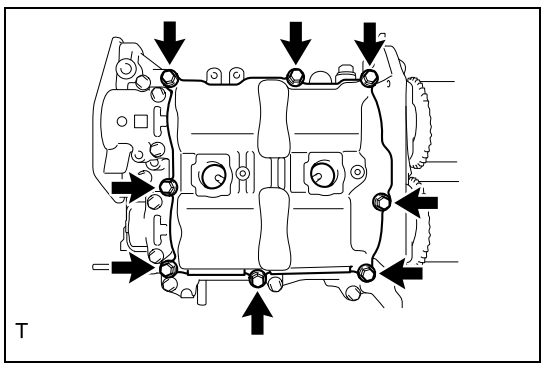


(2) Remove 2 bolts, and remove 2 ignition coil ASSYs.



96. Injector driver bracket removal
(1) Remove the two bolts and remove the injector driver bracket.

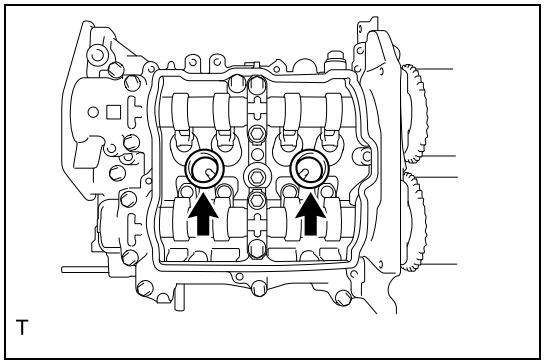
97. Removal of rocker cover RH
(1) Operate the engine stand, and make the bank 1 side face upward.



(2) Remove the 8 bolts.

(3) Remove the rocker cover RH using a flat tip screwdriver wrapped with protective tape.
CAUTION:
Do not damage the cam carrier, cam cap and rocker cover.

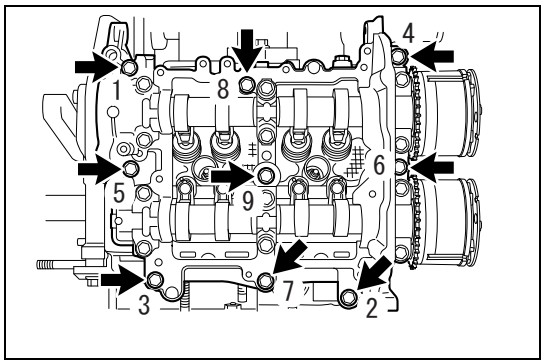
(4) Remove the rocker cover gasket.



(5) Remove the two spark plug pipe gaskets.
CAUTION:
When removing the seal gasket using scraper etc., be careful not to damage the cam lobe of camshaft.

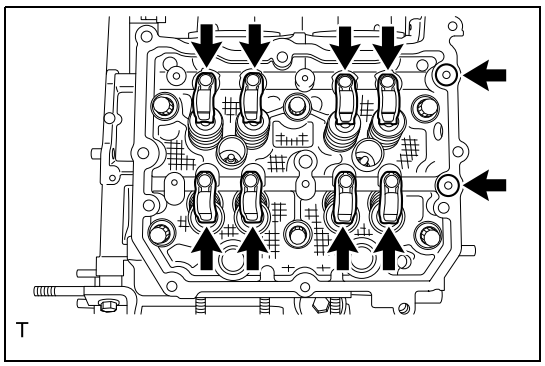
EM

98. Cam carrier RH removal
CAUTION:
Do not remove the intake and exhaust camshafts before removing the cam carrier. Doing so will result in distortion of cam carrier.

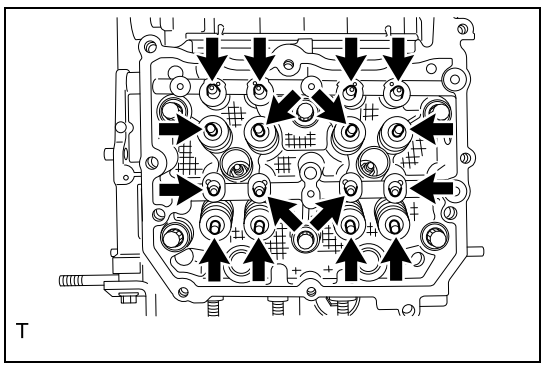


(1) Loosen the nine bolts equally in the order as shown in the figure and remove them.

(2) Remove the cam carrier RH using a flat tip screwdriver wrapped with protective tape.
CAUTION:
Do not damage the cylinder head and cam carrier.



(3) Remove the two O-rings and eight roller rocker arm from the cylinder head RH.
NOTE:
The removed parts must be organized by installation location.



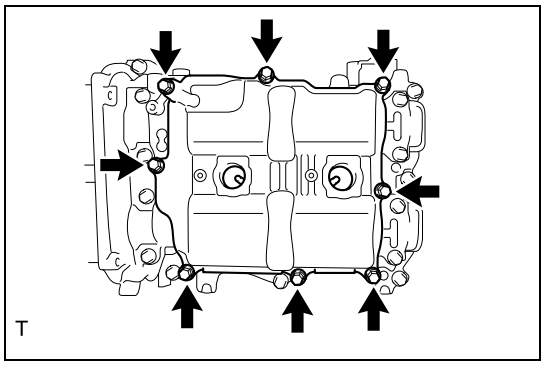
(4) Remove the eight valve shims and eight roller rocker arm pivots from the cylinder head RH.
NOTE:
The removed parts must be organized by installation location.

99. Cylinder head RH removal (Refer to EM - 42)

100. Cylinder head gasket removal (Refer to EM - 42)

101.Rocker cover LH removal

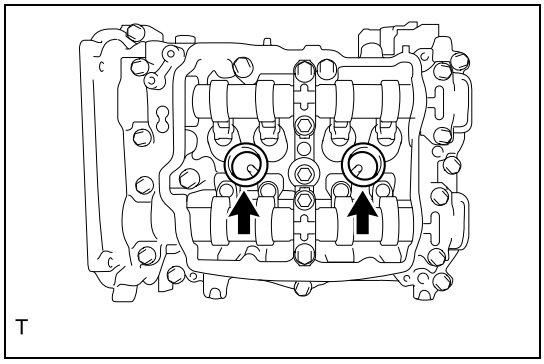
(1) Operate the engine stand, and make the bank 2 side face upward.



(2) Remove the 8 bolts.

(3) Remove the rocker cover LH using a flat tip screwdriver wrapped with protective tape.
CAUTION:
Do not damage the cam carrier, cam cap and rocker cover.

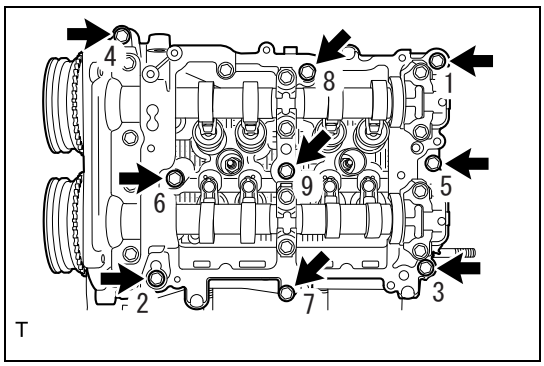
(4) Remove the rocker cover gasket NO. 2.



(5) Remove the two spark plug pipe gaskets.
CAUTION:
When removing the seal gasket using scraper etc., be careful not to damage the cam lobe of camshaft.

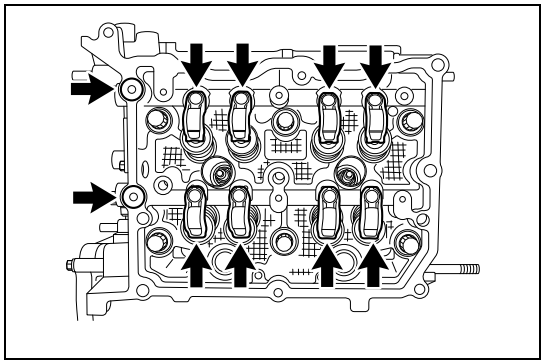
102.Cam carrier LH removal

CAUTION:
Do not remove the intake and exhaust camshafts before removing the cam carrier. Doing so will result in distortion of cam carrier.

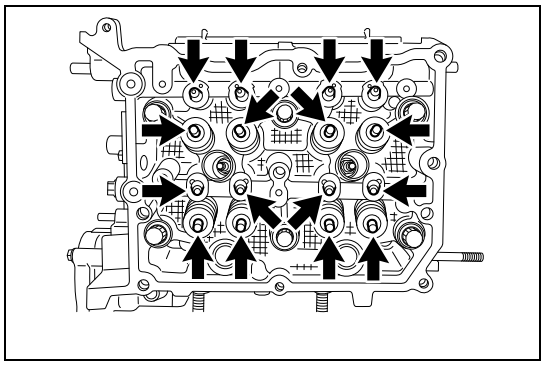


(1) Loosen the nine bolts equally in the order as shown in the figure and remove them.

(2) Remove the cam carrier using a flat tip screwdriver wrapped with protective tape.
CAUTION:
Do not damage the cylinder head and cam carrier.



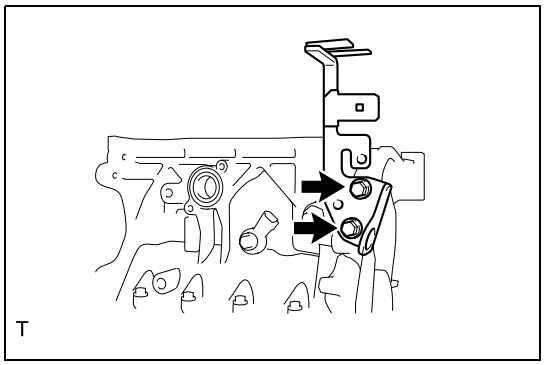
(3) Remove the two O-rings and eight roller rocker arms from the cylinder head LH.
NOTE:
The removed parts must be organized by installation location.



(4) Remove the eight valve shims and eight roller rocker arm pivots from the cylinder head LH.
NOTE:
The removed parts must be organized by installation location.

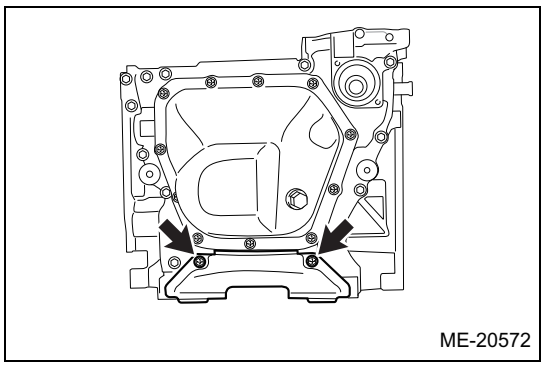
103.Cylinder head LH removal (Refer to EM - 42)

104.Cylinder head gasket NO. 2 removal (Refer to EM - 42)



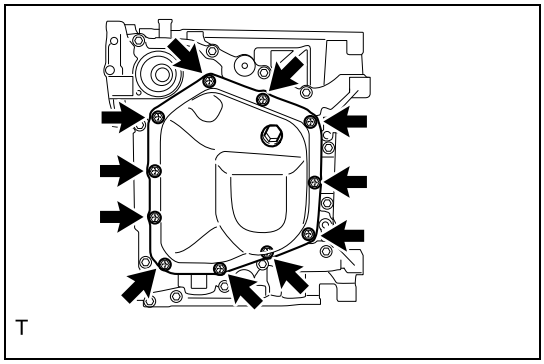
105.Engine hanger NO. 2 removal

(1) Remove the two bolts and remove the engine hanger NO. 2 from the cylinder block (bank 1 side).



106.Removal of housing cover

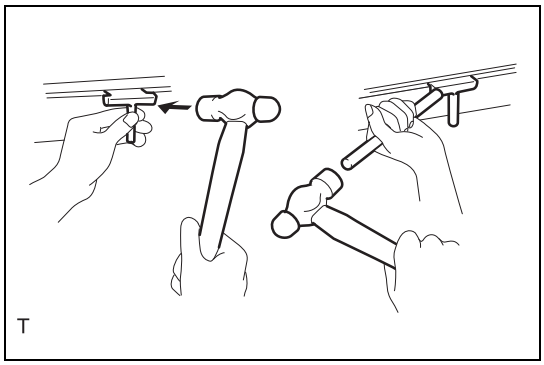
(1) Remove the two bolts and remove the housing cover from the oil pan upper.



T

107.Oil pan removal

(1) Remove the 11 bolts.

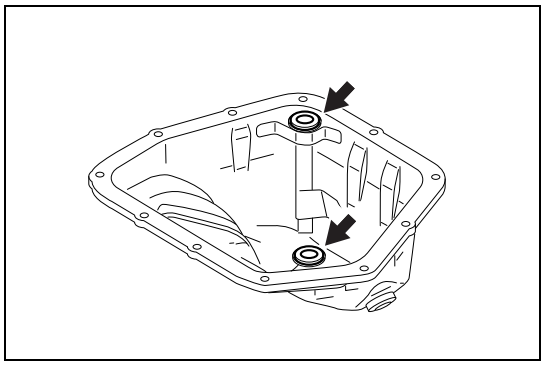


T

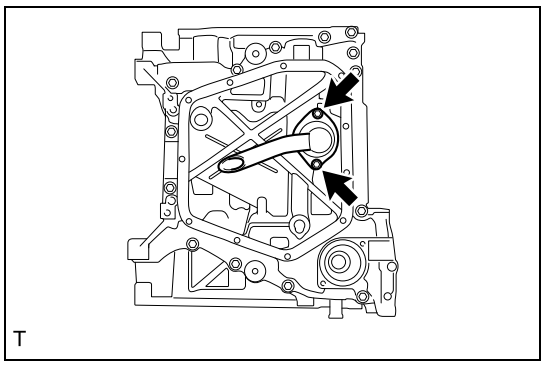
(2) Remove the oil pan with a oil pan seal cutter.

CAUTION:

Do not damage the installation surface of oil pan upper and the flange portion of oil pan.



(3) Remove the two seal rings from the oil pan.

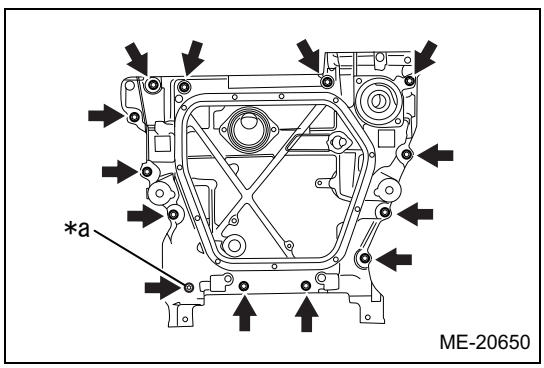


T

108.Oil strainer removal

(1) Remove the two bolts and remove the oil strainer.

(2) Remove the O-ring.



109.Oil pan upper removal

(1) Remove the 13 bolts.

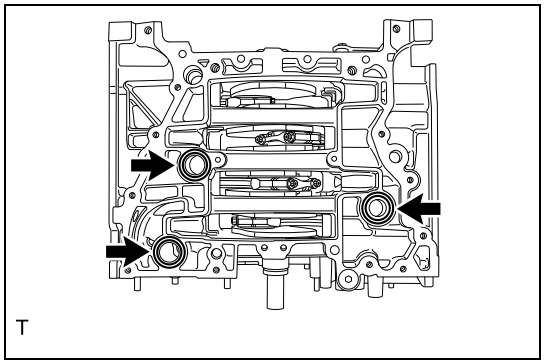
Captions in illustration

| | |
|---|---|
| *a | Use Torx® bit T45 for removal. |

(2) Remove the oil pan upper using a flat tip screwdriver wrapped with protective tape.

CAUTION:

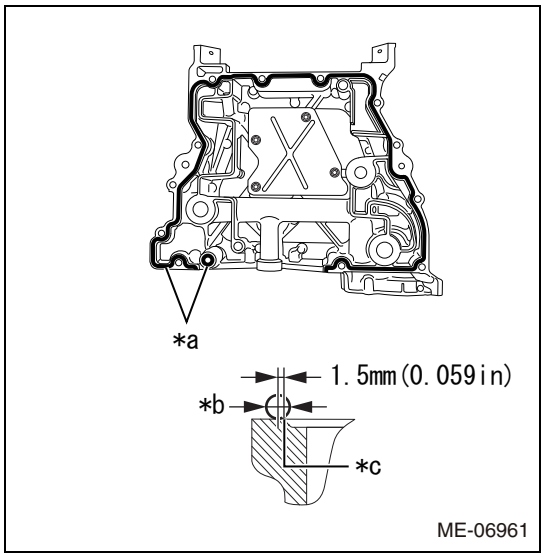
Do not damage the installation surfaces of cylinder block and oil pan upper.



(3) Remove the three O-rings from the cylinder block.

EM

## Installation

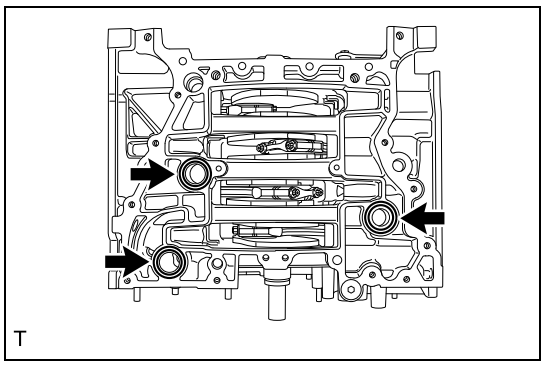


1. Oil pan upper installation
   (1) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of oil pan upper as shown in the figure.

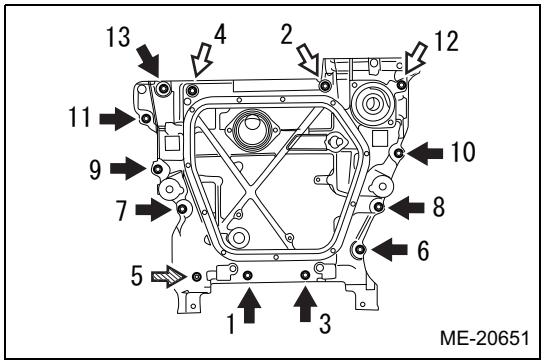
Captions in illustration

| | |
|---|---|
| *a | THREE BOND 1217G/1217H or equivalent |
| *b | Diameter: 4.0 to 6.0mm {0.158 to 0.236 in} |
| *c | Groove end |

CAUTION:
- Clean and degrease the installation surface.
- Install within 5 min. after applying liquid gasket.
- Apply liquid gasket 1.5 mm {0.0591 in} outside from the groove on the oil pan upper. However, application of liquid gasket on the groove around the bolt hole is allowed.



(2) Install three new O-rings to the cylinder block.



(3) Tighten the 13 bolts (A, B and C) in the order as shown in the figure to install the oil pan upper to the cylinder block.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}

Captions in illustration

| | |
|---|---|
| ➡ | Bolt A |
| ⇨ | Bolt B |
| ⇛ | Bolt C |

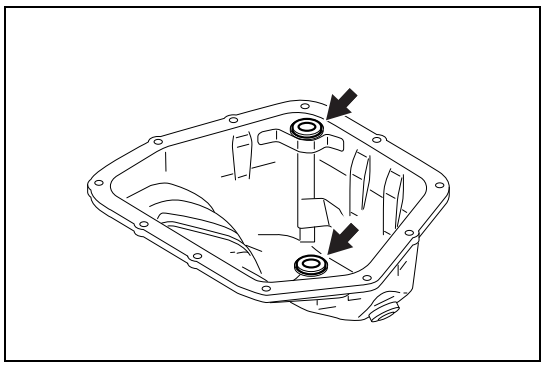
| Bolt type | Bolt length (except for head) |
|---|---|
| Bolt A | 25 mm {0.984 in} |
| Bolt B | 75 mm {2.953 in} |
| Bolt C | 30 mm{1.181 in} |

NOTE:

- Tighten the bolt C using Torx® bit T45.
- After tightening, if the liquid gasket is squeezed out onto the seal surface of chain cover, completely remove any squeezed-out liquid gasket.

2. Oil strainer installation
   (1) Install a new O-ring.

   (2) Install the oil strainer to the oil pan upper with the two bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}



3. Oil pan installation
   (1) Install two new oil pan seal rings to the oil pan.

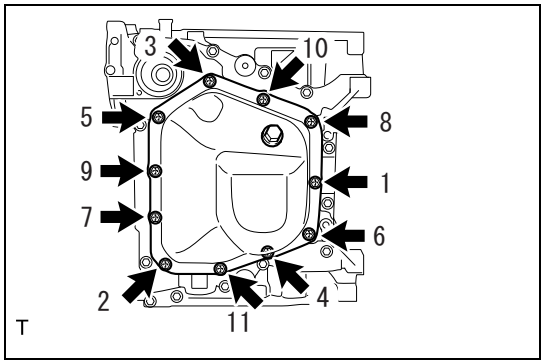
   (2) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of oil pan for the oil pan upper as shown in the figure.

Captions in illustration

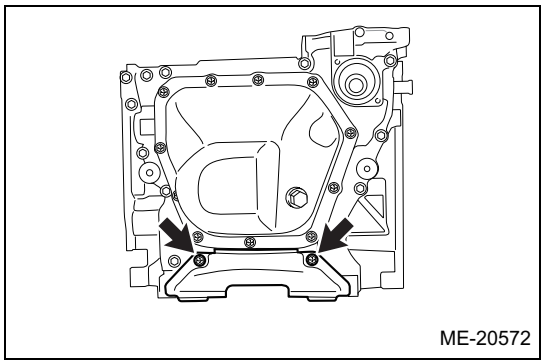
| | |
|---|---|
| *a | THREE BOND 1217G/1217H or equivalent |
| *b | Diameter: 4.0 to 6.0mm {0.158 to 0.236 in} |

CAUTION:

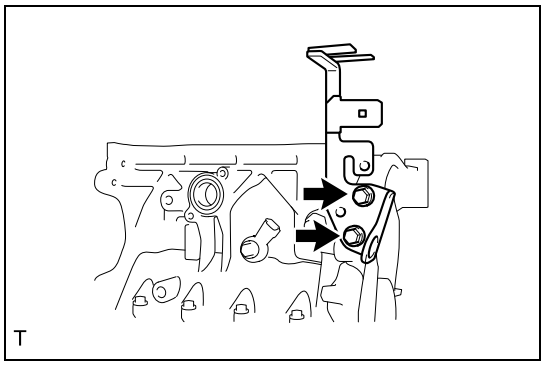
- Clean and degrease the installation surface.
- Install within 5 min. after applying liquid gasket.



(3) Tighten the 11 bolts in the order as shown in the figure to install the oil pan.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}

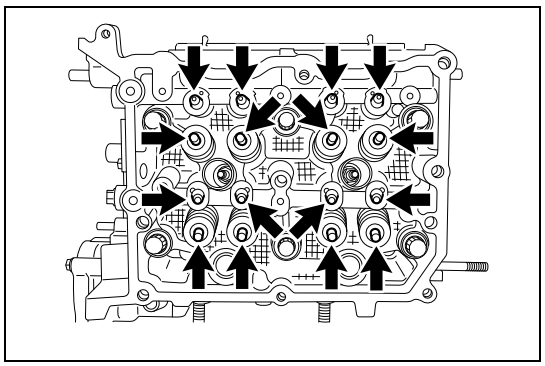


4. Installation of housing cover
(1) Install the housing cover to the oil pan upper with the two bolts.
Standard value:T=5.0N·m {51kgf·cm} {3.7ft·lbf}

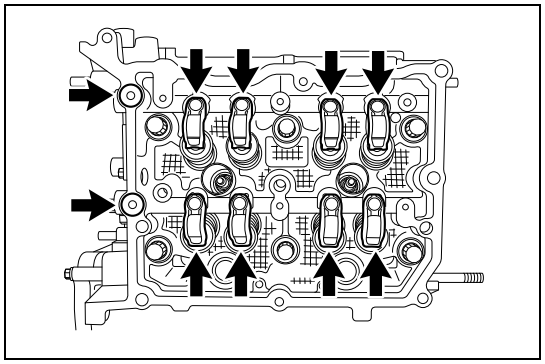


5. Engine hanger NO. 2 installation
(1) Install the engine hanger NO. 2 to the cylinder block (bank 1 side) with the two bolts.
Standard value:T=21N·m {214kgf·cm} {15.5ft·lbf}

6. Cylinder head gasket NO. 2 installation (Refer to EM - 42)
7. Cylinder head LH installation (Refer to EM - 43)
8. Cam carrier LH installation

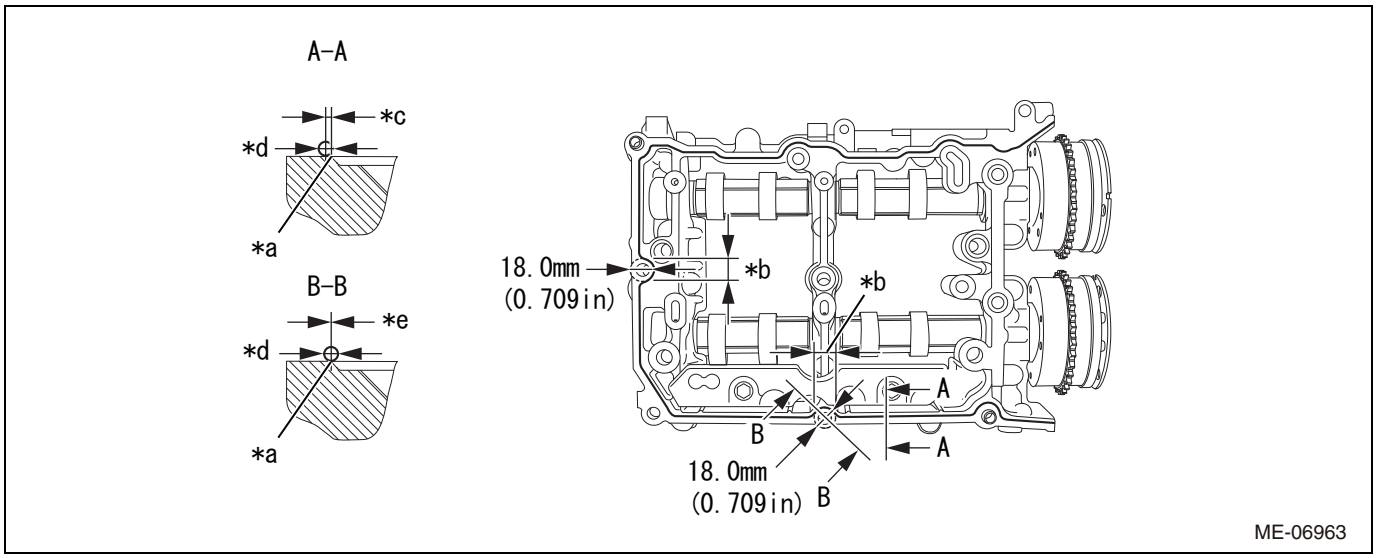


(1) Apply new engine oil to the valve shim and roller rocker arm pivot, and install them to the cylinder head LH.



(2) Apply new engine oil to the eight roller rocker arms and two new O-rings, and install them to the cylinder head LH.

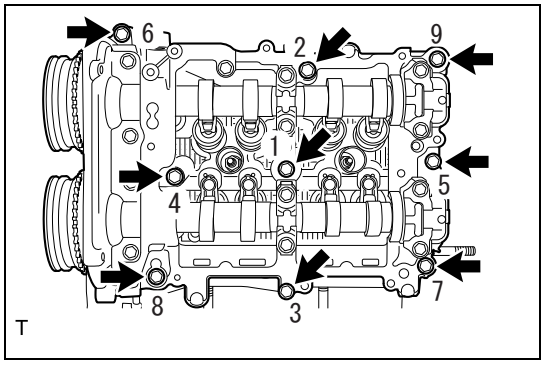
(3) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of cam carrier LH as shown in the figure.



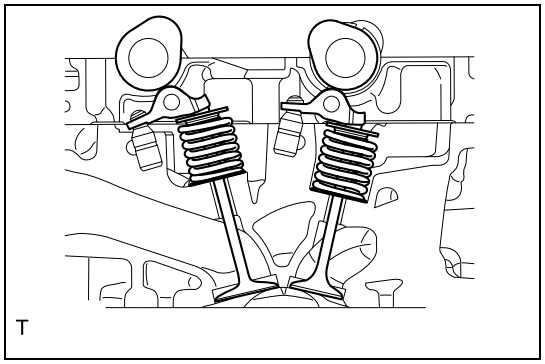
Captions in illustration

| | | | |
|---|---|---|---|
| *a | Groove end | *b | Area of B-B |
| *c | 1.0 mm {0.0394 in} or less | *d | Diameter: 2.5 to 3.5 mm {0.098 to 0.138 in} |
| *e | -0.5 to 0.5 mm {-0.0197 to 0.0197 in} | - | - |

CAUTION:
- Clean and degrease the installation surface.
- Do not apply liquid gasket excessively.
- Install within 5 min. after applying liquid gasket.
- Completely remove any liquid gasket that is squeezed out on the installation surface of chain cover.

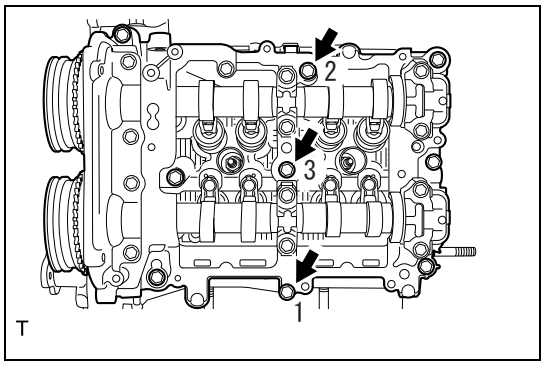


(4) Tighten the 9 bolts in the order as shown in the figure to install the cam carrier LH.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}

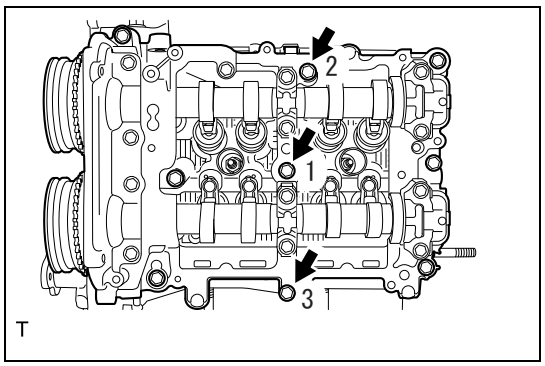


NOTE:
Set the intake camshaft LH and exhaust camshaft LH to the zero-lift position.

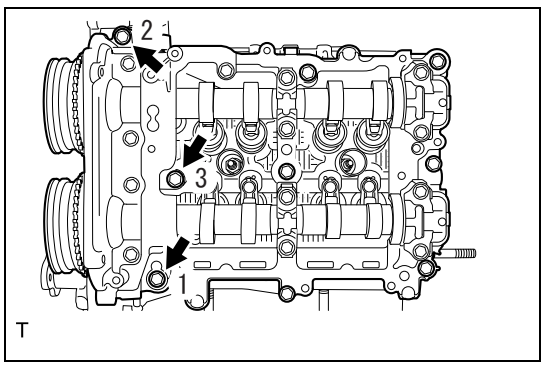
EM



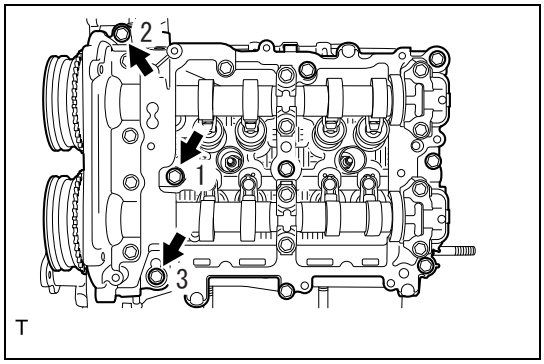
(5) Loosen the three bolts by 180° in the order as shown in the figure.



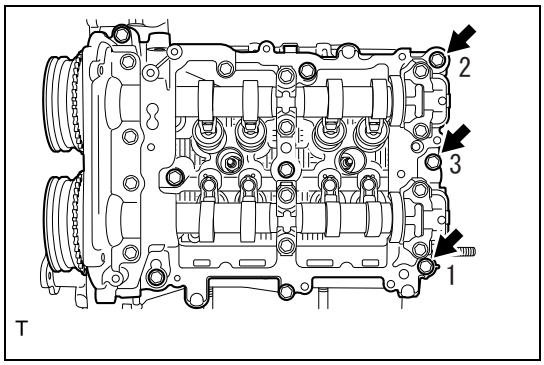
(6) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}



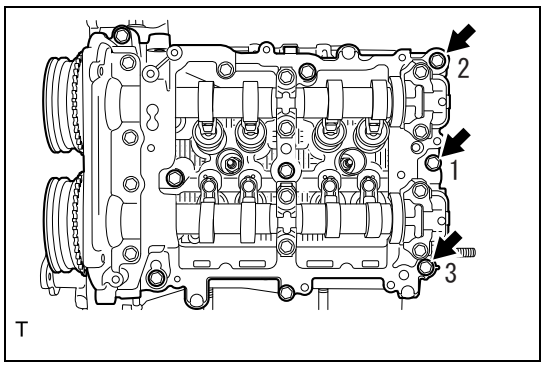
(7) Loosen the three bolts by 180° in the order as shown in the figure.



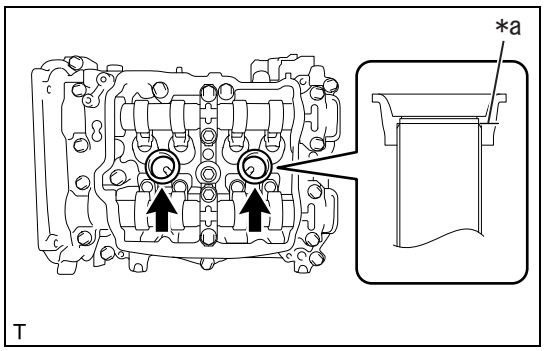
(8) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}



(9) Loosen the three bolts by 180° in the order as shown in the figure.



(10) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
NOTE:
After tightening, if the liquid gasket is squeezed out onto the seal surface of chain cover, completely remove any squeezed-out liquid gasket.

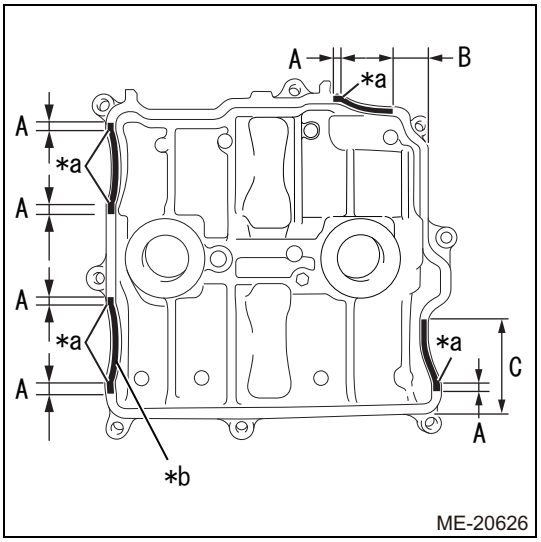


9. Rocker cover LH installation
(1) Apply a thin coat of new engine oil to two new spark plug pipe gaskets and insert them onto the spark plug pipe edge.

Captions in illustration

| | |
|---|---|
| *a | Spark plug pipe edge |

(2) Install a new head cover gasket NO. 2 to the rocker cover LH.

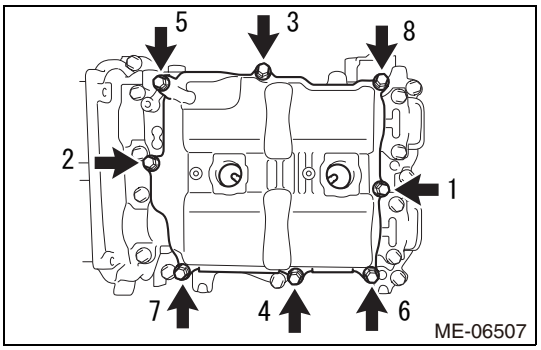


(3) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of rocker cover LH as shown in the figure.

| Application area | Application length |
|---|---|
| A | 10.0 mm {0.394 in} or more |
| B | 18.8 mm {0.740 in} or less |
| C | 63.0 mm {2.480 in} or more |

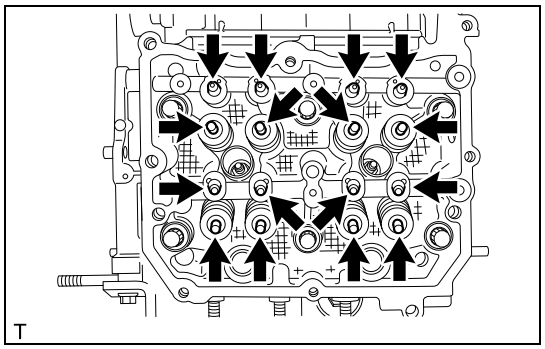
Captions in illustration

| | |
|---|---|
| *a | Arch starting point |
| *b | Diameter: 2.0 to 4.0 mm {0.079 to 0.158 in} |

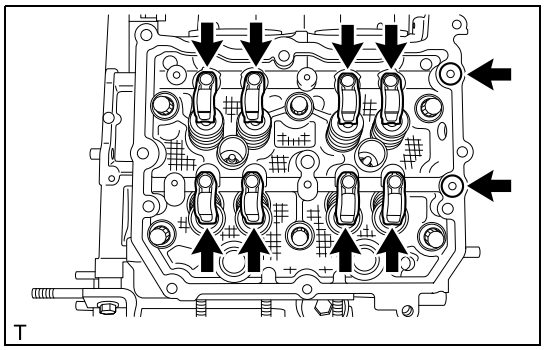


(4) Set the rocker cover LH and tighten the eight bolts in the order as shown in the figure.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}

10. Cylinder head gasket installation (Refer to EM - 45)
11. Cylinder head RH installation (Refer to EM - 45)
12. Cam carrier RH installation

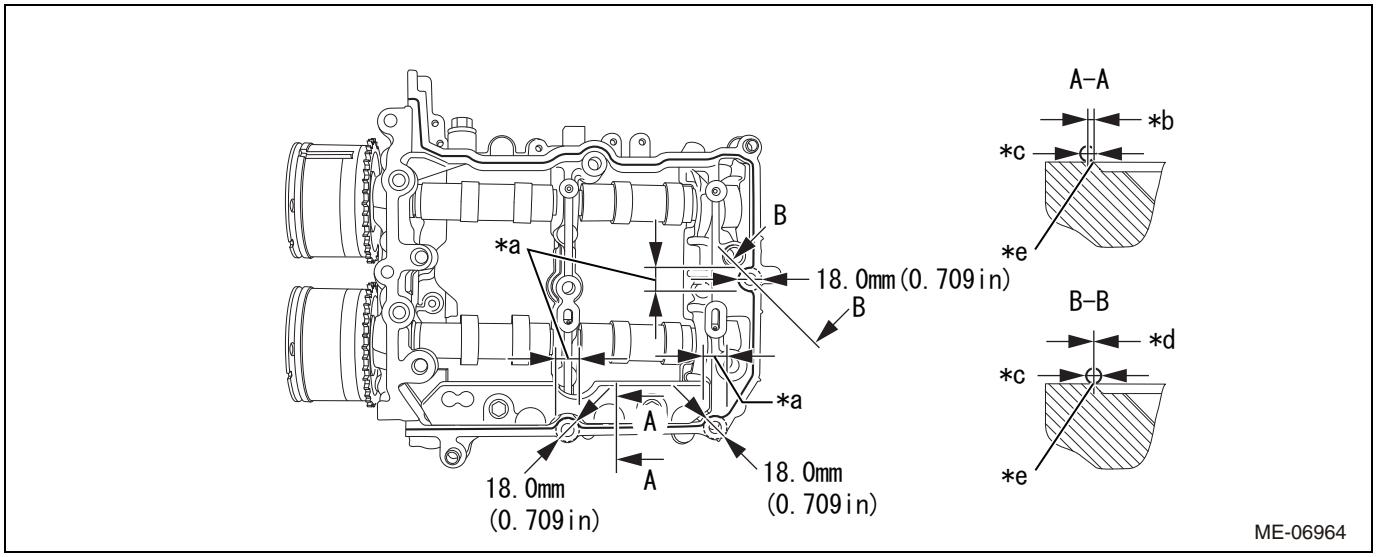


(1) Apply new engine oil to the valve shim and roller rocker arm pivot, and install them to the cylinder head RH.



(2) Apply new engine oil to the eight roller rocker arms and two new O-rings, and install them to the cylinder head RH.

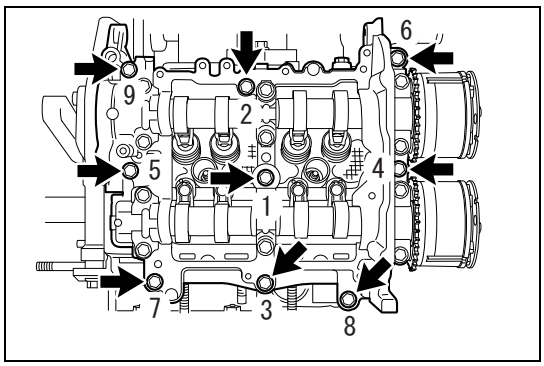
(3) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of cam carrier RH as shown in the figure.



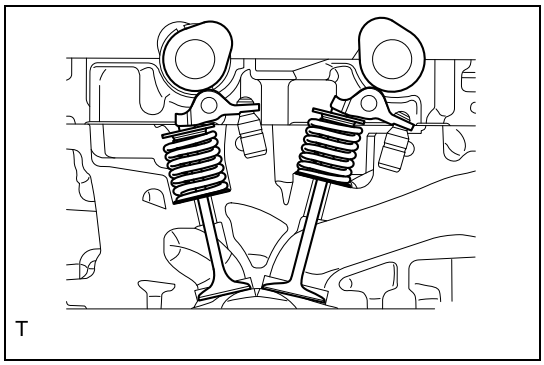
Captions in illustration

| | | | |
|---|---|---|---|
| *a | Area of B-B | *b | 1.0 mm {0.0394 in} or less |
| *c | Diameter: 2.5 to 3.5 mm {0.098 to 0.138 in} | *d | -0.5 to 0.5 mm {-0.0197 to 0.0197 in} |
| *e | Groove edge | - | - |

CAUTION:
- Clean and degrease the installation surface.
- Do not apply liquid gasket excessively.
- Install within 5 min. after applying liquid gasket.
- Completely remove any liquid gasket that is squeezed out on the installation surface of chain cover.

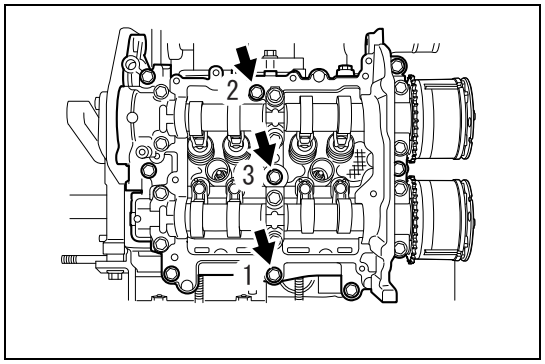


(4) Tighten the 9 bolts in the order as shown in the figure to install the cam carrier RH.
Standard value:T=18N·m {184kgf·cm} {1.3.3 ft·lbf}



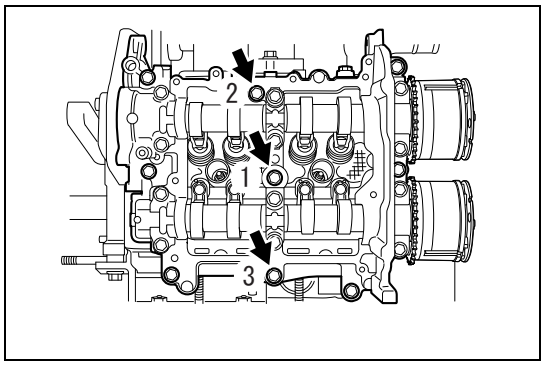
T

NOTE:
Set the intake camshaft RH and exhaust camshaft RH to the zero-lift position.

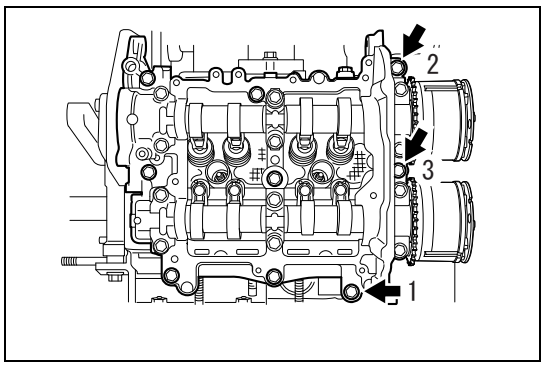


(5) Loosen the three bolts by 180° in the order as shown in the figure.

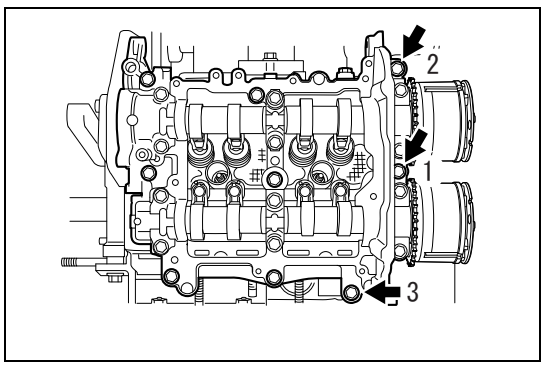
EM



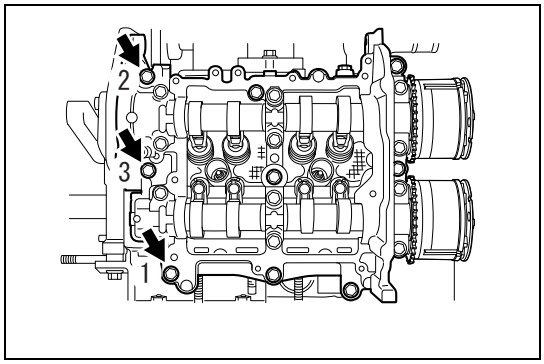
(6) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}



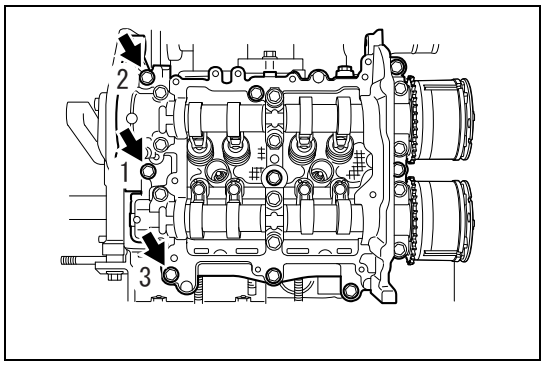
(7) Loosen the three bolts by 180° in the order as shown in the figure.



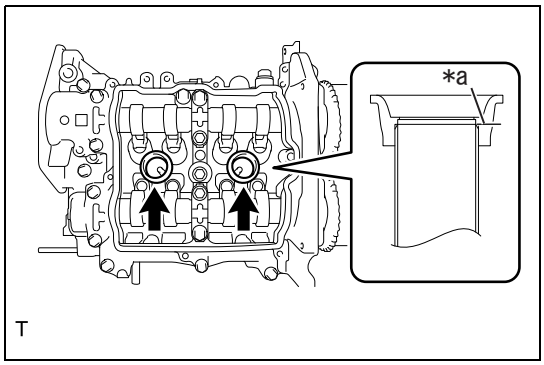
(8) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {1.3.3 ft·lbf}



(9) Loosen the three bolts by 180° in the order as shown in the figure.



(10) Tighten the three bolts in the order as shown in the figure.
Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
NOTE:
After tightening, if the liquid gasket is squeezed out onto the seal surface of chain cover, completely remove any squeezed-out liquid gasket.

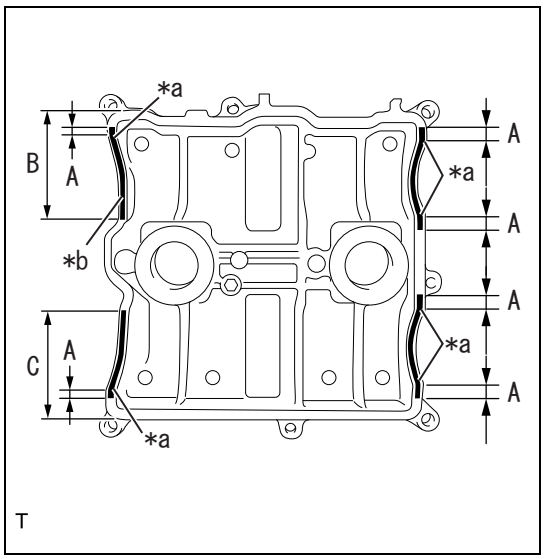


13. Installation of rocker cover RH
(1) Apply a thin coat of new engine oil to two new spark plug pipe gaskets and insert them onto the spark plug pipe edge.

Captions in illustration

| | |
|---|---|
| *a | Spark plug pipe edge |

(2) Install a new rocker cover gasket to the rocker cover RH.

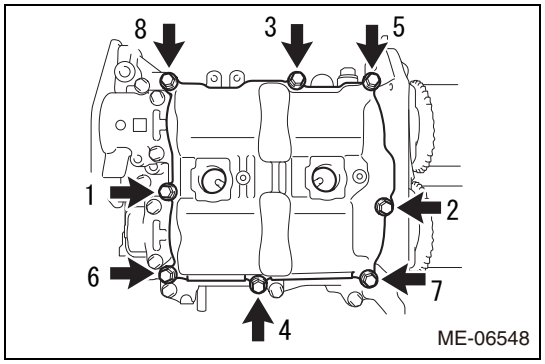


(3) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of rocker cover RH as shown in the figure.

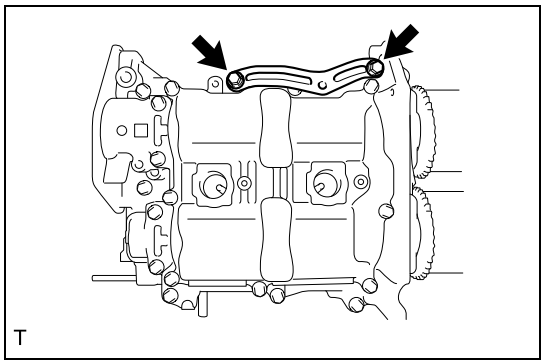
| Application area | Application length |
|---|---|
| A | 10.0 mm {0.394 in} or more |
| B | 68.0 mm {2.677 in} or more |
| C | 70.7 mm {2.784 in} or more |

Captions in illustration

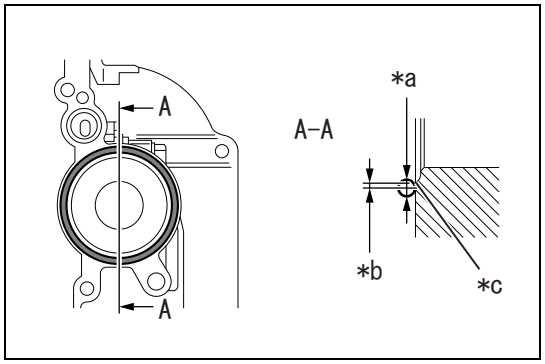
| | |
|---|---|
| *a | Arch starting point |
| *b | Diameter: 2.0 to 4.0 mm {0.079 to 0.158 in} |



(4) Set the rocker cover RH and tighten the eight bolts in the order as shown in the figure.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}



14. Injector driver bracket installation
    (1) Install the injector driver bracket with the two bolts.
    Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
15. Installation of ignition coil ASSY (bank 1 side)
    (1) Using 2 bolts, install the ignition coil ASSY.
    Standard value:T=8.5N·m {87kgf·cm} {6.3ft·lbf}
    (2) Connect 2 connectors of the ignition coil ASSY.
16. Installation of ignition coil ASSY (bank 2 side)
    (1) Using 2 bolts, install the ignition coil ASSY.
    Standard value:T=8.5N·m {87kgf·cm} {6.3ft·lbf}
    (2) Connect 2 connectors of the ignition coil ASSY.
17. Crankshaft sprocket installation
    (1) Install the crankshaft sprocket.
18. Timing chain installation (bank 2 side) (Refer to EM - 16)
19. Timing chain installation (bank 1 side) (Refer to EM - 18)
20. Chain cover installation (Refer to LU - 26)
21. Chain cover oil seal installation (Refer to EM - 50)
22. Crankshaft pulley installation (Refer to EM - 50)
23. Thermostat installation (Refer to CO - 38)
24. Thermostat cover installation (Refer to CO - 38)
25. Engine water pump ASSY installation (Refer to CO - 20)
26. Water pump pulley installation (Refer to CO - 20)
27. Idler pulley SUB-ASSY NO. 1 installation (Refer to LU - 29)
28. PCV valve installation (Refer to EC - 22)
29. Installation of crankshaft position sensor (Refer to ES - 686)
30. Installation of knock control sensor (Refer to ES - 705)



31. Cylinder head plate RR installation (transmission M/T)
    (1) Apply THREE BOND 1217G/1217H or equivalent to the cam carrier RH as shown in the figure.

Captions in illustration

| | |
|---|---|
| *a | Diameter: 2.0 to 4.0 mm {0.079 to 0.158 in} |
| *b | 1.0 mm {0.0394 in} or less |
| *c | Groove end |

CAUTION:
- Clean and degrease the installation surface.
- Install within 5 min. after applying liquid gasket.

    (2) Install the cylinder head plate with the three bolts.
    Standard value:T=16N·m {163kgf·cm} {11.8ft·lbf}

32. Vacuum pump ASSY installation (transmission A/T) (Refer to BR - 35)
33. Water by-pass pipe NO. 1 installation (transmission M/T)
    (1) Install the water by-pass pipe NO. 1 with the two bolts.
    Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
    (2) Install the water by-pass hose with the hose clamp.
34. Water by-pass pipe NO. 1 installation (transmission A/T)
    (1) Install the water by-pass pipe NO. 1 with the two bolts.
    Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
    (2) Install the two water by-pass hoses with the two hose clamps.
35. Water pipe ASSY installation
    (1) Install two new O-rings to the cylinder block.
    (2) Install the water pipe ASSY with the four bolts.
    Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
    (3) Install the water by-pass hose NO. 3 with the hose clamp.
36. Transmission oil cooler hose NO. 3 installation
    (1) Connect the transmission oil cooler hose NO. 3.
37. Water by-pass hose NO. 2 installation
    (1) Install the water by-pass hose NO. 2 with the hose clamp.
38. PCV hose connector installation
    (1) Install two new O-rings to the PCV hose connector.
    (2) Connect the water by-pass hose NO. 1 to the PCV hose connector and water pipe ASSY with the hose clamps.
    (3) Install the PCV hose connector with the three bolts.
    Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
39. Ventilation hose NO. 2 installation
    (1) Connect the ventilation hose NO. 2 with the hose clamp.
40. Engine wiring installation
    (1) Confirm the connection of each connector and clamp as shown in the figure.

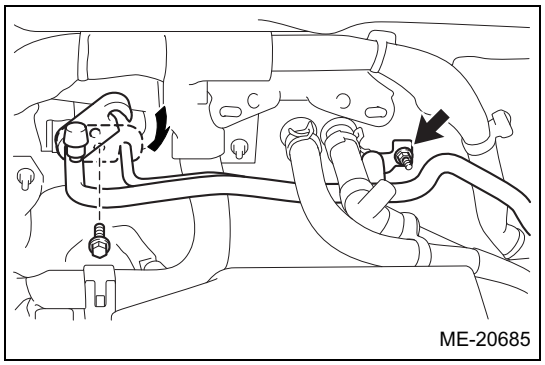
71. Installation of stabilizer bar FR (transmission A/T) (Refer to FP - 23)

72. Installation of under cover rear LH (with under cover rear LH)
    (1) Install the under cover rear LH with the three bolts and eight clips.
    Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
73. Ground cable installation
    (1) Install the ground cable with the two bolts.
    Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
74. SST removal (transmission A/T)
    (1) Remove the SST from the starter hole of torque converter clutch case.
75. Installation of starter ASSY (Refer to ST - 41)
76. Cooler refrigerant discharge hose No. 1 connection (Refer to AC - 145)
77. Suction hose SUB-ASSY installation
    (1) Remove the vinyl tape wrapped around the joint of the suction hose SUB-ASSY.
    (2) Apply sufficient compressor oil to a new O-ring and the fitting area of compressor ASSY (with pulley).
    (3) Install the O-ring to the suction hose SUB-ASSY.
    CAUTION:
    Do not allow dust etc. to adhere to the O-ring and O-ring sealing portion.
    (4) Connect the suction hose SUB-ASSY to the compressor ASSY (with pulley) with the bolt.
    Standard value:T=10N·m {102kgf·cm} {7.4ft·lbf}
    (5) Remove the vinyl tape wrapped on the connection of suction hose SUB-ASSY and unit.
    (6) Apply sufficient compressor oil to a new O-ring and the connection of suction hose SUB-ASSY.
    (7) Install the O-ring to the suction hose SUB-ASSY.
    CAUTION:
    Do not allow dust etc. to adhere to the O-ring and O-ring sealing portion.
    (8) Push the shaft of the pipe joint into the seal hole until it is completely engaged.

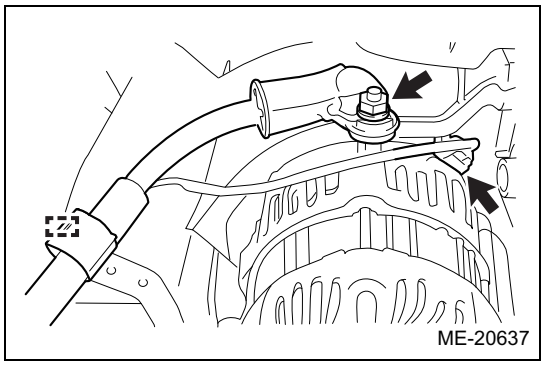


ME-20685

    (9) Turn the hook type connector to the tightening position and tighten it with bolts.
    Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
    (10) Install the suction hose SUB-ASSY with the nut.
    Standard value:T=10N·m {102kgf·cm} {7.4ft·lbf}
78. Radiator outlet hose connection
    (1) Connect the radiator outlet hose with the hose clamp.
79. Transmission oil cooler hose NO. 1 connection (transmission A/T)
    (1) Connect the transmission oil cooler hose NO. 1 with the hose clamp.
80. Transmission oil cooler hose NO. 3 connection (transmission A/T)
    (1) Connect the transmission oil cooler hose NO. 3 with the hose clamp.
81. Heater water hose connection
    (1) Install the heater water hoses with the two hose clamps.
82. Installation of exhaust manifold (Refer to IE - 36)
83. Vacuum tube connector hose connection (transmission A/T)
    (1) Install the vacuum tube connector hose with the bolt.
    Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
    (2) Connect the vacuum tube connector hose with the hose clamp.
84. Vacuum tube connector hose connection (transmission M/T)
    (1) Install the vacuum tube connector hose with the bolt.
    Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}

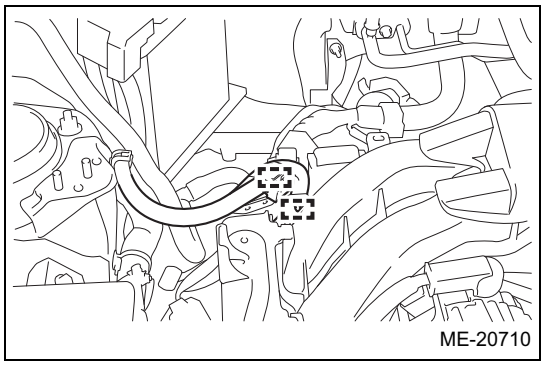
(2) Connect the vacuum tube connector hose with the hose clamp.

85. Drive plate & torque converter setting bolt installation (transmission A/T)
    (1) Use the SST to secure the crank pulley.
        SST 18355AA000, 18334AA000
    (2) Install the six drive plate & torque converter setting bolts through the service hole.
        Standard value:T=25N·m {255kgf·cm} {18.4ft·lbf}
86. Flywheel housing under cover installation (transmission A/T)
    (1) Install the flywheel housing under cover.
87. Installation of engine cover SUB-ASSY No. 1 (transmission A/T) (Refer to IE - 28)
88. V-belt installation (Refer to EM - 7)
89. Installation of A/C cover (Refer to EM - 7)
90. Installation of alternator cover (Refer to EM - 8)
91. CONNECT ENGINE WIRE

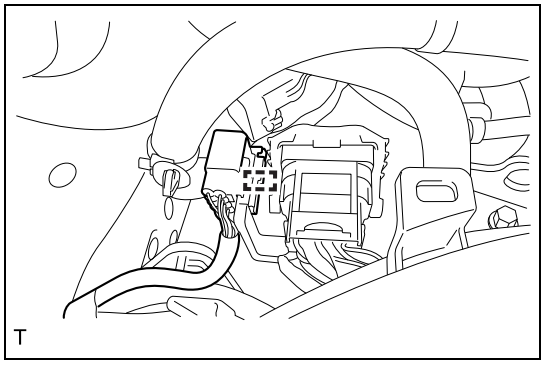


(1) Connect the generator connector and connect the clamp.

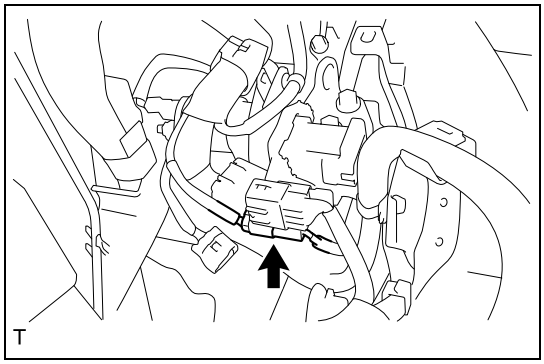
(2) Connect the generator wire with the nut.
    Standard value:T=15.5N·m {158kgf·cm} {11.4ft·lbf}
(3) Install the terminal cap.



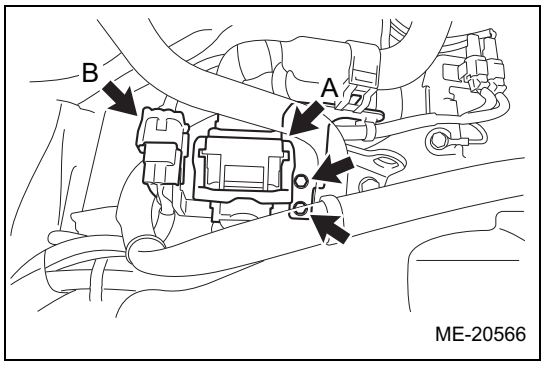
(4) Connect the 2 wire harness clamps



(5) Install the connector to the engine hanger No. 2.



(6) Connect the connector.

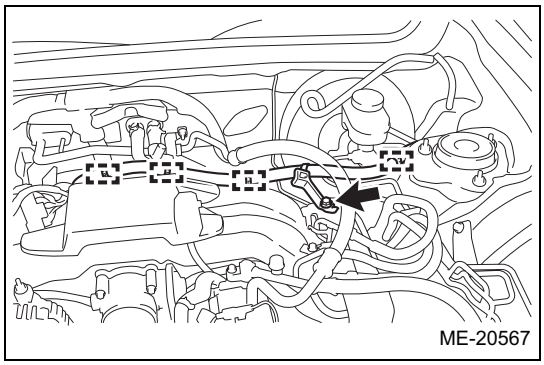


(7) Connect the connector (B).

(8) Connect the wire harness connector (A) and securely lock the connector.

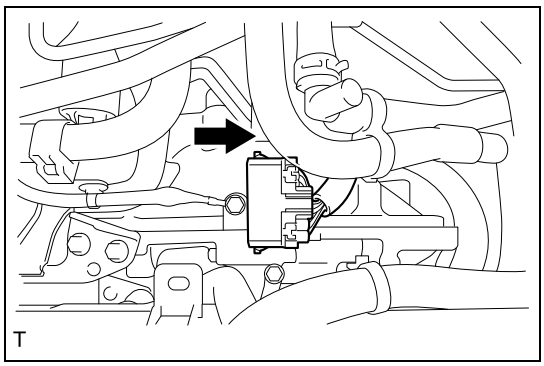
(9) Install the wire harness clamp bracket to the No. 2 engine hanger with the 2 bolts.
Standard value:T=10N·m {102kgf·cm} {7.4ft·lbf}

(10) for Automatic Transmission:

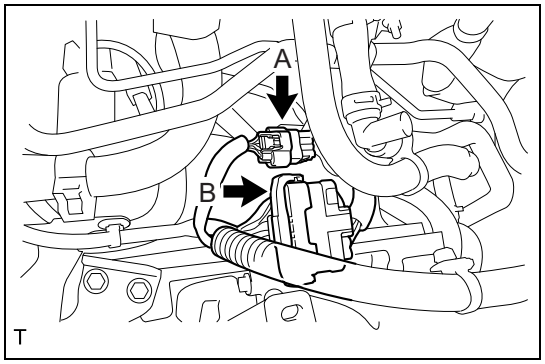


(a) Connect the 4 wire harness clamps.

(b) Install the wiring harness bracket with the bolt.
Standard value:T=11N·m {112kgf·cm} {8.1ft·lbf}



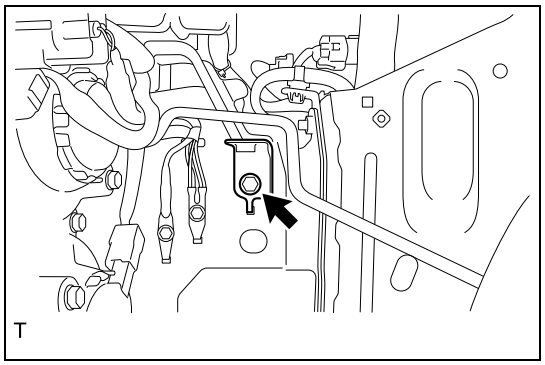
(c) Slide the connector in the direction shown in the diagram, and connect the wire harness.



(d)Connect the wire harness connector (A) and securely lock the connector.

(e)Connect the connector (B).

92. Installation of injector driver (Refer to FU - 44)
93. Water filler SUB-ASSY installation
    (1) Install the water filler SUB-ASSY with the two hose clamps.
    (2) Install the water filler SUB-ASSY with the two bolts.
    Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
94. Radiator reservoir tank ASSY installation (Refer to CO - 31)
95. Air cleaner case SUB-ASSY installation



(1) Install the stay with the bolt.
Standard value:T=35N·m {357kgf·cm} {25.8ft·lbf}

(2) Install the air cleaner case SUB-ASSY with the three bolts.
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
(3) Tighten the hose clamp.
Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}
(4) Engage the clamp and install the wiring harness to the air cleaner cap.
(5) Connect the connector to the intake air flow meter SUB-ASSY.
(6) Connect the ventilation hose NO. 2 with the hose clamp.
(7) Install the chamber with the two bolts.
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
(8) Connect the hose to the chamber ASSY.

96. Installation of front strut tower bar LH (Refer to FP - 5)
97. Installation of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
98. Installation of front strut tower bar RH (Refer to FP - 5)
99. Installation of flexible V-shaped bar RH (tS model) (Refer to FP - 5)
100. Engine oil refill (Refer to LU - 5)
101. Connection of the battery ground terminal
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
102. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
103. Shift lever position check (transmission A/T) (Refer to AT - 210)
104. Refilling of the refrigerant (Refer to AC - 90)
105. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)
106. Engine oil leakage check (Refer to LU - 6)

107.Fuel leakage check (Refer to FU - 10)

108.Exhaust gas leakage check (Refer to IE - 46)

109.Inspection of refrigerant gas leak (Refer to AC - 91)

110.Throttle body function check (Refer to ES - 671)

111. Ignition timing check (Refer to EM - 2)

112.Idle speed check (Refer to EM - 2)

113.CO, HC concentration check (Refer to EM - 3)

114.Coolant (SUBARU Super Coolant) level check (Refer to CO - 2)

115.Engine oil level check (Refer to LU - 2)

116.Hood SUB-ASSY set

(1) Change the front hood stay position from B to A and store it in the position A.

# Fuel system (FA20)

## Precautions

1. Precautions before work
   (1) Before performing the work related to the fuel system, perform the fuel spill prevention procedure and disconnect the negative terminal from the battery. (Refer to FU - 3)
   (2) Be sure not to perform the work related to the fuel system near open flames. Also be sure not to smoke during the work.
   (3) Keep rubber and leather parts away from gasoline.
2. Fuel spill prevention procedure
   CAUTION:
   - Perform this procedure when the engine coolant temperature is 60°C {140°F} or less.
   - Always perform the fuel spill prevention procedure before removing the fuel system parts.
   - Since a small amount of residue pressure exists in the fuel line after the fuel spill prevention procedure, prevent the fuel from splashing when disconnecting the fuel line.

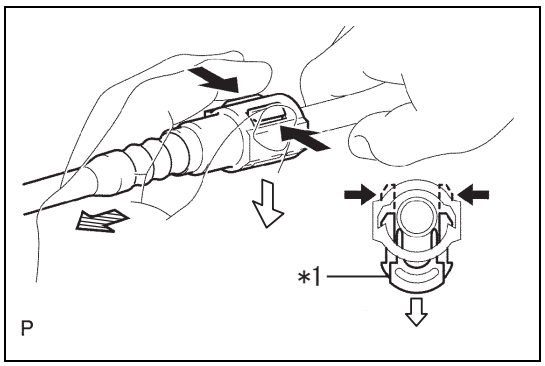
   (1) Remove the relay block cover UPR.

   (2) Remove the fuel pump fuse from the engine compartment relay block.

Captions in illustration

| | |
|---|---|
| *1 | Engine compartment relay block |

   (3) Start the engine.
   (4) Turn the ignition to OFF after the engine stalls by itself.
   (5) Crank the engine again and check that it does not start.
   NOTE:
   Since a diagnostic code may be detected, check/clear the diagnostic code after the work is completed. (Refer to ES - 28)
   (6) Remove the fuel tank cap to release the pressure in the fuel tank.
   (7) Disconnect the battery ground terminal. (Refer to IN - 6)
   (8) Install the fuel pump fuse.
   (9) Install the relay block cover UPR.

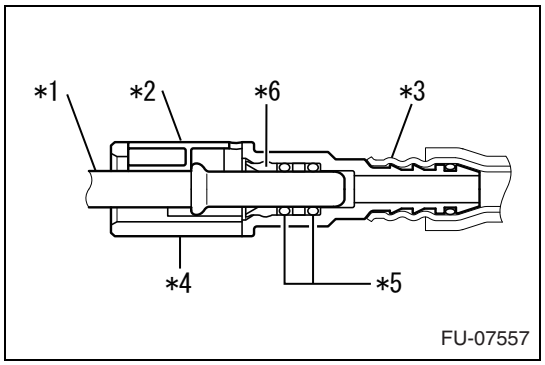


3. Fuel system (quick type A)
   (1) When disconnecting the fuel tube connector (quick type A), adhere to the following precautions.
   (a)Release the two claws in the retainer of fuel tube connector and push down the retainer as shown in the figure to disconnect the fuel tube connector from the pipe.

Captions in illustration

| | |
|---|---|
| *1 | Retainer |
| ➡ | Push |

| | |
|---|---|
| ⇨ | Lower |
| ⇛ | Pull |



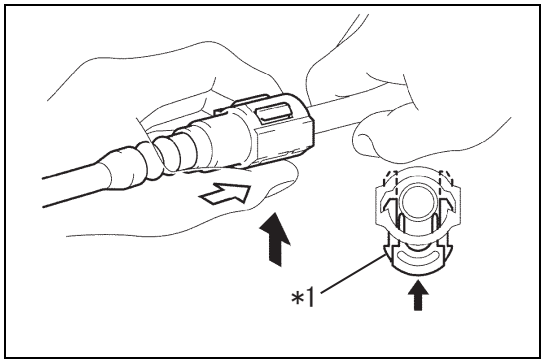
(b)If the fuel tube connector is seized on the pipe, hold the pipe and push/pull the fuel tube connector to release it, and then disconnect the fuel tube connector.

CAUTION:

- Before starting the work, remove the foreign matters such as dirt on the fuel tube connector.
- Since the fuel tube connector seals the fuel tube connector and pipe with the O-ring, pay special attention to the damage and foreign matters on the connection.
- Never use any tools.
- After the fuel tube is disconnected, protect the connection with a vinyl bag.
- If the fuel tube connector is seized on the pipe, push and pull the fuel tube connector to release it, and then pull out it.

Captions in illustration

| | |
|---|---|
| *1 | Pipe |
| *2 | Retainer |
| *3 | Nylon tube |
| *4 | Fuel tube connector |
| *5 | O-ring |
| *6 | Top hat |

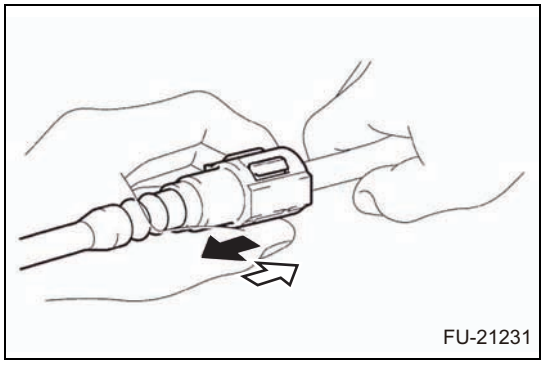


(2) When connecting the fuel tube connector (quick type A), adhere to the following precautions.

(a)Align the axis of fuel tube connector and the axis of pipe, then push in the fuel tube connector and push up the retainer.

Captions in illustration

| | |
|---|---|
| *1 | Retainer |
| ➡ | Push up |
| ⇨ | Push |



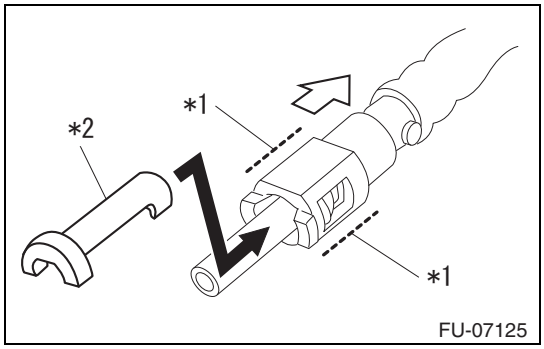
(b)After connecting the fuel tube connector, pull the fuel tube connector and pipe, and then push them to check that they are connected firmly.

NOTE:

Be sure to always finish checking the fuel pipe connections by pushing.

Captions in illustration

| | |
|---|---|
| ➡ | Pull |
| ⇨ | Push |



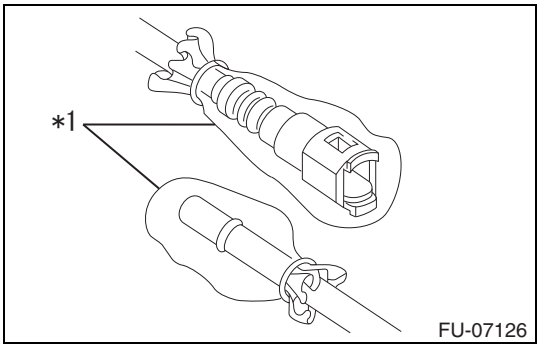
4. Fuel system (quick type B)
   (1) When disconnecting the fuel tube connector (quick type B) using the SST, adhere to the following precautions.
   (a) Before disconnecting the fuel tube connector, check the fuel tube connector and pipe for dirt or dust. If dirt or dust is found, clean them.
   (b) Attach the SST to the pipe. Push in the SST to disconnect the fuel tube connector from the pipe.
   SST 42099AE000

Captions in illustration

| | |
|---|---|
| *1 | Holding portion |
| *2 | SST |
| ➡ | Push |
| ⇨ | Pull |

CAUTION:
- Hold the holding portion of the connector to pull out it in axial direction.
- If the fuel tube connector is seized on the pipe, push and pull the fuel tube connector to release it with the SST pushed in, and then pull out fuel tube connector.
- When disconnecting the connector, do not bend or twist the fuel tube forcibly. If the tube is bent, replace with a new part.
- Catch the fuel from the tube using a container to prevent it from splashing.

   (c) After disconnecting the fuel tube, check the seal surface of pipe for dirt or dust.
   (d) Make sure that the top hat or O-ring does not fall off.
   (e) Protect the disconnected fuel tube connector and pipe with vinyl bags.

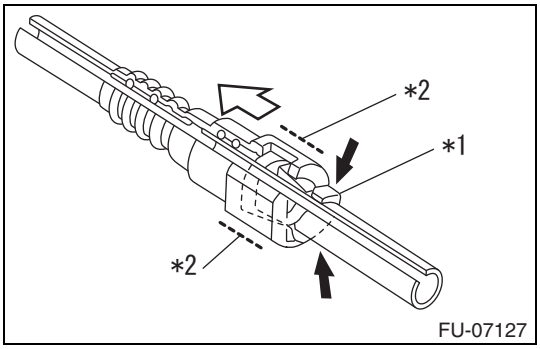


Captions in illustration

| | |
|---|---|
| *1 | Vinyl bag |

CAUTION:
- When reusing the retainer, do not remove the retainer from the connector.
- Do not damage the fuel tube connector and pipe or allow foreign matter to enter the pipe.

   (2) When disconnecting the fuel tube connector (quick type B) without the SST, adhere to the following precautions.
   (a) Before disconnecting the fuel tube connector, check the fuel tube connector and pipe for dirt or dust. If dirt or dust is found, clean them.
   (b) Push the retainer in the direction of the arrow, disconnect the fuel tube connector from pipe.



Captions in illustration

| | |
|---|---|
| *1 | Retainer |
| *2 | Holding portion |

FU

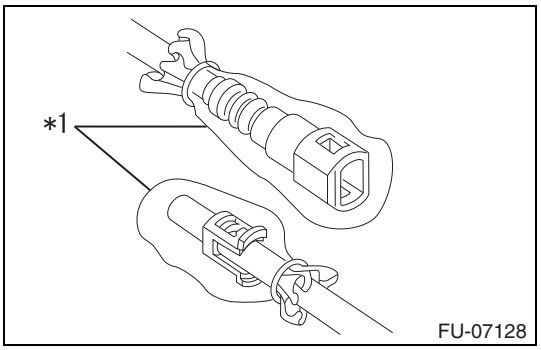
| | |
|---|---|
| ➡ | Push |
| ⇨ | Pull |

CAUTION:
- Hold the holding portion of the connector to pull out it in axial direction.
- If the fuel tube connector is seized on the pipe, push and pull the fuel tube connector to release it with the retainer pushed in, and then pull out fuel tube connector.
- When disconnecting the connector, do not bend or twist the fuel tube forcibly. If the tube is bent, replace with a new part.
- Catch the fuel from the tube using a container to prevent it from splashing.

(c) After disconnecting the fuel tube, check the seal surface of pipe for dirt or dust.

(d) Make sure that the top hat or O-ring does not fall off.

(e) Protect the disconnected fuel tube connector and pipe with vinyl bags.



Captions in illustration

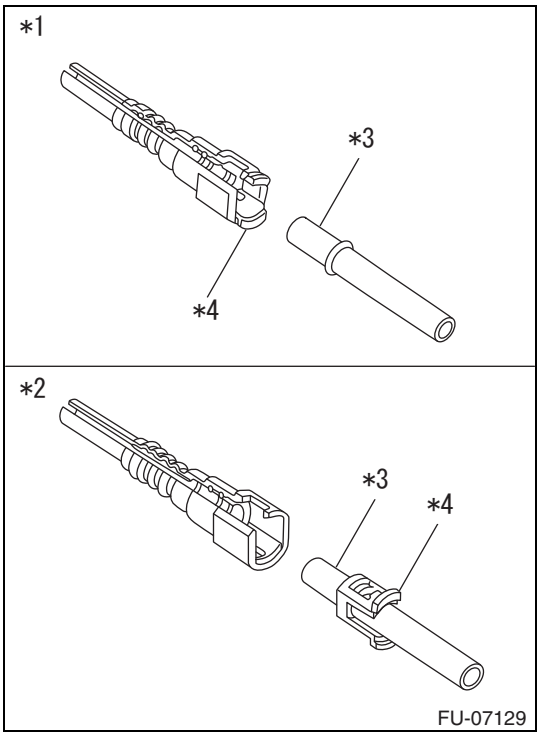
| | |
|---|---|
| *1 | Vinyl bag |

CAUTION:
- When reusing the retainer, do not remove the retainer from the pipe.
- Do not damage the fuel tube connector and pipe or allow foreign matter to enter the pipe.

(3) When connecting the fuel tube connector (quick type B), adhere to the following precautions.

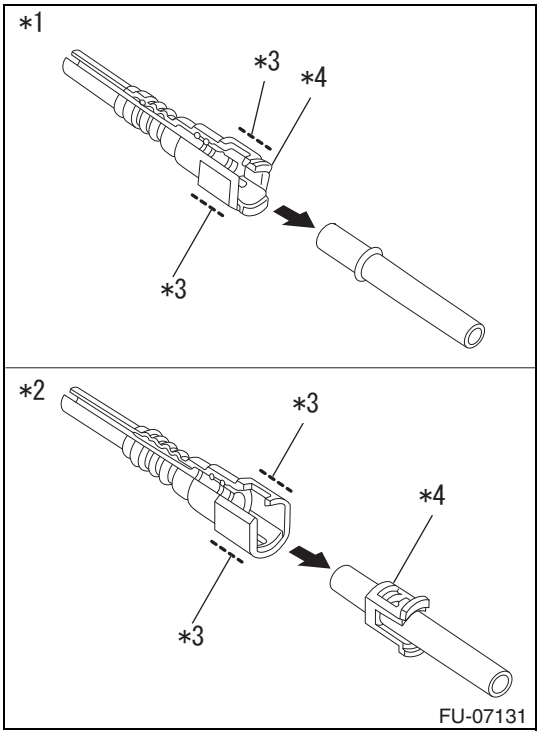
(a) Make sure there are no damage or dust on connections. If necessary, clean the seal surface of pipe.

(b) When reusing the retainer, make sure that neither damage nor deformation exist on the retainer. If it is faulty, replace it with a new retainer.



Captions in illustration

| | |
|---|---|
| *1 | When disconnected with the SST |
| *2 | When disconnected without the SST |
| *3 | Seal surface |
| *4 | Retainer |



(c) Align the axis of fuel tube connector and the axis of pipe, push in the fuel tube connector until a clicking sound is heard from the retainer.

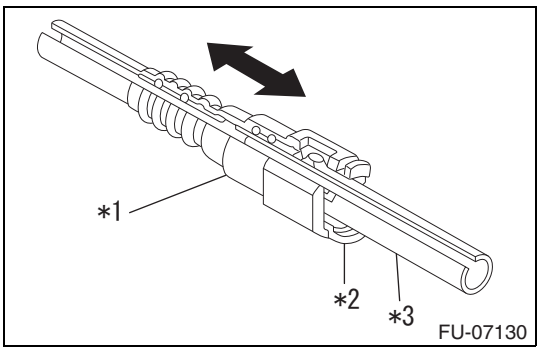
Captions in illustration

| | |
|---|---|
| *1 | When disconnected with the SST |
| *2 | When disconnected without the SST |
| *3 | Holding portion |
| *4 | Retainer |

CAUTION:

- Hold the holding portion of the connector to push in it in axial direction.
- When connecting the connector, do not bend or twist the fuel tube forcibly. If the tube is bent, replace with a new part.

FU



(d) After connecting the fuel tube connector, pull the fuel tube connector and pipe, and then push them to check that they are connected firmly.

NOTE:

Be sure to always finish checking the fuel pipe connections by pushing.

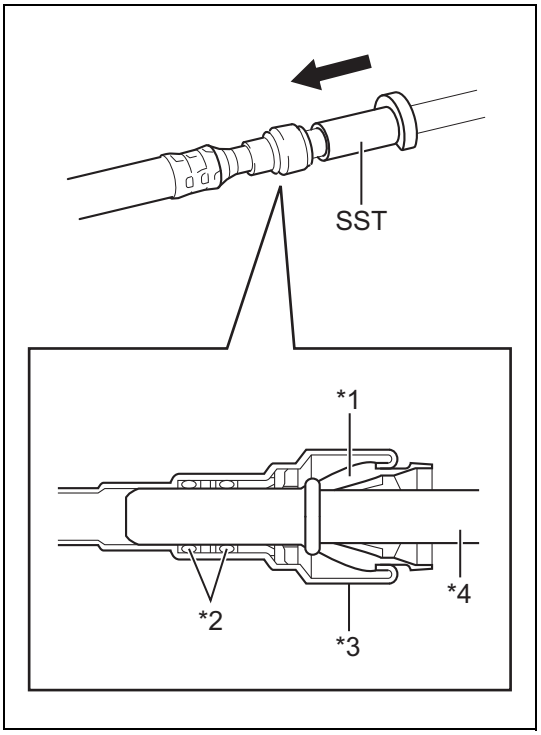
Captions in illustration

| | |
|---|---|
| *1 | Fuel tube connector |
| *2 | Retainer |
| *3 | Pipe |

CAUTION:

- Make sure that the two retainer pawls are engaged in their mating positions in the quick connector.
- Make sure that there are no fuel leakages from the fuel tube and its connection.

5. Fuel system (quick type C)
   (1) When disconnecting a fuel pressure line, a large amount of gasoline will spill out. Perform the following procedure:
   (a) Discharge fuel system pressure.
   (b) Put a container under the connection.
   (c) Disconnect the fuel pump tube.
   (d) Drain the fuel remaining inside the fuel pump tube into the container.
   (e) Cover the disconnected pipe and connector with a plastic bag to prevent damage and contamination.



(2) Observe these precautions when connecting the fuel tube connector .

(a) Attach SST to the fuel pipe.

SST 42099AE000

(b) Insert SST in the fuel tube connector side, and remove the fuel tube from the fuel pipe.

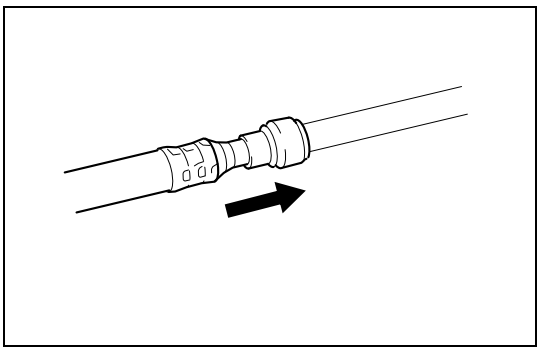
Captions in illustration

| | |
|---|---|
| *1 | Retainer |
| *2 | O-Ring |
| *3 | Housing |
| *4 | Fuel Pipe |
| ➡ | Insert |

(c) Cover the disconnected fuel pipe and fuel tube connector with plastic bags to prevent damage and contamination.

(3) Observe these precautions when connecting the fuel tube connector.

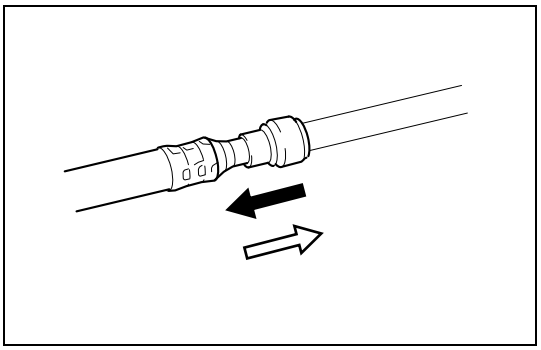
(a) Check for damage or foreign matter on the connected part of the fuel pipe.



(b) Align the fuel tube connector axis with the fuel pipe axis, and push the fuel tube connector in until the retainer makes a clicking sound.

Captions in illustration

| | |
|---|---|
| ➡ | Push |



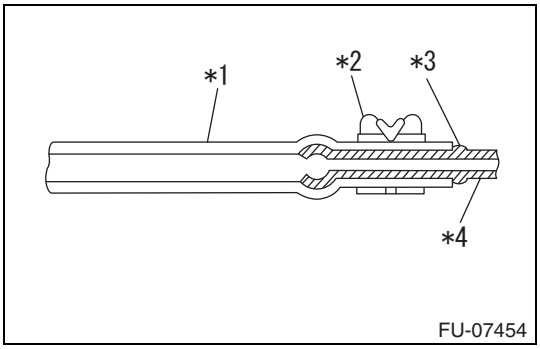
(c) After connecting the fuel tube connector, pull the fuel tube connector and pipe, and then push them to check that they are connected firmly.

NOTE:

Be sure to always finish checking the fuel pipe connections by pushing.

Captions in illustration

| | |
|---|---|
| ➡ | Pull |
| ⇨ | Push |



6. Fuel system (evaporation hose connection)
   (1) Connect the evaporation hose as shown in the figure.

Captions in illustration

| | |
|---|---|
| *1 | Hose |
| *2 | Clip |
| *3 | Spool or stopper |
| *4 | Pipe |

CAUTION:
If there is no spool or stopper, connect the hose by inserting it into the pipe by 15 to 20 mm {0.591 to 0.787 in}.

## Function inspection

1. Fuel pressure check (low-pressure side)
   (1) Fuel pressure gauge installation (port injection side)
      (a)Perform the fuel spill prevention procedure. (Refer to FU - 3)
         CAUTION:
         Since a small amount of residue pressure exists in the fuel line after the fuel spill prevention procedure, prevent the fuel from splashing when disconnecting the fuel line.

      (b)Disconnect the fuel hose NO.1 with the SST.
         SST 42099AE000
      (c)Install the fuel pressure gauge to the vehicle.
      (d)Wipe off any spilt fuel.
   (2) Fuel pressure gauge installation (cylinder injection side)
      (a)Perform the fuel spill prevention procedure. (Refer to FU - 3)
         CAUTION:
         Since a small amount of residue pressure exists in the fuel line after the fuel spill prevention procedure, prevent the fuel from splashing when disconnecting the fuel line.

      (b)Disconnect the fuel hose NO.2 with the SST.
         SST 42099AE000
      (c)Install the fuel pressure gauge to the vehicle.
      (d)Wipe off any spilt gasoline.
   (3) Fuel pressure check
      (a)Measure the fuel pressure while engine idling after warming up the engine.
         Standard value: 350 to 500 kPa {3.6 to 5.1 kgf/cm$^2$} {51 to 72 psi}
   (4) Perform the fuel spill prevention procedure. (Refer to FU - 3)
   (5) Fuel pressure gauge removal

FU

(a)Be careful not to splash gasoline and remove the fuel pressure gauge.
(b)Connect the fuel hoses NO. 1 and NO. 2.

2. Fuel pressure check (high pressure side)
   (1) Connect the SSM4 to the DLC.
   (2) Turn the ignition switch to ON.
   (3) Start the engine and check the value in 'Data monitor'→'Fuel pressure' at idling.
   Standard value: 3.5 to 4.5 MPa {35.7 to 45.9 kgf/cm$^2$} {507.5 to 652.5 psi}
3. D-4S inspection (power balance) active test
   (1) Connect the SSM4 to the DLC.
   (2) Start the engine, select 'active test'→'D-4S (power balance)' according to the screen display, and select 'port' or 'cylinder'.
   (3) Check the idle state after the injection to the executed cylinder of [#1 to #4] is stopped.
   Criteria: The idle speed shall vary.
   CAUTION:
   Only one cylinder can be tested at a time and multiple cylinders shall not be tested.
4. Fuel leakage check
   (1) Make sure that there are no fuel leakages from the fuel system with the fuel pressure.

   SST 42099AE000

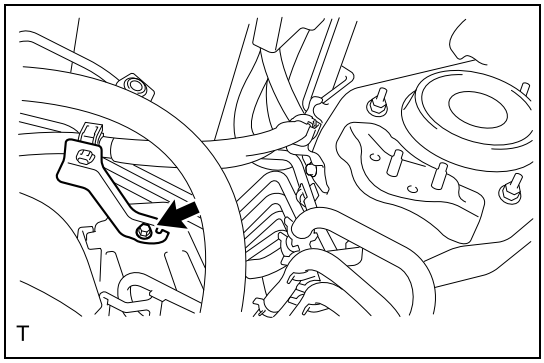
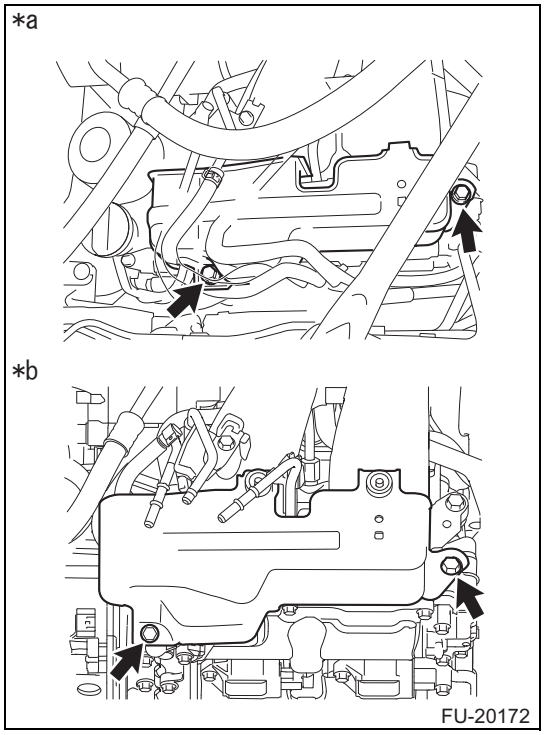
8. Purge hose disconnection
   (1) Move the hose clamp and disconnect the purge hose.



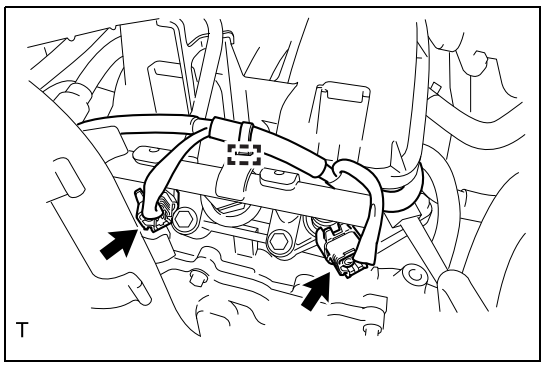
9. Intake manifold protector (bank 2 side) removal
   (1) Remove the bolt and disconnect the wiring harness clamp bracket. (Transmission A/T)



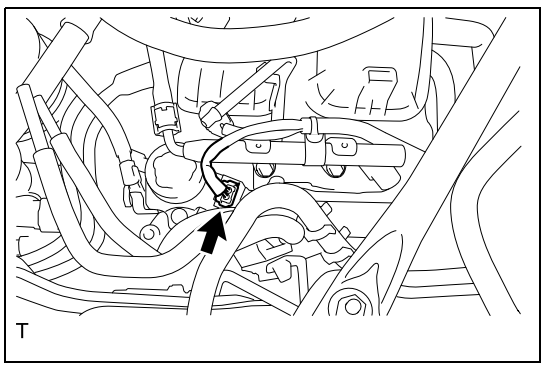
(2) Remove the 2 bolts, and remove the intake manifold protector (bank 2 side).

Captions in illustration

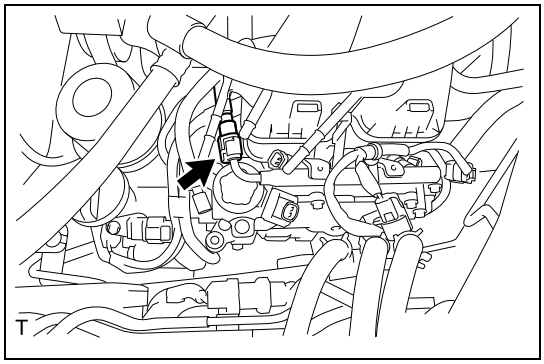
| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



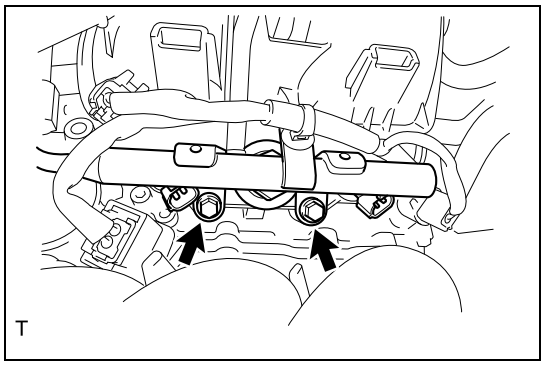
10. Fuel delivery pipe (bank 2 side) removal
    (1) Disconnect the two fuel injector ASSY connectors.
    (2) Release the clamp and disconnect the wiring harness.



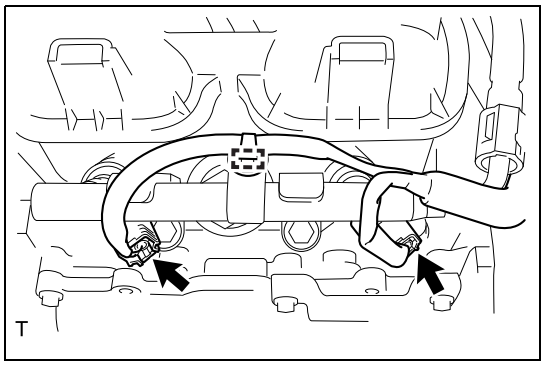
(3) Disconnect the fuel pump connector.



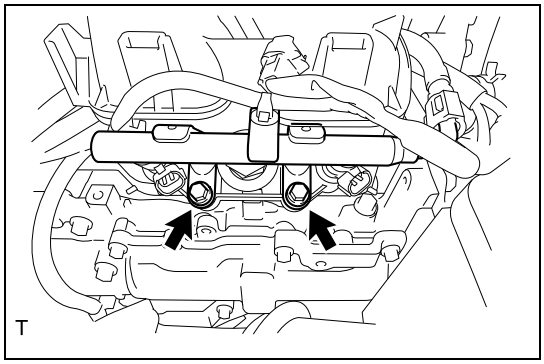
(4) Disconnect the fuel delivery pipe NO. 3 from the fuel delivery pipe (bank 2 side). (Refer to FU - 3)



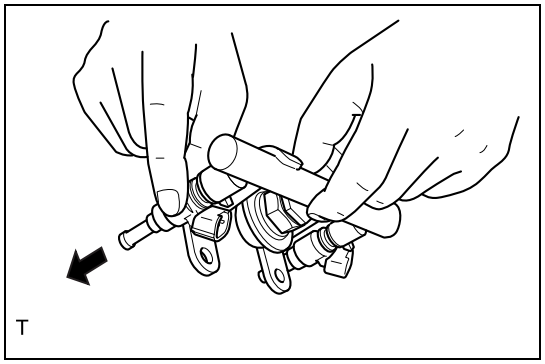
(5) Remove the 2 bolts and remove the fuel delivery pipe (bank 2 side) by pulling up it along the axis line of fuel injector ASSY.



11. Fuel delivery pipe (bank 1 side) removal
    (1) Disconnect the two fuel injector ASSY connectors.
    (2) Release the clamp and disconnect the wiring harness.
    (3) Disconnect the fuel delivery pipe NO. 3 from the fuel delivery pipe (bank 1 side). (Refer to FU - 3)

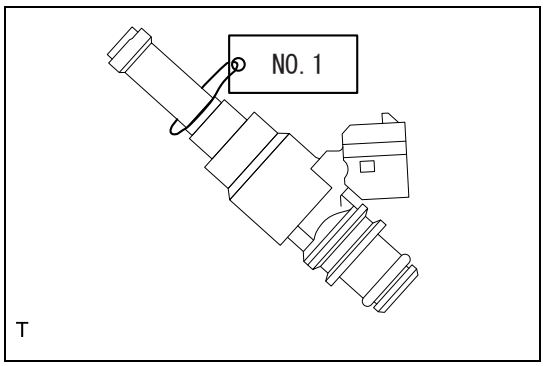


(4) Remove the 2 bolts and remove the fuel delivery pipe (bank 1 side) by pulling up it along the axis line of fuel injector ASSY.



T

12. Fuel injector ASSY removal
    (1) Remove the fuel injector ASSY from the fuel delivery pipe.



T

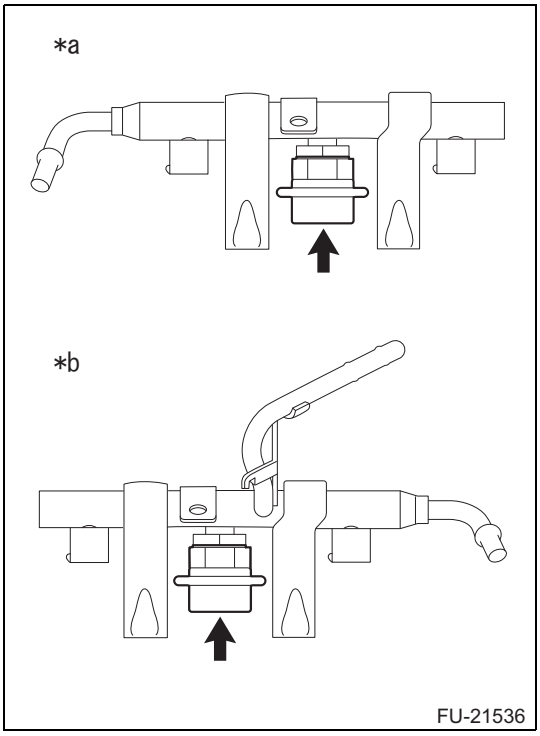
CAUTION:
When the fuel injector ASSY is reinstalled without replacing it, identify it with a tag etc. marked with the cylinder number.

    (2) Remove the O-ring, rubber and seal ring from the fuel injector ASSY.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Rubber |
| *3 | Seal ring |

13. Pulsation damper removal



(1) Remove the pulsation damper from the fuel delivery pipe.

Captions in illustration

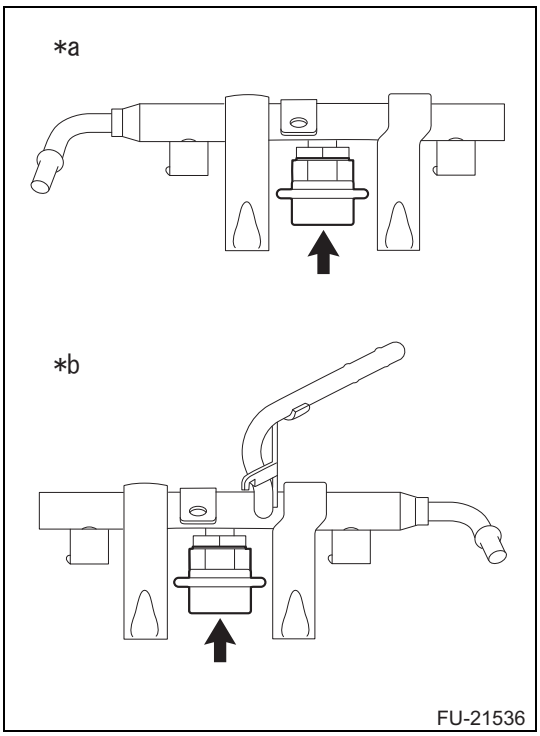
| | |
|---|---|
| *a | Bank 1 side |
| *b | Bank 2 side |

## Installation

1. Pulsation damper installation

CAUTION:

- Make sure that there are no foreign matter or scratches on the pulsation damper and the insertion portion of fuel delivery pipe.
- Be careful not to deform the fuel delivery pipe.

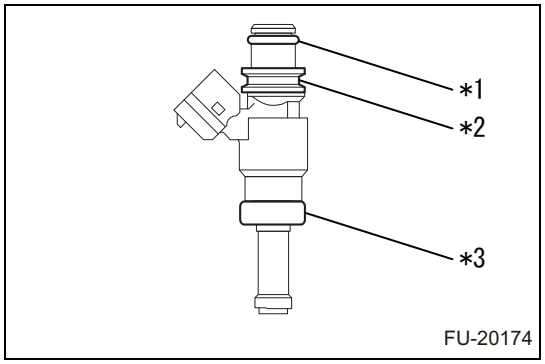


(1) Using a new gasket, install the pulsation damper to the fuel delivery pipe.

Standard value:T=21.6N·m {220kgf·cm} {15.9ft·lbf}

Captions in illustration

| | |
|---|---|
| *a | Bank 1 side |
| *b | Bank 2 side |



2. Fuel injector ASSY installation (low pressure side)
   (1) Apply gasoline to a new O-ring, rubber and seal ring, and install them to the fuel injector ASSY.
   CAUTION:
   Make sure that there are no damage or foreign matter in the O-ring grooves of fuel injector ASSY.

Captions in illustration

| | |
|---|---|
| *1 | New O-rings |
| *2 | New rubber |
| *3 | New seal ring |

   (2) Install the fuel injector ASSY to the fuel delivery pipe.
   CAUTION:
   - Make sure that there are no foreign matter or scratches on the insertion portion of fuel delivery pipe.
   - Be careful not to twist the O-ring.
   - After the fuel delivery pipe is installed, make sure that it can be rotated relatively lightly. If it cannot be rotated lightly, remove the fuel injector ASSY and repeat the work after replacing the O-rings with new ones.

FU

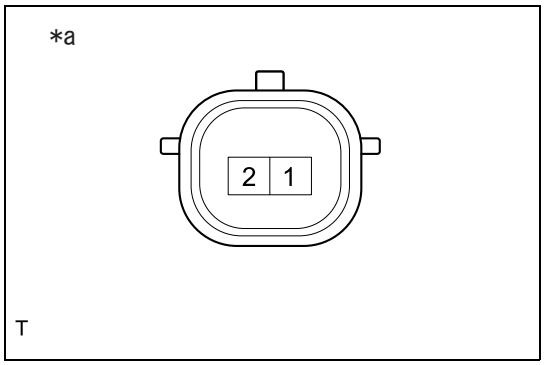
3. Fuel delivery pipe (bank 1 side) installation
   (1) Install the fuel delivery pipe (bank 1) to the intake manifold by moving it along the axis line of fuel injector ASSY.
   (2) Tighten the two bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (3) Connect the fuel delivery pipe NO. 3 to the fuel delivery pipe (bank 1 side). (Refer to FU - 3)
   (4) Connect the injector ASSY connector to engage the clamp.
4. Fuel delivery pipe (bank 2 side) installation
   (1) Install the fuel delivery pipe (bank 2) to the intake manifold by moving it along the axis line of fuel injector ASSY.
   (2) Tighten the two bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (3) Connect the fuel pump connector.
   (4) Connect the fuel delivery pipe NO. 3 to the fuel delivery pipe (bank 2 side). (Refer to FU - 3)
   (5) Connect the fuel injector ASSY connector to engage the clamp.
5. Intake manifold protector (bank 2 side) installation
   (1) Using 2 bolts, install the intake manifold protector (bank 2 side).
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Install the wiring harness clamp bracket with the bolt. (Transmission A/T)
   Standard value:T=11N·m {112kgf·cm} {8.1ft·lbf}
6. Purge hose connection
   (1) Connect the purge hose and secure it with the hose clamp.
7. Fuel hose NO.2 connection
8. Fuel hose NO.1 connection
9. Intake manifold protector (bank 1 side) installation
   (1) Using 2 bolts, install the intake manifold protector (bank 1 side).
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Engage the four clamps and connect the wiring harness.
10. Installation of injector driver (Refer to FU - 44)
11. Chamber ASSY installation
    (Refer to IE - 32)
12. Connection of the battery ground terminal
    Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## Unit inspection

1. Fuel injector ASSY check

   CAUTION:

   This procedure must be used only when judging short circuit and open circuit. It cannot be used for judging defective operation.



(1) Resistance check

(a)Measure the resistance between the terminals.

Resistance

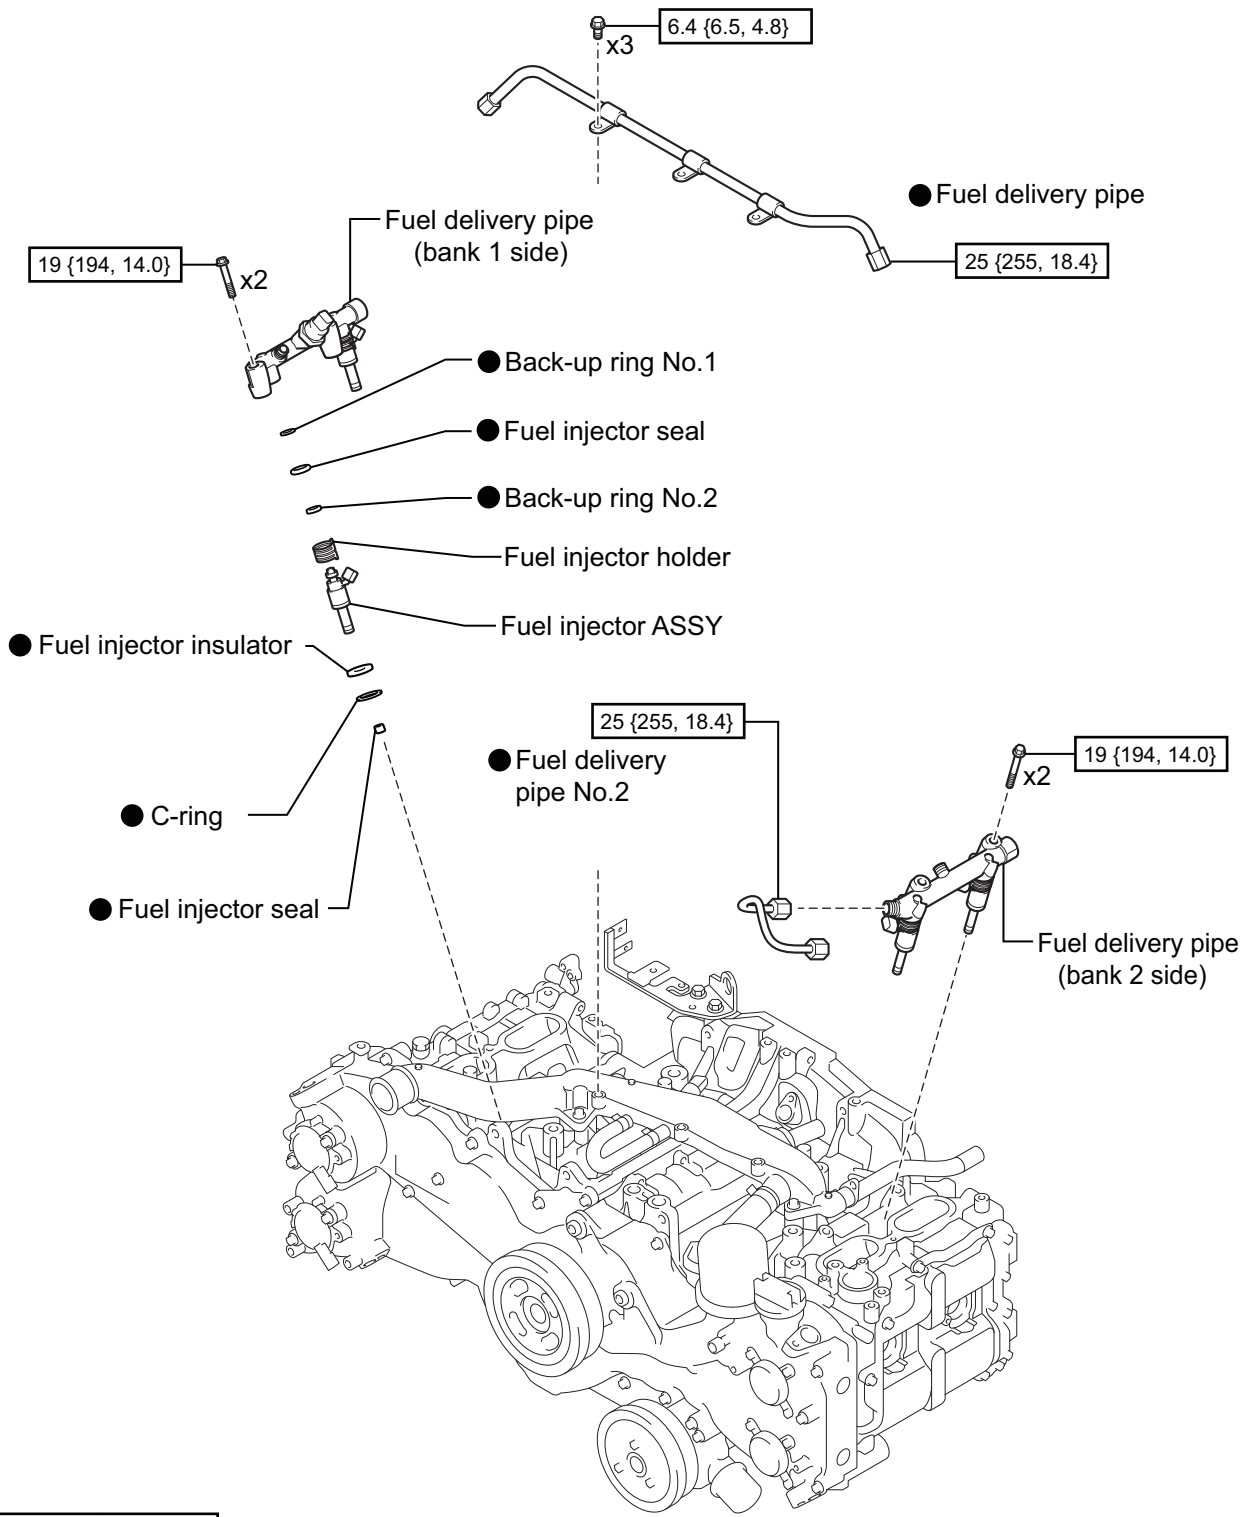
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F} | 12 Ω |

Captions in illustration

| | |
|---|---|
| *a | Connector not connected<br>(Fuel injector ASSY) |

# Injector ASSY (FA20 / direct fuel injection)

## Exploded view



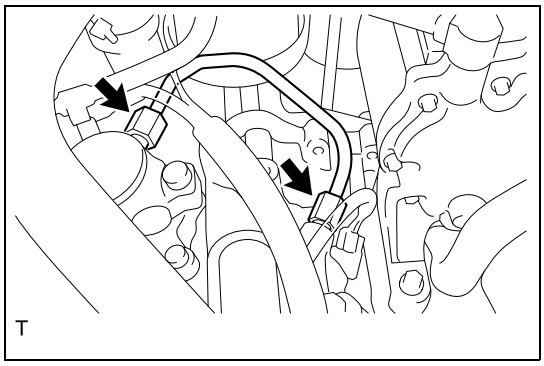
N*m {kgf*cm, ft*lbf} : Specified torque

● Non-reusable part

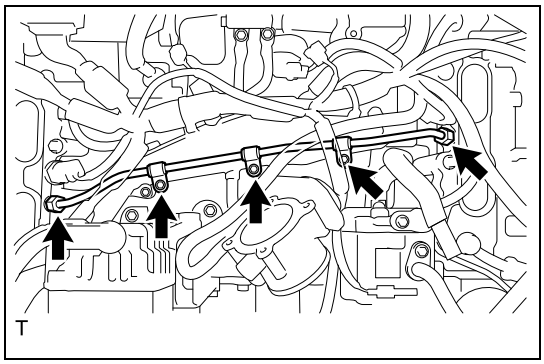
FU-20233

## Removal

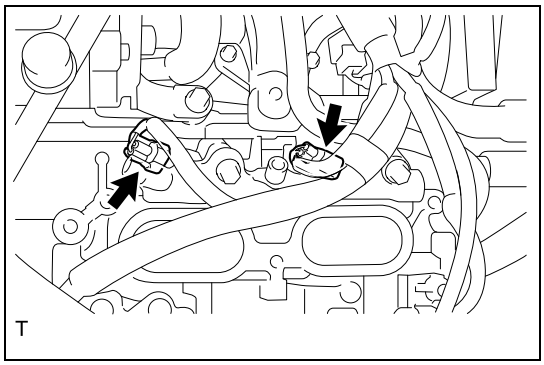
1. Intake manifold removal
   (Refer to IE - 17)



2. Fuel delivery pipe NO.2 removal
   (1) Remove the fuel delivery pipe NO.2.
   CAUTION:
   When removing the fuel delivery pipe NO.2, pull it straight out so that the seal surface of fuel delivery pipe LH is not damaged.

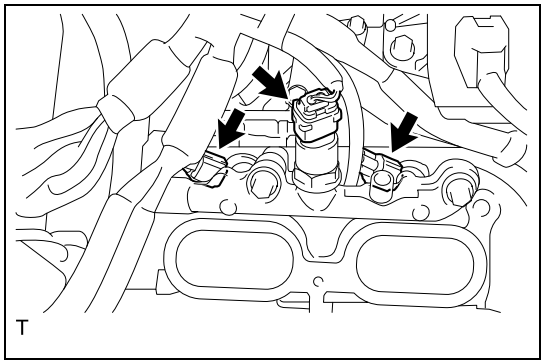


3. Fuel delivery pipe removal
   (1) Remove the 3 bolts.
   (2) Remove the fuel delivery pipe.



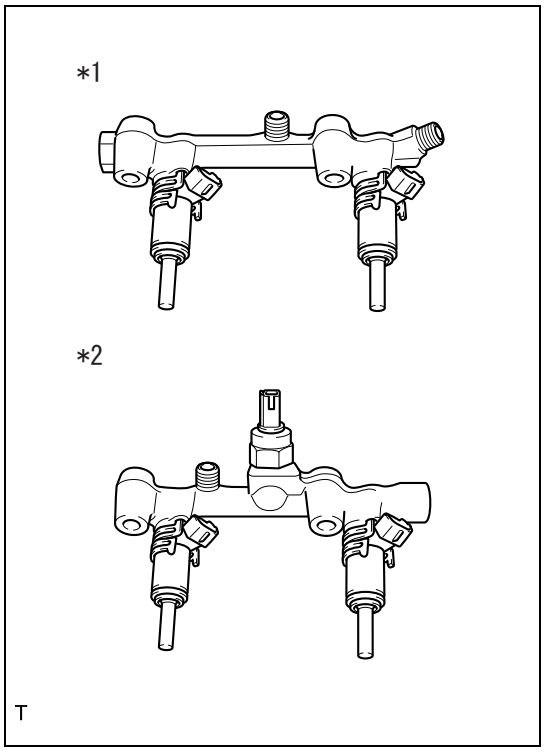
4. Fuel delivery pipe (bank 2 side) removal
   (1) Disconnect the two fuel injector connectors.

   (2) Remove the two bolts and remove fuel delivery pipe (bank 2 side).



5. Fuel delivery pipe (bank 1 side) removal
   (1) Disconnect the fuel pressure sensor connector and two fuel injector connectors.

   (2) Remove the two bolts and remove fuel delivery pipe (bank 1 side).

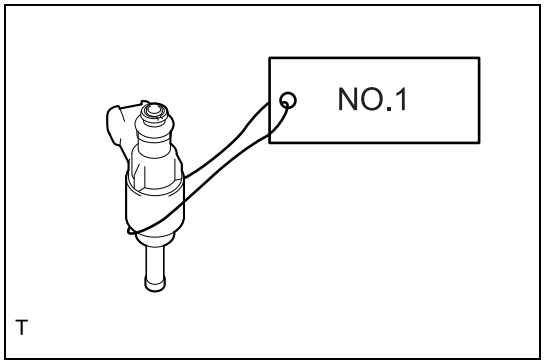


6. Fuel injector ASSY removal
   (1) Remove the fuel injector ASSY from the fuel delivery pipes (bank 2 side) and (bank 1 side).

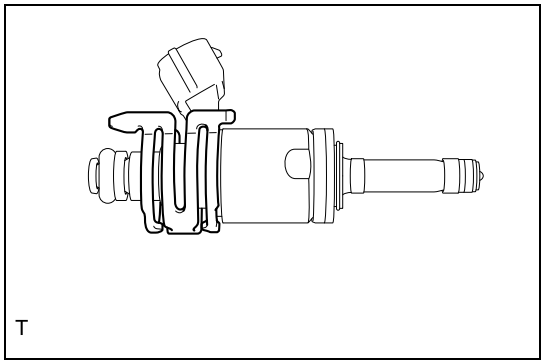
Captions in illustration

| | |
|---|---|
| *1 | Bank 2 side |
| *2 | Bank 1 side |

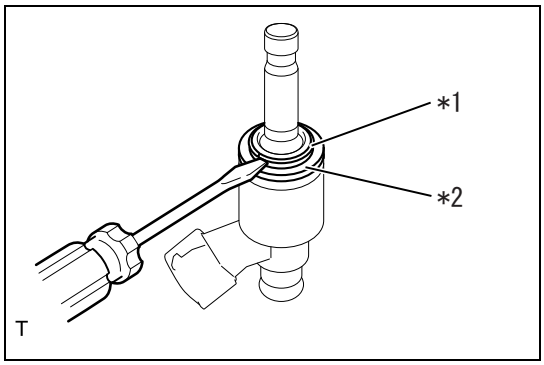
CAUTION:
- If the tip of fuel injector ASSY is bumped or dropped, replace the fuel injector ASSY with a new one.
- When removing the injector, pull it straight out so that the seal surfaces of fuel delivery pipes (bank 2 side) and (bank 1 side) are not damaged.



- Identify the removed fuel injector ASSY with a tag etc. marked with the cylinder number.



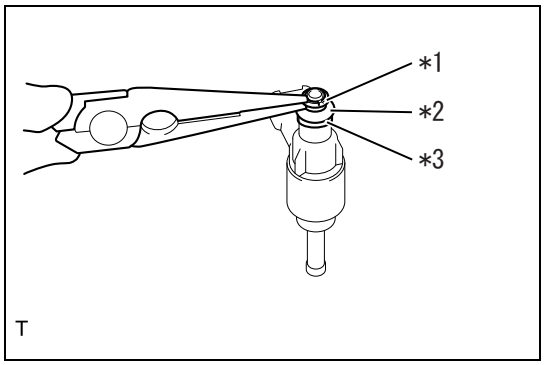
(2) Remove the fuel injector holder from the fuel injector ASSY.



(3) Remove the C-ring and fuel injector insulator.

Captions in illustration

| | |
|---|---|
| *1 | C-ring |
| *2 | Fuel injector insulator |

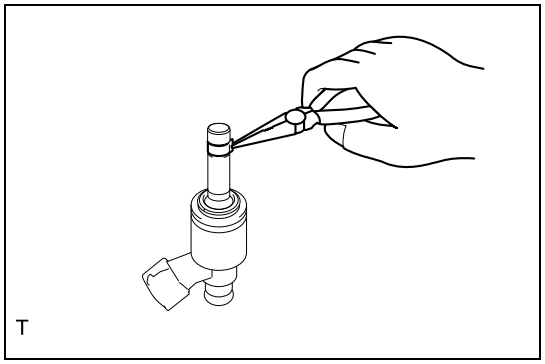


(4) Remove the back-up ring NO.1.

Captions in illustration

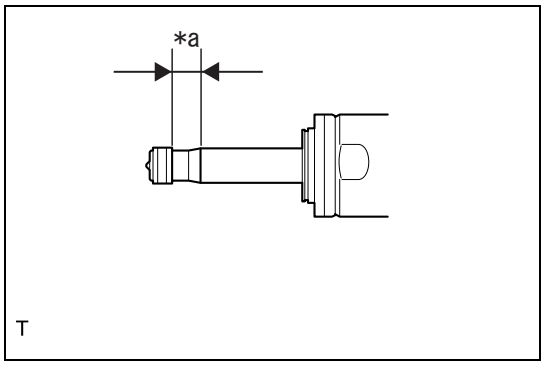
| | |
|---|---|
| *1 | Back-up ring NO.1 |
| *2 | Fuel injector seal |
| *3 | Back-up ring NO.2 |

(5) Remove the fuel injector seal and back-up ring NO.2.



7. Fuel injector seal removal
   (1) Hold the fuel injector seal and widen it a little.
   CAUTION:
   - Be careful not to hold the fuel injector seal too strongly in order to protect the injector groove from scratches.
   - If the tip of fuel injector ASSY is bumped or dropped, replace the fuel injector ASSY with a new one.

## Installation

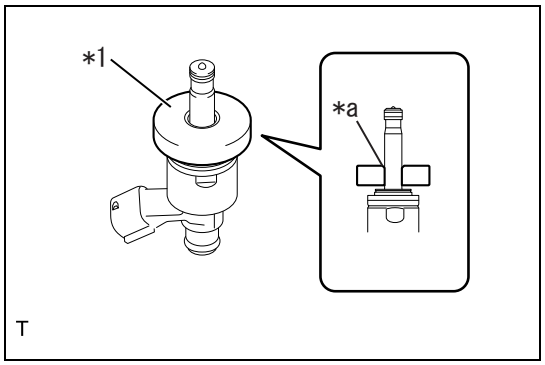


1. Fuel injector seal installation
   (1) Use the engine conditioner to remove the carbon on engine oil on the side surface and seal groove of injector shown in the figure.

Captions in illustration

| | |
|---|---|
| *a | Cleaning area |

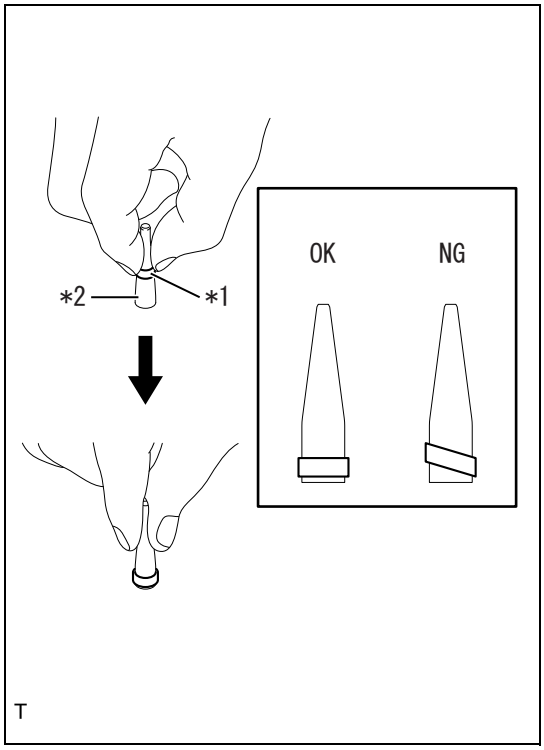
CAUTION:
- Do not clean the tip portion.
- Do not use a wire brush etc.
- If the tip of fuel injector ASSY is bumped or dropped, replace the fuel injector ASSY with a new one.



(2) Apply engine oil to the inner periphery of SST (guide) and set it on the injector so that the taper surface faces toward the tip side of injector.
SST 09260-39020

Captions in illustration

| | |
|---|---|
| *1 | SST (guide) |
| *a | Taper surface |

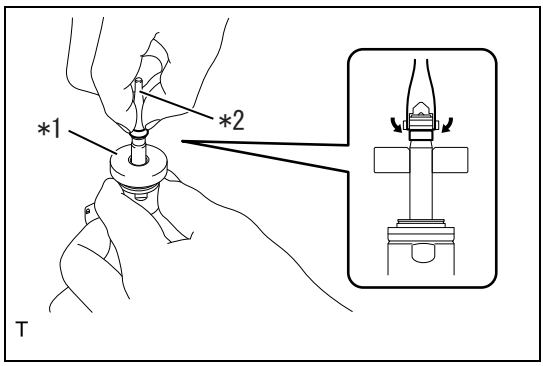


(3) Install a new fuel injector seal to the SST (holder).
SST 09260-39020

Captions in illustration

| | |
|---|---|
| *1 | Fuel injector seal |
| *2 | SST (holder) |

CAUTION:
When setting the fuel injector seal on the SST (holder), the seal is stretched and it is difficult to correct if the seal is set at an angle.

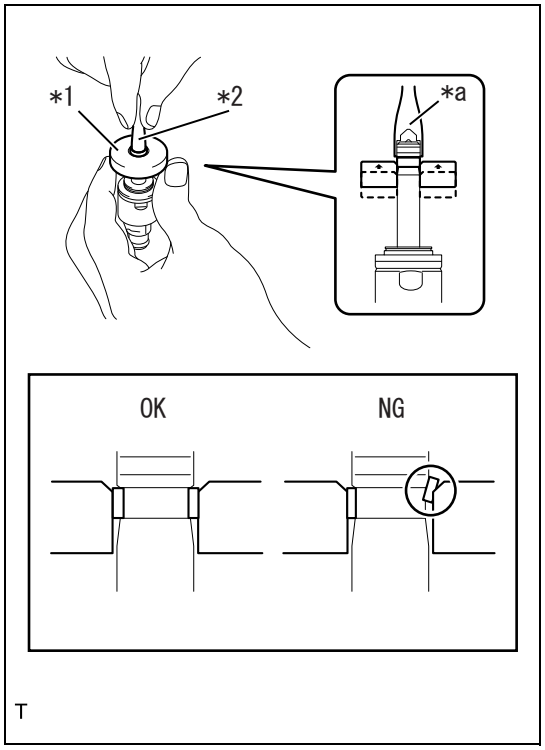


(4) Set the SST (holder) with the fuel injector seal to the tip of injector and push down the fuel injector seal with fingers to install it in the injector groove shown in the figure.
SST 09260-39020

Captions in illustration

| | |
|---|---|
| *1 | SST (guide) |
| *2 | SST (holder) |

CAUTION:
Make sure the fuel injector seal is completely fitted in the groove for its entire circumference.

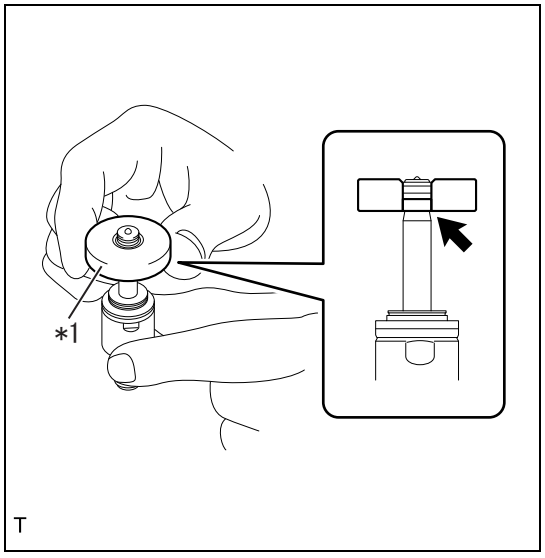


(5) While holding the fuel injector seal (connector side) lightly with the SST (holder), pull up the SST (guide) toward the injector tip side slowly and seat the fuel injector seal in the injector groove.
SST 09260-39020

Captions in illustration

| | |
|---|---|
| *1 | SST (guide) |
| *2 | SST (holder) |
| *a | Hold |

CAUTION:
Be careful not to pinch the fuel injector seal between the SST (guide) and injector groove. If it is pinched, replace it with a new one.

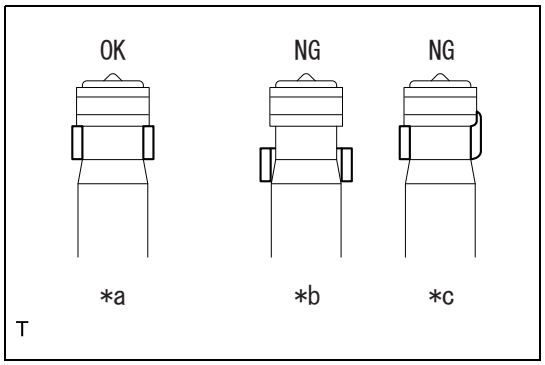


(6) Pull up the SST (guide) toward the injector tip side slowly and hold the SST for 5 sec. or more when the fuel injector seal on the connector side reaches to the straight portion of SST (guide) in order to correct the fuel injector seal.
SST 09260-39020

Captions in illustration

| | |
|---|---|
| *1 | SST (guide) |

CAUTION:
Be careful not to pinch the fuel injector seal between the SST (guide) and injector groove. If it is pinched, replace it with a new one.
NOTE:
- A rough indication of the straight portion is the position where the bottom of fuel injector seal aligns with the bottom of SST (guide).
- When the SST (guide) cannot be pulled up because it is stuck, pull up it gradually by rotating the SST (guide) to the left and right slowly.



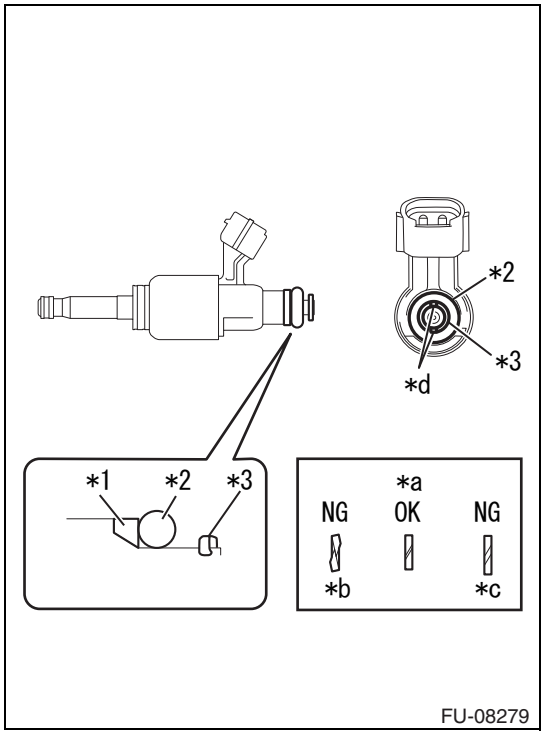
(7) After the fuel injector seal is installed, make sure that there is no scratches on the seal, crushing of the seal, or protrusion of the seal from the seal groove.

Captions in illustration

| | |
|---|---|
| *a | Normal |
| *b | Correction failure |
| *c | Failure |

CAUTION:
When there is any scratches on the fuel injector seal, crushing of it, or protrusion of it from the seal groove, replace it with a new part.

2. Fuel injector ASSY installation
CAUTION:
If the tip of fuel injector ASSY is bumped or dropped, replace the fuel injector ASSY with a new one.



(1) Install a new back-up ring NO.2, new fuel injector seal and new back-up ring NO.1 as shown in the figure.

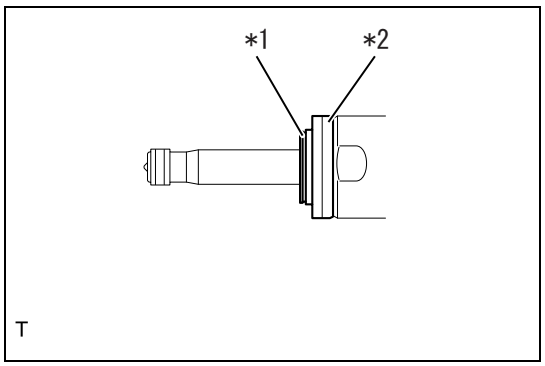
Captions in illustration

| | |
|---|---|
| *1 | Back-up ring No. 2 |
| *2 | Fuel injector seal |
| *3 | Back-up ring No. 1 |
| *a | Back-up ring gap |
| *b | Running on |
| *c | Widening |
| *d | Groove |

CAUTION:

- There must be no foreign matter, scratches, etc. in the fuel injector seal groove of injector.
- Be careful not to mix up the directions of back-up springs NO.1 and NO.2.
- Be careful not to mix up the installation order of back-up spring and fuel injector seal.
- There must be no running on or widening of back-up ring gap portion as shown in the figure.
- After the installation, there must be no foreign matter, scratches, etc. in the fuel injector seal.

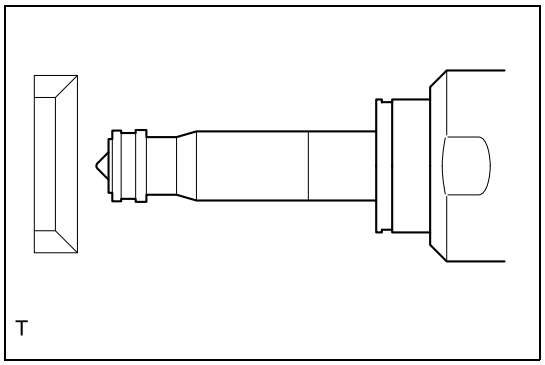
FU



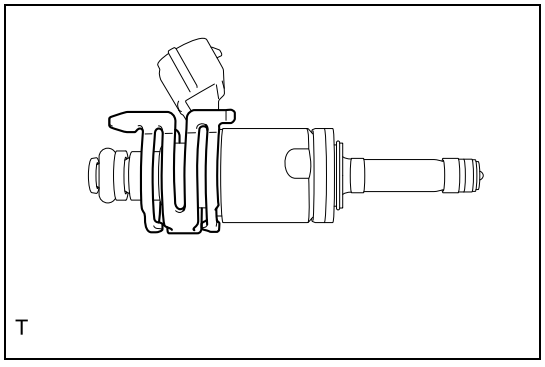
(2) Install a new fuel injector insulator and new O-ring.

Captions in illustration

| | |
|---|---|
| *1 | C-ring |
| *2 | Fuel injector insulator |

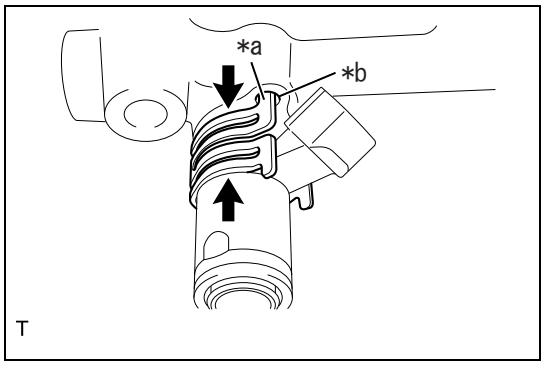


CAUTION:
Install the fuel injector insulator in the direction as shown in the figure.



(3) Install the fuel injector holder to the fuel injector ASSY.

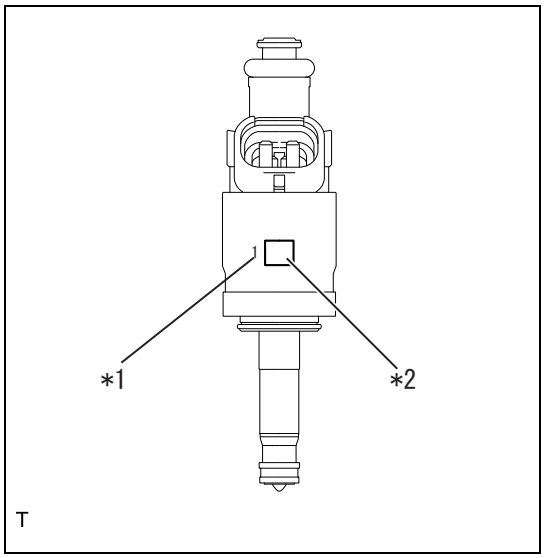
(4) Apply new engine oil to the chamfered portions of injector insertion holes of the fuel delivery pipes (bank 2 side) and (bank 1 side).



(5) Align the protrusion of fuel injector holder to the arrest holes of fuel delivery pipes (bank 2 side) and (bank 1 side) to install the fuel injector holder.

Captions in illustration

| | |
|---|---|
| *a | Protrusion portion |
| *b | Arrest hole |
| ➡ | There must be no gap. |



CAUTION:

- There must be no foreign matter, scratches, etc. inside the injector insertion holes of the fuel delivery pipes (bank 2 side) and (bank 1 side).
- There must be no gasoline on the fuel injector seal and inside the attachment hole.
- Insert the injector straight to the fuel delivery pipes (bank 2 side) and (bank 1 side) without tilting it.
- There must be no gap between the high pressure side fuel injector pipe and fuel injector holder.
- When replacing the fuel injector ASSY, install a new ASSY with the same flow stratified number.

Captions in illustration

| | |
|---|---|
| *1 | Flow stratified number |
| *2 | QR code |

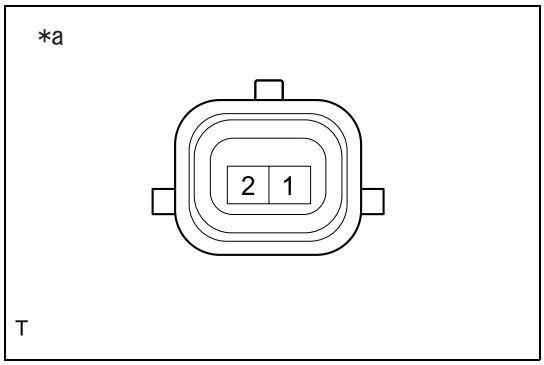
3. Fuel delivery pipe (bank 2 side) installation
   (1) Install the fuel delivery pipe (bank 2 side) with the two bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Connect the two fuel injector connectors.
4. Fuel delivery pipe (bank 1 side) installation
   (1) Install the fuel delivery pipe (bank 1 side) with the two bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Connect the two fuel injector connectors and fuel pressure sensor connector.
5. Fuel delivery pipe installation
   (1) Temporarily tighten the nut for new fuel delivery pipe until it is seated.
   (2) Temporarily install the fuel delivery pipe with the three bolts.
   (3) Tighten the three bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (4) Tighten the fuel delivery pipe.
   Standard value:T=25N·m {255kgf·cm} {18.4ft·lbf}
6. Fuel delivery pipe NO.2 installation
   (1) Temporarily tighten the nut for new fuel delivery pipe No.2 until it is seated.
   (2) Tighten the fuel delivery pipe NO.2.
   Standard value:T=25N·m {255kgf·cm} {18.4ft·lbf}
7. Intake manifold installation
   (Refer to IE - 28)

## Unit inspection

1. Fuel injector ASSY check

   CAUTION:

   This procedure must be used only when judging short circuit and open circuit. It cannot be used for judging defective operation.



(1) Resistance check

(a)Measure the resistance between the terminals.

Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C{68°F} | 1.9 Ω |

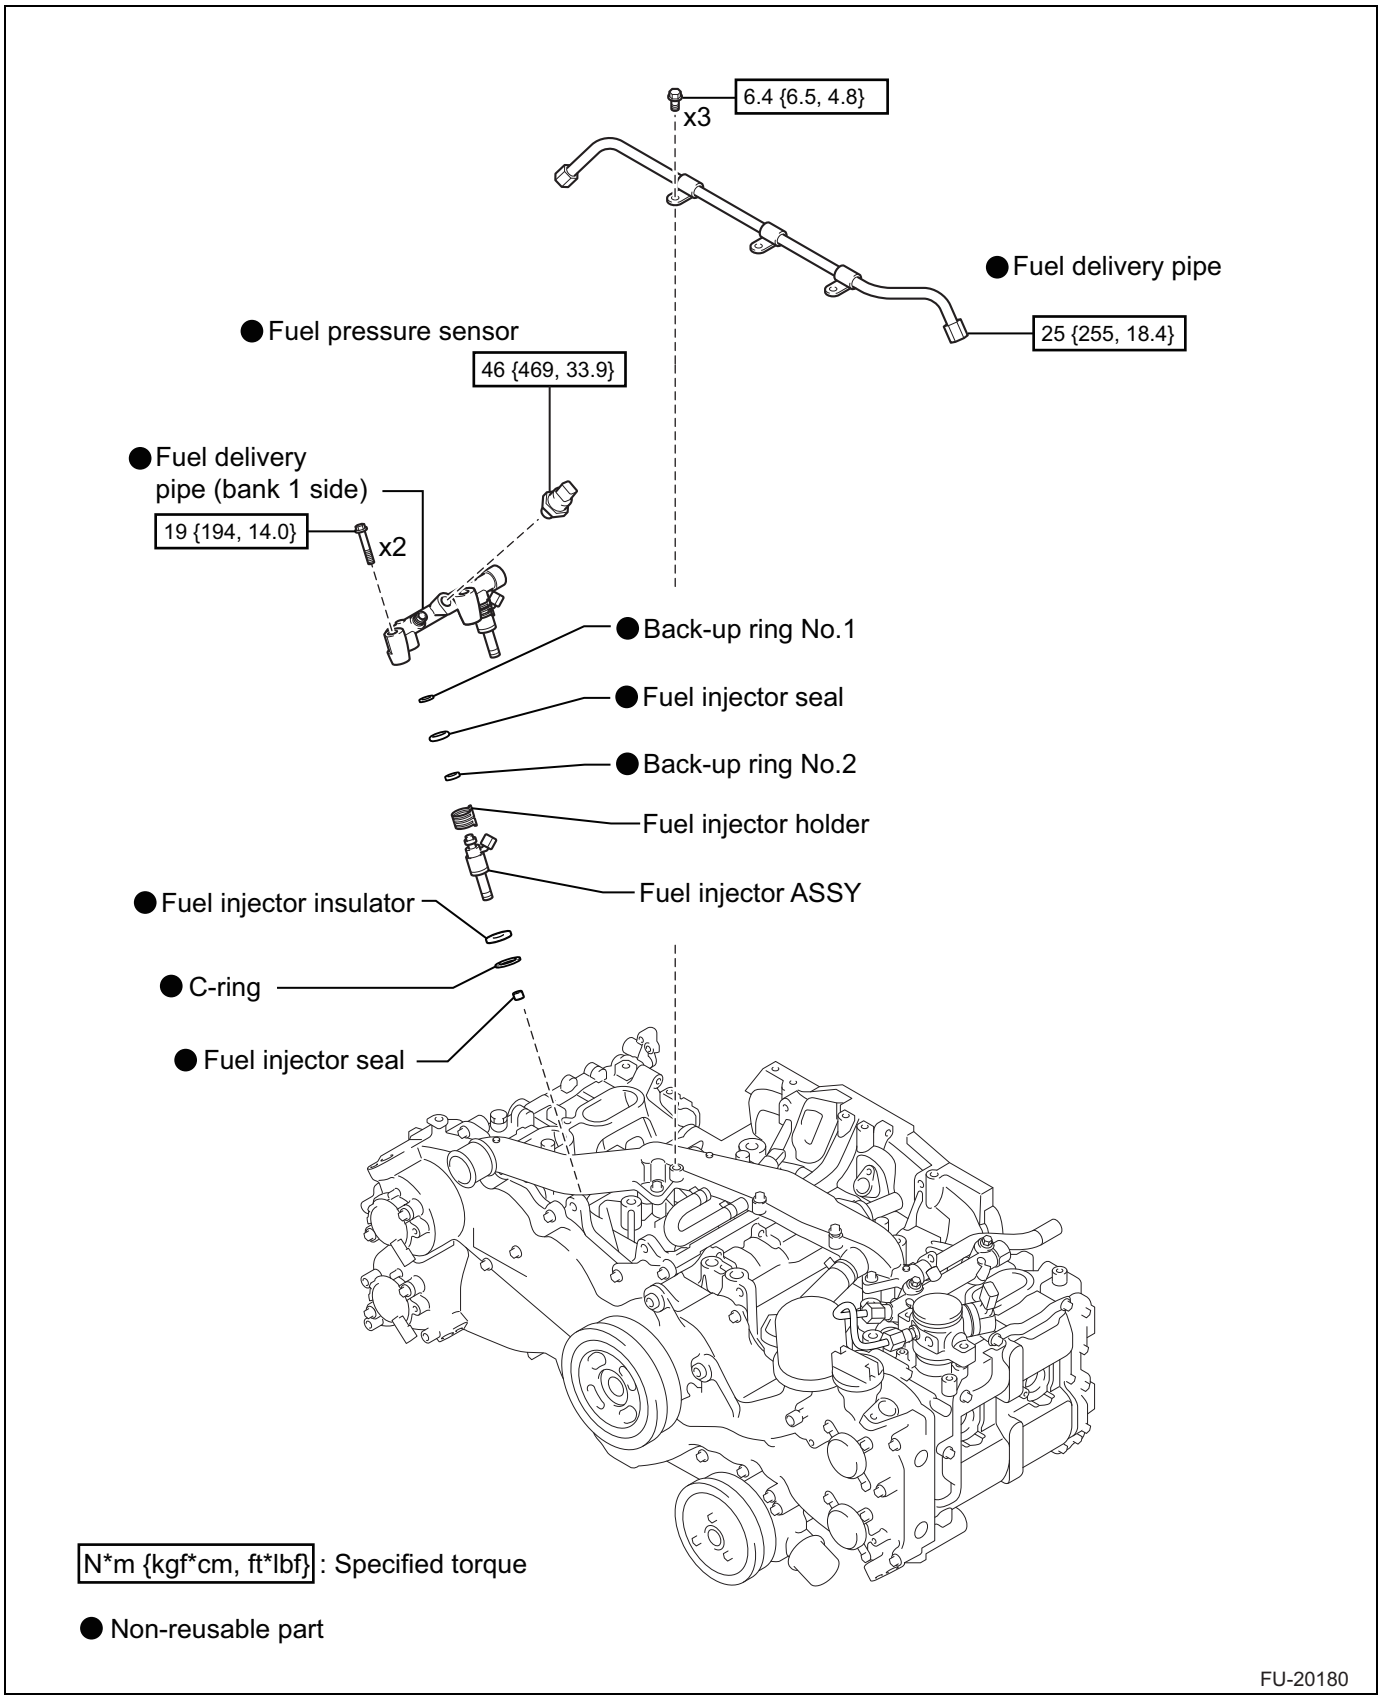
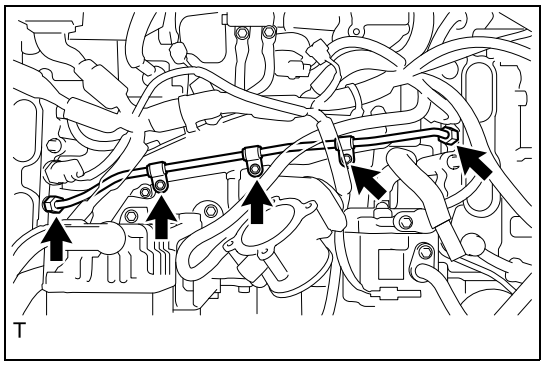
# Fuel pressure sensor (FA20)

## Exploded view



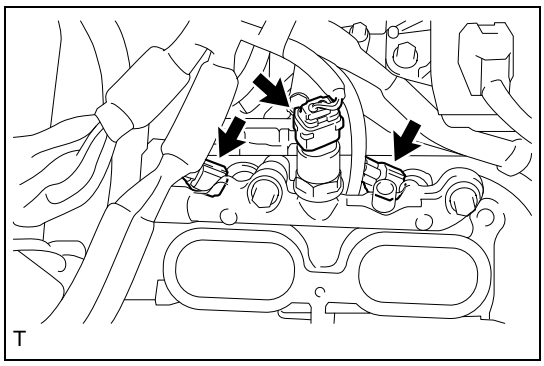
## Removal

1. Intake manifold removal
   (Refer to IE - 17)

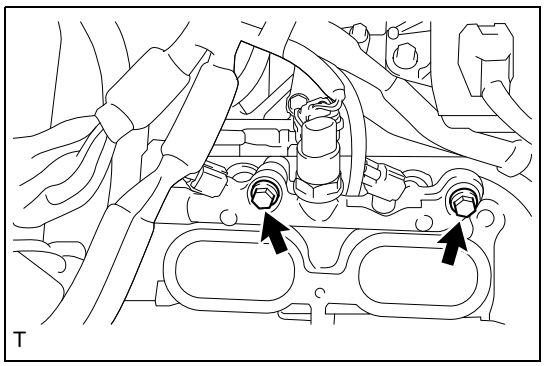


2. Fuel delivery pipe removal
   (1) Remove the 3 bolts.
   (2) Remove the fuel delivery pipe.

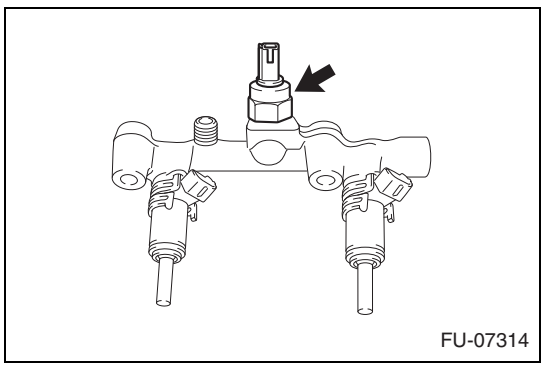
3. Fuel delivery pipe (bank 1 side) removal



(1) Disconnect the fuel pressure sensor connector and two fuel injector connectors.



(2) Remove the two bolts and remove fuel delivery pipe (bank 1 side).



4. Fuel pressure sensor removal
   (1) Remove the fuel pressure sensor from the fuel delivery pipe (bank 1 side).

5. Fuel injector ASSY removal (Refer to FU - 32)

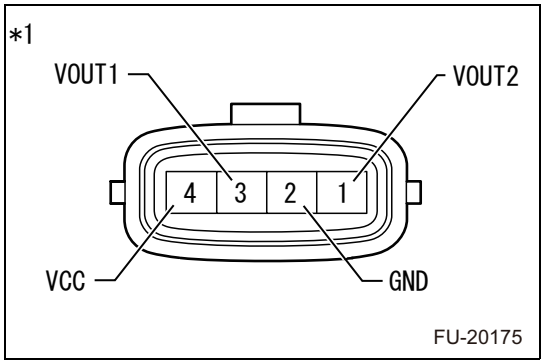
## Installation

1. Fuel injector ASSY installation (Refer to FU - 34)
   CAUTION:
   Use a new fuel delivery pipe (bank 1 side).

2. Fuel delivery pipe (bank 1 side) and fuel pressure sensor installation
   (1) Install the fuel delivery pipe (bank 1 side) with the two bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   (2) Temporarily install a new fuel pressure sensor to the fuel delivery pipe (bank 1 side) until it can be turned by hand.
   (3) Fuel the fuel pressure sensor.
   Standard value:T=46N·m {469kgf·cm} {33.9ft·lbf}
   CAUTION:
   - There must be no oil on the threaded portions of fuel pressure sensor and fuel delivery pipe (bank 1 side).
   - Do not allow foreign matter to get in when installing the fuel pressure sensor.
   - Do not retighten (or recheck the tightening torque of) the fuel pressure sensor after it is tightened once.
   (4) Connect the two fuel injector connectors and fuel pressure sensor connector.
3. Fuel delivery pipe installation
   (1) Temporarily tighten the nut for the new fuel delivery pipe until it is seated.
   (2) Temporarily install the fuel delivery pipe with the three bolts.
   (3) Tighten the three bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (4) Tighten the fuel delivery pipe.
   Standard value:T=25N·m {255kgf·cm} {18.4ft·lbf}
4. Intake manifold installation
   (Refer to IE - 28)

FU

## Unit inspection



1. Fuel pressure sensor check
   (1) Output voltage check
   (a)Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3(VOUT1) - 2(GND) | Apply 5 V voltage between the terminals 4 (VCC) and 2 (GND). | Approx. 0.5 V |

Captions in illustration

| | |
|---|---|
| *1 | Connector not connected (Fuel pressure sensor) |

CAUTION:
- Wrong connection of the inspection terminals may damage the fuel pressure sensor. Pay special attention to the connection work.
- Do not apply voltage of 6 V or higher between the terminals 4 (VCC) and 2 (GND).

NOTE:
If a stabilized power source is not available, use nickel hydride batteries (1.2 V ×4) etc.

# Injector driver (FA20)

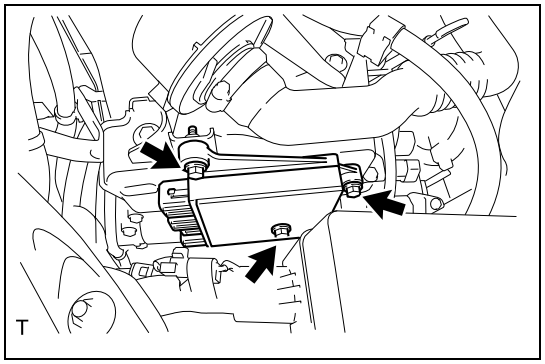
2. Injector driver removal
   (1) Move the lock lever in the direction of arrow to unlock the three connectors.

Captions in illustration

| | |
|---|---|
| *1 | Lock lever |
| *a | Unlock |
| ➡ | Connector with lock |
| ⇨ | Normal connector |

   (2) Disconnect the three connectors with lock and normal connector from the injector driver.



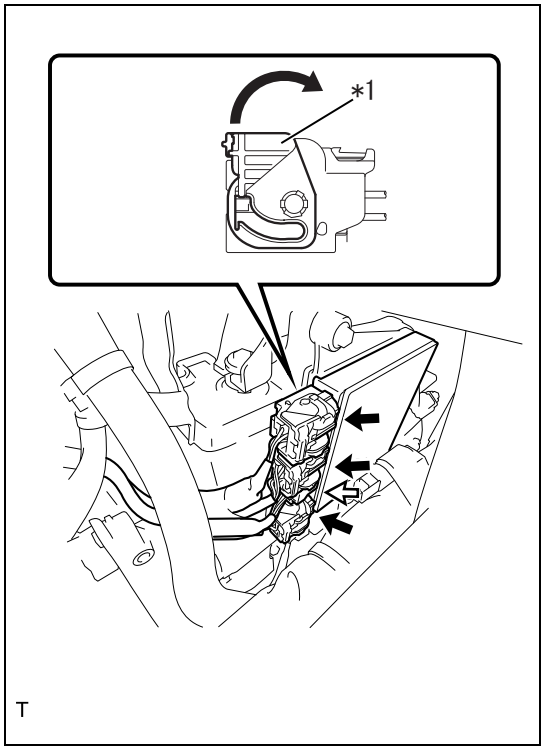
(3) Remove the three bolts and remove the injector driver.
CAUTION:
Do not apply any impact to the injector driver.

## Installation

FU

1. Injector driver installation
CAUTION:
- Do not apply any impact to the injector driver.
- When installing the injector driver, check that the installation portion of the injector driver to the engine is not dirty. The injector driver is grounded to the engine. Therefore, improper cleaning or installation may cause malfunction of the injector driver.

(1) Install the injector driver with the three bolts.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}



(2) Connect the three connectors with lock and normal connector to the injector driver and move the lock lever as shown in the figure to lock the three connectors with lock.

Captions in illustration

| | |
|---|---|
| *1 | Lock lever |
| ➡ | Connector with lock |
| ⇨ | Normal connector |

CAUTION:
For connector with lock, connect the connector securely to lock it.

2. Connection of the battery ground terminal
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

## Removal

CAUTION:

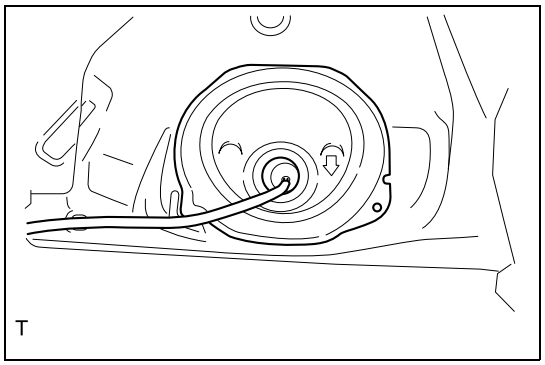
If the fuel gauge indicates that two thirds or more of the fuel is remaining, be sure to drain the fuel before starting the work to avoid the fuel to spill.

1. Fuel spill prevention procedure (Refer to FU - 3)
2. Fuel draining
   (1) If the fuel gauge indicates that two thirds or more of the fuel is remaining, drain the fuel according to the following procedure.
   WARNING:
   Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
   CAUTION:
   - Be careful not to spill fuel.
   - Fuel may remain in the fuel filler pipe. Drain the fuel from the fuel filler pipe through the fill opening using a gasoline proof pump and gasoline proof hose with a diameter of 10 mm {0.3937 in} or less before starting the work.

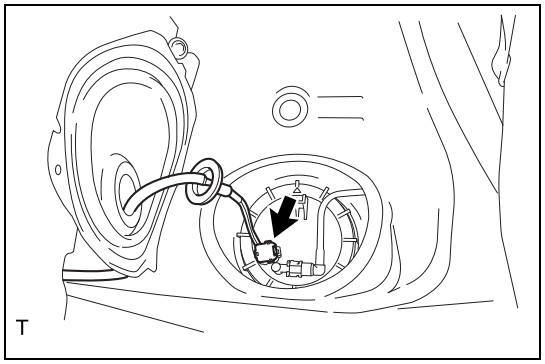
   (a) Remove the exhaust pipe ASSY CTR. (Refer to IE - 41)
   (b) Remove the exhaust tail pipe ASSY. (Refer to IE - 41)

   (c) Loosen the hose clamp and disconnect the fuel tank to filler pipe hose.
   CAUTION:
   - Before starting the work, remove the foreign matters such as dirt on the fuel tank to filler pipe hose connection.
   - Be careful not to spill fuel.

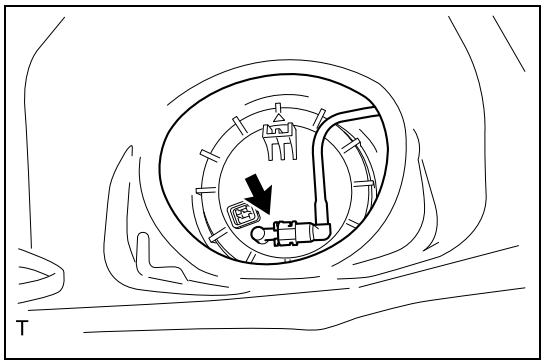
   (d) Set a metal container under the vehicle and drain the fuel from the fuel tank to filler pipe hose opening using the gasoline proof hose with a diameter of 10 mm {0.3937 in} or less.
   CAUTION:
   Be careful not to spill fuel.
   NOTE:
   Always be sure to use a steel container and ground the container as gasoline can easily become charged with static electricity.
   (e) Install the fuel tank to filler pipe hose with the hose clamp.
   Standard value: T=2.0N·m {20kgf·cm} {1.5ft·lbf}
3. Disconnection of the battery ground terminal (Refer to IN - 6)
4. Removal of separate type rear seat cushion ASSY LH (Refer to SE - 31)



5. Rear floor service hole cover NO.2 removal
   (1) Push in the grommet to remove the rear floor service hole cover NO.2.
   (2) Remove the butyl tape and remove the rear floor service hole cover NO.2.



(3) Disconnect the fuel pump connector.

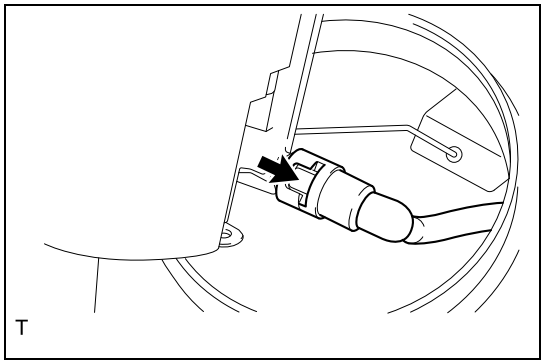


6. Fuel pump ASSY removal
   (1) Disconnect the fuel delivery tube. (Refer to FU - 3)
   CAUTION:
   Be careful not to spill fuel.

   (a)Remove the fuel delivery pipe from the fuel tank.

   (2) Ring nut removal
   (a)Use the SST to loosen the ring nut.
   SST 42099CA000
   CAUTION:
   - Do not use any tools other than the SST.
   - Be careful not to damage the tube with the SST.
   - Before setting the SST, move the tube to a position outside the SST.

   NOTE:
   Insert the cutout portion of SST into the rib of ring nut to fix the SST securely.
   (3) Remove the ring nut and ring nut plate while holding the fuel pump ASSY by hand.



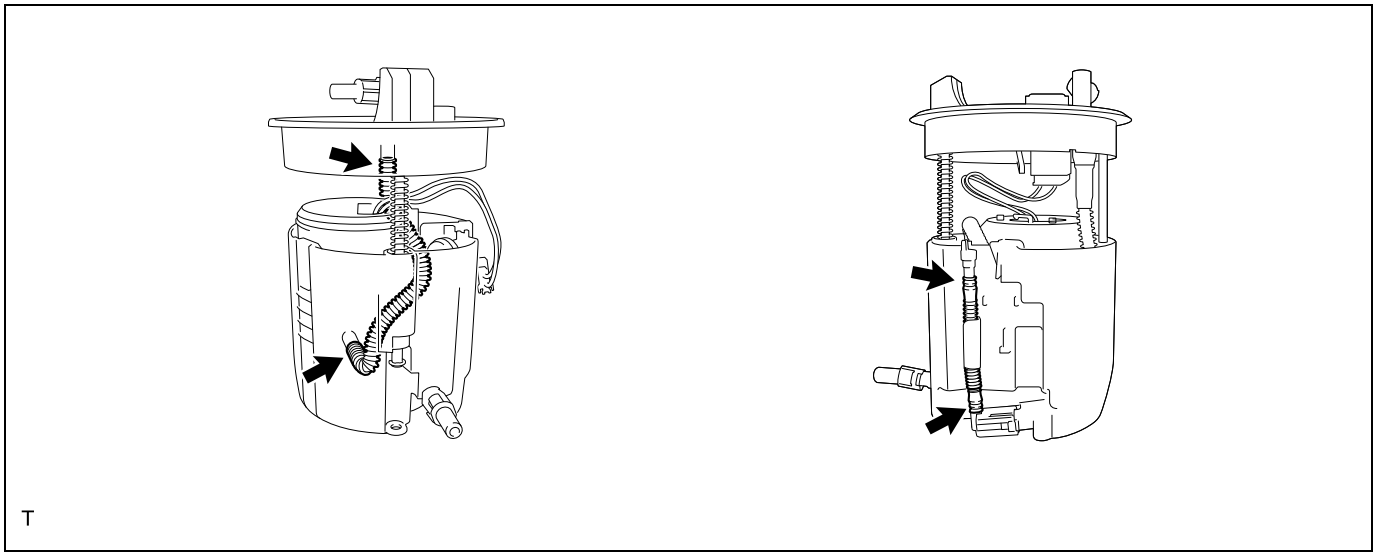
T

(4) Disconnect the fuel sub delivery tube and remove the fuel pump ASSY from the fuel tank.
CAUTION:
- When disconnecting the fuel sub delivery tube, do not pull the tube strongly.
- Do not bend the arm of fuel sender gauge ASSY.
- Do not turn the fuel pump ASSY in the fuel tank to prevent the arm of fuel sender gauge ASSY from bending.
- Be careful not to spill the fuel remaining in the fuel pump ASSY outside the fuel tank or in the vehicle.

(5) Remove the gasket from the fuel tank.

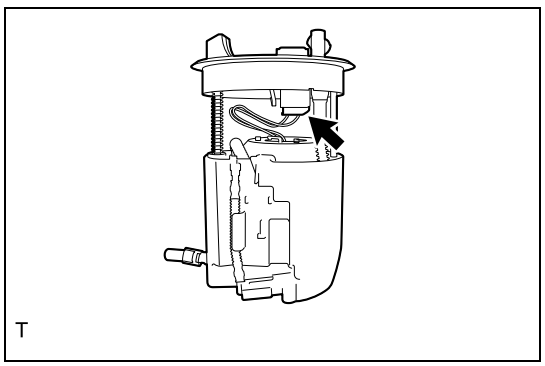
## Disassembly

CAUTION:
Do not disconnect the press fit hoses of fuel pump ASSY shown in the figure.



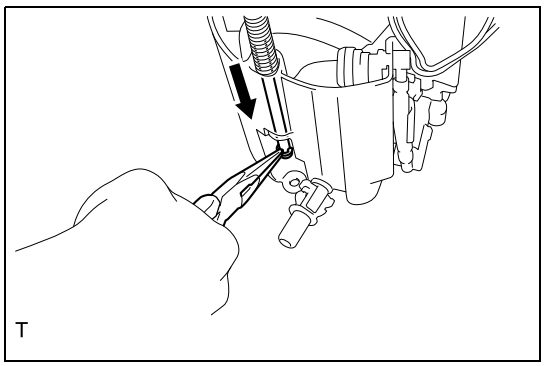
T

1. Fuel sender gauge ASSY removal (Refer to FU - 75)



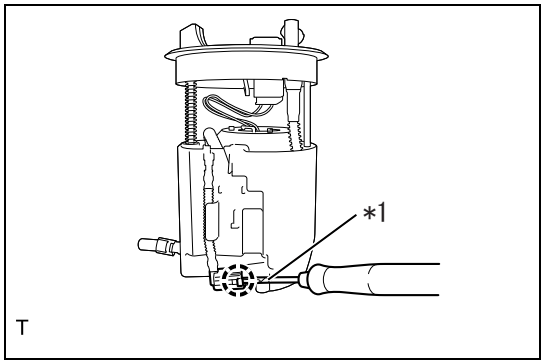
T

2. Fuel sub tank removal
(1) Disconnect the fuel pump harness connector.



T

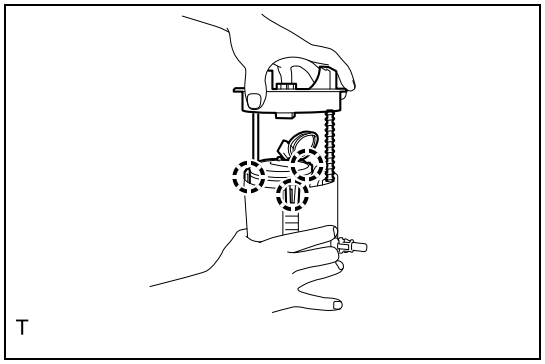
(2) Hold down the fuel suction plate in the direction of arrow shown the figure.
(3) Remove the E-ring.



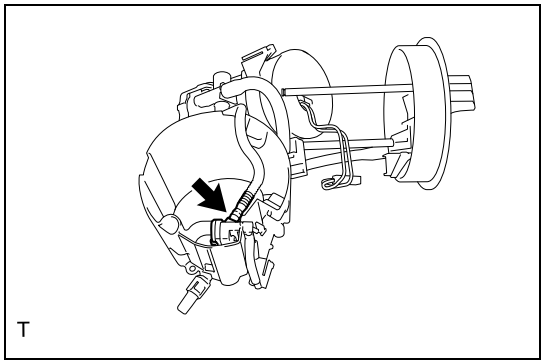
(4) Using a flat tip screwdriver wrapped with protective tape, release the claw and disconnect the jet pump nozzle.

Captions in illustration

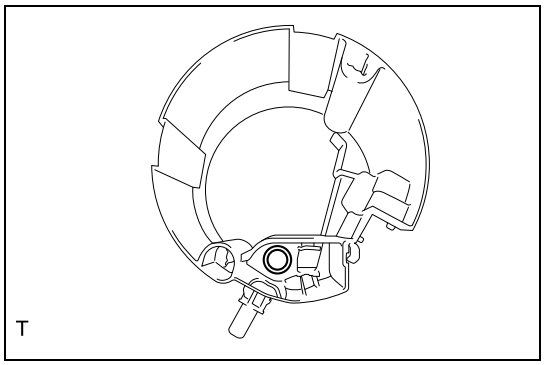
| | |
|---|---|
| *1 | Protective tape |



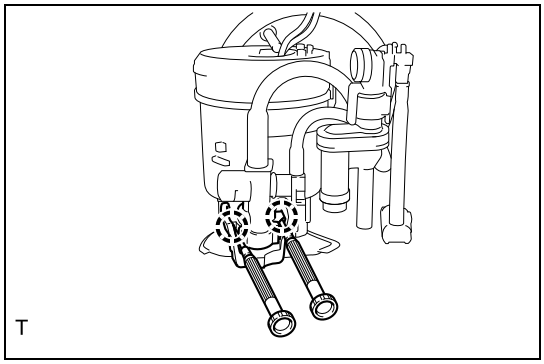
(5) Using a flat tip screwdriver wrapped with protective tape, release the three claws and pull out the fuel suction plate.
CAUTION:
Do not damage the fuel sub tank and fuel filter.



(6) Using a flat tip screwdriver wrapped with protective tape, release the claw and disconnect the jet pump.

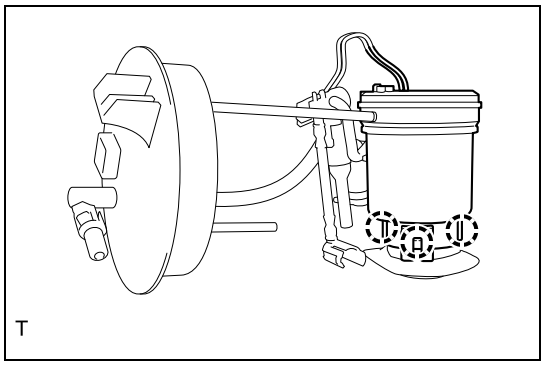


(7) Remove the O-ring from the fuel sub tank.



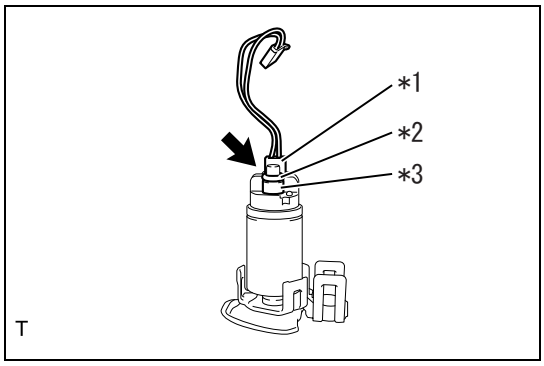
T

3. Fuel pump removal
   (1) Release the two claws using a flat tip screwdriver wrapped with protective tape.



T

   (2) Using a flat tip screwdriver wrapped with protective tape, release the three claws and pull the fuel pump straight out.
   CAUTION:
   Do not damage the fuel pump and fuel filter.

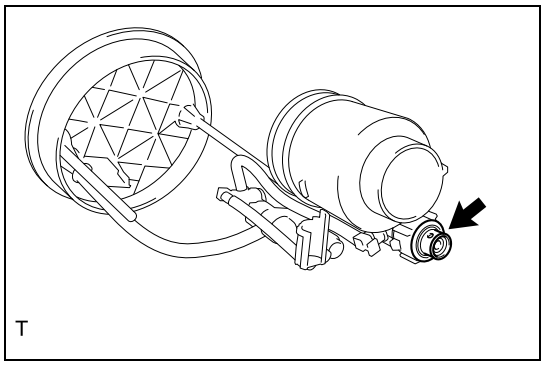


T

   (3) Disconnect the connector and remove the fuel pump harness.
   (4) Remove the O-ring and spacer from the fuel pump.

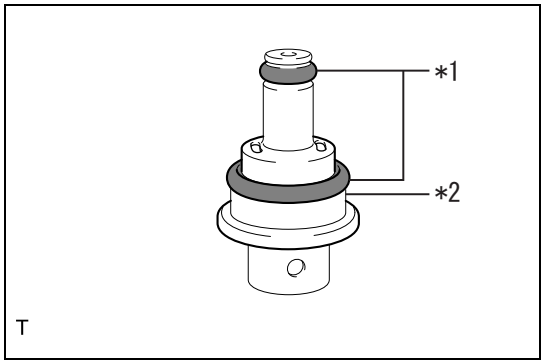
Captions in illustration

| | |
|---|---|
| *1 | Fuel pump harness |
| *2 | O-ring |
| *3 | Spacer |



T

4. Fuel pressure regulator removal
   (1) Remove the fuel pressure regulator from the fuel pump.

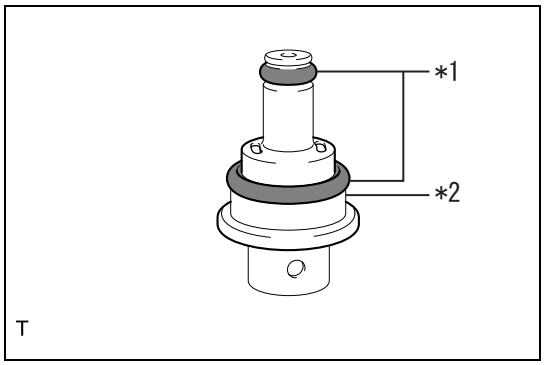


(2) Remove the two O-rings and back-up ring from the fuel pressure regulator.

Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Back-up ring |

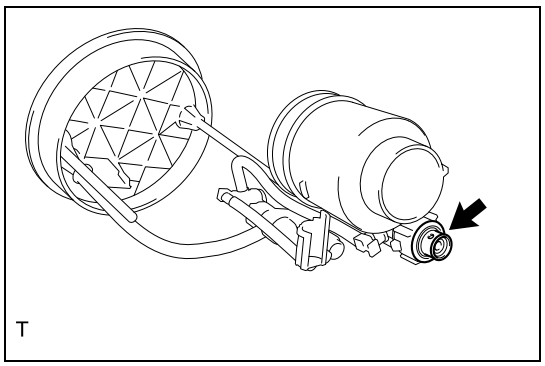
## Assembly



1. Fuel pressure regulator installation
   (1) Apply gasoline to two new O-rings and back-up ring, and then install them to the fuel pressure regulator.

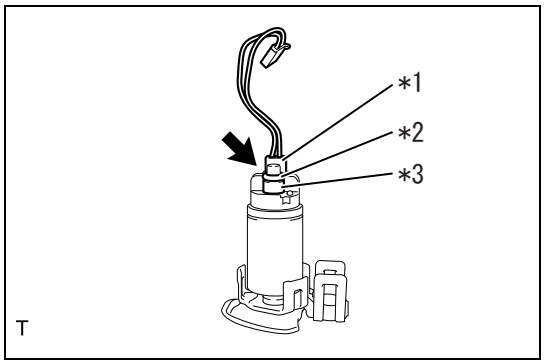
Captions in illustration

| | |
|---|---|
| *1 | O-ring |
| *2 | Back-up ring |



(2) Install the fuel pressure regulator to the fuel filter.
CAUTION:
Install it so that the O-ring is not cut or pinched.

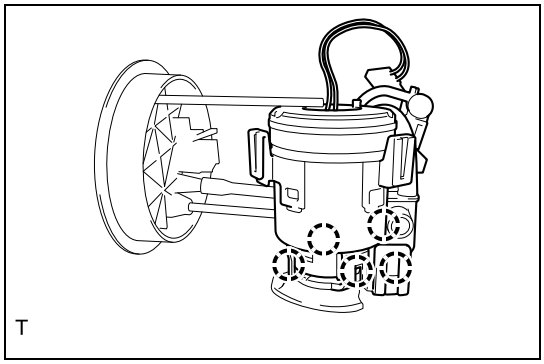
2. Fuel pump installation
   (1) Attach the spacer and a new O-ring to the fuel pump.



(2) Connect the connector and connect a new fuel pump harness.

Captions in illustration

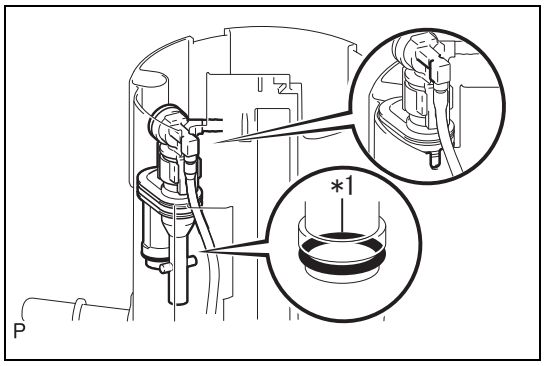
| | |
|---|---|
| *1 | Fuel pump harness |
| *2 | O-ring |
| *3 | Spacer |



T

(3) Apply a coat of gasoline to the O-ring and install the fuel pump to the fuel filter.
CAUTION:
Install it so that the O-ring is not cut or pinched.

3. Fuel sub tank installation
(1) Set the fuel suction plate on the fuel sub tank through the spring.



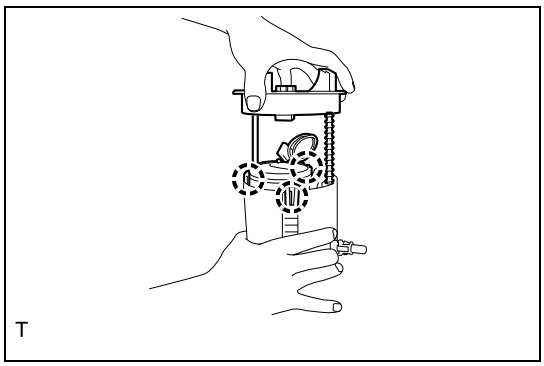
P

(2) Apply a coat of gasoline to a new O-ring and install it to the jet pump.

Captions in illustration

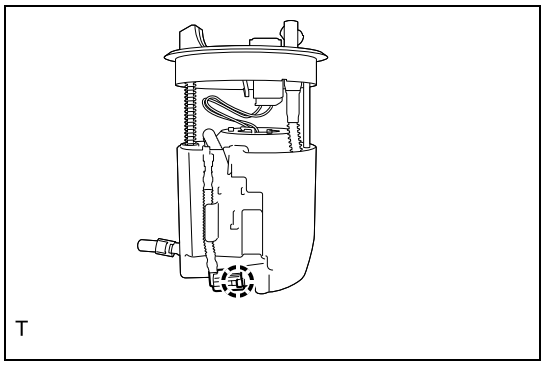
| | |
|---|---|
| *1 | O-ring |

(3) Install the jet pump to the fuel sub tank.
CAUTION:
- Install it so that the O-ring is not cut or pinched.
- Be sure to engage the claw.



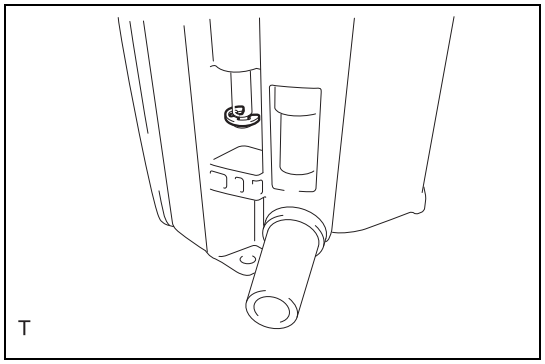
T

(4) Engage the three claws and install the fuel filter to the fuel sub tank.



T

(5) Engage the claw and install the jet pump nozzle to the fuel sub tank.

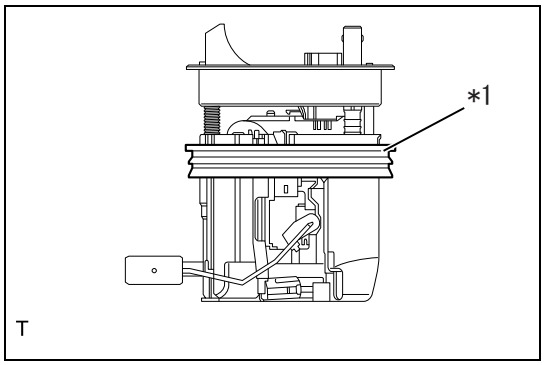


(6) Install a new E-ring.

(7) Connect the fuel pump harness connector and install the harness to the four clamps.

4. Fuel sender gauge ASSY installation (Refer to FU - 78)

## Installation

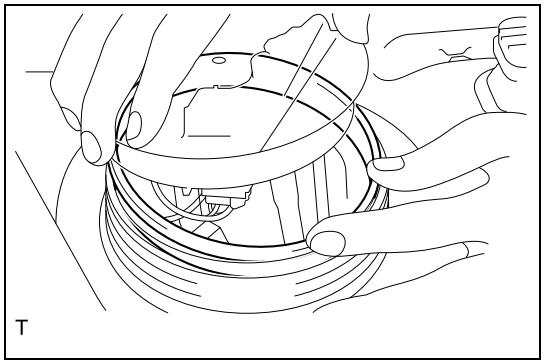


1. Fuel pump ASSY installation
   (1) Install a new gasket to the fuel pump ASSY.

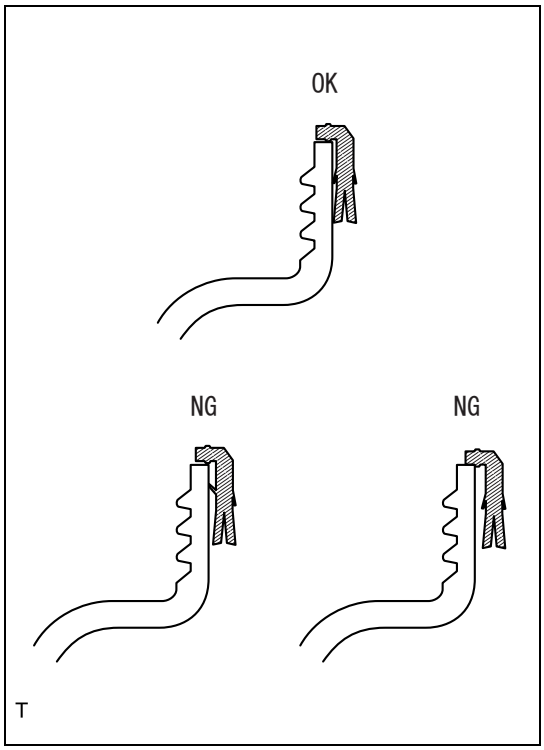
Captions in illustration

| | |
|---|---|
| *1 | Gasket |

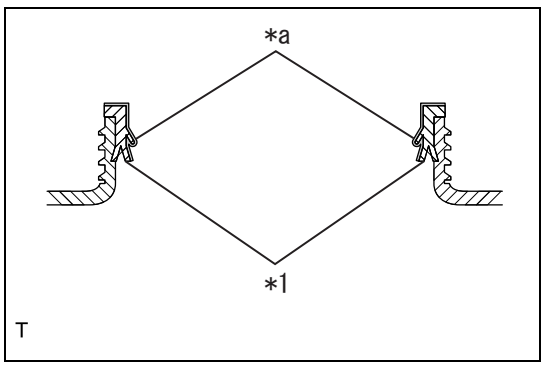
(2) Connect the fuel sub delivery tube.
CAUTION:
- When connecting the fuel sub delivery tube, do not pull the tube strongly .
- Do not bend the arm of fuel sender gauge ASSY.



(3) Insert the fuel pump ASSY into the fuel tank and install the new gasket, which was installed to the fuel pump ASSY earlier, to the fuel tank.



CAUTION:
Improper installation such as warpage, slip, etc. results in fuel leakage. Make sure that there is no warpage, slip, etc. in the entire circumference when installing the gasket to the fuel tank.

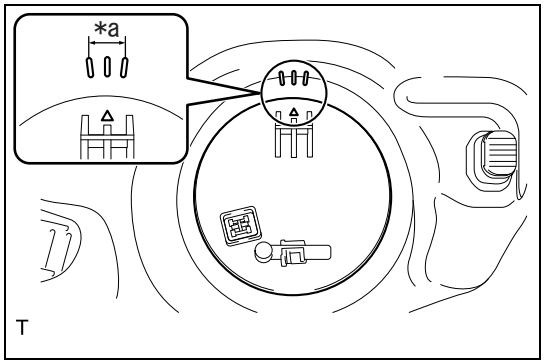


(4) Apply gasoline to the gasket.

Captions in illustration

| | |
|---|---|
| *1 | Gasket |
| *a | Areas of gasoline application |

CAUTION:
- When applying gasoline to the gasket, apply it to the area as shown in the figure.
- Be careful that no gasoline comes into contact with the threaded portion of fuel tank.
- Make sure that there is no fuel, foreign matter, etc. on the sealing portion.

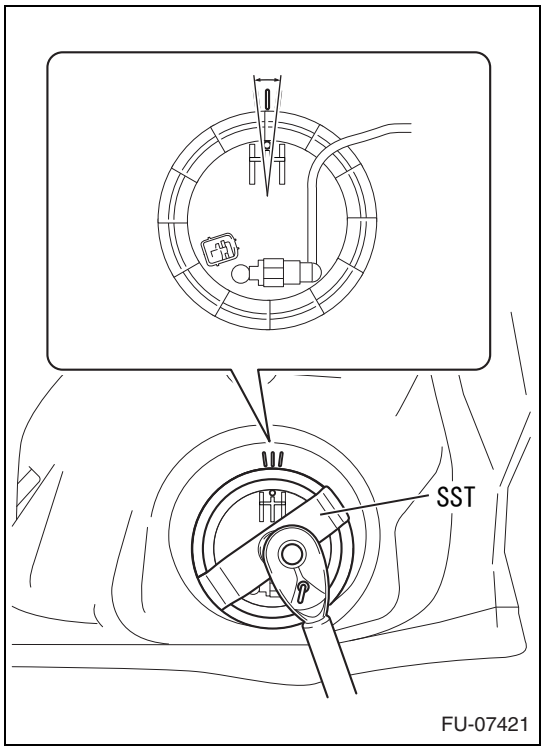


(5) Set the fuel pump ASSY in the installation position range mark of fuel tank.

Captions in illustration

| | |
|---|---|
| *a | Installation position range mark |

(6) Install a new ring nut plate and ring nut, and then temporarily tighten the ring nut.

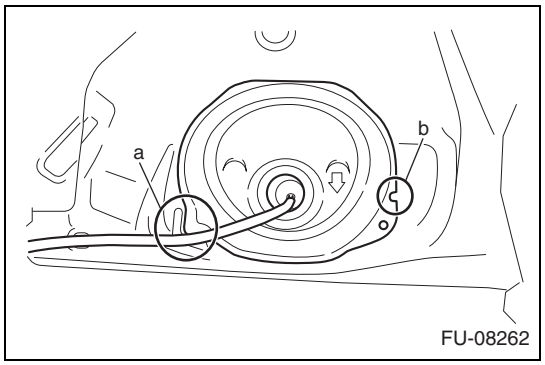


(7) Tighten the ring nut using the SST.
SST 42099CA000
Standard value:T=85N·m {867kgf·cm} {62.7ft·lbf}
CAUTION:
- Do not use any tools other than the SST.
- Be careful not to damage the tube with the SST.
- Before setting the SST, move the tube to a position outside the SST.
- Make sure that the position mark on the fuel pump ASSY is located within the installation position range mark on the fuel tank as shown in the figure.
- After tightening to the specified torque, confirm the tightening by tightening it to the specified torque again.

NOTE:
Insert the cutout portion of SST into the rib of ring nut to fix the SST securely.

(8) Connect the fuel delivery tube. (Refer to FU - 3)
(9) Install the fuel delivery tube to the fuel tank. (Refer to FU - 3)
(10) Connect the fuel pump connector.

2. Connection of the battery ground terminal
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}



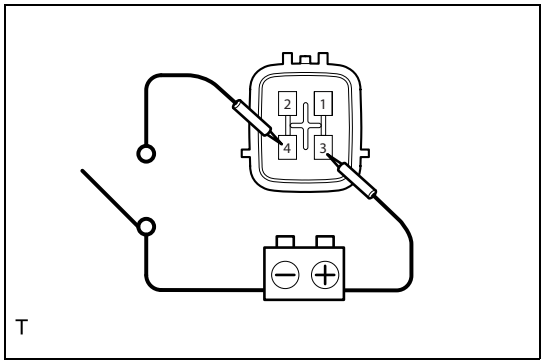
3. Rear floor service hole cover NO.2 installation
(1) Install the rear floor service hole cover NO.2 using new butyl tape.
NOTE:
(a) Align the flange of the rear floor service hole cover No. 2 to the corner bead on the floor.
(b) Align the cutout for the rear floor service hole cover No. 2 to the floor protrusion.
(2) Install the grommet to the rear floor service hole cover NO.2.

4. Separate type rear seat cushion ASSY LH installation (Refer to SE - 39)

## Unit inspection

1. Fuel pump check
(1) Resistance check
(a)Measure the resistance between the terminals.

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 4 | 20°C{68°F} | 0.2 to 3.0 Ω |



(2) Operation check

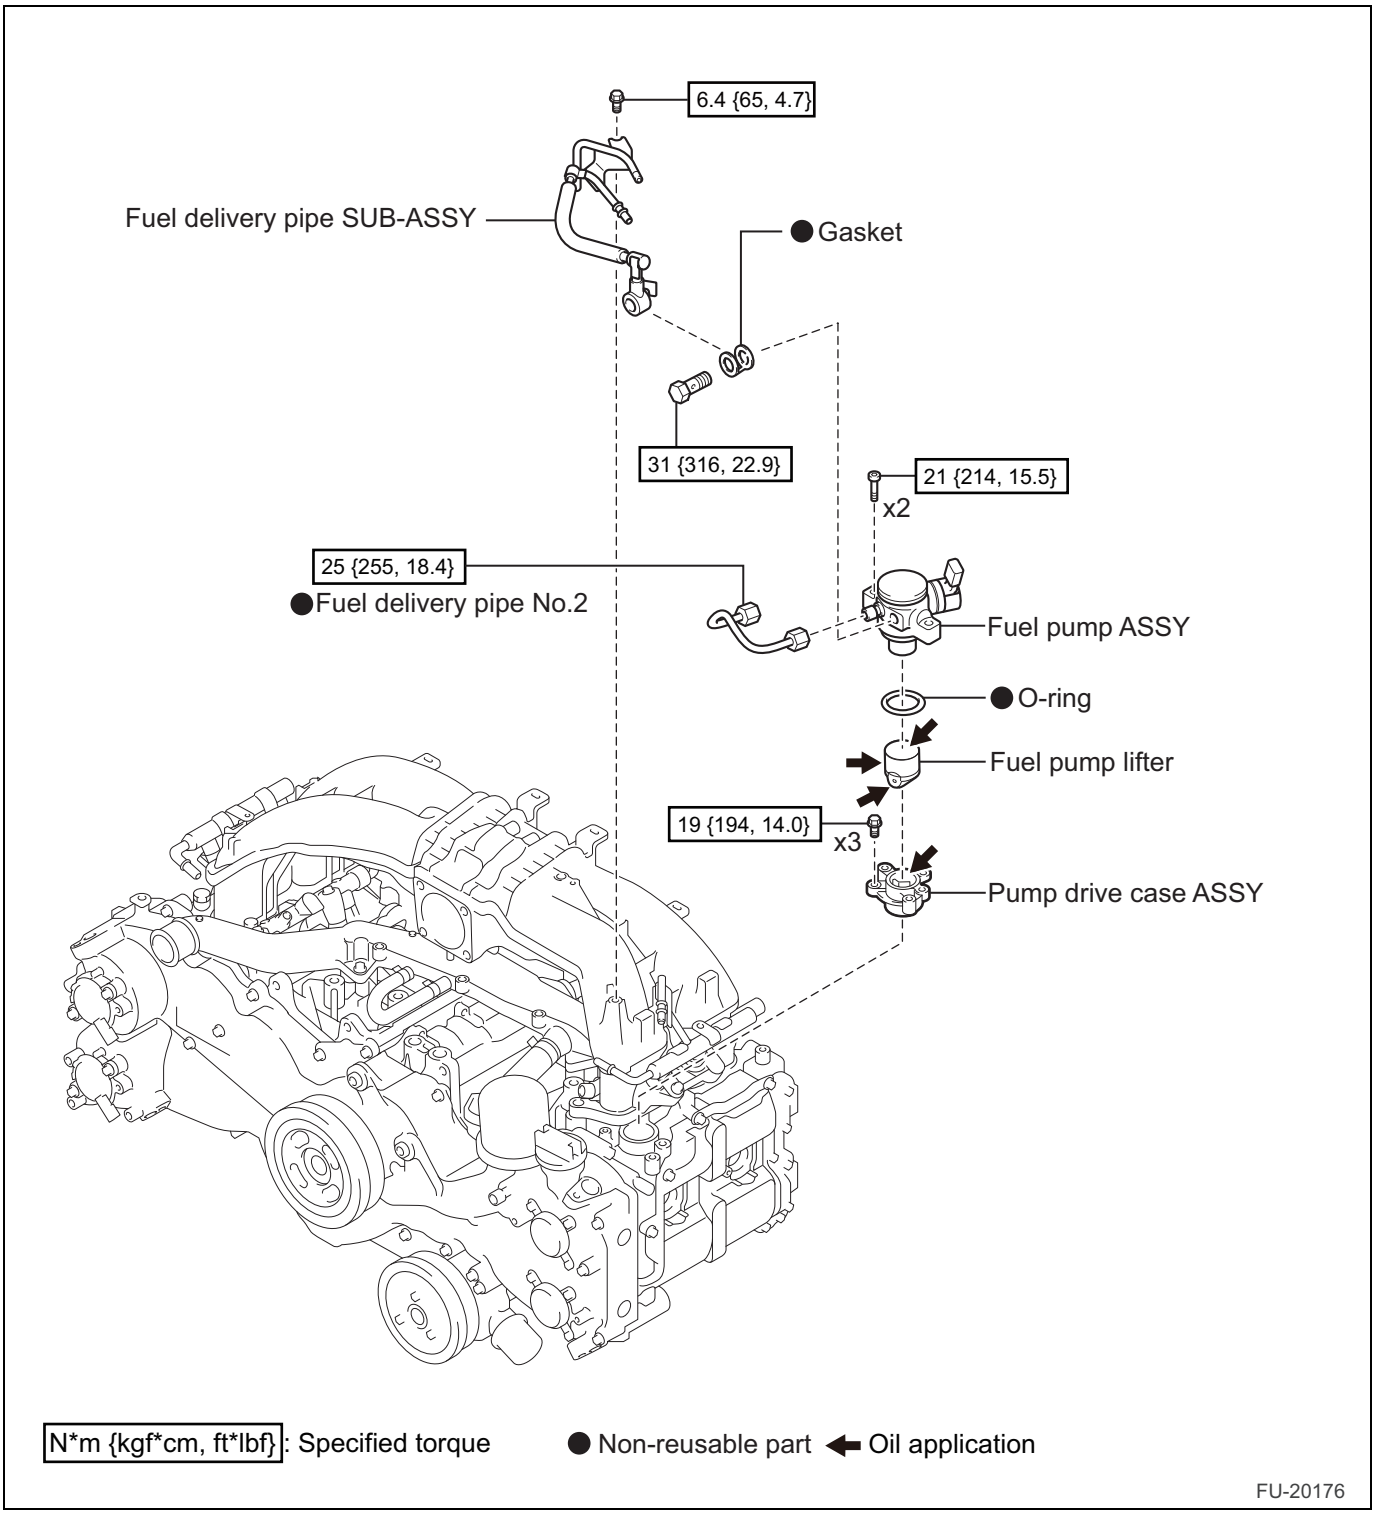
(a)Apply the battery voltage between the terminals and check the motor operation.

CAUTION:

- Drain the fuel completely.
- Perform the check in a short period of time (10 sec. or less).
- Place the fuel pump as far apart as possible from the battery.

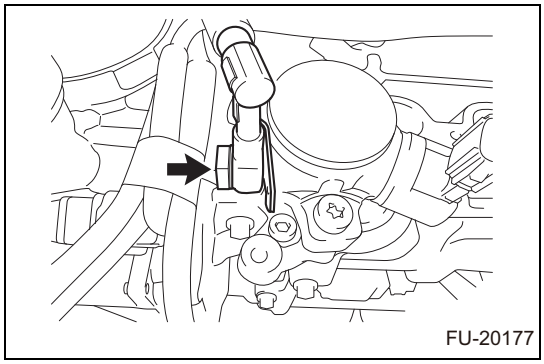
# Fuel pump ASSY (FA20 / high fuel pressure)

## Exploded view



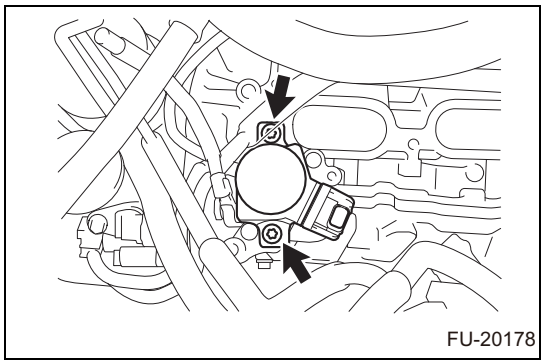
## Removal

1. Intake manifold removal
   (Refer to IE - 17)
2. Fuel delivery pipe NO.2 removal (Refer to FU - 31)



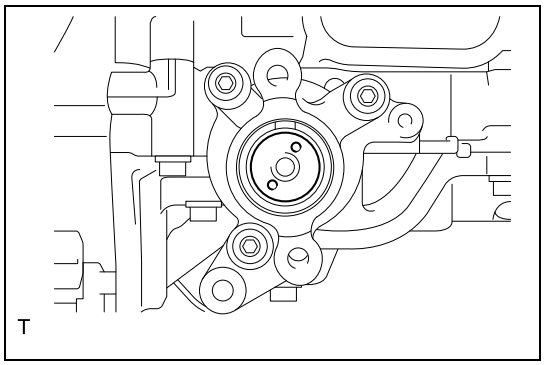
FU-20177

3. Disconnection of fuel delivery pipe SUB-ASSY
   (1) Remove the union bolt and gasket to disconnect the fuel delivery pipe SUB-ASSY.



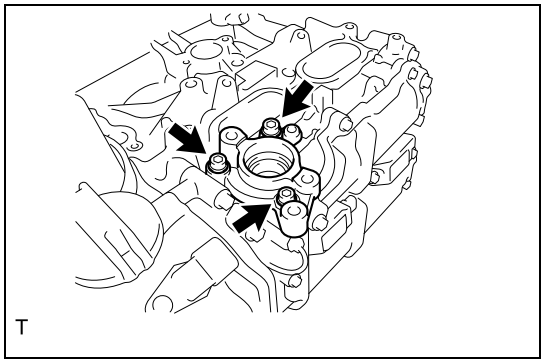
FU-20178

4. Fuel pump ASSY removal
   (1) Remove the two bolts with a TORX PLUS socket wrench 40IP to remove the fuel pump ASSY.



T

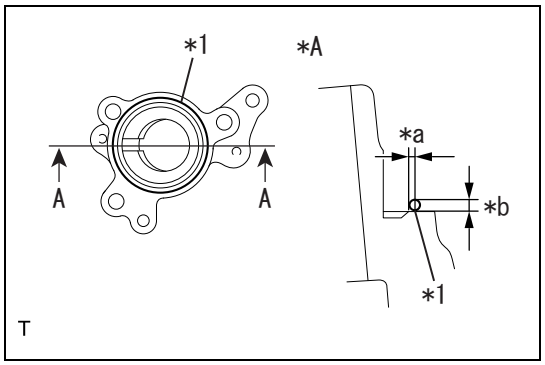
5. Fuel pump lifter removal
   (1) Remove the fuel pump lifter from the pump drive case ASSY.



T

6. Pump drive case ASSY removal
   (1) Remove the three bolts and remove the pump drive case ASSY.

## Installation



1. Pump drive case ASSY installation
   (1) Apply THREE BOND 1217G/1217H or equivalent to the mating surface of pump drive case ASSY.
   Install the pump drive case ASSY with the three bolts.
   Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}
   CAUTION:
   - Do not allow the liquid gasket to accumulate in the oil passage in the pump drive case ASSY.
   - Install within 5 min. after applying liquid gasket.
   - Do not fill the engine oil within 2 hours after the installation.
   - Do not start the engine within 2 hours after the installation.

Captions in illustration

| | |
|---|---|
| *A | Section A - A |
| *1 | THREE BOND 1217G/1217H or equivalent |
| *a | Liquid gasket application position: Within 1 mm {0.0394 in} from the edge |
| *b | Diameter of liquid gasket: 2 to 4 mm {0.0787 to 0.1575 in} |

FU

2. Fuel pump lifter installation
   (1) Turn the crankshaft until the flat surface of cam faces upward from the fuel pump ASSY installation hole of cam cap.
   NOTE:
   When installing the fuel pump ASSY, since the cam convex section does not push up the pump drive surface due to the work above, the fuel pump ASSY and fuel delivery pipe NO.2 can be installed easily.
   (2) Apply new engine oil to the pump drive cam and fuel pump lifter portion.

   (3) Apply new engine oil to the pump drive case ASSY side surface and fuel pump lifter bottom surface, and then install the fuel pump lifter to the pump drive case ASSY.

Captions in illustration

| | |
|---|---|
| *1 | Fuel pump lifter |
| *2 | Pump drive case ASSY |
| *3 | New engine oil application areas (side of pump drive case ASSY, bottom of fuel pump lifter, roller) |

3. Fuel pump ASSY installation
   (1) Install a new O-ring to the fuel pump ASSY.
   (2) Install the fuel pump ASSY with the two bolts using a TORX PLUS socket wrench 40IP.
   Standard value:T=21N·m {214kgf·cm} {15.5ft·lbf}
   (3) Connect the fuel pump connector.
4. Fuel delivery pipe SUB-ASSY connection
   (1) Connect the fuel delivery pipe SUB-ASSY with a new gasket and the union bolt.
   Standard value:T=31N·m {316kgf·cm} {22.9ft·lbf}

5. Fuel delivery pipe NO.2 connection (Refer to FU - 38)
6. Intake manifold installation
   (Refer to IE - 28)

## Unit inspection

1. Fuel pump ASSY check
   (1) Visual inspection
      (a)Check that the fuel pump ASSY has no deformation, cracks or other damages.

   (2) Resistance check
      (a)Measure the resistance between the fuel pump (high pressure side) terminals.
      Resistance

| Inspection terminals | Inspection conditions | Standard value |

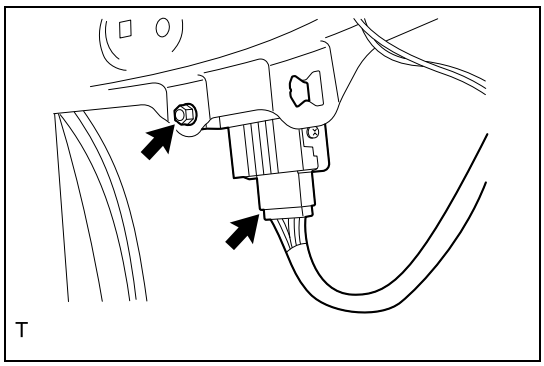
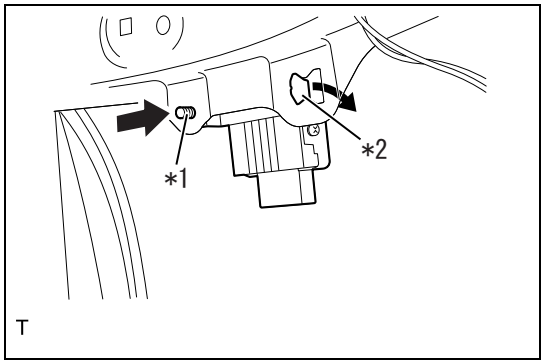
## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Disconnection of front door opening trim weather strip RH (Refer to IT - 48)
3. Removal of the front door scuff plate RH (Refer to IT - 49)
4. Removal of separate type rear seat cushion ASSY (Refer to SE - 31)
5. Removal of luggage compartment trim cover INN RH (Refer to IT - 48)
6. Removal of luggage compartment trim side cover RH (Refer to IT - 49)



7. Removal of fuel pump control computer ASSY
   (1) Disconnect the fuel pump control computer connector.
   (2) Remove the nut.



(3) Push in the stud bolt of fuel pump control computer ASSY.

Captions in illustration

| | |
|---|---|
| *1 | Stud bolt |
| *2 | Bracket |

(4) Slide the fuel pump control computer ASSY toward the rear of the vehicle to disengage the bracket and remove the fuel pump control computer ASSY.
CAUTION:
If impact is applied to the fuel pump control computer ASSY, do not reuse it.

## Installation

FU

1. Installation of fuel pump control computer ASSY
   (1) Engage the bracket of fuel pump control computer ASSY to the body mounting hole and pass the stud bolt through the body hole.
   (2) Install the fuel pump control computer ASSY with the nut.
   Standard value:T=5.0N·m {51kgf·cm} {3.7ft·lbf}
   CAUTION:
   If impact is applied to the fuel pump control computer ASSY, do not reuse it.
   (3) Connect the fuel pump control computer connector.
2. Installation of luggage compartment trim side cover RH (Refer to IT - 57)
3. Installation of luggage compartment trim cover INN RH (Refer to IT - 58)
4. Installation of separate type rear seat cushion ASSY (Refer to SE - 39)
5. Installation of the front door scuff plate RH (Refer to IT - 58)
6. Installation of the front door opening trim weather strip RH (Refer to IT - 58)

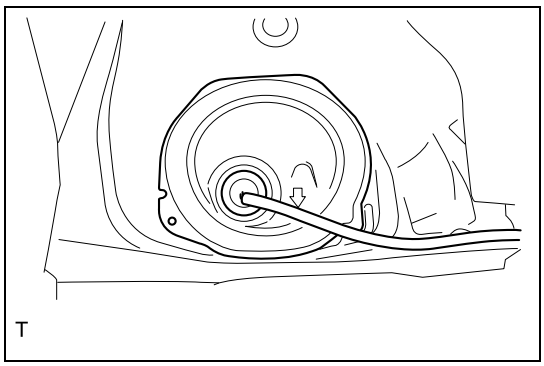
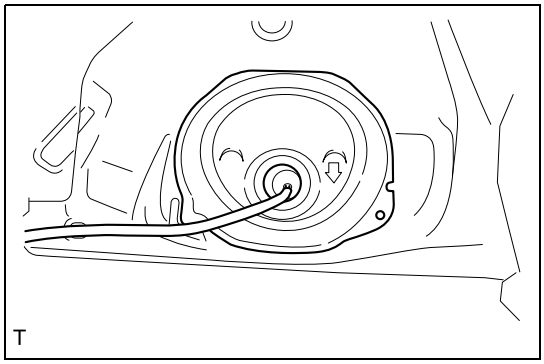
## Removal

1. Fuel spill prevention procedure (Refer to FU - 3)
2. Draining of fuel (Refer to FU - 47)
3. Disconnection of the battery ground terminal (Refer to IN - 6)
4. Removal of separate type rear seat cushion ASSY RH (Refer to SE - 31)
5. Removal of separate type rear seat cushion ASSY LH (Refer to SE - 31)



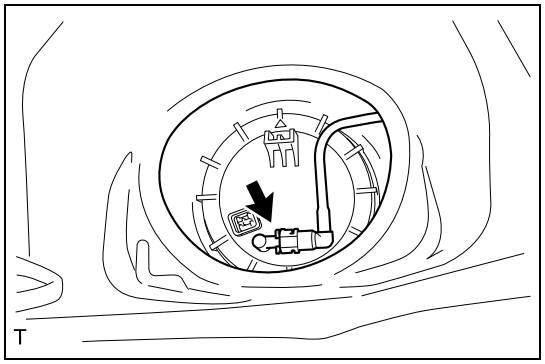
6. Rear floor service hole cover removal
   (1) Push in the grommet to remove the grommet from the rear floor service hole cover.
   (2) Remove the butyl tape and remove the rear floor service hole cover.

   (3) Disconnect the fuel sub sender gauge connector.



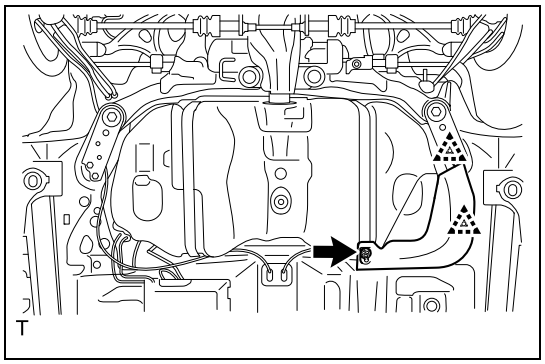
7. Rear floor service hole cover NO.2 removal
   (1) Push in the grommet to remove the grommet from the rear floor service hole cover NO.2.
   (2) Remove the butyl tape and remove the rear floor service hole cover NO.2.

   (3) Disconnect the fuel pump connector.

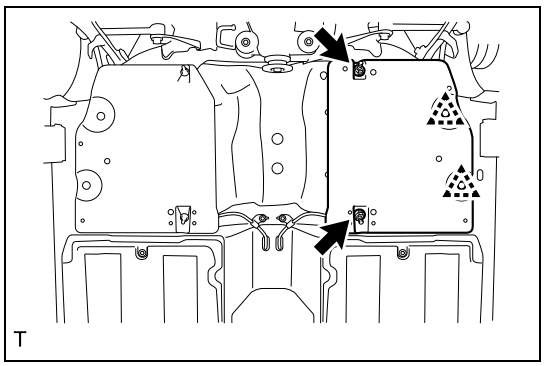


(4) Disconnect the fuel delivery tube. (Refer to FU - 3)
CAUTION:
Be careful not to spill fuel.

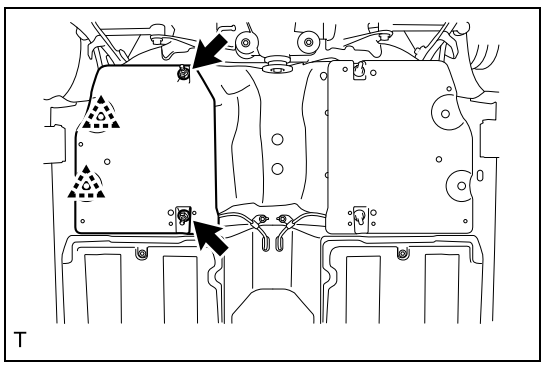
8. Removal of rear suspension member SUB-ASSY (Refer to RP - 33)



9. Removal of the fuel tank protector (small fuel tank protector model)
   (1) Remove the nut and two clips and remove the fuel tank protector.

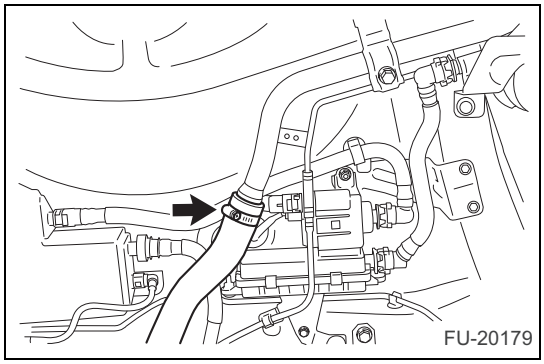


10. Removal of the fuel tank protector NO.1 (large fuel tank protector model)
    (1) Remove the 2 nuts and the 2 clips and remove the fuel tank protector NO.1.

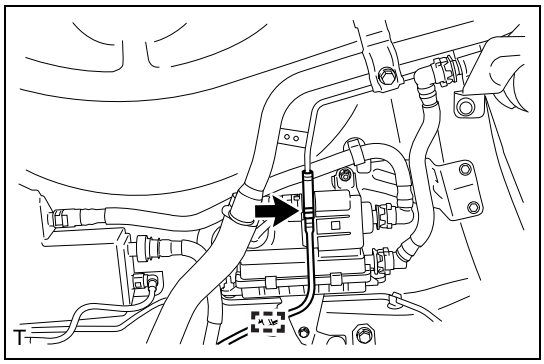


11. Removal of the fuel tank protector NO.2 (large fuel tank protector model)
    (1) Remove the 2 nuts and the 2 clips and remove the fuel tank protector NO.2.

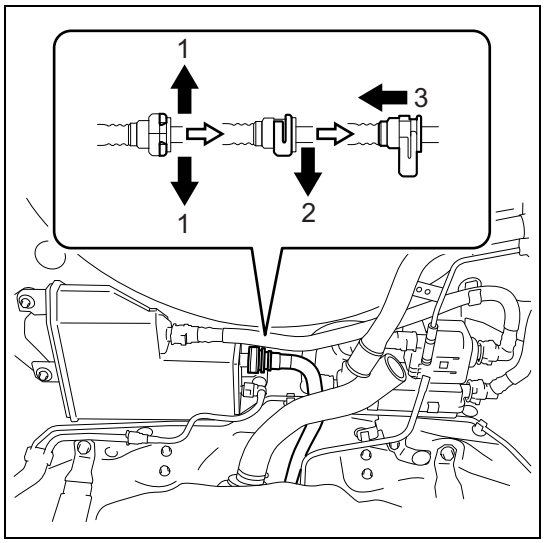
12. Parking brake cable ASSY NO.3 removal (Refer to PB - 11)
13. Parking brake cable ASSY NO.2 removal (Refer to PB - 12)



14. DISCONNECT FUEL TANK TO FILLER PIPE HOSE
    (1) Loosen the hose clamp bolt and disconnect the fuel tank to filler pipe hose.



15. DISCONNECT FUEL TANK VENT HOSE SUBASSEMBLY
    (1) Remove the clamp and disconnect the fuel tank vent hose subassembly.
    (2) Disengage the clamp and separate the tube.



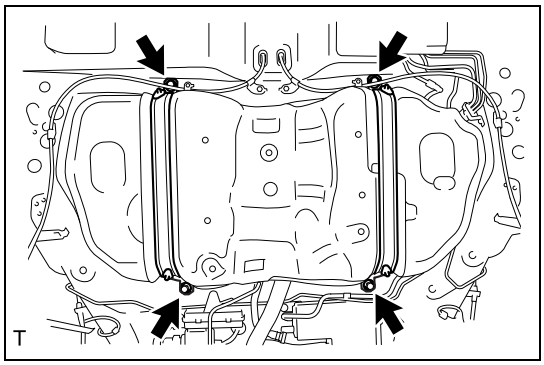
16. SEPARATE CHARCOAL CANISTER ASSEMBLY
    (1) Disconnect the fuel tank vent tube as indicated by the arrows in the order shown in the illustration.

17. Fuel tank ASSY removal

CAUTION:

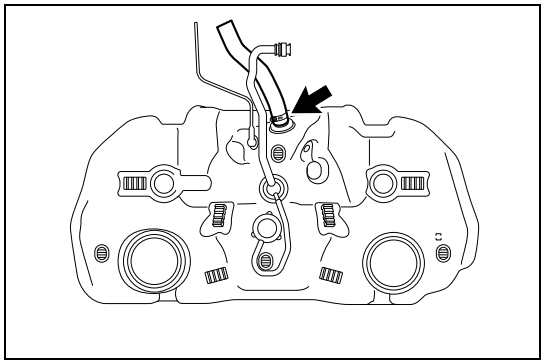
- Two persons are required to perform this procedure.
- The fuel may remain in the fuel tank and this may cause the left and right sides to be unbalanced. Be careful not to let the fuel tank ASSY fall off.

(1) Hold the fuel tank with the transmission jack.



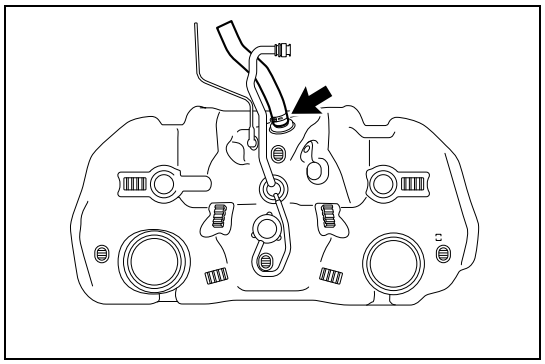
(2) Remove the four bolts and remove the fuel tank band NO.1.

(3) Lower the transmission jack to remove the fuel tank ASSY.

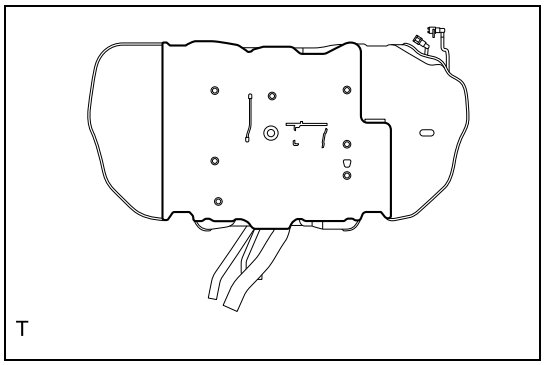


18. REMOVE FUEL TANK TO FILLER PIPE HOSE
    (1) Loosen the hose clamp bolt and remove the fuel tank to filler pipe hose from the fuel tank.

## Installation

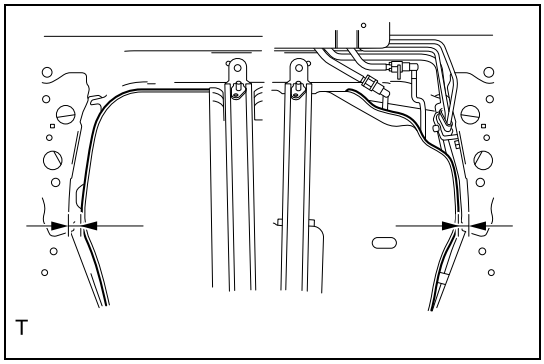


1. INSTALL FUEL TANK TO FILLER PIPE HOSE
    (1) Install the fuel tank to filler pipe hose to the fuel tank assembly with the clamp.
    (2) Tighten the hose clamp bolt.
    Standard value:T=2.0N·m {20kgf·cm} {18.0ft·lbf}

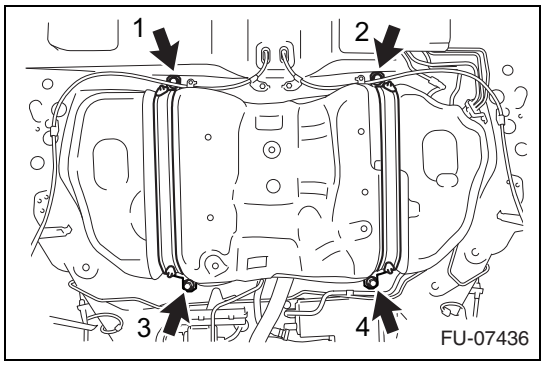


2. Fuel tank ASSY installation
    (1) Check the fuel tank cover.
    NOTE:
    As the fuel tank cover is used as a guide when installing the fuel tank ASSY, check for deformation, cracks, and other damages. If there is any problem, replace it with a new part
    (2) Hold the fuel tank ASSY with the transmission jack.
    (3) Temporarily install the fuel tank ASSY to the body with the two fuel tank bands NO.1 and four bolts.

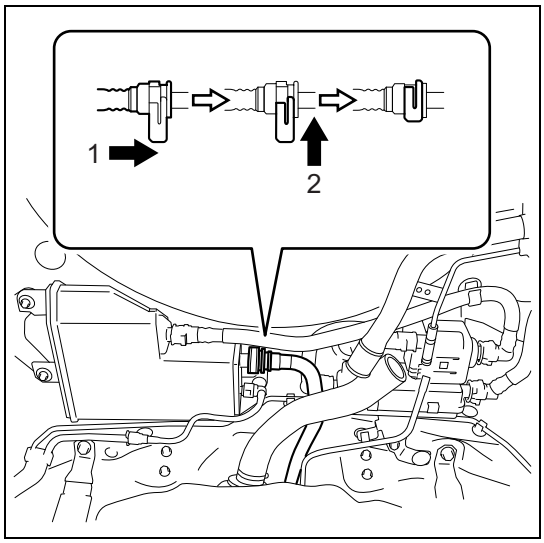
    (4) Adjust the fuel tank ASSY position so that the distance from the arrest hole of parking brake cable fixing bracket to the front edge of fuel tank cover is within the standard value.
    Standard value: 42 to 44 mm {1.6535 to 1.7327 in}



(5) Measure the distances from the left and right side of fuel tank ASSY to the body, respectively, and adjust the position of fuel tank ASSY so that the difference between the left and right values is within the standard value.
Standard value: 2 mm {0.0787 in} or less

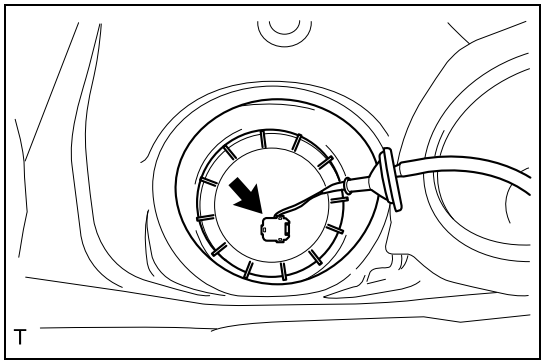


(6) Tighten the four bolts in the order as shown in the figure and install the fuel tank band NO.1.
Standard value:T=33N·m {337kgf·cm} {24.3ft·lbf}

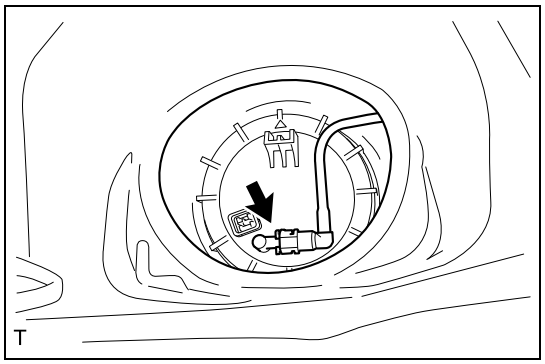


3. INSTALL CHARCOAL CANISTER ASSEMBLY
   (1) Connect the fuel tank vent tube as indicated by the arrows in the order shown in the illustration.

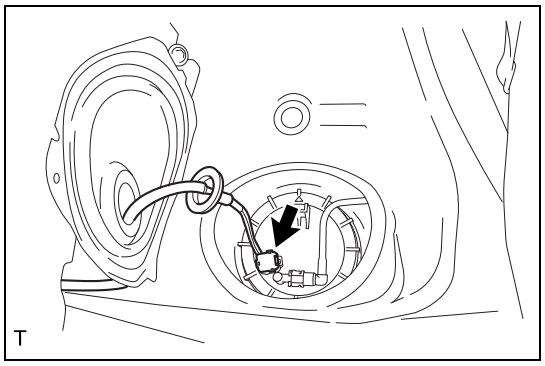
4. CONNECT FUEL TANK VENT HOSE SUB-ASSEMBLY
   (1) Engage the clamp to install the tube.
   (2) Connect the fuel tank vent hose sub-assembly with the clamp.
5. Fuel tank to filler pipe, hose connection
   (1) Connect the fuel tank to filler pipe hose with the hose clamp.
   Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}
6. Parking brake cable ASSY NO.3 installation (Refer to PB - 12)
7. Parking brake cable ASSY NO.2 installation (Refer to PB - 12)
8. Fuel tank protector installation
   (1) Install the fuel tank protector with a new nut and two clips.
   Standard value:T=9.0N·m {92kgf·cm} {6.6ft·lbf}
9. Installation of rear suspension member SUB-ASSY
   (Refer to RP - 37)



10. Fuel sub sender gauge connector installation
    (1) Connect the fuel sub sender gauge connector.

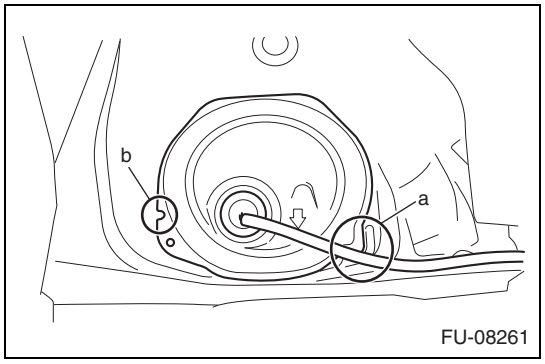


11. Fuel delivery tube installation
    (1) Connect the fuel delivery tube. (Refer to FU - 3)

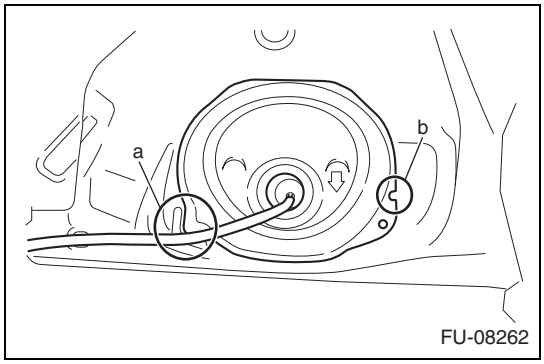


12. Fuel pump connector installation
    (1) Connect the fuel pump connector.

13. Fuel refill
14. Connection of the battery ground terminal
    Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
15. Exhaust gas leakage check (Refer to EC - 3)



16. Rear floor service hole cover installation
    (1) Install the rear floor service hole cover using new butyl tape.
    NOTE:
    (a) Align the flange of the rear floor service hole cover to the corner bead on the floor.
    (b) Align the cutout for the rear floor service hole cover to the floor protrusion.
    (2) Install the grommet to the rear floor service hole cover.



17. Rear floor service hole cover NO.2 installation
    (1) Install the rear floor service hole cover NO.2 using new butyl tape.
    NOTE:
    (a) Align the flange of the rear floor service hole cover No. 2 to the corner bead on the floor.
    (b) Align the cutout for the rear floor service hole cover No. 2 to the floor protrusion.
    (2) Install the grommet to the rear floor service hole cover NO.2.
18. Installation of separate type rear seat cushion ASSY RH (Refer to SE - 39)
19. Separate type rear seat cushion ASSY LH installation (Refer to SE - 39)

# Fuel sender gauge ASSY (FA20)

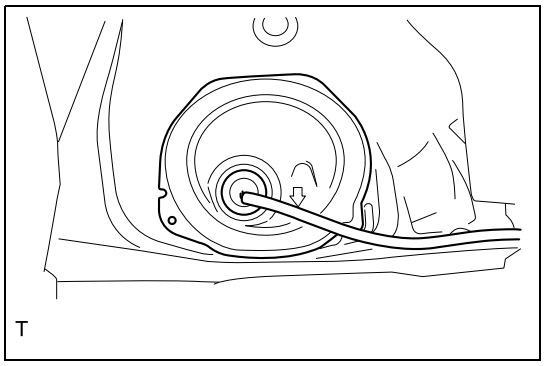
## Removal

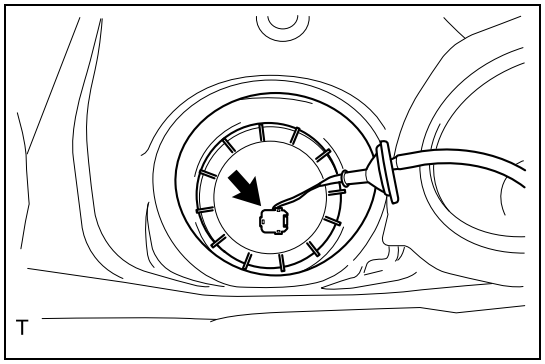
1. Fuel spill prevention procedure (Refer to FU - 3)
2. Draining of fuel (Refer to FU - 47)
3. Disconnection of the battery ground terminal (Refer to IN - 6)
4. Removal of separate type rear seat cushion ASSY RH (Refer to SE - 31)
5. Removal of separate type rear seat cushion ASSY LH (Refer to SE - 31)
6. Removal of rear floor service hole cover NO.2 (Refer to FU - 47)
7. Removal of fuel pump ASSY (Refer to FU - 48)

8. Removal of fuel sender gauge ASSY
   (1) Disconnect the fuel sender gauge connector and remove the harness from the clamp.

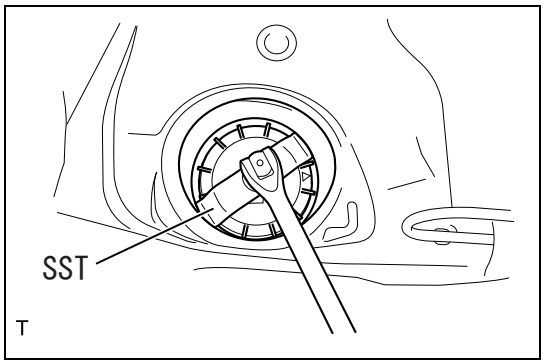
   (2) Push up the claw to remove the fuel sender gauge ASSY.
   CAUTION:
   Do not bend the arm of fuel sender gauge ASSY.



9. Rear floor service hole cover removal
   (1) Push in the grommet to remove the grommet from the rear floor service hole cover.
   (2) Remove the butyl tape and remove the rear floor service hole cover.



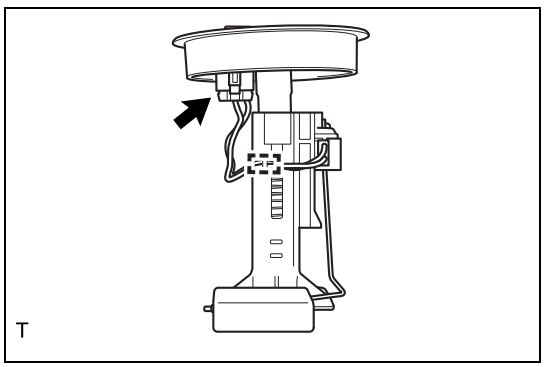
(3) Disconnect the fuel sub sender gauge connector.



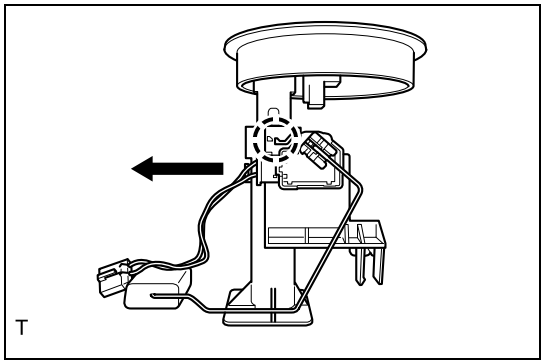
10. Fuel sub sender gauge ASSY removal
    (1) Use the SST to loosen the ring nut.
    SST 42099CA000
    CAUTION:
    - If the fuel gauge indicates that two thirds or more of the fuel is remaining, be sure to drain the fuel before starting the work to avoid the fuel to spill.
    - Do not use any tools other than the SST.
    - Do not turn the fuel sub sender gauge ASSY in the fuel tank ASSY to prevent the arm of fuel sender gauge ASSY NO.2 from bending.

    NOTE:
    Insert the cutout portion of SST into the rib of ring nut to fix the SST securely.

    (2) Take out the fuel sub sender gauge ASSY from the fuel tank and remove the filter and fuel delivery tube as a unit from the fuel sub sender gauge ASSY.
    CAUTION:
    - Do not bend the arm of fuel sender gauge ASSY NO.2.
    - Be careful not to spill the fuel outside the fuel tank or in the vehicle.



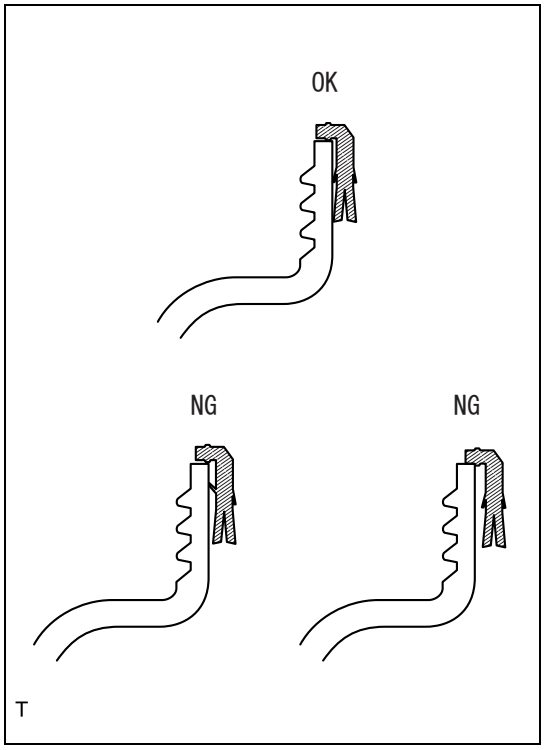
11. Fuel sender gauge ASSY NO.2 removal
    (1) Disconnect the connector from the fuel sender gauge ASSY NO.2 and remove the harness from the clamp.



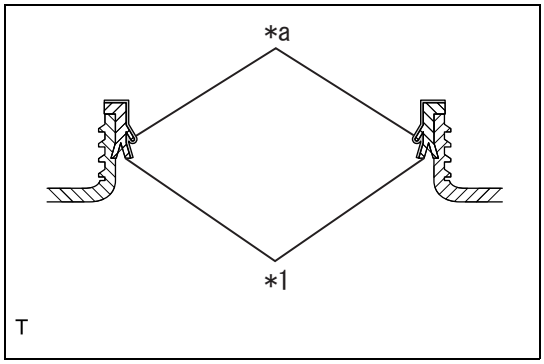
(2) Push the claw and remove the fuel sender gauge ASSY NO.2 by sliding it in the direction as shown in the figure.
CAUTION:
Do not bend the arm of fuel sender gauge ASSY NO.2.

## Installation

1. Fuel sender gauge ASSY NO.2 installation
   (1) Engage the claw and install the fuel sender gauge ASSY NO.2 to the fuel sub delivery tube.
   (2) Connect the fuel sender gauge ASSY NO.2 connector and install the harness to the clamp.
2. Fuel sub sender gauge ASSY installation
   (1) Install a new gasket to the fuel tank.



CAUTION:
- Do not bend the arm of fuel sender gauge ASSY NO.2.
- Improper installation such as warpage, slip, etc. results in fuel leakage. Make sure that there is no warpage, slip, etc. in the entire circumference when installing the gasket to the fuel tank.



(2) Apply gasoline to the gasket.

Captions in illustration

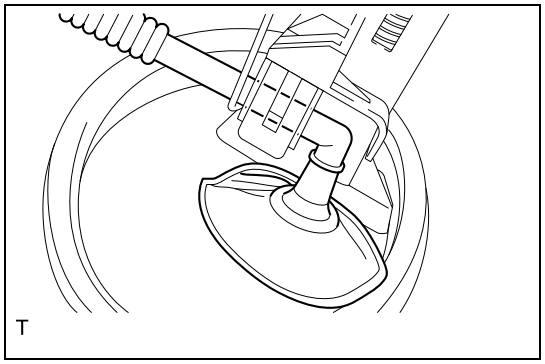
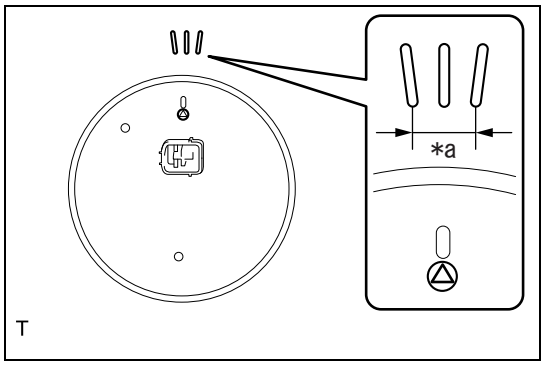
|---|---|
| *1 | Gasket |
| *a | Areas of gasoline application |

CAUTION:
- When applying gasoline to the gasket, apply it to the area as shown in the figure.
- Be careful that no gasoline comes into contact with the threaded portion of fuel tank.
- Make sure that there is no fuel, foreign matter, etc. on the sealing portion.



(3) Install the fuel sub delivery tube together with the filter to the fuel sub sender gauge ASSY.



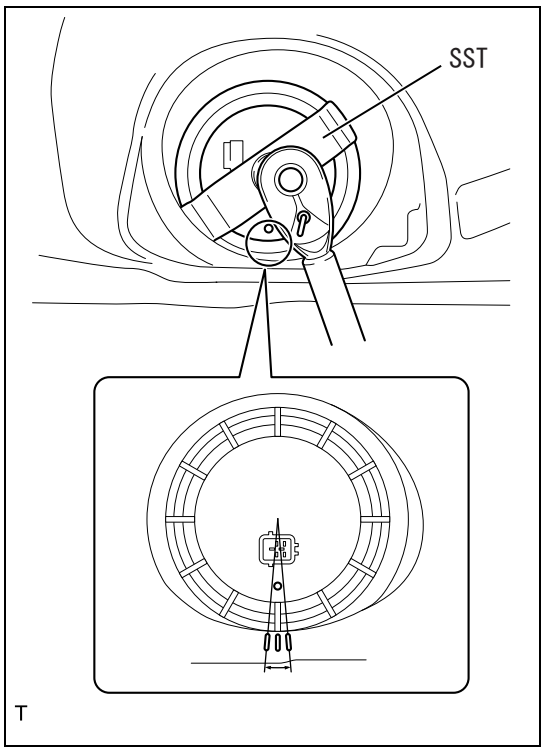
(4) Set the fuel sub sender gauge ASSY in the installation position range mark of fuel tank.

Captions in illustration

| | |
|---|---|
| *a | Installation position range mark |

CAUTION:
Do not bend the arm of fuel sender gauge ASSY NO.2.

(5) Install a new ring nut plate and ring nut, and then temporarily tighten the ring nut.



(6) Tighten the ring nut using the SST.
SST 42099CA000
Standard value:T=85N·m {867kgf·cm} {62.7ft·lbf}
CAUTION:
- Do not use any tools other than the SST.
- Make sure that the position mark on the fuel sub sender gauge ASSY is located within the installation position range mark on the fuel tank as shown in the figure.
- After tightening to the specified torque, confirm the tightening by tightening it to the specified torque again.

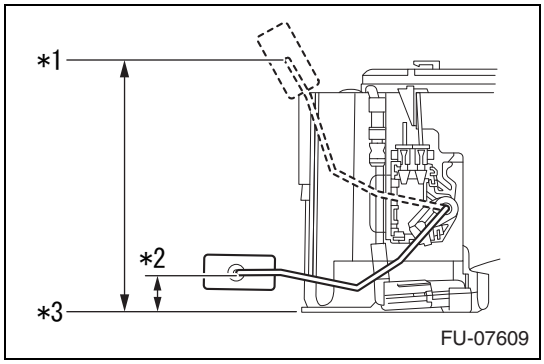
NOTE:
Insert the cutout portion of SST into the rib of ring nut to fix the SST securely.

3. Rear floor service hole cover installation
   (1) Connect the connector and install the rear floor service hole cover using new butyl tape.
4. Fuel sender gauge ASSY installation
   (1) Slide the fuel sender gauge downward to install it.
   (2) Install the fuel sender gauge connector.
5. Fuel pump ASSY installation (Refer to FU - 54)
6. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

7. Rear floor service hole cover NO.2 installation (Refer to FU - 56)
8. Installation of separate type rear seat cushion ASSY RH (Refer to SE - 39)
9. Separate type rear seat cushion ASSY LH installation (Refer to SE - 39)

## Unit inspection

1. Fuel sender gauge ASSY check (fuel sender gauge main)
   (1) Visual inspection
   (a)Check the fuel sender gauge ASSY for damage.



(b)Check the dimensions between the float and fuel tank seating surface when the float is at F (upper limit) and E (lower limit).

Dimension

| | |
|---|---|
| Float position F (upper limit) - fuel tank seating surface | 121 to 129 mm {4.76 to 5.08 in} |
| Float position E (lower limit) - fuel tank seating surface | 14.7 to 22.7 mm {0.579 to 0.894 in} |

Captions in illustration

| | |
|---|---|
| *1 | Float position F (upper limit) |
| *2 | Float position E (lower limit) |

## Removal

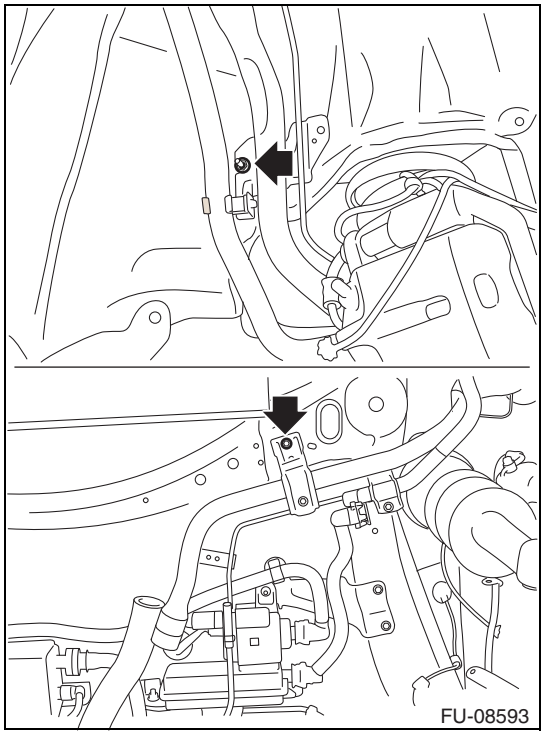
1. Fuel spill prevention procedure (Refer to FU - 3)

2. Draining of fuel (Refer to FU - 47)
3. Disconnection of the battery ground terminal (Refer to IN - 6)
4. Removal of fuel filler cap
   (1) Open the fuel filler lid, and remove the fuel filler cap.

   (2) Turn the fuel filler pipe protector in the direction of the arrow to unlock and remove it.

5. Removal of rear suspension member SUB-ASSY (Refer to RP - 33)
6. Removal of rear mud guard RH
   (1) Remove the clip to remove the rear mud guard RH.
7. Removal of filler pipe

   (1) Disconnect the fuel tank to filler pipe hose (A) and vent hose (B) from the filler pipe, and disconnect the quick connector of drain tube (C).

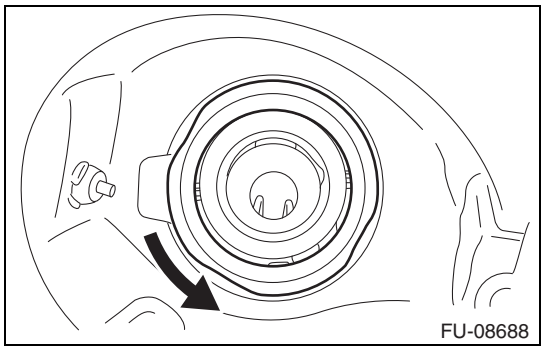


(2) Remove the bolts and nuts securing the filler pipe to the body.

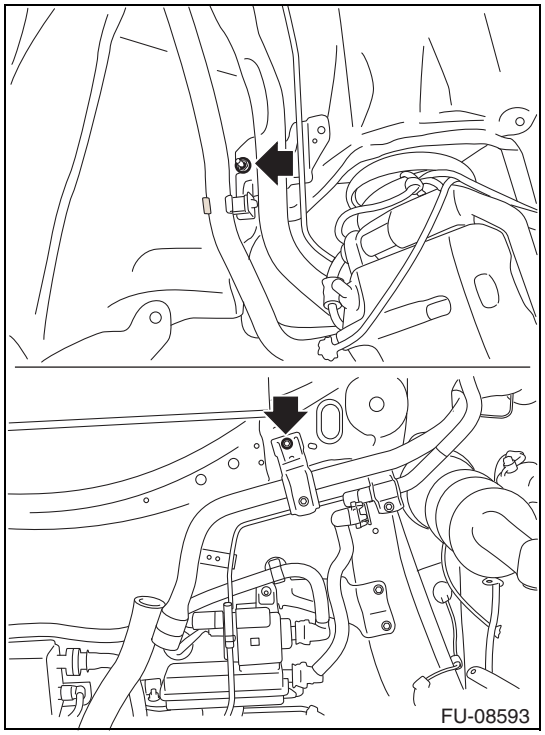
(3) Remove the filler pipe from underside of the vehicle.

## Installation

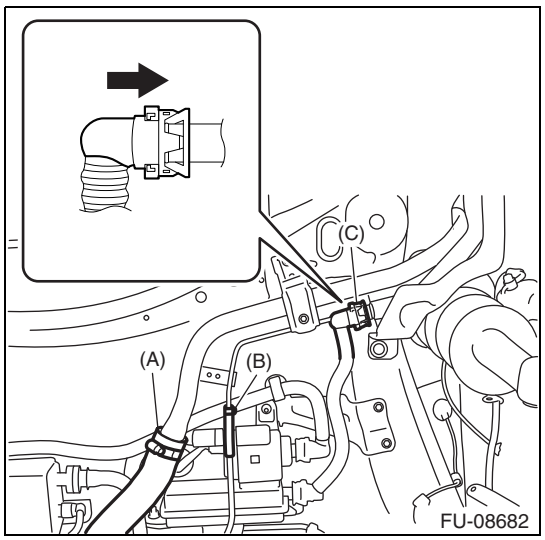
1. Installation of filler pipe
   (1) Open the fuel filler lid.
   (2) Insert the filler pipe from inside of the rear fender.



(3) Align the cutout of the filler pipe protector with the protrusion of the neck holder. Insert the filler pipe protector all the way down and turn in the direction of the arrow to lock.



(4) Install the filler pipe to the vehicle.
Standard value:T=7.5 N·m {77 kgf·cm} {5.5 ft·lb}



(5) Connect the fuel tank to filler pipe hose (A) and vent hose (B) to the filler pipe, and connect the quick connector of drain tube (C).
Standard value:T=2.0 N·m {20 kgf·cm} {1.5 ft·lb}

2. Installation of rear mud guard RH
   (1) Install the rear mud guard RH with clips.
3. Installation of rear suspension member SUB-ASSY (Refer toRP - 37)
4. Connection of the battery ground terminal
   Standard value:T=6.0 N·m {61 kgf·cm} {4.4 ft·lb}

## On-vehicle inspection

1. Filler pipe check
   (1) Check the filler pipe for deformation, cracks or other damages.
   (2) Check the fuel tank to filler pipe hose for cracks, damage or looseness.

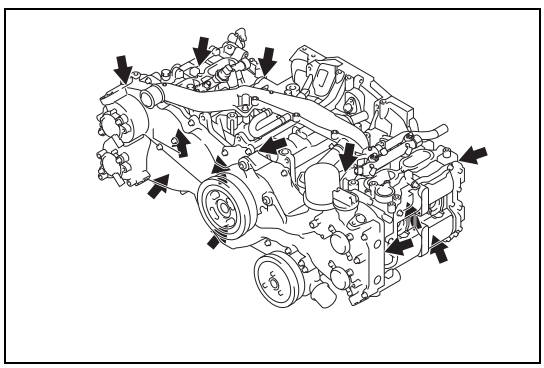
## On-vehicle inspection



1. Visual check of hose, connection and gasket
   (1) Check the hoses for cracks, leakage or damage.
   NOTE:
   - Removing the oil level gauge, oil filler cap, ventilation hose, etc. causes an engine trouble or engine stall.
   - If any of the parts between the throttle body and cylinder head are not installed, loose or cracked, the engine intakes secondary air and this causes an engine trouble or engine stall.

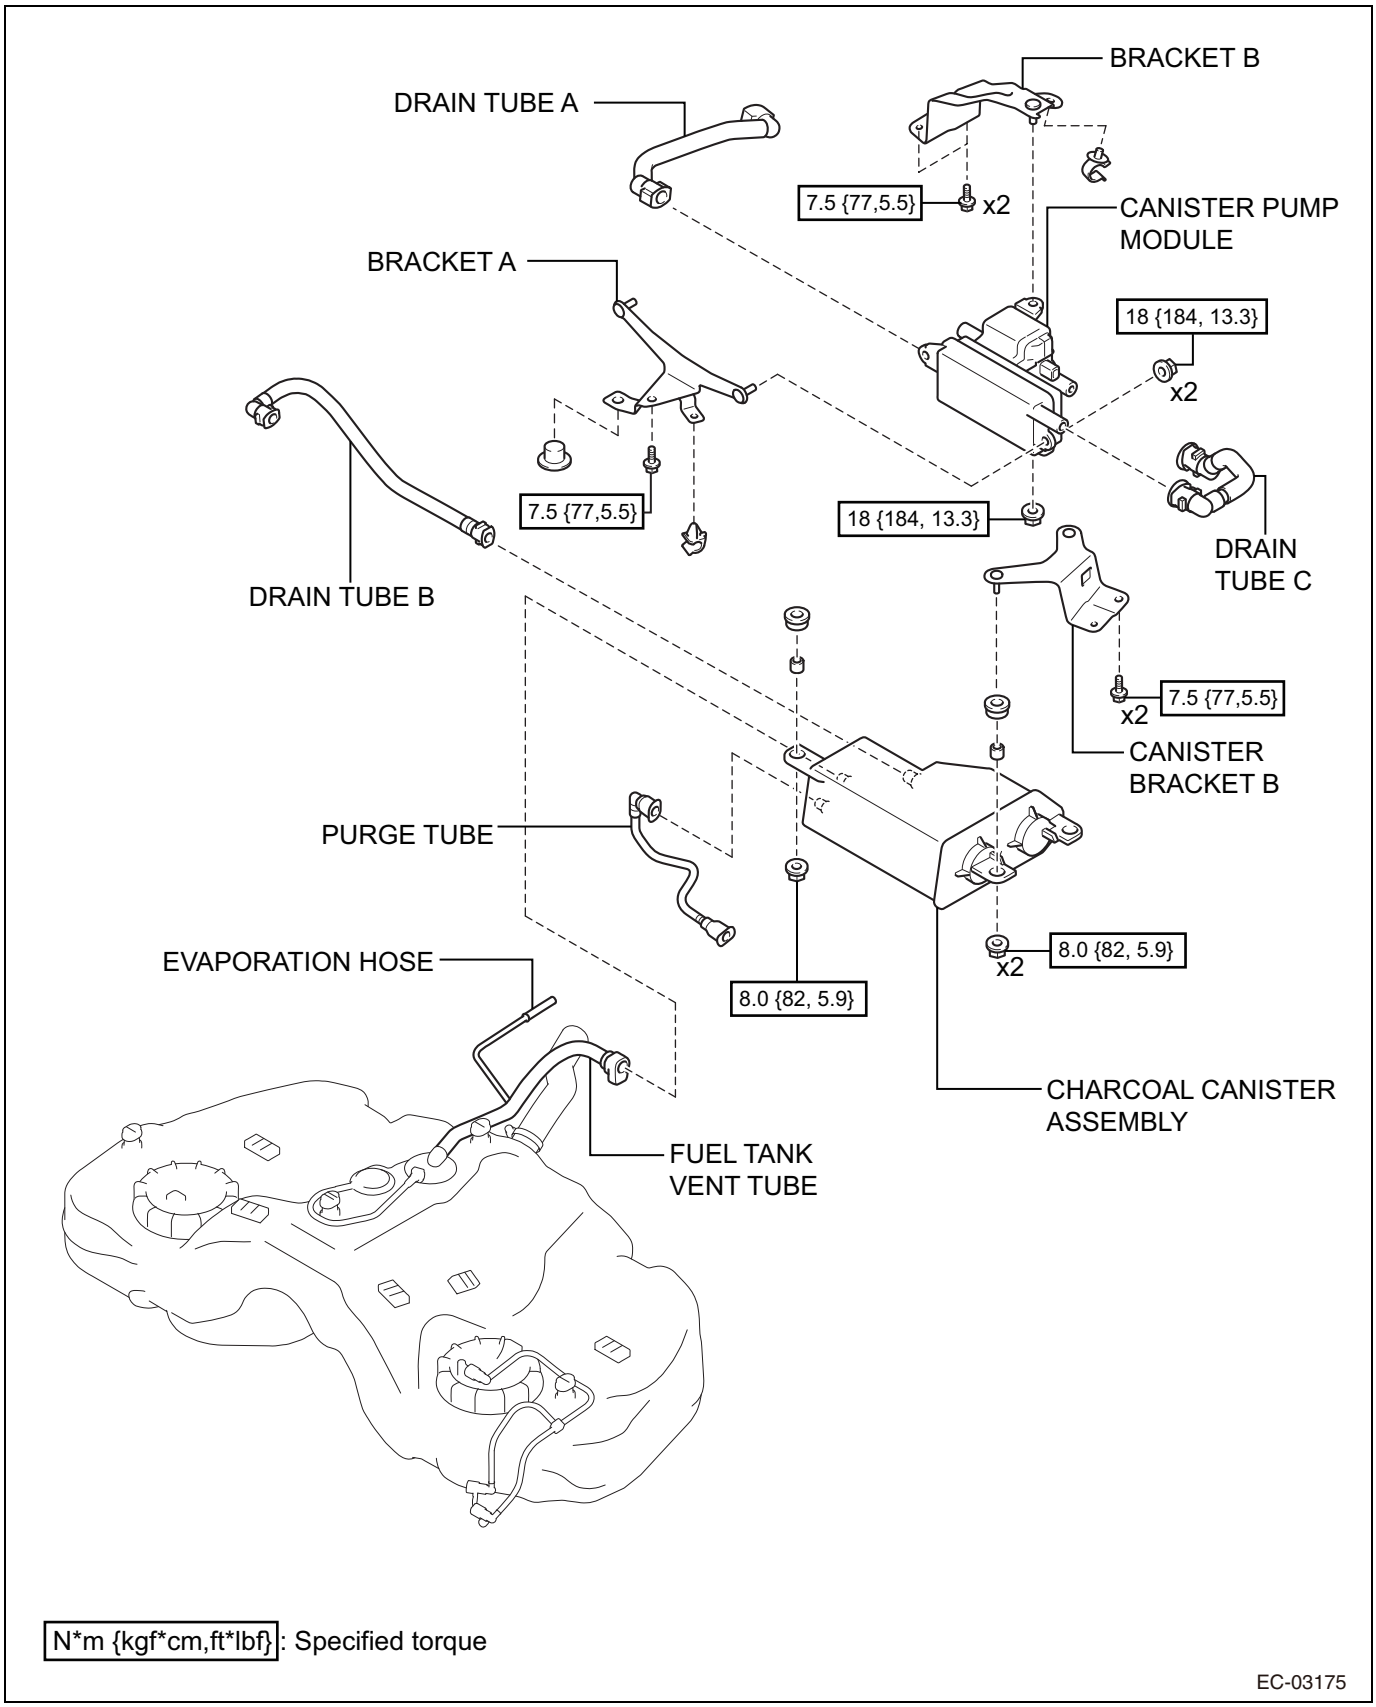
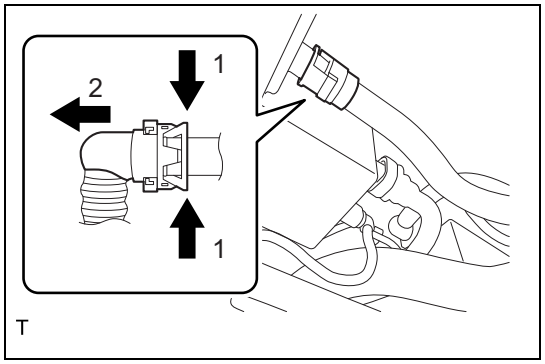
## COMPONENTS



## REMOVAL

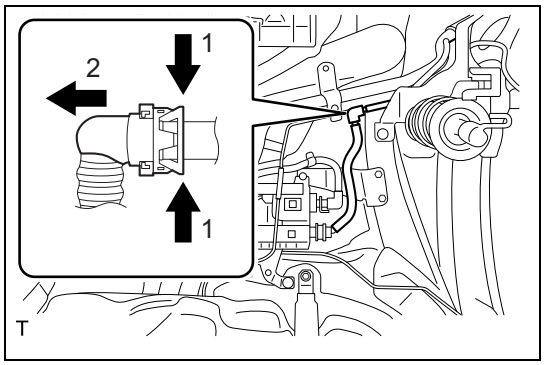
1. REMOVE REAR DIFFERENTIAL CARRIER ASSEMBLY(See page AD - 40)

2. REMOVE REAR SUSPENSION MEMBER SUB-ASSEMBLY(See page RP - 33)

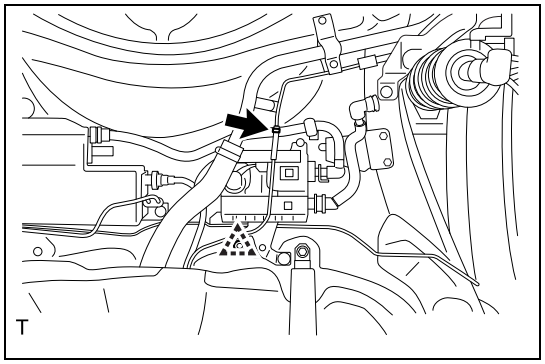


3. REMOVE CANISTER PUMP MODULE

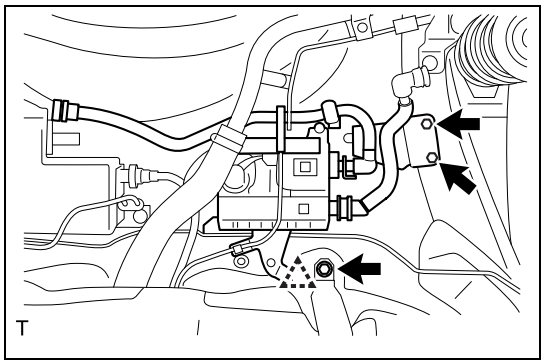
(1) Disconnect the drain tube B as indicated by the arrows, in the order shown in the illustration.



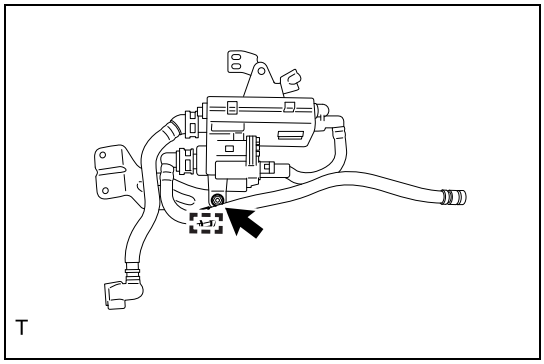
(2) Disconnect the drain tube A as indicated by the arrows, in the order shown in the illustration.



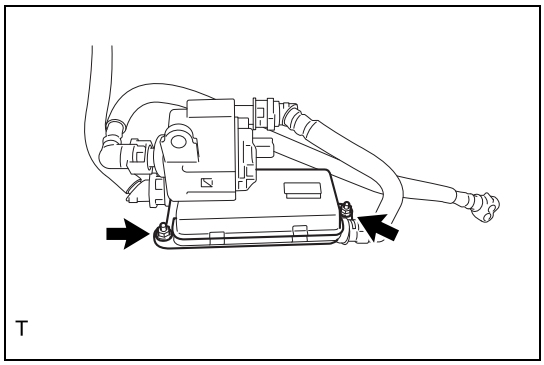
(3) Disconnect the evaporation hose from the fuel filler pipe assembly.
(4) Disengage the clip.



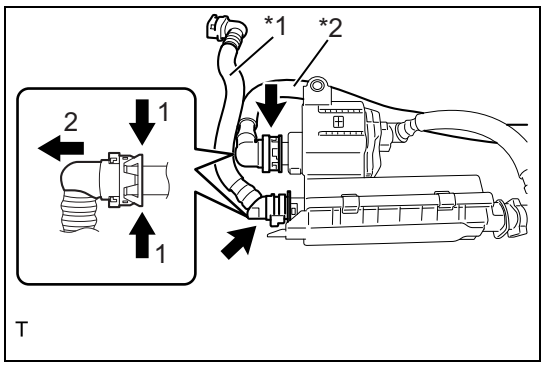
(5) Remove the 3 bolts and canister pump module.
(6) Disengage the clip.



(7) Disengage the clamp.
(8) Remove the nut and bracket B.



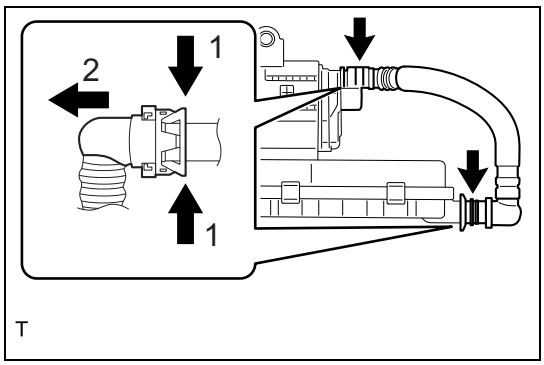
(9) Remove the 2 nuts and bracket A.



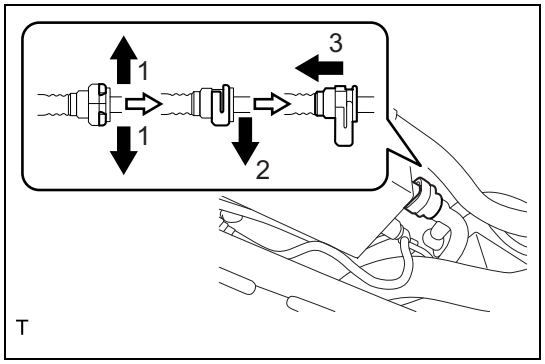
(10) Disconnect the drain tube A and drain tube B as indicated by the arrows, in the order shown in the illustration.

Text in Illustration

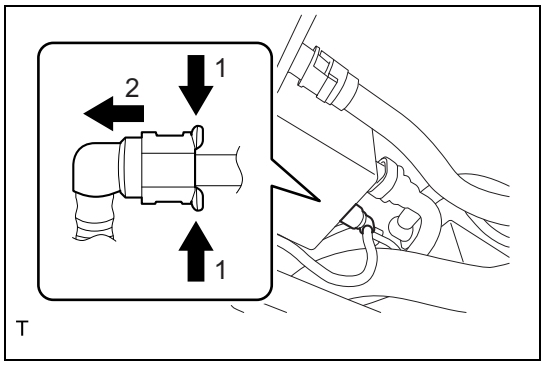
| | |
|---|---|
| *1 | Drain tube A |
| *2 | Drain tube B |



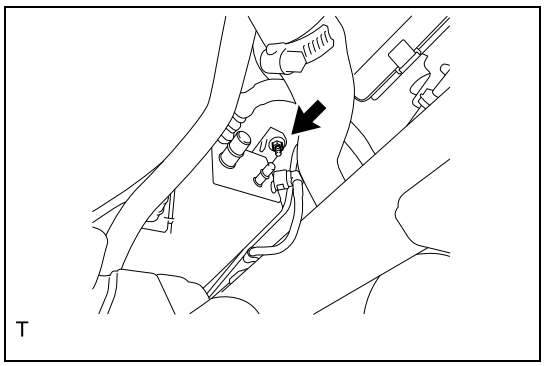
(11) Disconnect the 2 quick connector as indicated by the arrows, in the order shown in the illustration, and remove the drain tube C.



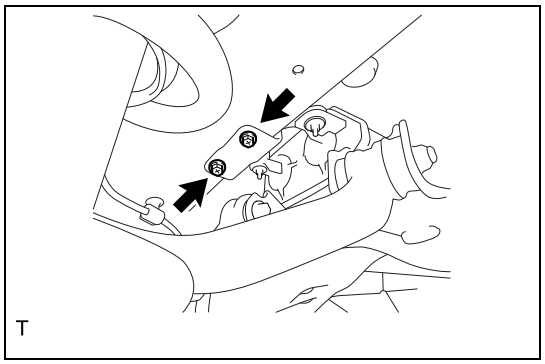
4. REMOVE CHARCOAL CANISTER ASSEMBLY
   (1) Disconnect the fuel tank vent tube as indicated by the arrows, in the order shown in the illustration.



(2) Disconnect the purge tube as indicated by the arrows, in the order shown in the illustration.

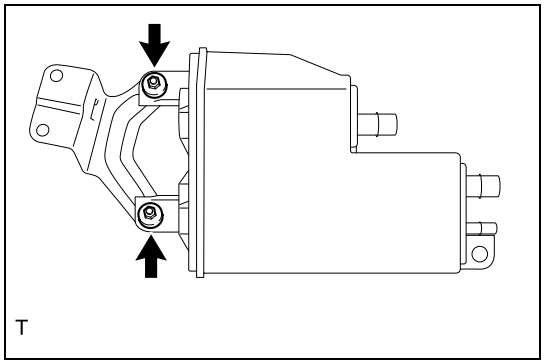


(3) Remove the nut.



(4) Remove the 2 bolts and charcoal canister assembly along with the canister bracket B.

EC



(5) Remove the 2 nuts and canister bracket B.

## INSPECTION

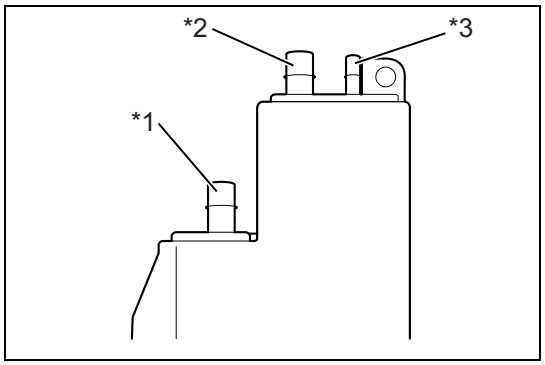
1. INSPECT CHARCOAL CANISTER ASSEMBLY

CAUTION:

When applying vacuum, the needle may waver but, as long as the needle returns to its initial position immediately, it is not a malfunction.

(1) Visually check the charcoal canister assembly for cracks or damage.

If cracks or damage is found, replace the charcoal canister assembly.



(2) Check the air flow.

(a) Using a vacuum pump, check the air flow according to the procedures below.

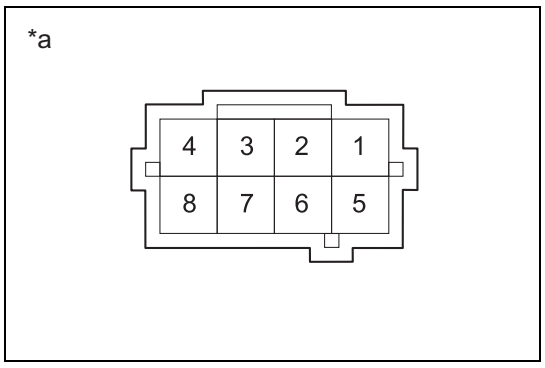
Text in Illustration

| | |
|---|---|
| *1 | Port A |
| *2 | Port B |
| *3 | Port C |

OK

| Measurement Condition | Specified Condition |
|---|---|
| Ports B and C closed, and vacuum applied to port A (2 kPa (15 mmHg, 0.590 in.Hg)) | No air leaks |
| Port C closed, and vacuum applied to port A (2 kPa (15 mmHg, 0.590 in.Hg)) | Air flows from port B |
| Port C closed and air blown into port A (5 kPa (0.1 kgf/cm$^2$, 0.725 psi)) | Air flows from port B |
| Air blown into port A (5 kPa (0.1 kgf/cm$^2$, 0.725 psi)) | Air flows from ports B and C |

If the result is not as specified, replace the charcoal canister assembly.



2. INSPECT CANISTER PUMP MODULE

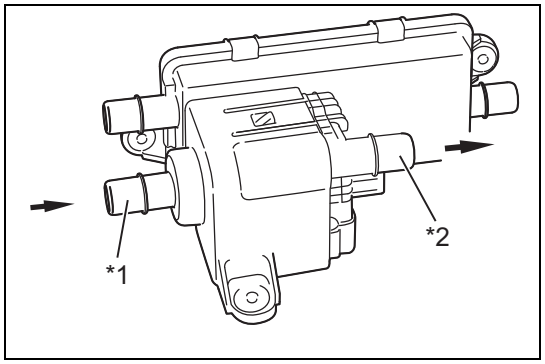
(1) Measure the resistance according to the value in the table below.

Standard Resistance

| Tester Connection | Condition | Specified Condition |
|---|---|---|
| 1 - 5 | 20°C (68°F) | 25 to 30 Ω |
| 1 - 5 | 60°C (140°F) | 27 to 35 Ω |

Text in Illustration

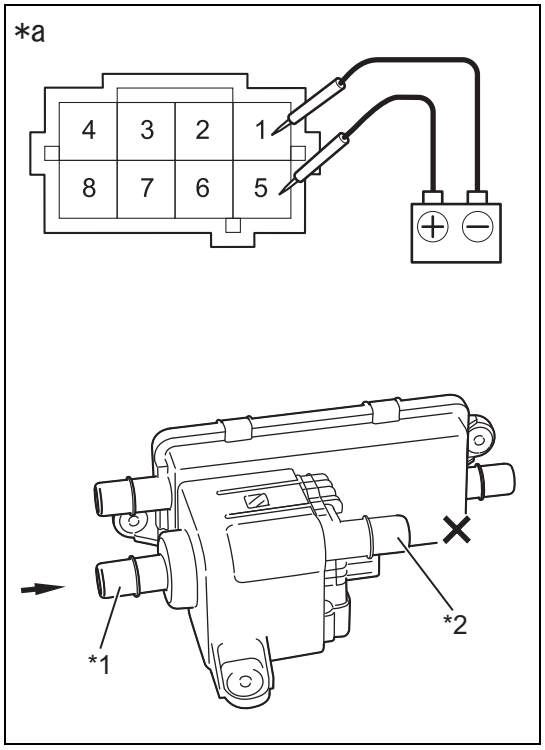
| | |
|---|---|
| *a | Component without harness connected (Canister Pump Module) |



(2) Check the operation of the check valve.
(a) Install a clean hose to the purge control solenoid valve.
(b) Check that air flows from port A to port B.

Text in Illustration

| | |
|---|---|
| *1 | Port A |
| *2 | Port B |

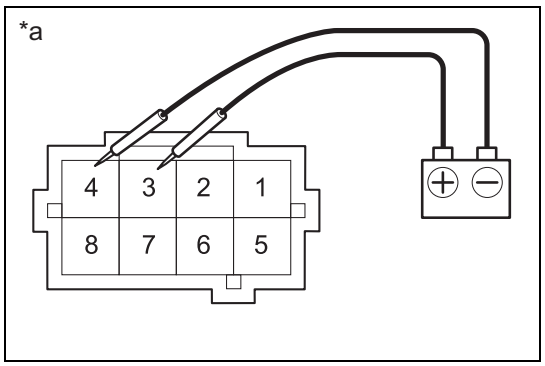


(c) Connect the positive (+) lead of the battery to terminal 5 and the negative (-) lead to terminal 1.
(d) Check that air does not flow from port A to port B.

Text in Illustration

| | |
|---|---|
| *1 | Port A |
| *2 | Port B |
| *a | Component without harness connected<br>(Canister Pump Module) |

NOTE:
The purpose of inspection is to check the valve operation, and it is sufficient as long as it is confirmed that the flow volume changes significantly by opening and closing the valve. Therefore, a small amount of flow from *2 while the valve is open is not failure.

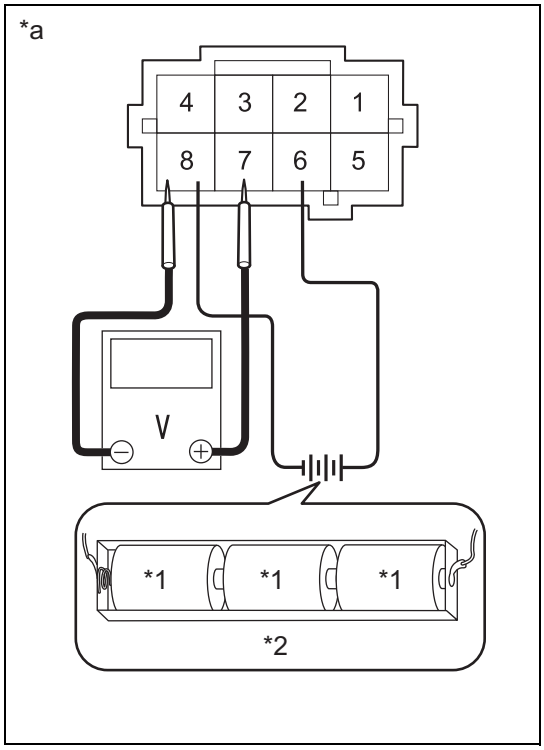


(e) Connect the positive (+) lead of the battery to terminal 3 and the negative (-) lead to terminal 4.

Text in Illustration

| | |
|---|---|
| *a | Component without harness connected<br>(Canister Pump Module) |

(f) Check that the vacuum pump operates.
CAUTION:
Do not operate vacuum pump for 5 minutes or more.



(g)Connect the positive (+) lead of the battery to terminal 6 and the negative (-) lead to terminal 8.

Text in Illustration

| | |
|---|---|
| *1 | 1.6 V |
| *2 | 4.8 to 5.2 V |
| *a | Component without harness connected (Canister Pump Module) |

NOTE:

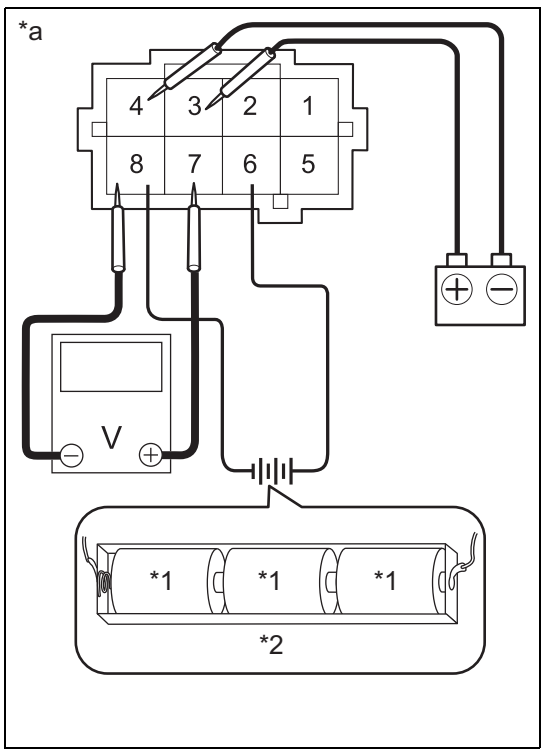
- Use new dry-cell batteries.
- Using a circuit tester, check that the initial voltage of a single dry-cell battery is 1.6 V or more. Also check that the voltage of the three batteries in position is within the range from 4.8 to 5.2 V.

(h)Measure the voltage according to the value in the table below.

Standard Voltage

| Tester Connection | Condition | Specified Condition |
|---|---|---|
| 7 - 8 | 25°C (77°F) | Approx. 3.5 V |

EC



(i) Connect the positive (+) lead of the battery to terminal 6 and the negative (-) lead to terminal 8.

Text in Illustration

| | |
|---|---|
| *1 | 1.6 V |
| *2 | 4.8 to 5.2 V |
| *a | Component without harness connected (Canister Pump Module) |

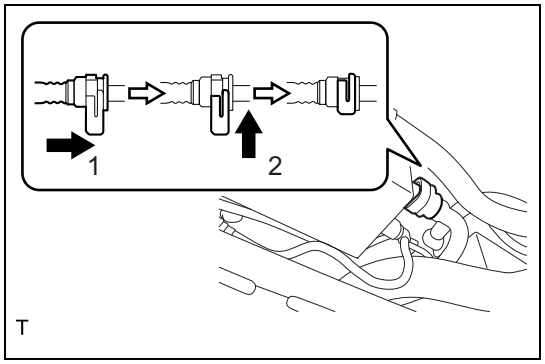
NOTE:

- Use new dry-cell batteries.
- Using a circuit tester, check that the initial voltage of a single dry-cell battery is 1.6 V or more. Also check that the voltage of the three batteries in position is within the range from 4.8 to 5.2 V.
- 5 V of power supply may be supplied through a DC constant voltage source.

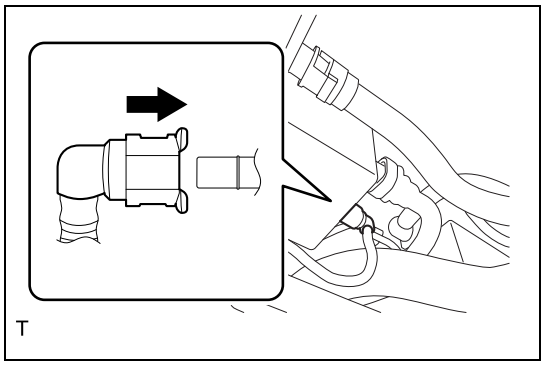
(j) Connect the positive (+) lead of the battery to terminal 3 and the negative (-) lead to terminal 4. Check that the voltage drops slightly from 3.5 volts.

## INSTALLATION

1. INSTALL CHARCOAL CANISTER ASSEMBLY
   (1) Install the canister bracket B to the charcoal canister assembly with 2 nuts.
   Standard value:T=8.0N·m {82kgf·cm} {5.9ft·lbf}
   (2) Install the charcoal canister assembly with canister bracket B with the 2 bolts and the nut.
   Standard value:Bolt
   T=7.5N·m {76kgf·cm} {5.5ft·lbf}
   Nut
   T=8.0N·m {82kgf·cm} {5.9ft·lbf}



(3) Connect the fuel tank vent tube as indicated by the arrows, in the order shown in the illustration.



(4) Connect the purge tube as shown in the illustration.

EC

2. INSTALL CANISTER PUMP MODULE
   (1) Install the drain tube C.
   (2) Connect the drain tube A and the drain tube B.
   (3) Engage the clamp.
   (4) Install the nuts and bracket B.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
   (5) Install the 2 nuts and bracket A.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
   (6) Engage the clip.
   (7) Install the canister pump module with 3 bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
   (8) Connect the evaporation hose to the fuel pipe assembly.
   (9) Engage the clip.
   (10) Connect the drain tube A to the fuel filler pipe.
   (11) Connect the drain tube B to the charcoal canister assembly.
3. INSTALL REAR SUSPENSION MEMBER SUB-ASSEMBLY(See page RP - 37)
4. INSTALL REAR DIFFERENTIAL CARRIER ASSEMBLY(See page AD - 70)

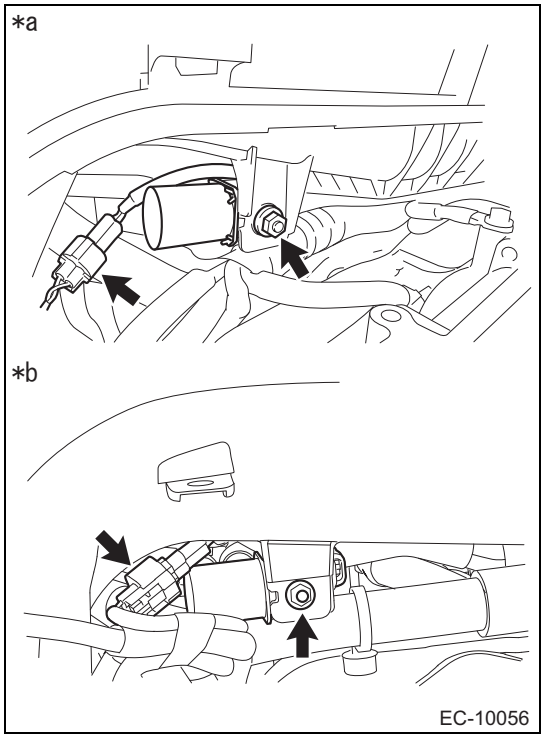
## Removal

1. Removal of engine cover SUB-ASSY No. 1 (transmission A/T) (Refer to IE - 16)



2. Removal of purge control solenoid valve
   (1) While holding the purge control solenoid valve by hand, remove the nut.
   (2) Disconnect the connector for the purge control solenoid valve.

Captions in illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

   (3) Disconnect the vacuum sensor connector. (Transmission A/T)
   (4) Disconnect the ventilation hose NO. 2 from the air intake boot. (Transmission A/T)

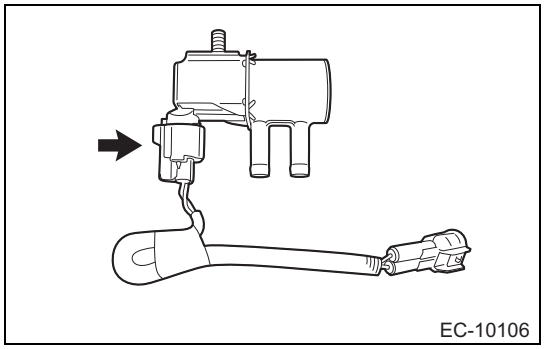
Captions in illustration

| | |
|---|---|
| *1 | Vacuum sensor connector |
| *2 | Ventilation hose NO. 2 |

   (5) Disconnect the fuel vapor feed hose No. 1 and fuel vapor feed hose No. 2, and remove the purge control solenoid valve.

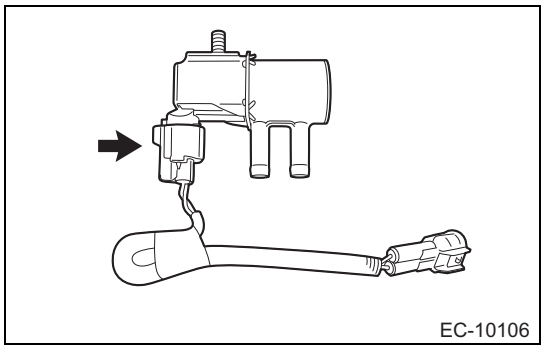
Captions in illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |
| *1 | Fuel vapor feed hose NO.1 |
| *2 | Fuel vapor feed hose NO.2 |



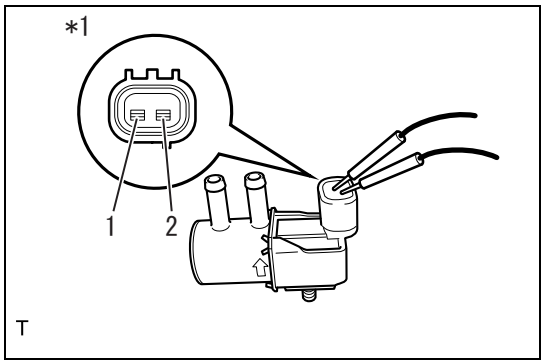
(6) Disconnect the joint wire harness connector from the purge control solenoid valve.

## Installation



1. Installation of purge control solenoid valve
   (1) Connect the joint wire harness connector to the purge control solenoid valve.
   (2) Connect the fuel vapor feed hose No. 1 and fuel vapor feed hose No. 2 to the purge control solenoid valve.
   (3) Connect the ventilation hose No. 2 to the air intake boot. (Transmission A/T)
   (4) Connect the vacuum sensor connector. (Transmission A/T)
   (5) Connect the purge control solenoid valve connector.
   (6) Using the nut, install the purge control solenoid valve.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
2. Installation of engine cover SUB-ASSY No. 1 (transmission A/T) (Refer to IE - 28)

## Unit inspection



1. Inspection of purge control solenoid valve
   (1) Resistance check
   (a)Measure the resistance between the terminals.

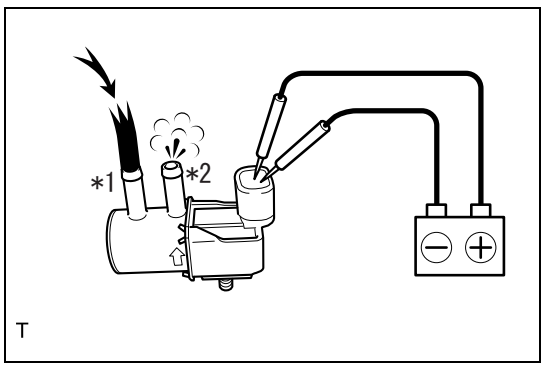
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C{68°F} | 21 to 27 Ω |
| 1 - chassis ground | Always | 10 MΩ or more |
| 2 - chassis ground | Always | 10 MΩ or more |

Captions in illustration

| | |
|---|---|
| *1 | Connector not connected (purge control solenoid valve) |

NOTE:
If it is out of standard value, replace the purge control solenoid valve.



(2) Operation check
(a)Apply the battery voltage between the terminals of the purge control solenoid valve, and check if air flow is present between the ports E and F when the coil is energized or de-energized.

Criteria

| Measurement condition | Criteria |
|---|---|
| Energized | Air vent present |
| Not energized | No air vent |

Captions in illustration

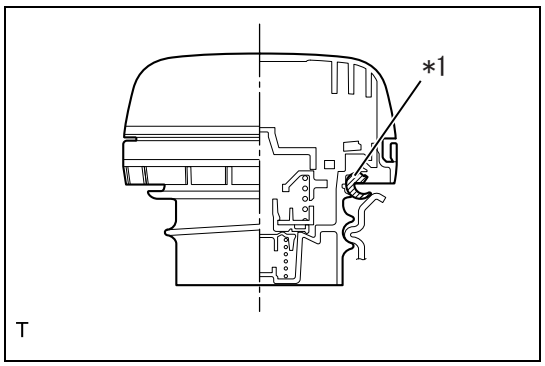
| | |
|---|---|
| *1 | Port E |
| *2 | Port F |

| | |
|---|---|
| ➡ | Air |

NOTE:
If it is out of standard value, replace the purge control solenoid valve.

# Fuel tank cap ASSY (FA20)

## Unit inspection



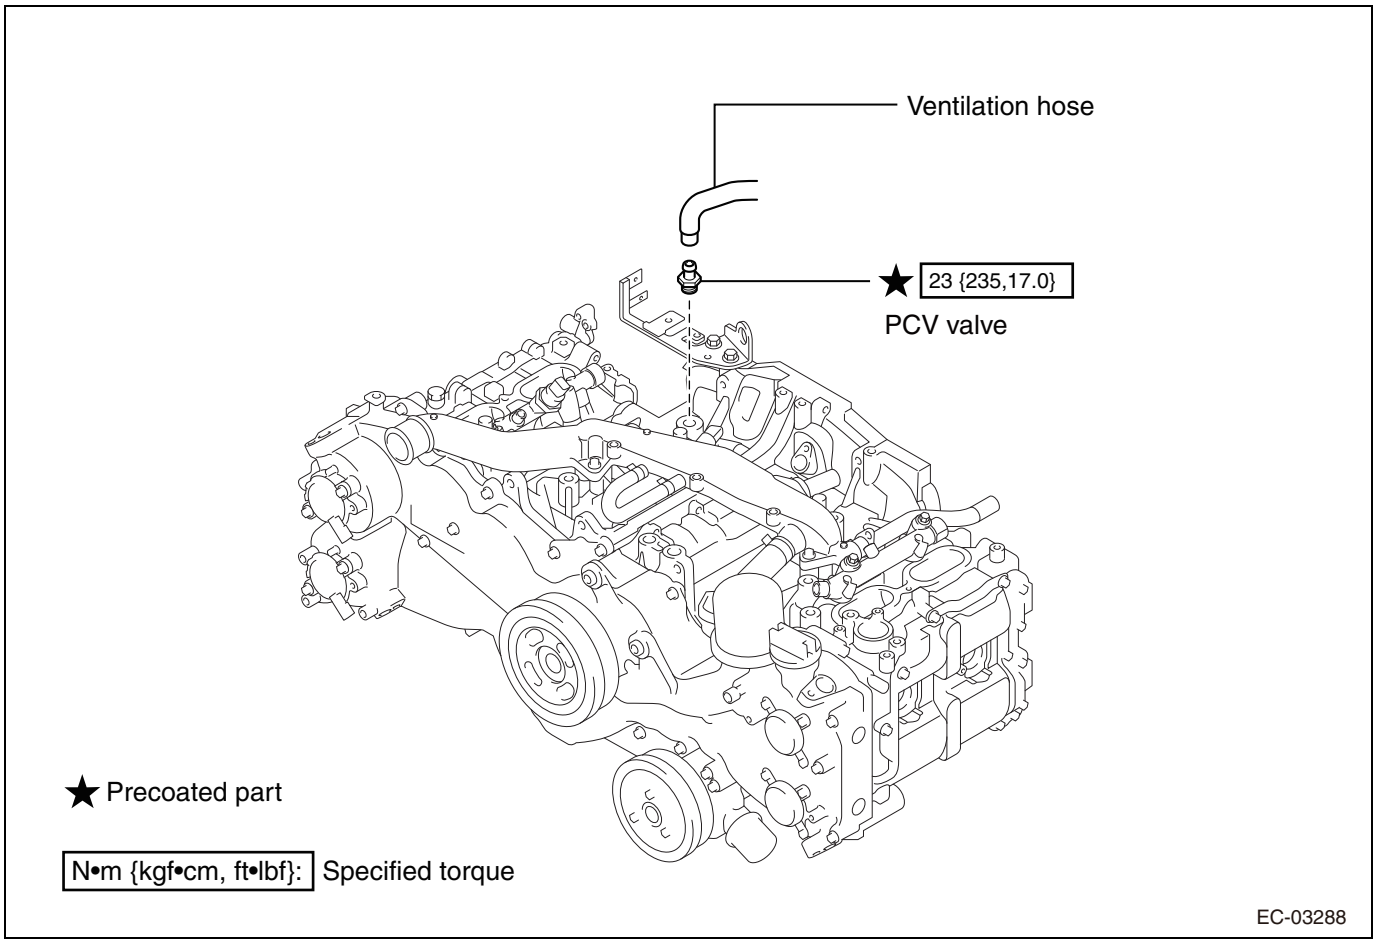
1. Check fuel tank ASSY check
   (1) Visually check the cap gasket for distortion or damage.

Captions in illustration

| | |
|---|---|
| *1 | Gasket |

# PCV valve (FA20)

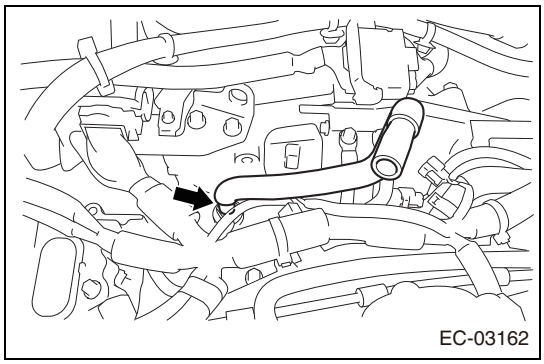
## Exploded view



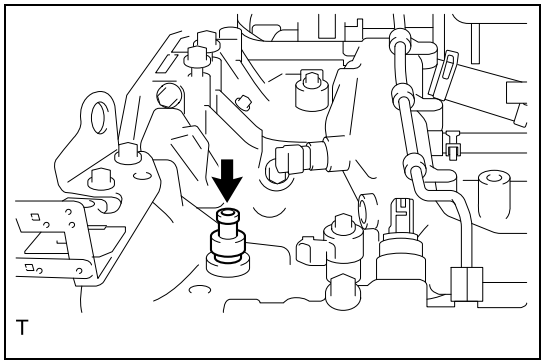
EC

## Removal

1. Removal of intake manifold (See page IE - 17)

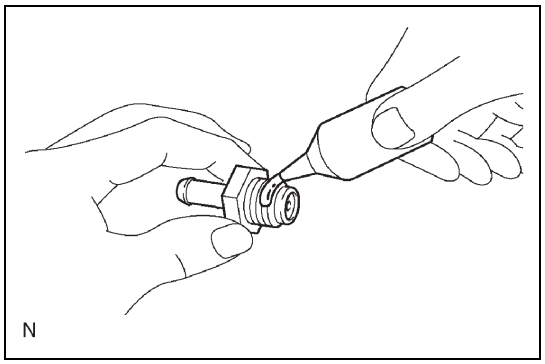


2. Removal of PCV valve
   (1) Remove the ventilation hose.



(2) Remove the PCV valve from the cylinder head RH.

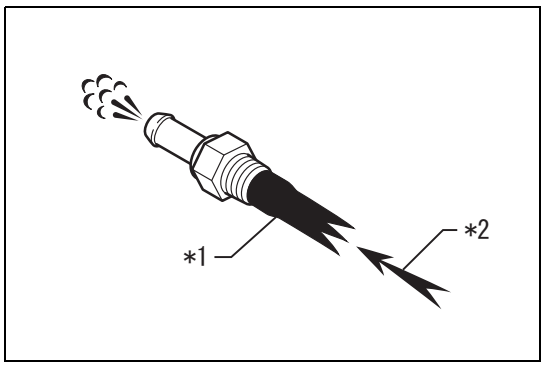
## Installation



1. Installation of PCV valve
   (1) Apply THREE BOND 1324 to the PCV valve.
   (2) Install the PCV valve to the cylinder head RH.
   Standard value:T=23N·m {235kgf·cm} {17.0ft·lbf}
   (3) Connect the ventilation hose to the PCV valve.
2. Installation of intake manifold (See page IE - 28)

## Unit inspection

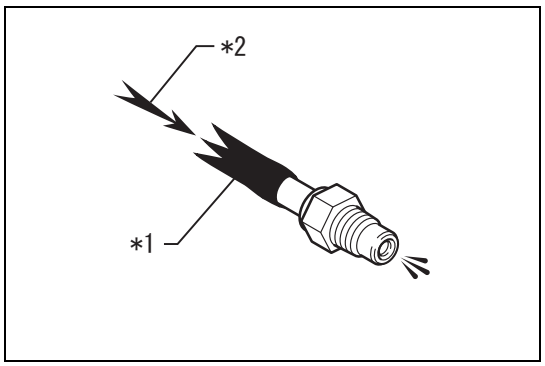
1. PCV valve inspection
   (1) Operation check
   (a)Install the hose to the PCV valve.



(b)Check that air comes out easily when air is blown into the hose from the cylinder head side.

Captions in illustration

| | |
|---|---|
| *1 | Hose |
| *2 | Air |



(c)Check that air does not comes out easily when air is blown into the valve from the intake manifold side.

Captions in illustration

| | |
|---|---|
| *1 | Hose |
| *2 | Air |

(d)Remove the hose from the PCV valve.

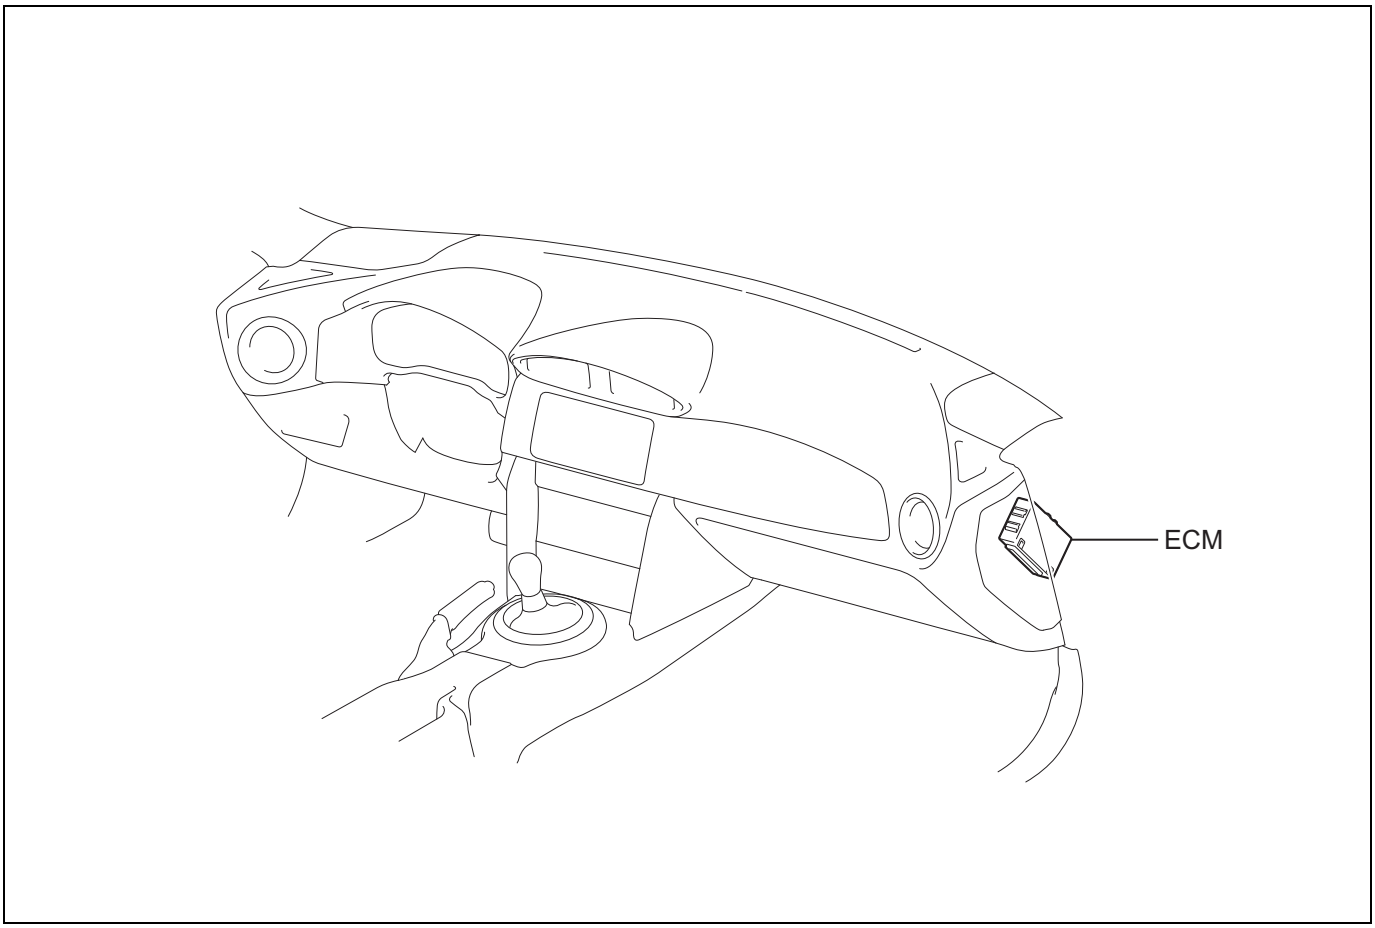
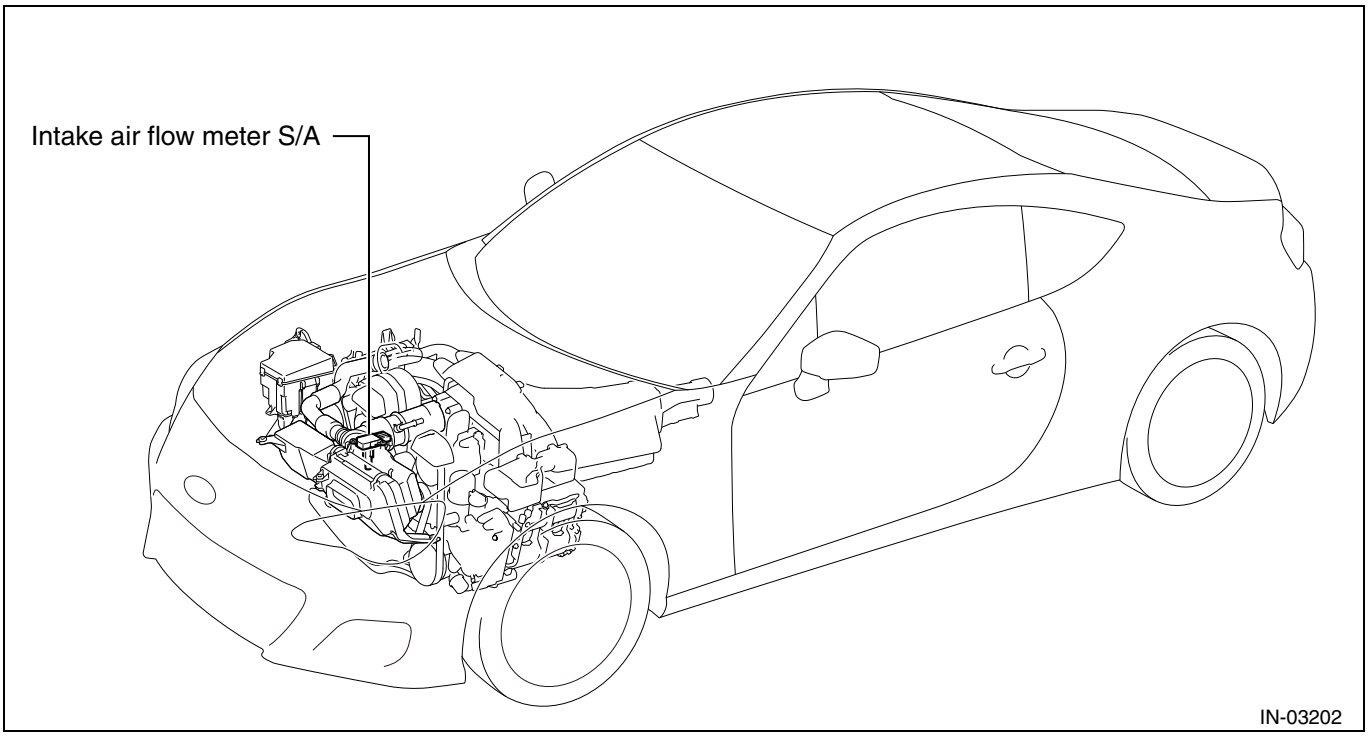
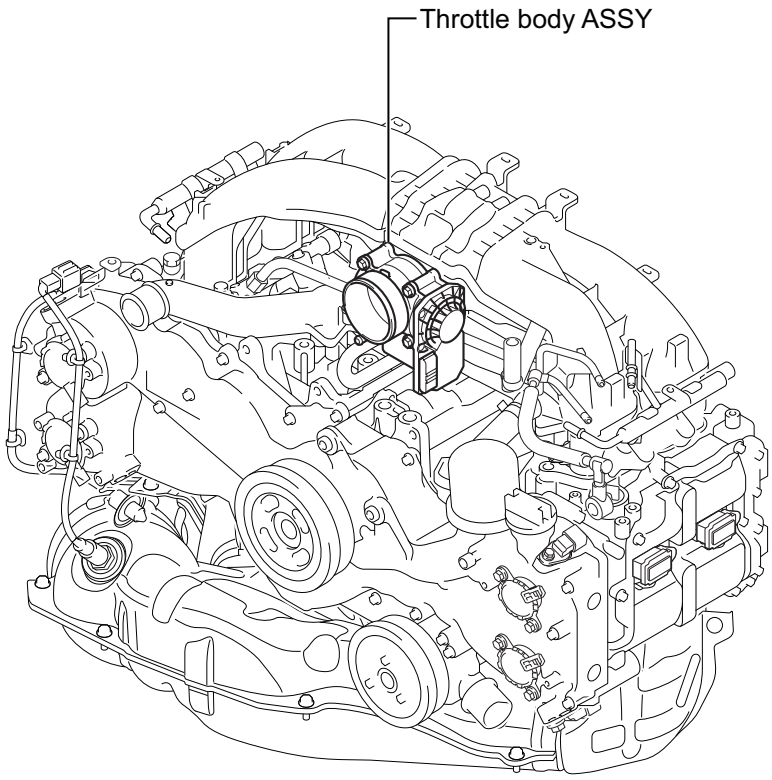
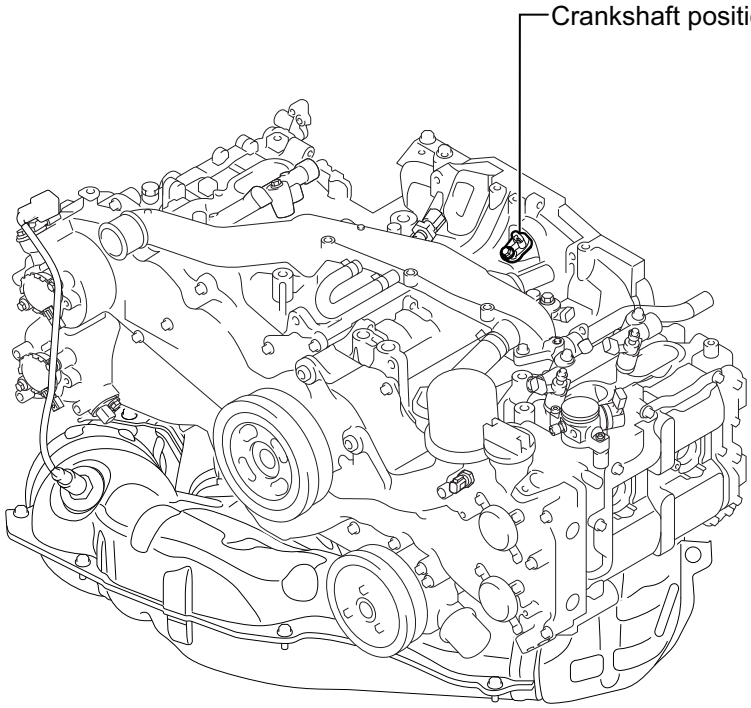
# Intake system (FA20)

## Parts location







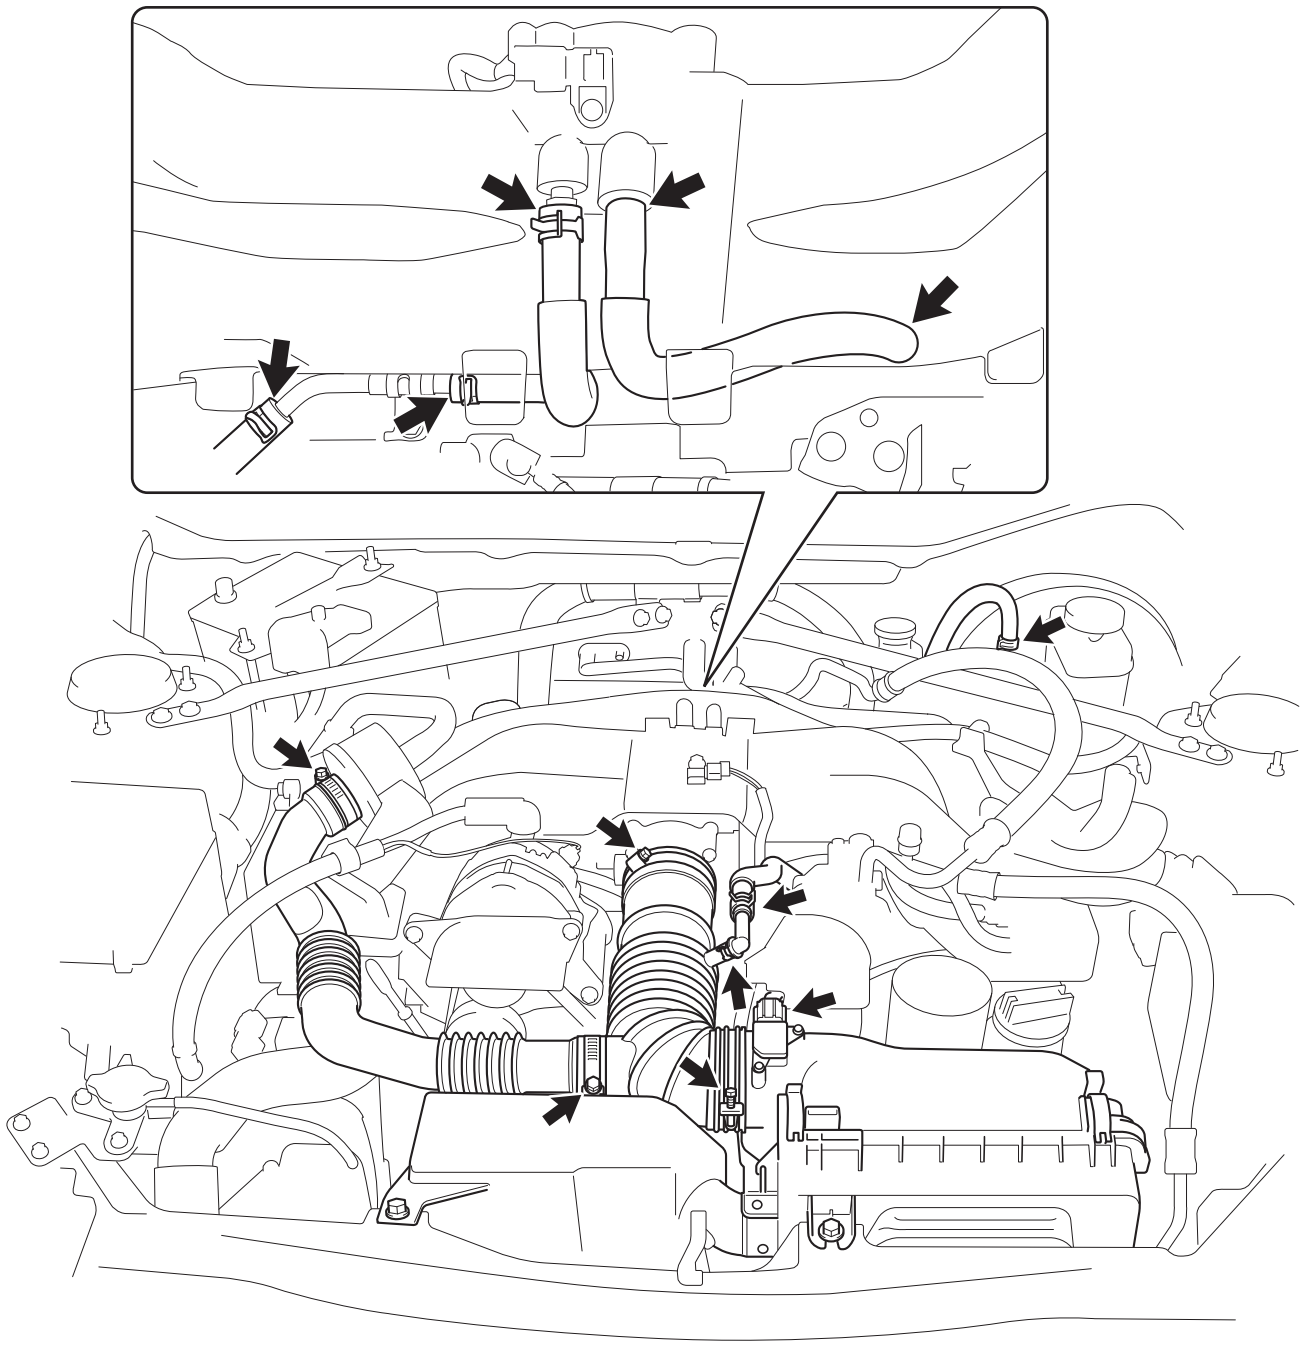


IN-10079

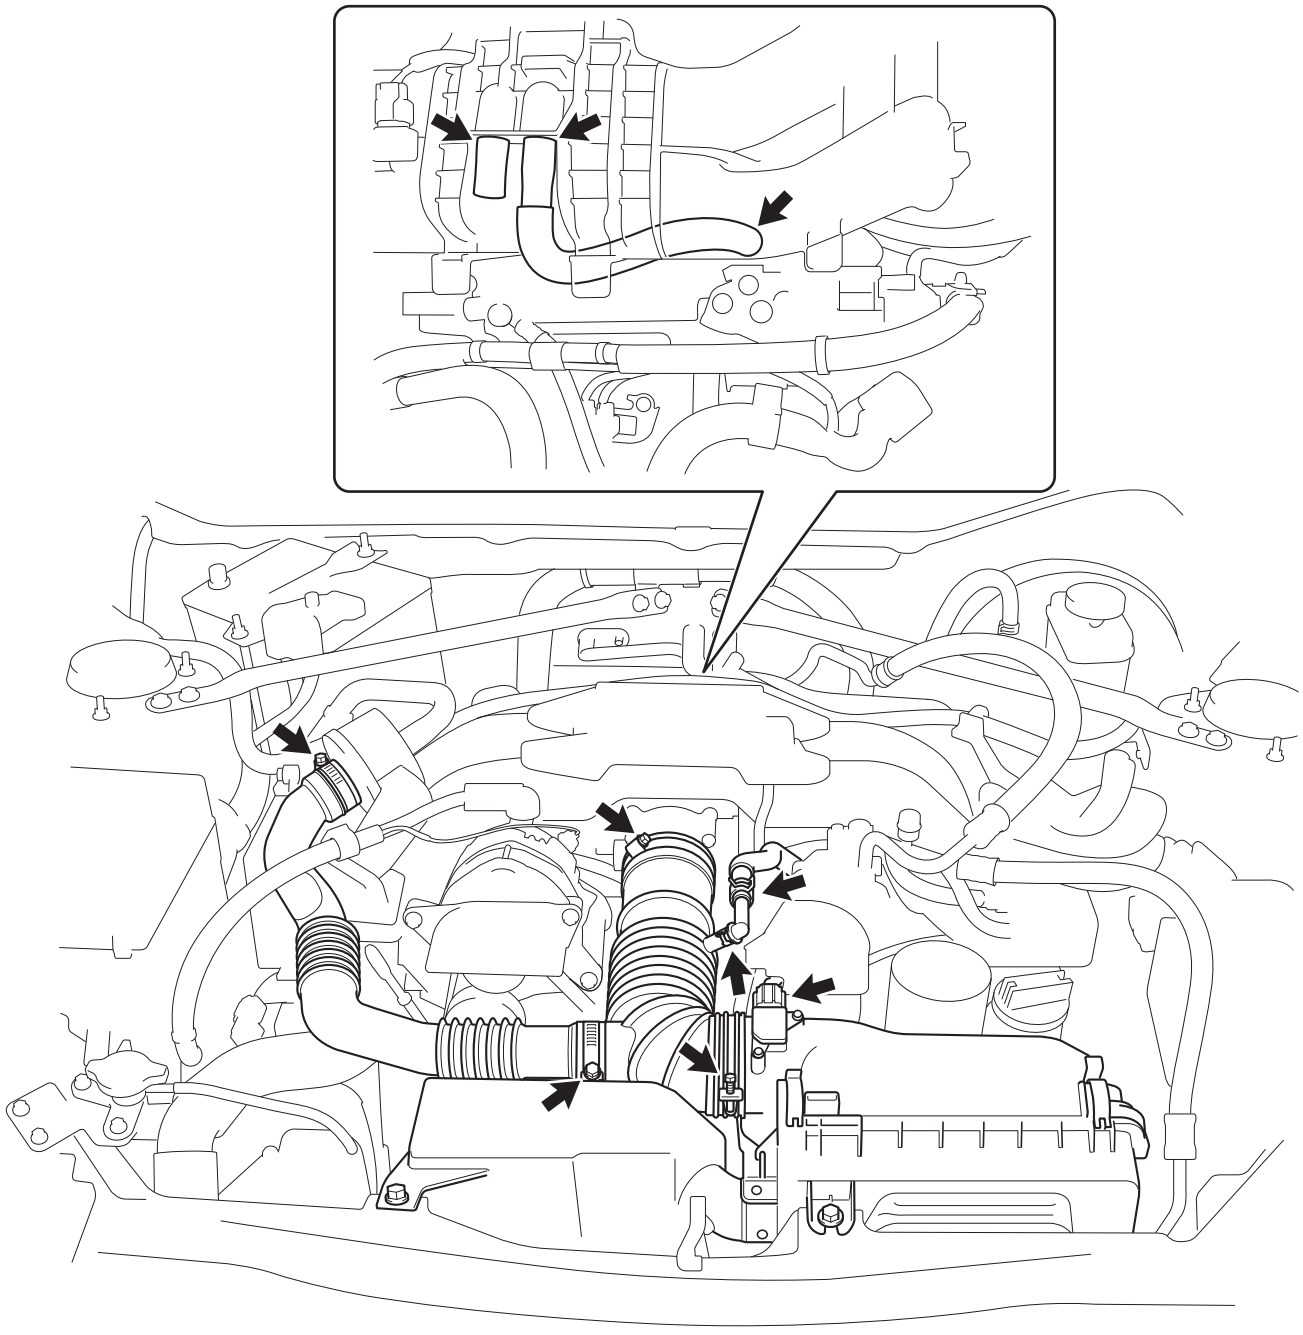
## On-vehicle inspection

1. Visual inspection
   (1) Make sure that there is no air suction at the locations shown in the figure.

*A:



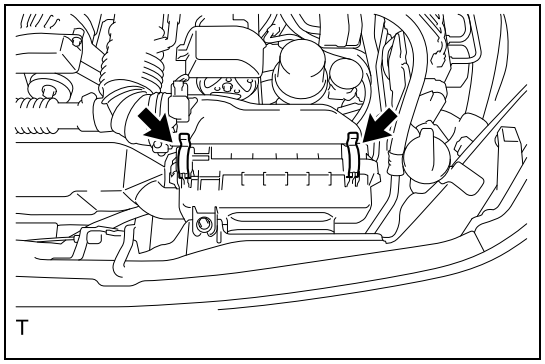
*B:



Captions in illustration

| | | | |
|---|---|---|---|
| *A | Transmission M/T | *B | Transmission A/T |

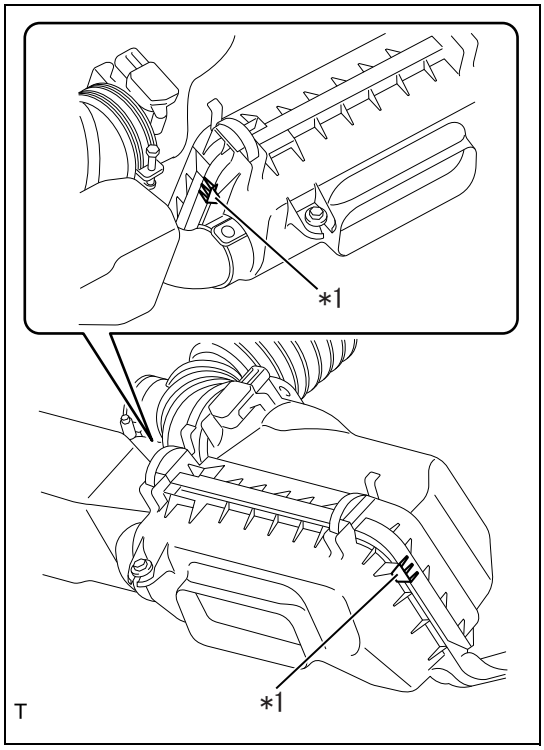
NOTE:
If the any of the parts on the intake side is disconnected, cracked or damaged, improper idling will be caused.



2. Check of air cleaner filter element SUB-ASSY
   (1) Remove the two clips from the air cleaner case (rear).

   (2) Lift the air cleaner case (rear) and release the two claws which engage in the air cleaner case (front).

   (3) Lift the air cleaner case (rear) at an angle as shown in the figure and remove the air cleaner filter element.
   (4) Check the air cleaner filter element for excessive dirt.
   Criteria: Not excessively dirty
   CAUTION:
   If it is excessively dirty, replace the air cleaner filter element.
   (5) When cleaning the air cleaner filter element, clean it by blowing air.
   (6) Lift the air cleaner case (rear) at an angle and install the air cleaner filter element.
   (7) Engage the two claws of air cleaner case (rear) to the air cleaner case (front).



(8) Install the two clips.

CAUTION:

- Make sure that the positioning protrusions at the right and left sides of the air cleaner case do not ride over.
- Be sure to engage the two claws at the lower side of air cleaner case.

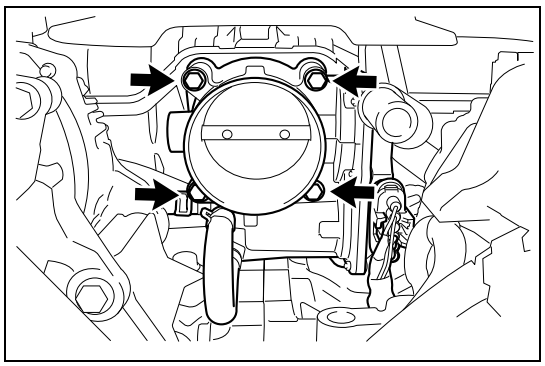
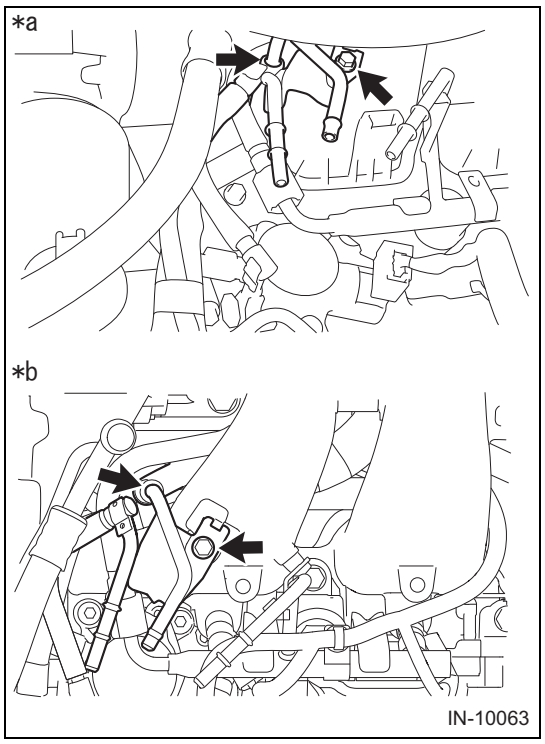
## REMOVAL

1. CHECK FUEL PUMP OPERATION AND INSPECT FOR FUEL LEAK (See page FU - 3)
2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL (See page IN - 6)
3. REMOVE AIR CLEANER CAP WITH AIR CLEANER HOSE (See page EM - 75)



4. REMOVE THROTTLE WITH MOTOR BODY ASSEMBLY
   (1) Remove the 4 bolts and the throttle with motor body assembly.
5. DISCONNECT FUEL HOSE No. 1 (See page FU - 23)
6. DISCONNECT FUEL HOSE No. 2 (See page FU - 23)
7. DISCONNECT PURGE HOSE (See page FU - 23)
8. REMOVE INJECTOR DRIVER (See page FU - 43)
9. REMOVE INTAKE MANIFOLD PROTECTOR (for Bank 2) (See page FU - 23)
10. REMOVE INTAKE MANIFOLD PROTECTOR (for Bank 1) (See page FU - 22)

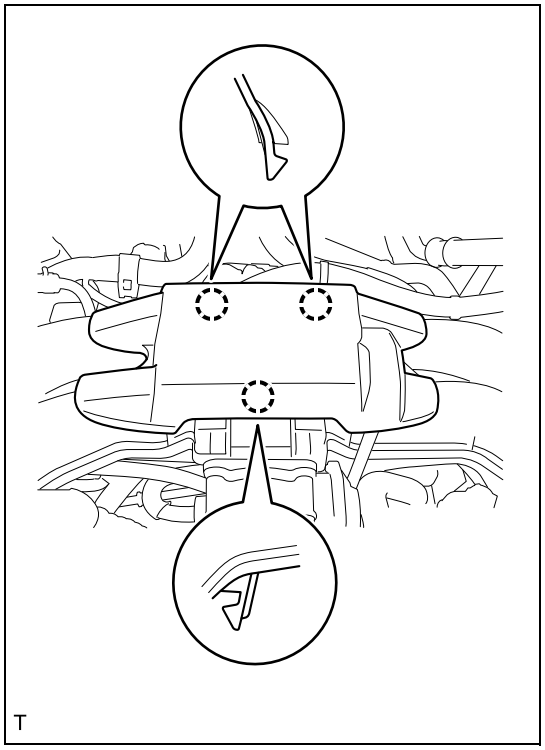


11. DISCONNECT FUEL DELIVERY PIPE SUB-ASSEMBLY
    (1) Remove the bolt and disconnect the fuel delivery pipe sub-assembly.
    (2) Disconnect the No. 2 fuel vapor feed hose and move the fuel delivery pipe toward the front of the vehicle.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

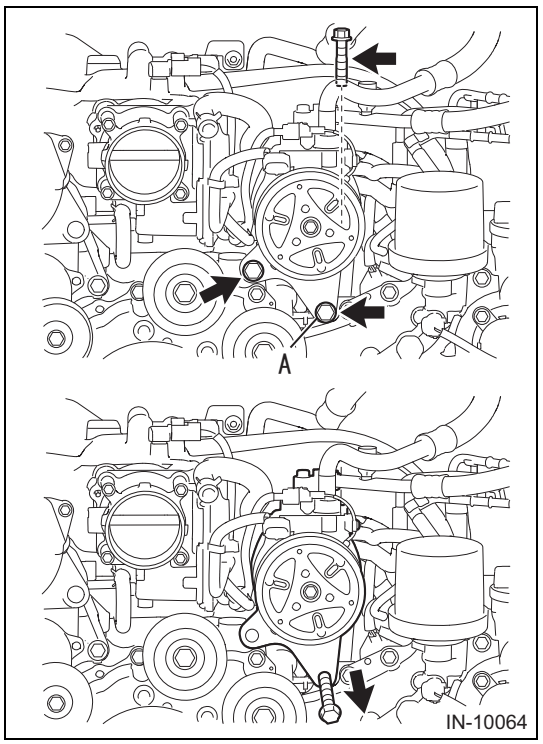
IE



T

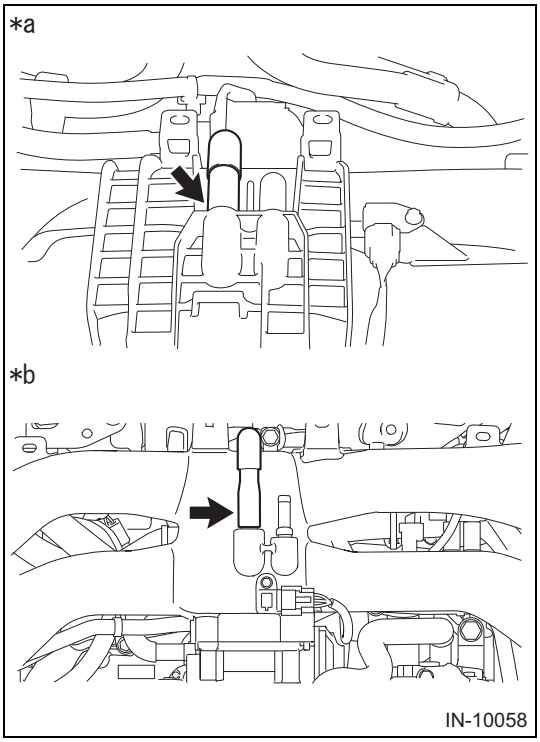
12. REMOVE NO. 1 ENGINE COVER SUB-ASSEMBLY (TRANSMISSION A/T)
    (1) Disengage the 3 craws and remove the No. 1 engine cover sub-assembly.
    NOTE:
    Release the tabs from the front side of the vehicle.

13. V-BELT REMOVAL (TRANSMISSION M/T) (See page EM - 5)



14. COMPRESSOR ASSY (WITH MAGNET CLUTCH) MOVING (TRANSMISSION M/T)
    (1) Remove the 3 bolts and hold the compressor ASSY (with magnet clutch) by hand.
    (2) Replace bolt A in the figure to a bolt of approximately 100 mm {3.937 in} in length, and move the compressor ASSY (with magnet clutch) towards the front of the vehicle.

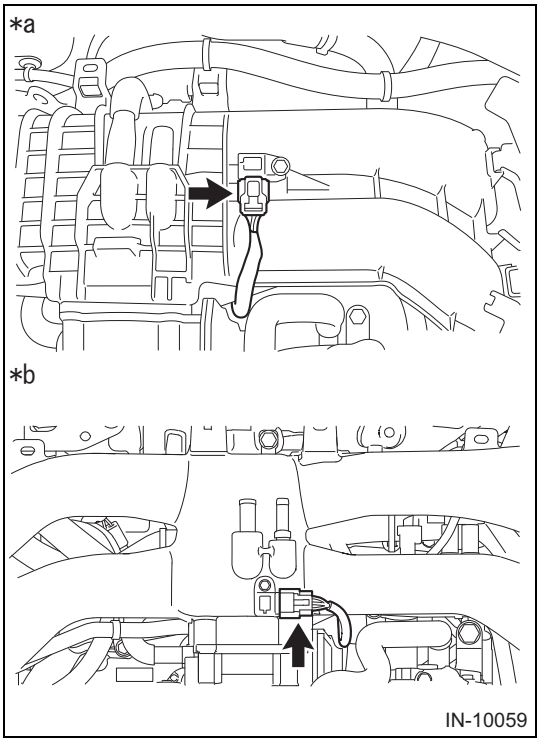
15. DISCONNECT NO. 2 VACUUM HOSE (for Manual Transmission) (See page BR - 28)



16. DISCONNECT VENTILATION HOSE
    (1) Disconnect the ventilation hose.

Text in Illustration

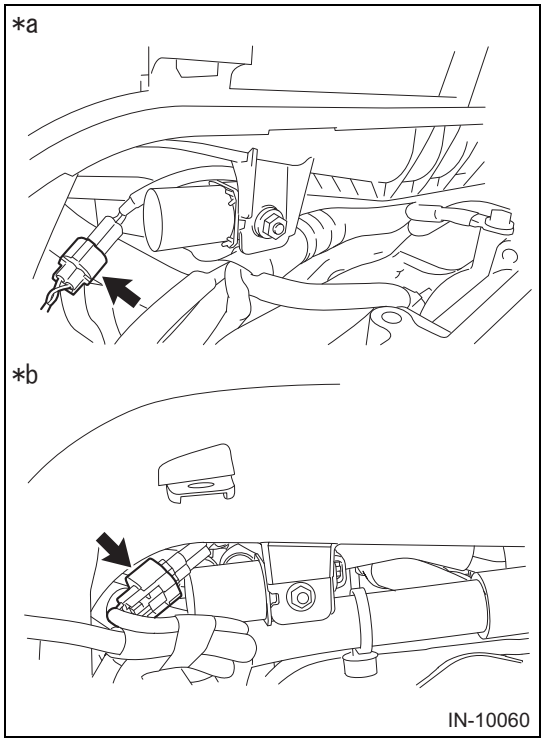
| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



17. REMOVE INTAKE MANIFOLD
    (1) Disconnect the manifold absolute pressure sensor connector.

Text in Illustration

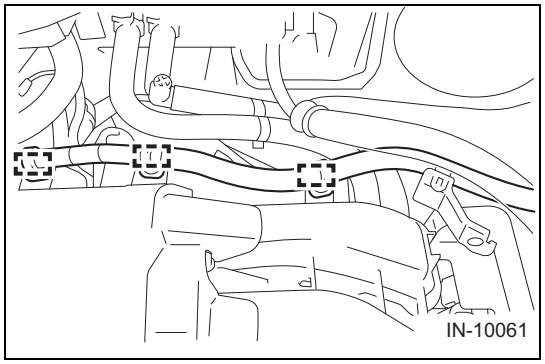
| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



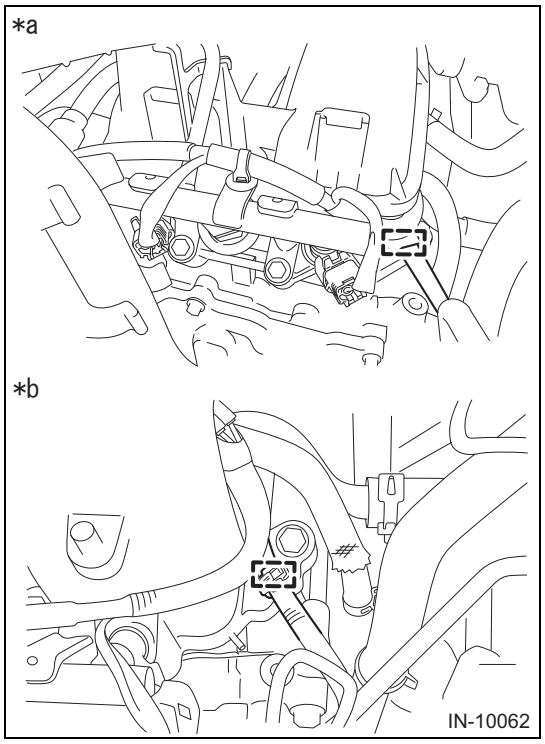
(2) Disconnect the purge control solenoid valve connector.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



(3) Release the three clips and disconnect the wiring harness. (Transmission A/T)

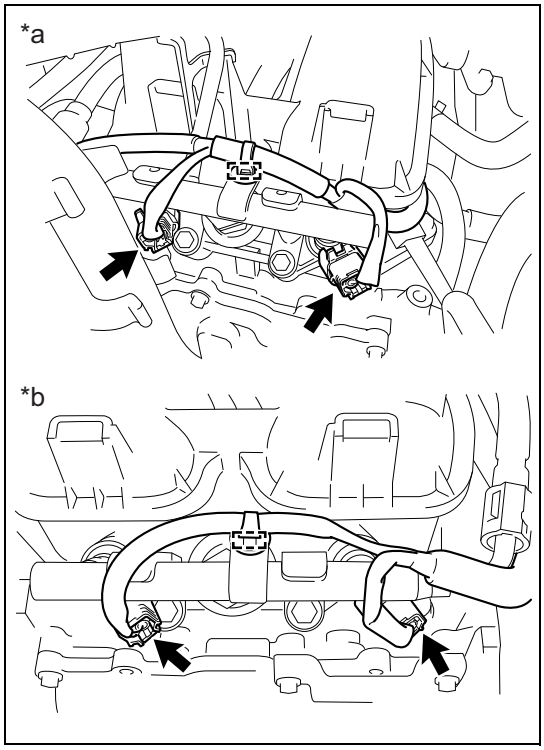


(4) Disengage the clamp and disconnect the engine wire harness.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

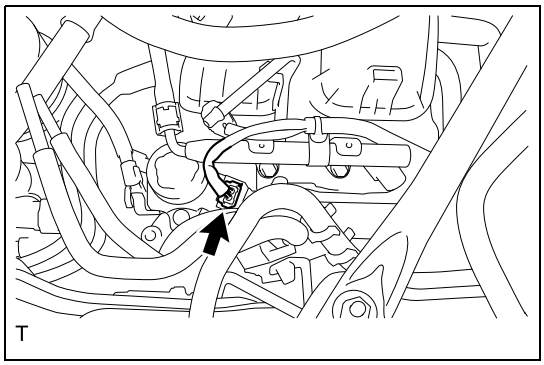
IE



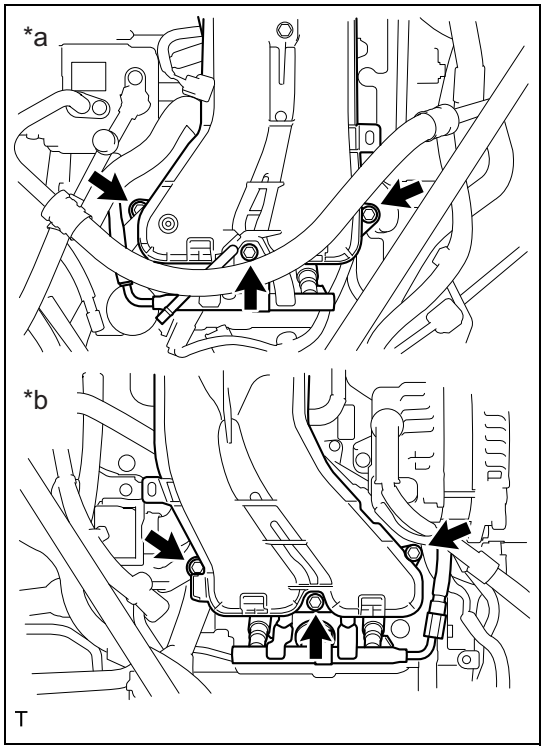
(5) Disengage the 2 clamps and disconnect the 4 connectors.

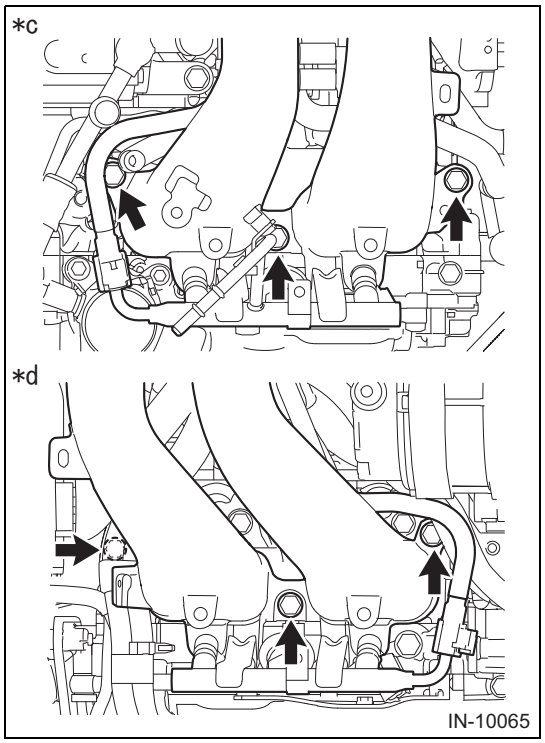
Text in Illustration

| | |
|---|---|
| *a | Bank 2 Side |
| *b | Bank 1 Side |



(6) Disconnect the fuel pump connector.



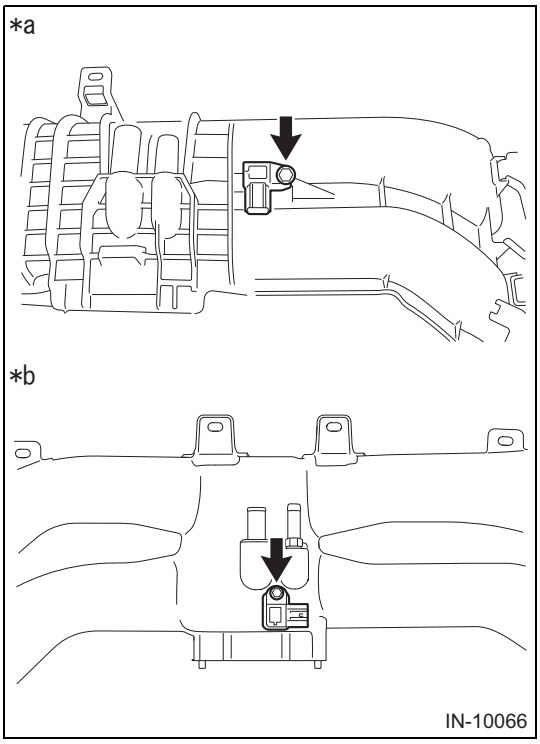


(7) Remove the 6 bolts, intake manifold and 2 gaskets.

Text in Illustration

| | |
|---|---|
| *a | Bank 2 side (transmission A/T) |
| *b | Bank 1 side (transmission A/T) |
| *c | Bank 2 side (transmission M/T) |
| *d | Bank 1 side (transmission M/T) |

## DISASSEMBLY

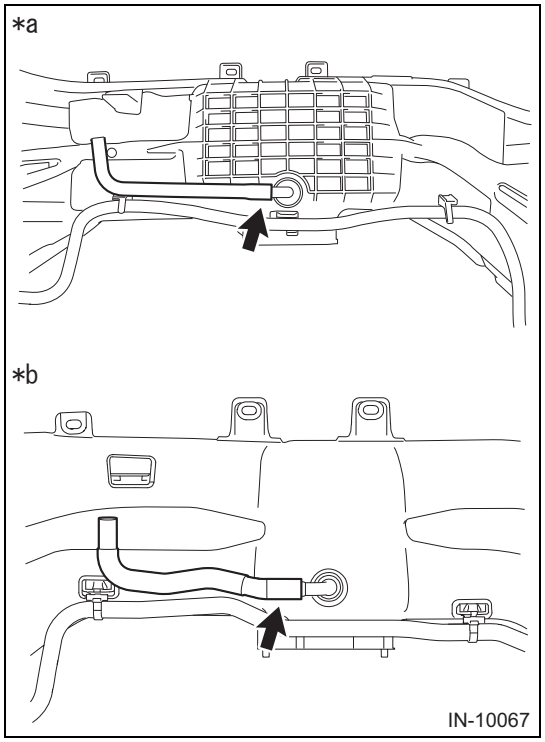


1. REMOVE MANIFOLD ABSOLUTE PRESSURE SENSOR
   (1) Remove the bolt and manifold absolute pressure sensor from the intake manifold.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

   (2) Remove the O-ring from the manifold absolute pressure sensor.



2. REMOVE PURGE CONTROL SOLENOID VALVE
   (1) Disconnect the No. 1 fuel vapor feed hose from the intake manifold.

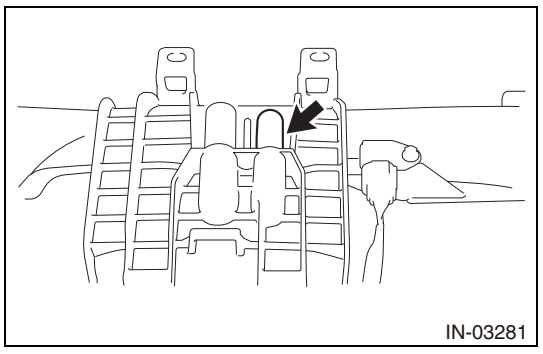
Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

   (2) Remove the nut and purge control solenoid valve.

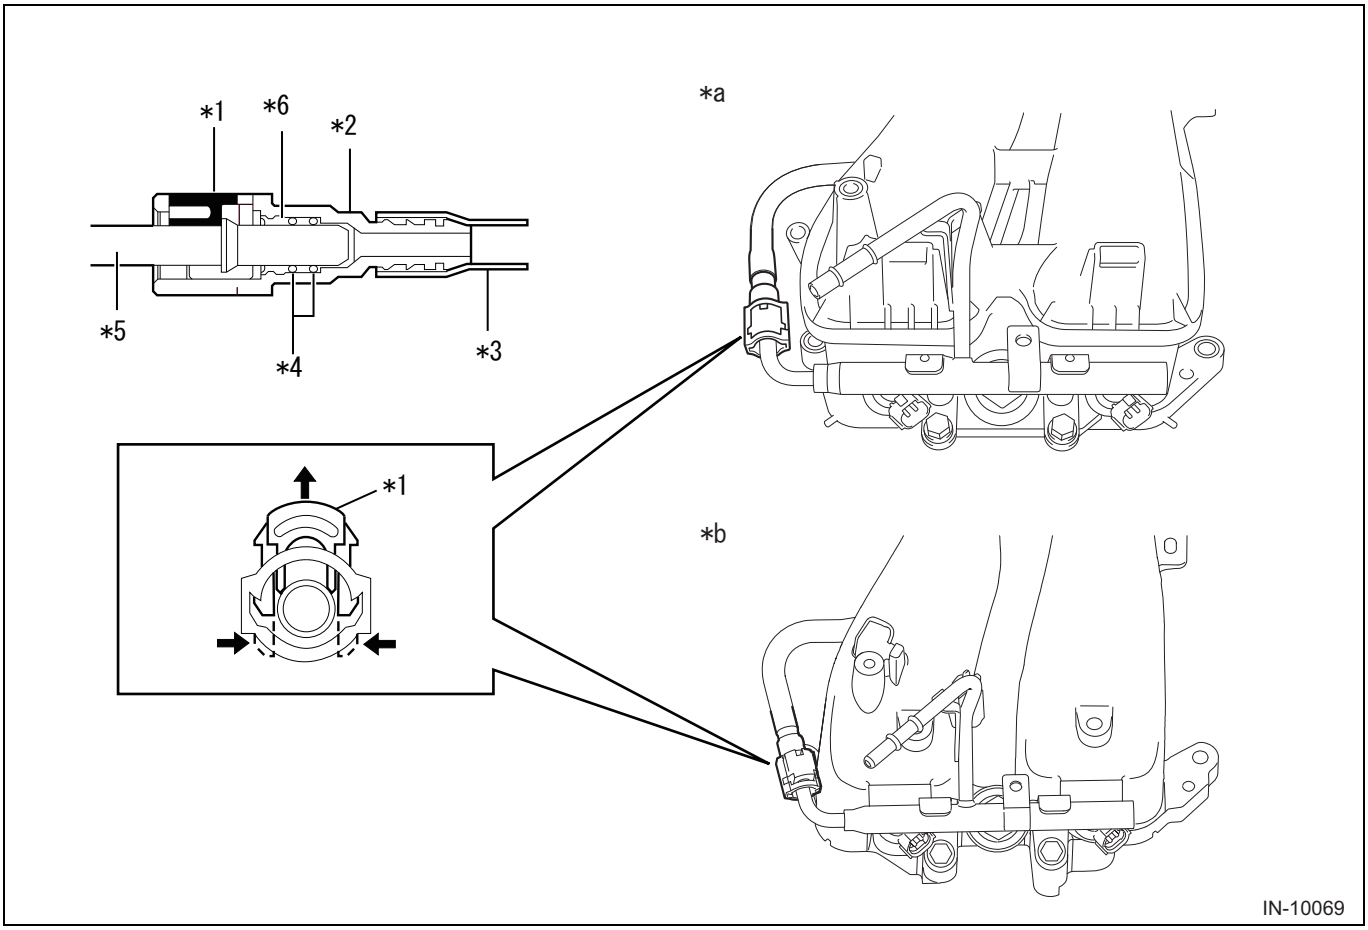
Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |



3. REMOVE CAP (for Automatic Transmission)
   (1) Remove the cap from the intake manifold.

4. REMOVE FUEL DELIVERY PIPE (for Bank 2)
   (1) Disconnect the No. 3 fuel delivery pipe sub-assembly from the fuel delivery pipe (for bank 2).
   CAUTION:
   - If the connector and pipe are stuck, pinch the fuel delivery pipe No. 3 by hand and push and pull the connector to disconnect it.
   - Do not allow any scratches or foreign matter on the parts when disconnecting them, as the No. 3 fuel delivery pipe joint contains the O-rings that seal the plug.
   - Do not use any tools to separate the pipe and connector.
   - Do not forcibly bend, twist or turn the nylon tube.
   - If the pipe and connector are stuck together, pinch the tube between your fingers and turn it carefully to free it. Then, disconnect the main tube.
   - Protect the disconnected part by covering it with a plastic bag and tape after disconnecting the main tube.
   - Check that the top hat cannot be pulled out.



Text in Illustration

| | | | |

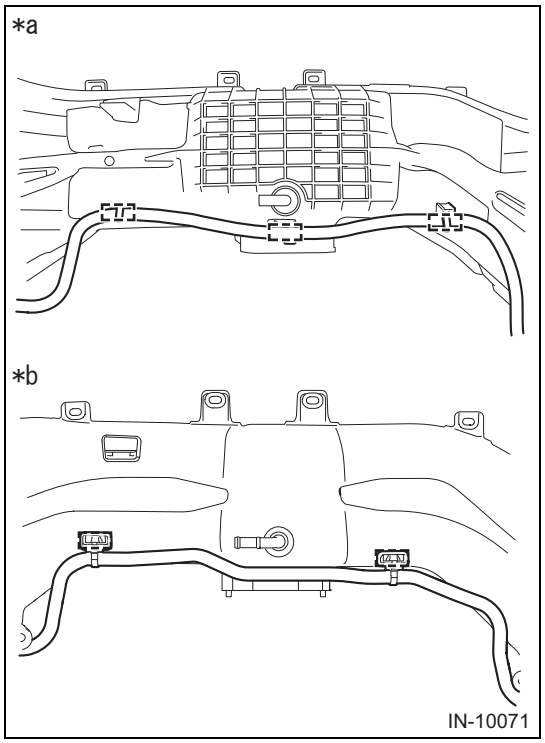
(2) Remove the 2 bolts and the fuel delivery pipe (for bank 2) from the intake manifold.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

5. REMOVE FUEL DELIVERY PIPE (for Bank 1)
NOTE:
Use the same procedure described for the fuel delivery pipe (for bank 2).

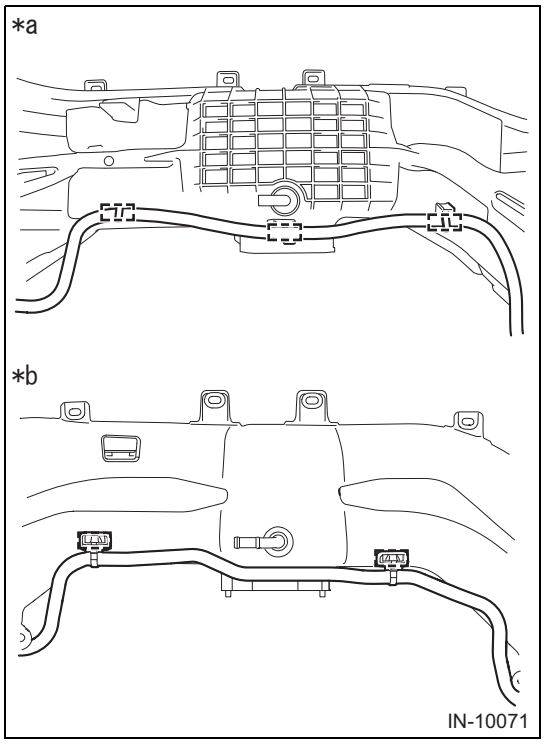


6. REMOVE NO. 3 FUEL DELIVERY PIPE
(1) Disengage the 3 clamps and remove the No. 3 fuel delivery pipe from the intake manifold. (Transmission A/T)
(2) Disengage the 2 clamps and remove the No. 3 fuel delivery pipe from the intake manifold. (Transmission M/T)

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

## REASSEMBLY



1. INSTALL NO. 3 FUEL DELIVERY PIPE
   (1) Install the No. 3 fuel delivery pipe to the intake manifold with the 3 clamps. (Transmission A/T)
   (2) Install the No. 3 fuel delivery pipe to the intake manifold with the 2 clamps. (Transmission M/T)

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

2. Fuel delivery pipe installation (bank 2 side)
   (1) Apply gasoline to two new seal rings and install them to the fuel injector ASSY.
   CAUTION:
   Make sure there is no damage to or foreign matter in seal ring grooves of the injector.
   (2) With the fuel injector ASSY installed on the fuel delivery pipe (bank 2 side), install it to the intake manifold.
   CAUTION:
   - Be careful not to twist the seal ring.
   - After it is attached to the fuel delivery pipe (bank 2 side), confirm that it can be rotated relatively lightly. If it cannot be rotated, remove the injector and repeat the work after replacing the seal rings with new ones.

   (3) With 2 bolts, install the fuel delivery pipe (bank 2 side) to the intake manifold.
   Standard value:T=19N·m {194kgf·cm} {14ft·lbf}

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

(4) Align the axis of the fuel delivery pipe NO.3 connector and the axis of the pipe, connect them, and push the retainer until you hear the click.

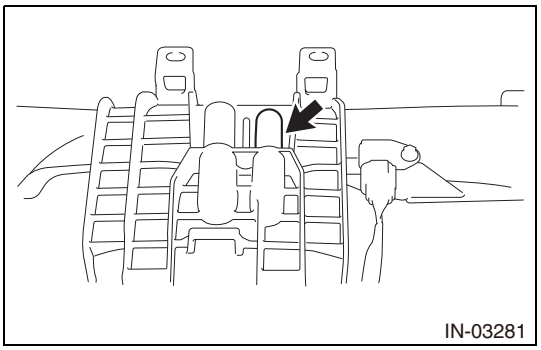
CAUTION:

- Before starting the work, check that there is no damage to or foreign material on the fuel delivery pipe NO.3 connector and the pipe connection.
- After connecting fuel delivery pipe NO.3, check that the fuel delivery pipe NO.3 connector and the pipe are securely attached.

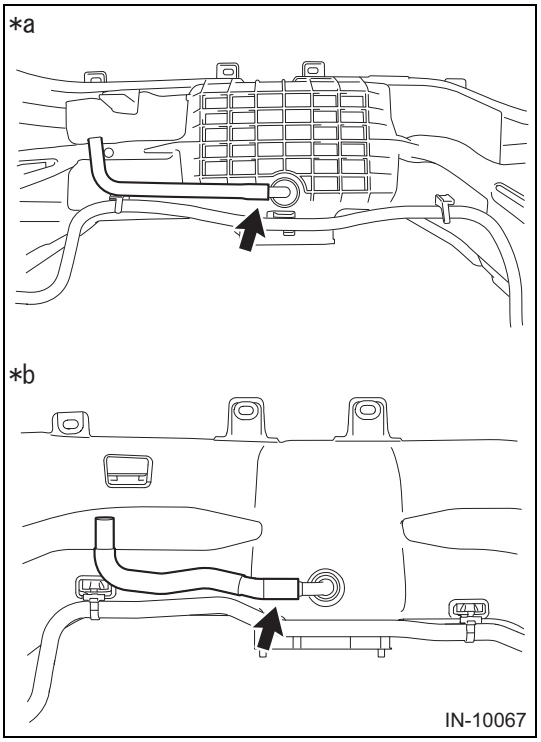
3. INSTALL FUEL DELIVERY PIPE (for Bank 1)

NOTE:

Use the same procedure described for the fuel delivery pipe (for bank 2).



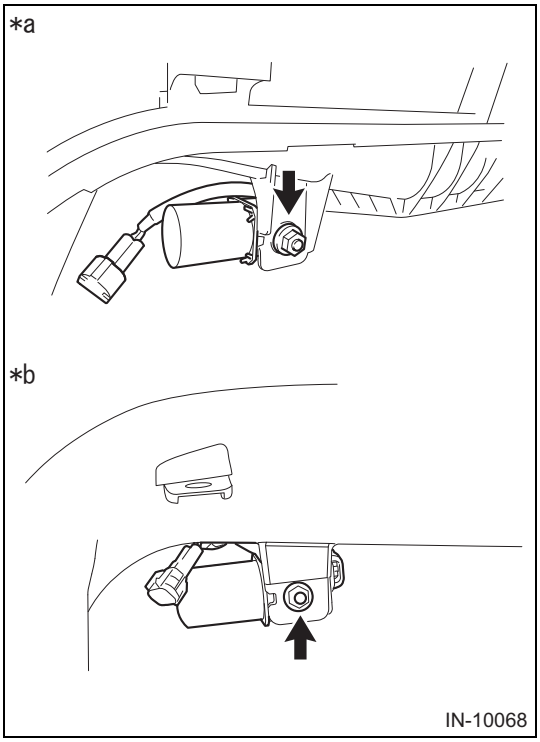
4. INSTALL CAP (for Automatic Transmission)
   (1) Install the cap to the intake manifold.



5. INSTALL PURGE CONTROL SOLENOID VALVE
   (1) Connect the No.1 fuel vapor feed hose to the intake manifold.

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

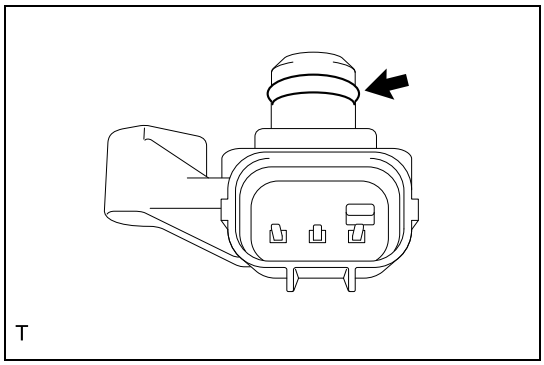


(2) Install the nut and purge control solenoid valve to the intake manifold.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}

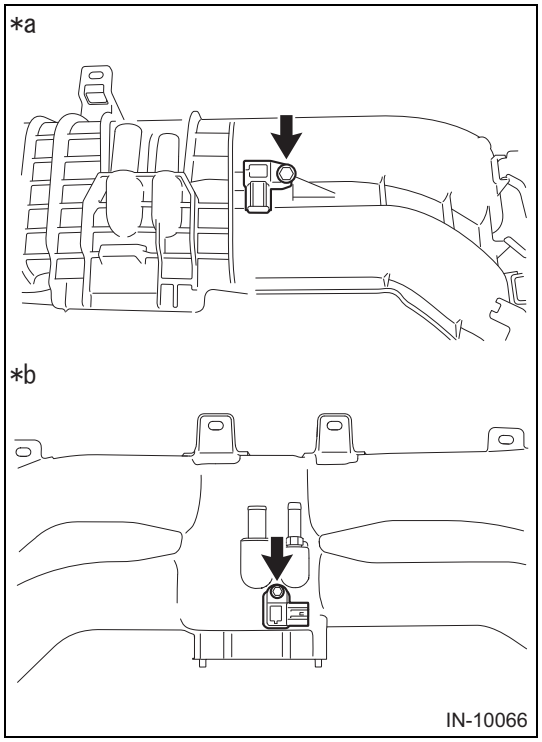
Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

6. INSTALL MANIFOLD ABSOLUTE PRESSURE SENSOR
(1) Apply engine oil to the contact surfaces of the new O-ring on manifold absolute pressure sensor.



(2) Install a new O-ring to the manifold absolute pressure sensor.



(3) Install the manifold absolute pressure sensor to the intake manifold with the bolt.
Standard value:T=4.0N·m {41kgf·cm} {3.0 ft·lbf} (Transmission A/T)
Standard value:T=3.4N·m {35kgf·cm} {2.5 ft·lbf} (Transmission M/T)

Text in Illustration

| | |
|---|---|
| *a | Transmission A/T |
| *b | Transmission M/T |

## INSTALLATION

1. INSTALL INTAKE MANIFOLD
   (1) Install the 2 new gaskets to the intake manifold.
   (2) Install the intake manifold with the 6 bolts.
   Standard value:T=25N·m {255kgf·cm} {18.4ft·lbf}
   (3) Engage the 4 connectors and connect the wire harness.
   (4) Connect the fuel pump connector.
   (5) Engage the clamp and connect the engine wire harness.
   (6) Engage the three clips and connect the wiring harness. (Transmission A/T)
   (7) Connect the purge control solenoid valve connector.
   (8) Connect the manifold absolute pressure sensor connector.
2. CONNECT VENTILATION HOSE
   (1) Connect the ventilation hose.
3. CONNECT NO. 2 VACUUM HOSE (for Manual Transmission) (See page BR - 30)
4. Installation of compressor ASSY (with magnet clutch) (transmission M/T) (See page AC - 145)
5. Installation of V-belt (transmission M/T) (See page EM - 7)
6. INSTALL NO. 1 ENGINE COVER SUB-ASSEMBLY (TRANSMISSION A/T)
   (1) Engage the 3 claws and install the No. 1 engine cover sub-assembly.
7. CONNECT FUEL DELIVERY PIPE SUB-ASSEMBLY
   (1) Connect the No. 2 fuel vapor feed hose.
   (2) Install the bolt and connect the fuel delivery pipe sub-assembly.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
8. INSTALL INTAKE MANIFOLD PROTECTOR (for Bank 2) (See page FU - 28)
9. INSTALL INTAKE MANIFOLD PROTECTOR (for Bank 1) (See page FU - 28)
10. INSTALL INJECTOR DRIVER (See page FU - 44)
11. CONNECT PURGE HOSE (See page FU - 28)
12. CONNECT FUEL HOSE NO. 2 (See page FU - 28)
13. CONNECT FUEL HOSE NO. 1 (See page FU - 28)
14. CONNECT THROTTLE WITH MOTOR BODY ASSEMBLY
   (1) Install a new gasket to the intake manifold.

(2) Install the 4 bolts and throttle with motor body assembly to intake manifold.
Standard value:T=8.0N·m {82kgf·cm} {5.9ft·lbf}

15. INSTALL AIR CLEANER CAP WITH AIR CLEANER HOSE (See page EM - 114)
16. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
17. INSPECT FUEL PUMP OPERATION AND INSPECT FOR FUEL LEAK (See page FU - 10)
18. INSPECT THROTTLE WITH MOTOR BODY ASSEMBLY (See page ES - 672)

# Chamber (FA20)

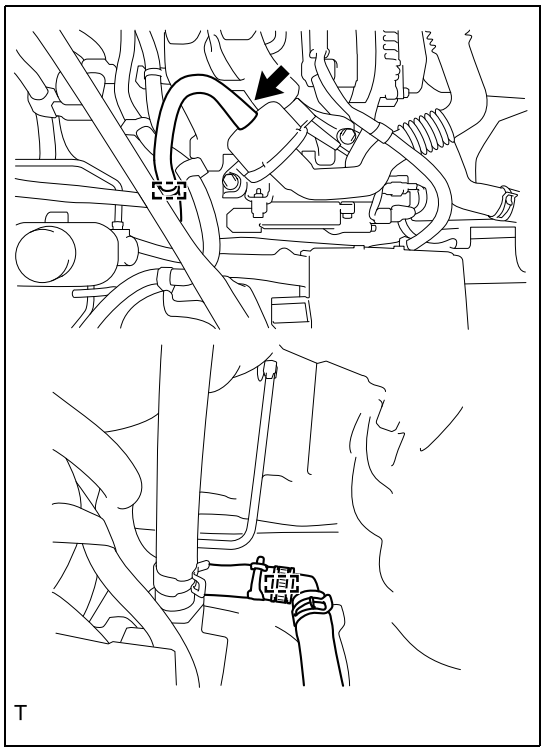
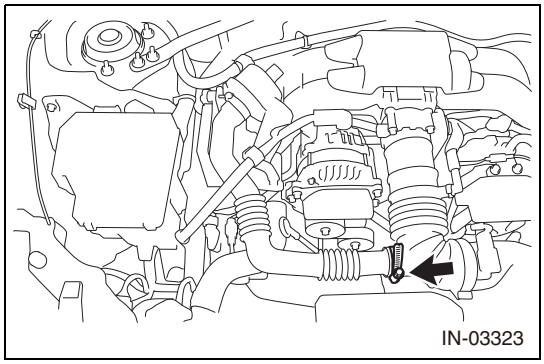
## Removal

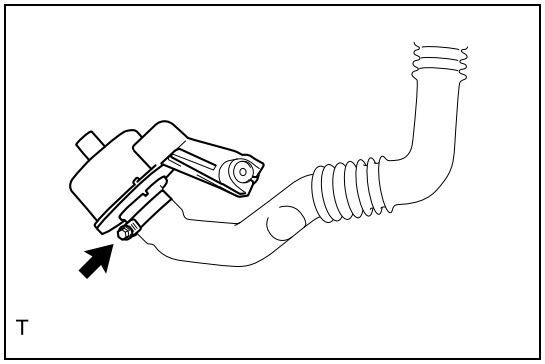


1. Hose removal
   (1) Disconnect the hose.
   (2) Release the two clamps and remove the hose from the grommet.



2. Duct removal
   (1) Loosen the hose clamp.

   (2) Remove the two bolts and remove the duct and chamber ASSY as a unit.



3. Chamber ASSY removal
   (1) Loosen the hose clamp and remove the chamber ASSY.

## Installation

1. Chamber ASSY installation
   (1) Install the chamber ASSY with the hose clamp.
   Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}

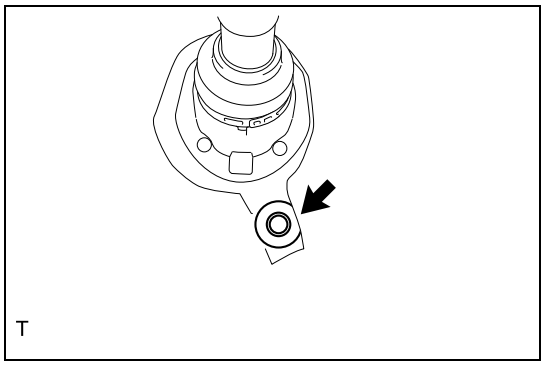
IE

2. Duct installation
   (1) Install the duct and chamber ASSY as a unit with the two bolts.
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
   (2) Install the duct with the hose clamp.
   Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}
3. Hose installation
   (1) Engage the two clamps and install the hose.

   (2) Insert the hose until the flange at the hose end contacts the grommet.

Captions in illustration

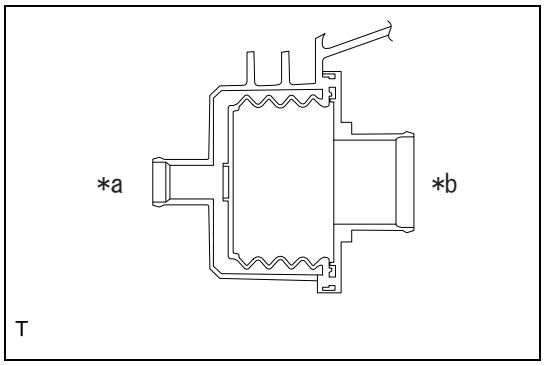
| | |
|---|---|
| *1 | Grommet |
| *a | Flange |



CAUTION:
When inserting the hose end, insert the hose so that the grommet rubber is not engulfed to avoid water leakage.

   (3) Make sure from the passenger room side that the hose end is inserted properly.
   (4) Connect the hose and install the hose.

## Unit inspection



1. Chamber ASSY check
   (1) Check that air does not comes out easily from the IN side when air is blown into the chamber from the EX side.

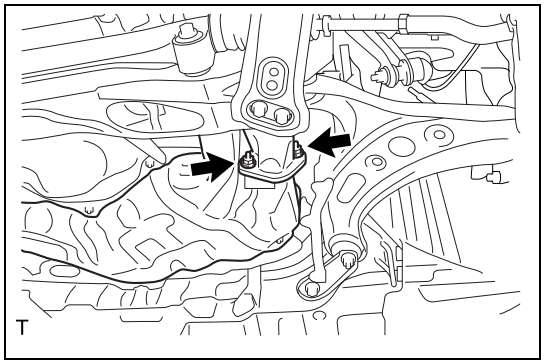
## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Disconnect the connector for air / fuel ratio sensor and the 2 clamps. (Refer to ES - 711)
3. Disconnect the connector for oxygen sensor and the 2 clamps. (Refer to ES - 714)
4. Removal of exhaust pipe ASSY FR (Refer to IE - 40)



5. Exhaust manifold removal
   (1) Remove the two nuts and remove the exhaust pipe SUB-ASSY FR.
   (2) Remove the gasket.

   (3) Remove the six nuts and remove the exhaust manifold.
   (4) Remove the two gaskets.

## Installation

1. Exhaust manifold installation
   (1) Install two new gaskets.
   (2) Install the exhaust manifold with the six nuts.
   Standard value:T=30N·m {306kgf·cm} {22.1ft·lbf}
   (3) Install a new gasket to the exhaust pipe SUB-ASSY FR installation portion of exhaust manifold.
   (4) Install the exhaust pipe SUB-ASSY FR with the two nuts.
   Standard value:T=42.5N·m {433kgf·cm} {31.3ft·lbf}
2. Installation of exhaust pipe ASSY FR (Refer to IE - 46)
3. Install the connector for oxygen sensor connector and the two clamps. (Refer to ES - 716)
4. Install the connector for air/fuel ratio sensor and the 2 clamps. (Refer to ES - 712)
5. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
6. Exhaust gas leakage check
   (1) Make sure that there is no exhaust gas leakage from the connections of exhaust pipes and the mounting portion of each sensor.

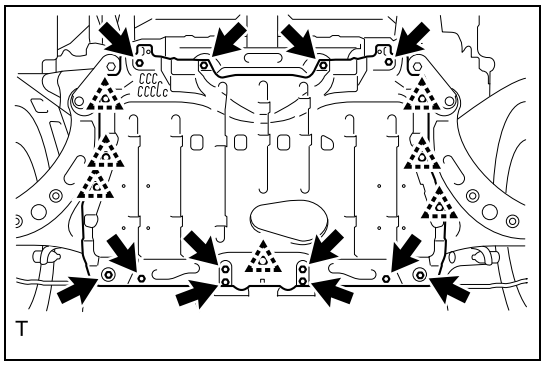
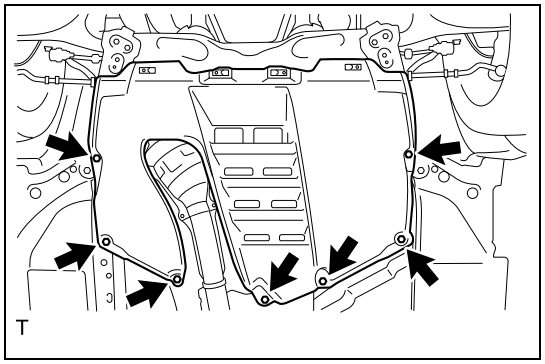
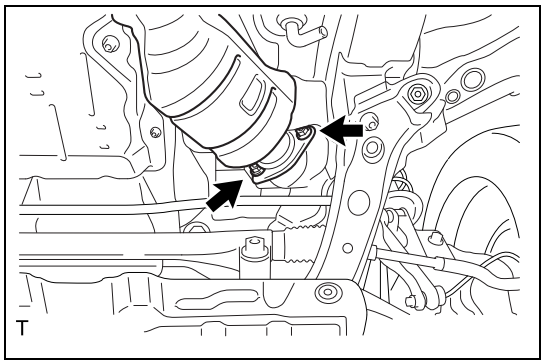
## Removal



1. Under cover front AL removal
   (1) Remove the 12 bolts, release the seven clips, and then remove the under cover front AL.



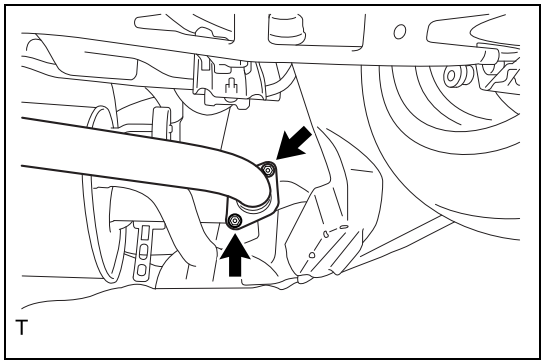
2. Under cover COMPL T/M removal
   (1) Remove the seven bolts to remove the under cover COMPL T/M.



3. Removal of exhaust pipe ASSY FR
   (1) Remove the two nuts and remove the exhaust pipe ASSY FR.

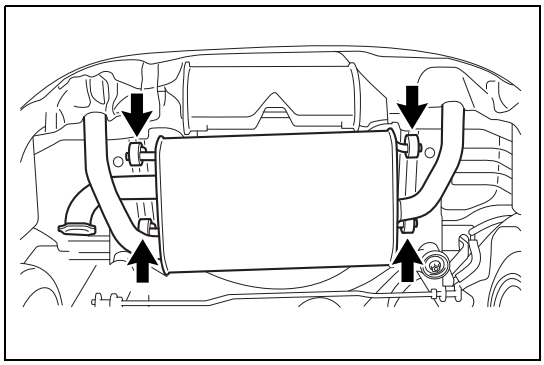
   (2) Remove the two nuts, two bolts and two compression springs to remove the exhaust pipe ASSY CTR.

   (3) Remove the bolt and remove the exhaust pipe ASSY FR.
   (4) Remove the two gaskets.



4. Removal of exhaust pipe ASSY CTR
   (1) Remove the two nuts and two bolts to remove the exhaust tail pipe ASSY.

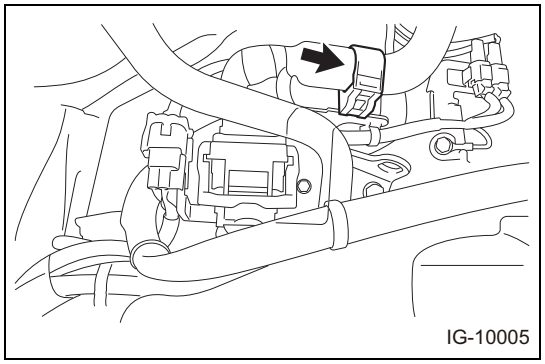
   (2) Remove the cushion rubber, and remove the exhaust pipe ASSY CTR.
   (3) Remove the gasket.



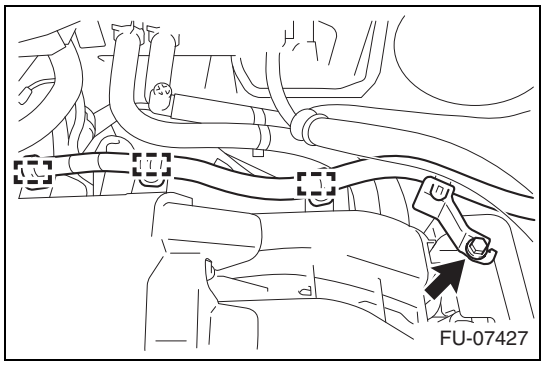
5. Exhaust tail pipe ASSY removal
   (1) Remove the four cushion rubbers and remove the exhaust tail pipe ASSY.

6. Tail pipe baffle removal (with tail pipe baffle)
   (1) Remove the two bolts and remove the two tail pipe baffles.
7. Exhaust manifold removal (Refer to IE - 36)
8. Removal of exhaust pipe SUB-ASSY FR
   (1) Front strut tower bar LH removal (Refer to FP - 5)
   (2) Removal of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
   (3) Front strut tower bar RH removal (Refer to FP - 4)
   (4) Removal of flexible V-shaped bar RH (tS model) (Refer to FP - 5)
   (5) Removal of air cleaner case SUB-ASSY (Refer to EM - 75)

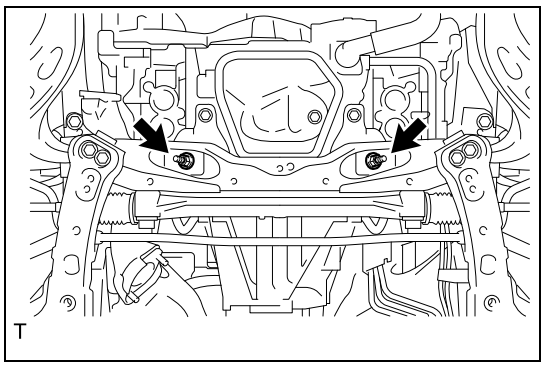
   (6) Engine wiring disconnection
      (a)Release the four clamps and disconnect the engine wiring.



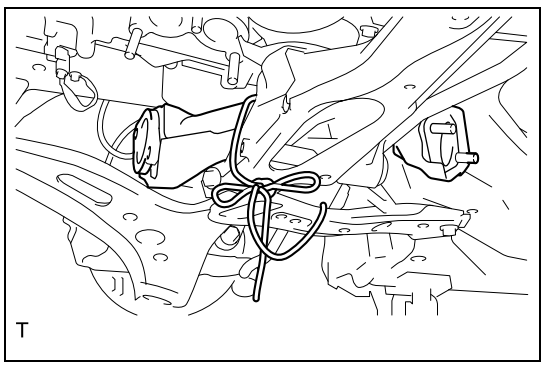
(b) Release the clamp and disconnect the bulkhead harness.



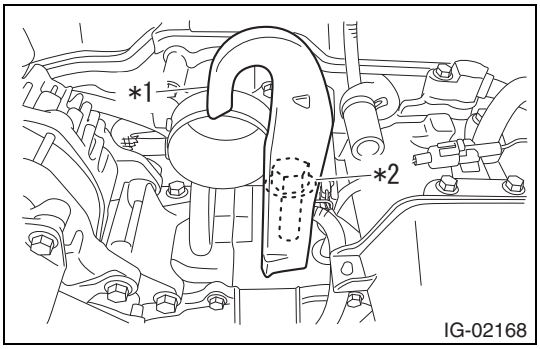
(c) Remove the bolt and three clamps, and then disconnect the engine wiring. (Transmission A/T)



(7) Remove the 2 nuts on the engine mount.



(8) Tie the joint pipe to the front suspension crossmember SUB-ASSY with rope.
NOTE:
This procedure is necessary to prevent the joint pipe from falling off.



(9) Install the SST to the cylinder block.

Captions in illustration

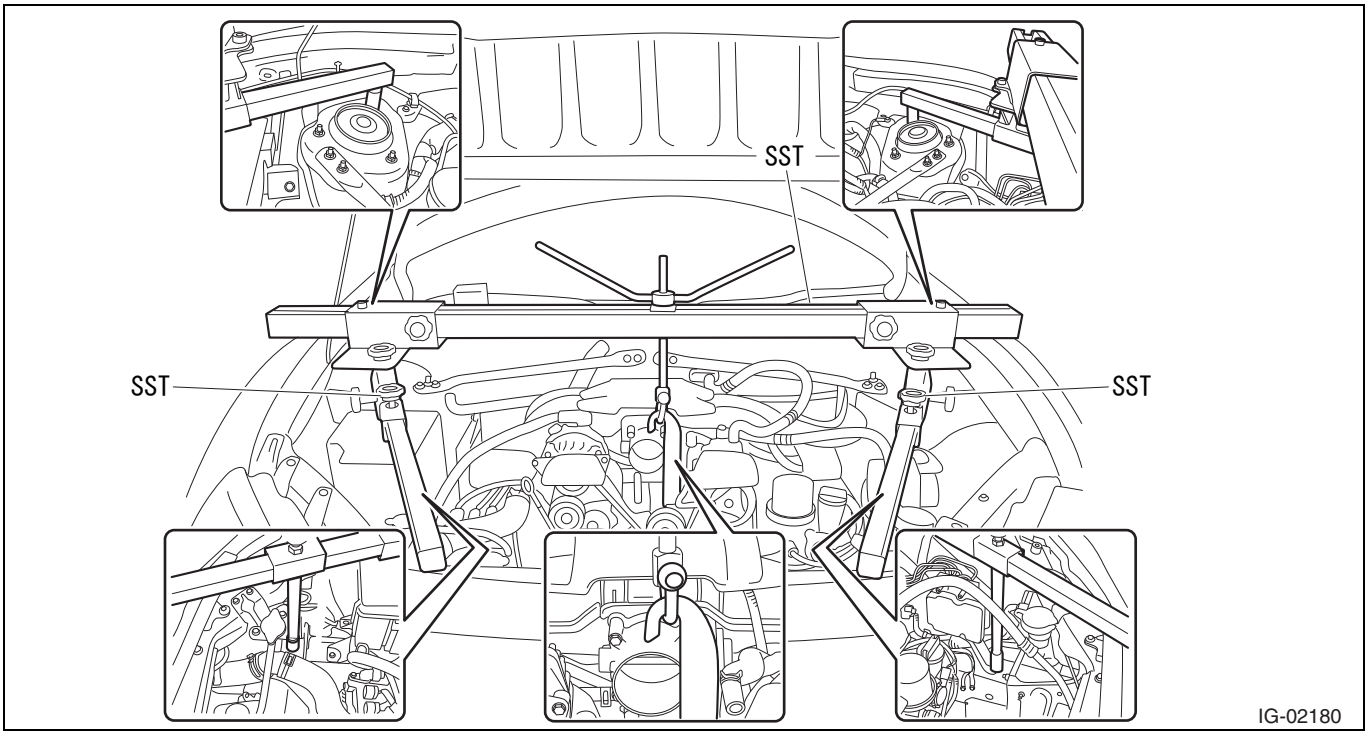
NOTE:

This procedure is required to prevent the engine wiring from damaging.

IE

(11) Install the SST to the vehicle.



SST 99099AJ000, 18679AA020

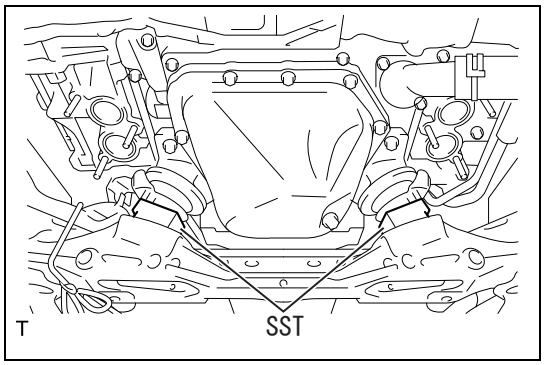
CAUTION:

- When installing the SST to the vehicle, do not damage the engine wiring.
- Use a shackle with a load capacity of 250 kg (551 lb) or more.

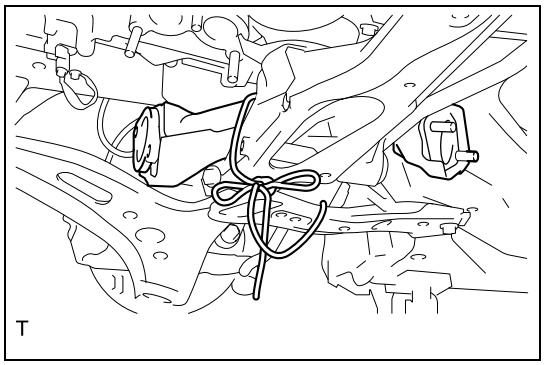
(12) Lift the engine ASSY a little bit at a time until the stud bolt of the engine mount is removed from the front crossmember.

CAUTION:

- To avoid the damage to the SST, apply grease or lubricant to the threaded portion.
- To avoid the damage to the vehicle and parts, perform lifting operation a little bit at a time while checking the clearance in each part.
- Lift up the engine ASSY until the position where the intake manifold (#4) and A/C suction hose contact lightly.
- Insert a cloth etc. between the intake manifold (#4) and A/C suction hose to protect the parts of them.



(13) Install the SST between engine mount and front crossmember.
SST 18632AA020

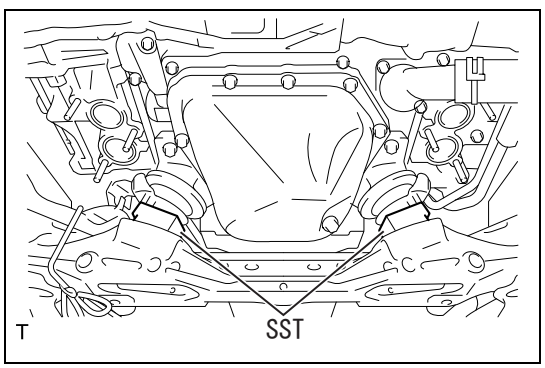


(14) Remove the rope which secures the exhaust pipe SUB-ASSY FR to the front suspension crossmember SUB-ASSY.

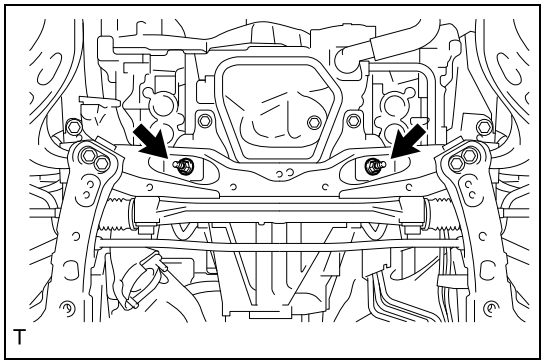
(15) Remove the exhaust pipe SUB-ASSY FR.

## Installation

1. Exhaust pipe SUB-ASSY FR installation
   (1) Tie the exhaust pipe SUB-ASSY FR to the front suspension crossmember SUB-ASSY with the rope.
   NOTE:
   This operation is required to avoid dropping the exhaust pipe SUB-ASSY FR.
2. Removal of SST
   (1) Using the SST, lift the engine ASSY.
   SST 99099AJ000, 18679AA020

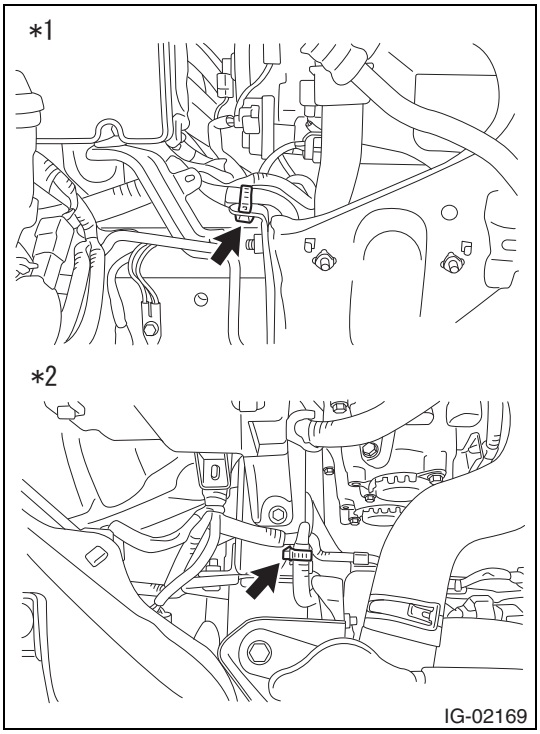


(2) Remove the SST.
SST 18632AA020



(3) Install the two nuts of the new engine mounting.
Standard value:T=60N·m {612kgf·cm} {44.2ft·lbf}

(4) Remove the rope which secures the joint pipe to the front suspension crossmember SUB-ASSY.
(5) Remove the SST from the vehicle.
(6) Remove the SST from the cylinder block.



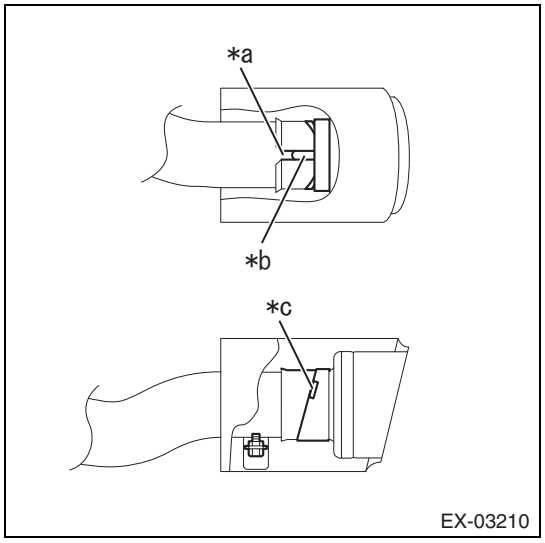
(7) Connect the engine wiring with the clamp.

Captions in illustration

| | |
|---|---|
| *1 | LH |
| *2 | RH |

(8) Engine wiring connection
(a) Connect the engine wiring with the bolt and three clamps. (Transmission A/T)
Standard value:T=1.1N·m {112kgf·cm} {8.1ft·lbf}
(b) Using the clamp, connect the bulkhead harness.
(c) Using 4 clamps, connect the engine wire.
(9) Installation of air cleaner case SUB-ASSY (Refer to EM - 114)
(10) Front strut tower bar LH installation (Refer to FP - 5)
(11) Installation of flexible V-shaped bar LH (tS model) (Refer to FP - 5)
(12) Front strut tower bar RH installation (Refer to FP - 5)
(13) Installation of flexible V-shaped bar RH (tS model) (Refer to FP - 5)

3. Exhaust manifold installation (Refer to IE - 36)



4. Tail pipe baffle installation (with tail pipe baffle)
   (1) As shown in the figure, align the notch of the tail pipe baffle and the protrusion of the exhaust tailpipe ASSY, and push in until it hits the tailpipe baffle stopper.

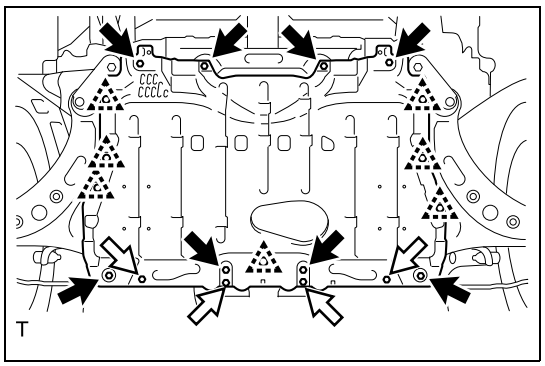
Captions in illustration

| | |
|---|---|
| *a | Cutout |
| *b | Protrusion portion |
| *c | Stopper |

   (2) Install the two tail pipe baffles with the two bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}

IE

5. Exhaust tail pipe ASSY installation
   (1) Install the exhaust tail pipe ASSY with the four cushion rubbers.
6. Installation of exhaust pipe ASSY CTR
   (1) Install the exhaust pipe ASSY CTR with the cushion rubber.
   (2) Install the exhaust pipe ASSY CTR to the exhaust tail pipe ASSY via a new gasket with the two bolts and two new nuts.
   Standard value:T=48N·m {490kgf·cm} {35.4ft·lbf}
7. Installation of exhaust pipe ASSY FR
   (1) Temporarily tighten the exhaust pipe ASSY FR to the bracket with the bolt.
   (2) Install the exhaust pipe ASSY FR to the exhaust pipe ASSY CTR via a new gasket with the two nuts, two bolts and two compression rings.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
   (3) Install the exhaust pipe ASSY FR to the exhaust pipe SUB-ASSY FR via a new gasket with the two nuts.
   Standard value:T=42.5N·m {433kgf·cm} {31.3ft·lbf}
   (4) Finally tighten the bolt for securing the bracket of exhaust pipe ASSY FR.
   Standard value:T=50N·m {510kgf·cm} {36.9ft·lbf}
8. Exhaust gas leakage check
   (1) Make sure that there is no exhaust gas leakage from the connections of exhaust pipes and the mounting portion of each sensor.
9. Shift lever position check (transmission A/T) (Refer to AT - 210)
10. Under cover COMPL T/M installation
   (1) Install the under cover COMPL T/M with the seven bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}



11. Under cover front AL installation
   (1) Install the under cover front AL with the 12 bolts and seven clips.

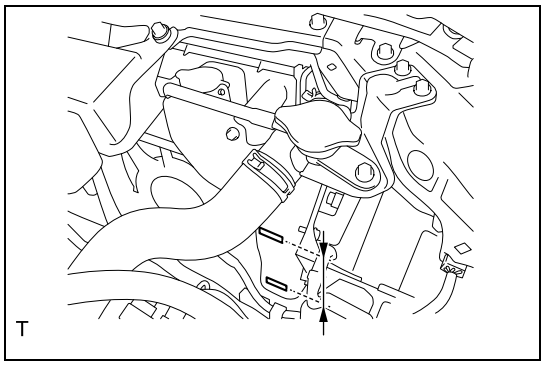
## On-vehicle inspection

WARNING:
To avoid the risk of burn, do not remove the radiator cap when the engine and radiator are hot. The fluid and steam may blow out due to the pressure.



1. Coolant (SUBARU Super Coolant) level check
   (1) When the engine is cold, make sure that the reservoir tank level is between the FULL line and LOW line.
   NOTE:
   If the fluid level is low, check for coolant leakage and refill the coolant to the FULL line.
   CAUTION:
   Do not use water instead of the coolant.
   (2) Remove the radiator cap and make sure that the coolant is filled up to the radiator filler neck.

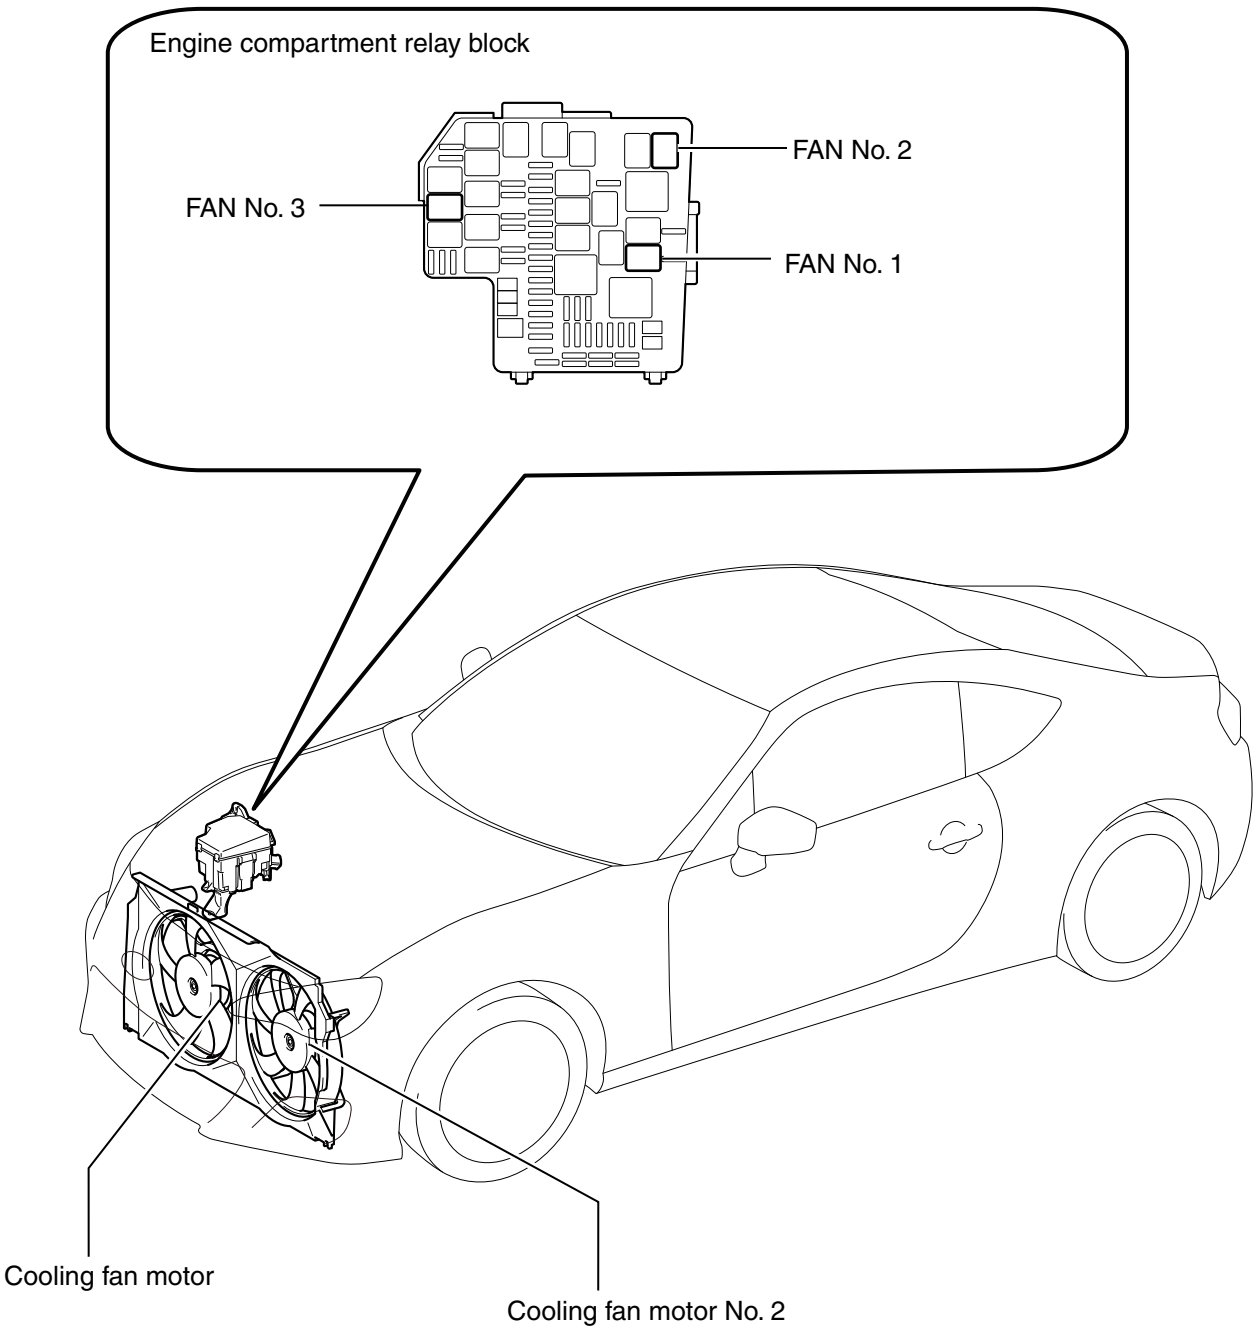
2. Coolant (SUBARU Super Coolant) check
   (1) Remove the radiator cap.
   WARNING:
   To avoid the risk of burn, do not remove the radiator cap when the engine and radiator are hot. The fluid and steam may blow out due to the pressure.
   (2) Check that there is no excessive rust or scale deposition around the radiator cap and water inlet.
   NOTE:
   If it is excessively dirty, replace the coolant. (Refer to CO - 16)
   (3) Install the radiator cap.

3. Coolant (SUBARU Super Coolant) leakage check
   WARNING:
   To avoid the risk of burn, do not remove the radiator cap when the engine and radiator are hot. The fluid and steam may blow out due to the pressure.

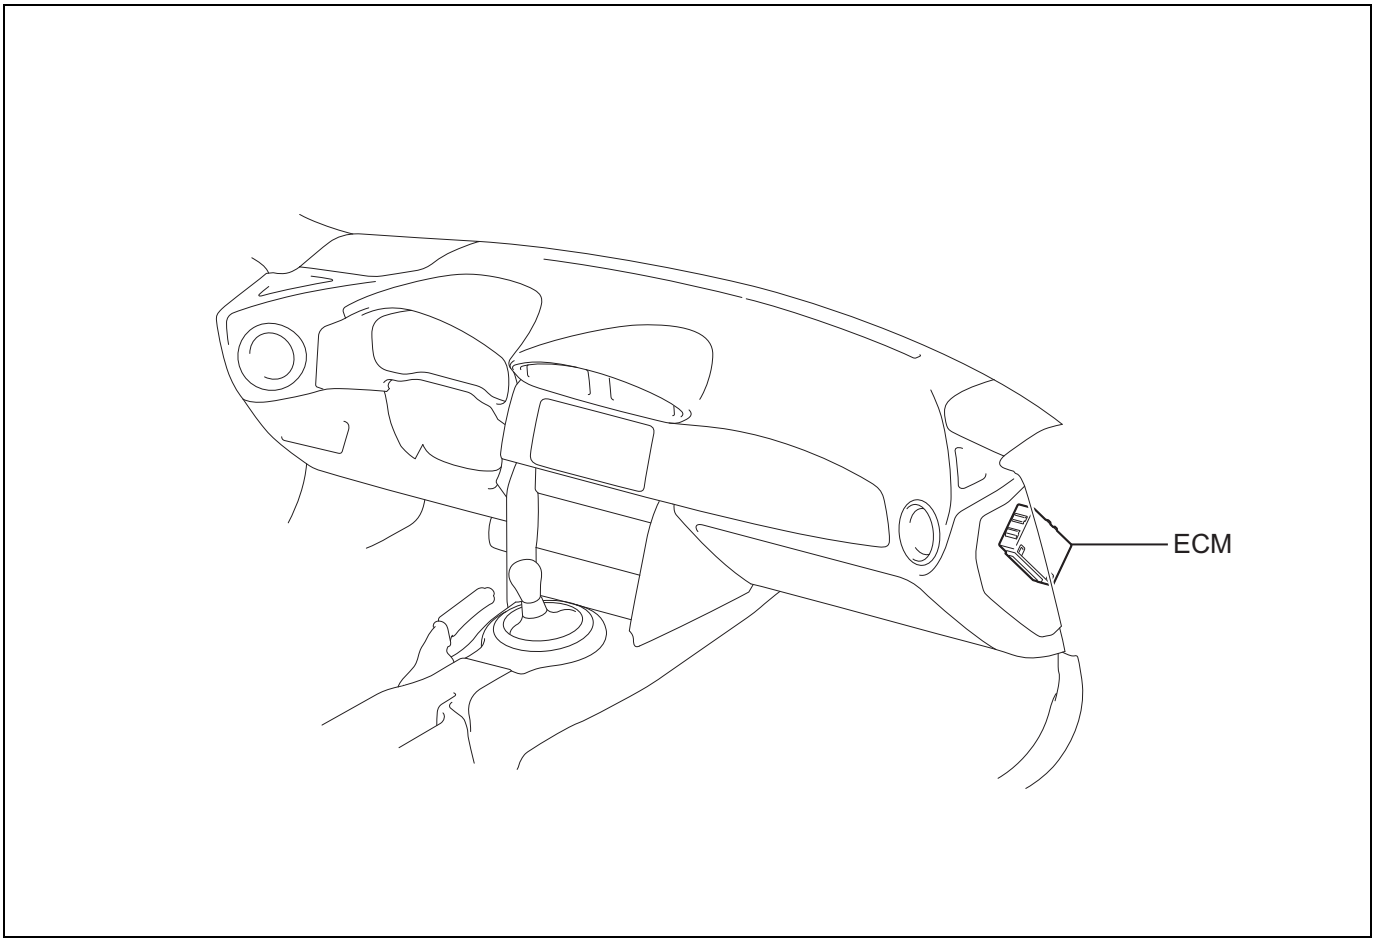
   (1) Attach the radiator cap tester to the radiator.
   NOTE:
   If the engine coolant level is low, refill the coolant of the specified concentration from the radiator filler neck.
   (2) Warm up the engine.
   (3) Perform the pumping operation up to a pressure of 137 kPa {1.4 kgf/cm$^2$, 20 psi} and make sure that the pressure does not decrease.
   NOTE:
   If the pressure decreases, check the hoses, radiator and water pump for leakage. If there is no leakage to the outside, check the heater core, cylinder block and cylinder head.

# Cooling fan system (FA20)

## Parts location



CO-03016



CO

## On-vehicle inspection

1. INSPECT COOLING FAN OPERATION AT LOW TEMPERATURES (Below 92 °C (198 °F))
   (1) Turn the ignition switch to ON.
   (2) Check that the cooling fans stop.
   If it does not, check the cooling fan relays and engine coolant temperature sensor, and check whether there is a disconnection or an open circuit between them.
   (3) Disconnect the engine coolant temperature sensor connector.
   (4) Check that the cooling fans operate.
   If it does not, check the fuses, cooling fan relays, ECM and cooling fans, and check for a short circuit between the cooling fan relays and the engine coolant temperature sensor.
   (5) Reconnect the engine coolant temperature sensor connector.
2. INSPECT COOLING FAN OPERATION AT HIGH TEMPERATURES (Above 95 °C (203 °F))
   (1) Start the engine, and raise the engine coolant temperature to above 95 °C (203 °F).
   NOTE:
   The engine coolant temperature is detected by the engine coolant temperature sensor on the water outlet.
   (2) Check that the cooling fans operate.
   If it does not, replace the engine coolant temperature sensor.

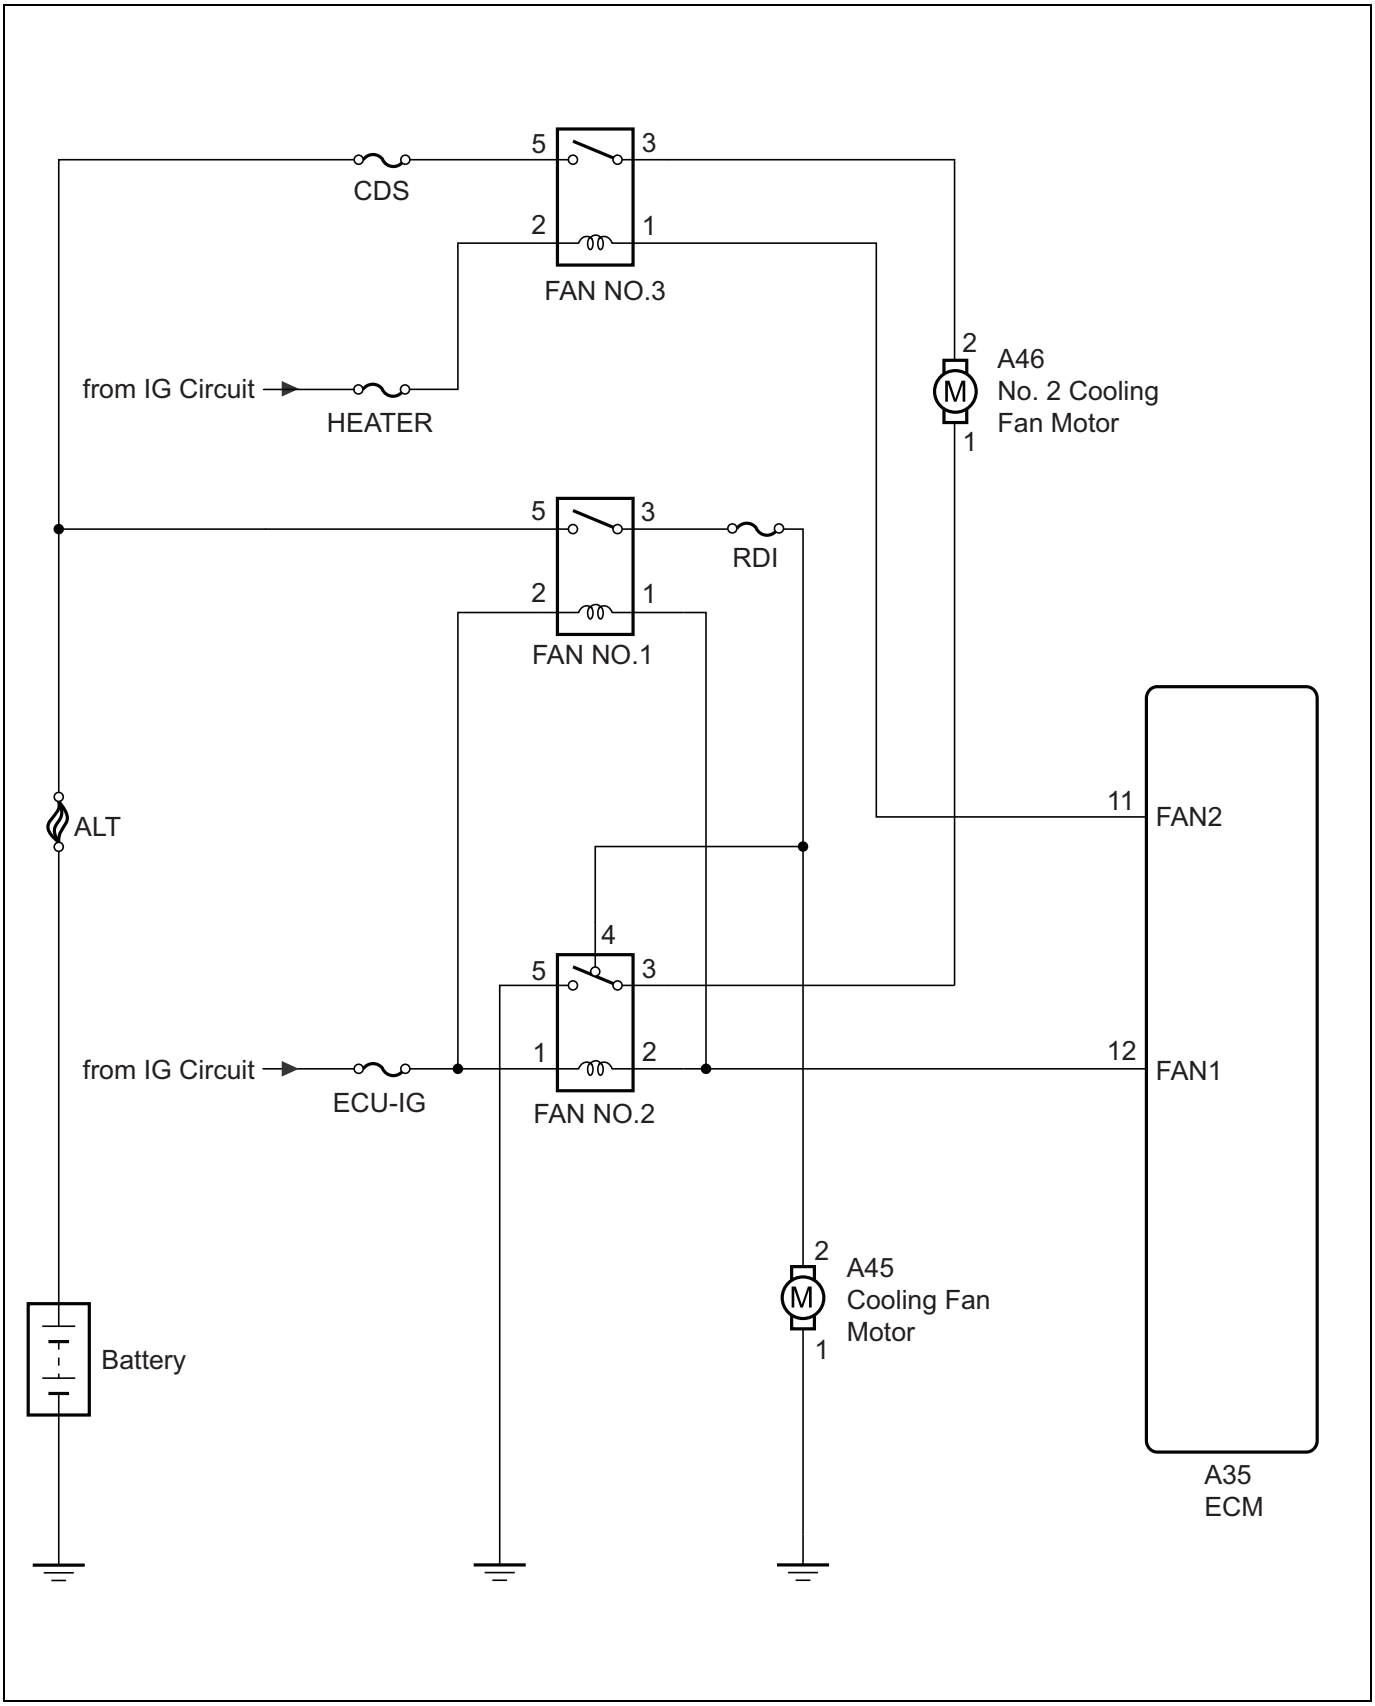
Circuit figure



# Cooling fan system

Circuit description

For the cooling fan, the engine control computer turns ON/OFF the cooling fan relay using the engine coolant temperature, A/C switch, A/C refrigerant pressure, engine speed and vehicle speed signals.

To control the cooling fan motor speed in two stages, the engine control computer turns ON/OFF the fan relay to switch between the series and parallel connections of cooling fan motor circuit.

Circuit figure

For a circuit figure, refer to CO - 6.

Inspection steps

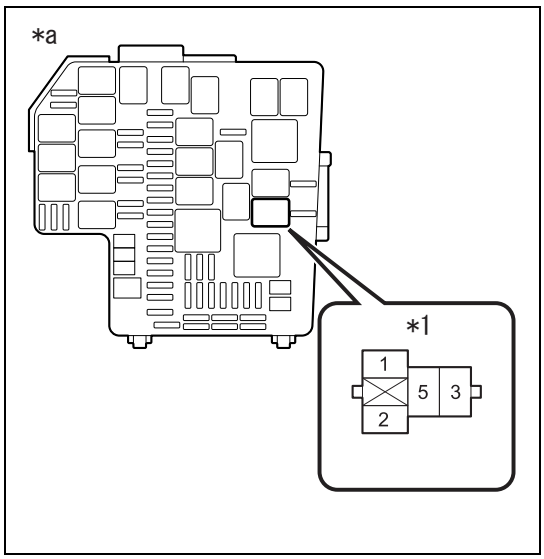
NOTE:

Read the freeze frame data using the SSM4. In the freeze frame data, part of the engine running condition at a trouble occurrence is stored and these information is helpful for troubleshooting.

CAUTION:

Check fuses in this circuit before performing the troubleshooting.

| 1 | FAN NO. 1 relay check (power supply voltage) |
|---|---|



(1) Remove the FAN NO. 1 relay from the engine compartment relay block.

(2) Measure the voltage between the terminals.

CAUTION:

When measuring the voltage by putting the tester probe etc. on the holder, the holder may be damaged if the probe is pressed against the holder too strong.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 5 (FAN NO. 1) - chassis ground | Always | 11 to 14V |

Captions in illustration

| | |

OK

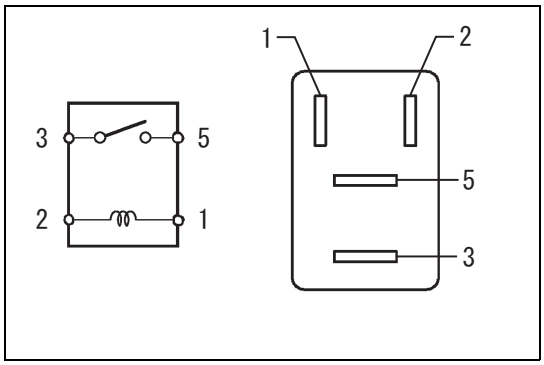
| 4 | FAN NO. 1 relay unit inspection |
|---|---|



(1) Remove the FAN NO. 1 relay from the engine compartment relay block.
(2) Measure the resistance between the terminals.

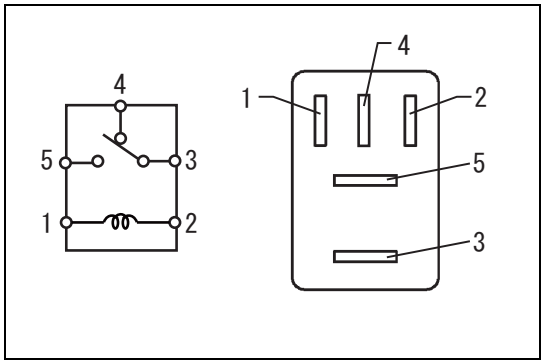
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminals 1 and 2: | 10 kΩ or more |
| 3 - 5 | When the battery voltage is applied to the terminals 1 and 2: | Less than 1 Ω |

NG → FAN NO. 1 relay replacement

OK

| 5 | FAN NO. 2 relay unit inspection |
|---|---|



(1) Remove the FAN NO. 2 relay from the engine compartment relay block.
(2) Measure the resistance between the terminals.

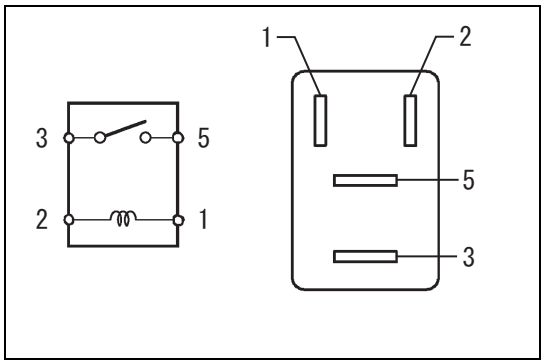
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 4 | When the battery voltage is not applied to the terminals 1 and 2: | Less than 1 Ω |
| 3 - 4 | When the battery voltage is applied to the terminals 1 and 2: | 10 kΩ or more |
| 3 - 5 | When the battery voltage is not applied to the terminals 1 and 2: | 10 kΩ or more |
| 3 - 5 | When the battery voltage is applied to the terminals 1 and 2: | Less than 1 Ω |

NG → FAN NO. 2 relay replacement

OK

| 6 | FAN NO. 3 relay unit inspection |
|---|---|



(1) Remove the FAN NO. 3 relay from the engine compartment relay block.
(2) Measure the resistance between the terminals.

Resistance

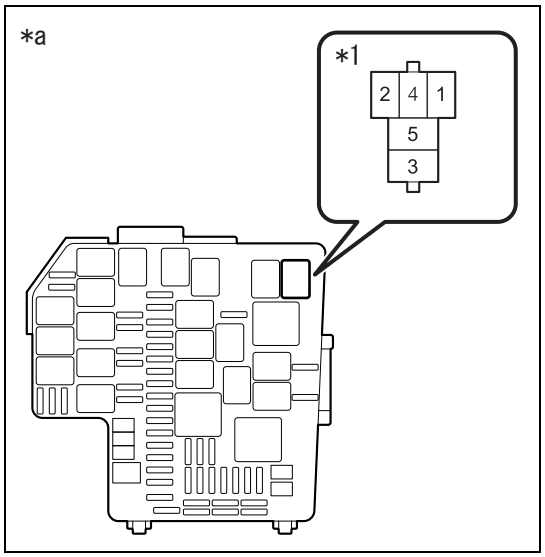
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminals 1 and 2: | 10 kΩ or more |
| 3 - 5 | When the battery voltage is applied to the terminals 1 and 2: | Less than 1 Ω |

NG → FAN NO. 3 relay replacement

OK

| 7 | Check wiring harness and connector (FAN NO. 2 relay - chassis ground) |
|---|---|

NOTE:
For the inspection procedure and precautions for wiring harnesses and connectors, refer to IN - 36.



(1) Remove the FAN NO. 2 relay from the engine compartment relay block.
(2) Measure the resistance between the terminals.
CAUTION:
When measuring the voltage by putting the tester probe etc. on the holder, the holder may be damaged if the probe is pressed against the holder too strong.

Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 5 (FAN NO. 2) - chassis ground | Always | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

Replacement of the engine control computer (Refer to ES - 675)

# Coolant (FA20)

## Replacement

1. Coolant (SUBARU Super Coolant) draining

   WARNING:

   To avoid the risk of burn, do not remove the radiator cap SUB-ASSY when the engine and radiator are hot. The fluid and steam may blow out due to the pressure.

   (1) Remove the service hole cover of front bumper under cover.

   (2) Connect the hose with an inner diameter of φ8 mm {0.315 in} to the drain plug.

   (3) Loosen the radiator drain cock plug.

   (4) Remove the radiator cap SUB-ASSY and drain the coolant.

2. Coolant (SUBARU Super Coolant) refill

   NOTE:

   Turn the A/C switch to OFF before refilling the coolant.

   (1) Tighten the radiator drain cock plug.

   (2) Fill the cooling system conditioner into the water inlet filler.

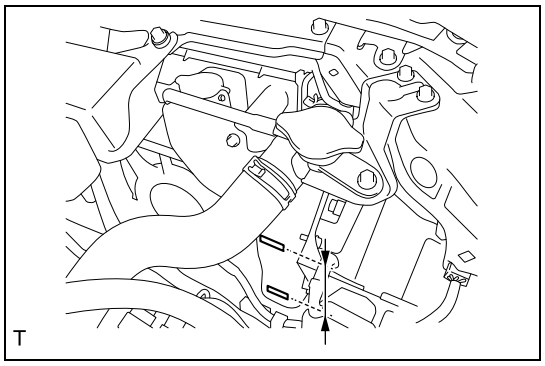
   (3) Fill the coolant of the specified concentration into the water inlet filler neck up to the filler neck position.

   NOTE:

   - The SUBARU Super Coolant contains anti-freeze and anti-rust agents for the engines with an aluminum cylinder block. Be sure to use the SUBARU Super Coolant, since the use of undesignated coolant may cause corrosion.
   - Press the radiator hose No. 1 and radiator outlet hose several times and add the coolant if the level at the water inlet filler neck drops.

   (4) Open the air bleeding plug on the heater hose side.

(5) If the level at the water inlet filler neck drops, fill the coolant into the radiator filler neck up to the filler neck position.
(6) Close the air bleeder valve when the coolant comes out from the air bleeder plug on the heater hose side.
(7) Fill the coolant of the specified concentration up to the FULL level of radiator reservoir tank.
(8) Tighten the radiator cap. [*1]
(9) Start the engine. Race 5 to 6 times at 3,000 r/min or less and then stop the engine. [*2]
NOTE:
Complete this operation within 40 seconds.
(10) After about 1 minute, remove the radiator cap, open the air bleeding plug of heater hose side and fill the coolant if the level at the water inlet filler neck is low, and then close the air bleeding plug. [*3]
(11) Repeat the steps [*1], [*2] and [*3] until the level at the water inlet filler neck does not drop.
NOTE:
When the engine warms up and the thermostat valve opens, the air from the radiator hose No. 1 enters into the radiator side. Therefore, complete the steps before the engine warms up.
(12) Tighten the radiator cap and radiator reservoir tank cap.
(13) Start the engine and operate the heater at maximum hot position and the blower speed setting to "LO".
(14) Run the engine at 2,000 r/min or less until the radiator fan starts and stops. [*4]
NOTE:
Be careful with the engine coolant temperature to prevent overheating.
(15) Stop the engine and wait until the coolant temperature lowers to 30°C (86°F) or less. [*5]
(16) Remove the radiator cap, and if the coolant level drops, fill the coolant into the radiator up to the filler neck position and the radiator reservoir tank up to its FULL level. [*6]
(17) Tighten the radiator cap. [*7]
(18) Set the heater setting to maximum hot position and the blower speed setting to LO and start the engine. Perform racing at 3,000 r/min or less. [*8]
(19) If the flowing sound of engine coolant is heard from the heater core at this time, perform the steps [*4], [*5], [*6], [*7] and [*8] again.



(20) When the level does not drop any more, adjust the level of radiator reservoir tank to the FULL line.

3. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)

## Adjustment

1. SUBARU Super Coolant concentration adjustment
CAUTION:
The SUBARU Super Coolant must be used at a concentration in the range of from 50 to 60 % to maximize the performance of the antifreeze and antiseptic agents.
NOTE:
When adjusting the concentration of SUBARU Super Coolant according to the temperature, select an appropriate SUBARU Super Coolant concentration from the table below and adjust the concentration of SUBARU Super Coolant (concentrated type) with the diluting water to achieve the appropriate concentration.

Relationship between SUBARU Super Coolant concentration and freezing temperature

| SUBARU Super Coolant concentration | 50% | 55% | 60% |
|---|---|---|---|
| Freezing temperature | -36°C {-33°F} | -41°C {-42°F} | -50°C {-58°F} |

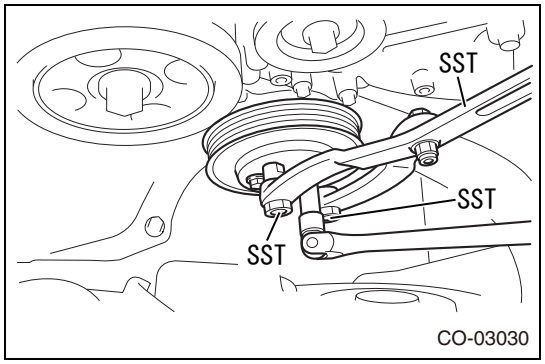
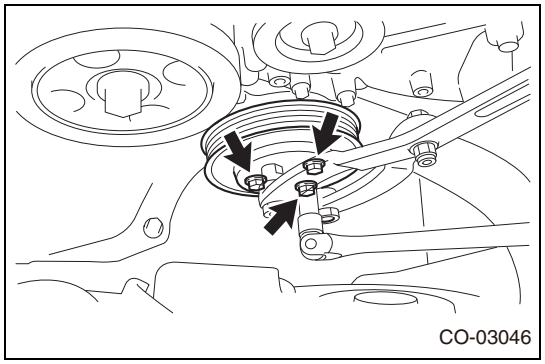
## Removal

1. Removal of under cover front AL (Refer to IE - 39)
2. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
3. Removal of V-belt (Refer to EM - 5)
4. Removal of exhaust manifold (Refer to IE - 35)

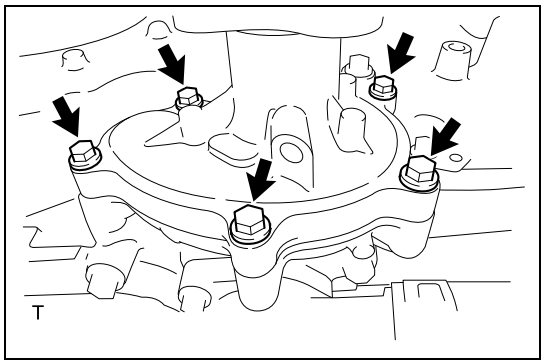


CO-03030

5. Removal of water pump pulley
   (1) Use the SST to secure the water pump pulley.
   SST 18355AA000, 18334AA030



(2) Remove the three bolts and remove the water pump pulley.



6. Removal of engine water pump ASSY
   (1) Remove the five bolts and remove the engine water pump ASSY and gasket.

## Installation

1. Engine water pump ASSY installation
   (1) Install a new gasket and install the engine water pump ASSY with the five bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
2. Water pump pulley installation
   (1) Temporarily tighten the three bolts to secure the water pump pulley.
   (2) Use the SST to secure the water pump pulley.
   SST 18355AA000, 18334AA030
   (3) Tighten the three bolts.
   Standard value:T=14N·m {143kgf·cm} {10.3ft·lbf}
3. Installation of exhaust manifold (Refer to IE - 36)
4. Installation of V-belt (Refer to EM - 7)
5. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
6. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)
7. Under cover front AL installation (Refer to IE - 46)

## On-vehicle inspection

1. Engine water pump ASSY check
   (1) Make sure that there is no bearing noise and drag.
   NOTE:
   If noise or drag is noted, replace the engine water pump ASSY.
   (2) Make sure that the water pump pulley has no fault.
   (3) Check the impeller for damage or abnormal deformation.
   NOTE:
   If the impeller is scratched or abnormally deformed, replace the engine water pump ASSY.

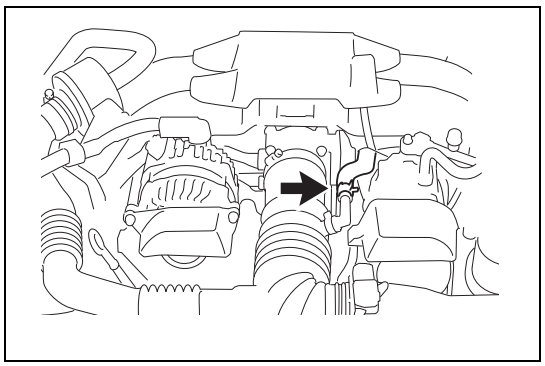
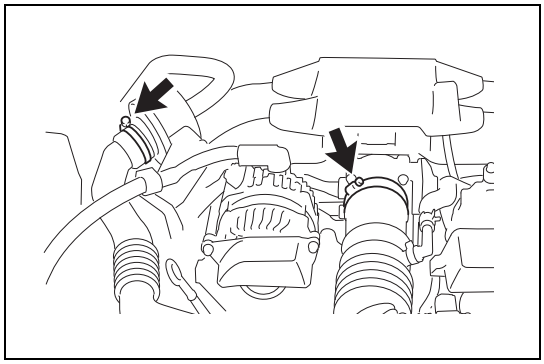
## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)

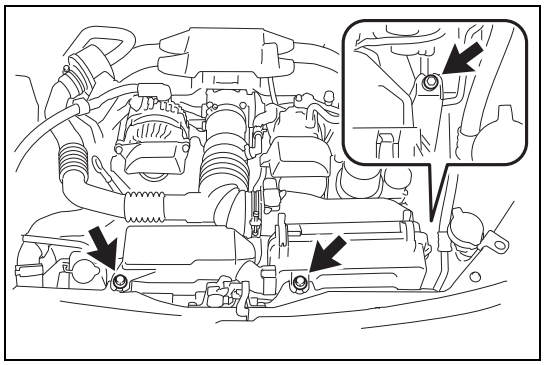


2. Removal of air cleaner case SUB-ASSY
   (1) Move the hose clip and disconnect the ventilation hose NO. 2.

   (2) Disconnect the connector from the intake air flow meter SUB-ASSY.
   (3) Release the clamp and disconnect the wiring harness from the air cleaner cap.

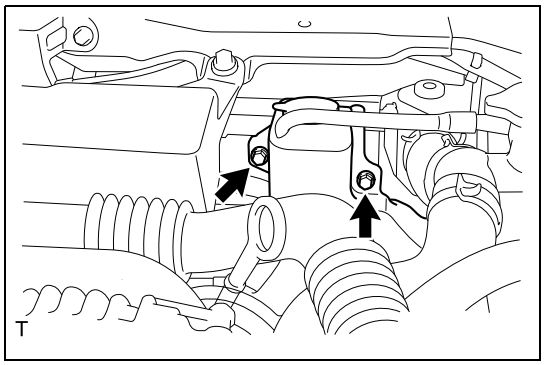


(4) Loosen the two hose clamps and remove the air cleaner duct and air intake boot.

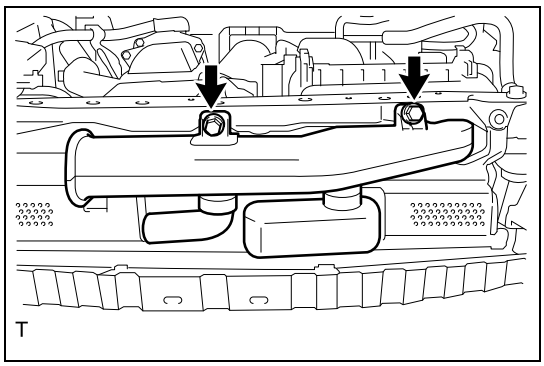


(5) Remove the three bolts and remove the air cleaner case SUB-ASSY.

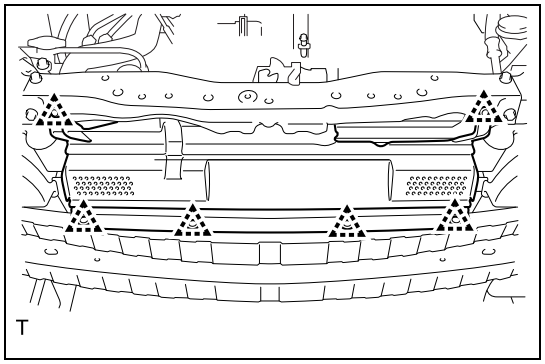
3. Removal of the front bumper cover (Refer to ET - 2)
4. Removal of under cover front AL (Refer to IE - 39)
5. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
6. Disconnection of radiator outlet hose (Refer to CO - 37)



7. Radiator reservoir tank ASSY removal
   (1) Remove the two bolts and remove the radiator reservoir tank ASSY.

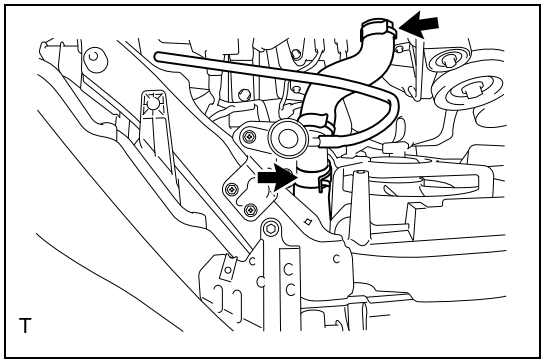


8. Air cleaner duct removal
   (1) Remove the two bolts and remove the air cleaner duct.

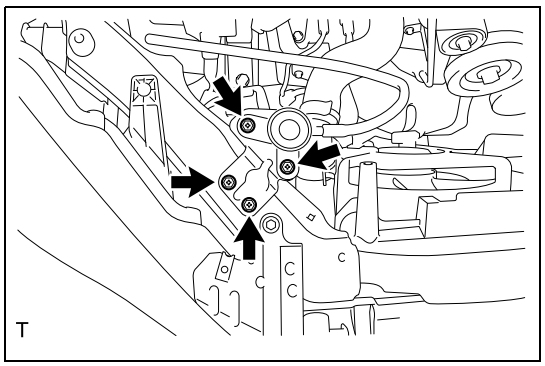


9. Radiator cover plate removal
   (1) Release the six clips and remove the radiator cover plate.

10. Removal of water filler SUB-ASSY
    (1) Disconnect the radiator cap hose.

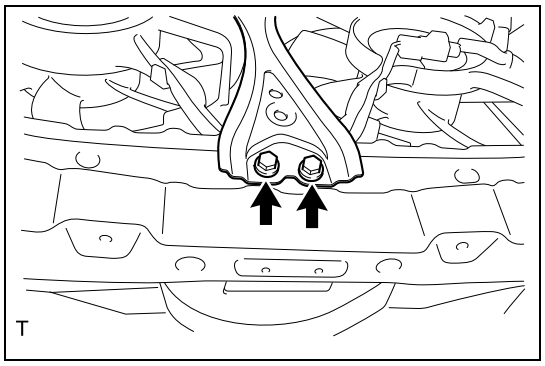


(2) Move the two hose clamps and disconnect the radiator inlet hose and radiator hose NO. 1.
NOTE:
Since the hose has its proper installation position, mark the alignment mark before removing it.

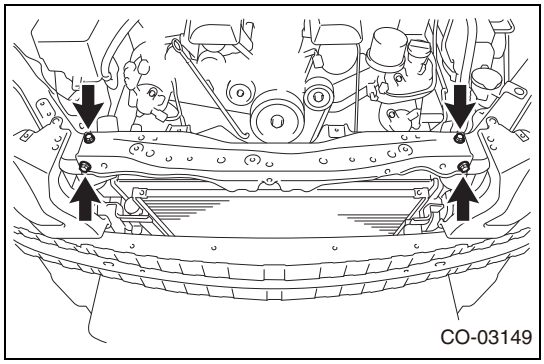


(3) Remove the four bolts and remove the radiator cap stay.

11. Disconnection of hood lock ASSY (Refer to DH - 24)



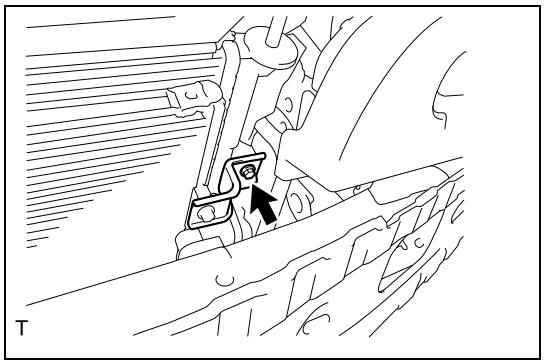
12. Radiator support SUB-ASSY removal
    (1) Remove the two lower bolts of radiator support SUB-ASSY.



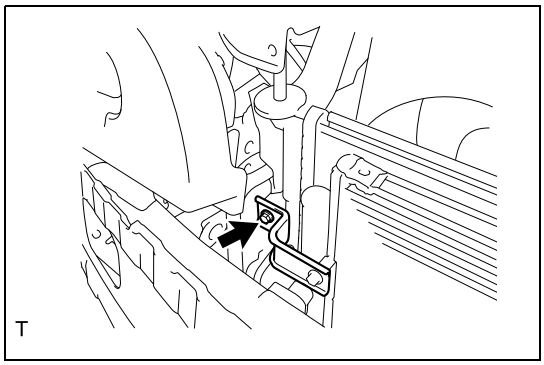
(2) Remove the four bolts and remove the radiator support SUB-ASSY.

13. Cooler condenser ASSY disconnection

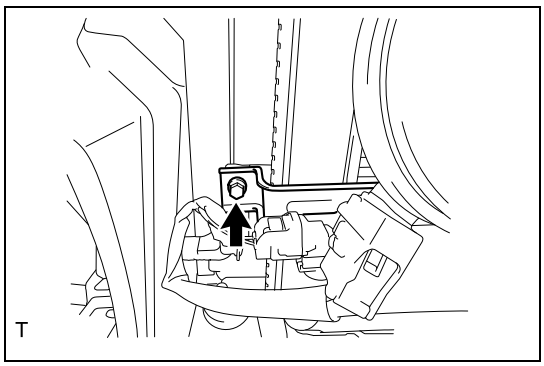
(1) Remove the bolt.

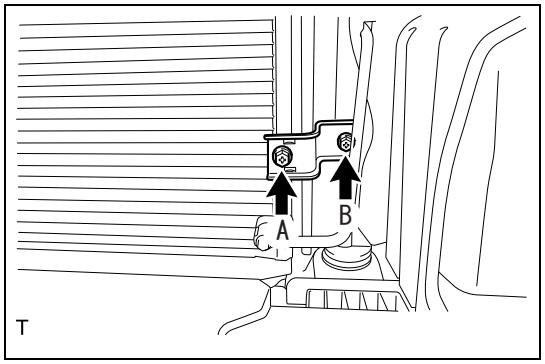


(2) Remove the bolt.



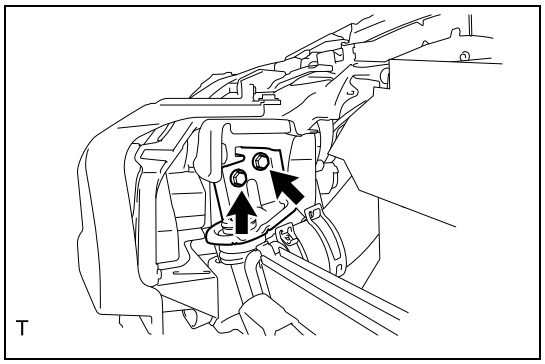
(3) Remove the bolt.



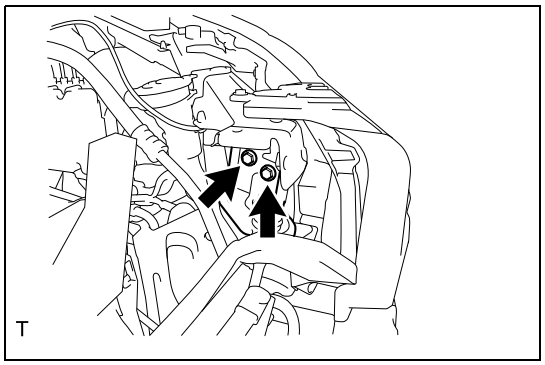


(4) Remove the bolt A.
Remove the bolt B and disconnect the cooler condenser ASSY from the radiator ASSY.

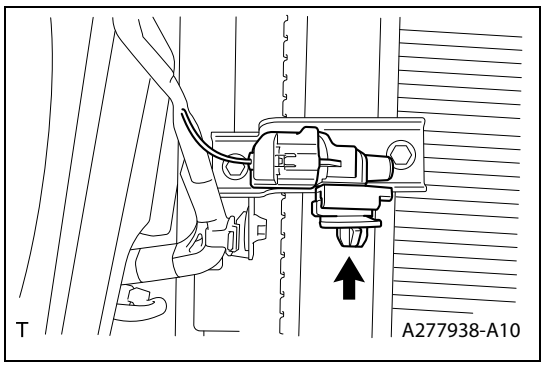
14. Fan shroud removal (Refer to CO - 41)



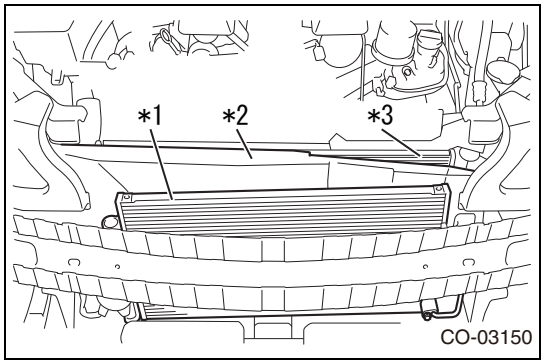
15. Radiator ASSY removal
(1) Remove the two bolts and remove the radiator support bracket RH.



(2) Remove the two bolts and remove the radiator support bracket LH.



(3) Disconnect the ambient sensor connector.



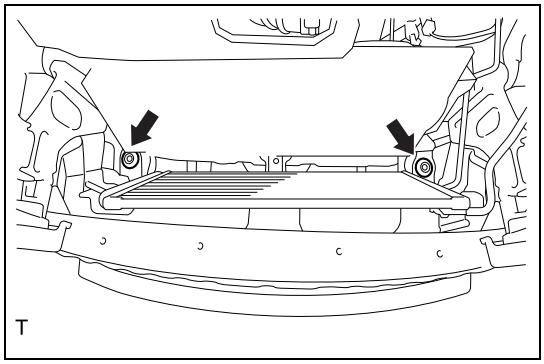
(4) Remove the radiator ASSY while lifting the radiator outlet hose.

CAUTION:

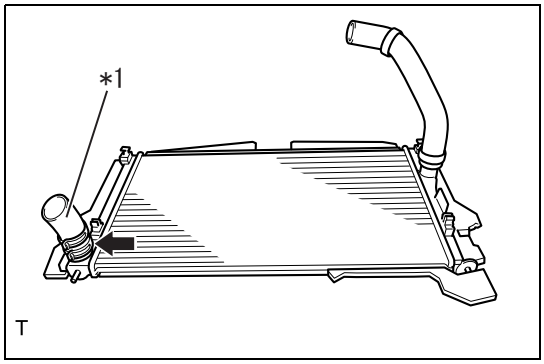
Insert a cardboard, blanket, etc. between the radiator ASSY and cooler condenser ASSY to protect the cooler condenser ASSY.

Captions in illustration

| | |
|---|---|
| *1 | Cooler condenser ASSY |
| *2 | Cardboard or blanket |
| *3 | Radiator ASSY |



(5) Remove the two radiator supports LWR.



16. Radiator hose NO. 1 removal

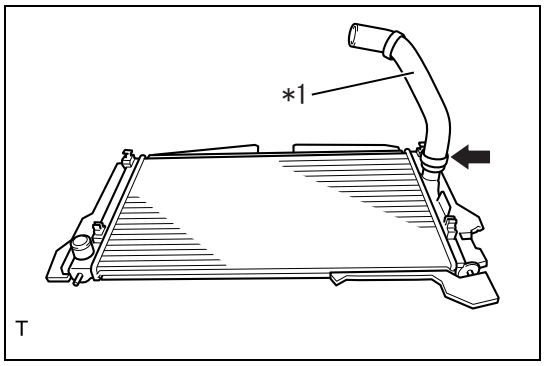
(1) Move the hose clamp and remove the radiator hose NO. 1 from the radiator ASSY.

Captions in illustration

| | |
|---|---|
| *1 | Radiator hose NO. 1 |

NOTE:

Since the hose has its proper installation position, mark the alignment mark before removing it.



17. Radiator outlet hose removal

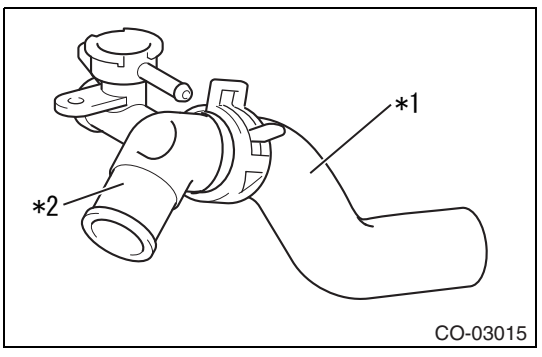
(1) Move the hose clamp and remove the radiator outlet hose.

Captions in illustration

| | |
|---|---|
| *1 | Radiator outlet hose |

NOTE:

Since the hose has its proper installation position, mark the alignment mark before removing it.



18. Radiator inlet hose removal

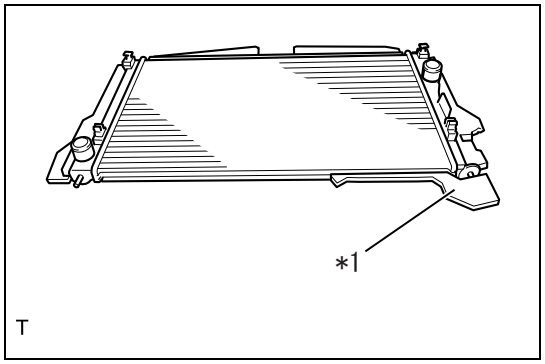
(1) Move the hose clamp and remove the radiator inlet hose from the radiator cap stay.

Captions in illustration

| | |
|---|---|
| *1 | Radiator inlet hose |
| *2 | Radiator cap stay |

NOTE:

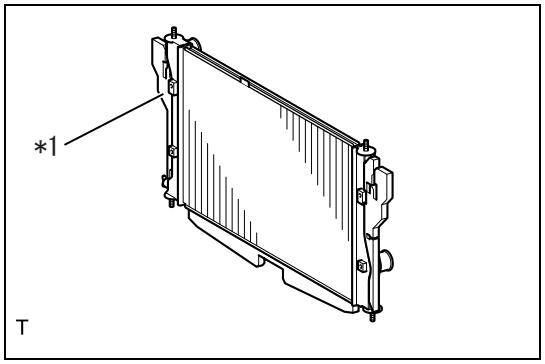
Since the hose has its proper installation position, mark the alignment mark before removing it.



19. Radiator gasket removal (for the upper side)
    (1) Remove the radiator gasket.

Captions in illustration

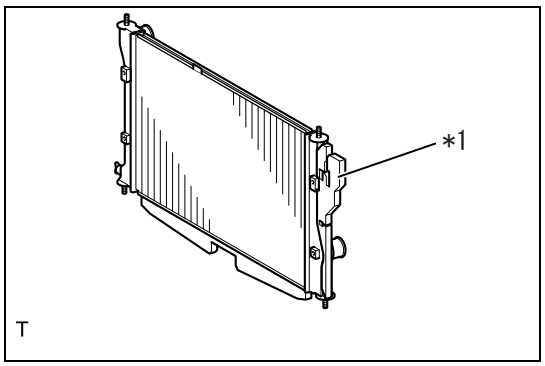
| | |
|---|---|
| *1 | Radiator gasket (upper side) |



20. Radiator gasket NO. 1 removal
    (1) Remove the radiator gasket NO. 1.

Captions in illustration

| | |
|---|---|
| *1 | Radiator gasket NO. 1 |



21. Radiator gasket NO. 2 removal
    (1) Remove the radiator gasket NO. 2.

Captions in illustration

| | |

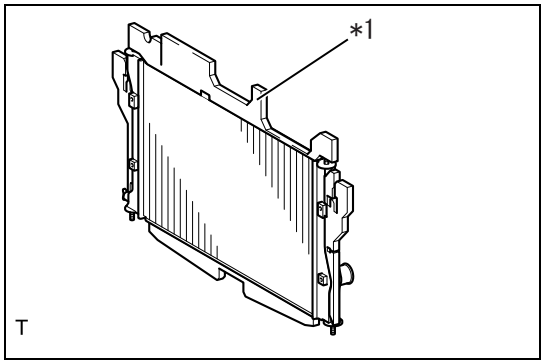
22. Radiator gasket removal (for the lower side)
    (1) Remove the radiator gasket.

Captions in illustration

| | |
|---|---|
| *1 | Radiator gasket (lower side) |

## Installation

1. Radiator gasket installation (for the lower side)
   (1) Install a new radiator gasket.
2. Radiator gasket NO. 2 installation
   (1) Install a new radiator gasket NO. 2.
3. Radiator gasket NO. 1 installation
   (1) Install a new radiator gasket NO. 1.



4. Radiator gasket installation (for the upper side)
   (1) Install a new radiator gasket.

Captions in illustration

| | |
|---|---|
| *1 | Radiator gasket |

NOTE:
Cut the gasket at the location where the old gasket was cut when removing it.

5. Radiator inlet hose installation
   (1) Align the marks marked when removing the hose and install the radiator inlet hose to the radiator cap stay with the hose clamp.
6. Radiator outlet hose installation
   (1) Align the marks marked when removing the hose and install the radiator outlet hose to the radiator with the hose clamp.
7. Radiator hose NO. 1 installation
   (1) Align the marks marked when removing the hose and install the radiator hose NO.1 to the radiator with the hose clamp.
8. Radiator ASSY installation
   (1) Install the two radiator supports LWR.
   (2) Install the radiator ASSY to the vehicle while lifting the radiator outlet hose.
   CAUTION:
   Place a cardboard, blanket, etc. on the cooler condenser ASSY to protect the cooler condenser ASSY.
   (3) Connect the ambient sensor connector.
   (4) Install the radiator support bracket RH with the two bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
   (5) Install the radiator support bracket LH with the two bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
9. Fan shroud installation (Refer to CO - 44)
10. Cooler condenser ASSY connection
   (1) Connect the cooler condenser ASSY to the radiator ASSY with the five bolts.
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
11. Radiator support SUB-ASSY installation
   (1) Install the radiator support SUB-ASSY with the six bolts.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
12. Hood lock ASSY connection (Refer to DH - 25)
13. Water filler SUB-ASSY installation
   (1) Install the water filler SUB-ASSY with the four bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
   (2) Align the marks marked when removing the hoses and install the radiator inlet hose and radiator hose NO.1 with the two hose clamps.
   (3) Connect the radiator cap hose.
14. Radiator cover plate installation
   (1) Install the radiator cover plate with the six clips.
15. Air cleaner duct installation
   (1) Install the air cleaner duct with the two bolts.
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
16. Radiator reservoir tank ASSY installation
   (1) Install the radiator reservoir tank ASSY with the two bolts.
   Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
17. Connection of radiator outlet hose (Refer to CO - 38)
18. Air cleaner case SUB-ASSY installation
   (1) Install the air cleaner case SUB-ASSY with the three bolts.

Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

(2) Install the air cleaner duct and air cleaner intake boot with the two hose clamps.
Standard value:T=2.0N·m {20kgf·cm} {1.5ft·lbf}

(3) Engage the clamp and install the wiring harness to the air cleaner cap.

(4) Connect the connector to the intake air flow meter SUB-ASSY.

(5) Connect the ventilation hose NO. 2 with the hose clip.

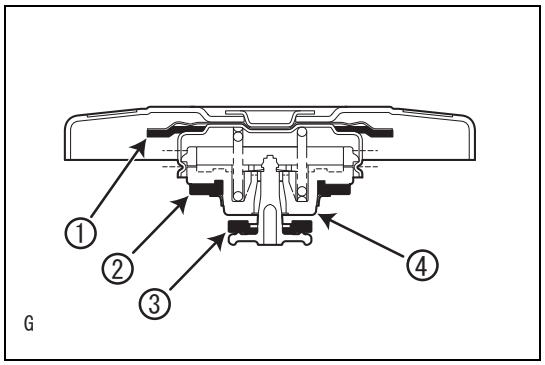
19. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
20. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)
21. Under cover front AL installation (Refer to IE - 46)
22. Installation of the front bumper cover (Refer to ET - 10)

## On-vehicle inspection

1. Radiator cap SUB-ASSY check

WARNING:
To avoid the risk of burn, do not remove the radiator cap SUB-ASSY when the engine and radiator are hot. The fluid and steam may blow out due to the pressure.

CO

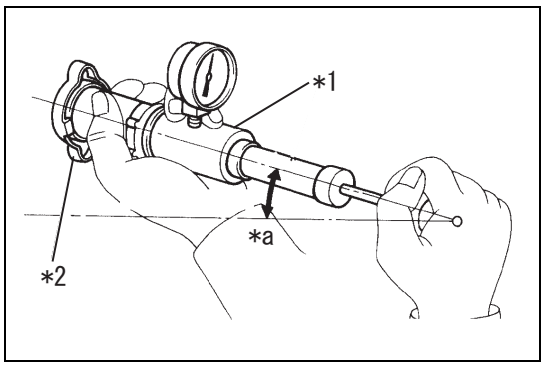


(1) Perform the visual check.

(a) When water scale or foreign matter is on the gaskets 1, 2 and 3, wash it with water.
NOTE:
Always perform the work by hands so as not to damage the gaskets 1, 2 and 3.

(b) Check the gaskets 1, 2 and 3 for deformation, cracks and expansion.

(c) Make sure that the gaskets 3 and 4 are not stuck.



(2) Perform the function check.

(a) Apply the engine coolant to the gaskets 2 and 3 before using the radiator cap tester.

Captions in illustration

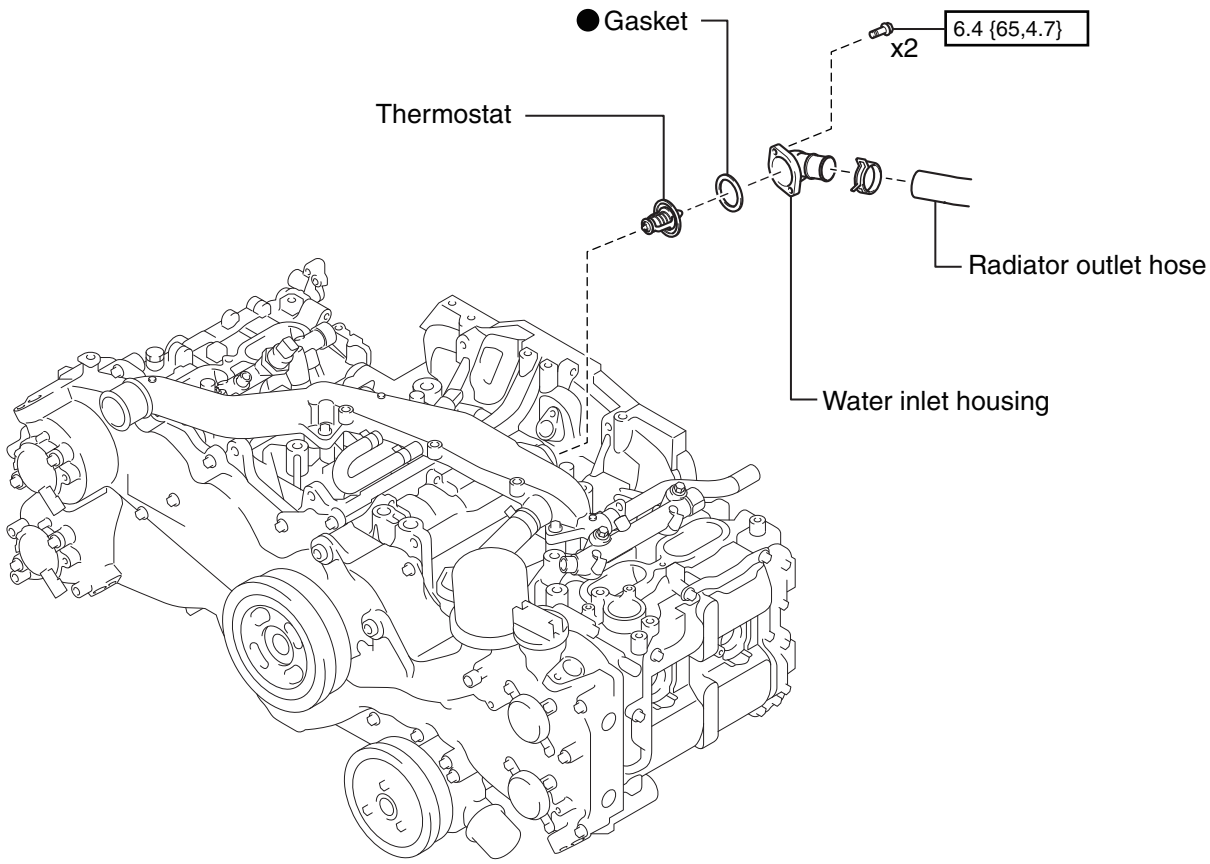
| | |
|---|---|
| *1 | Radiator cap tester |
| *2 | Radiator cap SUB-ASSY |
| *a | 30° or more |

(b) Pump the cap tester several times and check the maximum pressure.
Pumping speed: Pump once a second
CAUTION:
When using the cap tester, perform the check by tilting it 30° or more.
NOTE:
There is a case that the radiator cap SUB-ASSY cannot keep the maximum pressure, but it is not abnormal.
Standard value: 93 to 123 kPa {0.95 to 1.25 kgf/cm$^2$, 14 to 18 psi}
Limit: 83 kPa {0.85 kgf/cm$^2$, 12 psi}
NOTE:

- The valve opening pressure of a new radiator cap SUB-ASSY is 93 to 123 kPa {0.95 to 1.25 kgf/cm$^2$, 14 to 18 psi}.
- If the maximum valve opening pressure does not exceed the limit value, replace the radiator cap SUB-ASSY.

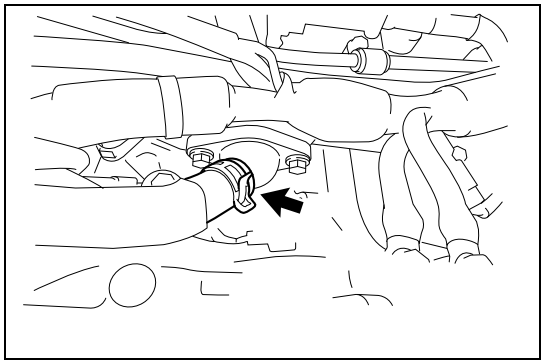
# Thermostat (FA20 / transmission AT)

## Exploded view

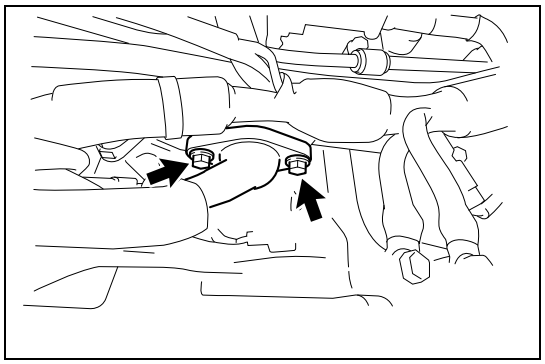


## Removal

1. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
2. Removal of intake manifold (Refer to IE - 17)



3. Radiator outlet hose disconnection
   (1) Move the hose clamp and disconnect the radiator outlet hose.



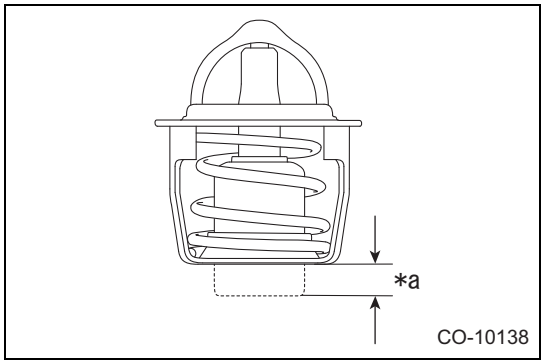
4. Water inlet housing removal
   (1) Remove the two bolts and remove the water inlet housing.

5. Thermostat removal
   (1) Remove the thermostat.
   (2) Remove the gasket from the thermostat.

## Inspection

1. Thermostat check
   (1) Check that the valve is fully closed when the thermostat is at 45°C {113°F} or less.
   NOTE:
   Replace the thermostat if the valve is not fully closed.

   (2) Immerse the thermostat in water and heat it gradually.
   NOTE:
   Hold the thermostat with a wire or the like to avoid contacting with container bottom.
   (3) Check the temperature when the valve starts to open.
   Standard value: 48 to 52°C {118 to 126°F}
   NOTE:
   Replace the thermostat if the temperature when the valve opens is outside the standard range.



(4) Check the valve lift.

Captions in illustration

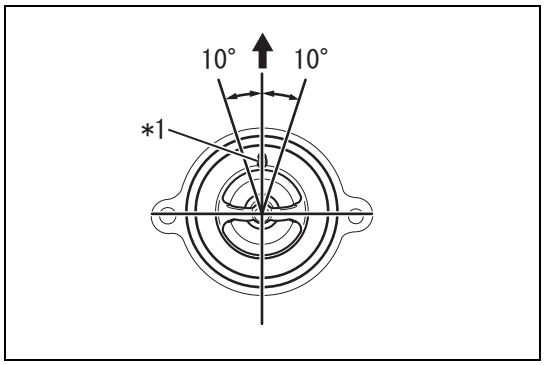
| | |
|---|---|
| *a | Lift |

Standard value: Lift 6.0mm {0.236in} or more
Full open temperature 63°C {145°F}

NOTE:
Replace the thermostat if the valve lift is outside the standard range.

## Installation

1. Thermostat installation
   (1) Install a new gasket to the thermostat.



(2) Install the thermostat to the thermostat cover with the jiggle valve facing upward as shown in the figure.

Captions in illustration

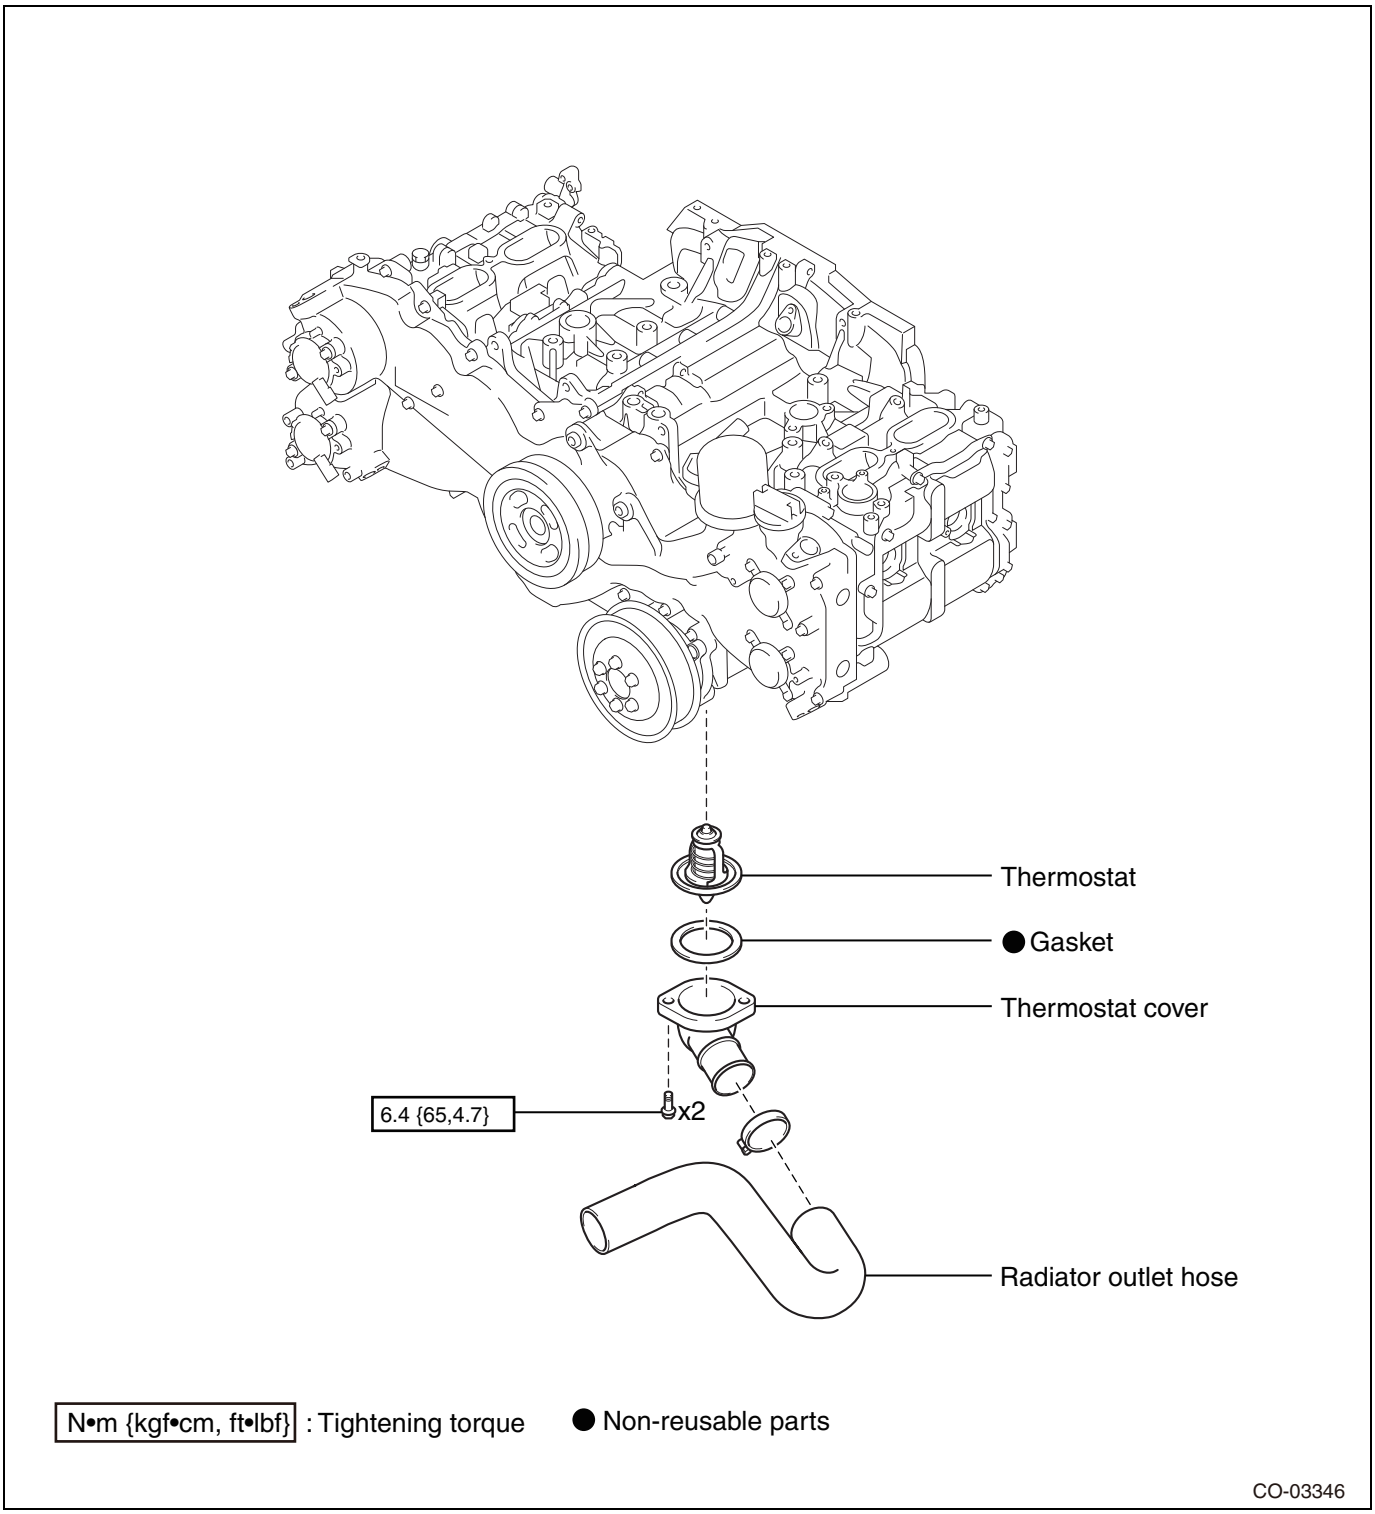
| | |
|---|---|
| *1 | Jiggle valve |
| ➡ | Upper side of vehicle |

NOTE:
The direction of jiggle valve must be within 10° from the upright.

2. Water inlet housing installation
   (1) Install the thermostat cover with the two bolts.
   Standard value: T=6.4N·m {65kgf·cm} {4.7ft·lbf}
3. Radiator outlet hose connection
   (1) Connect the water hose to the thermostat cover and secure it with the hose clamp.
4. Installation of intake manifold (Refer to IE - 28)
5. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
6. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)

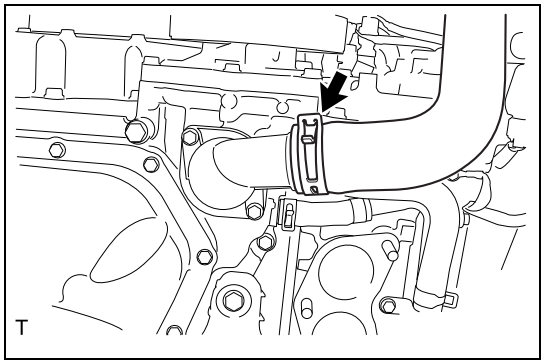
# Thermostat (FA20 / for engine coolant)

## Exploded view

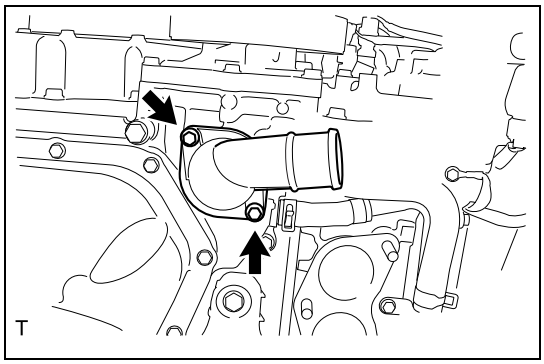


## Removal

1. Removal of exhaust manifold (Refer to IE - 35)
2. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)



3. Radiator outlet hose disconnection
   (1) Move the hose clamp and disconnect the radiator outlet hose.
   NOTE:
   Since the hose has its proper installation position, mark the alignment mark before removing it.



4. Thermostat cover removal
   (1) Remove the two bolts and remove the thermostat cover.

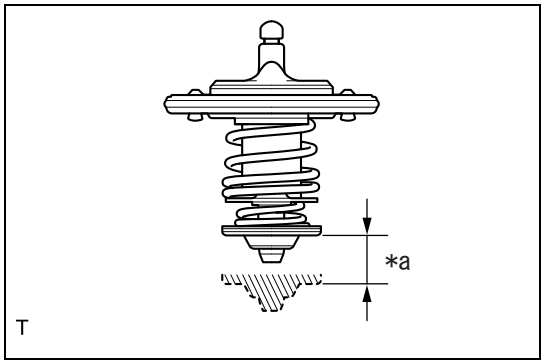
5. Thermostat removal
   (1) Remove the thermostat.
   (2) Remove the gasket from the thermostat.

## Inspection

1. Thermostat check
   (1) Check that the valve is fully closed when the thermostat is at 83°C {181°F} or less.
   NOTE:
   Replace the thermostat if the valve is not fully closed.

   (2) Immerse the thermostat in water and heat it gradually.
   NOTE:
   Hold the thermostat with a wire or the like to avoid contacting with container bottom.

   (3) Check the temperature when the valve starts to open.
   Standard value: 86 to 90°C {187 to 194°F}
   NOTE:
   Replace the thermostat if the temperature when the valve opens is outside the standard range.



(4) Check the valve lift.

Captions in illustration

| | |
|---|---|
| *a | Lift |

Standard value: Lift 8mm {0.315 in} or more
Full open temperature 95°C {203°F}

NOTE:
Replace the thermostat if the valve lift is outside the standard range.

## Installation

1. Thermostat installation
   (1) Install a new gasket to the thermostat.
   (2) Install the thermostat to the thermostat cover.
2. Thermostat cover installation
   (1) Install the thermostat cover with the two bolts.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
3. Radiator outlet hose connection
   (1) Align the marks marked when removing the hose, install the radiator outlet hose to the thermostat cover and secure the hose with the hose clamp.
4. Installation of exhaust manifold (Refer to IE - 36)
5. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)

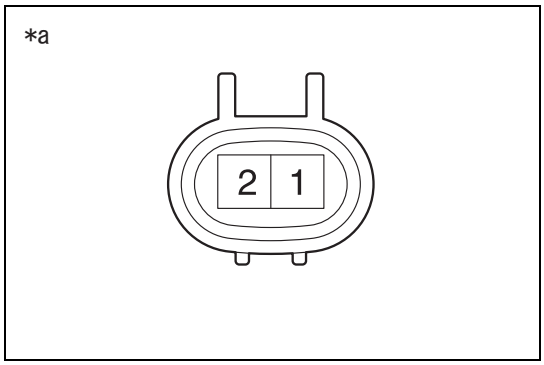
   (1) Install the cooling fan motor with the three screws.
   Standard value:T=3.9N·m {40kgf·cm} {2.9ft·lbf}
   (2) Connect the wiring harness to the cooling fan motor.
   (3) Engage the clamp of connector on the cooling fan motor NO. 2 side to the fan shroud.
3. Fan NO. 2 installation
   (1) Install the fan NO. 2 with the nut.
   Standard value:T=6.3N·m {64kgf·cm} {4.6 ft·lbf}
4. Fan installation
   (1) Install the fan with the nut.
   Standard value:T=6.3N·m {64kgf·cm} {4.6 ft·lbf}
5. Fan shroud installation
   NOTE:
   - Insert a cardboard, blanket, etc. between the radiator ASSY and fan shroud to protect the radiator ASSY.
   - When installing a new fan shroud, put a new radiator gasket (upper side) and cut the radiator gasket (upper side) at the location where the old gasket was cut when removing it.

   (1) Insert the fitting area at the lower part of fan shroud to the fitting area at the lower part of radiator ASSY.
   CAUTION:
   - Be careful not to damage the radiator outlet hose, discharge hose and A/C tube & accessory ASSY.
   - Be careful not to damage the radiator inlet hose, radiator hose NO. 1 and water filler SUB-ASSY.

   (2) Engage the two claws and install the fan shroud to the radiator ASSY.
   (3) Engage the two clamps.
   (4) Connect the connector for cooling fan and connector for cooling fan NO. 2.
6. Radiator support SUB-ASSY installation (Refer to CO - 31)
7. Radiator cover plate installation (Refer to CO - 31)
8. Air cleaner duct installation (Refer to CO - 31)
9. Hood lock ASSY connection (Refer to DH - 25)
10. Water filler SUB-ASSY installation
    (1) Install the radiator cap stay with the four bolts.
    Standard value:T=7.5N·m {77kgf·cm} {5.5ft·lbf}
11. Radiator reservoir tank ASSY installation (Refer to CO - 31)
12. Installation of the front bumper cover (Refer to ET - 10)
13. Installation of air cleaner case SUB-ASSY (Refer to CO - 31)

## On-vehicle inspection



1. Cooling fan motor check
   (1) Make sure that the motor rotates smoothly when the battery voltage is applied to the connectors.

Captions in illustration

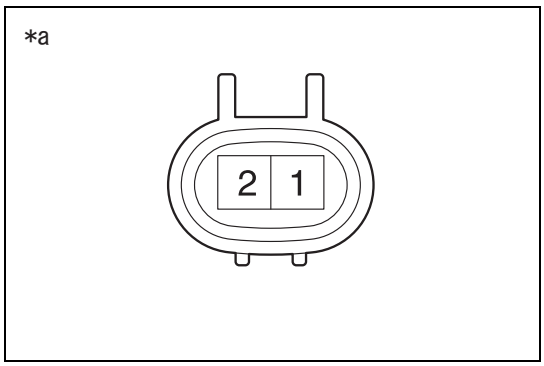
| | |
|---|---|
| *a | Connector not connected (Cooling fan motor) |

   (2) Measure the current when the motor is rotating.
   Current value

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F}, 12 V | 7.4 to 11.4 A |

Captions in illustration

| | |
|---|---|
| *a | Connector not connected (Cooling fan motor) |



2. Cooling fan motor NO. 2 check
   (1) Make sure that the motor rotates smoothly when the battery voltage is applied to the connectors.

Captions in illustration

| | |
|---|---|
| *a | Connector not connected (Cooling fan motor NO. 2) |

   (2) Measure the current when the motor is rotating.
   Current value

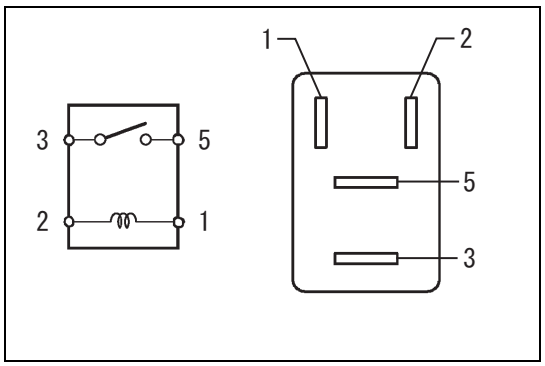
| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C {68°F}, 12 V | 7.4 to 11.4 A |

Captions in illustration

| | |
|---|---|
| *a | Connector not connected (Cooling fan motor NO. 2) |

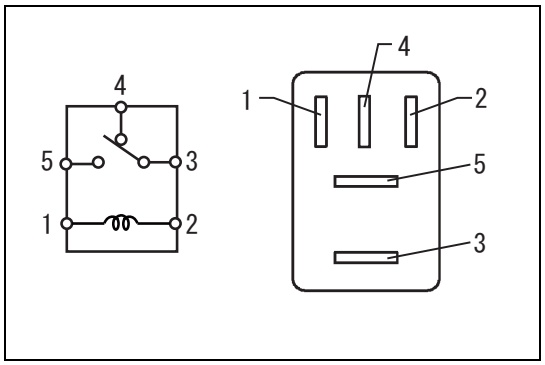
# Relay (FA20)

## Unit inspection



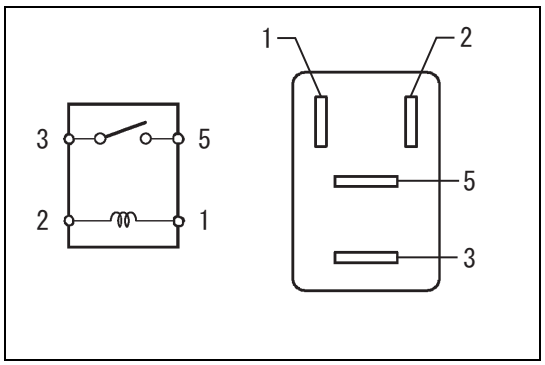
1. Cooling fan relay check
   (1) Check the resistance between connector terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



2. Cooling fan relay NO. 2 check
   (1) Check the resistance between connector terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 4 | When the battery voltage is not applied to the terminal 1 and terminal 2: | Less than 1 Ω |
| 3 - 4 | When the battery voltage is applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |



3. Cooling fan relay NO. 3 check
   (1) Check the resistance between connector terminals.
   Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 3 - 5 | When the battery voltage is not applied to the terminal 1 and terminal 2: | 10 k Ωor more |
| 3 - 5 | When the battery voltage is applied to the terminal 1 and terminal 2: | Less than 1 Ω |

# Lubrication system (FA20)

## Function inspection

1. Engine oil level check
   (1) Park the vehicle on a level surface.
   (2) Remove the oil level gauge and wipe away the oil.
   (3) Reinsert the oil level gauge all the way. Be sure that the oil level gauge is correctly inserted and properly orientated.
   (4) Pull out the oil level gauge again, and check both sides of the oil level gauge. Use a lower side to determine the engine oil level. If the engine oil level is below the L mark, check the engine for oil leakage and refill the oil to bring the level up to the F mark.
   (5) Start the engine to circulate the oil in the engine.

   (6) Five minutes after stopping the engine, check that the engine oil level is between the L and F marks of oil level gauge. If the oil level is low, check for oil leakage and refill the oil up to the F mark.
   NOTE:
   - To prevent overfilling of the engine oil, do not refill the oil above the F mark when the engine is cold.
   - As the oil level gauge is used for daily maintenance, the F and L marks are set assuming that the engine is cold.

Captions in illustration

| | |
|---|---|
| *1 | Oil level gauge |
| *2 | Oil filter |
| *3 | Oil filler cap |
| *4 | F mark |
| *5 | L mark |
| *6 | Approx. 1.0 L (1.1 US qt, 0.9 Imp qt) |

2. Engine oil quality check
   (1) Check the oil for degradation, mixture of moisture, discoloration and dilution. Replace the oil when its quality has deteriorated clearly.
3. Oil pressure check
   CAUTION:
   Wash the equipment and hoses before and after measurement.
   (1) Remove the engine oil pressure switch ASSY. (Refer to LU - 7)

   (2) Install the oil pressure gauge using the adapter.
   (3) Install the air cleaner case SUB-ASSY. (Refer to EM - 8)
   (4) Warm up the engine.
   (5) Measure the oil pressure.

Standard value:

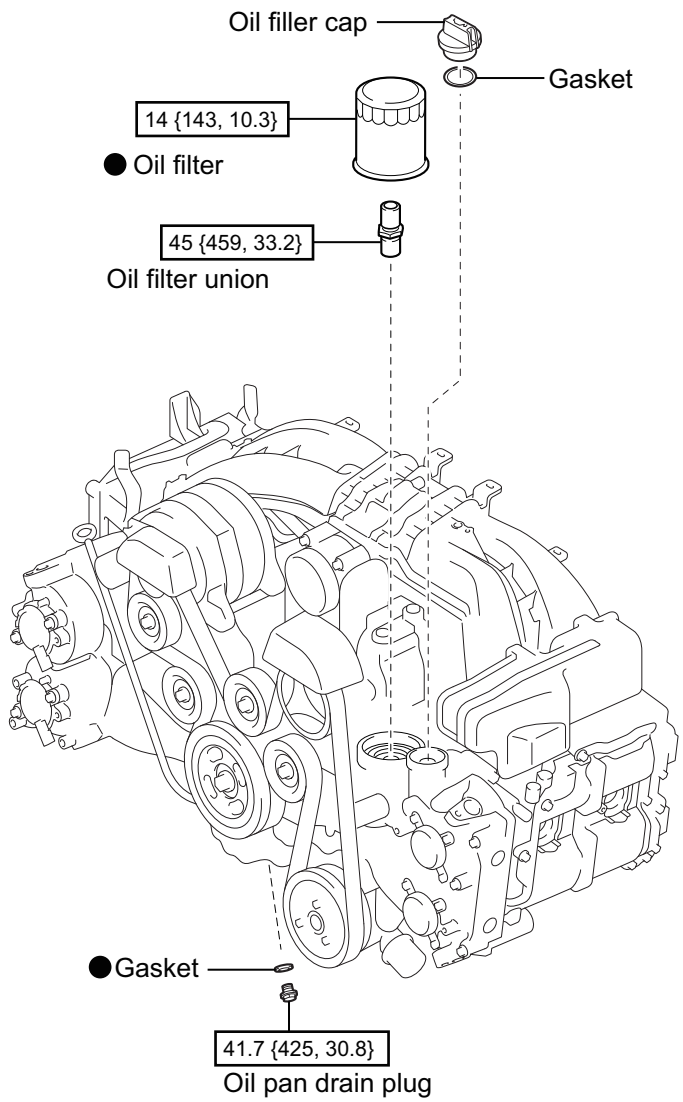
| Engine Speed | Oil temperature | Oil pressure |
|---|---|---|
| During idling | 80°C {176°F} | 50 kPa {0.5 kgf/cm$^2$, 7.3 psi} or more |
| 6,000 r/min | 80°C {176°F} | 350 kPa {3.6 kgf/cm$^2$, 51 psi} or more |

   (6) Remove the air cleaner case SUB-ASSY. (Refer to EM - 5)

(7) Remove the oil pressure gauge.
(8) Install the engine oil pressure switch ASSY (Refer to LU - 8)

# Oil & oil filter (FA20)

## Exploded view



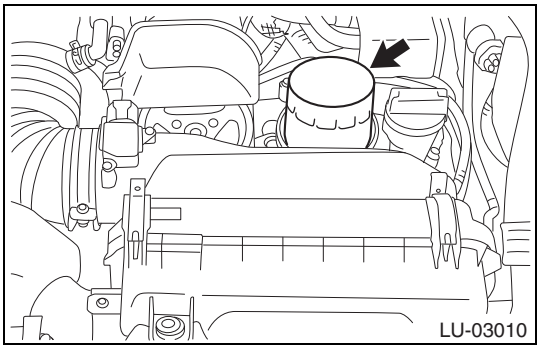
N*m {kgf*cm, ft*lbf}: Tightening torque

● Non-reusable part

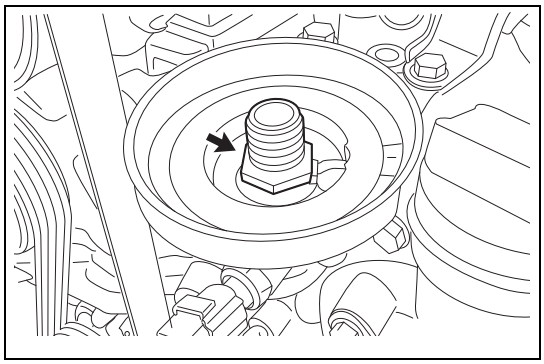
LU-10118

## Replacement

1. Oil filter removal
   (1) Remove the dirt and foreign matters on the engine side installing surface.



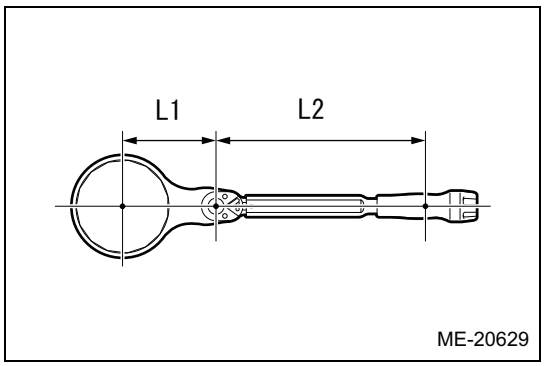
(2) Remove the oil filter using the SST.
SST 18332AA020



2. Oil filter union removal
(1) Remove the oil filter union.
NOTE:
Perform this operation as necessary.

3. Oil filter union installation
(1) Install the oil filter union.
Standard value:T=45N·m {459kgf·cm} {33.2ft·lbf}
NOTE:
Perform this operation as necessary.

4. Oil filter installation
(1) Remove the dirt and foreign matters on the engine side installing surface and inner side.
(2) Apply a thin coat of engine oil to the seal rubber of a new oil filter.
(3) Tighten the oil filter by hand.
CAUTION:
Be careful not to damage the seal rubber of oil filter.
(4) Tighten the oil filter using the SST.
SST 18332AA020
Standard value:T=14N·m {143kgf·cm} {10.3ft·lbf}
CAUTION:
- When extending the overall tool length by combining a torque wrench with the SST during tightening, tightening to the point where the value on the torque wrench reaches the specified tightening torque will cause the actual tightening torque to be excessive.
- This manual only indicates the specified tightening torque. If using an SST, it is necessary to use the following formula to calculate the proper torque wrench reading.



- Formula T'=T×L2/(L1+L2)

| | |
|---|---|
| T' | Torque wrench reading [N·m {kgf·cm}] |
| T | 14N·m {143kgf·cm}{10.3ft·lbf} |
| L1 | 0.080m {3.150 in} |
| L2 | Torque wrench effective length (m {in}) |

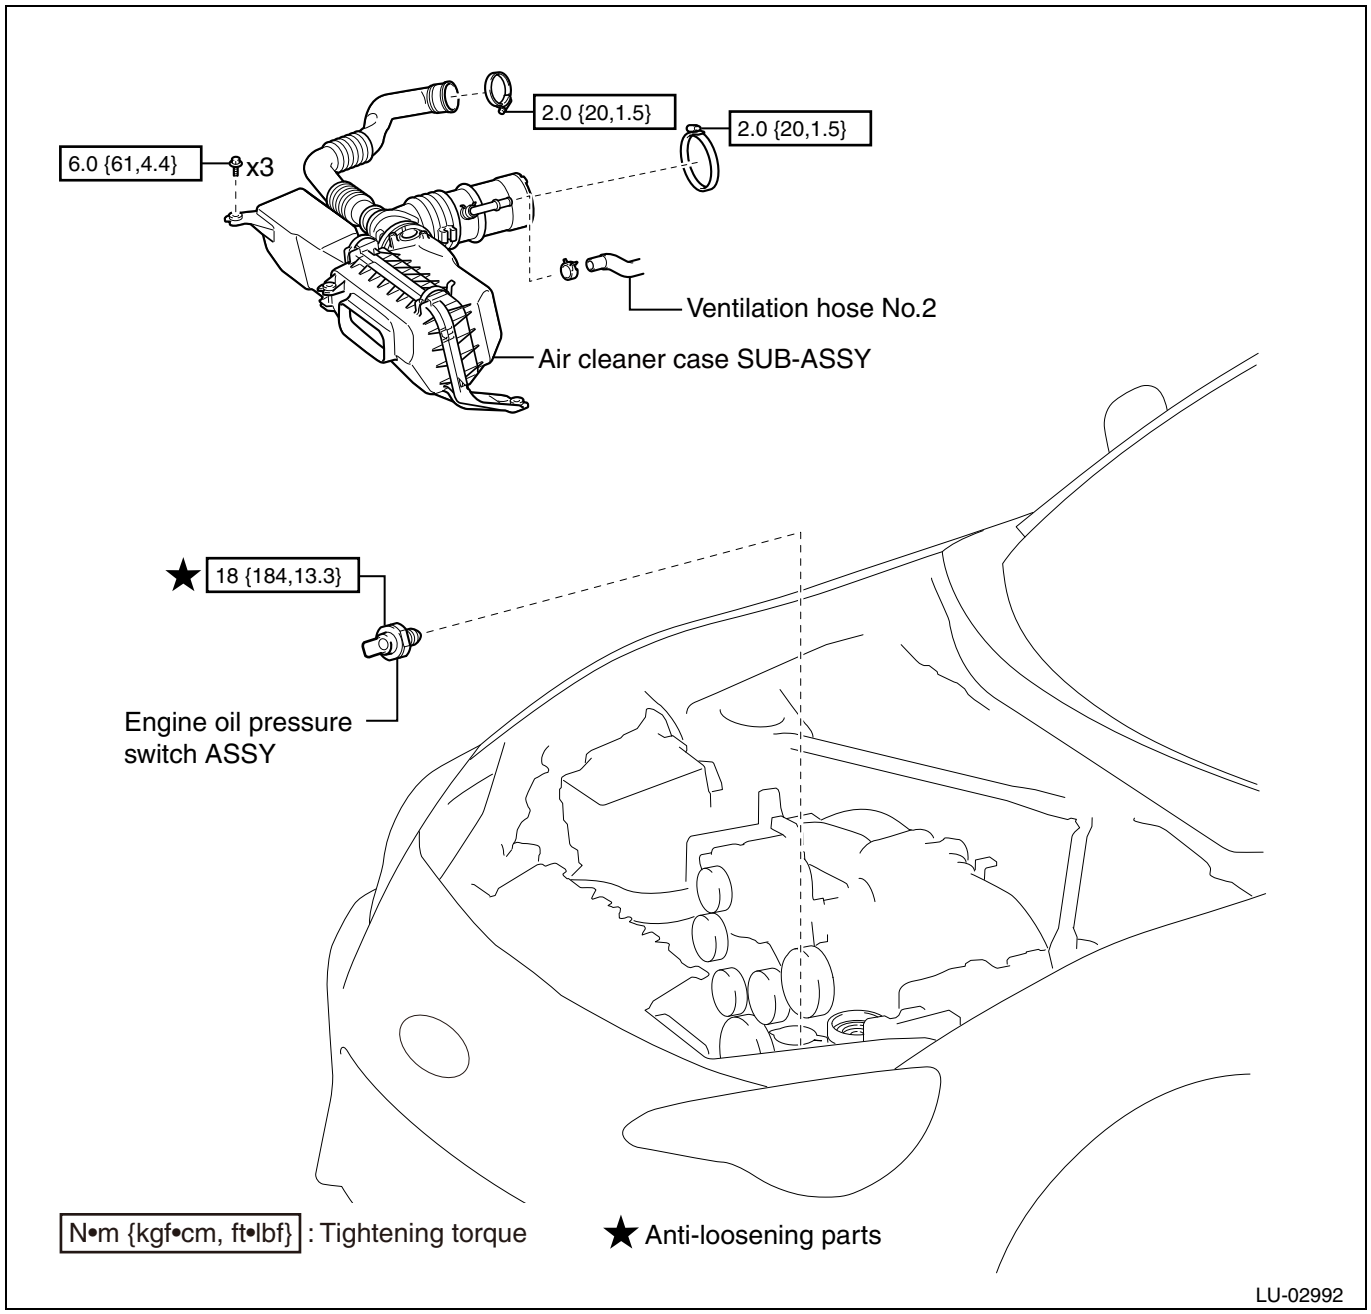
NOTE:
- This torque value is valid when the SST and torque wrench are aligned on a line.
- Attach the SST and torque wrench so that they are aligned on a line.

5. Engine oil refill
(1) Fill the engine oil.
(2) Install the oil filler cap.

6. Engine oil level check (Refer to LU - 2)
7. Engine oil leakage check
   (1) Start the engine and make sure that there is no oil leakage at the connected and tightened portions where the work has done.

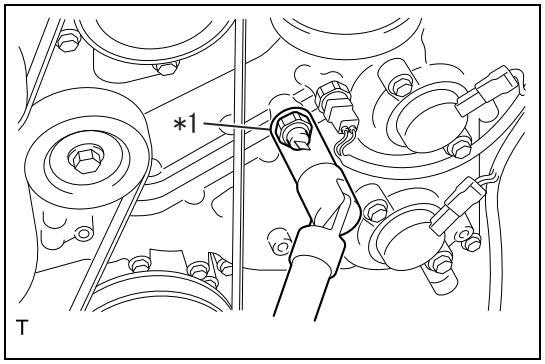
# Engine oil pressure switch ASSY (FA20)

## Exploded view



## Removal

1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Removal of air cleaner case SUB-ASSY (Refer to EM - 5)
3. Engine oil pressure switch ASSY removal
   (1) Disconnect the connector of engine oil pressure switch ASSY.



(2) Remove the engine oil pressure switch ASSY.

Captions in illustration

| | |
|---|---|
| *1 | Deep socket wrench |

CAUTION:
Catch the engine oil using cloth and the like to prevent it from splashing.

## Installation

1. Engine oil pressure switch ASSY installation
   (1) Degrease the threaded portion of engine oil pressure switch ASSY.

   (2) Apply THREE BOND 1324 to the threaded portion.
   CAUTION:
   Do not apply THREE BOND 1324 to the oil hole.

Captions in illustration

| | |
|---|---|
| *1 | THREE BOND 1324 |

   (3) Install the engine oil pressure switch ASSY.
   Standard value:T=18N·m {184kgf·cm} {13.3ft·lbf}
   CAUTION:
   Do not start the engine within 1 hour after the assembly.
   (4) Connect the connector of oil pressure switch.
2. Installation of air cleaner case SUB-ASSY (Refer to EM - 8)
3. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
4. Engine oil leakage check (Refer to LU - 6)

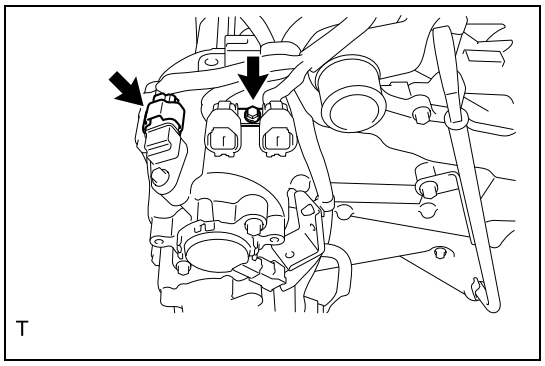
## Removal

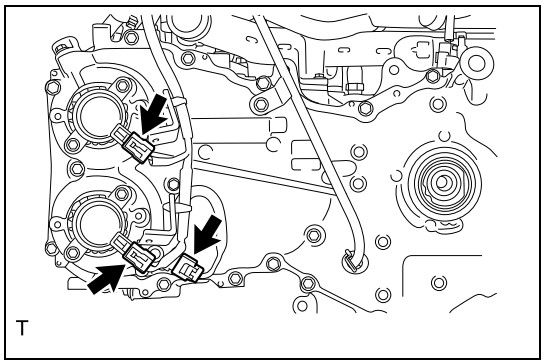
1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Draining of coolant (SUBARU Super Coolant) (Refer to CO - 16)
3. Generator ASSY removal (Refer to BH - 31)
4. Removal of injector driver (Refer to FU - 43)
5. Removal of radiator reservoir tank ASSY (Refer to CO - 25)
6. Water filler SUB-ASSY removal (Refer to EM - 77)
7. Removal of exhaust manifold (Refer to IE - 35)
8. Disconnection of radiator outlet hose (Refer to EM - 82)

9. Engine oil draining
   (1) Remove the oil filler cap.
   (2) Remove the oil pan drain plug and gasket.
   (3) After draining the oil, install the oil pan drain plug with a new gasket.
   Standard value:T=41.7N·m {425kgf·cm} {30.8ft·lbf}
10. Water pump pulley removal (Refer to CO - 19)
11. Crankshaft pulley removal (Refer to EM - 49)
12. Removal of intake manifold protector (bank 1 side) (Refer to FU - 22)
13. Engine wiring disconnection
   (1) Remove the two bolts and disconnect the two wiring harness clamp brackets and wiring harness.

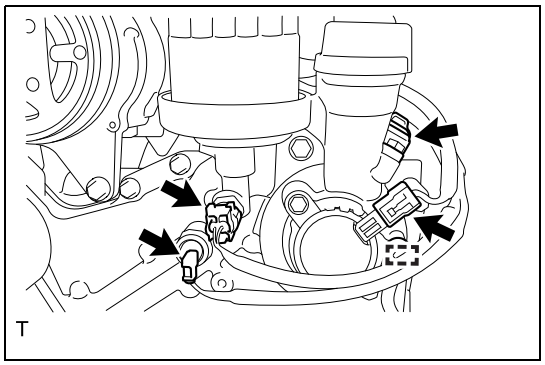


(2) Remove the bolt and disconnect the wiring harness clamp bracket and wiring harness.

(3) Disconnect the connector for camshaft position sensor.

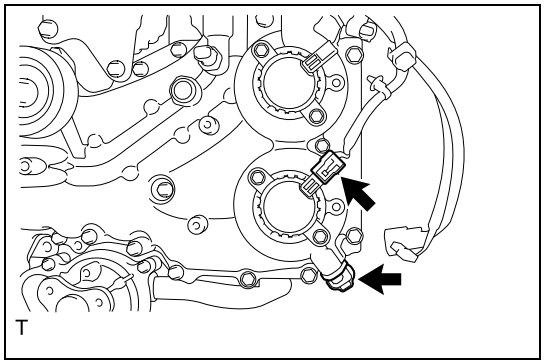


(4) Disconnect the connector of cam position sensor and two connectors of cam timing oil control valve ASSY.

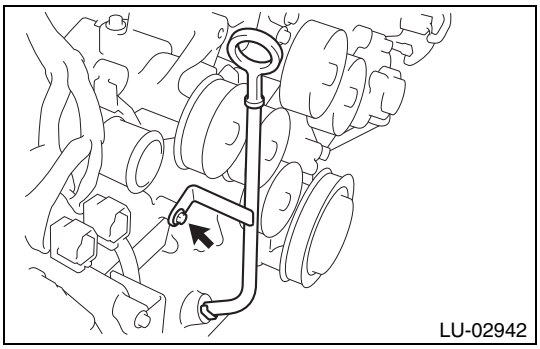


(5) Disconnect the connector of cam position sensor and connectors of cam timing oil control valve ASSY.

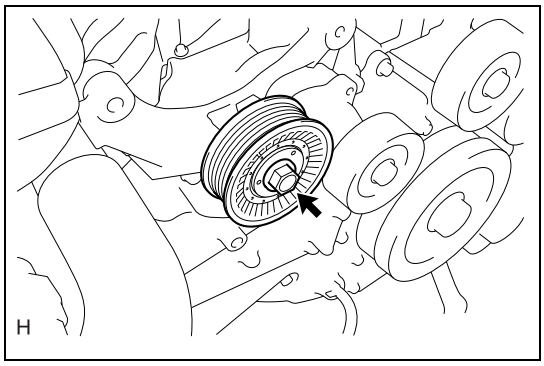
(6) Disconnect the connector of engine oil temperature sensor and connector of engine oil pressure switch ASSY.
(7) Disconnect the clamp.



(8) Disconnect the connector of cam position sensor and connectors of cam timing oil control valve ASSY.



14. Oil level gauge guide removal
    (1) Remove the oil level gauge.
    (2) Remove the bolt and remove the oil level gauge guide.
    (3) Remove the O-ring from the oil level gauge guide.

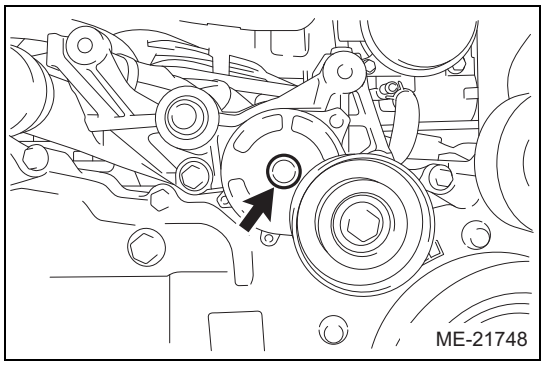


15. Idler pulley SUB-ASSY NO. 2 removal
    (1) Remove the bolt and remove the idler pulley SUB-ASSY NO. 2 and idler pulley cover.

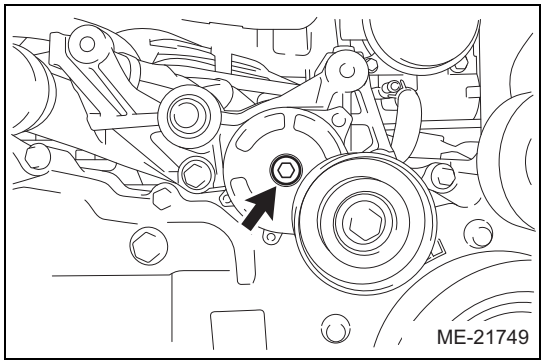
16. V-ribbed belt tensioner ASSY removal

    NOTE:

    V-ribbed belt tensioner ASSY can be removed together with the alternator bracket.

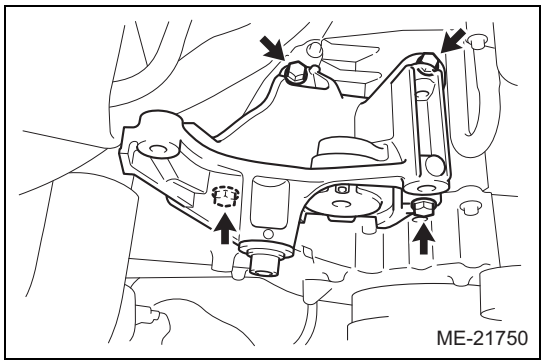


(1) Remove the cap.

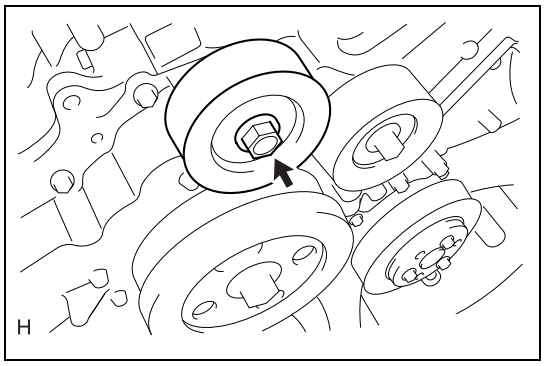


(2) Use a 8-mm socket hexagon wrench to remove the V-ribbed belt tensioner ASSY.

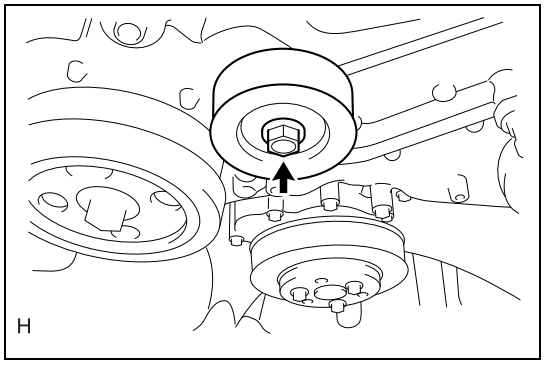
17. Removal of the alternator bracket.
    (1) Remove the four bolts and remove the alternator bracket.



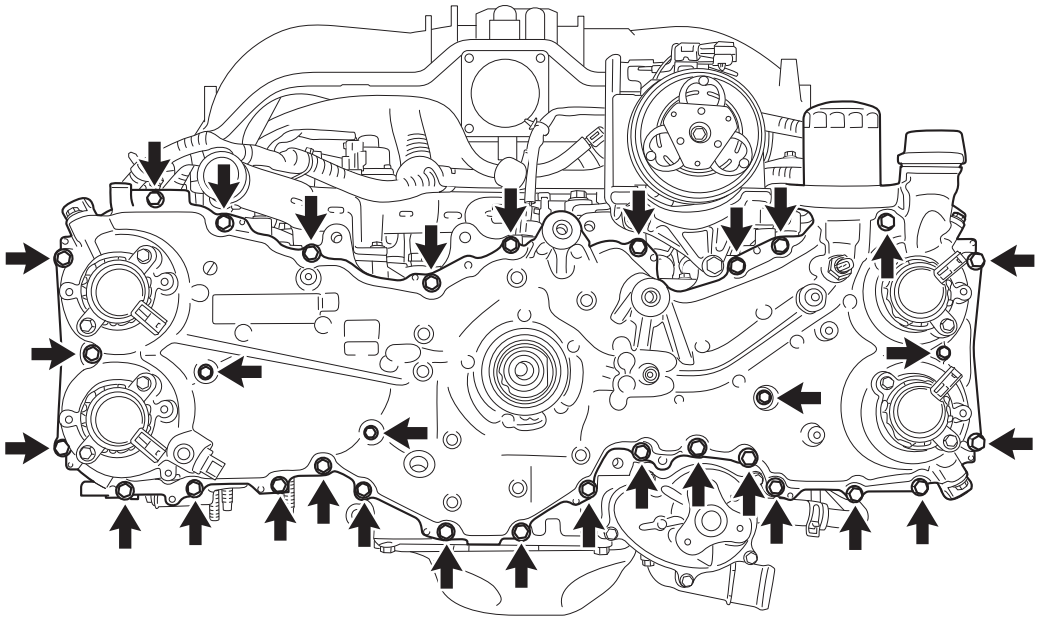
18. Idler pulley SUB-ASSY NO. 1 removal
    (1) Remove the bolt and remove the idler pulley SUB-ASSY NO. 1 and idler pulley cover.



(2) Remove the bolt and remove the idler pulley SUB-ASSY NO. 1 and idler pulley cover.

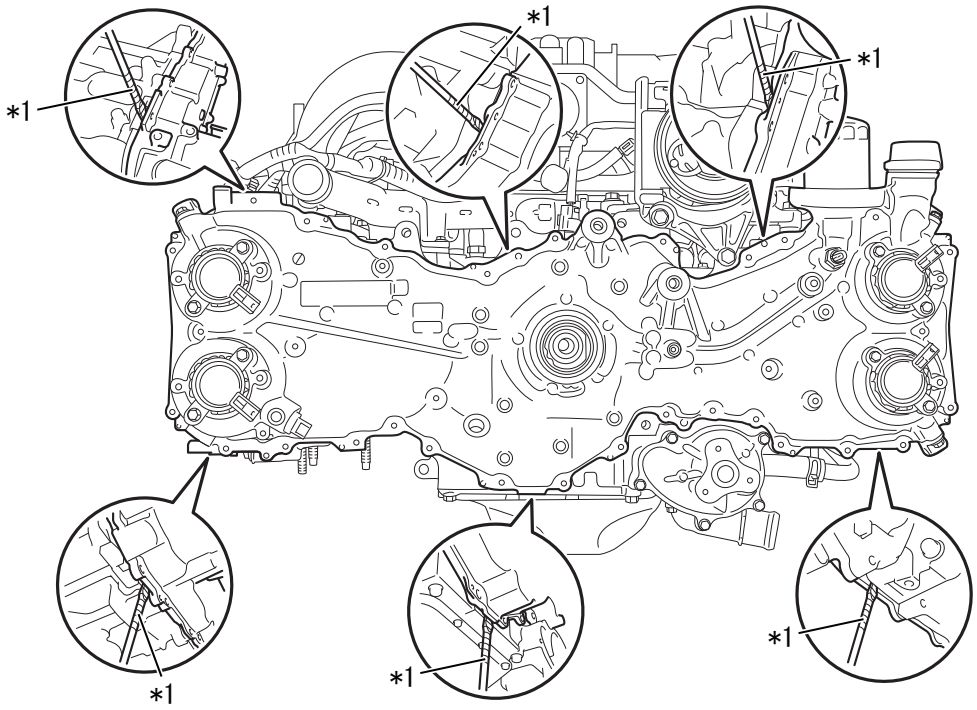


19. Chain cover oil seal removal (Refer to EM - 50)
20. Chain cover removal
    (1) Remove the 32 bolts.



LU-02968

(2) Push out the portions shown in the figure using a bar or similar wrapped with protective tape to remove the chain cover.



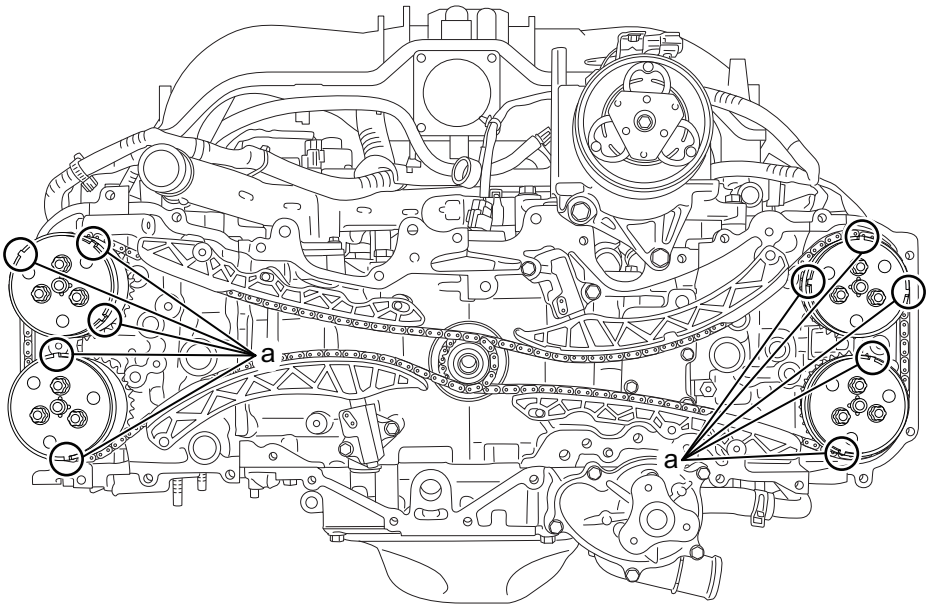
LU-02969

Captions in illustration

| | | | |
|---|---|---|---|
| *1 | Protective tape | - | - |

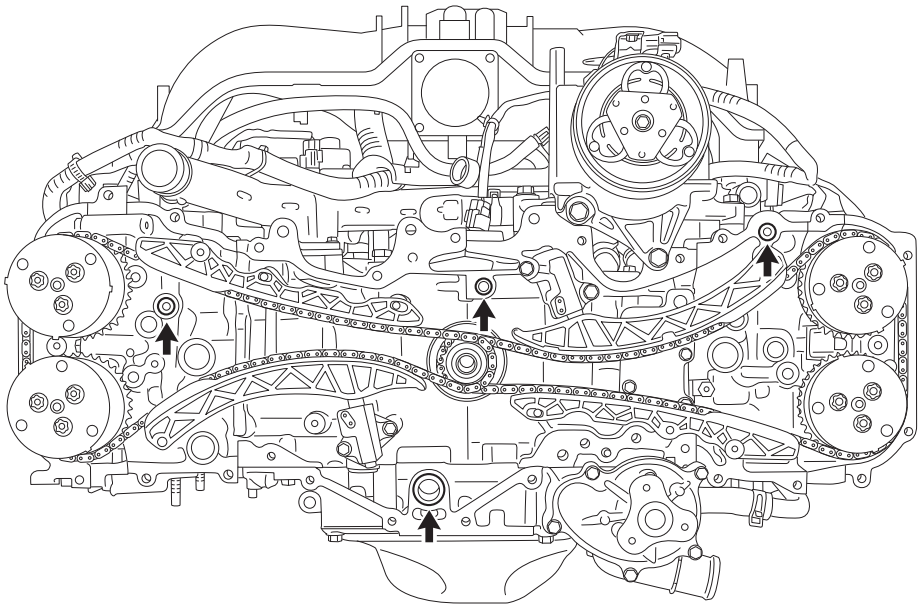
CAUTION:

- Do not damage the chain cover, cylinder head, camshaft timing gear and cylinder block.
- The chain cover may contact the protrusion "a" of the sensor plate of the cam sprocket and cause damage. Therefore, for removal, move the chain cover horizontally to the position where the cam sprocket is not contacted, and then carefully remove the chain cover.



LU-10106

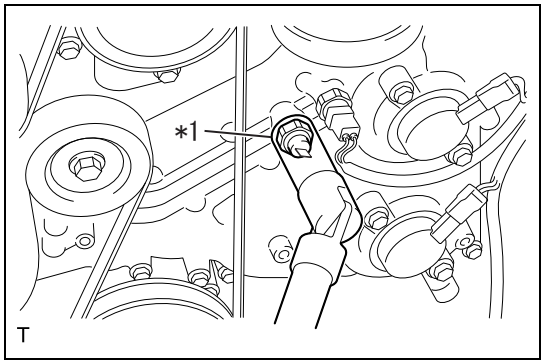
(3) Remove the four O-rings.



LU-10107

## Disassembly

1. Oil filter removal (Refer to LU - 4)
2. Oil filter union removal (Refer to LU - 5)



3. Engine oil pressure switch ASSY removal
   (1) Remove the engine oil pressure switch ASSY.

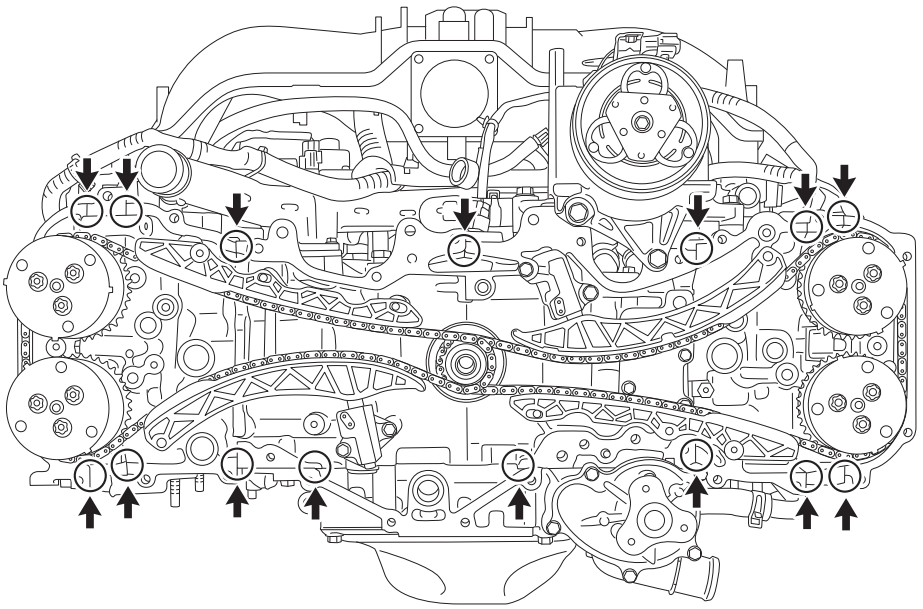
12. Oil filter installation (Refer to LU - 5)

LU

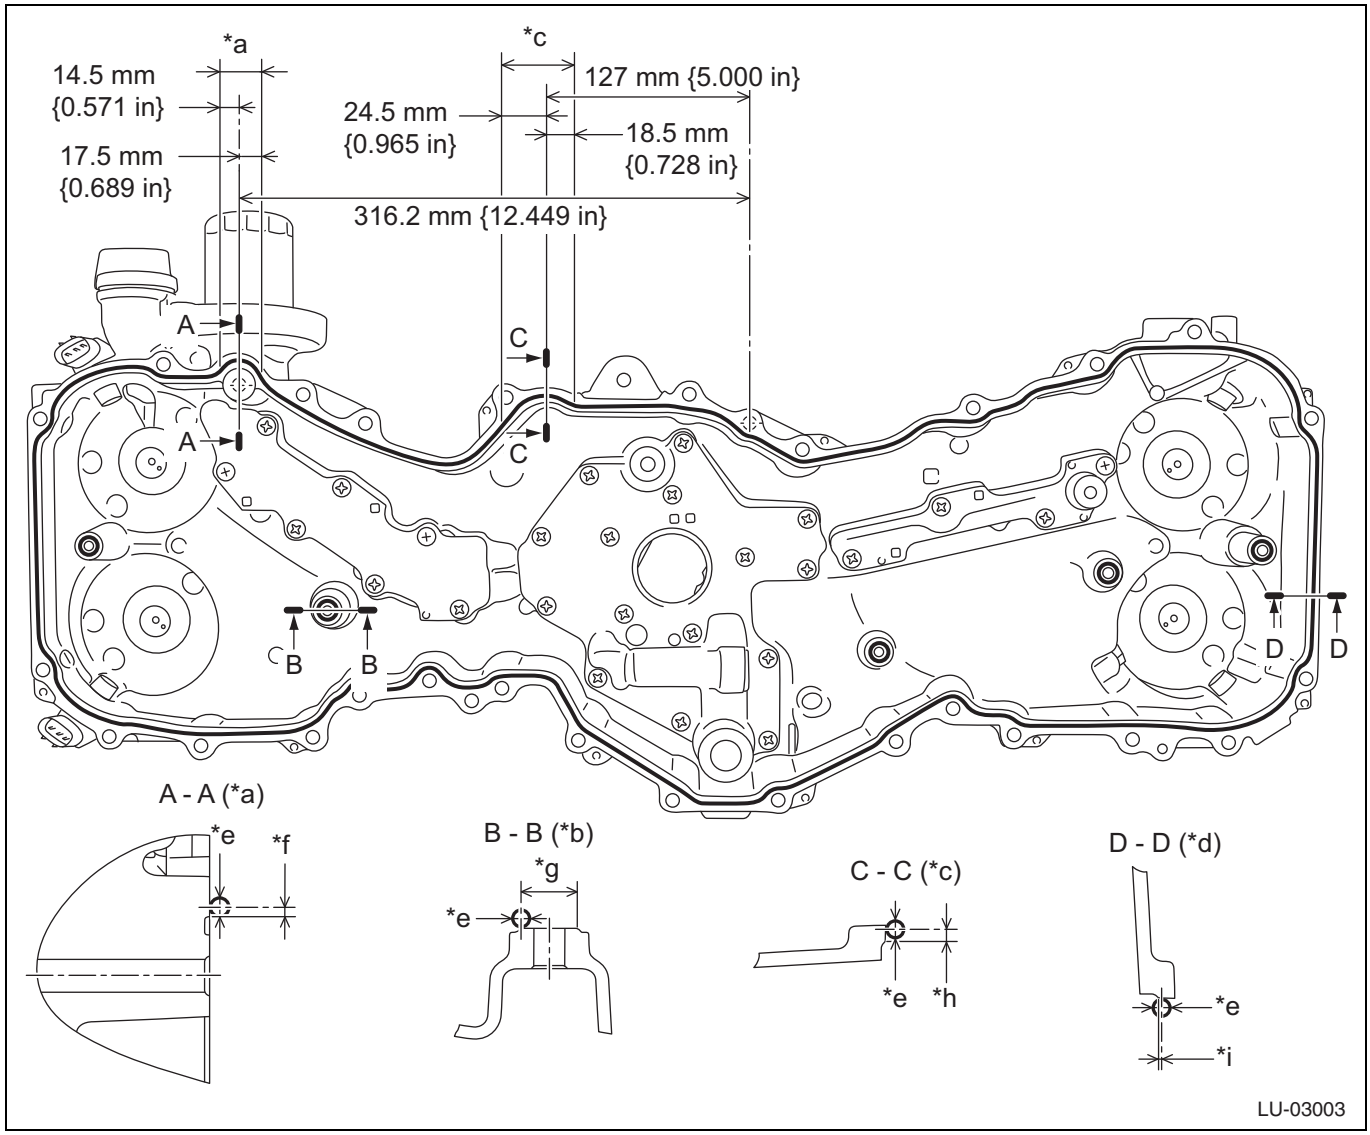
## Installation

1. Chain cover installation
   (1) Apply a coat of engine oil to four new O-rings and install them to the engine.
   (2) Before applying the liquid gasket, completely remove the old seal material on the sealing portion.
   (3) If there are gaps at the locations as shown in the figure, fill the gaps with THREE BOND 1217G/1217H or equivalent.



LU-10108

   (4) Apply THREE BOND 1217G/1217H or equivalent to the locations of chain cover as shown in the figure.

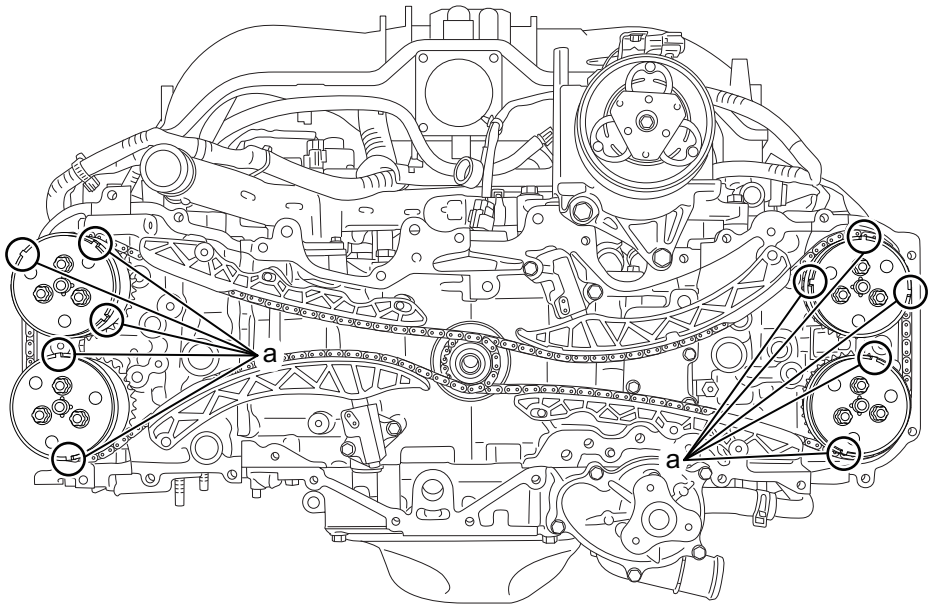


Captions in illustration

| | | | |
|---|---|---|---|
| *a | Range A | *b | Boss portion (five locations) |
| *c | Range B | *d | Other than ranges A and B |
| *e | φ3.5 to 4.5 mm {0.138 to 0.177 in} | *f | 2 mm {0.079 in} |
| *g | φ12 mm {0.472 in} | *h | 2.5 mm {0.098 in} |
| *i | 0.5 mm {0.020 in} | - | - |

CAUTION:

- Clean and degrease the installation surface.
- Install within 5 min. after applying liquid gasket.
- The chain cover may contact the protrusion "a" of the sensor plate of the cam sprocket and cause damage. Therefore, for installation, move horizontally and set the chain cover while being careful not to let the chain cover contact to the cam sprocket.



LU-10106

- Do not fill the engine oil within 2 hours after the installation.
- Do not start the engine within 2 hours after the installation.

(5) Temporarily install the chain cover with the 32 bolts.

(6) Fully tighten the 32 bolts in the order as shown in the figure.

| *a | Protrusion portion |

   (2) Install the idler pulley SUB-ASSY NO. 2 and idler pulley cover with the bolt.
   Standard value:T=36N·m {367kgf·cm} {26.6ft·lbf}

7. Oil level gauge guide installation
   (1) Install a new O-ring to the oil level gauge guide.
   (2) Apply engine oil to the O-ring and install the oil level gauge guide with the bolt.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (3) Install the oil level gauge.
8. Engine wiring connection
   (1) Connect the connector of cam position sensor and connector of cam timing oil control valve ASSY.
   (2) Connect the clamp.
   (3) Connect the connector of engine oil temperature sensor and connector of engine oil pressure switch ASSY.
   (4) Connect the connector of cam position sensor and connector of cam timing oil control valve ASSY.
   (5) Connect the two connectors of cam position sensor and connector of cam timing oil control valve ASSY.
   (6) Connect the connector for camshaft position sensor.
   (7) Install the wiring harness clamp bracket and wiring harness with the bolt.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
   (8) Install the two wiring harness clamp brackets and wiring harness with the bolt.
   Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
9. Installation of intake manifold protector (bank 1 side) (Refer to FU - 28)
10. Crankshaft pulley installation (Refer to EM - 50)
11. Water pump pulley installation (Refer to CO - 20)
12. Connection of radiator outlet hose (Refer to EM - 111)
13. Exhaust manifold installation (Refer to IE - 36)
14. Water filler SUB-ASSY installation (Refer to EM - 114)
15. Radiator reservoir tank ASSY installation (Refer to CO - 31)
16. Installation of injector driver (Refer to FU - 44)
17. Generator ASSY installation (Refer to BH - 35)
18. Connection of the battery ground terminal
   Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
19. Replenishing of coolant (SUBARU Super Coolant) (Refer to CO - 16)
20. Engine oil refill (Refer to LU - 5)
21. Engine oil level check (Refer to LU - 2)
22. Leak check of coolant (SUBARU Super Coolant) (Refer to CO - 2)
23. Engine oil leakage check (Refer to LU - 6)

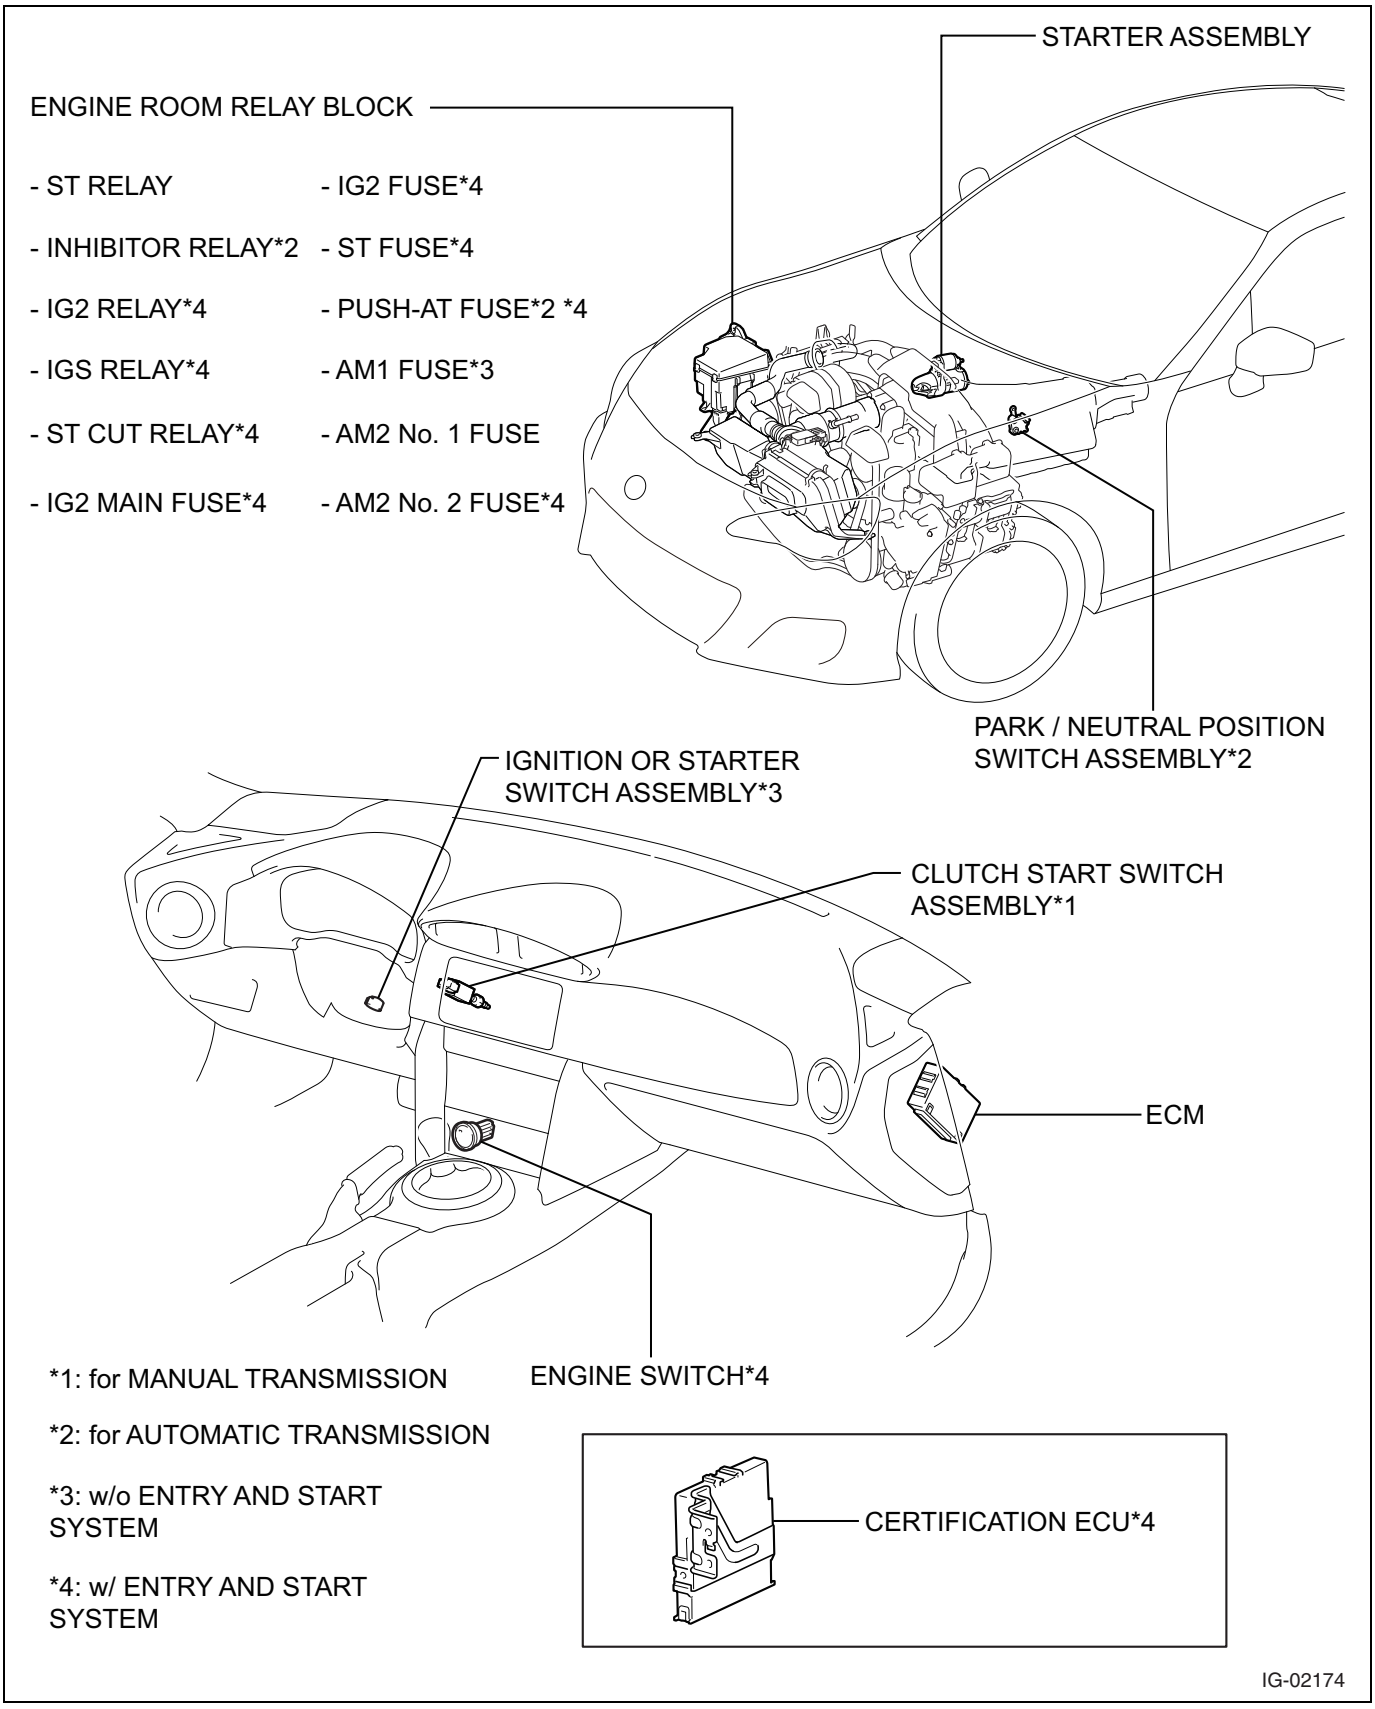
# Starting system (FA20)

## Parts location



ST

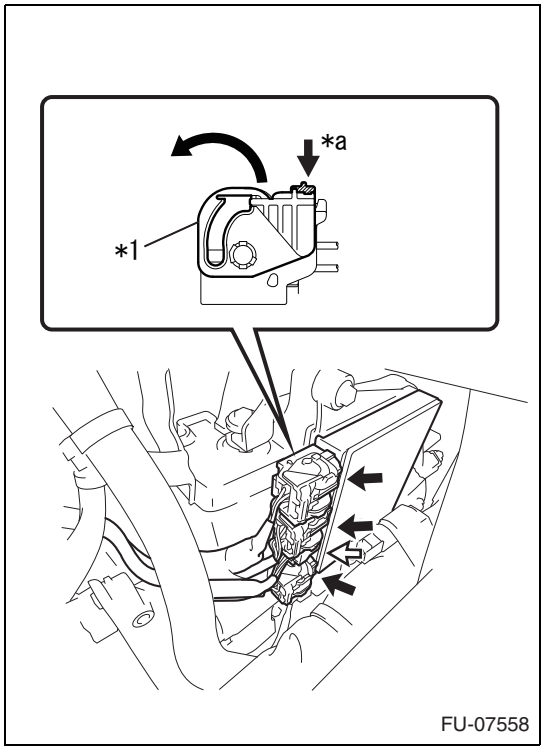
## On-vehicle inspection

NOTE:

- The following check is performed with the starter mounted on the vehicle to measure the contact condition of starter magnet switch contact (hereinafter referred to as contact) electrically during engine cranking for check.
- If the contact is faulty, its contact resistance is too high and the time required for the contact to switch ON completely is long.

1. Starter ASSY check
   (1) Contact resistance measurement method
   NOTE:
   - With the contact resistance measurement method, the resistance when the starter is energized is measured and the resistance increases when the contact is worn and its contact condition degrades.
   - Since the contact resistance cannot be measured directly, it is calculated from the starter driving current and the voltage between the terminals.

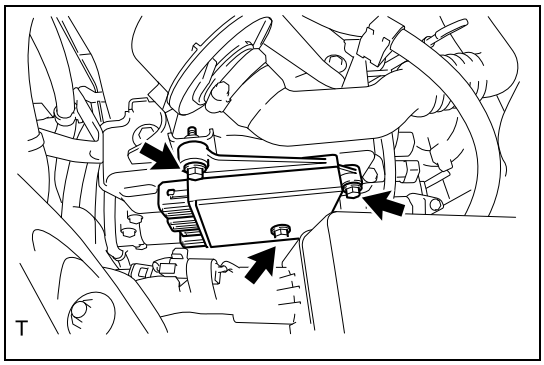
   (a)Check the DTC. (Refer to IN - 30)
   CAUTION:
   When a diagnostic code is detected, perform troubleshooting by code.



(b)Move the lock lever in the direction of arrow to unlock the three connectors.
Disconnect the three connectors with lock and normal connector from the injector driver.

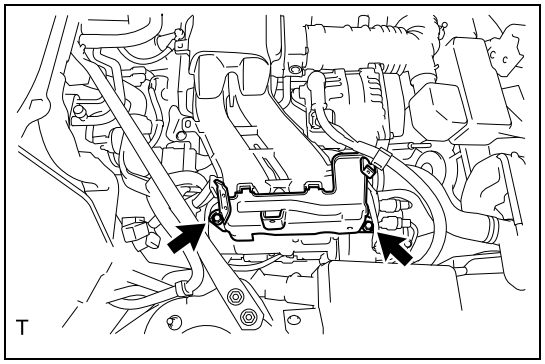
Captions in illustration

| | |
|---|---|
| *1 | Lock lever |
| ➡ | Connector with lock |
| ⇨ | Normal connector |
| *a | Unlock |

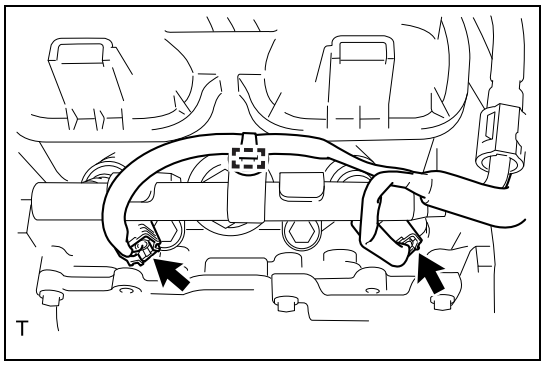


(c)Remove the three bolts and remove the injector driver.

(d)Remove the chamber. (Refer to IE - 31)

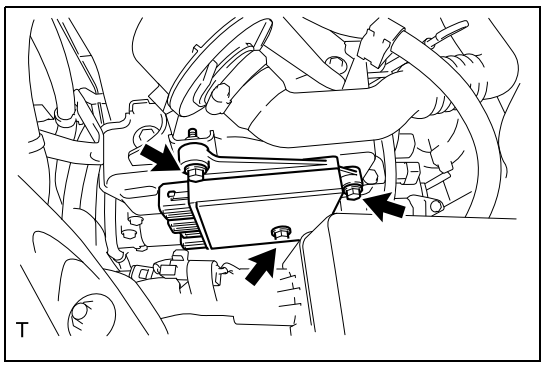


(e)Remove the 2 bolts, and remove the intake manifold protector (bank 1 side).

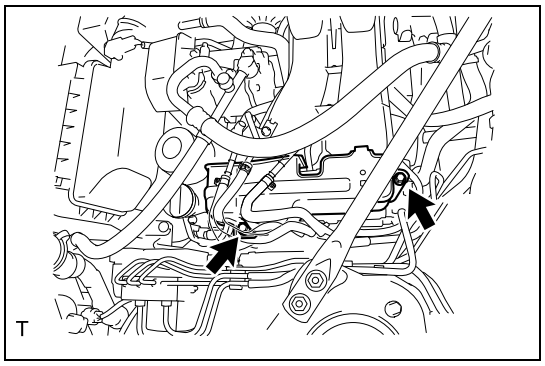


(f) Disconnect the two connectors of fuel injector.

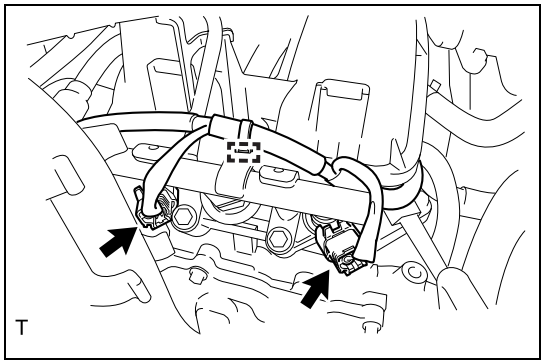
(g)Install the intake manifold protector (bank 1 side) with the two bolts.
Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}



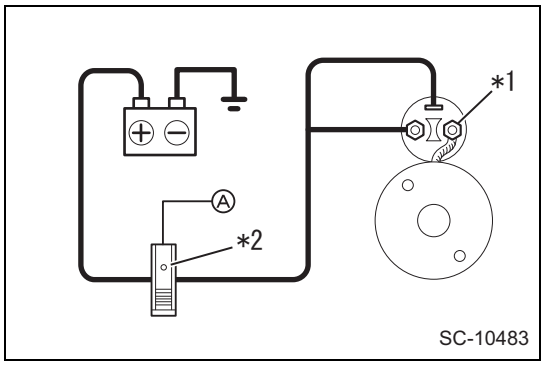
(h)Install the injector driver with the three bolts.
Standard value:T=6.4N·m {65kgf·cm} {4.7ft·lbf}
NOTE:
Leave the two upper connectors of injector driver disconnected.



(i) Remove the 2 bolts, and remove the intake manifold protector (bank 2 side).



(j) Disconnect the two connectors of fuel injector.



(k) Measure the starter driving current while cranking at the position A in the figure five times. Calculate the average and record it.

Captions in illustration

| | |
|---|---|
| *1 | Terminal M |
| *2 | AC/DC probe 400A |

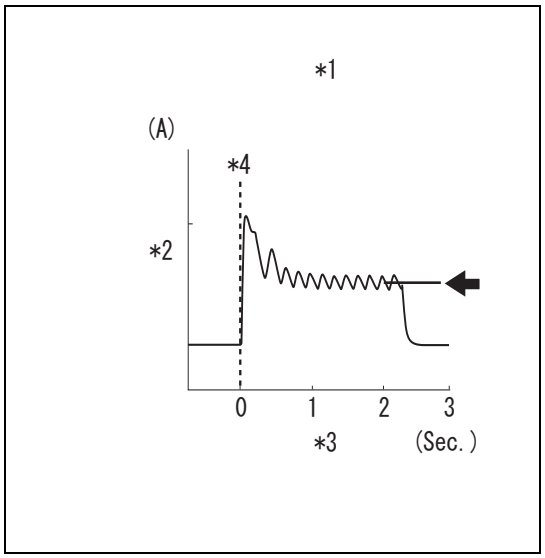
NOTE:

- Since the current generated by the generator may be measured depending on the measurement position, make sure that the current displayed on the electrical tester is within the range shown in the table and the starter driving current is measured properly.

Starter driving current

| Starter driving current | Starter output |
|---|---|
| 100 to 180 A | 1.0 kW (transmission MT)<br>1.6 kW (transmission AT) |

- The starter driving current in the table indicates the reference value when the engine is hot.



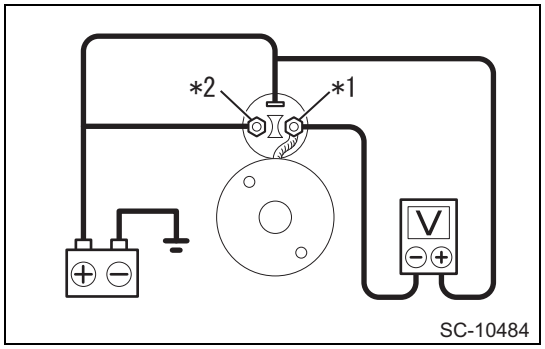
- Perform the cranking for about 2 seconds and then read the value when the current indicated on the circuit tester stabilizes.
- For starter protection, allow approx. 5 to 10-second interval between measurements.
- Since the vehicle with the smart entry & start system is equipped with the cranking hold control, cranking is continued for a certain period of time when the engine does not start. To stop cranking, press the push button start switch again.

Captions in illustration

| | |
|---|---|
| *1 | Current change image |
| *2 | Current |
| *3 | Time |
| *4 | STA ON |
| ➡ | Read the current value when the current change stabilizes. |

(l) Disconnect the battery ground terminal. (Refer to IN - 6)

ST



(m)Set the digital tester between the starter terminal M and engine wiring No. 2.

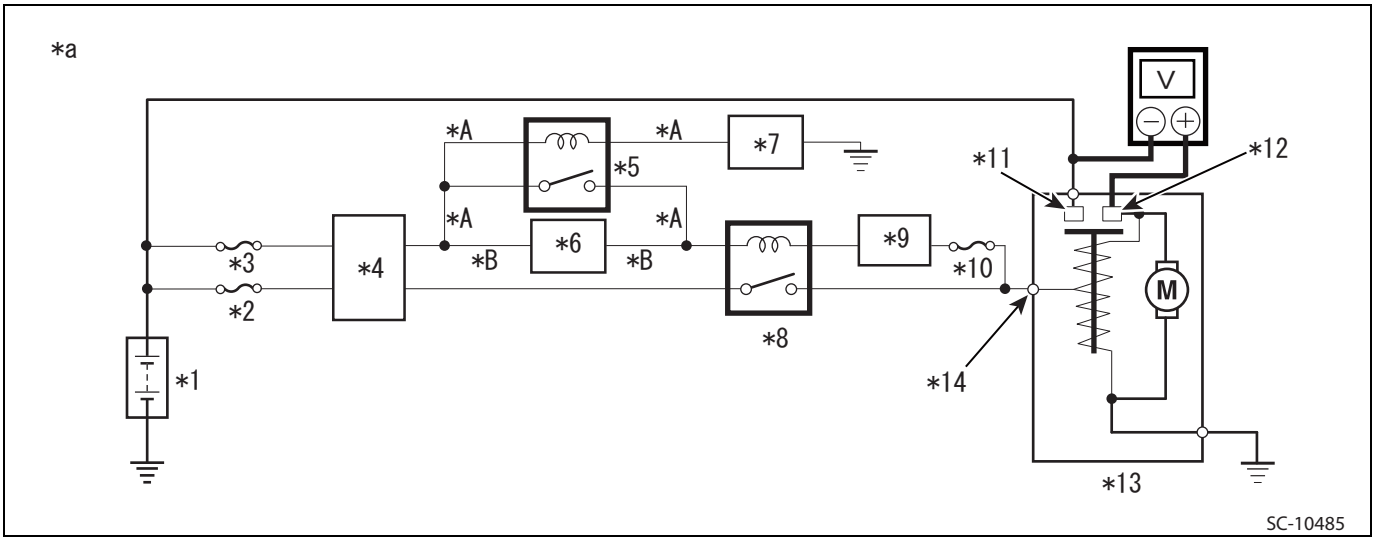
Captions in illustration

| | |
|---|---|
| *1 | Terminal M |
| *2 | B Terminal |

CAUTION:
Be careful not to short the terminal +B.
NOTE:

- Attach alligator clips to the leads of electrical tester and secure them on the terminal M and the battery positive terminal side.
- For starter protection, allow approx. 5 to 10-second interval between measurements.

(n)Reconnect the battery ground terminal.
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}
(o)Measure the voltage between the starter terminal M and engine wiring No. 2 while cranking 20 times.



Captions in illustration

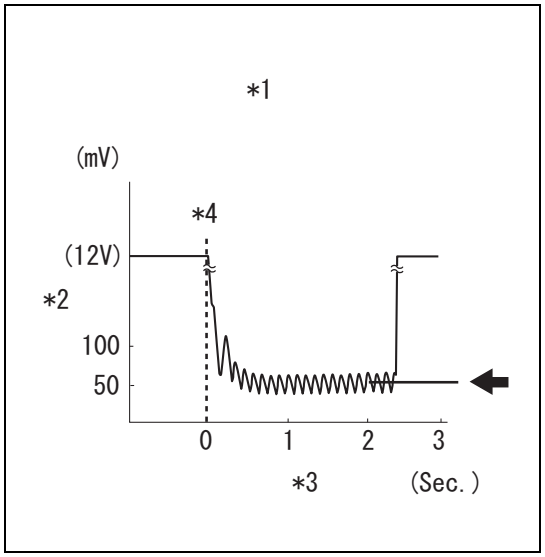
| | | | |
|---|---|---|---|
| *A | Transmission M/T | *B | Transmission A/T |
| *1 | Battery | *2 | AM2 No. 1 fuse |
| *3 | AM1 fuse | *4 | Ignition OR starter switch |
| *5 | INHIBITOR relay | *6 | Clutch start switch |
| *7 | Neutral start switch | *8 | ST relay |
| *9 | Engine control computer | *10 | ST fuse |
| *11 | B Terminal | *12 | Terminal M |
| *13 | Starter ASSY | *14 | Terminal S |
| *a | Wiring harness connection diagram | - | - |

CAUTION:

- Be careful not to short the terminal +B.
- If the starter cannot be stopped while the measurement, remove the battery negative terminal to stop the starter, and then check the push button start switch or ignition (starter) switch ASSY, starter relay, starter ASSY and wiring harness. Replace the faulty parts.

NOTE:

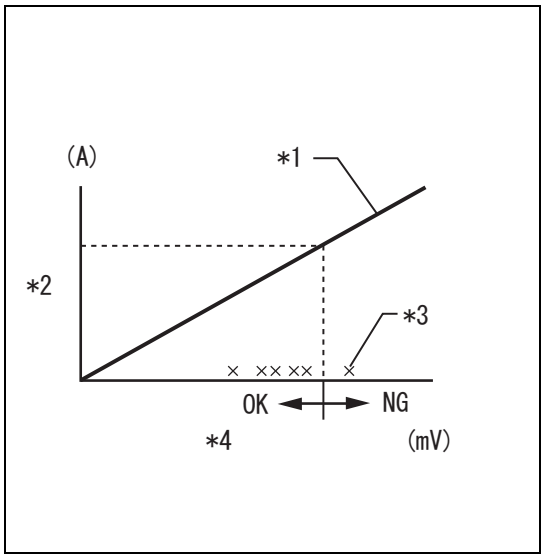
- Since the contact conditions of moving contacts and fixed contacts vary during the operation, it is necessary to measure about 20 times.



- Perform the cranking for about 2 seconds and then read the value when the voltage indicated on the circuit tester stabilizes.
- Since the vehicle with the smart entry & start system is equipped with the cranking hold control, cranking is continued for a certain period of time when the engine does not start. To stop cranking, press the push button start switch again.

Captions in illustration

| | |
|---|---|
| *1 | Current change image |
| *2 | Voltage |
| *3 | Time |
| *4 | STA ON |
| ➡ | Read the current value when the current change stabilizes. |



(p)Calculate the voltage between the starter terminals from the measurement values above.

How to calculate the standard value

| |
|---|
| Standard value (mV) = 2.5 mΩ (Starter criteria resistance) ×Average value of starter driving current |

Calculation example

| |
|---|
| Average value of starter driving current: 120 A<br>Starter criteria resistance (2.5 mΩ)<br>120 ×2.5 = 300, and the standard value is 300 mV or less. |

Standard value: Measurement voltage (mV) is equal to or less than standard value (mV).

NOTE:

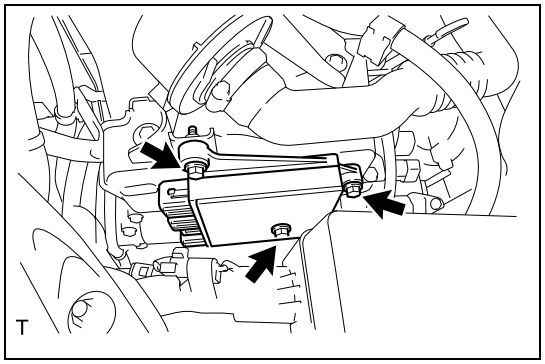
Replace the starter contact if the measurement value exceeds the standard value even once among the 20 measurements.

Captions in illustration

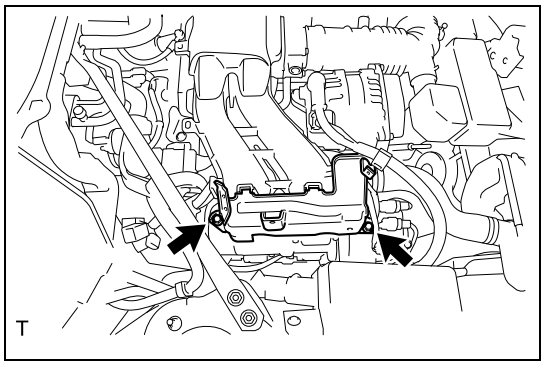
| | |
|---|---|
| *1 | Starter criteria resistance (1.5 mΩ) |
| *2 | Starter driving current |
| *3 | Measurement result |
| *4 | Measured voltage |

(q)Disconnect the battery ground terminal. (Refer to IN - 6)

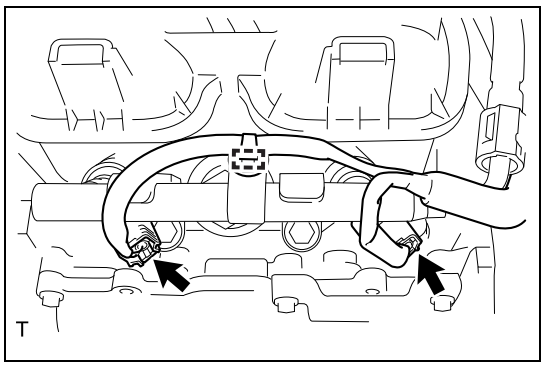
ST



(r) Remove the three bolts and remove the injector driver.



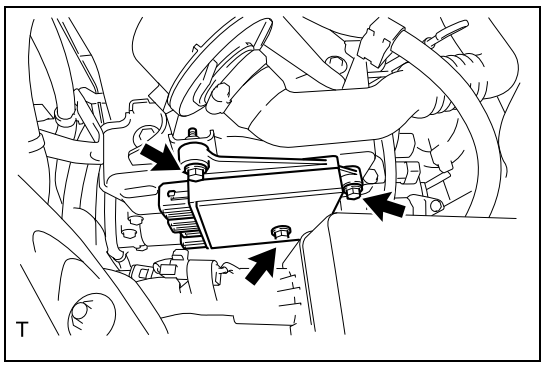
(s) Remove the 2 bolts, and remove the intake manifold protector (bank 1 side).



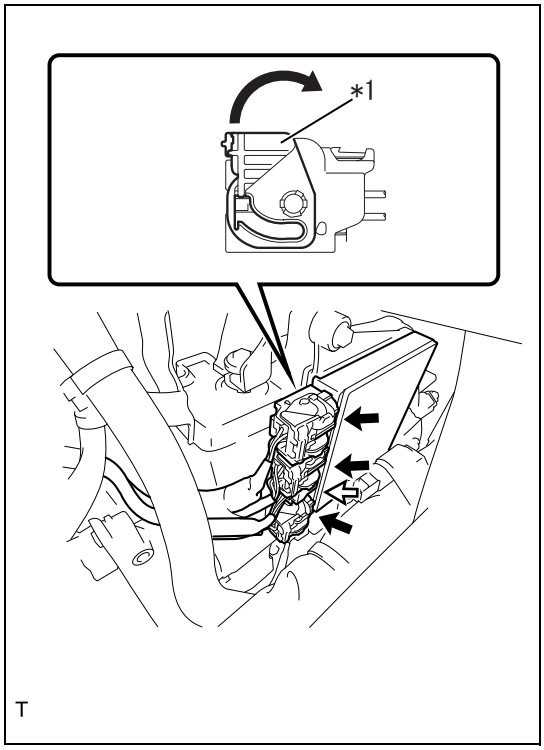
(t) Connect the two connectors of fuel injector.

(u) Using 2 bolts, install the intake manifold protector (bank 1 side).
Standard value: T=19N·m {194kgf·cm} {14.0ft·lbf}

(v) Install the chamber. (Refer to IE - 32)



(w) Install the injector driver with the three bolts.
Standard value: T=6.4N·m {65kgf·cm} {4.7ft·lbf}

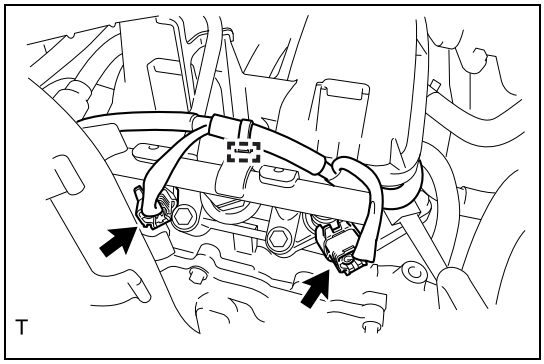


(x) Connect the three connectors with lock to the injector driver.
Move the lock lever as shown in the figure to lock the three connectors with lock.

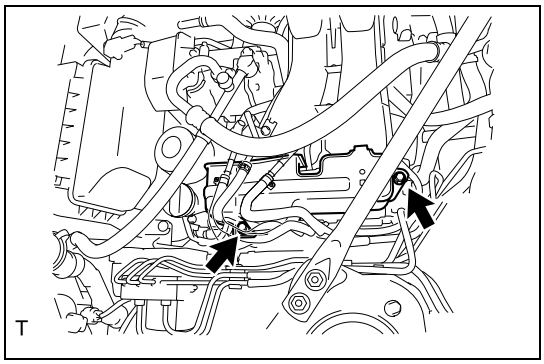
Captions in illustration

| | |
|---|---|
| *1 | Lock lever |
| ➡ | Connector with lock |
| ⇨ | Normal connector |

CAUTION:
For connector with lock, connect the connector securely to lock it.



(y) Connect the two connectors of fuel injector.



(z) Using 2 bolts, install the intake manifold protector (bank 2 side).
Standard value:T=19N·m {194kgf·cm} {14.0ft·lbf}

(aa) Reconnect the battery ground terminal.
Standard value:T=6.0N·m {61kgf·cm} {4.4ft·lbf}

(ab) Make sure that there is no influence on the engine startability and after the engine is started.

## How to troubleshoot

NOTE:

The following is the flowchart to check the troubles of starter main body. For the vehicle with the smart entry & start system, check the smart entry & start system in advance to make sure that there is no fault is found in the smart entry & start system, and then perform the check according to the flowchart.

| | |
|---|---|
| 1 | Bring in the car |

Next

| | |
|---|---|
| 2 | Interview and phenomenon check |

(1) Does the engine start with one cranking?

Result

| Result | Go to |
|---|---|
| Engine does not start | Check (2) |
| Engine starts this time but did not start in the past | Check (2) |
| Engine starts | B |

(2) Does the engine crank normally?

Result

| Result | Go to |
|---|---|
| Engine does not crank normally | A |
| Engine cranks normally this time but did not crank normally in the past | C |
| Engine cranks normally | B |

ST

B → Starter normal

C → Go to Step 4.

A

| | |
|---|---|
| 3 | Battery check |

(1) Battery terminal check
  (a) Check the battery terminals for looseness and damage.
(2) Battery voltage check
  (a) To remove the voltage due to surface charging (ECU. capacitor etc.), turn the headlight switch to ON with IG OFF for about 20 or 30 seconds.
  (b) Measure the battery voltage between the terminals.
    Voltage: 12.5 V or more (Electrolyte temperature: 20°C)
(3) Battery electrolyte level check
  (a) Check the electrolyte level of each cell and refill distilled water or replace the battery if the level is below the LOW level.
(4) Battery electrolyte specific gravity check
  (a) Check the electrolyte specific gravity in each cell.
    Standard value: 1.25 to 1.29 (Electrolyte temperature: 20°C)

NG → Go to Step 5.

OK

| | |
|---|---|
| 4 | Starter check |

(1) Perform the On-vehicle inspection (Refer to ST - 3).

NG → Go to Step 6.

OK

Complete

| 5 | Confirmation of past failure history |
|---|---|

(1) Is there a symptom in which the engine could not be started or did not crank.

Result

| Result | Go to |
|---|---|
| There was no such symptom | A |
| There was the symptom | B |

B → Charge or replace the battery and then go to step 4

A

Charge or replace the battery to complete the check

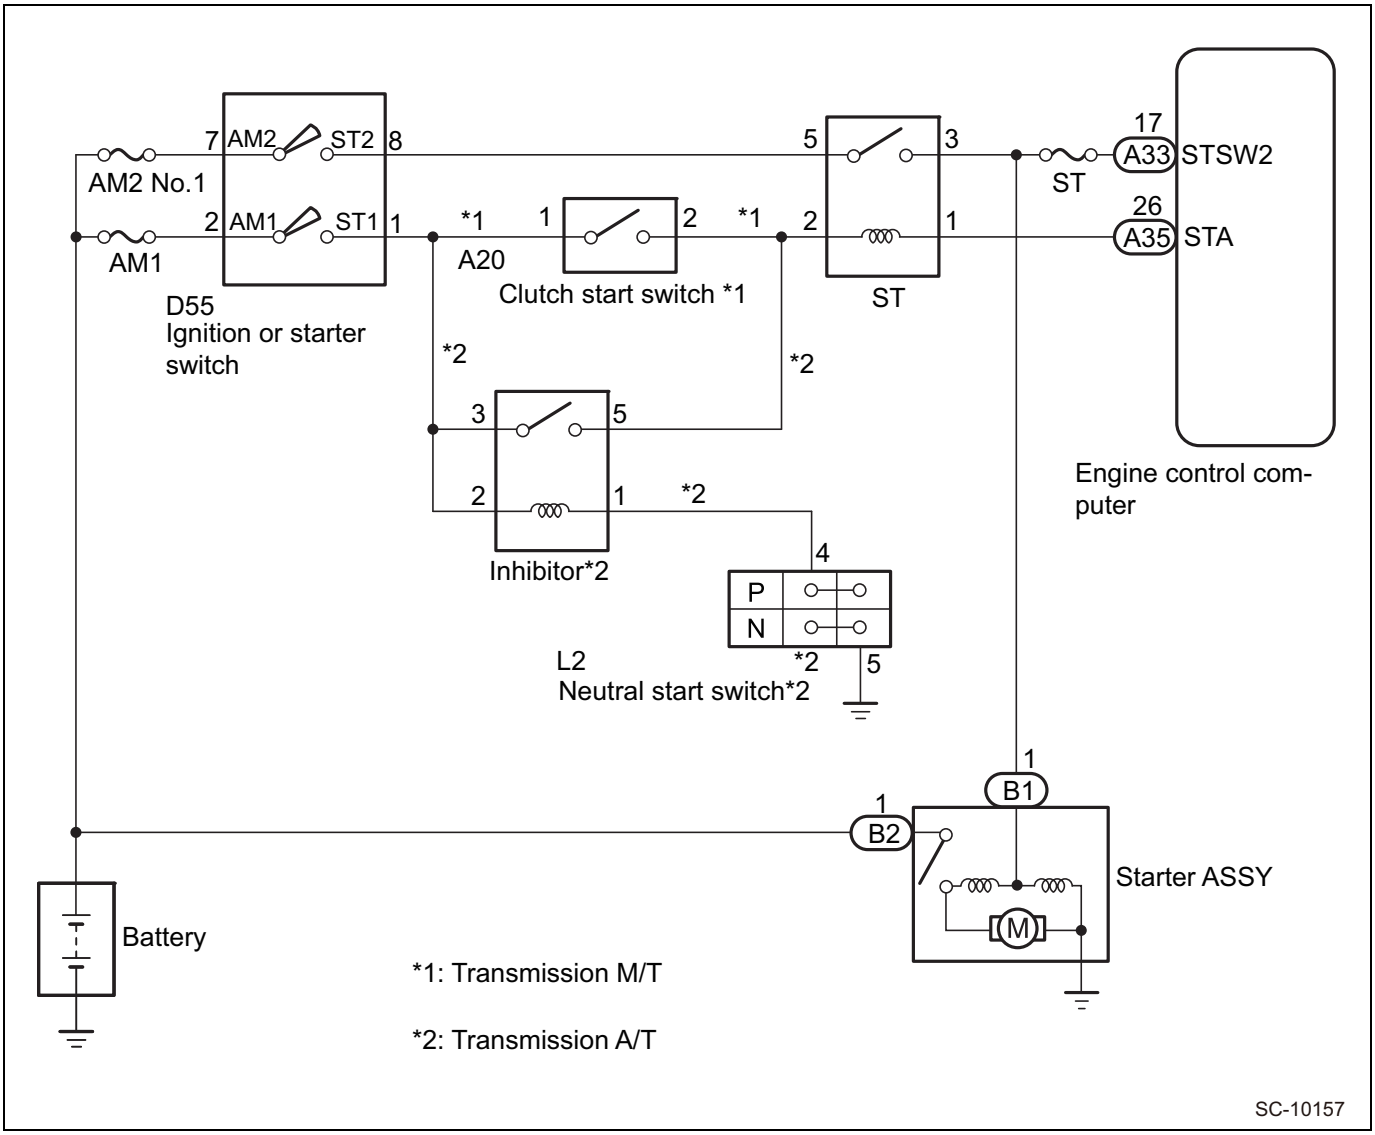
| 6 | Starter repair or replacement |
|---|---|

Next

Complete

## Circuit figure

- Without smart entry & start system



ST

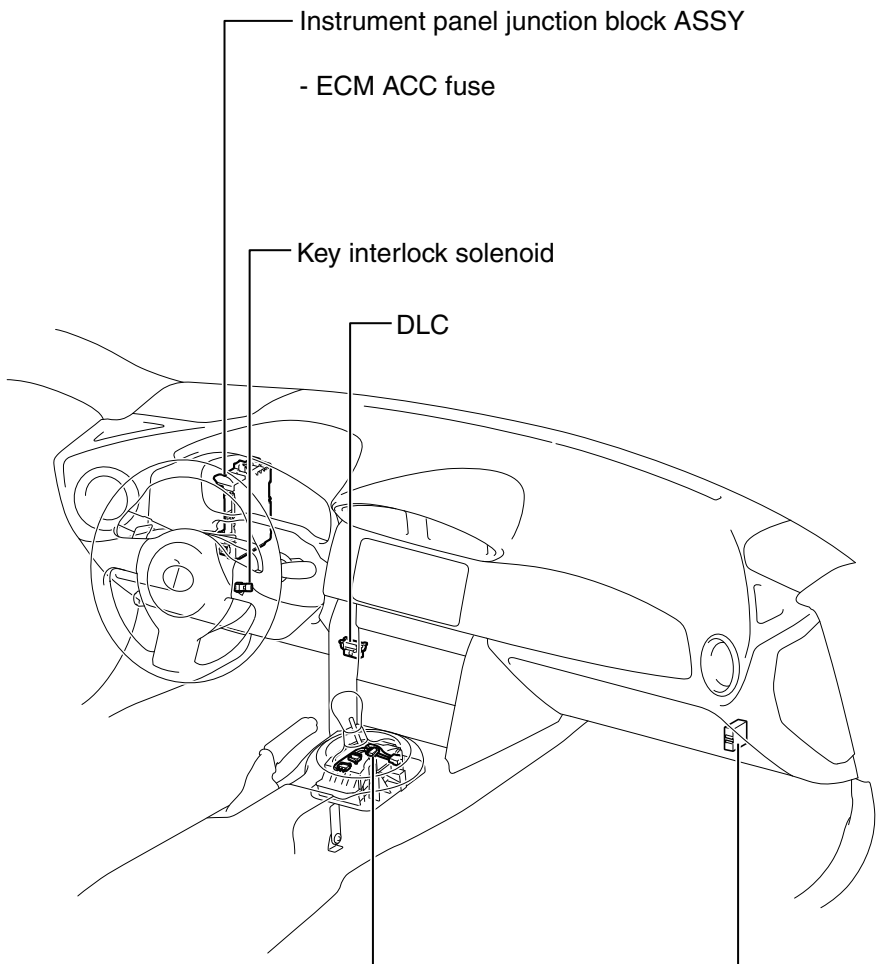
- With smart entry & start system
  (Refer to TD - 139)

# Key interlock system

## Function inspection

1. Key interlock function check
   (1) Turn the ignition switch to ON.
   (2) Depress the brake pedal and place the shift lever in a position other than the P position.
   (3) Check that the ignition key cannot be turned to the LOCK position.
   (4) Place the shift lever in the P position and turn the ignition key to the LOCK position to check that the ignition key can be pull out.

## Parts location

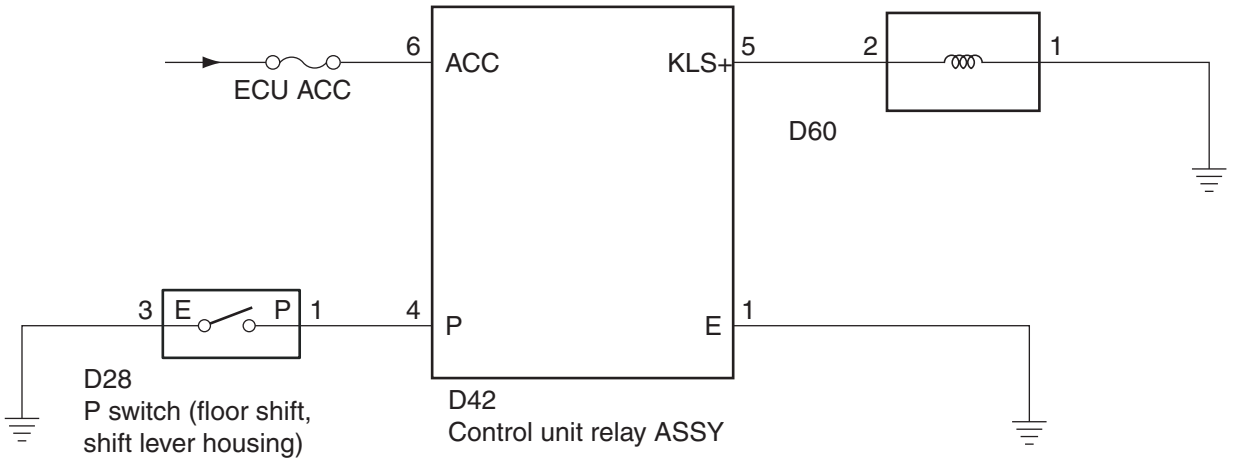


## Symptom table

Key interlock system

| Symptoms | Inspection items | Reference pages |
|---|---|---|
| Cannot remove or insert the key | Refer to troubleshooting flowchart "Cannot remove or insert the key." | ST - 14 |

## Circuit figure



ST

## Cannot remove or insert the key

Circuit description

The control unit relay ASSY outputs a signal to the key interlock solenoid when the ACC signal and P signal are input.

Circuit figure

For a circuit figure, refer to ST - 14.

Inspection steps

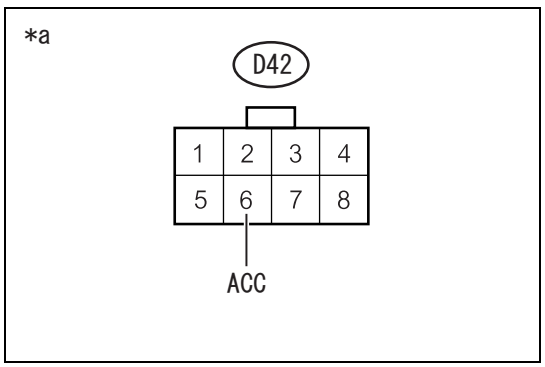
CAUTION:

Before performing troubleshooting, check the fuse for this circuit.

| 1 | Check wiring harness and connector (ACC voltage) |
|---|---|

NOTE:

For inspection procedures and precautions, refer to IN - 36.



(1) Disconnect the connector D42 of control unit relay ASSY.

(2) Measure the voltage between the terminals.

Voltage

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-6 (ACC) - chassis ground | IG ON | 11 to 14 V |

Captions in illustration

| | |
|---|---|
| *a | Front side of vehicle wiring harness connector (Control unit relay ASSY connecting connector) |

| NG | Repair or replacement of wiring harness or connector |
|---|---|

OK

| 2 | Check wiring harness and connector (control unit relay ASSY - chassis ground) |
|---|---|

NOTE:
For inspection procedures and precautions, refer to IN - 36.
(1) Disconnect the connector D42 of control unit relay ASSY.
(2) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-1 (E) - chassis ground | Always | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

| 3 | P switch (floor shift, shift lever housing) unit inspection |
|---|---|

(1) Perform the P switch (floor shift, shift lever housing) unit inspection. (Refer to AT - 211)

NG → P switch (floor shift, shift lever housing) replacement (Refer to AT - 200)

OK

| 4 | Check wiring harness and connector (control unit relay ASSY - P switch (floor shift, shift lever housing)) |
|---|---|

NOTE:
For inspection procedures and precautions, refer to IN - 36.
(1) Disconnect the connector D42 of control unit relay ASSY.
(2) Disconnect the connector D28 of P switch (floor shift, shift lever housing).
(3) Measure the resistance between the terminals.
Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-4 (P) - D28-1 (P) | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-4 (P) and D28-1 (P) - other terminals and chassis ground | Always | 10 kΩ or more |

NG → Repair or replacement of wiring harness or connector

OK

ST

| 5 | Check wiring harness and connector (P switch (floor shift, shift lever housing) - chassis ground) |
|---|---|

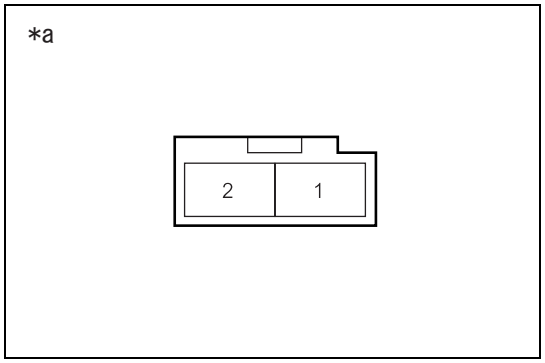
NOTE:
For inspection procedures and precautions, refer to IN - 36.
(1) Disconnect the connector D28 of P switch (floor shift, shift lever housing).
(2) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D28-3 (E) - chassis ground | Always | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

| 6 | Key interlock solenoid check |
|---|---|



(1) Disconnect the connector D60 of key interlock solenoid.
(2) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| 1 - 2 | 20°C | 13.05 to 15.95Ω |

Captions in illustration

| | |
|---|---|
| *a | Connector not connected (Key interlock solenoid) |

NG → Key interlock solenoid replacement (Refer to SR - 57)

OK

| 7 | Check wiring harness and connector (control unit relay ASSY - key interlock solenoid) |
|---|---|

NOTE:
For inspection procedures and precautions, refer to IN - 36.
(1) Disconnect the connector D42 of control unit relay ASSY.
(2) Disconnect the connector D60 of key interlock solenoid.
(3) Measure the resistance between the terminals.
Resistance (open circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-5 (KLS+) - D60-2 | Always | Less than 1 Ω |

Resistance (short circuit check)

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D42-5 (KLS+) and D60-2 - other terminals and chassis ground | Always | 10 kΩ or more |

NG → Repair or replacement of wiring harness or connector

OK

| | |
|---|---|
| 8 | Check wiring harness and connector (key interlock solenoid - chassis ground) |

NOTE:
For inspection procedures and precautions, refer to IN - 36.
(1) Disconnect the connector D60 of key interlock solenoid.
(2) Measure the resistance between the terminals.
Resistance

| Inspection terminals | Inspection conditions | Standard value |
|---|---|---|
| D60-1 - chassis ground | Always | Less than 1 Ω |

NG → Repair or replacement of wiring harness or connector

OK

Control unit relay ASSY replacement (Refer to ST - 47)

# Starter ASSY (FA20)

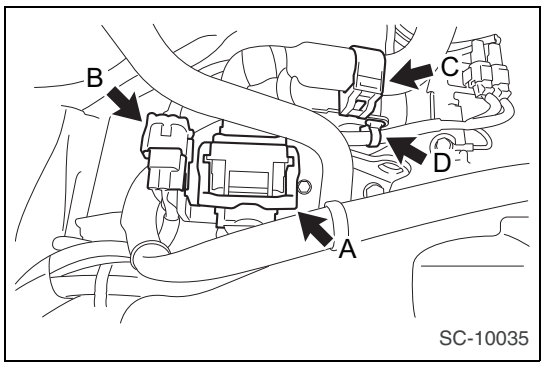
## Removal

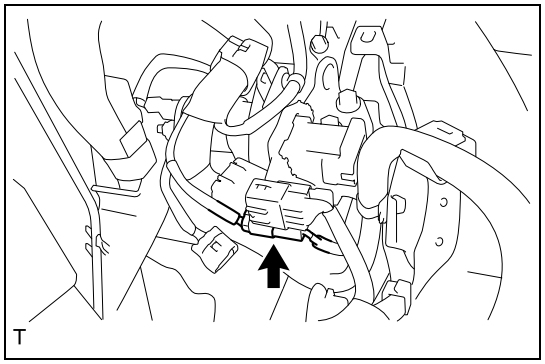
1. Disconnection of the battery ground terminal (Refer to IN - 6)
2. Removal of exhaust pipe ASSY FR (Refer to IE - 41)
3. DISCONNECT ENGINE WIRE
   NOTE:
   Fix the disconnected harness components with tape to keep them out of the way.



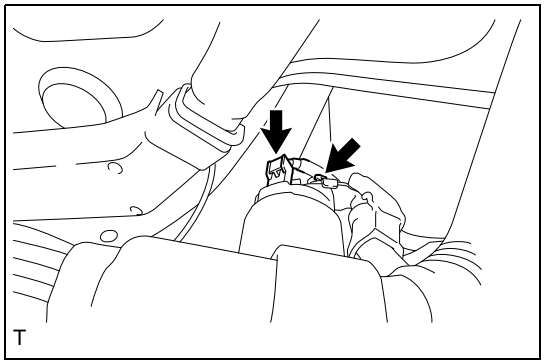
(1) Release the lock of connector (A) and disconnect the connector.

(2) Disconnect the connector (B).

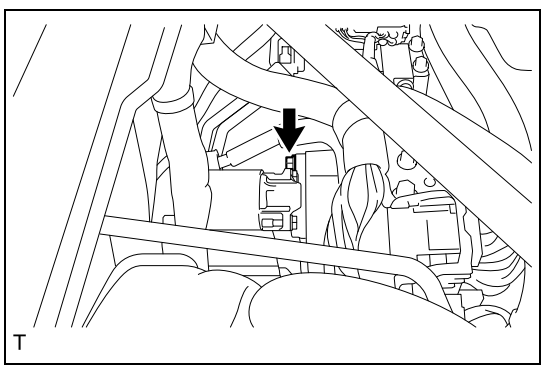
(3) Remove the wiring harness clamp (C) and clip (D).



(4) Disconnect the connector.

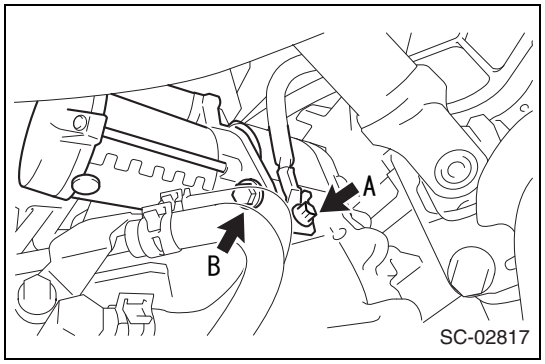


4. Removal of starter ASSY
   (1) Disconnect the connector and terminal B from the starter ASSY.



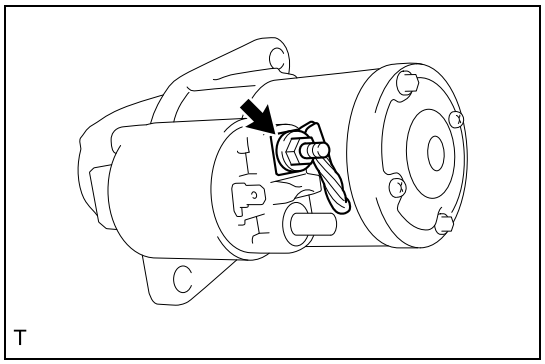
(2) Remove the upper mounting bolt.

ST

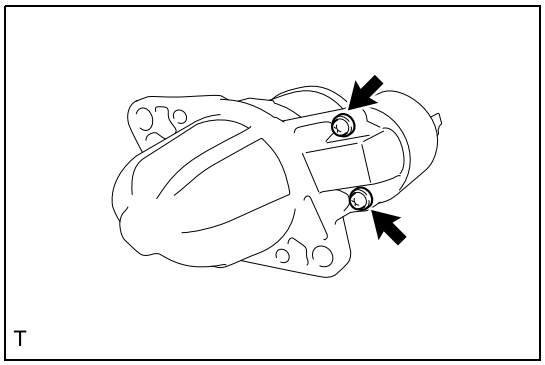


(3) Remove the lower mounting bolt.
1. Remove the ground cable fixing bolt A.
CAUTION:
When removing the ground cable, make sure to secure the stay.
2. Remove the lower mounting bolt B.
3. Remove the starter ASSY.

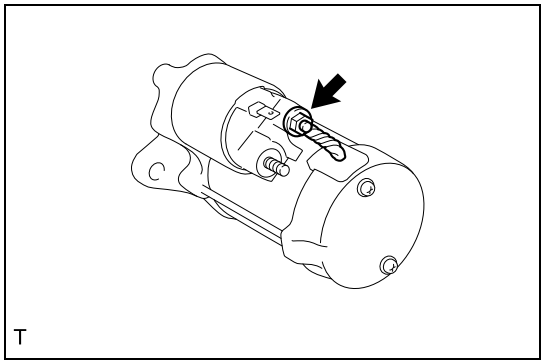
## DISASSEMBLY



1. REMOVE MAGNET STARTER SWITCH ASSEMBLY(for Manual Transmission)
(1) Remove the nut and disconnect the lead wire from terminal M.



(2) Remove the 2 screws and the magnet starter switch assembly from the starter drive housing assembly.



2. REMOVE MAGNET STARTER SWITCH ASSEMBLY(for Automatic Transmission)
(1) Remove the nut and disconnect the lead wire from terminal M.
