# 1. Precaution

## A: CAUTION

Please clearly understand and adhere to the following general precautions for environmental protection and to avoid minor or serious injury to the person doing the work or people in the area.

### 1. VEHICLE DYNAMICS CONTROL (VDC)

Handle the VDC as a total system. Do not disassemble or attempt to repair individual parts. Follow the directions in this manual when performing maintenance on the VDCCM&H/U. When parts other than those specified are disassembled, it is possible that the VDC system will not operate when needed or cause it to operate incorrectly and result in injury.

### 2. BRAKE FLUID

If brake fluid gets in your eyes or on your skin, do the following:

- Wash eyes and seek immediate medical attention.
- Wash your skin with soap and then rinse thoroughly with water.

### 3. RADIATOR FAN

The radiator fan may rotate without warning, even when the engine is not ON. Do not place your hand, cloth, tools or other items near the fan at any time.

### 4. ROAD TEST

Always conduct road tests in accordance with traffic rules and regulations to avoid bodily injury and interrupting traffic.

### 5. AIRBAG

To prevent bodily injury from unexpected deployment of airbags and unnecessary maintenance, follow the instructions in this manual when performing maintenance on the airbag components or nearby, around front of the vehicle (radiator panel, front wheel apron, front side frame, bumper, hood, front fender), around side of the vehicle (front door, rear door, center pillar, rear fender, side sill, rear wheel apron), around rear of the vehicle (rear seat cushion, rear floor, rear sub frame assembly) and the airbag wiring harnesses or nearby.

To prevent unexpected deployment, turn the ignition switch to OFF and disconnect the ground cable from battery, then wait at least 60 seconds before starting work.

### 6. AIRBAG MODULE AND SEAT BELT PRETENSIONER DISPOSAL

To prevent bodily injury from unexpected airbag deployment, do not dispose the airbag modules or seat belt pretensioner in the same way as other waste. Follow all government regulations concerning disposal of refuse.

### 7. AIRBAG MODULE

Adhere to the following when handing and storing the airbag module to prevent bodily injury from unexpected deployment:

- Do not hold the harnesses or connectors to carry the module.
- Do not face the bag in the direction that it opens towards yourself or other people.
- Do not face the bag in the direction that it opens towards the floor or walls.

### 8. AIRBAG SPECIAL TOOL

To prevent unexpected deployment, only use special tools.

### 9. WINDOW

Always wear safety glasses when working around any glass to prevent glass fragments from damaging your eyes.

### 10.WINDOW ADHESIVE

Always use the recommended or equivalent adhesive when attaching glass to prevent it from falling off, resulting in accidents and injury.

### 11.OIL

When handling oil, adhere to the following to prevent unexpected accident.

- Prepare a container and cloth to prevent scattering of oil when performing work where oil can be spilled. If the oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.
- Follow all government and local regulations concerning disposal of refuse when disposing.

### 12.FUEL

When handling and storing fuel, adhere to the following to prevent from unexpected accident.

- Be careful with fire.
- Prepare a container and cloth to prevent scattering of fuels when performing work where fuels can be spilled. If the oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.
- Follow all government and local regulations concerning disposal of refuse when disposing.

## 13.ENGINE COOLANT

When handling engine coolant, adhere to the following to prevent from unexpected accident.

• Never remove the radiator cap since engine coolant may blow out when it is hot.

• Prepare a container and cloth to prevent scattering of engine coolant when performing work where engine coolant can be spilled. If the oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.

• Follow all government and local regulations concerning disposal of refuse when disposing.

## 14.AIR CONDITIONER REFRIGERANT

In order to prevent from global warming, avoid releasing air conditioner refrigerant into the atmosphere. Using a refrigerant recovery system, discharge and reuse it.

## 15.REMOVAL AND INSTALLATION OPERATION OF HOSES, ETC.

### 1. Before the removal and installation operation of hoses, etc.

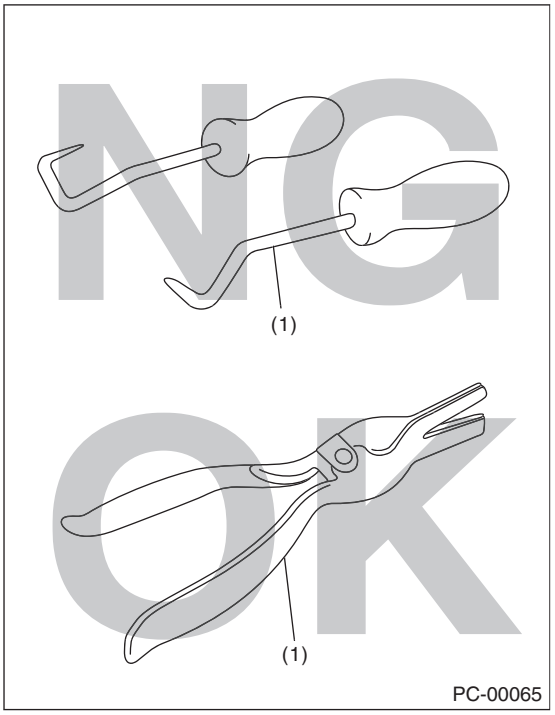
• If you keep using the damaged or deformed hose, it results bleeds or leakage of the fat adheres or disconnection of the hose. Be careful not to spill fat adheres on exhaust pipes, etc. during maintenance to prevent emitting smoke or causing fires.

• Perform the operation with the hose removed. If the operation is performed without removing the hose, it may damage inner surface of the hose.

### 2. Removal and installation operation of hoses, etc. during the inspection

**• Follow the instructions below when removing hose.**

• Do not use a pointed hose remover (hose plucker) when using a general hose remover. It may damage the pipe surface or the hose.

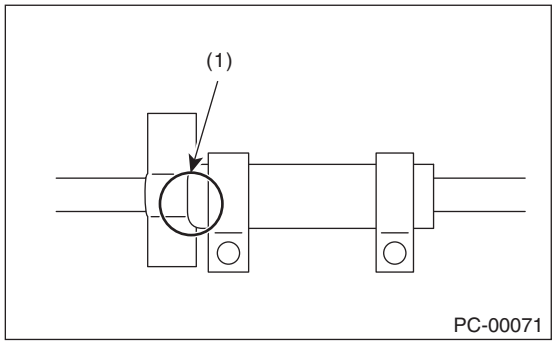


(1) Hose remover

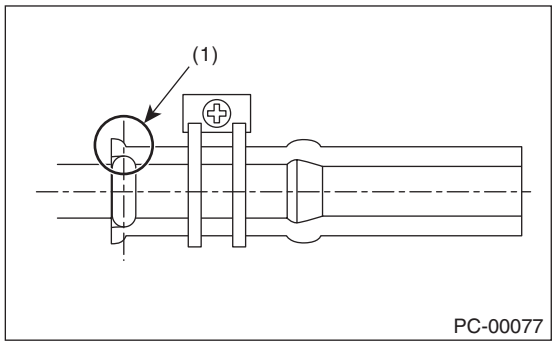
• When draining hose using pliers, be sure to cover the hose with cloth and rotate the hose slightly to extract straight.

**• If you keep using the hose, perform the inspection below and replace the hose with a new part if faulty.**

• Replace the hose with a new part if it rides over the stay or the top of spool.



(1) Hose rides over the stay



(1) Hose rides over the top of spool

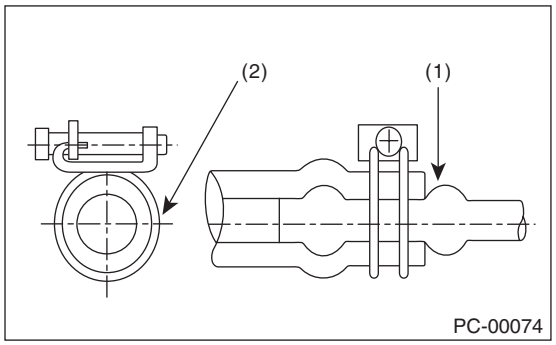
• Check if the surface and the inner surface of the hose are damaged, cracked, bend, hardened, softened, swelled, peeled or deformed due to the adherence or the entry of the foreign matter by bending the hose. Replace with the new part if faulty.

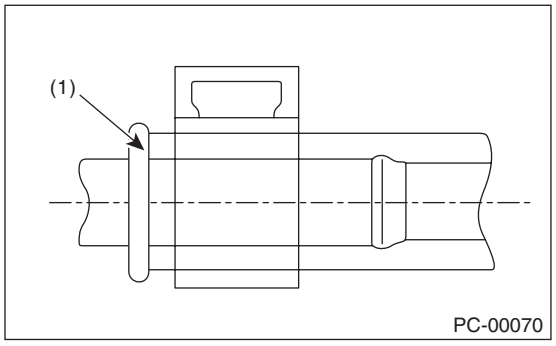
**• Follow the instructions below during installation.**

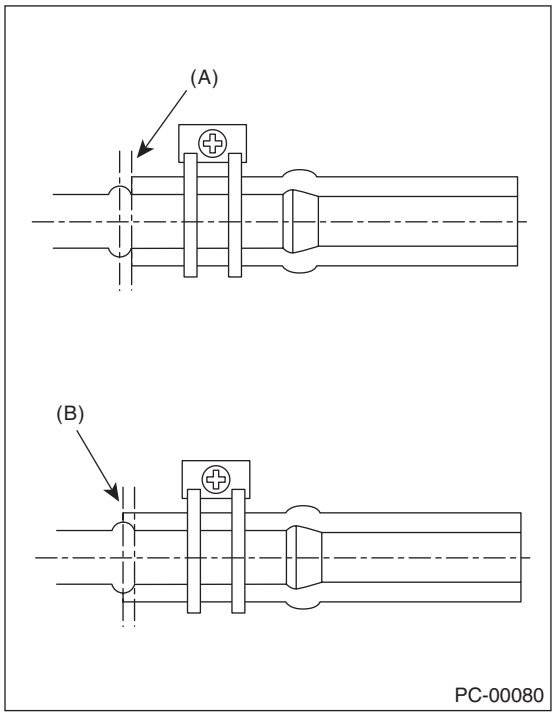
• Check carefully for assembling position.

• Never use lubricants.

• Insert the hose to the specified position (stopper or spool) securely. (The stopper of the spool is between the top of the spool and the bottom section.)







(1) Push against the spool. (Insert the hose and prevent it from becoming wrinkled.)

(2) Tighten the hose outwards and apply force thoroughly.

(A) OK position (bottom of spool)

(B) OK position (top of spool)

- Check if the position, direction and hose layout of the hose clamp are correct. (Check if the position, direction, length and the gap around are correct, or if it is different from the condition before the work)
- After the installation, check that the hose is installed securely and there is no leakage. (Check if it is fixed securely with the clamp)

**• For hose clips and hose clamps, perform the inspection below and replace them with a new part if faulty.**

- Check for deformation, rust, damage or foreign matters.
- For hose clip, check if it works and has clamping force.
- For hose clamp, check if it can tighten screw, not ovalized or the screw is not damaged.

**• For hose pipes, perform the inspection below and replace with a new part if faulty.**

Check if the pipe is not damaged, rusted, peeled (peeled plates included), covered with foreign matter, bent, compressed or cracked.

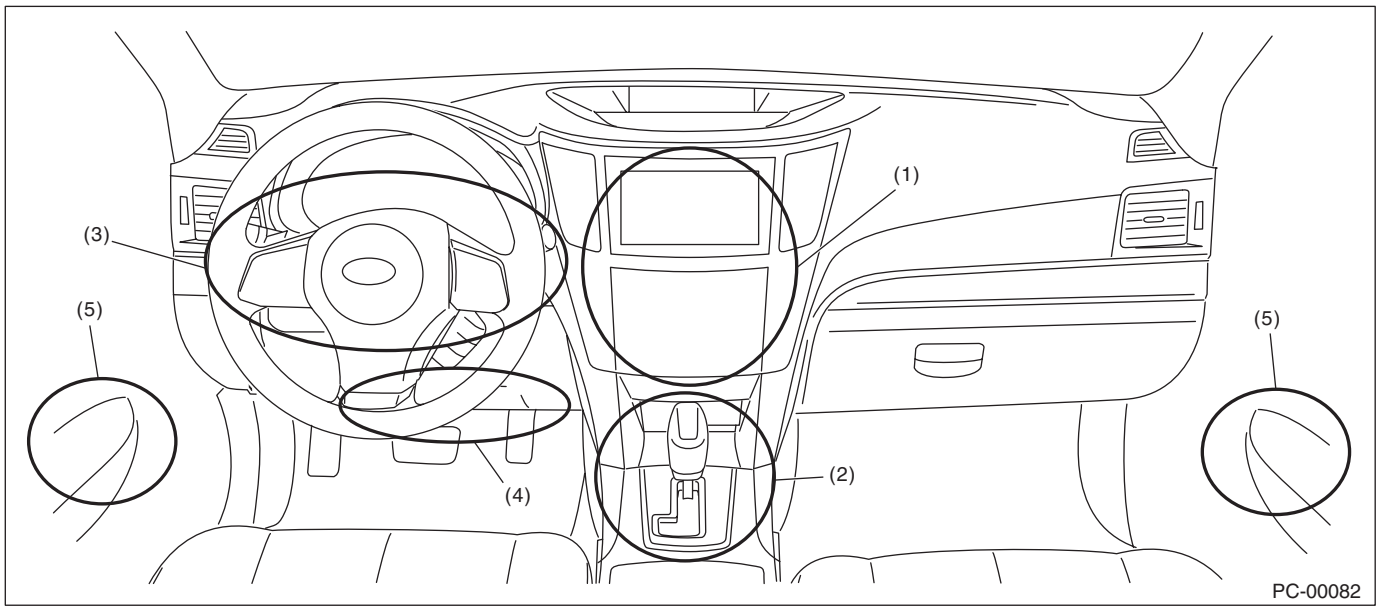
**• For the parts below, replaces with a new part when the hose is removed or the installation position is changed.**

CVTF cooler hose, power steering suction hose, power steering return hose, fuel hose (delivery)

## 16.HANDLING PRECAUTIONS FOR SILICON-CONTAINING SPRAY

When a silicone contained in the lubricant, rust inhibitor or glazing agent adheres to the electrical contact of the relay or switch, nonconducting silica dioxide ($SiO_2$) film will be formed, which may lead to poor continuity. Therefore, the following precautions must be observed when using the silicon-containing spray.

- Never spray directly to the electrical equipment.
- When using the spray close to the electrical equipment, always put the cover on it. Be sure to put the cover on the electrical equipment especially when using the spray to the locations shown in the figure below and their surrounding areas.



| | | | | | |
|---|---|---|---|---|---|
| (1) | Audio, heater control switch | (3) | Combination switch, steering switch | (5) | Power window switch |
| (2) | Shift/select lever switch, parking switch | (4) | Stop light switch, brake light switch, clutch switch, clutch start switch | | |

- If the residual silicon remains in the vicinity of the electrical equipment after the spray has been used, the vaporized silicon stands around the electrical equipment and it may adhere to electrical contact. After using the spray, be sure to wipe the silicon off with a cloth.
- Even when using the spray to the place away from the electrical equipment, the droplet of the spray may be splashed to the periphery. Use as small amount of spray as possible, and take care not to splash the silicon to the periphery.

NOTE:
The “silicon” used in this section refers to “silicone”, that is, silicon polymer.

## A: BASIC REPAIR HINT

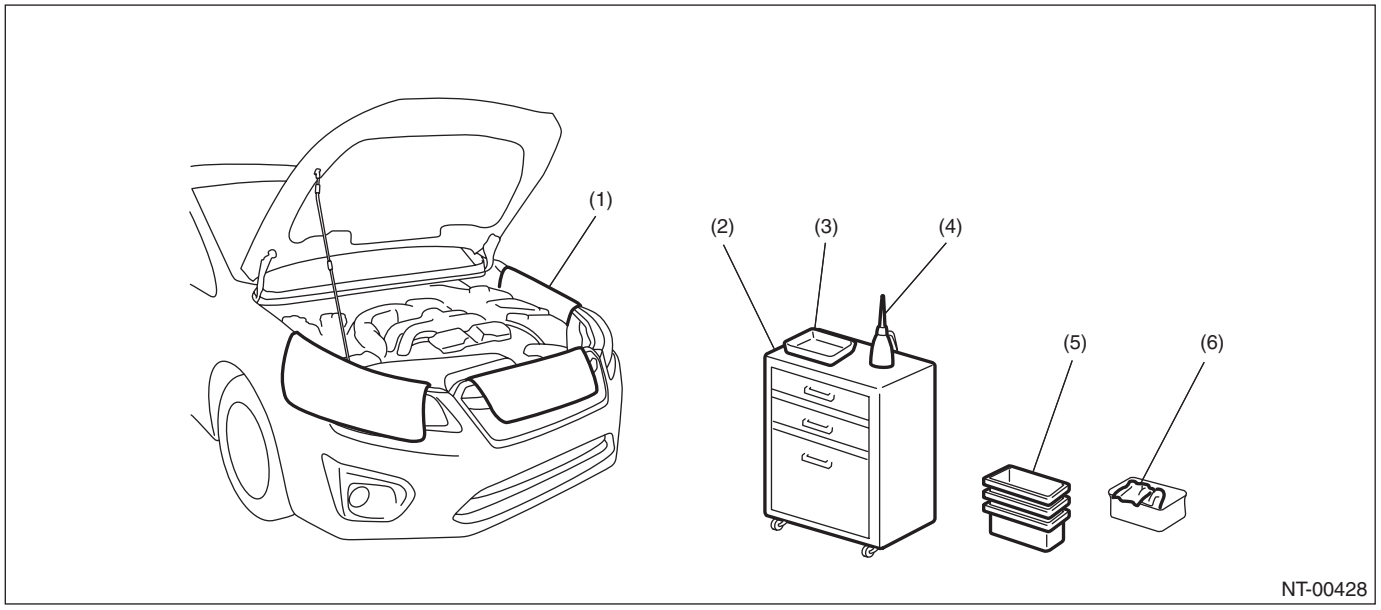
This section describes basic points that the service operator must understand before performing the service operation.

### 1. APPEARANCE

- Always wear clean work clothing.
- Wear a cap and protective shoes.

### 2. PROTECTION OF VEHICLE UNDER MAINTENANCE AND PREPARATION OF TOOLS/ EQUIPMENT

- Before work, cover the vehicle body. (Ex. grille cover, fender cover, seat cover and floor mat cover)
- Before performing the service operation, prepare tools, equipment, container box, grease and cloth etc.



| | | | | | |
|---|---|---|---|---|---|
| (1) | Fender cover | (3) | Tray | (5) | Container box |
| (2) | Tools/equipment case | (4) | Oil | (6) | Cloth |

### 3. SAFETY

- Before work, set the wheel stoppers to secure the vehicle.
- When performing work by multiple workers, call to each other to make sure that service operation is performed safely.
- Before starting engine, ventilate the room.
- When performing the service operation of high-temperature parts like muffler, rotating parts like fan and other movable parts, be careful not to get burned or injured.
- For the jack-up and lift up, set the tool to the proper location to support the vehicle correctly. And use the safety device properly when lifting up.

### 4. SERVICE OPERATION

- By identifying the vehicle problems thoroughly before work, service operation will be performed effectively.
- Before removing parts, confirm the installation condition or the damage of the parts.
- To reinstall parts properly, leave a note of the condition before work as necessary.
- For a part which needs positioning, take appropriate action such as putting alignment marks.
- For a removed part, clean it as necessary and check for damage and defect before installation.

## 5. REMOVED PART

- A removed part must be organized to avoid mixing up with similar parts. When same parts are used in multiple locations, such as pistons in engine, manage the parts by using labels with cylinder No. so that the parts are not installed to the wrong location.
- Always replace nonreusable parts such as gasket and O-ring with new parts.
- After work, have a customer confirm the replaced part.

## 6. WHEN REMOVING BATTERY

When removing battery, power supply is cut off and the information stored in the computer memory is volatilized. Therefore, setting information of some device is initialized to the factory default. The device and functions initialized by removing battery are as follows.

| No. | Item | Job contents when connecting battery |
|---|---|---|
| 1 | Clock (MFD) (settings that the customer set) | Set the clock to the current time. |
| 2 | MFD (high grade type) | Set to the contents checked before disconnecting the battery. |
| 3 | Audio (settings that the customer set) | Set to the contents checked before disconnecting the battery. |
| 4 | Navigation system (settings that the customer set) | • Time setting is not necessary because the time information is received via GPS.<br>• Set the sound and other settings (items that were set in the selection) to the contents checked before disconnecting the battery. |
| 5 | Temperature setting of fully automatic air conditioner (settings that the customer set) | Set to the contents checked before disconnecting the battery. |
| 6 | Power window system | Initialize automatic full open/close of driver's window (power window system). For the initialization procedure, refer to "GW" section. <Ref. to GW-10, OPERATION, Power Window System.> |
| 7 | Electronic throttle system | Turn the ignition switch to ON, wait for 10 seconds or more, and start the engine. |
| 8 | Engine control system | Let the engine run at idle until it fully warms up (the radiator fan turns 2 times or more) under no electrical load condition. |
| 9 | Past trouble history (memory code) | — |

## 7. OTHER ADJUSTMENT OPERATIONS BEFORE DELIVERING THE VEHICLE TO CUSTOMER

Due to service and parts replacement convenience, perform the following operations before delivering the vehicle to the customer.

| No. | Item | Check operation | Adjustment operation | Additional adjustment operations when replacing parts |
|---|---|---|---|---|
| 1 | Positions of devices<br>• Steering<br>• Room mirror<br>• Door mirror<br>• Seat<br>• Air conditioner vent grille | Is the device set to the same position when the vehicle was received from the customer? | Adjust the device to the similar position when the vehicle was received from the customer. | When removing/installing each device<br>• Meter, instrument panel, steering column, etc.<br>• Room mirror, roof trim, sunroof assembly, etc.<br>• Door mirror, door panel, etc.<br>• Seat, floor carpet, parking brake lever, etc.<br>• Vent grille, instrument panel, console box, etc. |
| 2 | Positions of switches<br>• SI-Drive<br>• Wiper, light (AUTO or OFF)<br>• Headlight beam leveler<br>• Illumination control<br>• Room light<br>• Seat heater, etc. | Is the switch set to the same position when the vehicle was received from the customer? | Set the switch to the same position when the vehicle was received from the customer. | When removing/installing each switch |
| 3 | Position of antenna | Is the antenna set to the same position when the vehicle was received from the customer? | Adjust the position of antenna. | When removing/installing the antenna and washing the vehicle |

# B: NOTE

This is the information that can improve the efficiency of maintenance and assure the sound work.

## 1. CLEANING

- Perform the operation in a clean location and use extra caution in dust proofing.
- Clean the items (except for assembly components) with steam, etc. before disassembly. During steam cleaning, wrap the air breather, oil level gauge, connectors, etc. with vinyl tape to prevent steam from entering inside the parts.
- For cleaning solution, use new kerosene, etc.
- Do not clean rubber parts such as O-ring, gasket and oil seal with cleaning solution.

## 2. FASTENERS NOTICE

Tighten the bolts and nuts to the specified torque. Do not apply paint, lubricant, rust retardant or other substance to the surface around bolts, nuts, etc. It may cause troubles with tightening to the specified torque and result in looseness and other problems of bolts and nuts.

## 3. STATIC ELECTRICITY DAMAGE

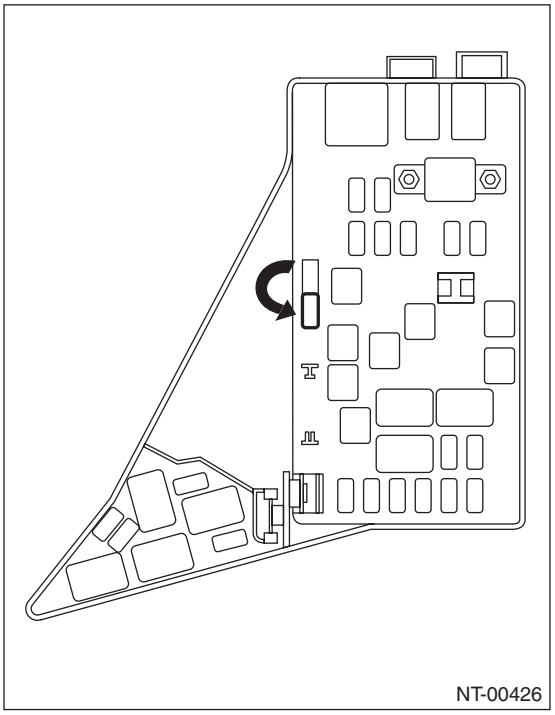
Do not touch the control modules, connectors, logic boards and other such parts when there is a risk of static electricity. Always use a static electricity prevention cord or touch grounded metal for the elimination of static electricity before conducting work.

## 4. BATTERY

When removing the battery terminal, always be sure to turn the ignition switch to OFF and remove the battery ground cable first.

## 5. BACKUP/POWER SUPPLY FUSE

Backup fuse (20A) remains removed to prevent the battery consumption when vehicles are delivered. Install the backup fuse by following the illustration.



## 6. IMMOBILIZER RELATED PART

Do not replace parts which have immobilizer ID (all ignition key, combination meter (except for Canada), body integrated unit, ECM and SCM (for Canada)) with the parts from other vehicle.

## 7. SERVICE PARTS

Use genuine parts for maximum performance and maintenance when conducting repairs. Subaru/FHI will not be responsible for poor performance resulting from the use of parts except for genuine parts.

## 8. PROTECTING VEHICLE UNDER MAINTENANCE

Make sure to attach the fender cover, seat covers, etc. before work.

## 9. ENSURING SECURITY DURING WORK

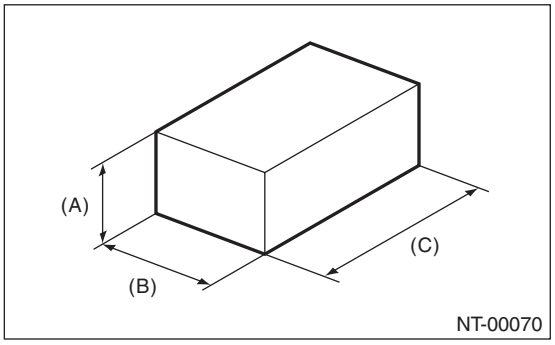
When working in a group of two or more, perform the work with calling each other to ensure mutual safety.

## 10.LIFT AND JACK

When using a lift or shop jack to raise a vehicle or using rigid rack to support a vehicle, always follow instructions concerning jack-up points and weight limits to prevent the vehicle from falling, which could result in injury. Be especially careful that the vehicle is balanced before raising it. Be sure to set the wheel stoppers when jacking-up only the front or rear side of the vehicle.

**CAUTION:**
**Select the lift attachment so that the side sill does not contact the lift arm.**

NOTE:
- When using a lift, follow its operation manual.
- When the side sill cover contacts the lift arm, use a lift attachment.
- Do not work or leave unattended while the vehicle is supported with jack, support it with rigid racks.
- Be sure to use the rigid racks with rubber attached to cradle to support the vehicle.
- When using a lift, use an attachment or something similar.
- When using a plate lift, use a rubber attachment. Place the attachment to the specified position of the vehicle, by adjusting front/rear and left/right sides accordingly.

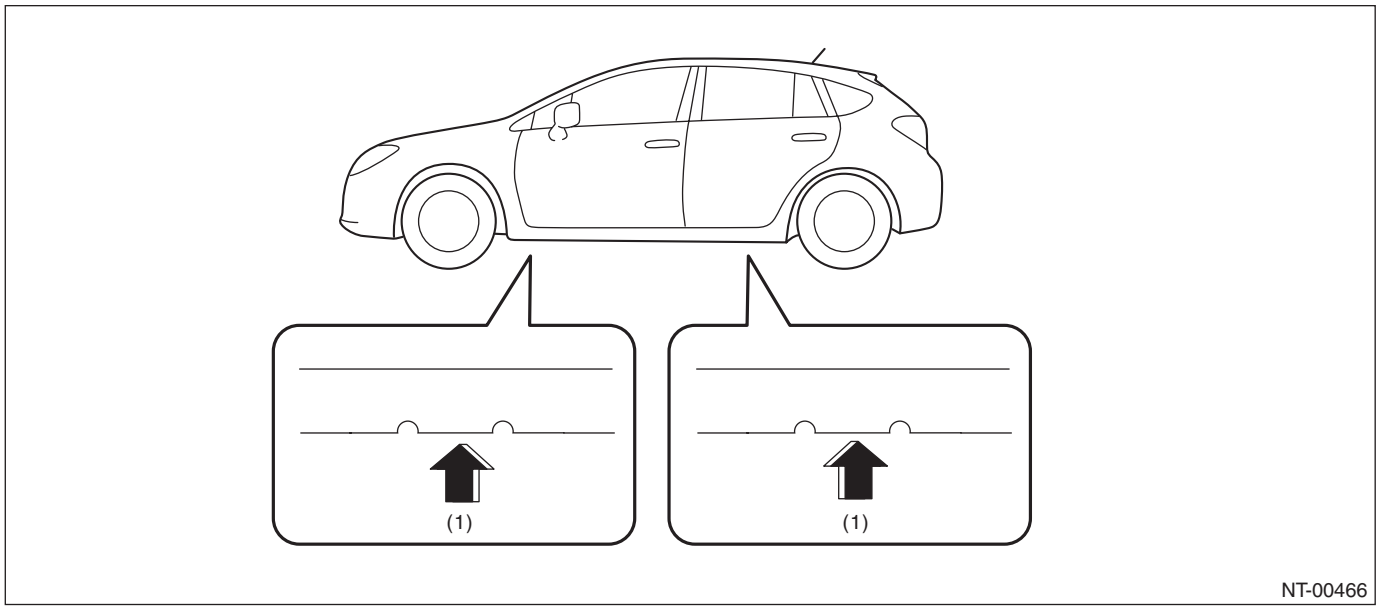


(A) 80 mm (3.1 in) or more
(B) 80 — 100 mm (3.15 — 3.94 in)
(C) 120 — 200 mm (4.72 — 7.87 in)

- Align the cushion rubber center part of plate lift with the center part of rubber attachment.
- Do not use the plate lift whose attachment does not reach the supporting locations.

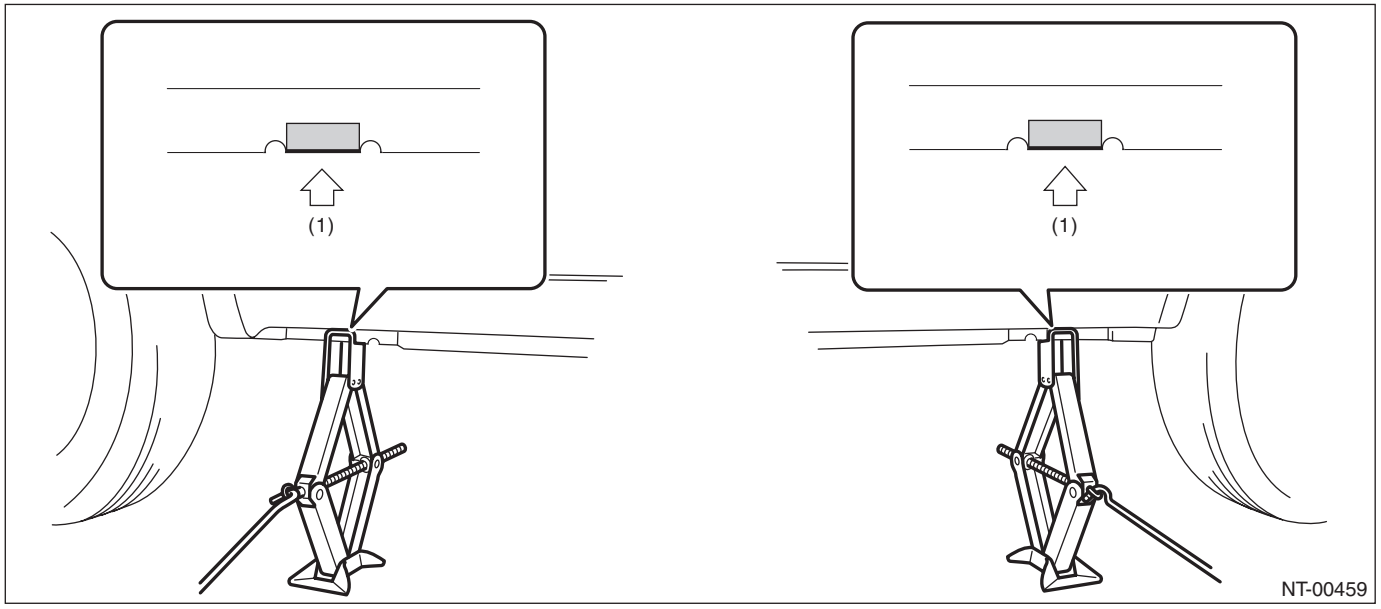
NOTE

- **Support locations**



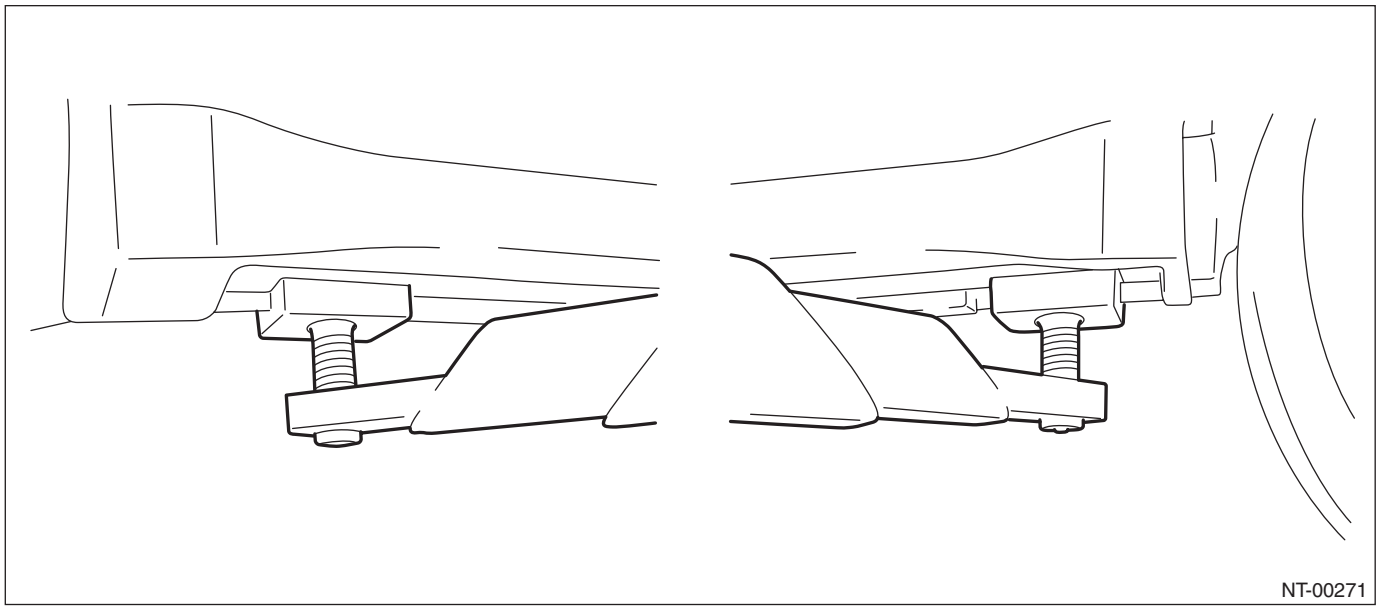
(1) Jack-up point

- **Pantograph jack**



(1) Jack-up point

- **Lift**



**CAUTION:**
**For models with side under skirt, use a spacer or an attachment to lift up the vehicle securely at jack up point, without contact of side under skirt and lift.**

- **Rigid rack**

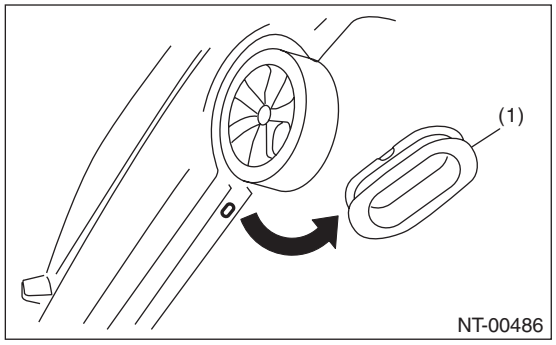
**If jacking up the front side of the vehicle, make sure that the jack is attached at the center of the jack-up plate not at the sides.**

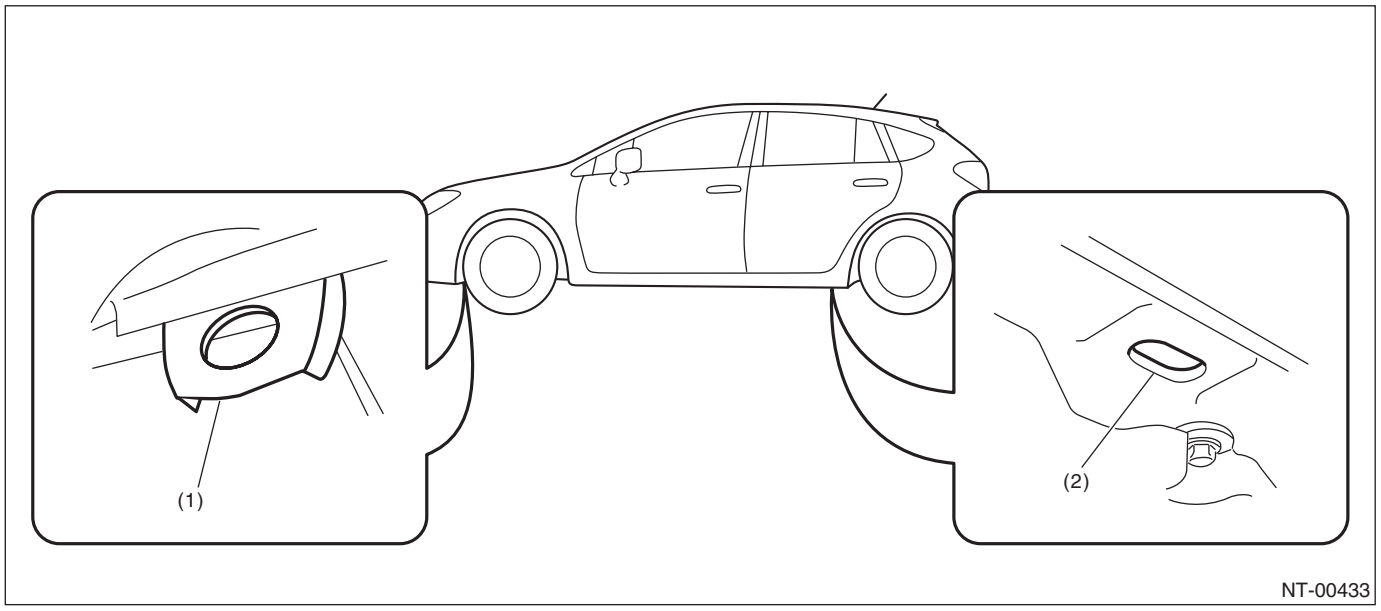
## 11.TIE-DOWNS

Tie-downs are used when transporting vehicles and when using the chassis dynamo. Remove the grommet of the tie-down hole (when equipped) and install the tie-down only to the specified locations on the vehicle.



(1) Grommet

- **Tie-down location**



(1) Hook for tie-down

(2) Tie-down hole

NOTE

**• Chain direction at tie-down condition**

**CAUTION:**

**• Pull the front and rear of the vehicle in the opposite direction, and pull the left and right of the vehicle in the same direction.**

**• Patterns except for the followings (recommended) are not allowed.**

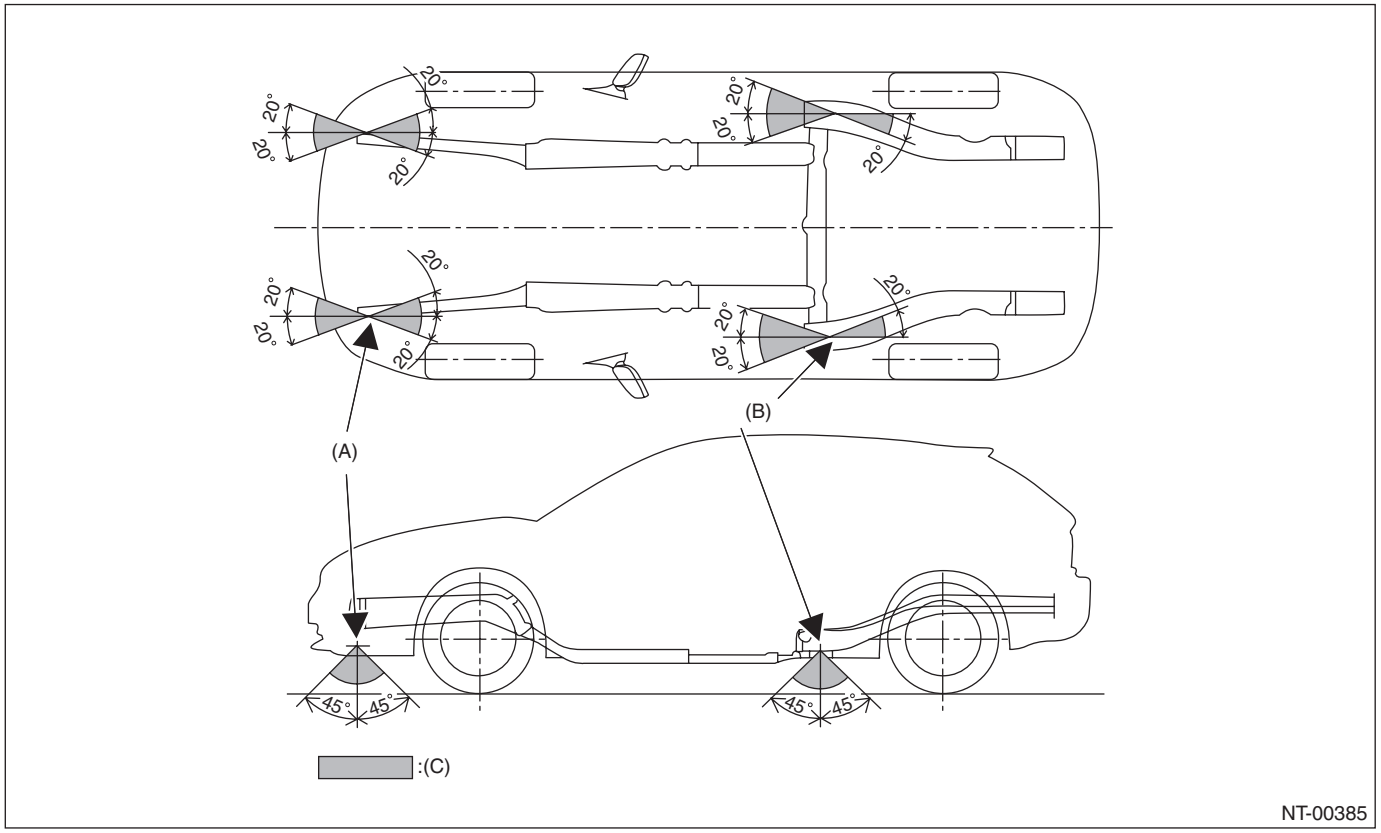
| | Recommended |
|---|---|
| Tie-down direction |  NT-00214 |

- **Tie-down range**

For ground transportation

**CAUTION:**

**When the vehicle is tied down from vehicle inside, hook the hooks of tie-down chain on the rear tie-down holes from vehicle inside. When the vehicle is tied down from vehicle outside, hook the hooks of tie-down chain on the rear tie-down hooks from vehicle outside.**



(A) Front tie-down hook

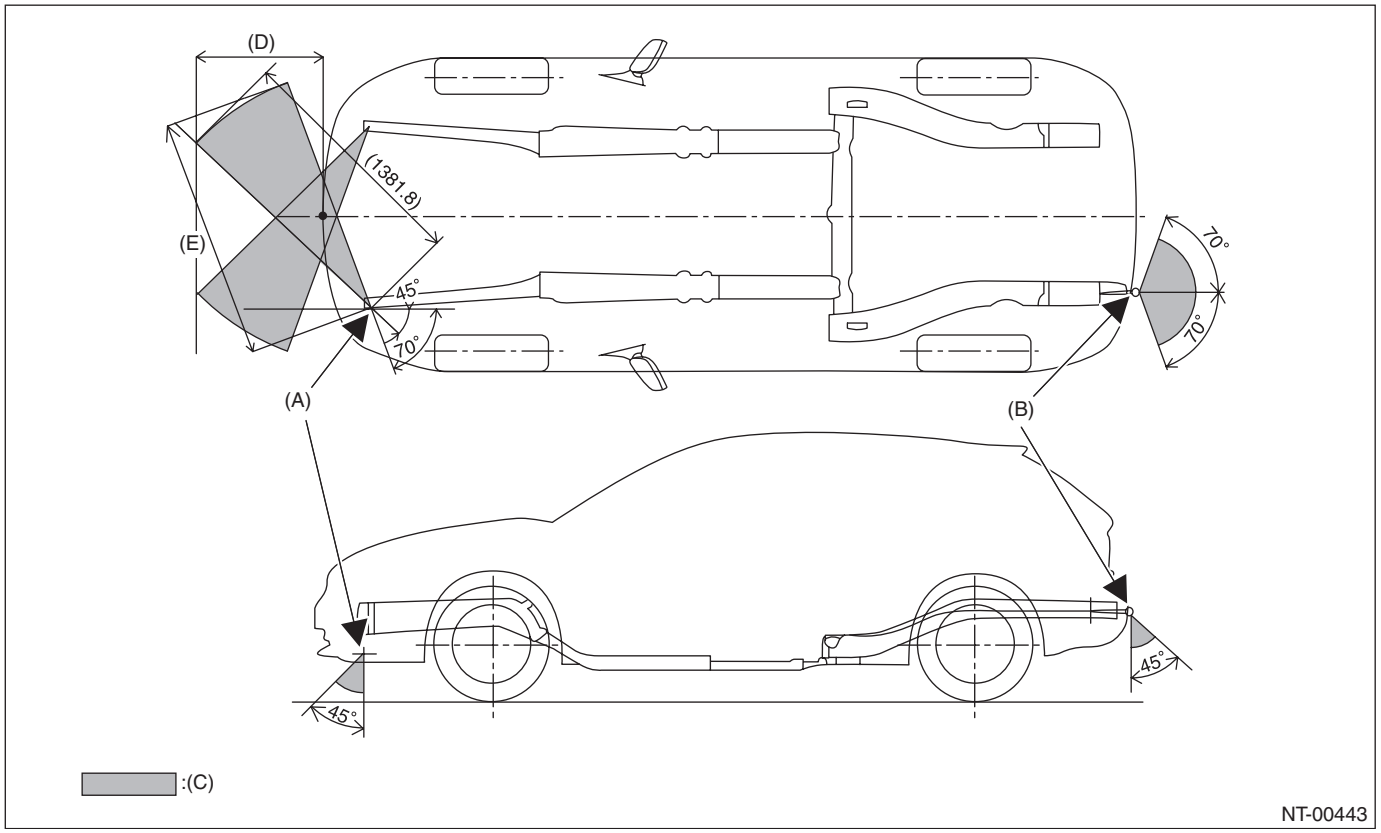
(B) Rear tie-down hole

(C) Chain pulling range at tie-down condition

NOTE

For sea transportation

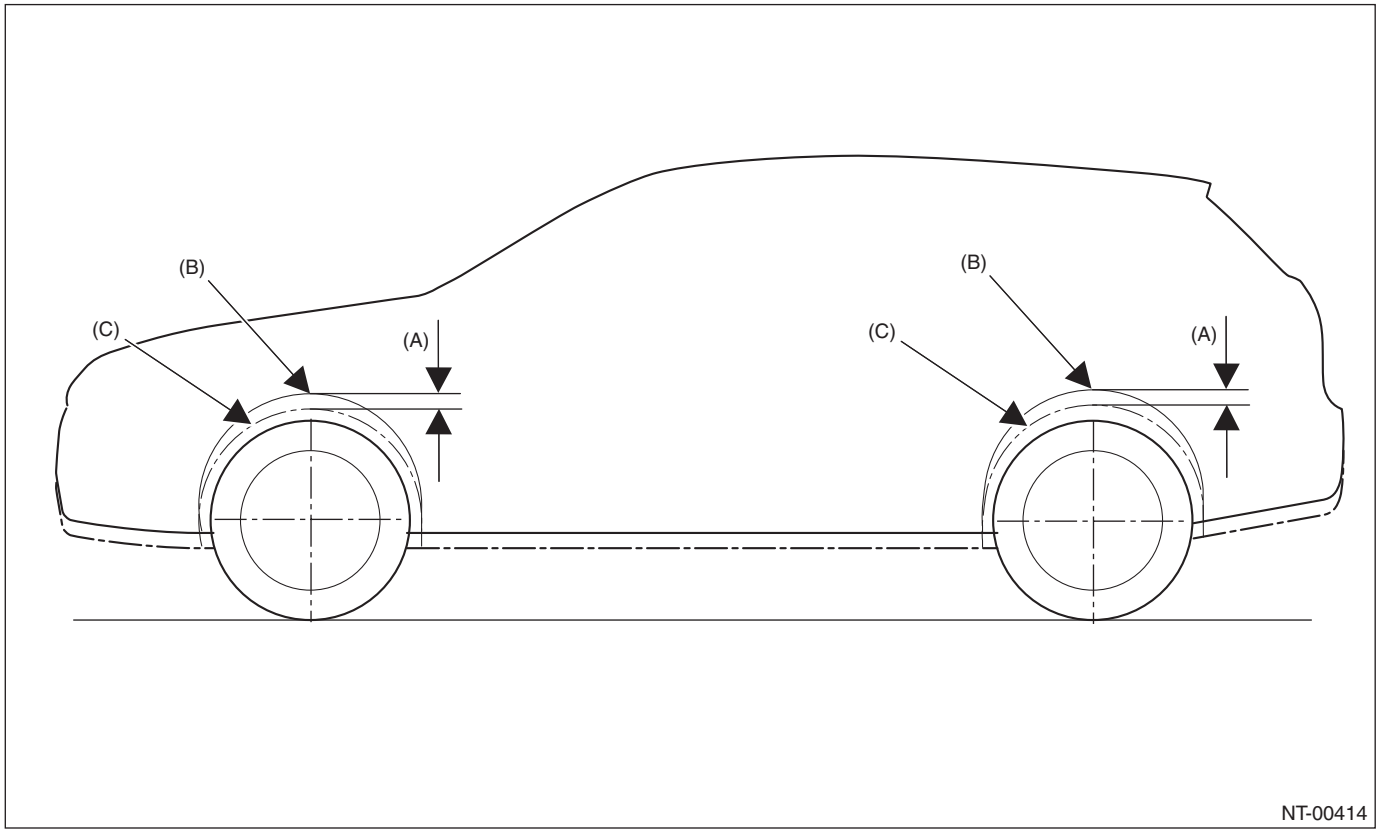
**CAUTION:**
**The eye bolts are exclusively used for towing and sea transportation tie-down, and do not use them for ground and freight transportation.**



| | | | | | |
|---|---|---|---|---|---|
| (A) | Front tie-down hook | (C) | Chain pulling range at tie-down condition | (E) | 1,320 mm (52.0 in) |
| (B) | Eye bolt | (D) | 400 mm (15.7 in) | | |

- **Vehicle sinking volume at tie-down condition**

**CAUTION:**
**The vehicle sinking volume at tie-down condition should be less than 50 mm (1.97 in) and make sure to fix the vehicle securely.**
**Check to see if the tensions of chains or belts at tie-down condition are appropriate in the following procedures.**
1) Before tie-down, measure the distance between the highest tire point and highest arch point at the center of wheel.
2) After tie-down, measure the distance between the highest tire point and highest arch point at the center of wheel.
3) If the distance (A) between the measured value of 1) and 2) above, is less than 50 mm (1.97 in), it is judged as OK. If the distance is 50 mm (1.97 in) or more, it is judged as NG because the tension is too high.



(B) Arch position before tie-down (C) Arch position after tie-down

- **Notes for the use of tie-down hook**

When the vehicle is tied down from vehicle inside, hook the hooks of tie-down chain from vehicle inside, and when the vehicle is tied down from vehicle outside, hook the hooks of tie-down chain from vehicle outside.
For front tie-down hook, use S hook and J hook, and for rear tie-down hole, use S hook, J hook and T hook. T hook can be used only for rear tie-down hole.

NOTE

## 12.TOWING

Avoid towing vehicles except when the vehicle cannot be driven. For models with AWD, CVT or VTD, use a loader instead of towing. When towing other vehicles, pay attention to the following to prevent hook or vehicle damage resulting from excessive weight.

- Do not tow other vehicles with a front tie-down hook.
- Make sure the vehicle towing is heavier than the vehicle being towed.
- Front

Remove the hook cover, and install the towing hook (eye bolt).

- **Since the power steering does not work, be careful for the heavy steering effort. (When engine is stopped)**
- **Since the servo brake does not work, be careful that the brake is not applied effectively. (When engine is stopped)**
- **In case of the malfunction of internal transmission or drive system, lift up four wheels (on a trailer) for towing.**
- **Do not use towing hook (eye bolt) except when towing.**
- **Make sure to detach the towing hook (eye bolt) after towing. If the hook remains attached, airbag may not operate properly when receiving a shock from front side. And it may also affect the crash performance of the vehicle.**

## 13.CARRIER CAR

Before lowering the vehicle from the carrier car, perform the following operations.

**CAUTION:**
**Always perform the following operations before lowering the vehicle from the carrier car. Otherwise, the power unit will rotate reversely, which may cause the damage to the engine, vacuum pump, and transmission.**

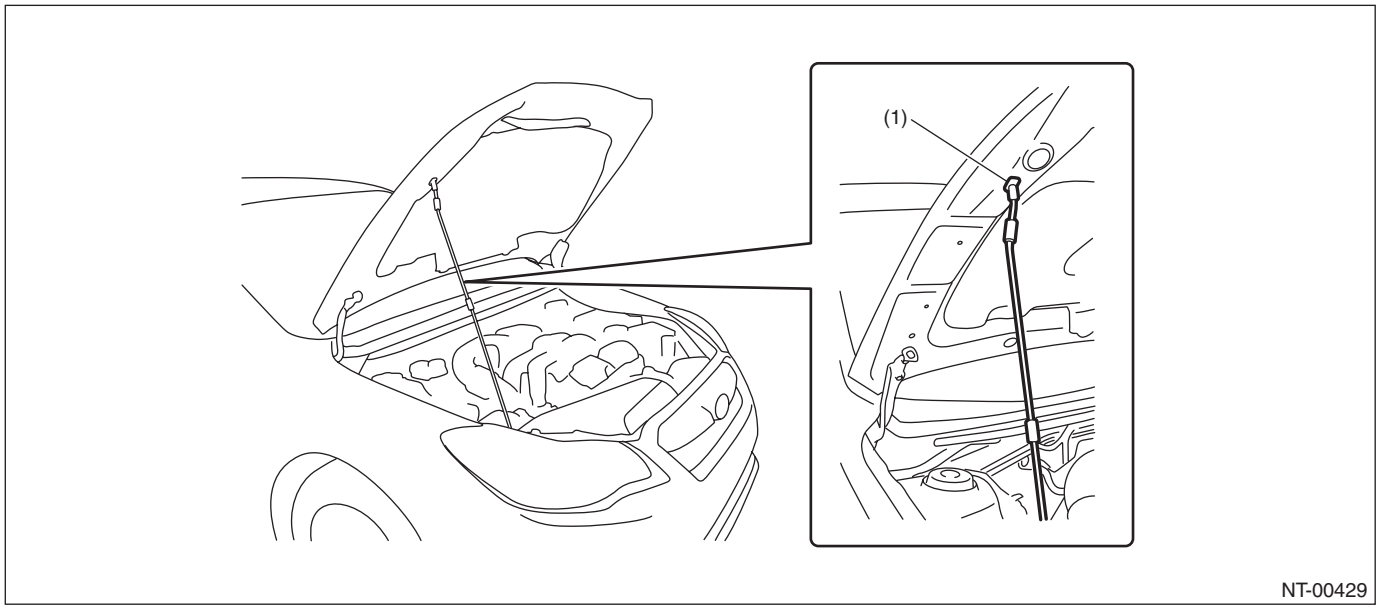
1) Start the engine.
2) Set the transmission shift position into driving direction of the vehicle. (When the vehicle drives forward, do not set the transmission into R range. When the vehicle drives rearward, do not set the transmission into 1 — 5 speed, or D range.)

**CAUTION:**
**Be sure to perform 2) mentioned above even if the engine cannot be started in some reasons.**

## 14.FRONT HOOD STAY

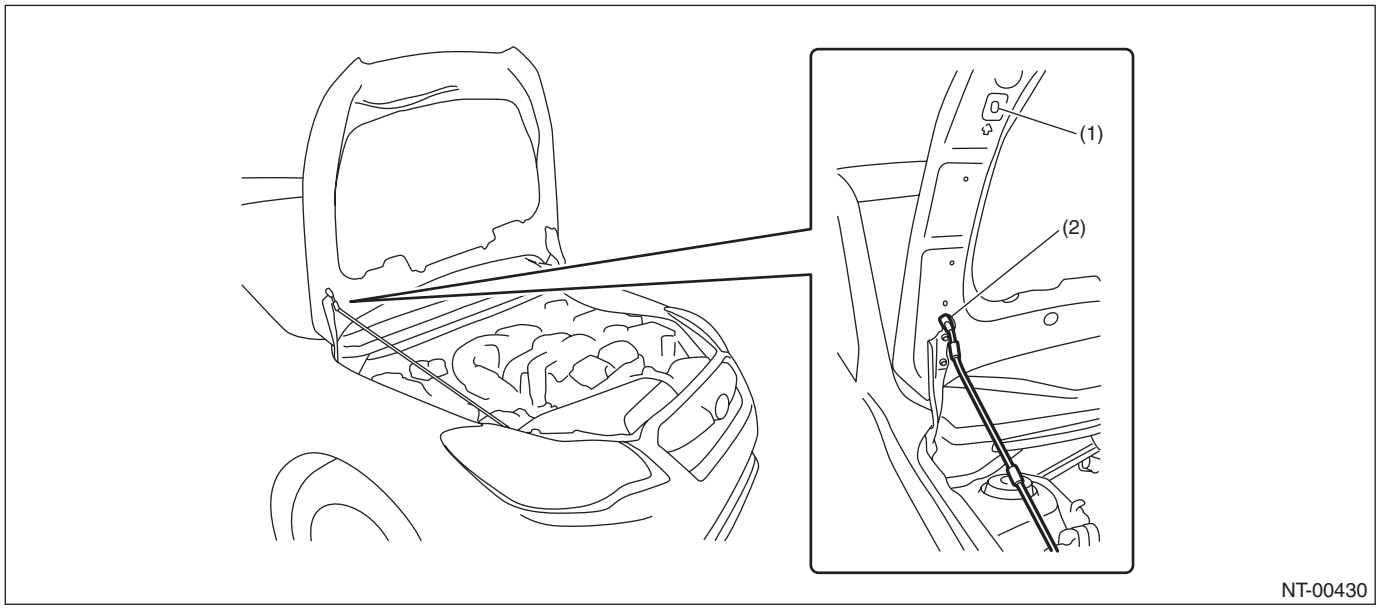
1) Always attach the stay to the normal position when performing works such as inspections and general maintenance.

**CAUTION:**
**At the inspection and general maintenance, do not detach the stay.**



(1) Normal attached position

2) When wider front hood opening is necessary, set the stay to the lower position (hood hinge) as shown in the figure.



(1) Normal attached position (2) Installation position at full open

## 15.GENERAL SCAN TOOL

Using general scan tools will greatly improve the efficiency of repairing engine electronic throttle controls. Subaru Select Monitor can be used to diagnose the engine, VDC, air conditioner and other parts.

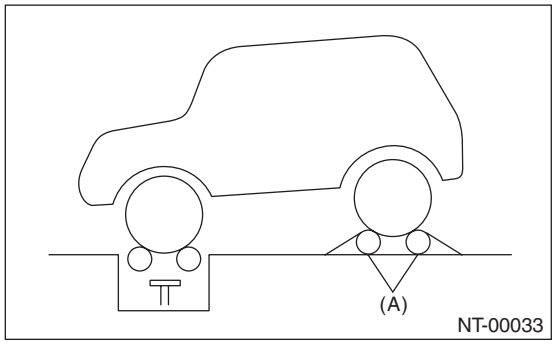
## 16.AWD CIRCUIT MEASURES

1) Full-time AWD MT model
Since viscous coupling (limited slip differential) is used in the center differential, cut-off of AWD circuit cannot be carried out.
2) Full-time AWD CVT model
Since electronically controlled MP-T hydraulic multi-plate clutch is adapted for center differential, switch to FWD by using Subaru Select Monitor.

## 17.SPEEDOMETER TEST

1) Rear wheel free roller system
   (1) Set the free roller on the floor of rear wheel side securely according to the wheel base and rear tread of the vehicle.
   (2) Let the vehicle ride on the tester and free roller gently.

**CAUTION:**
**Fix the vehicle using a pulling metal (chain or wire) to the front and rear towing hooks or tie-down hook to prevent the lateral runout of front wheels and springing out of vehicle.**



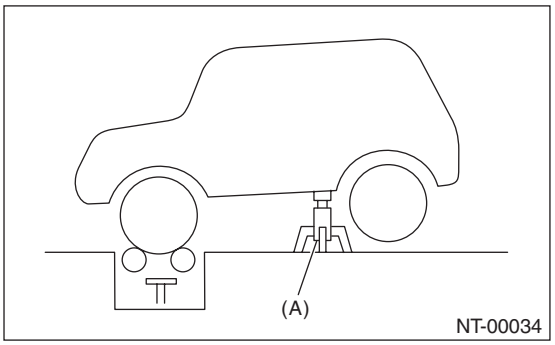
(A) Free roller

   (3) Set the speedometer tester.
   (4) Conduct the speedometer test work.

**CAUTION:**
**Do not operate the clutch quickly and do not accelerate or decelerate suddenly during work.**
2) Rear wheel jack-up system
   (1) Set the vehicle on speedometer tester.

**CAUTION:**
**Fix the vehicle using a pulling metal (chain or wire) to the front and rear towing hooks or tie-down hook to prevent the lateral runout of front wheels and springing out of vehicle.**

   (2) Jack up the rear wheels and set the rigid racks to the specified locations of side sill.



(A) Rigid rack

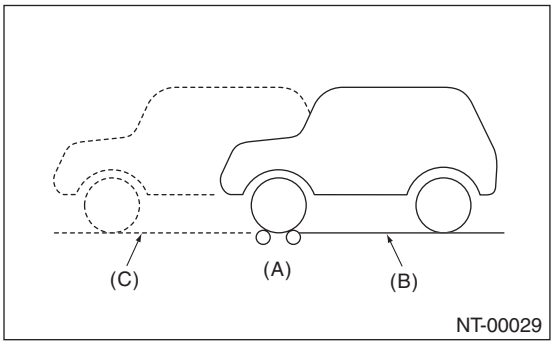
   (3) Conduct the speedometer test work.

**CAUTION:**
**Do not operate the clutch quickly and do not accelerate or decelerate suddenly during work.**

## 18.BRAKE TEST

1) Full-time AWD MT model
   (1) Perform this test after driving the vehicle 2 to 3 km (1.24 to 1.86 miles) on road in order to stabilize the viscous torque of viscous coupling.
   (2) Keep the front or rear wheels on the ground for this test.

NOTE:
Effect of the viscous torque on braking force will be added approx. 25 kg compared with FWD model.

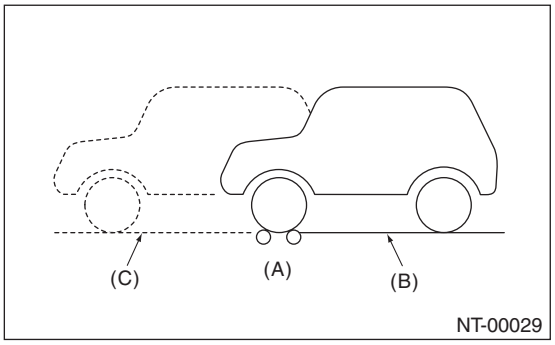


(A) Brake tester
(B) Position for measuring front wheel
(C) Position for measuring rear wheel

   (3) When the brake dragging force is large.
• Check the dragging of brake pad or brake shoe.
• Since it may be affected by the viscosity of viscous coupling, jack up either of the front or rear two wheels to check the each wheel rotation condition with the viscous coupling affection removed.

2) Full-time AWD CVT model

(1) Keep the front or rear wheels on the ground during measurement.



(A) Brake tester
(B) Position for measuring front wheel
(C) Position for measuring rear wheel

(2) When the brake dragging force is large.

• Check the dragging of brake pad or brake shoe.

***Specifications:***

| | Braking force |
|---|---|
| Rear wheel total | 10% or more of load on front or rear wheels |
| Difference between right and left wheels | 8% or less of load on front or rear wheels |
| Grand total | 50% or more of vehicle weight at the time of test |

• When measurement is difficult to carry out because both of front wheels are locked, break force measurement in this condition conforms to standard grand total.

## 19.ON THE CAR WHEEL BALANCING

**CAUTION:**

**• Carry out the procedures after measuring the balance of each single tire.**

**• Set the vehicle so that the front and rear wheels are the same height.**

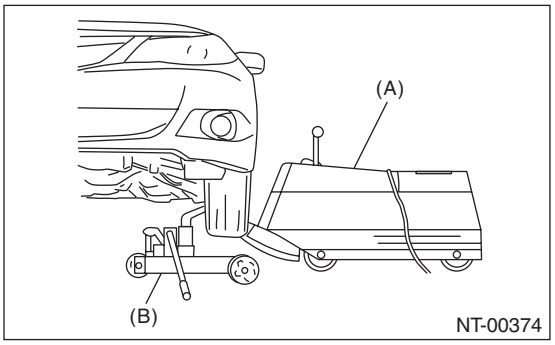
**• Release the parking brake during measurement.**

**• Rotate each wheel by hands, and make sure it rotates without dragging.**

**• Do not operate the clutch quickly and do not accelerate or decelerate suddenly during work.**

**• When an error is indicated during engine drive, do not use the motor drive together.**

1) Set the rigid rack to the specified locations of side sill, jack up the front or rear two wheels of non-measuring side and set the pickup stands to two wheels of measuring side.



(A) Balancer body
(B) Pickup stand (left and right)

2) For drive wheel, drive the tires with engine for measurement.

3) For non-drive wheel, drive the tires from the on the car wheel balancer for measurement.

# 1. Recommended Materials

## A: RECOMMENDED MATERIALS

### 1. GENERAL

To insure the best performance, always use the specified oil, gasoline, adhesive, sealant, etc. or a substitute of equivalent quality.

### 2. FUEL

• Use unleaded gasoline to reduce air pollution, because using leaded gasoline will damage the catalytic converter.
• Do not use the low quality gasoline, or improper fuel such as diesel fuel, fuel alcohol, or gasoline additive because they will adversely affect on engine components and fuel system components.
• Always use gasoline that is equivalent to that prescribed in the owner's manual or that of high octane value. There is the possibility of damaging or improper operation of the engine and fuel injection system if the specifications are not observed. Use the prescribed gasoline type to maintain proper vehicle performance.

### 3. LUBRICANTS

Use the lubricants shown in the table below, or equivalent. See the table below to choose the correct SAE viscosity.

| Lubricant | Recommended materials | |
|---|---|---|
| | API standard | ILSAC standard |
| Engine oil<br>Choose oil suitable for the standard from the right. | SN or SM grade "Resource conserving" or "Energy conserving"<br>  <br>RM-00076<br>Those with the above API service labels | GF-5 or GF-4<br> <br>RM-00002<br>Those with the above ILSAC certification mark (Starburst mark) |

• Connect a hose to a tap, and spray water on the vehicle. The rate of water spray must be approx. 20 to 25 L (5.3 — 6.6 US gal, 4.4 — 5.5 Imp gal) per minute.
When spraying water on areas adjacent to the floor and wheel house, increase the pressure. When spraying water on areas other than the floor and wheel house, decrease the pressure. But the force of water must be made strong occasionally by pressing the end of the hose.

NOTE:
Be sure to keep the hose at least 10 cm (3.9 in) away from vehicle.

## 56.APPEARANCE 2

1) If protective coating (lap guard) is applied, remove it.

NOTE:
• When removing the lap guard, using steam will make it easier to remove.
• Vehicle left for a extended periods or at low temperatures, spray the vehicle with water heated 50 — 60°C (122 — 140°F) to raise the surface temperature before peeling off the wrap guard. Do not use the water heated to over 60°C (140°F).
• If the adhesive remains exist on the coated surface, soak a flannel rag, etc. with a small amount of coating wax or solvent such as oil benzene and IPA, put the soaked cloth on the remains lightly, and then wipe them off with a flannel rag etc.
• Keep solvent from touching the resin or rubber parts. Do not use coating wax or solvents while the component surface temperature is hot due to hot weather etc.
• If the coated surface is swollen out due to seams or moisture, expose the vehicle to the sunlight for a few hours or heat the seam and swollen portions using a dryer etc.
• Dispose of the peeled wrap guard as burnable industrial garbage.
2) Check the whole vehicle body for flaking paint, damage by transportation, corrosion, dirt, cracks or blisters.

NOTE:
• It is better to determine an inspection pattern in order to avoid missing an area, since the total inspection area is wide.
• Do not repair the body paint unless absolutely necessary. Also, if the vehicle is in need of repair to remove scratches or corroded paint, the repair area must be limited to the minimum. Re-painting and spray painting must be avoided as much as possible.
3) Check each window glass for scratches carefully. Slight damage may be removed by polishing with cerium oxide. (Fill a cup half with cerium oxide, and add warm water to it. Then agitate the content until it turns to wax. Apply this wax to a soft cloth, and polish the glass with it.)
4) Check each portion of the vehicle body and underside components for the formation of rust. If rust is discovered, remove it with sandpaper of #80 to #180 and treat the surface with rust preventive. After this treatment is completed, flush the portion thoroughly, and prepare the surface for repair painting.
5) Check each portion of body and all of the exterior parts for deformation or distortion. Also, check each light lens for cracks.

## C: CAUTION

- Prior to starting work, pay special attention to the following:
  1. Always wear work clothes, a safety cap, protective shoes. Additionally, wear a helmet, protective goggles, etc. if necessary.
  2. Protect the vehicle using a seat cover, fender cover, etc.
  3. Prepare the service tools, clean cloth, containers to catch grease and oil, etc.
- Place “NO OPEN FLAMES” signs near the working area.
- Prepare a container and cloth to prevent scattering of fuels when performing work where fuels can be spilled. If the oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.
- Vehicle components are extremely hot immediately after driving. Be wary of receiving burns from heated parts.
- When performing a repair, identify the cause of trouble and avoid unnecessary removal, disassembly and replacement.
- Before disconnecting connectors of sensors or units, be sure to disconnect the ground cable from battery.
- Always use the jack-up point when the shop jacks or rigid racks are used to support the vehicle.
- Remove contamination including dirt and corrosion before removal, installation, disassembly or assembly.
- Keep the removed parts in order and protect them from dust and dirt.
- All removed parts, if to be reused, should be reinstalled in the original positions with attention to the correct directions, etc.
- Bolts, nuts and washers should be replaced with new parts as required.
- Follow all government and local regulations concerning disposal of refuse when disposing fuel.

## C: CAUTION

- Prior to starting work, pay special attention to the following:
  1. Always wear work clothes, a safety cap, protective shoes. Additionally, wear a helmet, protective goggles, etc. if necessary.
  2. Protect the vehicle using a seat cover, fender cover, etc.
  3. Prepare the service tools, clean cloth, containers to catch grease and oil, etc.
- Vehicle components are extremely hot immediately after driving. Be wary of receiving burns from heated parts.
- When performing a repair, identify the cause of trouble and avoid unnecessary removal, disassembly and replacement.
- Before disconnecting connectors of sensors or units, be sure to disconnect the ground cable from battery.
- Always use the jack-up point when the shop jacks or rigid racks are used to support the vehicle.
- Remove or install the engine in an area where chain hoists, lifting devices, etc. are available for ready use. When lifting up the vehicle, make sure to support the vehicle at the jack-up points.
- Be careful not to let any oil or grease contact the clutch disc or flywheel.
- Remove contamination including dirt and corrosion before removal, installation, disassembly or assembly.
- Keep the removed parts in order and protect them from dust and dirt.
- All removed parts, if to be reused, should be reinstalled in the original positions with attention to the correct directions, etc.
- Rotating parts and sliding parts such as piston, bearing and gear should be coated with oil when being assembled.
- Bolts, nuts and washers should be replaced with new parts as required.
- Be sure to tighten the fasteners including bolts and nuts to the specified torque.

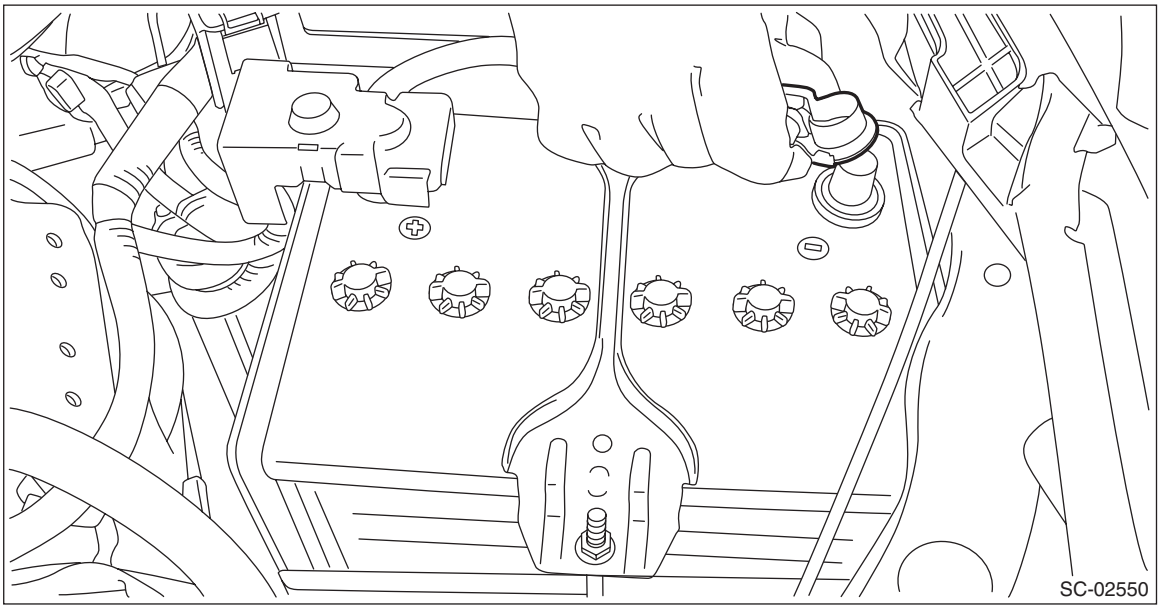
5) Start the engine and run it until it stalls.
6) After the engine stalls, crank it for five more seconds.
7) Turn the ignition switch to OFF.
8) Remove all spark plugs. <Ref. to IG(H4DO)-4, REMOVAL, Spark Plug.>
9) Connect the battery ground terminal.



10) Install the compression gauge to the spark plug hole.

11) Turn the ignition switch to ON.
12) Fully open the throttle valve.
13) Crank the engine by starter motor and read the value when the needle of the compression gauge becomes stable.

NOTE:
- Perform at least two measurements per cylinder, and make sure that the values are correct.
- If the compression pressure is out of standard, check or adjust the pistons, valves and cylinders.

***Compression (fully open throttle):***
***Standard***
***1,050 — 1,400 kPa (11 — 14 kgf/cm$^2$, 152 — 203 psi)***
***Difference between cylinders***
***100 kPa (1 kgf/cm$^2$, 14 psi) or less***

14) After inspection, install the related parts in the reverse order of removal.

# 3. Idle Speed

## A: INSPECTION

1) Before checking the idle speed, check the following item:
   (1) Check the air cleaner element is free from clogging, ignition timing is correct, spark plugs are in good condition, and hoses are connected properly.
   (2) Check the malfunction indicator light does not illuminate.
2) Warm up the engine.
3) Read the engine idle speed using Subaru Select Monitor. <Ref. to EN(H4DO)(diag)-36, READ CURRENT DATA FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>

NOTE:
- Idle speed cannot be adjusted manually, because the idle speed is automatically adjusted.
- If idle speed is out of standard, refer to the General Diagnosis Table under “Engine Control System”. <Ref. to EN(H4DO)(diag)-2, Basic Diagnostic Procedure.>

   (1) Check the idle speed when no-loaded. (Headlight, heater fan, rear defroster, radiator fan, A/C and etc. are OFF)

***Idle speed (No load, and for CVT model, select lever in “P” or “N” range, for MT model, gear shift lever in neutral position.):***
***Standard***
***650±50 rpm***

   (2) Check the idle speed when loaded. (Turn the A/C switch to ON and operate the compressor for at least one minute before inspection.)

***Idle speed (A/C on, and for CVT model, select lever in “P” or “N” range, for MT model, gear shift lever in neutral position.):***
***Standard***
***800 — 900±50 rpm***

# 4. Ignition Timing

## A: INSPECTION

**CAUTION:**
**After warming-up, engine becomes very hot. Be careful not to burn yourself at measurement.**

1) Before checking the ignition timing, check the following item:
   (1) Check the air cleaner element is free from clogging, spark plugs are in good condition, and hoses are connected properly.
   (2) Check the malfunction indicator light does not illuminate.
2) Warm up the engine.
3) Read the ignition timing using Subaru Select Monitor. <Ref. to EN(H4DO)(diag)-36, READ CURRENT DATA FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>

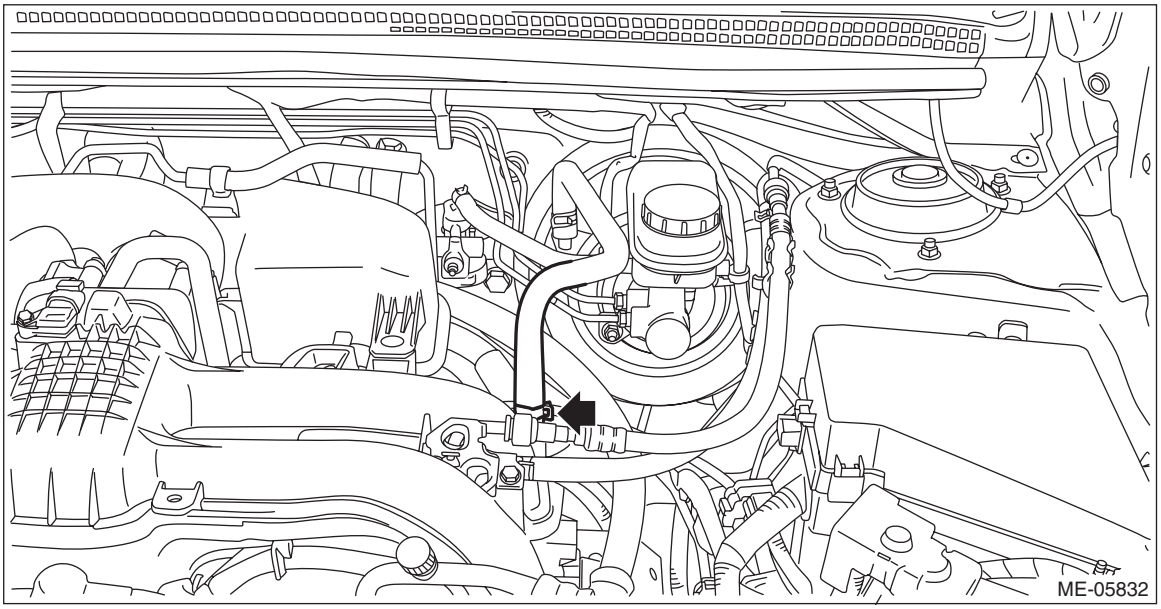
NOTE:
If ignition timing is out of standard, check the ignition control system. Refer to “Engine Control System”. <Ref. to EN(H4DO)(diag)-2, Basic Diagnostic Procedure.>

***Ignition timing [BTDC/rpm]:***
***Standard***
***16°±10°/650***

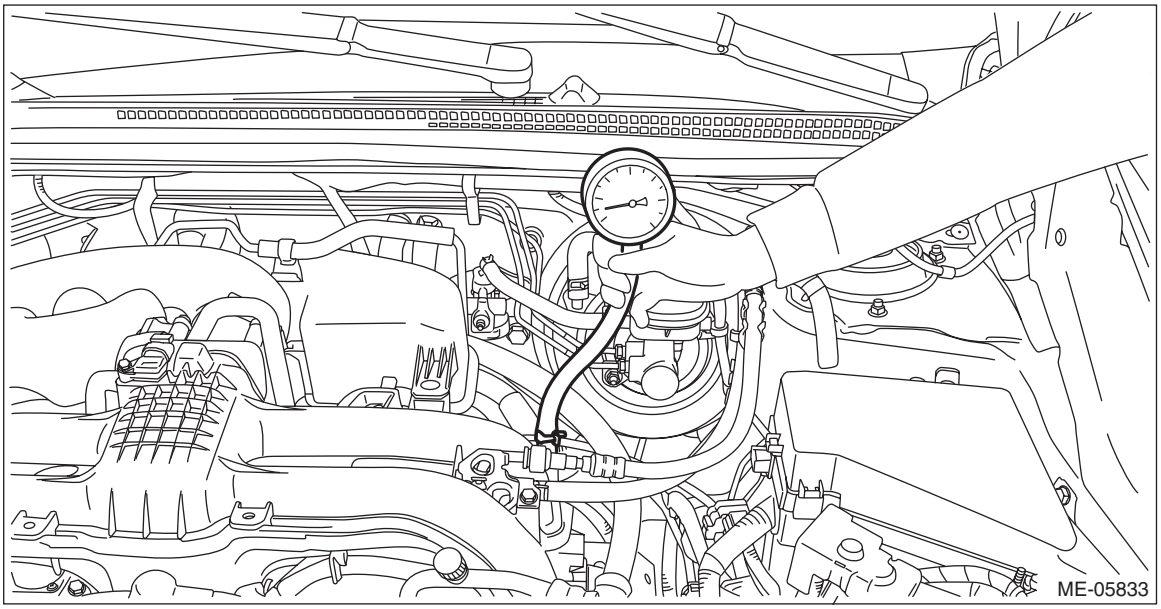
# 5. Intake Manifold Vacuum

## A: INSPECTION

1) Warm up the engine.
2) Disconnect the brake booster vacuum hose from the intake manifold.



3) Connect the vacuum gauge to the intake manifold.



4) Keep the engine at idle speed and read the vacuum gauge indication.

NOTE:
Condition of engine inside can be diagnosed by observing the behavior of the vacuum gauge needle as described in table below.

***Intake manifold vacuum (at idling, A/C OFF):***
***Standard***
***–60.0 kPa (–450 mmHg, –17.72 inHg) or more***

| **Diagnosis of engine condition by inspection of intake manifold vacuum** | |
|---|---|
| Vacuum gauge needle behavior | Possible engine condition |
| 1. Needle is steady but lower than standard value. This tendency becomes more evident as engine temperature rises. | Leakage around intake manifold gasket, disconnection or damage of vacuum hose |
| 2. Needle intermittently drops to position lower than standard value. | Leakage around cylinder |
| 3. Needle drops suddenly and intermittently from standard value. | Sticky valve |
| 4. When engine speed is gradually increased, needle begins to vibrate rapidly at certain speed, and then vibration increases as engine speed increases. | Weak or broken valve springs |
| 5. Needle vibrates above and below standard value in narrow range. | Defective ignition system |

5) After inspection, install the related parts in the reverse order of removal.

# 6. Engine Oil Pressure

## A: INSPECTION

# 8. Cam Clearance

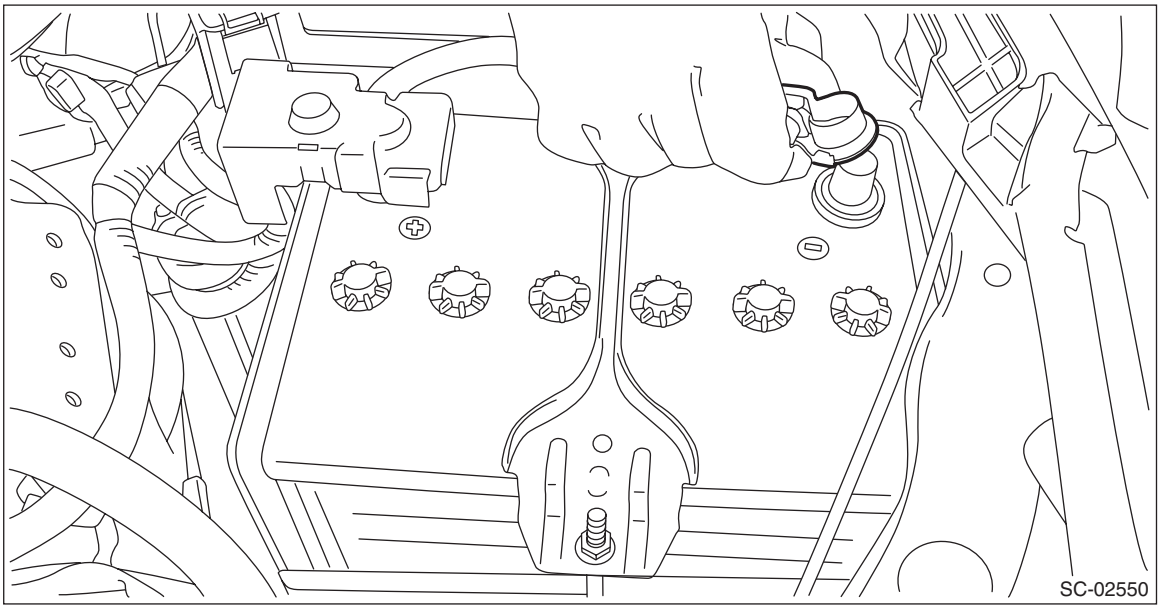
## A: INSPECTION

### 1. WHEN TIMING CHAIN ASSEMBLY IS NOT REMOVED

**CAUTION:**
**When working on the vehicle, if engine oil is spilt onto the exhaust pipe, wipe it off with cloth to avoid emission of smoke or causing a fire.**

NOTE:
- Inspection of cam clearance should be performed while engine is cold.
- If the engine is removed from vehicle, performing the step 1) and 2) is not necessary.

1) Disconnect the ground cable from battery.

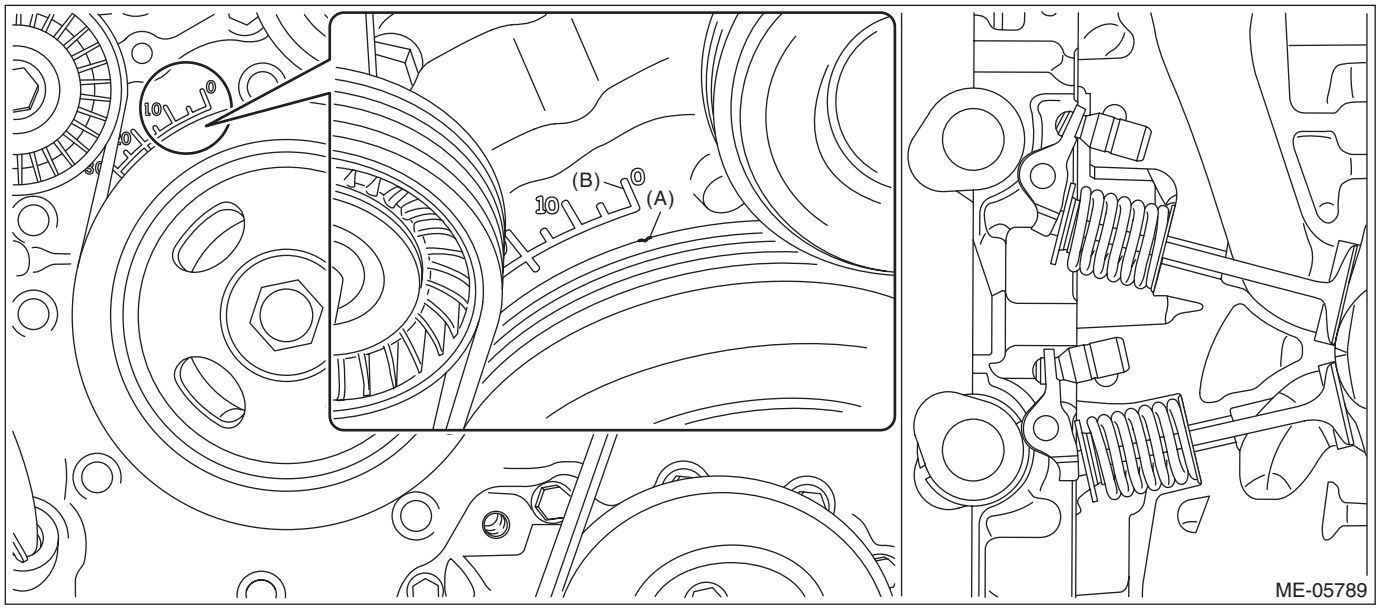


2) Remove the air intake duct. <Ref. to IN(H4DO)-13, REMOVAL, Air Intake Duct.>
3) When inspecting #1 and #3 cylinders
   (1) Remove the rocker cover RH. <Ref. to ME(H4DO)-139, ROCKER COVER RH, REMOVAL, Rocker Cover.>

NOTE:
When working on the vehicle, place a suitable container under the vehicle.

   (2) Set #1 cylinder piston to top dead center of compression stroke by rotating the crank pulley clockwise using the socket wrench.

NOTE:
When the timing mark (A) on crank pulley is aligned to the 0° in timing gauge (B) on chain cover as shown in the figure, the #1 cylinder piston is located at TDC of compression stroke if the intake camshaft and exhaust camshaft does not depress the #1 cylinder intake side roller rocker arm (intake valve) and exhaust side roller rocker arm (exhaust valve). If roller rocker arm (valve) is depressed, turn the crank pulley by 360° in order to make #1 cylinder piston at TDC of compression stroke.



(3) Check the cam clearance for #1 cylinder intake, #1 cylinder exhaust and #3 cylinder exhaust.

NOTE:
- Measure the roller surface of cam base circle and roller rocker arm using thickness gauge (A).
- If the measured value is out of standard, take notes of the value in order to adjust the cam clearance later on.

***Cam clearance:***
***Intake***
***Standard***

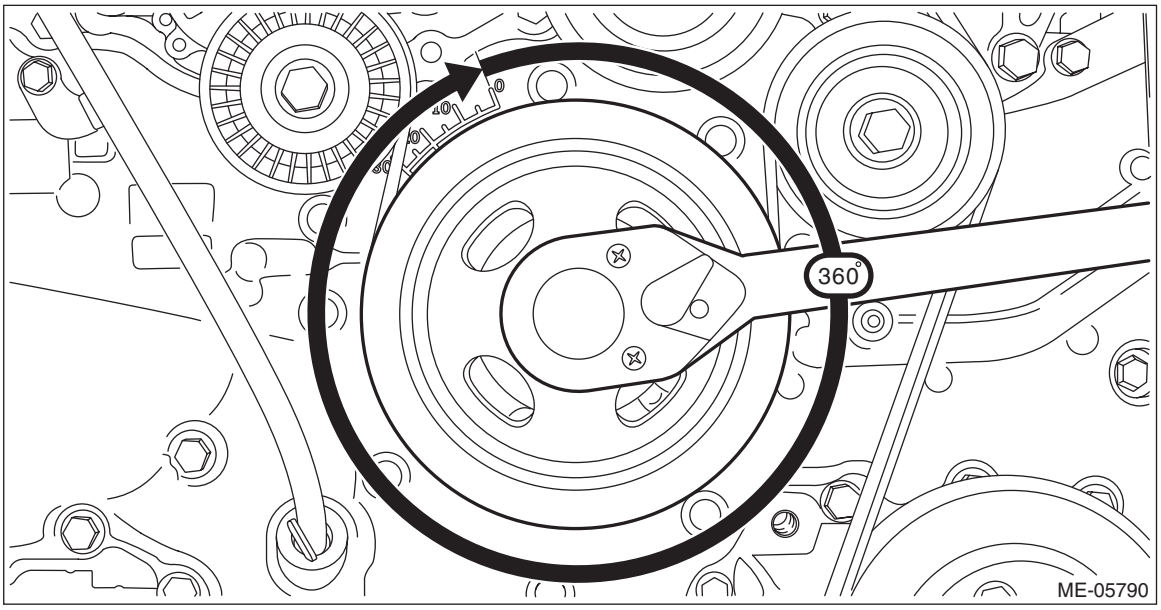
(4) Turn the crank pulley by 360°.



(5) Check the clearance of #3 cylinder intake.

NOTE:
- Measure the roller surface of cam base circle and roller rocker arm using thickness gauge (A).
- If the measured value is out of standard, take notes of the value in order to adjust the cam clearance later on.

***Cam clearance:***

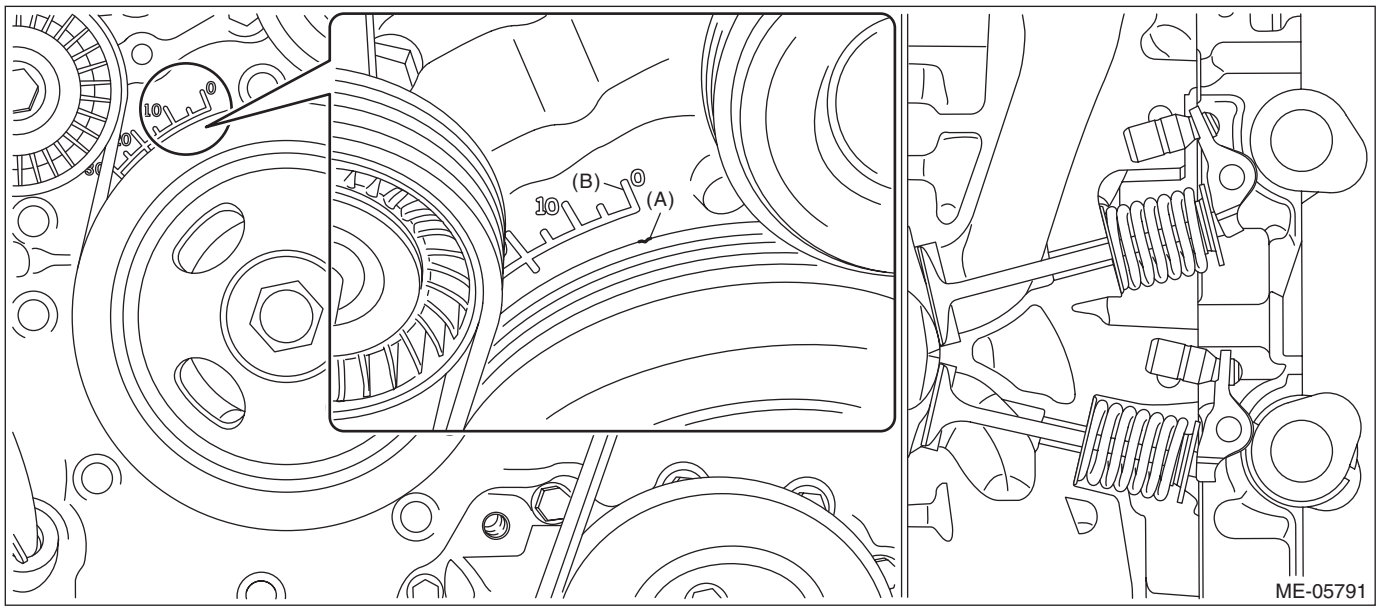
4) When inspecting #2 and #4 cylinders

(1) Remove the rocker cover LH. <Ref. to ME(H4DO)-142, ROCKER COVER LH, REMOVAL, Rocker Cover.>

NOTE:
When working on the vehicle, place a suitable container under the vehicle.

(2) Set #2 cylinder piston to top dead center of compression stroke by rotating the crank pulley clockwise using the socket wrench.

NOTE:
When the timing mark (A) on crank pulley is aligned to the 0° in timing gauge (B) on chain cover as shown in the figure, the #2 cylinder piston is located at TDC of compression stroke if the intake camshaft and exhaust camshaft does not depress the #2 cylinder intake side roller rocker arm (intake valve) and exhaust side roller rocker arm (exhaust valve). If roller rocker arm (valve) is depressed, turn the crank pulley by 360° in order to make #2 cylinder piston at TDC of compression stroke.



(3) Check the cam clearance for #2 cylinder intake, #2 cylinder exhaust and #4 cylinder exhaust.

NOTE:
- Measure the roller surface of cam base circle and roller rocker arm using thickness gauge (A).
- If the measured value is out of standard, take notes of the value in order to adjust the cam clearance later on.

NOTE:
When working on the vehicle, place a suitable container under the vehicle.
(2) Check the #1 and #3 cylinder cam clearance.

**CAUTION:**
**Intake and exhaust camshafts can be independently rotated with the timing chain removed. When the intake valve and exhaust valve lift at the same time, the valve heads contact each other and valve stem may bend. Do not turn it to the outside of range of zero lift (cam base circle position) (in range where it can be turned lightly by hand).**

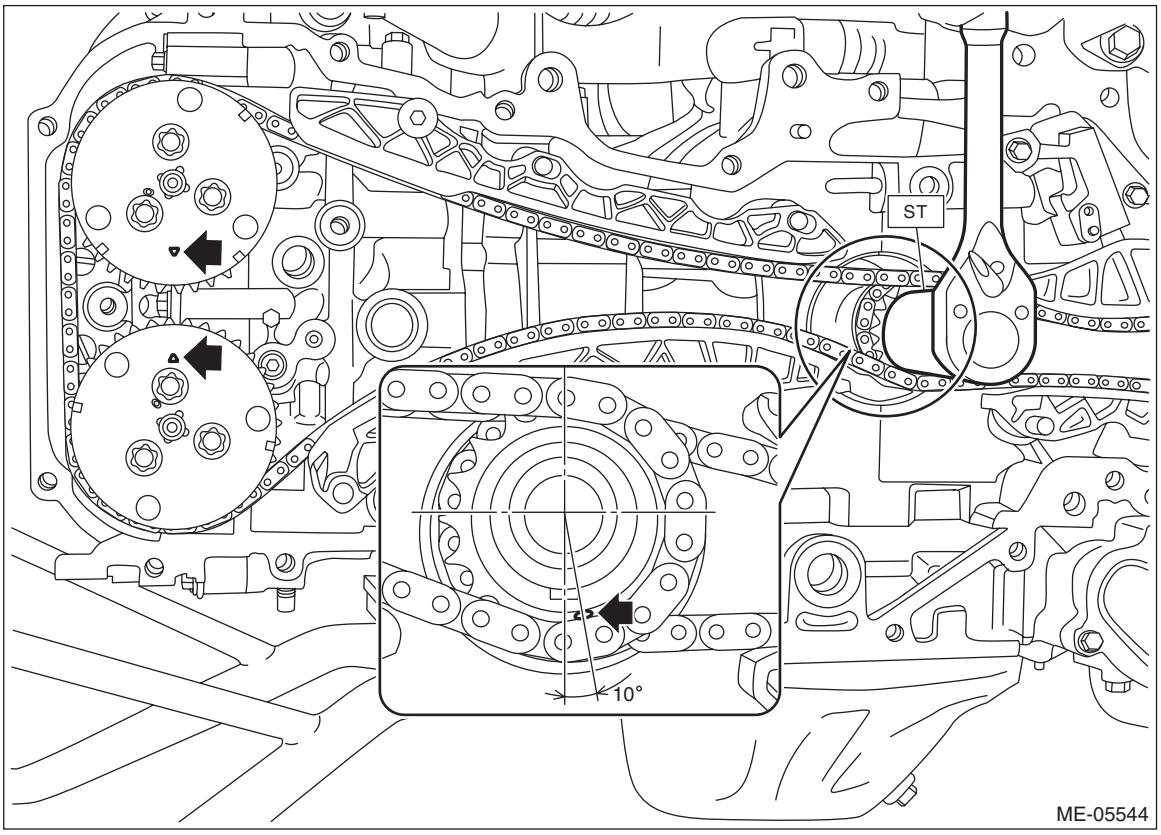
# 15.Timing Chain Assembly

## A: REMOVAL

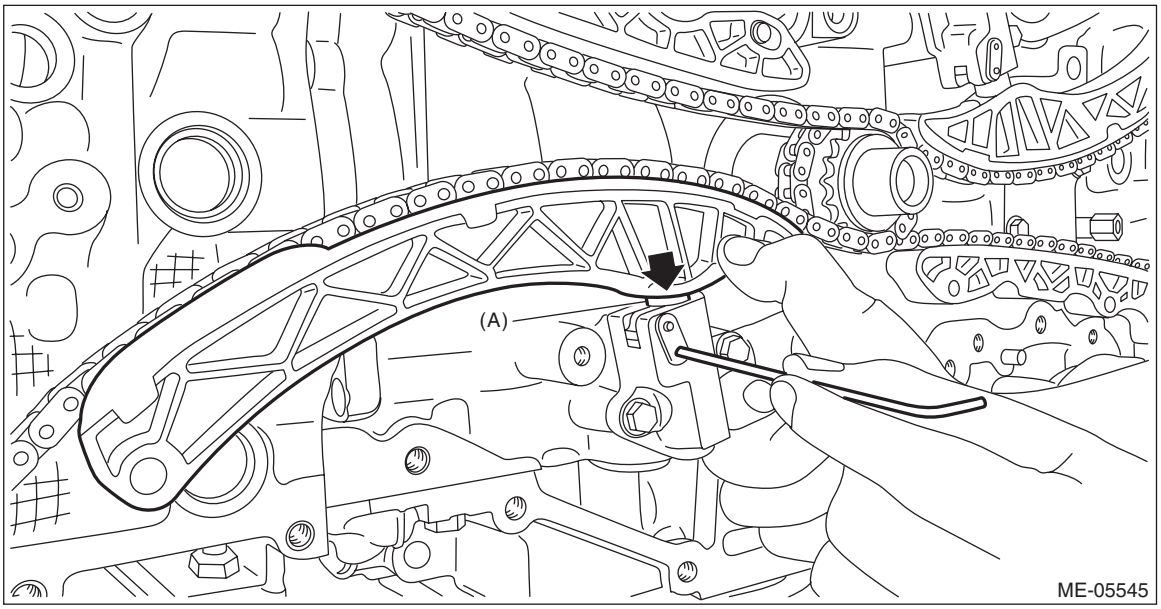
### 1. TIMING CHAIN RH

NOTE:
When replacing a single part, perform the work with the engine assembly installed to body.
1) Remove the chain cover. <Ref. to ME(H4DO)-92, REMOVAL, Chain Cover.>
2) Using ST and by turning the crankshaft, align the alignment marks of crank sprocket, intake cam sprocket RH and exhaust cam sprocket RH to the positions as shown in the figure.

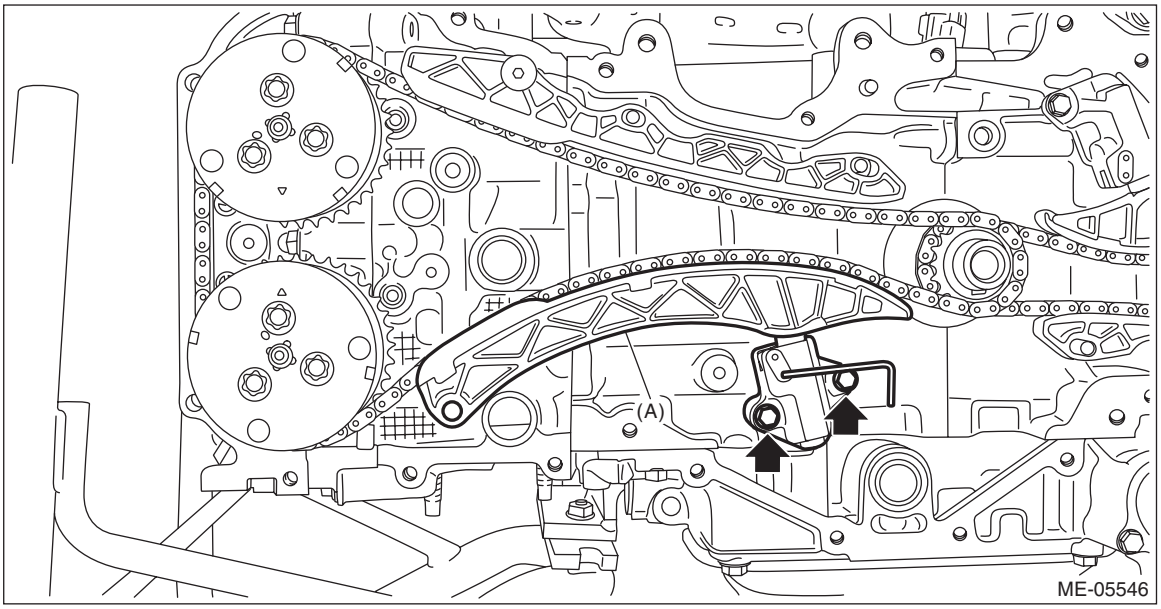
NOTE:
If the alignment marks are aligned to the positions as shown in the figure, the crankshaft key is located at six o'clock position.
ST 18252AA000 CRANKSHAFT SOCKET



3) Push down the chain lever tensioner RH, and with a 2.5 mm (0.98 in) dia. stopper pin or a 2.5 mm (0.98 in) dia. hex wrench inserted into the stopper pin hole in the chain tensioner RH, secure the plunger (A).



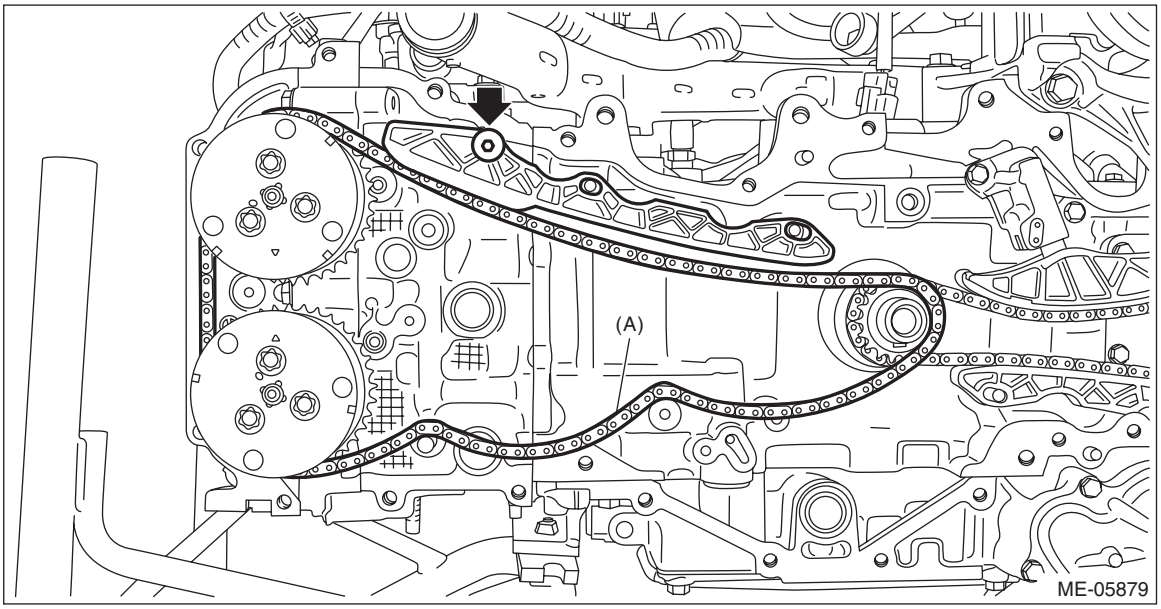
4) Remove the chain tensioner RH, and remove the chain tensioner lever RH (A).



5) Remove the chain guide RH, and remove the timing chain RH (A).

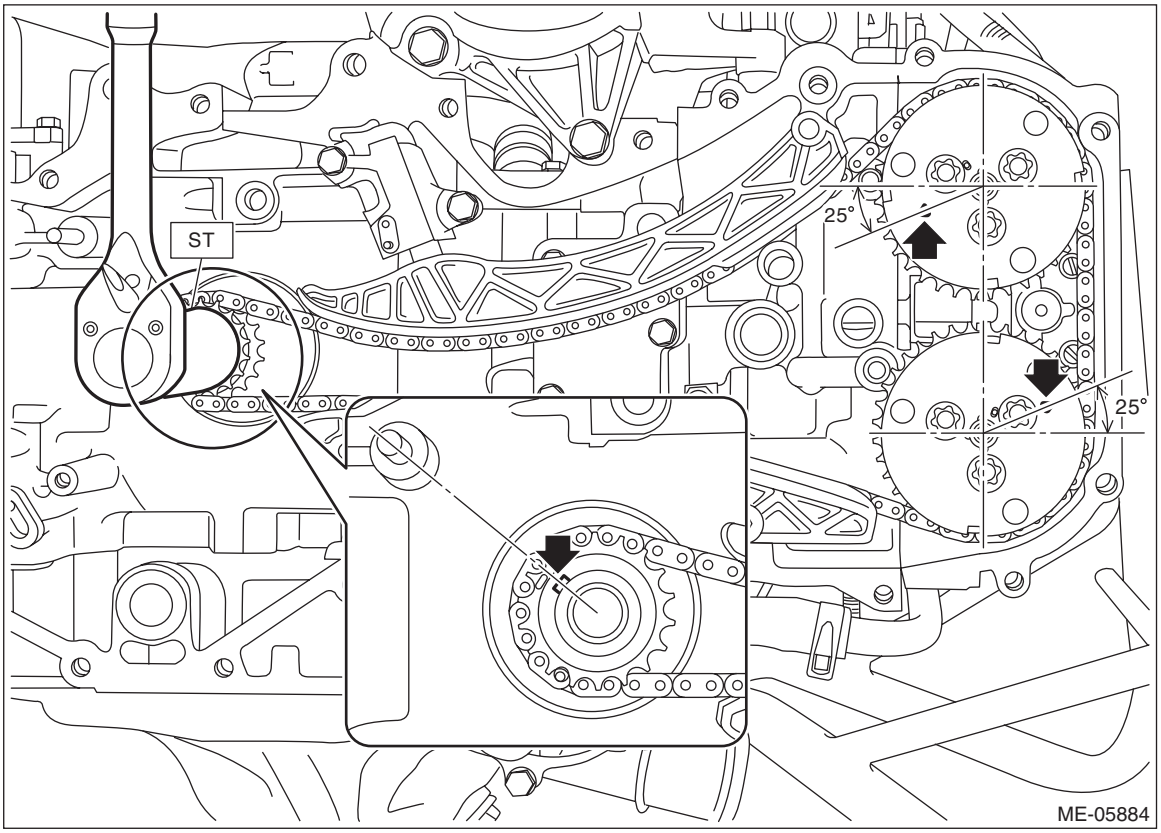
**CAUTION:**
**• If the timing chain RH is not installed, the intake camshaft RH and exhaust camshaft RH are kept at zero-lift position. All cams on the camshaft are not pressing down the roller rocker arm (intake valve and exhaust valve). (Under this condition, all valves remain unlifted.)**
**• Intake camshaft RH and exhaust camshaft RH can be independently rotated with the timing chain RH removed. When the intake valve and exhaust valve lift at the same time, the valve heads contact each other and valve stem may bend. Do not turn it to the outside of range of zero-lift (in range where it can be turned lightly by hand).**

NOTE:
To avoid mixing with LH side, keep the removed part in order.

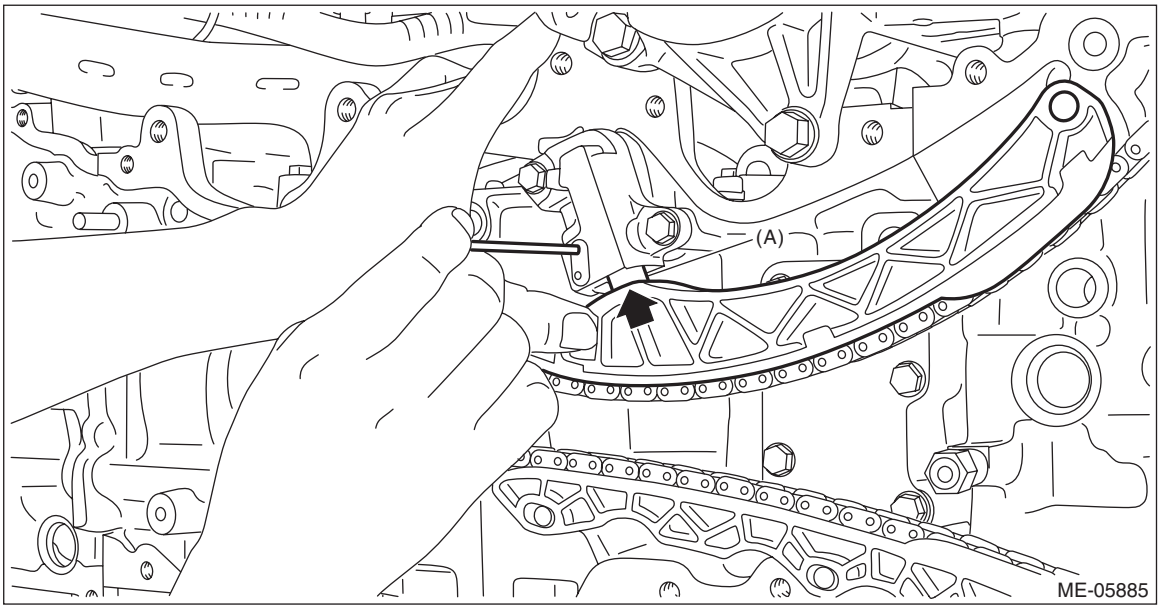


## 2. TIMING CHAIN LH

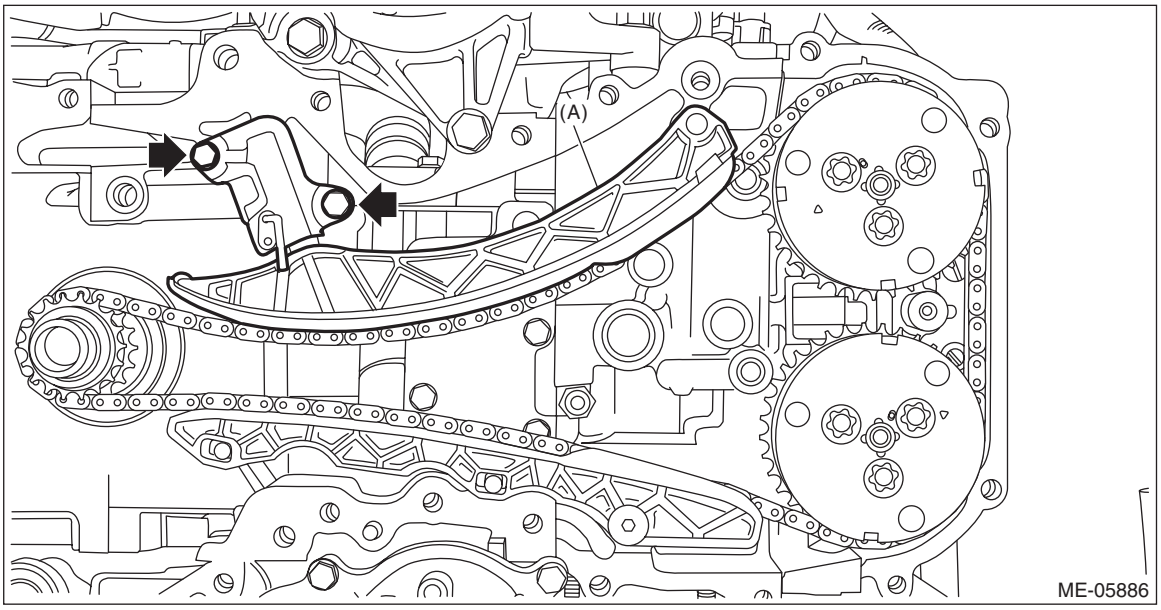
1) Remove the timing chain RH. <Ref. to ME(H4DO)-108, TIMING CHAIN RH, REMOVAL, Timing Chain Assembly.>
2) Using ST and by turning the crankshaft, align the alignment marks of crankshaft key, intake cam sprocket LH and exhaust cam sprocket LH to the positions as shown in the figure.
ST 18252AA000 CRANKSHAFT SOCKET



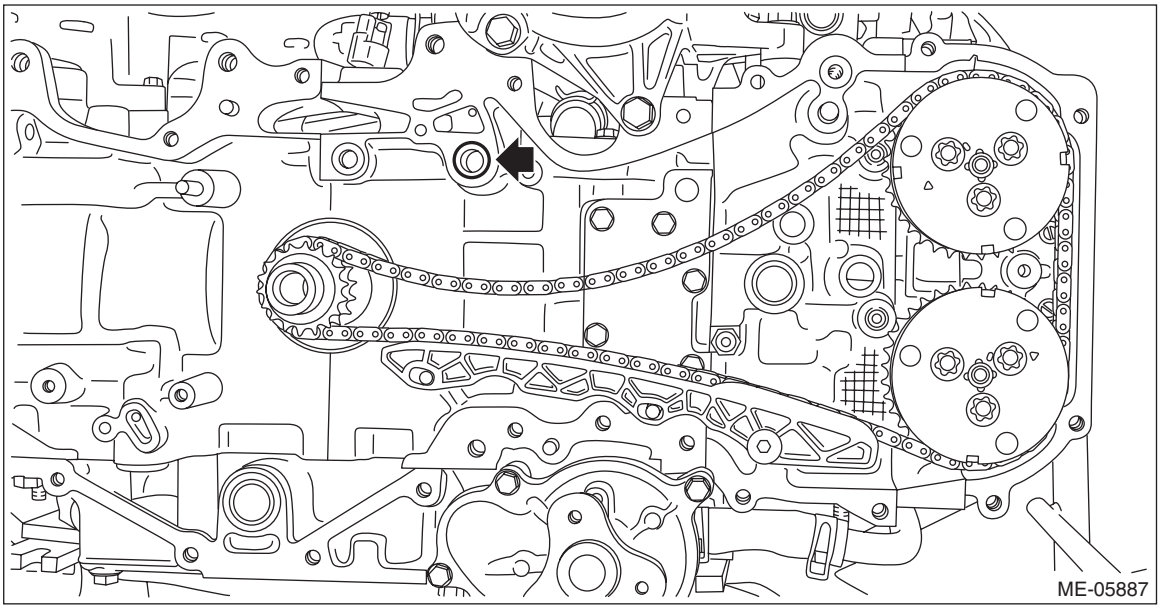
3) Push down the chain lever tensioner LH, and with a 2.5 mm (0.98 in) dia. stopper pin or a 2.5 mm (0.98 in) dia. hex wrench inserted into the stopper pin hole in the chain tensioner LH, secure the plunger (A).



4) Remove the chain tensioner LH, and remove the chain tensioner lever LH (A).



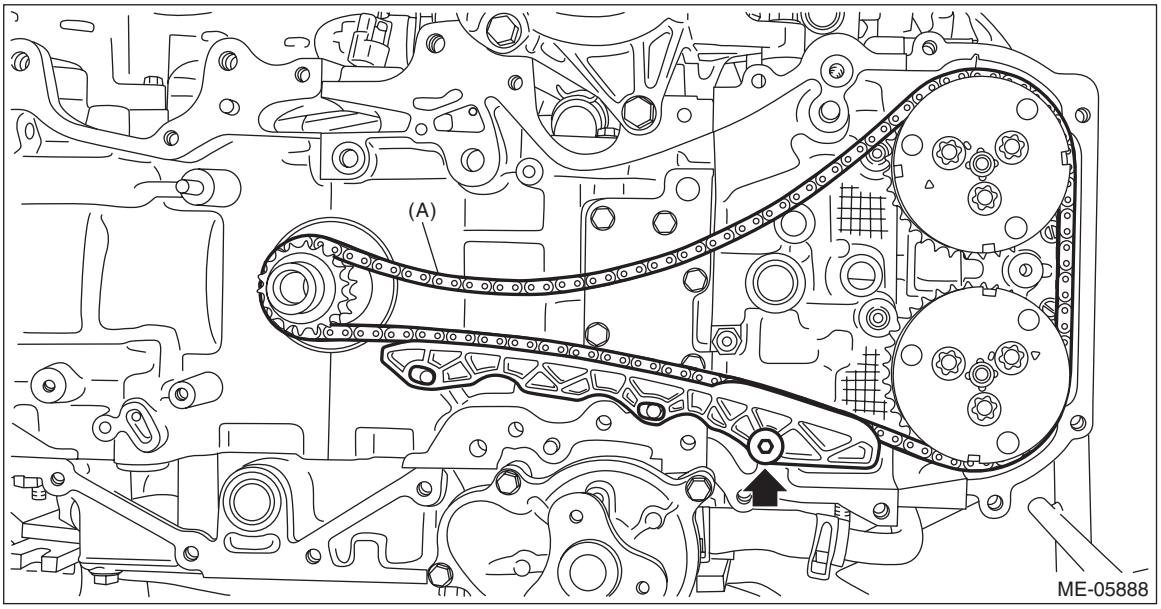
5) Remove the O-ring from the cylinder block LH.



6) Remove the chain guide LH, and remove the timing chain LH (A).

**CAUTION:**
**• If the timing chain LH is not installed, the exhaust camshaft LH is kept at zero-lift position. All cams on the exhaust camshaft LH are not pressing down the roller rocker arm (exhaust valve). (Under this condition, exhaust valves remain unlifted.)**
**• Intake camshaft LH is kept at lift position. All cams on the intake camshaft LH are pressing down the roller rocker arm (intake valve). (Under this condition, intake valves remain lifted.)**
**• Intake camshaft LH and exhaust camshaft RH can be independently rotated with the timing chain LH removed. When the exhaust camshaft LH is turned, the valve heads contact each other and valve stem may bend as described in above. Do not turn the exhaust camshaft LH to the outside of range of zero-lift (in range where it can be turned lightly by hand).**
**• #1 piston and #4 piston are located near TDC. If the intake camshaft LH is turned, the valve and the piston may contact and valve stem may bend. Do not turn the intake camshaft LH at this time.**

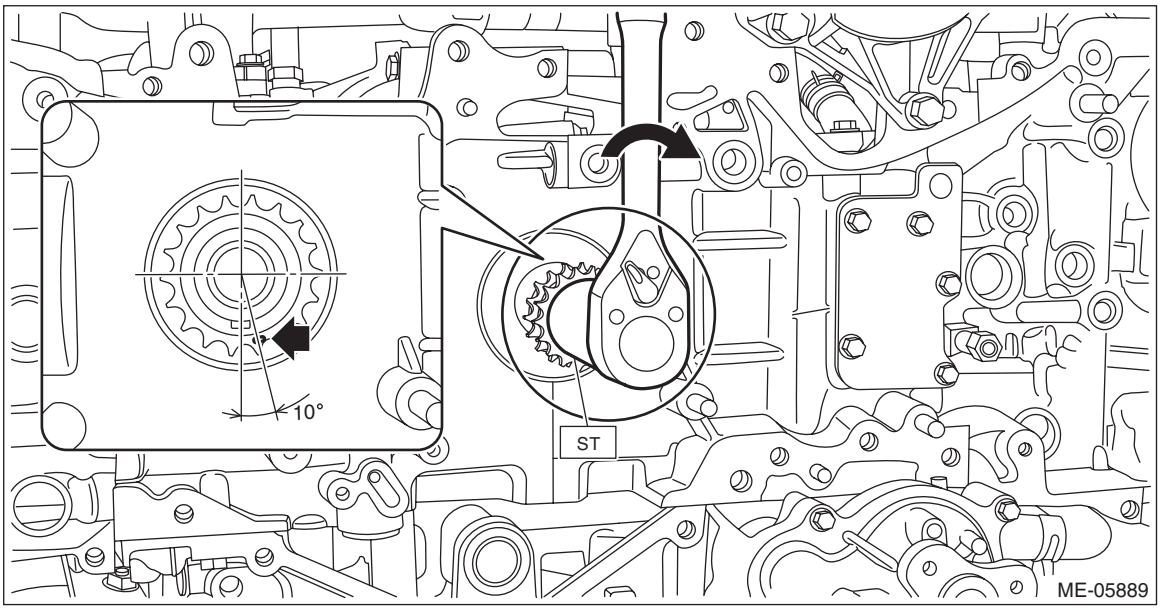
NOTE:
To avoid mixing with RH side, keep the removed part in order.



7) Using ST and by turning the crankshaft approximately 200° clockwise, align the alignment marks of crank sprocket to the positions as shown in the figure.

**CAUTION:**
**• This procedure is required to prevent the valve and piston contacting with each other, by moving the all pistons to the middle of the cylinders.**
**• Never turn counterclockwise because the valve and piston may contact. Counterclockwise turn is allowed only when adjusting precisely the alignment marks, after turning the crank sprocket alignment mark clockwise near the position as shown in the figure.**

ST 18252AA000 CRANKSHAFT SOCKET



8) Using ST and by turning the intake cam sprocket LH approximately 180°, align the alignment marks of intake cam sprocket LH to the positions (zero-lift position) as shown in the figure.

**CAUTION:**
**After this work, when the intake valve and exhaust valve lift at the same time, the valve heads contact each other and valve stem may bend. Do not turn the intake camshaft LH and exhaust camshaft LH to the outside of range of zero-lift (in range where it can be turned lightly by hand).**

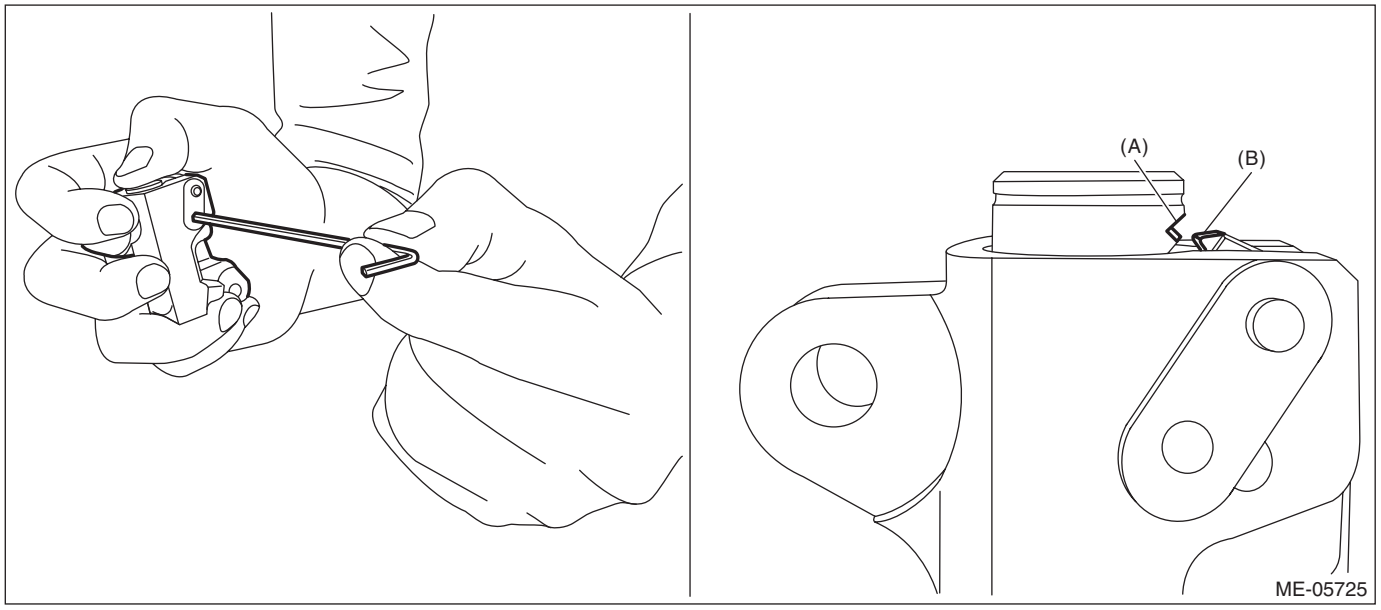
## 1. TIMING CHAIN LH

NOTE:
- Be careful that the foreign matter is not into or onto the assembled component during installation.
- Apply engine oil to all component parts of the timing chain.

1) Prepare to attach the chain tensioner LH.
   (1) Move the link plate (A) in the direction of arrow to press in the plunger (B).

   (2) With a 2.5 mm (0.98 in) dia. stopper pin or a 2.5 mm (0.98 in) (nominal) dia. hex wrench inserted into the stopper pin hole, secure the plunger.

NOTE:
If the stopper pin hole on the link plate and the stopper pin hole on the chain tensioner are not aligned, check that the first notch of plunger rack (A) is engaged with the stopper tooth (B). If not engaged, retract the plunger a little so that the first notch of plunger rack (A) is engaged with the stopper tooth (B).



2) Check that the crank sprocket is located at the position sown in the figure. If not aligned, using ST turn the crankshaft to align the crank sprocket alignment mark to the position shown in the figure.

NOTE:
This procedure is required to prevent the valve and piston contacting with each other in the next step.

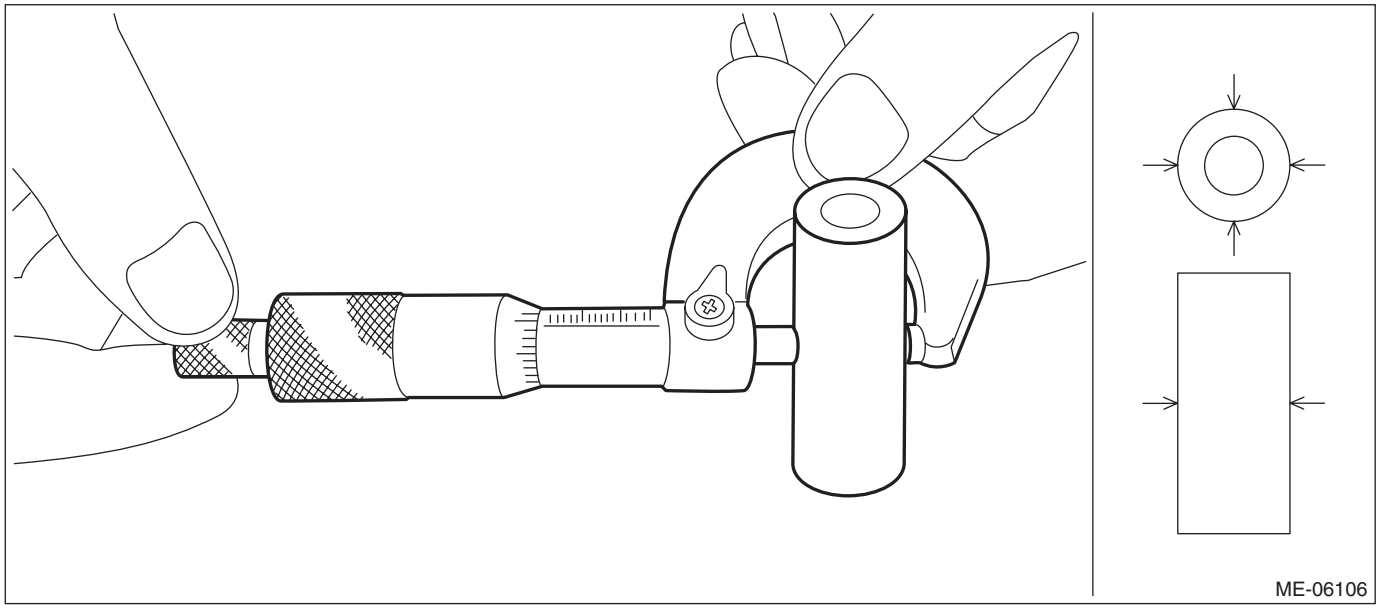
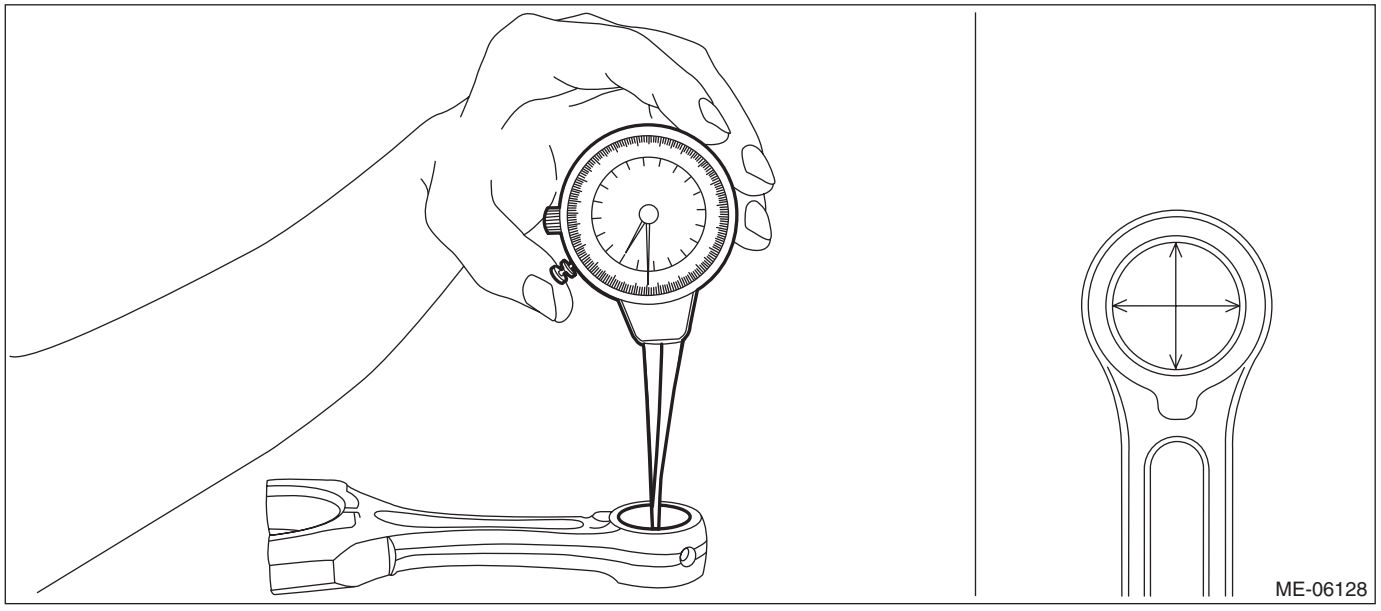
2) Check the clearance between piston pin and connecting rod bushing. Check the clearance between piston pin and connecting rod bushing by measuring the outer diameter of piston pin and the inner diameter of connecting rod bushing respectively.
(1) Measure the outer diameter of piston pin with a micrometer.

NOTE:
- Measurement should be performed at a temperature of 20°C (68°F).
- Measure the outer diameter of the piston pin at the two locations as shown in the figure, and read the value of most worn location.
- Record the measured value.



(2) Using a caliper gauge, measure the inner diameter of connecting rod bushing.

NOTE:
- Measurement should be performed at a temperature of 20°C (68°F).
- Measure the inner diameter of the connecting rod bushing at the two locations as shown in the figure, and read the value of most worn location.
- Record the measured value.



(3) Calculate the clearance between piston pin and connecting rod bushing.

***Clearance between piston pin and connecting rod bushing:***
***Standard***
***0.004 — 0.026 mm (0.0002 — 0.0010 in)***

3) If the clearance between piston pin and connecting rod bushing is not within the standard, replace the connecting rod bushing and piston pin as a set. For replacement procedure of connecting rod bushing, refer to the following.

(1) Remove the connecting rod bushing from connecting rod small end with ST and press.

NOTE:
Be careful not to confuse the direction of the ST, because it is used in opposite directions for extraction and press-fit.

(2) Press the connecting rod bushing with ST and the press, after applying engine oil on the periphery of connecting rod bushing.

NOTE:
- Position the clinch portion of connecting rod bushing as shown in the figure.

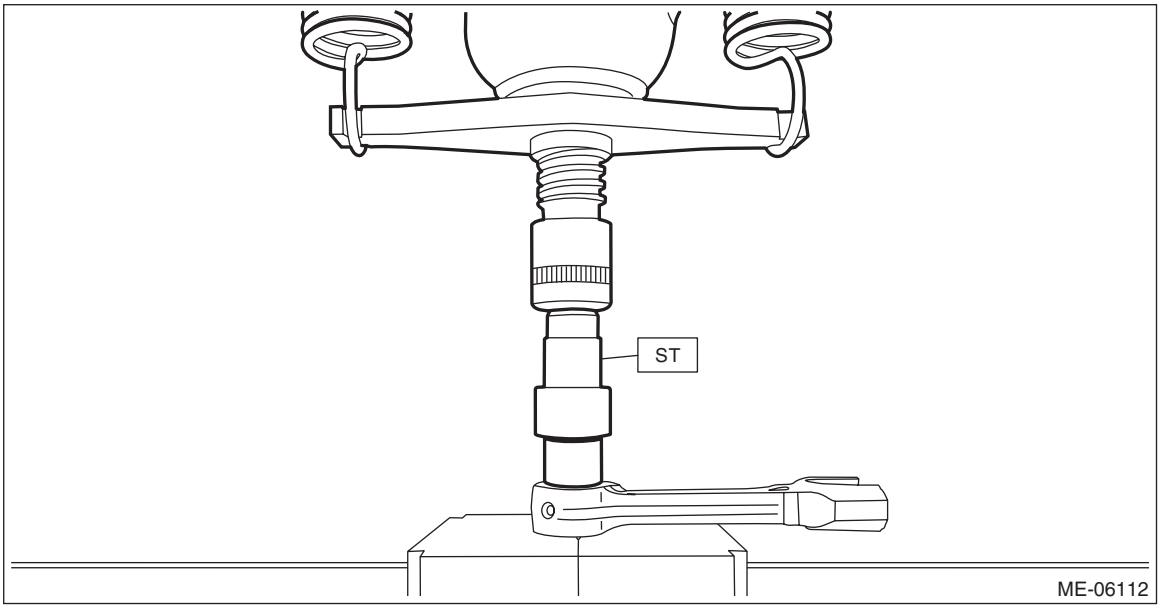
ST 18350AA000 CONNECTING ROD BUSHING REMOVER AND INSTALLER



(3) Make two 3 mm (0.12 in) holes in the pressed connecting rod bushing by aligning with the pre-manufactured holes on the connecting rod small end.

(4) Ream the inside of connecting rod bushing using the reamer. Insert the reamer in the connecting rod bushing, and turn slowly clockwise while pushing lightly. Bring the reamer back while rotating it clockwise.

NOTE:

• Use a ϕ22 reamer.
• Apply engine oil to the reamer.
• If the inner surface of valve guide is damaged, the edge of reamer should be slightly ground with oil stone.
• If the inner surface of connecting rod bushing becomes lustrous and the reamer does not chip, use a new reamer or remedy the reamer.

(5) After completion of reaming, clean the connecting rod bushing to remove chips.

# 3. Engine Coolant

## A: INSPECTION

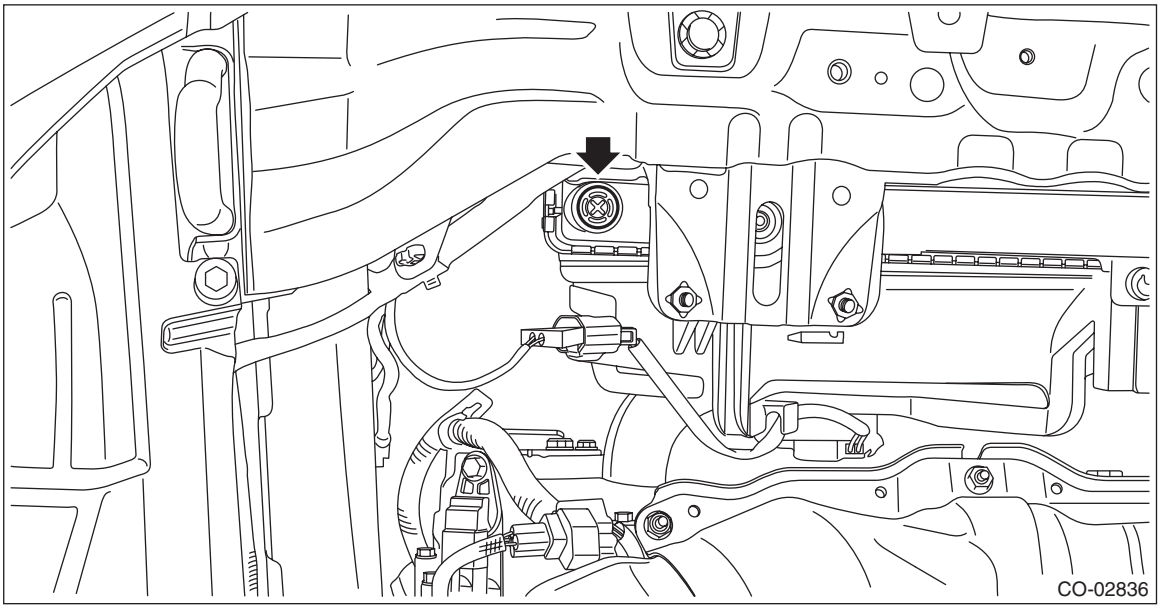
NOTE:
When adding the engine coolant, always use SUBARU Super Coolant.
1) Park the vehicle on a level surface.
2) Check the engine coolant amount, and if the coolant level is low, check for the coolant leakage, and then add the engine coolant.
   (1) Make sure the engine coolant level in the reservoir tank is between “FULL” and “LOW” with the engine in a cold condition.
   (2) Open the radiator cap and make sure that the radiator is filled with the engine coolant up to its filler neck position.

## B: REPLACEMENT

### 1. DRAINING OF ENGINE COOLANT

1) Lift up the vehicle.
2) Remove the under cover. <Ref. to EI-27, REMOVAL, Front Under Cover.>
3) Remove the drain plug to drain engine coolant into container.

NOTE:
Remove the radiator cap so that engine coolant will drain faster.



4) Install the drain plug.
5) Install the under cover. <Ref. to EI-27, INSTALLATION, Front Under Cover.>

## 2. FILLING OF ENGINE COOLANT

1) Pour cooling system conditioner through the filler neck.

***Cooling system protective agent:***
***Refer to "SPECIFICATION" for cooling system protective agent. <Ref. to CO(H4DO)-2, SPECIFICATION, General Description.>***

2) Pour engine coolant into the radiator up to the filler neck position.

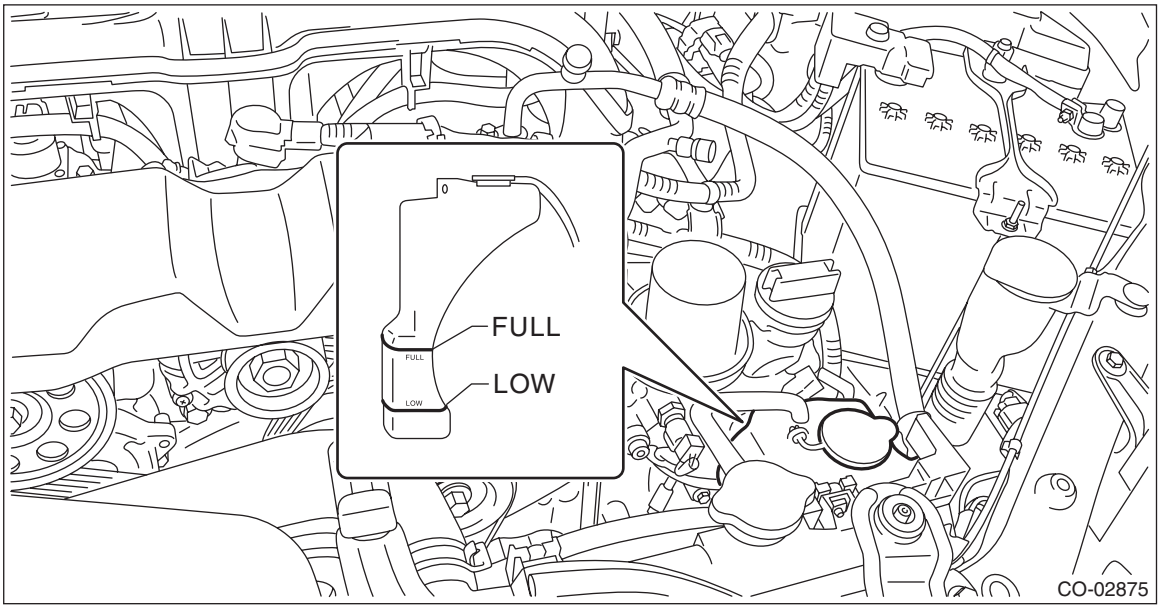
***Recommended engine coolant:***
***Refer to "SPECIFICATION" for recommended engine coolant. <Ref. to CO(H4DO)-2, SPECIFICATION, General Description.>***

***Engine coolant level:***
***Refer to "SPECIFICATION" for engine coolant level. <Ref. to CO(H4DO)-2, SPECIFICATION, General Description.>***

***Engine coolant concentration:***
***Refer to "ADJUSTMENT" for the recommended engine coolant concentration. <Ref. to CO(H4DO)-15, ADJUSTMENT, Engine Coolant.>***

NOTE:
The SUBARU Super Coolant contains anti-freeze and anti-rust agents, and is especially made for Subaru engines with an aluminum cylinder block. Be sure to use SUBARU Super Coolant, since other coolant may cause corrosion.

3) Fill engine coolant into the reservoir tank up to "FULL" level.



4) Close the radiator cap and start the engine. Race 5 to 6 times at 3,000 rpm or less, then stop the engine. (Complete this operation within 40 seconds.)
5) Wait for one minute after the engine stops, and open the radiator cap. If the engine coolant level drops, add engine coolant into radiator up to the filler neck position.
6) Perform the procedures 4) and 5) again.
7) Attach the radiator cap and reservoir tank cap properly.
8) Start the engine and operate the heater at maximum hot position and the blower speed setting to "LO".
9) Run the engine at 2,000 rpm or less until radiator fan starts and stops.

NOTE:
Be careful with the engine coolant temperature to prevent overheating.

10) Stop the engine and wait until the engine coolant temperature lowers to 30°C (86°F) or less.
11) Open the radiator cap. If the engine coolant level drops, add engine coolant into the radiator up to the filler neck position and the reservoir tank to "FULL" level.
12) Attach the radiator cap correctly.

13) Set the heater setting to maximum hot position and the blower speed setting to “LO” and start the engine. Perform racing at 3,000 rpm or less. If the flowing sound is heard from heater core at this time, perform the procedures from 9) again.

# C: ADJUSTMENT

## 1. PROCEDURE TO ADJUST THE SUBARU SUPER COOLANT CONCENTRATION

**CAUTION:**
**Use the SUBARU Super Coolant with a 50 — 60% concentration in order to obtain maximum anti-freeze and anti-rust performance.**
To adjust the concentration of SUBARU Super Coolant according to temperature, find the proper SUBARU Super Coolant concentration in the table, and add dilution water to the SUBARU Super Coolant (concentrated type) until it reaches the proper dilution.

| Relationship of SUBARU Super Coolant concentration and freezing temperature | | | |
|---|---|---|---|
| SUBARU Super Coolant concentration | 50% | 55% | 60% |
| Freezing temperature | –36°C (–33°F) | –41°C (–42°F) | –50°C (–58°F) |

***Engine coolant and diluting water:***

## C: CAUTION

- Prior to starting work, pay special attention to the following:
  1. Always wear work clothes, a safety cap, protective shoes. Additionally, wear a helmet, protective goggles, etc. if necessary.
  2. Protect the vehicle using a seat cover, fender cover, etc.
  3. Prepare the service tools, clean cloth, containers to catch grease and oil, etc.
- Prepare a container and cloth when performing work which oil possibly spills. If oil spills, wipe it off immediately to prevent from penetrating into floor or flowing out for environmental protection.
- Vehicle components are extremely hot immediately after driving. Be wary of receiving burns from heated parts.
- When performing a repair, identify the cause of trouble and avoid unnecessary removal, disassembly and replacement.
- Before disconnecting connectors of sensors or units, be sure to disconnect the ground cable from battery.
- Always use the jack-up point when the shop jacks or rigid racks are used to support the vehicle.
- Remove contamination including dirt and corrosion before removal, installation, disassembly or assembly.
- Keep the removed parts in order and protect them from dust and dirt.
- All removed parts, if to be reused, should be reinstalled in the original positions with attention to the correct directions, etc.
- Bolts, nuts and washers should be replaced with new parts as required.
- Be sure to tighten the fasteners including bolts and nuts to the specified torque.
- If the engine oil is spilt over exhaust pipe or the under cover, wipe it off with cloth to avoid emitting smoke or causing a fire.
- Follow all government and local regulations concerning disposal of refuse when disposing of oil.

# 3. Engine Oil

## A: INSPECTION

**CAUTION:**
**If the engine oil is spilt over exhaust pipe or the under cover, wipe it off with cloth to avoid emitting smoke or causing a fire.**

1) Park the vehicle on a level surface.
2) Remove the oil level gauge and wipe away the oil.
3) Reinsert the oil level gauge all the way. Be sure that the oil level gauge is correctly inserted and properly orientated.
4) Pull out the oil level gauge again, and check both sides of the oil level gauge. Use a lower side to determine the engine oil level. If the engine oil level is below “L” line, check for oil leakage from engine and add oil to bring the level up to “F” line.
5) Start the engine to circulate the oil in engine.
6) After turning off the engine, wait a few minutes for the oil to return to the oil pan before checking the level.

NOTE:
- To prevent overfilling of engine oil, do not add oil above “F” line when the engine is cold.

## C: INSPECTION

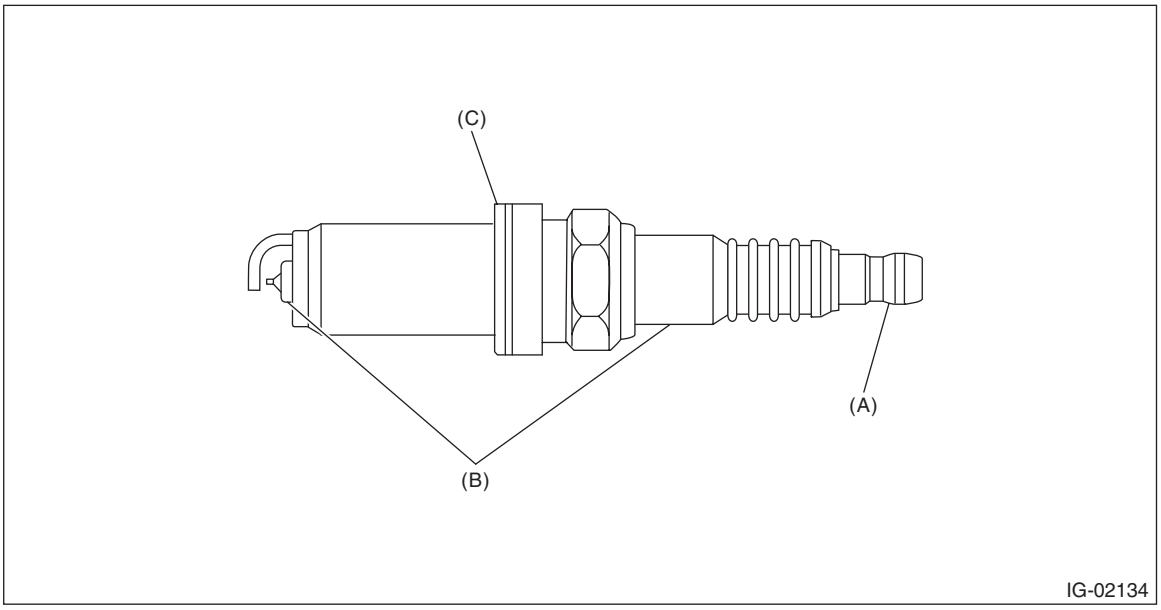
1) Check the spark plug for abnormalities. If defective, replace the spark plug.

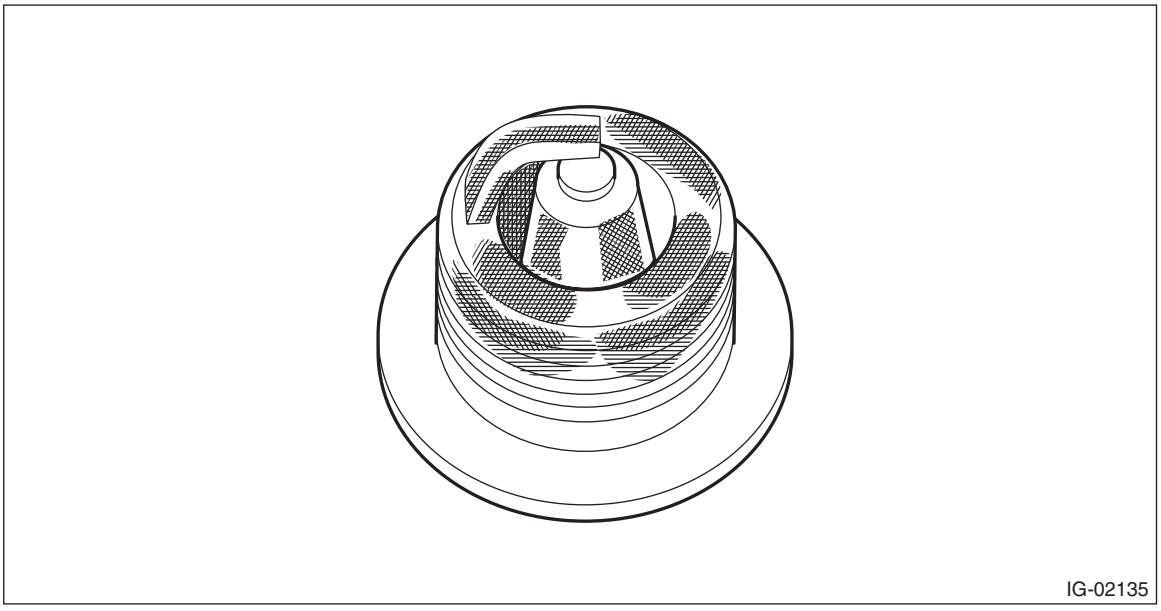


(A) Terminal damage (B) Crack or damage in insulator (C) Damaged gasket

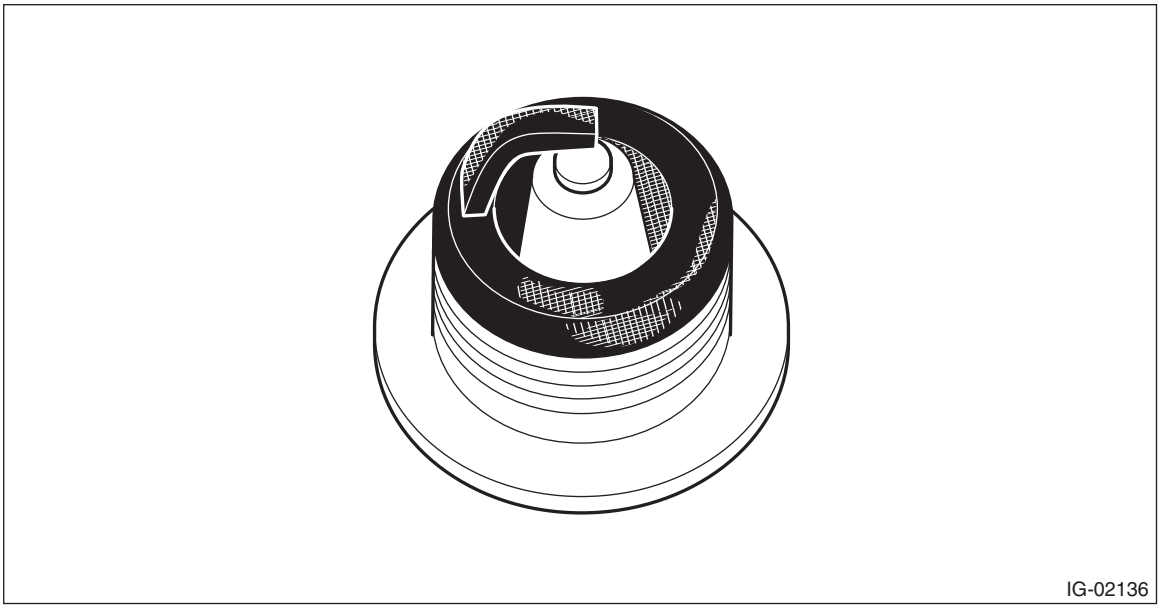
2) Check the spark plug electrode and condition of the insulator. If abnormal, check and repair the cause and replace the spark plug.

(1) Normal:

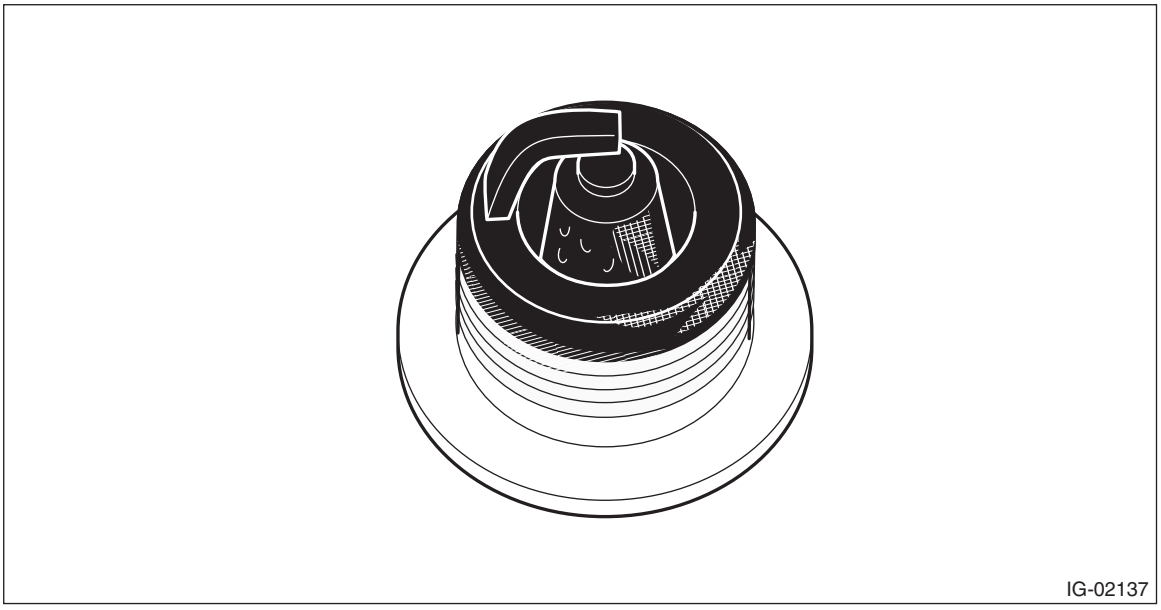
Brown to grayish-tan deposits and slight electrode wear indicate correct spark plug heat range.



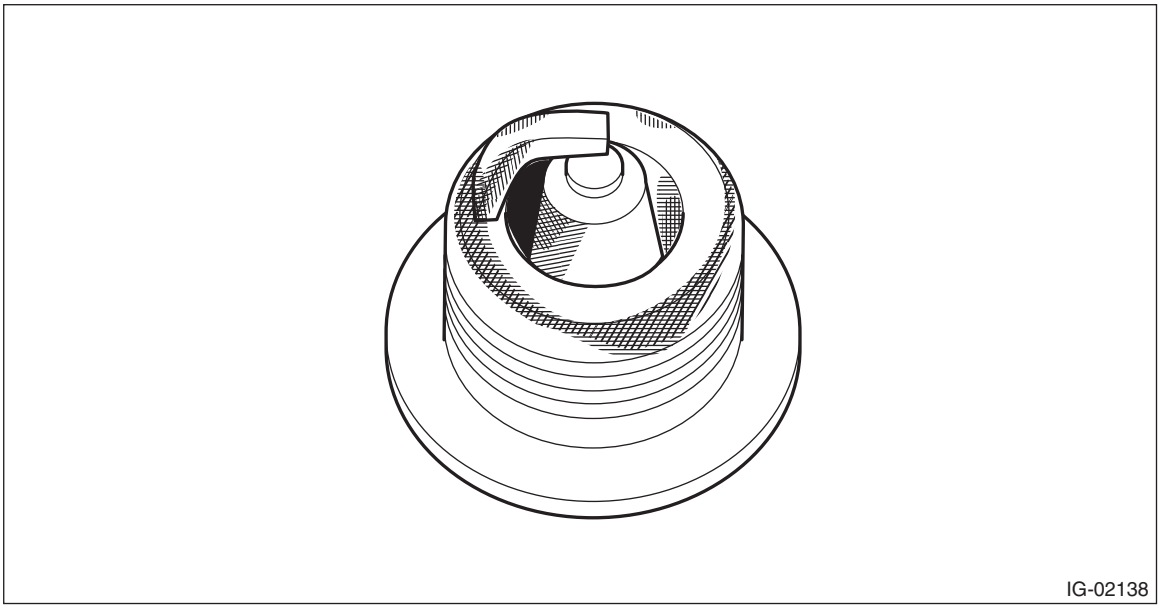
(2) Carbon fouled:
Dry fluffy carbon deposits on insulator and electrode are mostly caused by slow speed driving in the city, weak ignition, too rich fuel mixture, etc.



(3) Oil fouled:
Wet black deposits show oil entrance into combustion chamber through worn piston rings or increased clearance between valve guides and valve stems.



(4) Overheating:
White or light gray insulator with black or brown spots and bluish burnt electrodes indicate engine overheating, wrong selection of fuel, or loose spark plugs.



IG-02138

3) Using a nylon brush, etc., clean and remove the carbon or oxide deposits from the spark plug. If deposits are too stubborn, replace the spark plugs. After cleaning the spark plugs, check the spark plug gap “L” using a gap gauge. If it is not within the standard, replace the spark plug.

NOTE:
- Never use a plug cleaner.
- Do not use a metal brush as it may damage the electrode area.

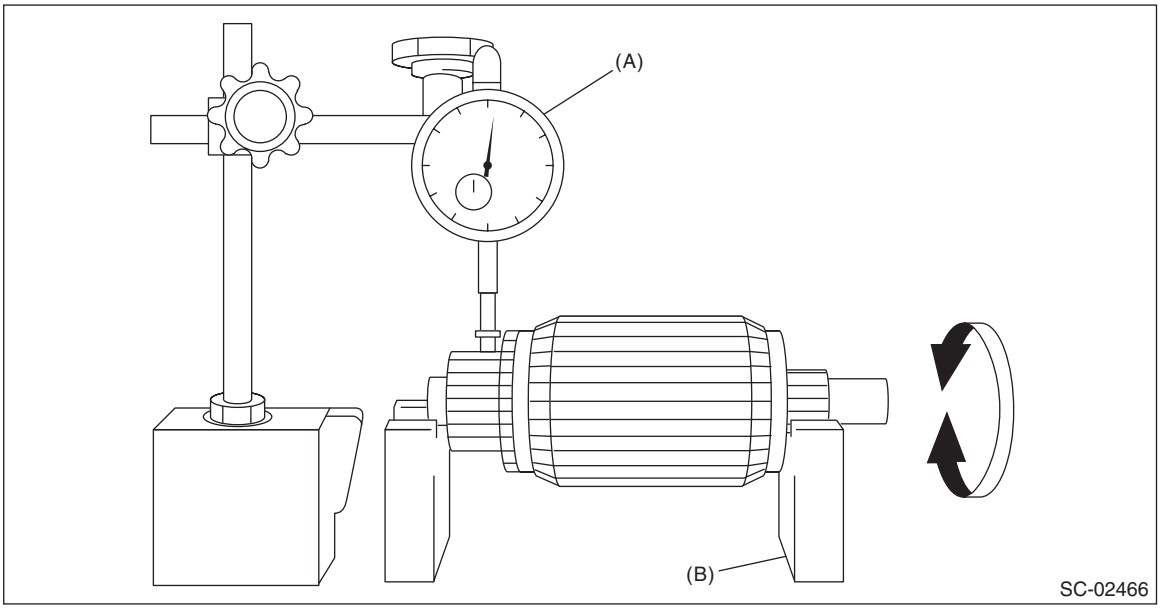
# E: INSPECTION

## 1. ARMATURE

1) Check the commutator for signs of seizure or stepped wear caused by roughness of the surface. If there is light wear, use sandpaper to repair.
2) Check for runout on the commutator. If excessive, replace the armature.

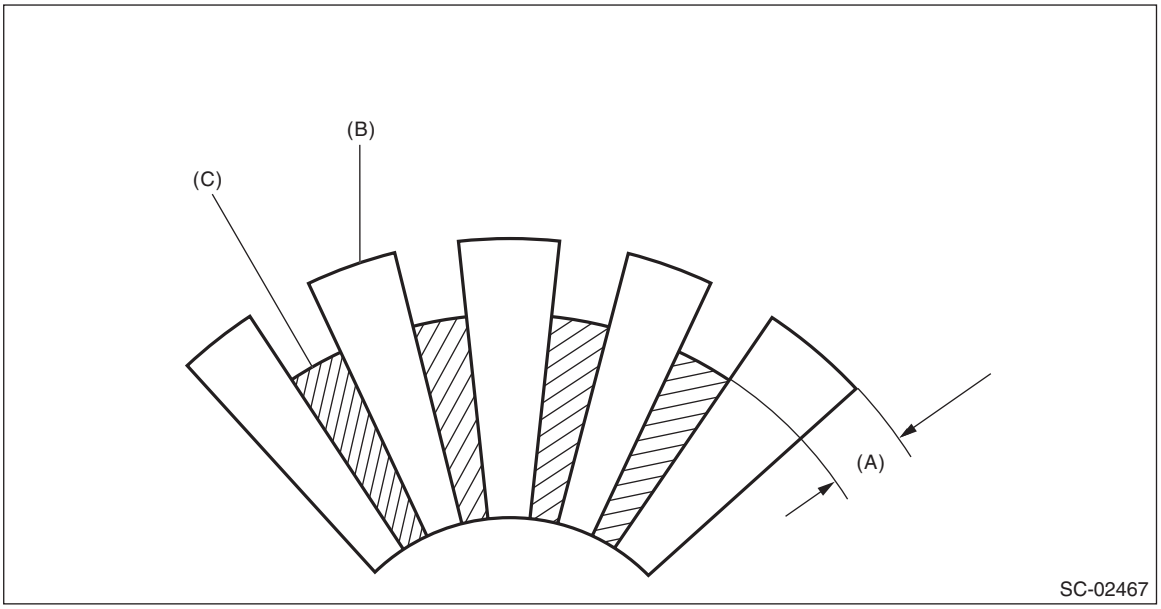
***Commutator runout:***
***Standard***
***0.05 mm (0.0020 in)***
***Limit***
***0.10 mm (0.0039 in)***



(A) Dial gauge
(B) V-block

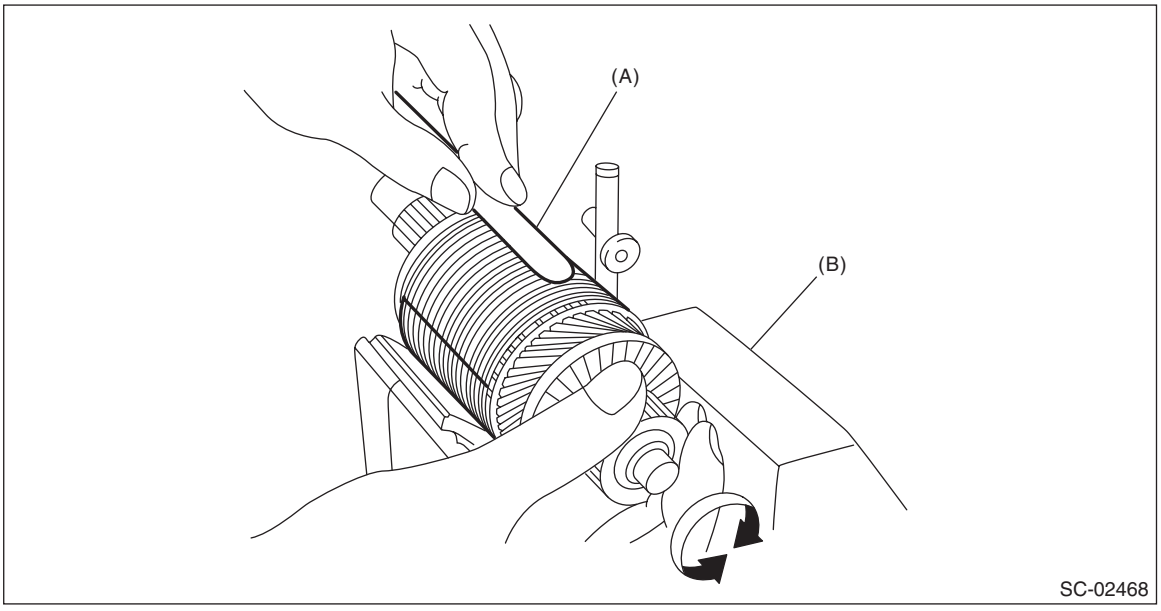
3) Check the depth of the segment mold. If it is not within the standard, replace the armature.

***Depth of segment mold:***
***Standard***
***0.50 mm (0.020 in)***



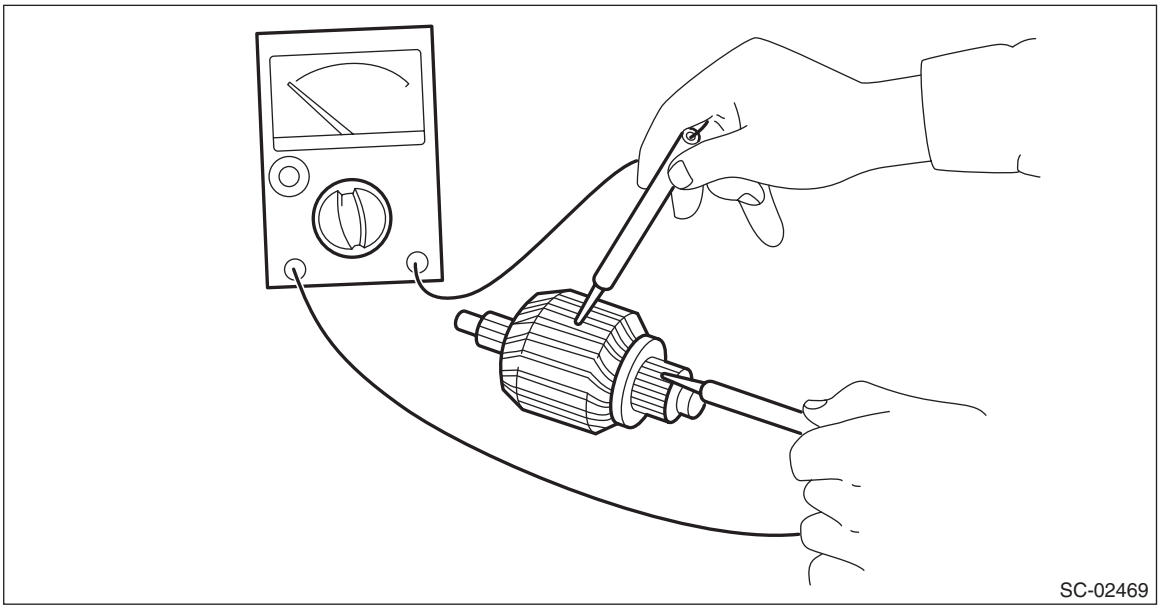
(A) Depth of mold (B) Segment (C) Mold

4) Place the armature on the growler tester to check for short circuits. While slowly turning the armature, support the steel sheet for the armature core. If the circuit of the armature is shorted, the steel sheet will vibrate, causing it to move towards the core. When the steel sheet has moved or vibrated, replace the armature.



(A) Steel sheet (B) Growler tester

5) Use a circuit tester to touch the probe of one side to the commutator segment, and the other probe to the shaft. If there is continuity, replace the armature.



### 2. YOKE

Make sure that the pole is set at the predetermined position.

### 3. OVERRUNNING CLUTCH

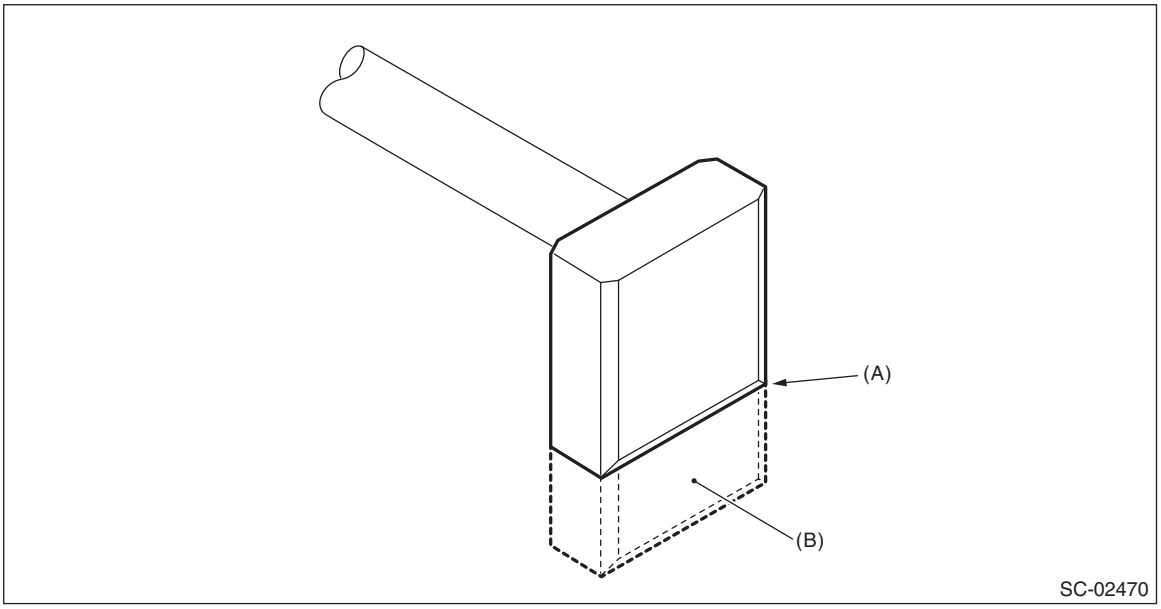
Inspect the pinion, and if there is any wear or damage, replace the overrunning clutch. Also, check that the pinion rotates counterclockwise smoothly and does not rotate clockwise. If there is any fault, replace the overrunning clutch.

**CAUTION:**
**To prevent spilling of grease, do not clean the overrunning clutch with oil.**

## 4. BRUSH AND BRUSH HOLDER

1) Visually check the brush. If there is any abnormal wear or cracks, replace the brush.
2) Measure the length of the brush. If it exceeds service limits, replace the brush.

***Brush length:***
***Standard***
***12.3 mm (0.484 in)***
***Limit***
***7.0 mm (0.276 in)***



(A) Service limit line (B) Brush

3) Check that the brush moves smoothly in the brush holder.
4) Measure the brush spring force with a spring scale. Replace the brush holder if below the service limit.

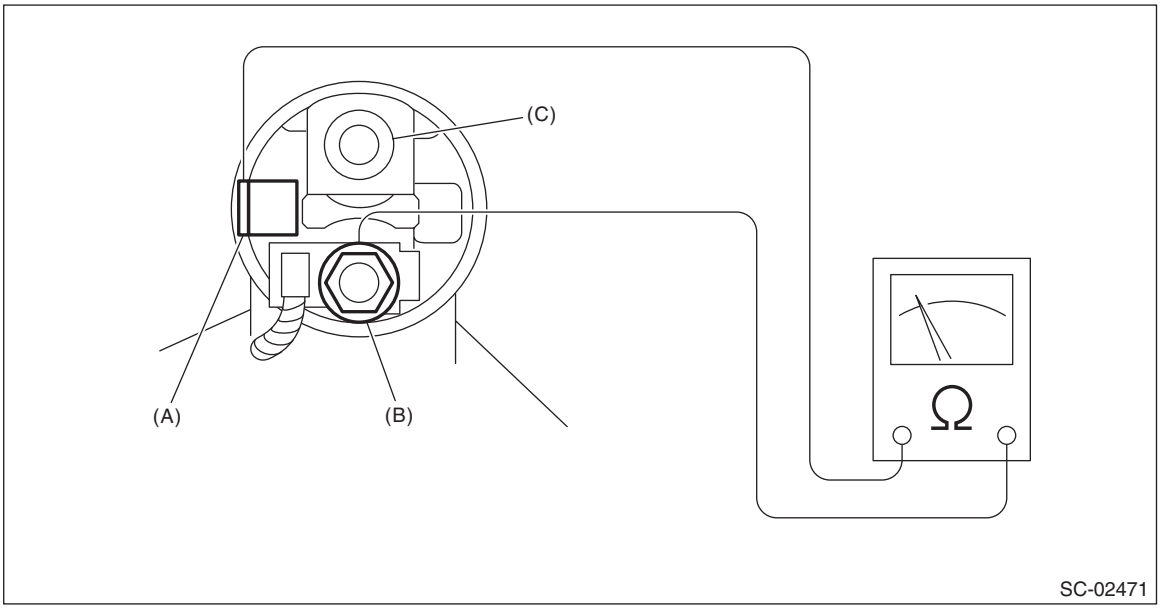
***Brush spring force:***
***Standard***
***15.9 — 19.5 N (1.62 — 1.99 kgf, 3.57 — 4.38 lbf) (When new)***
***Limit***
***2.5 N (0.25 kgf, 0.56 lbf)***

## 5. SWITCH ASSEMBLY

Using a circuit tester (set to “ohm”), check that there is continuity between terminals S and M, and between terminal S and ground. Also check to be sure there is no continuity between terminal M and B.

***Resistance between switch assembly terminals:***

| Terminals | Standard |
|---|---|
| S — M | 1 Ω or less |
| S — Ground | 1 Ω or less |
| M — B | 1 MΩ or more |



(A) Terminal S (B) Terminal M (C) Terminal B

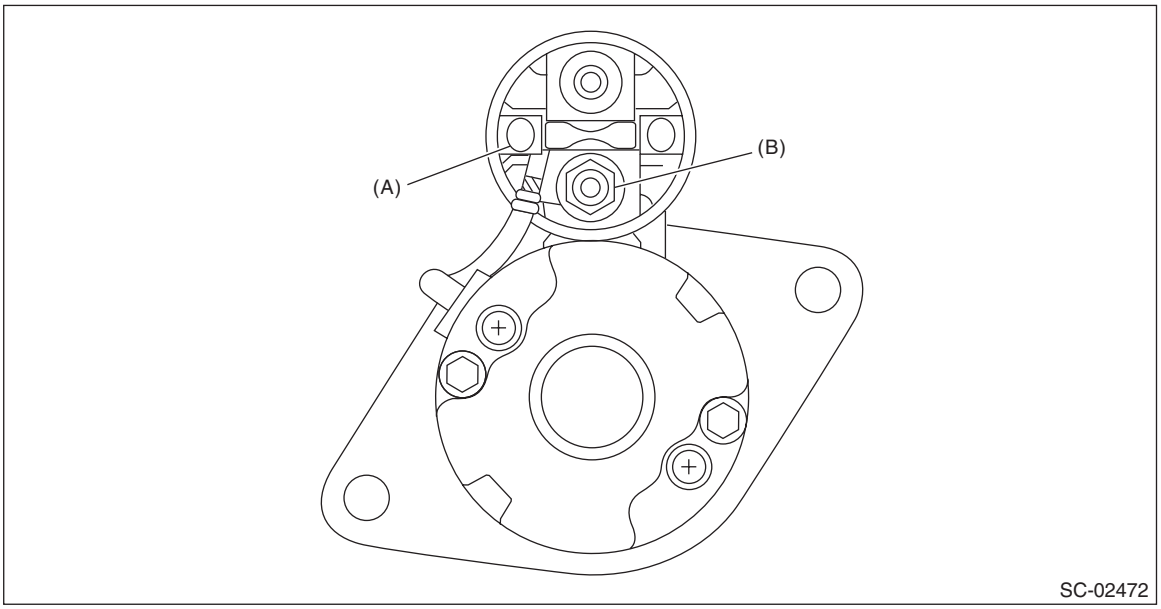
## 6. SWITCH ASSEMBLY OPERATION

1) Using a lead wire, connect the switch assembly terminal S to the positive terminal of battery, and the starter body to the ground terminal of battery. The pinion should be forced endwise on shaft.

NOTE:
With the pinion forced endwise on shaft, starter motor can sometimes rotate because current flows, through pull-in coil, to motor. This is not a problem.

2) Disconnect the connector from terminal M. Then using a lead wire, connect the positive terminal of battery and terminal M, and ground terminal to starter body.

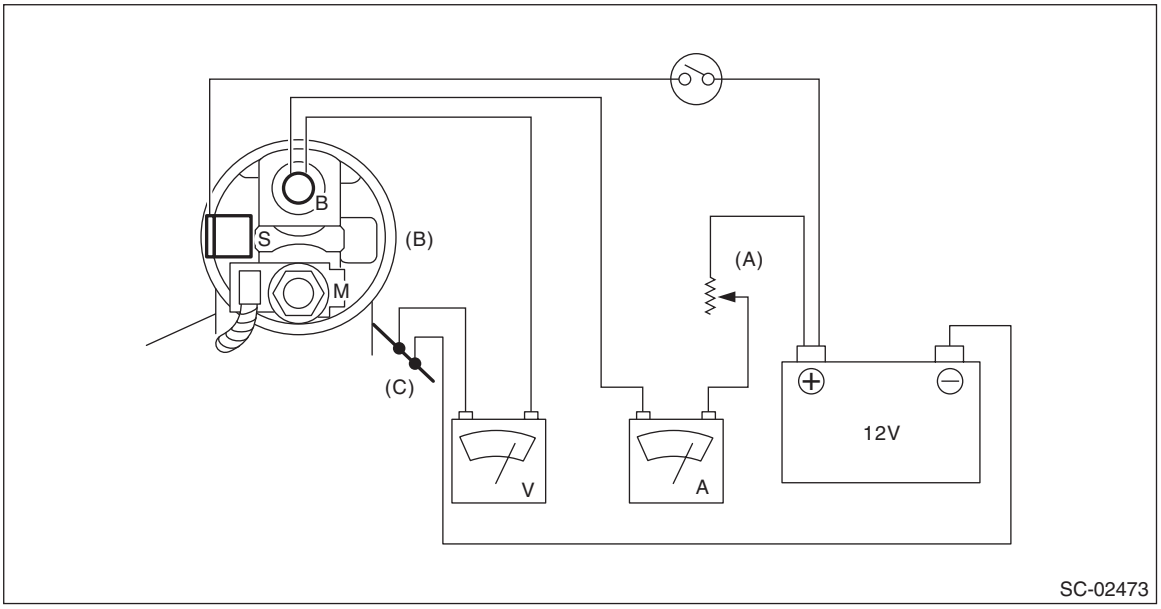
In this test set up, the pinion should return to its original position even when it is pulled out with a screwdriver.



(A) Terminal S (B) Terminal M

## 7. PERFORMANCE TEST

The starter should be submitted to performance tests whenever it has been overhauled, to assure its satisfactory performance when installed on the engine.
Three performance tests, no-load test, load test, and lock test, are presented here; however, if the load test and lock test cannot be performed, carry out at least the no-load test.
For these performance tests, use the circuit shown in figure.



(A) Variable resistance (B) Magnet switch (C) Starter body

1) Adjust the variable resistance with the switch on until the voltage is 11 V, and read the value displayed by the ammeter to measure starter speed. Compare these values with the standard.

***No-load test (standard):***

***Voltage/Current***
***CVT model***
***Max. 11 V/90 A or less***
***MT model***
***Max. 11 V/95 A or less***

***Rotating speed***
***CVT model***
***2,370 rpm or more***
***MT model***
***2,500 rpm or more***

2) Apply the specified braking torque to starter. The condition is normal if the current draw and starter speed are within standard.

***Load test (standard):***

***Voltage/Load***
***CVT model***
***7.5 V/10.65 N·m (1.1 kgf-m, 7.8 ft-lb)***
***MT model***

***Current/Speed***
***CVT model***
***300 A/840 rpm or more***
***MT model***
***300 A/870 rpm or more***

3) With the starter stalled, or not rotating, measure the torque developed and current draw when the voltage is adjusted to standard voltage.

***Lock test (standard):***

***Voltage/Current***
***CVT model***
***4 V/780 A or less***
***MT model***
***4 V/680 A or less***

***Torque***

## 1. DIODE

**CAUTION:**
**There is the possibility of damaging the diodes if a mega-tester (used to measure high voltages) or a similar measuring instrument is used. Never use a mega tester or equivalent for this test.**
1) Check for continuity between the diode lead and terminal E or B. If continuity is not as shown in the table, replace the rectifier.
- At analog type tester

| Tester lead | | Continuity |
|---|---|---|
| –lead | +lead | |
| E | P1, P2, P3, P4, P5, P6 | Yes |

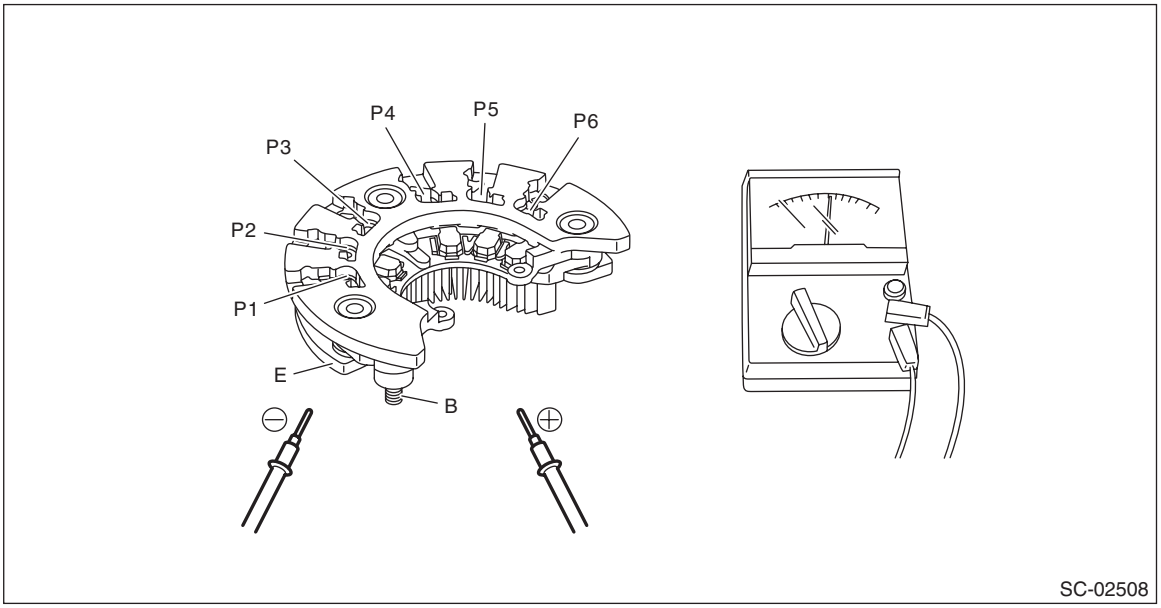
| B | | Yes |
| P1, P2, P3, P4, P5, P6 | E | Yes |
| | B | No |



## 2. ROTOR

1) Slip ring surface

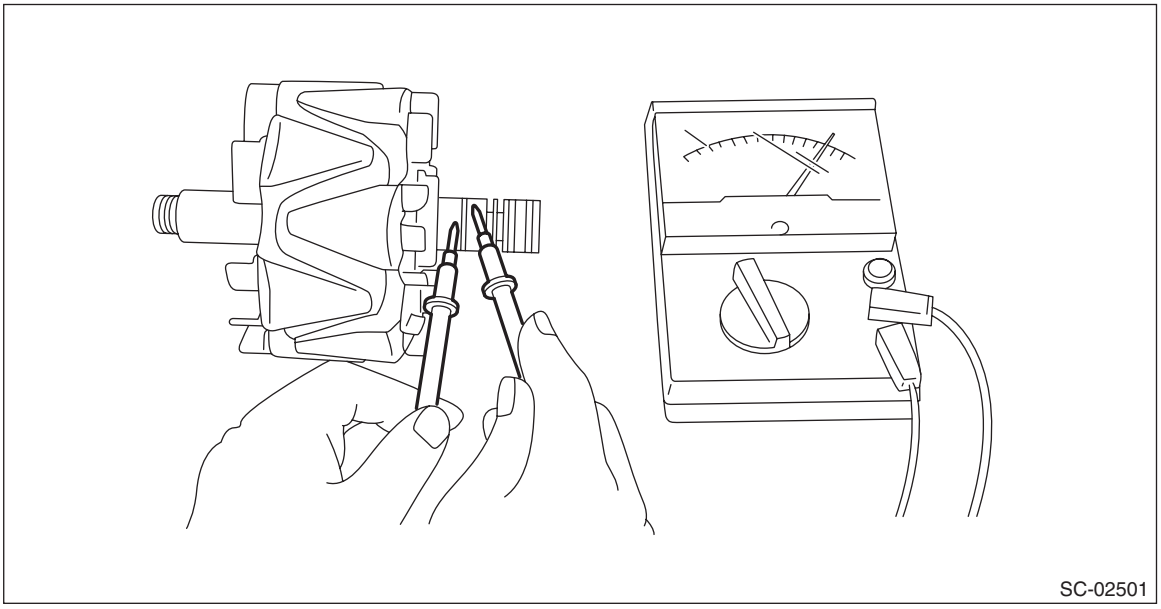
2) Slip ring outer diameter
Measure the slip ring outer diameter. Replace the rotor if the slip ring is worn.

***Slip ring outer diameter:***
***Standard***
***22.7 mm (0.894 in)***
***Limit***
***22.1 mm (0.870 in)***
3) Continuity test
Using a circuit tester, check the resistance between slip rings. If the resistance is not within the standard, replace the rotor.

***Standard:***
***Approx. 2.0 — 2.4 Ω***



SC-02501

4) Insulation test

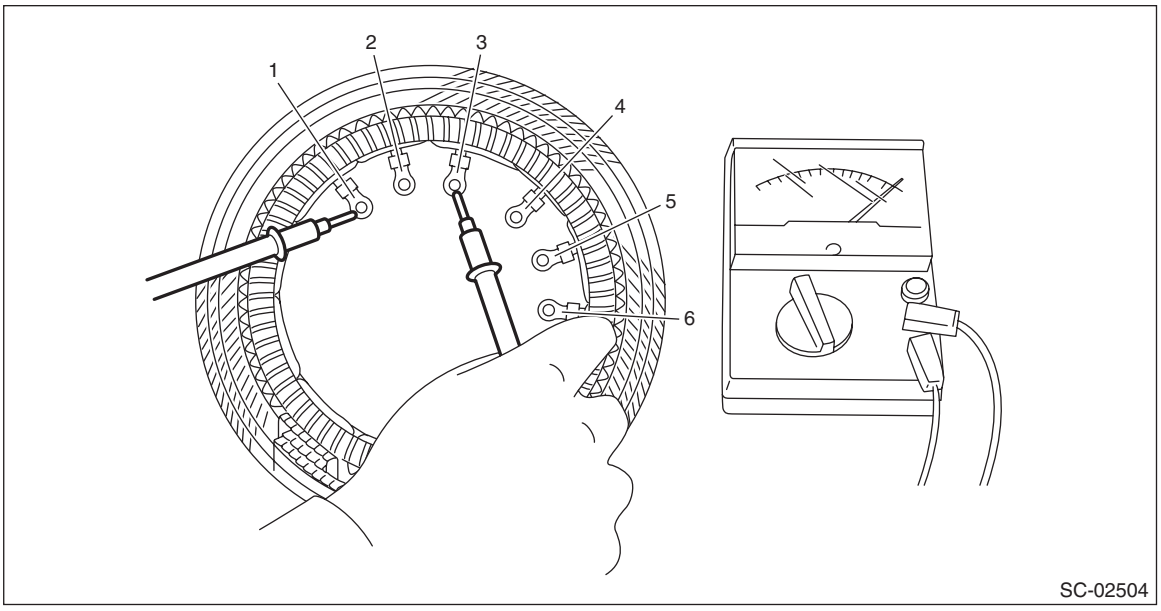
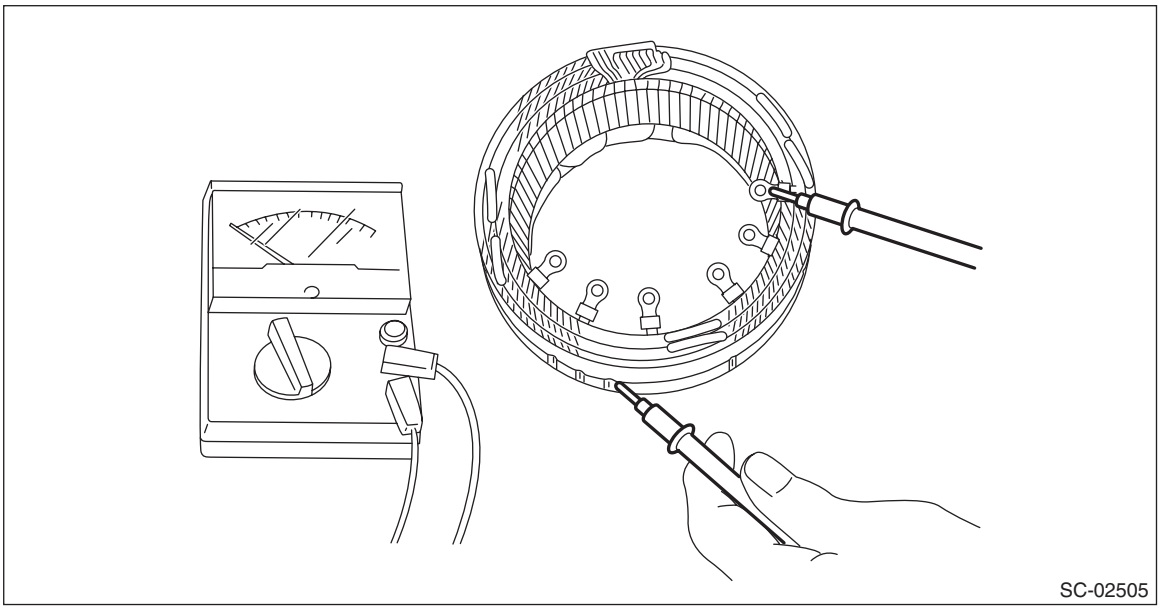
SC-02503

(A) Terminals



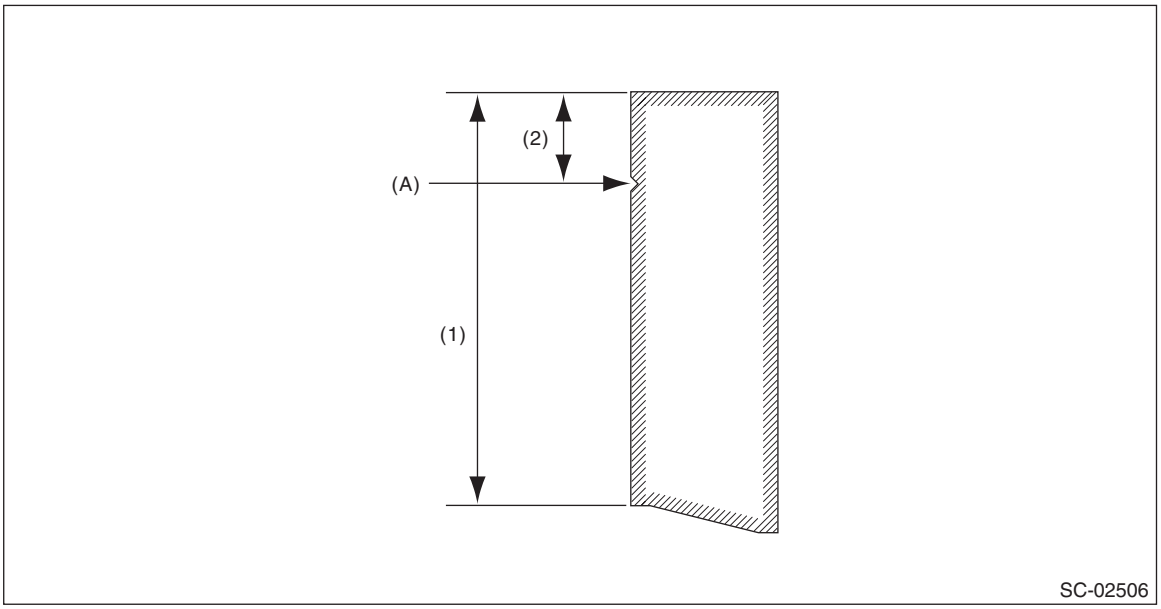
2) Insulation test
Inspect the continuity between the stator coil stator core and lead wire terminals. If there is continuity, replace the stator coil because the stator coil is grounded.



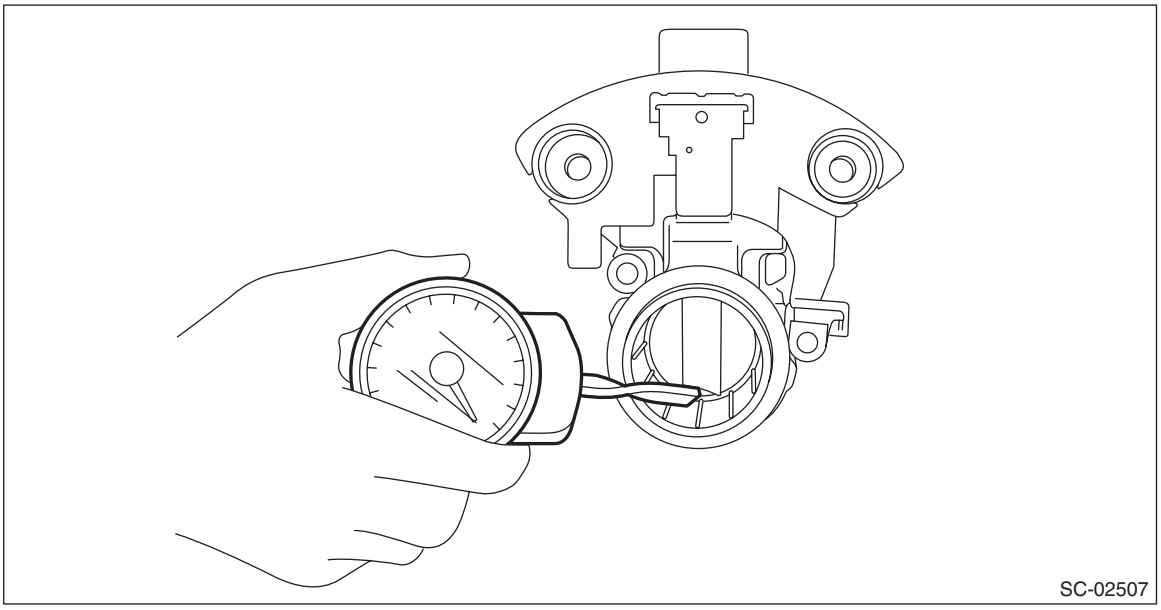
## 4. BRUSH

1) Measure the length of each brush. Replace the brush if wear exceeds service limits. There is a service limit mark (A) on each brush.

***Brush length:***
***Standard (1)***
***18.5 mm (0.728 in)***
***Limit (2)***
***5.0 mm (0.197 in)***



2) Check that there is appropriate pressure on the brush spring. Using a spring pressure indicator, push the brush into the brush holder until its tip protrudes 2 mm (0.0787 in). Then measure the pressure of brush spring. If the pressure is 1.7 N (173 gf, 6.11 ozf) or less, replace the brush spring. 4.1 — 5.3 N (418 — 540 gf, 14.75 — 19.06 ozf) pressure is required on the new spring.



## 5. BALL BEARING

NOTE:
- Clean the battery cable terminals and apply grease to retard the formation of corrosion.
- Connect the positive (+) terminal, and then connect the negative (–) terminal of the battery.
- After the battery is installed, initial diagnosis of the electronic throttle control is performed. Wait for 10 seconds or more after turning the ignition switch to ON, and then start the engine.

## C: INSPECTION

**WARNING:**
- **Electrolyte is corrosive acid, and has toxicity; be careful of handling the fluid.**
- **Make sure the electrode does not come into contact with skin, eyes or clothing. Especially at contact with eyes, flush with water for 15 minutes and get prompt medical attention.**
- **In addition, be careful not to let the electrode contact with the coated parts.**
- **Be careful when handling the batteries because they produce explosive gases.**
- **Be sure to keep battery away from any fire.**
- **For safety, in case an explosion does occur, wear eye protection or shield your eyes when working near any battery. In addition, never lean over the battery.**
- **Ventilate sufficiently when using or charging battery in enclosed space.**
- **Before starting work, remove rings, metal watch-bands, and other metal jewelry.**
- **Never allow metal tools to contact the positive battery terminal and anything connected to it while you are at the same time in contact with any other metallic portion of the vehicle.**

## 1. EXTERNAL PARTS

Check the battery case, top cover, vent plugs, and terminal posts for dirt or cracks. If necessary, clean with water and wipe with a dry cloth.
Apply a thin coat of grease on the terminal posts to prevent corrosion.

## 2. ELECTROLYTE LEVEL

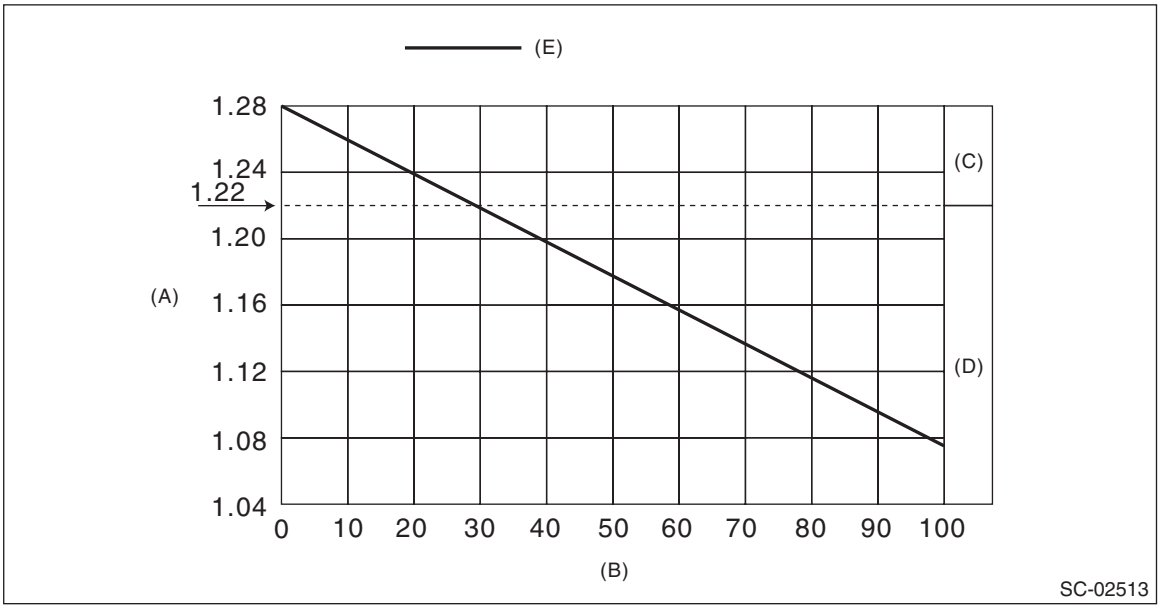
Check the electrolyte level in each cell. If the level is below MIN level, bring the level to MAX level by pouring distilled water into the battery cell. Do not fill beyond MAX level.

## 3. SPECIFIC GRAVITY OF ELECTROLYTE

1) Measure specific gravity of electrolyte using a hydrometer and a thermometer.
Specific gravity varies with temperature of electrolyte so that it must be corrected at 20°C (68°F) using the following calculation:

***$S_{20}$ = St + 0.0007 × (t – 20)***
***$S_{20}$: Specific gravity corrected at electrolyte temperature of 20°C***
***St: Measured specific gravity***
***t: Measured temperature (°C)***
***Judge whether or not the battery requires charging according to corrected specific gravity.***
***Standard specific gravity: 1.220 — 1.290 [at 20°C (68°F)]***

2) Measuring the specific gravity of the electrolyte in the battery will disclose the state of charge of the battery. The relation between specific gravity and state of charge is as shown in the figure.



(A) Specific gravity [20°C (68°F)]
(B) Amount of discharge (%)
(C) Good
(D) Need to charge
(E) Battery with standard specific gravity 1.280 [20°C (68°F)]

## D: MEASUREMENT

**WARNING:**
**Do not bring an open flame close to the battery when working.**

**CAUTION:**
- **Prior to charging, corroded terminals should be cleaned with a brush and common caustic soda solution.**
- **Be careful since battery electrolyte overflows while charging the battery.**
- **Observe instructions when handling the battery charger.**
- **Before charging the battery on the vehicle, disconnect the battery ground terminal to prevent damage of generator diodes or other electrical units.**

### 1. JUDGMENT OF BATTERY IN CHARGED CONDITION

1) Specific gravity of electrolyte should be held within the specific range of 1.250 — 1.290 for one hour or more.
2) Voltage per battery cell should be held at a specific value in a range of 2.5 — 2.8 V for one hour or more.

### 2. CHECK CONDITION OF CHARGE WITH HYDROMETER

| Hydrometer indicator | State of charge | Corrective action |
|---|---|---|
| Green dot | 65% or more | Load test |
| Dark dot | 65% or less | Charge battery |
| Clear dot | Low electrolyte | Replace the battery*<br>(If cranking is difficult) |
| * Check electrical system before replacement. | | |

### 3. NORMAL CHARGING

Charge the battery at the current value specified by manufacturer or at approximately 1/10 of battery's ampere-hour rating.

### 4. QUICK CHARGING

**CAUTION:**
- **Observe the items in "3. NORMAL CHARGING".**
- **Never use 10 A or more when charging the battery because it will shorten the battery life.**

Quick charging is a method that the battery is charged in a short period of time with a relatively large current by using a quick charger.
Since a large current flow raises electrolyte temperature, the battery is subject to damage if the large current is used for prolonged time. For this reason, quick charging must be carried out within a current range that will not raise the electrolyte temperature to 40°C (104°F) or more.
Also the quick charging is a temporary mean to bring battery voltage up to some level, and battery should be charged slowly with low current as a rule.

# 3. General Description

## A: CAUTION

1) Airbag system wiring harness is routed near the ECM, main relay and fuel pump relay.

**CAUTION:**
**• Do not use electrical test equipment on the airbag system circuits.**
**• Be careful not to damage the airbag system wiring harness when servicing the ECM, TCM, main relay and fuel pump relay.**

2) Never connect the battery in reverse polarity. Doing so will damage the ECM instantly, and other parts will also be damaged.

3) Do not disconnect the battery terminals while the engine is running. A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as ECM etc.

4) When disconnecting the connectors of the electrical components, always be sure to turn the ignition switch to OFF. Perform the Clear Memory Mode after connecting the connectors. <Ref. to EN(H4DO)(diag)-57, Clear Memory Mode.>

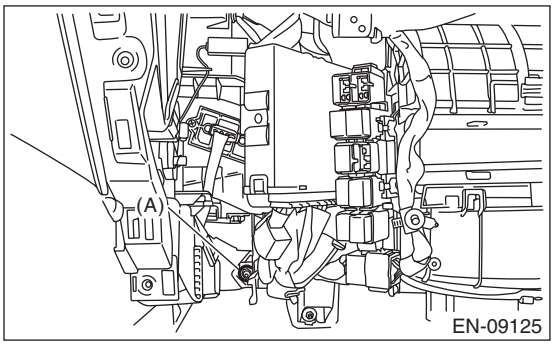
5) When measuring the voltage or resistance of individual sensor or all electrical control modules, use a tapered pin with a diameter of less than 0.6 mm (0.024 in). Do not insert the pin 4 mm (0.16 in) or more into the part.

**CAUTION:**
**When replacing the ECM, be careful not to use the ECM of wrong specification to avoid any damage on the fuel injection system.**

NOTE:
When replacing the ECM of the models with immobilizer, immobilizer system must be registered. For detailed procedures, refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.

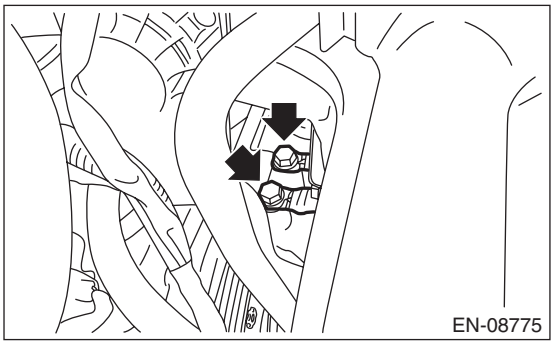
6) Take care not to allow water to get into the connectors when servicing or washing the vehicle in rainy weather. Avoid exposure to water even if the connectors are waterproof.

7) Use ECM mounting stud bolts for the grounding point when measuring voltage and resistance inside the passenger compartment.



(A) Stud bolt

8) Use the engine ground terminal or engine assembly for the grounding point when measuring the voltage and resistance in engine compartment.



9) All parts related to the engine control system are precision parts. Do not drop or otherwise apply impact. Do not reuse the parts that are dropped accidentally.

10) Observe the following cautions when installing a radio in vehicle.

**CAUTION:**
**• The antenna must be kept as far apart as possible from the ECM. <Ref. to EN(H4DO)(diag)-9, CONTROL MODULE, LOCATION, Electrical Component Location.>**
**• The antenna feeder must be placed as far apart as possible from the ECM and engine control system harness.**
**• Carefully adjust the antenna for correct matching.**
**• When mounting a large power type radio, pay special attention to the three items mentioned above.**
**• Incorrect installation of the radio may affect the operation of ECM.**

11) When disconnecting the fuel hose, release the fuel pressure. <Ref. to FU(H4DO)-112, RELEASING OF FUEL PRESSURE, PROCEDURE, Fuel.>
12) Warning lights may illuminate when performing driving test with jacked-up or lifted-up condition, but this is not a system malfunction. The reason for this is the rotating speed difference between the front and rear wheels. When engine control system diagnosis is finished, perform the VDC memory clearance procedure of self-diagnosis function. <Ref. to VDC(diag)-24, Clear Memory Mode.>

## B: INSPECTION

Before performing diagnostics, check the following item which might affect engine problems.

### 1. BATTERY

1) Measure the battery voltage and specific gravity of the electrolyte.

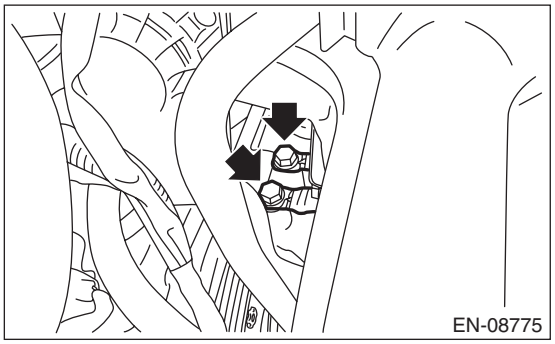
***Standard voltage: 12 V***

***Specific gravity: 1.260 or more***

2) Check the condition of the main and other fuses, and harnesses and connectors. Also check for proper grounding.

### 2. ENGINE GROUND

Make sure that the engine ground terminal has no contamination, corrosion or looseness and is properly connected to the engine.



## C: NOTE

- The on-board diagnostic (OBD) system detects and indicates a fault in various inputs and outputs of the complex electronic control. Malfunction indicator light in the combination meter indicates occurrence of a fault or trouble.
- Further, against such a failure of sensors as may disable the drive, the fail-safe function is provided to ensure the minimal drivability.
- The OBD system incorporated with the vehicles within this type of engine complies with OBD-II regulations. The OBD system monitors the components and the system malfunction listed in “Engine Section” which affects on emissions.
- When the system decides that a malfunction occurs, malfunction indicator light illuminates. At the same time of the malfunction indicator light illumination or blinking, a DTC and a freeze frame engine conditions are stored into on-board computer.
- The OBD system stores freeze frame engine condition data (engine load, engine coolant temperature, fuel trim, engine speed and vehicle speed, etc.) into on-board computer when it detects a malfunction.
- Freeze frame engine condition data are stored until the DTCs are cleared. However when such malfunctions as fuel trim fault and misfire are detected with the freeze frame engine condition data stored, they are rewritten into those related to the fuel trim fault and misfire.
- When the malfunction does not occur again for three consecutive driving cycles*, malfunction indicator light is turned off, but DTC remains at on-board computer.

*: One driving cycle means the period between the ignition switch ON and the ignition switch OFF after driving.

- When performing diagnosis, connect the Subaru Select Monitor or general scan tool to the vehicle.

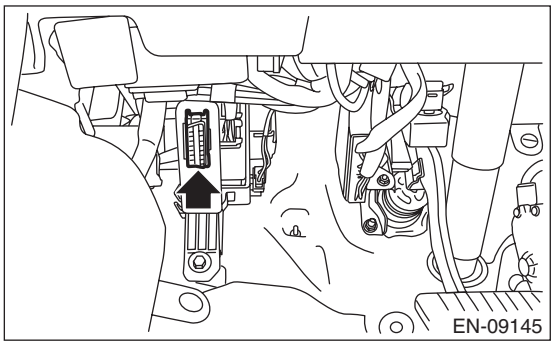
# 8. General Scan Tool

## A: OPERATION

### 1. HOW TO USE GENERAL SCAN TOOL

1) Prepare a scan tool (general scan tool) required by SAE J1978.
2) Connect the general scan tool to data link connector located in the lower portion of the instrument panel (on the driver's side).



3) Using the general scan tool, call up each data. General scan tool functions consist of:
   (1) MODE $01: Current powertrain diagnostic data
   (2) MODE $02: Powertrain freeze frame data
   (3) MODE $03: Emission-related powertrain DTC
   (4) MODE $04: Clear/Reset emission-related diagnostic information
   (5) MODE $06: Request on-board monitoring test results for intermittently monitored systems
   (6) MODE $07: Request on-board monitoring test results for continuously monitored systems
   (7) MODE $08: Request control for on-board system, test, and component
   (8) MODE $09: Request vehicle information
4) Read out the data according to repair procedures. (For detailed operation procedure, refer to the general scan tool operation manual.)

NOTE:
For details concerning DTC, refer to "List of Diagnostic Trouble Code (DTC)". <Ref. to EN(H4DO)(diag)-82, List of Diagnostic Trouble Code (DTC).>

## 2. MODE $01: (CURRENT POWERTRAIN DIAGNOSTIC DATA)

## 1. PREPARATION FOR THE INSPECTION MODE

1) Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 L (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2) Lift up the vehicle using a garage jack and place it on rigid racks, or drive the vehicle onto free rollers.

**WARNING:**
**• Before lifting up the vehicle, ensure parking brake is applied.**
**• Do not use a pantograph jack in place of a rigid rack.**
**• Secure a rope or wire to the front or rear towing hooks to prevent the lateral runout of front wheels.**
**• Before rotating the wheels, make sure that there is no one in front of the vehicle. Besides while the wheels are rotating, make sure that no one approaches the vehicle front side.**
**• Make sure that there is nothing around the wheels. For AWD model, pay attention to all four wheels.**
**• While servicing, do not depress or release the clutch pedal or accelerator pedal quickly regardless of the engine speed. Quick operation may cause the vehicle to drop off the free roller.**
**• To prevent the vehicle from slipping due to vibration, do not place anything between rigid rack and the vehicle.**

# 12.Drive Cycle

## A: PROCEDURE

It is necessary to perform the drive cycle listed below if DTC is not found in the Inspection Mode. It is possible to complete diagnosis of the DTC by performing the indicated drive cycle. After the repair for the DTC, perform a necessary drive cycle and make sure the function recovers and the DTC is recorded.

### 1. PREPARATION FOR DRIVE CYCLE

1) Check that the battery voltage is 12 V or more and fuel remains approx. half [20 — 40 L (5.3 — 10.6 US gal, 4.4 — 8.8 Imp gal)].
2) After performing the diagnostics and Clear Memory Mode, check that no DTC remains. <Ref. to EN(H4DO)(diag)-57, Clear Memory Mode.>
3) Check the delivery (test) mode fuse is removed.

NOTE:
• Perform the drive cycle after warming up the engine except when the engine coolant temperature at engine start is specified.
• Perform the drive cycle twice if the DTC in the list is marked with *. After completing the first drive cycle, stop the engine and perform second diagnosis in same condition.

**Diagnostic procedure:**
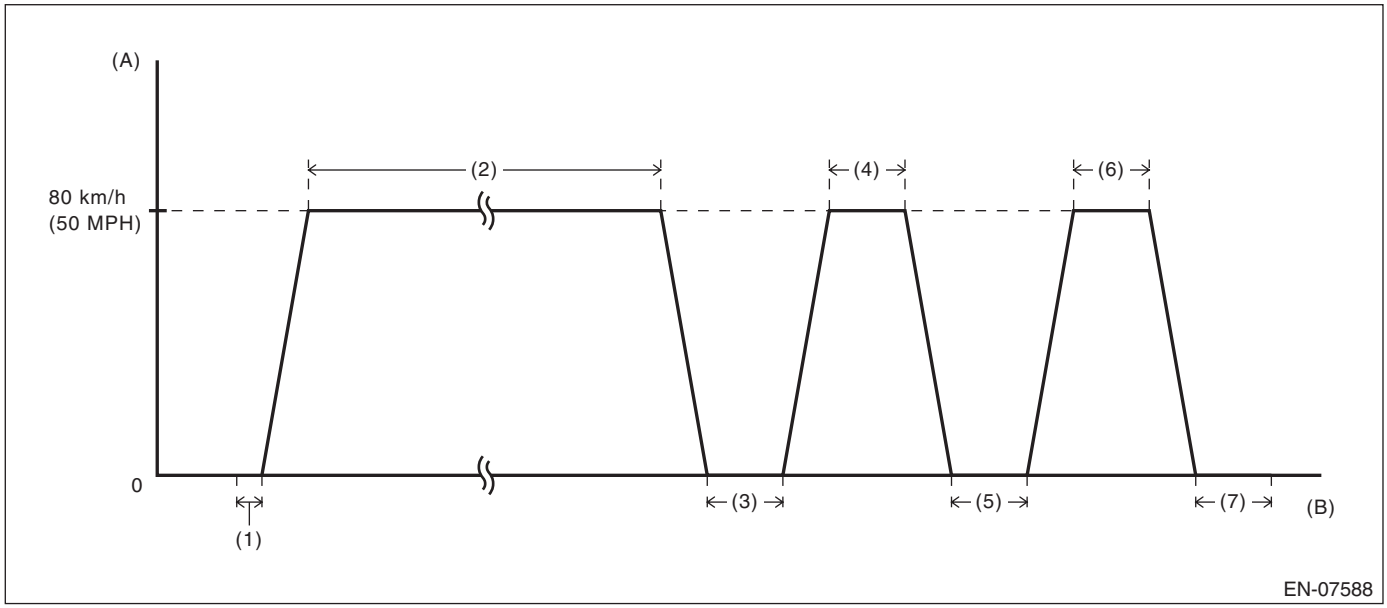
1) Make sure that the engine coolant temperature is less than 30°C (86°F).
2) Drive according to the drive pattern described below.



(A) Vehicle speed
(B) Elapsed time
(1) Idle the engine for 10 seconds or more after engine start.
(2) Drive for 8 minutes or more at a constant speed of 80 km/h (50 MPH) or more.

(6) Drive for 30 seconds or more at a constant speed of 80 km/h (50 MPH) or more.
(7) Stop the vehicle and idle for 30 seconds.

NOTE:
- There is no given transition time between idling and cruising.
- Driving at constant speed only on a downhill causes smaller engine load and may result in failure to obtain a right diagnostic result.
- When the engine stops while performing drive cycle F, perform it again from the state of procedure 1).

## 7. DRIVE CYCLE H

| DTC | Item | Condition |
|---|---|---|
| *P050A | Cold Start Idle Air Control System Performance | — |
| *P050B | Cold Start Ignition Timing Performance | — |

1) Perform the Clear Memory Mode. <Ref. to EN(H4DO)(diag)-57, Clear Memory Mode.>
2) With the ignition switch ON, read the value in «Coolant Temp.» and «Intake Air Temp.». <Ref. to EN(H4DO)(diag)-36, READ CURRENT DATA FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>
3) If the values from step 2) satisfy the following conditions, idle the engine for one minute.

***Condition:***
***|Engine coolant temperature — Intake air temperature| ≤ 5°C (9°F)***

NOTE:
- If the conditions are not satisfied, turn the ignition switch to OFF and wait until the parameters are satisfied.
- For CVT models, hold the select lever to “P” range or “N” range at idling, and for MT models, the shift lever in the neutral position at idling.

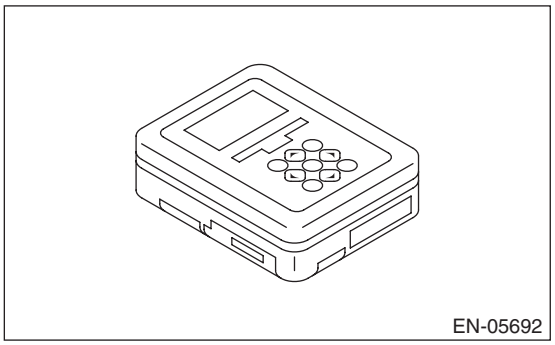
## 8. DRIVE CYCLE I

| DTC | Item | Condition |
|---|---|---|
| *P0455 | Evaporative Emission System Leak Detected (Large Leak) | «Coolant Temp.»: 5 — 45°C (41 — 113°F)<br>«Intake Air Temp.»: 5 — 50°C (41 — 122°F) |
| *P0456 | Evaporative Emission Control System Leak Detected (Very Small Leak) | |
| *P1451 | Evaporative Emission Cont. Sys. | |
| *P2402 | Evaporative Emission System Leak Detection Pump Control Circuit High | |
| *P2404 | Evaporative Emission System Leak Detection Pump Sense Circuit Range/Performance | |
| *P2420 | Evaporative Emission System Switching Valve Control Circuit High | |

**CAUTION:**
**Be careful of the state of the battery when performing the DRIVE CYCLE I consecutively. Performing the DRIVE CYCLE I consecutively without the engine running may cause a low battery voltage and battery discharge.**

NOTE:
- If it is necessary to perform DRIVE CYCLE I consecutively, drive the vehicle under the following conditions to release accumulated evaporating gas. Performing the DRIVE CYCLE I consecutively without starting the engine causes a large amount of evaporating gas to accumulate in the canister, which hinders an accurate diagnosis.
  - After engine is warmed up
  - Drive for 10 minutes or more at a speed of 48 km/h (30 MPH) or more (duration of drive can be an accumulation)
- To obtain an accurate diagnostic result, perform the procedures according to the following points.
  - Do not refuel gas immediately before performing DRIVE CYCLE I. There will be a large amount of evaporating gas immediately after refuel, which may cause a less accurate diagnostic performance.
  - Do not shake the vehicle while performing DRIVE CYCLE I. Shaking the vehicle causes evaporating gas to increase inside the fuel tank, which may cause a less accurate diagnostic performance.
  - Do not perform any service operation including installation or removal of parts or connectors while performing DRIVE CYCLE I. Performing service operation could affect on the functions of related parts, which may cause a less accurate diagnostic performance.

1) Prepare the Subaru Select Monitor kit. <Ref. to EN(H4DO)(diag)-8, PREPARATION TOOL, General Description.>



EN-05692

2) Prepare PC with Subaru Select Monitor installed.
3) Connect the USB cable to SDI (Subaru Diagnosis Interface) and USB port on the personal computer (dedicated port for the Subaru Select Monitor).

## 1. OUTLINE OF DIAGNOSIS

Detect the presence of misfire occurrence. (Revolution fluctuation method)
Monitoring Misfire which influences exhaust deterioration (1.5 times of FTP) and catalyst damage is made obligatory by the law. Misfire affecting these two has two patterns below:
• Intermittent misfire (The same cylinder misfires in random, or different cylinders misfire in random.): FTP 1.5 times misfire
• Every time misfire (The same cylinder misfires every time.): FTP 1.5 times misfire, Catalyst damage misfire
The following detecting methods are adopted for these detection.
1) Intermittent misfire: FTP 1.5 times misfire
• 180° Interval Difference Method (MT: 1,800 rpm or less, AT: None)
• 360° Interval Difference Method (whole range)
• 720° Interval Difference Method (3,000 rpm or more)
2) Misfire every time: FTP 1.5 times misfire, Catalyst damage misfire
• 360° Interval Difference Method

## 3. GENERAL DRIVING CYCLE

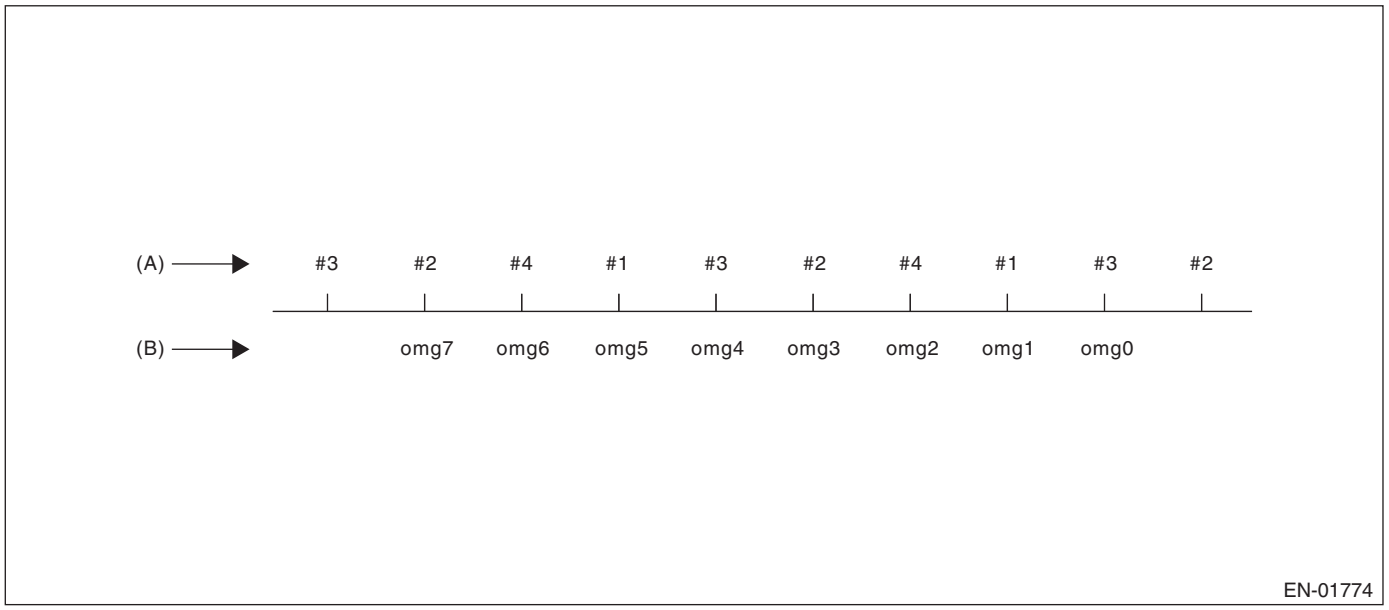
• If conditions are met, it is possible to detect the misfires from idling to high engine speed. However, to avoid excessive load or harm to the engine, perform diagnosis at idle.
• Perform the diagnosis continuously.

## 4. DIAGNOSTIC METHOD

When a misfire occurs, the engine speed will decrease and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed by the following formula, and judge whether a misfire is occurring or not comparing the calculated result with judgment value. Count the number of misfires, if the misfire ratio is higher during 1000 revs. or 200 revs., judge corresponding cylinders as NG.

| Diagnostic value calculation (Calculate from angle speed) → | Misfire detection every single ignition (Compare diagnostic value with judgment value) → | NG judgment (Misfire occurrence judgment required by the law) (Compare number of misfire with judgment value) |
|---|---|---|
| | • 180° Interval Difference Method<br>• 360° Interval Difference Method<br>• 720° Interval Difference Method | • FTP 1.5 times misfire NG judgment<br>• Catalyst damage misfire NG judgment |

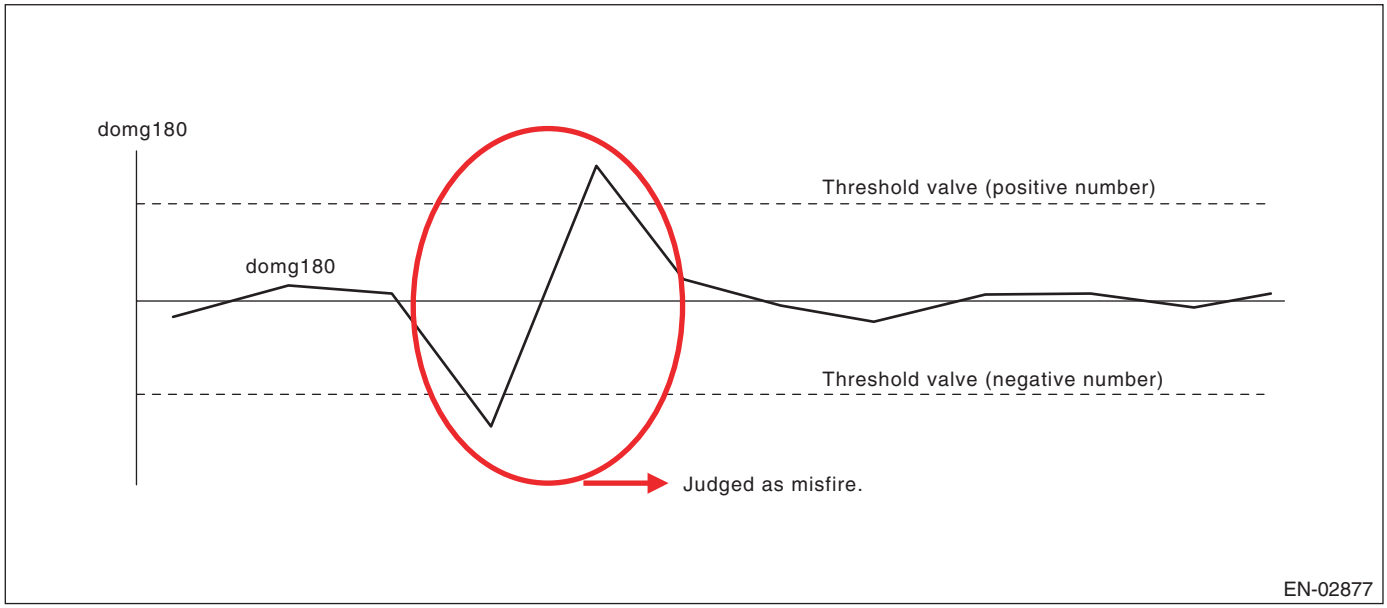
As shown in the following figure, pick a cylinder as the standard and name it omg 0. And the former crankshaft position speed is named omg 1, the second former crankshaft position speed is named omg 2, the third is named omg 3, etc.



(A) Ignition order (B) Crankshaft position speed

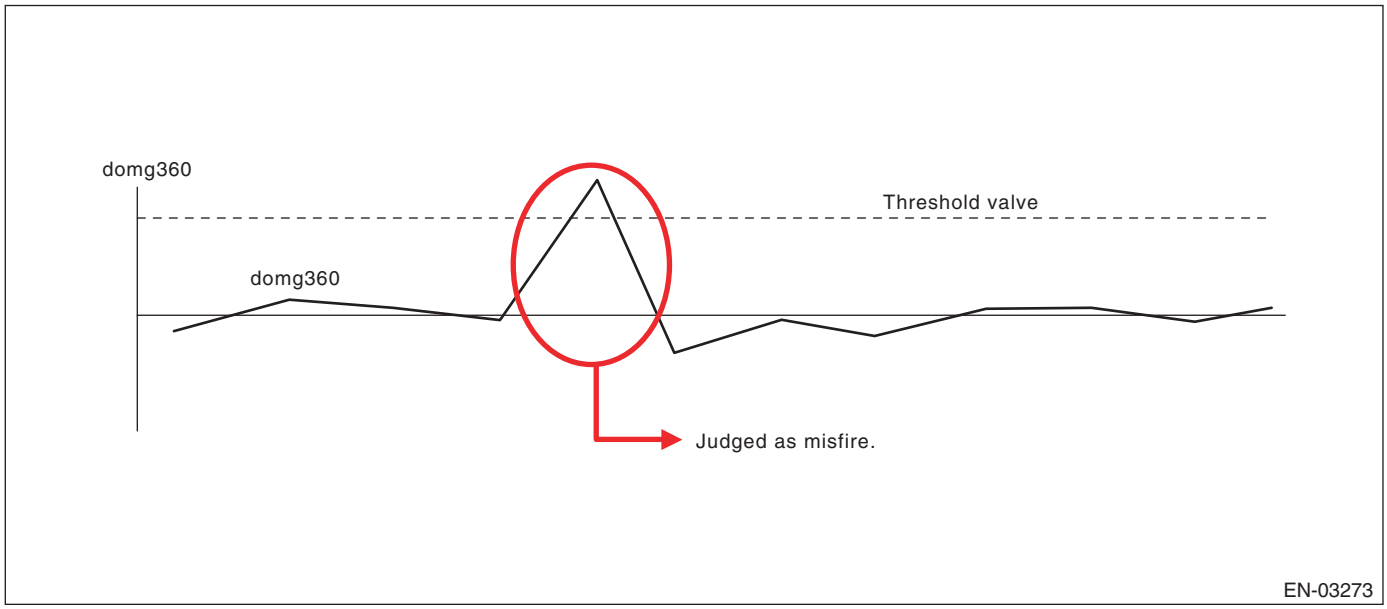
### 180° Interval Difference Method

| | |
|---|---|
| Diagnostic value | domg 180 = (omg 1 – omg 0) – (omg 5 – omg 1)/4 |
| Judge as a misfire in the following cases.<br>• domg 180 > judgment value of positive side<br>• domg 180 ≤ judgment value of negative side<br>(Diagnostic value before 180° CA) | |



### 360° Interval Difference Method

| | |
|---|---|
| Diagnostic value | domg 360 = (omg 1 – omg 0) – (omg 3 – omg 2) |
| Misfire judgment | domg 360 > Judgment value → Judge as misfire |



### 720° Interval Difference Method

| | |
|---|---|
| Diagnostic value | domg 720 = (omg 1 – omg 0) – (omg 5 – omg 4) |
| Misfire judgment | domg 720 > Judgment value → Judge as misfire |

# CI: DTC P0455 EVAPORATIVE EMISSION SYSTEM LEAK DETECTED (LARGE LEAK)

## 1. OUTLINE OF DIAGNOSIS

This diagnosis judges whether the ELCM operation is normal or not, and whether the evaporative emission system has leak and clogging or not.
To purge the canister, after driving, perform the five hours soaking after ignition switch OFF in order to stabilize the evaporative gas status. * After 5, 7 or 9.5 hours passed, ECM is activated by soaking timer, and the leak check is started.
Judges whether the ELCM operation is normal or not, by measuring the reference pressure status via reference orifice (0.02 inch orifice). Judge as malfunction if the reference pressure is out of specified range. Then, judge whether there is a leak or not, by comparing the pressure (leak pressure) when the reference pressure and the evaporative emission system are in negative pressure condition. Judge as system leak in the evaporative emission system if the leak pressure is higher than reference pressure. Judge as clogging of pipe if the leak pressure becomes lower than the reference pressure within the specified amount of time.
0.02 inch leak and 0.04 inch leak can be distinguished by measuring the leak pressure.
The diagnosis results are stored inside ECM until the engine is started again.
*: When the test conditions are not met in 5 hours, perform diagnosis at elapsed time of 7 hours. When the test conditions are not met in 7 hours, perform diagnosis at elapsed time of 9.5 hours.

# FJ: DTC P219A BANK 1 AIR-FUEL RATIO IMBALANCE

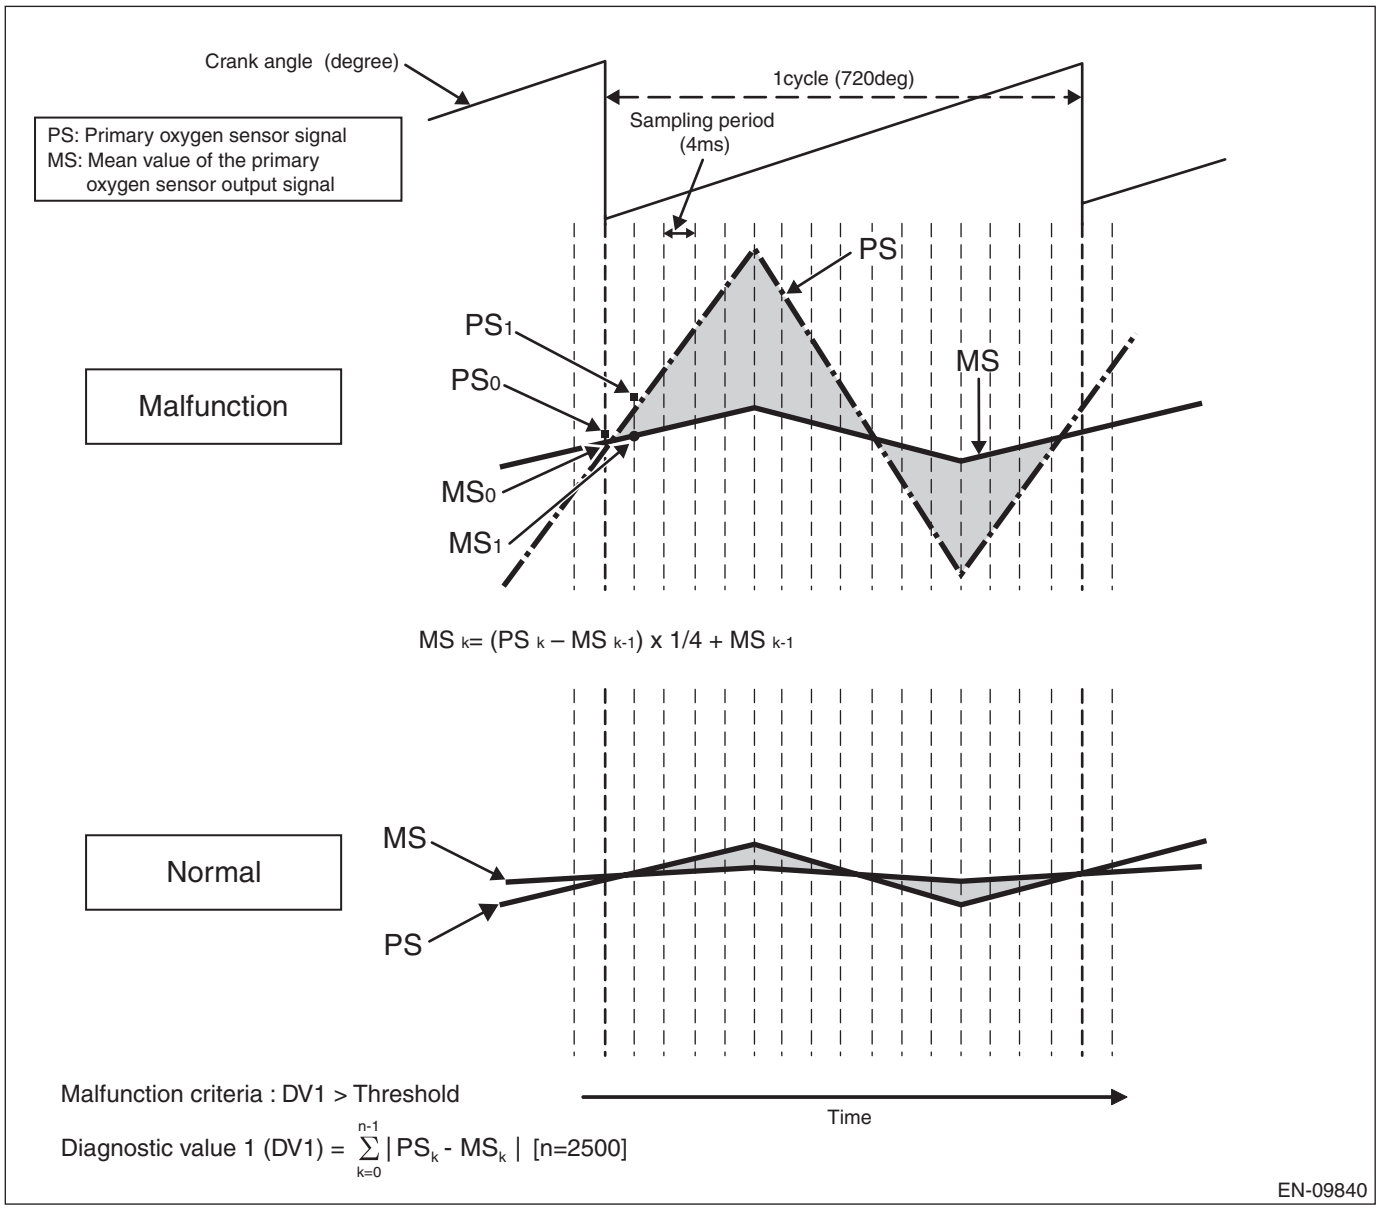
## 1. OUTLINE OF DIAGNOSIS

This diagnostic monitor performs a functional check of the fuel system to determine an air-fuel ratio cylinder imbalance.
This diagnosis is composed of two monitors.
The outline of “monitor A1” is as follows. When an air-fuel ratio cylinder imbalance occurs, the primary oxygen sensor output signal will oscillate with increased amplitude. This monitor utilizes this behavior to make a diagnosis. The monitor integrates the difference between the amplification value and the mean value of the first oxygen sensor output signal and compares it to a threshold to make a judgment.
The outline of “monitor B1” is as follows. Similarly, when an imbalance occurs, the engine speed also fluctuates with increased amplitude. This monitor utilizes this behavior to make a diagnosis. For reference, it should be noted that this imbalance monitor method is actually similar to the current misfire diagnostic monitor, and the parameter “domg360” (units: degrees CA) is shared between the imbalance and misfire monitors. The imbalance monitor is performed during idle condition when the engine is warm. The monitor integrates the count of “domg360” which exceeds a threshold in 1000 revolution.
When both the “monitor A1” value and the “monitor B1” value exceed a predetermined threshold, this monitor determines a malfunction and stores a fault code.

**Monitor A1**

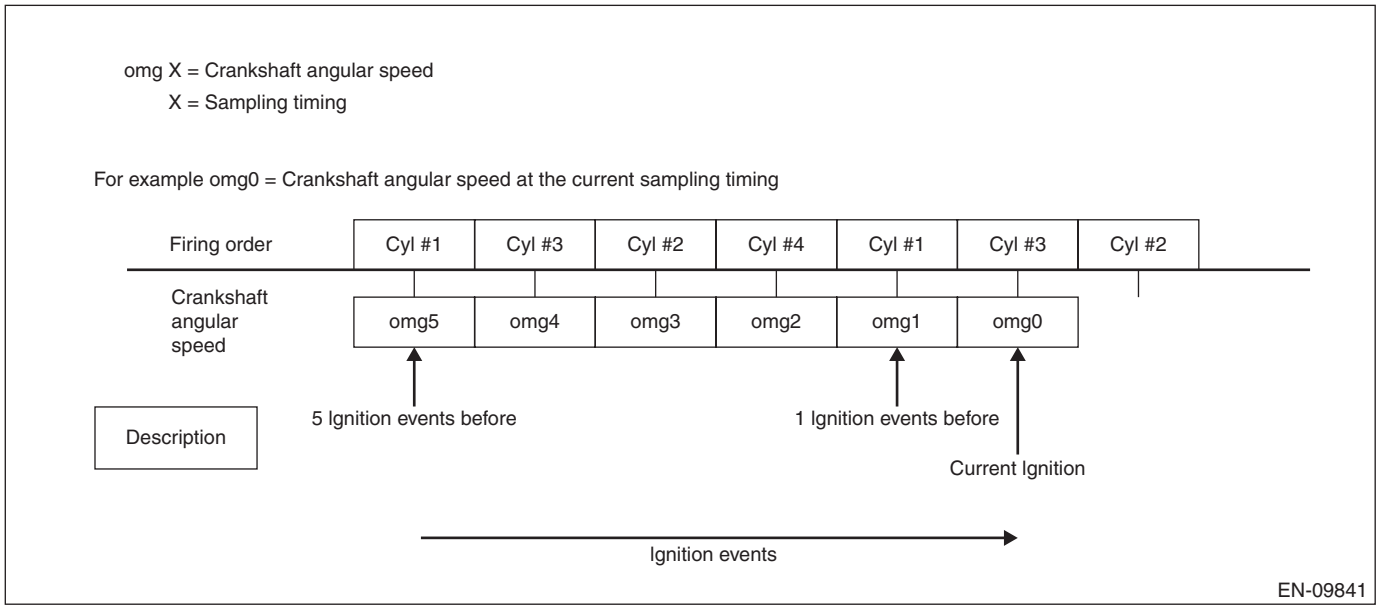
When there is an air-fuel ratio cylinder imbalance malfunction, the primary oxygen sensor output fluctuates widely compared with a normal sensor, as shown by the chain line in Figure 1 below. This monitor makes a diagnosis based on this phenomenon. Each primary oxygen sensor signal (PS) and mean value of the primary oxygen sensor signal (MS) is calculated from the primary oxygen sensor signal. The absolute values of (PS – MS) are sampled every 4 ms as shown in the figure. Diagnostic value 1 (DV1) is obtained by integrating the absolute value of (PS – MS) for 2500 times. A malfunction is determined when DV1 exceeds the threshold. The judgment values are determined experimentally.

**Figure 1. Compare malfunctioned primary oxygen sensor output with a normal sensor**



**Monitor B1**

**Method used:** Difference method of 360 degrees CA
**Monitor value:** domg360 = (omg 1 – omg 0) – (omg 3 – omg 2) = angular speed
Each crankshaft angular speed is defined as Figure 2 below.
**Figure 2. Description of domg360 output**



This method uses the fact that the domg360 of lean conditioned cylinder caused by imbalance malfunction indicates big value, as shown by the chain line in Figure 3 below.
The number of times for domg360 to exceed the judgment value in 1000 revolutions (500 cycles) is calculated as diagnostic value 2 (DV2). A malfunction is determined when DV2 exceeds the threshold.
**Figure 3. Compare malfunctioned domg360 output with a normal output**

## C: CAUTION

- Wear appropriate work clothing, including a cap, protective goggles and protective shoes when performing any work.
- Remove contamination including dirt and corrosion before removal, installation or disassembly.
- Keep the disassembled parts in order and protect them from dust and dirt.
- Do not place the valve cover with its inner side facing up until it is installed, to prevent intrusion of foreign matter into the control valve body.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- When disassembling the case and other light alloy parts, use a plastic hammer to force it apart. Do not pry apart with screwdrivers or other tools.
- Vehicle components are extremely hot after driving. Be wary of receiving burns from heated parts.
- Use SUBARU genuine CVTF and recommended grease. Do not mix CVTF, grease etc. of different grades or manufacturers.
- Be sure to tighten bolts and nuts to the specified torque.
- Place lifts, shop jacks or rigid racks at specified locations.
- Apply CVTF onto sliding or revolving surfaces before installation.
- Replace deformed or damaged snap rings with new parts.
- Before installing O-rings or oil seals, apply sufficient amount of CVTF or gear oil to appropriate locations in order to avoid damage and deformation.
- Be careful not to incorrectly install or fail to install O-rings, snap rings and other such parts.
- Before securing a part on a vise, place cushioning material such as wood blocks, aluminum plate, or cloth between the part and the vise.
- Avoid damaging the mating surface of the case.
- Before applying liquid gasket, completely remove the old liquid gasket.
- After removing the sensors, breather hose and plugs, plug the holes to avoid foreign materials intruding as necessary.
- During disassembly or assembly, be sure to use nylon gloves or paper towels. Do not use cloth gloves or waste cloth.

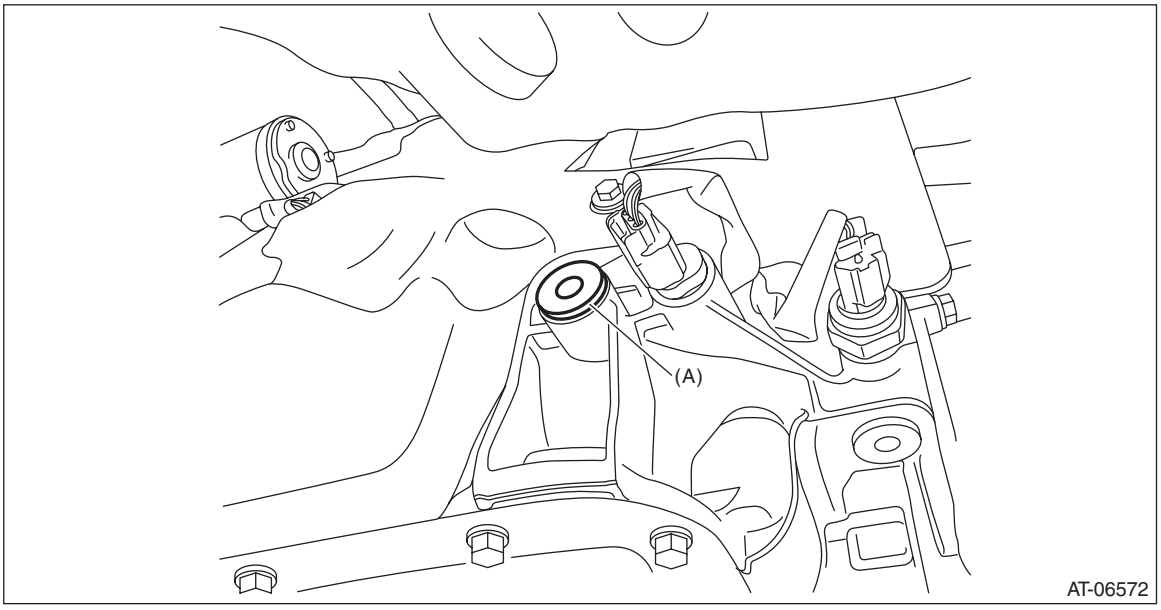
## B: ADJUSTMENT

**CAUTION:**
**• CVTF level changes along with CVTF temperature. When inspecting CVTF level, observe the specified CVTF temperature.**
**• Always use specified CVTF. Using other fluid will cause malfunction.**

1) Idle the engine to raise CVTF temperature to 35 — 45°C (95 — 113°F) on Subaru Select Monitor.
2) Operate the select lever in P → R → N → D and D → N → R → P to circulate CVTF with the engine idling.
3) With the engine running, lift up the vehicle and remove the filler plug.

**CAUTION:**
**Pay special attention to the following operations as the engine is at idle.**

NOTE:
CVTF is at the specified level when it is up to the filler plug hole lower section.



(A) Filler plug

4) When there is no CVTF leakage from the transmission, add the specified fluid up to the filler plug hole lower section.

***Specified fluid:***
***<Ref. to CVT-3, HYDRAULIC CONTROL AND LUBRICATION, SPECIFICATION, General Description.>***

**CAUTION:**
**Note that when CVTF is added up to the lower section of filler plug while the transmission is in cold condition, overfilling of CVTF occurs, causing the oil to spill out.**

# 5. Road Test

## A: INSPECTION

### 1. GENERAL PRECAUTION

Road tests should be conducted to properly diagnose the condition of CVT.

**CAUTION:**
**Always observe the local traffic laws when performing the test.**

### 2. D RANGE SHIFT FUNCTION

Make sure the engine speed is 1,100 — 1,300 rpm while driving on the level road at 50 km/h (31 MPH) after accelerating from halting to 1/4 of accelerator opening angle. Then stop the vehicle. Check normal gear change has occurred while the vehicle speed changes from a constant speed to zero.

### 3. KICK-DOWN FUNCTION

Check if engine speed will rise by operating the accelerator opening angle to the full from a constant speed of 50 km/h (31 MPH) or more.

### 4. ENGINE BRAKE OPERATION

**• Model with manual mode**

• Drive in “6th speed of manual mode” [70 — 80 km/h (43 — 50 MPH)], and shift down from 6th to 5th. Check if the indicator of combination meter switches “6” → “5”. At the same time, check the engine brake in 5th gear.
• Drive in “5th speed of manual mode” [60 — 70 km/h (37 — 43 MPH)], and shift down from 5th to 4th. Check if the indicator of combination meter switches “5” → “4”. At the same time, check the engine brake in 4th gear.
• Drive in “4th speed of manual mode” [50 — 60 km/h (31 — 37 MPH)], and shift down from 4th to 3rd. Check if the indicator of combination meter switches “4” → “3”. At the same time, check the engine brake in 3rd gear.
• Drive in “3rd speed of manual mode” [40 — 50 km/h (25 — 31 MPH)], and shift down from 3rd to 2nd. Check if the indicator of combination meter switches “3” → “2”. At the same time, check the engine brake in 2nd gear.
• Drive in “2nd speed of manual mode” [20 — 30 km/h (12 — 19 MPH)], and shift down from 2nd to 1st. Check if the indicator of combination meter switches “2” → “1”. At the same time, check the engine brake in 1st gear.

**• Model without manual mode**

Drive in D range at [50 — 60 km/h (31 — 37 MPH)], and shift to “L” range. Check if the indicator of combination meter switches “D” → “L”. At the same time, check the engine brake in L range.

### 5. LOCK-UP FUNCTION

When the accelerator is lightly depressed while driving on a flat road in “D” range, check that rpm does not change abruptly.

### 6. P RANGE OPERATION

Stop the vehicle on an uphill grade of 5% or more and shift to the “P” range and apply the parking brake. Check that the vehicle does not move when the parking brake is released.

### 7. NOISE AND VIBRATION

Check for noise and vibration during a constant driving, accelerating, decelerating and manual shift operation.

### 8. OIL LEAKAGE

After the driving test, inspect for leakage of CVTF and differential gear oil from the transmission body.

# 6. Stall Test

## A: INSPECTION

**CAUTION:**
**Make sure no other person is around the vehicle during stall test measurement.**

NOTE:
Stall test is extremely important in diagnosing the condition of CVT and engine. The test is necessary to measure the engine stall speeds in “R” and “D” range.
Purposes of the stall test:
- Operational check of forward clutch and reverse brake
- Operational check of the torque converter assembly
- Engine performance check

1) Place wheel chocks at the front and rear of all wheels and engage the parking brake.
2) Turn the A/C OFF.
3) Using the Subaru Select Monitor, check if the throttle valve operates when you depress the accelerator pedal. <Ref. to EN(H4DO)(diag)-36, READ CURRENT DATA FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>
4) Check the engine oil level. <Ref. to LU(H4DO)-9, Engine Oil.>
5) Check the coolant level. <Ref. to CO(H4DO)-13, Engine Coolant.>
6) Adjust the CVTF level. <Ref. to CVT-34, ADJUSTMENT, CVTF.>
7) Increase the CVTF temperature to 60 — 80°C (140 — 176°F) with the engine running and the select lever shifted to “N” or “P” range.
8) Shift the select lever to “D” range.
9) Depress the accelerator pedal to the full while fully depressing the foot brake pedal with your left foot.
10) When the engine speed stabilizes, quickly record the engine speed and release accelerator pedal. Shift the select lever to “N” range. Let the engine idle for one minute or more to cool it down.
11) Shift to “R” range and perform the same stall test.

NOTE:
- Do not perform a stall test for over 5 seconds at a time. (From closed throttle, fully open throttle to stall speed reading.) Failure to follow this instruction will cause the engine oil and CVTF to deteriorate and the clutch and brake to be adversely affected.
- Be sure to cool down the engine for at least one minute after each stall test with the select lever set in the “P” or “N” range and with the idle speed of 1,200 rpm or less.
- If the stall speed is higher than the specified range, attempt to finish the stall test in as short a time as possible, in order to prevent the CVT from sustaining damage.

***Stall speed standard:***
***D range: 2,350 — 3,100 rpm***
***R range: 2,100 — 2,800 rpm***

**Stall test judgment**

| Range | Range | Probable cause |
|---|---|---|
| Lower than standard value | D, R | • Insufficient engine output<br>• Torque converter malfunction |
| Higher than standard value | D | • Forward clutch slippage<br>• Secondary pressure (line pressure) is low.<br>• Variator chain malfunction |
| | R | • Reverse brake slippage<br>• Secondary pressure (line pressure) is low.<br>• Variator chain malfunction |
| | D, R | • Torque converter malfunction<br>• Control valve body malfunction<br>• TCM malfunction<br>• Damaged harness and harness connector |

# 7. Time Lag Test

## A: INSPECTION

NOTE:
When the select lever is shifted while the engine is idling, there will be a certain time elapse or lag before shock is felt. This symptom helps to check the condition of forward clutch and reverse brake.
- Perform the test at normal operation CVTF temperature of 60 — 80°C (140 — 176°F).
- Be sure to allow one minute or more interval between tests.
- Make three measurements and take the average value.

1) Apply the parking brake.
2) Start the engine. Check the idle speed. (A/C OFF)
3) Shift the select lever from “N” to “D” range. Using a stop watch, measure the time elapsed from shifting the lever until the shock is felt.

***Time lag standard:***
***1.2 seconds or less***

If “N” → “D” time lag is longer than specified:
- Secondary pressure (line pressure) is too low.
- Forward clutch worn
- Forward clutch piston malfunction
- Control valve body malfunction
- Learning incomplete

4) In the same manner, measure the time lag when shifting from “N” to “R” range.

***Time lag standard:***
***1.5 seconds or less***

If “N” → “R” time lag is longer than specified:
- Secondary pressure (line pressure) is too low.
- Reverse brake worn
- Reverse brake piston malfunction
- Control valve body malfunction
- Learning incomplete

# 8. Secondary Pressure (Line Pressure) Test

## A: INSPECTION

**CAUTION:**
**• Directly after the vehicle has been running or the engine has been long idle running, the CVTF is hot. Be careful not to burn yourself.**
**• Make sure no other person is around the vehicle during secondary pressure (line pressure) test measurement.**
**• After performing the secondary pressure (line pressure) test measurement, adjust the CVTF level.**

NOTE:
• If the pulley and variator chain, clutch or brake show signs of slipping or shift feel is not correct, check the secondary pressure (line pressure).
• Connect Subaru Select Monitor to vehicle so as to measure the engine speed and actual secondary pressure (secondary pressure (line pressure)).
• In many cases, slippage or inability to operate the vehicle may be due to insufficient oil pressure for the operation of clutch, brake or control valve.

1) Lift up the vehicle.
2) Remove the secondary pressure (line pressure) test plug, and install ST1 and ST2.

**CAUTION:**
**Removal of the test plug and installation of the ST shall be both performed quickly.**

NOTE:
Use ST2 PRESSURE GAUGE ADAPTER with genuine O-ring (part No. 806916050) attached.

3) Lower the vehicle.
4) Set the gauge so that it can be seen from the driver's seat.
5) Using the Subaru Select Monitor, check if the throttle valve operates when you depress the accelerator pedal. <Ref. to EN(H4DO)(diag)-36, READ CURRENT DATA FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>
6) Check the engine oil level. <Ref. to LU(H4DO)-9, Engine Oil.>
7) Check the coolant level. <Ref. to CO(H4DO)-13, Engine Coolant.>
8) Adjust the CVTF level. <Ref. to CVT-34, ADJUSTMENT, CVTF.>
9) Increase the CVTF temperature to 60 — 80°C (140 — 176°F) with the engine running and the select lever shifted to "N" or "P" range.
10) Shift the select lever to "D" range.
11) Depress the accelerator pedal to the full while fully depressing the foot brake pedal with your left foot.
12) Immediately after the engine speed becomes steady, record the reading of the secondary pressure (line pressure), engine speed and actual secondary pressure on Subaru Select Monitor. And then release the accelerator pedal. Shift the select lever to "N" range. Let the engine idle for one minute or more to cool it down.

NOTE:
• Do not continue the stall test for 5 seconds or more at a time (from fully closed throttle, fully open throttle to secondary pressure (line pressure) reading). Failure to follow this instruction will cause the engine oil and CVTF to deteriorate and the clutch and brake to be adversely affected.
• After performing the secondary pressure (line pressure) test, be sure to cool down the engine for at least one minute with the select lever set in "P" or "N" range and with the idle speed at 1,200 rpm or less.
• Under each condition, check that the measured pressure matches almost totally with actual secondary pressure.
• When both measured pressure and actual secondary pressure are out of specification, judge as control valve malfunction.
• The value at stall is for reference because the pressure changes under different conditions or circumstances.
• The value at idling is steady because it is not affected by any condition or circumstance.

| Secondary pressure (line pressure) standard | | | | |
|---|---|---|---|---|
| | Range | Throttle | Brake | Secondary pressure (line pressure) (MPa (kgf/cm$^2$, psi)) |
| Stall | D, R | Full open | ON | 4.5 — 6.0 (45.9 — 61.2, 652 — 870) |
| Idling | P, N | Full closed | OFF | 0.5 — 1.5 (5.1 — 15.3, 72 — 218) |

13) Remove the ST and install the plug after measurement.

**CAUTION:**
**Removal of the ST and installation of the test plug shall be both performed quickly.**

NOTE:
• Use new O-rings.
• Apply CVTF to the O-ring.
