If the voltage is not as specified, replace the accelerator pedal rod.

7. INSPECT MAIN RELAY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1Ω (Apply battery voltage to terminals 1 and 2)

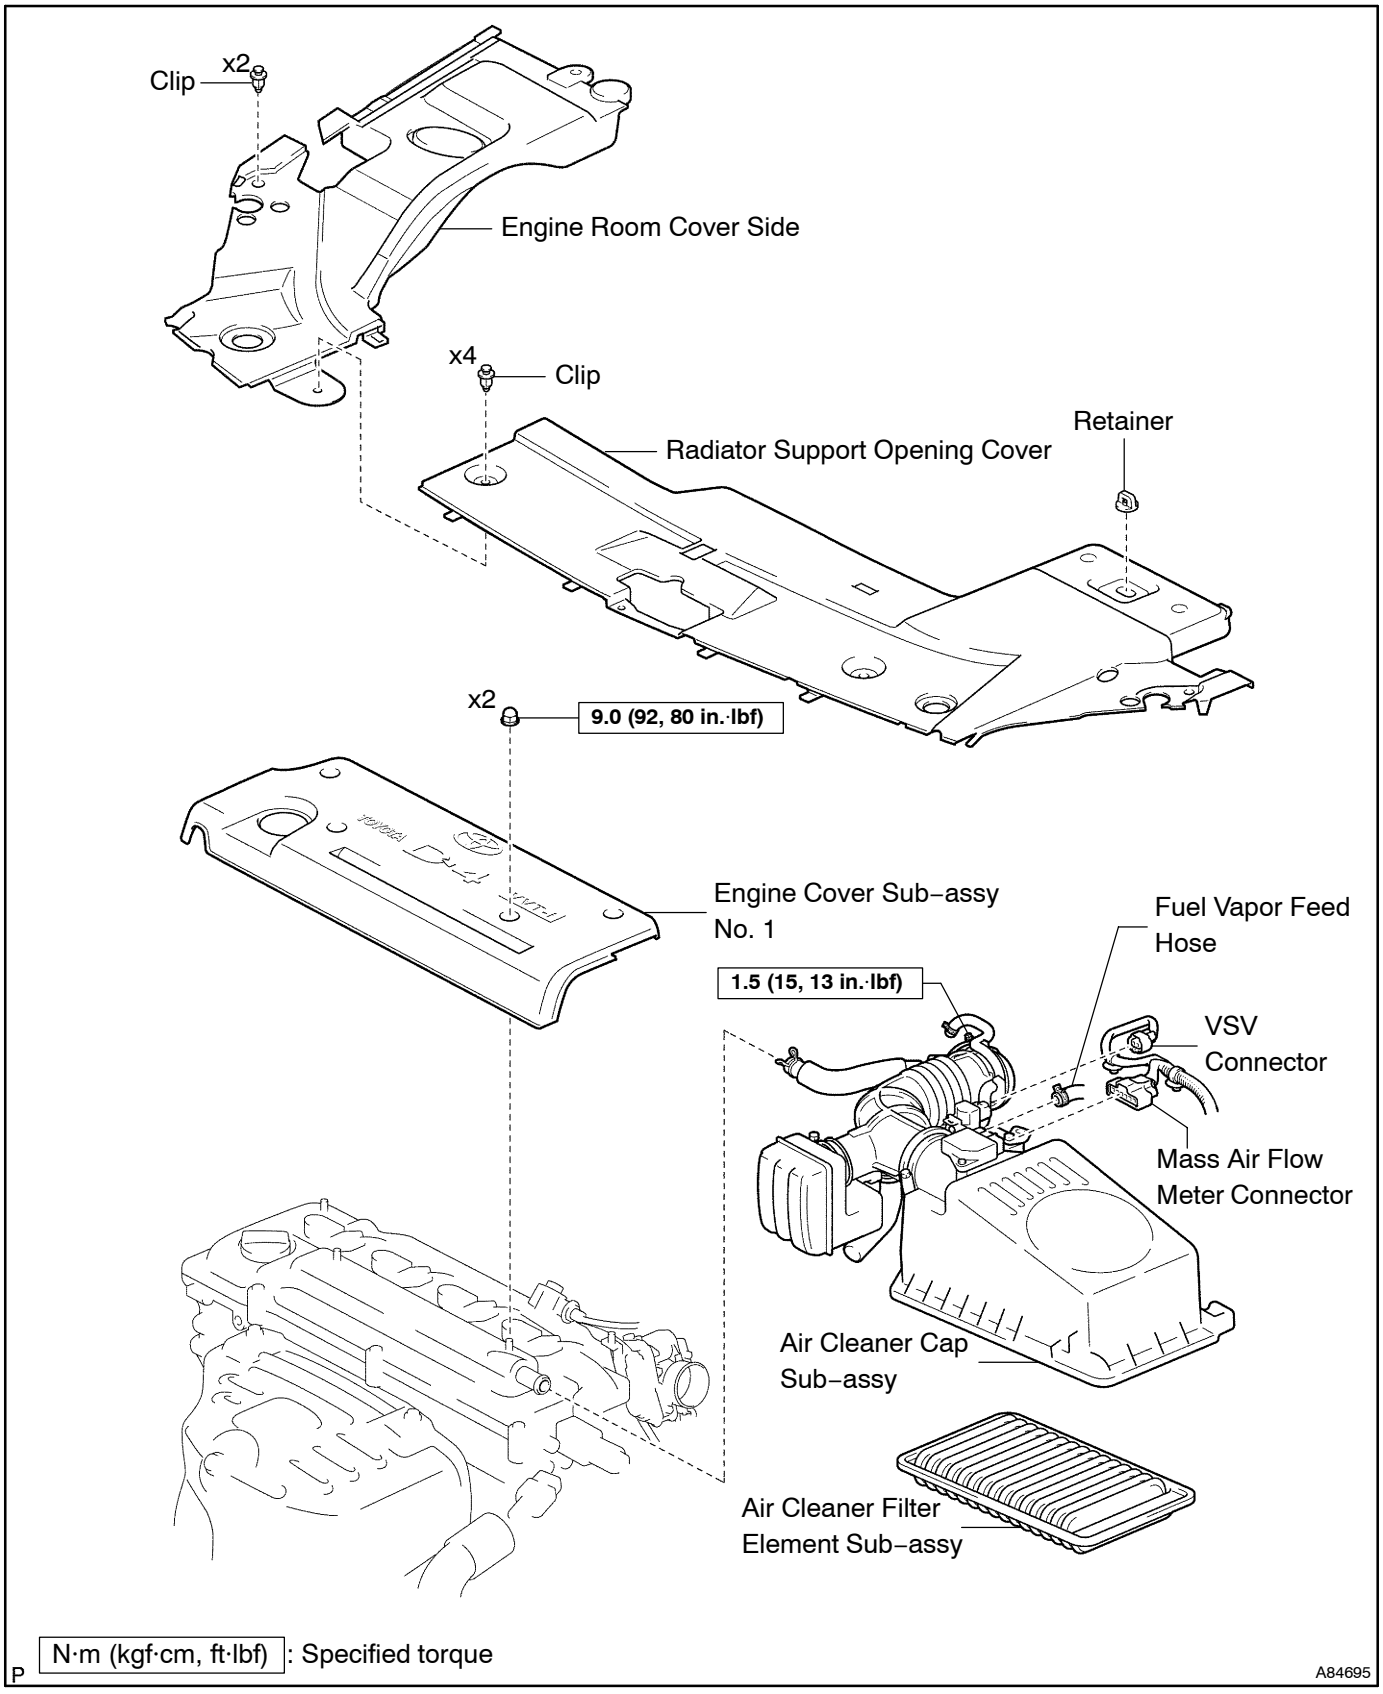
If the result is not as specified, replace the main relay.

8. INSPECT CIRCUIT OPENING RELAY

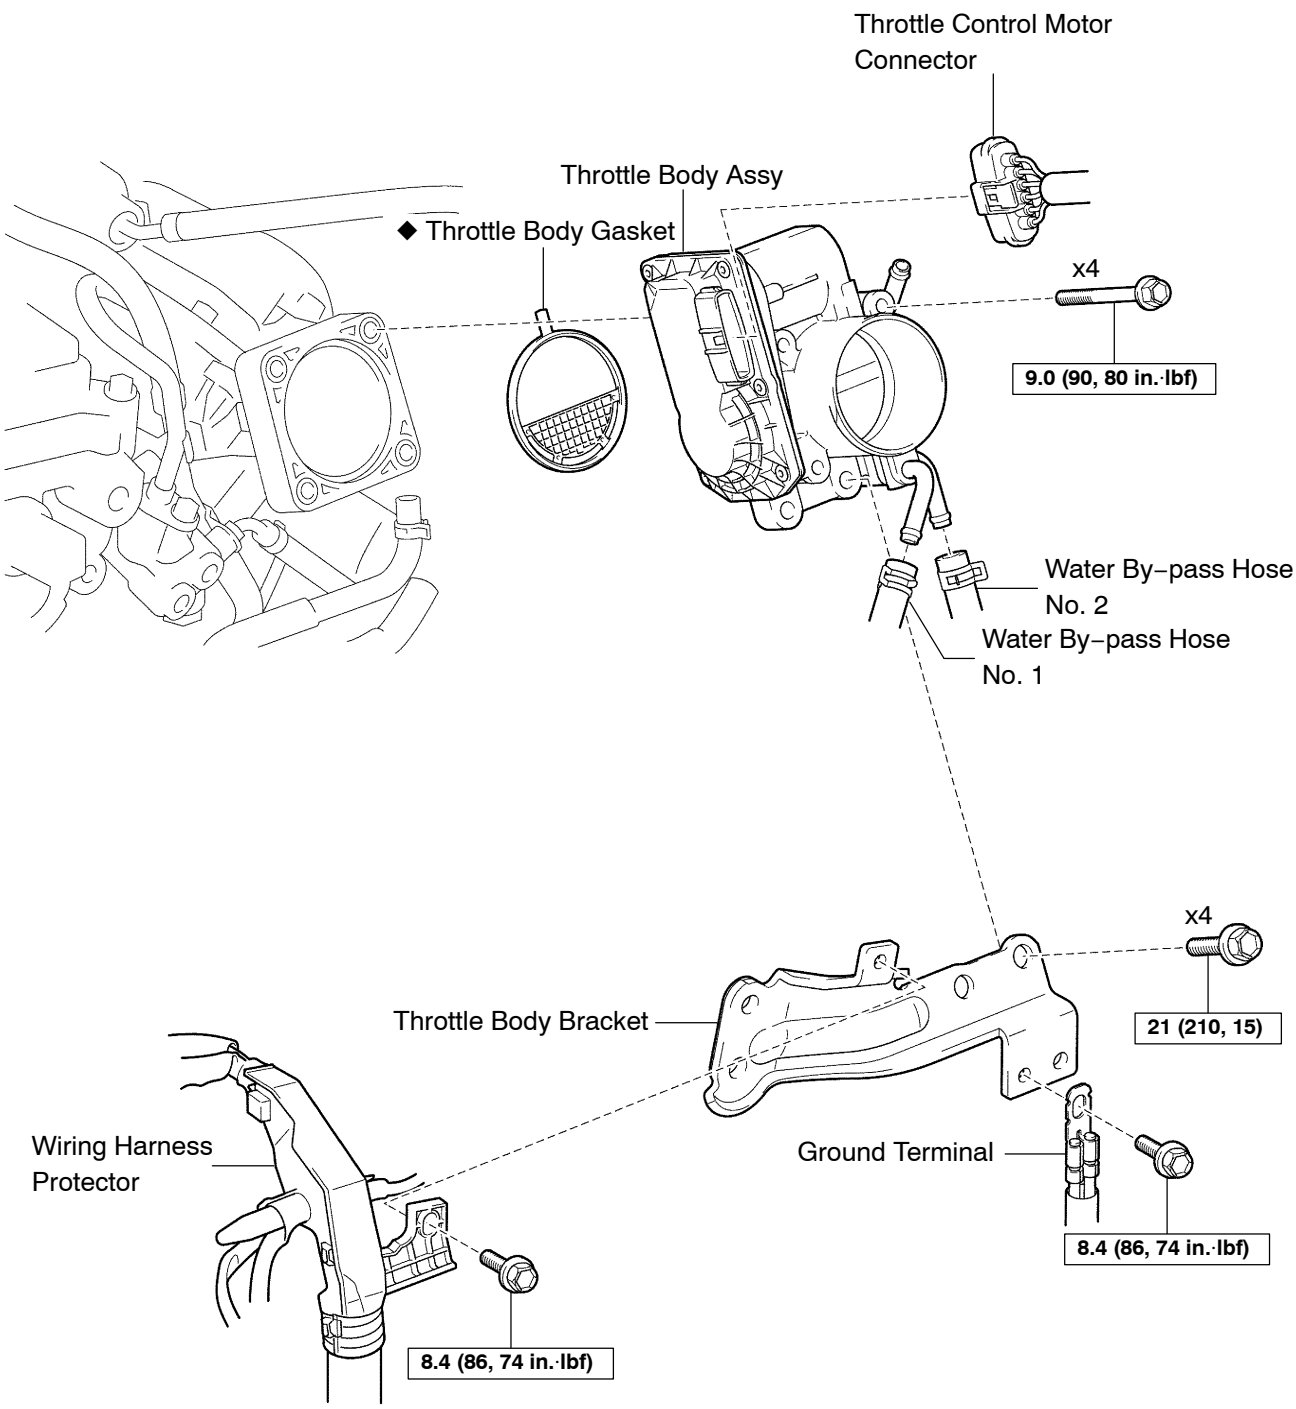
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1Ω (Apply battery voltage to terminals 1 and 2)

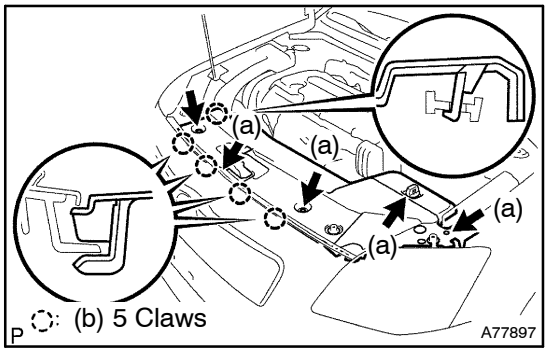


If the result is not as specified, replace the circuit opening relay.

THROTTLE BODY ASSY (2AZ–FSE)

COMPONENTS

100LW–01

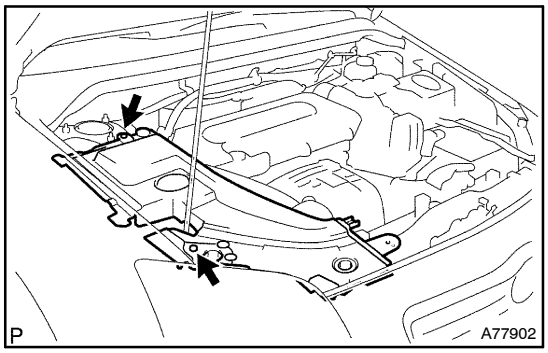


N·m (kgf·cm, ft·lbf) : Specified torque

◆ Non–reusable part

A84696

100LX–01

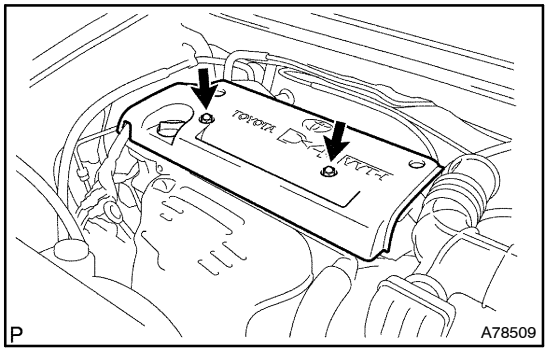


REPLACEMENT

1. REMOVE RADIATOR SUPPORT OPENING COVER

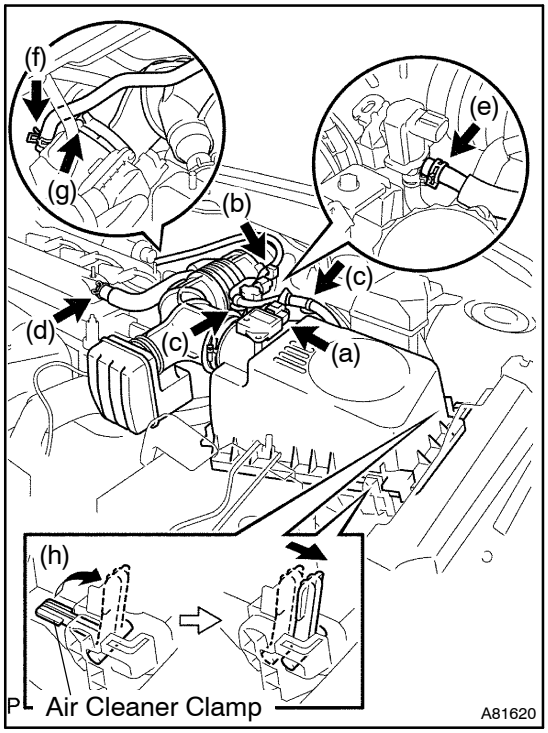
(a) Remove the retainer and 4 clips.

(b) Unfasten the 5 claws, then remove the radiator support opening cover.



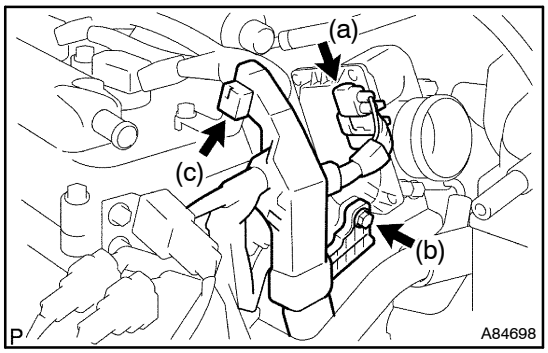
2. REMOVE ENGINE ROOM COVER SIDE

(a) Remove the 2 clips, then remove the engine room cover side.



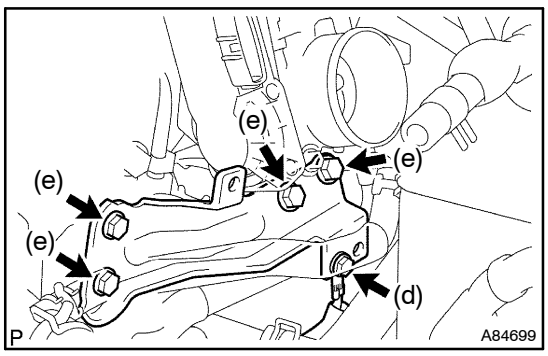
3. DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)

4. DRAIN ENGINE COOLANT (See page 16–7)



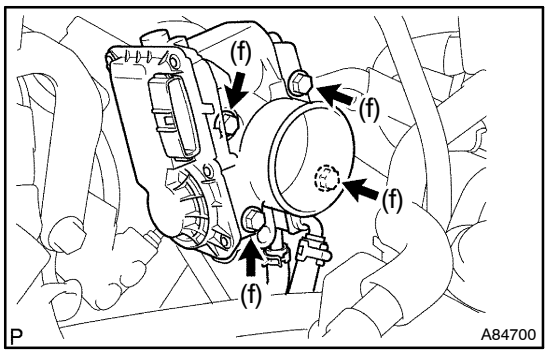
5. REMOVE ENGINE COVER SUB–ASSY NO.1

(a) Remove the 2 nuts, then remove the engine cover No. 1.

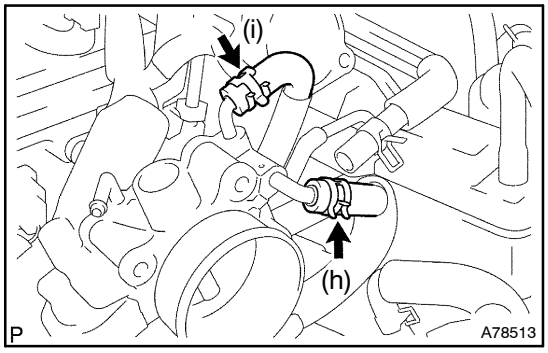


6. REMOVE AIR CLEANER CAP SUB–ASSY

(a) Disconnect the mass air flow meter connector.
(b) Disconnect the VSV connector.
(c) Remove the 2 wiring harness clamps.
(d) Disconnect the ventilation hose.
(e) Disconnect the fuel vapor feed hose No. 1.
(f) Disconnect the fuel vapor feed hose No. 2.
(g) Loosen the hose clamp bolt.
(h) Raise the air cleaner clamp up, then the slide it to the air cleaner cap.
(i) Remove the air cleaner cap together with the air cleaner hose No. 1.
(j) Remove the air cleaner filter element.



7. REMOVE THROTTLE BODY ASSY



(a) Disconnect the throttle control motor connector.
(b) Remove the bolt.
(c) Unfasten the clip, then remove the wiring harness protector.

(d) Remove the bolt, then remove the ground terminal.
(e) Remove the 4 bolts, then remove the throttle body bracket.

(f) Remove the 4 bolts, then remove the throttle body.
(g) Remove the gasket from the intake manifold.

(h) Disconnect the water by–pass hose No. 1.
(i) Disconnect the water by–pass hose No. 2.

8. INSTALL THROTTLE BODY ASSY

(a) Connect the water by–pass hose No. 2.
(b) Connect the water by–pass hose No. 1.
(c) Install a new gasket to the intake manifold.
(d) Install the throttle body with the 4 bolts.
Torque: 9.0 N·m (90 kgf·cm, 80 in.·lbf)
(e) Install the throttle body bracket with the 4 bolts.
Torque: 21 N·m (210 kgf·cm, 15 ft·lbf)
(f) Install the ground terminal with the bolt.
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)
(g) Install the wiring harness protector with the clip.
(h) Tighten the bolt.
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)
(i) Connect the throttle control motor connector.

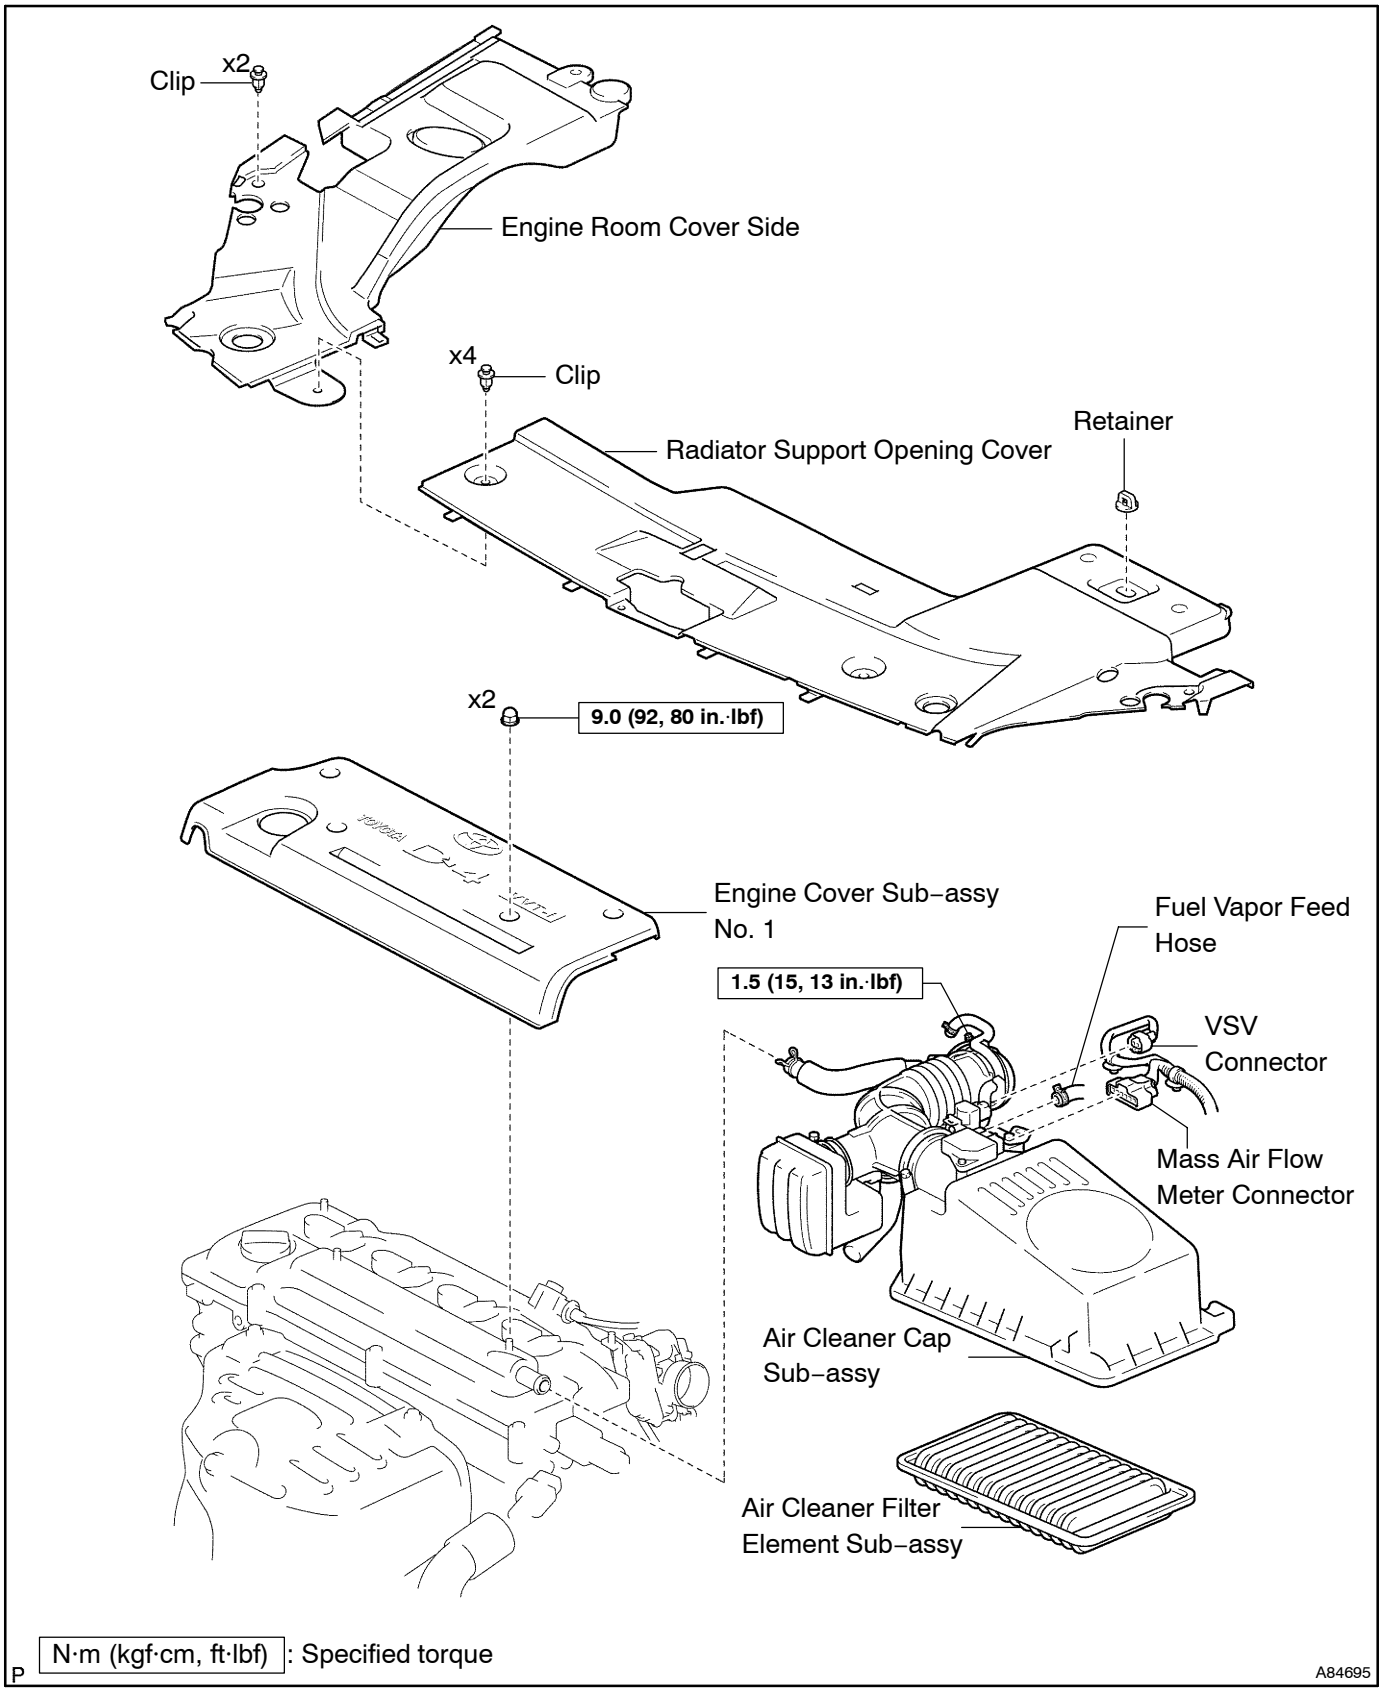
9. INSTALL AIR CLEANER CAP SUB–ASSY
Torque: 1.5 N·m (15 kgf·cm, 13 in.·lbf)

10. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

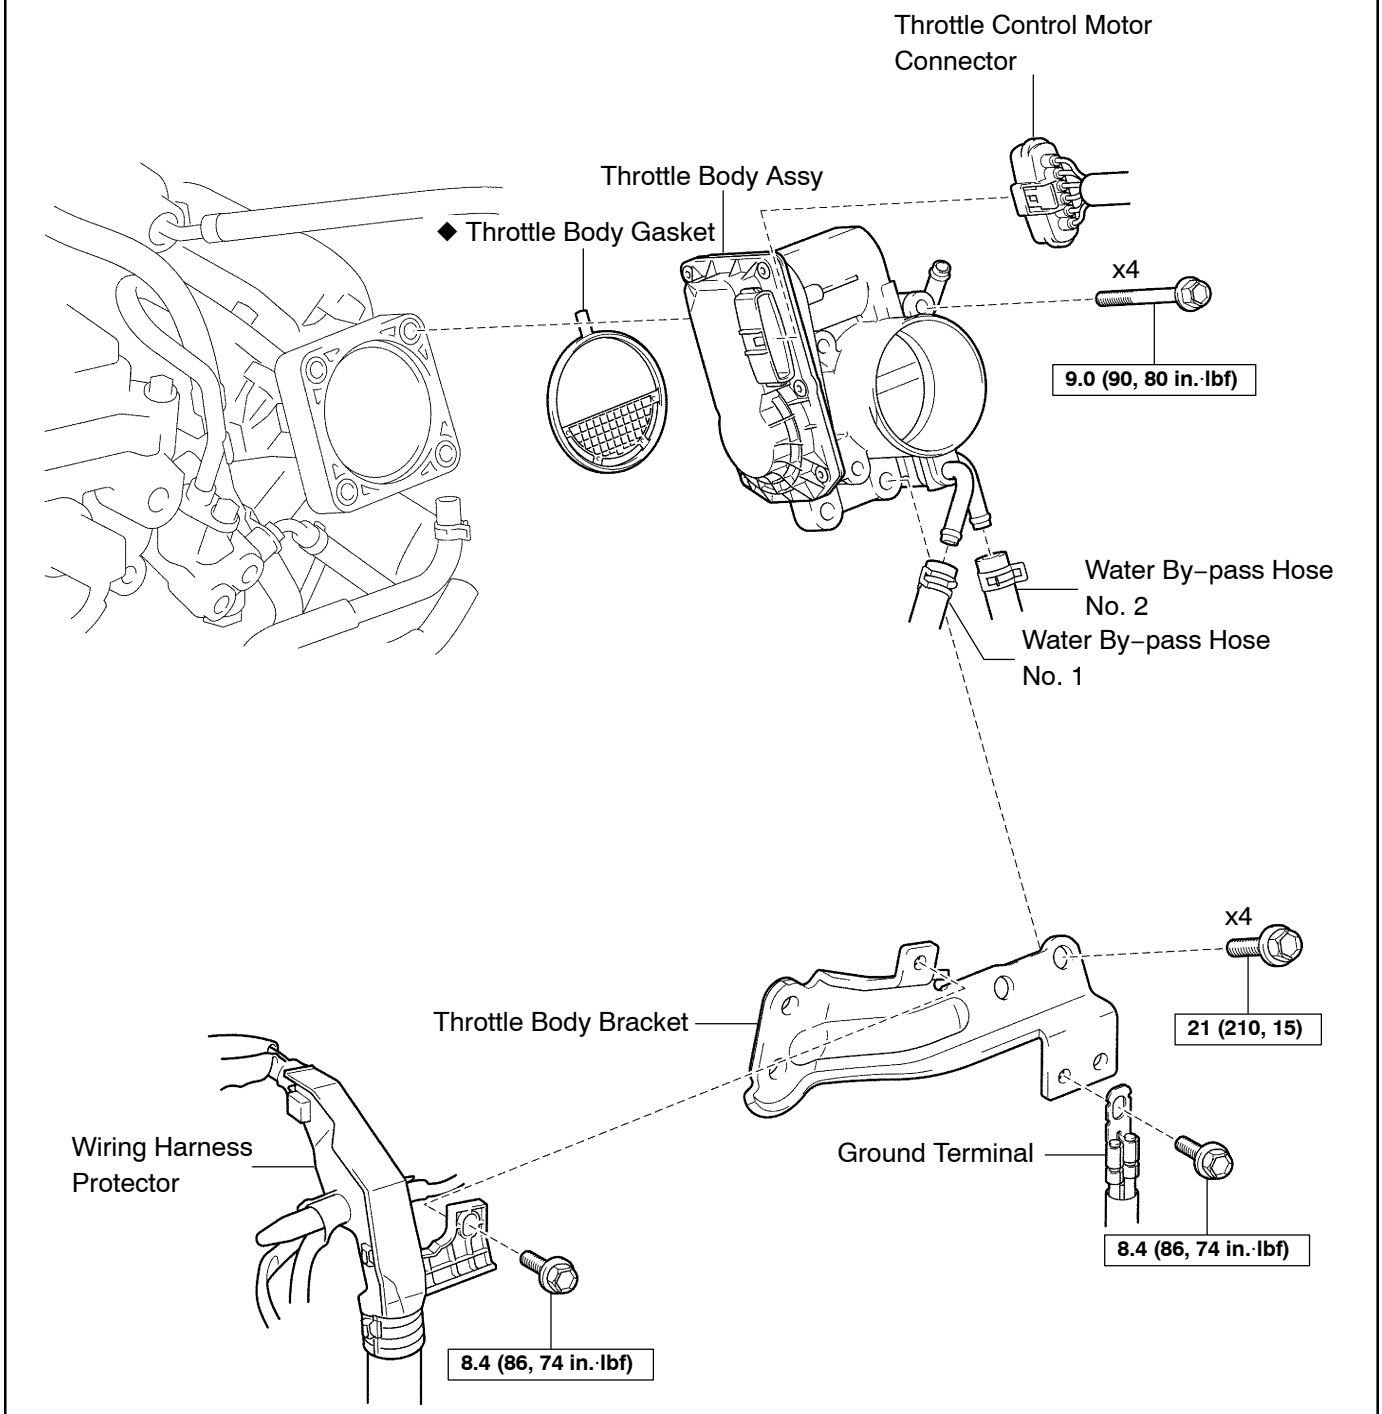
11. CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

12. ADD ENGINE COOLANT (See page 16–7)

13. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)



14. INSTALL ENGINE ROOM COVER SIDE



15. INSTALL RADIATOR SUPPORT OPENING COVER

KNOCK SENSOR (2AZ–FSE)

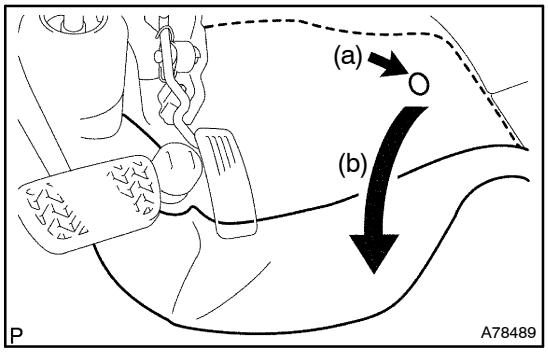
REPLACEMENT

1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–1)
2. REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)
3. REMOVE ENGINE ROOM COVER SIDE (See page 10–8)
4. DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
5. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 10–8)
6. DRAIN ENGINE COOLANT (See page 16–7)
7. REMOVE AIR CLEANER CAP SUB–ASSY (See page 10–8)
8. REMOVE THROTTLE BODY ASSY (See page 10–8)
9. REMOVE FUEL TUBE SUB–ASSY (See page 11–24)
   SST 09617–24011
10. REMOVE FUEL HOSE (See page 11–24)
11. REMOVE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
    SST 09023–12900
12. REMOVE FUEL PUMP ASSY (See page 11–24)
13. REMOVE CHARCOAL CANISTER ASSY (See page 11–13)
14. REMOVE VACUUM SENSOR ASSY (LHD STEERING POSITION TYPE) (See page 11–13)
15. REMOVE INTAKE MANIFOLD (See page 11–4)
16. REMOVE SURGE TANK STAY NO.1 (See page 11–13)
17. REMOVE INTAKE MANIFOLD INSULATOR NO.2 (See page 11–13)

18. REMOVE KNOCK SENSOR
(a) Disconnect the knock sensor connector.
(b) Remove the nut, then remove the knock sensor.

19. INSTALL KNOCK SENSOR
(a) Install the knock sensor with the nut as shown in the illustration.
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)
(b) Connect the knock sensor connector.

20. INSTALL INTAKE MANIFOLD INSULATOR NO.2
21. INSTALL SURGE TANK STAY NO.1 (See page 11–13)
22. INSTALL INTAKE MANIFOLD (See page 11–13)
23. INSTALL VACUUM SENSOR ASSY (LHD STEERING POSITION TYPE) (See page 11–13)
24. INSTALL CHARCOAL CANISTER ASSY



25. **INSTALL FUEL PUMP ASSY (See page 11–24)**

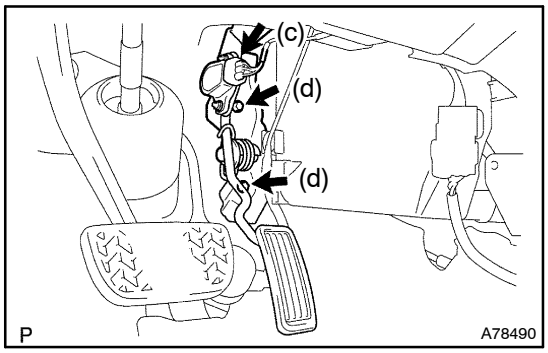
29. **INSTALL THROTTLE BODY ASSY (See page 10–8)**
30. **INSTALL AIR CLEANER CAP SUB–ASSY (See page 10–8)**
31. **CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
    Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)
32. **ADD ENGINE COOLANT (See page 16–7)**
33. **CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)**
34. **CHECK FOR FUEL LEAKS (See page 11–4)**
35. **CHECK FOR ENGINE OIL LEAKS**
36. **INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 10–8)**
37. **INSTALL ENGINE ROOM COVER SIDE**
38. **INSTALL RADIATOR SUPPORT OPENING COVER**

ACCELERATOR PEDAL ASSY (2AZ–FSE)

100M0–01

REPLACEMENT



1. DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)

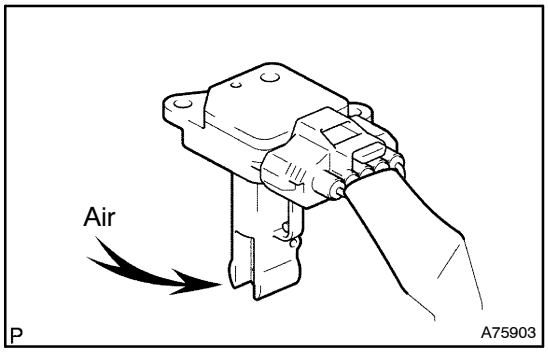
2. REMOVE ACCELERATOR PEDAL ASSY

(a) Using a clip remover, remove the clip.

(b) Open the floor carpet.

(c) Disconnect the accelerator position sensor connector.

(d) Remove the 2 bolts, then remove the accelerator pedal.

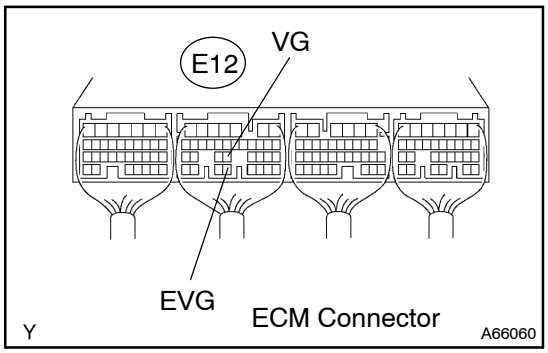


3. INSTALL ACCELERATOR PEDAL ASSY
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

4. CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

ECD SYSTEM (1CD–FTV)(From September, 2003)

100M2–01



ON–VEHICLE INSPECTION

1. INSPECT MASS AIR FLOW METER

(a) If you have the hand–held tester:
Check the operation.
(1) Connect the hand–held tester to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the item "DIAGNOSIS / OBD / MOBD / DATA LIST" on the hand–held tester.
(4) Blow air into the mass air flow (MAF) meter, then check that the MAF reading in DATA LIST fluctuates.

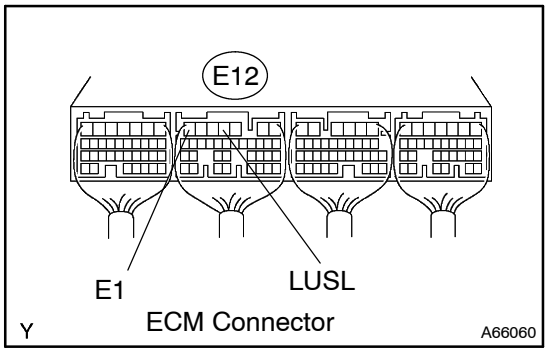
If the operation is not as specified, check the MAF meter (see page 10–22), wiring and ECM.

(b) If you have no hand–held tester:
Check the operation.
(1) Turn the ignition switch to ON.
(2) Connect the positive tester probe of a voltmeter to terminal VG of the ECM, and the negative tester probe of the voltmeter to terminal EVG of the ECM.
(3) Blow air into the MAF meter, then check that the voltage fluctuates.

If the operation is not as specified, check the MAF meter (see page 10–22), wiring and ECM.

2. INSPECT INTAKE SHUTTER

(a) Listen to the operating sounds of the throttle control motor.
(1) Turn the ignition switch to ON.
(2) Listen to the operating sounds while turning the accelerator pedal position sensor lever.



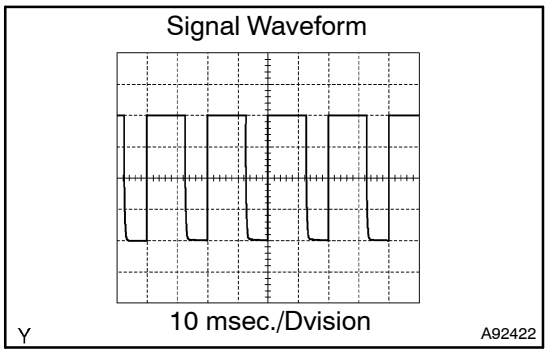
If a collision sound is heard, check the throttle control motor.
If no sound is heard, check the wire harness and ECM.

(b) If you have the hand–held tester:
Inspect the throttle position sensor.
(1) Connect the hand–held tester to the DLC3.
(2) Turn the ignition switch to ON.
(3) Select the item "DIAGNOSIS / OBD / MOBD / DATE LIST" on the hand held–tester.

(4) When turning the accelerator pedal position sensor lever to the full–open position, check that the throttle valve opening percentage (THROTTLE POS) of DATA LIST shows the standard value.

Standard throttle valve opening percentage:
60 % or higher

If the operation is not as specified, check the accelerator pedal position sensor (see page 10–22), wiring and ECM.



(c) If you have no hand–held tester:

(1) Inspect the throttle position sensor using a oscilloscope.

(2) During idling, check the waveform between the specified terminals of the E12 ECM connectors.

Standard:

Tester Connection	Specified Condition
LUSL (E12–4) – E1 (E12–7)	Correct waveform is as shown on the left

If the operation is not as specified, check the accelerator pedal position sensor (see page 10–22), wiring and ECM.

(d) Inspect the air assist system.

(1) Start the engine, then check that the check engine warning light does not light up.

(2) Allow the engine to warm up to the normal operating temperature.

(3) Turn the A/C compressor ON to OFF, then check the idle speed (see page 14–87).

Idle speed (transmission in neutral): 800 ± 50 rpm

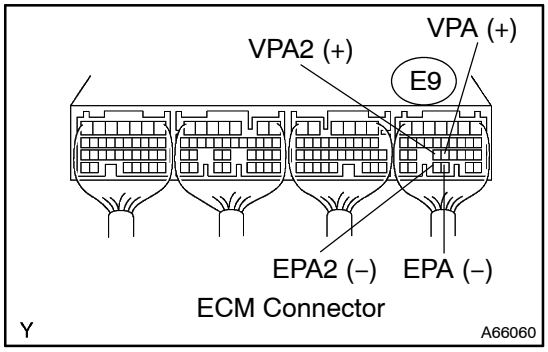
If the result is not as specified, check the wiring and ECM.

NOTICE:

Perform the inspection under condition without electrical load.

(e) After taking the above steps (b) to (c), perform the driving test.

(f) Check that there is no sense of incongruity.



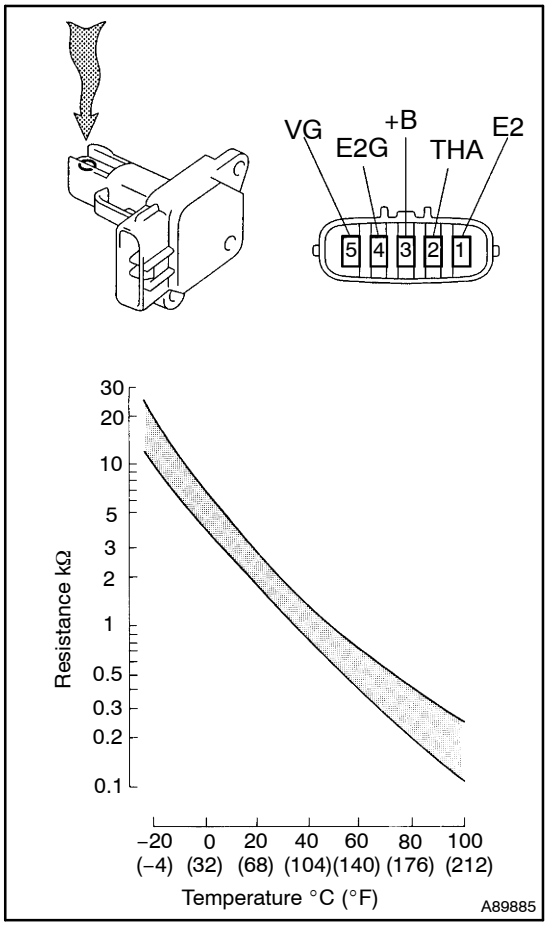
3. INSPECT ACCELERATOR PEDAL POSITION SENSOR

(a) If you have the hand–held tester:
Inspect the accelerator pedal position sensor.
(1) Connect the hand–held tester to the DLC3.
(2) Turn the ignition switch to ON.

(b) Select the item "DIAGNOSIS / OBD / MOBD / DATE LIST" on the hand–held tester.
(1) Check that the voltage (ACCEL POS) of DATA LIST shows the standard value.
Accelerator pedal released: 0.5 to 1.1 V
Accelerator pedal depressed: 3.0 to 4.6 V
(2) Check that the voltage (ACCEL POS #2) of DATA LIST shows the standard value.
Accelerator pedal released: 0.9 to 2.3 V
Accelerator pedal depressed: 3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal position sensor (see page 10–22), wiring and ECM.

(c) If you have no hand–held tester:
Inspect the accelerator pedal position sensor.



(1) Turn the ignition switch to ON.
(2) Measure the voltage between the specified terminals of the E9 ECM connector.

Accelerator Pedal Position	Tester Connection	Specified Condition	Tester Connection	Specified Condition
Released	VPA (E9–22) –EPA (E9–28)	0.5 to 1.1 V	VPA2 (E9–23) –EPA2 (E9–29)	0.9 to 2.3 V
Depressed	VPA (E9–22) –EPA (E9–28)	3.0 to 4.6 V	VPA2 (E9–23) –EPA2 (E9–29)	3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal position sensor (see page 10–22), wiring and ECM.

100M3–01

INSPECTION

1. INSPECT MASS AIR FLOW METER

(a) Check the operation.

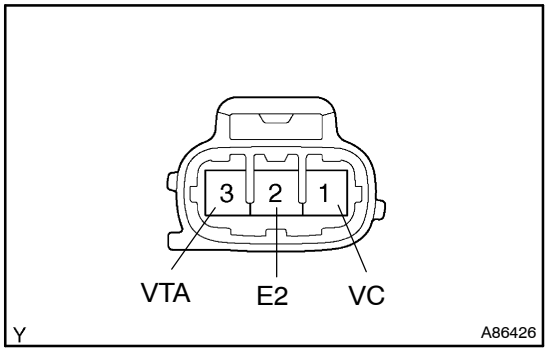
(1) Apply battery voltage across terminals 3 (+B) and 4 (E2G).

(2) Using a voltmeter, connect the positive (+) tester probe to terminal VG, and negative (–) tester probe to terminal E2G.

(3) Blow air into the MAF meter, then check that the voltage fluctuates.

(b) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between terminals 2 (THA) and 1 (E2).



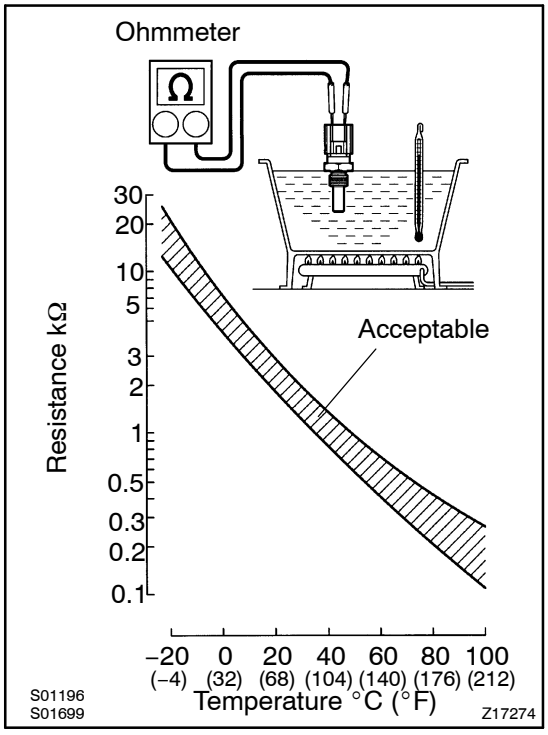
Resistance:

12.5 to 16.9 kΩ at –20°C (–4°F)

2.19 to 2.67 kΩ at 20°C (68°F)

0.50 to 0.68 kΩ at 60°C (140°F)

If the result is not as specified, replace the MAF meter.



2. INSPECT INTAKE SHUTTER ASSY

(a) Inspect the resistance of the throttle position sensor.

(1) Using an ohmmeter, measure the resistance between terminals 1 (VC) and 2 (E2).

Resistance: 4.0 to 8.0 kΩ

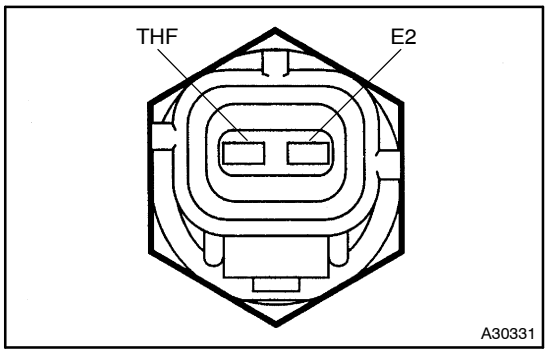
If the result is not as specified, replace the intake shutter.

3. INSPECT DIESEL ENGINE ENGINE COOLANT TEMPERATURE SENSOR

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:



2.32 to 2.59 kΩ at 20°C (68°F)

0.310 to 0.326 kΩ at 80°C (176°F)

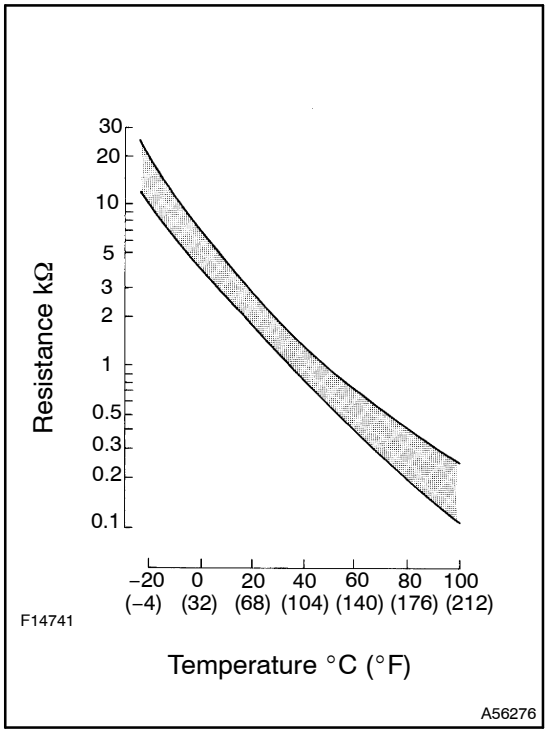
If the result is not as specified, replace the diesel engine engine coolant temperature sensor.

NOTICE:

In case of checking the water temperature sensor in the water, be careful not to allow water to go into the terminals. After checking, wipe out the sensor.

4. INSPECT FUEL TEMPERATURE SENSOR

(a) Inspect the resistance.



(1) Using an ohmmeter, measure the resistance between the terminals.

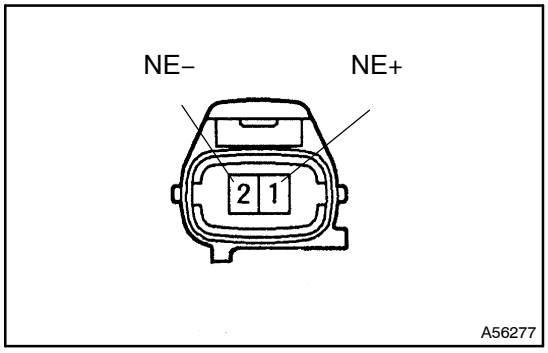
Resistance:

2.21 to 2.69 kΩ at 20°C (68°F)

0.287 to 0.349 kΩ at 80°C (176°F)

If the result is not as specified, replace the fuel temperature sensor.

5. INSPECT DIESEL TURBO INLET AIR TENPERATURE SENSOR



(a) Inspect the resistance.

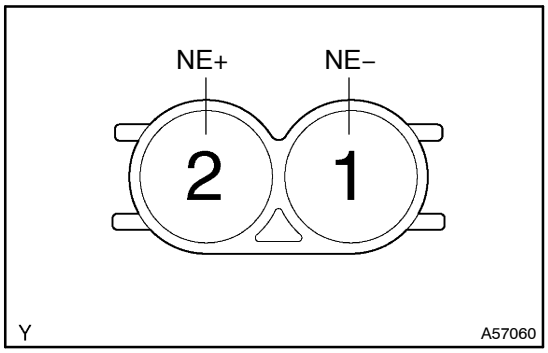
(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:

2.21 to 2.65 kΩ at 20°C (68°F)

If the result is not as specified, replace the diesel turbo inlet air temperature sensor.

6. INSPECT CRANKSHAFT POSITION SENSOR



(a) Inspect the resistance.

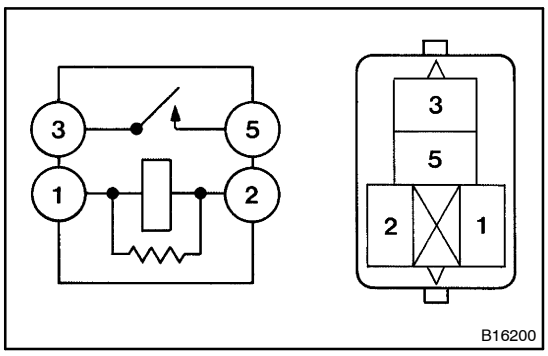
(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:
1630 to 2740 Ω at cold
2065 to 3225 Ω at hot

If the result is not as specified, replace the crankshaft position sensor.

NOTICE:
"Cold" and "Hot" in the above sentences mean the temperature of the sensor itself. "Cold" is from –10°C (14°F) to 50°C (122°F) and "Hot" is from 50°C (122°F) to 100°C (212°F).

7. INSPECT CAMSHAFT POSITION SENSOR



(a) Inspect the resistance.

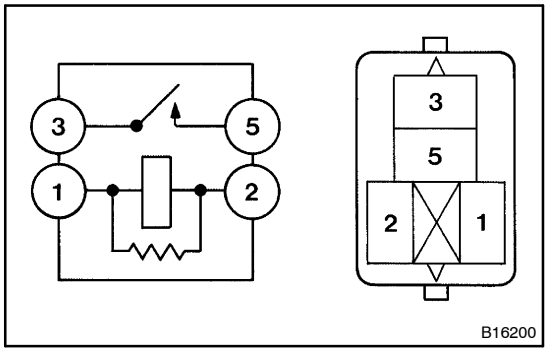
(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:
1630 to 2740 Ω at cold
2065 to 3225 Ω at hot

If the result is not as specified, replace the camshaft position sensor.

NOTICE:
"Cold" and "Hot" in the above sentences mean the temperature of the sensor itself. "Cold" is from –10°C (14°F) to 50°C (122°F) and "Hot" is from 50°C (122°F) to 100°C (212°F).

8. INSPECT EDU RELAY



(a) Inspect the resistance.

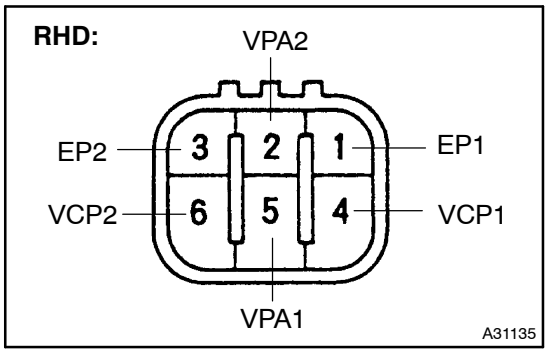
(1) Using an ohmmeter, measure the resistance between the terminals.

Specified condition:

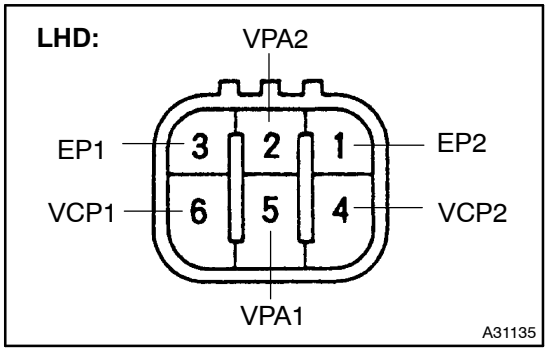
Tester Connection	Specified Condition
3 – 5	10 kΩ or Higher
3 – 5	Below 1 Ω (When battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the EDU relay.

9. INSPECT EFI MAIN RELAY



(a) Inspect the resistance.



(1) Using an ohmmeter, measure the resistance between the terminals.

Specified condition:

Tester Connection	Specified Condition
3 – 5	10 kΩ or Higher
3 – 5	Below 1 Ω (When battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the EFI main relay.

10. INSPECT ACCELERATOR PEDAL ASSY

(a) Inspect the resistance.

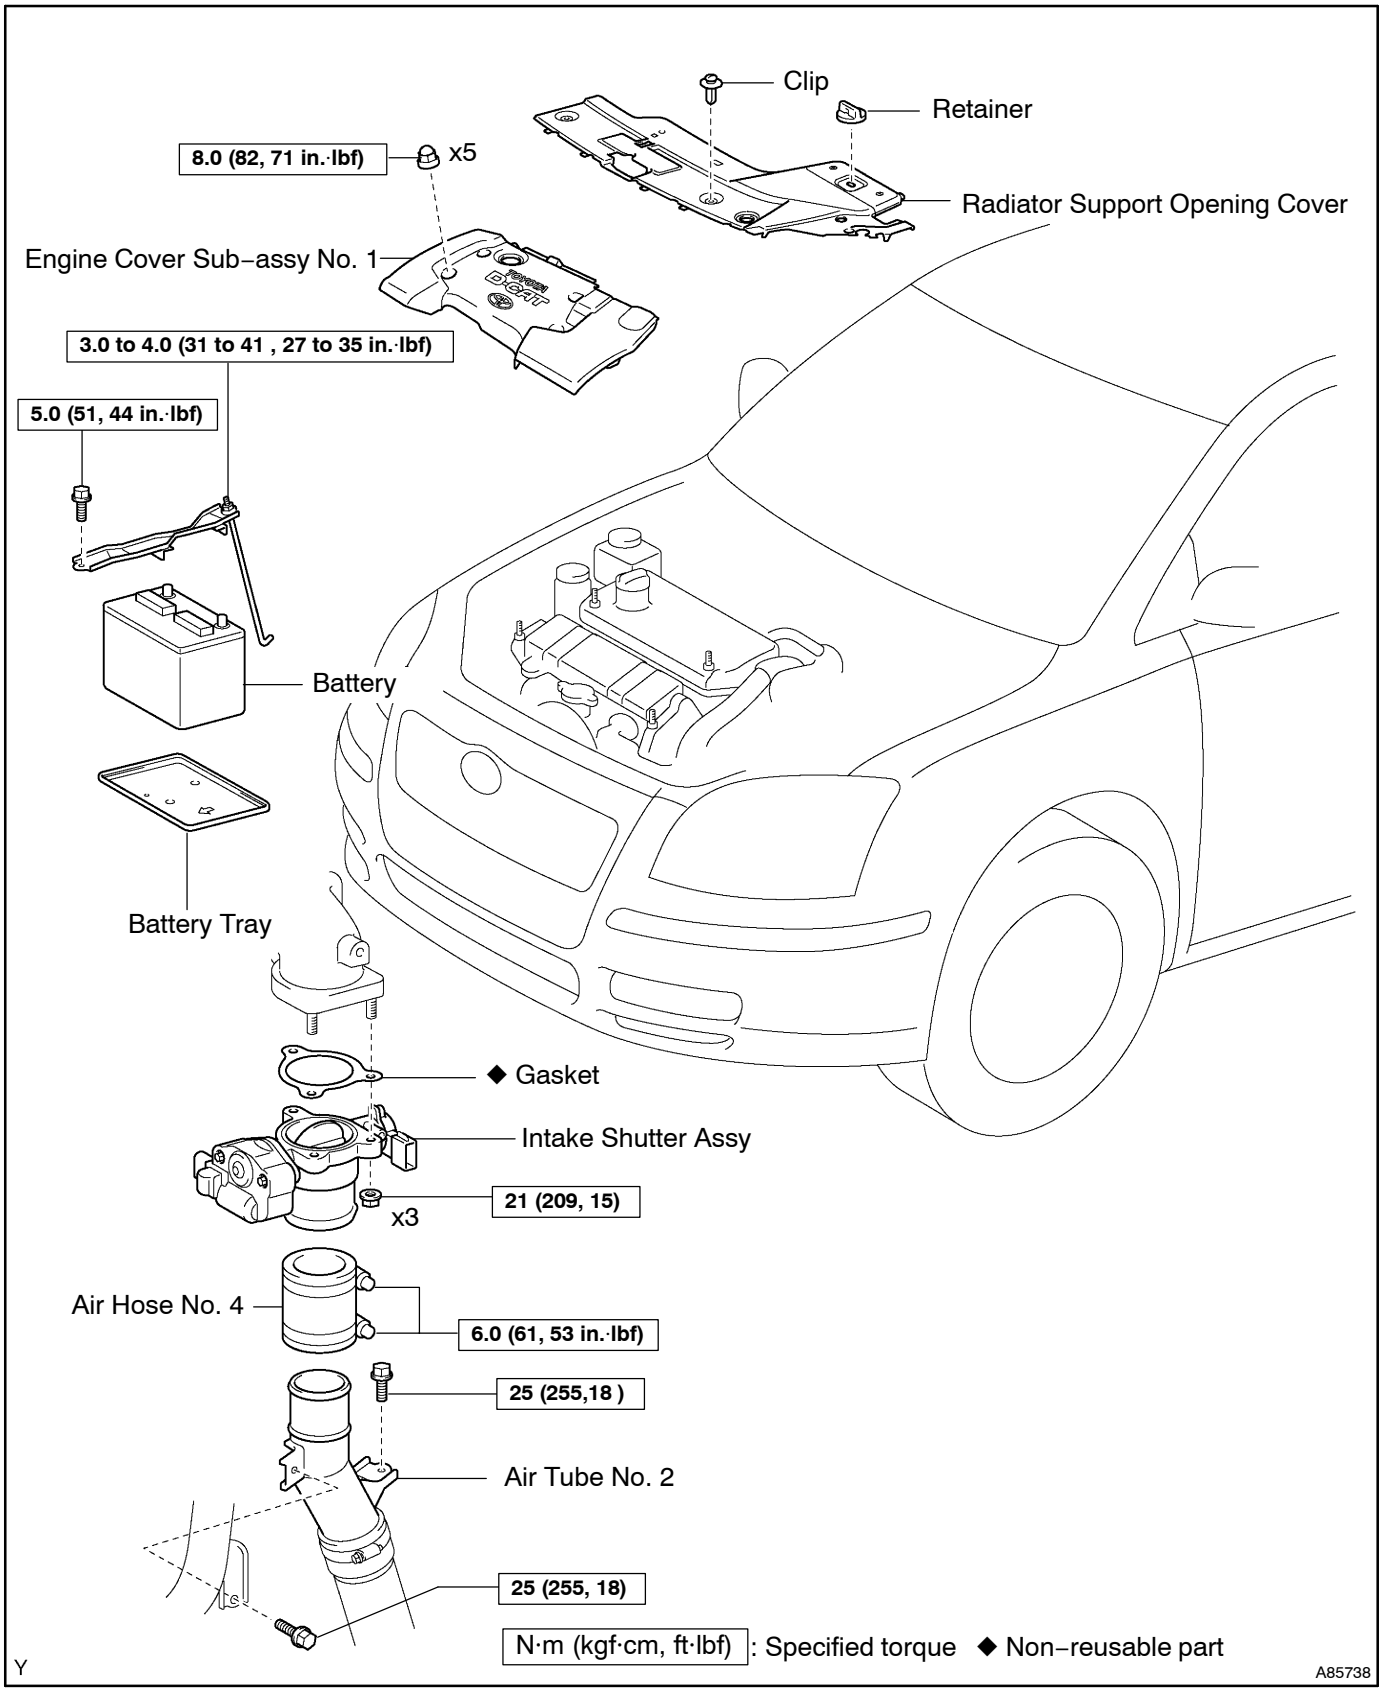
(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:

RHD:

Tester Connection	Specified Condition
5 (VPA1) – 1 (EP1)	5.0 kΩ or less
2 (VPA2) – 3 (EP2)	5.0 kΩ or less
4 (VCP1) – 1 (EP1)	1.5 to 6.0 kΩ
6 (VCP2) – 3 (EP2)	1.5 to 6.0 kΩ

LHD:



Tester Connection	Specified Condition
5 (VPA1) – 3 (EP1)	5.0 kΩ or less
2 (VPA2) – 1 (EP2)	5.0 kΩ or less
6 (VCP1) – 3 (EP1)	1.5 to 6.0 kΩ
4 (VCP2) – 1 (EP2)	1.5 to 6.0 kΩ

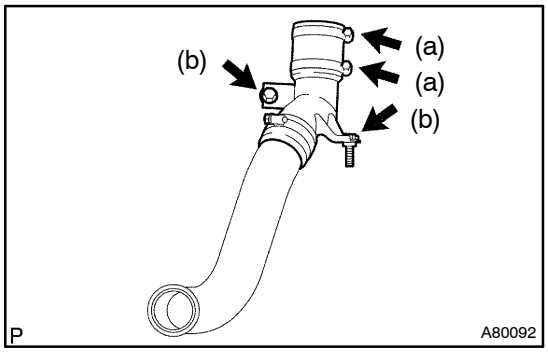
If the result is not as specified, replace the accelerator pedal assembly.

INTAKE SHUTTER ASSY (1CD–FTV)(From September, 2003)

100FN–02

COMPONENTS

100FO–02



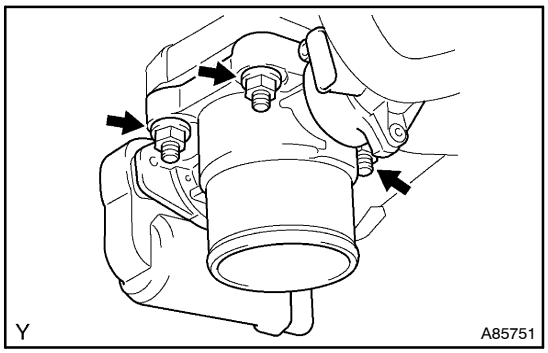
Removal & Installation and Disassembly & Reassembly

1. REMOVE RADIATOR SUPPORT OPENING COVER

2. REMOVE ENGINE COVER SUB–ASSY NO.1

(a) Remove the 5 nuts and engine cover.

3. REMOVE BATTERY



4. REMOVE AIR HOSE NO.4

(a) Loosen the 2 hose clamps.

(b) Remove the 2 bolts, then separate the air tube No. 2.

(c) Remove the air hose No. 4.

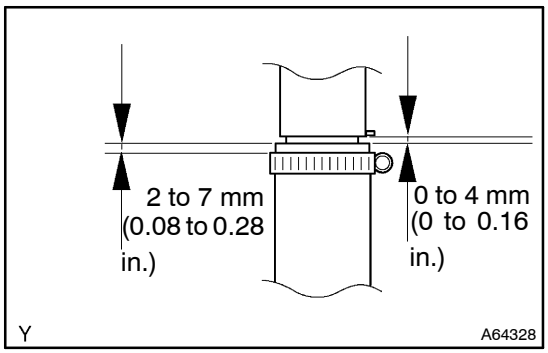
5. REMOVE INTAKE SHUTTER ASSY

(a) Disconnect the 2 connectors.

(b) Remove the 3 nuts, then remove the intake shutter and gasket.

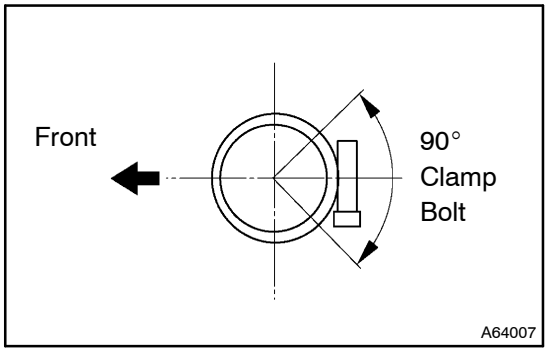
6. INSTALL INTAKE SHUTTER ASSY

(a) Install a new gasket and the intake shutter with the 3 nuts.



Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

7. INSTALL AIR HOSE NO.4



(a) Install the air hose No. 4 to the air tube No. 2.

(b) Install the air tube No. 2 with the 2 bolts.

Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

(c) Install the air hose and hose clamps as shown in the illustration.

(d) Tighten the hose clamps as shown in the illustration.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

8. INSTALL ENGINE COVER SUB–ASSY NO.1

(a) Install the engine cover with the 5 nuts.
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

9. INSTALL BATTERY
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt
3.0 to 4.0 N·m (31 to 41 kgf·cm, 27 to 35 in.·lbf) for nut

ECM (From September, 2003)

100LT–01

REPLACEMENT

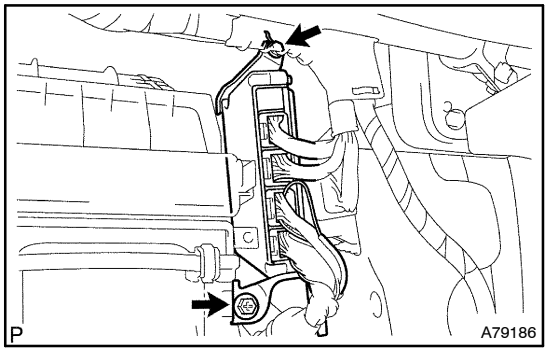
NOTICE:

1CD–FTV Engine Type:

- **If an incorrect injector compensation code was registered with the ECM, it may rattle the engine assembly or the engine idling may become rough. In addition, it may become a cause of engine failure or shorten the life of the engine.**
- **If you replace the ECM with a new one, register all the injectors' injector compensation codes with the new ECM as follows:**

(a) Prior to replacing the ECM, read all the compensation codes stored in the existing ECM using the hand–held tester, then write them down (see page 05–273).

(b) After replacing the ECM, enter the written compensation codes into the ECM using the hand–held tester (see page 05–277).



(c) Turn the ignition switch to OFF, then wait for 30 seconds or more.

(d) Turn the ignition switch to ON, then clear DTC P1601 using the hand–held tester (see page 05–290).

HINT:

- In order to optimize the injector's fuel injection characteristic, the ECM compensates the injection duration by each cylinder. The ECM stores and uses compensating data in the form of a 30–digit–alphanumeric value that is imprinted on the head portion of each injector as the injector compensation code.
- If you installed a new injector, its own injector compensation code is needed to register with the ECM. Also, if you replaced the ECM, the compensation codes of all the injectors are needed to register because the new ECM does not have the codes until they are registered.
- Once the ECM is replaced, DTC P1601 will be present when turning the ignition switch to ON. This is to inform you that the injector compensation codes are required to register with the ECM. In order to clear the DTC, register the compensation codes first, then turn the ignition switch to OFF and wait for 30 seconds or longer.

1. REMOVE GLOVE COMPARTMENT DOOR ASSY (See Pub. No. RM1018E on page 71–11)

2. REMOVE ECM

(a) Disconnect the 4 ECM connectors (1ZZ–FE, 3ZZ–FE, 1AZ–FE, 1CD–FTV).

(b) Disconnect the 5 ECM connectors (1AZ–FSE, 2AZ–FSE).

(c) Disconnect the wire harness clamp.

(d) Remove the bolt and screw, then remove the ECM.

(e) Remove the 2 screws and ECM bracket No. 1 from the ECM.

(f) Remove the 2 screws and ECM bracket No. 2 from the ECM.

3. INSTALL ECM

Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)

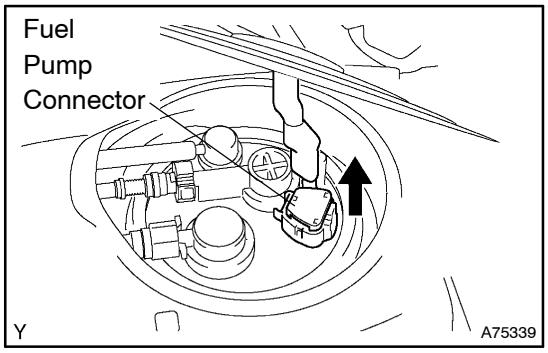
4. INSTALL GLOVE COMPARTMENT DOOR ASSY (See Pub. No. RM1018E on page 71–11)

5. REGISTRATION OF INJECTOR COMPENSATION CODE (1CD–FTV ENGINE TYPE) (See page 05–277)

6. CLEAR DTC (1CD–FTV ENGINE TYPE)

(a) Turn the ignition switch to OFF, then wait for 30 seconds or longer.

(b) Turn the ignition switch to ON, then clear DTC P1601 using the hand–held tester (see page 05–290).



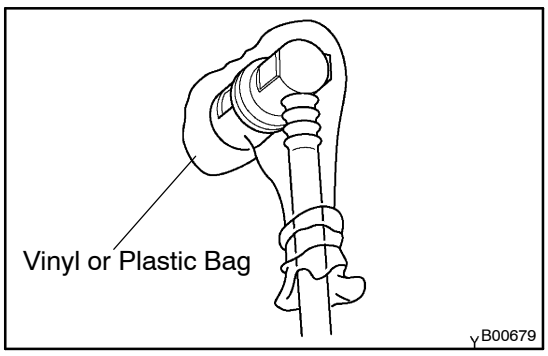
FUEL SYSTEM (2AZ–FSE)

11110–01

PRECAUTION

1. PRECAUTION

(a) Before working on the fuel system, disconnect the engine wire No. 3 (battery negative terminal).
(b) Do not smoke or work near fire when handling the fuel system.
(c) Keep gasoline away from any rubber or leather parts.

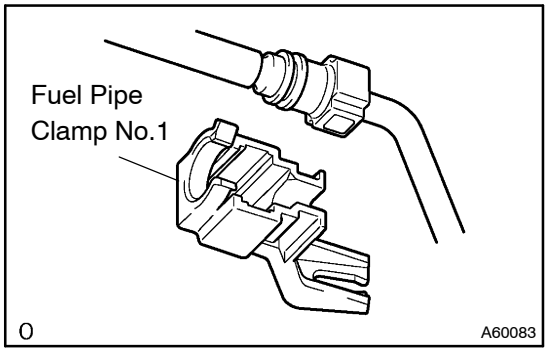


2. DISCHARGE FUEL SYSTEM PRESSURE

CAUTION:

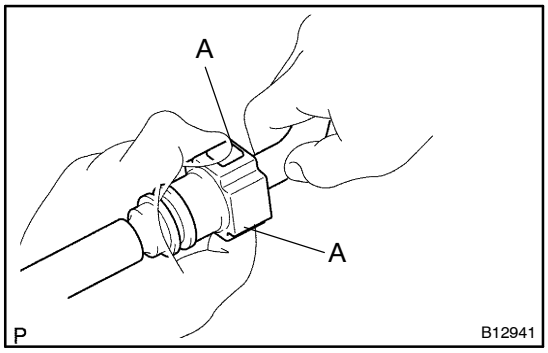
- **Do not disconnect any part of the fuel system until you have discharged the fuel system pressure.**
- **Even after discharging the fuel pressure, place a shop rag over fittings as you separate them to reduce risk of fuel spray on yourself or in the engine compartment.**

(a) Disconnect the fuel pump connector.
(b) Start the engine. After the engine stopped, turn the ignition switch OFF.
(c) Disconnect the engine wire No. 3 (battery negative terminal).
(d) Connect the fuel pump connector.



3. FUEL SYSTEM

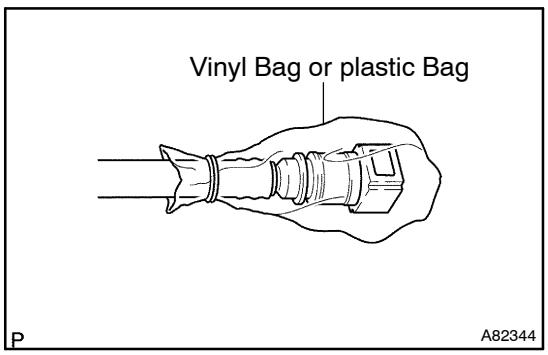
(a) When disconnecting the high fuel pressure line, a large amount of gasoline will spill out, so observe the following procedure:
  (1) Discharge fuel system pressure (see step 2).
  (2) Disconnect the fuel pump tube (see page 11–29).
  (3) Drain the remaining fuel inside the fuel pump tube.
  (4) Cover the disconnected fuel pump tubes with a vinyl or a plastic bag to prevent any damage and dirt.
  (5) Place a tray under the vehicle or point of disconnection to catch any fuel that may spill.
(b) Take the following precautions when removing and installing the fuel injectors.



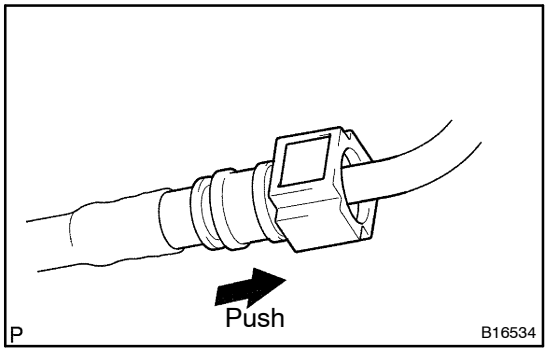
NOTICE:

Never reuse the O–ring.

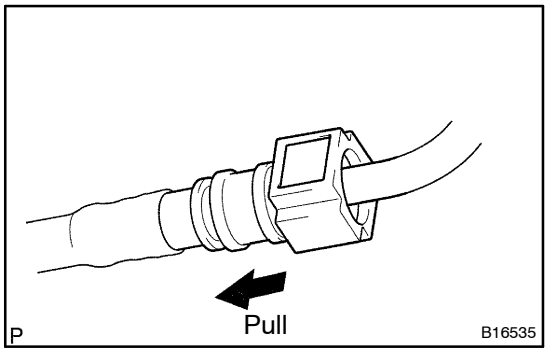
  (1) When installing a new O–ring to the injector, be careful not to damage the injector.
  (2) Coat the new O–ring with grease or gasoline before installing. Never use engine oil, gear oil or brake oil.



(c) Take the following precautions when disconnecting the fuel tube connector (quick type).
(1) Remove the fuel pipe clamp No.1.
(2) Check the pipe and around the connector for dirt or mud before disconnecting them. Clean them if necessary.



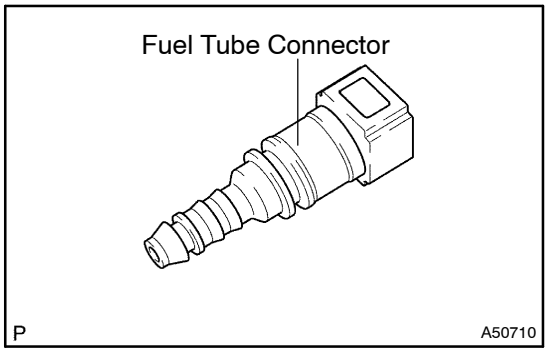
(3) Disconnect the connector from the hose while pinching portion A with fingers as shown in the illustration.



(4) When the connector and the pipe are stuck, push and pull the connector to release and pull the connector out from the pipe carefully.
(5) Check the sealing surface of the disconnected pipe for dirt or mud. Clean it away if necessary.

(6) To prevent the disconnected pipe and connector from being damaged and foreign objects from being introduced, cover them with a vinyl or plastic bag.

(d) Take the precautions when connecting the fuel tube connectors (Quick Type):
(1) Check the connected part of the pipe for any damage or foreign objects.
(2) Align the axis of the connector with the axis of the pipe, then push into the connector until the connector makes a ”click” sound. If the connection is tight, apply a little amount of fresh engine oil on the tip of the pipe.



(3) After finishing the connection, check if the pipe and the connector are securely connected by pulling on them.
(4) Check for fuel leaks.

4. CHECK FOR FUEL LEAKS

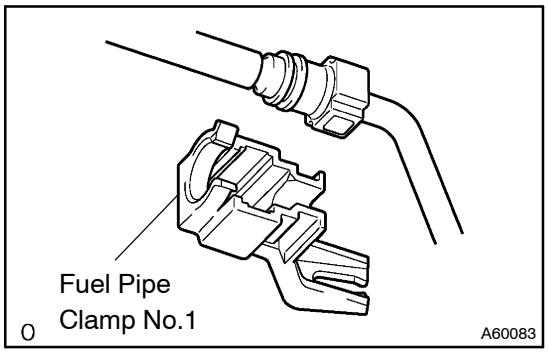
(a) Check that there are no fuel leaks after doing maintenance anywhere on the fuel system (see page 11–4).

11111–01

ON–VEHICLE INSPECTION

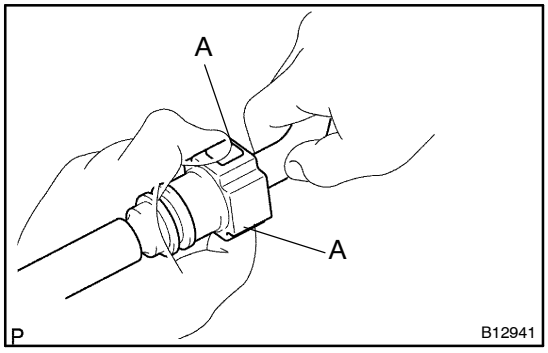
1. CHECK FUEL PRESSURE

(a) Discharge the pressure in the fuel system and take precautions for possible fuel spillage (see page 11–1).



(b) Check that the battery voltage is above 12 V.

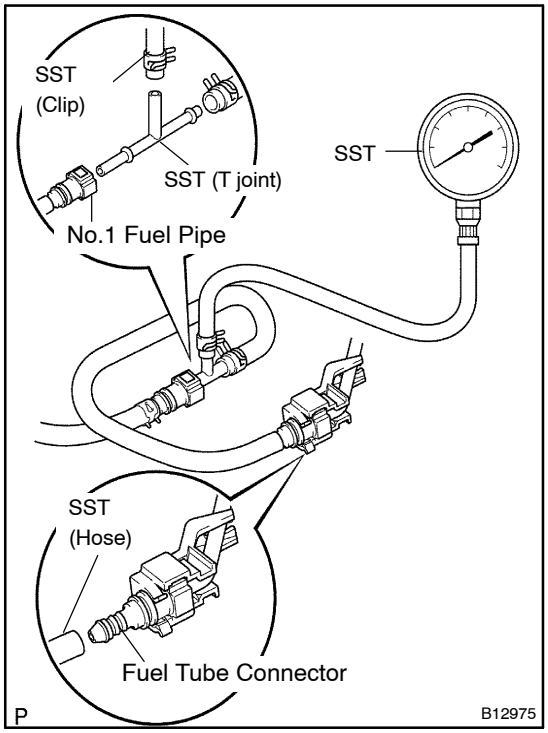
(c) Disconnect the negative (–) battery cable.



(d) Pull out the connecter from a new fuel tube.

HINT:

Part No. 23901–28160



(e) Detach the fuel tube clamp from the fuel tube connector.

(f) Disconnect the fuel tube connector from the fuel pipe while pinching portion A with your fingers as shown in the illustration.

CAUTION:

- **Do not disconnect the fuel tube connector (quick type) until you have discharged the fuel system pressure and taken appropriate steps to prevent fuel spillage.**
- **There may be some pressure remained in the fuel lines after discharging the pressure.**
  Take precautions to prevent fuel from spraying on you, your clothing or inside the engine compartment.

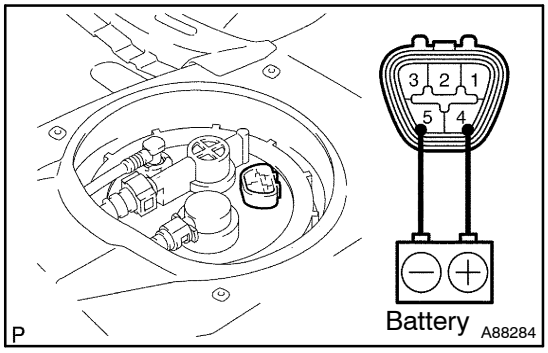
(g) Install SST (pressure gauge) and the fuel tube connector using SST as shown in the illustration.
SST 09268–41047(95336–08070),09268–45014 (09268–41250, 09268–41200, 09268–41220)
(h) Wipe up any gasoline.
(i) Reconnect the negative (–) battery cable.
(j) Connect the hand–held tester to the DLC3.
(k) Measure the fuel pressure.
Fuel pressure:
196 to 588 kPa (2 to 6 kgf/cm^2, 28 to 85 psi)

If pressure is high, replace the fuel pressure regulator.
If pressure is low, check the fuel hose connections, fuel pump, fuel filter and fuel pressure regulator.

(l) Disconnect the hand–held tester from the DLC3.
(m) Start the engine.
(n) Measure the fuel pressure at idle.
Fuel pressure:
196 to 588 kPa (2 to 6 kgf/cm^2, 28 to 85 psi)
(o) Stop the engine.
(p) Check that the fuel pressure remains as specified for 5 minutes after the engine has stopped.
Fuel pressure:147 kPa (1.5 kgf/cm^2, 21 psi) or more

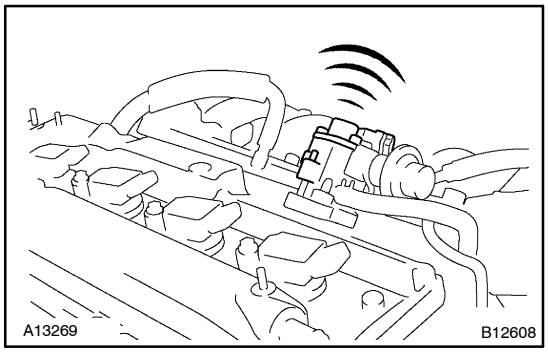
If pressure is not as specified, check the fuel pump, pressure regulator and/or fuel injectors.

(q) After checking the fuel pressure, disconnect the negative (–) battery cable and carefully remove SST and the fuel tube connector to prevent gasoline splash.
(r) Reconnect the No. 1 fuel pipe (fuel tube connector).



CAUTION:
After taking the precautions, connect the fuel tube connecter (quick type).

2. CHECK FUEL PUMP OPERATION AND CHECK FOR FUEL LEAKS

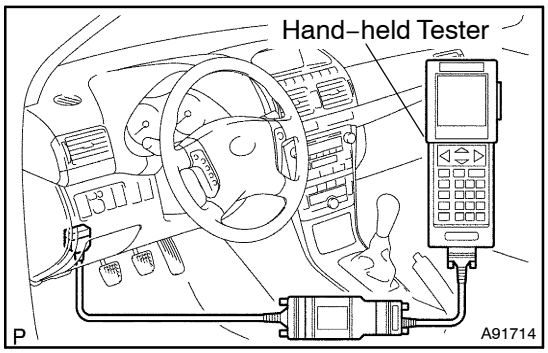


(a) When using the hand–held tester.
(1) Connect the hand–held tester to the DLC3.
(2) Turn the ignition switch ON and the hand–held tester main switch ON.

NOTICE:
Do not start the engine.

(3) Select the ACTIVE TEST mode on the hand–held tester.
(4) Perform the active test. Check that the fuel pump operates and check for fuel leaks.

(b) When not using the hand–held tester.
(1) Connect the positive (+) lead form the battery to terminal 4 of the connector, and connect the negative (–) lead to terminal 5.
(2) Check that the pump operates.



3. CHECK FUEL PUMP OPERATION (HIGH PRESSURE)

(a) Remove the engine cover No. 1 (see page 10–8).
(b) Start the engine.
(c) Using a sound scope, hear the operating sound of the pump.

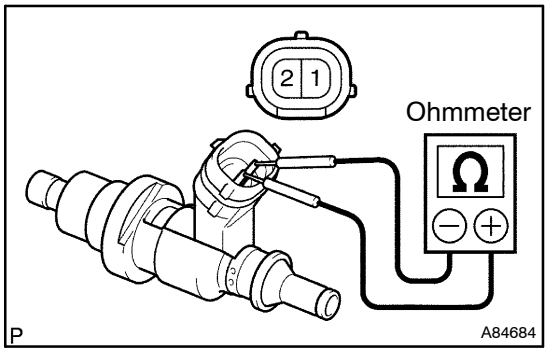
If there is no sound, replace the fuel pump.

(d) Stop the engine.
(e) Reinstall the engine cover No. 1 (see page 10–8).

4. CHECK FUEL HIGH PRESSURE

(a) Connect the hand–held tester to the DLC3.
(b) Start the engine.
(c) Select the ACTIVE TEST mode on the hand–held tester.
(d) Perform the ACTIVE TEST check the fuel high pressure at idle to 3,000 rpm.

Fuel high pressure:



9.5 to 10.5 Mpa (97 to 107 kgf/cm^2, 1,380 to 1,520 psi)

If the pressure is not as specified, check the fuel pump, high pressure fuel pump, fuel pressure sensor, wiring and fuel leakage.

(e) Stop the engine.
(f) Disconnect the hand–held tester.

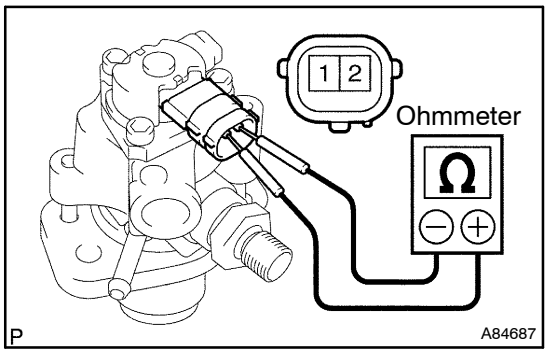
11112–01

INSPECTION

1. INSPECT FUEL INJECTOR ASSY

NOTICE:

This inspection aims at inspecting the fuel injectors for open or short, because the fuel injectors of this vehicle are high–pressure type and do not allow to inspect fuel injection volume.



(a) Inspect the resistance.

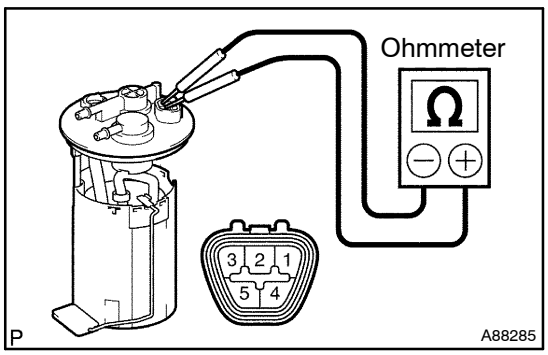
(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 – 2	2.55 to 2.85 Ω at 20°C (68°F)

If the resistance is not as specified, replace the fuel injector.

2. INSPECT FUEL PUMP ASSY



(a) Inspect the resistance.

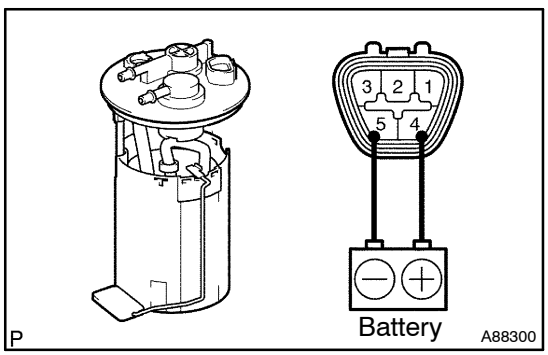
(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 – 2	1.19 to 1.39 Ω at 20°C (68°F)

If the resistance is not as specified, replace the fuel pump.

3. INSPECT FUEL PUMP ASSY



(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

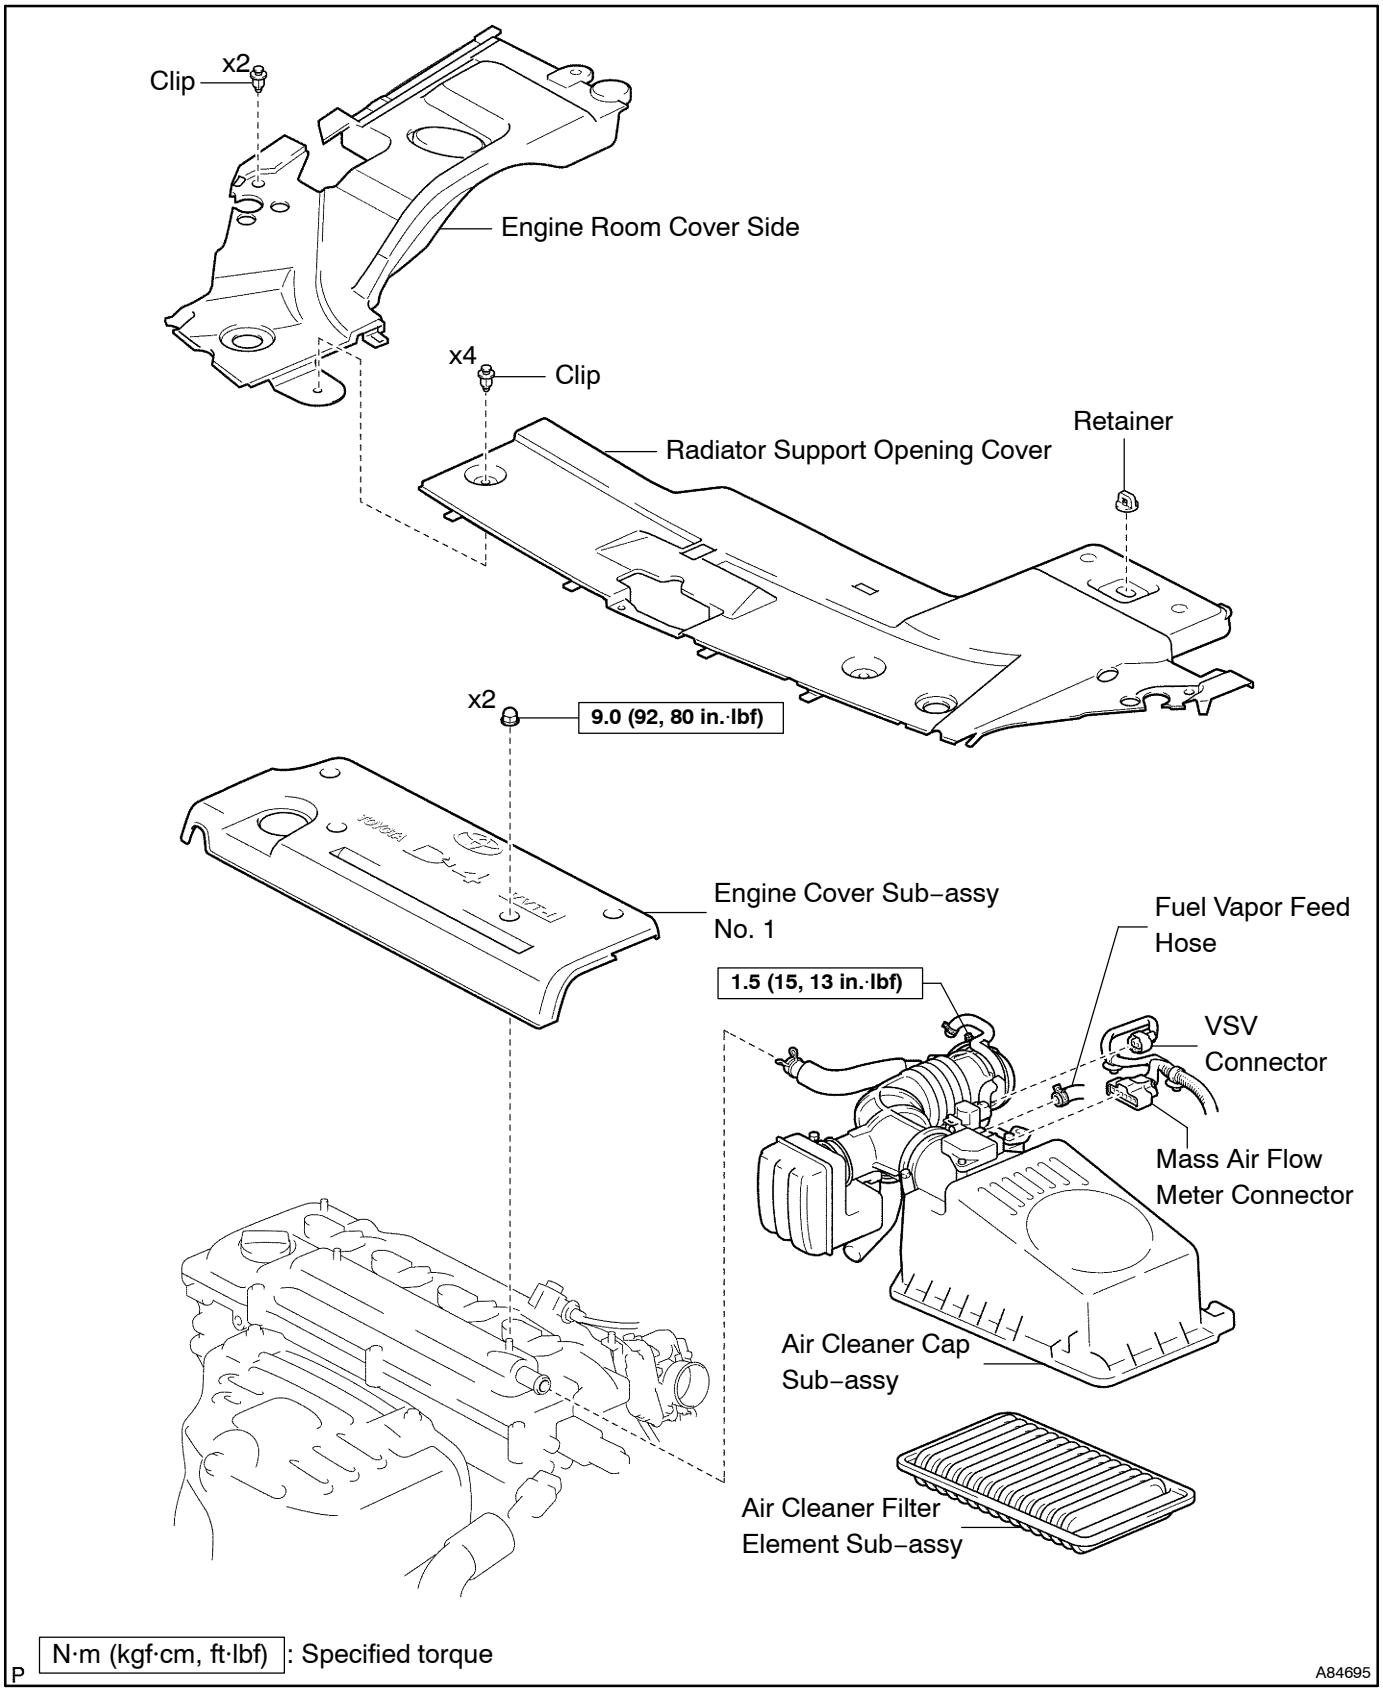
Tester Connection	Specified Condition
4 – 5	0.2 to 3.0 Ω at 20°C (68°F)

If the resistance is not as specified, replace the fuel pump.

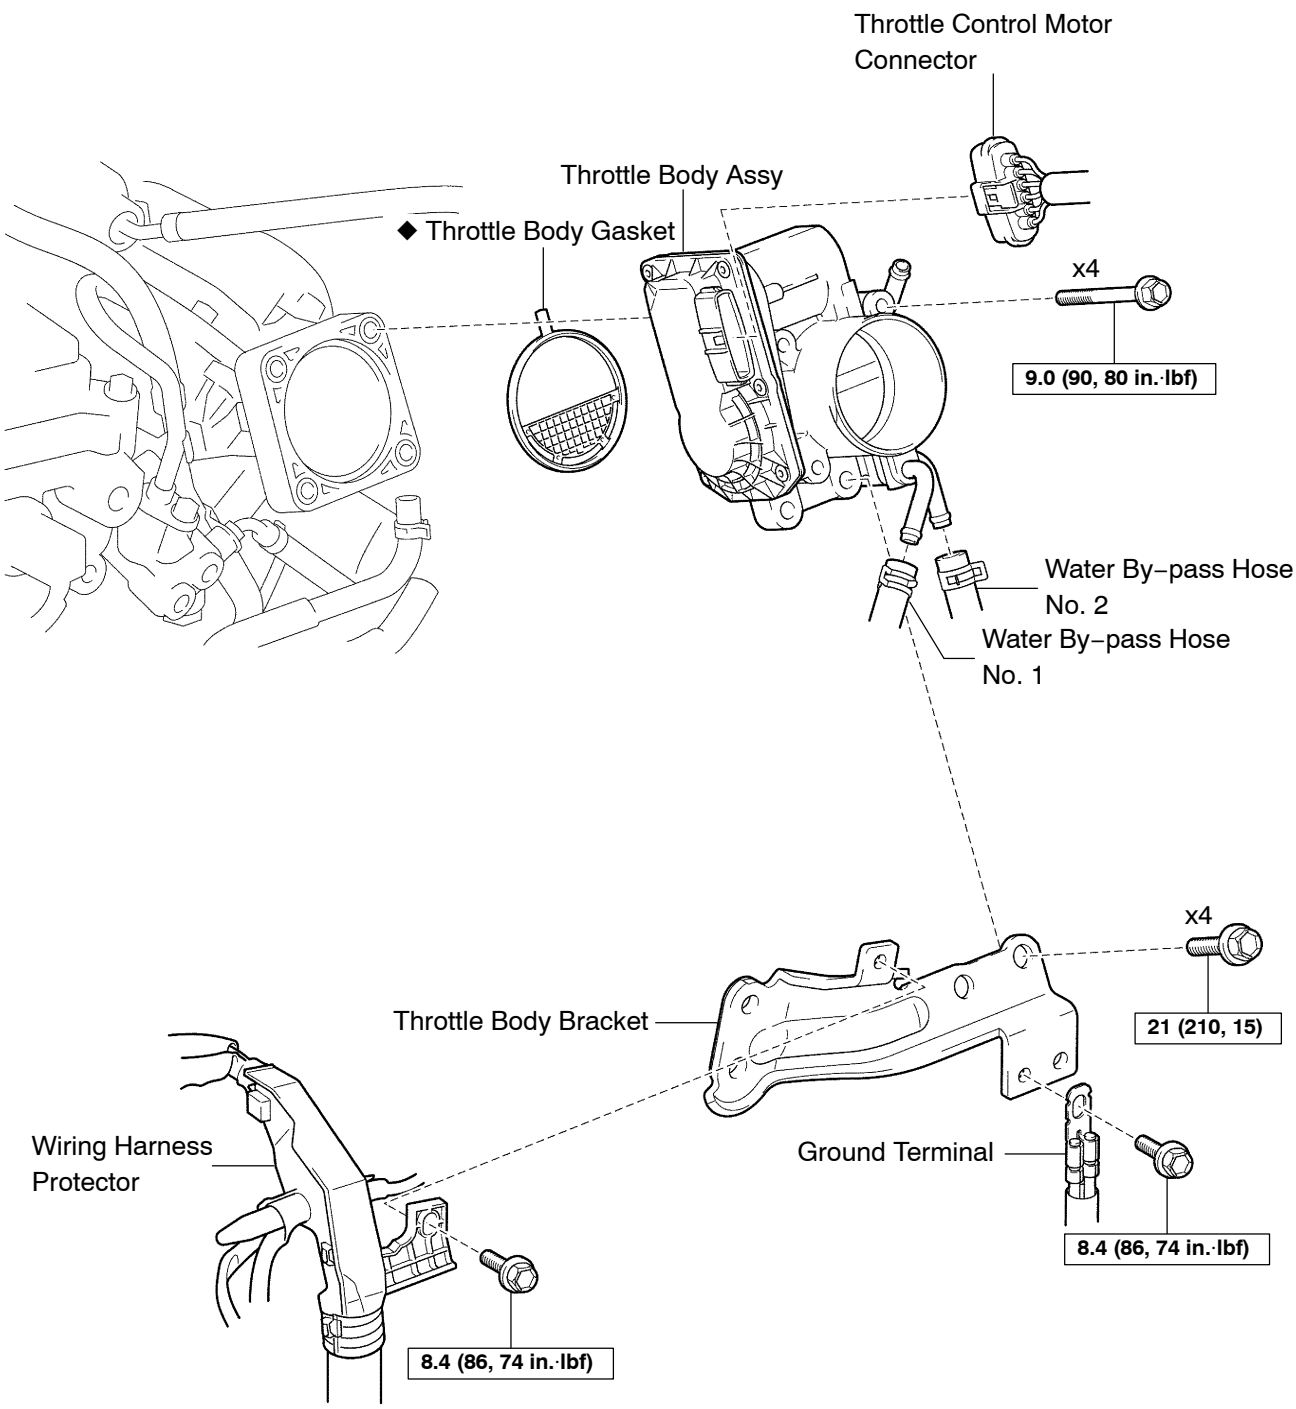
(b) Check the operation.

(1) Apply battery voltage across the terminals. Check that the fuel pump operates.

NOTICE:



- **These tests must be performed quickly (within 10 seconds) to prevent burnout of the coil.**
- **Keep fuel pump as far away from the battery as possible.**
- **Always do the switching at the battery side.**



If the operate is not as specified, replace the fuel pump.

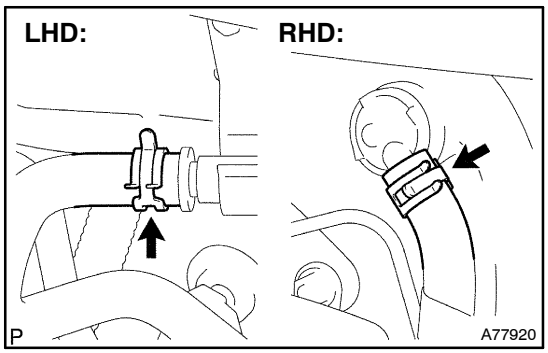
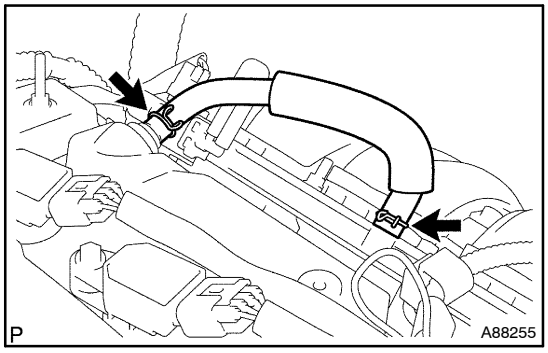
REPLACEMENT

1. **DISCHARGE FUEL SYSTEM PRESSURE (See page 11–1)**
2. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)**
3. **REMOVE ENGINE ROOM COVER SIDE (See page 10–8)**
4. **DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
5. **DRAIN ENGINE COOLANT (See page 16–7)**
6. **REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 10–8)**
7. **REMOVE AIR CLEANER CAP SUB–ASSY (See page 10–8)**
8. **REMOVE THROTTLE BODY ASSY (See page 10–8)**
9. **REMOVE FUEL TUBE SUB–ASSY (See page 11–24)**
   SST 09617–24011
10. **REMOVE FUEL HOSE (See page 11–24)**
11. **REMOVE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)**
    SST 09023–12900
12. **REMOVE FUEL PUMP ASSY (See page 11–24)**



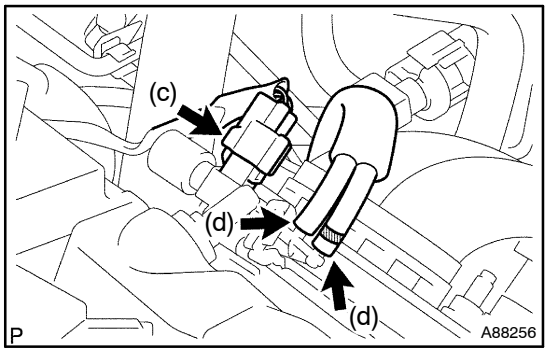
13. REMOVE CHARCOAL CANISTER ASSY

(a) Disconnect the fuel hose from the charcoal canister hose.
(b) Disconnect the charcoal canister outlet hose No. 1 from the charcoal canister.
(c) Pull out the charcoal canister from the charcoal canister base bracket.

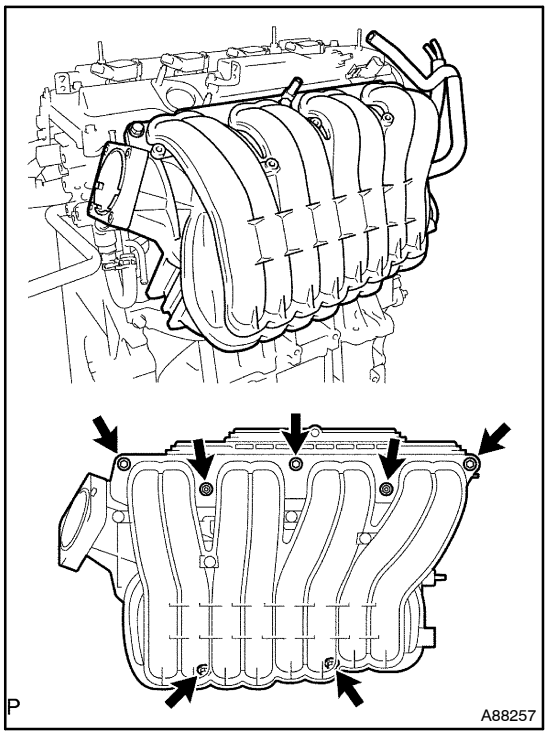


14. REMOVE VACUUM SENSOR ASSY (LHD STEERING POSITION TYPE)

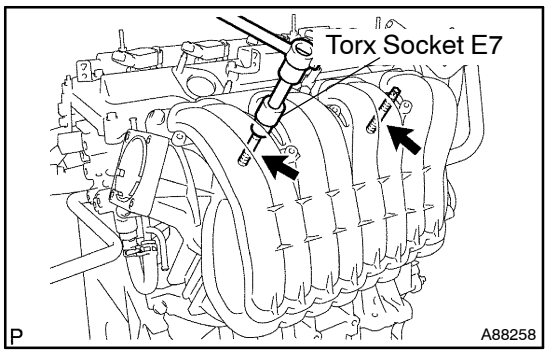
(a) Remove the wiring harness clamp.
(b) Disconnect the vacuum sensor connector.
(c) Disconnect the vacuum hose from the vacuum sensor.
(d) Remove the bolt, then remove the vacuum sensor.



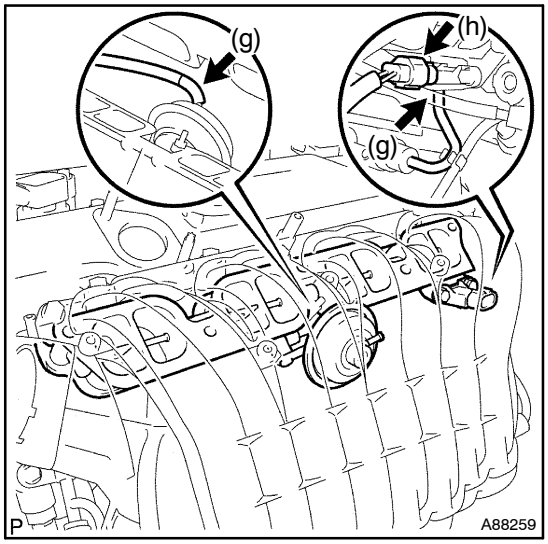
15. REMOVE INTAKE MANIFOLD



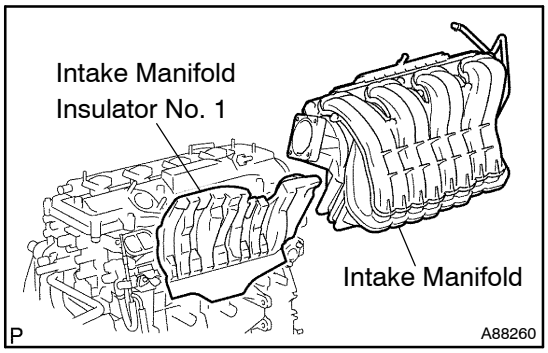
(a) Disconnect the union to connector tube hose from the brake booster.



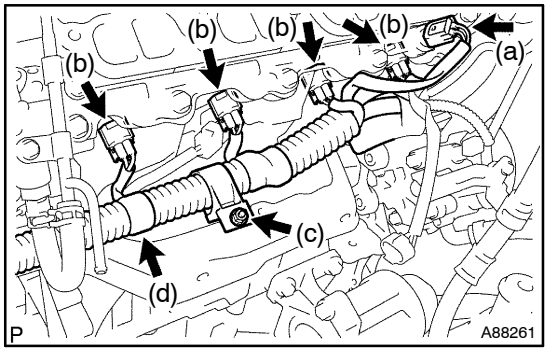
(b) Remove the ventilation hose No. 1 from the ventilation valve and intake manifold.



(c) Disconnect the VSV connector.
(d) Disconnect the 2 vacuum hoses from the VSV.

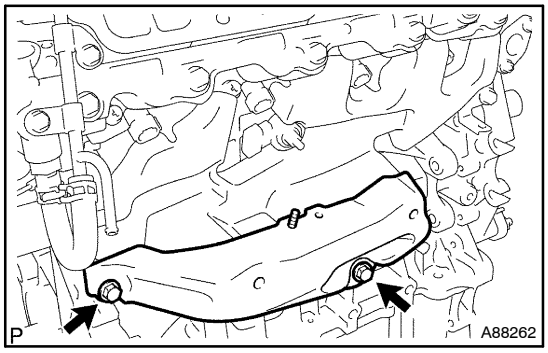


(e) Remove the 5 bolts and 2 nuts.

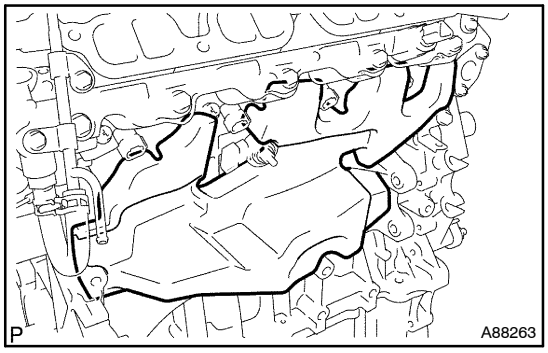


(f) Using a Torx socket E7, remove the 2 stud bolts.

(g) Disconnect the 2 vacuum hoses from the intake air control valve and pressure sensor.
(h) Disconnect the pressure sensor connector.
(i) Remove the intake air control valve and gasket from the cylinder head.

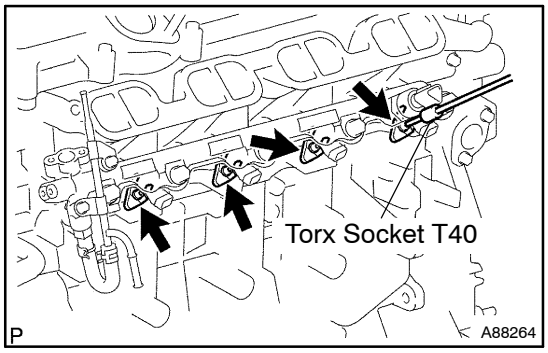


(j) Remove the intake manifold insulator No. 1 from the intake manifold.
(k) Remove the intake manifold from the vehicle.



16. REMOVE SURGE TANK STAY NO.1

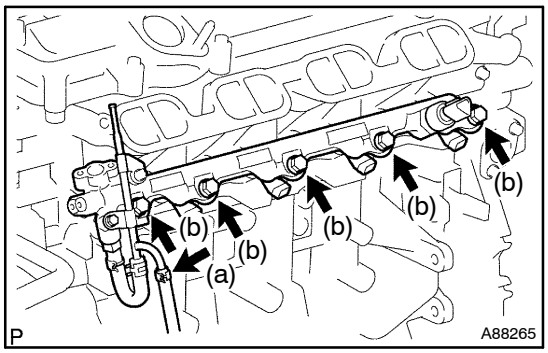
(a) Disconnect the fuel pressure sensor connector.
(b) Disconnect the 4 fuel injector connectors.
(c) Remove the nut.
(d) Remove the wiring harness clamp, then remove the engine wire.



(e) Remove the 2 bolts, then remove the surge tank stay No. 1.

17. REMOVE INTAKE MANIFOLD INSULATOR NO.2

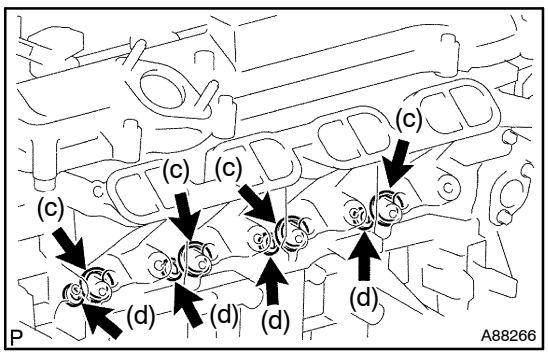
(a) Remove the intake manifold insulator No. 2 from the cylinder block.



18. REMOVE NOZZLE HOLDER CLAMP

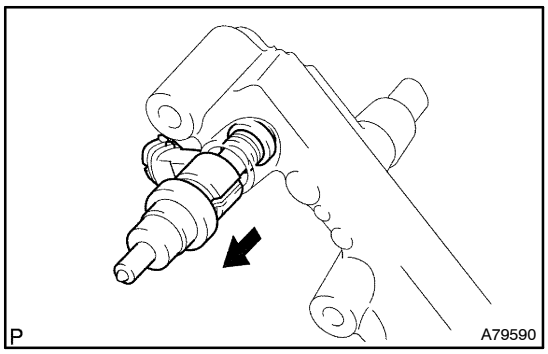
(a) Using a Torx socket T40, remove the 4 bolts, then remove the 4 nozzle holder clamps.

HINT:



The nozzle holder clamp is installed with a bolt.

19. REMOVE FUEL DELIVERY PIPE SUB–ASSY

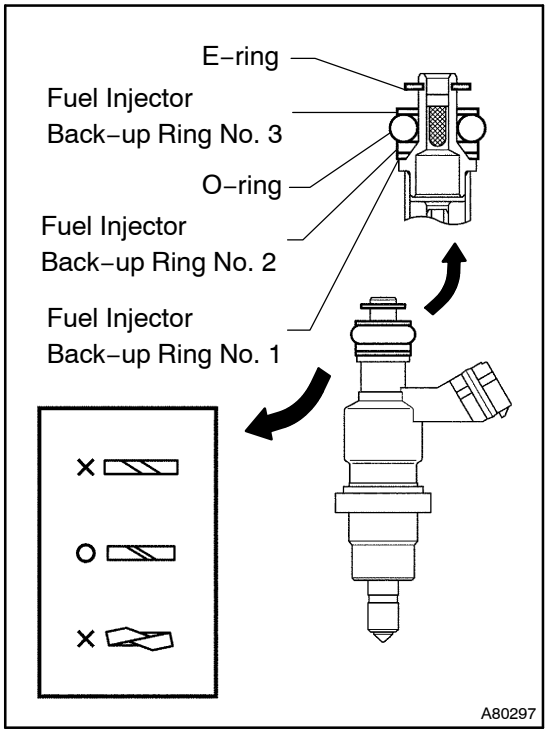


(a) Disconnect the fuel hose from the fuel pipe No. 2.

(b) Remove the 5 bolts, then remove the fuel delivery pipe together with the 4 fuel injectors.

(c) Remove the 4 gaskets from the cylinder head.

(d) Remove the 4 seals from the cylinder head.

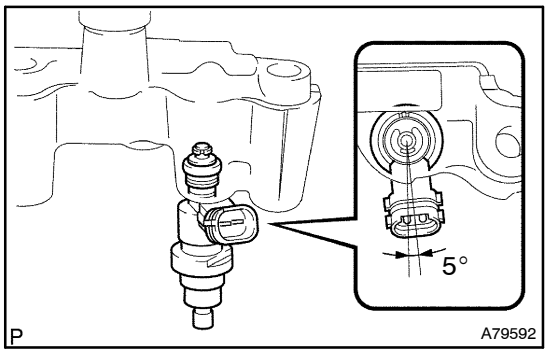


20. REMOVE FUEL INJECTOR ASSY

(a) Pull out the 4 fuel injectors from the fuel delivery pipe.

NOTICE:

Be careful not to damage the sealing surface of the fuel delivery pipe when removing the fuel injector.

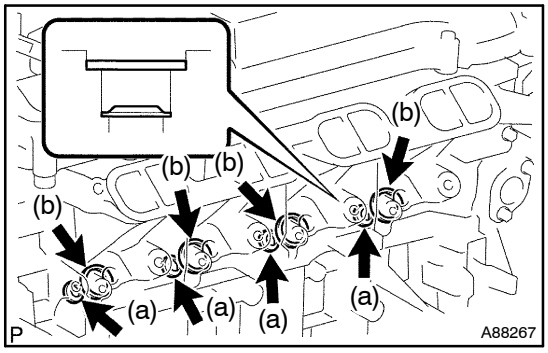


21. INSTALL FUEL INJECTOR ASSY

(a) Install new fuel injector back–up ring No. 1, No. 2, No. 3, a new O–ring and a new E–ring to each fuel injector.

NOTICE:

- **There is a draft angle inside the back–up ring No. 1 and No. 2. Put the draft angle downward when installing those rings to the fuel injector.**
- **The back–up ring No. 1 and No. 2 have a diagonal slit. Pay attention to the splice of the slits after installing them.**
- **After Installation of these 5 rings to the fuel injector, check that there are no damages and foreign objects on them.**



(b) Apply a light coat of spindle oil or gasoline to the O–ring on the fuel injector and the mounting hole on the fuel delivery pipe.

(c) Install the fuel injector to the fuel delivery pipe as shown in the illustration.

NOTICE:

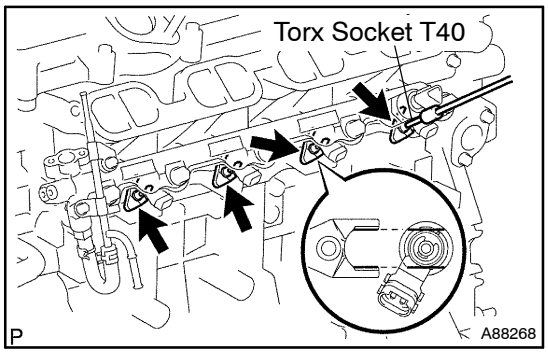
- **Be careful not to damage the sealing surface of the fuel delivery pipe when installing the injector.**
- **Check that there are no damages and foreign objects in the fuel injector mounting hole of the fuel delivery pipe sub–assy.**
- **In order to avoid any damage, be sure to apply fuel to both the O–ring and the mounting hole before installing the fuel injector to the fuel delivery pipe.**

22. INSTALL FUEL DELIVERY PIPE SUB–ASSY

(a) Install the 4 new seals to the cylinder head.

NOTICE:

Pay attention the mounting orientation of the seal.



(b) Install the 4 new gaskets to the cylinder head.

(c) Install the fuel delivery pipe together with the 4 fuel injectors to the cylinder head.

NOTICE:

- **Remove any carbon from the tip of the fuel injector if necessary.**
- **Do not give any physical impact on the tip because the fuel injector tip is sensitive.**
- **If you drop the fuel injector by mistake, replace it with a new one.**
- **Check that there are no damages and foreign objects on the fuel injector mounting area of the cylinder head.**

(d) Temporarily install the fuel delivery pipe with the 5 bolts.

23. INSTALL NOZZLE HOLDER CLAMP

(a) Align the keyway of the fuel injector with the nozzle holder clamp, then fit them.

(b) Using a Torx socket T40, install the 4 nozzle holder clamps with the 4 bolts.

Torque: 13 N·m (127 kgf·cm, 9 ft·lbf)

(c) Tighten the 5 bolts until they reach the specified torque to secure the fuel delivery pipe.

Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

(d) Connect the fuel hose to the fuel pipe No. 2.

24. INSTALL INTAKE MANIFOLD INSULATOR NO.2

25. INSTALL SURGE TANK STAY NO.1

Torque:

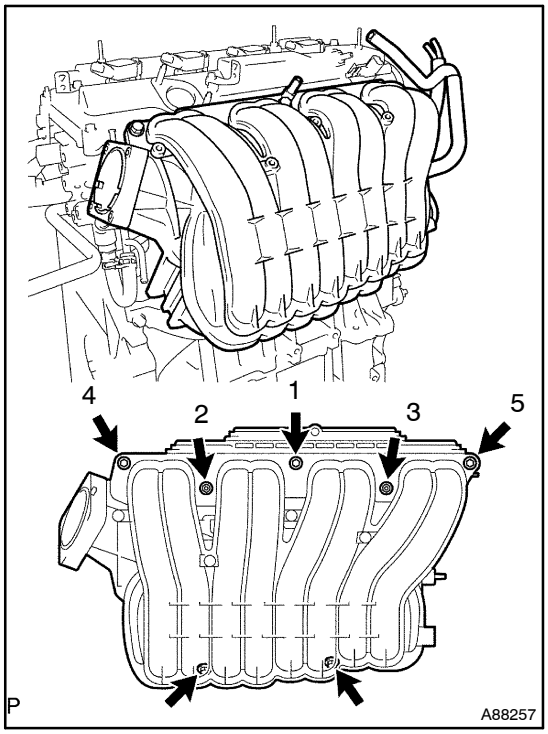
21 N·m (210 kgf·cm, 15 ft·lbf) for surge tank stay No. 1 x cylinder block

9.8 N·m (100 kgf·cm, 7 ft·lbf) for surge tank stay No. 1 x engine wire

26. INSTALL INTAKE MANIFOLD

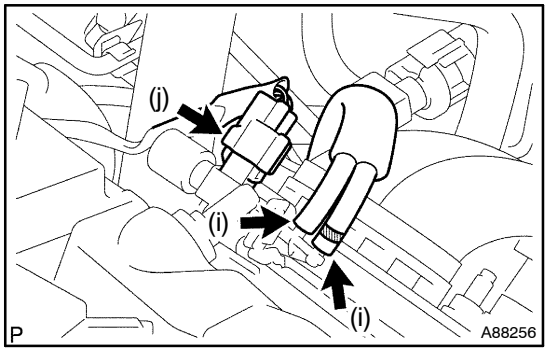
(a) Install a new gasket to the intake manifold.

(b) Temporarily install the intake manifold to the cylinder head.



(c) Install the intake manifold insulator No. 1 to the intake manifold.

(d) Temporarily install the intake air control valve and a new gasket between the intake manifold and cylinder head, then check that the stud bolt holes are aligned.



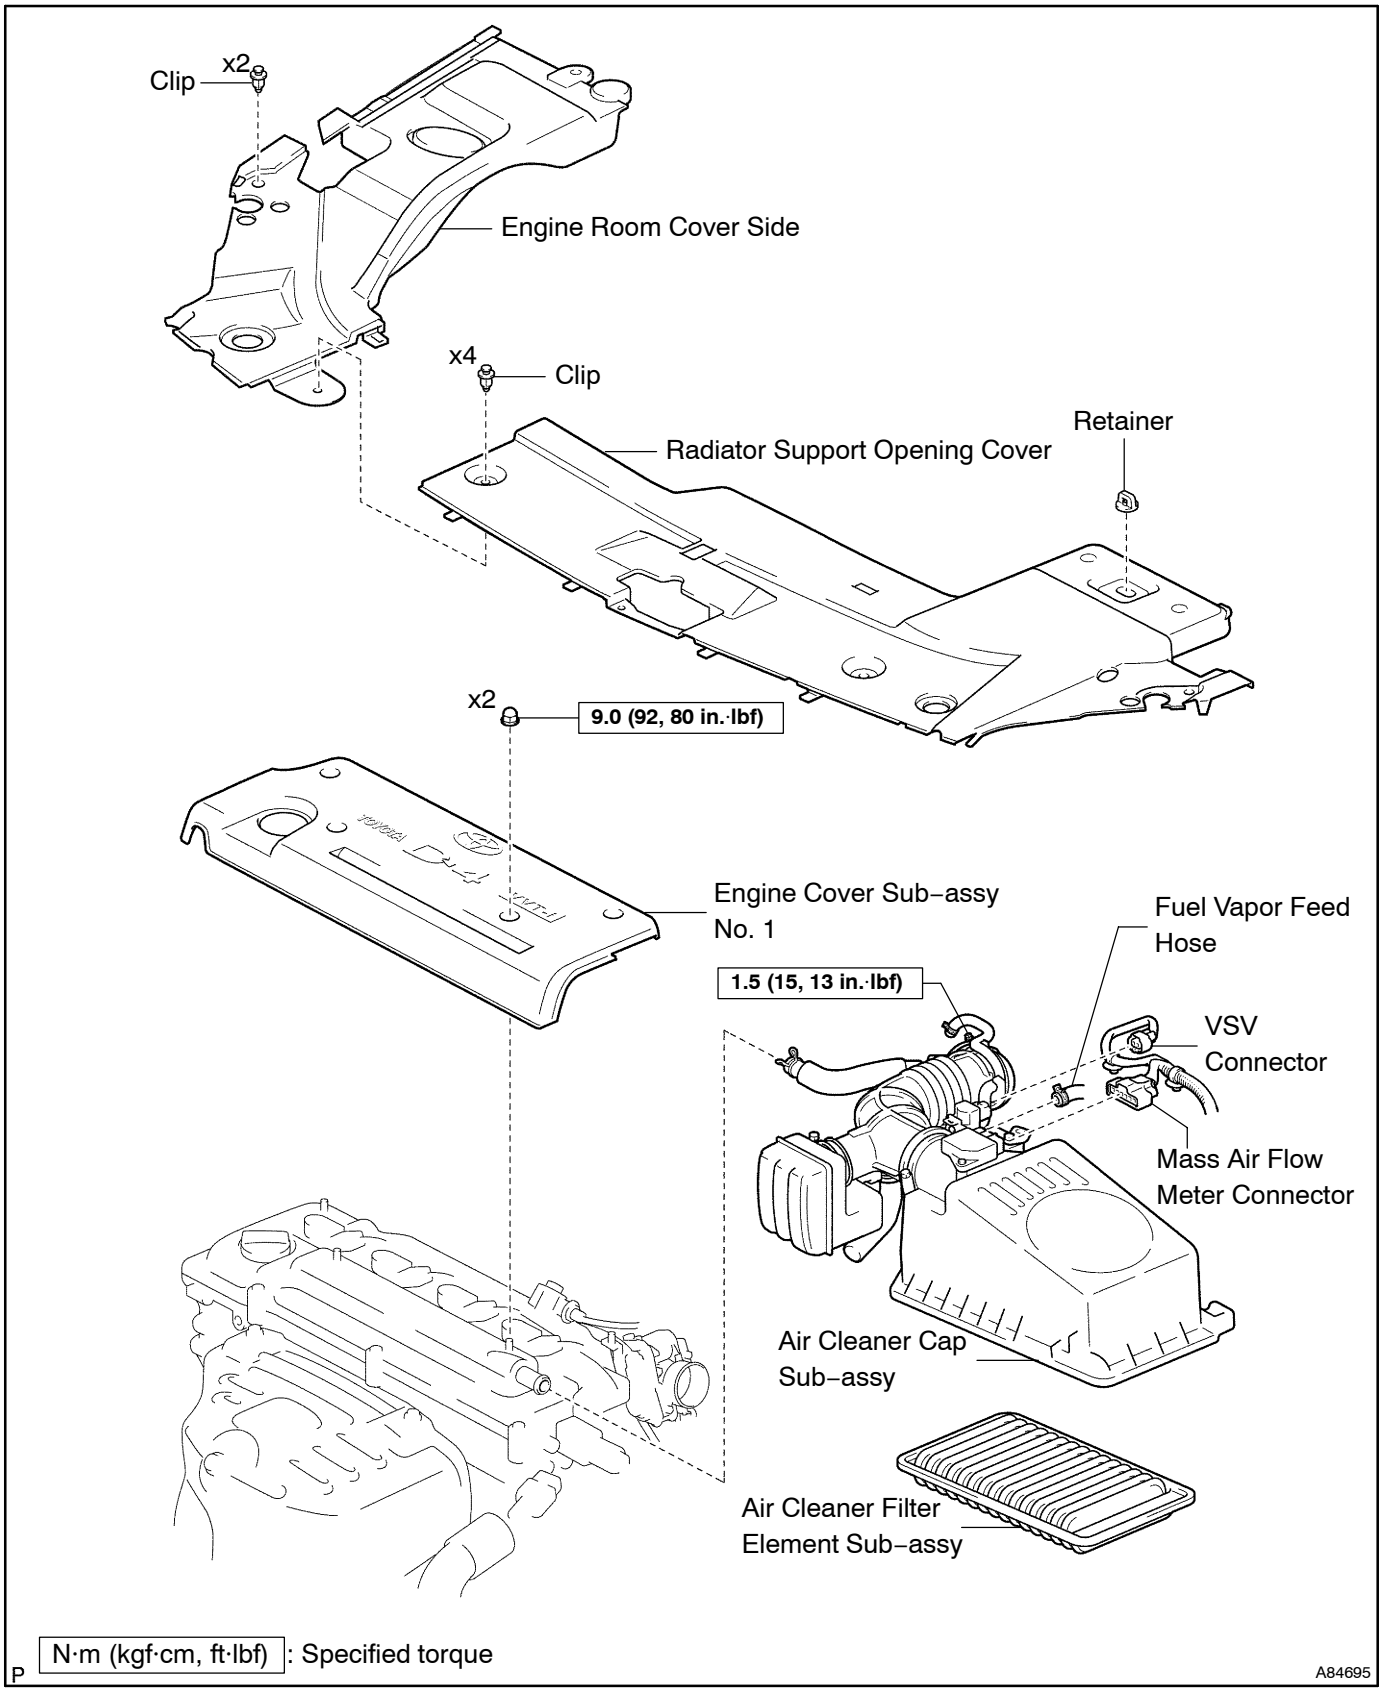
(e) Connect the 2 vacuum hoses to the intake air control valve and pressure sensor.

(f) Connect the pressure sensor connector.

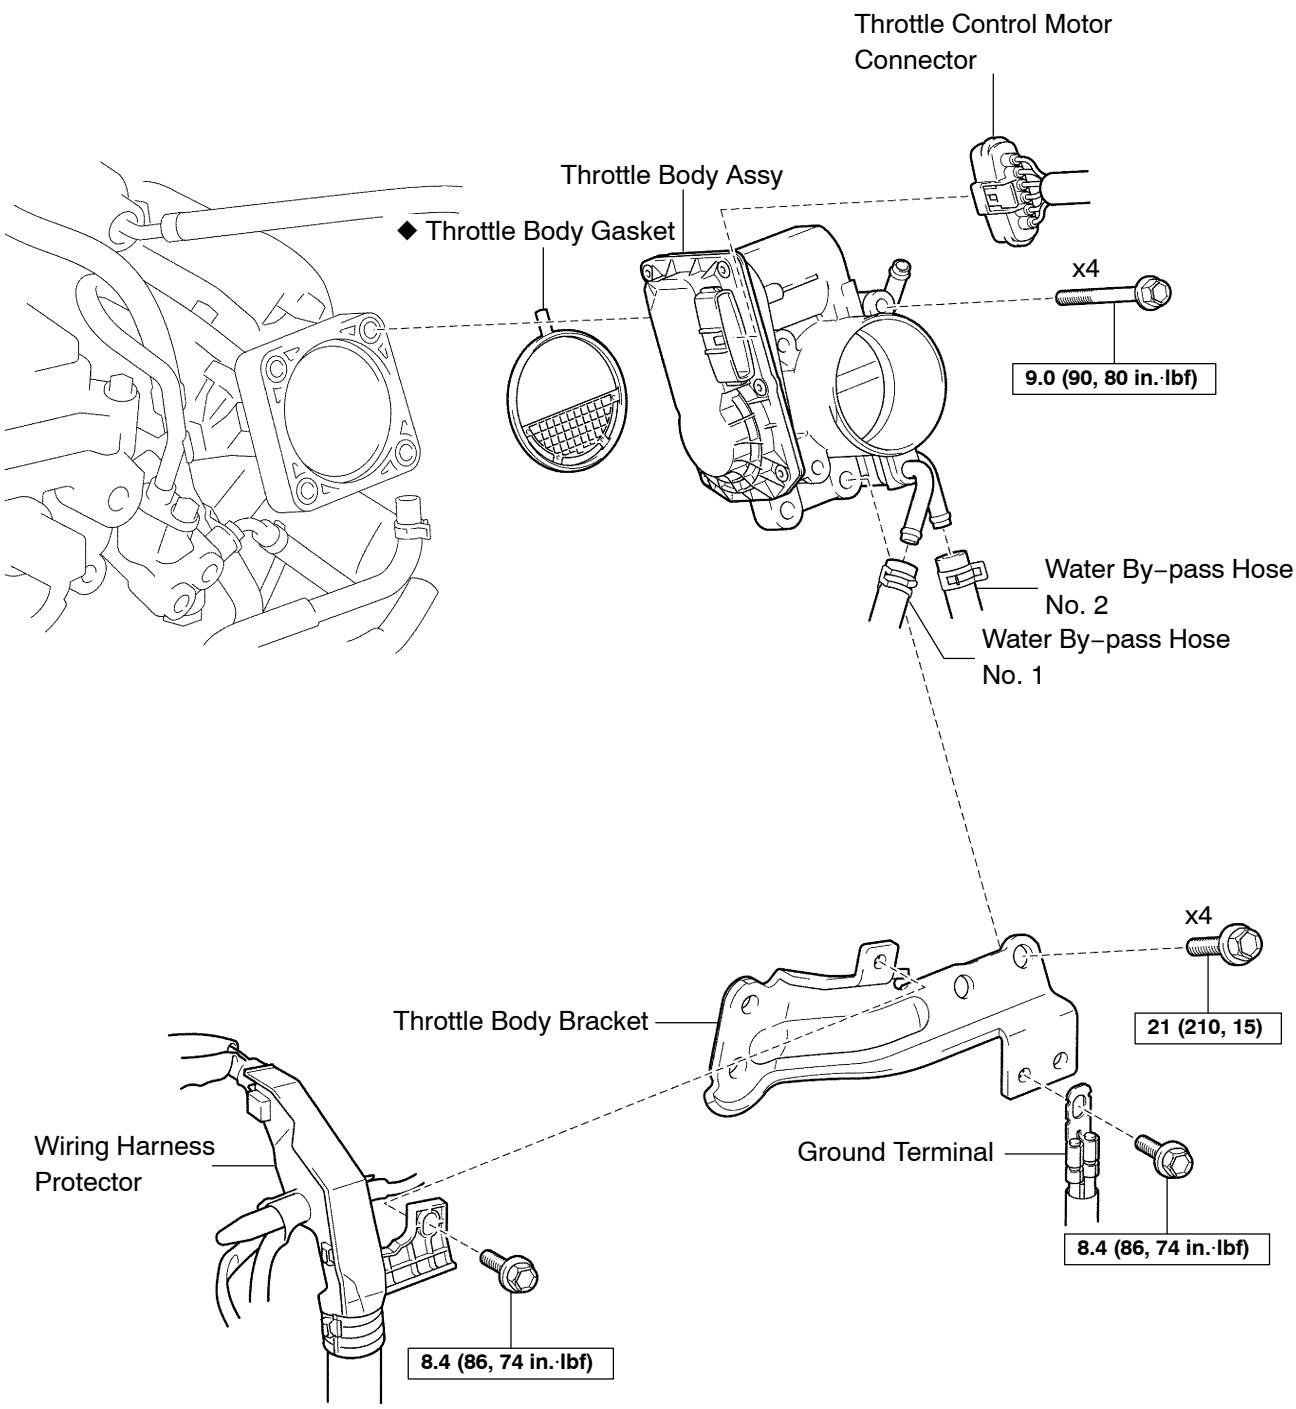
(g) Using a Torx socket E7, install and tighten the 2 stud bolts to secure the intake manifold, intake air control valve and gasket.
Torque: 9.5 N·m (97 kgf·cm, 84 in.·lbf)

(h) In order to install the intake manifold to the cylinder head, tighten the 3 bolts and 2 nuts in the sequence shown in the illustration.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

(i) Connect the 2 vacuum hoses to the VSV as shown in the illustration.
(j) Connect the VSV connector.
(k) Install the ventilation hose No. 1 to the ventilation valve and intake manifold.
(l) Connect the union to connector tube hose to the brake booster.



27. **INSTALL VACUUM SENSOR ASSY (LHD STEERING POSITION TYPE)**
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)
28. **INSTALL CHARCOAL CANISTER ASSY**
29. **INSTALL FUEL PUMP ASSY (See page 11–24)**
30. **INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)**
SST 09023–12900
31. **INSTALL FUEL HOSE**
32. **INSTALL FUEL TUBE SUB–ASSY (See page 11–24)**
SST 09617–24011
33. **INSTALL THROTTLE BODY ASSY (See page 10–8)**
34. **INSTALL AIR CLEANER CAP SUB–ASSY (See page 10–8)**
35. **CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)



36. ADD ENGINE COOLANT (see page 16–7)
37. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)
38. CHECK FOR FUEL LEAKS (See page 11–4)
39. CHECK FOR ENGINE OIL LEAKS
40. INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 10–8)
41. INSTALL ENGINE ROOM COVER SIDE
42. INSTALL RADIATOR SUPPORT OPENING COVER

FUEL PUMP ASSY (2AZ–FSE)

COMPONENTS

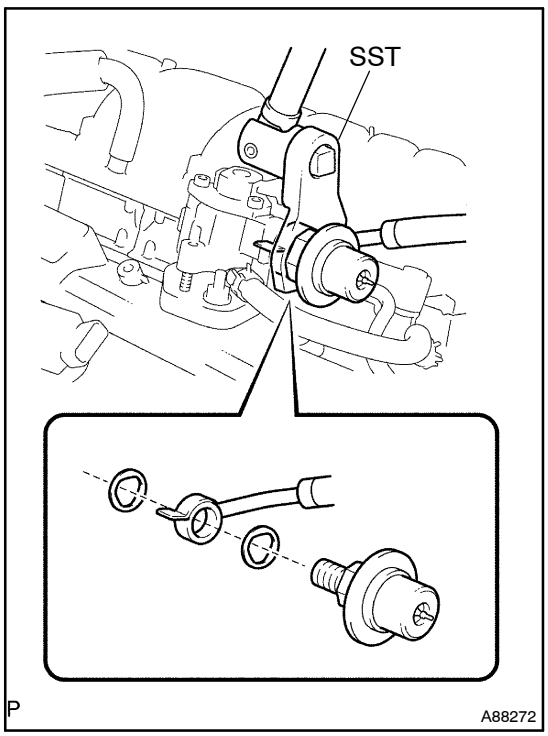
A84701

11116–01

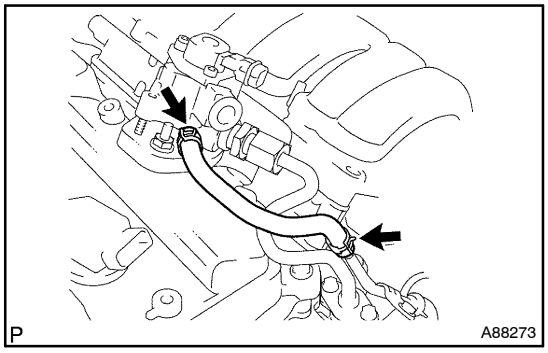
REPLACEMENT

1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–1)
2. REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)
3. DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
4. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 10–8)
5. REMOVE AIR CLEANER CAP SUB–ASSY (See page 10–8)
6. REMOVE THROTTLE BODY ASSY (See page 10–8)



7. REMOVE FUEL TUBE SUB–ASSY

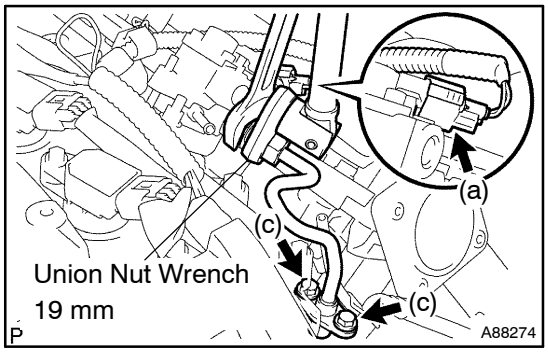
(a) Remove the fuel pipe clamp No. 1.



(b) Pinch the retainer, then pull out the fuel tube connector.

NOTICE:

- **Check around the fuel tube connector for any dirt or mud before this operation, and remove it if necessary.**
- **Be careful of mud because the fuel tube connector has an O–ring which seals the fuel tube connector and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube connector by covering it with a vinyl or plastic bag.**
- **When the fuel tube connector and pipe are stuck, push and pull the fuel tube connector to release, then pull the fuel tube connector out carefully.**



(c) Using SST, remove the fuel pressure pulsation damper, fuel tube and 2 gaskets.
SST 09617–24011

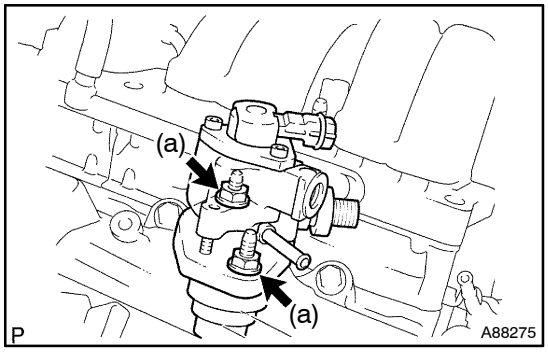
8. REMOVE FUEL HOSE

(a) Remove the fuel hose from the fuel pump and fuel pipe No. 2.

9. REMOVE FUEL PIPE SUB–ASSY NO.1

(a) Disconnect the fuel pump connector.

(b) Clamp the union bolt on the fuel pump with a 21 mm wrench, then remove the fuel pipe No. 1 from the fuel pump using a union nut wrench 19mm.

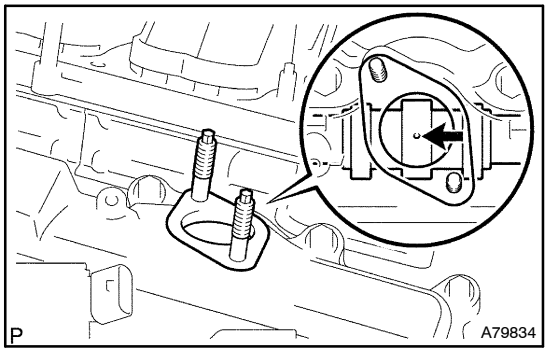


NOTICE:

Do not loosen the union bolt on the fuel pump. If it becomes loose, replace the fuel pump with a new fuel pump.

(c) Remove the 2 bolts, then remove the fuel pipe No. 1.

NOTICE:

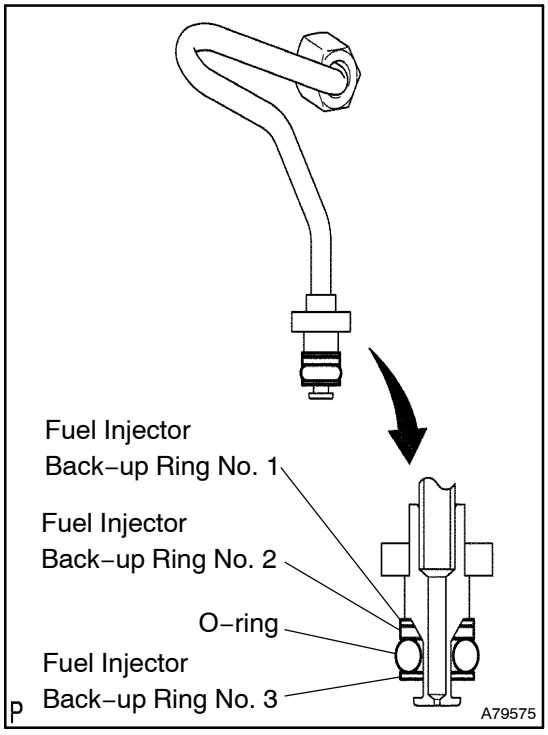


Be careful not to damage both the sealing surfaces of the fuel delivery pipe and fuel pump when removing the fuel pipe No. 1.

10. REMOVE FUEL PUMP ASSY

(a) Remove the 2 nuts, then remove the fuel pump.

(b) Remove the insulator from the cylinder head.



11. INSTALL FUEL PUMP ASSY

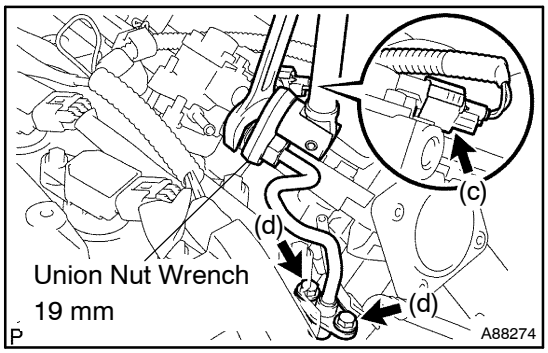
(a) Turn the crankshaft, then set the camshaft to the position where the oil port of the camshaft can be seen from the fuel pump mounting hole.

(b) From the fuel pump mounting hole of the cylinder head, pour 35 to 45cc (2.14 to 2.75 cu in) engine oil into the cylinder head.

(c) For more smooth rotation, apply engine oil on the cam lobe which can be seen from the fuel pump mounting hole using fingers.

(d) Install a new insulator and the fuel pump with the 2 nuts.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

12. INSTALL FUEL PIPE SUB–ASSY NO.1



(a) Attach a new O–ring, fuel injector back–up ring No. 1, No. 2 and No. 3 to the fuel pipe No.1.

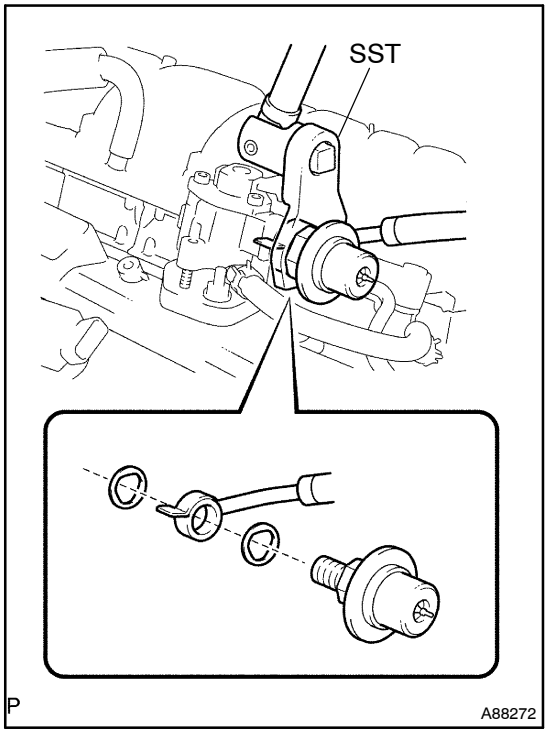
(b) Apply a small amount of fuel on the O–ring, then install the fuel pipe No. 1 to the fuel pump and fuel delivery pipe.

NOTICE:

Be careful not to damage both the sealing surfaces of the fuel delivery pipe and the fuel pump when installing the fuel pipe No.1.

(c) Tighten the nut by hand to attach the fuel pipe No. 1 to the fuel pump.

(d) In order to secure the fuel pipe No. 1, tighten the 2 bolts to the specified torque.



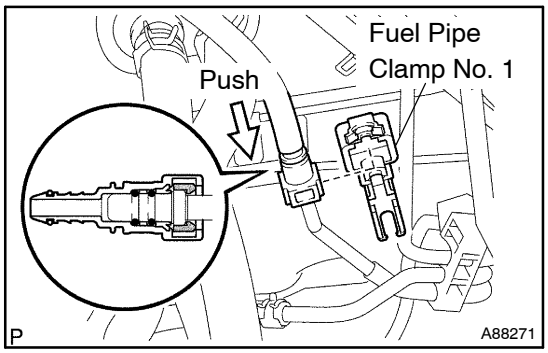
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

(e) Clamp the union bolt on the fuel pump with a 21 mm wrench, then tighten the nut with the specified torque to secure the fuel pipe No. 1 to the fuel pump using a union nut wrench 19 mm.

Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

(f) Connect the fuel pump connector.

13. INSTALL FUEL HOSE



14. INSTALL FUEL TUBE SUB–ASSY

(a) Install the fuel pulsation damper to the fuel pump after fitting the 2 new gaskets and fuel tube between those assys.

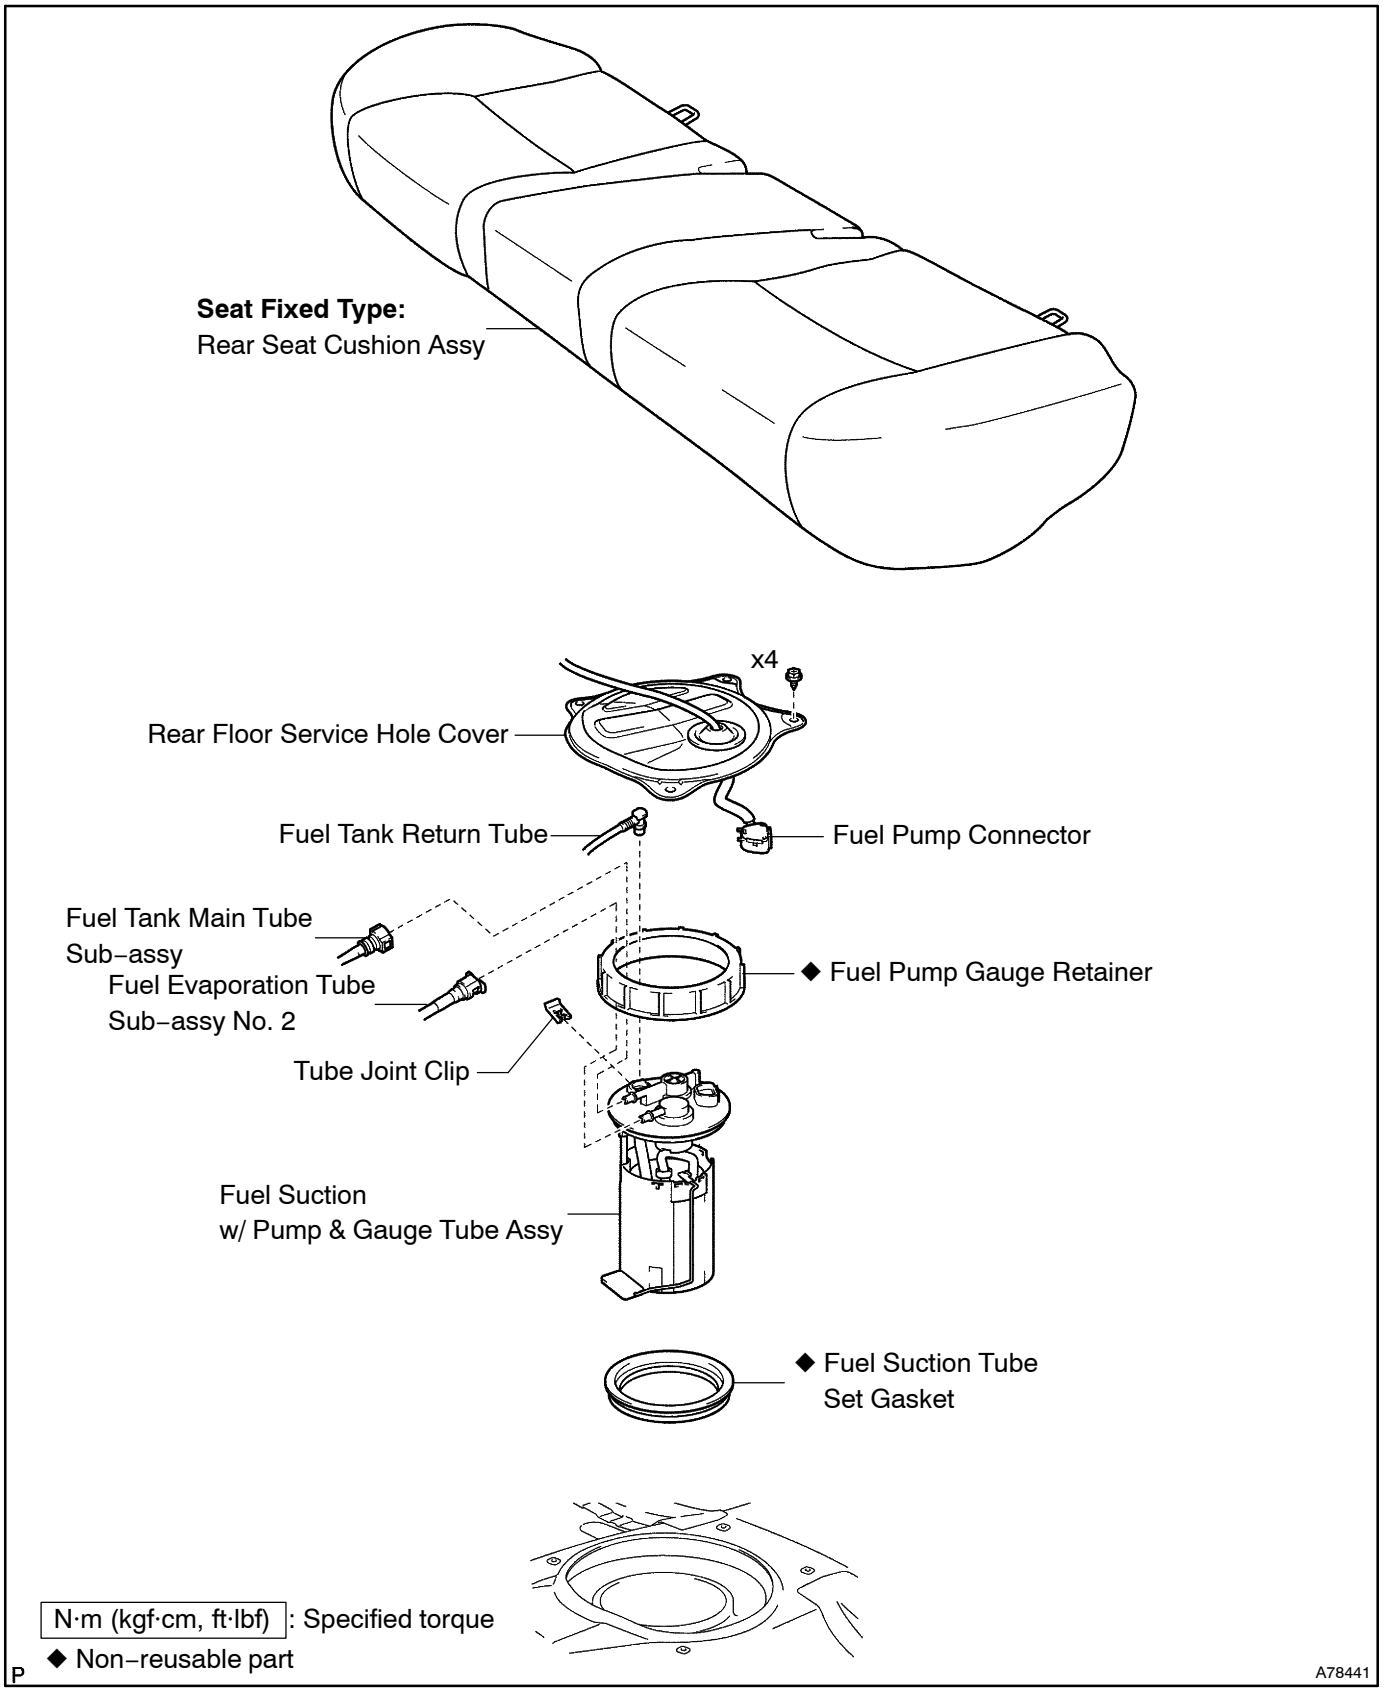
(b) Using SST, install the fuel pressure pulsation damper to the fuel pump.

SST 09617–24011

Torque: 33 N·m (331 kgf·cm, 24 ft·lbf)

(c) Push in the fuel tube connector to the pipe until fuel tube connector makes ”click” sound.

NOTICE:

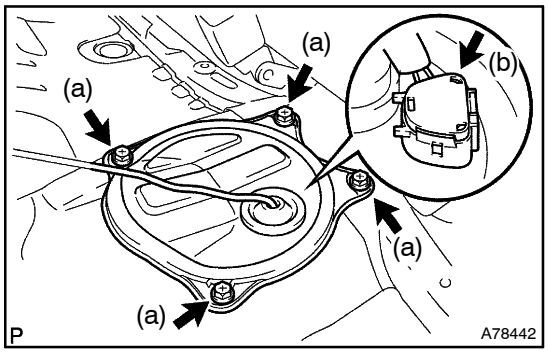


- **Check the connected part for any damage or foreign objects.**
- **After connecting, check if the fuel tube connector and pipe are securely connected by pulling on them.**

15. INSTALL THROTTLE BODY ASSY (See page 10–8)
16. INSTALL AIR CLEANER CAP SUB–ASSY (See page 10–8)
17. CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)
18. CHECK FOR FUEL LEAKS (See page 11–4)
19. CHECK FOR ENGINE OIL LEAKS
20. INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 10–8)
21. INSTALL RADIATOR SUPPORT OPENING COVER

FUEL SUCTION W/ PUMP & GAUGE TUBE ASSY (2AZ–FSE)

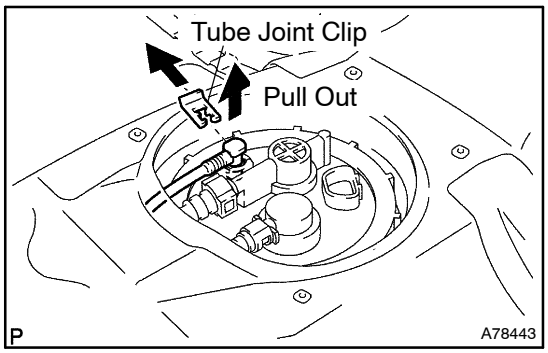
11117–01



COMPONENTS

11118–01

REPLACEMENT

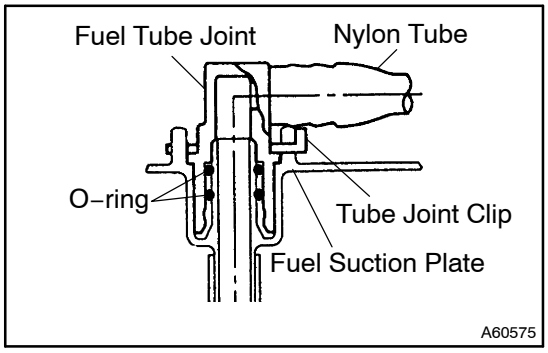


1. **DISCHARGE FUEL SYSTEM PRESSURE (See page 11–1)**
2. **DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
3. **REMOVE REAR SEAT CUSHION ASSY (SEAT FIXED TYPE) (See Pub. No. RM1018E, page 72–32)**

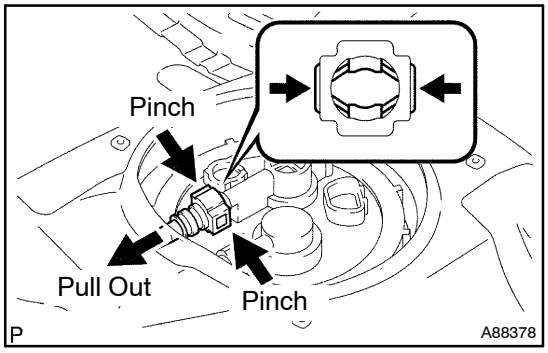
4. REMOVE REAR FLOOR SERVICE HOLE COVER

(a) Remove the 4 screws, then remove the rear floor service hole cover.

(b) Disconnect the fuel pump connector.



5. REMOVE FUEL SUCTION W/ PUMP & GAUGE TUBE ASSY

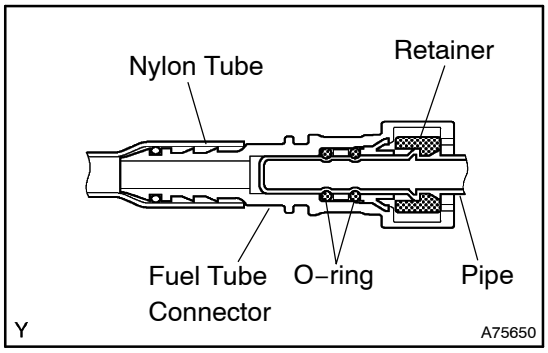


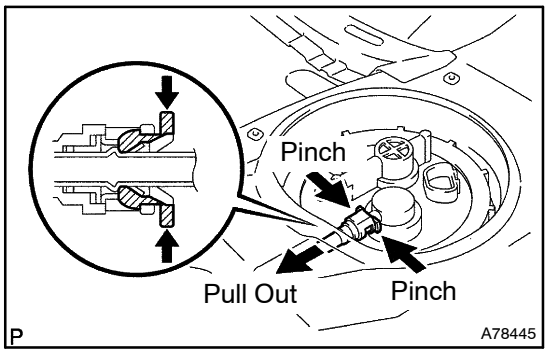
(a) Disconnect the fuel tank return tube.

(1) Remove the tube joint clip, then pull out the fuel tank return tube.

NOTICE:

- **Check around the fuel tube joint for any dirt or mud before this operation, then remove it if necessary.**
- **Be careful of mud because the fuel tube joint has an O–ring which seals the fuel tube joint and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube joint by covering it with a vinyl or plastic bag.**
- **When the fuel tube joint and pipe are stuck, push and pull the fuel tube joint to release, then pull the fuel tube joint out carefully.**



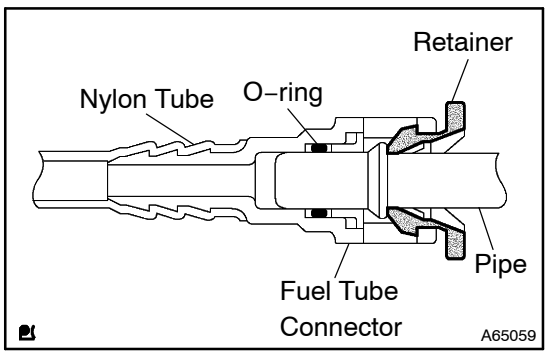


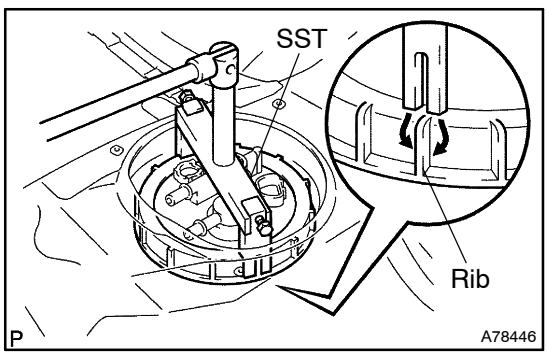
(b) Disconnect the fuel tank main tube.

(1) Pinch the retainer, then pull out the fuel tank main tube.

NOTICE:

- **Check around the fuel tube connector for any dirt or mud before this operation, then remove it if necessary.**
- **Be careful of mud because the fuel tube connector has an O–ring which seals the fuel tube connector and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube connector by covering it with a vinyl or plastic bag.**
- **When the fuel tube connector and pipe are stuck, push and pull the fuel tube connector to release, then pull the fuel tube connector out carefully.**





(c) Disconnect the fuel evaporation tube No. 2.

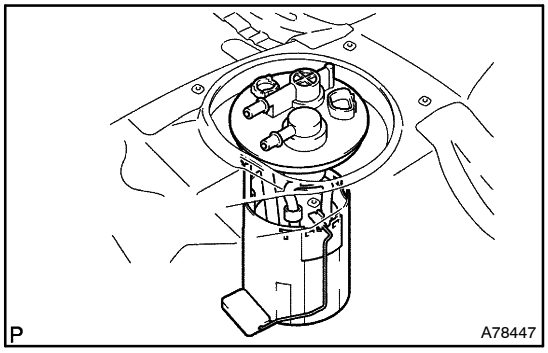
(1) Pinch the retainer, then pull out the fuel evaporation tube No. 2.

NOTICE:

- **Check around the fuel tube connector for any dirt or mud before this operation, then remove it if necessary.**
- **Be careful of mud because the fuel tube connector has an O–ring which seals the fuel tube connector and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube connector by covering it with a vinyl or plastic bag.**
- **When the fuel tube connector and pipe are stuck, push and pull the fuel tube connector to release, then pull the fuel tube connector out carefully.**

(d) Using SST, loosen the fuel pump gauge retainer.

SST 09808–14010



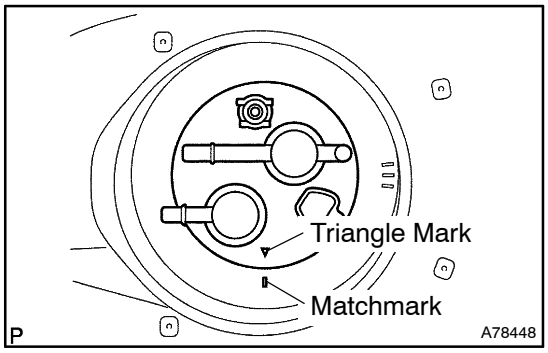
NOTICE:

Do not use other tools in this operation. Damage to the fuel pump gauge retainer and the fuel tank may result.

HINT:

A rib on the fuel pump gauge retainer can be fitted into a tip of the SST.

(e) Remove the fuel pump gauge retainer.



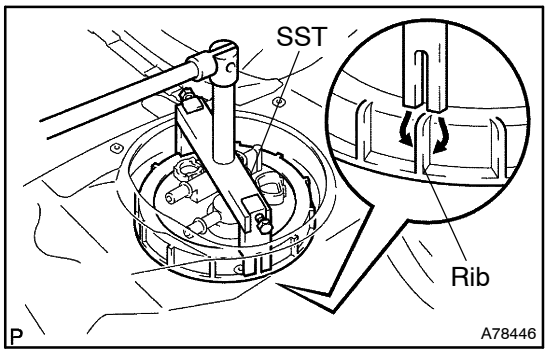
(f) Remove the fuel suction w/ pump & gauge tube.

NOTICE:

Be careful that the arm of the fuel sender gauge should not be bent.

(g) Remove the gasket from the fuel tank.

6. INSTALL FUEL SUCTION W/ PUMP & GAUGE TUBE ASSY



(a) Install a new gasket to the fuel tank.

(b) Install the fuel suction w/ pump & gauge tube.

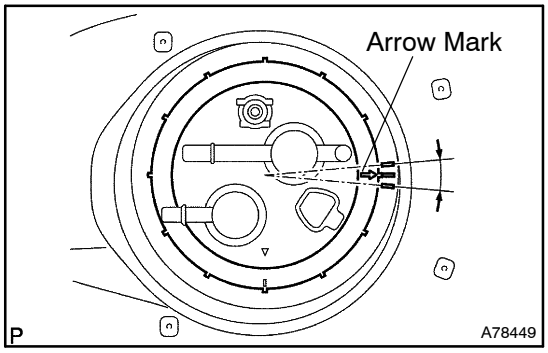
NOTICE:

Be careful that the arm of the fuel sender gauge should not be bent.

(c) Align the triangle mark of the fuel suction w/ pump & gauge tube with the matchmark location of the fuel tank.

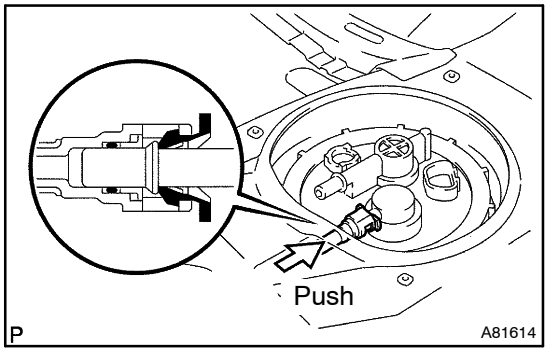
(d) Temporarily install the fuel pump gauge retainer.

(e) Using SST, tighten the fuel pump gauge retainer until the arrow mark is aligned with the center mark on the fuel tank.



SST 09808–14010

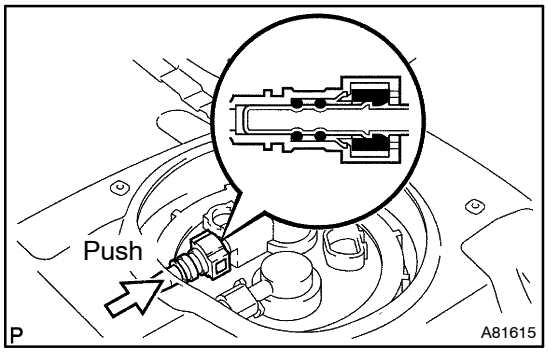
NOTICE:



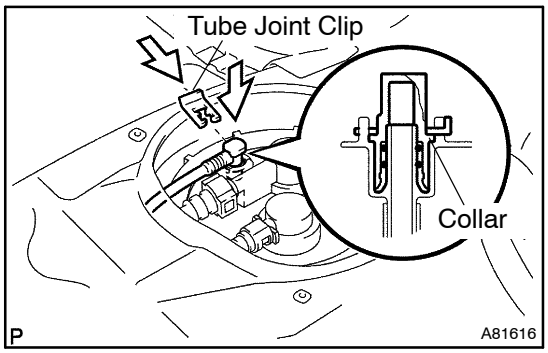
Do not use other tools in this operation. Damage to the fuel pump gauge retainer and the fuel tank may result.

HINT:

A rib on the fuel pump gauge retainer can be fitted into a tip of the SST.



(f) Check that the arrow mark and center mark are aligned as shown in the illustration.



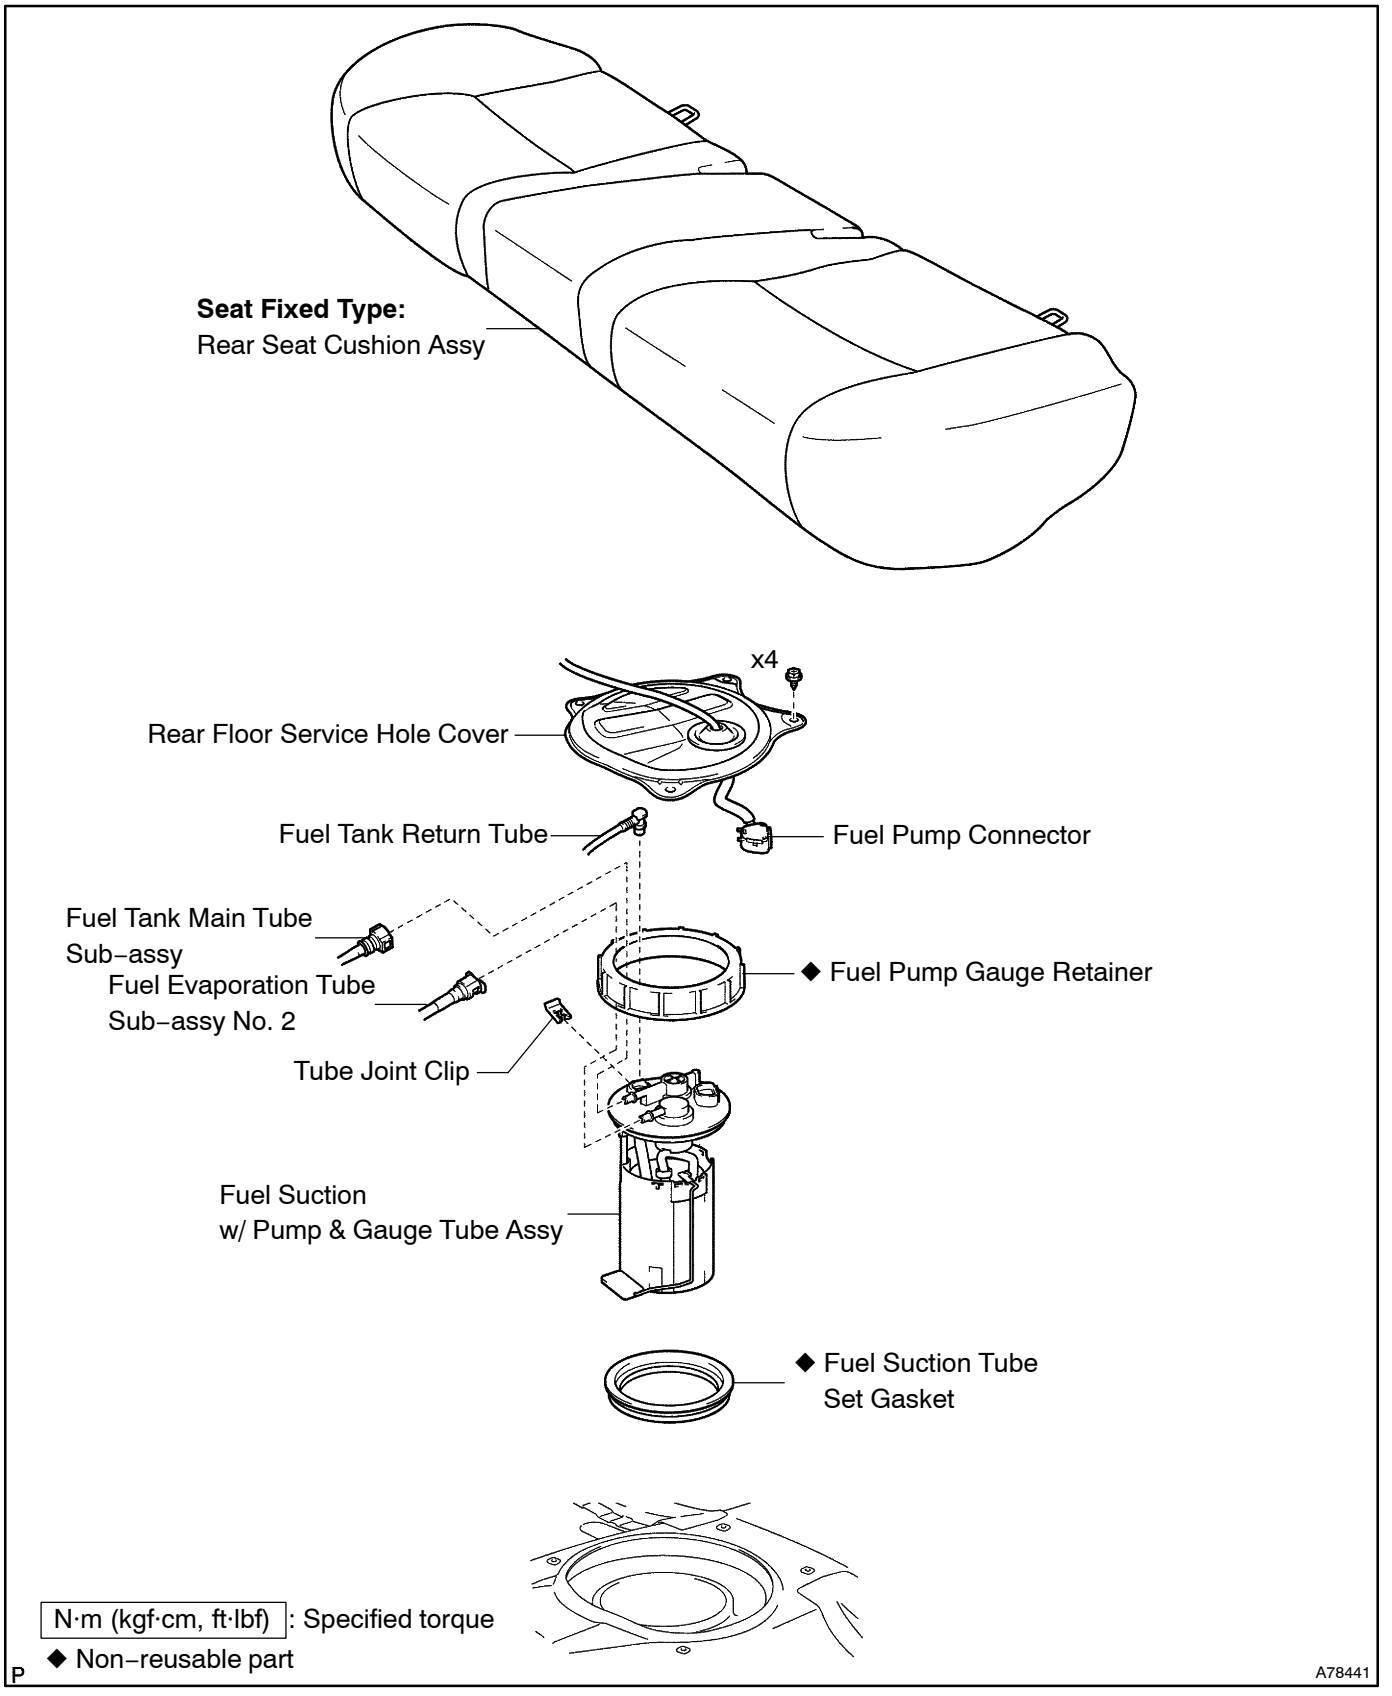
(g) Connect the fuel tank evaporation tube No. 2.
(1) Push in the fuel tube connector to the pipe until fuel tube connector makes ”click” sound.

NOTICE:
- **Check the connected part for any damage or foreign objects.**
- **After connecting, check if the fuel tube connector and pipe are securely connected by pulling on them.**

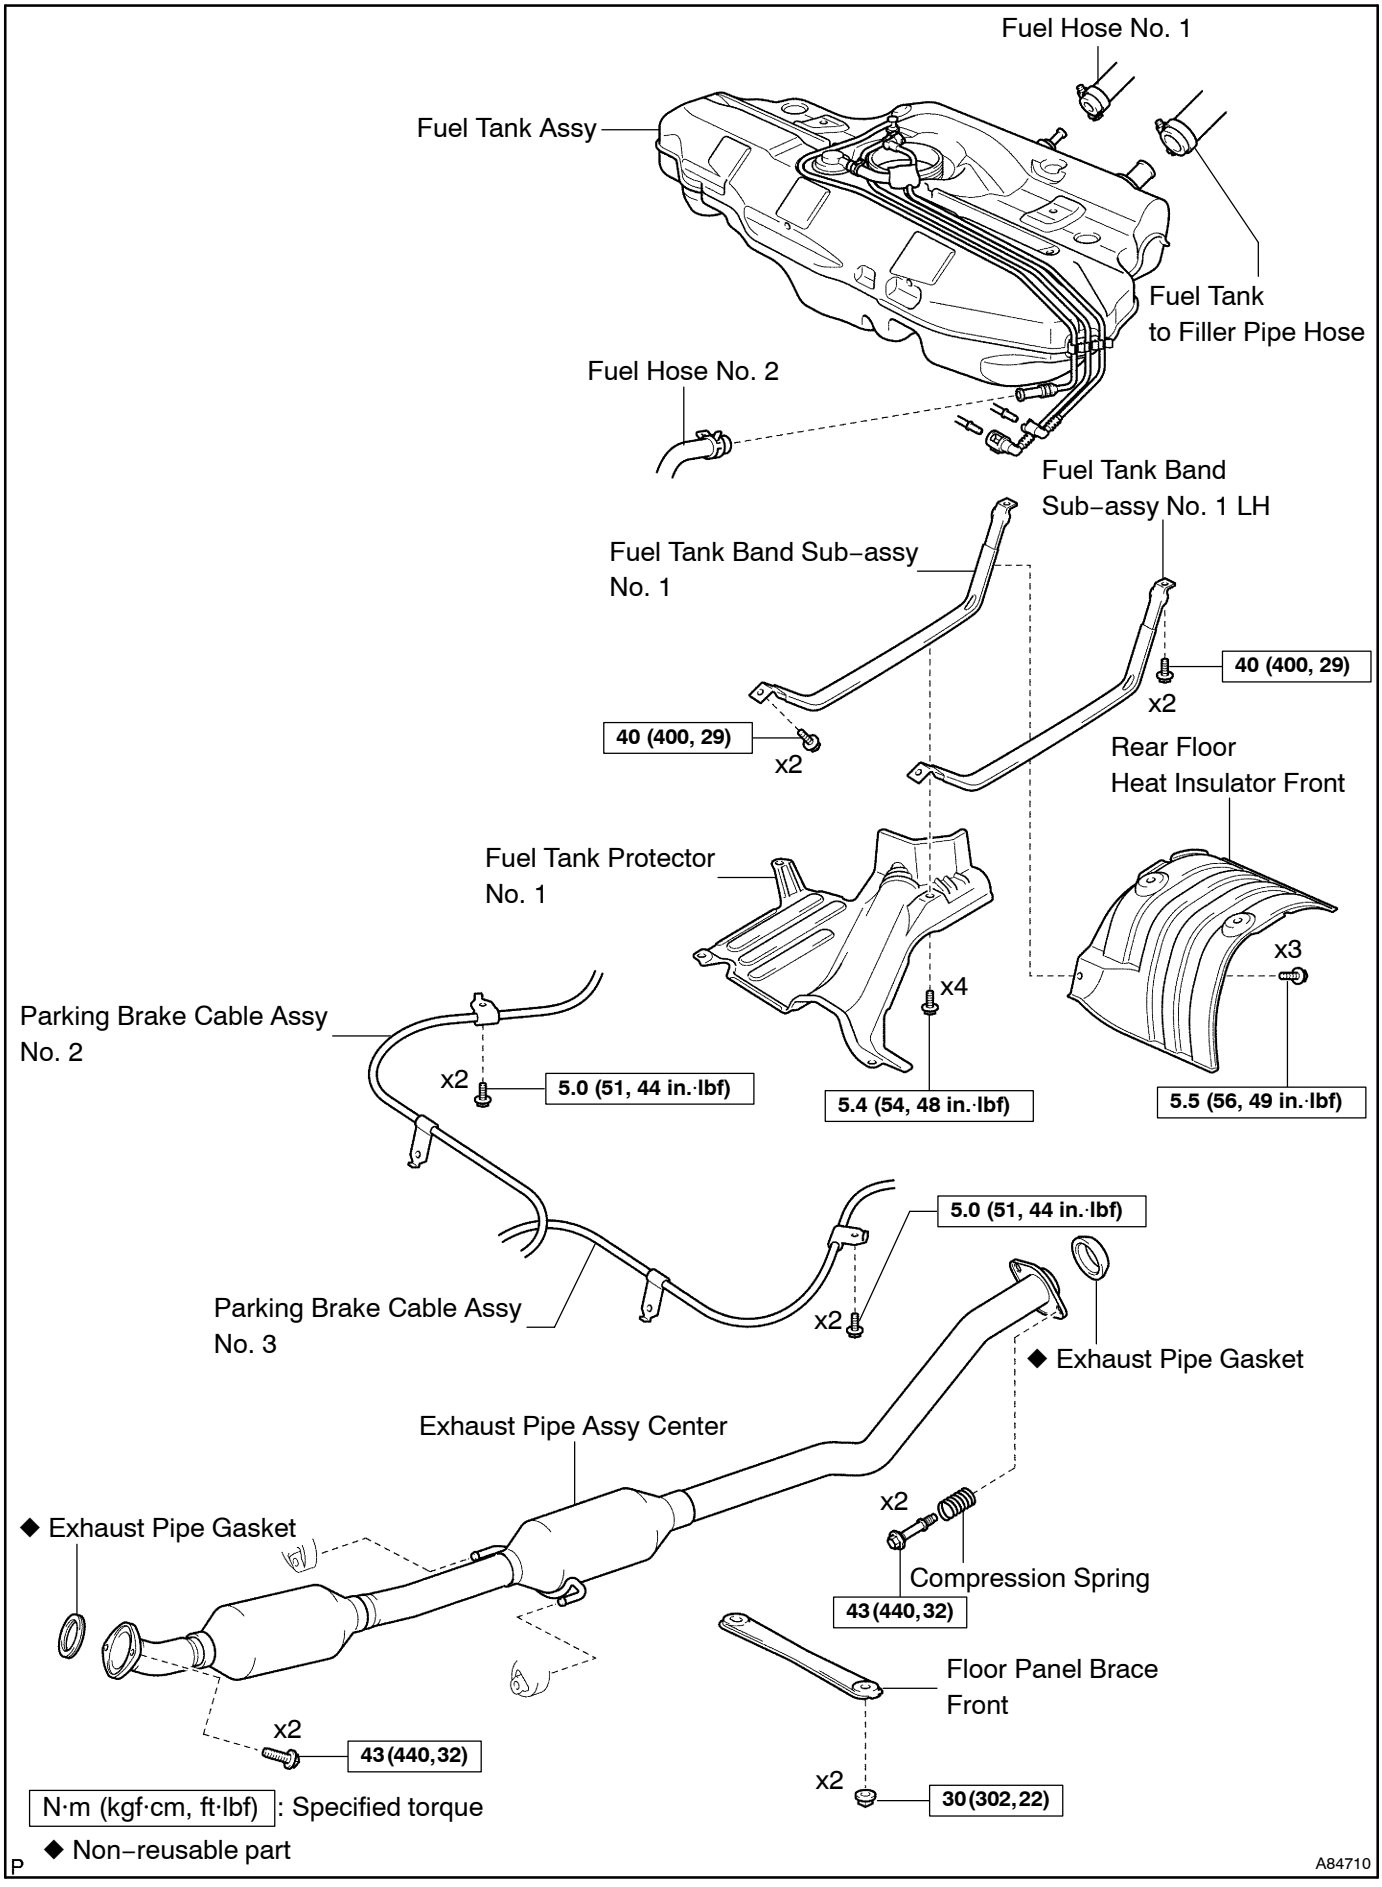
(h) Connect the fuel tank main tube.
(1) Push in the fuel tube connector to the pipe until fuel tube connector makes ”click” sound.

NOTICE:
- **Check the connected part for any damage or foreign objects.**
- **After connecting, check if the fuel tube connector and pipe are securely connected by pulling on them.**

(i) Connect the fuel tank return tube.
(1) Install the fuel tube joint to the plug with the tube joint clip.



NOTICE:
- **Check the connecting part for scratch or foreign objects.**
- **Check that the fuel tube joint is inserted securely.**
- **Check that the tube joint clip is on the collar of the fuel tube joint.**
- **After installing the tube joint clip, check that the fuel tube joint has not been pulled off.**



7. CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)
8. CHECK FOR FUEL LEAKS (See page 11–4)
9. INSTALL REAR FLOOR SERVICE HOLE COVER
10. INSTALL REAR SEAT CUSHION ASSY (SEAT FIXED TYPE) (See Pub. No. RM1018E, page 72–32)

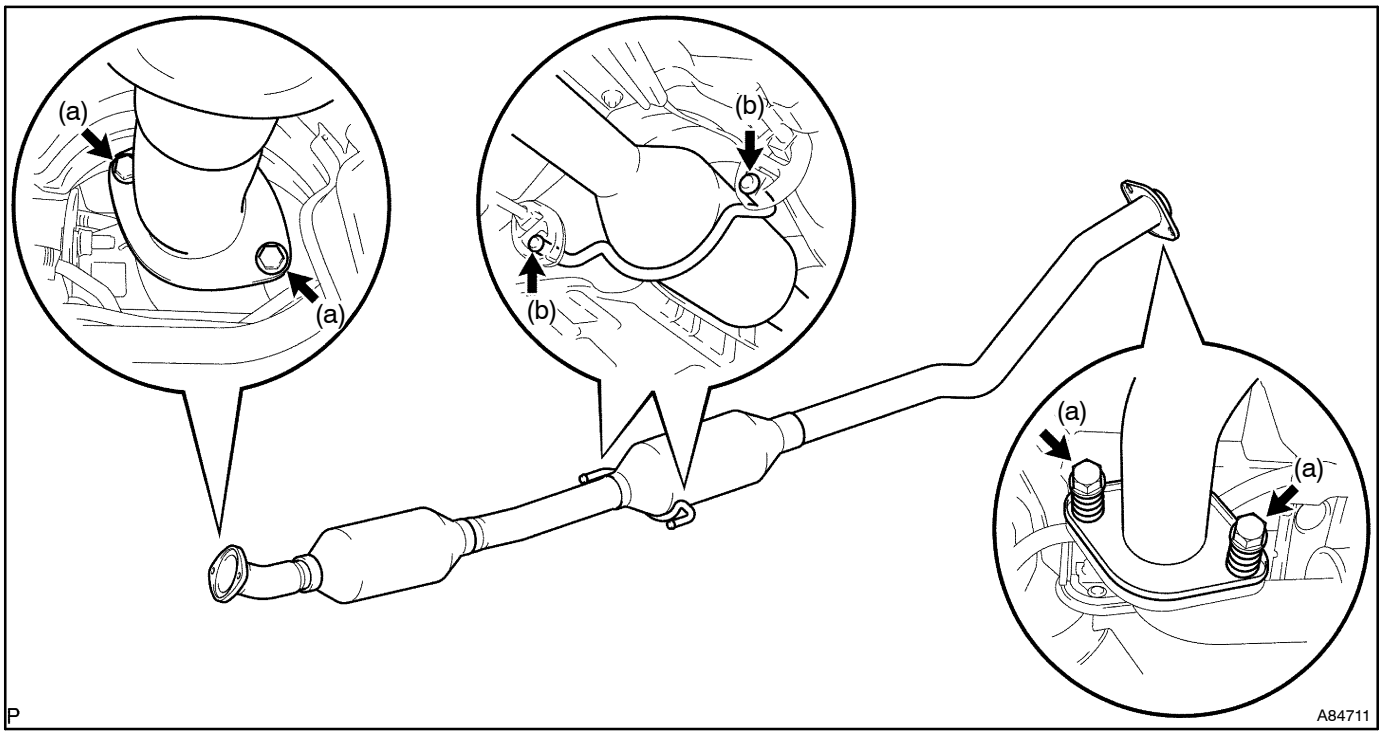
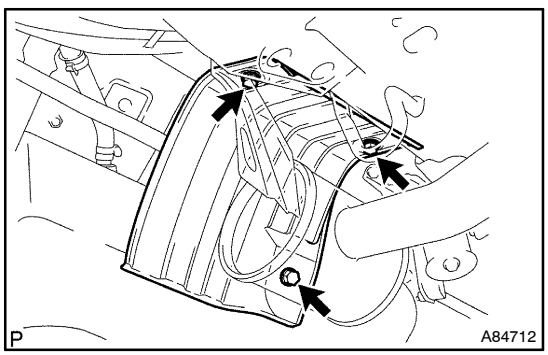
Removal & Installation and Disassembly & Reassembly



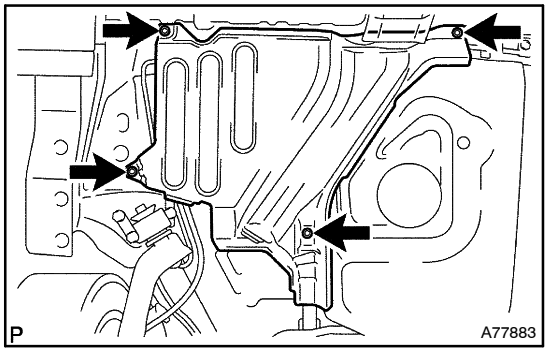
1. **DISCHARGE FUEL SYSTEM PRESSURE (See page 11–1)**
2. **DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
3. **REMOVE REAR SEAT CUSHION ASSY (SEAT FIXED TYPE)**
   (See Pub. No. RM1018E, page 72–32)
4. **REMOVE REAR FLOOR SERVICE HOLE COVER (See page 11–29)**
5. **REMOVE FUEL SUCTION W/ PUMP & GAUGE TUBE ASSY (See page 11–29)**
   SST 09808–14010
6. **DRAIN FUEL**
7. **REMOVE FLOOR PANEL BRACE FRONT (See page 15–2)**



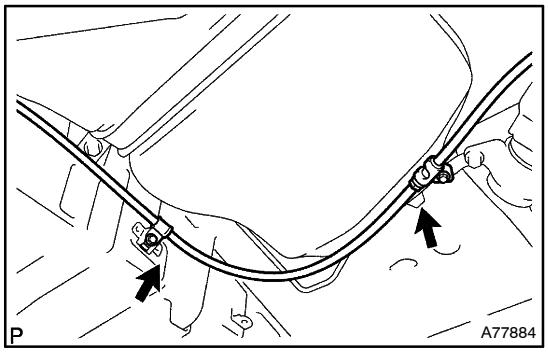
8. **REMOVE EXHAUST PIPE ASSY CENTER**

(a) Remove the 4 bolts and 2 compression springs.

(b) Remove the exhaust pipe center and gasket from the 2 exhaust pipe supports.

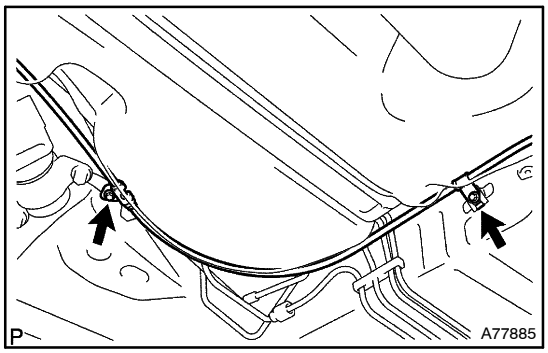


(c) Remove the gasket from the exhaust pipe center.



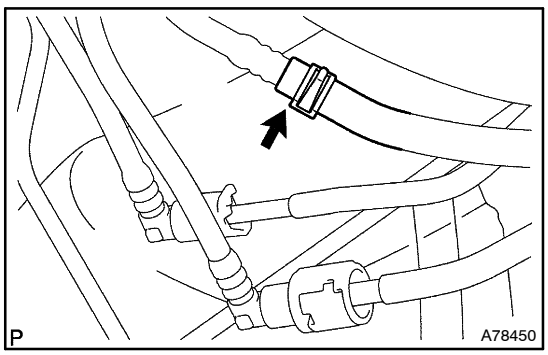
9. **REMOVE REAR FLOOR HEAT INSULATOR FRONT**

(a) Remove the 3 bolts, then remove the rear floor heat insulator front.



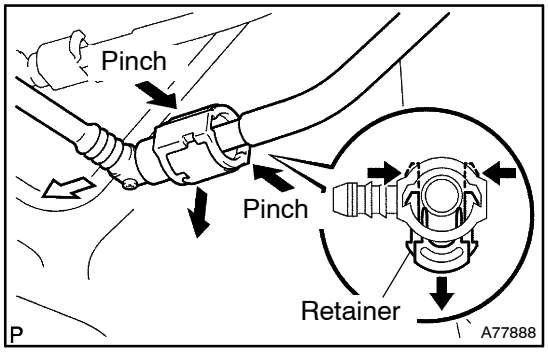
10. REMOVE FUEL TANK PROTECTOR NO.1

(a) Remove the 4 bolts, then remove the fuel tank protector.



11. DISCONNECT PARKING BRAKE CABLE ASSY NO.2

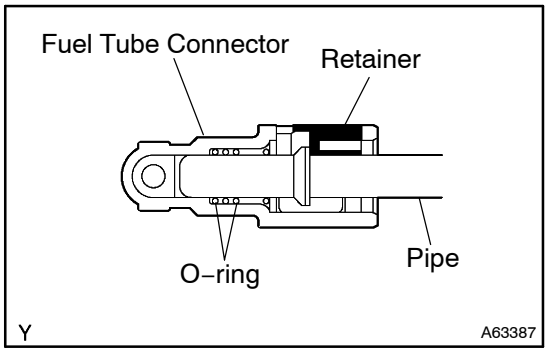
(a) Remove the 2 bolts, then disconnect the parking brake cable No. 2.



12. DISCONNECT PARKING BRAKE CABLE ASSY NO.3

(a) Remove the 2 bolts, then disconnect the parking brake cable No. 3.

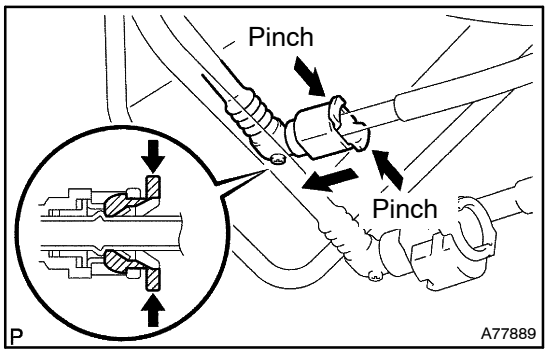
13. REMOVE FUEL TANK ASSY



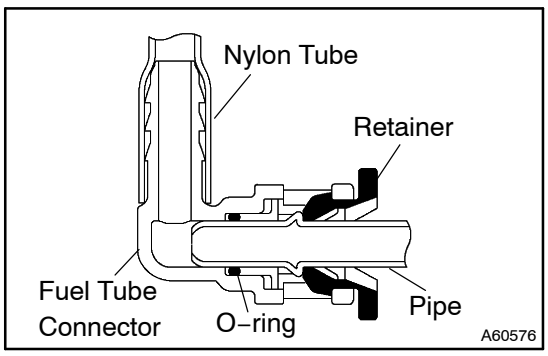
(a) Disconnect the fuel hose No. 2 from the fuel tank return tube.

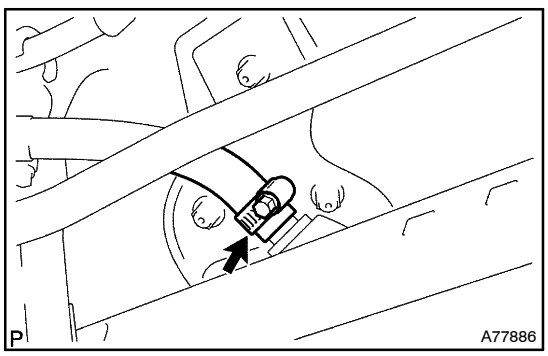
(b) Disconnect the fuel tank main tube.
(1) Pinch the tab of the retainer of the fuel tube connector to remove the lock claws and pull down it as shown in the illustration.
(2) Pull out the fuel tank main tube.

NOTICE:



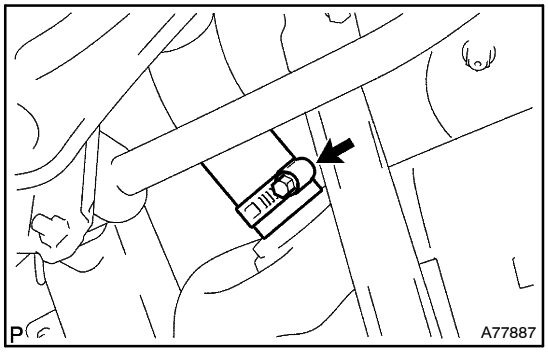
- **Check around the fuel tube connector for any dirt or mud before this operation, then remove it if necessary.**
- **Be careful of mud because the fuel tube connector has an O–ring which seals the fuel tube connector and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube connector by covering it with a vinyl or plastic bag.**
- **When the fuel tube connector and pipe are stuck, push and pull the fuel tube connector to release, then pull out the fuel tube connector from the pipe.**



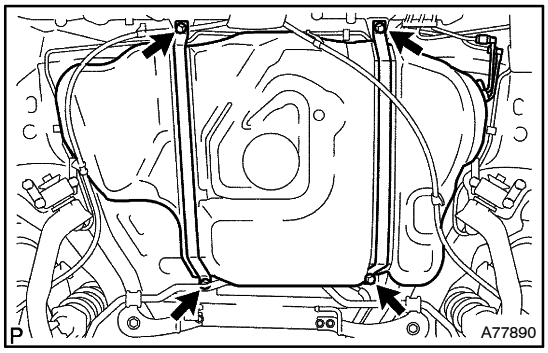


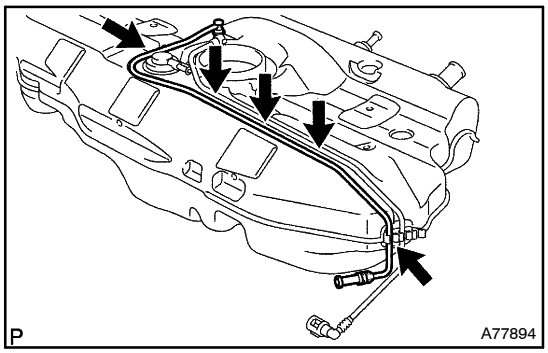
(c) Disconnect the fuel evaporation tube No. 2
(1) Pinch the retainer of the fuel tube connector, then pull out the fuel evaporation tube No. 2.

NOTICE:



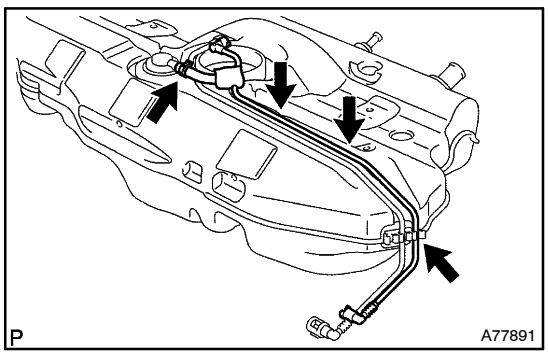
- **Check around the fuel tube connector for any dirt or mud before this operation, then remove it if necessary.**
- **Be careful of mud because the fuel tube connector has an O–ring which seals the fuel tube connector and pipe that can be contaminated.**
- **Do not use any tool in this operation.**
- **Do not bend or twist the nylon tube. Protect the fuel tube connector by covering it with a vinyl or plastic bag.**
- **When the fuel tube connector and pipe are stuck, push and pull the fuel tube connector to release, then pull out the fuel tube connector from the pipe.**



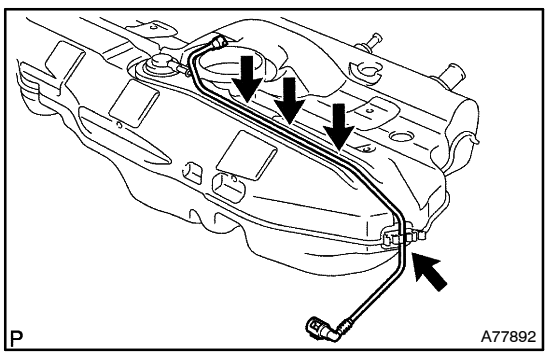


(d) Loosen the hose clamp, then disconnect the breather tube fuel hose.

(e) Loosen the hose clamp, then disconnect the fuel tank to filler pipe hose.



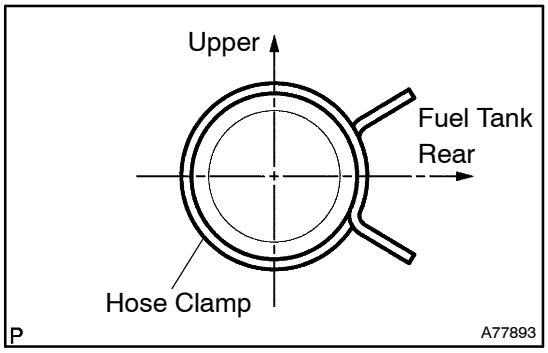
(f) Set a transmission jack to the fuel tank.
(g) Remove the 4 bolts, then remove the 2 fuel tank bands.
(h) Operate the transmission jack, then remove the fuel tank.



14. REMOVE FUEL TANK RETURN TUBE

(a) Unfasten the 5 claws, then remove the fuel tank return tube.

15. REMOVE FUEL EVAPORATION TUBE SUB–ASSY NO.2



(a) Unfasten the 3 claws and disconnect the fuel hose, then remove the fuel evaporation tube.

16. REMOVE FUEL TANK MAIN TUBE SUB–ASSY

(a) Unfasten the 4 claws, then remove the fuel tank main tube from the fuel tank.

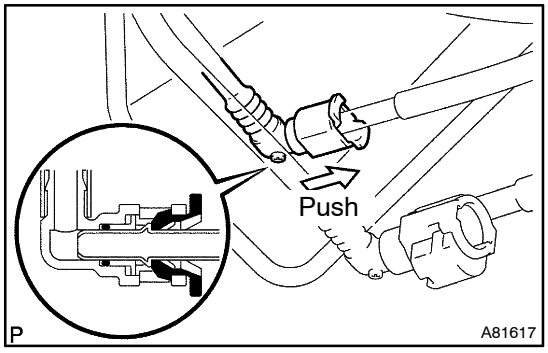
17. INSTALL FUEL TANK MAIN TUBE SUB–ASSY

18. INSTALL FUEL EVAPORATION TUBE SUB–ASSY NO.2

(a) Install the hose clamp as shown in the illustration.

19. INSTALL FUEL TANK RETURN TUBE

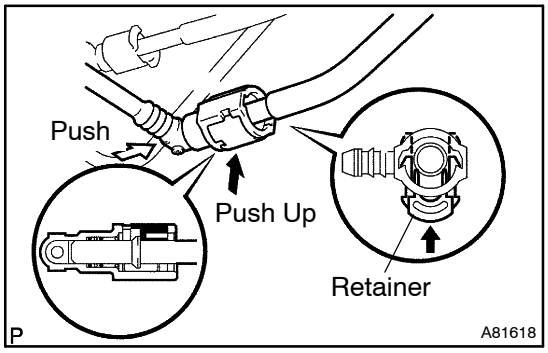
20. INSTALL FUEL TANK ASSY



(a) Set the fuel tank to a transmission jack.

(b) Operate the transmission jack, then install the fuel tank.

(c) Install the 2 fuel tank bands with the 4 bolts.
Torque: 40 N·m (400 kgf·cm, 29 ft·lbf)



(d) Connect the fuel tank to filler pipe hose to the fuel tank.

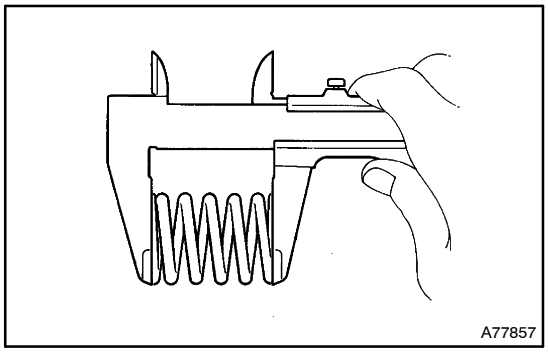
(e) Connect the breather tube fuel hose to the fuel tank.

(f) Connect the fuel evaporation tube No. 2.
(1) Push in the fuel tube connector to the pipe until fuel tube connector makes ”click” sound.

NOTICE:
- **Check the connected part for any damage or foreign objects.**
- **After connecting, check that the fuel tube connector and pipe are securely connected by pulling on them.**

(g) Connect the fuel tank main tube.
(1) Push in the fuel tube connector to the pipe until fuel tube connector makes ”click” sound, then push up the retainer to the claws lock.

NOTICE:
- **Check the connected part for any damage or foreign objects.**
- **After connecting, check that the fuel tube connector and pipe are securely connected by pulling on them.**



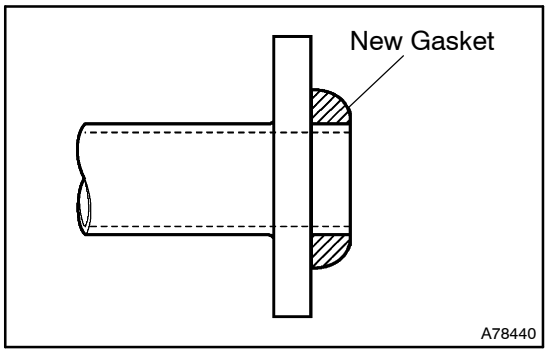
(h) Connect the fuel hose No. 2 to the fuel tank return tube.

21. CONNECT PARKING BRAKE CABLE ASSY NO.3
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)

22. CONNECT PARKING BRAKE CABLE ASSY NO.2
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)

23. INSTALL FUEL TANK PROTECTOR NO.1
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

24. INSTALL REAR FLOOR HEAT INSULATOR FRONT
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)



25. INSTALL EXHAUST PIPE ASSY CENTER

(a) Inspect the free length.

(1) Using vernier calipers, measure the free length of the compression spring.

Minimum length: 38.5 mm (1.516 in.)

If the free length is less than minimum, replace the compression spring.

(b) Install a new gasket to the exhaust pipe center (exhaust pipe tail side) as shown in the illustration.

(c) Install a new gasket (exhaust pipe front side) and the exhaust pipe center to the 2 exhaust pipe supports.

(d) Tighten the 2 compression springs and 4 bolts.
Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

26. ADD FUEL

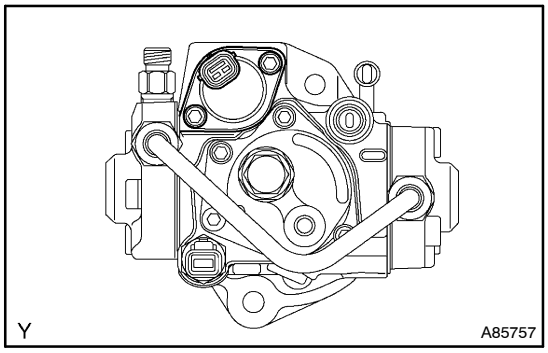
27. INSTALL FUEL SUCTION W/ PUMP & GAUGE TUBE ASSY (See page 11–29)
SST 09808–14010

28. CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

29. CHECK FOR FUEL LEAKS (See page 11–4)

30. CHECK FOR EXHAUST GAS LEAKS

31. INSTALL FLOOR PANEL BRACE FRONT (See page 15–2)



32. INSTALL REAR FLOOR SERVICE HOLE COVER (See page 11–29)

33. INSTALL REAR SEAT CUSHION ASSY (SEAT FIXED TYPE) (See Pub. No. RM1018E, page 72–32)

FUEL SYSTEM (1CD–FTV)(From September, 2003)

1111C–01

INSPECTION

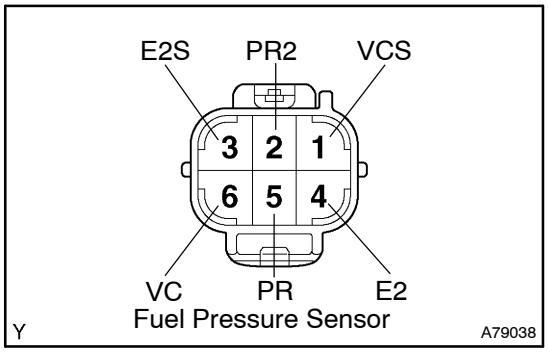
1. INSPECT INJECTION OR SUPPLY PUMP ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance: 1.6 to 2.6 Ω at 20°C (68°F)

If the result is not as specified, replace the supply pump assembly.



2. INSPECT INJECTOR ASSY

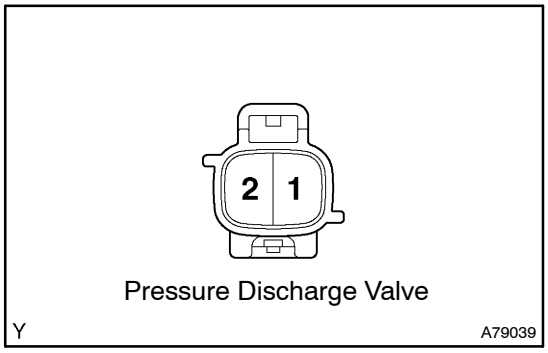
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance: 0.45 to 1.45 Ω at 20°C (68°F)

If the result is not as specified, replace the injector assembly.

3. INSPECT COMMON RAIL ASSY



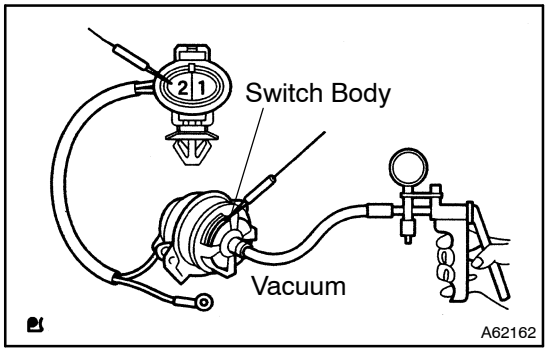
(a) Inspect the resistance of the fuel pressure sensor.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:

Tester Connection	Specified Condition
5 (PR) – 4 (E2)	16.4 kΩ or less
2 (PR2) – 3 (E2S)	16.4 kΩ or less
6 (VC) – 5 (PR)	3 kΩ or less
1 (VCS) – 2 (PR2)	3 kΩ or less

If the result is not as specified, replace the common rail assembly.



(b) Inspect the resistance of the pressure discharge valve.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance: 0.45 to 1.45 Ω at 20°C (68°F)

If the result is not as specified, replace the common rail assembly.

4. INSPECT FUEL HEATER ASSY

(a) Inspect the resistance.

(1) Apply vacuum of 34.7 ± 5.3 kPa (260 ± 40 mmHg, 10.24 ± 1.57 in Hg) to the vacuum switch port.

(2) Using an ohmmeter, measure the resistance between terminal 2 and the switch body.

Resistance: 0.5 to 20 Ω at 20°C (68°F)

If the result is not as specified, replace the fuel heater assembly.

5. INSPECT LEVEL WARNING SWITCH

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Specified condition:

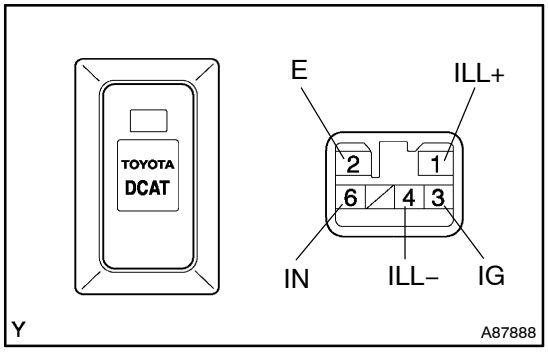
When raising the float: Below 1 Ω

When letting the float down: 10 kΩ or higher

If the result is not as specified, replace the level warning switch.

6. INSPECT FUEL TEMPERATURE SENSOR

(a) Inspect the resistance.



(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:

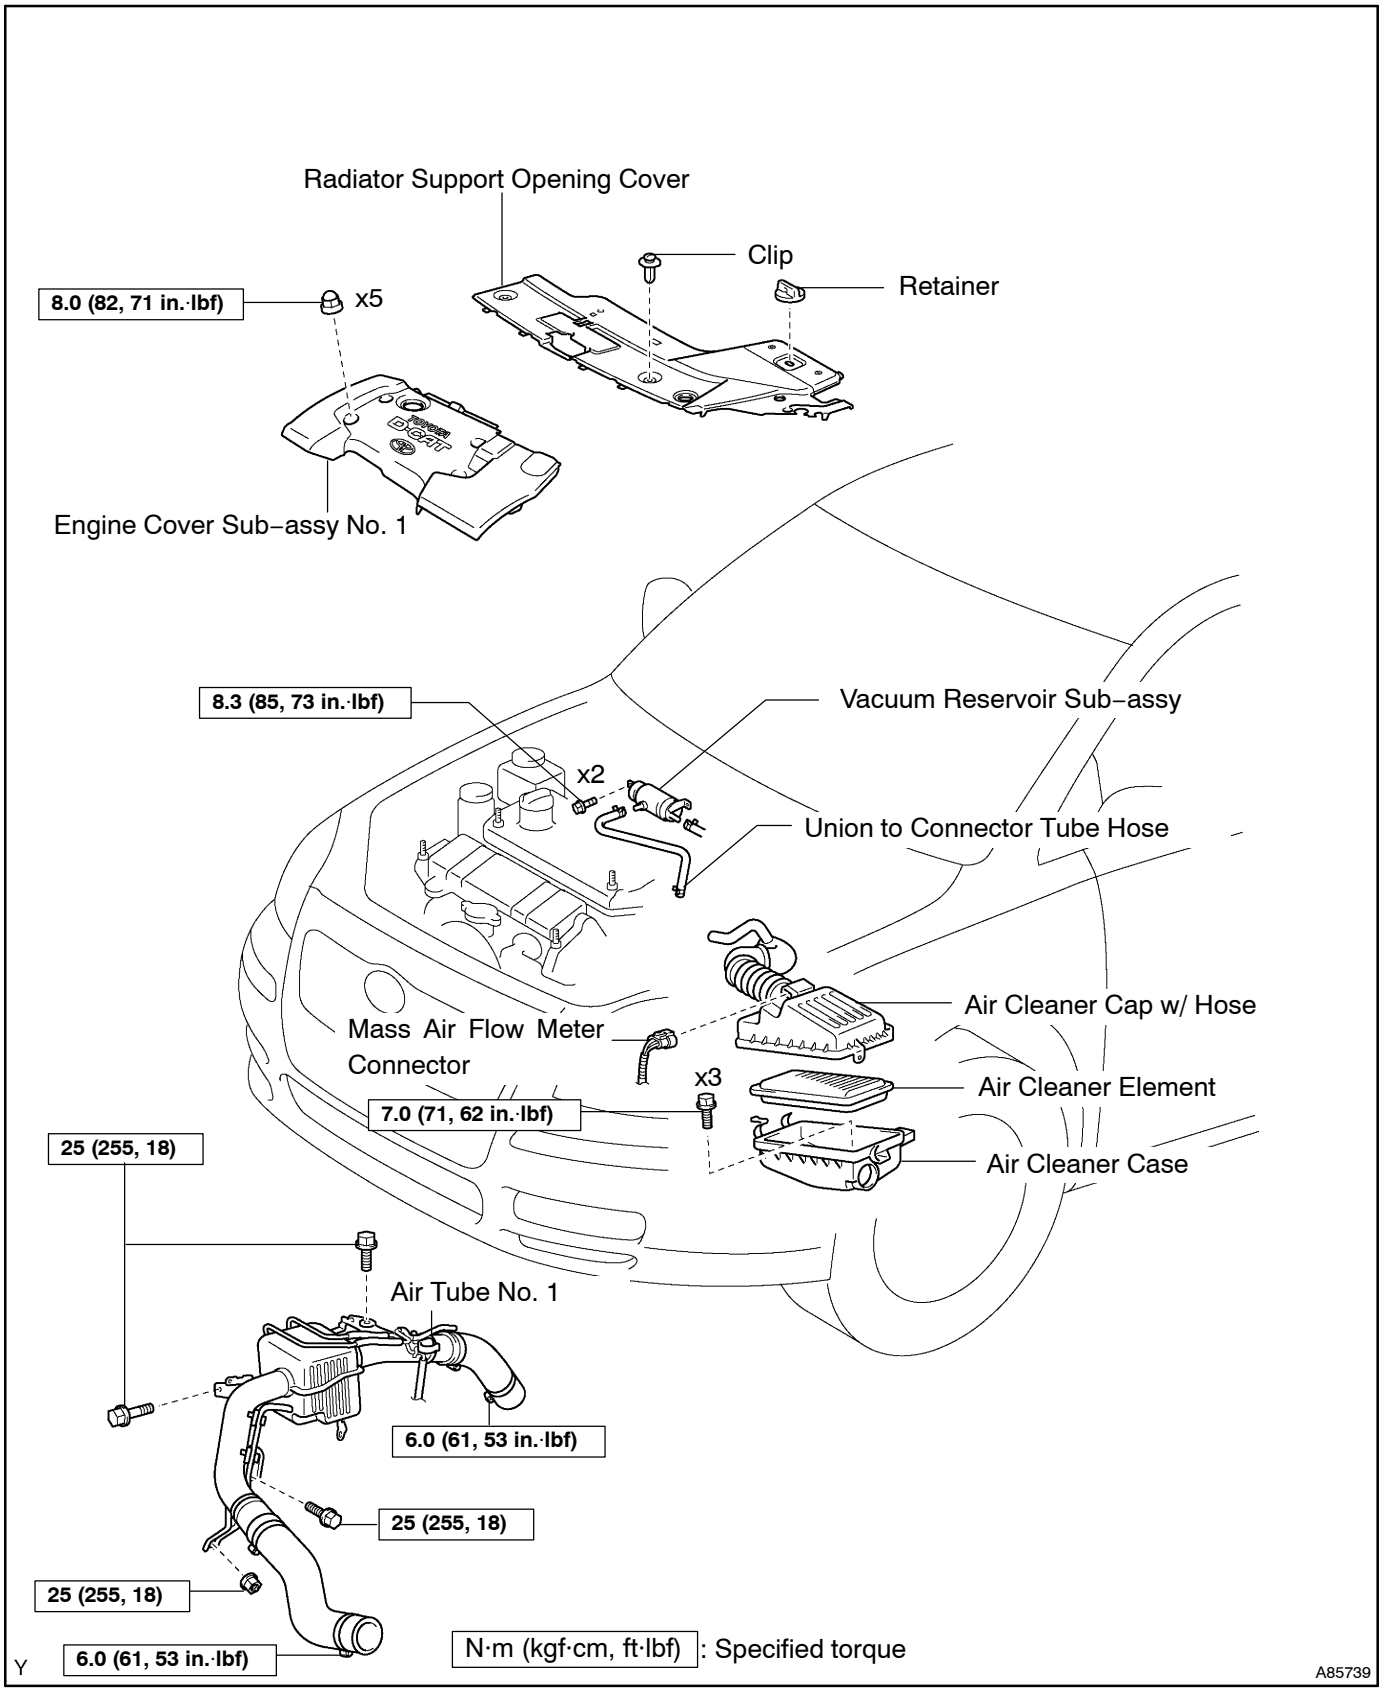
2.21 to 2.69 Ω at 20°C (68°F)

0.287 to 0.349 Ω at 80°C (176°F)

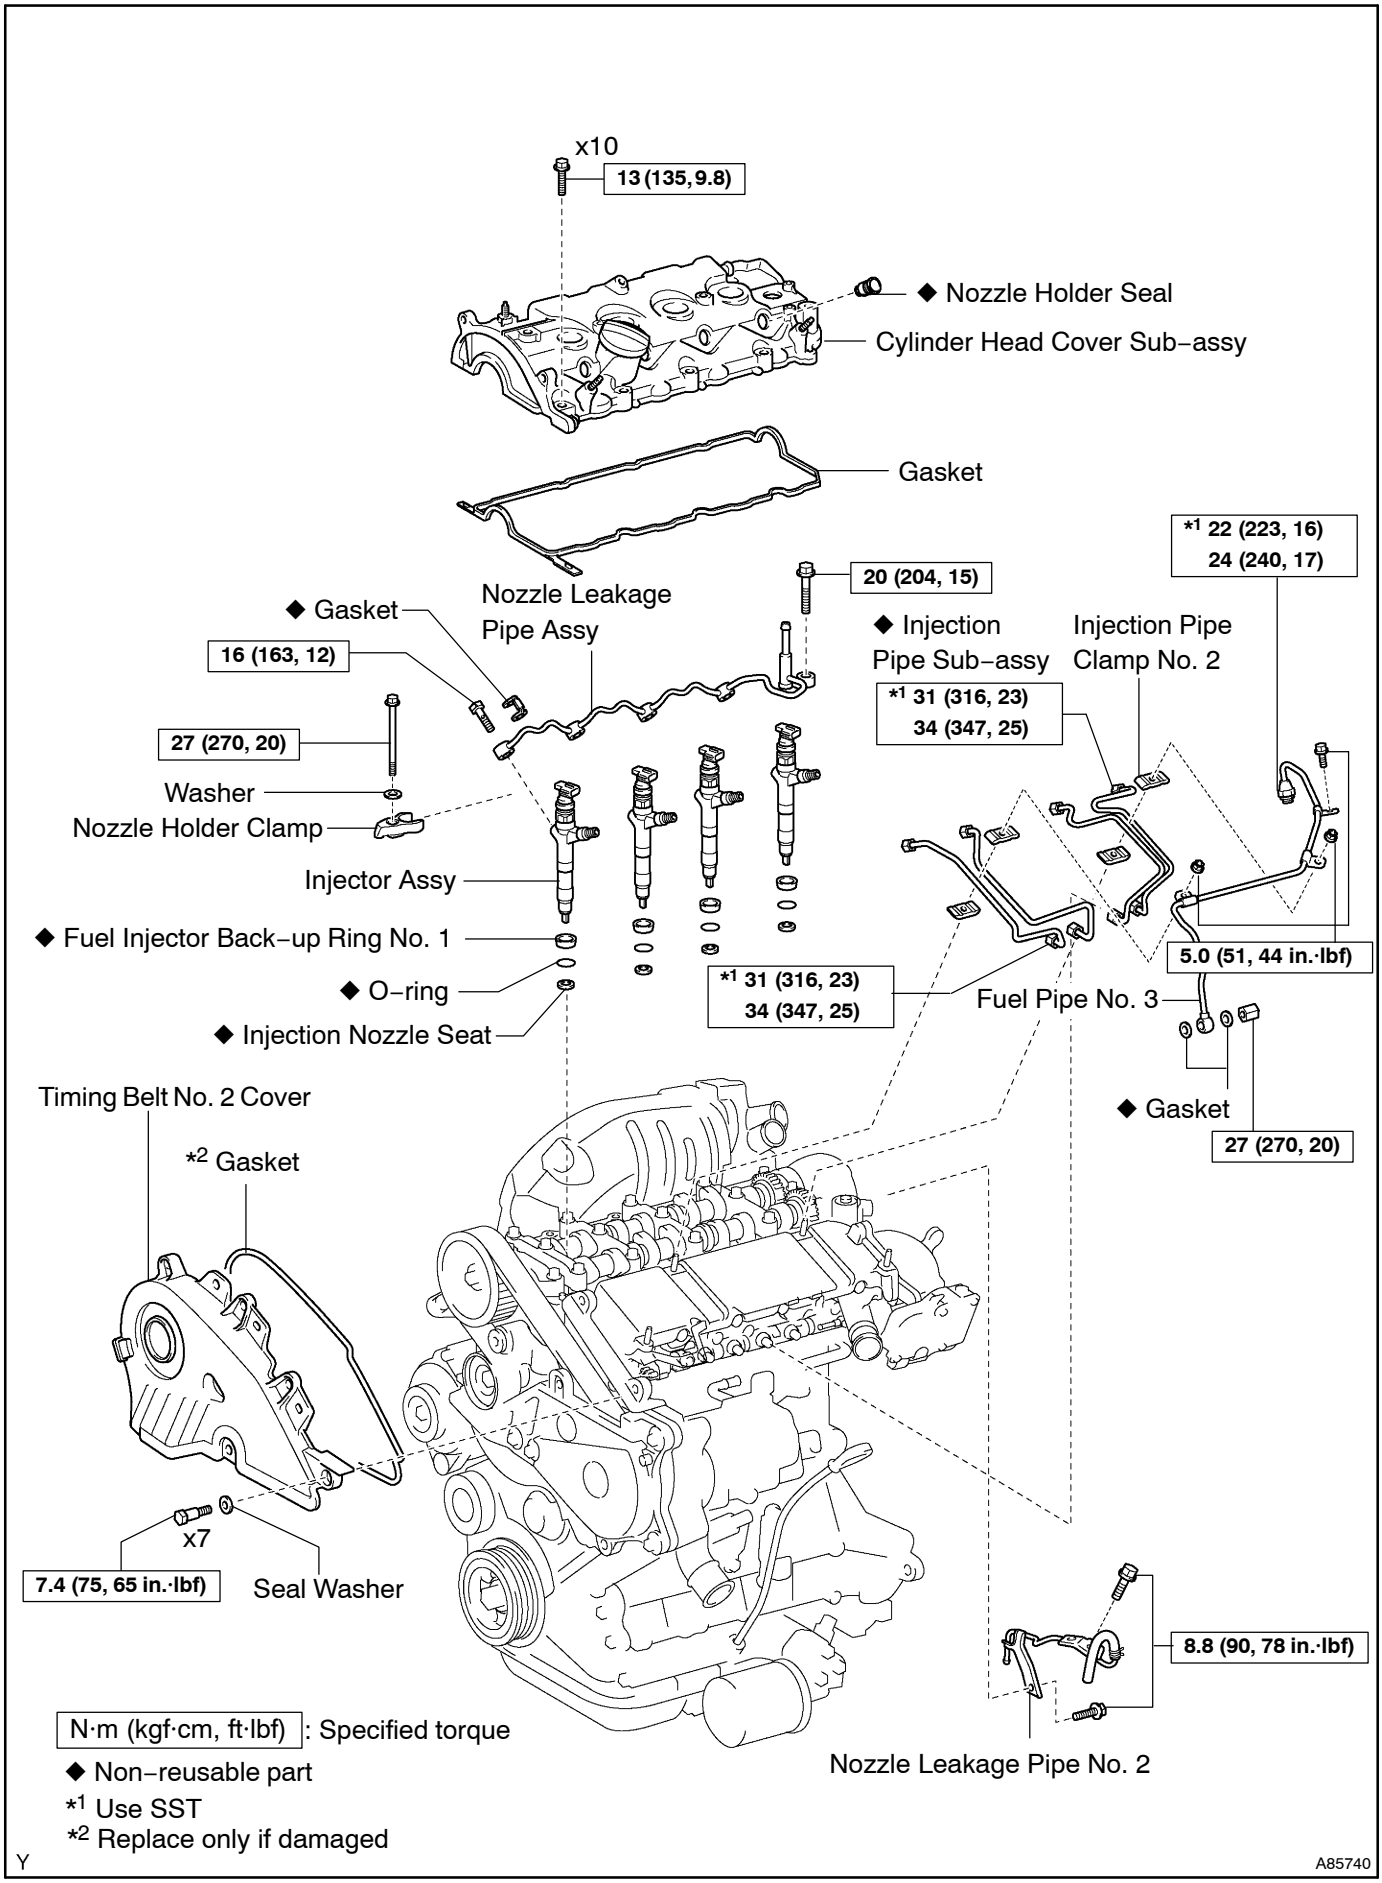
If the result is not as specified, replace the fuel temperature sensor.

7. INSPECT FUEL CONTROL SWITCH

(a) Inspect the resistance.



Switch Position	Tester Connection	Specified Condition
Switch OFF	2 – 6	Below 1 Ω
Switch ON	2 – 3 – 6	Below 1 Ω
Illumination circuit	1 – 4	Below 1 Ω



If the result is not as specified, replace the fuel control switch.

REPLACEMENT

NOTICE:

If an incorrect injector compensation code was registered with the ECM, it may rattle the engine assembly or the engine idling may become rough. In addition, it may become a cause of engine failure or shorten the life of the engine.

HINT:

- In order to optimize the injector's fuel injection characteristic, the ECM compensates the injection duration by each cylinder. The ECM stores and uses compensating data in the form of a 30–digit–alphanumeric value that is imprinted on the head portion of each injector as the injector compensation code.
- If you installed a new injector, its own injector compensation code is needed to register with the ECM. Also, if you replaced the ECM, the compensation codes of all the injectors are needed to register because the new ECM does not have the codes until they are registered.
- Once the ECM is replaced, DTC P1601 will be present when turning the ignition switch to ON. This is to inform you that the injector compensation codes are required to register with the ECM. In order to clear the DTC, register the compensation codes first, then turn the ignition switch to OFF and wait for 30 seconds or longer.

1. REMOVE VACUUM RESERVOIR SUB–ASSY

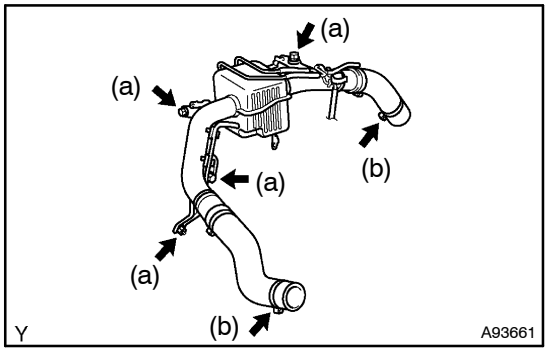
(a) Disconnect the 2 vacuum hoses and connector.

(b) Remove the 2 bolts and vacuum reservoir.

2. REMOVE RADIATOR SUPPORT OPENING COVER

3. REMOVE ENGINE COVER SUB–ASSY NO.1

(a) Remove the 5 nuts and engine cover.

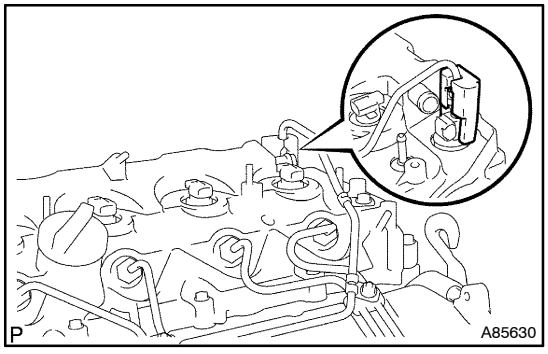


4. REMOVE AIR CLEANER ASSY

(a) Disconnect the connector.

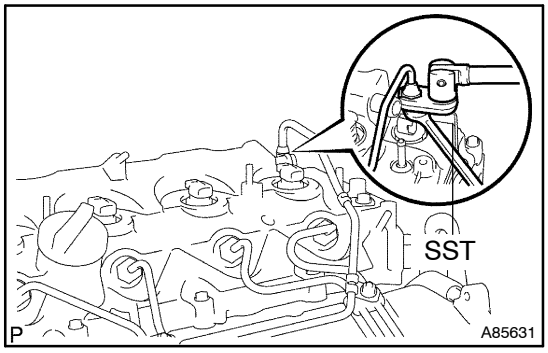
(b) Remove the air cleaner cap together with the air cleaner hose.

(c) Remove the air cleaner filter element.



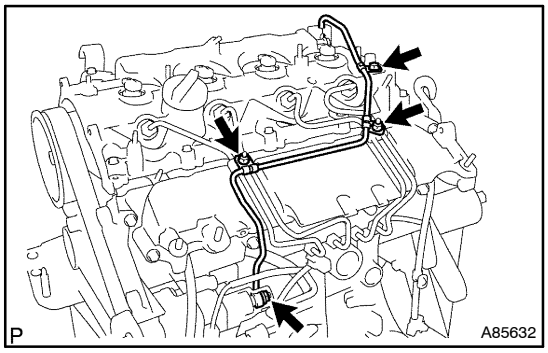
(d) Remove the 3 bolts and air cleaner case.

5. REMOVE AIR TUBE NO.1

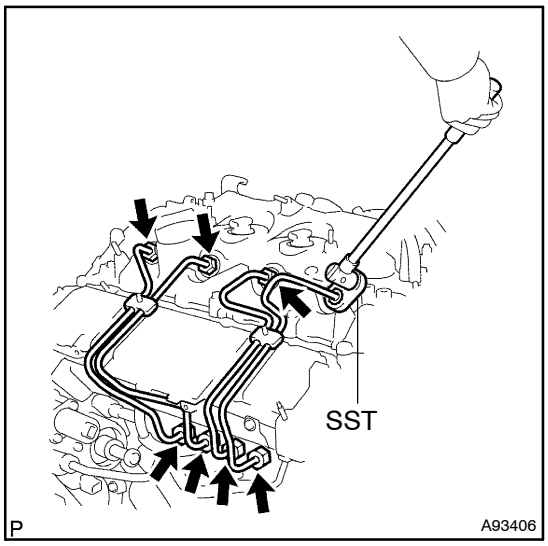


(a) Remove the 3 bolts and nut, then separate the air tube No. 1.

(b) Loosen the hose clamp bolts.



6. REMOVE FUEL PIPE NO.3



(a) Remove the fuel pipe insulator.

(b) Hold the hexagonal lobe of the exhaust fuel addition injector assembly first. Using SST, remove the fuel pipe No. 3 from the injector side.
SST 09023–12700

(c) Remove the bolt and 3 nuts, then remove the fuel pipe No. 3 and 2 gaskets.

7. REMOVE INJECTION PIPE SUB–ASSY NO.1

(a) Remove the 2 nuts and 2 upper infection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

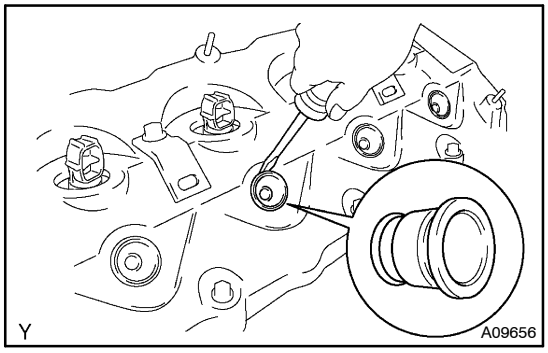
(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

(d) After removing the fuel pipe, to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

8. REMOVE INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

9. REMOVE INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700



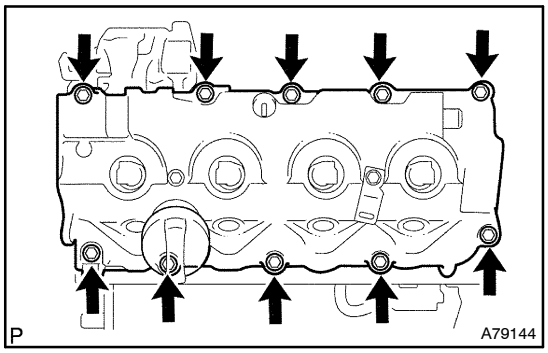
HINT:
Perform the same procedures as the injection pipe No. 1.

10. REMOVE INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

11. REMOVE TIMING BELT NO.2 COVER

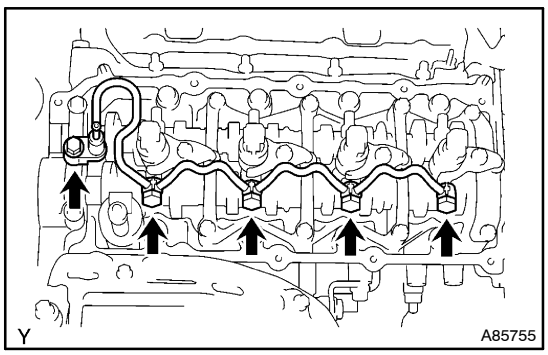
(a) Remove the 7 bolts and 7 seal washers, then remove the timing belt cover.



12. REMOVE NOZZLE HOLDER SEAL

(a) Using a screwdriver, pry out the 4 nozzle holder seals.

13. REMOVE NOZZLE LEAKAGE PIPE NO.2



(a) Disconnect the 2 fuel hoses from the nozzle leakage pipe No. 2.

(b) Remove the 2 bolts and nozzle leakage pipe No. 2.

14. REMOVE CYLINDER HEAD COVER SUB–ASSY

(a) Remove the 10 bolts and cylinder head cover.

15. REMOVE NOZZLE LEAKAGE PIPE ASSY

(a) Remove the bolt and 4 hollow screws, then remove the nozzle leakage pipe and 4 gaskets.

NOTICE:

When removing the nozzle leakage pipe, place a shop rag under the pipe to protect the cylinder head from the fuel remaining inside the pipe.

16. REMOVE NOZZLE HOLDER CLAMP

(a) Remove the 4 bolts, 4 washers and 4 nozzle holder clamps.

17. REMOVE INJECTOR ASSY

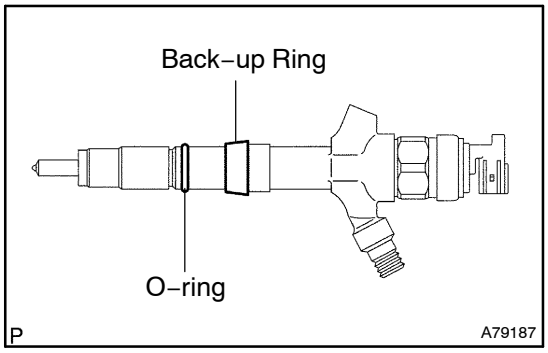
HINT:

Each injector assembly has its own fuel injection characteristic. When replacing the injector assembly, store them in the correct order so that they can be returned to the original locations when reassembling.

(a) Remove the 4 injectors from the cylinder head.

(b) Remove the O–rings and back–up rings from each injector.

(c) Remove the 4 nozzle seats from the cylinder head.

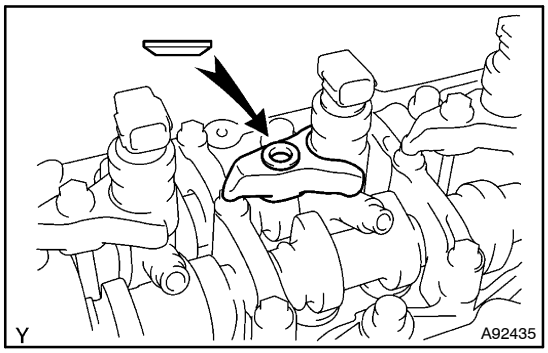


18. REGISTRATION OF INJECTOR COMPENSATION CODE (REPLACEMENT OF THE NEW INJECTORS) (See page 05–277)

HINT:

Each injector assembly has characteristic fuel injecting behavior. When replacing the injector assembly, store them in the correct order so that they can be returned to the original locations when reassembling.

19. INSTALL INJECTOR ASSY



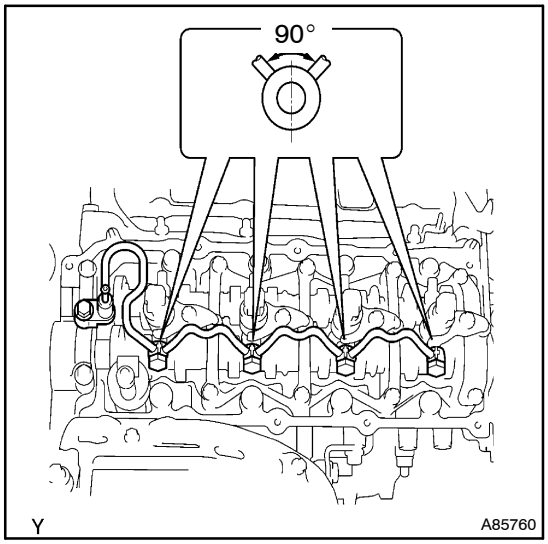
(a) Install the 4 new nozzle seats to the cylinder head.

(b) Install new back–up rings and O–rings to each injector.
(c) Apply a light coat of engine oil to the O–rings on each injector.
(d) Install the injector to the cylinder head.

NOTICE:

Fit the injectors to the nozzle seat.

(e) Install the nozzle holder clamp as shown in the illustration. Tighten the camshaft bearing cap bolt by hand to fix the nozzle holder clamp.



NOTICE:

- **Pay attention to the mounting orientation of the washer.**
- **When temporarily attaching the nozzle holder clamp and mounting bolt, be careful not to orient them at an angle.**

HINT:

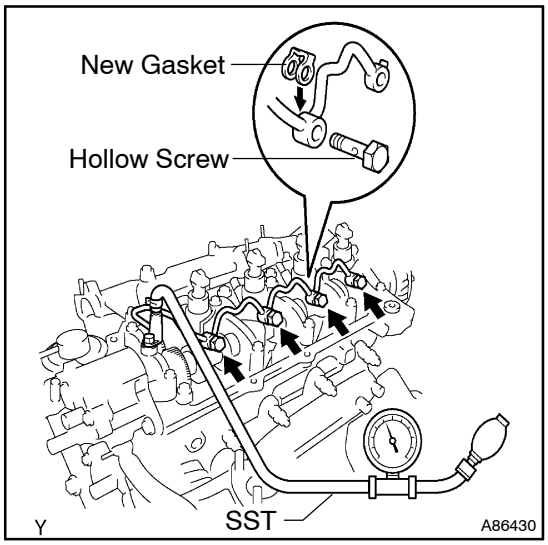
Apply a light coat of engine oil to the threads of the nozzle holder clamp bolts.

(f) Install the injection pipe No. 1, No. 2, No. 3 and No. 4, then tighten the nuts by hand.
(g) Install new 4 gaskets and the leakage pipe No. 1. Tighten the 4 hollow screws by hand.
(h) Tighten the 4 nozzle holder clamp bolts.
Torque: 27 N·m (270 kgf·cm, 20 ft·lbf)
(i) Remove the 4 injection pipes.

20. INSTALL NOZZLE LEAKAGE PIPE ASSY

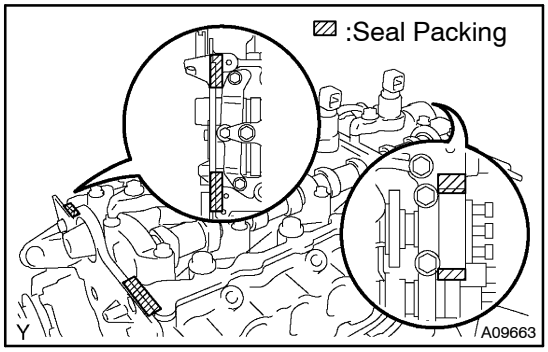
(a) Install the nozzle leakage pipe and 4 new gaskets.

NOTICE:



When installing the gaskets, pay attention to the mounting orientation. Install the gasket so that the joint of the gasket comes within the range shown in the illustration.

(b) Apply a light coat of engine oil to the 4 hollow screws and the bolt.

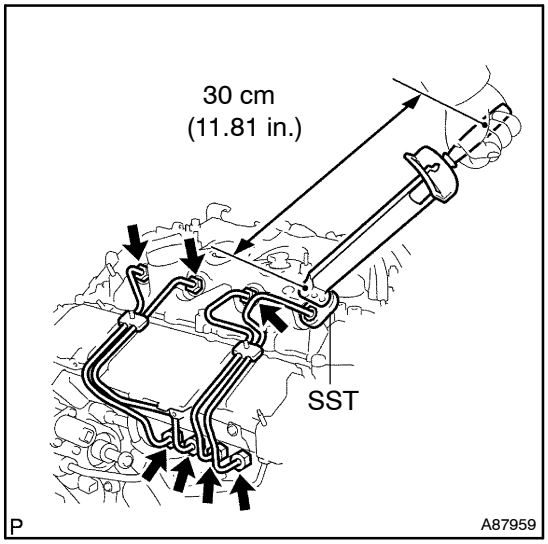


(c) Tighten the 4 hollow screws and bolt by hand.
(d) Tighten the 4 hollow screws and bolt.
Torque:
16 N·m (163 kgf·cm, 12 ft·lbf) for hollow screw
20 N·m (204 kgf·cm, 15 ft·lbf) for flange bolt

NOTICE:
In any case, when the torque exceeds the upper limit, replace the leakage pipe hollow screw and gaskets with new ones.

(e) Check that there are no leaks from the nozzle leakage pipe connection.
(1) Apply a light coat of soapy water (any fluid to detect fuel leaks) to the nozzle leakage pipe connection.

(2) Using SST (a turbocharger pressure gauge), attach SST to the fuel return side of the nozzle leakage pipe, then maintain 100 kPa (1.0 kgf/cm^2, 14.5 psi) of pressure for 60 seconds to check that there are no bubbles from the pipe connection.
SST 09992–00242
(3) After checking fuel leaks, wipe off soapy water from the pipe connection.



21. INSTALL CYLINDER HEAD COVER SUB–ASSY
(a) Remove any old packing (FIPG) material.
(b) Apply seal packing to the cylinder head.
Seal packing: Part No. 08826–00080 or equivalent
(c) Install the gasket to the cylinder head cover.
(d) Install the cylinder head cover with the 10 bolts.
Torque: 13 N·m (135 kgf·cm, 9.8 ft·lbf)

22. INSTALL NOZZLE LEAKAGE PIPE NO.2
(a) Install the nozzle leakage pipe No. 2 with the 2 bolts.
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)
(b) Connect the 2 fuel hoses.

23. INSTALL NOZZLE HOLDER SEAL
(a) Install new 4 nozzle holder seals.

24. INSTALL TIMING BELT NO.2 COVER (See page 14–138)

25. INSTALL INJECTION PIPE SUB–ASSY NO.1

NOTICE:

- **In case of replacing the injectors, the injection pipes must be replaced, too.**
- **When assembling the pipes, perform the operation with the engine cold under room temperature.**

(a) Remove the vinyl or plastic bag from the injector and vinyl tape from the common rail.

(b) Temporarily install the injection pipe.

(c) Using SST, tighten the nut of the injection pipe to the common rail.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(d) Using SST, tighten the nut of the injection pipe to the injector.

SST 09023–12700

Torque:

For used pipe:

36 N·m (372 kgf·cm, 27 ft·lbf) with SST

40 N·m (408 kgf·cm, 30 ft·lbf) without SST

For new pipe:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

26. INSTALL INJECTION PIPE SUB–ASSY NO.2

SST 09023–12700

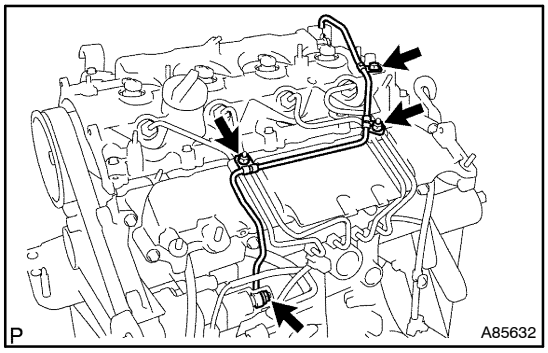
HINT:

Perform the same procedures as the injection pipe No. 1.

27. INSTALL INJECTION PIPE SUB–ASSY NO.3

SST 09023–12700

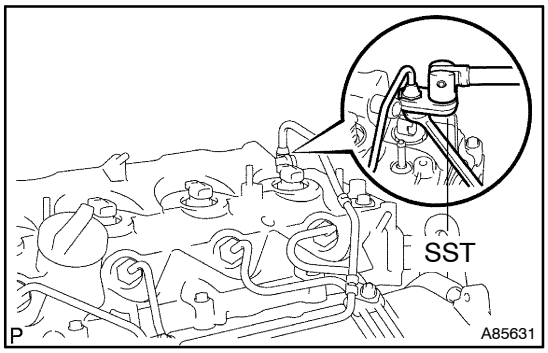
HINT:



Perform the same procedures as the injection pipe No. 1.

28. INSTALL INJECTION PIPE SUB–ASSY NO.4

SST 09023–12700



HINT:

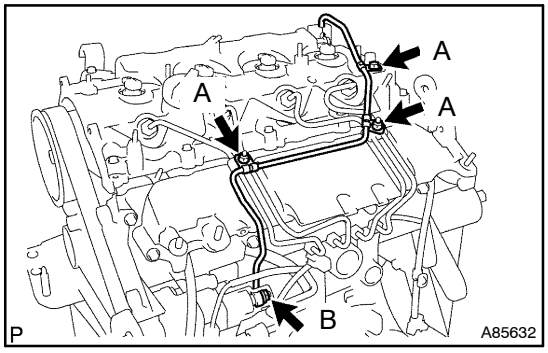
Perform the same procedures as the injection pipe No. 1.

29. INSTALL FUEL PIPE NO.3

(a) Install 2 new gaskets, then temporarily install the bolt, 3 nuts and fuel pipe No. 3.

(b) Hold the hexagonal lobe of the exhaust fuel addition injector assembly first. Using SST, tighten the nut of the fuel pipe No. 3 to the injector side.

SST 09023–12700



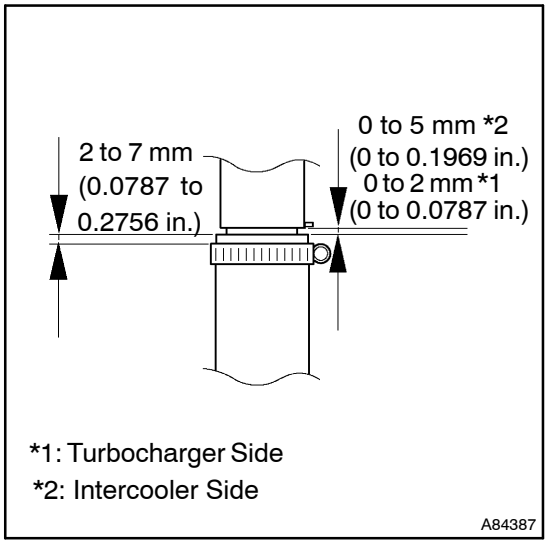
Torque:

22 N·m (223 kgf·cm, 16 ft·lbf) with SST

24 N·m (240 kgf·cm, 17 ft·lbf) without SST

HINT:

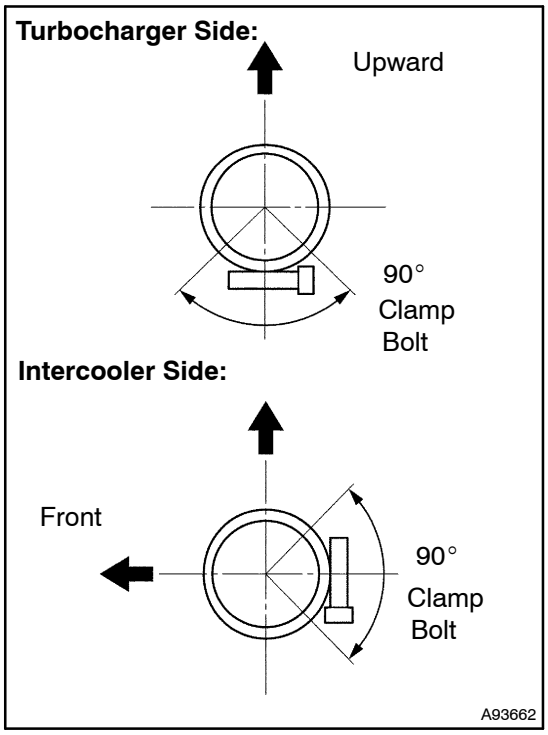
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.



(c) Tighten the bolt and 3 nuts.

Torque:

5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt and nut A



27 N·m (275 kgf·cm, 20 ft·lbf) for nut B

(d) Install the fuel pipe insulator.

30. INSTALL AIR TUBE NO.1

(a) Install the air hose and hose clamps as shown in the illustration.

(b) Tighten the hose clamps as shown in the illustration.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

(c) Install the air tube No. 1 with the 3 bolts and nut.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

31. INSTALL AIR CLEANER ASSY
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)

32. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

33. INSTALL VACUUM RESERVOIR SUB–ASSY
Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)

34. CHECK FOR FUEL LEAKS

NOTICE:

Under the ACTIVE TEST mode, the fuel pressure increases. Take precautions to prevent fuel from spraying on you or inside the engine compartment.

HINT:

During the ACTIVE TEST mode, engine speed goes high and combustion noise becomes loud.

(a) Check that there are no fuel leaks from any parts of the fuel system when the engine is not running.

HINT:

If fuel leakage could be found on specific parts, replace them with new parts.

(b) While cranking or when starting the engine, check that there is no leaks from any parts of the fuel system.

HINT:

If fuel leakage could be found on specific parts, replace them with new parts.

(c) Disconnect the fuel hose from the common rail.

(d) While cranking the engine, check fuel leaks from the return pipe.

HINT:

If there is fuel leakage, replace the common rail.

(e) Connect the hand–held tester to the DLC3.

(f) Start the engine, then turn the hand–held tester ON.

(g) Select the FUEL LEAK test of the ACTIVE TEST mode on the hand–held tester.

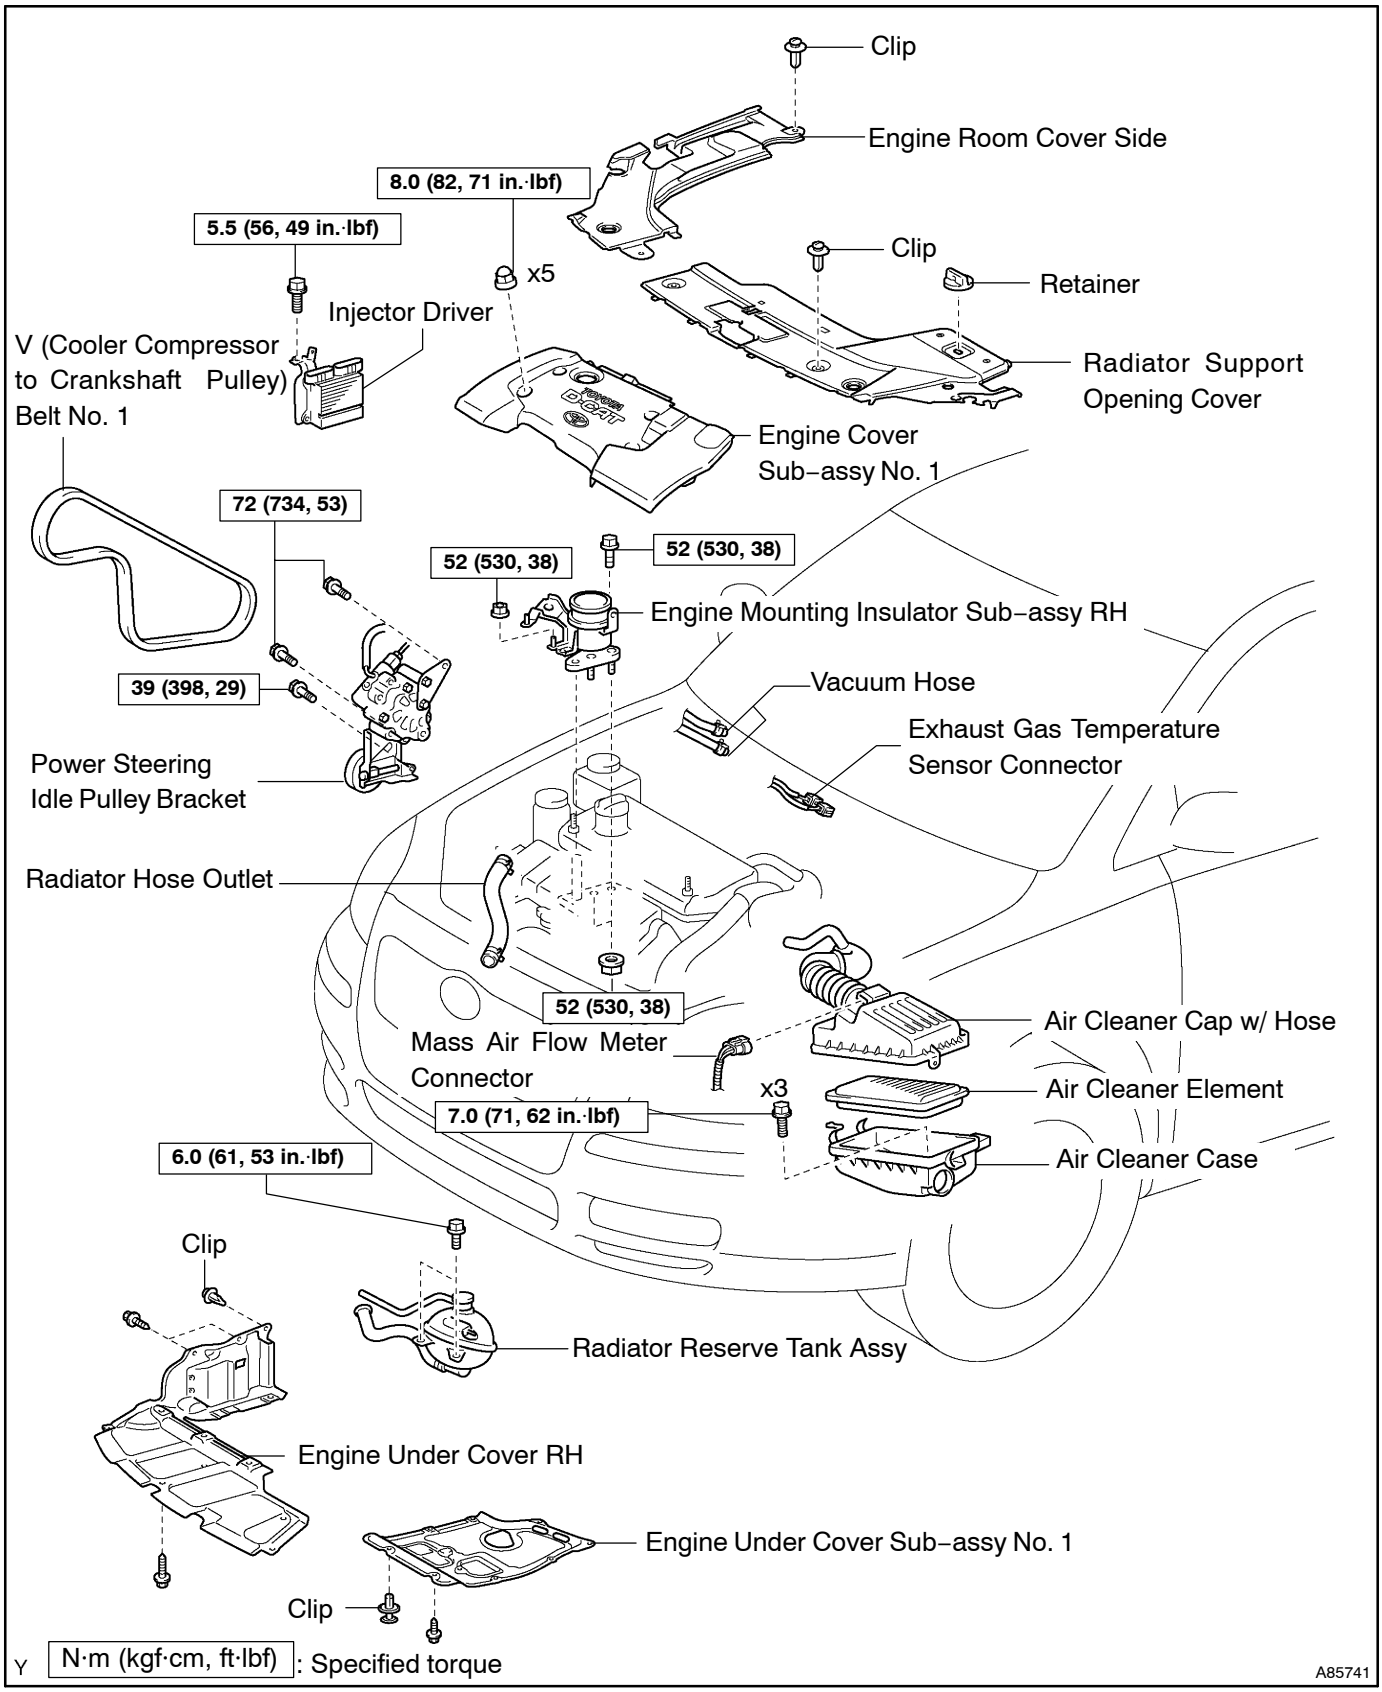
(h) If you do not have the hand–held tester, depress the accelerator pedal quickly and fully to increase the engine speed to its maximum, then keep it for 2 seconds. Repeat this operation several times.

(i) Check that there are no leaks from any parts of the fuel system.

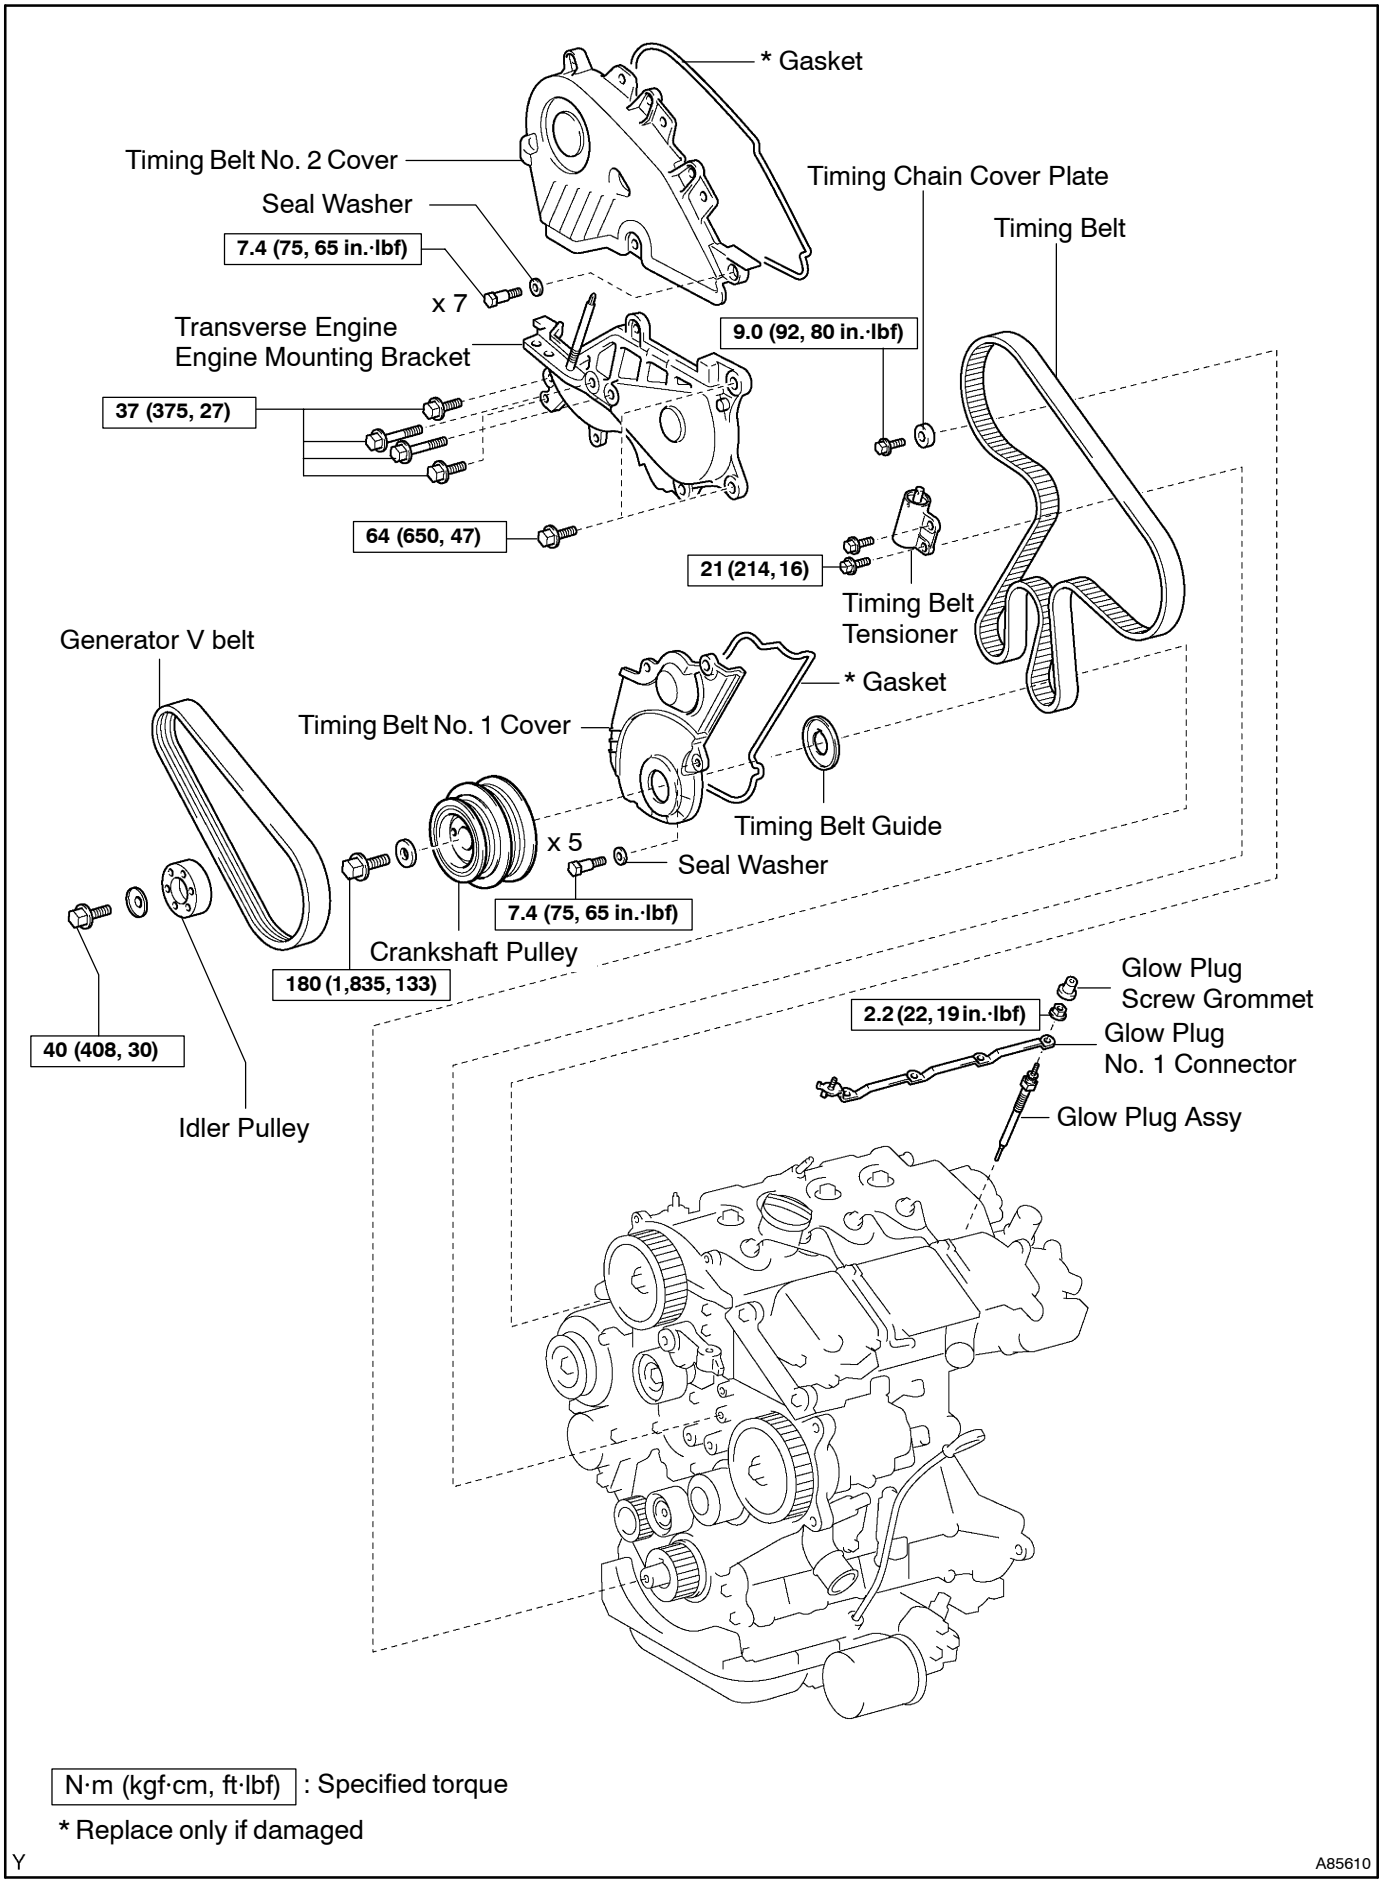
NOTICE:

If the leakage from the return pipe is less than 10 cc (0.6 cu in.) in a minute, it is acceptable.

HINT:



If fuel leakage could be found on specific parts, replace them with new parts.



(j) Reconnect the fuel hose to the common rail.

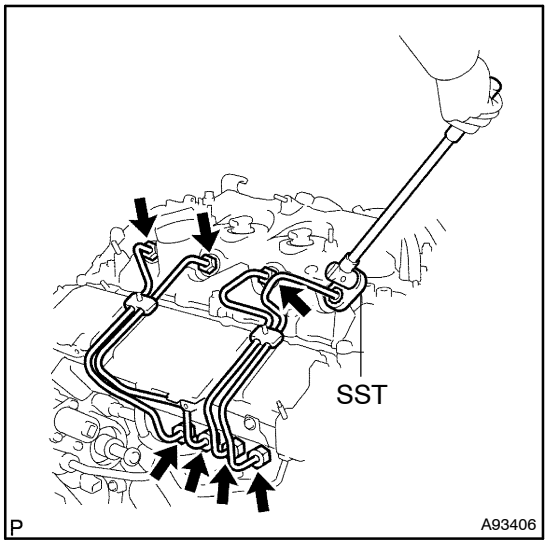
22. **REMOVE TIMING BELT GUIDE**
23. **REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)**
24. **SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)**
25. **REMOVE TIMING CHAIN COVER PLATE (See page 14–138)**
26. **REMOVE TIMING BELT (See page 14–138)**

27. **REMOVE FUEL INLET PIPE SUB–ASSY**

NOTICE:



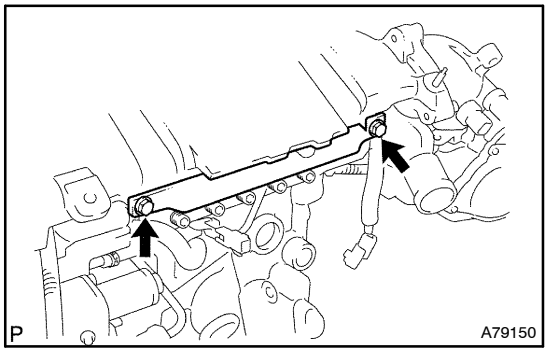
After removing the fuel inlet pipe, cover the common rail and injection pump with vinyl tape to prevent dust from being introduced.

(a) Remove the wire bracket, then slide the engine wire.
(b) Using SST, remove the fuel inlet pipe from the common rail.

SST 09023–12700

(c) Using SST, remove the fuel inlet pipe from the injection pump.
SST 09023–12700

28. REMOVE FUEL PIPE NO.3 (See page 11–46)
SST 09023–12700

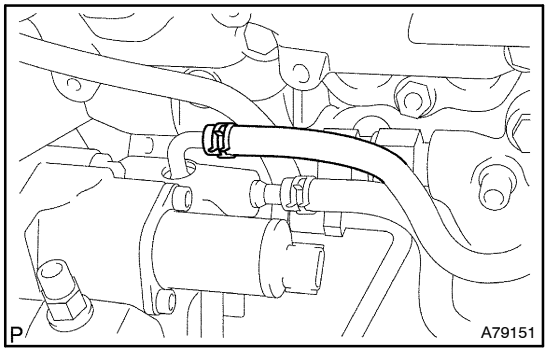


29. REMOVE INJECTION PIPE SUB–ASSY NO.1
(a) Remove the 2 nuts, then remove the 2 upper injection pipe clamps from the intake manifold.
(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700
(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700
(d) After removing the fuel pipe, to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

30. REMOVE INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700
HINT:
Perform the same procedures as the injection pipe No. 1.

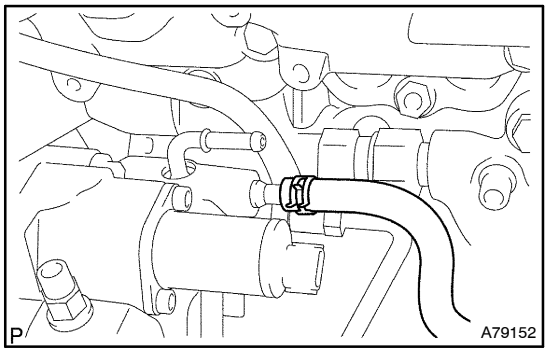
31. REMOVE INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700
HINT:
Perform the same procedures as the injection pipe No. 1.

32. REMOVE INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700
HINT:
Perform the same procedures as the injection pipe No. 1.



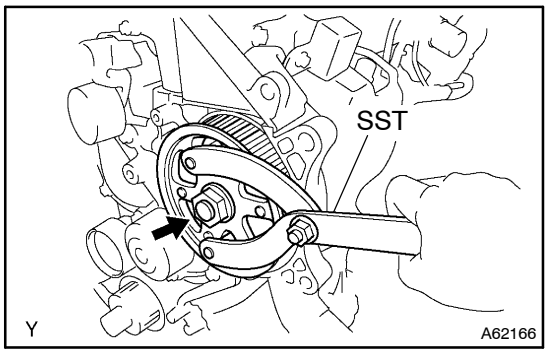
33. REMOVE INTAKE MANIFOLD INSULATOR NO.1
(a) Remove the 2 bolts and intake manifold insulator.

34. REMOVE OIL LEVEL GAGE SUB–ASSY



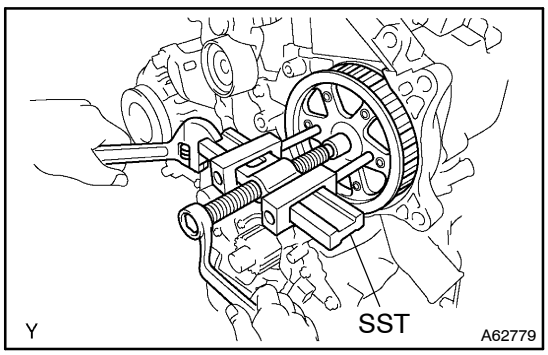
35. REMOVE OIL LEVEL GAGE GUIDE (See page 17–11)

36. REMOVE WATER INLET (See Pub. No. RM1018E on page 16–50)



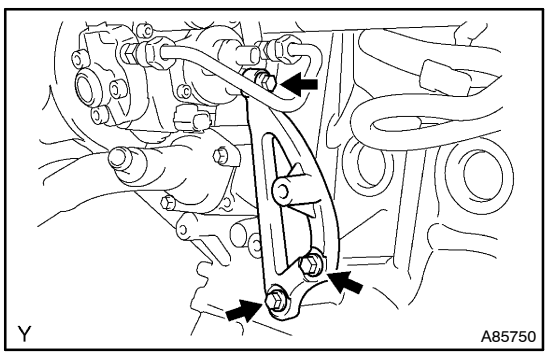
37. DISCONNECT INJECTION PUMP TO FUEL PIPE FUEL HOSE

(a) Disconnect the injection pump to fuel pipe fuel hose from the supply pump.



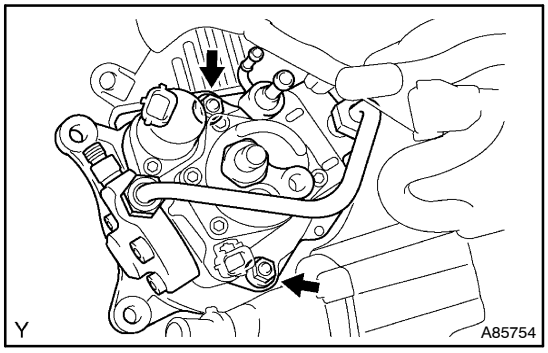
38. DISCONNECT INJECTION PUMP TO FUEL FILTER FUEL HOSE OR PIPE

(a) Disconnect the injection pump to fuel filter fuel hose or pipe from the supply pump.



39. REMOVE INJECTION PUMP DRIVE PULLEY

(a) Using SST, remove the pulley nut.
SST 09960–10010 (09962–01000, 09963–01000)



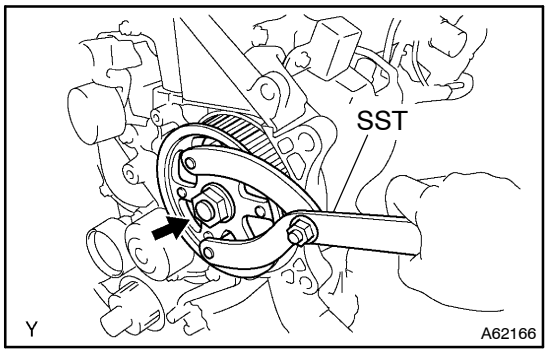
(b) Using SST, remove the injection pump drive pulley.
SST 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)

40. REMOVE INJECTION PUMP STAY NO.1

(a) Remove the 3 bolts and injection pump stay No. 1.

41. REMOVE INJECTION OR SUPPLY PUMP ASSY

(a) Remove the 2 nuts and injection pump.



42. INSTALL INJECTION OR SUPPLY PUMP ASSY

Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

43. INSTALL INJECTION PUMP STAY NO.1

(a) Install the injection pump stay No. 1 with the 3 bolts.

Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

44. INSTALL INJECTION PUMP DRIVE PULLEY

(a) Using SST, install the pulley nut.

SST 09960–10010 (09962–01000, 09963–01000)

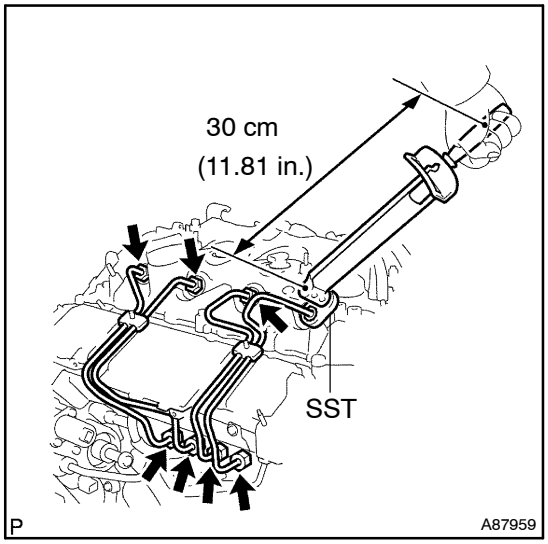
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)

45. INSTALL WATER INLET (See Pub. No. RM1018E on page 16–50)

46. INSTALL OIL LEVEL GAGE GUIDE (See page 17–11)

47. INSTALL INTAKE MANIFOLD INSULATOR NO.1

Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)



48. INSTALL INJECTION PIPE SUB–ASSY NO.1

NOTICE:

When assembling the pipes, perform the operation with the engine cold under room temperature.

(a) Remove the vinyl or the plastic bag from the injector and the vinyl tape from the common rail.

(b) Temporarily install the injection pipe.

(c) Using SST, tighten the nut of the injection pipe to the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(d) Using SST, tighten the nut of the injection pipe to the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

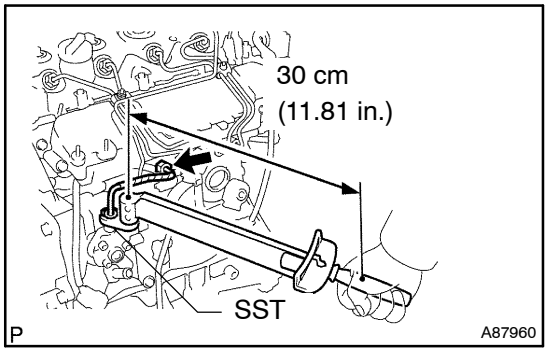
49. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No. 1.

50. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:



Perform the same procedures as the injection pipe No. 1.

51. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No. 1.

52. INSTALL FUEL PIPE NO.3 (See page 11–46)
SST 09023–12700

53. INSTALL FUEL INLET PIPE SUB–ASSY

NOTICE:

- **In case of replacing the injection pump, the fuel inlet pipe must be replaced, too.**
- **When assembling the pipe, perform the operation with the engine cold under room temperature.**

(a) Temporarily install the fuel inlet pipe.

(b) Using SST, tighten the nut of the fuel inlet pipe to the common rail side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Using SST, tighten the nut of the fuel inlet pipe to the injection pump side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

54. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)

SST 09960–10010 (09962–01000, 09963–01000)

55. INSTALL TIMING BELT (See page 14–138)

56. CHECK VALVE TIMING (See page 14–138)

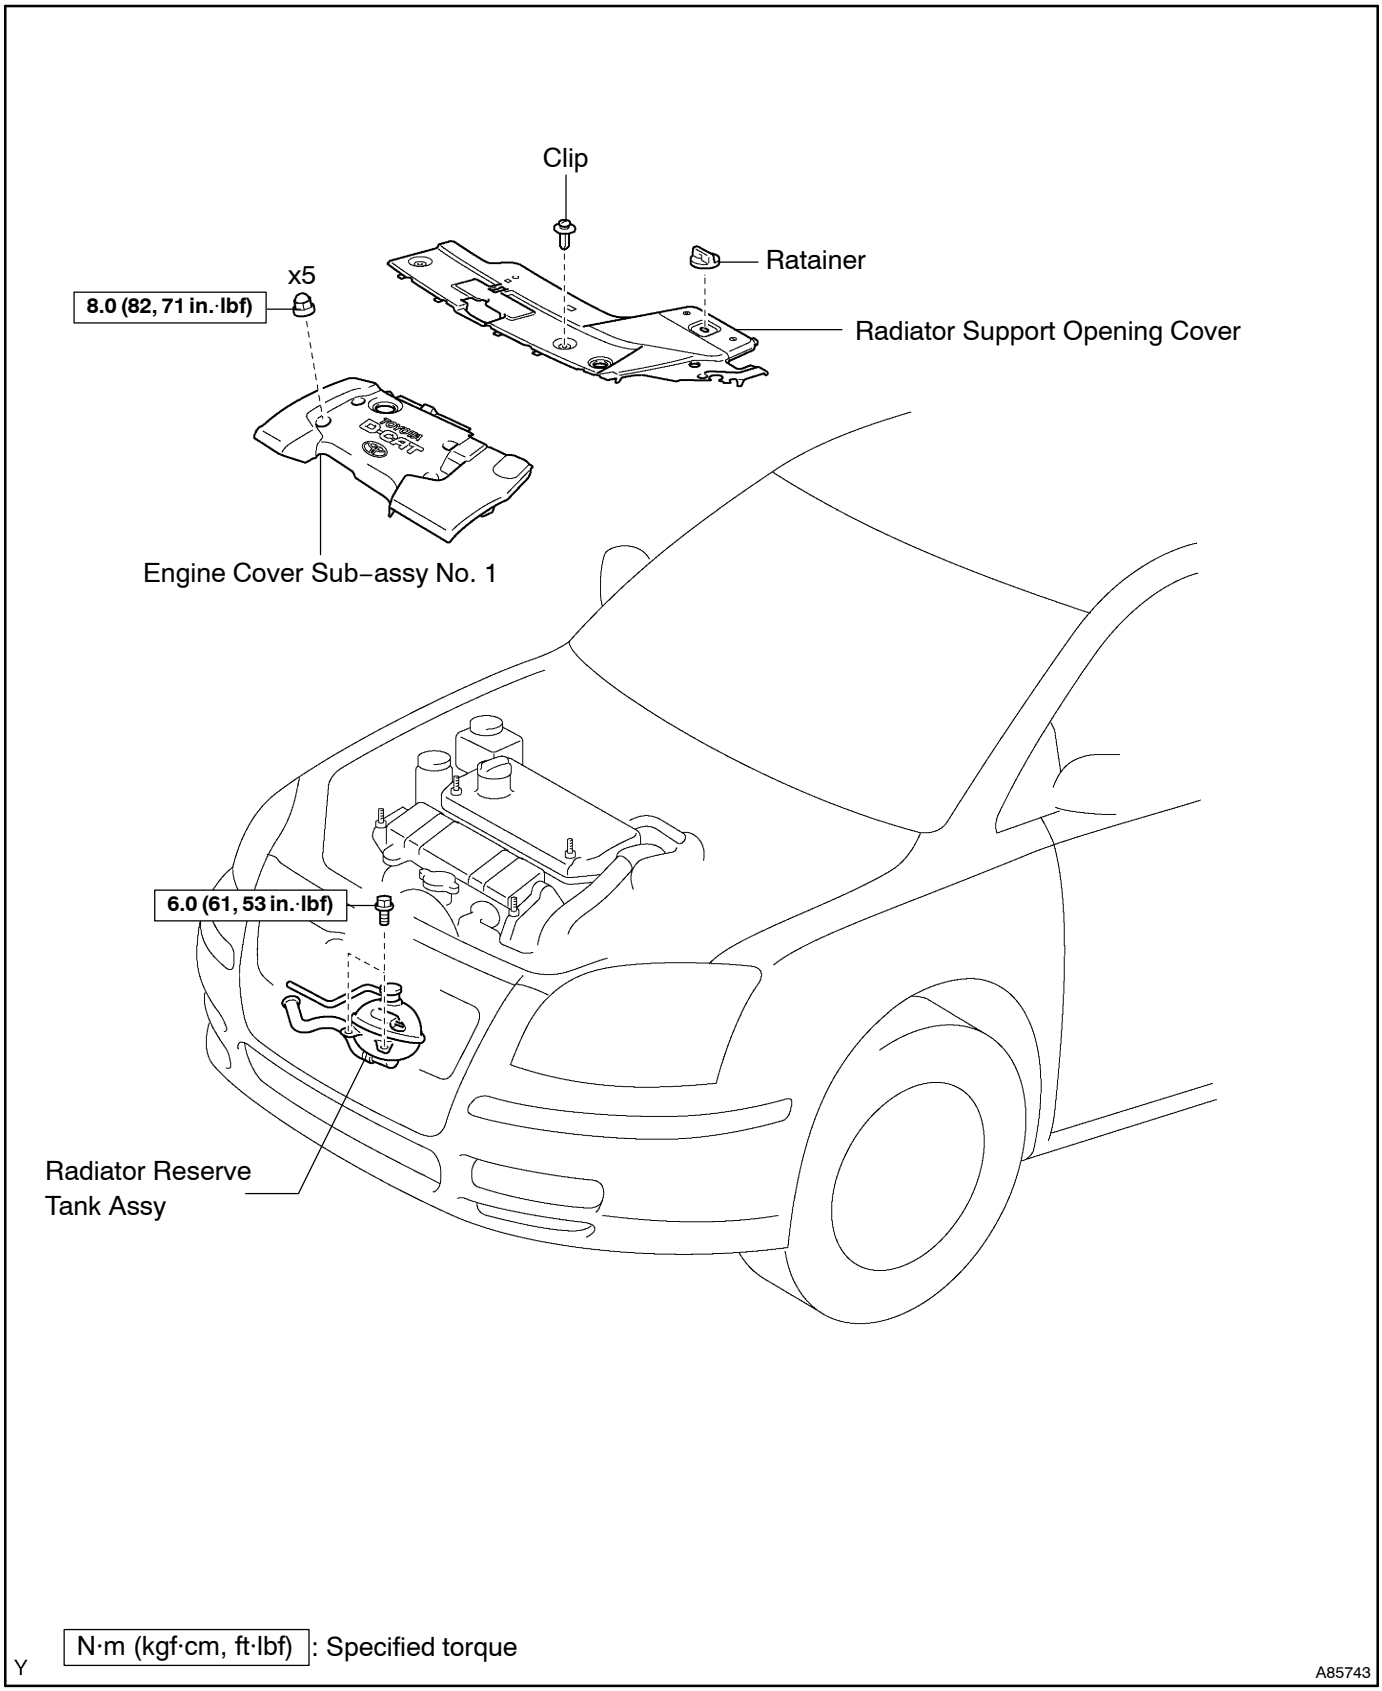
57. INSTALL TIMING CHAIN COVER PLATE (See page 14–138)

58. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)

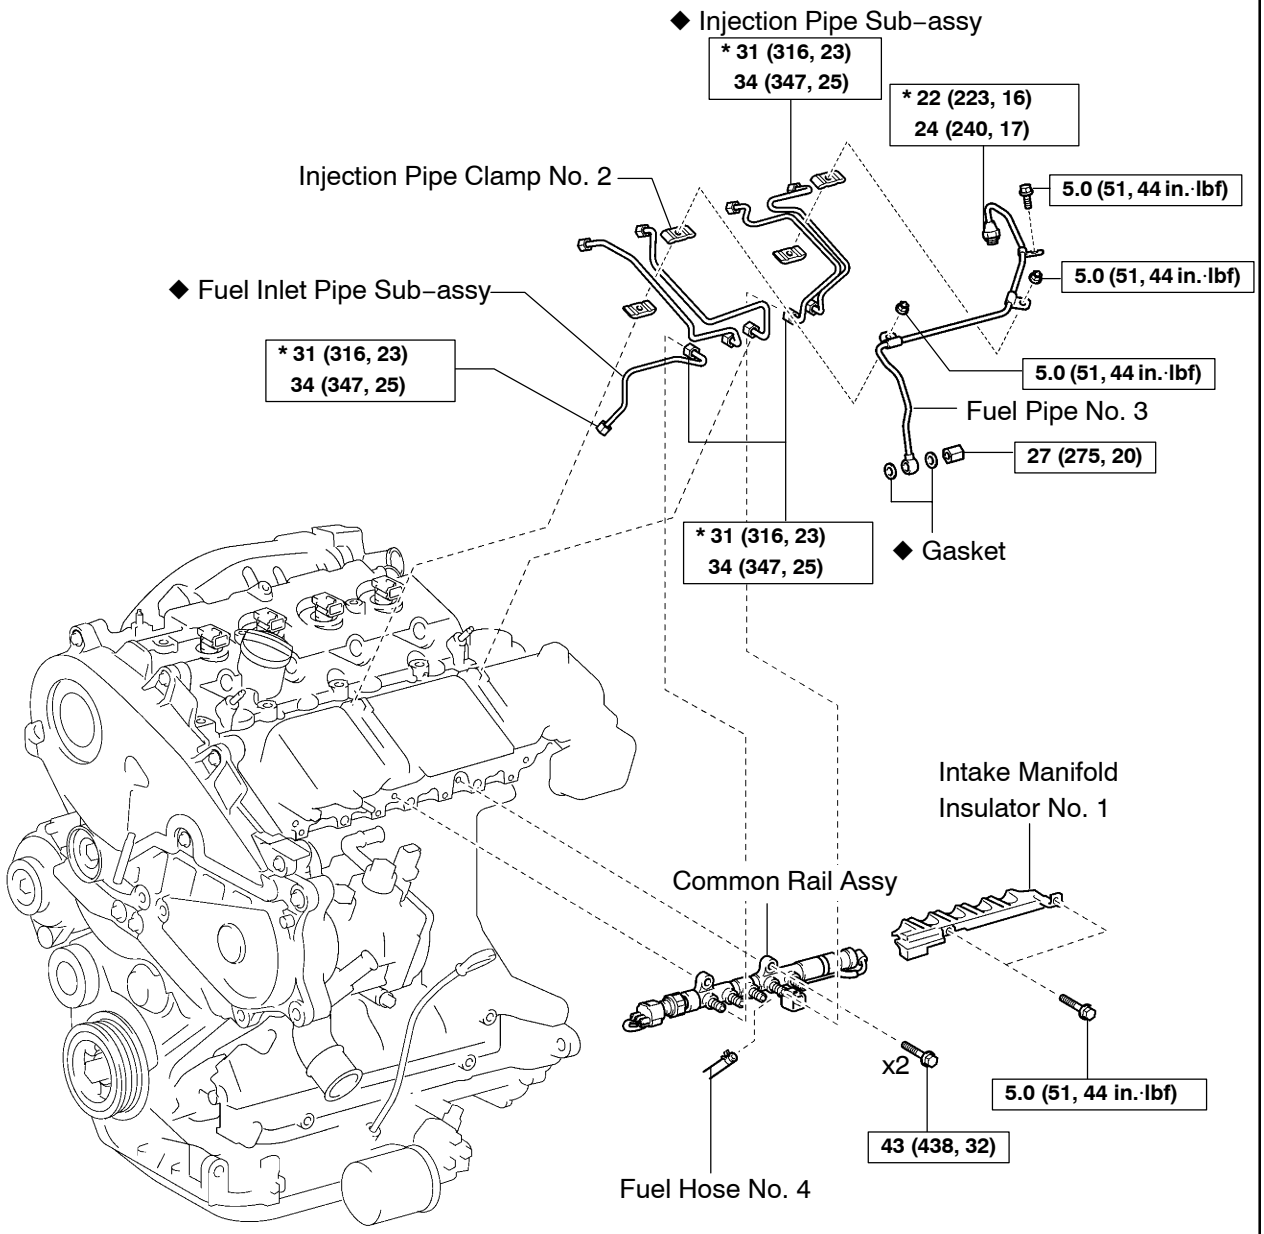
59. INSTALL TIMING BELT GUIDE (See page 14–138)

60. INSTALL TIMING BELT NO.1 COVER (See page 14–138)

61. INSTALL TIMING BELT NO.2 COVER (See page 14–138)



62. INSTALL IDLER PULLEY SUB–ASSY (See page 14–138)



63. INSTALL CRANKSHAFT PULLEY (See page 14–138)
SST 09213–54015 (90105–08076), 09330–00021
64. INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)
65. INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)
66. INSTALL INJECTOR DRIVER
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)
67. ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1
(See Pub. No. RM1018E on page 14–269)
68. INSTALL RADIATOR RESERVE TANK SUB–ASSY (See Pub. No. RM1018E on page 16–50)
69. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
70. INSTALL AIR CLEANER ASSY (See page 11–46)
71. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
72. ADD ENGINE COOLANT (See page 16–19)
73. CHECK FOR ENGINE COOLANT LEAKS (See page 16–15)
74. CHECK FOR FUEL LEAKS (See page 11–46)

COMMON RAIL ASSY (1CD–FTV)(From September, 2003)

110UB–02

COMPONENTS

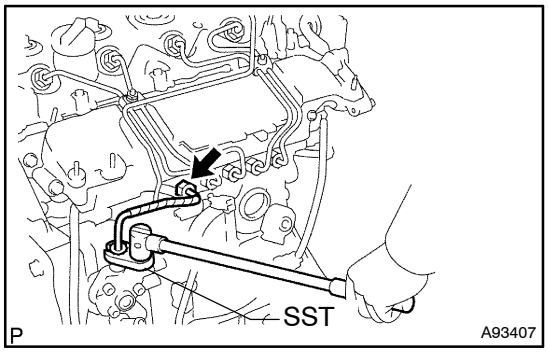
N·m (kgf·cm, ft·lbf) : Specified torque

◆ Non–reusable part

* Use SST

Y

A85744



110UC–02

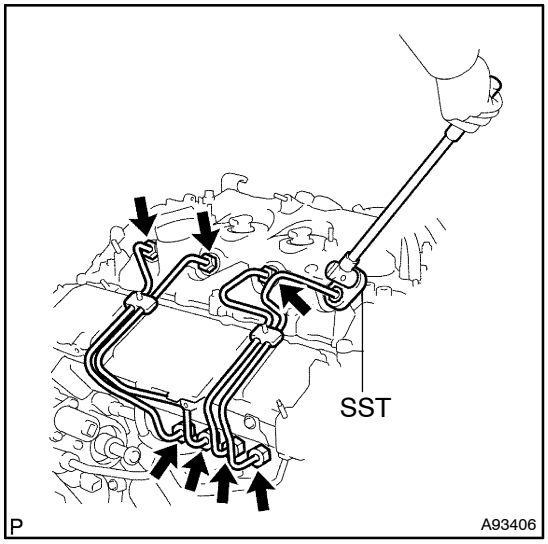
REPLACEMENT

1. **DRAIN ENGINE COOLANT (See page 16–19)**
2. **REMOVE RADIATOR SUPPORT OPENING COVER**
3. **REMOVE ENGINE COVER SUB–ASSY NO.1**

(a) Remove the 5 nuts and engine cover.

4. **REMOVE RADIATOR RESERVE TANK SUB–ASSY (See Pub.No. RM1018E on page 16–50)**

5. **REMOVE FUEL INLET PIPE SUB–ASSY**



NOTICE:

After removing the fuel inlet pipe, cover the common rail and injection pump with vinyl tape to prevent dust from being introduced.

(a) Using SST, remove the fuel inlet pipe from the common rail.
SST 09023–12700

(b) Using SST, remove the fuel inlet pipe from the injection pump.
SST 09023–12700

6. **REMOVE FUEL PIPE NO.3 (See page 11–46)**
SST 09023–12700

7. **REMOVE INJECTION PIPE SUB–ASSY NO.1**

(a) Remove the 2 nuts and 2 upper injection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

(d) After removing the fuel pipe, to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

8. **REMOVE INJECTION PIPE SUB–ASSY NO.2**
SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No. 1.

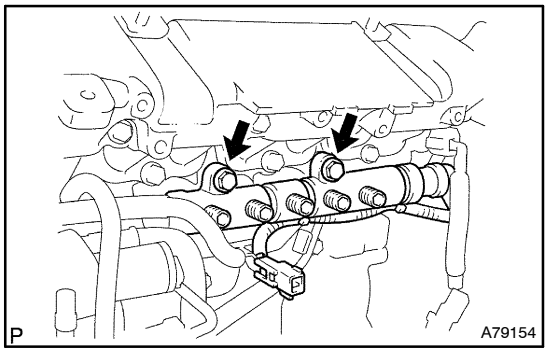
9. **REMOVE INJECTION PIPE SUB–ASSY NO.3**
SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No. 1.

10. REMOVE INJECTION PIPE SUB–ASSY NO.4

SST 09023–12700



HINT:

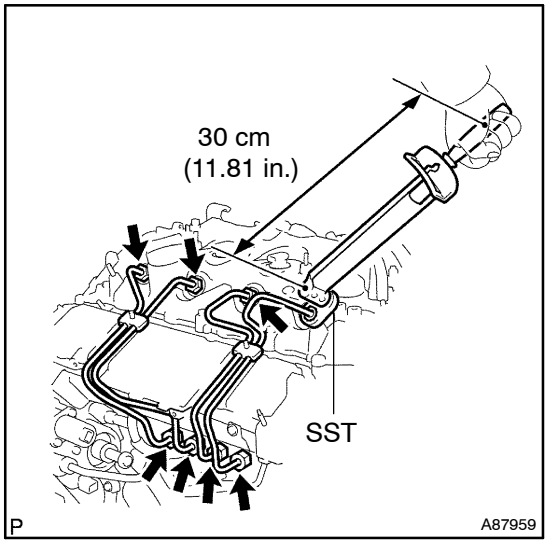
Perform the same procedures as the injection pipe No. 1.

11. DISCONNECT FUEL HOSE NO.4

(a) Disconnect the fuel hose from the common rail.

12. REMOVE INTAKE MANIFOLD INSULATOR NO.1 (See page 11–58)

13. REMOVE COMMON RAIL ASSY



(a) Disconnect the engine wire connector from the bracket.

(b) Remove the 2 bolts and common rail.

14. INSTALL COMMON RAIL ASSY

Torque: 43 N·m (438 kgf·cm, 32 ft·lbf)

15. INSTALL INTAKE MANIFOLD INSULATOR NO.1 (See page 11–58)

16. INSTALL INJECTION PIPE SUB–ASSY NO.1

NOTICE:

- **In case of replacing the common rail, the injector pipes must be replaced, too.**
- **When assembling the pipes, perform the operation with the engine cold under room temperature.**

(a) Remove the vinyl or the plastic bag from the injector and the vinyl tape from the common rail.

(b) Temporarily install the injection pipe.

(c) Using SST, tighten the nut of the injection pipe to the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

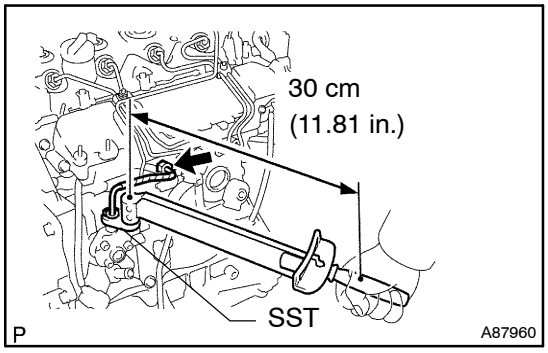
HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(d) Using SST, tighten the nut of the injection pipe to the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

17. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



18. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

19. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

20. INSTALL FUEL PIPE NO.3 (See page 11–46)
SST 09023–12700

21. INSTALL FUEL INLET PIPE SUB–ASSY

NOTICE:

- **In case of replacing the common rail, the fuel inlet pipe must be replaced, too.**
- **When assembling the pipe, perform the operation with the engine cold under room temperature.**

(a) Temporarily install the fuel inlet pipe.

(b) Using SST, tighten the nut of the fuel inlet pipe to the common rail side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Using SST, tighten the nut of the fuel inlet pipe to the injection pump side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

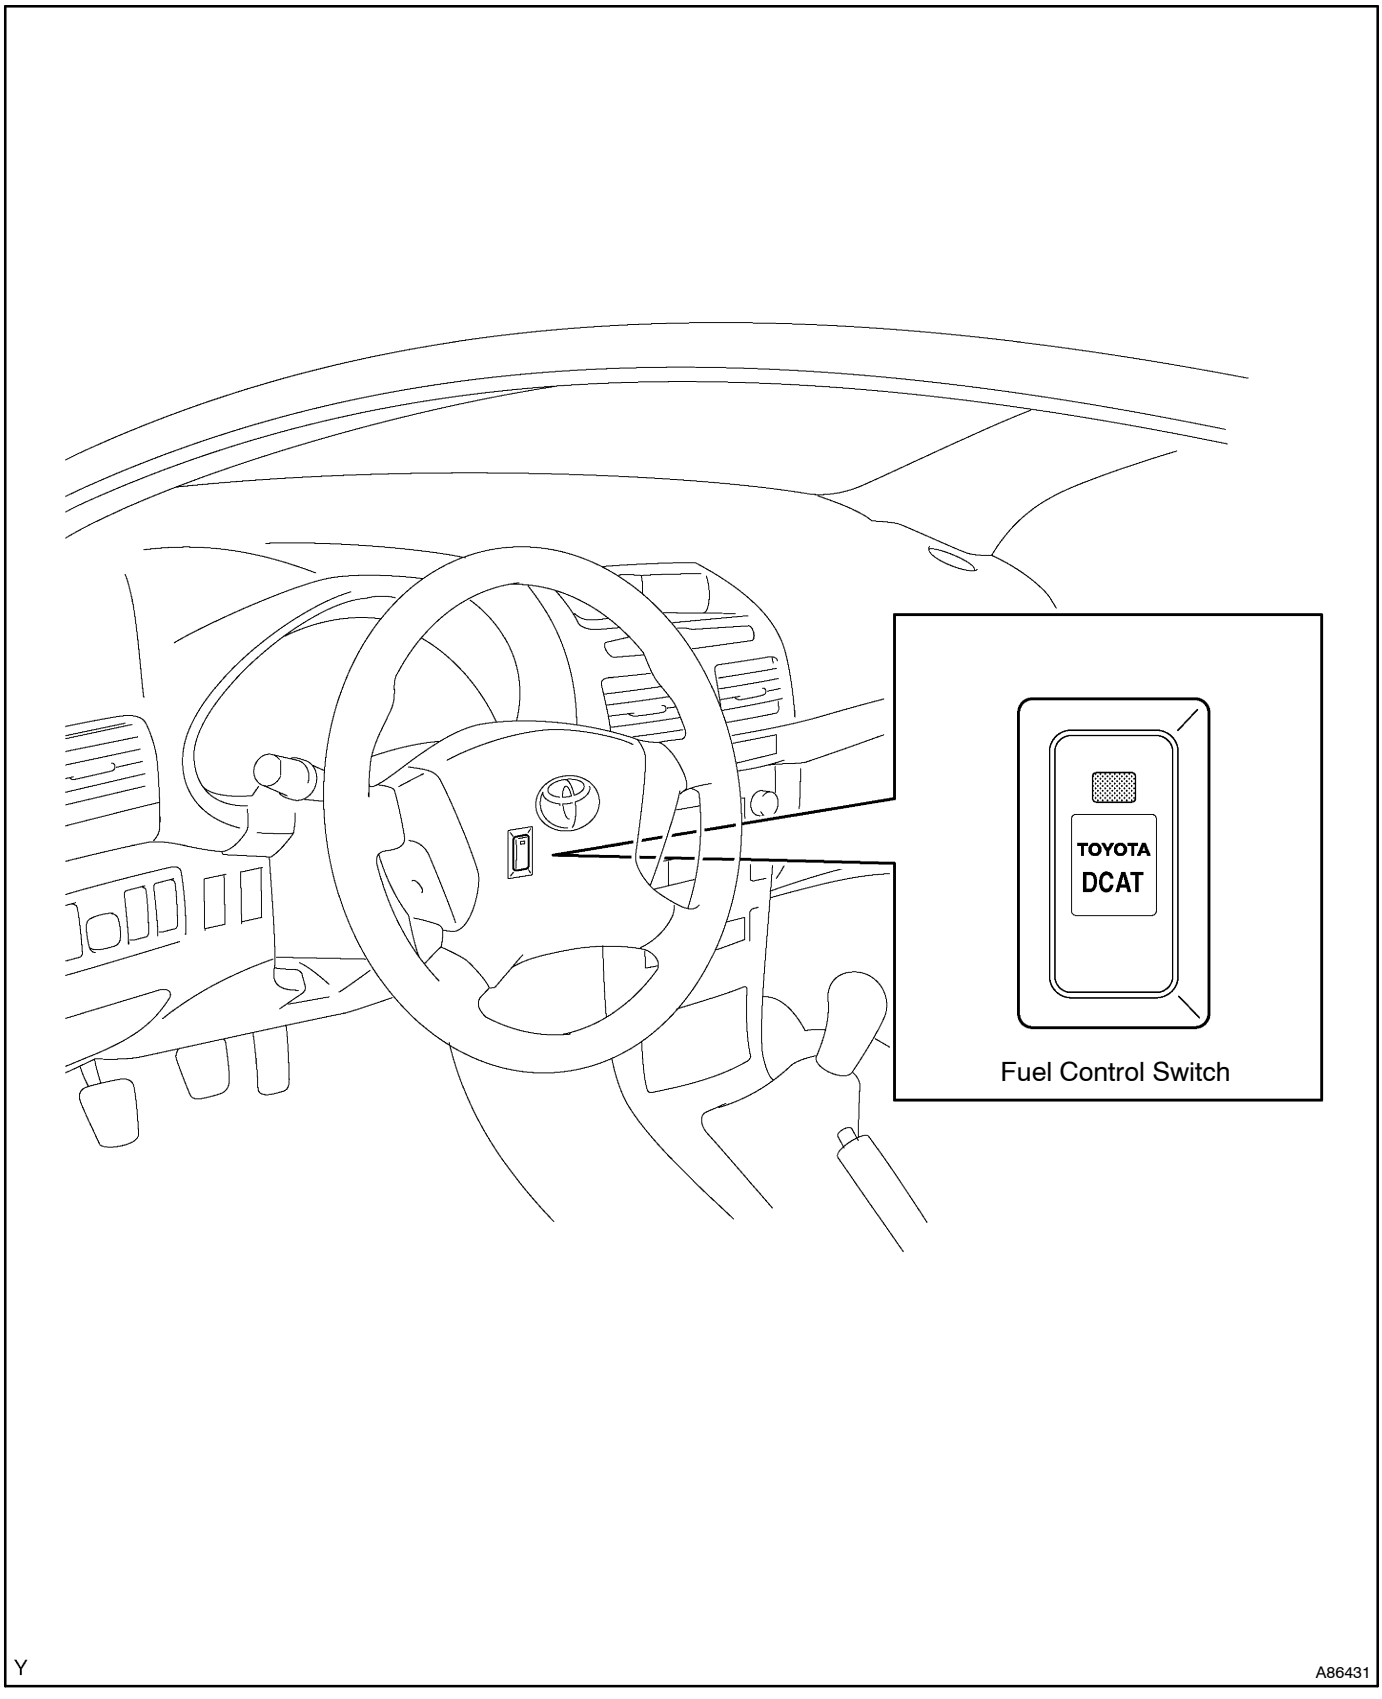
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

22. INSTALL RADIATOR RESERVE TANK SUB–ASSY (See Pub. No. RM1018E on page 16–50)

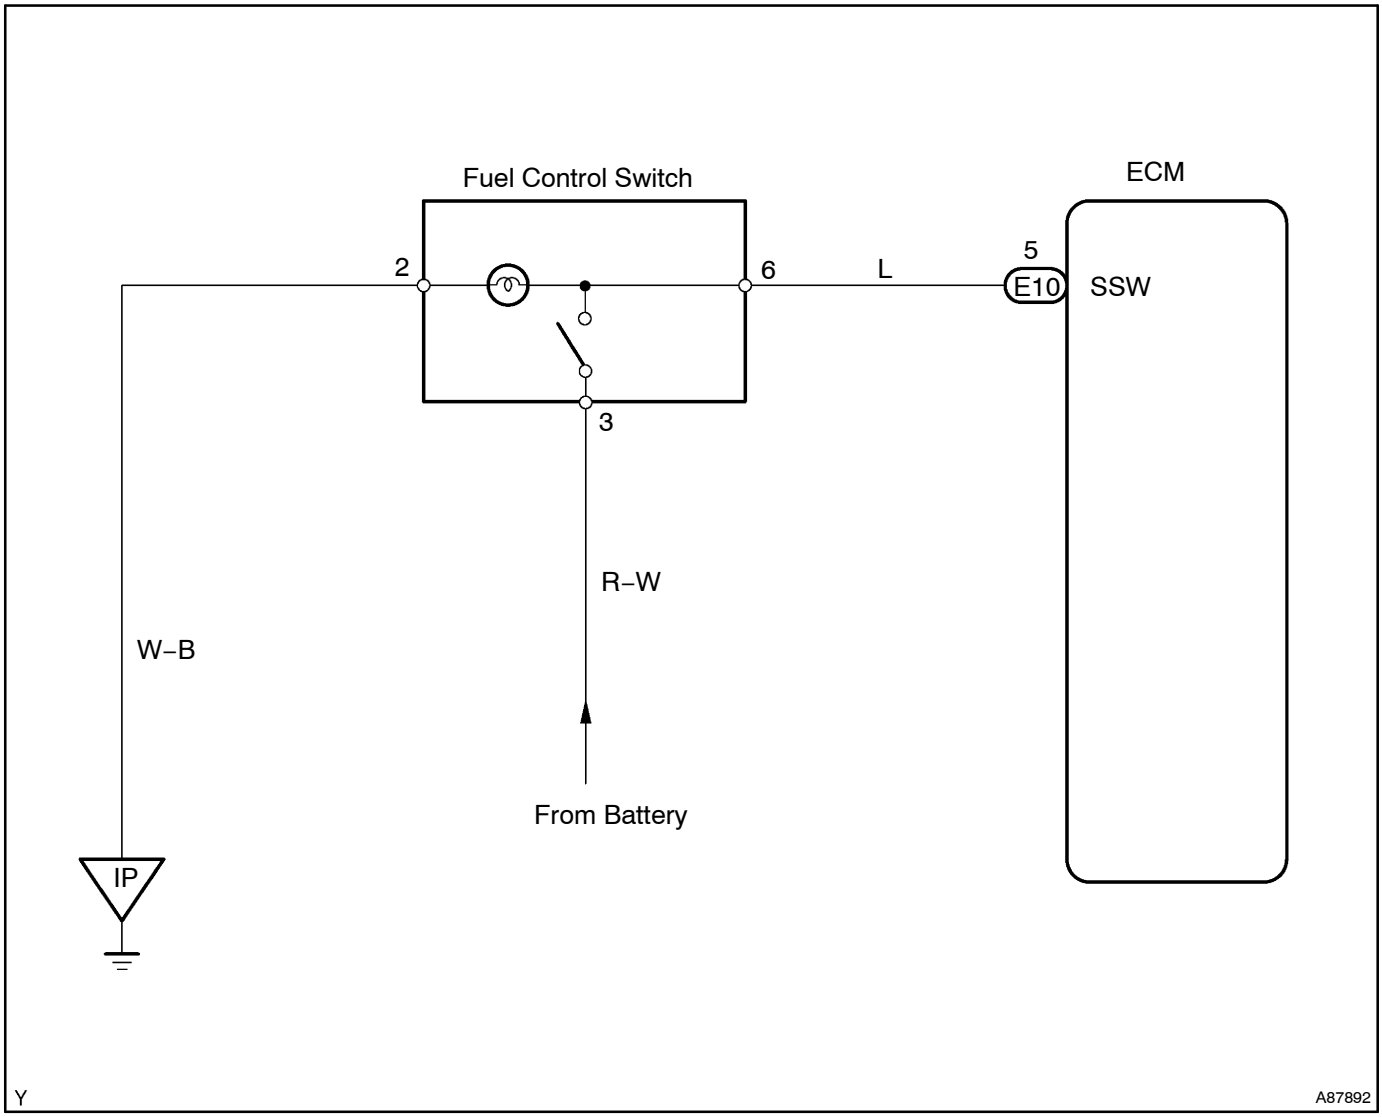
23. INSTALL ENGINE COVER SUB–ASSY NO.1

Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

24. ADD ENGINE COOLANT (See page 16–19)



25. CHECK FOR ENGINE COOLANT LEAKS (See page 16–15)



26. CHECK FOR FUEL LEAKS (See page 11–46)

FUEL CONTROL SWITCH (1CD–FTV)(From September, 2003)

1111F–01

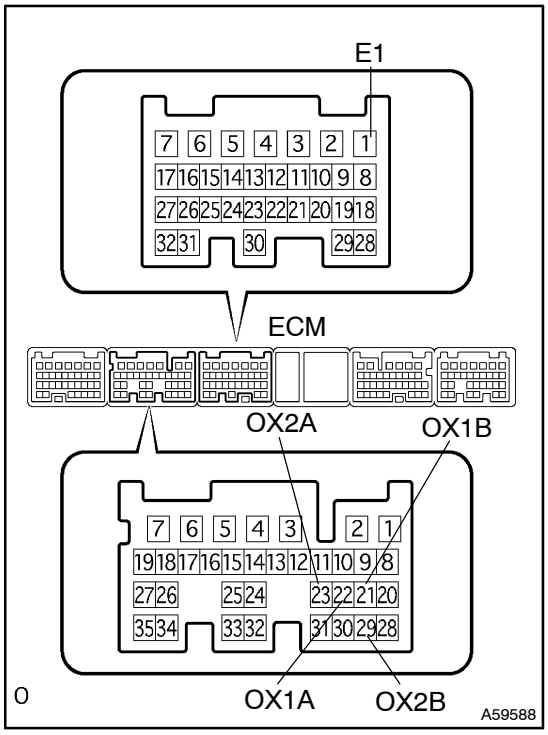
REPLACEMENT

1. REMOVE FUEL CONTROL SWITCH

(a) Separate the 2 claw fittings, then remove the fuel control switch.

(b) Disconnect the fuel control switch connector.

2. INSTALL FUEL CONTROL SWITCH



HINT:

The installation is in the reverse order of the removal.

EMISSION CONTROL SYSTEM (2AZ–FSE)

120D8–01

ON–VEHICLE INSPECTION

1. INSPECT AIR–FUEL RATIO COMPENSATION SYSTEM

HINT:

Check the system by choosing "DATA MONITOR/ O_2 SENSOR OUTPUT VOLTAGE" on the monitor of the hand–held tester.

(a) Connect the hand–held tester to the following each pair of the ECM terminals:
  (1) Terminals 21 (OX1B) and 1 (E1)
  (2) Terminals 22 (OX1A) and 1 (E1)
  (3) Terminals 23 (OX2A) and 1 (E1)
  (4) Terminals 29 (OX2B) and 1 (E1)

CAUTION:

Connect test leads from the back side of the connector with the ECM connected.

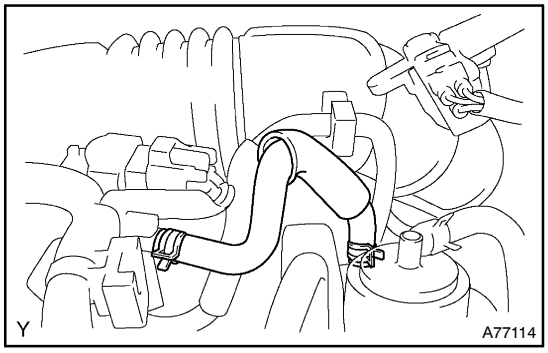
(b) Warm up the heated oxygen sensor with the engine speed at 2,500 rpm for approximately 2 minutes.

(c) Confirm that the voltage output varies between 0 V and 1 V with the engine speed at 2,500 rpm.

OK:

The voltage output varies more than 8 times in 10 seconds.

CAUTION:



- **Perform the check immediately after the warming up.**
- **If the voltage variation could not be verified, warm up the heated oxygen sensor again.**

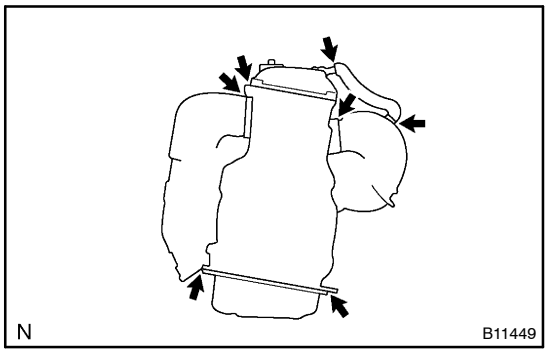
2. INSPECT FUEL CUT OFF RPM

(a) Check the operation.
  (1) Increase the engine speed to at least 3,500 rpm.
  (2) Use a sound scope to check the fuel injector operating noise.
  (3) Check that when the accelerator pedal is released, the fuel injector operation noise stops momentarily at 2,500 rpm and then resumes at 1,200 rpm.

2,500 rpm: Fuel cut off rpm

1,200 rpm: Fuel return rpm

3. INSPECT EVAPORATIVE EMISSION CONTROL SYSTEM



(a) After starting the engine, disconnect the vacuum hose shown in the illustration.

(b) Check if vacuum occurs at the VSV port when choosing ”ACTIVE TEST” and ”PURGE VSV” according to the display on hand–held tester.

(c) Finish ”ACTIVE TEST”, then reconnect the vacuum hose.

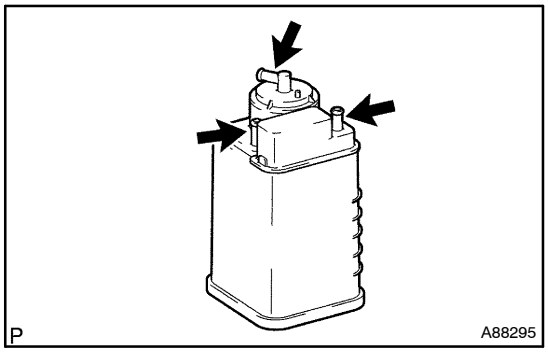
(d) After entering to ”ECU DATA MONITOR” on the hand–held tester, choose ”PURGE VSV” to check the operation of the purge VSV.

(e) After driving the vehicle with a warm engine, confirm that the VSV turns from OFF to ON.

4. VISUALLY INSPECT HOSES, CONNECTIONS AND GASKETS

(a) Check the appearance.

(1) Check the engine assembly if the portions indicated with the arrows are cracked, leaked or damaged.



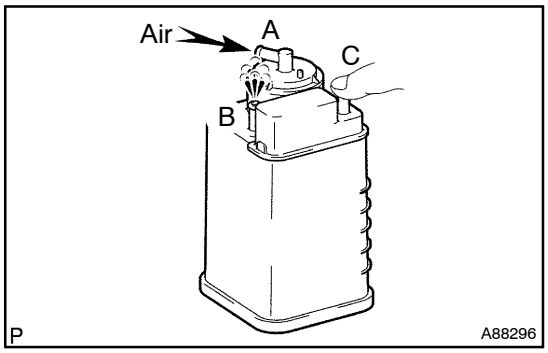
HINT:

Separation of the engine oil level gauge, oil filler cap, PCV hose, etc. may cause the engine to run improperly. Disconnection, looseness or cracks in the parts of the air induction system between the throttle body and cylinder head will allow air suction and cause the engine to run improperly.

If necessary, repair the engine assembly.

120D9–01

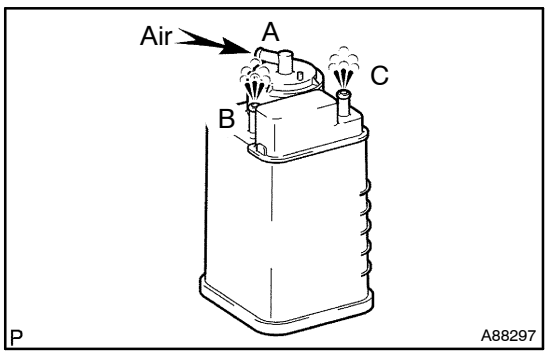
INSPECTION



1. INSPECT CHARCOAL CANISTER ASSY

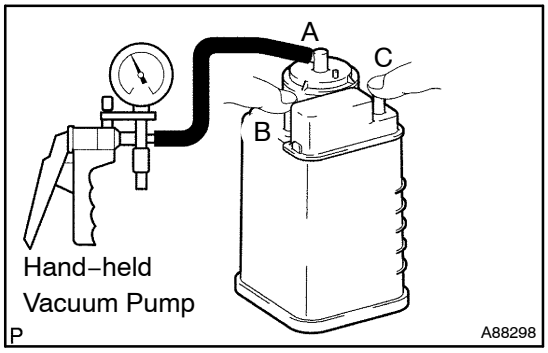
(a) Check the appearance.

(1) Visually check the charcoal canister if the portions indicated with the arrows are cracked or damaged.



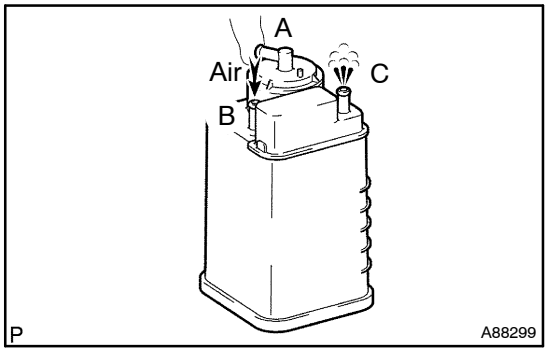
If necessary, replace the charcoal canister.

(b) Check the ventilation.



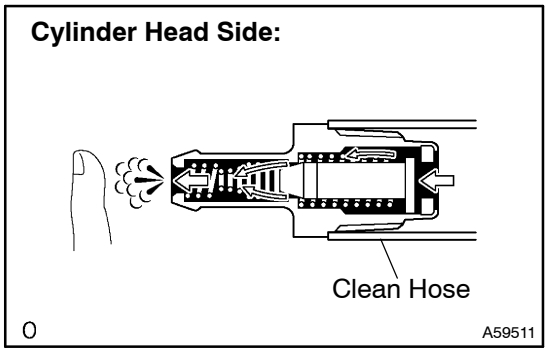
(1) Blow air (4.7 kPa (48 gf/cm^2, 0.68 psi)) into the port A, then check that the air flows from the B while holding the port C closed.

If the ventilation is not as specified, replace the charcoal canister.



(2) Blow air (4.7 kPa (48 gf/cm^2, 0.68 psi)) into the port A, then check that the air flows from the port B and C.

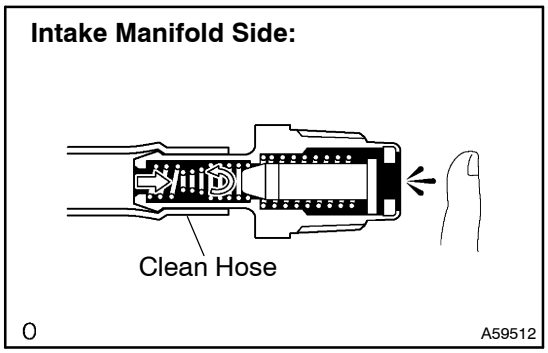
If the ventilation is not as specified, replace the charcoal canister.



(3) Apply vacuum (2.0 kPa (15 mmHg, 0.59 in.Hg)) to the port A, then check that the vacuum does not decrease when port B and port C are closed, and check that the vacuum decrease when the port B is released.

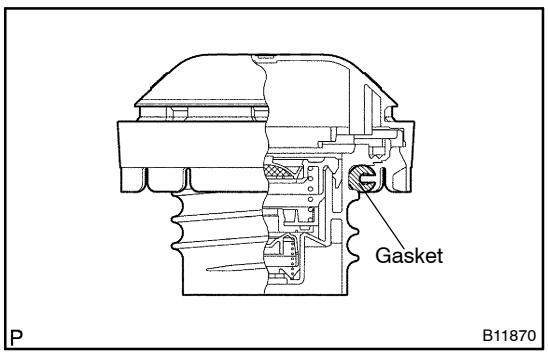
If the ventilation is not as specified, replace the charcoal canister.

(c) Clean the filter in canister.
(1) Clean the filter by blowing (19.6 kPa (0.2 kgf/cm^2, 2.8 psi)) compressed air into port B while holding the port A closed.



NOTICE:
- **Do not attempt to wash the charcoal canister.**
- **No activated carbon should come out.**

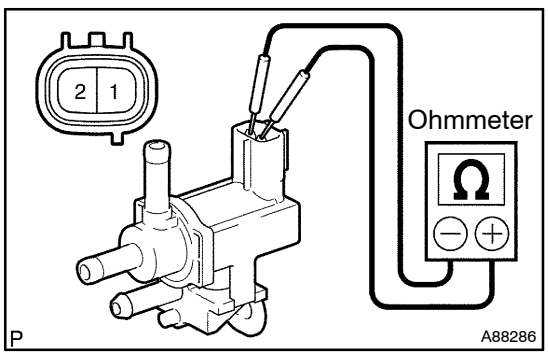
2. INSPECT VENTILATION VALVE SUB–ASSY



(a) Check the operation.
(1) Install a clean hose as shown in the illustration.
(2) Blow air into the cylinder head side, then check that air passes through easily.

CAUTION:
Do not suck air through the ventilation valve. Petroleum substances inside the ventilation valve are harmful.

(3) Blow air into intake manifold side, then check that air passes through with difficulty.

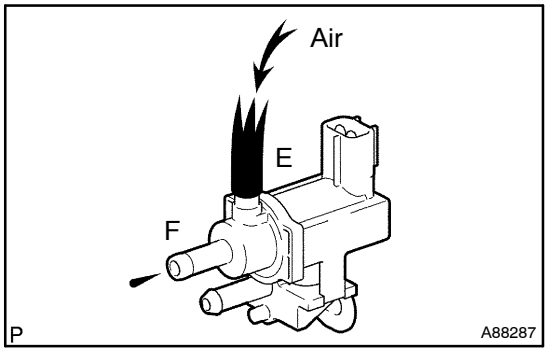


If the operation is not as specified, replace the ventilation valve.

3. INSPECT FUEL TANK CAP ASSY

(a) Check the appearance.
(1) Visually check if the fuel tank cap and gasket are deformed or damaged.

If necessary, replace the fuel tank cap.

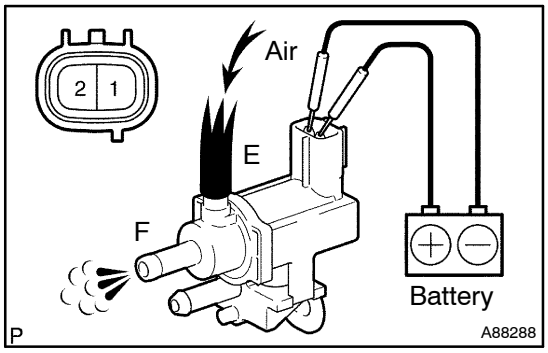


4. INSPECT VACUUM SWITCHING VALVE ASSY NO.1

(a) Inspect the resistance.
(1) Using an ohmmeter, measure resistance between the terminals.

Standard:

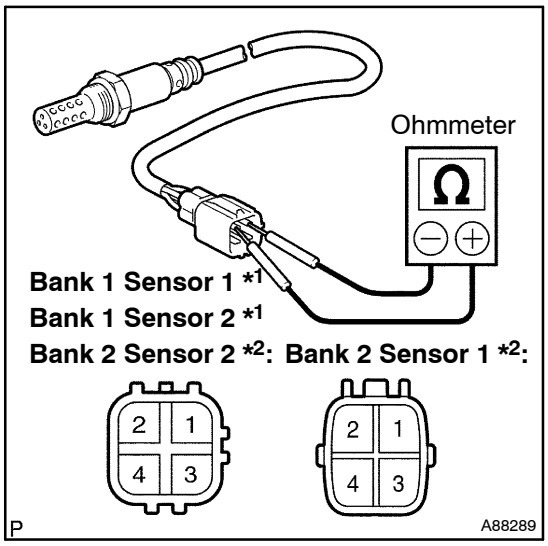
Tester Connection	Specified Condition
1 – 2	26 to 30 Ω at 20°C (68°F)



If the resistance is not as specified, replace the vacuum switching valve No. 1.

(b) Check the operation.

(1) Check that air does not flow from port E to F.



If the operation is not as specified, replace the vacuum switching valve No. 1.

(2) Apply battery voltage across the terminals.

(3) Check that air flows from port E to F.

If the operation is not as specified, replace the vacuum switching valve No. 1.

5. INSPECT HEATED OXYGEN SENSOR

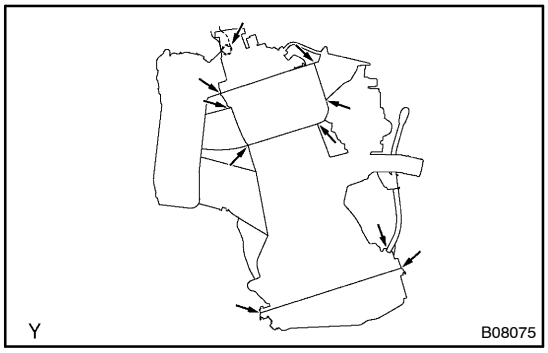
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 (HT) – 2 (+B)	11 to 16 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

HINT:



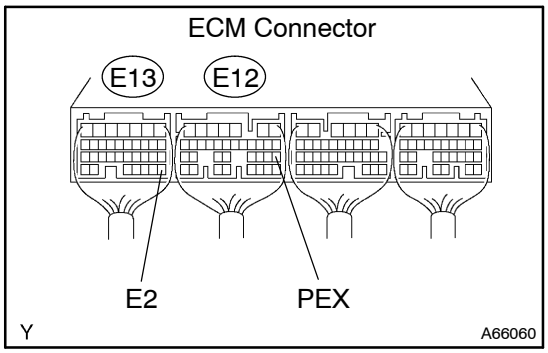
- *1: Bank 1 refers to the No. 1 and No. 4 cylinders
- *2: Bank 2 refers to the No. 2 and No. 3 cylinders

If the result is not as specified, replace the heated oxygen sensor.

EMISSION CONTROL SYSTEM (1CD–FTV)(From September, 2003)

ON–VEHICLE INSPECTION

120DB–01



1. VISUALLY INSPECT HOSES, CONNECTIONS AND GASKETS

(a) Check for cracks, leaks or damage.

(1) Check the engine assembly to see if the indicated portions by the arrows have cracks, leaks or damage.

HINT:

Separation of the engine oil dipstick, oil filler cap, PCV hose, etc. may cause the engine to run improperly. Disconnection, looseness or cracks in the parts of the air induction system between the throttle body and cylinder head will allow air suction and cause the engine to run improperly.

2. INSPECT DIFFERENTIAL PRESSURE SENSOR ASSY

(a) Turn the ignition switch to ON.

(b) Measure the voltage between the specified terminals of the E12 and E13 ECM connector.

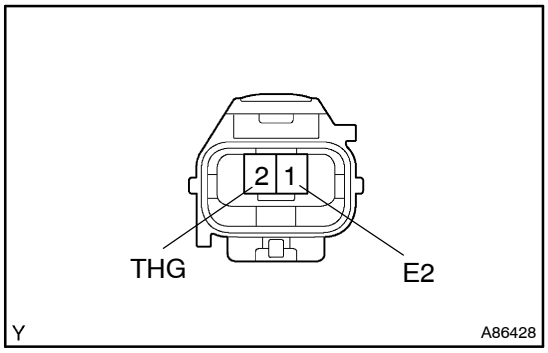
Standard:

Tester Connection	Specified Condition
PEX (E12–20) – E2 (E13–28)	0.4 to 4.8 V

If the result is not as specified, check the wiring and ECM.

120DC–01

INSPECTION



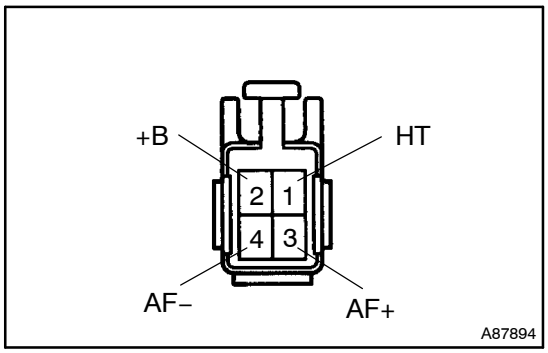
1. INSPECT EXHAUST FUEL ADDITION INJECTOR ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance: 11.6 to 12.4 Ω at 20°C (68°F)

If the result is not as specified, replace the exhaust fuel addition injector assembly (see page 14–166).



2. INSPECT EXHAUST GAS TEMPERATURE SENSOR

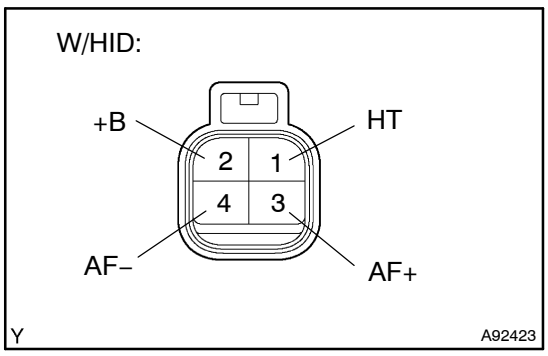
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance: 242 kΩ at 20°C (68°F)

If the result is not as specified, replace the exhaust gas temperature sensor (see page 14–108).

3. INSPECT AIR–FUEL RATIO SENSOR



(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:

Tester Connection	Resistance
1 (HT) – 2 (+B)	0.8 to 1.4 Ω at 20°C (68°F)
1 (HT) – 4 (AF–)	10 kΩ or higher

If the result is not as specified, replace the air–fuel ratio sensor (see page 15–6).

EGR SYSTEM (1CD–FTV)(From September, 2003)

1209I–03

ON–VEHICLE INSPECTION

HINT:

In a malfunction that the EGR system is always operating, black smoke or white smoke may be emitted from the exhaust pipe. If this occurs, inspect the EGR system as well.

1. INSPECT SEATING OF EGR VALVE

(a) Start the engine, then check that it starts and runs at idle.

2. INSPECT HOT ENGINE CONDITION (WHEN USING HAND–HELD TESTER)

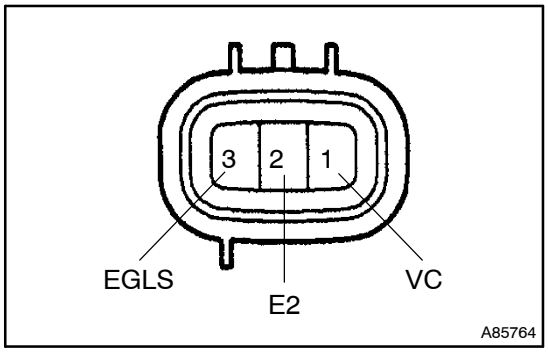
(a) Warm up the engine.
(b) Turn the ignition switch to OFF.
(c) Connect the hand–held tester to the DLC3.
(d) Start the engine, then run it at idle.
(e) Turn the hand–held tester ON.
(f) To confirm the following information in DATA LIST, select ”DIAGNOSIS / OBD / MOBD / ACTIVE TEST / EGR STEP POS / ALL” on the hand–held tester.
(g) Warm up the engine. The coolant temperature should be between 75°C (167°F) and 90°C (194°F).
(h) Check the MAF reading with the engine idling.
Standard: MAF reading is between 4 g/s and 16 g/s
(i) Operate the EGR valve with the hand–held tester. Regulate the valve opening angle to 0°, then check the MAF reading.
Standard: MAF reading is between 10 g/s and 16 g/s

If the MAF reading is out of range in either step (h) or (i), replace the EGR valve.

If the MAF reading is out of range in both step (h) and (i), check the air flow sensor (see page 10–22).

If it has no defects, check the operation of the EGR valve.

If any defects are found, replace the air flow meter, then check the operation of the EGR valve.



3. INSPECT HOT ENGINE CONDITION (WHEN NOT USING HAND–HELD TESTER)

(a) Install the vacuum gauge.
(1) Using a 3–way connector, connect a vacuum gauge to the hose between the intake manifold and turbo pressure sensor.
(b) Warm up the engine. The coolant temperature should be between 75°C (167°F) and 90°C (194°F).
(c) Check that the vacuum gauge indicates 2.5 kPa (19 mmHg 0.7 in Hg) or higher.
(d) Stop the engine with the ignition switch OFF, then remove the EGR valve connector.
(e) Restart the engine, then check that the load under idling is 2.5 kPa (19 mmHg 0.7 in Hg) or lower.

If the load pressure exceeds the above value, replace the EGR valve.

120DD–01

INSPECTION

1. INSPECT EGR VALVE POSITION SENSOR

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between terminals 1 (VC) and 2 (E2).

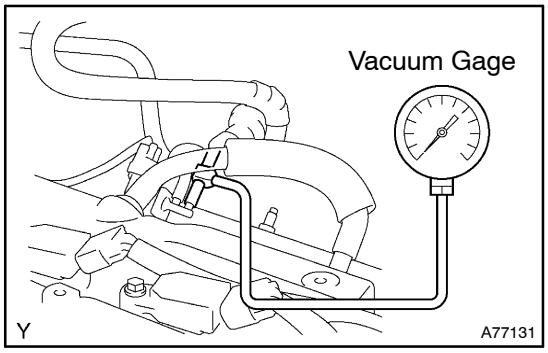
Resistance: 4.0 to 6.0 kΩ at 20°C (68°F)

If the result is not as specified, replace the EGR valve position sensor.

2. INSPECT EGR VALVE ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.



Resistance: 6.5 to 7.5 Ω at 20°C (68°F)

If the result is not as specified, replace the EGR valve assembly.

INTAKE AIR CONTROL SYSTEM (2AZ–FSE)

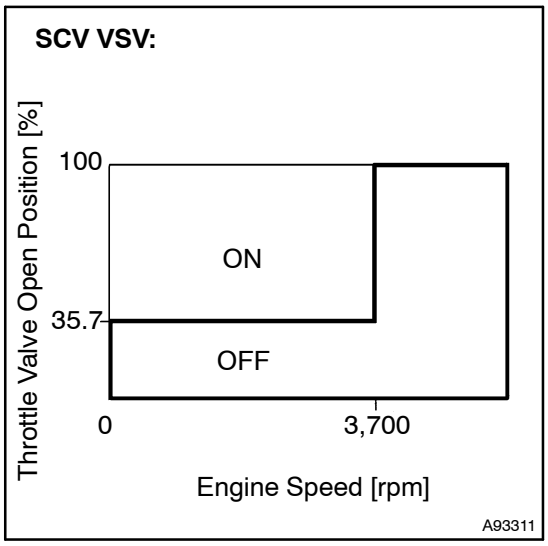
1308J–01

ON–VEHICLE INSPECTION

1. INSPECT INTAKE AIR CONTROL SYSTEM

(a) Using a 3–way connector, connect the vacuum gauge to the actuator hose as shown in the illustration.

(b) Connect the hand–held tester to the DLC 3.



(c) Start the engine.

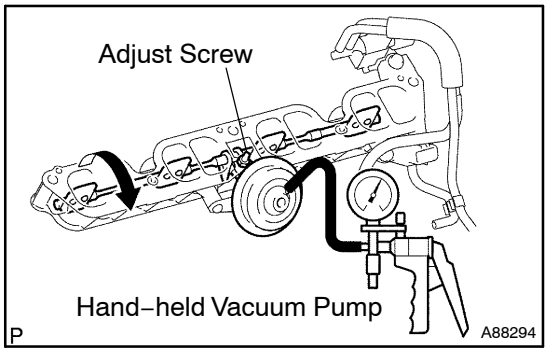
(d) Turn the hand–held tester ON.

(e) Select the item "DIAGNOSIS/ENHANCED OBD II/ACTIVE TEST/INTAKE CTL VSV 1", then operate the VSV for AICS.

Vacuum:

Tester Operation	Specified Condition
VSV is ON	approximately 27.6 kpa (207 mmHg, 8.1 in.Hg)
VSV is OFF	0 kPa (0 mm Hg, 0 in. Hg.)

(f) Shift the transmission into the P range, then control the accelerator pedal.



(g) Using the hand–held tester, check the VSV operation.

HINT:

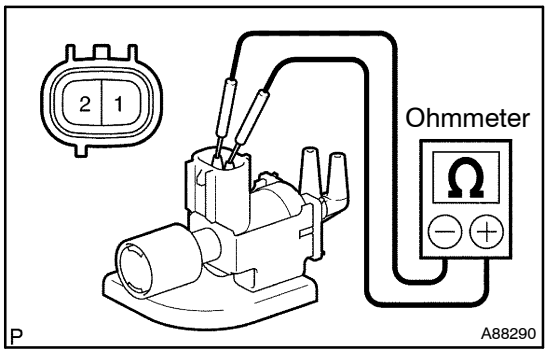
The value in the illustration is only for reference; the throttle valve may operate diversely depending on the engine running condition.

1308K–01

INSPECTION

1. INSPECT INTAKE AIR CONTROL VALVE ASSY

(a) Check the operation.



(1) With 34.7 kPa (260 mmHg, 10.2 in.Hg) of vacuum applied to the actuator, check that the actuator rod moves.

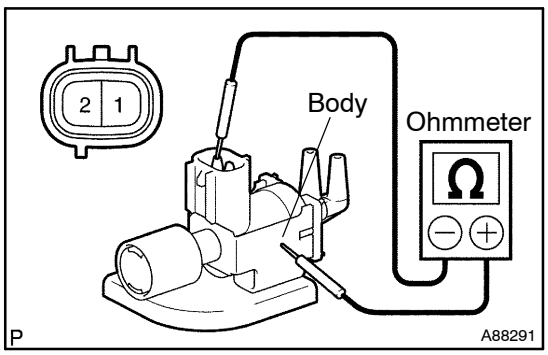
(2) 1 minute after applying the vacuum, check that the actuator rod does not return.

NOTICE:

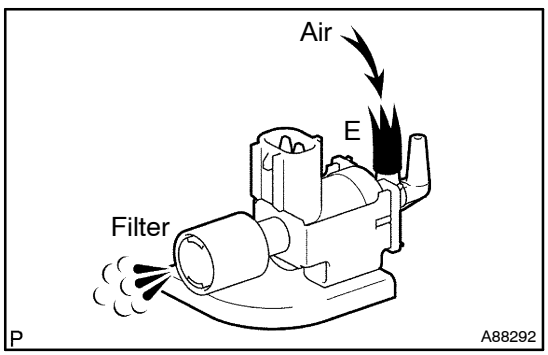
Do not adjust the adjust screw.

If the operation is not as specified, replace the intake air control valve.

2. INSPECT VACUUM SWITCHING VALVE ASSY NO.1



(a) Inspect the resistance.

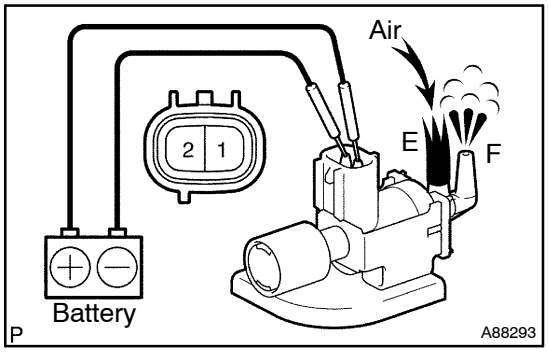


(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 – 2	33 to 39 Ω at 20°C (68°F)
1 – Body	10 kΩ or higher
2 – Body	10 kΩ or higher

If the result is not as specified, replace the vacuum switching valve No. 1.



(b) Check the ventilation.

(1) Check that air flows from port E to filter.

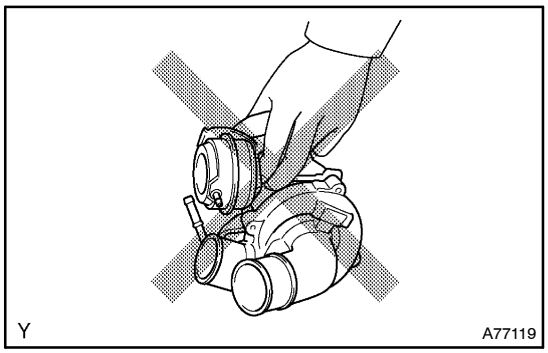
If the operation is not as specified, replace the vacuum switching valve No. 1.

(2) Apply battery voltage across the terminals.
(3) Check that air flows from ports E to F.

If the operation is not as specified, replace the vacuum switching valve No. 1.

TURBO CHARGER SYSTEM (1CD–FTV)(From September, 2003)

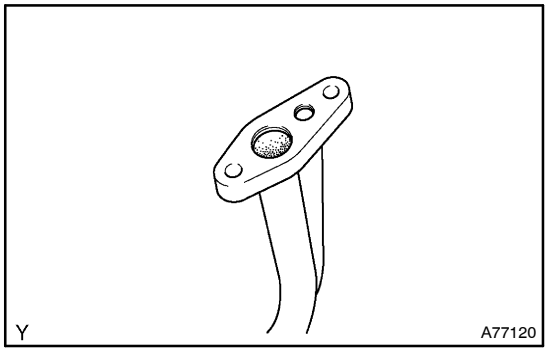
PRECAUTION



1302Y–04

1. MAINTENANCE PRECAUTION

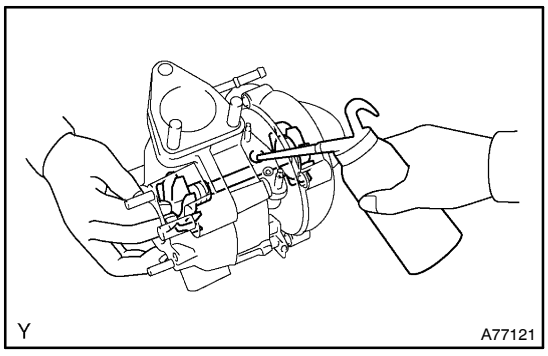
(a) Do not stop the engine immediately after pulling a trailer, or after high speed or uphill driving. Let the engine idle for 20 to 120 seconds before turning the ignition switch to OFF (according as the driving condition, the idling time varies).



(b) Avoid quickly accelerating the pedal or increasing the engine speed immediately after starting a cold engine.

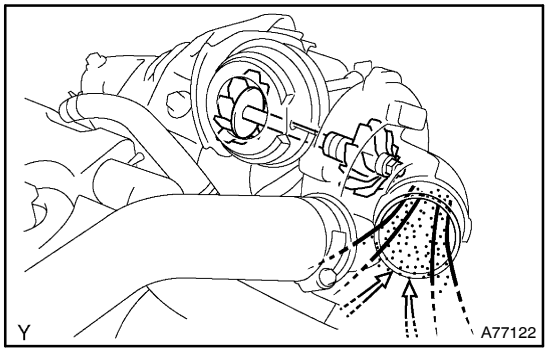
(c) If the turbocharger is found defective, it must be replaced. Also, inspect the source of the trouble including conditions of the turbocharger that having been used. Repair or replace the followings if necessary:
  (1) Engine oil (level and quality)
  (2) Oil lines leading to the turbocharger

(d) Pay due attention when removing and reinstalling the turbocharger assembly. Do not drop, grasp, or give shock to the easily–deformed assembly parts such as the actuator or push rod when removing or reinstalling.



(e) Before removing, cover both the intake and exhaust ports and the oil inlet to prevent dirt or foreign objects from being introduced.

(f) If replacing the turbocharger, check the oil pipe for deposits. If necessary, replace the oil pipe, too.



(g) Thoroughly remove old gasket sticking to the lubrication oil pipe flange and turbocharger oil flange.

(h) If replacing the bolt(s) or nut(s), Toyota genuine parts must be used to prevent breakage or deformation.

(i) If replacing the turbocharger, put 20 cm^3 (1.2 cu in.) of fresh oil into the turbocharger oil inlet hole, then turn the turbine wheel by hand to spread oil to the bearing.

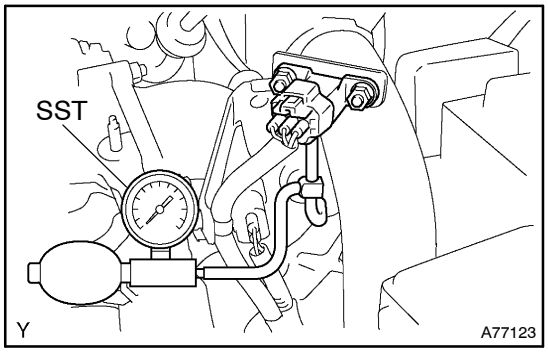
(j) If overhauling or replacing the engine, cut the fuel supply after reassembling and crank the engine for 30 seconds to feed oil throughout the engine. Run the engine at idle for 60 seconds.

(k) Since the turbine wheels run at extremely high speed, if the engine is running without the air cleaner, case cover and hose, the turbine wheel will be damaged by introduced foreign particles.

1302Z–04

ON–VEHICLE INSPECTION

1. INSPECT INTAKE AIR SYSTEM



(a) Check for leakage or clogging between the air cleaner housing and turbocharger inlet and between the turbocharger outlet and cylinder head.

Condition	Operation
Clogged air cleaner	Clean or replace the element
Collapsed or deformed hoses	Repair or replace
Leakage from connections	Check each connection and repair
Cracks in components	Check and replace

2. INSPECT EXHAUST SYSTEM

(a) Check for leakage or clogging between the cylinder head and turbocharger inlet and between the turbocharger outlet and exhaust pipe.

Condition	Operation
Deformed components	Repair or replace
Foreign material in passages	Remove
Leakage from components	Repair or replace
Cracks in components	Check and replace

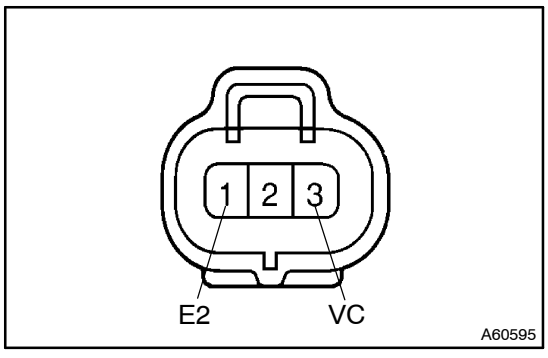
3. CHECK TURBOCHARGING PRESSURE

(a) Warm up the engine.

(b) Using a 3–way connector, connect SST (turbocharger pressure gauge) to the hose leading to the intake air connector.

SST 09992 – 00242

(c) While depressing the clutch pedal, press the accelerator pedal down fully. Measure the turbocharging pressure at the maximum speed (5,100 to 5,250 rpm).



Standard pressure:

15 to 45 kPa (0.15 to 0.46 kgf/cm^2, 2.2 to 6.5 psi)

If the pressure is less than specification, check both the intake air and exhaust systems for leakage.

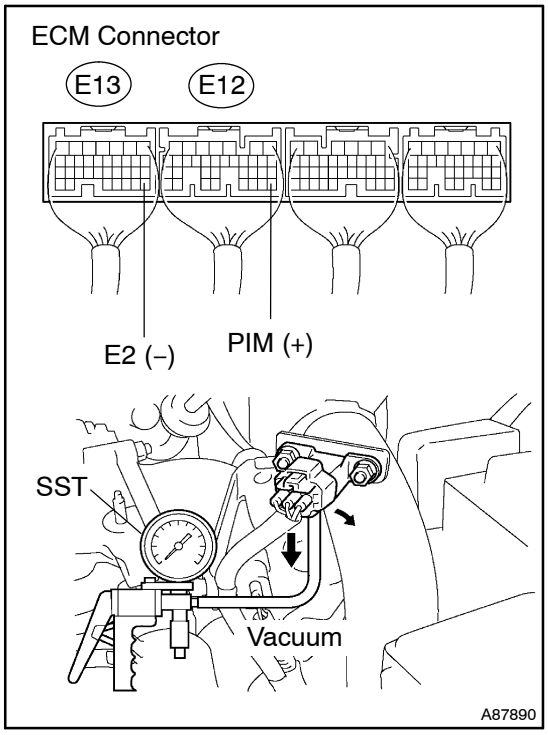
If there is no leakage, check if the actuator hose has disconnected. If not, check the turbocharger.

If the pressure is greater than the specification, check if the actuator hose has disconnected or cracked. If not, check the turbocharger.

4. INSPECT TURBO PRESSURE SENSOR

(a) Inspect the power source voltage.

(1) Disconnect the turbo pressure sensor connector.

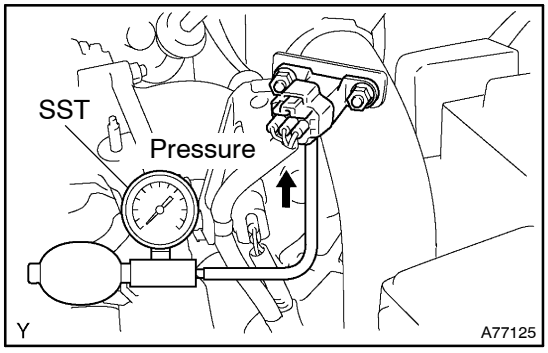


(2) Turn the ignition switch to ON.

(3) Using a voltmeter, measure the voltage between connector terminals 3 (VC) and 1 (E2) of the wire harness side.

Voltage: 4.5 to 5.5 V

If the result is not as specified, check the wiring and ECM.



(4) Turn the ignition switch to OFF.
(5) Reconnect the turbo pressure sensor connector.

(b) Inspect the supply power.
(1) Turn the ignition switch to ON.
(2) Disconnect the vacuum hose from the turbo pressure sensor.
(3) Connect a voltmeter to terminals E12–28 (PIM) and E13–28 (E2) of the ECM, then measure the output voltage under atmospheric pressure.
(4) Apply vacuum to the turbo pressure sensor in 13.3 kPa (100 mmHg, 3.94 in.Hg) to 66.7 kPa (500 mmHg, 19.69 in.Hg).
(5) Measure the voltage decrease from step (3).

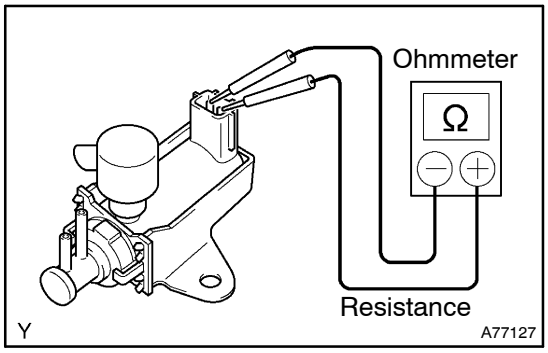
Voltage drop:

Apply Vacuum [kPa (mmHg, in.Hg)]	Voltage Decrease [V]
13.3 (100, 3.94)	0.1 to 0.3
26.7 (200, 7.87)	0.3 to 0.5
40.0 (300, 11.81)	0.5 to 0.7
57.3 (400, 15.75)	0.7 to 0.9
66.7 (500, 19.69)	0.9 to 1.0

(6) Using SST (a turbocharger pressure gauge), apply pressure to the turbo pressure sensor in 19.6 kPa (0.20 kgf/cm^2, 2.84 psi) to 98.0 kPa (1.00 kgf/cm^2, 14.2 psi).

SST 09992–00242

(7) Measure the voltage increase from step (3).



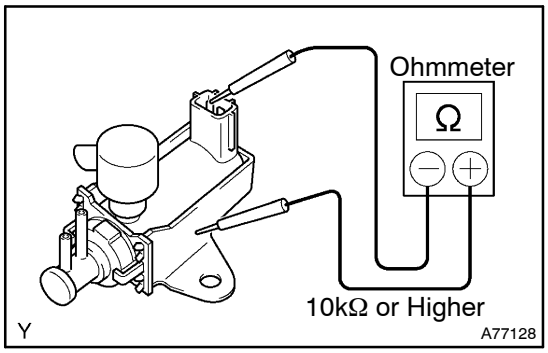
Voltage up:

Applied Pressure [kPa (kgf/cm^2, psi)]	Voltage Increase [V]
19.6 (0.20, 2.84)	0.1 to 0.4
39.2 (0.40, 5.69)	0.4 to 0.7
58.8 (0.60, 8.53)	0.7 to 1.0
78.5 (0.80, 11.4)	1.0 to 1.3
98.0 (1.00, 14.2)	1.3 to 1.6

If the result is not as specified, check the wiring and ECM.

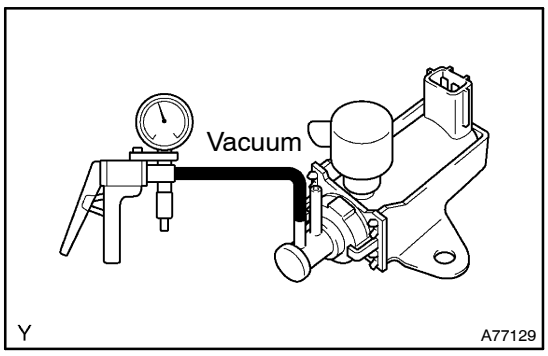
1308M–01

INSPECTION



1. INSPECT VACUUM REGULATING VALVE ASSY

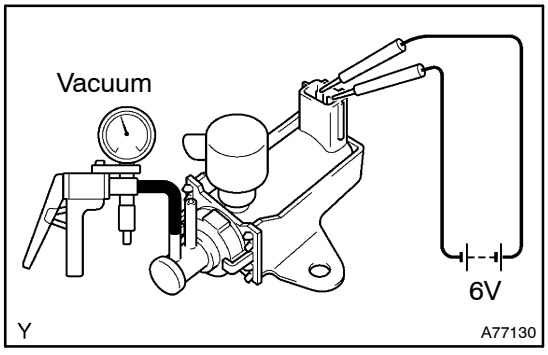
(a) Inspect the resistance.



(1) Using an ohmmeter, measure the resistance between the terminals.

Resistance:
10 to 14 Ω at 20°C (68°F)

(2) Using an ohmmeter, measure the resistance between each terminal and the body.



Standard: 10 kΩ or higher

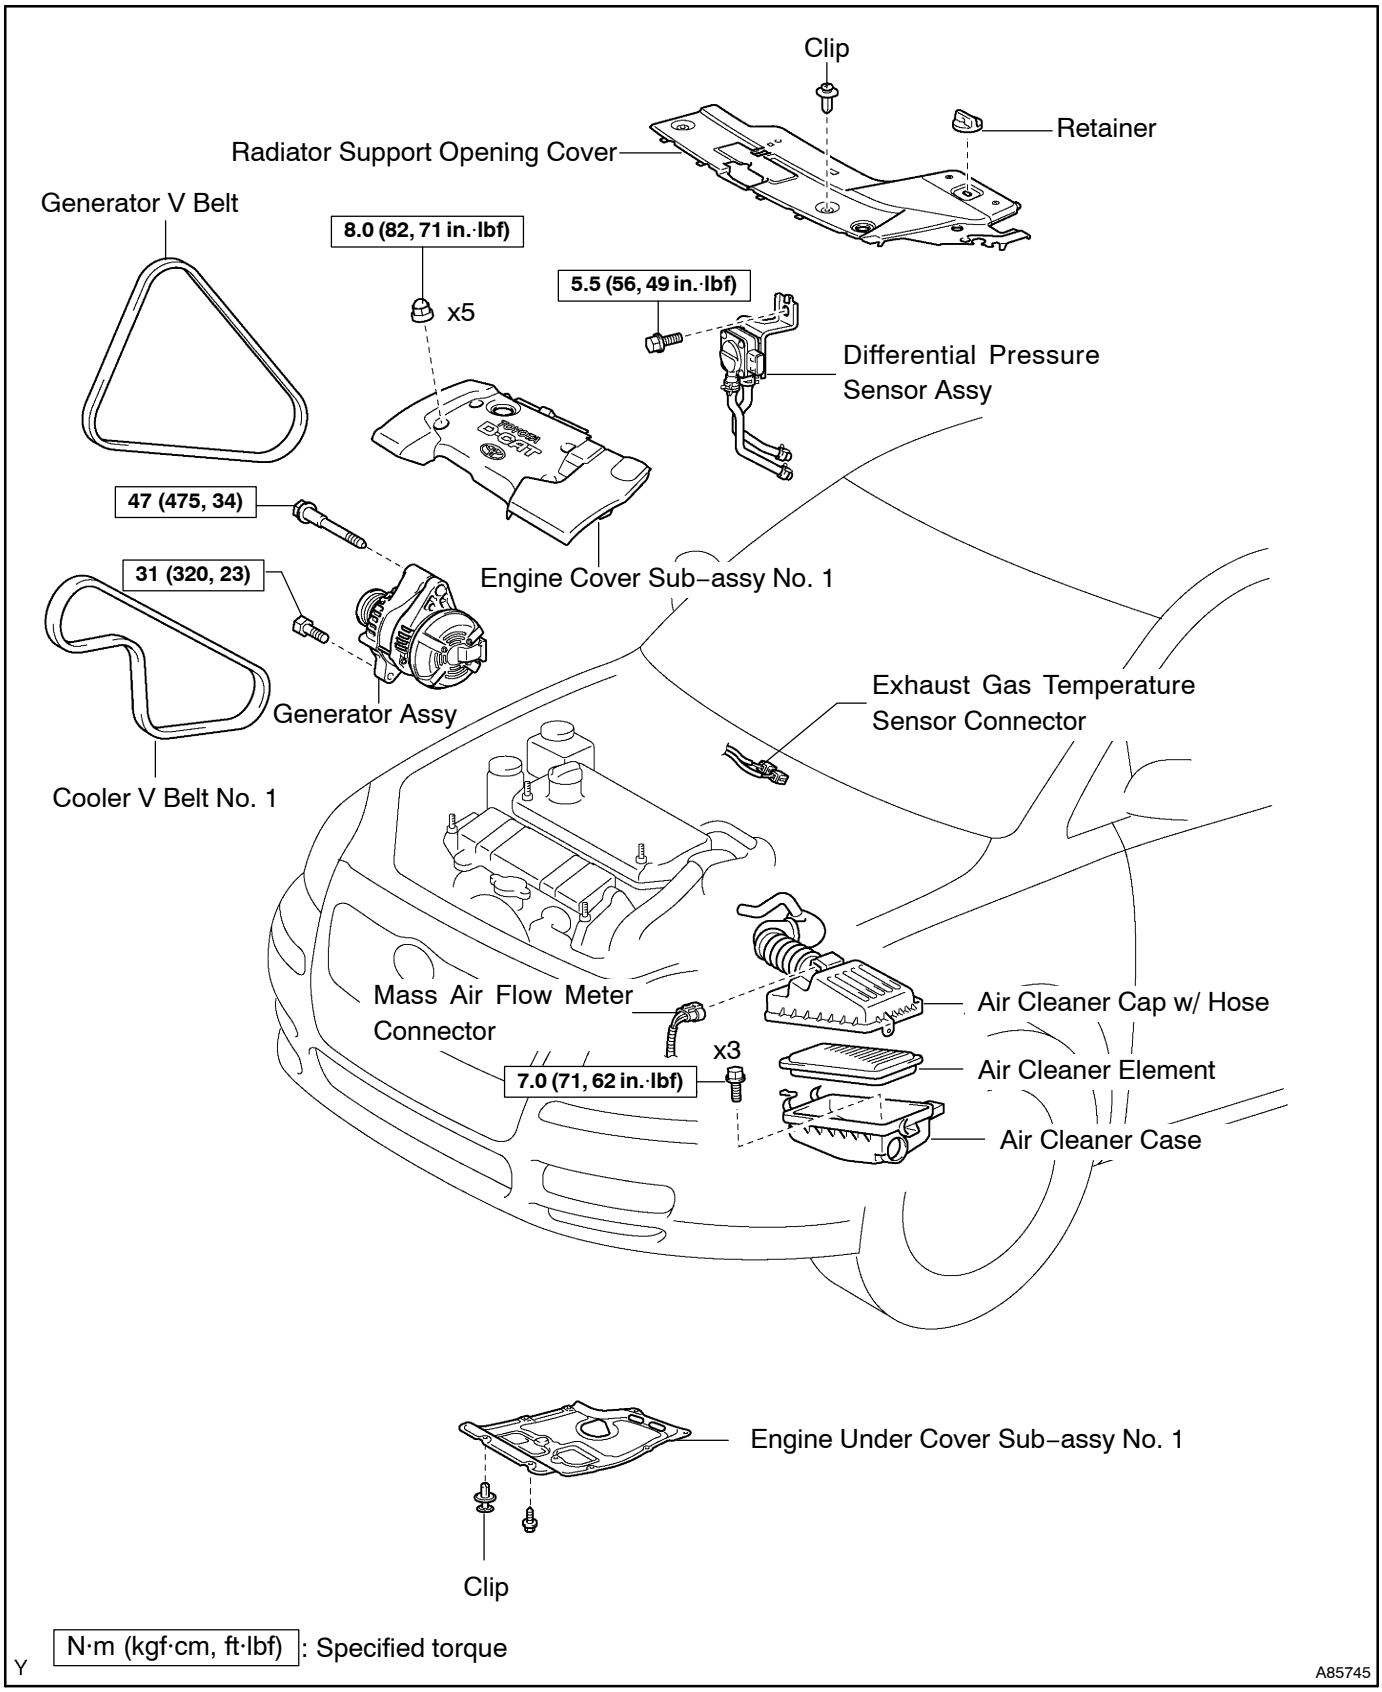
(b) Check the air tightness.

(1) Apply vacuum to the vacuum output port. Check that the needle of the vacuum pump indicates increase of 66.7 kPa (500 mmHg, 19.7 in.Hg) or more.

If the air tightness is not as specified, replace the vacuum regulating valve.

(c) Check the operation.

(1) Apply about 4 dry batteries of 1.5V in series.



(2) Check that the needle does not move when vacuum is applied to the vacuum outlet port.

If the operation is not as specified, replace the vacuum regulating valve.

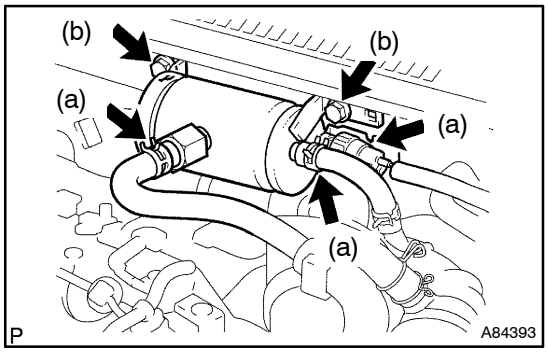
1308N–01

REPLACEMENT



1. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1

2. DRAIN ENGINE COOLANT (See page 16–19)

3. REMOVE RADIATOR SUPPORT OPENING COVER

4. REMOVE ENGINE COVER SUB–ASSY NO.1

(a) Remove the 5 nuts and engine cover.

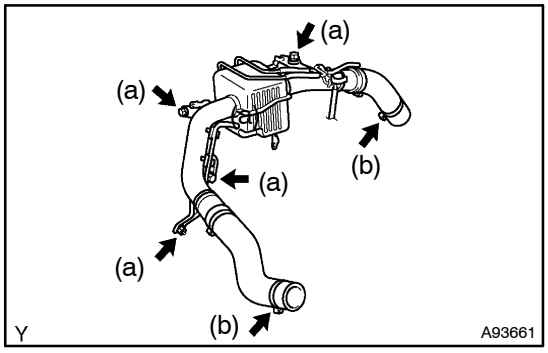
5. REMOVE VACUUM RESERVOIR SUB–ASSY

(a) Disconnect the 2 vacuum hoses and connector.

(b) Remove the 2 bolts and vacuum reservoir.

6. REMOVE DIFFERENTIAL PRESSURE SENSOR ASSY (See page 14–108)

7. DISCONNECT ENGINE WIRE (See page 14–138)



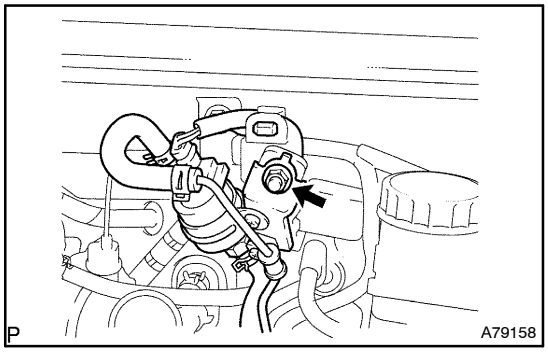
8. REMOVE AIR CLEANER ASSY

(a) Disconnect the PCV hose and connector.

(b) Remove the air cleaner cap with the air cleaner hose.

(c) Remove the air cleaner filter element.

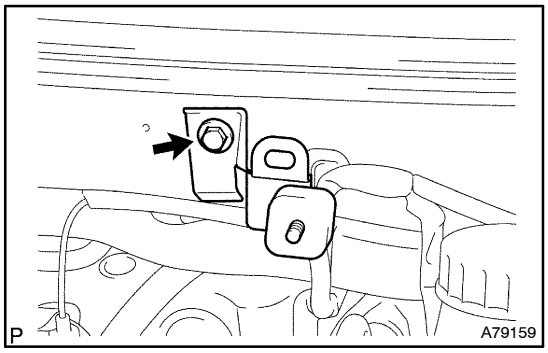
(d) Remove the 3 bolts and air cleaner case.



9. REMOVE AIR TUBE NO.1

(a) Remove the 3 bolts and nut, then separate the air tube No. 1.

(b) Loosen the hose clamp bolts.

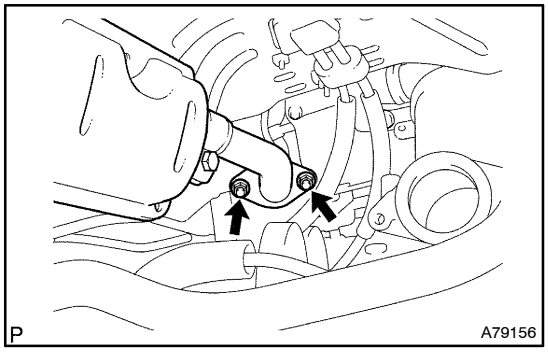


10. REMOVE FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)

11. SEPARATE HEATER PUMP ASSY (W/ COLD AREA)

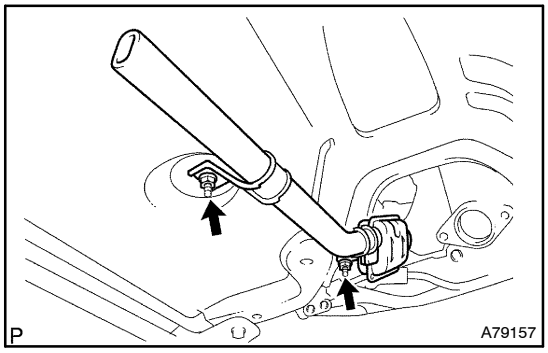
(a) Remove the nut, then disconnect the connector.

(b) Separate the heater pump.



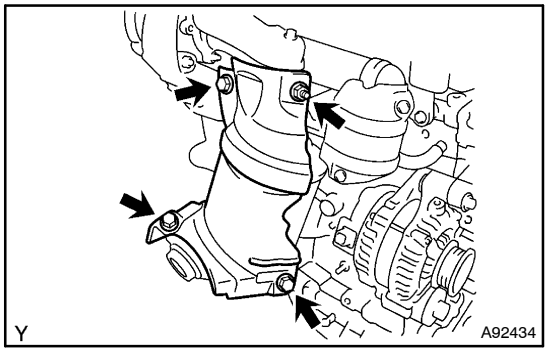
12. REMOVE HEATER BRACKET (W/ COLD AREA)

(a) Remove the bolt and heater bracket.



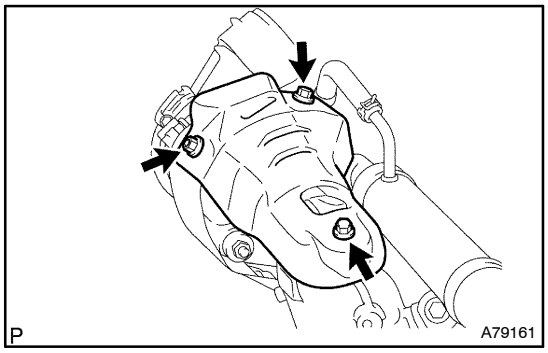
13. REMOVE FLOOR PANEL BRACE FRONT (See page 15–6)

14. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–6)

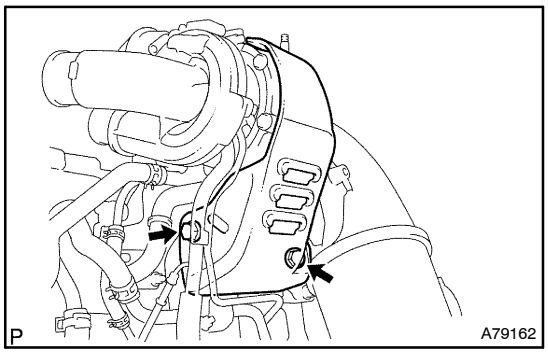


15. REMOVE EXHAUST PIPE ASSY (W/ COLD AREA)

(a) Remove the 2 nuts.



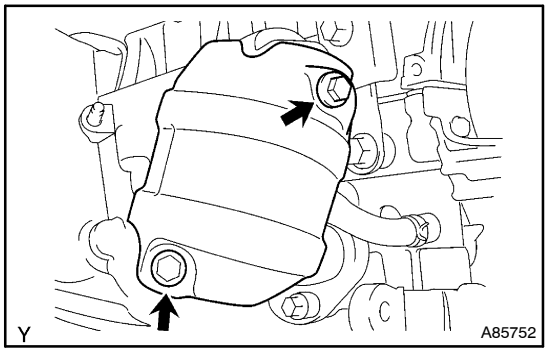
(b) Remove the 2 nuts and exhaust pipe sub–assembly.



16. REMOVE TURBO INSULATOR NO.2

(a) Remove the 3 bolts and nut, then remove the turbo insulator.

17. REMOVE TURBO INSULATOR NO.1

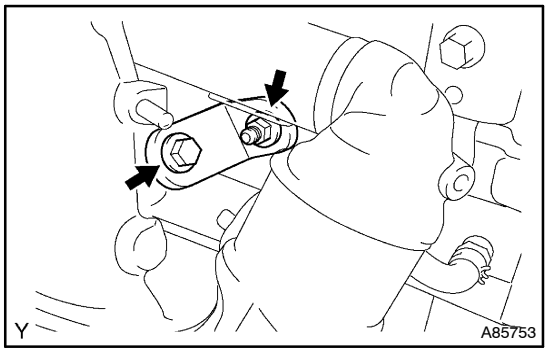


(a) Remove the 2 bolts and nut, then remove the turbo insulator.

18. REMOVE EXHAUST MANIFOLD HEAT INSULATOR NO.2

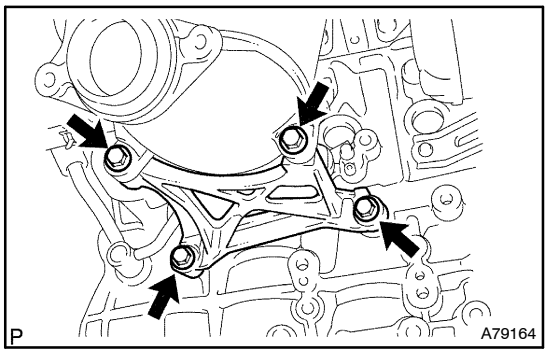
(a) Remove the 2 bolts and exhaust manifold heat insulator.

19. REMOVE GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)



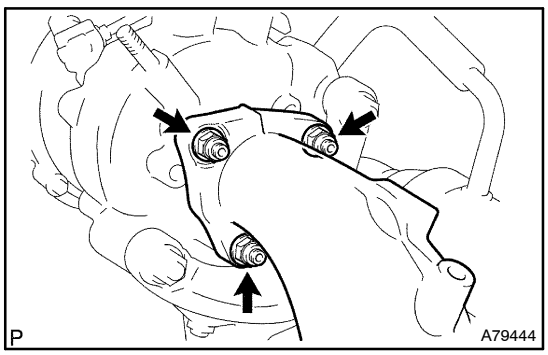
20. REMOVE EGR PIPE INSULATOR

(a) Remove the 2 bolts and EGR pipe insulator.

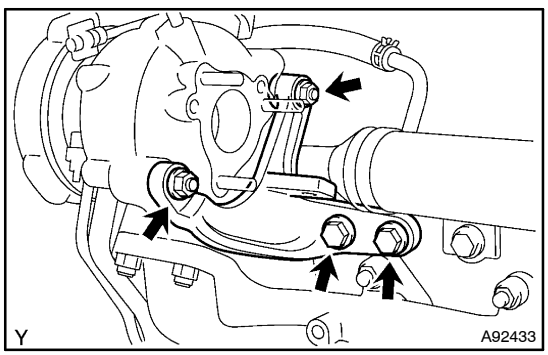


21. REMOVE EXHAUST GAS TEMPERATURE SENSOR (See page 14–108)
SST 09023–38400

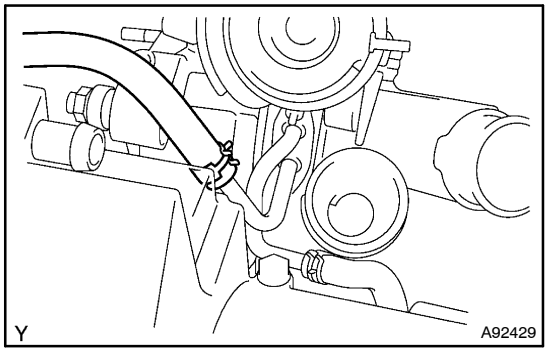
22. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.1 (See page 14–108)
SST 09023–38200



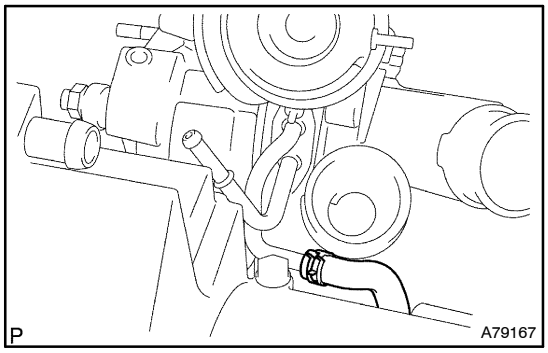
23. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.2 (See page 14–108)
SST 09023–38200



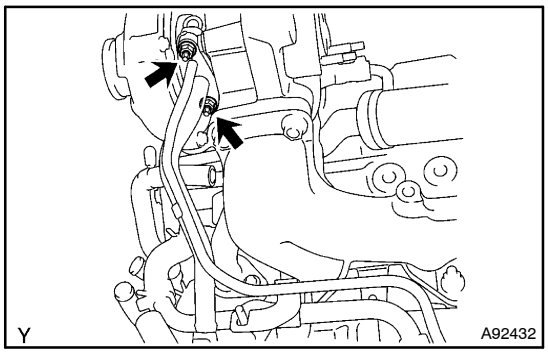
24. REMOVE MANIFOLD STAY NO.2
(a) Remove the bolt and nut, then remove the manifold stay No. 2.



25. REMOVE MANIFOLD STAY
(a) Remove the 4 bolts and manifold stay.

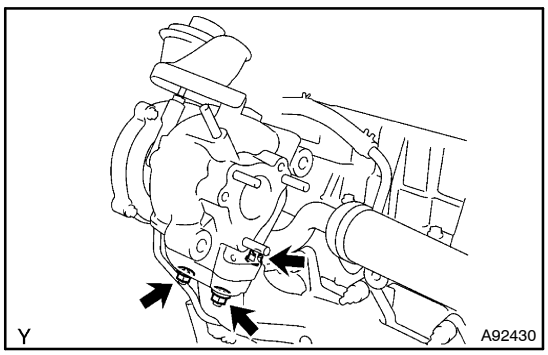


26. REMOVE EXHAUST MANIFOLD CONVERTER SUB–ASSY
(a) Remove the 3 nuts, manifold converter and gasket.

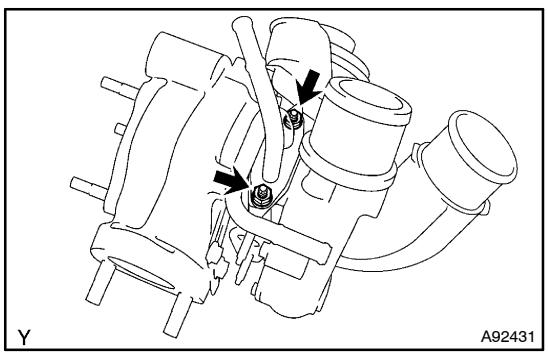


27. REMOVE TURBOCHARGER STAY
(a) Remove the 2 bolts and 2 nuts, then remove the turbocharger stay.

28. DISCONNECT TURBO WATER HOSE NO.1



29. DISCONNECT TURBO WATER HOSE NO.2



30. SEPARATE TURBO OIL INLET PIPE SUB–ASSY

(a) Remove the 2 nuts, turbo oil pipe and gasket.

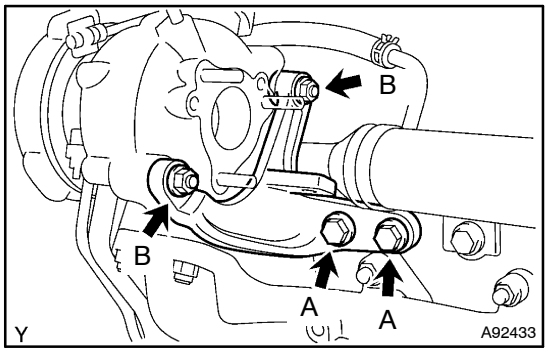
31. REMOVE TURBOCHARGER SUB–ASSY

(a) Remove the 3 nuts, turbocharger and gasket.

32. REMOVE TURBO WATER PIPE SUB–ASSY NO.1

(a) Remove the 2 nuts, turbo water pipe and gasket.

33. INSTALL TURBO WATER PIPE SUB–ASSY NO.1



(a) Install a new gasket and the turbo water pipe with the 2 nuts.
Torque: 13 N·m (135 kgf·cm, 9.8 ft·lbf)

34. INSTALL TURBOCHARGER SUB–ASSY

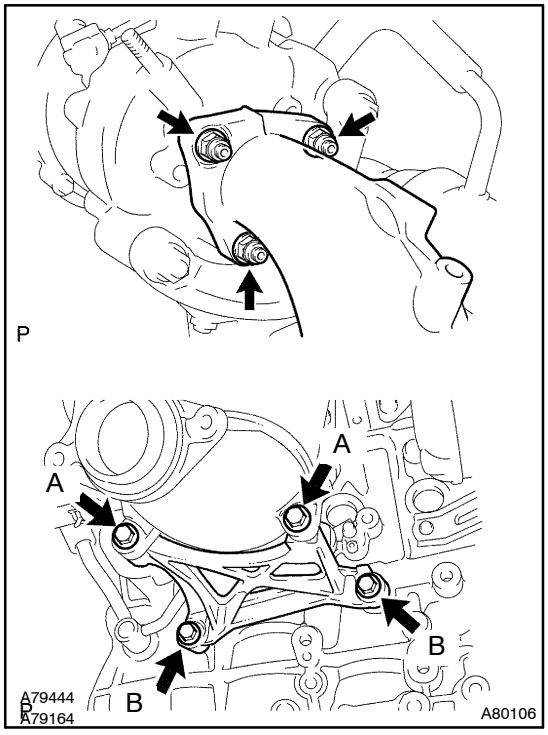
(a) Install a new gasket and the turbocharger with the 3 nuts.
Torque: 60 N·m (612 kgf·cm, 44 ft·lbf)

35. INSTALL TURBO OIL INLET PIPE SUB–ASSY

(a) Install a new gasket and the oil pipe with the 2 nuts.
Torque: 13 N·m (135 kgf·cm, 9.8 ft·lbf)

36. INSTALL TURBOCHARGER STAY

(a) Install the turbocharger stay, then temporarily tighten bolts A.



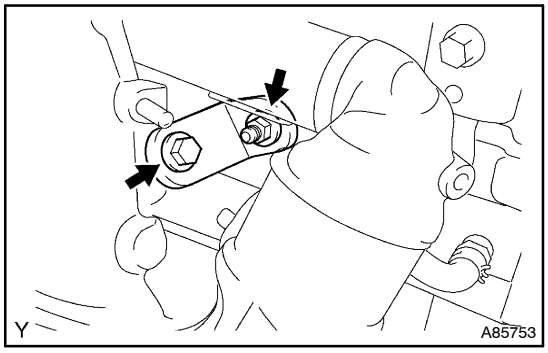
(b) Temporarily tighten nuts B while pushing the cylinder head toward the turbocharger stay.
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

(c) Tighten bolts A.
Torque: 56 N·m (571 kgf·cm, 41 ft·lbf)

(d) Tighten nuts B.
Torque: 56 N·m (571 kgf·cm, 41 ft·lbf)

37. INSTALL EXHAUST MANIFOLD CONVERTER SUB–ASSY

(a) Install the manifold stay, then temporarily tighten the cylinder block side of the manifold stay.



(b) Install a new gasket and the manifold converter, then temporarily tighten bolts A and bolts B while pushing the upper portion of the converter toward the turbocharger.
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

(c) Tighten the 3 nuts.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

(d) Tighten bolts A.
Torque: 61 N·m (622 kgf·cm, 45 ft·lbf)

(e) Tighten bolts B.
Torque: 61 N·m (622 kgf·cm, 45 ft·lbf)

38. INSTALL MANIFOLD STAY NO.2

(a) Install the manifold stay No. 2, then temporarily tighten the bolt.

(b) Temporarily tighten the nut while pushing the manifold stay No. 2 toward the cylinder head.

Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

HINT:

No clearance between the stay and cylinder head should be confirmed.

(c) Tighten the bolt.

Torque: 56 N·m (571 kgf·cm, 41 ft·lbf)

(d) Tighten the nut.

Torque: 56 N·m (571 kgf·cm, 41 ft·lbf)

39. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.2 (See page 14–108)

SST 09023–38200

40. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.1 (See page 14–108)

SST 09023–38200

41. INSTALL EXHAUST GAS TEMPERATURE SENSOR (See page 14–108)

SST 09023–38400

42. INSTALL EGR PIPE INSULATOR

Torque: 12 N·m (122 kgf·cm, 8.9 ft·lbf)

43. INSTALL GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)

44. INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.2

Torque: 12 N·m (122 kgf·cm, 8.9 ft·lbf)

45. INSTALL TURBO INSULATOR NO.1

Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

46. INSTALL TURBO INSULATOR NO.2

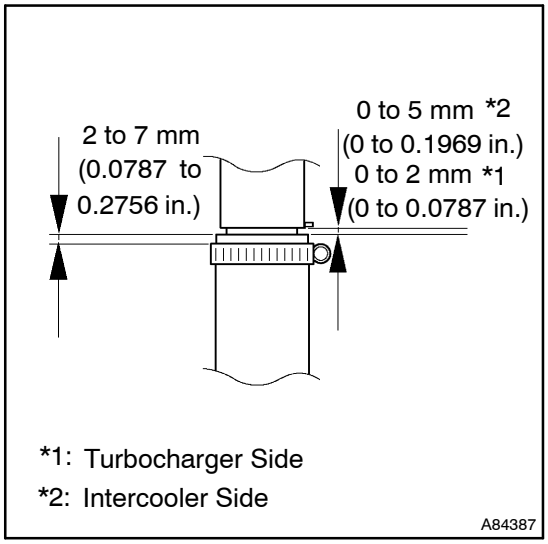
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

47. INSTALL EXHAUST PIPE ASSY (W/ COLD AREA)

Torque: 7.5 N·m (76 kgf·cm, 66 in.·lbf)

48. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–6)

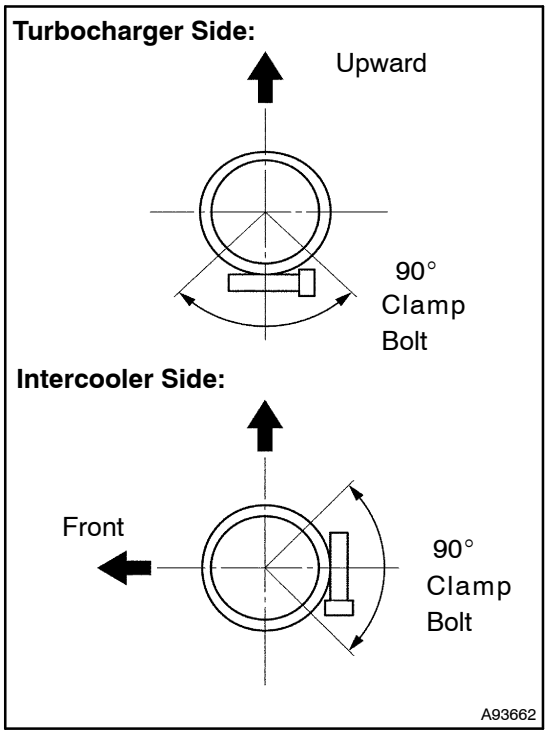
49. INSTALL FLOOR PANEL BRACE FRONT (See page 15–6)



50. INSTALL HEATER BRACKET (W/ COLD AREA)

Torque: 7.5 N·m (76 kgf·cm, 66 in.·lbf)

51. INSTALL HEATER PUMP ASSY (W/ COLD AREA)



Torque: 7.5 N·m (76 kgf·cm, 66 in.·lbf)

52. INSTALL FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)

53. INSTALL AIR TUBE NO.1

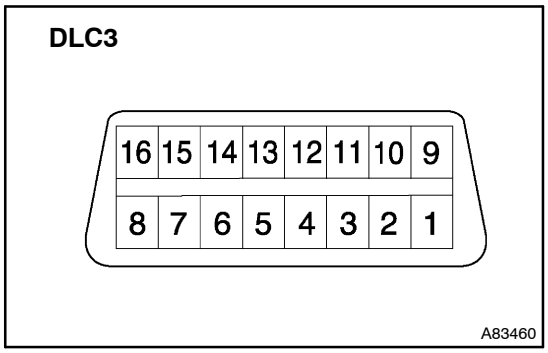
(a) Install the air hose and hose clamps as shown in the illustration.

(b) Tighten the hose clamps as shown in the illustration.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

(c) Install the air tube No. 1 with the 3 bolts and nut.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

54. INSTALL DIFFERENTIAL PRESSURE SENSOR ASSY (See page 14–108)
55. INSTALL AIR CLEANER ASSY
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
56. INSTALL VACUUM RESERVOIR SUB–ASSY
Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)
57. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
58. ADD ENGINE COOLANT (See page 16–19)
59. CHECK ENGINE OIL LEVEL
60. CHECK FOR ENGINE COOLANT LEAKS (See page 16–15)
61. CHECK FOR ENGINE OIL LEAKS
62. CHECK FOR FUEL LEAKS (See page 11–46)
63. CHECK FOR EXHAUST GAS LEAKS

ENGINE (2AZ–FSE)



141N2–01

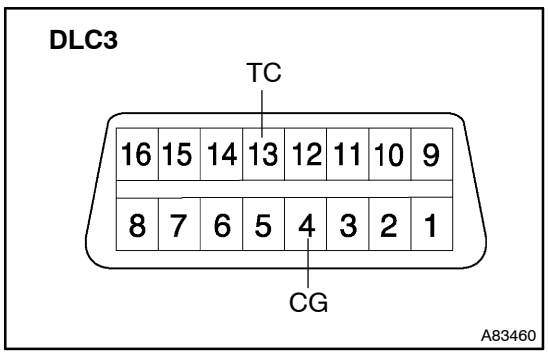
INSPECTION

1. **INSPECT COOLANT (See page 16–7)**
2. **INSPECT ENGINE OIL (See page 17–1)**
3. **INSPECT BATTERY (See page 19–6)**
4. **INSPECT AIR CLEANER FILTER ELEMENT SUB–ASSY**
5. **INSPECT SPARK PLUG (See page 18–3)**
6. **INSPECT V–RIBBED BELT**
7. **INSPECT IGNITION TIMING**

(a) Warm up the engine.

(b) Remove the DLC3 cover from the DLC3 connector.

(c) When using the hand–held tester.



(1) Connect the hand–held tester to the DLC3.

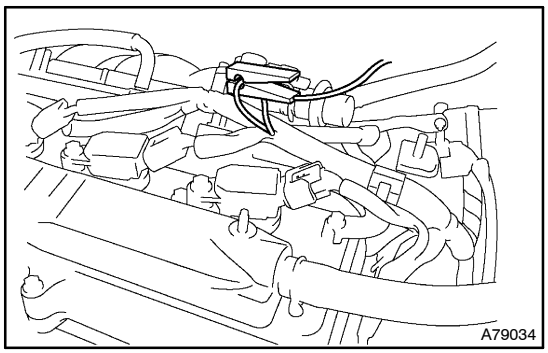
(2) Enter DATA LIST MODE on the hand–held tester.

Ignition timing: 8 to 12° BTDC

HINT:

Please refer to the hand–held tester operator's manual if you need help to select DATA LIST.

(d) When not using the hand–held tester.



(1) Using SST, connect terminals 13 (TC) and 4 (CG) of DLC3.

SST 09843–18040

NOTICE:

- **Be careful to connect correctly. It causes breakage of the engine.**
- **Turn all electrical systems OFF before connecting the terminals.**
- **Operate the inspection after the cooling fan motor is turned OFF**

(2) Remove the cylinder head cover No.2 (see page 14–45).

(3) Pull out the wire harness as shown in the illustration. Connect the clip of the timing light to the engine.

NOTICE:

- **Use a timing light which detects the first signal.**
- **After checking, be sure to wrap the wire harness with tape.**

(4) Inspect the ignition timing at idle.

Ignition timing: 8 to 12° BTDC

NOTICE:

When checking the ignition timing, shift the transmission to the neutral position.

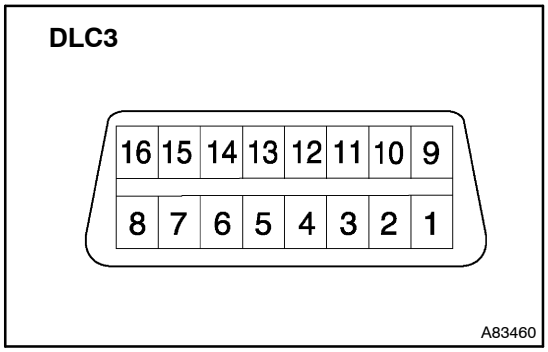
HINT:

Run the engine speed at 1,000 to 1,300 rpm for 5 seconds, check that the engine speed returns to the idle speed.

(5) Disconnect terminals 13 (TC) and 4 (CG) of the DLC3.

(6) Inspect the ignition timing at idle.

Ignition timing: 5 to 23° BTDC



(7) Confirm that ignition timing moves to advanced angle when the engine speed is increased.

(8) Remove the timing light.

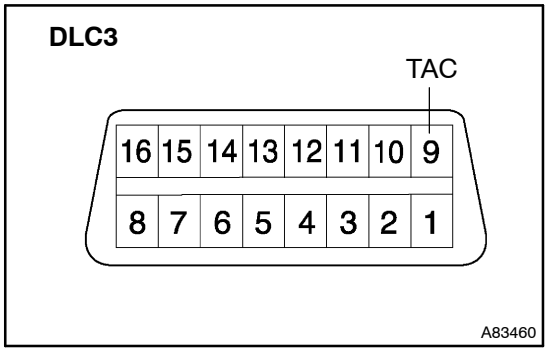
8. INSPECT ENGINE IDLE SPEED

(a) Warm up the engine.

(b) Remove the DLC3 cover from the DLC3 connector.

(c) When using the hand–held tester:

(1) Connect the hand–held tester to the DLC3.



Idle speed: 625 to 725 rpm

NOTICE:

- **Check idle speed with the cooling fan OFF.**
- **Switch off all accessories and air conditioning.**

HINT:

Please refer to the hand–held tester operator's manual if you need help to select DATA LIST.

(d) When not using hand–held tester:

(1) Using SST, connect the tachometer test prove to terminal 9 (TAC) of DLC3.

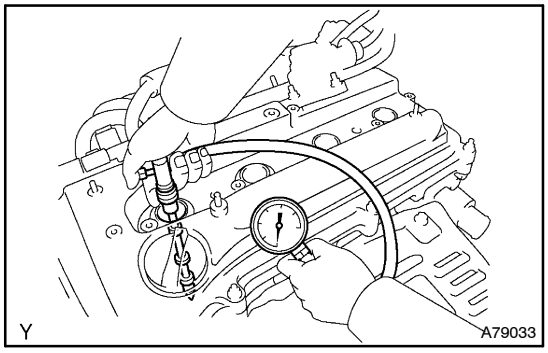
SST 09843–18030

(2) Check the idle speed.

Idle speed: 625 to 725 rpm

NOTICE:

- **Check the idle speed with the cooling fan OFF.**
- **Switch OFF all accessories and air conditioning.**



9. INSPECT COMPRESSION

(a) Stop a warm engine.

(b) Disconnect the injector connectors.

(c) Remove all ignition coils.

(d) Remove all spark plugs.

(e) Inspect the cylinder compression pressure.
SST 09992–00500
(1) Insert a compression gauge into the spark plug hole.
(2) Fully open the throttle with hand.
(3) While cranking the engine, measure the compression pressure.

Compression pressure:
1.3 MPa (13.3 kgf/cm^2, 189 psi)
Minimum pressure:
1.0 MPa (10.2 kgf/cm^2, 145 psi)
Difference between each cylinder:
0.1 MPa (1.0 kgf/cm^2, 14 psi)

NOTICE:
- **Always use a fully–charged battery to obtain engine speed of 250 rpm or more.**
- **Check the other cylinder's compression pressure in the same way.**
- **This measurement must be done quickly as possible.**

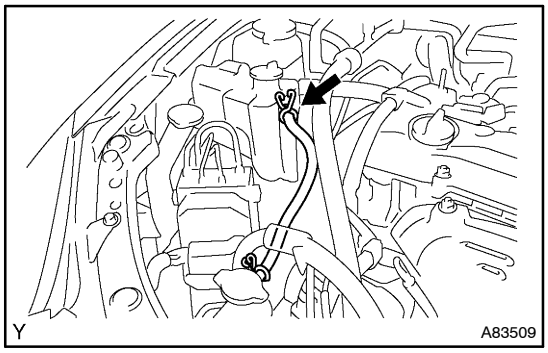
(4) If the cylinder compression is low, pour a small amount of engine oil into the cylinder through the spark plug hole and inspect again.

HINT:
- If adding oil increases the compression, it is likely that the piston rings and/or cylinder bore may be worn or damaged.
- If pressure stays low, the valve may be sticking or seating improperly, or there may be leakage past the gasket.

10. INSPECT CO/HC

(a) Start the engine.
(b) Race the engine at 2,500 rpm for approximately 180 seconds.
(c) Insert the CO/HC meter testing probe at least 40 cm (1.3 ft) into the tailpipe during idling.
(d) Check the CO/HC concentration at idle and/or 2,500 rpm.

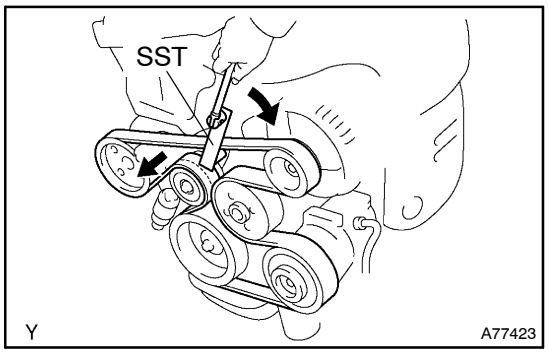
HINT:
When performing the 2 modes test (2,500 rpm and idle), follow the measurement order prescribed by the applicable local regulations.
If the CO/HC concentration does not comply with regulations, troubleshoot in the order given below.
(1) Check the A/F sensor and heated oxygen sensor operation.
(2) See the table below for possible causes, then inspect and repair the applicable causes if necessary.



CO	HC	Problems	Causes
Normal	High	Rough idle	1. Faulty ignitions: • Incorrect timing • Fouled, shorted or improperly gapped plugs 2. Incorrect valve clearance 3. Leaky in intake and exhaust valves 4. Leaky in cylinders
Low	High	Rough idle (Fluctuating HC reading)	1. Vacuum leaks: • PCV hoses • Intake manifold • Throttle body • Brake booster line 2. Lean mixture causing misfire
High	High	Rough idle (Black smoke from exhaust)	1. Restricted air filter 2. Plugged PCV valve 3. Faulty SFI systems: • Faulty pressure regulator • Defective water temperature sensor • Faulty ECM • Faulty injectors • Faulty throttle position sensor • Faulty MAF sensor

FAN AND GENERATOR V BELT (2AZ–FSE)

141N3–01



REPLACEMENT

1. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)**
2. **REMOVE ENGINE ROOM COVER SIDE (See page 14–23)**
3. **REMOVE ENGINE UNDER COVER LH (See page 14–23)**
4. **REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)**
5. **REMOVE ENGINE UNDER COVER RH (See page 14–23)**

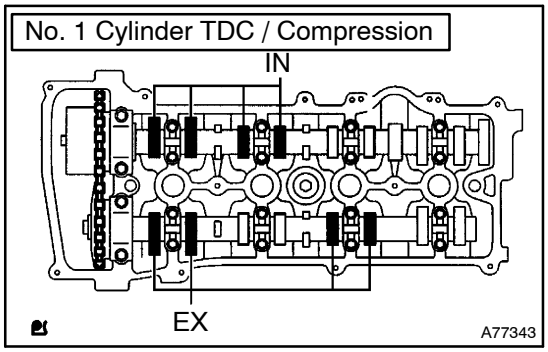
6. **REMOVE FAN AND GENERATOR V BELT**

(a) Disconnect the radiator reserve tank hose as shown in the illustration.

(b) Using SST, loosen the V belt tensioner arm clockwise, then remove the fan and generator V belt.
SST 09249–63010

7. **INSTALL FAN AND GENERATOR V BELT**

(a) Using SST, loosen the V belt tensioner arm clockwise, then install the fan and generator V belt.
SST 09249–63010



8. **INSTALL ENGINE UNDER COVER RH**
9. **INSTALL ENGINE UNDER COVER NO.4 RH**
10. **INSTALL ENGINE UNDER COVER LH**
11. **INSTALL ENGINE ROOM COVER SIDE**
12. **INSTALL RADIATOR SUPPORT OPENING COVER**

VALVE CLEARANCE (2AZ–FSE)

141N4–01

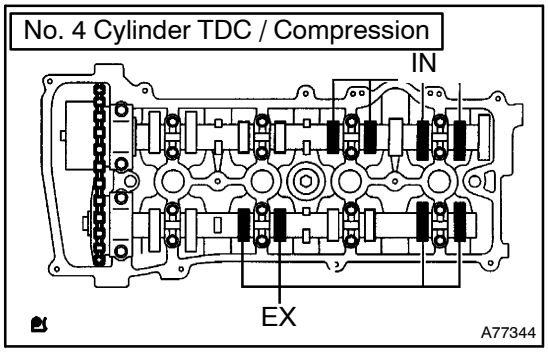
ADJUSTMENT

1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–4)
2. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)
3. REMOVE ENGINE ROOM COVER SIDE (See page 14–23)
4. REMOVE ENGINE UNDER COVER LH (See page 14–23)
5. REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)
6. REMOVE ENGINE UNDER COVER RH (See page 14–23)
7. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–45)
8. REMOVE FUEL PRESSURE PULSATION DAMPER ASSY
9. REMOVE FUEL TUBE SUB–ASSY (See page 11–4)
10. REMOVE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
    SST 09023–12900
11. REMOVE IGNITION COIL ASSY (See page 14–45)
12. REMOVE CYLINDER HEAD COVER SUB–ASSY (See page 14–45)
13. SET NO.1 CYLINDER TO TDC/COMPRESSION (See page 14–45)

14. INSPECT VALVE CLEARANCE

HINT:

Inspect and adjust the valve clearance when the engine is cold.



(a) Check the valves indicated in the illustration.

(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

Valve clearance (Cold):
Intake 0.19 to 0.29 mm (0.0075 to 0.0114 in.)
Exhaust 0.30 to 0.40 mm (0.0118 to 0.0157 in.)

(2) Record the out–of specification valve clearance measurements. They will be used later to determine the required replacement adjusting shim.

(b) Turn the crankshaft clockwise 1 revolution (360°), then set No. 4 cylinder to TDC/compression.

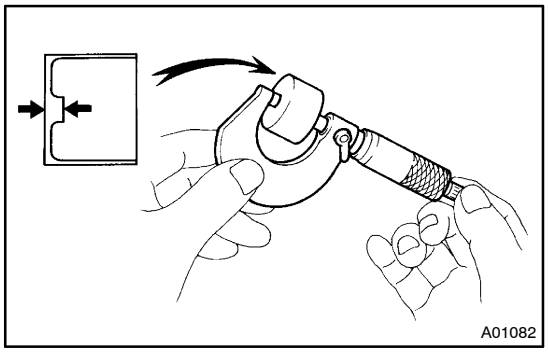
(c) Check the valves indicated in the illustration.

(1) Using a feeler gauge, measure the clearance between the valve lifter and the camshaft.

Valve clearance (Cold):
Intake 0.19 to 0.29 mm (0.0075 to 0.0114 in.)
Exhaust 0.30 to 0.40 mm (0.0118 to 0.0157 in.)

(2) Record the out–of specification valve clearance measurements. They will be used later to determine the required replacement adjusting shim.

15. ADJUST VALVE CLEARANCE



NOTICE:

Be sure not to turn the crankshaft without the chain tensioner.

(a) Set the No. 1 cylinder to TDC/compression (see page 14–45).
(b) Remove the chain tensioner (see page 14–45).

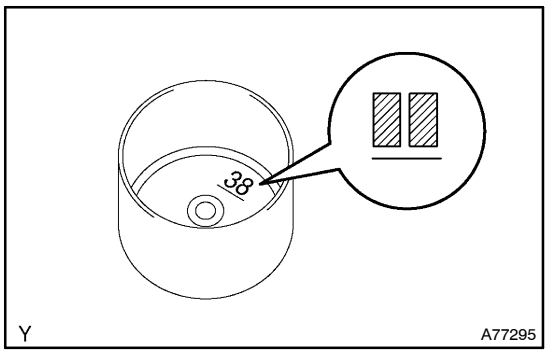
NOTICE:
Be careful not to drop anything inside the timing chain cover.

(c) Remove the camshafts (see page 14–64).
(d) Tie the timing chain with a string.
(e) Remove the valve lifters.

A01082

(f) Determine the replacement valve lifter size according to these Formula or Charts:
(1) Using a micrometer, measure the thickness of the removed lifter.
(2) Calculate the thickness of a new lifter so that the valve clearance comes within the specified valve.

A	Thickness of new lifter
B	Thickness of used lifter
C	Measured valve clearance



Valve clearance:
Intake: A = B + (C – 0.24 mm (0.0094 in.))
Exhaust: A = B + (C – 0.35 mm (0.0138 in.))

EXAMPLE: (Intake)
Measure valve clearance = 0.44 mm (0.0173 in.)
0.44 mm (0.0173 in.) – 0.24 mm (0.0094 in.) = 0.20 mm (0.0079 in.)
(Measured – Specification = Excess clearance)
Used shim measurement = 5.30 mm (0.2087 in.)
0.20 mm (0.0079 in.) + 5.30 mm (0.2087 in.) = 5.50 mm (0.2165 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 5.50 mm (0.2165 in.) = Shim No. "50"

(3) Select a new lifter with a thickness which is as close to the calculated valves as possible.

HINT:

- The lifter are available in 35 sizes in increments of 0.020 mm (0.0008 in.), from 5.060 mm (0.1992 in.) to 5.740 mm (0.2260 in.).

A77295

- Identification number inside the valve lifter shows the value of the 2 decimal places. (The illustration shows 5.380 mm (0.2118 in.))
- Refer to the New Lifter Thickness Table on the next 2 pages.

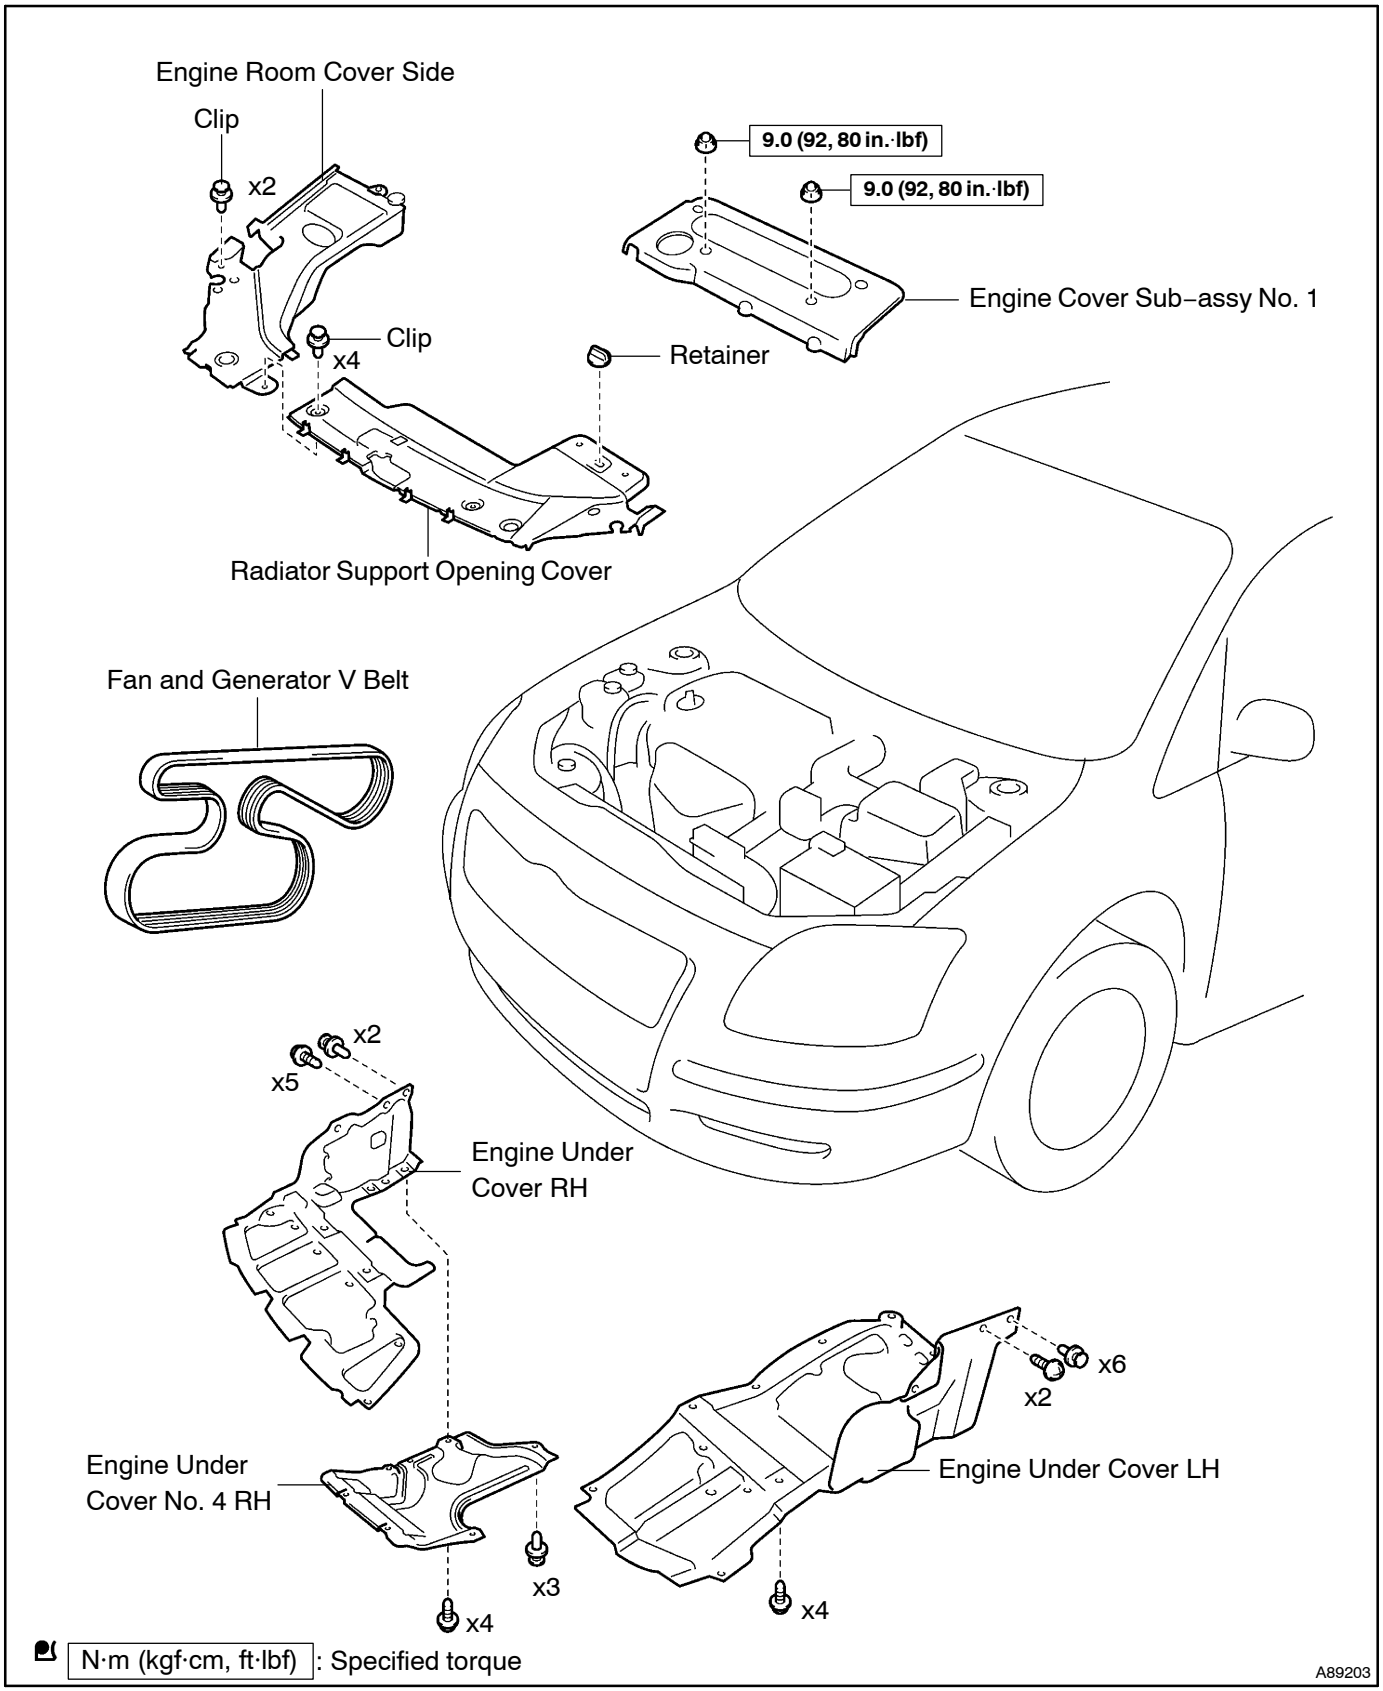
Exhaust valve clearance (Cold):
0.30 to 0.40 mm (0.0118 to 0.0157 in.)

EXAMPLE:

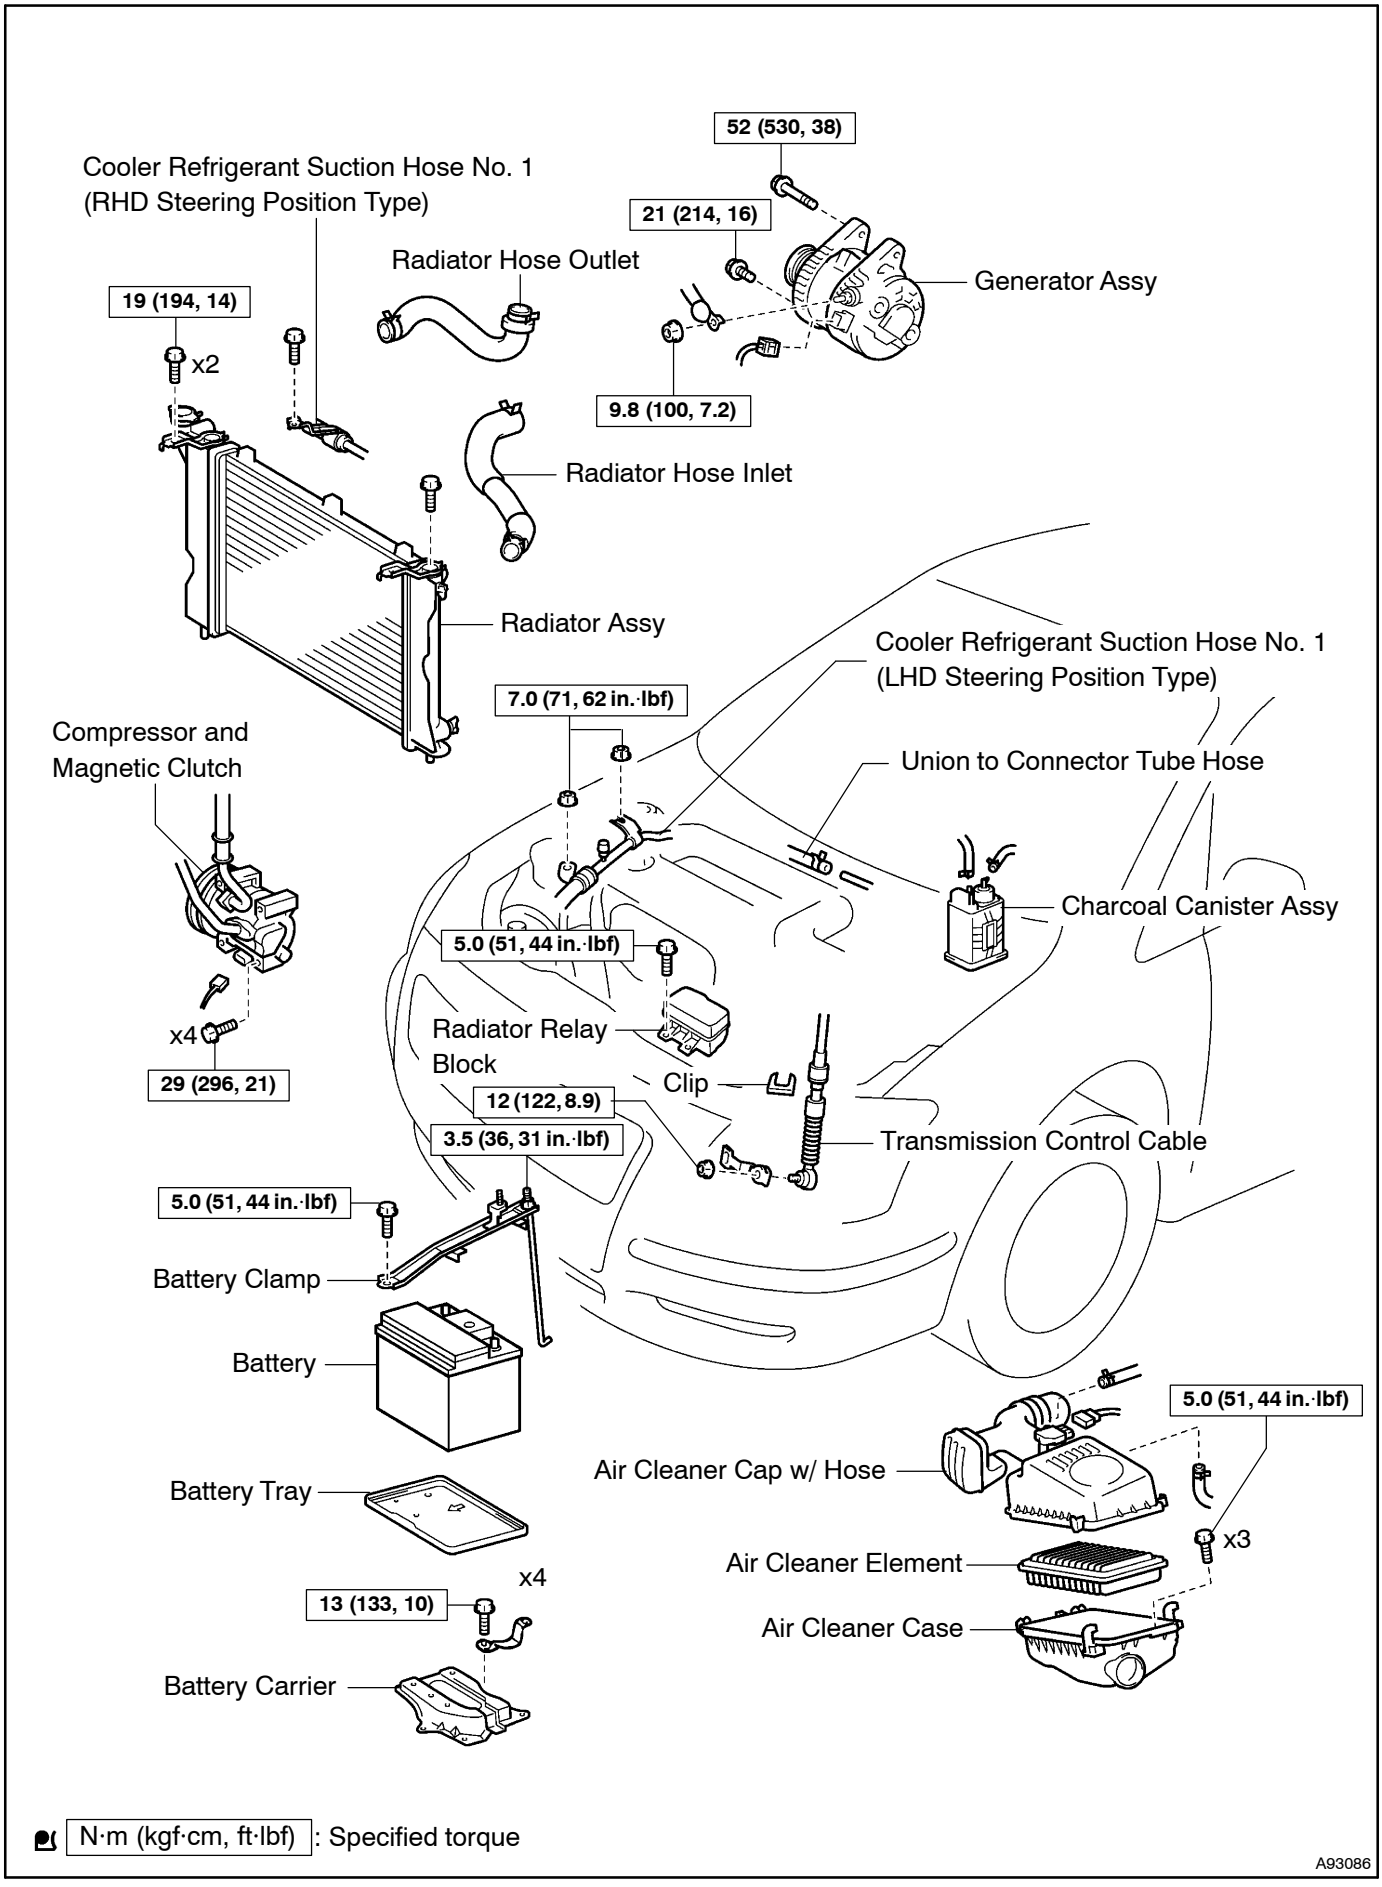
The 5.340 mm (0.2102 in.) lifter is installed, and
the measured clearance is 0.440 mm (0.0173 in.).

Replace the 5.340 mm (0.2102 in.) lifter with a new No. 44 lifter.

A93870



(g) Install the camshafts (see page 14–64).
(h) Install the chain tensioner (see page 14–45).



16. **INSTALL CYLINDER HEAD COVER SUB–ASSY (See page 14–45)**
17. **INSTALL IGNITION COIL ASSY**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
18. **INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)**
    SST 09023–12900
19. **INSTALL FUEL TUBE SUB–ASSY (See page 11–4)**
20. **INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)**
21. **CHECK FOR ENGINE OIL LEAKS**
22. **CHECK FOR FUEL LEAKS (See page 11–4)**
23. **INSTALL ENGINE COVER SUB–ASSY NO.1**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

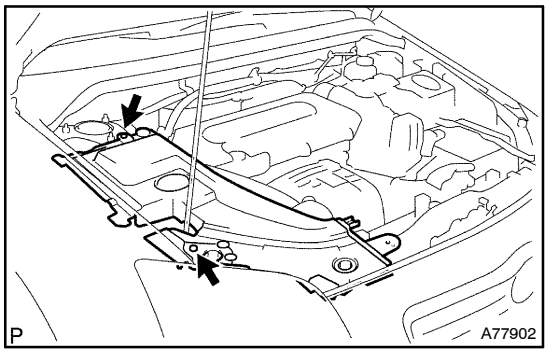
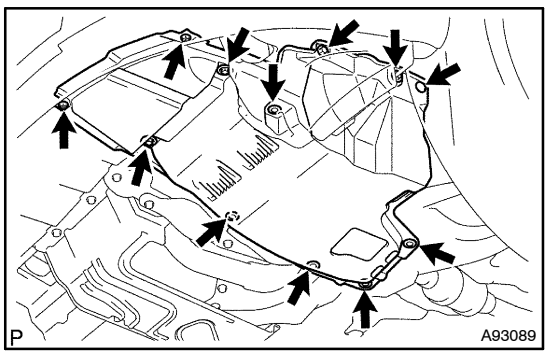
141N5–01

REPLACEMENT



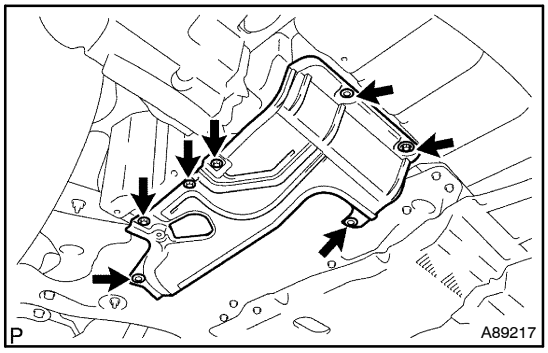
1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–4)
2. REMOVE FRONT WHEELS

3. REMOVE RADIATOR SUPPORT OPENING COVER



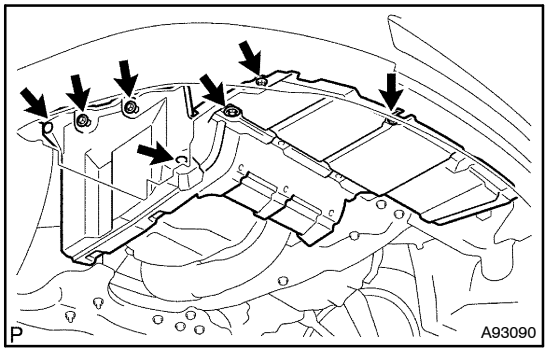
(a) Remove the retainer and 4 clips.

(b) Unfasten the 5 claws, then remove the radiator support opening cover.



4. REMOVE ENGINE ROOM COVER SIDE

(a) Remove the 2 clips, then remove the engine room cover side.



5. REMOVE ENGINE UNDER COVER LH

(a) Remove the 6 screws and 6 clips, and then remove the engine under cover LH.

6. REMOVE ENGINE UNDER COVER NO.4 RH

(a) Remove the 4 screws and 3 clips, then remove the engine under cover No. 4 RH.

7. REMOVE ENGINE UNDER COVER RH

(a) Remove the 5 screws and 2 clips, then remove the engine under cover RH.

8. DRAIN COOLANT (See page 16–7)

9. DRAIN ENGINE OIL (See page 17–6)

10. DRAIN AUTOMATIC TRANSAXLE FLUID (See Pub. No. RM1018E on page 40–2)

11. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–45)

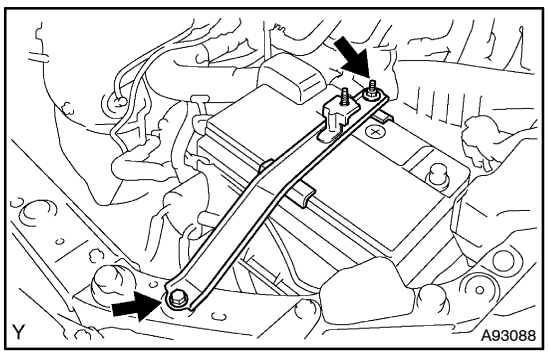
12. DISCONNECT RADIATOR HOSE INLET (See page 16–9)

13. DISCONNECT RADIATOR HOSE OUTLET (See page 16–9)

14. SEPARATE RADIATOR RELAY BLOCK (See page 16–9)

15. SEPARATE COOLER REFRIGERANT SUCTION HOSE NO.1 (RHD STEERING POSITION TYPE) (See page 55–1)

16. REMOVE RADIATOR ASSY (See page 16–9)



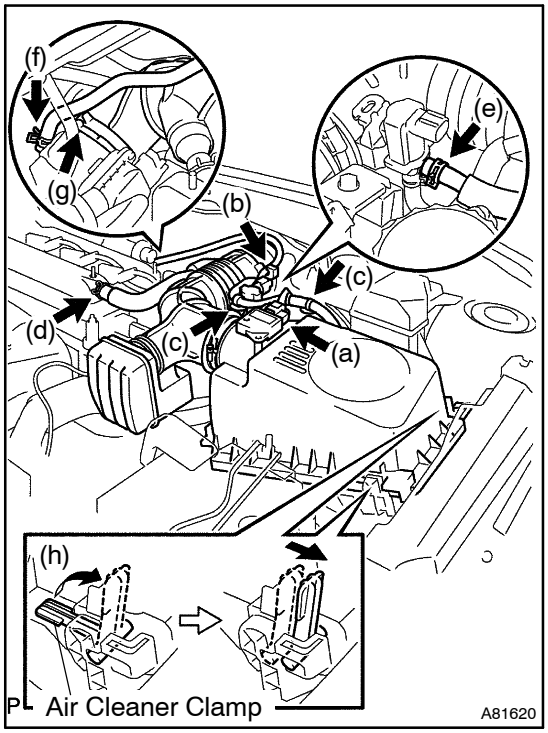
17. REMOVE FAN AND GENERATOR V BELT (See page 14–5)

18. REMOVE GENERATOR ASSY (See page 19–8)

19. REMOVE W/PULLEY COMPRESSOR ASSY (See page 55–4)

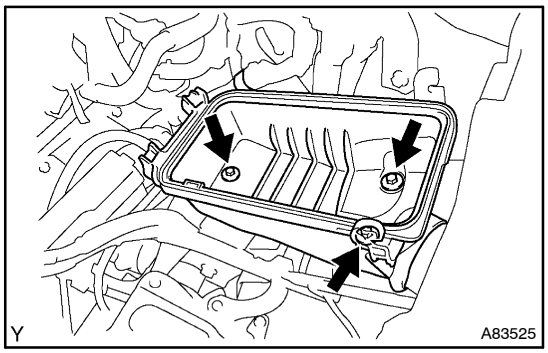
HINT:

Secure the hoses off to the side instead of detaching.



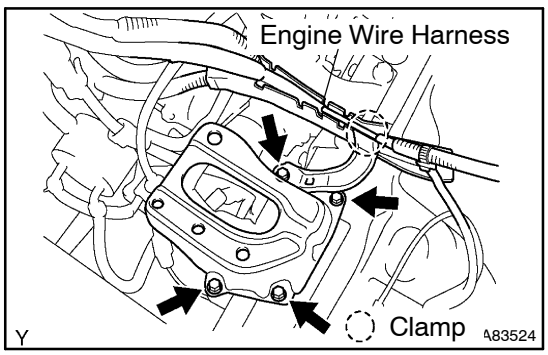
20. REMOVE BATTERY

(a) Disconnect the battery positive terminal.



(b) Remove the bolt and a nut, then remove the battery clamp.

(c) Remove the battery from the vehicle.



21. REMOVE AIR CLEANER ASSEMBLY WITH HOSE

(a) Disconnect the mass air flow meter connector.
(b) Disconnect the VSV connector.
(c) Remove the 2 wire harness clamps.
(d) Disconnect the ventilation hose.
(e) Disconnect the fuel vapor feed hose No. 1.
(f) Disconnect the fuel vapor feed hose No. 2.
(g) Loosen the hose clamp bolt.
(h) Raise the air cleaner clamp up, then slide it to the air cleaner cap.
(i) Remove the air cleaner cap together with the air cleaner hose.

(j) Remove the 3 bolts and air cleaner case.

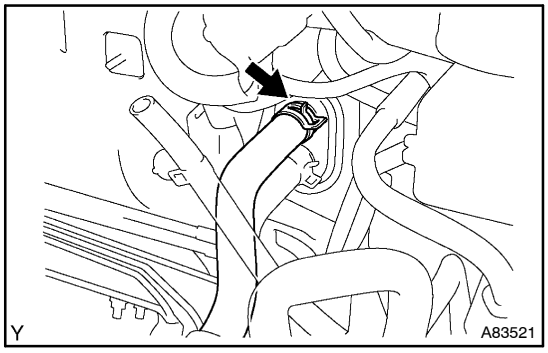
22. REMOVE BATTERY CARRIER

(a) Separate the engine wire harness from the clamp.
(b) Remove the 4 bolts and the battery carrier.

23. REMOVE RADIATOR RESERVE TANK ASSY

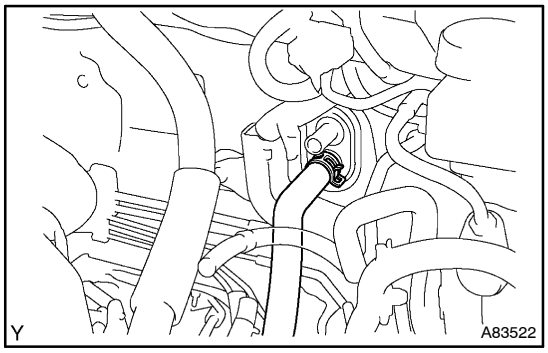
(a) Remove the 3 bolts, then remove the radiator reserve tank together with bracket.

24. SEPARATE RETURN TUBE SUB–ASSY (See page 14–45)



25. REMOVE VANE PUMP OIL RESERVOIR ASSY (See page 14–45)

26. REMOVE OIL RESERVOIR BRACKET NO.1 (See page 14–45)

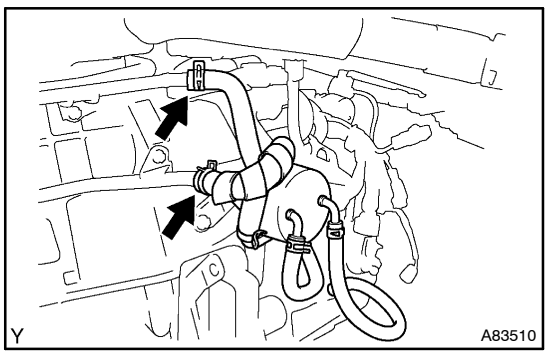


27. SEPARATE COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE) (See page 14–45)

28. REMOVE COOLER BRACKET (LHD STEERING POSITION TYPE) (See page 14–45)

29. REMOVE ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE) (See page 14–45)

30. DISCONNECT HEATER INLET WATER HOSE



31. DISCONNECT HEATER OUTLET WATER HOSE

32. REMOVE CHARCOAL CANISTER ASSY

33. DISCONNECT FUEL TUBE SUB–ASSY (See page 11–4)

34. DISCONNECT UNION TO CONNECTOR TUBE HOSE

(a) Disconnect the union to connector tube hose from the brake booster.

35. DISCONNECT TRANSMISSION OIL COOLER

(a) Disconnect the transmission oil cooler.

36. REMOVE FLOOR PANEL BRACE FRONT (See page 15–2)

37. REMOVE EXHAUST PIPE ASSY CENTER (See page 15–2)

38. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–2)

39. REMOVE FRONT AXLE HUB LH NUT (See page 30–4)

SST 09330–00030

40. REMOVE FRONT AXLE HUB RH NUT

SST 09330–00030

HINT:

Perform the same procedure as above on the opposite side.

41. SEPARATE TIE ROD END SUB–ASSY LH (See page 30–4)

42. SEPARATE TIE ROD END SUB–ASSY RH

HINT:

Perform the same procedure as above on the opposite side.

43. SEPARATE FRONT STABILIZER LINK ASSY LH (See page 30–4)

44. SEPARATE FRONT STABILIZER LINK ASSY RH

HINT:

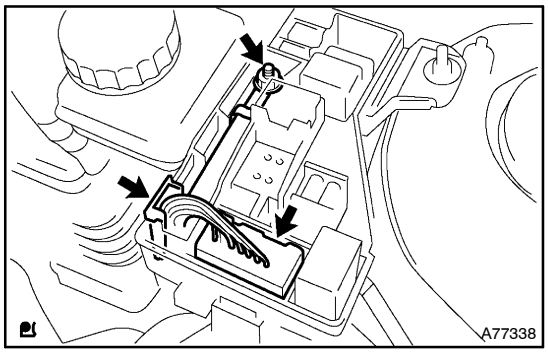
Perform the same procedure as above on the opposite side.

45. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH
(See Pub. No. RM1018E on page 26–16)

46. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH

HINT:

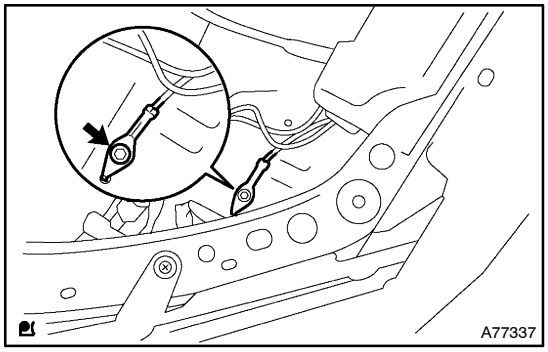
Perform the same procedure as above on the opposite side.



47. SEPARATE FRONT AXLE ASSY LH (See page 30–4)

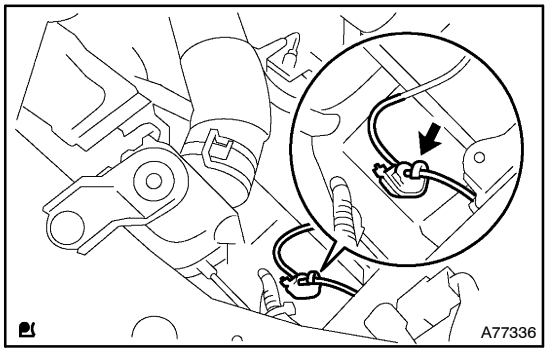
48. SEPARATE FRONT AXLE ASSY RH

HINT:



Perform the same procedure as above on the opposite side.

49. SEPARATE TRANSMISSION CONTROL CABLE ASSY (See page 40–3)

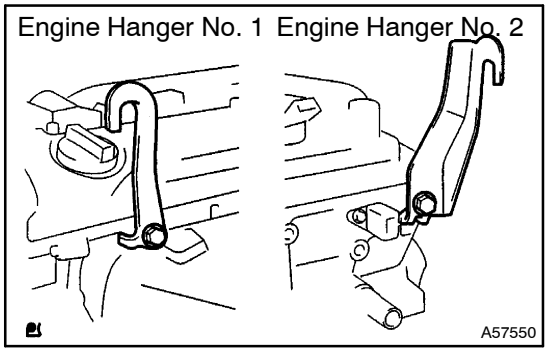


50. SEPARATE ENGINE ROOM RELAY BLOCK NO.2

(a) Remove the nut, then disconnect the connector shown in the illustration.

51. SEPARATE ENGINE WIRE

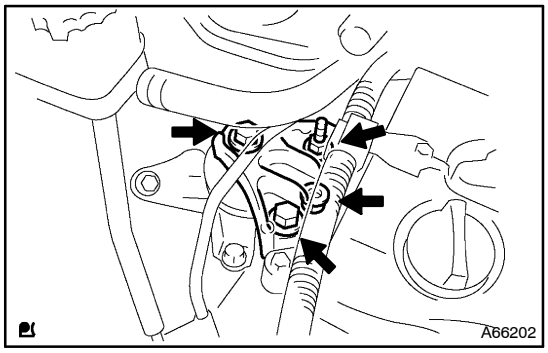
(a) Remove the bolt, then separate the grand terminal.



(b) Separate the ground terminal connector.

(c) Remove the glove compartment door panel (see Pub. No. RM1018E on page 71–11).

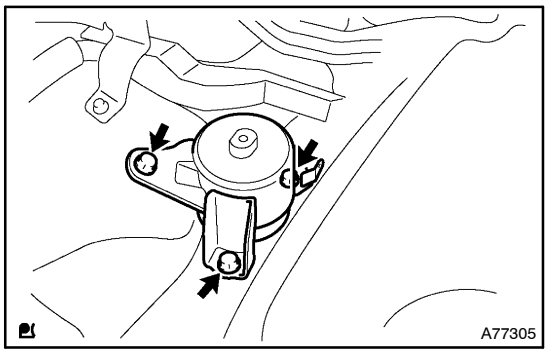
(d) Separate the engine wire.



52. SEPARATE STEERING INTERMEDIATE SHAFT ASSY NO.2
(See Pub. No. RM1018E on page 51–36)

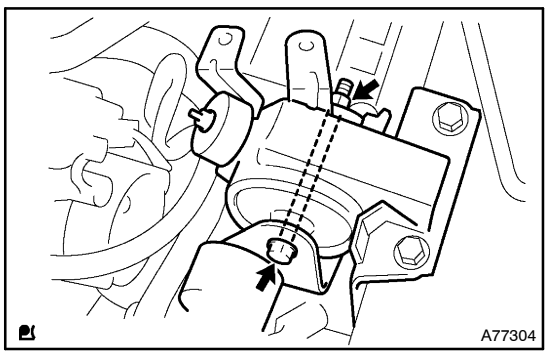
53. INSTALL ENGINE HANGERS

(a) Install the engine hanger No. 1 (12281–28010, 28020, 28030) with the bolt (91512–61020).
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)



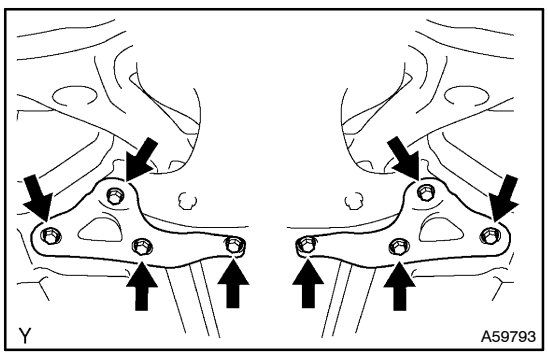
(b) Install the engine hanger No. 2 (12282–28010, 28020, 28030) with the bolt (91512–61020).
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)

54. REMOVE ENGINE MOUNTING BRACKET NO.2 RH



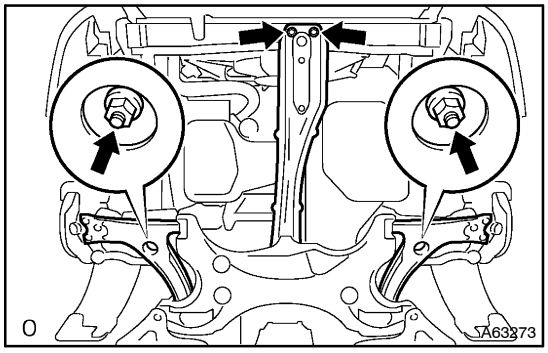
(a) Set the engine lifter.

(b) Remove the 2 bolts and 2 nuts, then detach the mounting bracket No. 2.



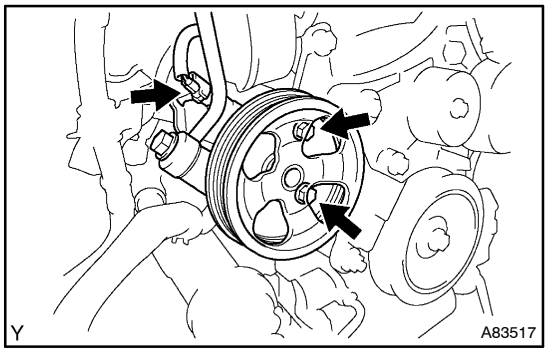
55. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR

(a) Remove the 3 bolts and engine mounting insulator.



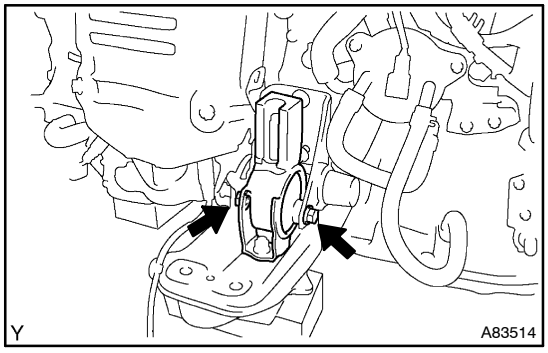
56. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR

(a) Remove the through bolt and nut, then detach the engine mounting insulator.



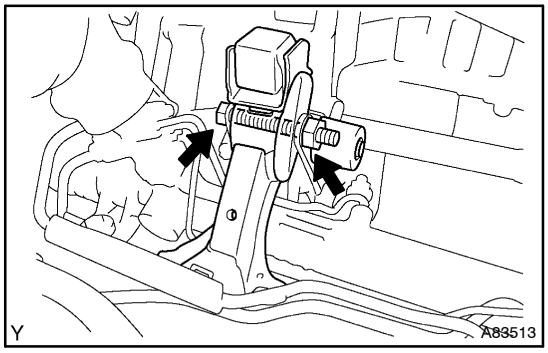
57. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Remove the 8 bolts and front suspension member braces.



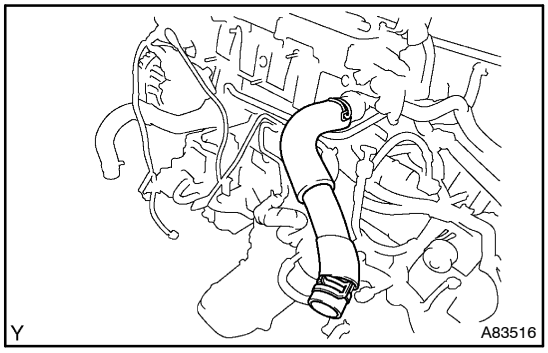
(b) Remove the 2 bolts and 2 nuts shown in the illustration.
(c) Carefully remove the engine assembly with transaxle from the vehicle.

58. SEPARATE VANE PUMP ASSY



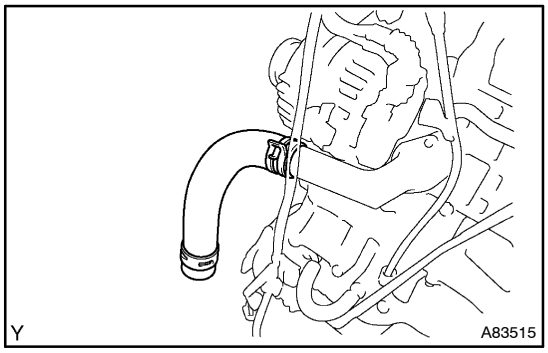
(a) Disconnect the PS oil pressure switch connector.
(b) Remove the 2 bolts, then separate the vane pump from the engine.

59. REMOVE STARTER ASSY (See page 19–3)



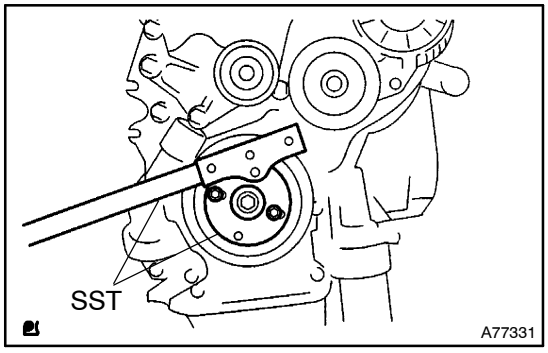
60. REMOVE FRONT SUSPENSION CROSSMEMBER W/CENTER MEMBER

(a) Remove the through bolt and a nut from the engine mounting insulator FR.



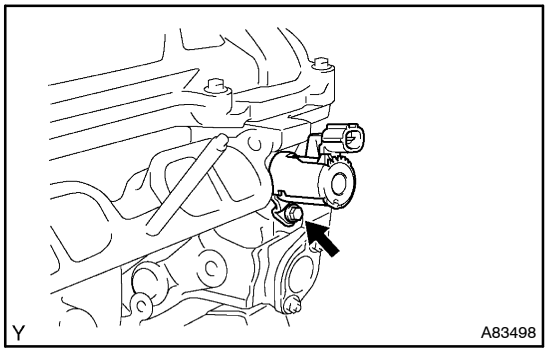
(b) Remove the through bolt and a nut from the engine mounting insulator RR.

61. REMOVE FRONT DRIVE SHAFT ASSY LH (See page 30–4)
62. REMOVE FRONT DRIVE SHAFT ASSY RH (See page 30–4)



63. REMOVE RADIATOR HOSE INLET

64. REMOVE RADIATOR HOSE OUTLET

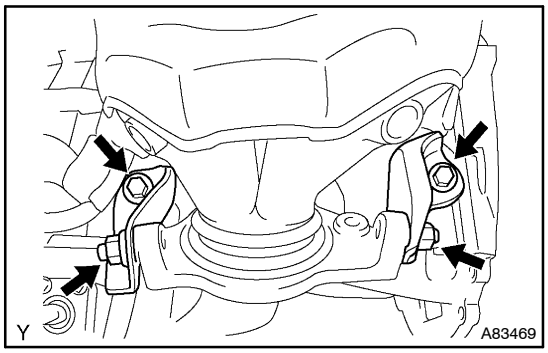


65. REMOVE AUTOMATIC TRANSAXLE ASSY (See page 40–3)

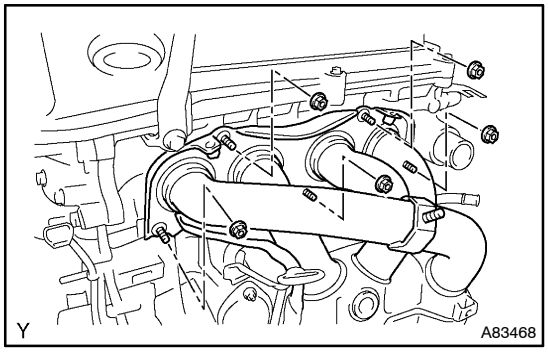
66. REMOVE DRIVE PLATE & RING GEAR SUB–ASSY

(a) Using SST, hold the crankshaft pulley.
SST 09213–54015 (91651–60855), 09330–00021

(b) Remove the 8 bolts and drive plate and ring gear.



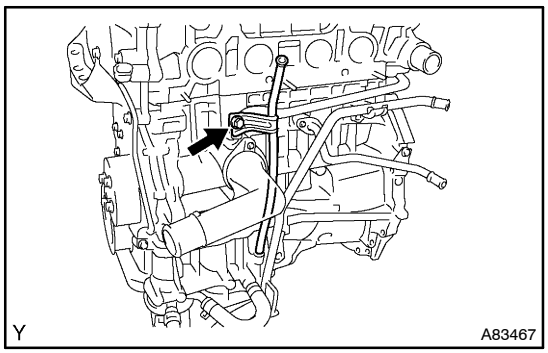
67. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSY



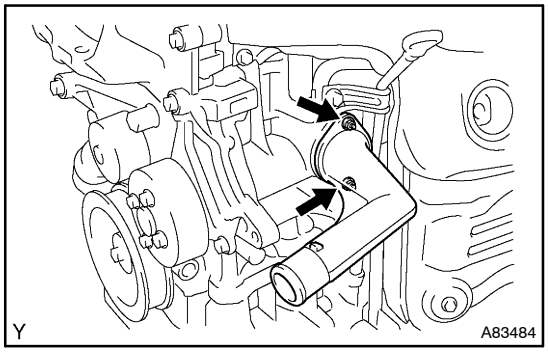
(a) Remove the bolt, O–ring and the camshaft timing oil control valve.

68. REMOVE THROTTLE BODY BRACKET (See page 10–8)
69. REMOVE THROTTLE BODY ASSY (See page 10–8)
70. REMOVE FUEL PRESSURE PULSATION DAMPER ASSY
71. DISCONNECT FUEL TUBE SUB–ASSY (See page 11–1)
72. REMOVE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)

73. REMOVE FUEL PUMP ASSY (See page 11–24)
74. REMOVE INTAKE MANIFOLD (See page 11–13)
75. REMOVE SURGE TANK STAY NO.1 (See page 11–13)
76. REMOVE INTAKE MANIFOLD INSULATOR NO.2 (See page 11–13)
77. REMOVE NOZZLE HOLDER CLAMP (See page 11–13)
78. REMOVE FUEL DELIVERY PIPE SUB–ASSY (See page 11–13)
79. REMOVE FUEL INJECTOR ASSY (See page 11–13)
80. REMOVE V–RIBBED BELT TENSIONER ASSY (See page 14–45)
81. REMOVE IGNITION COIL ASSY (See page 14–45)
82. REMOVE EXHAUST MANIFOLD HEAT INSULATOR NO.1
(a) Remove the 3 bolts and nut, then remove the exhaust manifold heat insulator.

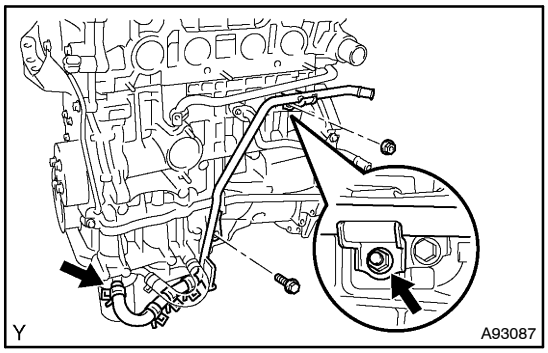


83. REMOVE EXHAUST MANIFOLD CONVERTER SUB–ASSY
(a) Remove the 2 bolts and 2 nuts, then detach the No. 1 and No. 2 exhaust manifold stay.



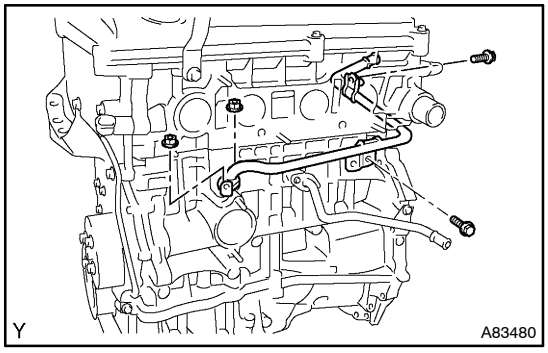
(b) Remove the 5 nuts, the exhaust manifold converter and gasket.

84. REMOVE OIL LEVEL GAGE SUB–ASSY



85. REMOVE OIL LEVEL GAGE GUIDE
(a) Remove the bolt, then detach the oil level gage guide.

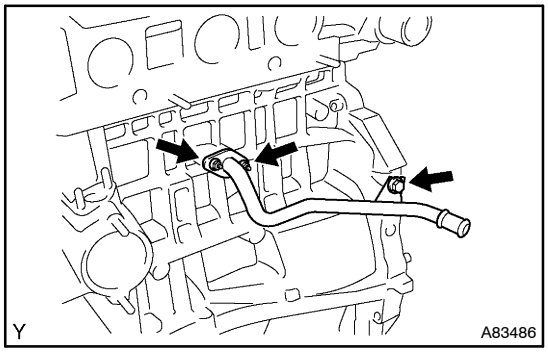
86. REMOVE WATER INLET



(a) Remove the 2 nuts and the water inlet.

87. REMOVE THERMOSTAT

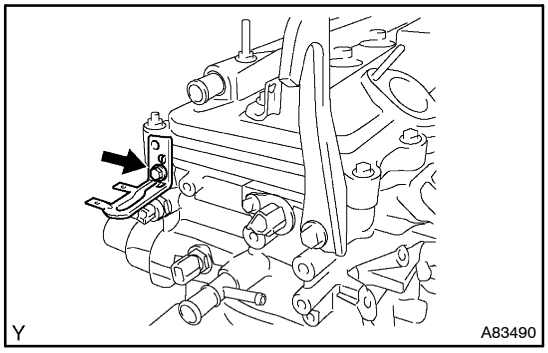
88. REMOVE OIL COOLER PIPE



(a) Remove the bolt and nut shown in the illustration, then disconnect the oil cooler pipe from the cylinder block.

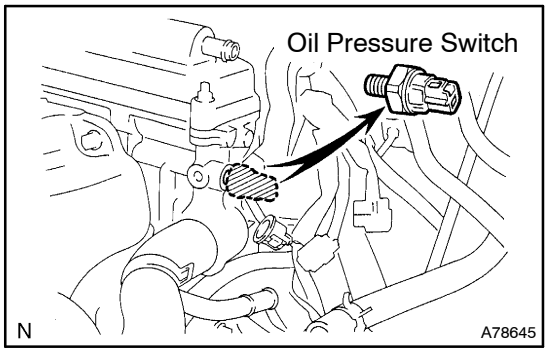
89. REMOVE WATER BY–PASS PIPE NO.1

(a) Remove the 2 bolts and 2 nuts.



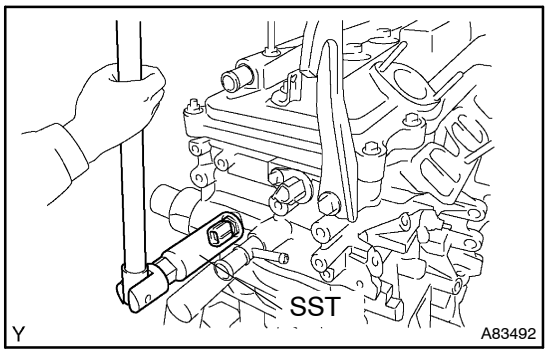
(b) Remove the water by–pass pipe No. 1 and a gasket.

90. REMOVE WATER BY–PASS PIPE NO.3



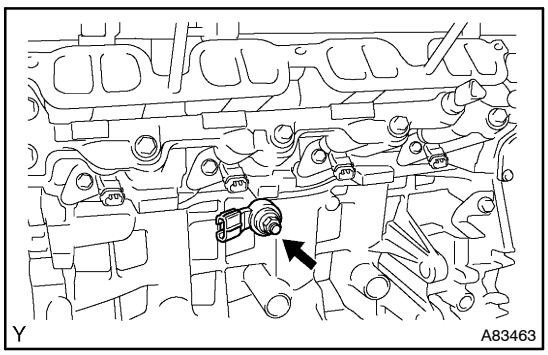
(a) Remove the bolt and 2 nuts.

(b) Remove the water by–pass pipe No.3 and gasket.



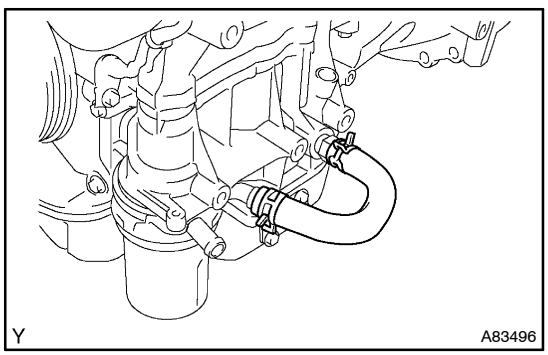
91. REMOVE ENGINE OIL PRESSURE SWITCH ASSY

(a) Remove the bolt and oxygen sensor bracket.



(b) Using SST, remove the engine oil pressure switch.
SST 09268–46021

92. REMOVE E.F.I. ENGINE COOLANT TEMPERATURE SENSOR



(a) Using SST, remove the coolant temperature sensor
SST 09817–33190

(b) Remove the gasket.

93. REMOVE KNOCK SENSOR

(a) Remove the nut and knock sensor.

94. REMOVE OIL COOLER HOSE

95. REPLACE PARTIAL ENGINE ASSY

96. INSTALL KNOCK SENSOR

Torque: 20 N·m (208 kgf·cm, 15 ft·lbf)

97. INSTALL E.F.I. ENGINE COOLANT TEMPERATURE SENSOR

(a) Install a new gasket to the engine coolant temperature sensor.

(b) Using SST, install the engine coolant temperature sensor.

SST 09817–33190

Torque: 20 N·m (208 kgf·cm, 15 ft·lbf)

98. INSTALL ENGINE OIL PRESSURE SWITCH ASSY

(a) Clean the threads of the oil pressure switch, apply adhesive there.

Adhesive: Part No. 08833 – 00080 THREE BOND 1344 or equivalent.

(b) Install the oil pressure switch.

Torque: 15 N·m (153 kgf·cm, 11 ft·lbf)

SST 09268–46021

99. INSTALL WATER BY–PASS PIPE NO.3

(a) Install the water by–pass No.2 in the cylinder block with a new gasket.

(b) Fasten the water by–pass pipe No.3 with the bolt and 2 nuts.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

100. INSTALL WATER BY–PASS PIPE NO.1

(a) Install the water by–pass pipe No. 1 and a new gasket.

(b) Install the 2 bolts and 2 nuts.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

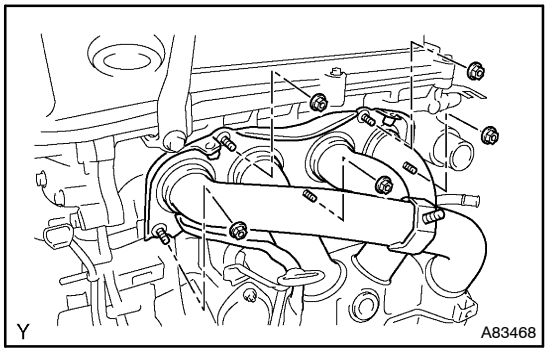
101. INSTALL OIL COOLER PIPE

(a) Install the oil cooler pipe with the 2 bolts.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

102. INSTALL THERMOSTAT (See page 16–14)

103. INSTALL WATER INLET

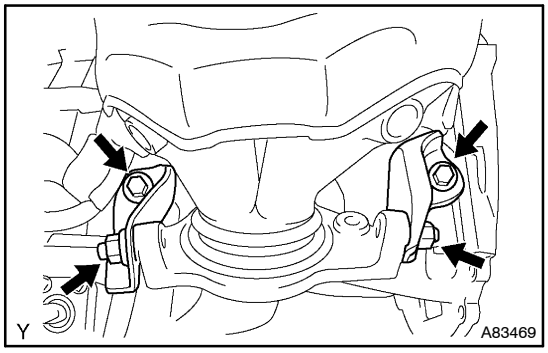


Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

104. INSTALL OIL LEVEL GAGE GUIDE

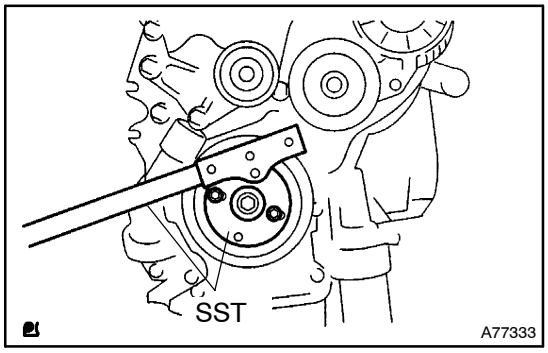
(a) Apply a light coat of engine oil to the O–ring, then install it to the oil level gage guide.

(b) Install the oil level gage and guide with the bolt.



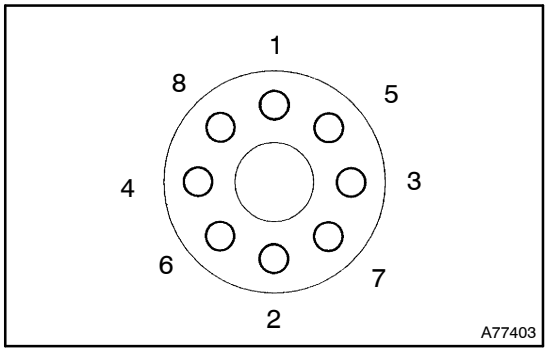
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

105. INSTALL EXHAUST MANIFOLD CONVERTER SUB–ASSY



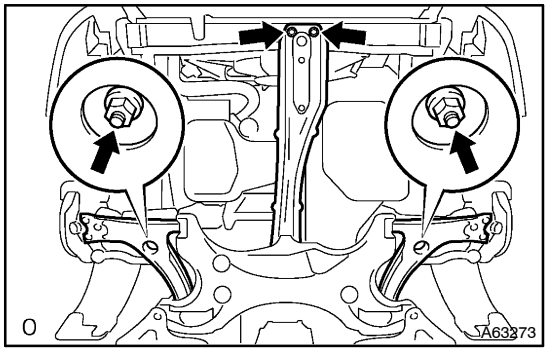
(a) Install a new gasket and the exhaust manifold converter with the 5 nuts.

Torque: 37 N·m (378 kgf·cm, 27 ft·lbf)

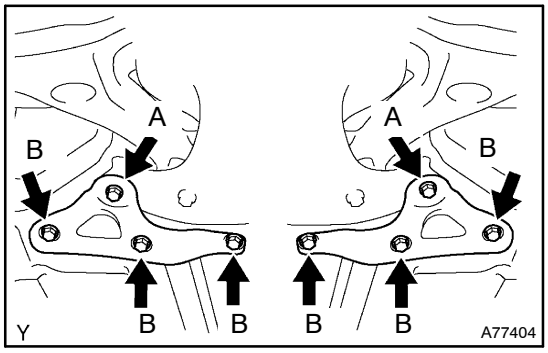


(b) Install the No. 1 and No. 2 exhaust manifold stays with the 2 bolts and 2 nuts.
Torque: 44 N·m (449 kgf·cm, 32 ft·lbf)

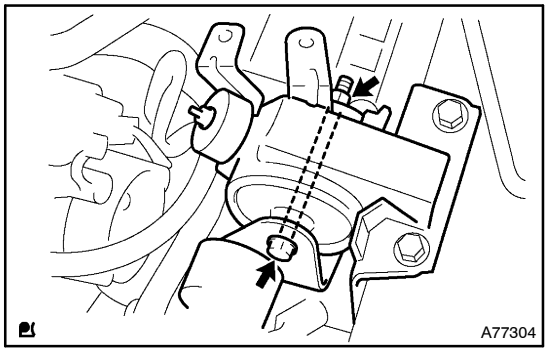
106. INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.1
Torque: 12 N·m (122 kgf·cm, 9.0 ft·lbf)
107. INSTALL V–RIBBED BELT TENSIONER ASSY
Torque: 60 N·m (607 kgf·cm, 44 ft·lbf)
108. INSTALL IGNITION COIL ASSY
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
109. INSTALL FUEL INJECTOR ASSY (See page 11–13)
110. INSTALL FUEL DELIVERY PIPE SUB–ASSY (See page 11–13)
111. INSTALL NOZZLE HOLDER CLAMP (See page 11–13)
112. INSTALL SURGE TANK STAY NO.1 (See page 11–13)
113. INSTALL INTAKE MANIFOLD (See page 11–13)
114. INSTALL FUEL PUMP ASSY (See page 11–24)
115. INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
SST 09023–12900
116. INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)
117. INSTALL THROTTLE BODY ASSY (See page 10–8)
118. INSTALL THROTTLE BODY BRACKET (See page 10–8)
119. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSY
(a) Apply a light coat of engine oil to the new O–ring, then install it to the camshaft timing oil control valve.
(b) Install the camshaft oil control valve with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 79 in.·lbf)



120. INSTALL DRIVE PLATE & RING GEAR SUB–ASSY
(a) Hold the crankshaft with SST.
SST 09213–54015 (91651–60855), 09330–00021
Adhesive:
Part No. 08833–00070, THREE BOND or equivalent

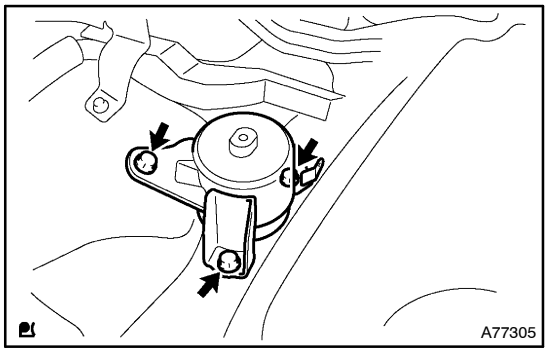


(b) Install the drive plate.
(1) Clean the bolt and bolt hole.
(2) Apply adhesive to the bolts.
(3) Using several steps, install and tighten the 8 bolts uniformly in the sequence shown in the illustration.
Torque: 98 N·m (1,000 kgf·cm, 72 ft·lbf)

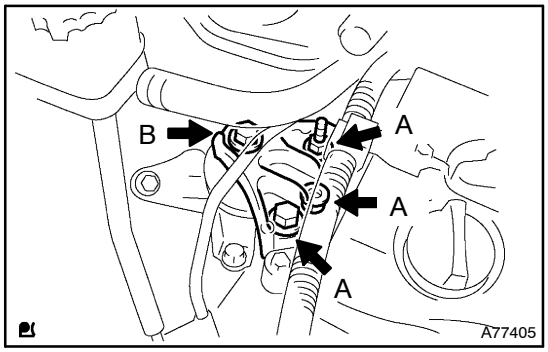


121. INSTALL AUTOMATIC TRANSAXLE ASSY (See page 40–3)
122. INSTALL FRONT DRIVE SHAFT ASSY LH (See page 30–4)
123. INSTALL FRONT DRIVE SHAFT ASSY RH (See page 30–4)
124. INSTALL FRONT SUSPENSION CROSSMEMBER W/CENTER MEMBER
(a) Install the engine mounting insulator FR with the through bolt and nut.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)
(b) Install the engine mounting insulator RR with the through bolt and nut.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)
125. INSTALL STARTER ASSY (See page 19–3)
126. INSTALL VANE PUMP ASSY
Torque: 37 N·m (370 kgf·cm, 27 ft·lbf)

127. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE
(a) Install the 2 bolts and 2 nuts as shown in the illustration.
Torque:
45 N·m (459 kgf·cm, 33 ft·lbf) for Bolt
133 N·m (1,356 kgf·cm, 98 ft·lbf) for Nut



(b) Install the front suspension member braces with the 8 bolts.
Torque:
133 N·m (1,356 kgf·cm, 98 ft·lbf) for Bolt A
80 N·m (816 kgf·cm, 59 ft·lbf) for Bolt B



128. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR

(a) Install the bolt, nut and transverse engine engine mounting insulator.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)

129. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR

(a) Install the 3 bolts and transverse engine engine mounting insulator.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

130. INSTALL ENGINE MOUNTING BRACKET NO.2 RH

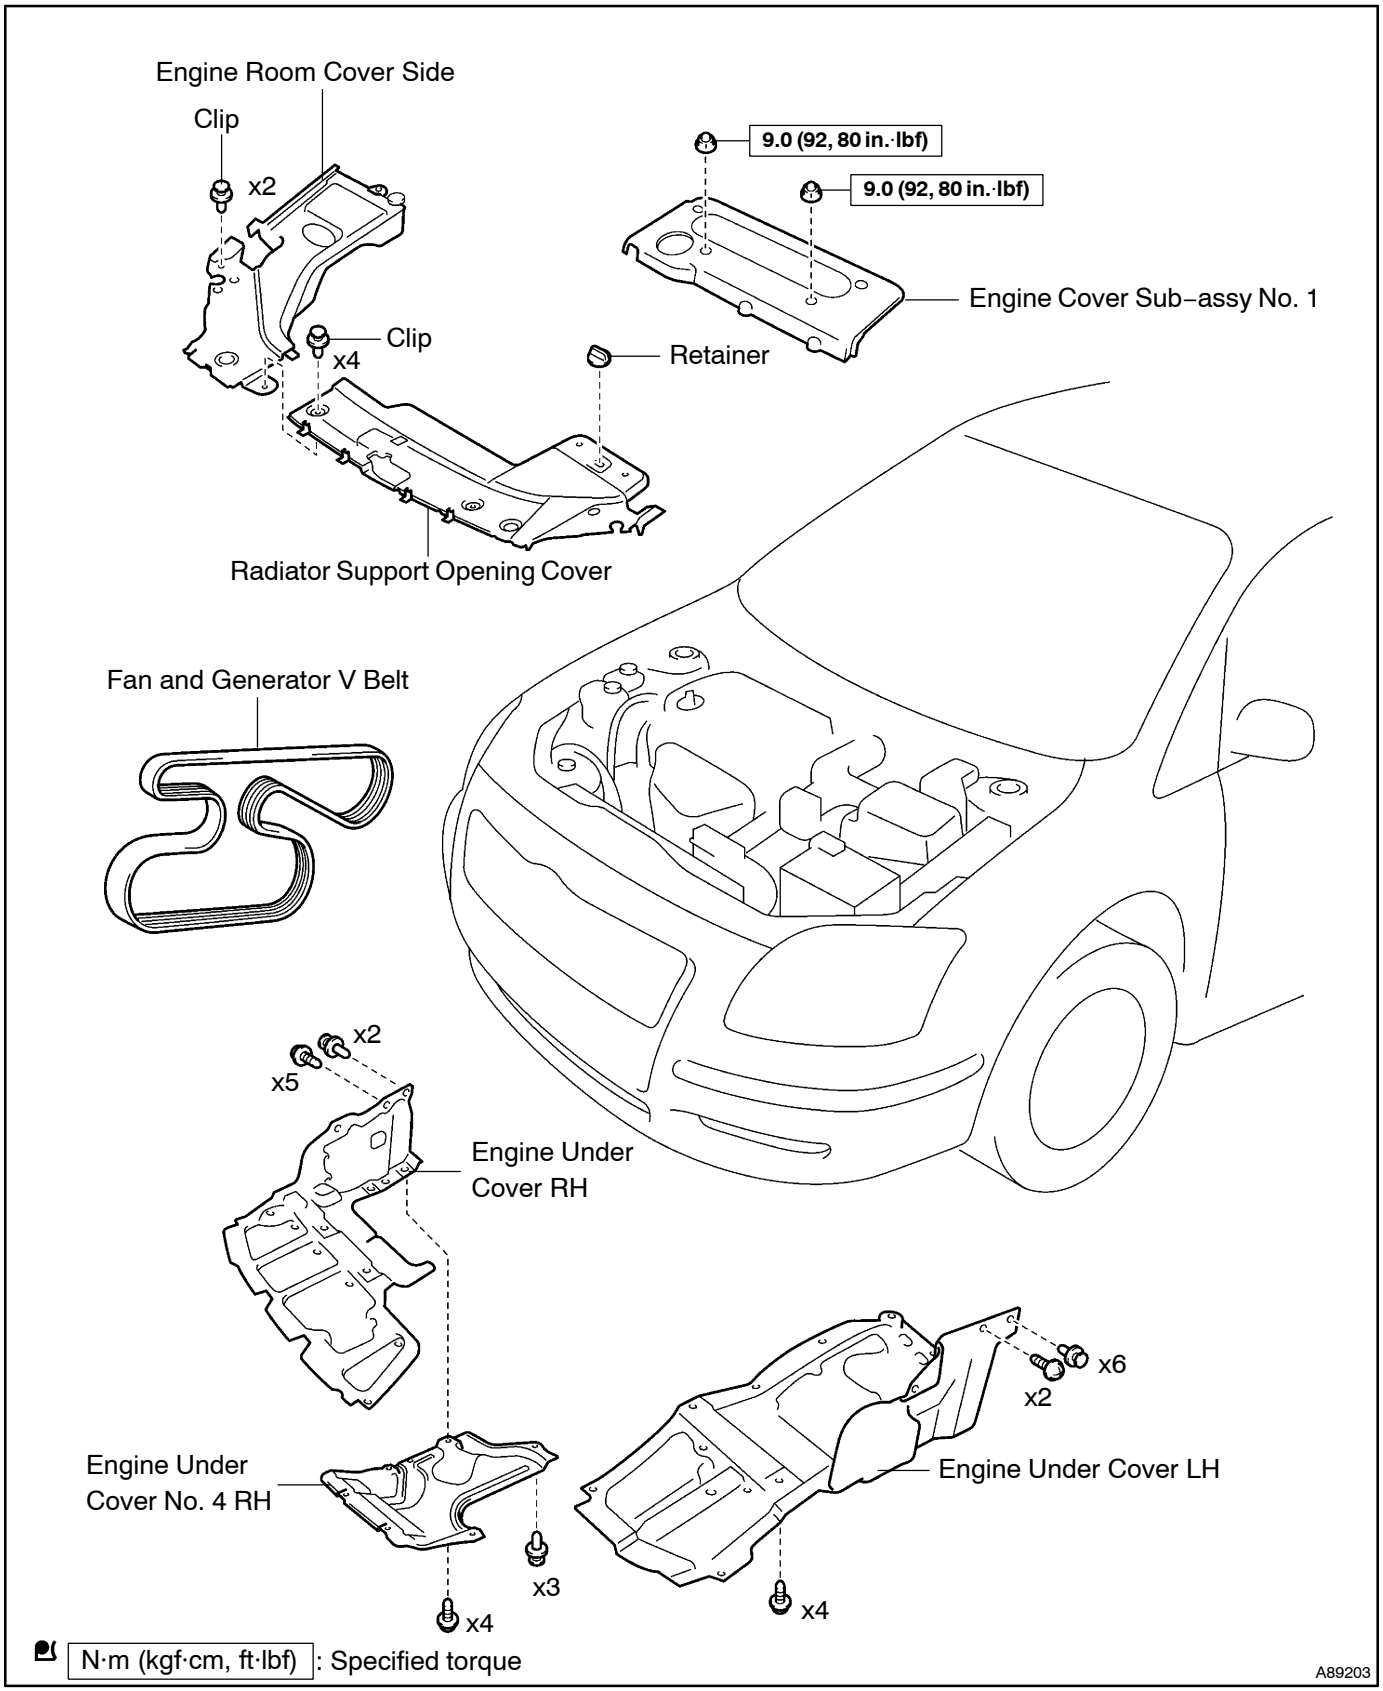
(a) Install the 2 bolts, 2 nuts and engine mounting bracket No. 2 RH.
Torque:
52 N·m (530 kgf·cm, 38 ft·lbf) for A
113 N·m (1,152 kgf·cm, 83 ft·lbf) for B

131. REMOVE ENGINE HANGERS
132. INSTALL STEERING INTERMEDIATE SHAFT ASSY NO.2 (See Pub. No. RM1018E on page 51–36)
133. INSTALL TRANSMISSION CONTROL CABLE ASSY (See page 40–3)
134. INSTALL FRONT AXLE ASSY LH (See page 30–4)
135. INSTALL FRONT AXLE ASSY RH
HINT:
Perform the same procedure as above on the opposite side.
136. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH
(See Pub. No. RM1018E on page 26–16)
137. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH
HINT:
Perform the same procedure as above on the opposite side.
138. INSTALL FRONT STABILIZER LINK ASSY LH
Torque: 74 N·m (755 kgf·cm, 55 ft·lbf)
139. INSTALL FRONT STABILIZER LINK ASSY RH
Torque: 74 N·m (755 kgf·cm, 55 ft·lbf)
140. INSTALL TIE ROD END SUB–ASSY LH (See page 30–4)
141. INSTALL TIE ROD END SUB–ASSY RH
HINT:
Perform the same procedure as above on the opposite side.

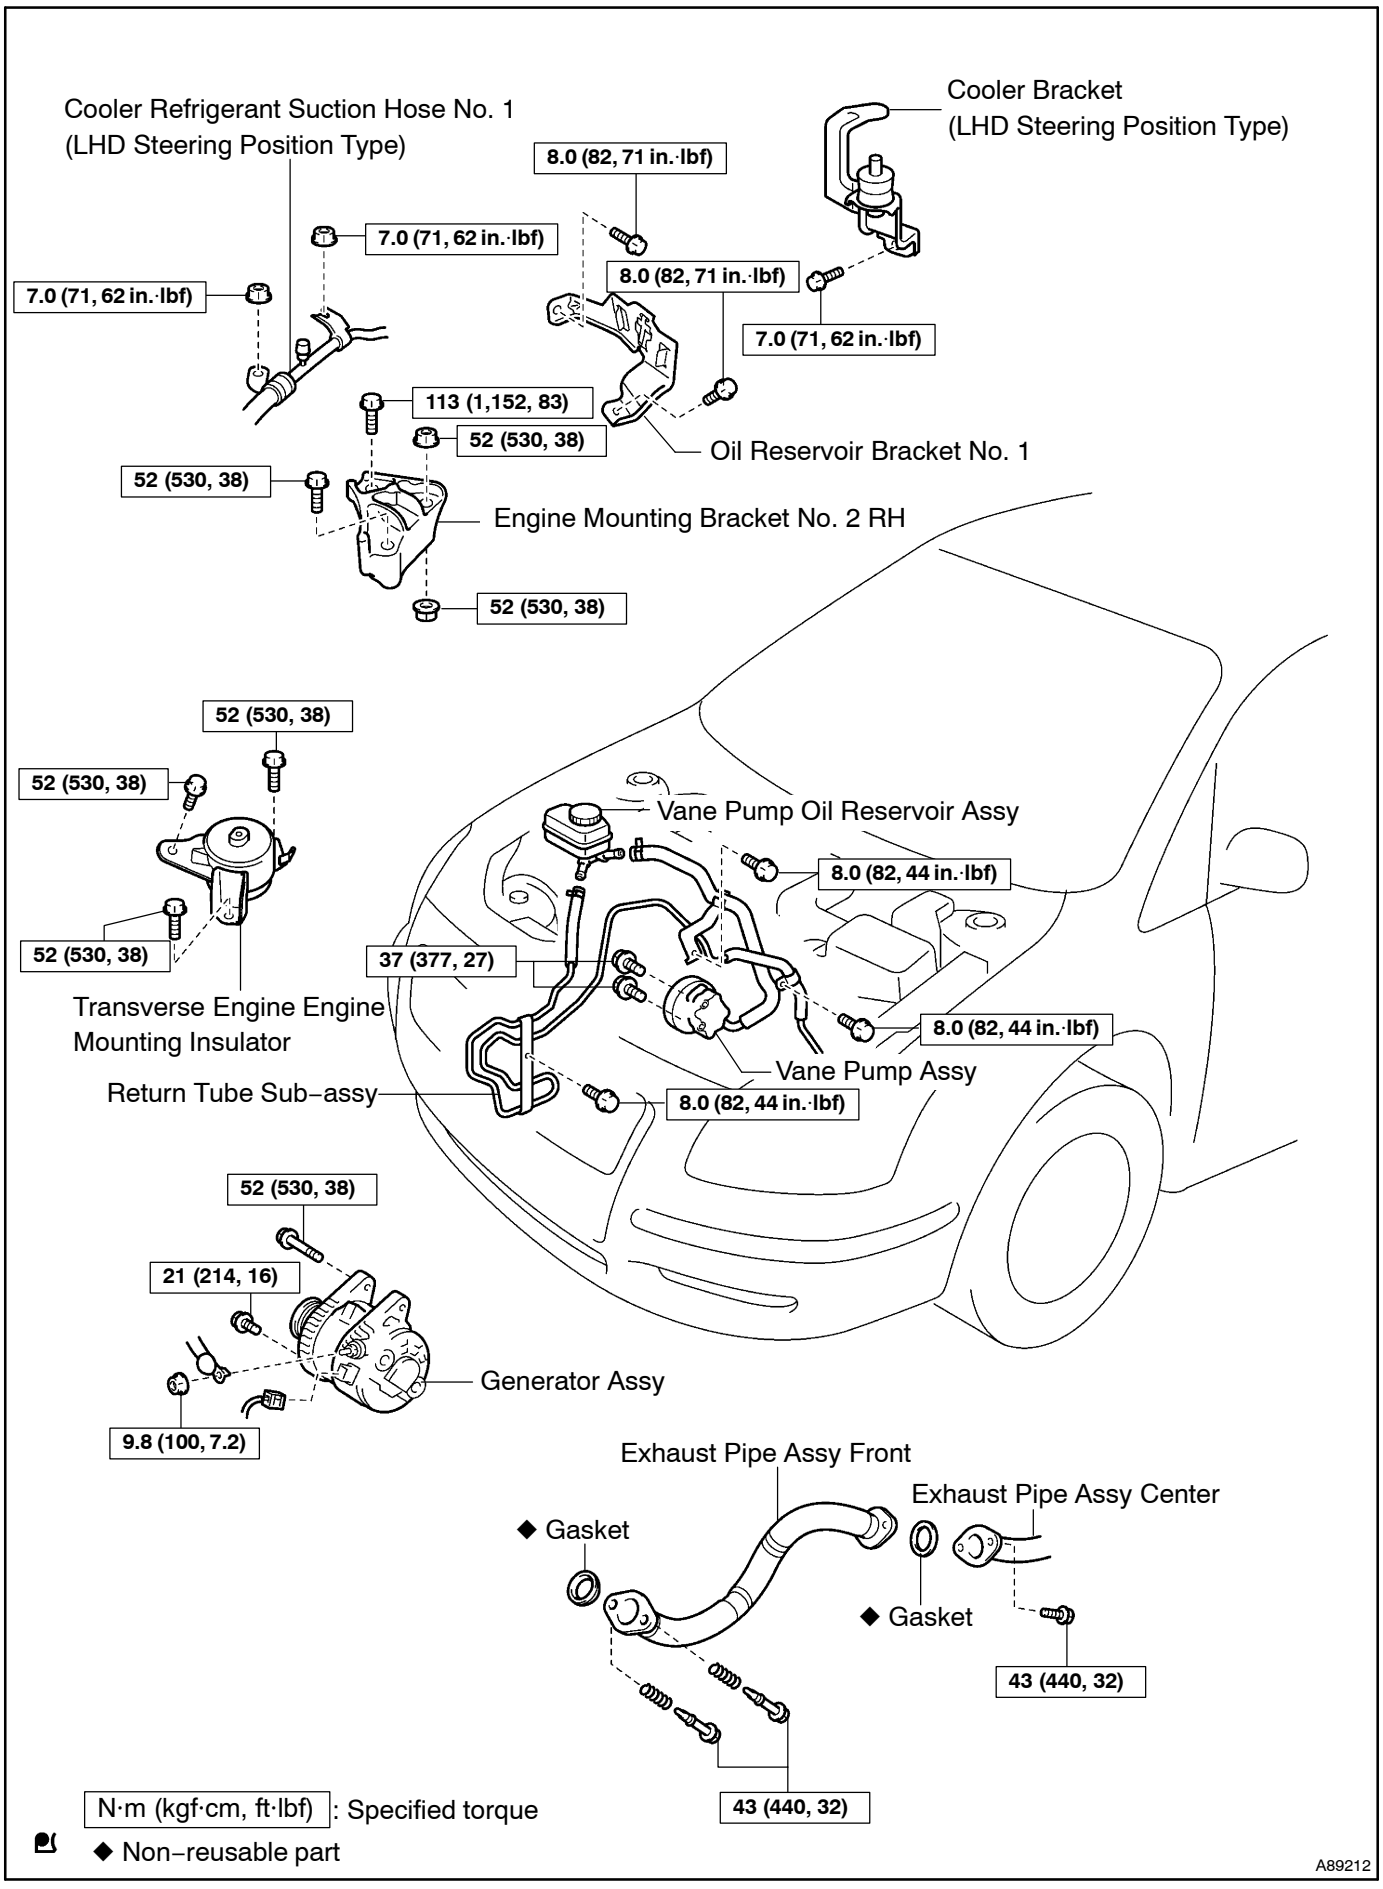
142. INSTALL FRONT AXLE HUB LH NUT (See page 30–4)
143. INSTALL FRONT AXLE HUB RH NUT

HINT:

Perform the same procedure as above on the opposite side.



144. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–2)
145. INSTALL EXHAUST PIPE ASSY CENTER (See page 15–2)
146. INSTALL FLOOR PANEL BRACE FRONT
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)
147. CONNECT FUEL TUBE SUB–ASSY (See page 11–1)
148. INSTALL COOLER BRACKET (LHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
149. INSTALL ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
150. INSTALL COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
151. INSTALL OIL RESERVOIR BRACKET NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
152. INSTALL RETURN TUBE SUB–ASSY
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
153. INSTALL VANE PUMP OIL RESERVOIR ASSY
154. INSTALL RADIATOR RESERVE TANK ASSY
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)
155. INSTALL BATTERY CARRIER
Torque: 13 N·m (131 kgf·cm, 9.5 ft·lbf)
156. INSTALL AIR CLEANER ASSEMBLY WITH HOSE
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)
157. INSTALL BATTERY
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for Bolt
3.5 N·m (36 kgf·cm, 31 in.·lbf) for Nut
158. INSTALL W/PULLEY COMPRESSOR ASSY(See page 55–4)
159. INSTALL GENERATOR ASSY (See page 19–8)
160. INSTALL FAN AND GENERATOR V BELT (See page 14–5)
161. INSTALL RADIATOR ASSY (See page 16–9)
162. CONNECT COOLER REFRIGERANT SUCTION HOSE NO.1 (RHD STEERING POSITION TYPE) (See page 55–1)
163. INSTALL RADIATOR RELAY BLOCK
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)
164. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
165. ADD AUTOMATIC TRANSAXLE FLUID (See Pub. No. RM1018E on page 40–2)
166. ADD ENGINE OIL (See page 17–6)
167. ADD COOLANT (See page 16–7)
168. ADD POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
169. BLEED POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
170. CHECK FOR ENGINE OIL LEAKS
171. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)
172. CHECK FOR FUEL LEAKS (See page 11–4)
173. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)



174. CHECK POWER STEERING FULUID LEVEL IN RESERVOIR
(See Pub. No. RM1018E on page 51–4)
175. ADJUST FRONT WHEEL ALIGNMENT (See Pub. No. RM1018E on page 26–6)
176. INSPECT CHECK IDLE SPEED AND IGNITION TIMING (See page 14–1)
177. INSPECT CO/HC (See page 14–1)
178. CHECK ABS SPEED SENSOR SIGNAL

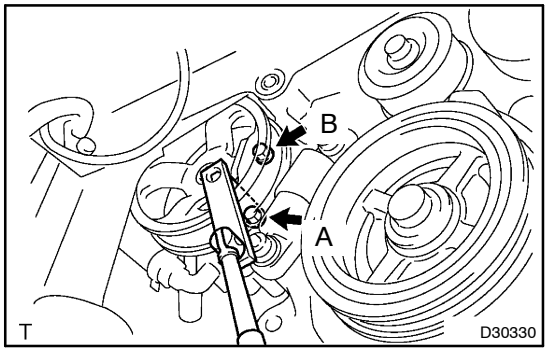
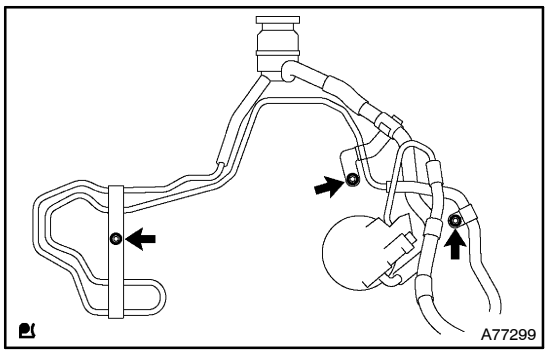
REPLACEMENT



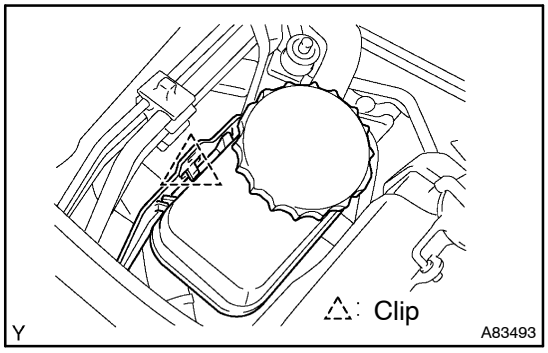
1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–4)
2. REMOVE FRONT WHEEL RH
3. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)
4. REMOVE ENGINE ROOM COVER SIDE (See page 14–23)
5. REMOVE ENGINE UNDER COVER LH (See page 14–23)
6. REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)
7. REMOVE ENGINE UNDER COVER RH (See page 14–23)
8. DRAIN ENGINE OIL (See page 17–6)

9. REMOVE ENGINE COVER SUB–ASSY NO.1



(a) Remove the 2 nuts and engine cover No. 1.

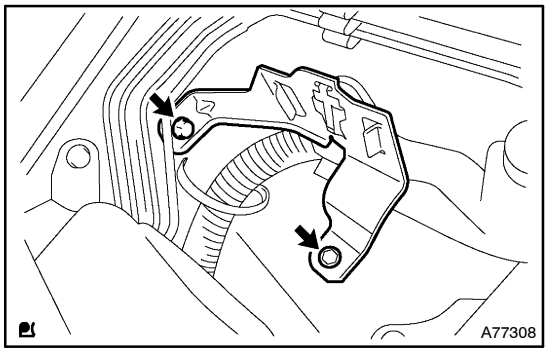
10. REMOVE FUEL PRESSURE PULSATION DAMPER ASSY
11. DISCONNECT FUEL TUBE SUB–ASSY (See page 11–4)
12. SEPARATE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
    SST 09023–12900
13. REMOVE FUEL PUMP ASSY (See page 11–24)
14. REMOVE FAN AND GENERATOR V BELT (See page 14–5)
    SST 09249–63010
15. REMOVE GENERATOR ASSY (See page 19–8)
16. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–2)



17. SEPARATE VANE PUMP ASSY

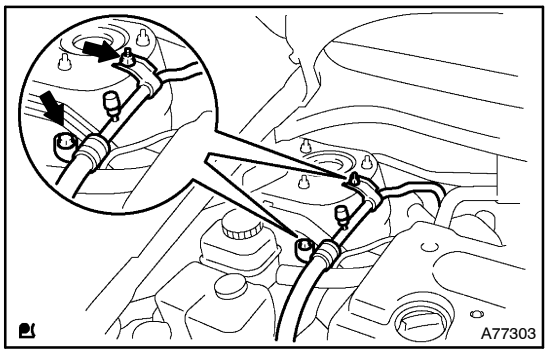
(a) Disconnect the connector from oil pressure switch.
(b) Using SST and a deep socket (14mm), loosen the bolt A.
    SST 09249–63010
(c) Remove the bolt B, then detach the vane pump assembly.

18. SEPARATE RETURN TUBE SUB–ASSY



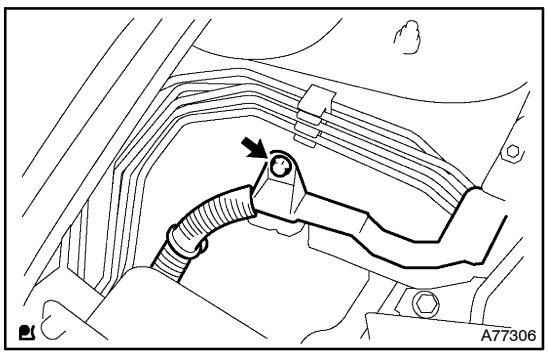
(a) Remove the 3 bolts, then separate the return tube as shown in the illustration.

19. REMOVE VANE PUMP OIL RESERVOIR ASSY



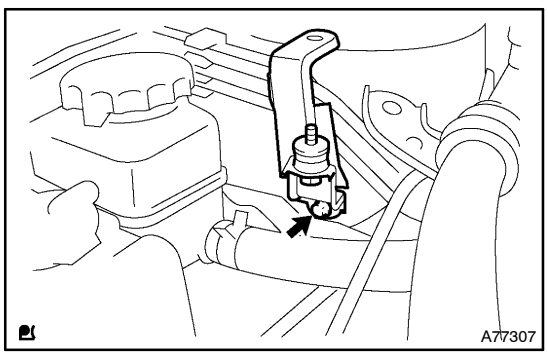
(a) Disconnect the 2 hoses.

(b) Remove the clip fitting shown in the illustration, then remove the vane pump oil reservoir assembly.



20. REMOVE OIL RESERVOIR BRACKET NO.1

(a) Remove the 2 bolts, then the oil pump reservoir bracket No. 1.



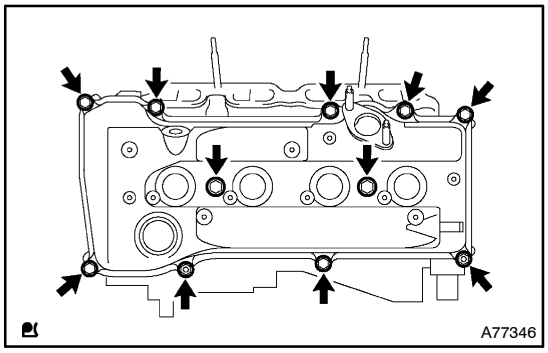
21. SEPARATE COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE)

(a) Remove the 2 nuts, then separate the Cooler refrigerant Suction hose No. 1.

22. SEPARATE ENGINE WIRE

(a) Remove the bolt, then separate the clamp and engine wire.

23. REMOVE COOLER BRACKET (LHD STEERING POSITION TYPE)

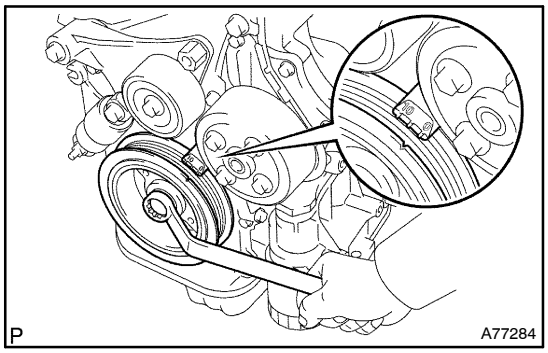


(a) Remove the bolt and cooler bracket.

24. REMOVE ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE)

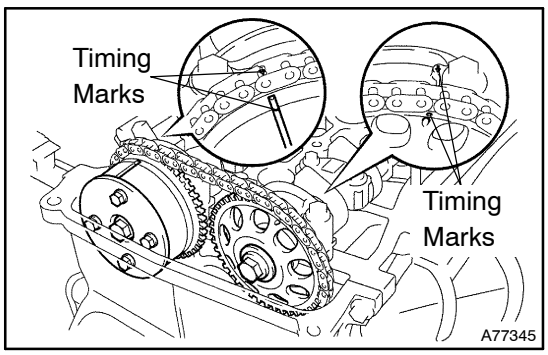
(a) Remove the bolt and the engine service cover bracket RH.

25. REMOVE IGNITION COIL ASSY



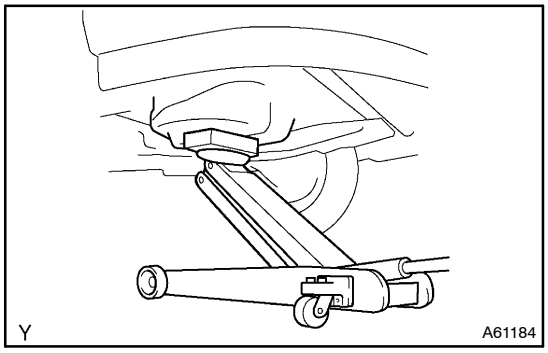
(a) Remove the 4 bolts and 4 ignition coils.

26. REMOVE CYLINDER HEAD COVER SUB–ASSY



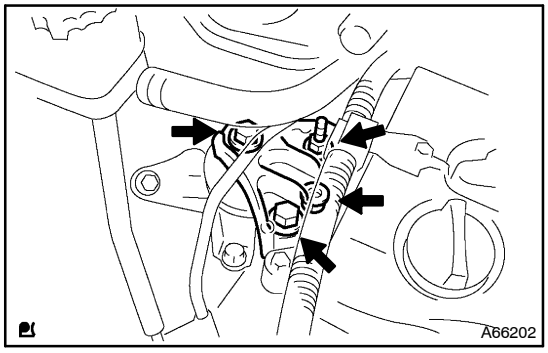
(a) Disconnect the 2 PCV hoses from the cylinder head cover.

(b) Remove the 9 bolts and 2 nuts, then remove the cylinder head cover and gasket.



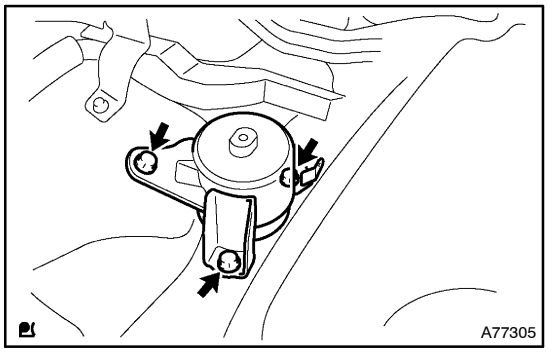
27. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Turn the crankshaft pulley, then align its groove with timing mark 0 of the timing chain cover.



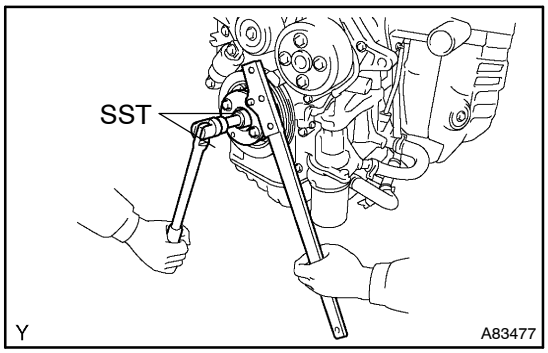
(b) Check that each timing mark of the camshaft timing gears is aligned with the timing marks of the No. 1 and No. 2 bearing caps as shown in the illustration.

If not, turn the crankshaft 1 revolution (360°), then align the marks as above.



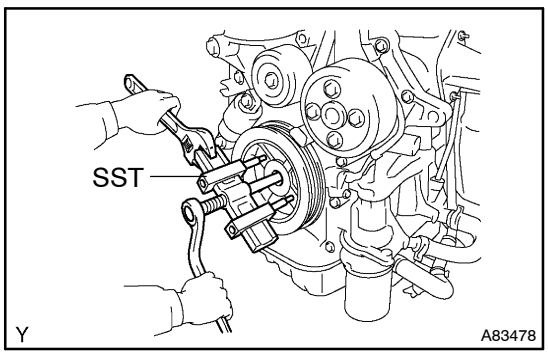
28. REMOVE ENGINE MOUNTING BRACKET NO.2 RH

(a) Set the jack underneath the engine, then place a wooden block on the jack.



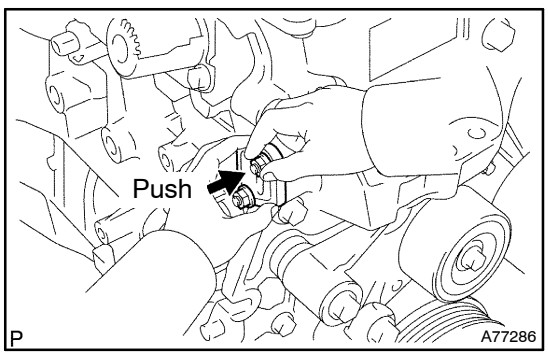
(b) Remove the 2 bolts and 2 nuts, then detach the mounting bracket No. 2 RH.

29. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR



(a) Remove the 3 bolts and the engine mounting insulator.

30. REMOVE CRANKSHAFT PULLEY

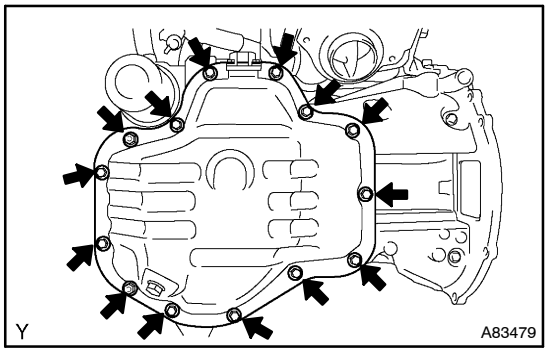


(a) Using SST, hold the crankshaft pulley, then loosen a crankshaft pulley bolt.

SST 09213–54015 (91651–60855), 09330–00021

(b) Using a crankshaft pulley bolt and SST, then remove the crankshaft pulley.

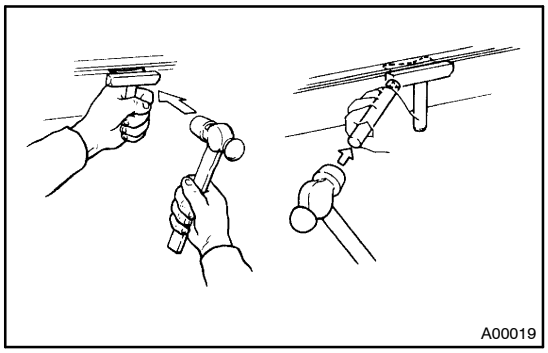
SST 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)



31. REMOVE CHAIN TENSIONER ASSY NO.1

(a) Remove the 2 nuts, the chain tensioner No. 1 and gasket.

NOTICE:

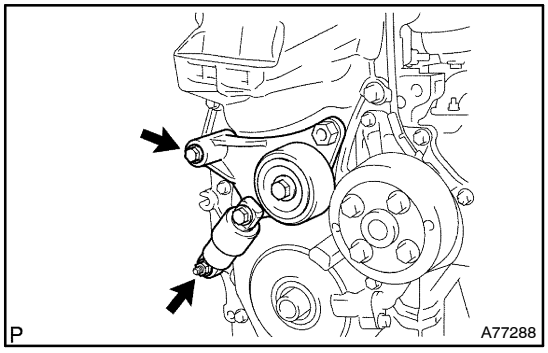


Do not turn the crankshaft.

32. REMOVE CRANKSHAFT POSITION SENSOR (See page 18–6)

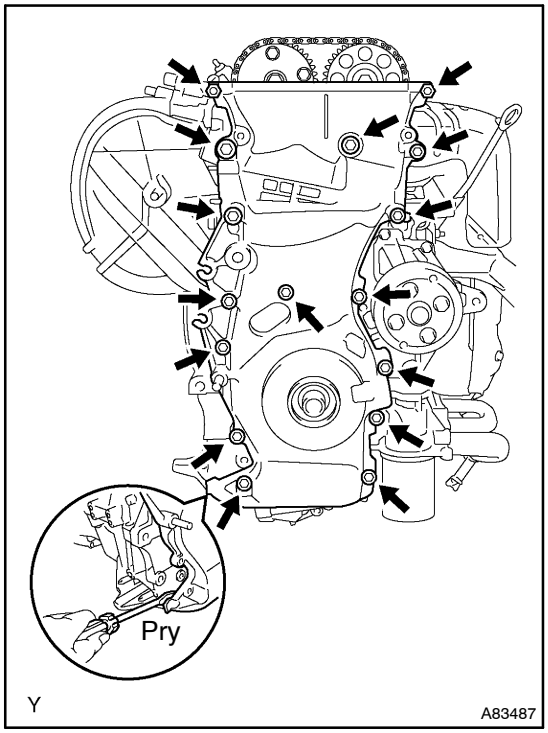
33. REMOVE OIL PAN SUB–ASSY

(a) Remove the 12 bolts and 2 nuts.



(b) Insert the blade of SST among the crank case, timing chain cover and oil pan, then cut off applied sealer and remove the oil pan.

SST 09032–00100



NOTICE:

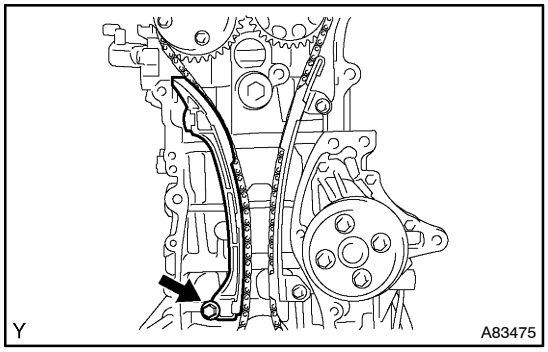
Be careful not to damage the contact surface of the timing chain cover, crank case and oil pan.

34. REMOVE V–RIBBED BELT TENSIONER ASSY

(a) Remove the bolt and nut, then remove the V–ribbed belt tensioner.

35. REMOVE TIMING CHAIN OR BELT COVER SUB–ASSY

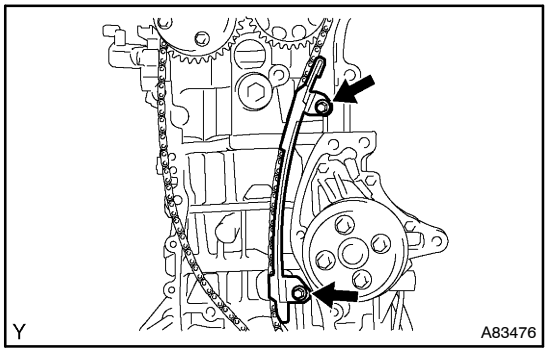
(a) Remove the 14 bolts and 2 nuts.



(b) Using a screwdriver, pry between the timing chain cover and cylinder head or cylinder block.

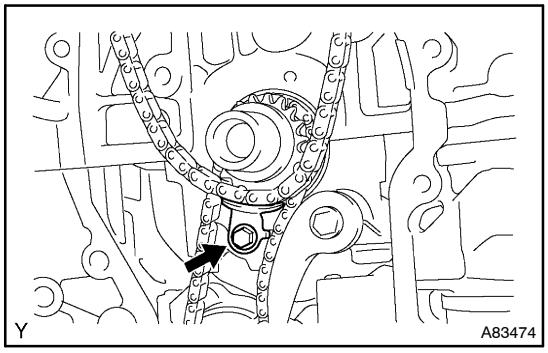
(c) Remove the timing chain cover.

NOTICE:



Be careful not to damage the contact surface of the timing chain cover, cylinder head and cylinder block.

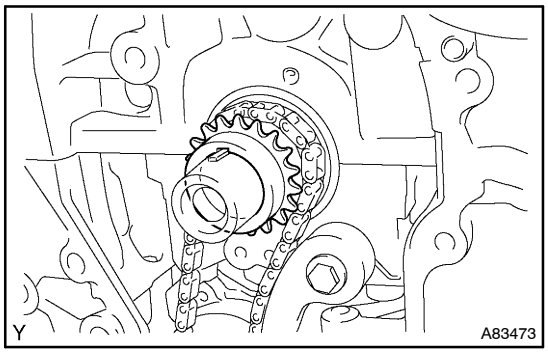
36. REMOVE CRANKSHAFT POSITION SENSOR PLATE NO.1



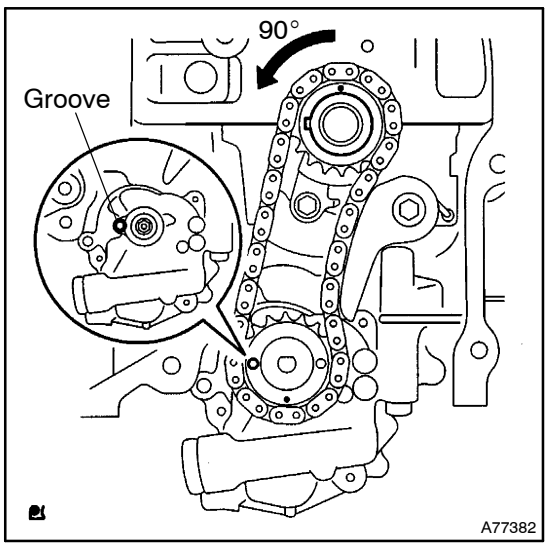
37. REMOVE CHAIN VIBRATION DAMPER NO.1

(a) Remove the bolt and chain vibration damper No. 1

38. REMOVE CHAIN TENSIONER SLIPPER



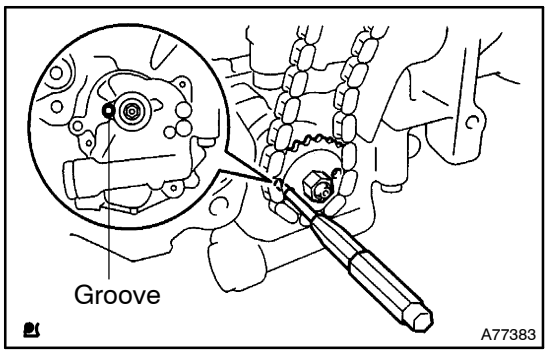
(a) Remove the 2 bolts and chain tensioner slipper.



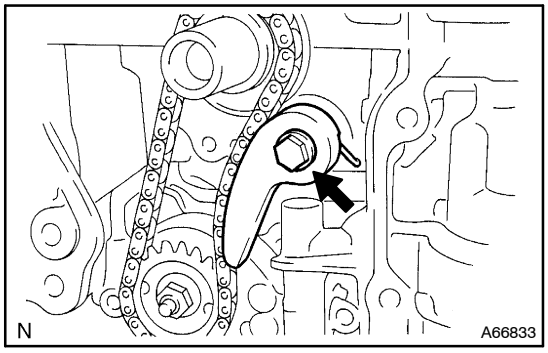
39. REMOVE TIMING CHAIN GUIDE

(a) Remove the bolt and timing chain guide.

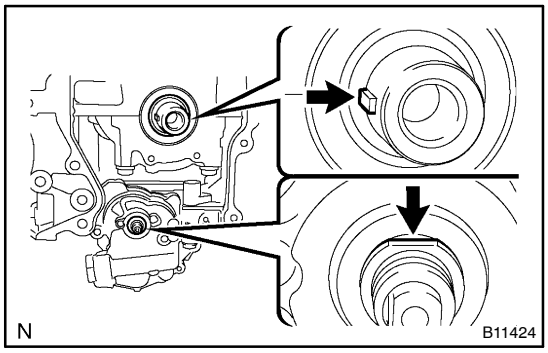
40. REMOVE CHAIN SUB–ASSY



41. REMOVE CRANKSHAFT TIMING GEAR OR SPROCKET

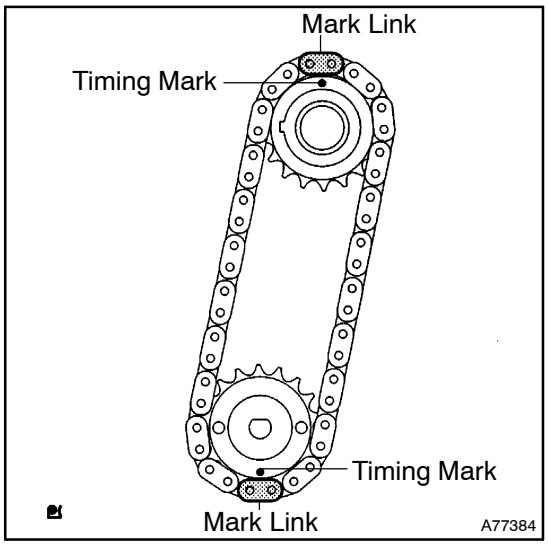


42. REMOVE NO.2 CHAIN SUB–ASSY

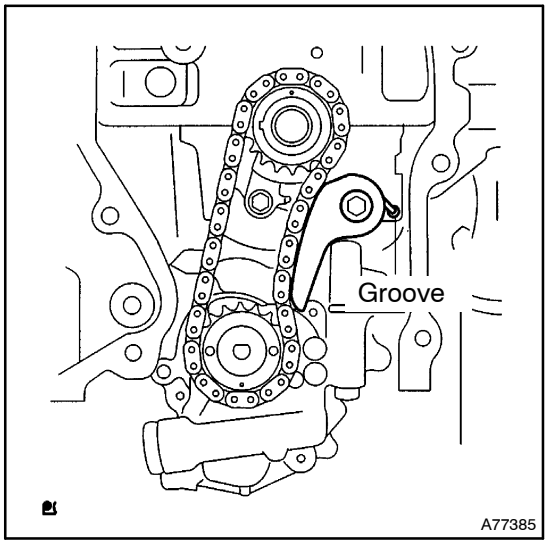


(a) Turn the crankshaft counterclockwise 90°, then align an adjusting hole of the oil pump drive shaft gear with the groove of the oil pump.

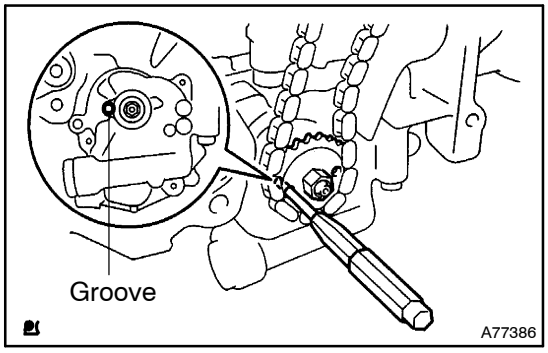
(b) Put a 4 mm diameter bar in the adjusting hole of the oil pump drive shaft gear to lock in position, then remove the nut.



(c) Remove the bolt, then remove the chain tensioner and spring.
(d) Remove the oil pump drive shaft gear and chain No. 2.

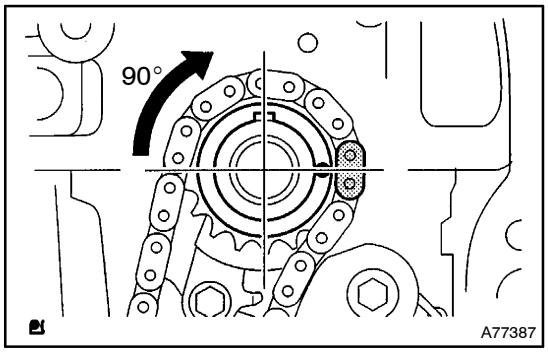


43. INSTALL NO.2 CHAIN SUB–ASSY

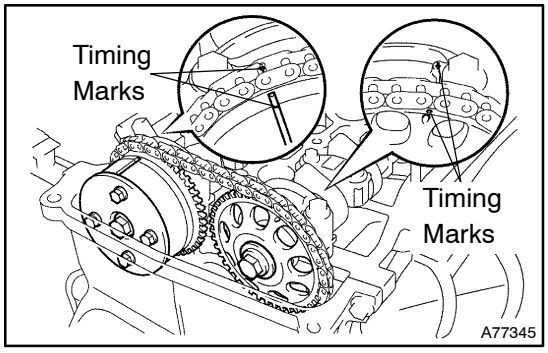


(a) Set the crankshaft key to the left side position.
(b) Position the flat portion of the drive shaft upward.

(c) Align the mark links (yellow colored links) with the timing marks of each gear as shown in the illustration.
(d) Install the gears to the crankshaft and oil pump shaft wrapped with the chain.
(e) Temporarily tighten the oil pump drive shaft gear with the nut.

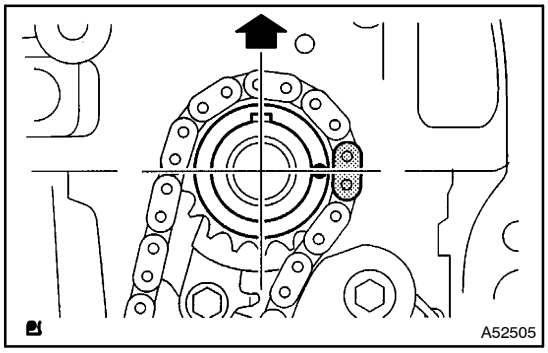


(f) Insert the damper spring into the adjusting hole, then install the chain tensioner plate with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



(g) Align an adjusting hole of the sprocket with the groove of the oil pump.

(h) Insert a 4 mm diameter bar into the adjusting hole of the sprocket to lock in position, then tighten the nut.
Torque: 30 N·m (301 kgf·cm, 22 ft·lbf)

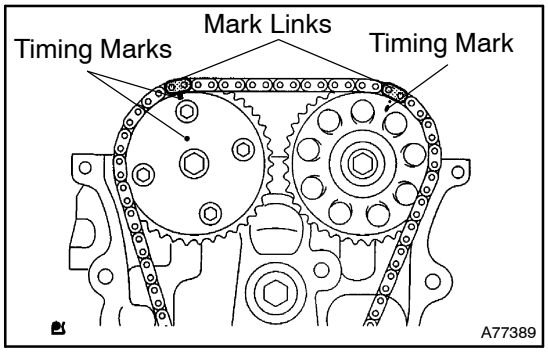


(i) Rotate the crankshaft clockwise 90°, then position the crankshaft key upward.

44. INSTALL CRANKSHAFT TIMING GEAR OR SPROCKET

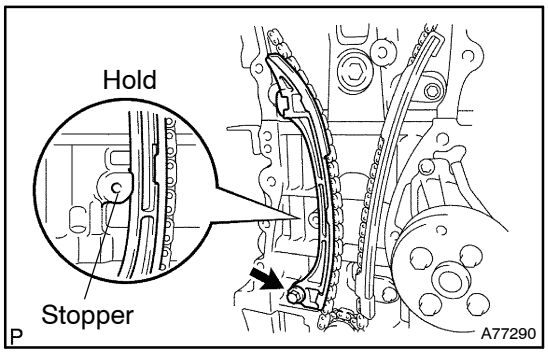
45. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Turn the camshafts with a wrench on the hexagonal lobe, then align the timing marks of the camshaft timing gear with each timing mark located on the No. 1 and No. 2 bearing caps as shown in the illustration.



(b) Using the crankshaft pulley bolt, turn the crankshaft and position the key on the crankshaft upward.

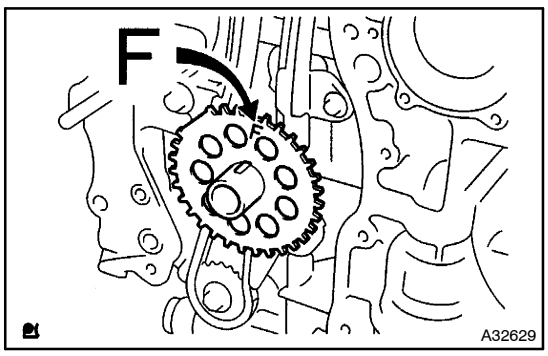
46. INSTALL CHAIN VIBRATION DAMPER NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



47. INSTALL CHAIN SUB–ASSY

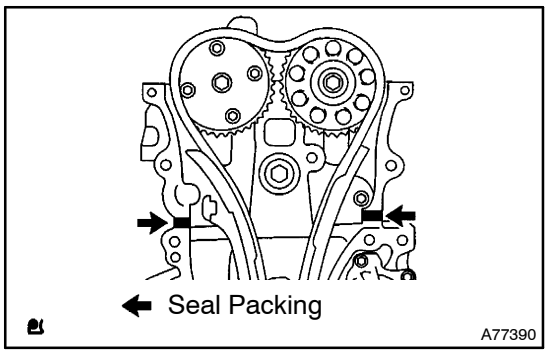
(a) Install the chain to the crankshaft timing gear or sprocket.

(b) Align the mark links (gold or yellow colored links) with each timing mark located on the camshaft timing gears, then install the chain.



48. INSTALL TIMING CHAIN GUIDE
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

49. INSTALL CHAIN TENSIONER SLIPPER

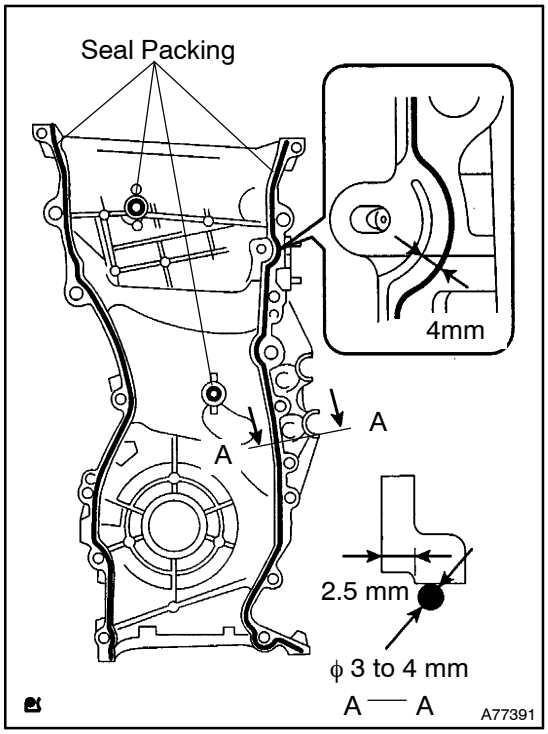


(a) Install the chain tensioner slipper with bolt.
Torque: 19 N·m (195 kgf·cm, 14 ft·lbf)

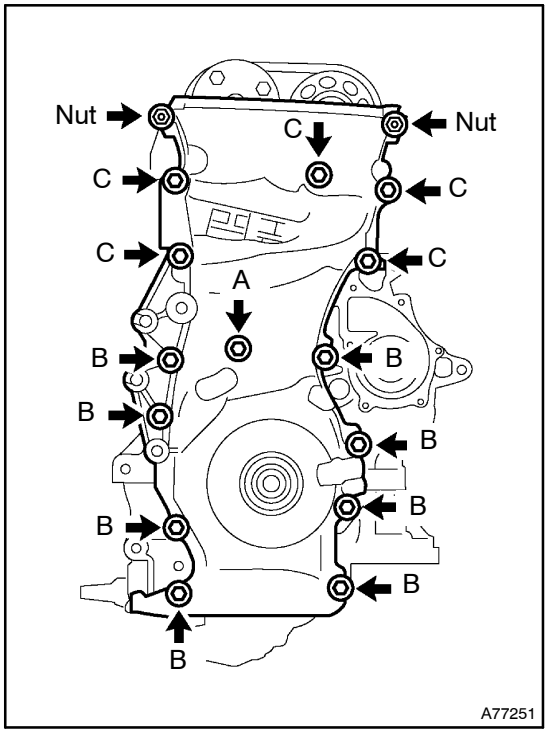
(b) Check that the chain tensioner slipper is held on the cylinder block stopper.

50. INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1

(a) Install the plate with the ”F” mark facing forward.

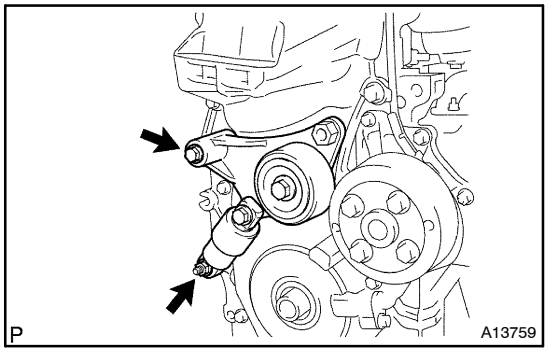


51. INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY
NOTICE:



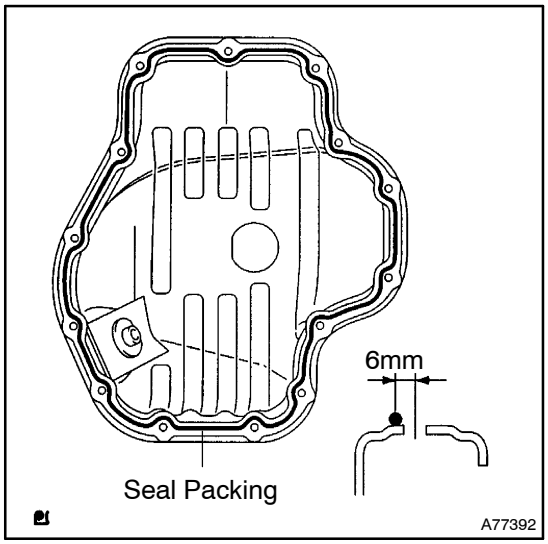
- **Remove any oil from the contact surface.**
- **Install the chain cover within 3 minutes after applying seal packing.**
- **Do not start the engine within 2 hours of installation.**

(a) Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the timing chain cover.



(b) Apply a continuous bead (Diameter 2 mm (0.09 in.)) of seal packing as shown in the illustration.
Seal packing: Part No. 08826 – 00080 or equivalent.

(c) Apply a continuous bead (Diameter 3 to 4 mm (0.118 to 0.157 in.)) of seal packing as shown in the illustration.
Seal packing: Part No. 08826 – 00080 or equivalent

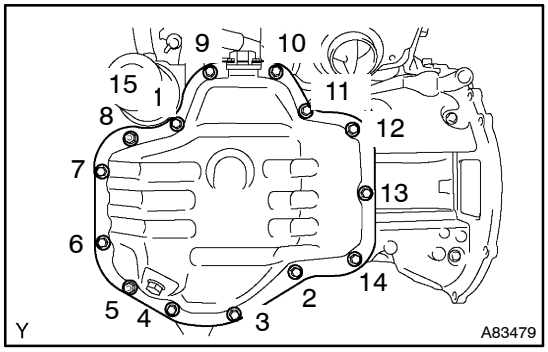


(d) Install the timing chain cover with the 14 bolts and 2 nuts.
Torque:
9.0 N·m (92 kgf·cm, 80 in.·lbf) for Bolt A
25 N·m (255 kgf·cm, 18 ft·lbf) for Bolt B
43 N·m (438 kgf·cm, 32 ft·lbf) for Bolt C
11 N·m (112 kgf·cm, 8.1 ft·lbf) for Nut

52. INSTALL V–RIBBED BELT TENSIONER ASSY

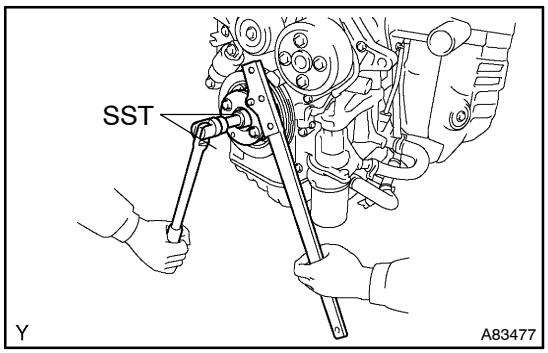
(a) Install the V–ribbed belt tensioner with the bolt and nut.
Torque: 60 N·m (610 kgf·cm, 44 ft·lbf)

NOTICE:
The drive tensioner should be fastened together with the timing chain cover, so be sure install it within 15 minutes after the timing chain cover is installed.



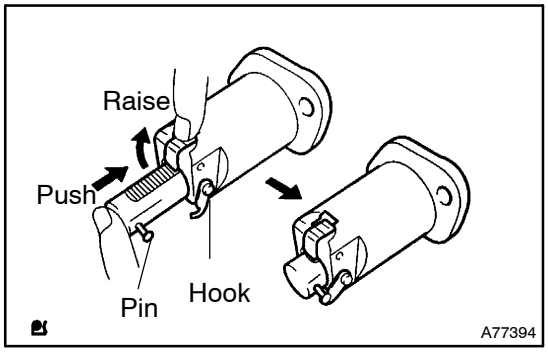
53. INSTALL OIL PAN SUB–ASSY

NOTICE:
- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes after applying seal packing.**
- **Do not start the engine within 2 hours of installation.**



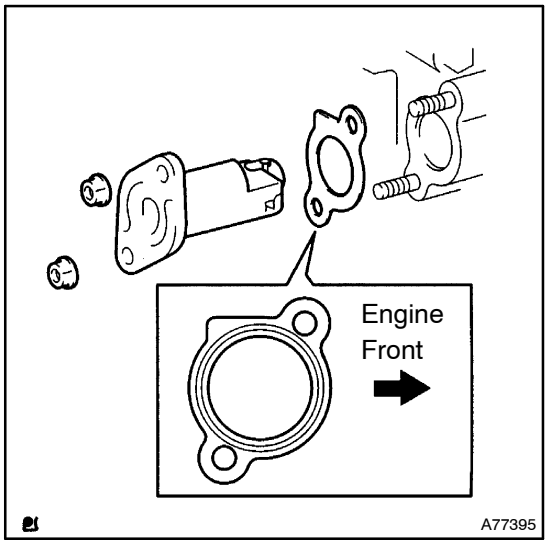
(a) Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surface of the cylinder block and oil pan.

(b) Apply a continuous bead (Diameter 3 to 4 mm (0.118 to 0.157 in.)) of seal packing as shown in the illustration, then install the oil pan.
Seal packing: part No. 08826 – 00080 or equivalent



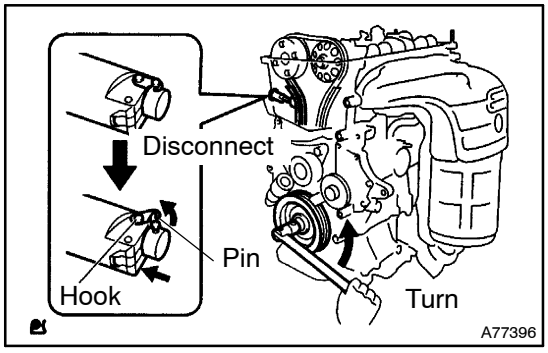
(c) Install the oil pan with the 12 bolts and 2 nuts sequence shown in the illustration.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

54. INSTALL CRANKSHAFT POSITION SENSOR (See page 18–6)



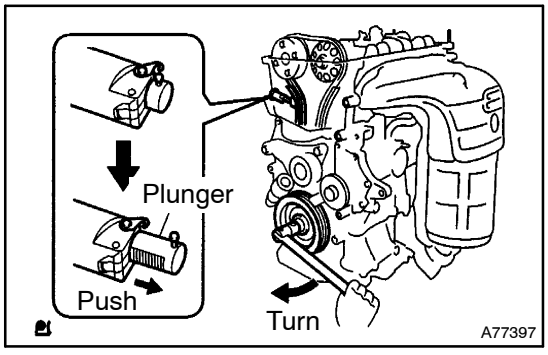
55. INSTALL CRANKSHAFT PULLEY

(a) Using SST, tighten the set bolt.
SST 09213–54015 (91651–60855), 09330–00021
Torque: 170 N·m (1,733 kgf·cm, 125 ft·lbf)



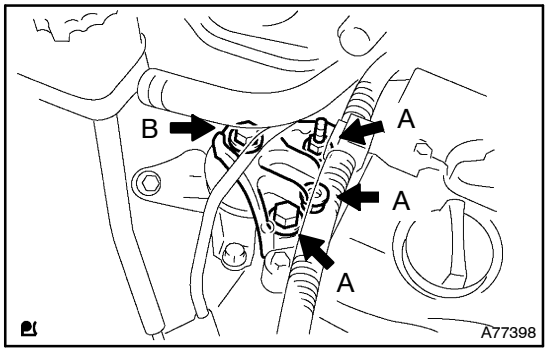
56. INSTALL CHAIN TENSIONER ASSY NO.1

(a) Release the ratchet pawl, fully push in the plunger and apply the hook to the pin so that the plunger is located in position.

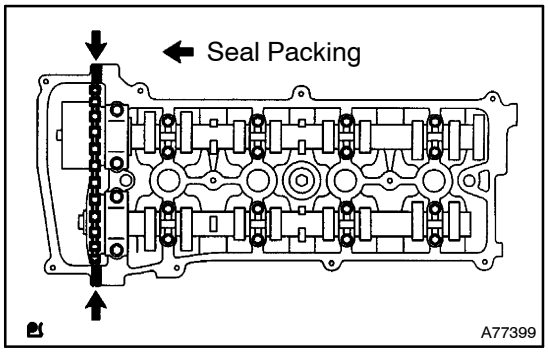


(b) Install a new gasket chain tensioner with the 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:
If the hook is released while inserting, apply the hook again and insert the chain tensioner.

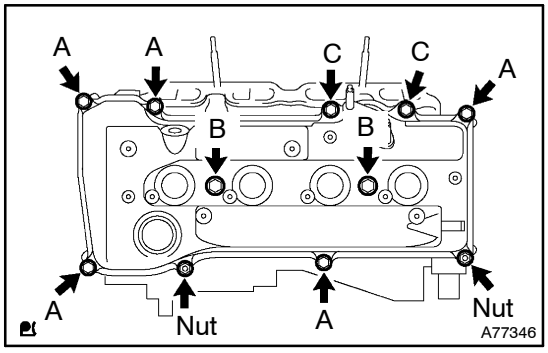


(c) Turn the crankshaft counterclockwise, then check that the hook is disengaged from the plunger knock pin.



(d) Turn the crankshaft clockwise, then check that the plunger is extended.

57. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

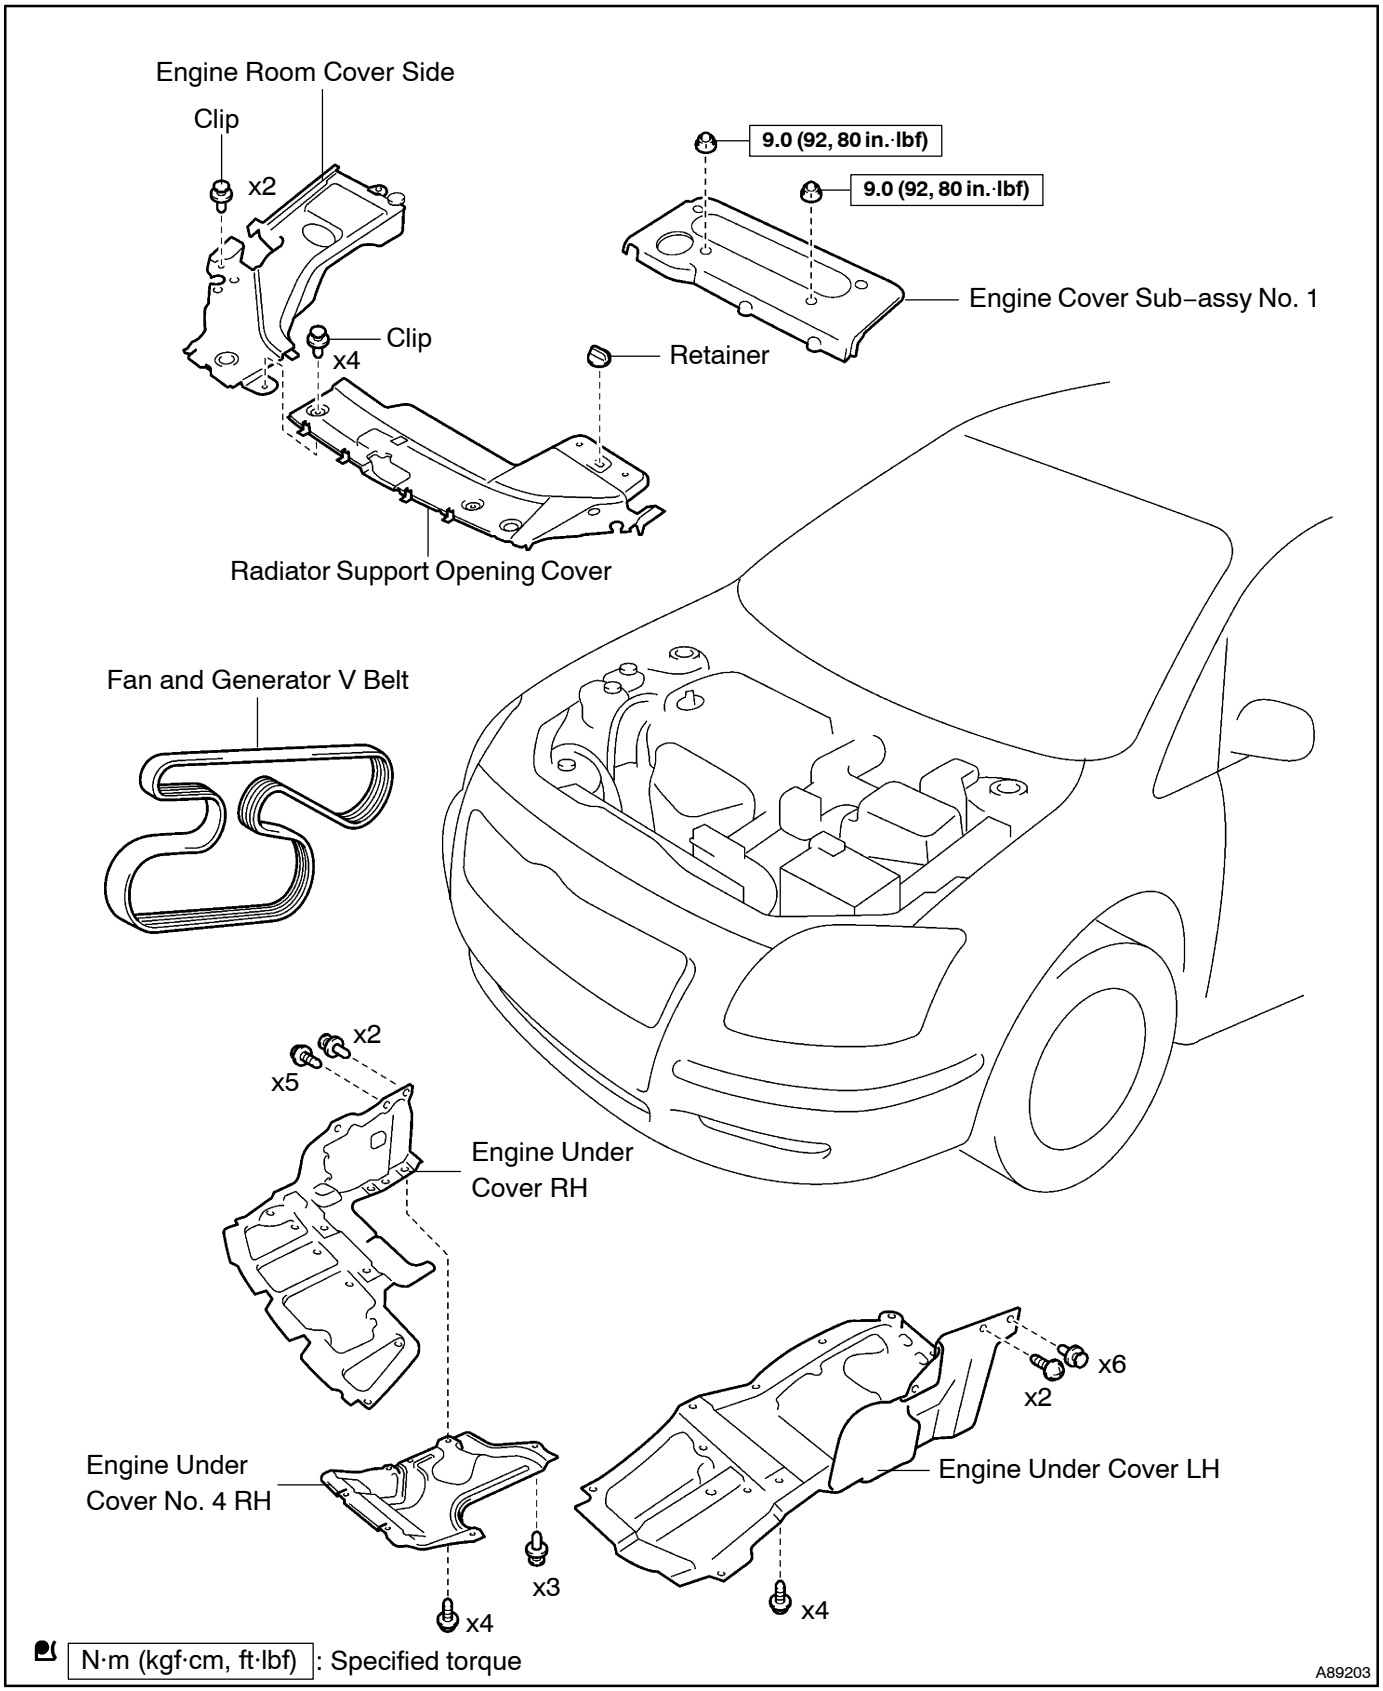


58. INSTALL ENGINE MOUNTING BRACKET NO.2 RH
Torque:
52 N·m (530 kgf·cm, 38 ft·lbf) for A
113 N·m (1,152 kgf·cm, 83 ft·lbf) for B

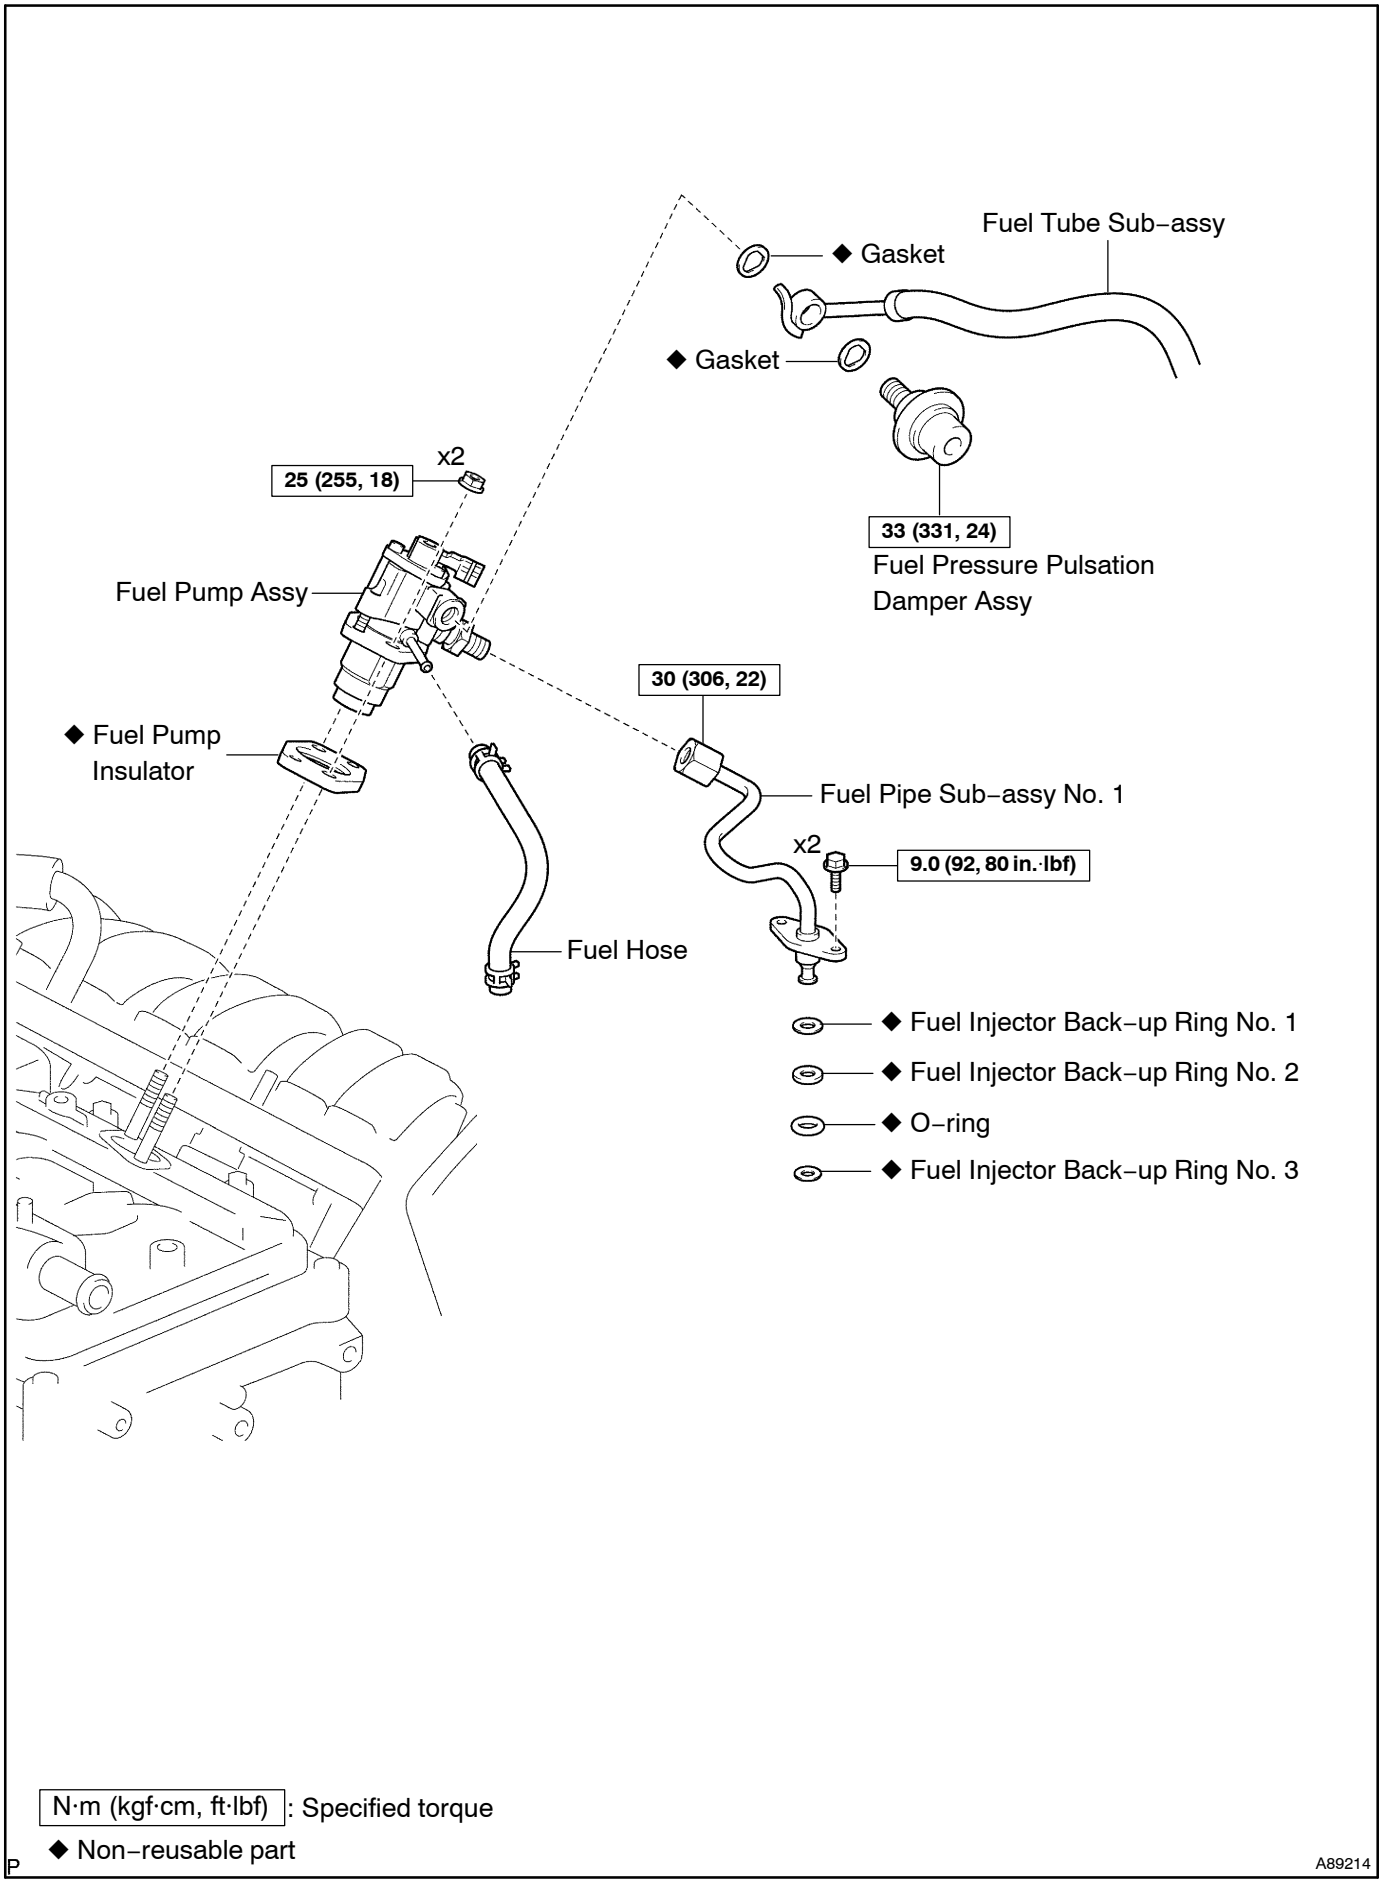
59. INSTALL CYLINDER HEAD COVER SUB–ASSY
(a) Remove any old seal packing (FIPG) material.
(b) Apply seal packing to the 2 locations as shown in the illustration.
Seal Packing: Part No. 08826–00080 or equivalent

NOTICE:
- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 5 minutes after applying seal packing.**
- **Do not expose the seal to engine oil 2 hours after installing.**

(c) install the cylinder head cover with the 9 bolts and 2 nuts.
Torque:
11 N·m (112 kgf·cm, 8 ft·lbf) for Nnt
11 N·m (112 kgf·cm, 8 ft·lbf) for Bolt A
14 N·m (143 kgf·cm, 10 ft·lbf) for Bolt B
21 N·m (214 kgf·cm, 16 ft·lbf) for Bolt C



60. INSTALL COOLER BRACKET (LHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
61. INSTALL ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
62. INSTALL ENGINE WIRE
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
63. INSTALL OIL RESERVOIR BRACKET NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
64. INSTALL COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE)
65. INSTALL RETURN TUBE SUB–ASSY
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
66. INSTALL IGNITION COIL ASSY
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



67. INSTALL VANE PUMP ASSY
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)
SST 09249–63010
68. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–2)
69. INSTALL GENERATOR ASSY (See page 19–8)
70. INSTALL FAN AND GENERATOR V BELT (See page 14–5)
SST 09249–63010
71. INSTALL FUEL PUMP ASSY (See page 11–24)
72. INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
SST 09023–12900
73. INSTALL FUEL TUBE SUB–ASSY (See page 11–4)
74. INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)
75. ADD ENGINE OIL (See page 17–6)
76. CHECK FOR ENGINE OIL LEAKS
77. CHECK FOR FUEL LEAKS
78. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
79. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
80. ADD POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
81. BLEED POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
82. CHECK POWER STEERING FULUID LEVEL IN RESERVER (See Pub. No. RM1018E on page 51–4)

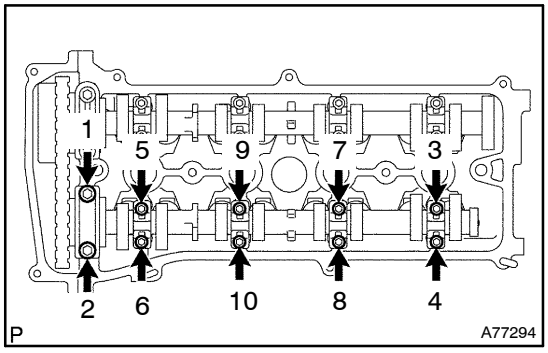
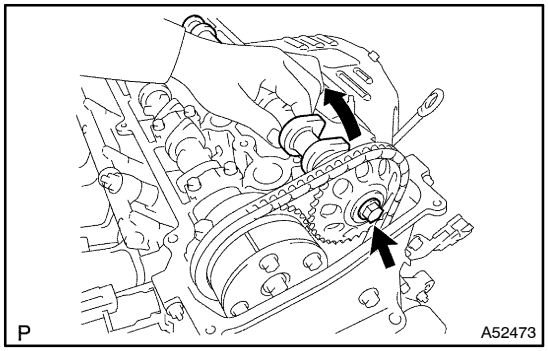
REPLACEMENT

1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–4)
2. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)
3. REMOVE ENGINE ROOM COVER SIDE (See page 14–23)
4. REMOVE ENGINE UNDER COVER LH (See page 14–23)
5. REMOVE COVER, ENGINE UNDER, NO.4 RH (See page 14–23)
6. REMOVE ENGINE UNDER COVER RH (See page 14–23)
7. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–45)
8. REMOVE IGNITION COIL ASSY (See page 14–45)
9. REMOVE FUEL PRESSURE PULSATION DAMPER ASSY
10. REMOVE FUEL TUBE SUB–ASSY (See page 11–4)
11. REMOVE FUEL PIPE SUB–ASSY NO.1 (See page 11–4)
    SST 09023–12900
12. REMOVE FUEL PUMP ASSY (See page 11–24)
13. REMOVE CYLINDER HEAD COVER SUB–ASSY (See page 14–45)
14. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–45)
15. REMOVE CHAIN TENSIONER ASSY NO.1 (See page 14–45)



16. REMOVE NO.2 CAMSHAFT

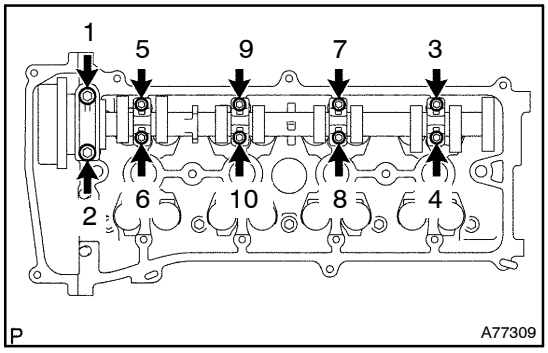
(a) Hold the No. 2 camshaft with a wrench on the hexagonal lobe, then loosen the camshaft timing gear set bolt.



NOTICE:

Be careful not to damage the cylinder head and valve lifter with the wrench.

(b) Using several steps, loosen and remove the 10 camshaft bearing cap bolts uniformly in the sequence shown in the illustration.

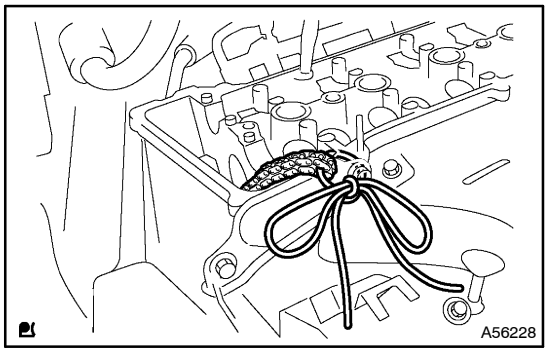


(c) Remove the 5 camshaft bearing caps.

(d) Raising the No. 2 camshaft, remove the set bolt.

(e) Remove the camshaft timing gear from the No. 2 camshaft with with the timing chain wrapped.

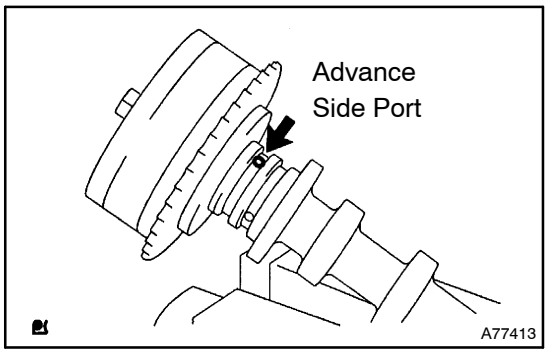
(f) Remove the camshaft timing gear from the timing chain.



17. REMOVE CAMSHAFT

(a) Using several steps, loosen and remove the 10 camshaft bearing cap bolts uniformly in the sequence shown in the illustration.

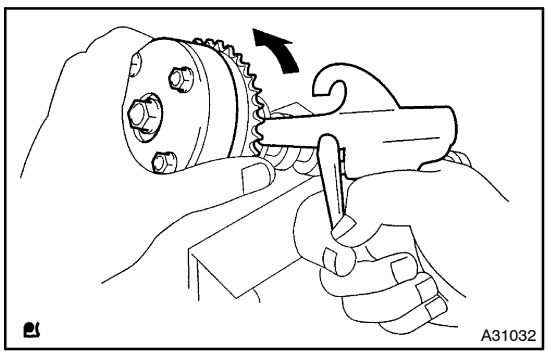
(b) Remove 5 camshaft bearings.



(c) Remove the camshaft.

(d) Tie the timing chain as shown in the illustration.

NOTICE:

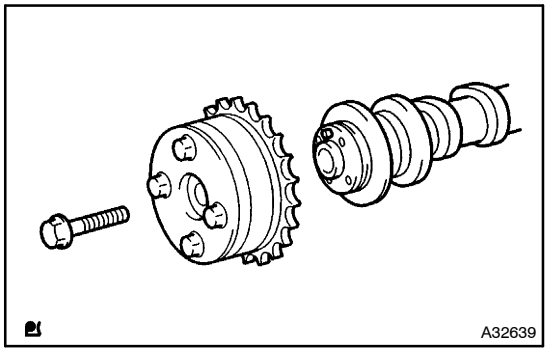


- **Be careful not to drop anything inside the timing chain cover.**
- **Do not expose the chain to water and dust.**

18. REMOVE CAMSHAFT TIMING GEAR ASSY

(a) Clamp the camshaft in a vise, then make sure the camshaft timing gear does not rotate.

(b) Cover all the oil ports with vinyl tape except an advance side port shown in the illustration.

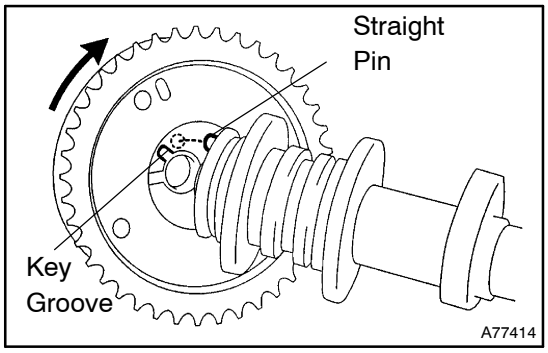


(c) Put air pressure into the oil port with 150 kpa (1.5 kgf/cm^2 21 psi), then turn the camshaft timing gear to the advance direction (counterclockwise) with hand.

CAUTION:

Cover the ports with shop rag to avoid oil splashing.

HINT:



Depending on the air pressure, the camshaft timing gear will turn to the advance angle side without applying force with hand. Also, under the condition that the pressure can be hardly applied because of the air leakage from the port, there may be the case that the lock pin could be hardly released.

(d) Remove a fringe bolt of camshaft timing gear.

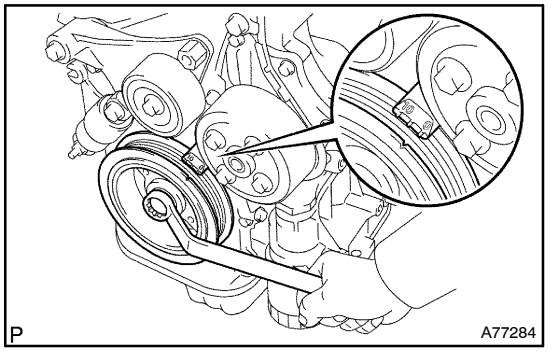
NOTICE:

- **Be sure not to remove the other 4 bolts.**
- **When reusing the camshaft timing gear, release the straight pin lock first, and then install the gear.**

19. INSTALL CAMSHAFT TIMING GEAR ASSY

(a) Put the camshaft timing gear and the camshaft together with the straight pin off the key groove.

(b) Turn the camshaft timing gear assembly to the left direction (as shown in the illustration) while lightly pushing it toward the camshaft. Push further at the position where the pin gets into the groove.

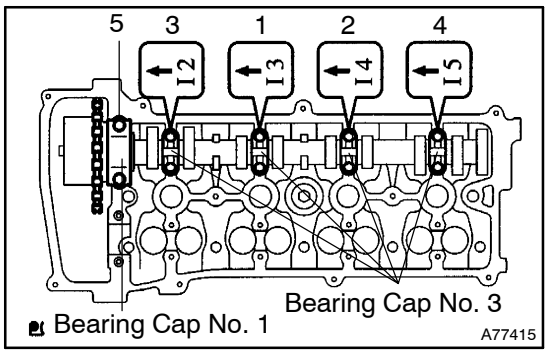


NOTICE:

Be sure not to turn the camshaft timing gear to the retard angle side (to the right direction).

(c) Check that there is no clearance between the gear's fringe and the camshaft.

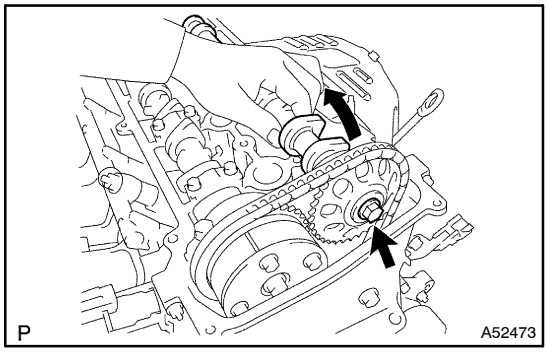
(d) Tighten the fringe bolt with the camshaft timing gear fixed.
Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)



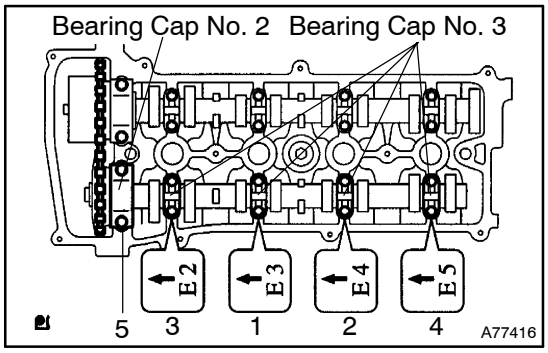
(e) Check that the camshaft timing gear can move to the retard angle side (to the right direction) and is locked at the most retarded position.

20. INSTALL CAMSHAFT

(a) Turn the crankshaft pulley, then align its groove with the timing mark 0 of the timing chain cover.

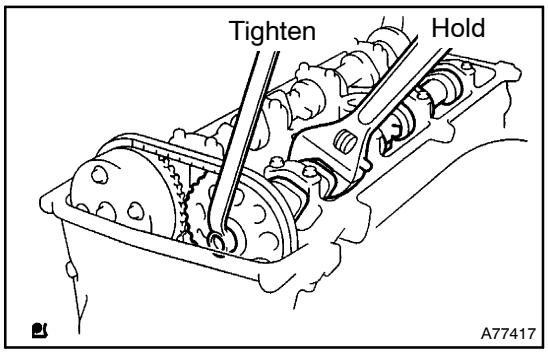


(b) Install the timing chain on the camshaft timing gear, with the painted links aligned with the timing marks on the camshaft timing gear.



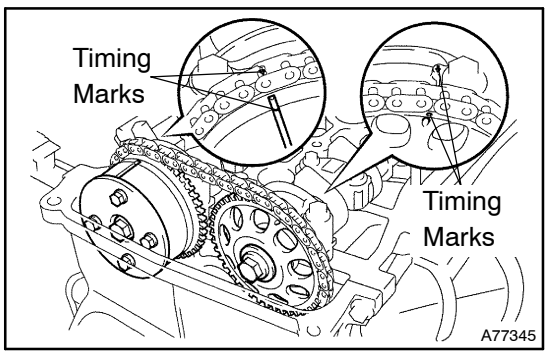
(c) Examine the front marks and numbers, then tighten the bolts in the sequence shown in the illustration.
Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for Bearing cap No. 1
9.0 N·m (92 kgf·cm, 80 in.·lbf) for Bearing cap No. 3

21. INSTALL NO.2 CAMSHAFT



(a) Put the No. 2 camshaft on the cylinder head with the painted links of chain aligned with the timing mark on the camshaft timing gear.

(b) Raising the No. 2 camshaft, tighten the set bolt temporarily.



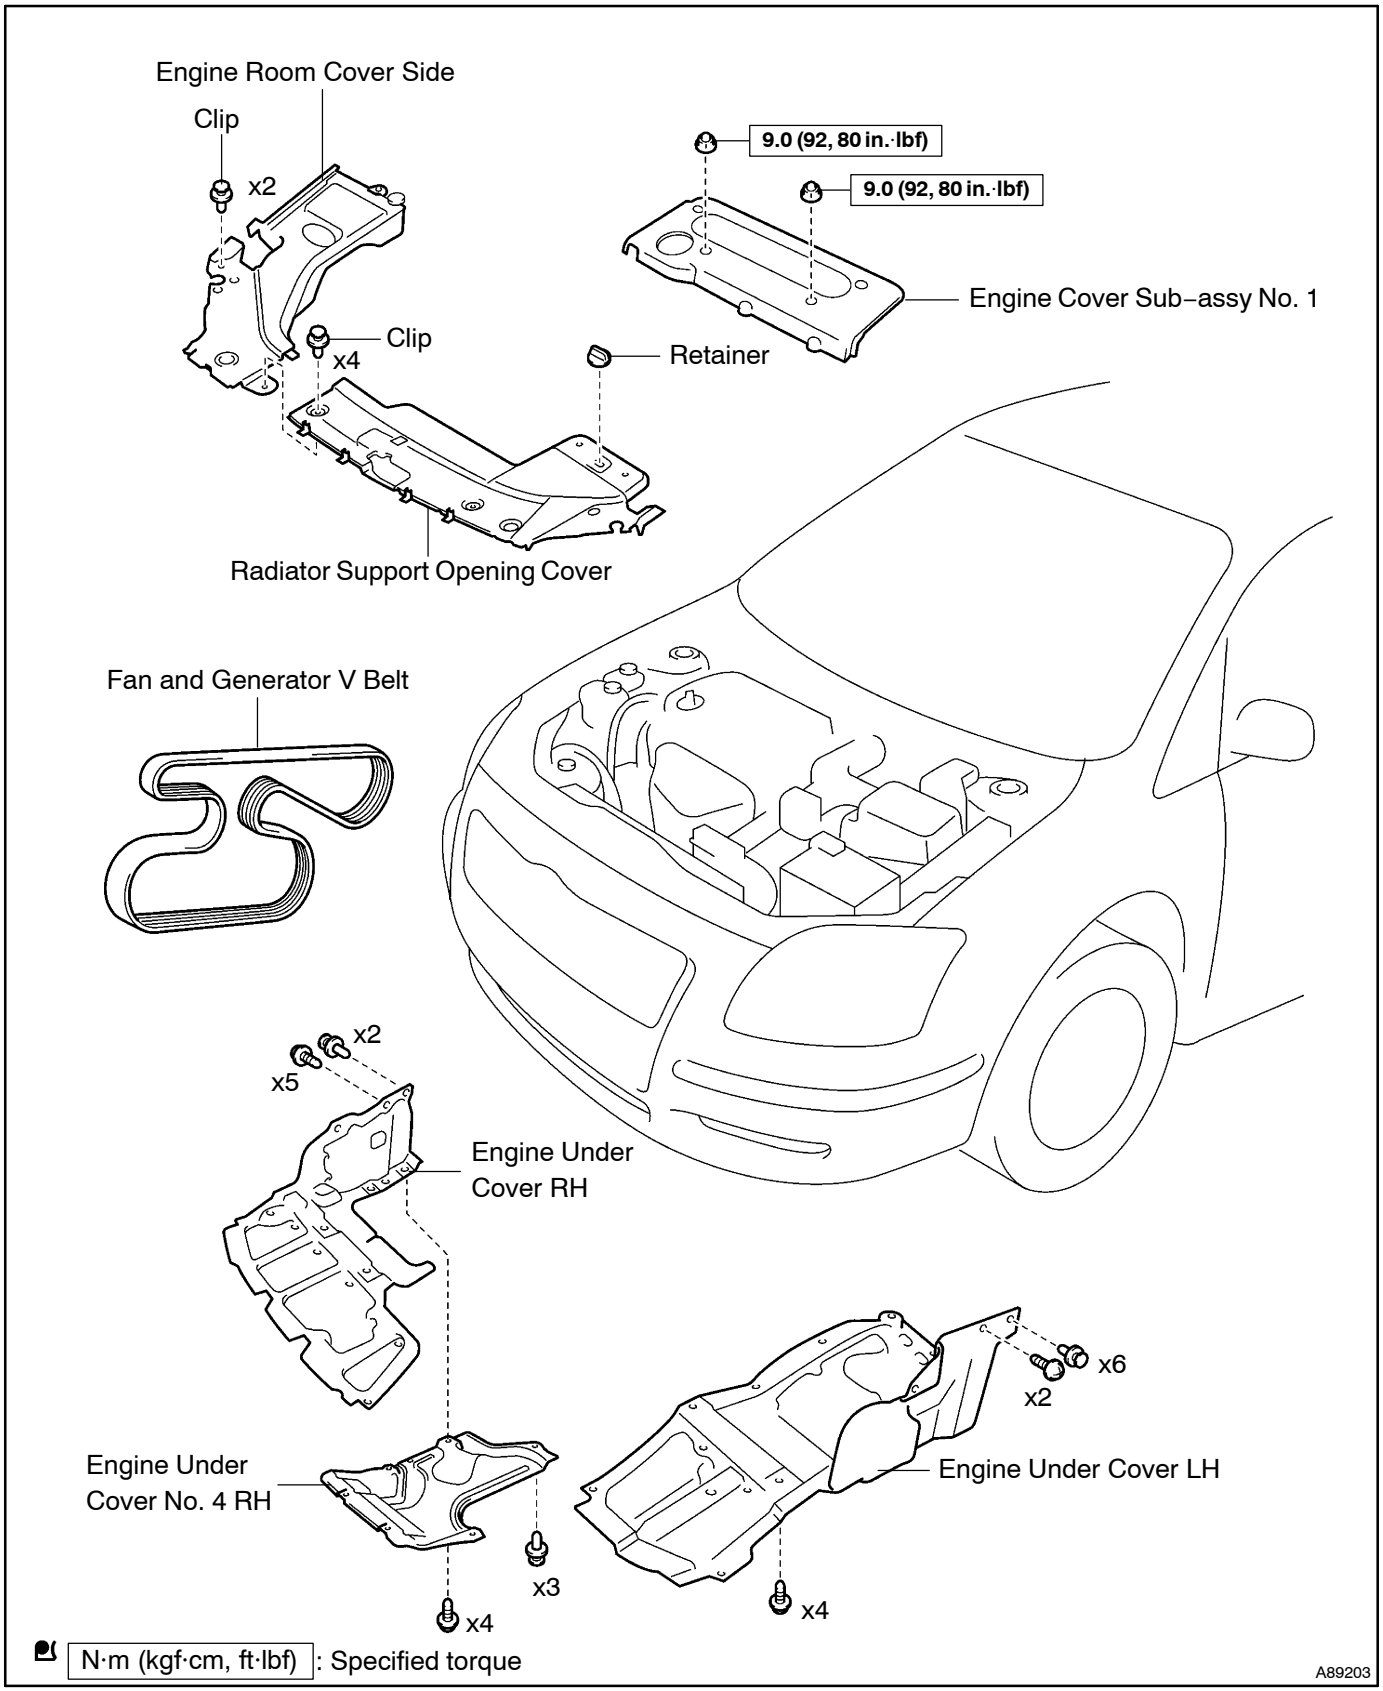
(c) Examine the from marks and numbers, then tighten the bolts in the sequence shown in the illustration.
Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for Bearing cap No. 2
9.0 N·m (92 kgf·cm, 80 in.·lbf) for Bearing cap No. 3

(d) Hold the camshaft with a wrench on the hexagonal lobe, then tighten the camshaft timing gear set bolt.
Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)

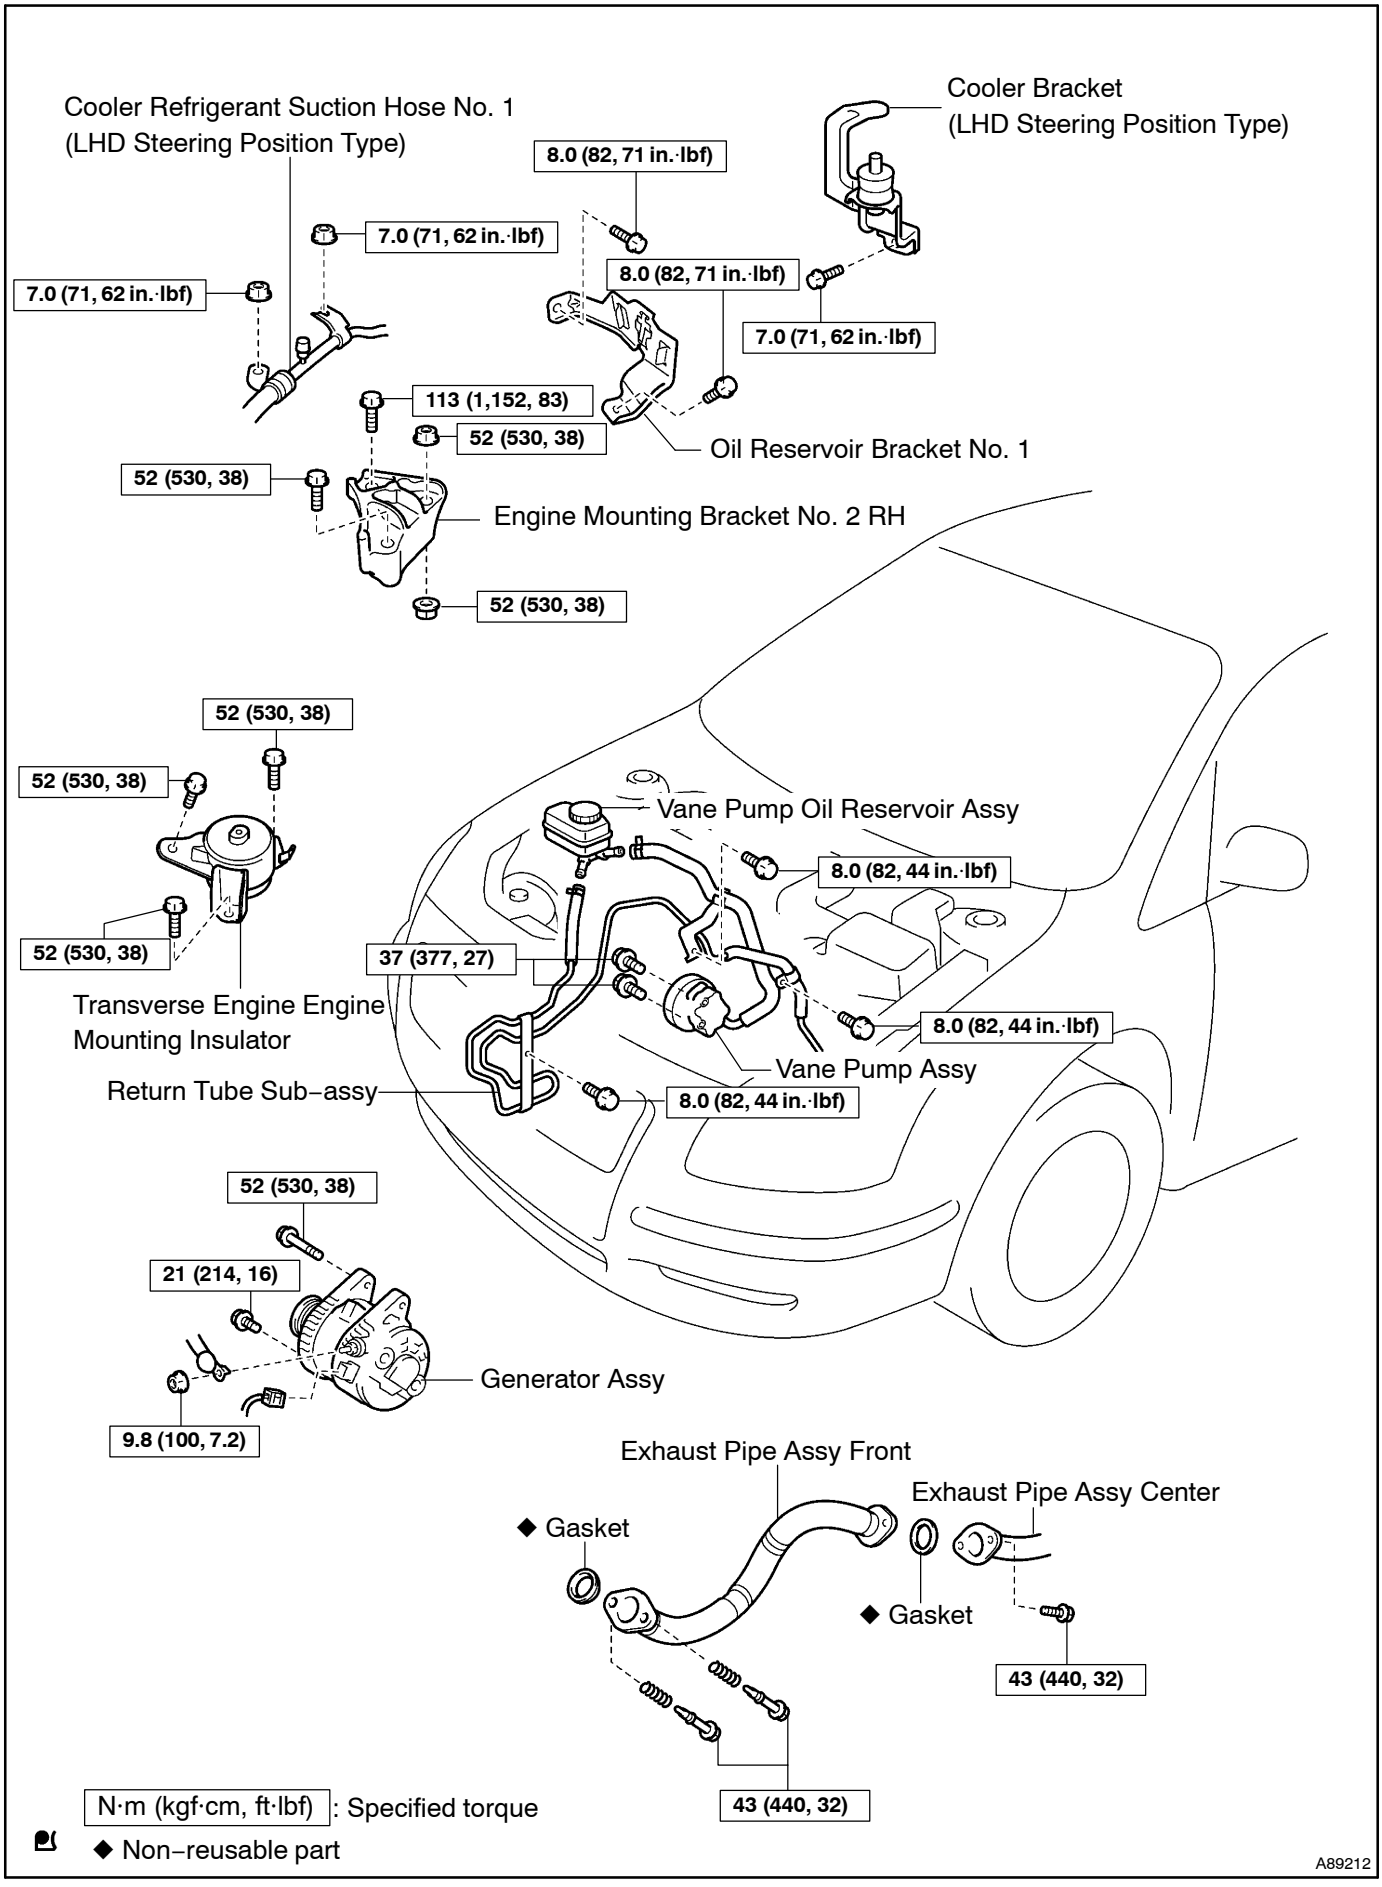
NOTICE:
Be careful not to damage the cylinder head and valve lifter.

(e) Check that the match marks on the timing chain and camshaft timing gears are positioned as shown in the illustration

22. **INSTALL CHAIN TENSIONER ASSY NO.1 (See page 14–45)**
23. **INSTALL CYLINDER HEAD COVER SUB–ASSY (See page 14–45)**
24. **INSTALL FUEL PUMP ASSY (See page 11–24)**
25. **INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)**
    SST 09023–12900
26. **INSTALL FUEL TUBE SUB–ASSY (See page 11–4)**
27. **INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)**
28. **INSTALL IGNITION COIL ASSY**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



29. CHECK FOR ENGINE OIL LEAKS



30. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

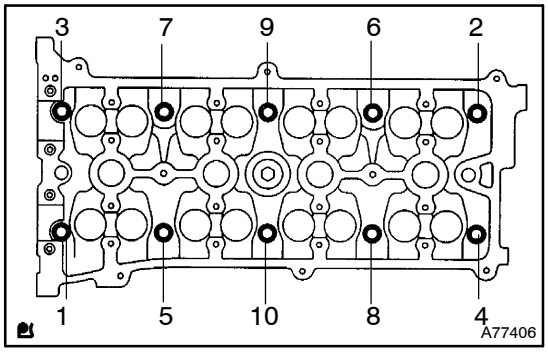
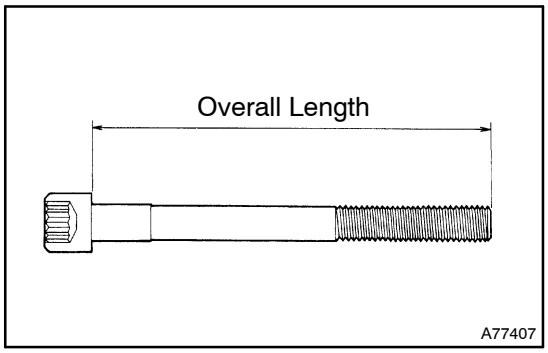
45. DISCONNECT UNION TO CONNECTOR TUBE HOSE (See page 14–23)
46. DISCONNECT HEATER INLET WATER HOSE (See page 14–23)
47. SEPARATE FUEL TUBE SUB–ASSY (See page 11–1)
48. SEPARATE ENGINE WIRE
49. REMOVE THROTTLE BODY ASSY (See page 10–8)
50. REMOVE CHARCOAL CANISTER ASSY
51. REMOVE INTAKE MANIFOLD (See page 11–13)
52. REMOVE MANIFOLD CONVERTER INSULATOR NO.1 (See page 14–23)
53. REMOVE EXHAUST MANIFOLD CONVERTER SUB–ASSY (See page 14–23)
54. REMOVE NO.2 CAMSHAFT (See page 14–64)
55. REMOVE CAMSHAFT (See page 14–64)
56. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSY (See page 14–23)



57. REMOVE CAMSHAFT BEARING NO.2

58. SUPPORT ENGINE ASSEMBLY WITH TRANSAXLE
(a) Install the oil pan sub–assy.
(b) Set the jack under the engine assembly with transaxle, then place a wooden block on the jack.
(c) Remove the chain block and sling devise.

59. REMOVE CYLINDER HEAD SUB–ASSY
(a) Remove the bolt, then separate the water by–pass pipe.
(b) Remove the camshaft housing plug.



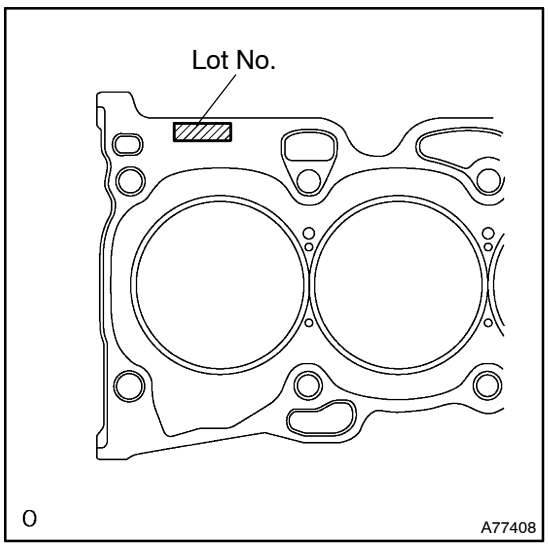
(c) Using several steps, loosen the 10 cylinder head bolts with 10 mm bi–hexagon wrench uniformly in the sequence shown in the illustration.

(d) Remove the 10 cylinder head bolts and plate washers.

NOTICE:

- **Be careful not to drop washers into the cylinder head.**
- **Head warpage or cranking could result from removing bolts and installing incorrect order.**

60. REMOVE CYLINDER HEAD GASKET

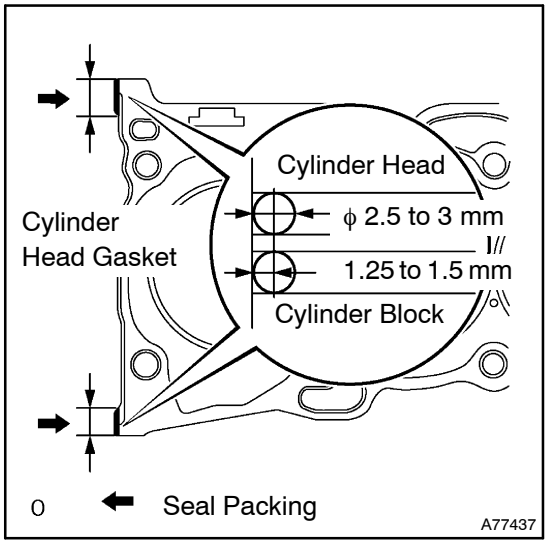


61. INSPECT CYLINDER HEAD SET BOLT

(a) Using a vernier calipers, measure the length of the cylinder head set bolts from the seat to the end.

Standard bolt length:
161.3 to 162.3 mm (6.350 to 6.390 in.)
Maximum bolt length: 164.2 mm (6.465 in.)

If the length is greater than maximum, replace the cylinder head set bolts.



62. INSTALL CYLINDER HEAD GASKET

(a) Place a new cylinder head gasket on the cylinder block surface with the Lot No. stamp upward.

NOTICE:

- **Remove any oil from contact surface.**
- **Be careful of the installation direction.**
- **Place the cylinder head gently in order not to damage the gasket with the bottom part of the head.**

63. INSTALL CYLINDER HEAD SUB–ASSY

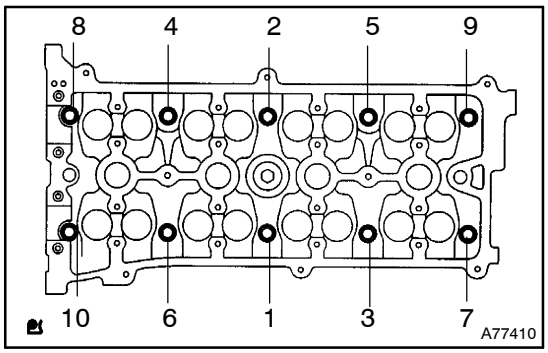
HINT:

The cylinder head set bolts are tightened in the 2 successive steps.

(a) Apply a continuous bead (Diameter 2.5 to 3 mm (0.098 to 0.118 in.)) of seal packing as shown in the illustration.

Seal packing: Part No. 08826–00080 or equivalent

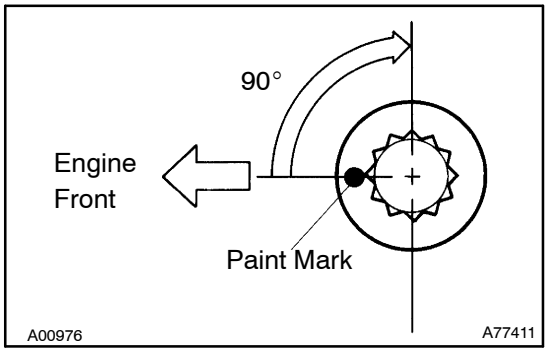
NOTICE:



- **Remove any oil from contact surface.**
- **Install the cylinder head within 3 minutes after applying seal packing.**
- **After installing the cylinder head, cylinder head bolts must be tightened within 15 minutes.**
- **Do not start the engine within 2 hours of installation.**

(b) Apply a light coat of engine oil on the threads of the cylinder head bolts.

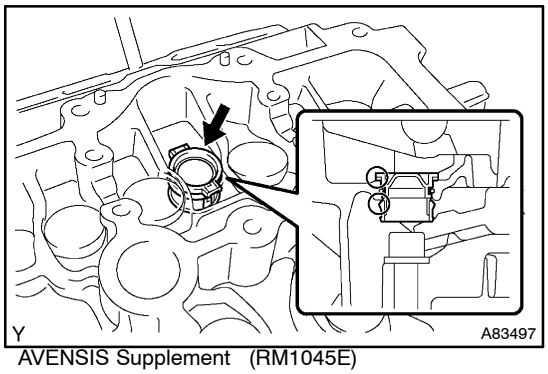
(c) Install bolts and plate washers to the cylinder head.



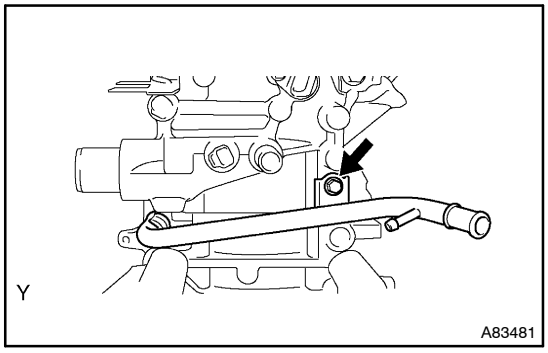
NOTICE:

Do not drop the washers into the cylinder head.

(d) Using several steps, install and tighten the 10 cylinder head bolts and plate washers with a 10 mm bi–hexagon wrench uniformly in the sequence shown in the illustration.



Torque: 79 N·m (806 kgf·cm, 58 ft·lbf)



(e) Mark the front side of the cylinder head set bolts with paint.

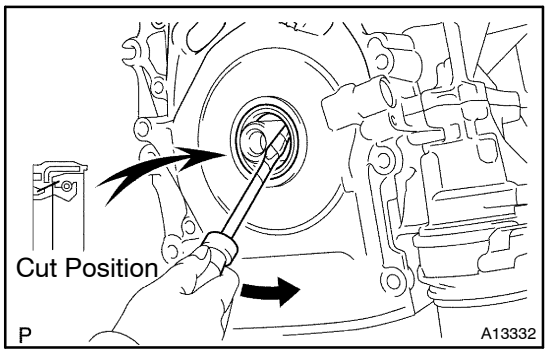
(f) Retighten the cylinder head set bolts by 90° in the same sequence as a step (d).

(g) Check that each paint mark is now at a 90° angle to the front.

(h) Install the camshaft housing plug as shown in the illustration.

(i) Install the water by–pass pipe with a bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

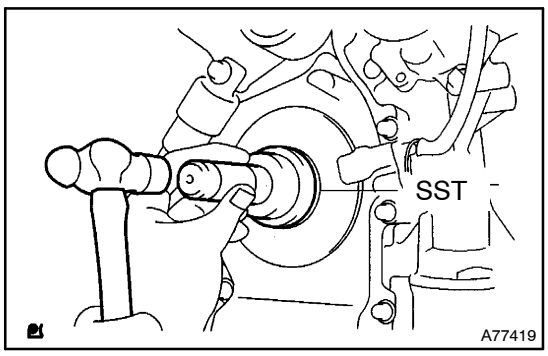
64. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSY**
65. **INSTALL CAMSHAFT (See page 14–64)**
66. **INSTALL NO.2 CAMSHAFT (See page 14–64)**
67. **INSTALL EXHAUST MANIFOLD CONVERTER SUB–ASSY (See page 14–23)**
68. **INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.1 (See page 14–23)**
69. **INSTALL INTAKE MANIFOLD (See page 11–13)**
70. **INSTALL THROTTLE BODY ASSY (See page 10–8)**
71. **INSTALL AIR CLEANER ASSEMBLY WITH HOSE (See page 14–23)**
72. **INSTALL BATTERY**
    Torque:
    5.0 N·m (51 kgf·cm, 44 in.·lbf) for Bolt
    3.5 N·m (36 kgf·cm, 31 in.·lbf) for Nut
73. **INSTALL CHAIN VIBRATION DAMPER NO.1 (See page 14–45)**
74. **INSTALL CHAIN SUB–ASSY (See page 14–45)**
75. **INSTALL TIMING CHAIN GUIDE (See page 14–45)**
76. **INSTALL CHAIN TENSIONER SLIPPER (See page 14–45)**
77. **INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1 (See page 14–45)**
78. **INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY (See page 14–45)**
79. **INSTALL V–RIBBED BELT TENSIONER ASSY (See page 14–45)**
80. **INSTALL OIL PAN SUB–ASSY (See page 14–45)**
81. **INSTALL CRANKSHAFT POSITION SENSOR (See page 14–45)**
82. **INSTALL CRANKSHAFT PULLEY (See page 14–45)**
    SST 09213–54015 (91651–60855), 09330–00021
83. **INSTALL CHAIN TENSIONER ASSY NO.1 (See page 14–45)**
84. **INSTALL TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR**
    Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)
85. **INSTALL ENGINE MOUNTING BRACKET NO.2 RH (See page 14–45)**
86. **INSTALL CYLINDER HEAD COVER SUB–ASSY (See page 14–45)**
87. **INSTALL COOLER BRACKET (LHD STEERING POSITION TYPE)**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
88. **INSTALL ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE)**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
89. **INSTALL OIL RESERVOIR BRACKET NO.1**
    Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
90. **INSTALL COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE)**
91. **INSTALL RETURN TUBE SUB–ASSY**
    Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
92. **INSTALL IGNITION COIL ASSY**
    Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
93. **INSTALL FUEL PUMP ASSY (See page 11–24)**



94. INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
SST 09023–12900
95. INSTALL FUEL TUBE SUB–ASSY (See page 11–24)
96. INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)
97. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
98. INSTALL VANE PUMP ASSY
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)
99. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–2)
100. INSTALL GENERATOR ASSY (See page 19–8)
101. INSTALL FAN AND GENERATOR V BELT (See page 14–5)
SST 09249–63010
102. ADD COOLANT (See page 16–7)
103. ADD ENGINE OIL (See page 17–6)
104. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)
105. CHECK FOR ENGINE OIL LEAKS
106. CHECK FOR FUEL LEAKS (See page 11–4)
107. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
108. ADD POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
109. BLEED POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
110. CHECK POWER STEERING FULUID LEVEL IN RESERVOIR
(See Pub. No. RM1018E on page 51–4)
111. CHECK FUNCTION OF THROTTLE BODY

TIMING GEAR CASE OR TIMING CHAIN CASE OIL SEAL (2AZ–FSE)

141NC–01



REPLACEMENT

1. **REMOVE FRONT WHEEL RH**
2. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)**
3. **REMOVE ENGINE ROOM COVER SIDE (See page 14–23)**
4. **REMOVE ENGINE UNDER COVER LH (See page 14–23)**
5. **REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)**
6. **REMOVE ENGINE UNDER COVER RH (See page 14–23)**
7. **REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–45)**
8. **REMOVE FAN AND GENERATOR V BELT (See page 14–5)**
   SST 09249–63010
9. **REMOVE CRANKSHAFT PULLEY (See page 14–45)**
   SST 09213–54015 (91651–60855), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)

10. **REMOVE TIMING GEAR CASE OR TIMING CHAIN CASE OIL SEAL**
    (a) Using a screwdriver with tip wrapped in the tape, pry out the oil seal.

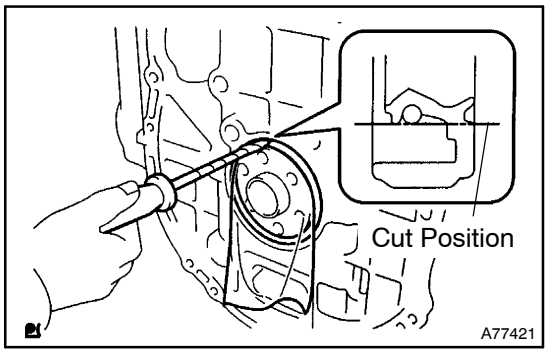
HINT:
After removal, check that the crankshaft is not damaged.
If damaged, smooth the surface with 400–grit sandpaper.

11. **INSTALL TIMING GEAR CASE OR TIMING CHAIN CASE OIL SEAL**
    (a) Apply MP grease to a new oil seal lip.

NOTICE:
Keep the lip off foreign materials.

    (b) Using SST and a hammer, tap in the oil seal until its surface is flush with the rear oil seal retainer edge.
    SST 09223–22010

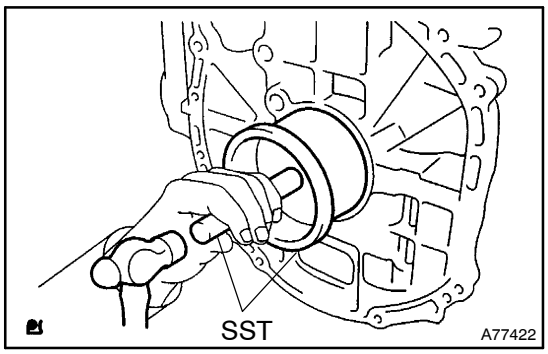
NOTICE:
Wipe off extra grease on the crankshaft.



12. **INSTALL CRANKSHAFT PULLEY (See page 14–45)**
    SST 09213–54015 (91651–60855), 09330–00021
13. **INSTALL FAN AND GENERATOR V BELT (See page 14–5)**
    SST 09249–63010
14. **INSTALL ENGINE COVER SUB–ASSY NO.1**
    Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
15. **INSTALL FRONT WHEEL RH**
    Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
16. **CHECK FOR ENGINE OIL LEAKS**

ENGINE REAR OIL SEAL (2AZ–FSE)

141BS–02



REPLACEMENT

1. **REMOVE AUTOMATIC TRANSAXLE ASSY (See page 40–3)**
2. **REMOVE DRIVE PLATE & RING GEAR SUB–ASSY (See page 14–23)**
   SST 09213–54015 (91651–60855), 09330–00021

3. **REMOVE ENGINE REAR OIL SEAL**
(a) Using a knife, cut off the engine rear oil seal lip.
(b) Using a screwdriver with the tip wrapped in tape, pry out the engine rear oil seal.

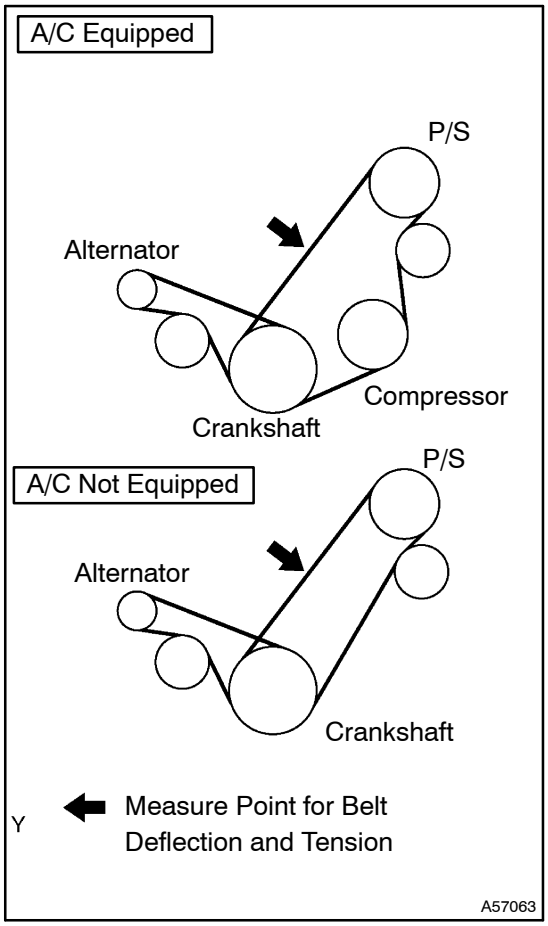
HINT:
After the removal, check that the crankshaft is not damaged. If damaged, smooth the surface with 400–grit sandpaper.

4. **INSTALL ENGINE REAR OIL SEAL**
(a) Apply MP grease to a new engine rear oil seal lip.

NOTICE:
Keep the lip off foreign materials.

(b) Using SST and a hammer, tap in the engine rear oil seal until its surface is flush with the engine rear oil seal retainer edge.
   SST 09223–15030, 09950–70010 (09951–07100)

NOTICE:
Wipe off extra grease on the crankshaft.



5. **INSTALL DRIVE PLATE & RING GEAR SUB–ASSY (See page 14–23)**
   SST 09213–54015 (91651–60855), 09330–00021
6. **INSTALL AUTOMATIC TRANSAXLE ASSY (See page 40–3)**

ENGINE (1CD–FTV)(From September, 2003)

141ND–01

INSPECTION

1. **INSPECT ENGINE COOLANT (See page 16–15)**
2. **INSPECT ENGINE OIL (See page 17–9)**
3. **INSPECT BATTERY (See Pub. No. RM1018E on page 19–26)**
4. **INSPECT AIR CLEANER FILTER ELEMENT SUB–ASSY**

5. **INSPECT DRIVE BELT**

(a) Inspect the vane pump V–ribbed belt.

(1) Measure the belt deflection.

Pressing force: 98 N (10 kgf, 22 lbf)

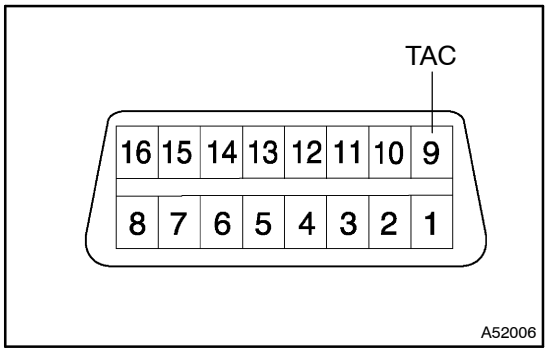
	New Belt mm (in.)	Used Belt mm (in.)
A/C Equipped	8.0 to 10.5 (0.31 to 0.41)	10.5 to 12.5 (0.41 to 0.49)
A/C Not Equipped	10 to 12 (0.39 to 0.47)	14 to 17 (0.55 to 0.67)

(2) Measure the belt tension.

	New Belt N (kgf, lbf)	Used Belt N (kgf, lbf)
A/C Equipped	647 to 843 (66 to 86, 145 to 189)	441 to 637 (45 to 65, 99 to 143)
A/C Not Equipped	686 to 784 (70 to 80, 154 to 176)	294 to 441 (30 to 45, 66 to 99)

NOTICE:

- **Check the drive belt deflection at the specified point.**
- **When installing a new belt, set its tension value as specified.**
- **When inspecting the belt which has been used for over 5 minutes, apply the specifications of "Used Belt."**
- **When reinstalling the belt which has been used for over 5 minutes, adjust its deflection and tension to the intermediate value of each specification of "Used Belt."**
- **The V–ribbed belt tension and deflection should be checked after 2 revolutions of engine cranking.**
- **When using a belt tension gauge, confirm the accuracy by using a master gauge first.**



(b) Inspect the generator V–ribbed belt.
(1) Check that the tension indicator is within range A on the auto tensioner scale.

If the tension indicator is not within range A, replace the belt with a new one.

HINT:

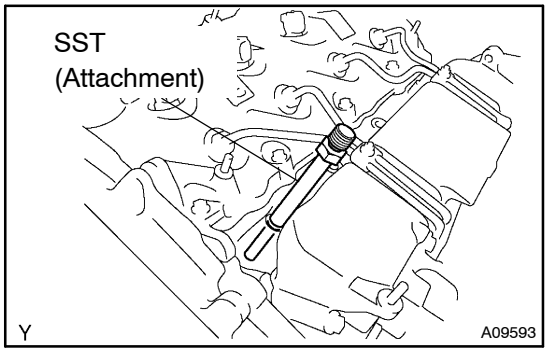
When replacing the drive belt with a new one, the tension indicator should be within range B.

6. INSPECT ENGINE IDLE SPEED

(a) Using SST, connect a tachometer test probe to terminal 9 (TAC) of the DLC3.
SST 09843–18040

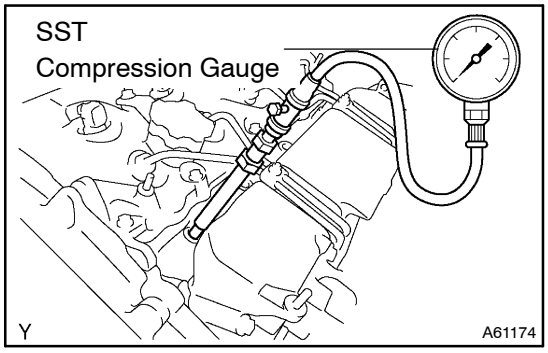
(b) Check the idle speed.
Idle speed: 750 to 850 rpm

NOTICE:



- **Check the idle speed with the cooling fan OFF.**
- **Switch OFF all accessories and air conditioning before connecting the test probe to the terminal.**

7. INSPECT MAXIMUM SPEED



(a) Start the engine.
(b) Fully depress the accelerator pedal.
(c) Check the maximum speed.
Maximum speed: 5,100 to 5,250 rpm

8. INSPECT COMPRESSION

(a) Warm up the engine to the normal operating temperature, then stop the engine.
(b) Remove the 4 glow plugs
(see Pub. No. RM1018E on page 19–33).
(c) Disconnect the 4 injector connectors.

(d) Inspect the cylinder compression pressure.
(1) Install SST (an attachment) to the glow plug hole.
SST 09992–00025 (09992–00121, 09992–00211)
Torque: 12 N·m (125 kgf·cm, 95 ft·lbf)

(2) Connect SST (a compression gauge) to SST (the attachment).

SST 09992–00025 (09992–00121, 09992–00211)

(3) Fully open the throttle valve, then start the engine.

(4) While cranking the engine, measure the compression pressure.

NOTICE:

- **Always use a fully–charged battery to obtain engine speed of 250 rpm or more.**
- **Check the other cylinder compression pressure in the same way.**
- **This measurement must be done as quickly as possible.**

Compression pressure:
2,628 kPa (26.8 kgf/cm^2, 381 psi) or more
Minimum pressure:
2,157 kPa (22.0 kgf/cm^2, 312 psi) or more
Difference between each cylinder:
490 kPa (5.0 kgf/cm^2, 71 psi) or less

(5) If the cylinder compression is low, pour a small amount of engine oil into the cylinder through the glow plug hole, then measure the compression pressure again.

HINT:

- If adding oil raises the compression pressure, the piston rings and/or cylinder bore may be worn or damaged.
- If the compression pressure stays low, the valve may be sticking or seating improperly, or there may be leakage past the gasket.

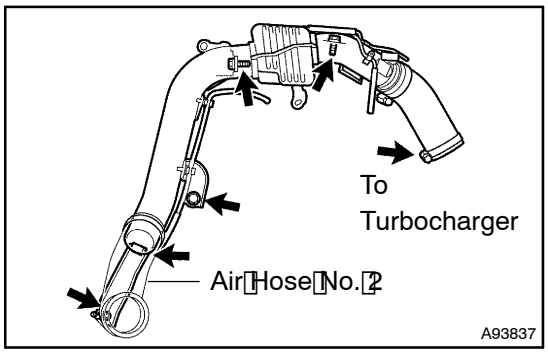
VALVE CLEARANCE (1CD–FTV)(From September, 2003)

141NE–01

ADJUSTMENT

NOTICE:

- **Before removing the injection pipes, clean them up with a soft brush and compressed air.**
- **After removing the injection pipes, cover the supply pump, common rail and injector mounting area of the cylinder head cover with vinyl tape to prevent dust from being introduced.**
- **After removing the cylinder head cover, protect the injector inlet with a vinyl or plastic bag to prevent foreign objects from being introduced.**



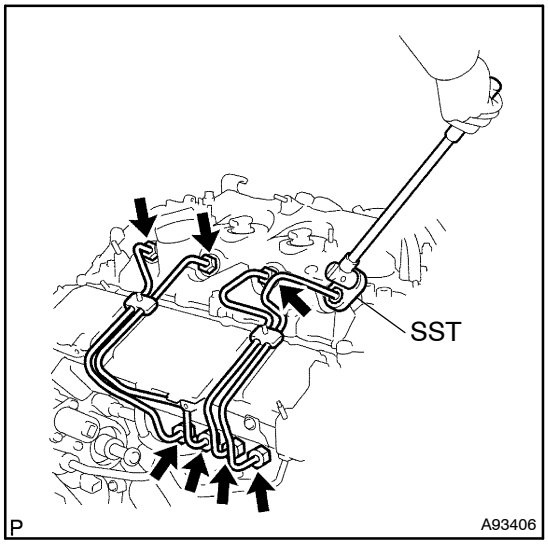
HINT:

Inspect and adjust the valve clearance after the engine becomes cold.

1. **REMOVE RADIATOR SUPPORT OPENING COVER**
2. **REMOVE FRONT WHEEL RH**
3. **REMOVE ENGINE UNDER COVER LH**
4. **REMOVE ENGINE UNDER COVER SUB–ASSY NO.1**
5. **REMOVE ENGINE UNDER COVER RH**
6. **REMOVE ENGINE COVER SUB–ASSY NO.1**

(a) Remove the 5 nuts, then remove the engine cover.

7. **REMOVE BATTERY**



8. **REMOVE AIR TUBE NO.1**

(a) Disconnect the vacuum hoses and connectors.
(b) Loosen the 2 hose clamps.
(c) Remove the 3 bolts and nut, then detach the air tube No. 1.

9. **REMOVE TIMING BELT NO.2 COVER (See page 14–138)**
10. **REMOVE FUEL PIPE NO.3 (See page 14–108)**

SST 09023–12700

11. **REMOVE INJECTION PIPE SUB–ASSY NO.1**

(a) Remove the 2 upper injection pipe clamps from the intake manifold.
(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700
(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700
(d) After removing the fuel pipe, in order to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

12. REMOVE INJECTION PIPE SUB–ASSY NO.2

SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No.1.

13. REMOVE INJECTION PIPE SUB–ASSY NO.3

SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No.1.

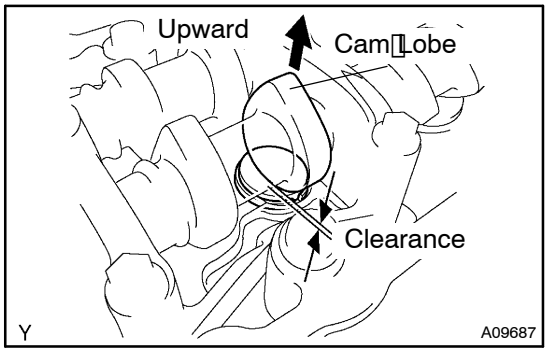
14. REMOVE INJECTION PIPE SUB–ASSY NO.4

SST 09023–12700

HINT:

Perform the same procedures as the injection pipe No.1.

15. REMOVE NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)

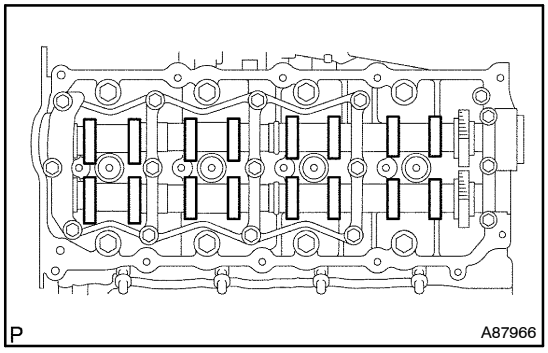


16. REMOVE CYLINDER HEAD COVER SUB–ASSY (See page 14–151)

17. REMOVE NOZZLE LEAKAGE PIPE ASSY (See page 11–46)

18. REMOVE INJECTOR ASSY (See page 11–46)

HINT:

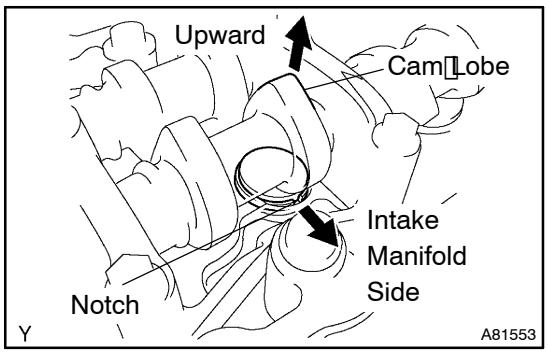


Since each injector assembly has characteristic fuel injecting behavior, keep them in the correct order so that they can be returned to the original locations when reassembling.

19. INSPECT VALVE CLEARANCE

(a) Turn the crankshaft so that the cam lobe located over the inspecting valve faces upward.

(b) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

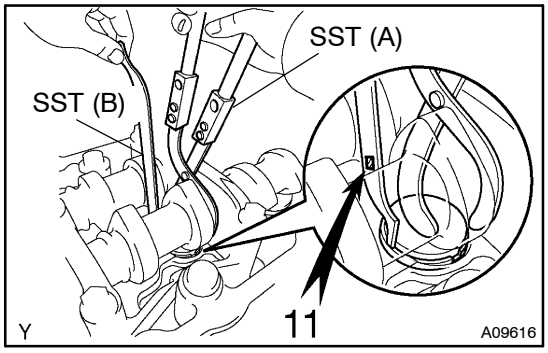


(c) Measure the clearance at 16 places.

(d) Record the out–of–specification valve clearance measurements. They will be used later to select an adjusting shim to replace.

Valve clearance (Cold):

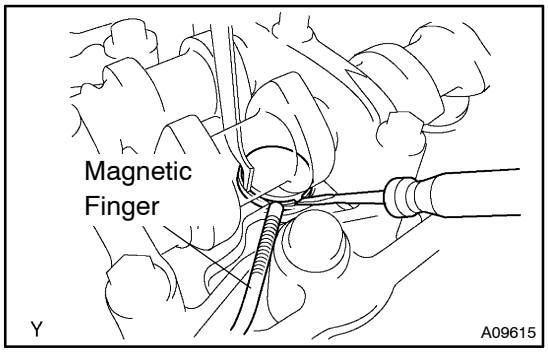
Intake	0.20 to 0.30 mm (0.008 to 0.012 in.)
Exhaust	0.35 to 0.45 mm (0.014 to 0.018 in.)



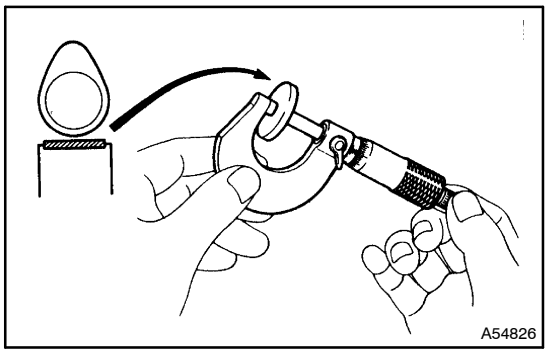
20. ADJUST VALVE CLEARANCE

(a) Remove the adjusting shim.

(1) Turn the crankshaft so that the cam lobe located over the adjusting valve faces upward.



(2) Position the notch of the valve lifter toward the intake manifold side.



(3) Using SST (A), press down the valve lifter, then place SST (B) between the camshaft and valve lifter. Remove SST (A).

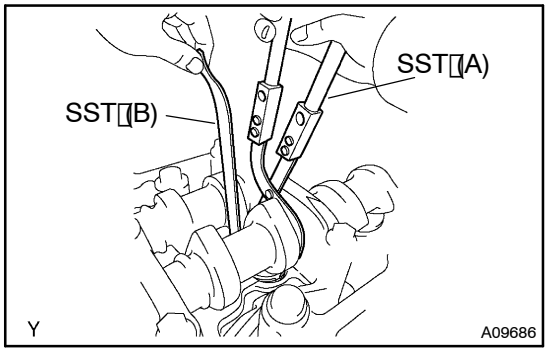
SST 09248–55050 (09248–05510, 09248–05520)

HINT:
Use SST (B) marked with "11".

(4) Remove the adjusting shim using a small screwdriver and magnetic finger.

(b) Select the size of an adjusting shim to replace by following the formula or the charts attached to the end of this section.

(1) Using a micrometer, measure the thickness of the removed shim.



(2) Calculate the thickness of a new shim so that the valve clearance comes within the specified value.

HINT:
T ..... Thickness of the removed adjusting shim
A ..... Measured valve clearance
N ..... Thickness of a new adjusting shim
Intake: N = T + (A – 0.25 mm (0.010 in.))
Exhaust: N = T + (A – 0.40 mm (0.016 in.))

(3) Select a new shim with a thickness which is as close to the calculated value as possible.

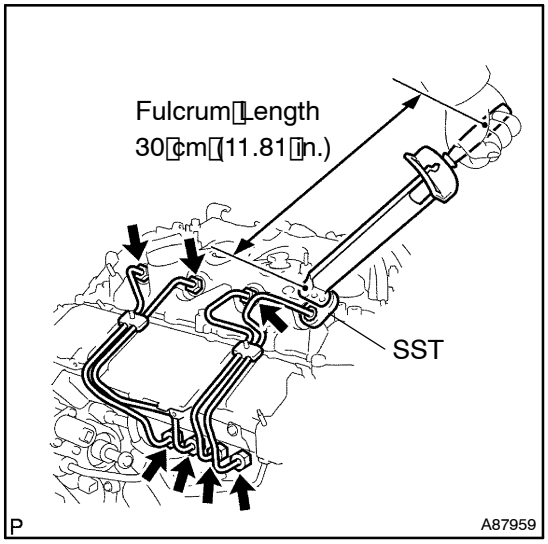
EXAMPLE (Intake):
Measured valve clearance = 0.45 mm (0.0177 in.)
0.45 mm (0.0177 in.) – 0.25 mm (0.0098 in.) = 0.20 mm (0.0078 in.)
(Measured – Specification = Excess clearance)
Used shim measurement = 2.80 mm (0.1102 in.)
0.20 mm (0.0078 in.) + 2.80 mm (0.1102 in.) = 3.00 mm (0.1181 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 3.00 mm (0.1181 in.)
Select No. 21 shim

HINT:
The shims are available in 17 sizes in increments of 0.05 mm (0.0020 in.), from 2.50 mm (0.0984 in.) to 3.30 mm (0.1299 in.).

(c) Install the new adjusting shim.
(1) Place the new adjusting shim on the valve lifter.
(2) Using SST (A), press down the valve lifter, then remove SST (B).
SST 09248–55050 (09248–05510, 09248–05520)
(d) Recheck the valve clearance.

21. INSTALL INJECTOR ASSY (See page 11–46)

22. INSTALL NOZZLE LEAKAGE PIPE ASSY (See page 11–46)
SST 09992–00242



23. INSTALL CYLINDER HEAD COVER SUB–ASSY (See page 14–151)

24. INSTALL NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)

25. INSTALL INJECTION PIPE SUB–ASSY NO.1

NOTICE:
When assembling the pipes, perform the operation with the engine cold at room temperature.

(a) Remove the vinyl or plastic bag from the injector and the vinyl tape from the common rail.
(b) Temporarily install the injection pipe.

(c) Using SST, tighten the nut of the injection pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(d) Using SST, tighten the nut of the injection pipe on the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

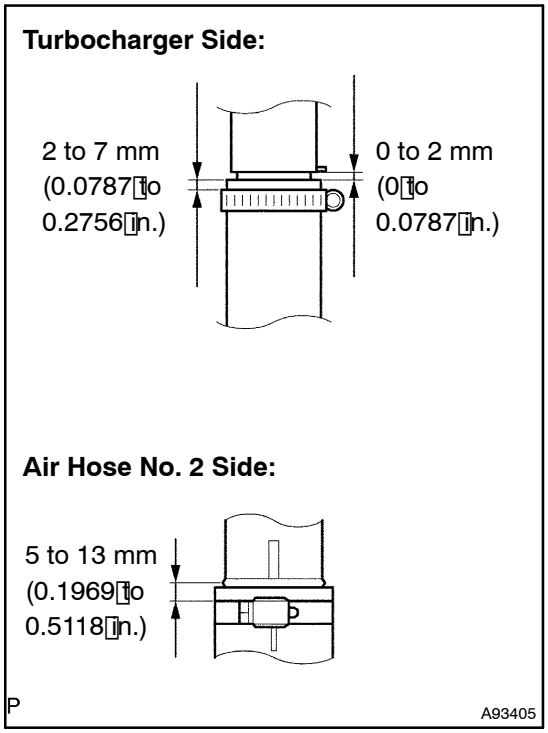
HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(e) Install the 2 upper injection pipe clamps.

26. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

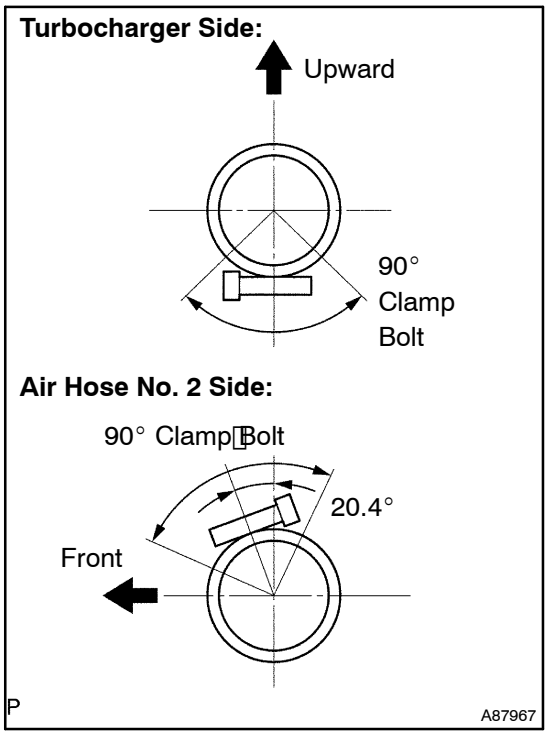
27. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

28. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



29. INSTALL FUEL PIPE NO.3 (See page 14–108)

30. INSTALL TIMING BELT NO.2 COVER (See page 14–138)

31. INSTALL AIR TUBE NO.1

(a) Install a new air hose No. 2 and new 2 hose clamps as shown in the illustration.

(b) Tighten the 2 hose clamps as shown in the illustration.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

(c) Install the air tube No. 1 with the 3 bolts and nut.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

32. INSTALL BATTERY (See page 14–108)

33. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

34. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

35. CHECK FOR FUEL LEAKS (See page 11–46)

Adjusting Shim Selection Chart (Intake)

	2.500 (0.0984)	2.525 (0.0994)	2.550 (0.1004)	2.575 (0.1014)	2.600 (0.1024)	2.625 (0.1033)	2.650 (0.1043)	2.675 (0.1053)	2.700 (0.1063)	2.725 (0.1073)	2.750 (0.1083)	2.775 (0.1093)	2.800 (0.1102)	2.825 (0.1112)	2.850 (0.1122)	2.875 (0.1132)	2.900 (0.1142)	2.925 (0.1152)	2.950 (0.1161)	2.975 (0.1171)	3.000 (0.1181)	3.025 (0.1191)	3.050 (0.1201)	3.075 (0.1211)	3.100 (0.1220)	3.125 (0.1230)	3.150 (0.1240)	3.175 (0.1250)	3.200 (0.1260)	3.225 (0.1270)	3.250 (0.1280)	3.275 (0.1289)	3.300 (0.1299)

Intake valve clearance (Cold):

0.20 to 0.30 mm (0.008 to 0.012 in.)

EXAMPLE: The 2.800 mm (0.1102 in.) shim is installed, and the measured clearance is 0.450 mm (0.0177 in.). Replace the 2.800 mm (0.1102 in.) shim with a new No. 21 shim.

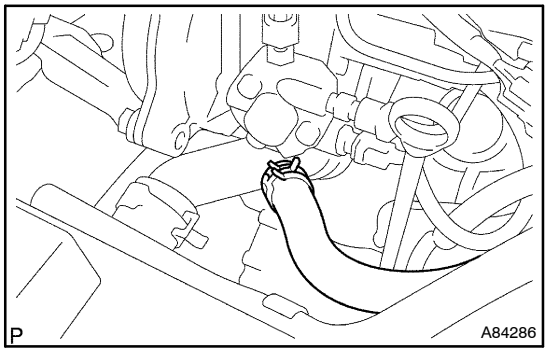
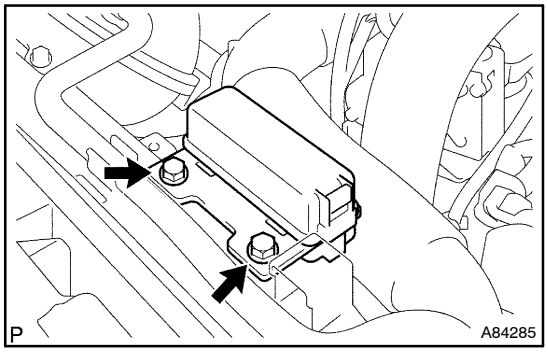
141NG–01



REPLACEMENT

1. REMOVE FRONT WHEELS
2. REMOVE ENGINE UNDER COVER LH
3. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1
4. REMOVE ENGINE UNDER COVER RH
5. REMOVE RADIATOR SUPPORT OPENING COVER
6. REMOVE ENGINE ROOM COVER SIDE
7. DRAIN ENGINE COOLANT (See page 16–19)
8. DRAIN ENGINE OIL (See Pub No. RM1018E on page 17–30)
9. DRAIN MANUAL TRANSAXLE OIL
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)
10. REMOVE ENGINE COVER SUB–ASSY NO.1
(a) Remove the 5 nuts, then remove the engine cover.
11. REMOVE BATTERY
12. REMOVE AIR CLEANER ASSY
(a) Disconnect the mass air flow meter connector.
(b) Remove the air cleaner cap together with the air cleaner hose.
(c) Remove the air cleaner filter element.
(d) Remove the 3 bolts and air cleaner case.

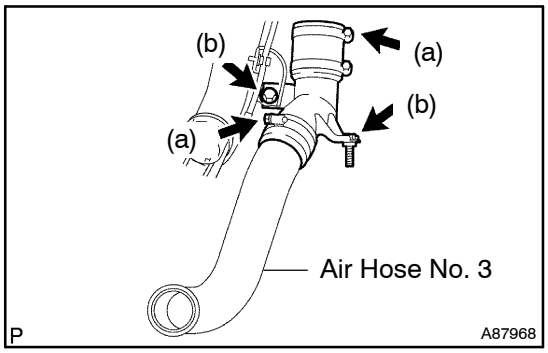


13. REMOVE VACUUM RESERVOIR SUB–ASSY
(a) Disconnect the 2 vacuum hoses and connector.
(b) Remove the 2 bolts and vacuum reservoir.

14. REMOVE FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)
15. REMOVE RADIATOR HOSE INLET
16. REMOVE RADIATOR HOSE OUTLET

17. DISCONNECT WATER BY–PASS HOSE NO.2

18. REMOVE ENGINE ROOM RELAY BLOCK NO.3



(a) Remove the 2 bolts, then remove the engine room relay block.

19. REMOVE RADIATOR ASSY (W/ AIR CONDITIONING)
(See Pub. No. RM1018E on page 16–51)

20. DISCONNECT HEATER INLET WATER HOSE

21. DISCONNECT HEATER OUTLET WATER HOSE

22. DISCONNECT FUEL HOSE NO.2

23. REMOVE AIR TUBE NO.2

(a) Loosen the 2 hose clamps, then disconnect the air hose No. 3.

(b) Remove the 2 bolts and air tube No. 2.

24. SEPARATE TRANSMISSION CONTROL CABLE ASSY

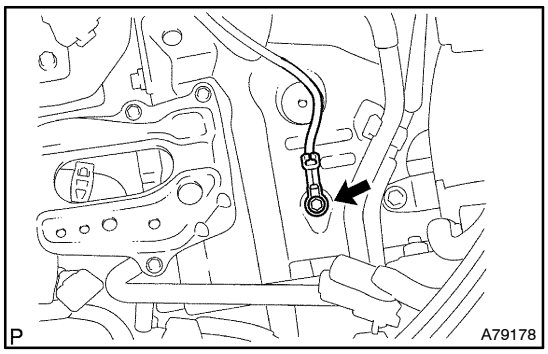
(a) Remove the 2 clips, then separate the control cable assembly.

25. REMOVE INJECTOR DRIVER

(a) Remove the 2 nuts which secure the injector driver.

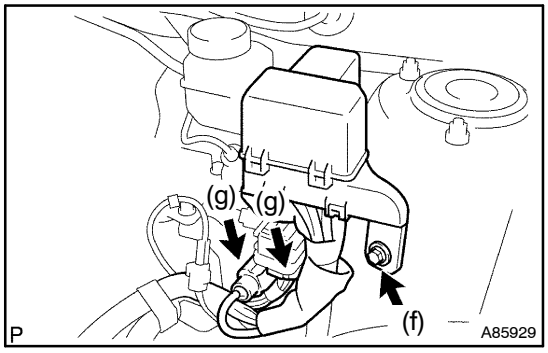
(b) Disconnect the injector driver connector and harness clamp.

(c) Remove the injector driver.



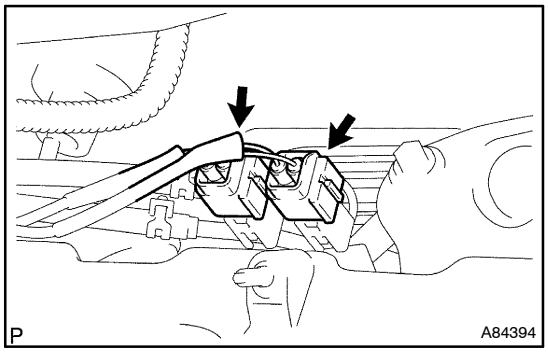
26. DISCONNECT ENGINE WIRE

(a) Remove the glove compartment door.

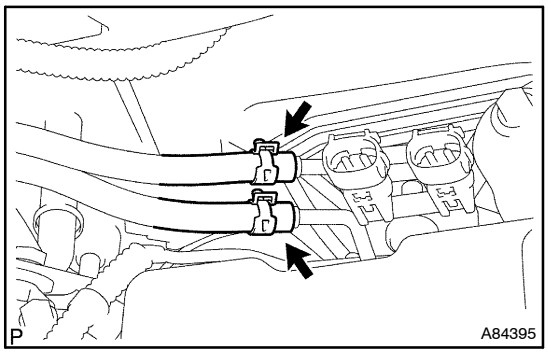


(b) Disconnect the engine wire from the ECM and junction block.

(c) Pull out the engine wire.

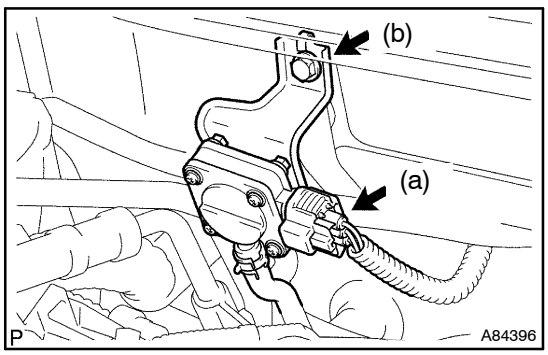


(d) Disconnect the engine wire from the engine room junction block.

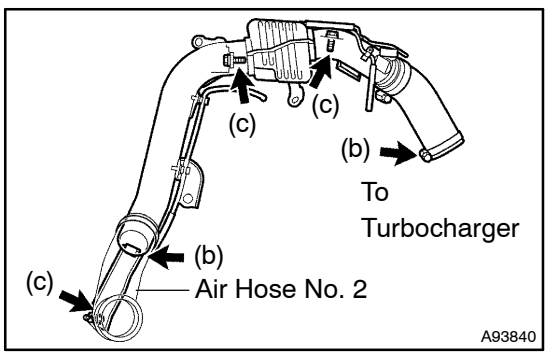


(e) Remove the bolt, then disconnect the wire harness from the body.

(f) Remove the bolt and engine room relay block No. 3.
(g) Disconnect the 2 connectors.
(h) Disconnect the wire harness from the fuel filter support.



(i) Disconnect the 2 exhaust gas temperature sensor connectors.



27. DISCONNECT VACUUM HOSE

(a) Disconnect the 2 vacuum hoses.

28. REMOVE DIFFERENTIAL PRESSURE SENSOR ASSY

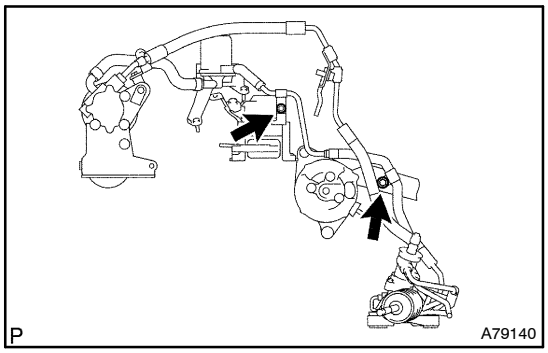
(a) Disconnect the connector.
(b) Remove the bolt and differential pressure sensor.

29. REMOVE AIR TUBE NO.1

(a) Disconnect the vacuum hoses and connectors.
(b) Loosen the 2 hose clamps.
(c) Remove the 2 bolts and nut, then detach the air tube No. 1.

30. REMOVE CLUTCH ACCUMULATOR ASSY (See Pub. No. RM1018E on page 42–22)
SST 09023–00100

31. REMOVE CLUTCH RELEASE CYLINDER ASSY (See Pub. No. RM1018E on page 42–17)



32. REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)

33. SEPARATE COMPRESSOR AND MAGNETIC CLUTCH (W/ AIR CONDITIONING) (See Pub. No. RM1018E on page 55–86)

HINT:
Secure the hoses off to the side instead of detaching.

34. REMOVE FLOOR PANEL BRACE FRONT (See page 15–6)

35. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–6)

36. SEPARATE RETURN TUBE SUB–ASSY
(a) Remove the 2 clamp bolts, then separate the return tube sub–assembly.

37. SEPARATE VANE PUMP OIL RESERVOIR ASSY

38. REMOVE FRONT AXLE HUB LH NUT (See Pub. No. RM1018E on page 30–6)
SST 09930–00010

HINT:
Perform the same procedure as above on the opposite side.

39. SEPARATE TIE ROD END SUB–ASSY LH (See Pub. No. RM1018E on page 30–6)
SST 09628–62011

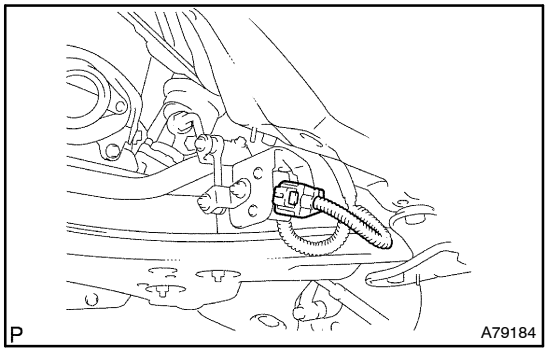
HINT:
Perform the same procedure as above on the opposite side.

40. SEPARATE FRONT STABILIZER LINK ASSY LH (See Pub. No. RM1018E on page 30–6)

HINT:
Perform the same procedure as above on the opposite side.

41. REMOVE COLUMN HOLE COVER SILENCER SHEET
(a) Remove the 2 clips and column hole cover silencer sheet.

42. REMOVE STEERING COLUMN HOLE COVER SUB–ASSY NO.1

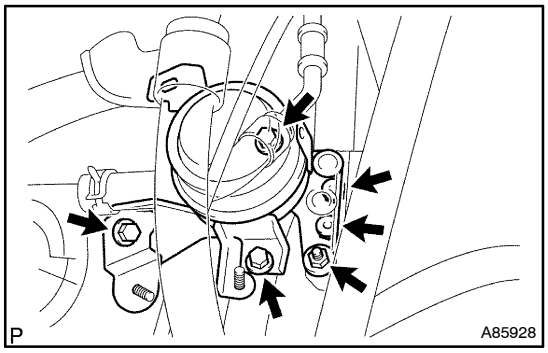


43. REMOVE STEERING INTERMEDIATE SHAFT ASSY NO.2 (See Pub. No. RM1018E on page 51–36)

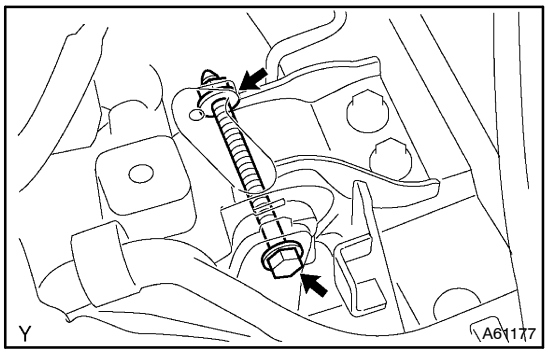
44. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH (See Pub. No. RM1018E on page 30–6)

HINT:
Perform the same procedure as above on the opposite side.

45. SEPARATE FRONT AXLE ASSY LH (See Pub. No. RM1018E on page 30–6)

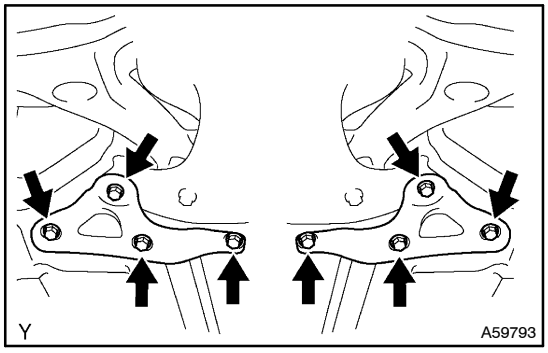


HINT:
Perform the same procedure as above on the opposite side.

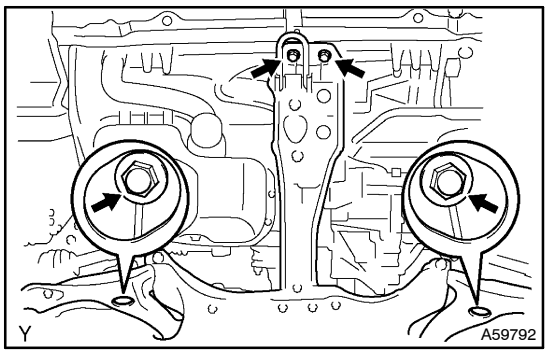


46. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Disconnect the height control sensor connector (with discharge head lamp).

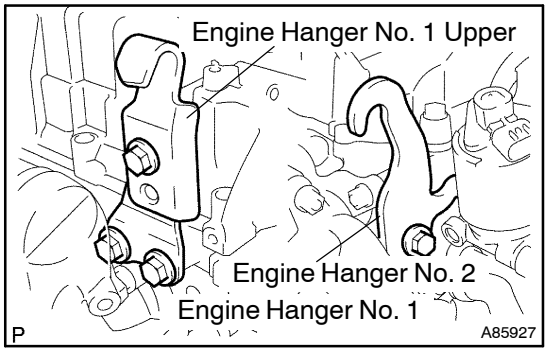


(b) Set the engine lifter.

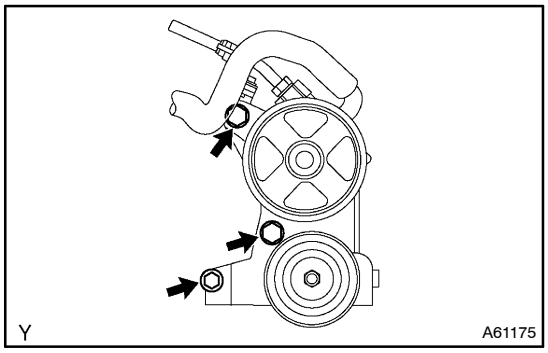


(c) Remove the 3 bolts, 3 nuts and engine mounting insulator sub–assembly RH.

(d) Remove the through bolt and nut, then detach the engine mounting insulator LH from the vehicle.

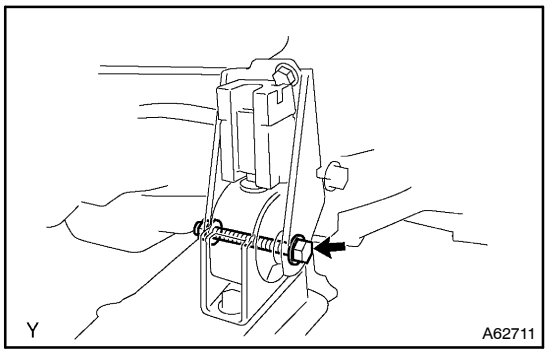


(e) Remove the 8 bolts and front suspension member brace rear RH and LH.



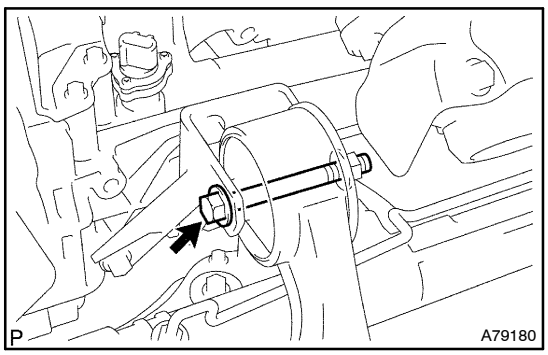
(f) Remove the 2 bolts and 2 nuts.

(g) Carefully remove the engine together with the transaxle from the vehicle.



(h) Install the 2 engine hangers with the 2 bolts.
Part No.:
No. 1 engine hanger upper (yellow) 12284–27020
No. 1 engine hanger upper (black) 12284–27030
No. 1 engine hanger 12281–27050
No. 2 engine hanger 12282–27060
Bolt 91642–81025
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

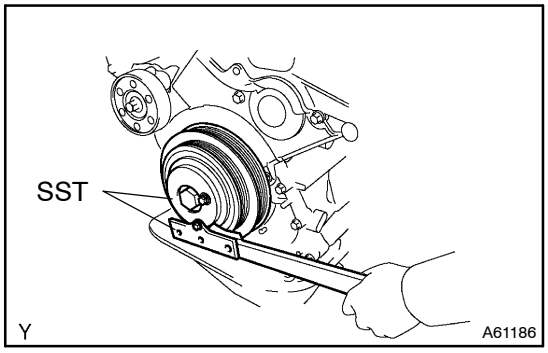
(i) Attach the engine sling, then hang the engine with the chain block.



47. REMOVE POWER STEERING IDLE PULLEY BRACKET

(a) Remove the 3 bolts and power steering idle pulley bracket.

48. REMOVE FRONT SUSPENSION CROSSMEMBER SUB–ASSY



(a) Remove the through bolt and nut, then detach the engine mounting insulator front from the engine mounting bracket.

(b) Remove the through bolt, then detach the engine mounting insulator rear from the suspension crossmember.

(c) Separate the engine together with the transaxle from the suspension crossmember and engine mounting member.

49. REMOVE STARTER ASSY (See Pub. No. RM1018E on page 19–24)
50. REMOVE MANUAL TRANSAXLE (See Pub. No. RM1018E on page 41–33)
51. REMOVE CLUTCH COVER ASSY (See Pub. No. RM1018E on page 42–26)
52. REMOVE CLUTCH DISC ASSY (See Pub. No. RM1018E on page 42–26)

53. REMOVE FLYWHEEL SUB–ASSY

(a) Hold the crankshaft with SST.
SST 09213–54015 (09213–70020), 09330–00021

(b) Using a Torx socket wrench (T55), remove the 8 Torx screws and flywheel.

54. REMOVE REAR END PLATE

(a) Remove the 2 bolts and rear end plate.

55. REMOVE DRIVE SHAFT BEARING BRACKET

56. REMOVE ENGINE MOUNTING BRACKET FR

57. REMOVE ENGINE MOUNTING BRACKET RR

58. REMOVE GLOW PLUG ASSY (See Pub. No. RM1018E on page 19–33)

59. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)

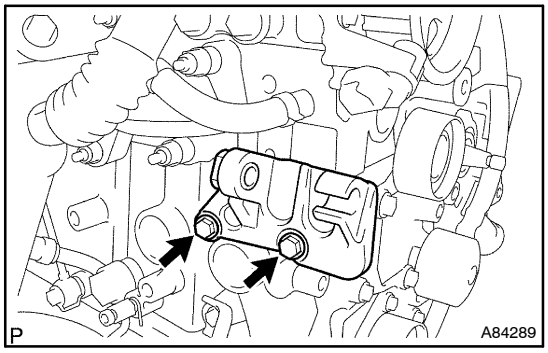
60. REMOVE CRANKSHAFT PULLEY (See page 14–138)
SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)

61. REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)

62. REMOVE TIMING BELT NO.2 COVER (See page 14–138)

63. REMOVE TIMING BELT NO.1 COVER (See page 14–138)

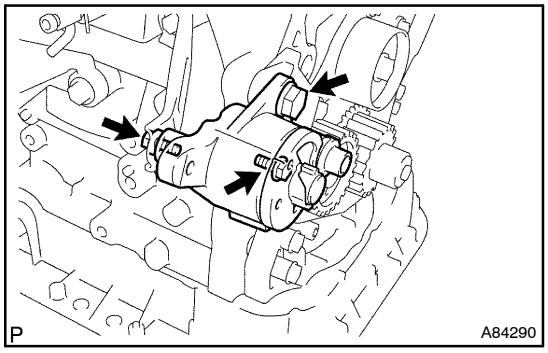
64. REMOVE TIMING BELT GUIDE



65. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)

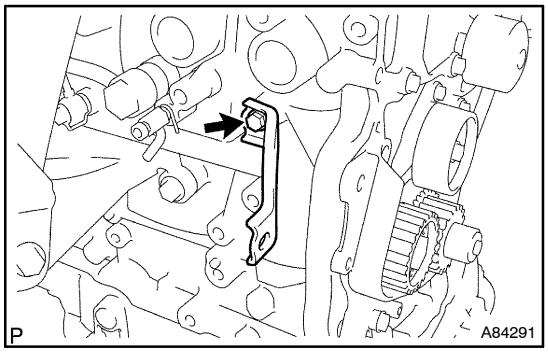
66. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)

67. REMOVE TIMING BELT (See page 14–138)



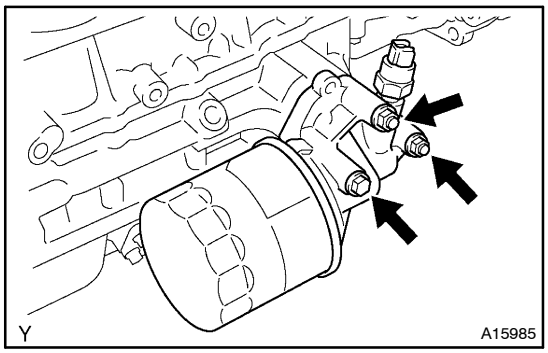
HINT:
If reusing the timing belt, draw an arrow on the belt which indicates the engine revolution direction and put match marks on the pulleys and belt before removing. This operation will be very helpful when reinstalling the timing belt.

68. REMOVE GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)



69. REMOVE GENERATOR BRACKET NO.1

(a) Remove the 2 bolts and generator bracket.



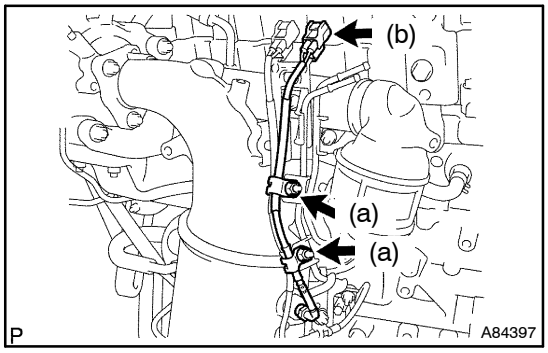
70. REMOVE V–RIBBED BELT TENSIONER ASSY

(a) Remove the 3 bolts and V–ribbed belt tensioner.

71. REMOVE V–RIBBED BELT TENSIONER BRACKET

(a) Remove the bolt and V–ribbed belt tensioner bracket.

72. REMOVE OIL FILTER BRACKET SUB–ASSY

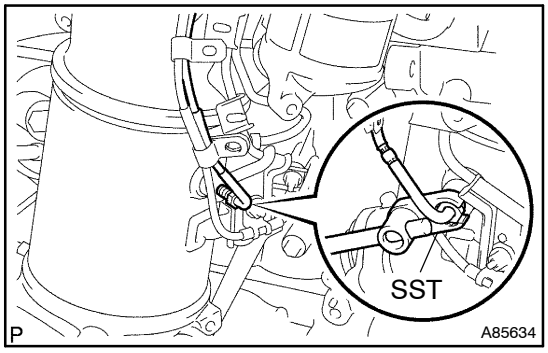


(a) Remove the bolt and 2 nuts, then remove the oil filter bracket and gasket.

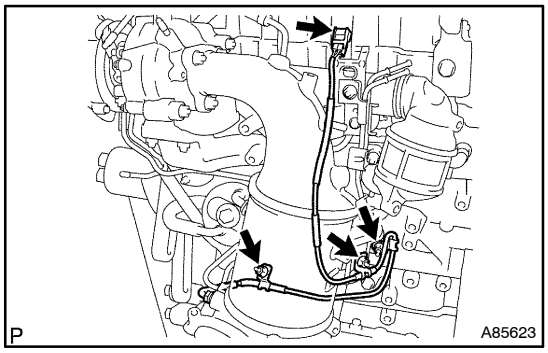
73. REMOVE TURBO INSULATOR NO.2 (See page 13–12)

74. REMOVE TURBO INSULATOR NO.1 (See page 13–12)

75. REMOVE EXHAUST MANIFOLD HEAT INSULATOR NO.2 (See page 13–12)

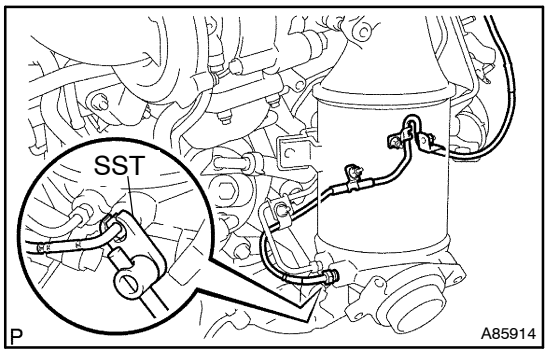


76. REMOVE EGR PIPE INSULATOR (See page 13–12)

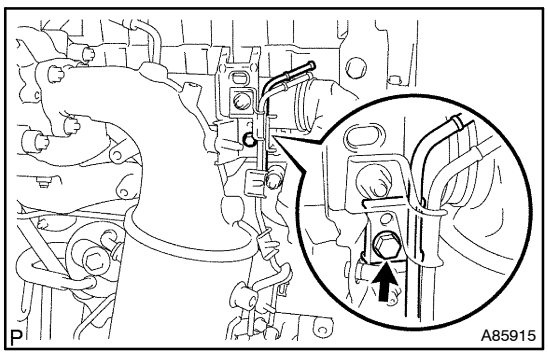


77. REMOVE EXHAUST GAS TEMPERATURE SENSOR

(a) Remove the 2 nuts, then detach the wire harness from the clamp.

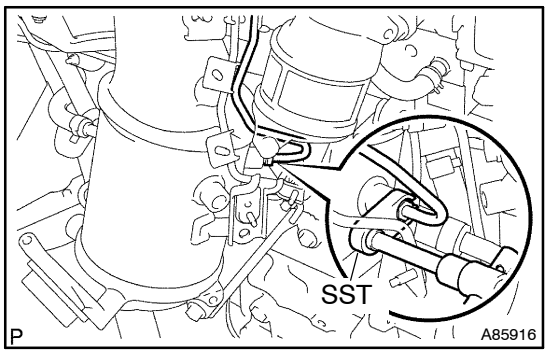


(b) Disconnect the connector.

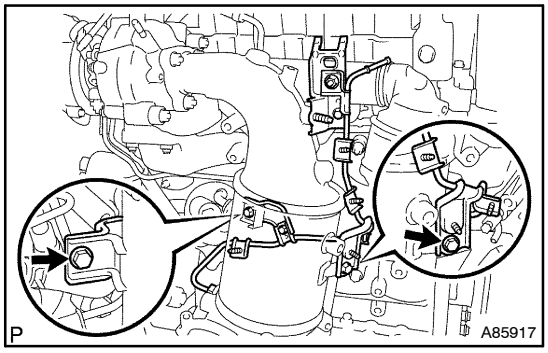


(c) Using SST, remove the exhaust gas temperature sensor on up stream.
SST 09023–38400

(d) Remove the 3 nuts, then detach the wire harness from the clamp.
(e) Disconnect the connector.

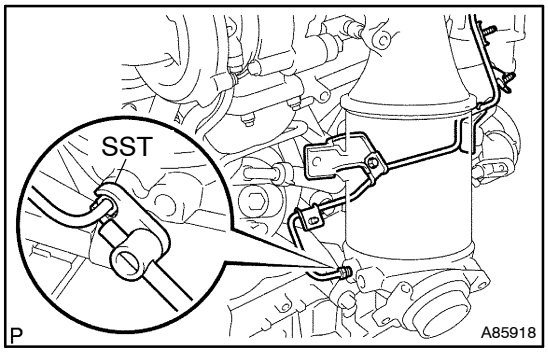


(f) Using SST, remove the exhaust gas temperature sensor on down stream.
SST 09023–38400

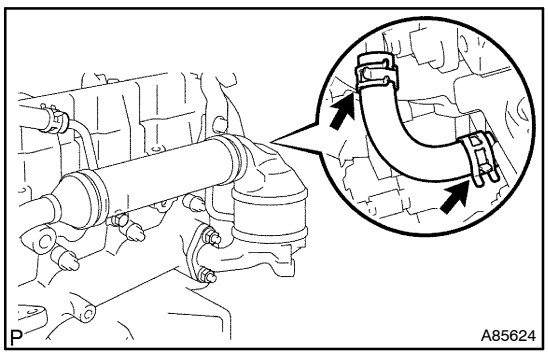


78. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.1

(a) Remove the bolt.

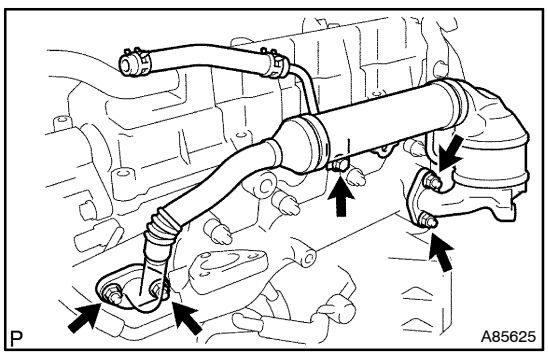


(b) Using SST, remove the vacuum pipe.
SST 09023–38200



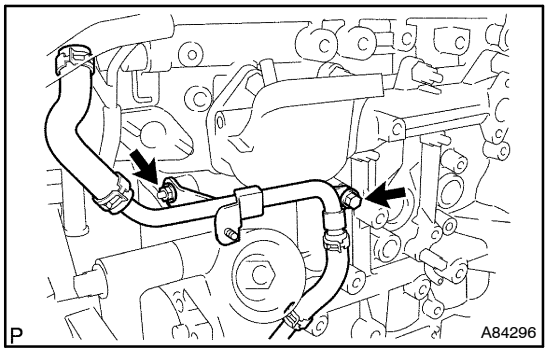
79. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.2

(a) Remove the 2 bolts.



(b) Using SST, remove the vacuum pipe.
SST 09023–38200

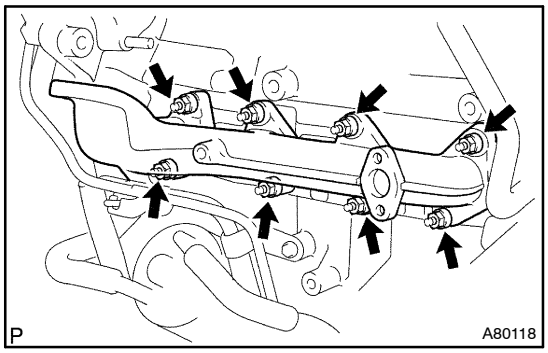
80. REMOVE MANIFOLD STAY NO.2 (See page 13–12)
81. REMOVE MANIFOLD STAY (See page 13–12)
82. REMOVE MANIFOLD CONVERTER SUB–ASSY (See page 13–12)
83. REMOVE TURBOCHARGER STAY (See page 13–12)
84. DISCONNECT TURBO WATER HOSE NO.1 (See page 13–12)
85. DISCONNECT TURBO WATER HOSE NO.2 (See page 13–12)
86. REMOVE TURBO OIL INLET PIPE SUB–ASSY (See page 13–12)
87. REMOVE TURBOCHARGER SUB–ASSY (See page 13–12)



88. DISCONNECT WATER BY–PASS HOSE NO.3

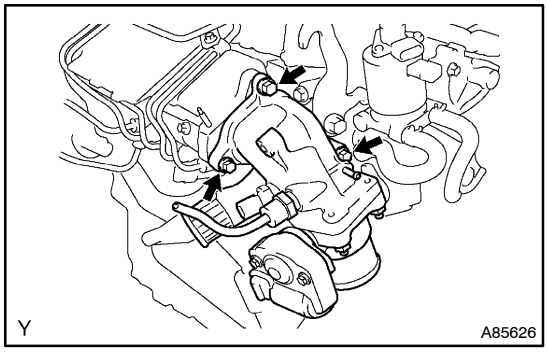
89. REMOVE EGR PIPE SUB–ASSY NO.1

(a) Remove the bolt and 4 nut, then detach the EGR pipe and 2 gaskets.



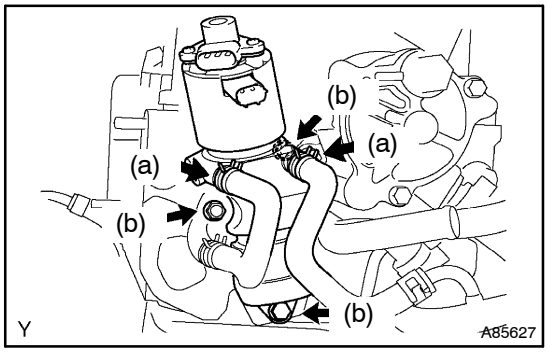
90. REMOVE OIL COOLER ASSY (See Pub. No. RM1018E on page 17–32)

91. REMOVE VACUUM PUMP OIL PIPE



(a) Disconnect the 2 hoses.

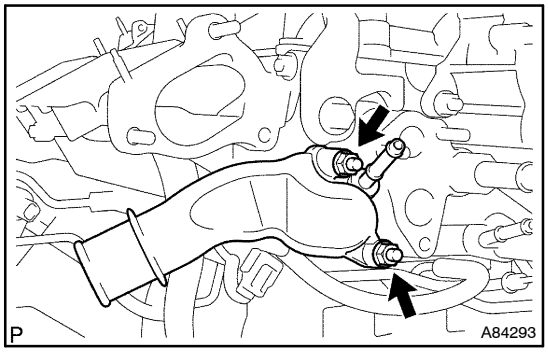
(b) Remove the bolt and nut, then remove the vacuum pump oil pipe.



92. REMOVE EXHAUST MANIFOLD

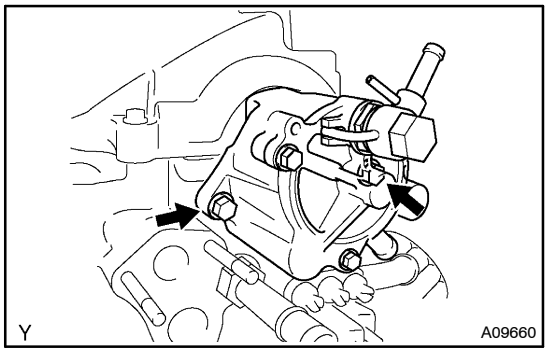
(a) Remove the 8 nuts, exhaust manifold and gasket.

93. REMOVE INTAKE AIR CONNECTOR



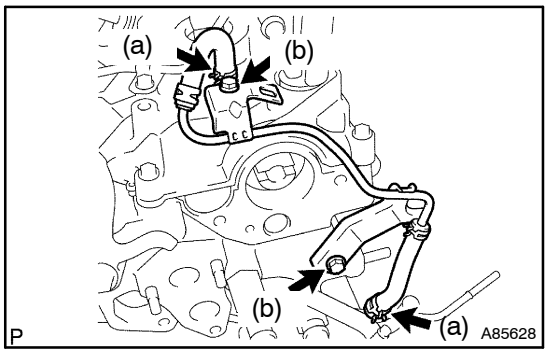
(a) Remove the 3 bolts, intake air connector together with the diesel throttle body and gasket.

94. REMOVE EGR VALVE ASSY



(a) Disconnect the 2 hoses.

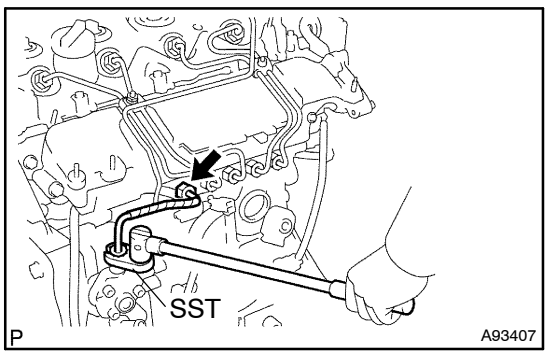
(b) Remove the bolt and 2 nuts, then remove the EGR valve and gasket.



95. REMOVE WATER OUTLET SUB–ASSY

(a) Remove the 2 bolts, water outlet and gasket.

96. REMOVE VACUUM PUMP ASSY

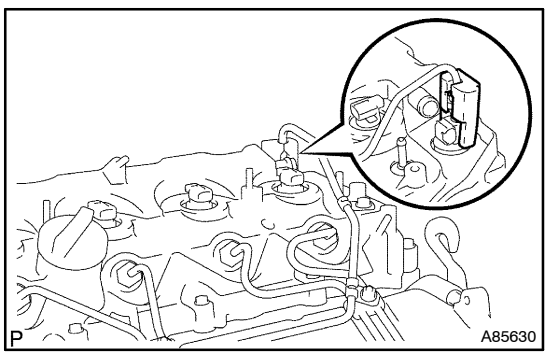


(a) Remove the 2 bolts, vacuum pump and 2 O–rings.

97. REMOVE NOZZLE LEAKAGE PIPE NO.2

(a) Disconnect the 2 hoses.

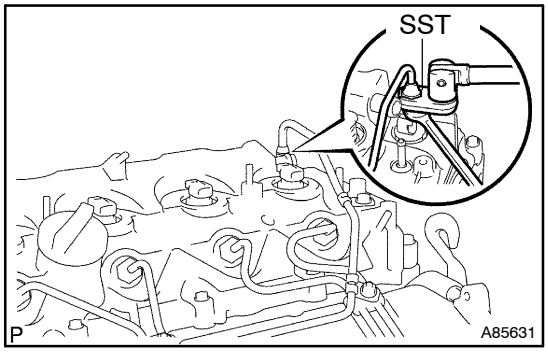
(b) Remove the 2 bolts, nozzle leakage pipe No. 2.



98. REMOVE FUEL INLET PIPE SUB–ASSY

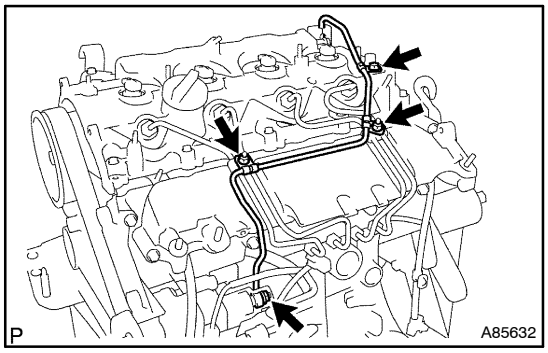
(a) Using SST, remove the fuel inlet pipe from the common rail side.

SST 09023–12700

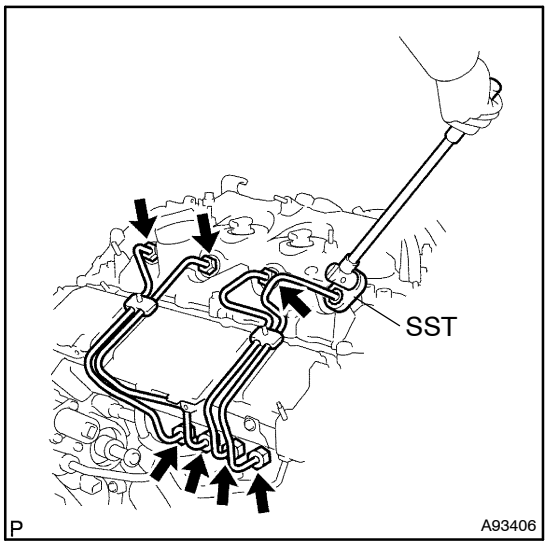


(b) Using SST, remove the fuel inlet pipe from the pump side.

SST 09023–12700



99. REMOVE FUEL PIPE NO.3



(a) Remove the fuel pipe insulator.

(b) Hold the hexagonal lobe of the exhaust fuel addition injector assembly first. Using SST, remove the fuel pipe No. 3 from the injector side.
SST 09023–12700

(c) Remove the bolt and 3 nuts, then remove the fuel pipe No. 3 and 2 gaskets.

100. REMOVE INJECTION PIPE SUB–ASSY NO.1

(a) Remove the 2 upper injection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

(d) After removing the fuel pipe, in order to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

(e) Remove the 2 lower injection pipe clamps from the intake manifold.

101. REMOVE INJECTION PIPE SUB–ASSY NO.2

SST 09023–12700

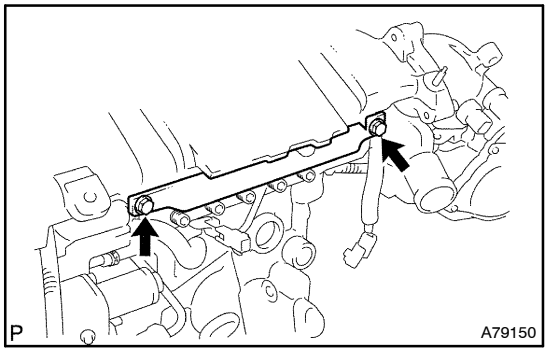
HINT:

Perform the same procedures as the injection pipe No. 1.

102. REMOVE INJECTION PIPE SUB–ASSY NO.3

SST 09023–12700

HINT:

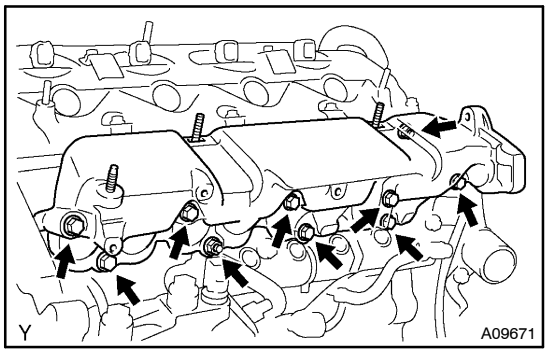


Perform the same procedures as the injection pipe No. 1.

103. REMOVE INJECTION PIPE SUB–ASSY NO.4

SST 09023–12700

HINT:



Perform the same procedures as the injection pipe No. 1.

104. REMOVE INTAKE MANIFOLD INSULATOR NO.1

(a) Remove the 2 bolts and intake manifold insulator.

105. REMOVE COMMON RAIL ASSY (See page 11–67)

106. REMOVE INTAKE MANIFOLD

(a) Remove the 8 bolts and 2 nuts, then remove the intake manifold and gasket.

107. REMOVE INJECTION PUMP DRIVE PULLEY (See page 11–58)

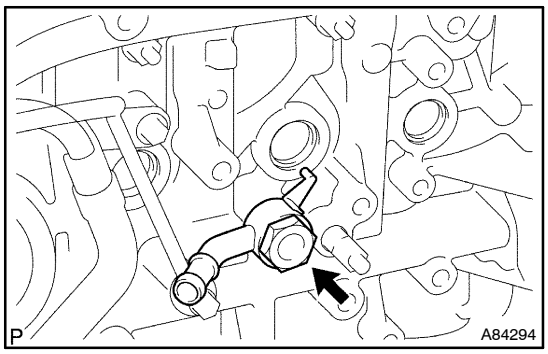
SST 09960–10010 (09962–01000, 09963–01000)

108. REMOVE TIMING BELT NO.3 COVER

(a) Remove the 2 bolts and 2 seal washers, then remove the timing belt cover.

109. REMOVE OIL LEVEL GAGE GUIDE (See page 17–11)

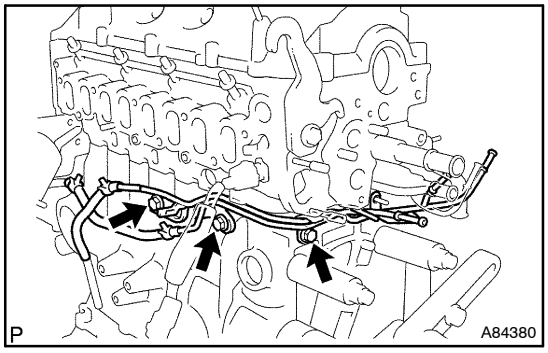
110. REMOVE INJECTION PUMP STAY NO.1 (See page 11–58)



111. REMOVE INJECTION OR SUPPLY PUMP ASSY (See page 11–58)

112. REMOVE COMPRESSOR MOUNTING BRACKET NO.1 (W/ AIR CONDITIONING)

(a) Remove the 4 bolts and compressor mounting bracket.



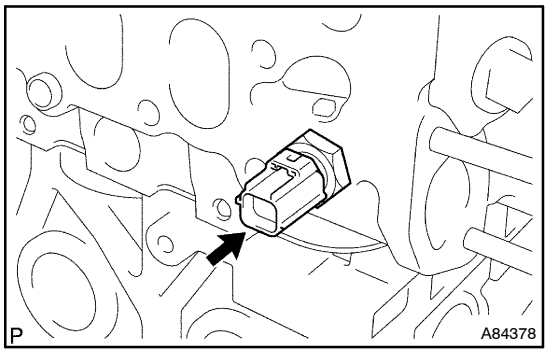
113. REMOVE WATER INLET (See Pub. No. RM1018E on page 16–50)

114. REMOVE THERMOSTAT

115. REMOVE OIL COOLER PIPE

(a) Using a socket wrench for 27 mm, remove the union bolt, oil cooler pipe and gasket.

116. REMOVE FUEL FILTER TO INJECTION PUMP FUEL PIPE



(a) Remove the 3 bolts and fuel pipe.

117. REMOVE CRANKSHAFT POSITION SENSOR

(a) Remove the bolt and crankshaft position sensor.

118. REMOVE CAMSHAFT POSITION SENSOR

(a) Remove the bolt and camshaft position sensor.

119. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

120. REPLACE PARTIAL ENGINE ASSY

121. INSTALL ENGINE COOLANT TEMPERATURE SENSOR
Torque: 20 N·m (200 kgf·cm, 14 ft·lbf)

122. INSTALL CAMSHAFT POSITION SENSOR
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)

123. INSTALL CRANKSHAFT POSITION SENSOR
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)

124. INSTALL FUEL FILTER TO INJECTION PUMP FUEL PIPE
Torque:
8.8 N·m (90 kgf·cm, 78 in.·lbf) for M6
21 N·m (209 kgf·cm, 15 ft·lbf) for M8

125. INSTALL OIL COOLER PIPE

(a) Using a socket wrench for 27 mm, install 2 new gaskets and the oil cooler pipe with the union bolt.
Torque: 56 N·m (575 kgf·cm, 42 ft·lbf)

126. INSTALL THERMOSTAT (See Pub. No. RM1018E on page 16–50)

127. INSTALL WATER INLET (See Pub. No. RM1018E on page 16–50)

128. INSTALL COMPRESSOR MOUNTING BRACKET NO.1 (W/ AIR CONDITIONING)
Torque: 42 N·m (428 kgf·cm, 31 ft·lbf)

129. INSTALL INJECTION OR SUPPLY PUMP ASSY (See page 11–58)

130. INSTALL INJECTION PUMP STAY NO.1 (See page 11–58)

131. INSTALL OIL LEVEL GAGE GUIDE (See page 17–11)

132. INSTALL TIMING BELT NO.3 COVER
Torque: 7.4 N·m (75 kgf·cm, 65 in.·lbf)

133. INSTALL INJECTION PUMP DRIVE PULLEY (See page 11–58)

SST 09960–10010 (09962–01000, 09963–01000)

134. INSTALL INTAKE MANIFOLD

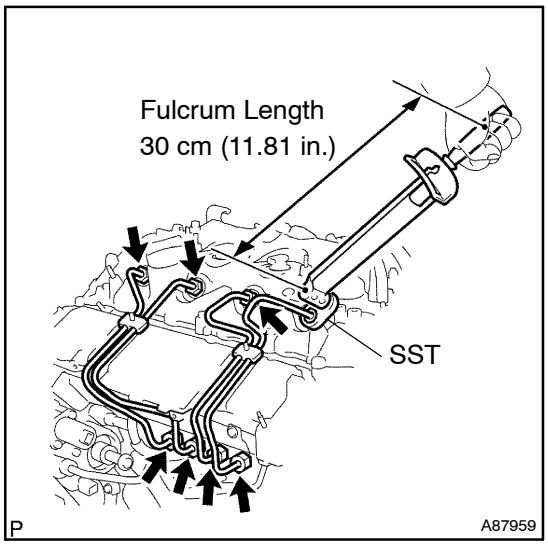
(a) Install a new gasket and the intake manifold with the 8 bolts and 2 nuts.

Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

135. INSTALL COMMON RAIL ASSY (See page 11–67)

136. INSTALL INTAKE MANIFOLD INSULATOR NO.1

Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)



137. INSTALL INJECTION PIPE SUB–ASSY NO.1

NOTICE:

- **In case of replacing the injectors, the injection pipes must be replaced, too.**
- **When assembling the pipes, perform the operation with the engine cold at room temperature.**

(a) Install the 2 lower injection pipe clamps to the intake manifold.

(b) Temporarily install a new injection pipe.

(c) Using SST, tighten the nut of the injection pipe on the common rail side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

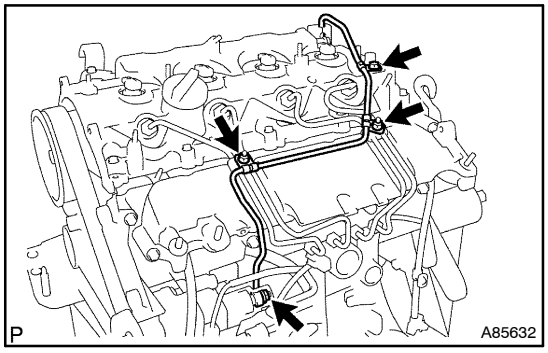
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(d) Using SST, tighten the nut of the injection pipe on the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

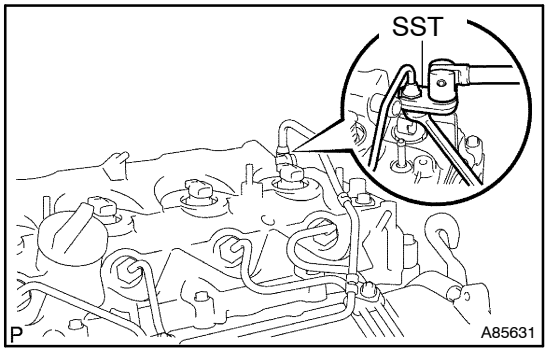
(e) Install the 2 upper injection pipe clamps.

138. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

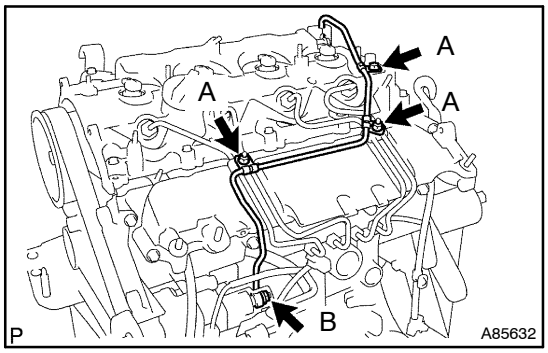
139. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

140. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



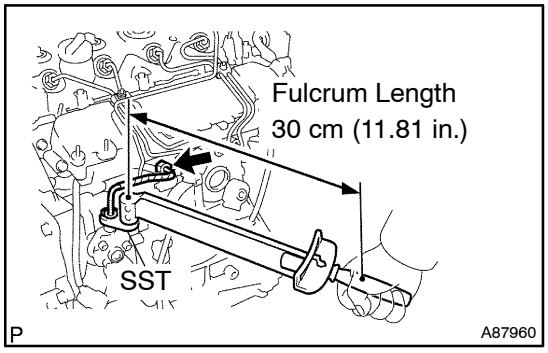
141. INSTALL FUEL PIPE NO.3
(a) Install 2 new gaskets, then temporarily install the bolt, 3 nuts and fuel pipe No. 3.

(b) Hold the hexagonal lobe of the exhaust fuel addition injector assembly first. Using SST, tighten the nut of the fuel pipe No. 3 on the injector side.
SST 09023–12700
Torque:
22 N·m (223 kgf·cm, 16 ft·lbf) with SST
23.5 N·m (240 kgf·cm, 17 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Tighten the bolt and 3 nuts.
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt and nut A
27 N·m (275 kgf·cm, 20 ft·lbf) for nut B



(d) Install the fuel pipe insulator.

142. INSTALL FUEL INLET PIPE SUB–ASSY

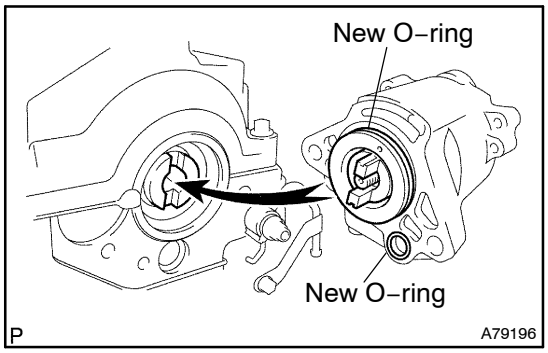
NOTICE:

- **In case of replacing the cylinder head, the fuel inlet pipe must be replaced, too.**
- **When assembling the pipe, perform the operation with the engine cold at room temperature.**

(a) Temporarily install a new fuel inlet pipe.

(b) Using SST, tighten the nut of the fuel inlet pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:



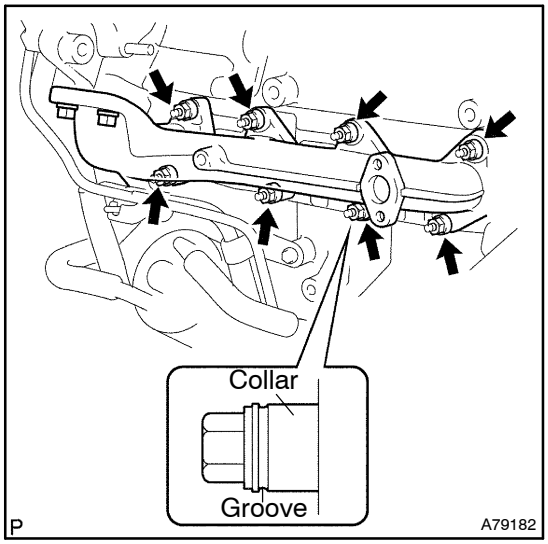
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Using SST, tighten the nut of the fuel inlet pipe on the pump side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

143. INSTALL NOZZLE LEAKAGE PIPE NO.2
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)



144. INSTALL VACUUM PUMP ASSY
(a) Install 2 new O–rings to the vacuum pump.
(b) Align the key of the vacuum pump with the keyway of the exhaust camshaft, then insert the vacuum pump into place. Secure the pump with the 2 bolts.
Torque: 21 N·m (214 kgf·cm, 15 ft·lbf)

145. INSTALL WATER OUTLET SUB–ASSY
(a) Install a new gasket and the water outlet with the 2 bolts.
Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

146. INSTALL EGR VALVE ASSY
(a) Install a new gasket and the EGR valve with the bolt and 2 nuts.
Torque: 18 N·m (184 kgf·cm, 13 ft·lbf)

147. INSTALL INTAKE AIR CONNECTOR
(a) Install a new gasket and the intake air connector together with the diesel throttle body with the 3 bolts.
Torque: 21 N·m (209 kgf·cm, 15 ft·lbf)

148. INSTALL EXHAUST MANIFOLD
(a) Install a new gasket, the exhaust manifold and 8 collars with new 8 nuts.
Torque: 47 N·m (474 kgf·cm, 34 ft·lbf)

HINT:
When installing the collars, pay attention to the mounting orientation. The ring groove of the collar should be outward. Refer to the illustration on the left.

149. INSTALL VACUUM PUMP OIL PIPE

Torque:
21 N·m (214 kgf·cm, 15 ft·lbf) for bolt
8.8 N·m (90 kgf·cm, 78 in.·lbf) for nut

150. INSTALL OIL COOLER ASSY (See Pub. No. RM1018E on page 17–32)

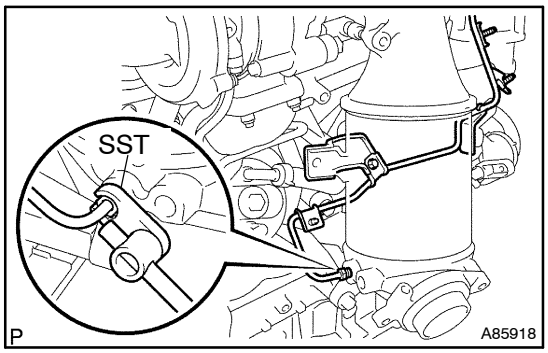
151. INSTALL EGR PIPE SUB–ASSY NO.1

(a) Install 2 new gaskets and the EGR pipe with the bolt and 4 new nuts.

Torque:
37 N·m (375 kgf·cm, 27 ft·lbf) for bolt
25 N·m (250 kgf·cm, 18 ft·lbf) for nut

152. INSTALL TURBOCHARGER SUB–ASSY (See page 13–12)

153. INSTALL TURBO OIL INLET PIPE SUB–ASSY (See page 13–12)



154. INSTALL TURBOCHARGER STAY (See page 13–12)

155. INSTALL MANIFOLD CONVERTER SUB–ASSY (See page 13–12)

156. INSTALL MANIFOLD STAY NO.2 (See page 13–12)

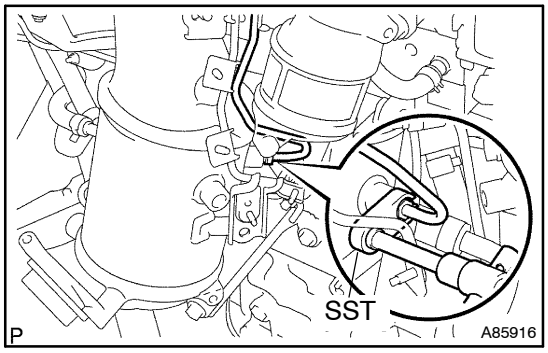
157. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.2

(a) Temporarily install the vacuum pipe.

(b) Using SST, tighten the nut of the vacuum pipe on the manifold converter side.

SST 09023–38200

Torque:
27 N·m (275 kgf·cm, 20 ft·lbf) with SST
30 N·m (306 kgf·cm, 22 ft·lbf) without SST



HINT:
Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).

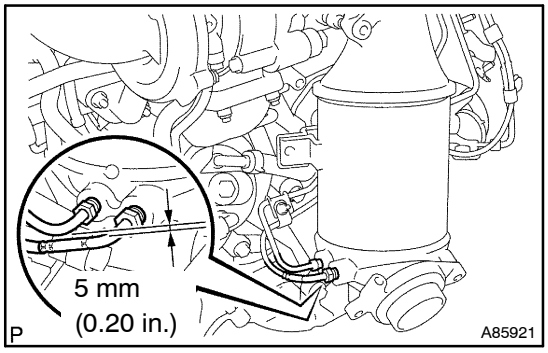
(c) Install the 2 bolts.

Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

158. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.1

(a) Temporarily install the vacuum pipe.

(b) Using SST, tighten the nut of the vacuum pipe on the manifold converter side.



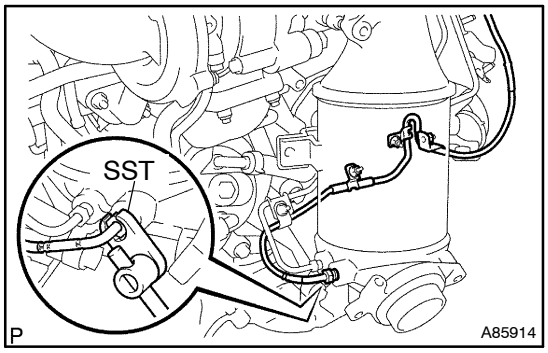
SST 09023–38200

Torque:
27 N·m (275 kgf·cm, 20 ft·lbf) with SST
30 N·m (306 kgf·cm, 22 ft·lbf) without SST

HINT:
Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).

(c) Install the bolt.

Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)



159. INSTALL EXHAUST GAS TEMPERATURE SENSOR

(a) Temporarily install the 3 nuts and exhaust gas temperature sensor on down stream as shown in the illustration.

NOTICE:

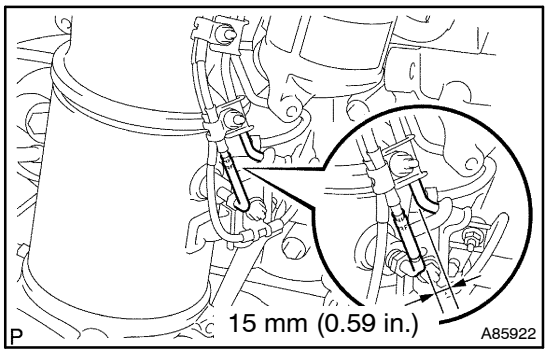
Keep 5 mm (0.20 in.) of the clearance between the exhaust gas temperature sensor and vacuum transmitting pipe.

(b) Using SST, tighten the sensor on the manifold converter side.

SST 09023–38400

Torque:

27 N·m (275 kgf·cm, 20 ft·lbf) with SST

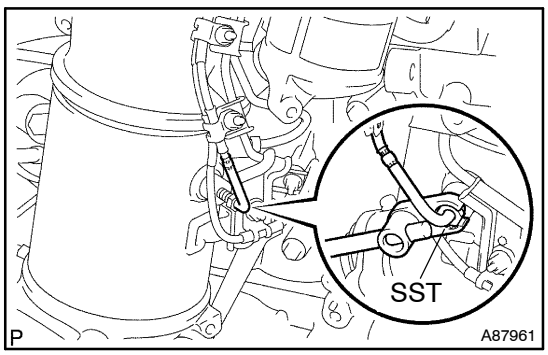


30 N·m (306 kgf·cm, 22 ft·lbf) without SST

HINT:

Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).

(c) Tighten the 3 nuts.



Torque: 6.4 N·m (65 kgf·cm, 57 in.·lbf)

(d) Temporarily install the 2 nuts and exhaust gas temperature sensor on up stream as shown in the illustration.

NOTICE:

Keep 15 mm (0.59 in.) of the clearance between the exhaust gas temperature sensor and vacuum transmitting pipe.

(e) Using SST, tighten the sensor on the manifold converter side.

SST 09023–38400

Torque:

27 N·m (275 kgf·cm, 20 ft·lbf) with SST

30 N·m (306 kgf·cm, 22 ft·lbf) without SST

HINT:

Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).

(f) Tighten the 2 nuts.

Torque: 6.4 N·m (65 kgf·cm, 57 in.·lbf)

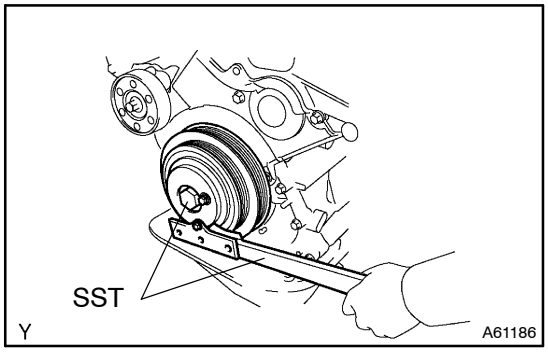
160. INSTALL EGR PIPE INSULATOR (See page 13–12)

161. INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.2 (See page 13–12)

162. INSTALL TURBO INSULATOR NO.1 (See page 13–12)

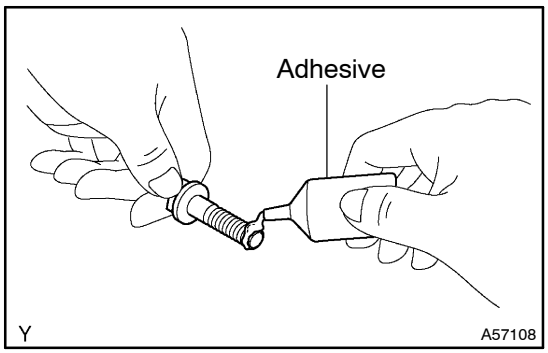
163. INSTALL TURBO INSULATOR NO.2 (See page 13–12)

164. INSTALL OIL FILTER BRACKET SUB–ASSY



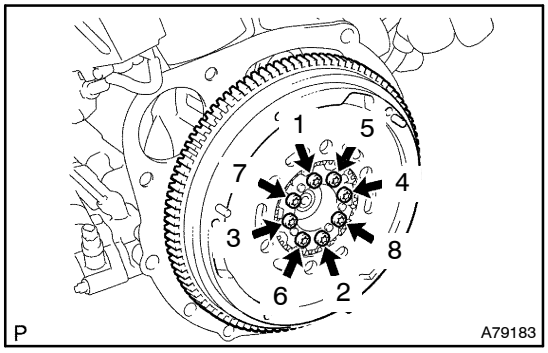
(a) Install a new gasket and the oil filter bracket with the bolt and 2 nuts.

Torque: 34 N·m (347 kgf·cm, 25 ft·lbf)



165. INSTALL V–RIBBED BELT TENSIONER BRACKET

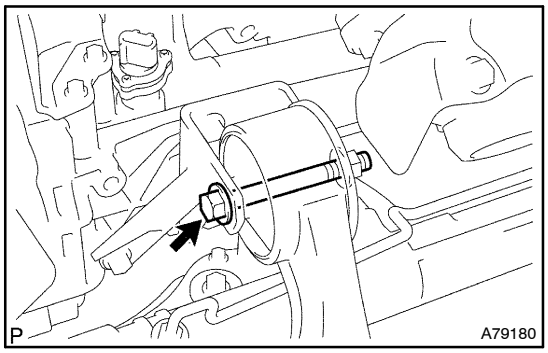
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)



166. INSTALL V–RIBBED BELT TENSIONER ASSY
Torque: 31 N·m (316 kgf·cm, 23 ft·lbf)
167. INSTALL GENERATOR BRACKET NO.1
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)
168. INSTALL GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)
169. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
SST 09960–10010 (09962–01000, 09963–01000)
170. INSTALL TIMING BELT (See page 14–138)
171. CHECK VALVE TIMING (See page 14–138)
172. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)
173. INSTALL TIMING BELT GUIDE (See page 14–138)
174. INSTALL TIMING BELT NO.1 COVER (See page 14–138)
175. INSTALL TIMING BELT NO.2 COVER (See page 14–138)
176. INSTALL IDLER PULLEY SUB–ASSY
Torque: 40 N·m (408 kgf·cm, 30 ft·lbf)
177. INSTALL CRANKSHAFT PULLEY (See page 14–138)
SST 09213–54015 (09213–70020), 09330–00021
178. INSTALL GLOW PLUG ASSY (See Pub. No. RM1018E on page 19–33)
179. INSTALL ENGINE MOUNTING BRACKET RR
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)
180. INSTALL ENGINE MOUNTING BRACKET FR
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)
181. INSTALL DRIVE SHAFT BEARING BRACKET
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)
182. INSTALL REAR END PLATE
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)

183. INSTALL FLYWHEEL SUB–ASSY
(a) Using SST, hold the crankshaft.
SST 09213–54015 (09213–70020), 09330–00021
(b) Clean the bolts and their bolt holes.

(c) Apply adhesive to the 2 or 3 threads of the bolt end.
Adhesive: Part No. 08833–00070, THREE BOND 1324 or equivalent

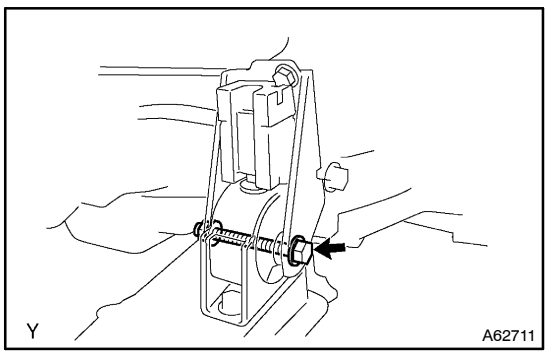


(d) Using a Torx socket wrench (T55), uniformly install and tighten the 8 Torx screws in several steps in the sequence shown in the illustration.
Torque: 71 N·m (720 kgf·cm, 52 ft·lbf)

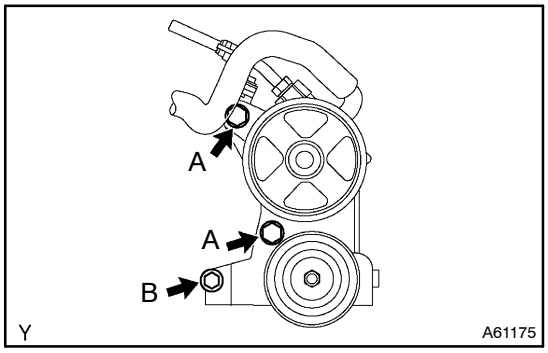
184. INSTALL CLUTCH DISC ASSY (See Pub. No. RM1018E on page 42–26)
SST 09301–00210

185. INSTALL CLUTCH COVER ASSY (See Pub. No. RM1018E on page 42–26)

186. INSTALL MANUAL TRANSAXLE (See Pub. No. RM1018E on page 41–33)



187. INSTALL STARTER ASSY (See Pub. No. RM1018E on page 19–24)

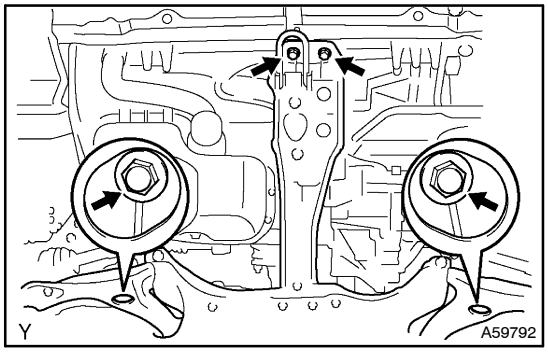


188. INSTALL FRONT SUSPENSION CROSSMEMBER SUB–ASSY

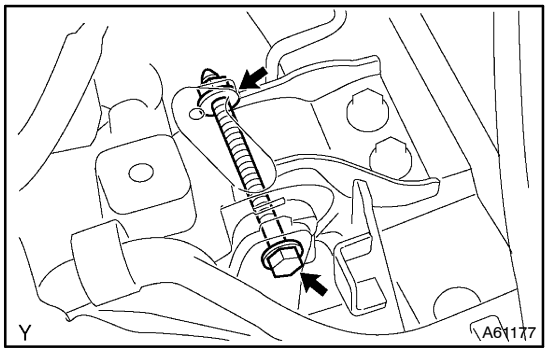
(a) Attach the engine together with the transaxle to the suspension crossmember and engine mounting member.

(b) Install the bolt which secures the rear engine mounting bracket to the mounting insulator.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)

(c) Install the bolt which secures the front engine mounting bracket to the mounting insulator.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

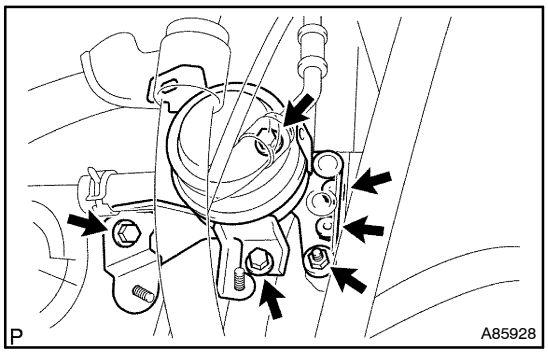


189. INSTALL POWER STEERING IDLE PULLEY BRACKET

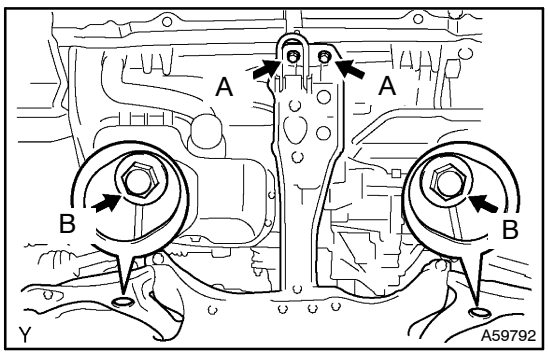


(a) Install the power steering idle pulley bracket with the 3 bolts.
Torque:
72 N·m (734 kgf·cm, 53 ft·lbf) for bolt A
39 N·m (398 kgf·cm, 29 ft·lbf) for bolt B

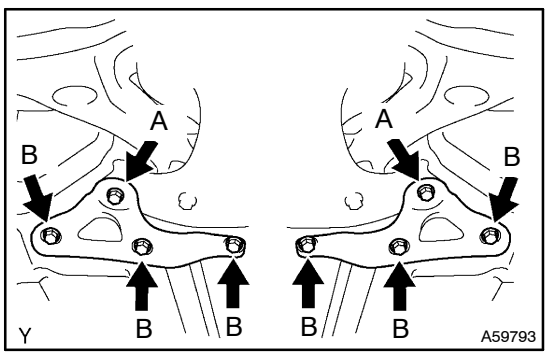
190. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE



(a) Set the engine together with the transaxle on the engine lifter.



(b) Temporarily install the suspension crossmember with the 2 bolts and 2 nuts.



(c) Install the engine mounting insulator LH.
Torque: 80 N·m (816 kgf·cm, 59 ft·lbf)

(d) Install the engine mounting insulator RH.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

(e) Install the front suspension crossmember with the 2 bolts and 2 nuts.
Torque:
45 N·m (459 kgf·cm, 33 ft·lbf) for bolt A
133 N·m (1,356 kgf·cm, 98 ft·lbf) for nut B

(f) Install the front suspension member brace LH and RH with the 8 bolts.
Torque:
133 N·m (1,356 kgf·cm, 98 ft·lbf) for bolt A
80 N·m (816 kgf·cm, 59 ft·lbf) for bolt B

NOTICE:
After installing the crossmember, check that the positioning holes on the crossmember and vehicle are aligned.

191. INSTALL FRONT AXLE ASSY LH (See Pub. No. RM1018E on page 30–6)

HINT:

Perform the same procedure as above on the opposite side.

192. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH (See Pub. No. RM1018E on page 30–6)

HINT:

Perform the same procedure as above on the opposite side.

193. INSTALL STEERING INTERMEDIATE SHAFT ASSY NO.2 (See Pub. No. RM1018E on page 51–36)

194. INSTALL FRONT STABILIZER LINK ASSY LH (See Pub. No. RM1018E on page 30–6)

HINT:

Perform the same procedure as above on the opposite side.

195. INSTALL TIE ROD END SUB–ASSY LH (See Pub. No. RM1018E on page 30–6)

HINT:

Perform the same procedure as above on the opposite side.

196. INSTALL FRONT AXLE HUB LH NUT (See Pub. No. RM1018E on page 30–6)

HINT:

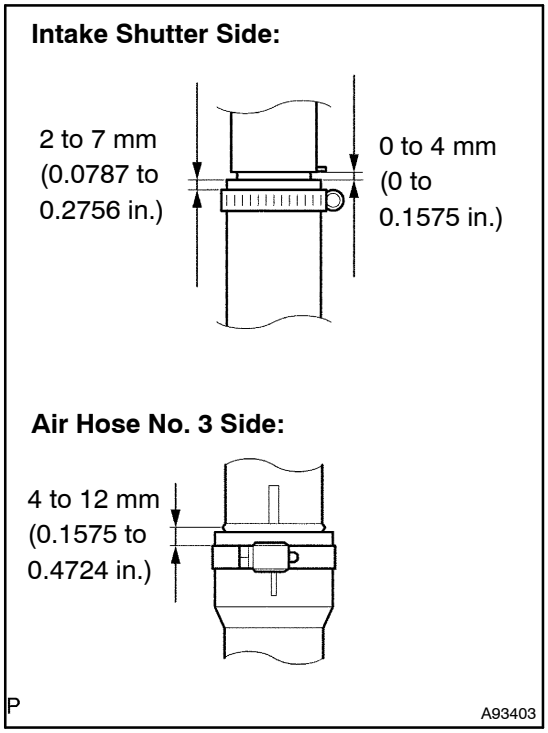
Perform the same procedure as above on the opposite side.

197. INSTALL RETURN TUBE SUB–ASSY

Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

198. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–6)

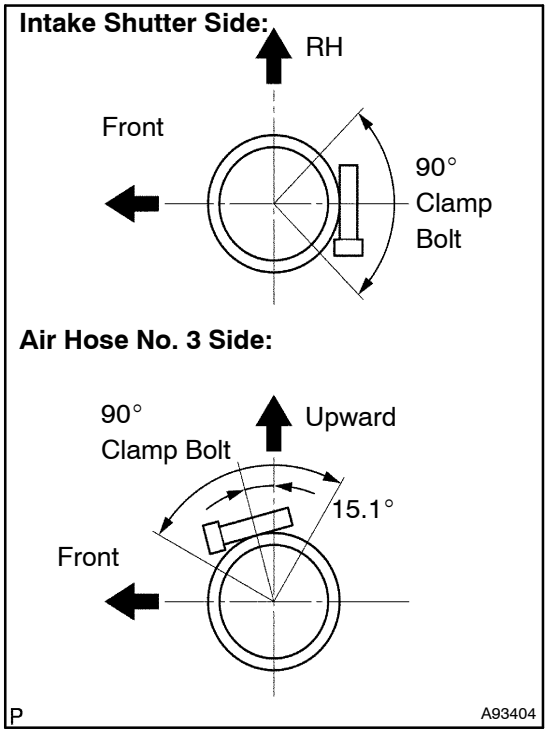
199. INSTALL FLOOR PANEL BRACE FRONT (See page 15–6)



200. INSTALL COMPRESSOR AND MAGNETIC CLUTCH (W/ AIR CONDITIONING) (See Pub. No. RM1018E on page 55–86)

201. ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)

202. INSTALL CLUTCH RELEASE CYLINDER ASSY (See Pub. No. RM1018E on page 42–17)

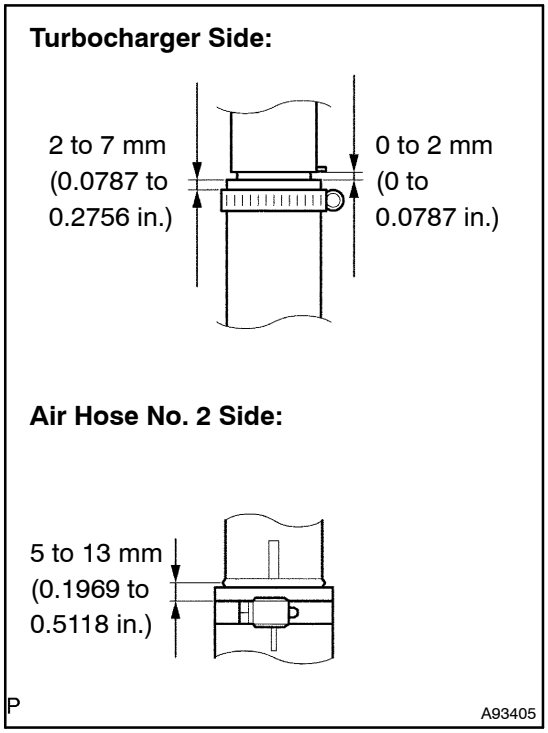


203. INSTALL CLUTCH ACCUMULATOR ASSY (See Pub. No. RM1018E on page 42–22)

SST 09023–00100

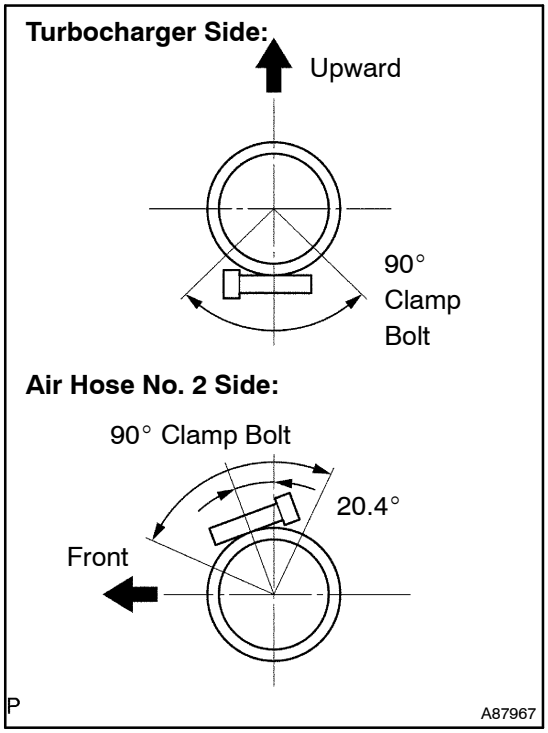
204. INSTALL AIR TUBE NO.2

(a) Install the air hose and 2 hose clamps as shown in the illustration.



(b) Tighten the 2 hose clamps as shown in the illustration.
Torque:
6.0 N·m (61 kgf·cm, 53 in.·lbf) for intake shutter side
5.3 N·m (54 kgf·cm, 47 in.·lbf) for air hose No. 3 side

(c) Install the bolt and air tube No. 2 assembly to the transaxle.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)



205. CONNECT ENGINE WIRE
Torque:
8.4 N·m (85 kgf·cm, 74 in.·lbf) for wire harness
5.3 N·m (54 kgf·cm, 47 in.·lbf) for engine room relay block No. 2

206. INSTALL INJECTOR DRIVER
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)

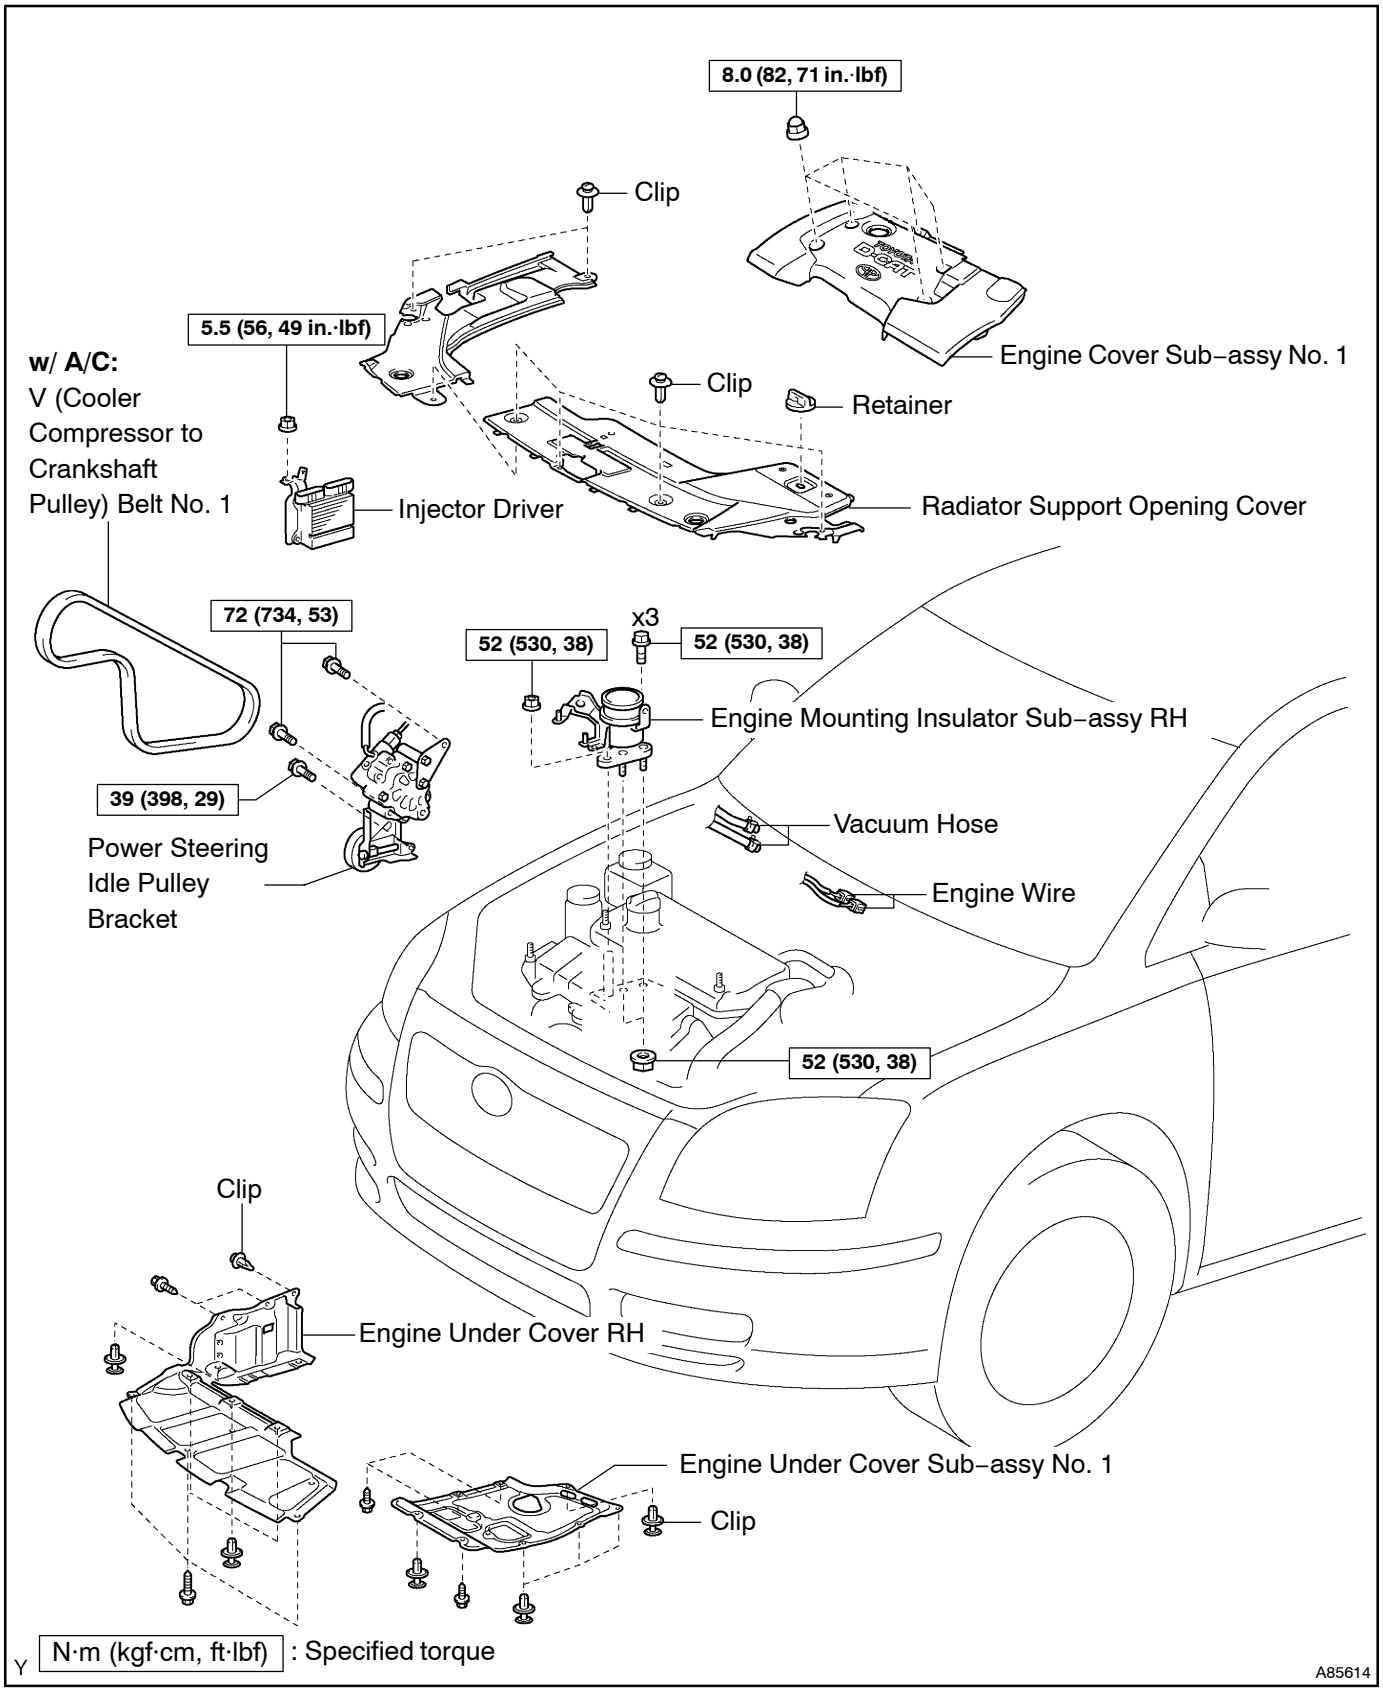
207. INSTALL AIR TUBE NO.1

(a) Install a new air hose No. 2 and new 2 hose clamps as shown in the illustration.

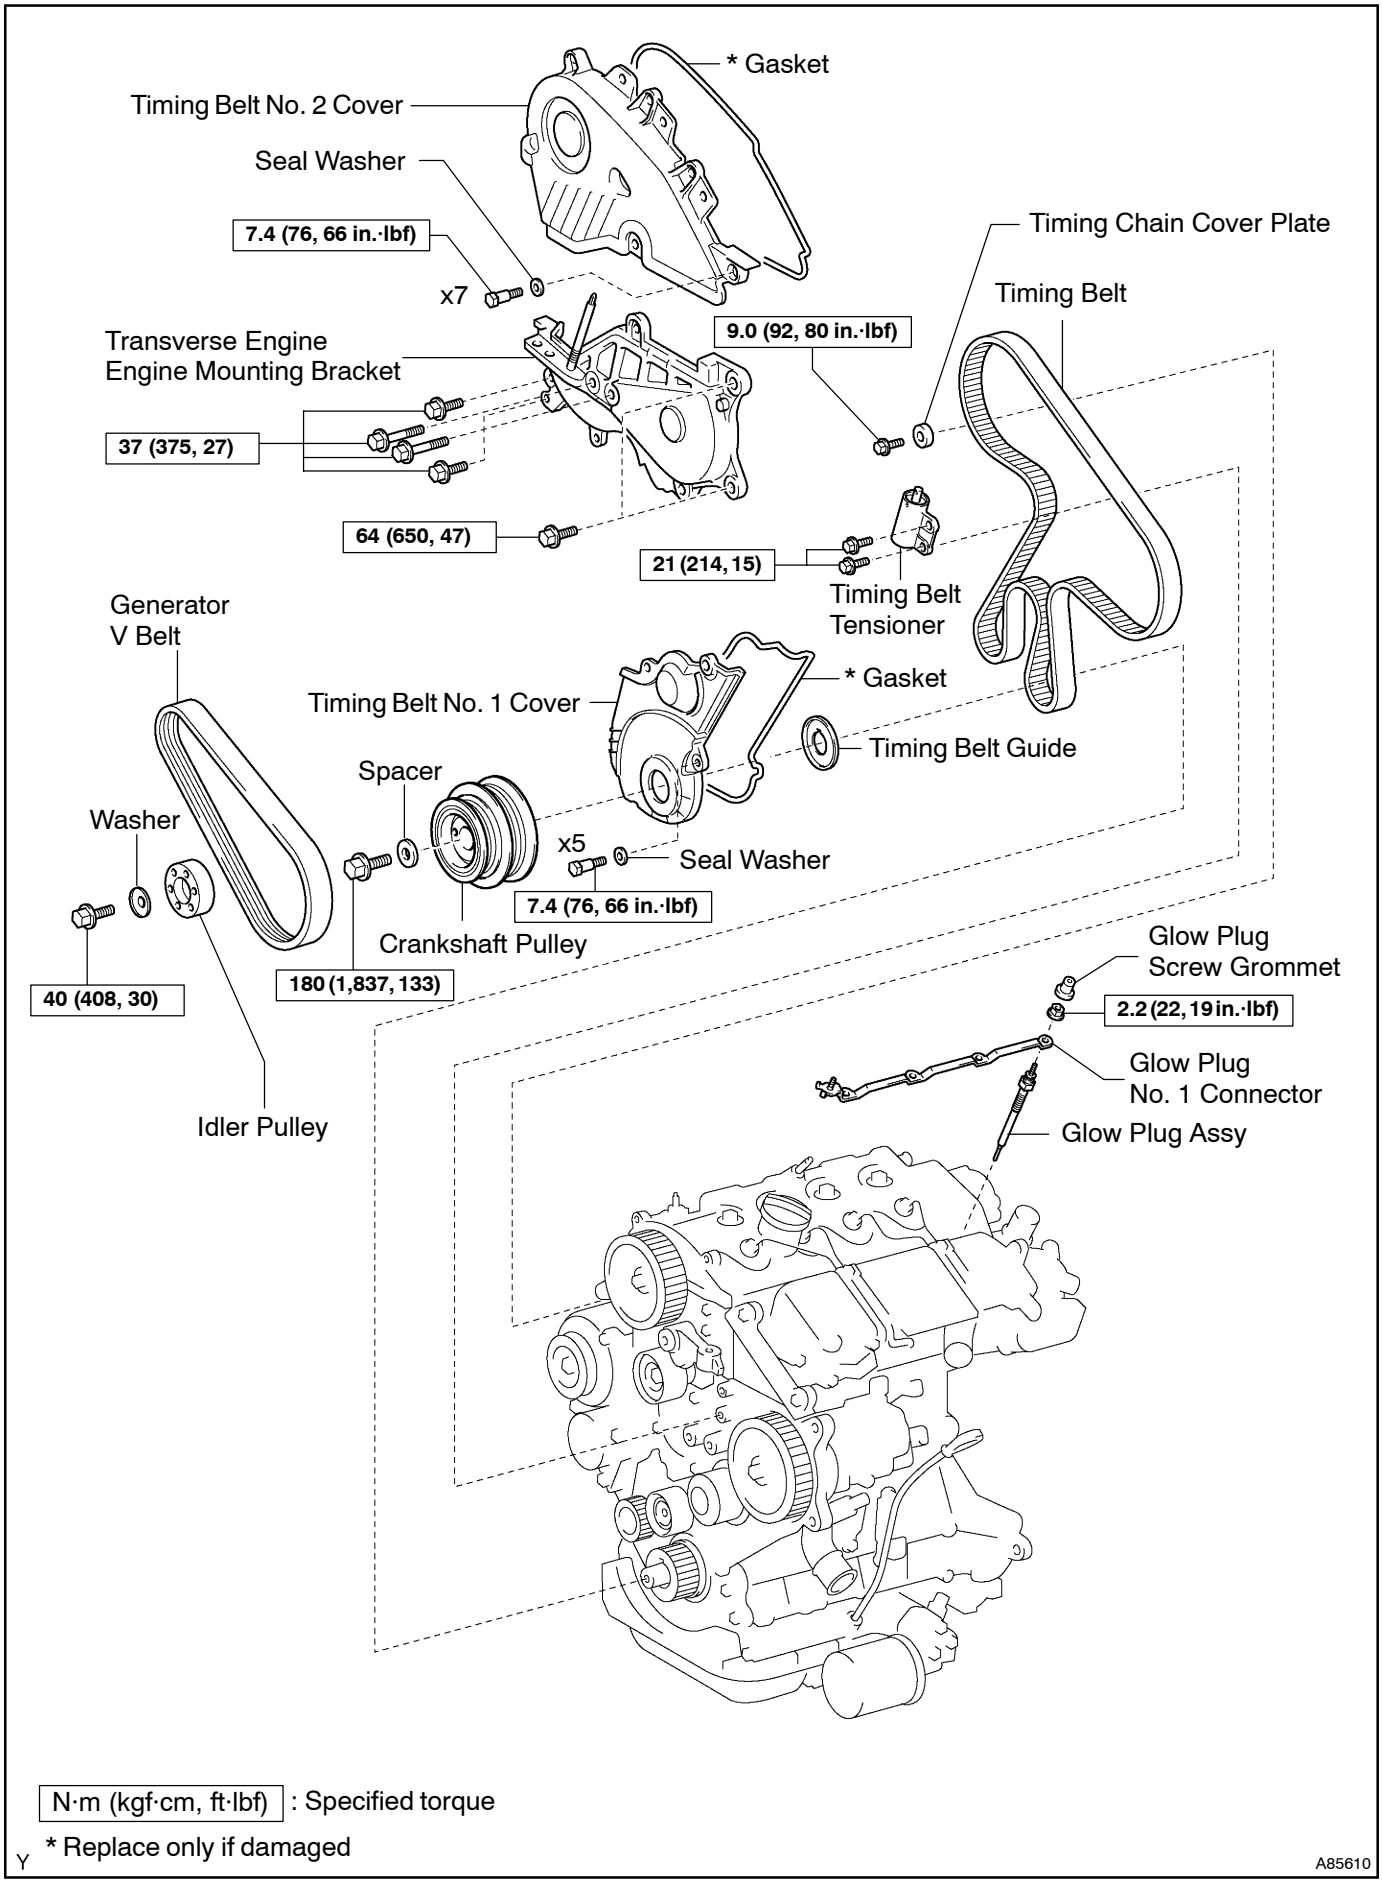
(b) Tighten the 2 hose clamps as shown in the illustration.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

(c) Install the air tube No. 1 with the 3 bolts and nut.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

208. INSTALL DIFFERENTIAL PRESSURE SENSOR ASSY
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)
209. INSTALL RADIATOR ASSY (W/ AIR CONDITIONING) (See Pub. No. RM1018E on page 16–51)
210. INSTALL ENGINE ROOM RELAY BLOCK NO.3
Torque: 5.3 N·m (54 kgf·cm, 47 in.·lbf)
211. INSTALL FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)
212. INSTALL AIR CLEANER ASSY
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
213. INSTALL BATTERY
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt
3.0 to 4.0 N·m (31 to 41 kgf·cm, 27 to 35 in.·lbf) for nut
5.4 N·m (55 kgf·cm, 48 in.·lbf) for terminal
214. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
215. BLEED CLUTCH PIPE LINE (See Pub. No. RM1018E on page 42–12)
216. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
217. ADD MANUAL TRANSAXLE OIL (See Pub. No. RM1018E on page 41–5)
218. ADD ENGINE OIL (See Pub. No. RM1018E on page 17–30)
219. ADD ENGINE COOLANT (See page 16–19)
220. CHECK CLUTCH FLUID LEAKAGE
221. CHECK FLUID LEVEL IN RESERVOIR
222. CHECK BRAKE FLUID LEAKAGE
223. CHECK FOR ENGINE OIL LEAKS
224. CHECK FOR FUEL LEAKS (See page 11–46)
225. CHECK FOR ENGINE COOLANT LEAKS (See page 16–15)
226. CHECK FOR EXHAUST GAS LEAKS
227. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT (See Pub. No. RM1018E on page 26–6)



228. INSPECT ENGINE IDLE SPEED (See page 14–87)



229. CHECK ABS SPEED SENSOR SIGNAL (See Pub. No. RM1018E on page 05–756)

TIMING BELT (1CD–FTV)(From September, 2003)

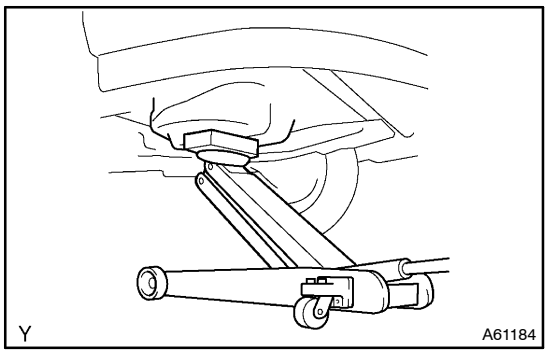
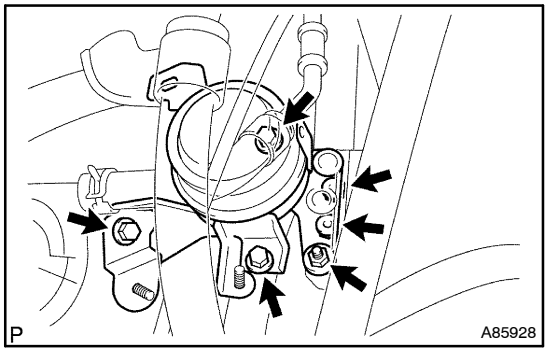
REPLACEMENT

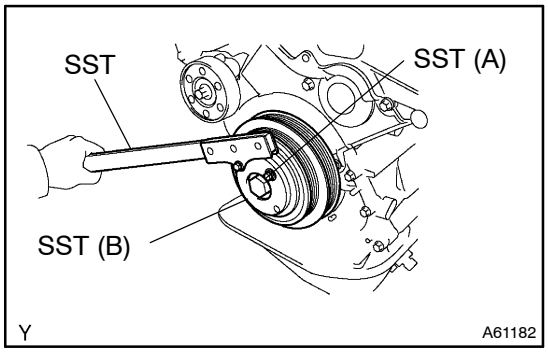
1. REMOVE FRONT WHEEL RH
2. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1
3. REMOVE ENGINE UNDER COVER RH
4. REMOVE RADIATOR SUPPORT OPENING COVER
5. REMOVE ENGINE ROOM COVER SIDE
6. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–90)
7. REMOVE INJECTOR DRIVER (See page 14–108)
8. REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)
9. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)



10. SEPARATE POWER STEERING IDLE PULLEY BRACKET
(a) Remove the 3 bolts and power steering idle pulley bracket.

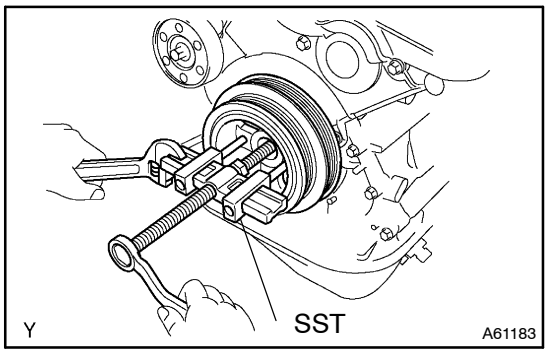


11. DISCONNECT ENGINE WIRE
(a) Disconnect the 2 exhaust gas temperature sensor connectors.

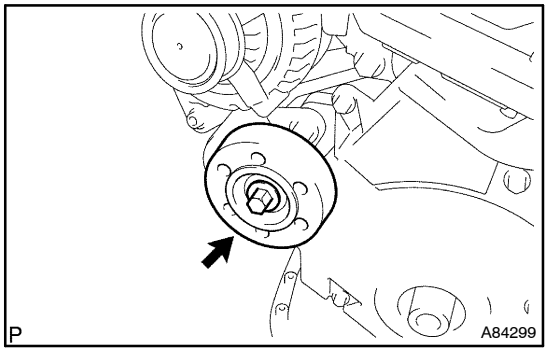


12. DISCONNECT VACUUM HOSE (See page 14–108)

13. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH
(a) Place a wooden block on a jack underneath the engine.



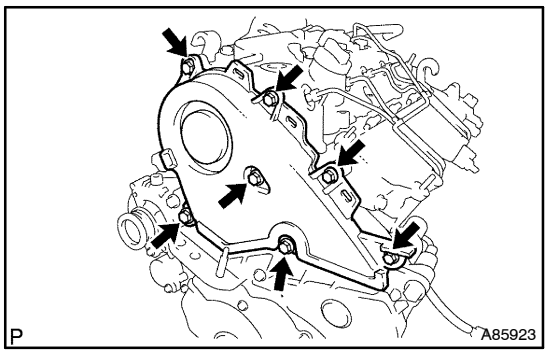
(b) Remove the 3 bolts and 3 nuts, then detach the engine mounting insulator sub–assembly RH.



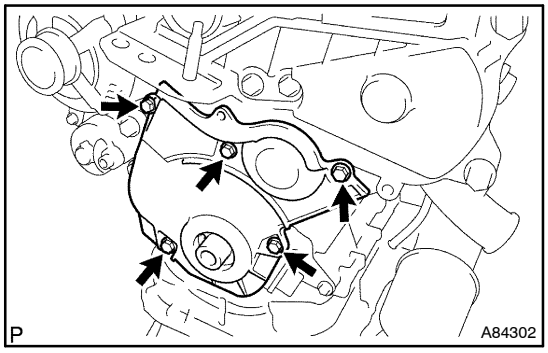
14. REMOVE CRANKSHAFT PULLEY

(a) Using SST, remove the pulley bolt.
SST 09213–54015 (09213–70020), 09330–00021

HINT:
When using SST (A) (09213–70020), a plate washer (5 mm (0.20 in.)) must be inserted between SST (A) and SST (B).



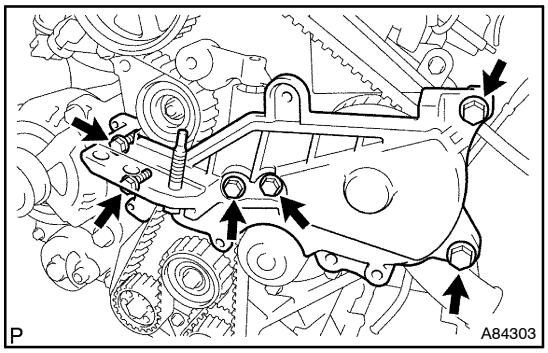
(b) Using SST, remove the pulley.
SST 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)



15. REMOVE IDLER PULLEY SUB–ASSY

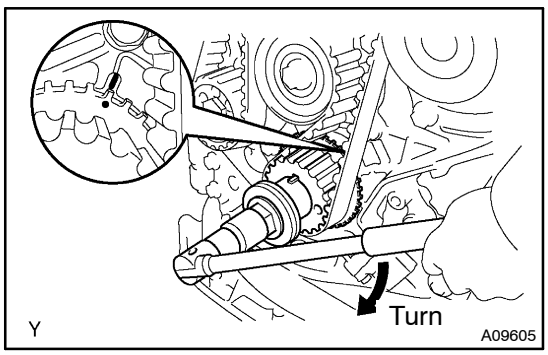
(a) Remove the bolt and washer, then remove the pulley.

16. REMOVE TIMING BELT NO.2 COVER



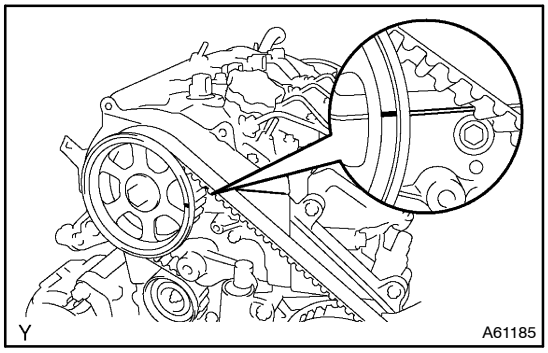
(a) Remove the 7 bolts and 7 seal washers, then remove the timing belt cover.

17. REMOVE TIMING BELT NO.1 COVER



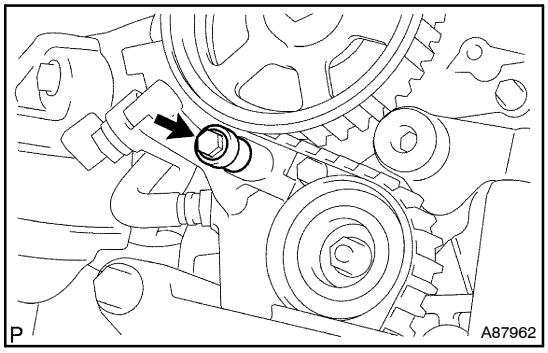
(a) Remove the 5 bolts and 5 seal washers, then remove the timing belt cover.

18. REMOVE TIMING BELT GUIDE



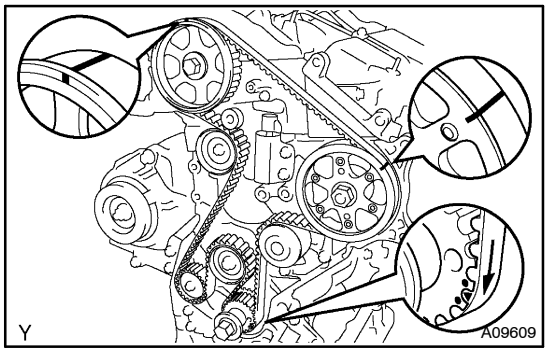
19. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

(a) Remove the 6 bolts and engine mounting bracket.



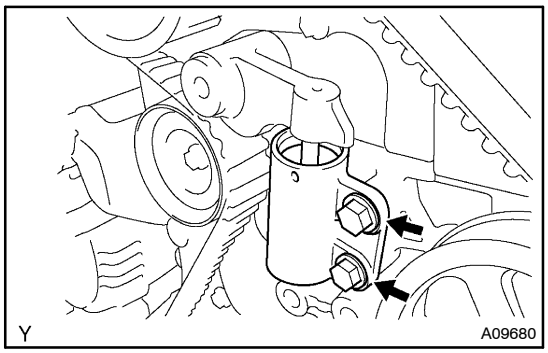
20. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Using the crankshaft pulley bolt, align the dot mark of the crankshaft timing gear with the TDC mark of the oil pump by turning the crankshaft.



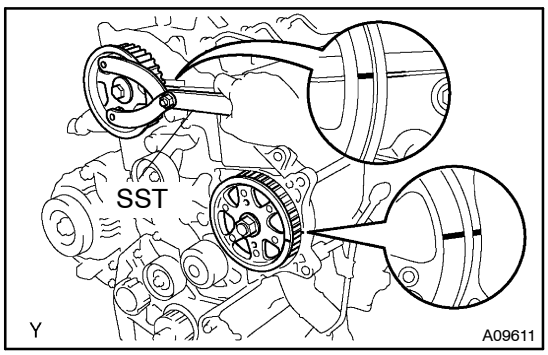
(b) Check that the timing mark of the camshaft timing pulley is aligned with the joint of the cylinder head and cylinder head cover.

21. REMOVE TIMING CHAIN COVER PLATE



(a) Remove the bolt and timing chain cover plate.

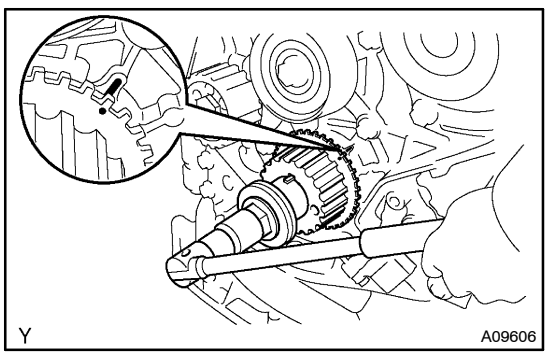
22. REMOVE TIMING BELT



HINT:

If reusing the timing belt, draw an arrow on the belt which indicates the engine revolution direction and put match marks on the pulleys and belt before removing. This operation will be very helpful when reinstalling the timing belt.

(a) Alternately loosen the 2 bolts to remove the timing belt tensioner.



(b) Remove the timing belt.

23. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Using SST, set the pulleys of the camshaft and injection pump so that each timing mark of the pulleys is aligned with its timing mark on the cylinder head assembly and water pump assembly.

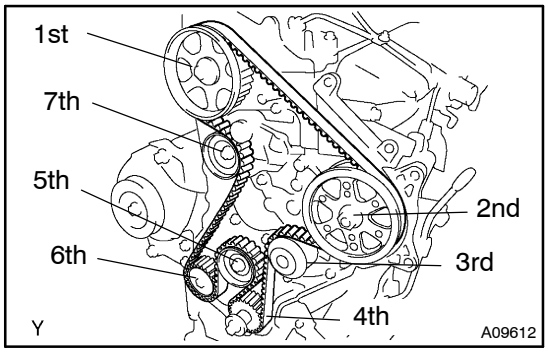
SST 09960–10010 (09962–01000, 09963–01000)

(b) Using the crankshaft pulley bolt, align the dot mark of the crankshaft timing gear with the TDC mark of the oil pump by turning the crankshaft.

NOTICE:

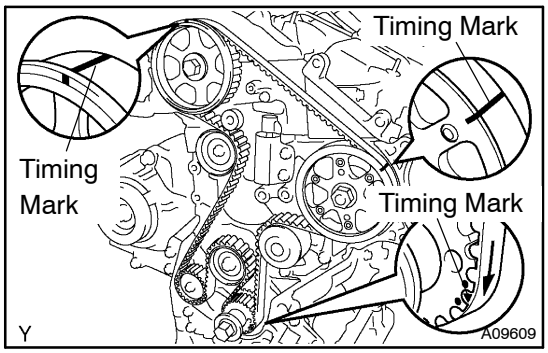
Be very careful in turning the camshaft and crankshaft. Since the valve head and piston head are sensitive, contact of the piston head with the valve heads may damage them.

24. INSTALL TIMING BELT



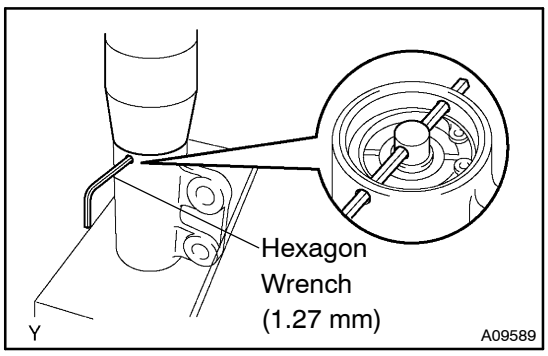
NOTICE:

The engine should be cold.

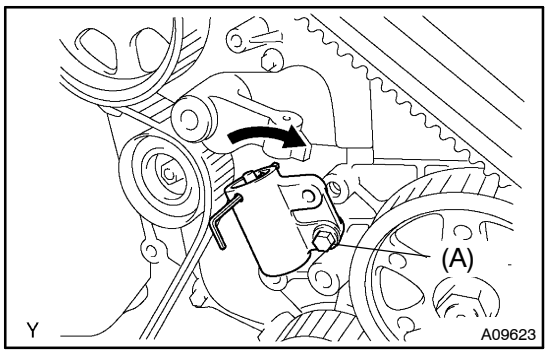


(a) Remove any oil or water on each pulley, then keep them clean.

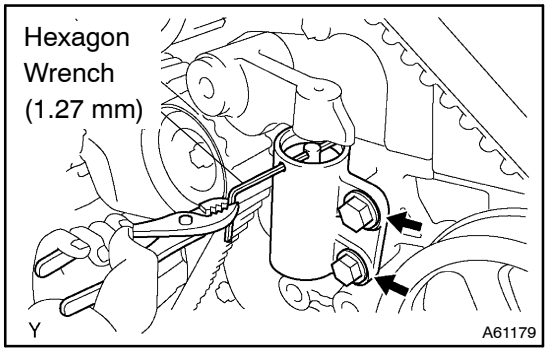
NOTICE:



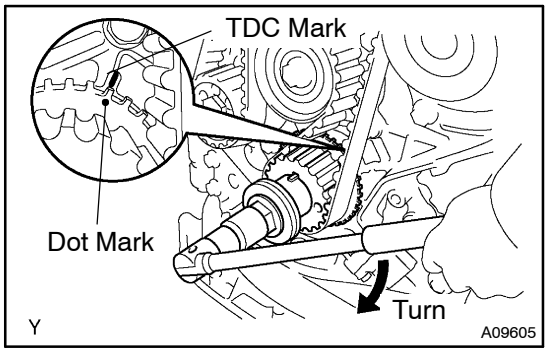
Do not use any cleaning agent.



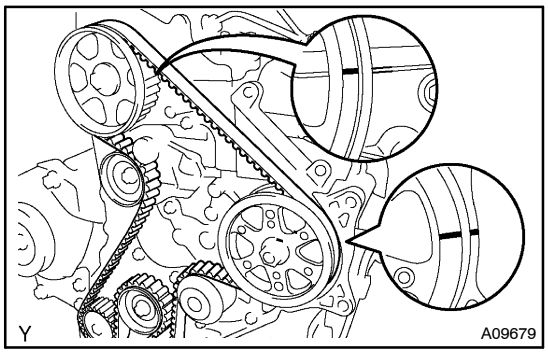
(b) Install the timing belt in the following order:
1. Camshaft timing pulley
2. Supply pump drive pulley
3. Water pump pulley
4. Crankshaft timing pulley
5. No. 2 idler pulley
6. Oil pump pulley
7. No. 1 idler pulley



(c) Check that the timing marks are aligned as shown in the illustration.

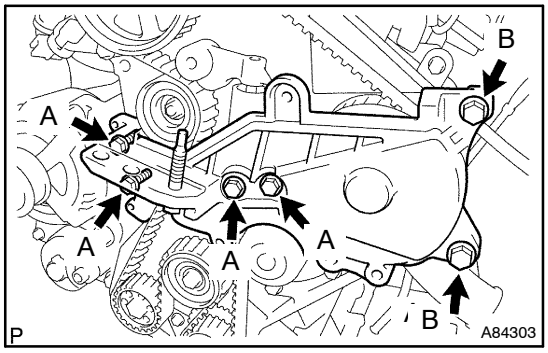


(d) Install the timing belt tensioner.
(1) Using a press, slowly press in the push rod with pressure of 981 to 9,807 N (100 to 1,000 kgf, 200 to 2,205 lbf).
(2) Align the holes of the push rod and housing, then insert hexagon wrench (1.27 mm) through the holes to keep the setting position of the push rod.
(3) Release the press.

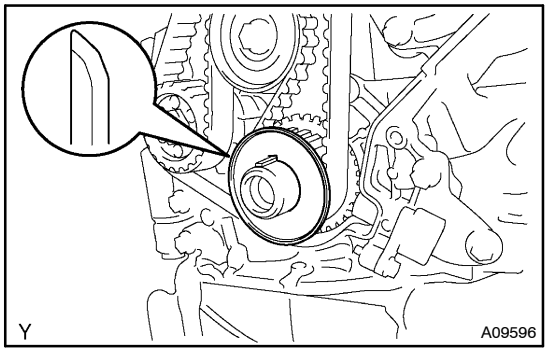


(4) Temporarily install the tensioner with bolt (A).
(5) Turn the tensioner clockwise, then temporarily install the other bolt.

(6) Alternately tighten the 2 bolts.
Torque: 21 N·m (214 kgf·cm, 15 ft·lbf)
(7) Remove the hexagon wrench from the tensioner.



25. CHECK VALVE TIMING
(a) Slowly turn the crankshaft by 2 complete revolutions (720°) from the TDC to TDC.
NOTICE:
Always turn the crankshaft clockwise.
HINT:
Align the TDC mark with the dot mark.



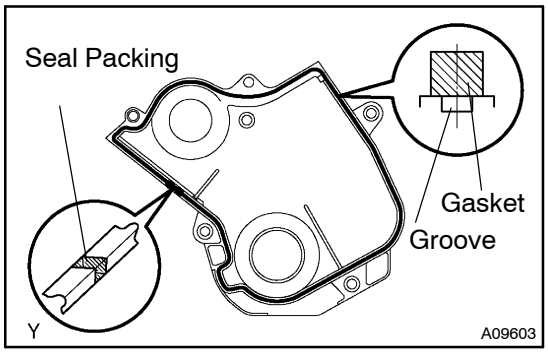
(b) Check that each timing mark of the pulleys is aligned with the timing marks of the engine assembly as shown in the illustration.
If the timing marks are not aligned, remove the timing belt, then reinstall it.
(c) Remove the crankshaft pulley bolt.

26. INSTALL TIMING CHAIN COVER PLATE
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

27. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET
Torque:
37 N·m (375 kgf·cm, 27 ft·lbf) for bolt A
64 N·m (650 kgf·cm, 47 ft·lbf) for bolt B

28. INSTALL TIMING BELT GUIDE

(a) Install the belt guide with the cap side facing outward.



29. INSTALL TIMING BELT NO.1 COVER

(a) Check the timing belt cover gasket for cracks or deteriorations, etc.

If the gasket has cracked or deteriorated, replace it by the following steps:

(1) Using a screwdriver and gasket scraper, remove all the old gaskets.

(2) Thoroughly clean all components to remove all the loose material.

(3) Remove the backing paper from a new gasket, then affix the gasket to the timing belt cover as shown in the illustration.

NOTICE:

- **Affix the gasket at the center of the groove.**
- **At the corners, try to keep the gasket thickness uniform.**

(4) After installing the gasket, press it down so that the adhesive firmly sticks to the timing belt cover.

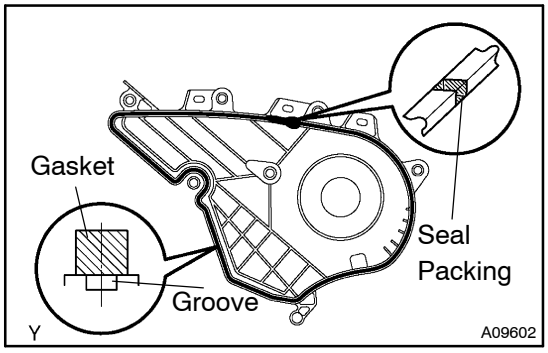
(5) If there is a gap between the ends of the gasket, use seal packing to close the gap.

Seal packing: Part No. 08826–00080 or equivalent

(b) Install the No. 1 timing belt cover and gasket with the 5 bolts and 5 seal washers.

Torque: 7.4 N·m (75 kgf·cm, 65 in.·lbf)

(c) After installing the belt cover, check that there is no peelings of the gasket.



30. INSTALL TIMING BELT NO.2 COVER

(a) Check the timing belt cover gasket for cracks or deteriorations, etc.

If the gasket has cracked or deteriorated, replace it by the following steps:

(1) Using a screwdriver and gasket scraper, remove all the old gasket.

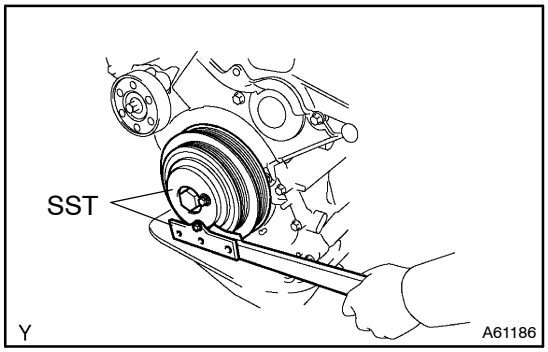
(2) Thoroughly clean all components to remove all the loose material.

(3) Remove the backing paper from a new gasket, then affix the gasket to the timing belt cover as shown in the illustration.

NOTICE:

- **Affix the gasket at the center of the groove.**
- **At the corners, try to keep the gasket thickness uniform.**

(4) After installing the gasket, press it down so that the adhesive firmly sticks to the timing belt cover.



(5) If there is a gap between the ends of the gasket, use seal packing to close the gap.

Seal packing: Part No. 08826–00080 or equivalent

(b) Install the No. 2 timing belt cover and gasket with the 7 bolts and 7 seal washers.

Torque: 7.4 N·m (75 kgf·cm, 65 in.·lbf)

31. INSTALL IDLER PULLEY SUB–ASSY
Torque: 40 N·m (408 kgf·cm, 30 ft·lbf)

32. INSTALL CRANKSHAFT PULLEY

(a) Align the keyway of the pulley with the key located on the crankshaft, then slide the pulley into place.

(b) Using SST, install the pulley bolt.
SST 09213–54015 (09213–70020), 09330–00021
Torque: 180 N·m (1,835 kgf·cm, 133 ft·lbf)

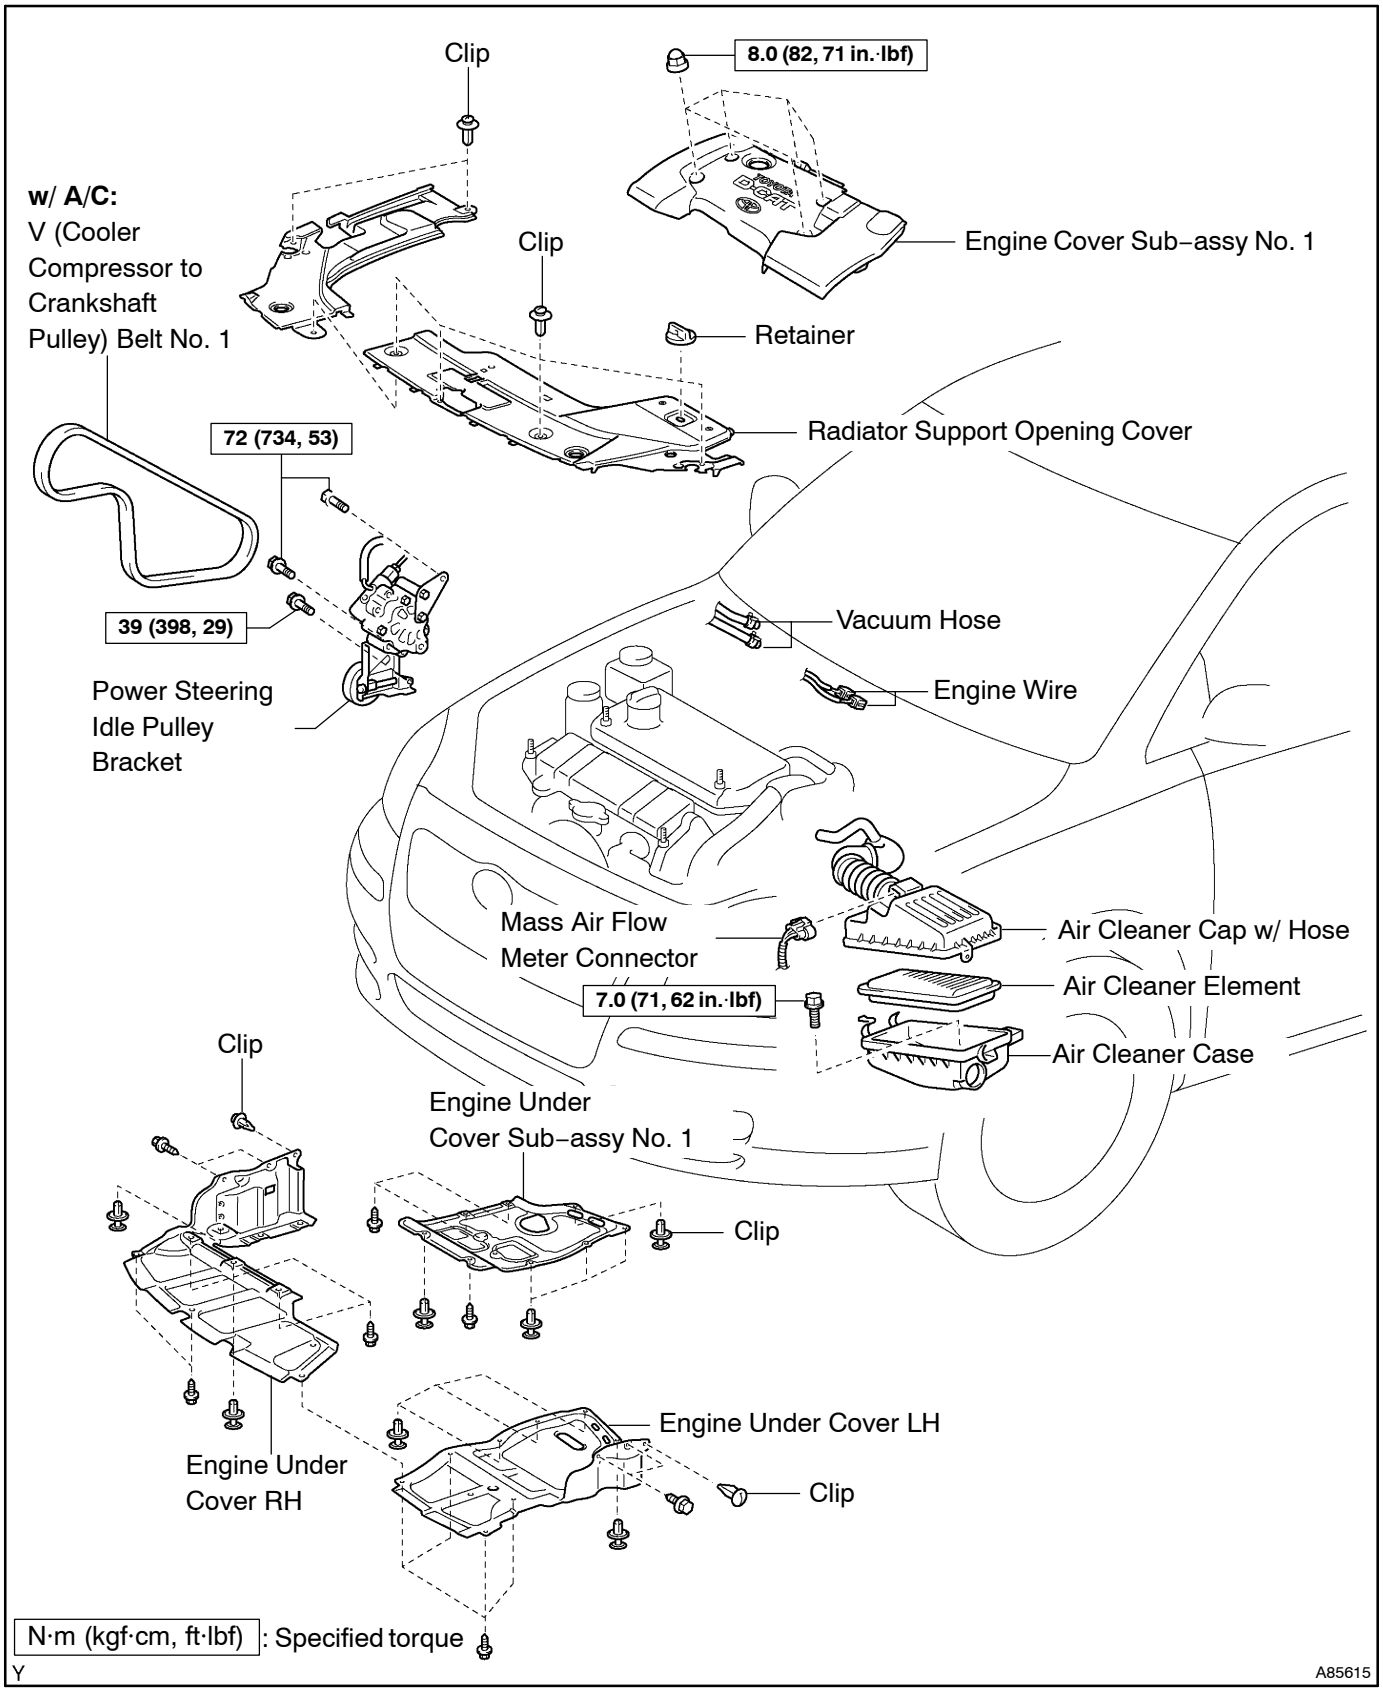
HINT:
When using the bolt (91651–60855), a plate washer (5 mm (0.20 in.)) must be inserted between the pulley bolt and SST.

33. INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

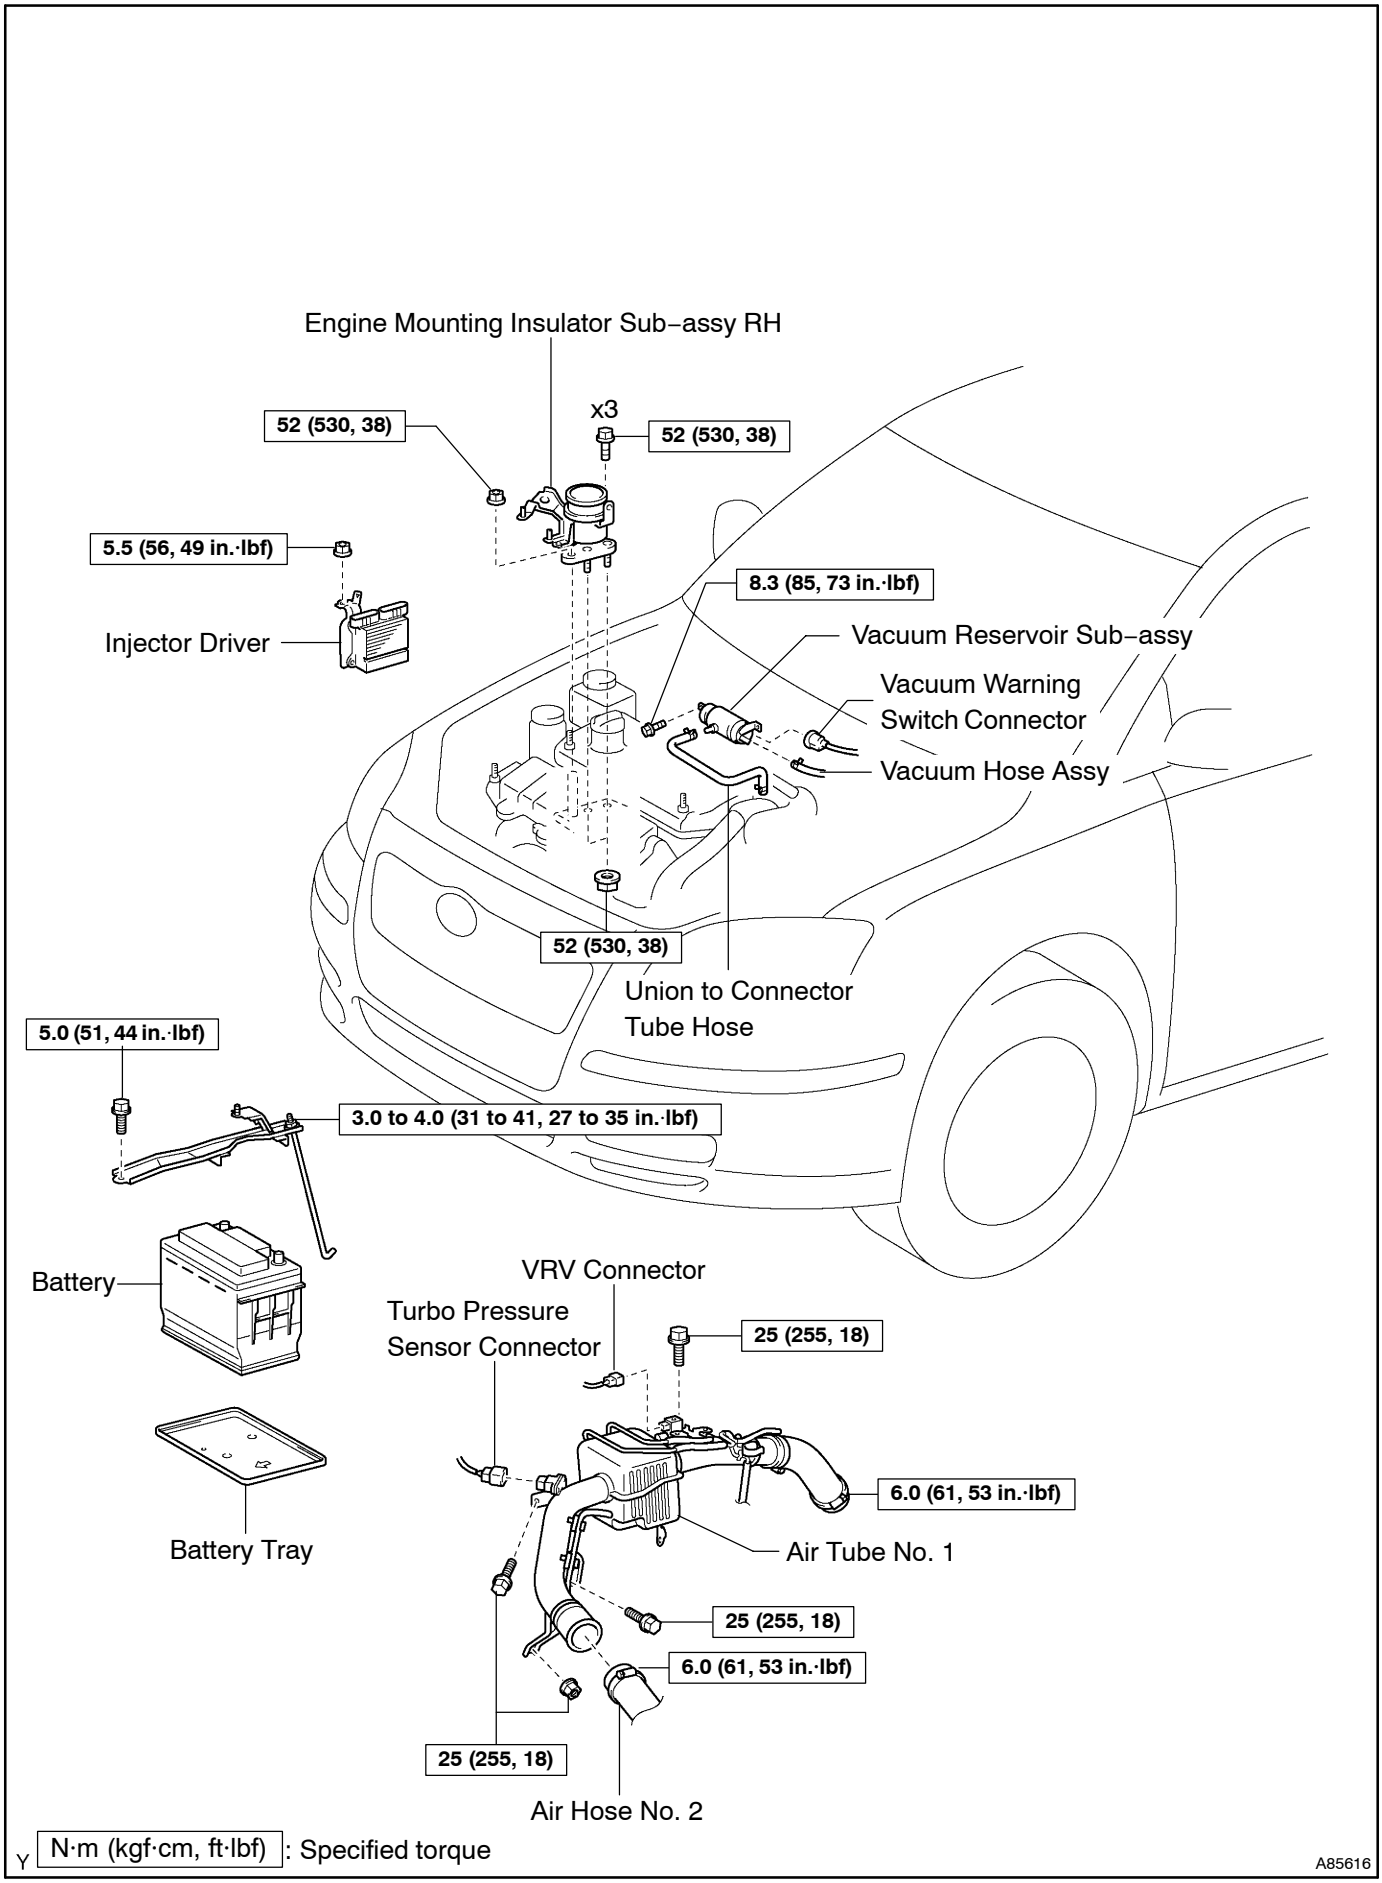
34. INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)

35. ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1
(See Pub. No. RM1018E on page 14–269)

36. INSTALL INJECTOR DRIVER (See page 14–108)



37. INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 14–90)



38. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

14. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)
15. SEPARATE POWER STEERING IDLE PULLEY BRACKET (See page 14–138)
16. DISCONNECT ENGINE WIRE (See page 14–138)
17. DISCONNECT VACUUM HOSE (See page 14–108)
18. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)
19. REMOVE CRANKSHAFT PULLEY (See page 14–138)
    SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)
20. REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)
21. REMOVE TIMING BELT NO.2 COVER (See page 14–138)
22. REMOVE TIMING BELT NO.1 COVER (See page 14–138)
23. REMOVE TIMING BELT GUIDE
24. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)
25. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
26. REMOVE TIMING CHAIN COVER PLATE (See page 14–138)
27. REMOVE TIMING BELT (See page 14–138)
28. REMOVE CAMSHAFT POSITION SENSOR (See page 14–108)

29. REMOVE CAMSHAFT TIMING PULLEY
(a) Using SST, remove the pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
(b) Remove the timing pulley.
HINT:
Using a plastic–faced hammer, tap out the pulley.
(c) Remove the set key.

30. REMOVE FUEL PIPE NO.3 (See page 14–108)
SST 09023–12700

31. REMOVE INJECTION PIPE SUB–ASSY NO.1

(a) Remove the 2 upper injection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

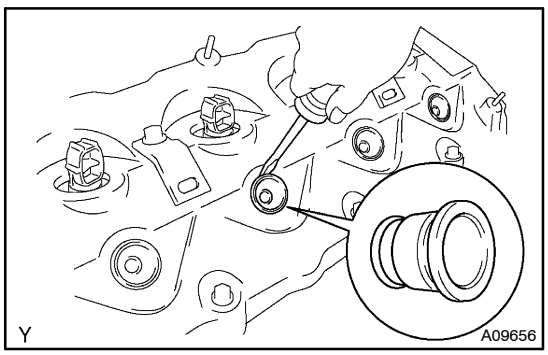
(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

(d) After removing the fuel pipe, in order to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

32. REMOVE INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

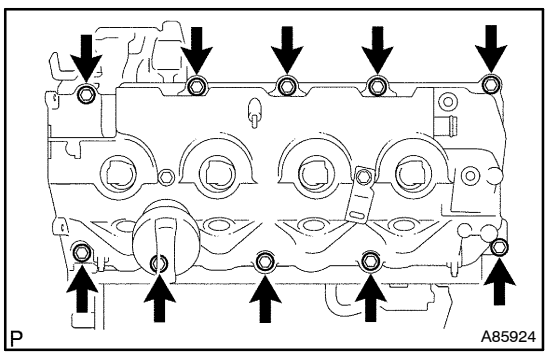
33. REMOVE INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

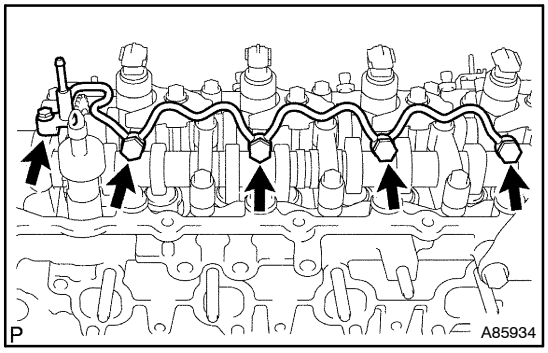
34. REMOVE INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



35. REMOVE VACUUM PUMP ASSY (See page 14–108)

36. REMOVE NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)



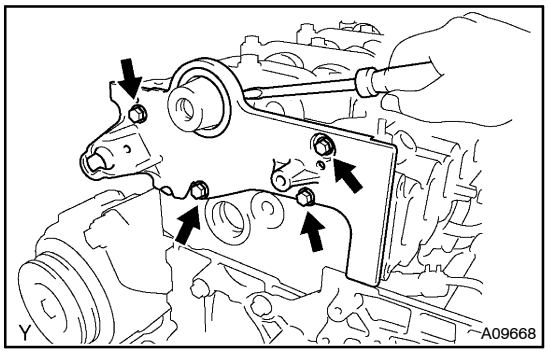
37. REMOVE NOZZLE HOLDER SEAL

(a) Using a screwdriver, pry out the 4 nozzle holder seals.

38. REMOVE CYLINDER HEAD COVER SUB–ASSY

(a) Remove the 10 bolts, cylinder head cover and gasket.

39. REMOVE NOZZLE LEAKAGE PIPE ASSY

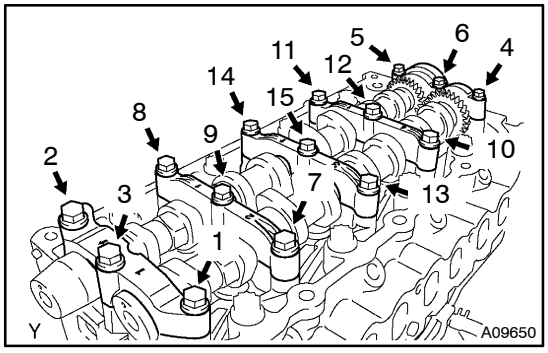


(a) Remove the 4 hollow screws and bolt.

(b) Remove the nozzle leakage pipe and 4 gaskets from the cylinder head and injector.

40. REMOVE INJECTOR ASSY (See page 11–46)

HINT:

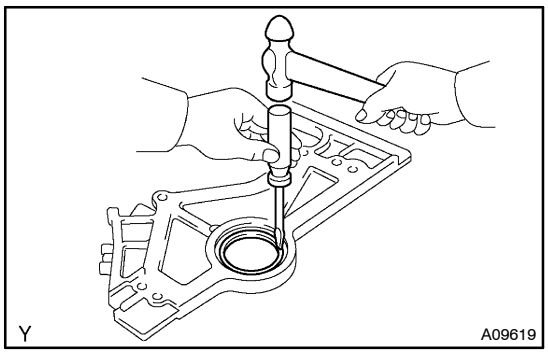


Since each injector assembly has characteristic fuel injecting behavior, keep them in the correct order so that they can be returned to the original locations when reassembling.

41. REMOVE CAMSHAFT OIL SEAL RETAINER

(a) Remove the 4 bolts.

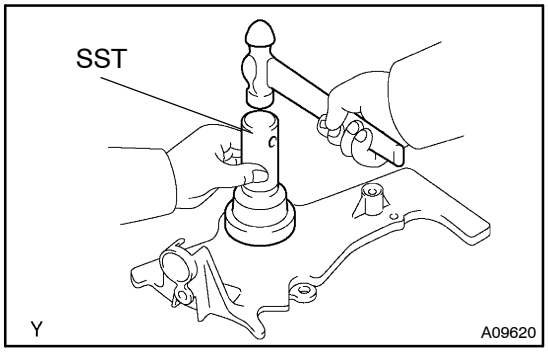
(b) Using a screwdriver, remove the oil seal retainer by prying between the oil seal retainer and camshaft bearing cap.



42. REMOVE CAMSHAFT

(a) Using several steps, loosen and remove the 14 bearing cap bolts uniformly in the sequence shown in the illustration.

(b) Remove the 5 bearing caps and camshaft sub–assembly.

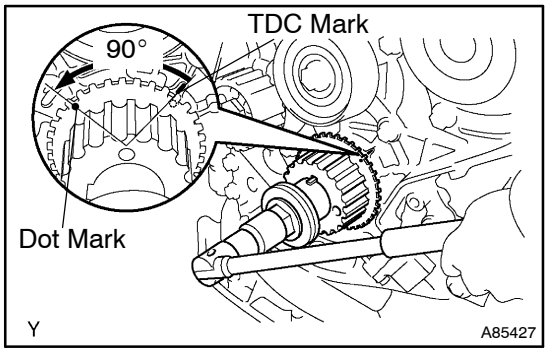


43. REMOVE NO.2 CAMSHAFT

(a) Remove the camshaft sub–assembly and camshaft carrier.

44. REMOVE CAMSHAFT OIL SEAL

(a) Using a screwdriver and hammer, tap out the oil seal.



45. INSTALL CAMSHAFT OIL SEAL

(a) Using SST and a hammer, tap in a new oil seal until its surface is flush with the camshaft oil seal retainer edge.
SST 09223–46011

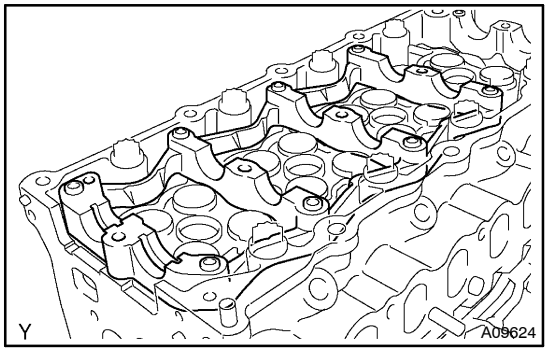
(b) Apply multipurpose grease to a new oil seal lip.

NOTICE:

Keep the lip free of foreign object.

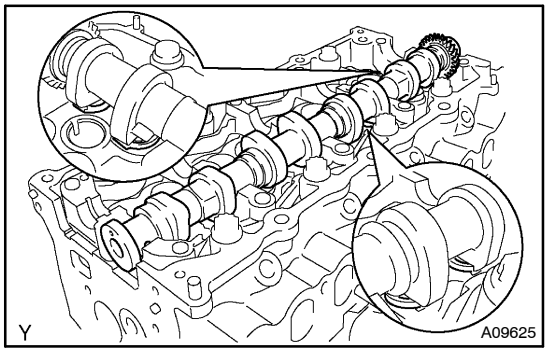
46. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Using the crankshaft pulley bolt, turn the crankshaft to set the dot mark of the crankshaft timing gear at the position of 90° BTDC.



NOTICE:

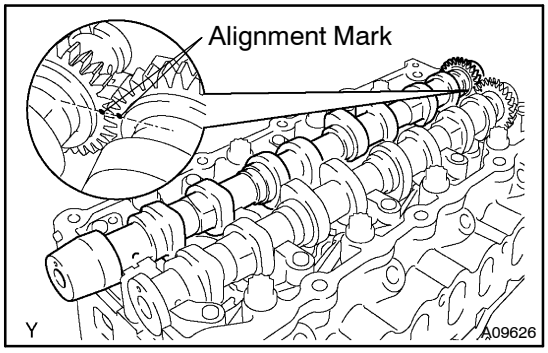
If the timing belt is disengaged, the crankshaft timing gear placed at wrong angle can cause contact of the piston head with the valve head.



47. INSTALL CAMSHAFT

NOTICE:

Since the thrust clearance of the camshaft is small, the camshaft must be kept level while being installed. If the camshaft is not kept level, the cylinder head or camshaft may be damaged. To avoid this, the following procedures should be carried out.

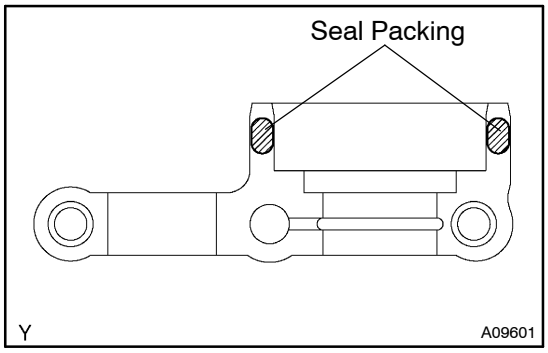


(a) Place the camshaft carrier on the cylinder head.

(b) Install the camshaft.

(c) Apply engine oil to the cam and gear of the camshaft, and the journal of the camshaft carrier.

(d) Place the intake camshaft on the camshaft carrier so that the No. 3 and No. 4 of the cylinder cam lobes face downward as shown in the illustration.



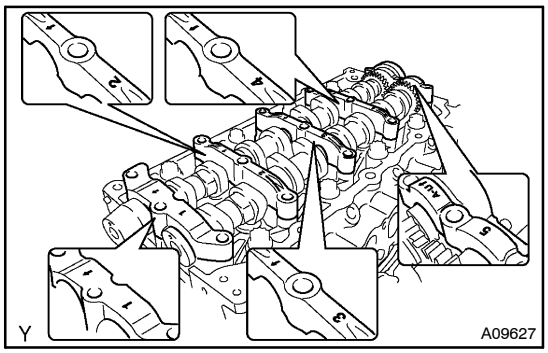
48. INSTALL NO.2 CAMSHAFT

(a) Install the No. 2 camshaft.

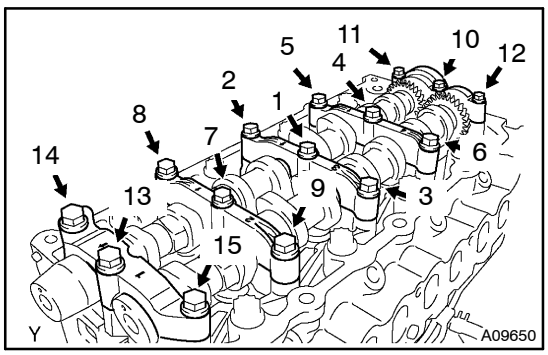
(b) Apply engine oil to the cam and gear of the camshaft, and the journal of the camshaft carrier.

(c) Engage the exhaust camshaft gear and intake camshaft gear by aligning the alignment marks on each gear.

(d) Roll down the exhaust camshaft onto the bearing journals while engaging the gears with each other.



(e) Install the camshaft bearing caps.



(1) Remove any old packing (FIPG) material from the No. 5 camshaft bearing cap.

(2) Apply seal packing to the No. 5 camshaft bearing cap as shown in the illustration.

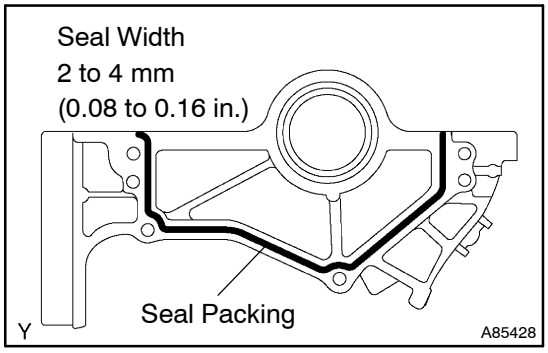
Seal packing: Part No. 08826–00080 or equivalent

(3) Place the 5 bearing caps in their proper locations.

(4) Using several steps, install and tighten the 15 bearing cap bolts uniformly in the sequence shown in the illustration.

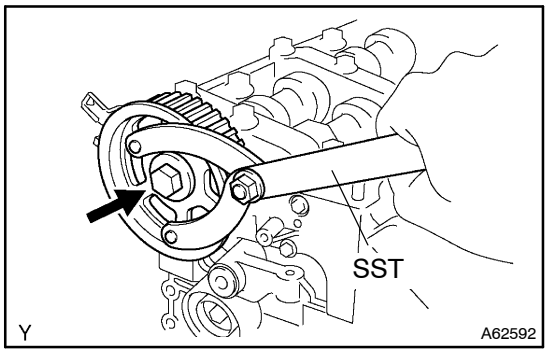
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

49. INSPECT VALVE CLEARANCE (See page 14–90)



50. ADJUST VALVE CLEARANCE (See page 14–90)

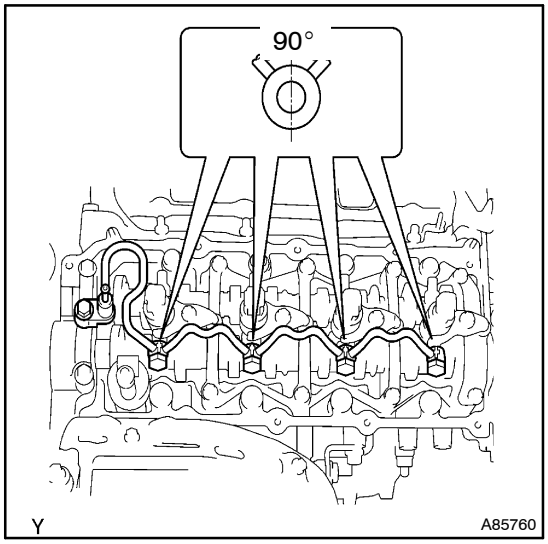
51. INSTALL CAMSHAFT OIL SEAL RETAINER



(a) Remove any old packing (FIPG) material. Be careful not to drop any oil on the contact surfaces of the oil seal retainer and cylinder block.

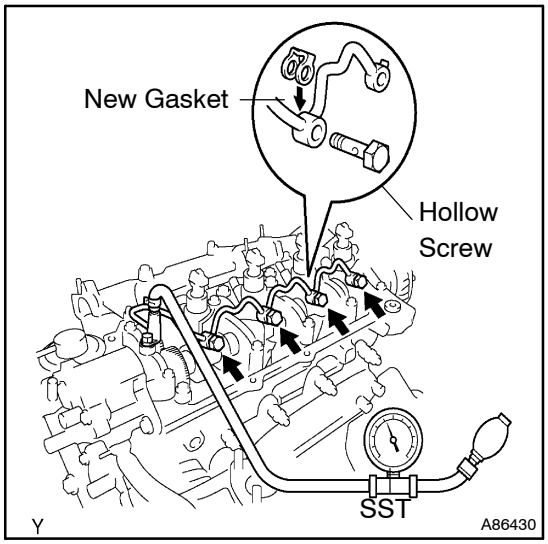
(1) Thoroughly clean all components to remove all the loose material.

(2) Using non–residue solvent, clean both the sealing surfaces.



(b) Apply seal packing to the oil seal retainer as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent
(1) Install a nozzle of which opening is cut to 2 to 4 mm (0.08 to 0.16 in.).
(2) The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing.
(3) Immediately remove the nozzle from the tube, then reinstall the cap.
(c) Install the oil seal retainer with the 4 bolts. Tighten the 4 bolts uniformly in several steps.
Torque: 9.8 N·m (100 kgf·cm, 7.2 ft·lbf)

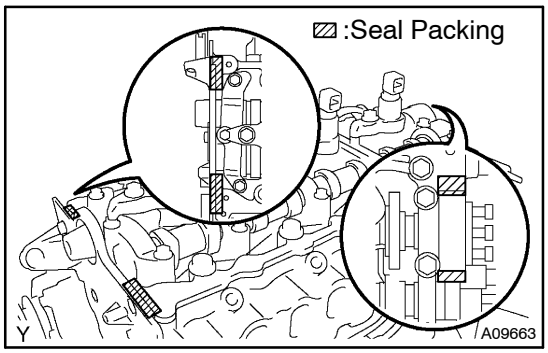
52. INSTALL CAMSHAFT TIMING PULLEY
(a) Install the pulley set key to the groove of the camshaft.
(b) Align the keyway of the timing pulley with the key located on the camshaft, then slide the pulley into place.
(c) Using SST, install the pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
Torque: 88 N·m (899 kgf·cm, 65 ft·lbf)



53. INSTALL CAMSHAFT POSITION SENSOR (See page 14–108)

54. INSTALL INJECTOR ASSY

55. INSTALL NOZZLE LEAKAGE PIPE ASSY
(a) Remove the bolt which is tightened at the center of the camshaft bearing cap No. 4.
(b) Install the nozzle leakage pipe and 4 new gaskets.
NOTICE:
When installing the gaskets, pay attention to the mounting orientation. Install the gasket so that the joint of the gasket comes within the ranges shown in the illustration.
(c) Apply a light coat of engine oil to the 4 hollow screws and bolt.
(d) Tighten the 4 hollow screws and bolt by hand.
(e) Tighten the 4 hollow screws and bolt.
Torque:
16 N·m (163 kgf·cm, 12 ft·lbf) for hollow screw
20 N·m (204 kgf·cm, 15 ft·lbf) for flange bolt
NOTICE:
In any case, when the torque exceeds the upper limit, replace the leakage pipe hollow screw and gaskets with new ones.
(f) Check that there are no leaks from the nozzle leakage pipe connection.



(1) Apply a light coat of soapy water (any fluid to detect fuel leakage) to the nozzle leakage pipe connection.

(2) Using SST (a turbocharger pressure gauge), attach SST to the fuel return side of the nozzle leakage pipe, then maintain 100 kPa (1.0 kgf/cm^2, 14.5 psi) of pressure for 60 seconds to check that there are no bubbles from the pipe connection.

SST 09992–00242

(3) After checking fuel leaks, wipe off soapy water from the pipe connection.

56. INSTALL CYLINDER HEAD COVER SUB–ASSY

(a) Remove any old packing (FIPG) material.

(b) Apply seal packing to the cylinder head as illustrated.
Seal packing: Part No. 08826–00080 or equivalent

(c) Install the gasket to the cylinder head cover.

(d) Install the cylinder head cover with the 10 bolts.
Torque: 13 N·m (135 kgf·cm, 9.7 ft·lbf)

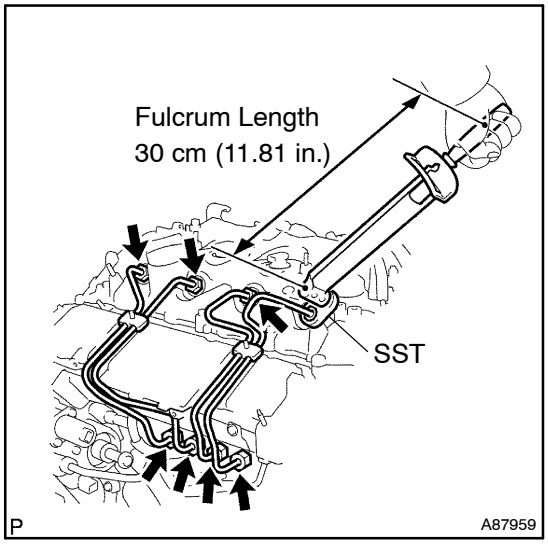
57. INSTALL NOZZLE HOLDER SEAL

(a) Install 4 new nozzle holder seals.

58. INSTALL NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)

59. INSTALL VACUUM PUMP ASSY (See page 14–108)

60. INSTALL INJECTION PIPE SUB–ASSY NO.1



NOTICE:

When assembling the pipes, perform the operation with the engine cold at room temperature.

(a) Install the 2 lower injection pipe clamps to the intake manifold.

(b) Remove the vinyl or plastic bag from the injector and the vinyl tape from the common rail.

(c) Temporarily install the injection pipe.

(d) Using SST, tighten the nut of the injection pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(e) Using SST, tighten the nut of the injection pipe on the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(f) Install the 2 upper injection pipe clamps.

61. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

62. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

63. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

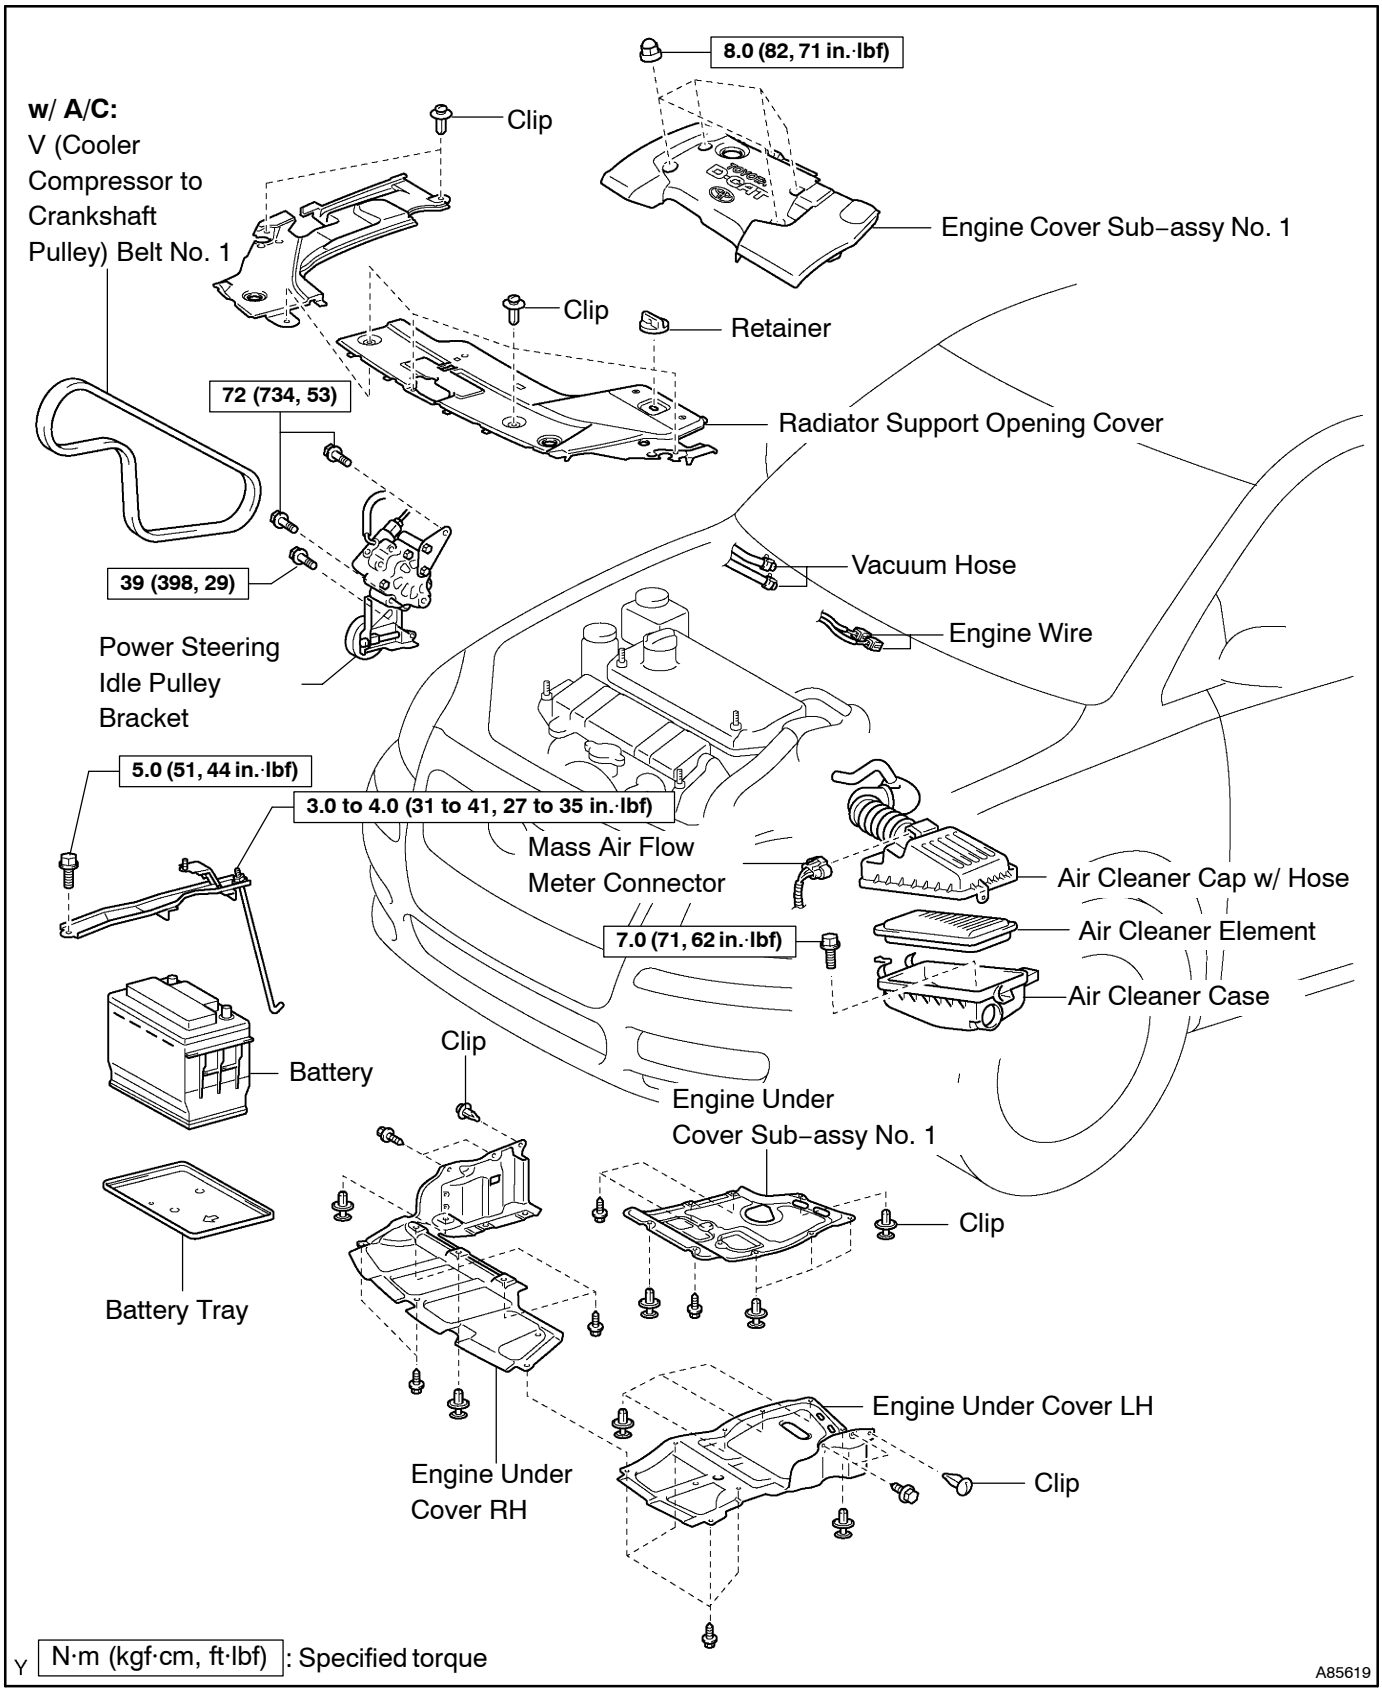
64. INSTALL FUEL PIPE NO.3 (See page 14–108)
SST 09023–12700

65. INSTALL TIMING BELT (See page 14–138)

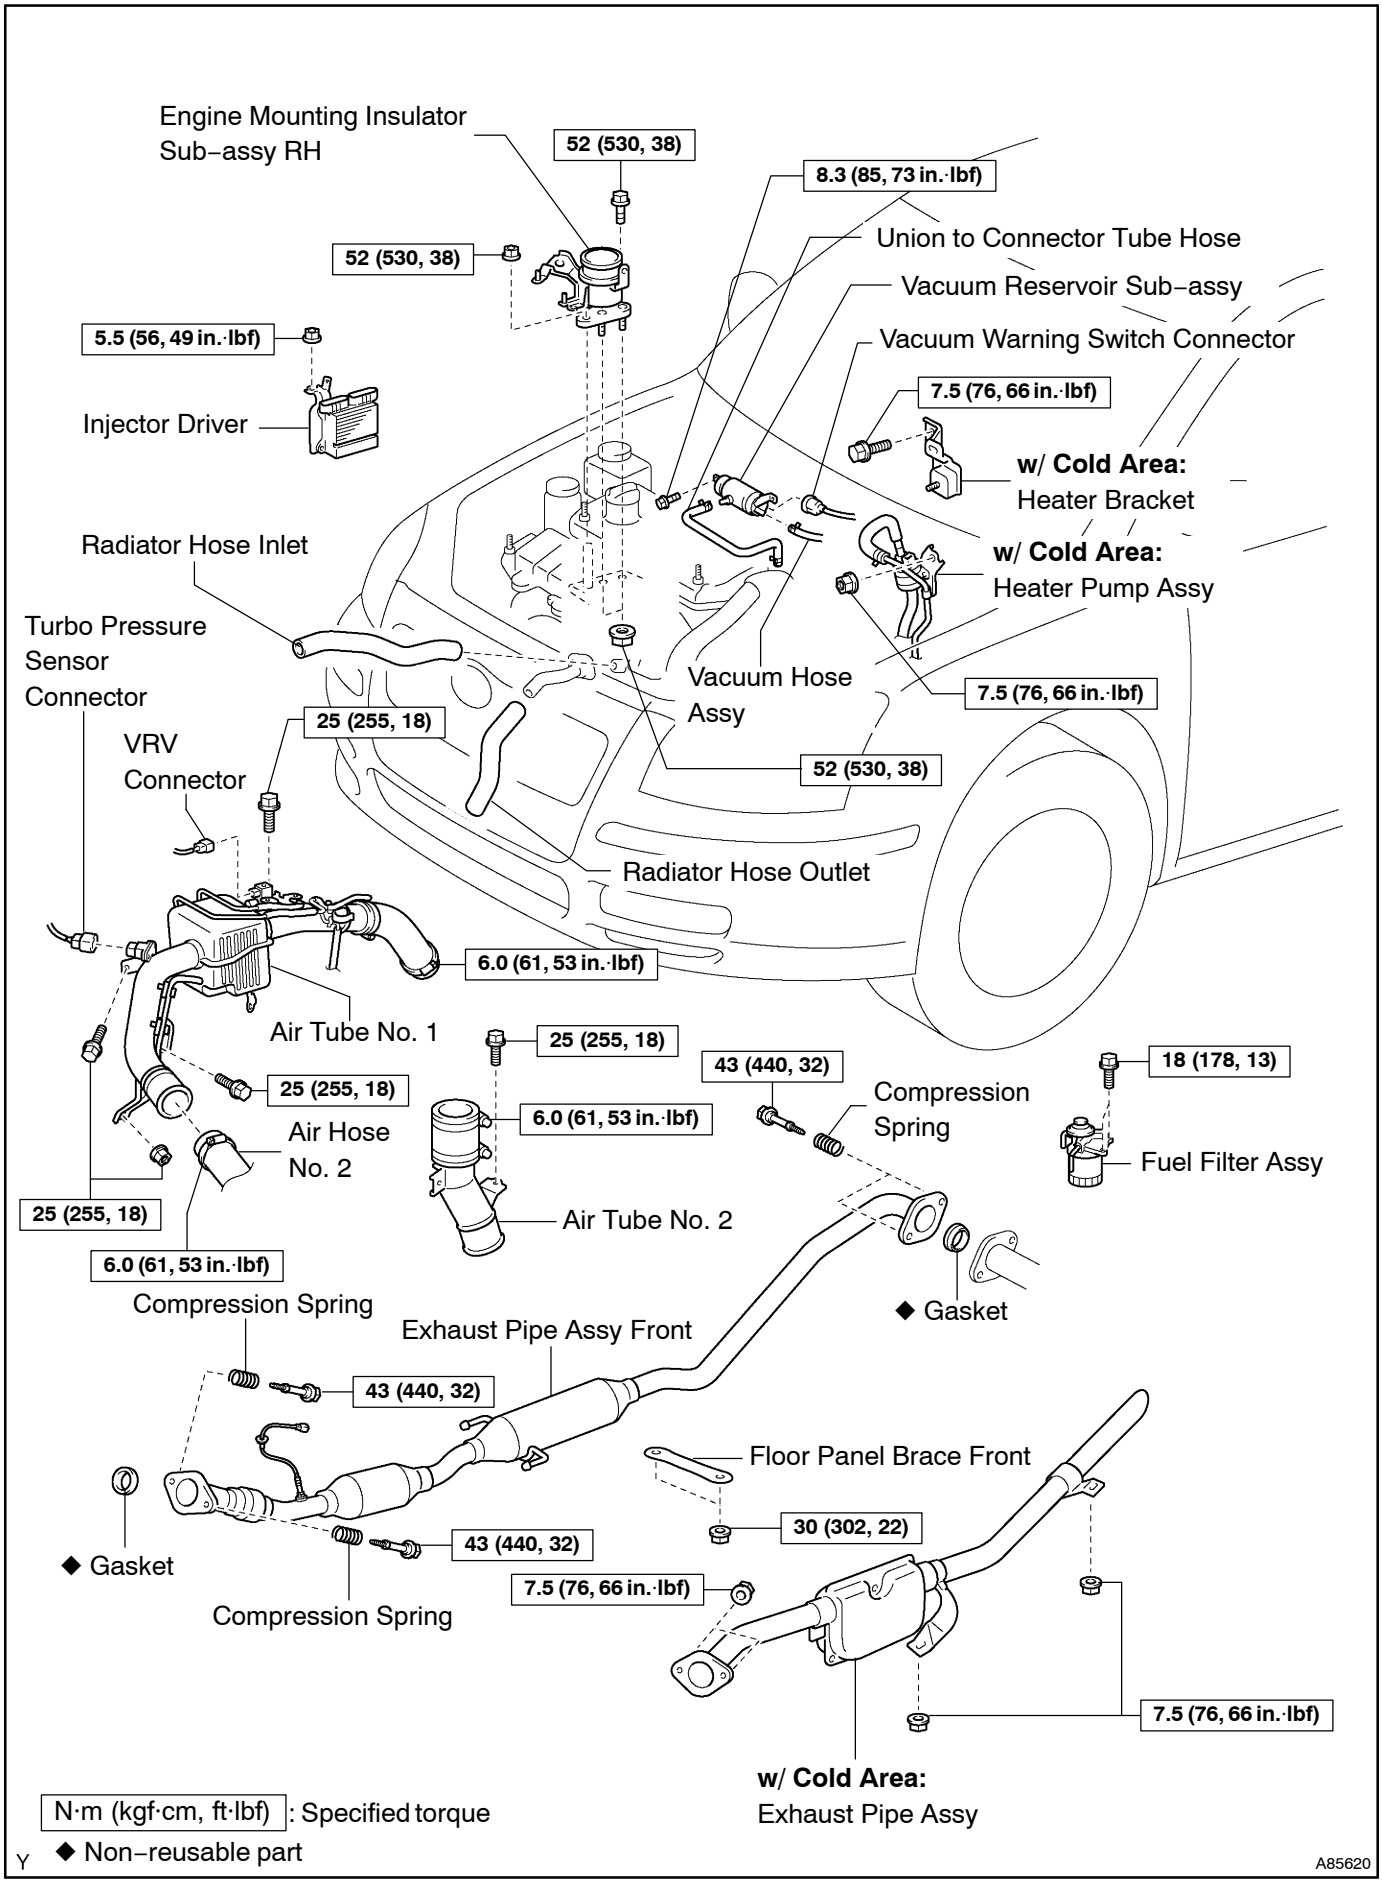
66. CHECK VALVE TIMING (See page 14–138)

67. INSTALL TIMING CHAIN COVER PLATE (See page 14–138)

68. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)



69. INSTALL TIMING BELT GUIDE (See page 14–138)



70. **INSTALL TIMING BELT NO.1 COVER (See page 14–138)**
71. **INSTALL TIMING BELT NO.2 COVER (See page 14–138)**
72. **INSTALL IDLER PULLEY SUB–ASSY (See page 14–138)**
73. **INSTALL CRANKSHAFT PULLEY (See page 14–138)**
    SST 09213–54015 (09213–70020), 09330–00021
74. **INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)**
75. **INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)**
76. **ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)**
77. **INSTALL INJECTOR DRIVER (See page 14–108)**
78. **INSTALL AIR TUBE NO.1 (See page 14–108)**
79. **INSTALL VACUUM RESERVOIR SUB–ASSY (See page 14–108)**
80. **INSTALL BATTERY (See page 14–108)**
81. **INSTALL AIR CLEANER ASSY (See page 14–108)**
82. **INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 14–90)**
83. **INSTALL FRONT WHEEL RH**
    Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
84. **CHECK FOR FUEL LEAKS (See page 11–46)**

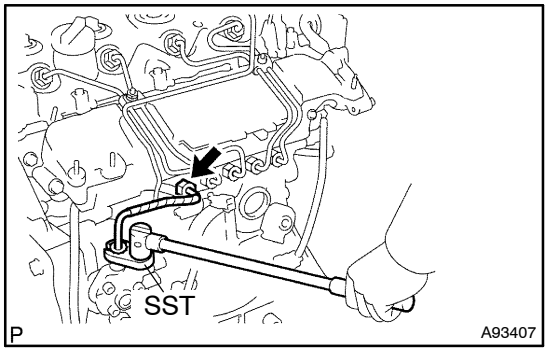
REPLACEMENT

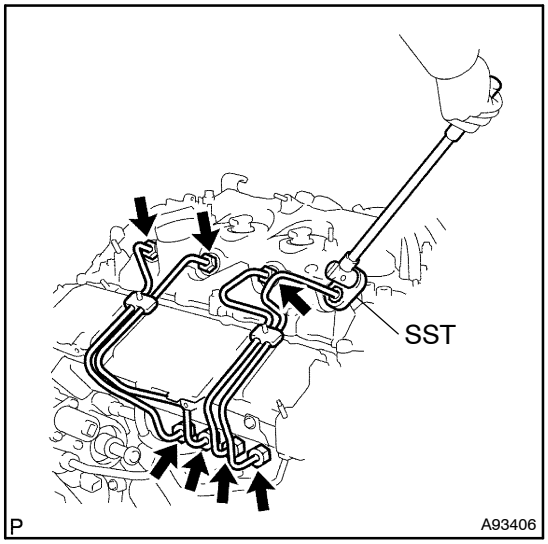


1. REMOVE FRONT WHEEL RH
2. REMOVE ENGINE UNDER COVER LH
3. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1
4. REMOVE ENGINE UNDER COVER RH
5. REMOVE RADIATOR SUPPORT OPENING COVER
6. REMOVE ENGINE ROOM COVER SIDE
7. DRAIN ENGINE COOLANT (See page 16–19)
8. DRAIN ENGINE OIL (See Pub. No. RM1018E on page 17–30)
9. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–90)
10. REMOVE VACUUM RESERVOIR SUB–ASSY (See page 14–108)
11. REMOVE AIR CLEANER ASSY (See page 14–108)
12. REMOVE BATTERY
13. REMOVE AIR TUBE NO.2 (See page 14–108)
14. REMOVE AIR TUBE NO.1 (See page 14–108)
15. REMOVE INJECTOR DRIVER (See page 14–108)
16. REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)
17. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)
18. SEPARATE POWER STEERING IDLE PULLEY BRACKET (See page 14–138)
19. DISCONNECT ENGINE WIRE (See page 14–138)
20. DISCONNECT VACUUM HOSE (See page 14–108)
21. REMOVE DIFFERENTIAL PRESSURE SENSOR ASSY(See page 14–108)
22. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)
23. REMOVE CRANKSHAFT PULLEY (See page 14–138)
    SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)
24. REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)
25. REMOVE TIMING BELT NO.2 COVER (See page 14–138)
26. REMOVE TIMING BELT NO.1 COVER (See page 14–138)
27. REMOVE TIMING BELT GUIDE
28. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)
29. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
30. REMOVE TIMING CHAIN COVER PLATE (See page 14–138)
31. REMOVE TIMING BELT (See page 14–138)

HINT:

If reusing the timing belt, draw an arrow on the timing belt which indicates the engine revolution direction and put match marks on the pulleys and timing belt.

32. REMOVE FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)
33. REMOVE HEATER PUMP ASSY (W/ COLD AREA) (See page 13–12)
34. REMOVE HEATER BRACKET (W/ COLD AREA) (See page 13–12)
35. REMOVE FLOOR PANEL BRACE FRONT (See page 15–6)
36. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–6)
37. REMOVE EXHAUST PIPE ASSY (W/ COLD AREA) (See page 13–12)
38. DISCONNECT RADIATOR HOSE INLET
39. DISCONNECT HEATER INLET WATER HOSE
40. DISCONNECT HEATER OUTLET WATER HOSE
41. DISCONNECT FUEL PIPE TO FUEL TUBE FUEL HOSE
42. DISCONNECT OIL COOLER HOSE



43. REMOVE TURBO INSULATOR NO.2 (See page 13–12)
44. REMOVE TURBO INSULATOR NO.1 (See page 13–12)
45. REMOVE EXHAUST MANIFOLD HEAT INSULATOR NO.2 (See page 13–12)
46. REMOVE EGR PIPE INSULATOR (See page 13–12)
47. REMOVE GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)
48. REMOVE EXHAUST GAS TEMPERATURE SENSOR (See page 14–108)
SST 09023–38400
49. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.1 (See page 14–108)
SST 09023–38200
50. REMOVE VACUUM TRANSMITTING PIPE SUB–ASSY NO.2 (See page 14–108)
SST 09023–38200
51. REMOVE MANIFOLD STAY NO.2 (See page 13–12)
52. REMOVE MANIFOLD STAY (See page 13–12)
53. REMOVE MANIFOLD CONVERTER SUB–ASSY (See page 13–12)
54. REMOVE TURBOCHARGER STAY (See page 13–12)
55. REMOVE TURBO WATER HOSE NO.1 (See page 13–12)
56. REMOVE TURBO WATER HOSE NO.2 (See page 13–12)
57. SEPARATE TURBO OIL INLET PIPE SUB–ASSY (See page 13–12)
58. REMOVE TURBOCHARGER SUB–ASSY (See page 13–12)
59. REMOVE CAMSHAFT POSITION SENSOR (See page 14–108)
60. REMOVE CAMSHAFT TIMING PULLEY (See page 14–151)
SST 09960–10010 (09962–01000, 09963–01000)

61. REMOVE FUEL INLET PIPE SUB–ASSY
(a) Using SST, remove the fuel inlet pipe from the common rail side.
SST 09023–12700
(b) Using SST, remove the fuel inlet pipe from the pump side.
SST 09023–12700

NOTICE:
After removing the fuel pipe, cover the common rail and injector mounting holes with vinyl tape to prevent dust from being introduced.

62. REMOVE FUEL PIPE NO.3 (See page 14–108)
SST 09023–12700

63. REMOVE INJECTION PIPE SUB–ASSY NO.1

(a) Remove the 2 upper injection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

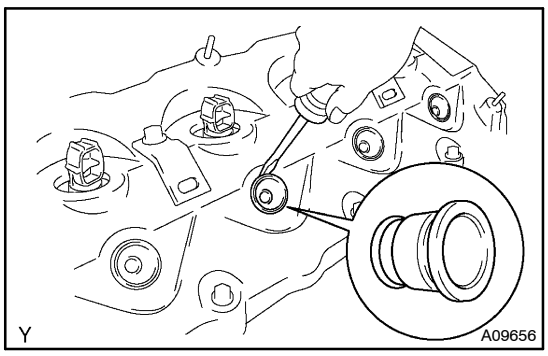
(d) After removing the fuel pipe, in order to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

(e) Remove the 2 lower injection pipe clamps from the intake manifold.

64. REMOVE INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

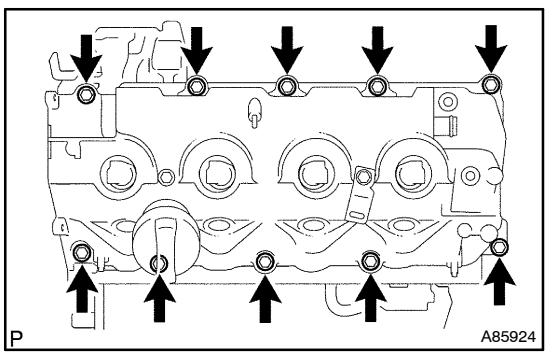
65. REMOVE INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

66. REMOVE INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



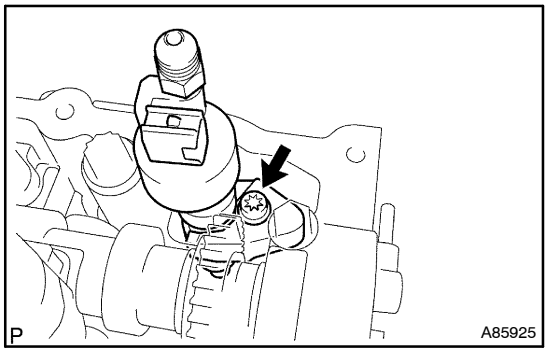
67. REMOVE VACUUM PUMP ASSY (See page 14–108)

68. REMOVE NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)

69. REMOVE NOZZLE HOLDER SEAL

(a) Using a screwdriver, pry out the 4 nozzle holder seals.

70. REMOVE CYLINDER HEAD COVER SUB–ASSY



(a) Remove the 10 bolts, cylinder head cover and gasket.

71. REMOVE NOZZLE LEAKAGE PIPE ASSY (See page 14–151)

72. REMOVE INJECTOR ASSY (See page 11–46)

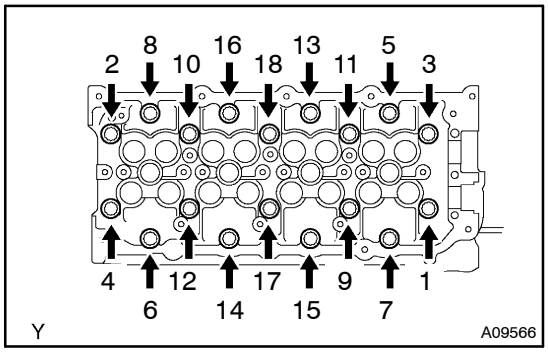
HINT:

Since each injector assembly has characteristic fuel injecting behavior, keep them in the correct order so that they can be returned to the original locations when reassembling.

73. REMOVE EXHAUST FUEL ADDITION INJECTOR ASSY

(a) Using a Torx socket wrench (T40), remove the Torx screw.

NOTICE:



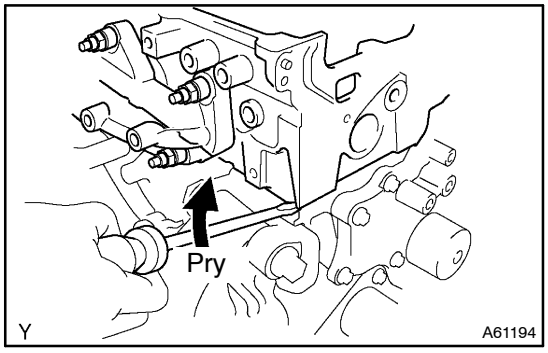
Be careful that the tools do not interfere with the resin part when removing.

(b) Remove the nozzle holder clamp, addition injector and gasket.

74. REMOVE CAMSHAFT OIL SEAL RETAINER (See page 14–151)

75. REMOVE CAMSHAFT (See page 14–151)

76. REMOVE NO.2 CAMSHAFT (See page 14–151)



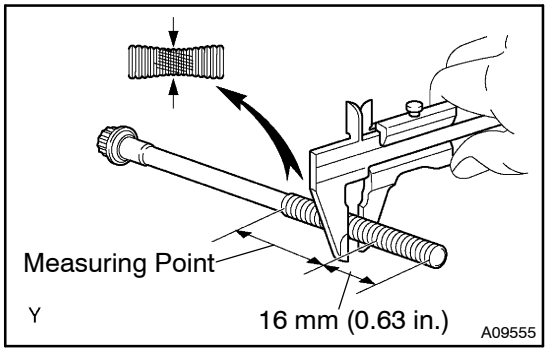
77. REMOVE CYLINDER HEAD SUB–ASSY

(a) Using several steps, loosen the 18 cylinder head bolts uniformly in the sequence shown in the illustration. Remove the 18 cylinder head bolts and plate washers.

NOTICE:

Removing the bolts in a wrong order could cause warpage or cracks of the cylinder head.

(b) Lift the cylinder head from the dowels on the cylinder block, then place the cylinder head on wooden blocks on a work bench.



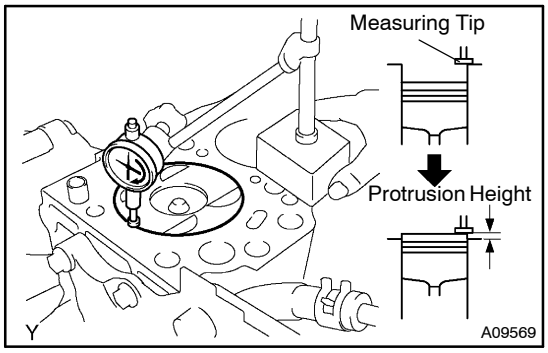
NOTICE:

Be careful not to damage the contact surfaces of the cylinder head and cylinder block.

HINT:

To lift the cylinder head, pry between the cylinder head and cylinder block using a screwdriver.

78. REMOVE CYLINDER HEAD GASKET



79. INSPECT CYLINDER HEAD SET BOLT

(a) Using vernier calipers, measure the tension portion diameter of the bolts.

Standard outside diameter:
10.40 to 11.00 mm (0.4094 to 0.4331 in.)

If the diameter is less than minimum, replace the bolt.

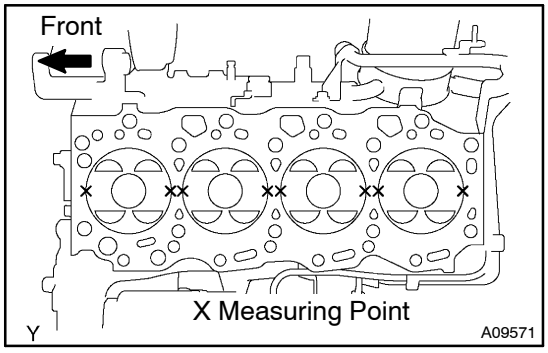
80. INSTALL CYLINDER HEAD GASKET

(a) Measure the protrusion height of the piston heads.

(1) Clean the cylinder block with solvent.

(2) Set the piston to measure to slightly before the TDC.

(3) Place a dial indicator on the cylinder block, then calibrate the dial indicator at 0 mm (0 in.).



HINT:

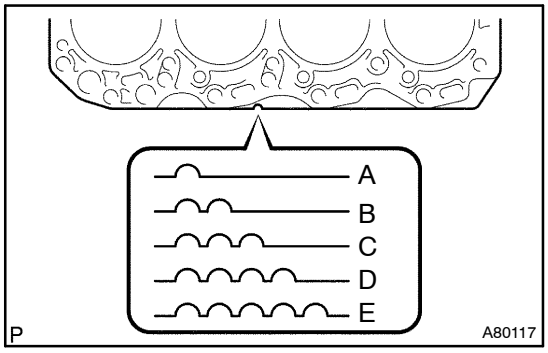
- Place the measuring tip of the dial indicator as shown in the illustration.
- Make sure that the measuring tip is square to the cylinder block gasket and piston head when measuring.

(4) Find the most overhung position of the piston head by slowly turning the crankshaft clockwise and counterclockwise.

(5) Measure the protrusion height of the piston head for each cylinder at 2 places as shown in the illustration. (Total of 8 measurements.)

(6) Record the higher protrusion height of the 2 measurements at each cylinder.

(b) Select a new cylinder head gasket.

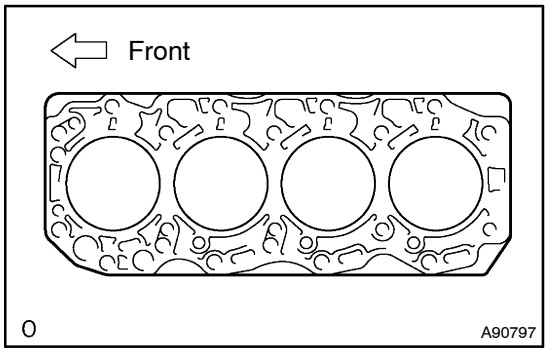


HINT:

There are 5 sizes of new cylinder head gaskets, marked ”A”, ”B”, ”C”, ”D”, and ”E”.

New cylinder head gasket thickness:

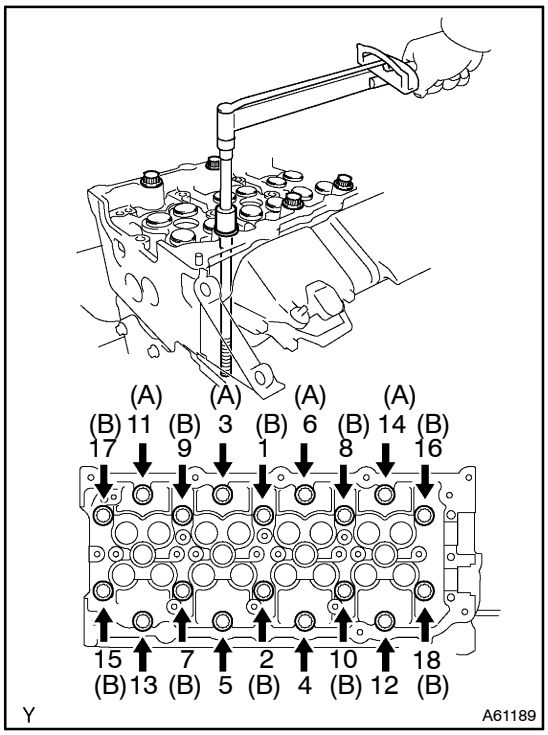
A	0.85 to 0.95 mm (0.0335 to 0.0374 in.)
B	0.90 to 1.00 mm (0.0354 to 0.0394 in.)
C	0.95 to 1.05 mm (0.0374 to 0.0413 in.)
D	1.00 to 1.10 mm (0.0394 to 0.0433 in.)
E	1.05 to 1.15 mm (0.0413 to 0.0453 in.)



(1) Find the highest protrusion height among the 4 measurement records. It is used to select a new cylinder head gasket.

(2) Select a new gasket among A to E using the matrix below.

New gasket matrix:



Piston Protrusion mm (in.)	Gasket Size
0.165 to 0.220 (0.0065 to 0.0087)	A
0.220 to 0.270 (0.0087 to 0.0106)	B
0.270 to 0.320 (0.0106 to 0.0126)	C
0.320 to 0.370 (0.0126 to 0.0146)	D
0.370 to 0.425 (0.0146 to 0.0167)	E

(c) Place the selected new cylinder head gasket on the cylinder block.

NOTICE:

Pay attention to the mounting orientation.

81. INSTALL CYLINDER HEAD SUB–ASSY

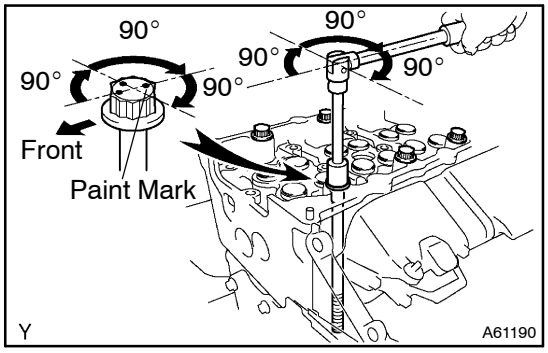
HINT:

- The cylinder head bolts are tightened in 4 successive steps (steps (c), (e), (f) and (g)).
- If the cylinder head bolt is broken or deformed, replace it with a new bolt.

(a) Apply a light coat of engine oil to the threads of the cylinder head bolts and plate washers.

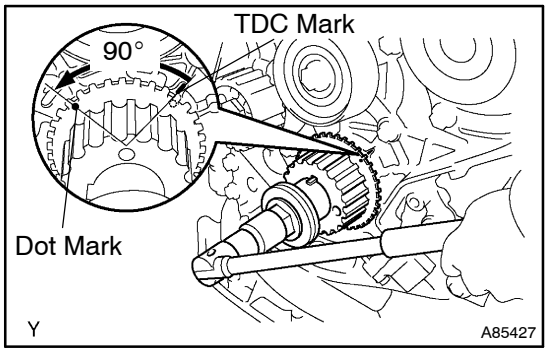
(b) Install the plate washer to the cylinder head bolt.

(c) Using several steps, install and tighten the 18 cylinder head bolts uniformly in the sequence shown in the illustration.



Torque: 45 N·m (459 kgf·cm, 33 ft·lbf)

HINT:

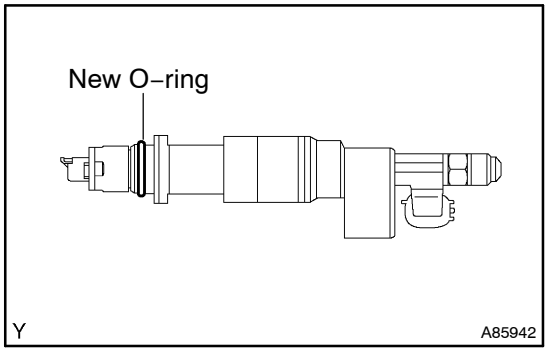


See the table below for the bolt length.

Bolt Type	Bolt Length
(A)	160mm (6.30 in.)
(B)	104mm (4.09 in.)

If the cylinder head bolt does not meet the specified torque, replace the cylinder head bolt with a new bolt.

(d) Mark the front of the cylinder head bolt with paint.
(e) Retighten the cylinder head bolts by 90° in the same sequence as step (c).
(f) Retighten the cylinder head bolts by an additional 90° in the same sequence as step (c).
(g) Retighten the cylinder head bolts by one more additional 90° in the same sequence as step (c).
(h) Check that each painted mark is now at the intake manifold side.



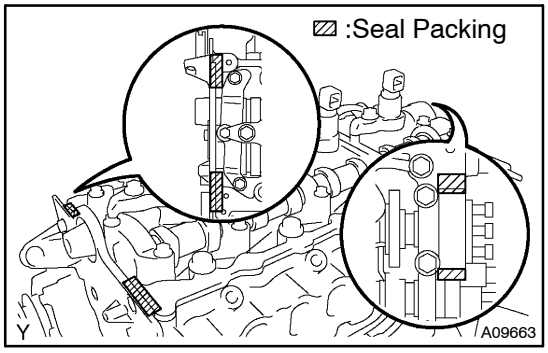
82. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Using the crankshaft pulley bolt, turn the crankshaft to set the dot mark of the crankshaft timing gear at the position of 90° BTDC.

NOTICE:

If the timing belt is disengaged, the crankshaft timing gear placed at wrong angle can cause contact of the piston head with the valve head.

83. INSTALL CAMSHAFT (See page 14–151)
84. INSTALL NO.2 CAMSHAFT (See page 14–151)
85. REMOVE CAMSHAFT OIL SEAL (See page 14–151)
86. INSTALL CAMSHAFT OIL SEAL (See page 14–151)
SST 09223–46011
87. INSTALL CAMSHAFT OIL SEAL RETAINER (See page 14–151)



88. INSTALL EXHAUST FUEL ADDITION INJECTOR ASSY

(a) Install a new gasket to the cylinder head.
(b) Install a new O–ring to the injector.
(c) Apply a light coat of engine oil to the O–ring on the injector.
(d) Install the addition injector and nozzle holder clamp.
(e) Using a Torx socket wrench (T40), install the Torx screw.
Torque: 12 N·m (117 kgf·cm, 8.5 ft·lbf)

NOTICE:

Be careful that the tools do not interfere with the resin part when installing.

89. INSTALL CAMSHAFT TIMING PULLEY (See page 14–151)
SST 09960–10010 (09962–01000, 09963–01000)
90. INSTALL CAMSHAFT POSITION SENSOR (See page 14–108)
91. INSTALL INJECTOR ASSY (See page 11–46)
92. INSTALL NOZZLE LEAKAGE PIPE ASSY (See page 14–151)
SST 09992–00242

93. INSTALL CYLINDER HEAD COVER SUB–ASSY

(a) Remove any old packing (FIPG) material.

(b) Apply seal packing to the cylinder head as illustrated.
Seal packing: Part No. 08826–00080 or equivalent

(c) Install the gasket to the head cover.

(d) Install the cylinder head cover with the 10 bolts.
Torque: 13 N·m (135 kgf·cm, 9.7 ft·lbf)

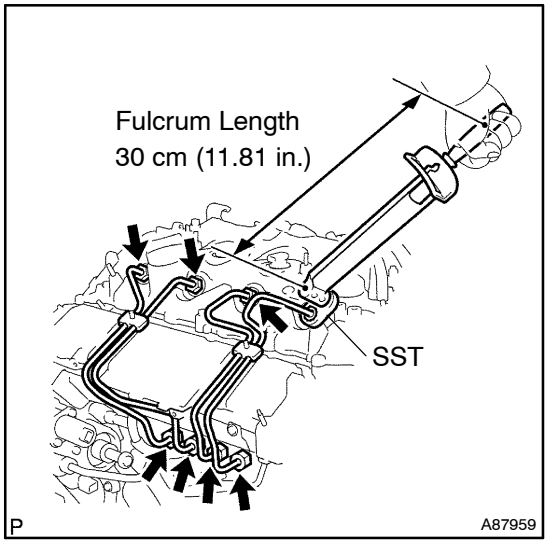
94. INSTALL NOZZLE HOLDER SEAL

(a) Install 4 new nozzle holder seals.

95. INSTALL NOZZLE LEAKAGE PIPE NO.2 (See page 14–108)

96. INSTALL VACUUM PUMP ASSY (See page 14–108)

97. INSTALL INJECTION PIPE SUB–ASSY NO.1



NOTICE:

When assembling the pipes, perform the operation with the engine cold at room temperature.

(a) Remove the vinyl or plastic bag from the injector and the vinyl tape from the common rail.

(b) Install the 2 lower injection pipe clamps to the intake manifold.

(c) Temporarily install the injection pipe.

(d) Using SST, tighten the nut of the injection pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(e) Using SST, tighten the nut of the injection pipe on the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(f) Install the 2 upper injection pipe clamps.

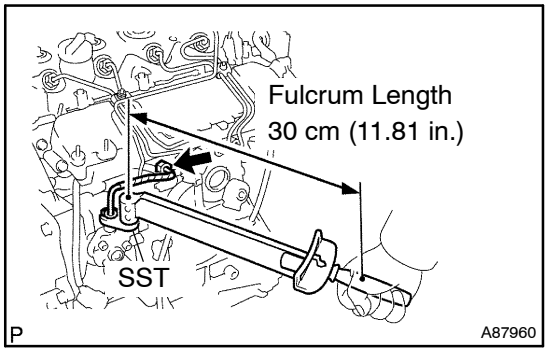
98. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

99. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

100. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700



HINT:
Perform the same procedures as the injection pipe No. 1.

101. INSTALL FUEL PIPE NO.3 (See page 14–108)
SST 09023–12700

102. INSTALL FUEL INLET PIPE SUB–ASSY

NOTICE:
- **In case of replacing the cylinder head gasket, the fuel inlet pipe must be replaced, too.**
- **When assembling the pipe, perform the operation with the engine cold at room temperature.**

(a) Temporarily install a new fuel inlet pipe.

(b) Using SST, tighten the nut of the fuel inlet pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Using SST, tighten the nut of the fuel inlet pipe on the pump side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

103. INSTALL TURBOCHARGER SUB–ASSY (See page 13–12)
104. INSTALL TURBO OIL INLET PIPE SUB–ASSY (See page 13–12)
105. INSTALL TURBOCHARGER STAY (See page 13–12)
106. INSTALL MANIFOLD CONVERTER SUB–ASSY (See page 13–12)
107. INSTALL MANIFOLD STAY NO.2 (See page 13–12)
108. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.2 (See page 14–108)
SST 09023–38200
109. INSTALL VACUUM TRANSMITTING PIPE SUB–ASSY NO.1 (See page 14–108)
SST 09023–38200
110. INSTALL EXHAUST GAS TEMPERATURE SENSOR (See page 14–108)
SST 09023–38400
111. INSTALL GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)
112. INSTALL EGR PIPE INSULATOR (See page 13–12)
113. INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.2 (See page 13–12)
114. INSTALL TURBO INSULATOR NO.1 (See page 13–12)
115. INSTALL TURBO INSULATOR NO.2 (See page 13–12)
116. INSTALL EXHAUST PIPE ASSY (W/ COLD AREA) (See page 13–12)
117. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–6)
118. INSTALL FLOOR PANEL BRACE FRONT (See page 15–6)
119. INSTALL HEATER BRACKET (W/ COLD AREA) (See page 13–12)
120. INSTALL HEATER PUMP ASSY (W/ COLD AREA) (See page 13–12)
121. INSTALL FUEL FILTER ASSY (See Pub. No. RM1018E on page 11–82)

122. **SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)**
SST 09960–10010 (09962–01000, 09963–01000)

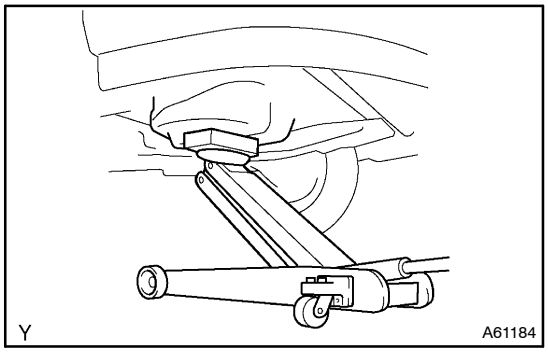
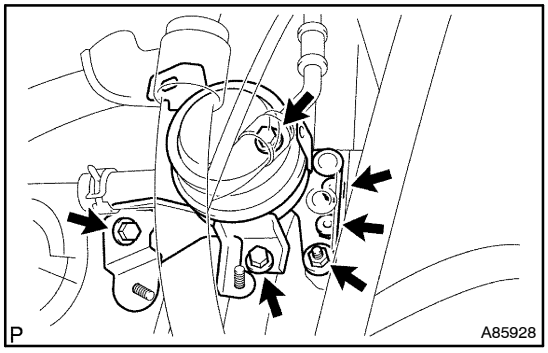
CRANKSHAFT SEAL (1CD–FTV)(From September, 2003)



141NN–01

REPLACEMENT

1. **DRAIN ENGINE OIL**

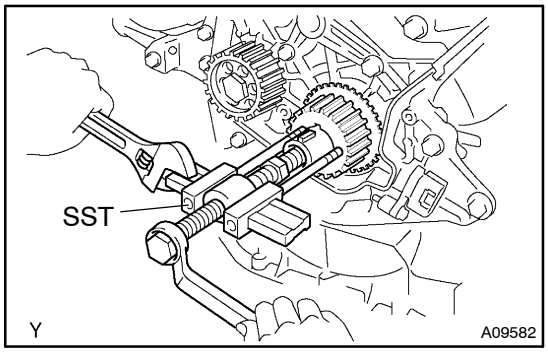


(a) Install a new gasket and the drain plug after draining engine oil.
Torque: 34 N·m (350 kgf·cm, 25 ft·lbf)

2. **REMOVE FRONT WHEEL RH**
3. **REMOVE ENGINE UNDER COVER SUB–ASSY NO.1**
4. **REMOVE ENGINE UNDER COVER RH**
5. **REMOVE RADIATOR SUPPORT OPENING COVER**
6. **REMOVE ENGINE ROOM COVER SIDE**
7. **REMOVE ENGINE COVER NO.1 (See page 14–90)**
8. **REMOVE INJECTOR DRIVER (See page 14–108)**
9. **REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)**
10. **REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)**
11. **SEPARATE POWER STEERING IDLE PULLEY BRACKET (See page 14–138)**
12. **DISCONNECT ENGINE WIRE (See page 14–138)**
13. **DISCONNECT VACUUM HOSE (See page 14–108)**

14. **REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH**

(a) Place a wooden block on a jack underneath the engine.

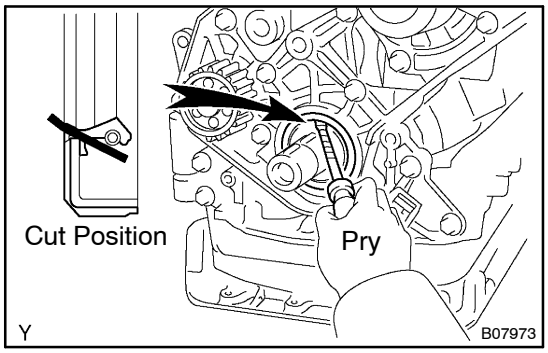


(b) Remove the 3 bolts and 3 nuts, then detach the engine mounting insulator sub–assembly.

15. **REMOVE CRANKSHAFT PULLEY (See page 14–138)**
SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)
16. **REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)**
17. **REMOVE TIMING BELT NO.2 COVER (See page 14–138)**
18. **REMOVE TIMING BELT NO.1 COVER (See page 14–138)**
19. **REMOVE TIMING BELT GUIDE**
20. **REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)**

21. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)

22. REMOVE TIMING CHAIN COVER PLATE (See page 14–138)

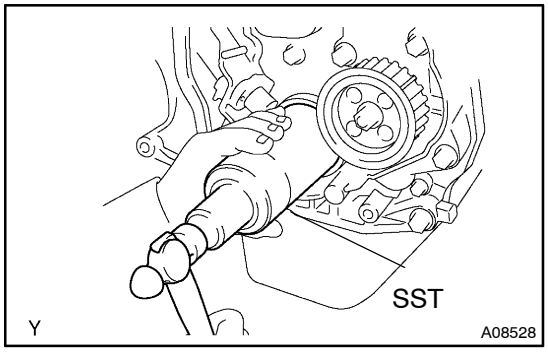


23. REMOVE TIMING BELT (See page 14–138)

24. REMOVE CRANKSHAFT TIMING PULLEY

(a) If the timing pulley cannot be removed by hand, use SST to remove the pulley.

SST 09950–50013 (09951–05010, 09952–05010, 09953–05010, 09953–05020, 09954–05021)



25. REMOVE CRANKSHAFT SEAL

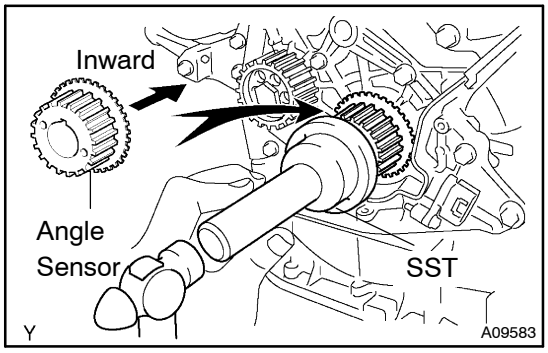
(a) Using a knife, cut off the oil seal lip.

(b) Using a screwdriver, pry out the oil seal.

NOTICE:

Be careful not to damage the crankshaft. Wrap the tip of the screwdriver with tape.

26. INSTALL CRANKSHAFT SEAL



(a) Apply multipurpose grease to a new oil seal lip.

NOTICE:

Keep the lip free of foreign objects.

(b) Using SST and a hammer, tap in the oil seal until its surface is flush with the oil pump edge.

SST 09316–60011 (09316–00011)

27. INSTALL CRANKSHAFT TIMING PULLEY

(a) Align the keyway of the timing pulley with the key located on the crankshaft, then slide the pulley into place.

(b) Using SST and a hammer, tap in the timing pulley with the angle sensor facing inward.

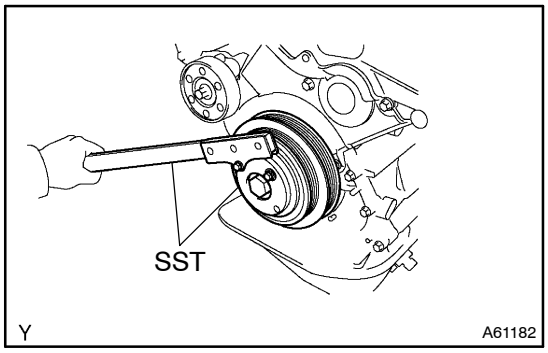
SST 09223–46011

28. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)

SST 09960–10010 (09962–01000, 09963–01000)

29. INSTALL TIMING BELT (See page 14–138)

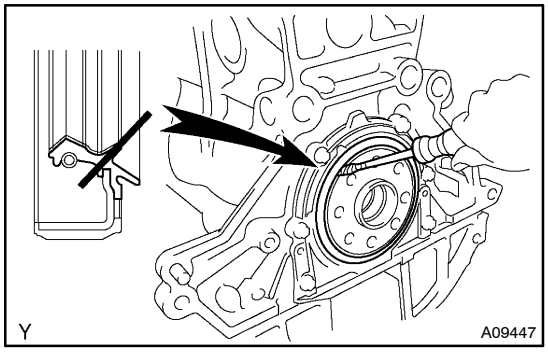
30. CHECK VALVE TIMING (See page 14–138)



31. **INSTALL TIMING CHAIN COVER PLATE (See page 14–138)**
32. **INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)**
33. **INSTALL TIMING BELT GUIDE (See page 14–138)**
34. **INSTALL TIMING BELT NO.1 COVER (See page 14–138)**
35. **INSTALL TIMING BELT NO.2 COVER (See page 14–138)**
36. **INSTALL IDLER PULLEY SUB–ASSY (See page 14–138)**
37. **INSTALL CRANKSHAFT PULLEY (See page 14–138)**
    SST 09213–54015 (09213–70020), 09330–00021
38. **INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)**
39. **INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)**
40. **ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)**
41. **INSTALL INJECTOR DRIVER (See page 14–108)**
42. **INSTALL ENGINE COVER NO.1 (See page 14–90)**
43. **INSTALL FRONT WHEEL RH**
    Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
44. **ADD ENGINE OIL**
45. **CHECK FOR ENGINE OIL LEAKS**

ENGINE REAR OIL SEAL (1CD–FTV)(From September, 2003)

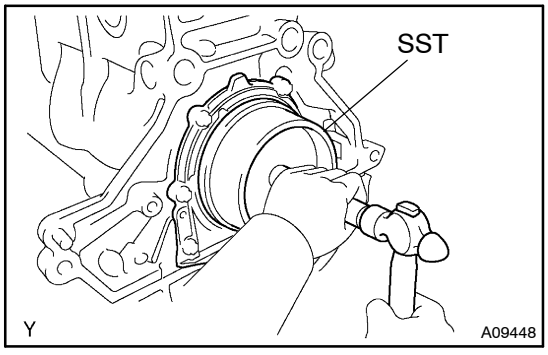
141NO–01



REPLACEMENT

1. **REMOVE MANUAL TRANSAXLE ASSY (See Pub. No. RM1018E on page 41–33)**
   SST 09930–00010, 09628–62011, 09520–01010, 09520–24010 (09520–32040)
2. **REMOVE CLUTCH COVER ASSY (See Pub. No. RM1018E on page 42–26)**
3. **REMOVE CLUTCH DISC ASSY (See Pub. No. RM1018E on page 42–26)**

4. **REMOVE FLYWHEEL SUB–ASSY**
(a) Hold the crankshaft with SST.
SST 09213–54015 (09213–70020), 09330–00021
(b) Using a Torx socket wrench (T55), remove the 8 Torx screws and flywheel.



5. **REMOVE REAR END PLATE**
(a) Remove the 2 bolts and rear end plate.

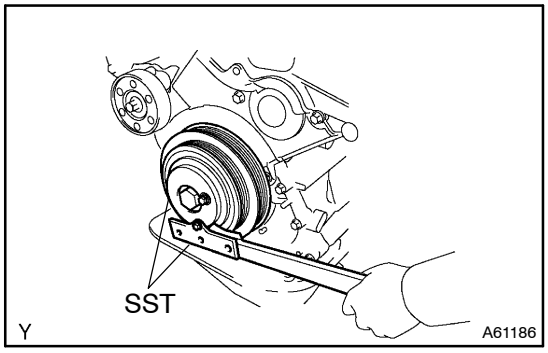
6. **REMOVE ENGINE REAR OIL SEAL**
(a) Using a knife, cut off the oil seal lip.
(b) Using a screwdriver, pry out the oil seal.

NOTICE:

After removing, check that the crankshaft is not damaged. If damaged, smooth the surface with 400–grit sandpaper.

7. **INSTALL ENGINE REAR OIL SEAL**
(a) Apply multipurpose grease to a new oil seal lip.

NOTICE:



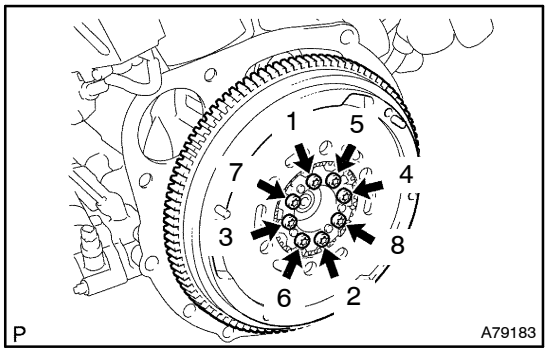
Keep the lip free of foreign objects.

(b) Using SST and a hammer, tap in the oil seal until its surface is flush with the rear oil seal retainer edge.
SST 09223–15030, 09950–70010 (09951–07100)

NOTICE:

Wipe off extra grease on the crankshaft.

8. **INSTALL REAR END PLATE**
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)



9. INSTALL FLYWHEEL SUB–ASSY

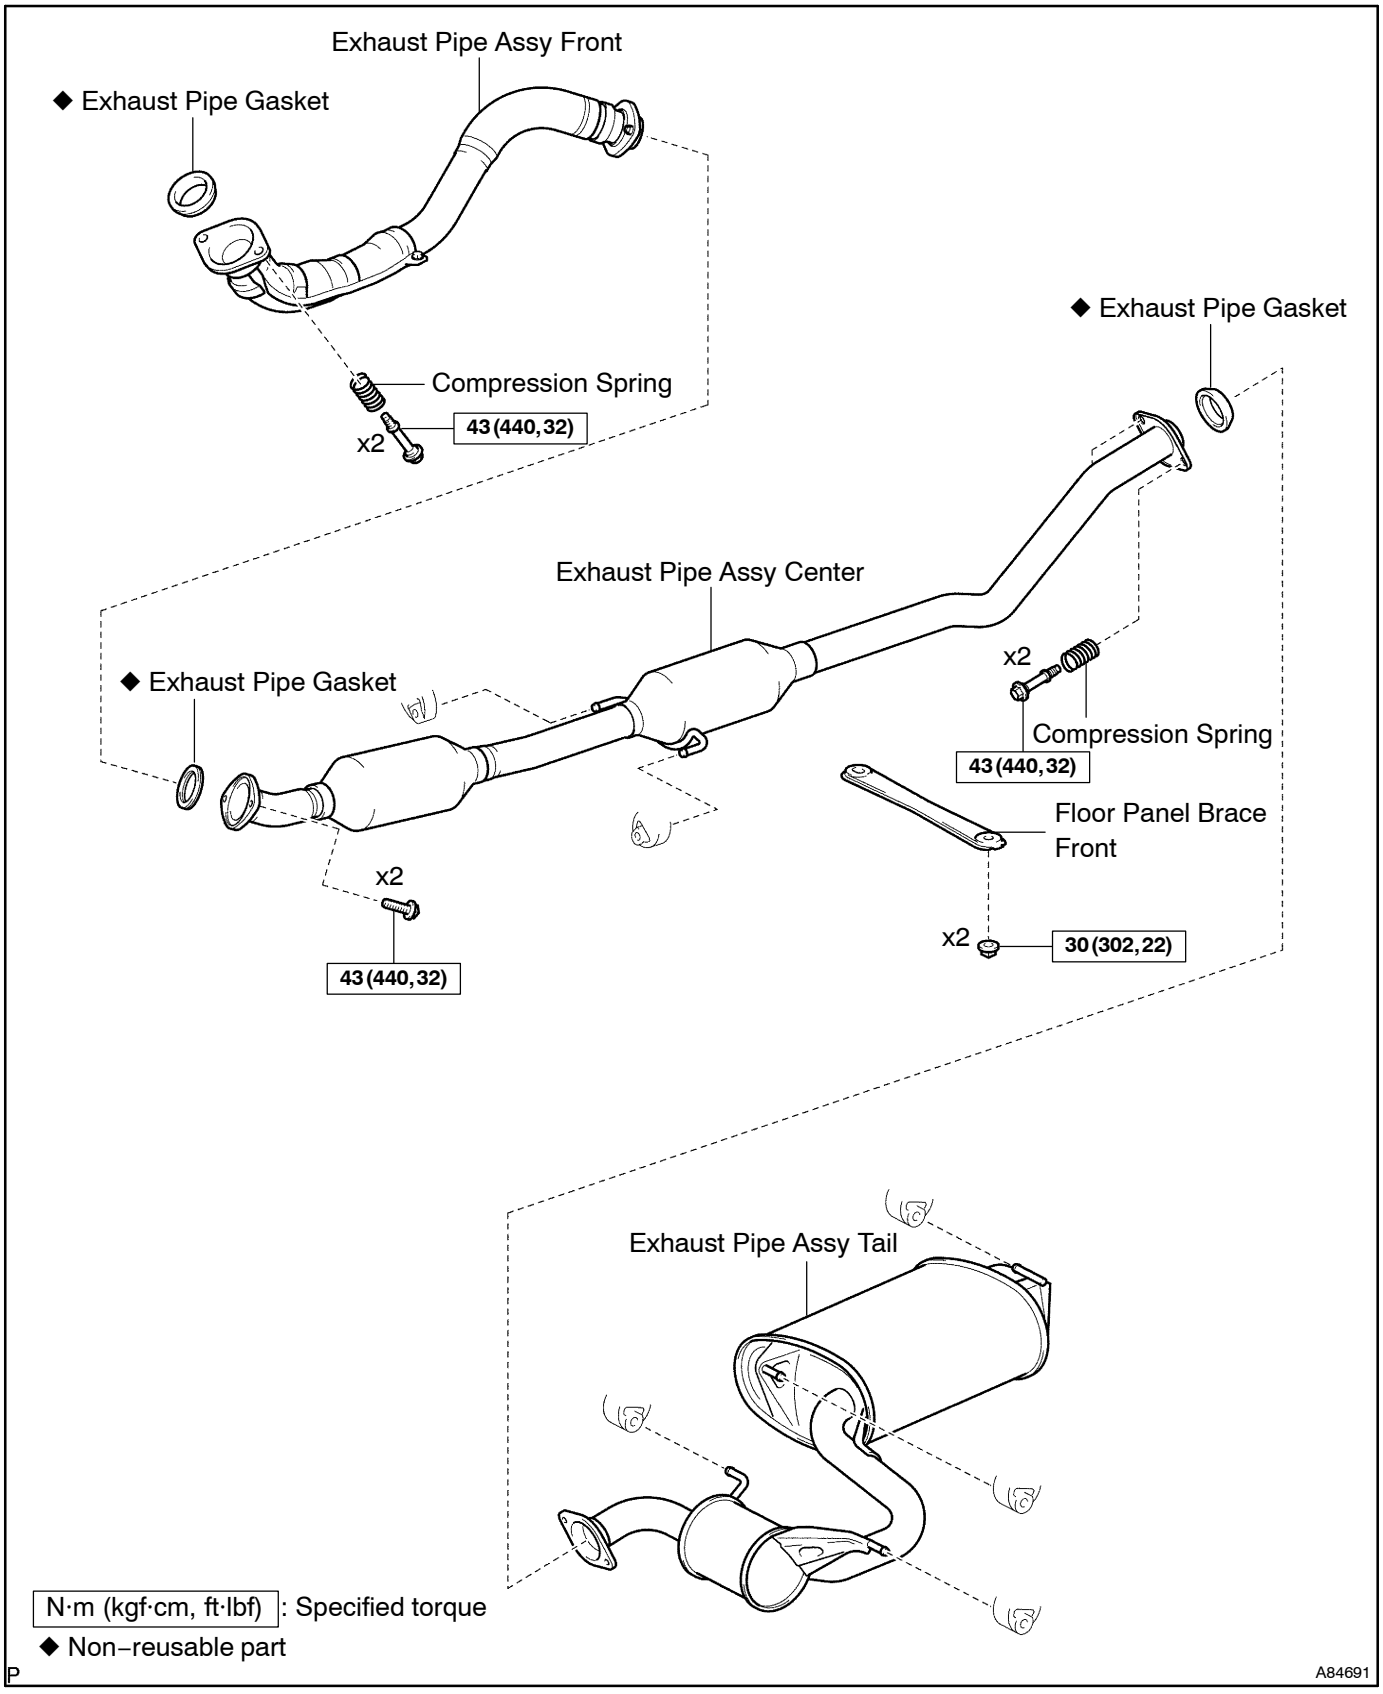
(a) Hold the crankshaft with SST.
SST 09213–54015 (09213–70020), 09330–00021

(b) Clean the bolts and bolt holes.

(c) Apply adhesive to the 2 or 3 threads of the bolt end.
Adhesive: Part No. 08833–00070, THREE BOND 1324 or equivalent

(d) Using a Torx socket wrench (T55), uniformly install and tighten the 8 Torx screws in several steps in the sequence shown in the illustration.
Torque: 71 N·m (720 kgf·cm, 52 ft·lbf)

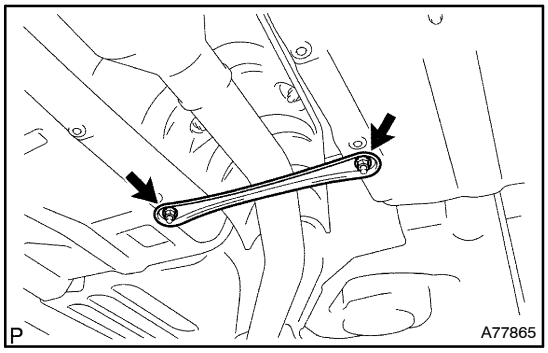
10. INSTALL CLUTCH DISC ASSY (See Pub. No. RM1018E on page 42–26)
SST 09301–00220



11. INSTALL CLUTCH COVER ASSY (See Pub. No. RM1018E on page 42–26)

12. INSTALL MANUAL TRANSAXLE ASSY (See Pub. No. RM1018E on page 41–33)
SST 09670–00010

EXHAUST PIPE ASSY (2AZ–FSE)



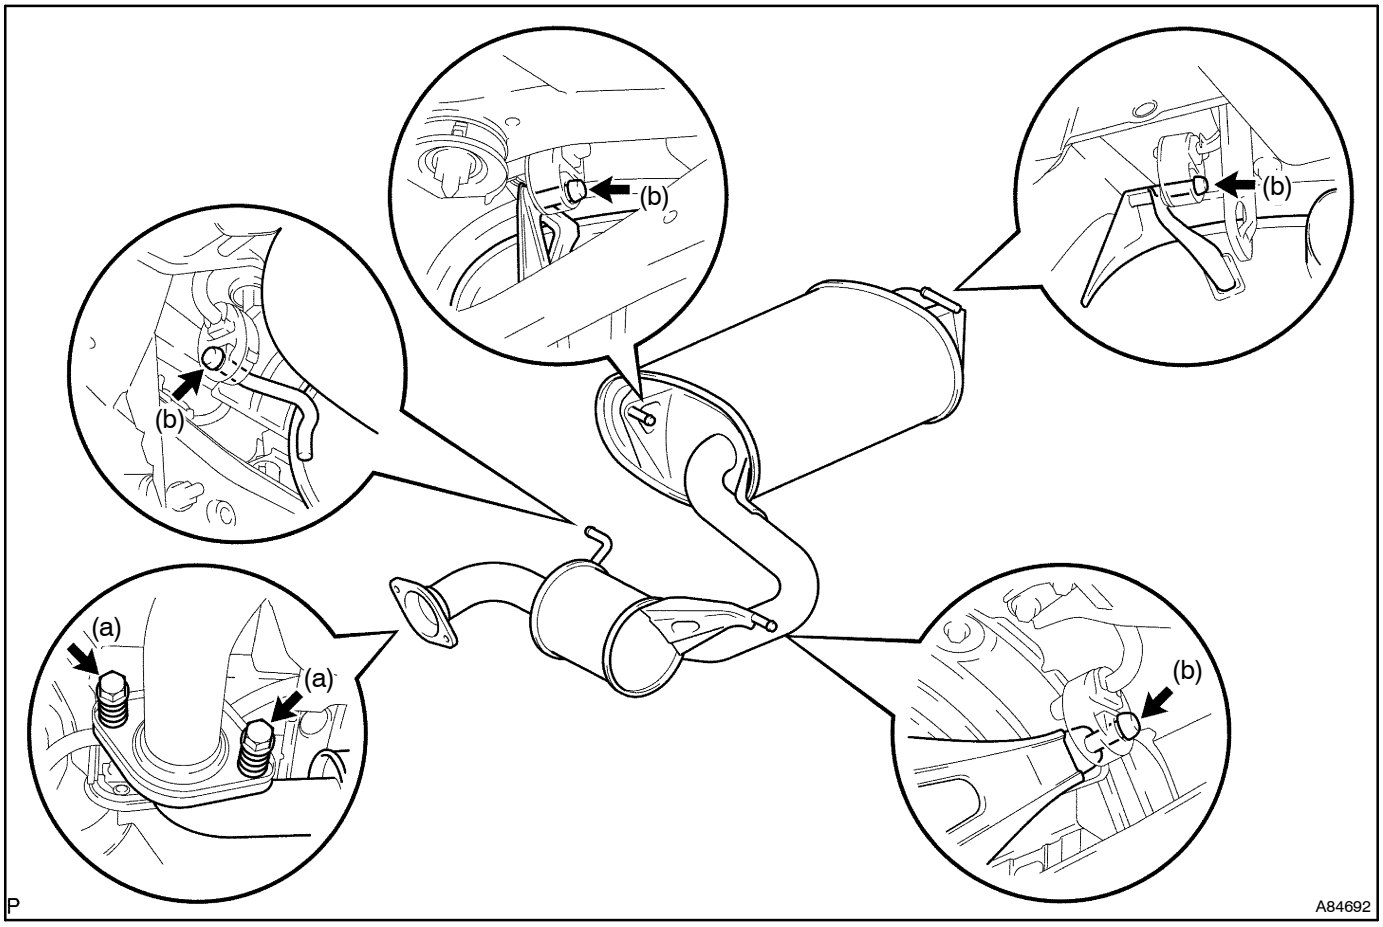
COMPONENTS

150C8–01

150C9–01

Removal & Installation and Disassembly & Reassembly

1. REMOVE FLOOR PANEL BRACE FRONT

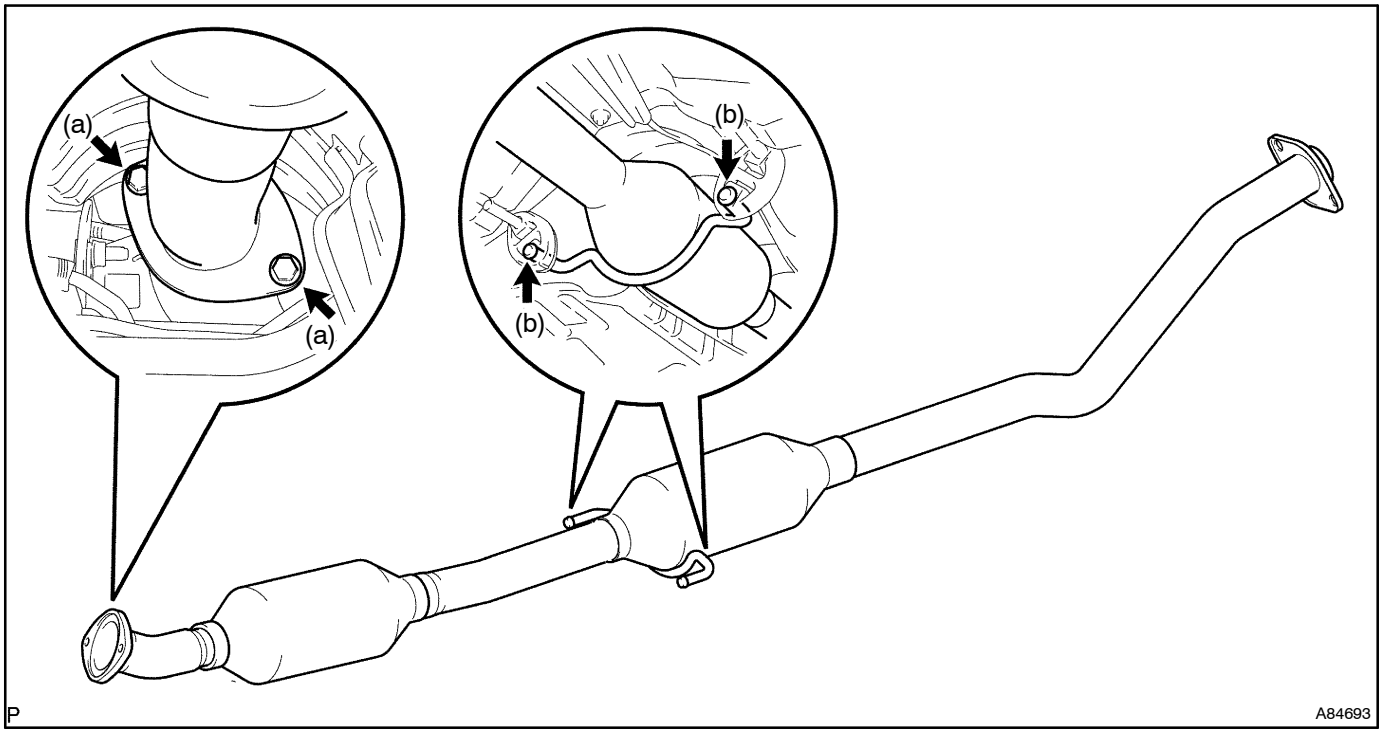


(a) Remove the 2 nuts, then remove the floor panel brace front.

2. REMOVE EXHAUST PIPE ASSY TAIL

(a) Remove the 2 bolts and 2 compression springs.

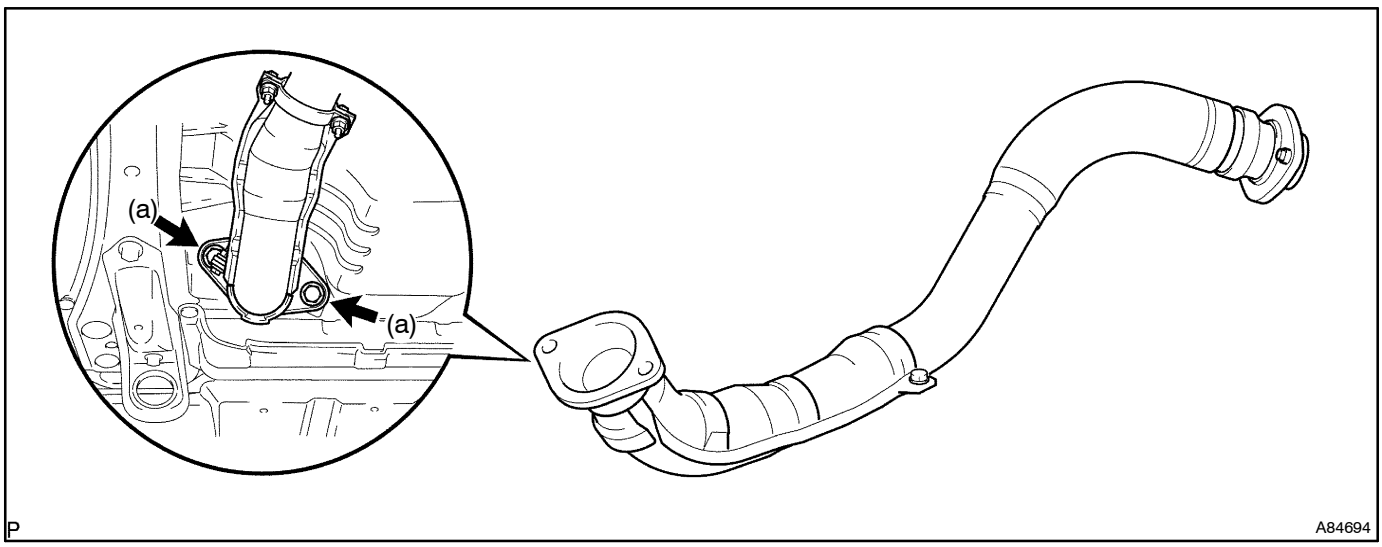
(b) Remove the exhaust pipe from the 4 exhaust pipe supports.



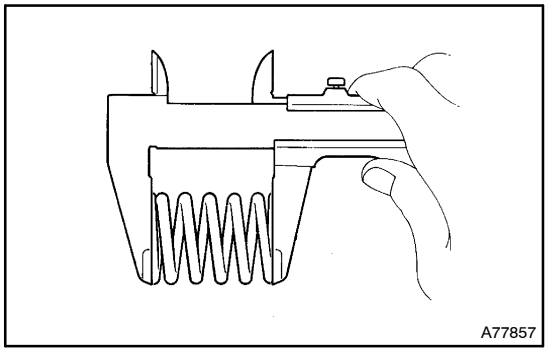
(c) Remove the gasket from the exhaust pipe center.

3. REMOVE EXHAUST PIPE ASSY CENTER

(a) Remove the 2 bolts.



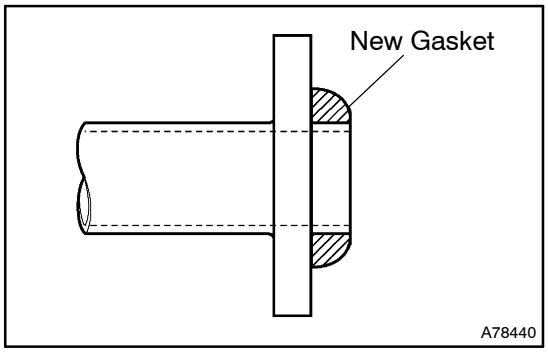
(b) Remove the exhaust pipe center and the gasket from the 2 exhaust pipe supports.



4. REMOVE EXHAUST PIPE ASSY FRONT

(a) Remove the 2 bolts and 2 compression springs, then remove the exhaust pipe front.

(b) Remove the gasket from the exhaust manifold.



5. INSTALL EXHAUST PIPE ASSY FRONT

(a) Inspect the free length.

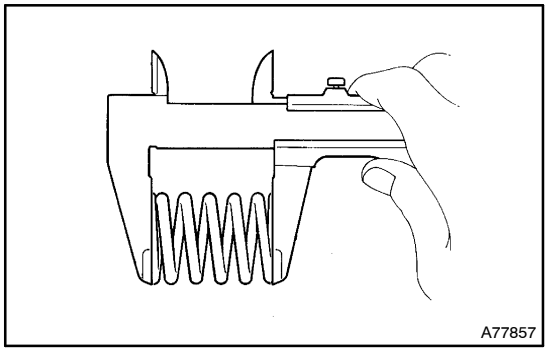
(1) Using vernier calipers, measure the free length of the compression spring.

Minimum length: 41.5 mm (1.634 in.)

If the free length is less than minimum, replace the compression spring.

(b) Install a new gasket to the exhaust manifold as shown in the illustration.

(c) Install the exhaust pipe front with the 2 compression springs and 2 bolts.



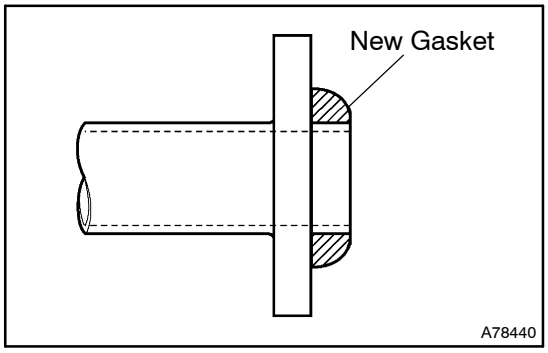
Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

6. INSTALL EXHAUST PIPE ASSY CENTER

(a) Install a new gasket and the exhaust pipe center to the 2 exhaust pipe supports.

(b) Tighten the 2 bolts.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)



7. INSTALL EXHAUST PIPE ASSY TAIL

(a) Inspect the free length.

(1) Using vernier calipers, measure the free length of the compression spring.

Minimum length: 38.5 mm (1.516 in.)

If the free length is less than minimum, replace the compression spring.

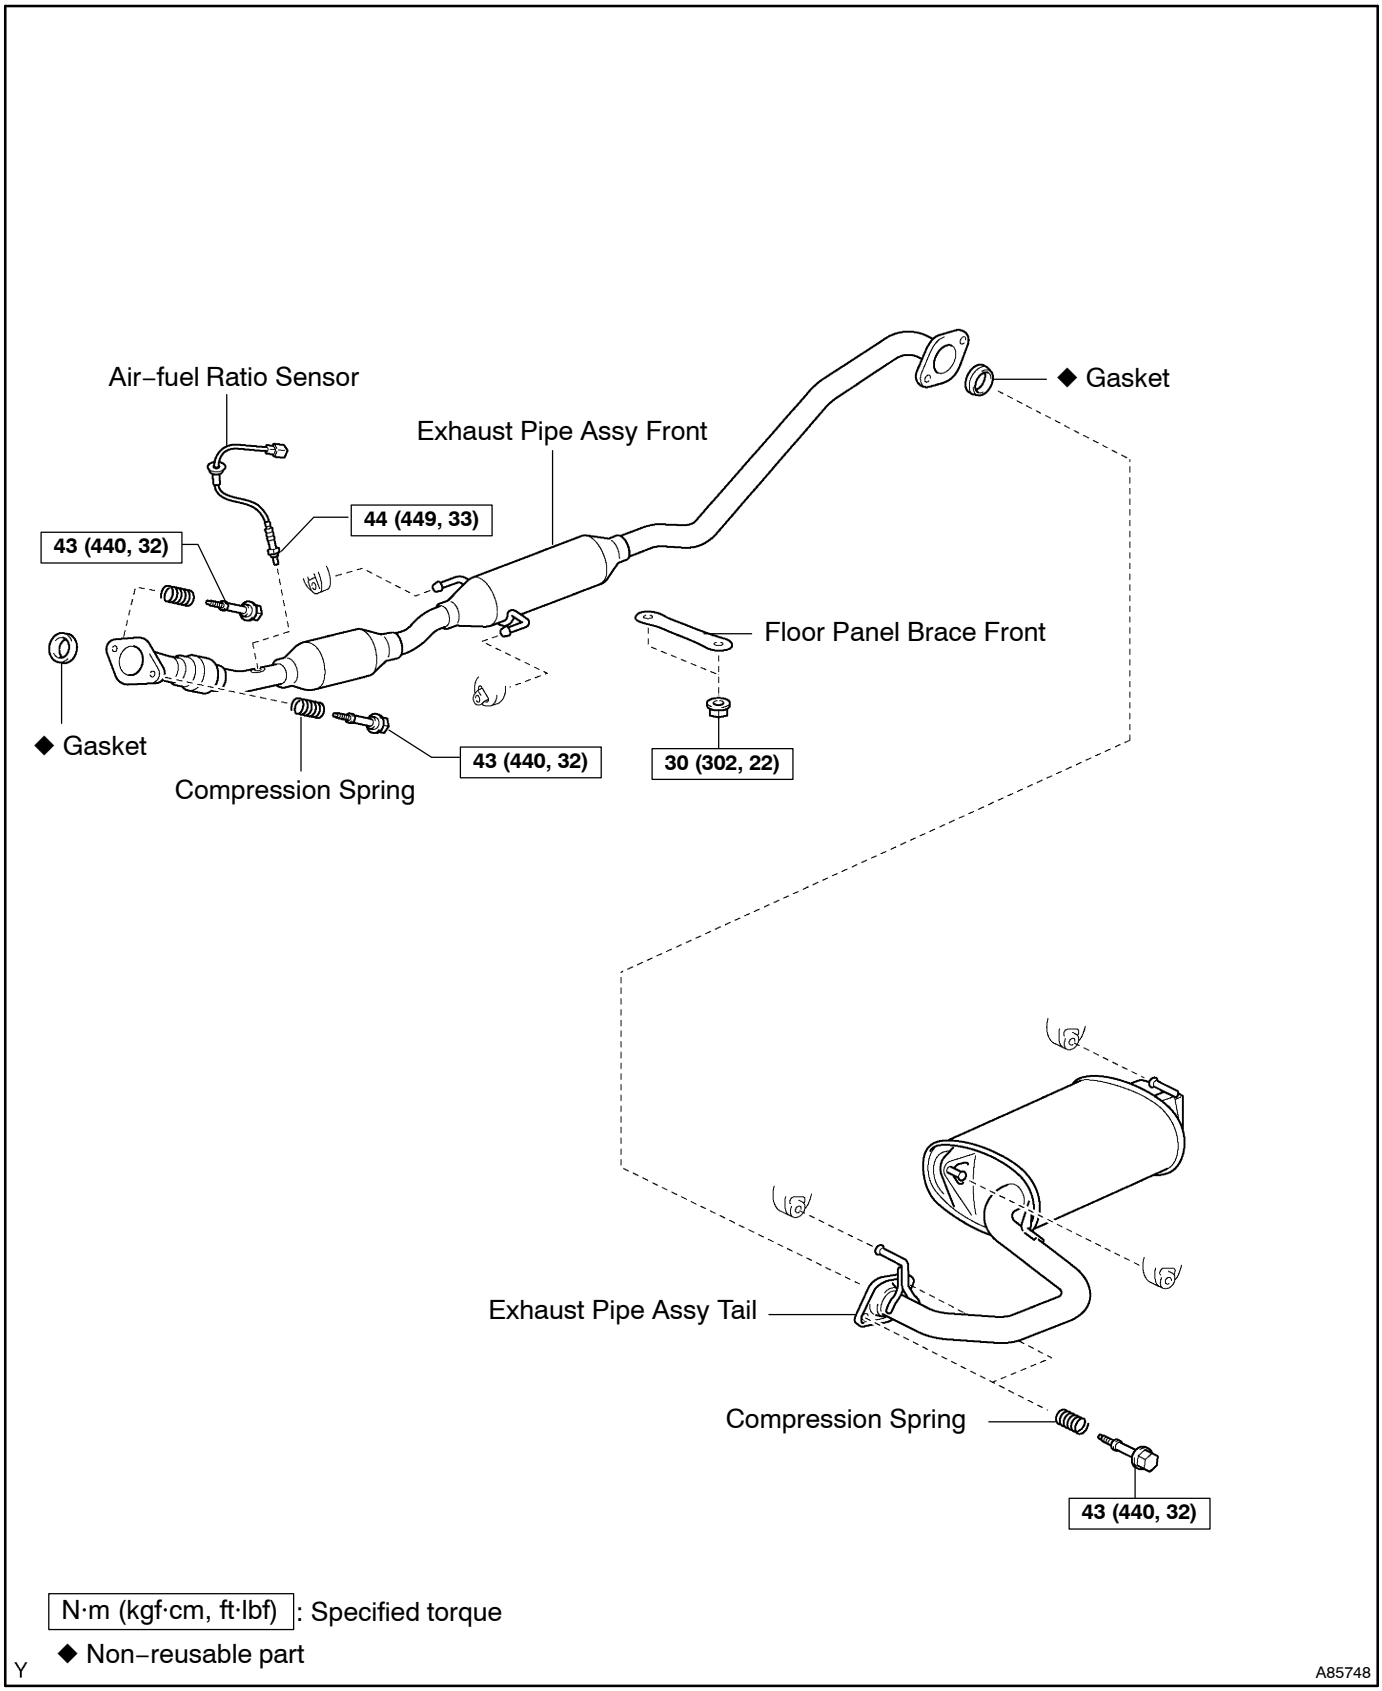
(b) Install a new gasket to the exhaust pipe center as shown in the illustration.

(c) Install the exhaust pipe tail to the 4 exhaust pipe supports.

(d) Tighten the compression springs and 2 bolts.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

8. CHECK FOR EXHAUST GAS LEAKS



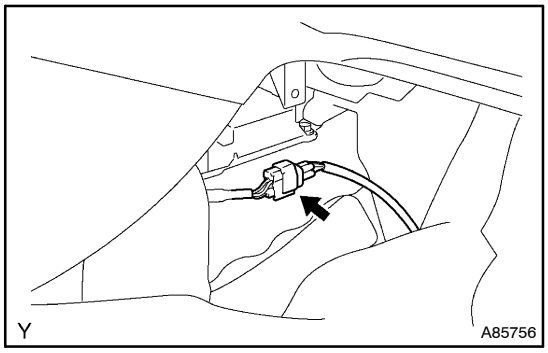
9. INSTALL FLOOR PANEL BRACE FRONT

Torque: 30 N·m (302 kgf·cm, 22 ft·lbf)

EXHAUST PIPE ASSY (1CD–FTV)(From September, 2003)

1509W–02

COMPONENTS



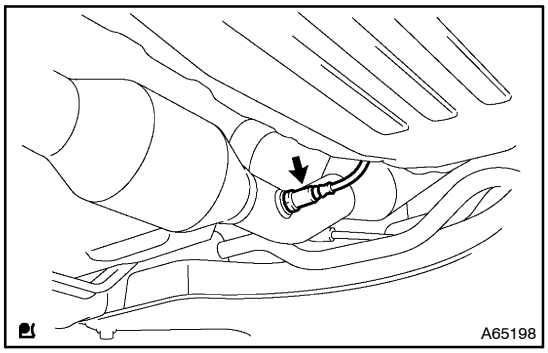
N·m (kgf·cm, ft·lbf): Specified torque

◆ Non–reusable part

A85748

150CB–01

Removal & Installation and Disassembly & Reassembly

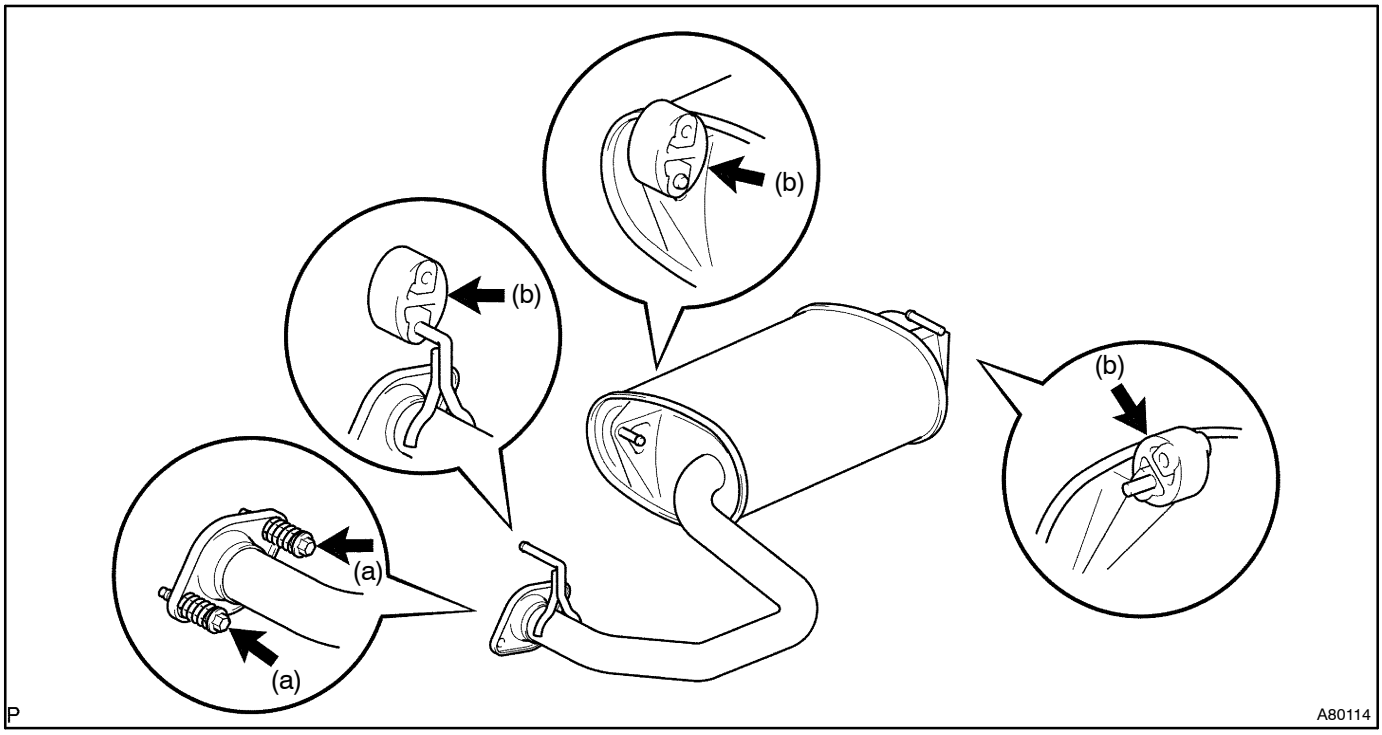


1. REMOVE AIR–FUEL RATIO SENSOR

(a) Using a clip remover, remove the clip.

(b) Open the floor carpet.

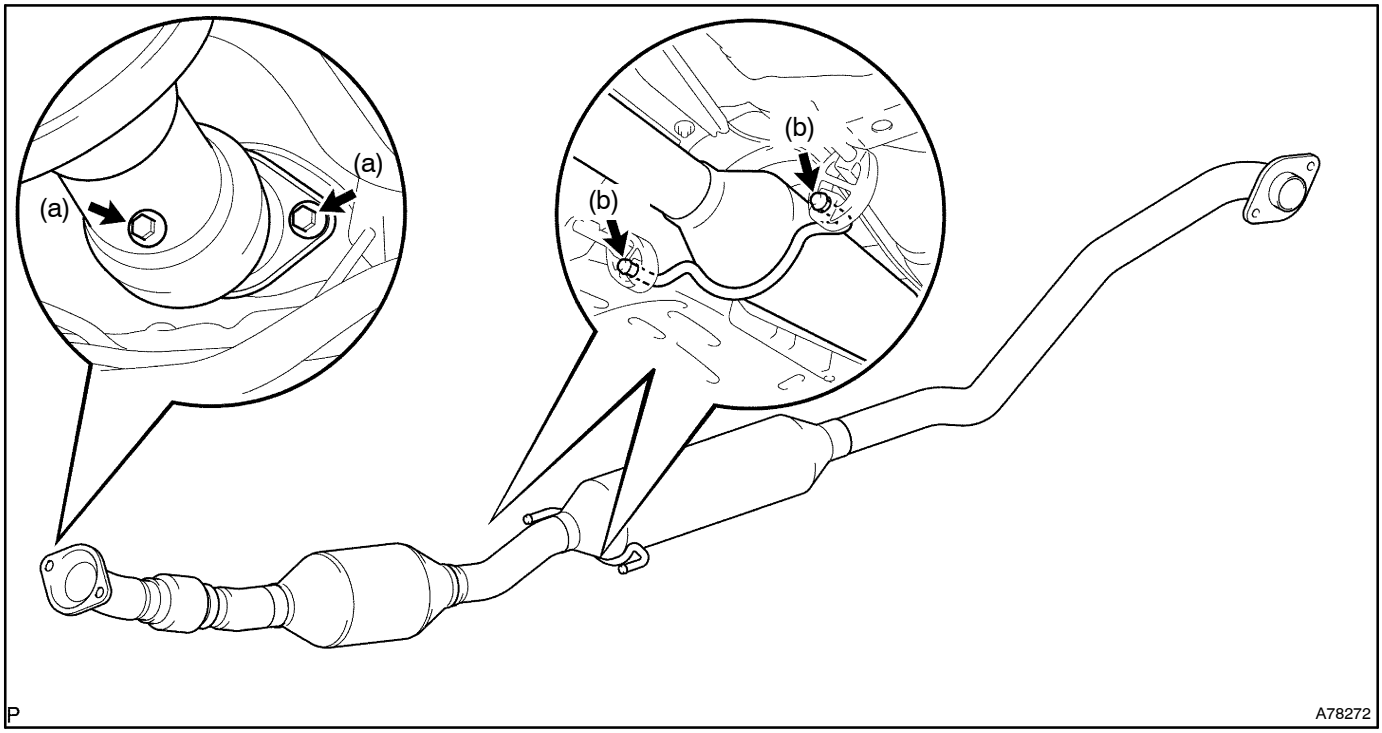
(c) Disconnect the air–fuel ratio sensor connector.



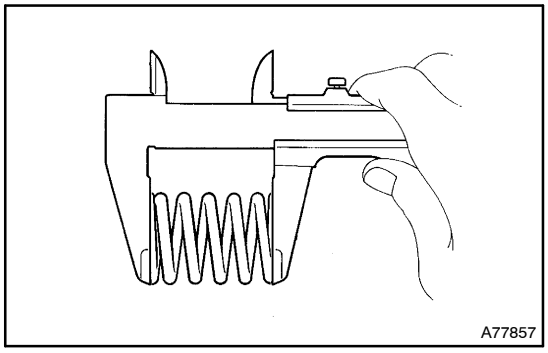
(d) Remove the air–fuel ratio sensor.

2. REMOVE FLOOR PANEL BRACE FRONT

(a) Remove the 2 nuts and floor panel brace front.



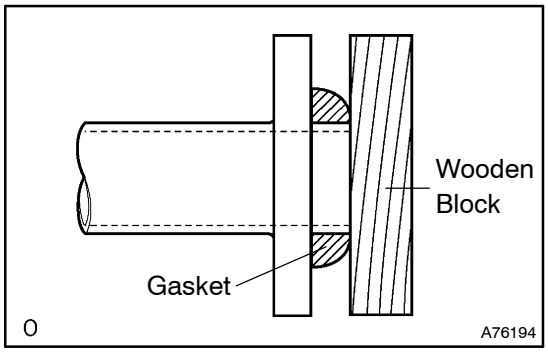
3. REMOVE EXHAUST PIPE ASSY TAIL



(a) Remove the 2 bolts and 2 compression springs.
(b) Disconnect the 3 exhaust pipe supports, then remove the exhaust pipe tail.
(c) Remove the gasket from the exhaust pipe tail.

4. REMOVE EXHAUST PIPE ASSY FRONT

(a) Remove the 2 bolts and 2 compression springs.
(b) Disconnect the 2 exhaust pipe supports, then remove the exhaust pipe front.
(c) Remove the gasket from the manifold converter.

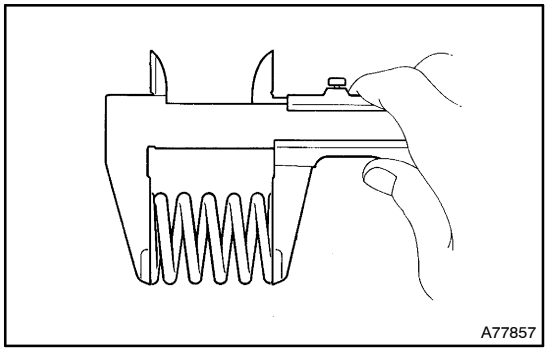


5. INSTALL EXHAUST PIPE ASSY FRONT

(a) Using vernier calipers, measure the free length of the compression spring.

Minimum length: 41.5 mm (1.634 in.)

If the free length is less than minimum, replace the compression spring.



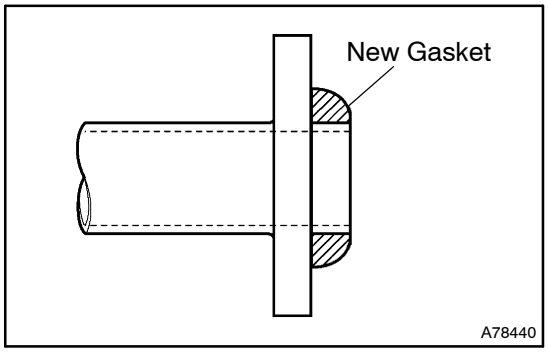
(b) Using a plastic hammer and wooden block, tap in a new gasket until its surface is flush with the exhaust manifold.

NOTICE:

- **Tap in the gasket in the correct direction.**
- **Do not reuse the removed gasket.**
- **Be sure not to push in the gasket when installing the exhaust pipe.**

(c) Connect the 2 exhaust pipe supports, then install the exhaust pipe front with the 2 compression springs and 2 bolts.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)



6. INSTALL EXHAUST PIPE ASSY TAIL

(a) Using vernier calipers, measure the free length of the compression spring.

Minimum length: 38.5 mm (1.515 in.)

If the free length is less than minimum, replace the compression spring.

(b) Install a new gasket to the pipe front converter as shown in the illustration.

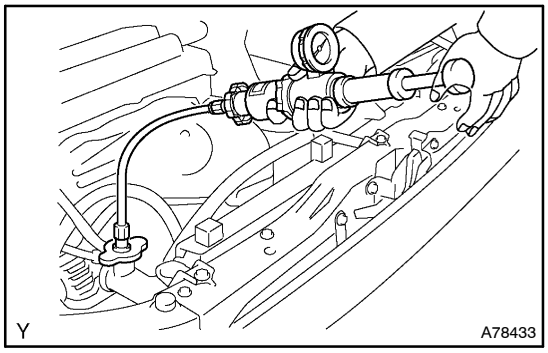
(c) Connect the 3 exhaust pipe supports, then install the exhaust pipe tail with the 2 compression springs and 2 bolts.

Torque: 43 N·m (440 kgf·cm, 32 ft·lbf)

7. INSTALL AIR–FUEL RATIO SENSOR

Torque: 44 N·m (449 kgf·cm, 33 ft·lbf)

8. CHECK FOR EXHAUST GAS LEAKS



9. INSTALL FLOOR PANEL BRACE FRONT

Torque: 30 N·m (302 kgf·cm, 22 ft·lbf)

COOLING SYSTEM (2AZ–FSE)

160MY–02

ON–VEHICLE INSPECTION

1. INSPECT COOLING SYSTEM FOR LEAKS

(a) Remove the radiator cap.

CAUTION:

To avoid the danger of being burned, radiator cap is required while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(b) Remove the radiator support opening cover (see page 14–23).

(c) Remove the engine room cover side (see page 14–23).

(d) Fill the radiator with coolant, then attach a radiator cap tester.

(e) Warm up the engine.

(f) Pump it to 118 kPa (1.2 kgf/cm^2, 17.1 psi), then check that the pressure does not drop.

If the pressure drops, check the hoses, radiator and water pump for leaks. If there are no signs or traces of external coolant leaks, check the heater core, cylinder block and head.

(g) Reinstall the engine room cover side.

(h) Reinstall the radiator support opening cover.

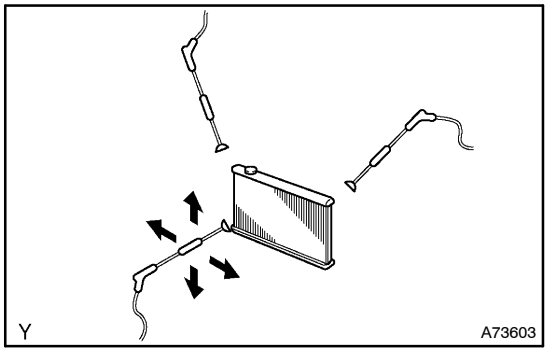
(i) Reinstall the radiator cap.

2. CHECK ENGINE COOLANT LEVEL AT RESERVOIR

(a) Check that the coolant level in the reservoir tank is between ”F” and ”L” lines when the engine is cold. If low, check for leaks and add ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate, non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology up to the ”FULL” line.

3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator cap.



CAUTION:

To avoid the danger of being burned, radiator cap are required while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(b) Check if there are any excessive deposits of rust or scale around the water outlet cap and water outlet filler hole; the coolant should be free of oil.

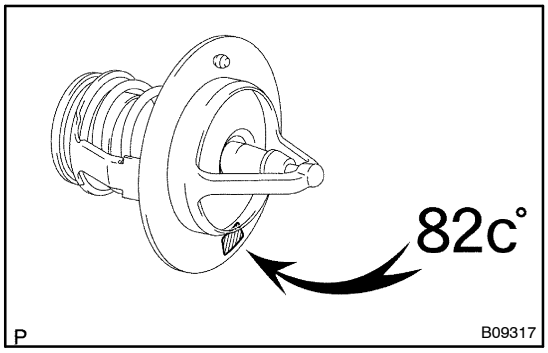
If excessively dirty, replace the coolant.

(c) Reinstall the radiator cap.

4. INSPECT FIN BLOCKAGE

(a) If the fins are clogged, wash them with water or a steam cleaner, then dry them with compressed air.

NOTICE:

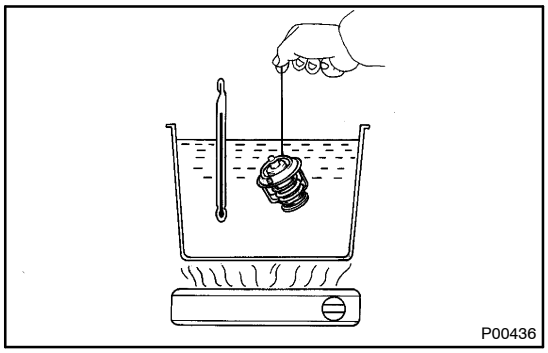


- **If the distance between the steam cleaner and core is too close, there is a possibility of damaging the fins, so keep the following injection distance.**

Injection Pressure kPa (kgf/cm^2, psi)	Injection Distance mm (in.)
2,942 to 4,903 (30 to 50, 427 to 711)	300 (11.811)
4,903 to 7,845 (50 to 80, 711 to 1,138)	500 (19.685)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Be careful not to expose electronic components to water.**

160MZ–02

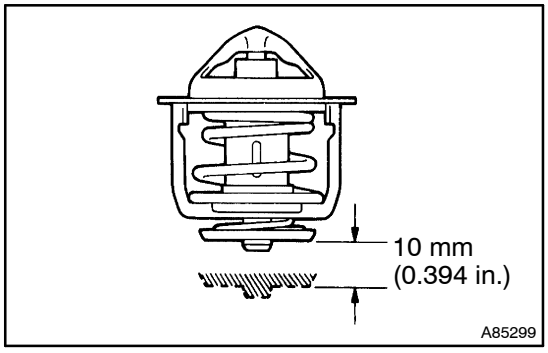


INSPECTION

1. INSPECT THERMOSTAT

HINT:

The thermostat is numbered with the valve opening temperature.



(a) Immerse the thermostat in water, then gradually heat the water.

(b) Check the valve opening temperature of the thermostat.

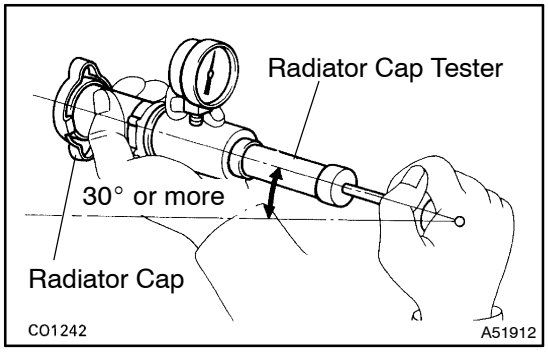
Valve opening temperature:
80 to 84°C (176 to 183°F)

If the valve opening temperature is not as specified, replace the thermostat.

(c) Inspect the valve lift.

Valve lift: 10 mm (0.394 in.) or more at 95°C (203°F)

If the valve lift is not as specified, replace the thermostat.



(d) Camshaft that the valve of the thermostat is closed when the water temperature (b) cools down below 77 °C (170 °F).

If not fully closed, replace the thermostat.

2. INSPECT RADIATOR CAP SUB–ASSY

NOTICE:

- **If the radiator cap is contaminated, rinse it with water.**
- **Before using a radiator cap tester, wet the relief valve and pressure valve with engine coolant or water.**
- **When performing the following steps (a) and (b), keep the tester at an angle of over 30° above horizontal.**

(a) Using a radiator cap tester, slowly pump the tester, then check that air is coming from the vacuum valve.

Pump speed: 1 push / 3 seconds or more

NOTICE:

Push the pump at a constant speed.

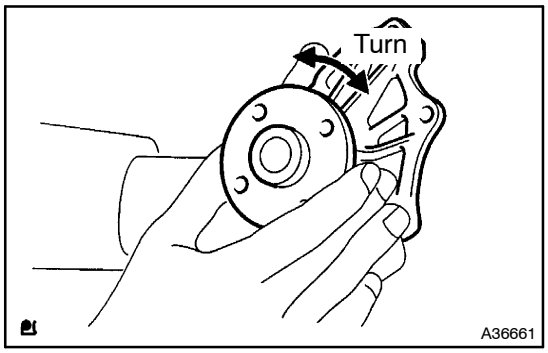
If air is not coming from the vacuum valve, replace the radiator cap.

(b) Pump the tester, then measure the relief valve opening pressure.

NOTICE:

The following pump speed is for the first pump only (in order to close the vacuum valve). After the first pump, the pump speed can be reduced.

Pump speed: 1 push within 1 second



Standard opening pressure:

74 to 103 kPa (0.75 to 1.05 kgf/cm^2, 10.7 to 14.9 psi)

If the opening pressure is less than specified, replace the radiator cap.

HINT:

Use the tester's maximum reading as the opening pressure.

3. INSPECT WATER PUMP ASSY

(a) Visually check the drain hole for coolant leakage.

If leakage is found, replace the water pump.

(b) Turn the pulley, then check that the water pump bearing moves smoothly and does not make noise.

If necessary, replace the water pump.

COOLING FAN SYSTEM (2AZ–FSE)

160SZ–01

ON–VEHICLE INSPECTION

HINT:

It is normal that the cooling fan sometime rotates when the ignition switch is turned from ACC to ON.

1. CHECK COOLING FAN OPERATION WITH LOW TEMPERATURE (Below 83°C (181°F))

(a) Turn the ignition switch ON.

(b) Check that the cooling fan stops.

If not, check the cooling fan relay and engine coolant temperature sensor, then check for disconnection of connectors or wire break between the cooling fan relay and engine coolant temperature sensor.

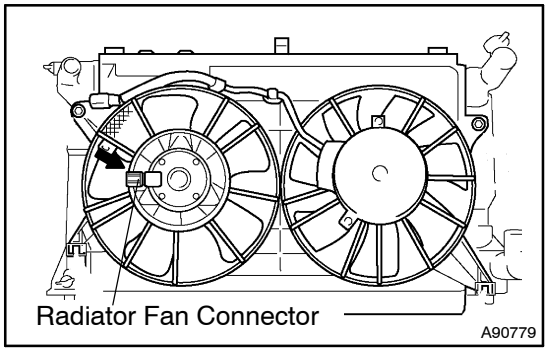
(c) Disconnect the engine coolant temperature sensor connector.

(d) Check that the cooling fan rotates.

If not, check the fuses, cooling fan relay, ECM and cooling fan, then check for a short circuit between the cooling fan relay and engine coolant temperature sensor.

(e) Reconnect the engine coolant temperature sensor connector.

2. CHECK COOLING FAN OPERATION WITH HIGH TEMPERATURE (Above 100°C (212°F))



(a) Start the engine, then raise coolant temperature to above 100°C (212°F).

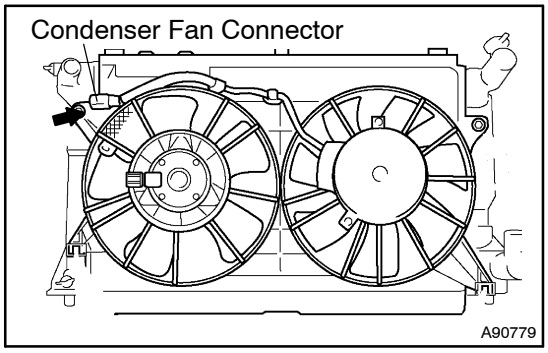
HINT:

Coolant temperature is the value detected by the engine coolant temperature sensor on the water outlet.

(b) Check that the cooling fan rotates.

If not, replace the engine coolant temperature sensor.

3. INSPECT RADIATOR FAN MOTOR



(a) Disconnect the radiator fan connector.

(b) Connect battery and ammeter to the radiator fan connector.

(c) Check that the radiator fan rotates smoothly, then check the reading on the ammeter.

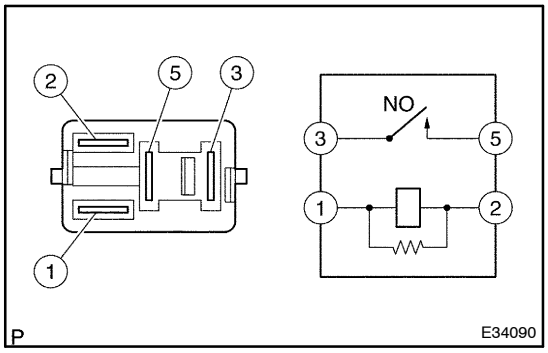
Standard amperage: 8.5 to 11.5 A at 20°C (68°F)

(d) Reconnect the cooling fan connector.

4. INSPECT CONDENSER FAN MOTOR

(a) Disconnect the condenser fan connector.

(b) Connect battery and ammeter to the condenser fan connector.



(c) Check that the condenser fan rotates smoothly, then check the reading on the ammeter.

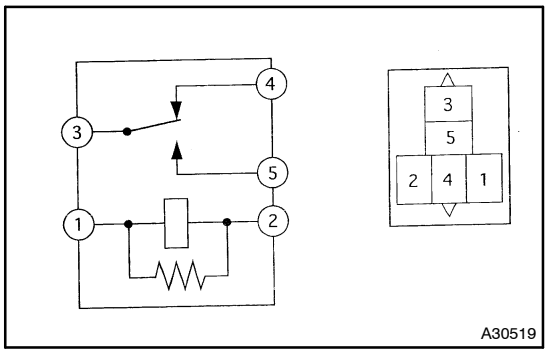
Standard amperage: 5.2 to 8.2 A at 20°C (68°F)

(d) Reconnect the condenser fan connector.

160N0–02

INSPECTION

1. INSPECT COOLING FAN RELAY



(a) Inspect the resistance

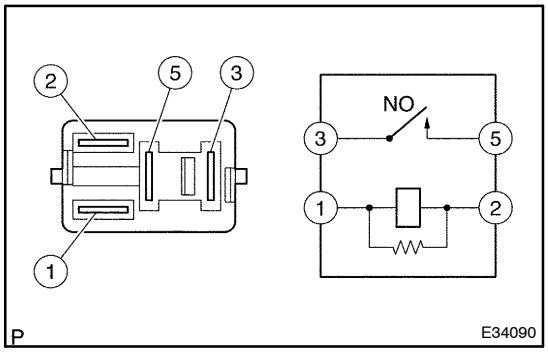
(1) Using an ohmmeter, measure the resistance between each terminal.

Specified condition:

Tester Connection	Specified Condition
3 – 5	10 kΩ or Higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

If the specified condition is not as specified, replace the cooling fan relay.

2. INSPECT COOLING FAN RELAY NO.2



(a) Inspect the resistance

(1) Using an ohmmeter, measure the resistance between each terminal.

Specified condition:

Tester Connection	Specified Condition
3 – 4	Below 1 Ω
3 – 4	10 kΩ or Higher (Apply battery voltage to terminals 1 and 2)
3 – 5	10 kΩ or Higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

If the specified condition is not as specified, replace the cooling fan relay No. 2.

3. INSPECT COOLING FAN RELAY NO.3

(a) Inspect the resistance

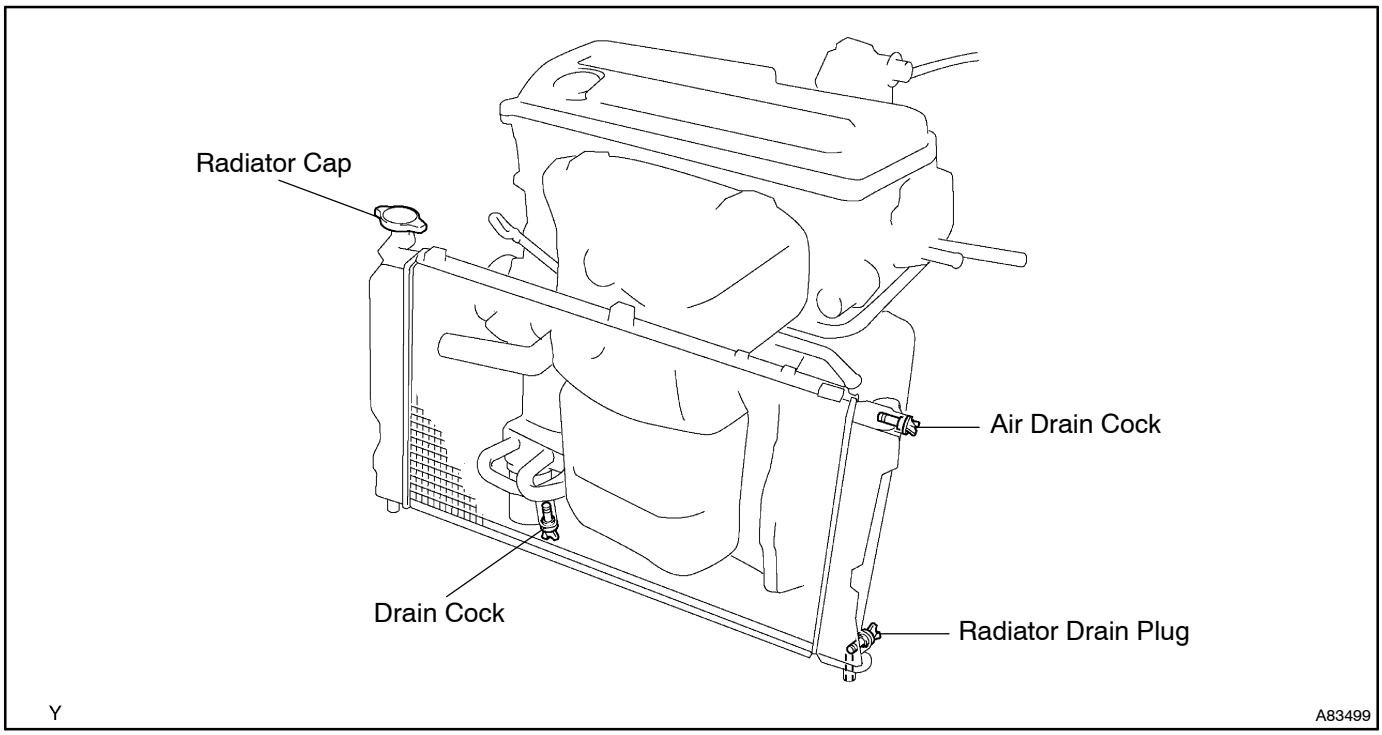
(1) Using an ohmmeter, measure the resistance between each terminal.

Specified condition:

Tester Connection	Specified Condition
3 – 5	10 kΩ or Higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

If the specified condition is not as specified, replace the cooling fan relay No. 3.

ENGINE COOLANT (2AZ–FSE)



REPLACEMENT

160MU–02

1. DRAIN ENGINE COOLANT

CAUTION:
To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot, as fluid and steam can be blown out under pressure.

(a) Remove the radiator cap.
(b) Loosen the radiator drain plug, then drain the engine coolant.
(c) Remove the engine under cover No. 4 RH (see page 17–6).
(d) Loosen the drain cock, then drain the engine coolant.
(e) Loosen the air drain cock.

(f) Tighten the drain plug and 2 drain cocks.

2. ADD ENGINE COOLANT

(a) Pour coolant into the radiator until it overflows.

Capacity:

Steering	Coolant Capacity [liters (US gts, Imp. gts)]
LHD	6.3 (6.7, 5.5)
RHD	6.4 (6.8, 5.6)

HINT:

- Use of improper coolants may damage the engine cooling system.
- Only use ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate, non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology.
- New Toyota vehicles are filled with Toyota Super Long Life Coolant. When replacing the coolant. Toyota Super Long Life Coolant is recommended.
- Observe the coolant level inside the radiator by pressing the inlet and outlet radiator hoses several times by hand. If the coolant level goes down, add the coolant.

CAUTION:

Do not use plain water alone.

(b) Loosen the drain cock, then fasten the drain cock if the engine coolant overflowed.

(c) Reinstall the radiator cap.

(d) Pour engine coolant into the reservoir tank until it reaches full line.

(e) Warm up the engine until the thermostat valve begins to open.

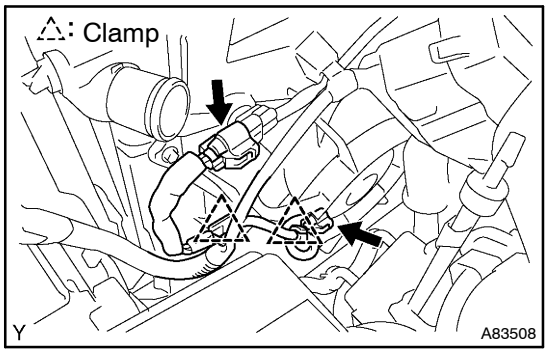
HINT:

Press the radiator inlet and outlet hose several times with hard during the warming up.

(f) Stop the engine, then wait until the coolant temperature drops. Gets cold. Then remove the radiator cap to check the coolant level.

HINT:

- If the level gets lower, perform the procedures above again.
- If the level does not gets lower, adjust the reservoir tank coolant level.

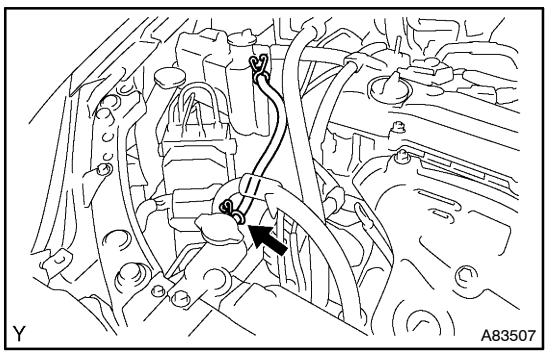


3. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)

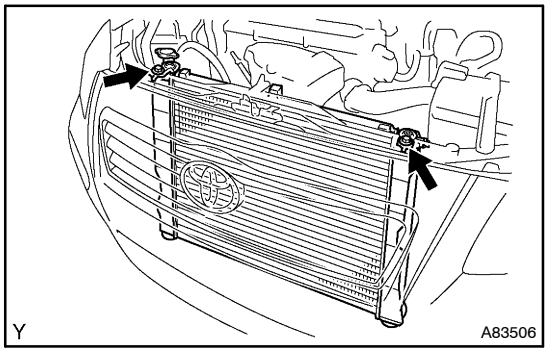
RADIATOR ASSY (2AZ–FSE)

160T0–01

REPLACEMENT

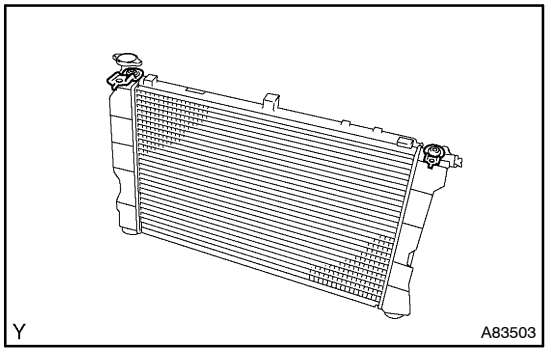


1. DRAIN COOLANT (See page 16–7)
2. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)
3. REMOVE ENGINE ROOM COVER SIDE (See page 14–23)
4. REMOVE ENGINE UNDER COVER LH (See page 14–23)
5. REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)
6. REMOVE ENGINE UNDER COVER RH (See page 14–23)
7. DISCONNECT RADIATOR HOSE INLET (See page 14–23)
8. DISCONNECT RADIATOR HOSE OUTLET (See page 14–23)
9. SEPARATE RADIATOR RELAY BLOCK (See page 14–23)



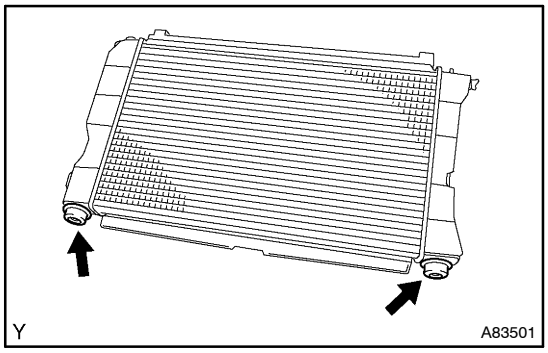
10. REMOVE RADIATOR ASSY

(a) Disconnect the 2 connectors from the 2 fan motors.

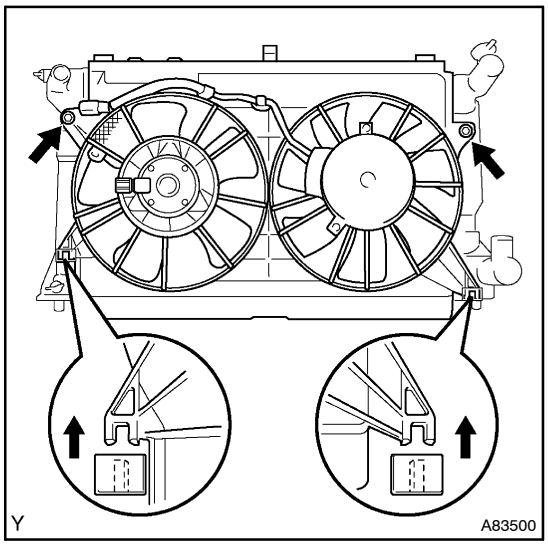


(b) Separate the 2 clamps from the fan shroud.

(c) Disconnect the radiator reservoir tank hose as shown in the illustration.



(d) Remove the 2 bolts, then remove the radiator assembly.



11. REMOVE RADIATOR SUPPORT NO.1

(a) Remove the 2 radiator supports from the radiator assembly.

12. REMOVE RADIATOR SUPPORT LOWER

(a) Remove the 2 radiator support lowers from the radiator assembly.

13. REMOVE FAN ASSY W/MOTOR

(a) Remove the 2 bolts.

(b) Remove the 2 pawl fittings, then remove the fan assembly with motor.

14. INSTALL FAN ASSY W/MOTOR

(a) Insert tabs in the slot, then attach the fan assembly with motor with the 2 bolts.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

15. INSTALL RADIATOR SUPPORT LOWER

(a) Be sure to insert the 2 radiator support lowers to the radiator lower plane.

16. INSTALL RADIATOR SUPPORT NO.1

17. INSTALL RADIATOR ASSY
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

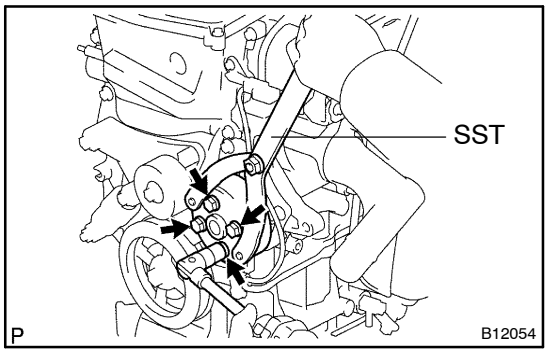
18. INSTALL RADIATOR RELAY BLOCK
Torque: 5.0 N·m (54 kgf·cm, 46 in.·lbf)

19. CONNECT RADIATOR HOSE OUTLET

20. CONNECT RADIATOR HOSE INLET

21. ADD COOLANT (See page 16–7)

22. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)



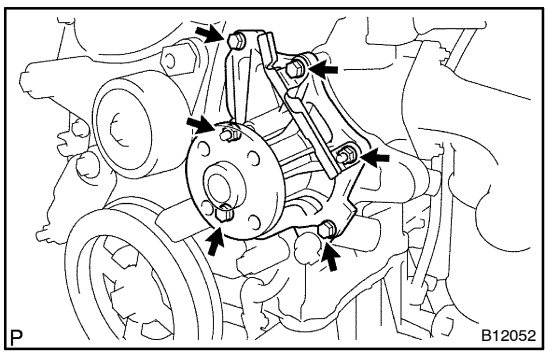
23. INSTALL ENGINE UNDER COVER RH
24. INSTALL ENGINE UNDER COVER NO.4 RH
25. INSTALL ENGINE UNDER COVER LH
26. INSTALL ENGINE ROOM COVER SIDE
27. INSTALL RADIATOR SUPPORT OPENING COVER

WATER PUMP ASSY (2AZ–FSE)

160MR–02

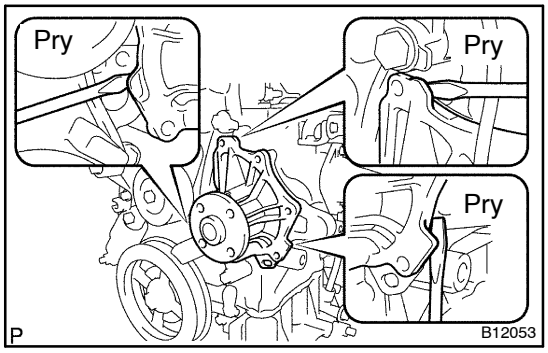
REPLACEMENT

1. **DRAIN COOLANT (See page 16–7)**
2. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)**
3. **REMOVE ENGINE ROOM COVER SIDE (See page 14–23)**
4. **REMOVE ENGINE UNDER COVER LH (See page 14–23)**
5. **REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)**
6. **REMOVE ENGINE UNDER COVER RH (See page 14–23)**
7. **REMOVE FAN AND GENERATOR V BELT (See page 14–5)**
   SST 09249–63010
8. **REMOVE GENERATOR ASSY (See page 19–8)**



9. REMOVE WATER PUMP PULLEY

(a) Using SST, remove the 4 bolts and pump pulley.
SST 09960–10010 (09962–01000, 09963–00700)

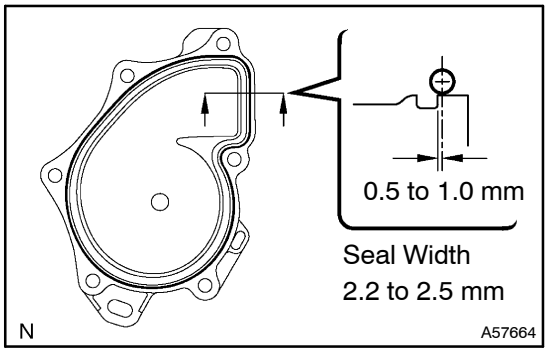


(b) Disconnect the crankshaft position sensor wire clamp from the water pump.

(c) Disconnect the crankshaft position sensor wire from the clamp on the water pump.

10. REMOVE WATER PUMP ASSY

(a) Remove the 4 bolts, 2 nuts, wire clamp and water pump.



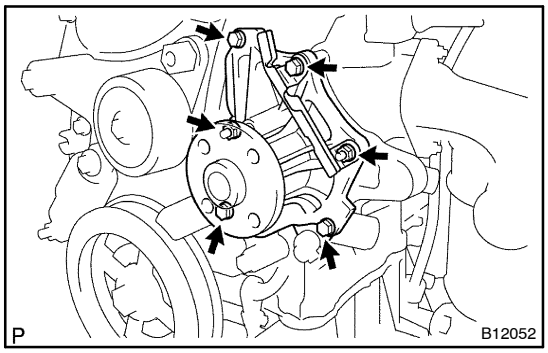
(b) Using a screwdriver, pry out between the water pump and cylinder block, and remove the water pump.

NOTICE:

Be careful not to damage the contact surface of the water pump and cylinder block.

11. INSTALL WATER PUMP ASSY

(a) Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the water pump assy.

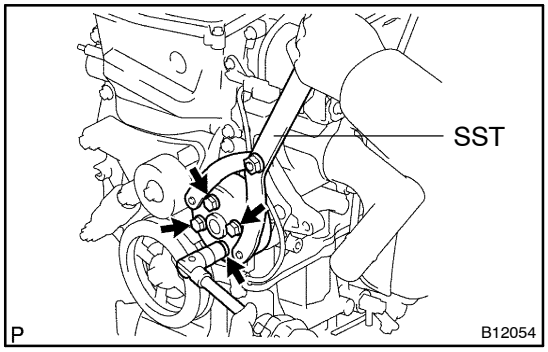


(b) Apply a continuous bead of the seal packing (diameter 2.2 to 2.5 mm (0.09 to 0.10 in.)) as shown in the illustration.

Seal packing: Part No. 08826 – 00100 or equivalent

NOTICE:

Install the water pump assy within 5 minutes after applying seal packing. Otherwise the material must be removed and reapplied.



(c) Install the water pump and wire clamp with 4 bolts and 2 nuts.

Torque: 9.0 N·m (90 kgf·cm, 80 in.·lbf)

(d) Install the crankshaft position sensor wire harness clamp to the water pump.

(e) Install the crankshaft position sensor wire to the wire clamp on the water pump.

12. INSTALL WATER PUMP PULLEY

(a) Using SST, install the pump pulley with 4 bolts.

SST 09960–10010 (09962–01000, 09963–00700)

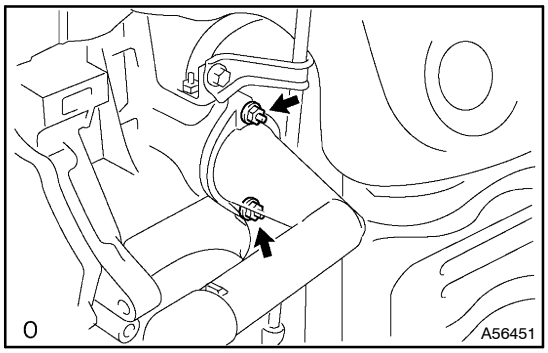
Torque: 26 N·m (265 kgf·cm, 19 ft·lbf)

13. INSTALL GENERATOR ASSY (See page 19–8)

14. INSTALL FAN AND GENERATOR V BELT (See page 14–5)

SST 09249–63010

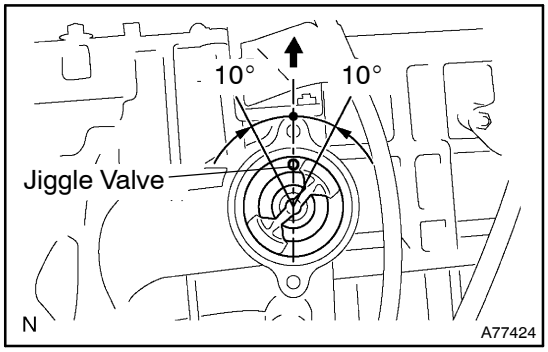
15. ADD COOLANT (See page 16–7)



16. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)

THERMOSTAT (2AZ–FSE)

160MQ–02



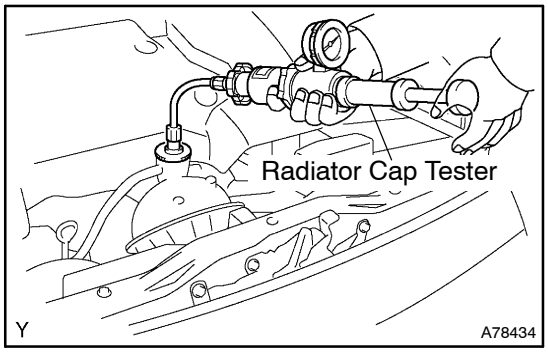
REPLACEMENT

1. **DRAIN COOLANT (See page 16–7)**
2. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)**
3. **REMOVE ENGINE ROOM COVER SIDE (See page 14–23)**
4. **REMOVE ENGINE UNDER COVER LH (See page 14–23)**
5. **REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)**
6. **REMOVE ENGINE UNDER COVER RH (See page 14–23)**
7. **REMOVE FAN AND GENERATOR V BELT (See page 14–5)**
   SST 09249–63010
8. **REMOVE GENERATOR ASSY (See page 19–8)**

9. **REMOVE WATER INLET**
   (a) Remove the 2 nuts and water inlet.

10. **REMOVE THERMOSTAT**

11. **INSTALL THERMOSTAT**
   (a) Install a new gasket to the thermostat.
   (b) Install the thermostat while aligning the jiggle valve with its right position described in the illustration.



HINT:
The jiggle valve may be set within 10° of either side of the prescribed position.

12. **INSTALL WATER INLET**
    Torque: 9.0 N·m (92 kgf·cm, 7 in.·lbf)
13. **INSTALL GENERATOR ASSY (See page 19–8)**
14. **INSTALL FAN AND GENERATOR V BELT (See page 14–5)**
    SST 09249–63010
15. **ADD COOLANT (See page 16–7)**
16. **CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)**

COOLING SYSTEM (1CD–FTV)(From September, 2003)

160T1–01

ON–VEHICLE INSPECTION

1. INSPECT COOLING SYSTEM FOR LEAKS

CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(a) Remove the radiator support opening cover.
(b) Remove the engine room cover side.
(c) Fill the radiator with coolant, then attach a radiator cap tester.
(d) Warm up the engine.
(e) Pump it to 137 kPa (1.4 kgf/cm^2, 19.9 psi), then check that the pressure does not drop.

If the pressure drops, check the hoses, radiator and water pump for leaks. If there are no signs or traces of external coolant leaks, check the heater core, cylinder block and head.

(f) Reinstall the engine room cover side.
(g) Reinstall the radiator support opening cover.

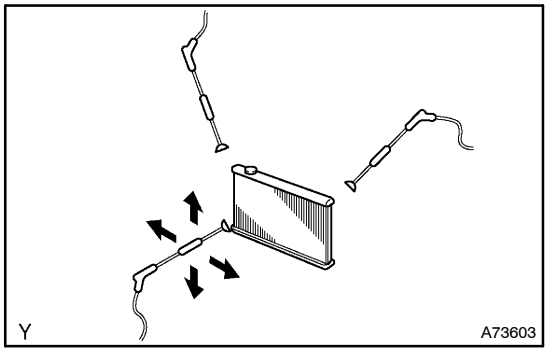
2. CHECK ENGINE COOLANT LEVEL AT RESERVOIR

(a) The engine coolant should be between the ”LOW” and ”FULL” lines when the engine is cold.

If low, check for leaks and add ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate, non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology up to the ”FULL” line.

3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator cap.



CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

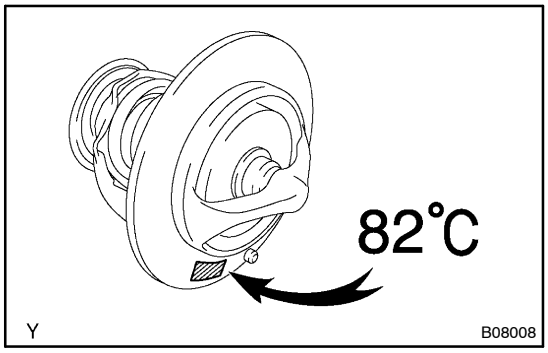
(b) Check the radiator cap and radiator filler hole for rust or scale; the coolant should be free from oil.

If excessively dirty, replace the coolant.

(c) Reinstall the radiator cap.

4. INSPECT FIN BLOCKAGE

(a) If the fins are clogged, wash them with water or a steam cleaner and dry them with compressed air.

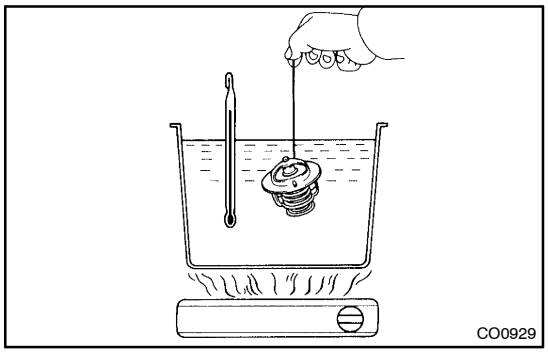


NOTICE:

- **If the distance between the steam cleaner and core is too close, there is a possibility of damaging the fins, so keep the following injection distance.**

Injection Pressures kPa (kgf/cm^2, psi)	Injection Distance mm (in.)
2,942 to 4,903 (30 to 50, 427 to 711)	300 (11.811)
4,903 to 7,845 (50 to 80, 711 to 1,138)	500 (19.685)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Be careful not to pour water directly onto the electronic components.**

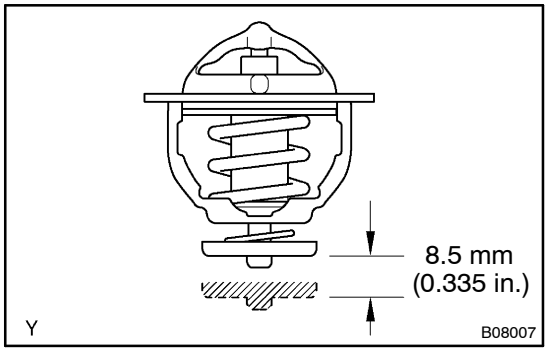


INSPECTION

1. INSPECT THERMOSTAT

HINT:

The thermostat is imprinted with the valve opening temperature.



(a) Immerse the thermostat in the water, then gradually heat the water.

(b) Check the valve opening temperature of the thermostat.

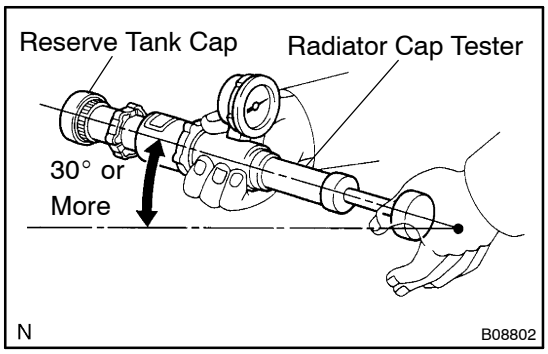
Valve opening temperature:
80 to 84°C (176 to 183°F)

If the valve opening temperature is not as specified, replace the thermostat.

(c) Check the valve lift.

Valve lift: 8.5 mm (0.335 in.) or more at 95°C (203°F)

If the valve lift is not as specified, replace the thermostat.



(d) Check that the valve is fully closed when the thermostat is at low temperatures (below 77°C (171°F)).

If not fully closed, replace the thermostat.

2. INSPECT RESERVE TANK CAP SUB–ASSY

NOTICE:

- **If the radiator cap is contaminated, rinse it with water.**
- **Before using a radiator cap tester, wet the relief valve and pressure valve with engine coolant or water.**
- **When performing following steps (a) and (b), keep the tester at an angle of over 30° above horizontal.**

(a) Using a radiator cap tester, slowly pump the tester and check that air is coming from the vacuum valve.

Pumping speed: 1 push / 3 seconds or more

NOTICE:

Push the pump at a constant speed.

If air is not coming from the vacuum valve, replace the reserve tank cap.

(b) Pump the tester, then measure the relief valve opening pressure.

NOTICE:

The following pumping speed is for the first pump only (in order to close the vacuum valve). After the first pumping, the pumping speed can be reduced.

Pumping speed: 1 push within 1 second

Standard opening pressure:

93 to 122 kPa (0.95 to 1.25 kgf/cm^2, 13.4 to 17.6 psi)

Minimum opening pressure:

78 kPa (0.8 kgf/cm^2, 11.4 psi)

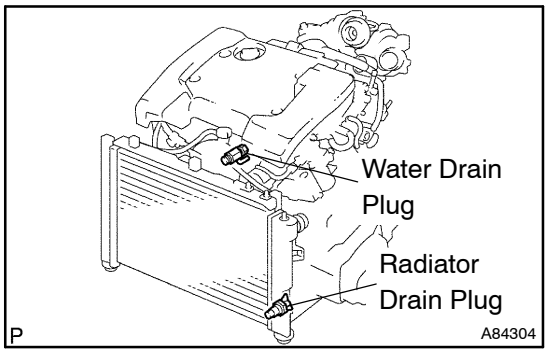
If the opening pressure is less than minimum, replace the reserve tank cap.

HINT:

Use the tester's maximum reading as the opening pressure.

ENGINE COOLANT (1CD–FTV)(From September, 2003)

160T3–01



REPLACEMENT

1. DRAIN ENGINE COOLANT

(a) Remove the radiator cap.

CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(b) Loosen the radiator and engine drain plugs, then drain the coolant.

(c) Put in the drain plugs.

Torque: 13 N·m (133 kgf·cm, 10 ft·lbf) for engine

2. ADD ENGINE COOLANT

(a) Loosen air bleed valve A.

(b) Fill the cooling system with coolant up to line B.

Capacity:

7.6 liters (8.0 US qts, 6.7 Imp. qts) : with power heater

7.4 liters (7.8 US qts, 6.5 Imp. qts) : without power heater

HINT:

- Use of improper coolants may damage the engine cooling system.
- Only use ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate, non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology.
- New Toyota vehicles are filled with Toyota Super Long Life Coolant. When replacing the coolant, Toyota Super Long Life Coolant is recommended.
- Observe the coolant level inside the radiator by pressing the inlet and outlet radiator hoses several times by hand. If the coolant level goes down, add the coolant.

NOTICE:

Do not use plain water alone.

(c) Tighten air bleed valve A securely.

(d) Install the radiator cap securely.

(e) Warm up the engine.

HINT:

Warm up the engine with the engine speed of 2,000 rpm or more. Keep warming it up until the thermostat is open and the radiator reservoir becomes hot.

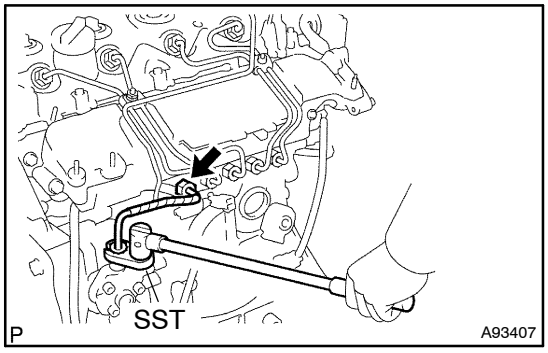
(f) Run the engine intermittently at 3,000 rpm for 5 seconds and at idle for 45 seconds.

(g) Do the above operation for 7 minutes or more.

(h) After the engine gets cold, check that the coolant level is between the ”LOW” and ”FULL” lines.

3. CHECK FOR ENGINE COOLANT LEAKS

(a) Fill the radiator with coolant, then attach a radiator cap tester.



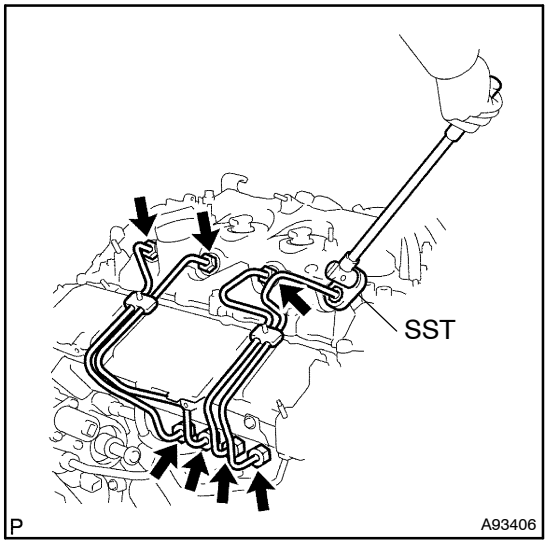
(b) Pump it to 137 kPa (1.4 kgf/cm^2, 19.9 psi), then check that the pressure does not drop.

WATER PUMP ASSY (1CD–FTV)(From September, 2003)

160T4–01

REPLACEMENT

1. REMOVE RADIATOR SUPPORT OPENING COVER
2. REMOVE ENGINE ROOM COVER SIDE
3. DRAIN ENGINE COOLANT (See page 16–19)
4. REMOVE FRONT WHEEL RH
5. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1
6. REMOVE ENGINE UNDER COVER RH
7. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–90)
8. REMOVE INJECTOR DRIVER (See page 14–108)
9. REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)
10. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)
11. SEPARATE POWER STEERING IDLE PULLEY BRACKET (See page 14–138)
12. DISCONNECT ENGINE WIRE (See page 14–138)
13. DISCONNECT VACUUM HOSE (See page 14–108)
14. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)
15. REMOVE CRANKSHAFT PULLEY (See page 14–138)
    SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)
16. REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)
17. REMOVE TIMING BELT NO.2 COVER (See page 14–138)
18. REMOVE TIMING BELT NO.1 COVER (See page 14–138)
19. REMOVE TIMING BELT GUIDE
20. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)
21. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
22. REMOVE TIMING CHAIN COVER PLATE (See page 14–138)
23. REMOVE TIMING BELT (See page 14–138)



24. REMOVE FUEL INLET PIPE SUB–ASSY

NOTICE:

After removing the fuel inlet pipe, cover the common rail and injection pump with vinyl tape to prevent dust from being introduced.

(a) Remove the wire bracket, then slide the engine wire.
(b) Using SST, remove the fuel inlet pipe from the common rail.
    SST 09023–12700
(c) Using SST, remove the fuel inlet pipe from the injection pump.
    SST 09023–12700

25. REMOVE FUEL PIPE NO.3 (See page 14–108)
    SST 09023–12700

26. REMOVE INJECTION PIPE SUB–ASSY NO.1

(a) Remove the 2 upper injection pipe clamps from the intake manifold.

(b) Using SST, remove the injection pipe from the common rail side.
SST 09023–12700

(c) Using SST, remove the injection pipe from the injector side.
SST 09023–12700

(d) After removing the fuel pipe, in order to prevent dust or foreign objects from being introduced, cover the common rail with vinyl tape and protect the injector inlet with a vinyl or plastic bag.

(e) Remove the 2 lower injection pipe clamps from the intake manifold.

27. REMOVE INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

28. REMOVE INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

29. REMOVE INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

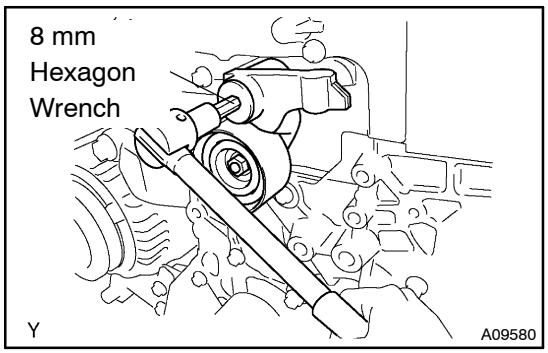
HINT:
Perform the same procedures as the injection pipe No. 1.

30. REMOVE INTAKE MANIFOLD INSULATOR NO.1 (See page 14–108)

31. REMOVE OIL LEVEL GAGE SUB–ASSY

32. REMOVE OIL LEVEL GAGE GUIDE (See page 17–11)

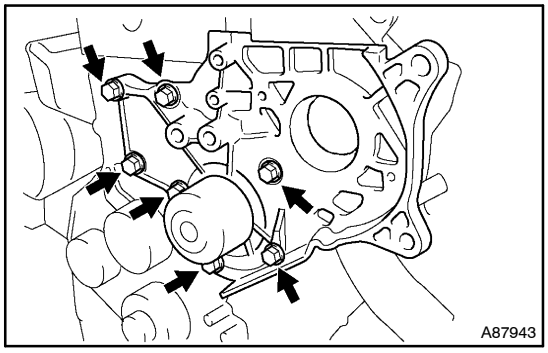
33. REMOVE WATER INLET (See Pub. No. RM1018E on page 16–50)



34. DISCONNECT INJECTION PUMP TO FUEL PIPE FUEL HOSE (See page 11–58)

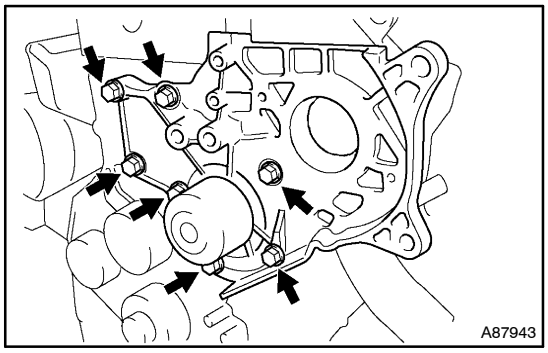
35. DISCONNECT INJECTION PUMP TO FUEL FILTER FUEL HOSE OR PIPE (See page 11–58)

36. REMOVE INJECTION PUMP DRIVE PULLEY (See page 11–58)
SST 09960–10010 (09962–01000, 09963–01000), 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)



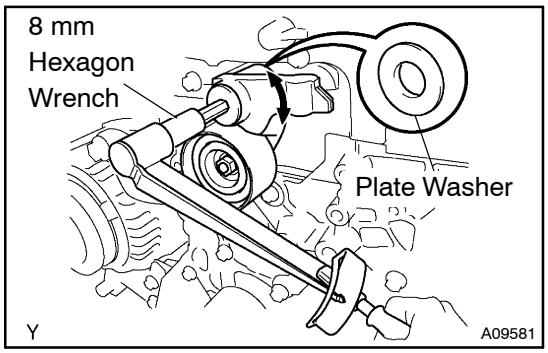
37. REMOVE INJECTION PUMP STAY NO.1 (See page 11–58)

38. REMOVE INJECTION OR SUPPLY PUMP ASSY (See page 11–58)



39. REMOVE TIMING BELT IDLER SUB–ASSY NO.1

(a) Using an 8 mm hexagon wrench, remove the idler pulley shaft, idler pulley and plate washer.



40. REMOVE WATER PUMP ASSY

(a) Remove the 7 bolts, then remove the water pump and gasket.

41. INSTALL WATER PUMP ASSY

(a) Install a new gasket and the water pump with the 7 bolts.
Torque: 31 N·m (320 kgf·cm, 23 ft·lbf)

42. INSTALL TIMING BELT IDLER SUB–ASSY NO.1

(a) Using an 8 mm hexagon wrench, install the plate washer and idler pulley with the idler pulley shaft.
Torque: 35 N·m (357 kgf·cm, 26 ft·lbf)

(b) Check that the pulley bracket moves smoothly.

43. INSTALL INJECTION OR SUPPLY PUMP ASSY (See page 11–58)

44. INSTALL INJECTION PUMP STAY NO.1 (See page 11–58)

45. INSTALL INJECTION PUMP DRIVE PULLEY (See page 11–58)

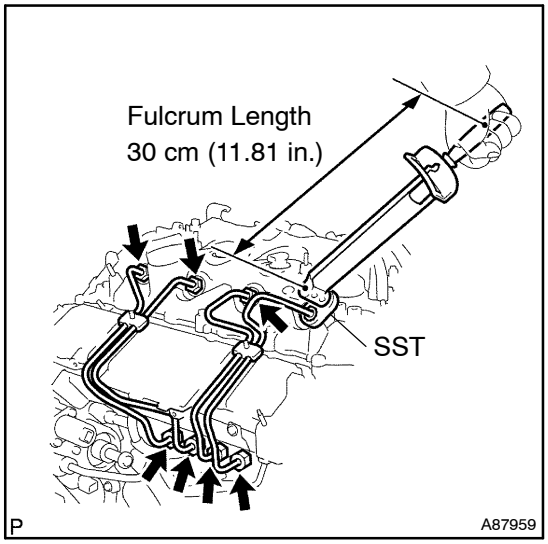
SST 09960–10010 (09962–01000, 09963–01000)

46. INSTALL WATER INLET (See Pub. No. RM1018E on page 16–50)

47. INSTALL OIL LEVEL GAGE GUIDE (See page 17–11)

48. INSTALL INTAKE MANIFOLD INSULATOR NO.1 (See page 14–108)

49. INSTALL INJECTION PIPE SUB–ASSY NO.1



NOTICE:

When assembling the pipes, perform the operation with the engine cold at room temperature.

(a) Remove the vinyl or plastic bag from the injector and the vinyl tape from the common rail.

(b) Install the 2 lower injection pipe clamps to the intake manifold.

(c) Temporarily install the injection pipe.

(d) Using SST, tighten the nut of the injection pipe on the common rail side.
SST 09023–12700
Torque:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(e) Using SST, tighten the nut of the injection pipe on the injector side.
SST 09023–12700
Torque:
For used pipe:
36 N·m (372 kgf·cm, 27 ft·lbf) with SST
40 N·m (408 kgf·cm, 30 ft·lbf) without SST
For new pipe:
31 N·m (316 kgf·cm, 23 ft·lbf) with SST
34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:
- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the injection pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(f) Install the 2 upper injection pipe clamps.

50. INSTALL INJECTION PIPE SUB–ASSY NO.2
SST 09023–12700

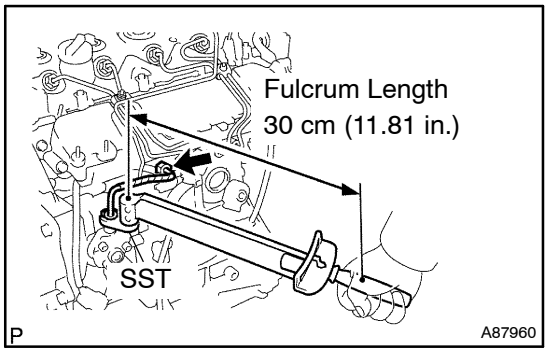
HINT:
Perform the same procedures as the injection pipe No. 1.

51. INSTALL INJECTION PIPE SUB–ASSY NO.3
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.

52. INSTALL INJECTION PIPE SUB–ASSY NO.4
SST 09023–12700

HINT:
Perform the same procedures as the injection pipe No. 1.



53. INSTALL FUEL PIPE NO.3 (See page 14–108)
SST 09023–12700

54. INSTALL FUEL INLET PIPE SUB–ASSY

NOTICE:

- **In case of replacing the water pump, the fuel inlet pipe must be replaced, too.**
- **When assembling the pipe, perform the operation with the engine cold at room temperature.**

(a) Temporarily install a new fuel inlet pipe.

(b) Using SST, tighten the nut of the fuel inlet pipe on the common rail side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

(c) Using SST, tighten the nut of the fuel inlet pipe on the injection pump side.

SST 09023–12700

Torque:

31 N·m (316 kgf·cm, 23 ft·lbf) with SST

34 N·m (347 kgf·cm, 25 ft·lbf) without SST

HINT:

- Use a torque wrench with the fulcrum length of 30 cm (11.81 in.).
- After the inlet pipe is reassembled, check that the used pipe has no deflection and is installed properly. If it has deflection or could not be installed properly, replace the used pipe with a new pipe.

55. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)

SST 09960–10010 (09962–01000, 09963–01000)

56. INSTALL TIMING BELT (See page 14–138)

57. CHECK VALVE TIMING (See page 14–138)

58. INSTALL TIMING CHAIN COVER PLATE (See page 14–138)

59. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)

60. INSTALL TIMING BELT GUIDE (See page 14–138)

61. INSTALL TIMING BELT NO.1 COVER (See page 14–138)

62. INSTALL TIMING BELT NO.2 COVER (See page 14–138)

63. INSTALL IDLER PULLEY SUB–ASSY (See page 14–138)

64. INSTALL CRANKSHAFT PULLEY (See page 14–138)

SST 09213–54015 (09213–70020), 09330–00021

65. INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)

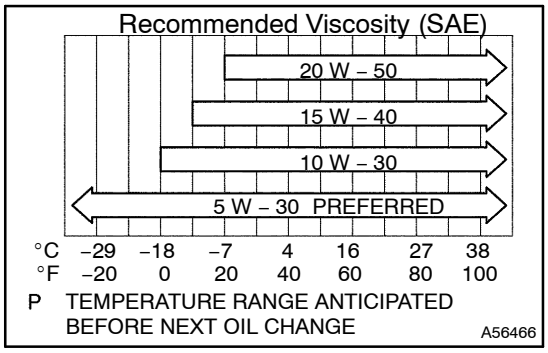
66. **INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)**
67. **ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)**
68. **INSTALL INJECTOR DRIVER (See page 14–108)**
69. **INSTALL FRONT WHEEL RH**
    Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
70. **INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 14–90)**
71. **ADD ENGINE COOLANT (See page 16–19)**
72. **CHECK FOR ENGINE COOLANT LEAKS (See page 16–15)**
73. **CHECK FOR FUEL LEAKS (See page 11–46)**

LUBRICATION SYSTEM (2AZ–FSE)

1700E–10

ON–VEHICLE INSPECTION

1. CHECK ENGINE OIL LEVEL



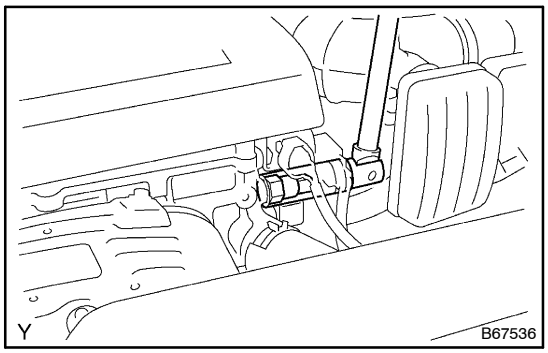
(a) After warm up the engine, then stop the engine and wait for 5 minutes,

(b) Check that the engine oil level is between the ”L” and ”F” marks on the oil level gage.

If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill with engine oil above the full level mark.

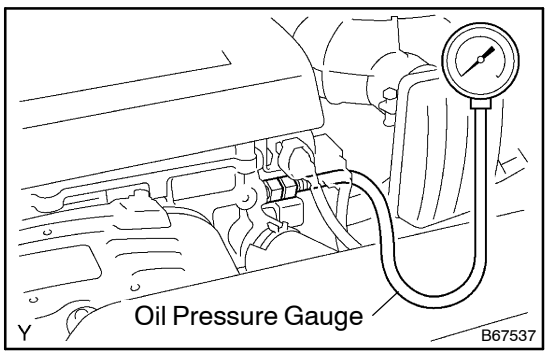


2. CHECK ENGINE OIL QUALITY

(a) Check the oil for deterioration, water intrusion.

If the quality is visibly poor, replace the engine oil.

Oil grade:



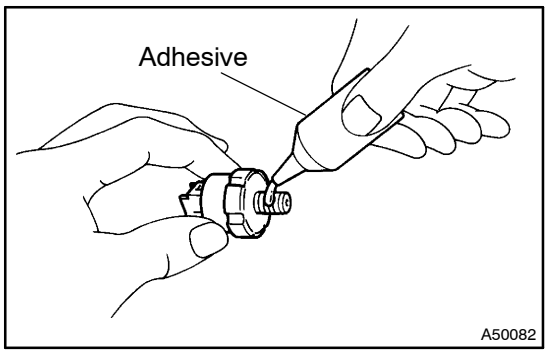
API grade ”SL” Energy–Conserving or ILSAC multi grade engine oil. Recommended viscosity is as shown in the illustration.

3. INSPECT OIL PRESSURE

(a) Disconnect the oil pressure switch connector.

(b) Using a deep socket wrench 24mm, remove the oil pressure switch.

(c) Install the oil pressure gauge.



(d) Warm up the engine.

(e) Check the oil pressure.

Oil pressure:

Engine Condition	Oil Pressure
At idle	29 kPa (0.3 kgf/cm^2, 4.3 psi) or more
At 3,000 rpm	245 to 539 kPa (2.5 to 5.5 kgf/cm^2, 36 to 78 psi) or more

(f) Remove the oil pressure gauge.

(g) Apply adhesive to 2 or 3 threads of the oil pressure switch.

Adhesive:

Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

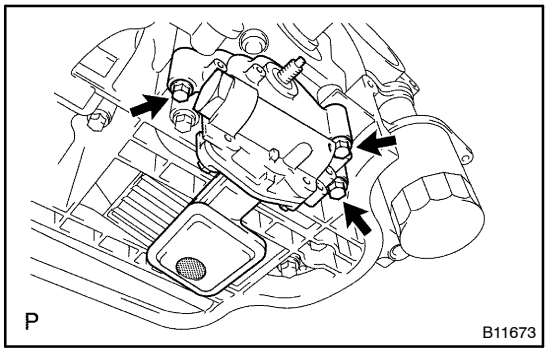
(h) Using a 24 mm deep socket wrench, install the oil pressure switch.

Torque: 15 N·m (153 kgf·cm, 11 ft·lbf)

NOTICE:

Do not start the engine within 1 hour of installation.

(i) Connect the oil pressure switch connector.
(j) Start the engine.
(k) Check for the engine oil leaks.



OIL PUMP ASSY (2AZ–FSE)

170IV–01

REPLACEMENT

1. DISCHARGE FUEL SYSTEM PRESSURE (See page 11–4)
2. REMOVE FRONT WHEEL RH
3. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–23)
4. REMOVE ENGINE ROOM COVER SIDE (See page 14–23)
5. REMOVE ENGINE UNDER COVER LH (See page 14–23)
6. REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)
7. REMOVE ENGINE UNDER COVER RH (See page 14–23)
8. DRAIN ENGINE OIL (See page 17–6)
9. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–45)
10. REMOVE FUEL PRESSURE PULSATION DAMPER ASSY
11. DISCONNECT FUEL TUBE SUB–ASSY (See page 11–4)
12. SEPARATE FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
    SST 09023–12900
13. REMOVE FUEL PUMP ASSY (See page 11–24)
14. REMOVE FAN AND GENERATOR V BELT (See page 14–5)
    SST 09249–63010
15. REMOVE GENERATOR ASSY (See page 19–8)
16. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–2)
17. SEPARATE VANE PUMP ASSY (See page 14–45)
18. SEPARATE RETURN TUBE SUB–ASSY (See page 14–45)
19. SEPARATE COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE) (See page 14–45)
20. REMOVE VANE PUMP OIL RESERVOIR ASSY (See page 14–45)
21. REMOVE OIL RESERVOIR BRACKET NO.1 (See page 14–45)
22. SEPARATE ENGINE WIRE (See page 14–45)
23. REMOVE COOLER BRACKET (LHD STEERING POSITION TYPE) (See page 14–45)
24. REMOVE ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE) (See page 14–45)
25. REMOVE IGNITION COIL ASSY (See page 14–45)
26. REMOVE CYLINDER HEAD COVER SUB–ASSY (See page 14–45)
27. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–45)
28. REMOVE ENGINE MOUNTING BRACKET NO.2 RH (See page 14–45)
29. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR (See page 14–45)
30. REMOVE CRANKSHAFT PULLEY (See page 14–45)
    SST 09213–54015 (91651–60855), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)
31. REMOVE CHAIN TENSIONER ASSY NO.1 (See page 14–45)
32. REMOVE CRANKSHAFT POSITION SENSOR (See page 18–6)
33. REMOVE OIL PAN SUB–ASSY (See page 14–45)
    SST 09032–00100
34. REMOVE V–RIBBED BELT TENSIONER ASSY (See page 14–45)
35. REMOVE TIMING CHAIN OR BELT COVER SUB–ASSY (See page 14–45)
36. REMOVE CRANKSHAFT POSITION SENSOR PLATE NO.1
37. REMOVE CHAIN TENSIONER SLIPPER
38. REMOVE CHAIN VIBRATION DAMPER NO.1
39. REMOVE TIMING CHAIN GUIDE (See page 14–45)

40. REMOVE CHAIN SUB–ASSY
41. REMOVE CRANKSHAFT TIMING GEAR OR SPROCKET
42. REMOVE NO.2 CHAIN SUB–ASSY (See page 14–45)

43. REMOVE OIL PUMP ASSY
(a) Remove the 3 bolts, oil pump and gasket.

44. INSTALL OIL PUMP ASSY
(a) Install a new gasket and oil pump with 3 bolts.
Torque: 19 N·m (195 kgf·cm, 15 ft·lbf)
45. INSTALL NO.2 CHAIN SUB–ASSY (See page 14–45)
46. INSTALL CRANKSHAFT TIMING GEAR OR SPROCKET
47. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–45)
48. INSTALL CHAIN VIBRATION DAMPER NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
49. INSTALL CHAIN SUB–ASSY (See page 14–45)
50. INSTALL TIMING CHAIN GUIDE
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
51. INSTALL CHAIN TENSIONER SLIPPER (See page 14–45)
52. INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1 (See page 14–45)
53. INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY (See page 14–45)
54. INSTALL V–RIBBED BELT TENSIONER ASSY (See page 14–45)
55. INSTALL OIL PAN SUB–ASSY (See page 14–45)
56. INSTALL CRANKSHAFT POSITION SENSOR (See page 18–6)
57. INSTALL CRANKSHAFT PULLEY (See page 14–45)
SST 09213–54015 (91651–60855), 09330–00021
58. INSTALL CHAIN TENSIONER ASSY NO.1
59. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING INSULATOR
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)
60. INSTALL ENGINE MOUNTING BRACKET NO.2 RH (See page 14–45)
61. INSTALL CYLINDER HEAD COVER SUB–ASSY (See page 14–45)
62. INSTALL COOLER BRACKET (LHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
63. INSTALL ENGINE SERVICE COVER BRACKET RH (RHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
64. INSTALL ENGINE WIRE
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)
65. INSTALL OIL RESERVOIR BRACKET NO.1
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
66. INSTALL COOLER REFRIGERANT SUCTION HOSE NO.1 (LHD STEERING POSITION TYPE)
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

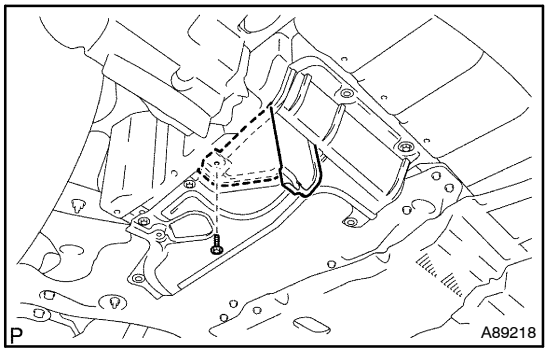
67. INSTALL RETURN TUBE SUB–ASSY
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)
68. INSTALL IGNITION COIL ASSY
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
69. INSTALL VANE PUMP ASSY
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)
70. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–2)
71. INSTALL GENERATOR ASSY (See page 19–8)
72. INSTALL FAN AND GENERATOR V BELT (See page 14–5)
SST 09249–63010
73. INSTALL FUEL PUMP ASSY (See page 11–24)
74. INSTALL FUEL PIPE SUB–ASSY NO.1 (See page 11–24)
SST 09023–12900
75. INSTALL FUEL TUBE SUB–ASSY (See page 11–4)
76. INSTALL FUEL PRESSURE PULSATION DAMPER ASSY (See page 11–24)
77. ADD ENGINE OIL (See page 17–6)
78. CHECK FOR ENGINE OIL LEAKS
79. CHECK FUEL LEAK
80. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
81. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
82. ADD POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
83. BLEED POWER STEERING FLUID (See Pub. No. RM1018E on page 51–4)
84. CHECK POWER STEERING FULUID LEVEL IN RESERVER (See Pub. No. RM1018E on page 51–4)

OIL FILTER SUB–ASSY (2AZ–FSE)

170IW–01

REPLACEMENT

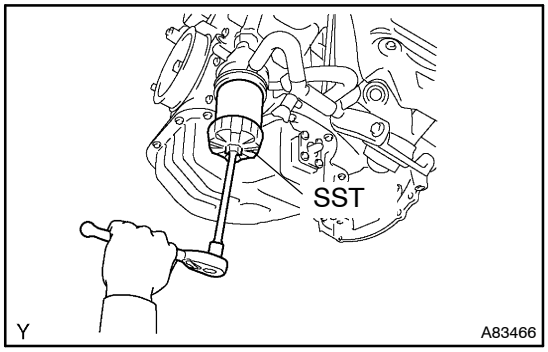
CAUTION:



- **Prolonged and repeated contact with mineral oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Exercise caution in order to minimize the length and frequency of contact of your skin to used oil. Wear protective clothing and gloves. Wash your skin thoroughly with soap and water, or use water–less hand cleaner to remove any used engine oil. Do not use gasoline, thinners or solvents.**
- **In order to preserve the environment, used oil and used oil filter must be disposed of only at designated disposal sites.**

1. DRAIN ENGINE OIL

(a) Remove the oil filler cap

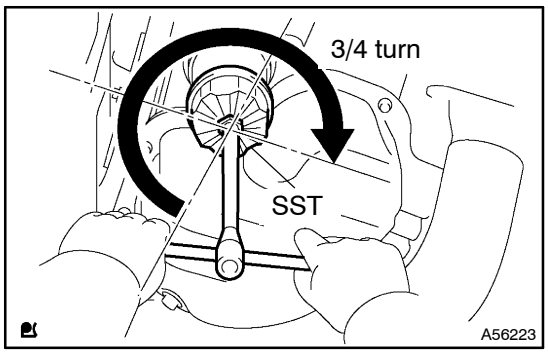


(b) Remove the drain plug from the oil pan.

(c) Install a new gasket and drain plug after draining engine oil.
Torque: 25 N·m (250 kgf·cm, 18 ft·lbf)

2. REMOVE OIL FILTER SUB–ASSY

(a) Remove the bolt, then pull out the engine under cover No.4.



(b) Using SST, remove the oil filter.
SST 09228–06501

3. INSTALL OIL FILTER SUB–ASSY

(a) Check and clean the oil filter installation surface.

(b) Apply clean engine oil to the gasket of a new oil filter.

(c) Lightly screw the oil filter into place, then tighten it until the gasket contacts the seat.

(d) Using SST, tighten it by an additional 3/4 turn.
SST 09228–06501
Torque: 17.5 N·m (178 kgf·cm, 13 ft·lbf)

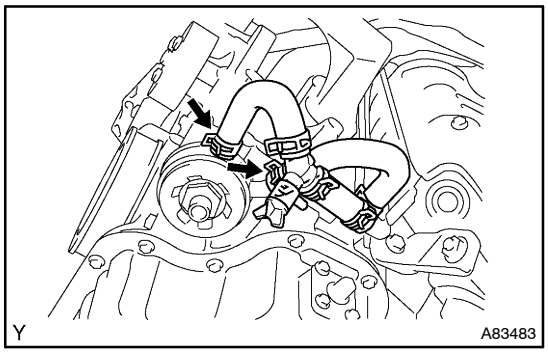
4. ADD ENGINE OIL

(a) Fill with fresh engine oil.

Capacity:

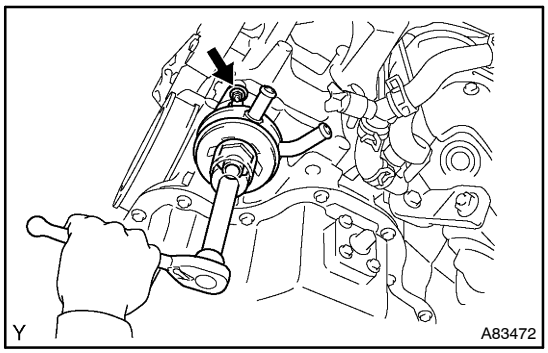
Condition	Capacity	Quality
Drain and refill w/ oil filter change	3.8 liters (4.0 US qts, 3.3 lmp.qts)	See Page 17–1
Drain and refill w/o oil filter change	3.6 liters (3.8 US qts, 3.2 lmp.qts)	
Dry fill	4.5 liters (4.8 US qts, 4.0 lmp.qts)	

(b) Install the oil filler cap.



5. CHECK FOR ENGINE OIL LEAKS

OIL COOLER ASSY (2AZ–FSE)



170IX–01

REPLACEMENT

1. **REMOVE ENGINE UNDER COVER NO.4 RH (See page 14–23)**
2. **REMOVE ENGINE UNDER COVER RH (See page 14–23)**
3. **DRAIN ENGINE OIL (See page 17–6)**
4. **DRAIN COOLANT (See page 16–7)**
5. **REMOVE OIL FILTER SUB–ASSY (See page 17–6)**
   SST 09228–06501

6. **REMOVE OIL COOLER ASSY**
(a) Disconnect the 2 oil cooler hoses from the oil cooler.

(b) Using the 30 mm socket wrench, remove the oil cooler union bolt.
(c) Remove the nut, then remove the oil cooler.
(d) Remove the O–ring from the oil cooler.

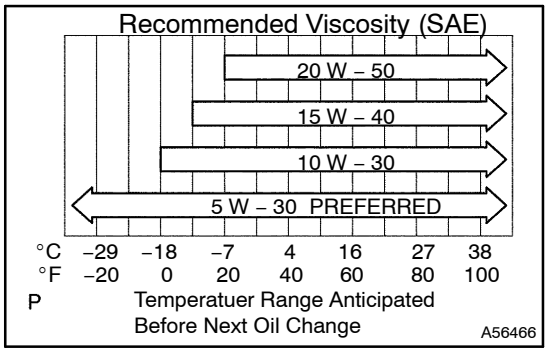
7. **INSTALL OIL COOLER ASSY**
(a) Install a new O–ring to the oil cooler.
(b) Install the oil cooler with a nut.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)
(c) Using the 30 mm socket wrench, install the oil cooler union bolt to the oil cooler.
Torque: 79 N·m (800 kgf·cm, 58 ft·lbf)
(d) Connect the 2 oil cooler hoses.
8. **INSTALL OIL FILTER SUB–ASSY (See page 17–6)**
   SST 09228–06501
9. **ADD ENGINE OIL (See page 17–6)**
10. **ADD COOLANT (See page 16–7)**
11. **CHECK FOR ENGINE OIL LEAKS**
12. **CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)**

LUBRICATION SYSTEM (1CD–FTV)(From September, 2003)

170IY–01

ON–VEHICLE INSPECTION

1. CHECK ENGINE OIL LEVEL



(a) Warm up the engine. Stop the engine, then wait for 5 minutes.

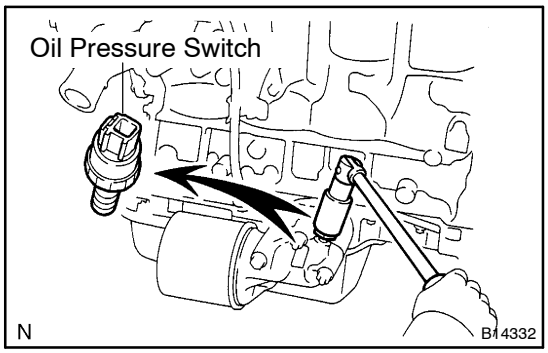
(b) Check that the engine oil level is between the 2 marks on the oil level gage.

If low, check for leakage and add oil up to the upper mark.

NOTICE:

Do not fill with engine oil above the upper mark.

2. CHECK ENGINE OIL QUALITY

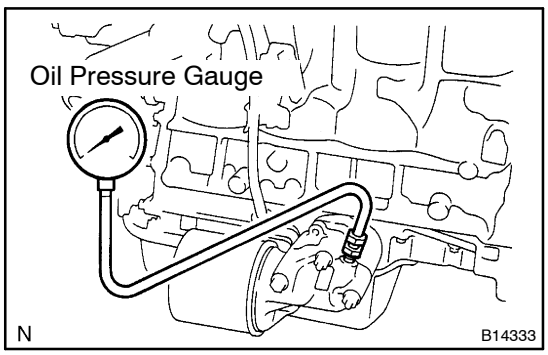


(a) Check the oil for deterioration, water intrusion, discoloring or thinning.

If the quality is visibly poor, replace the oil.

Oil grade:

Use ACEA B1, API grade CF – 4, CF or G–DLD–1. (You may also use API CE or CD.)



SAE 5W – 30 is the best choice for your vehicle in terms of good fuel economy and good starting in cold weather.

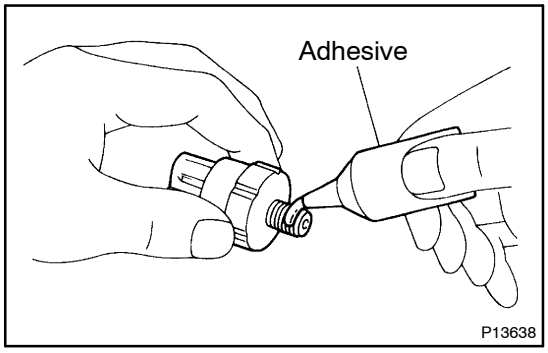
3. REMOVE OIL PRESSURE SWITCH ASSY

(a) Disconnect the oil pressure switch connector.

(b) Using a deep socket wrench 24mm, remove the oil pressure switch.

4. INSTALL OIL PRESSURE GAUGE

(a) Install the oil pressure gauge.



5. WARM UP ENGINE

6. CHECK OIL PRESSURE

Oil pressure:

At idle	29 kPa (0.3 kgf/cm^2, 4.3 psi) or more
At 4,500 rpm	245 to 588 kPa (2.5 to 6.0 kgf/cm^2, 36 to 85 psi) or more

7. REMOVE OIL PRESSURE GAUGE

8. INSTALL OIL PRESSURE SWITCH ASSY

(a) Apply adhesive to the 2 or 3 threads of the oil pressure switch.

Adhesive:
Part No. 08833 – 00080, THREE BOND 1344, LOCTITE 242 or equivalent

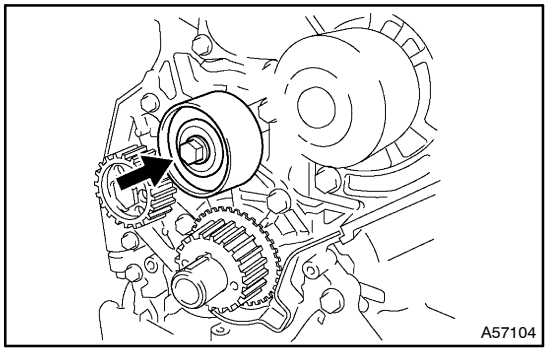
(b) Using a deep socket wrench 24mm, install the oil pressure switch.

Torque: 15 N·m (153 kgf·cm, 11 ft·lbf)

NOTICE:

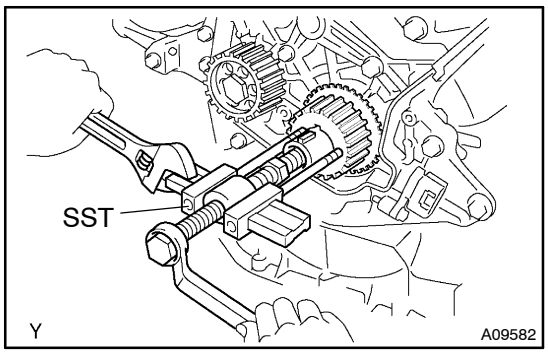
Do not start the engine within 1 hour after the installation.

(c) Connect the oil pressure switch connector.



9. START ENGINE AND CHECK FOR LEAKS

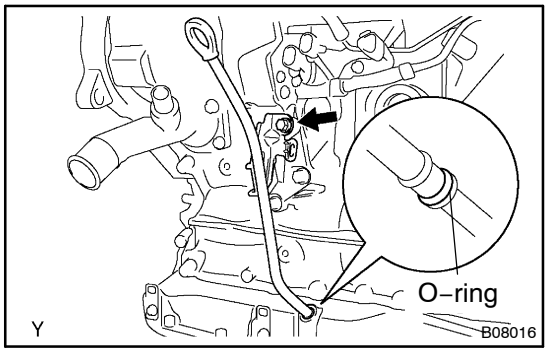
OIL PUMP ASSY (1CD–FTV)(From September, 2003)



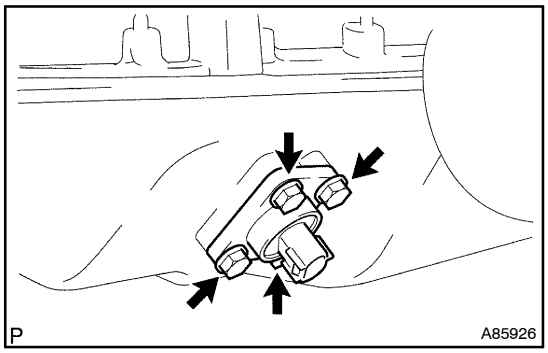
170IZ–01

REPLACEMENT

1. DRAIN ENGINE OIL (See Pub. No. RM1018E on page 17–30)
2. REMOVE RADIATOR SUPPORT OPENING COVER
3. REMOVE ENGINE ROOM COVER SIDE
4. REMOVE FRONT WHEEL RH
5. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1
6. REMOVE ENGINE UNDER COVER RH
7. REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 14–90)
8. REMOVE INJECTOR DRIVER (See page 14–108)
9. REMOVE V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)
10. REMOVE GENERATOR V BELT (See Pub. No. RM1018E on page 14–269)
11. SEPARATE POWER STEERING IDLE PULLEY BRACKET (See page 14–138)
12. DISCONNECT ENGINE WIRE (See page 14–138)
13. DISCONNECT VACUUM HOSE (See page 14–108)
14. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)
15. REMOVE CRANKSHAFT PULLEY (See page 14–138)
    SST 09213–54015 (09213–70020), 09330–00021, 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05031)
16. REMOVE IDLER PULLEY SUB–ASSY (See page 14–138)
17. REMOVE TIMING BELT NO.2 COVER (See page 14–138)
18. REMOVE TIMING BELT NO.1 COVER (See page 14–138)
19. REMOVE TIMING BELT GUIDE
20. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)
21. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
22. REMOVE TIMING CHAIN COVER PLATE (See page 14–138)
23. REMOVE TIMING BELT (See page 14–138)

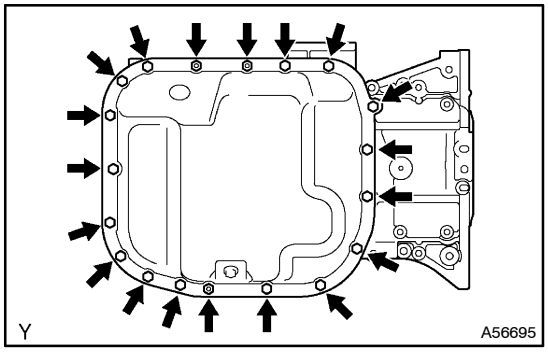


24. REMOVE TIMING BELT IDLER SUB–ASSY NO.2

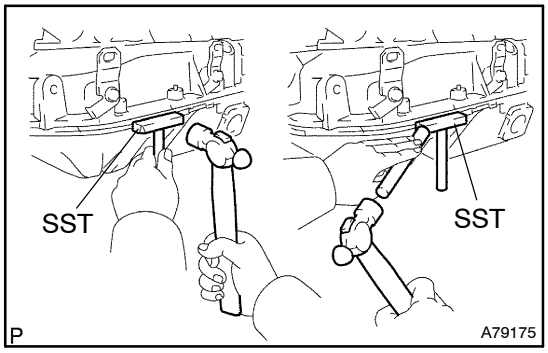


25. REMOVE CRANKSHAFT TIMING PULLEY

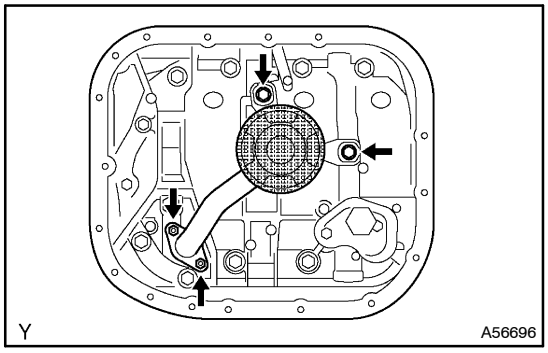
(a) If the timing pulley cannot be removed by hand, use SST to remove the pulley.
    SST 09950–50013 (09951–05010, 09952–05010, 09953–05010, 09953–05020, 09954–05021)



26. REMOVE FLOOR PANEL BRACE FRONT (See page 15–6)
27. REMOVE EXHAUST PIPE ASSY FRONT (See page 15–6)
28. REMOVE GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)
29. REMOVE TIMING BELT IDLER SUB–ASSY NO.1 (See page 16–21)
30. REMOVE V–RIBBED BELT TENSIONER ASSY (See page 14–108)

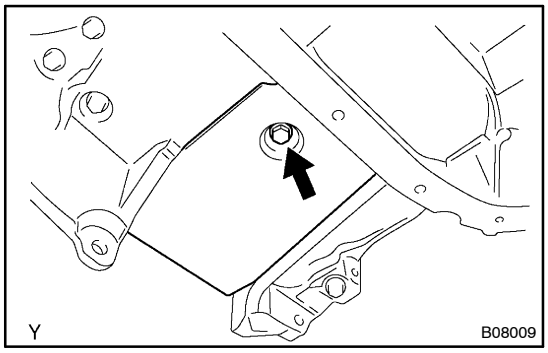


31. REMOVE OIL LEVEL GAGE GUIDE
(a) Remove the bolt which secures the oil level gage guide to the cylinder block.
(b) Pull out the oil level gage guide together with the oil level gage from the No. 1 oil pan.
(c) Remove the O–ring from the oil level gage guide.

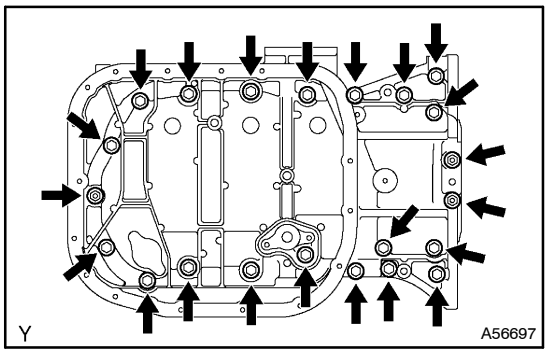


32. REMOVE ENGINE OIL LEVEL SENSOR
(a) Remove the 4 bolts and level sensor.
NOTICE:
Be careful not to drop the oil level sensor when removing.

33. REMOVE OIL PAN SUB–ASSY NO.2
(a) Remove the 16 bolts and 3 nuts.

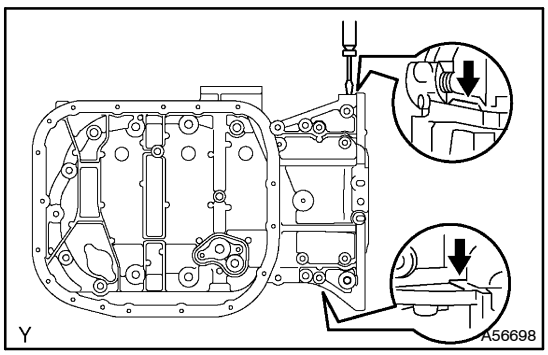


(b) Insert the blade of SST between the No. 1 and No. 2 oil pans, then cut off the applied sealer and remove the No. 2 oil pan.
SST 09032–00100
NOTICE:
Be careful not to damage the No. 1 and No. 2 oil pans.



34. REMOVE OIL STRAINER SUB–ASSY

(a) Remove the 2 bolts and 2 nuts, then remove the oil strainer and gasket.

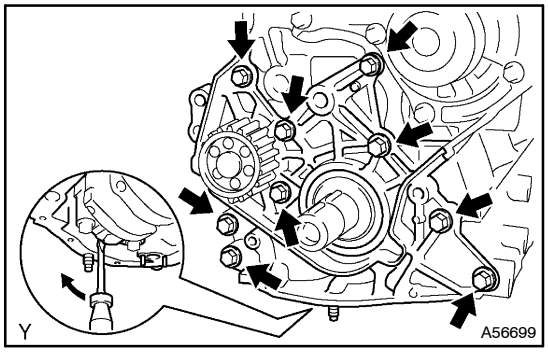


35. REMOVE OIL PAN INSULATOR

(a) Remove the bolt and oil pan insulator.

36. REMOVE OIL PAN SUB–ASSY

(a) Remove the 19 bolts and 3 nuts.

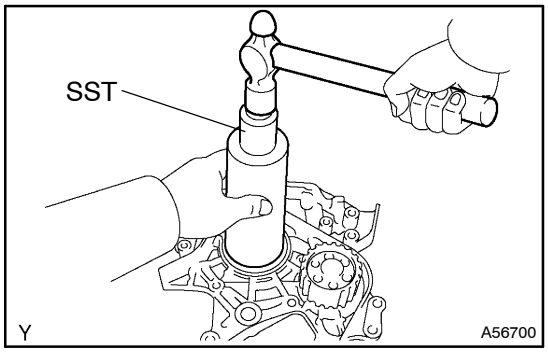


(b) Using a screwdriver, remove the oil pan by prying between the cylinder block and No. 1 oil pan.

NOTICE:

Be careful not to damage the cylinder block and No. 1 oil pan.

37. REMOVE CRANKSHAFT POSITION SENSOR (See page 14–138)



38. REMOVE OIL PUMP ASSY

(a) Remove the 9 bolts.

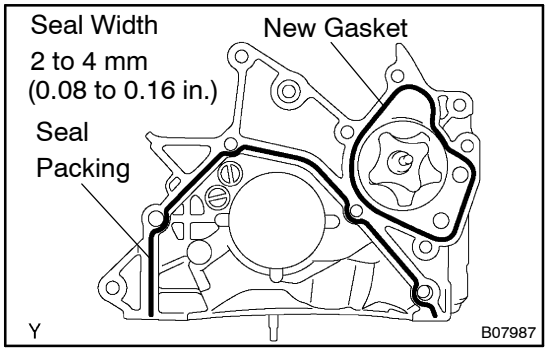
(b) Remove the oil pump by prying between the oil pump and main bearing cap using a screwdriver.

(c) Remove the gasket.

39. INSTALL CRANKSHAFT SEAL

(a) Using SST and a hammer, tap in a new oil seal until its surface is flush with the oil pump edge.

SST 09316–60011 (09316–00011, 09316–00021)



40. INSTALL OIL PUMP ASSY

(a) Remove any old packing (FIPG). Be careful not to drop any oil on the contact surfaces of the oil pump and cylinder block.

(1) Using a razor blade and gasket scraper, remove all the old packing from the gasket surfaces and sealing groove.

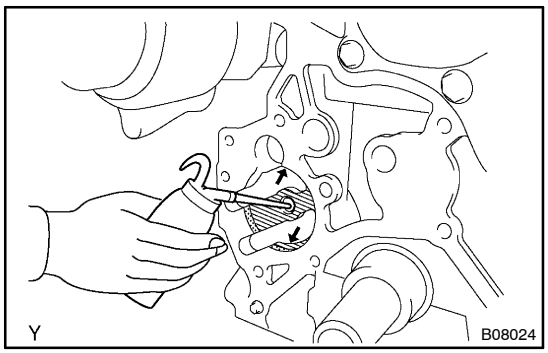
(2) Thoroughly clean all components to remove all the loose material.

(3) Using a non–residue solvent, clean both the sealing surfaces.

(b) Apply seal packing to the oil pump as shown in the illustration.

Seal packing: Part No. 08826–00080 or equivalent

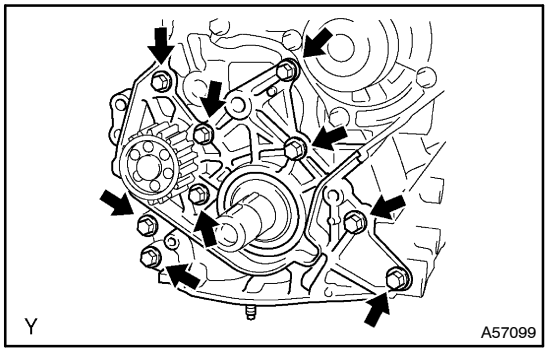
NOTICE:



Avoid applying an excessive amount to the surface.

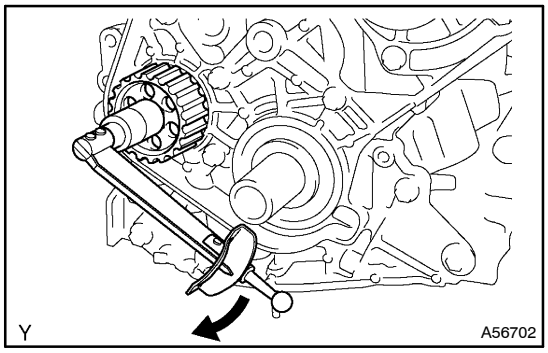
(1) Install a nozzle of which opening is cut to 2 to 4 mm (0.08 to 0.16 in.).

(2) The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.



(3) Immediately remove the nozzle from the tube, then reinstall the cap.

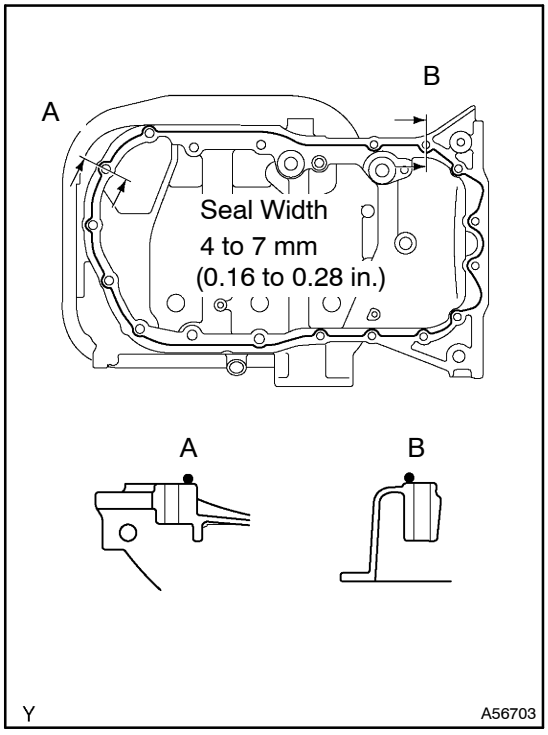
(c) Install a new gasket to the oil pump.



(d) Pour 0.5 cm^3 (0.03 cu in.) or more of engine oil into the bushing of the cylinder block.

(e) Apply engine oil to the cylinder block side which contacts the oil pump driven rotor.

(f) Install the oil pump with the 9 bolts.
Torque: 31 N·m (320 kgf·cm, 23 ft·lbf)

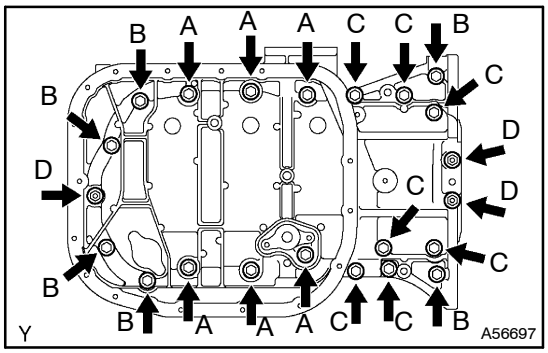


(g) Measure the oil pump rotating torque.
(1) Check that the pump rotates smoothly without making a noise.
(2) Using a torque wrench, check the pump rotating torque.
Rotating torque: 3.0 N·m (31 kgf·cm, 27 in.·lbf) or less

41. INSTALL CRANKSHAFT POSITION SENSOR (See page 14–138)

42. INSTALL OIL PAN SUB–ASSY

(a) Remove any old packing (FIPG). Be careful not to drop any oil on the contact surfaces of the No. 1 oil pan, cylinder block, oil pump and rear oil seal retainer.
(1) Using a razor blade and gasket scraper, remove all the old packing from the gasket surfaces.
(2) Thoroughly clean all components to remove all the loose material.
(3) Using a non–residue solvent, clean both the sealing surfaces.



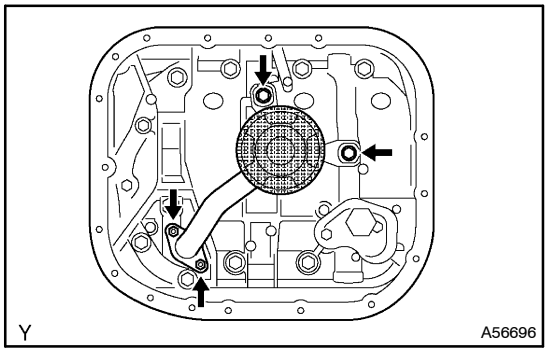
(b) Apply seal packing to the No. 1 oil pan as shown in the illustration.

Seal packing: Part No. 08826–00080 or equivalent

(1) Install a nozzle of which opening is cut to 4 to 7 mm (0.16 to 0.28 in.).

(2) The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.

(3) Immediately remove the nozzle from the tube, then reinstall the cap.



(c) Install the oil pan with the 19 bolts and 3 nuts.

Torque:
42 N·m (428 kgf·cm, 31 ft·lbf) for bolt A
21 N·m (209 kgf·cm, 15 ft·lbf) for bolt B
11 N·m (112 kgf·cm, 8 ft·lbf) for bolt C
11 N·m (112 kgf·cm, 8 ft·lbf) for nut D

43. INSTALL OIL PAN INSULATOR

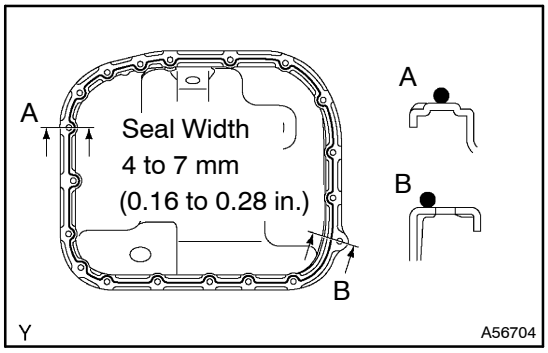
(a) Install the oil pan insulator with the bolt.
Torque: 7.5 N·m (76 kgf·cm, 66 in.·lbf)

44. INSTALL OIL STRAINER SUB–ASSY

(a) Install a new gasket and the oil strainer with the 2 bolts and 2 nuts.

Torque:
21 N·m (209 kgf·cm, 15 ft·lbf) for bolt
13 N·m (135 kgf·cm, 10 ft·lbf) for nut

45. INSTALL OIL PAN SUB–ASSY NO.2

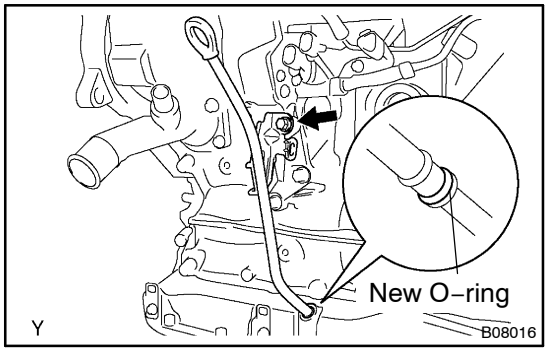


(a) Remove any old packing (FIPG). Be careful not to drop any oil on the contact surfaces of the No. 1 and No. 2 oil pans.

(1) Using a razor blade and gasket scraper, remove all the old packing from the gasket surfaces.

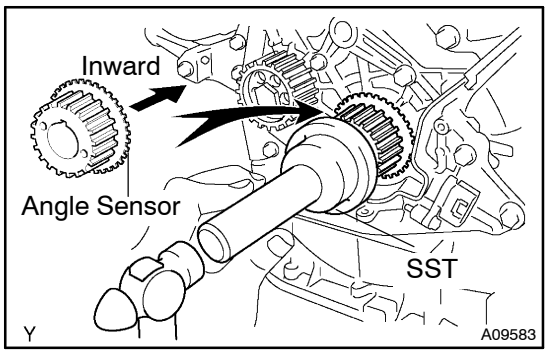
(2) Thoroughly clean all components to remove all the loose material.

(3) Using a non–residue solvent, clean both the sealing surfaces.



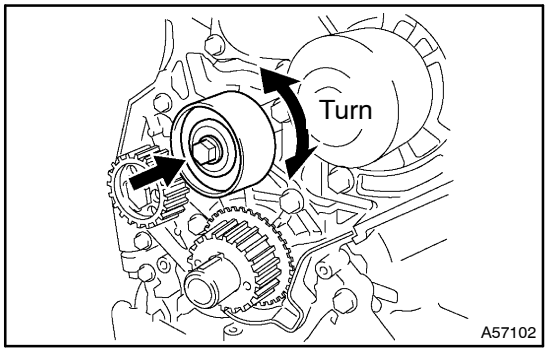
NOTICE:
Do not use a solvent. It will affect the painted surfaces.

(b) Apply seal packing to the oil pan as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent
(1) Install a nozzle of which opening is cut to 4 to 7 mm (0.16 to 0.28 in.).
(2) The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.
(3) Immediately remove the nozzle from the tube, then reinstall the cap.



(c) Install the oil pan with the 17 bolts and 2 nuts. Tighten the bolts and nuts uniformly in several steps.
Torque: 12 N·m (119 kgf·cm, 9 ft·lbf)

46. INSTALL ENGINE OIL LEVEL SENSOR
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)



47. INSTALL OIL LEVEL GAGE GUIDE
(a) Install a new O–ring to the oil level gage guide.
(b) Apply engine oil to the O–ring.
(c) Push the oil level gage guide end into the guide hole of the No. 1 oil pan.
(d) Install the oil level gage guide with the bolt.
Torque: 18 N·m (184 kgf·cm, 13 ft·lbf)
(e) Apply engine oil to the O–ring on the oil level gage.
(f) Install the oil level gage.

48. INSTALL V–RIBBED BELT TENSIONER ASSY (See page 14–138)
49. INSTALL TIMING BELT IDLER SUB–ASSY NO.1 (See page 16–21)
50. INSTALL GENERATOR ASSY (See Pub. No. RM1018E on page 19–29)
51. INSTALL EXHAUST PIPE ASSY FRONT (See page 15–6)
52. INSTALL FLOOR PANEL BRACE FRONT (See page 15–6)

53. INSTALL CRANKSHAFT TIMING PULLEY
(a) Align the keyway of the timing pulley with the key located on the camshaft, then slide the pulley into place.
(b) Using SST and a hammer, tap in the timing pulley with the angle sensor facing inward.
SST 09223–46011

54. INSTALL TIMING BELT IDLER SUB–ASSY NO.2

(a) Install the idler pulley with bolt.
Torque: 47 N·m (475 kgf·cm, 34 ft·lbf)

(b) Check that the idler pulley moves smoothly.

55. SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page 14–138)
SST 09960–10010 (09962–01000, 09963–01000)

56. INSTALL TIMING BELT (See page 14–138)

57. CHECK VALVE TIMING (See page 14–138)

58. INSTALL TIMING CHAIN COVER PLATE (See page 14–138)

59. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET (See page 14–138)

60. INSTALL TIMING BELT GUIDE (See page 14–138)

61. INSTALL TIMING BELT NO.1 COVER (See page 14–138)

62. INSTALL TIMING BELT NO.2 COVER (See page 14–138)

63. INSTALL IDLER PULLEY SUB–ASSY (See page 14–138)

64. INSTALL CRANKSHAFT PULLEY (See page 14–138)
SST 09213–54015 (09213–70020), 09330–00021

65. INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH (See page 14–138)

66. INSTALL POWER STEERING IDLE PULLEY BRACKET (See page 14–108)

67. ADJUST V (COOLER COMPRESSOR TO CRANKSHAFT PULLEY) BELT NO.1 (See Pub. No. RM1018E on page 14–269)

68. INSTALL INJECTOR DRIVER (See page 14–108)

69. INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 14–90)

70. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

71. ADD ENGINE OIL (See Pub. No. RM1018E on page 17–30)

72. CHECK FOR ENGINE OIL LEAKS

IGNITION SYSTEM (2AZ–FSE)

180AY–01

ON–VEHICLE INSPECTION

NOTICE:

”Cold” and ”Hot” in this section mean temperature of the coils themselves. ”Cold” is from –10°C (14°F) to 50°C (122°F) and ”Hot” is from 50°C (122°F) to 100°C (212°F).

1. INSPECT IGNITION COIL AND SPARK TEST

(a) Check for DTCs (see page 05–19).

NOTICE:

If a DTC is present, perform troubleshooting in accordance with a procedure for that DTC.

(b) Check that spark occurs.

(1) Remove the engine cover No. 1 (see page 10–8).

(2) Remove the ignition coils.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

(3) Using a 16mm (0.63 in.) plug wrench, remove the spark plugs.

Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

(4) Install the spark plugs to each ignition coil, then connect the ignition coil connectors.

(5) Disconnect the 4 fuel injector connectors.

(6) Ground the spark plugs.

(7) Check that spark occurs at each spark plug while engine is being cranked.

NOTICE:

- **Be sure to ground the spark plug when checking.**
- **Replace the ignition coil if any physical impact is felt.**
- **Do not crank the engine for more than 2 seconds.**

If the sparks do not occur, do the following test.

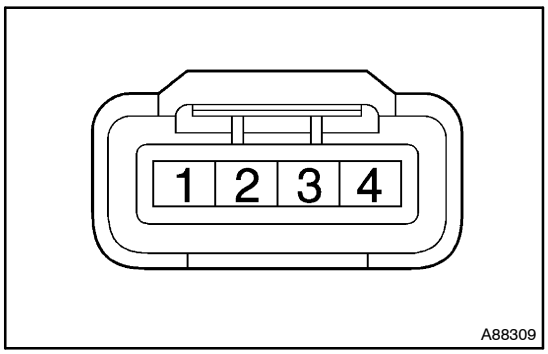
1	SPARK TEST

NG

2	CHECK CONNECTION OF IGNITION COIL CONNECTOR

OK → CONNECT SECURELY

NG



3	REPLACE IGNITION COIL ASSY

(a) Replace the normal ignition coil, then perform spark test.

OK → REPLACE IGNITION COIL ASSY

NG

4	INSPECT IGNITION COIL ASSY (POWER SUPPLY)

(a) Disconnect the ignition coil connector.
(b) Turn the ignition switch to ON.
(c) Using a voltmeter, measure the voltage between the terminals of the wire harness side and the body ground.

Standard:

Tester Connection	Specified Condition
1 (+B) – 4 (GND)	9.0 to 14 V

NG → **CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSY – IGNITION OR START SWITCH ASSY)**

OK

5	INSPECT CAMSHAFT POSITION SENSOR (See page 18–3)

NG → **REPLACE CAMSHAFT POSITION (See page 18–5)**

OK

6	INSPECT CRANKSHAFT POSITION SENSOR (See page 18–3)

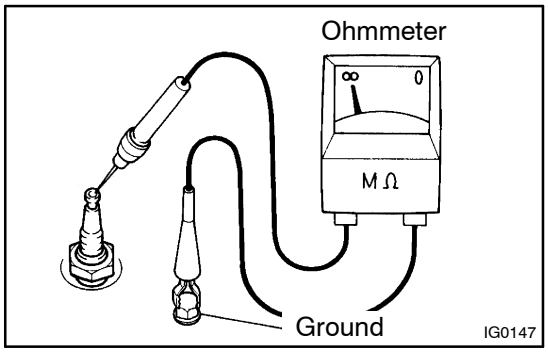
NG → **REPLACE CRANKSHAFT POSITION SENSOR (See page 18–6)**

OK

7	INSPECT ECM (IGT SIGNAL) (See page 05–12)

NG → **REPLACE ECM (See 10–29)**

OK



REPAIR OR REPLACE HARNESS AND CONNECTOR (IGNITION COIL ASSY – ECM)

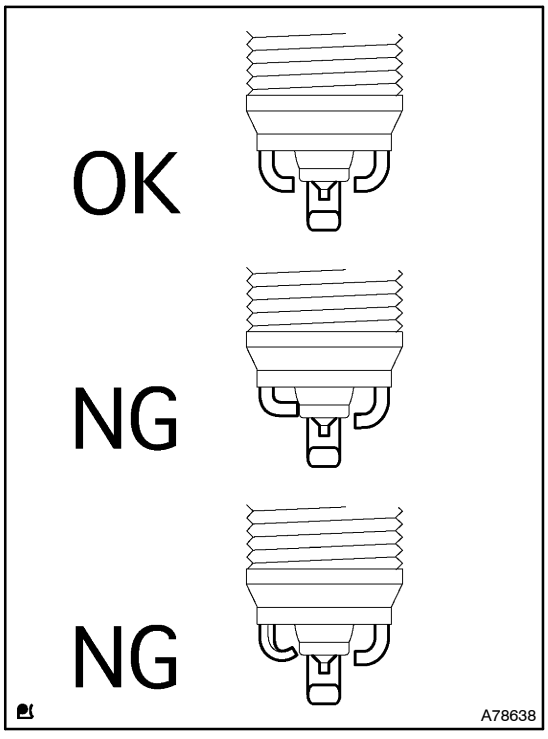
INSPECTION

1. INSPECT SPARK PLUG

NOTICE:

- **Do not use a wire brush for cleaning.**
- **Do not try to adjust the electrode gap of a used spark plug.**

(a) Inspect the electrode.



(1) Using an ohmmeter, measure the insulation resistance.

Standard: 10 MΩ or more

If the resistance is less than the specified value, check the spark plug electrode gap.

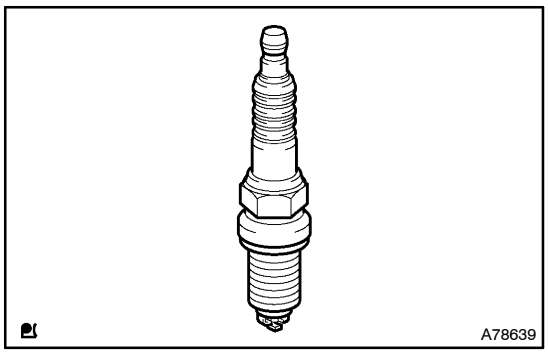
HINT:

If the ohmmeter is not available, do the following simple inspection instead.

(b) Alternative inspection method:

(1) Quickly accelerate the engine speed up to 4,000 rpm 5 times.

(2) Remove the spark plug.



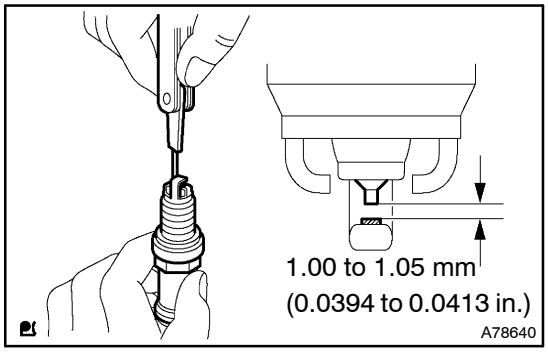
(3) Visually check the spark plug.

If a kink or twist as shown in the illustration on the left is found on the spark plug, replace it with a new one.

(4) If the electrode is dry...OK.

(5) If the electrode is wet...Check the spark plug for any damage on its thread and insulator.

(6) Reinstall the spark plug.

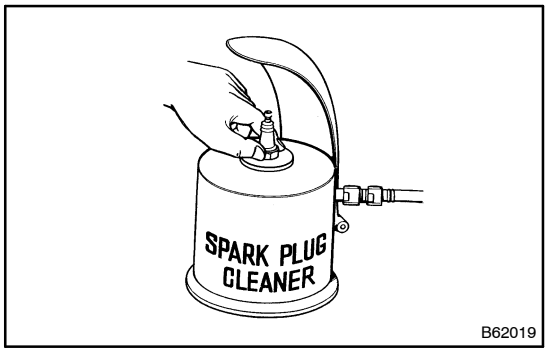


(c) Check the spark plug for any damage on its thread and insulator.

If there is damage, replace the spark plug.

Recommended spark plug:

Made	Type
DENSO	SK20BR11

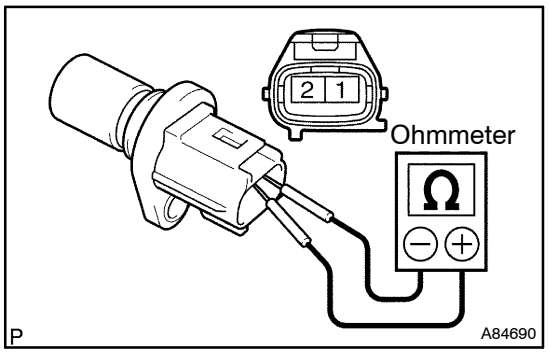


(d) Check the spark plug electrode gap.

Maximum electrode gap for used spark plug:
1.3 mm (0.051 in.)

If the gap is greater than maximum, replace the spark plug.

Standard electrode gap for new spark plug:
1.00 to 1.10 mm (0.0394 to 0.0433 in.)



(e) Clean the spark plugs.

If the electrode has traces of wet carbon, clean the electrode with a spark plug cleaner, then dry it.

Air pressure: Blow 588 kPa (6 kgf/cm^2, 85 psi)
Duration: 20 seconds or less

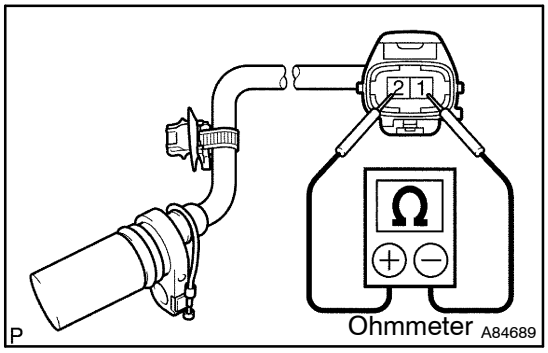
HINT:

If there are traces of oil, remove them with gasoline before using the spark plug cleaner.

2. INSPECT CAMSHAFT POSITION SENSOR

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.



Standard:

Tester Connection	Specified Condition
1 (G+) – 2 (G–)	835 to 1,400 Ω at cold
1 (G+) – 2 (G–)	1,060 to 1,645 Ω at hot

NOTICE:

"Cold" and "Hot" mean temperature of the coils themselves. "Cold" is from –10°C (14°F) to 50 °C (122°F) and "Hot" is from 50°C (122°F) to 100°C (212°F).

If the resistance is not as specified, replace the camshaft position sensor.

3. INSPECT CRANKSHAFT POSITION SENSOR

(a) Inspect the resistance.

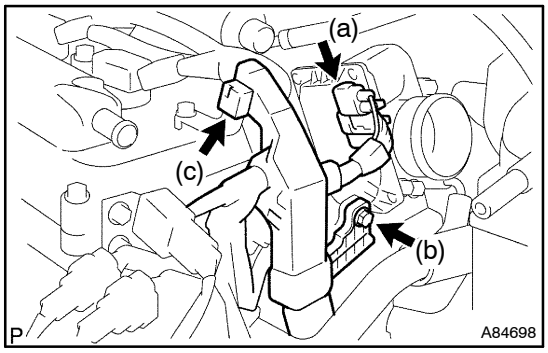
(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 (NE+) – 2 (NE–)	985 to 1,600 Ω at cold
1 (NE+) – 2 (NE–)	1,265 to 1,890 Ω at hot

NOTICE:

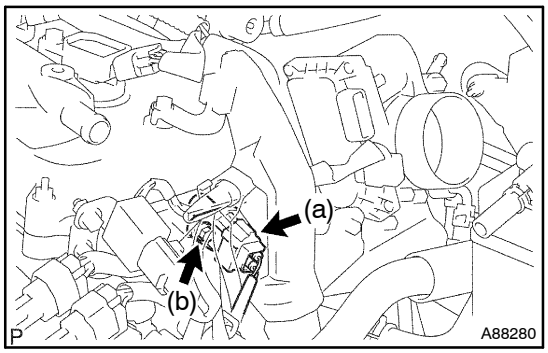
"Cold" and "Hot" mean temperature of the coils themselves. "Cold" is from –10°C (14°F) to 50°C (122°F) and "Hot" is from 50°C (122°F) to 100°C (212°F).



If the resistance is not as specified, replace the crankshaft position sensor.

CAMSHAFT POSITION SENSOR (2AZ–FSE)

180B0–01



REPLACEMENT

1. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)**
2. **DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
3. **REMOVE ENGINE COVER SUB–ASSY NO.1 (See page 10–8)**
4. **REMOVE AIR CLEANER CAP SUB–ASSY (See page 10–8)**

5. **REMOVE CAMSHAFT POSITION SENSOR**

(a) Disconnect the throttle control motor connector.
(b) Remove the bolt.
(c) Unfasten the clip, then remove the wiring harness protector.

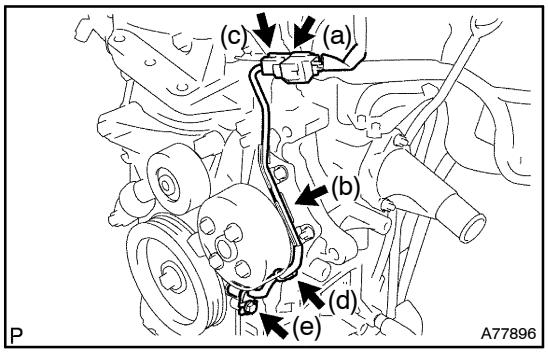
(d) Disconnect the camshaft position sensor connector.
(e) Remove the bolt, then remove the camshaft position sensor.

6. **INSTALL CAMSHAFT POSITION SENSOR**

(a) Apply a light coat of engine oil to the O–ring on the camshaft position sensor.
(b) Install the camshaft position sensor with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 79 in.·lbf)

NOTICE:
Be careful not to twist the O–ring.

(c) Connect the camshaft position sensor connector.
(d) Install the wiring harness protector with the clip.
(e) Tighten the bolt.
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)
(f) Connect the throttle control motor connector.



7. **INSTALL AIR CLEANER CAP SUB–ASSY (See page 10–8)**
8. **CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)
9. **CHECK FOR ENGINE OIL LEAKS**
10. **INSTALL ENGINE COVER SUB–ASSY NO.1 (See page 10–8)**
11. **INSTALL RADIATOR SUPPORT OPENING COVER**

CRANKSHAFT POSITION SENSOR (2AZ–FSE)

180B1–01

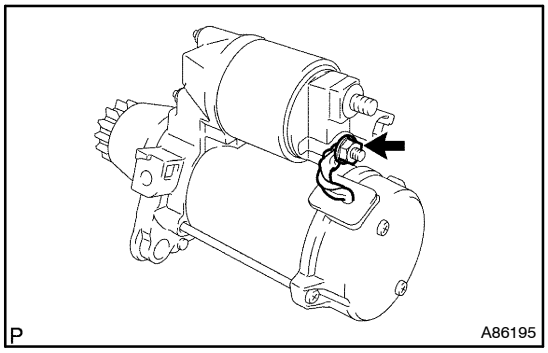
REPLACEMENT

1. **REMOVE ENGINE UNDER COVER LH(See page 19–8)**
2. **REMOVE ENGINE UNDER COVER RH(See page 19–8)**
3. **REMOVE RADIATOR SUPPORT OPENING COVER(See page 10–8)**
4. **REMOVE ENGINE ROOM COVER SIDE (See page 10–8)**
5. **DISCONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
6. **REMOVE FAN AND GENERATOR V BELT(See page 14–5)**
   SST 09249–63010
7. **REMOVE GENERATOR ASSY(See page 19–8)**

8. **REMOVE CRANKSHAFT POSITION SENSOR**
(a) Disconnect the crankshaft position sensor connector.
(b) Remove the wiring harness of the crankshaft position sensor from the wiring harness clamp bracket.
(c) Remove the connector clamp.
(d) Remove the wiring harness clamp.
(e) Remove the bolt, then remove the crankshaft position sensor.

9. **INSTALL CRANKSHAFT POSITION SENSOR**
(a) Apply a light coat of engine oil to the O–ring on the crankshaft position sensor.
(b) Install the crankshaft position sensor with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 79 in.·lbf)

NOTICE:
Be careful not to twist the O–ring.



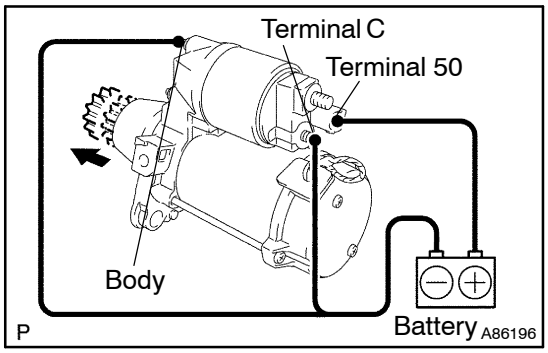
(c) Install the wiring harness clamp.
(d) Install the connector clamp.
(e) Install the wiring harness of the crankshaft position sensor to the wire harness clamp bracket.
(f) Connect the crankshaft position sensor connector.

10. **INSTALL GENERATOR ASSY(See page 19–8)**
11. **INSTALL FAN AND GENERATOR V BELT(See page 14–5)**
    SST 09249–63010
12. **CONNECT ENGINE WIRE NO.3 (BATTERY NEGATIVE TERMINAL)**
    Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)
13. **CHECK FOR ENGINE OIL LEAKS**
14. **INSTALL ENGINE ROOM COVER SIDE**
15. **INSTALL RADIATOR SUPPORT OPENING COVER**
16. **INSTALL ENGINE UNDER COVER RH**
17. **INSTALL ENGINE UNDER COVER LH**

STARTING SYSTEM (2AZ–FSE)

INSPECTION

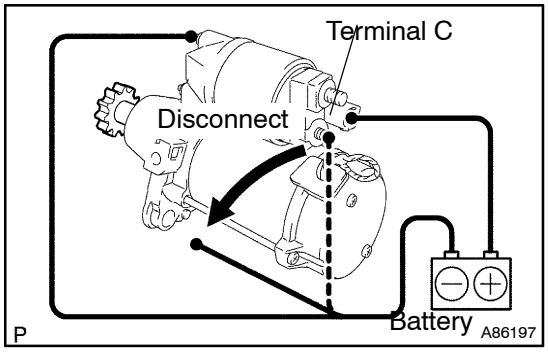
190V3–01



1. INSPECT STARTER ASSY

NOTICE:

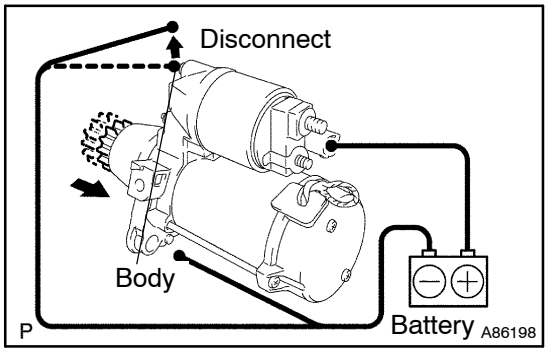
These tests must be performed within 3 to 5 seconds to prevent burnout of the coil.



(a) Perform the pull–in test.

(1) Remove the nut, then disconnect the lead wire from terminal C.

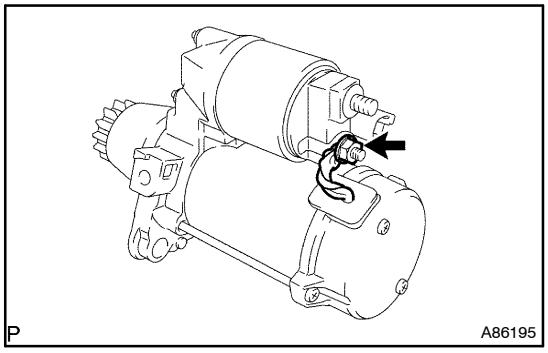
(2) Connect the battery to the repair service starter kit as shown in the illustration. Check that the clutch pinion gear is extended.



If the clutch pinion gear does not move, replace the starter magnetic switch.

(b) Perform the hold–in test.

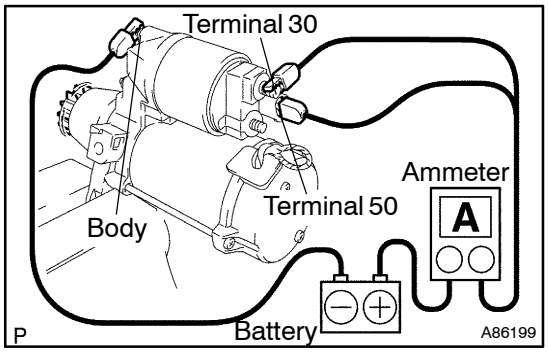
(1) Disconnect the negative (–) lead from terminal C with the lead wire disconnected from terminal C. Check that the clutch pinion gear remains extended.



If the clutch pinion gear returns inward, replace the starter magnetic switch.

(c) Check the clutch pinion gear return.

(1) Disconnect the negative (–) lead from the switch body. Check that the clutch pinion gear returns.

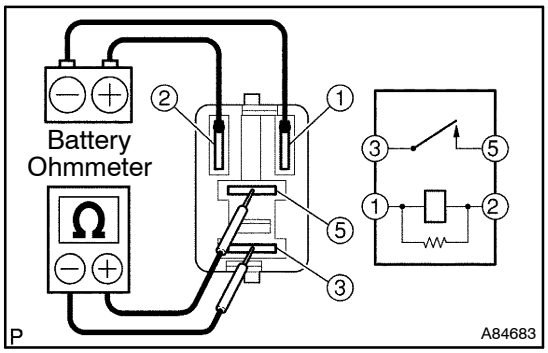


If the clutch pinion gear does not return inward, replace the magnetic switch.

(d) Perform the no–load performance test.

(1) Connect the lead wire to terminal C. Make sure that the lead is not grounded.

Torque: 5.9 N·m (60 kgf·cm, 52 in.·lbf)



(2) Clamp the starter in a vise.

(3) Connect the battery and an ammeter to the starter as shown in the illustration.

(4) Check that the starter rotates smoothly and steadily with the clutch pinion gear extended. Check that the ammeter reads the specified current.

Standard: 75 A or less at 11.5 V

If the current is not as specified, replace the starter.

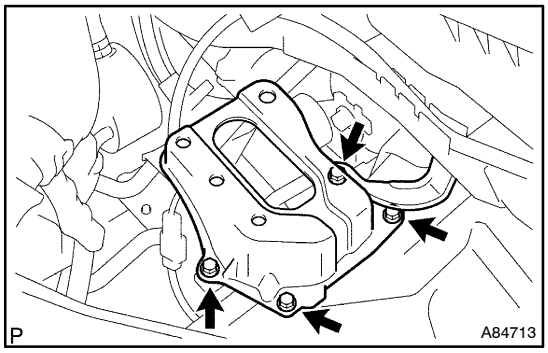
2. INSPECT STARTER RELAY ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

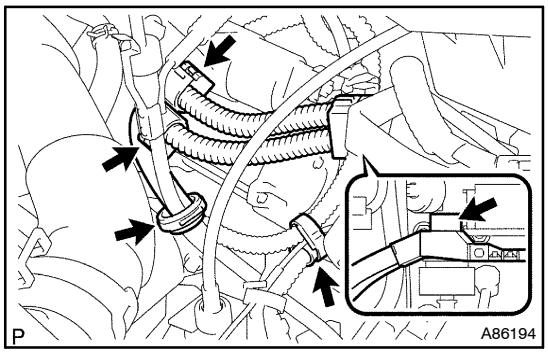
Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1Ω (Apply battery voltage to terminals 1 and 2)



If the result is not as specified, replace the starter relay.

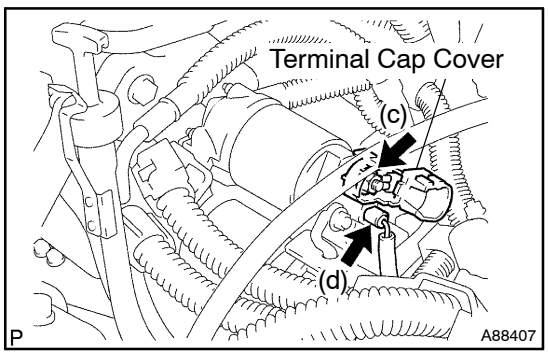
STARTER ASSY (2AZ–FSE)

190V4–01



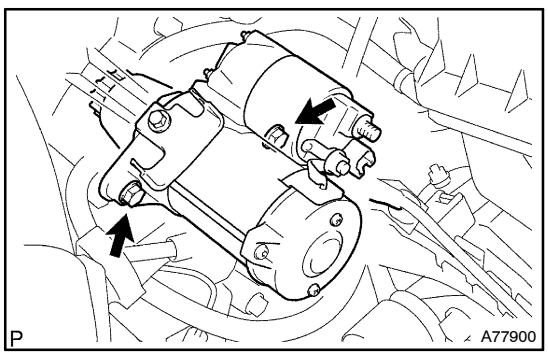
REPLACEMENT

1. REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)
2. REMOVE BATTERY CLAMP SUB–ASSY
3. REMOVE BATTERY
4. REMOVE BATTERY TRAY

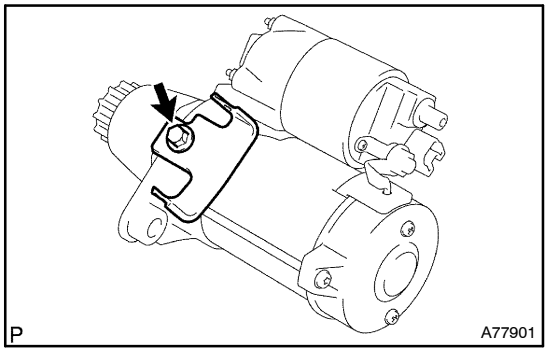


5. REMOVE BATTERY CARRIER

(a) Remove the 4 bolts, then remove the battery carrier.



6. REMOVE STARTER ASSY



(a) Remove the 5 wire harness clamps.

(b) Open the terminal cap cover.
(c) Remove the nut, then disconnect the starter wire.
(d) Disconnect the starter connector.

(e) Remove the 2 bolts, then remove the starter.

(f) Remove the bolt, then remove the wire harness clamp bracket.

7. INSTALL STARTER ASSY

(a) Install the wire harness clamp bracket with the bolt.
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)

(b) Install the starter with the 2 bolts.
Torque: 37 N·m (380 kgf·cm, 28 ft·lbf)

(c) Connect the starter connector.

(d) Connect the starter wire with the nut.
Torque: 13 N·m (130 kgf·cm, 9 ft·lbf)

(e) Close the terminal cap cover.

(f) Install the 5 wiring harness clamps.

8. INSTALL BATTERY CARRIER
Torque: 13 N·m (131 kgf·cm, 9 ft·lbf)

9. INSTALL BATTERY TRAY

10. INSTALL BATTERY

11. INSTALL BATTERY CLAMP SUB–ASSY
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt
3.5 N·m (36 kgf·cm, 31 in.·lbf) for nut
5.4 N·m (55 kgf·cm, 48 in.·lbf) for terminal

12. INSTALL RADIATOR SUPPORT OPENING COVER

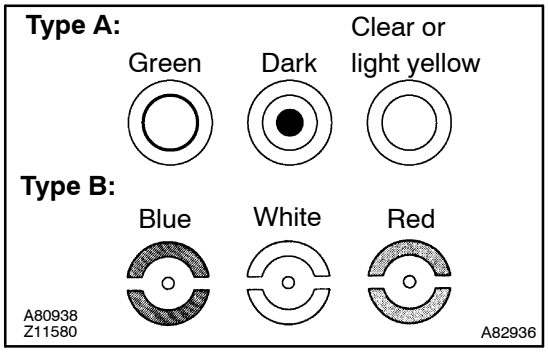
CHARGING SYSTEM (2AZ–FSE)

190V5–01

PRECAUTION

1. **Check that the battery cables are connected to the correct terminals.**
2. **Disconnect the battery cables If a quick change is given to the battery.**
3. **Do not perform tests with a high voltage insulation resistance tester.**
4. **Never disconnect the battery while the engine is running.**
5. **Check that the charging cable is tightened on terminal B of the generator and the fuse box.**
6. **Do not check whether the alternator generates or not with connecting terminal F to the other terminal.**

190V6–01



ON–VEHICLE INSPECTION

1. INSPECT BATTERY (EXCEPT MAINTENANCE–FREE BATTERY)

(a) Check the battery electrolyte level.

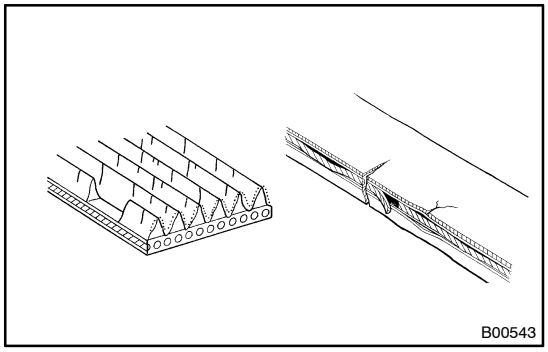
(1) Check the electrolyte quantity of each cell.

If the electrolyte quantity is below the recommended amount, add distilled water.

(b) Check the indicator as shown in the illustration.

HINT:

Indicator color		Condition
Type A	Type B	
Green	Blue	OK
Dark	White	Charging necessary
Clear or light yellow	Red	Replace



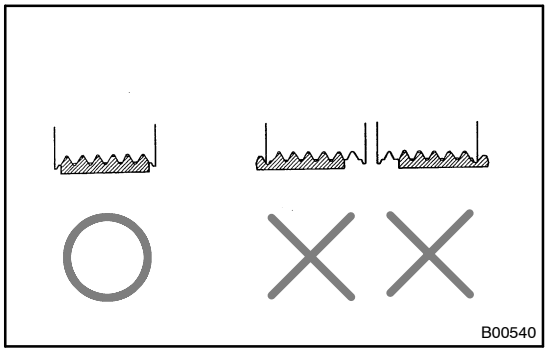
2. INSPECT BATTERY TERMINALS, FUSIBLE LINK AND FUSES

(a) Visually check the battery terminals.

(1) Check that the battery terminals are not loosened or corroded.

(b) Visually check the fusible link and fuses.

(1) Check that there is continuity of the fusible links, high–current fuses and regular fuses.



3. INSPECT V–RIBBED BELT

(a) Visually check the belt for excessive wear, frayed cords etc.

- If any defects are found, replace the v–ribbed belt.
- Cracks on the rib side of the belt are considered acceptable.

  If the belt has chunks missing from the ribs, it should be replaced.

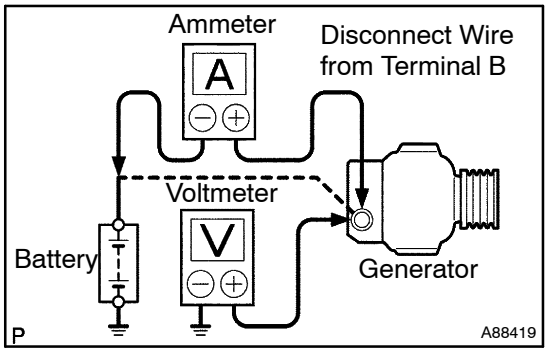
(b) Check that the belt fits properly in the ribbed grooves.

Confirm that the belt has not slipped out of the groove on the bottom of the pulley by hand.

4. VISUALLY CHECK GENERATOR WIRING

(a) Check that the wiring is in good condition.

5. LISTEN FOR ABNORMAL NOISES FROM GENERATOR



(a) Check that no abnormal noise is heard from the generator while the engine is running.

6. INSPECT CHARGE WARNING LIGHT CIRCUIT

(a) Turn the ignition switch ON. Check that the charge warning light comes on.
(b) Start the engine, then check that the light goes off.

HINT:

If the light does not operate as specified, troubleshoot the charge warning light circuit.

7. INSPECT CHARGING CIRCUIT WITHOUT LOAD

(a) If a tester is not available, connect a voltmeter to the charging circuit as follows:
  (1) Disconnect the wire from terminal B of the generator, then connect it to the negative (–) lead of the ammeter.
  (2) Connect the positive (+) lead of the ammeter to terminal B of the generator.
  (3) Connect the positive (+) lead of the voltmeter to terminal B of the generator.
  (4) Ground the negative (–) lead of the voltmeter.
(b) Check the charging circuit.
  (1) Keep the engine speed at 2,000 rpm, then check the reading on the ammeter and voltmeter.

  Standard amperage: 10 A or less
  Standard voltage: 12.9 to 14.9 V

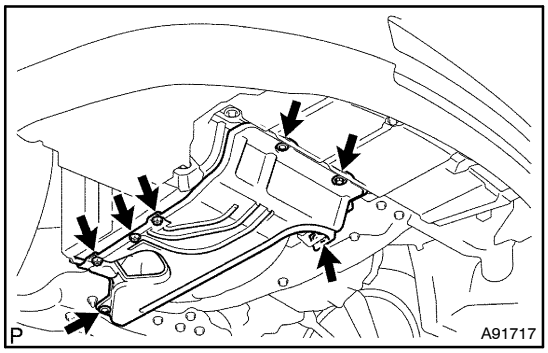
8. INSPECT CHARGING CIRCUIT WITH LOAD

(a) With the engine running at 2,000 rpm, turn the high beam headlights ON and turn the heater blower switch to the ”HI” position.
(b) Check the reading on the ammeter.

  Standard amperage: 30 A or more

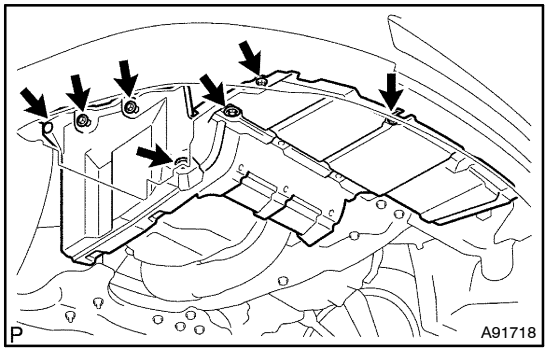
- If the ammeter reading is less than the standard amperage, repair the generator.
- If the battery is fully charged, the indication will sometimes be less than the standard amperage.

GENERATOR ASSY (2AZ–FSE)



REPLACEMENT

190V7–01



1. REMOVE ENGINE UNDER COVER LH

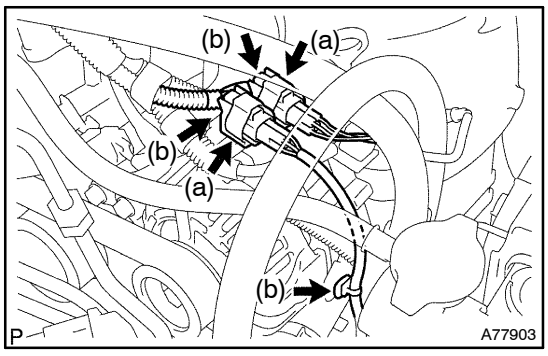
(a) Remove the 6 screws and 6 clips, then remove the engine under cover.

2. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1

(a) Remove the bolt, 3 screws and 3 clips, then remove the engine under cover No. 1.

3. REMOVE ENGINE UNDER COVER RH

(a) Remove the 5 screws and 2 clips, then remove the engine under cover.

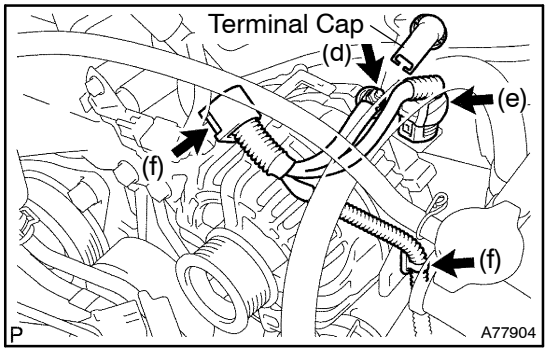


4. REMOVE RADIATOR SUPPORT OPENING COVER (See page 10–8)

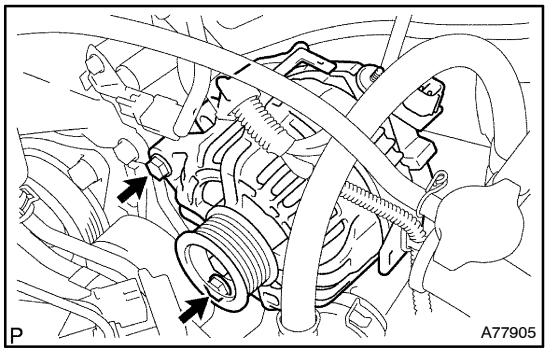
5. REMOVE ENGINE ROOM COVER SIDE (See page 10–8)

6. DISCONNECT ENGIEN WIRE NO. 3 (BATTERY NEGATIVE TERMINAL)

7. REMOVE FAN AND GENERATOR V BELT (See page 14–5)

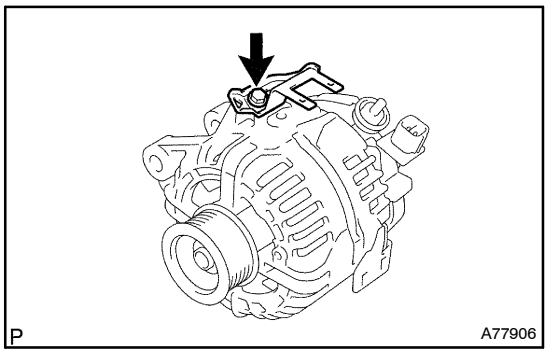


SST 09249–63010

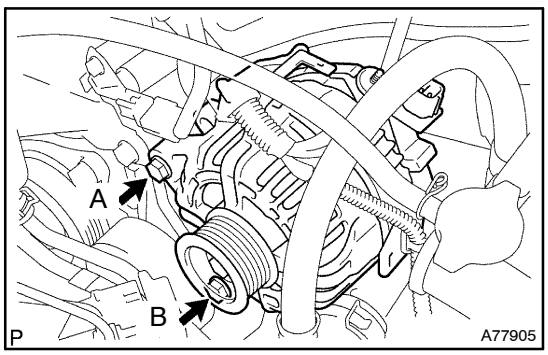


8. REMOVE GENERATOR ASSY

(a) Disconnect the 2 heated oxygen sensor connectors.



(b) Remove the 2 connector clamps of the heated oxygen sensor and the wiring harness clamp.



(c) Remove the terminal cap.
(d) Remove the nut, then disconnect the generator wire.
(e) Disconnect the generator connector.
(f) Remove the 2 wiring harness clamps.

(g) Remove the 2 bolts, then remove the generator.

(h) Remove the bolt, then remove the wire harness clamp bracket.

9. INSTALL GENERATOR ASSY

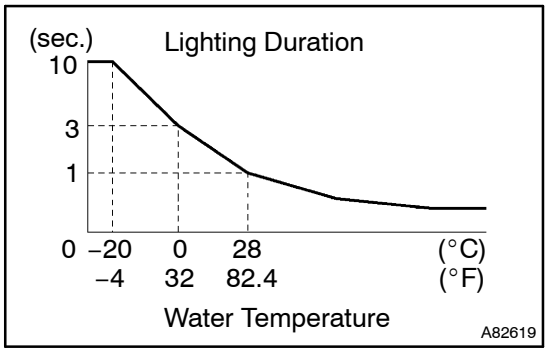
(a) Install the wire harness clamp bracket wire the bolt.
Torque: 8.4 N·m (86 kgf·cm, 74 in.·lbf)
(b) Install the generator with the 2 bolts.
Torque:
52 N·m (530 kgf·cm, 38 ft·lbf) for bolt A
21 N·m (214 kgf·cm, 16 ft·lbf) for bolt B
(c) Install the 2 wiring harness clamps.
(d) Connect the generator connector.
(e) Install the generator wire with the nut.
Torque: 9.8 N·m (100 kgf·cm, 7 ft·lbf)
(f) Install the terminal cap.
(g) Install the 2 connector clamps of the heated oxygen sensor and the wiring harness clamp.
(h) Connect the 2 heated oxygen sensor connectors.

10. INSTALL FAN AND GENERATOR V BELT (See page 14–5)
SST 09249–63010

11. CONNECT ENGIEN WIRE NO. 3 (BATTERY NEGATIVE TERMINAL)
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)

12. INSTALL ENGINE ROOM COVER SIDE

13. INSTALL RADIATOR SUPPORT OPENING COVER
14. INSTALL ENGINE UNDER COVER RH
15. INSTALL ENGINE UNDER COVER SUB–ASSY NO.1
16. INSTALL ENGINE UNDER COVER LH



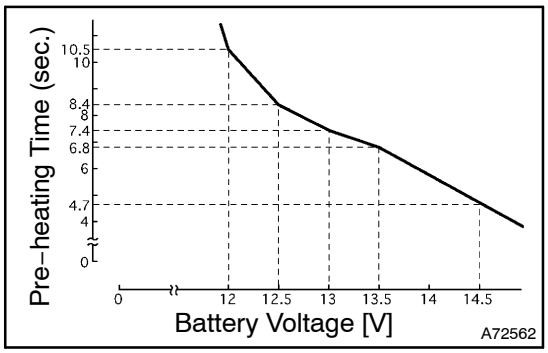
PRE–HEATING SYSTEM (1CD–FTV)(From September, 2003)

190V9–01

ON–VEHICLE INSPECTION

NOTICE:

Turn the ignition switch to OFF for 60 seconds before performing the following inspections.



1. INSPECT LIGHTING DURATION OF GLOW INDICATOR LIGHT

(a) Turn the ignition switch to ON, then measure the lighting duration.

Lighting duration: Refer to the graph

If the result is not as specified, inspect the ECM, engine coolant temperature sensor, glow plug and glow plug relay.

2. INSPECT PRE–HEATING

(a) Turn the ignition switch to ON, then measure how long it takes for the battery voltage to be applied to the glow plugs.

SST 09082–00030, 09083–00150

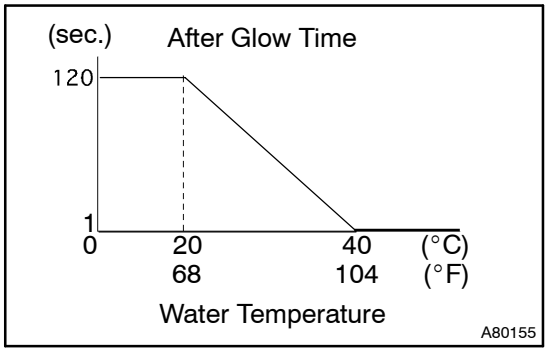
Pre–Heating time:

Engine Coolant Temperature	Pre–Heating Time
40 °C or higher	1 second
Below 40 °C	Refer to the graph (15 seconds at the longest)

If the result is not as specified, inspect the ECM, engine coolant temperature sensor, glow plug and glow plug relay.

(b) Turn the ignition switch to STA, check that the battery voltage applied to the glow plugs.

SST 09082–00030, 09083–00150



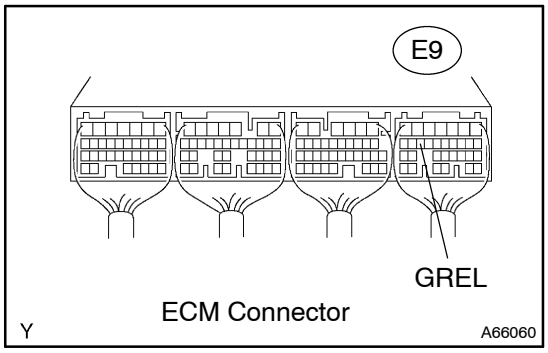
(c) While cranking the engine, measure how long it takes for the battery voltage to be applied to the glow plugs.

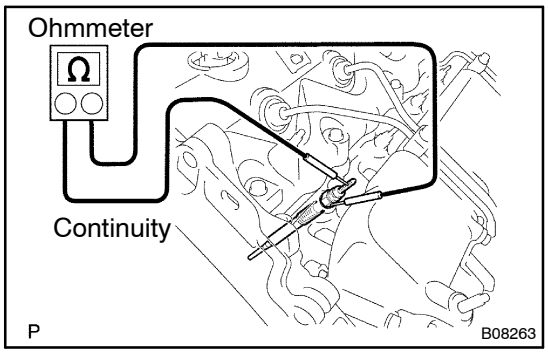
SST 09082–00030, 09083–00150

Pre–Heating time:

Engine Coolant Temperature	Pre–Heating Time
40 °C or higher	1 second
Blow 40 °C	Refer to the graph (15 seconds at the longest)

If the result is not as specified, inspect the ECM, engine coolant temperature sensor, glow plug and glow plug relay.





3. INSPECT AFTER GLOW TIME

(a) After starting the engine, measure how long it takes for the battery voltage to be applied to terminal E9–15 (GREL) of the ECM.

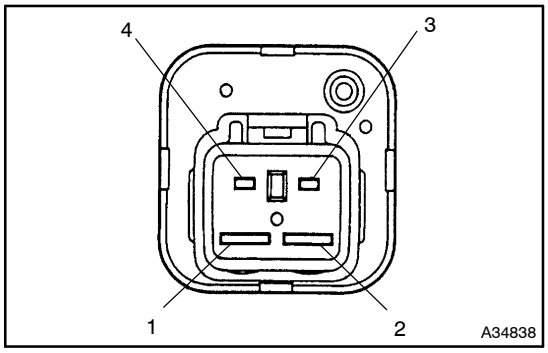
After glow time: Refer to the graph

If the result is not as specified, inspect the ECM, engine coolant temperature sensor, glow plug and glow plug relay.

4. INSPECT GLOW PLUGS

(a) Using an ohmmeter, measure the resistance between the glow plug terminal and ground.

Standard resistance: Approximately 1.1 Ω at 20°C (68°F)



If the resistance is not as specified, replace the glow plug.

NOTICE:

- **Be careful not to damage the glow plug pipes as it could cause an open circuit or shorten life of the glow plugs.**
- **Avoid contact of the glow plug with oil or gasoline when cleaning.**
- **Wipe up any oil on the terminal and Bakelite washer using a dry cloth if they are stained with oil during the inspection.**

190JF–03

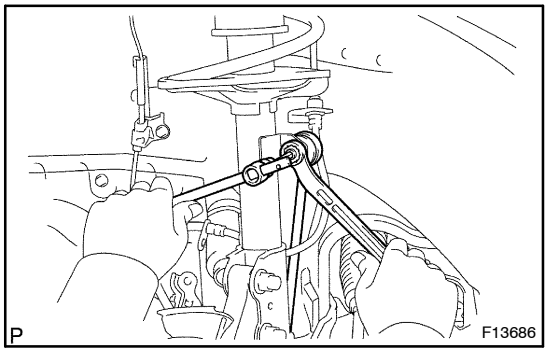
INSPECTION

1. INSPECT GLOW PLUG RELAY ASSY

(a) Using an ohmmeter, measure the resistance between the terminals.

Specified condition:

Tester Connection	Specified Condition
1 – 2	10 kΩ or Higher
1 – 2	Below 1 Ω (When battery voltage is applied to terminals 3 and 4)



If the result is not as specified, replace the glow plug relay.

FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH (2AZ–FSE)

REPLACEMENT

260DQ–02

1. REMOVE FRONT WHEELS

2. SEPARATE FRONT STABILIZER LINK ASSY LH

(a) Remove the nut and disconnect the stabilizer bar link from the shock absorber.

HINT:

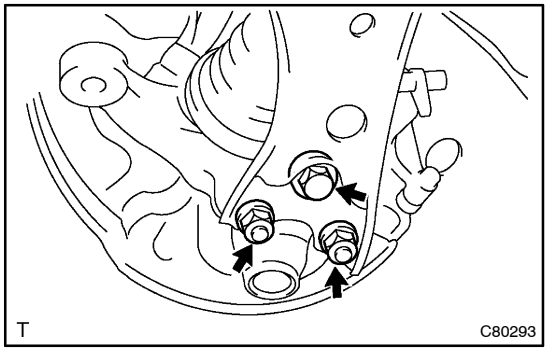
If the ball joint turns together with the nut, use a hexagon (6 mm) wrench to hold the stud.

3. SEPARATE FRONT STABILIZER LINK ASSY RH

HINT:

Separate the RH side by the same procedures as the LH side.

4. SEPARATE TIE ROD END SUB–ASSY LH



SST 09628–62011

5. SEPARATE TIE ROD END SUB–ASSY RH

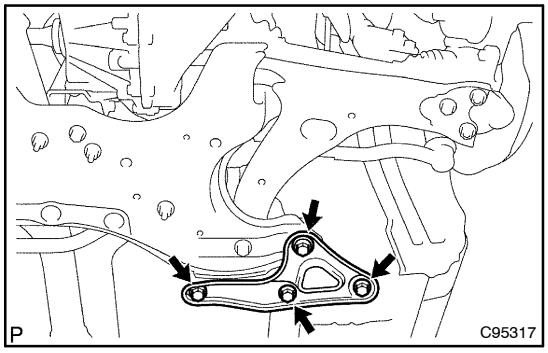
SST 09628–62011

HINT:

Separate the RH side by the same procedures as the LH side.

6. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Remove the bolt and 2 nuts, and separate the front suspension arm sub–assy lower No.1 from the lower ball joint.



7. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH

HINT:

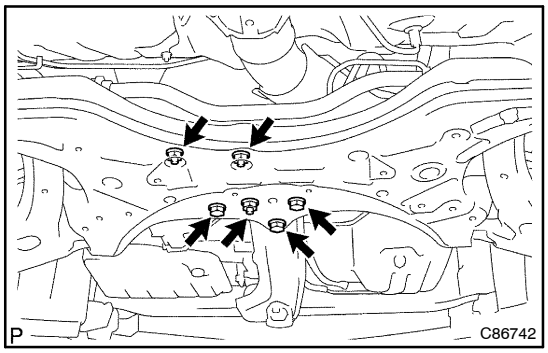
Separate the RH side by the same procedures as the LH side.

8. SEPARATE RACK & PINION POWER STEERING GEAR ASSY

9. SUSPEND ENGINE ASSY (See page 40–3)

10. REMOVE FRONT SUSPENSION MEMBER BRACE REAR LH

(a) Support the front suspension crossmember sub–assy with a transmission jack.

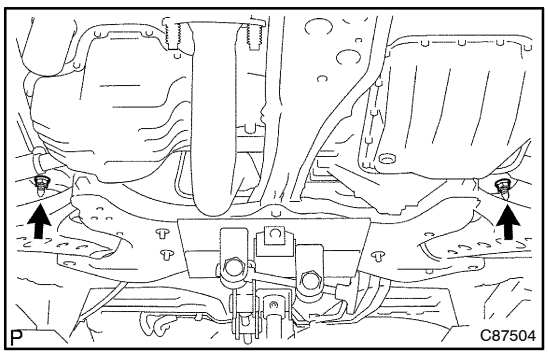


(b) Remove the 4 bolts and front suspension member brace rear LH.

(c) Remove the front suspension member body mounting stopper rear from the front suspension member brace rear LH.

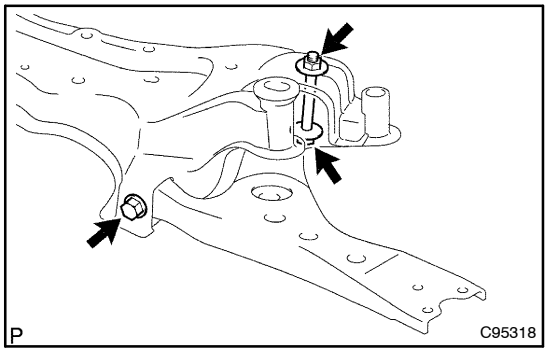
11. REMOVE FRONT SUSPENSION MEMBER BRACE REAR RH

HINT:



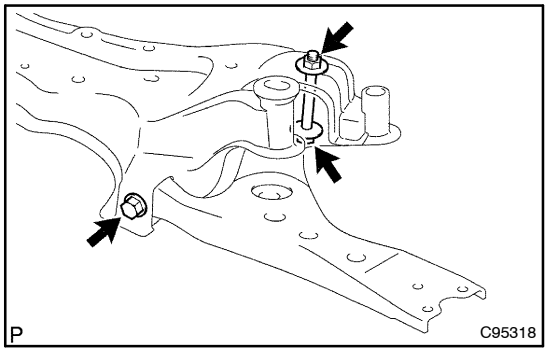
Remove the RH side by the same procedures as the LH side.

12. SEPARATE FRONT SUSPENSION CROSSMEMBER SUB–ASSY



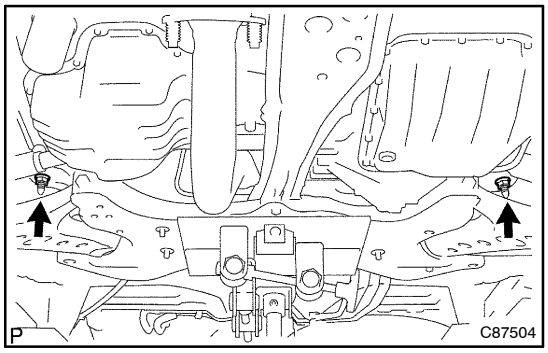
(a) w/ HID:
Disconnect the height control sensor (Front) connector.

(b) Remove the 3 bolts and 3 nuts, disconnect the transverse engine engine mounting insulator and engine mounting member sub–assy center from the front suspension crossmember sub–assy.



(c) Remove the 2 nuts and 2 front suspension member body mounting stoppers front.

(d) Lower the transmission jack, remove the front suspension crossmember sub–assy.

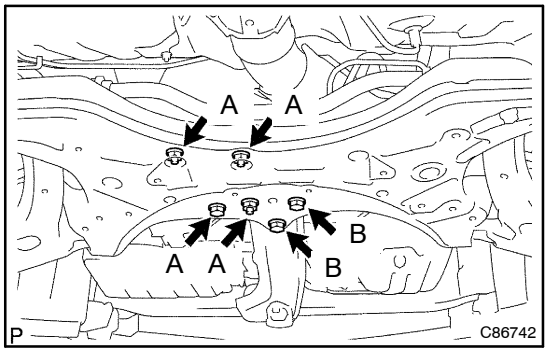


13. REMOVE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Remove the 2 bolts, nut and lower suspension arm sub–assy lower No.1 LH from the front suspension crossmember sub–assy.

14. TEMPORARILY TIGHTEN FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Install the lower suspension arm sub–assy lower No.1 LH, and temporarily tighten the 2 bolts and nut.

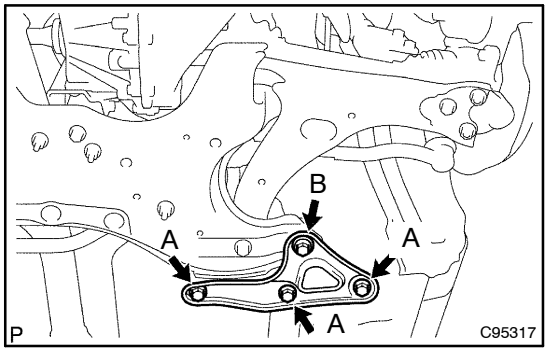


15. INSTALL FRONT SUSPENSION CROSSMEMBER SUB–ASSY

(a) Support the front suspension crossmember sub–assy with a transmission jack.

(b) Install the 2 front suspension member body mounting stoppers front and 2 nuts.

Torque: 133 N·m (1,360 kgf·cm, 98 ft·lbf)



(c) Connect the transverse engine engine mounting insulator and engine mounting member sub–assy center to the front suspension crossmember sub–assy.

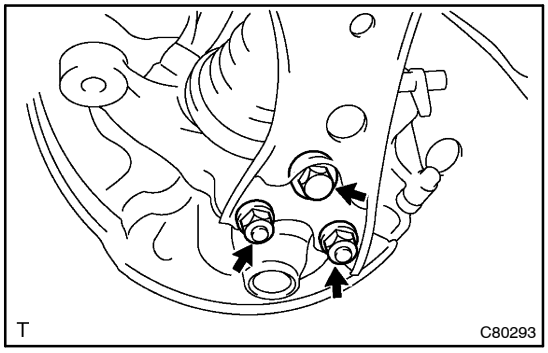
(d) Install the 3 bolts and 3 nuts.

Torque:
Bolt, Nut A: 52 N·m (530 kgf·cm, 38 ft·lbf)
Bolt B: 96 N·m (979 kgf·cm, 71 ft·lbf)

(e) w/ HID:
Connect the height control sensor (Front) connector.

16. INSTALL FRONT SUSPENSION MEMBER BRACE REAR LH

(a) Install the front suspension member body mounting stopper rear to the front suspension member brace rear LH.



(b) Install the 4 bolts and front suspension member brace rear LH.

Torque:
Bolt A: 80 N·m (816 kgf·cm, 59 ft·lbf)
Bolt B: 133 N·m (1,360 kgf·cm, 98 ft·lbf)

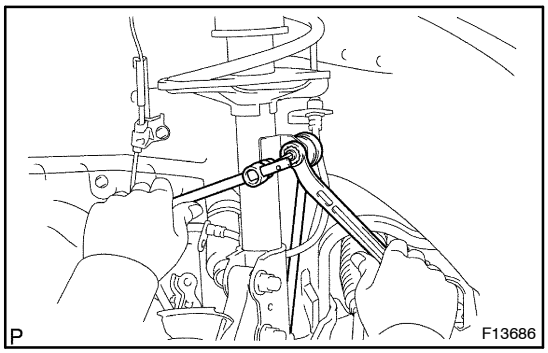
17. INSTALL FRONT SUSPENSION MEMBER BRACE REAR RH

HINT:
Install the RH side by the same procedures as the LH side.

18. CONNECT RACK & PINION POWER STEERING GEAR ASSY

19. CONNECT FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Connect the lower suspension arm to the lower ball joint with the 2 nuts and bolt.
Torque: 89 N·m (908 kgf·cm, 66 ft·lbf)



20. CONNECT FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH

HINT:
Connect the RH side by the same procedures as the LH side.

21. INSTALL TIE ROD END SUB–ASSY LH

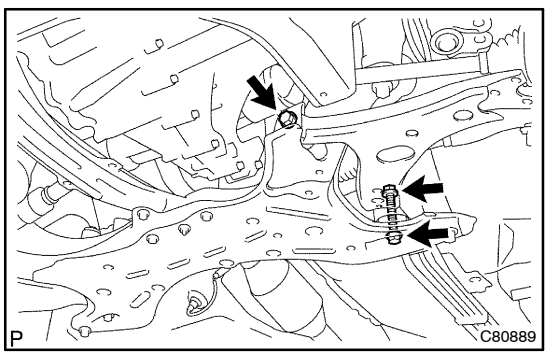
22. INSTALL TIE ROD END SUB–ASSY RH

HINT:
Connect the RH side by the same procedures as the LH side.

23. CONNECT FRONT STABILIZER LINK ASSY LH

(a) Install the stabilizer bar link with the nut.
Torque: 74 N·m (755 kgf·cm, 55 ft·lbf)

HINT:
If the ball joint turns together with the nut, use a hexagon (6 mm) wrench to hold the stud.



24. CONNECT FRONT STABILIZER LINK ASSY RH

HINT:
Install the RH side by the same procedures as the LH side.

25. STABILIZE SUSPENSION

(a) Install the front wheel and jack down the vehicle.
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

(b) Bounce the vehicle up and down several times to stabilize the suspension.

26. FULLY TIGHTEN FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Fully tighten the 2 bolts and nut.
Torque: 137 N·m (1,400 kgf·cm, 101 ft·lbf)

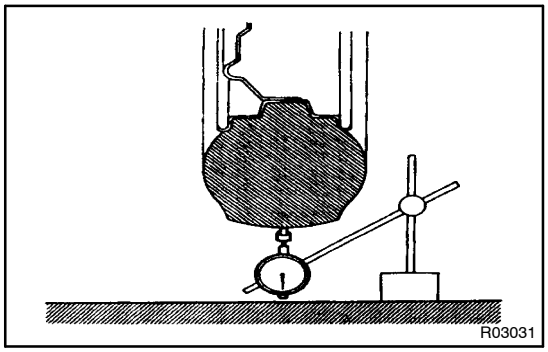
27. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT

WHEEL AND TIRE SYSTEM (2AZ–FSE)

2801F–03

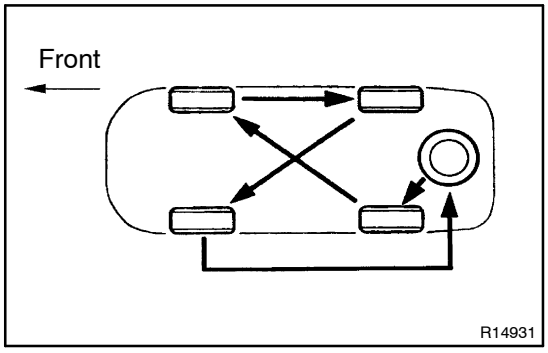
INSPECTION

1. INSPECT TIRE



(a) Check the tires for wear and proper inflation pressure.

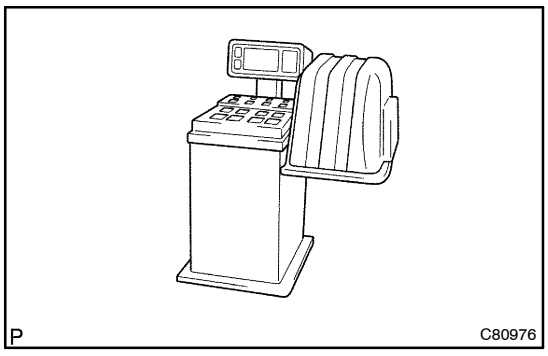
Cold tire inflation pressure:



Tire size	Front kPa (kgf·cm^2, psi)	Rear kPa (kgf·cm^2, psi)
205/55R16 91V:		
4 passengers or less	220 (2.2, 32) *1 250 (2.5, 36) *2	220 (2.2, 32) *1 250 (2.5, 36) *2
5 passengers	220 (2.2, 32) *1 270 (2.7, 39) *2	220 (2.2, 32) *1 280 (2.8, 41)*2
215/45R17 87W:		
4 passengers or less	240 (2.4, 35) *1 290 (2.9, 42) *2	240 (2.4, 35) *1 290 (2.9, 42) *2
5 passengers	240 (2.4, 35) *1 310 (3.1, 45) *2	240 (2.4, 35) *1 330 (3.3, 48) *2

***1: For driving under 160 km/h (100 mph)**

***2: For driving at 160 km/h (100 mph) or over**



(b) Using a dial indicator, check the runout of tires.
Tire runout: 1.4 mm (0.055 in.) or less

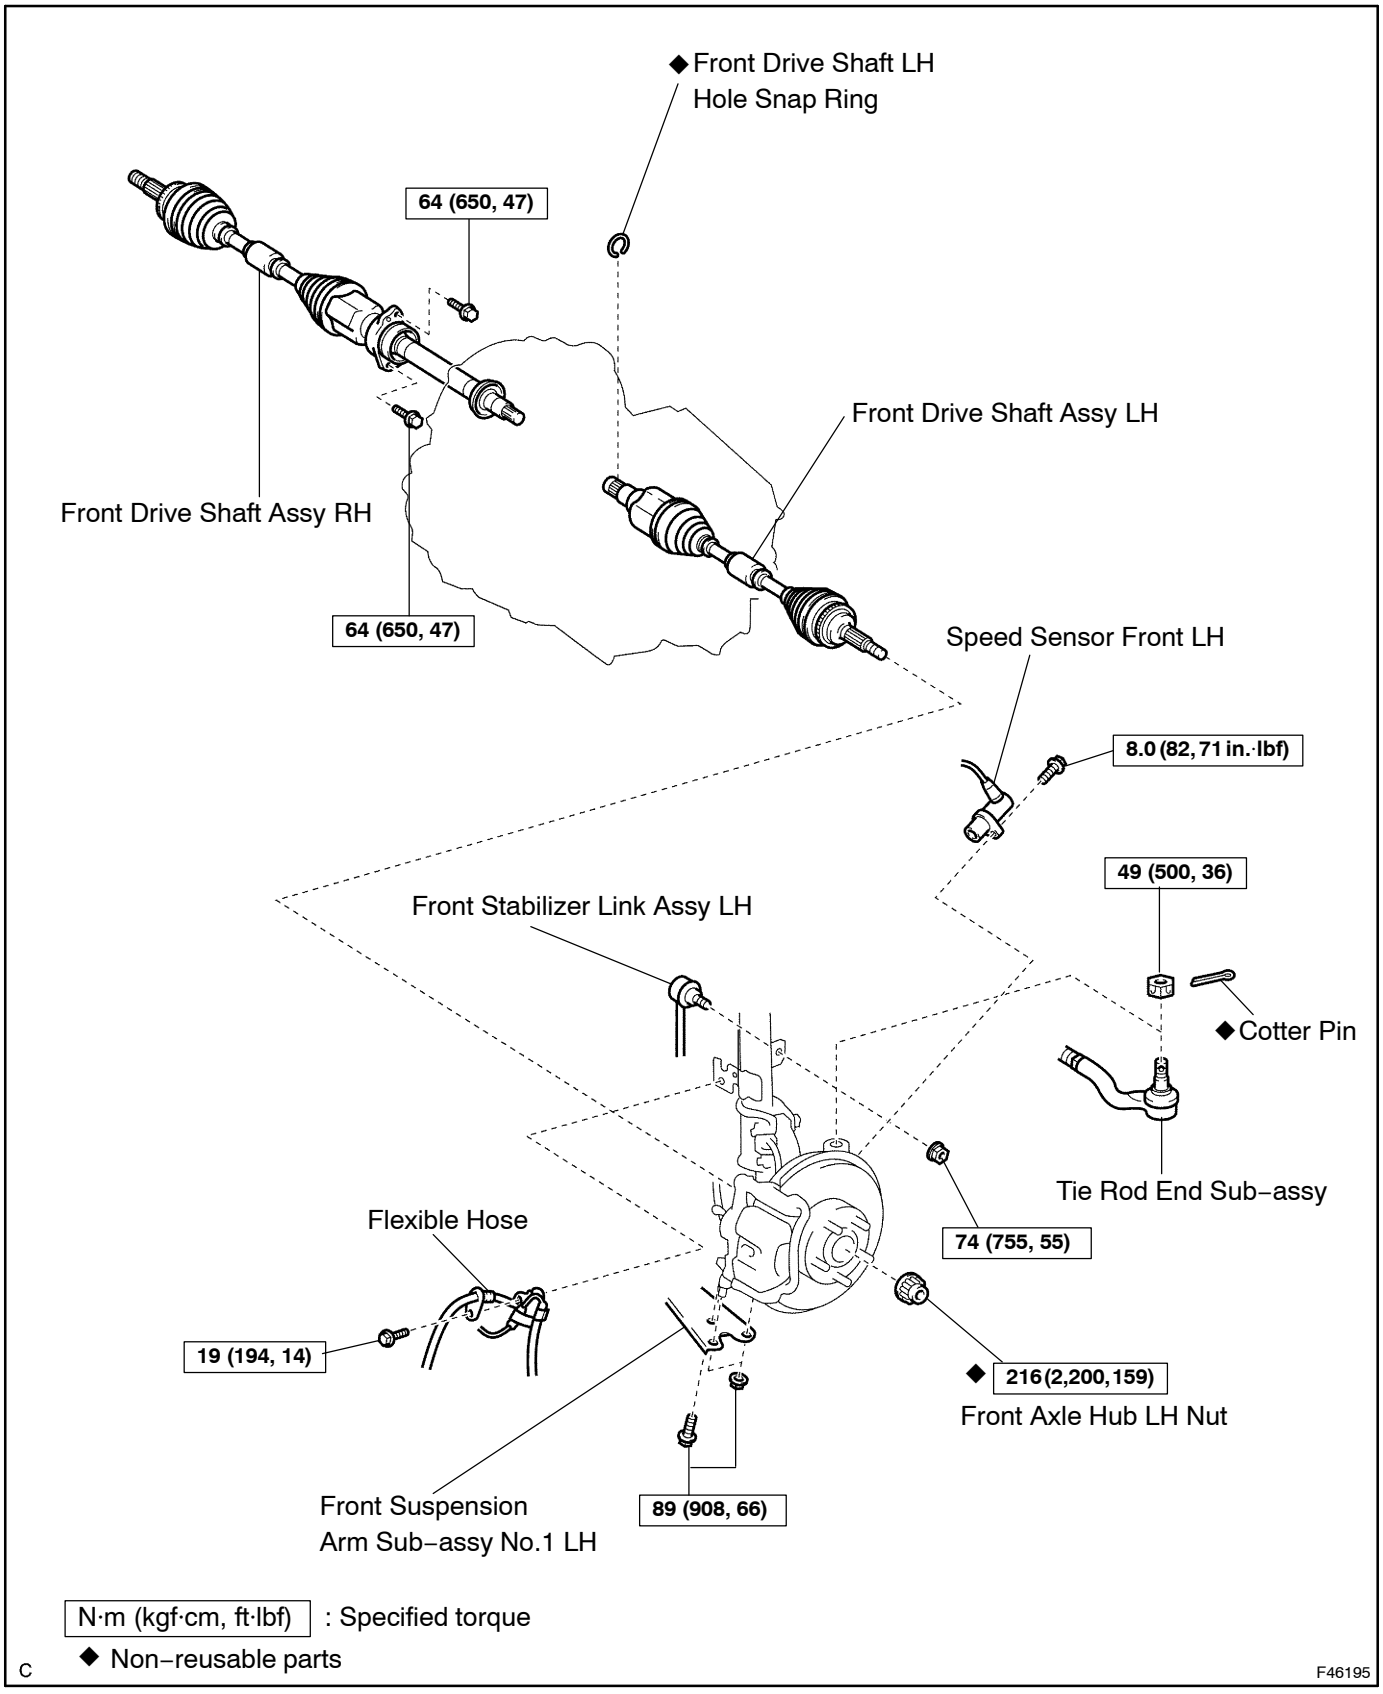
2. ROTATE TIRE

HINT:

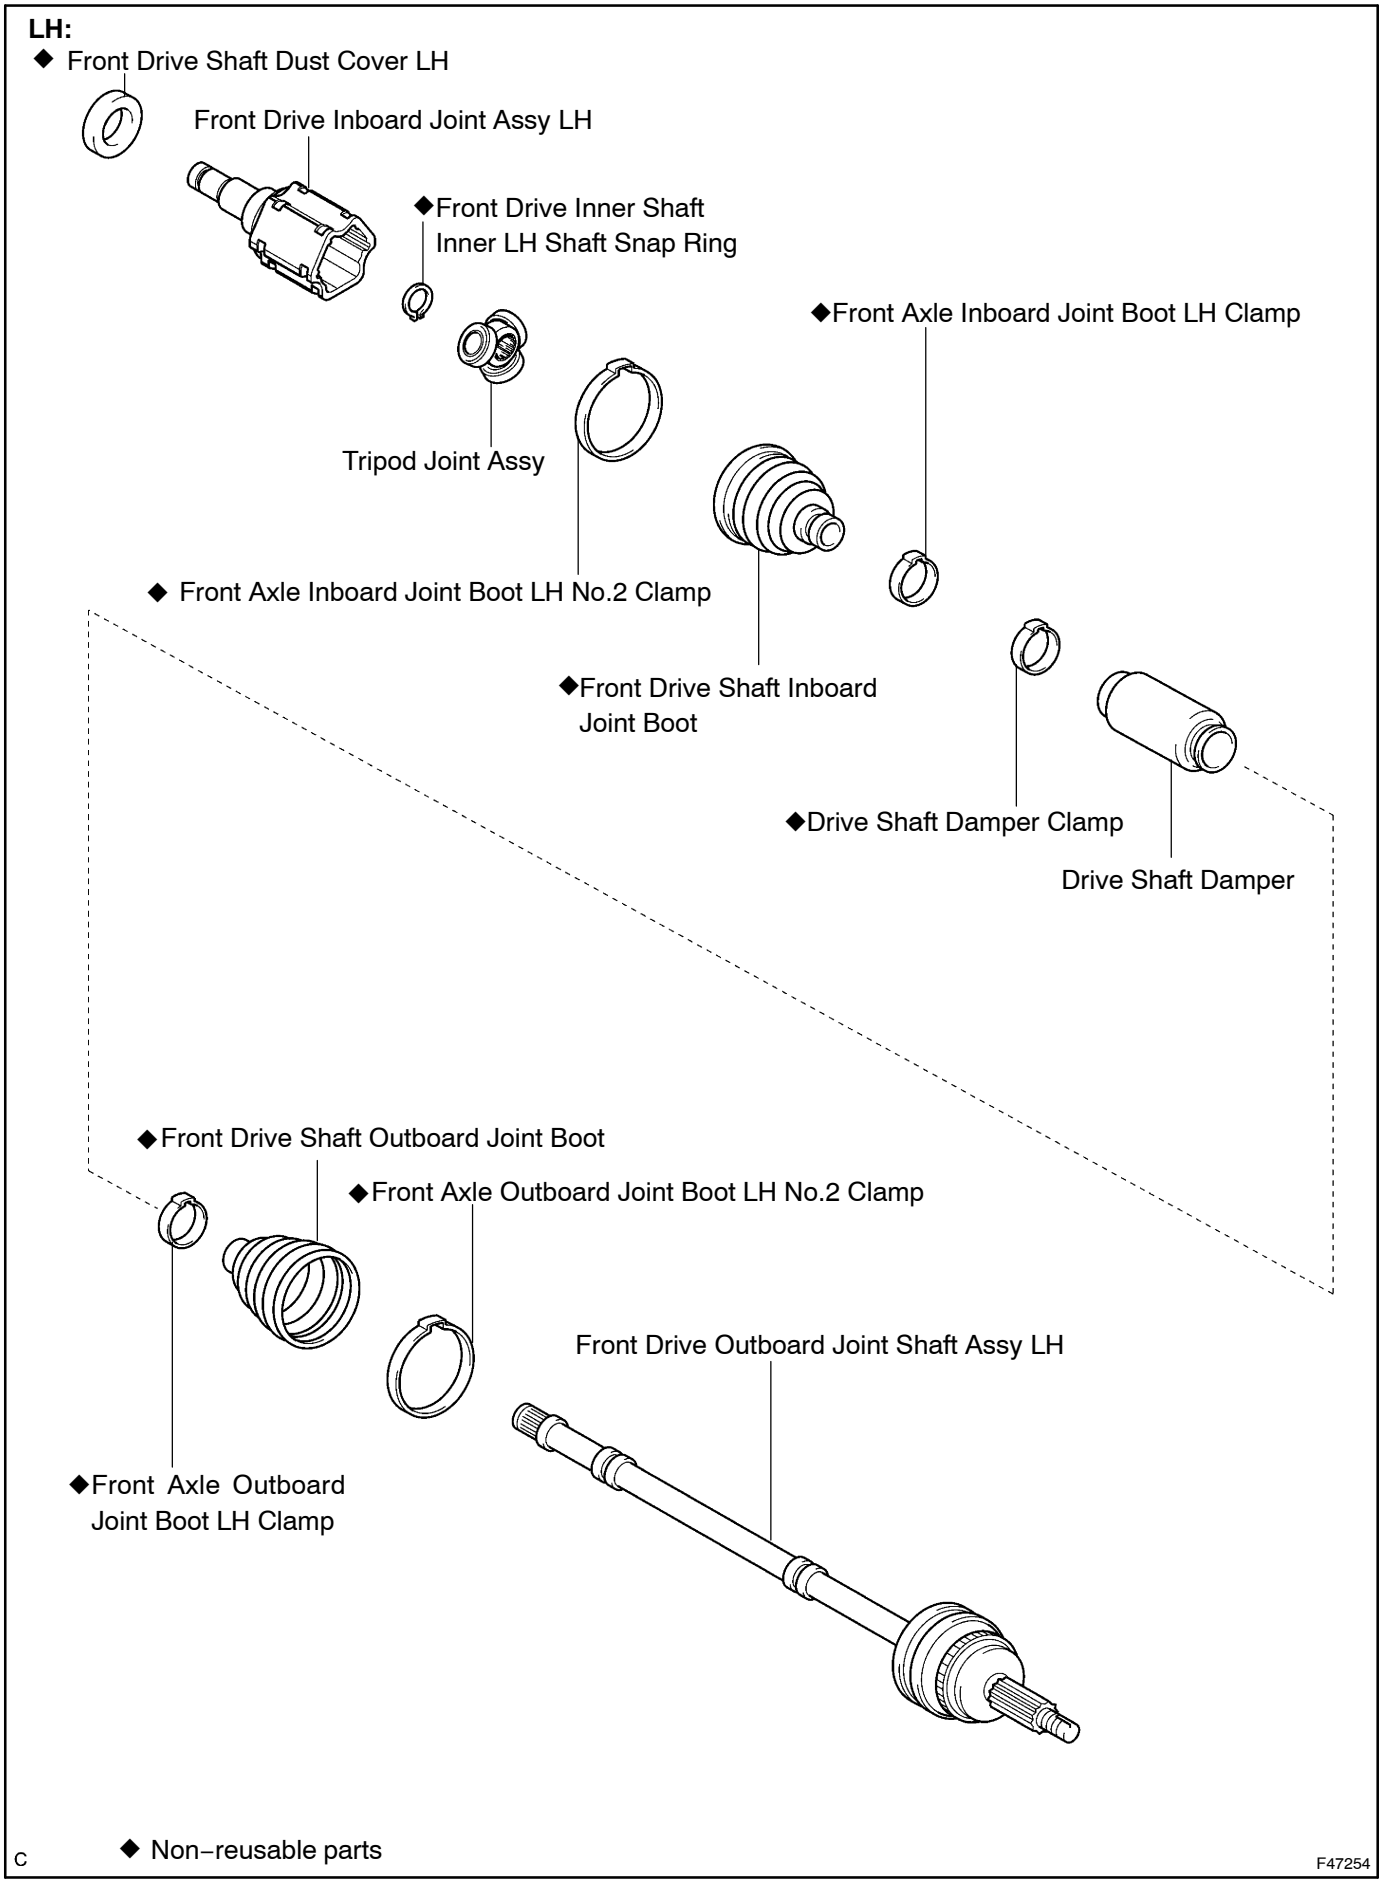
Rotate tires as shown in the illustration.

3. INSPECT WHEEL BALANCE

(a) Check and adjust the Off–the–car balance.



(b) If required, check and adjust the On–the–car balance.
Imbalance after adjustment: 8.0 g (0.018 lb) or less



4. INSPECT BEARING BACKLASH
5. INSPECT AXLE HUB DEVIATION
6. INSPECT BEARING BACKLASH
7. INSPECT AXLE HUB DEVIATION

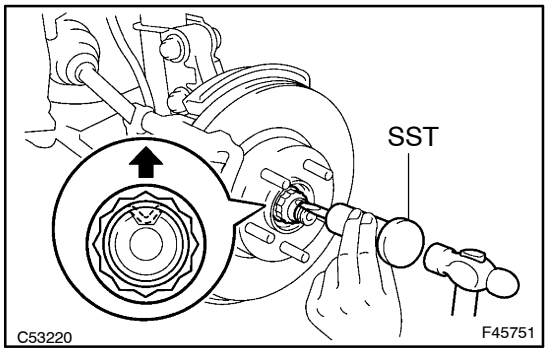
OVERHAUL

HINT:

Overhaul the RH side following the same procedure as for the LH side.

1. DRAIN AUTOMATIC TRANSAXLE FLUID (A/T TRANSAXLE)



(a) Remove the drain plug and gasket, and then drain the ATF.

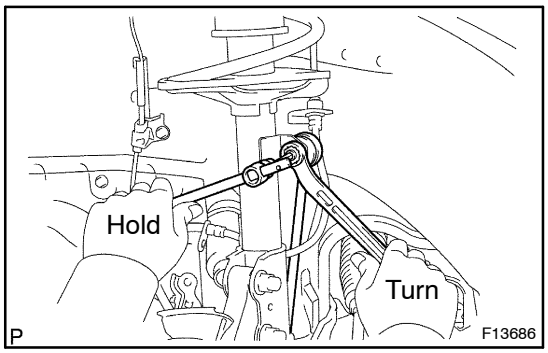
(b) Install a new gasket and drain plug.

Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

2. REMOVE FRONT WHEEL

3. REMOVE ENGINE UNDER COVER LH

4. SEPARATE FRONT AXLE HUB LH NUT



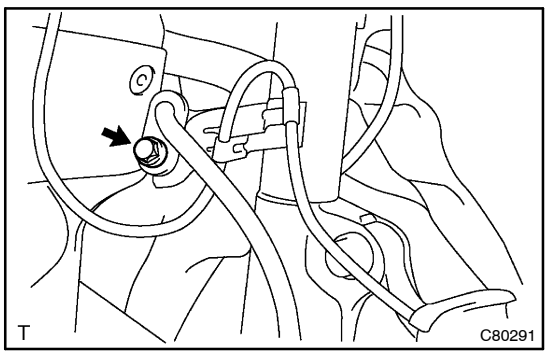
(a) Using SST and a hammer, unstake the staked part of the nut.

SST 09930–00010

(b) While applying the brake, remove the axle hub LH nut.

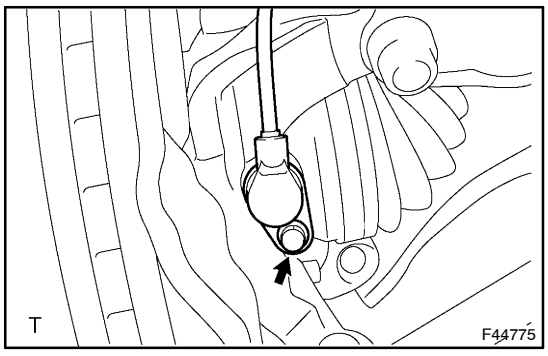
NOTICE:

Loosen the staked part of the lock nut completely, otherwise the screw of the drive shaft may become damaged.



5. SEPARATE FRONT STABILIZER LINK ASSY LH

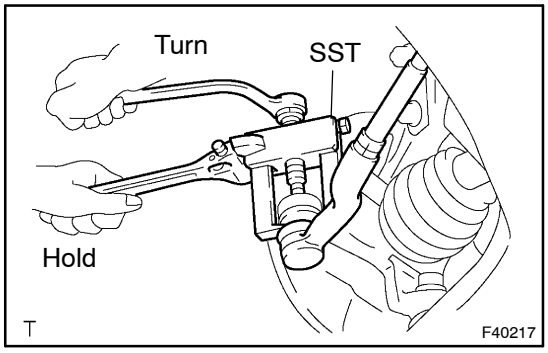
(a) Remove the nut and separate the front stabilizer link assy LH from the shock absorber assy LH.



HINT:

If the ball joint turns together with the nut, use a hexagon wrench (6 mm) to hold the stud.

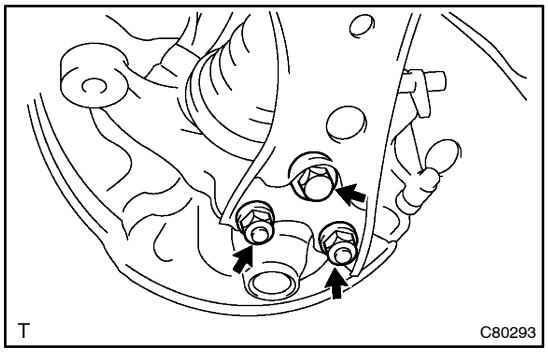
6. DISCONNECT SPEED SENSOR FRONT LH



(a) Remove the bolt, and disconnect the speed sensor wire and flexible hose from the shock absorber.

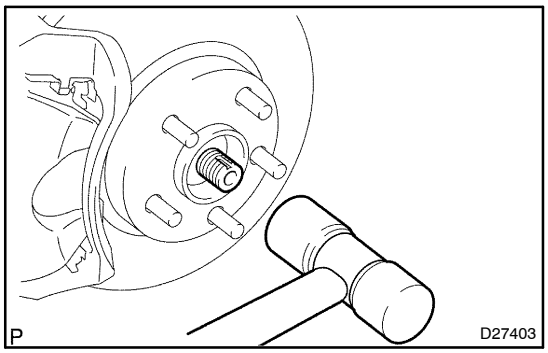
(b) Remove the bolt, and disconnect the speed sensor from the steering knuckle.

NOTICE:



- **Be careful not to damage the speed sensor.**
- **Prevent foreign matter from adhering to the speed sensor.**

7. SEPARATE TIE ROD END SUB–ASSY LH

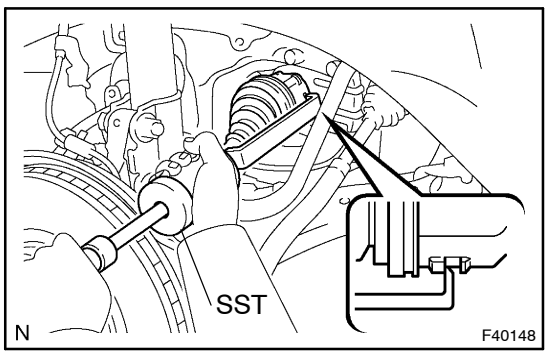


(a) Remove the cotter pin and nut.

(b) Using SST, separate the tie rod end sub–assy LH from the steering knuckle.
SST 09628–62011

8. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Remove the bolt and 2 nuts, and separate the front suspension arm sub–assy lower No.1 LH from the lower ball joint.

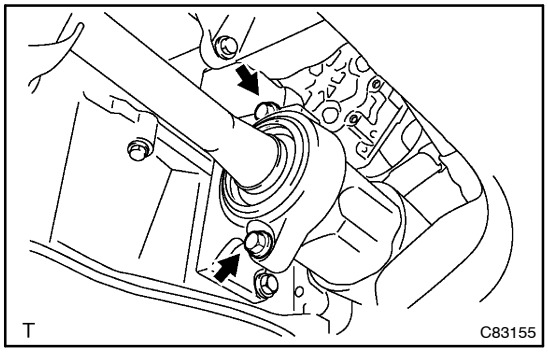


9. SEPARATE FRONT AXLE ASSY LH

(a) Using a plastic hammer, separate the front drive shaft assy LH from the axle hub.

NOTICE:

Be careful not to damage the boot and speed sensor rotor.

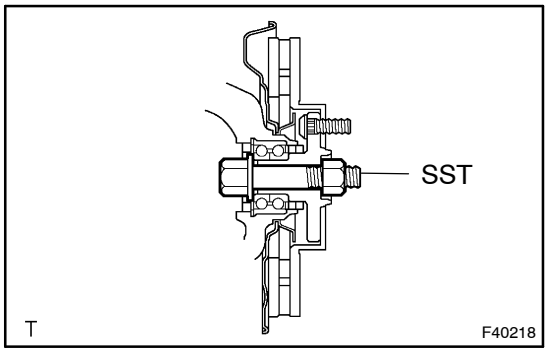


10. REMOVE FRONT DRIVE SHAFT ASSY LH

(a) Using SST, remove the front drive shaft assy LH.
SST 09520–01010, 09520–24010 (09520–32040)

NOTICE:

- **Be careful not to damage the oil seal, boot and dust cover.**
- **Be careful not to drop the drive shaft assy.**



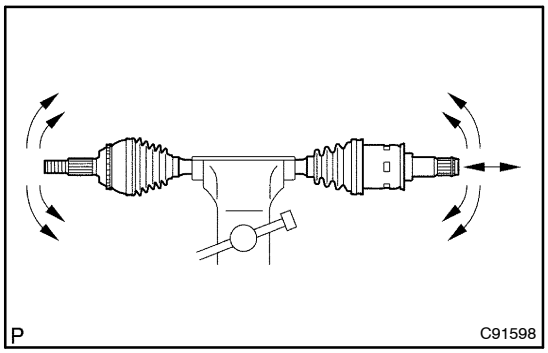
11. REMOVE FRONT DRIVE SHAFT ASSY RH (RH DRIVE SHAFT)

(a) Remove the 2 bolts and pull out the drive shaft together with the center bearing bracket.

(b) Remove the drive shaft from the transaxle.

NOTICE:

- **Be careful not to damage the oil seal, boot and dust cover.**
- **Be careful not to drop the drive shaft assy.**



12. FIX FRONT AXLE HUB LH BEARING

NOTICE:

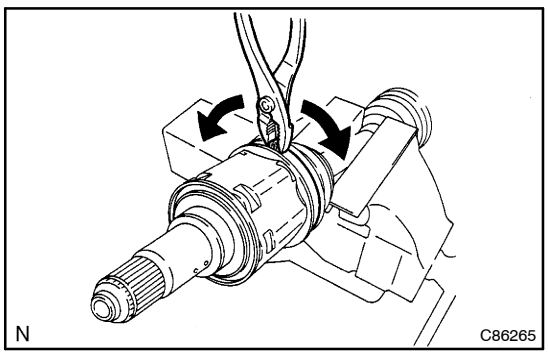
The hub bearing may become damaged if subjected to the vehicle weight. For example, moving the vehicle with the drive shaft removed.

Therefore, if it is absolutely necessary to place the vehicle weight on the hub bearing, first support it with SST.

SST 09608–16042 (09608–02021, 09608–02041)

13. INSPECT FRONT DRIVE SHAFT ASSY LH

(a) Check that there is no excessive play in the radial direction of the outboard joint.



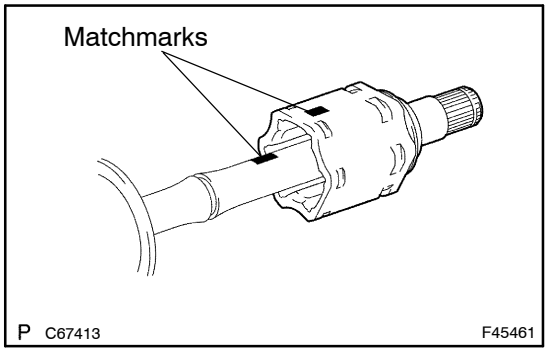
(b) Check that the inboard joint slides smoothly in the thrust direction.

(c) Check that there is no excessive play in the radial direction of the inboard joint.

(d) Check the boots for damage.

NOTICE:

Keep the drive shaft assy level during inspection.



14. REMOVE FRONT AXLE INBOARD JOINT BOOT CLAMP

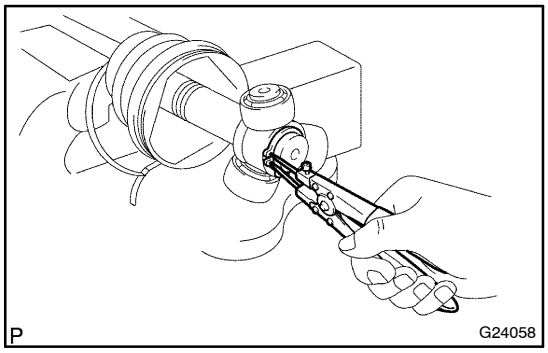
(a) Using pliers, remove the inboard joint boot LH No.2 clamp as shown in the illustration.

(b) Remove the inboard joint boot LH clamp ifollwng the same procedure as for the inboard joint boot LH No.2 clamp.

15. REMOVE FR AXLE INBOARD JOINT BOOT

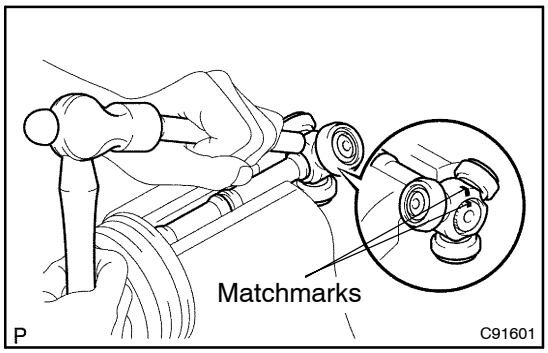
(a) Remove the inboard joint boot from the inboard joint assy LH.

16. REMOVE FRONT DRIVE INBOARD JOINT ASSY LH



(a) Remove the old grease from the inboard joint.

(b) Place matchmarks on the inboard joint assy LH and outboard joint shaft assy LH.



NOTICE:

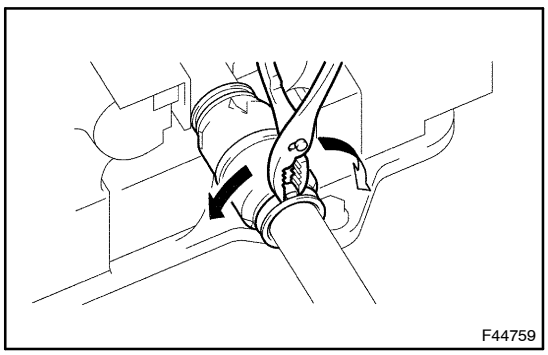
Do not use a punch for the marks.

(c) Remove the inboard joint assy LH from the outboard joint shaft assy LH.

(d) Using a snap ring expander, remove the shaft snap ring.

(e) Place matchmarks on the outboard joint shaft assy LH and tripod joint assy.

NOTICE:

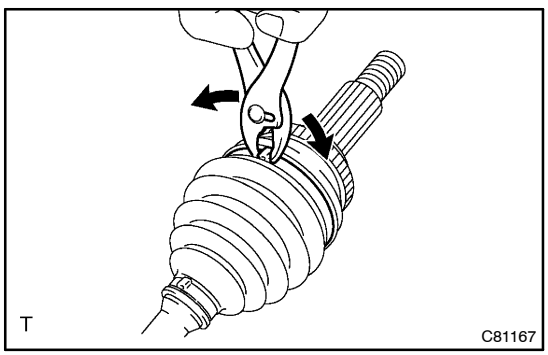


Do not punch the marks.

(f) Using a brass bar and hammer, remove the tripod joint assy from the outboard joint shaft assy LH.

NOTICE:

Do not tap the roller.



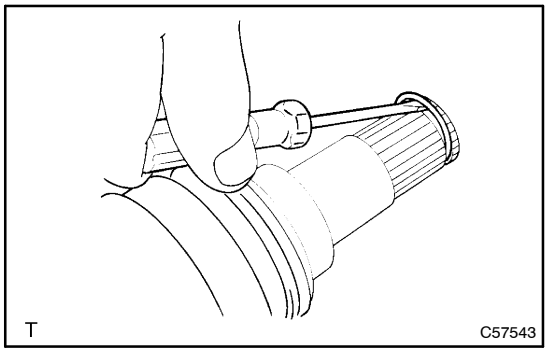
(g) Remove the inboard joint boot and 2 clamps.

17. REMOVE FRONT DRIVE SHAFT DAMPER LH

(a) Using pliers, remove the damper clamp as shown in the illustration.

(b) Remove the drive shaft damper.

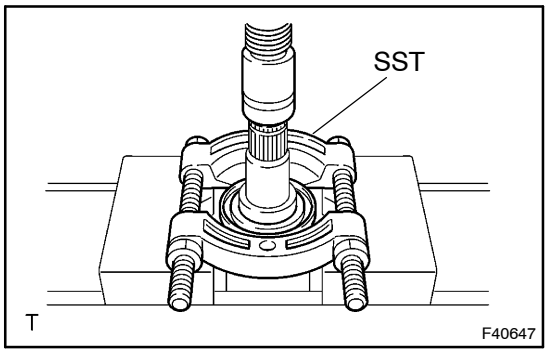
18. REMOVE FRONT AXLE OUTBOARD JOINT BOOT CLAMP



(a) Using pliers, remove the outboard joint boot LH No.2 clamp as shown in the illustration.

(b) Remove the outboard joint boot LH clamp following the same procedure as for the outboard joint boot LH No.2 clamp.

19. REMOVE OUTBOARD JOINT BOOT

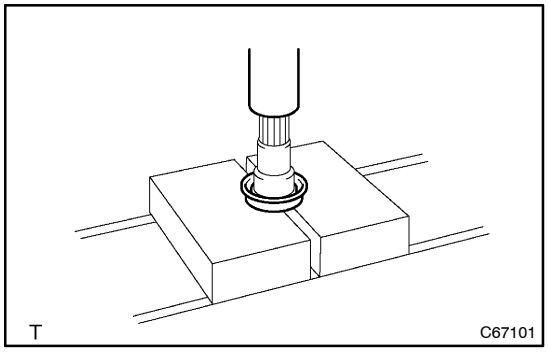


(a) Remove the outboard joint boot from the outboard joint shaft assy LH.

(b) Remove the old grease from the outboard joint.

20. REMOVE FRONT DRIVE SHAFT LH HOLE SNAP RING

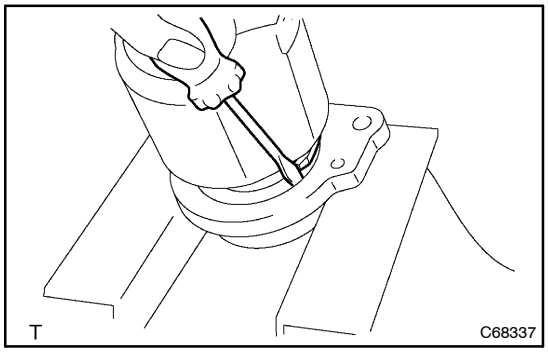
(a) Using a screwdriver, remove the hole snap ring.



21. REMOVE FRONT DRIVE SHAFT DUST COVER LH

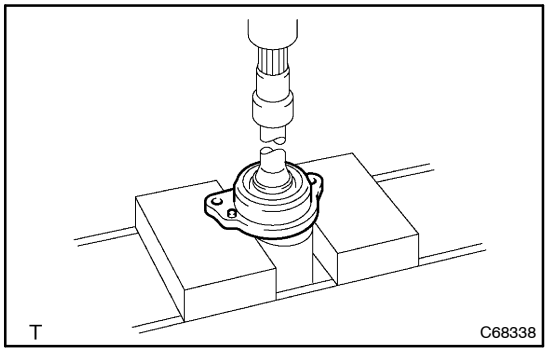
(a) Using SST and a press, remove the front drive shaft dust cover LH.

SST 09950–00020



NOTICE:

Be careful not to drop the inboard joint assy.

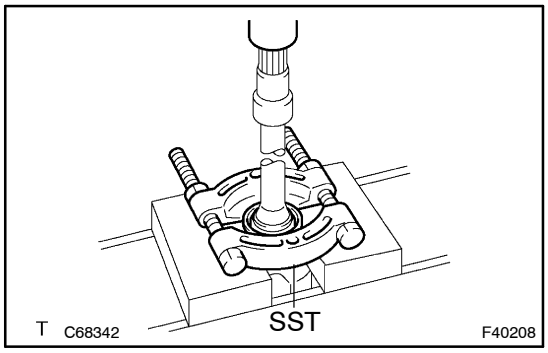


22. REMOVE FRONT DRIVE SHAFT DUST COVER RH (RH DRIVE SHAFT)

(a) Using a press, remove the drive shaft dust cover RH.

23. REMOVE CASE SUB ASSY, DRIVE SHAFT BEARING SNAP RING (RH DRIVE SHAFT)

(a) Using a screwdriver, remove the bearing case snap ring.

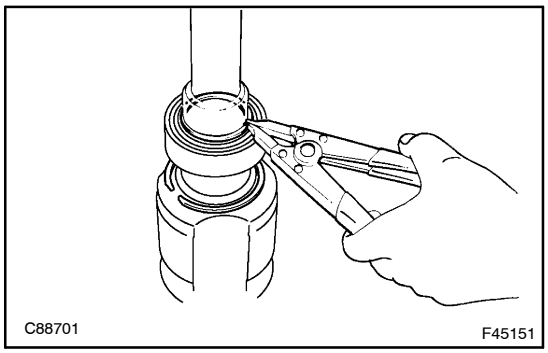


24. REMOVE DRIVE SHAFT BEARING CASE SUB ASSY (RH DRIVE SHAFT)

(a) Using a press, remove the drive shaft bearing case.

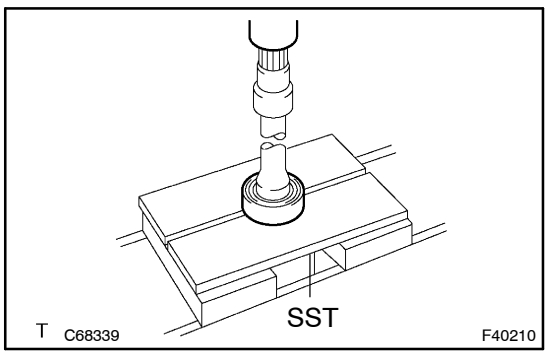
NOTICE:

Be careful not to drop the inboard joint assy.



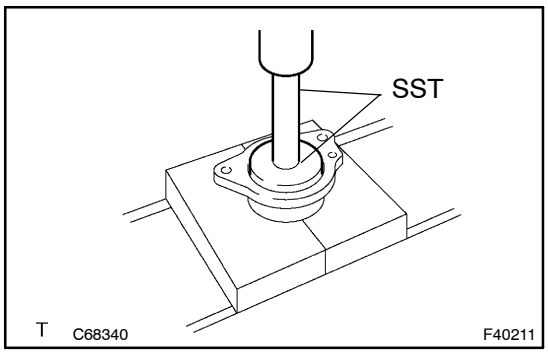
25. REMOVE FRONT DRIVE SHAFT DUST COVER (RH DRIVE SHAFT)

(a) Using SST and a press, remove the drive shaft dust cover.
SST 09950–00020



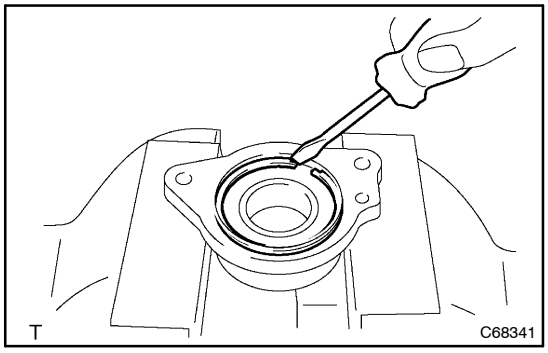
NOTICE:

Be careful not to drop the inboard joint assy.



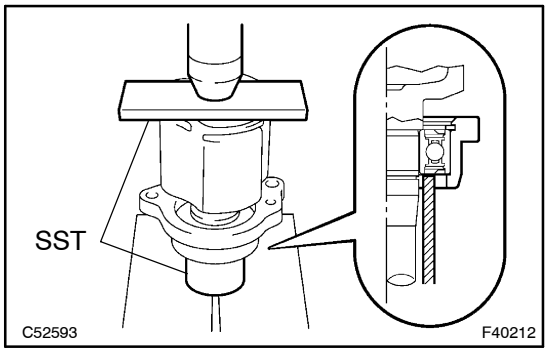
26. REMOVE FRONT DRIVE SHAFT BEARING (RH DRIVE SHAFT)

(a) Using a snap ring expander, remove the drive shaft hole snap ring.



(b) Using SST and a press, remove the drive shaft bearing.
SST 09527–10011

(c) Remove the snap ring.

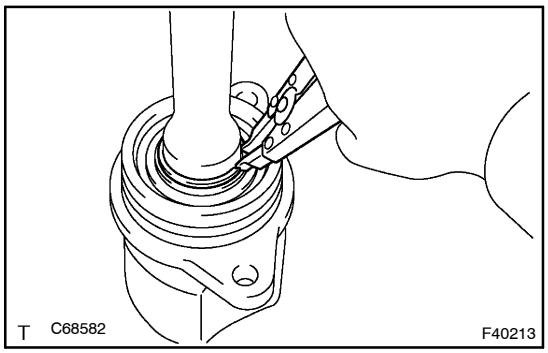


27. INSTALL FRONT DRIVE SHAFT BEARING (RH DRIVE SHAFT)

(a) Using SST and a press, install a new drive shaft bearing.
SST 09950–60020 (09951–00710), 09950–70010 (09951–07100)

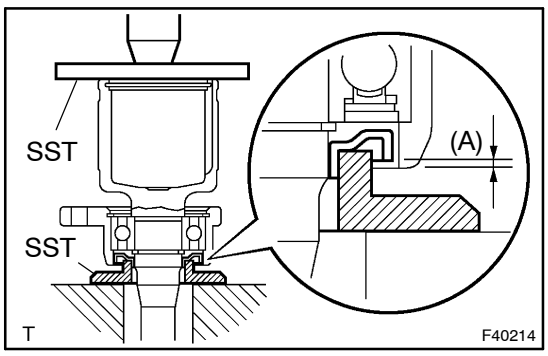
28. INSTALL CASE SUB ASSY, DRIVE SHAFT BEARING SNAP RING (RH DRIVE SHAFT)

(a) Using a screwdriver, install a new bearing case snap ring.



29. INSTALL DRIVE SHAFT BEARING CASE SUB ASSY (RH DRIVE SHAFT)

(a) Using SST and a press, install the drive shaft bearing case to the inboard joint assy RH.



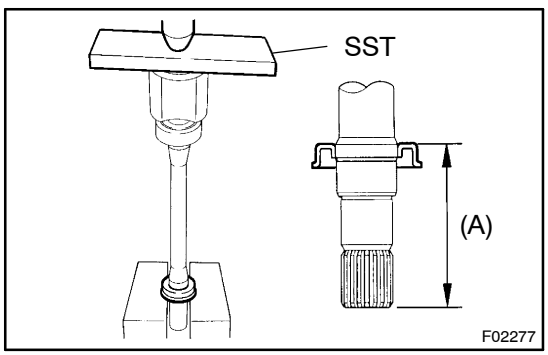
SST 09527–10011, 09710–04081

NOTICE:

Bearing should be installed completely.

(b) Using a snap ring expander, install a new drive shaft hole snap ring.

30. INSTALL FRONT DRIVE SHAFT DUST COVER (RH DRIVE SHAFT)



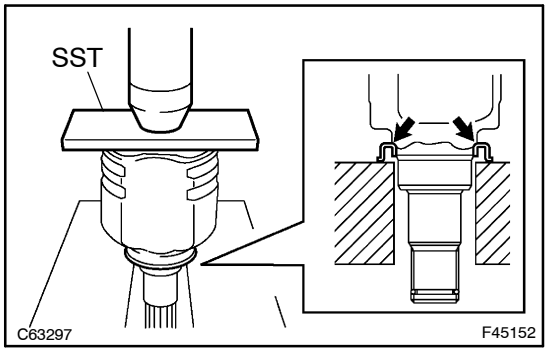
(a) Using SST and a press, install a new drive shaft dust cover.

SST 09726–40010, 09527–10011

Distance (A): 0.5 ± 0.5 mm (0.020 ± 0.020 in.)

NOTICE:

Be careful not to damage the dust cover.



31. INSTALL FRONT DRIVE SHAFT DUST COVER RH (RH DRIVE SHAFT)

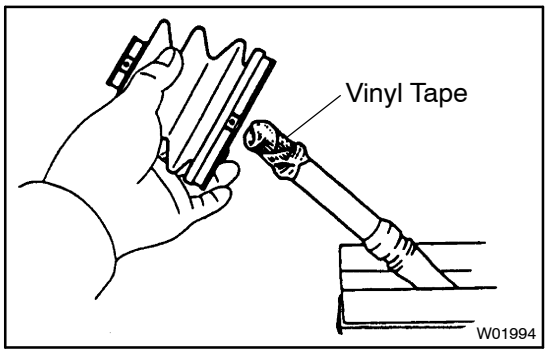
(a) Using SST and a press, install a new drive shaft dust cover RH until the distance from the tip of the center drive shaft to the drive shaft dust cover RH reaches the specification, as shown in the illustration.

SST 09527–10011

Distance (A): 110.5 ± 0.5 mm (4.350 ± 0.020 in.)

(b) Using SST and a press, install a new drive shaft dust cover RH.
SST 09527–10011

NOTICE:
- **Dust cover should be installed completely.**
- **Be careful not to damage the dust cover.**



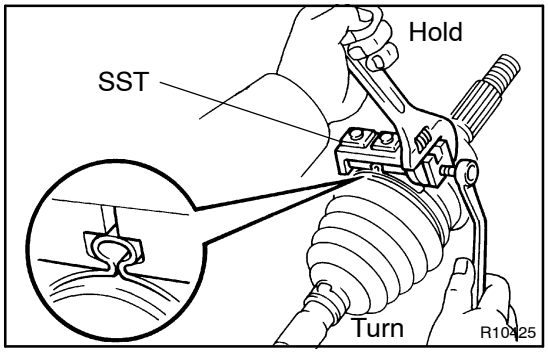
32. INSTALL FRONT DRIVE SHAFT DUST COVER LH

(a) Using SST and a press, install a new drive shaft dust cover LH.
SST 09527–10011

NOTICE:
- **Dust cover should be installed completely.**
- **Be careful not to damage the dust cover.**

33. INSTALL FRONT DRIVE SHAFT LH HOLE SNAP RING

(a) Install a new hole snap ring.

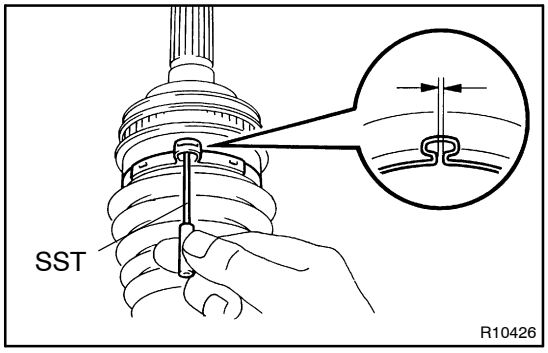


34. INSTALL OUTBOARD JOINT BOOT

HINT:
Before installing the boots, wrap the drive shaft spline with vinyl tape to prevent the boots from being damaged.

(a) Install new parts to the outboard joint shaft assy in the following order.
(1) Outboard joint boot LH No.2 clamp
(2) Outboard joint boot
(3) Outboard joint boot LH clamp

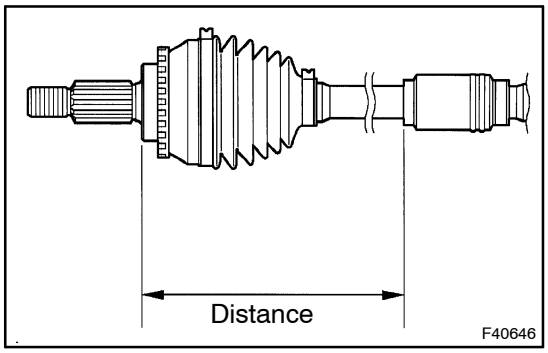
(b) Pack the outboard joint shaft and boot with grease in the boot kit.



Grease capacity: 152 to 162 g (5.4 to 5.7 oz.)

35. INSTALL FRONT AXLE OUTBOARD JOINT BOOT CLAMP

(a) Hold the front drive shaft in a soft vise.
(b) Secure the 2 outboard joint boot clamps onto the boot.
(c) Place SST onto the outboard joint large boot clamp.
SST 09521–24010
(d) Tighten the SST so that the large clamp is pinched.

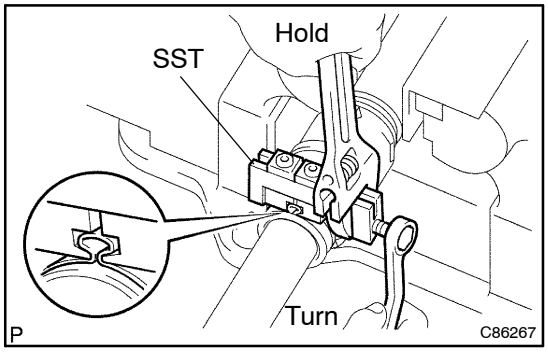


NOTICE:
Do not overtighten the SST.

(e) Using SST, adjust the clearance of the large clamp.
SST 09240–00020
Clearance: 0.8 mm (0.031 in.) or less

(f) Install the outboard joint boot LH clamp following the same procedure as for the outboard joint boot LH No.2 clamp.

NOTICE:
When the measured value exceeds the specified value, re-tighten the clamp.



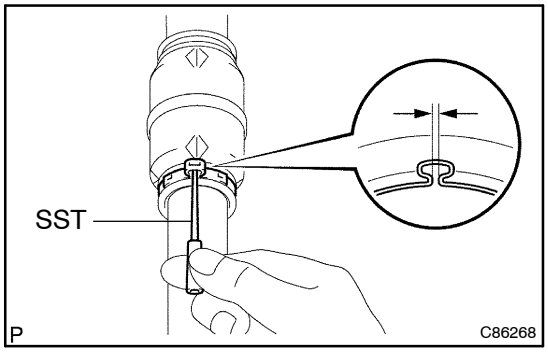
36. INSTALL FRONT DRIVE SHAFT DAMPER LH

HINT:
Perform the above procedure only when reassembling the RH side.

(a) Temporarily install a new damper clamp.

(b) Set the distance as described below.

Drive shaft type	Distance mm (in.)
RH	212.0 ± 2.0 (8.35 ± 0.08)
LH	168.0 ± 2.0 (6.61 ± 0.08)



(c) Install the damper clamp.

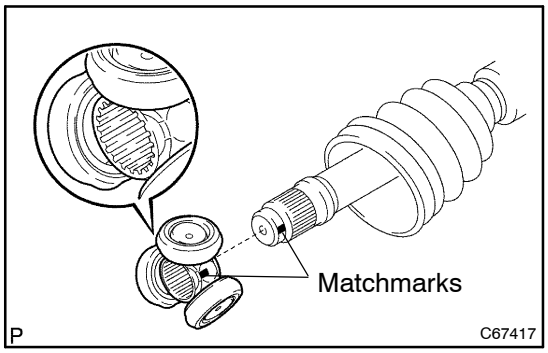
HINT:
Install the damper clamp to inboard joint side.

(1) Hold the front drive shaft in a soft vise.
(2) Secure the damper clamp onto the damper.
(3) Place SST onto the damper clamp.
SST 09521–24010
(4) Tighten the SST so that the damper clamp is pinched.

NOTICE:
Do not overtighten the SST.

(5) Using SST, adjust the clearance of the damper clamp.

SST 09240–00020



Clearance: 0.8 mm (0.031 in.) or less

NOTICE:

When the measured value exceeds the specified value, re-tighten the clamp.

HINT:

- Install the damper clamp to inboard joint side.
- Perform the above procedure only when reassembling the RH side.

37. INSTALL FRONT DRIVE INBOARD JOINT ASSY LH

(a) Wrap the outboard joint shaft assy LH spline with vinyl tape to prevent it from being damaged.

(b) Install new parts to the outboard joint shaft assy LH in the following order.

(1) Inboard joint boot LH clamp

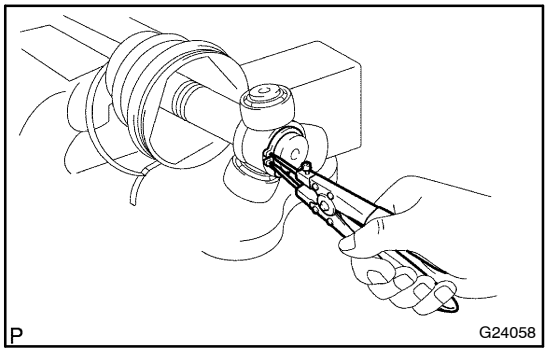
(2) Inboard joint boot

(3) Inboard joint boot LH No.2 clamp

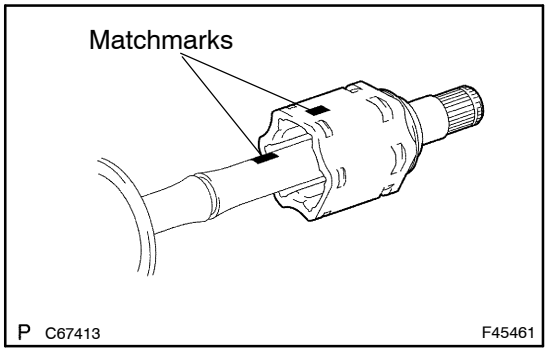
(c) Place the beveled side of the tripod axial spline toward the outboard joint.

(d) Align the match marks.

(e) Using a brass bar and hammer, tap in the tripod joint assy to the drive shaft assy LH.



NOTICE:

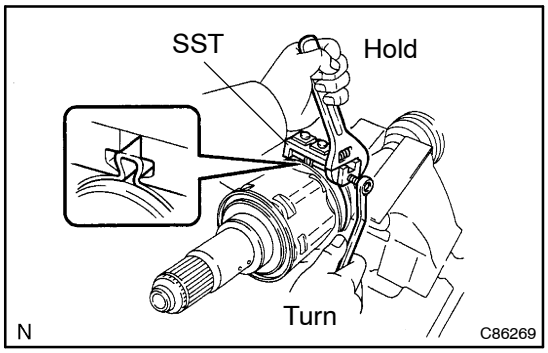


- **Do not tap the roller.**
- **Be sure to install the tripod joint assy in the correct direction.**

(f) Pack the inboard joint shaft and boot with grease in the boot kit.

Grease capacity: 170 to 190 g (6.0 to 6.7 oz.)

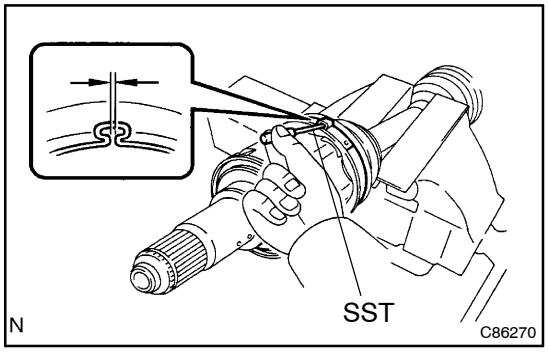
(g) Using a snap ring expander, install a new shaft snap ring.



(h) Aligning the matchmarks, install the inboard joint assy LH to the outboard joint shaft assy LH.

38. INSTALL FR AXLE INBOARD JOINT BOOT

(a) Install the inboard joint boot to the inboard joint assy LH and outboard joint shaft assy LH.



39. INSTALL FRONT AXLE INBOARD JOINT BOOT CLAMP

(a) Install the inboard joint boot clamp.
  (1) Hold the drive shaft in a soft vise.
  (2) Secure the 2 inboard joint boot clamps onto the boot.
  (3) Place SST onto the inboard joint large boot clamp.
  SST 09521–24010
  (4) Tighten the SST so that the large clamp is pinched.

NOTICE:

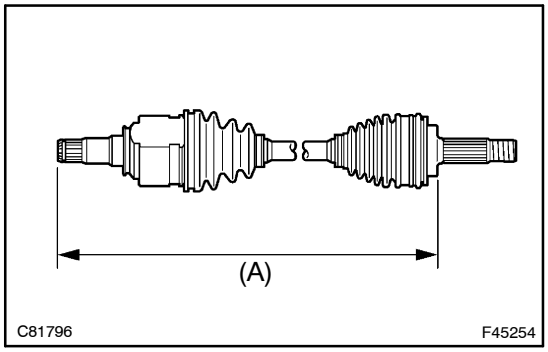
Do not overtighten the SST.

  (5) Using SST, adjust the clearance of the large clamp.
  SST 09240–00020
  Clearance: 0.8 mm (0.031 in.) or less

NOTICE:

When the measured value exceeds the specified value, re-tighten the clamp.

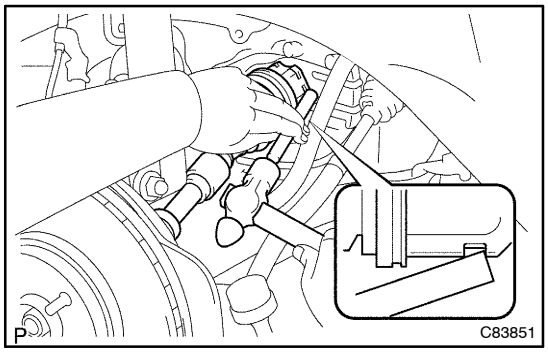
(b) Install the inboard joint boot LH clamp following the same procedure as for the inboard joint boot LH No.2 clamp.



40. INSPECT FRONT DRIVE SHAFT

(a) Check that there is no excessive play in the radial direction of the outboard joint.
(b) Check that the inboard joint slides smoothly in the thrust direction.
(c) Check that there is no excessive play in the radial direction of the inboard joint.
(d) Check the boots for damage.

NOTICE:

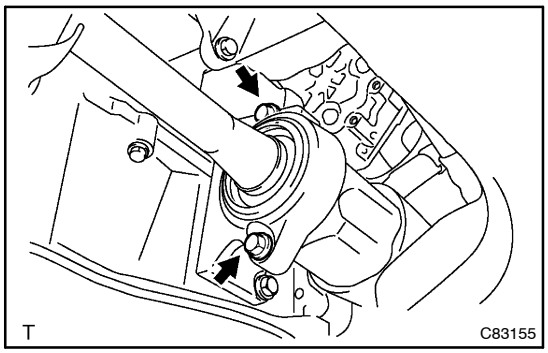


Keep the drive shaft assy level during inspection.

HINT:

For dimension (A), refer to the following table.

Drive shaft type	Dimension (A) mm (in.)
LH	546.1 (21.50) ± 5.0 (0.20)
RH	884.0 (34.80) ± 5.0 (0.20)



41. INSTALL FRONT DRIVE SHAFT ASSY LH

(a) Coat the inboard joint shaft assy LH spline with gear oil.

(b) Align the shaft splines and install the drive shaft assy LH with a brass bar and hammer.

NOTICE:

- **Set the snap ring with the opening side facing downwards.**
- **Be careful not to damage the oil seal, boot and dust cover.**

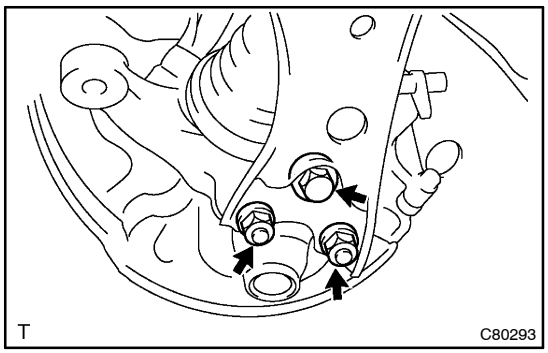
42. INSTALL FRONT DRIVE SHAFT ASSY RH (RH DRIVE SHAFT)

(a) Coat the inboard joint shaft assy RH spline with gear oil.

(b) Align the shaft splines and install the drive shaft assy RH with the 2 bolts.

Torque: 64 N·m (650 kgf·cm, 47 ft·lbf)

NOTICE:



Do not damage the oil seal, boot and dust cover.

43. INSTALL FRONT AXLE ASSY LH

(a) Install the drive shaft assy LH to the front axle assy LH.

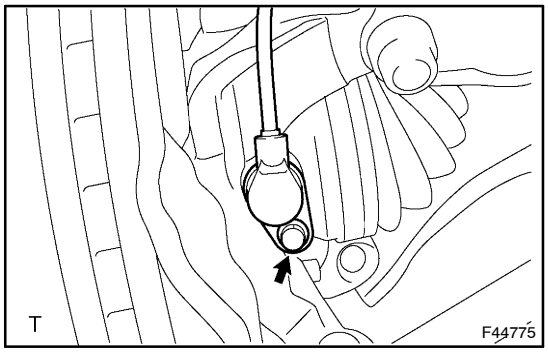
NOTICE:

- **Be careful not to damage the outboard joint boot.**
- **Be careful not to damage the speed sensor rotor.**

44. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH

(a) Install the lower ball joint to the front suspension arm sub–assy lower No.1 LH with the bolt and 2 nuts.

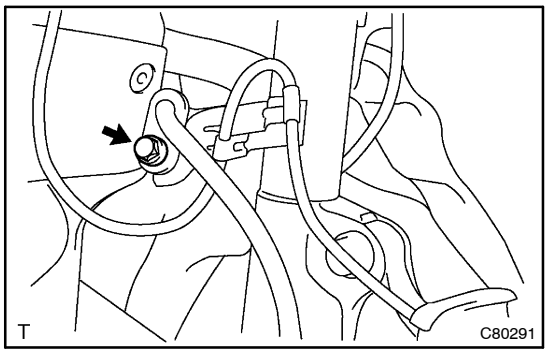
Torque: 89 N·m (908 kgf·cm, 66 ft·lbf)



45. INSTALL TIE ROD END SUB–ASSY LH

(a) Install the tie rod end sub–assy LH to the steering knuckle with the nut.
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

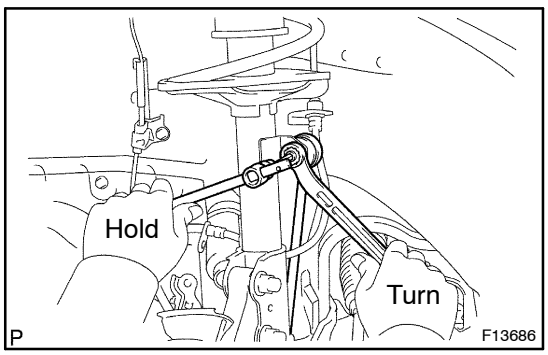
(b) Install a new cotter pin.



NOTICE:

If the holes for the cotter pin are not aligned, tighten the nut up to 60° further.

46. CONNECT SPEED SENSOR FRONT LH

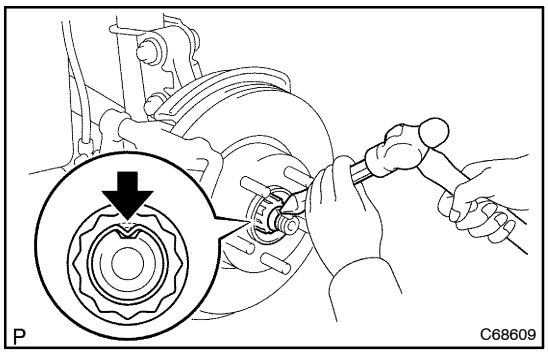


(a) Install the speed sensor front LH to the steering knuckle with the bolt.
Torque: 8.0 N·m (82 kgf·cm, 71 in.·lbf)

(b) Connect the speed sensor wire and flexible hose to the shock absorber with the bolt.
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

NOTICE:

- **Be careful not to damage the speed sensor.**
- **Keep the speed sensor clean.**
- **Do not twist the sensor wire when installing the sensor.**



47. INSTALL FRONT STABILIZER LINK ASSY LH

(a) Install the front stabilizer link assy LH with the nut.
Torque: 74 N·m (755 kgf·cm, 55 ft·lbf)

HINT:

If the ball joint turns together with the nut, use a hexagon wrench (6 mm) to hold the stud.

48. INSTALL FRONT AXLE HUB LH NUT

(a) Install a new axle hub LH nut.
Torque: 216 N·m (2,200 kgf·cm, 159 ft·lbf)

(b) Using a chisel and hammer, stake the axle hub LH nut.

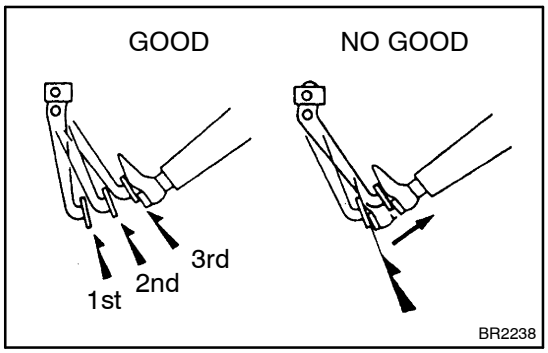
49. INSTALL ENGINE UNDER COVER LH

50. INSTALL FRONT WHEEL
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

51. ADD AUTOMATIC TRANSAXLE FLUID (A/T TRANSAXLE)
(SEE PUB. NO. RM1018E ON PAGE 40–2)

52. INSPECT AND ADJUST AUTOMATIC TRANSAXLE FLUID (A/T TRANSAXLE)
(SEE PUB. NO. RM1018E ON PAGE 40–2)

53. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT (SEE PUB. NO. RM1018E ON PAGE 26–6)



54. CHECK ABS SPEED SENSOR SIGNAL

(a) ABD WITH EBD & BA & TRAC & VSC SYSTEM (SEE PUB. NO. RM1018E ON PAGE 5–756)

BRAKE BOOSTER ASSY (RHD) (2AZ–FSE)

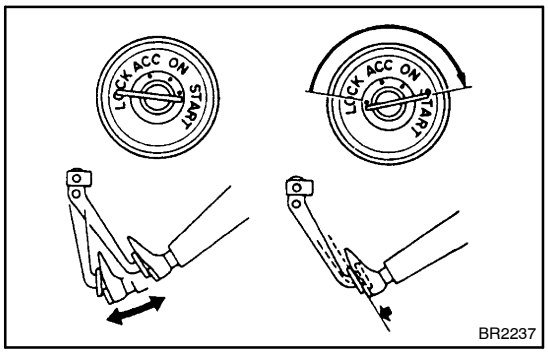
3211D–01

ON–VEHICLE INSPECTION

1. INSPECT BRAKE BOOSTER

(a) Airtightness check.

(1) Start the engine and stop it after 1 or 2 minutes. Depress the brake pedal several times slowly.



HINT:

If the pedal can be depressed to the floor the first time, but on the 2nd or 3rd time cannot be depreesed as far, the booster is airtight.

(2) Depress the brake pedal while the engine is running, and stop the engine with the pedal depressed.

HINT:

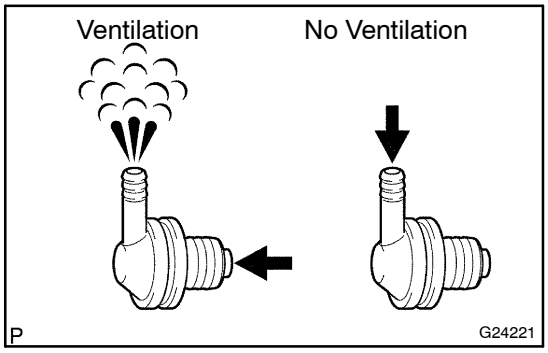
If there is no change in the pedal reserve distance after holding the pedal for 30 seconds, the booster is airtight.

(b) Operating check.

(1) Depress the brake pedal several times with the ignition switch off and check that there is no change in the pedal reserve distance.

(2) Depress the brake pedal and start the engine.

HINT:



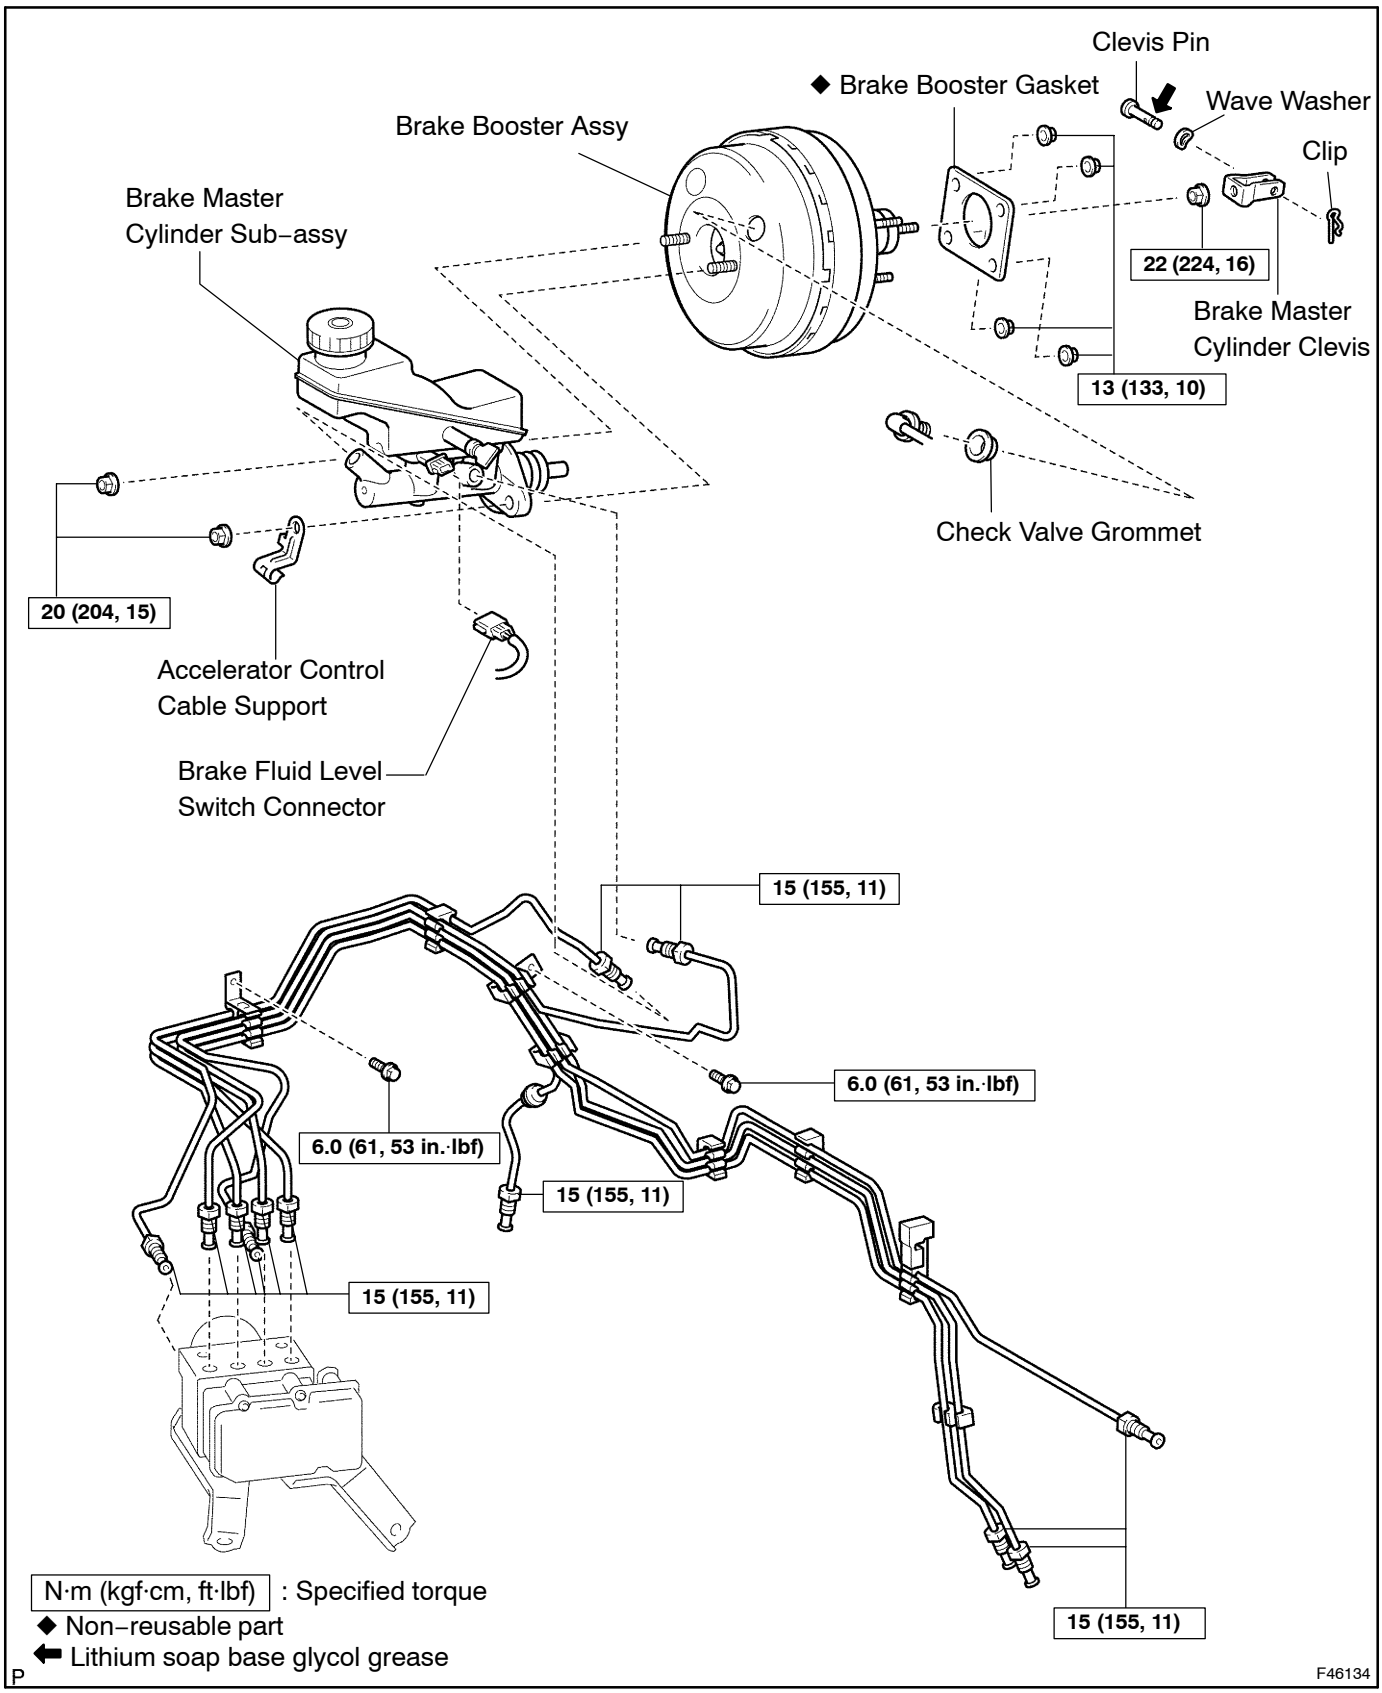
If the pedal goes down slightly, operation is normal.

2. INSPECT VACUUM CHECK VALVE

(a) Inspect vacuum check valve.

(1) Slide the clip and disconnect the vacuum hose.

(2) Remove the vacuum check valve.



(3) Check that there is ventilation from the booster to the engine, and no ventilation from the engine to the booster.

(4) If any fault is found, replace the vacuum check valve.

3211E–01

COMPONENTS

3211F–01

REPLACEMENT

NOTICE:

Do not adjust the brake booster push rod.

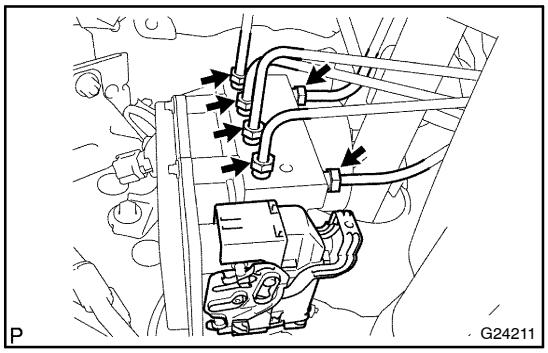
1. DRAIN BRAKE FLUID

NOTICE:

Wash the brake fluid off immediately if it adheres to any painted surface.

2. REMOVE FRONT WHEEL RH

3. REMOVE ENGINE COVER NO.1

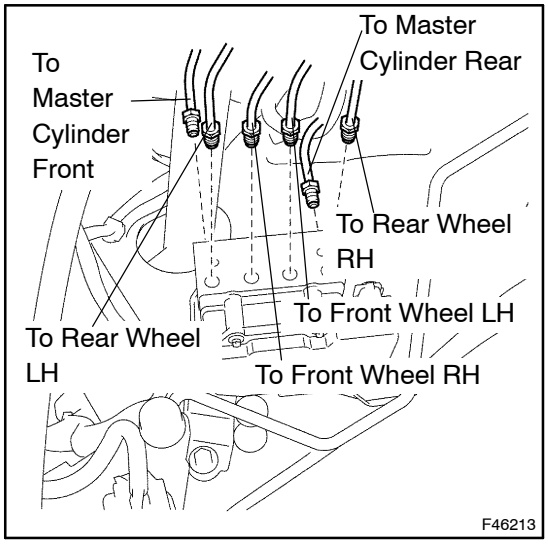


4. REMOVE CYLINDER HEAD COVER SUB–ASSY (SEE PAGE 14–79)

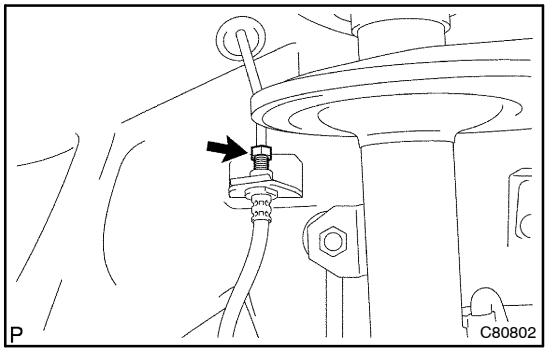
5. REMOVE IGNITION COIL ASSY (SEE PAGE 14–79)

6. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE (SEE PAGE 14–23)

7. REMOVE BRAKE MASTER CYLINDER SUB–ASSY

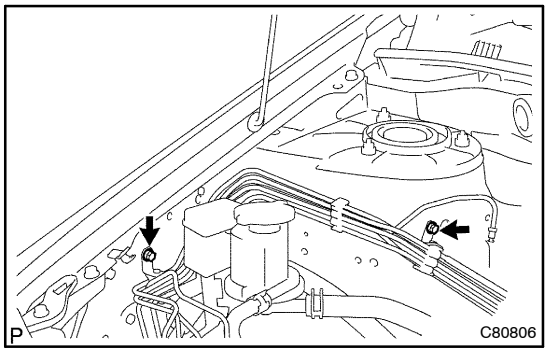


SST 09023–00100

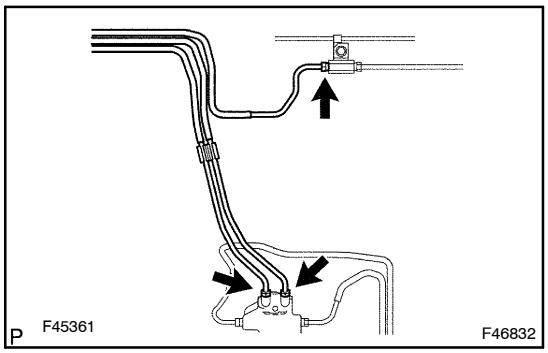


8. REMOVE BRAKE TUBE

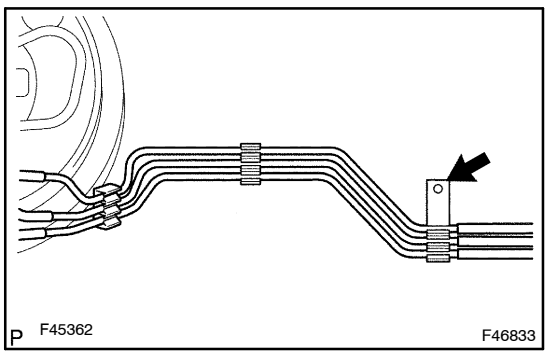
(a) Using SST, disconnect the 6 brake tubes from the brake actuator.



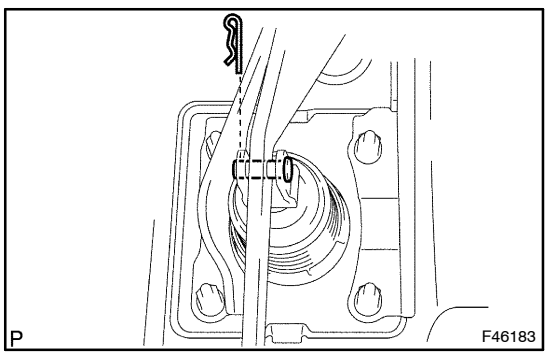
SST 09023–00100



(b) Use tags or make a memo to identify the place to reconnect.

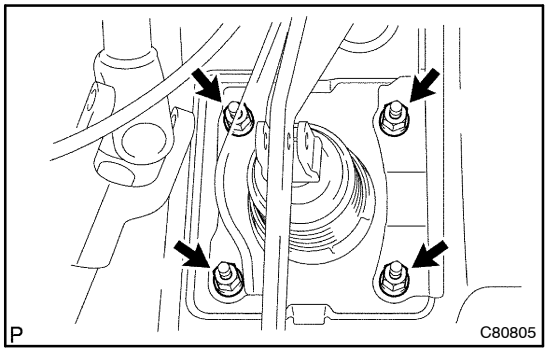


(c) Using SST and a spanner, disconnect the brake tube from the flexible hose of the front brake RH.
SST 09023–00100



(d) Remove the 2 bolts and disconnect the 2 brake tube clamps.

(e) Using SST, disconnect the 3 brake tubes from the ways.
SST 09023–00100



(f) Disconnect the clamp from the stud bolt and remove the brake tubes.

9. REMOVE BRAKE BOOSTER ASSY

(a) Disconnect the vacuum hose from the brake booster assy.

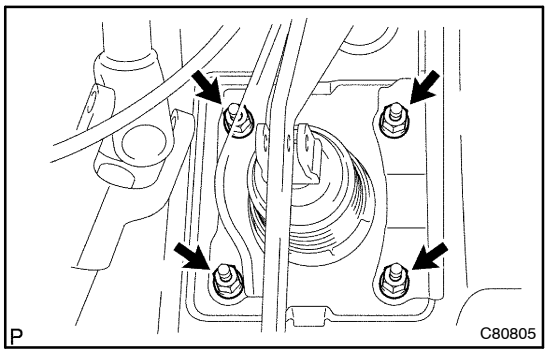
(b) Remove the clip, the clevis pin and the wave washer.

(c) Remove the 4 nuts.
(d) Pull out the brake booster assy.
(e) Remove the brake master cylinder clevis from the brake booster assy.

10. REMOVE BRAKE BOOSTER GASKET

(a) Pull out the brake booster gasket.

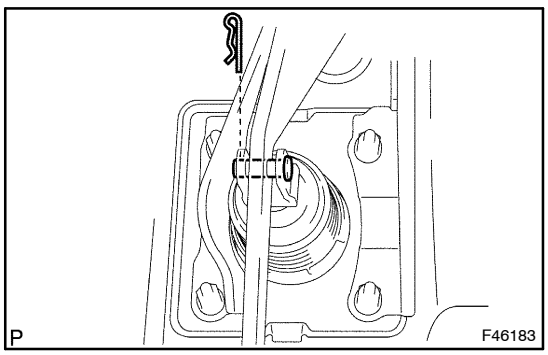
11. REMOVE CHECK VALVE



(a) Remove the check valve and grommet from the brake booster assy.

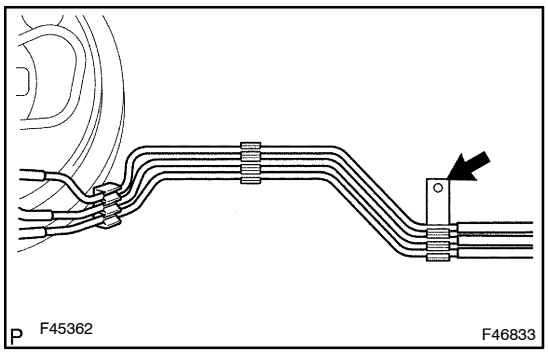
12. INSTALL CHECK VALVE

(a) Install the check valve and grommet to the brake booster assy.



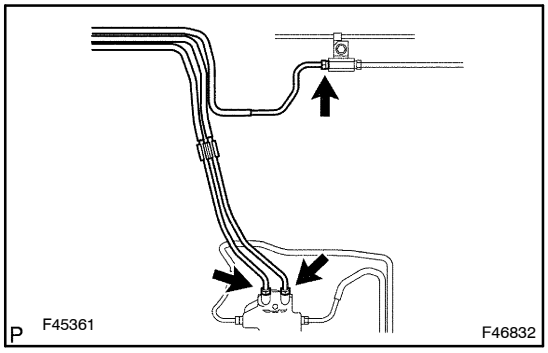
13. INSTALL BRAKE BOOSTER GASKET

(a) Install a new brake booster gasket to the brake booster assy.

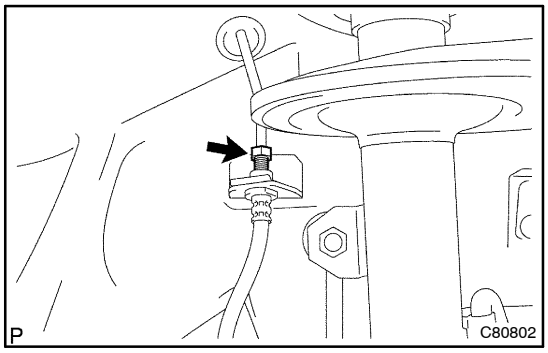


14. INSTALL BRAKE BOOSTER ASSY

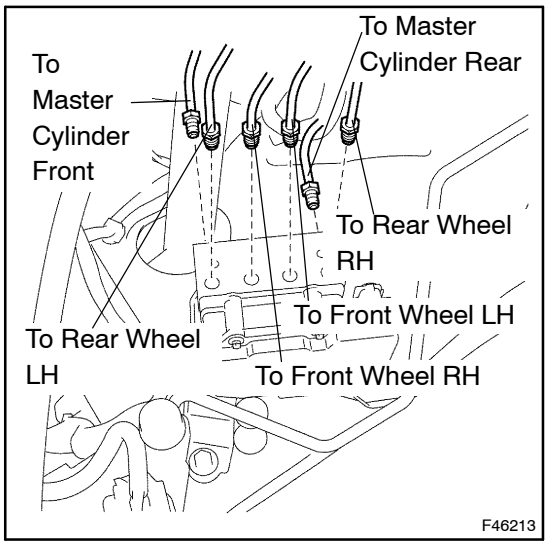
(a) Install the brake master cylinder clevis to the brake booster assy.
Torque: 22 N·m (224 kgf·cm, 16 ft·lbf)
(b) Install the brake booster assy with the 4 nuts.
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)



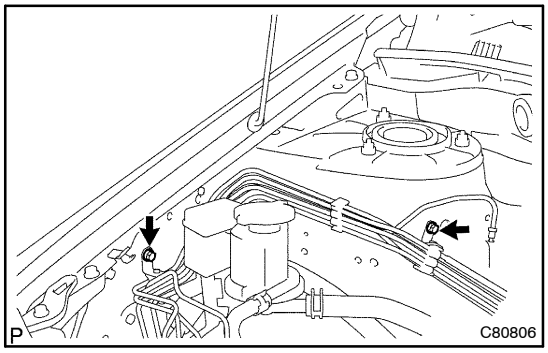
(c) Install the clevis pin, the clip and the wave washer.
(d) Connect the vacuum hose to the check valve.



15. INSTALL BRAKE TUBE



(a) Connect the clamp to the stud bolt.



(b) Using SST, connect the 3 brake tubes to the ways.
SST 09023–00100
Torque: 15 N·m (155 kgf·cm, 11 ft·lbf)

(c) Using SST and a spanner, connect the brake tube to the flexible hose of front brake RH.
SST 09023–00100
Torque: 15 N·m (155 kgf·cm, 11 ft·lbf)

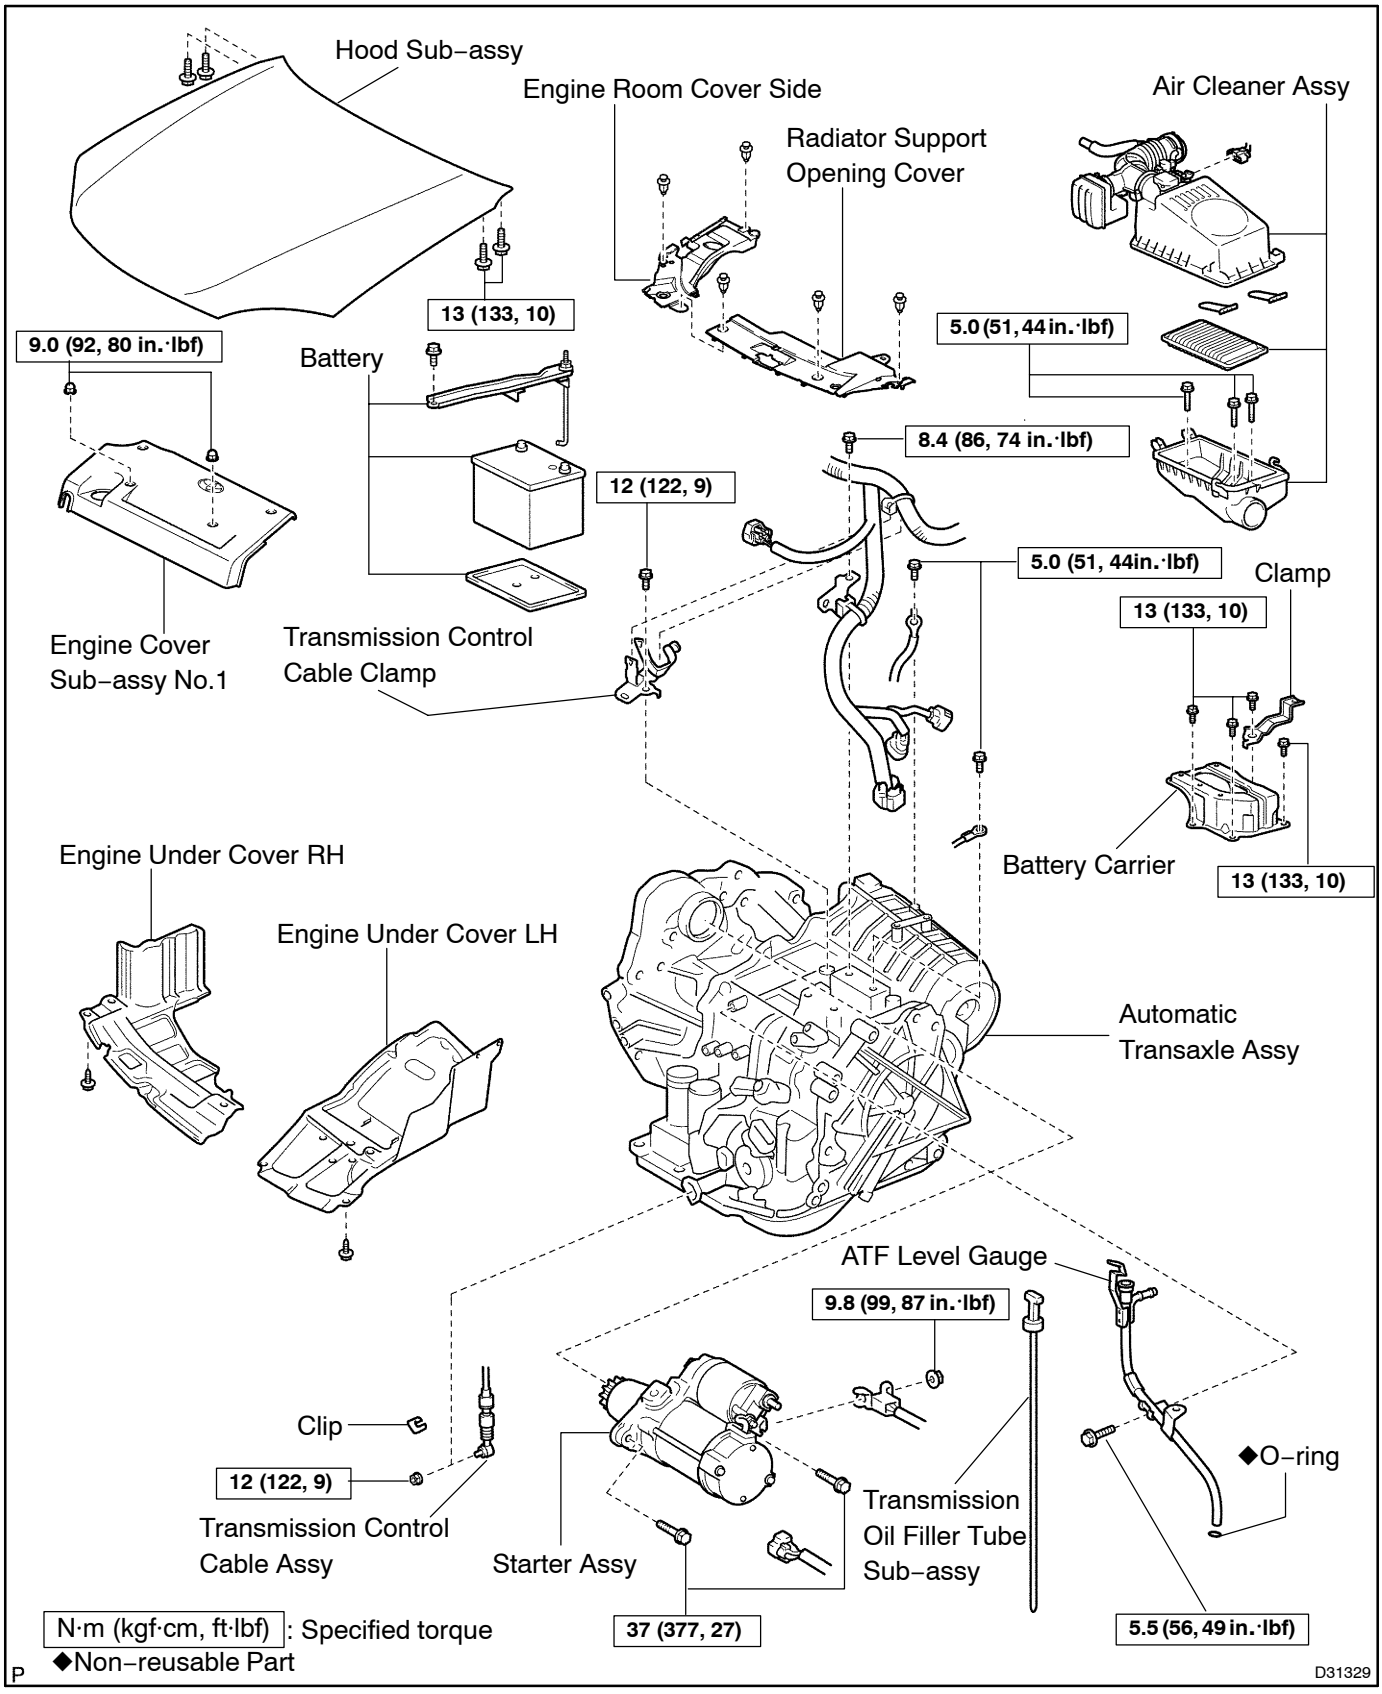
(d) Using SST, connect the 6 brake tubes to the brake actuator, as shown in the illustration.
SST 09023–00100
Torque: 15 N·m (155 kgf·cm, 11 ft·lbf)

(e) Install the brake tube clamps with the 2 bolts.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

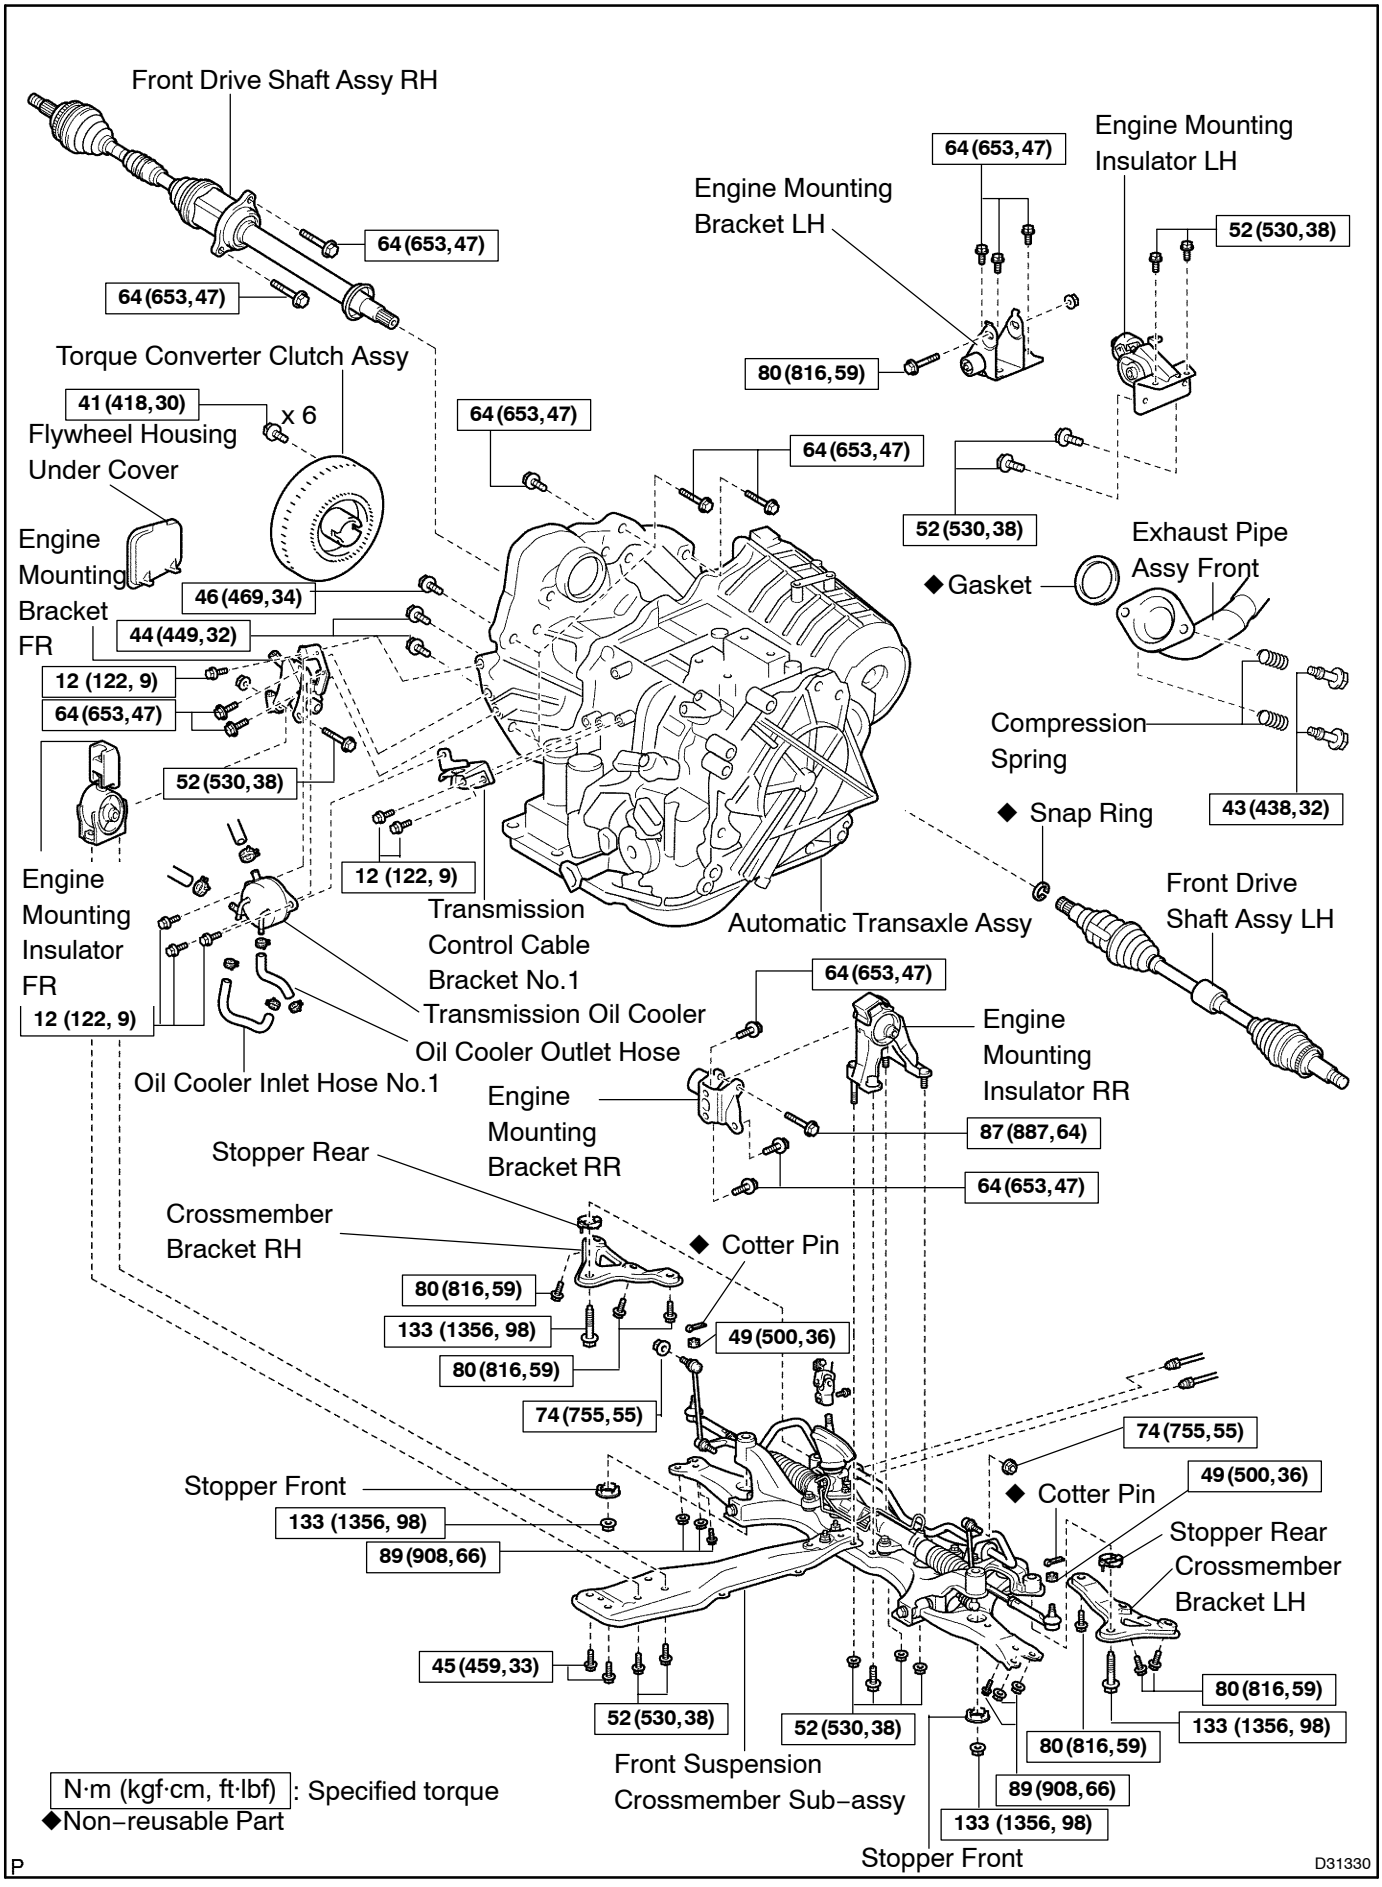
16. INSTALL BRAKE MASTER CYLINDER SUB–ASSY
SST 09023–00100

17. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE (SEE PAGE 14–23)

18. INSTALL IGNITION COIL ASSY (SEE PAGE 14–79)



19. INSTALL CYLINDER HEAD COVER SUB–ASSY (SEE PAGE 14–79)



20. INSTALL ENGINE COVER NO.1
21. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
22. FILL RESERVOIR WITH BRAKE FLUID
23. BLEED MASTER CYLINDER
SST 09023–00100
24. BLEED BRAKE LINE
25. CHECK AND ADJUST BRAKE PEDAL HEIGHT
26. CHECK PEDAL FREE PLAY
27. CHECK PEDAL RESERVE DISTANCE
28. CHECK FLUID LEVEL IN RESERVOIR
29. CHECK BRAKE FLUID LEAKAGE

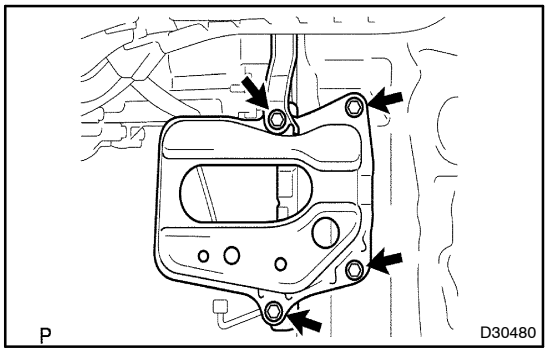
REPLACEMENT

1. REMOVE HOOD SUB–ASSY



2. REMOVE ENGINE COVER SUB–ASSY NO.1

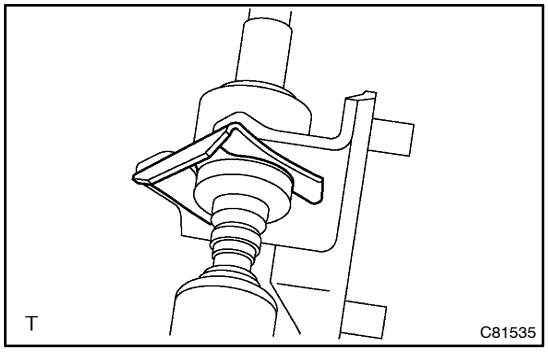
(a) Remove the 2 nuts and engine cover.

3. REMOVE RADIATOR SUPPORT OPENING COVER

4. REMOVE ENGINE ROOM COVER SIDE

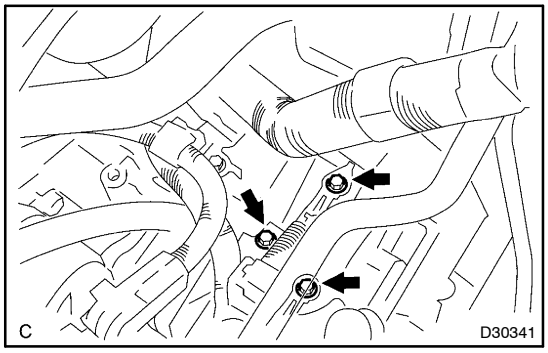
5. REMOVE BATTERY

6. REMOVE BATTERY CARRIER



(a) Remove the 4 bolts and battery carrier.

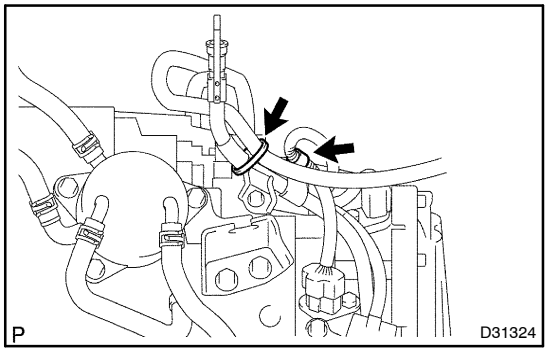
7. REMOVE AIR CLEANER ASSY



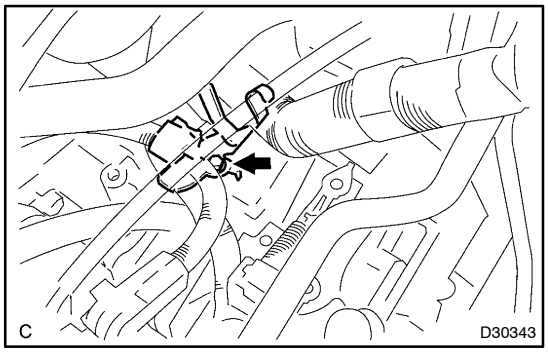
8. SEPARATE TRANSMISSION CONTROL CABLE ASSY

(a) Remove the nut from the control shaft lever.

(b) Separate the control cable from the control shaft lever.

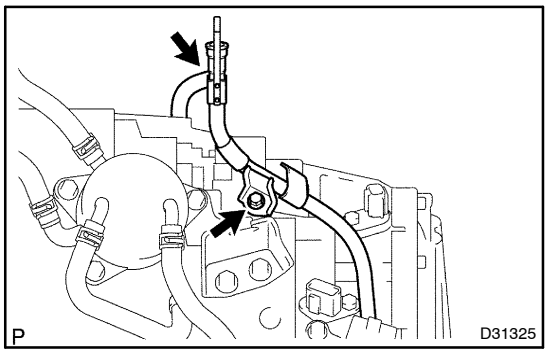


(c) Remove the clip and separate the control cable from the control cable bracket.



9. SEPARATE WIRE HARNESS

(a) Remove the 3 bolts and separete the 2 wire harnesses with the wire harness bracket.



10. DISCONNECT CONNECTOR

(a) Separate the 2 wire harness clamps from the oil filler tube.
(b) Disconnect the transmission wire connector.
(c) Disconnect the park/neutral position switch connector.
(d) Disconnect the 2 speed sensor connectors.

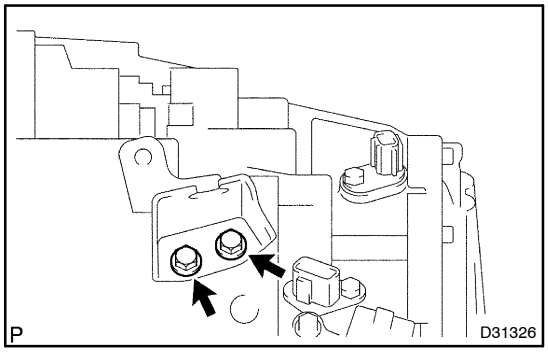
11. REMOVE TRANSMISSION CONTROL CABLE CLAMP

(a) Remove the bolt and transmission control cable clamp from the automatic transaxle.

12. REMOVE TRANSMISSION OIL FILLER TUBE SUB–ASSY

(a) Remove the ATF level gauge.
(b) Remove the breather hose.
(c) Remove the bolt and oil filler tube.
(d) Remove the O–ring from the oil filler tube.

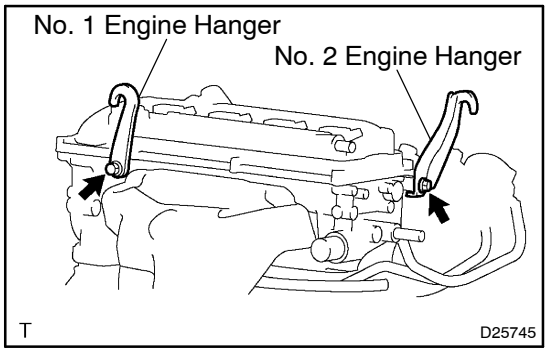
13. REMOVE FRONT WHEELS
14. REMOVE ENGINE UNDER COVER RH
15. REMOVE ENGINE UNDER COVER LH
16. DRAIN AUTOMATIC TRANSAXLE FLUID



(a) Remove the drain plug and drain ATF.
(b) Remove the gasket from the drain plug.
(c) Install a new gasket and the drain plug.
Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)

17. DRAIN COOLANT (SEE PAGE 16–7)
18. REMOVE TRANSMISSION OIL COOLER (SEE PAGE 40–26)
19. SEPARATE OIL COOLER INLET HOSE NO.1

(a) Loosen the clip and separate the oil cooler inlet hose No.1 from the automatic transaxle assy.



20. SEPARATE OIL COOLER OUTLET HOSE

(a) Loosen the clip and separate the oil cooler outlet hose from the automatic transaxle assy.

21. REMOVE TRANSMISSION CONTROL CABLE BRACKET NO.1

(a) Remove the 2 bolts and control cable bracket No.1.

22. SUSPEND ENGINE ASSY

(a) Install the No.1 and No.2 engine hangers in the correct direction.

Parts No.:
No. 1 engine hanger: 12281–28010
No. 2 engine hanger: 12282–28010
Bolt: 91512–61020
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)

(b) Attach the engine chain hoist to the engine hanger.

CAUTION:
Do not attempt to hang the engine by hooking the chain to any other part.

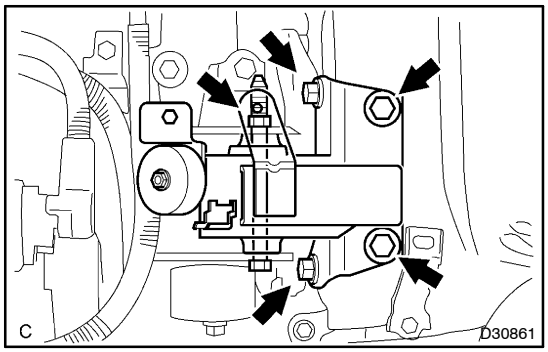
23. REMOVE EXHAUST PIPE ASSY FRONT (SEE PAGE 15–2)

24. REMOVE FRONT DRIVE SHAFT ASSY RH (SEE PAGE 30–4)

SST 09520–01010, 09520–24010 (09520–32040)

25. REMOVE FRONT DRIVE SHAFT ASSY LH (SEE PAGE 30–4)

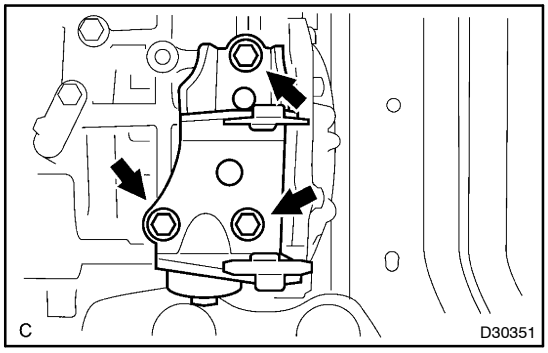
SST 09520–01010, 09520–24010 (09520–32040)



26. REMOVE STARTER ASSY

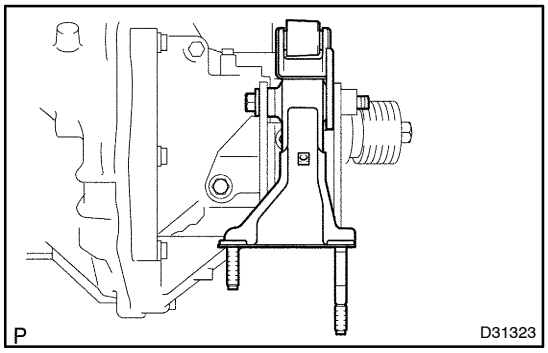
(a) Remove the nut and disconnect the starter wire.
(b) Disconnect the connector.
(c) Remove the 2 bolts and starter.

27. SUPPORT AUTOMATIC TRANSAXLE ASSY



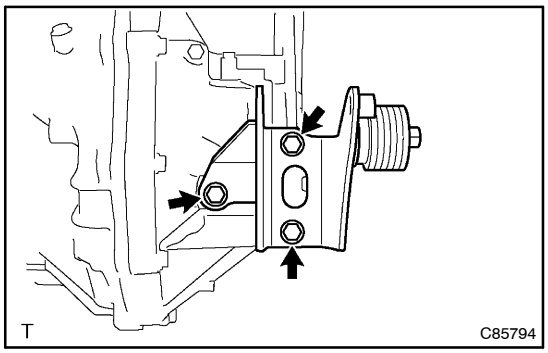
(a) Support the automatic transaxle with a transmission jack.

28. REMOVE FRONT SUSPENSION CROSSMEMBER SUB–ASSY (SEE PAGE 14–23)



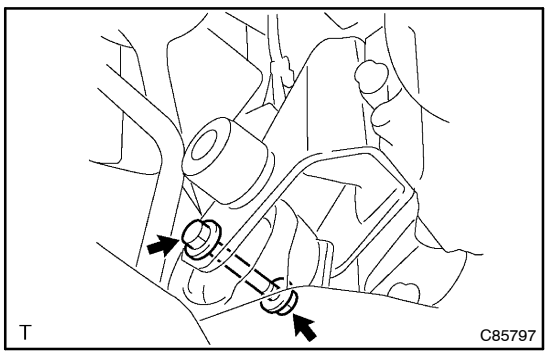
29. REMOVE ENGINE MOUNTING INSULATOR LH

(a) Remove the 5 bolts, nut and engine mounting insulator LH.



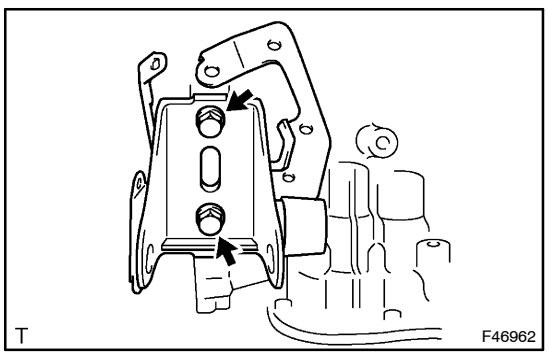
30. REMOVE ENGINE MOUNTING BRACKET LH

(a) Remove the 3 bolts and engine mounting bracket LH from the automatic transaxle.



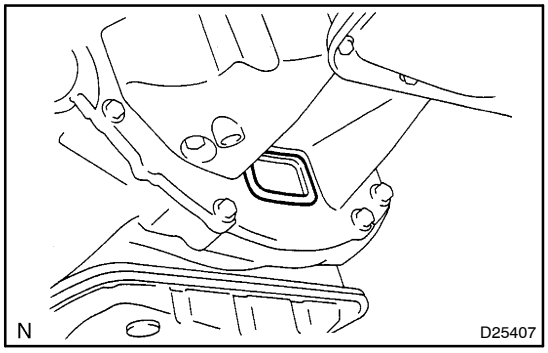
31. REMOVE ENGINE MOUNTING INSULATOR RR

(a) Remove the bolt and engine mounting insulator RR from the engine mounting bracket RR.



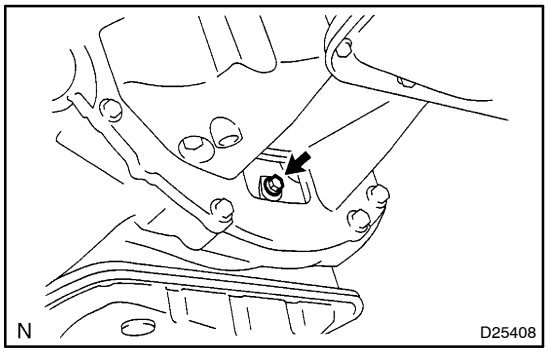
32. REMOVE ENGINE MOUNTING BRACKET RR

(a) Remove the 3 bolts and engine mounting bracket RR from the automatic transaxle.



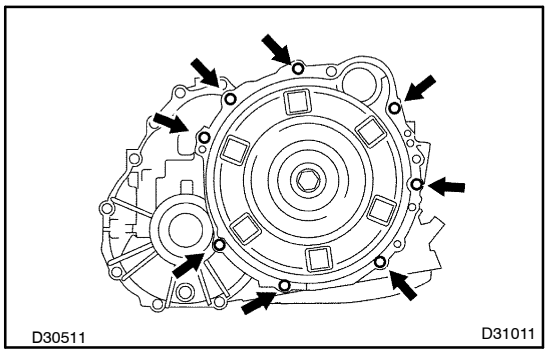
33. REMOVE ENGINE MOUNTING INSULATOR FR

(a) Remove the bolt and nut from the engine mounting bracket FR.



34. REMOVE ENGINE MOUNTING BRACKET FR

(a) Remove the 2 bolts and engine mounting bracket FR from the automatic transaxle.

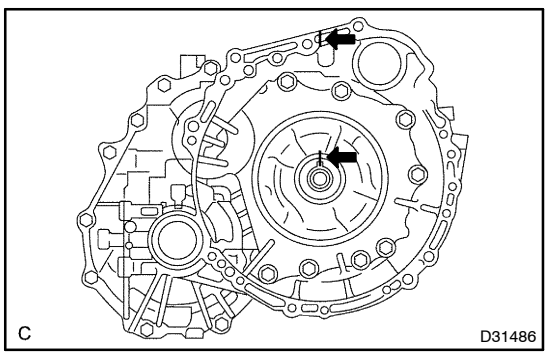


35. REMOVE FLYWHEEL HOUSING UNDER COVER

(a) Remove the flywheel housing under cover from the automatic transaxle.

36. REMOVE AUTOMATIC TRANSAXLE ASSY

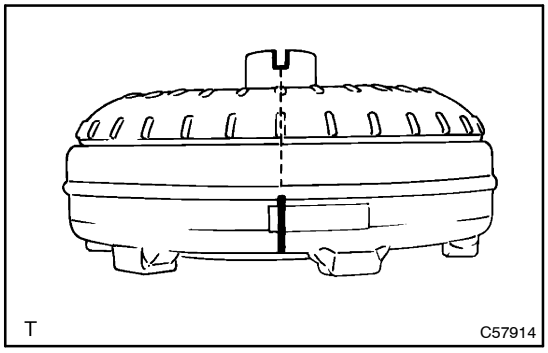
(a) Turn the crankshaft to remove the 6 bolts while holding the crankshaft pulley bolt with a wrench.



(b) Remove the 8 bolts.

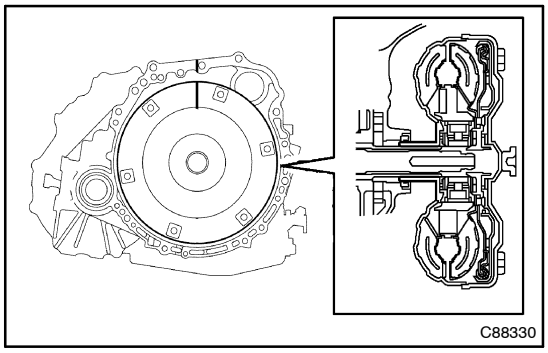
(c) Separate and remove the automatic transaxle.

37. REMOVE TORQUE CONVERTER CLUTCH ASSY

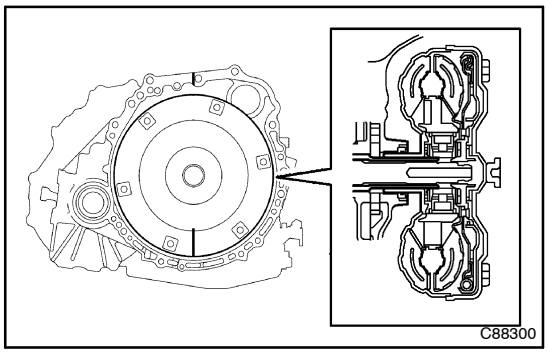


38. INSPECT TORQUE CONVERTER CLUTCH ASSY (SEE PUB. NO. RM1018E, PAGE 40–37)

SST 09350–32014 (09351–32010, 09351–32020)

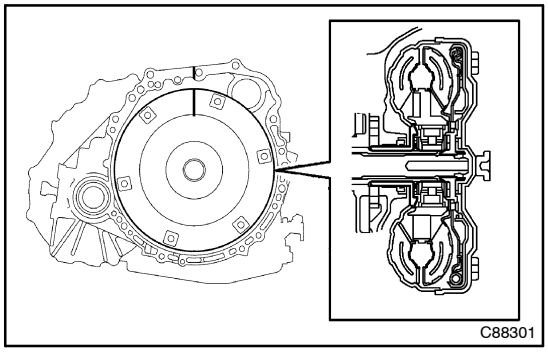


39. INSTALL TORQUE CONVERTER CLUTCH ASSY

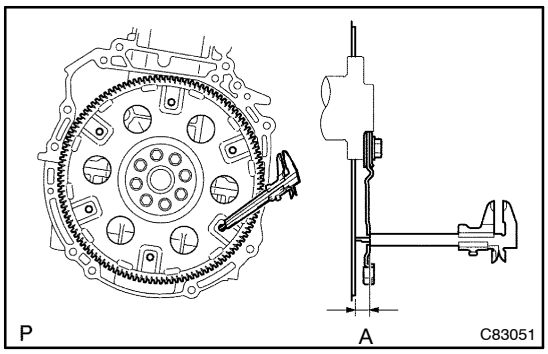


(a) Set the key of the front oil pump drive gear at the top and put a mark on the transaxle case.

(b) Put a mark on the torque converter clutch so that its groove can be clearly indicated.

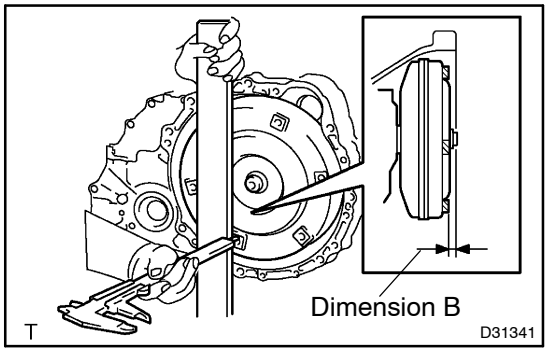


(c) Match the 2 marks on the transaxle case and the torque converter clutch and fit the spline part of the input shaft with the one of the turbine runner.

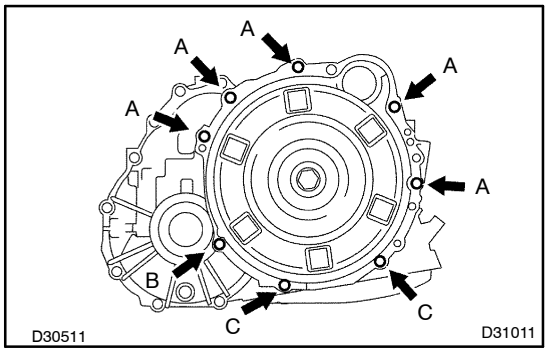


(d) Rotating the torque converter clutch, fit the spline part of the stator shaft with the one of the stator.

HINT:
Rotate it about 180 degrees.

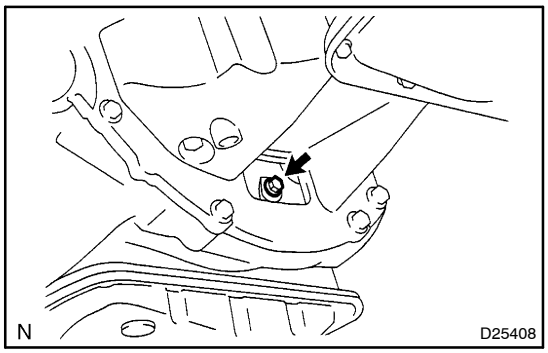


(e) Rotating the torque converter clutch, match the 2 marks on the case and the torque converter clutch again and fit the key of the oil pump drive gear into the key way of the torque converter clutch.

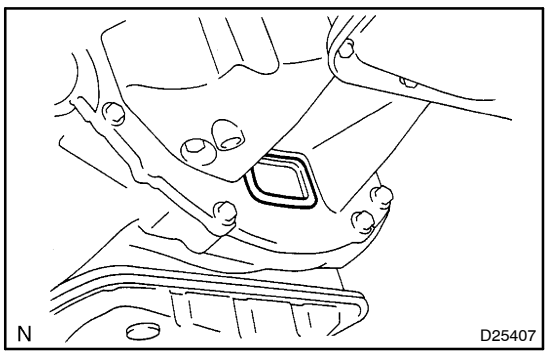


NOTICE:
When rotating the torque converter clutch, do not use excessive force to push it.

(f) Using vernier calipers, measure the dimension A between the transaxle and the end surface of the drive plate.

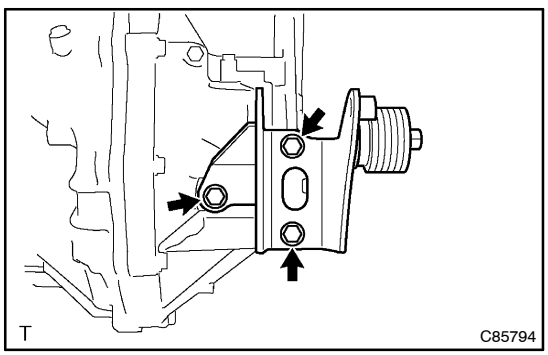


(g) Using calipers and a straight edge, measure the dimension B shown in the illustration and check that B is greater than A measured in step (f).
Standard: A + 1 mm or more



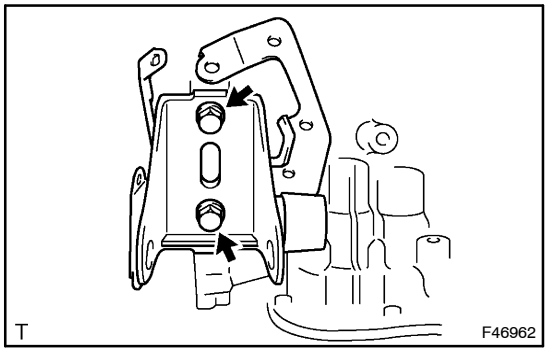
40. INSTALL AUTOMATIC TRANSAXLE ASSY

(a) Install the automatic transaxle and 8 bolts to the engine.
Torque:
Bolt A: 64 N·m (653 kgf·cm, 47 ft·lbf)
Bolt B: 46 N·m (469 kgf·cm, 34 ft·lbf)
Bolt C: 44 N·m (449 kgf·cm, 32 ft·lbf)



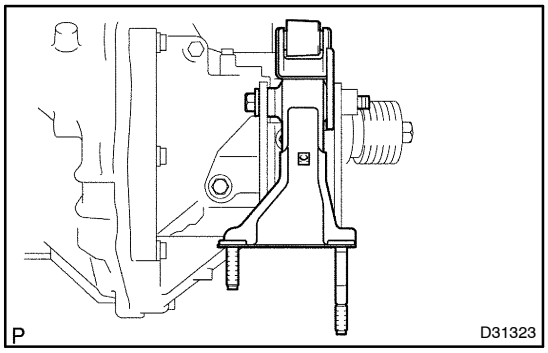
(b) Install the 6 torque converter clutch mounting bolts.
Torque: 41 N·m (418 kgf·cm, 30 ft·lbf)

HINT:
First install the green colored bolt, and then the remaining 5 bolts.



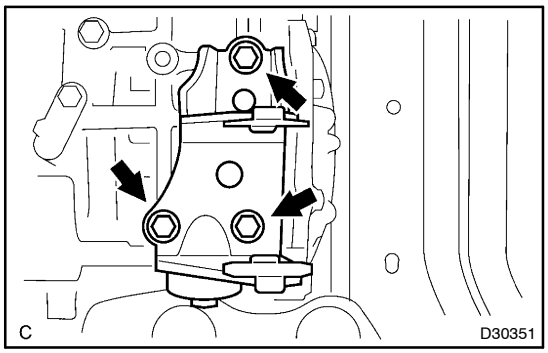
41. INSTALL FLYWHEEL HOUSING UNDER COVER

(a) Install the flywheel housing under cover to the automatic transaxle.



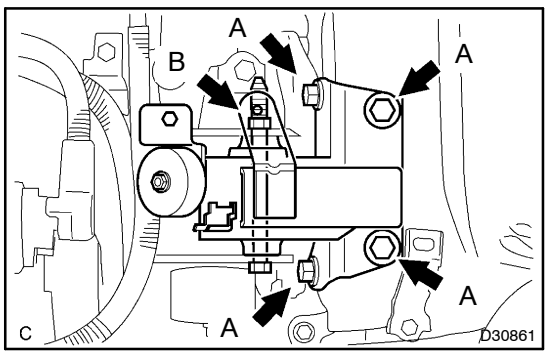
42. INSTALL ENGINE MOUNTING BRACKET RR

(a) Install the engine mounting bracket RR and 3 bolts to the automatic transaxle.
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)



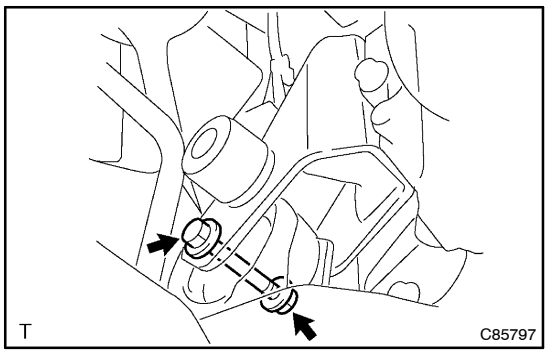
43. INSTALL ENGINE MOUNTING BRACKET FR

(a) Install the engine mounting bracket FR and 2 bolts to the automatic transaxle.
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)



44. TEMPORARILY TIGHTEN ENGINE MOUNTING INSULATOR RR

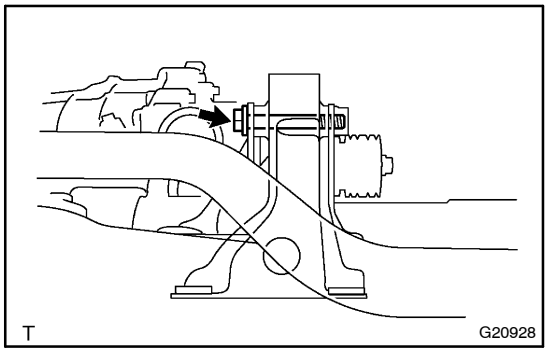
(a) Install the engine mounting insulator RR to the engine mounting bracket RR, and temporarily tighten the bolt.



45. INSTALL ENGINE MOUNTING BRACKET LH

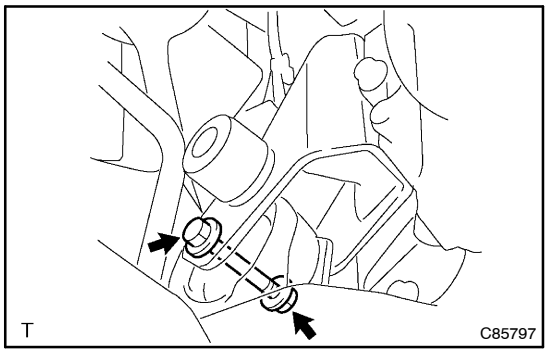
(a) Install the engine mounting bracket LH and 3 bolts to the automatic transaxle.
Torque: 64 N·m (653 kgf·cm, 47 ft·lbf)

46. INSTALL ENGINE MOUNTING INSULATOR LH



(a) Install the engine mounting insulator LH, 5 bolts and nut.
Torque:
Bolt A: 52 N·m (530 kgf·cm, 38 ft·lbf)
Nut B: 80 N·m (816 kgf·cm, 59 ft·lbf)

47. TEMPORARILY TIGHTEN ENGINE MOUNTING INSULATOR FR



(a) Install the engine mounting insulator FR to the engine mounting bracket FR, and temporarily tighten the bolt and nut.

48. INSTALL FRONT SUSPENSION CROSSMEMBER SUB–ASSY (SEE PAGE 14–23)

49. FULLY TIGHTEN ENGINE MOUNTING INSULATOR RR

(a) Fully tighten the bolt.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)

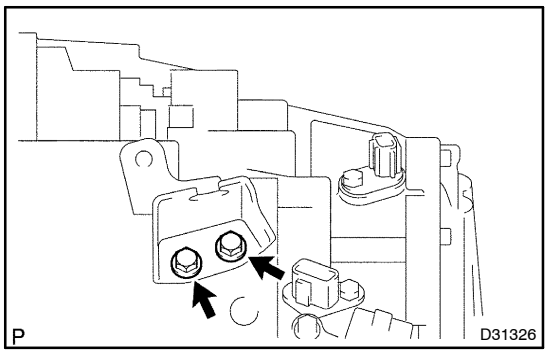
50. FULLY TIGHTEN ENGINE MOUNTING INSULATOR FR

(a) Fully tighten the bolt and nut.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

51. INSTALL STARTER ASSY

(a) Install the starter with the 2 bolts.
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

(b) Connect the connector.



(c) Install the starter wire with the nut.
Torque: 9.8 N·m (99 kgf·cm, 87 in.·lbf)

52. INSTALL FRONT DRIVE SHAFT ASSY LH (SEE PAGE 30–4)

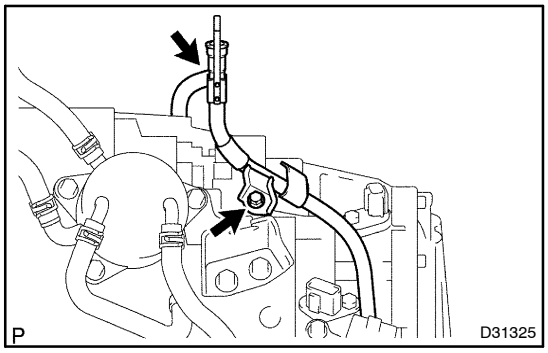
53. INSTALL FRONT DRIVE SHAFT ASSY RH (SEE PAGE 30–4)

54. INSTALL EXHAUST PIPE ASSY FRONT (SEE PAGE 15–2)

55. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

56. INSTALL TRANSMISSION CONTROL CABLE BRACKET NO.1

(a) Install the transmission control cable bracket No.1 with the 2 bolts to the automatic trasaxle.
Torque: 12 N·m (122 kgf·cm, 9 ft·lbf)



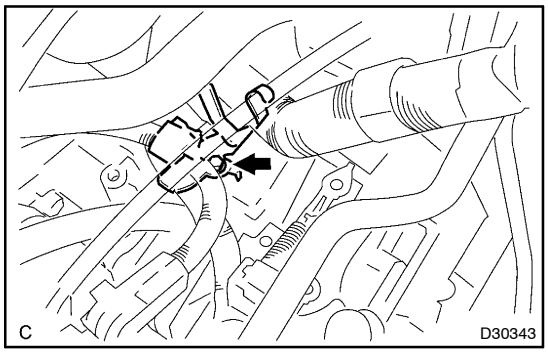
57. CONNECT OIL COOLER OUTLET HOSE

(a) Connect the oil cooler outlet hose with the clip to the automatic transaxle assy.

58. CONNECT OIL COOLER INLET HOSE NO.1

(a) Connect the oil cooler inlet hose No.1 with the clip to the automatic transaxle assy.

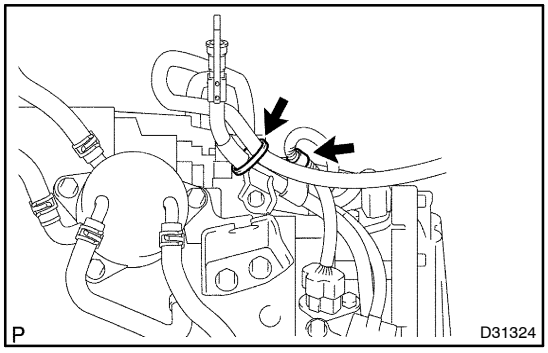
59. INSTALL TRANSMISSION OIL COOLER



60. INSTALL TRANSMISSION OIL FILLER TUBE SUB–ASSY

(a) Coat a new O–ring with ATF, and install it to the oil filler tube.

(b) Install the oil filler tube and bolt to the automatic transaxle.
Torque: 5.5 N·m (56 kgf·cm, 49 in.·lbf)

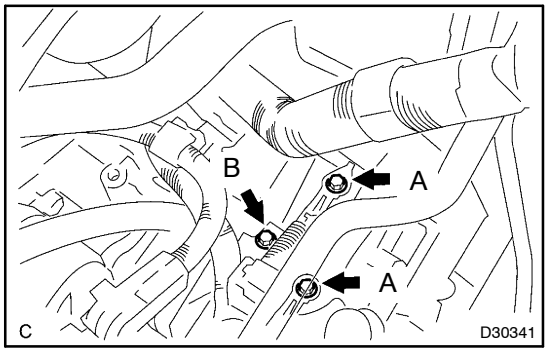


(c) Install the breather hose.

(d) Install the ATF level gauge.

61. INSTALL TRANSMISSION CONTROL CABLE CLAMP

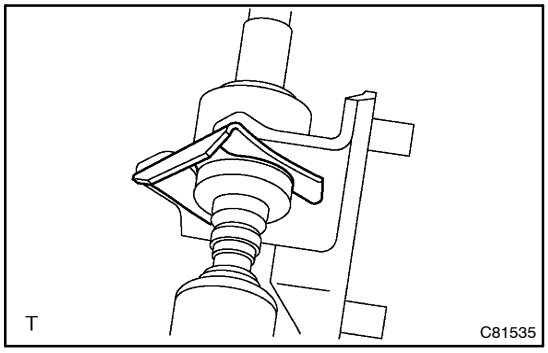
(a) Install the transmission control cable clamp and bolt to the automatic transaxle.
Torque: 12 N·m (122 kgf·cm, 9 ft·lbf)



62. CONNECT CONNECTOR

(a) Connect the 2 clamps to the oil filler tube.

(b) Connect the transmission wire connector.



(c) Connect the park/neutral position switch connector.

(d) Connect the 2 speed sensor connectors.

63. INSTALL WIRE HARNESS

(a) Install the 2 wire harnesses and wire harness bracket with the 3 bolts.
Torque:
Bolt A: 5.0 N·m (51 kgf·cm, 44 in.·lbf)
Bolt B: 8.4 N·m (86 kgf·cm, 74 in.·lbf)

64. INSTALL TRANSMISSION CONTROL CABLE ASSY

(a) Temporarily install the control cable to the control shaft lever with the nut.

(b) Install the control cable and clip to the bracket.

65. INSTALL AIR CLEANER ASSY
Torque: 5.0 N·m (50 kgf·cm, 44 in.·lbf)

66. INSTALL BATTERY CARRIER
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)

67. INSTALL BATTERY

68. INSTALL ENGINE COVER SUB–ASSY NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

69. INSTALL HOOD SUB–ASSY
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)

70. INSPECT HOOD SUB–ASSY (SEE PUB. NO. RM1018E, PAGE 75–2)

71. ADJUST HOOD SUB–ASSY (SEE PUB. NO. RM1018E, PAGE 75–2)

72. ADD COOLANT (SEE PEGE 16–7)

73. ADD AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

74. INSPECT AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

75. INSPECT FOR FLUID LEAKS

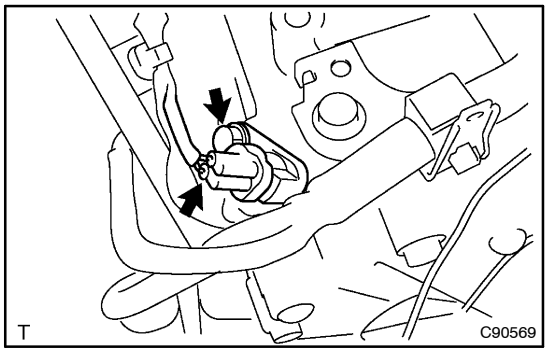
76. ADJUST SHIFT LEVER POSITION (SEE PUB. NO. RM1018E, PAGE 40–69)

77. INSPECT SHIFT LEVER POSITION (SEE PUB. NO. RM1018E, PAGE 40–69)

78. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT (SEE PUB. NO. RM1018E, PAGE 26–6)

79. CHECK ABS SPEED SENSOR SIGNAL

(a) ABS WITH EBD & BA &TRAC & VSC SYSTEM (SEE PUB. NO. RM1018E, PAGE 5–756)

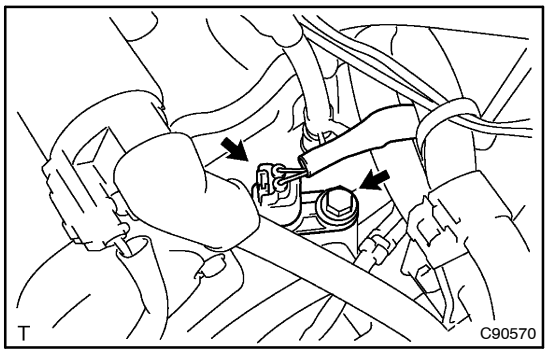


80. RESET MEMORY (SEE PEGE 05–541)

SPEED SENSOR (U151E)

40186–01

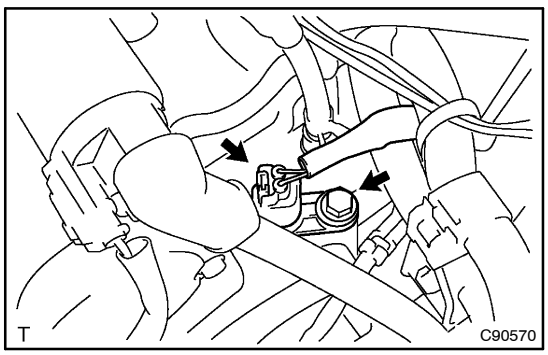
REPLACEMENT



1. **REMOVE BATTERY**
2. **REMOVE BATTERY CARRIER**
3. **REMOVE AIR CLEANER ASSY**

4. REMOVE SPEED SENSOR (NT SENSOR)

(a) Disconnect the speed sensor connector.



(b) Remove the bolt and speed sensor.

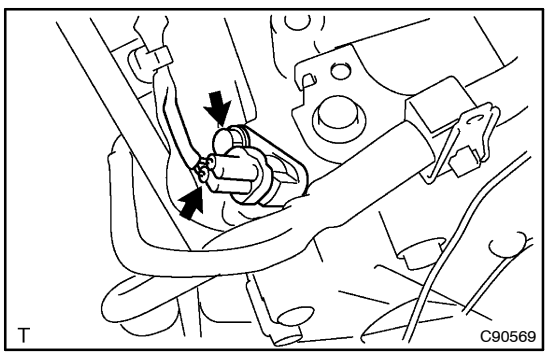
5. REMOVE SPEED SENSOR (NC SENSOR)

(a) Disconnect the speed sensor connector.

(b) Remove the bolt and speed sensor.

6. INSTALL SPEED SENSOR (NC SENSOR)

(a) Coat the O–ring with ATF.



(b) Install the speed sensor with the bolt.

Torque: 11 N·m (115 kgf·cm, 8 ft·lbf)

HINT:

Make sure of the sensor manufacturer's name.

(c) Connect the speed sensor connector.

7. INSTALL SPEED SENSOR (NT SENSOR)

(a) Coat the O–ring with ATF.

(b) Install the speed sensor with the bolt.

Torque: 11 N·m (115 kgf·cm, 8 ft·lbf)

HINT:

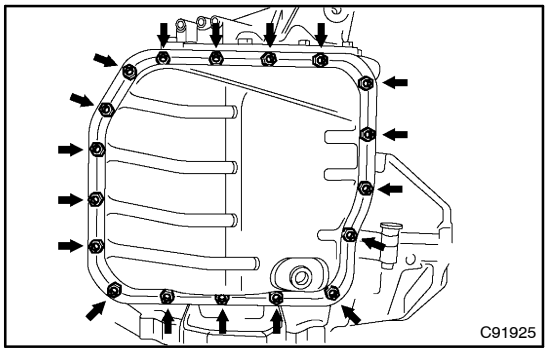
Make sure of the sensor manufacturer's name.

(c) Connect the speed sensor connector.

8. INSTALL AIR CLEANER ASSY
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)
9. INSTALL BATTERY CARRIER
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)
10. INSTALL BATTERY

TRANSMISSION WIRE (U151E)

40187–01



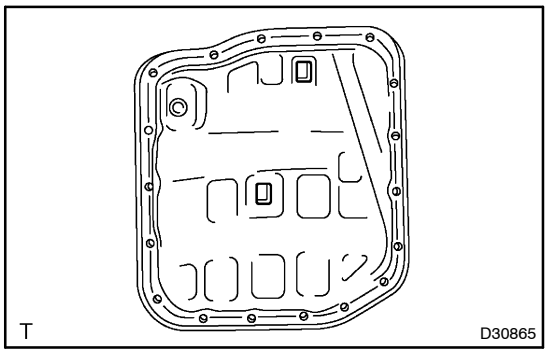
REPLACEMENT

1. REMOVE ENGINE UNDER COVER LH

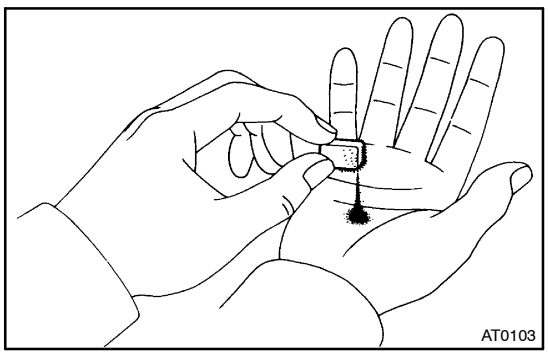
2. DRAIN AUTOMATIC TRANSAXLE FLUID

(a) Remove the drain plug and gasket, and drain ATF.

(b) Install a new gasket and the drain plug.
Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)



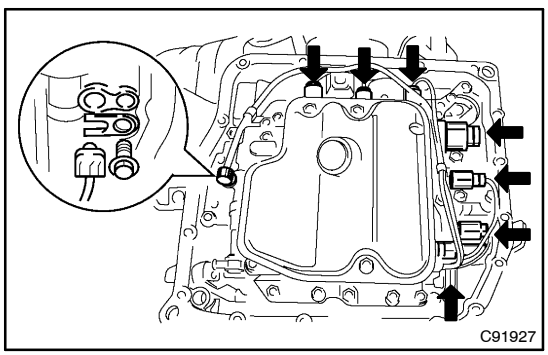
3. REMOVE AUTOMATIC TRANSAXLE OIL PAN SUB–ASSY



(a) Remove the 18 bolts, oil pan and gasket.

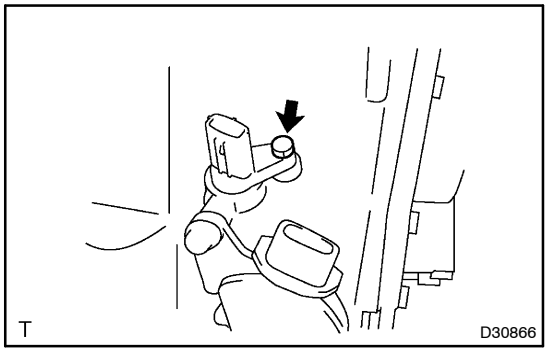
NOTICE:

Some fluid will remain in the oil pan. Remove all of the oil pan bolts, and carefully remove the oil pan assembly.



(b) Remove the 2 magnets from the oil pan.

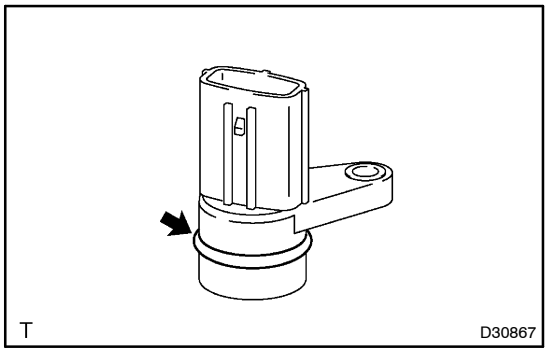
(c) Examine the particles in the oil pan.



(1) Collect any steel chips with the removed magnets. Look at the chips and particles in the pan and on the magnets carefully to see the type of wear which might be found in the transaxle.
Steel (magnetic): bearing, gear and plate wear
Brass (non–magnetic): bearing wear

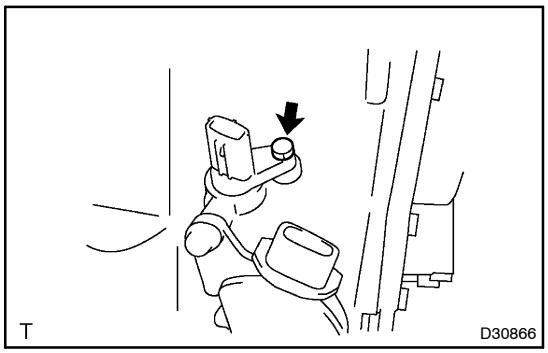
4. DISCONNECT TRANSMISSION WIRE

(a) Disconnect the 7 shift solenoid valve connectors.



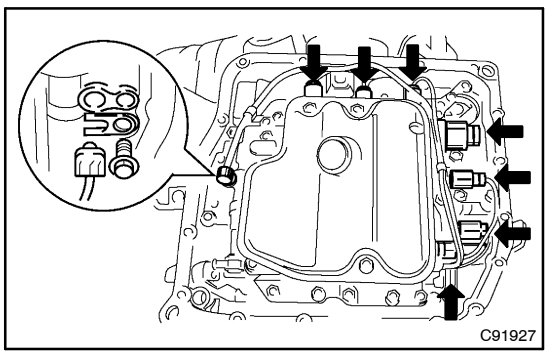
(b) Remove the bolt and lock plate, and disconnect the ATF temperature sensor.

5. REMOVE TRANSMISSION WIRE



(a) Disconnect the transmission wire connectors.

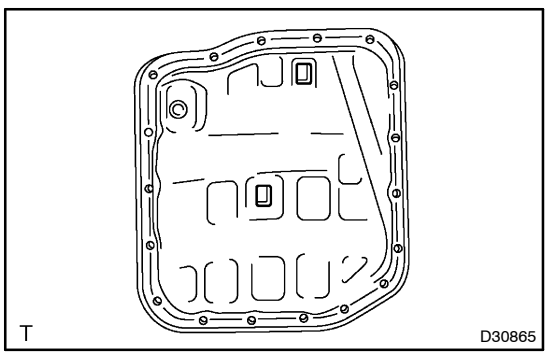
(b) Remove the bolt and transmission wire.



6. INSTALL TRANSMISSION WIRE

(a) Coat an O–ring of the transmission wire connector with ATF.

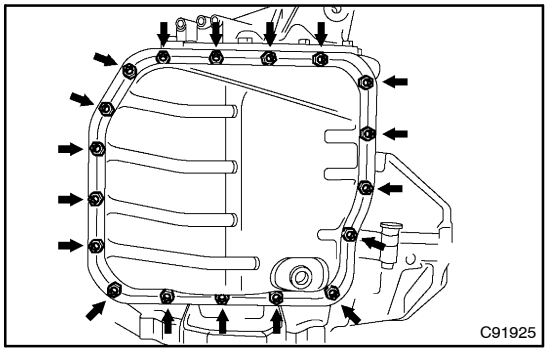
(b) Install the transmission wire and bolt.
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)



7. CONNECT TRANSMISSION WIRE

(a) Coat an O–ring of the ATF temperature sensor with ATF.

(b) Install the ATF temperature sensor with the lock plate and bolt.
Torque: 6.6 N·m (67 kgf·cm, 58 in.·lbf)



(c) Connect the 7 shift solenoid valve connectors.

8. INSTALL AUTOMATIC TRANSAXLE OIL PAN SUB–ASSY

(a) Install the 2 magnets in the oil pan.

(b) Apply seal packing to the 18 bolts.
Seal packing:
THREE BOND 1344 or equivalent

(c) Install a new gasket, the oil pan and 18 bolts to the transaxle case.

Torque: 7.8 N·m (80 kgf·cm, 69 in.·lbf)

NOTICE:

Apply seal packing to the bolts and tighten them within 10 minutes of application.

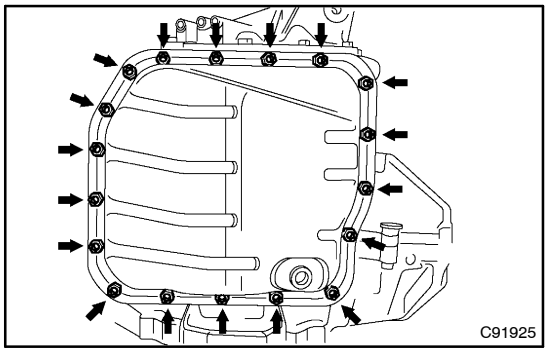
9. ADD AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

10. INSPECT AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

11. RESET MEMORY (SEE PAGE 05–541)

TRANSMISSION VALVE BODY ASSY (U151E)

40188–01



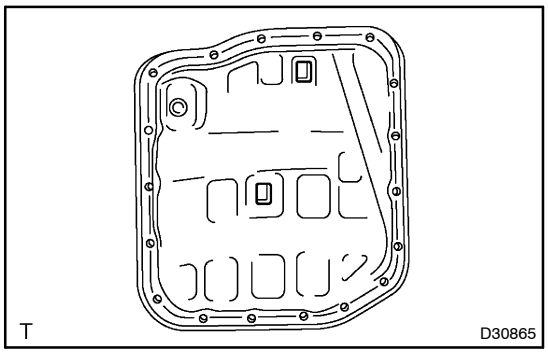
REPLACEMENT

1. REMOVE ENGINE UNDER COVER LH

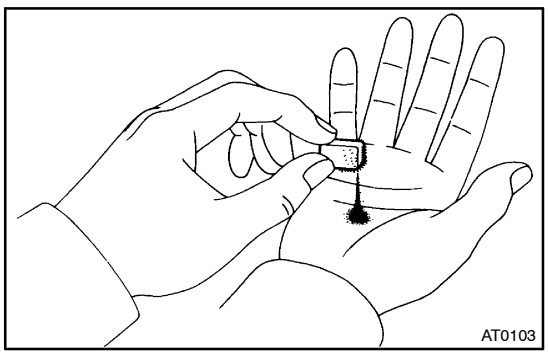
2. DRAIN AUTOMATIC TRANSAXLE FLUID

(a) Remove the drain plug and gasket, and drain ATF.

(b) Install a new gasket and the drain plug.
Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)



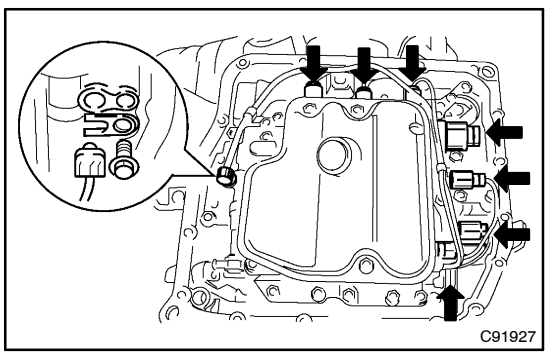
3. REMOVE AUTOMATIC TRANSAXLE OIL PAN SUB–ASSY



(a) Remove the 18 bolts, oil pan and gasket.

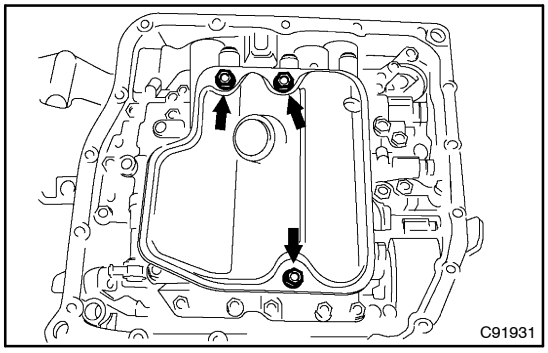
NOTICE:

Some fluid will remain in the oil pan. Remove all of the oil pan bolts, and carefully remove the oil pan assembly.



(b) Remove the 2 magnets from the oil pan.

(c) Examine the particles in the oil pan.

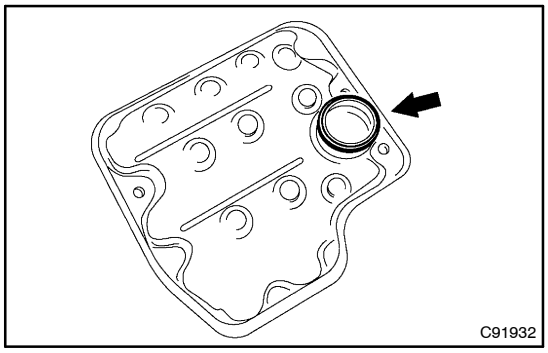


(1) Collect any steel chips with the removed magnets. Look at the chips and particles in the pan and on the magnets carefully to see the type of wear which might be found in the transaxle.
Steel (magnetic): bearing, gear and plate wear
Brass (non–magnetic): bearing wear

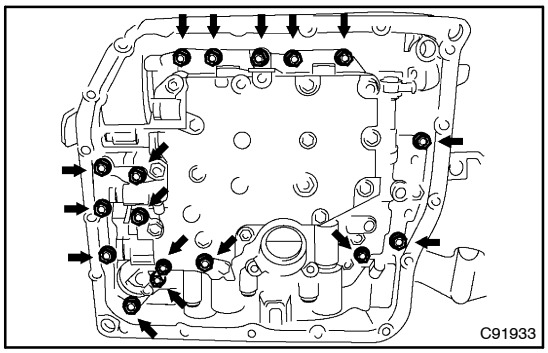
4. DISCONNECT TRANSMISSION WIRE

(a) Disconnect the 7 shift solenoid valve connectors.

(b) Remove the bolt and lock plate, and disconnect the ATF temperature sensor.



5. REMOVE VALVE BODY OIL STRAINER ASSY

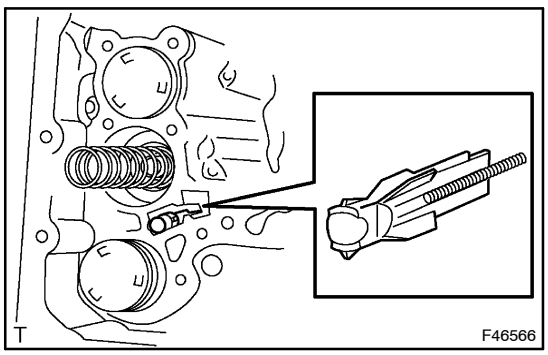


(a) Remove the 3 bolts and oil strainer.

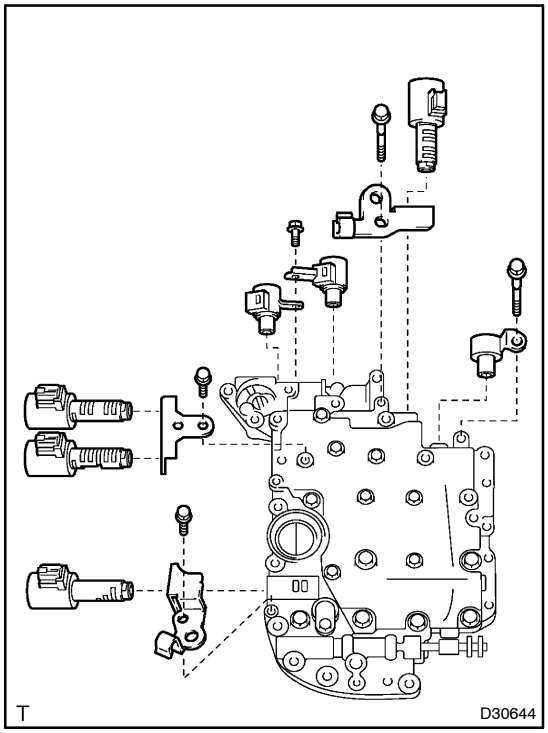
NOTICE:

Be careful that some fluid will come out of the oil strainer.

(b) Remove the O–ring from the oil strainer.

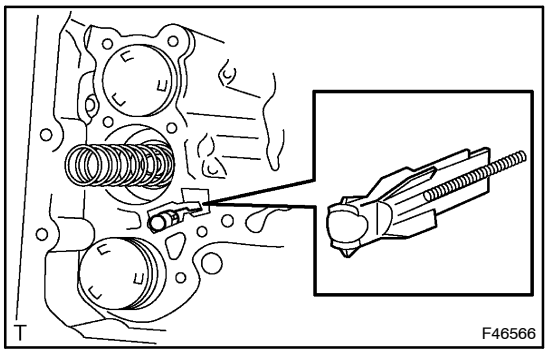


6. REMOVE TRANSMISSION VALVE BODY ASSY



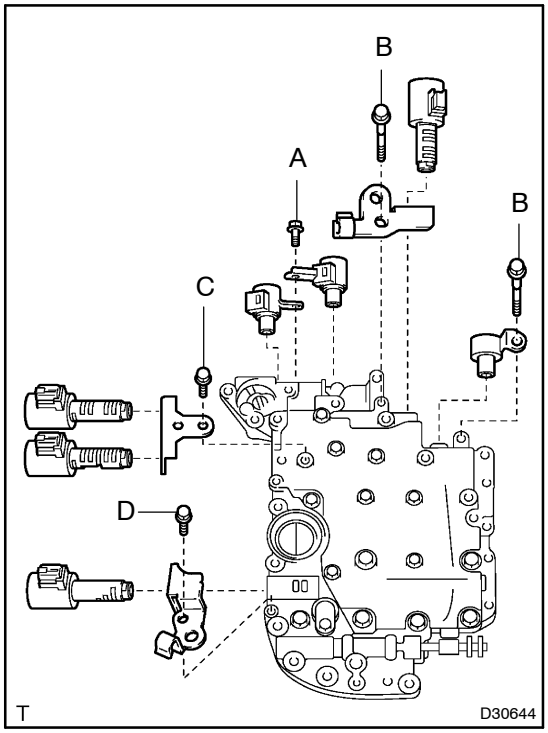
(a) Support the valve body assy and remove the 17 bolts and the valve body assy.

NOTICE:

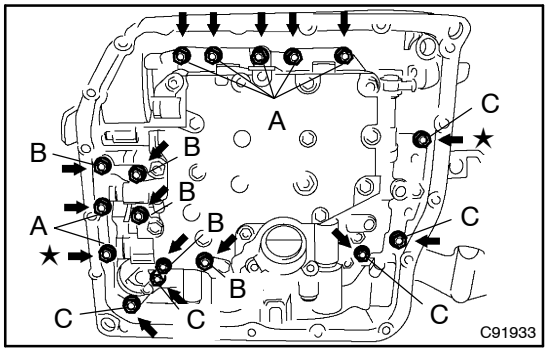


Be careful not to drop the check ball body, spring and accumulator piston.

(b) Remove the check ball body and spring.



(c) Remove the 5 bolts, 3 lock plates and 7 shift solenoid valves.



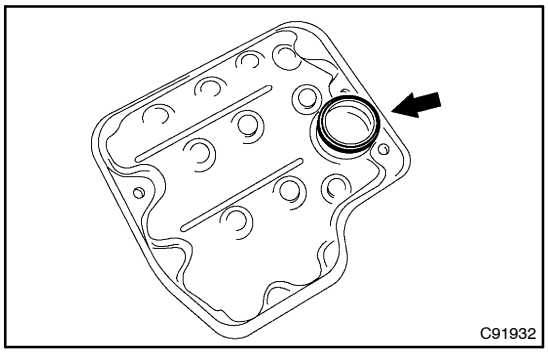
7. INSTALL TRANSMISSION VALVE BODY ASSY

(a) Install the spring and check ball body.

(b) Install the 7 shift solenoid valves and 3 lock plates with the 5 bolts.

Torque:
Bolts A, B: 11 N·m (110 kgf·cm, 8 ft.·lbf)
Bolts C, D: 6.6 N·m (67 kgf·cm, 58 in. lbf)
Bolt length:
Bolt A: 16 mm (0.63 in.)
Bolt B: 57 mm (2.24 in.)
Bolt C: 20 mm (0.79 in.)
Bolt D: 12 mm (0.47 in.)

(c) Align the groove of the manual valve with the pin of the lever.

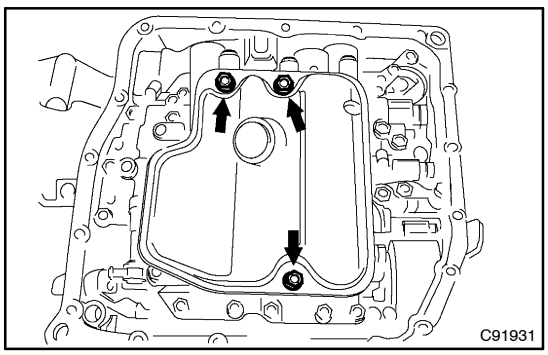


(d) Install the 17 bolts.

Torque: 11 N·m (110 kgf·cm, 8 ft·lbf)

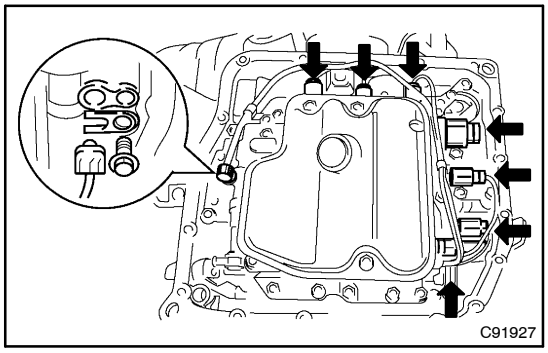
NOTICE:

- **Push the valve body against the accumulator piston spring and the check ball body to install it.**
- **First, temporarily tighten those bolts marked by ★ in the illustration because they are positioning bolts.**



Bolt length:
Bolt A: 25 mm (0.984 in.)
Bolt B: 57 mm (2.244 in.)
Bolt C: 41 mm (1.614 in.)

8. INSTALL VALVE BODY OIL STRAINER ASSY

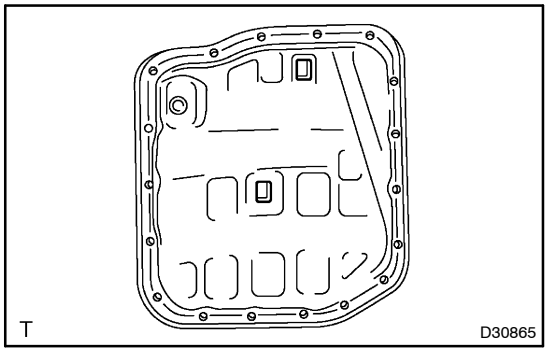


(a) Coat a new O–ring with ATF.

(b) Install the O–ring to the oil strainer.

(c) Install the oil strainer with the 3 bolts.

Torque: 11 N·m (110 kgf·cm, 8 ft·lbf)



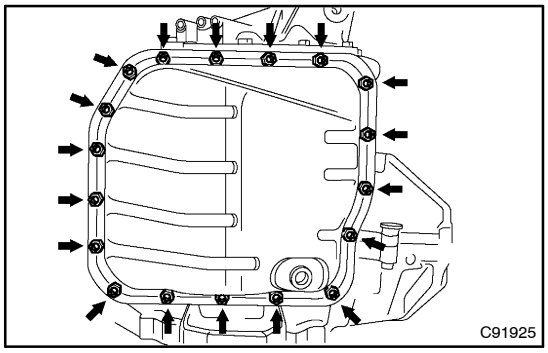
9. INSTALL TRANSMISSION WIRE

(a) Coat an O–ring with ATF.

(b) Install the ATF temperature sensor with the lock plate and bolt.

Torque: 6.6 N·m (67 kgf·cm, 58 in.·lbf)

(c) Connect the 7 shift solenoid valve connectors.



10. INSTALL AUTOMATIC TRANSAXLE OIL PAN SUB–ASSY

(a) Install the 2 magnets to the oil pan.

(b) Apply seal packing to the 18 bolts.

Seal packing:
THREE BOND 1344 or equivalent

(c) Install a new gasket, the oil pan and 18 bolts to the transaxle case.

Torque: 7.8 N·m (80 kgf·cm, 69 in.·lbf)

NOTICE:
Apply seal packing to the bolts and tighten them within 10 minutes of application.

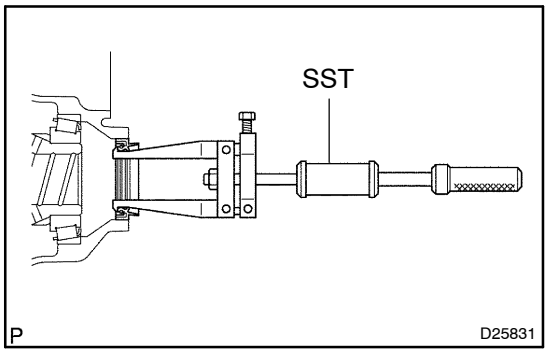
11. ADD AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

12. INSPECT AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

13. RESET MEMORY (SEE PAGE 05–541)

FRONT DIFFERENTIAL OIL SEAL (U151E)

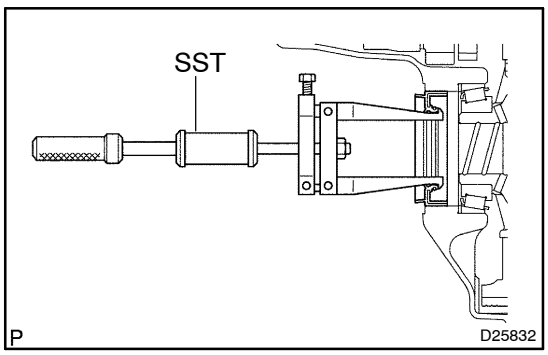
40189–01



REPLACEMENT

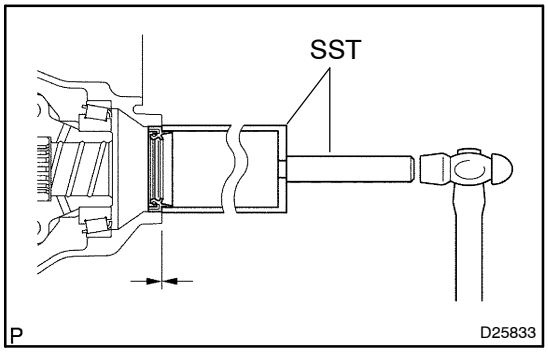
1. **REMOVE FRONT WHEELS**
2. **REMOVE ENGINE UNDER COVER RH**
3. **REMOVE ENGINE UNDER COVER LH**
4. **DRAIN AUTOMATIC TRANSAXLE FLUID**

(a) Remove the drain plug and gasket, and drain ATF.



(b) Install a new gasket and the drain plug.
Torque: 47 N·m (480 kgf·cm, 35 ft·lbf)

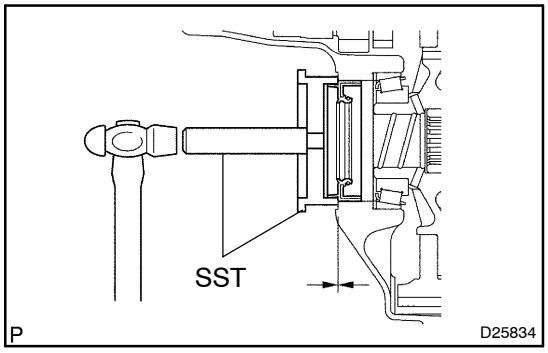
5. **REMOVE FRONT DRIVE SHAFT ASSY RH (SEE PAGE 30–4)**
6. **REMOVE FRONT DRIVE SHAFT ASSY LH (SEE PAGE 30–4)**



7. **REMOVE TRANSAXLE HOUSING OIL SEAL**

(a) Using SST, pull out the oil seal.
SST 09308–00010

8. **REMOVE DIFFERENTIAL SIDE BEARING RETAINER OIL SEAL**



(a) Using SST, pull out the oil seal.
SST 09308–00010

9. **INSTALL TRANSAXLE HOUSING OIL SEAL**

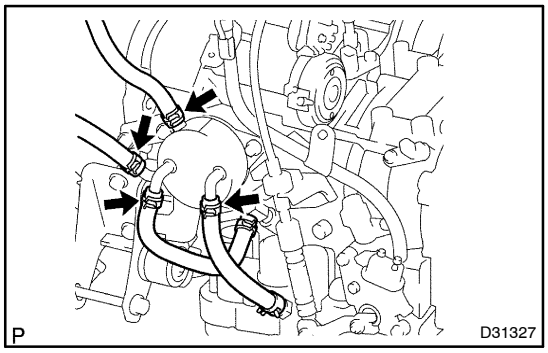
(a) Using SST and a hammer, drive in a new oil seal.
SST 09316–60011 (09316–00011)
Oil seal drive in depth:
0 ± 0.5 mm (0 ± 0.020 in.)

(b) Coat the lip of the oil seal with MP grease.

10. INSTALL DIFFERENTIAL SIDE BEARING RETAINER OIL SEAL

(a) Using SST and a hammer, drive in a new oil seal.
SST 09649–17010, 09950–70010 (09951–07150)
Oil seal drive in depth:
0 ± 0.5 mm (0 ± 0.020 in.)

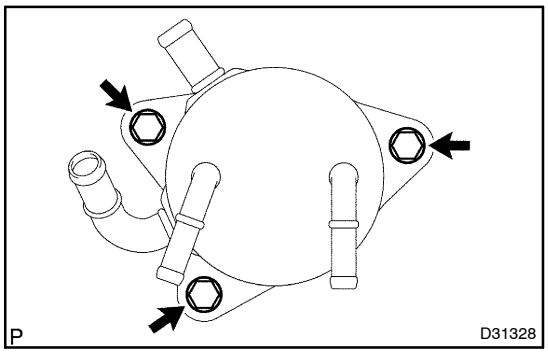
(b) Coat the lip of the oil seal with MP grease.



11. INSTALL FRONT DRIVE SHAFT ASSY LH (SEE PAGE 30–4)
12. INSTALL FRONT DRIVE SHAFT ASSY RH (SEE PAGE 30–4)
13. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)
14. ADD AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE40–2)
15. INSPECT AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE40–2)
16. CHECK ABS SPEED SENSOR SIGNAL
(a) ABS WITH EBD & BA &TRAC & VSC SYSTEM (SEE PUB, NO. RM1018E, PAGE 5–756)

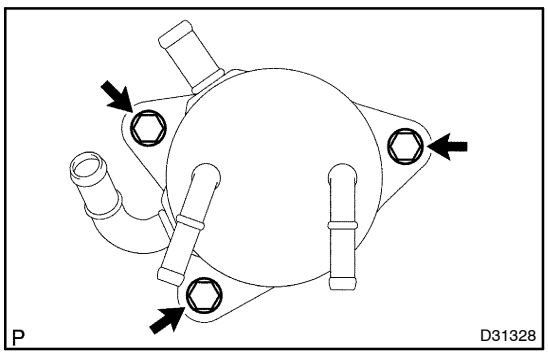
TRANSMISSION OIL COOLER (U151E)

4018A–01



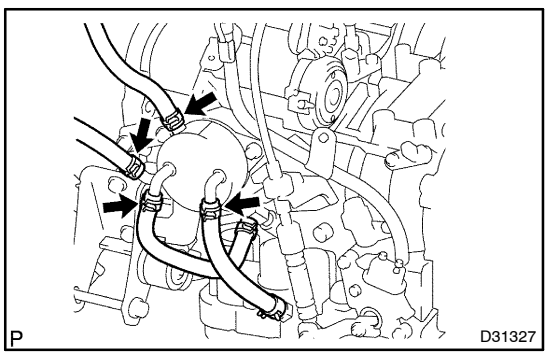
REPLACEMENT

1. **DRAIN AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)**
2. **DRAIN COOLANT (SEE PAGE 16–7)**



3. REMOVE TRANSMISSION OIL COOLER

(a) Loosen the clips and disconnect the 4 hoses from the transmission oil cooler.

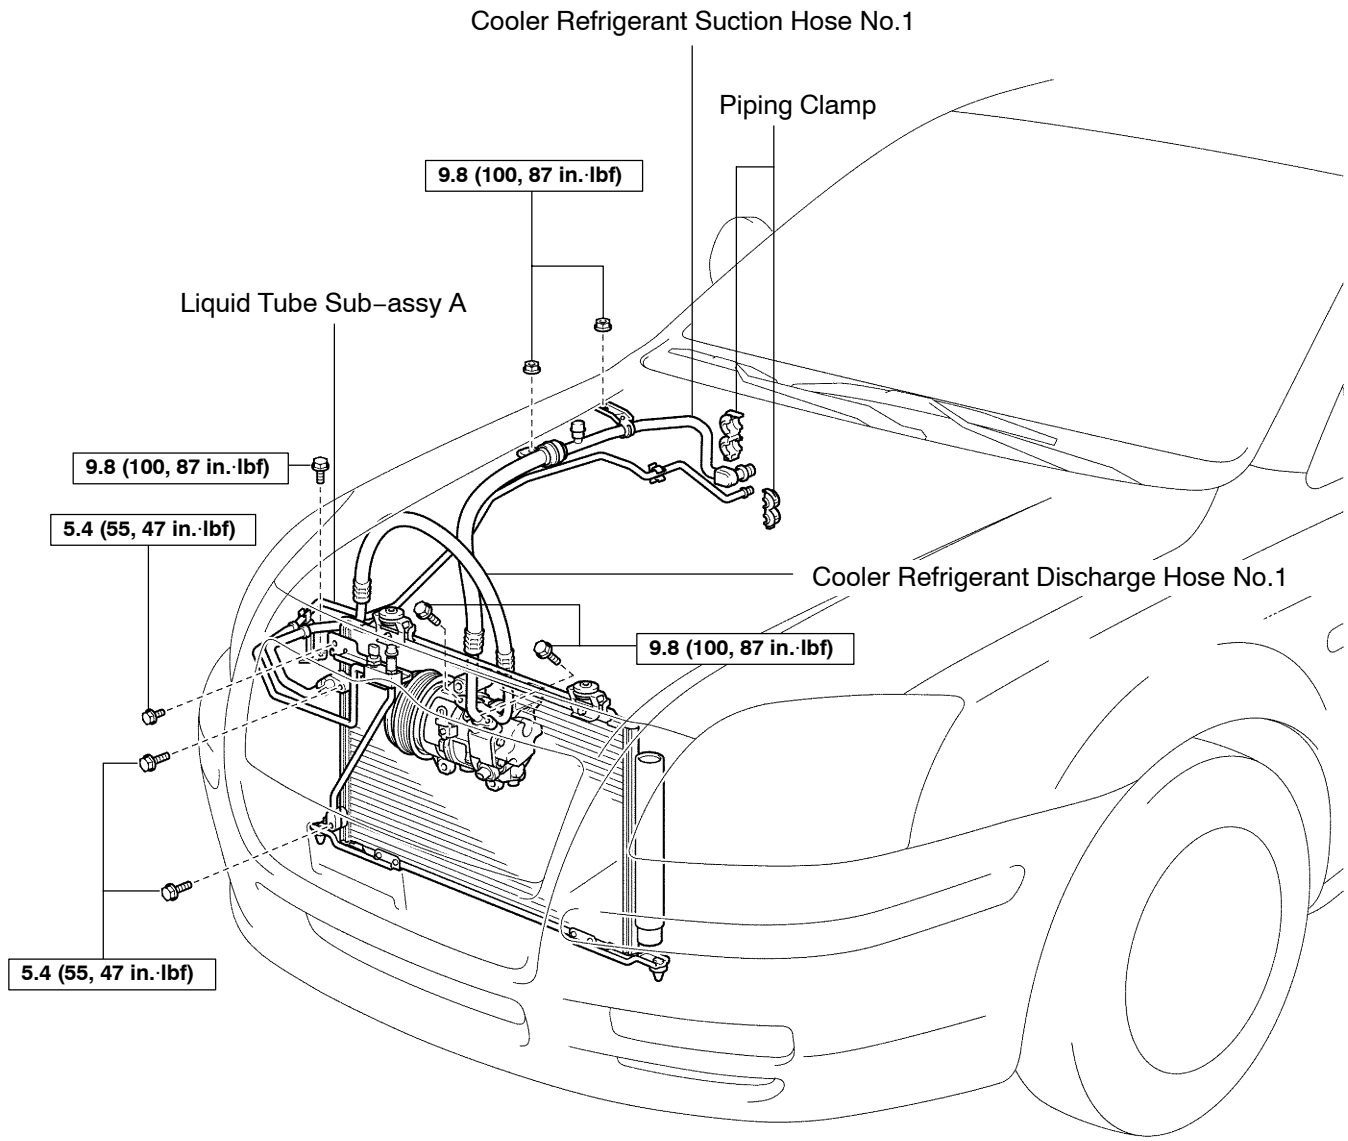


(b) Remove the 3 bolts and the oil cooler from the bracket.

4. INSTALL TRANSMISSION OIL COOLER

(a) Install the oil cooler to the bracket with the 3 bolts.
Torque: 12 N·m (122 kgf·cm, 9 ft·lbf)

(b) Connect the 4 hoses with the clips to the transmission.



5. ADD COOLANT (SEE PAGE 16–7)
6. ADD AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)
7. INSPECT AUTOMATIC TRANSAXLE FLUID (SEE PUB. NO. RM1018E, PAGE 40–2)

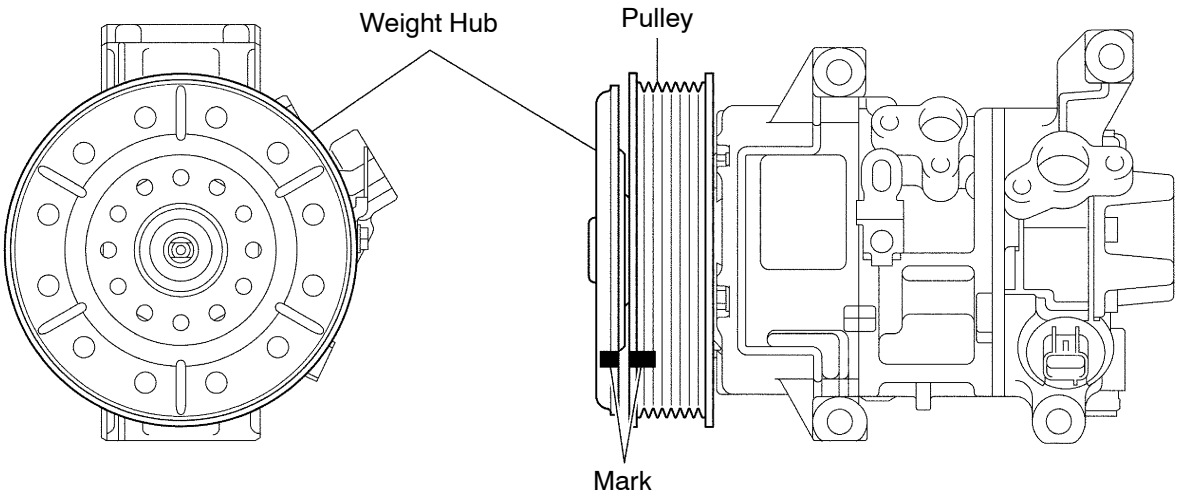
W/PULLEY COMPRESSOR ASSY (2AZ–FSE)

551AM–01

ON–VEHICLE INSPECTION

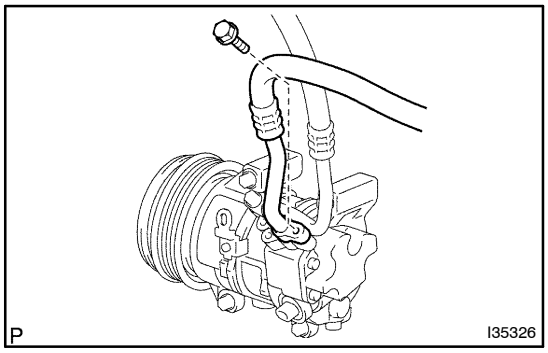


1. INSPECT W/PULLEY COMPRESSOR ASSY

(a) Start the engine.

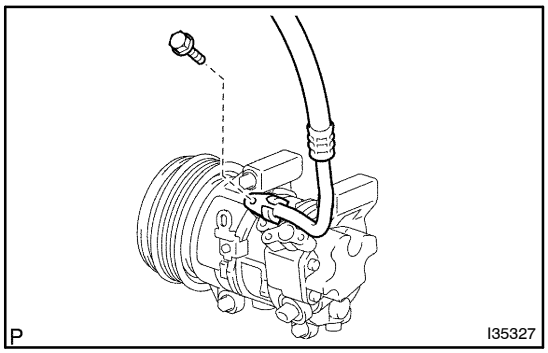
(b) Check that the weight hub of the compressor assy rotates along with the pulley.

NORMAL: The pulley and the weight hub rotate together.



ABNORMAL: The pulley and the weight hub rotate separately when the compressor is locked.

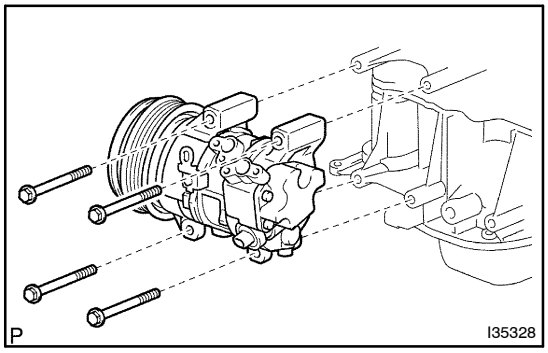
551AN–01



REPLACEMENT

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM
(See Pub. No. RM1018E, page 55–38)
SST 07110–58060 (07117–58080, 07117–58090, 07117–78050, 07117–88060, 07117–88070, 07117–88080)

2. DISCONNECT COOLER REFRIGERANT SUCTION HOSE NO.1
(a) Remove the bolt and disconnect the cooler refrigerant suction hose No.1 from the w/pulley compressor assy.
(b) Remove the O–ring from the cooler refrigerant suction hose No.1.



NOTICE:
Seal the opening of the disconnected parts using vinyl tape to prevent moisture and foreign matters from entering.

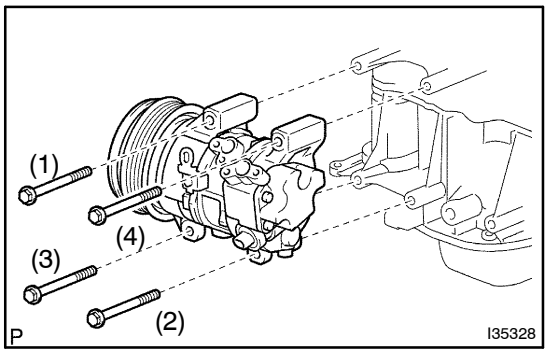
3. DISCONNECT COOLER REFRIGERANT DISCHARGE HOSE NO.1
(a) Remove the bolt and disconnect the cooler refrigerant discharge hose No.1 from the w/pulley compressor assy.
(b) Remove the O–ring from the cooler refrigerant discharge hose No.1.

NOTICE:
Seal the opening of the disconnected parts using vinyl tape to prevent moisture and foreign matters from entering.

4. REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–5)
5. REMOVE ENGINE ROOM COVER SIDE (See page 14–5)
6. REMOVE ENGINE UNDER COVER RH (See page 14–5)
7. REMOVE FAN AND GENERATOR V BELT (See page 14–5)
SST 09249–63010

8. REMOVE W/PULLEY COMPRESSOR ASSY
(a) Disconnect the connector.
(b) Remove the 4 bolts and the w/pulley compressor assy.

9. INSPECT COMPRESSOR OIL



(a) When replacing the w/pulley compressor assy with a new one, after gradually removing the refrigerant gas from the service valve, drain the following amount of oil from the new w/pulley compressor assy before installation.

Standard:

(Oil capacity inside new w/pulley compressor assy: 90 + 15 cc (3.0 + 0.5 fl. oz.)) – (Remaining oil amount in the removed w/pulley compressor assy) + (Oil amount to be removed when replacing)

NOTICE:

- **When checking the compressor oil level, observe the precautions on the cooler removal/installation.**
- **Since compressor oil remains in the pipes of the vehicle, if a new w/pulley compressor assy is installed without removing some oil inside, the oil amount becomes excessive, preventing heat exchange in the refrigerant cycle and causing refrigerant failure.**
- **If the remaining oil in the removed w/pulley compressor assy is too small in volume, check for oil leakage.**
- **Be sure to use ND–OIL 8 for compressor oil.**

10. INSTALL W/PULLEY COMPRESSOR ASSY

(a) Install the w/pulley compressor assy with the 4 bolts.

Torque: 29 N·m (300 kgf·cm, 21 ft·lbf)

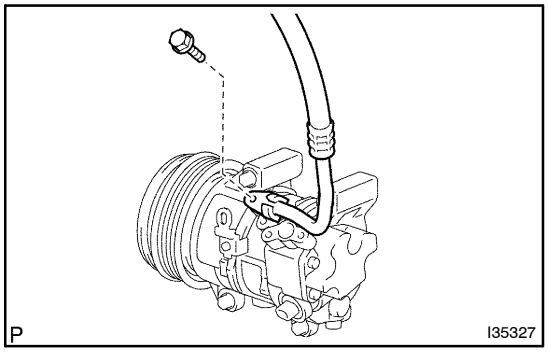
NOTICE:

Tighten the bolts in the order shown in the illustration to install the w/pulley compressor assy.

(b) Connect the connector.

11. INSTALL FAN AND GENERATOR V BELT (See page 14–5)

SST 09249–63010

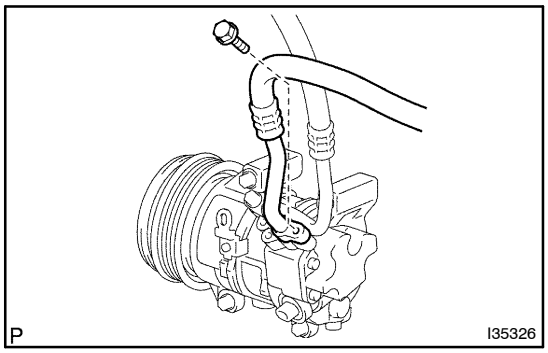


12. INSTALL COOLER REFRIGERANT DISCHARGE HOSE NO.1

(a) Remove the attached vinyl tape from the hose.

(b) Sufficiently apply compressor oil to a new O–ring and the fitting surface of the w/pulley compressor assy.

Compressor oil: ND–OIL 8 or equivalent



(c) Install the O–ring on the cooler refrigerant discharge hose No.1.

(d) Install the cooler refrigerant discharge hose No.1 on the w/pulley compressor assy with the bolt.
Torque: 9.8 N·m (100 kgf·cm, 87 in.·lbf)

13. INSTALL COOLER REFRIGERANT SUCTION HOSE NO.1

(a) Remove the attached vinyl tape from the hose.
(b) Sufficiently apply compressor oil to a new O–ring and the fitting surface of the w/pulley compressor assy.
Compressor oil: ND–OIL 8 or equivalent
(c) Install the O–ring on the cooler refrigerant suction hose No.1.

(d) Install the cooler refrigerant suction hose No.1 on the w/pulley compressor assy with the bolt.
Torque: 9.8 N·m (100 kgf·cm, 87 in.·lbf)

14. CHARGE REFRIGERANT (See Pub. No. RM1018E, page 55–38)
SST 07110–58060 (07117–58060, 07117–58070, 07117–58080, 07117–58090, 07117–78050, 07117–88060, 07117–88070, 07117–88080)
Specified amount: 440 ± 30 g (15.51 ± 1.06 oz.)

15. WARM UP ENGINE (See Pub. No. RM1018E, page 55–38)

16. INSPECT LEAKAGE OF REFRIGERANT (See Pub. No. RM1018E, page 55–38)

HOW TO USE THIS MANUAL

010B2–19

GENERAL INFORMATION

1. GENERAL DESCRIPTION

(a) This manual is made in accordance with SAE J2008.

(b) Generally, repair operations can be separated in the following 3 main processes:
1. Diagnosis
2. Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting
3. Final Inspection

(c) This manual explains the 1st process of ”Diagnosis” (placed in the ”Diagnostics” section), the 2nd process of ”Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting”, but the 3rd process of ”Final Inspection” is omitted.

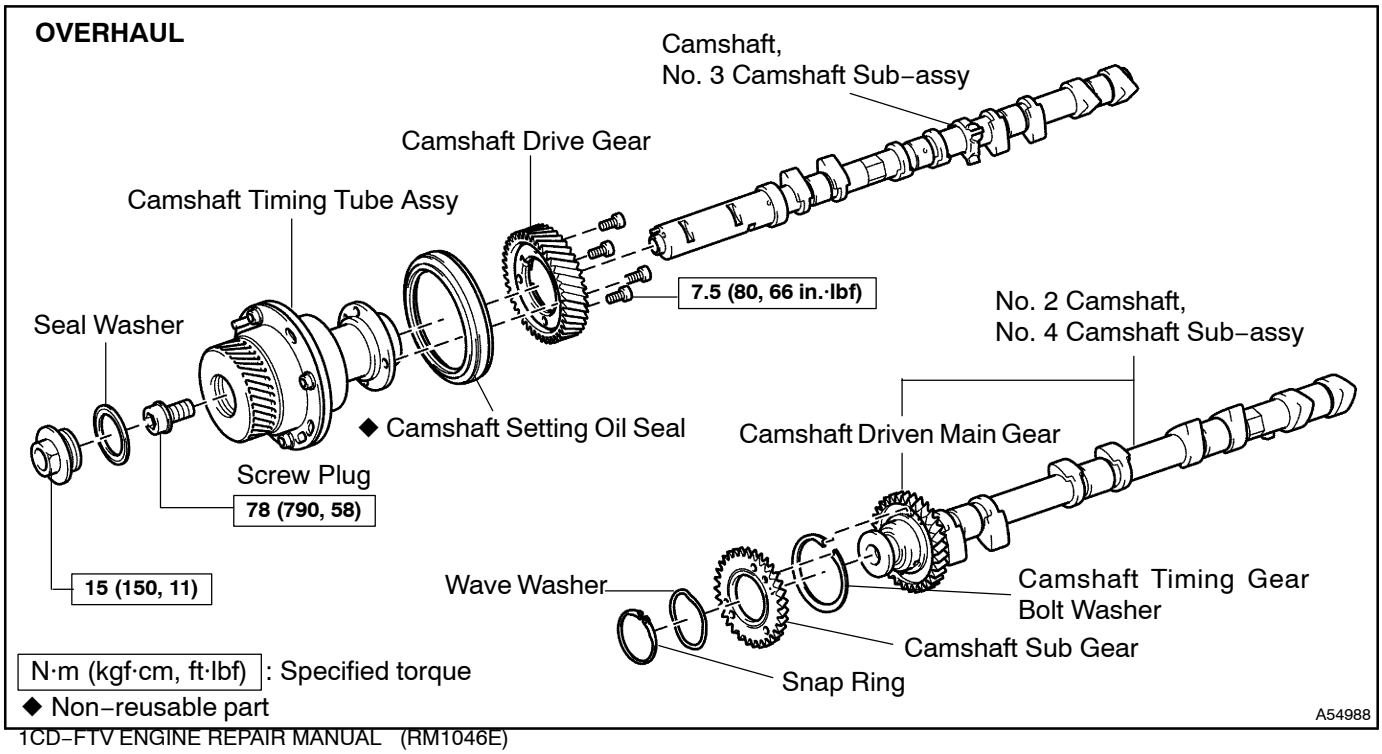
(d) The following essential operations are not written in this manual. However, these operations must be done in the practical situation.
(1) Operation with a jack or lift
(2) Cleaning of a removed part when necessary
(3) Visual check

2. INDEX

(a) An alphabetical INDEX is provided as a section on the end of the book to guide you to the item to be repaired.

3. PREPARATION

(a) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the repairing condition. Be sure to use SST and SSM when they are required and follow the working procedure properly. A list of SST and SSM is in the Preparation section of this manual.



4. REPAIR PROCEDURES

(a) Component drawing is placed under the title when necessary.

(b) Illustrations are placed as ”disassembled parts drawing” so that it enables you to understand the fitting condition of the components.

(c) Non–reusable parts, grease applied parts, precoated parts and tightening torque are specified in the components drawing.

Example:

(d) Tightening torque, oil applying position, and non–reusable parts are described as important points in the procedure.

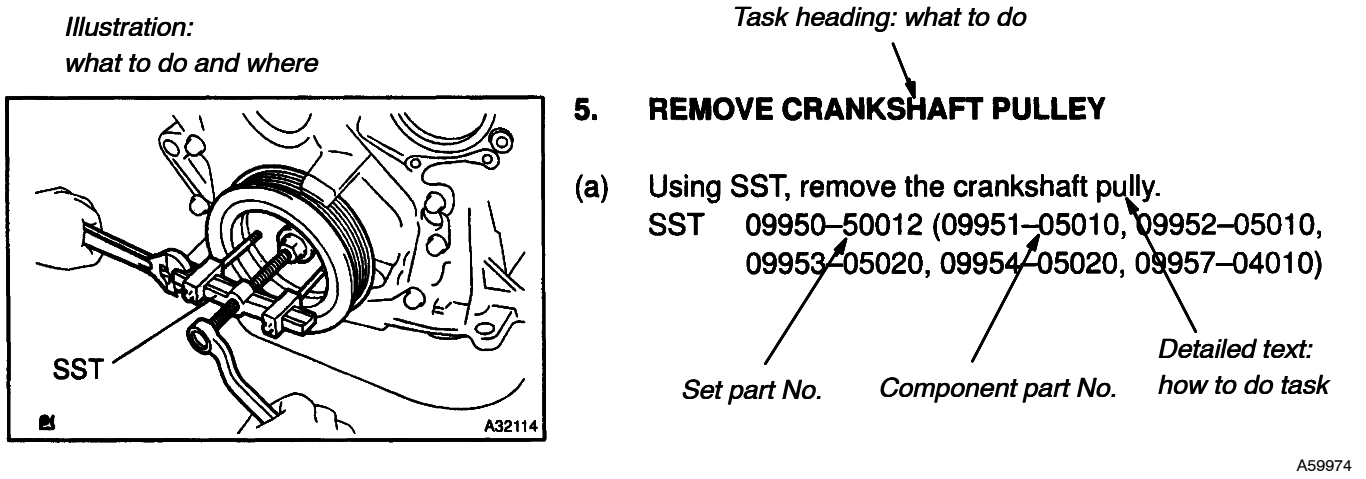
NOTICE:

There are cases where such information can only be indicated by an illustration. In that case, all the information such as torque, oil, etc. are described in the illustration.

(e) Installing procedure of operation items is performed in the reverse order of the removal, and only the important points are described.

(f) Only items with points are described in the procedure, and the operational portion and content are placed using an illustration. In the explanations, details of the operational method, standard value and notice are placed.

(g) There may be a case where the illustrations of the similar models are used. In that case the details may be different from the actual vehicle.



(h) The procedures are presented in a step–by–step format:

(1) The illustration shows what to do and where to do it.

(2) The task heading tells what to do.

(3) The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

HINT:

This format provides an experienced technician with a FAST TRACK to the necessary information. The task heading can be read at a glance when necessary, and the text below provides detailed information. Important specifications and warnings always stand out in bold type.

5. SERVICE SPECIFICATIONS

(a) Specifications are presented in bold type throughout the manual. You never have to leave the procedure to look up your specifications. The specifications are also found in the Service Specifications section for a quick reference.

6. TERMS DEFINITION

CAUTION	Indicates the possibility of injury to you or other people.
NOTICE	Indicates the possibility of damage to the components being repaired.
HINT	Provides additional information to help you to perform the repair efficiently.

7. SI UNIT

(a) The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System.

Example:

Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

REPAIR INSTRUCTION

010R3–01

PRECAUTION

1. TO PREVENT FROM ENTERING FOREIGN SUBSTANCES.

(a) When foreign substances such as dust, grain of sand or metallic dust enter inside of engine, it often causes functional failure of the engine.
  (1) Precaution before disassembly.
    • Remove adequately all sand and mud adhere to the outside of engine .
  (2) Precaution at reassembly.
    • Protect disassembled parts from dust by using vinyl sheet to cover.

2. TO PREVENT SCRATCHES ON THE PARTS.

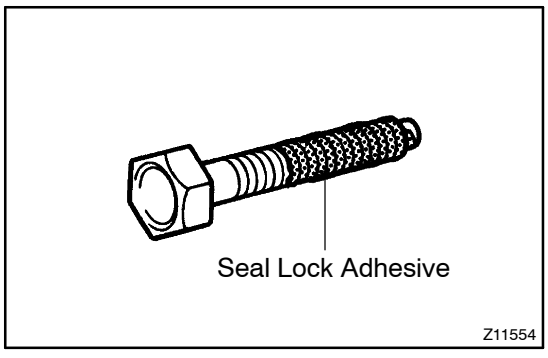
(a) The existence of scratches on the contact and revolving surfaces often causes oil leak and seisure.
  (1) Precautions at disassembly and reassembly.
    • When disassemble the contact surface of the parts, use plastic hummer striking lightly. (Do not pry out by screwdriver).
    • When fix the parts to the vise, do not directly catch it in the vise. Fix the parts through aluminum bar.

3. TO CLEAN AND WASH THE PARTS.

(a) Each parts needs to be well cleaned, washed, and dried by air, and apply specified oil before reassembly.
  (1) Cleaning and washing by alkaline solvent is prohibited:
    • Parts made of aluminum and rubber. (ex. cylinder head cover gasket etc.)
  (2) Cleaning and washing by flushing oil (ex. kerosene, white gasoline etc.) is prohibited:
    • Parts made of rubber. (ex. cylinder head cover gasket etc.)

4. POSITION AND DIRECTION OF EACH PARTS.

(a) Each parts needs to be reassembled as the same position and direction as it disassembled.
  (1) Precautions at disassembly and reassembly.
    • Follow the directions when the manual designates to mark the matchmark and/or direction mark.
    • Disassembled parts needs to be put in order as disassembled, not to change position and/or direction.
    • Follow the directions when the manual instructs the position and direction.



5. INSTALL ENGINE ASSEMBLY TO OVERHAUL STAND WHEN OVERHAUL THE ENGINE.

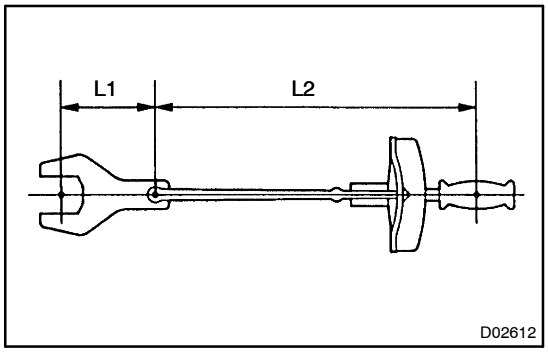
6. PUT THE DISASSEMBLED PARTS IN ORDER AS THEY DISASSEMBLED.

7. APPLY ENGINE OIL TO THE SLIDING AND ROTATING SURFACES.

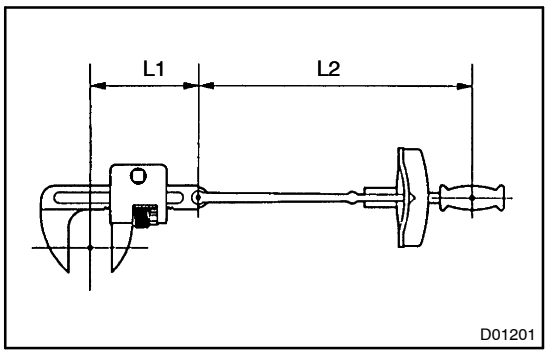
8. NON–REUSABLE PARTS SUCH AS GASKET AND SEAL NEEDS TO BE CHANGED TO THE NEW PARTS.

9. BASIC REPAIR HINT

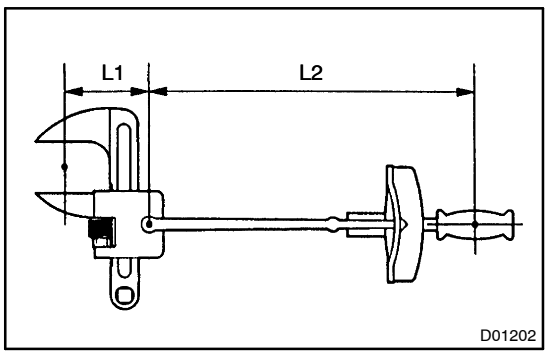
(a) Precoated Parts:
  (1) Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.
  (2) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.
  (3) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.



NOTICE:



Do the torque checking with the lower limit value of the torque tolerance.



(4) Depending on the seal lock agent to apply, there may be a case where it is necessary to leave it for a specified time until it hardens.

(b) Gaskets:
When necessary, use a sealer on gaskets to prevent leaks.

(c) Bolts, Nuts and Screws:
Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.

(d) Torque When Using Extension Tool with Torque Wrench:

(1) In case of tightening by extending the entire length of the torque wrench combined with SST or tool, if you tighten until the reading of the torque wrench reached the specified torque value, the actual torque becomes excessive.

(2) In this text, only the specified torque is described. In case of using SST or extension tool, find the reading of the torque wrench by the formula.

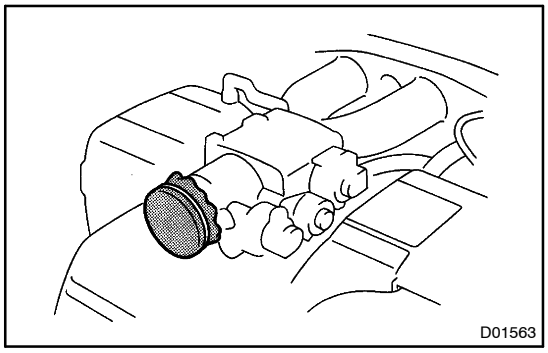
(3) Formula T'=T x L2/(L1 + L2)

T'	Reading of torque wrench {N·m (kgf·cm, ft·lbf)}
T	Torque {N·m (kgf·cm, ft·lbf)}
L1	Length of SST or tool (cm)
L2	Length of torque wrench (cm)

10. REMOVAL AND INSTALLATION OF FUEL CONTROL PARTS

(a) Place for Removing and Installing Fuel System Parts:

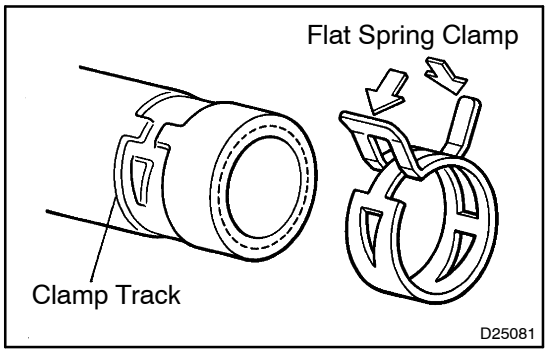
(1) Place with good air ventilation and without anything flammable such as welder, grinder, drill, electric motor or stove in the surroundings.



(2) Never work in a place like a pit or nearby pit as there is a possibility that vaporized fuel fills those places.

(b) Removing and Installing of Fuel System Parts:

(1) Prepare a fire extinguisher before starting the operation.



(2) For prevention of the static electricity, install a ground on the fuel changer, vehicle and fuel tank, and do not spray much water so as to prevent slipping.

(3) Never use any electric equipment like an electric motor or a working light as they may cause spark or high temperature.
(4) Never use an iron hammer as it may cause spark.
(5) Dispose the shop lag separately from any fuel deposit.

D01563

11. REMOVAL AND INSTALLATION OF ENGINE INTAKE PARTS

(a) If any metal tip is mixed in the inlet pass, that may give a bad effect to the engine and turbo charger.
(b) When removing and installing of the inlet system parts, close the opening of the removed inlet system parts and the engine with a clean shop lag or gum tape.
(c) When installing the inlet system parts, check that there is no mixing of a metal tip.

D25081

12. HANDLING OF HOSE CLAMPS

(a) Before removing the hose, check the depth of inserting portion and the clamp position to restore it surely.
(b) Change a deformed or dented into a new one.
(c) In case of reusing the hose, install the clamp on the hose where it has a clamp track.
(d) For a flat spring type clamp, make it adjust by adding force to the arrow mark direction after the installation.

TERMS

ABBREVIATIONS USED IN MANUAL

010B9–17

Abbreviations	Meaning
ABS	Anti–Lock Brake System
A/C	Air Conditioner
AC	Alternating Current
ACC	Accessory
ACIS	Acoustic Control Induction System
ACSD	Automatic Cold Start Device
A.D.D.	Automatic Disconnecting Differential
A/F	Air–Fuel Ratio
AHC	Active Height Control Suspension
ALR	Automatic Locking Retractor
ALT	Alternator
AMP	Amplifier
ANT	Antenna
Approx.	Approximately
ASSY	Assembly
A/T, ATM	Automatic Transmission (Transaxle)
ATF	Automatic Transmission Fluid
AUTO	Automatic
AUX	Auxiliary
AVG	Average
AVS	Adaptive Variable Suspension
B+	Battery Voltage
BA	Brake Assist
BACS	Boost Altitude Compensation System
BAT	Battery
BDC	Bottom Dead Center
B/L	Bi–Level
B/S	Bore–Stroke Ratio
BTDC	Before Top Dead Center
BVSV	Bimetallic Vacuum Switching Valve
CAN	Controller Area Network
CB	Circuit Breaker
CCo	Catalytic Converter For Oxidation
CD	Compact Disc
CF	Cornering Force
CG	Center Of Gravity
CH	Channel
CKD	Complete Knock Down
COMB.	Combination
CPE	Coupe
CPS	Combustion Pressure Sensor
CPU	Central Processing Unit
CRS	Child Restraint System
CTR	Center
C/V	Check Valve
CV	Control Valve
CW	Curb Weight
DC	Direct Current

Abbreviations	Meaning
DEF	Defogger
DFL	Deflector
DIFF.	Differential
DIFF. LOCK	Differential Lock
D/INJ	Direct Injection
DLC	Data Link Connector
DLI	Distributorless Ignition
DOHC	Double Overhead Camshaft
DP	Dash Pot
DS	Dead Soak
DSP	Digital Signal Processor
DTC	Diagnostic Trouble Code
DVD	Digital Versatile Disc
EBD	Electric Brake Force Distribution
ECAM	Engine Control And Measurement System
ECD	Electronic Controlled Diesel
ECDY	Eddy Current Dynamometer
ECT	Electronic Control Transmission
ECU	Electronic Control Unit
ED	Electro–Deposited Coating
EDU	Electronic Driving Unit
EDIC	Electric Diesel Injection Control
EFI	Electronic Fuel Injection
E/G	Engine
EGR	Exhaust Gas Recirculation
EGR–VM	EGR–Vacuum Modulator
ELR	Emergency Locking Retractor
EMPS	Electric Motor Power Steering
ENG	Engine
ESA	Electronic Spark Advance
ETCS–i	Electronic Throttle Control System–intelligent
EVAP	Evaporative Emission Control
EVP	Evaporator
E–VRV	Electric Vacuum Regulating Valve
EX	Exhaust
FE	Fuel Economy
FF	Front–Engine Front–Wheel–Drive
F/G	Fuel Gauge
FIPG	Formed In Place Gasket
FL	Fusible Link
F/P	Fuel Pump
FPU	Fuel Pressure Up
Fr	Front
F/W	Flywheel
FW/D	Flywheel Damper
FWD	Front–Wheel–Drive
GAS	Gasoline
GND	Ground
GPS	Global Positioning System
HAC	High Altitude Compensator
H/B	Hatchback

Abbreviations	Meaning
H–FUSE	High Current Fuse
HI	High
HID	High Intensity Discharge (Head Lamp)
HSG	Housing
HT	Hard Top
HWS	Heated Windshield System
IC	Integrated Circuit
IDI	Indirect Diesel Injection
IFS	Independent Front Suspension
IG	Ignition
IIA	Integrated Ignition Assembly
IN	Intake (Manifold, Valve)
INT	Intermittent
I/P	Instrument Panel
IRS	Independent Rear Suspension
ISC	Idle Speed Control
J/B	Junction Block
J/C	Junction Connector
KD	Kick–Down
LAN	Local Area Network
LB	Liftback
LCD	Liquid Crystal Display
LED	Light Emitting Diode
LH	Left–Hand
LHD	Left–Hand Drive
L/H/W	Length, Height, Width
LLC	Long–Life Coolant
LNG	Liquified Natural Gas
LO	Low
LPG	Liquified Petroleum Gas
LSD	Limited Slip Differential
LSP & PV	Load Sensing Proportioning And Bypass Valve
LSPV	Load Sensing Proportioning Valve
MAP	Manifold Absolute Pressure
MAX.	Maximum
MIC	Microphone
MIL	Malfunction Indicator Lamp
MIN.	Minimum
MG1	Motor Generator No.1
MG2	Motor Generator No.2
MP	Multipurpose
MPI	Multipoint Electronic Injection
MPX	Multiplex Communication System
M/T, MTM	Manual Transmission (Transaxle)
MT	Mount
MTG	Mounting
N	Neutral
NA	Natural Aspiration
No.	Number
O2S	Oxygen Sensor
O/D	Overdrive

Abbreviations	Meaning
OEM	Original Equipment Manufacturing
OHC	Overhead Camshaft
OHV	Overhead Valve
OPT	Option
ORVR	On–board Refilling Vapor Recovery
O/S	Oversize
P & BV	Proportioning And Bypass Valve
PCS	Power Control System
PCV	Positive Crankcase Ventilation
PKB	Parking Brake
PPS	Progressive Power Steering
PTC	Positive Temperature Coefficient
PS	Power Steering
PTO	Power Take–Off
P/W	Power Window
R & P	Rack And Pinion
RAM	Random Access Memory
R/B	Relay Block
RBS	Recirculating Ball Type Steering
R/F	Reinforcement
RFS	Rigid Front Suspension
RH	Right–Hand
RHD	Right–Hand Drive
RLY	Relay
ROM	Read Only Memory
Rr	Rear
RRS	Rigid Rear Suspension
RWD	Rear–Wheel Drive
SDN	Sedan
SEN	Sensor
SICS	Starting Injection Control System
SOC	State Of Charge
SOHC	Single Overhead Camshaft
SPEC	Specification
SPI	Single Point Injection
SRS	Supplemental Restraint System
SSM	Special Service Materials
SST	Special Service Tools
STD	Standard
STJ	Cold–Start Fuel Injection
SW	Switch
SYS	System
T/A	Transaxle
TACH	Tachometer
TBI	Throttle Body Electronic Fuel Injection
TC	Turbocharger
TCCS	TOYOTA Computer–Controlled System
TCV	Timing Control Valve
TDC	Top Dead Center
TEMP.	Temperature
TEMS	TOYOTA Electronic Modulated Suspension

Abbreviations	Meaning
TFT	Toyota Free–Tronic
TIS	Total Information System For Vehicle Development
T/M	Transmission
TMC	TOYOTA Motor Corporation
TMMK	TOYOTA Motor Manufacturing Kentucky, Inc.
TRC	Traction Control System
TURBO	Turbocharge
TWC	Three–Way Catalyst
U/D	Underdrive
U/S	Undersize
VCV	Vacuum Control Valve
VENT	Ventilator
VIN	Vehicle Identification Number
VPS	Variable Power Steering
VSC	Vehicle Stability Control
VSV	Vacuum Switching Valve
VTV	Vacuum Transmitting Valve
VVT–i	Variable Valve Timing–intelligent
w/	With
WGN	Wagon
W/H	Wire Harness
w/o	Without
WU–TWC	Warm Up Three–way Catalytic Converter
WU–OC	Warm Up Oxidation Catalytic Converter
1st	First
2nd	Second
2WD	Two Wheel Drive Vehicle (4 x 2)
3rd	Third
4th	Fourth
4WD	Four Wheel Drive Vehicle (4 x 4)
4WS	Four Wheel Steering System
5th	Fifth

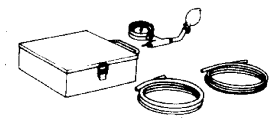
010BA–20

GLOSSARY OF SAE AND TOYOTA TERMS

This glossary lists all SAE–J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ( )––ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	–
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	–
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft Position	Cam Angle
CPP	Clutch Pedal Position	–
CTOX	Continuous Trap Oxidizer	–
CTP	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI/INJ)
DI	Distributor Ignition	–
DLC1 DLC2 DLC3	Data Link Connector 1 Data Link Connector 2 Data Link Connector 3	1: Check Connector 2: Total Diagnosis Communication Link (TDCL) 3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Trouble Code
DTM	Diagnostic Test Mode	–
ECL	Engine Control Level	–
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	Distributorless Ignition (DLI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	–
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	–
FEPROM	Flash Erasable Programmable Read Only Memory	–
FF	Flexible Fuel	–
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)

HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO_2S)
IAC	Idle Air Control	Idle Speed Control (ISC)
IAT	Intake Air Temperature	Intake or Inlet Air Temperature
ICM	Ignition Control Module	–
IFI	Indirect Fuel Injection	Indirect Injection (IDL)
IFS	Inertia Fuel–Shutoff	–
ISC	Idle Speed Control	–
KS	Knock Sensor	Knock Sensor
MAF	Mass Air Flow	Air Flow Meter
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)
MDP	Manifold Differential Pressure	–
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)
MIL	Malfunction Indicator Lamp	Check Engine Lamp
MST	Manifold Surface Temperature	–
MVZ	Manifold Vacuum Zone	–
NVRAM	Non–Volatile Random Access Memory	–
O2S	Oxygen Sensor	Oxygen Sensor, O_2 Sensor (O_2S)
OBD	On–Board Diagnostic	On–Board Diagnostic System (OBD)
OC	Oxidation Catalytic Converter	Oxidation Catalyst Convert (OC), CCo
OP	Open Loop	Open Loop
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)
PCM	Powertrain Control Module	–
PNP	Park/Neutral Position	–
PROM	Programmable Read Only Memory	–
PSP	Power Steering Pressure	–
PTOX	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)
RAM	Random Access Memory	Random Access Memory (RAM)
RM	Relay Module	–
ROM	Read Only Memory	Read Only Memory (ROM)
RPM	Engine Speed	Engine Speed
SC	Supercharger	Supercharger
SCB	Supercharger Bypass	E–ABV
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection
SPL	Smoke Puff Limiter	–
SRI	Service Reminder Indicator	–
SRT	System Readiness Test	–
ST	Scan Tool	–
TB	Throttle Body	Throttle Body
TBI	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)
TC	Turbocharger	Turbocharger
TCC	Torque Converter Clutch	Torque Converter



TCM	Transmission Control Module	Transmission ECU, ECT ECU
TP	Throttle Position	Throttle Position
TR	Transmission Range	–
TVV	Thermal Vacuum Valve	Bimetallic Vacuum Switching Valve (BVSV) Thermostatic Vacuum Switching Valve (TVSV)
TWC	Three–Way Catalytic Converter	Three–Way Catalytic (TWC) Manifold Converter CC_{RO}
TWC+OC	Three–Way + Oxidation Catalytic Converter	CC_R + CCo
VAF	Volume Air Flow	Air Flow Meter
VR	Voltage Regulator	Voltage Regulator
VSS	Vehicle Speed Sensor	Vehicle Speed Sensor
WOT	Wide Open Throttle	Full Throttle
WU–OC	Warm Up Oxidation Catalytic Converter	–
WU–TWC	Warm Up Three–Way Catalytic Converter	–
3GR	Third Gear	–
4GR	Fourth Gear	–

HOW TO DETERMINE NUT STRENGTH

Nut Type			Class
Present Standard Hexagon Nut	Old Standard Hexagon Nut		
	Cold Forging Nut	Cutting Processed Nut	
 No Mark			4N
 No Mark (w/ Washer)	 No Mark (w/ Washer)	 No Mark	5N (4T)
 6N			6N
		 *	7N (5T)
 8N			8N
 10N		 No Mark	10N (7T)
 11N			11N
 12N			12N

*: Nut with 1 or more marks on one side surface of the nut.

B06432

HINT:

Use the nut with the same number of the nut strength classification or the greater than the bolt strength classification number when tightening parts with a bolt and nut.

Example: Bolt = 4T

Nut = 4N or more

	Minimum	0.6 mm (0.0236 in.)
Exhaust valve		
Overall length	Standard	101.97 mm (4.0146in.)
	Minimum	101.55 mm (3.9980 in.)
Valve stem diameter		5.960 to 5.975 mm (0.2346 to 0.2352 in.)
Margin thickness	Standard	0.9 mm (0.035 in.)
	Minimum	0.6 mm (0.024 in.)
Inner compression spring		
Free length		40.45 mm (1.5925 in.)
Deviation	Maximum	2.0 mm (0.079 in.)
Installed tension	at 31.1 mm (1.224 in.)	177 to 195 N (18.0 to 19.9 kgf, 39.7 to 44.1 lbf)
Intake Valve guide bush		
Bushing inside diameter		6.010 to 6.030 mm (0.2366 to 0.2374 in.)
Oil clearance	Standard	0.025 to 0.060 mm (0.0010 to 0.0024 in.)
	Maximum	0.08 mm (0.0031 in.)
Diameter		10.985 to 11.006 mm (0.4325 to 0.4333 in.)
Protrusion height		10.05 to 10.45 mm (0.3957 to 0.4114 in.)
Exhaust valve guide bush		
Bushing inside diameter		6.010 to 6.030 mm (0.2366 to 0.2374 in.)
Oil clearance	Standard	0.035 to 0.070 mm (0.0014 to 0.0028 in.)
	Maximum	0.10 mm (0.0039 in.)
Diameter		10.985 to 11.006 mm (0.4325 to 0.4333 in.)
Protrusion height		9.65 to 10.05 mm (0.3799 to 0.3957 in.)
Valve lifter		
Lifter diameter		27.975 to 27.985 mm (1.1014 to 1.1018 in.)
Lifter bore diameter		28.010 to 28.031 mm (1.1028 to 1.1036 in.)
Oil clearance	Standard	0.025 to 0.080 mm (0.0010 to 0.0031 in.)

Camshaft		
Circle runout	Maximum	0.06 mm (0.0024 in.)
Cam lobe height (intake)	Standard	46.57 to 46.67 mm (1.8335 to 1.8374 in.)
	Minimum	46.10 mm (1.8150 in.)
Cam lobe height (exhaust)	Standard	47.52 to 47.62 mm (1.8709 to 1.8748 in.)
	Minimum	47.05 mm (1.8524 in.)
Journal diameter		26.969 to 26.985 mm (1.0618 to 1.0624 in.)
Thrust clearance		0.035 to 0.11 mm (0.0014 to 0.0043 in.)
Oil clearance	Standard	0.025 to 0.080 mm (0.0010 to 0.0031 in.)
Gear backlash	Standard	0.014 to 0.170 mm (0.0006 to 0.0067 in.)
Connecting rod		
Thrust clearance	Standard	0.08 to 0.40 mm (0.0031 to 0.0157 in.)
Oil clearance	Standard	0.038 to 0.056 mm (0.0015 to 0.0022 in.)
	Maximum	0.10 mm (0.0039 in.)
Cylinder block		
Warpage	Maximum	0.05 mm (0.0020 in.)
Bore diameter	Standard	82.200 to 82.400 mm (3.2362 to 3.2441 in.)
Piston		
Piston diameter		82.118 to 82.132 mm (3.2330 to 3.2335 in.)
Piston oil clearance	Standard	0.068 to 0.140 mm (0.0027 to 0.0055 in.)
Bushing inside diameter		31.015 to 31.027 mm (1.2211 to 1.2215 in.)
Piston pin		
Piston pin diameter		31.000 to 31.012 mm (1.2205 to 1.2209 in.)
Oil clearance	Standard	0.005 to 0.019 mm (0.0002 to 0.0007 in.)
Cylinder head set bolt		
Out side diameter	Standard	10.40 to 11.00 mm (0.4094 to 0.4331 in.)
Connecting rod bolt		
Diameter	Standard	8.0 to 8.3 mm (0.315 to 0.315 in.)
Connecting rod		
Out–of–alignment	Maximum per 100 mm (3.94 in.)	0.05 mm (0.0020 in.)
Rod twist	Maximum per 100 mm (3.94 in.)	0.15 mm (0.0059 in.)
Ring groove clearance	No. 1	0.11 to 0.15 mm (0.0043 to 0.0059 in.)
	No. 2	0.075 to 0.115 mm (0.0030 to 0.0045 in.)
	Oil	0.03 to 0.07 mm (0.0012 to 0.0028 in.)
Piston ring end gap		
Standard	No. 1	0.27 to 0.39 mm (0.0106 to 0.0514 in.)
	No. 2	0.39 to 0.54 mm (0.0154 to 0.0213 in.)
	Oil	0.20 to 0.40 mm (0.0079 to 0.0157 in.)
Maximum	No. 1	0.82 mm (0.0323 in.)
	No. 2	1.00 mm (0.0394 in.)
	Oil	0.90 mm (0.0354 in.)
Crankshaft		
Thrust clearance	Standard	0.040 to 0.300 mm (0.0016 to 0.0118 in.)
Circle runout	Maximum	0.025 mm (0.0010 in.)
Crank pin taper and out– of –round	Maximum	0.01 mm (0.0004 in.)
Crank pin diameter		50.482 to 50.500 mm (1.9875 to 1.9882 in.)
Main journal diameter		56.992 to 57.010 mm (2.2438 to 2.2445 in.)
Oil clearance	Standard	0.032 to 0.100 mm (0.0013 to 0.0039 in.)

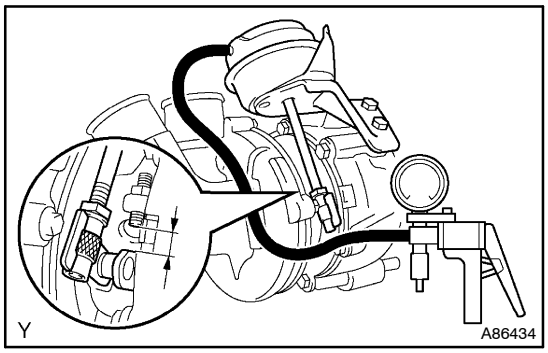
TURBOCHARGER SUB–ASSY (1CD–FTV)(From September, 2003)

INSPECTION

1308O–01



1. INSPECT TURBINE SHAFT

(a) Check the operation.

(1) Grasp the edge of the turbine shaft, then turn it. Check that the turbine shaft turns smoothly.

If the turbine shaft does not turn or it turns with heavy drag, replace the turbocharger.

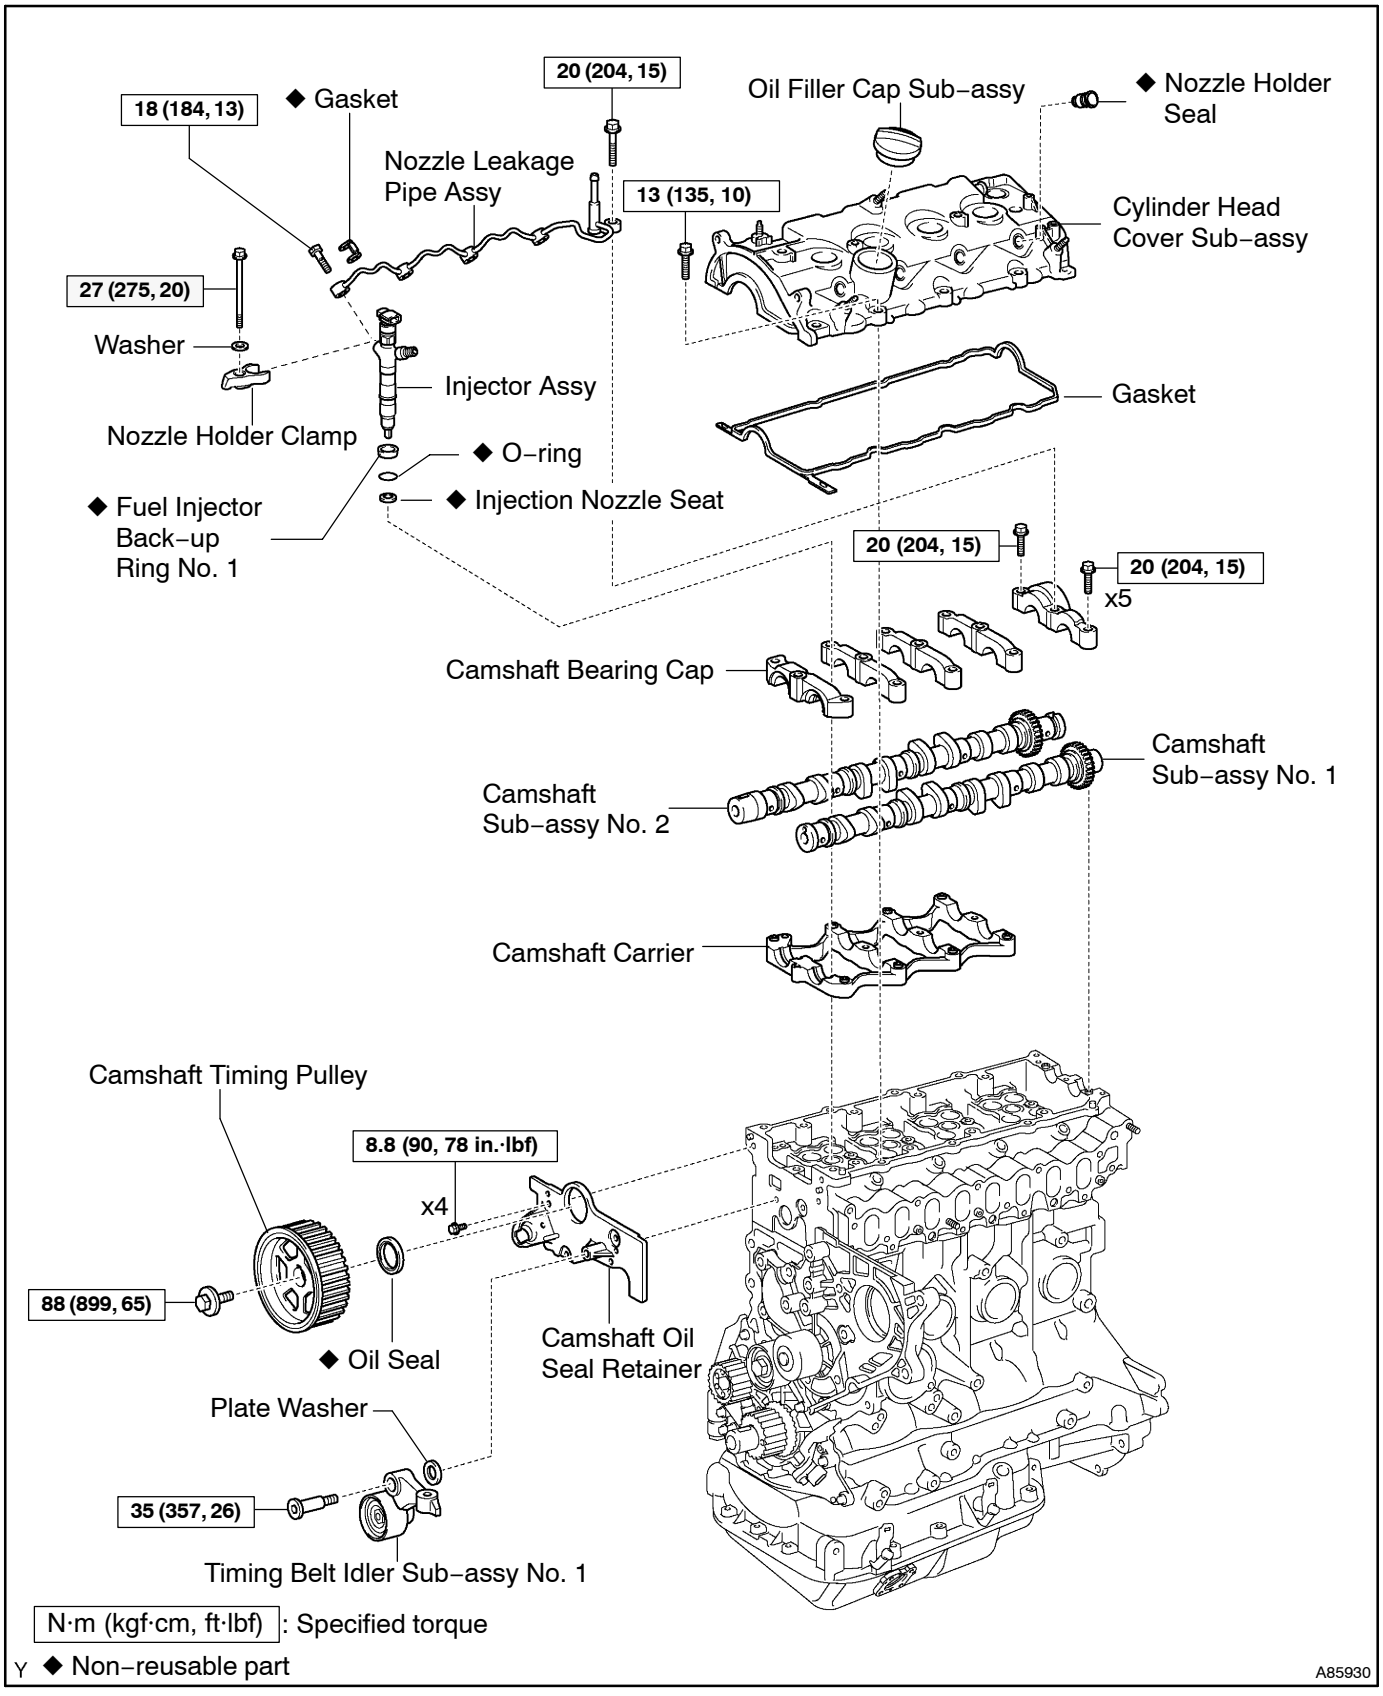
2. INSPECT ACTUATOR OPERATION

(a) Apply vacuum of 66 kPa (500 mmHg, 20 in.Hg), then raise the actuator push rod.

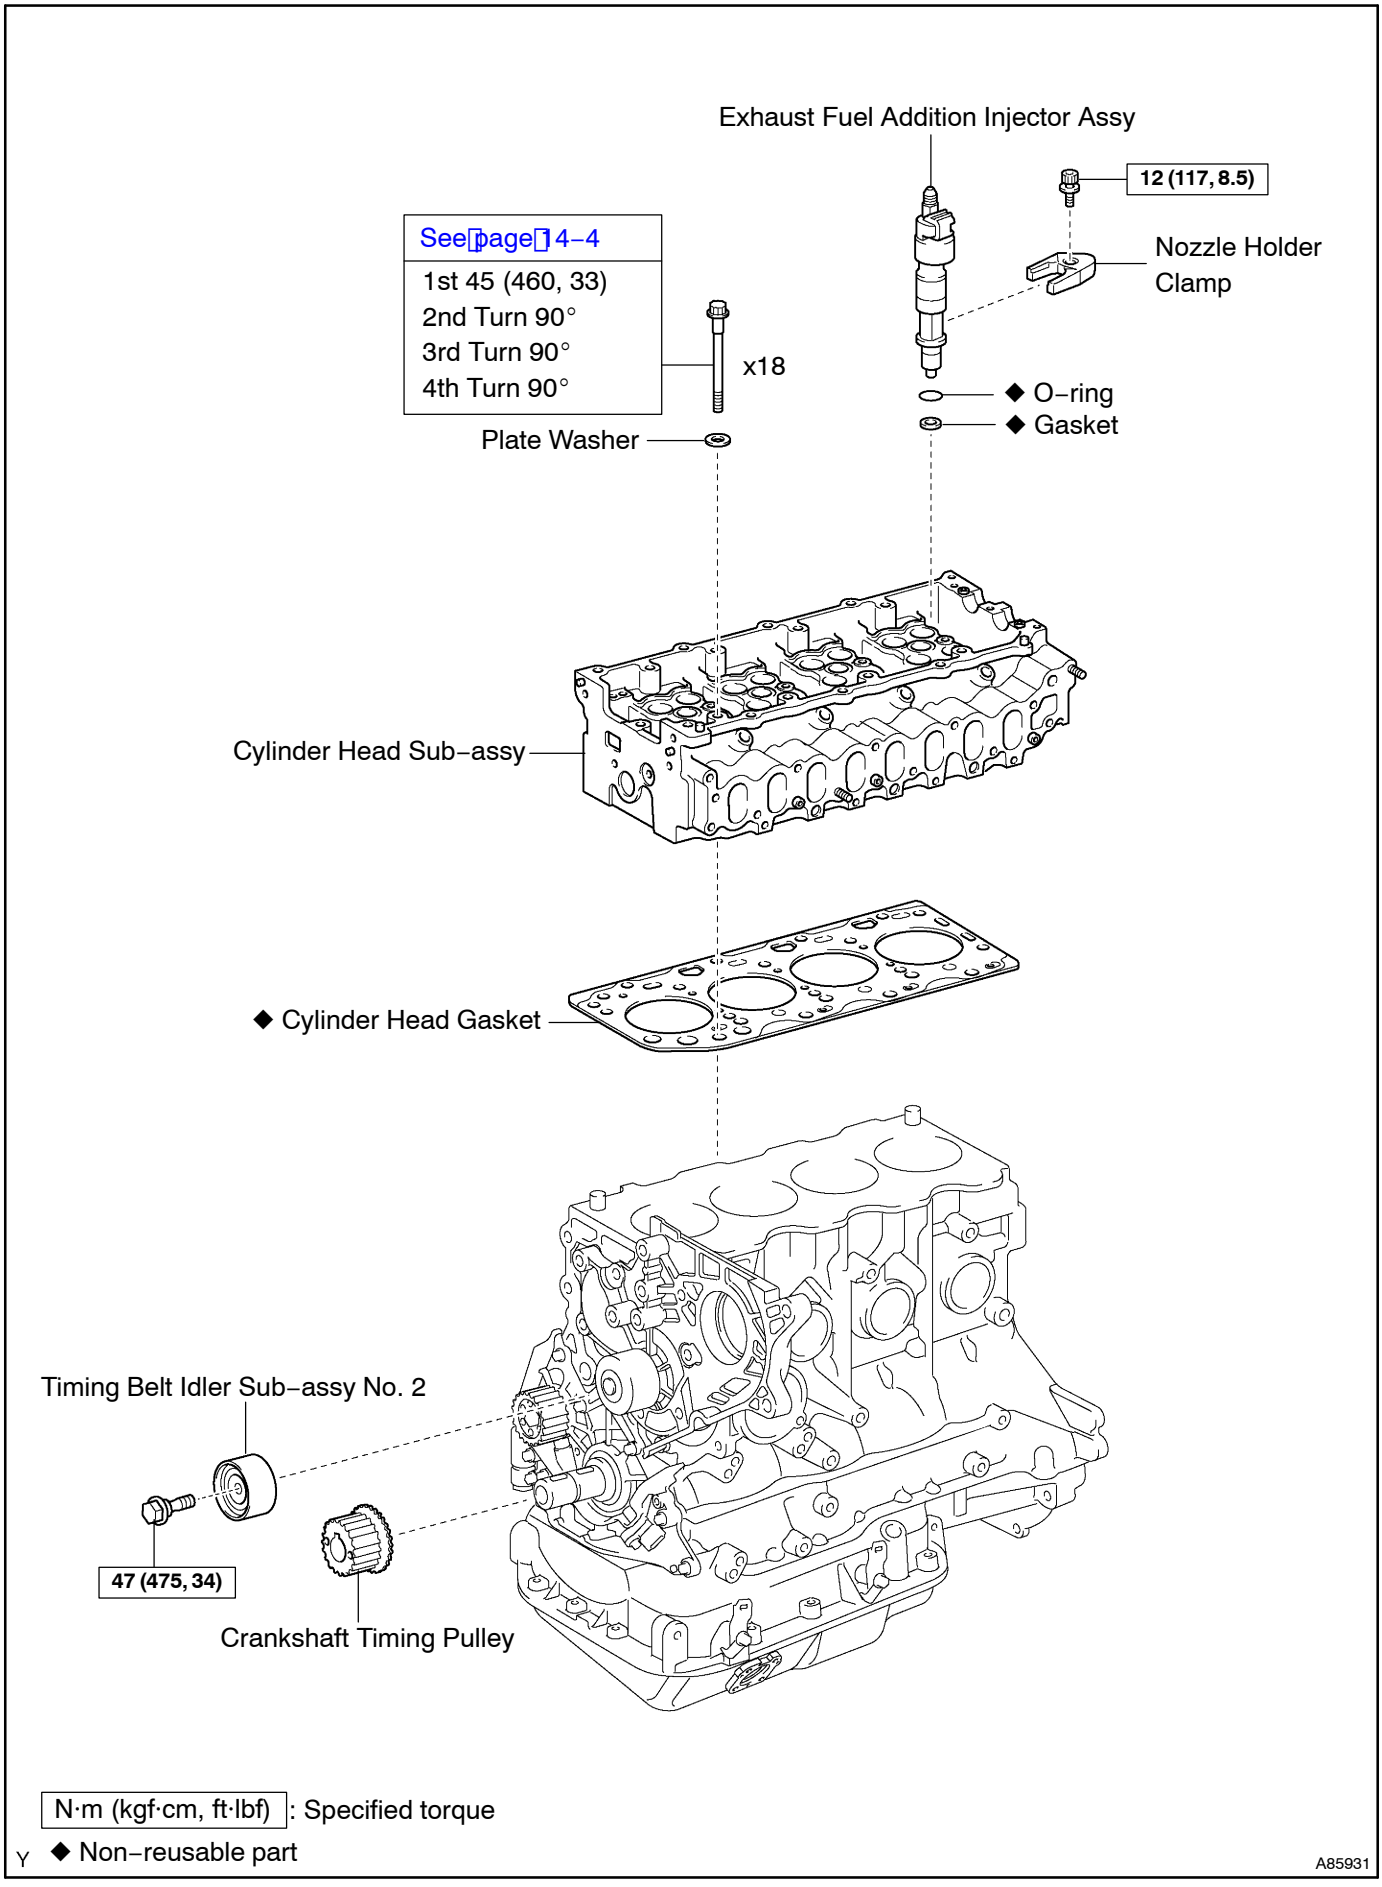
(b) Lower the vacuum, then check the stroke when the vacuum is at the following values.

Standard stroke:

50 kPa (375 mmHg, 15 in.Hg): 0.2 mm (0.008 in.)



30 kPa (225 mmHg, 9 in.Hg): 5.0 mm (0.197 in.)



If the operation is not as specified, replace the turbocharger.

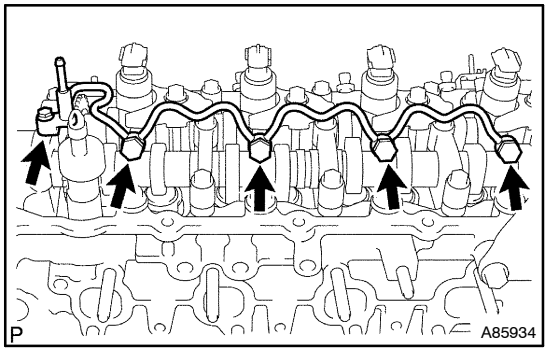
OVERHAUL

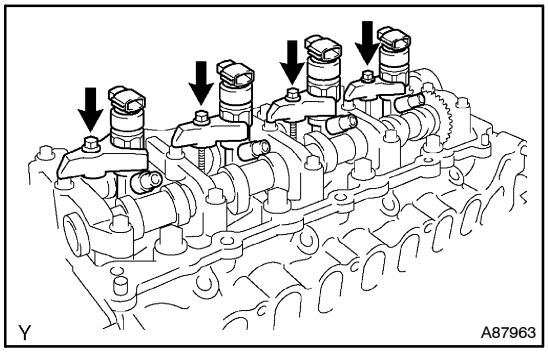
1. REMOVE OIL FILLER CAP SUB–ASSY



2. REMOVE NOZZLE HOLDER SEAL

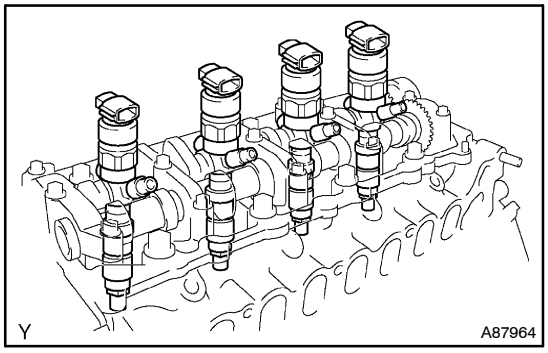
(a) Using a screwdriver, pry out the 4 nozzle holder seals.

3. REMOVE CYLINDER HEAD COVER SUB–ASSY



(a) Remove the 10 bolts, cylinder head cover and gasket.

4. REMOVE NOZZLE LEAKAGE PIPE ASSY

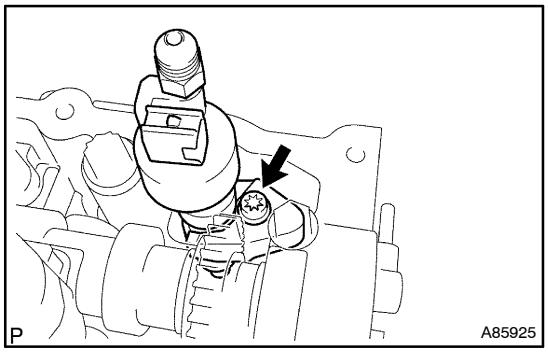


(a) Remove the 4 hollow screws and bolt.

(b) Remove the nozzle leakage pipe and 4 gaskets from the cylinder head and injector.

5. REMOVE NOZZLE HOLDER CLAMP

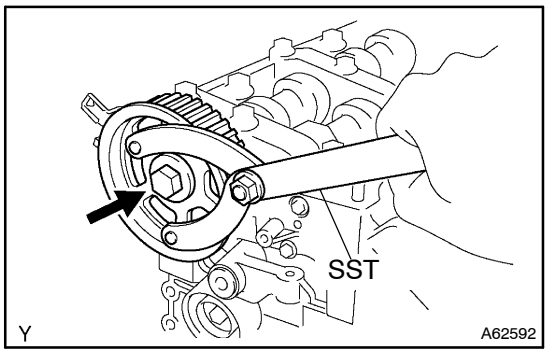
(a) Remove the 4 bolts, 4 washers and 4 nozzle holder clamps.



6. REMOVE INJECTOR ASSY

(a) Remove the 4 injectors from the cylinder head.

HINT:



Arrange the injectors in the correct order.

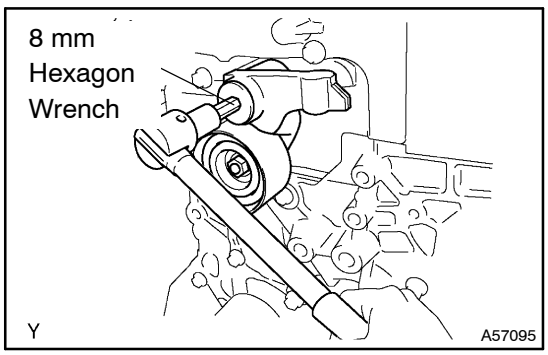
7. REMOVE EXHAUST FUEL ADDITION INJECTOR ASSY

(a) Using a Torx socket wrench (T40), remove the Torx screw.

(b) Remove the nozzle holder clamp, addition injector and gasket.

8. REMOVE CAMSHAFT TIMING PULLEY

(a) Using SST, remove the pulley bolt.

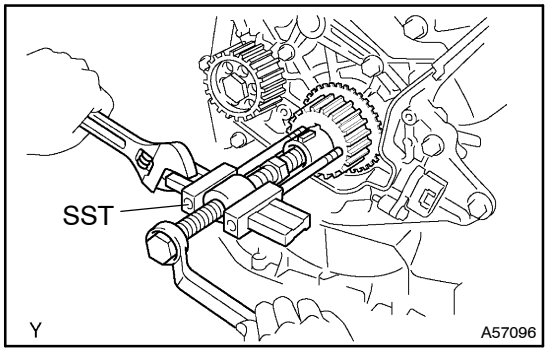


SST 09960–10010 (09962–01000, 09963–01000)

(b) Remove the timing pulley.

HINT:

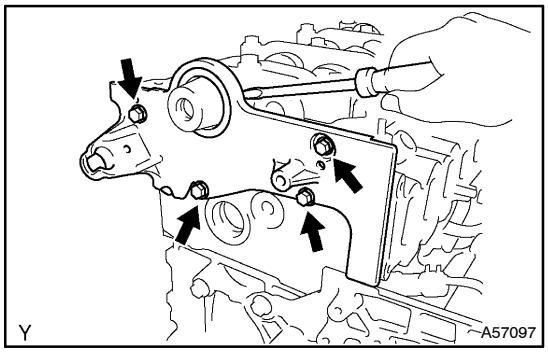
Using a plastic–faced hammer, tap out the pulley.



(c) Remove the set key.

9. REMOVE TIMING BELT IDLER SUB–ASSY NO.1

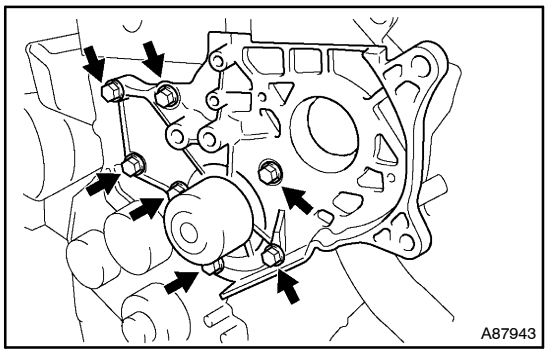
(a) Using an 8 mm hexagon wrench, remove the idler pulley shaft, idler pulley and plate washer.



10. REMOVE TIMING BELT IDLER SUB–ASSY NO.2

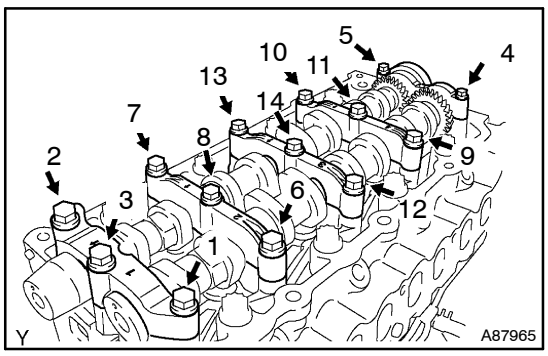
11. REMOVE CRANKSHAFT TIMING PULLEY

(a) If the timing pulley cannot be removed by hand, use SST to remove the pulley.



SST 09950–50013 (09951–05010, 09952–05010, 09953–05010, 09953–05020, 09954–05021)

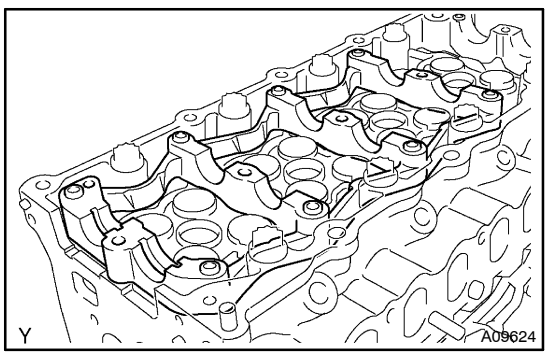
12. REMOVE CAMSHAFT OIL SEAL RETAINER



(a) Remove the 4 bolts.

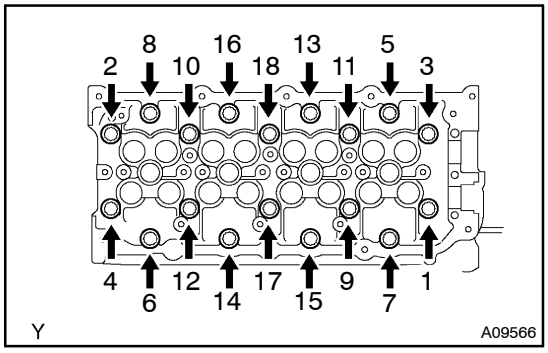
(b) Using a screwdriver, remove the oil seal retainer by prying between the oil seal retainer and camshaft bearing cap.

13. REMOVE WATER PUMP ASSY



(a) Remove the 7 bolts, water pump and gasket.

14. REMOVE CAMSHAFT

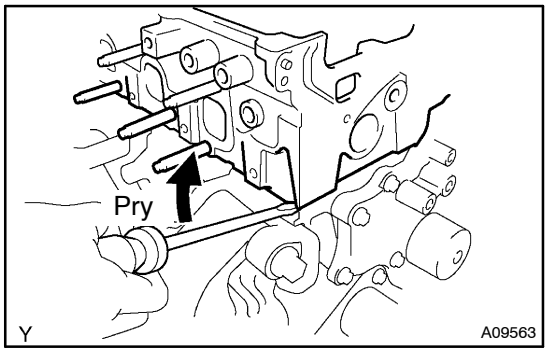


(a) Using several steps, loosen and remove the 14 bearing cap bolts uniformly in the sequence shown in the illustration.

(b) Remove the 5 bearing caps and camshaft sub–assembly.

15. REMOVE NO.2 CAMSHAFT

(a) Remove the camshaft sub–assembly and camshaft carrier.

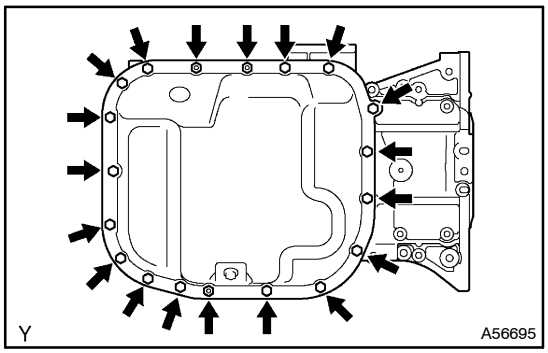


16. REMOVE CYLINDER HEAD SUB–ASSY

(a) Using several steps, loosen the 18 cylinder head bolts uniformly in the sequence shown in the illustration. Remove the 18 cylinder head bolts and plate washers.

NOTICE:

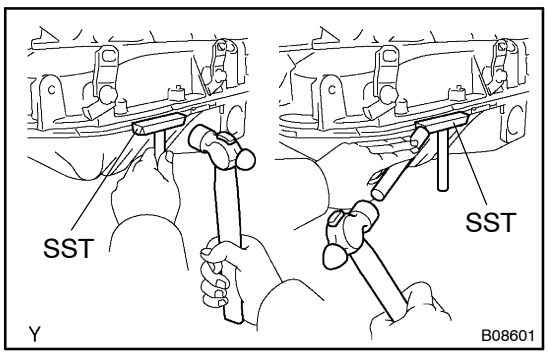
Removing the bolts in a wrong order could cause warpage or cracks of the cylinder head.



(b) Lift the cylinder head from the dowels on the cylinder block, then place the cylinder head on wooden blocks on a work bench.

HINT:

To lift the cylinder head, pry between the cylinder head and cylinder block using a screwdriver.

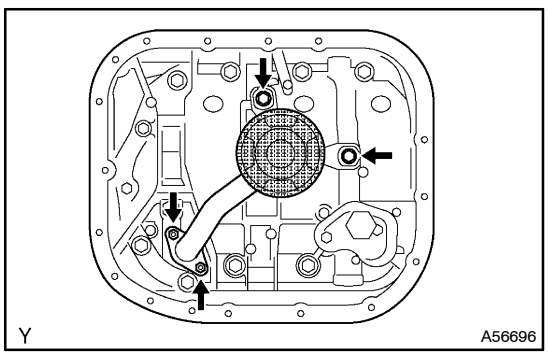


NOTICE:

Be careful not to damage the contact surfaces of the cylinder head and cylinder block.

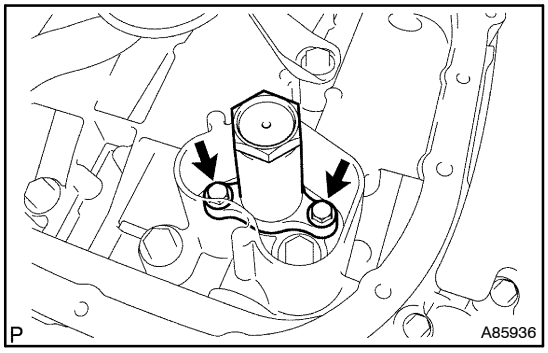
17. REMOVE OIL PAN SUB–ASSY NO.2

(a) Remove the 16 bolts and 3 nuts.



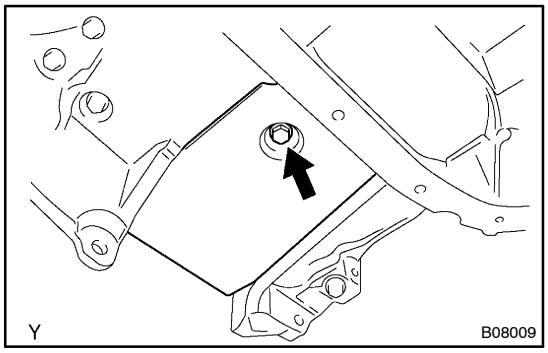
(b) Insert the blade of SST between the No. 1 and No. 2 oil pans, then cut off the applied sealer and remove the No. 2 oil pan.

SST 09032–00100



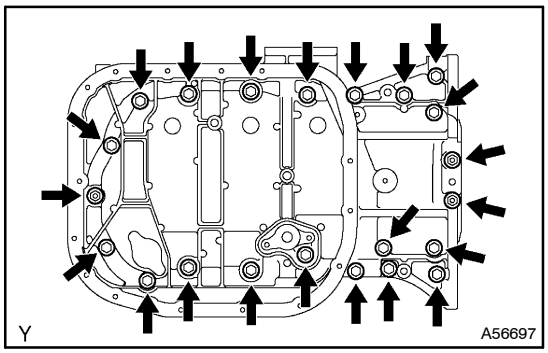
NOTICE:

Be careful not to damage the No. 1 and No. 2 oil pans.



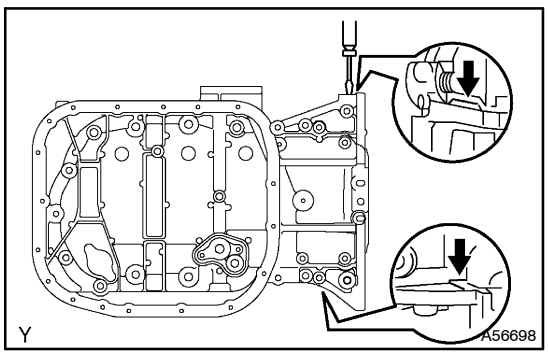
18. REMOVE OIL STRAINER SUB–ASSY

(a) Remove the 2 bolts and 2 nuts, then remove the oil strainer and gasket.



19. REMOVE OIL REGULATOR ASSY

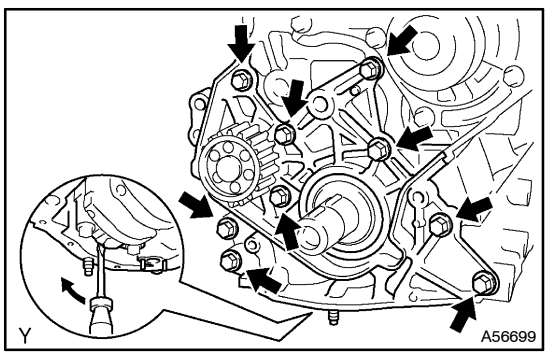
(a) Remove the 2 bolts and oil regulator.



20. REMOVE OIL PAN INSULATOR

(a) Remove the bolt and oil pan insulator.

21. REMOVE OIL PAN SUB–ASSY

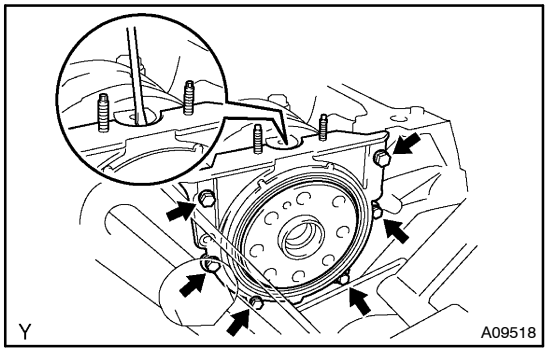


(a) Remove the 19 bolts and 3 nuts.

(b) Using a screwdriver, remove the oil pan by prying between the cylinder block and No. 1 oil pan.

NOTICE:

Be careful not to damage the cylinder block and No. 1 oil pan.

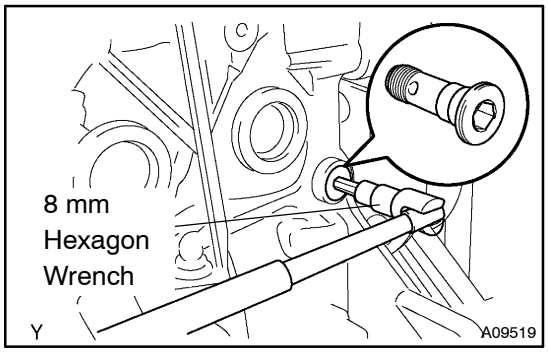


22. REMOVE OIL PUMP ASSY

(a) Remove the 9 bolts.

(b) Remove the oil pump by prying between the oil pump and main bearing cap using a screwdriver.

(c) Remove the gasket.

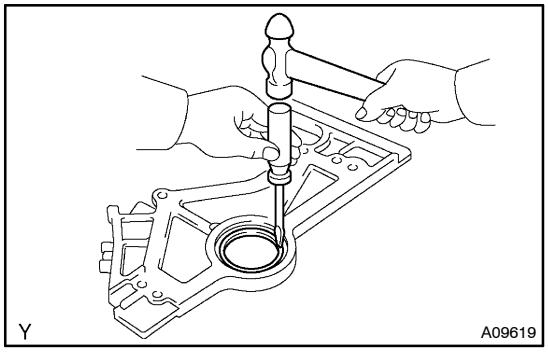


23. REMOVE ENGINE REAR OIL SEAL RETAINER

(a) Remove the 6 bolts.

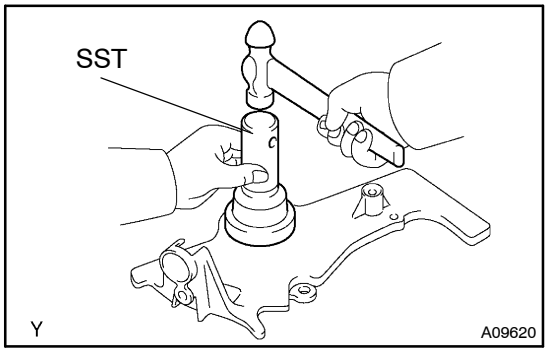
(b) Using a screwdriver, remove the oil seal retainer by prying between the oil seal retainer and main bearing cap.

NOTICE:



Be careful not to damage the oil seal retainer and main bearing cap.

24. REMOVE OIL CHECK VALVE SUB–ASSY

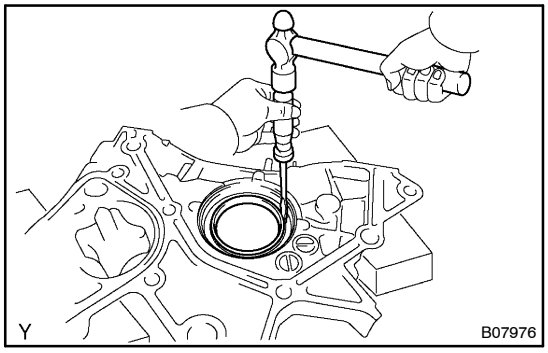


(a) Using an 8 mm hexagon wrench, remove the check valve and gasket.

25. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB–ASSY

26. REMOVE CAMSHAFT OIL SEAL

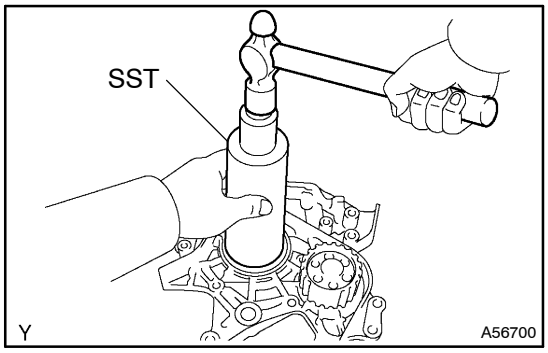
(a) Using a screwdriver and hammer, tap out the oil seal.



27. INSTALL CAMSHAFT OIL SEAL

(a) Using SST and a hammer, tap in a new oil seal until its surface is flush with the camshaft oil seal retainer edge.
SST 09223–46011

(b) Apply multipurpose grease to a new oil seal lip.

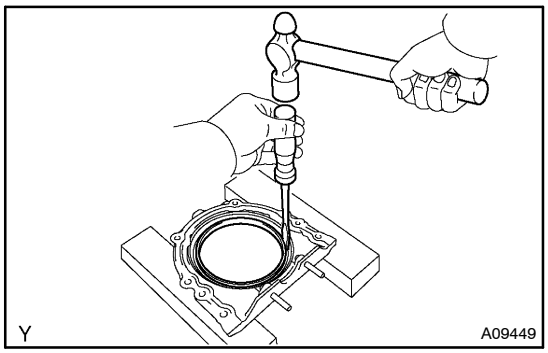


NOTICE:

Keep the lip free of foreign objects.

28. REMOVE CRANKSHAFT SEAL

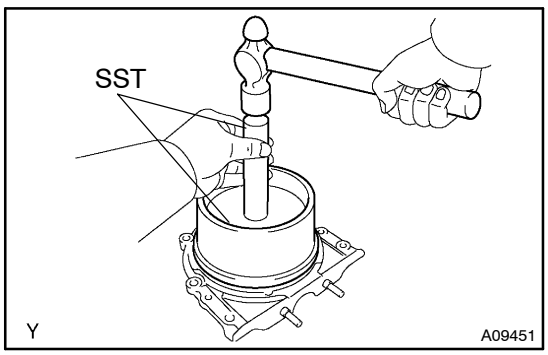
(a) Using a screwdriver and hammer, tap out the oil seal.



29. INSTALL CRANKSHAFT SEAL

(a) Using SST and a hammer, tap in a new oil seal until its surface is flush with the oil pump edge.
SST 09316–60011 (09316–00011, 09316–00021)

(b) Apply multipurpose grease to a new oil seal lip.

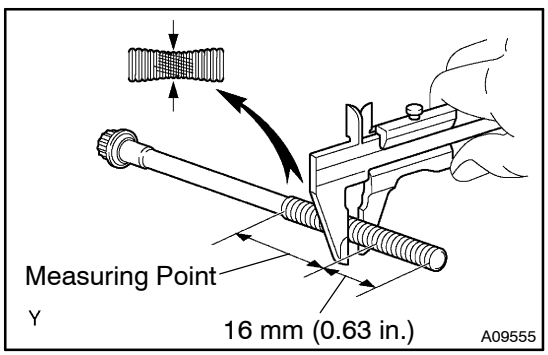


NOTICE:

Keep the lip free of foreign objects.

30. REMOVE ENGINE REAR OIL SEAL

(a) Using a screwdriver and hammer, tap out the oil seal.

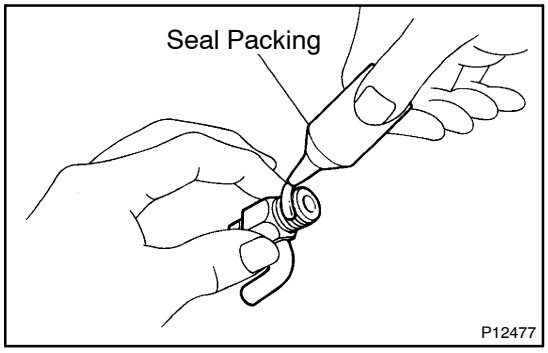


31. INSTALL ENGINE REAR OIL SEAL

(a) Using SST and a hammer, tap in a new oil seal until its surface is flush with the rear oil seal retainer edge.
SST 09223–15030, 09950–70010 (09951–07100)

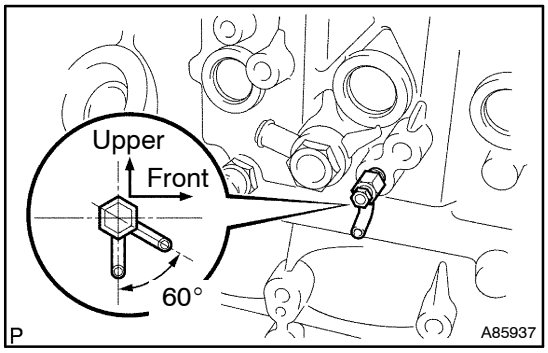
(b) Apply multipurpose grease to a new oil seal lip.

NOTICE:



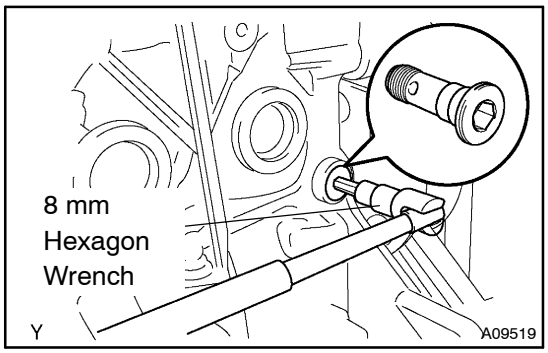
Keep the lip free of foreign objects.

32. INSPECT CYLINDER HEAD SET BOLT



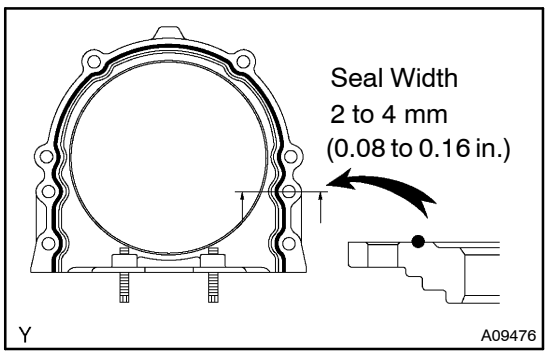
(a) Using vernier calipers, measure the tension portion diameter of the bolt.
Standard outside diameter:
10.40 to 11.00 mm (0.4094 to 0.4331 in.)

If the diameter is less than minimum, replace the bolt.



33. INSTALL CYLINDER BLOCK WATER DRAIN COCK SUB–ASSY

(a) Apply seal packing to the 2 or 3 threads.
Seal packing: Part No. 08826–00100 or equivalent

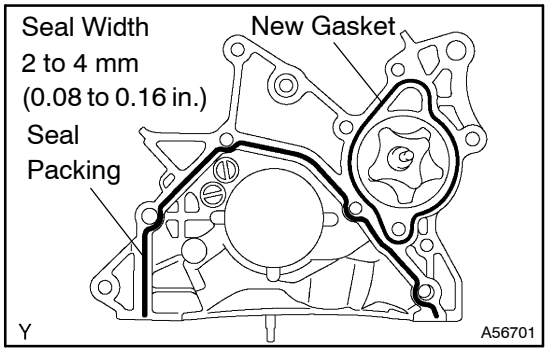


(b) Install the drain union.
Torque: 29 N·m (291 kgf·cm, 21 ft·lbf)

HINT:
After applying the specified torque, if the drain pipe of the drain union is not located as shown in the illustration, rotate the drain union further clockwise so the drain pipe faces downward.

34. INSTALL OIL CHECK VALVE SUB–ASSY

(a) Using an 8 mm hexagon wrench, install a new gasket and the check valve.
Torque: 33 N·m (331 kgf·cm, 24 ft·lbf)



35. INSTALL ENGINE REAR OIL SEAL RETAINER

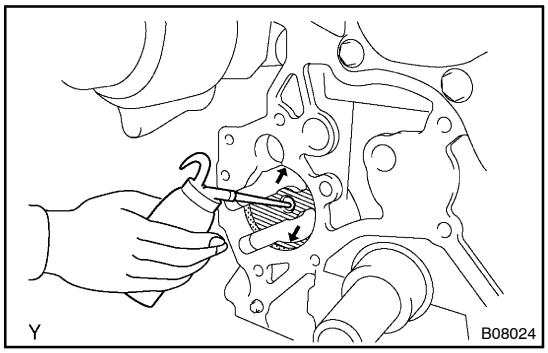
(a) Apply seal packing to the oil seal retainer as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Install a nozzle of which opening is cut to 2 to 4 mm (0.08 to 0.16 in.).**
- **The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.**
- **Immediately remove the nozzle from the tube, then re-install the cap.**

(b) Install the oil seal retainer with the 6 bolts. Tighten the bolts uniformly in several steps.
Torque: 7.4 N·m (75 kgf·cm, 65 in.·lbf)

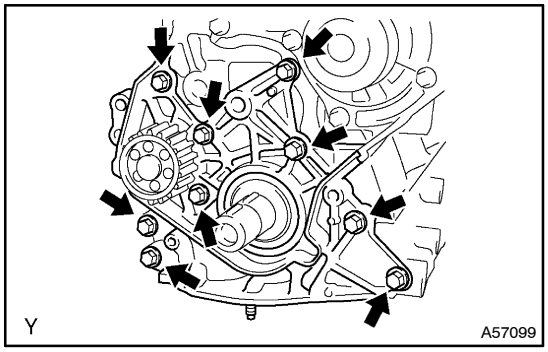
36. INSTALL OIL PUMP ASSY



(a) Apply seal packing to the oil pump as shown in the illustration.

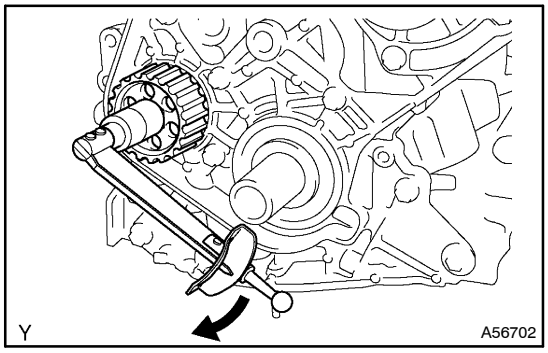
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:



- **Avoid applying an excessive amount to the surface.**
- **Install a nozzle of which opening is cut to 2 to 4 mm (0.08 to 0.16 in.).**
- **The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.**
- **Immediately remove the nozzle from the tube, then reinstall the cap.**

(b) Install a new gasket to the oil pump.

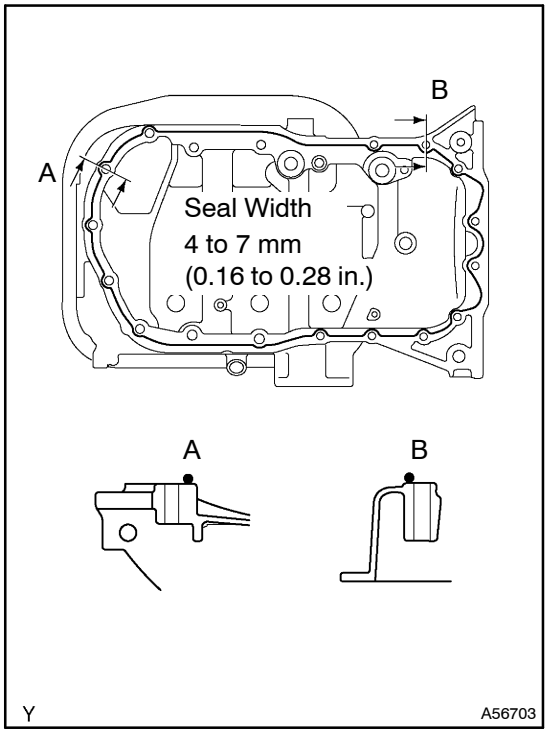


(c) Pour 0.5 cm^3 (0.03 cu in.) or more of engine oil into the bushing of the cylinder block.

(d) Apply engine oil to the cylinder block side which contacts the oil pump driven rotor.

(e) Install the oil pump with the 9 bolts.

Torque: 31 N·m (320 kgf·cm, 23 ft·lbf)

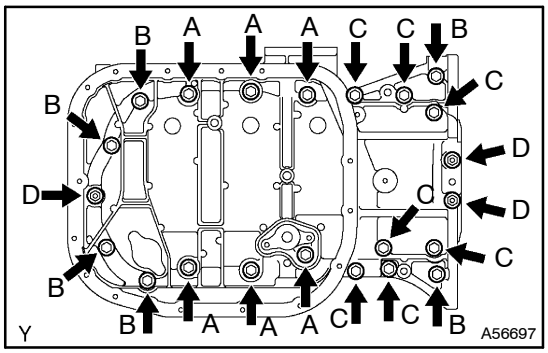


(f) Measure the oil pump rotating torque.

(1) Check that the pump rotates smoothly without making a noise.

(2) Using a torque wrench, check the pump rotating torque.

Rotating torque: 3.0 N·m (31 kgf·cm, 27 in.·lbf) or less



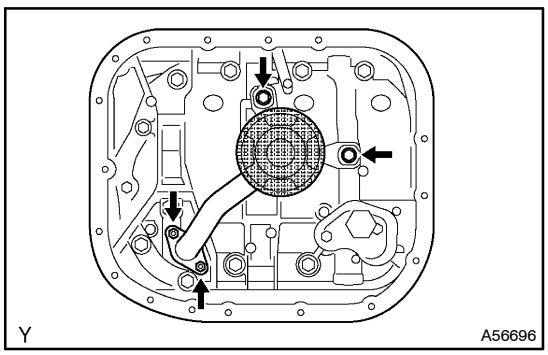
37. INSTALL OIL PAN SUB–ASSY

(a) Apply seal packing to the No. 1 oil pan as shown in the illustration.

Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

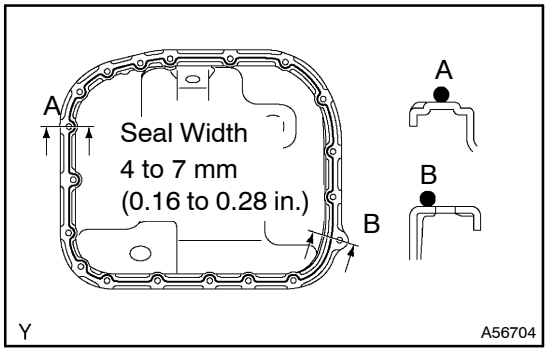
- **Install a nozzle of which opening is cut to 4 to 7 mm (0.16 to 0.28 in.).**
- **The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.**
- **Immediately remove the nozzle from the tube, then re-install the cap.**



(b) Install the oil pan with 19 bolts and 3 nuts.

Torque:
42 N·m (428 kgf·cm, 31 ft·lbf) for bolt A
21 N·m (209 kgf·cm, 15 ft·lbf) for bolt B
11 N·m (112 kgf·cm, 8 ft·lbf) for bolt C
11 N·m (112 kgf·cm, 8 ft·lbf) for nut D

38. INSTALL OIL REGULATOR ASSY



Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

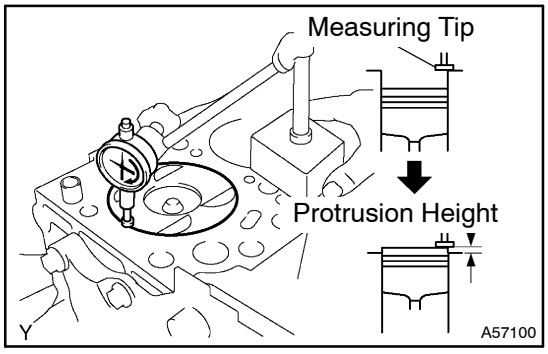
39. INSTALL OIL STRAINER SUB–ASSY

(a) Install a new gasket and the oil strainer with the 2 bolts and 2 nuts.

Torque:
21 N·m (209 kgf·cm, 15 ft·lbf) for bolt
13 N·m (135 kgf·cm, 10 ft·lbf) for nut

40. INSTALL OIL PAN SUB–ASSY NO.2

(a) Apply seal packing to the oil pan as shown in the illustration.



Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Install a nozzle of which opening is cut to 4 to 7 mm (0.16 to 0.28 in.).**
- **The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.**
- **Immediately remove the nozzle from the tube, then reinstall the cap.**

(b) Install the oil pan with the 16 bolts and 3 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque: 12 N·m (119 kgf·cm, 9 ft·lbf)

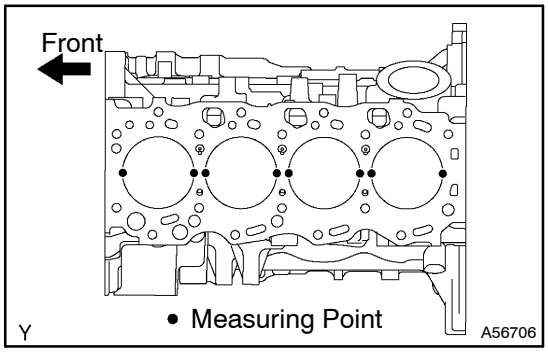
41. INSTALL CYLINDER HEAD SUB–ASSY

(a) Measure the protrusion height of the piston heads.

(1) Clean the cylinder block with solvent.

(2) Set the piston to measure to slightly before the TDC.

(3) Place a dial indicator on the cylinder block, then calibrate the dial indicator at 0 mm (0 in.).



HINT:

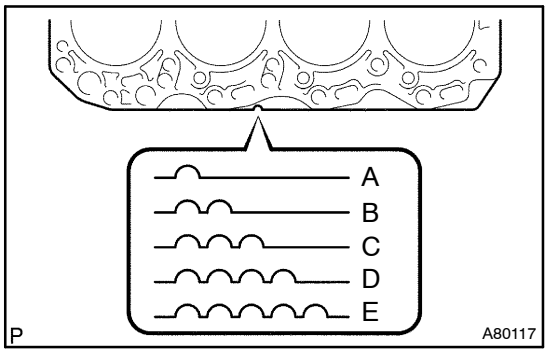
- Place the measuring tip of the dial indicator as shown in the illustration.
- Make sure that the measuring tip is square to the cylinder block gasket and piston head when measuring.

(4) Find the most overhung position of the piston head by slowly turning the crankshaft clockwise and counterclockwise.

(5) Measure the protrusion height of the piston head for each cylinder at 2 places as shown in the illustration. (Total of 8 measurements.)

(6) Record the higher protrusion height of the 2 measurements at each cylinder.

(b) Select a new cylinder head gasket.

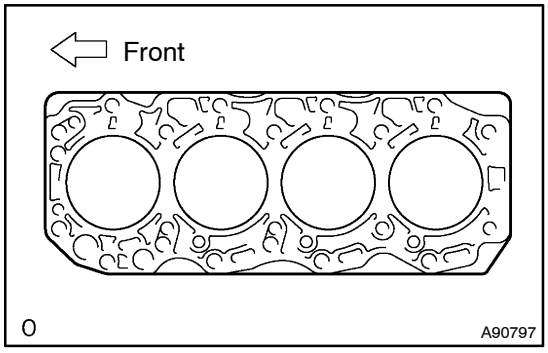


HINT:

There are 5 sizes of new cylinder head gaskets, marked ”A”, ”B”, ”C”, ”D”, and ”E”.

New cylinder head gasket thickness:

A	0.85 to 0.95 mm (0.0335 to 0.0374 in.)
B	0.90 to 1.00 mm (0.0354 to 0.0394 in.)
C	0.95 to 1.05 mm (0.0374 to 0.0413 in.)
D	1.00 to 1.10 mm (0.0394 to 0.0433 in.)
E	1.05 to 1.15 mm (0.0413 to 0.0453 in.)

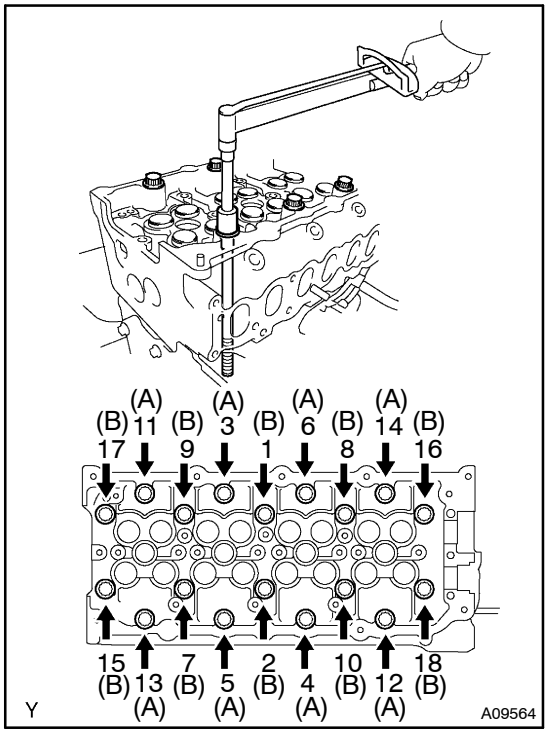


(1) Find the highest protrusion height among the 4 measurement records. It is used to select a new cylinder head gasket.

(2) Select a new gasket among A to E using the matrix below.

New gasket matrix:

Piston Protrusion mm (in.)	Gasket Size
0.165 to 0.220 (0.0065 to 0.0087)	A
0.220 to 0.270 (0.0087 to 0.0106)	B
0.270 to 0.320 (0.0106 to 0.0126)	C
0.320 to 0.370 (0.0126 to 0.0146)	D
0.370 to 0.425 (0.0146 to 0.0167)	E



(c) Place the selected new cylinder head gasket on the cylinder block.

NOTICE:

Pay attention to the mounting orientation.

(d) Place the cylinder head in position on the cylinder head gasket.

(e) Install the cylinder head bolts.

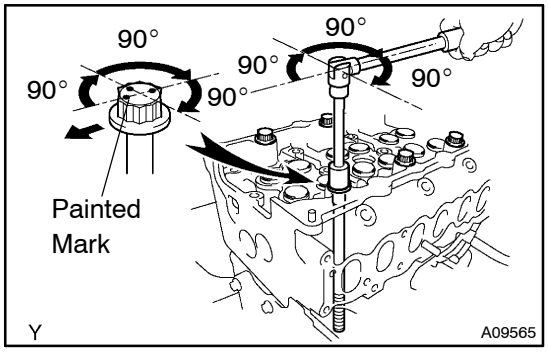
HINT:

- The cylinder head bolts are tightened in 4 successive steps (steps (3), (5), (6) and (7)).
- If the cylinder head bolt is broken or deformed, replace it with a new bolt.

(1) Apply a light coat of engine oil to the threads of the cylinder head bolts and plate washers.

(2) Install the plate washer to the cylinder head bolt.

(3) Using several steps, install and tighten the 18 cylinder head bolts uniformly in the sequence shown in the illustration.



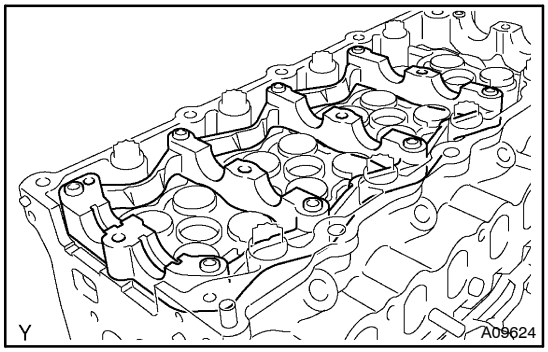
Torque: 45 N·m (459 kgf·cm, 33 ft·lbf)

HINT:

See the table below for the bolt length.

Bolt Type	Bolt Length
(A)	160 mm (6.30 in.)
(B)	104 mm (4.09 in.)

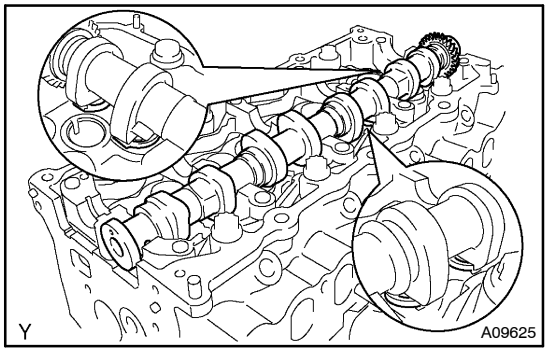
If the cylinder head bolt does not meet the specified torque, replace the cylinder head bolt with a new bolt.



(4) Mark the front of the cylinder head bolt with paint.

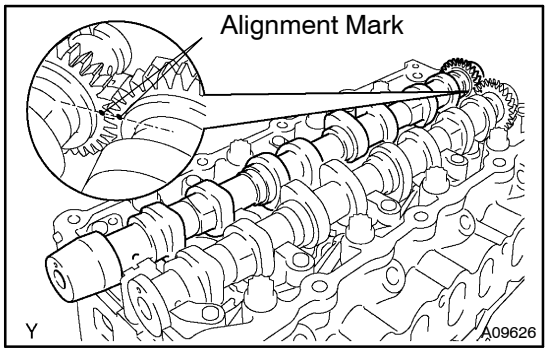
(5) Retighten the cylinder head bolts by 90° in the same sequence as step (3).

(6) Retighten the cylinder head bolts by an additional 90° in the same sequence as step (3).



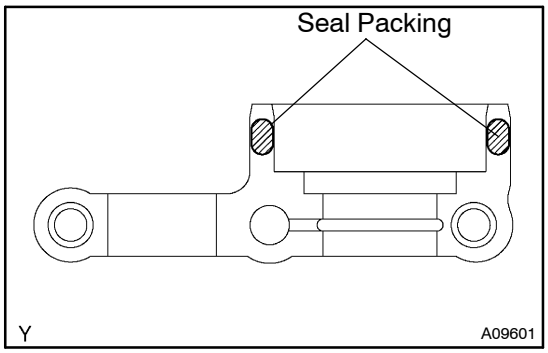
(7) Retighten the cylinder head bolts by one more additional 90° in the same sequence as step (3).

(8) Check that each painted mark is now at the intake manifold side.

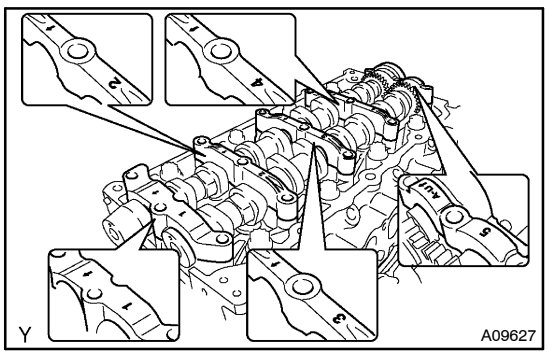


42. INSTALL CAMSHAFT

(a) Place the camshaft carrier on the cylinder head.

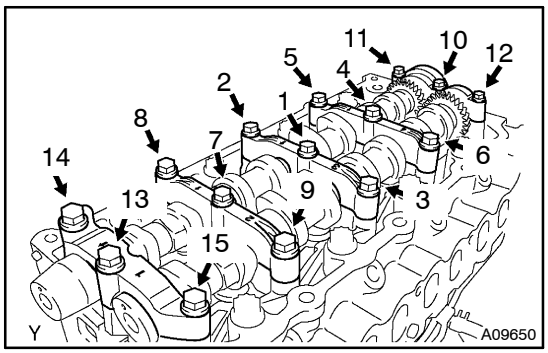


(b) Install the camshaft.
(c) Apply engine oil to the cam and gear of the camshaft, and the journal of the camshaft carrier.
(d) Place the intake camshaft on the camshaft carrier as shown in the illustration so that the No. 3 and No. 4 of the cylinder cam lobes face downward.



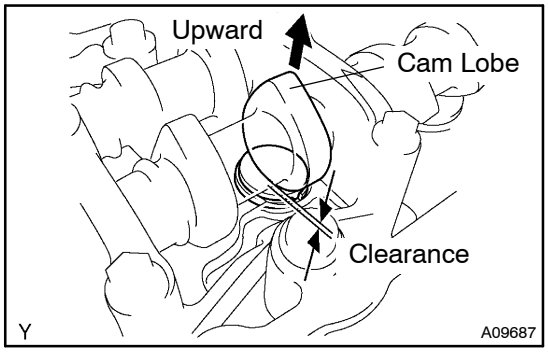
43. INSTALL NO.2 CAMSHAFT

(a) Install the No. 2 camshaft.
(b) Apply engine oil to the cam and gear of the camshaft, and the journal of the camshaft carrier.
(c) Engage the exhaust camshaft gear and intake camshaft gear by matching the alignment marks on each gear.
(d) Roll down the exhaust camshaft onto the bearing journals while engaging gears with each other.



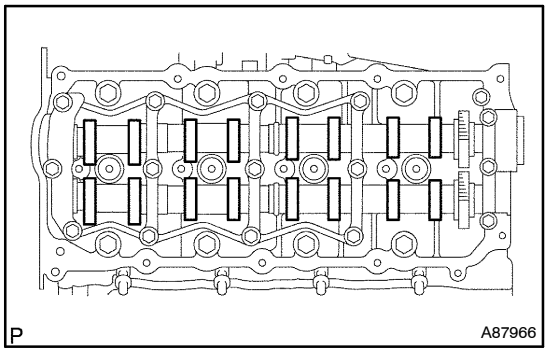
(e) Install the camshaft bearing caps.
(1) Remove any old packing (FIPG) material from the No. 5 camshaft bearing cap.
(2) Apply seal packing to the No. 5 camshaft bearing cap as shown in the illustration.

Seal packing: Part No. 08826–00080 or equivalent



(3) Place the 5 bearing caps in their proper locations.

(4) Using several steps, install and tighten the 15 bearing cap bolts uniformly in the sequence shown in the illustration.

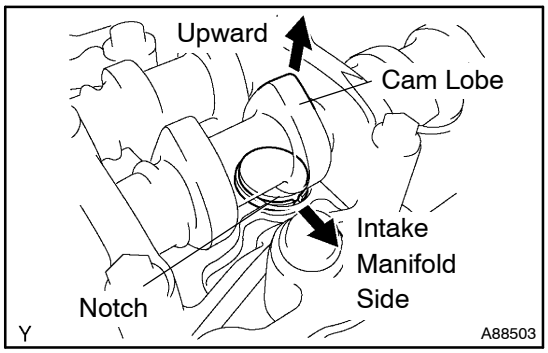


Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

44. INSPECT VALVE CLEARANCE

(a) Turn the crankshaft so that the cam lobe located over the inspecting valve faces upward.

(b) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

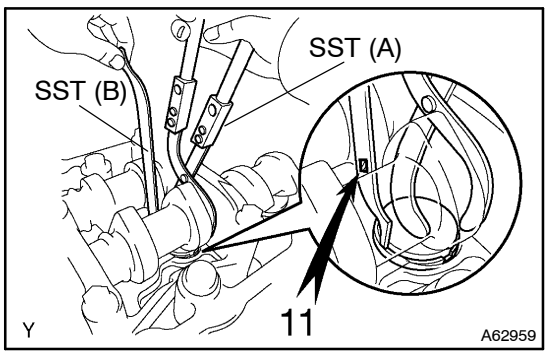


(c) Measure the clearance at 16 places.

(d) Record the out–of–specification valve clearance measurements. They will be used later to select an adjusting shim to replace.

Valve clearance (Cold) :

Intake	0.20 to 0.30 mm (0.008 to 0.012 in.)
Exhaust	0.35 to 0.45 mm (0.014 to 0.018 in.)

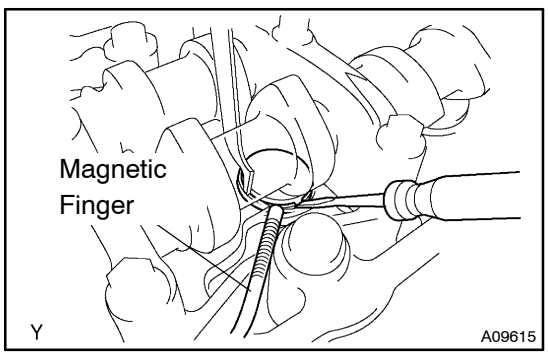


45. ADJUST VALVE CLEARANCE

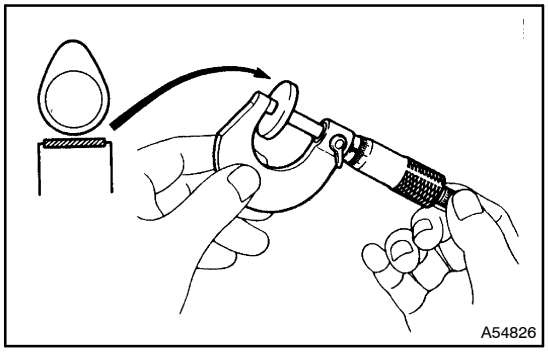
(a) Remove the adjusting shim.

(1) Turn the crankshaft so that the cam lobe located over the adjusting valve faces upward.

(2) Position the notch of the valve lifter toward the intake manifold side.



(3) Using SST (A), press down the valve lifter, then place SST (B) between the camshaft and valve lifter. Remove SST (A).



SST 09248–55050 (09248–05510, 09248–05520)

HINT:

Use SST (B) marked with ”11”.

(4) Remove the adjusting shim using a small screwdriver and magnetic finger.

(b) Select the size of an adjusting shim to replace by following the formula or the charts:

(1) Using a micrometer, measure the thickness of the removed shim.

(2) Calculate the thickness of a new shim so that the valve clearance comes within the specified value.

HINT:

T ..... Thickness of the removed adjusting shim
A ..... Measured valve clearance
N ..... Thickness of a new adjusting shim
Intake: N = T + (A – 0.25 mm (0.010 in.))
Exhaust: N = T + (A – 0.40 mm (0.016 in.))

(3) Select a new shim with a thickness which is as close to the calculated value as possible.

EXAMPLE (Intake):
Measured valve clearance = 0.45 mm (0.0177 in.)
0.45 mm (0.0177 in.) – 0.25 mm (0.0098 in.) = 0.20 mm (0.0078 in.)
(Measured – Specification = Excess clearance)
Used shim measurement = 2.80 mm (0.1102 in.)
0.20 mm (0.0078 in.) + 2.80 mm (0.1102 in.) = 3.00 mm (0.1181 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 3.00 mm (0.1181 in.)
Select No. 21 shim

HINT:

- The shims are available in 17 sizes in increments of 0.05 mm (0.0020 in.), from 2.50 mm (0.0984 in.) to 3.30 mm (0.1299 in.).
- Refer to New Shim Thickness table on the next 2 pages.

Adjusting Shim Selection Chart (Intake)

	2.500 (0.0984)	2.525 (0.0994)	2.550 (0.1004)	2.575 (0.1014)	2.600 (0.1024)	2.625 (0.1033)	2.650 (0.1043)	2.675 (0.1053)	2.700 (0.1063)	2.725 (0.1073)	2.750 (0.1083)	2.775 (0.1093)	2.800 (0.1102)	2.825 (0.1112)	2.850 (0.1122)	2.875 (0.1132)	2.900 (0.1142)	2.925 (0.1152)	2.950 (0.1161)	2.975 (0.1171)	3.000 (0.1181)	3.025 (0.1191)	3.050 (0.1201)	3.075 (0.1211)	3.100 (0.1220)	3.125 (0.1230)	3.150 (0.1240)	3.175 (0.1250)	3.200 (0.1260)	3.225 (0.1270)	3.250 (0.1280)	3.275 (0.1289)	3.300 (0.1299)

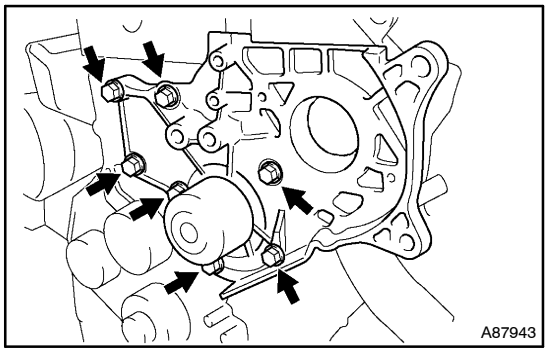
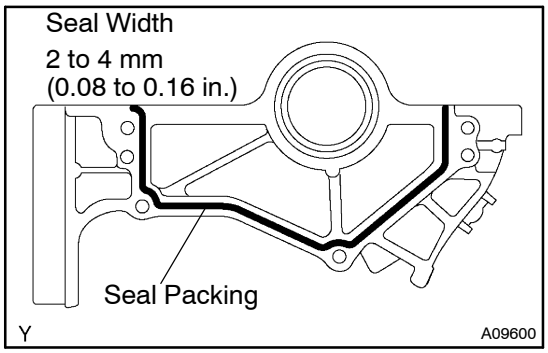
Exhaust valve clearance (Cold):
0.35 to 0.45 mm (0.014 to 0.018 in.)



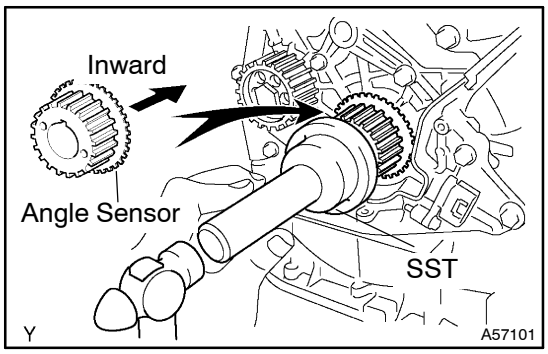
EXAMPLE: The 2.800 mm (0.1102 in.) shim is installed, and the measured clearance is 0.590 mm (0.0232 in.). Replace the 2.800 mm (0.1102 in.) shim with a new No. 21 shim.

Y

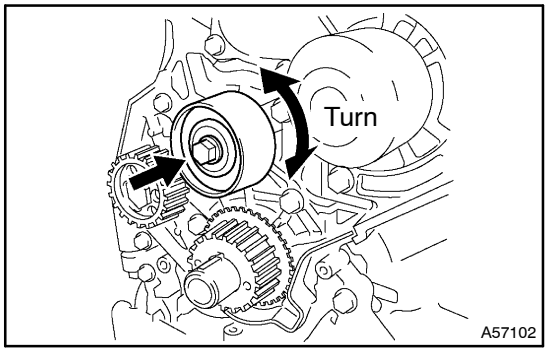


A57527

(c) Install the new adjusting shim.
(1) Place the new adjusting shim on the valve lifter.
(2) Using SST (A), press down the valve lifter and remove SST (B).
SST 09248–55050 (09248–05510, 09248–05520)
(d) Recheck the valve clearance.



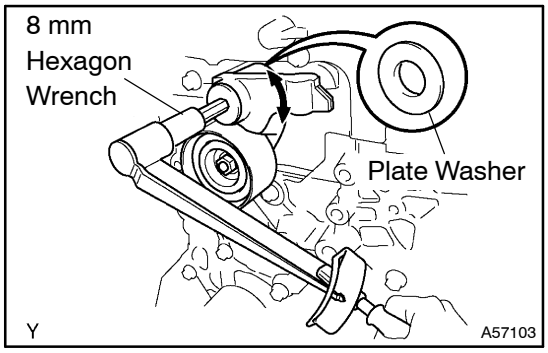
46. INSTALL WATER PUMP ASSY
(a) Install a new gasket and water pump with the 7 bolts.
Torque: 31 N·m (320 kgf·cm, 23 ft·lbf)



47. INSTALL CAMSHAFT OIL SEAL RETAINER
(a) Apply seal packing to the oil seal retainer as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:
- **Install a nozzle of which opening is cut to 2 to 4 mm (0.08 to 0.16 in.).**
- **The parts must be set within 3 minutes and must be assembled within 15 minutes after applying seal packing. Otherwise the material must be removed and reapplied.**
- **Immediately remove the nozzle from the tube, then reinstall the cap.**

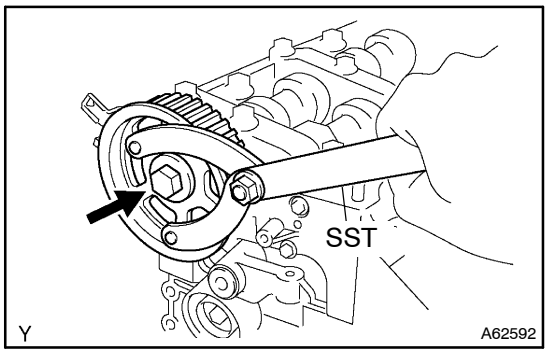
(b) Install the oil seal retainer with 4 bolts. Uniformly tighten the 4 bolts in several passes.
Torque: 9.8 N·m (100 kgf·cm, 7.2 ft·lbf)



48. INSTALL CRANKSHAFT TIMING PULLEY
(a) Align the keyway of the timing pulley with the key located on the crankshaft, then slide the pulley into place.
(b) Using SST and a hammer, tap in the timing pulley with the angle sensor facing inward.
SST 09223–46011

49. INSTALL TIMING BELT IDLER SUB–ASSY NO.2

(a) Install the idler pulley with the bolt.
Torque: 47 N·m (475 kgf·cm, 34 ft·lbf)

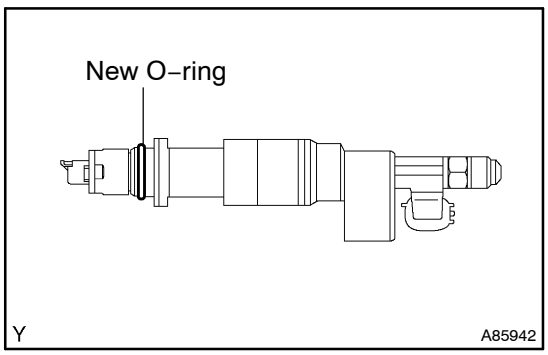


(b) Check that the idler pulley moves smoothly.

50. INSTALL TIMING BELT IDLER SUB–ASSY NO.1

(a) Using an 8 mm hexagon wrench, install the plate washer and idler pulley with the idler pulley shaft.
Torque: 35 N·m (357 kgf·cm, 26 ft·lbf)

(b) Check that the pulley bracket moves smoothly.



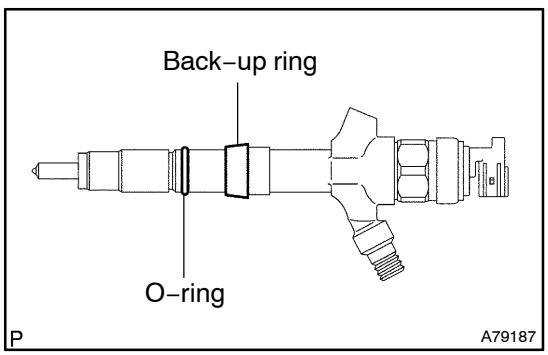
51. INSTALL CAMSHAFT TIMING PULLEY

(a) Install the pulley set key to the key groove of the camshaft.

(b) Align the keyway of the timing pulley with the key located on the camshaft, then slide the pulley into place.

(c) Using SST, install the pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
Torque: 88 N·m (899 kgf·cm, 65 ft·lbf)

52. INSTALL EXHAUST FUEL ADDITION INJECTOR ASSY



(a) Install a new gasket to the cylinder head.

(b) Install a new O–ring to the injector.

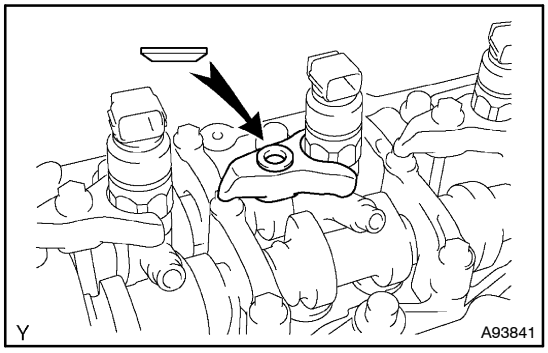
(c) Apply a light coat of engine oil to the O–ring on the injector.

(d) Install the addition injector and nozzle holder clamp.

(e) Using a Torx wrench (T40), install the Torx screw.
Torque: 12 N·m (117 kgf·cm, 8.5 ft·lbf)

53. INSTALL INJECTOR ASSY

(a) Install the 4 new nozzle seats to the cylinder head.



(b) Install new back–up rings and the O–rings to each injector.

(c) Apply a light coat of engine oil to the O–rings on each injector.

(d) Install the injector to the cylinder head.

NOTICE:

Fit the injectors to the nozzle seats.

(e) Install the nozzle holder clamp as shown in the illustration. Tighten the camshaft bearing cap bolt by hand to fix the nozzle holder clamp.

NOTICE:

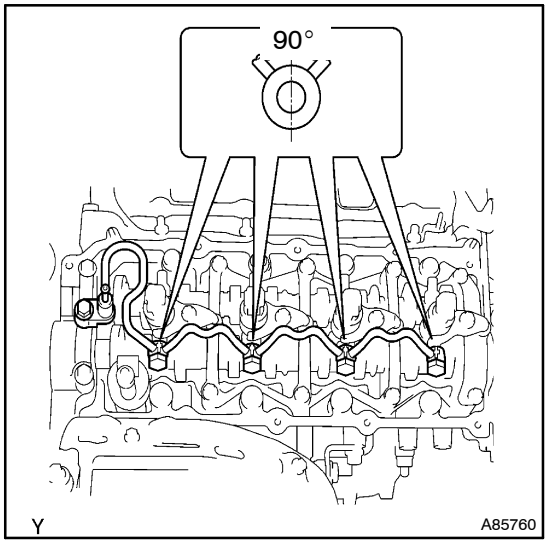
- **Pay attention to the mounting orientation of the washer.**
- **When temporarily attaching the nozzle holder clamp and mounting bolt, be careful not to orient them at an angle.**

HINT:

Apply a light coat of engine oil to the threads of the nozzle holder clamp bolts.

(f) Install the injection pipe No. 1, No. 2, No. 3 and No. 4, then tighten the nuts by hand.

(g) Install new 5 gaskets and the leakage pipe No. 1. Tighten the 4 hollow screws by hand.



(h) Tighten the 4 nozzle holder clamp bolts.

Torque: 26 N·m (265 kgf·cm, 19 ft·lbf)

(i) Remove the 4 injection pipes.

54. INSTALL NOZZLE LEAKAGE PIPE ASSY

(a) Remove the bolt which is tightened at the center of the camshaft bearing cap No. 4.

(b) Install the nozzle leakage pipe and 4 new gaskets.

NOTICE:

When installing the gaskets, pay attention to the mounting orientation. Install the gasket so that the joint of the gasket comes within the ranges shown in the illustration.

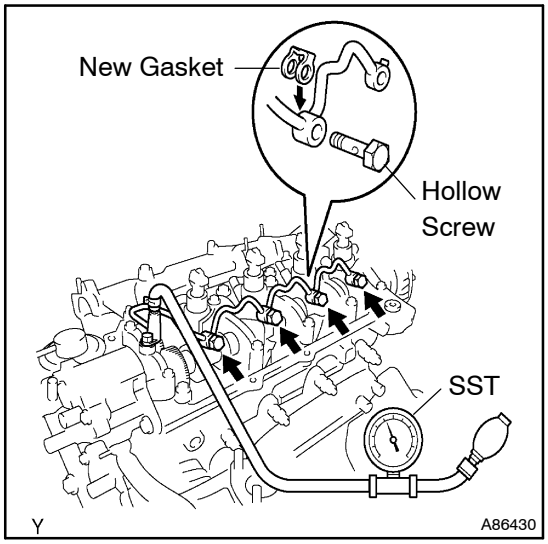
(c) Apply a light coat of engine oil to the 4 hollow screws and bolt.

(d) Tighten the 4 hollow screws and bolt by hand.

(e) Tighten the 4 hollow screws and bolt.

Torque:

16 N·m (163 kgf·cm, 12 ft·lbf) for hollow screw

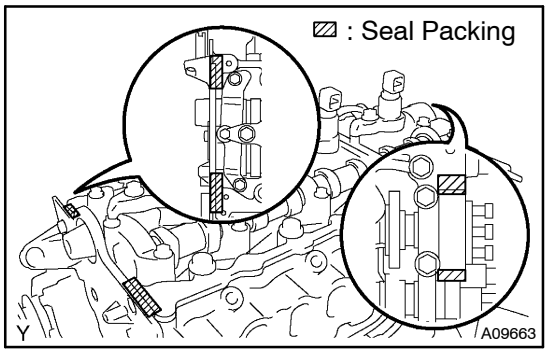


20 N·m (204 kgf·cm, 15 ft·lbf) for flange bolt

NOTICE:

In any case, when the torque exceeds the upper limit, replace the leakage pipe hollow screw and gaskets with new ones.

(f) Check that there are no leaks from the nozzle leakage pipe connection.



(1) Apply a light coat of soapy water (any fluid to detect fuel leakage) to the nozzle leakage pipe connection.

(2) Using SST (a turbocharger pressure gauge), attach SST to the fuel return side of the nozzle leakage pipe, then maintain 100 kPa (1.0 kgf/cm^2, 14.5 psi) of pressure for 60 seconds to check that there are no bubbles from the pipe connection.

SST 09992–00242

(3) After checking fuel leaks, wipe off soapy water from the pipe connection.

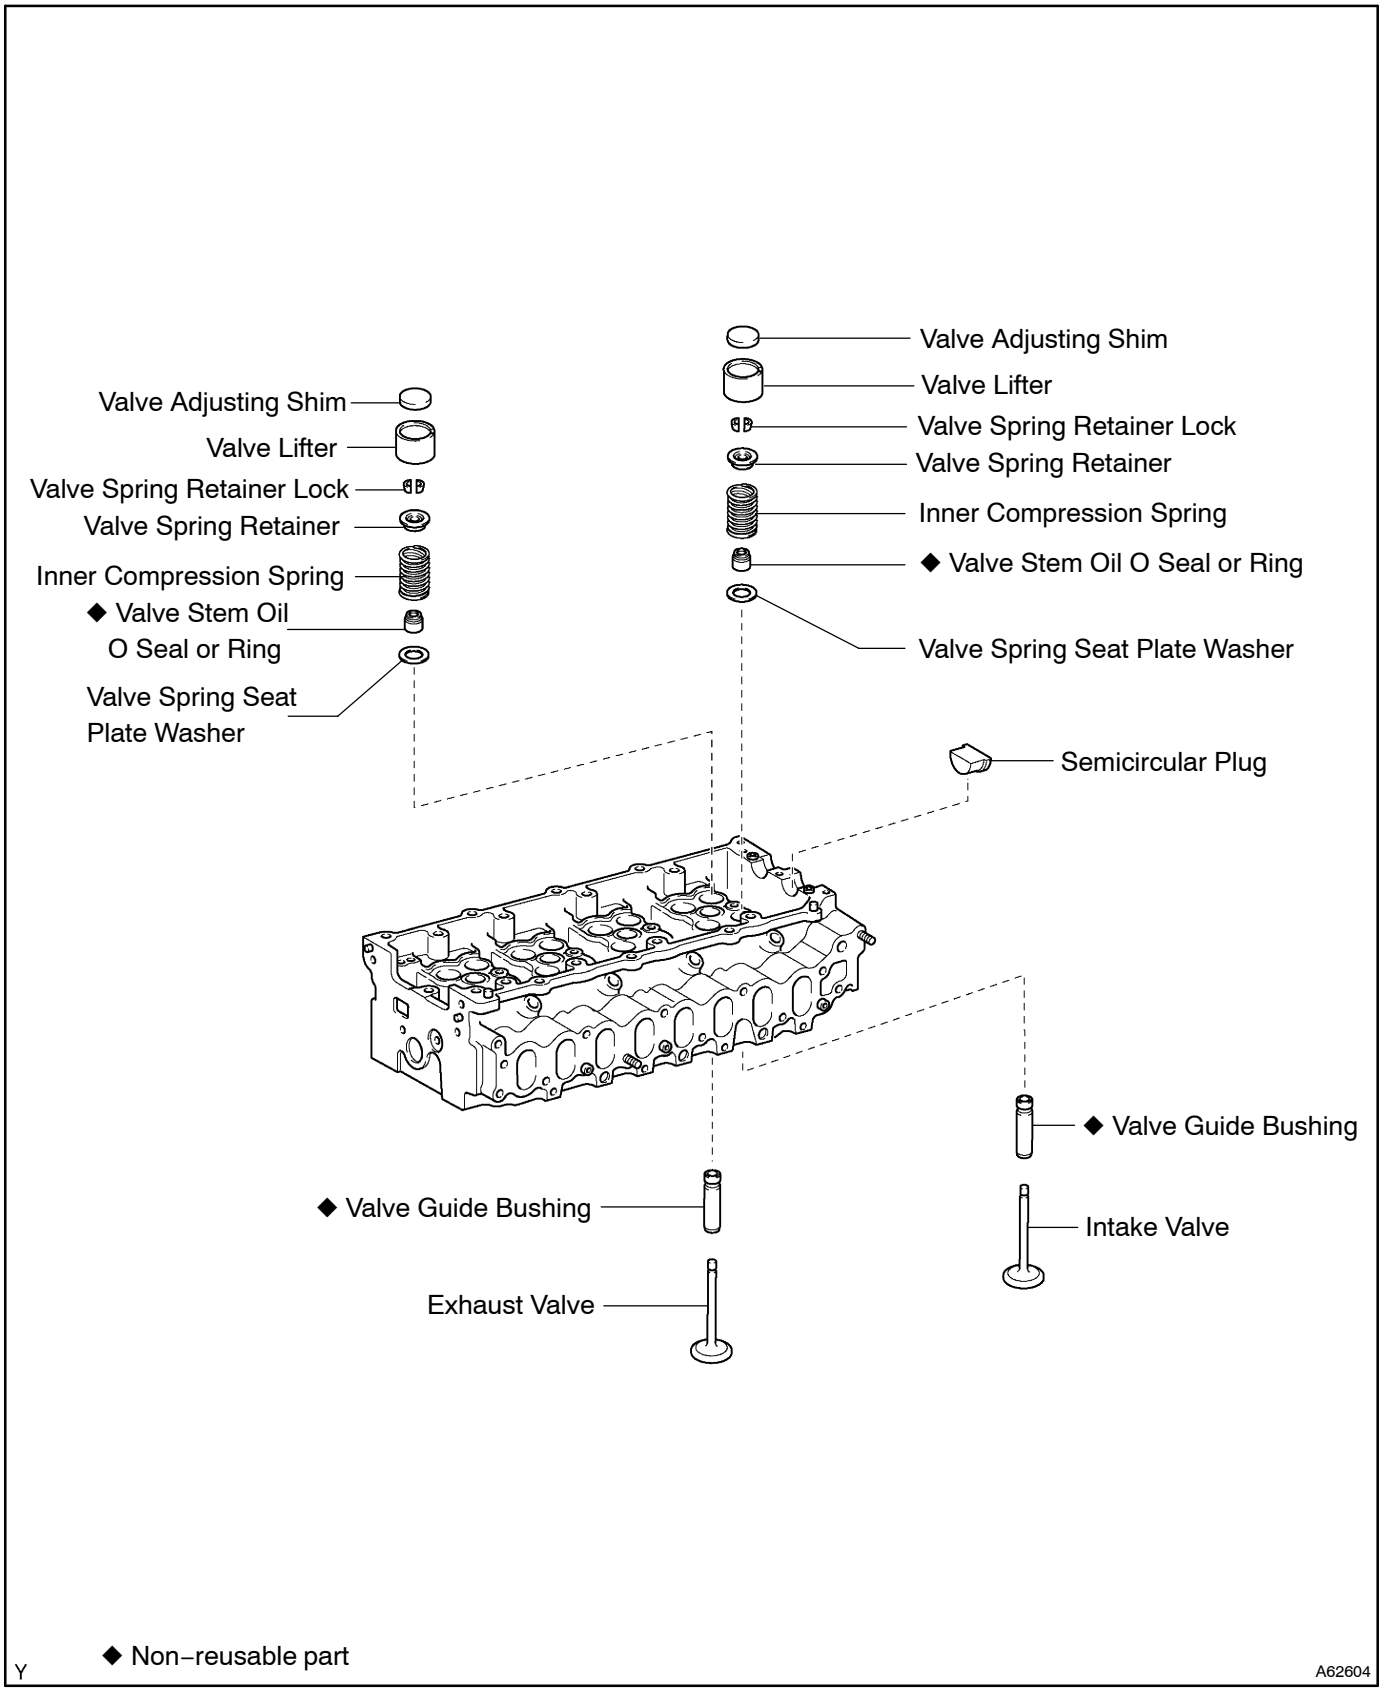
55. INSTALL CYLINDER HEAD COVER SUB–ASSY

(a) Remove any old packing (FIPG) material.

(b) Apply seal packing to the cylinder head.

Seal packing: Part No. 08826–00080 or equivalent

(c) Install the gasket to the head cover.



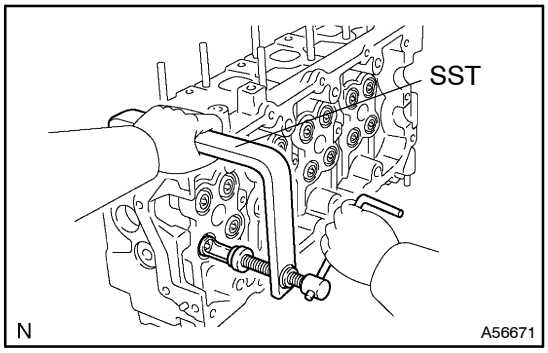
(d) Install the cylinder head cover with 10 bolts.

Torque: 13 N·m (135 kgf·cm, 9.7 ft·lbf)

CYLINDER HEAD ASSY (1CD–FTV)(From September, 2003)

141NR–01

COMPONENTS



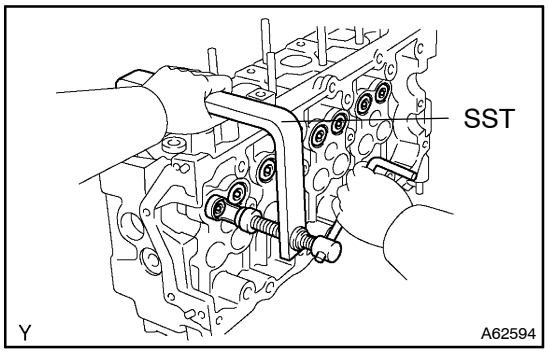
141NS–01

OVERHAUL

1. REMOVE VALVE LIFTER

HINT:

Arrange the valve lifters in the correct order.

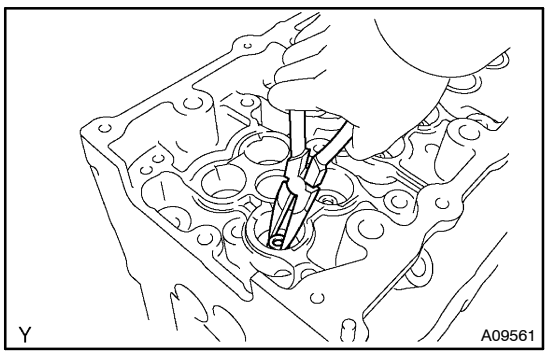


2. REMOVE INTAKE VALVE

(a) Using SST, compress the valve spring and remove the 2 keepers.

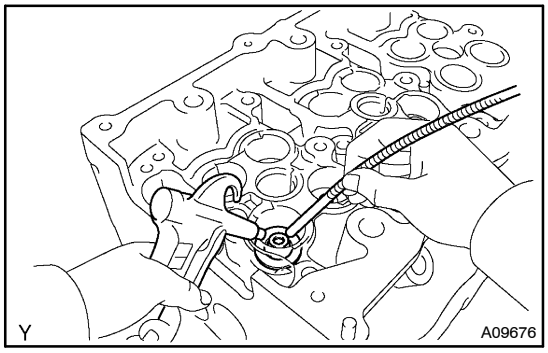
SST 09202–70020 (09202–00010)

(b) Remove the spring retainer, valve spring and valve.



3. REMOVE EXHAUST VALVE

(a) Using SST, compress the valve spring and remove the 2 keepers.

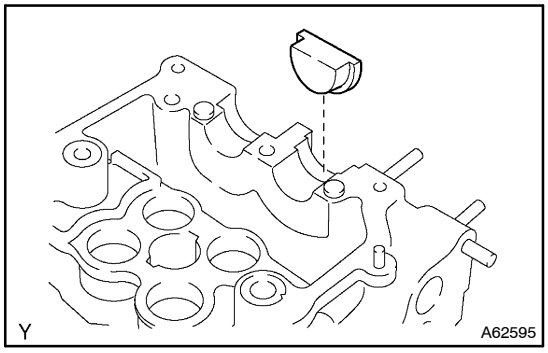


SST 09202–70020 (09202–00010)

(b) Remove the spring retainer, valve spring and valve.

4. REMOVE VALVE STEM OIL O SEAL OR RING

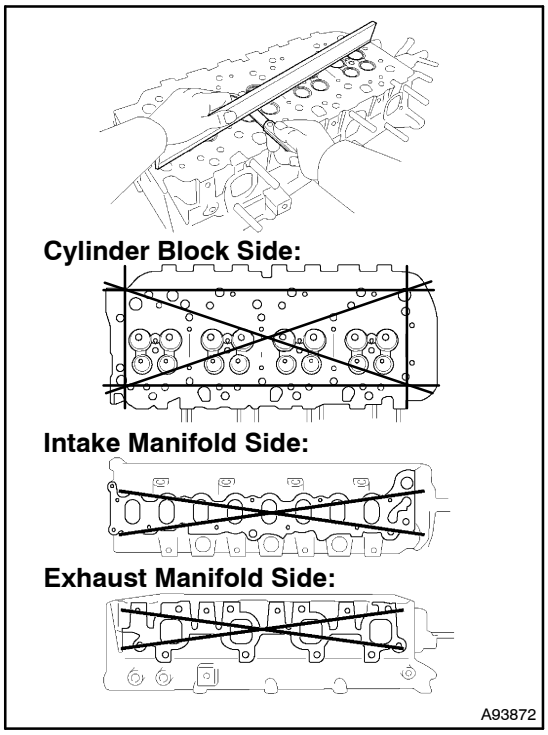
(a) Using needle–nose pliers, remove the oil seal.



5. REMOVE VALVE SPRING SEAT PLATE WASHER

(a) Using compressed air and a magnetic finger, remove the spring seat by blowing air.

HINT:

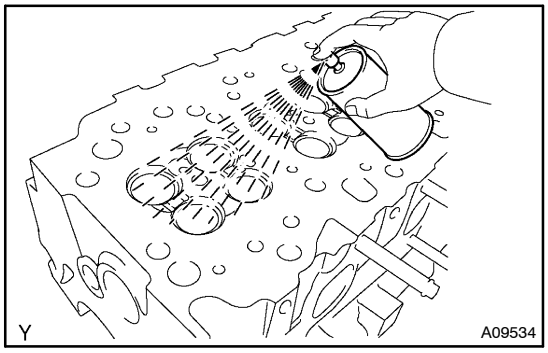


Arrange the valves, valve springs, spring seats and spring retainers in the correct order.

6. REMOVE SEMICIRCULAR PLUG

7. REMOVE W/HEAD TAPER SCREW PLUG NO.1

(a) Using a hexagon wrench (6 mm), remove the 3 plugs.

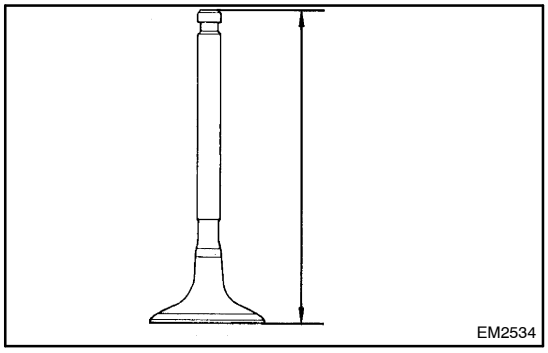


8. INSPECT CYLINDER HEAD FOR FLATNESS

(a) Using a precision straight edge and feeler gauge, measure the warpage on the surfaces which contact the cylinder block and manifolds.

Maximum warpage:

Cylinder block side	0.08mm (0.0031in.)
Intake manifold side	0.20mm (0.0079in.)
Exhaust manifold side	0.20mm (0.0079in.)

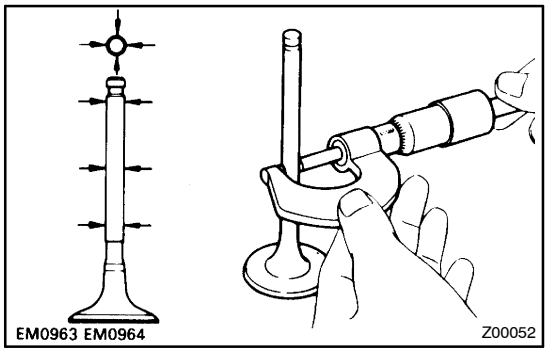


If the warpage is greater than maximum, replace the cylinder head.

9. INSPECT CYLINDER HEAD FOR CRACKS

(a) Using dye penetrate, check the intake ports, exhaust ports and cylinder block contact surface for cracks.

If cracked, replace the cylinder head.

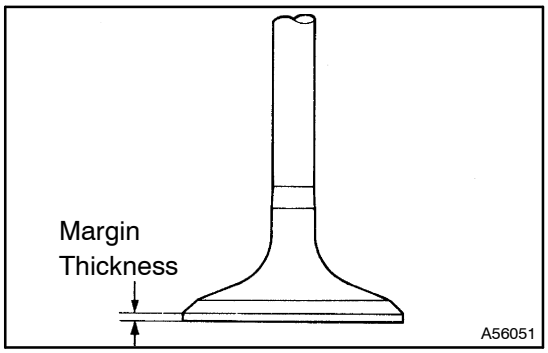


10. INSPECT INTAKE VALVE

(a) Using vernier calipers, measure the valve overall length.

Standard overall length: 102.53 mm (4.0366 in.)

Minimum overall length: 102.10 mm (4.0197 in.)

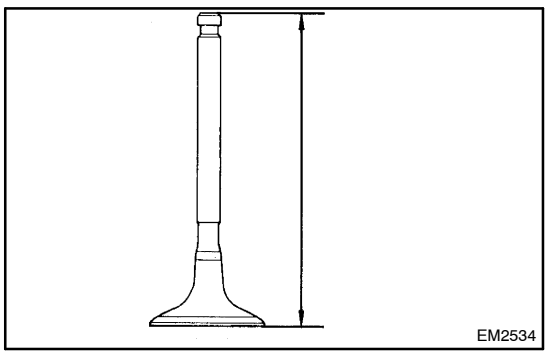


If the overall length is less than minimum, replace the valve.

(b) Using a micrometer, measure the diameter of the valve stem.

Valve stem diameter:

5.970 to 5.985 mm (0.2350 to 0.2356 in.)

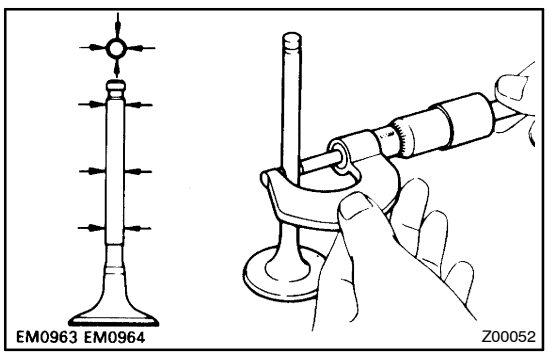


(c) Using vernier calipers, measure the valve head margin thickness.

Standard margin thickness: 0.9 mm (0.035 in.)

Minimum margin thickness: 0.6 mm (0.0236 in.)

If the margin thickness is less than minimum, replace the valve.

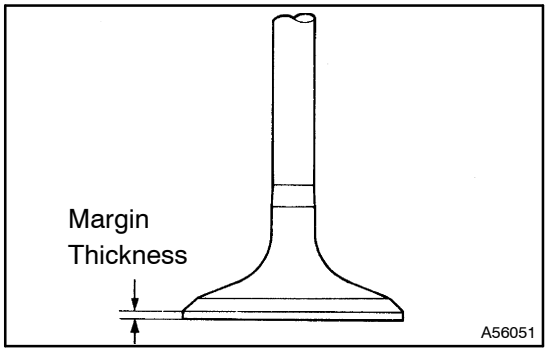


11. INSPECT EXHAUST VALVE

(a) Using vernier calipers, measure the valve overall length.

Standard overall length: 101.97 mm (4.0146 in.)

Minimum overall length: 101.55 mm (3.9980 in.)

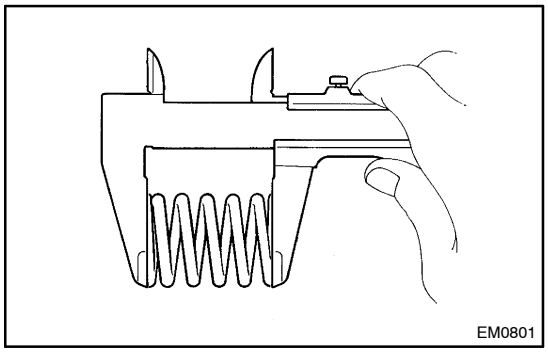


If the overall length is less than minimum, replace the valve.

(b) Using a micrometer, measure the diameter of the valve stem.

Valve stem diameter:

5.960 to 5.975 mm (0.2346 to 0.2352 in.)

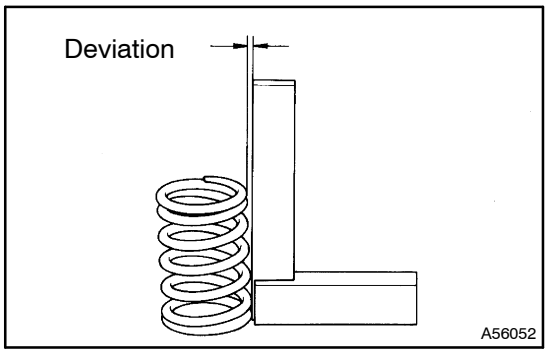


(c) Using vernier calipers, measure the valve head margin thickness.

Standard margin thickness: 0.9 mm (0.035 in.)

Minimum margin thickness: 0.6 mm (0.024 in.)

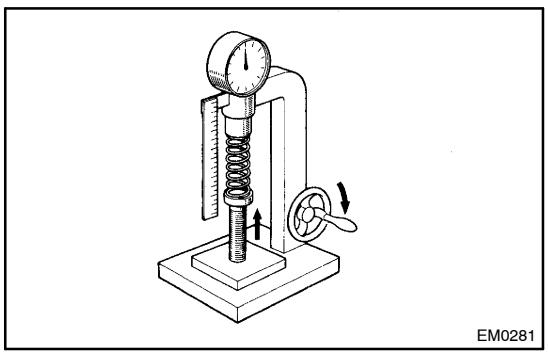
If the margin thickness is less than minimum, replace the valve.



12. INSPECT INNER COMPRESSION SPRING

(a) Using vernier calipers, measure the free length of the valve spring.

Free length: 40.45 mm (1.5925 in.)

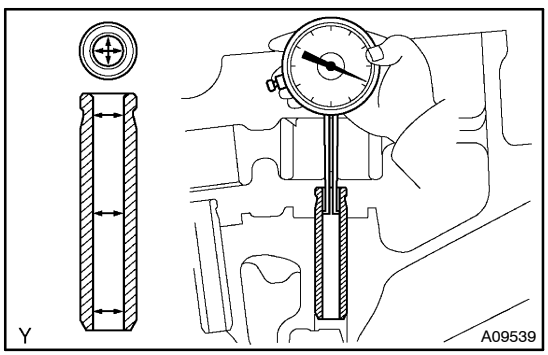


If the free length is not as specified, replace the spring.

(b) Using a steel square, measure the deviation of the valve spring.

Maximum deviation: 2.0 mm (0.079 in.)

If the deviation is greater than maximum, replace the spring.



(c) Using a spring tester, measure the tension of the valve spring when the spring is the specified installed length.

Installed tension:

177 to 195 N (18.0 to 19.9 kgf, 39.7 to 44.1 lbf)

at 31.1 mm (1.224 in.)

If the installed tension is not as specified, replace the spring.

13. INSPECT VALVE GUIDE BUSHING OIL CLEARANCE

(a) Using a caliper gauge, measure the inside diameter of the guide bushing.

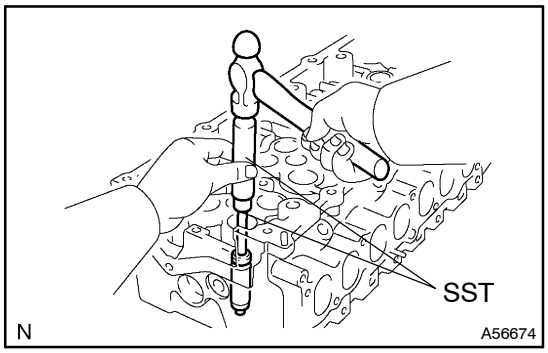
Bushing inside diameter:

6.010 to 6.030 mm (0.2366 to 0.2374 in.)

(b) Subtract the valve stem diameter measurement from the guide bushing inside diameter measurement.

Standard oil clearance:

Intake	0.025 to 0.060 mm (0.0010 to 0.0024 in.)
Exhaust	0.035 to 0.070 mm (0.0014 to 0.0028 in.)

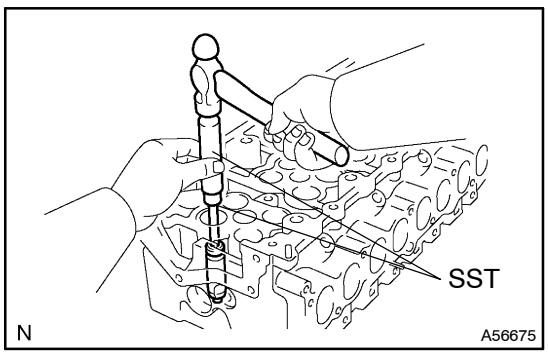


Maximum oil clearance:

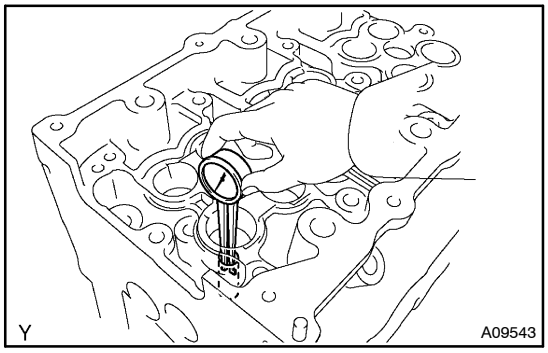
Intake	0.08 mm (0.0031 in.)
Exhaust	0.10 mm (0.0039 in.)

If the clearance is greater than maximum, replace the valve and valve guide bush.

14. REMOVE INTAKE VALVE GUIDE BUSH



(a) Heat the cylinder head up to 80 to 100°C (176 to 212°F).



(b) Using SST and a hammer, tap out the guide bushing.
SST 09201–10000 (09201–01060), 09950–70010 (09951–07100)

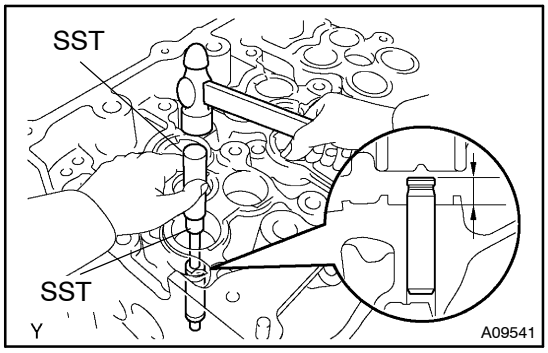
15. REMOVE EXHAUST VALVE GUIDE BUSH

(a) Heat the cylinder head up to 80 to 100°C (176 to 212°F).

(b) Using SST and a hammer, tap out the guide bushing.
SST 09201–10000 (09201–01060), 09950–70010 (09951–07100)

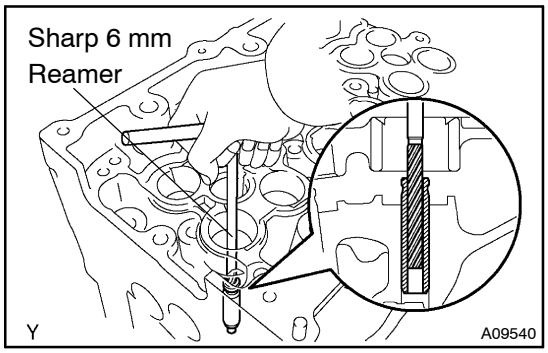
16. INSTALL INTAKE VALVE GUIDE BUSH

(a) Using a caliper gauge, measure the bushing bore diameter of the cylinder head.



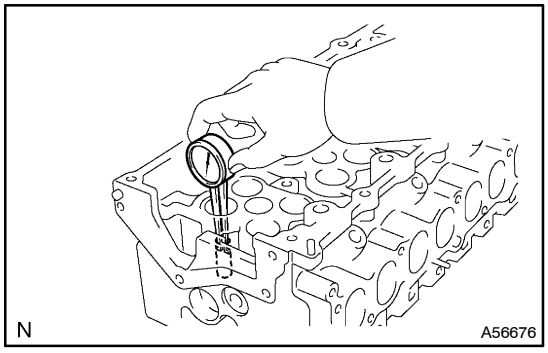
Diameter: 10.985 to 11.006 mm (0.4325 to 0.4333 in.)

If the bushing bore diameter of the cylinder head is greater than 11.006 mm (0.4333 in.), machine the bushing bore to the dimension of 11.035 to 11.056 mm (0.4344 to 0.4353 in.).



HINT:

Bushing Size	Bushing Bore Diameter mm (in.)
Use Standard	10.985 to 11.006 (0.4325 to 0.4333)
Use Oversize 0.05	11.035 to 11.056 (0.4344 to 0.4353)

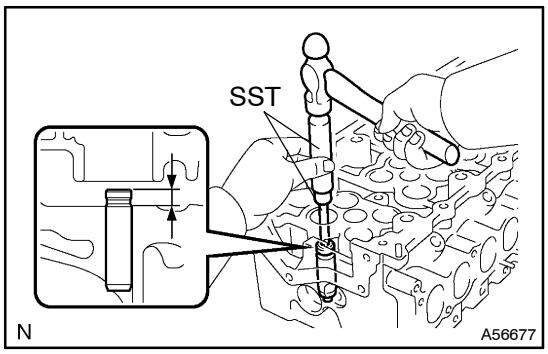


(b) Heat the cylinder head up to 80 to 100°C (176 to 212°F).

(c) Using SST and a hammer, tap in a new guide bushing until its protrusion heihgt is as specified.
SST 09201–10000 (09201–01060), 09950–70010 (09951–07100)
Protrusion height:
10.05 to 10.45 mm (0.3957 to 0.4114 in.)

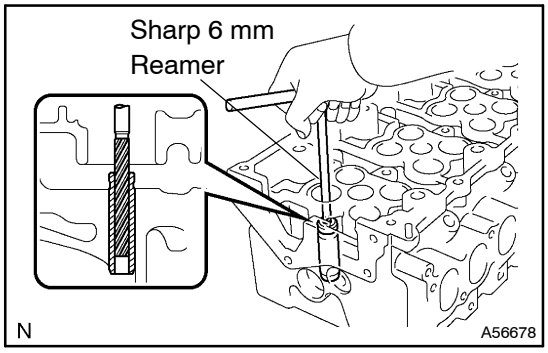
(d) Using a sharp 6 mm reamer, ream the guide bushing to obtain the standard specified clearance between the guide bushing and valve stem.
Standard oil clearance:
0.025 to 0.060 mm (0.0001 to 0.0024 in.)

17. INSTALL EXHAUST VALVE GUIDE BUSH



(a) Using a caliper gauge, measure the bushing bore diameter of the cylinder head.
Diameter: 10.985 to 11.006 mm (0.4325 to 0.4333 in.)

If the bushing bore diameter of the cylinder head is greater than 11.006 mm (0.4333 in.), machine the bushing bore to the dimension of 11.035 to 11.056 mm (0.4344 to 0.4353 in.).



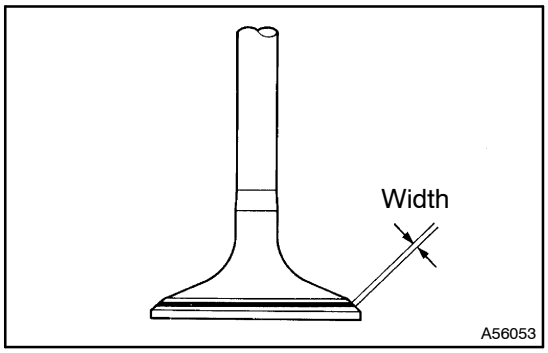
HINT:

Bushing Size	Bushing Bore Diameter mm (in.)
Use Standard	10.985 to 11.006 (0.4325 to 0.4333)
Use Oversize 0.05	11.035 to 11.056 (0.4344 to 0.4353)

(b) Heat the cylinder head up to 80 to 100°C (176 to 212°F).

(c) Using SST and a hammer, tap in a new guide bushing untol its protrusion height is as specified.
SST 09201–10000 (09201–01060), 09950–70010 (09951–07100)
Protrusion height:
9.65 to 10.05 mm (0.3799 to 0.3957 in.)

(d) Using a sharp 6 mm reamer, ream the guide bushing to obtain the standard specified clearance between the guide bushing and valve stem.



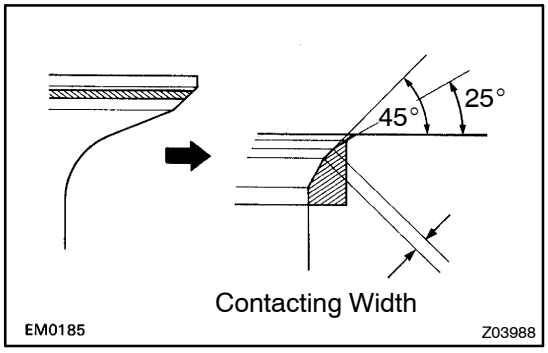
Standard oil clearance:
0.035 to 0.070 mm (0.0014 to 0.0028 in.)

18. INSPECT VALVE SEATS

(a) Apply a light coat of prussian blue (or white lead) to the valve face.

(b) Lightly press the valve against the seat.

NOTICE:
Do not rotate the valve.

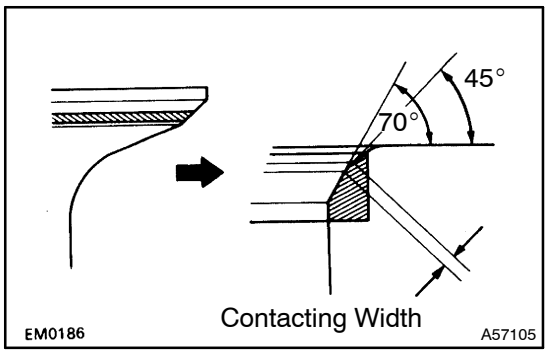


(c) Check the valve face and seat according to the following procedures.

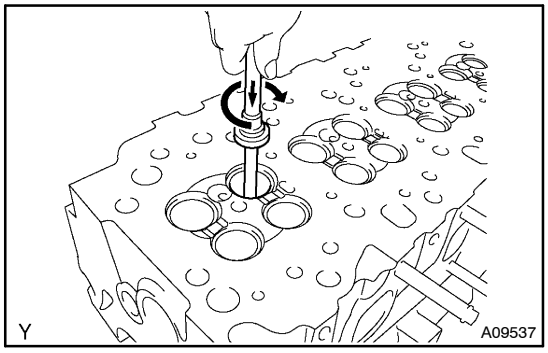
(1) If the blue appears 360° around the face, the valve is concentric. If not, replace the valve.

(2) If the blue appears 360° around the valve seat, the guide and face are concentric. If not, resurface the seat.

(3) Check that the seat contact is in the middle of the valve face with the following width.

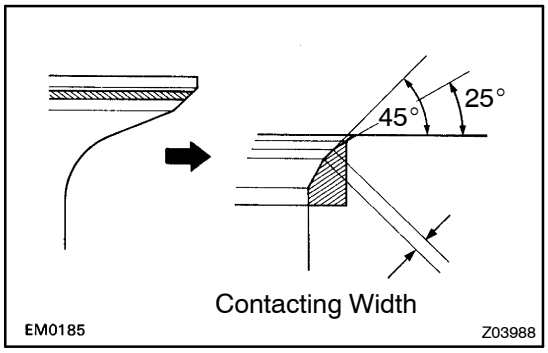


Intake	1.2 to 1.6 mm (0.047 to 0.063 in.)
Exhaust	1.6 to 2.0 mm (0.063 to 0.079 in.)



19. REPAIR INTAKE VALVE SEATS

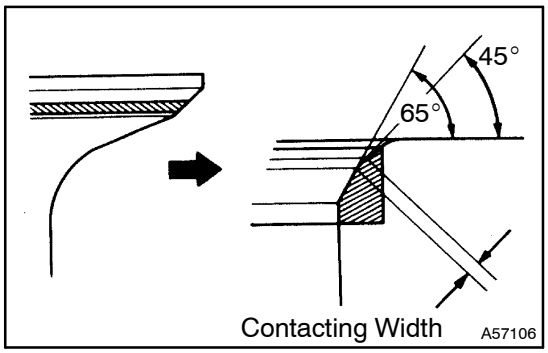
NOTICE:
Releasing the seat cutter pressure gradually helps to make smooth valve seat faces.



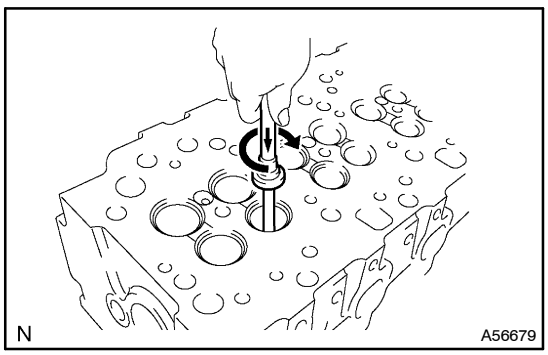
(a) If the seating is too high on the valve face, use 25° and 45° cutters to correct the seat.

(b) If the seating is too low on the valve face, use 70° and 45° cutters to correct the seat.

(c) Lap the valve and valve seat by hand using an abrasive compound.
(d) Check the valve seating position.

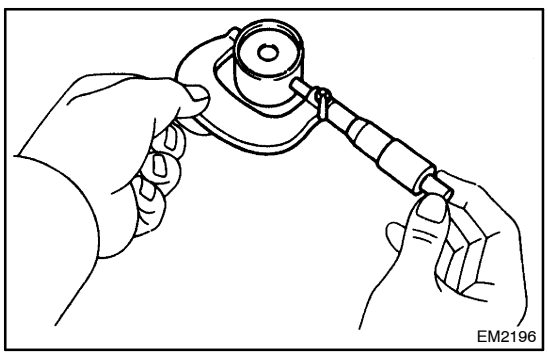


20. REPAIR EXHAUST VALVE SEATS



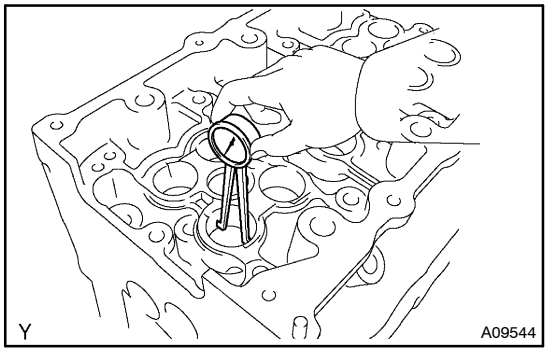
NOTICE:

Releasing the seat cutter pressure gradually helps to make smooth valve seat faces.



(a) If the seating is too high on the valve face, use 25° and 45° cutters to correct the seat.

(b) If the seating is too low on the valve face, use 65° and 45° cutters to correct the seat.



(c) Lap the valve and valve seat by hand using an abrasive compound.
(d) Check the valve seating position.

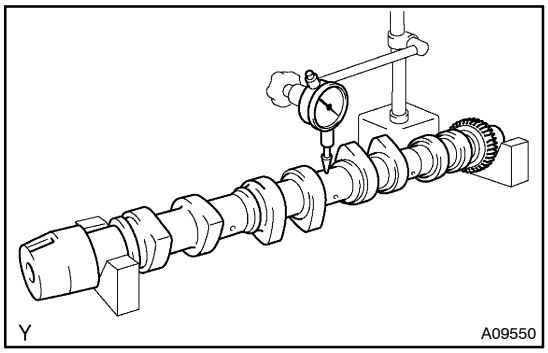
21. INSPECT VALVE LIFTER

(a) Using a micrometer, measure the lifter diameter.
Lifter diameter:
27.975 to 27.985 mm (1.1014 to 1.1018 in.)

22. INSPECT VALVE LIFTER OIL CLEARANCE

(a) Using a caliper gauge, measure the lifter bore diameter of the cylinder head.

Lifter diameter:



28.010 to 28.031 mm (1.1028 to 1.1036 in.)

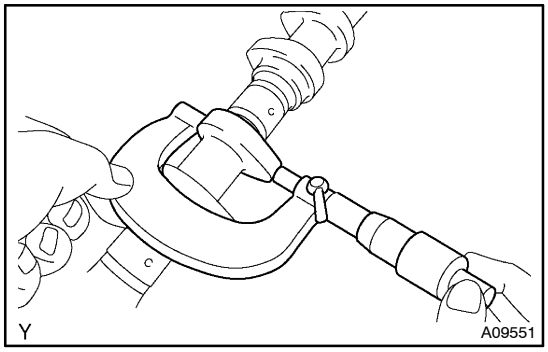
(b) Subtract the lifter diameter measurement from the lifter bore diameter measurement.

Standard oil clearance:

0.025 to 0.080 mm (0.0010 to 0.0031 in.)

- If the oil clearance is greater than maximum, replace the valve lifter.
- If necessary, replace the cylinder head.

23. INSPECT CAMSHAFT



(a) Inspect the circle runout.

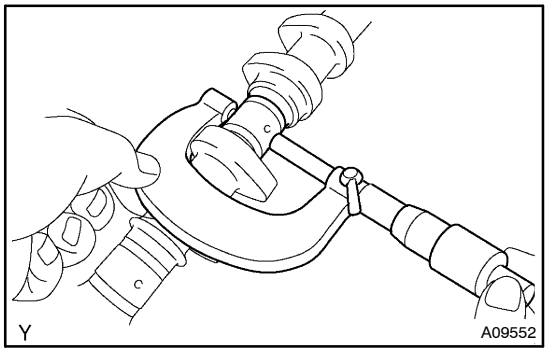
(1) Place the camshaft on V–blocks.

(2) Using a dial indicator, measure the circle runout at the center journal.

Maximum circle runout: 0.06 mm (0.0024 in.)

If the circle runout is greater than maximum, replace the camshaft.

(b) Using a micrometer, measure the cam lobe height.



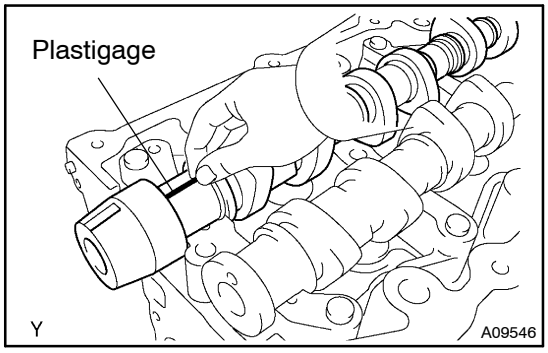
Standard cam lobe height:

Intake	46.57 to 46.67 mm (1.8335 to 1.8374 in.)
Exhaust	47.52 to 47.62 mm (1.8709 to 1.8748 in.)

Minimum cam lobe height:

Intake	46.10 mm (1.8150 in.)
Exhaust	47.05 mm (1.8524 in.)

If the cam lobe height is less than minimum, replace the camshaft.



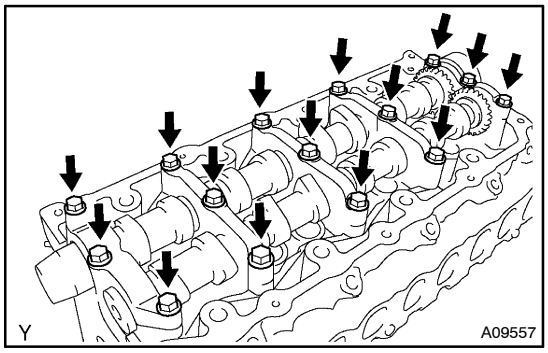
(c) Using a micrometer, measure the journal diameter.

Journal diameter:

26.969 to 26.985 mm (1.0618 to 1.0624 in.)

If the journal diameter is not as specified, check the oil clearance.

24. INSPECT CAMSHAFT OIL CLEARANCE



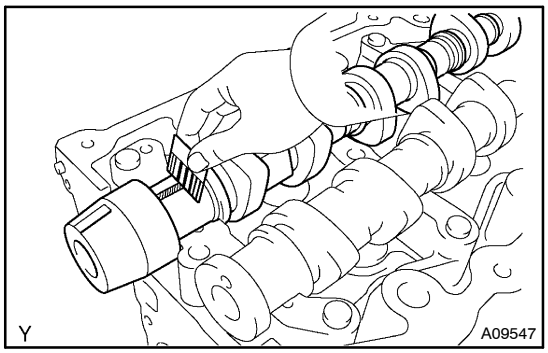
(a) Clean the bearing caps and camshaft carrier.

(b) Check the bearings for flaking or score.

If the bearings are damaged, replace the bearing caps, camshaft carrier and cylinder head as a set.

(c) Place the camshaft carrier and camshafts on the cylinder head.

(d) Lay a strip of Plastigage across each of the camshaft journals.



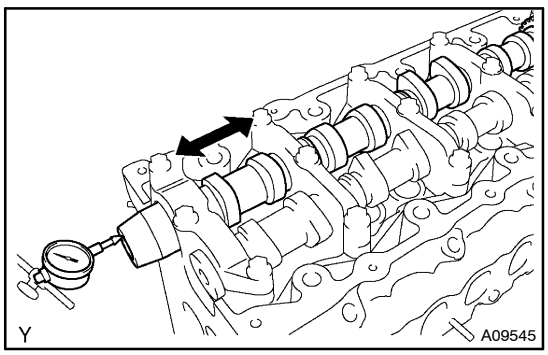
(e) Install the bearing caps.

Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

NOTICE:

Do not turn the camshaft.

(f) Remove the bearing caps.



(g) Measure the Plastigage at its widest point.

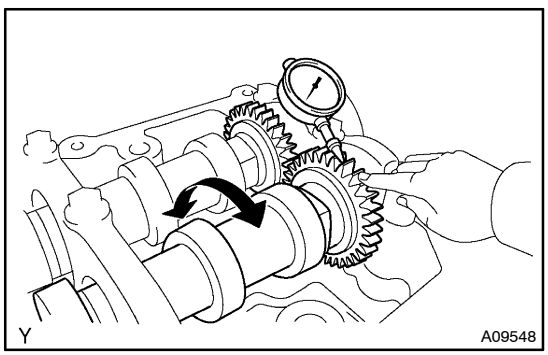
Standard oil clearance:

0.025 to 0.080 mm (0.0010 to 0.0031 in.)

If the oil clearance is greater than maximum, replace the camshaft. If necessary, replace the bearing caps, camshaft carrier and cylinder head as a set.

(h) Completely remove the Plastigage.

25. INSPECT CAMSHAFT THRUST CLEARANCE



(a) Install the camshaft.

(b) Using a dial indicator, measure the thrust clearance while moving the camshaft back and forth.

Standard thrust clearance:

0.035 to 0.110 mm (0.0014 to 0.0043 in.)

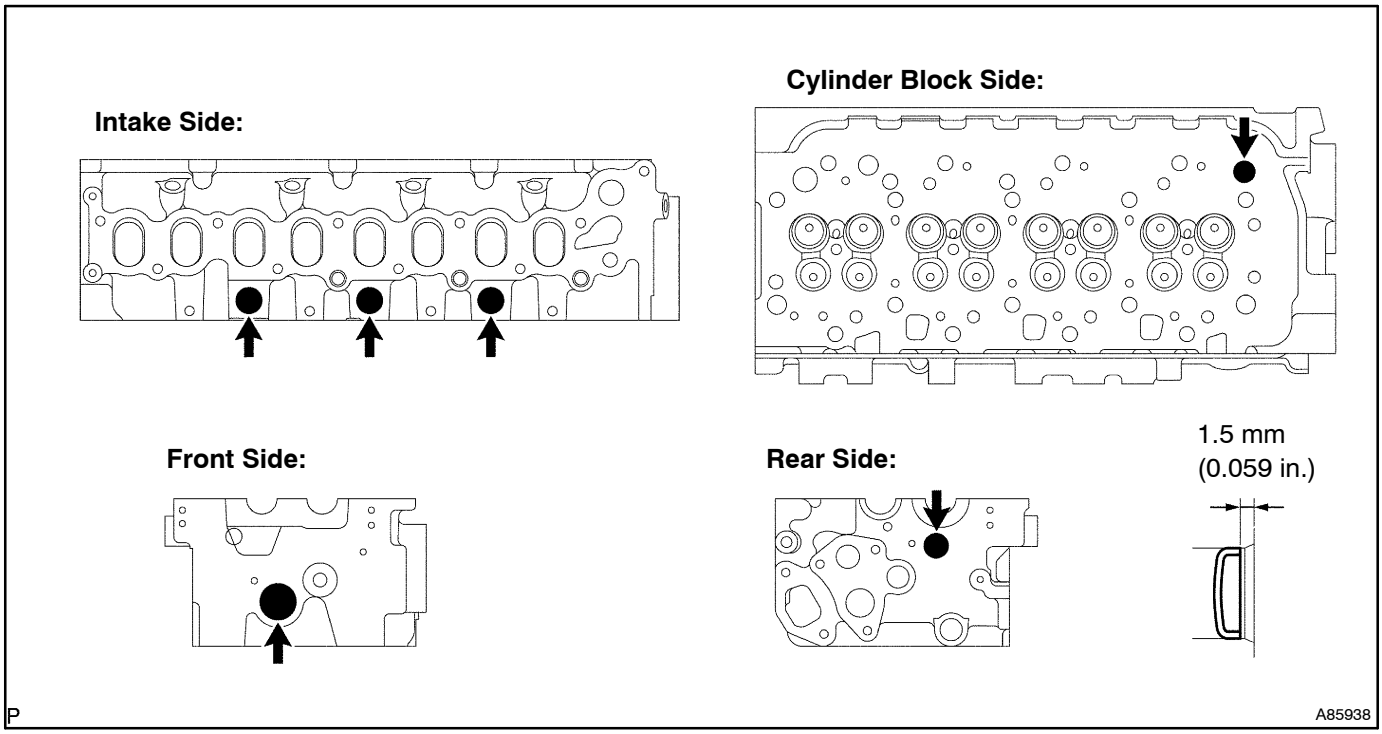
If the thrust clearance is not as specified, replace the camshaft. If necessary, replace the bearing caps, camshaft carrier and cylinder head as a set.

26. INSPECT CAMSHAFT GEAR BACKLASH

(a) Install the camshafts.

(b) Using a dial indicator, measure the backlash.

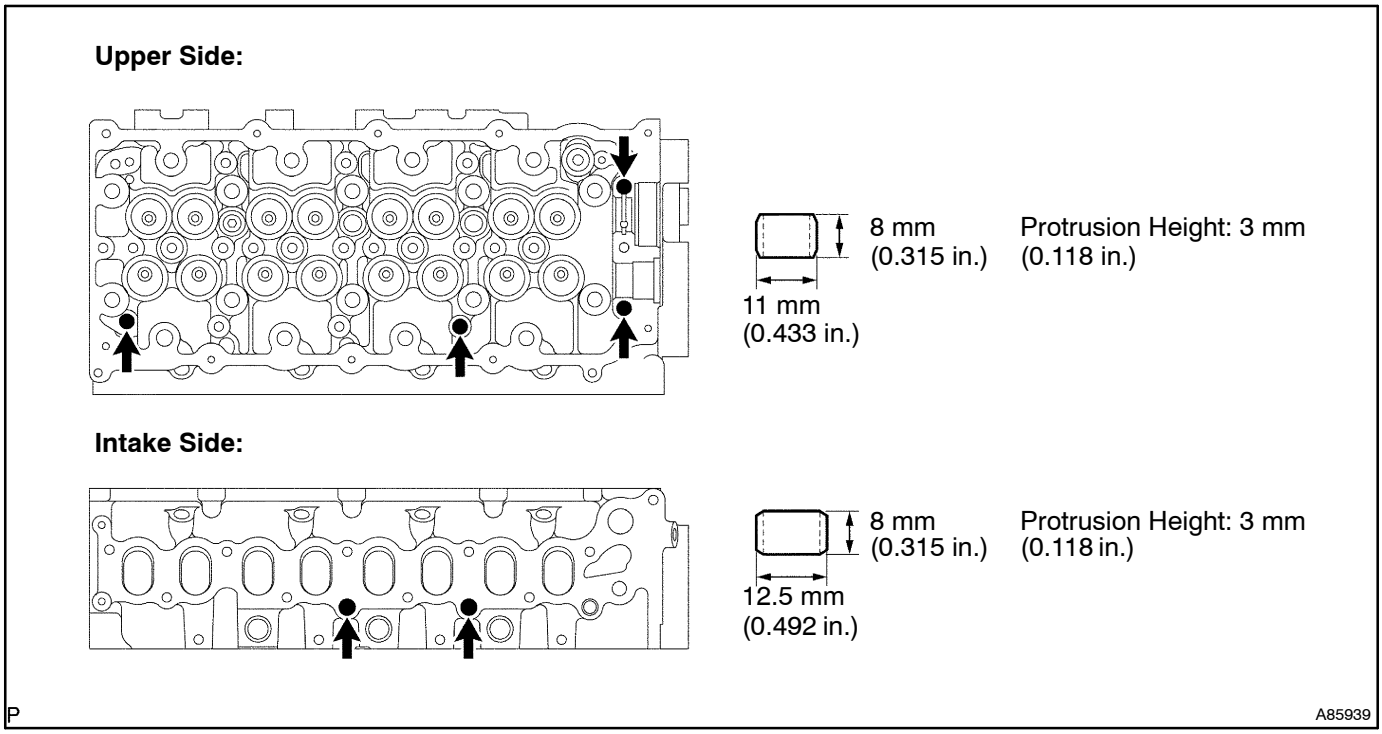
Standard backlash:



0.014 to 0.170 mm (0.0006 to 0.0067 in.)

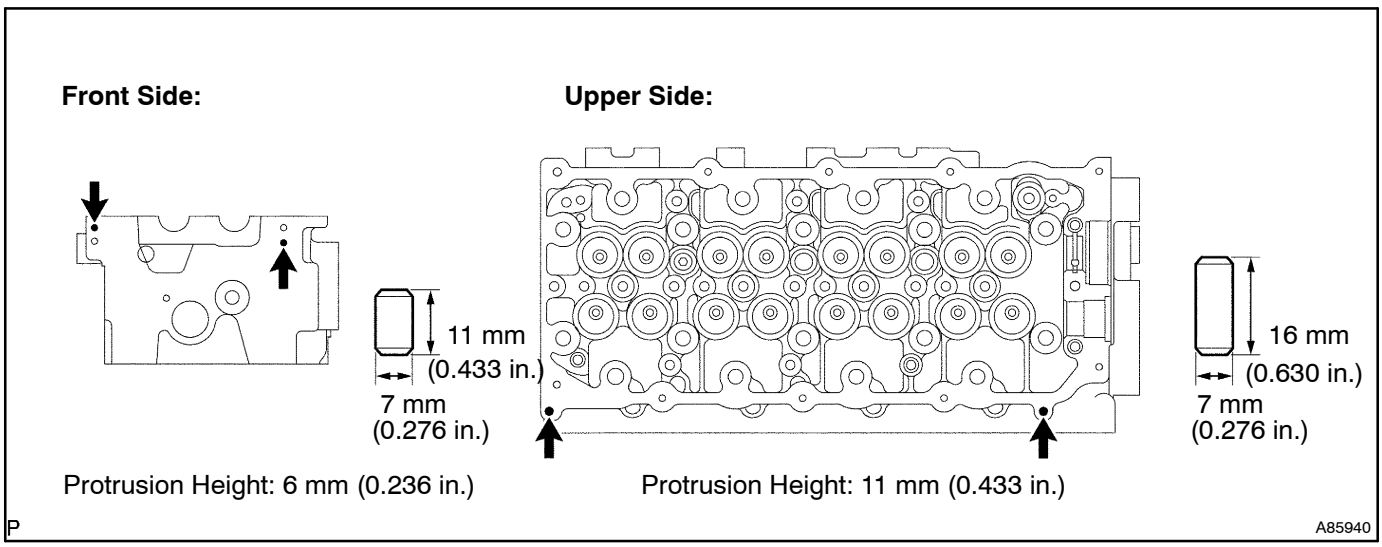
If the backlash is greater than maximum, replace the camshafts.

27. INSTALL TIGHT PLUG



(a) Apply adhesive around new tight plugs.
Adhesive: Part No.08833 – 00070, THREE BOND 1324 or equivalent

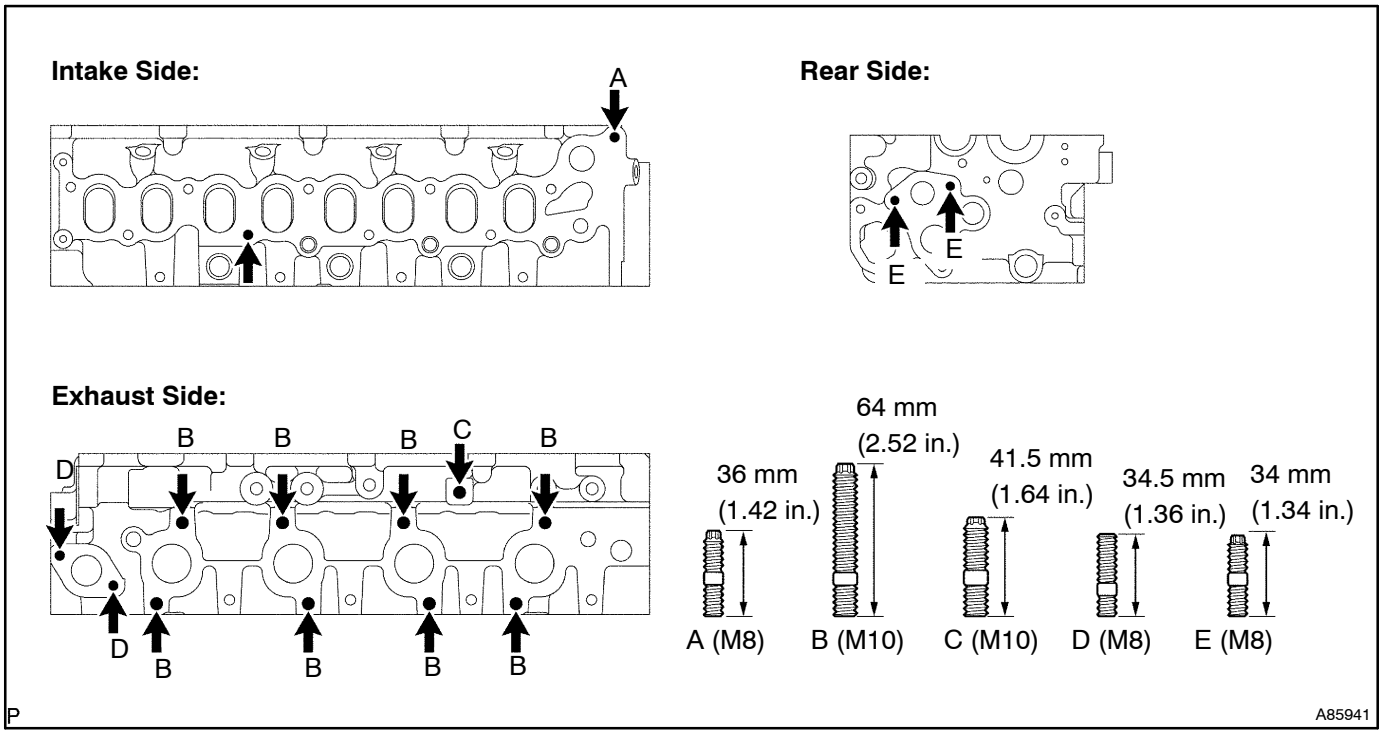
(b) Using SST, tap in the tight plugs as shown in the illustration.
SST 09950–60010 (09951–00210), 09950–70010 (09951–07100)



28. INSTALL RING PIN

(a) Using a plastic–faced hammer, tap in new ring pins until thier protrusion heights are as specified.

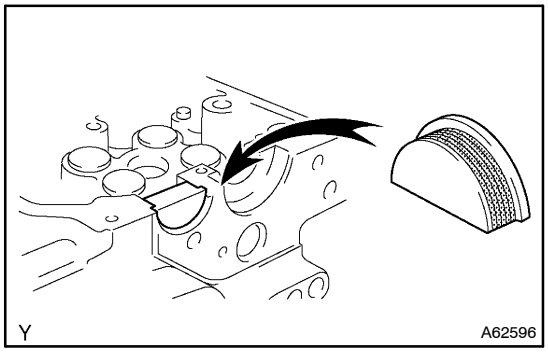
29. INSTALL STRAIGHT PIN



(a) Using a plastic–faced hammer, tap in new straight pins.

30. INSTALL STUD BOLT

(a) Install the stud bolts as shown in the illustration.

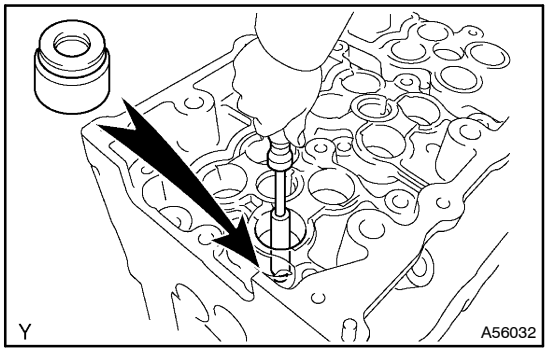


Torque:
8.8 N·m (90 kgf·cm, 78 in.·lbf) for bolt A
12 N·m (120 kgf·cm, 8.7 ft·lbf) for bolt B
28 N·m (286 kgf·cm, 21 ft·lbf) for bolt C
8.8 N·m (90 kgf·cm, 78 in.·lbf) for bolt D
8.8 N·m (90 kgf·cm, 78 in.·lbf) for bolt E

31. INSTALL W/HEAD TAPER SCREW PLUG NO.1

(a) Apply adhesive to the plug ends.
Adhesive: Part No. 08833 – 00070, THREE BOND 1324 or equivalent

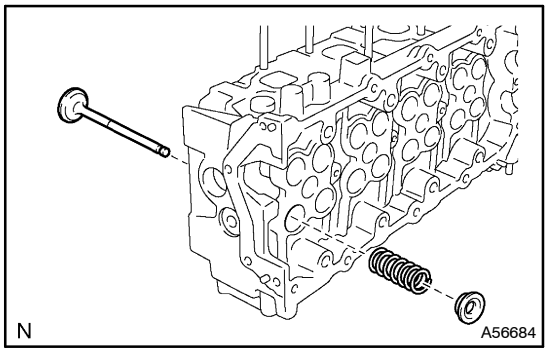
(b) Using a hexagon wrench (6 mm), install the 3 plugs.
Torque:25 N·m (255 kgf·cm, 18 ft·lbf)



32. INSTALL SEMICIRCULAR PLUG

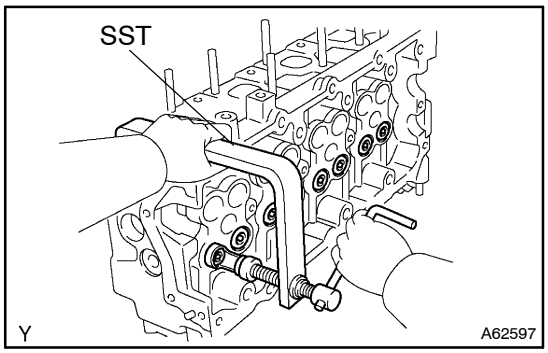
(a) Apply seal packing to the semicircular plug grooves.
Seal packing: Part No. 08826 – 00080 or equivalent

(b) Install the semicircular plug to the cylinder head.



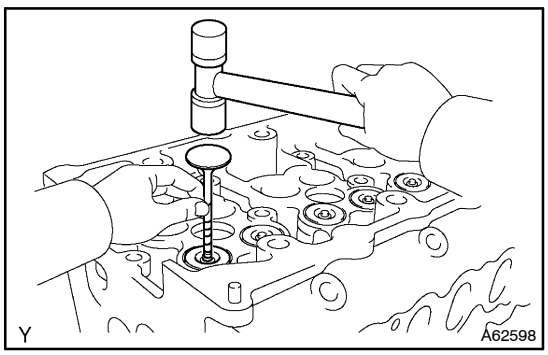
33. INSTALL VALVE SPRING SEAT PLATE WASHER

34. INSTALL VALVE STEM OIL O SEAL OR RING



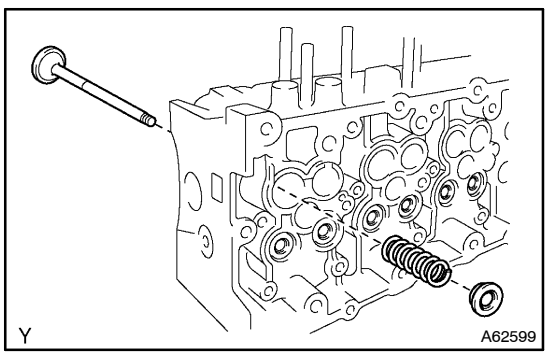
(a) Apply a light coat of engine oil to the valve stem.

(b) Install a new oil seal on the valve guide bushing.



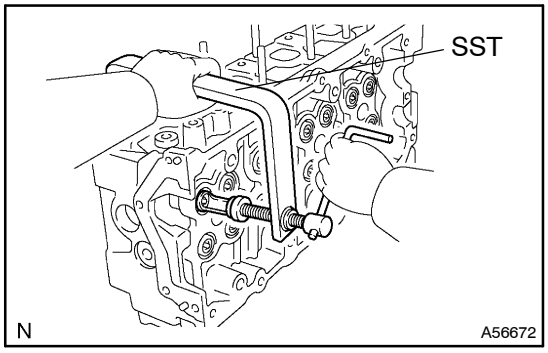
35. INSTALL INTAKE VALVE

(a) Install the valve, valve spring, and spring retainer.



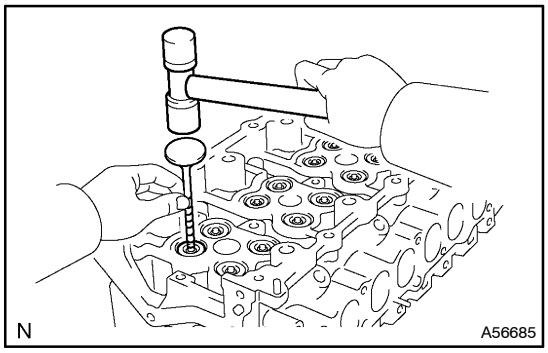
(b) Using SST, compress the valve spring and place the 2 keepers around the valve stem.
SST 09202–70020 (09202–00010)

(c) Using a plastic–faced hammer and the valve stem (not in use) with its tip wrapped in vinyl tape, lightly tap the valve stem tip to ensure proper fit.



NOTICE:

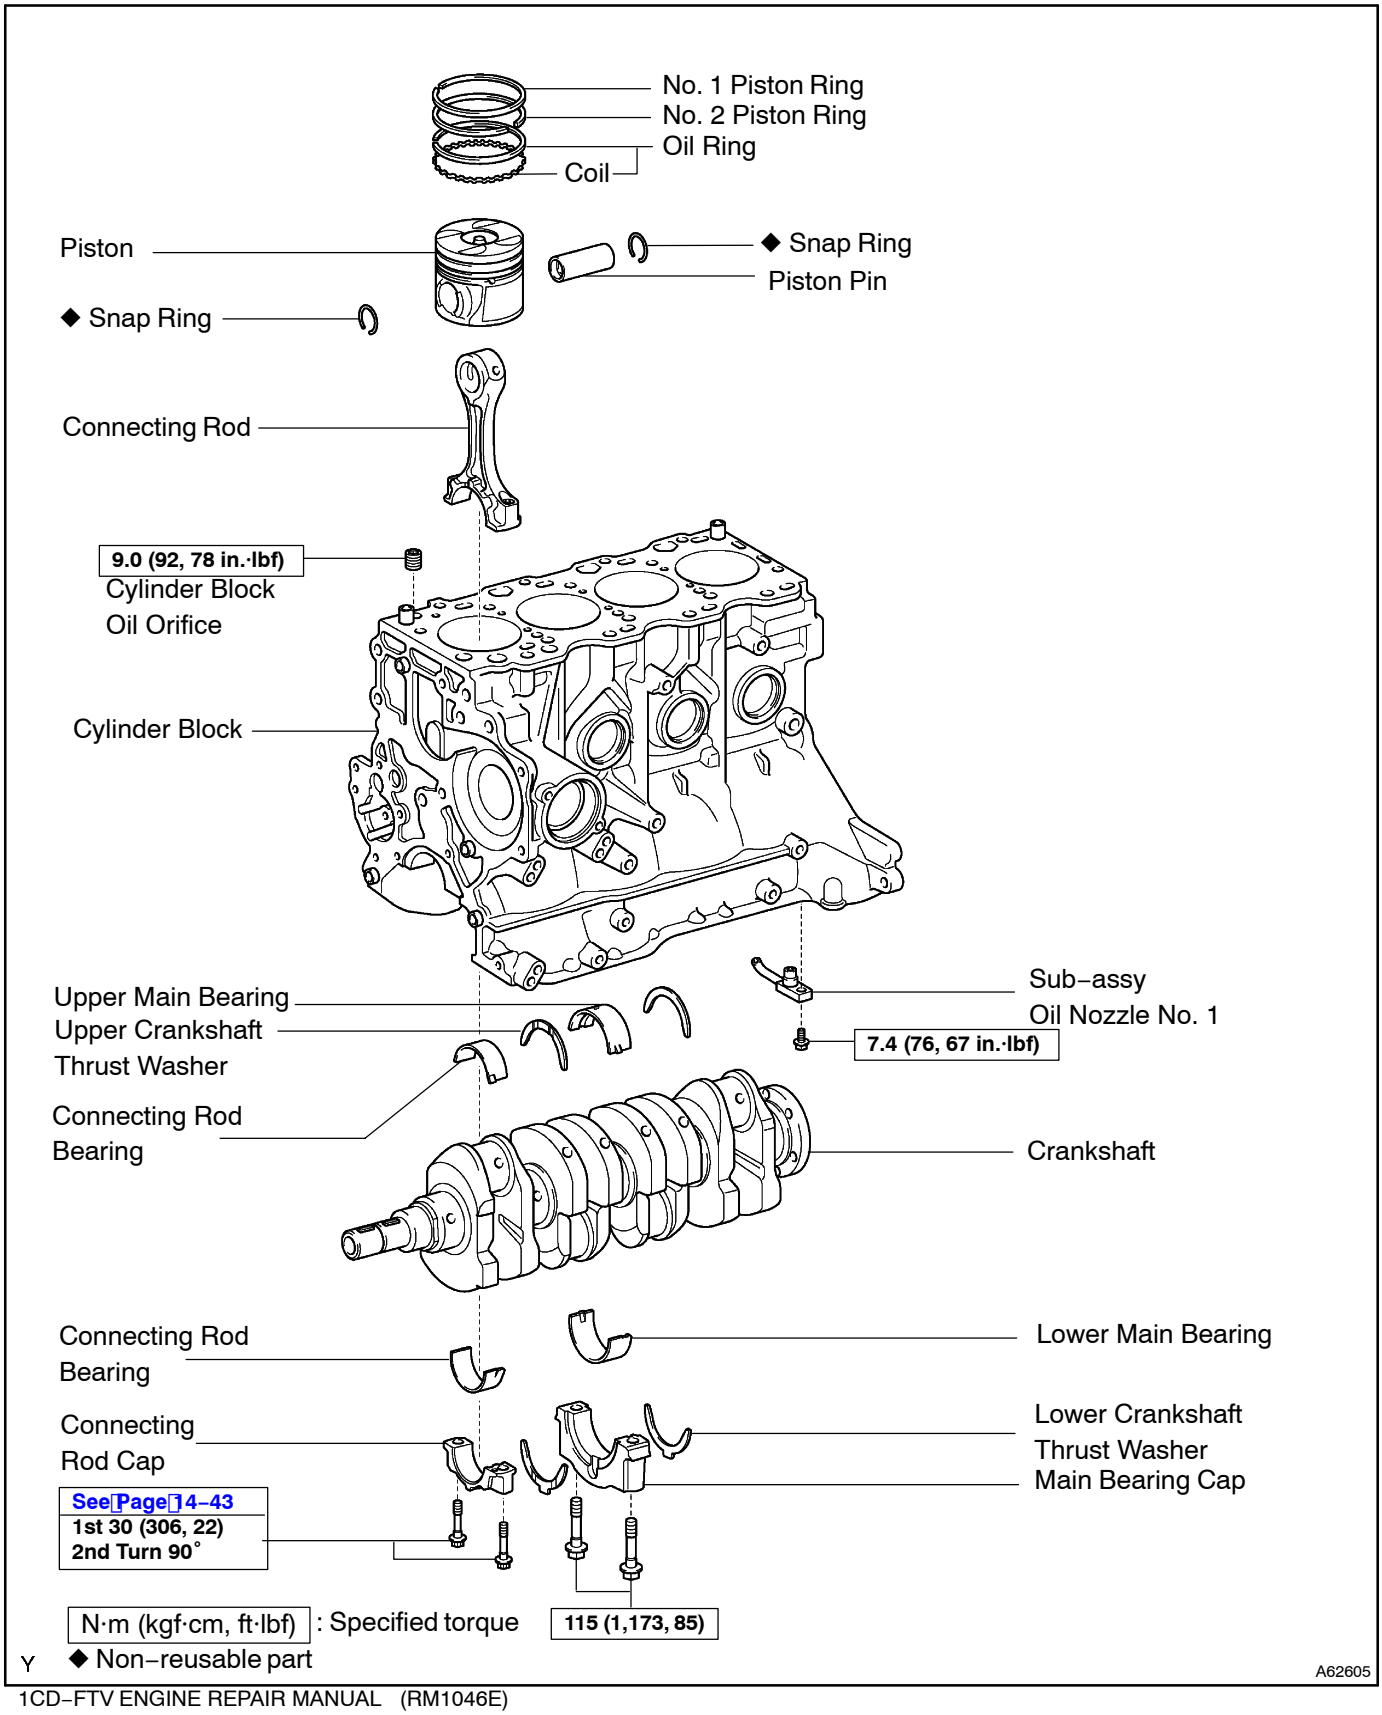
Be careful not to damage the valve stem tip.



36. INSTALL EXHAUST VALVE

(a) Install the valve, valve spring, and spring retainer.

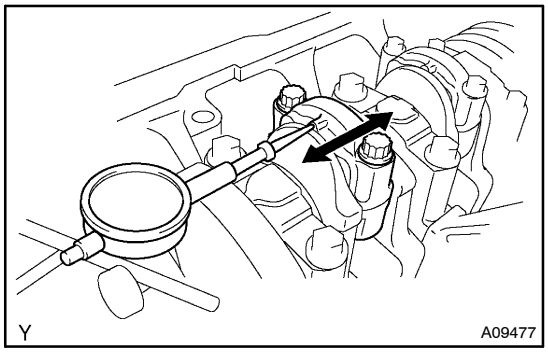
(b) Using SST, compress the valve spring and place the 2 keepers around the valve stem.
SST 09202–70020 (09202–00010)



(c) Using a plastic–faced hammer and the valve stem (not in use) with its tip wrapped in vinyl tape, lightly tap the valve stem tip to ensure proper fit.

NOTICE:
Be careful not to damage the valve stem tip.

CYLINDER BLOCK ASSY (1CD–FTV)(From September, 2003)

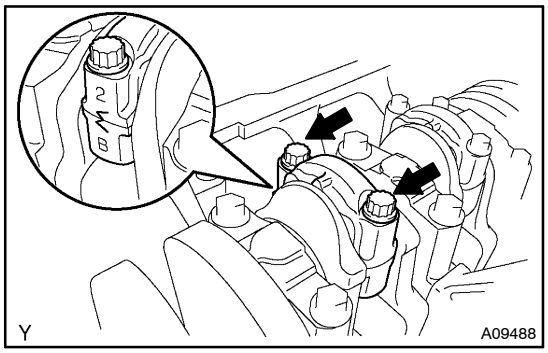


COMPONENTS

141NT–01

141NU–01

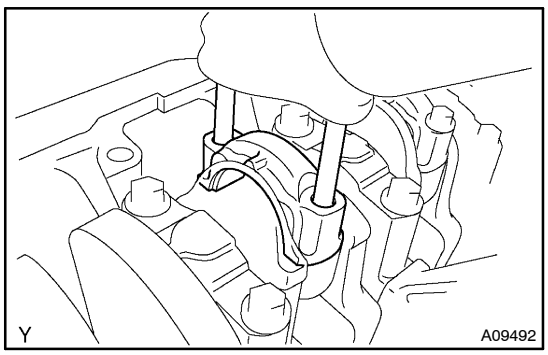
OVERHAUL



1. INSPECT CONNECTING ROD THRUST CLEARANCE

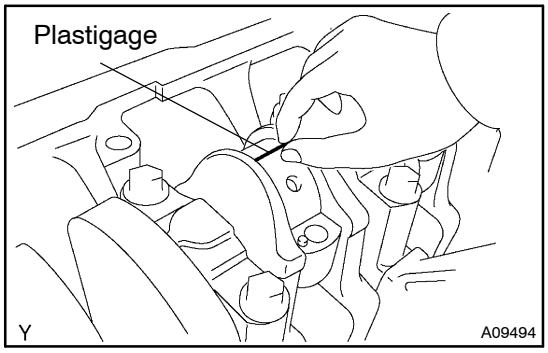
(a) Using a dial indicator, measure the thrust clearance while moving the connecting rod back and forth.

Standard thrust clearance:
0.08 to 0.40 mm (0.0031 to 0.0157 in.)



If the thrust clearance is greater than maximum, replace the connecting rod assembly(s). If necessary, replace the crankshaft.

2. INSPECT CONNECTING ROD OIL CLEARANCE

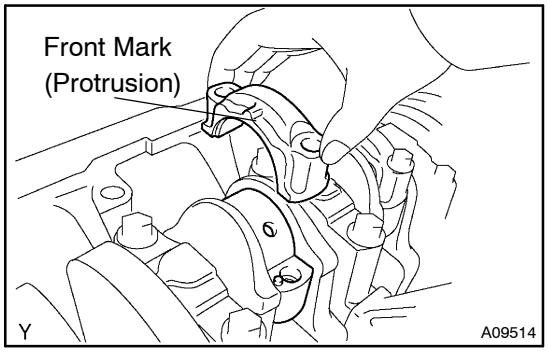


(a) Check the match marks on the connecting rod and cap to ensure correct reassembly.

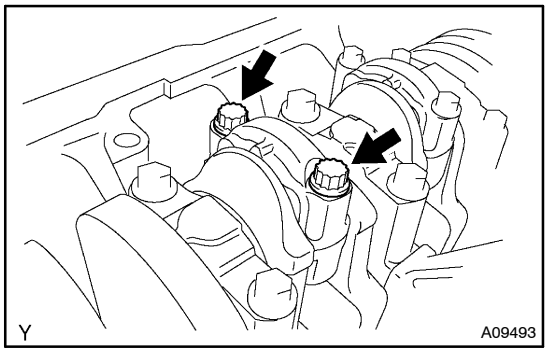
(b) Remove the 2 connecting rod cap bolts.

(c) Using the 2 removed connecting rod cap bolts, remove the connecting rod cap and lower bearing by wiggling the connecting rod cap right and left.

HINT:
Keep the lower bearing attached to the connecting rod cap.



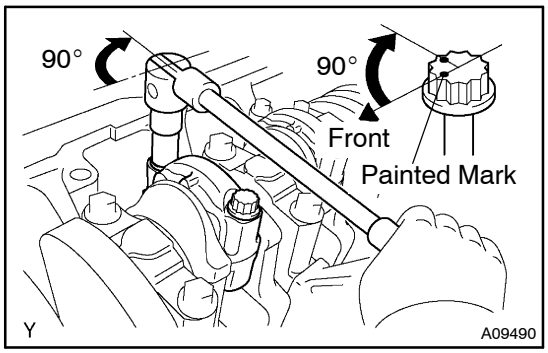
(d) Clean the crank pin and bearing.



(e) Check the crank pin and bearing for pits and scratches.

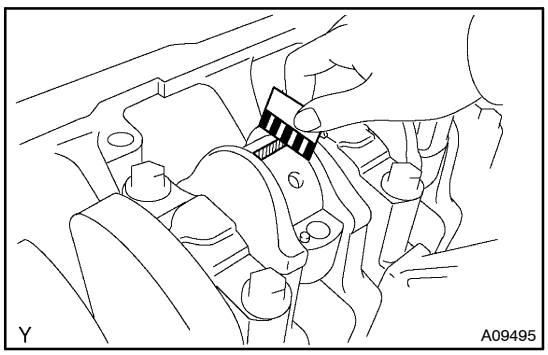
If the crank pin or bearing is damaged, replace the bearings. If necessary, replace the crankshaft.

(f) Lay a strip of Plastigage across the crank pin.



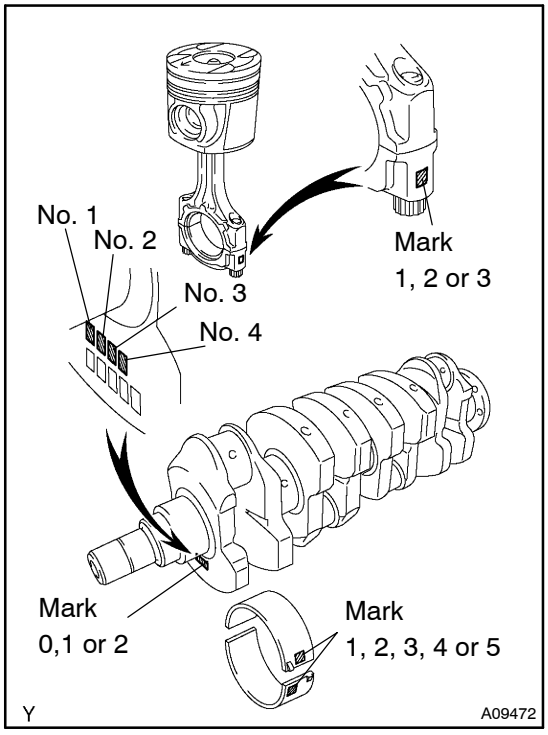
(g) Match the numbered connecting rod cap with the connecting rod.
(h) Install the connecting rod cap with the front mark facing forward.
(i) Apply a light coat of engine oil to the threads and underheads of the connecting rod cap bolts.

(j) Install and alternately tighten the 2 cap bolts in several steps.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)



If any of the cap bolts does not meet the specified torque, replace the connecting rod cap bolts.

(k) Mark the front of the cap bolt with paint.
(l) Retighten the cap bolts by 90° as illustrated.
(m) Check that the painted mark is now at a 90° angle to the front.



NOTICE:
Do not turn the crankshaft.

(n) Remove the 2 bolts, connecting rod cap and lower bearing.

(o) Measure the Plastigage at its widest point.
Standard oil clearance:
0.038 to 0.056 mm (0.0015 to 0.0022 in.)
Maximum oil clearance: 0.10 mm (0.0039 in.)

If the oil clearance is greater than maximum, replace the bearings. If necessary, replace the crankshaft.

(p) If using the standard bearing, replace it with one having the same number. If the number of the bearing cannot be determined, find the correct number of the bearing by adding together the numbers imprinted on the crankshaft and connecting rod cap, then select the bearing with the same number as the total. There are 5 sizes of standard bearings, marked ”1”, ”2”, ”3”, ”4” and ”5” accordingly.

Connecting Rod Cap	Crankshaft	Use Bearing
1	0	1
1	1	2
1	2	3
2	0	2
2	1	3
2	2	4
3	0	3
3	1	4
3	2	5

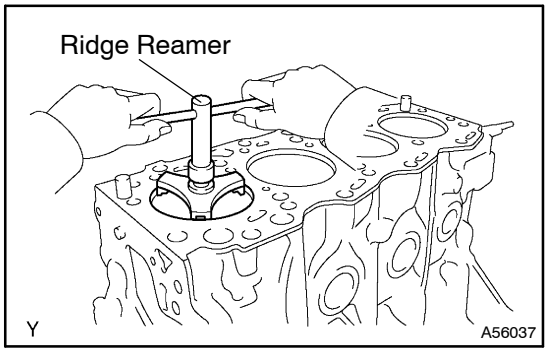
HINT:

EXAMPLE: Connecting rod cap ”2” + Crankshaft ”1”
= Total number 3 (Use bearing ”3”)

Connecting rod big end inside diameter:

Mark ”1”	53.500 to 53.506 mm (2.1063 to 2.1065 in.)
Mark ”2”	53.506 to 53.512 mm (2.1065 to 2.1068 in.)
Mark ”3”	53.512 to 53.518 mm (2.1068 to 2.1070 in.)

Crankshaft crank pin diameter:



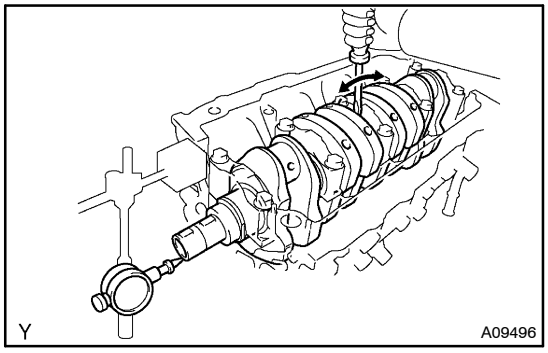
Mark ”0”	50.494 to 50.500 mm (1.9880 to 1.9882 in.)
Mark ”1”	50.488 to 50.494 mm (1.9877 to 1.9880 in.)
Mark ”2”	50.482 to 50.488 mm (1.9875 to 1.9877 in.)

Standard size bearing center wall thickness:

Mark ”1”	1.478 to 1.481 mm (0.0582 to 0.0583 in.)
Mark ”2”	1.481 to 1.484 mm (0.0583 to 0.0584 in.)
Mark ”3”	1.484 to 1.487 mm (0.0584 to 0.0585 in.)
Mark ”4”	1.487 to 1.490 mm (0.0585 to 0.0587 in.)
Mark ”5”	1.490 to 1.493 mm (0.0587 to 0.0588 in.)

(q) Completely remove the Plastigage.

3. REMOVE PISTON SUB–ASSY W/CONNECTING ROD



(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.

(b) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.

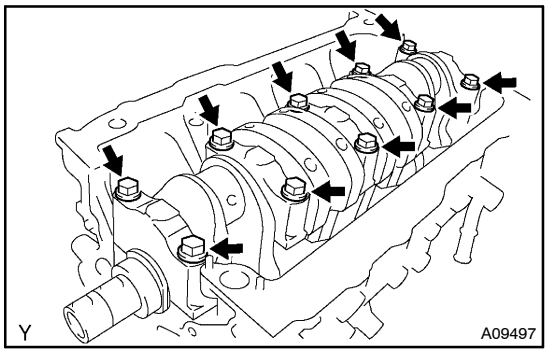
HINT:

- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.

4. REMOVE CONNECTING ROD BEARING

5. INSPECT CRANKSHAFT THRUST CLEARANCE

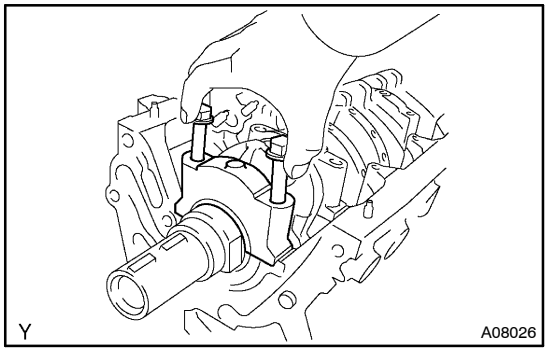
(a) Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.



Standard thrust clearance:

0.040 to 0.300 mm (0.0016 to 0.0118 in.)

If the thrust clearance is greater than maximum, replace the thrust washer as a set.



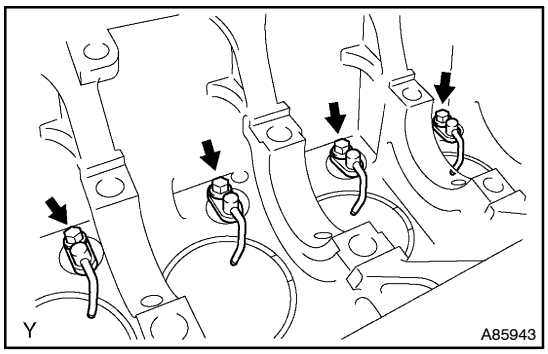
Thrust washer thickness:

Standard	2.680 to 2.730 mm (0.1055 to 0.1075 in.)
Oversize 0.125	2.743 to 2.793 mm (0.1080 to 0.1100 in.)
Oversize 0.250	2.805 to 2.855 mm (0.1104 to 0.1124 in.)

6. REMOVE CRANKSHAFT

(a) Uniformly loosen and remove the 10 main bearing cap bolts.

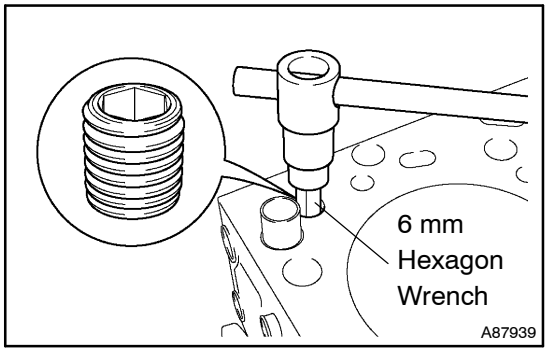
(b) Using the removed main bearing cap bolts, wiggle the cap back and forth, then remove the 5 main bearing caps, 5 lower bearings and 2 lower thrust washers (the No. 3 main bearing cap only).



HINT:

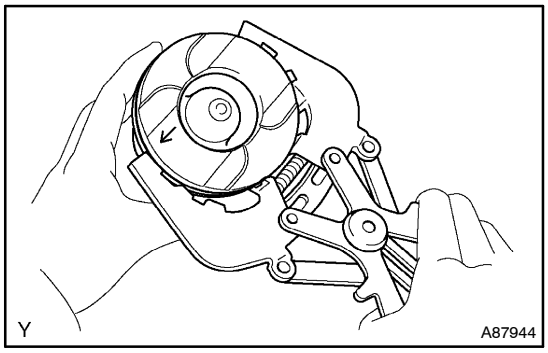
- Keep the lower bearing and main bearing cap together.
- Arrange the main bearing caps and lower thrust washers in the correct order.

(c) Lift the crankshaft out.



HINT:

Keep the upper bearing and upper thrust washers together with the cylinder block.



7. REMOVE SUB–ASSY OIL NOZZLE NO.1

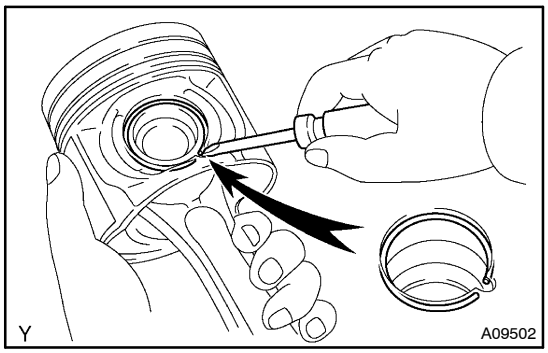
(a) Remove the 4 bolts and 4 oil nozzles.

8. REMOVE CYLINDER BLOCK OIL ORIFICE

(a) Using a hexagon wrench (6 mm), remove the oil orifice.

9. REMOVE PISTON RING SET

(a) Using a piston ring expander, remove the No. 1 and No. 2 piston ring and oil ring.

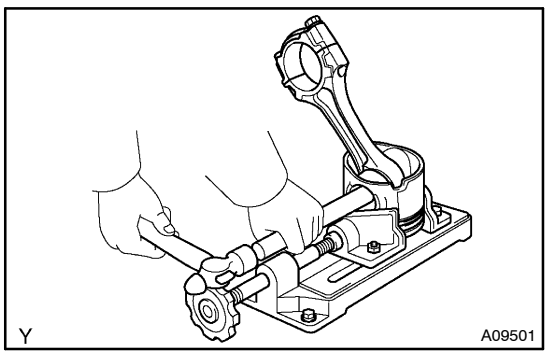


NOTICE:

Try to keep the piston ring expansion as small as possible.

(b) Remove the coil by hand.

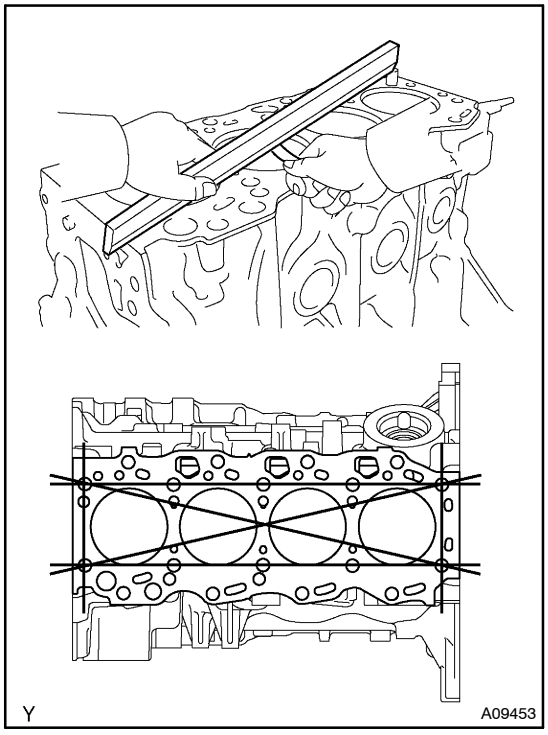
HINT:



Arrange the piston rings in the correct order.

10. REMOVE W/PIN PISTON SUB–ASSY

(a) Using a small screwdriver, pry the snap rings off the piston.

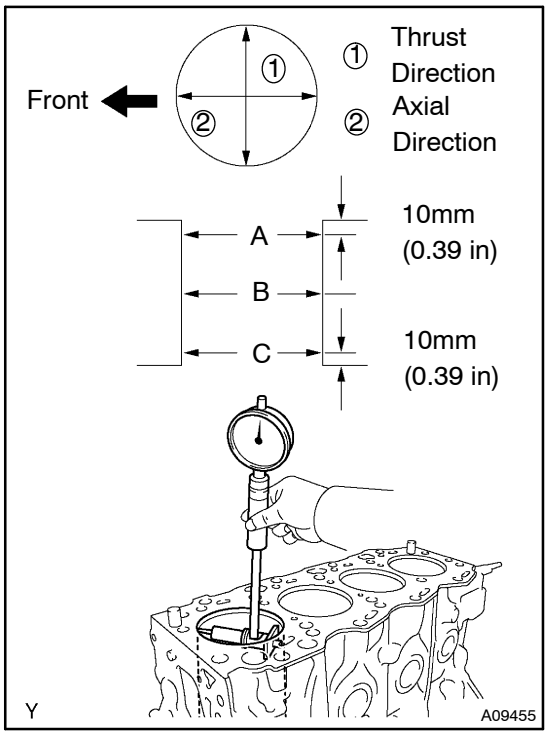


(b) Gradually heat the piston up to approximately 60°C (140°F).

(c) Using a plastic–faced hammer and brass bar, lightly tap out the piston pin and remove the connecting rod.

HINT:

- The piston and pin are a matched set.
- Arrange the pistons, pins, rings, connecting rods and bearings in the correct order.

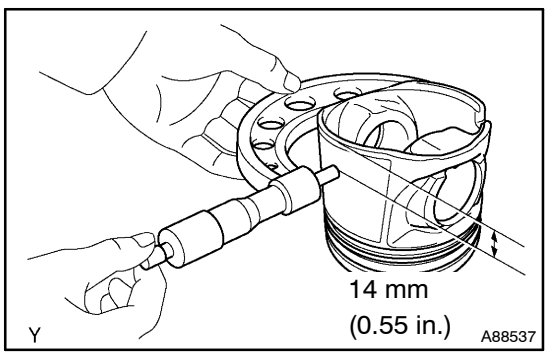


11. INSPECT CYLINDER BLOCK FOR FLATNESS

(a) Using a precision straight edge and feeler gauge, measure the warpage on the surface which contacts the cylinder head gasket.

Maximum warpage: 0.05 mm (0.0020 in.)

If the warpage is greater than maximum, replace the cylinder block.



12. INSPECT CYLINDER BORE DIAMETER

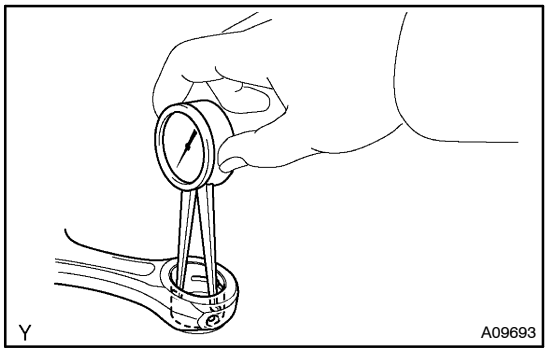
(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A, B and C in the thrust and axial directions.

Standard diameter:

82.200 to 82.400 mm (3.2362 to 3.2441 in.)

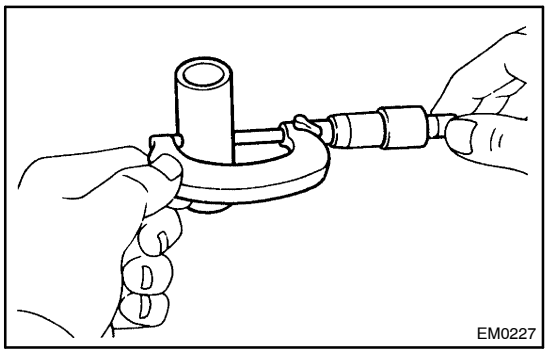
If the diameter is greater than maximum, replace the cylinder block.

13. INSPECT W/PIN PISTON SUB–ASSY



(a) Using a micrometer, measure the piston diameter at a right angle to the piston pin center line and 14 mm (0.55 in.) from the skirt bottom edge.

Piston diameter:

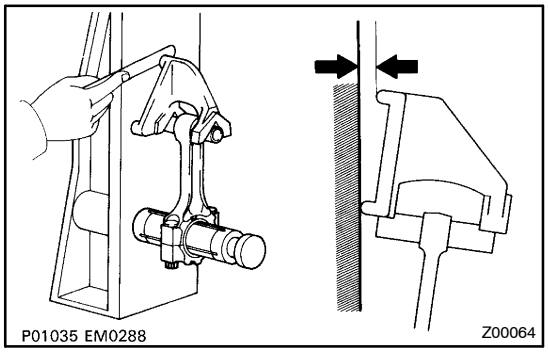


82.118 to 82.132 mm (3.2330 to 3.2335 in.)

(b) Subtract the piston diameter measurement from the cylinder bore diameter measurement.
Standard oil clearance:
0.068 to 0.140 mm (0.0027 to 0.0055 in.)

If the oil clearance is greater than maximum, replace all the 4 pistons. If necessary, replace the cylinder block.

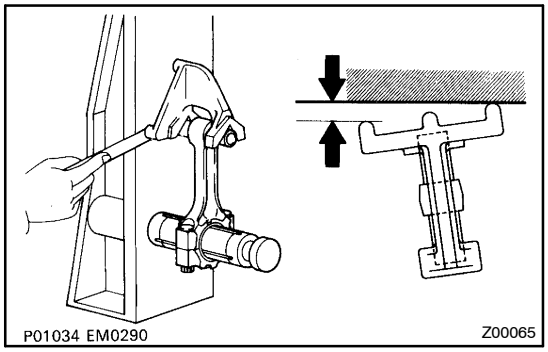
(c) Using a caliper gauge, measure the inside diameter of the connecting rod bushing.
Bushing inside diameter:
31.015 to 31.027 mm (1.2211 to 1.2215 in.)



(d) Using a micrometer, measure the piston pin diameter.
Piston pin diameter:
31.000 to 31.012 mm (1.2205 to 1.2209 in.)

(e) Subtract the piston pin diameter measurement from the bushing inside diameter measurement.
Standard oil clearance:
0.005 to 0.019 mm (0.0002 to 0.0007 in.)

If the oil clearance is greater than maximum, replace the connecting rod. If necessary, replace the piston and piston pin as a set.

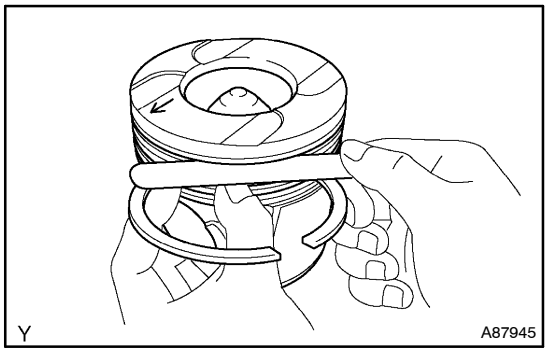


14. INSPECT CONNECTING ROD SUB–ASSY

(a) Using a rod aligner and feeler gauge, check the connecting rod alignment.

(1) Inspect the misalignment.
Maximum misalignment:
0.05 mm (0.0020 in.) per 100 mm (3.94 in.)

If the alignment is greater than maximum, replace the connecting rod assembly.

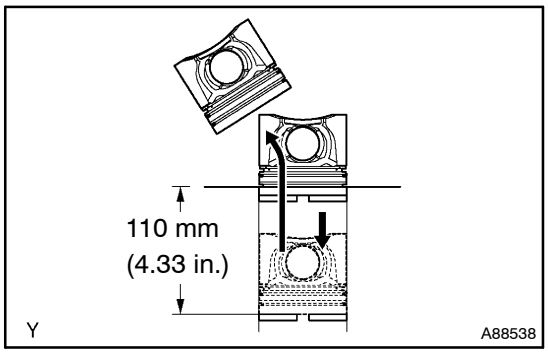


(2) Inspect the twist.

Maximum twist:

0.15 mm (0.0059 in.) per 100 mm (3.94 in.)

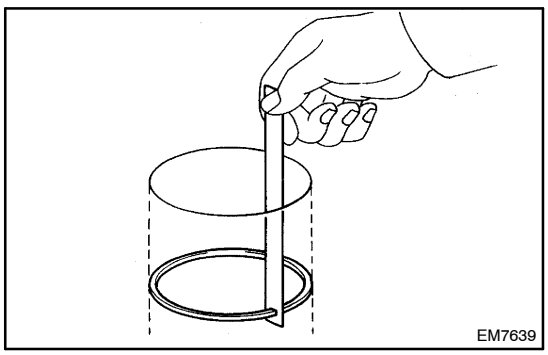
If the twist is greater than maximum, replace the connecting rod assembly.



15. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between a new piston ring and wall of the ring groove.

Ring groove clearance:



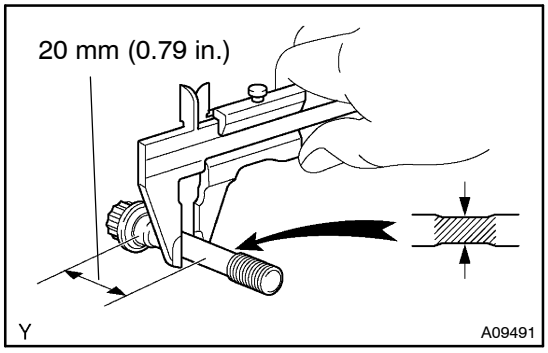
No. 1	0.11 to 0.15 mm (0.0043 to 0.0059 in.)
No. 2	0.075 to 0.115 mm (0.0030 to 0.0045 in.)
Oil	0.03 to 0.07 mm (0.0012 to 0.0028 in.)

If the clearance is not as specified, replace the piston.

16. INSPECT PISTON RING END GAP

(a) Using a piston, push the piston ring until it is a little below the bottom of the ring travel, 110 mm (4.33 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.



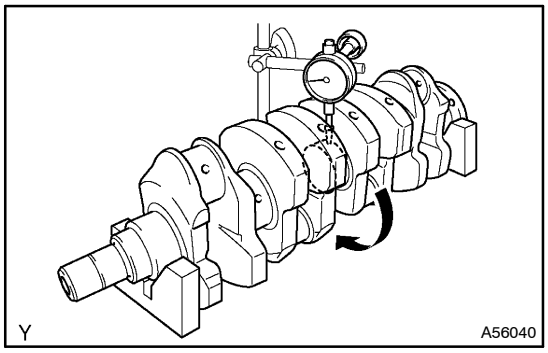
Standard end gap:

No. 1	0.27 to 0.39 mm (0.0106 to 0.0514 in.)
No. 2	0.39 to 0.54 mm (0.0154 to 0.0213 in.)
Oil	0.20 to 0.40 mm (0.0079 to 0.0157 in.)

Maximum end gap:

No. 1	0.82 mm (0.0323 in.)
No. 2	1.00 mm (0.0394 in.)
Oil	0.90 mm (0.0354 in.)

If the end gap is greater than maximum, replace the piston ring.
If the end gap is greater than maximum, even with a new piston ring, replace the cylinder block.

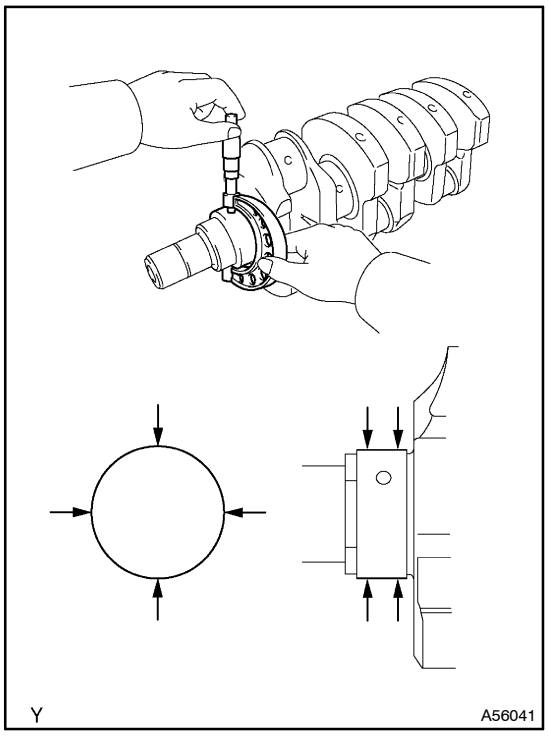


17. INSPECT CONNECTING ROD BOLT

(a) Using vernier calipers, measure the tension portion diameter.

Standard diameter:
8.0 to 8.3 mm (0.315 to 0.327 in.)

If the diameter is less than minimum, replace the connecting rod bolt.



18. INSPECT CRANKSHAFT

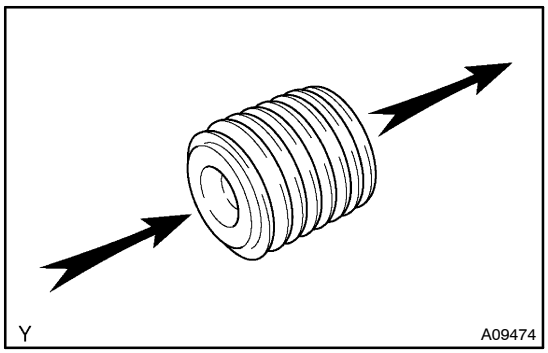
(a) Place the crankshaft on V–blocks.

(b) Using a dial indicator, measure the circle runout at the center journal.

Maximum circle runout: 0.025 mm (0.0010 in.)

If the circle runout is greater than maximum, replace the crankshaft.

(c) Using a micrometer, measure the diameter of each main journal and crank pin.



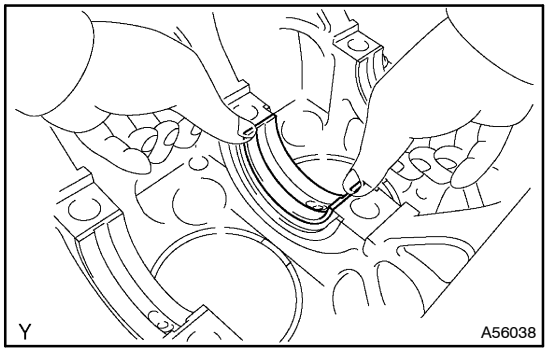
Main journal diameter:
56.992 to 57.010 mm (2.2438 to 2.2445 in.)
Crank pin diameter:
50.482 to 50.500 mm (1.9875 to 1.9882 in.)

If the diameter is not as specified, replace the crankshaft.

(d) Check each main journal and crank pin for taper and out–of–round as illustrated.

Maximum taper and out–of–round:
0.01 mm (0.0004 in.)

If the taper and out–of–round is greater than maximum, replace the crankshaft.



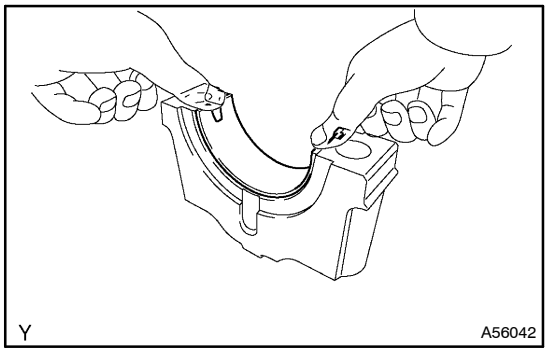
19. INSPECT CYLINDER BLOCK OIL ORIFICE

(a) Check the oil orifice for clogging.

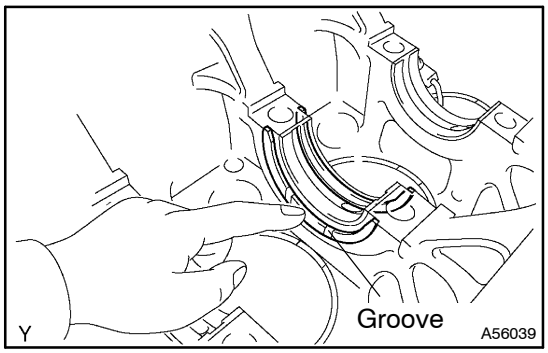
If necessary, replace the oil orifice.

20. INSPECT CRANKSHAFT OIL CLEARANCE

(a) Clean each main journal and bearing.

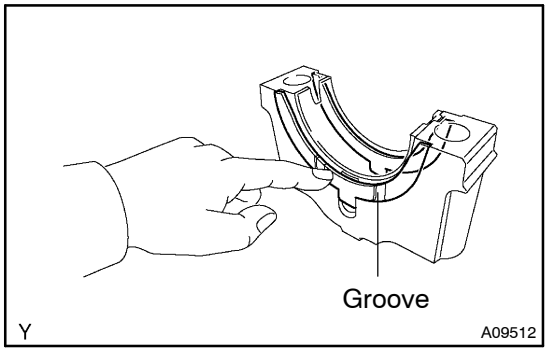


(b) Install the bearing on the cylinder block and bearing cap.



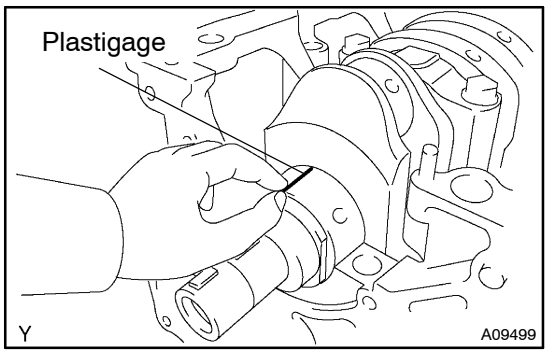
HINT:

Each upper bearing has an oil groove and oil hole and each lower bearing does not.

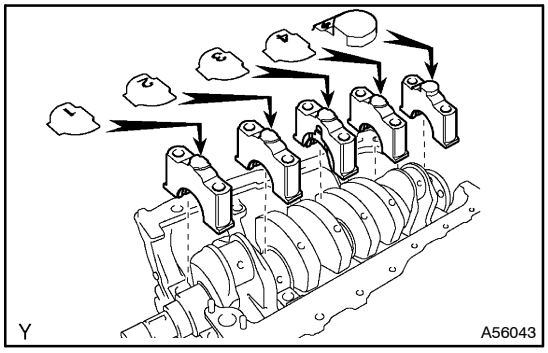


(1) Align the bearing claw with the claw groove of the cylinder clock, then push in the 5 upper bearings.

(2) Align the bearing claw with the claw groove of the main bearing cap, then push in the 5 lower bearings.

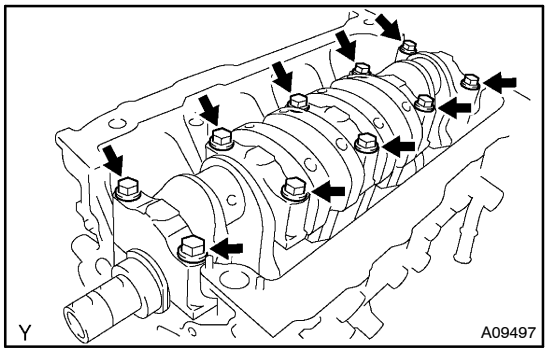


(c) Install the 2 thrust washers under the No. 3 journal position of the cylinder block with the oil grooves facing outward.



(d) Install the 2 thrust washers on the No. 3 bearing cap with the oil grooves facing outward.

(e) Place the crankshaft on the cylinder block.



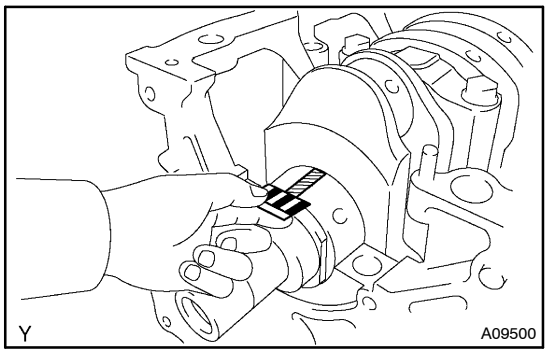
(f) Lay a strip of Plastigage across each journal.

(g) Install the 5 main bearing caps in their proper locations.

HINT:

Each bearing cap has a number and front mark.

(h) Apply a light coat of engine oil to the threads and under the heads of the main bearing cap bolts.



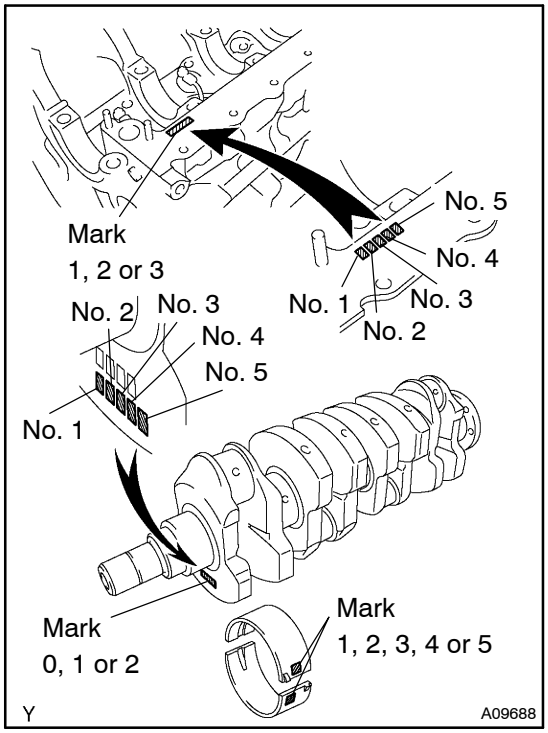
(i) Install and uniformly tighten the 10 bolts of the main bearing cap in several steps.

Torque: 115 N·m (1,173 kgf·cm, 85 ft·lbf)

NOTICE:

Do not turn the crankshaft.

(j) Remove the bearing cap.



(k) Measure the Plastigage at its widest point.

Standard oil clearance:

0.032 to 0.100 mm (0.0013 to 0.0039 in.)

If the oil clearance is greater than maximum, replace the bearing. If necessary, replace the crankshaft.

(l) If using the standard bearing, replace it with one having the same number. If the number of the bearing cannot be determined, find the correct number of the bearing by adding together the numbers imprinted on the cylinder block and crankshaft, then select the bearing with the same number as the total. There are 5 sizes of standard bearings, marked ”1”, ”2”, ”3”, ”4” and ”5” accordingly.

Number Marked

Cylinder Block	Crankshaft	Use Bearing
1	0	1
1	1	2
1	2	3
2	0	2
2	1	3
2	2	4
3	0	3
3	1	4
3	2	5

HINT:

EXAMPLE

Cylinder block ”2” + Crankshaft ”1” = Total number 3 (Use bearing ”3”)

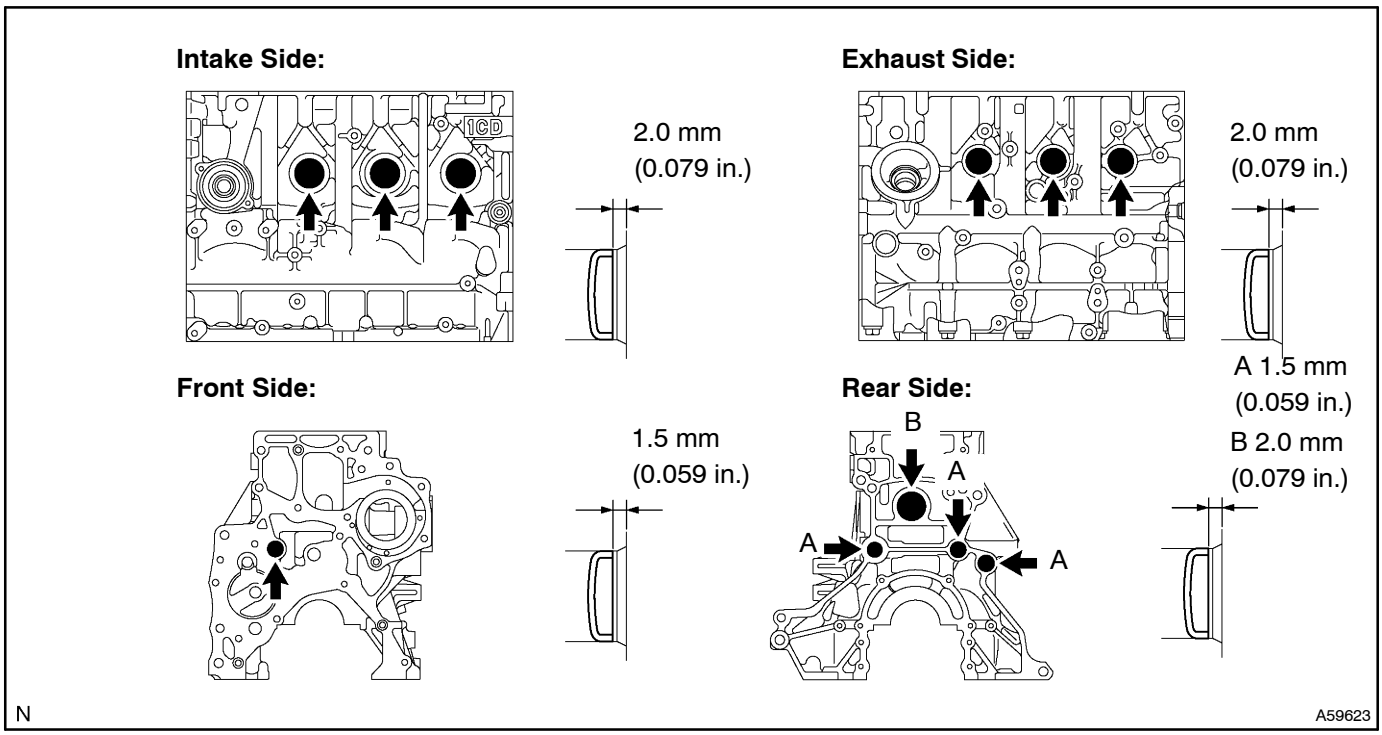
Cylinder block main journal bore diameter:

Mark ”1”	61.000 to 61.006 mm (2.4016 to 2.4018 in.)
Mark ”2”	61.006 to 61.012 mm (2.4018 to 2.4020 in.)
Mark ”3”	61.012 to 61.018 mm (2.4020 to 2.4023 in.)

Crankshaft main journal diameter:

Mark ”0”	57.004 to 57.010 mm (2.2443 to 2.2445 in.)
Mark ”1”	56.998 to 57.004 mm (2.2440 to 2.2443 in.)
Mark ”2”	56.992 to 56.998 mm (2.2438 to 2.2440 in.)

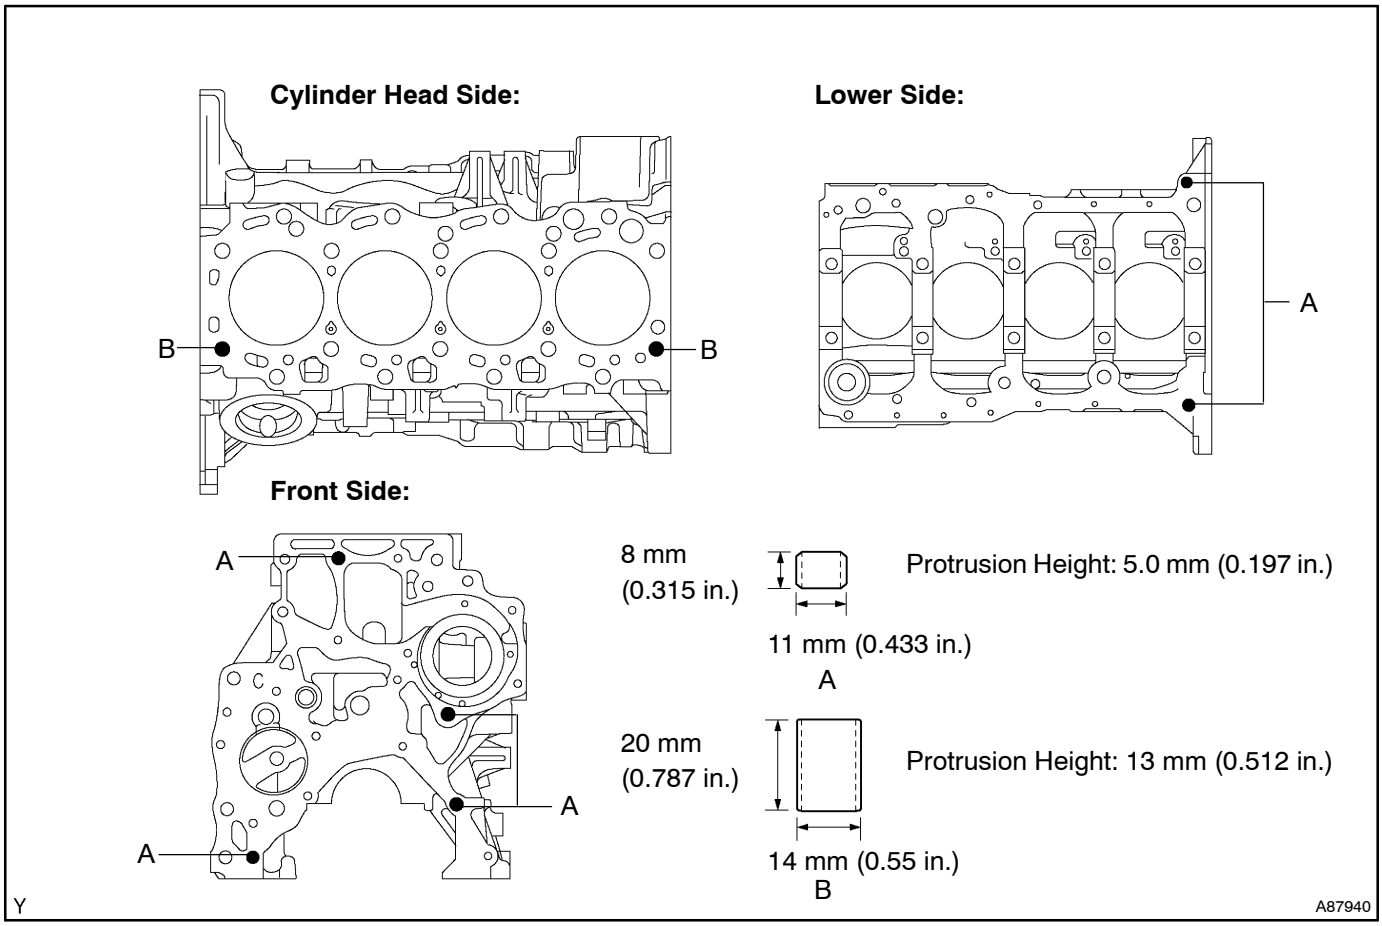
Standard size bearing center wall thickness:



Mark ”1”	1.976 to 1.979 mm (0.0778 to 0.0779 in.)
Mark ”2”	1.979 to 1.982 mm (0.0779 to 0.0780 in.)
Mark ”3”	1.982 to 1.985 mm (0.0780 to 0.0781 in.)
Mark ”4”	1.985 to 1.988 mm (0.0781 to 0.0783 in.)
Mark ”5”	1.988 to 1.991 mm (0.0783 to 0.0784 in.)

(m) Completely remove the Plastigage.

21. INSTALL TIGHT PLUG



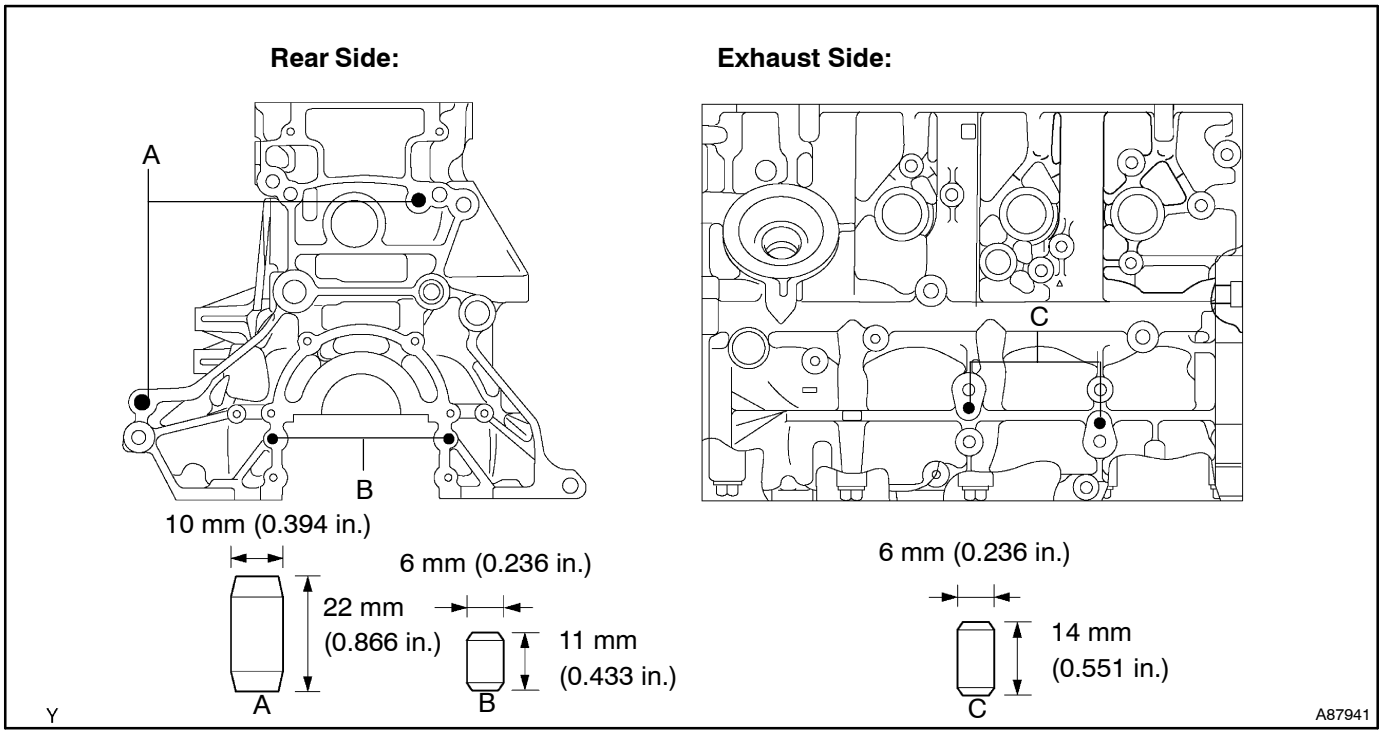
(a) Apply adhesive around new tight plugs.
Adhesive: Part No.08833 – 00070, THREE BOND 1324 or equivalent.

(b) Using SST, tap in the tight plugs as shown tn the illustration.
SST 09950–60010 (09951–00350), 09950–70010 (09951–07100)
Standard depth:
2.0 mm (0.079 in.) for intake side
2.0 mm (0.079 in.) for exhaust side
1.5 mm (0.059 in.) for front side
1.5 mm (0.059 in.) for rear side A
2.0 mm (0.079 in.) for rear side B

22. INSTALL RING PIN

(a) Using a plastic–faced hammer, tap in new ring pins until their protrusion heights are as specified.

23. INSTALL STRAIGHT PIN

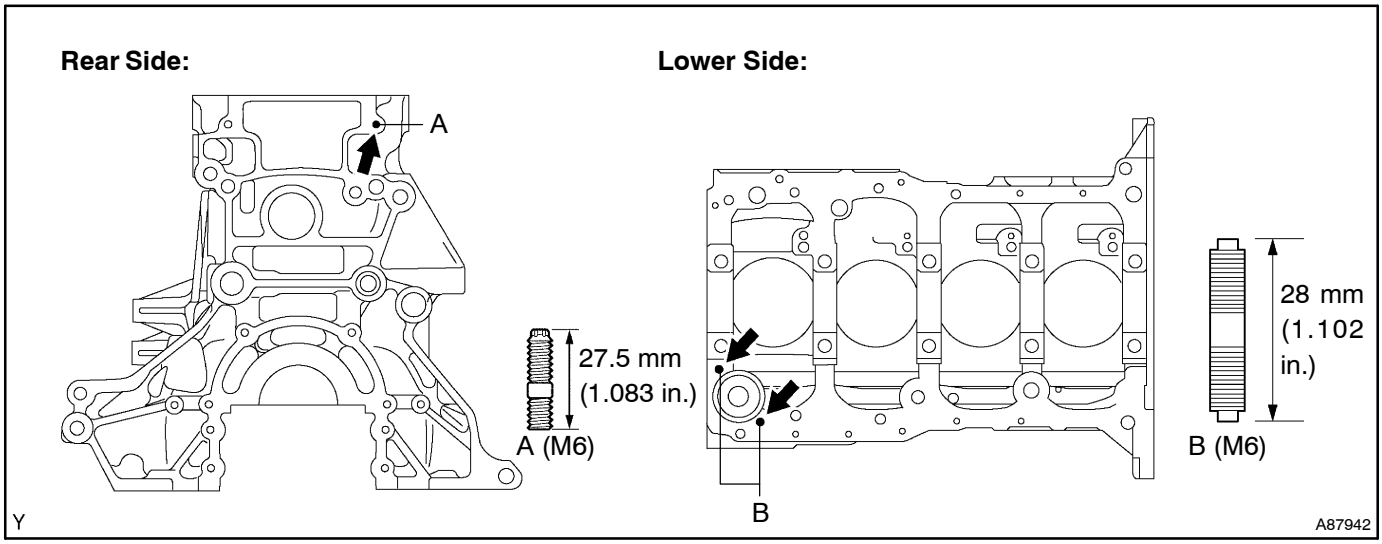


(a) Using a plastic–faced hammer, tap in new straight pins.

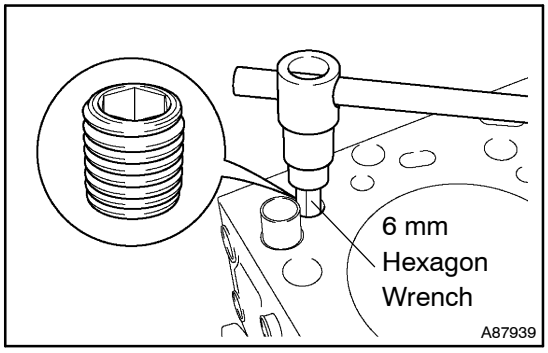
Standard protrusion:

13 mm (0.5118 in.) for straight pin A

4.0 mm (0.1575 in.) for straight pin B

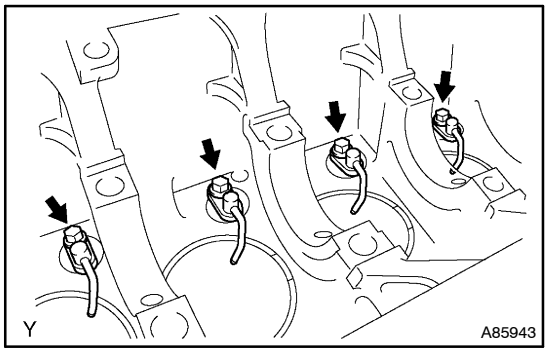


5.0 mm (0.1968 in.) for straight pin C

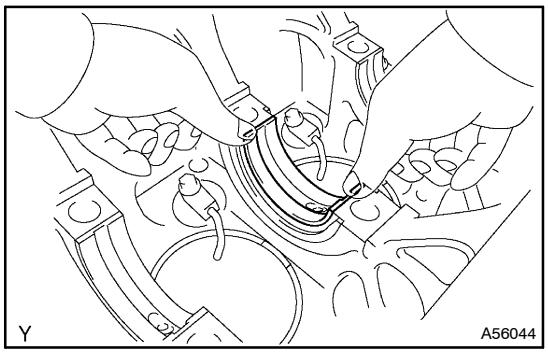


24. INSTALL STUD BOLT

(a) Install the stud bolts as shown in the illustration.



Torque: 2.9 N·m (30 kgf·cm, 27 in.·lbf)

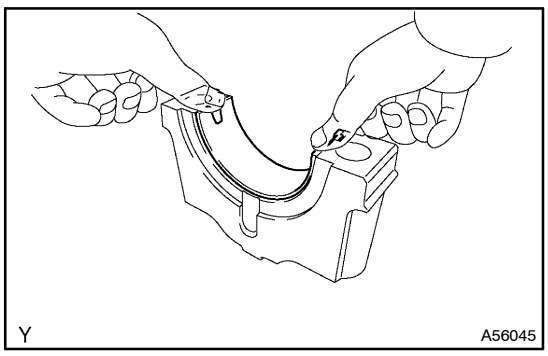


25. INSTALL CYLINDER BLOCK OIL ORIFICE

(a) Using a hexagon wrench (6 mm), install the oil orifice.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

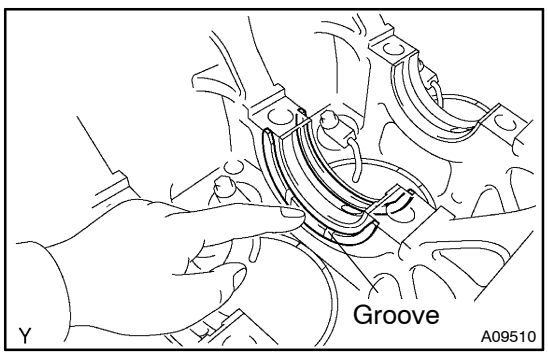
26. INSTALL SUB–ASSY OIL NOZZLE NO.1

(a) Install the 4 oil nozzles with the 4 bolts.
Torque: 7.4 N·m (75 kgf·cm, 65 in.·lbf)



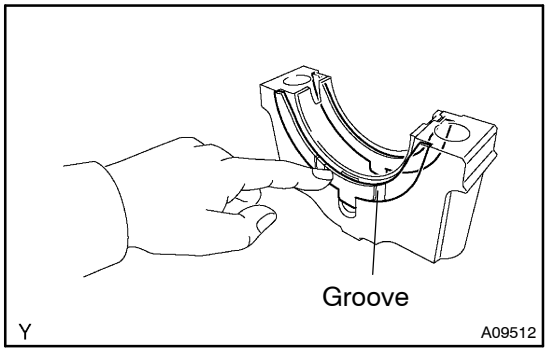
27. INSTALL CRANKSHAFT

(a) Install the bearing on the cylinder block and bearing cap.

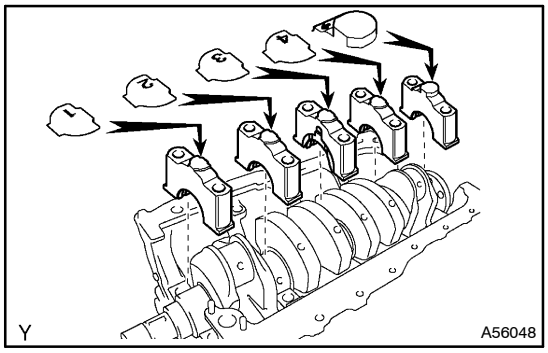


HINT:

Each upper bearing has an oil groove and oil hole and each lower bearing does not.

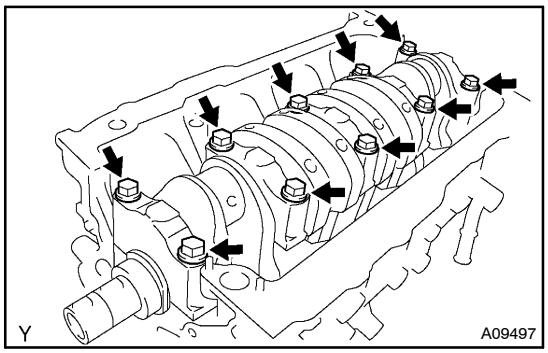


(1) Align the bearing claw with the claw groove of the cylinder block, then push in the 5 upper bearings.



(2) Align the bearing claw with the claw groove of the main bearing cap, then push in the 5 lower bearings.

(b) Install the 2 thrust washers under the No. 3 journal position of the cylinder block with the oil grooves facing outward.

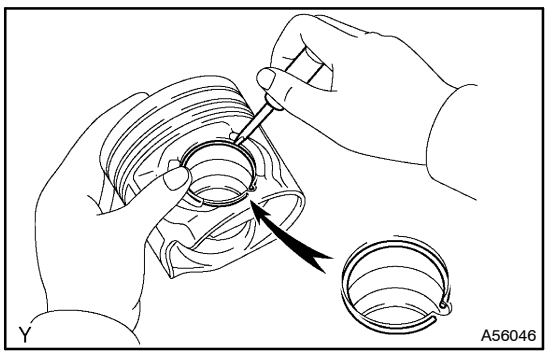


(c) Install the 2 thrust washers on the No. 3 bearing cap with the oil grooves facing outward.

(d) Install the 5 main bearing caps in their proper locations.

HINT:

Each bearing cap has a number and font mark.

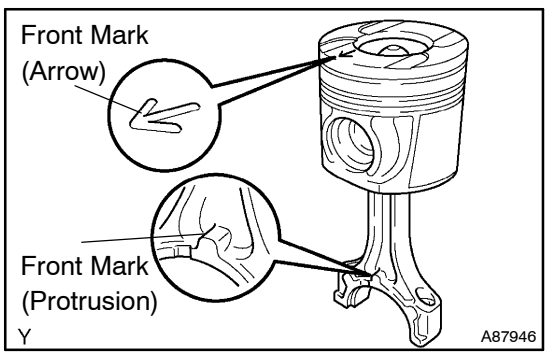


(e) Apply a light coat of engine oil to the threads and underheads of the main bearing cap bolts.

(f) Install and uniformly tighten the 10 bolts of the main bearing cap in several steps.

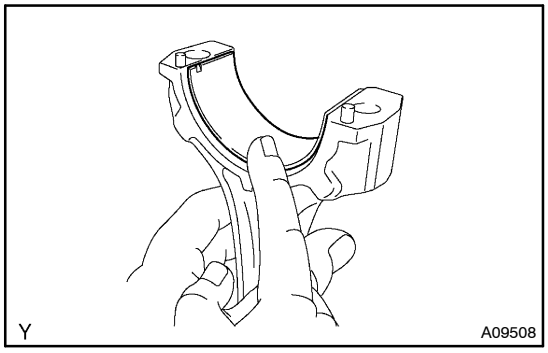
Torque: 115 N·m (1,173 kgf·cm, 85 ft·lbf)

(g) Check that the crankshaft turns smoothly.



28. INSTALL W/PIN PISTON SUB–ASSY

(a) Install a new snap ring on one side of the piston pin hole.

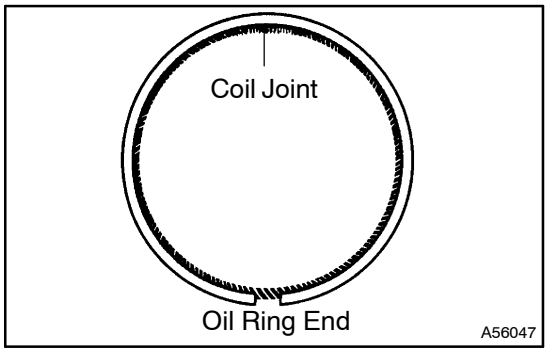


(b) Gradually heat the piston up to approximately 60°C (140°F).

(c) Coat the piston pin and piston hole of the piston with engine oil.

(d) Align the front marks of the piston and connecting rod, then push in the piston pin by hand.

(e) Install a new snap ring on the other side of the piston pin hole.

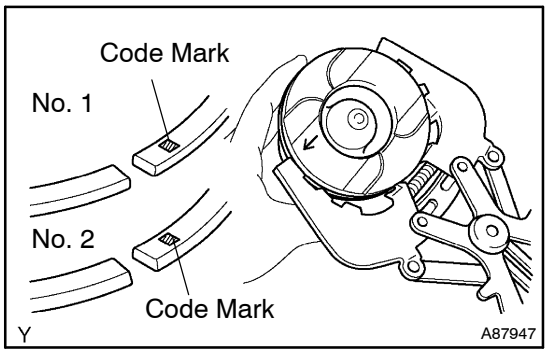


29. INSTALL CONNECTING ROD BEARING

(a) Align the bearing claw with the groove of the connecting rod or connecting cap.

(b) Install the bearings in the connecting rod and connecting rod cap.

30. INSTALL PISTON RING SET

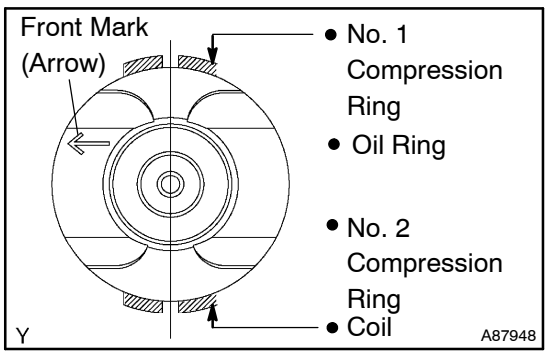


(a) Install the coil by hand.

(b) Using a piston ring expander, install the oil ring.

HINT:

Align the oil ring so its end faces the opposite of the coil joint.



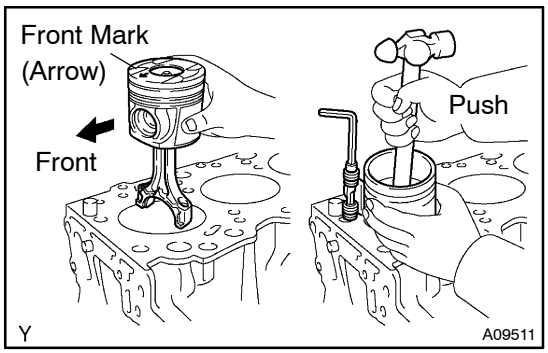
(c) Using a piston ring expander, install the No. 2 and No. 1 piston rings with the code mark facing upward.

Code mark:

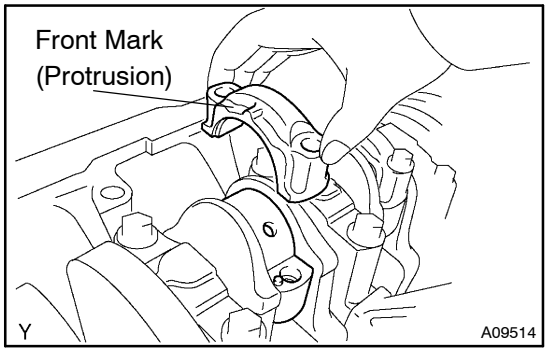
No. 1	1T
No. 2	2T

NOTICE:

Try to keep the piston ring expansion as small as possible.

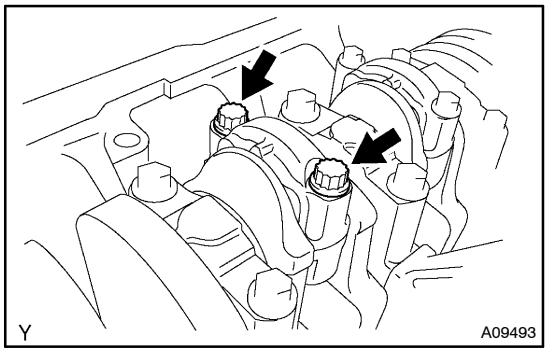


(d) Position the piston rings so that the ring ends are as illustrated.



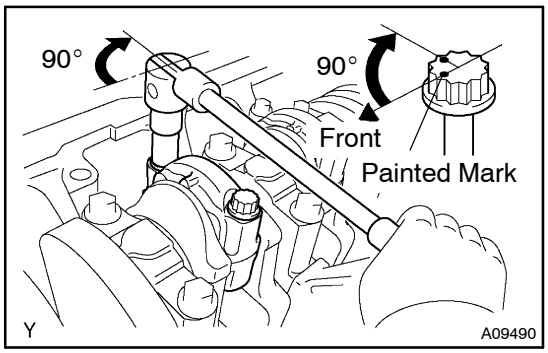
31. INSTALL PISTON SUB–ASSY W/CONNECTING ROD

(a) Apply engine oil to the cylinder walls, pistons, and surfaces of the connecting rod bearings.



(b) Check the position of the piston ring ends.

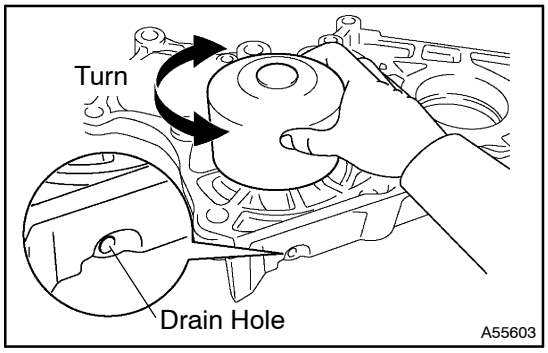
(c) Using a piston ring compressor, push the correctly–numbered piston and connecting rod assemblies into each cylinder with the front mark of the piston facing forward.



(d) Match the numbered connecting rod cap with the connecting rod.
(e) Install the connecting rod cap with the front mark facing forward.
(f) Apply a light coat of engine oil to the threads and underheads of the connecting rod cap bolts.

(g) Install and alternately tighten the 2 cap bolts in several steps.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

If any of the cap bolts does not meet the specified torque, replace the connecting rod cap bolts.



(h) Mark the front of the cap bolt with paint.
(i) Retighten the cap bolts by 90° as illustrated.
(j) Check that the painted mark is now at a 90° angle to the front.
(k) Check that the crankshaft turns smoothly.

WATER PUMP ASSY (1CD–FTV)(From September, 2003)

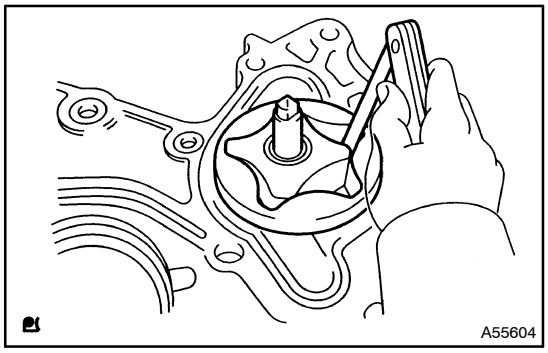
160T5–01

INSPECTION

1. INSPECT WATER PUMP ASSY

(a) Visually check the drain hole for coolant leakage.

If leakage is found, replace the water pump.



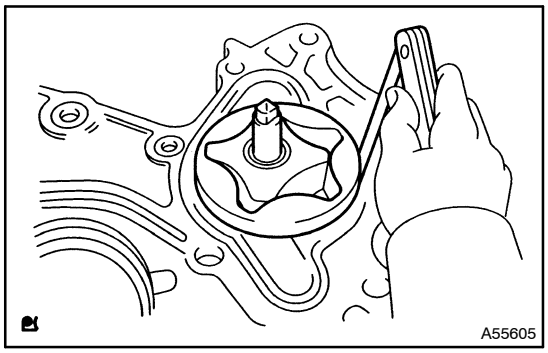
(b) Turn the pulley, then check that the water pump bearing moves smoothly without making a noise.

If necessary, replace the water pump.

OIL PUMP ASSY (1CD–FTV)(From September, 2003)

170J0–01

INSPECTION



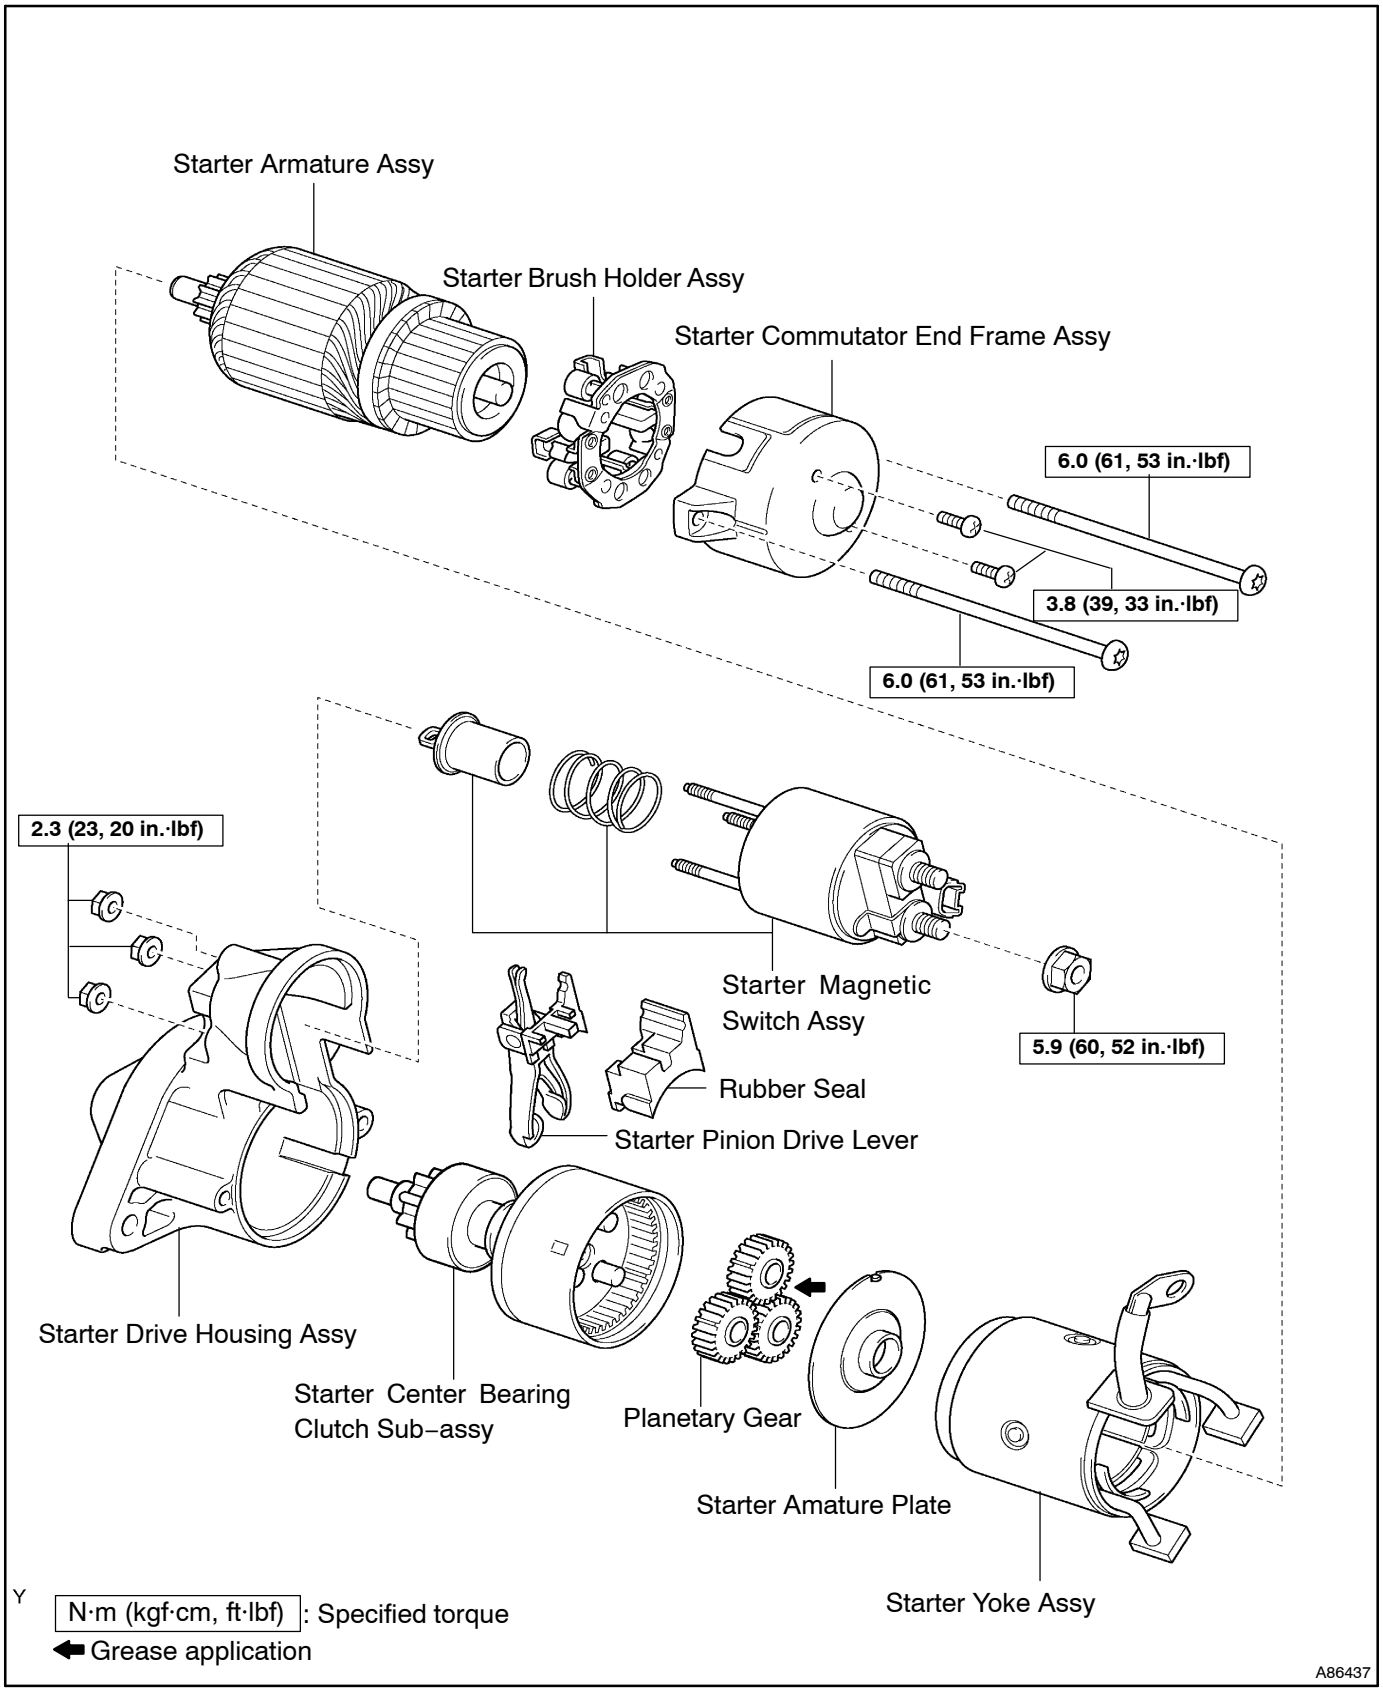
1. INSPECT OIL PUMP ASSY

(a) Inspect the tip clearance.

(1) Using a feeler gauge, measure the clearance between the drive and driven rotor tips.

Standard tip clearance:
0.08 to 0.20 mm (0.0031 to 0.0079 in.)

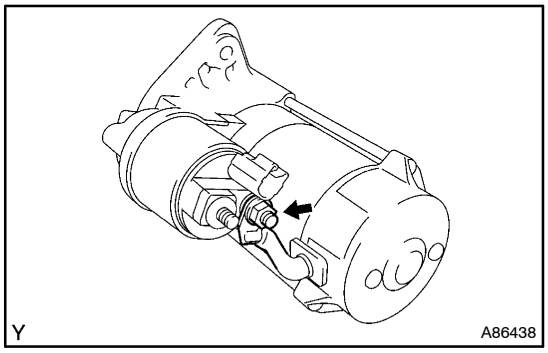
(b) Inspect the body clearance.



(1) Using a feeler gauge, measure the clearance between the driven rotor and body.

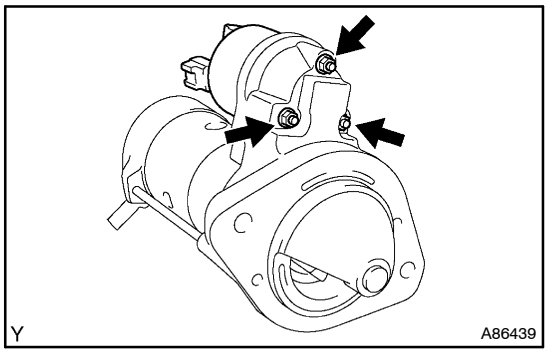
Standard body clearance:
0.1 to 0.20 mm (0.0039 to 0.0079 in.)

STARTER ASSY (1CD–FTV)(From September, 2003)



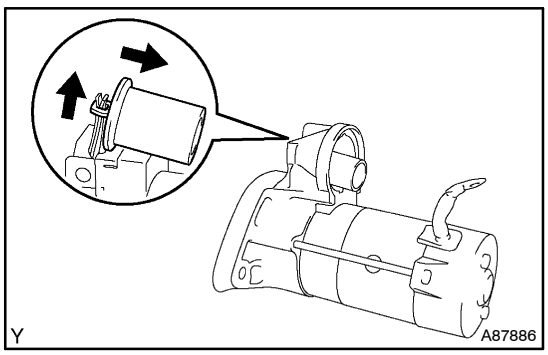
COMPONENTS

190VA–01

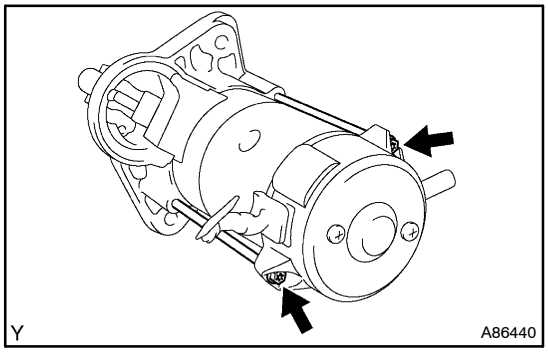


190VB–01

OVERHAUL

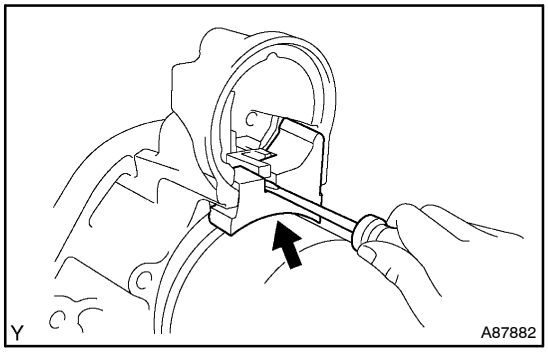


1. REMOVE STARTER MAGNETIC SWITCH ASSY

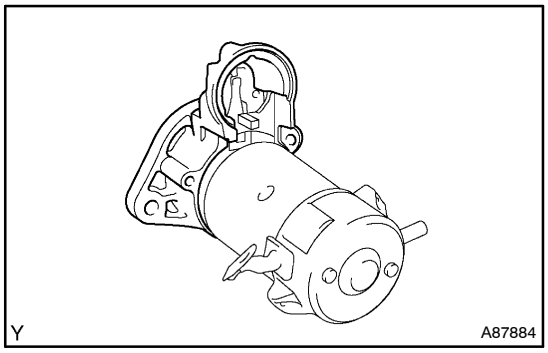


(a) Remove the nut, then disconnect the lead wire from the starter magnetic switch.

(b) Remove the 3 nuts and starter magnetic switch.

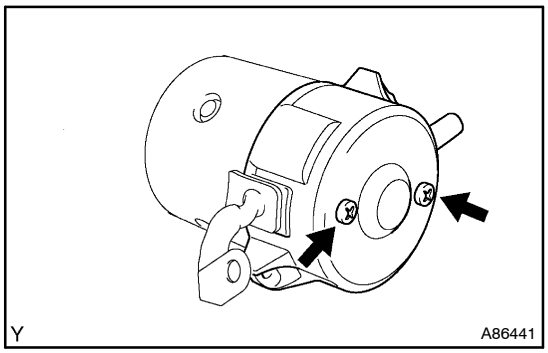


(c) Pull the plunger, then disconnect the plunger hook from the upper side of the starter pinion drive lever.

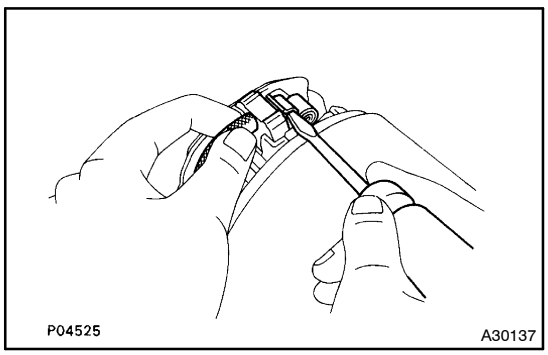


2. REMOVE STARTER DRIVE HOUSING ASSY

(a) Using a Torx wrench, remove the 2 bolts.



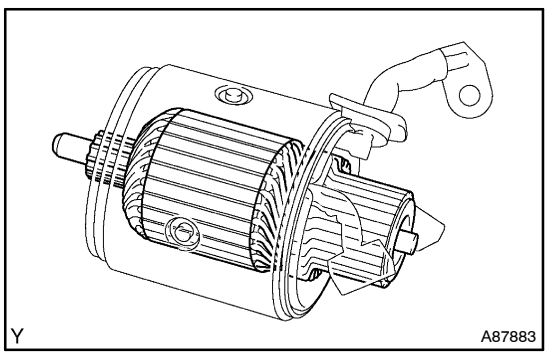
(b) Using a screwdriver, remove the rubber seal from the starter pinion drive lever.



(c) Remove the starter drive housing from the starter pinion drive lever by separating them at the part fitting surface.

(d) Remove the starter center bearing clutch from the starter yoke.

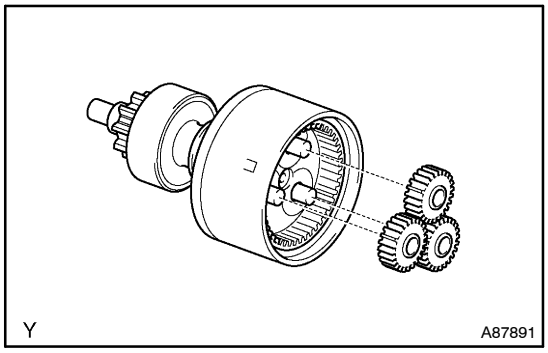
3. REMOVE STARTER COMMUTATOR END FRAME ASSY



(a) Remove the 2 screws and starter commutator end frame.

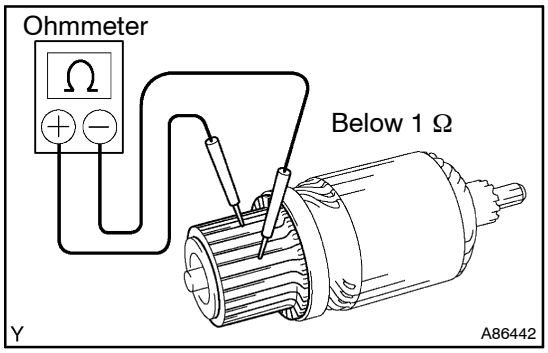
4. REMOVE STARTER ARMATURE ASSY

(a) Using a screwdriver, hold the spring back and disconnect the brush from the brush holder.



(b) Disconnect the 4 brushes, then remove the brush holder.

(c) Remove the starter armature from the starter yoke.

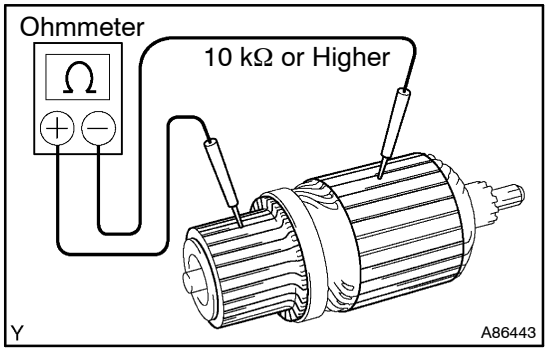


5. REMOVE STARTER ARMATURE PLATE

(a) Remove the starter armature plate from the starter center bearing clutch.

6. REMOVE PLANETARY GEAR

(a) Remove the 3 planetary gears.



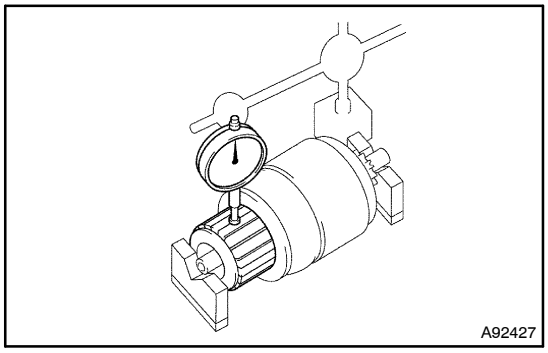
7. INSPECT STARTER ARMATURE ASSY

(a) Inspect the resistance of the commutator.

(1) Using an ohmmeter, measure the resistance between the segments of the commutator.

Standard: Below 1 Ω

If the resistance is not as specified, replace the armature.



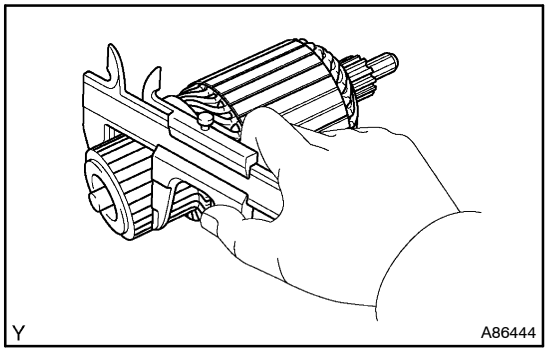
(2) Using an ohmmeter, measure the resistance between the commutator and armature coil core.

Standard: 10 kΩ or higher

If the resistance is not as specified, replace the armature.

(b) Check the commutator surface for dirt or burn.

If the surface is dirty or burnt, smooth it with 400–grit sandpaper or on a lathe.



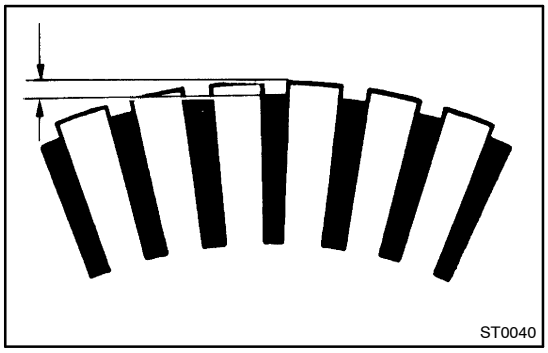
(c) Check the circle runout of the commutator.

(1) Place the commutator on V–blocks.

(2) Using a dial indicator, measure the circle runout.

Maximum circle runout: 0.05 mm (0.0020 in.)

If the circle runout is greater than maximum, correct it on a lathe.

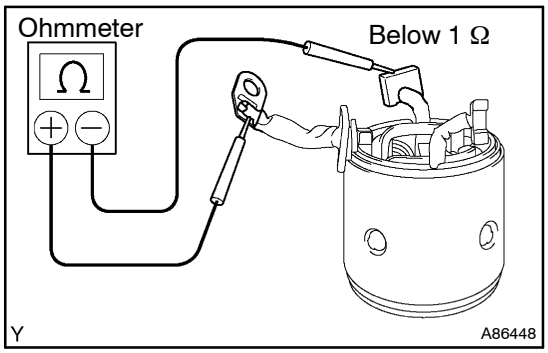


(d) Using vernier calipers, measure the commutator diameter.

Standard diameter: 35.0 mm (1.378 in.)

Minimum diameter: 34.0 mm (1.339 in.)

If the diameter is less than minimum, replace the armature.

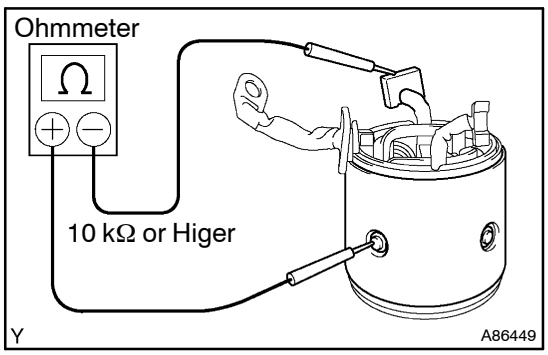


(e) Check that the undercut depth is clean and free of foreign materials. Smooth out the edge.

Standard undercut depth: 0.6 mm (0.024 in.)

Minimum undercut depth: 0.2 mm (0.008 in.)

If the undercut depth is less than minimum, increase the depth using a hacksaw blade.

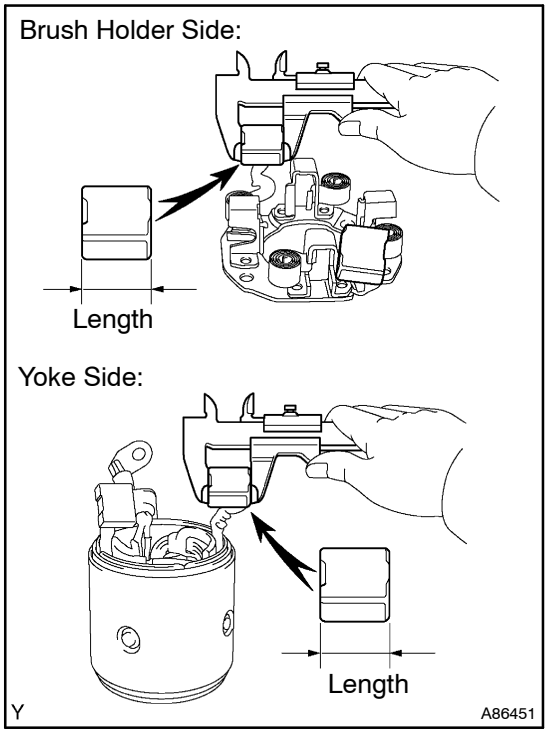


8. INSPECT STARTER YOKE ASSY

(a) Inspect the resistance of the field coil.

(1) Using an ohmmeter, measure the resistance between the lead wire and field coil brush lead.

Standard: Below 1 Ω

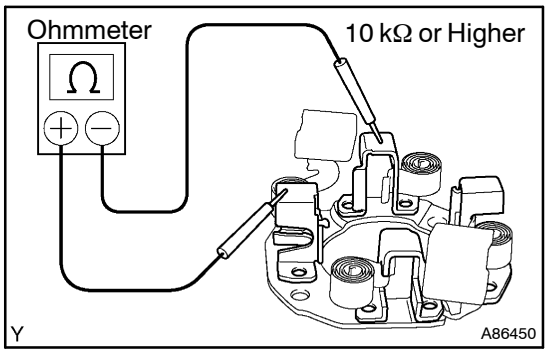


If the resistance is not as specified, replace the starter yoke.

(2) Using an ohmmeter, measure the resistance between the field coil end and field frame.

Standard: 10 kΩ or higer

If the resistance is not as specified, repair or replace the starter yoke.



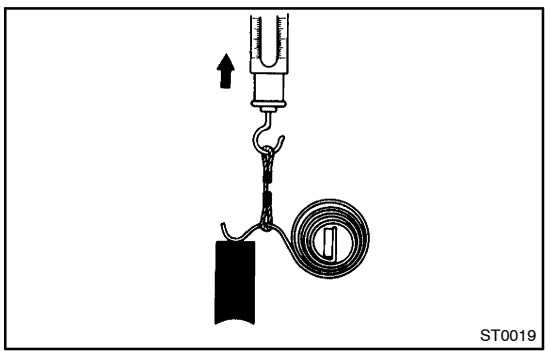
9. INSPECT BRUSH

(a) Using vernier calipers, measure the brush length.

Standard length: 15.5 mm (0.610 in.)

Minimum length: 10.0 mm (0.394 in.)

If the brush length is less than minimum, replace the brush holder and field frame.



10. INSPECT STARTER BRUSH HOLDER ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the positive (+) and negative (–) brush holders.

Standard: 10 kΩ or higher

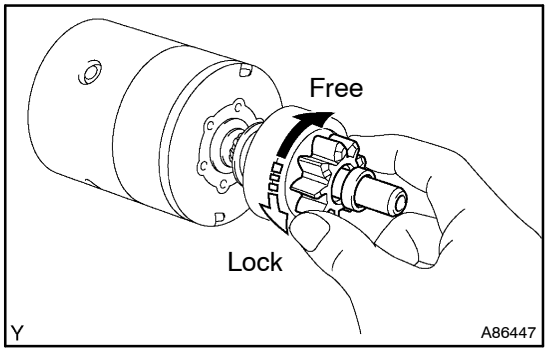
If the resistance is not as specified, repair or replace the brush holder.

(b) Inspect the load of the brush spring.

(1) Take the pull scale reading immediately after the brush spring separates from the brush.

Standard spring installed load:

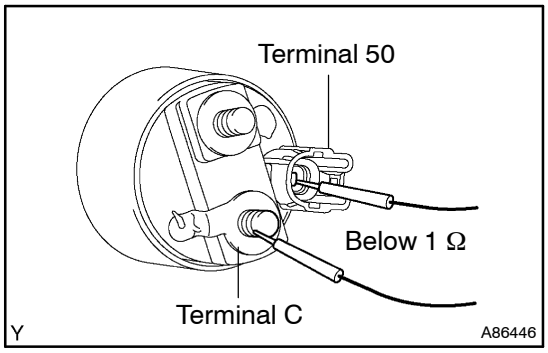
23.5 to 29.5 N (2.4 to 3.0 kgf, 5.3 to 6.6 lbf)



If the installed load is less than minimum replace the brush springs.

11. INSPECT STARTER CENTER BEARING CLUTCH SUB–ASSY

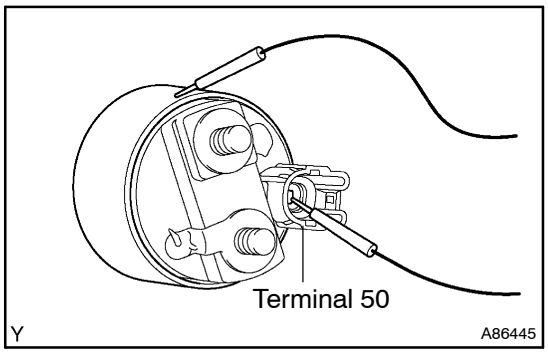
(a) Check the gear teeth of the planetary gear and starter center bearing clutch for wear or damage.



If any of the planetary gear is damaged, replace the planetary gear assembly.

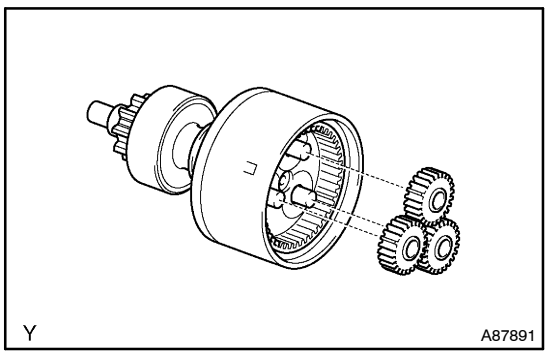
If any of the gears of the starter center bearing clutch is damaged, replace the clutch.

(b) Check the movement of the clutch pinion gear.
  (1) Rotate the clutch pinion gear clockwise, then check that it turns freely.
  (2) Try to rotate the clutch pinion gear counterclockwise, then check that it locks.



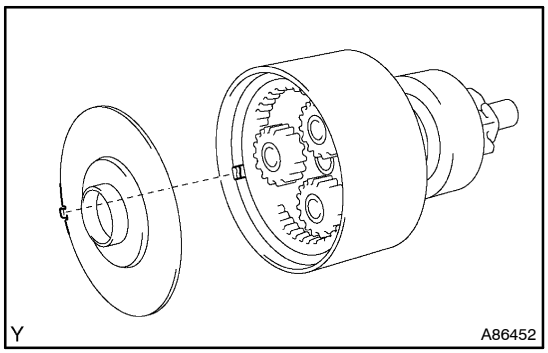
If necessary, replace the center bearing clutch sub–assembly.

12. INSPECT STARTER MAGNETIC SWITCH ASSY



(a) Inspect the resistance of the pull–in coil.
  (1) Using an ohmmeter, measure the resistance between terminals 50 and C.
  Standard: Below 1 Ω

If the resistance is not as specified, replace the starter magnetic switch.

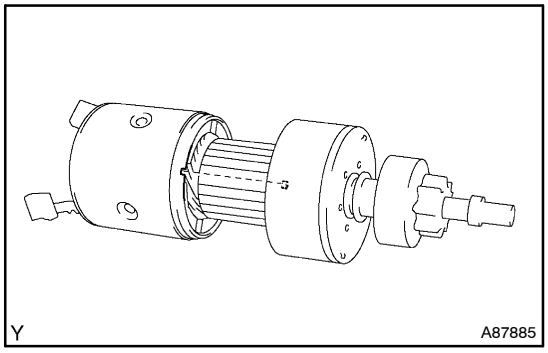


(b) Inspect the resistance of the hold–in coil.
  (1) Using an ohmmeter, measure the resistance between terminal 50 and the switch body.
  Standard: Below 1.5 Ω

If the resistance is not as specified, replace the starter magnetic switch.

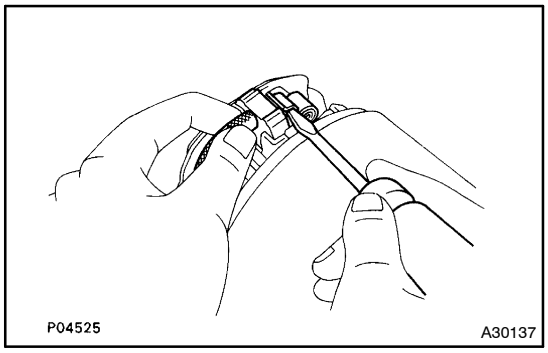
13. INSTALL PLANETARY GEAR

(a) Apply grease to the planetary gears of the planetary shaft.
(b) Install the 3 planetary gears.



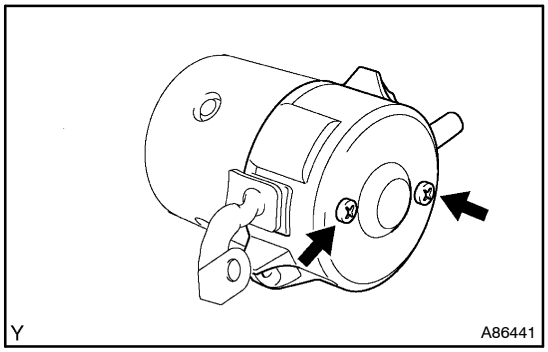
14. INSTALL STARTER ARMATURE PLATE

(a) Insert the starter armature plate to the starter center bearing clutch.
(b) Check that the keyway of the starter armature plate fits into the key of the starter center bearing clutch.



15. INSTALL STARTER ARMATURE ASSY

(a) Install the starter armature to the starter center bearing clutch.



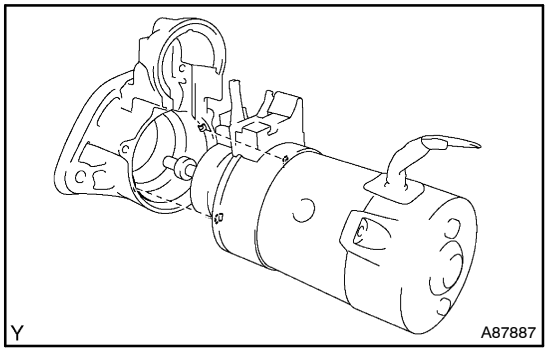
(b) Align the protrusion of the starter center bearing clutch with the cutout of the starter yoke, then install the starter center bearing clutch to the starter yoke.

(c) Install the brush holder.

(d) Using a screwdriver, hold the brush spring back and connect the brush into the brush holder.

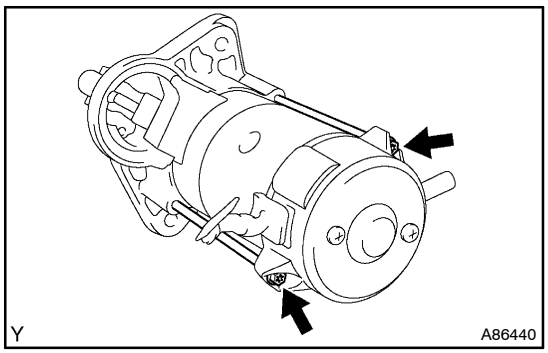
(e) Connect the 4 brushes.

16. INSTALL STARTER COMMUTATOR END FRAME ASSY



(a) Install the starter commutator end frame with the 2 screws.

Torque: 3.8 N·m (39 kgf·cm, 33 in.·lbf)

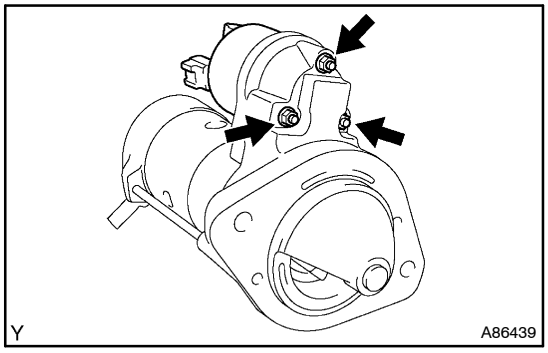


17. INSTALL STARTER DRIVE HOUSING ASSY

(a) Install the starter pinion drive lever to the starter center bearing clutch.

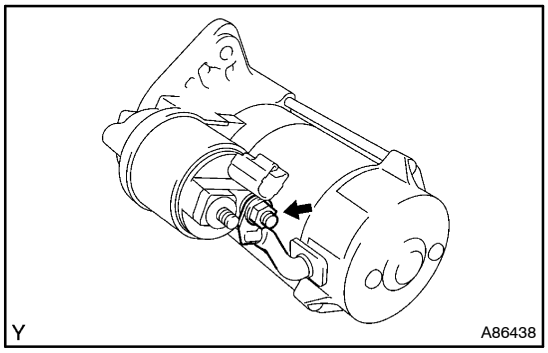
(b) Install the rubber seal to the starter pinion drive lever.

(c) Align the 2 protrusions of the starter center bearing clutch with the 2 cutouts of the starter drive housing, then install the starter center bearing clutch to the starter drive housing.



(d) Using a Torx wrench, install the starter drive housing with the 2 bolts.

Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

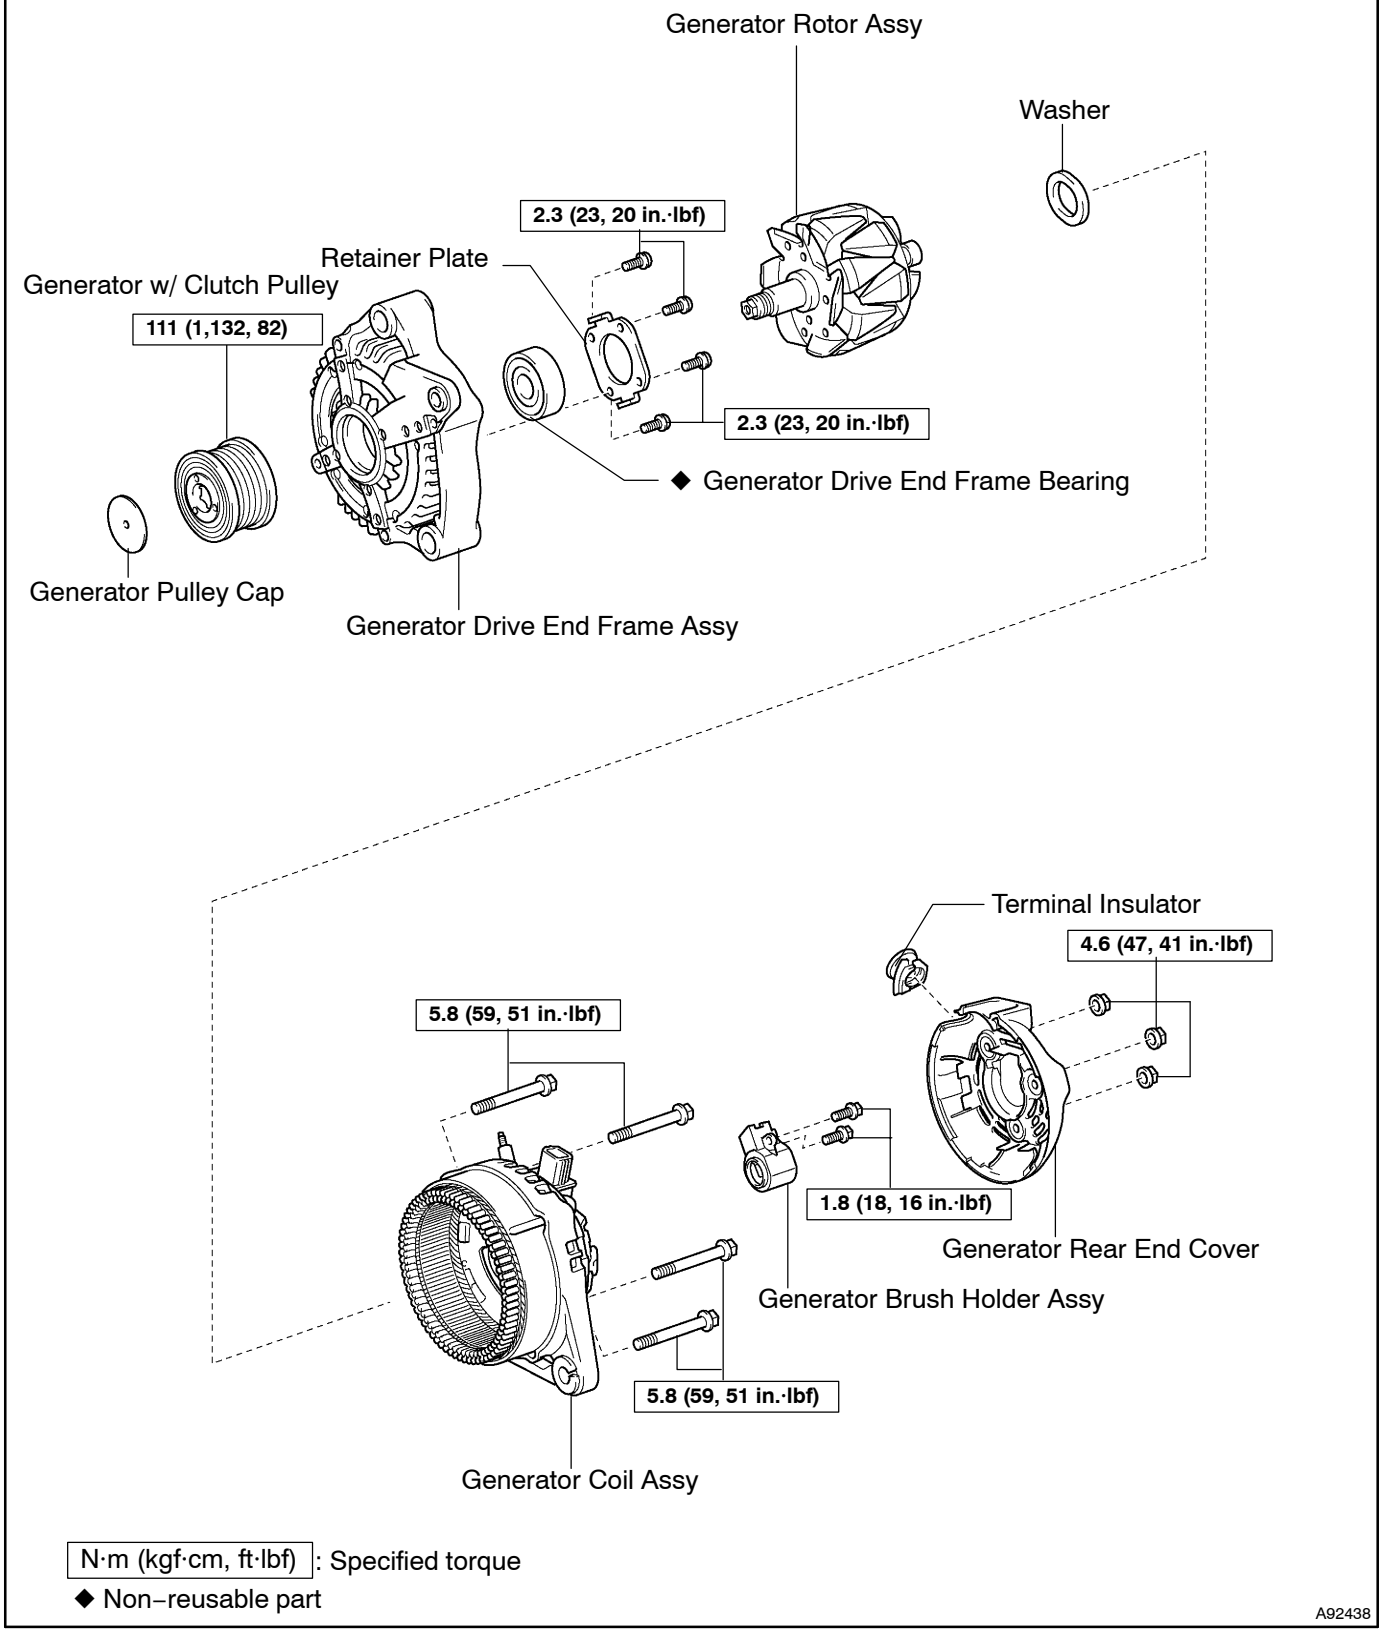


18. INSTALL STARTER MAGNETIC SWITCH ASSY

(a) Hook the plunger hook on the upper side of the starter pinion drive lever.

(b) Install the spring to the starter magnetic switch.

(c) Install the starter magnetic switch the 3 nuts.
Torque: 2.3 N·m (23 kgf·cm, 20 in.·lbf)

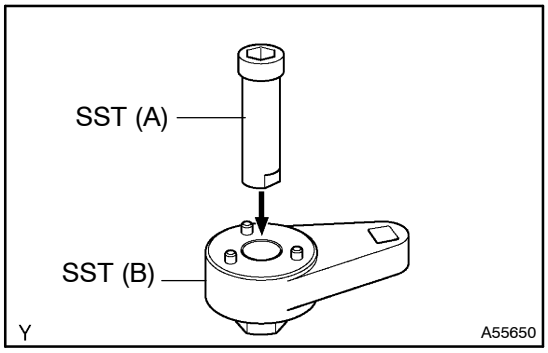


(d) Connect the lead wire to the terminal with the nut.
Torque: 5.9 N·m (60 kgf·cm, 52 in.·lbf)

GENERATOR ASSY (1CD–FTV)(From September, 2003)

COMPONENTS

190VC–01

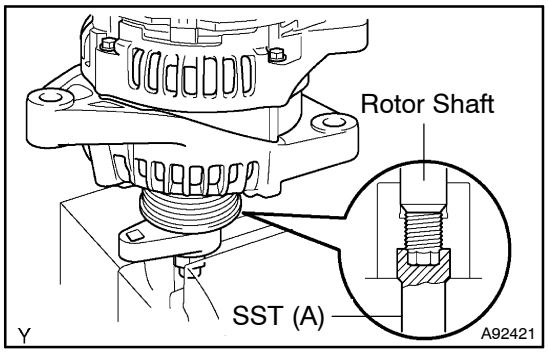


N·m (kgf·cm, ft·lbf) : Specified torque

◆ Non–reusable part

A92438

190VD–01

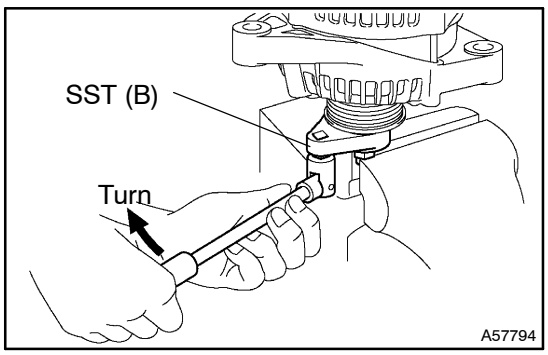


OVERHAUL

1. REMOVE GENERATOR W/CLUTCH PULLEY

(a) Remove the generator pulley cap.

(b) Set SST (A) and (B).
SST 09820–63020

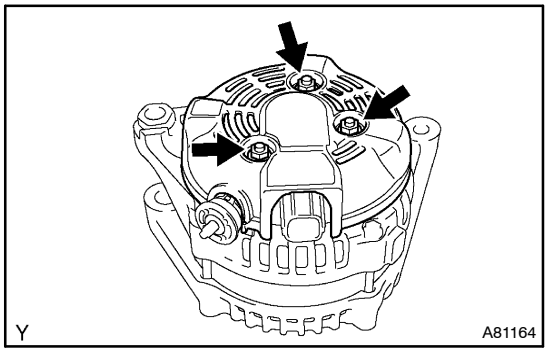


(c) Clamp SST (A) in a vise.

(d) Set the generator to SST.

NOTICE:

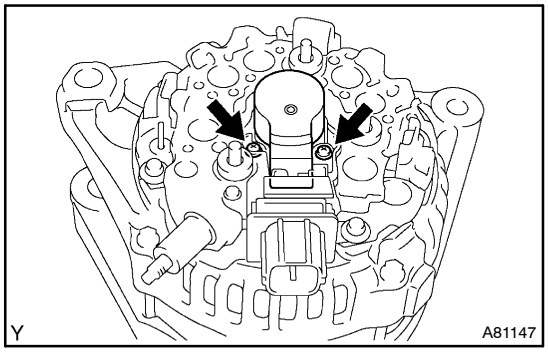
At this time, make sure that the generator and SST are perpendicular to one another.



(e) Insert the 3 tabs of SST (B) into the 3 holes on the pulley.

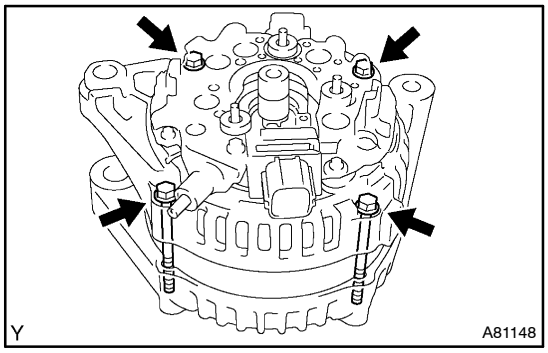
(f) To loosen the pulley, turn SST (B) in the direction shown in the illustration.

(g) Remove the generator from SST.



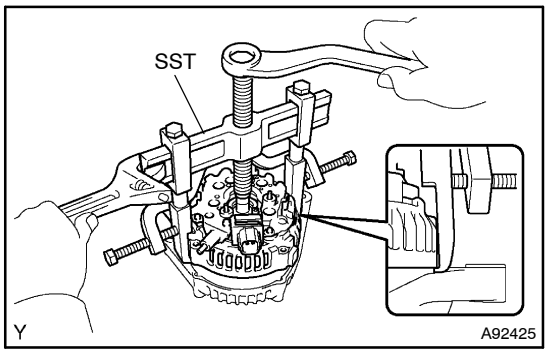
(h) Remove the pulley from the rotor shaft.

2. REMOVE GENERATOR REAR END COVER



(a) Remove the 3 nuts and end cover.

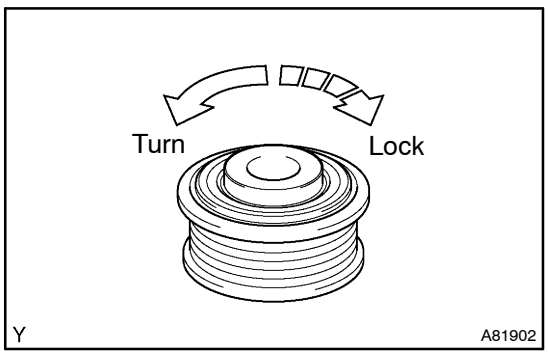
(b) Remove the terminal insulator.



3. REMOVE GENERATOR BRUSH HOLDER ASSY

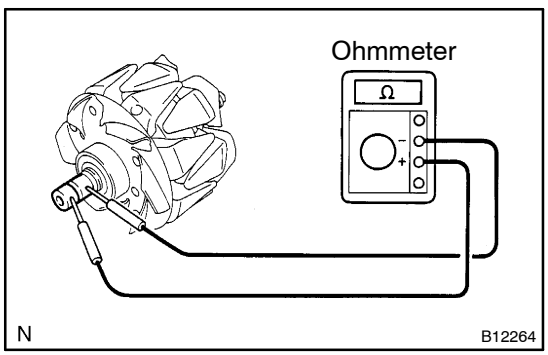
(a) Remove the 2 screws, then remove the generator brush holder.

4. REMOVE GENERATOR COIL ASSY



(a) Remove the 4 bolts.

(b) Using SST, remove the coil assembly.

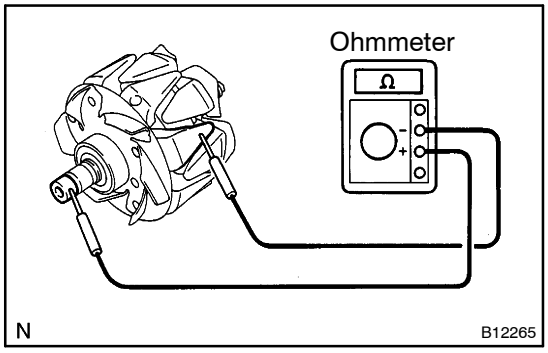


SST 09950–40011 (09951–04020, 09952–04010, 09953–04020, 09954–04010, 09955–04071, 09957–04010, 09958–04011)

5. REMOVE GENERATOR ROTOR ASSY

6. INSPECT GENERATOR W/CLUTCH PULLEY

(a) Check that the pulley is locked when it is turned clockwise, and that the pulley rotates smoothly when it is turned counterclockwise.



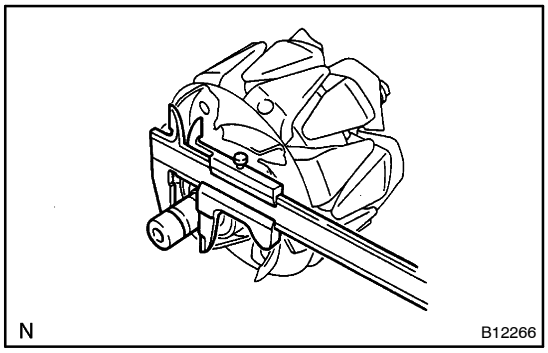
7. INSPECT GENERATOR ROTOR ASSY

(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the slip rings.

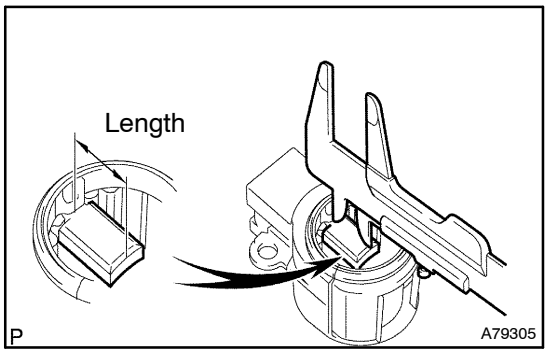
Standard resistance: 2.3 to 2.7 Ω at 20°C (68°F)

If the resistance is not as specified, replace the rotor.



(b) Inspect the resistance.
(1) Using an ohmmeter, measure the resistance between the slip ring and rotor.
Standard: 1 MΩ or higher

If the resistance is not as specified, replace the rotor.



(c) Check that the slip rings are not rough or scored.

If rough or scored, replace the rotor.

(d) Using vernier calipers, measure the slip ring diameter.
Standard diameter: 14.2 to 14.4 mm (0.559 to 0.567 in.)
Minimum diameter: 14.0 mm (0.551 in.)

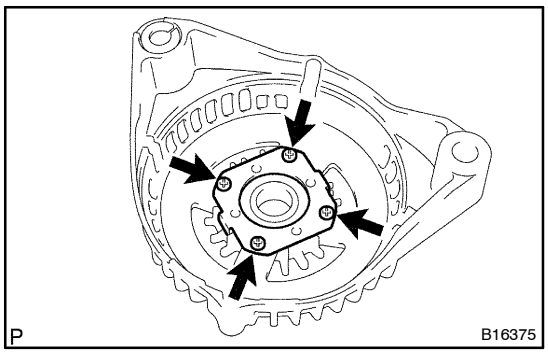
If the diameter is less than minimum, replace the rotor.

8. INSPECT GENERATOR BRUSH HOLDER ASSY

(a) Using vernier calipers, measure the exposed brush length.
Standard exposed length: 10.5 mm (0.413 in.)
Minimum exposed length: 4.5 mm (0.177 in.)

If the exposed length is less than minimum, replace the brushes and brush holder assembly.

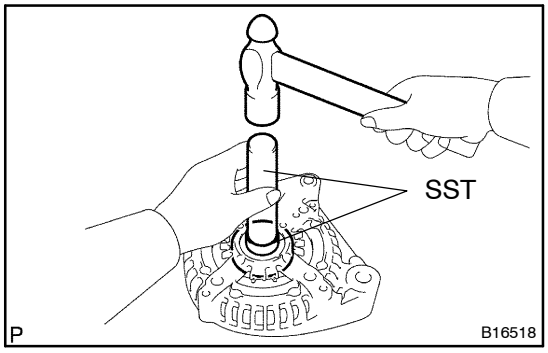
9. INSPECT GENERATOR ROTOR BEARING



(a) Check that the bearing is not rough or worn.

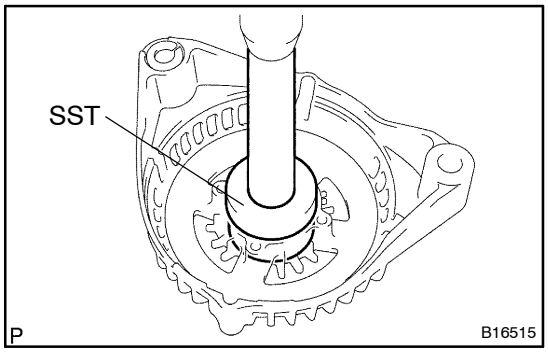
If necessary, replace the rotor.

10. INSPECT GENERATOR DRIVE END FRAME BEARING



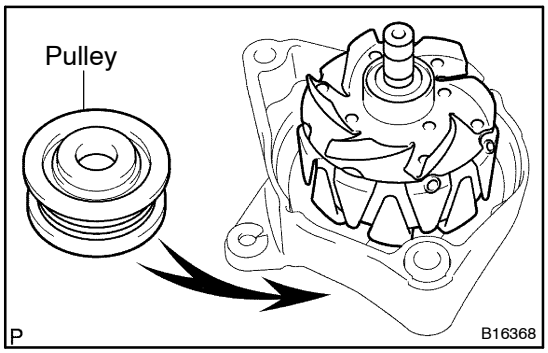
(a) Check that the bearing is not rough or worn.

If necessary, replace the bearing.



11. REMOVE GENERATOR DRIVE END FRAME BEARING

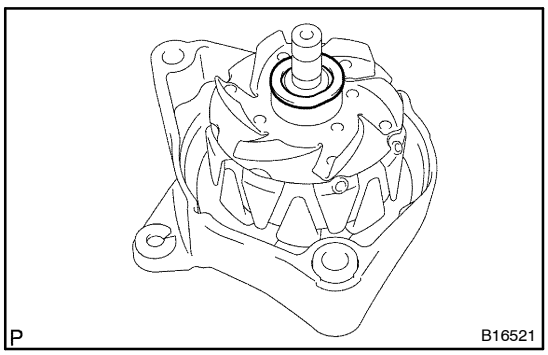
(a) Remove the 4 screws, bearing retainer.



(b) Using SST and a hammer, tap out the bearing.
SST 09950–60010 (09951–00250), 09950–70010 (09951–07100)

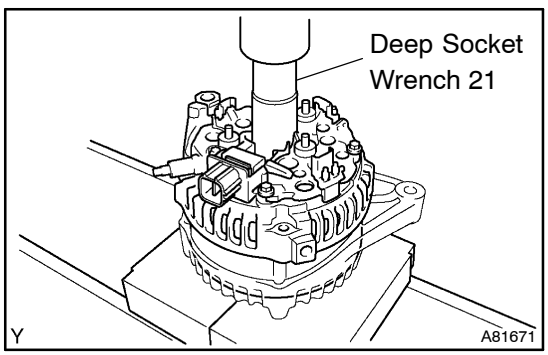
12. INSTALL GENERATOR DRIVE END FRAME BEARING

(a) Using SST and a press, press in a new bearing.
SST 09950–60010 (09951–00470), 09950–70010 (09951–07100)



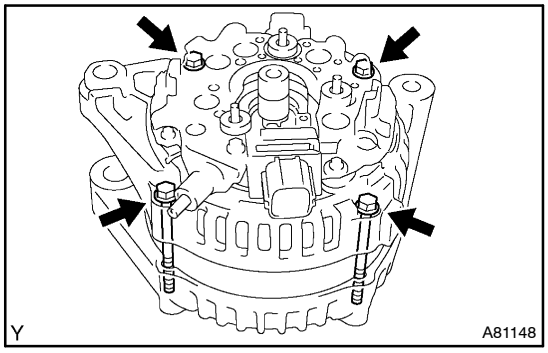
(b) Install the bearing retainer with the 4 screws.
Torque: 2.3 N·m (23 kgf·cm, 20 in.·lbf)

13. INSTALL GENERATOR ROTOR ASSY

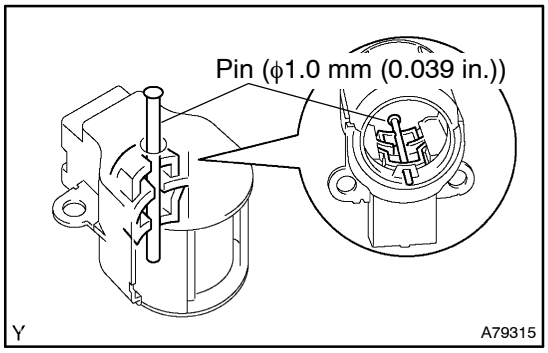


(a) Place the drive end frame on the pulley.

(b) Install the rotor to the drive end frame.

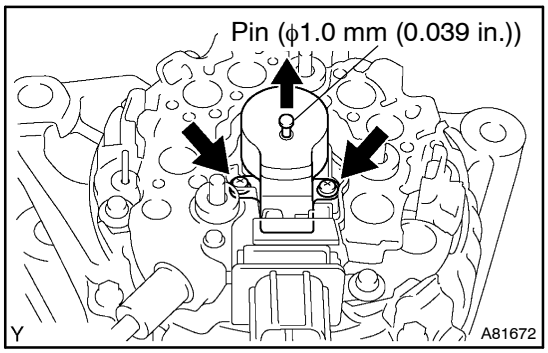


14. INSTALL GENERATOR COIL ASSY

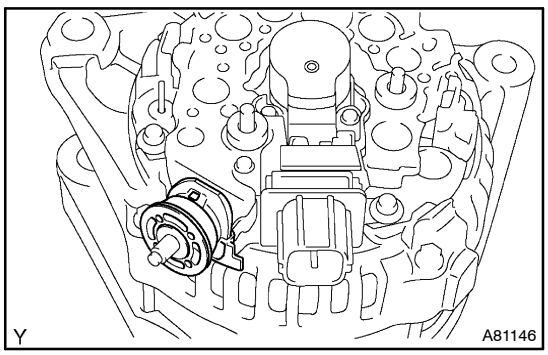


(a) Place the generator washer on the rotor.

(b) Using a 21 mm deep socket wrench and press, press in the coil carefully.



(c) Install the coil assembly with the 4 bolts.
Torque: 5.8 N·m (59 kgf·cm, 51 in.·lbf)

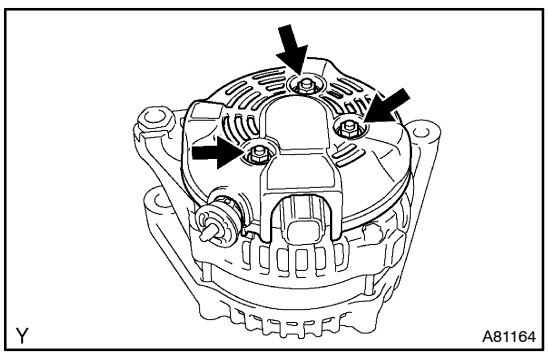


15. INSTALL GENERATOR BRUSH HOLDER ASSY

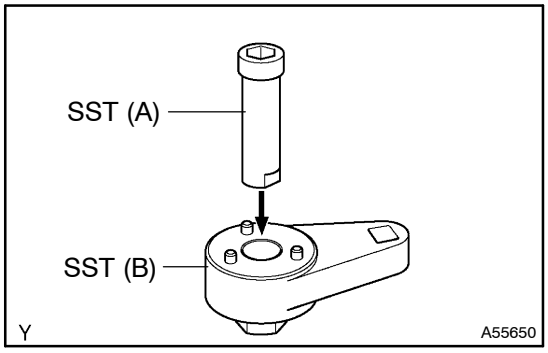
(a) While pushing the 2 brushes to inside the brush holder, insert a pin (ϕ1.0 mm (0.039 in.)) into the brush holder hole.

(b) Install the generator brush holder with the 2 screws.
Torque: 1.8 N·m (18 kgf·cm, 16 in.·lbf)

(c) Pull out the pin (ϕ1.0 mm (0.039 in.)) from the generator brush holder.



16. INSTALL GENERATOR REAR END COVER

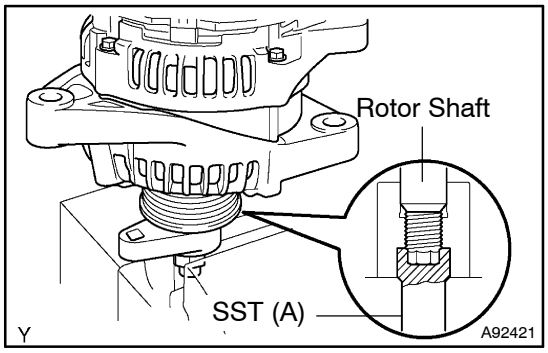


(a) Install the terminal insulator.

NOTICE:

Be careful of the terminal insulator installation direction.

(b) Install the end cover with the 3 nuts.
Torque: 4.6 N·m (47 kgf·cm, 41 in.·lbf)

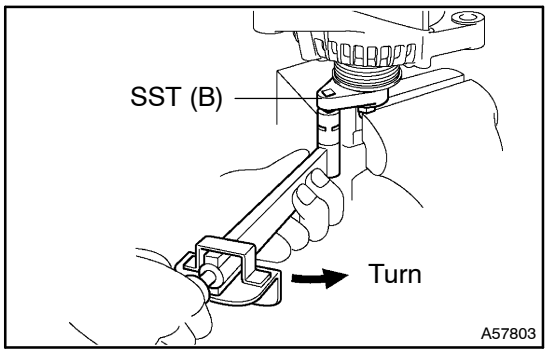


17. INSTALL GENERATOR W/CLUTCH PULLEY

(a) Temporarily install the pulley to the rotor shaft.

(b) Set SST (A) and (B).

SST 09820–63020



(c) Clamp SST (A) in a vise.

(d) Set the generator to SST.

NOTICE:

At this time, make sure that the generator and SST are perpendicular to one another.

(e) Insert the 3 tabs of SST (B) into the 3 holes on the pulley.

(f) To torque the pulley, turn SST (B) in the direction shown in the illustration.

Torque: 111 N·m (1,132 kgf·cm, 82 ft·lbf)

HINT:

Use a torque wrench with the fulcrum length of 50 cm (19.69 in.).

(g) Remove the generator from SST.

(h) Check that the generator pulley rotates smoothly.

(i) Install the generator pulley cap.

HOW TO USE THIS ENGINE REPAIR MANUAL

0108M–02

GENERAL INFORMATION

1. GENERAL DESCRIPTION

(a) This manual is made in accordance with SAE J2008.

(b) Generally repair operations can be separated in the following 3 main processes:
1. Diagnosis
2. Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting
3. Final Inspection

(c) This manual explains ”Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting”, but ”Final Inspection” is omitted.

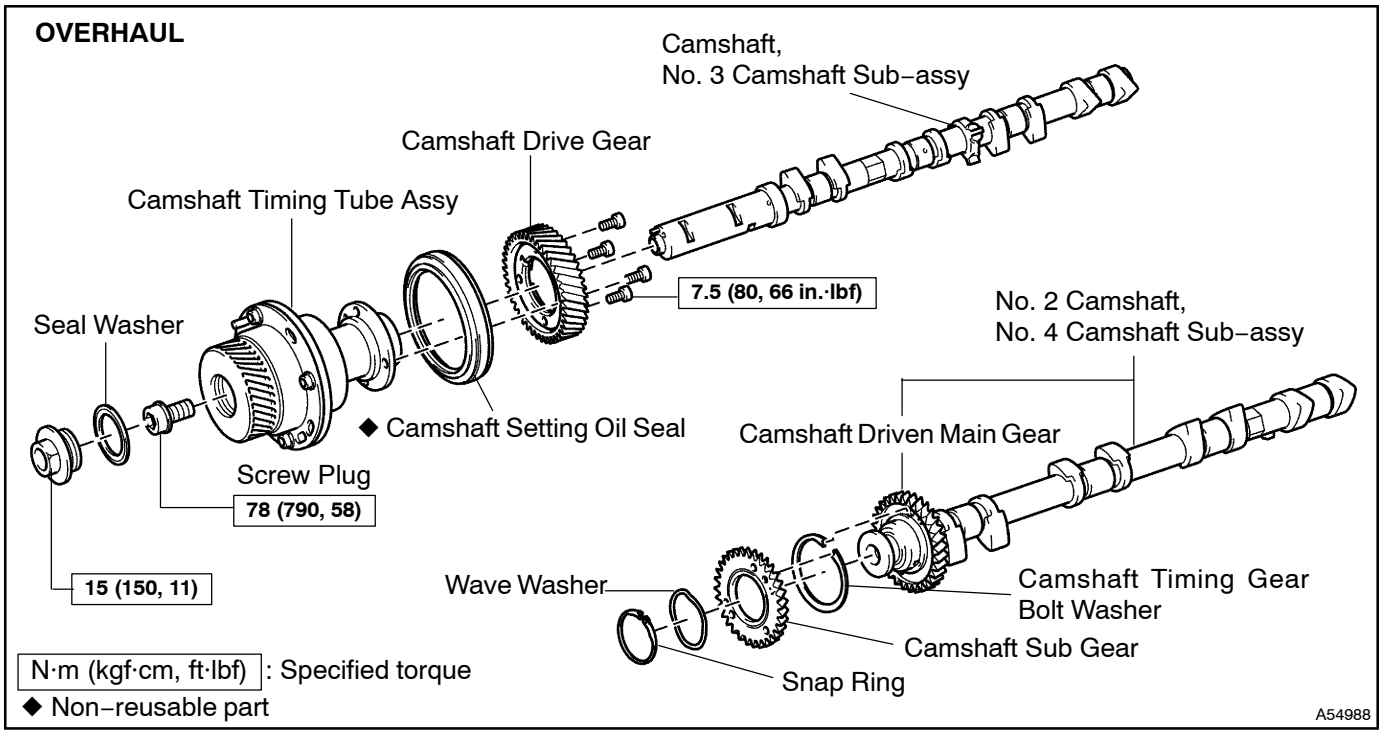
(d) The following essential operations are not written in this manual, however these operations must be done in the practical situation.
(1) Operation with a jack or lift
(2) Cleaning of a removed part when necessary
(3) Visual check

2. INDEX

(a) An alphabetical INDEX is provided as a section on the end of the book to guide you to the item to be repaired.

3. PREPARATION

(a) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the repairing condition. Be sure to use SST and SSM when they are required and follow the working procedure properly. A list of SST and SSM is in the Preparation section of this manual.



4. REPAIR PROCEDURES

(a) Component drawing is placed as the section or title when necessary.

(b) Illustrations of the parts catalog are placed as the ”disassembled parts drawing” so that it enables you to understand the fitting condition of the components.

(c) Non–reusable parts, grease applied parts, precoated parts and tightening torque are specified in the components drawing.

Example:

(d) Tightening torque, oil applying position, and non–reusable parts are described as important points in the procedure.

NOTICE:

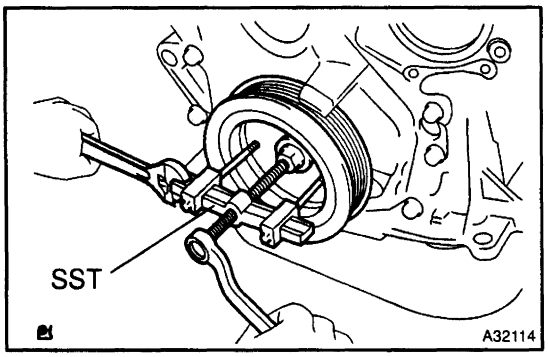
There are cases where such information can only be indicated by an illustration. In that case, all the information such as torque, oil, etc. are described in the illustration.

(e) Installing procedure of operation items is performed in the reverse order of the removing, and only the important points are described.

(f) Only items with points are described in the procedure, and the operational portion and content are placed using an illustration. In the explanations, details of the operational method, standard value and notice are placed.

(g) There may be a case where the illustrations of similar models are used. In that case the details may be different from the actual vehicle.

(h) The procedures are presented in a step–by–step format:



(1) The illustration shows what to do and where to do it.

(2) The task heading tells what to do.

(3) The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

Illustration: what to do and where

Task heading: what to do

5. REMOVE CRANKSHAFT PULLEY

(a) Using SST, remove the crankshaft pully.
SST 09950–50012 (09951–05010, 09952–05010, 09953–05020, 09954–05020, 09957–04010)

Set part No. *Component part No.* *Detailed text: how to do task*

A59974

HINT:

This format provides an experienced technician with a FAST TRACK to the necessary information. The task heading can be read at a glance when necessary, and the text below provides detailed information. Important specifications and warnings always stand out in bold type.

5. SERVICE SPECIFICATIONS

(a) Specifications are presented in bold type throughout the manual. You never have to leave the procedure to look up your specifications. The specifications are also found in the Service Specifications section for a quick reference.

6. TERMS DEFINITION

CAUTION	Indicate the possibility of injury to you or other people.
NOTICE	Indicate the possibility of damage to the components being repaired.
HINT	Provide additional information to help you perform the repair efficiently.

7. SI UNIT

(a) The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System.

Example:

Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

REPAIR INSTRUCTION FOR ENGINE REPAIR MANUAL

0108N–02

PRECAUTION

1. TO PREVENT FROM ENTERING FOREIGN SUBSTANCES

(a) When foreign substances such as dust, grain of sand or metallic dust enter inside of engine, it often causes functional failure of the engine.

(1) Precaution before disassembly.

- Remove adequately all sand and mud adhere to the outside of engine .

(2) Precaution at reassembly.

- Protect disassembled parts from dust by using vinyl sheet to cover.

2. TO PREVENT SCRATCHES ON THE PARTS

(a) The existence of scratches on the contact and revolving surfaces often causes oil leak and seisure.

(1) Precautions at disassembly and reassembly.

- When disassemble the contact surface of the parts, use plastic hummer striking lightly. (Do not pry out by screwdriver).
- When fix the parts to the vise, do not directly catch it in the vise. Fix the parts through aluminum bar.

3. TO CLEAN AND WASH THE PARTS

(a) Each parts needs to be well cleaned, washed, and dried by air, and apply specified oil before reassembly.

(1) Cleaning and washing by alkaline solvent is prohibited:

- Parts made of aluminum and rubber. (ex. cylinder head cover gasket etc.)

(2) Cleaning and washing by flushing oil (ex. kerosene, white gasoline etc.) is prohibited:

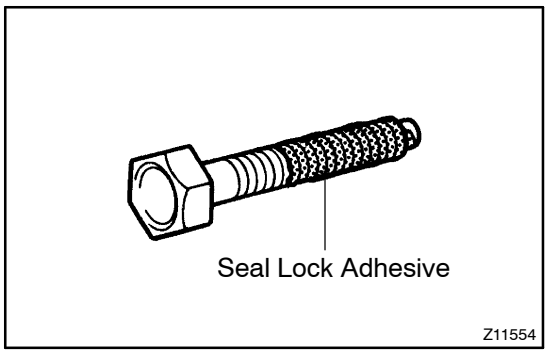
- Parts made of rubber. (ex. cylinder head cover gasket etc.)

4. POSITION AND DIRECTION OF EACH PARTS

(a) Each parts needs to be reassembled as the same position and direction as it disassembled.

(1) Precautions at disassembly and reassembly.

- Follow the directions when the manual designates to mark the matchmark and/or direction mark.
- Disassembled parts needs to be put in order as disassembled, not to change position and/or direction.
- Follow the directions when the manual instructs the position and direction.



5. INSTALL ENGINE ASSEMBLY TO OVERHAUL STAND WHEN OVERHAUL THE ENGINE

6. PUT THE DISASSEMBLED PARTS IN ORDER AS THEY DISASSEMBLED

7. APPLY ENGINE OIL TO THE SLIDING AND ROTATING SURFACES

8. NON–REUSABLE PARTS SUCH AS GASKET AND SEAL NEEDS TO BE CHANGED TO THE NEW PARTS

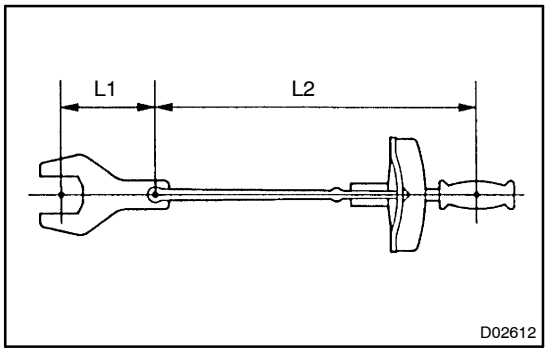
9. BASIC REPAIR HINT

(a) Precoated Parts:

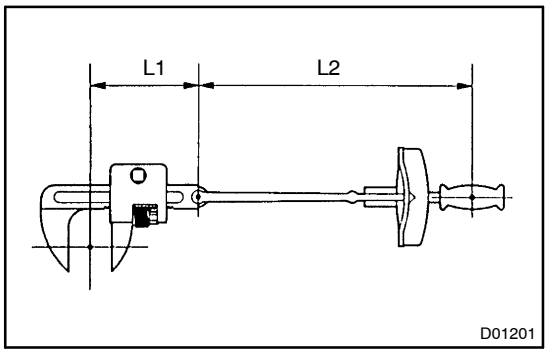
(1) Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.

(2) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.

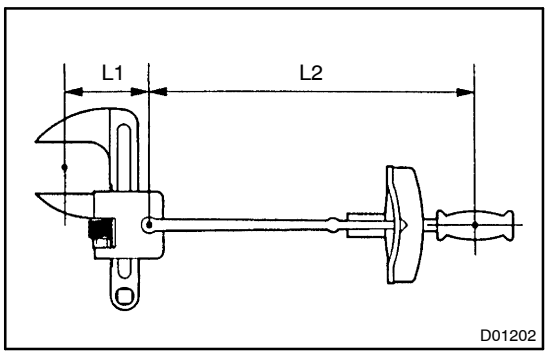
(3) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.



NOTICE:



Do the torque checking with the lower limit value of the torque tolerance.



(4) Depending on the seal lock agent to apply, there may be a case where it is necessary to leave it for a specified time until it hardens.

(b) Gaskets:
When necessary, use a sealer on gaskets to prevent leaks.

(c) Bolts, Nuts and Screws:
Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.

(d) Torque When Using Extension Tool with Torque Wrench:

(1) In case of tightening by extending the entire length of the torque wrench combined with SST or tool, if you tighten until the reading of the torque wrench reached the specified torque value, the actual torque becomes excessive.

(2) In this text, only the specified torque is described. In case of using SST or extension tool, find the reading of the torque wrench by the formula.

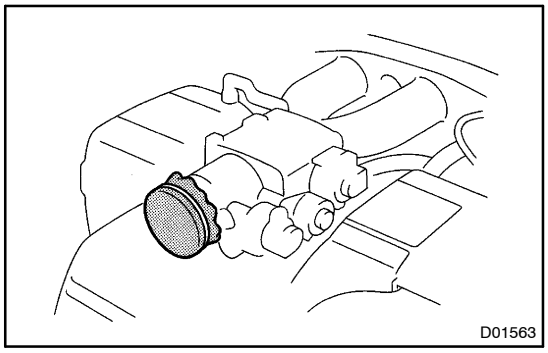
(3) Formula T' = T x L2/(L1 + L2)

T'	Reading of torque wrench {N·m (kgf·cm, ft·lbf)}
T	Torque {N·m (kgf·cm, ft·lbf)}
L1	Length of SST or tool (cm)
L2	Length of torque wrench (cm)

10. REMOVAL AND INSTALLATION OF FUEL CONTROL PARTS

(a) Place for Removing and Installing Fuel System Parts:

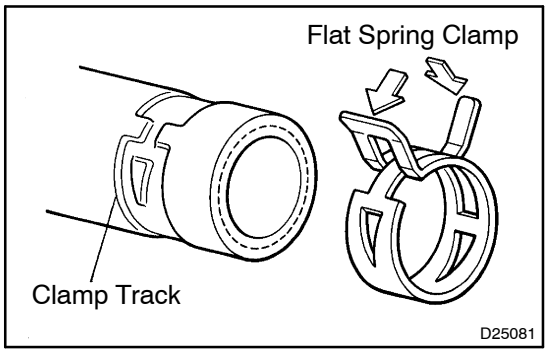
(1) Place with good air ventilation and without anything flammable such as welder, grinder, drill, electric motor or stove in the surroundings.



(2) Never work in a place like a pit or nearby pit as there is a possibility that vaporized fuel fills those places.

(b) Removing and Installing of Fuel System Parts:

(1) Prepare a fire extinguisher before starting the operation.



(2) For prevention of the static electricity, install a ground on the fuel changer, vehicle and fuel tank, and do not spray much water so as to prevent slipping.

(3) Never use any electric equipment like an electric motor or a working light as they may cause spark or high temperature.
(4) Never use an iron hammer as it may cause spark.
(5) Dispose the shop lag separately from any fuel deposit.

D01563

11. REMOVAL AND INSTALLATION OF ENGINE INTAKE PARTS

(a) If any metal tip is mixed in the inlet pass, that may give a bad effect to the engine and turbo charger.
(b) When removing and installing of the inlet system parts, close the opening of the removed inlet system parts and the engine with a clean shop lag or gum tape.
(c) When installing the inlet system parts, check that there is no mixing of a metal tip.

D25081

12. HANDLING OF HOSE CLAMPS

(a) Before removing the hose, check the depth of inserting portion and the clamp position to restore it surely.
(b) Change a deformed or dented into a new one.
(c) In case of reusing the hose, install the clamp on the hose where it has a clamp track.
(d) For a flat spring type clamp, make it adjust by adding force to the arrow mark direction after the installation.

TERMS FOR ENGINE REPAIR MANUAL

0108O–02

ABBREVIATIONS USED IN MANUAL

Abbreviations	Meaning
ABS	Anti–Lock Brake System
A/C	Air Conditioner
AC	Alternating Current
ACC	Accessory
ACIS	Acoustic Control Induction System
ACSD	Automatic Cold Start Device
A.D.D.	Automatic Disconnecting Differential
A/F	Air–Fuel Ratio
AHC	Active Height Control Suspension
ALR	Automatic Locking Retractor
ALT	Alternator
AMP	Amplifier
ANT	Antenna
APPROX.	Approximately
ASSY	Assembly
A/T	Automatic Transmission (Transaxle)
ATF	Automatic Transmission Fluid
AUTO	Automatic
AUX	Auxiliary
AVG	Average
AVS	Adaptive Variable Suspension
B+	Battery Voltage
BACS	Boost Altitude Compensation System
BAT	Battery
BDC	Bottom Dead Center
B/L	Bi–Level
B/S	Bore–Stroke Ratio
BTDC	Before Top Dead Center
BVSV	Bimetallic Vacuum Switching Valve
CB	Circuit Breaker
CCo	Catalytic Converter For Oxidation
CD	Compact Disc
CF	Cornering Force
CG	Center Of Gravity
CH	Channel
CKD	Complete Knock Down
COMB.	Combination
CPE	Coupe
CPS	Combustion Pressure Sensor
CPU	Central Processing Unit
CRS	Child Restraint System
CTR	Center
C/V	Check Valve
CV	Control Valve
CW	Curb Weight
DC	Direct Current
DEF	Defogger
DFL	Deflector

Abbreviations	Meaning
DIFF.	Differential
DIFF. LOCK	Differential Lock
D/INJ	Direct Injection
DLC	Data Link Connector
DLI	Distributorless Ignition
DOHC	Double Overhead Cam
DP	Dash Pot
DS	Dead Soak
DSP	Digital Signal Processor
DTC	Diagnostic Trouble Code
ECAM	Engine Control And Measurement System
ECD	Electronic Controlled Diesel
ECDY	Eddy Current Dynamometer
ECT	Electronic Control Transmission
ECU	Electronic Control Unit
ED	Electro–Deposited Coating
EDU	Electronic Driving Unit
EDIC	Electric Diesel Injection Control
EFI	Electronic Fuel Injection
E/G	Engine
EGR	Exhaust Gas Recirculation
EGR–VM	EGR–Vacuum Modulator
ELR	Emergency Locking Retractor
ENG	Engine
ESA	Electronic Spark Advance
ETCS	Electronic Throttle Control System
EVAP	Evaporative Emission Control
EVP	Evaporator
E–VRV	Electric Vacuum Regulating Valve
EX	Exhaust
FE	Fuel Economy
FF	Front–Engine Front–Wheel–Drive
F/G	Fuel Gauge
FIPG	Formed In Place Gasket
FL	Fusible Link
F/P	Fuel Pump
FPU	Fuel Pressure Up
FR	Front
F/W	Flywheel
FW/D	Flywheel Damper
FWD	Front–Wheel–Drive
GAS	Gasoline
GND	Ground
HAC	High Altitude Compensator
H/B	Hatchback
H–FUSE	High Current Fuse
HI	High
HID	High Intensity Discharge (Head Lamp)
HSG	Housing
HT	Hard Top
HWS	Heated Windshield System

Abbreviations	Meaning
IC	Integrated Circuit
IDI	Indirect Diesel Injection
IFS	Independent Front Suspension
IG	Ignition
IIA	Integrated Ignition Assembly
IN	Intake (Manifold, Valve)
INT	Intermittent
I/P	Instrument Panel
IRS	Independent Rear Suspension
ISC	Idle Speed Control
J/B	Junction Block
J/C	Junction Connector
KD	Kick–Down
LAN	Local Area Network
LB	Liftback
LCD	Liquid Crystal Display
LED	Light Emitting Diode
LH	Left–Hand
LHD	Left–Hand Drive
L/H/W	Length, Height, Width
LLC	Long–Life Coolant
LNG	Liquified Natural Gas
LO	Low
LPG	Liquified Petroleum Gas
LSD	Limited Slip Differential
LSP & PV	Load Sensing Proportioning And Bypass Valve
LSPV	Load Sensing Proportioning Valve
MAP	Manifold Absolute Pressure
MAX.	Maximum
MIC	Microphone
MIL	Malfunction Indicator Lamp
MIN.	Minimum
MP	Multipurpose
MPI	Multipoint Electronic Injection
MPX	Multiplex Communication System
M/T	Manual Transmission
MT	Mount
MTG	Mounting
N	Neutral
NA	Natural Aspiration
NO.	Number
O2S	Oxygen Sensor
O/D	Overdrive
OEM	Original Equipment Manufacturing
OHC	Overhead Camshaft
OHV	Overhead Valve
OPT	Option
O/S	Oversize
P & BV	Proportioning And Bypass Valve
PCS	Power Control System
PCV	Positive Crankcase Ventilation

Abbreviations	Meaning
PKB	Parking Brake
PPS	Progressive Power Steering
PS	Power Steering
PTO	Power Take–Off
P/W	Power Window
R & P	Rack And Pinion
R/B	Relay Block
RBS	Recirculating Ball Type Steering
R/F	Reinforcement
RFS	Rigid Front Suspension
RRS	Rigid Rear Suspension
RH	Right–Hand
RHD	Right–Hand Drive
RLY	Relay
ROM	Read Only Memory
RR	Rear
RRS	Rear–Wheel Drive
RWD	Rear–Wheel Drive
SDN	Sedan
SEN	Sensor
SICS	Starting Injection Control System
SOC	State Of Charge
SOHC	Single Overhead Camshaft
SPEC	Specification
SPI	Single Point Injection
SRS	Supplemental Restraint System
SSM	Special Service Materials
SST	Special Service Tools
STD	Standard
STJ	Cold–Start Fuel Injection
SW	Switch
SYS	System
T/A	Transaxle
TACH	Tachometer
TBI	Throttle Body Electronic Fuel Injection
TC	Turbocharger
TCCS	TOYOTA Computer–Controlled System
TCV	Timing Control Valve
TDC	Top Dead Center
TEMP.	Temperature
TEMS	TOYOTA Electronic Modulated Suspension
TFT	Toyota Free–Tronic
TIS	Total Information System For Vehicle Development
T/M	Transmission
TMC	TOYOTA Motor Corporation
TMMK	TOYOTA Motor Manufacturing Kentucky, Inc.
TRC	Traction Control System
TURBO	Turbocharge
TWC	Three–Way Catalyst
U/D	Underdrive
U/S	Undersize

Abbreviations	Meaning
VCV	Vacuum Control Valve
VENT	Ventilator
VIN	Vehicle Identification Number
VPS	Variable Power Steering
VSC	Vehicle Skid Control
VSV	Vacuum Switching Valve
VTV	Vacuum Transmitting Valve
VVT–i	Variable Valve Timing–intelligent
W/	With
WGN	Wagon
W/H	Wire Harness
W/O	Without
1ST	First
2ND	Second
2WD	Two Wheel Drive Vehicle (4 x 2)
3RD	Third
4TH	Fourth
4WD	Four Wheel Drive Vehicle (4 x 4)
4WS	Four Wheel Steering System
5TH	Fifth

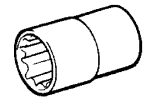
0108P–02

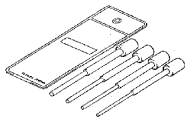
GLOSSARY OF SAE AND TOYOTA TERMS

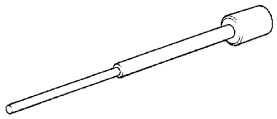
This glossary lists all SAE–J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

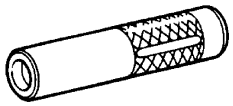
SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ( )––ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	–
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburettor	Carburettor
CFI	Continuous Fuel Injection	–
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft Position	Cam Angle
CPP	Clutch Pedal Position	–
CTOX	Continuous Trap Oxidizer	–
CTP	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI)
DI	Distributor Ignition	–
DLC1 DLC2 DLC3	Data Link Connector 1 Data Link Connector 2 Data Link Connector 3	1: Check Connector 2: Total Diagnosis Comunication Link (TDCL) 3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Code
DTM	Diagnostic Test Mode	–
ECL	Engine Control Level	–
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	TOYOTA Distributorless Ignition (TDI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	–
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	–
FEPROM	Flash Erasable Programmable Read Only Memory	–
FF	Flexible Fuel	–
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)

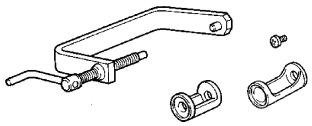
HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO_2S)
IAC	Idle Air Control	Idle Speed Control (ISC)
IAT	Intake Air Temperature	Intake or Inlet Air Temperature
ICM	Ignition Control Module	–
IFI	Indirect Fuel Injection	Indirect Injection (IDL)
IFS	Inertia Fuel–Shutoff	–
ISC	Idle Speed Control	–
KS	Knock Sensor	Knock Sensor
MAF	Mass Air Flow	Air Flow Meter
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)
MDP	Manifold Differential Pressure	–
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)
MIL	Malfunction Indicator Lamp	Check Engine Lamp
MST	Manifold Surface Temperature	–
MVZ	Manifold Vacuum Zone	–
NVRAM	Non–Volatile Random Access Memory	–
O2S	Oxygen Sensor	Oxygen Sensor, O_2 Sensor (O_2S)
OBD	On–Board Diagnostic	On–Board Diagnostic System (OBD)
OC	Oxidation Catalytic Converter	Oxidation Catalyst Convert (OC), CCo
OP	Open Loop	Open Loop
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)
PCM	Powertrain Control Module	–
PNP	Park/Neutral Position	–
PROM	Programmable Read Only Memory	–
PSP	Power Steering Pressure	–
PTOX	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)
RAM	Random Access Memory	Random Access Memory (RAM)
RM	Relay Module	–
ROM	Read Only Memory	Read Only Memory (ROM)
RPM	Engine Speed	Engine Speed
SC	Supercharger	Supercharger
SCB	Supercharger Bypass	E–ABV
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection
SPL	Smoke Puff Limiter	–
SRI	Service Reminder Indicator	–
SRT	System Readiness Test	–
ST	Scan Tool	–
TB	Throttle Body	Throttle Body
TBI	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)
TC	Turbocharger	Turbocharger
TCC	Torque Converter Clutch	Torque Converter

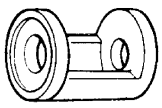


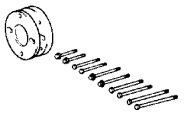


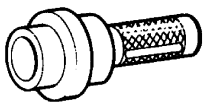


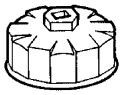












TCM	Transmission Control Module	Transmission ECU, ECT ECU
TP	Throttle Position	Throttle Position
TR	Transmission Range	–
TVV	Thermal Vacuum Valve	Bimetallic Vacuum Switching Valve (BVSV) Thermostatic Vacuum Switching Valve (TVSV)
TWC	Three–Way Catalytic Converter	Three–Way Catalytic (TWC) Manifold Converter CC_{RO}
TWC+OC	Three–Way + Oxidation Catalytic Converter	CC_R + CCo
VAF	Volume Air Flow	Air Flow Meter
VR	Voltage Regulator	Voltage Regulator
VSS	Vehicle Speed Sensor	Vehicle Speed Sensor
WOT	Wide Open Throttle	Full Throttle
WU–OC	Warm Up Oxidation Catalytic Converter	–
WU–TWC	Warm Up Three–Way Catalytic Converter	–
3GR	Third Gear	–
4GR	Fourth Gear	–

030LM–08

HOW TO DETERMINE NUT STRENGTH

Nut Type			Class
Present Standard Hexagon Nut	Old Standard Hexagon Nut		
	Cold Forging Nut	Cutting Processed Nut	
 No Mark			4N
 No Mark (w/ Washer)	 No Mark (w/ Washer)	 No Mark	5N (4T)
 6N			6N
		 *	7N (5T)
 8N			8N
 10N		 No Mark	10N (7T)
 11N			11N
 12N			12N

*: Nut with 1 or more marks on one side surface of the nut.

B06432

HINT:

Use the nut with the same number of the nut strength classification or the greater than the bolt strength classification number when tightening parts with a bolt and nut.

Example: Bolt = 4T

Nut = 4N or more

ENGINE MECHANICAL

SERVICE DATA

031H1–04

Oil pump drive gear		
Gear diameter (w/chain)	Minimum	48.2 mm (1.898 in.)
Oil pump drive shaft gear		
Gear diameter (w/chain)	Minimum	48.2 mm (1.898 in.)
Crankshaft timing gear or sprocket		
Gear diameter (w/chain)	Minimum	51.6 mm (2.031 in.)
Chain tensioner slipper		
Wear	Maximum	1.0 mm (0.039 in.)
Chain vibration damper No.1		
Wear	Maximum	1.0 mm (0.039 in.)
Cylinder head set bolt		
Bolt length	Standard	161.3 to 162.7 mm (6.350 to 6.406 in.)
	Maximum	164.2 mm (6.465 in.)
Chain sub–assy		
Elongation	Maximum	115.4 mm (4.543 in.)
Camshaft timing gear or sprocket		
Sprocket diameter (w/chain)	Minimum	97.3 mm (3.831 in.)
Camshaft		
Circle runout	Maximum	0.03 mm (0.0012 in.)
Cam lobe height	Standard	45.510 to 45.610 mm (1.7917 to 1.7957 in.)
	Minimum	45.430 mm (1.7886 in.)
Camshaft No.2		
Circle runout	Maximum	0.03 mm (0.0012 in.)
Cam lobe height	Standard	45.983 to 46.083 mm (1.8106 to 1.8143 in.)
	Minimum	45.900 mm (1.8071 in.)
No. 1 journal diameter		35.971 to 35.985 mm (1.4162 to 1.4167 in.)
Other journal diameter		22.959 to 22.975 mm (0.9039 to 0.9045 in.)
Thrust clearance		
Intake	Standard	0.040 to 0.095 mm (0.0016 to 0.0037 in.)
	Maximum	0.11 mm (0.0043 in.)
Exhaust	Standard	0.080 to 0.135 mm (0.0032 to 0.0053 in.)
	Maximum	0.15 mm (0.0059 in.)
Oil clearance		
Intake No. 1 journal bearing mark 1	Standard	0.007 to 0.038 mm (0.0028 to 0.00150 in.)
Intake No. 1 journal bearing mark 2	Standard	0.008 to 0.038 mm (0.0031 to 0.00150 in.)
Intake No. 1 journal bearing mark 3	Standard	0.008 to 0.038 mm (0.0031 to 0.00150 in.)
Exhaust No. 1 journal	Standard	0.040 to 0.079 mm (0.00157 to 0.00311 in.)
Other journals	Standard	0.025 to 0.062 mm (0.00098 to 0.00244 in.)
Intake No. 1 journal	Maximum	0.07 mm (0.0028 in.)
Other journals	Maximum	0.10 mm (0.0039 in.)
Valve clearance	(Cold)	
Intake		0.19 to 0.29 mm (0.007 to 0.0114 in.)
Exhaust		0.30 to 0.40 mm (0.012 to 0.0160 in.)
Cylinder head		
Warpage		
Cylinder block side	Maximum	0.05 mm (0.0020 in.)
Intake manifold side	Maximum	0.08 mm (0.0031 in.)
Exhaust manifold side	Maximum	0.08 mm (0.0031 in.)
Inner compression spring		
Free length		45.7 mm (1.799 in.)
Deviation	Maximum	1.6 mm (0.063 in.)
Intake valve		
Overall length	Standard	101.71 mm (4.0043in.)
	Minimum	101.21 mm (3.9846in.)
Valve stem diameter		5.470 to 5.485 mm (0.2154 to 0.2159 in.)
Margin thickness	Standard	1.05 to 1.45 mm (0.041 to 0.057 in.)
	Minimum	0.75 mm (0.030 in.)

Exhaust valve		
Overall length	Standard	101.15 mm (3.9823in.)
	Minimum	100.70 mm (3.9646 in.)
Valve stem diameter		5.465 to 5.480 mm (0.2152 to 0.2157 in.)
Margin thickness	Standard	1.2 to 1.6 mm (0.047 to 0.063 in.)
	Minimum	0.9 mm (0.035 in.)
Intake valve guide bush		
Bushing inside diameter		5.510 to 5.530 mm (0.2169 to 0.2177 in.)
Oil clearance	Standard	0.025 to 0.060 mm (0.00098 to 0.00236 in.)
	Maximum	0.08 mm (0.0031 in.)
Diameter		10.285 to 10.306 mm (0.4049 to 0.4057 in.)
Protrusion height		9.6 to 10.0 mm (0.3779 to 0.3937 in.)
Exhaust valve guide bush		
Bushing inside diameter		5.510 to 5.530 mm (0.2169 to 0.2177 in.)
Oil clearance	Standard	0.030 to 0.065 mm (0.0012 to 0.0026 in.)
	Maximum	0.10 mm (0.0039 in.)
Diameter		10.285 to 10.306 mm (0.4049 to 0.4057 in.)
Protrusion height		9.6 to 10.0 mm (0.3779 to 0.3937 in.)
Valve lifter		
Lifter diameter		30.966 to 30.976 mm (1.2191 to 1.2195 in.)
Lifter bore diameter		31.009 to 31.025 mm (1.2208 to 1.2215 in.)
Oil clearance	Standard	0.033 to 0.059 mm (0.0013 to 0.0023 in.)
	Maximum	0.08 mm (0.0032 in.)
Ring w/head pin		
Protrusion height		5.5 mm (0.217 in.)
Connecting rod		
Thrust clearance	Standard	0.160 to 0.362 mm (0.0063 to 0.0143 in.)
	Maximum	0.362 mm (0.0143 in.)
Oil clearance	Standard	0.024 to 0.048 mm (0.0009 to 0.0019 in.)
	Maximum	0.08 mm (0.0031 in.)
Bushing inside diameter		22.005 to 22.014 mm (0.8663 to 0.8667 in.)
Oil clearance	Standard	0.001 to 0.007 mm (0.00004 to 0.00028 in.)
	Maximum	0.05 mm (0.0020 in.)
Out–of–alignment	Maximum per 100 mm (3.94 in.)	0.05 mm (0.0020 in.)
Rod twist	Maximum per 100 mm (3.94 in.)	0.15 mm (0.0059 in.)
Cylinder block		
Warpage	Maximum	0.05 mm (0.0020 in.)
Bore diameter	Standard	88.500 to 88.513 mm (3.4842 to 3.3848 in.)
Piston		
Piston diameter		88.439 to 88.449 mm (3.4818 to 3.4822 in.)
Piston oil clearance	Standard	0.051 to 0.074 mm (0.0020 to 0.0029 in.)
	Maximum	0.1 mm (0.0039 in.)
Piston ring		
Ring groove clearance	No. 1	0.030 to 0.080 mm (0.0012 to 0.0031 in.)
	No. 2	0.020 to 0.060 mm (0.0008 to 0.0024 in.)
	Oil (side rail)	0.020 to 0.070 mm (0.0008 to 0.0028 in.)
End gap	Standard No. 1	0.22 to 0.32 mm (0.0087 to 0.0126 in.)
	No. 2	0.50 to 0.60 mm (0.0197 to 0.0236 in.)
	Oil (side rail)	0.10 to 0.35 mm (0.0039 to 0.0138 in.)
	Maximum No. 1	0.89 mm (0.0350 in.)
	No. 2	1.35 mm (0.0531 in.)
	Oil (side rail)	0.73 mm (0.0287 in.)
Piston pin		
Bushing inside diameter		22.005 to 22.014 mm (0.8663 to 0.8667 in.)
Piston pin diameter		21.997 to 22.009 mm (0.8660 to 0.8665 in.)
Oil clearance	Standard	0.001 to 0.007 mm (0.00004 to 0.00028 in.)
	Maximum	0.010 mm (0.0039 in.)
Connecting rod bolt		
Diameter	Standard	7.2 to 7.3 mm (0.283 to 0.287 in.)
	Minimum	7.0 mm (0.276 in.)

Crankshaft		
Thrust clearance	Standard	0.040 to 0.240 mm (0.0016 to 0.0094 in.)
	Maximum	0.30 mm (0.0118 in.)
Thrust washer thickness		1.930 to 1.980 mm (0.0760 to 0.0780 in.)
Circle runout	Maximum	0.03 mm (0.0012 in.)
Main journal diameter		54.988 to 55.000 mm (2.1648 to 2.06535 in.)
Oil clearance	Standard	0.017 to 0.040 mm (0.0007 to 0.0016 in.)
	Maximum	0.050 mm (0.0020 in.)
Crank pin taper and out– of –round	Maximum	0.003 mm (0.0001 in.)
Crank pin diameter		47.990 to 48.000 mm (1.8894 to 1.8898 in.)
Crankshaft bearing cap set bolt		
Diameter	Standard	7.5 to 7.6 mm (0.295 to 0.299 in.)
	Minimum	7.2 mm (0.283 in.)

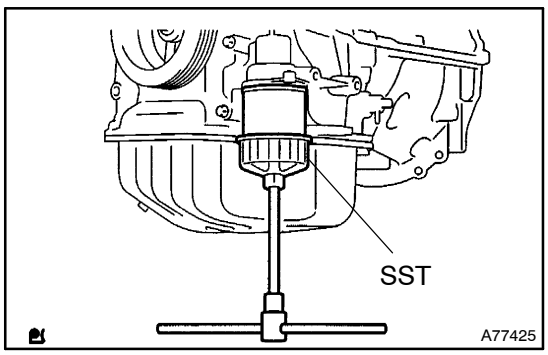
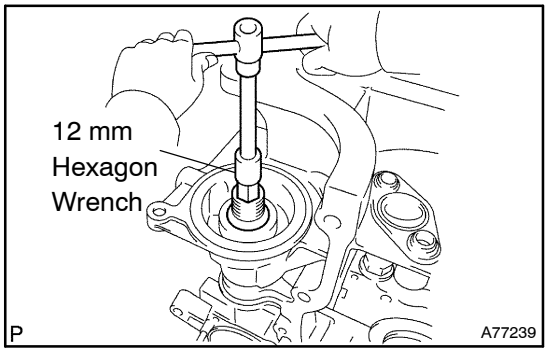
OVERHAUL

1. REMOVE OIL FILLER CAP SUB–ASSY

2. REMOVE OIL FILLER CAP GASKET

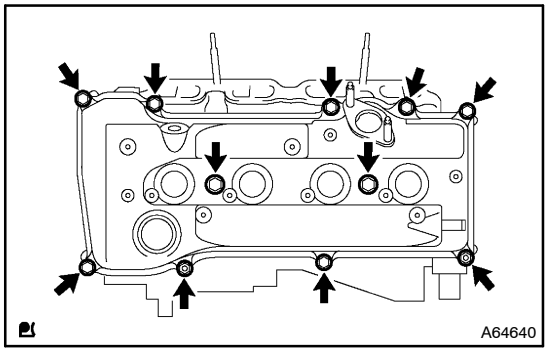


3. REMOVE VENTILATION VALVE SUB–ASSY



4. REMOVE SPARK PLUG

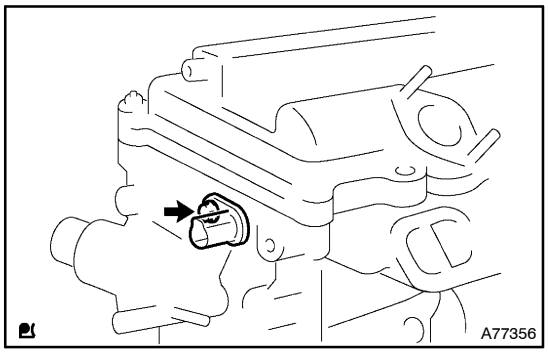
(a) Using a 16 mm plug wrench, remove the spark plugs.



5. REMOVE OIL FILTER SUB–ASSY

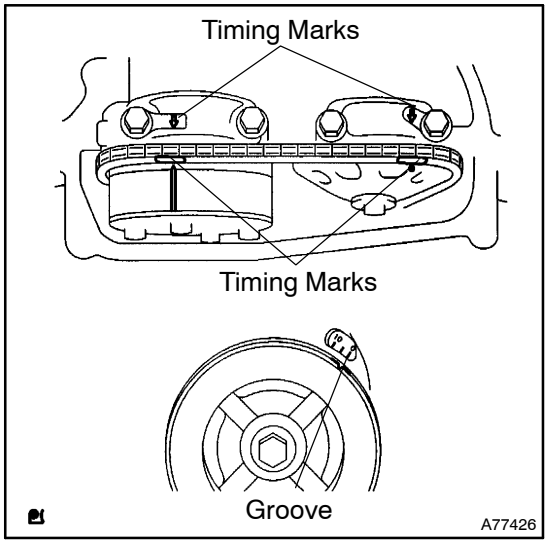
(a) Using SST, remove the oil filter.
SST 09228–06501

6. REMOVE OIL FILTER UNION



(a) Using a 12 mm socket hexagon wrench, remove the oil filter union.

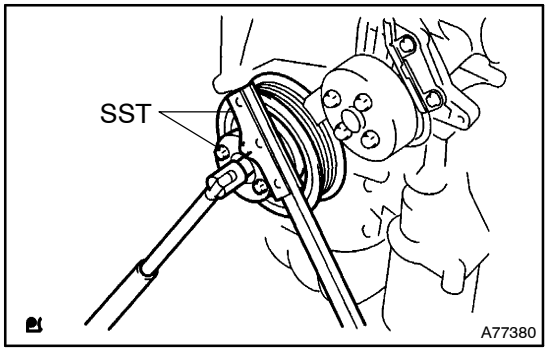
7. REMOVE CYLINDER HEAD COVER SUB–ASSY



(a) Remove the 9 bolts 2 nuts and cylinder head cover.

8. REMOVE CYLINDER HEAD COVER GASKET

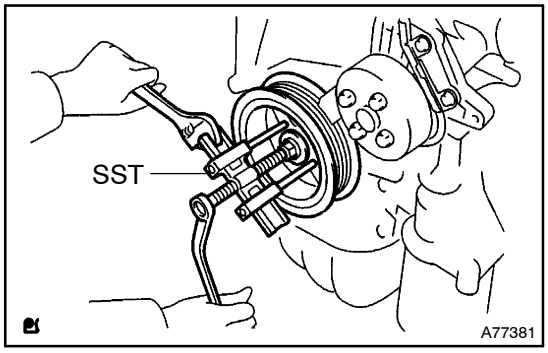
9. REMOVE CAMSHAFT POSITION SENSOR



(a) Remove the bolt and sensor.

10. REMOVE CRANKSHAFT PULLEY

(a) Turn the crankshaft pulley and align its groove with timing mark 0 of the timing chain cover.

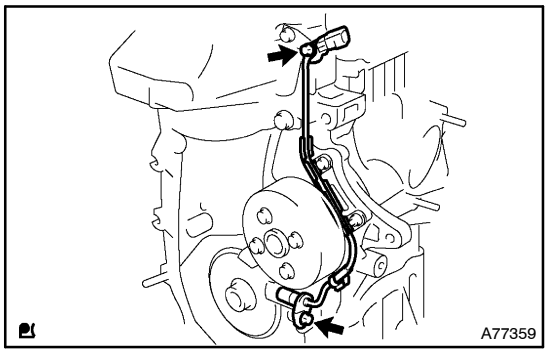


(b) Check that the timing marks of the camshaft timing sprockets are aligned with the timing marks of the No. 1 bearing cap, as shown in the illustration.

(c) Remove the crankshaft pulley.

(1) Using SST, fix the crankshaft pulley and loosen the pulley set bolt.

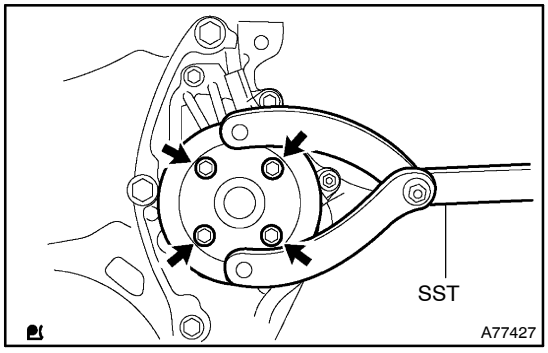
SST 09213–54015 (91651–60855), 09330–00021



(2) Using SST, remove the crankshaft pulley.
SST 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)

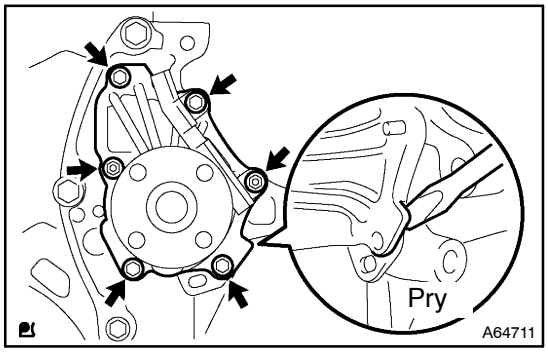
11. REMOVE CHAIN TENSIONER ASSY NO.1

(a) Remove the 2 nuts, chain tensioner and gasket.



NOTICE:

Be sure not to operate the crankshaft without the chain tensioner.



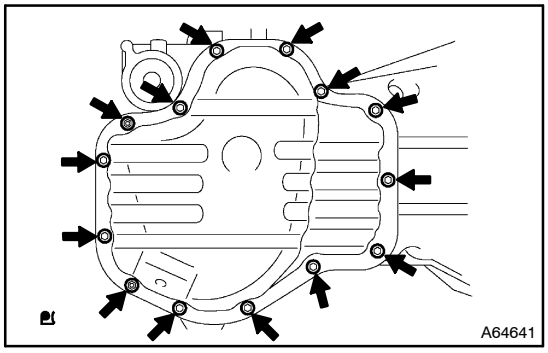
12. REMOVE CRANKSHAFT POSITION SENSOR

(a) Remove the 2 bolts and crankshaft position sensor.

13. REMOVE WATER PUMP PULLEY

(a) Using SST, remove the 4 bolts and pulley.
SST 09960–10010 (09962–01000, 09963–00700)

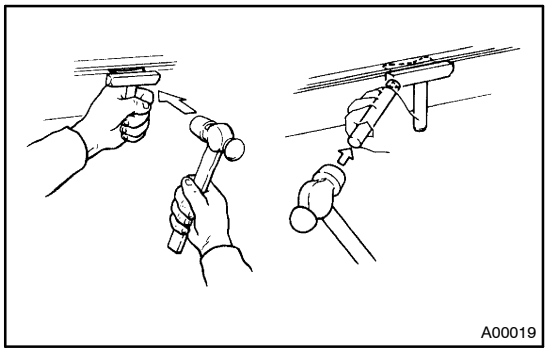
14. REMOVE WATER PUMP ASSY



(a) Remove the 4 bolts, 2 nuts and clamp.

(b) Using a screwdriver, pry between the water pump and cylinder block, and then remove the pump.

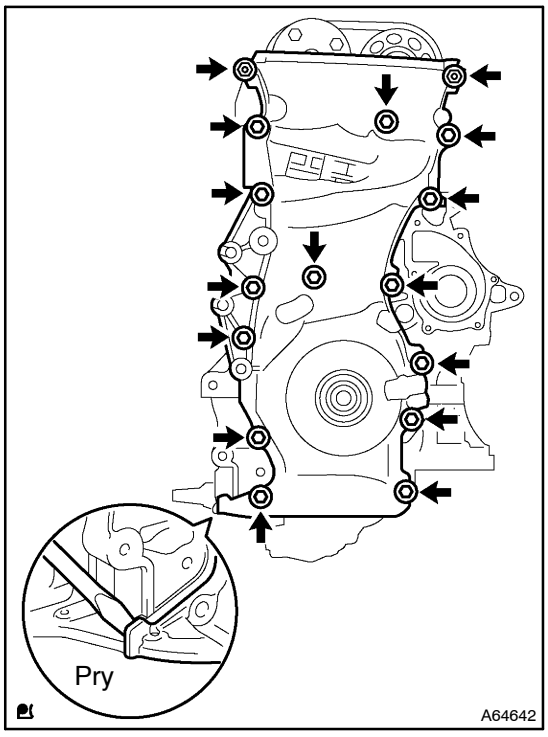
NOTICE:



Be careful not to damage the contact surface of the water pump and cylinder block.

15. REMOVE OIL PAN DRAIN PLUG

16. REMOVE OIL PAN SUB–ASSY

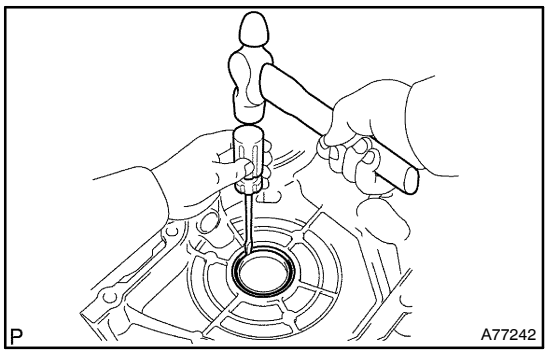


(a) Remove the 12 bolts and 2 nuts.

(b) Insert the blade of SST between the crankcase and oil pan. Cut off applied sealer and remove the oil pan.
SST 09032–00100

NOTICE:

Be careful not to damage the contact surface of the cylinder block and oil pan.



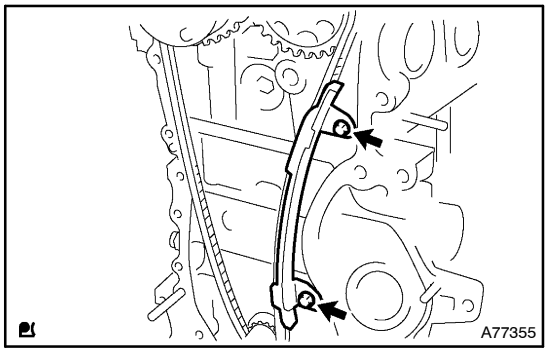
17. REMOVE TIMING CHAIN OR BELT COVER SUB–ASSY

(a) Remove the 14 bolts and 2 nuts.

(b) Remove the timing chain cover by prying between the timing chain cover and cylinder head or cylinder block with a screwdriver.

NOTICE:

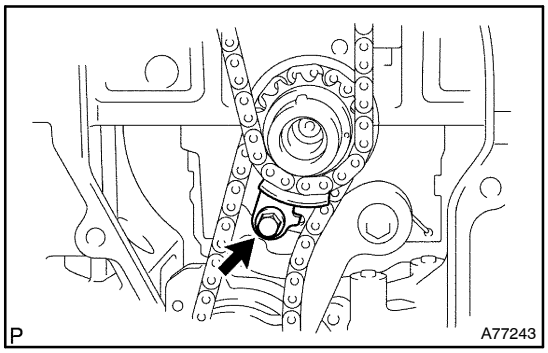
Be careful not to damage the contact surfaces of the timing chain cover, cylinder block and cylinder head.



18. REMOVE TIMING GEAR CASE OR TIMING CHAIN CASE OIL SEAL

(a) Using a screwdriver and a hammer, remove the oil seal.

19. REMOVE CRANKSHAFT POSITION SENSOR PLATE NO.1

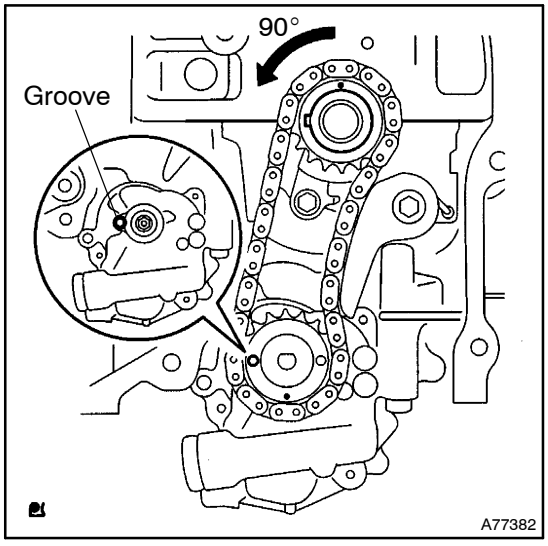


20. REMOVE CHAIN TENSIONER SLIPPER

(a) Remove the bolt and chain tensioner slipper.

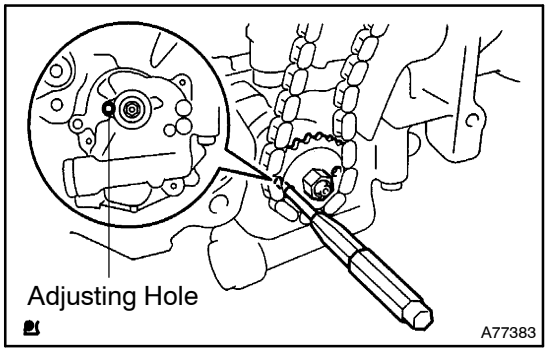
21. REMOVE CHAIN VIBRATION DAMPER NO.1

(a) Remove the 2 bolts and damper.



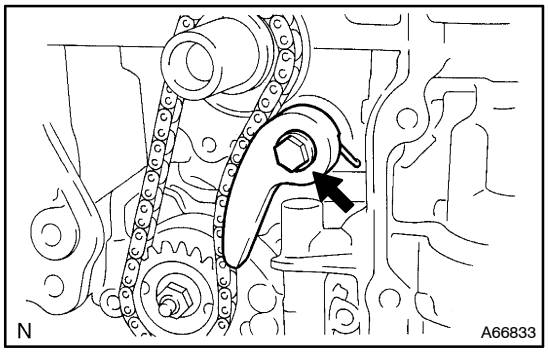
22. REMOVE TIMING CHAIN GUIDE

(a) Remove the bolt and guide.

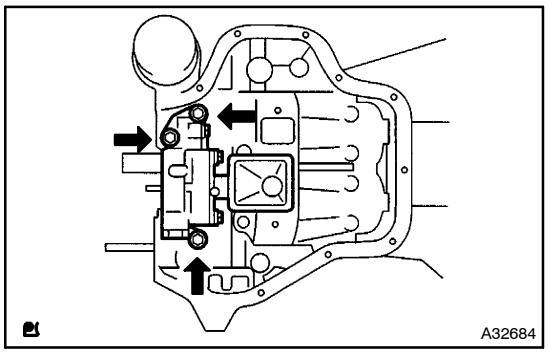


23. REMOVE CHAIN SUB–ASSY

24. REMOVE CRANKSHAFT TIMING GEAR OR SPROCKET

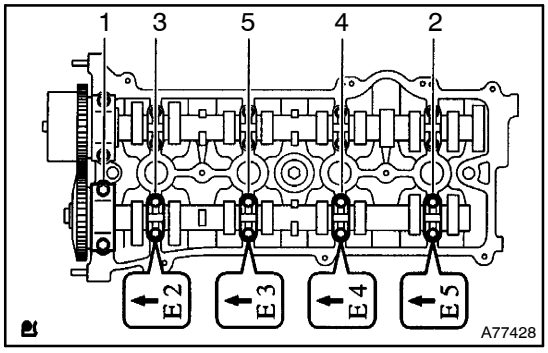


25. REMOVE NO.2 CHAIN SUB–ASSY

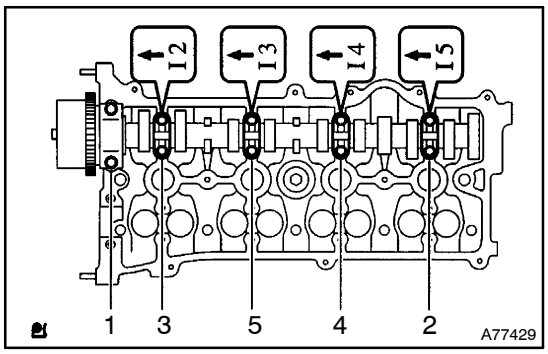


(a) Turn the crankshaft counterclockwise by 90°, and align the adjusting hole of the oil pump drive shaft gear with the groove of the oil pump.

(b) Put a bar (ϕ 4 mm) in the adjusting hole of the oil pump drive shaft gear to temporarily lock the gear in position. Remove the nut.



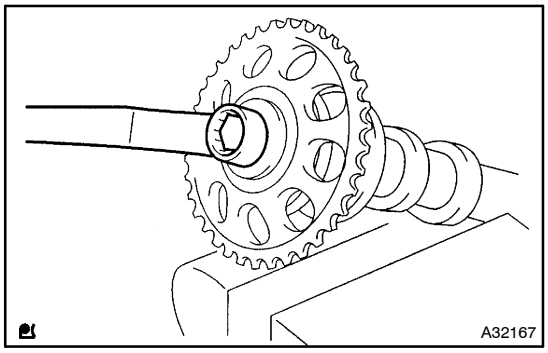
(c) Remove the bolt, chain tensioner plate and spring.
(d) Remove the oil pump drive gear, oil pump drive shaft gear and chain.



26. REMOVE OIL PUMP ASSY

(a) Remove the 3 bolts, oil pump and gasket.

27. REMOVE NO.2 CAMSHAFT

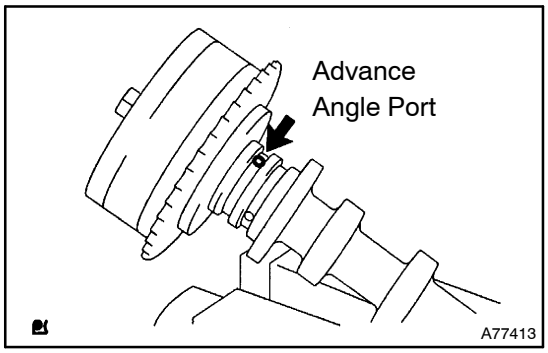


(a) Uniformly loosen and remove the No. 2 camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearings.
(b) Remove the camshaft.

28. REMOVE CAMSHAFT

(a) Uniformly loosen and remove the No. 2 camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearings.
(b) Remove the camshaft.

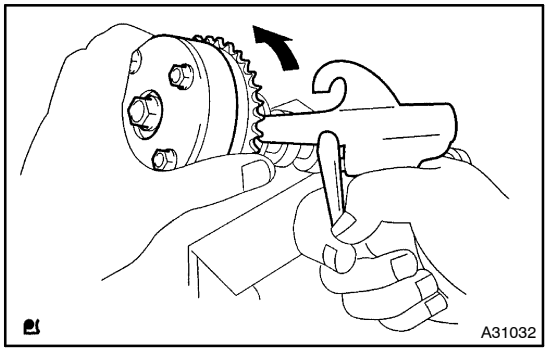
29. REMOVE CAMSHAFT BEARING NO.1



30. REMOVE CAMSHAFT TIMING GEAR OR SPROCKET

(a) Fix the camshaft with a vise and remove the camshaft timing sprocket.

NOTICE:



Be careful not to damage the camshaft.

31. REMOVE CAMSHAFT TIMING GEAR ASSY

(a) Fix the camshaft with a vise, and make sure that the camshaft timing gear does not move.

(b) Cover all the oil ports with vinyl tape except the advanced angle side, as shown in the illustration.

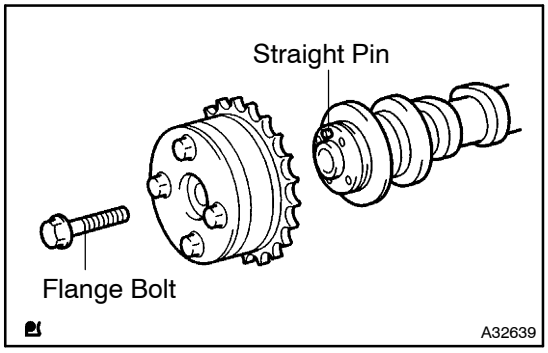
(c) Using an air gun, apply about 150 kPa (1.5 kgf/cm, 21 psi) of air pressure to the port on the advanced angle side.

CAUTION:

Some oil spraying will occur. Contain the spray with a shop rag.

HINT:

This operation releases the lock pin for the extreme retarded angle lock.

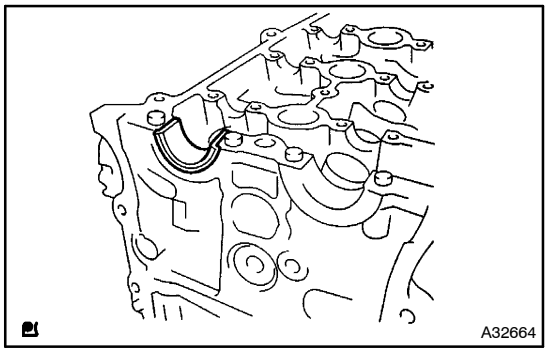


(d) Under the condition above, check that the camshaft timing gear can be turned by hand to the advanced angle side (counterclockwise), the direction of the arrow in the illustration.

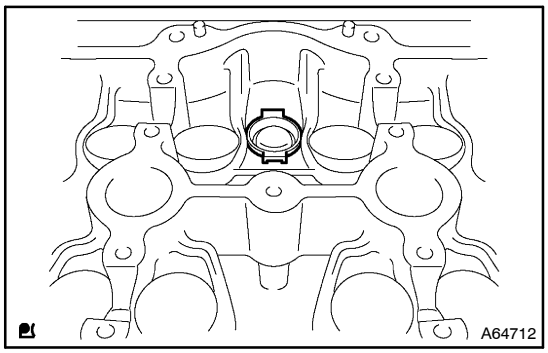
Standard:

The camshaft timing gear can be turned by hand.

HINT:

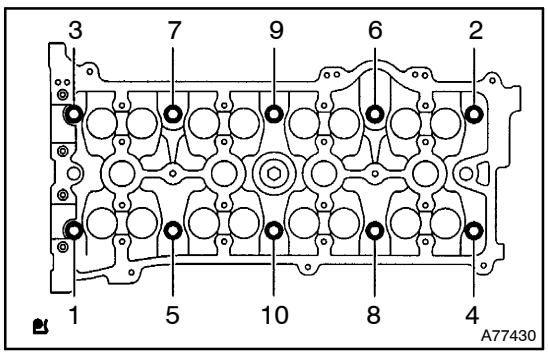


The camshaft timing gear will turn to the advanced angle side without applying force by hand depending on the force of the air pressure applied. Also, if applying pressure to the oil path is difficult as a result of air leakage from the port, the lock–pin may be difficult to release.



(e) Remove the flange bolt from the camshaft timing gear.

NOTICE:



- **Be sure not to remove the other 4 bolts.**
- **If planning to reuse the camshaft timing gear, release the straight pin lock first, and then install the gear.**

32. REMOVE CAMSHAFT BEARING NO.2

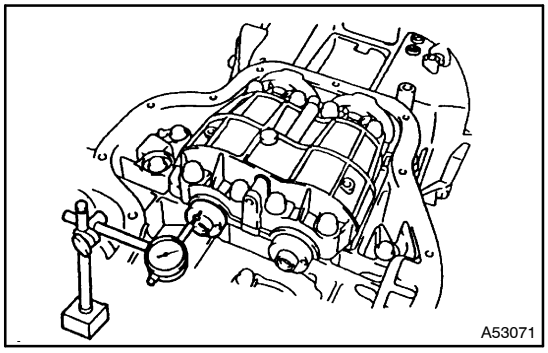
33. REMOVE CAMSHAFT HOUSING PLUG

34. REMOVE CYLINDER HEAD SUB–ASSY

(a) Using a 10 mm bi–hexagon wrench, uniformly loosen the 10 bolts in the sequence shown in the illustration. Remove the 10 cylinder head bolts and plate washers.

NOTICE:

- **Be careful not to drop washers into the cylinder head.**
- **Head warpage or cracking could result from removing bolts in an incorrect order.**



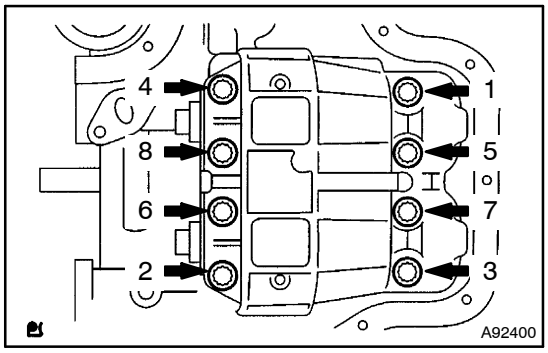
35. REMOVE CYLINDER HEAD GASKET

36. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB–ASSY

37. REMOVE OIL CONTROL VALVE FILTER

(a) Using a 12 mm hexagon wrench, remove the plug, gasket and filter.

38. REMOVE W/HEAD TAPER SCREW PLUG NO.1



39. REMOVE BALANCE SHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the balance shaft back and forth.

Standard thrust clearance:
0.050 to 0.090 mm (0.0020 to 0.0035 in.)
Maximum thrust clearance: 0.090 mm (0.0035 in.)

If the thrust clearance is greater than the maximum, replace the balance shaft housing and bearings. If necessary, replace the balance shaft.

40. REMOVE BALANCE SHAFT OIL CLEARANCE

(a) Uniformly loosen and remove the 8 bolts in the sequence shown in the illustration.

NOTICE:

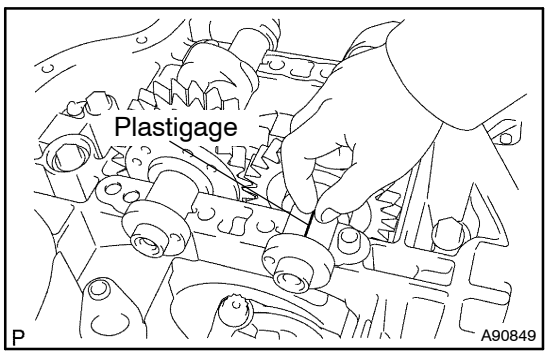
Be careful not to damage the contact surfaces of the balance shaft housing and crankcase.

HINT:

Keep the lower bearing and balance shaft housing together.

(b) Lift out the No. 1 and No. 2 balance shafts.

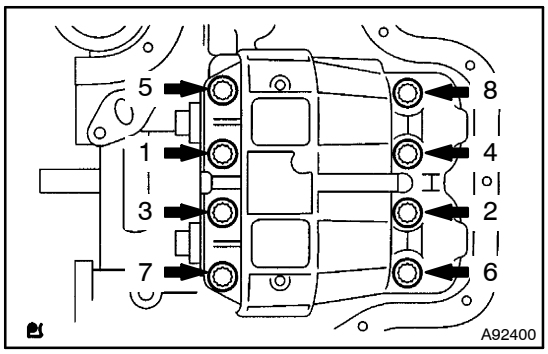
HINT:



Keep the upper bearing with the crankcase.

(c) Clean each bearing and journal.

(d) Check each bearing and journal for pitting and scratches.

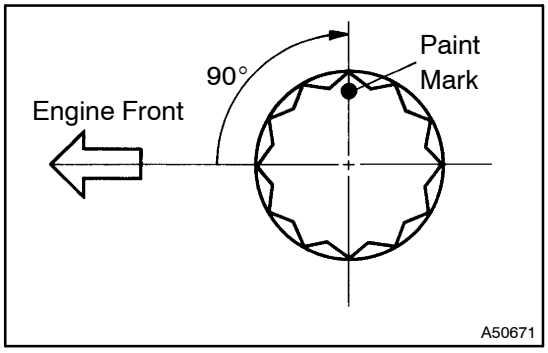


If a bearing or journal is damaged, replace the bearings. If necessary, replace the balance shaft.

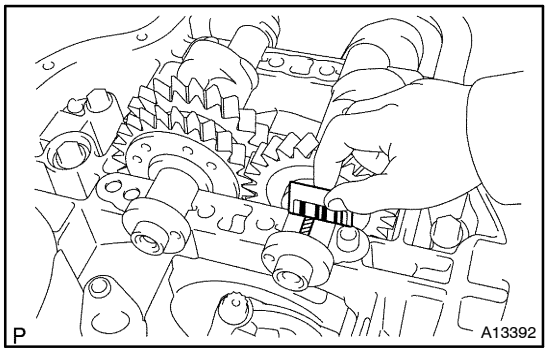
(e) Place the No. 1 and No. 2 balance shafts on the crankcase.

(f) Lay a strip of Plastigage across each journal and install the balance shaft housing.

(g) Apply a light coat of engine oil on the threads and under the heads of the balance shaft housing bolts.

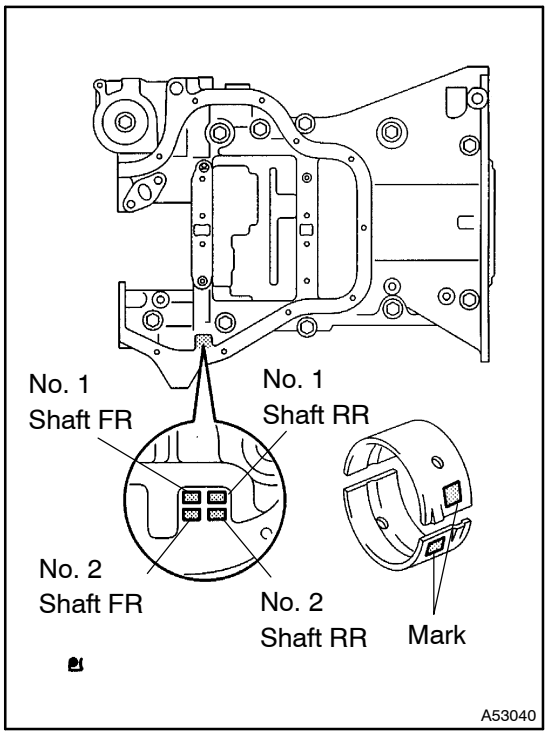


(h) Uniformly tighten the 8 bolts in the sequence shown in the illustration.



Torque: 22 N·m (220 kgf·cm, 16 ft·lbf)

HINT:



The balance shaft housing bolts are tightened in 2 progressive steps.

(i) Mark the front side of each balance shaft housing bolt head with paint.
(j) Retighten the bolts by 90° as shown in the illustration.
(k) Check that the paint marks are now at a 90° angle to the front.

(l) Remove the balance shaft housing, and measure the Plastigage at its widest point.
Standard oil clearance:
0.004 to 0.031 mm (0.0002 to 0.0012 in.)
Maximum oil clearance: 0.031 mm (0.0012 in.)
(m) Completely remove the Plastigage after the inspection.

If the clearance is greater than the maximum, replace the bearing. If necessary, replace the balance shaft.
If using a standard bearing, replace it with one of the same number.

Balance shaft housing journal bore diameter:

Mark 1	26.000 to 26.006 mm (1.0236 to 1.0239 in.)
Mark 2	26.007 to 26.012 mm (1.0239 to 1.0241 in.)
Mark 3	26.013 to 26.018 mm (1.0241 to 1.0243 in.)

Balance shaft journal diameter:

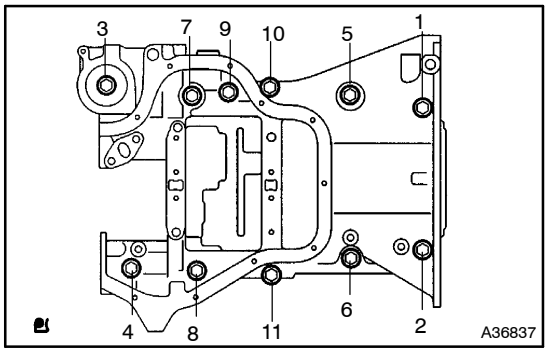
	22.985 to 23.000 mm (0.9049 to 0.9055 in.)

Standard bearing center wall thickness:

Mark 1	1.486 to 1.489 mm (0.0585 to 0.0586 in.)
Mark 2	1.490 to 1.492 mm (0.0587 to 0.0587 in.)
Mark 3	1.493 to 1.495 mm (0.0588 to 0.0589 in.)

(n) Completely remove the Plastigage after the inspection.

41. REMOVE BALANCE SHAFT
42. REMOVE BALANCE SHAFT BEARING NO. 1



43. REMOVE ENGINE REAR OIL SEAL

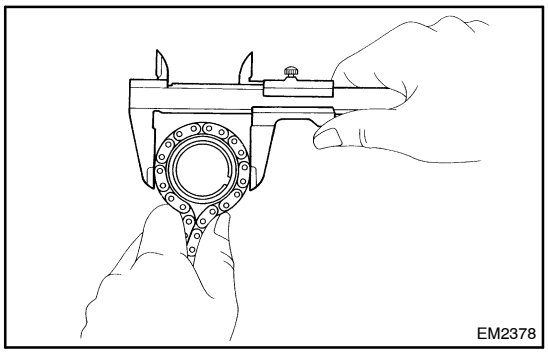
(a) Using a knife, cut off the oil seal lip.

(b) Using a screwdriver with its tip taped, pry out the oil seal.

NOTICE:

After the removal, check the crankshaft for damage. If it is damaged, smooth the surface with 400–grit sandpaper.

44. REMOVE STIFFENING CRANKCASE ASSY



(a) Uniformly loosen and remove the 11 bolts in the sequence shown in the illustration.

(b) Using a screwdriver, remove the crankcase by prying the portions between the crankcase and cylinder block.

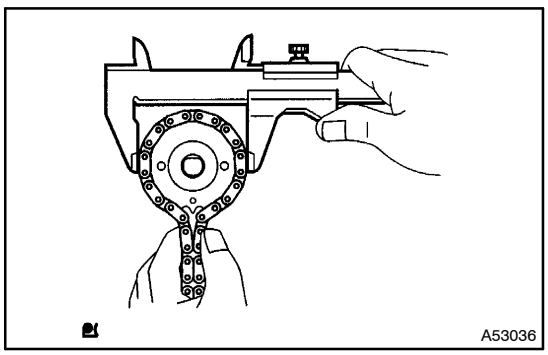
NOTICE:

Be careful not to damage the contact surfaces of the crankcase and cylinder block.

(c) Remove the O–ring from the cylinder block.

45. INSPECT OIL PUMP DRIVE GEAR

(a) Wrap the chain around the drive gear.



(b) Using a vernier caliper, measure the drive gear diameter with the chain.

Minimum gear diameter (w/chain): 48.2 mm (1.898 in.)

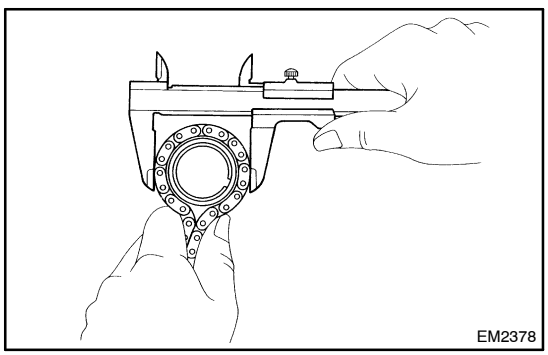
NOTICE:

The vernier caliper must contact the chain rollers for the measurement.

If the diameter is less than the minimum, replace the chain and drive gear.

46. INSPECT OIL PUMP DRIVE SHAFT GEAR

(a) Wrap the chain around the drive shaft gear.



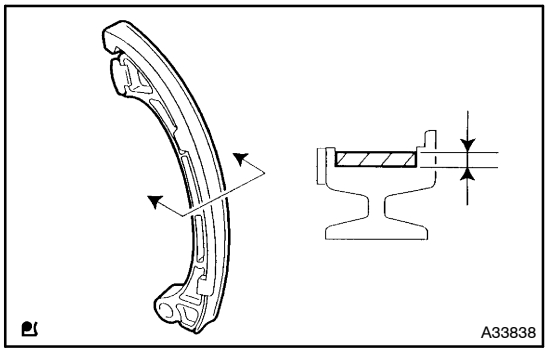
(b) Using a vernier caliper, measure the drive shaft gear diameter with the chain.

Minimum gear diameter (w/chain): 48.2 mm (1.898 in.)

NOTICE:

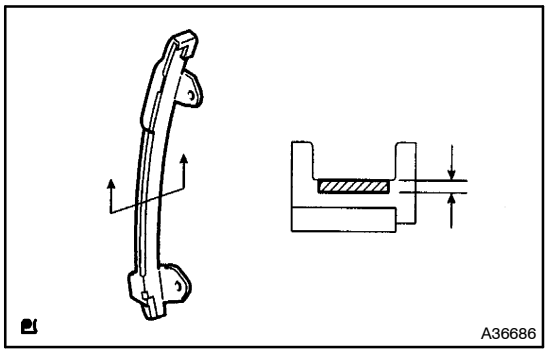
The vernier caliper must contact the chain rollers for the measurement.

If the diameter is less than the minimum, replace the chain and drive shaft gear.



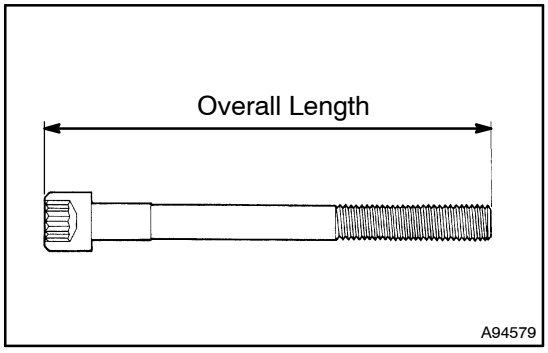
47. INSPECT CRANKSHAFT TIMING GEAR OR SPROCKET

(a) Wrap the chain around the timing gear.

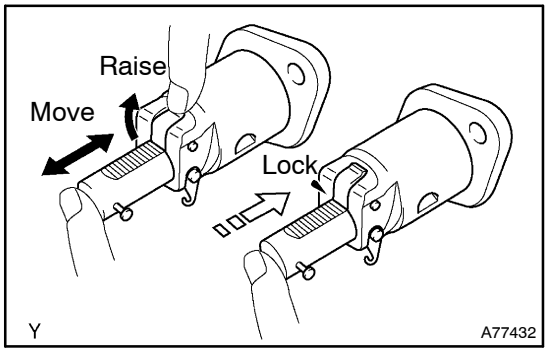


(b) Using a vernier caliper, measure the timing gear diameter with the chain.

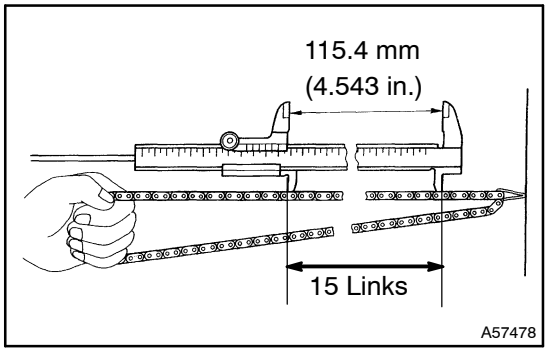
Minimum gear diameter (w/chain): 51.6 mm (2.031 in.)



NOTICE:
The vernier caliper must contact the chain rollers for the measurement.
If the diameter is less than the minimum, replace the chain and timing gear.



48. INSPECT CHAIN TENSIONER SLIPPER
(a) Measure the tensioner slipper wear.
Maximum wear: 1.0 mm (0.039 in.)
If the wear is greater than the maximum, replace the tensioner slipper.

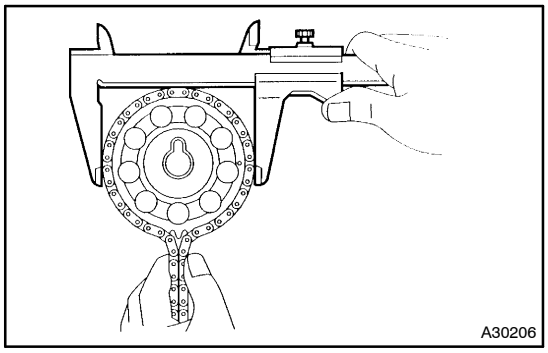


49. INSPECT CHAIN VIBRATION DAMPER NO.1
(a) Measure the vibration damper wear.
Maximum wear: 1.0 mm (0.039 in.)
If the wear is greater than the maximum, replace the chain vibration damper.

50. INSPECT CYLINDER HEAD SET BOLT
(a) Using a vernier caliper, measure the length of the head bolts from the seat to the end.
Standard bolt length:
161.3 to 162.7 mm (6.350 to 6.406 in.)
Maximum bolt length: 164.2 mm (6.465 in.)
If the length is greater than the maximum, replace the bolt.

51. INSPECT CHAIN TENSIONER ASSY NO.1
(a) Check that the plunger moves smoothly when the ratchet pawl is raised.
(b) Release the ratchet pawl and check that the plunger is locked in place by the ratchet pawl and does not move when pushed with finger.

52. INSPECT CHAIN SUB–ASSY



(a) Using a vernier caliper, measure the length of the 15 links with the chain fully stretched.

NOTICE:

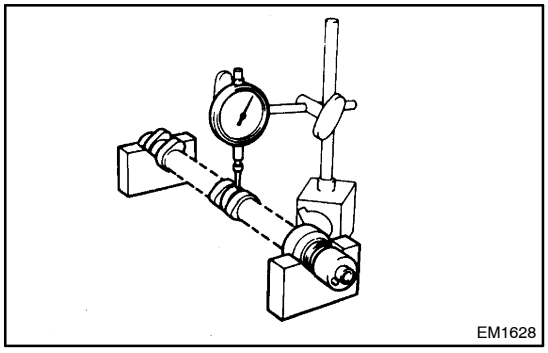
Make the same measurements pulling at 3 or more random places to obtain an average length.

Maximum chain elongation: 115.4 mm (4.543 in.)

If the elongation is greater than the maximum, replace the chain.

53. INSPECT CAMSHAFT TIMING GEAR OR SPROCKET

(a) Wrap the chain around the timing sprocket.



(b) Using a vernier caliper, measure the timing sprocket diameter with the chain.

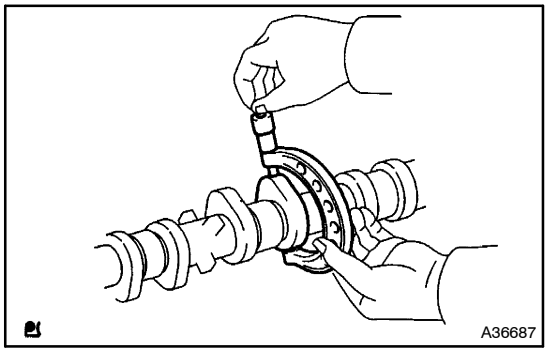
Minimum sprocket diameter (w/ chain):
97.3 mm (3.831 in.)

NOTICE:

The vernier caliper must contact the chain rollers for the measurement.

If the diameter is less than the minimum, replace the chain and timing gear.

54. INSPECT CAMSHAFT



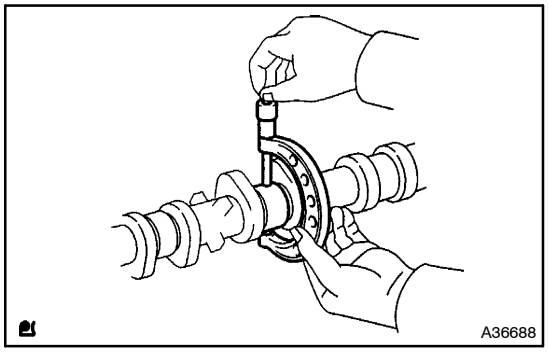
(a) Check the camshaft for runout.

(1) Place the camshaft on V–blocks.

(2) Using a dial indicator, measure the circle runout at the center journal.

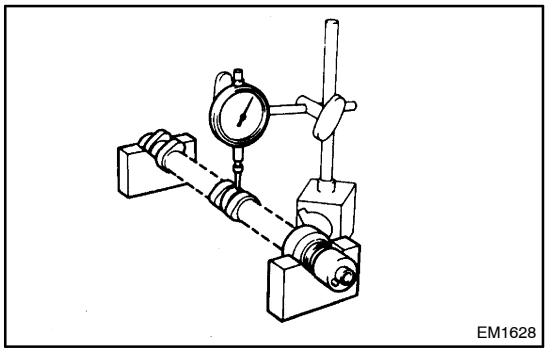
Maximum circle runout: 0.03 mm (0.0012 in.)

If the circle runout is greater than the maximum, replace the camshaft.



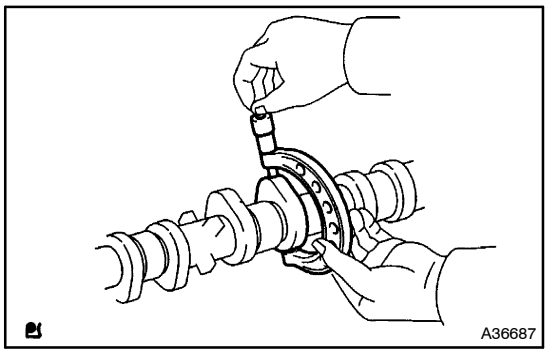
(b) Using a micrometer, measure the cam lobe height.

(1) Using a micrometer, measure the cam lobe height.

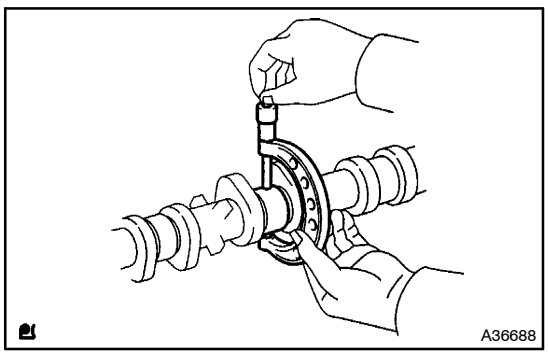


Standard cam lobe height:
45.510 to 45.610 mm (1.7917 to 1.7957 in.)

Minimum cam lobe height: 45.430 mm (1.7886 in.)

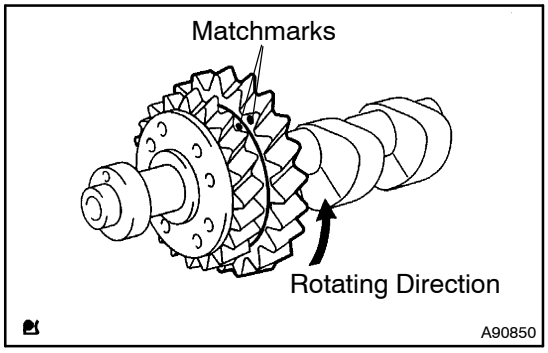


If the cam lobe height is less than the minimum, replace the camshaft.



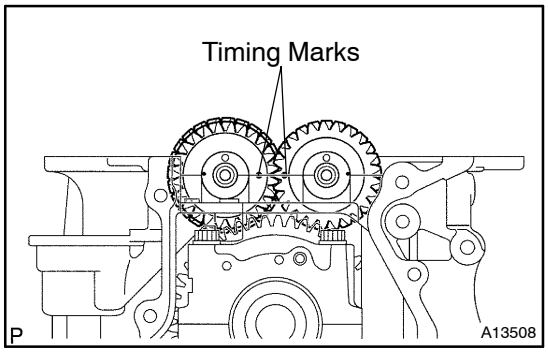
(c) Using a micrometer, measure the journal diameter.
No. 1 Journal diameter:
35.971 to 35.985 mm (1.4162 to 1.4167 in.)
Other journal diameter:
22.959 to 22.975 mm (0.9040 to 0.9045 in.)
If the journal diameter is not as specified, check the oil clearance.

55. INSPECT NO.2 CAMSHAFT
(a) Check the camshaft for runout.
(1) Place the camshaft on V–blocks.
(2) Using a dial indicator, measure the circle runout at the center journal.
Maximum circle runout: 0.03 mm (0.0012 in.)
If the circle runout is greater than the maximum, replace the camshaft.



(b) Using a micrometer, measure the cam lobe height.
Standard cam lobe height:
45.983 to 46.083 mm (1.8106 to 1.8143 in.)
Minimum cam lobe height: 45.900 mm (1.8071 in.)
If the cam lobe height is less than the minimum, replace the camshaft.

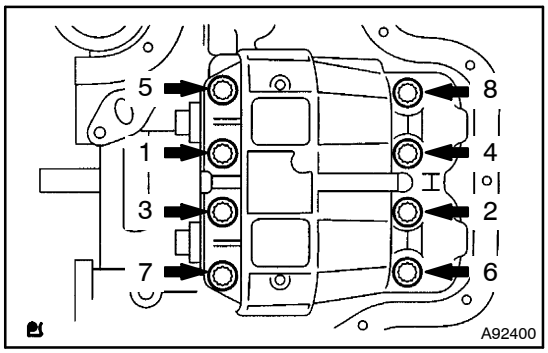
(c) Using a micrometer, measure the journal diameter.
No. 1 journal diameter:
35.971 to 35.985 mm (1.4162 to 1.4167 in.)
Other journal diameter:
22.959 to 22.975 mm (0.9039 to 0.9045 in.)
If the journal diameter is not as specified, check the oil clearance.



56. INSTALL BALANCE SHAFT BEARING NO. 1
(a) Install the bearings in the crankcase and balance shaft housing.
(b) Apply a light coat of engine oil on the bearings.

57. INSTALL BALANCE SHAFT NO. 1 AND NO. 2

(a) Rotate the driven gear No. 1 of the balance shaft No. 1 as indicated by the arrow in the illustration until it hits the stopper.

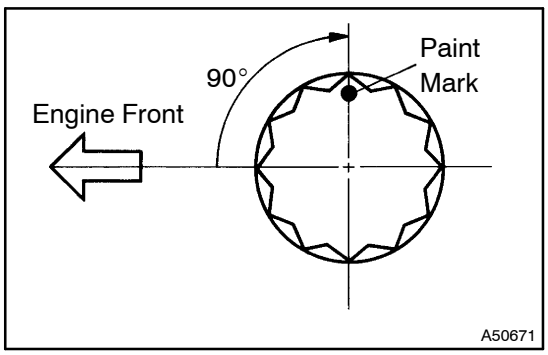


(b) Confirm that the matchmarks on driven gear No. 1 and No. 2 are matched.

(c) Align the timing marks of the No. 1 and No. 2 balance shafts as shown in the illustration.

(d) Place the No. 1 and No. 2 balance shafts on the crankcase.

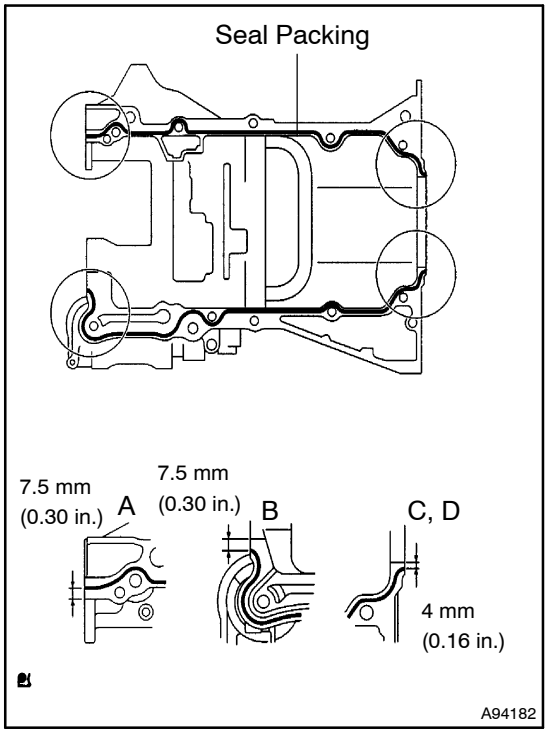
(e) Apply a light coat of engine oil under the heads of the balance shaft housing bolts.



(f) Uniformly tighten the 8 bolts in the sequence shown in the illustration.

Torque: 22 N·m (220 kgf·cm, 16 ft·lbf)

HINT:

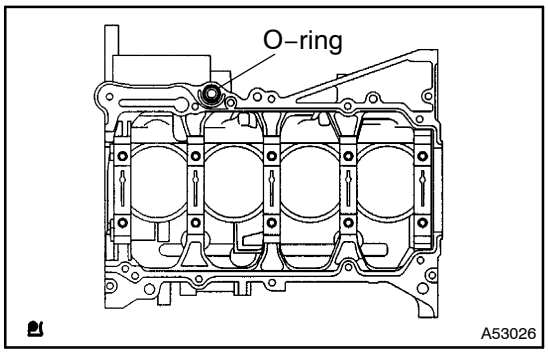


The balance shaft housing bolts are tightened in 2 progressive steps.

(g) Mark the front side of each balance shaft housing bolt head with paint.

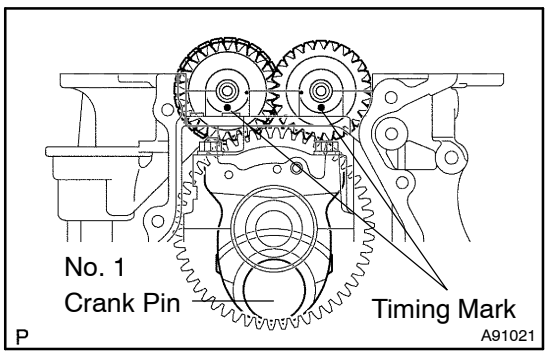
(h) Retighten the bolts by 90° as shown in the illustration.

(i) Check that the painted marks are now at a 90° angle to the front.



58. INSTALL STIFFENING CRANKCASE ASSY

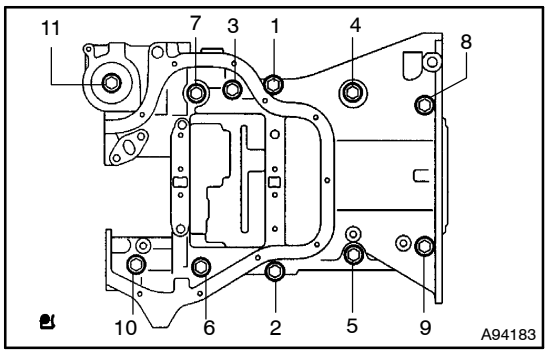
(a) Apply seal packing in a continuous bead (seal width: 2.5 to 3 mm (0.10 to 0.12 in.)) to the places shown in the illustration.



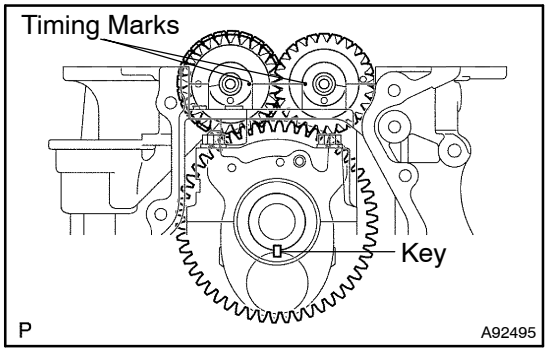
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the crankcase within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after the installation.**

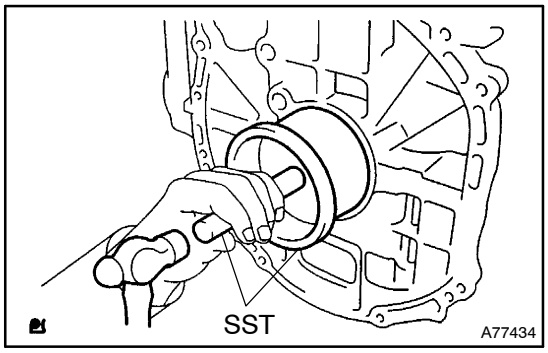


(b) Place a new O–ring on the cylinder block, as shown in the illustration.



(c) Align the timing marks of the No. 1 and No. 2 balance shafts as shown in the illustration.

(d) With the No. 1 crank pin of the crankshaft placed at 6 o'clock, place the No. 1 and No. 2 balance shafts on the crankcase.



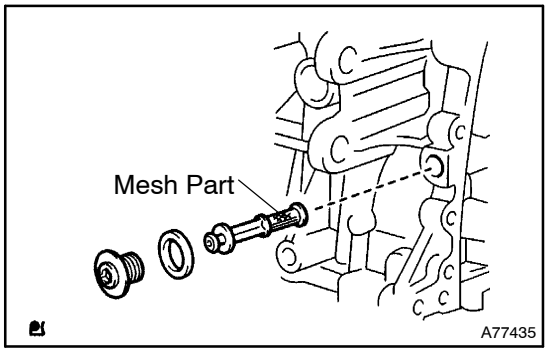
(e) Uniformly tighten the 11 bolts in the sequence shown in the illustration.

Torque: 33 N·m (332 kgf·cm, 24 ft·lbf)

(f) Confirm that the timing marks of the balance shafts are matched when the key groove is placed at 6 o'clock, as shown in the illustration.

59. INSTALL ENGINE REAR OIL SEAL

(a) Apply MP grease to a new oil seal lip.

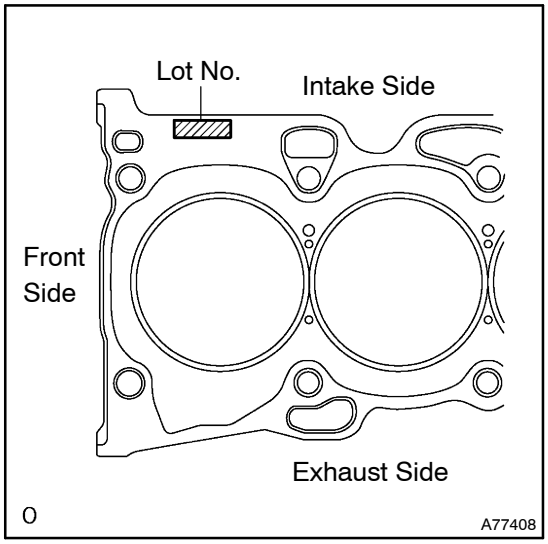


NOTICE:

Keep the lip free of foreign materials.

(b) Using SST and a hammer, evenly tap the oil seal until its surface is flush with the rear oil seal retainer edge.
SST 09223–15030, 09950–70010 (09951–07100)

NOTICE:



Wipe off extra grease on the crankshaft.

60. INSTALL OIL CONTROL VALVE FILTER

(a) Check that no foreign substance is on the mesh part of the filter.

(b) Using a 6 mm socket hexagon wrench, install a new gasket and the oil control valve filter with the screw plug.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

61. INSTALL CYLINDER HEAD GASKET

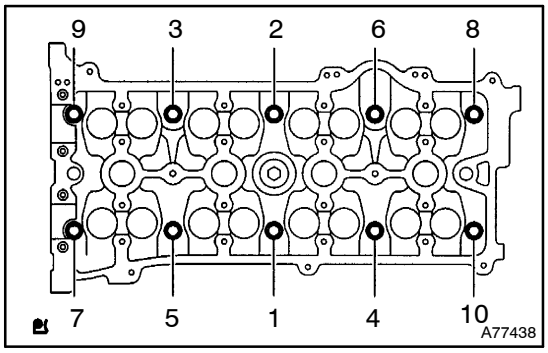
(a) Place a new gasket on the cylinder block surface with the Lot No. stamp placed upward.

NOTICE:

- **Remove any oil from contact surface.**
- **Be careful of the installation direction.**
- **To avoid damage to the gasket, place the cylinder head on the gasket carefully.**

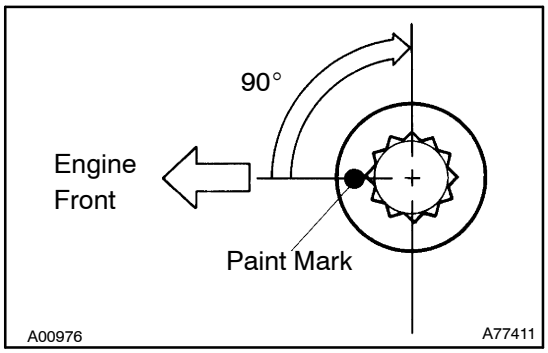
62. INSTALL CYLINDER HEAD SUB–ASSY

HINT:



The cylinder head bolts are tightened in 2 successive steps.

(a) Apply a light coat of engine oil on the threads and under the heads of the cylinder head bolts.



(b) Install the 10 bolts and plate washers to the cylinder head.

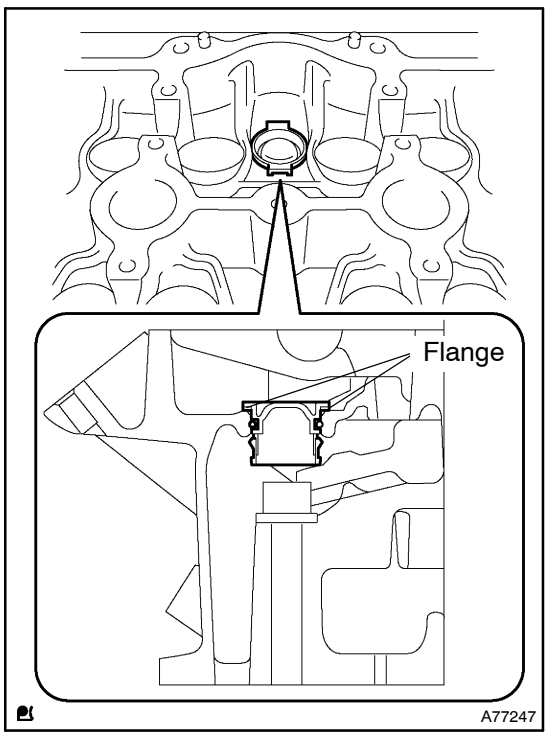
NOTICE:

Do not drop the washers into the cylinder head.

(c) Using a 10 mm bi–hexagon wrench, uniformly tighten the 10 bolts in the sequence shown in the illustration.
Torque: 79 N·m (806 kgf·cm, 58 ft·lbf)

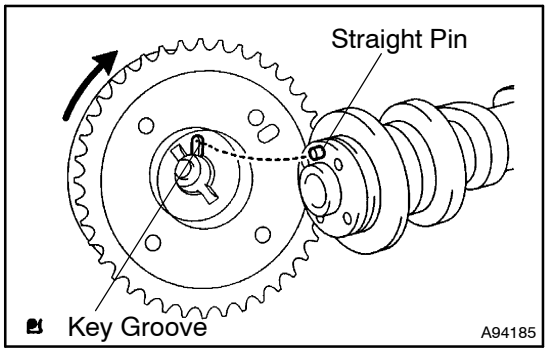
(d) Mark the front side of each cylinder head bolt with paint.

(e) Retighten the cylinder head bolts by 90° in the sequence shown in the illustration.



(f) Check that the painted marks are now at a 90° angle to the front.

63. INSTALL CAMSHAFT HOUSING PLUG



(a) Apply engine oil to a new O–ring, and install the camshaft housing plug.

NOTICE:

- **Install the plug with its flange portions faced the manifold.**
- **Insert the plug into the cylinder head until its flange portions reach the installation surface of the cylinder head.**

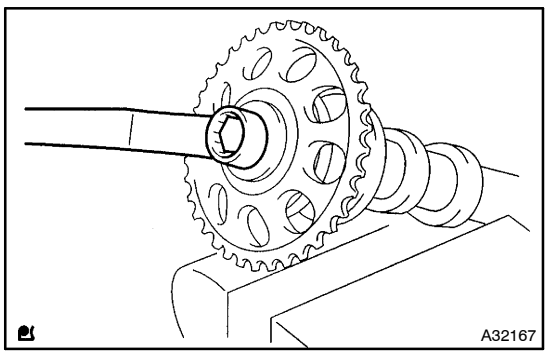
64. INSTALL CAMSHAFT BEARING NO.2

65. INSTALL CAMSHAFT TIMING GEAR ASSY

(a) Put the camshaft timing gear and the camshaft together with the straight pin and key groove.

(b) Turn the camshaft timing gear (as shown in the illustration) while pushing it lightly against the camshaft. Push further at the position where the pin enters the groove.

CAUTION:



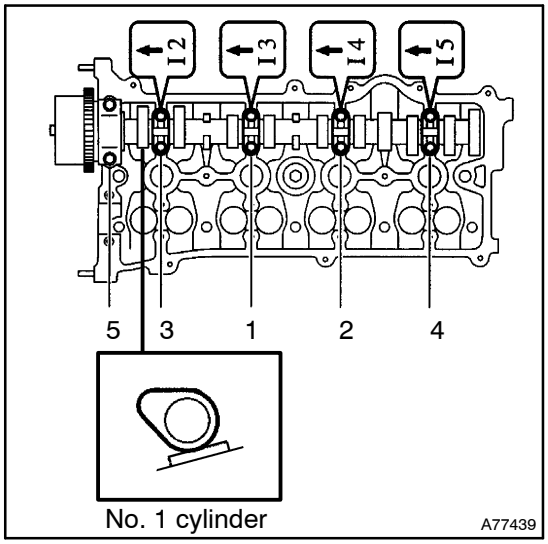
Be sure not to turn the camshaft timing gear to the retard angle side (to the right angle).

(c) Check that there is no clearance between the gear's flange and the camshaft.

(d) Tighten the flange bolt with the camshaft timing gear fixed.

Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)

(e) Check that the camshaft timing gear can move to the retarded angle side (the right direction) and is locked at the extreme retarded angle position.

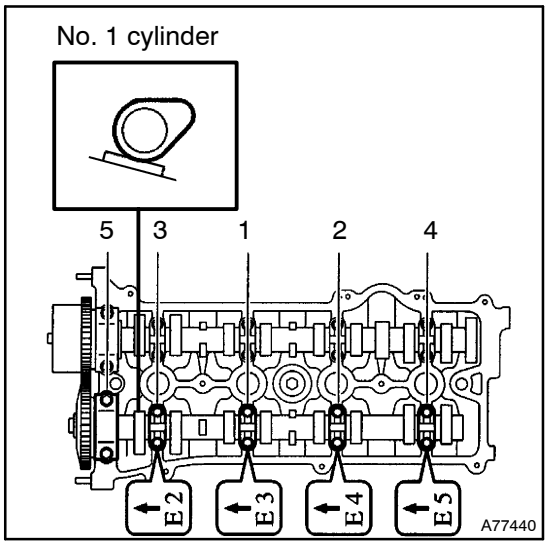


66. INSTALL CAMSHAFT TIMING GEAR OR SPROCKET

(a) Fix the camshaft with a vise, and install the camshaft No. 2 timing gear.

Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)

67. INSTALL CAMSHAFT BEARING NO.1



68. INSTALL CAMSHAFT

(a) Examine the front marks and numbers of the 5 bearing caps and install them. Then install the 10 bearing cap bolts. Uniformly tighten the bolts in the sequence shown in the illustration.

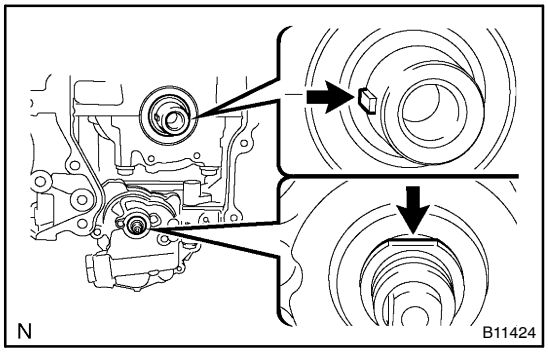
Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for bearing cap No. 1
9.0 N·m (92 kgf·cm, 80 in.·lbf) for bearing cap No. 3

NOTICE:

- **Tighten the bolts after deciding the position for the thrust direction of the camshaft by the bearing cap No. 1.**
- **Install the camshaft with its timing mark of the camshaft timing gear on top.**

69. INSTALL NO.2 CAMSHAFT

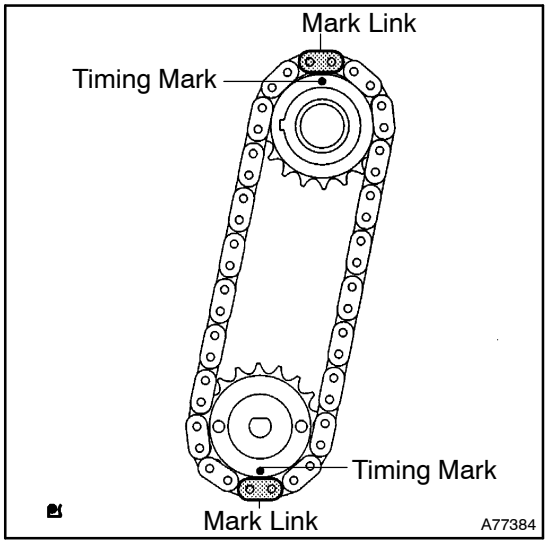
(a) Examine the front marks and numbers of the 5 bearing caps and install them. Then install the 10 bearing cap bolts. Uniformly tighten the bolts in the sequence shown in the illustration.



Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for bearing cap No. 2
9.0 N·m (92 kgf·cm, 80 in.·lbf) for bearing cap No. 3

NOTICE:

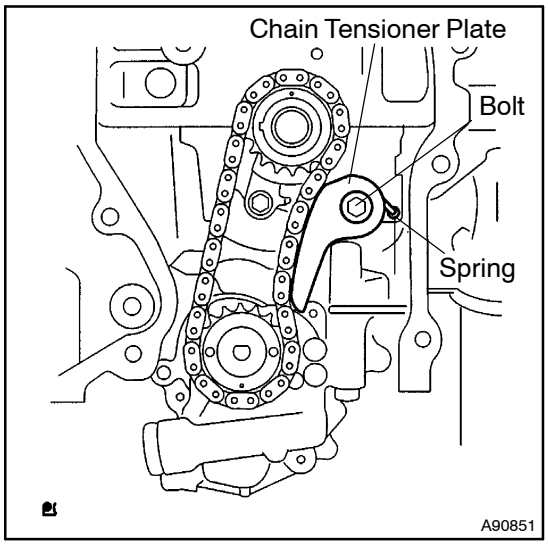
- **Tighten the bolts after deciding the position for the thrust direction of the camshaft by the bearing cap No. 2.**
- **Install the camshaft with its timing mark of the camshaft timing gear on top.**



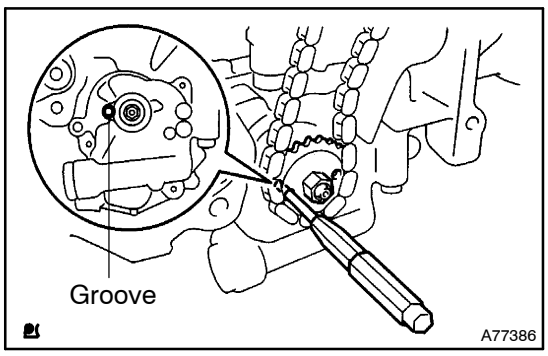
70. INSTALL OIL PUMP ASSY

(a) Install a new gasket and the oil pump with the 3 bolts.
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

71. INSTALL NO.2 CHAIN SUB–ASSY



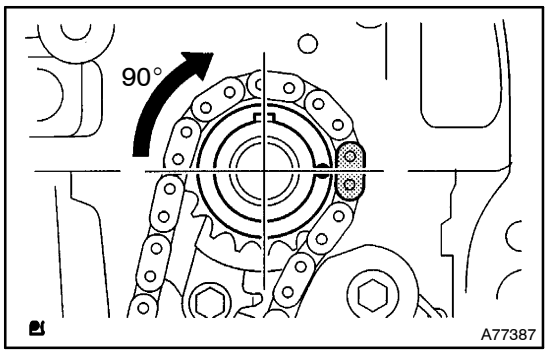
(a) Set the crankshaft key into the left horizontal position.
(b) Turn the cutout of the driveshaft to the top.



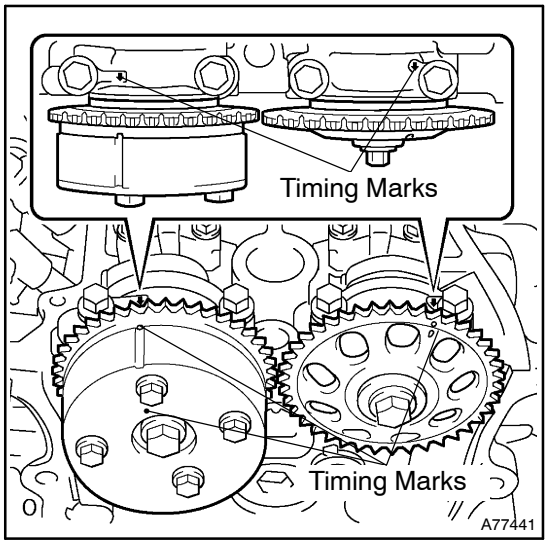
(c) Align the mark links (yellow colored links) of he chain with the timing marks of the gears as shown in the illustration.

(d) Insert the gear with the chain into the crankshaft and oil pump shaft.

(e) Temporarily tighten the oil pump drive shaft gear with the nut.



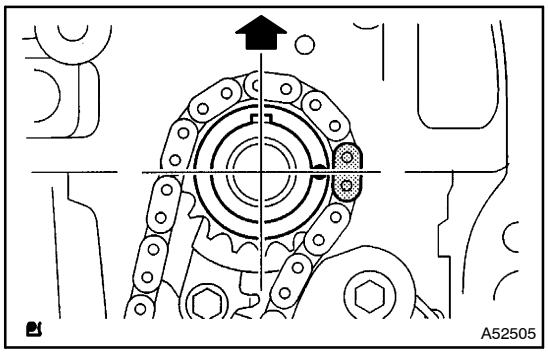
(f) Insert the damper spring into the adjusting hole, and install the chain tensioner plate with the bolt.
Torque: 12 N·m (122 kgf·cm, 9 ft·lbf)



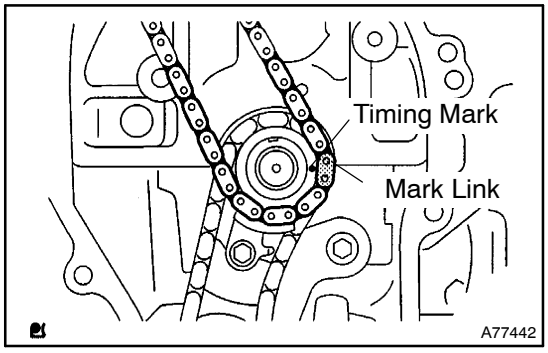
(g) Align the adjusting hole of the sprocket with the groove of the oil pump.

(h) Put a bar (ϕ 4 mm) into the adjusting hole of the sprocket to temporarily lock the gear in position. Install the nut.
Torque: 30 N·m (301 kgf·cm, 22 ft·lbf)

(i) Rotate the crankshaft clockwise by 90°, and align the crankshaft key with the top.

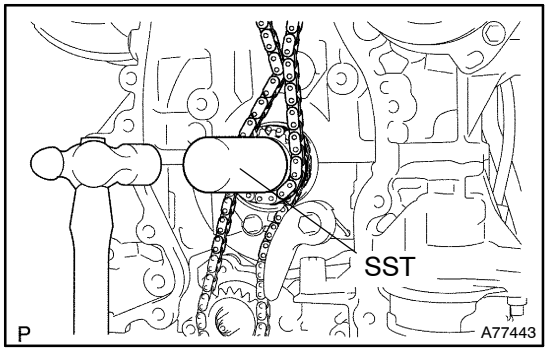


72. INSTALL CRANKSHAFT TIMING GEAR OR SPROCKET

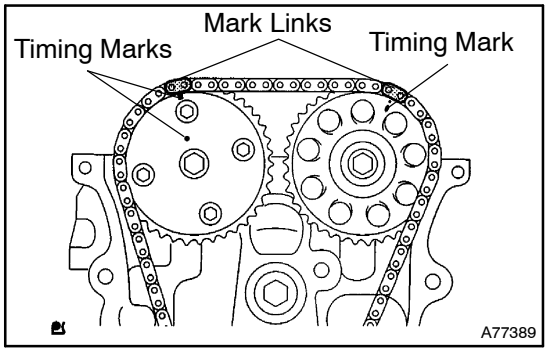


73. INSTALL CHAIN SUB–ASSY

(a) Set the No. 1 cylinder to TDC/compression.



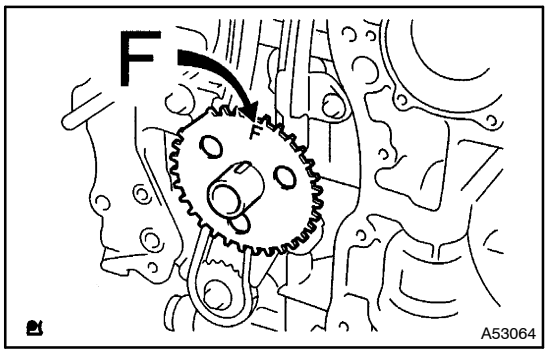
(1) Align the timing marks of the camshaft timing gear/sprocket and bearing caps (No. 1 and No. 2).



(2) Using the crankshaft pulley bolt, turn the crankshaft and set the set key on the crankshaft upward.

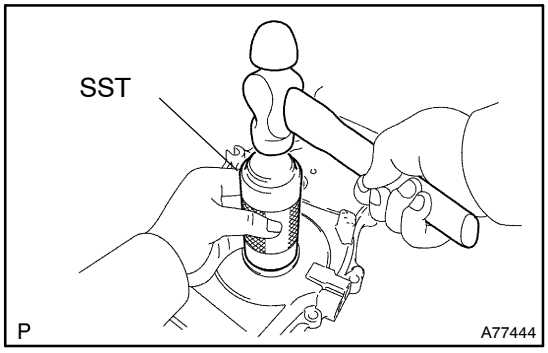
(b) Align the mark link (blue or orange colored link) of the chain with the timing mark of the crankshaft timing sprocket.

(c) Using SST, tap in the sprocket.
SST 09309–37010



(d) Align the mark links (gold or yellow colored links) of the chain with the timing marks of the camshaft timing gear and camshaft timing sprocket, and install the chain.

74. INSTALL TIMING CHAIN GUIDE
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

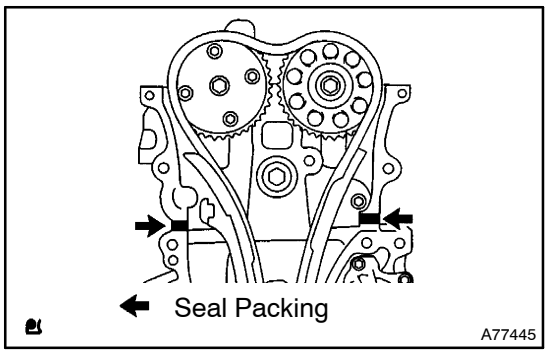


75. INSTALL CHAIN VIBRATION DAMPER NO.1
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

76. INSTALL CHAIN TENSIONER SLIPPER
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

77. INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1

(a) Install the sensor plate with the F mark facing forward.

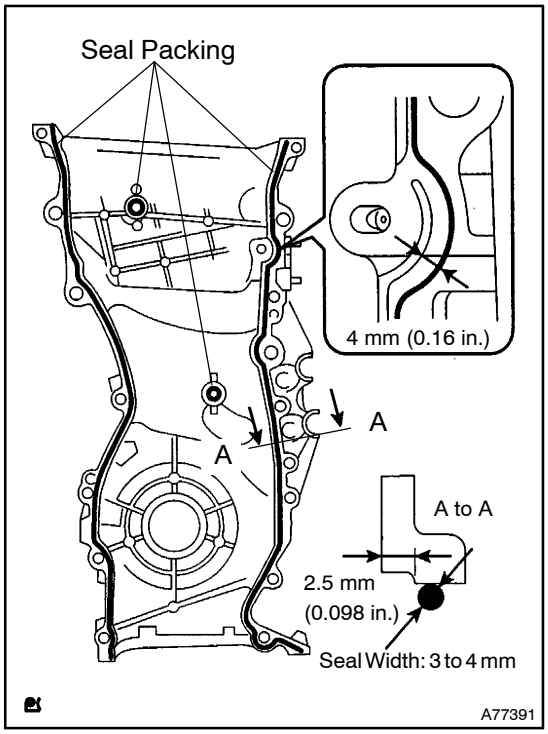


78. INSTALL TIMING GEAR CASE OR TIMING CHAIN CASE OIL SEAL

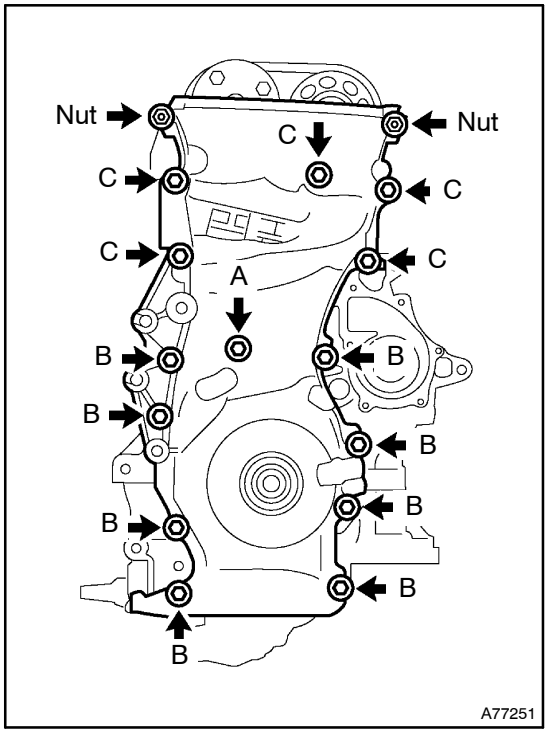
(a) Using SST, tap in a new oil seal until its surface is flush with the timing chain cover edge.
SST 09223–22010

(b) Apply a light coat of MP grease to the lip of a new oil seal.

NOTICE:
Keep the gap between the timing chain cover edge and the oil seal free of foreign matter.

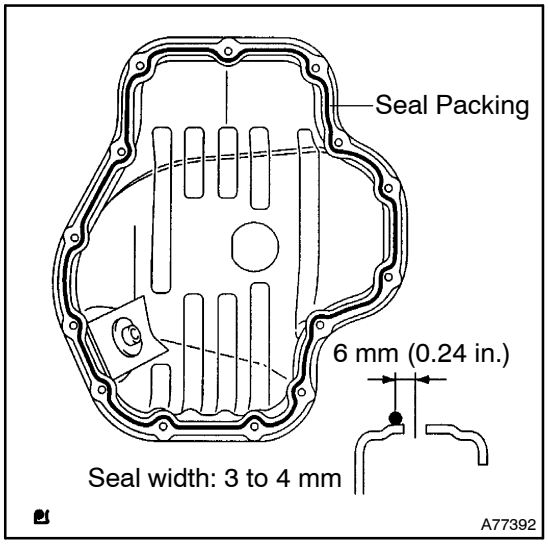


79. INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY



NOTICE:
- **Remove any oil from the contact surface.**
- **Install the chain cover within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after the installation.**

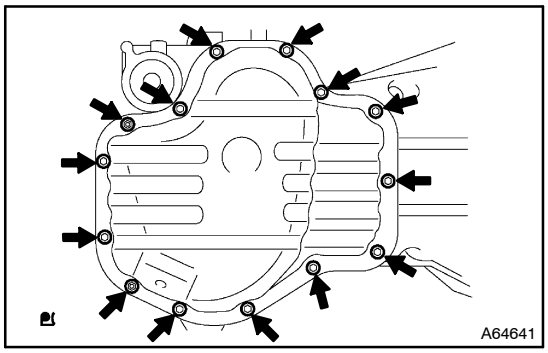
(a) Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the timing chain cover, cylinder head and cylinder block.



(b) Apply seal packing in a continuous bead (seal width: 2 mm (0.08 in.)) as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

(c) Apply seal packing in a continuous bead (seal width: 3 to 4 mm (0.12 to 0.16 in.)) as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

(d) Install the timing chain cover with the 14 bolts and 2 nuts.
Torque:
9.0 N·m (92 kgf·cm, 80 in.·lbf) for bolt A
21 N·m (214 kgf·cm, 15 ft·lbf) for bolt B
43 N·m (438 kgf·cm, 32 ft·lbf) for bolt C
9.0 N·m (92 kgf·cm, 80 in.·lbf) for nut

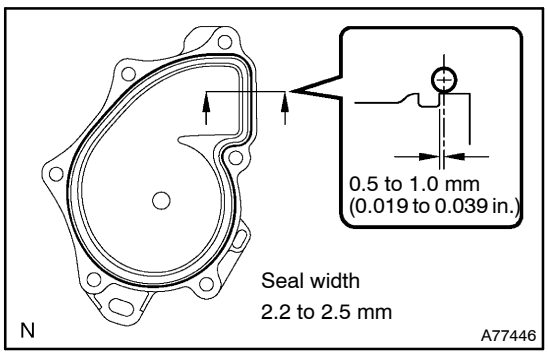


80. INSTALL OIL PAN SUB–ASSY

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after the installation.**

(a) Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surface of the cylinder block and oil pan.

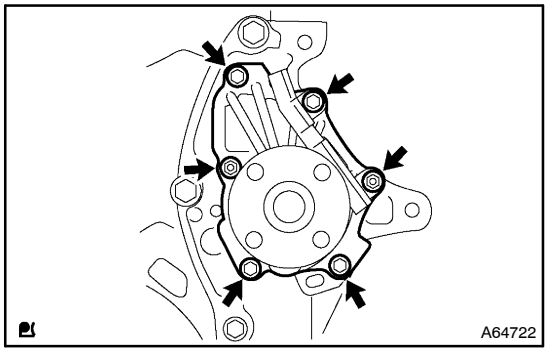


(b) Apply seal packing in a continuous bead (seal width: 3 to 4 mm (0.12 to 0.16 in.)) as shown in the illustration, and install the oil pan.
Seal packing: Part No. 08826–00080 or equivalent

(c) Install the oil pan with the 12 bolts and 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

81. INSTALL OIL PAN DRAIN PLUG

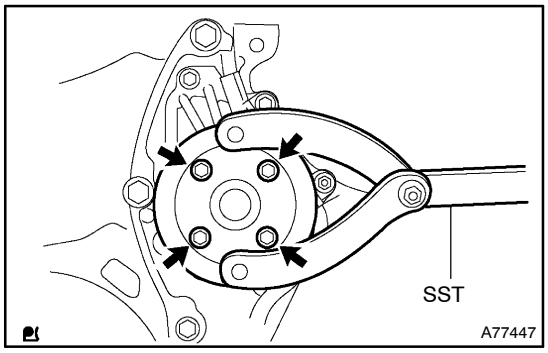
(a) Install a new gasket and oil pan drain plug with a new gasket.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)



82. INSTALL WATER PUMP ASSY

(a) Clean the contact surface of the cylinder block.

(b) Apply seal packing in a continuous bead (seal width: 2.2 to 2.5 mm (0.09 to 0.10 in.)) to the outside edge of the water pump.
Seal packing: Part No. 08826–00100 or equivalent

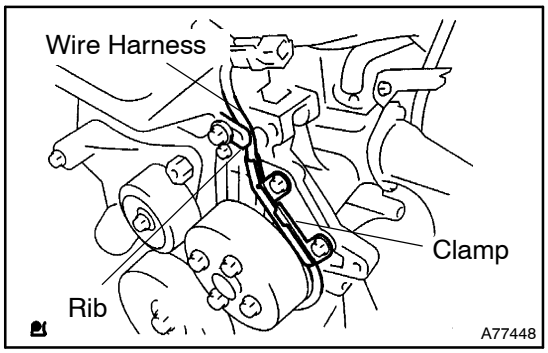


NOTICE:

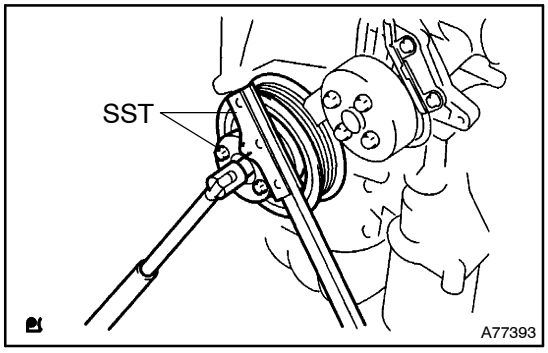
- **Remove any oil from the contact surface.**
- **Install the water pump within 5 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after installing.**

(c) Install the water pump with the 4 bolts and 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:
Tighten the outside bolts and nuts with the clamp.



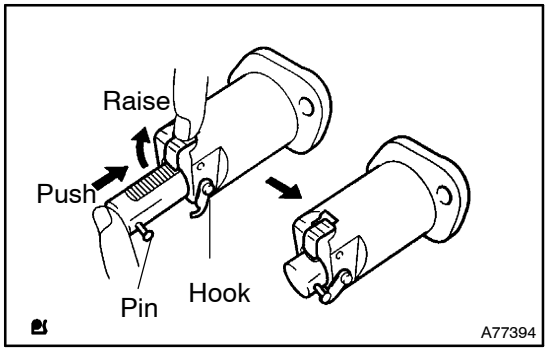
83. INSTALL WATER PUMP PULLEY



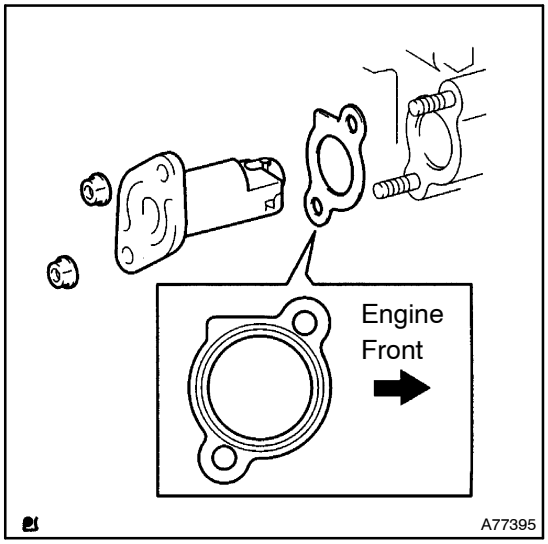
(a) Using SST, install the water pump pulley.
SST 09960–10010 (09962–01000, 09963–00700)
Torque: 26 N·m (265 kgf·cm, 19 ft·lbf)

84. INSTALL CRANKSHAFT POSITION SENSOR

(a) Apply a light coat of engine oil to the O–ring.
(b) Install the crankshaft position sensor with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



(c) Confirm that the wire harness of the sensor is placed as shown in the illustration.

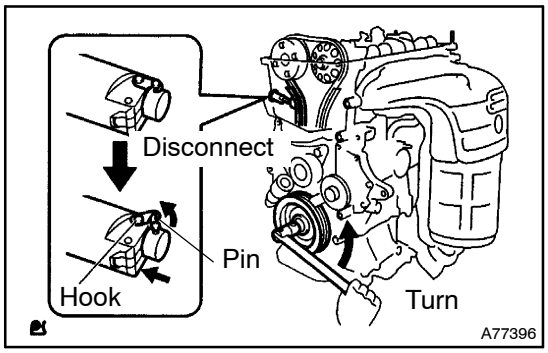


85. INSTALL CRANKSHAFT PULLEY

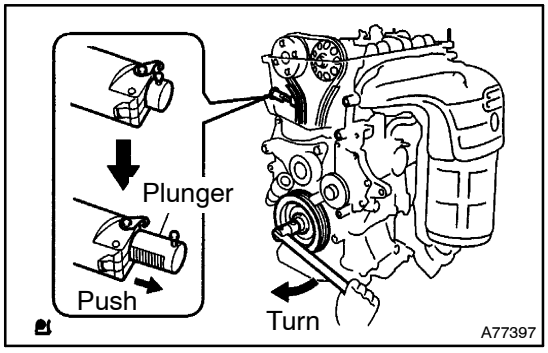
(a) Install the pulley.
(b) Using SST, tighten the set bolt.
SST 09213–54015 (91651–60855), 09330–00021
Torque: 180 N·m (1,835 kgf·cm, 132 ft·lbf)

86. INSTALL CHAIN TENSIONER ASSY NO.1

(a) Release the ratchet pawl, fully push in the plunger and apply the hook to the pin so that the plunger cannot spring out.

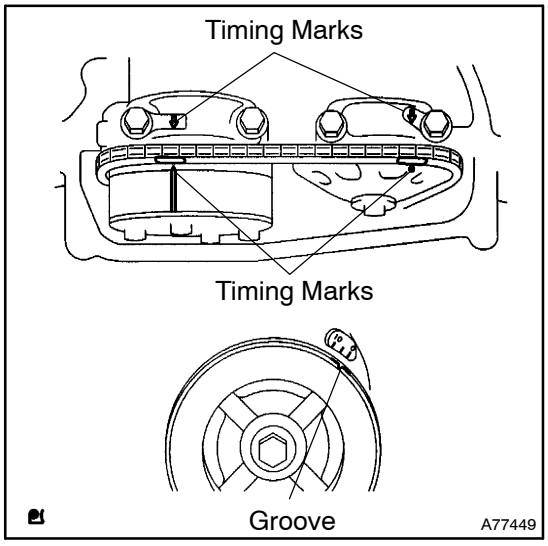


(b) Install a new gasket and the chain tensioner with the 2 nuts.



Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

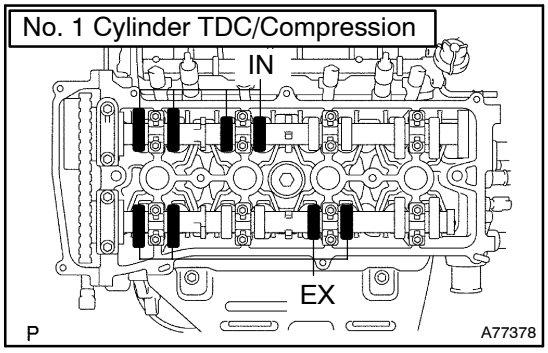
NOTICE:



If the hook is released while inserting, apply the hook again, and insert the chain tensioner.

(c) Turn the crankshaft pulley counterclockwise, and check that the plunger knock pin is free from the hook.

(d) Turn the crankshaft clockwise and check that the slipper is pushed by the plunger.



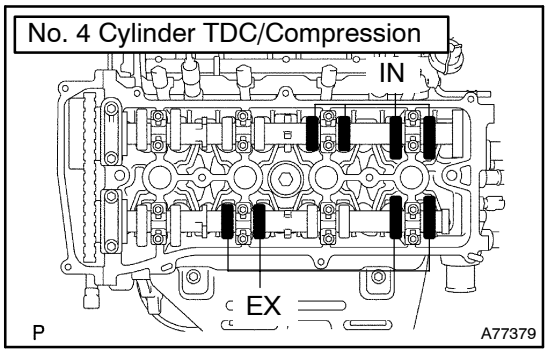
87. INSPECT VALVE CLEARANCE

(a) Turn the crankshaft pulley, and align its groove with timing mark 0 of the timing chain cover.

(b) Check that the timing marks of the camshaft timing gear and sprocket are aligned with the timing marks of the bearing cap No. 1 and No. 2 as shown in the illustration.

HINT:

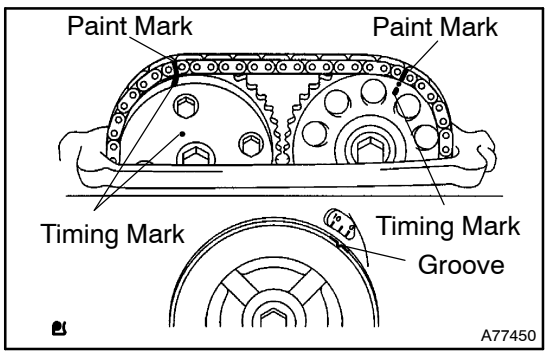
Inspect and adjust the valve clearance when the engine is cold.



(c) Check only the valve indicated on the left.
(1) Using a feeler gauge, measure the clearance between the valve lifter and the camshaft.
(2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.19 to 0.29 mm (0.008 to 0.011 in.)
Exhaust	0.30 to 0.40 mm (0.012 to 0.016 in.)

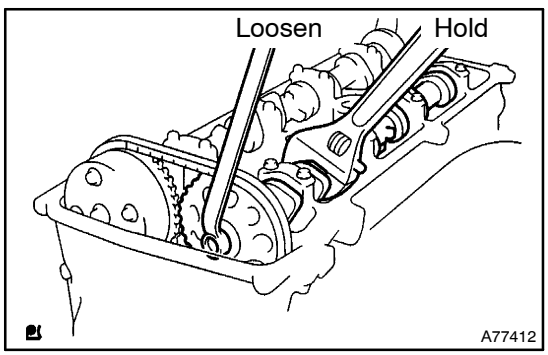


(d) Turn the crankshaft clockwise 1 revolution (360°) and set the No. 4 cylinder to TDC/compression.

(e) Check only the valve indicated on the left.
(1) Using a feeler gauge, measure the clearance between the valve lifter and the camshaft.
(2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.

Valve clearance (Cold):

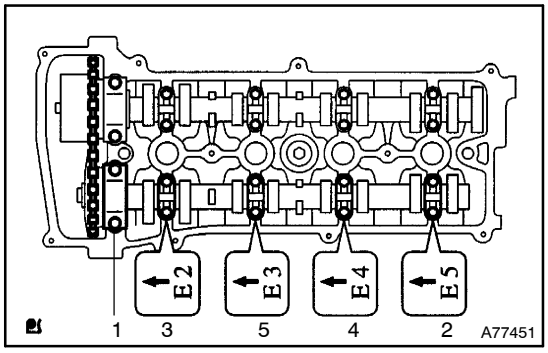
Item	Specified Condition
Intake	0.19 to 0.29 mm (0.008 to 0.011 in.)
Exhaust	0.30 to 0.40 mm (0.012 to 0.016 in.)



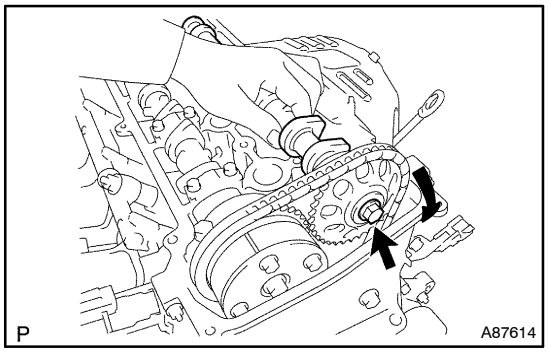
88. ADJUST VALVE CLEARANCE

NOTICE:

Be sure not to turn the crankshaft without the chain tensioner.

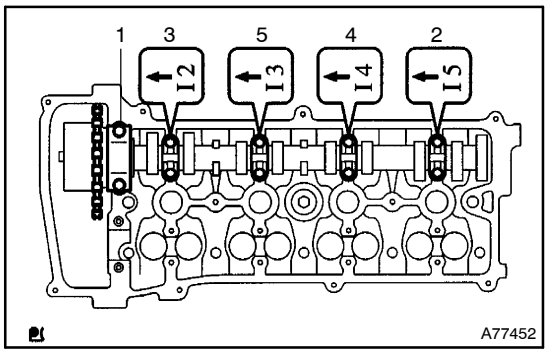


(a) Turn the crankshaft 1 revolution (360°) clockwise, and set the No. 1 cylinder to TDC/compression.
(b) Place matchmarks on the timing chain and camshaft timing gear.
(c) Remove the 2 bolts and the chain tensioner.

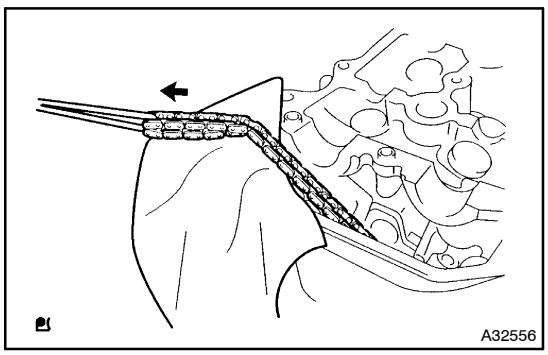


(d) Fix the camshaft with a wrench and then loosen the sprocket bolt.

NOTICE:



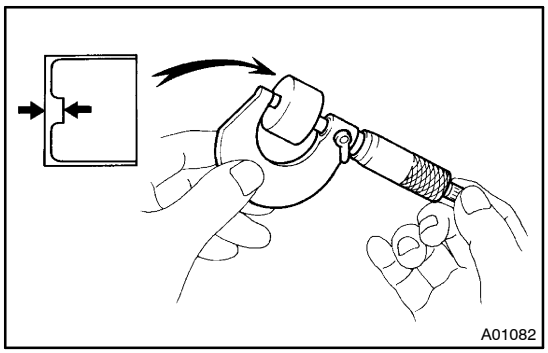
Be careful not to damage the valve lifter.



(e) Uniformly loosen and remove the No. 2 camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearing caps.

(f) Raise the No. 2 camshaft and remove it. Then remove the sprocket bolt.
(g) Remove the camshaft timing sprocket and the timing chain from the No. 2 camshaft.
(h) Remove the camshaft timing sprocket from the timing chain.

(i) Uniformly loosen and remove the No. 1 camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearing caps.
(j) Remove the camshaft.



(k) Tie the timing chain with a string.

NOTICE:

Be careful not to drop anything inside the timing chain cover.

(l) Remove the valve lifters.

(m) Using a micrometer, measure the thickness of the removed lifter.
(n) Calculate the thickness of a new lifter so that the valve clearance comes within the specified valve.

A	Thickness of the new lifter
B	Thickness of the used lifter
C	Measured valve clearance

Valve clearance:

Item	Specified Condition
Intake	A = B + (C – 0.24 mm (0.0094 in.))
Exhaust	A = B + (C – 0.35 mm (0.0138 in.))

EXAMPLE: (Intake)
Measured valve clearance = 0.44 mm (0.0173 in.)
0.44 mm (0.0173 in.) – 0.24 mm (0.0094 in.) = 0.20 mm (0.0079 in.)
(Measured value – Specification = Excess clearance)
Used shim measurement = 5.30 mm (0.2087 in.)
0.20 mm (0.0079 in.) + 5.30 mm (0.2087 in.) = 5.50 mm (0.2165 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 5.50 mm (0.2165 in.) = Shim No. ”50”

(o) Select a new lifter with a thickness as close as possible to the calculated values.

HINT:

- Lifters are available in 35 sizes in increments of 0.020 mm (0.0008 in.), from 5.060 mm (0.1992 in.) to 5.740 mm (0.2260 in.)
- Refer to new lifter thickness table on the following 2 pages.

Valve Lifter Selection Chart (Intake)

Intake valve clearance (Cold):
0.19 to 0.29 mm (0.008 to 0.011 in.)

EXAMPLE:

The 5.250 mm (0.2067 in.) lifter is installed, and the measured clearance is 0.400 mm (0.0157 in.). Replace the 5.250 mm (0.2067 in.) lifter with a new No. 42 lifter.

New Lifter Thickness mm (in.)

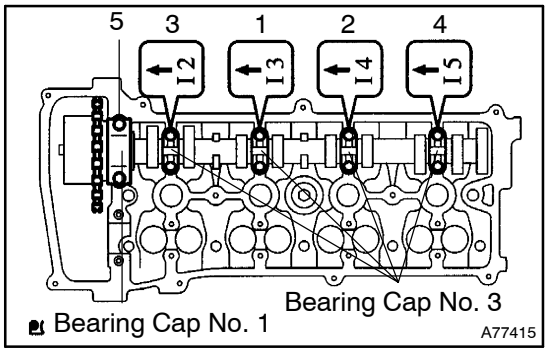
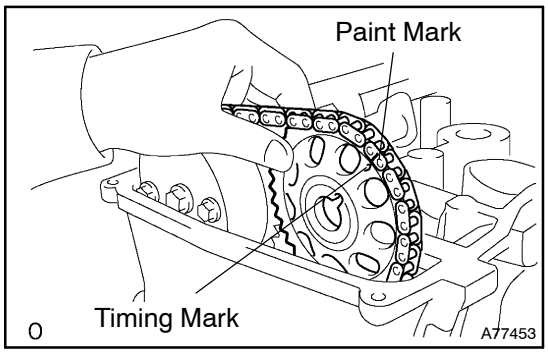
Exhaust valve clearance (Cold):
0.30 to 0.40 mm (0.012 to 0.016 in.)



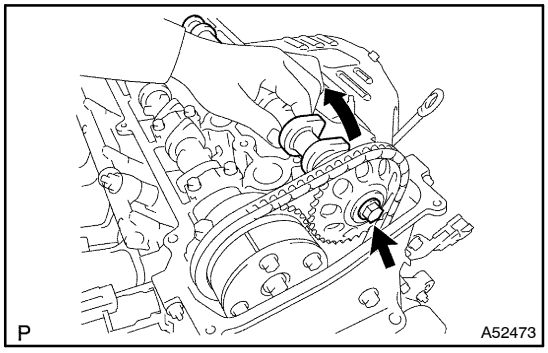
EXAMPLE:

The 5.340 mm (0.2102 in.) lifter is installed, and the measured clearance is 0.440 mm (0.0173 in.). Replace the 5.340 mm (0.2102 in.) lifter with a new No. 42 lifter.

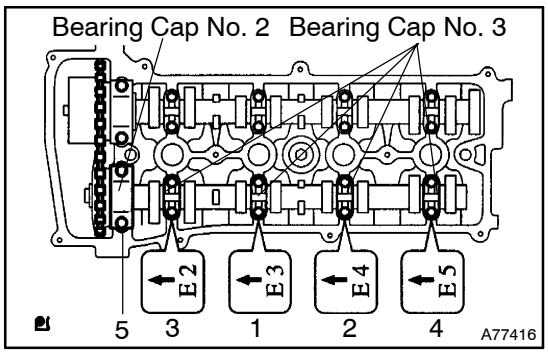
A77297



(p) Install the timing chain on the No. 1 camshaft timing gear, with the paint mark aligned with the timing marks on the camshaft timing gear.

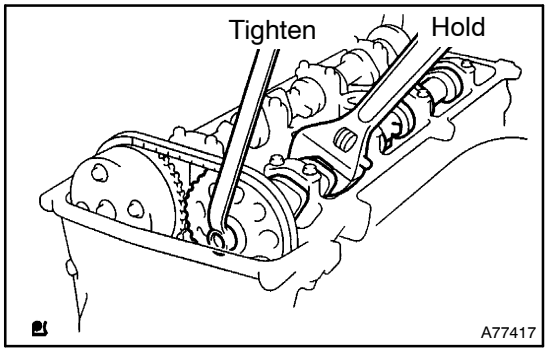


(q) Examine the front marks and numbers of the 5 bearing caps and install them. Then install the 10 bearing cap bolts. Uniformly tighten the bolts in the sequence shown in the illustration.



Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for bearing cap No. 1
9.0 N·m (92 kgf·cm, 80 in.·lbf) for bearing cap No. 3

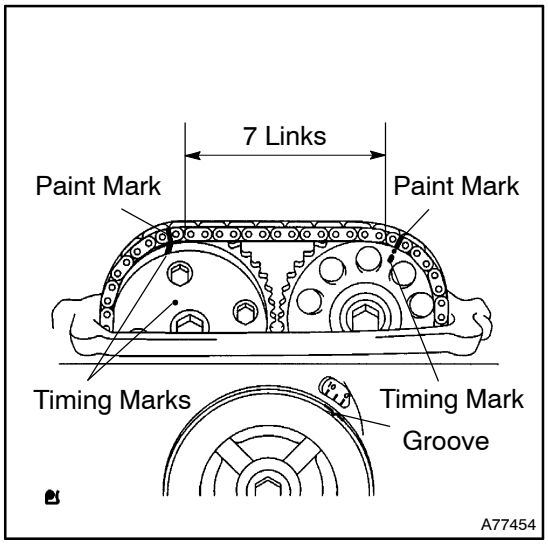
(r) Put the No. 2 camshaft on the cylinder head with the paint mark of the chain aligned with the timing mark on the camshaft timing sprocket.



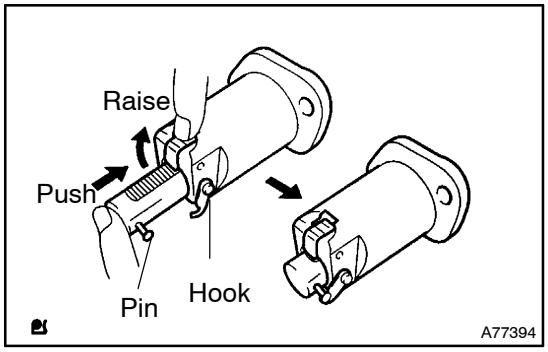
(s) Raise the No. 2 camshaft and temporarily tighten the sprocket bolt.

(t) Examine the front marks and numbers of the 5 bearing caps and install them. Then install the 10 bearing cap bolts. Uniformly tighten the bolts in the sequence shown in the illustration.

Torque:
30 N·m (301 kgf·cm, 22 ft·lbf) for bearing cap No. 1
9.0 N·m (92 kgf·cm, 80 in.·lbf) for bearing cap No. 3



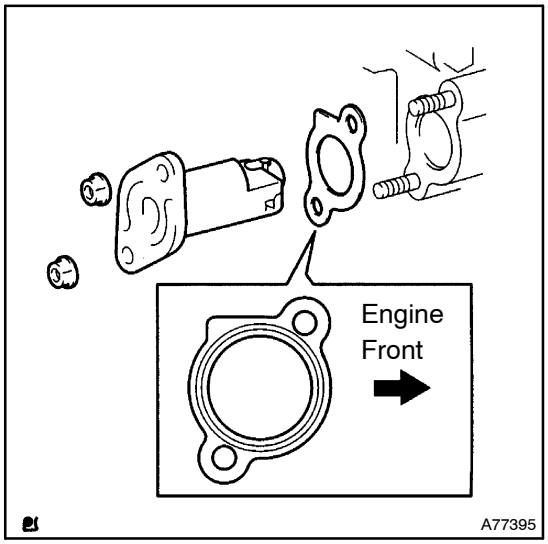
(u) Fix the camshaft with a wrench, then tighten the sprocket bolt.



Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)

NOTICE:

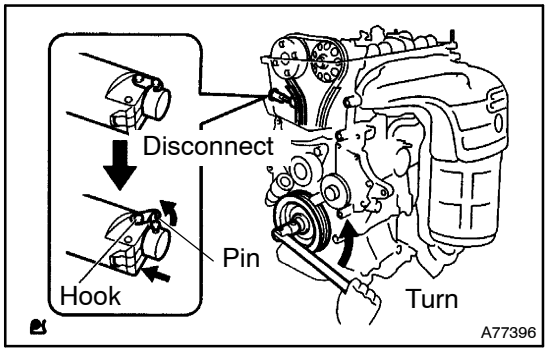
Be careful not to damage the valve lifter.



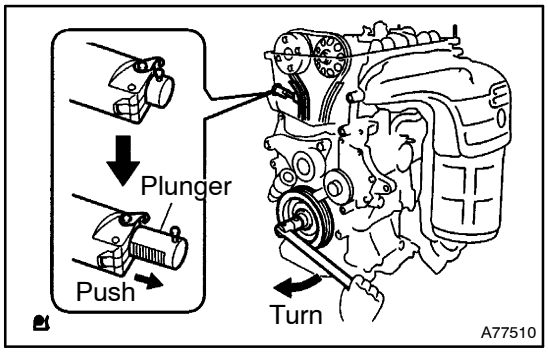
(v) Check that the timing chain paint marks are aligned with the camshaft timing sprocket timing mark and the camshaft timing gear timing mark. Also check the alignment of the pulley groove and chain cover timing mark.

(w) Install the chain tensioner.

(1) Release the ratchet pawl, fully push in the plunger and apply the hook to the pin so that the plunger cannot spring out.



(2) Install a new gasket and the chain tensioner with the 2 nuts.



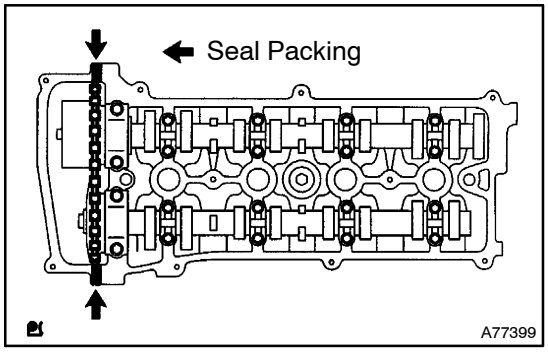
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:

When installing the tensioner, set the hook again if the hook releases the plunger.

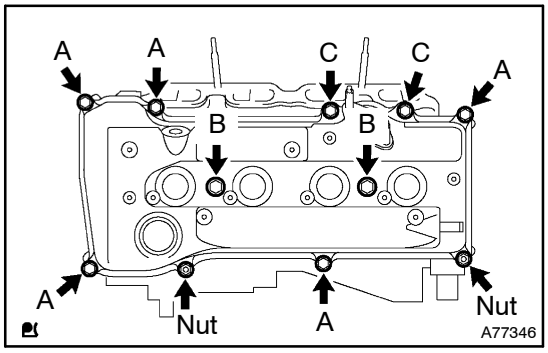
(3) Turn the crankshaft counterclockwise, and disconnect the plunger knock pin from the hook.

(4) Turn the crankshaft clockwise, and check that the slipper is pushed by the plunger.



89. INSTALL CAMSHAFT POSITION SENSOR
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

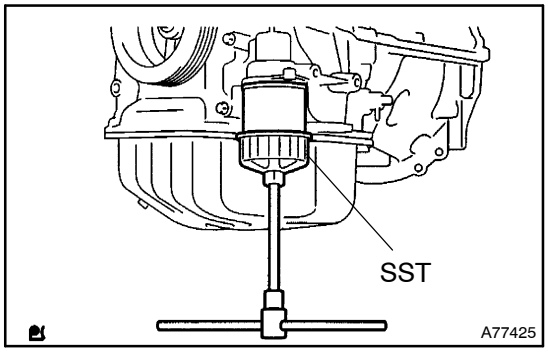
90. INSTALL CYLINDER HEAD COVER GASKET



91. INSTALL CYLINDER HEAD COVER SUB–ASSY

(a) Remove any old packing (FIPG) material.

(b) Apply seal packing to the 2 locations shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent



NOTICE:
- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 5 minutes after applying seal packing.**
- **Do not apply engine oil for at least 2 hours after the installation.**

(c) Install the cylinder head cover with the 9 bolts and 2 nuts.
Torque:
11 N·m (112 kgf·cm, 8 ft·lbf) for bolt A
14 N·m (143 kgf·cm, 10 ft·lbf) for bolt B
21 N·m (214 kgf·cm, 15 ft·lbf) for bolt C
11 N·m (112 kgf·cm, 8 ft·lbf) for nut

92. INSTALL OIL FILTER UNION

(a) Using a 12 mm hexagon wrench, install the oil filter union.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

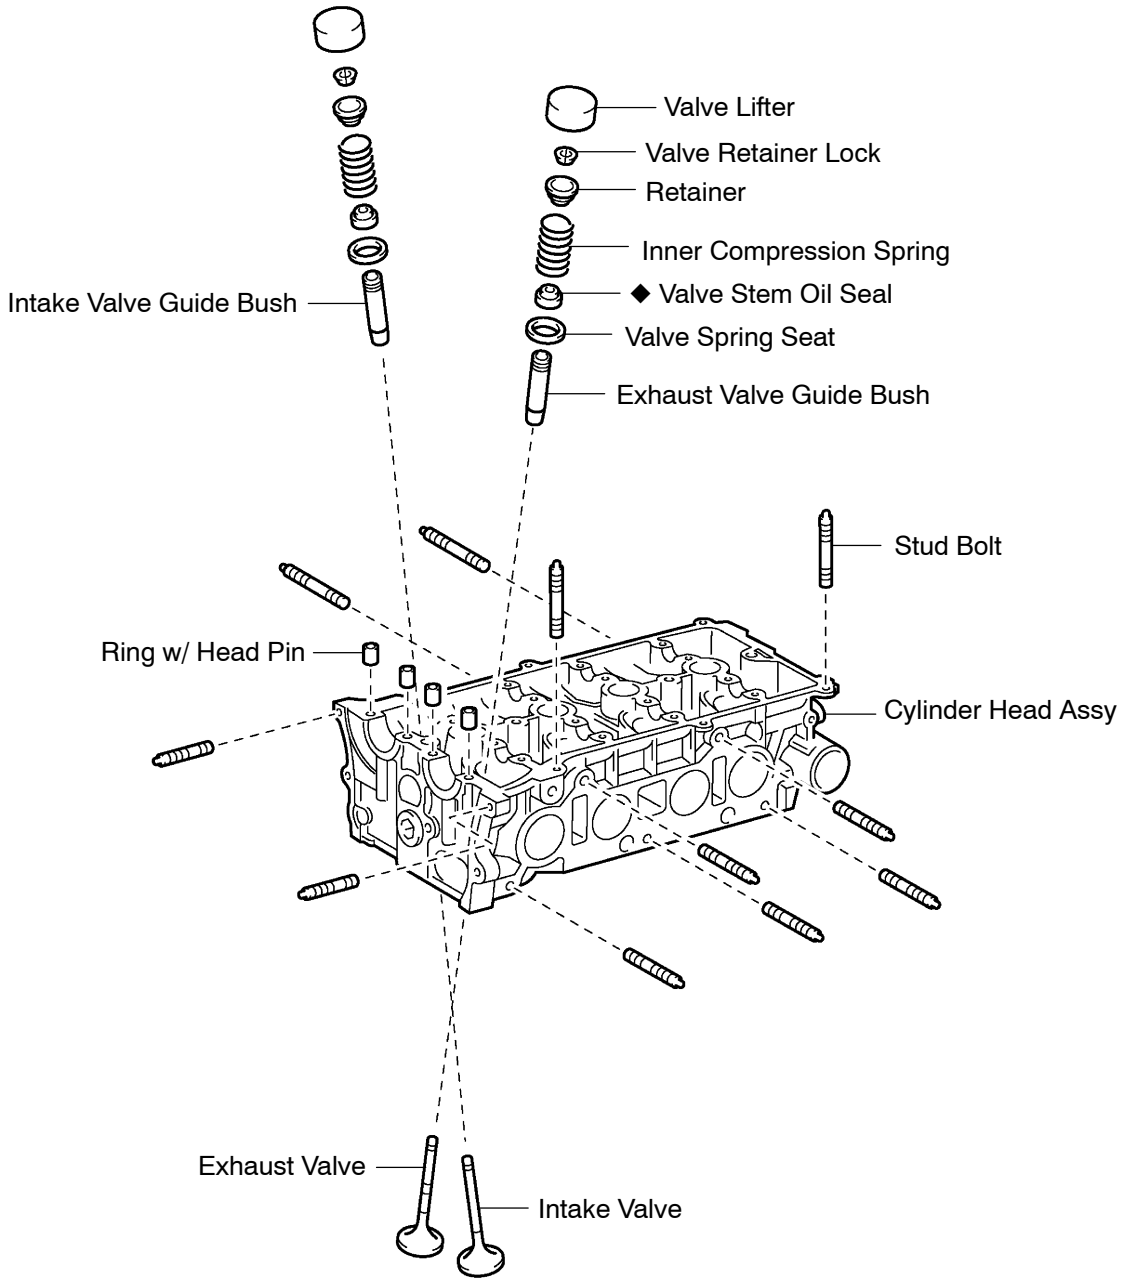
93. INSTALL OIL FILTER SUB–ASSY

(a) Check and clean the oil filter installation surface.
(b) Apply clean engine oil to the gasket of a new oil filter.
(c) Lightly screw the oil filter into place, and tighten it until the gasket contacts the seat.
(d) Using SST, tighten it an additional 3/4 turn.
SST 09228–06501

94. INSTALL SPARK PLUG
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

95. INSTALL VENTILATION VALVE SUB–ASSY

(a) Apply adhesive on the threads of the ventilation valve.
Adhesive: Part No. 08833–00070 THREE BOND 1324 or equivalent
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)



96. INSTALL OIL FILLER CAP GASKET

97. INSTALL OIL FILLER CAP SUB–ASSY

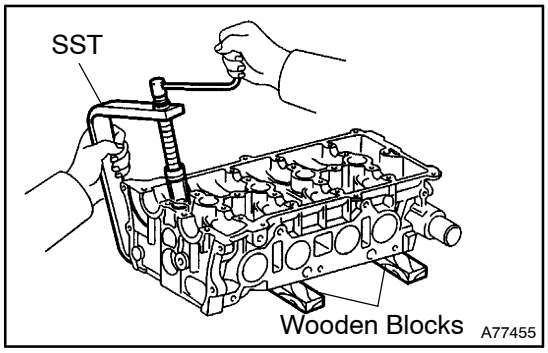
CYLINDER HEAD ASSY (2AZ–FSE)

COMPONENTS

141Q6–01

◆ Non–reusable part

A77366



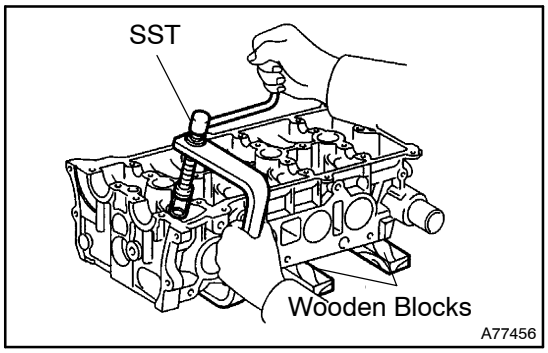
141Q7–01

OVERHAUL

1. REMOVE VALVE LIFTER

HINT:

Arrange the valve lifters in the correct order.



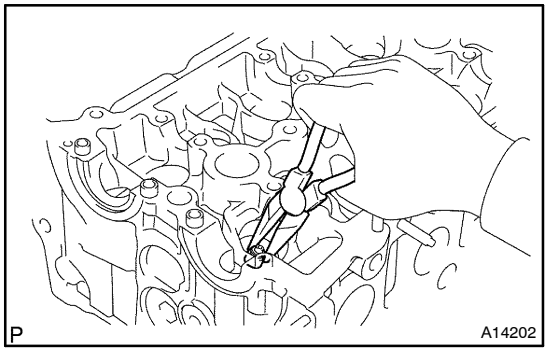
2. REMOVE INTAKE VALVE

(a) Using SST and wooden blocks, compress and remove the 8 valve spring retainer locks.
SST 09202–70020 (09202–00010)

(b) Remove the retainer, valve spring and valve.

HINT:

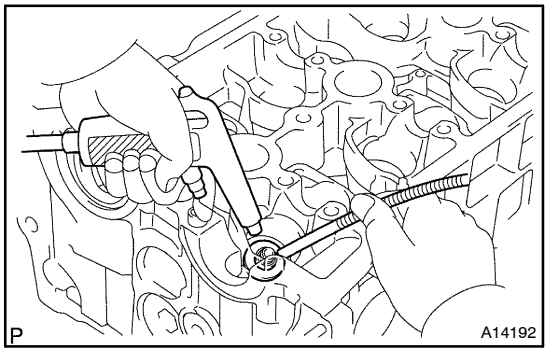
Arrange the removed parts in the correct order.



3. REMOVE EXHAUST VALVE

(a) Using SST and wooden blocks, compress and remove the 8 valve spring retainer locks.
SST 09202–70020 (09202–00010)

(b) Remove the retainer, valve spring and valve.

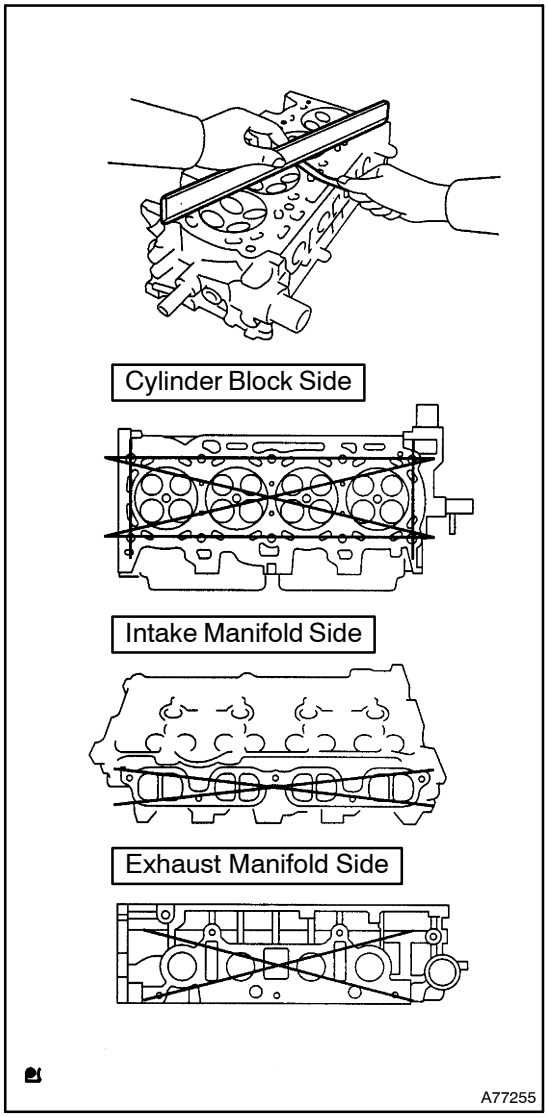


HINT:

Arrange the removed parts in the correct order.

4. REMOVE VALVE STEM OIL SEAL

(a) Using needle–nose pliers, remove the oil seals.



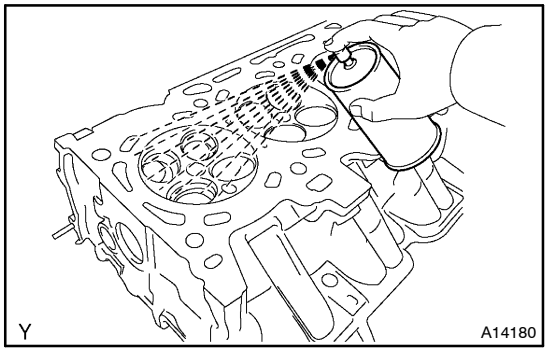
5. REMOVE VALVE SPRING SEAT

(a) Using compressed air and a magnetic finger, remove the spring seat by blowing air.

HINT:

Store the removed parts in the correct order so that they can be returned to the original locations when re–assembling.

6. REMOVE STUD BOLT

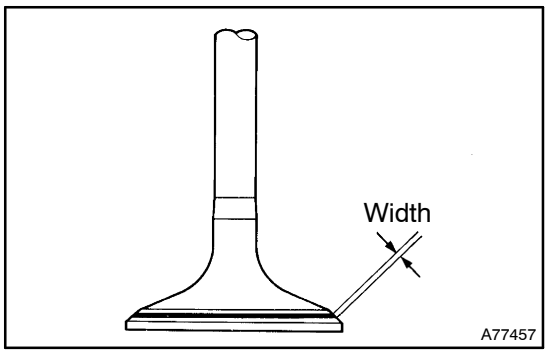


7. INSPECT CYLINDER HEAD FOR FLATNESS

(a) Using a precision straight edge and a feeler gauge, measure the surface contacting the cylinder block and the manifolds for warpage.

Maximum warpage:

Item	Specified Condition
Cylinder block side	0.05 mm (0.0020 in.)
Intake manifold side	0.08 mm (0.0031 in.)
Exhaust manifold side	0.08 mm (0.0031 in.)



If the warpage is greater than the maximum, replace the cylinder head.

8. INSPECT CYLINDER HEAD FOR CRACKS

(a) Using a dye penetrant, check the intake ports, exhaust ports and cylinder surface for cracks.

If cracked, replace the cylinder head.

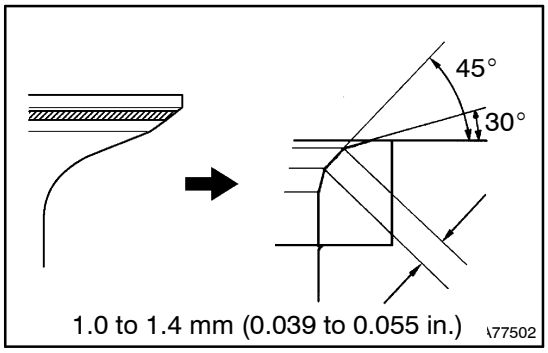
9. INSPECT VALVE SEATS

(a) Apply a light coat of prussian blue (or white lead) to the valve face.

(b) Lightly press the valve face against the valve seat.

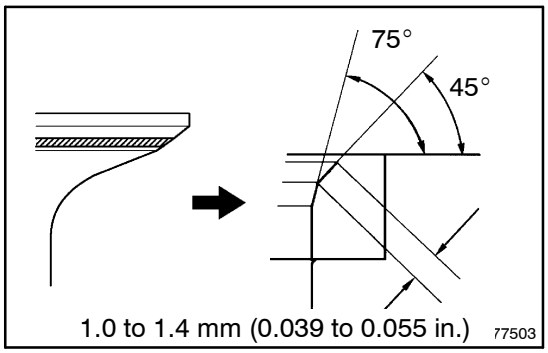
(c) Check the valve face and valve seat according to the following procedure.

(1) If blue appears 360° around the valve face, the valve face is concentric. If not, replace the valve.



(2) If blue appears 360° around the valve seat, the guide and valve face are concentric. If not, resurface the valve seat.

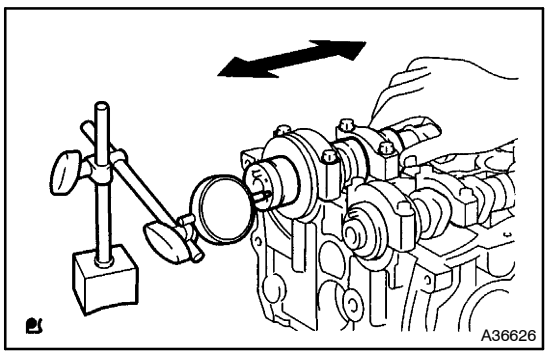
(3) Check that the valve seat contact is in the middle of the valve face with the width between 1.0 to 1.4 mm (0.039 to 0.055 in.).



10. REPAIR VALVE SEATS

NOTICE:

Keep the lip free of foreign matter.



(a) If the seating is too high on the valve face, use 30° and 45° cutters to correct the seat.

(b) If the seating is too low on the valve face, use 75° and 45° cutters to correct the seat.

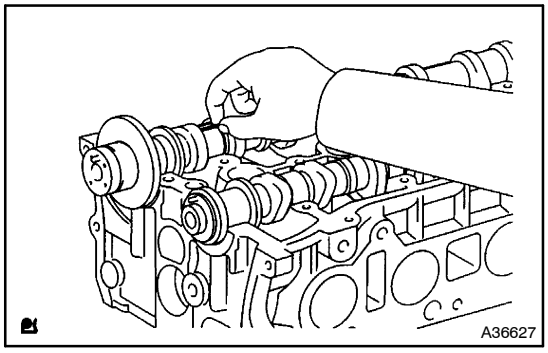
(c) Hand–rub the valve and valve seat with an abrasive compound.

(d) Check the valve seating position.

11. INSPECT CAMSHAFT THRUST CLEARANCE

(a) Install the camshafts.

(b) Using a dial indicator, measure the thrust clearance while moving the camshaft back and forth.



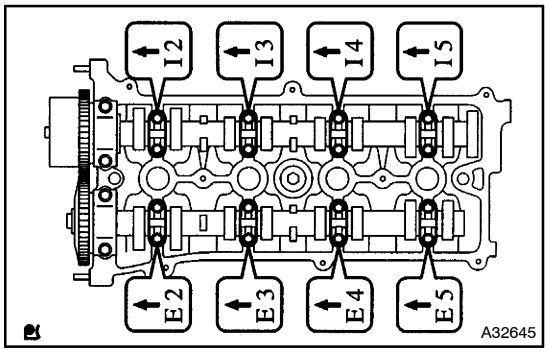
Standard thrust clearance:

Item	Specified Condition
Intake	0.040 to 0.095 mm (0.0016 to 0.0037 in.)
Exhaust	0.080 to 0.135 mm (0.0032 to 0.0053 in.)

Maximum thrust clearance:

Item	Specified Condition
Intake	0.11 mm (0.0043 in.)
Exhaust	0.15 mm (0.0059 in.)

If the thrust clearance is greater than the maximum, replace the cylinder head. If the thrust surface is damaged, replace the camshaft.



12. INSPECT CAMSHAFT OIL CLEARANCE

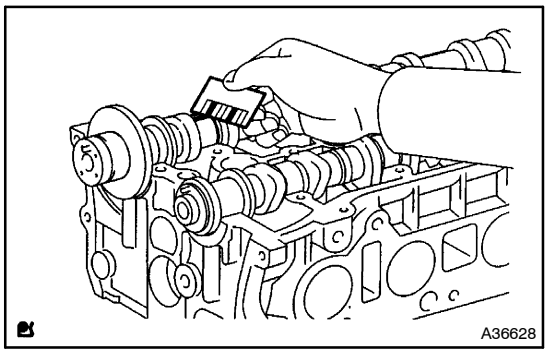
(a) Clean the bearing caps and camshaft journals.

(b) Place the camshafts on the cylinder head.

(c) Lay a strip of Plastigage across each of the camshaft journal.

(d) Install the bearing caps.

Torque:



30 N·m (301 kgf·cm, 22 ft·lbf) for No. 1 bearing cap

30 N·m (301 kgf·cm, 22 ft·lbf) for No. 2 bearing cap

9.0 N·m (92 kgf·cm, 80 in.·lbf) for No. 3 bearing cap

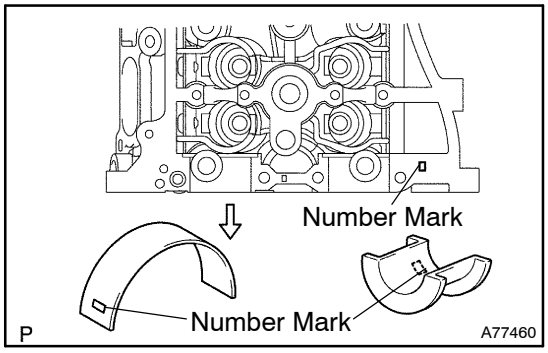
NOTICE:

Do not turn the camshaft.

(e) Remove the bearing cap and measure the Plastigage at its widest point.

Standard oil clearance:

Item	Specified Condition
Intake No. 1 journal bearing mark 1	0.007 to 0.038 mm (0.00028 to 0.0015 in.)
Intake No. 1 journal bearing mark 2	0.080 to 0.038 mm (0.00031 to 0.015 in.)
Intake No. 1 journal bearing mark 3	0.080 to 0.038 mm (0.00031 to 0.015 in.)
Exhaust No. 1 journal	0.040 to 0.079 mm (0.00157 to 0.00311 in.)
Other journals	0.025 to 0.062 mm (0.00098 to 0.00244 in.)



Maximum oil clearance:

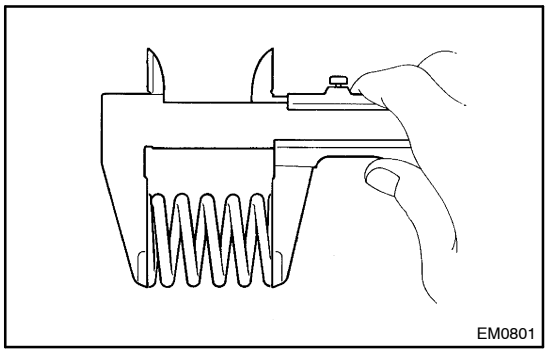
Item	Specified Condition
Intake No. 1 journal	0.07 mm (0.0028 in.)
Other journals	0.10 mm (0.0039 in.)

NOTICE:

Completely remove the plastigage after the inspection.

If the oil clearance is greater than the maximum, replace the camshaft. If necessary, replace the cylinder head.

If the oil clearance on the No. 1 journal is greater than the maximum, choose a new bearing and install it.



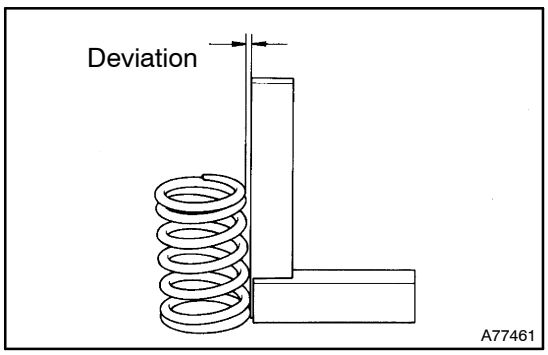
Cylinder head journal bore diameter:

Mark 1	40.000 to 40.008 mm (1.57480 to 1.57511 in.)
Mark 2	40.009 to 40.017 mm (1.57515 to 1.57547 in.)
Mark 3	40.018 to 40.025 mm (1.57551 to 1.57578 in.)

Standard bearing center wall thickness:

Mark 1	2.000 to 2.004 mm (0.07874 to 0.07890 in.)
Mark 2	2.005 to 2.008 mm (0.07894 to 0.07905 in.)
Mark 3	2.009 to 2.012 mm (0.07909 to 0.07921 in.)

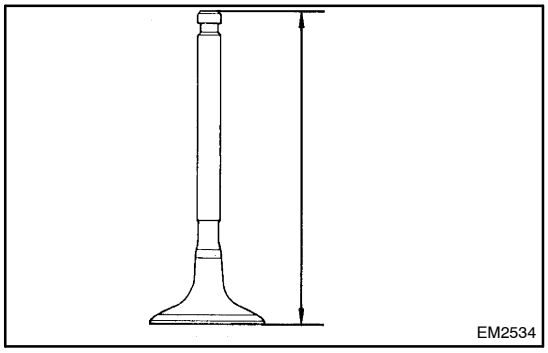
Camshaft journal diameter:
35.971 to 35.985 mm (1.41648 to 1.41673 in.)



13. INSPECT INNER COMPRESSION SPRING

(a) Using a vernier caliper, measure the free length of the valve spring.

Free length: 45.7 mm (1.799 in.)

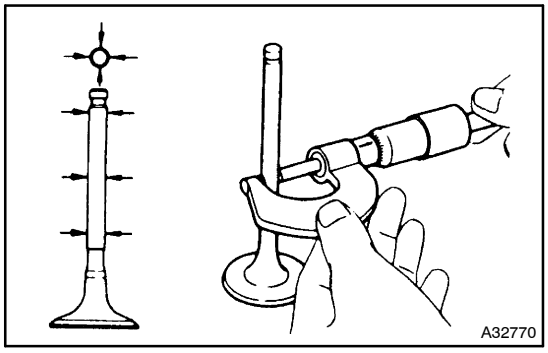


If the free length is not as specified, replace the valve spring.

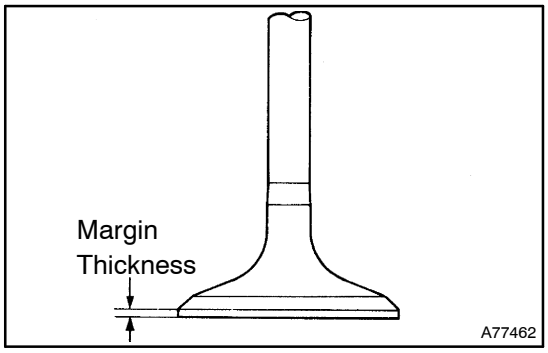
(b) Using steel squares, measure the deviation of the valve spring.

Maximum deviation: 1.6 mm (0.063 in.)

If the deviation is greater than the maximum, replace the valve spring.

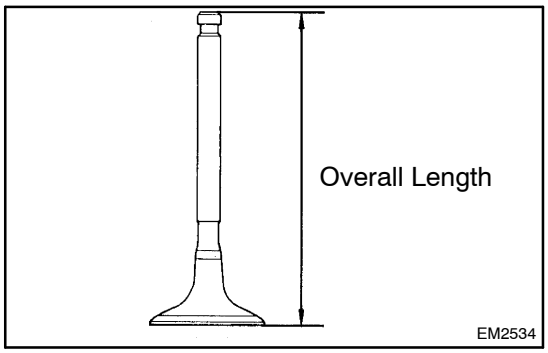


14. INSPECT INTAKE VALVE

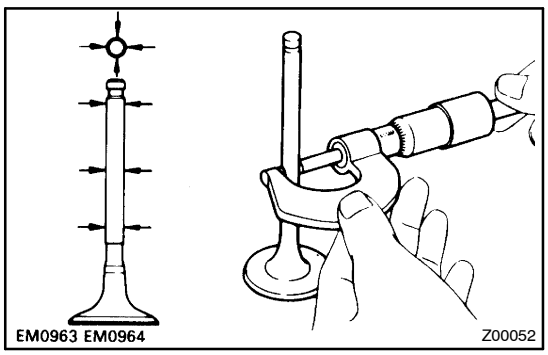


(a) Using a vernier caliper, measure the valve overall length.

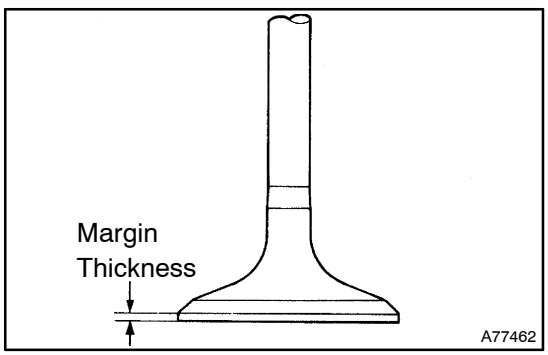
Standard overall length: 101.71 mm (4.0043 in.)
Minimum overall length: 101.21 mm (3.9846 in.)



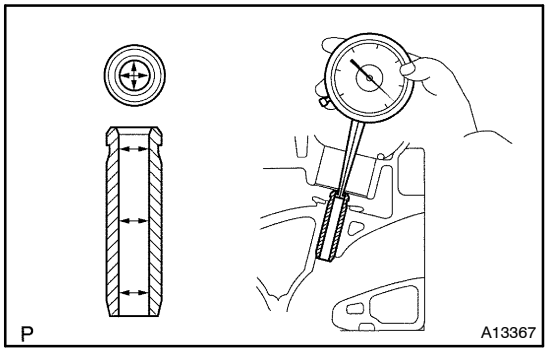
If the overall length is less than the minimum, replace the valve.



(b) Using a micrometer, measure the diameter of the valve stem.
Valve stem diameter:
5.470 to 5.485 mm (0.2154 to 0.2159 in.)



(c) Using a vernier caliper, measure the valve head margin thickness.
Standard margin thickness:
1.05 to 1.45 mm (0.041 to 0.057 in.)
Minimum margin thickness: 0.75 mm (0.030 in.)
If the margin thickness is less than the minimum, replace the valve.

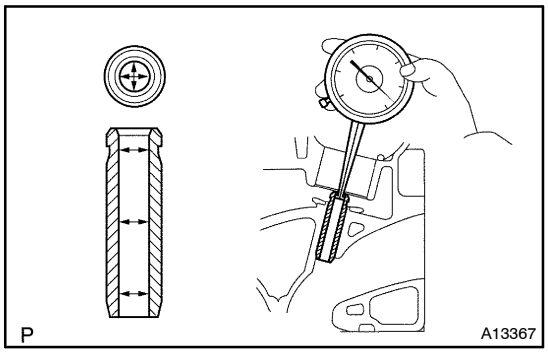


15. INSPECT EXHAUST VALVE
(a) Using a vernier caliper, measure the valve overall length.
Standard overall length: 101.15 mm (3.9823 in.)
Minimum overall length: 100.70 mm (3.9646 in.)
If the overall length is less than the minimum, replace the valve.

(b) Using a micrometer, measure the diameter of the valve stem.
Valve stem diameter:
5.465 to 5.480 mm (0.2152 to 0.2157 in.)

(c) Using a vernier caliper, measure the valve head margin thickness.
Standard margin thickness:
1.2 to 1.6 mm (0.047 to 0.063 in.)
Minimum margin thickness: 0.9 mm (0.035 in.)
If the margin thickness is less than the minimum, replace the valve.

16. INSPECT INTAKE VALVE GUIDE BUSH



(a) Using a caliper gauge, measure the inside diameter of the guide bush.

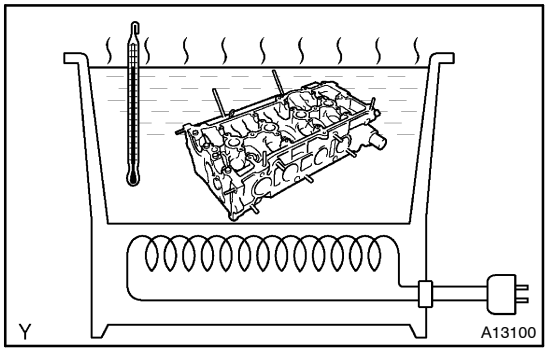
Bushing inside diameter:
5.510 to 5.530 mm (0.2169 to 0.2177 in.)

(b) Subtract the valve stem diameter measurement from the guide bush inside diameter measurement.

Standard oil clearance:
0.025 to 0.060 mm (0.00098 to 0.00236 in.)
Maximum oil clearance: 0.08 mm (0.0031 in.)

If the clearance is greater than the maximum, replace the valve and guide bush (see steps 18 and 20).

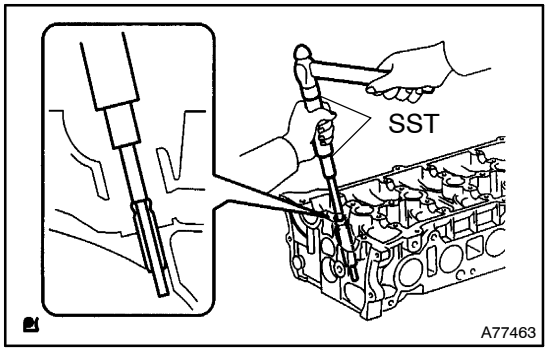
17. INSPECT EXHAUST VALVE GUIDE BUSH



(a) Using a caliper gauge, measure the inside diameter of the guide bush.

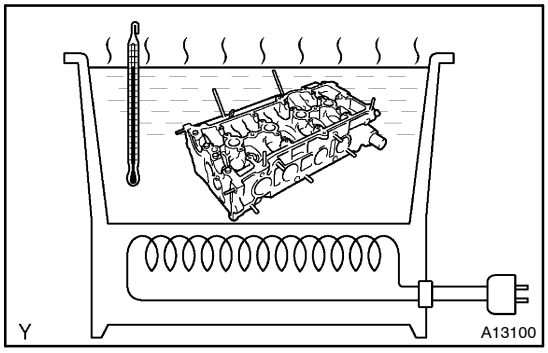
Bushing inside diameter:
5.510 to 5.530 mm (0.2169 to 0.2177 in.)

(b) Subtract the valve stem diameter measurement from the guide bushing inside diameter measurement.



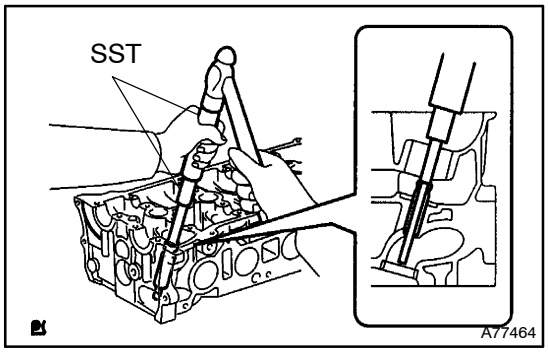
Standard oil clearance:
0.030 to 0.065 mm (0.0012 to 0.0026 in.)
Maximum oil clearance: 0.10 mm (0.0039 in.)

If the clearance is greater than the maximum, replace the valve and guide bush (see steps 19 and 21).

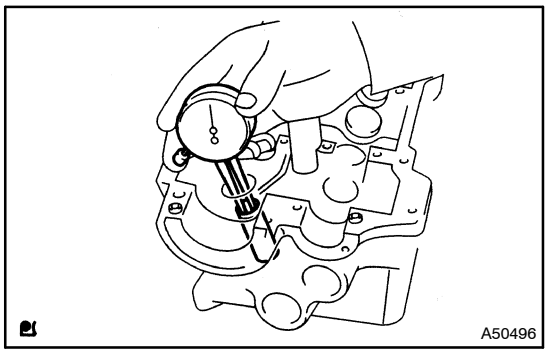


18. REMOVE INTAKE VALVE GUIDE BUSH

(a) Gradually heat the cylinder head to 80 to 100°C (176 to 212°F).



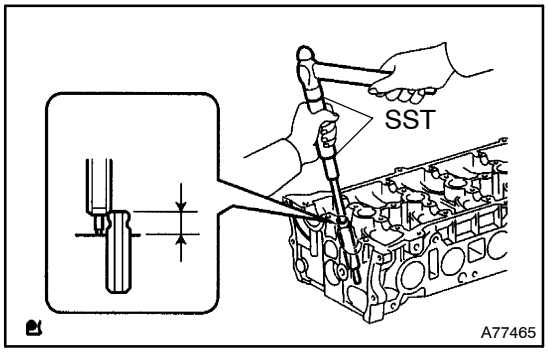
(b) Using SST and a hammer, tap out the guide bush.
SST 09201–10000 (09201–01050), 09950–70010 (09951–07100)



19. REMOVE EXHAUST VALVE GUIDE BUSH

(a) Gradually heat the cylinder head to 80 to 100°C (176 to 212°F).

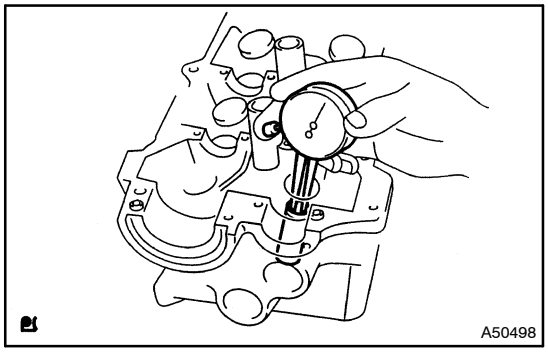
(b) Using SST and a hammer, tap out the guide bush.
SST 09201–10000 (09201–01050), 09950–70010 (09951–07100)



20. INSTALL INTAKE VALVE GUIDE BUSH

(a) Using a caliper gauge, measure the bush bore diameter of the cylinder head.

(b) Select a new guide bush (STD or O/S 0.05).



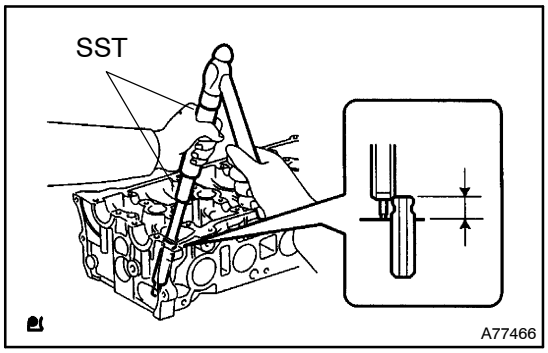
Bush size	Bush bore diameter
Use STD	10.285 to 10.306 mm (0.4049 to 0.4057 in.)
Use O/S 0.05	10.333 to 10.344 mm (0.4068 to 0.4072 in.)

If the bush bore diameter of the cylinder head is greater than 10.306 mm (0.4057 in.), machine the bush bore diameter to between 10.333 and 10.344 mm (0.4068 to 0.4072 in.).
If the bush bore diameter of the cylinder head is greater than 10.344 mm (0.4072 in.), replace the cylinder head.

(c) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.
Protrusion height:
9.6 to 10.0 mm (0.3779 to 0.3937 in.)
SST 09201–10000 (09201–01050), 09950–70010 (09951–07100), 23801

(d) Using a sharp 5.5 mm reamer, ream the guide bush to obtain the standard specified clearance between the guide bush and valve stem.
Standard oil clearance:
0.025 to 0.060 mm (0.00098 to 0.00236 in.)

21. INSTALL EXHAUST VALVE GUIDE BUSH



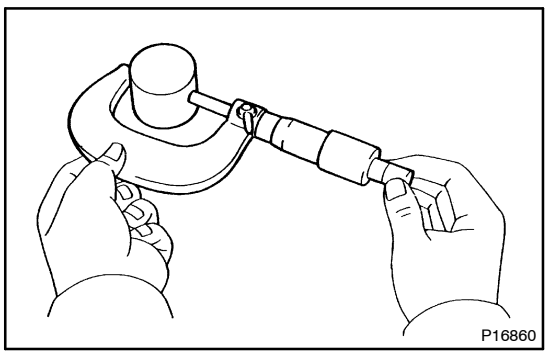
(a) Using a caliper gauge, measure the bush bore diameter of the cylinder head.

(b) Select a new guide bush (STD or O/S 0.05).

Bush size	Bush bore diameter
Use STD	10.285 to 10.306 mm (0.4049 to 0.4057 in.)
Use O/S 0.05	10.333 to 10.344 mm (0.4068 to 0.4072 in.)

If the bush bore diameter of the cylinder head is greater than 10.306 mm (0.4057 in.), machine the bush bore diameter to between 10.333 and 10.344 mm (0.4068 to 0.4072 in.).

If the bush bore diameter of the cylinder head is greater than 10.344 mm (0.4072 in.), replace the cylinder head.

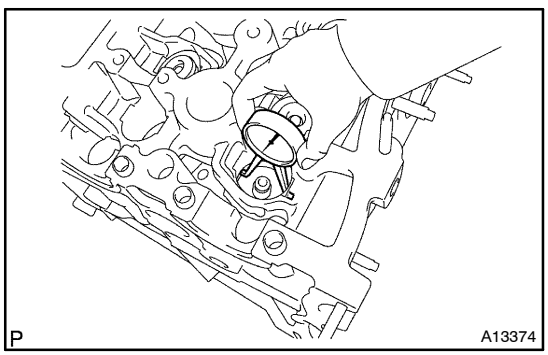


(c) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.

Protrusion height:
9.6 to 10.0 mm (0.3779 to 0.3937 in.)

(d) Using a sharp 5.5 mm reamer, ream the guide bush to obtain the standard specified clearance between the guide bush and valve stem.

SST 09201–10000 (09201–01050), 09950–70010 (09951–07100), 23801



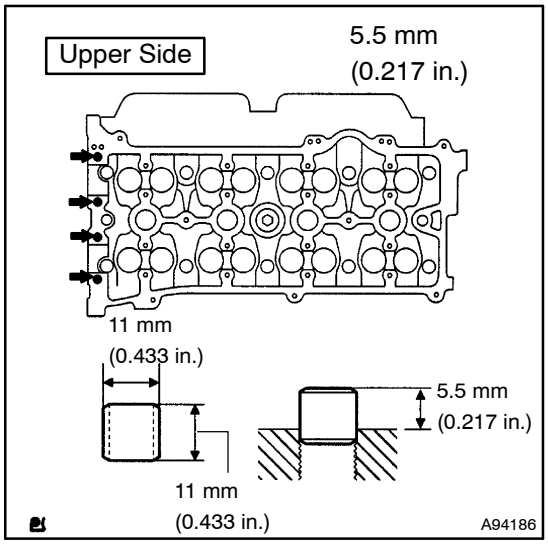
Standard oil clearance:
0.030 to 0.065 mm (0.00118 to 0.00256 in.)

22. INSPECT VALVE LIFTER

(a) Using a micrometer, measure the lifter diameter.

Lifter diameter:
30.966 to 30.976 mm (1.2191 to 1.2195 in.)

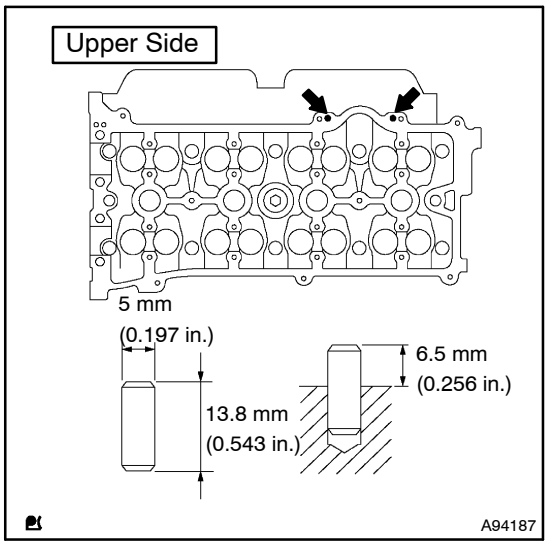
(b) Using a caliper gauge, measure the lifter bore diameter of the cylinder head.



Lifter bore diameter:
31.009 to 31.025 mm (1.2208 to 1.2215 in.)

If the journal diameter is not as specified, check the oil clearance.

(c) Subtract the lifter diameter measurement from the lifter bore diameter measurement.

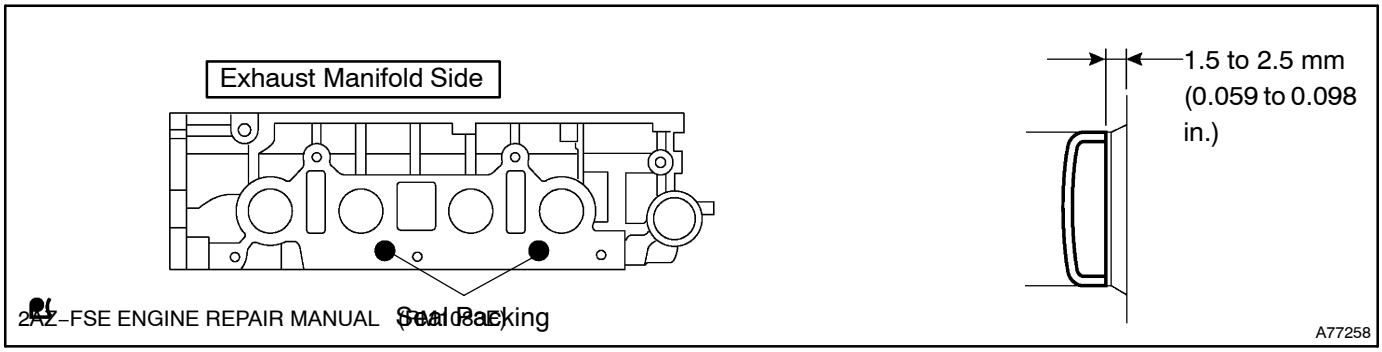


Standard oil clearance:
0.033 to 0.059 mm (0.0013 to 0.0023 in.)
Maximum oil clearance: 0.08 mm (0.0032 in.)

If the oil clearance is greater than the maximum, replace the lifter. If necessary, replace the cylinder head.

23. INSTALL RING W/HEAD PIN

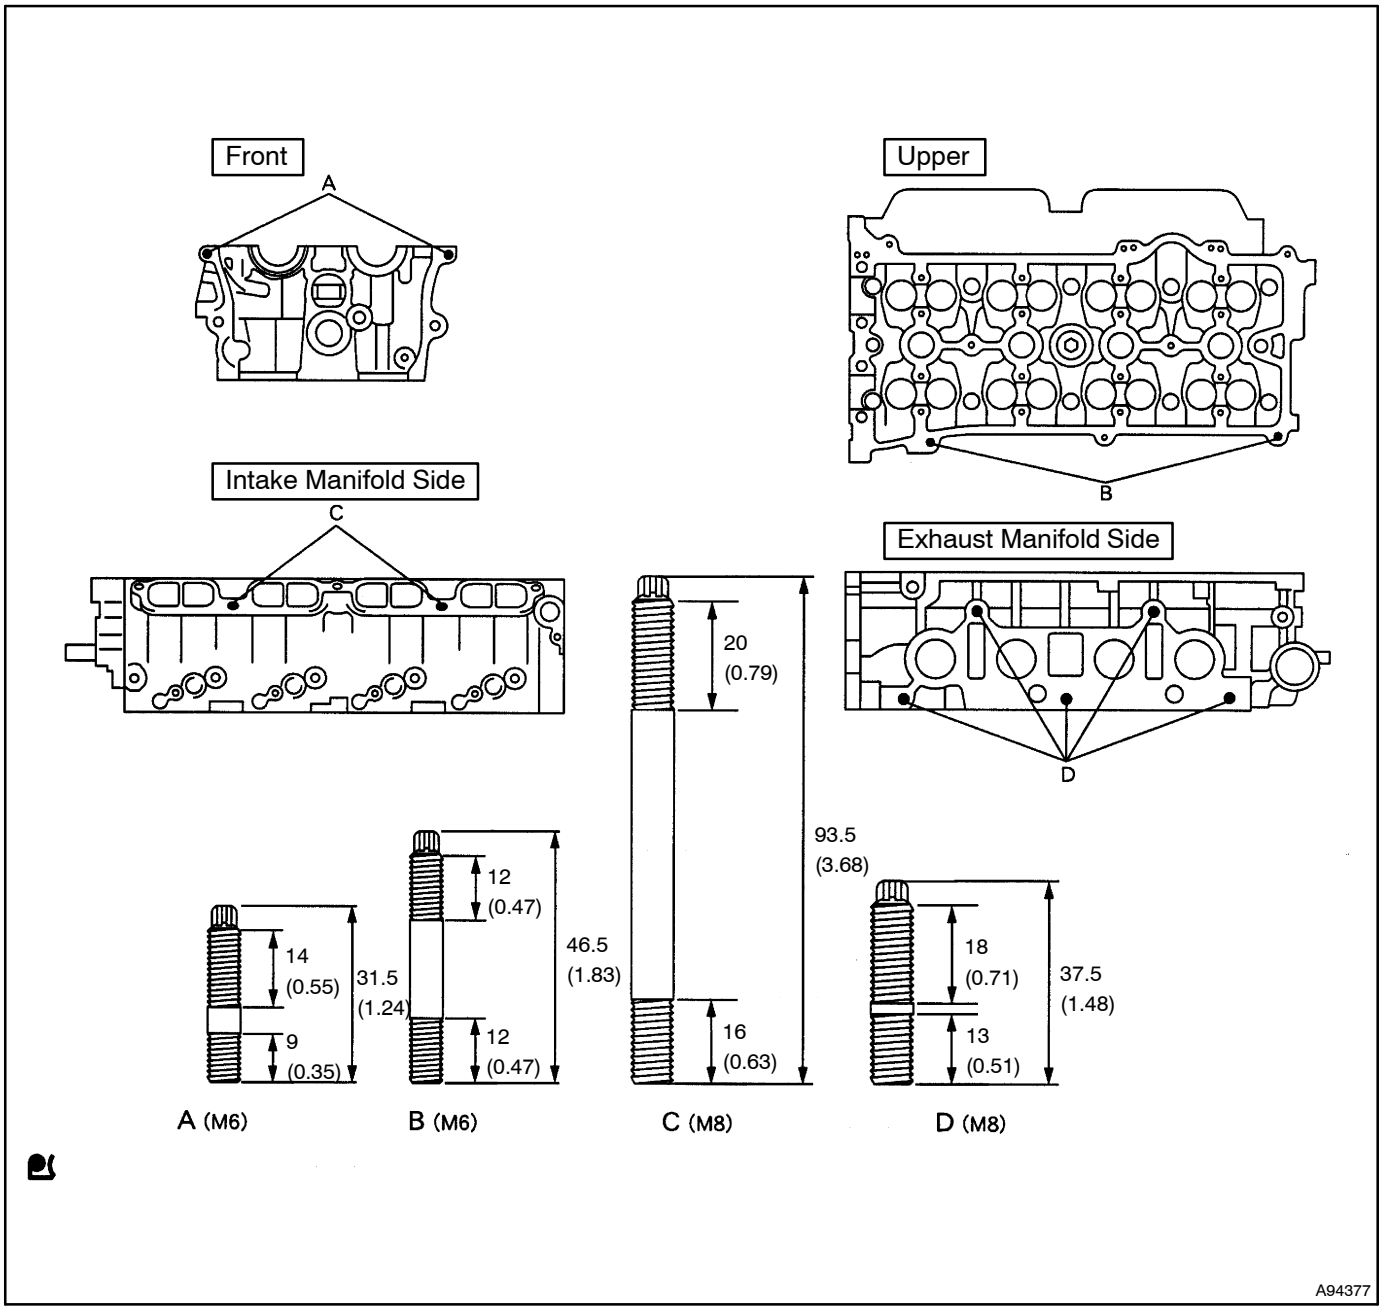
(a) Using a plastic–faced hammer, tap in a new ring pin to the specified protrusion height.
Protrusion height: 5.5 mm (0.217 in.)



24. INSTALL RING PIN

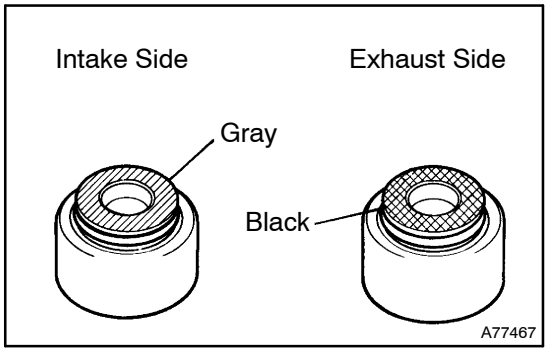
(a) Using a plastic–faced hammer, tap in a new ring pin to the specified protrusion height.
Protrusion height: 6.5 mm (0.256 in.)

25. INSTALL TIGHT PLUG



(a) Apply seal packing to the cylinder head as shown in the illustration.

(b) Using SST, tap in plug to the specified protrusion height.
SST 09950–60010 (09951–00180), 09950–70010 (09951–07100)
Protrusion height: 1.5 to 2.5 mm (0.059 to 0.098 in.)

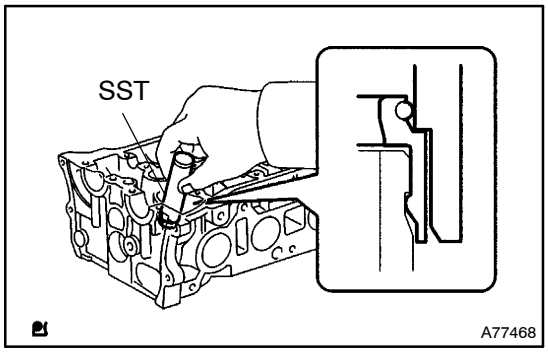


26. INSTALL STUD BOLT

Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt A
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt B
9.5 N·m (97 kgf·cm, 84 in.·lbf) for bolt C
9.5 N·m (97 kgf·cm, 84 in.·lbf) for bolt D

27. INSTALL VALVE SPRING SEAT

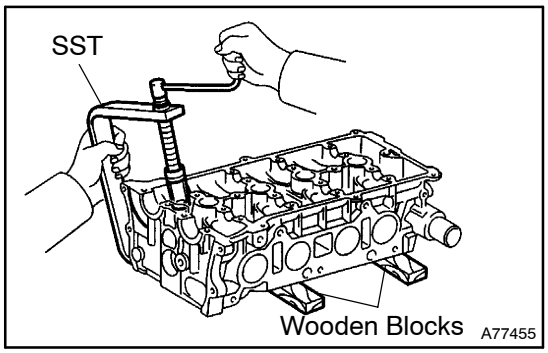
28. INSTALL VALVE STEM OIL SEAL



(a) Apply a light coat of engine oil on a new oil seal.

NOTICE:

Pay close attention when installing the intake and exhaust oil seals. For example, installing the intake oil seal into the exhaust or installing the exhaust oil seal to the intake can cause installation problems later.

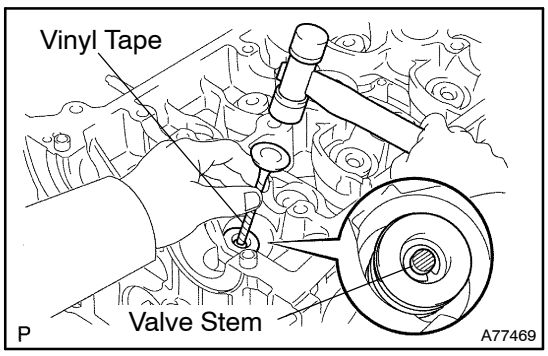


HINT:

The intake valve oil seal is gray and the exhaust valve oil seal is black.

(b) Using SST, push in the oil seal.

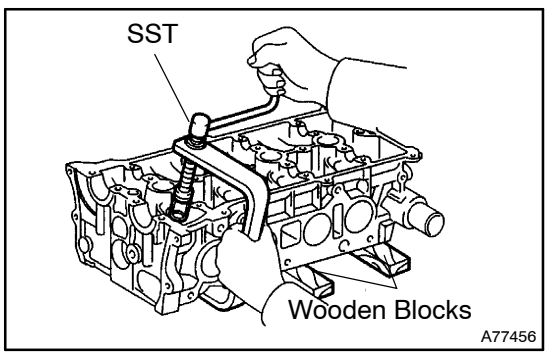
SST 09201–41020



29. INSTALL INTAKE VALVE

(a) Install the valve, spring and retainer to the cylinder head.

(b) Using SST and wooden blocks, compress the spring and install the 2 retainer locks.

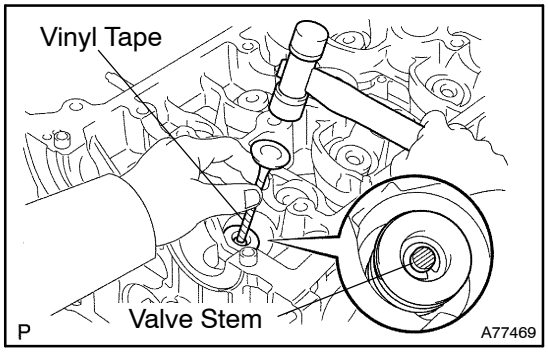


SST 09202–70020 (09202–00010)

(c) Using a plastic–faced hammer and a discarded valve with its tip wrapped in tape, lightly tap the installed valve to ensure that it is securely fit.

NOTICE:

Be careful not to damage the valve stem tip.



30. INSTALL EXHAUST VALVE

(a) Install the valve, spring and retainer to the cylinder head.

(b) Using SST and wooden blocks, compress the spring and install the 2 retainer locks.

SST 09202–70020 (09202–00010)

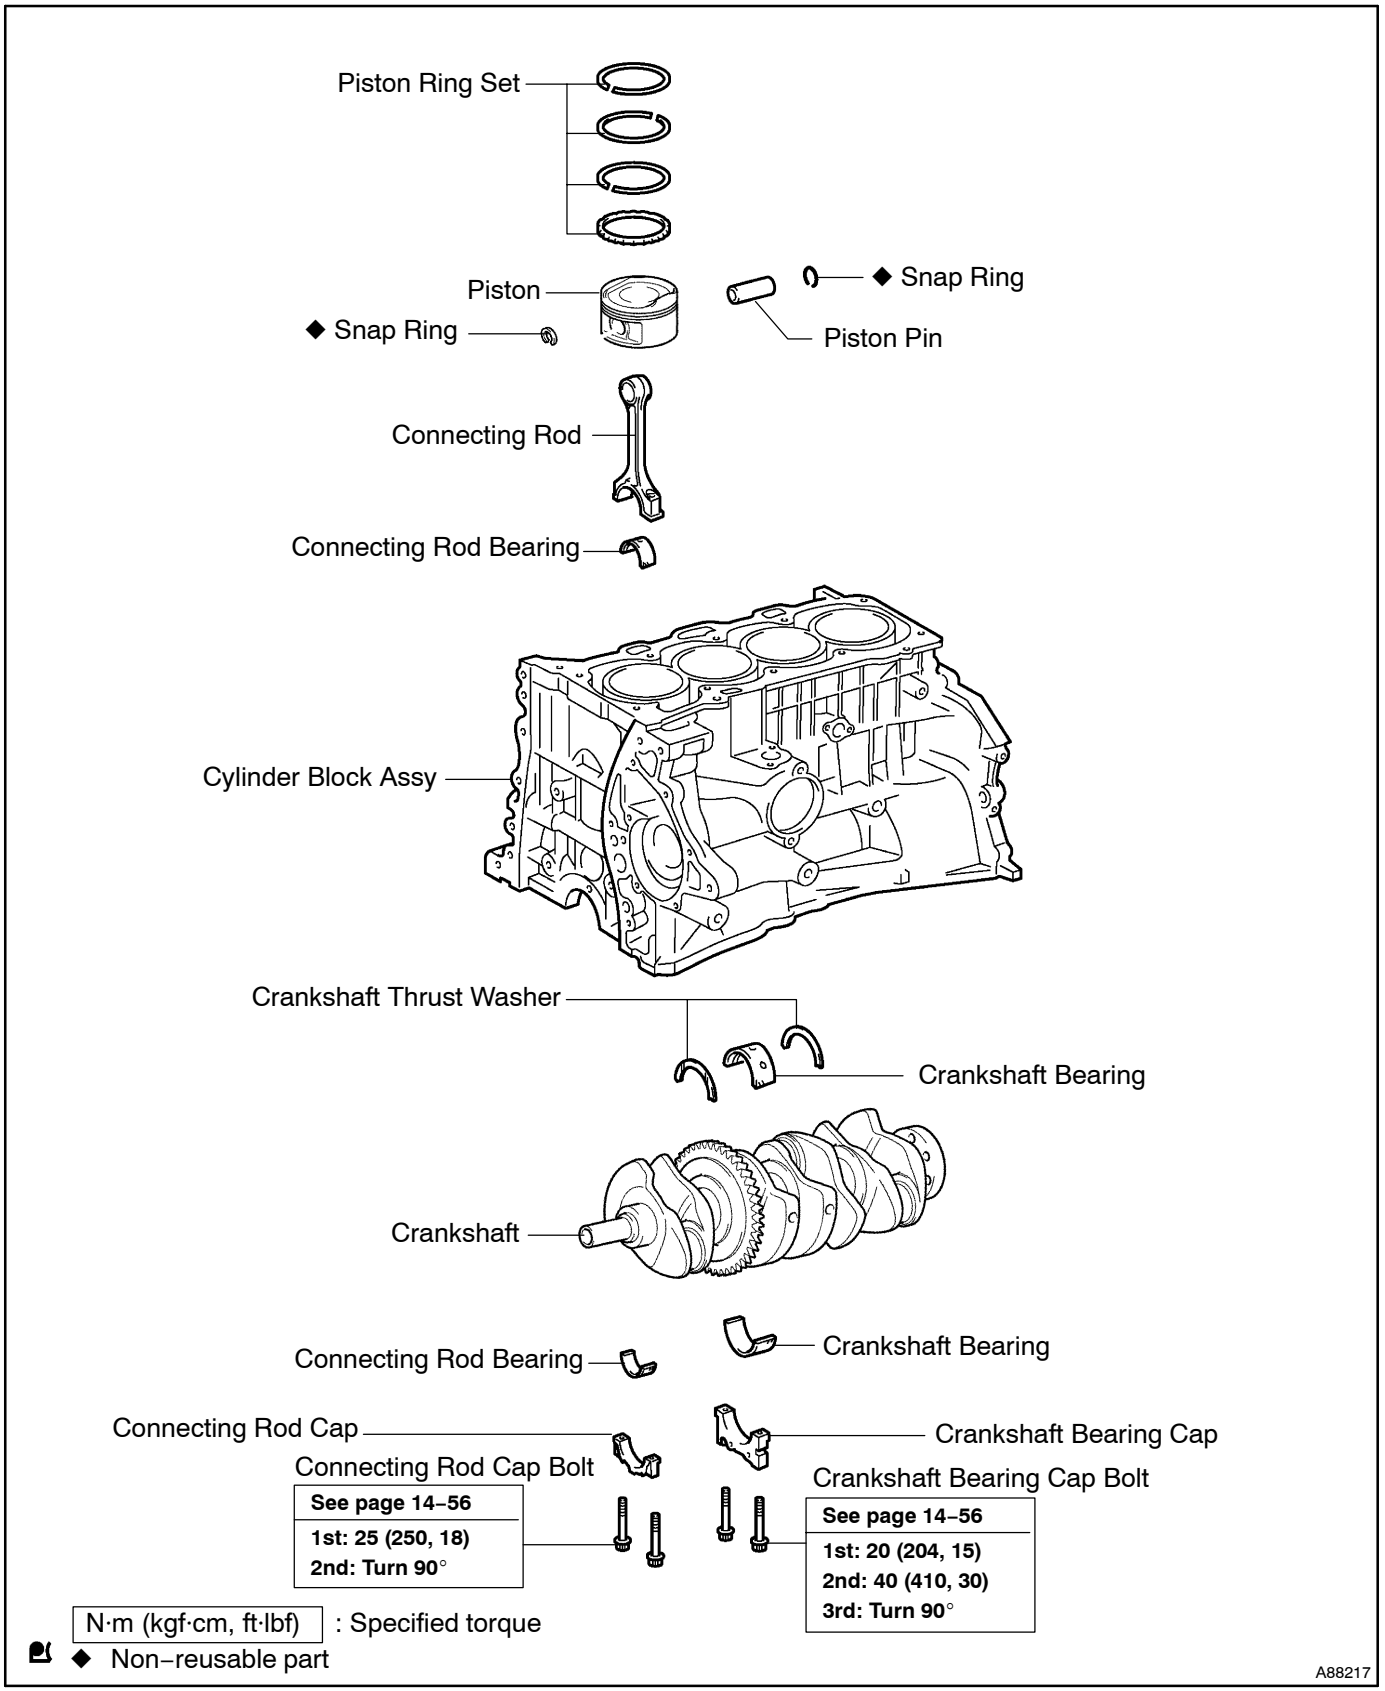
(c) Using a plastic–faced hammer and a discarded valve with its tip wrapped in tape, lightly tap the installed valve to ensure that it is securely fit.

NOTICE:

Be careful not to damage the valve stem tip.

31. INSTALL VALVE LIFTER

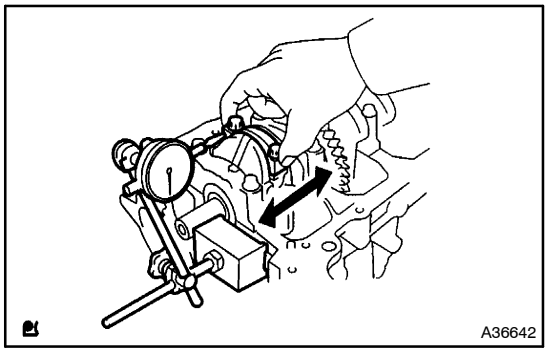
(a) Assemble the valve lifter and the tip of the valve stem with a light coat of engine oil applied.



NOTICE:

Install the valve lifters in their original places.

CYLINDER BLOCK ASSY (2AZ–FSE)

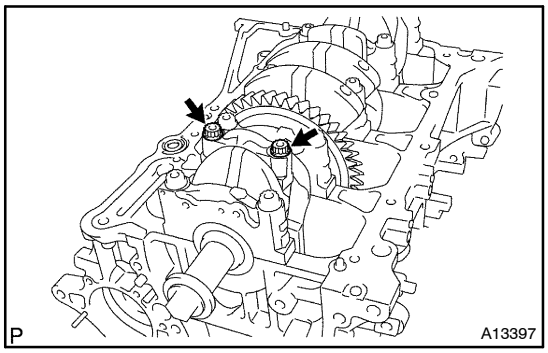


COMPONENTS

141Q8–01

141Q9–01

OVERHAUL



1. INSPECT CONNECTING ROD THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the connecting rod back and forth.

Standard thrust clearance:
0.160 to 0.362 mm (0.0063 to 0.0143 in.)
Maximum thrust clearance: 0.362 mm (0.0143 in.)

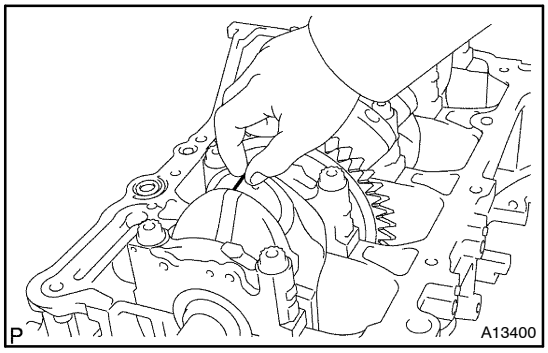
If the thrust clearance is greater than the maximum, replace the connecting rod assembly(s). If necessary, replace the crankshaft.

2. INSPECT CONNECTING ROD OIL CLEARANCE

HINT:
The connecting rod cap bolts are tightened in 2 progressive steps.

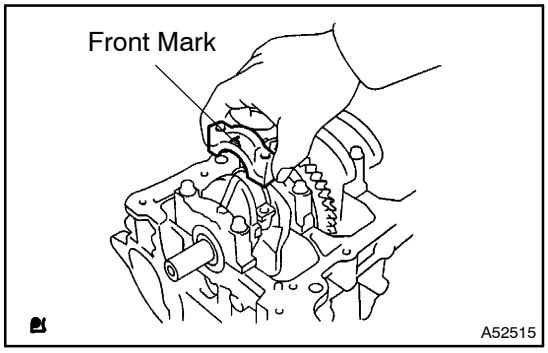
(a) Check that the matchmarks on the connecting rod and cap are aligned to ensure the correct reassembly.

HINT:
The matchmarks on the connecting rods and caps are for ensuring the correct reassembly.



(b) Using a 12 mm socket wrench, remove the 2 connecting rod cap bolts.

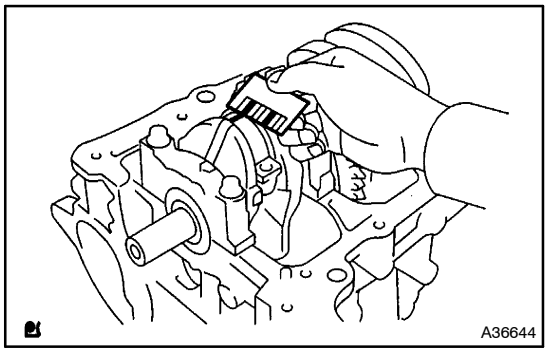
(c) Using the 2 removed connecting rod cap bolts, remove the connecting rod cap and the lower bearing by wiggling the connecting rod cap right and left.



HINT:
Keep the lower bearing inserted to the connecting rod cap.

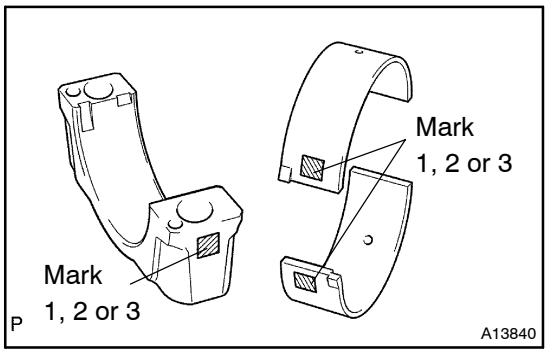
(d) Clean the crank pin and bearing.

(e) Check the crank pin and bearing for pitting and scratches.



(f) Lay a strip of Plastigage on the crank pin.

(g) Check that the front mark of the connecting rod cap is facing in the correct direction.
(h) Apply a light coat of engine oil on the threads and under the heads of the connecting rod cap bolts.
(i) Install the connecting cap (see step 37).

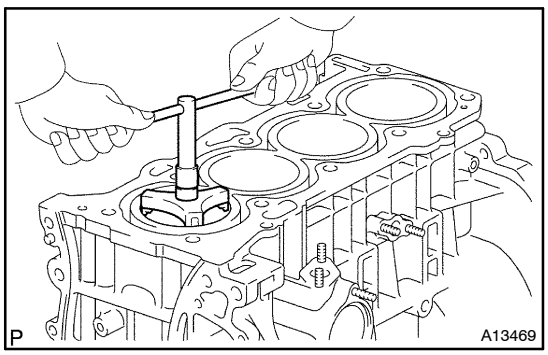


NOTICE:
Do not turn the crankshaft.

(j) Remove the 2 bolts and connecting rod cap.

(k) Measure the Plastigage at its widest point.
Standard oil clearance:
0.024 to 0.048 mm (0.0009 to 0.0019 in.)
Maximum oil clearance: 0.08 mm (0.0031 in.)

If the crank pin or bearing is damaged, replace the bearings. If necessary, replace the crankshaft.

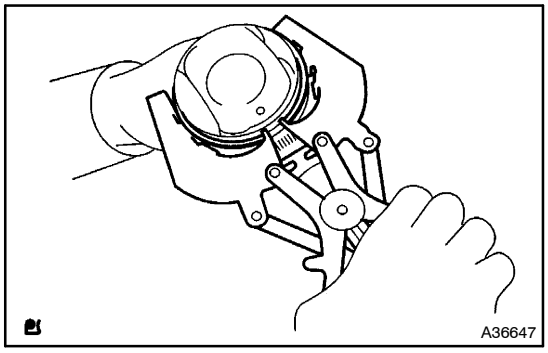


HINT:
If replacing a bearing, replace it with one that has the same number as the connecting rod. There are 3 sizes of standard bearings: 1, 2 and 3.

Standard bearing center wall thickness:

Mark 1	1.485 to 1.488 mm (0.0585 to 0.0586 in.)
Mark 2	1.489 to 1.491 mm (0.0586 to 0.0587 in.)
Mark 3	1.492 to 1.494 mm (0.0587 to 0.0588 in.)

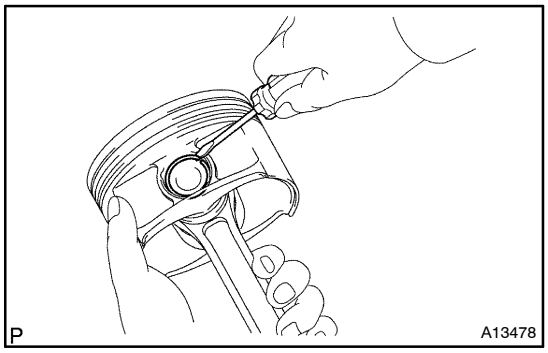
(l) Completely remove the Plastigage.



3. REMOVE PISTON SUB–ASSY W/CONNECTING ROD

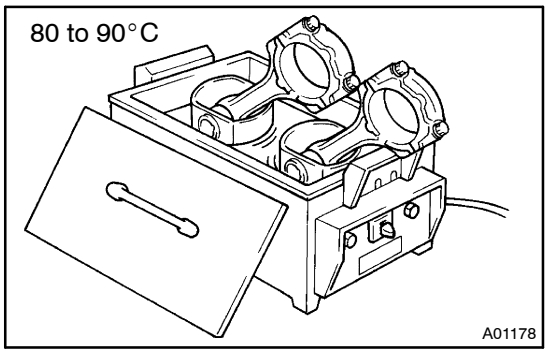
(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.
(b) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.

HINT:
- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.



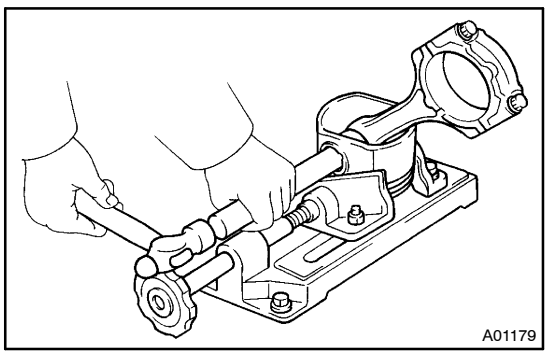
4. REMOVE CONNECTING ROD BEARING

5. REMOVE PISTON RING SET



(a) Using a piston ring expander, remove the 2 compression rings.

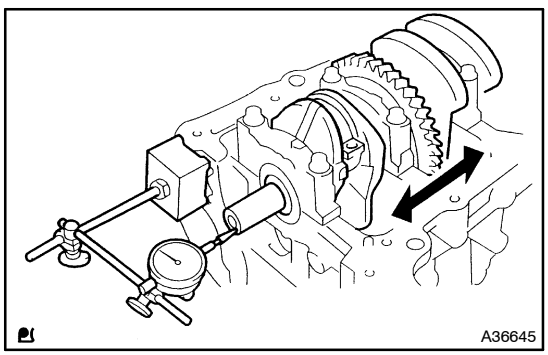
(b) Remove the 2 side rails and oil ring by hand.



6. REMOVE PISTON PIN HOLE SNAP RING

(a) Using a small screwdriver, pry out the 2 snap rings.

7. REMOVE PISTON



(a) Gradually heat the piston to approximately 80 to 90°C (176 to 194°F).

(b) Using a plastic–faced hammer and brass bar, lightly tap out the piston pin and remove the connecting rod.

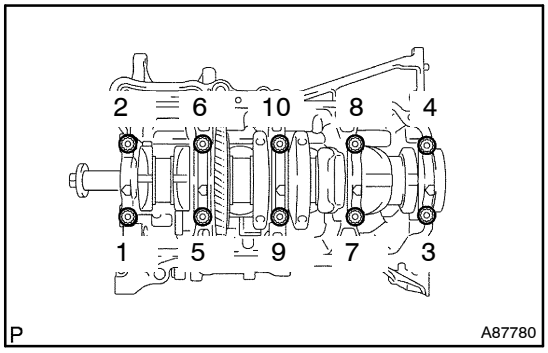
HINT:

- The piston and pin are a matched set.
- Arrange the pistons, pins, rings, connecting rods and bearings in the correct order.

8. INSPECT CRANKSHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

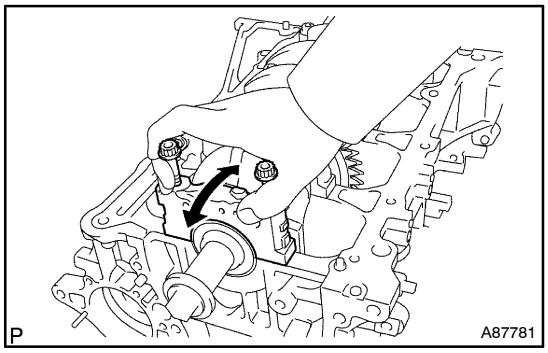
Standard thrust clearance:



0.040 to 0.240 mm (0.0016 to 0.0094 in.)

Maximum thrust clearance: 0.30 mm (0.0118 in.)

If the thrust clearance is greater than the maximum, replace the thrust washers as a set.



Thrust washer thickness:

1.930 to 1.980 mm (0.0760 to 0.0780 in.)

9. INSPECT CRANKSHAFT OIL CLEARANCE

(a) Uniformly loosen and remove the 10 main bearing cap bolts in the sequence shown in the illustration.

(b) Use 2 removed main bearing cap bolts to remove the 5 main bearing caps and 5 lower bearings.

NOTICE:

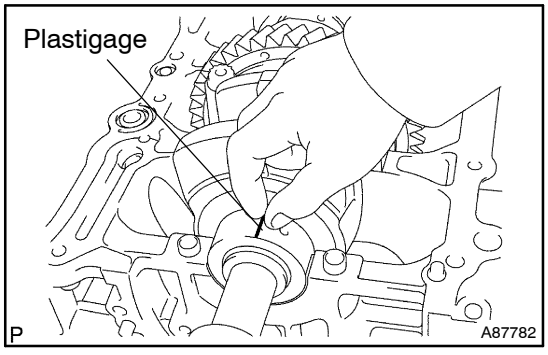
Insert the bolts into one of the caps. Ease the cap out by gently pulling up and applying force toward the front and back side of the cylinder block, as shown in the illustration. Take care not to damage the contact surfaces of the cap and cylinder block.

HINT:

- Keep the lower bearing and main bearing cap together.
- Arrange the main bearing caps in the correct order.

(c) Lift out the crankshaft.

HINT:



Keep the upper bearings together with the cylinder block.

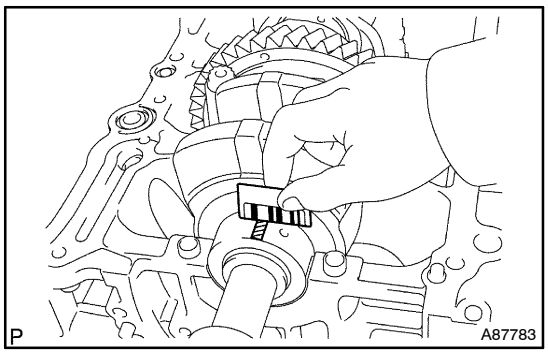
(d) Clean each main journal and bearing.

(e) Check each main journal and bearing for pitting and scratches.

If the journal or bearing is damaged, replace the bearings.

If necessary, replace the crankshaft.

(f) Place the crankshaft on the cylinder block.

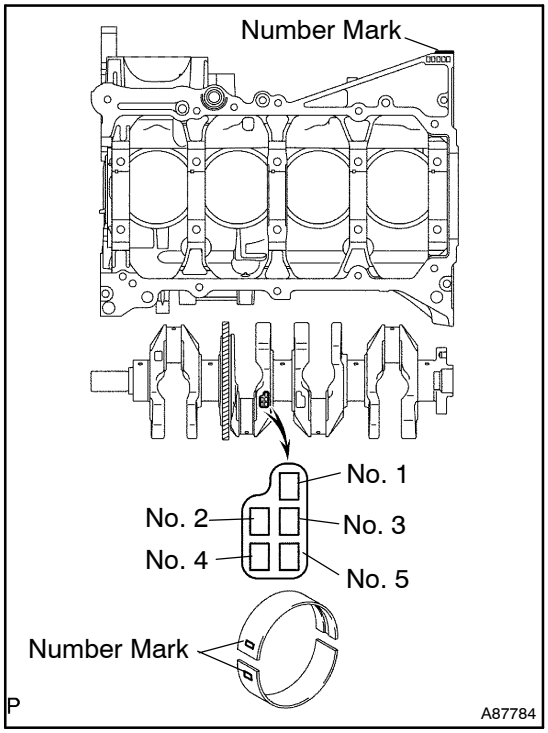


(g) Lay a strip of Plastigage across each journal.

(h) Install the main bearing caps (see step 36).

HINT:

Do not turn the crankshaft.



(i) Remove the main bearing cap (see steps (a) to (b) above).

(j) Measure the Plastigage at its widest point.

Standard oil clearance:
0.017 to 0.040 mm (0.00067 to 0.00157 in.)
Maximum oil clearance: 0.050 mm (0.002 in.)

If the oil clearance is greater than the maximum, replace the bearings. If necessary, replace the crankshaft.

(k) If using a standard bearing, replace it with one having the same number. If the number of the bearing cannot be determined, select the correct bearing by adding together the numbers imprinted on the cylinder block and crankshaft, and then selecting the bearing according to the chart below. There are 4 sizes of standard bearings: 1, 2, 3 and 4.

Cylinder block (A) + Crankshaft (B)	0 to 2	3 to 5	6 to 8	9 to 11
Use bearing	1	2	3	4

HINT:
EXAMPLE
Cylinder block 4 (A) + Crankshaft 3 (B) =
Total number 7 (Use bearing 3)

Reference:

Item	Mark	Specified Condition
Cylinder block main journal bore diameter (A)	0	59.000 to 59.002 mm (2.08683 to 2.32291 in.)
	1	59.003 to 59.004 mm (2.08694 to 2.32299 in.)
	2	59.005 to 59.006 mm (2.08701 to 2.32307 in.)
	3	59.007 to 59.009 mm (2.08708 to 2.32318 in.)
	4	59.010 to 59.011 mm (2.08718 to 2.32326 in.)
	5	59.012 to 59.013 mm (2.08725 to 2.32334 in.)
	6	59.014 to 59.016 mm (2.08733 to 2.32346 in.)
Crankshaft main journal diameter (B)	0	54.999 to 55.000 mm (1.94528 to 2.16535 in.)
	1	54.997 to 54.998 mm (1.94521 to 2.16527 in.)
	2	54.995 to 54.996 mm (1.94514 to 2.16519 in.)
	3	54.993 to 54.994 mm (1.94507 to 2.16511 in.)
	4	54.991 to 54.992 mm (1.94500 to 2.16504 in.)
	5	54.988 to 54.990 mm (1.94493 to 2.16496 in.)
Standard bearing center wall thickness	1	1.993 to 1.996 mm (0.07846 to 0.07858 in.)
	2	1.996 to 1.999 mm (0.07858 to 0.07870 in.)
	3	2.000 to 2.002 mm (0.07874 to 0.07882 in.)
	4	2.003 to 2.005 mm (0.07886 to 0.07894 in.)

(l) Completely remove the Plastigage.

10. REMOVE CRANKSHAFT

(a) Lift out the crankshaft.

(b) Remove the 5 upper main bearings and 2 thrust washers from the cylinder block.

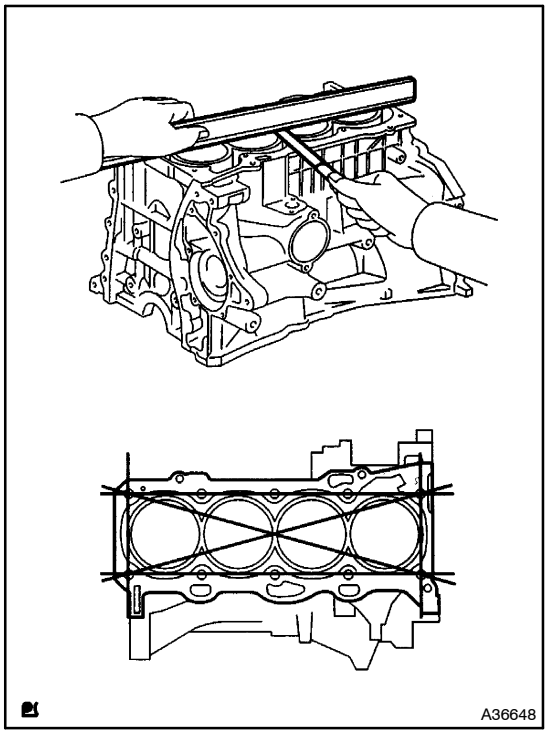
HINT:
Arrange the main bearings and thrust washers in the correct order.

11. REMOVE CRANKSHAFT THRUST WASHER UPPER

12. REMOVE CRANKSHAFT BEARING

HINT:
Arrange the bearings in the correct order.

13. REMOVE CRANKSHAFT BEARING NO.2



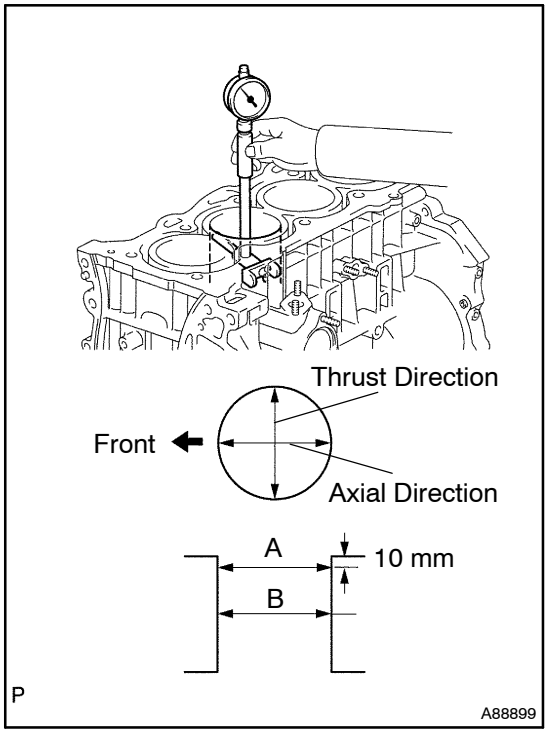
HINT:
Arrange the main bearings and thrust washers in the correct order.

14. REMOVE STUD BOLT

15. CLEAN CYLINDER BLOCK

NOTICE:

If the cylinder is washed at high temperatures, the cylinder liner sticks out beyond the cylinder block. Always wash the cylinder block at a temperature of 45°C (113°F) or less.



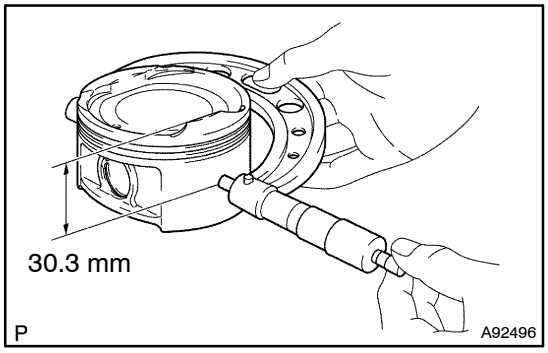
16. INSPECT CYLINDER BLOCK FOR FLATNESS

(a) Using a precision straight edge and feeler gauge, measure the surface contacting the cylinder head gasket for warpage.

Maximum warpage: 0.05 mm (0.0020 in.)

If the warpage is greater than the maximum, replace the cylinder block.

17. INSPECT CYLINDER BORE



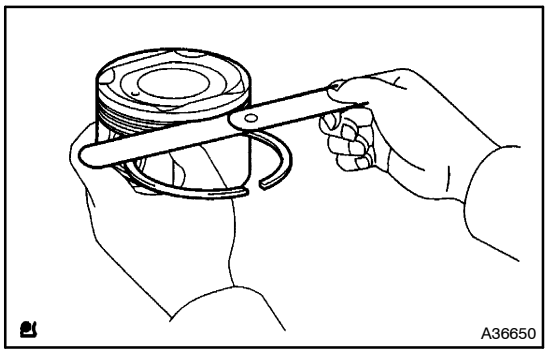
(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A and B in the thrust and axial directions.

Standard diameter:

88.500 to 88.513 mm (3.4843 to 3.4848 in.)

Maximum diameter: 88.633 (3.4895 in.)

If the diameter is greater than the maximum, replace the cylinder block.



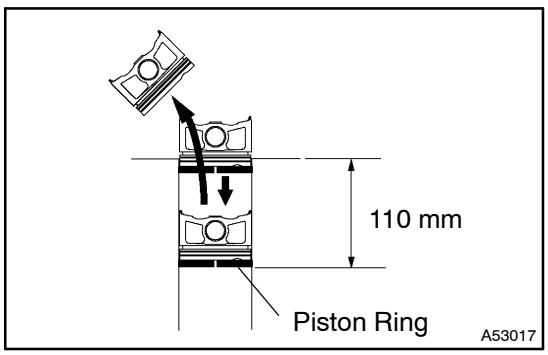
18. INSPECT PISTON DIAMETER

(a) Using a micrometer, measure the piston diameter at right angles to the piston pin center line, 30.3 mm (1.193 in.) from the piston head.
Piston diameter:
88.439 to 88.449 mm (3.4818 to 3.4822 in.)

19. INSPECT PISTON CLEARANCE

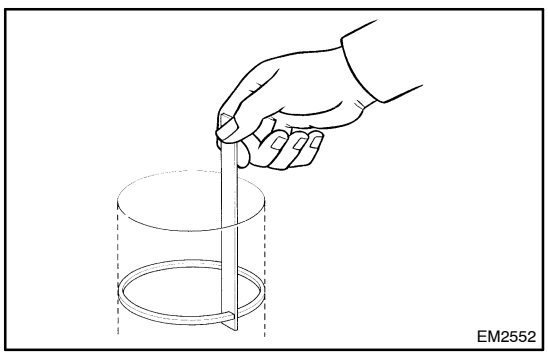
(a) Subtract the piston diameter measurement from the cylinder bore diameter measurement.
Standard oil clearance: 0.051 to 0.074 mm (0.0020 to 0.0029 in.)
Maximum oil clearance: 0.1 mm (0.0039 in.)

If the clearance is greater than the maximum, replace all the 4 pistons.
If necessary, replace the cylinder block.



20. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between the piston ring and the wall of the ring groove.
Ring groove clearance:



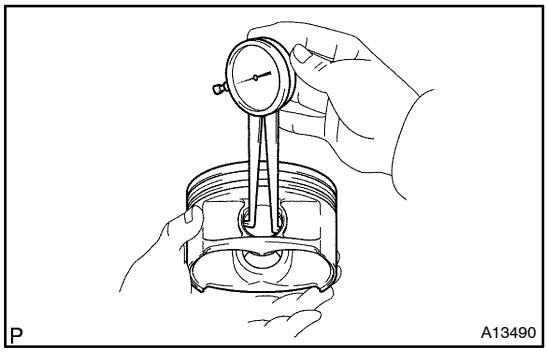
Item	Specified Condition
No. 1	0.030 to 0.080 mm (0.0011 to 0.0031 in.)
No. 2	0.020 to 0.060 mm (0.0008 to 0.0024 in.)
Oil (side rail)	0.020 to 0.070 mm (0.0008 to 0.0028 in.)

If the clearance is not as specified, replace the piston.

21. INSPECT PISTON RING END GAP

(a) Using a piston, push the piston ring a little beyond the bottom of the ring travel, 110 mm (4.33 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.
Standard end gap:



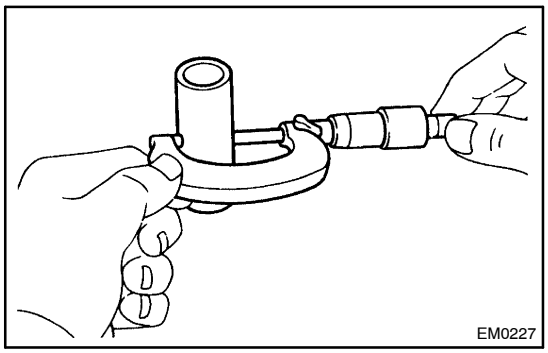
Item	Specified Condition
No. 1	0.22 to 0.32 mm (0.0087 to 0.0126 in.)
No. 2	0.50 to 0.60 mm (0.0197 to 0.0236 in.)
Oil (side rail)	0.10 to 0.35 mm (0.0039 to 0.0138 in.)

Maximum end gap:

Item	Specified Condition
No. 1	0.89 mm (0.0350 in.)
No. 2	1.35 mm (0.0531 in.)
Oil (side rail)	0.73 mm (0.0287 in.)

If the end gap is greater than the maximum, replace the piston ring.

If the end gap is greater than the maximum even with a new piston ring, replace the cylinder block.

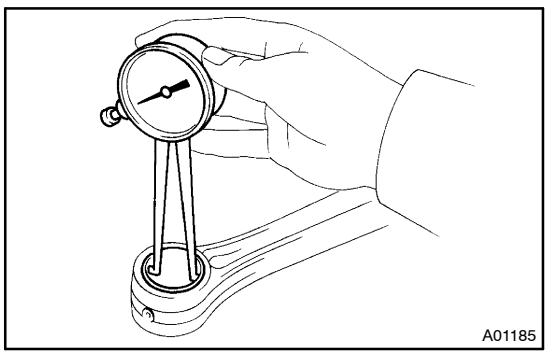


22. INSPECT PISTON PIN OIL CLEARANCE

(a) Using a caliper gauge, measure the pin hole bush diameter of the piston.

Pin hole diameter (Reference):

Mark	Specified Condition
A	22.001 to 22.004 mm (0.8662 to 0.8663 in.)
B	22.005 to 22.007 mm (0.8663 to 0.8664 in.)
C	22.008 to 22.010 mm (0.8665 to 0.8665 in.)

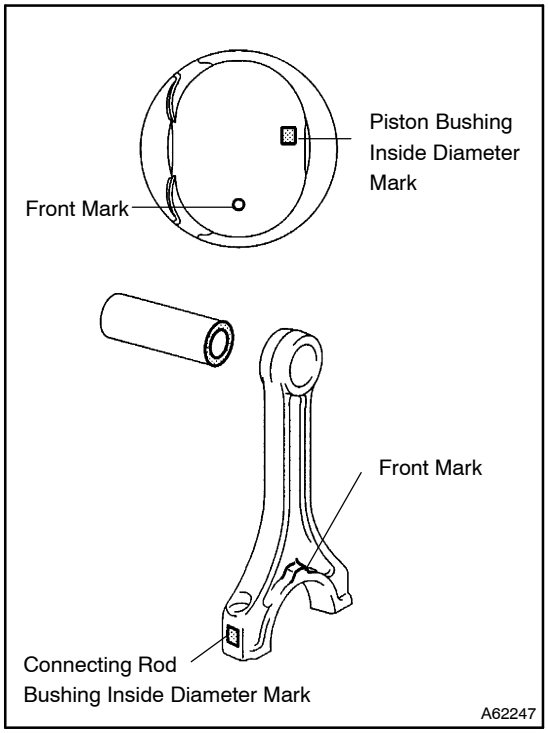


If the diameter is not as specified, check the oil clearance.

(b) Using a micrometer, measure the piston pin diameter.

Piston pin diameter (Reference):

Mark	Specified Condition
A	21.997 to 22.000 mm (0.8660 to 0.8661 in.)
B	22.001 to 22.003 mm (0.8662 to 0.8663 in.)
C	22.004 to 22.006 mm (0.8663 to 0.8664 in.)
D	22.007 to 22.009 mm (0.8664 to 0.8665 in.)



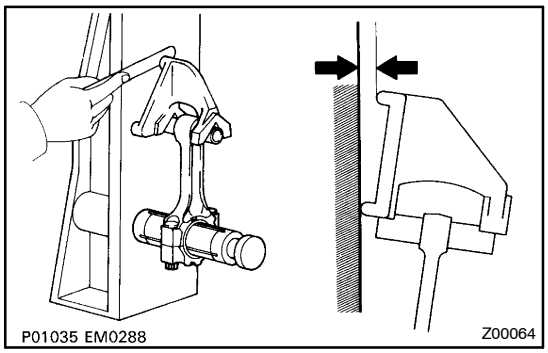
(c) Using a caliper gauge, measure the inside diameter of the connecting rod bush.

Bush inside diameter:

Mark	Specified Condition
A	22.005 to 22.008 mm (0.8663 to 0.8665 in.)
B	22.008 to 22.011 mm (0.8665 to 0.8666 in.)
C	22.011 to 22.014 mm (0.8666 to 0.8667 in.)

(d) Subtract the piston pin diameter measurement from the piton pin hole diameter measurement.

Standard oil clearance:
0.001 to 0.007 mm (0.00004 to 0.00028 in.)
Maximum oil clearance: 0.010 mm (0.0020 in.)



If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the piston and piston pin as a set.

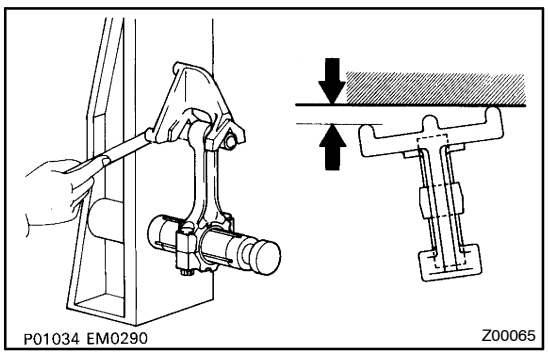
(e) Subtract the piston pin diameter measurement from the bushing inside diameter measurement.

Specified oil clearance:

0.005 to 0.100 mm (0.0002 to 0.0020 in.)

If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the connecting rod and piston pin as a set.

23. INSPECT CONNECTING ROD SUB–ASSY



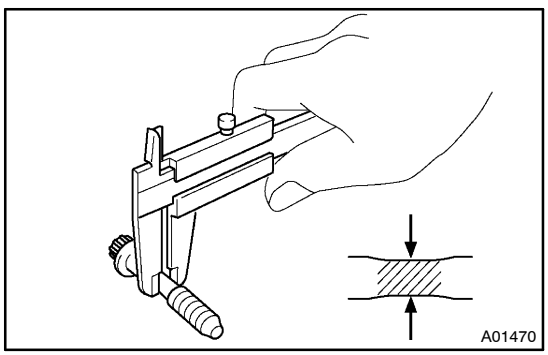
(a) Using a rod aligner and feeler gauge, check the connecting rod alignment.

(1) Check for out–of–alignment.

Maximum out–of–alignment:

0.05 mm (0.0020 in.) per 100 mm (3.94 in.)

If the out–of–alignment is greater than the maximum, replace the connecting rod assembly.

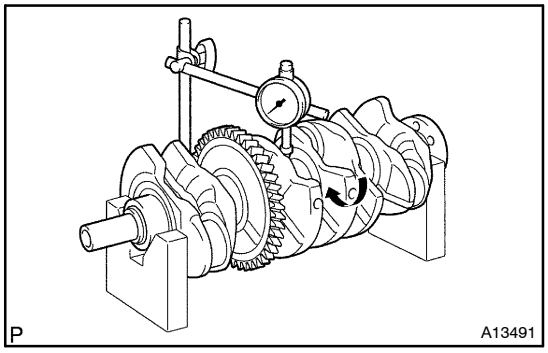


(2) Check for twist.

Maximum twist:

0.15 mm (0.0059 in.) per 100 mm (3.94 in.)

If the twist is greater than the maximum, replace the connecting rod assembly.



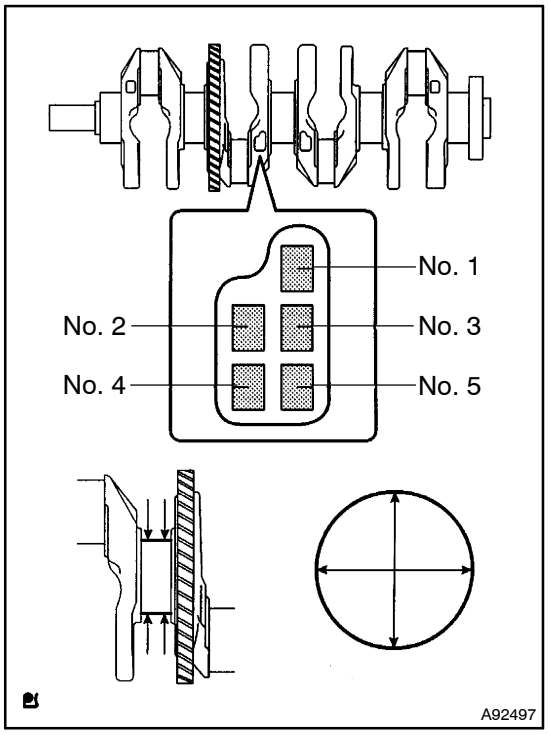
24. INSPECT CONNECTING ROD BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolt.

Standard diameter: 7.2 to 7.3 mm (0.283 to 0.287 in.)

Minimum diameter: 7.0 mm (0.276 in.)

If the diameter is less than the minimum, replace the bolt.



25. INSPECT CRANKSHAFT

(a) Using a dial indicator and V–blocks, measure the circle runout, as shown in the illustration.

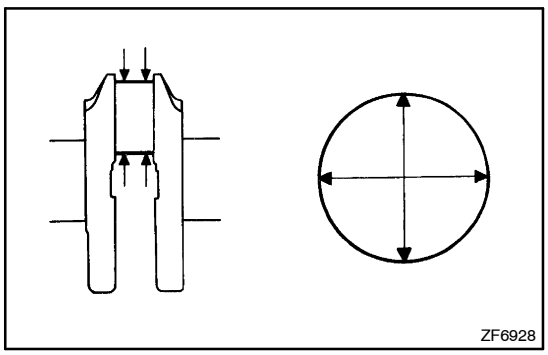
Maximum circle runout: 0.03 mm (0.0012 in.)

If the circle runout is greater than the maximum, replace the crankshaft.

(b) Using a micrometer, measure the diameter of each main journal.

Diameter: 54.988 to 55.000 (2.1648 to 2.06535 in.)

If the diameter is not as specified, check the oil clearance (see step 9). If necessary, replace the crankshaft.



(c) Check each main journal for taper and out–of–round as shown in the illustration.

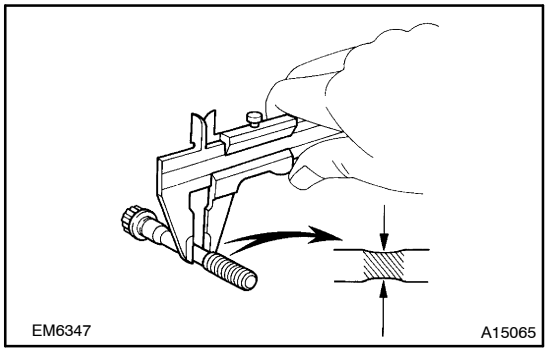
Maximum taper and out–of–round:
0.003 mm (0.0001 in.)

If the taper and out–of–round is greater than the maximum, replace the crankshaft.

Diameter (Reference):

Mark	Specified Condition
0	54.999 to 55.000 mm (2.16531 to 2.16535 in.)
1	54.997 to 54.998 mm (2.16523 to 2.16528 in.)
2	54.995 to 54.996 mm (2.16515 to 2.16520 in.)
3	54.993 to 54.994 mm (2.16507 to 2.16512 in.)
4	54.991 to 54.992 mm (2.16500 to 2.16504 in.)
5	54.988 to 54.990 mm (2.16490 to 2.16496 in.)

(d) Using a micrometer, measure the diameter of each crank pin.



Diameter: 47.990 to 48.000 mm (1.8894 to 1.8898 in.)

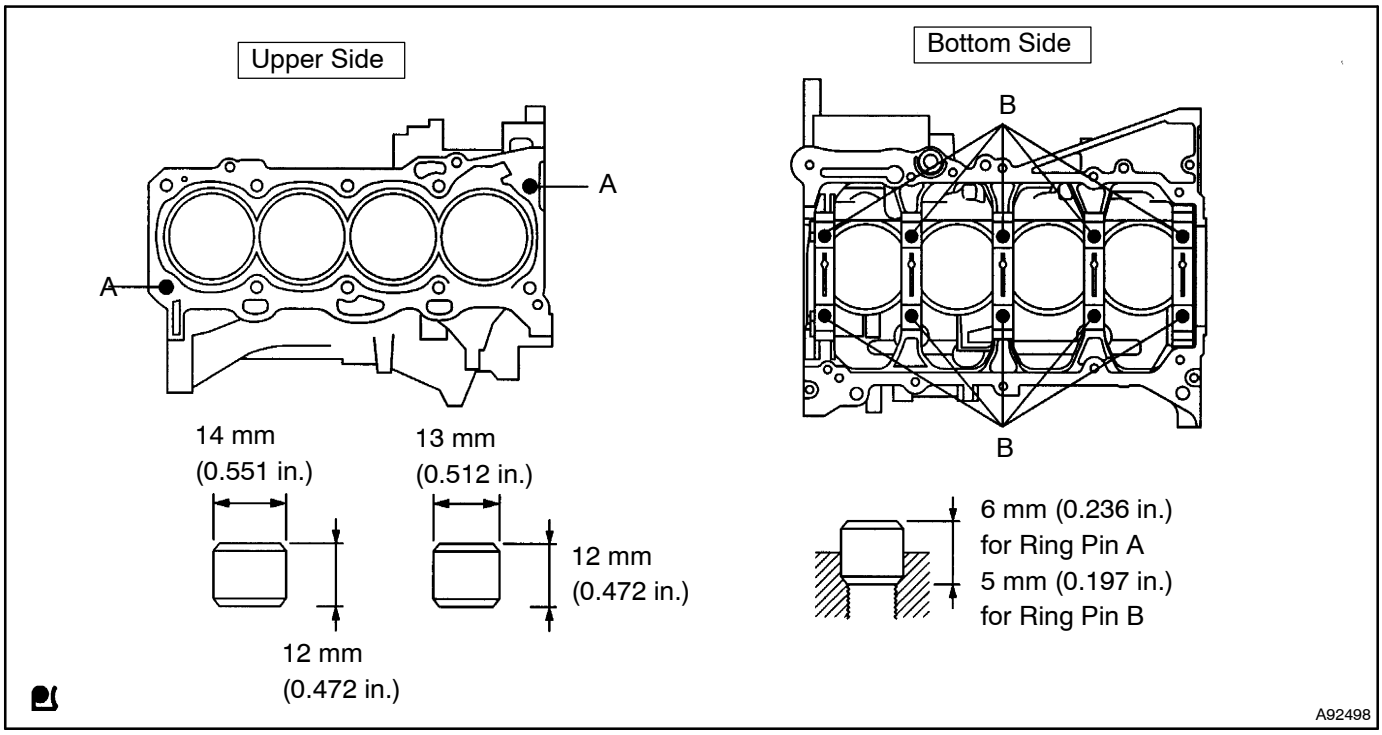
If the diameter is not as specified, check the oil clearance (see step 2). If necessary, replace the crankshaft.

(e) Check each crank pin for taper and out–of–round as shown in the illustration.

Maximum taper and out–of–round:
0.003 mm (0.0001 in.)

If the taper and out–of–round is greater than the maximum, replace the crankshaft.

26. INSPECT CRANKSHAFT BEARING CAP SET BOLT

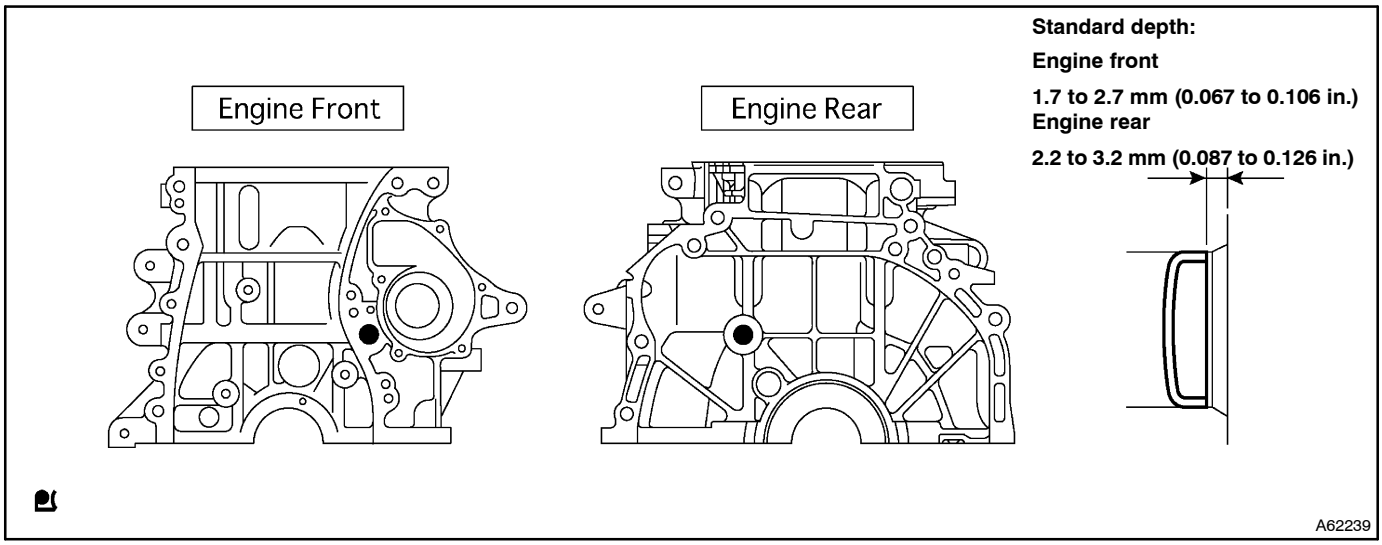


(a) Using a vernier caliper, measure the tension portion diameter of the bolt.

Standard diameter: 7.5 to 7.6 mm (0.295 to 0.299 in.)
Minimum diameter: 7.2 mm (0.283 in.)

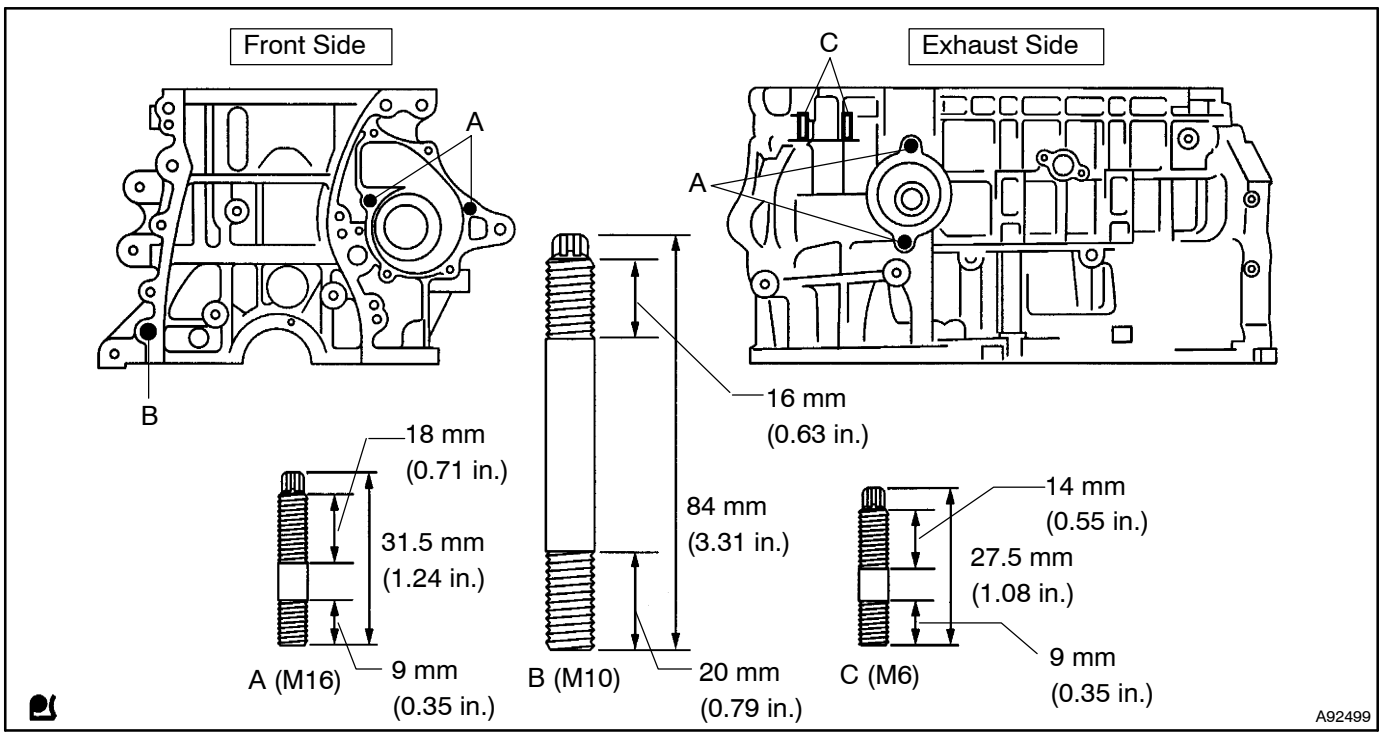
If the diameter is less than the minimum, replace the bolt.

27. INSTALL RING PIN



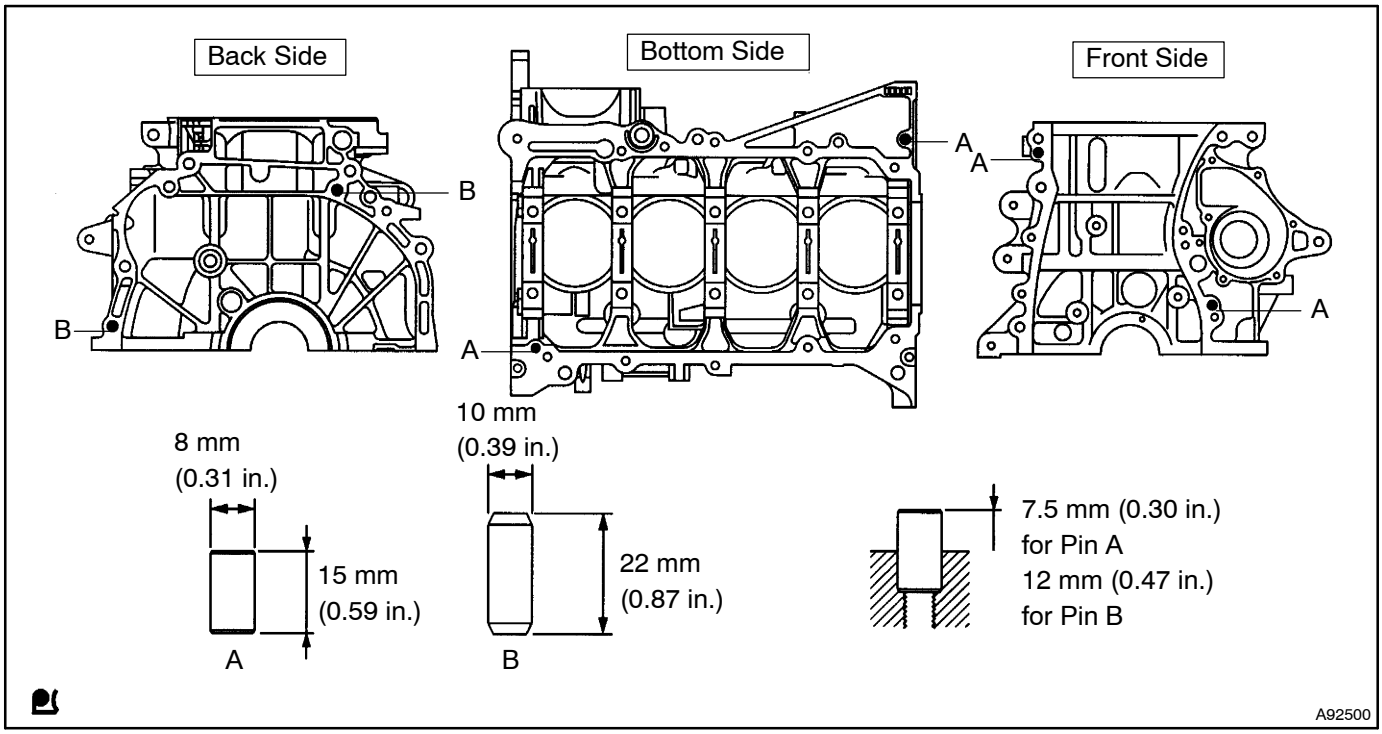
(a) Using a plastic–faced hammer, tap into the ring pin.

28. INSTALL TIGHT PLUG

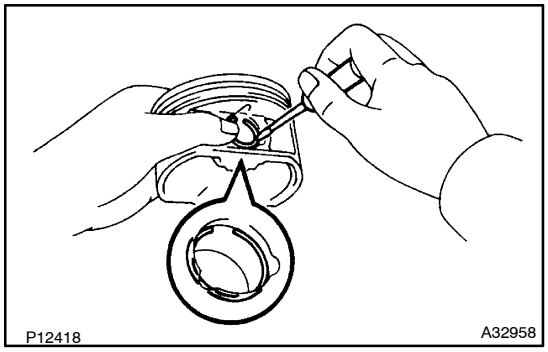


(a) Apply adhesive around the tight plugs.
Adhesive: Part No. 08833–00070, THREE BOND 1324 or equivalent

(b) Using SST, install new tight plugs as shown in the illustration.
SST 09950–60010 (09951–00200), 09950–70010 (09951–07100)



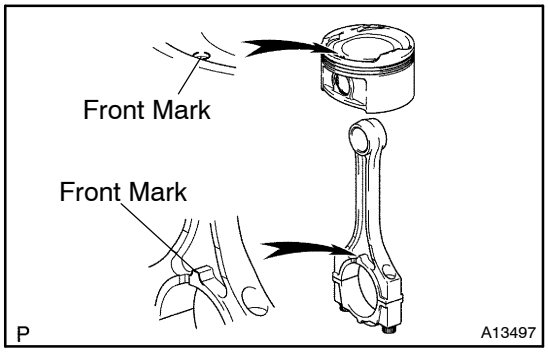
29. INSTALL STUD BOLT



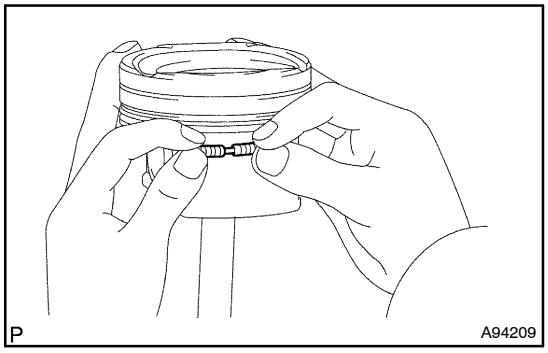
(a) Install the stud bolts as shown in the illustration.
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for stud bolt A
10 N·m (102 kgf·cm, 7 ft·lbf) for stud bolt B
5.0 N·m (51 kgf·cm, 44 in.·lbf) for stud bolt C

30. INSTALL STRAIGHT PIN

(a) Using a plastic–faced hammer, tap into the straight pin.



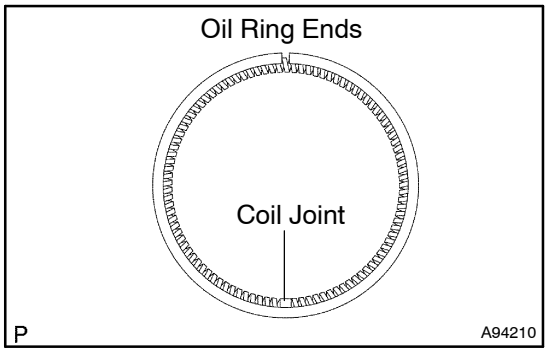
31. INSTALL PISTON



(a) Using a small screwdriver, install a new snap ring at one end of the piston pin hole.

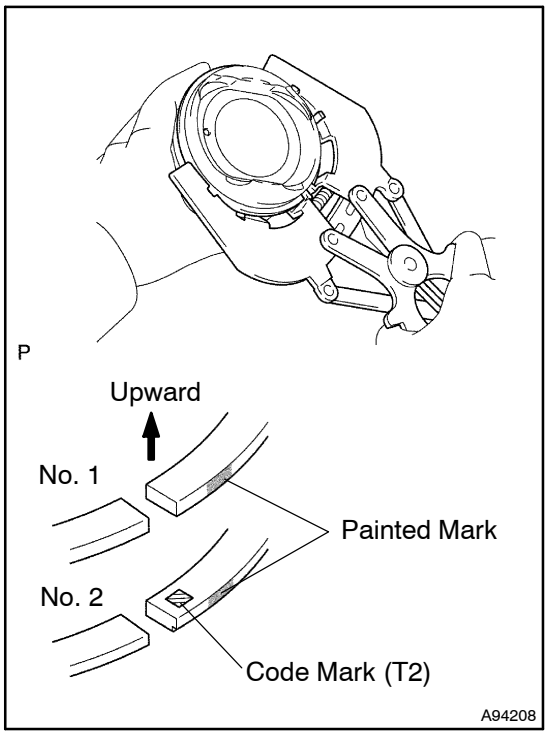
(b) Gradually heat the piston to approximately 80 to 90°C (176 to 194°F).

(c) Align the front marks of the piston and connecting rod, and push in the piston with your thumb.



(d) Using a small screwdriver, install a new snap ring on the other end of the piston pin hole.

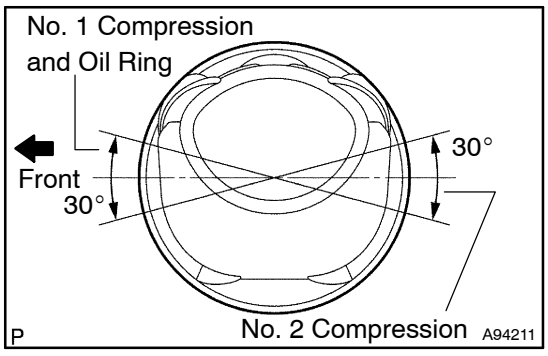
32. INSTALL PISTON RING SET



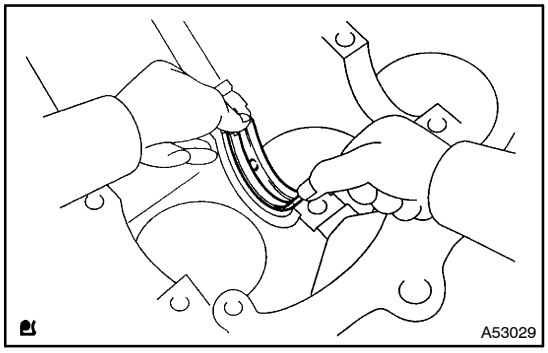
(a) Install the coil by hand.

(b) Using a piston ring expander, install the oil ring.

HINT:



Face the end gap of the oil ring in the opposite direction of coil joint.

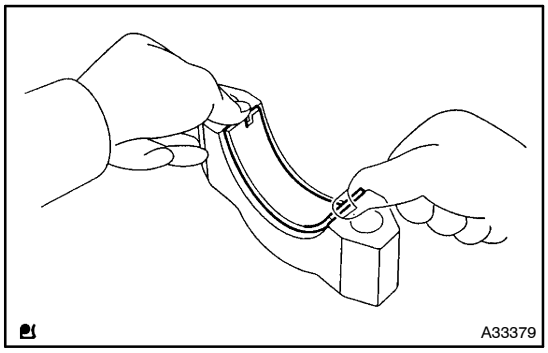


(c) Using a piston ring expander, install the 2 compression rings with the painted mark as shown in the illustration.

NOTICE:

Install the compression ring No. 2 with the code mark (T2) facing upward.

(d) Position the piston rings so that the ring ends are as shown in the illustration.

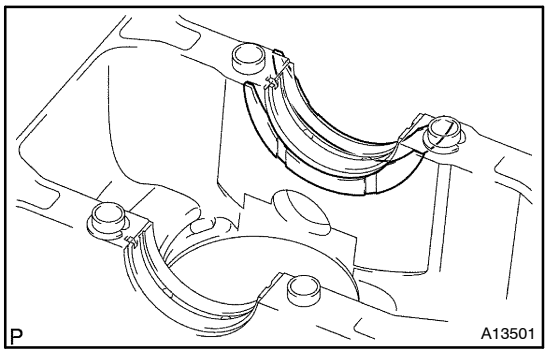


33. INSTALL CRANKSHAFT BEARING

(a) Install the upper bearing with an oil groove on the cylinder block.

NOTICE:

Clean the backside of the bearing and the bearing surface of the connecting rod. The surface should be free of dust and oil.

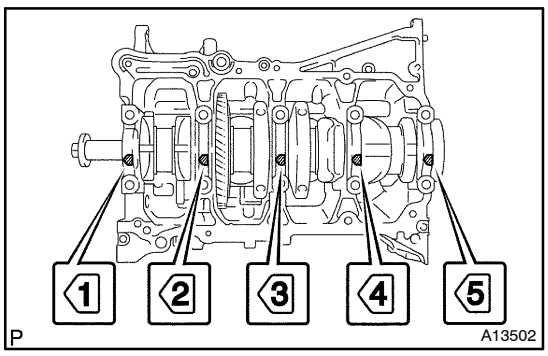


34. INSTALL CRANKSHAFT BEARING NO.2

(a) Install the lower bearing on bearing cap.

NOTICE:

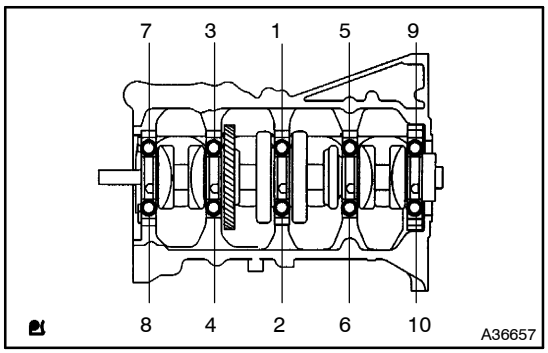
Clean the backside of the bearing and the bearing surface of the connecting rod. The surface should be free of dust and oil.



35. INSTALL CRANKSHAFT THRUST WASHER UPPER

(a) Install the 2 thrust washers under the No. 3 journal position of the cylinder block with the oil grooves facing outward.

36. INSTALL CRANKSHAFT

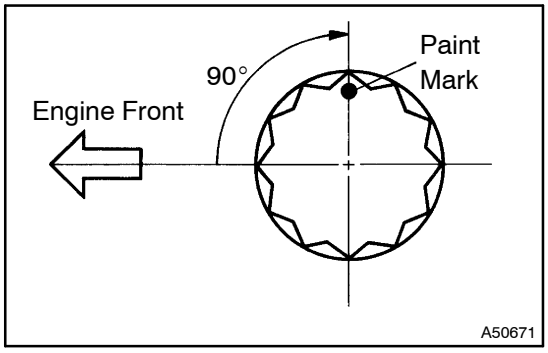


(a) Apply engine oil to the upper bearing and install the crankshaft on the cylinder block.

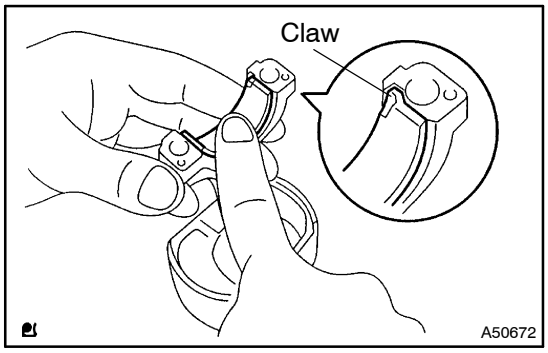
(b) Apply engine oil to the lower bearing.

(c) Examine the front marks and install the bearing caps on the cylinder block.

(d) Apply a light coat of engine oil on the threads and under the bearing cap bolts.



(e) Uniformly install and tighten the 16 main bearing cap bolts in the sequence shown in the illustration.



Torque:

20 N·m (204 kgf·cm, 15 ft·lbf) for 1st

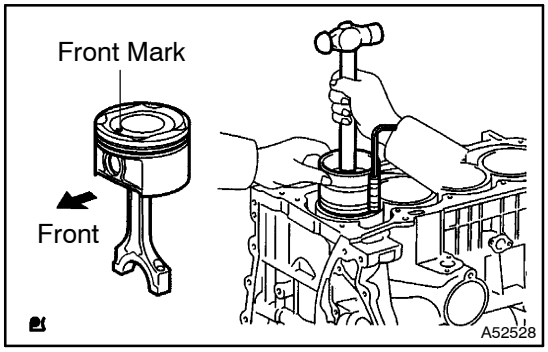
40 N·m (408 kgf·cm, 30 ft·lbf) for 2nd

(f) Mark the front of the bearing cap bolts with paint.
(g) Retighten the bearing cap bolts by 90° same sequence as step (e).
(h) Check that the painted mark is now at a 90° angle to the front.
(i) Check that the crankshaft turns smoothly.

37. INSTALL CONNECTING ROD BEARING

(a) Align the bearing claw with the groove of the connecting rod or connecting cap.

NOTICE:

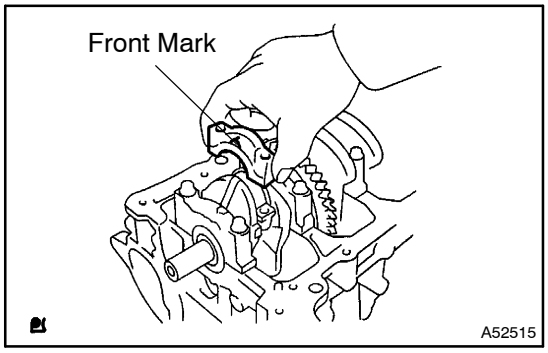


Clean the backside of the bearing and the bearing surface of the connecting rod. The surface should be free of dust and oil.

38. INSTALL PISTON

NOTICE:

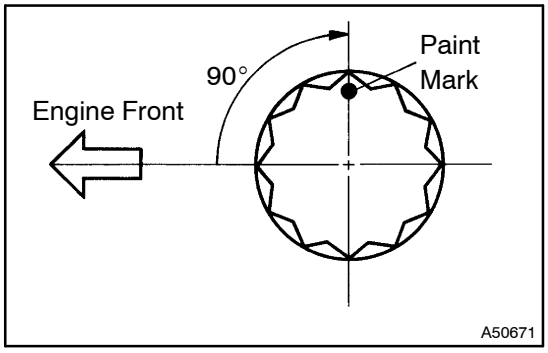
The connecting rod cap bolts are tightened in 2 progressive steps.



(a) Apply engine oil to the cylinder walls, the pistons, and the surfaces of connecting rod bearings.
(b) Check the position of the piston ring ends.

(c) Using a piston ring compressor, push the correctly numbered piston and connecting rod assemblies into each cylinder with the front mark of the piston facing forward.

NOTICE:

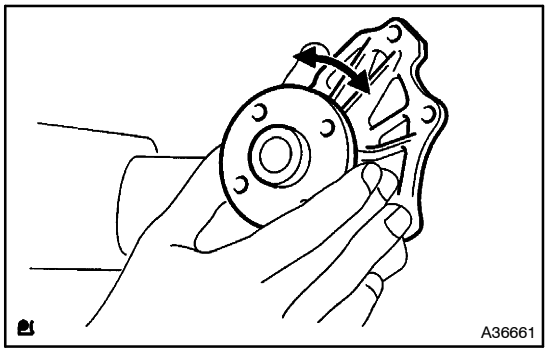


Match the numbered connecting rod cap with the connecting rod.

(d) Check that the protrusion of the connecting rod cap is facing in the correct direction.
(e) Apply a light coat of engine oil on the threads and under the heads of the connecting rod cap bolts.
(f) Using a 12 mm socket wrench, uniformly tighten the 2 bolts.

Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

(g) Mark the front of the connecting cap bolts with paint.



(h) Retighten the cap bolts by 90° as shown in the illustration.
(i) Check that the crankshaft turns smoothly.

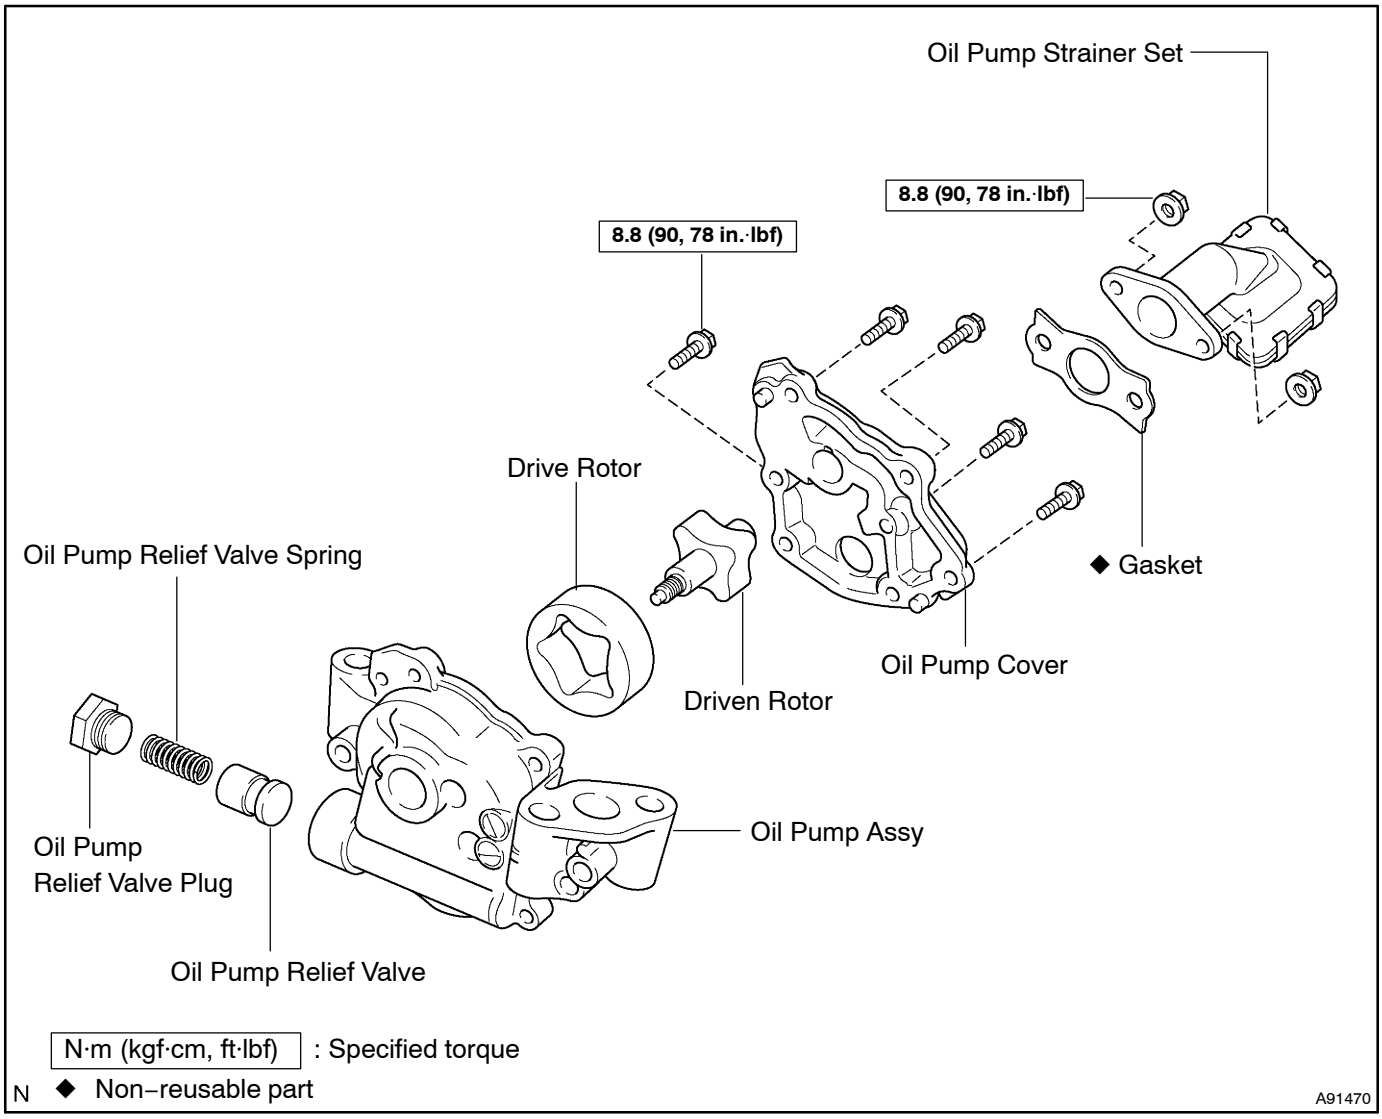
WATER PUMP ASSY (2AZ–FSE)

160UF–01

INSPECTION

1. INSPECT WATER PUMP ASSY

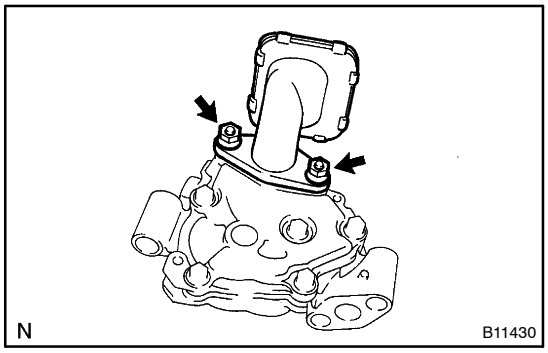
(a) Visually check the drain hole coolant leakage.



(b) Turn the pulley, and check that the water pump bearing moves smoothly and quietly.

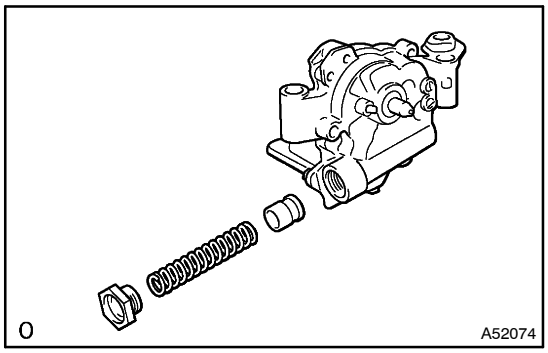
If moves roughly or noisily, replace the water pump.

OIL PUMP ASSY (2AZ–FSE)



COMPONENTS

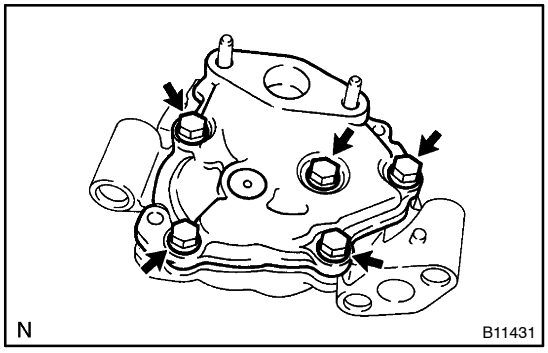
170JO–01



170JP–01

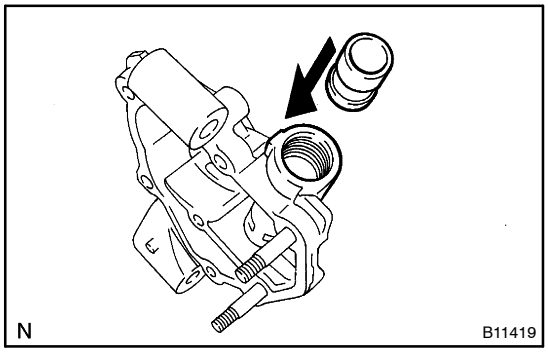
OVERHAUL

1. REMOVE OIL PUMP STRAINER SET



(a) Remove 2 nuts and oil pump strainer.

2. REMOVE OIL PUMP RELIEF VALVE

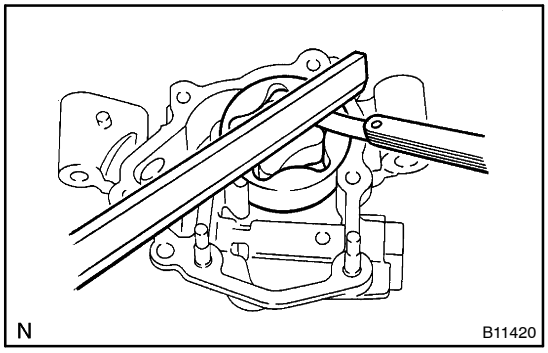


(a) Using a socket wrench (27mm), remove the plug.

(b) Remove the valve spring and relief valve.

3. REMOVE OIL PUMP COVER

(a) Remove 5 bolts and oil pump cover.

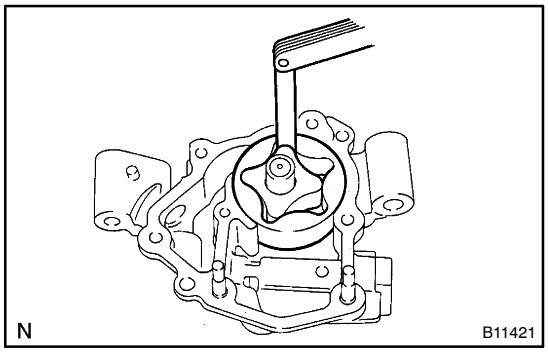


4. INSPECT OIL PUMP RELIEF VALVE

(a) Check the relief valve.

(1) Coat the valve with engine oil and check that it falls smoothly into the valve hole by its own weight.

If it does not, replace the relief valve. If necessary, replace the oil pump assy.



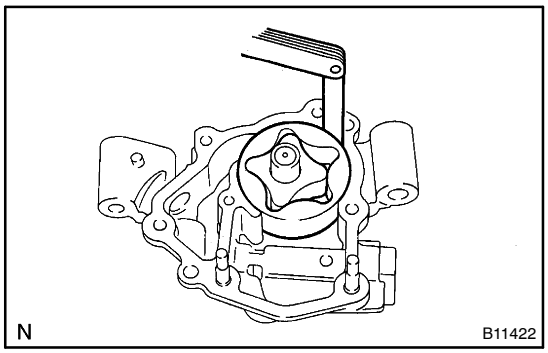
5. INSPECT OIL PUMP ROTOR

(a) Check the rotor side clearance.

(1) Using a feeler gauge and precision straight edge, measure the clearance between the rotors and precision straight edge.

Standard side clearance:
0.030 to 0.085 mm (0.0012 to 0.0033 in.)
Maximum side clearance: 0.16 mm (0.0063 in.)

If the side clearance is greater than the maximum, replace the oil pump assy.



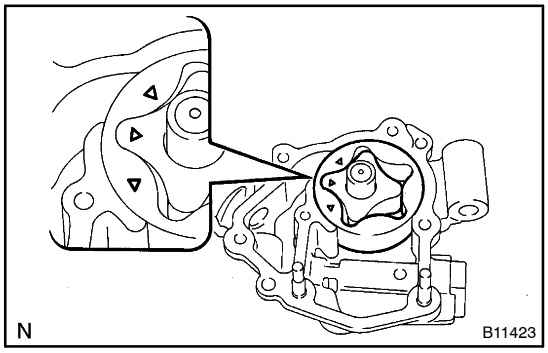
(b) Check the rotor tip clearance.

(1) Using a feeler gauge, measure the clearance between the drive and driven rotor tips.

Standard tip clearance:
0.080 to 0.160 mm (0.0031 to 0.0063 in.)
Maximum tip clearance: 0.35 mm (0.0138 in.)

If the tip clearance is greater than the maximum, replace the oil pump assy.

(c) Check the rotor body clearance.

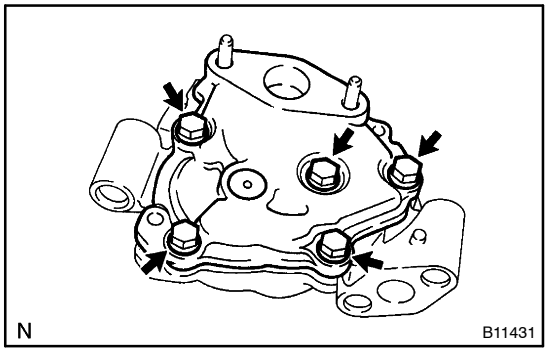


(1) Using a feeler gauge, measure the clearance between the driven rotor and body.

Standard body clearance:
0.100 to 0.170 mm (0.00394 to 0.00669 in.)
Maximum body clearance: 0.325 mm (0.01280 in.)

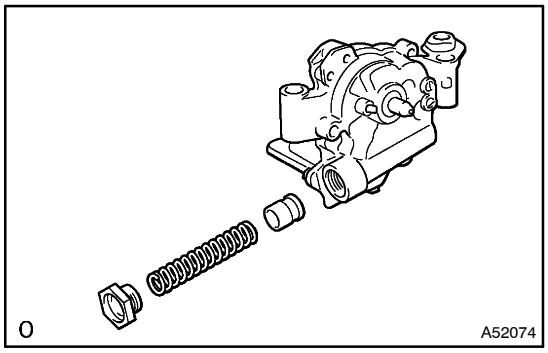
(d) Remove the oil pump rotors.

If the body clearance is greater than the maximum, replace the oil pump assy.



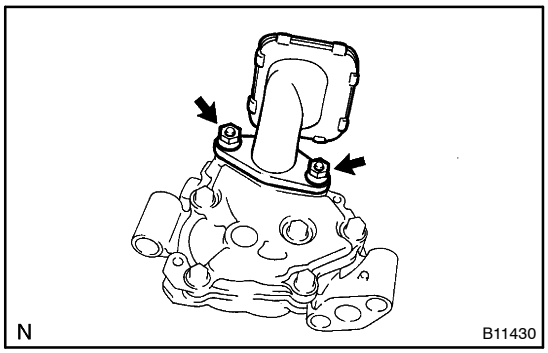
6. REMOVE OIL PUMP ROTOR

7. INSTALL OIL PUMP ROTOR



(a) Coat the drive rotor and driven rotors with engine oil.

(b) Place the drive and driven rotors into pump body with the marks facing the pump cover side.

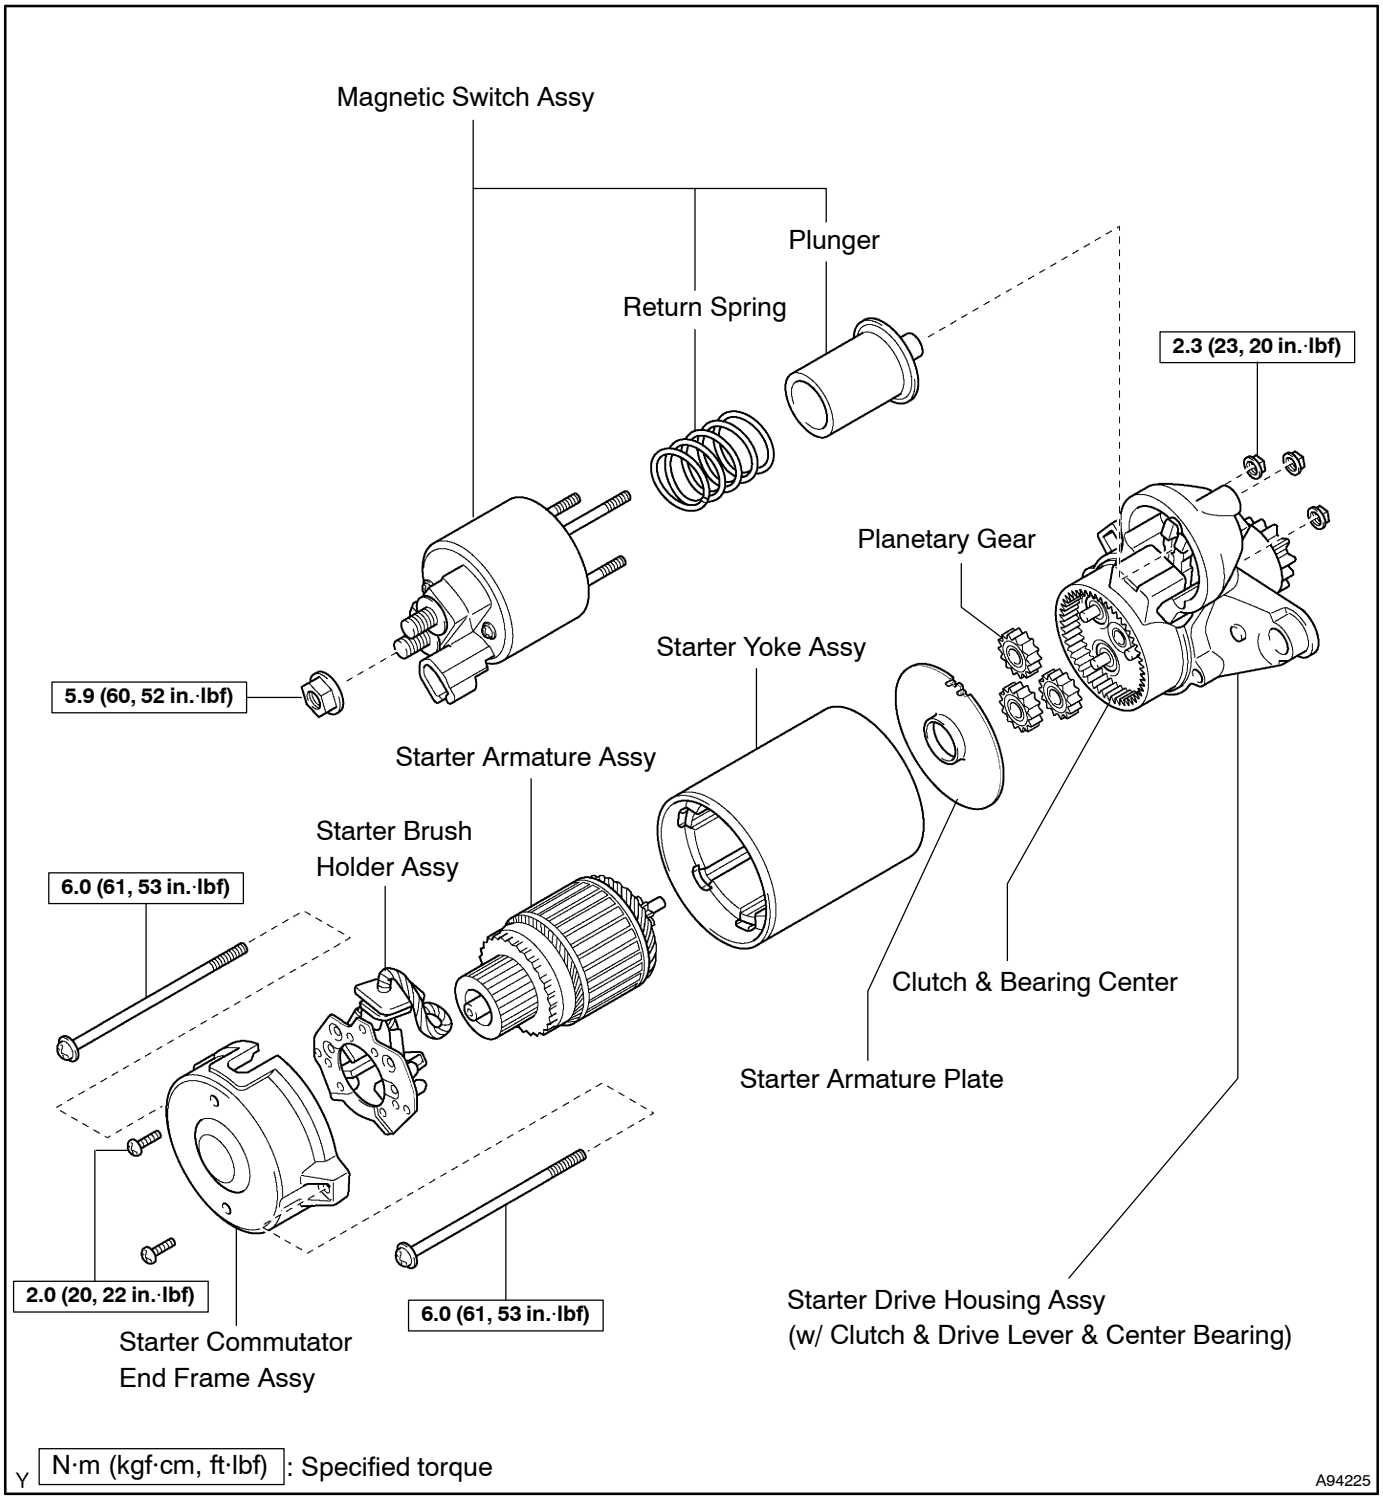


8. INSTALL OIL PUMP COVER

(a) Install the pump body cover with the 5 bolts.
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)

9. INSTALL OIL PUMP RELIEF VALVE

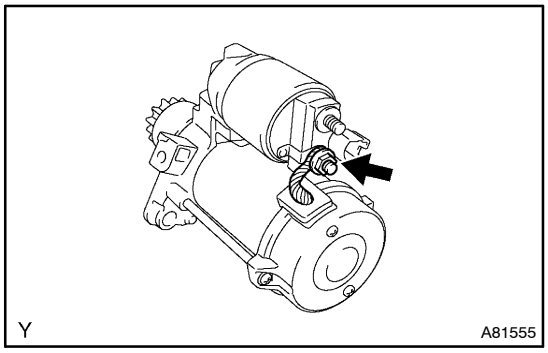
(a) Coat the relief valve with engine oil.
(b) Insert the relief valve and spring into the pump body hole.
(c) Using a socket wrench (27 mm), install the plug.



10. INSTALL OIL PUMP STRAINER SET

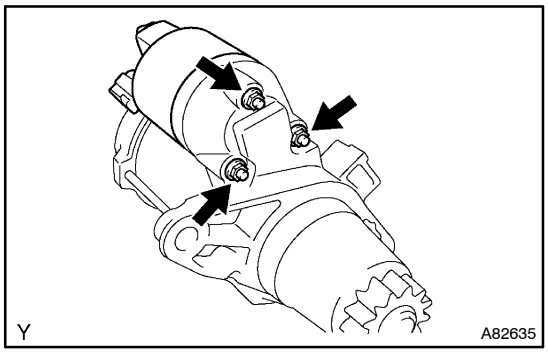
(a) Place a new gasket on the oil pump.
(b) Install the oil strainer with the 2 nuts.
Torque: 8.8 N·m (90 kgf·cm, 78 in.·lbf)

STARTER ASSY (2AZ–FSE)



COMPONENTS

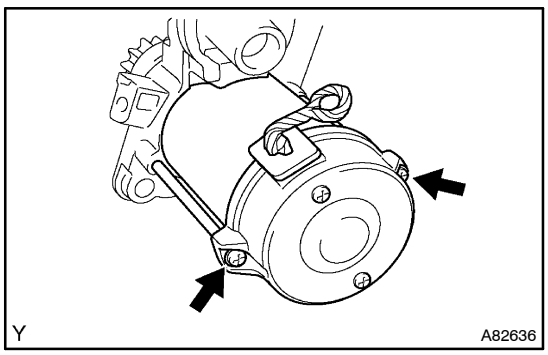
190VX–01



190VY–01

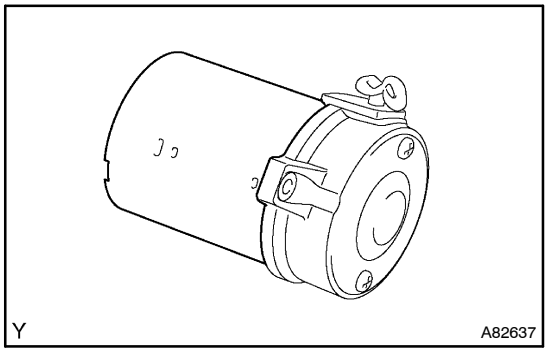
OVERHAUL

1. REMOVE MAGNETIC SWITCH ASSY



(a) Remove the nut and disconnect the lead wire from the magnetic switch.

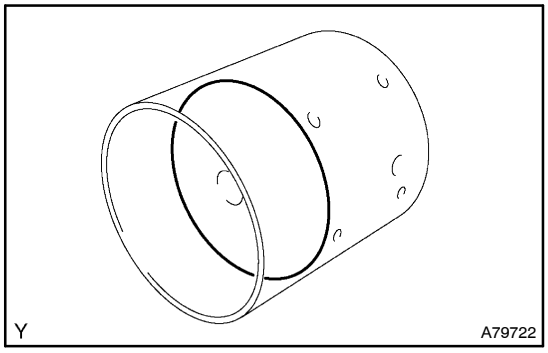
(b) Remove the 3 nuts holding the magnetic switch to the starter drive housing.



(c) Remove the magnetic switch.

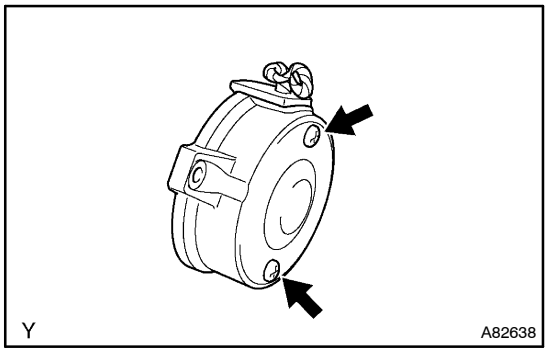
(d) Remove the return spring and plunger form the starter drive housing.

2. REMOVE STARTER YOKE ASSY



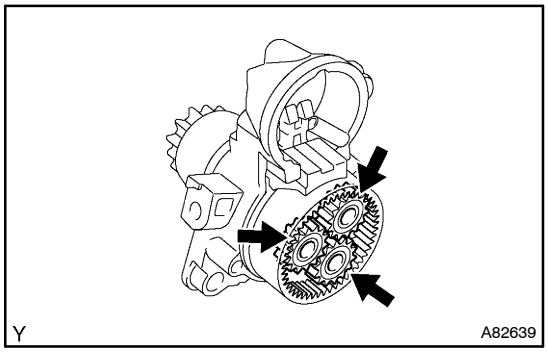
(a) Using a torx driver T25, remove the 2 through bolts, and pull out the yoke together with the starter commutator end frame.

(b) Remove the yoke from the starter commutator end frame.



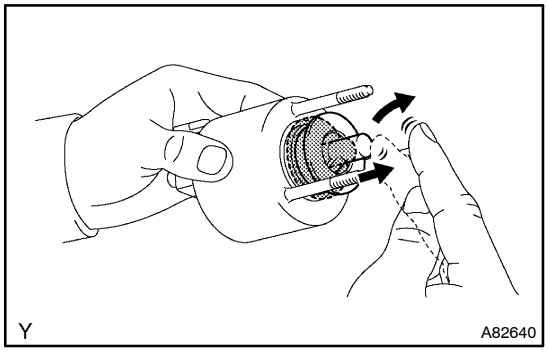
3. REMOVE STARTER ARMATURE ASSY

(a) Remove the starter armature from the yoke.



4. REMOVE STARTER ARMATURE PLATE

(a) Remove the armature plate from the yoke.

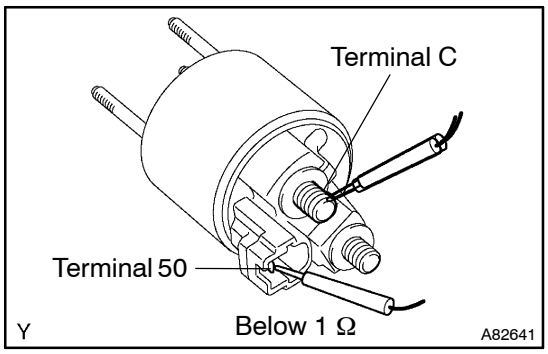


5. REMOVE STARTER BRUSH HOLDER ASSY

(a) Remove the 2 screws and brush holder from the commutator end frame.

6. REMOVE PLANETARY GEAR

(a) Remove the 3 planetary gears from the starter housing.

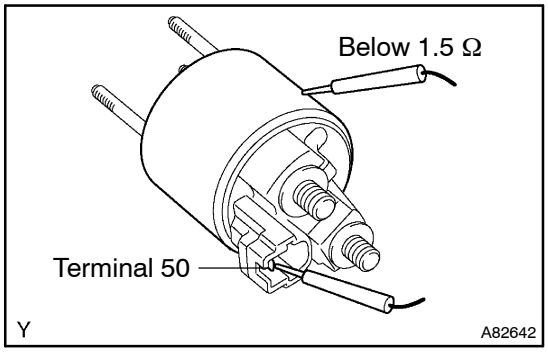


7. INSPECT MAGNETIC SWITCH ASSY

(a) Check the plunger.

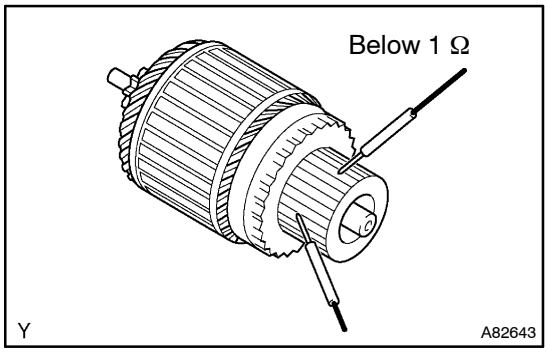
(1) Push in the plunger and check that it returns quickly to its original position.

If necessary, replace the magnetic switch assy.



(b) Check if the pull–in coil has an open circuit.

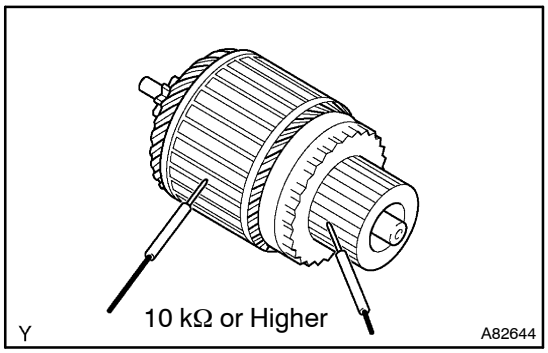
(1) Measure the resistance between terminals 50 and C.



Standard: Below 1 Ω

If the result is not as specified, replace the magnetic switch assy.

(c) Check if the hold–in coil has an open circuit.
(1) Measure the resistance between terminal 50 and the switch body.
Standard: Below 1.5 Ω

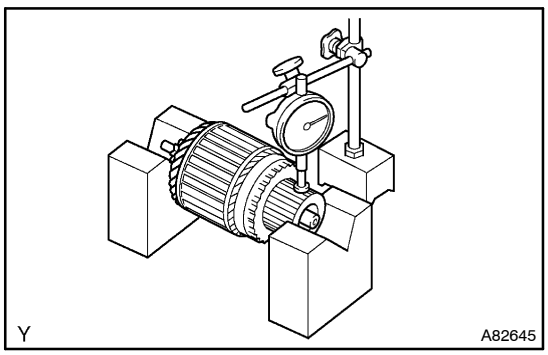


If the result is not as specified, replace the magnetic switch assy.

8. INSPECT STARTER ARMATURE ASSY

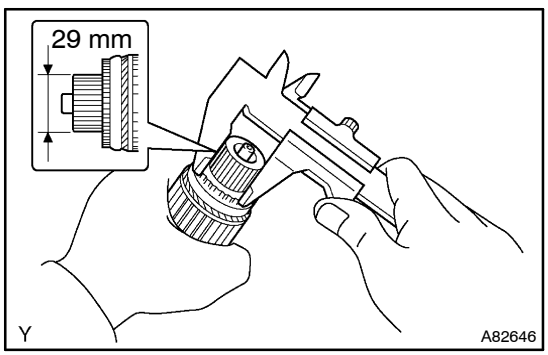
(a) Check if the commutator has an open circuit.
(1) Measure the resistance between the segments of the commutator.
Standard: Below 1 Ω

If the result is not as specified, replace the armature assy.



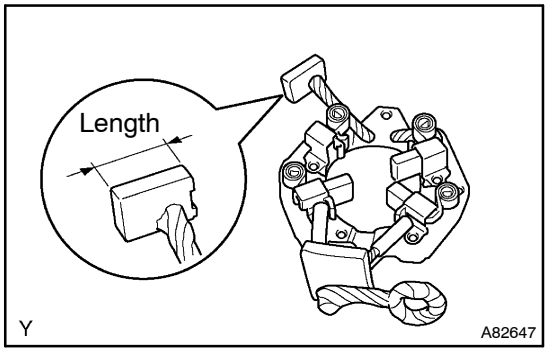
(b) Check if the commutator is grounded.
(1) Measure the resistance between the commutator and armature coil core.
Standard: 10 kΩ or higher

If the result is not as specified, replace the armature assy.



(c) Check the commutator for dirty or burned surface.

If the surface is dirty or burnt, smooth the surface with 400–grit sandpaper.

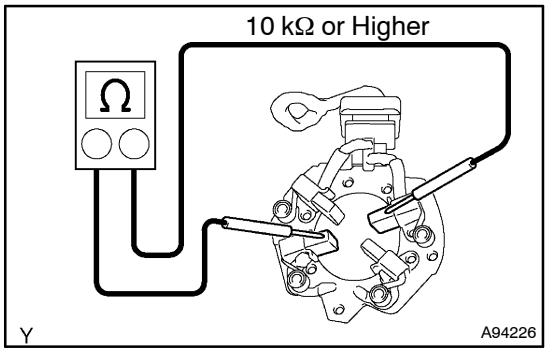


(d) Check for the commutator circle runout.
(1) Place the commutator on V–blocks.
(2) Using a dial indicator, measure the circle runout.
Standard runout: 0.02 mm (0.0008 in.)
Maximum runout: 0.05 mm (0.0020 in.)

If the runout is greater than the maximum, replace the armature assy.

(e) Using a vernier caliper, measure the commutator diameter.
Standard length: 29 mm (1.142 in.)
Minimum length: 28 mm (1.102 in.)

If the diameter is less than the minimum, replace the armature assy.



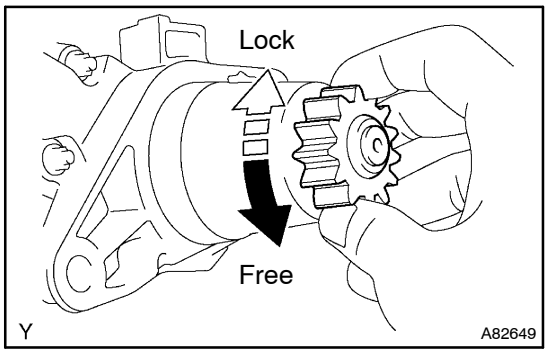
9. INSPECT STARTER BRUSH HOLDER ASSY

(a) Using a vernier caliper, measure the brush length.

Standard length: 15.5 mm (0.610 in.)

Minimum length: 9.0 mm (0.354 in.)

If the length is less than the minimum, replace the starter brush holder assy.

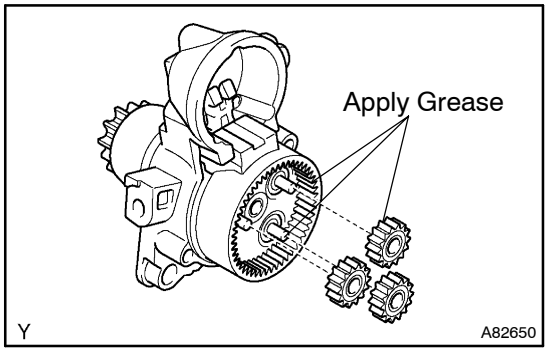


(b) Check the brush insulation.

(1) Measure the resistance between the positive (+) terminal and negative (–) terminal of the brush.

Standard: 10 kΩ or higher

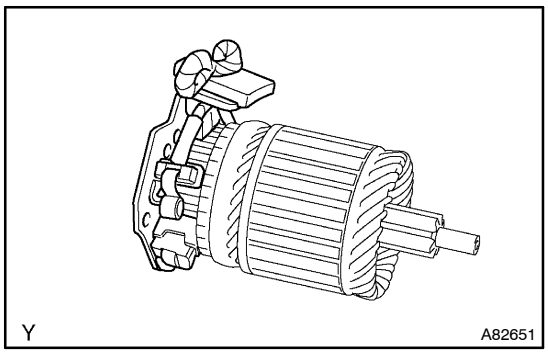
If the result is not as specified, repair or replace the brush holder assy.



10. INSPECT CLUTCH & BEARING CENTER

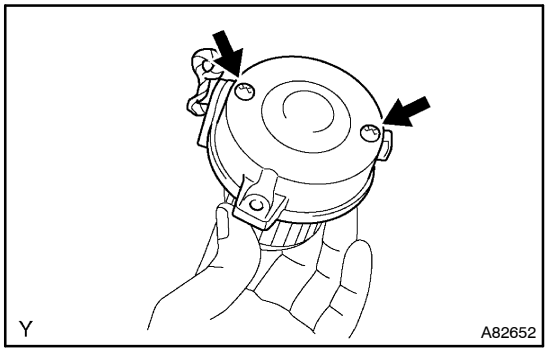
(a) Check the starter clutch.

(1) Rotate the clutch pinion gear counterclockwise and check that it turns freely. Try to rotate the clutch pinion gear clockwise and check that it locks.



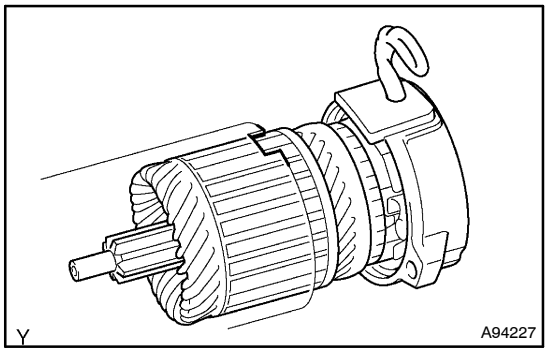
If necessary, replace the starter drive housing assy.

11. INSTALL PLANETARY GEAR



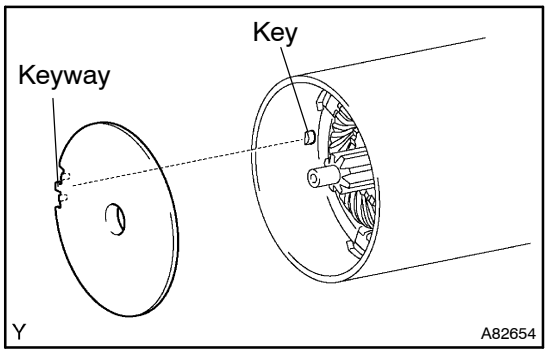
(a) Apply grease to the planetary gears and pin parts of the planetary shaft.

(b) Install the 3 planetary gears.



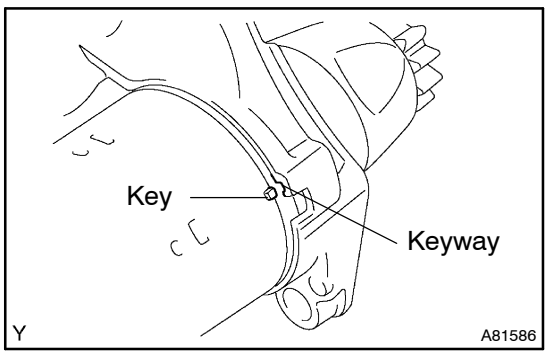
12. INSTALL STARTER BRUSH HOLDER ASSY

(a) Install the brush holder to the starter armature.



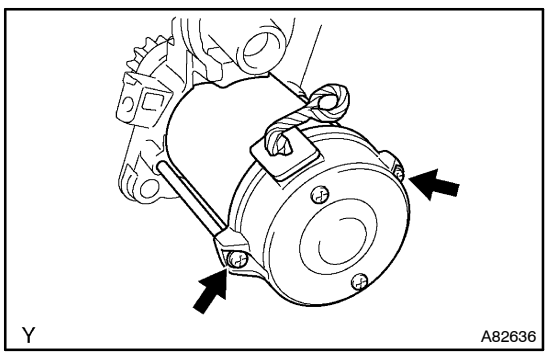
13. INSTALL STARTER COMMUTATOR END FRAME ASSY

(a) Install the commutator end frame with the 2 screws.
Torque: 2.0 N·m (20 kgf·cm, 22 in.·lbf)



14. INSTALL STARTER ARMATURE ASSY

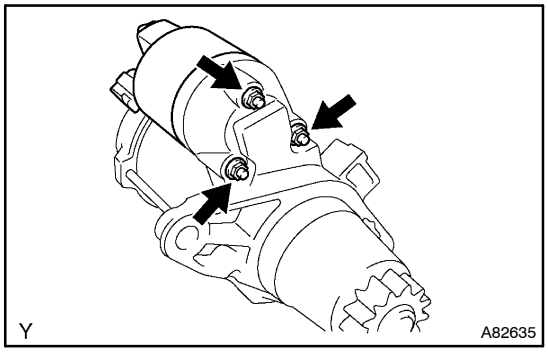
(a) Align the rubber with the convex cutout of the field frame.
(b) Install the starter armature with the brush holder to the field frame.



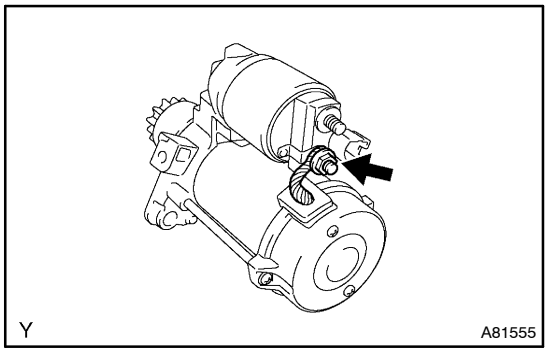
15. INSTALL STARTER ARMATURE PLATE

(a) Insert the starter armature plate to the yoke.
(b) Align the keyway of the starter plate with the key inside the yoke, and install the starter plate.

16. INSTALL STARTER YOKE ASSY



(a) Align the key of the yoke with the keyway located on the starter drive housing.

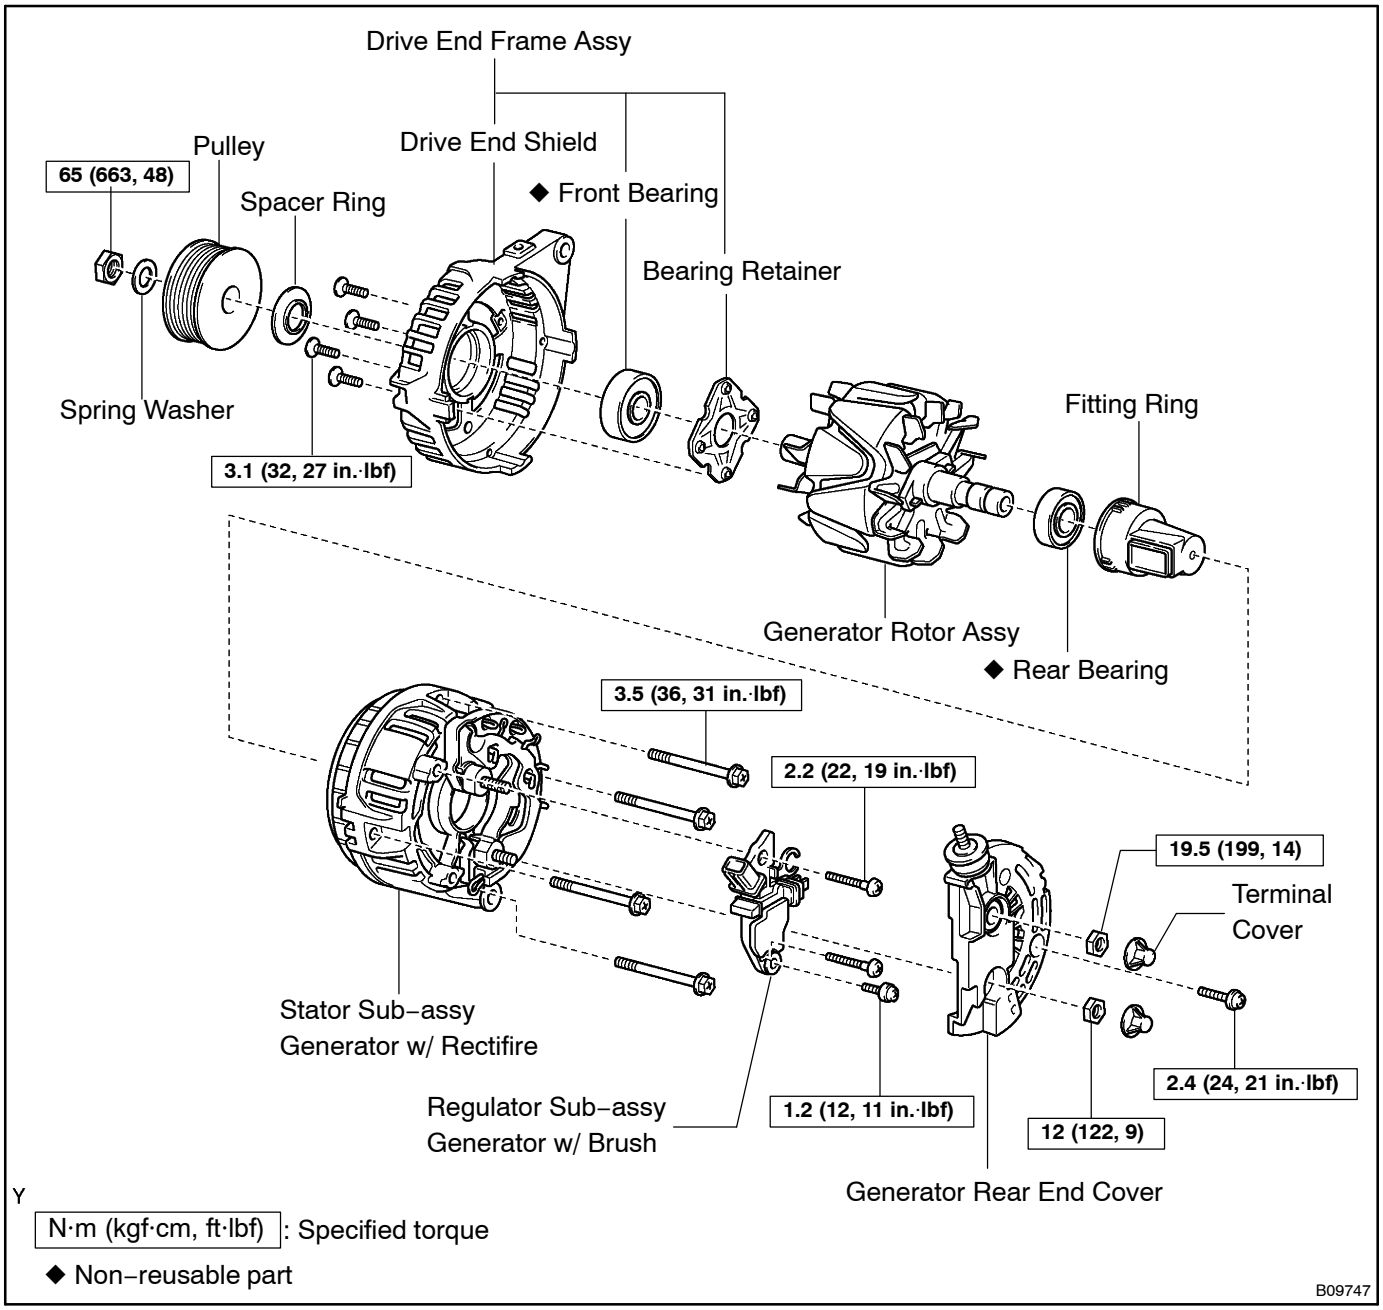


(b) Using a torx driver T25, install the field frame with the 2 through bolts.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)

17. INSTALL MAGNETIC SWITCH ASSY

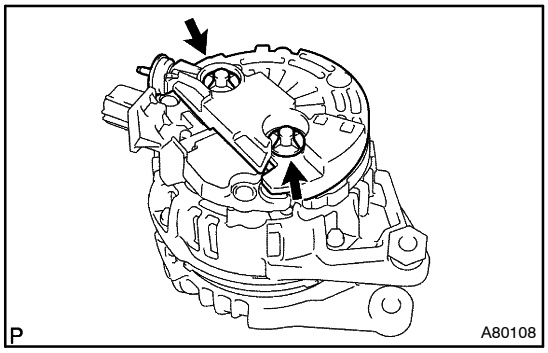
(a) Apply grease to the hook.
(b) Set the plunger and hook of the drive housing to the drive lever.
(c) Install the plunger and return spring.

(d) Install the magnetic switch with the 3 nuts.
Torque: 2.3 N·m (23 kgf·cm, 20 in.·lbf)



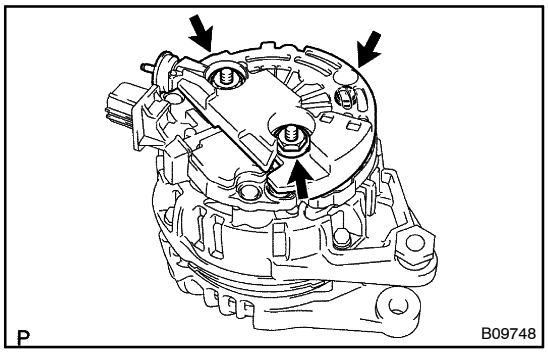
(e) Connect the lead wire to the magnetic switch. Tighten the nut.
Torque: 5.9 N·m (60 kgf·cm, 52 in.·lbf)

GENERATOR ASSY (2AZ–FSE)



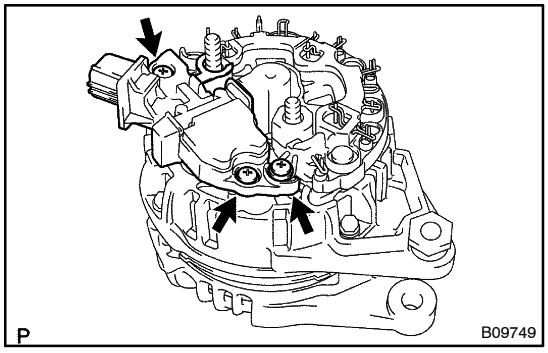
COMPONENTS

190VZ–01



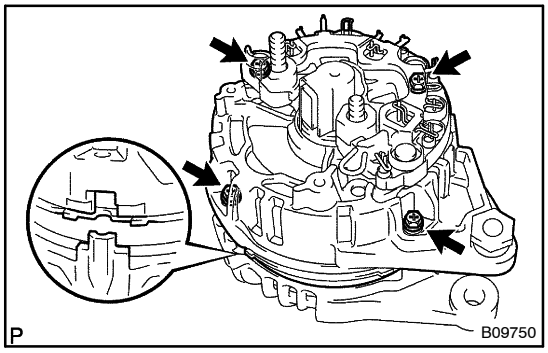
190W0–01

OVERHAUL

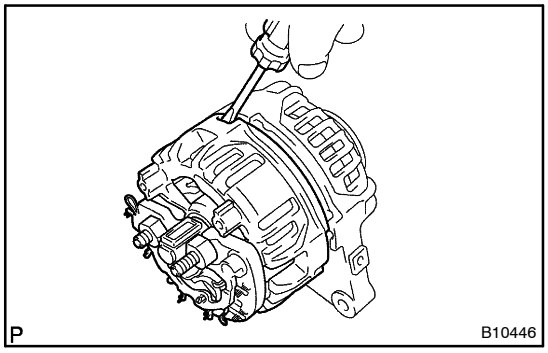


1. REMOVE GENERATOR REAR END COVER

(a) Remove the 2 terminal covers by turning them counter-clockwise.

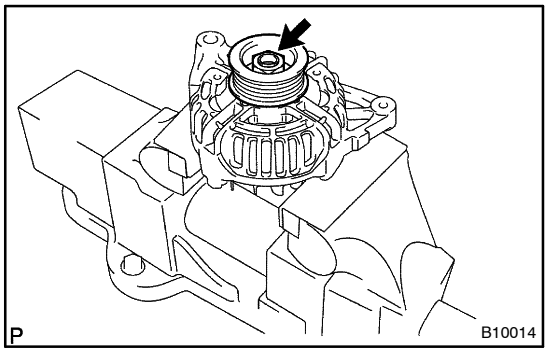


(b) Remove the screw, 2 nuts and end cover.



2. REMOVE REGULATOR SUB–ASSY GENERATOR W/BRUSH

(a) Remove the 3 screws and regulator.

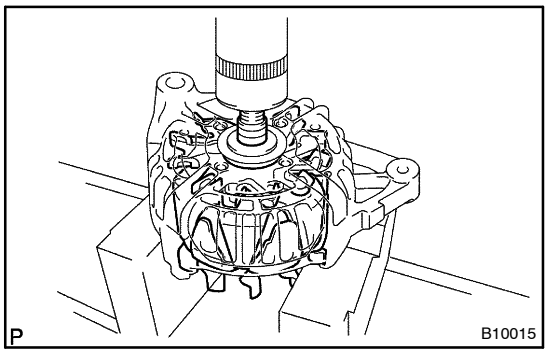


3. REMOVE STATOR SUB–ASSY GENERATOR W/RECTIFIRE

(a) Remove the 4 bolts.

(b) Using a screwdriver, pry out the stator.

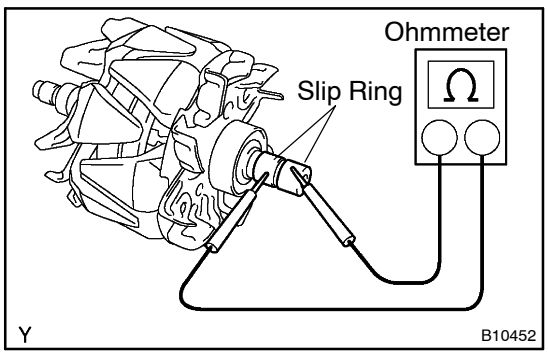
4. REMOVE BEARING SET GENERATOR



5. REMOVE PULLEY SET GENERATOR

(a) Clamp the swivel arm in a vise.

NOTICE:

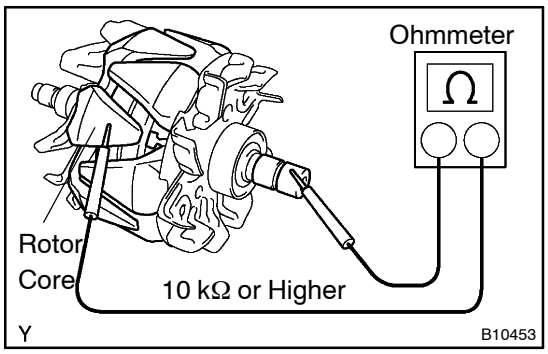


Be careful not to damage the fan.

(b) Using an impact wrench, remove the nut and spring washer, then detach the pulley.

6. REMOVE GENERATOR ROTOR ASSY

(a) Using a press, press out the rotor and spacer ring.



7. INSPECT GENERATOR ROTOR ASSY

(a) Check the rotor for open circuit.

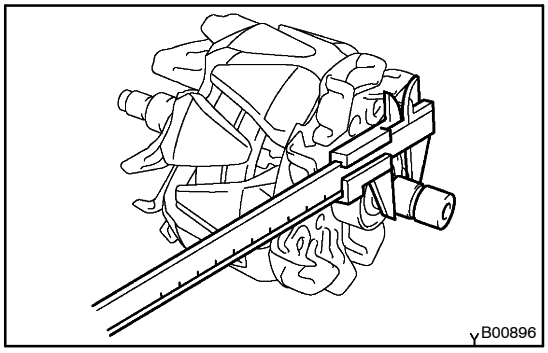
(1) Using an ohmmeter, measure the resistance between the slip rings.

Standard resistance: 1.8 to 2.8 Ω at 20°C (68°F)

If the resistance is not as specified, replace the rotor assy.

(b) Check the rotor for ground.

(1) Using an ohmmeter, measure the resistance between the slip ring and rotor core.



Standard: 10 kΩ or higher

If the resistance is not as specified, replace the rotor assy.

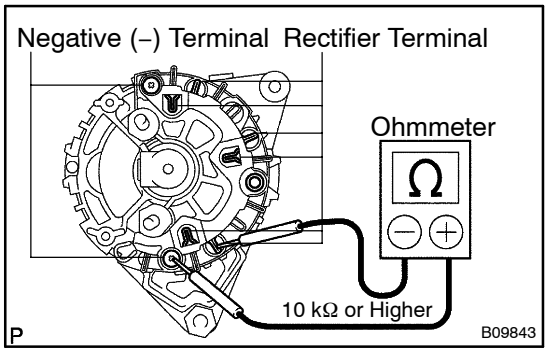
(c) Inspect slip rings.

(1) Check that the slip rings are not rough or scored.

If rough or scored, replace the rotor assy.

(d) Inspect the slip rings.

(1) Check that the slip rings are not rough or scored.



If rough or scored, replace the rotor assy.

(2) Using a vernier caliper, measure the slip ring diameter.

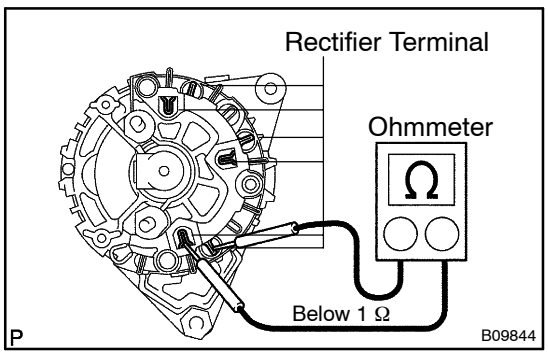
Standard diameter: 15.3 to 15.5 mm (0.602 to 0.610 in.)

Minimum diameter: 14.3 mm (0.561 in.)

If the diameter is less than the minimum, replace the rotor assy.

8. INSPECT STATOR SUB–ASSY GENERATOR W/RECTIFIRE

(a) Using an ohmmeter, measure the resistance between the generator's negative (–) terminal and rectifier terminal.

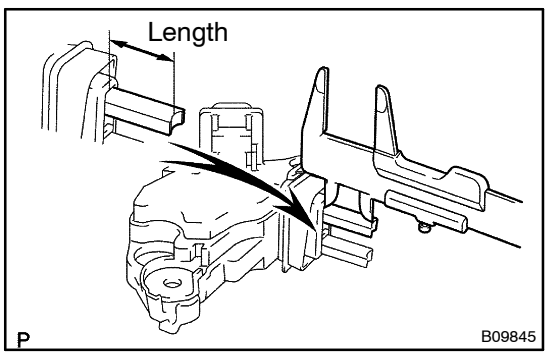


(1) Connect the ohmmeter's positive (+) probe to the generator's negative (–) terminals and the negative (–) probe to the rectifier terminals. Measure the resistance one by one.

Standard: 10 kΩ or higher

(2) Connect the ohmmeter's positive (+) probe to the rectifier terminals and the negative (–) probe to the generator's negative (–) terminals. Measure the resistance one by one.

Standard: Below 1 Ω



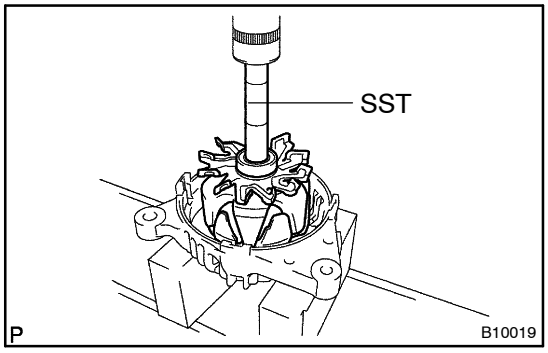
If the result is not as specified, replace the stator sub–assy generator w/ rectifier.

(b) Using an ohmmeter, measure the resistance between the rectifier terminals.

Standard: Below 1 Ω

If the result is not as specified, replace the stator sub–assy generator w/ rectifier.

9. INSPECT BRUSH

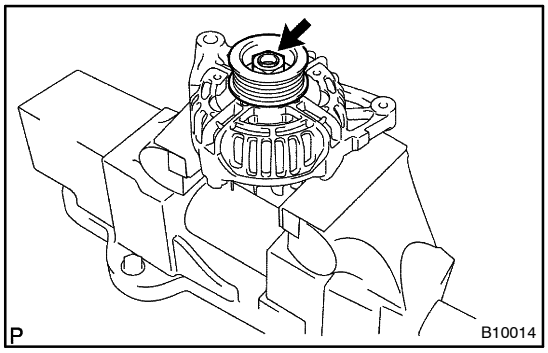


(a) Using a vernier caliper, measure the exposed brush length.

Standard exposed length:

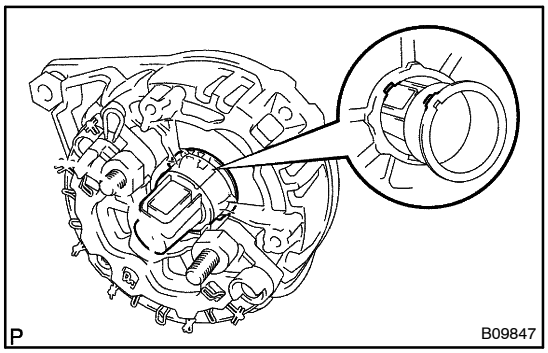
13.2 mm (0.520 in.) in new condition

Minimum exposed length: 6.0 mm (0.236 in.)



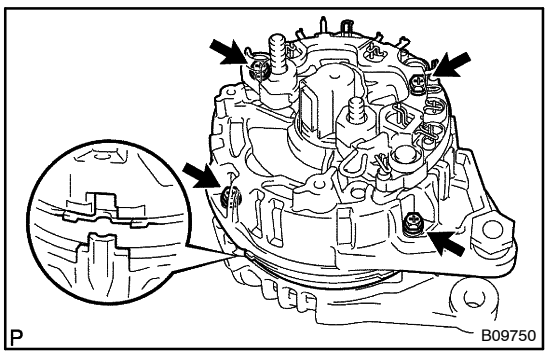
If the exposed length is less than the minimum, replace the regulator sub–assy generator w/ brush.

10. INSTALL GENERATOR ROTOR ASSY



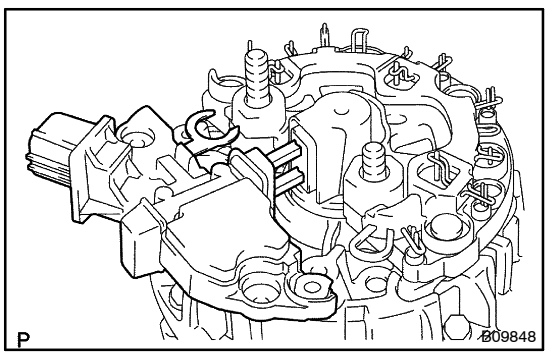
(a) Using SST and a press, press in the rotor.
SST 09285–76010

NOTICE:
Avoid misalignment during pressing.



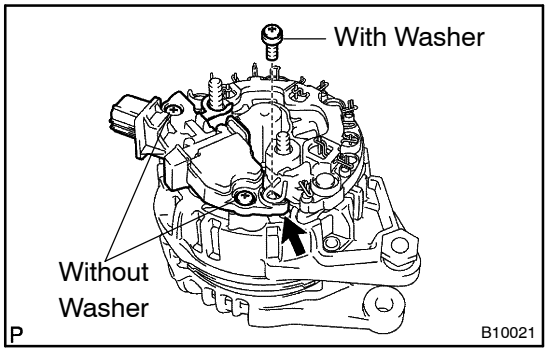
11. INSTALL PULLEY SET GENERATOR

(a) Clamp the rotor in a soft jaw vise.
(b) Install the pulley with the spring washer and nut.
Torque: 65 N·m (663 kgf·cm, 48 ft·lbf)



12. INSTALL BEARING SET GENERATOR

(a) Insert the fitting ring into the position shown in the illustration.
(b) Align the key of the fitting ring with the keyway of the stator.
(c) Install the bearing.



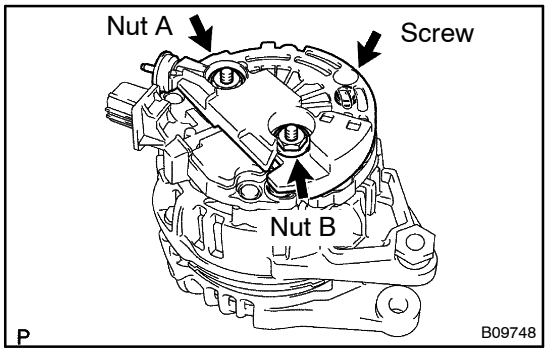
13. INSTALL STATOR SUB–ASSY GENERATOR W/RECTIFIRE

(a) Align the key of the drive end frame with the keyway of the stator generator.
(b) Install the stator with the 4 bolts.
Torque: 3.5 N·m (36 kgf·cm, 31 in.·lbf)

14. INSTALL REGULATOR SUB–ASSY GENERATOR W/BRUSH

(a) Attach the brushes and terminals to the rectifier end frame of the regulator.

(b) Install the regulator with the 3 screws.



Torque:

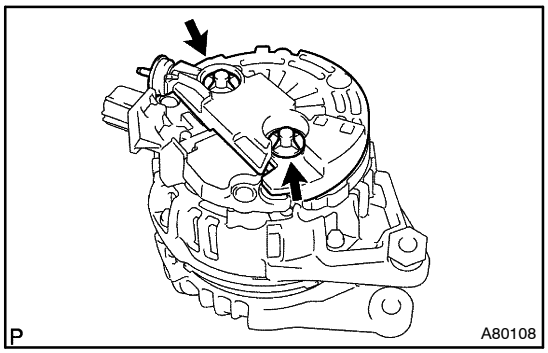
2.2 N·m (22 kgf·cm, 19 in.·lbf) for screw without washer

1.2 N·m (12 kgf·cm, 11 in.·lbf) for screw with washer

HINT:

Install the screw with the plate washer to the position shown in the illustration.

15. INSTALL GENERATOR REAR END COVER



(a) Install the end cover with the 2 nuts and screw.

Torque:

19.5 N·m (199 kgf·cm, 14 ft·lbf) for nut A

12 N·m (122 kgf·cm, 9 ft·lbf) for nut B

2.4 N·m (24 kgf·cm, 21 in.·lbf) for screw

(b) Install the 2 terminal covers by turning them clockwise.

HOW TO USE THIS MANUAL

010B2–23

GENERAL INFORMATION

1. GENERAL DESCRIPTION

(a) This manual is made in accordance with SAE J2008.

(b) Generally repair operations can be separated in the following 3 main processes:
1. Diagnosis
2. Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting
3. Final Inspection

(c) This manual explains ”Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting”, but ”Final Inspection” is omitted.

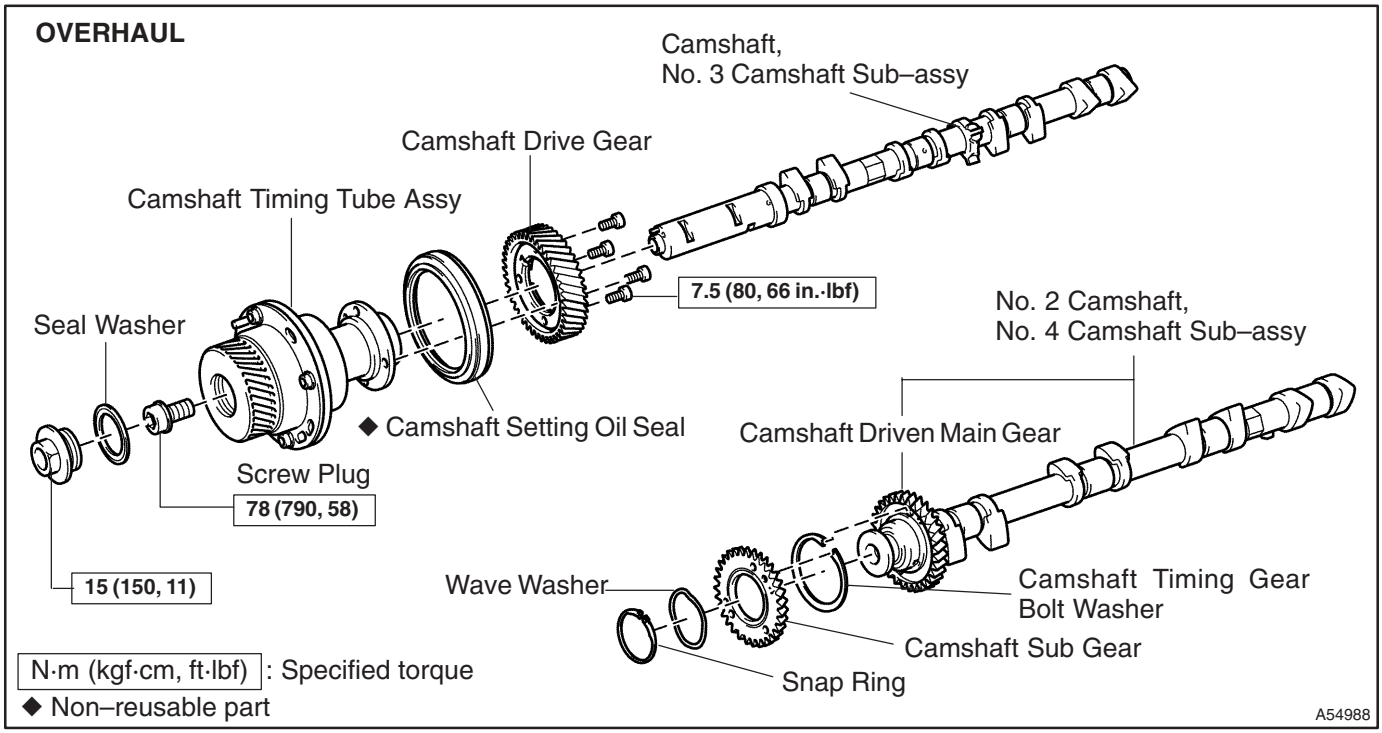
(d) The following essential operations are not written in this manual, however these operations must be done in the practical situation.
(1) Operation with a jack or lift
(2) Cleaning of a removed part when necessary
(3) Visual check

2. INDEX

(a) An alphabetical INDEX is provided as a section on the end of the book to guide you to the item to be repaired.

3. PREPARATION

(a) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the repairing condition. Be sure to use SST and SSM when they are required and follow the working procedure properly. A list of SST and SSM is in the Preparation section of this manual.



4. REPAIR PROCEDURES

(a) Component drawing is placed as the section or title when necessary.

(b) Illustrations of the parts catalog are placed as the ”disassembled parts drawing” so that it enables you to understand the fitting condition of the components.

(c) Non–reusable parts, grease applied parts, precoated parts and tightening torque are specified in the components drawing.

Example:

(d) Tightening torque, oil applying position, and non–reusable parts are described as important points in the procedure.

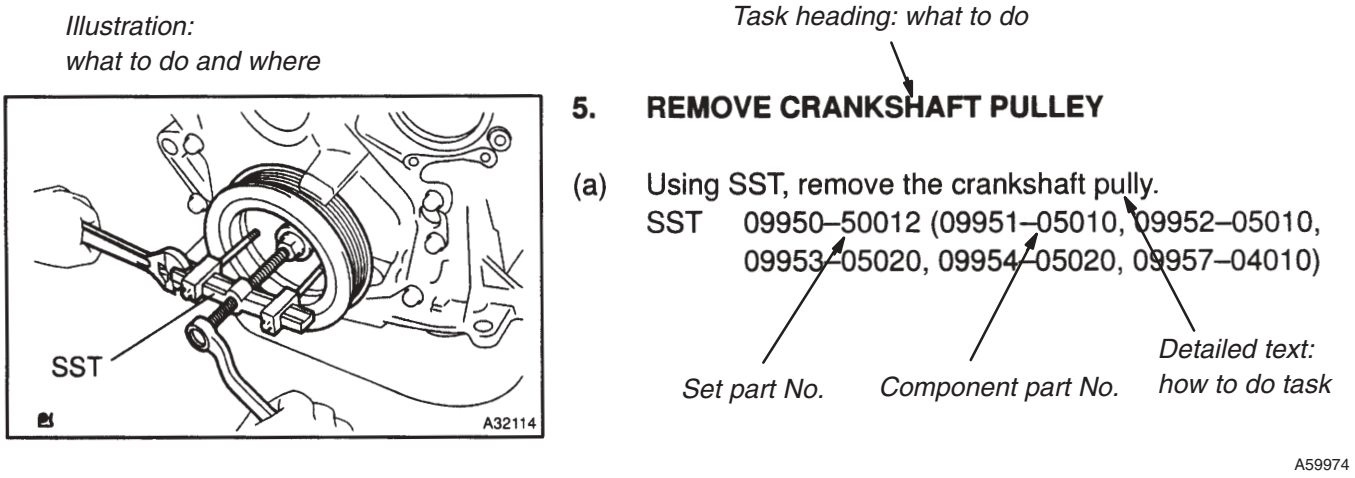
NOTICE:

There are cases where such information can only be indicated by an illustration. In that case, all the information such as torque, oil, etc. are described in the illustration.

(e) Installing procedure of operation items is performed in the reverse order of the removing, and only the important points are described.

(f) Only items with points are described in the procedure, and the operational portion and content are placed using an illustration. In the explanations, details of the operational method, standard value and notice are placed.

(g) There may be a case where the illustrations of similar models are used. In that case the details may be different from the actual vehicle.



(h) The procedures are presented in a step–by–step format:

(1) The illustration shows what to do and where to do it.

(2) The task heading tells what to do.

(3) The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

HINT:

This format provides an experienced technician with a FAST TRACK to the necessary information. The task heading can be read at a glance when necessary, and the text below provides detailed information. Important specifications and warnings always stand out in bold type.

5. SERVICE SPECIFICATIONS

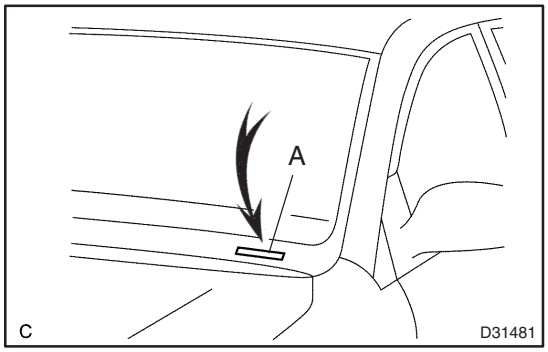
(a) Specifications are presented in bold type throughout the manual. You never have to leave the procedure to look up your specifications. The specifications are also found in the Service Specifications section for a quick reference.

6. TERMS DEFINITION

CAUTION	Indicate the possibility of injury to you or other people.
NOTICE	Indicate the possibility of damage to the components being repaired.
HINT	Provide additional information to help you perform the repair efficiently.

7. SI UNIT

(a) The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System.



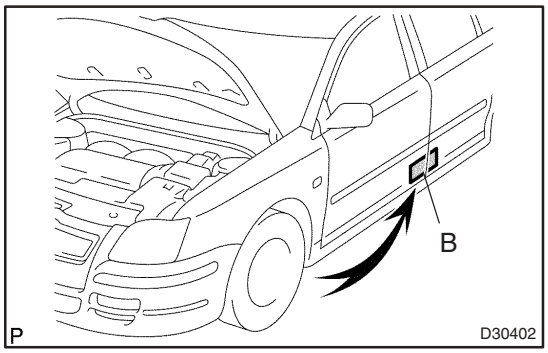
Example:

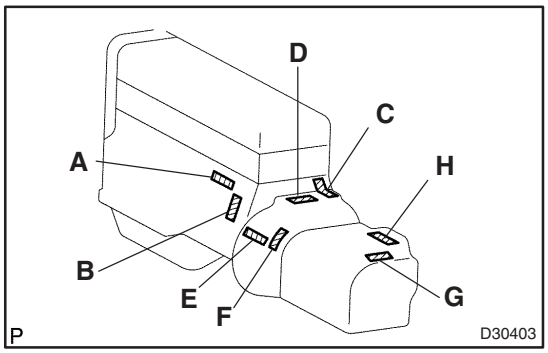
Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

IDENTIFICATION INFORMATION

VEHICLE IDENTIFICATION AND SERIAL NUMBERS

010SB–02





1. VEHICLE IDENTIFICATION NUMBER

(a) The vehicle identification number is stamped on the vehicle identification number plate and the certification label, as shown in the illustration.

A: Vehicle Identification Number Plate

B: Certification Label

2. ENGINE SERIAL NUMBER AND TRANSAXLE SERIAL NUMBER

(a) The engine serial number is stamped on the cylinder block of the engine and the transmission serial number is stamped on the housing as shown in the illustration.

A: 1CD–FTV

B: 1AZ–FE, 1AZ–FSE, 2AZ–FSE

C: 1ZZ–FE, 3ZZ–FE

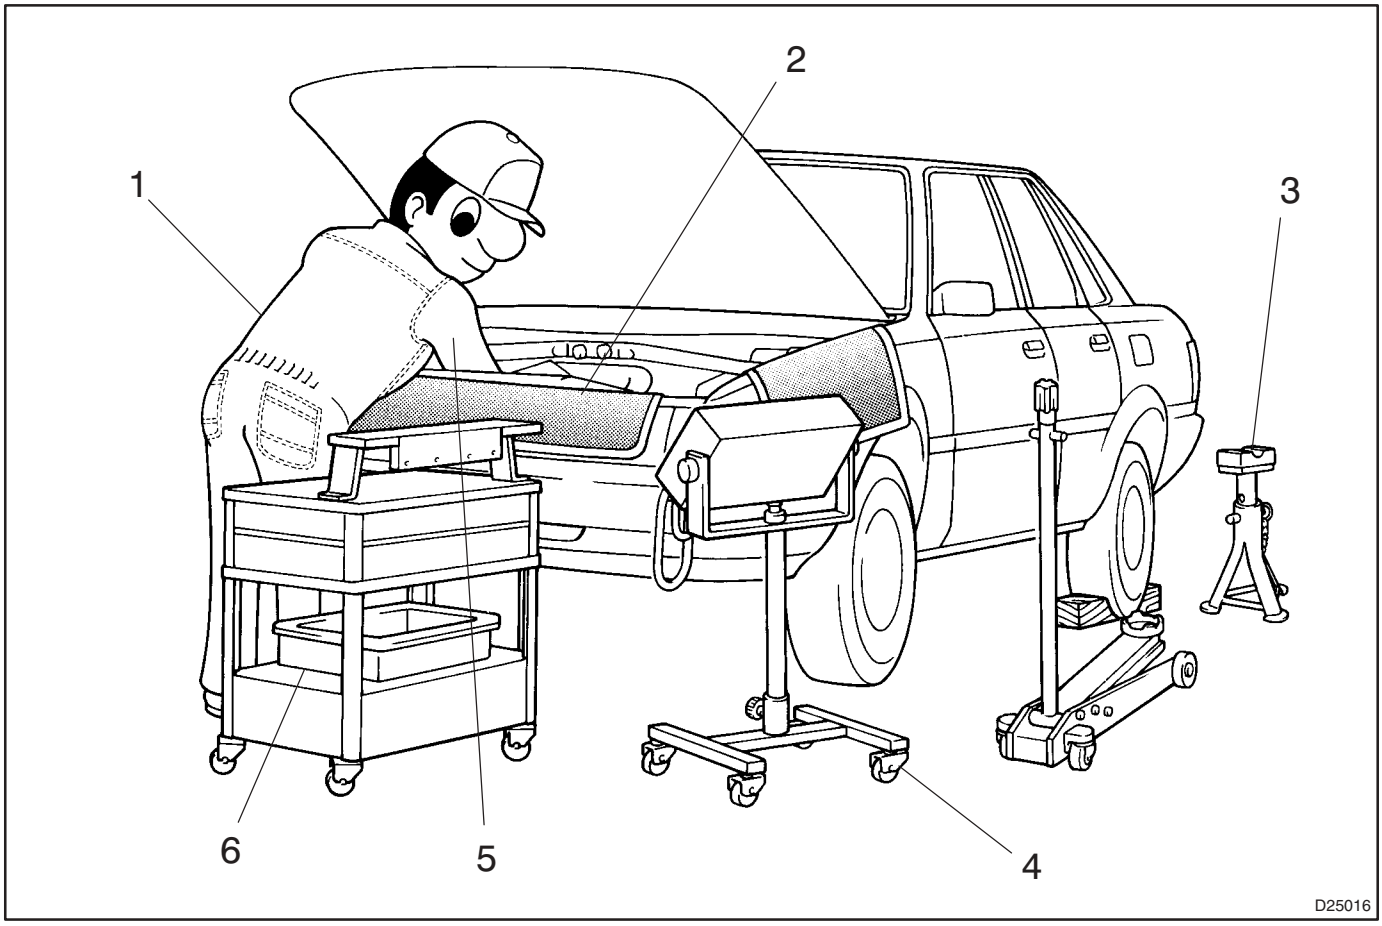
D: C50, C250

E: U241E, U151E

F: E354, E357

G: U241E, U151E

H: U341E

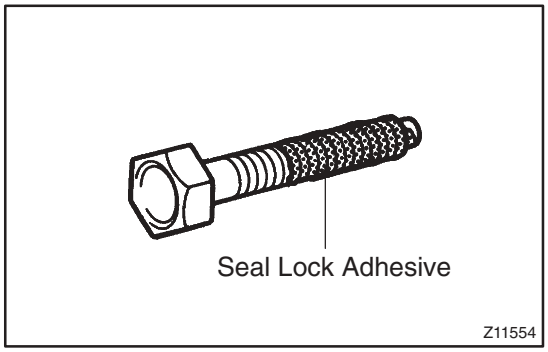


REPAIR INSTRUCTION

010LF–04

PRECAUTION

1. BASIC REPAIR HINT



(a) HINTS ON OPERATIONS

1	Looks	• Always wear a clean uniform. • Hat and safety shoes must be worn.
2	Vehicle protection	• Set a grill cover, fender cover, seat cover and floor mat before starting operation.
3	Safe operation	• When working with 2 or more persons, be sure to check the safety of one another. • When working with the engine running, pay attention to providing ventilation for exhaust fumes in the workshop. • When working with high–temperatures, rotating, moving or vibrating parts, be careful not to burn or injure yourself. • When jacking up the vehicle, be sure to support the specified location with a safety stand. • When lifting up the vehicle, use safety equipment.
4	Preparation of tools and measuring gauge	• Before starting repairs, prepare the tool stand, SST, gauge, oil, shop rag and parts for replacement.
5	Removal and installation, disassembly and assembly operations	• Diagnose with a thorough understanding of the trouble condition and perform effective operation. • Before removing the parts, check the general condition of the assembly, and for deformation and damage. • When the structure is complicated, take a notes or make matchmarks as not to make mistakes that affect the function of the parts. • Clean and wash the removed parts if necessary and assemble them after a thorough check.
6	Removed parts	• Place the removed parts in the correct order to avoid mixing them up or making them dirty. • As for non–reusable parts such as gaskets, O–rings, and self–locking nuts, replace them with new ones following the instructions in this manual. • Organize the parts that were replaced in a box and show them to the customer.

(b) JACKING UP AND SUPPORTING VEHICLE

(1) Care must be taken when jacking up and supporting the vehicle. Be sure to lift and support the vehicle at the proper locations (See page 01–19).

(c) PRECOATED PARTS

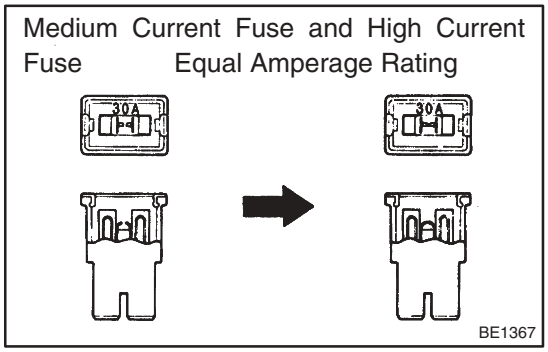
(1) Precoated parts such as bolts, nuts, etc., are coated with a seal lock adhesive at the factory.

(2) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.

(3) When reusing precoated parts, clean off the old adhesive and dry the part with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.

NOTICE:

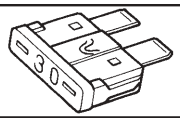
Check the torque with the lower limit value of the torque tolerance.

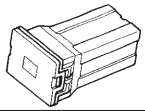


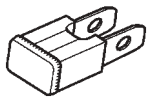
(4) Depending on the seal lock agent to be applied, there may be cases where it is necessary to leave it for a specified time until it hardens.

(d) GASKETS

(1) When necessary, use a sealer on gaskets to prevent leaks.







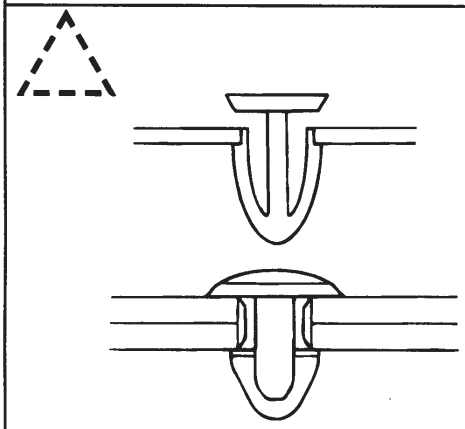
(e) BOLTS, NUTS AND SCREWS

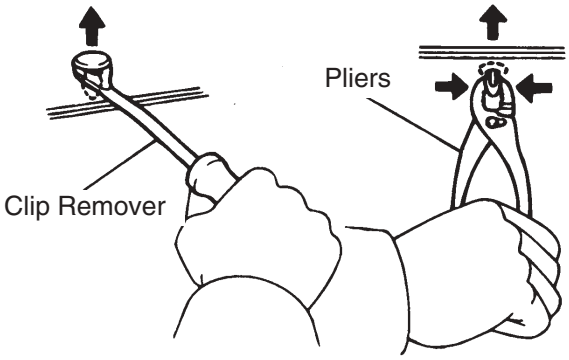
(1) Carefully follow all the specifications for tightening torques. Always use a torque wrench.

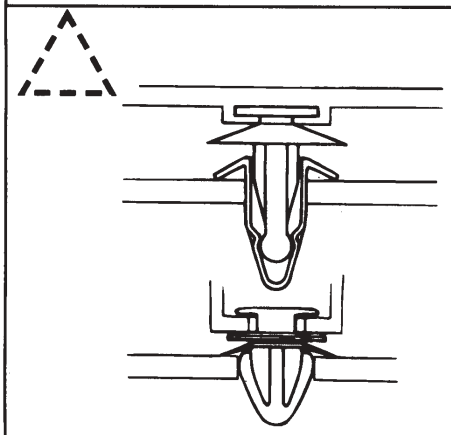
(f) FUSES

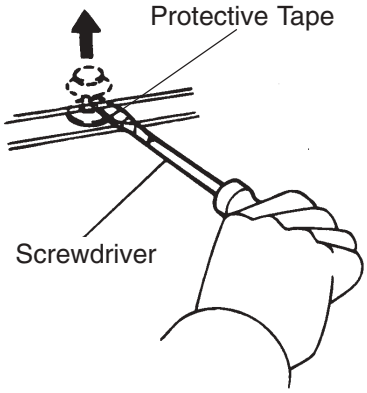
(1) When replacing fuses, be sure that a new fuse has the correct amperage rating. DO NOT exceed the rating, or use one with a lower rating.

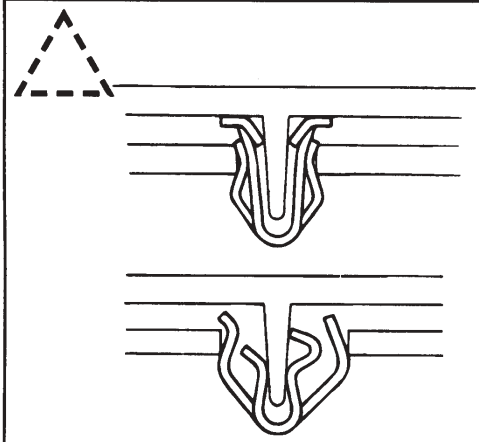
Illustration	Symbol	Part Name	Abbreviation
 BE5594	IN0365	FUSE	FUSE
 BE5595	 IN0366	MEDIUM CURRENT FUSE	M–FUSE
 D27353	 IN0367	HIGH CURRENT FUSE	H–FUSE

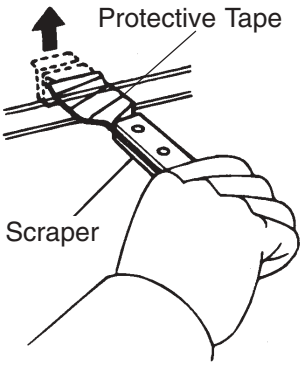






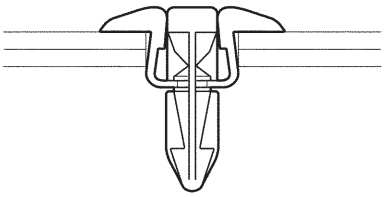


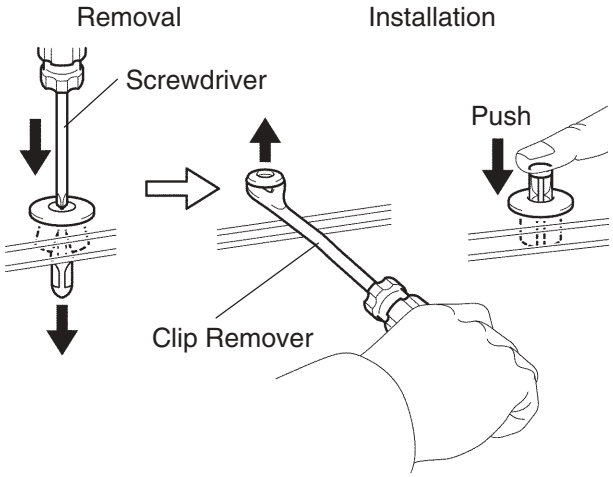


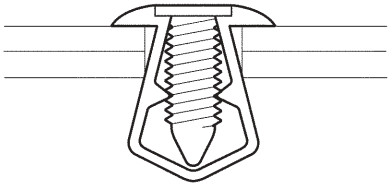


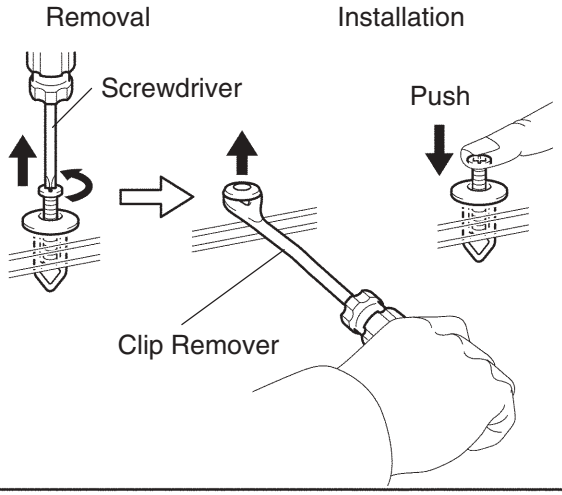
V35002

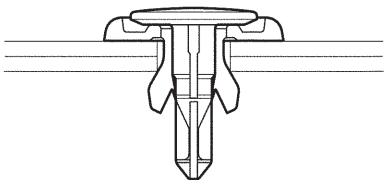
(g) CLIPS

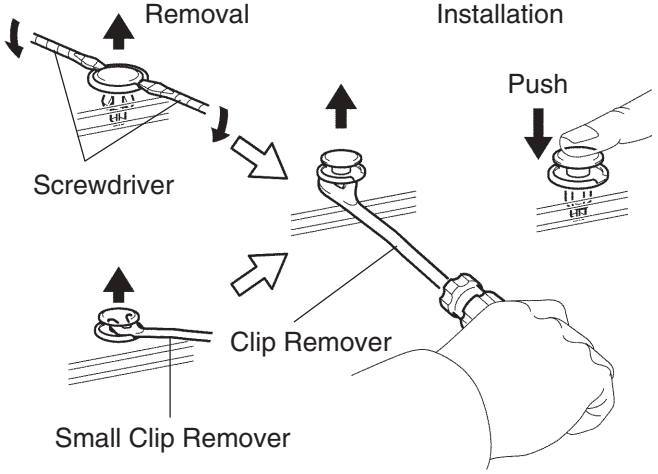








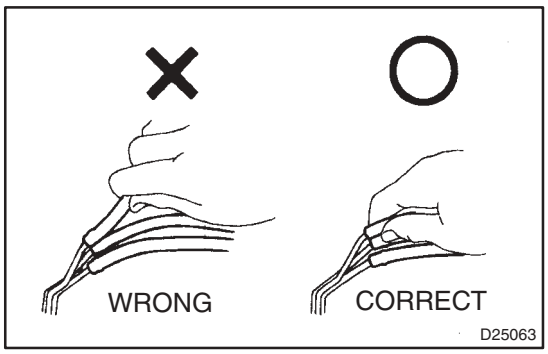




(1) The removal and installation methods of typical clips used in body parts are shown in the table below.

HINT:

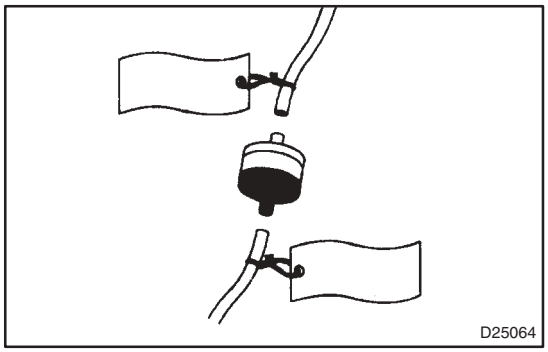
If the clip is damaged during the procedure, always replace it with a new clip.



Shape (Example)	Removal/Installation
	
	
	

D25786

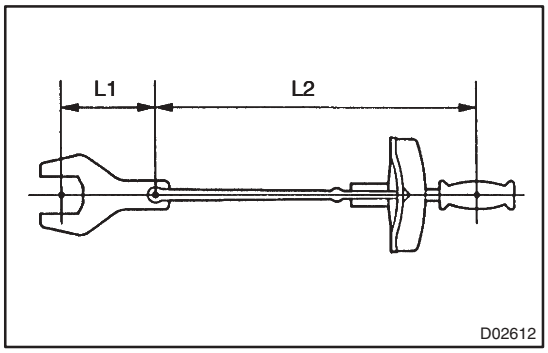
Shape (Example)	Removal/Installation
	
	
	



P

V35006

(h) REMOVAL AND INSTALLATION OF VACUUM HOSES

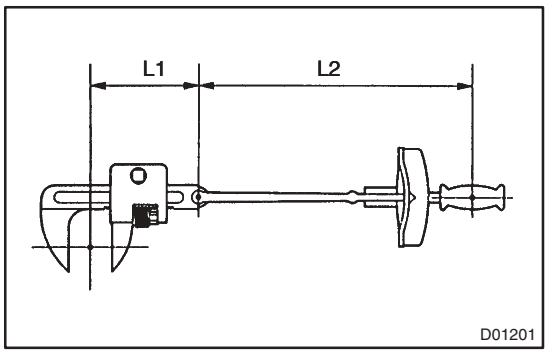


(1) To disconnect vacuum hoses, pull them by holding the end, not the middle of the hose.

(2) When disconnecting vacuum hoses, use tags to identify where they should be reconnected.

(3) After completing the job, make a double check whether the vacuum hoses are properly connected. A label under the hood shows the proper layout.

(4) When using a vacuum gauge, never force the hose onto a connector that is too large. Use a step–down adapter for adjustment. Once the hose has been stretched, it may leak air.



(i) TORQUE WHEN USING TORQUE WRENCH WITH EXTENSION TOOL

(1) When the torque wrench is combined with SST or an extension tool to extend the length, and you tighten until the torque wrench reads the specified torque value, the actual torque becomes excessive.

(2) In this manual, only the specified torque is described. In case of using SST or extension tool, calculate the reading of the torque wrench by the following formula.

(3) Formula T'=T x L2/(L1 + L2)

T'	Reading of torque wrench {N·m (kgf·cm, ft·lbf)}
T	Torque {N·m (kgf·cm, ft·lbf)}
L1	Length of SST or extension tool (cm)
L2	Length of torque wrench (cm)

2. FOR VEHICLES EQUIPPED WITH SRS AIRBAG AND SEAT BELT PRETENSIONER

HINT:

The AVENSIS is equipped with an SRS (Supplemental Restraint System), which includes the driver airbag, front passenger airbag, instrument panel passenger airbag, instrument panel lower airbag, side airbag, curtain shield and seat belt pretensioner.

Failure to carry out the service operations in the correct sequence could cause the supplemental restraint system to unexpectedly deploy while servicing. This could cause a serious accident.

Furthermore, if a mistake is made when servicing the supplemental restraint system, it is possible that the SRS will fail to operate when required. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the following items carefully. Then follow the correct procedures described in this manual.

(a) GENERAL NOTICE

(1) Malfunction symptoms of the supplemental restraint system are difficult to confirm so the diagnostic trouble codes become the most important source of information when troubleshooting. When troubleshooting the supplemental restraint system, always check the diagnostic trouble codes before disconnecting the battery (See Pub. No. RM1018E on 05–1184).

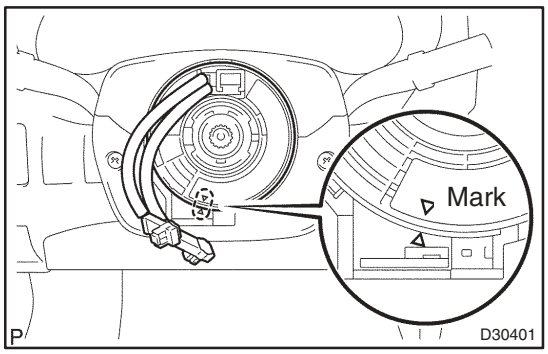
(2) Work must be started after 90 seconds from the time that the ignition switch is turned to the LOCK position and the negative (–) terminal cable is disconnected from the battery.
(The supplemental restraint system is equipped with a back–up power source. So, if work is started within 90 seconds after disconnecting the negative (–) terminal cable from the battery, the SRS may deploy).
When the negative (–) terminal cable is disconnected from the battery, memory of the clock and audio systems is cancelled. So, before starting work, make a record of the contents recorded in each memory system. Then, when work is finished, reset the clock and audio systems as before.

(3) Even in the case of a minor collision where the SRS does not deploy, the horn button assembly, instrument panel passenger airbag assembly and seat belt pretensioner should be inspected (See Pub. No. RM1018E on 60–19 and 60–9).

(4) Never use the SRS related parts from another vehicle. When replacing the parts, replace them with new parts.

(5) Before repairs, remove the airbag sensor if impacts are likely to be applied to the sensor during repairs.

(6) Never disassemble and repair the center airbag sensor assembly, side airbag sensor assembly, horn button assembly, instrument panel passenger airbag assembly, front seat airbag assembly, instrument panel lower airbag assembly, curtain shield airbag assembly or seat belt pretensioner.



(7) If the center airbag sensor assembly, the side airbag sensor assembly, the horn button assembly, the instrument panel passenger airbag assembly, the instrument panel lower airbag assembly have been dropped, or if there are cracks, dents or other defects in the case, bracket or connector, replace them with new ones.

(8) Do not directly expose the airbag sensor assembly, the side airbag sensor assembly, the horn button assembly, the instrument panel passenger airbag assembly, the instrument panel lower airbag assembly or the seat belt pretensioner to hot air or flames.

(9) Use a volt/ohmmeter with high impedance (10 kΩ/V minimum) for troubleshooting an electrical circuits.

(10) Information labels are attached to the SRS components. Follow the instructions on the notices.

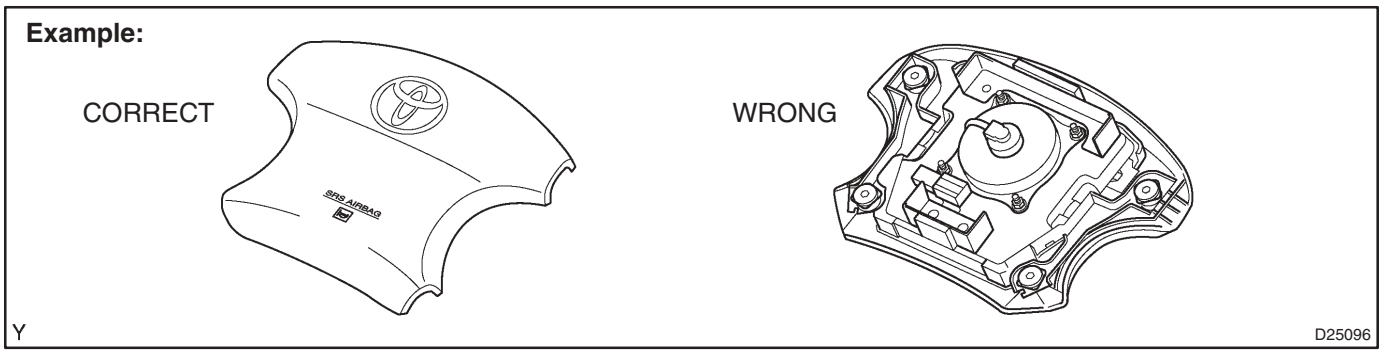
(11) After work on the supplemental restraint system is completed, check the SRS warning light (See Pub. No. RM1018E on 05–1184)

(b) SPIRAL CABLE (in Combination Switch)

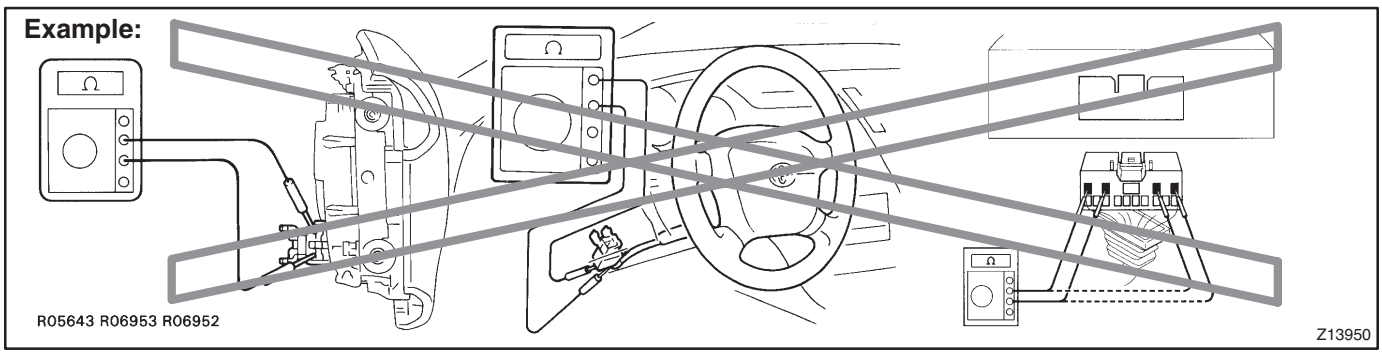
(1) The steering wheel must be fitted correctly to the steering column with the spiral cable at the neutral position, otherwise cable disconnection and other troubles may occur. Refer to Pub. No. RM1018E on 60–26 of this manual concerning the correct installation of the steering wheel.

(c) HORN BUTTON ASSEMBLY (with Airbag)

(1) When removing the horn button assembly or handling a new horn button, it should be placed with the top of the pad surface facing upward. Placing it with the pad surface facing downward may lead to a serious accident if the airbag deploys for some reasons. Also, do not place anything on top of the horn button.



(2) Never measure the resistance of the airbag squib (This may cause the airbag to inflate, which is very dangerous).



(3) Grease should not be applied to the horn button assembly, and the pad should not be cleaned with any type of detergent.

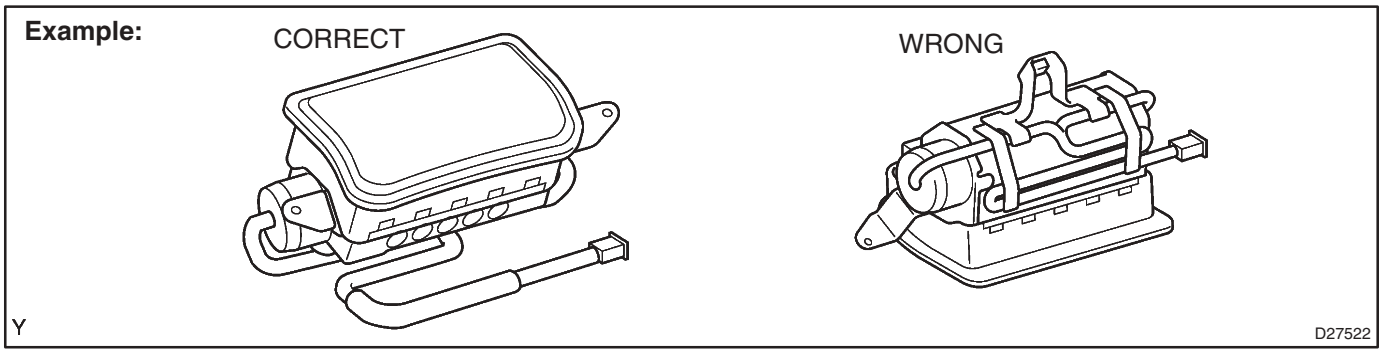
(4) Store the horn button assembly where the ambient temperature remains below 93˚C (200˚F), without high humidity and away from electrical noise.

(5) When using electric welding, disconnect the airbag connector (4 yellow pins) under the steering column near the combination switch connector before starting work.

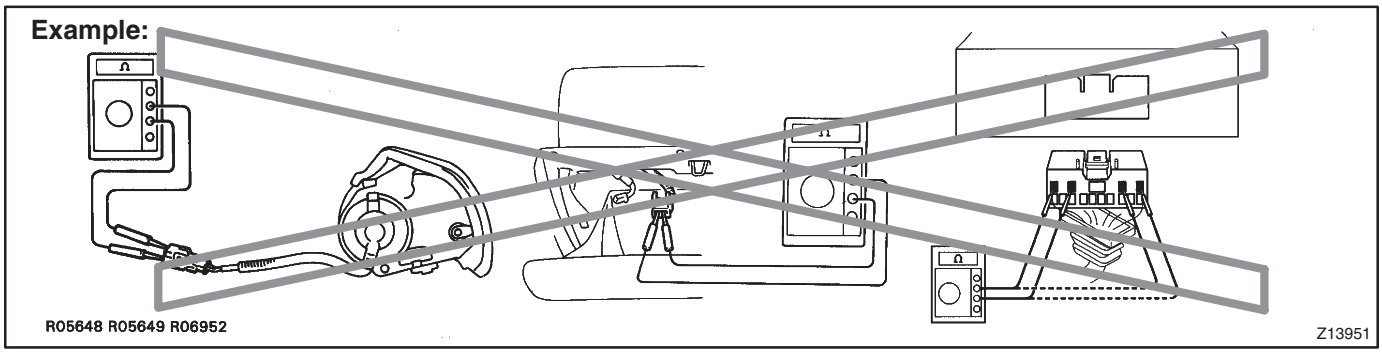
(6) When disposing the vehicle or the horn button assembly unit, the airbag should be deployed using SST before disposal (See Pub. No. RM1018E on 60–19).
Activate in a safe place away from electrical noise.

(d) INSTRUMENT PANEL PASSENGER AIRBAG ASSEMBLY

(1) Always place a removed or new instrument panel passenger airbag assembly with the airbag inflation direction facing upward. Placing the airbag assembly with the airbag inflation direction facing downward could cause a serious accident if the airbag deploys.



(2) Never measure the resistance of the airbag squib (This may cause the airbag to inflate, which is very dangerous).



(3) Grease should not be applied to the instrument panel passenger airbag assembly and the airbag door should not be cleaned with detergents of any kind.

(4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.

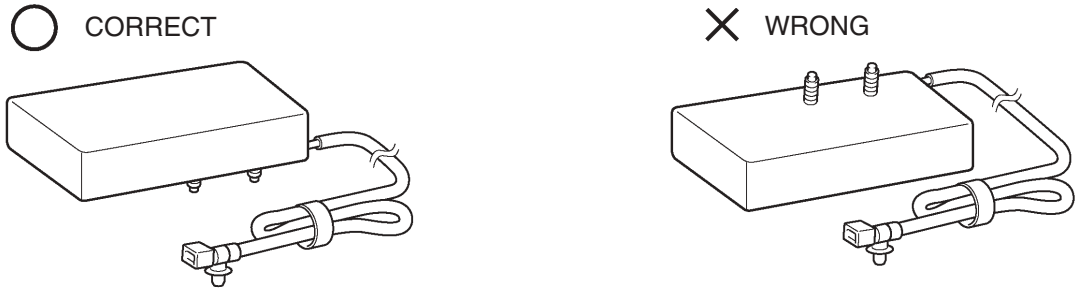
(5) When using electric welding, disconnect the airbag connector (4 yellow pins) installed on the assembly before starting work.

(6) When disposing of a vehicle or the airbag assembly unit, the airbag should be deployed using SST before disposal (See Pub. No. RM1018E on 60–30).
Activate in a safe place away from electrical noise.

(e) FRONT SEAT AIRBAG ASSEMBLY

(1) Always place a removed or new front seat airbag assembly with the airbag inflating direction facing upward.
Placing the airbag assembly with the airbag inflation direction facing downward could cause a serious accident if the airbag deploys.

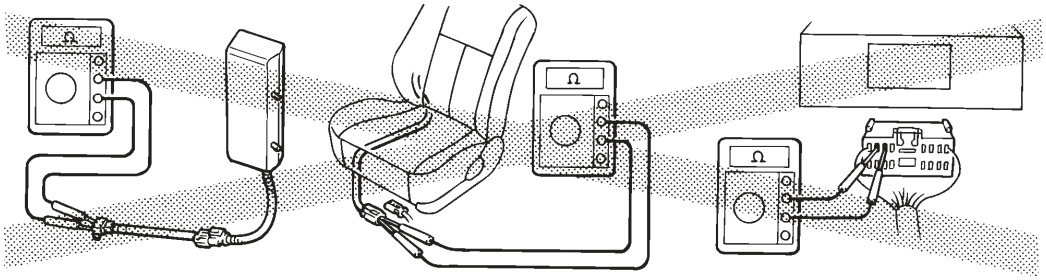
(2) Never measure the resistance of the airbag squib (This may cause the airbag to inflate, which is very dangerous.).



(3) Grease should not be applied to the front seat airbag assembly and the airbag door should not be cleaned with detergents of any kind.

(4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.

(5) When using electric welding, first disconnect the airbag connector (2 yellow pins) installed on the assembly before starting work.



(6) When disposing of a vehicle or the airbag assembly unit, the airbag should be inflated using SST before disposal (See Pub. No. RM1018E on 60–47).
Activate in a safe place away from electrical noise.

Example:

Y D26612

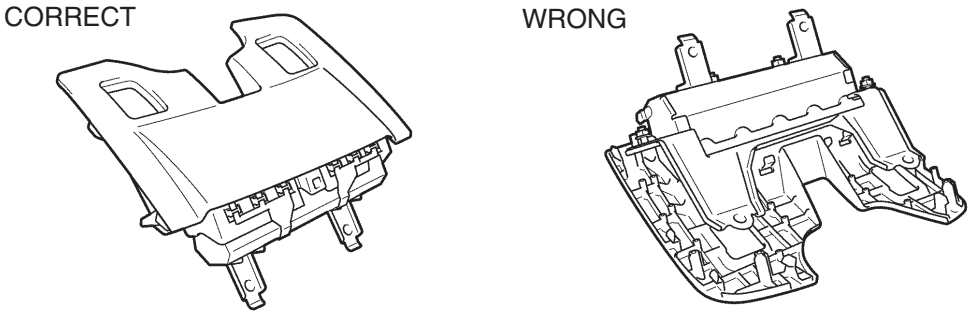
Example:

B01546

(f) INSTRUMENT PANEL LOWER AIRBAG ASSEMBLY

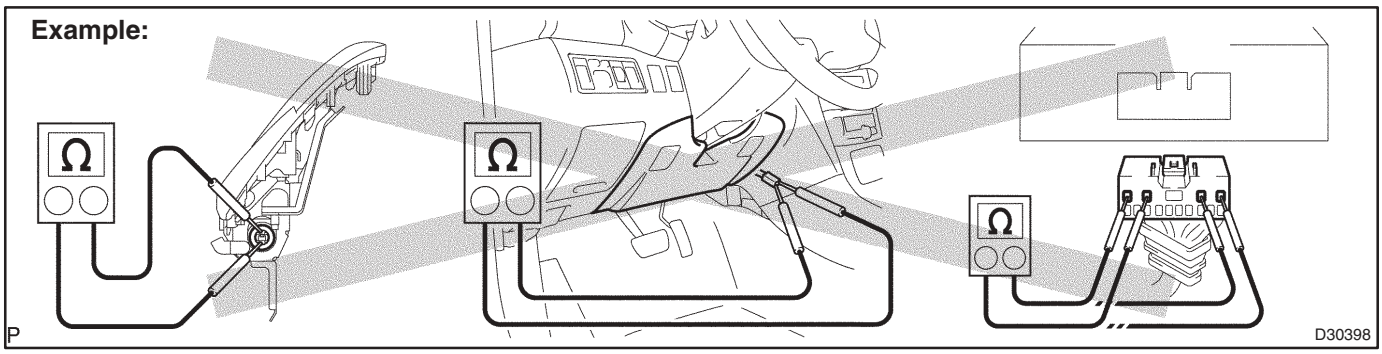
(1) Always place a removed or new instrument panel lower airbag assembly with the airbag inflating direction facing upward.
Placing the airbag assembly with the airbag inflation direction facing downward could cause a serious accident if the airbag deploys.

(2) Never measure the resistance of the airbag squib (This may cause the airbag to inflate, which is very dangerous.).



(3) Grease should not be applied to the instrument panel lower airbag assembly and the airbag door should not be cleaned with detergents of any kind.

(4) Store the instrument panel lower airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.



(5) When using electric welding, first disconnect the airbag connector (2 yellow pins) installed on the instrument panel lower airbag assembly before starting work.

(6) When disposing of a vehicle or the instrument panel lower airbag assembly alone, the airbag should be inflated using an SST before disposal (See Pub. No. RM1018E on 60–55).
Activate in a safe place away from electrical noise.

Example:

P D30399

(g) CURTAIN SHIELD AIRBAG ASSEMBLY

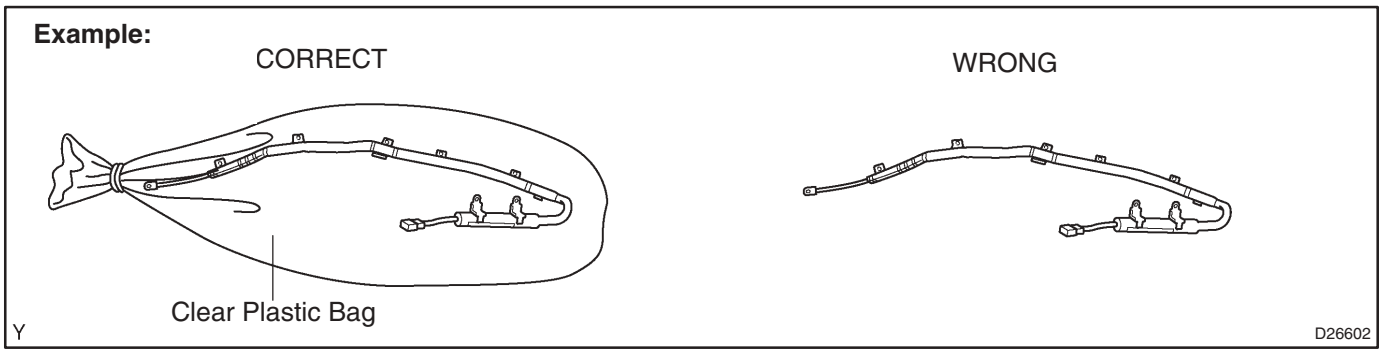
(1) Always place the removed or new curtain shield airbag assembly in a clear plastic bag, and keep it in a safe place.

NOTICE:

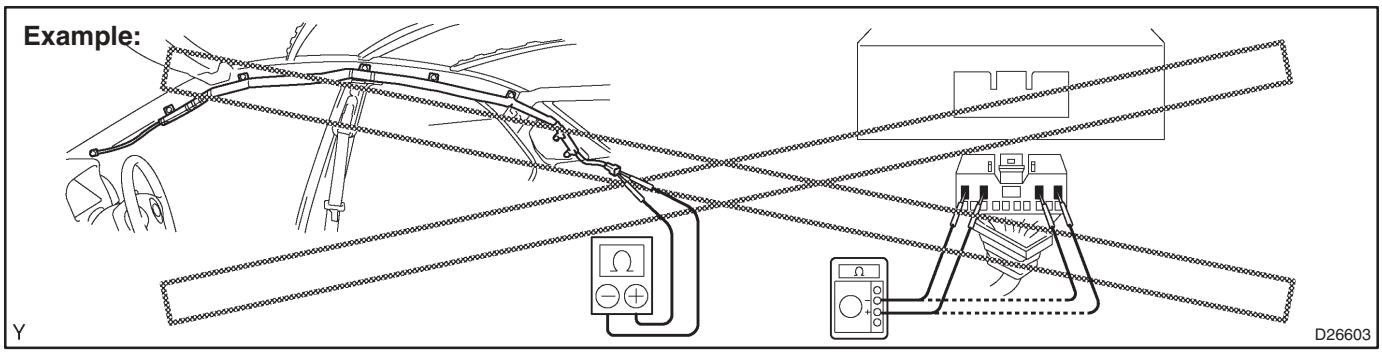
Protection bag is not re–useable.

CAUTION:

Never disassemble the curtain shield airbag assembly.



(2) Never measure the resistance of the airbag squib (This may cause the airbag to inflate, which is very dangerous).



(3) Grease should not be attached to the curtain shield airbag assembly, and the surface should not be cleared with detergents of any kind.

(4) Store the airbag assembly where the ambient temperature remains below 93˚C (200˚F), without high humidity and away from electrical noise.

(5) When using electric welding, first disconnect the airbag connector (4 yellow pins) from the instrument panel before starting work.

(6) When disposing of a vehicle or the curtain shield airbag assembly alone, the airbag should be deployed using SST before the disposal (See Pub. No. RM1018E on 60–41). Active in a safe place away from electrical noise.

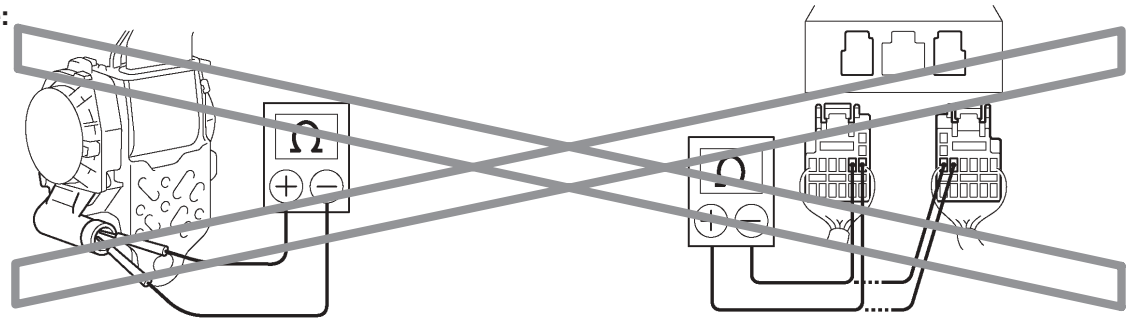
(h) SEAT BELT PRETENSIONER

(1) Never measure the resistance of the seat belt pretensioner (This may cause the seat belt pretensioner to activate, which is very dangerous.).

(2) Never disassemble the seat belt pretensioner.

(3) Never install the seat belt pretensioner in another vehicle.

(4) Store the seat belt pretensioner where the ambient temperature remains below 80°C (176°F) without high humidity and away from electrical noise.



(5) When using electric welding, first disconnect the connector (2 yellow pins) before starting work.

(6) When disposing of a vehicle or the seat belt pretensioner alone, the seat belt pretensioner should be activated before disposal (See Pub. No. RM1018E on 61–9). Perform the operation in a safe place away from electrical noise.

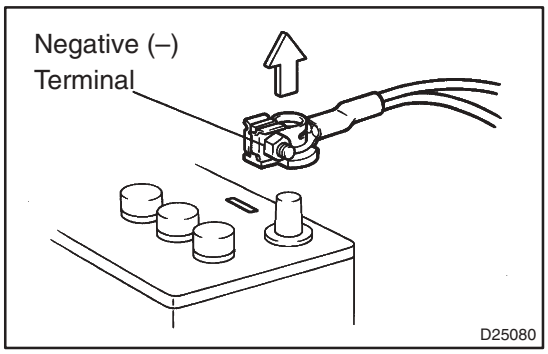
(7) The seat belt pretensioner is hot after being activation so allow some time for it to cool down sufficiently before disposal. Never apply water to cool down the seat belt pretensioner.

(8) Oil or water should not be put on the front seat outer belt, and the front seat outer belt should be cleaned with the appropriate detergents.

Example:

Y D26613

(i) AIRBAG SENSOR ASSEMBLY



(1) Never reuse the airbag sensor assembly involved in a collision where the SRS has deployed.

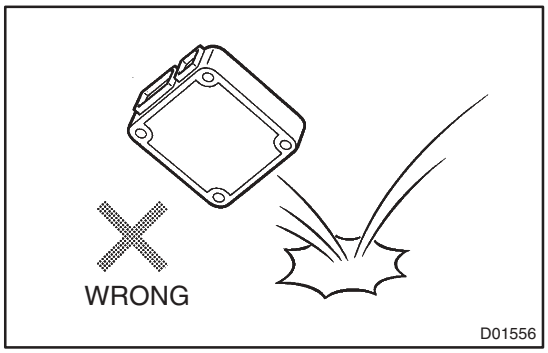
(2) The connectors to the airbag sensor assembly should be connected or disconnected with the sensor mounted on the floor. If the connectors are connected or disconnected while the airbag sensor assembly is not mounted to the floor, it could cause the supplemental restraint system to deploy potentially resulting in injury.

(3) Work must be started after 90 seconds from the time the ignition switch is turned to the ”LOCK” position and the negative (–) terminal cable is disconnected from the battery, even if only loosening the set bolts of the airbag sensor assembly.

(j) WIRE HARNESS AND CONNECTOR

(1) The SRS wire harness is integrated with the instrument panel wire harness assembly. All the connectors in the system are a standard yellow color. If the SRS wire harness becomes disconnected or the connector becomes broken due to an accident, etc., repair or replace it.

3. ELECTRONIC CONTROL



(a) REMOVAL AND INSTALLATION OF BATTERY TERMINAL

(1) Before performing electronic work, disconnect the battery negative (–) terminal cable beforehand in order to prevent it from shorting and burning out.

(2) When disconnecting and installing the terminal cable, turn the ignition switch and lighting switch OFF, and loosen the terminal nut completely. Perform these operations without twisting or prying the terminal.

(3) When the battery terminal cable is removed, the memories of the clock, radio, DTCs, etc. are erased. So before removing it, check them and make a note of their settings.

(4) When the battery negative (–) terminal cable is disconnected, memories of various systems are erased. Therefore, refer to the PRE–CHECK for each system to make sure whether or not the system needs to be initialized after the battery negative (–) terminal cable is disconnected. If necessary, be sure to initialize the system.

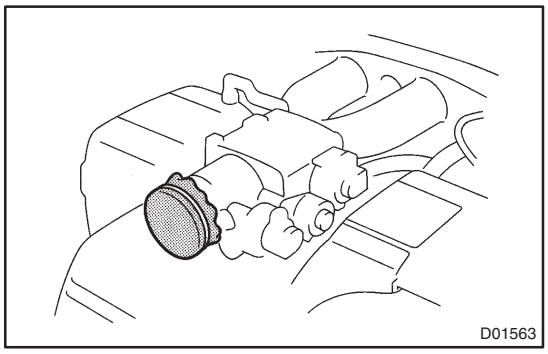
(b) HANDLING OF ELECTRONIC PARTS

(1) Do not open the cover or case of the ECU unless absolutely necessary (If the IC terminals are touched, the IC may be rendered inoperative by static electricity).

(2) To disconnect electronic connectors, pull the connector itself, not the wires.

(3) Be careful not to drop electronic components, such as sensors or relays. If they are dropped on a hard floor, they should be replaced and not be reused.

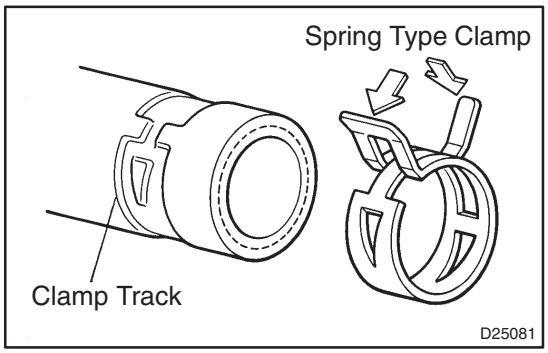
(4) When cleaning the engine with steam, protect the electronic components, air filter and emission–related components from water.



(5) Never use an impact wrench to remove or install temperature switches or temperature sensors.

(6) When checking the continuity at the wire connector, insert the tester probe carefully to prevent terminals from bending.

4. REMOVAL AND INSTALLATION OF FUEL CONTROL PARTS

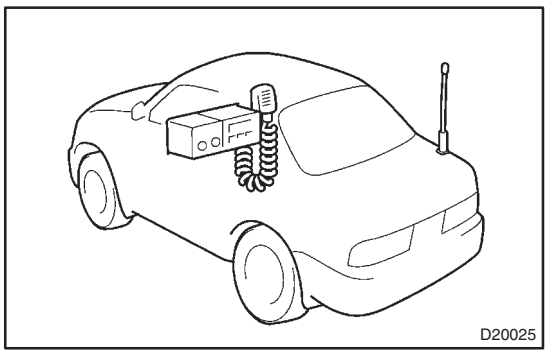


(a) PLACE FOR REMOVING AND INSTALLING OF FUEL SYSTEM PARTS
   (1) Work in a place with good air ventilation and without anything that could cause combustion around you such as a welder, grinder, drill, electric motor or stove.
   (2) Never work in a place such as a pit or nearby a pit, as there is a possibility that vaporized fuel will collect in those places.

(b) REMOVING AND INSTALLING OF FUEL SYSTEM PARTS
   (1) Prepare a fire extinguisher before starting operations.
   (2) To prevent static electricity, install a ground on the fuel changer, vehicle and fuel tank, and do not spray much water so as to prevent slipping.
   (3) Never use any electric equipment like an electric motor or a working light, as they may create sparks or a high temperature.
   (4) Never use an iron hammer, as it may create sparks.
   (5) Dispose of shop rags containing fuel deposits separately.

D01563

5. REMOVAL AND INSTALLATION OF ENGINE INTAKE PARTS



(a) If any metal tip is mixed in the inlet pass, this may give a bad effect to the engine and turbocharger.
(b) When removing and installing the inlet system parts, close the opening of the removed inlet system parts and the engine with a clean waste cloth or gum tape.
(c) When installing the inlet system parts, check that no metal particles have entered.

D25081

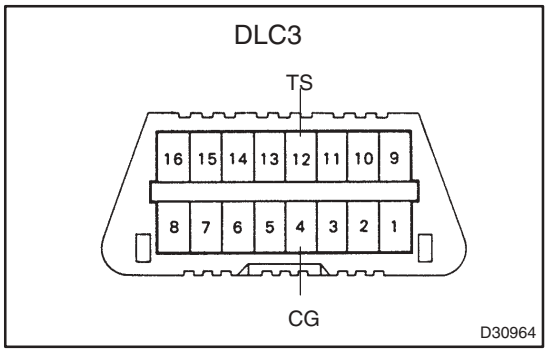
6. HANDLING OF HOSE CLAMPS

(a) Before removing the hose, check the depth of the inserting portion and the clamp position to restore it surely.
(b) Replace a deformed or dented clamp for a new one.
(c) When reusing a hose, attach the clamp on the clamp track portion of the hose.
(d) For a spring type clamp, adjust it by adding force to the arrow mark direction after the installation.

D20025

7. FOR VEHICLES EQUIPPED WITH MOBILE COMMUNICATION SYSTEMS

(a) Install the antenna as far away from the ECU and sensors of the vehicle electronic systems as possible.
(b) Install an antenna feeder at least 20 cm (7.87 in.) away from the ECU and sensors of the vehicle electronic systems. For details of the ECU and sensors locations, refer to the section on applicable components.
(c) Prevent the antenna feeder from getting entangled with the other wiring, and keep the antenna feeder separate from other wiring as much as possible.
(d) Check that the antenna and feeder are correctly adjusted.
(e) Do not install any high–powered mobile communication system.



8. FOR VEHICLES EQUIPPED WITH TRACTION CONTROL (TRC) SYSTEM

(a) NOTICES WHEN USING 2–WHEEL DRUM TESTER

(1) When using a 2–wheel drum tester such as a speedometer tester, a combination tester of speedometer and brake, chassis dynamometer or else, always turn the TRC system off via the TRC OFF switch before measurement.

NOTICE:

TRC system OFF condition can be confirmed by the indication, "TRC OFF", of the indicator light in the combination meter.

9. FOR VEHICLES EQUIPPED WITH VEHICLE SKID CONTROL (VSC) SYSTEM

(a) NOTICES WHEN USING DRUM TESTER

(1) When using a drum tester, be sure to start the engine with the ignition OFF, and connect SST to the terminals TS and CG of the DLC3 before measurement in order to prohibit the VSC operation.

SST 09843–18040

NOTICE:

- **Confirm that the VSC warning light blinks.**
- **VSC system will be reset when the engine is restarted.**
- **Fasten the vehicle with lock chains.**

(b) NOTICES OF RELATED OPERATIONS TO VSC

(1) Do not carry out unnecessary installation and removal as it might disorder the adjustment of related parts to VSC.

(2) Be sure to carry out the preparation for operation and the confirmation of operation completion in accordance with the instruction of the text and when the related operations to VSC are performed.

10. FOR VEHICLES EQUIPPED WITH CATALYTIC CONVERTER

CAUTION:

If a large amount of unburned gasoline flows into the converter, it may cause overheating and is a fire hazard. To prevent this, observe the following precautions.

(a) Use only unleaded gasoline.

(b) Avoid prolonged idling.
Avoid idling the engine for more than 20 minutes.

(c) Avoid a spark jump test.

(1) Perform a spark jump test only when absolutely necessary. Perform this test as rapidly as possible.

(2) While testing, never race the engine.

(d) Avoid a prolonged engine compression measurement.
Engine compression measurements must be performed as rapidly as possible.

(e) Do not run the engine when the fuel tank is nearly empty. This may cause the engine to misfire and create an extra load on the converter.

010B5–19

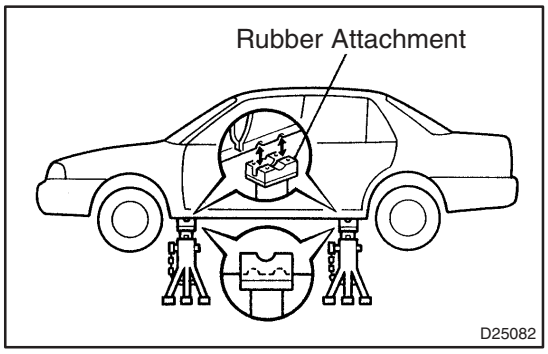
VEHICLE LIFT AND SUPPORT LOCATIONS

1. NOTICE ABOUT VEHICLE CONDITION WHEN JACKING UP

(a) As a rule, the vehicle must be unloaded when jacking up. Never jack up or lift up the vehicle loaded with things of heavy weight.

(b) When removing any parts of heavy weight like the engine and transmission, the center of gravity of the vehicle moves. Place a balance weight so as to keep it from rolling, or hold the jacking support location using the mission jack.

2. NOTICE FOR USING 4 POST LIFT



(a) Follow the instruction manual for a safety operation.

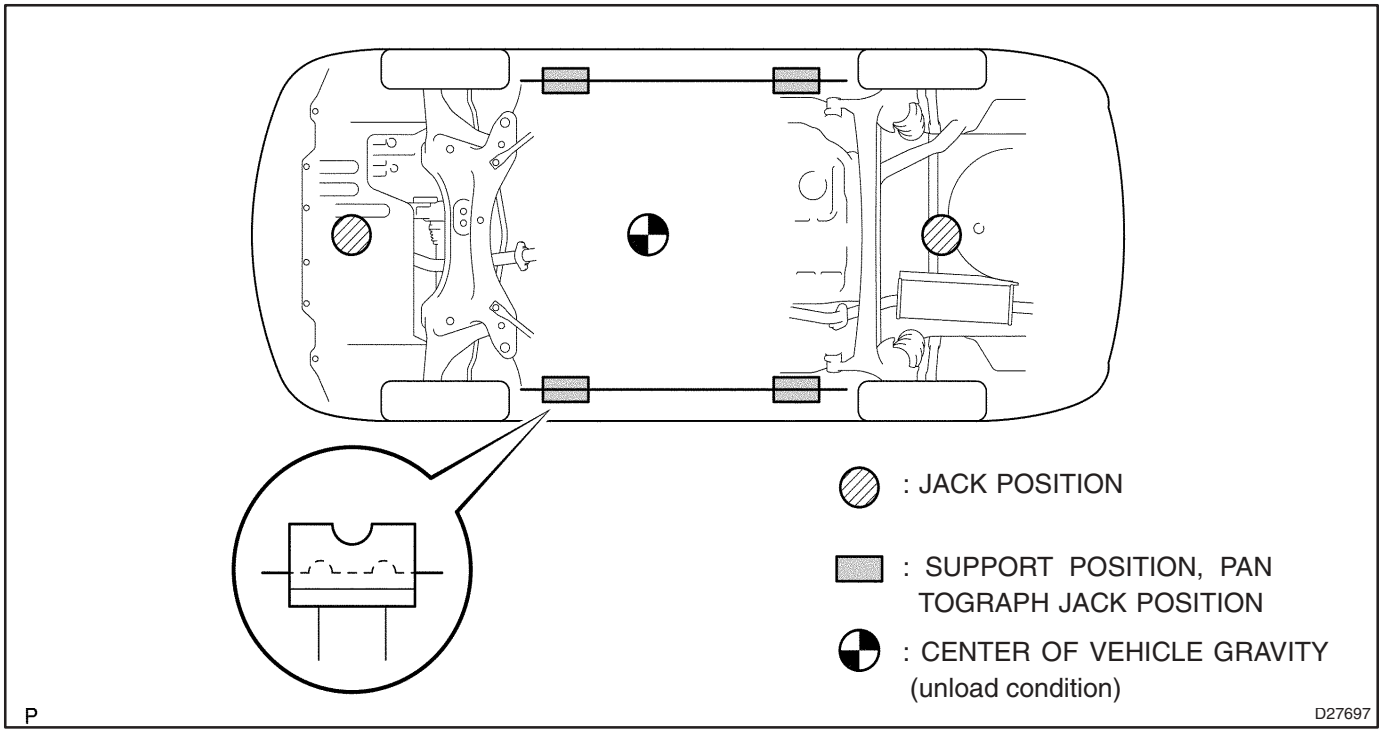
(b) Do not damage tires or wheels with a free wheel beam.

(c) Using a wheel stopper, fix the vehicle.

3. NOTICE FOR USING JACK AND SAFETY STAND

(a) Work in the flat place using a wheel stopper at all times.

(b) Use a safety stand with a rubber attachment, as shown in the illustration.



(c) Support the specified location with a jack and safety stand accurately.

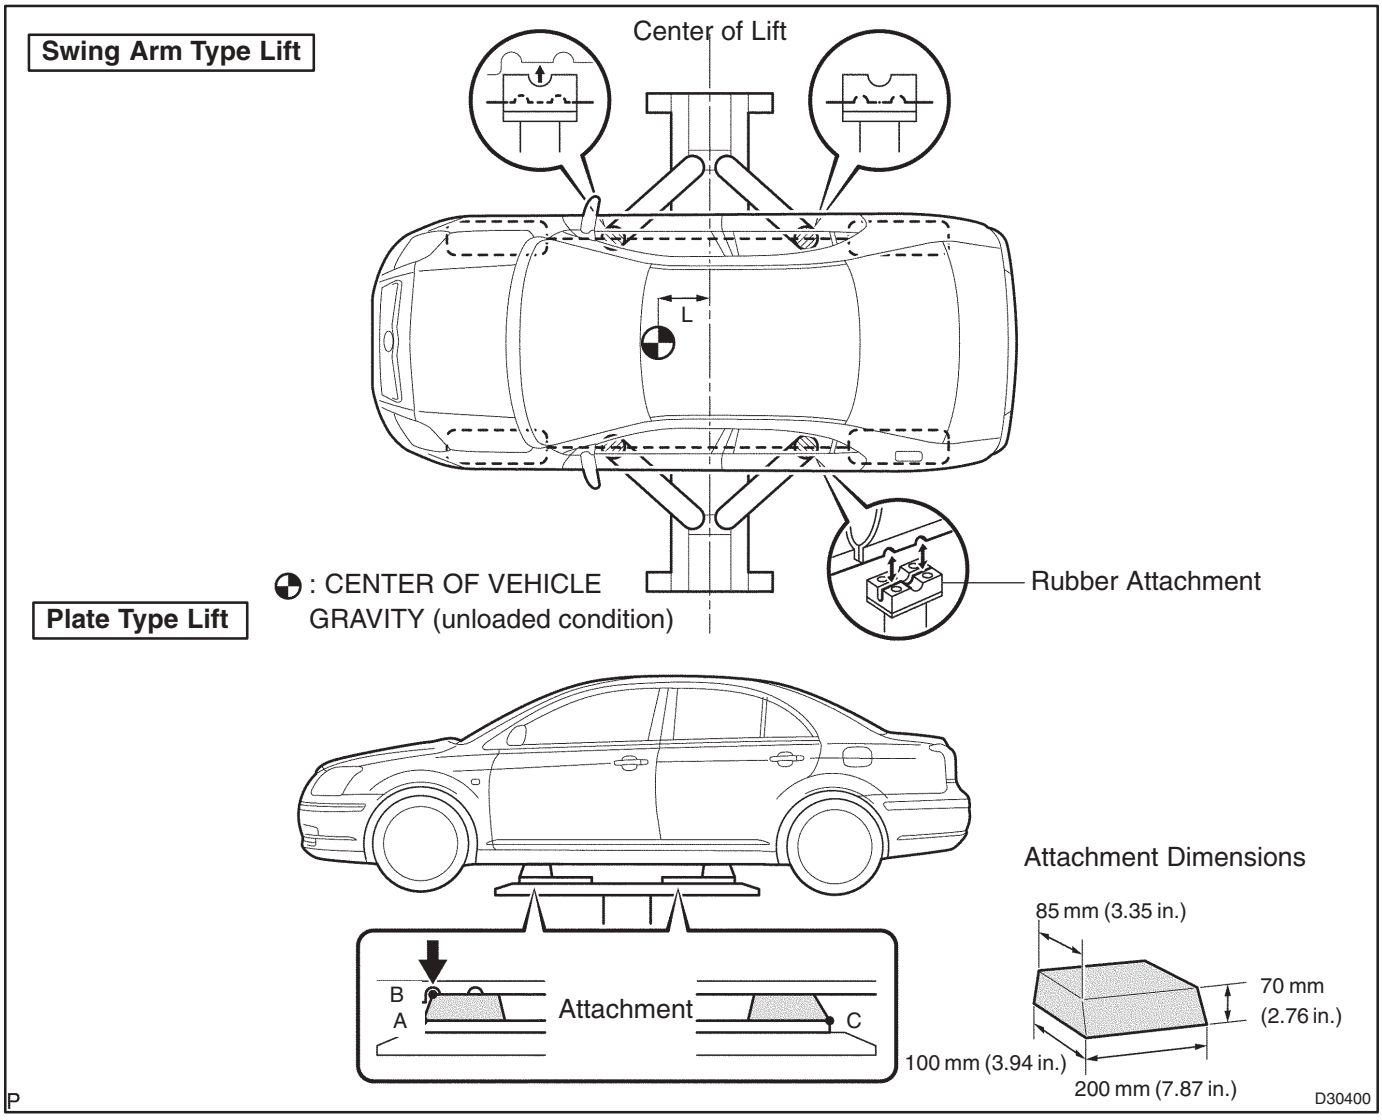
(d) When jacking up the front wheels, release the parking brake and place wheel stoppers only behind the rear wheels. When jacking up the rear wheels, place wheel stoppers only in front of the front wheels.

(e) Do not work or leave the vehicle supported only by a jack. Be sure to support the vehicle with a safety stand.

(f) When jacking up only the front wheels or only the rear wheels, place wheel stoppers to both sides of the wheels that contact ground.

(g) When jacking down the vehicle with its front wheels jacked up, release the parking brake and place wheel stoppers only in front of the rear wheels. When jacking down the vehicle with its rear wheels jacked up, place wheel stoppers only behind the front wheels.

4. NOTICE FOR USING SWING ARM TYPE LIFT



(a) Follow the instruction manual of the lift for a safe operation.
(b) Use a cradle with a rubber attachment, as shown in the illustration.
(c) Set in the vehicle so as to make its center of gravity as close as possible to the center of the lift. (”L” becomes short.)
(d) Place the vehicle horizontally by adjusting the height of the cradle, and match the groove of the cradle and the safety stand support location accurately.
(e) Be sure to lock the swing arm during the operation.
(f) Lift the vehicle up until the tires float, and shake the vehicle to make sure that the vehicle is stable.

5. NOTICE FOR USING PLATE TYPE LIFT

(a) Follow the instruction manual of the lift for a safe operation.
(b) Use a plate lift attachment.
(c) Be sure to set the vehicle to the specified position.

Right and left set position	• Place the vehicle over the center of the lift.
Front and rear set position	• Align the cushion gum ends of the plate with the attachment lower ends (A and C). • Align the attachment upper end (B) with the rocker flange front side notch.

(d) Lift the vehicle up until the tires float a bit, and shake the vehicle to make sure that the vehicle is stable.

HOW TO TROUBLESHOOT ECU CONTROLLED SYSTEMS

010B6–21

GENERAL INFORMATION

There are many ECU controlled systems used in the AVENSIS. In general, ECU controlled system are considered to be very intricate and require a high level of technical knowledge and expert skill to troubleshoot. The fact is, however, that if you proceed by inspecting the circuits one by one, troubleshooting of these systems is not complex. If you have adequate understanding of the system and basic knowledge of electricity, the problem can be accurately diagnosed and fixed. This manual is designed based on the above principle to help service technicians perform accurate and effective troubleshooting, and is compiled for the following major ECU controlled systems:

The troubleshooting procedures are described on the following pages.

System	Page
1. SFI System [1ZZ–FE/3ZZ–FE]	05–1
2. Electronic Controlled Automatic Transmission [ECT] [U341E]	05–207
3. Cruise Control System [2AZ–FSE]	05–303

FOR USING HAND–HELD TESTER

- Before using the tester, the tester's operator manual should be read thoroughly.
- If the tester cannot communicate with the ECU controlled systems when you have connected the cable of tester to the DLC3 with the ignition switch and tester turned ON, there is a problem on the vehicle side or tester side.
  (1) If the communication is normal when the tester is connected to another vehicle, inspect the diagnosis data link line (Bus⊕line) or ECU power circuit of the vehicle.
  (2) If the communication is still impossible when the tester is connected to another vehicle, the problem is probably in the tester itself, so perform the Self Test procedures outlined in the Tester Operator's Manual.

010B7–21

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:

Carry out troubleshooting in accordance with the procedures on the following page. Here, only the basic procedures are shown. Details are provided in the Diagnostics Section, showing the most effective methods for each circuit. Confirm the troubleshooting procedures first for the relevant circuit before beginning troubleshooting of that circuit.

1	Vehicle brought to workshop

2	Customer problem analysis

(a) Ask the customer about the conditions and environment when the problem occurred.

3	Symptom confirmation and DTC (and freeze frame data) check

(a) Check the battery positive voltage.
Voltage: 11 to 14 V (Engine stopped)
(b) Visually check the wire harness, connectors and fuses for open and short, etc.
(c) Warm up the engine to the normal operating temperature.
(d) Confirm the problem symptoms and conditions, and check for DTCs according to the related chart.

OK → **Go to step 5**

NG

4	DTC chart

(a) Check the results obtained in step 3, then confirm the inspection procedures for the system or the part which should be checked using the DTC chart.

→ **Go to step 6**

5	Problem symptoms chart

(a) Check the results obtained in step 3, then confirm the inspection procedures for the system or the part which should be checked using the problem symptoms table.

6	Circuit inspection or parts inspection

(a) Confirm the circuit for the system or the part which should be checked using the problem symptoms table or the results obtained in step 4.

7	Repair

(a) Repair the affected system or part in accordance with the instructions in step 6.

8	Confirmation test

(a) After completing repairs, confirm that the problem has been solved (If the problem does not recur, perform a confirmation test under the same conditions and in the same environment as when it occurred for the first time).

END

CUSTOMER PROBLEM ANALYSIS

HINT:

- In troubleshooting, the problem symptoms must be confirmed accurately, meaning that all preconceptions must be set aside in order to make an accurate judgement. To ascertain what the problem symptoms are, it is extremely important to ask the customer about the problem and conditions when it occurred.
- The following 5 items are important points in the problem analysis. Past problems which are thought to be unrelated and the repair history, etc. may also help in some cases. Therefore, as much information as possible should be gathered and its relationship with the problem symptoms should be correctly ascertained for use as reference in troubleshooting. A customer problem analysis table is provided for your use in the Diagnostics Section for each system.

Important Points with Customer Problem Analysis

- What ——— Vehicle model, system name
- When ——— Date, time, occurrence frequency
- Where ——— Road conditions
- Under what conditions? ——— Running conditions, driving conditions, weather conditions
- How did it happen? ——— Problem symptoms

(Sample) Supplemental restraint system check sheet.

CUSTOMER PROBLEM ANALYSIS CHECK

Supplemental Restraint System Check Sheet **Inspector's Name**

Customer's Name		**Registration No.**	
		Registration Year	/ /
		Frame No.	
Date Vehicle Brought In	/ /	**Odometer Reading**	**km miles**

Date Problem First Occurred	/ /
Weather	☐ Fine ☐ Cloudy ☐ Rainy ☐ Snowy ☐ Other
Temperature	**Approx.**

Vehicle Operation	☐ Starting ☐ Idling ☐ Driving [☐ Constant speed ☐ Acceleration ☐ Deceleration ☐ Other]

SYMPTOM CONFIRMATION AND DIAGNOSTIC TROUBLE CODE

HINT:

- The diagnostic system in AVENSIS has various functions. The first function is the Diagnostic Trouble Code (DTC) Check, in which a malfunction in the signal circuits to the ECU is stored in code form in the ECU memory. Another function is the Input Signal Check, which checks if the signals from various switches are sent to the ECU correctly. By using these check functions, it is possible to quickly narrow down potential problem areas and troubleshooting can be performed effectively. The diagnostic functions are incorporated in the following systems in the AVENSIS.

System	Diagnostic Trouble Code Check	Input Signal Check (Sensor Check)	Diagnostic Test Mode (Active Test)
SFI System [1ZZ–FE/3ZZ–FE]	○ (with Check Mode)	○	○
Electronically Controlled Automatic Transmission [ECT] [U341E]	○ (with Check Mode)	○	○
Cruise Control System [2AZ–FSE]	○	○	–

- In the DTC check, it is very important to determine whether the problem indicated by the DTC is still occurring or has occurred in the past but returned to normal at present. In addition during the problem symptom check, it a check must be made on whether the malfunction indicated by the DTC is directly related to the problem symptom or not. For this reason, the DTC should be checked before and after symptom confirmation to determine the current conditions. If this is not done, it may, depending on the case, result in unnecessary troubleshooting for systems that are operating normally. This would make more difficult to detect the problem area or to try to repair irrelevant areas. Therefore, always follow the procedures in the correct order and perform the DTC check.
- A flow chart showing how to proceed with troubleshooting using the diagnostic trouble code (DTC) check is shown the this page. This flow chart shows how to utilize the DTC check effectively. Then, by carefully checking the results, this chart indicates how to proceed either to the DTC troubleshooting or to the troubleshooting of the problem symptoms table.

1 DTC check

2 Make a note of DTCs displayed and then clear the memory

3 Symptom confirmation

a	Symptoms exist
b	No symptoms exist

a → Go to step 5

b

4 Simulation test using the symptom simulation methods

5	DTC check

a	DTC displayed
b	Normal code displayed

a → **Troubleshooting of problem indicated by DTC**

b

6	Symptom confirmation

a	No symptoms exist
b	Symptoms exist

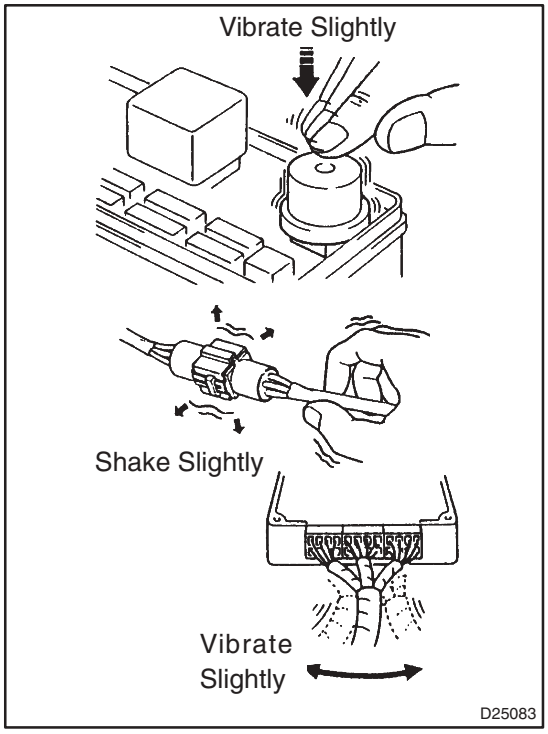
If a DTC is displayed in the initial DTC check, it indicates that a trouble may have occurred in a wire harness or connector in that circuit in the past. Therefore, check the wire harness and connectors (See page 01–32).

a → **System normal**

b

Troubleshooting of each problem symptom

The problem is still occurring in a place other than the diagnostic circuit (The DTC displayed first is either for a past problem or a secondary problem).



SYMPTOM SIMULATION

HINT:

The most difficult case in troubleshooting is when no symptoms occurs. In such cases, a thorough customer problem analysis must be carried out. Then the same or similar conditions and environment in which the problem occurred in the customer's vehicle should be simulated. No matter how much experience a technician has, or how skilled he may be, if he proceeds to troubleshoot without confirming the problem symptoms, he will tend to overlook something important in the repair operation and make a wrong guess somewhere, which will only lead to a standstill. For example, for a problem which only occurs when the engine is cold, or for a problem which occurs due to vibration caused by the road during driving, etc., the problem can never be determined when the engine is hot or when the vehicles is at a standstill. Since vibration, heat or water penetration (moisture) is a likely cause for the problem which is difficult to reproduce, the symptom simulation tests introduced here are effective measures in a point that the external causes are applied to the vehicle in a stationary condition.

Important points in the symptom simulation test:

In the symptom simulation test, the problem symptoms should be confirmed, and the problem area or parts must also be discovered. To do so, reduce the possible problem circuits according to the symptoms before starting this type of test and have the hand–held tester connected beforehand. After that, carry out the symptom simulation test, judging whether the circuit being tested is defective or normal and also confirming the problem symptoms at the same time. Refer to the problem symptoms table of each system to narrow down the possible causes of the symptom.

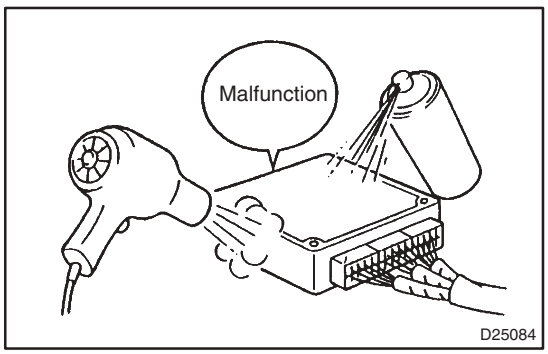
1. VIBRATION METHOD: When vibration seems to be the major cause.

(a) PART AND SENSOR

(1) Apply slight vibration with your finger to the part of the sensor considered to be the problem cause and check whether the malfunction occurs.

HINT:

Applying strong vibration to relays may result in open relays.



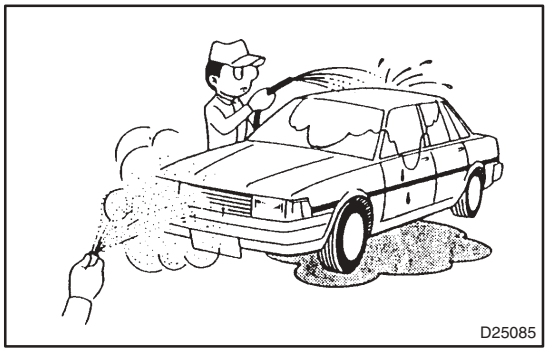
(b) CONNECTORS

(1) Slightly shake the connector vertically and horizontally.

(c) WIRE HARNESS

(1) Slightly shake the wire harness vertically and horizontally.

The connector joint and fulcrum of the vibration are the major areas that should be checked thoroughly.



2. HEAT METHOD: If the problem seems to occur when the area in question is heated.

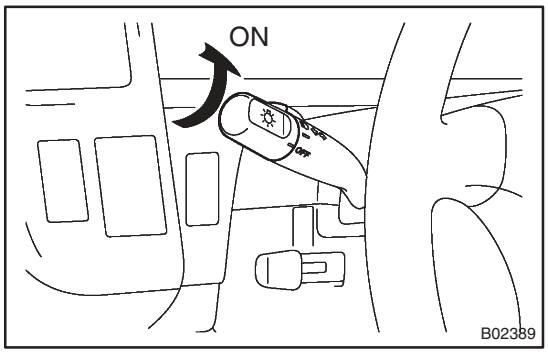
(a) Heat the component that is the possible cause of the malfunction with a hair dryer or similar object. Check if the malfunction occurs.

NOTICE:

- **Do not heat the components to more than 60°C (140°F) (Temperature is limited to keep the components from being damaged).**

- **Do not apply heat directly to the parts in the ECU.**

3. WATER SPRINKLING METHOD: When the malfunction seems to occur on a rainy day or in high–humidity.



(a) Sprinkle water onto the vehicle and check if the malfunction occurs.

NOTICE:

- **Never sprinkle water directly onto the engine compartment, but indirectly change the temperature and humidity by spraying a mist of water onto the radiator front surface.**
- **Never apply water directly onto the electronic components.**

HINT:

If a vehicle is subject to water leakage, the leaking water may contaminate the ECU. When testing a vehicle with a water leakage problem, this factor must also be considered.

4. OTHERS: If the malfunction seems to occur when electrical load is excessive.

(a) Turn on all the electrical equipment including the heater blower, headlights, rear window defogger, etc., and check if the malfunction occurs.

DIAGNOSTIC TROUBLE CODE CHART

The inspection procedures are shown in the table below. This table allows efficient and accurate troubleshooting using the diagnostic trouble codes displayed in the diagnostic trouble code chart. Proceed with troubleshooting in accordance with the inspection procedures listed in the diagnostic chart corresponding to the diagnostic trouble codes displayed. The diagnostic trouble code chart for the Supplemental Restraint System is shown below as an example.

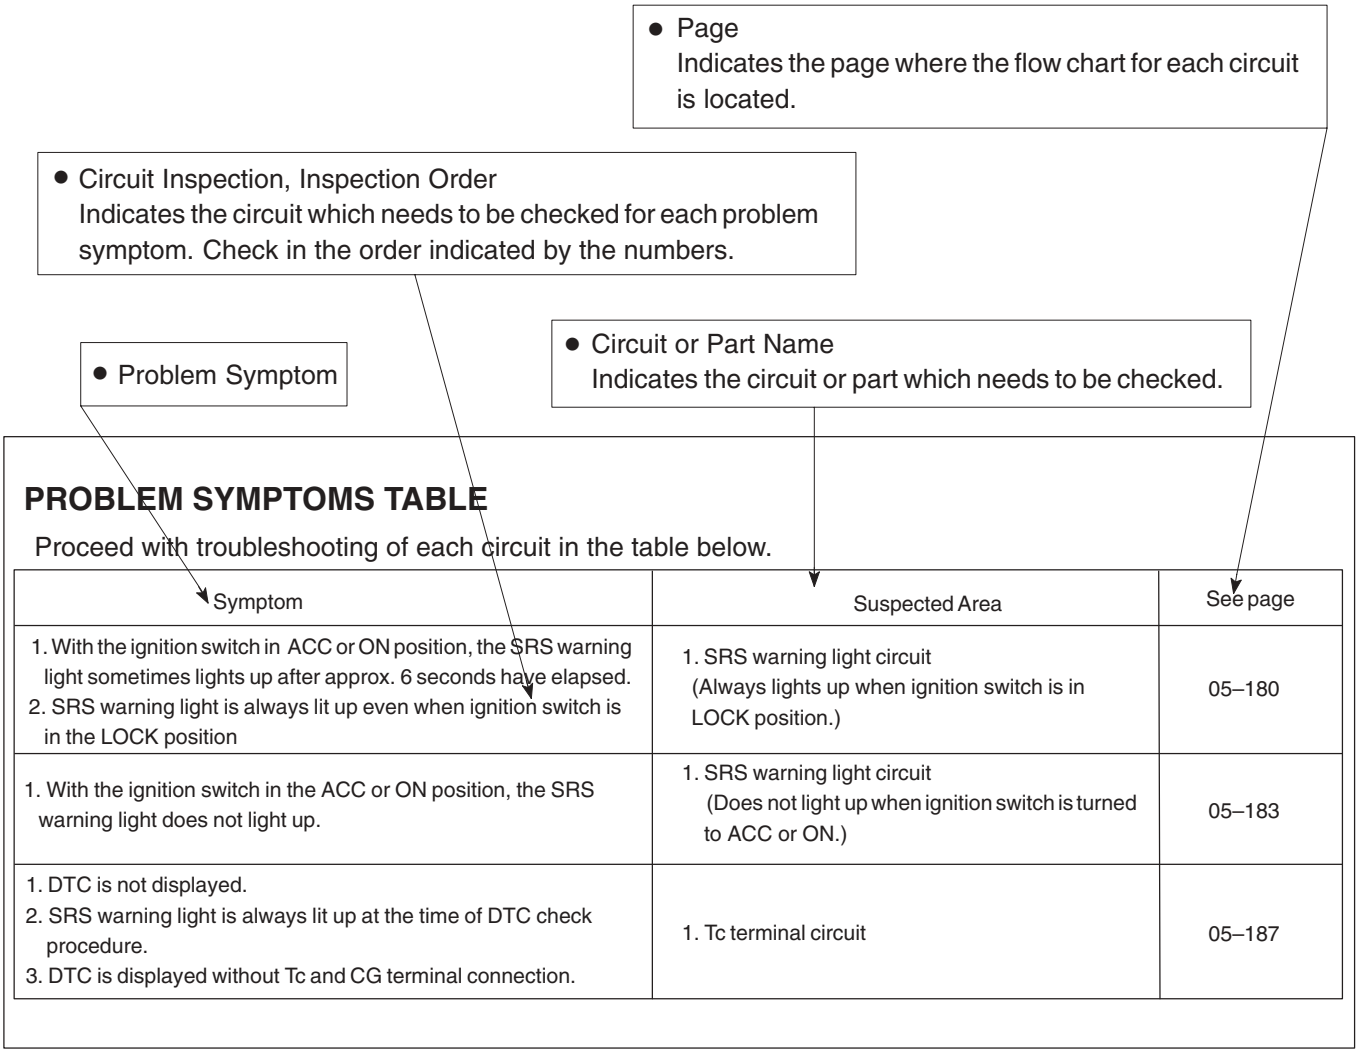
- DTC No.
  Indicates the diagnostic trouble code.
- Page or Instructions
  Indicates the page where the inspection procedures for each circuit is to be found, or gives instructions for checking and repairs.

- Trouble Area
  Indicates the suspect areas of the problem.

- Detection Item
  Indicates the system or details of the problem.

DIAGNOSTIC TROUBLE CODE CHART

If a malfunction code is displayed during the DTC check, check the circuit for that code listed in the table below (Proceed to the page given for that circuit).



DTC No. (See page)	Detection Item	Trouble Area	SRS Warning Light
B0100/13 (05–119)	● Short in D squib circuit	● Steering wheel pad (squib) ● Spiral cable ● Airbag sensor assembly ● Wire harness	ON
B0101/14 (05–124)	● Open in D squib circuit	● Steering wheel pad (squib) ● Spiral cable ● Airbag sensor assembly ● Wire harness	ON
B0102/11 (05–128)	● Short in D squib circuit (to ground)	● Steering wheel pad (squib) ● Spiral cable ● Airbag sensor assembly ● Wire harness	ON
B0103/12 (05–132)	● Short in D squib circuit (to B+)	● Steering wheel pad (squib) ● Spiral cable ● Airbag sensor assembly ● Wire harness	ON
B0105/53 (05–136)	● Short in P squib circuit	● Front passenger airbag assembly (squib) ● Airbag sensor assembly ● Wire harness	ON
B0106/54	● Open in P squib circuit	● Front passenger airbag assembly (squib) ● Airbag sensor assembly ● Wire harness	
	circuit (to Ground)	● Front passenger airbag assembly (squib) ● Airbag sensor assembly ● Wire harness	

PROBLEM SYMPTOMS TABLE

The suspected circuits or parts for each problem symptom are shown in the table below. Use this table to troubleshoot the problem when a Normal code is displayed in the diagnostic trouble code chart but the problem is still occurring. Numbers in the table indicate the inspection order in which the circuits or parts should be checked.

HINT:

When the problem is not detected by the diagnostic system even though the problem symptom is present, it may be that the problem is occurring outside the detection range of the diagnostic system.

PROBLEM SYMPTOMS TABLE

Proceed with troubleshooting of each circuit in the table below.

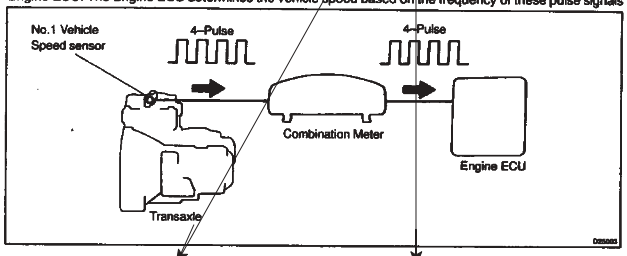
Symptom	Suspected Area	See page
1. With the ignition switch in ACC or ON position, the SRS warning light sometimes lights up after approx. 6 seconds have elapsed. 2. SRS warning light is always lit up even when ignition switch is in the LOCK position	1. SRS warning light circuit (Always lights up when ignition switch is in LOCK position.)	05–180
1. With the ignition switch in the ACC or ON position, the SRS warning light does not light up.	1. SRS warning light circuit (Does not light up when ignition switch is turned to ACC or ON.)	05–183
1. DTC is not displayed. 2. SRS warning light is always lit up at the time of DTC check procedure. 3. DTC is displayed without Tc and CG terminal connection.	1. Tc terminal circuit	05–187

CIRCUIT INSPECTION

How to read and use each page is shown below.

● Circuit Description
The major role and, operation of the circuit and its component parts are explained.

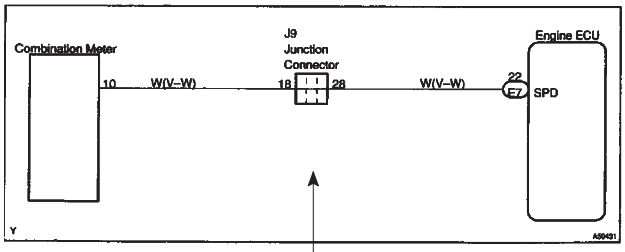
● Diagnostic Trouble Code No. and Detection Item



● Indicates the diagnostic trouble codes, diagnostic trouble code settings and suspect areas for a problem.

● Inspection Procedures
Use the inspection procedures to determine if the circuit is normal or abnormal. If it is abnormal, use it to determine whether the problem is located in the sensors, actuators, wire harness or ECU.

DTC P0500/42 VEHICLE SPEED SENSOR MALFUNCTION



CIRCUIT DESCRIPTION

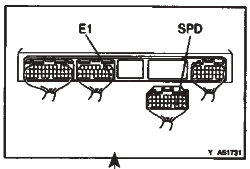
The vehicle speed sensor outputs a 4–pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the Engine ECU. The Engine ECU determines the vehicle speed based on the frequency of these pulse signals

DTC No.	DTC Detecting Condition	Trouble Area
P0500/42	During vehicle is being driven, no vehicle speed sensor signal to engine ECU (2 trip detection logic)	• Combination meter • Open or short in No.1 vehicle speed sensor circuit • No.1 vehicle speed sensor • Engine ECU

WIRING DIAGRAM

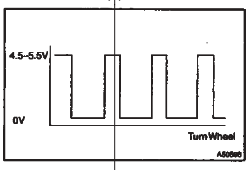
● Wiring Diagram
This shows a wiring diagram of the circuit.
Use this diagram together with ELECTRICAL WIRING DIAGRAM to thoroughly understand the circuit.
Wire colors are indicated by an alphabetical code.
B = Black, L = Blue, R = Red, BR = Brown,
LG = Light Green, V = Violet, G = Green,
O = Orange, W = White, GR = Gray, P = Pink,
Y = Yellow, SB = Sky Blue
The first letter indicates the basic wire color and the second letter indicates the color of the stripe.

INSPECTION PROCEDURE



1 READ VALUE OF VEHICLE SPEED VALUE(SPEEDOMETER OPERATION)

(a) Select data monitor on the hand–held tester.
(b) Perform a test drive of the vehicle.
(c) Read the vehicle speed on the hand–held tester.
RESULT: The same as the speed displayed on the speed meter.

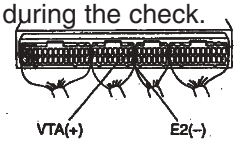


NG → **REPLACE COMBINATION METER ASSY**

OK →

2 INSPECT ECU

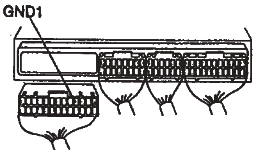
(a) Check the output waveform.
HINT:
Using the oscilloscope function of hand–held tester, it is possible to check the function between the engine ECU and the knock control sensor. The waveform shown in the illustration is an example without noise and chattering.
(1) Connect the hand–held tester between the terminals SPD of the engine ECU E7 connector and E1 of the engine ECU E8 connector.
(2) Select the oscilloscope function on the hand–held tester. (Refer to the hand–held tester's instruction book for operating instructions.)
RESULT: Voltage is intermittently generated



ITEM	CONTENTS
TERMINAL	SPD⇔E1
EQUIPMENT SET	5V/DIV, 20ms/DIV
CONDITION	Running at 20 km/h

HINT:
• The multitude gets shorter as the engine speed becomes faster.

OK → **CHECK AND REPLACE ECU**



NG →

● Indicates the condition of the connector of the ECU during the check.

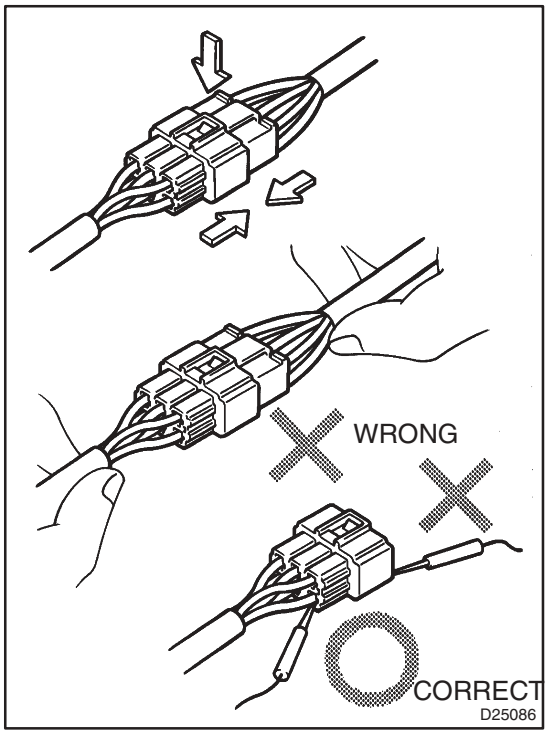
Connector being checked is connected.

Connections of tester are indicated by (+), (–) after terminals name.

Connector being checked is disconnected.

For inspection of connector with body ground, there is nothing about the body ground written down.

D25842



010B8–13

ELECTRONIC CIRCUIT INSPECTION PROCEDURE

1. BASIC INSPECTION

(a) RESISTANCE MEASURING CONDITION OF ELECTRONIC PARTS

(1) Unless stated, all resistance is measured at an ambient temperature of 20°C (68°F). As the resistance may be outside the specifications if measured at high temperatures immediately after the vehicle has been running, measurements should be made when the engine has cooled down.

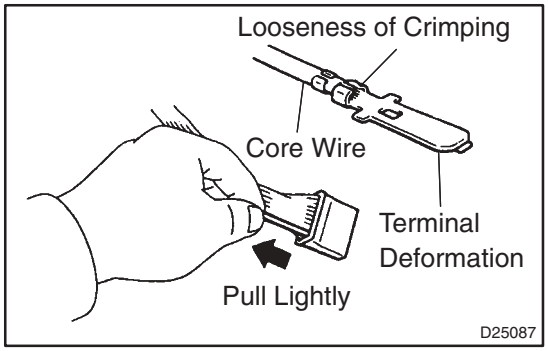
(b) HANDLING OF CONNECTOR

(1) When removing the connector with lock, press the connector in the direction of the engagement and remove the lock by lightly pressing the lock claw.

(2) When removing the connector, do not hold the harness, but hold the connector.

(3) Before connecting the connector, check that there is no deformation, damage or missing terminals.

(4) The connector with a lock should be securely connected until it makes a ”click” sound.

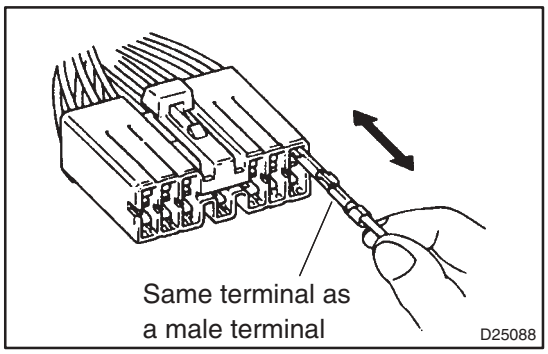


(5) When checking the connector with a Toyota electrical tester, check it from the backside (harness side) of the connector using a mini test lead.

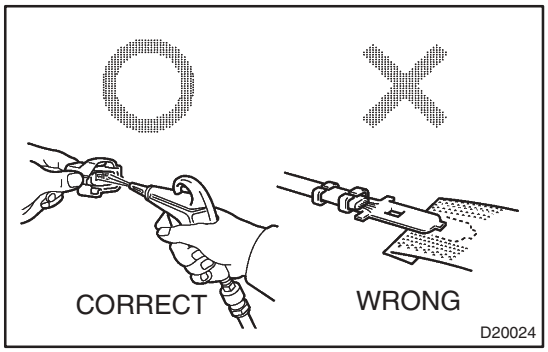
NOTICE:

- **As a water proof connector cannot be checked from the backside, check by connecting the sub–harness.**
- **Do not damage the terminals by moving the inserted tester needle.**

(c) CONNECTOR CHECKING POINTS



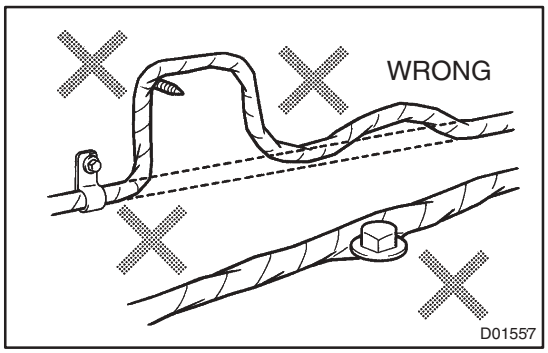
(1) Checking when the connector is connected:
By holding the connector, check the inserted condition and locking efficiency (engaged condition).



(2) Checking when the connector is removed:
Check by lightly pulling the wire harness (missing terminal, terminal crimping condition, core wire break).
Check visually for any rust, metal particles, water and bent terminals (rust, mixing of foreign object, terminal deformation).

NOTICE:

When testing a gold–plated female terminal, always use a gold–plated male terminal.



(3) Checking of the contact pressure of the terminal:
Prepare a spare male terminal.
Insert it into a female terminal, check the engaged condition and sliding resistance.

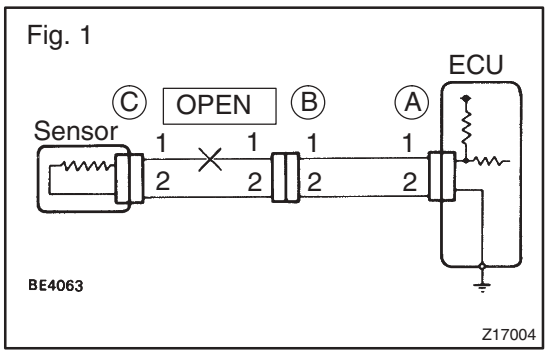
(d) REPAIR METHOD OF CONNECTOR TERMINAL

(1) If there is any dirt on the terminal, clean the contact point using an air gun or shop rag. Never polish the contact point using sandpaper as the platings may come off.

(2) In case of abnormal contact pressure, replace the female terminal. However, if a male terminal is gold–plated (gold color), use gold–plated female terminal and if it is silver–plated (silver color), use silver–plated female terminal.

(e) HANDLING OF WIRE HARNESS

(1) When removing the wire harness, check the positioning of the wiring and clamping before starting work in order to be able to restore it correctly.



(2) Never twist, pull or loosen the wire harness more than necessary.

(3) Never allow the wire harness to come into contact with a high–temperature, rotating, moving, vibrating or sharp (edge of the panel, tip of the screw, etc.) part.

(4) When installing parts, never let the wire harness be interfered with.

(5) Never cut or break the cover of the wire harness. If one is cut or broken, replace it or securely repair it with electrical tape.

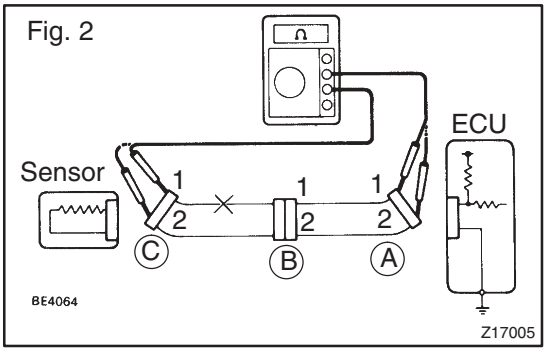


Fig. 1

2. CHECK OPEN CIRCUIT

(a) For the open circuit in the wire harness in Fig. 1, perform a continuity check in step (b) or a voltage check in step (c) to locate the section.

Fig. 2

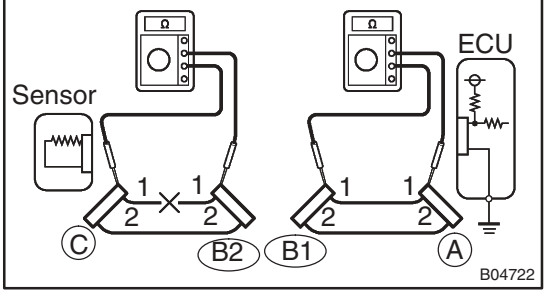
(b) Check the continuity.

(1) Disconnect connectors A and C and measure the resistance between them.

Resistance: 1 Ω or less

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.



In the case of Fig. 2:

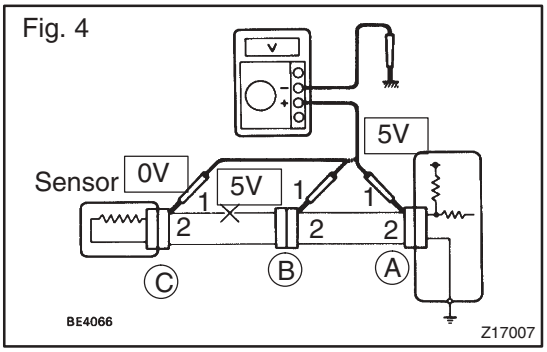
Between terminal 1 of connector A and terminal 1 of connector C → No continuity (open)

Between terminal 2 of connector A and terminal 2 of connector C → Continuity

Therefore, the cause is an open circuit between terminal 1 of connector A and terminal 1 of connector C.

Fig. 3

(2) Disconnect connector B and measure the resistance between the connectors.



In the case of Fig. 3:

Between terminal 1 of connector A and terminal 1 of connector B1 → Continuity

Between terminal 1 of connector B2 and terminal 1 of connector C → No continuity (open)

Therefore, the cause is an open circuit between terminal 1 of connector B2 and terminal 1 of connector C.

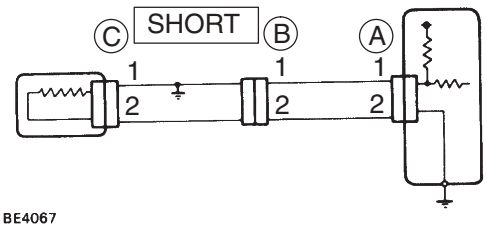
Fig. 4

(c) Check the voltage.

(1) In a circuit in which voltage is applied (to the ECU connector terminal), an open circuit can be checked by conducting a voltage check.

As shown in Fig. 4, with each connector still connected, measure the voltage between the body ground and terminal 1 of connector A at the ECU 5 V output terminal, terminal 1 of connector B, and terminal 1 of connector C, in that order.

(2) If the results are:



5 V: Between terminal 1 of connector A and body ground

5 V: Between terminal 1 of connector B and body ground

0 V: Between terminal 1 of connector C and body ground

Therefore, the cause is an open circuit in the wire harness between terminal 1 of connector B and terminal 1 of connector C.

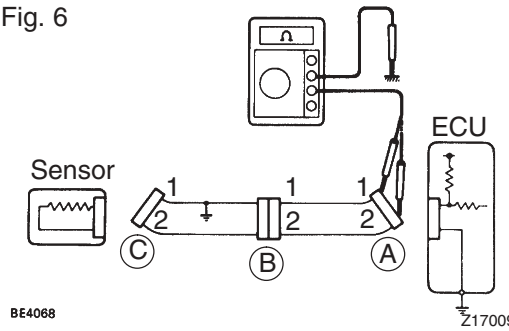


Fig. 5

3. CHECK SHORT CIRCUIT

(a) If the wire harness is ground shorted as shown in Fig. 5, locate the section by conducting a continuity check with the body ground in step (b).

Fig. 6

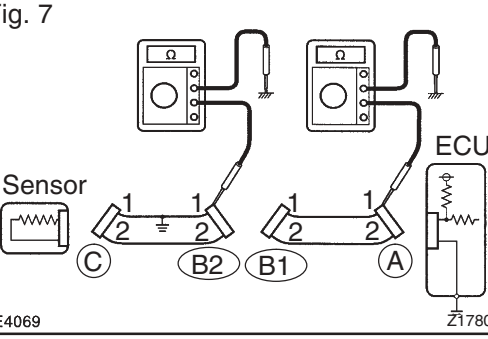
(b) Check the continuity with the body ground.

(1) Disconnect connectors A and C and measure the resistance between terminals 1 and 2 of connector A and the body ground.

Resistance: 10 kΩ or higher

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.



In the case of Fig. 6:

Between terminal 1 of connector A and body ground → Continuity (short)

Between terminal 2 of connector A and body ground → No continuity

Therefore, the cause is a short circuit between terminal 1 of connector A and terminal 1 of connector C.

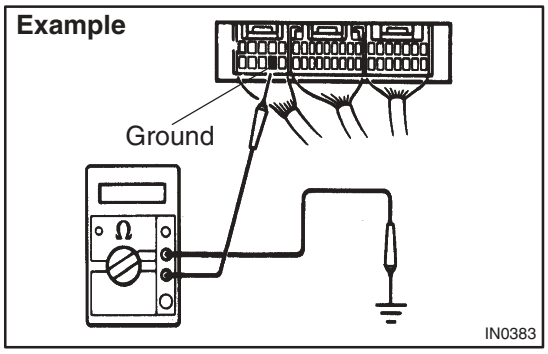
Fig. 7

(2) Disconnect connector B and measure the resistance between terminal 1 of connector A and the body ground, and terminal 1 of connector B2 and the body ground.

In the case of Fig. 7:

Between terminal 1 of connector A and body ground → No continuity

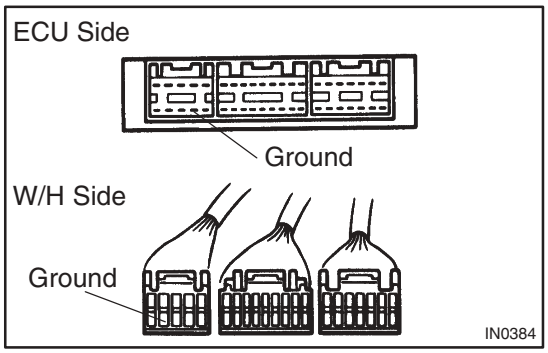
Between terminal 1 of connector B2 and body ground → Continuity (short)



Therefore, the cause is a short circuit between terminal 1 of connector B2 and terminal 1 of connector C.

4. CHECK AND REPLACE ECU

NOTICE:



- **Start an inspection of the connector from the backside of the connector on the wire harness side with the connector connected to the ECU.**
- **When no measurement condition is specified, perform the inspection with the engine stopped and also the ignition switch ON.**

(a) First check the ECU ground circuit. If it is faulty, repair it. If it is normal, the ECU could be faulty. In this case, replace the ECU with one that functions normally and check if the symptoms appear.

(1) Measure the resistance between the ECU ground terminal and body ground.

Resistance: 1 Ω or less

(2) Disconnect the ECU connector, check the ground terminals on the ECU side and wire harness side for bends and check the contact pressure.

TERMS

ABBREVIATIONS USED IN THIS MANUAL

010B9–20

Abbreviations	Meaning
ABS	Anti–Lock Brake System
A/C	Air Conditioner
AC	Alternating Current
ACC	Accessory
ACIS	Acoustic Control Induction System
ACSD	Automatic Cold Start Device
A.D.D.	Automatic Disconnecting Differential
A/F	Air–Fuel Ratio
AHC	Active Height Control Suspension
ALR	Automatic Locking Retractor
ALT	Alternator
AMP	Amplifier
ANT	Antenna
Approx.	Approximately
ASSY	Assembly
A/T, ATM	Automatic Transmission (Transaxle)
ATF	Automatic Transmission Fluid
AUTO	Automatic
AUX	Auxiliary
AVG	Average
AVS	Adaptive Variable Suspension
B+	Battery Voltage
BA	Brake Assist
BACS	Boost Altitude Compensation System
BAT	Battery
BDC	Bottom Dead Center
B/L	Bi–Level
B/S	Bore–Stroke Ratio
BTDC	Before Top Dead Center
BVSV	Bimetallic Vacuum Switching Valve
CAN	Controller Area Network
CB	Circuit Breaker
CCo	Catalytic Converter For Oxidation
CD	Compact Disc
CF	Cornering Force
CG	Center Of Gravity
CH	Channel
CKD	Complete Knock Down
COMB.	Combination
CPE	Coupe
CPS	Combustion Pressure Sensor
CPU	Central Processing Unit
CRS	Child Restraint System
CTR	Center
C/V	Check Valve
CV	Control Valve
CW	Curb Weight
DC	Direct Current

Abbreviations	Meaning
DEF	Defogger
DFL	Deflector
DIFF.	Differential
DIFF. LOCK	Differential Lock
D/INJ	Direct Injection
DLC	Data Link Connector
DLI	Distributorless Ignition
DOHC	Double Overhead Camshaft
DP	Dash Pot
DS	Dead Soak
DSP	Digital Signal Processor
DTC	Diagnostic Trouble Code
DVD	Digital Versatile Disc
EBD	Electric Brake Force Distribution
ECAM	Engine Control And Measurement System
ECD	Electronic Controlled Diesel
ECDY	Eddy Current Dynamometer
ECT	Electronic Control Transmission
ECU	Electronic Control Unit
ED	Electro–DepositedCoating
EDU	Electronic Driving Unit
EDIC	Electric Diesel Injection Control
EFI	Electronic Fuel Injection
E/G	Engine
EGR	Exhaust Gas Recirculation
EGR–VM	EGR–Vacuum Modulator
ELR	Emergency Locking Retractor
EMPS	Electric Motor Power Steering
ENG	Engine
ESA	Electronic Spark Advance
ETCS–i	Electronic Throttle Control System–intelligent
EVAP	Evaporative Emission Control
EVP	Evaporator
E–VRV	Electric Vacuum Regulating Valve
EX	Exhaust
FE	Fuel Economy
FF	Front–EngineFront–Wheel–Drive
F/G	Fuel Gauge
FIPG	Formed In Place Gasket
FL	Fusible Link
F/P	Fuel Pump
FPU	Fuel Pressure Up
Fr	Front
F/W	Flywheel
FW/D	Flywheel Damper
FWD	Front–Wheel–Drive
GAS	Gasoline
GND	Ground
GPS	Global Positioning System
HAC	High Altitude Compensator
H/B	Hatchback

Abbreviations	Meaning
H–FUSE	High Current Fuse
HI	High
HID	High Intensity Discharge (Head Lamp)
HSG	Housing
HT	Hard Top
HWS	Heated Windshield System
IC	Integrated Circuit
IDI	Indirect Diesel Injection
IFS	Independent Front Suspension
IG	Ignition
IIA	Integrated Ignition Assembly
IN	Intake (Manifold, Valve)
INT	Intermittent
I/P	Instrument Panel
IRS	Independent Rear Suspension
ISC	Idle Speed Control
J/B	Junction Block
J/C	Junction Connector
KD	Kick–Down
LAN	Local Area Network
LB	Liftback
LCD	Liquid Crystal Display
LED	Light Emitting Diode
LH	Left–Hand
LHD	Left–Hand Drive
L/H/W	Length, Height, Width
LLC	Long–Life Coolant
LNG	Liquified Natural Gas
LO	Low
LPG	Liquified Petroleum Gas
LSD	Limited Slip Differential
LSP & PV	Load Sensing Proportioning And Bypass Valve
LSPV	Load Sensing Proportioning Valve
MAP	Manifold Absolute Pressure
MAX.	Maximum
MIC	Microphone
MIL	Malfunction Indicator Lamp
MIN.	Minimum
MG1	Motor Generator No.1
MG2	Motor Generator No.2
MP	Multipurpose
MPI	Multipoint Electronic Injection
MPX	Multiplex Communication System
M/T, MTM	Manual Transmission (Transaxle)
MT	Mount
MTG	Mounting
N	Neutral
NA	Natural Aspiration
No.	Number
O2S	Oxygen Sensor
O/D	Overdrive

Abbreviations	Meaning
OEM	Original Equipment Manufacturing
OHC	Overhead Camshaft
OHV	Overhead Valve
OPT	Option
ORVR	On–board Refilling Vapor Recovery
O/S	Oversize
P & BV	Proportioning And Bypass Valve
PCS	Power Control System
PCV	Positive Crankcase Ventilation
PKB	Parking Brake
PPS	Progressive Power Steering
PTC	Positive Temperature Coefficient
PS	Power Steering
PTO	Power Take–Off
P/W	Power Window
R & P	Rack And Pinion
RAM	Random Access Memory

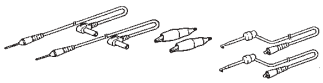
GLOSSARY OF SAE AND TOYOTA TERMS

This glossary lists all SAE–J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ( )—ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	–
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	–
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft Position	Cam Angle
CPP	Clutch Pedal Position	–
CTOX	Continuous Trap Oxidizer	–
CTP	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI/INJ)
DI	Distributor Ignition	–
DLC1 DLC2 DLC3	Data Link Connector 1 Data Link Connector 2 Data Link Connector 3	1: Check Connector 2: Total Diagnosis Communication Link (TDCL) 3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Trouble Code
DTM	Diagnostic Test Mode	–
ECL	Engine Control Level	–
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	Distributorless Ignition (DLI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	–
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	–
FEPROM	Flash Erasable Programmable Read Only Memory	–
FF	Flexible Fuel	–
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)

HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO_2S)
IAC	Idle Air Control	Idle Speed Control (ISC)
IAT	Intake Air Temperature	Intake or Inlet Air Temperature
ICM	Ignition Control Module	–
IFI	Indirect Fuel Injection	Indirect Injection (IDL)
IFS	Inertia Fuel–Shutoff	–
ISC	Idle Speed Control	–
KS	Knock Sensor	Knock Sensor
MAF	Mass Air Flow	Air Flow Meter
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)
MDP	Manifold Differential Pressure	–
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)
MIL	Malfunction Indicator Lamp	Check Engine Lamp
MST	Manifold Surface Temperature	–
MVZ	Manifold Vacuum Zone	–
NVRAM	Non–Volatile Random Access Memory	–
O2S	Oxygen Sensor	Oxygen Sensor, O_2 Sensor (O_2S)
OBD	On–Board Diagnostic	On–Board Diagnostic System (OBD)
OC	Oxidation Catalytic Converter	Oxidation Catalyst Convert (OC) Catalytic Converter for Oxidation (CCo)
OP	Open Loop	Open Loop
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)
PCM	Powertrain Control Module	–
PNP	Park/Neutral Position	–
PROM	Programmable Read Only Memory	–
PSP	Power Steering Pressure	–
PTOX	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)
RAM	Random Access Memory	Random Access Memory (RAM)
RM	Relay Module	–
ROM	Read Only Memory	Read Only Memory (ROM)
RPM	Engine Speed	Engine Speed
SC	Supercharger	Supercharger
SCB	Supercharger Bypass	E–ABV
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection
SPL	Smoke Puff Limiter	–
SRI	Service Reminder Indicator	–
SRT	System Readiness Test	–
ST	Scan Tool	–
TB	Throttle Body	Throttle Body
TBI	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)
TC	Turbocharger	Turbocharger
TCC	Torque Converter Clutch	Torque Converter



TCM	Transmission Control Module	Transmission ECU, ECT ECU
TP	Throttle Position	Throttle Position
TR	Transmission Range	–
TVV	Thermal Vacuum Valve	Bimetallic Vacuum Switching Valve (BVSV) Thermostatic Vacuum Switching Valve (TVSV)
TWC	Three–Way Catalytic Converter	Three–Way Catalytic (TWC) Manifold Converter CC_{RO}
TWC+OC	Three–Way + Oxidation Catalytic Converter	CC_R + CCo
VAF	Volume Air Flow	Air Flow Meter
VR	Voltage Regulator	Voltage Regulator
VSS	Vehicle Speed Sensor	Vehicle Speed Sensor
WOT	Wide Open Throttle	Full Throttle
WU–OC	Warm Up Oxidation Catalytic Converter	–
WU–TWC	Warm Up Three–Way Catalytic Converter	–
3GR	Third Gear	–
4GR	Fourth Gear	–

HOW TO PROCEED WITH TROUBLESHOOTING

The intelligent tester II is used in steps 3, 4, 5, 7 and 10.

1	VEHICLE BROUGHT TO WORKSHOP

2	CUSTOMER PROBLEM ANALYSIS (See page 05–8)

3	CONNECT INTELLIGENT TESTER II TO DLC3

HINT:
If the display indicates a communication fault in the tester, inspect the DLC3.

4	CHECK DTC AND FREEZE FRAME DATA (See page 05–18)

HINT:
Record or print DTCs and freeze frame data, if needed.

5	CLEAR DTC AND FREEZE FRAME DATA (See page 05–18)

6	CONDUCT VISUAL INSPECTION

7	SET CHECK MODE DIAGNOSIS (See page 05–20)

8	CONFIRM PROBLEM SYMPTOMS

HINT:
If the engine does not start, perform steps 10 and 12 first.

Result	Proceed To
Malfunction does not occur	A
Malfunction occurs	B

B → GO TO STEP 10

A

9	SIMULATE SYMPTOMS

10	CHECK DTC (See page 05–18)

Result	Proceed To
Malfunction code	A
No code	B

B → GO TO STEP 12

A

11	REFER TO DTC CHART (See page 05–27)

GO TO STEP 14

12	CONDUCT BASIC INSPECTION (See page 05–10)

Result	Proceed To
Wrong parts not confirmed	A
Wrong parts confirmed	B

B → GO TO STEP 17

A

13	REFER TO PROBLEM SYMPTOMS TABLE (See page 05–12)

Result	Proceed To
Wrong circuit confirmed	A
Wrong parts confirmed	B

B → GO TO STEP 17

A

14	CHECK ECM POWER SOURCE CIRCUIT (See page 05–195)

15	CONDUCT CIRCUIT INSPECTION

Result	Proceed To
Malfunction not confirmed	A
Malfunctionconfirmed	B

B → GO TO STEP 18

ENGINE CONTROL SYSTEM Check Sheet

Inspector's Name _____

Driver's Name		VIN	
Date Vehicle Brought in		Production Date	
License Plate No.		Odometer Reading	km miles

Problem Symptoms	☐ Engine does not Start	☐ Engine does not crank ☐ No initial combustion ☐ No complete combustion
	☐ Difficult to Start	☐ Engine cranks slowly ☐ Other _____
	☐ Poor Idling	☐ Incorrect first idle ☐ Idling rpm is abnormal ☐ High (rpm) ☐ Low (rpm) ☐ Rough idling ☐ Other _____
	☐ Poor Driveability	☐ Hesitation ☐ Back fire ☐ Muffler explosion (after–fire) ☐ Surging ☐ Knocking ☐ Other _____
	☐ Engine Stalling	☐ Soon after starting ☐ After accelerator pedal depressed ☐ After accelerator pedal released ☐ During A/C operation ☐ Shifting from N to D ☐ Other _____
	☐ Others	

Data Problem Occurred		
Problem Frequency		☐ Constant ☐ Sometimes (times per day/month) ☐ Once only ☐ Other _____
Condition When Problem Occurs	Weather	☐ Fine ☐ Cloudy ☐ Rainy ☐ Snowy ☐ Various/Other _____
	Outdoor Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Cold (approx.____ °C/____ °F)
	Place	☐ Highway ☐ Suburbs ☐ Inner city ☐ Uphill ☐ Downhill ☐ Rough road ☐ Other _____
	Engine Temp.	☐ Cold ☐ Warming up ☐ After warming up ☐ Any temp. ☐ Other _____
	Engine Operation	☐ Starting ☐ Just after starting (min.) ☐ Idling ☐ Rev–up ☐ Driving ☐ Constant speed ☐ Acceleration ☐ Deceleration ☐ A/C switch ON/OFF ☐ Other _____

Malfunction Indicator Lamp (MIL)		☐ Remains on	☐ Sometimes lights up ☐ Does not light up
DTC Inspection	Normal mode (Pre–check)	☐ Normal	☐ Malfunction code(s) (code) ☐ Freeze frame data ( )
	Check Mode	☐ Normal	☐ Malfunction code(s) (code) ☐ Freeze frame data ( )

05JO6–03

CHECK FOR INTERMITTENT PROBLEMS

HINT:

Intelligent tester II only:

Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with the intelligent tester II when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which has a higher sensitivity to malfunctions than normal mode (default) using 2 trip detection logic.

(a) Clear the DTCs (see page 05–18).

(b) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).

(c) Perform a simulation test (see page 01–22).

(d) Check the connector(s) and terminal(s) (see page 01–32).

(e) Wiggle the harness(es) and connector(s) (see page 01–32).

05JO7–03

BASIC INSPECTION

When a malfunction is not confirmed in the DTC check, troubleshooting should be carried out in all the circuits considered possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential in engine troubleshooting.

1	CHECK BATTERY VOLTAGE

NOTICE:
Carry out this check with the engine stopped and ignition switch OFF.

Result	Proceed To
11 V or more	OK
Below 11 V	NG

NG → **CHARGE OR REPLACE BATTERY**

OK

2	CHECK IF ENGINE WILL CRANK

NG → **PROCEED TO PROBLEM SYMPTOMS TABLE ON PAGE 05–12**

OK

3	CHECK IF ENGINE STARTS

NG → **GO TO STEP 7**

OK

4	CHECK AIR FILTER

(a) Visually check if the air filter is not contaminated with dirt or oil.

NG → **REPLACE AIR FILTER**

OK

5	CHECK IDLING SPEED (See page 14–1 of Pub. No. RM1018E AVENSIS)

NG → **PROCEED TO PAGE 14–1 of Pub. No. RM1018E AVENSIS AND CONTINUE TO TROUBLESHOOT**

OK

PROCEED TO PROBLEM SYMPTOMS TABLE ON PAGE 05–12

6	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

NG → PROCEED TO PAGE 11–5 of Pub. No. RM1018E AVENSIS AND CONTINUE TO TROUBLESHOOT

OK

7	CHECK FOR SPARK (See page 18–3 of Pub. No. RM1018E AVENSIS)

NG → PROCEED TO PAGE 18–3 of Pub. No. RM1018E AVENSIS AND CONTINUE TO TROUBLESHOOT

OK

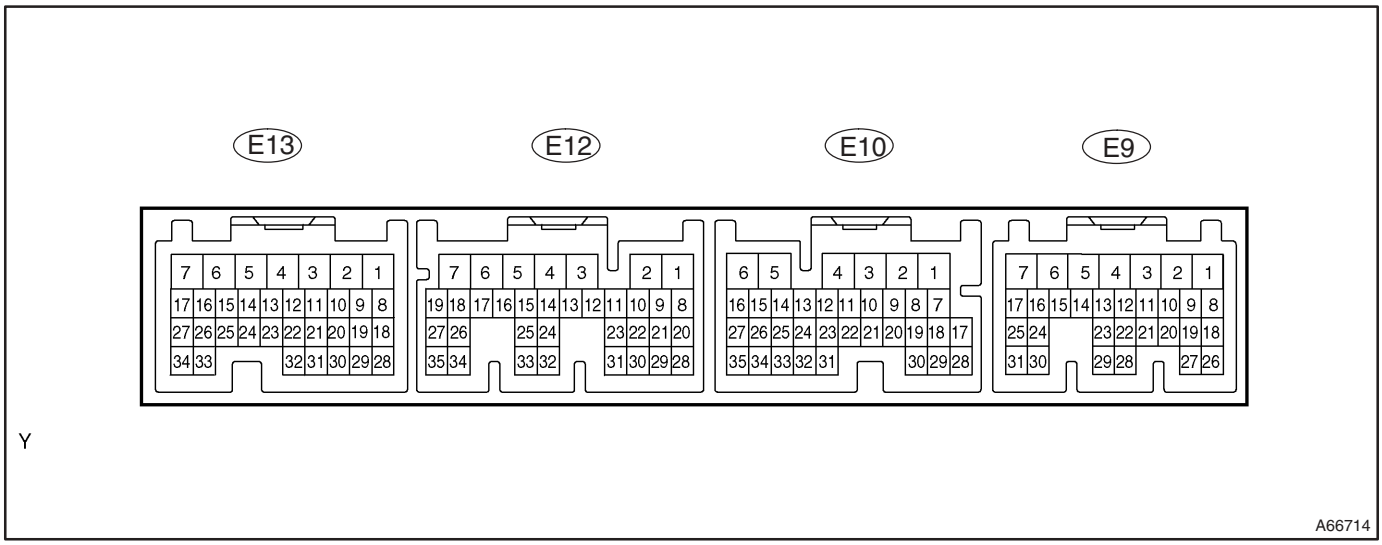
PROCEED TO PROBLEM SYMPTOMS TABLE ON PAGE 05–12

054JF–24

PROBLEM SYMPTOMS TABLE

When the malfunction is not confirmed in the diagnostic trouble code check and the problem still cannot be confirmed in the basic inspection, use this table and troubleshoot according to the priority order given below.

Symptom	Suspect Area	See Page
Engine does not crank (Does not start)	1. Starter signal circuit 2. Starter 3. ST relay	05–171 *1 *1
No initial combustion (Does not start)	1. ECM power source circuit 2. Fuel pump control circuit 3. ECM	05–195 05–199 *2
No complete combustion (Does not start)	1. Fuel pump control circuit	05–199
Engine cranks normally but difficult to start	1. Starter signal circuit 2. Fuel pump control circuit 3. Compression	05–171 05–199 *3
Difficult to start with cold engine	1. Starter signal circuit 2. Fuel pump control circuit	05–171 05–199
Difficult to start with hot engine	1. Starter signal circuit 2. Fuel pump control circuit	05–171 05–199
High engine idling speed (Poor idling)	1. A/C signal circuit (Compressor circuit) 2. ECM power source circuit	— 05–195
Low engine idling speed (Poor idling)	1. A/C signal circuit (Compressor circuit) 2. Fuel pump control circuit	— 05–199
Rough idling (Poor idling)	1. Compression 2. Fuel pump control circuit	*3 05–199
Hunting (Poor idling)	1. ECM power source circuit 2. Fuel pump control circuit	05–195 05–199
Hesitation/Poor acceleration (Poor driveability)	1. Fuel pump control circuit 2. Automatic transmission assembly	05–199 05–229
Surging (Poor driveability)	1. Fuel pump control circuit	05–199
Engine stalls soon after starting	1. Fuel pump control circuit	05–199
Engine stalls during A/C operation	1. A/C signal circuit (Compressor circuit) 2. ECM	— *2



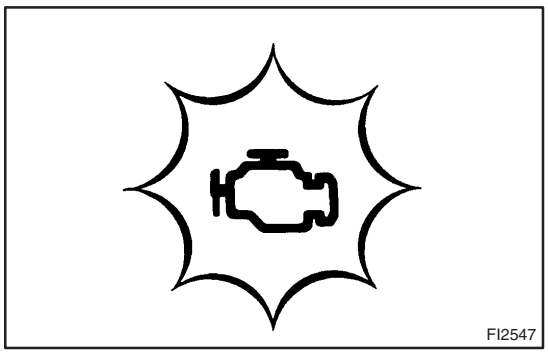
*1: See page 19–1 of Pub. No. RM1018E AVENSIS

*2: See page 10–65 of Pub. No. RM1018E AVENSIS

*3: See page 14–1 of Pub. No. RM1018E AVENSIS

054KK–23

TERMINALS OF ECM



HINT:
Each ECM terminal's standard normal voltage is shown in the table below.
In the table, first follow the information under "Condition." Look under "Symbols (Terminals No.)" for the terminals to be inspected. The standard normal voltage between the terminals is shown under "STD Voltage."
Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	STD Voltage
BATT (E9–3) – E1 (E13–5)	B–Y – BR	Battery (for measuring the battery voltage and for the ECM memory)	Always	9 to 14 V
+BM (E10–6) – ME01 (E12–3)	G–Y – W–B	Power source of throttle motor	Always	9 to 14 V
IGSW (E9–9) – E1 (E13–5)	B–W – BR	Ignition switch	Ignition switch ON	9 to 14 V
+B (E9–1) – E1 (E13–5)	B–R – BR	Power source of ECM	Ignition switch ON	9 to 14 V
MREL (E10–4) – E01 (E13–7)	GR – W–B	EFI relay	Ignition switch ON	9 to 14 V
VC (E13–18) – E2 (E13–28)	R–W – BR	Power source of sensor (a specific voltage)	Ignition switch ON	4.5 to 5.5 V
VTA1 (E13–21) – E2 (E13–28)	L–W – BR	Throttle position sensor (for engine control)	Ignition switch ON, Accelerator pedal fully released	0.4 to 1.0 V
VTA1 (E13–21) – E2 (E13–28)	L–W – BR	Throttle position sensor (for engine control)	Ignition switch ON, Accelerator pedal fully depressed	3.2 to 4.8 V
VTA2 (E13–31) – E2 (E13–28)	B–R – BR	Throttle position sensor (for sensor malfunction detection)	Ignition switch ON, Accelerator pedal fully released	2.1 to 3.1 V
VTA2 (E13–31) – E2 (E13–28)	B–R – BR	Throttle position sensor (for sensor malfunction detection)	Ignition switch ON, Accelerator pedal fully depressed	4.5 to 5.0 V
VPA (E9–22) – EPA (E9–28)	G – Y	Accelerator pedal position sensor (for engine control)	Ignition switch ON, Accelerator pedal fully released	0.5 to 1.1 V
VPA (E9–22) – EPA (E9–28)	G – Y	Accelerator pedal position sensor (for engine control)	Ignition switch ON, Accelerator pedal fully depressed	2.6 to 4.5 V
VPA2 (E9–23) – EPA2 (E9–29)	W – Y	Accelerator pedal position sensor (for sensor malfunction detection)	Ignition switch ON, Accelerator pedal fully released	1.2 to 2.0 V
VPA2 (E9–23) – EPA2 (E9–29)	W – Y	Accelerator pedal position sensor (for sensor malfunction detection)	Ignition switch ON, Accelerator pedal fully depressed	3.4 to 5.0 V

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	STD Voltage
VCPA (E9–26) – EPA (E9–28)	B – Y	Power source of accelerator pedal position sensor (for VPA)	Ignition switch ON	4.5 to 5.0 V
VCP2 (E9–27) – EPA2 (E9–29)	B – Y	Power source of accelerator pedal position sensor (for VPA2)	Ignition switch ON	4.5 to 5.0 V
VG (E13–30) – EVG (E13–29)	G – L–Y	Mass air flow meter	Idling, Shift position P or N, A/C switch OFF	0.5 to 3.0 V
THA (E13–20) – E2 (E13–28)	G–R – BR	Intake air temperature sensor	Idling, Intake air temperature 20°C (68°F)	0.5 to 3.4 V
THW (E13–19) – E2 (E13–28)	B–W – BR	Engine coolant temperature sensor	Idling, Engine coolant temperature 80°C (176°F)	0.2 to 1.0 V

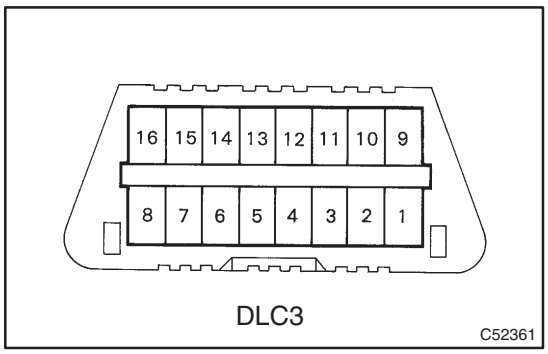
FI2547

DIAGNOSIS SYSTEM



1. DESCRIPTION

- When troubleshooting Euro–OBD vehicles, the only difference from the usual troubleshooting procedure is that you connect an OBD scan tool (complying with ISO 15031–4) or the intelligent tester II to the vehicle, and read the various data output from the vehicle's ECM.
- Euro–OBD regulations require that the vehicle's on–board computer illuminates the MIL (Malfunction Indicator Lamp) on the instrument panel when the computer detects a malfunction in: 1) the emission control systems and components, or 2) the powertrain control components (which affect vehicle emissions), or 3) the computer. In addition, the applicable DTCs (Diagnostic Trouble Codes) prescribed by ISO 15031–4 are recorded in the ECM memory (see page 05–27).

If the malfunction does not recur in 3 consecutive trips, the MIL goes off automatically but the DTCs remain recorded in the ECM memory.

- To check the DTCs, connect the OBD scan tool or intelligent tester II to the DLC3 (Data Link Connector 3) on the vehicle. The OBD scan tool or intelligent tester II also enables you to erase the DTCs and check the freeze frame data and various forms of engine data. (See the instruction manual for the OBD scan tool or intelligent tester II.)
- The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic* is used to ensure accurate detection of malfunctions. Check mode is also available to technicians as an option. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent problems (intelligent tester II only) (see page 05–20).
- *2 trip detection logic:
  When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the ignition switch is turned to OFF and then to ON again, and the same malfunction is detected again, the MIL will illuminate (2nd trip).
- Freeze frame data:
  The freeze frame data record the engine condition (fuel system, calculated engine load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, the freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

DLC3

2. CHECK DLC3

(a) The vehicle's ECM uses the ISO 9141–2 (Euro–OBD) communication protocol. The terminal arrangement of the DLC3 complies with ISO 15031–03 and matches the ISO 9141–2 format.

Symbol	Terminal No.	Name	Reference Terminal	Result	Condition
SIL	7	Bus "+" line	5 – Signal ground	Pulse generation	During transmission
CG	4	Chassis ground	Body ground	1 Ω or less	Always
SG	5	Signal ground	Body ground	1 Ω or less	Always
BAT	16	Battery positive	Body ground	9 to 14 V	Always

HINT:

When you use the intelligent tester II, first connect the cable of the tester to the DLC3. Next, turn the ignition switch to ON. Finally turn the tester ON. If the screen displays NO INFORMATION AVAILABLE and bus check is also failed, a problem exists in the vehicle, the tester or the tester cable.

- If communication is normal when the tester is connected to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still not possible when the tester is connected to another vehicle, the problem is probably in the tester or the cable, so consult the Service Department listed in its instruction manual.

3. INSPECT BATTERY VOLTAGE

Standard: 11 to 14 V

If the voltage is below 11 V, recharge the battery before proceeding.

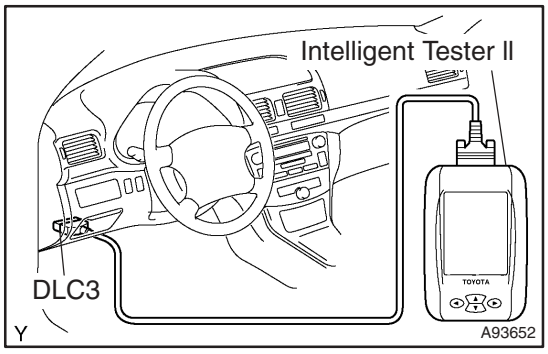
4. CHECK MIL

(a) The MIL illuminates when the ignition switch is turned to ON and the engine is not running.

HINT:

If the MIL is not illuminated, check the MIL Circuit (see page 05–204).

(b) When the engine is started, the MIL should turn off. If the MIL remains on, the diagnosis system has detected a malfunction or abnormality in the system.



05KNS–02

DTC CHECK/CLEAR

NOTICE:

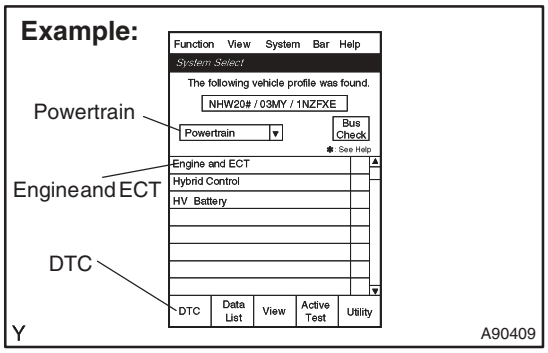
Intelligent tester II only:

When the diagnosis system is changed from normal mode to check mode or vice–versa, all DTCs and freeze frame data recorded in normal mode will be erased. Before changing modes, always check and make a note of DTCs and freeze frame data.

1. CHECK DTC (using the intelligent tester II)

(a) Connect the intelligent tester II to the DLC3.

(b) Turn the ignition switch to ON and turn the intelligent tester II ON.



(c) Select the following menu items: Powertrain / Engine and ECT / DTC.

(d) Check DTCs and freeze frame data, and then write them down.

HINT:

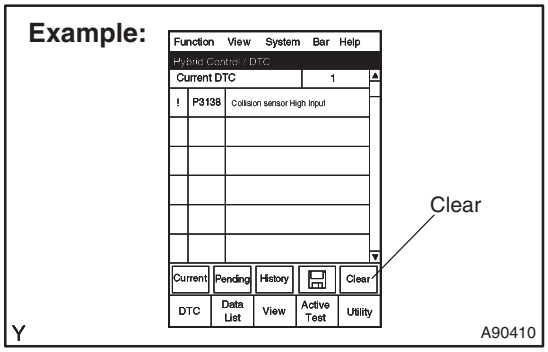
If you need help using the intelligent tester II, refer to the instruction manual.

(e) See page 05–27 to confirm the details of the DTCs.

2. FREEZE FRAME DATA

(a) Connect the intelligent tester II to the DLC3.

(b) Turn the ignition switch to ON and turn the intelligent tester II ON.



(c) Read DTCs by selecting the following menu items: Powertrain / Engine and ECT / DTC.

(d) Select a parameter(s) to check the freeze frame data.

(e) Note down the DTC(s) and freeze frame data.

HINT:

If you need help using the intelligent tester II, refer to the instruction manual.

3. CLEAR DTCs AND FREEZE FRAME DATA (using the intelligent tester II)

(a) Connect the intelligent tester II to the DLC3.

(b) Turn the ignition switch to ON (do not start the engine) and turn the intelligent tester II ON.

(c) Select the following menu items: Powertrain / Engine and ECT / DTC / Clear.

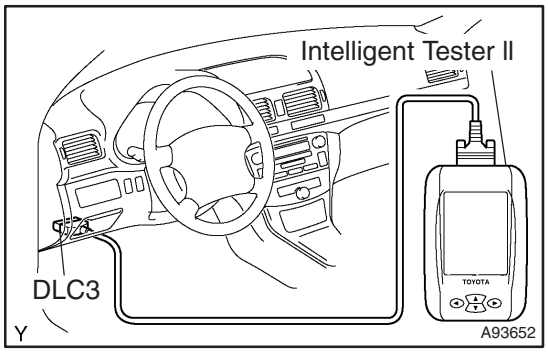
(d) Erase DTCs and freeze frame data by pressing the YES button on the tester.

HINT:

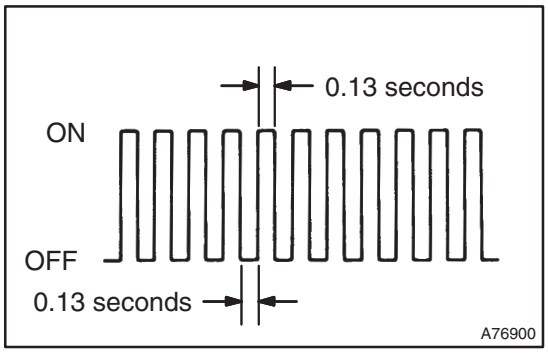
If you need help using the intelligent tester II, refer to the instruction manual.

4. CLEAR DTCs AND FREEZE FRAME DATA (not using the intelligent tester II)

(a) Remove the EFI and ETCS fuse from the engine room R/B for more than 60 seconds, or disconnect the negative battery cable for more than 60 seconds. When disconnecting the negative battery cable, perform the ”INITIALIZE” procedure (see page 05–1).



05JOA–03



CHECK MODE PROCEDURE

HINT:

Intelligent tester II only:

Compared to normal mode, check mode has more sensing ability to detect malfunctions. Furthermore, the same diagnostic items which are detected in normal mode can also be detected in check mode.

1. CHECK MODE PROCEDURE

(a) Make sure that the items below are true.
  (1) Battery voltage 11 V or more.
  (2) Throttle valve fully closed.
  (3) Transmission in the P or N position.
  (4) A/C switched OFF.

(b) Turn the ignition switch to OFF.

(c) Connect the intelligent tester II to the DLC3.

(d) Turn the ignition switch to ON and turn the intelligent tester II ON.

(e) Select the following menu items: Powertrain / Engine and ECT / Utility / Check Mode.

(f) Make sure that the MIL flashes as shown in the illustration.

NOTICE:

All the recorded DTCs and freeze frame data will be erased if: 1) the intelligent tester II is used to change the ECM from normal mode to check mode or vice–versa; or 2) during check mode, the ignition switch is turned from ON to ACC or OFF.

(g) Start the engine (the MIL should turn off).

(h) Simulate the condition of the malfunction described by the customer.

(i) After simulating the malfunction condition, check the DTCs, freeze frame data and other data.

(j) After checking the DTCs, inspect the applicable circuits (see page 05–12).

FAIL–SAFE CHART

If any of the following DTCs are recorded, the ECM enters fail–safe mode.

DTC No.	Fail–Safe Operation	Fail–Safe Deactivation Condition
P0031 P0032	Heated oxygen sensor (Sensor 1) heater is turned off	Ignition switch turned to OFF
P0037 P0038	Heated oxygen sensor (Sensor 2) heater is turned off	Ignition switch turned to OFF
P0100 P0102 P0103	Ignition timing is calculated from engine RPM and Throttle Position (TP)	”Pass” condition detected
P0110 P0112 P0113	Intake Air Temperature (IAT) is fixed at 20°C (68°F)	”Pass” condition detected
P0115 P0117 P0118	Engine Coolant Temperature (ECT) is fixed at 80°C (176°F)	”Pass” condition detected
P0120 P0122 P0123 P0220 P0222 P0223 P2102 P2103 P2111 P2112 P2118 P2119 P2135	When Electronic Throttle Control System (ETCS) is malfunctioning, electric current to throttle actuator is cut off and throttle valve returns to throttle position (TP) 16° by its spring. Then, required engine power is calculated using ignition timing and Accelerator Pedal Position (APP). Engine is controlled by intermittent fuel–cut. As a result, fully slowly depressing accelerator pedal enables driving at minimum speed. However, quickly depressing pedal would vary vehicle speed remarkably.	”Pass” condition detected followed by the ignition switch turned to OFF
P0121	Fuel is cut intermittently	”Pass” condition detected followed by the ignition switch turned to OFF
P0325 P0327 P0328	Maximum ignition timing retardation	Ignition switch turned to OFF
P0351 P0352 P0353 P0354	Fuel is cut	”Pass” condition detected
P2120 P2121 P2122 P2123 P2125 P2127 P2128 P2138	Accelerator Pedal Position (APP) sensor has main circuit and associate circuit. When one of circuits is malfunctioning, APP is calculated by output of other circuit. When both of circuits are malfunctioning, it is interpreted that accelerator pedal is releasing. As a result, throttle valve is closed and engine idles.	”Pass” condition detected followed by the ignition switch turned to OFF

05JOC–03

DATA LIST/ACTIVE TEST

1. DATA LIST

HINT:

Using the Data List displayed on the intelligent tester II, you can read values including those of the switches, sensors, and actuators, without removing any parts. Reading the Data List as the first step of troubleshooting is one method to shorten diagnostic time.

NOTICE:

In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

(a) Warm up the engine.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON.
(e) Turn the intelligent tester II ON.
(f) Select the following menu items: Powertrain / Engine and ECT / Data List.
(g) Check the results by referring to the following table.

Intelligent Tester II Display (Abbreviation)	Measurement Item/Range (Display)	Normal Condition *1	Diagnostic Note
Injector (INJECTOR)	Injection period of the No. 1 cylinder/ Min.: 0 ms, Max.: 32.6 ms	Idling: 1.92 to 3.37 ms	—
IGN Advance (IGN ADVANCE)	Ignition timing advance for No. 1 cylinder/ Min.: –64 deg., Max.: 63.5 deg.	Idling: BTDC 10 to 18 deg. (N position)	—
CALC Load (CALC LOAD)	Calculated load by ECM/ Min.: 0 %, Max.: 100 %	• Idling: 27.5 to 46.4 % • Running without load (2,500 rpm): 19.7 to 40.5 %	—
AFM (AFM)	Air flow rate from MAF meter/ Min.: 0 g/s, Max.: 665.35 g/s	Idling: 3 to 7 g/s (1,500 rpm)	If the value is approximately 0.0 g/s: • Mass air flow meter power source circuit is open • VG circuit is open or shorted If the value is 160.0 g/s or more: • E2G circuit is open
Engine SPD (ENGINE SPD)	Engine speed/ Min.: 0 rpm, Max.: 16,383 rpm	Idling: 650 to 750 rpm (N position)	—
Coolant Temp (COOLANT TEMP)	Engine coolant temperature/ Min.: –40°C (–40°F) Max.: 215°C (419°F)	After warming up the engine: 80° to 95°C (176° to 203°F)	• If the value is –40°C (–40°F): sensor circuit is open • If the value is 140°C (284°F): sensor circuit is shorted
Intake Air (INTAKE AIR)	Intake air temperature/ Min.: –40°C (–40°F) Max.: 215°C (419°F)	Equivalent to ambient air temperature	• If the value is –40°C (–40°F): sensor circuit is open • If the value is 140°C (284°F): sensor circuit is shorted
Throttle POS (THROTTLE POS)	Absolute throttle position sensor/ Min.: 0 %, Max.: 100 %	• Throttle fully closed: 8 to 20 % • Throttle fully open: 64 to 96 %	Read the value with the ignition switch ON (Do not start engine)
Vehicle SPD (VEHICLE SPD)	Vehicle speed/ Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on the speedometer
Accelerator POS No.1 (ACCEL POS #1)	Accelerator pedal position sensor No.1 output voltage/ Min.: 0 V, Max.: 5 V	• Accelerator pedal released: 0.5 to 1.1 V • Accelerator pedal depressed: 2.6 to 4.5 V	Read the value with the ignition switch ON (Do not start engine)

Intelligent Tester II Display (Abbreviation)	MeasurementItem/Range (Display)	Normal Condition *1	Diagnostic Note
Accelerator POS No.2 (ACCEL POS #2)	Accelerator pedal position sensor No.2 output voltage/ Min.: 0 V, Max.: 5 V	• Accelerator pedal released: 1.2 to 2.0 V • Accelerator pedal depressed: 3.4 to 5.0 V	Read the value with the ignition switch ON (Do not start engine)
Throttle POS No.2 (THROTTLE POS #2)	Throttle position sensor No. 2 output voltage/ Min.: 0 V, Max.: 5 V	• Throttle fully closed: 2.1 to 3.1 V • Throttle fully open: 4.5 to 5.0 V	Read the value with the ignition switch ON (Do not start engine)
Throttle Request POS (THROTTLE TARGT)	Throttle requirement position Min.: 0 V, Max.: 5 V	Idling: 0.4 to 1.1 V	—
Throttle Motor Open Duty (THROTL OPN DUTY)	Throttle motor opening duty ratio/ Min.: 0 %, Max.: 100 %	Throttle fully closed: 0 %	• When the accelerator pedal is depressed, duty ratio is increased • Read the value with the ignition switch ON (Do not start engine)
Throttle Motor Close Duty (THROTL CLS DUTY)	Throttle motor closed duty ratio/ Min.: 0 %, Max.: 100 %	Throttle fully open: 0 %	• When the accelerator pedal is released quickly, duty ratio is increased • Read the value with the ignition switch ON (Do not start engine)
Throttle Motor (THROTTLE MOT)	Whether or not throttle motor control is permitted/ ON or OFF	Idling: ON	Read the value with the ignition switch ON (Do not start engine)
ETCS Actuator Power (+BM)	Whether or not Electronic Throttle Control System (ETCS) power is applied/ ON or OFF	Idling: ON	—
Accelerator IDL POS (ACCEL IDL POS)	Whether or not accelerator pedal position sensor is detecting engine idling/ ON or OFF	Idling: ON	—
Throttle IDL POS (THROTTL IDL POS)	Whether or not throttle position sensor is detecting engine idling/ ON or OFF	Idling: ON	—
Fail Safe Drive (FAIL #1)	Whether or not fail–safe function is executed/ ON or OFF	ETCS has failed: ON	—
Fail Safe Drive (Main CPU) (FAIL #2)	Whether or not fail–safe function is executed/ ON or OFF	ETCS has failed: ON	—
Throttle Closed Initial Value (THROTTL INITIAL)	Throttle fully closed (learned value) Min.: 0 V, Max.: 5 V	0.5 to 0.9 V	—
Accelerator Learned Value (ACCEL LEARN VAL)	Accelerator fully closed (learned value) Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	—
Throttle Motor Current (THROTTLE MOT)	Throttle motor current Min.: 0 A, Max.: 20 A	Idling: 0 to 3.0 A	—
O2S B1 S1 (O2S B1 S1)	Heated oxygen sensor output voltage for bank 1 sensor 1/ Min.: 0 V, Max.: 1.275 V	Driving (50 km/h, 31 mph): 0.1 to 0.9 V	Performing the A/F Control function of the Active Test enables the technician to check voltage output of the sensor
O2S B1 S2 (O2S B1 S2)	Heated oxygen sensor output voltage for bank 1 sensor 2/ Min.: 0 V, Max.: 1.275 V	Driving (50 km/h, 31 mph): 0.1 to 0.9 V	Performing the A/F Control function of the Active Test enables the technician to check voltage output of the sensor

Intelligent Tester II Display (Abbreviation)	MeasurementItem/Range (Display)	Normal Condition *1	Diagnostic Note
Short FT #1 (SHORT FT #1)	Short–term fuel trim of bank 1/ Min.: –100 %, Max.: 100 %	0 ± 20 %	This item is the short–term fuel compensation used to maintain the air–fuel ratio at stoichiometric air–fuel ratio
Long FT #1 (LONG FT #1)	Long–term fuel trim of bank 1/ Min.: –100 %, Max.: 99.2 %	0 ± 20 %	This item is overall long–term fuel compensation that helps to maintain air–fuel ratio at stoichiometric air–fuel ratio (steadies long term deviations of short–term fuel trim from central value)
TOTAL FT#1 (TOTAL FT#1)	Total fuel trim of bank 1: Average value for fuel trim system of bank 1/ Min.: –0.5, Max.: 1.496	Idling: 0.5 to 1.4	—
O2 FT B1 S1 (O2 FT B1 S1)	Short–term fuel trim associated with the bank 1 sensor 1/ Min.: –100 %, Max.: 100 %	0 ± 20 %	Same as Short FT #1
O2FT B1 S2 (O2FT B1 S2)	Short–term fuel trim associated with the bank 1 sensor 2/ Min.: –100 %, Max.: 100 %	0 ± 20 %	Same as Short FT #1
FUEL SYS #1 (FUEL SYS #1)	Fuel system status (Bank1) / OL or CL or OL DRIVE or OL FAULT or CL FAULT	Idling after warming up: CL	• OL (Open Loop): Has not yet satisfied conditions for closed loop • CL (Closed Loop): Using the heated oxygen sensor as feed back for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but the heated oxygen sensor used for fuel control is malfunctioning
FC IDL (FC IDL)	Fuel cut idle/ ON or OFF	Fuel cut operation: ON	Fuel cut idle = ”ON” when the throttle valve is fully closed and engine speed is over 1,500 rpm
MIL Status (MIL/WARN LIGHT)	MIL status/ ON or OFF	MIL ON: ON	—
Starter SIG (STARTER SIG)	Starter signal/ ON or OFF	Cranking: ON	—
A/C SIG (A/C SIG)	A/C signal/ ON or OFF	A/C ON: ON	—
PNP SW (PNP SW [NSW])	Park/Neutral position switch signal/ ON or OFF	P or N position: ON	—
Elect Load SIG (ELECT LOAD SIG)	Electrical load signal/ ON or OFF	• Taillamp switch ON: ON • Defogger switch ON: ON	—
Stop Light SW (STOP LIGHT SW)	Stop lamp switch/ ON or OFF	• Brake pedal depressed: ON • Brake pedal released: OFF	—
PS Oil Press SW (PS OIL PRESS SW)	Power steering oil pressure switch signal/ ON or OFF	• While turning the steering wheel: ON • While not turning the steering wheel: OFF	Idle–up control is performed when PS is ON
PS Signal (PS SIGNAL)	Power steering signal/ ON or OFF	When the steering wheel is turned	This signal is usually ON until the ignition switch is turned to OFF

Intelligent Tester II Display (Abbreviation)	Measurement Item/Range (Display)	Normal Condition *1	Diagnostic Note
Fuel Pump (FUEL PUMP / SPD)	Fuel pump/speed status/ ON/H or OFF/M,L	Idling: ON	—
EVAP VSV (EVAP VSV)	EVAP VSV/ ON or OFF	VSV operating: ON	EVAP VSV is controlled by the ECM (ground side duty control)
VVT CTRL B1 (VVT CTRL B1)	VVT control status (bank 1)/ ON or OFF	VVT system in operation: ON	—
IGNITION (IGNITION)	Ignition counter/ Min.: 0, Max.: 400	0 to 400	—
Cylinder #1,#2,#3,#4 Misfire Rate (Cyl #1, #2, #3, #4)	Misfire ratio of the cylinder 1 to 4/ Min.: 0, Max.: 255	0 %	This item is displayed only when idling
MISFIRE RPM (MISFIRE RPM)	Engine RPM for first misfire range/ Min.: 0 rpm, Max.: 6,375 rpm	Misfire 0: 0 rpm	—
MISFIRE LOAD (MISFIRE LOAD)	Engine load for first misfire range/ Min.: 0 g/rev, Max.: 3.98 g/rev	Misfire 0: 0 g/rev	—
FC TAU (FC TAU)	Fuel cut TAU: Fuel cut during very light load/ ON or OFF	Fuel cut operating: ON	Fuel cut is being performed under very light load to prevent engine combustion from becoming incomplete
Check Mode (CHECK MODE)	Check mode/ ON or OFF	Check mode ON: ON	See page 05–20

*1: If no conditions are specifically stated for ”Idling,” the shift lever is in the N or P position, the A/C switch is OFF and all accessory switches are OFF.

2. ACTIVE TEST

HINT:

Performing an Active Test using the intelligent tester II enables components including the relay, VSV, and actuator to be operated without removing any parts. Performing the Active Test as the first step of trouble-shooting is one method to shorten diagnostic time.

Data List is displayed during an Active Test.

(a) Warm up the engine.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON.
(e) Turn the intelligent tester II ON.
(f) Select the following menu items: Powertrain / Engine and ECT / Active Test.
(g) Perform the Active Test by referring to the following table.

Intelligent Tester II Display (Abbreviation)	Test Details	Diagnostic Note
Injector Volume (INJ VOL)	[Test Details] Control the injection volume Min.: –12 %, Max.: 25 % [Vehicle Condition] Engine speed: 3,000 rpm or less	• All injectors are tested at once • Injection volume is gradually changed between –12 % and 25 %
A/F Control (A/F CONTROL)	[Test Details] Control the injection volume –12.5 or 25 % (Change the injection volume by 12.5 % or 25 %) [Vehicle Condition] Engine speed: 3,000 rpm or less	The following A/F Control procedure enables the technician to check and graph the voltage outputs of both the heated oxygen sensors To display the graph, select the following menu items: View / Line graph 1 or Line graph 2
Fuel Pump Relay (FUEL PMP SP CTL)	[Test Details] Control the fuel pump speed ON or OFF	—
Purge VSV (EVAP (PURGE) VSV)	[Test Details] Activate the EVAP VSV control ON or OFF	—
VVT Control (Bank 1) (VVT CTRL B1)	[Test Details] Activate the VVT system (Bank 1) ON or OFF	• ON: Rough idle or engine stall • OFF: Normal engine speed
FC IDL Prohibit (FC IDL PROHBT)	[Test Details] Control the idle fuel cut prohibition ON or OFF	During idling
TE1 (TC) (TC/TE1)	[Test Details] Connect the TC and TE1 ON or OFF	—

054JD–22

DIAGNOSTIC TROUBLE CODE CHART

HINT:

Parameters listed in the chart may not be exactly the same as your readings due to factors such as the type of instrument.

If a DTC is displayed during the DTC check in check mode, check the circuit for the DTC listed in the table below. For details of each DTC, refer to the ”See page” under the respective ”DTC No.” in this chart.

DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P0010 (05–34)	Camshaft Position ”A” Actuator Circuit (Bank 1)	• Open or short in oil control valve circuit • Oil control valve • ECM	○	○
P0011 (05–38)	Camshaft Position ”A” –Timing Over–Advanced or System Performance (Bank 1)	• Valve timing • Oil control valve • Camshaft timing gear assy • ECM	—	○
P0012 (05–38)	Camshaft Position ”A” –Timing Over– Retarded (Bank 1)	• Valve timing • Oil control valve • Camshaft timing gear assy • ECM	—	○
P0016 (05–42)	Crankshaft Position – Camshaft Position Correlation (Bank 1 Sensor A)	• Mechanical system (Jumped tooth of timing chain or chain stretched) • ECM	—	○
P0031 (05–43)	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	• Open or short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (Sensor 1) • EFI relay • ECM	○	○
P0032 (05–43)	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 1)	• Open or short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (Sensor 1) • EFI relay • ECM	○	○
P0037 (05–46)	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	• Open in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (Sensor 2) • EFI relay • ECM	○	○
P0038 (05–46)	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	• Short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (Sensor 2) • EFI relay • ECM	○	○
P0100 (05–49)	Mass Air Flow Circuit Malfunction	• Open or short in mass air flow meter circuit • Mass air flow meter • ECM	○	○
P0102 (05–49)	Mass or Volume Air Flow Circuit Low Input	• Open in mass air flow meter circuit • Mass air flow meter • ECM	○	○
P0103 (05–49)	Mass or Volume Air Flow Circuit High Input	• Short in mass air flow meter circuit • Mass air flow meter • ECM	○	○
P0110 (05–55)	Intake Air Temperature Circuit	• Open or short in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM	○	○
P0112 (05–55)	Intake Air Temperature Circuit Low Input	• Short in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM	○	○
P0113 (05–55)	Intake Air Temperature Circuit High Input	• Open in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM	○	○

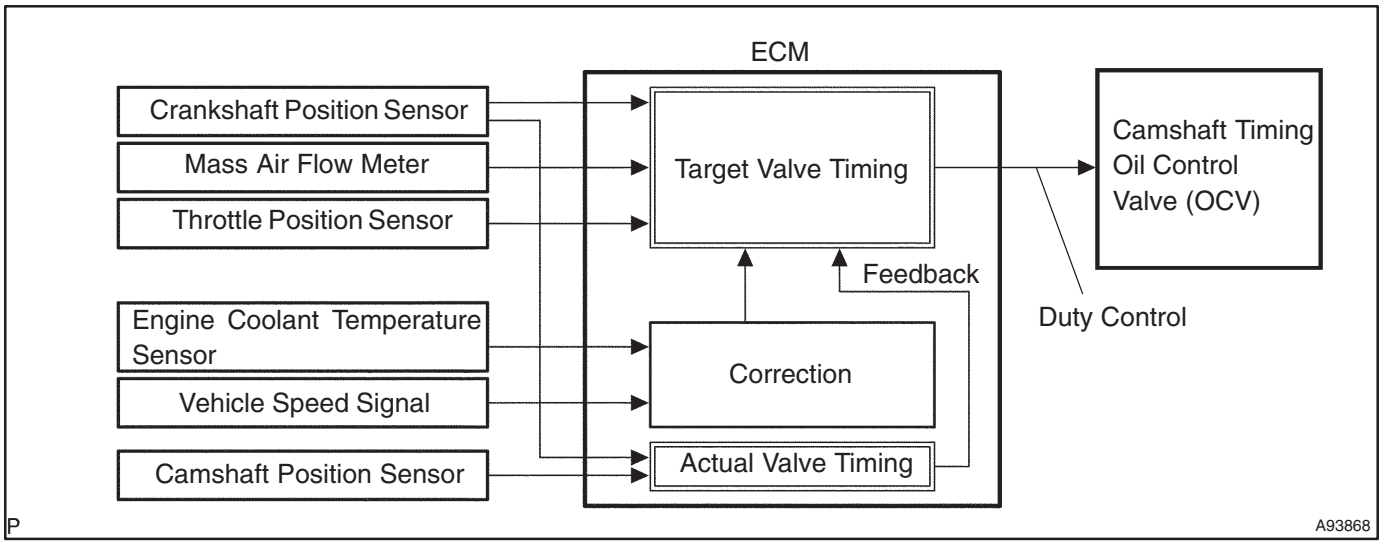
DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P0115 (05–60)	Engine Coolant Temperature Circuit	• Open or short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM	○	○
P0116 (05–65)	Engine Coolant Temperature Circuit Range/Performance Problem	• Engine coolant temperature sensor	○	○
P0117 (05–60)	Engine Coolant Temperature Circuit Low Input	• Short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM	○	○
P0118 (05–60)	Engine Coolant Temperature Circuit High Input	• Open in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM	○	○
P0120 (05–66)	Throttle/Pedal Position Sensor/ Switch "A" Circuit	• Throttle position sensor (built into throttle body) • ECM	○	○
P0121 (05–73)	Throttle/Pedal Position Sensor/ Switch "A" Circuit Range/Performance Problem	• Throttle position sensor (built into throttle body)	○	○
P0122 (05–66)	Throttle/Pedal Position Sensor/ Switch "A" Circuit Low Input	• Throttle position sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM	○	○
P0123 (05–66)	Throttle/Pedal Position Sensor/ Switch "A" Circuit High Input	• Throttle position sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • VC and VTA1 circuits are short–circuited • ECM	○	○
P0130 *4 (05–74)	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 1)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (Sensor 1) • Heated oxygen sensor heater (Sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM	○	○
P0133 *4 (05–84)	Oxygen Sensor Circuit Slow Response (Bank 1 Sensor 1)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (Sensor 1) • Heated oxygen sensor heater (Sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM	○	○
P0134 (05–91)	Oxygen Sensor Circuit No Activity Detected (Bank 1 Sensor 1)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (Sensor 1) • PCV valve and hose • EFI relay • Air induction system • Fuel pressure • Injector • Gas leakage in exhaust system • ECM	○	○
P0136 (05–100)	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (sensor 2) • Heated oxygen sensor heater (sensor 2) • EFI relay	○	○

DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P0171 *4 (05–106)	System Too Lean (Bank 1)	• Air induction system • Injector blockage • Mass air flow meter • Engine coolant temperature sensor • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (sensor 1) circuit • Heated oxygen sensor (sensor 1) • PCV valve and hose • PCV hose connection • ECM	○	○
P0172 *4 (05–106)	System Too Rich (Bank 1)	• Injector leakage or blockage • Mass air flow meter • Engine coolant temperature sensor • Ignition system • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (sensor 1) circuit • Heated oxygen sensor (sensor 1) • ECM	○	○
P0220 (05–66)	Throttle/Pedal Position Sensor/ Switch "B" Circuit	• Throttle position sensor (built into throttle body) • ECM	○	○
P0222 (05–66)	Throttle/Pedal Position Sensor/ Switch "B" Circuit Low Input	• Throttle position sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM	○	○
P0223 (05–66)	Throttle/Pedal Position Sensor/ Switch "B" Circuit High Input	• Throttle position sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • VC and VTA2 circuits are short–circuited • ECM	○	○
P0300 *4 (05–118)	Random/Multiple Cylinder Misfire Detected	• Open or short in engine wire harness • Connector connection • Vacuum hose connection • Ignition system • Injector • Fuel pressure • Mass air flow meter • Engine coolant temperature sensor • Compression pressure • Valve clearance • Valve timing • PCV hose connection • PCV hose • ECM	○ *2	○
P0301 *4 (05–118)	Cylinder 1 Misfire Detected	• Same as DTC P0300	○ *2	○
P0302 *4 (05–118)	Cylinder 2 Misfire Detected	• Same as DTC P0300	○ *2	○
P0303 *4 (05–118)	Cylinder 3 Misfire Detected	• Same as DTC P0300	○ *2	○
P0304 *4 (05–118)	Cylinder 4 Misfire Detected	• Same as DTC P0300	○ *2	○
P0325 (05–132)	Knock Sensor 1 Circuit (Bank 1 or Single Sensor)	• Open or short in knock sensor circuit • Knock sensor (under–torqued or looseness) • ECM	○	○

DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P0327 (05–132)	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)	• Short in knock sensor circuit • Knock sensor • ECM	○	○
P0328 (05–132)	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)	• Open in knock sensor circuit • Knock sensor • ECM	○	○
P0335 (05–136)	Crankshaft Position Sensor "A" Circuit	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Sensor plate (crankshaft) • ECM	○	○
P0339 (05–136)	Crankshaft Position Sensor "A" Circuit Intermittent	• Same as DTC P0335	—	○
P0340 (05–140)	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing pulley • Jumped tooth of timing chain • ECM	○	○
P0341 (05–140)	Camshaft Position Sensor "A" Circuit Range/Performance (Bank 1 or Single Sensor)	• Same as DTC P0340	○	○
P0351 (05–143)	Ignition Coil "A" Primary/Secondary Circuit	• Ignition system • Open or short in IGF or IGT1 to 4 circuit from ignition coil with igniter to ECM • No. 1 to No. 4 ignition coil with igniter • ECM	○	○
P0352 (05–143)	Ignition Coil "B" Primary/Secondary Circuit	• Same as DTC P0351	○	○
P0353 (05–143)	Ignition Coil "C" Primary/Secondary Circuit	• Same as DTC P0351	○	○
P0354 (05–143)	Ignition Coil "D" Primary/Secondary Circuit	• Same as DTC P0351	○	○
P0420 *4 (05–150)	Catalyst System Efficiency Below Threshold (Bank 1)	• Gas leakage in exhaust system • Heated oxygen sensor (sensor 1) • Heated oxygen sensor (sensor 2) • Three–way catalytic converter	○	○
P0443 (05–155)	Evaporative Emission Control System Purge Control Valve Circuit	• Open or short in EVAP VSV circuit • EVAP VSV • ECM	○	○
P0500 (05–158)	Vehicle Speed Sensor "A"	• Open or short in speed sensor circuit • Speed sensor • Combinationmeter • ECM • Skid control ECU	○	○
P0504 (05–161)	Brake Switch "A"/"B" Correlation	• Short in stop lamp switch signal circuit • Stop lamp fuse • Stop lamp switch • ECM	—	○
P0505 (05–165)	Idle Air Control System	• Electronic throttle control system • Air induction system • PCV hose connection	○	○
P0560 (05–167)	System Voltage	• Open in backup power source circuit • ECM	○	○
P0604 (05–170)	Internal Control Module Random Access Memory (RAM) Error	• ECM	○	○
P0606 (05–170)	ECM/PCM Processor	• ECM	○	○

DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P0607 (05–170)	Control Module Performance	• ECM	○	○
P0617 (05–171)	Starter Relay Circuit High	• Short in park/neutral position switch circuit (MMT) • Short in STA circuit • Park/neutral position switch (MMT) • ECM	○	○
P0657 (05–170)	Actuator Supply Voltage Circuit / Open	• ECM	○	○
P0705 (05–247)	Transmission Range Sensor Circuit Malfunction (PRNDL Input)	• Electronic control automatic transaxle	○	○
P0710 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit	• Electronic control automatic transaxle	○	○
P0711 (05–255)	Transmission Fluid Temperature Sensor "A" Performance	• Electronic control automatic transaxle	○	○
P0712 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit Low Input	• Electronic control automatic transaxle	○	○
P0713 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit High Input	• Electronic control automatic transaxle	○	○
P0717 (05–258)	Turbine Speed Sensor Circuit No Signal	• Electronic control automatic transaxle	○	○
P0724 (05–261)	Brake Switch "B" Circuit High	• Electronic control automatic transaxle	○	○
P0741 (05–264)	Torque Converter Clutch Solenoid Performance (Shift Solenoid Valve SL)	• Electronic control automatic transaxle	○	○
P0751 (05–268)	Shift Solenoid "A" Performance (Shift Solenoid Valve S1)	• Electronic control automatic transaxle	○	○
P0756 (05–271)	Shift Solenoid "B" Performance (Shift Solenoid Valve S2)	• Electronic control automatic transaxle	○	○
P0787 (05–274)	Shift/Timing Solenoid Low (Shift Solenoid Valve ST)	• Electronic control automatic transaxle	○	○
P0788 (05–274)	Shift/Timing Solenoid High (Shift Solenoid Valve ST)	• Electronic control automatic transaxle	○	○
P0973 (05–277)	Shift Solenoid "A" Control Circuit Low (Shift Solenoid Valve S1)	• Electronic control automatic transaxle	○	○
P0974 (05–277)	Shift Solenoid "A" Control Circuit High (Shift Solenoid Valve S1)	• Electronic control automatic transaxle	○	○
P0976 (05–280)	Shift Solenoid "B" Control Circuit Low (Shift Solenoid Valve S2)	• Electronic control automatic transaxle	○	○
P0977 (05–280)	Shift Solenoid "B" Control Circuit High (Shift Solenoid Valve S2)	• Electronic control automatic transaxle	○	○
P0998 (05–283)	Shift Solenoid "F" Control Circuit Low (Shift Solenoid Valve SB)	• Electronic control automatic transaxle	○	○
P0999 (05–283)	Shift Solenoid "F" Control Circuit High (Shift Solenoid Valve SB)	• Electronic control automatic transaxle	○	○
P2102 (05–174)	Throttle Actuator Control Motor Circuit Low	• Open in throttle control actuator circuit • Throttle actuator • ECM	○	○
P2103 (05–174)	Throttle Actuator Control Motor Circuit High	• Short in throttle control actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM	○	○

DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P2111 (05–177)	Throttle Actuator Control System – Stuck Open	• Throttle actuator • Throttle body assembly • Throttle valve	○	○
P2112 (05–177)	Throttle Actuator Control System – Stuck Closed	• Same as DTC P2111	○	○
P2118 (05–179)	Throttle Actuator Control Motor CurrentRange/Performance	• Open in ETCS power source circuit • ETCS fuse • ECM	○	○
P2119 (05–182)	Throttle Actuator Control Throttle BodyRange/Performance	• Electronic throttle control system • ECM	○	○
P2120 (05–184)	Throttle/Pedal Position Sensor/ Switch "D" Circuit	• Accelerator pedal position sensor • ECM	○	○
P2121 (05–192)	Throttle/Pedal Position Sensor/ Switch "D" Circuit Range/Perfor-mance	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor • ECM	○	○
P2122 (05–184)	Throttle/Pedal Position Sensor/ Switch "D" Circuit Low Input	• Accelerator pedal position sensor • Open in VCP1 circuit • Open or ground short in VPA1 circuit • ECM	○	○
P2123 (05–184)	Throttle/Pedal Position Sensor/ Switch "D" Circuit High Input	• Accelerator pedal position sensor • Open in EPA circuit • ECM	○	○
P2125 (05–184)	Throttle/Pedal Position Sensor/ Switch "E" Circuit	• Accelerator pedal position sensor • ECM	○	○
P2127 (05–184)	Throttle/Pedal Position Sensor/ Switch "E" Circuit Low Input	• Accelerator pedal position sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM	○	○
P2128 (05–184)	Throttle/Pedal Position Sensor/ Switch "E" Circuit High Input	• Accelerator pedal position sensor • Open in EPA2 circuit • ECM	○	○
P2135 (05–66)	Throttle/Pedal Position Sensor/ Switch "A"/"B" Voltage Correla-tion	• VTA1 and VTA2 circuits are short–circuited • Throttle position sensor (built into throttle body) • ECM	○	○
P2138 (05–184)	Throttle/Pedal Position Sensor/ Switch "D"/"E" Voltage Correla-tion	• VPA1 and VPA2 circuits are short circuited • Accelerator pedal position sensor • ECM	○	○
P2195 *4 (05–74)	Oxygen Sensor Signal Stuck Lean (Bank 1 Sensor 1)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (Sensor 1) • Heated oxygen sensor heater (Sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM	○	○
P2196 *4 (05–74)	Oxygen Sensor Signal Stuck Rich (Bank 1 Sensor 1)	• Same as DTC P2195	○	○
P2716 (05–286)	Pressure Control Solenoid "D" Electrical (Shift Solenoid SLT)	• Electronic control automatic transaxle	○	○
P2769 (05–289)	Torque Converter Clutch Sole-noid Circuit Low (Shift Solenoid Valve SL)	• Electronic control automatic transaxle	○	○



DTC No. (See Page)	Detection Item	Trouble Area	*1 MIL	Memory
P2770 (05–289)	Torque Converter Clutch Solenoid Circuit High (Shift Solenoid Valve SL)	• Electronic control automatic transaxle	○	○
B2799 (*3)	Engine Immobilizer System Malfunction	• Immobilizer system	—	○

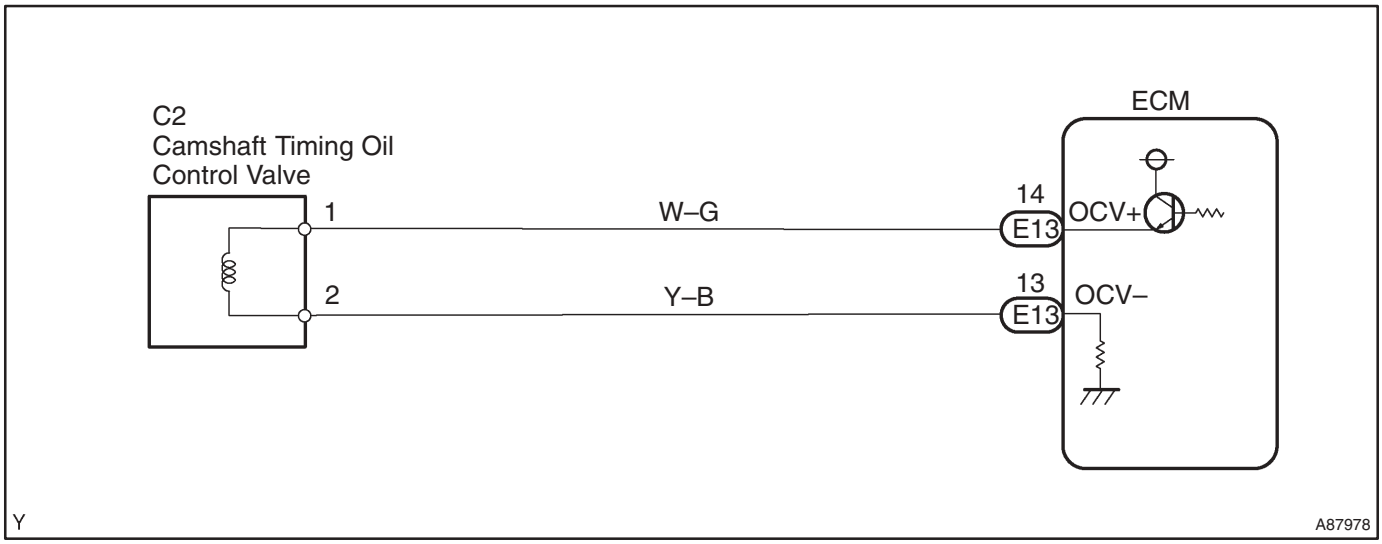
DTC	P0010	CAMSHAFT POSITION ”A” ACTUATOR CIRCUIT (BANK 1)



CIRCUIT DESCRIPTION

The Variable Valve Timing (VVT) system includes the ECM, Oil Control Valve (OCV) and VVT controller. The ECM sends a target ”duty–cycle” control signal to the OCV. This control signal, applied to the OCV, regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed based on engine operating conditions such as intake air volume, throttle position and engine coolant temperature.
The ECM controls the OCV based on the signals from several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative position between the camshaft and crankshaft is optimized, the engine torque and the fuel economy improve, and the exhaust emission drops. The ECM detects the actual valve timing using signals from the camshaft and crankshaft position sensors. The ECM performs feedback control and verifies target valve timing.

DTC No.	DTC Detection Condition	Trouble Area
P0010	Open or short in oil control valve circuit (1 trip detection logic)	• Open or short in oil control valve circuit • Oil control valve • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

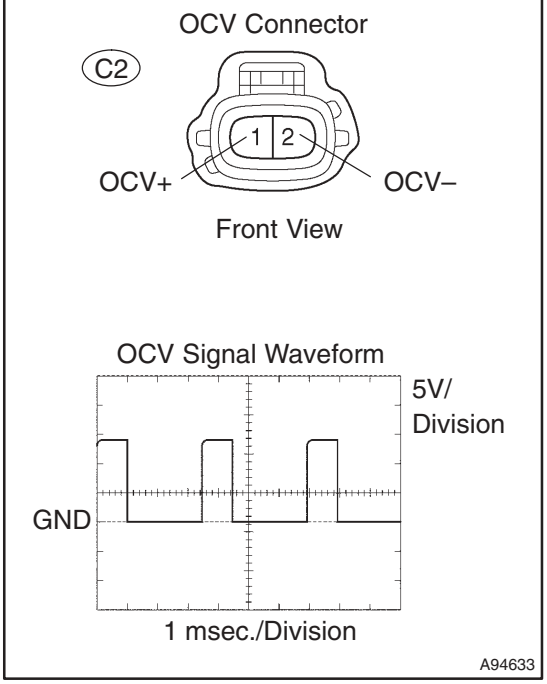
HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER II(OPERATE OCV)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Active Test / VVT Control (Bank 1).
(f) Check the engine speed when operating the OCV using the intelligent tester II.

Standard:



Tester Operation	Specified Condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idling or engine stalling

OK → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

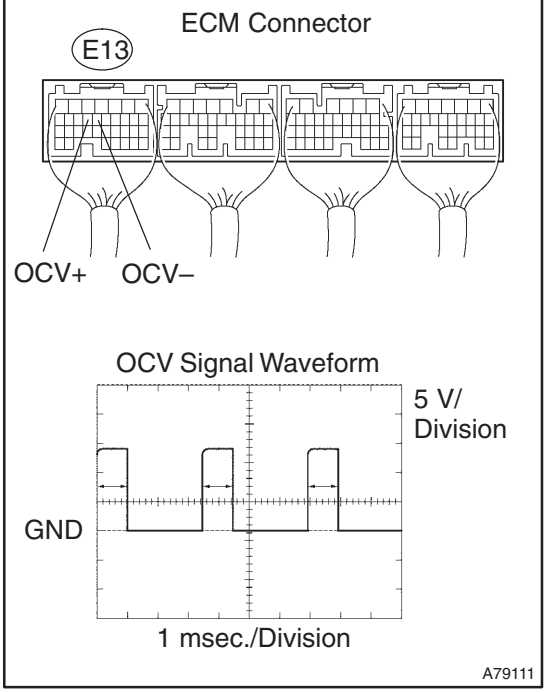
NG

2 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSY(OCV)

Wire Harness Side:

(a) Disconnect the C2 OCV connector.
(b) During idling, check the waveform between the specified terminals of the C2 OCV connector using the oscilloscope.

Standard:



Tester Connection	Specified Condition
OCV+ (C2–1) – OCV– (C2–2)	Correct waveform is as shown

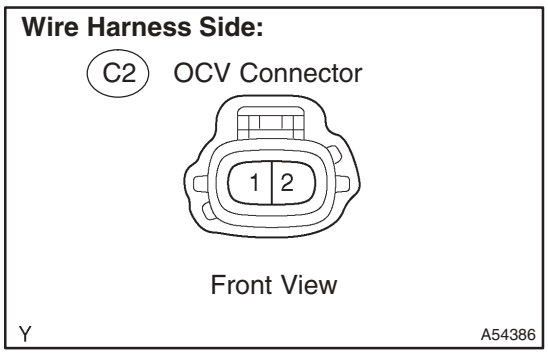
(c) Reconnect the OCV connector.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSY**

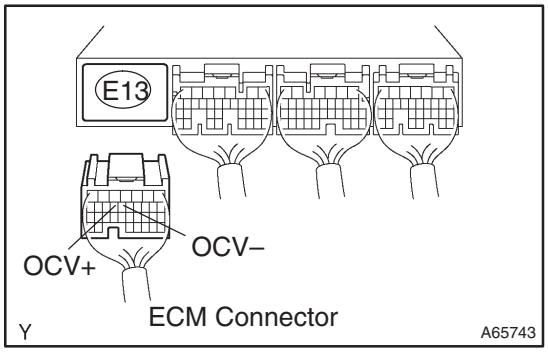
OK

3 INSPECT ECM(OCV SIGNAL)

(a) Inspect using the oscilloscope.
(b) During idling, check the waveform between the specified terminals of the E13 ECM connector.



Standard:



Tester Connection	Specified Condition
OCV+ (E13–14) – OCV– (E13–13)	Correct waveform is as shown

NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

4	CHECK HARNESS AND CONNECTOR(CAMSHAFT TIMING OIL CONTROL VALVE (OCV) – ECM)

(a) Disconnect the C2 OCV connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
OCV (C2–1) – OCV+ (E13–14)	Below 1 Ω
OCV (C2–2) – OCV– (E13–13)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
OCV (C2–1) or OCV+ (E13–14) – Body ground	10 kΩ or higher
OCV (C2–1) or OCV– (E13–13) – Body ground	10 kΩ or higher

(d) Reconnect the OCV connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

DTC	P0011	CAMSHAFT POSITION ”A” –TIMING OVER–ADVANCED OR SYSTEM PERFORMANCE (BANK 1)

DTC	P0012	CAMSHAFT POSITION ”A” –TIMING OVER–RETARDED (BANK 1)

CIRCUIT DESCRIPTION

Refer to DTC P0010 on page 05–34.

DTC No.	DTC Detection Condition	Trouble Area
P0011	Advanced cam timing: After engine is warmed up, valve timing does not change from current valve timing while driving at engine speed of 500 to 4,000 rpm (1 trip detection logic)	• Valve timing • Oil control valve • Camshaft timing gear assy • ECM
P0012	Retarded cam timing: After engine is warmed up, valve timing does not change from current valve timing while driving at engine speed of 500 to 4,000 rpm (2 trip detection logic)	• Valve timing • Oil control valve • Camshaft timing gear assy • ECM

WIRING DIAGRAM

Refer to DTC P0010 on page 05–34.

INSPECTION PROCEDURE

HINT:

Advanced timing over (Valve timing is out of specified range)	P0011
Retarded timing over (Valve timing is out of specified range)	P0012

- If DTC P0011 or P0012 is displayed, check the VVT system circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK VALVE TIMING (See page 14–49 of Pub. No. RM1018E AVENSIS)

(a) Check for looseness or a jumped tooth of the timing chain.
OK: The matchmarks of the crankshaft pulley and camshaft pulley are aligned.

NG → **ADJUST VALVE TIMING (See page 14–49 of Pub. No. RM1018E AVENSIS)**

OK

2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER II(OPERATE OCV)

(a) Start the engine and warm it up.
(b) Turn the ignition switch to OFF.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Active Test / VVT Control (Bank 1).
(f) Check the engine speed when operating the OCV using the intelligent tester II.

Standard:

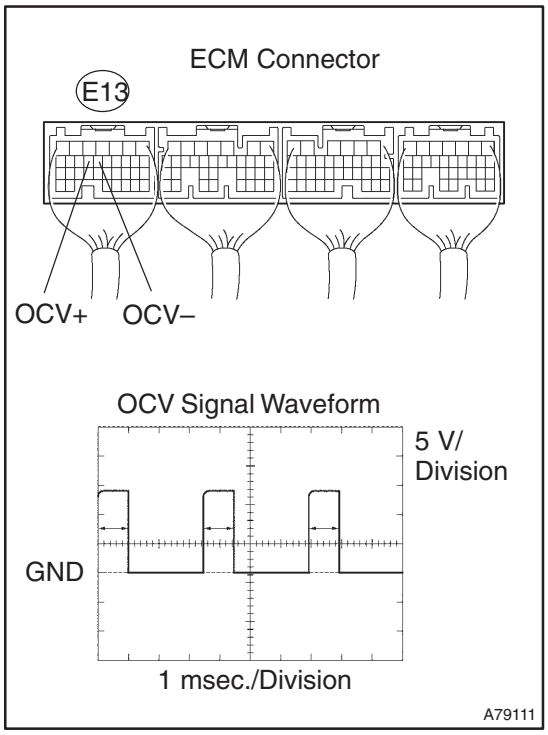
Tester Operation	Specified Condition
OCV is OFF	Normal engine speed
OCV is ON	Rough idling or engine stalling

NG → **Go to step 4**

OK

3	CHECK IF DTC OUTPUT RECURS(DTC P0011 OR P0012)

(a) Clear the DTC(s) using the intelligent tester II (see page 05–18).
(b) Start the engine and warm it up.
(c) Drive the vehicle for 10 minutes or more.
(d) Read output DTCs using the intelligent tester II.



OK: No DTC output.

OK → **VVT SYSTEM OK**

HINT:
DTC P0011 or P0012 is output when foreign objects in engine oil are caught in some part of the system. These DTCs will remain set even when the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

NG

4	INSPECT ECM(OCV SIGNAL)

(a) Inspect using the oscilloscope.
(b) During idling, check the waveform between the specified terminals of the E13 ECM connector.

Standard:

Tester Connection	Specified Condition
OCV+ (E13–14) – OCV– (E13–13)	Correct waveform is as shown

NG → **REPLACE ECM(See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

5	INSPECT OIL CONTROL VALVE FILTER

OK: The filter is not clogged.

NG → **REPLACE OIL CONTROL VALVE FILTER**

OK

6	INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSY(OCV) (See page 10–3)

OK: The OCV has no contamination and moves smoothly.

OK → **Go to step 8**

NG

7	REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSY(OCV)

GO

8	**INSPECT CAMSHAFT TIMING GEAR ASSY (See page 14–64 of Pub. No. RM1018E AVENSIS)**

OK: The camshaft timing gear rotates smoothly when applying pressure.

OK → **Go to step 10**

NG

9	**REPLACE CAMSHAFT TIMING GEAR ASSY**

GO

10	**CHECK FOR BLOCKAGE(OCV, OIL CHECK VALVE AND OIL HOLE)**

OK: No blockage.

NG → **REPAIR OR REPLACE**

OK

11	**CHECK IF DTC OUTPUT RECURS(DTC P0011 OR P0012)**

(a) Clear the DTC(s) using the intelligent tester II (see page 05–18).
(b) Start the engine and warm it up.
(c) Drive the vehicle for 10 minutes or more.
(d) Read output DTCs using the intelligent tester II.

Standard: No DTC output.

OK → **VVT SYSTEM OK**

HINT:
DTC P0011 or P0012 is output when foreign objects in engine oil are caught in some part of the system. These DTCs will remain set even when the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

NG

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0016	CRANKSHAFT POSITION – CAMSHAFT POSITION CORRELATION (BANK 1 SENSOR A)

CIRCUIT DESCRIPTION

Refer to DTC P0335 and P0339 on page 05–136.

DTC No.	DTC Detection Condition	Trouble Area
P0016	Deviation in crankshaft position sensor signal and camshaft position signal (2 trip detection logic)	• Mechanical system (Jumped tooth of timing chain or chain stretched) • ECM

WIRING DIAGRAM

Refer to DTC P0335 and P0339 on page 05–136.

INSPECTION PROCEDURE

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK VALVE TIMING(CHECK FOR LOOSENESS AND JUMPED TEETH ON TIMING CHAIN) (See page 14–49 of Pub. No. RM1018E AVENSIS)

(a) Check for looseness or a jumped tooth of the timing chain.
OK: The matchmarks of the crankshaft pulley and camshaft pulley are aligned.

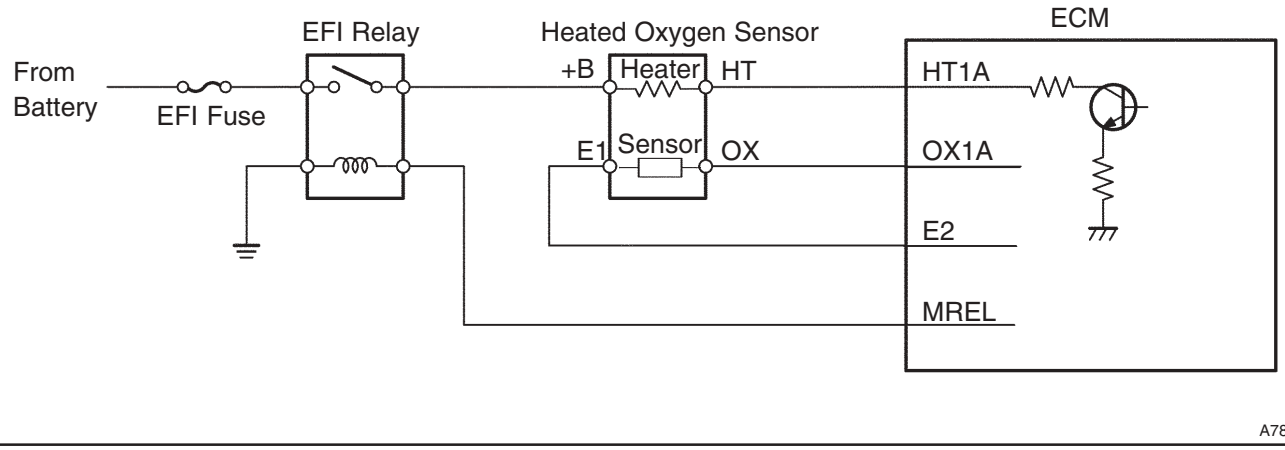
NG → **ADJUST VALVE TIMING (See page 14–49 of Pub. No. RM1018E AVENSIS) (REPAIR OR REPLACE TIMING CHAIN)**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0031	OXYGEN SENSOR HEATER CONTROL CIRCUIT LOW (BANK 1 SENSOR 1)

DTC	P0032	OXYGEN SENSOR HEATER CONTROL CIRCUIT HIGH (BANK 1 SENSOR 1)



CIRCUIT DESCRIPTION

Refer to DTC P0130 on page 05–74.

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The heated oxygen sensor heater circuit uses a relay on the +B side of the circuit.

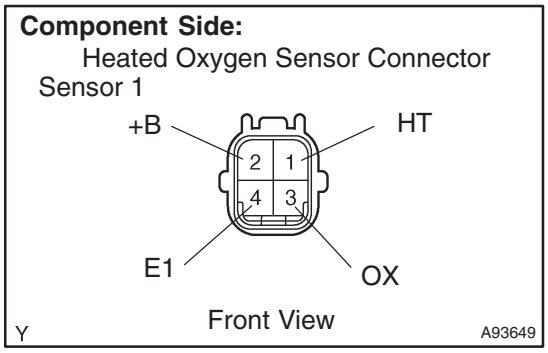
Reference (Sensor 1 System Diagram):

DTC No.	DTC Detection Condition	Trouble Area
P0031	Heated current is 0.8 A or less when heater operates (1 trip detection logic)	• Open or short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (sensor 1) • EFI relay • ECM
P0032	Heated current exceeds 10 A when the heater operates (1 trip detection logic)	• Open or short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (sensor 1) • EFI relay • ECM

HINT:

- Sensor 1 refers to the sensor mounted in front of the Three–Way Catalytic Converter (TWC) and located near the engine assembly.
- Sensor 2 refers to the sensor mounted behind the TWC and located far from the engine assembly.

WIRING DIAGRAM



Refer to DTC P0130 on page 05–74.

INSPECTION PROCEDURE

HINT:

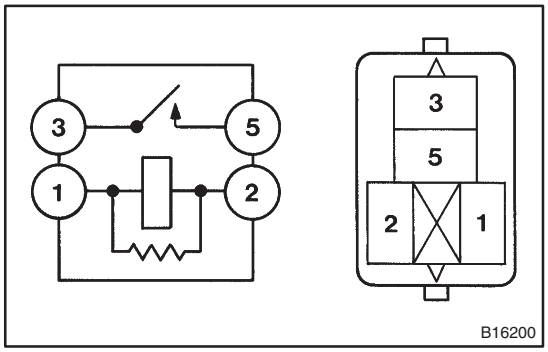
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

(a) Disconnect the H7 heated oxygen sensor connector.

(b) Measure the resistance between the terminals of the heated oxygen sensor connector.

Standard (Sensor 1):



Tester Connection	Specified Condition
1 (HT) – 2 (+B)	5 to 10 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

(c) Reconnect the heated oxygen sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

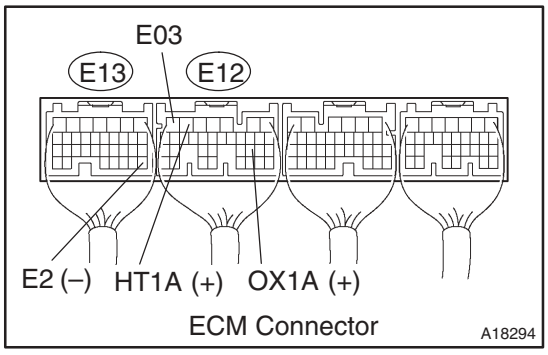
OK

2 INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B.

(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

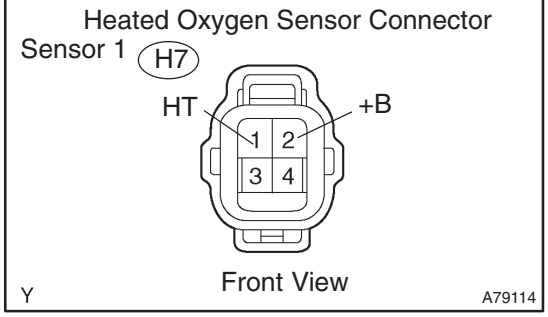
OK

3 INSPECT ECM(HT1A VOLTAGE)

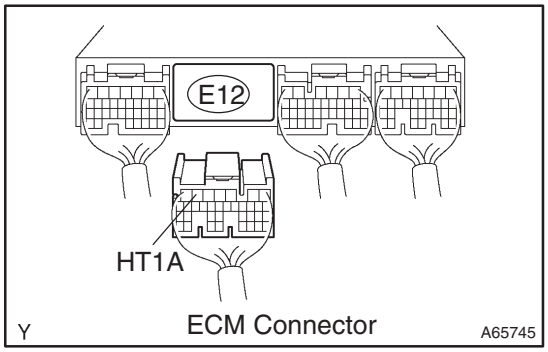
(a) Turn the ignition switch to ON.

(b) Measure the voltage between the applicable terminals of the E12 and E13 ECM connectors.

Standard:

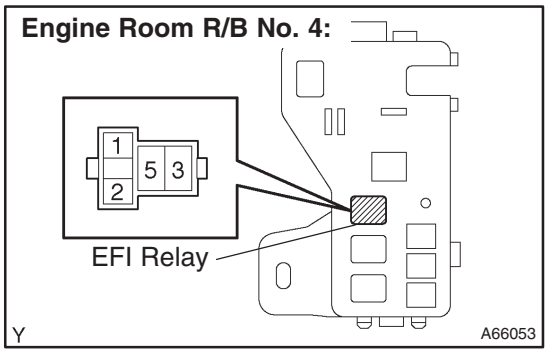


Tester Connection	Specified Condition
HT1A (E12–6) – E03 (E12–7)	9 to 14 V
OX1A (E12–22) – E2 (E13–28)	9 to 14 V



OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG



4	CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM, HEATED OXYGEN SENSOR – EFI RELAY)

Wire Harness Side:

Engine Room R/B No. 4:

(a) Check the harness and the connectors between the ECM and the heated oxygen sensor.
  (1) Disconnect the H7 heated oxygen sensor connector.
  (2) Disconnect the E12 ECM connector.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
HT (H7–1) – HT1A (E12–6)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
HT (H7–1) or HT1A (E12–6) – Body ground	10 kΩ or higher

  (4) Reconnect the heated oxygen sensor connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and the connectors between the heated oxygen sensor and EFI relay.
  (1) Disconnect the H7 heated oxygen sensor connector.
  (2) Remove the EFI relay from the engine room R/B No.4.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
+B (H7–2) – EFI relay (3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
+B (H7–2) or EFI relay (3) – Body ground	10 kΩ or higher

  (4) Reconnect the heated oxygen sensor connector.
  (5) Reinstall the EFI relay.

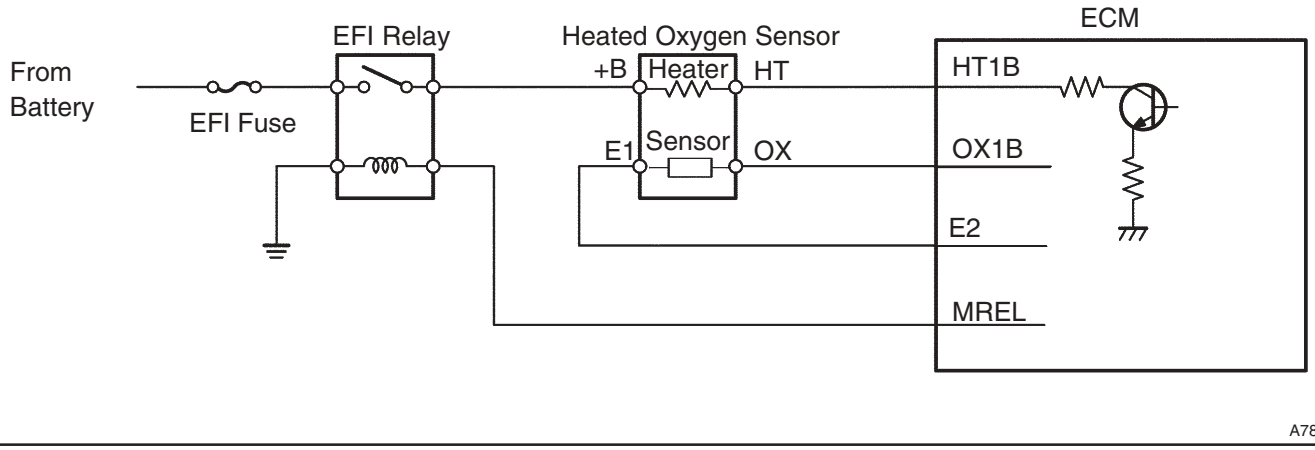
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0037	OXYGEN SENSOR HEATER CONTROL CIRCUIT LOW (BANK 1 SENSOR 2)

DTC	P0038	OXYGEN SENSOR HEATER CONTROL CIRCUIT HIGH (BANK 1 SENSOR 2)



CIRCUIT DESCRIPTION

Refer to DTC P0130 on page 05–74.

HINT:

The ECM provides a pulse width modulated control circuit to adjust current through the heater. The heated oxygen sensor heater circuit uses a relay on the +B side of the circuit.

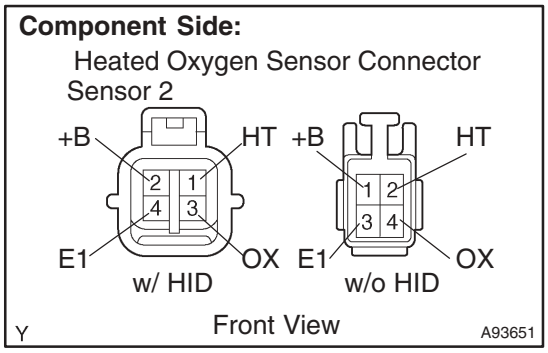
Reference (Sensor 2 System Diagram):

DTC No.	DTC Detection Condition	Trouble Area
P0037	Heated current is 0.25 A or less when heater operates (1 trip detection logic)	• Open in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (sensor 2) • EFI relay • ECM
P0038	Heater current exceeds 2 A when heater operates (1 trip detection logic)	• Short in heater circuit of heated oxygen sensor • Heated oxygen sensor heater (sensor 2) • EFI relay • ECM

HINT:

- Sensor 1 refers to the sensor mounted in front of the Three–Way Catalytic Converter (TWC) and located near the engine assembly.
- Sensor 2 refers to the sensor mounted behind the TWC and located far from the engine assembly.

WIRING DIAGRAM



Refer to DTC P0130 on page 05–74.

INSPECTION PROCEDURE

HINT:

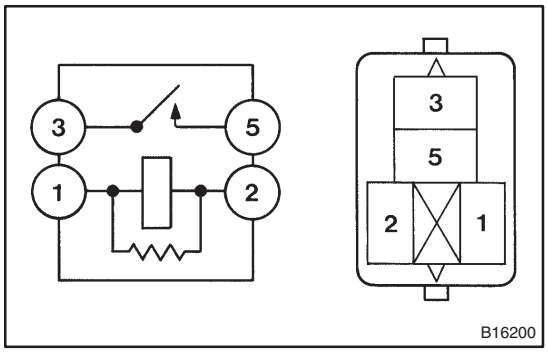
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

(a) Disconnect the H17 heated oxygen sensor connector.

(b) Measure the resistance between the terminals of the heated oxygen sensor connector.

Standard:



Tester Connection	Specified Condition
With HID: 1 (HT) – 2 (+B)	11 to 16 Ω at 20°C (68°F)
With HID: 1 (HT) – 4 (E1)	No Continuity
Without HID: 2 (HT) – 1 (+B)	11 to 16 Ω at 20°C (68°F)
Without HID: 2 (HT) – 3 (E1)	No Continuity

(c) Reconnect the heated oxygen sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

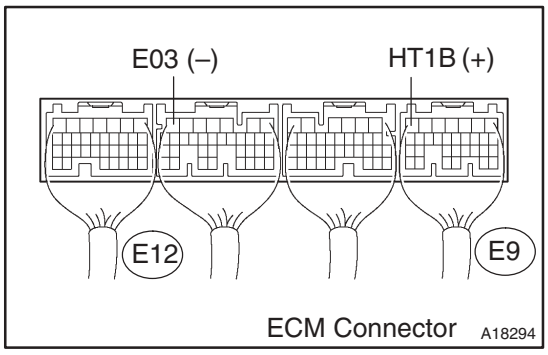
OK

2 INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B No. 4.

(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

(c) Reinstall the EFI relay.

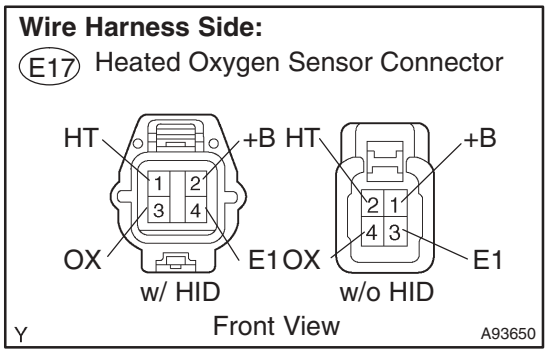
NG → **REPLACE EFI RELAY**

OK

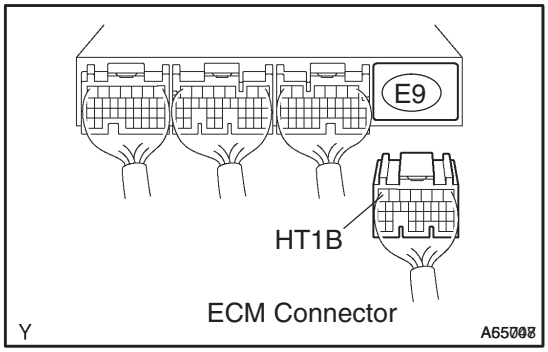
3 INSPECT ECM(HT1B VOLTAGE)

(a) Turn the ignition switch to ON.

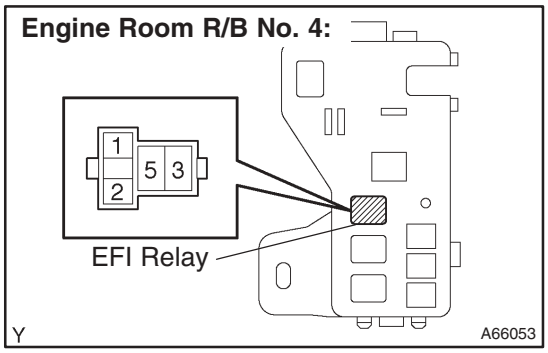
(b) Measure the voltage between the applicable terminals of the E9 and E12 ECM connectors.



Standard:



Tester Connection	Specified Condition
HT1B (E9–7) – E03 (E12–7)	9 to 14 V



OK	REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

NG

4	CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM, HEATED OXYGEN SENSOR – EFI RELAY)

(a) Check the harness and the connectors between the ECM and heated oxygen sensor.
  (1) Disconnect the H17 heated oxygen sensor connector.
  (2) Disconnect the E9 ECM connector.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
With HID: HT (H17–1) – HT1B (E9–7)	Below 1 Ω
Without HID: HT (H17–2) – HT1B (E9–7)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
With HID: HT (H17–1) or HT1B (E9–7) – Body ground	10 kΩ or higher
Without HID: HT (H17–2) or HT1B (E9–7) – Body ground	10 kΩ or higher

  (4) Reconnect the heated oxygen sensor connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and the connectors between the heated oxygen sensor and EFI relay.
  (1) Disconnect the H17 heated oxygen sensor connector.
  (2) Remove the EFI relay from the engine room R/B No. 4.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
+B (H17–1) – EFI relay (3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
+B (H17–1) or EFI relay (3) – Body ground	10 kΩ or higher

  (4) Reconnect the heated oxygen sensor connector.
  (5) Reinstall the EFI relay.

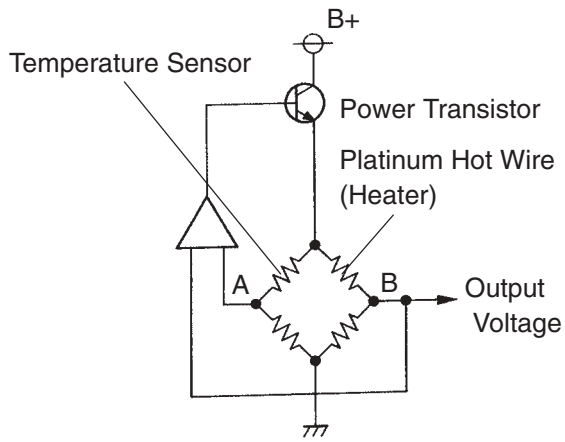
NG	REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

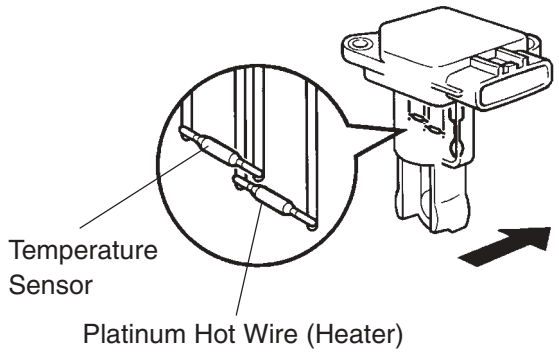
DTC	P0100	MASS AIR FLOW CIRCUIT MALFUNCTION

DTC	P0102	MASS OR VOLUME AIR FLOW CIRCUIT LOW INPUT



DTC	P0103	MASS OR VOLUME AIR FLOW CIRCUIT HIGH INPUT

CIRCUIT DESCRIPTION

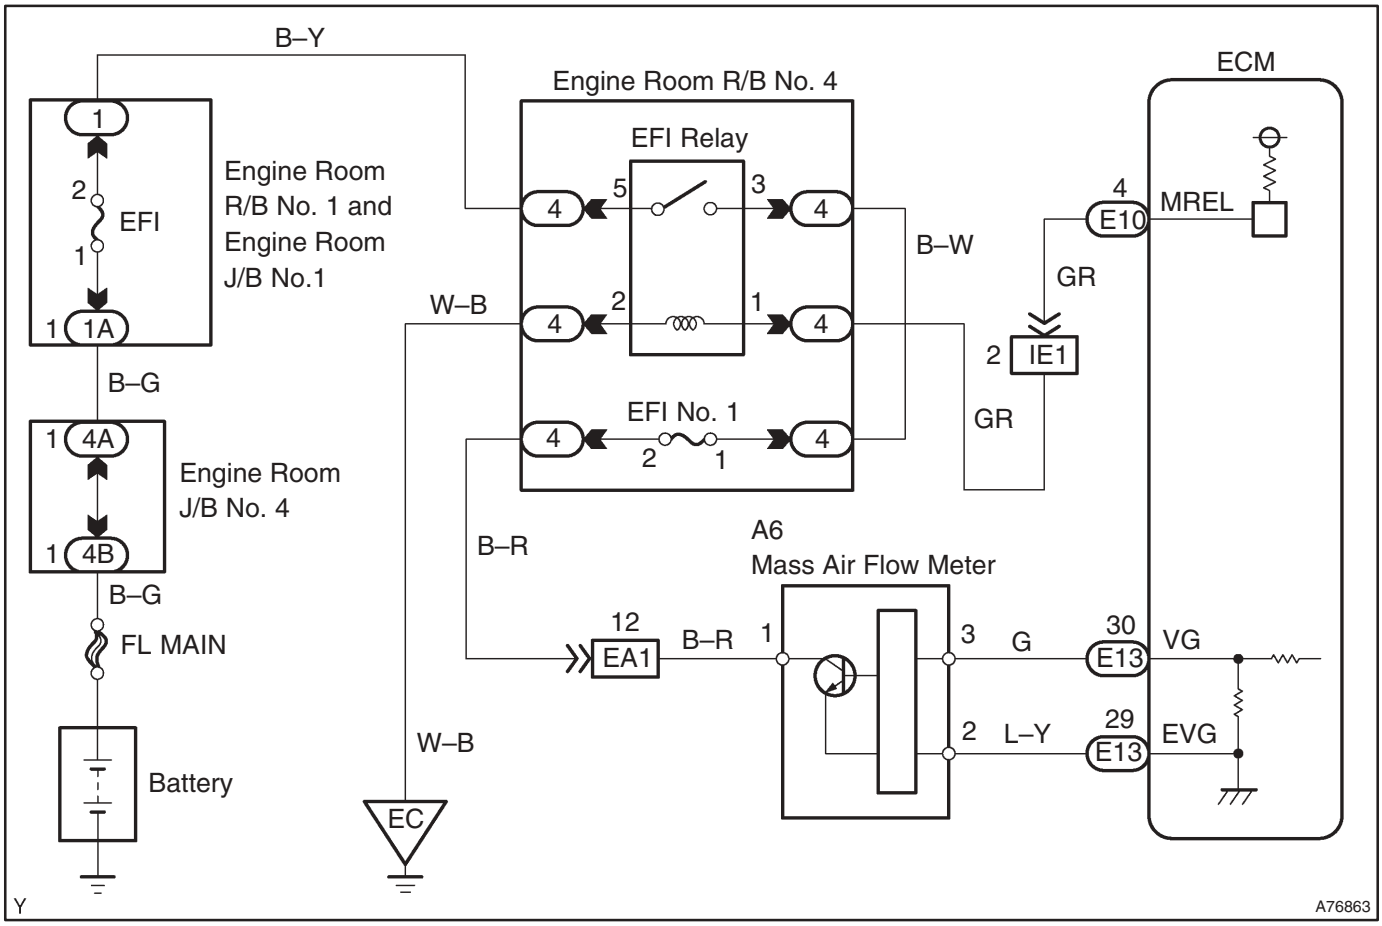


The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and provides a proper air–fuel ratio. Inside the MAF meter, there is a heated platinum wire exposed to the flow of intake air.

By applying a specific current to the wire, the ECM heats this wire to a given temperature. The flow of incoming air cools the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the flow of the air passing through the sensor. The ECM interprets this voltage as the intake air amount.

The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, and the power transistor is controlled so that the potential of A and B remains equal to maintain the predetermined temperature.

FI6929
A09074



A94508

DTC No.	DTC Detection Condition	Trouble Area
P0100	When the mass air flow meter circuit has an open or a short for more than 3 seconds	• Open or short in mass air flow meter circuit • Mass air flow meter • ECM
P0102	When the mass air flow meter circuit has an open for more than 3 seconds	• Open in mass air flow meter circuit • Mass air flow meter • ECM
P0103	When the mass air flow meter circuit has a short for more than 3 seconds	• Short in mass air flow meter circuit • Mass air flow meter • ECM

HINT:
When DTC P0100, P0102 or P0103 is detected, check the air–flow ratio by selecting Powertrain / Engine and ECT / Data List / AFM on the intelligent tester II.

Air Flow Value (gm/second)	Malfunction
Approximately 0.0	• Open in mass air flow meter power source circuit • Open or short in VG circuit
271.0 or more	• Open in EVG circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 READ VALUE OF INTELLIGENT TESTER II(MASS AIR FLOW RATE)

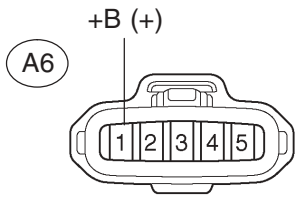
(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine.
(c) Turn the intelligent tester II ON.
(d) Select the following menu items: Powertrain / Engine and ECT / Data List / AFM.
(e) Read the value.

Result:

Mass Air Flow Rate (g/second)	Proceed To
0.0	A
271.0 or more	B
Between 1.0 and 270.0 (*1)	C

*1: The value must be changed when the throttle valve is opened or closed.

B → **Go to step 6**



C → **CHECK FOR INTERMITTENT PROBLEMS**

A

2 INSPECT MASS AIR FLOW METER(POWER SOURCE)

Wire Harness Side:

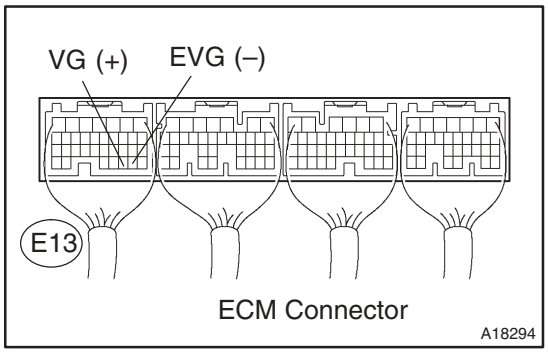
Mass Air Flow Meter Connector

Front View

A84809

(a) Disconnect the A6 mass air flow meter connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminal of the wire harness side connector and body ground.

Standard:



Tester Connection	Specified Condition
+B (A6–1) – Body ground	9 to 14 V

(d) Reconnect the mass air flow meter connector.

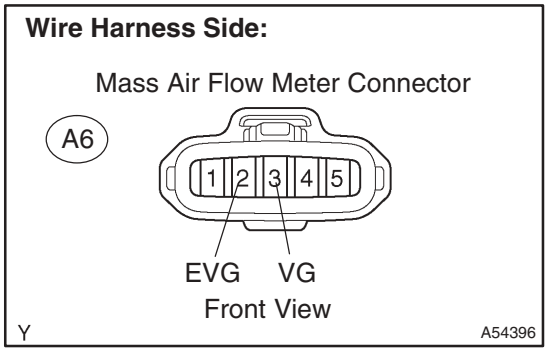
NG → **Go to step 5**

OK

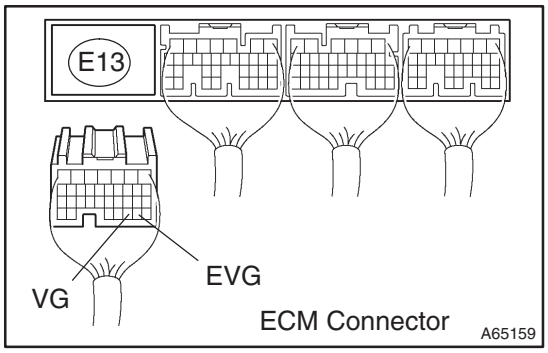
3 INSPECT ECM(VG VOLTAGE)

(a) Start the engine.
(b) Measure the voltage between the specified terminals of the E13 ECM connector.

HINT:
The shift position should be P or N and the A/C switch should be turned OFF.



Standard:



Tester Connection	Condition	Specified Condition
VG (E13–30) – EVG (E13–29)	Engine is idling	0.5 to 3.0 V

OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG

4 CHECK HARNESS AND CONNECTOR(MASS AIR FLOW METER – ECM)

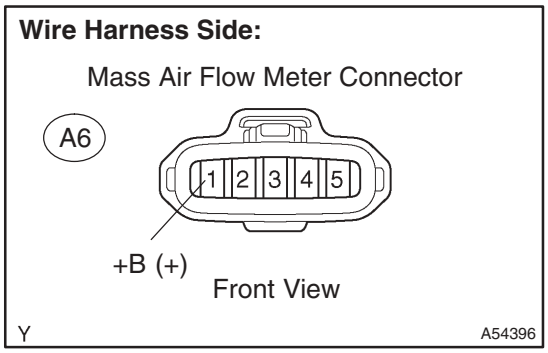
(a) Disconnect the A6 mass air flow meter connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
VG (A6–3) – VG (E13–30)	Below 1 Ω
EVG (A6–2) – EVG (E13–29)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
VG (A6–3) or VG (E13–30) – Body ground	10 kΩ or higher



(d) Reconnect the mass air flow meter connector.
(e) Reconnect the ECM connector.

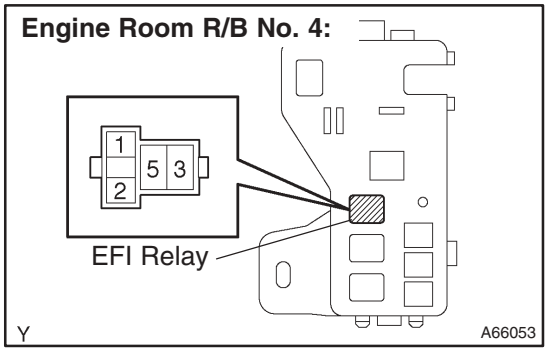
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE MASS AIR FLOW METER

5 CHECK HARNESS AND CONNECTOR(MASS AIR FLOW METER – EFI RELAY)

(a) Disconnect the A6 mass air flow meter connector.
(b) Remove the EFI relay from the engine room R/B No. 4.
(c) Check the resistance.



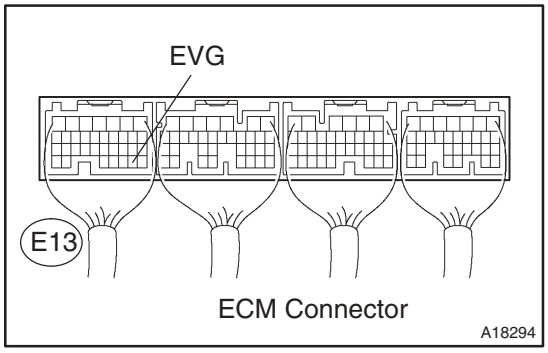
Standard (Check for open):

Tester Connection	Specified Condition
+B (A6–1) – EFI relay (3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
+B (A6–1) or EFI relay (3) – Body ground	10 kΩ or higher

(d) Reconnect the mass air flow meter connector.
(e) Reinstall the EFI relay.



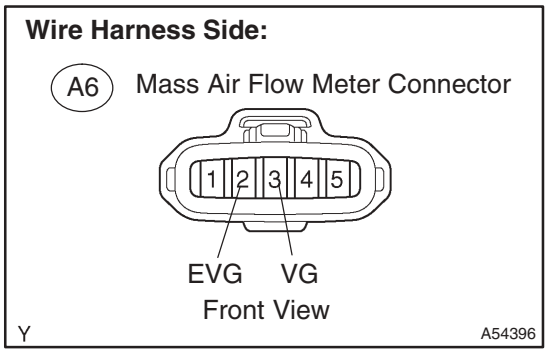
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

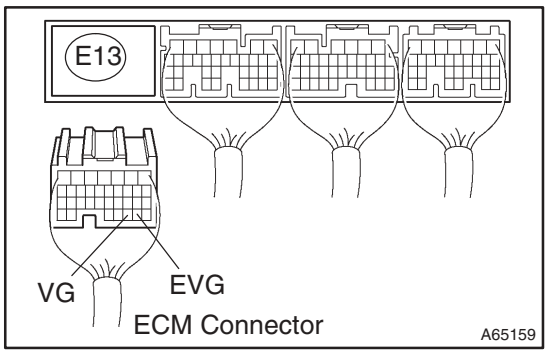
INSPECT ECM POWER SOURCE CIRCUIT (See page 05–195)

6 INSPECT ECM(SENSOR GROUND)

(a) Check the resistance between the specified terminal of the E13 ECM connector and body ground.



Standard:



Tester Connection	Specified Condition
EVG (E13–29) – Body ground	Below 1 Ω

NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

7 CHECK HARNESS AND CONNECTOR(MASS AIR FLOW METER – ECM)

(a) Disconnect the A6 mass air flow meter connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
VG (A6–3) – VG (E13–30)	Below 1 Ω
EVG (A6–2) – EVG (E13–29)	Below 1 Ω

Standard (Check for short):

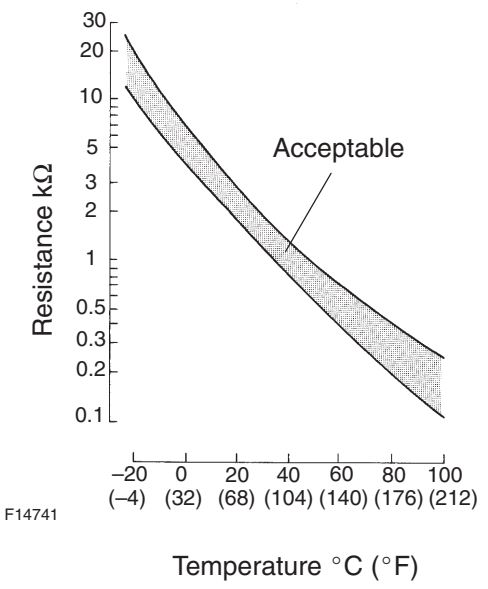
Tester Connection	Specified Condition
VG (A6–3) or VG (E13–30) – Body ground	10 kΩ or higher

(d) Reconnect the mass air flow meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE MASS AIR FLOW METER



DTC	P0110	INTAKE AIR TEMPERATURE CIRCUIT

DTC	P0112	INTAKE AIR TEMPERATURE CIRCUIT LOW INPUT

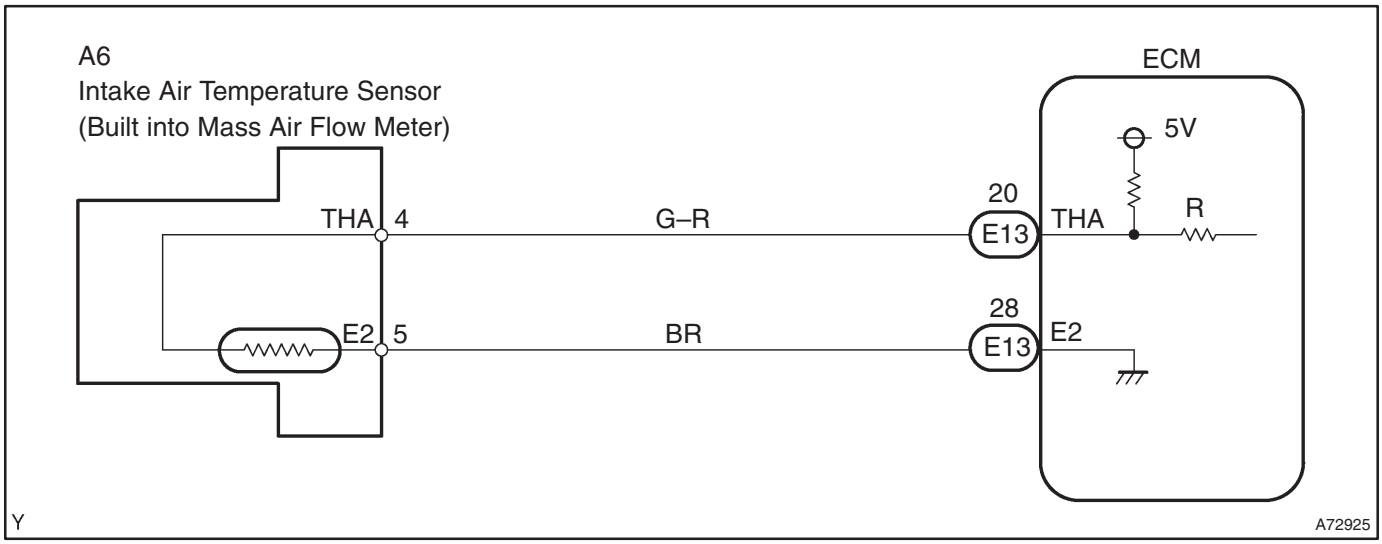
DTC	P0113	INTAKE AIR TEMPERATURE CIRCUIT HIGH INPUT

CIRCUIT DESCRIPTION

(Figure 1)

The Intake Air Temperature (IAT) sensor is built into the Mass Air Flow (MAF) meter, and monitors the intake air temperature. The IAT sensor has a built–in thermistor that varies its resistance depending on the temperature of the intake air. When the air temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. The variations in resistance are reflected as voltage changes to the ECM terminal (see figure 1).

The IAT sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the IAT sensor from terminal THA via resistor R.



That is, the resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes in accordance with changes in the intake air temperature, the voltage at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve the driveability during cold engine operation.

DTC No.	Proceed To	DTC Detection Condition	Trouble Area
P0110	Step 1	Open or short in intake air temperature sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM
P0112	Step 4	Short in intake air temperature sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM
P0113	Step 2	Open in intake air temperature sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in intake air temperature sensor circuit • Intake air temperature sensor (built into mass air flow meter) • ECM

HINT:
When DTC P0110, P0112 or P0113 is detected, check the intake air temperature by selecting Powertrain / Engine and ECT / Data List / Intake Air on the intelligent tester ll.

Temperature Displayed	Malfunction
–40˚C (–40˚F)	Open circuit
140˚C (284˚F) or more	Short circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

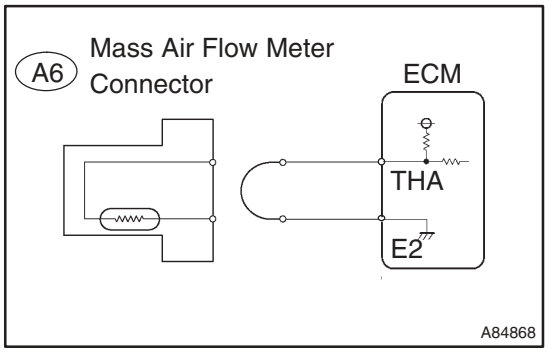
HINT:

- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

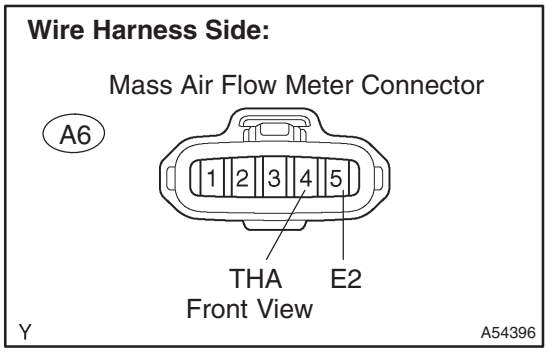
1	READ VALUE OF INTELLIGENT TESTER II(INTAKE AIR TEMPERATURE)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
(d) Read the value.
OK:
Temperature value: Same as the actual intake air temperature.
Result:

Temperature Displayed	Proceed To
–40˚C (–40˚F)	A
140˚C (284˚F) or more	B
OK (Same as air actual intake temperature)	C



HINT:
- If there is an open circuit, the intelligent tester II indicates –40˚C (–40˚F).
- If there is a short circuit, the intelligent tester II indicates 140˚C (284˚F) or more.

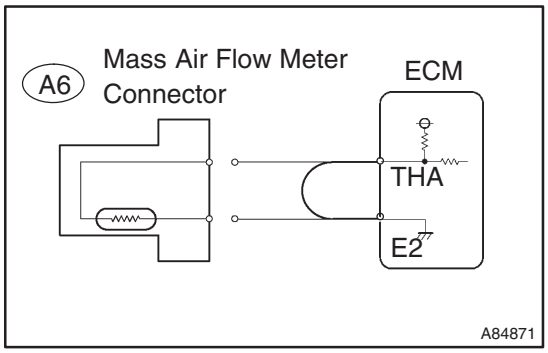


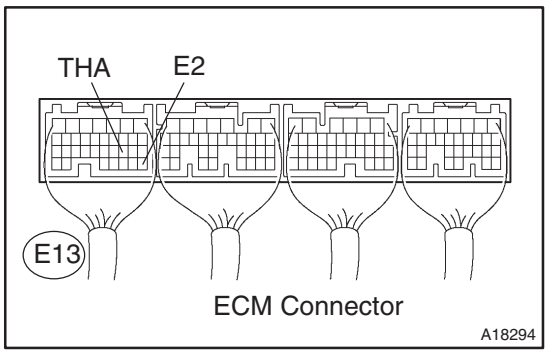
B → **Go to step 4**

C → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

A

2	READ VALUE OF INTELLIGENT TESTER II(CHECK FOR OPEN IN WIRE HARNESS)





(a) Disconnect the A6 mass air flow meter connector.
(b) Connect terminals THA and E2 of the mass air flow meter wire harness side connector.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester II ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
(f) Read the value.
OK:
Temperature value: 140°C (284°F) or more
(g) Reconnect the mass air flow meter connector.

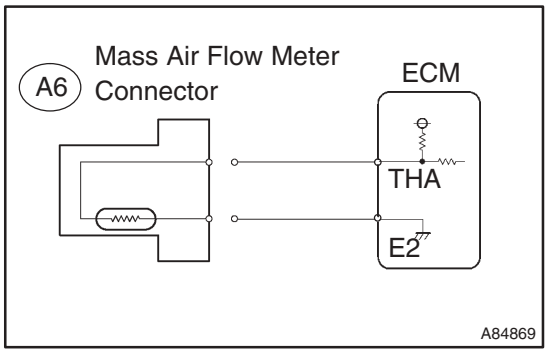
OK → **CONFIRM GOOD CONNECTION AT SENSOR. IF OK, REPLACE MASS AIR FLOW METER**

NG

3 READ VALUE OF INTELLIGENT TESTER II(CHECK FOR OPEN IN ECM)

(a) Disconnect the A6 mass air flow meter connector.
(b) Connect terminals THA and E2 of the E13 ECM connector.

HINT:
Before checking, do visual and contact pressure checks on the ECM connector.



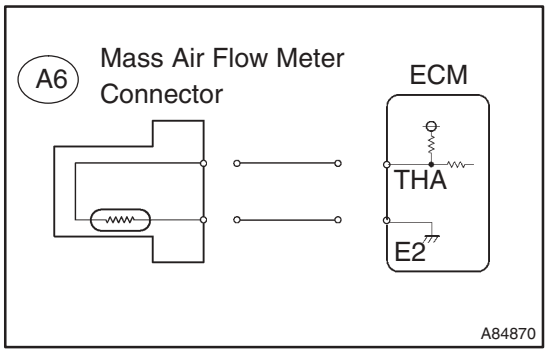
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester II ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
(f) Read the value.
OK:
Temperature value: 140°C (284°F) or more
(g) Reconnect the mass air flow meter connector.

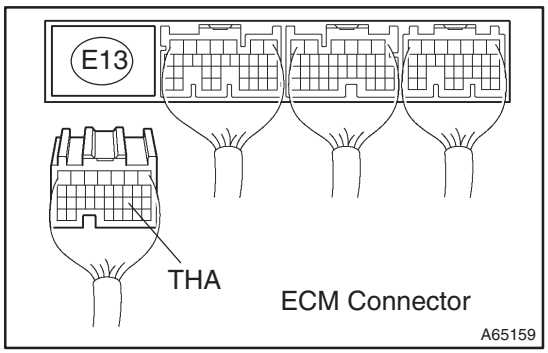
OK → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

NG

CONFIRM GOOD CONNECTION AT ECM. IF OK, REPLACE ECM
(See page 10–65 of Pub. No. RM1018E AVENSIS)

4 READ VALUE OF INTELLIGENT TESTER II(CHECK FOR SHORT IN WIRE HARNESS)





(a) Disconnect the A6 mass air flow meter connector.
(b) Connect the intelligent tester II to the DLC3.
(c) Turn the ignition switch to ON and turn the intelligent tester II ON.
(d) Select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
(e) Read the value.
OK:
Temperature value: –40°C (–40°F)
(f) Reconnect the mass air flow meter connector.

OK → **REPLACE MASS AIR FLOW METER**

NG

5	READ VALUE OF INTELLIGENT TESTER II(CHECK FOR SHORT IN ECM)

(a) Disconnect the E13 ECM connector.
(b) Disconnect the A6 mass air flow meter connector.
(c) Turn the ignition switch to ON and turn the intelligent tester II ON.
(d) Select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
(e) Read the value.
OK:
Temperature value: –40°C (–40°F)
(f) Reconnect the ECM sensor connector.
(g) Reconnect the mass air flow meter connector.

OK	REPAIR OR REPLACE HARNESS OR CONNECTOR

NG

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0115	ENGINE COOLANT TEMPERATURE CIRCUIT

DTC	P0117	ENGINE COOLANT TEMPERATURE CIRCUIT LOW INPUT

DTC	P0118	ENGINE COOLANT TEMPERATURE CIRCUIT HIGH INPUT

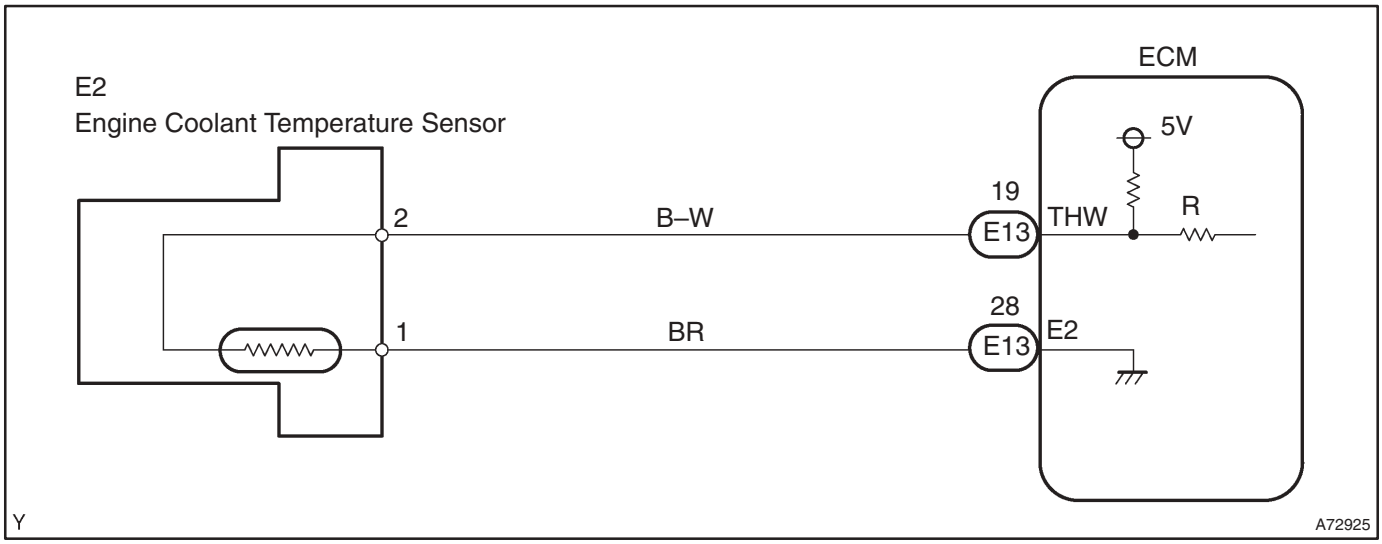
CIRCUIT DESCRIPTION

A thermistor is built in the engine coolant temperature sensor and changes its resistance value according to the engine coolant temperature.

The structure of the sensor and connection to the ECM is the same as those of the intake air temperature sensor.

HINT:

If the ECM detects DTC P0115, P0117 or P0118, the ECM enters fail–safe mode in which the engine coolant temperature is assumed to be 80°C (176°F).



DTC No.	Proceed To	DTC Detection Condition	Trouble Area
P0115	Step 1	Open or short in engine coolant temperature sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM
P0117	Step 4	• Short in engine coolant temperature sensor circuit for 0.5 seconds (Sensor resistance value is less than 79 Ω) (1 trip detection logic)	• Short in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM
P0118	Step 2	• Open in engine coolant temperature sensor circuit for 0.5 seconds (Sensor resistance value is more than 156 kΩ) (1 trip detection logic)	• Open in engine coolant temperature sensor circuit • Engine coolant temperature sensor • ECM

HINT:

When DTC P0115, P0117 or P0118 is detected, check the engine coolant temperature by selecting Powertrain / Engine and ECT / Data List / Coolant Temp on the intelligent tester II.

Temperature Displayed	Malfunction
–40°C (–40°F)	Open circuit
140°C (284°F) or more	Short circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER II(ENGINE COOLANT TEMPERATURE)

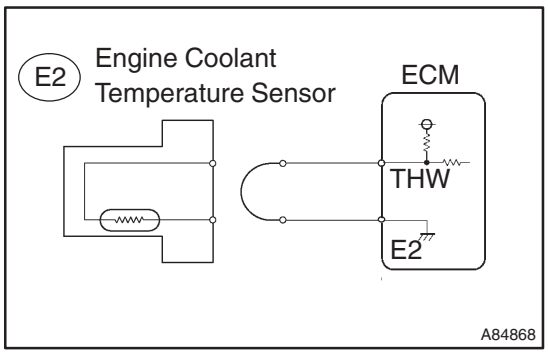
(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Coolant Temp.
(d) Read the value.

OK:

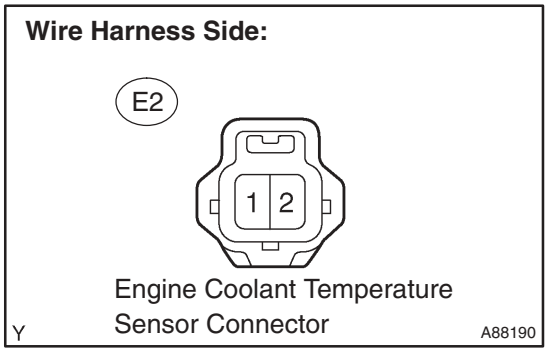
Temperature value: 80° to 97°C (176° to 207°F) after warming up the engine.

Result:

Temperature Displayed	Proceed To
–40°C (–40°F)	A
140°C (284°F) or more	B
OK (Same as the actual engine coolant temperature)	C



HINT:

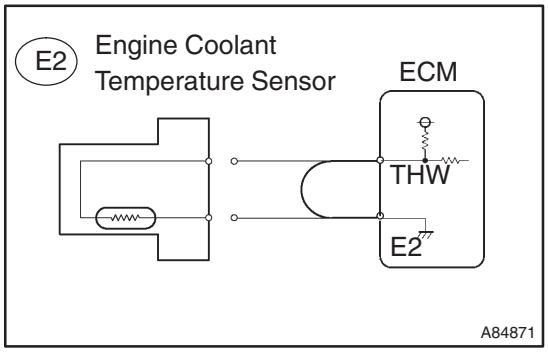


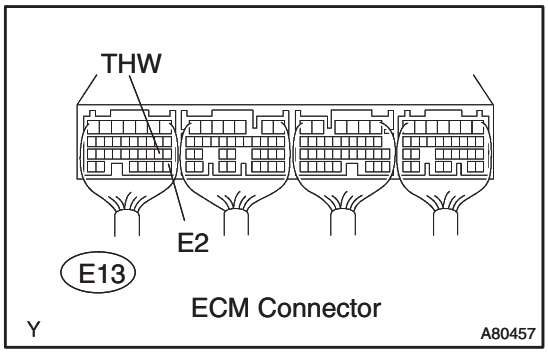
- If there is an open circuit, the intelligent tester II indicates –40°C (–40°F).
- If there is a short circuit, the intelligent tester II indicates 140°C (284°F) or more.

B	**Go to step 4**
C	**CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

A

2	READ VALUE OF INTELLIGENT TESTER II(CHECK FOR OPEN IN WIRE HARNESS)





(a) Disconnect the E2 engine coolant temperature sensor connector.
(b) Connect terminals 1 and 2 of the engine coolant temperature sensor wire harness side connector.
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester II ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Data List / Coolant Temp.
(f) Read the value.
OK:
Temperature value: 140°C (284°F) or more
(g) Reconnect the engine coolant temperature sensor connector.

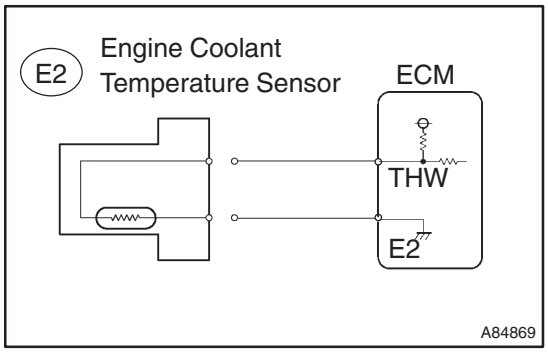
OK	CONFIRM GOOD CONNECTION AT SENSOR. IF OK, REPLACE ENGINE COOLANT TEMPERATURE SENSOR

NG

3	READ VALUE OF INTELLIGENT TESTER II(CHECK FOR OPEN IN ECM)

(a) Disconnect the E2 engine coolant temperature sensor connector.
(b) Connect terminals THW and E2 of the E13 ECM connector.

HINT:
Before checking, do visual and contact pressure checks on the ECM connector.



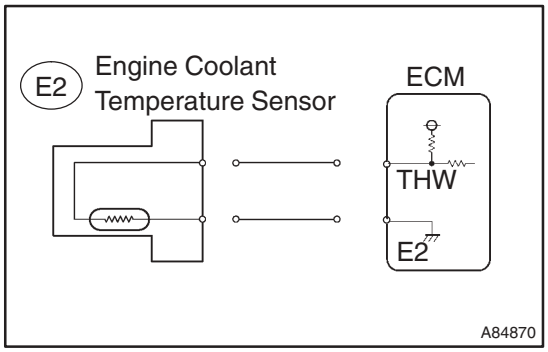
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester II ON.
(e) Select the following menu items: Powertrain / Engine and ECT / Data List / Coolant Temp.
(f) Read the value.
OK:
Temperature value: 140°C (284°F) or more
(g) Reconnect the engine coolant temperature sensor connector.

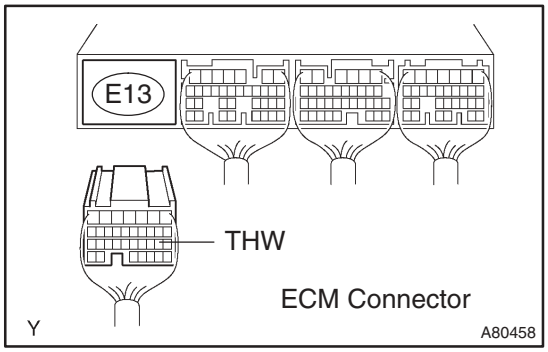
OK	REPAIR OR REPLACE HARNESS OR CONNECTOR

NG

CONFIRM GOOD CONNECTION AT ECM. IF OK, REPLACE ECM
(See page 10–65 of Pub. No. RM1018E AVENSIS)

4 READ VALUE OF INTELLIGENT TESTER II(CHECK FOR SHORT IN WIRE HARNESS)





(a) Disconnect the E2 engine coolant temperature sensor connector.
(b) Connect the intelligent tester II to the DLC3.
(c) Turn the ignition switch to ON and turn the intelligent tester II ON.

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0116	ENGINE COOLANT TEMPERATURE CIRCUIT RANGE/PERFORMANCE PROBLEM

CIRCUIT DESCRIPTION

Refer to DTC P0115 on page 05–60.

DTC No.	DTC Detection Condition	Trouble Area
P0116	If the engine coolant temperature was between 35°C (95°F) and 60°C (140°F) at engine start, and conditions (a) and (b) are met (2 trip detection logic): (a) Vehicle is driven at varying speeds (under acceleration and deceleration) (b) Engine coolant temperature remains within 3°C (5.4°F) of the engine starting temperature	• Engine coolant temperature sensor
P0116	If the engine coolant temperature was more than 60°C (140°F) at engine start, and conditions (a) and (b) are met (6 trip detection logic): (a) Vehicle is driven at varying speeds (under acceleration and deceleration) (b) Engine coolant temperature remains within 1°C (1.8°F) of the engine starting temperature, and this is successively recorded 6 times	• Engine coolant temperature sensor

WIRING DIAGRAM

Refer to DTC P0115 on page 05–60.

INSPECTION PROCEDURE

HINT:

- If DTCs P0115, P0116, P0117 and P0118 are output simultaneously, the engine coolant temperature sensor may have an open or short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0120	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”A” CIRCUIT

DTC	P0122	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”A” CIRCUIT LOW INPUT

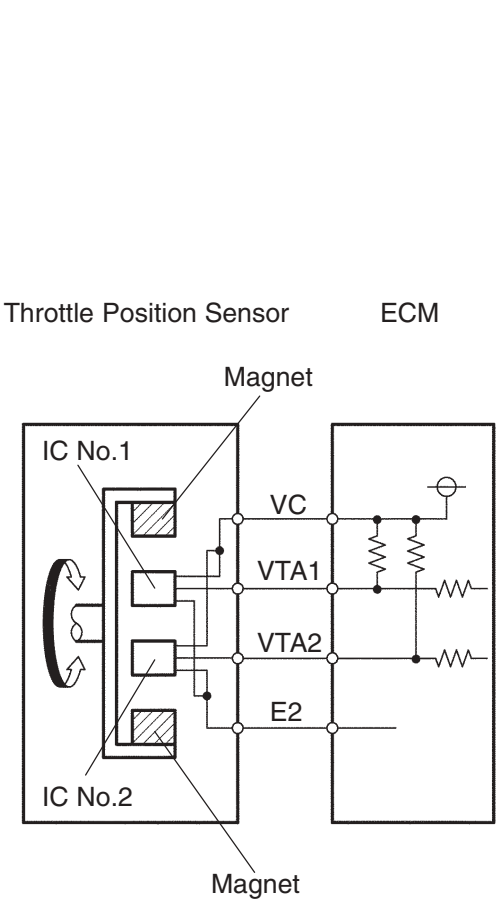
DTC	P0220	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”B” CIRCUIT

DTC	P0222	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”B” CIRCUIT LOW INPUT

DTC	P0223	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”B” CIRCUIT HIGH INPUT

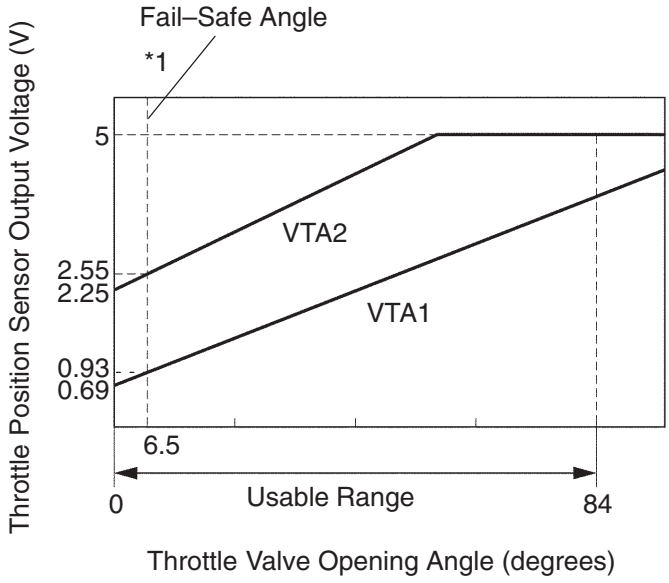
DTC	P2135	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”A”/”B” VOLTAGE CORRELATION

HINT:
These DTCs are related to the throttle position sensor.



CIRCUIT DESCRIPTION

HINT:



- This ETCS (Electronic Throttle Control System) does not use a throttle cable.
- This throttle position sensor is a non–contact type.

The throttle position sensor is mounted on the throttle body and it detects the opening angle of the throttle valve. This sensor is electronically controlled and uses Hall–effect elements, so that accurate control and reliability can be obtained. The throttle position sensor has 2 sensor elements and signal output: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect a malfunction in VTA1. Voltage applied to VTA1 and VTA2 changes between 0V and 5V in proportion to the opening angle of the throttle valve. There are several checks that the ECM performs to confirm proper operation of the throttle position sensor and VTA1.

The ECM judges the actual opening angle of the throttle valve from these signals input from terminals VTA1 and VTA2, and the ECM controls the throttle motor to make the throttle valve angle properly in response to driver input.

A19755

Throttle Valve Fully Closed, VTA1 is 10 to 20 %

Throttle Valve Fully Opened, VTA1 is 64 to 96 %

*1: Fail–Safe Angle (6.5°), VTA1 is approximately 16 %

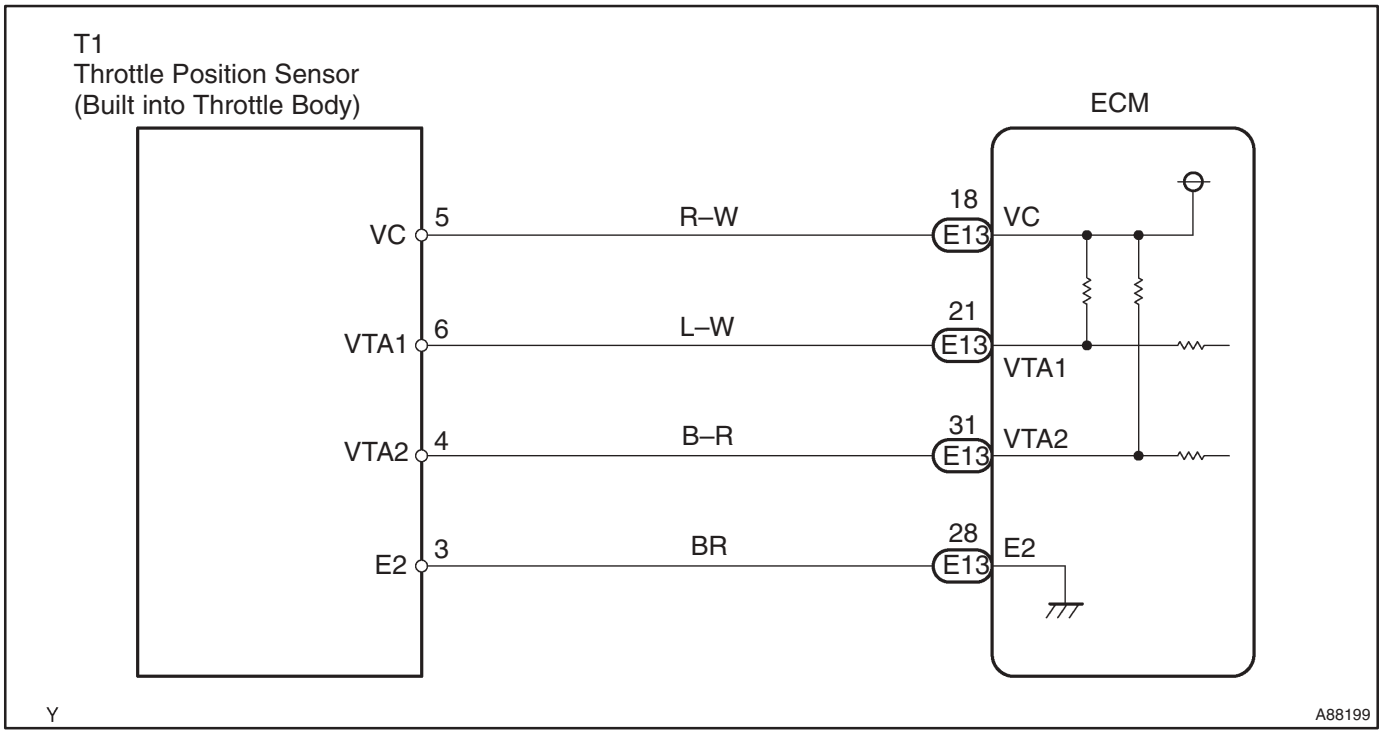
NOTE: Throttle valve opening angle detected by the sensor terminal VTA1 is expressed as percentages.

A19802

DTC No.	DTC Detection Condition	Trouble Area
—	Conditions of DTC P0120, P0122, P0123, P0220, P0222 or P0223 continue for 2 seconds (Open or short in the throttle position sensor circuit)	—
P0120	Output voltage of VTA1 quickly fluctuates up and down beyond lower and upper malfunction thresholds	• Throttle position sensor (built into throttle body) • ECM
P0122	VTA1 is 0.2 V or less	• Throttle position sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	VTA1 is 4.8 V or more	• Throttle position sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • VC and VTA1 circuits are short–circuited • ECM
P0220	Output voltages of VTA1 and VTA2 quickly fluctuate up and down beyond their respective lower and upper malfunction thresholds	• Throttle position sensor (built into throttle body) • ECM
P0222	VTA2 is 0.5 V or less	• Throttle position sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	VTA2 is 4.8 V or more, VTA1 is between 0.2 V and 1.8 V	• Throttle position sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • VC and VTA2 circuits are short–circuited • ECM
P2135	Condition (a) continues for 0.5 seconds or more, or condition (b) continues for 0.4 seconds or more: (a) Difference between VTA1 and VTA2 is 0.02 V or less (b) VTA1 is 0.2 V or less and VTA2 is 0.5 V or less	• VTA1 and VTA2 circuits are short–circuited • Throttle position sensor (built into throttle body) • ECM

NOTICE:

When a malfunction is detected, the throttle valve is locked at a certain opening angle. Also, the whole electronically controlled throttle operation is cancelled until the system returns to normal and the ignition switch is turned to OFF.



HINT:

- When any of these DTCs is detected, check the throttle valve opening angle (Throttle POS and Throttle POS No. 2) using the intelligent tester II.
- The Throttle POS means VTA1 signal (expressed as percentages), and Throttle POS No. 2 means the VTA2 signal (expressed as voltages).

Reference (Normal condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle POS	10 to 24 %	64 to 96 %
Throttle POS No. 2	2.1 to 3.1 V	4.5 to 5.0 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

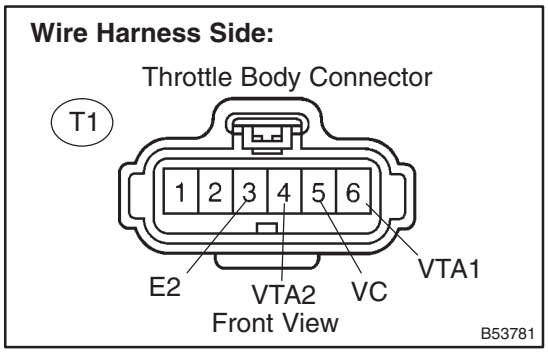
- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER II(THROTTLE POS AND THROTTLE POS NO.2)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Throttle POS and Throttle POS No. 2.
(d) Check the values displayed on the intelligent tester II.

Result:

TP (VTA1) When AP Released	TP No. 2 (VTA2) When AP Released	TP (VTA1) When AP Depressed	TP No. 2 (VTA2) When AP Depressed	Trouble Area	Proceed To
0 %	0 to 0.2 V	0 %	0 to 0.2 V	VC circuit open	A
100 %	4.5 to 5.0 V	100 %	4.5 to 5.0 V	E2 circuit open	A
0 or 100 %	2.1 to 3.1 V (Fail–safe)	0 % or 100 %	2.1 to 3.1 V (Fail–safe)	VTA1 circuit open or ground short	A
10 to 24 % (Fail–safe)	0 to 0.2 V or 4.5 to 5.0 V	10 to 24 % (Fail–safe)	0 to 0.2 V or 4.5 to 5.0 V	VTA2 circuit open or ground short	A
10 to 24 %	2.1 to 3.1 V	64 to 96 % (Not fail–safe)	4.5 to 5.0 V (Not fail–safe)	Throttle position sensor circuit is normal	B



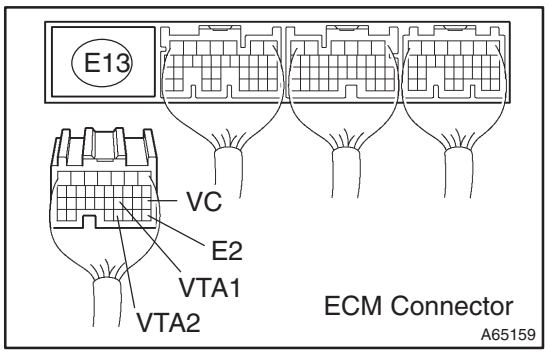
HINT:

- TP stands for Throttle Position, and AP stands for Accelerator Pedal.
- VTA1 is expressed as percentages, and VTA2 is expressed as voltages.

B → **Go to step 5**

A

2 CHECK HARNESS AND CONNECTOR(THROTTLE POSITION SENSOR – ECM)



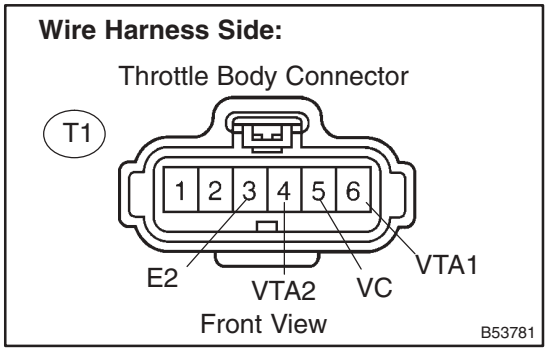
(a) Disconnect the T1 throttle body connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
VC (T1–5) – VC (E13–18)	Below 1 Ω
VTA1 (T1–6) – VTA1 (E13–21)	Below 1 Ω
VTA2 (T1–4) – VTA2 (E13–31)	Below 1 Ω
E2 (T1–3) – E2 (E13–28)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
VC (T1–5) or VC (E13–18) – Body ground	10 kΩ or higher
VTA1 (T1–6) or VTA1 (E13–21) – Body ground	10 kΩ or higher
VTA2 (T1–4) or VTA2 (E13–31) – Body ground	10 kΩ or higher

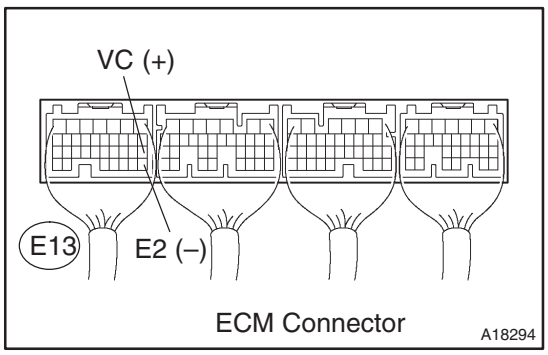


(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT ECM(VC VOLTAGE)



(a) Disconnect the T1 throttle body connector.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Measure the voltage between the specified terminals of the E13 ECM connector.

Standard:

Tester Connection	Specified Condition
VC (E13–18) – E2 (E13–28)	4.5 to 5.5 V

(d) Reconnect the throttle body connector.

NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

4	REPLACE THROTTLE BODY ASSY (See page 10–6)

GO

5	CHECK IF DTC OUTPUT RECURS(THROTTLE POSITION SENSOR DTCS)

(a) Clear the DTC(s) (see page 05–18).
(b) Start the engine.
(c) Run the engine in idling for 15 seconds or more.
(d) Connect the intelligent tester II to the DLC3.
(e) Turn the ignition switch to ON and turn the intelligent tester II ON.
(f) Select the following menu items: Powertrain / Engine and ECT / DTC.
(g) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0120, P0122, P0123, P0220, P0222, P0223 and/or P2135	A
No output	B

B → **SYSTEM OK**

A

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0121	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”A” CIRCUIT RANGE/PERFORMANCE PROBLEM

HINT:
These DTCs are related to the throttle position sensor.

CIRCUIT DESCRIPTION

Refer to DTC P0120 on page 05–66.

DTC No.	DTC Detection Condition	Trouble Area
P0121	Difference between VTA and VTA2 voltage deviates from the malfunction criteria (1 trip detection logic)	• Throttle position sensor (built into throttle body)

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

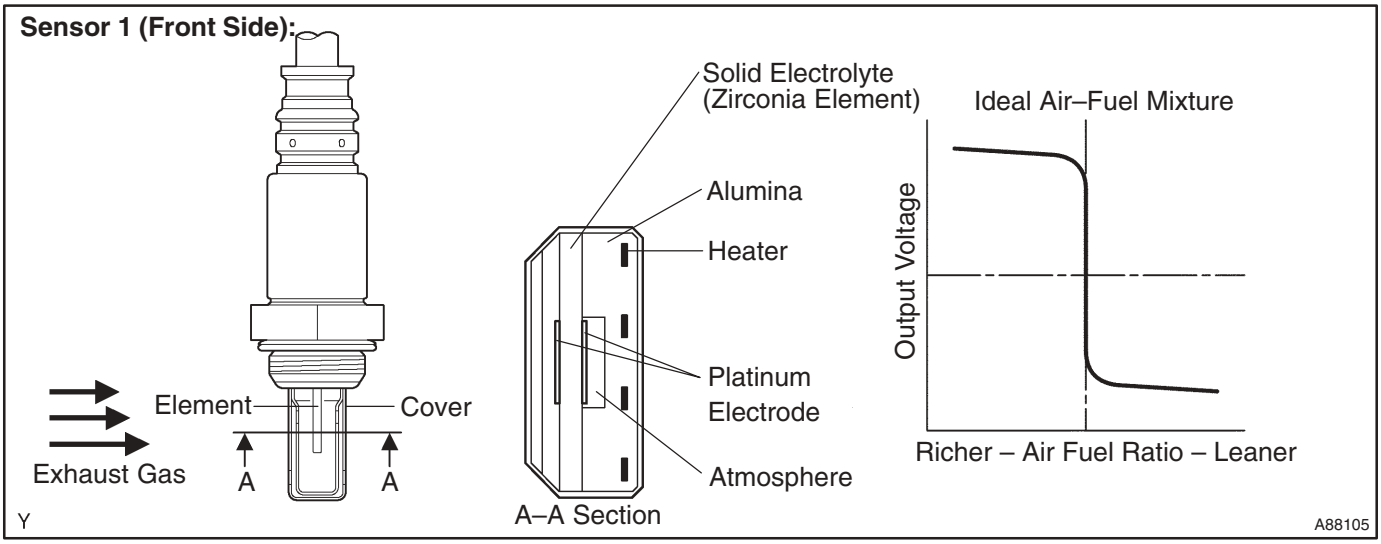
REPLACE THROTTLE BODY ASSY (See page 10–6)

DTC	P0130	OXYGEN SENSOR CIRCUIT MALFUNCTION (BANK 1 SENSOR 1)

DTC	P2195	OXYGEN SENSOR SIGNAL STUCK LEAN (BANK 1 SENSOR 1)

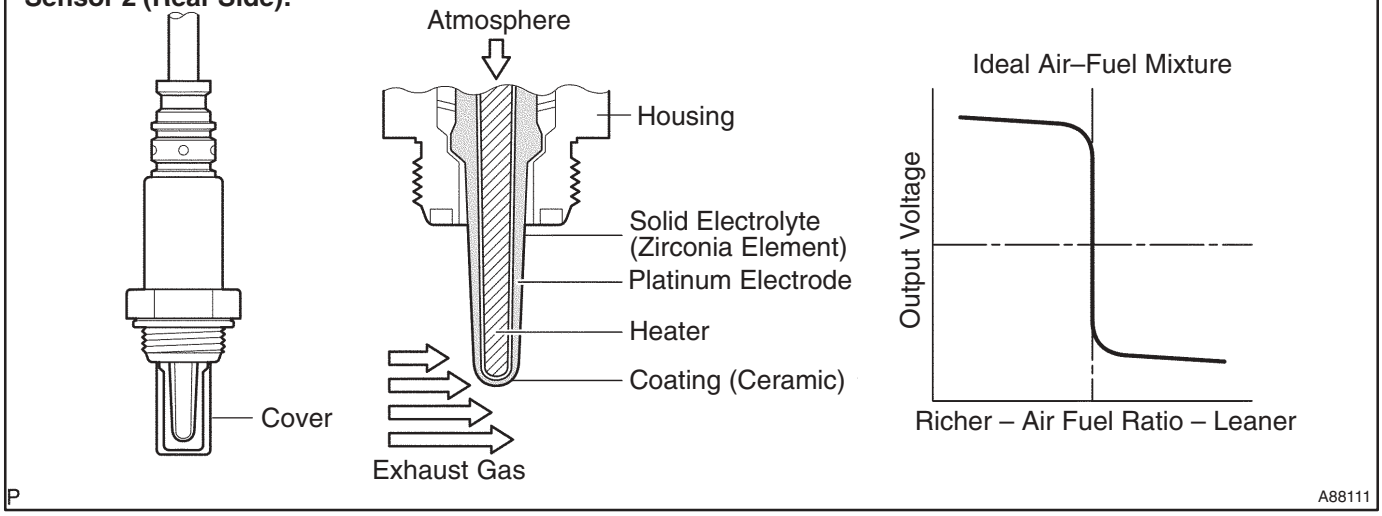
DTC	P2196	OXYGEN SENSOR SIGNAL STUCK RICH (BANK 1 SENSOR 1)

CIRCUIT DESCRIPTION



In order to obtain a high purification rate for the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components of the exhaust gas, a Three–Way Catalytic Converter (TWC) is used. For the most efficient use of the TWC, the air–fuel ratio must be precisely controlled so that it is always close to the stoichiometric air–fuel ratio.

The heated oxygen sensor has the characteristic whereby its output voltage changes suddenly in the vicinity of the stoichiometric air–fuel ratio. This is used to detect the oxygen concentration in the exhaust gas and provide the ECM with feedback to control the air–fuel ratio.

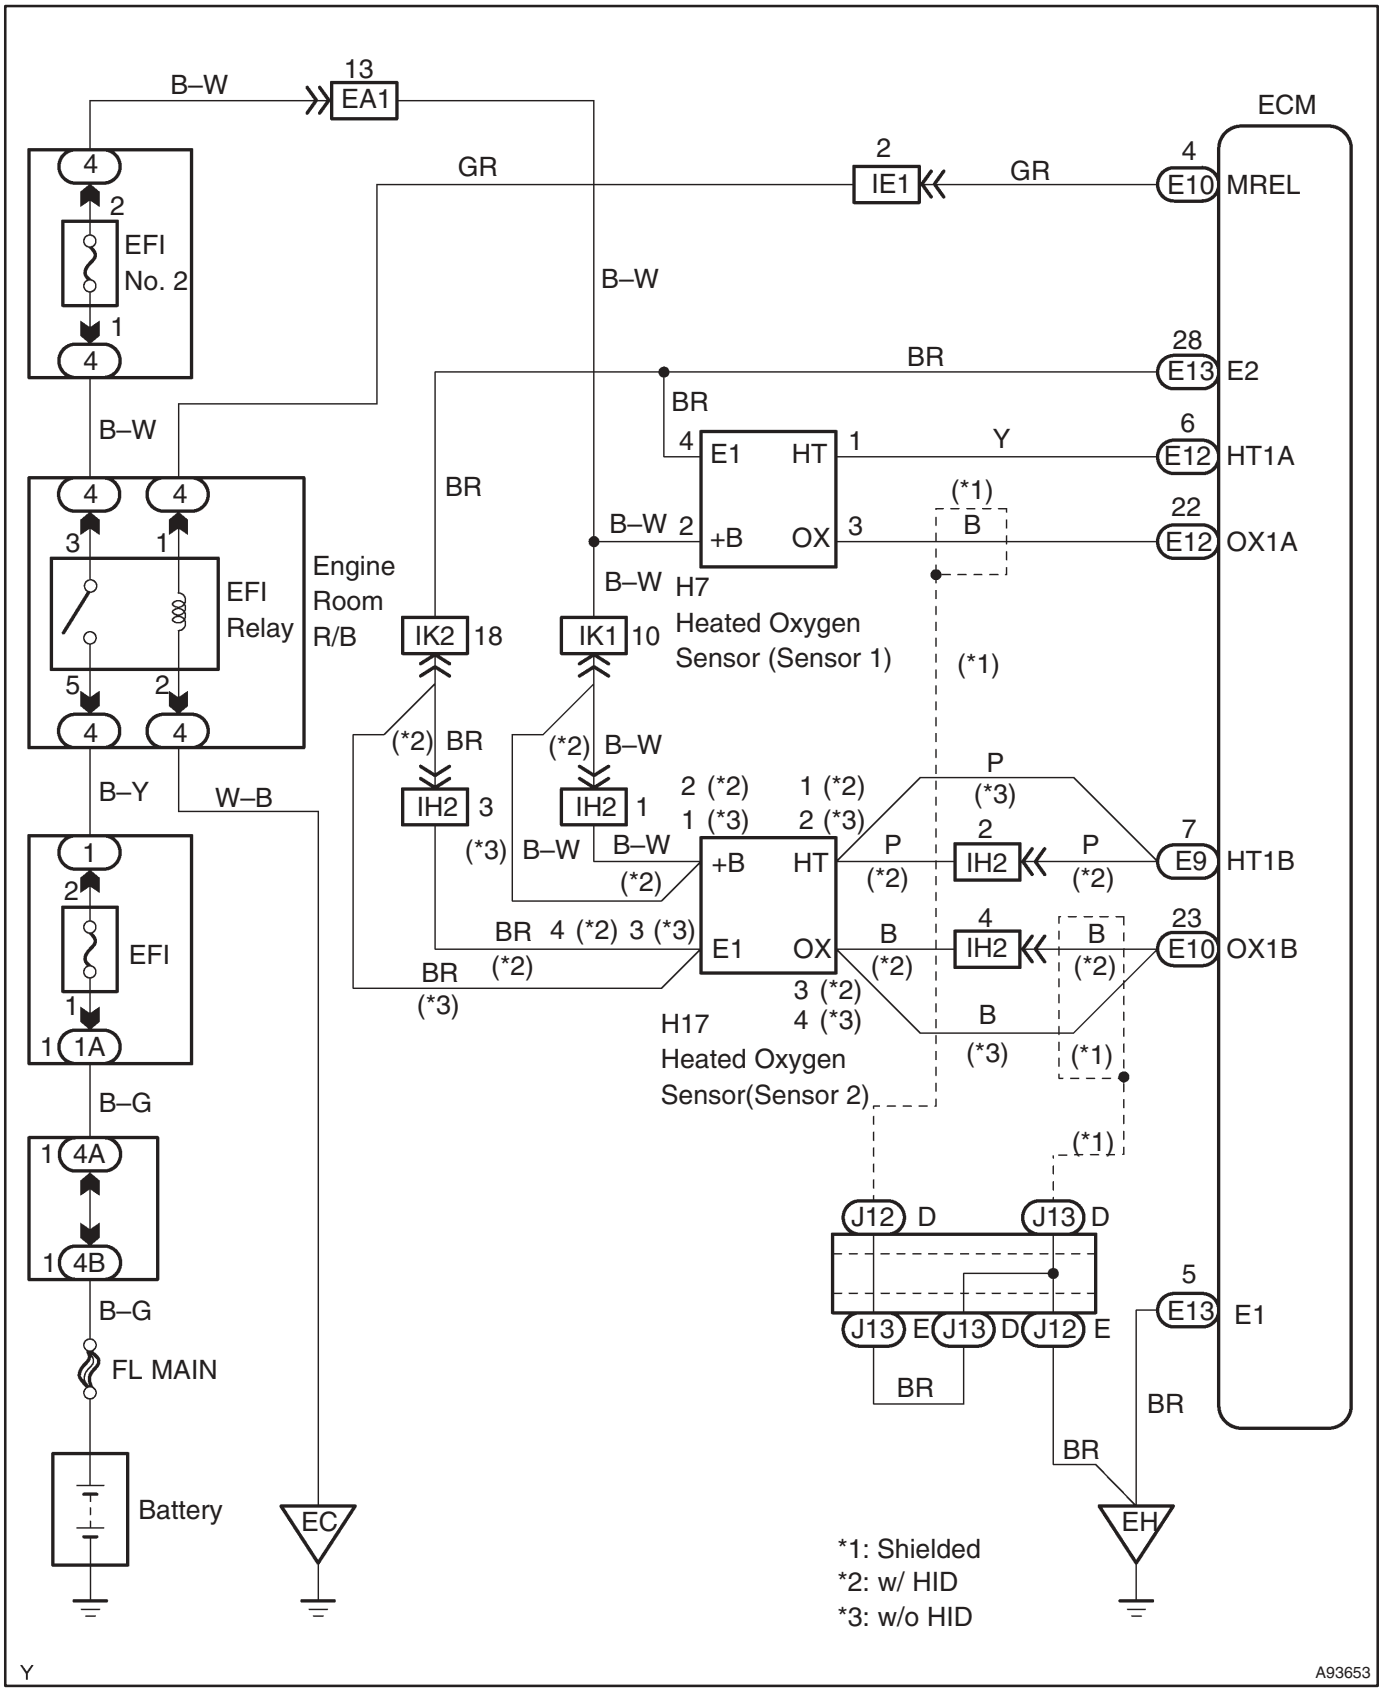


When the air–fuel ratio becomes lean, the oxygen concentration in the exhaust gas increases. The heated oxygen sensor informs the ECM of the lean condition (low voltage, i.e. less than 0.45 V).

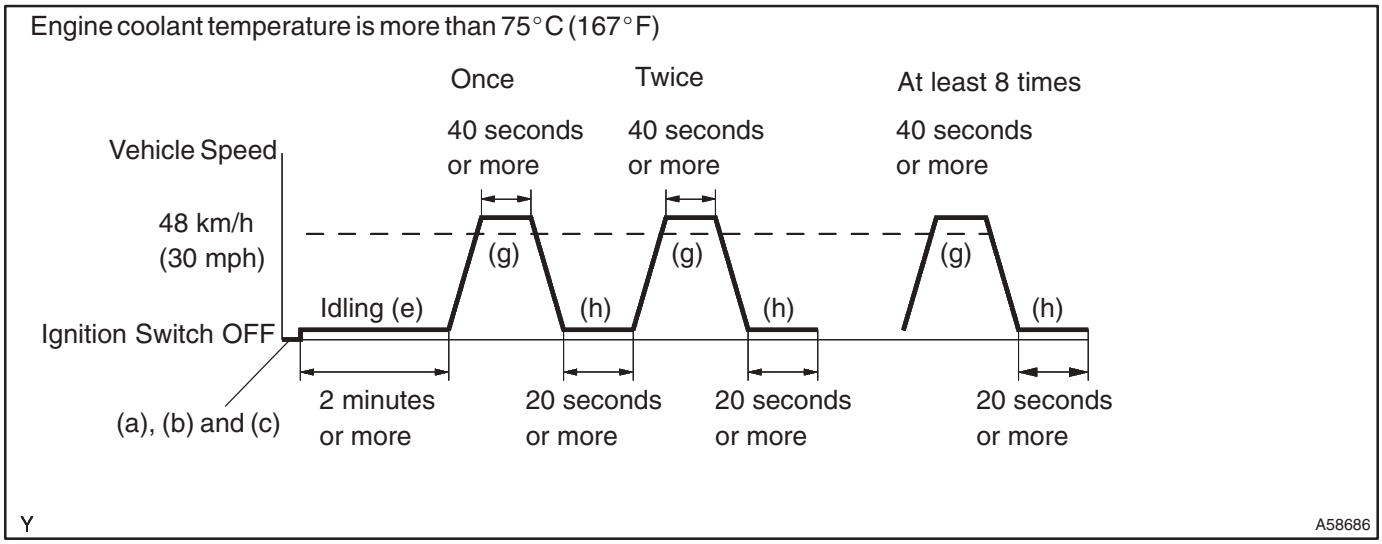
When the air–fuel ratio is richer than the stoichiometric air–fuel ratio, the oxygen concentration in the exhaust gas is reduced. And the heated oxygen sensor informs the ECM of the rich condition (high voltage, i.e. more than 0.45 V). The ECM judges by the voltage output of the heated oxygen sensor whether the air–fuel ratio is rich or lean and controls the injection time accordingly. If a malfunction of the heated oxygen sensor causes an output of abnormal voltage, the ECM will be unable to perform accurate air–fuel ratio control.

The heated oxygen sensor includes a heater which heats the zirconia element. The heater is controlled by the ECM. When the intake air volume is low (the temperature of the exhaust gas is low), a current flows to the heater in order to heat the sensor for accurate oxygen concentration detection.

Sensor 2 (Rear Side):



DTC No.	DTC Detection Condition	Trouble Area
P0130	After engine is warmed up, output voltage of heated oxygen sensor remains at 0.4 V or more, or 0.5 V or less, during engine idling (2 trip detection logic)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (sensor 1) • Heated oxygen sensor heater (sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM
P2195	The following conditions are met (2 trip detection logic): • Heated oxygen sensor (sensor 1) voltage remains at below 0.5 V (stuck in lean condition) • Engine is idling after engine warm–up	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (sensor 1) • Heated oxygen sensor heater (sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM
P2196	The following conditions are met (2 trip detection logic): • Heated oxygen sensor (sensor 1) voltage remains at 0.4 V or more (stuck in rich condition) • Engine is idling after engine warm–up	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (sensor 1) • Heated oxygen sensor heater (sensor 1) • EFI relay • Air induction system • Fuel pressure • Injector • ECM



HINT:

- Sensor 1 refers to the sensor near the engine assembly.
- The output voltage of the heated oxygen sensor and the short–term fuel trim value can be read using the intelligent tester II.

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).
(d) Start the engine.
(e) Allow the engine to idle for 2 minutes.
(f) Warm up the engine until the engine coolant temperature reaches more than 75°C (167°F).
(g) Drive the vehicle at 48 km/h (30 mph) or more for 40 seconds or more.
(h) Stop the vehicle and allow the engine to idle for 20 seconds or more.
(i) Repeat the steps (g) and (h) at least 8 times in one driving cycle.

HINT:

If a malfunction exists, the MIL will be illuminated during step (i).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected. If you do not have the intelligent tester II, turn the ignition switch to OFF after performing steps from (d) to (i), then perform steps (d) to (i) again.

INSPECTION PROCEDURE

HINT:

Intelligent tester II only:

Malfunctioning areas can be found using the Active Test / A/F Control operation. The A/F Control operation can determine if the heated oxygen sensor or other potential trouble areas are malfunctioning or not.

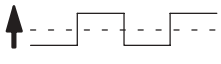
(a) Perform the Active Test using the intelligent tester II.

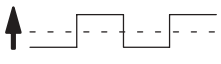
HINT:

The A/F Control operation lowers the injection volume by 12.5 % or increases the injection volume by 25 %.

(1) Connect the intelligent tester II to the DLC3.
(2) Start the engine and turn the intelligent tester II ON.
(3) Warm up the engine by running the engine at 2,500 rpm for approximately 3 minutes.
(4) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Active Test / A/F Control.
(5) Select the following monitor items: O2S B1 S1 and O2S B1 S2.
(6) Perform the A/F Control operation with the engine in an idling condition (press the right or left button).

Result:





The heated oxygen sensor reacts in accordance with increases and decreases of the injection volume:

+25 % → Rich output: More than 0.5 V

–12.5 % → Lean output: Less than 0.4 V

NOTICE:

Sensor 1 (front sensor) has an output delay of a few seconds. Sensor 2 (rear sensor) has a maximum output delay of approximately 20 seconds.

	Output Voltage of Heated Oxygen Sensor (sensor 1: front sensor)	Output Voltage of Heated Oxygen Sensor (sensor 2: rear sensor)	Main Suspect Trouble Area
Case 1	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	—
Case 2	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Sensor 1: front sensor (Sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Sensor 2: rear sensor (Sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Extremely rich or lean actual air–fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

The following A/F Control procedure enables the technician to check and graph the voltage output of both the heated oxygen sensors.

To display the graph, select the following menu items on the tester: View / Line Graph.

NOTICE:

If the vehicle is short of fuel, the air–fuel ratio becomes lean and the heated oxygen sensor DTCs will be recorded, and the MIL then illuminates.

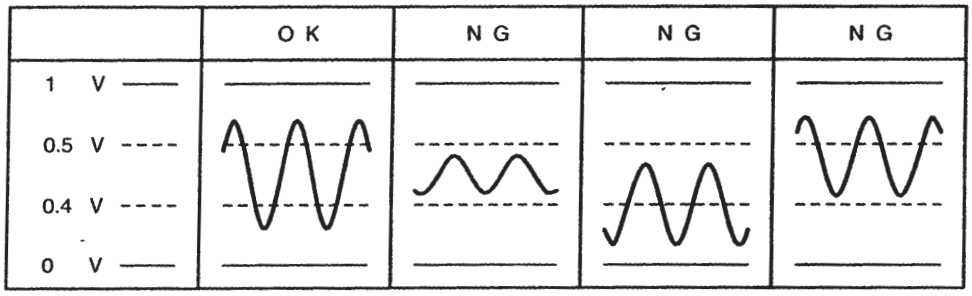
HINT:

- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air–fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air–fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0130, P2195 AND P2196)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0130 and/or P2195 or P2196	A
P0130 or P2195 and/or P2196 and other DTCs	B



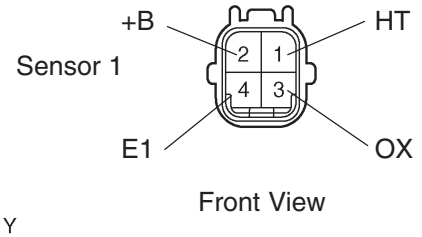
HINT:
If any DTCs other than P0130, P2195 and P2196 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2	READ VALUE OF INTELLIGENT TESTER II(OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / O2S B1 S1.
(d) Warm up the heated oxygen sensor at the engine speed of 2,500 rpm for approximately 90 seconds.
(e) Read the output voltage of the heated oxygen sensor during engine idling.
Standard:
Fluctuates between less than 0.4 V and more than 0.5 V (see the following figure).



A97090

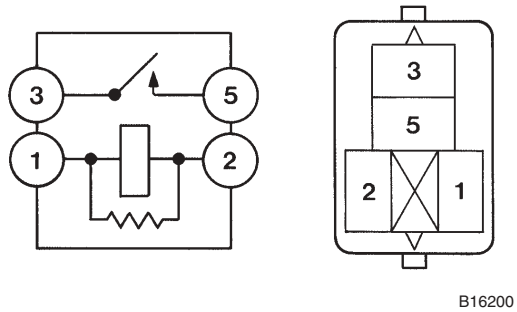
OK → **Go to step 9**

NG

3 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

Component Side:
Heated Oxygen Sensor Connector

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Measure the resistance between the terminals of the heated oxygen sensor connector.
Standard:



Tester Connection	Specified Condition
1 (HT) – 2 (+B)	5 to 10 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

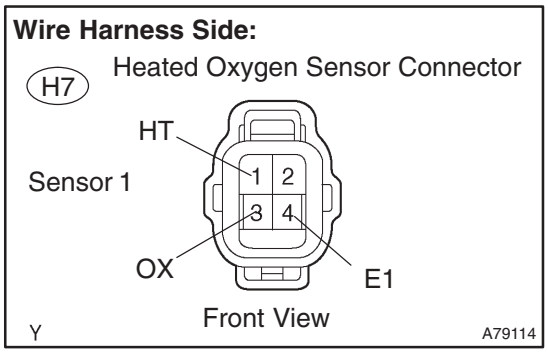
(c) Reconnect the heated oxygen sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

4 INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.
Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

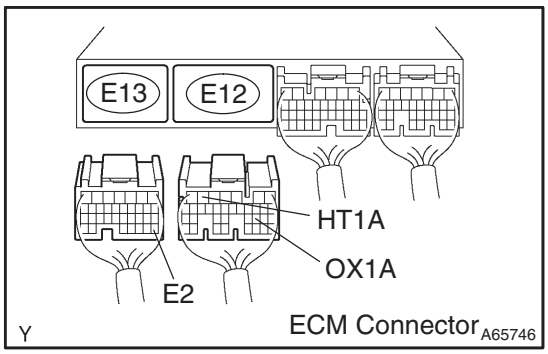
(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

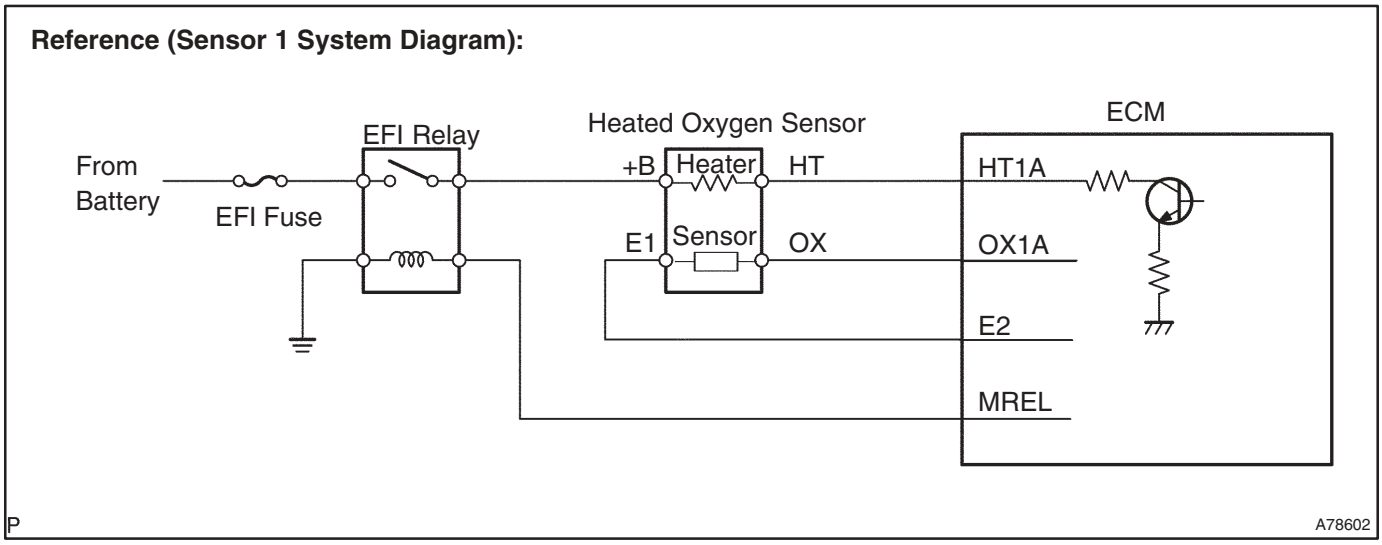
5 CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM)

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Disconnect the E12 and E13 ECM connectors.
(c) Check the resistance.



Standard (Check for open):

Tester Connection	Specified Condition
OX (H7–3) – OX1A (E12–22)	Below 1 Ω
HT (H7–1) – HT1A (E12–6)	Below 1 Ω
E1 (H7–4) – E2 (E13–28)	Below 1 Ω



Standard (Check for short):

Tester Connection	Specified Condition
OX (H7–3) or OX1A (E12–22) – Body ground	10 kΩ or higher
HT (H7–1) or HT1A (E12–6) – Body ground	10 kΩ or higher

(d) Reconnect the heated oxygen sensor connector.
(e) Reconnect the ECM connector.

Reference (Sensor 1 System Diagram):

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6	CHECK AIR INDUCTION SYSTEM

(a) Check for vacuum leaks in the air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

7	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

(a) Check the fuel pressure (high or low pressure).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8	INSPECT FUEL INJECTOR ASSY(INJECTION AND VOLUME) (See page 11–8 of Pub. No. RM1018E AVENSIS)

NG → REPLACE FUEL INJECTOR ASSY (See page 11–10 of Pub. No. RM1018E AVENSIS)

OK

REPLACE HEATED OXYGEN SENSOR

9	PERFORM CONFIRMATION DRIVING PATTERN

HINT:
Clear all DTCs prior to performing the confirmation driving pattern.

GO

10	CHECK IF DTC OUTPUT RECURS(DTC P0130, P2195 AND P2196)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0130 and/or P2195 or P2196	A
No output	B

The following A/F Control procedure enables the technician to check and graph the voltage output of both the heated oxygen sensors.

To display the graph, select the following menu items on the tester: View / Line Graph.

NOTICE:

If the vehicle is short of fuel, the air–fuel ratio becomes lean and the heated oxygen sensor DTCs will be recorded, and the MIL then illuminates.

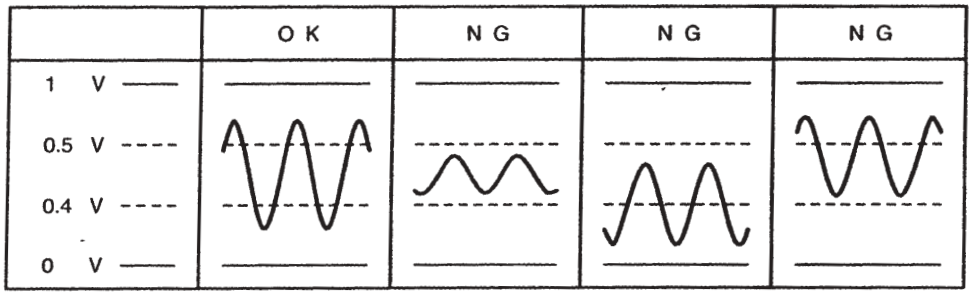
HINT:

- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air–fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air–fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0133)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0133	A
P0133 and other DTCs	B



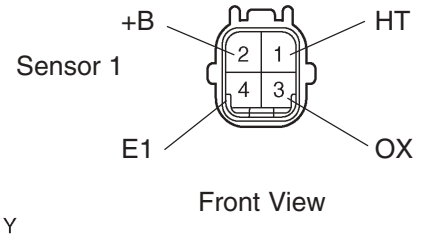
HINT:
If any DTCs other than P0133 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2	READ VALUE OF INTELLIGENT TESTER II(HEATED OXYGEN SENSOR DURING IDLING)

(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / O2S B1 S1.
(d) Warm up the heated oxygen sensor at the engine speed of 2,500 rpm for approximately 90 seconds.
(e) Read the output voltage of the heated oxygen sensor during engine idling.
Standard:
Fluctuates between less than 0.4 V and more than 0.5 V (see the following figure).



A97090

OK → **Go to step 9**

NG

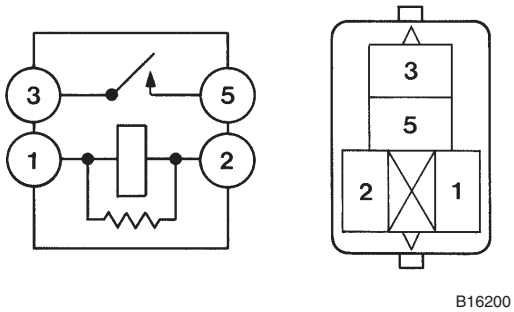
3 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

Component Side:
Heated Oxygen Sensor Connector

Y A93649

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Measure the resistance between the terminals of the heated oxygen sensor connector.

Standard:



Tester Connection	Specified Condition
1 (HT) – 2 (+B)	5 to 10 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

(c) Reconnect the heated oxygen sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

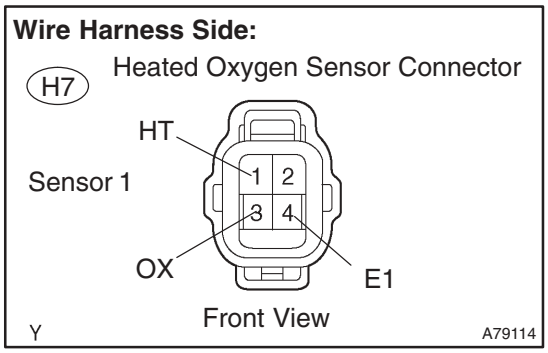
OK

4 INSPECT EFI RELAY

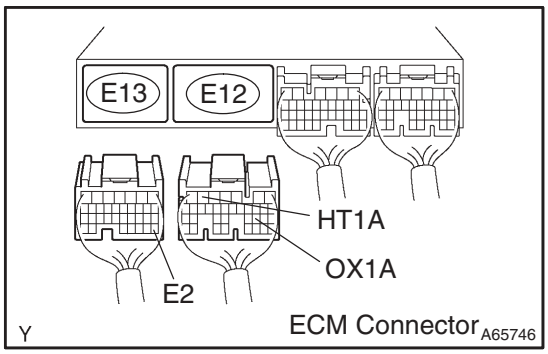
B16200

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)



(c) Reinstall the EFI relay.

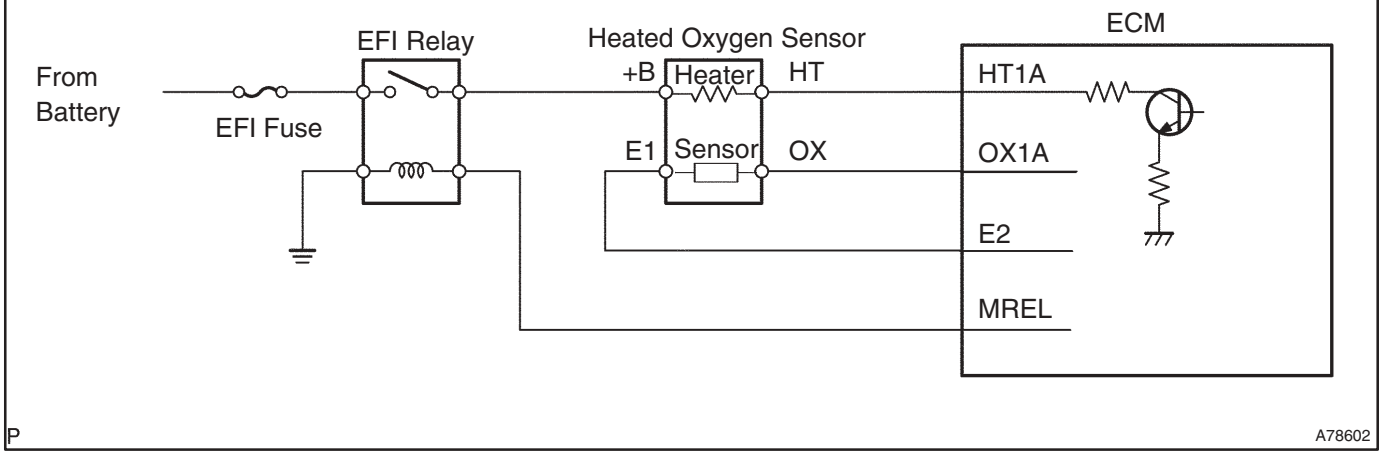
NG → **REPLACE EFI RELAY**

OK

5 CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM)

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Disconnect the E12 and E13 ECM connectors.
(c) Check the resistance.

Standard (Check for open):



Tester Connection	Specified Condition
OX (H7–3) – OX1A (E12–22)	Below 1 Ω
HT (H7–1) – HT1A (E12–6)	Below 1 Ω
E1 (H7–4) – E2 (E13–28)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
OX (H7–3) or OX1A (E12–22) – Body ground	10 kΩ or higher
HT (H7–1) or HT1A (E12–6) – Body ground	10 kΩ or higher

(d) Reconnect the heated oxygen sensor connector.
(e) Reconnect the ECM connector.

Reference (Sensor 1 System Diagram):

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6 CHECK AIR INDUCTION SYSTEM

(a) Check for vacuum leaks in the air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

7	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

(a) Check the fuel pressure (high or low pressure).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8	INSPECT FUEL INJECTOR ASSY(INJECTION AND VOLUME) (See page 11–8 of Pub. No. RM1018E AVENSIS)

NG → REPLACE FUEL INJECTOR ASSY (See page 11–10 of Pub. No. RM1018E AVENSIS)

OK

REPLACE HEATED OXYGEN SENSOR

9	PERFORM CONFIRMATION DRIVING PATTERN

HINT:
Clear all DTCs prior to performing the confirmation driving pattern.

GO

10	CHECK IF DTC OUTPUT RECURS(DTC P0133)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0133	A
No output	B

B → CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

A

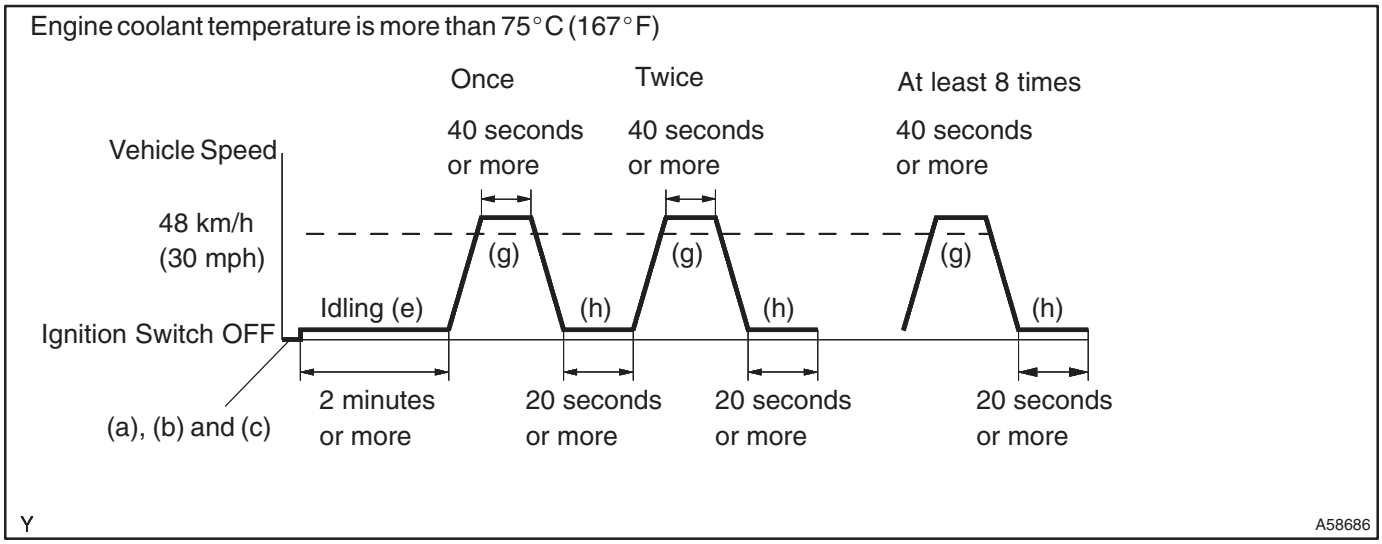
REPLACE HEATED OXYGEN SENSOR

DTC	P0134	OXYGEN SENSOR CIRCUIT NO ACTIVITY DETECTED (BANK 1 SENSOR 1)

CIRCUIT DESCRIPTION

Refer to DTC P0130 on page 05–74.

DTC No.	DTC Detecting Condition	Trouble Area
P0134	After engine is warmed up, voltage of heated oxygen sensor (sensor 1) does not become rich (greater than 0.45 V) even once when conditions (a), (b), (c), (d) and (e) continue for more than 50 seconds (1 trip detection logic): (a) Engine speed: 1,400 rpm or more (b) Vehicle speed: 40 km/h (25 mph) or more (c) Throttle valve is not fully closed (d) 180 seconds or more after starting engine (e) Engine coolant temperature is more than 40°C (104°F)	• Open or short in heated oxygen sensor circuit • Heated oxygen sensor (sensor 1) • PCV valve and hose • EFI relay • Air induction system • Fuel pressure • Injector • Gas leakage in exhaust system • ECM



HINT:

- Sensor 1 refers to the sensor near the engine assembly.
- When DTC P0134 is detected, confirm the output voltage of the heated oxygen sensor (sensor 1) in the Data List using the intelligent tester II.
  If the voltage output of the heated oxygen sensor is less than 0.1 V, the heated oxygen sensor circuit may be open or short.

WIRING DIAGRAM

Refer to DTC P0130 on page 05–74.

CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).
(d) Start the engine.
(e) Allow the engine to idle for 2 minutes.
(f) Warm up the engine until the engine coolant temperature reaches more than 75°C (167°F).
(g) Drive the vehicle at 48 km/h (30 mph) or more for 40 seconds or more.
(h) Stop the vehicle and allow the engine to idle for 20 seconds or more.
(i) Repeat the steps (g) and (h) at least 8 times in one driving cycle.

HINT:

If a malfunction exists, the MIL will be illuminated during step (i).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected. If you do not have the intelligent tester II, turn the ignition switch to OFF after performing steps from (d) to (i), then perform steps (d) to (i) again.

INSPECTION PROCEDURE

HINT:

Intelligent tester II only:

Malfunctioning areas can be found using the Active Test / A/F Control operation. The A/F Control operation can determine if the heated oxygen sensor or other potential trouble areas are malfunctioning or not.

(a) Perform the Active Test using the intelligent tester II.

HINT:

The A/F Control operation lowers the injection volume by 12.5 % or increases the injection volume by 25 %.

(1) Connect the intelligent tester II to the DLC3.
(2) Start the engine and turn the intelligent tester II ON.
(3) Warm up the engine by running the engine at 2,500 rpm for approximately 3 minutes.
(4) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Active Test / A/F Control.
(5) Select the following monitor items: O2S B1 S1 and O2S B1 S2.
(6) Perform the A/F Control operation with the engine in an idling condition (press the right or left button).

Result:

The heated oxygen sensor reacts in accordance with increases and decreases of the injection volume:

+25 % → Rich output: More than 0.5 V

–12.5 % → Lean output: Less than 0.4 V

NOTICE:

Sensor 1 (front sensor) has an output delay of a few seconds. Sensor 2 (rear sensor) has a maximum output delay of approximately 20 seconds.

	Output Voltage of Heated Oxygen Sensor (sensor 1: front sensor)	Output Voltage of Heated Oxygen Sensor (sensor 2: rear sensor)	Main Suspect Trouble Area
Case 1	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	—
Case 2	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Sensor 1: front sensor (Sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Sensor 2: rear sensor (Sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Extremely rich or lean actual air–fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

The following A/F Control procedure enables the technician to check and graph the voltage output of both the heated oxygen sensors.

To display the graph, select the following menu items on the tester: View / Line Graph.

NOTICE:

If the vehicle is short of fuel, the air–fuel ratio becomes lean and the heated oxygen sensor DTCs will be recorded, and the MIL then illuminates.

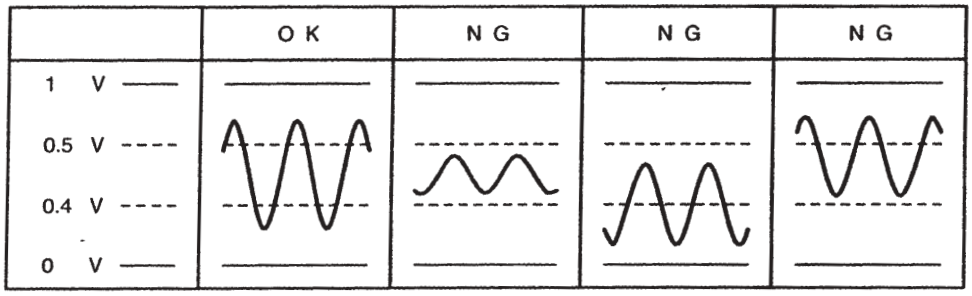
HINT:

- If different DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air–fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air–fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0134)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0134	A
P0134 and other DTCs	B



HINT:
If any DTCs other than P0134 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2	READ VALUE OF INTELLIGENT TESTER II(OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

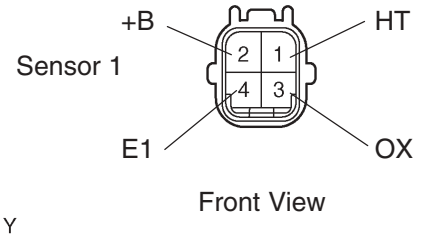
(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / O2S B1 S1.
(d) Warm up the heated oxygen sensor at the engine speed of 2,500 rpm for approximately 90 seconds.
(e) Read the output voltage of the heated oxygen sensor during engine idling.
Standard:
Fluctuates between less than 0.4 V and more than 0.5 V (see the following figure).

A97090

OK → **Go to step 12**

NG

3	CHECK CONNECTION OF PCV HOSE



OK: The PCV hose is connected correctly and not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

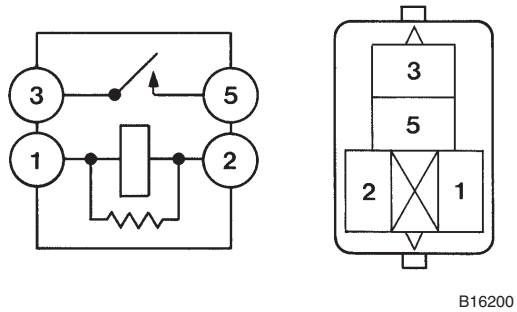
OK

4 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

Component Side:
Heated Oxygen Sensor Connector

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Measure the resistance between the terminals of the heated oxygen sensor connector.

Standard:



Tester Connection	Specified Condition
1 (HT) – 2 (+B)	5 to 10 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

(c) Reconnect the heated oxygen sensor connector.

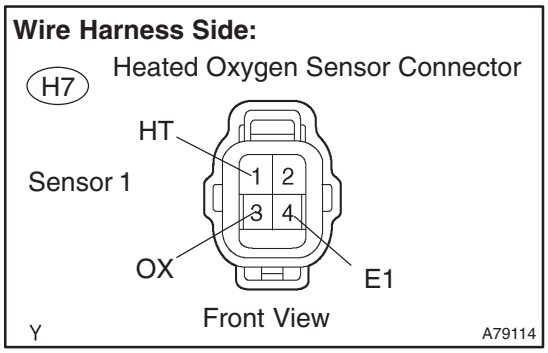
NG → **REPLACE HEATED OXYGEN SENSOR**

OK

5 INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

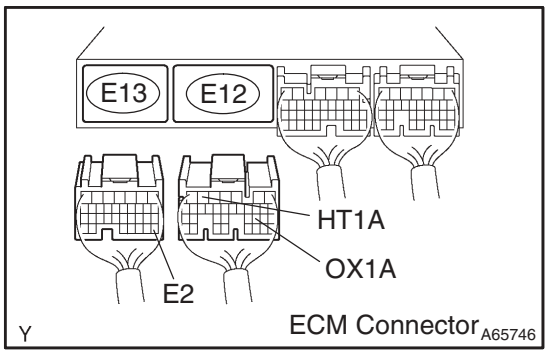
(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

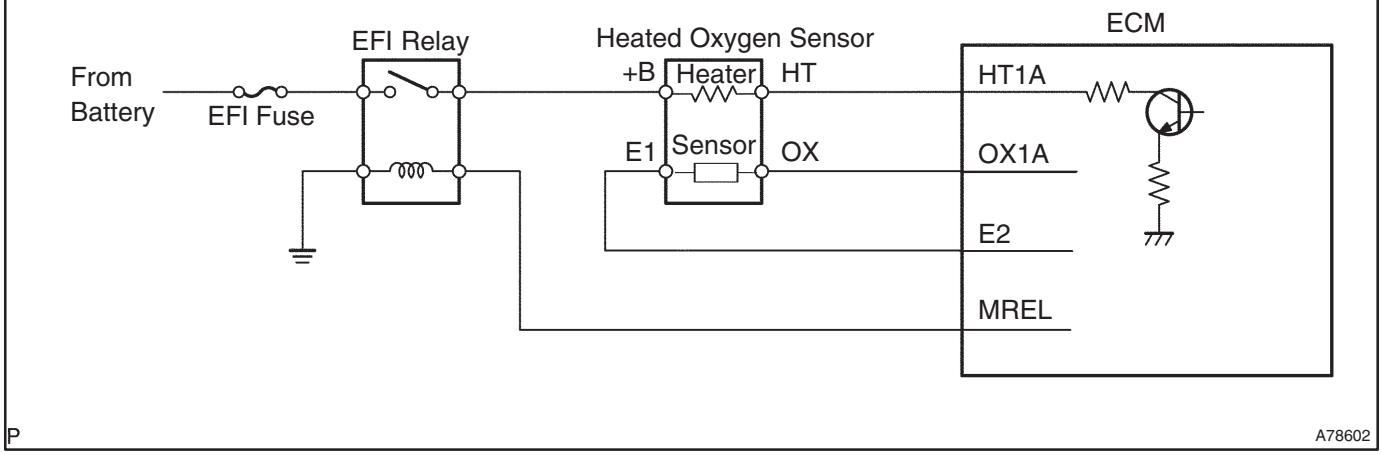
6 CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM)

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Disconnect the E12 and E13 ECM connectors.
(c) Check the resistance.



Standard (Check for open):

Tester Connection	Specified Condition
OX (H7–3) – OX1A (E12–22)	Below 1 Ω
HT (H7–1) – HT1A (E12–6)	Below 1 Ω
E1 (H7–4) – E2 (E13–28)	Below 1 Ω



Standard (Check for short):

Tester Connection	Specified Condition
OX (H7–3) or OX1A (E12–22) – Body ground	10 kΩ or higher
HT (H7–1) or HT1A (E12–6) – Body ground	10 kΩ or higher

(d) Reconnect the heated oxygen sensor connector.
(e) Reconnect the ECM connector.

Reference (Sensor 1 System Diagram):

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

7	CHECK WHETHER MISFIRE OCCURS OR NOT BY MONITORING DTC AND DATA LIST

NG → TROUBLESHOOT MISFIRES

OK

8	CHECK AIR INDUCTION SYSTEM

(a) Check for vacuum leaks in the air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

9	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

(a) Check the fuel pressure (high or low pressure).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

10	INSPECT FUEL INJECTOR ASSY(INJECTION AND VOLUME) (See page 11–8 of Pub. No. RM1018E AVENSIS)

- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air–fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air–fuel mixture. Check for conditions that would cause the engine to run lean.

1 CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0136)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0136	A
P0136 and other DTCs	B

HINT:
If any DTCs other than P0136 are output, troubleshoot those DTCs first.

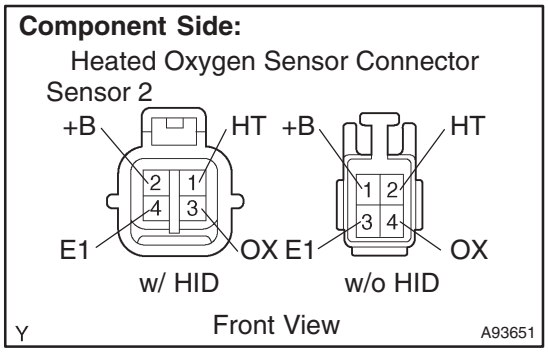
B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2 READ VALUE OF INTELLIGENT TESTER II(OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) After warming up the engine, run the engine at 2,500 rpm for 3 minutes.
(e) Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:
Quickly accelerate the engine to 4,000 rpm 3 times by using the accelerator pedal.



Standard: Fluctuates between 0.4 V or less and 0.5 V or more.

OK → **Go to step 6**

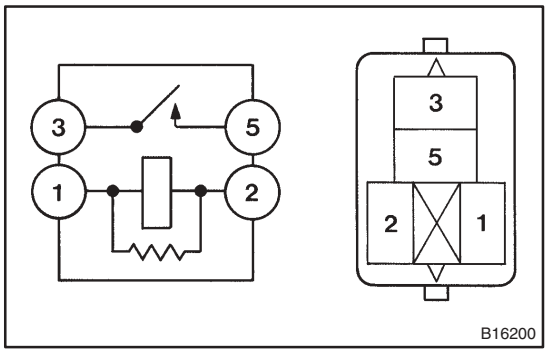
NG

3 INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

Component Side:

(a) Disconnect the H17 heated oxygen sensor connector.
(b) Measure the resistance between the terminals of the heated oxygen sensor connector.

Standard:



Tester Connection	Specified Condition
With HID: 1 (HT) – 2 (+B)	11 to 16 Ω at 20°C (68°F)
With HID: 1 (HT) – 4 (E1)	10 kΩ or higher
Without HID: 2 (HT) – 1 (+B)	11 to 16 Ω at 20°C (68°F)
Without HID: 2 (HT) – 3 (E1)	10 kΩ or higher

(c) Reconnect the heated oxygen sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

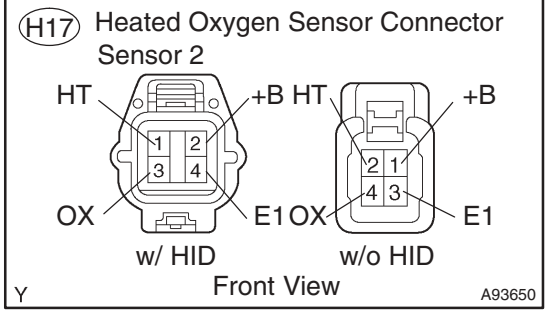
OK

4 INSPECT EFI RELAY

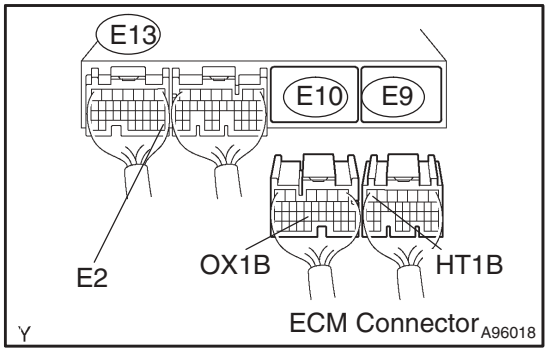
(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.

Standard:

Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)



(c) Reinstall the EFI relay.



NG → **REPLACE EFI RELAY**

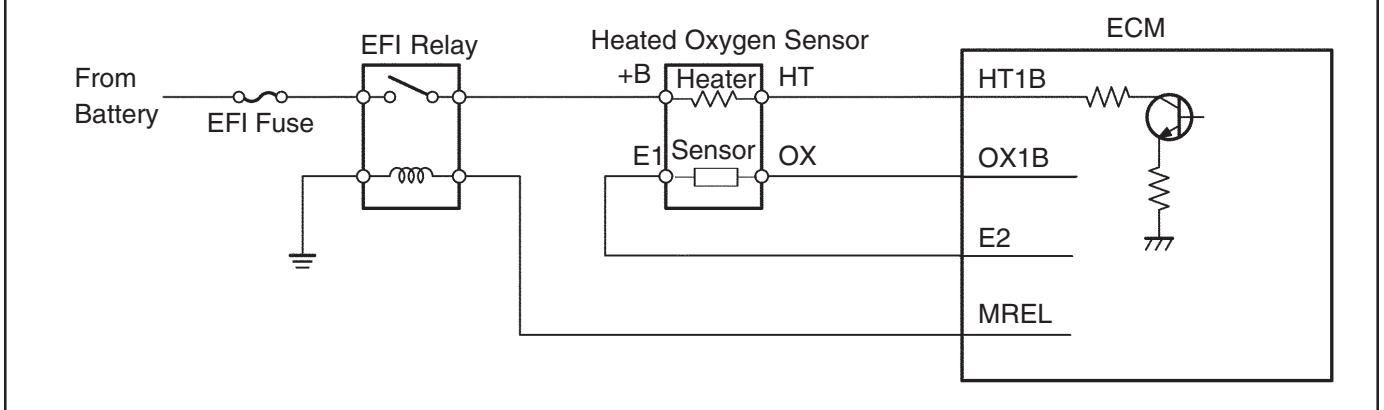
OK

5 CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM)

Wire Harness Side:

(a) Disconnect the H17 heated oxygen sensor connector.
(b) Disconnect the E9 and E10 ECM connectors.
(c) Check the resistance.

Standard (Check for open):



Tester Connection	Specified Condition
With HID: OX (H17–3) – OX1B (E10–23)	Below 1 Ω
With HID: HT (H17–1) – HT1B (E9–7)	Below 1 Ω
With HID: E1 (H17–4) – E2 (E13–28)	Below 1 Ω
Without HID: OX (H17–4) – OX1B (E10–23)	Below 1 Ω
Without HID: HT (H17–2) – HT1B (E9–7)	Below 1 Ω
Without HID: E1 (H17–3) – E2 (E13–28)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
With HID: OX (H17–3) or OX1B (E10–23) – Body ground	10 kΩ or higher
With HID: HT (H17–1) or HT1B (E9–7) – Body ground	10 kΩ or higher
Without HID: OX (H17–4) or OX1B (E10–23) – Body ground	10 kΩ or higher
Without HID: HT (H17–2) or HT1B (E9–7) – Body ground	10 kΩ or higher

(d) Reconnect the heated oxygen sensor connector.
(e) Reconnect the ECM connector.

Reference (Sensor 2 System Diagram):

(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
No output	A
P0136	B

B → REPLACE HEATED OXYGEN SENSOR

A

CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

DTC	P0171	SYSTEM TOO LEAN (BANK 1)

DTC	P0172	SYSTEM TOO RICH (BANK 1)

CIRCUIT DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim includes the short–term fuel trim and the long–term fuel trim.

The short–term fuel trim is the short–term fuel compensation used to maintain the air–fuel ratio at its ideal theoretical value. The signal from the heated oxygen sensor indicates whether the air–fuel ratio is rich or lean compared to the ideal theoretical value, triggering a reduction in the fuel volume if the air–fuel ratio is rich, and an increase in the fuel volume if it is lean.

The long–term fuel trim is the overall fuel compensation in order to balance the short–term fuel trim for a continual deviation from the central value by individual engine differences, operating environment and age deterioration.

If both the short–term fuel trim and the long–term fuel trim are lean or rich beyond a standard level, it is detected as a malfunction in the SFI system. The ECM illuminates the MIL and the DTC is set.

DTC No.	DTC Detection Condition	Trouble Area
P0171	When air–fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on lean side (2 trip detection logic)	• Air induction system • Injector blockage • Mass air flow meter • Engine coolant temperature sensor • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (sensor 1) circuit • Heated oxygen sensor (sensor 1) • PCV valve and hose • PCV hose connection • ECM
P0172	When air–fuel ratio feedback is stable after warming up engine, fuel trim is considerably in error on rich side (2 trip detection logic)	• Injector leakage or blockage • Mass air flow meter • Engine coolant temperature sensor • Ignition system • Fuel pressure • Gas leakage in exhaust system • Open or short in heated oxygen sensor (sensor 1) circuit • Heated oxygen sensor (sensor 1) • ECM

HINT:

- When DTC P0171 is set, the actual air–fuel ratio is lean. When DTC P0172 is set, the actual air–fuel ratio is rich.
- If the vehicle runs out of fuel, the air–fuel ratio is lean and DTC P0171 may be set. The MIL then illuminates.
- If the total of the short–term fuel trim value and long–term fuel trim value is within ± 20 %, the system is functioning normally.

WIRING DIAGRAM

Refer to DTC P0130 on page 05–74.

INSPECTION PROCEDURE

HINT:

Intelligent tester II only:

Malfunctioning areas can be found using the Active Test / A/F Control operation. The A/F Control operation can determine if the heated oxygen sensor or other potential trouble areas are malfunctioning or not.

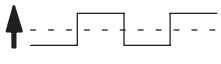
(a) Perform the Active Test using the intelligent tester II.

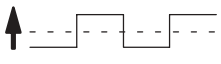
HINT:

The A/F Control operation lowers the injection volume by 12.5 % or increases the injection volume by 25 %.

(1) Connect the intelligent tester II to the DLC3.
(2) Start the engine and turn the intelligent tester II ON.
(3) Warm up the engine by running the engine at 2,500 rpm for approximately 3 minutes.
(4) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Active Test / A/F Control.
(5) Select the following monitor items: O2S B1 S1 and O2S B1 S2.
(6) Perform the A/F Control operation with the engine in an idling condition (press the right or left button).

Result:





The heated oxygen sensor reacts in accordance with increases and decreases of the injection volume:

+25 % → Rich output: More than 0.5 V

–12.5 % → Lean output: Less than 0.4 V

NOTICE:

Sensor 1 (front sensor) has an output delay of a few seconds. Sensor 2 (rear sensor) has a maximum output delay of approximately 20 seconds.

	Output Voltage of Heated Oxygen Sensor (sensor 1: front sensor)	Output Voltage of Heated Oxygen Sensor (sensor 2: rear sensor)	Main Suspect Trouble Area
Case 1	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	—
Case 2	Injection volume +25 % –12.5 %  Output voltage Almost no reaction NG	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Sensor 1: front sensor (Sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  OK	Injection volume +25 % –12.5 %  Output voltage Almost no reaction  NG	Sensor 2: rear sensor (Sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % –12.5 %  Output voltage Almost no reaction  NG	Injection volume +25 % –12.5 %  Output voltage Almost no reaction  NG	Extremely rich or lean actual air–fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

The following A/F Control procedure enables the technician to check and graph the voltage output of both the heated oxygen sensors.

To display the graph, select the following menu items on the tester: View / Line Graph.

NOTICE:

If the vehicle is short of fuel, the air–fuel ratio becomes lean and the heated oxygen sensor DTCs will be recorded, and the MIL then illuminates.

HINT:

- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A high heated oxygen sensor (sensor 1) voltage (0.5 V or more) could be caused by a rich air–fuel mixture. Check for conditions that would cause the engine to run rich.
- A low heated oxygen sensor (sensor 1) voltage (0.4 V or less) could be caused by a lean air–fuel mixture. Check for conditions that would cause the engine to run lean.

1	CHECK AIR INDUCTION SYSTEM

(a) Check for vacuum leaks in the air induction system.
OK: No vacuum leak.

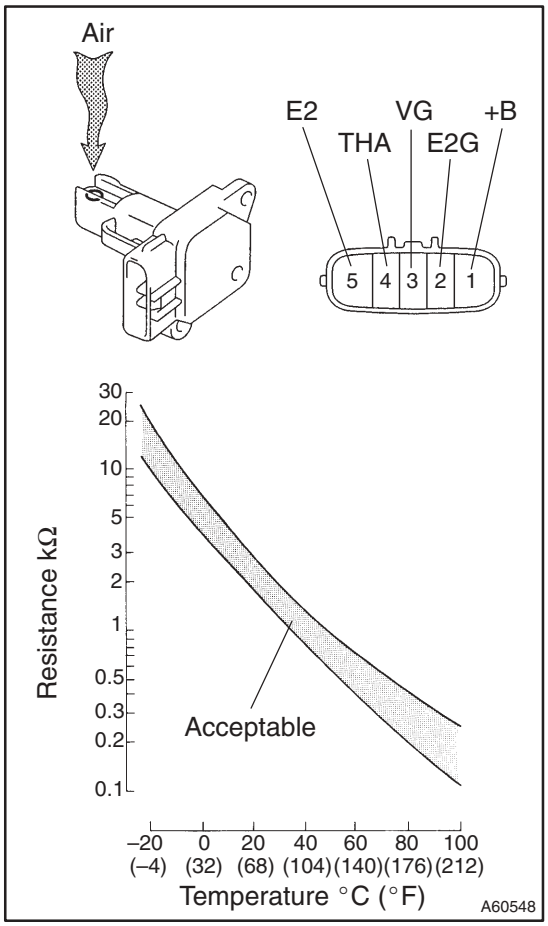
NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

2	CHECK CONNECTION OF PCV HOSE

OK: The PCV hose is connected correctly and not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**



OK

3	INSPECT FUEL INJECTOR ASSY(INJECTION AND VOLUME) (See page 11–8 of Pub. No. RM1018E AVENSIS)

NG → **REPLACE FUEL INJECTOR ASSY (See page 11–10 of Pub. No. RM1018E AVENSIS)**

OK

4 INSPECT MASS AIR FLOW METER

(a) Remove the mass air flow meter.

(b) Inspect output voltage.

(1) Apply the battery voltage across terminals +B and E2G.

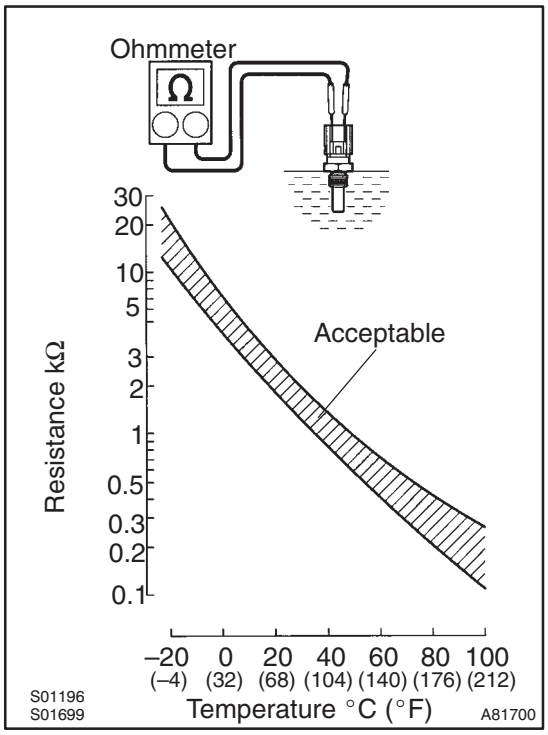
(2) Connect the positive (+) tester probe to terminal VG, and negative (–) tester probe to terminal E2G.

(3) Blow air into the mass air flow meter, and check that the voltage fluctuates.

(c) Inspect the resistance.

(1) Measure the resistance between the terminals of the intake air temperature sensor.

Standard:



Tester Connection	Specified Condition
THA (4) – E2 (5)	13.6 to 18.4 kΩ at –20°C (–4°F)
THA (4) – E2 (5)	2.21 to 2.69 kΩ at 20°C (68°F)
THA (4) – E2 (5)	0.49 to 0.67 kΩ at 60°C (140°F)

(d) Reinstall the mass air flow meter.

NG → **REPLACE MASS AIR FLOW METER**

OK

5	INSPECT ENGINE COOLANT TEMPERATURE SENSOR(RESISTANCE)

(a) Remove the engine coolant temperature sensor.
(b) Measure the resistance between the terminals of the engine coolant temperature sensor.

Standard:

Tester Connection	Specified Condition
1 – 2	2.32 to 2.59 kΩ at 20°C (68°F)
1 – 2	0.310 to 0.326 kΩ at 80°C (176°F)

NOTICE:

When checking the engine coolant temperature sensor in water, be careful not to allow water to get in contact with the terminals. After checking, dry the sensor.

HINT:

Alternative procedure: Connect an ohmmeter to the installed engine coolant temperature sensor and read the resistance. Use an infrared thermometer to measure the engine temperature in the immediate vicinity of the sensor. Compare these values against the resistance/temperature graph. Change the engine temperature (warm up or allow to cool down) and repeat the test.

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

6	CHECK FOR SPARK AND IGNITION (See page 18–3 of Pub. No. RM1018E AVENSIS)

OK: The spark occurs.

NG → **REPAIR OR REPLACE**

OK

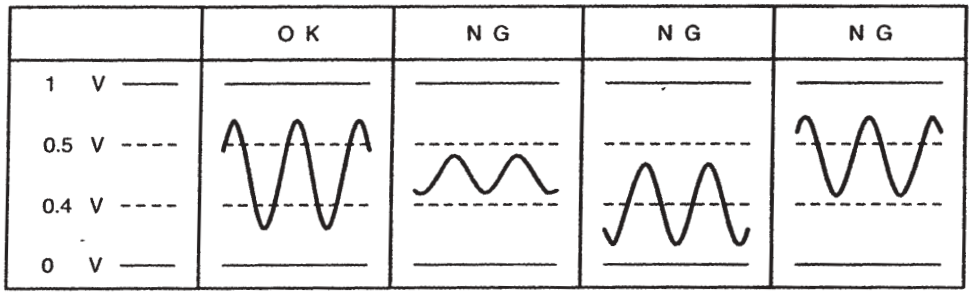
7	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

(a) Check the fuel pressure (high or low pressure).

NG → **CHECK AND REPLACE FUEL SYSTEM**

OK

8	CHECK FOR EXHAUST GAS LEAKAGE



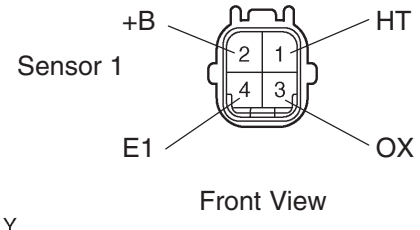
OK: No gas leak.

NG → **REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT**

OK

9	READ VALUE OF INTELLIGENT TESTER II(OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / O2S B1 S1.
(d) Warm up the heated oxygen sensor at the engine speed of 2,500 rpm for approximately 90 seconds.
(e) Read the output voltage of the heated oxygen sensor during engine idling.
Standard:
Fluctuates between less than 0.4 V and more than 0.5 V (see the following figure).



A97090

OK → **Go to step 17**

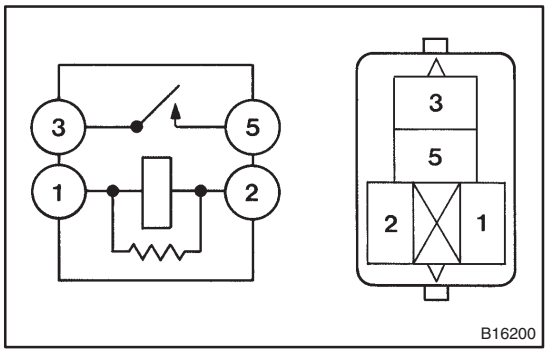
NG

10	INSPECT HEATED OXYGEN SENSOR(HEATER RESISTANCE)

Component Side:
Heated Oxygen Sensor Connector

Y A93649

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Measure the resistance between the terminals of the heated oxygen sensor connector.
Standard:



Tester Connection	Specified Condition
1 (HT) – 2 (+B)	5 to 10 Ω at 20°C (68°F)
1 (HT) – 4 (E1)	10 kΩ or higher

(c) Reconnect the heated oxygen sensor connector.

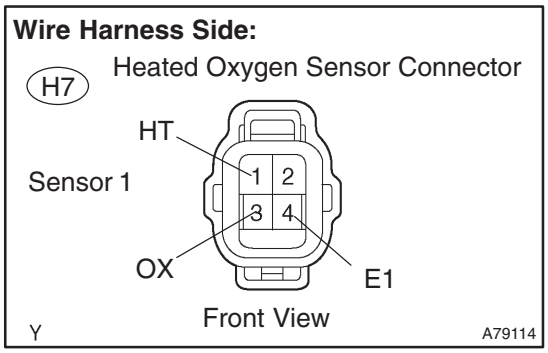
NG → **REPLACE HEATED OXYGEN SENSOR**

OK

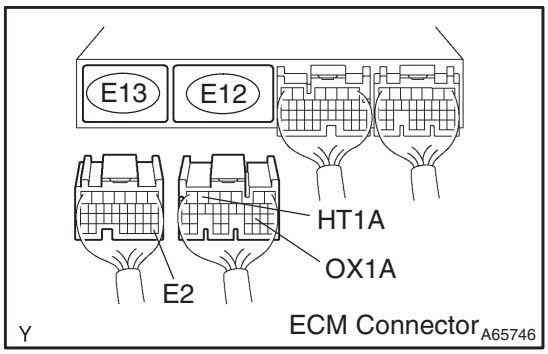
11	INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)



(c) Reinstall the EFI relay.

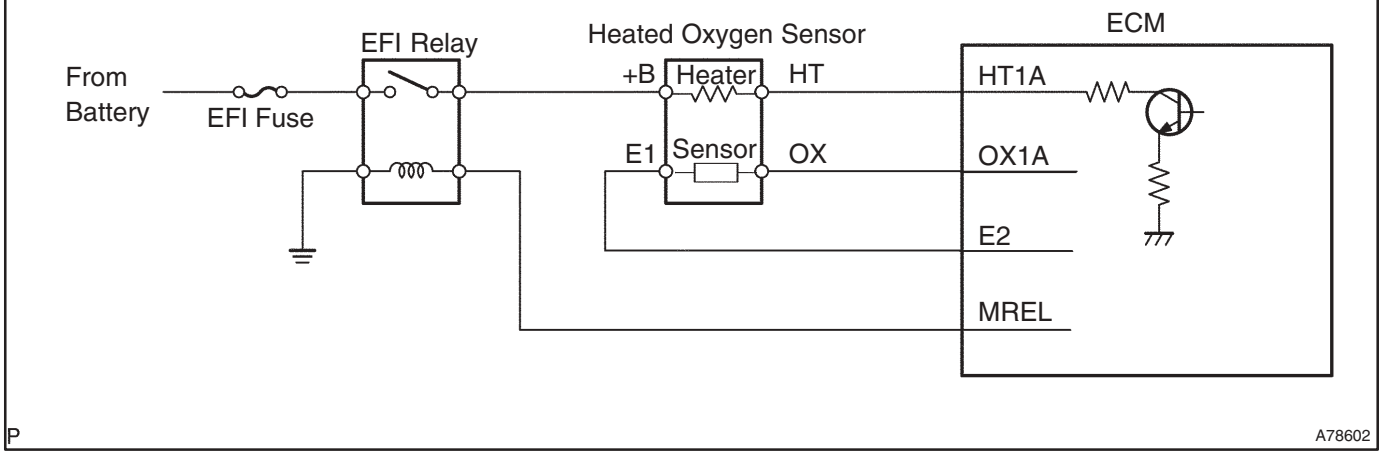
NG → **REPLACE EFI RELAY**

OK

12 CHECK HARNESS AND CONNECTOR(HEATED OXYGEN SENSOR – ECM)

(a) Disconnect the H7 heated oxygen sensor connector.
(b) Disconnect the E12 and E13 ECM connectors.
(c) Check the resistance.

Standard (Check for open):



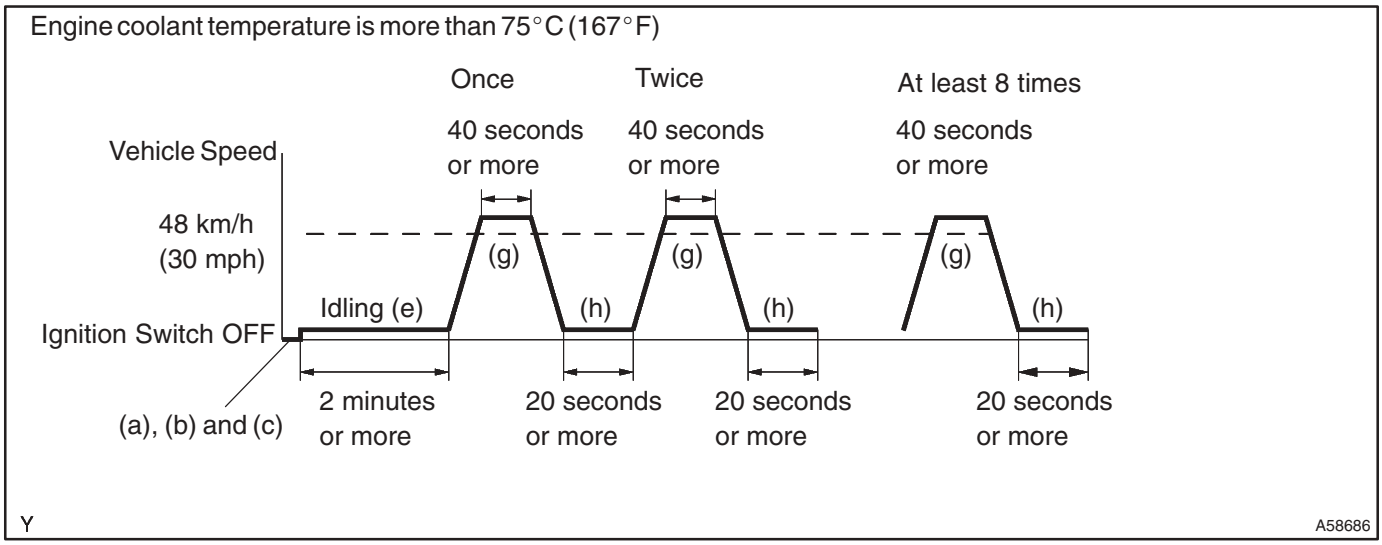
Tester Connection	Specified Condition
OX (H7–3) – OX1A (E12–22)	Below 1 Ω
HT (H7–1) – HT1A (E12–6)	Below 1 Ω
E1 (H7–4) – E2 (E13–28)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
OX (H7–3) or OX1A (E12–22) – Body ground	10 kΩ or higher
HT (H7–1) or HT1A (E12–6) – Body ground	10 kΩ or higher

(d) Reconnect the heated oxygen sensor connector.
(e) Reconnect the ECM connector.

Reference (Sensor 1 System Diagram):



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

13 REPLACE HEATED OXYGEN SENSOR

GO

14	PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).
(d) Start the engine.
(e) Allow the engine to idle for 2 minutes.
(f) Warm up the engine until the engine coolant temperature reaches more than 75°C (167°F).
(g) Drive the vehicle at 48 km/h (30 mph) or more for 40 seconds or more.
(h) Stop the vehicle and allow the engine to idle for 20 seconds or more.
(i) Repeat the steps (g) and (h) at least 8 times in one driving cycle.

HINT:

If a malfunction exists, the MIL will be illuminated during step (i).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected. If you do not have the intelligent tester II, turn the ignition switch to OFF after performing steps from (d) to (i), then perform steps (d) to (i) again.

GO

15	CHECK IF DTC OUTPUT RECURS(DTC P0171 AND/OR P0172)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
No output	A
P0171 and/or P0172	B

B → **REPLACE ECM AND PERFORM CONFIRMATION DRIVING PATTERN (Refer to step 14)**

A

16	CONFIRM IF VEHICLE HAS RUN OUT OF FUEL IN PAST

NO → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

YES

DTCS ARE CAUSED BY RUNNING OUT OF FUEL (DTCS P0171 AND/OR P0172)

17	PERFORM CONFIRMATION DRIVING PATTERN

HINT:
Clear all DTCs prior to performing the confirmation driving pattern (refer to step 14).

GO

18	CHECK IF DTC OUTPUT RECURS(DTC P0171 AND/OR P0172)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P0171 and/or P0172	A
No output	B

B → **Go to step 22**

A

19	REPLACE HEATED OXYGEN SENSOR

GO

20	PERFORM CONFIRMATION DRIVING PATTERN

HINT:
Clear all DTCs prior to performing the confirmation driving pattern (refer to step 14).

GO

21	CHECK IF DTC OUTPUT RECURS(DTC P0171 AND/OR P0172)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
No output	A
P0171 and/or P0172	B

B → **REPLACE ECM AND PERFORM CONFIRMATION DRIVING PATTERN (Refer to step 14)**

A

22	CONFIRM IF VEHICLE HAS RUN OUT OF FUEL IN PAST

NO → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

YES

DTCS ARE CAUSED BY RUNNING OUT OF FUEL (DTCS P0171 AND/OR P0172)

DTC	P0300	RANDOM/MULTIPLE CYLINDER MISFIRE DETECTED

DTC	P0301	CYLINDER 1 MISFIRE DETECTED

DTC	P0302	CYLINDER 2 MISFIRE DETECTED

DTC	P0303	CYLINDER 3 MISFIRE DETECTED

DTC	P0304	CYLINDER 4 MISFIRE DETECTED

CIRCUIT DESCRIPTION

When a misfire occurs in the engine, hydrocarbons (HC) enter the exhaust gas in high concentrations. If this HC concentration is high enough, there could be an increase in exhaust emission levels. High concentrations of HC can also cause temperature of the catalyst to increase, possibly damaging the catalyst. To prevent this increase in emissions and limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the catalyst reaches a point of thermal degradation, the ECM will blink the MIL. For monitoring misfire, the ECM uses both the camshaft position sensor and the crankshaft position sensor. The camshaft position sensor is used to identify misfiring cylinders and the crankshaft position sensor is used to measure variations in the crankshaft rotation speed. The misfire counter increments when crankshaft rotation speed variations exceed threshold values.

If the misfiring rate exceeds the threshold and could cause emission deterioration, the ECM illuminates the MIL.

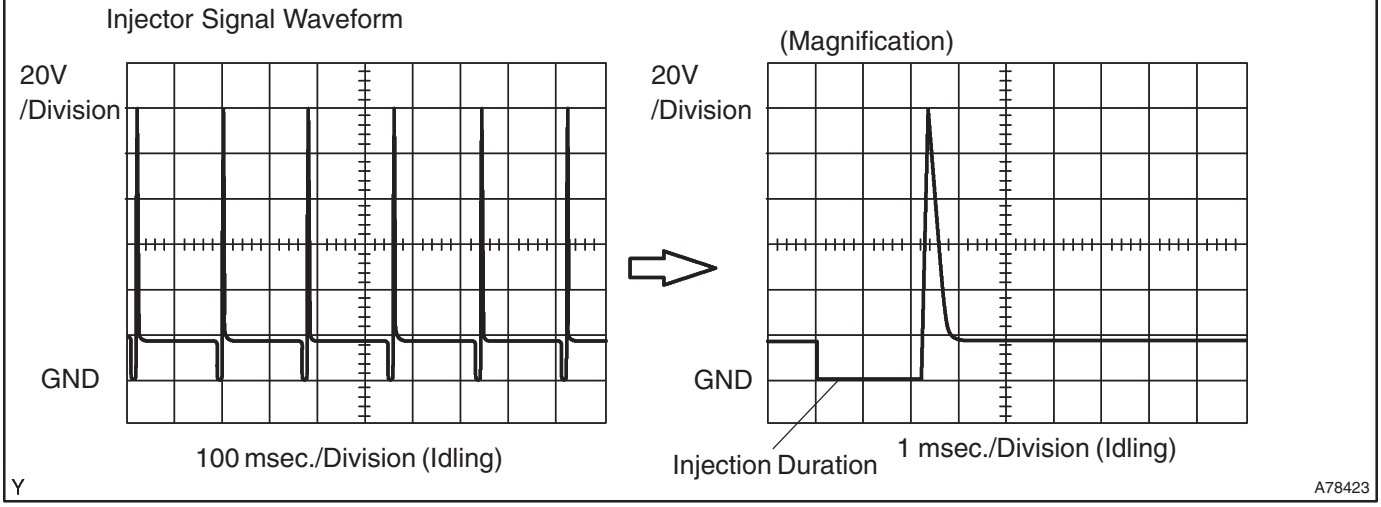
HINT:

- For any particular 200 revolutions of the engine, misfiring which could result in overheating of the catalyst is detected. This will cause the MIL to blink (1 trip detection logic).
- For any particular 1,000 revolutions of the engine, misfiring which could result in emission deterioration is detected. This will cause the MIL to illuminate (2 trip detection logic).

DTC No.	DTC Detection Condition	Trouble Area
P0300	Misfiring of random cylinders is detected	• Open or short in engine wire harness • Connector connection • Vacuum hose connection • Ignition system • Injector • Fuel pressure • Mass air flow meter • Engine coolant temperature sensor • Compression pressure • Valve clearance • Valve timing • PCV hose connection • PCV hose • ECM
P0301 P0302 P0303 P0304	Misfiring of each cylinder is detected	• Open or short in engine wire harness • Connector connection • Vacuum hose connection • Ignition system • Injector • Fuel pressure • Mass air flow meter • Engine coolant temperature sensor • Compression pressure • Valve clearance • Valve timing • PCV hose connection • PCV hose • ECM

HINT:

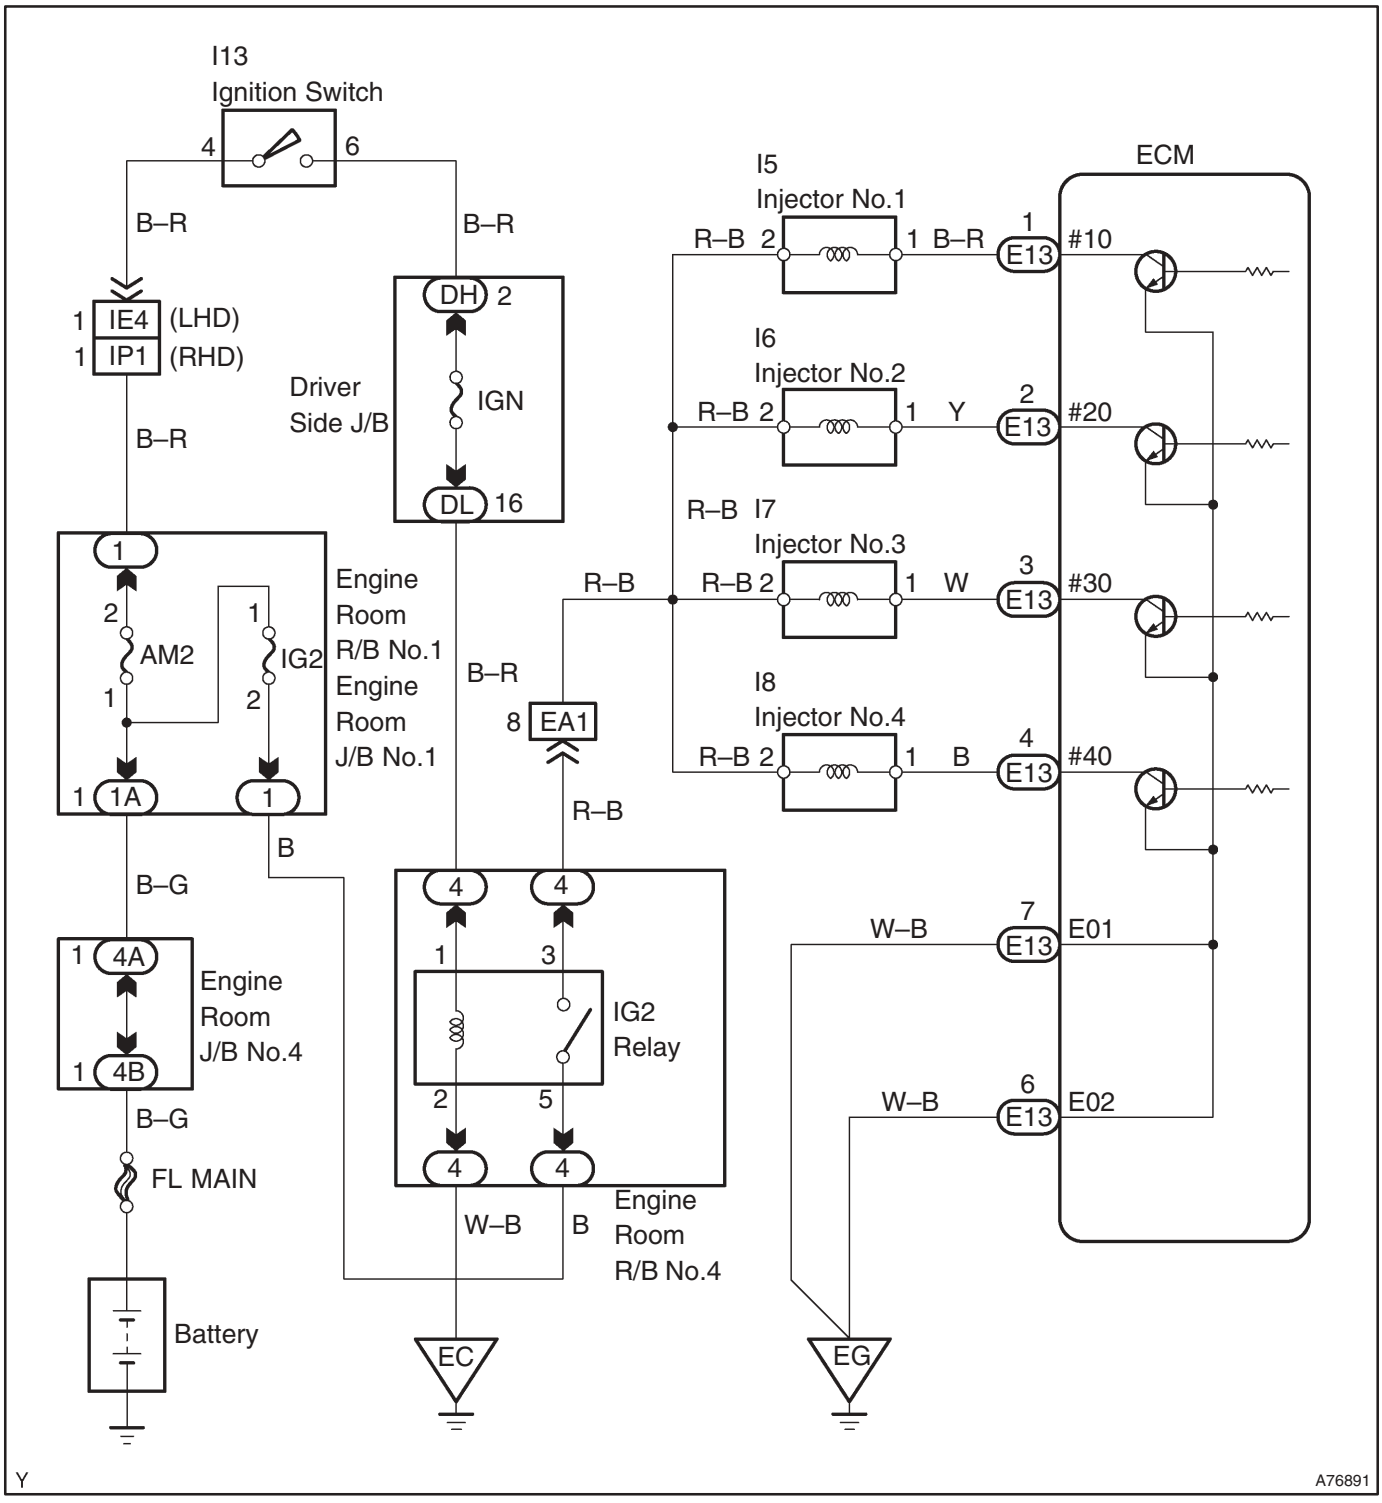
When the DTCs for misfiring cylinders are recorded repeatedly but no random misfire DTC is recorded, it indicates that the misfires have been set and recorded at different times.



Reference: Inspection using the oscilloscope

With the engine idling, check the waveform between terminals #10 to #40 and E01 of the ECM connectors.

Item	Contents
Terminal	#10 to #40 – E01
Equipment Setting	20V/Division, 100 or 1 ms/Division
Condition	Idling



HINT:

The correct waveform is as shown.

WIRING DIAGRAM

Refer to DTC P0351 on page 05–143 for the wiring diagram of the ignition system.

CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Note down the DTC(s) and freeze frame data.
(d) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).
(e) Check the misfire counter values for each cylinder when idling. If the misfire counter value indicates 0, perform the following procedure of the confirmation driving pattern.
(f) Drive the vehicle several times using an engine speed (Engine Speed), engine load (Calculate Load) and other data stored in the freeze frame data.

If you have no intelligent tester II, turn the ignition switch to OFF after the symptom is simulated once. Then repeat the simulation process again.

HINT:

In order to record the misfire DTCs, it is necessary to drive around Misfire RPM and Misfire Load in Data List for the following period of time. Do not turn the ignition switch to OFF. Turning the ignition switch to OFF switches the diagnosis system from check mode to normal mode. So all DTCs and other data will be erased.

Engine Speed	Time
Idling	3 minutes 30 seconds or more
1,000 rpm	3 minutes or more
2,000 rpm	1 minute 30 seconds or more
3,000 rpm	1 minute or more

(g) Check if there is the DTC(s) to verify whether misfires have occurred. If the DTC(s) is present, record the DTC and freeze frame data.
(h) Turn the ignition switch to OFF and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If any DTCs other than the misfire DTCs are set simultaneously, first troubleshoot them.
- If a misfire does not occur when the vehicle is brought to the workshop, a misfire can be confirmed by reproducing the condition of the freeze frame data. Also, after finishing repairs, confirm that misfires do not recur (see the confirmation driving pattern).
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- On 6 and 8 cylinder engines, misfiring cylinders cannot be identified at high engine speed and only a general misfire DTC P0300 is stored instead of the individual misfiring cylinder DTCs (P0301 to P0308).
  If a misfire starts in a high engine speed area or a misfire occurs only in a high engine speed area, only DTC P0300 may be stored.

  When only a general misfire DTC P0300 is stored:
- Erase the general misfire DTC from the ECM using the intelligent tester II.
- Start the engine and perform the confirmation driving pattern.
- Check the value of the misfire ratio for each cylinder. Or check the DTC(s).
- Perform repairs on the cylinder that has a high misfire ratio. Or repair the cylinder indicated by the DTC.
- After finishing repairs, perform the confirmation driving pattern again and confirm that no misfire occurs.
- When either of Short FT #1 and Long FT #1 in the freeze frame data is over the range of ±20 %, there is a possibility that the air–fuel ratio is becoming rich (–20 % or less) or lean (+20 % or more).
- When Coolant Temp in the freeze frame data is less than 80°C (176°F), there is a possibility that misfires occur only during engine warm–up.
- If a misfire cannot be reproduced, the following reasons may apply: 1) the vehicle has low fuel, 2) improper fuel is being used, and 3) the ignition plug has been contaminated.
- Be sure to check the misfire counter value after repairs.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO MISFIRE DTCS)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0300, P0301, P0302, P0303 and/or P0304	A
P0300, P0301, P0302, P0303 or P0304 and other DTCs	B

HINT:
If any DTCs other than P0300, P0301, P0302, P0303 or P0304 are output, troubleshoot those DTCs.

B → **GO TO RELEVANT DTC CHART** (See page 05–27)

A

2	CHECK WIRE HARNESS, CONNECTOR AND VACUUM HOSE IN ENGINE ROOM

(a) Check the connection condition of the wire harnesses and connector.
(b) Check the piping of the vacuum hose.
(c) Check the vacuum hose for disconnection or breakage.

OK: Connected correctly and no damage on the wire harnesses.

NG → **REPAIR OR REPLACE, THEN CONFIRM THAT THERE IS NO MISFIRE**

OK

3	CHECK CONNECTION OF PCV HOSE

OK: The PCV hose is connected correctly and not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

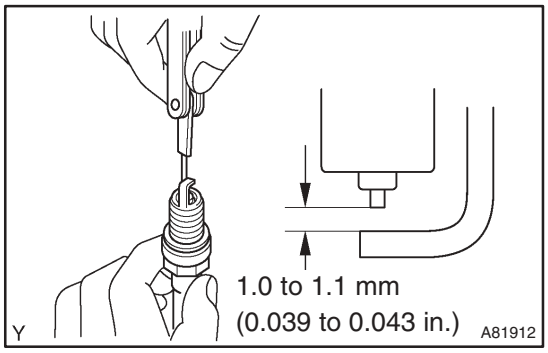
OK

4	READ VALUE OF INTELLIGENT TESTER II(NUMBER OF MISFIRING CYLINDERS)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(c) Start the engine.
(d) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Data List / Cylinder #1 Misfire Rate – Cylinder #4 Misfire Rate.
(e) Check the number of misfiring cylinders on the intelligent tester II.

HINT:

When a misfire is not reproduced, be sure to proceed according to the table below based on the stored DTC.



Result:

High Misfire Rate Cylinder	Proceed To
1 or 2 cylinders	A
3 cylinders or more	B

B → **Go to step 15**

A

5	CHECK SPARK PLUG AND SPARK OF MISFIRING CYLINDER

(a) Remove the ignition coil assembly.
(b) Remove the spark plug.
(c) Check the spark plug type.
Recommended spark plug:

Supplier	Type
DENSO	K16R–U11

(d) Check the spark plug electrode gap.
Standard: 1.0 to 1.1 mm (0.039 to 0.043 in.)
Maximum: 1.3 mm (0.047 in.)

NOTICE:
If adjusting the gap of a new spark plug, bend only the ground electrode. Do not touch the tip. Never attempt to adjust the gap of a used plug.

(e) Check the electrode for carbon deposits.
(f) Perform a spark test.

CAUTION:
Completely disconnect each injector connector.

NOTICE:
Do not crank the engine for more than 5 to 10 seconds.

(1) Install the spark plug to the ignition coil, and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if a spark occurs while the engine is being cranked.

OK: A spark jumps across electrode gap.

(g) Reinstall the spark plug.
(h) Reinstall the ignition coil assembly.

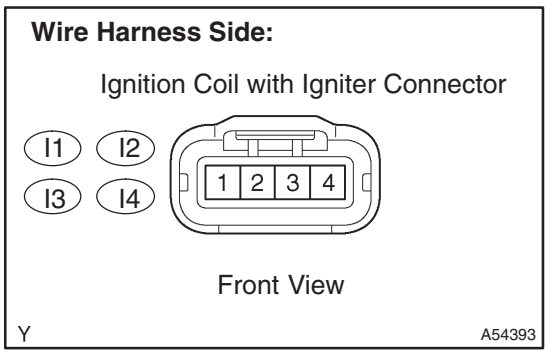
OK	Go to step 8

NG

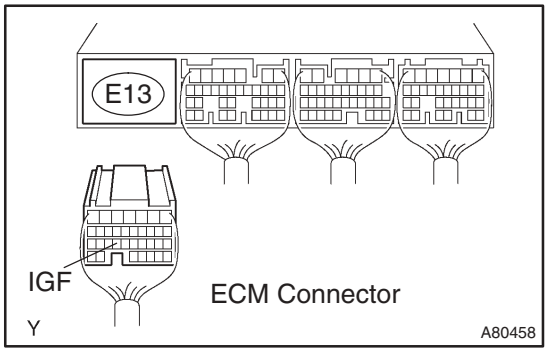
6	CHANGE NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

(a) Change the spark plug with the normal spark plug.
(b) Perform a spark test.

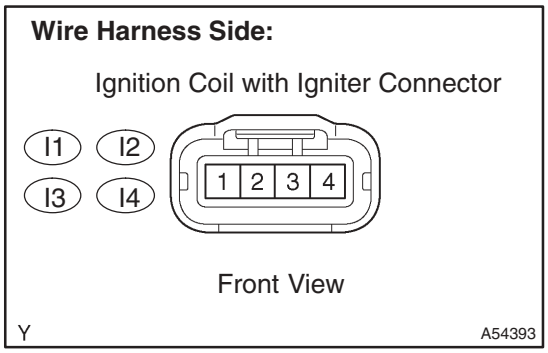
CAUTION:
Completely disconnect each injector connector.
NOTICE:
Do not crank the engine for more than 5 to 10 seconds.



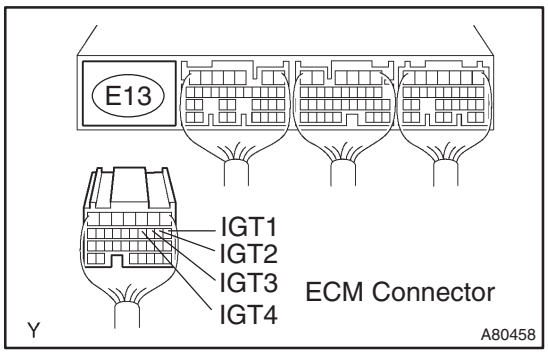
(1) Install the spark plug to the ignition coil, and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if a spark occurs while the engine is being cranked.



OK: A spark jumps across electrode gap.



OK → **REPLACE IGNITION COIL ASSY**



NG

7	CHECK HARNESS AND CONNECTOR OF MISFIRING CYLINDER(IGNITION COIL ASSY – ECM)

(a) Check the harness and the connectors between the ignition coil with igniter and ECM (IGF terminal).
  (1) Disconnect the I1, I2, I3 and/or I4 ignition coil with igniter connector.
  (2) Disconnect the E13 ECM connector.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Ignition coil (I1–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I2–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I3–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I4–2) – IGF (E13–24)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Ignition coil (I1–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I2–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I3–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I4–2) or IGF (E13–24) – Body ground	10 kΩ or higher

  (4) Reconnect the ignition coil with igniter connector.
  (5) Reconnect the ECM connector.

(b) Check the harness and the connectors between the ignition coil with igniter and ECM (IGT terminal).
  (1) Disconnect the I1, I2, I3 and/or I4 ignition coil with igniter connector.
  (2) Disconnect the E13 ECM connector.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Ignition coil (I1–3) – IGT1 (E13–8)	Below 1 Ω
Ignition coil (I2–3) – IGT2 (E13–9)	Below 1 Ω
Ignition coil (I3–3) – IGT3 (E13–10)	Below 1 Ω
Ignition coil (I4–3) – IGT4 (E13–11)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Ignition coil (I1–3) or IGT1 (E13–8) – Body ground	10 kΩ or higher
Ignition coil (I2–3) or IGT2 (E13–9) – Body ground	10 kΩ or higher
Ignition coil (I3–3) or IGT3 (E13–10) – Body ground	10 kΩ or higher
Ignition coil (I4–3) or IGT4 (E13–11) – Body ground	10 kΩ or higher

  (4) Reconnect the ignition coil with igniter connector.
  (5) Reconnect the ECM connector.

OK → **REPLACE IGNITION COIL ASSY**

NG

REPAIR OR REPLACE HARNESS OR CONNECTOR

8	INSPECT ECM TERMINAL OF MISFIRING CYLINDER(#10, #20, #30 OR #40 VOLTAGE)

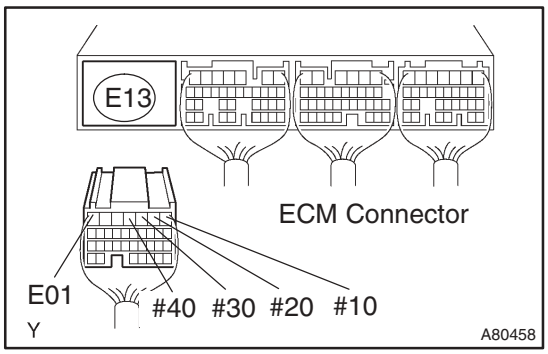
(a) Turn the ignition switch to ON.

(b) Measure the voltage between the specified terminals of the E13 ECM connector.

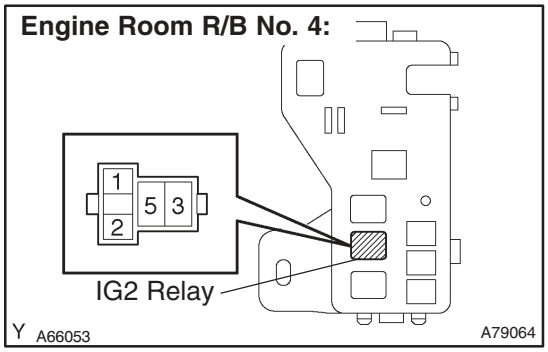
Standard:

Tester Connection	Specified Condition
#10 (E13–1) – E01 (E13–7)	9 to 14 V
#20 (E13–2) – E01 (E13–7)	9 to 14 V
#30 (E13–3) – E01 (E13–7)	9 to 14 V
#40 (E13–4) – E01 (E13–7)	9 to 14 V

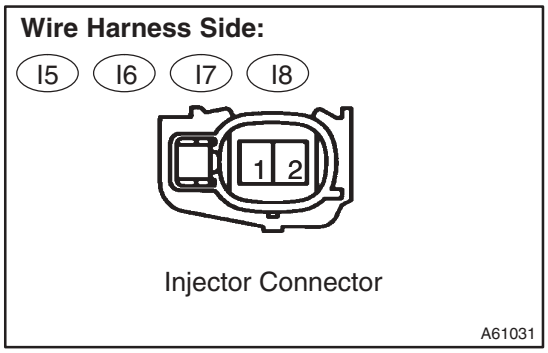
OK → **Go to step 11**



NG



9	INSPECT FUEL INJECTOR RESISTANCE OF MISFIRING CYLINDER (See page 11–8 of Pub. No. RM1018E AVENSIS)



NG → **REPLACE FUEL INJECTOR ASSY (See page 11–10 of Pub. No. RM1018E AVENSIS)**

OK

10 CHECK HARNESS AND CONNECTOR OF MISFIRING CYLINDER(INJECTOR – ECM, INJECTOR – IG2 RELAY)

(a) Check the harness and connectors between the injector and ECM.

(1) Disconnect the I5, I6, I7 and/or I8 injector connector.

(2) Disconnect the E13 ECM connector.

(3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Injector (I5–1) – #10 (E13–1)	Below 1 Ω
Injector (I6–1) – #20 (E13–2)	Below 1 Ω
Injector (I7–1) – #30 (E13–3)	Below 1 Ω
Injector (I8–1) – #40 (E13–4)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Injector (I5–1) or #10 (E13–1) – Body ground	10 kΩ or higher
Injector (I6–1) or #20 (E13–2) – Body ground	10 kΩ or higher
Injector (I7–1) or #30 (E13–3) – Body ground	10 kΩ or higher
Injector (I8–1) or #40 (E13–4) – Body ground	10 kΩ or higher

(4) Reconnect the injector connector.

(5) Reconnect the ECM connector.

(b) Check the harness and connectors between the injector and IG2 relay.

(1) Disconnect the I5, I6, I7 and/or I8 injector connector.

(2) Remove the IG2 relay from the engine room R/B No. 4.

(3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Injector (I5–2) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Injector (I6–2) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Injector (I7–2) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Injector (I8–2) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Injector (I5–2) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Injector (I6–2) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Injector (I7–2) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Injector (I8–2) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher

(4) Reconnect the injector connector.

(5) Reinstall the IG2 relay.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

11	INSPECT FUEL INJECTOR INJECTION AND INJECTION VOLUME OF MISFIRING CYLINDER (See page 11–8 of Pub. No. RM1018E AVENSIS)

NG → REPLACE FUEL INJECTOR ASSY (See page 11–10 of Pub. No. RM1018E AVENSIS)

OK

12	CHECK CYLINDER COMPRESSION PRESSURE OF MISFIRING CYLINDER (See page 14–1 of Pub. No. RM1018E AVENSIS)

NG → REPAIR OR REPLACE

OK

13	CHECK VALVE CLEARANCE OF MISFIRING CYLINDER (See page 14–6 of Pub. No. RM1018E AVENSIS)

NG → ADJUST VALVE CLEARANCE (See page 14–6 of Pub. No. RM1018E AVENSIS)

OK

14	PROCEED TO STEP APPROPRIATE FOR NUMBER OF MISFIRING CYLINDERS(REFER TO RESULT OF STEP 4)

HINT:

- If the result of step 4 is ”1 or 2 cylinders”, proceed to A.
- If the result of step 4 is ” 3 cylinders or more”, proceed to B.

B → CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

A

15	CHECK VALVE TIMING(CHECK FOR LOOSENESS AND JUMPED TEETH ON TIMING CHAIN) (See page 14–49 of Pub. No. RM1018E AVENSIS)

OK: The matchmarks of the crankshaft pulley and camshaft pulley are aligned.

NG → ADJUST VALVE TIMING (See page 14–49 of Pub. No. RM1018E AVENSIS)

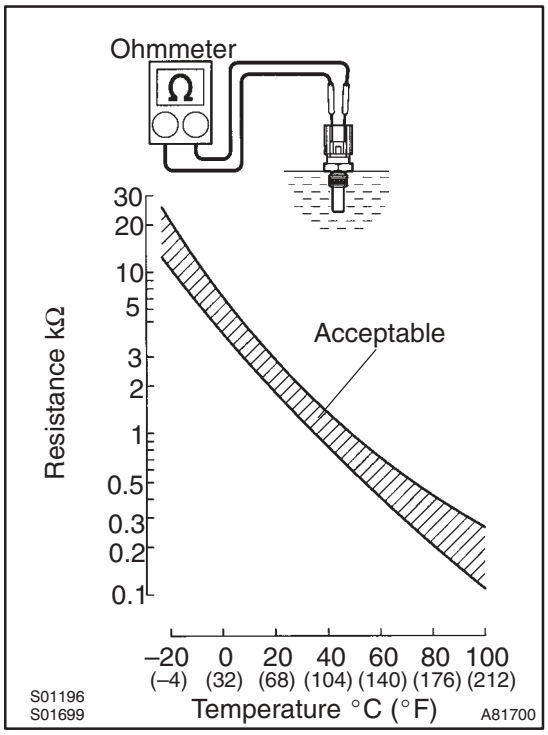
OK

16	CHECK FUEL PRESSURE (See page 11–5 of Pub. No. RM1018E AVENSIS)

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

17	READ VALUE OF INTELLIGENT TESTER II(INTAKE AIR TEMPERATURE AND MASS AIR FLOW RATE)



(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON.
(c) Check the intake air temperature.
  (1) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Data List / Intake Air.
  (2) Read the value.
  Standard: Equivalent to ambient air temperature.
(d) Check the mass air flow rate.
  (1) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Data List / AFM.
  (2) Read the values.
  Standard:

Condition	Mass Air Flow Rate (gm/s)
Ignition switch ON (do not start engine)	0
Idling	3.2 to 4.7
Revving up without load (2,500 rpm)	13.1 to 18.9
Idling – Revving up	Mass air flow rate fluctuates

NG → REPLACE MASS AIR FLOW METER

OK

18 INSPECT ENGINE COOLANT TEMPERATURE SENSOR(RESISTANCE)

(a) Remove the engine coolant temperature sensor.
(b) Measure the resistance between the terminals.
Standard:

Tester Connection	Specified Condition
1 – 2	2.32 to 2.59 kΩ at 20°C (68°F)
1 – 2	0.310 to 0.326 kΩ at 80°C (176°F)

NOTICE:
When checking the engine coolant temperature sensor in water, be careful not to allow water to get in contact with the terminals. After the check, dry the sensor.
HINT:
Alternative procedure: Connect an ohmmeter to the installed engine coolant temperature sensor and read the resistance. Use an infrared thermometer to measure the engine temperature in the immediate vicinity of the sensor. Compare these values against the resistance/temperature graph. Change the engine temperature (warm up or allow to cool down) and repeat the test.

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

19 PROCEED TO STEP APPROPRIATE FOR NUMBER OF MISFIRING CYLINDERS(REFER TO RESULT OF STEP 4)

HINT:
- If the result of step 4 is ”1 or 2 cylinders”, proceed to A.
- If the result of step 4 is ”3 cylinders or more”, proceed to B.

B → **GO BACK TO STEP 4**

A

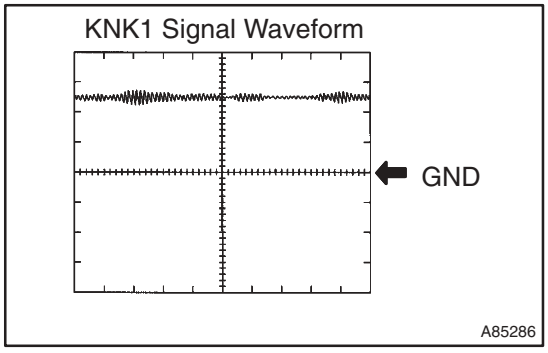
CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

DTC	P0325	KNOCK SENSOR 1 CIRCUIT (BANK 1 OR SINGLE SENSOR)

DTC	P0327	KNOCK SENSOR 1 CIRCUIT LOW INPUT (BANK 1 OR SINGLE SENSOR)

DTC	P0328	KNOCK SENSOR 1 CIRCUIT HIGH INPUT (BANK 1 OR SINGLE SENSOR)

CIRCUIT DESCRIPTION



The flat type knock sensor (non–resonant type) has a structure that can detect vibration in a wider band of frequency, from about 6 kHz to 15 kHz and has the following features:

- The knock sensor is fitted on the cylinder block to detect engine knocking.
- The sensor contains a piezoelectric element which generates voltage when it becomes deformed. This occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, the ignition timing is retarded to suppress it.

DTC No.	DTC Detecting Condition	Trouble Area
P0325	Knock sensor signal level remains at low for more than 10 seconds	• Open or short in knock sensor circuit • Knock sensor (under–torqued or looseness) • ECM
P0327	Output voltage of the knock sensor is 0.5 V or less	• Short in knock sensor circuit • Knock sensor • ECM
P0328	Output voltage of the knock sensor is 4.5 V or more	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

If the ECM detects DTC P0325, P0327 and/or P0328, it enters fail–safe mode in which the corrective retarded angle value is set to the maximum value.

Reference: Inspection by using the oscilloscope.

The correct waveform is as shown.

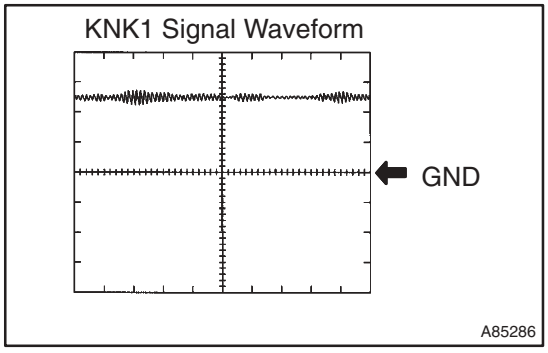
Item	Contents
Terminal	KNK1 – EKNK
Equipment Setting	0.01 to 10 V/Division, 0.01 to 10 msec./Division
Condition	After warming up the engine, keep the engine speed at 4,000 rpm

DTC	P0325	KNOCK SENSOR 1 CIRCUIT (BANK 1 OR SINGLE SENSOR)

DTC	P0327	KNOCK SENSOR 1 CIRCUIT LOW INPUT (BANK 1 OR SINGLE SENSOR)

DTC	P0328	KNOCK SENSOR 1 CIRCUIT HIGH INPUT (BANK 1 OR SINGLE SENSOR)

CIRCUIT DESCRIPTION



The flat type knock sensor (non–resonant type) has a structure that can detect vibration in a wider band of frequency, from about 6 kHz to 15 kHz and has the following features:

- The knock sensor is fitted on the cylinder block to detect engine knocking.
- The sensor contains a piezoelectric element which generates voltage when it becomes deformed. This occurs when the cylinder block vibrates due to knocking. If engine knocking occurs, the ignition timing is retarded to suppress it.

Condition	After warming up the engine, keep the engine speed at 4,000 rpm

WIRING DIAGRAM

INSPECTION PROCEDURE

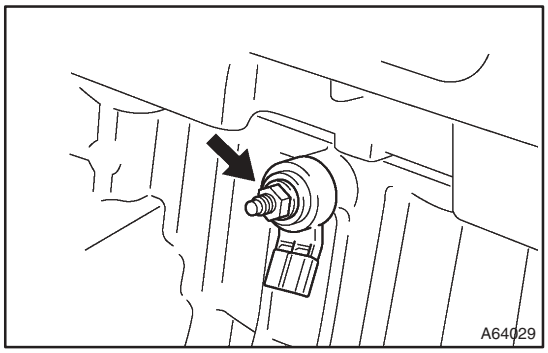
HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ OUTPUT DTC

(a) Clear the DTC(s) (see page 05–18).
(b) Warm up the engine.
(c) Run the engine at 3,000 rpm for 10 seconds or more.
(d) Connect the intelligent tester II to the DLC3.
(e) Turn the ignition switch to ON and turn the intelligent tester II ON.
(f) Select the following menu items: Powertrain / Engine and ECT / DTC.
(g) Read DTCs.

Result :



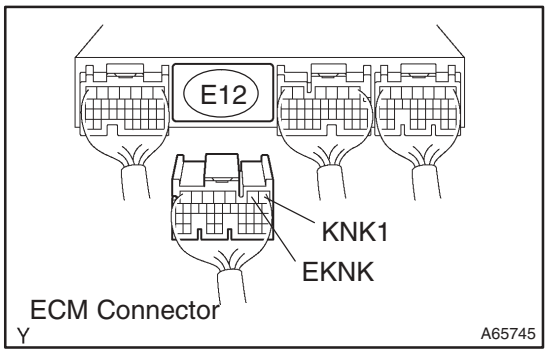
Display (DTC Output)	Proceed To
P0325	A
P0325, and P0327 and/or P0328	B
No output	C

B → **Go to step 3**

C → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

A

2 INSPECT KNOCK SENSOR



(a) Check the knock sensor installation.
OK:
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

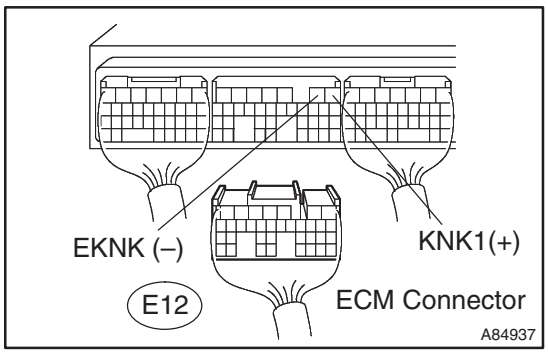
NG → **SECURELY REINSTALL SENSOR**

OK

REPLACE KNOCK SENSOR

3 CHECK HARNESS AND CONNECTOR(ECM – KNOCK SENSOR)

(a) Disconnect the E12 ECM connector.
(b) Measure the resistance between the terminals of the E12 ECM connector.
Standard:



Tester Connection	Specified Condition
KNK1 (E12–1) – EKNK (E12–2)	120 to 280 kΩ at 20°C (68°F)

(c) Reconnect the ECM connector.

NG → **Go to step 5**

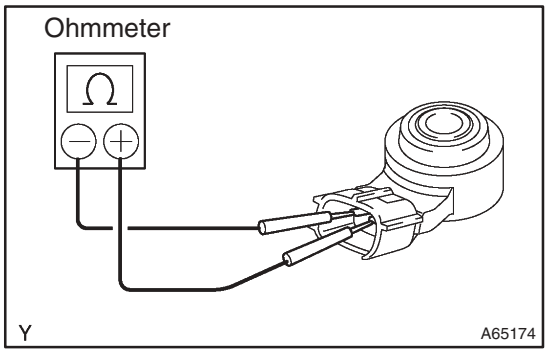
OK

4 INSPECT ECM(KNK1 VOLTAGE)

(a) Disconnect the E12 ECM connector.
(b) Turn the ignition switch to ON.
(c) Measure the voltage between the terminals of the E12 ECM terminal.
Standard:

Tester Connection	Specified Condition
KNK1 (E12–1) – EKNK (E12–2)	4.5 to 5.5 V

(d) Reconnect the ECM connector.



NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

NOTICE:
Fault may be intermittent. Check the wire harness and connectors carefully.

5 INSPECT KNOCK SENSOR

(a) Remove the knock sensor.
(b) Measure the resistance between the terminals.
Standard:

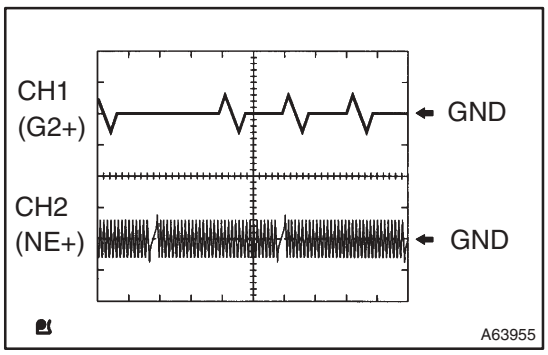
Tester Connection	Specified Condition
KNK1 (K1–1) – EKNK (K1–2)	120 to 280 kΩ at 20°C (68°F)

(c) Reinstall the knock sensor.

NG → **REPLACE KNOCK SENSOR**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR



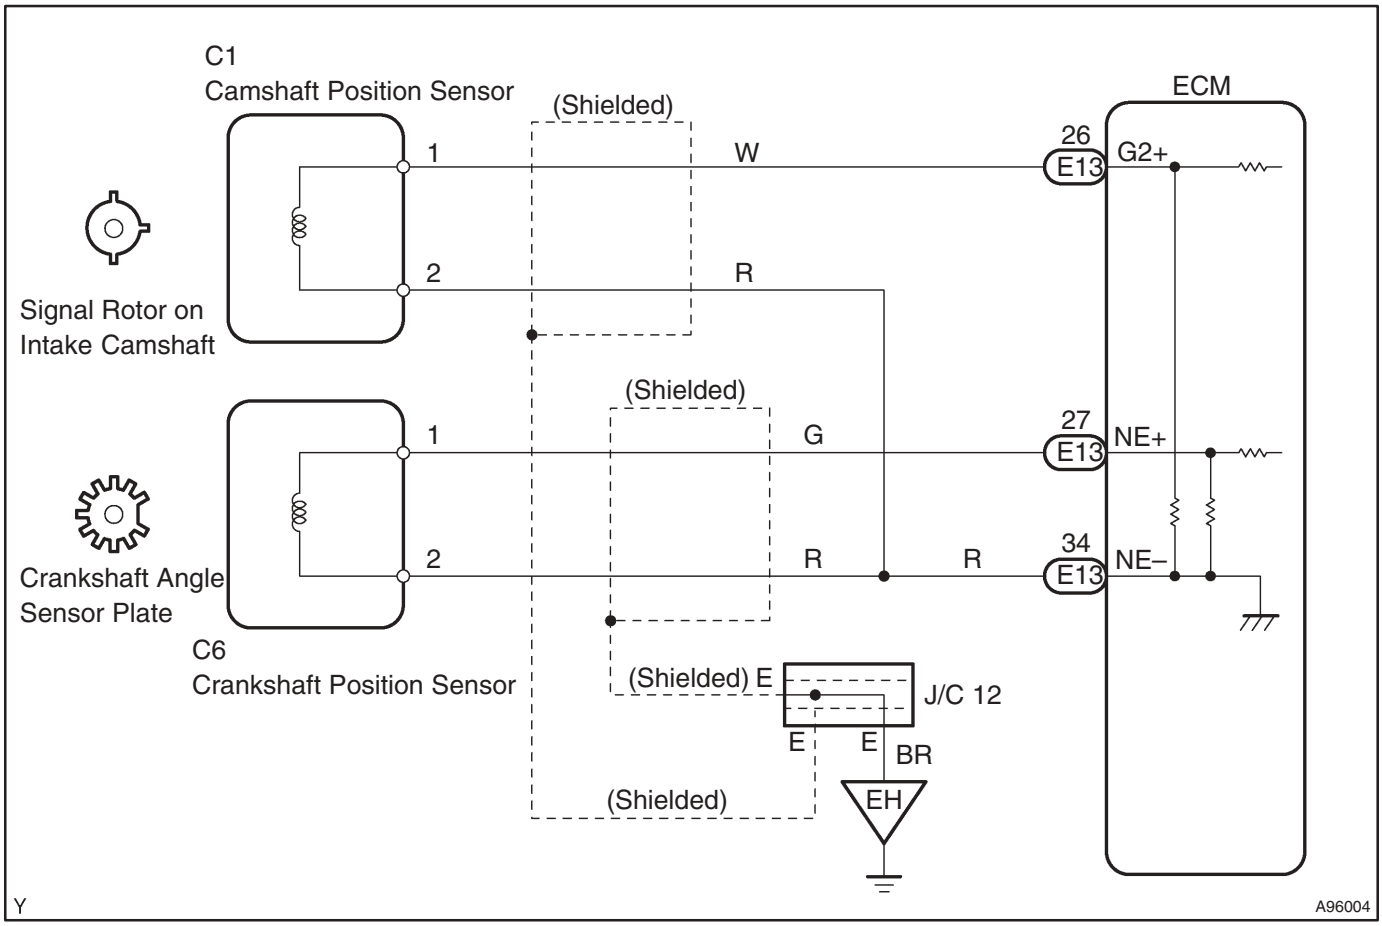
DTC	P0335	CRANKSHAFT POSITION SENSOR ”A” CIRCUIT

DTC	P0339	CRANKSHAFT POSITION SENSOR ”A” CIRCUIT INTERMITTENT

CIRCUIT DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of an iron core and magnet. The sensor plate rotates and as each tooth passes through the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC No.	DTC Detection Condition	Trouble Area
P0335	No crankshaft position sensor signal to ECM during cranking (2 trip detection logic)	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Sensor plate (crankshaft) • ECM
P0335	No crankshaft position sensor signal to ECM at engine speed of 600 rpm or more (2 trip detection logic)	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Sensor plate (crankshaft) • ECM
P0339	In conditions (a), (b) and (c), when no crankshaft position sensor (NE) signal is input for 0.05 seconds or more. (a) Engine revolution 1,000 rpm or more (b) Starter signal is OFF (c) 3 seconds or more has lapsed after starter signal was switched from ON to OFF	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • Sensor plate (crankshaft) • ECM

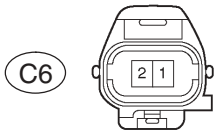


Reference: Inspection using the oscilloscope.
HINT:

- The correct waveform is as shown on the left.
- G2+ stands for the camshaft position sensor signal, and NE+ stands for the crankshaft position sensor signal.

Item	Contents
Terminal	CH1: G2+ – NE– CH2: NE+ – NE–
Equipment Setting	5V/Division, 20ms/Division
Condition	During cranking or idling

WIRING DIAGRAM



INSPECTION PROCEDURE

HINT:

- If no problem is found in the diagnostic troubleshooting procedure of DTC P0335, troubleshoot the engine mechanical systems.
- Check the value on the intelligent tester II.
  (a) Connect the intelligent tester II to the DLC3.
  (b) Start the engine and turn the intelligent tester II ON.
  (c) Select the following menu items: Powertrain / Engine and ECT / Data List / Engine SPD.
- The engine speed can be confirmed in the Data List using the intelligent tester II. If there are no NE signals from the crankshaft position sensor despite the engine revolving, the engine speed will be indicated as zero. If the voltage output of the crankshaft position sensor is insufficient, the engine speed will be indicated as lower than the actual engine rpm.
- Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT CRANKSHAFT POSITION SENSOR(RESISTANCE)

Component Side:

Crankshaft Position Sensor

Y A73303

(a) Disconnect the C6 crankshaft position sensor connector.
(b) Measure the resistance between terminals 1 and 2.

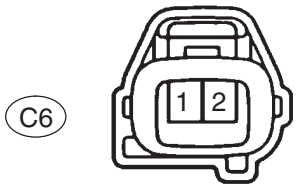
Standard:

Tester Connection	Specified Condition
1 – 2	1,630 to 2,740 Ω at cold
1 – 2	2,065 to 3,225 Ω at hot

NOTICE:

Terms ”cold” and ”hot” refer to the temperature of the coils. ”Cold” means approximately –10° to 50°C (14° to 122°F). ”Hot” means approximately 50° to 100°C (122° to 212°F).

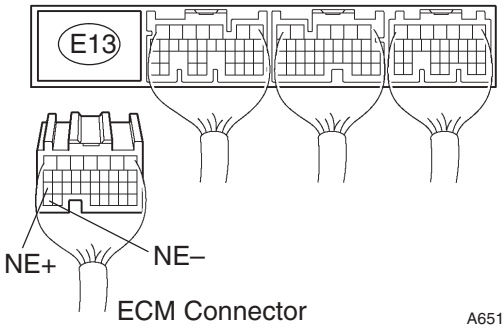
(c) Reconnect the crankshaft position sensor connector.



NG → **REPLACE CRANKSHAFT POSITION SENSOR (See page 18–6 of Pub. No. RM1018E AVENSIS)**

OK

2 CHECK HARNESS AND CONNECTOR(CRANKSHAFT POSITION SENSOR – ECM)



Wire Harness Side:

Crankshaft Position Sensor Connector

Front View

A66132

ECM Connector

A65159

(a) Disconnect the C6 crankshaft position sensor connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Crankshaft position sensor (C6–1) – NE+ (E13–27)	Below 1 Ω
Crankshaft position sensor (C6–2) – NE– (E13–34)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Crankshaft position sensor (C6–1) or NE+ (E13–27) – Body ground	10 kΩ or higher
Crankshaft position sensor (C6–2) or NE– (E13–34) – Body ground	10 kΩ or higher

(d) Reconnect the crankshaft position sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	CHECK SENSOR INSTALLATION(CRANKSHAFT POSITION SENSOR)

(a) Check the crankshaft position sensor installation.
OK: The sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4	CHECK CRANKSHAFT POSITION SENSOR PLATE(TEETH OF SENSOR PLATE(CRANKSHAFT))

(a) Check the teeth of the sensor plate.
OK: The plate does not have any cracks or deformation.

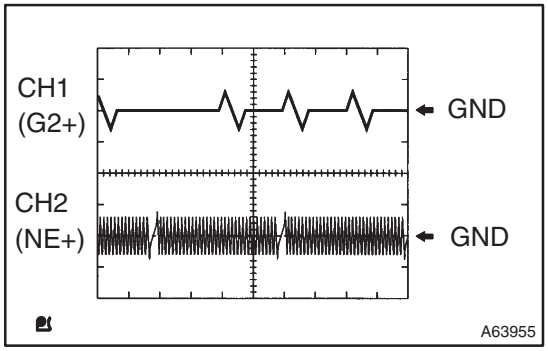
NG → **REPLACE CRANKSHAFT POSITION SENSOR PLATE (CRANKSHAFT)**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0340	CAMSHAFT POSITION SENSOR ”A” CIRCUIT (BANK 1 OR SINGLE SENSOR)

DTC	P0341	CAMSHAFT POSITION SENSOR ”A” CIRCUIT RANGE/PERFORMANCE (BANK 1 OR SINGLE SENSOR)



CIRCUIT DESCRIPTION

The Camshaft Position (CMP) sensor consists of a magnet and an iron core which is wrapped with copper wire, and is installed on the cylinder head. When the camshaft rotates, each of 3 teeth on the camshaft passes through the CMP sensor. This activates the internal magnet in the sensor, generating a voltage in the copper wire. The camshaft rotation is synchronized with the crankshaft rotation. When the crankshaft turns twice the voltage is generated 3 times in the CMP sensor. The generated voltage in the sensor acts as a signal, allowing the ECM to locate the camshaft position. This signal is then used to control ignition timing, fuel injection timing, and the VVT system.

DTC No.	DTC Detection Condition	Trouble Area
P0340	• No camshaft position sensor signal to ECM during cranking (2 trip detection logic) • No camshaft position sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing pulley • Jumped tooth of timing chain • ECM
P0341	While crankshaft rotates twice, camshaft position sensor signal is input to ECM 12 times or more (1 trip detection logic)	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing pulley • Jumped tooth of timing chain • ECM

HINT:

- DTC P0340 indicates a malfunction related to the CMP sensor (+) circuit (the wire harness between the ECM and CMP sensor, and the CMP sensor itself).
- DTC P0341 indicates a malfunction related to the CMP sensor (–) circuit (the wire harness between the ECM and CMP sensor, and the CMP sensor itself).

Reference: Inspection using the oscilloscope.

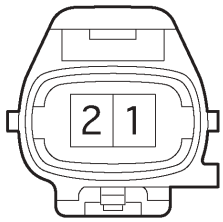
HINT:

- The correct waveform is as shown on the left.
- G2+ stands for the camshaft position sensor signal, and NE+ stands for the crankshaft position sensor signal.

Item	Contents
Terminal	CH1: G2+ – NE– CH2: NE+ – NE–
Equipment Setting	5V/Division, 20ms/Division
Condition	During cranking or idling

WIRING DIAGRAM

Refer to DTC P0335 on page 05–136.



INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	INSPECT CAMSHAFT POSITION SENSOR(RESISTANCE)

Component Side:

Camshaft Position Sensor

A64984

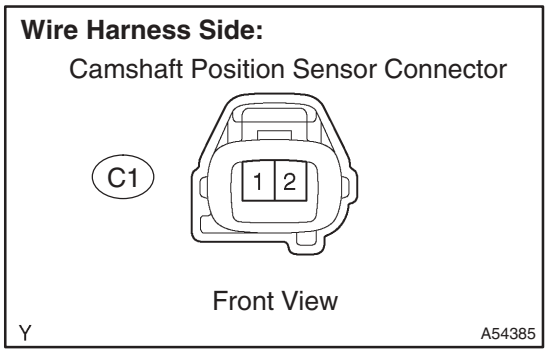
(a) Disconnect the C1 camshaft position sensor connector.

(b) Measure the resistance between the terminals of the camshaft position sensor.

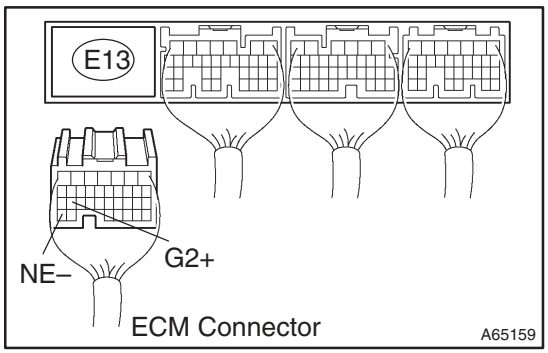
Standard:

Tester Connection	Specified Condition
1 – 2	835 to 1,400 Ω at cold
1 – 2	1,060 to 1,645 Ω at hot

NOTICE:



Terms ”cold” and ”hot” refer to the temperature of the coils. ”Cold” means approximately –10° to 50°C (14° to 122°F). ”Hot” means approximately 50° to 100°C (122° to 212°F).



(c) Reconnect the camshaft position sensor connector.

NG → **REPLACE CAMSHAFT POSITION SENSOR (See page 18–5 of Pub. No. RM1018E AVENSIS)**

OK

2 CHECK HARNESS AND CONNECTOR(CAMSHAFT POSITION SENSOR – ECM)

(a) Disconnect the C1 camshaft position sensor connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Camshaft position sensor (C1–1) – G2+ (E13–26)	Below 1 Ω
Camshaft position sensor (C1–2) – NE– (E13–34)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Camshaft position sensor (C1–1) or G2+ (E13–26) – Body ground	10 kΩ or higher
Camshaft position sensor (C1–2) or NE– (E13–34) – Body ground	10 kΩ or higher

(d) Reconnect the camshaft position sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 CHECK SENSOR INSTALLATION(CAMSHAFT POSITION SENSOR)

(a) Check the sensor installation.
OK: The sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4 CHECK CAMSHAFT

(a) Check the teeth of the camshaft.
OK: The teeth do not have any cracks or deformation.

NG → **REPLACE CAMSHAFT**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

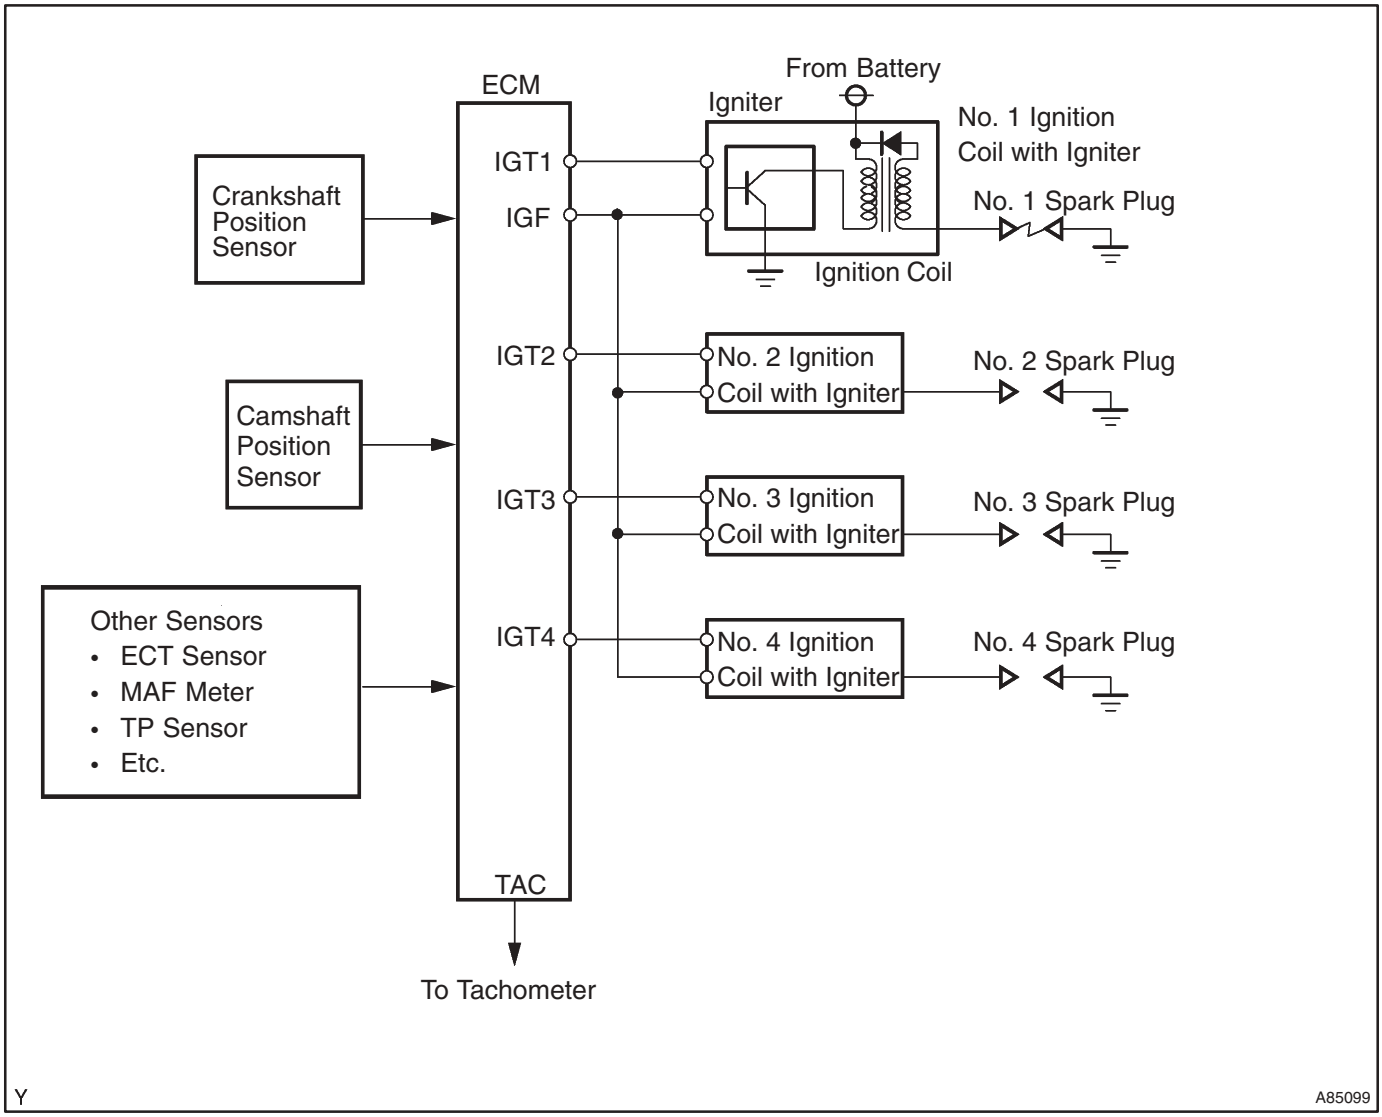
DTC	P0351	IGNITION COIL ”A” PRIMARY/SECONDARY CIRCUIT

DTC	P0352	IGNITION COIL ”B” PRIMARY/SECONDARY CIRCUIT

DTC	P0353	IGNITION COIL ”C” PRIMARY/SECONDARY CIRCUIT

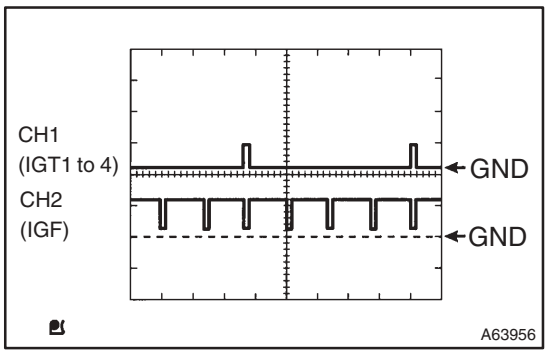
DTC	P0354	IGNITION COIL ”D” PRIMARY/SECONDARY CIRCUIT

CIRCUIT DESCRIPTION



HINT:

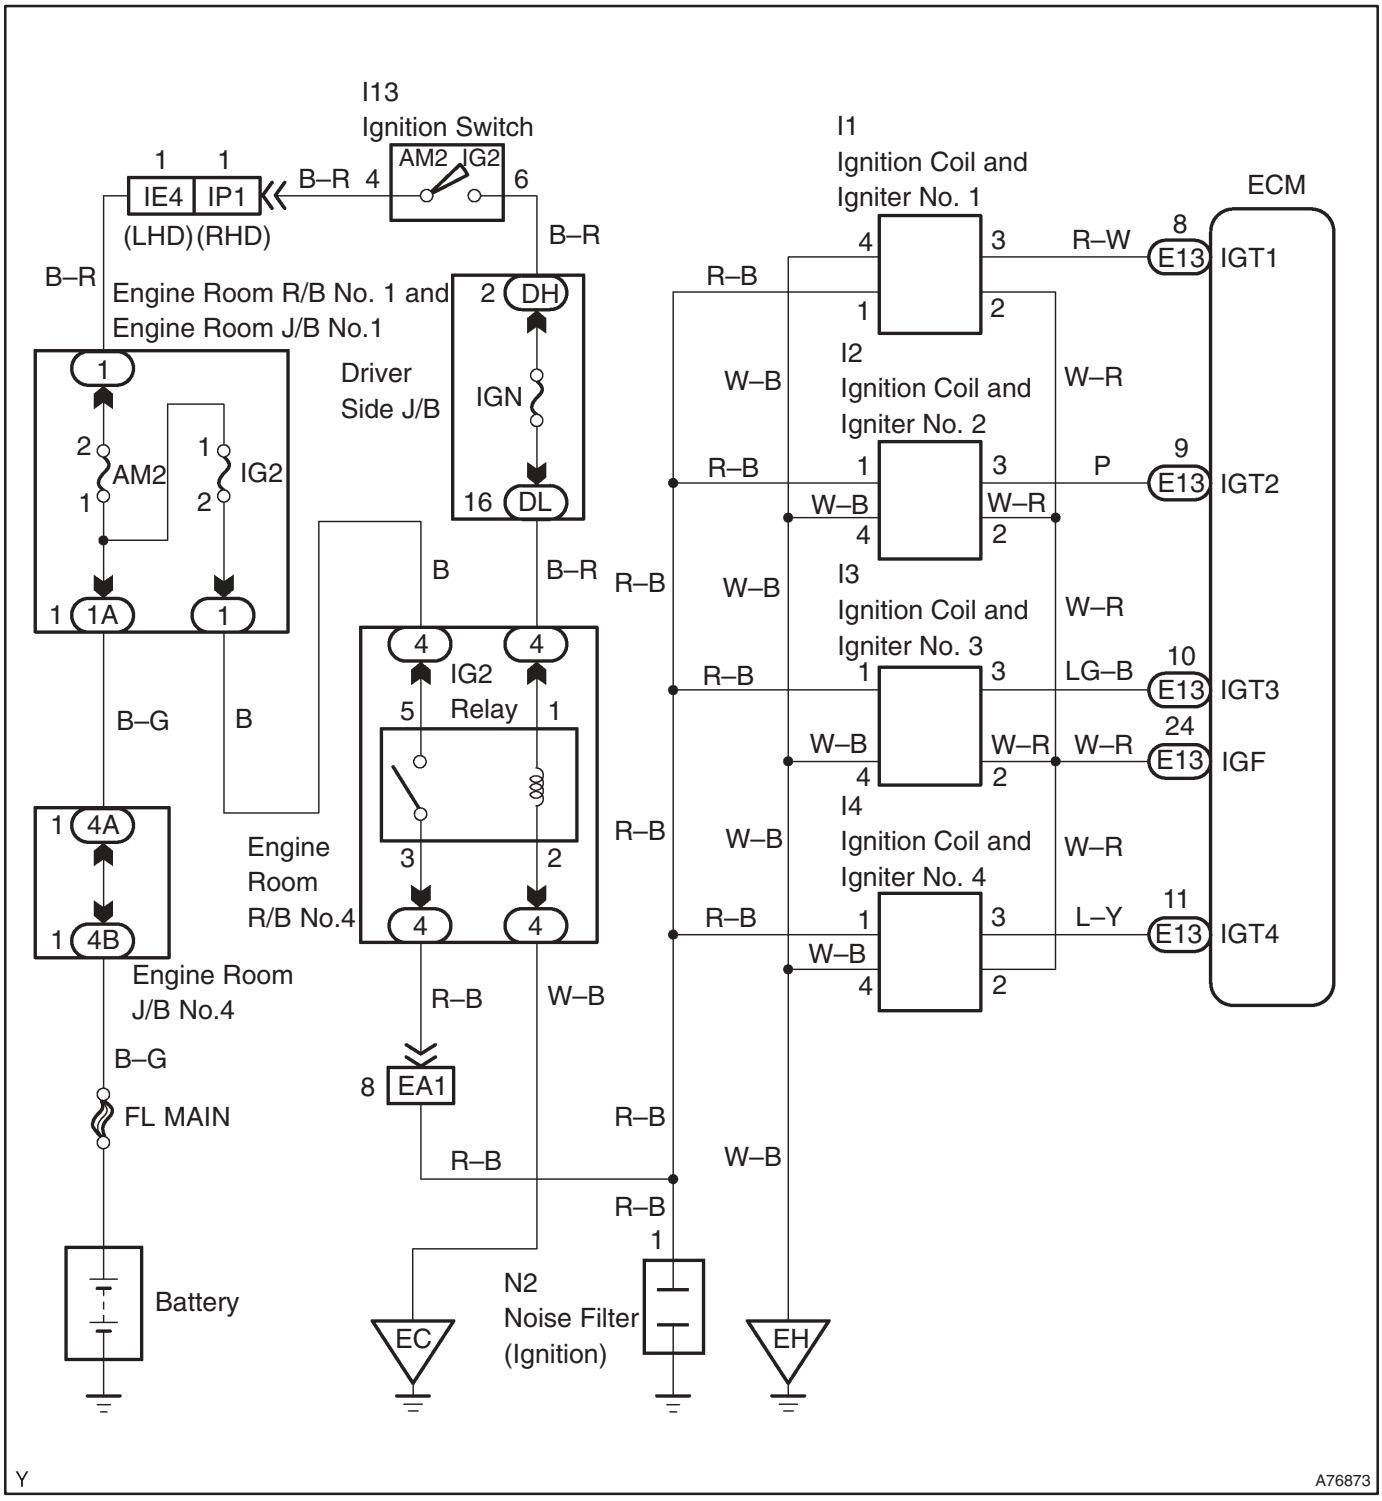
- These DTCs indicate a malfunction related to the primary circuit.
- If DTC P0351 is displayed, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is displayed, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is displayed, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is displayed, check No. 4 ignition coil with igniter circuit.



A Direct Ignition System (DIS) is used on this vehicle.

The DIS is a 1–cylinder ignition system which ignites one cylinder with one ignition coil. In the 1–cylinder ignition system, one spark plug is connected to the end of the secondary winding. High–voltage is generated in the secondary winding and is applied directly to the spark plug. The spark of the spark plug passes from the center electrode to the ground electrode.

The ECM determines the ignition timing and transmits the ignition (IGT) signals for each cylinder. Using the IGT signals, the ECM turns ON and OFF the power transistor inside the igniter, which switches ON and OFF a current to the primary coil. When the current to the primary coil is cut off, high–voltage is generated in the secondary coil and this voltage is applied to the spark plugs to create sparks inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back the ignition confirmation (IGF) signal to the ECM.



DTC No.	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354	No IGF signal to ECM while engine is running	• Ignition system • Open or short in IGF or IGT1 to 4 circuit from ignition coil with igniter to ECM • No. 1 to No. 4 ignition coil with igniter • ECM

Reference: Inspection using the oscilloscope.
During cranking or idling, check the waveform between terminals IGT1 to IGT4 and E1, and IGF and E1 of the E11 ECM connector.

Item	Contents
Terminal	CH1: IGT1, IGT2, IGT3, IGT4 – E1 CH2: IGF1 – E1
Equipment Setting	2 V/Division, 20 ms/Division
Condition	While the engine is cranking or idling

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	PERFORM SIMULATION TEST

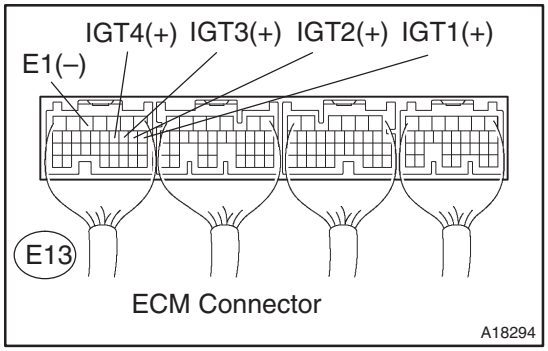
(a) Clear the DTC(s) (see page 05–18).

(b) Shuffle arrangement of the ignition coil with igniters.

NOTICE:

Do not shuffle the connectors.

(c) Perform the simulation test.



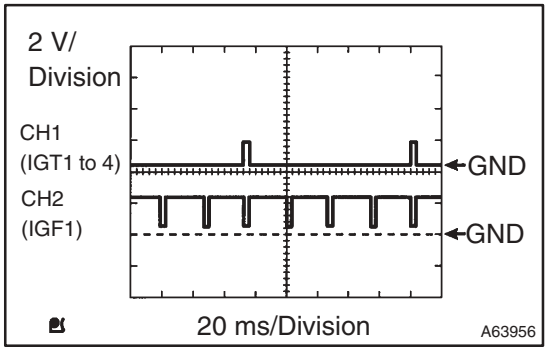
Result:

Display (DTC Output)	Proceed To
Same DTCs (that have been erased)	A
Other DTCs	B

B → **REPLACE IGNITION COIL ASSY**

A

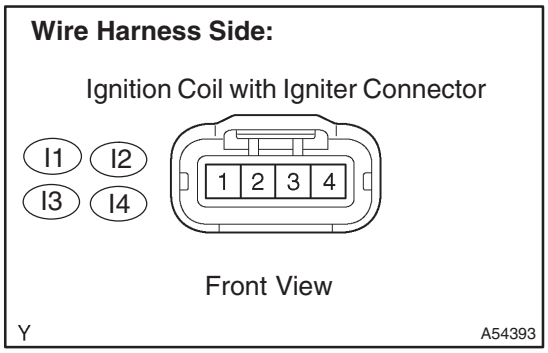
2	INSPECT ECM(IGT1, IGT2, IGT3, IGT4 AND IGF1 SIGNAL)



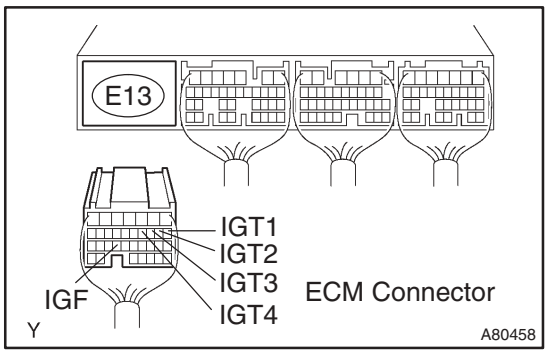
(a) Inspect using the oscilloscope.

(b) During cranking or idling, check the waveform between the specified terminals of the E13 ECM connector.

Standard:



Tester Connection	Specified Condition
IGT1 (E13–8) – E1 (E13–5)	Correct waveform is as shown
IGT2 (E13–9) – E1 (E13–5)	Correct waveform is as shown
IGT3 (E13–10) – E1 (E13–5)	Correct waveform is as shown
IGT4 (E13–11) – E1 (E13–5)	Correct waveform is as shown



NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

3 CHECK HARNESS AND CONNECTOR(IGNITION COIL ASSY – ECM)

(a) Disconnect the I1, I2, I3 or I4 ignition coil with igniter connector.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Ignition coil (I1–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I2–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I3–2) – IGF (E13–24)	Below 1 Ω
Ignition coil (I4–2) – IGF (E13–24)	Below 1 Ω

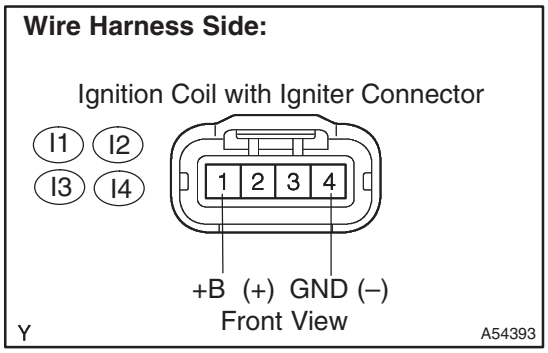
Standard (Check for open):

Tester Connection	Specified Condition
Ignition coil (I1–3) – IGT1 (E13–8)	Below 1 Ω
Ignition coil (I2–3) – IGT2 (E13–9)	Below 1 Ω
Ignition coil (I3–3) – IGT3 (E13–10)	Below 1 Ω
Ignition coil (I4–3) – IGT4 (E13–11)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Ignition coil (I1–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I2–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I3–2) or IGF (E13–24) – Body ground	10 kΩ or higher
Ignition coil (I4–2) or IGF (E13–24) – Body ground	10 kΩ or higher

Standard (Check for short):



Tester Connection	Specified Condition
Ignition coil (I1–3) or IGT1 (E13–8) – Body ground	10 kΩ or higher
Ignition coil (I2–3) or IGT2 (E13–9) – Body ground	10 kΩ or higher
Ignition coil (I3–3) or IGT3 (E13–10) – Body ground	10 kΩ or higher
Ignition coil (I4–3) or IGT4 (E13–11) – Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the ignition coil with igniter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4 INSPECT SPARK PLUG(POWER SOURCE)

(a) Disconnect the I1, I2, I3 or I4 ignition coil with igniter connector.

(b) Check the resistance.

Standard (Check for open):

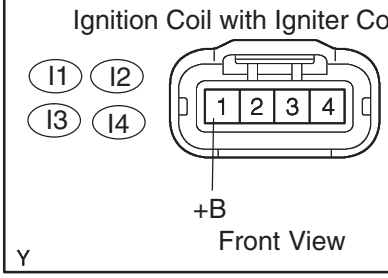
Tester Connection	Specified Condition
GND (I1–4) – Body ground	Below 1 Ω
GND (I2–4) – Body ground	Below 1 Ω
GND (I3–4) – Body ground	Below 1 Ω
GND (I4–4) – Body ground	Below 1 Ω

(c) Turn the ignition switch to ON.

(d) Measure the voltage between the terminals of the wire harness side connectors.

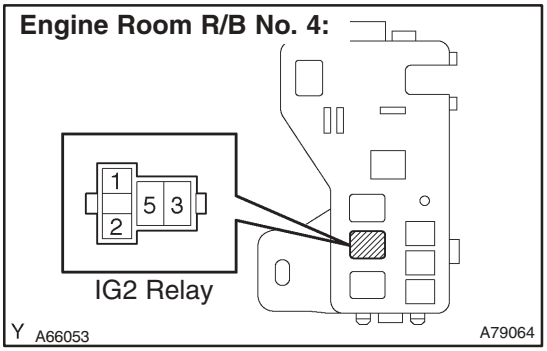
Standard:

Tester Connection	Specified Condition
+B (I1–1) – GND (I1–4)	9 to 14 V
+B (I2–1) – GND (I2–4)	9 to 14 V
+B (I3–1) – GND (I3–4)	9 to 14 V
+B (I4–1) – GND (I4–4)	9 to 14 V



(e) Reconnect the ignition coil with igniter connector.

OK → **REPLACE IGNITION COIL ASSY**



NG

5 CHECK HARNESS AND CONNECTOR(IGNITION COIL ASSY – IG2 RELAY)

Wire Harness Side:

Engine Room R/B No. 4:

(a) Disconnect the I1, I2, I3 or I4 ignition coil with igniter connector.

(b) Remove the IG2 relay from the engine room R/B No. 4.

(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Ignition coil (I1–1) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Ignition coil (I2–1) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Ignition coil (I3–1) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω
Ignition coil (I4–1) – Engine room R/B No. 4 (IG2 relay terminal 3)	Below 1 Ω

Standard (Check for short):

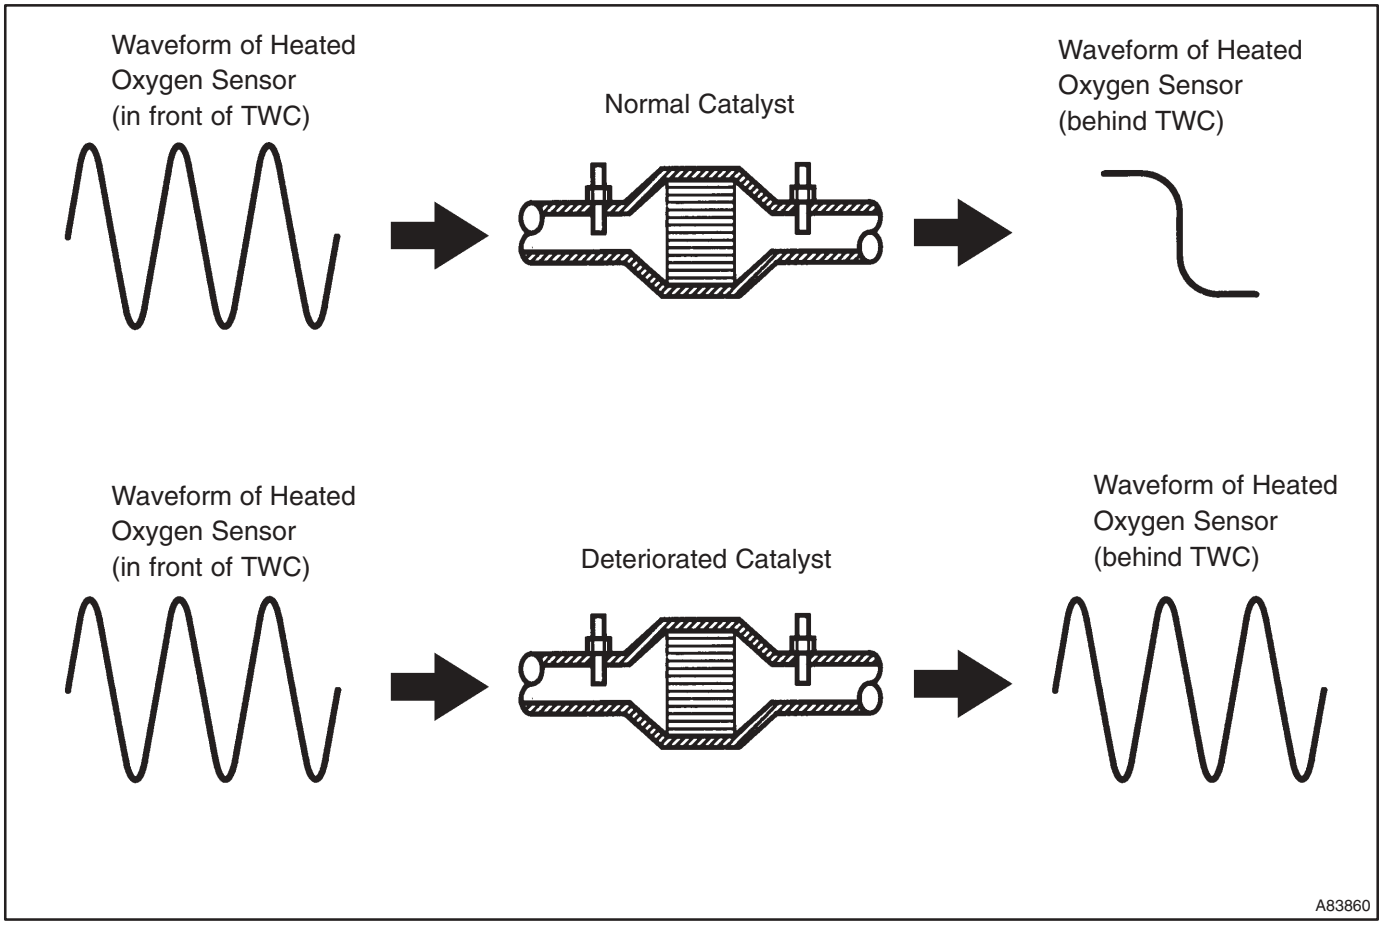
Tester Connection	Specified Condition
Ignition coil (I1–1) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Ignition coil (I2–1) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Ignition coil (I3–1) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher
Ignition coil (I4–1) or Engine room R/B No. 4 (IG2 relay terminal 3) – Body ground	10 kΩ or higher

(d) Reconnect the ignition coil with igniter connector.

(e) Reinstall the IG2 relay.

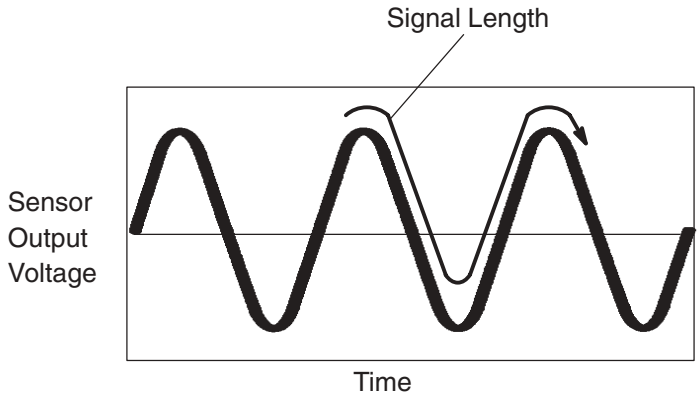
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK



REPLACE IGNITION COIL ASSY

DTC	P0420	CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)

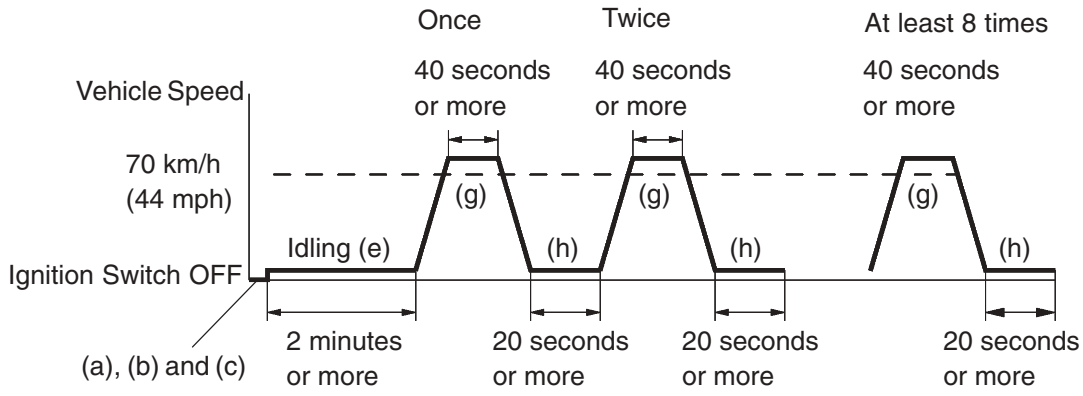


CIRCUIT DESCRIPTION

This vehicle has two Heated Oxygen (O2) sensors. One is located in front of the Three–Way Catalyst Converter (TWC), and the other is mounted behind the TWC. Each signal output of the sensors is converted into a waveform inside the ECM. The front O2 sensor is used to monitor the air–fuel ratio by the ECM, and whose signal prompts the ECM to perform air–fuel ratio feedback control. As a result, the air–fuel ratio is balanced, and the waveform of the front O2 sensor oscillates between rich and lean regularly.

To determine whether or not the catalyst performance has deteriorated, the ECM compares the waveforms of the front and rear O2 sensors. While the catalyst is functioning normally, the waveform of the rear O2 sensor fluctuates between rich and lean more slowly than the front O2 sensor's waveform. When the rear O2 sensor's waveform frequently fluctuates, it indicates that the catalyst performance deteriorates.

Heated Oxygen Sensor Signal Length:



A82718

DTC No.	DTC Detecting Condition	Trouble Area
P0420	After engine and TWC are warmed up, and while vehicle is driven within predetermined vehicle speed and engine speed range: Waveforms of heated oxygen sensor (sensor 2) frequently fluctuates between rich and lean (2 trip detection logic)	• Gas leakage in exhaust system • Heated oxygen sensor (sensor 1) • Heated oxygen sensor (sensor 2) • Three–way catalytic converter (TWC)

CONFIRMATION DRIVING PATTERN

Engine coolant temperature is more than 75°C (167°F)

Y

A58686

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Switch the ECM from normal mode to check mode using the intelligent tester II (see page 05–20).
(d) Start the engine.
(e) Allow the engine to idle for 2 minutes.
(f) Warm up the engine until the engine coolant temperature reaches more than 75°C (167°F).
(g) Drive the vehicle at 70 km/h (44 mph) or more for 40 seconds or more.
(h) Stop the vehicle and allow the engine to idle for 20 seconds or more.
(i) Repeat the steps (g) and (h) at least 8 times in one driving cycle.

HINT:

If a malfunction exists, the MIL will be illuminated during step (i).

NOTICE:
If the conditions in this test are not strictly followed, no malfunction will be detected. If you do not have the intelligent tester II, turn the ignition switch to OFF after performing steps from (d) to (i), then perform steps (d) to (i) again.

WIRING DIAGRAM

Refer to DTC P0130 on page 05–74.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0420)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0420	A
P0420 and other DTCs	B

HINT:
If any DTCs other than P0420 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2	CHECK FOR EXHAUST GAS LEAKAGE

OK: No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT**

OK

3	INSPECT HEATED OXYGEN SENSOR(SENSOR 1) (See page 05–74)

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

4	INSPECT HEATED OXYGEN SENSOR(SENSOR 2) (See page 05–100)

OK: During air–fuel ratio feedback, the oxygen sensor output fluctuates between rich and lean.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

REPLACE THREE–WAY CATALYTIC CONVERTER (BOTH FRONT AND REAR TWC)

NOTICE:

On the damaged bank, replace both the front and rear catalysts.

HINT:

Intelligent tester II only:

Malfunctioning areas can be found by performing the Active Test / A/F Control operation. The A/F Control operation can determine if the heated oxygen sensor or other potential trouble areas are malfunctioning or not.

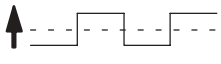
(a) Perform the Active Test using the intelligent tester II.

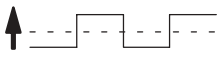
HINT:

The A/F Control operation lowers the injection volume by 12.5 % or increases the injection volume by 25 %.

(1) Connect the intelligent tester II to the DLC3.
(2) Start the engine and turn the intelligent tester II ON.
(3) Warm up the engine by running the engine at 2,500 rpm for approximately 3 minutes.
(4) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Active Test / A/F Control.
(5) Select the following monitor items: O2S B1 S1 and O2S B1 S2.
(6) Perform the A/F Control operation with the engine in an idling condition (press the right or left button).

Result:





The heated oxygen sensor reacts in accordance with increases and decreases of the injection volume:

+25 % → Rich output: More than 0.5 V

–12.5 % → Lean output: Less than 0.4 V

NOTICE:

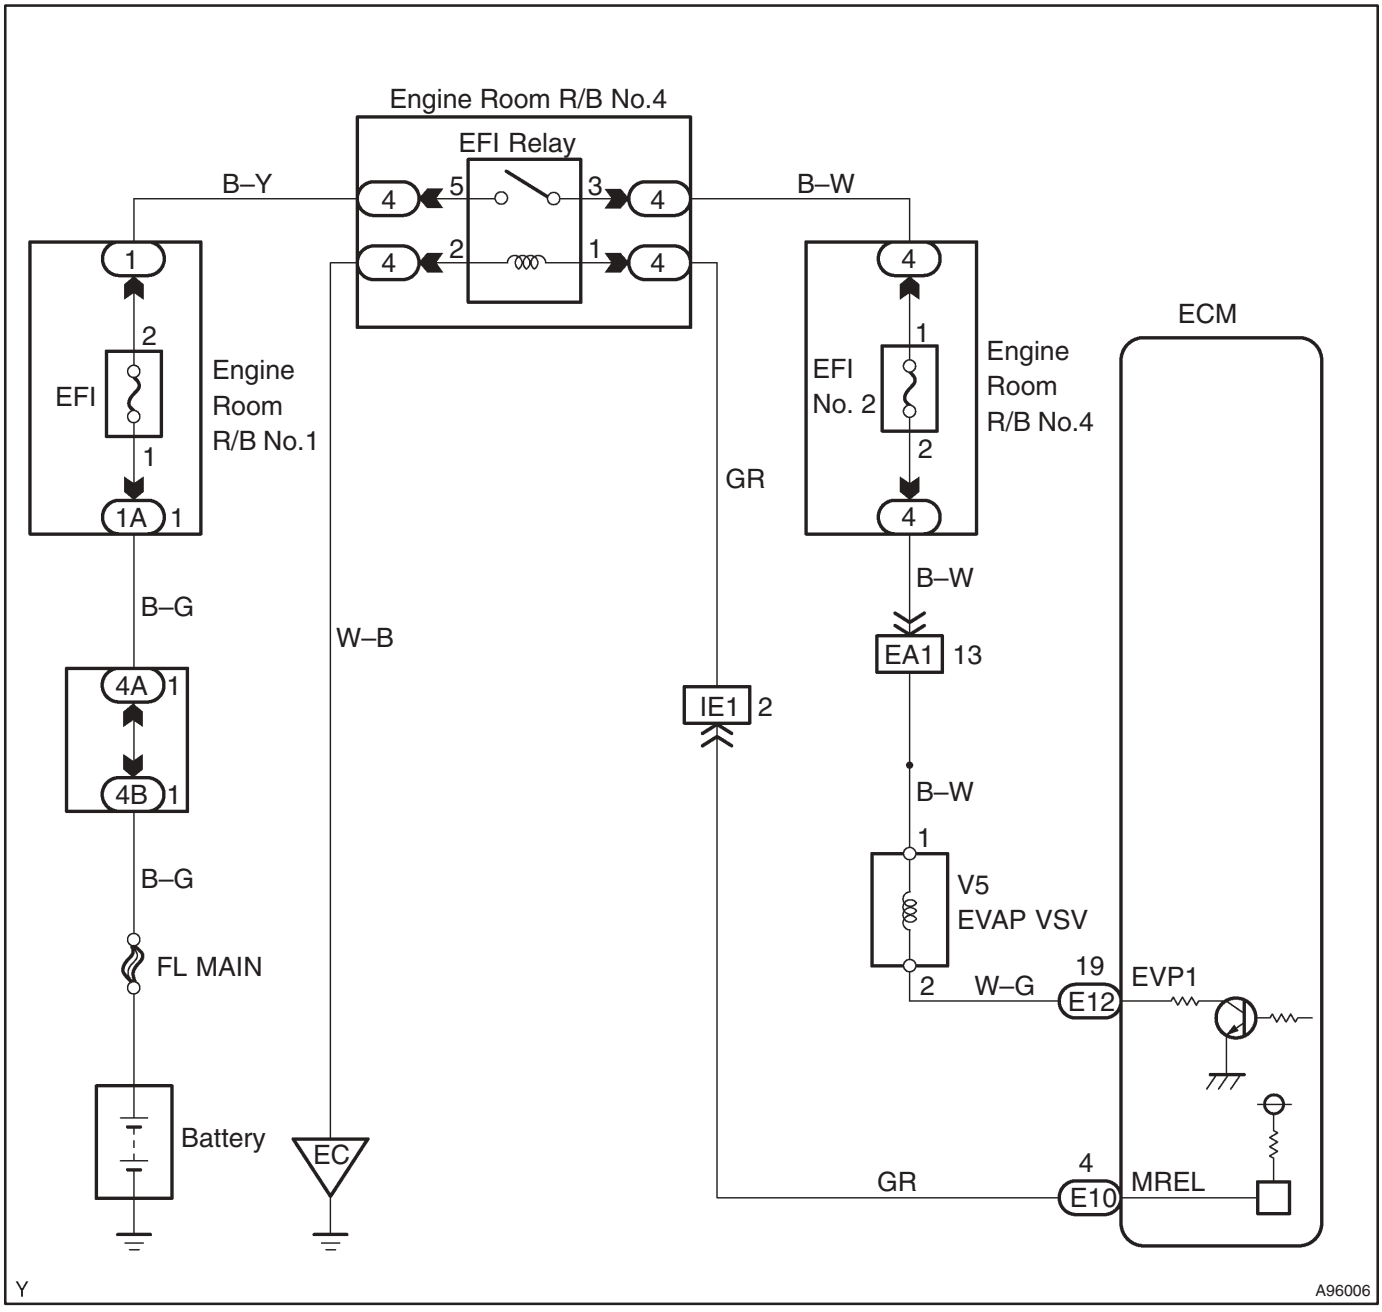
Sensor 1 (front sensor) has an output delay of a few seconds. Sensor 2 (rear sensor) has a maximum output delay of approximately 20 seconds.

	Output Voltage of Heated Oxygen Sensor (sensor 1: front sensor)	Output Voltage of Heated Oxygen Sensor (sensor 2: rear sensor)	Main Suspect Trouble Area
Case 1	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  **OK**	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  **OK**	—
Case 2	Injection volume +25 % –12.5 %  Output voltage Almost no reaction **NG**	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  **OK**	Sensor 1: front sensor (Sensor 1, heater, sensor 1 circuit)
Case 3	Injection volume +25 % –12.5 %  Output voltage More than 0.5 V Less than 0.4V  **OK**	Injection volume +25 % –12.5 %  Output voltage Almost no reaction **NG**	Sensor 2: rear sensor (Sensor 2, heater, sensor 2 circuit)
Case 4	Injection volume +25 % –12.5 %  Output voltage Almost no reaction **NG**	Injection volume +25 % –12.5 %  Output voltage Almost no reaction **NG**	Extremely rich or lean actual air–fuel ratio (Injector, fuel pressure, gas leakage in exhaust system, etc.)

The following A/F Control procedure enables the technician to check and graph the voltage output of both the heated oxygen sensors.

To display the graph, select the following menu items on the tester: View / Line Graph.

DTC	P0443	EVAPORATIVE EMISSION CONTROL SYSTEM PURGE CONTROL VALVE CIRCUIT



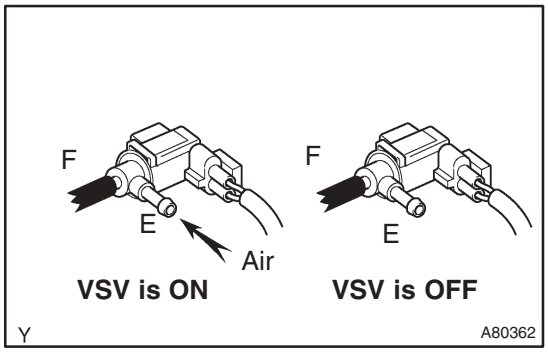
CIRCUIT DESCRIPTION

In order to reduce hydrocarbon (HC) emissions, evaporated fuel from the fuel tank is routed through the charcoal canister to the intake manifold for combustion in the cylinders.

The ECM changes the duty signal to the EVAP VSV so that the intake of HC emissions is appropriate for the driving conditions (engine load, engine speed, vehicle speed, etc.) after the engine is warmed up.

DTC No.	DTC Detection Condition	Trouble Area
P0443	Proper response to ECM command does not occur (1 trip detection logic)	• Open or short in EVAP VSV circuit • EVAP VSV • ECM

WIRING DIAGRAM



INSPECTION PROCEDURE

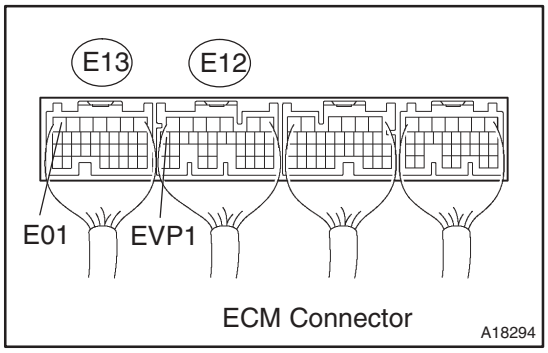
HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 PERFORM ACTIVE TEST USING INTELLIGENT TESTER II(EVAP VSV)

(a) Disconnect the vacuum hose of the EVAP VSV.
(b) Connect the intelligent tester II to the DLC3.
(c) Start the engine and turn the intelligent tester II ON.
(d) Select the following menu items: Powertrain / Engine and ECT / Active Test / Purge VSV. Press the right or left button.
(e) Check if the disconnected port applies suction to your finger when operating the EVAP VSV using the intelligent tester II.

Standard:



Tester Operation	Specified Condition
VSV is ON	Applies suction to your finger
VSV is OFF	Applies no suction to your finger

(f) Reconnect the vacuum hose.

OK → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

NG

2 INSPECT ECM(CHECK VOLTAGE)

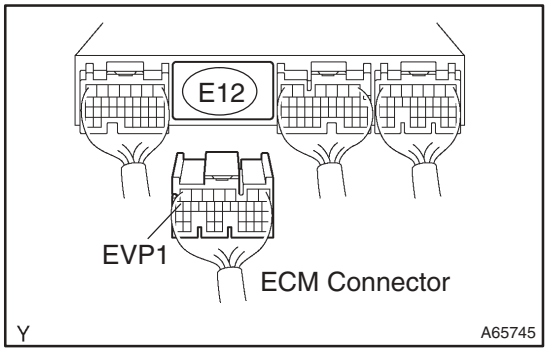
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E12 and E13 ECM connectors.

Standard:

Tester Connection	Specified Condition
EVP1 (E12–19) – E01 (E13–7)	9 to 14 V

OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG



3 INSPECT VACUUM SWITCHING VALVE(OPERATION OF EVAP VSV)

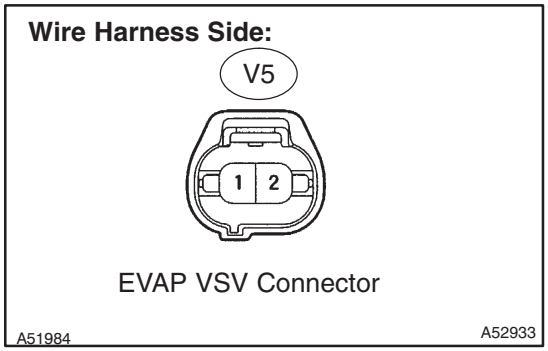
OK: Air flows when the battery voltage is applied to the EVAP VSV.

NG → **REPLACE VACUUM SWITCHING VALVE**

OK

4 CHECK HARNESS AND CONNECTOR(ECM – EVAP VSV)

(a) Disconnect the E12 ECM connector.
(b) Disconnect the V5 EVAP VSV connector.
(c) Check the resistance.

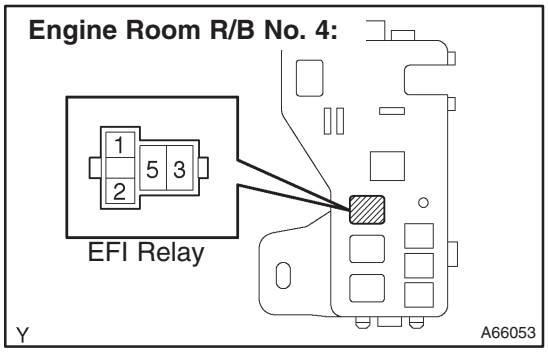


Standard (Check for open):

Tester Connection	Specified Condition
EVAP VSV (V5–2) – EVP1 (E12–19)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
EVAP VSV (V5–2) or PRG (E12–19) – Body ground	10 kΩ or higher



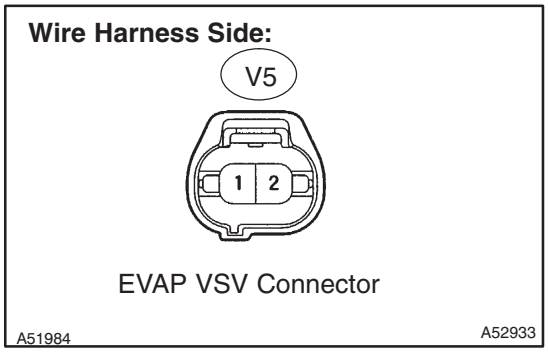
(d) Reconnect the ECM connector.
(e) Reconnect the EVAP VSV connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

5 CHECK HARNESS AND CONNECTOR(EFI RELAY – EVAP VSV)

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Disconnect the V5 EVAP VSV connector.
(c) Check the resistance.



Standard (Check for open):

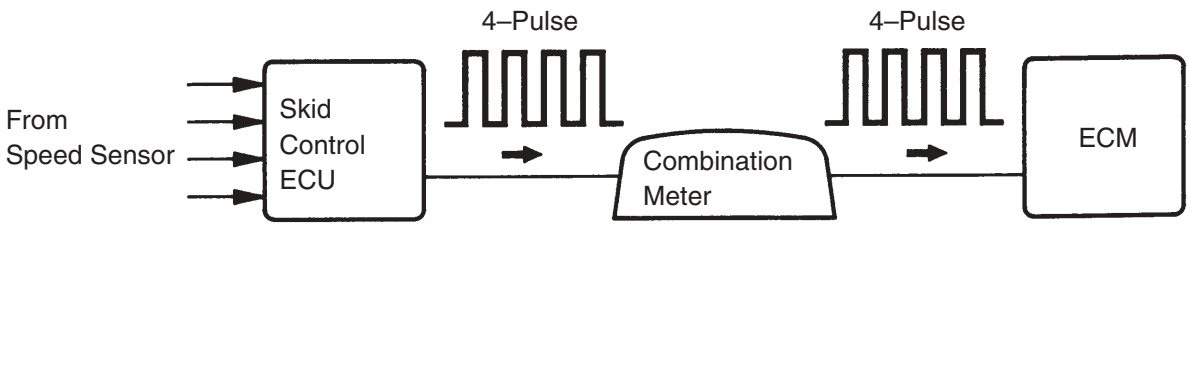
Tester Connection	Specified Condition
EVAP VSV (V5–1) – EFI relay (3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
EVAP VSV (V5–1) or EFI relay (3) – Body ground	10 kΩ or higher

(d) Reinstall the EFI relay
(e) Reconnect the EVAP VSV connector.

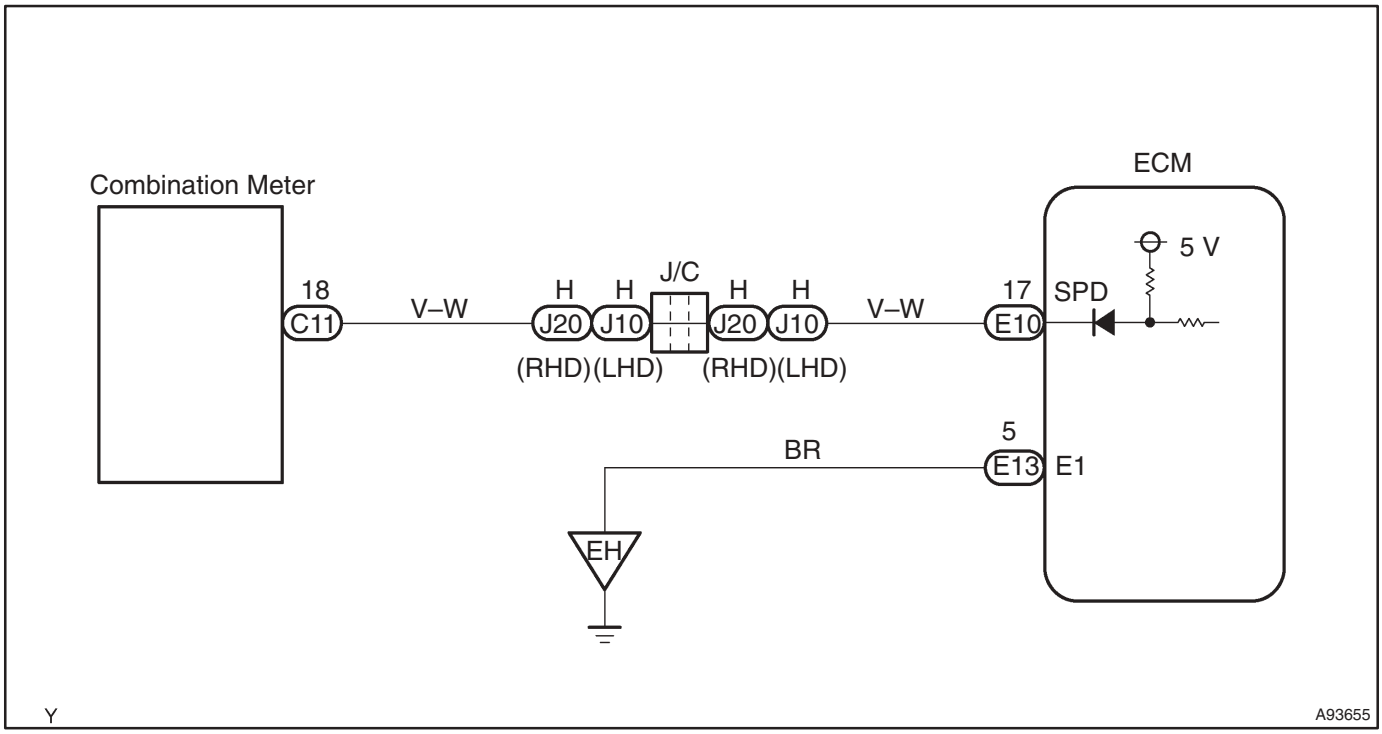
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**



OK

INSPECT ECM POWER SOURCE CIRCUIT (See page 05–195)

DTC	P0500	VEHICLE SPEED SENSOR ”A”



CIRCUIT DESCRIPTION

The speed sensor detects the wheel speed and sends appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4–pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	DTC Detection Condition	Trouble Area
P0500	Conditions (a), (b) and (c) continue for 8 seconds or more (2 trip detection logic): (a) Engine coolant temperature is more than 60°C (140°F) (b) Engine speed is between 2,000 rpm and 3,000 rpm (c) No speed signal is input to ECM	• Open or short in speed sensor circuit • Speed sensor • Combination meter • ECM • Skid control ECU

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK OPERATION OF SPEEDOMETER

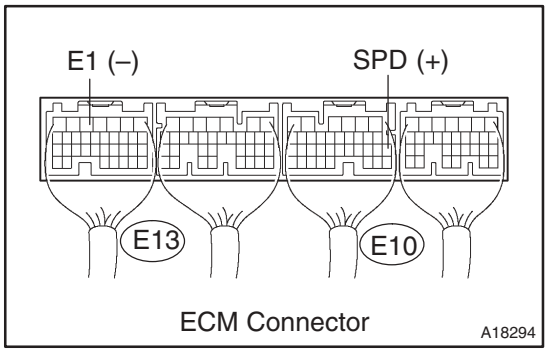
(a) Drive the vehicle and check if the operation of the speedometer in the combination meter is normal.

HINT:

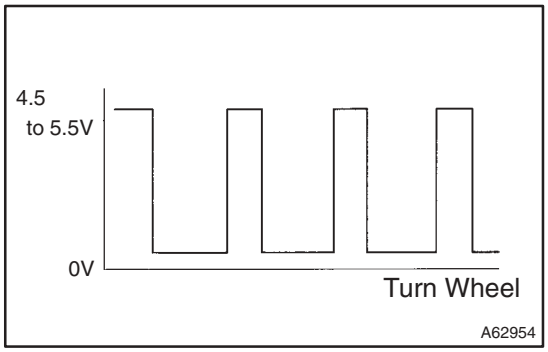
The vehicle speed sensor is operating normally if the speedometer reading is normal.

NG → **CHECK SPEEDOMETER CIRCUIT (See page 05–1510 of Pub. No. RM1018E AVENSIS)**

OK



2	READ VALUE OF INTELLIGENT TESTER II(VEHICLE SPEED)



(a) Connect the intelligent tester II to the DLC3.
(b) Start the engine and turn the intelligent tester II ON.
(c) On the intelligent tester II, select the following menu items: Powertrain / Engine and ECT / Data List / Vehicle SPD.
(d) Check the vehicle speed at the engine speed of 2,000 rpm or more when the vehicle is running.
Standard: Same value as the actual vehicle speed.

YES → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

NO

3	INSPECT ECM(SPD VOLTAGE)

(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch to ON.
(d) Measure the voltage between the terminals of the E10 and E13 ECM connectors as the wheel is turned slowly.
Standard:

Tester Connection	Specified Condition
SPD (E10–17) – E1 (E13–5)	Generatedintermittently

HINT:
The output voltage should fluctuate up and down similarly to the diagram on the left when the wheel is turned slowly.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

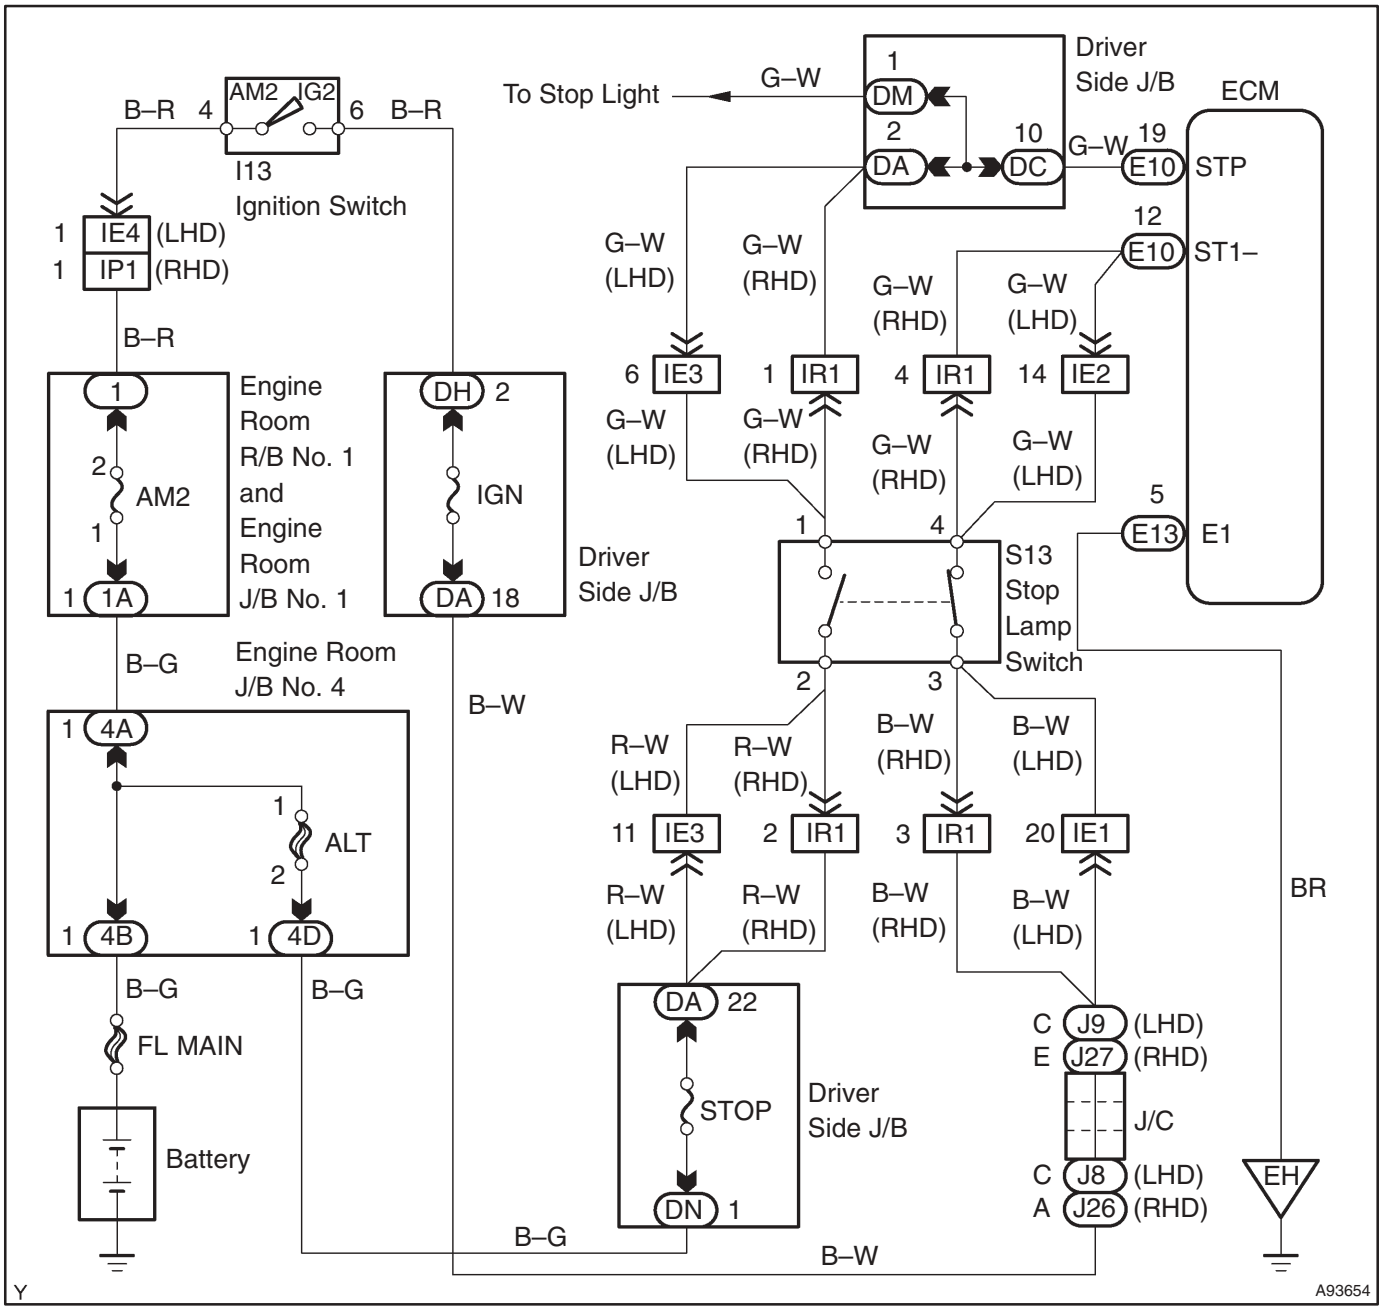
REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P0504	BRAKE SWITCH ”A”/”B” CORRELATION

CIRCUIT DESCRIPTION

In this system, the signal of the stop lamp switch is used to judge whether the brake system is abnormal or not.

The stop lamp switch has a duplex system (signals STP and ST1–) to detect abnormalities. When the signals of depressing and releasing the brake pedal are detected simultaneously, the ECM interprets this as a malfunction of the stop lamp switch.



HINT:

Normal condition is as shown in the table.

Signal	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1–	ON	ON	OFF

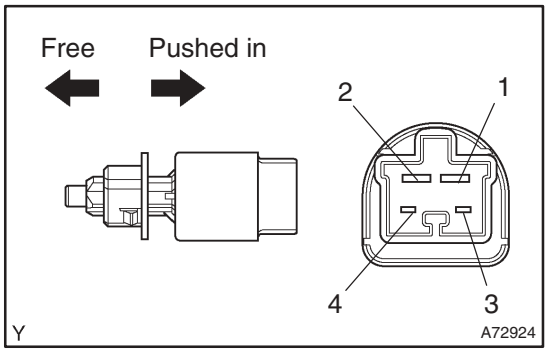
DTC No.	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more: (a) Ignition switch ON (b) Brake pedal released (c) STP signal is OFF when the ST1– signal is OFF	• Short in stop lamp switch signal circuit • Stop lamp fuse • Stop lamp switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.



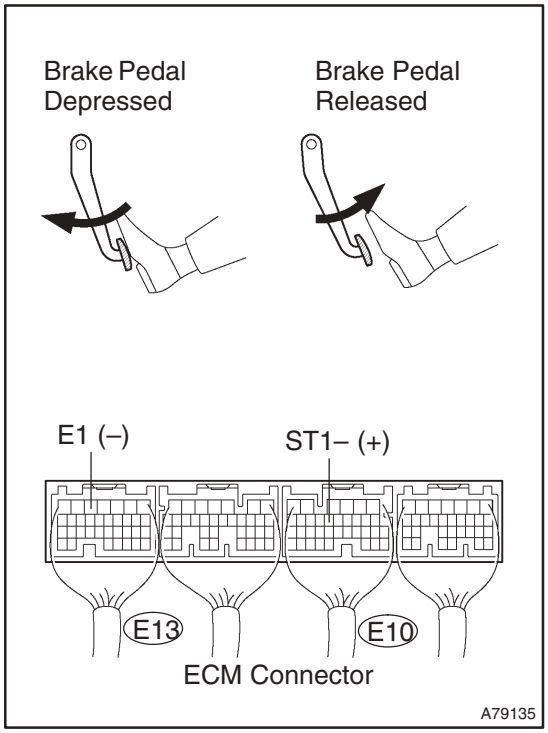
1 CHECK OPERATION OF STOP LAMP

(a) Check if the stop lamps go on and off normally when the brake pedal is depressed and released.
OK: The stop lamps turn ON when you depress the brake pedal.

NG → **REPAIR OR REPLACE STOP LAMP SWITCH CIRCUIT**

OK

2 INSPECT STOP LAMP SWITCH ASSY



(a) Check the resistance between each pair of terminals.
Standard:

Switch Position	Tester Connection	Specified Condition
Switch pin free	1 – 2	Below 1 Ω
Switch pin free	3 – 4	10 kΩ or higher
Switch pin pushed in	1 – 2	10 kΩ or higher
Switch pin pushed in	3 – 4	Below 1 Ω

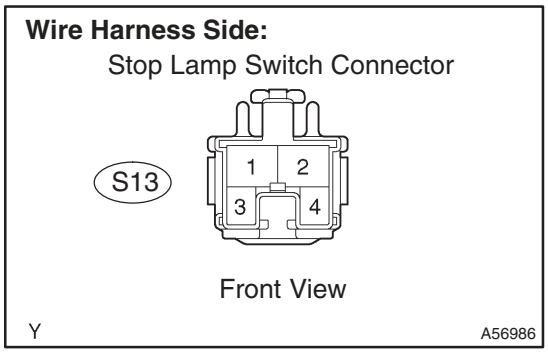
NG → **REPLACE STOP LAMP SWITCH ASSY**

OK

3 READ VALUE OF INTELLIGENT TESTER II(STP SIGNAL AND ST1– VOLTAGE)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Stop Light SW.
(d) Check the result.
Standard:

Brake Pedal	Specified Condition
Depressed	STP Signal ON
Released	STP Signal OFF



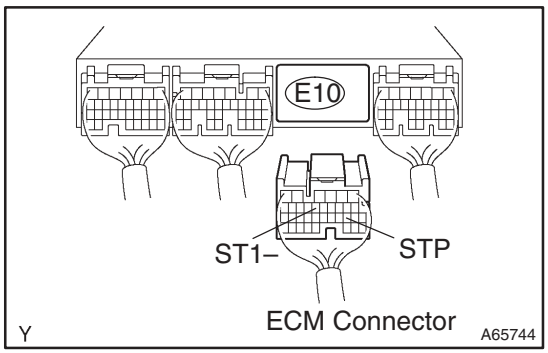
(e) Measure the voltage between the specified terminals of the E10 and E13 ECM connectors.
Standard:

Tester Connection	Brake Pedal	Specified Condition
ST1– (E10–12) – E1 (E13–5)	Depressed	Below 1.5 V
ST1– (E10–12) – E1 (E13–5)	Released	7.5 to 14 V

OK → **CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)**

NG

4 CHECK HARNESS AND CONNECTOR(STOP LAMP SWITCH – ECM)



(a) Disconnect the S13 stop lamp switch connector.
(b) Disconnect the E10 ECM connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Stop lamp switch (S13–1) – STP (E10–19)	Below 1 Ω
Stop lamp switch (S13–4) – ST1– (E10–12)	Below 1 Ω

(d) Reconnect the stop lamp switch connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC P0505 IDLE AIR CONTROL SYSTEM

CIRCUIT DESCRIPTION

The idle speed is controlled by the ETCS (Electronic Throttle Control System).
The ETCS is composed of the throttle actuator which operates the throttle valve, and the throttle position sensor which detects an opening angle of the throttle valve.
The ECM controls the throttle motor to provide the proper throttle valve opening angle to obtain the target idling speed.

DTC No.	DTC Detection Condition	Trouble Area
P0505	Idling speed continues to vary greatly from target speed (2 trip detection logic)	• Electronic throttle control system • Air induction system • PCV hose connection

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P0505)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P0505	A
P0505 and other DTCs	B

HINT:
If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2 CHECK CONNECTION OF PCV HOSE

OK: The PCV hose is connected correctly and not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3	CHECK AIR INDUCTION SYSTEM

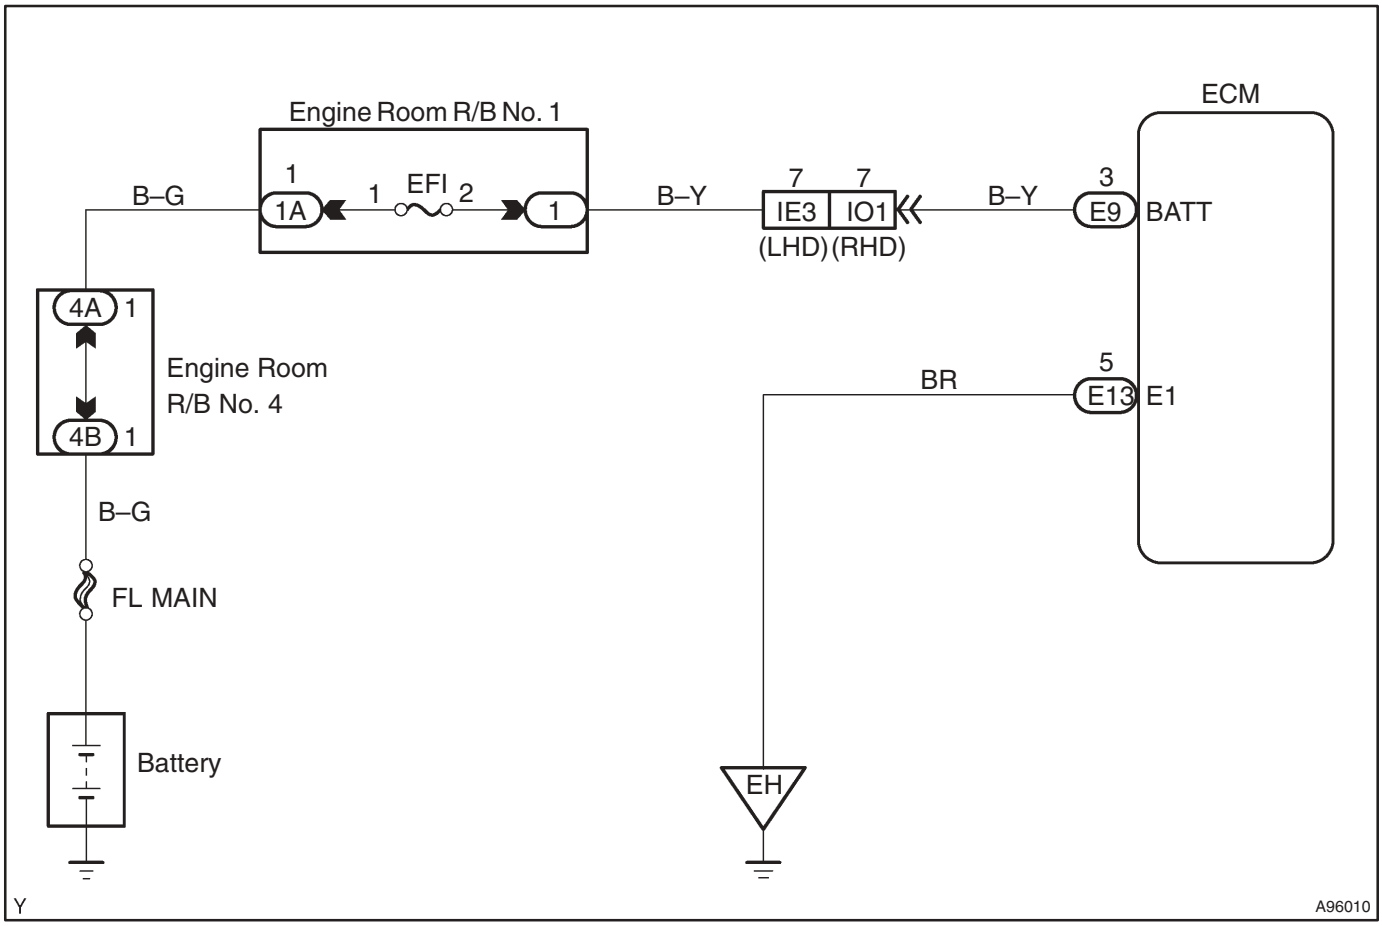
(a) Check for vacuum leaks in the air induction system.
OK: No leak in the air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK ↓

CHECK ELECTRONIC THROTTLE CONTROL SYSTEM (See page 10–1)

DTC	P0560	SYSTEM VOLTAGE

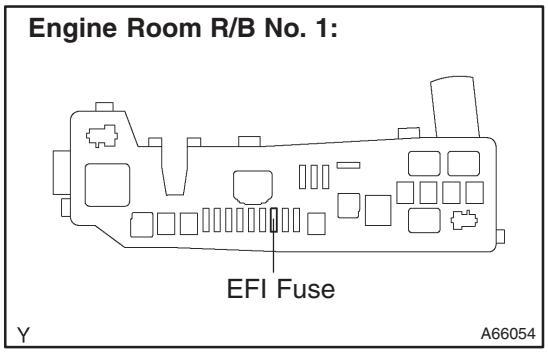


CIRCUIT DESCRIPTION

The battery supplies electricity to terminal BATT of the ECM even when the ignition switch is OFF. This electricity allows the ECM to store DTC histories, freeze frame data, fuel trim values, and other data.

DTC No.	DTC Detection Condition	Trouble Area
P0560	Open in backup power source circuit	• Open in backup power source circuit • ECM

HINT:
If DTC P0560 is set, the ECM does not store other DTCs.

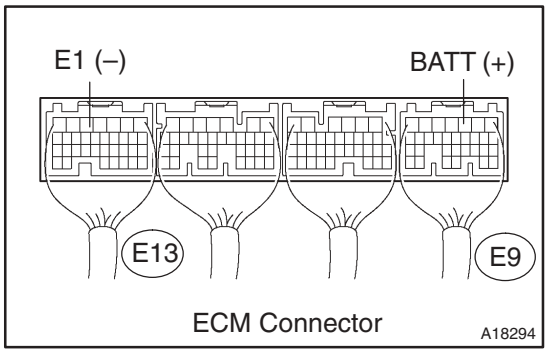


WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK FUSE(EFI FUSE)

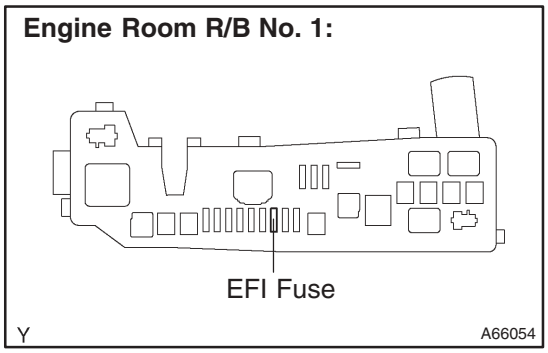


(a) Remove the EFI fuse from the engine room R/B No. 1.
(b) Check the EFI fuse resistance.
Standard: Below 1 Ω
(c) Reinstall the EFI fuse.

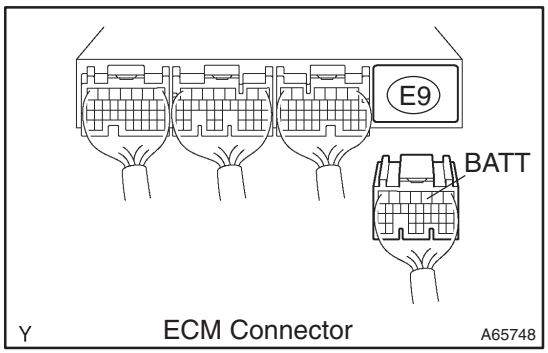
NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

OK

2 INSPECT ECM(BATT VOLTAGE)



(a) Measure the voltage between the terminals of the E9 and E13 ECM connectors.
Standard:



Tester Connection	Specified Condition
BATT (E9–3) – E1 (E13–5)	9 to 14 V

OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG

3 CHECK HARNESS AND CONNECTOR(ECM – EFI FUSE, EFI FUSE – BATTERY)

(a) Check the harness and the connectors between the EFI fuse and ECM.
   (1) Remove the EFI fuse from the engine room R/B No. 1.
   (2) Disconnect the E9 ECM connector.
   (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
EFI fuse (2) – BATT (E9–3)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
EFI fuse (2) or BATT (E9–3) – Body ground	10 kΩ or higher

   (4) Reinstall the EFI fuse.
   (5) Reconnect the ECM connector.

(b) Check the harness and the connector between the EFI fuse and battery.
   (1) Remove the EFI fuse from the engine room R/B No. 1.
   (2) Disconnect the positive battery cable.
   (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Positive battery cable terminal – EFI fuse (1)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Positive battery cable terminal or EFI fuse (1) – Body ground	10 kΩ or higher

   (4) Reinstall the EFI fuse.
   (5) Reconnect the positive battery cable.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK AND REPLACE ENGINE ROOM RELAY BLOCK

DTC	P0604	INTERNAL CONTROL MODULE RANDOM ACCESS MEMORY (RAM) ERROR

DTC	P0606	ECM/PCM PROCESSOR

DTC	P0607	CONTROL MODULE PERFORMANCE

DTC	P0657	ACTUATOR SUPPLY VOLTAGE CIRCUIT/OPEN

CIRCUIT DESCRIPTION

The ECM continuously monitors its internal memory status, internal circuits, and output signals to the throttle actuator. This self–check ensures that the ECM is functioning properly. If any malfunction is detected, the ECM will set appropriate DTCs and illuminate the MIL.

The ECM memory status is diagnosed by internal ”mirroring” of the main CPU and the sub CPU to detect Random Access Memory (RAM) errors. The two CPUs also perform continuous mutual monitoring.

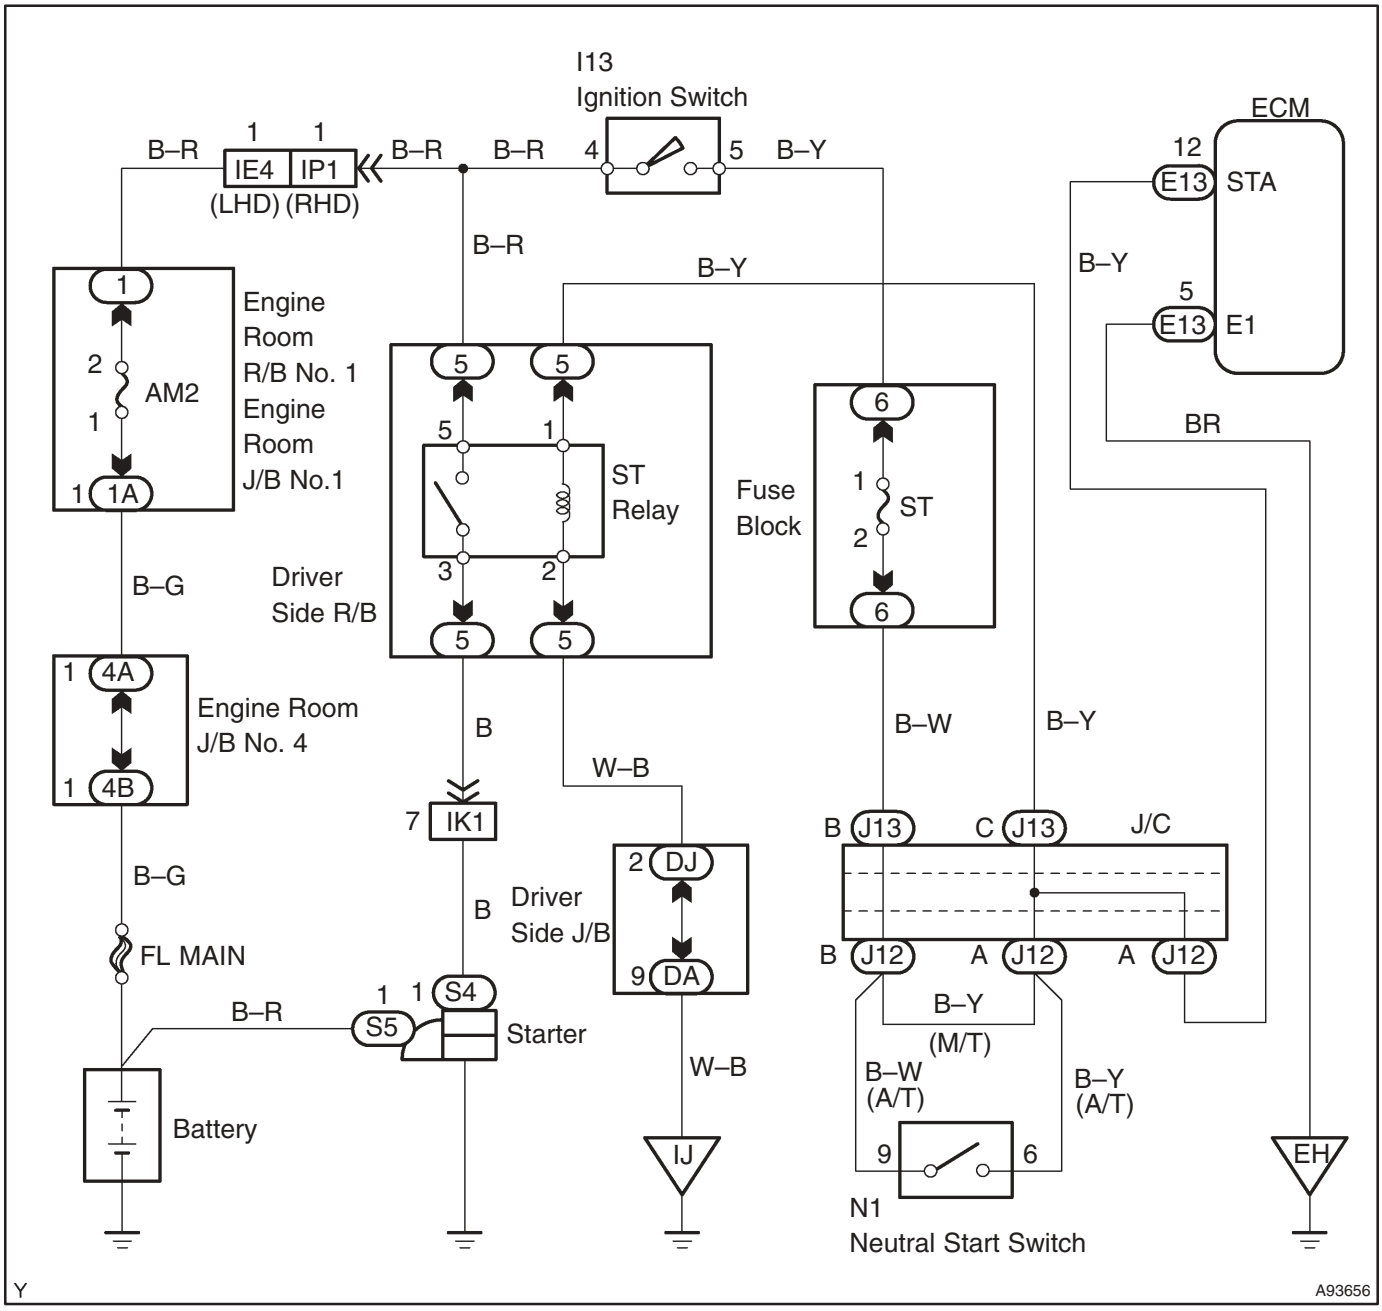
DTC No.	DTC Detection Condition	Trouble Area
P0604 P0606 P0607 P0657	ECM internal error	• ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)



DTC	P0617	STARTER RELAY CIRCUIT HIGH

CIRCUIT DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) are met when the battery voltage of 10.5 V or more is applied for 20 seconds (a) Vehicle speed greater than 20 km/h (12 mph) (b) Engine RPM greater than 1,000 rpm (c) STA signal ON	• Short in park/neutral position switch circuit (MMT) • Short in STA circuit • Park/neutral position switch (MMT) • ECM

WIRING DIAGRAM

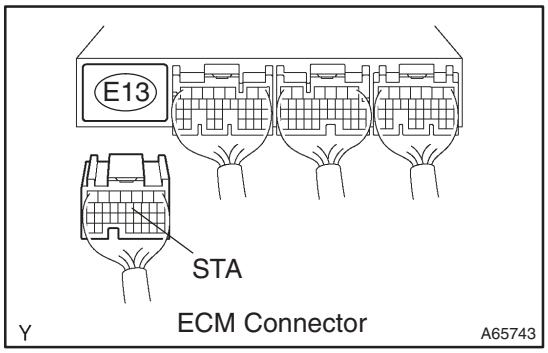
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER II(STA SIGNAL)

(a) Connect the intelligent tester ll to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Starter SIG.
(d) Check the result when the ignition switch is turned to the ON and START positions.



Standard:

Ignition Switch Position	ON	START
STARTER SIG	OFF	ON

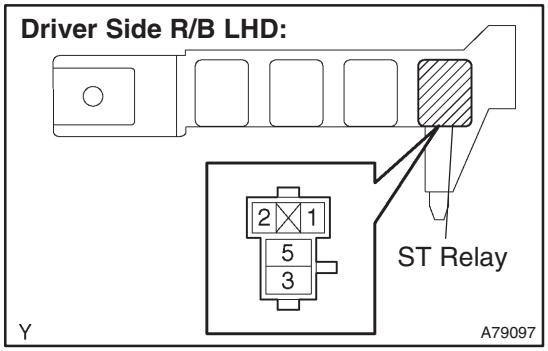
OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN ON PROBLEM SYMPTOMS TABLE (See page 05–12)**

NG

2 CHECK HARNESS AND CONNECTOR(ECM – ST RELAY)

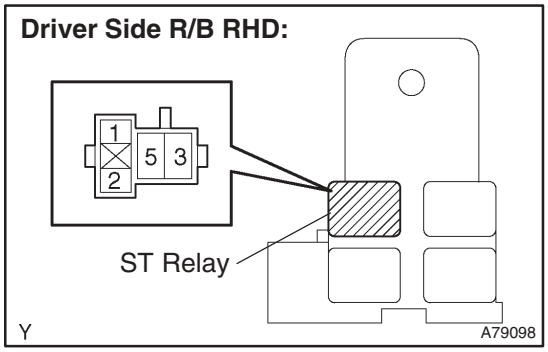
(a) Disconnect the E13 ECM connector.
(b) Remove the ST relay from the driver side R/B.
(c) Check the resistance.

Standard (Check for open):



Tester Connection	Specified Condition
ST relay (1) – STA (E13–12)	Below 1 Ω

Standard (Check for short):



Tester Connection	Specified Condition
ST relay (1) or STA (E13–12) – Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reinstall the ST relay.

Driver Side R/B LHD:

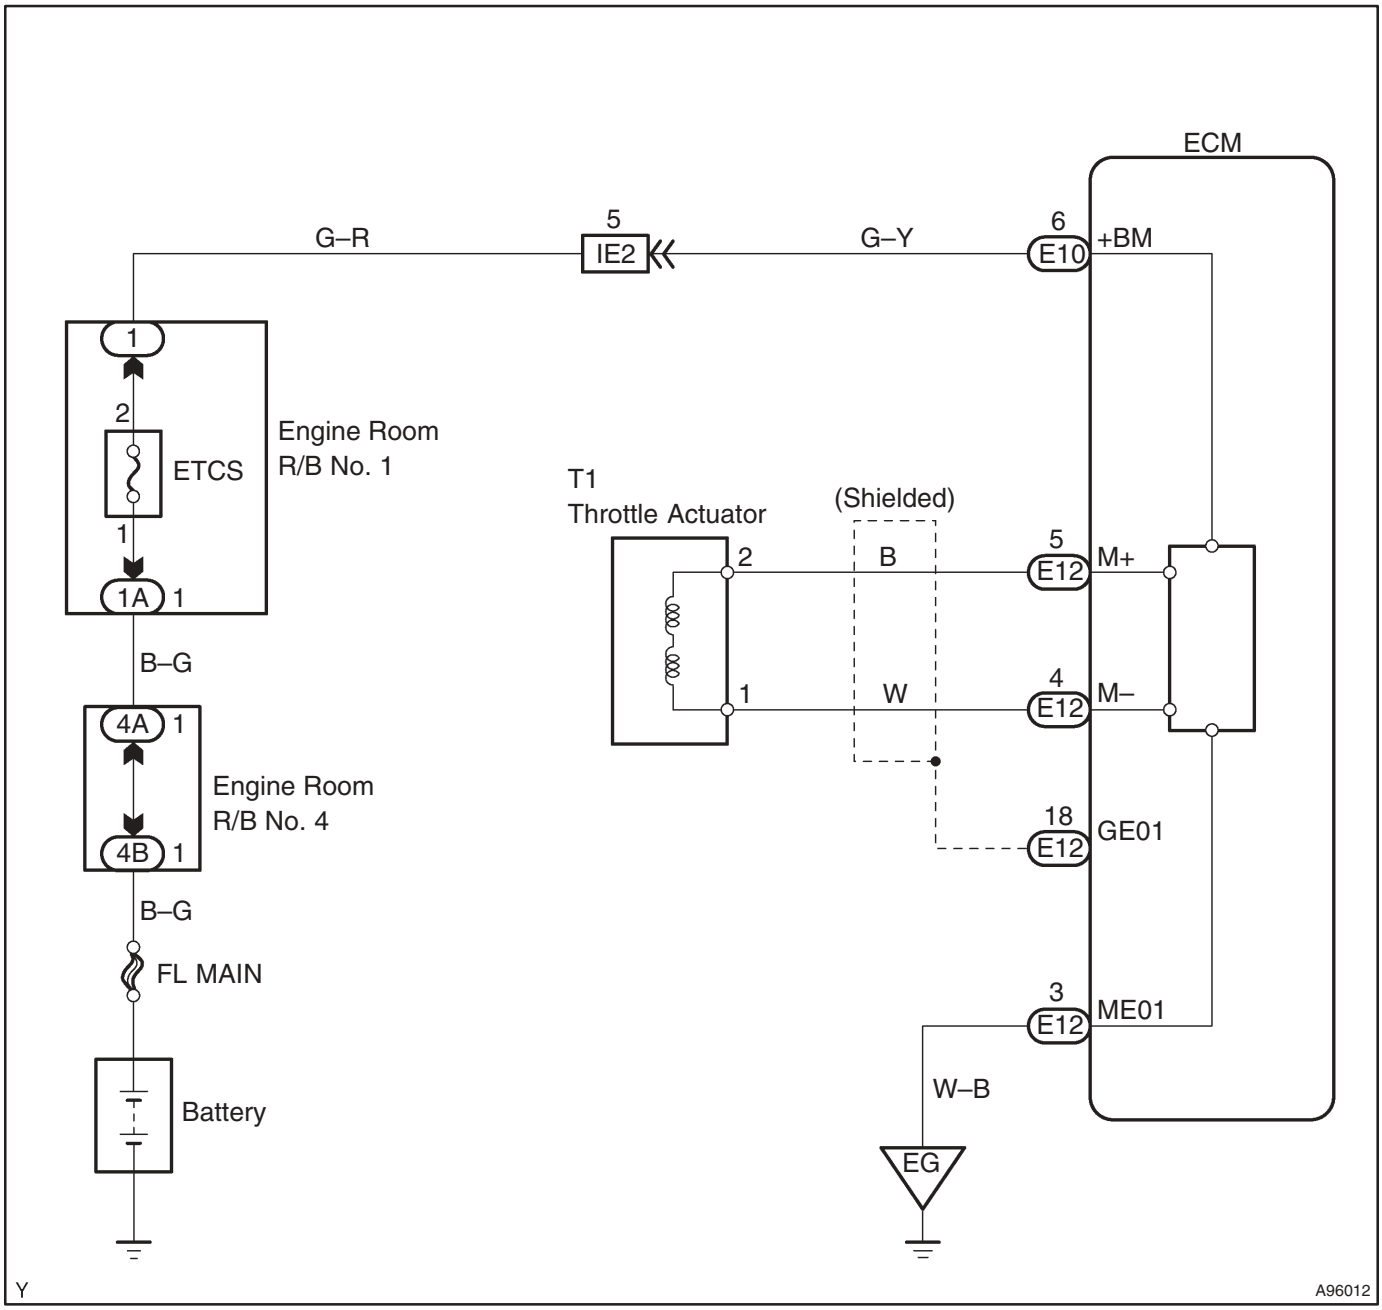
Driver Side R/B RHD:

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P2102	THROTTLE ACTUATOR CONTROL MOTOR CIRCUIT LOW



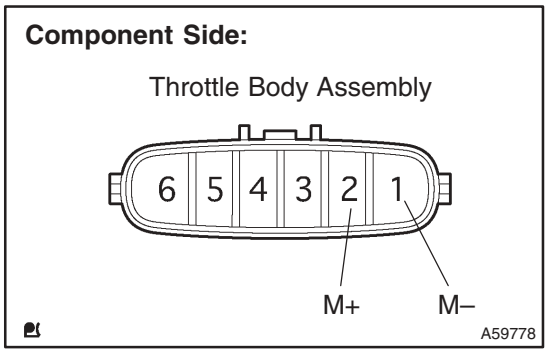
DTC	P2103	THROTTLE ACTUATOR CONTROL MOTOR CIRCUIT HIGH

CIRCUIT DESCRIPTION

The throttle actuator is operated by the ECM and it opens and closes the throttle valve.
The opening angle of the throttle valve is detected by the throttle position sensor which is mounted on the throttle body. It provides feedback to the ECM to control the throttle actuator in order to control the throttle valve opening angle properly in response to the driving condition.
If this malfunction is detected, the ECM shuts down the power for the throttle actuator, and the throttle valve is locked at a certain angle by the return spring. Also, the whole electronically controlled throttle operation is cancelled until the system returns to normal and the ignition switch is turned to OFF.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) Throttle actuator output duty ratio is 80 % or more (b) Throttle actuator current is 0.5 A or less	• Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Either of following conditions is met (1 trip detection logic): • Throttle actuator current is 10 A or more for 0.1 seconds • Throttle actuator current is 7A or more for 0.6 seconds	• Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

WIRING DIAGRAM



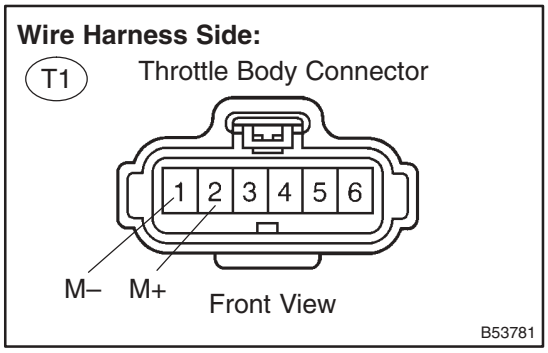
INSPECTION PROCEDURE

HINT:

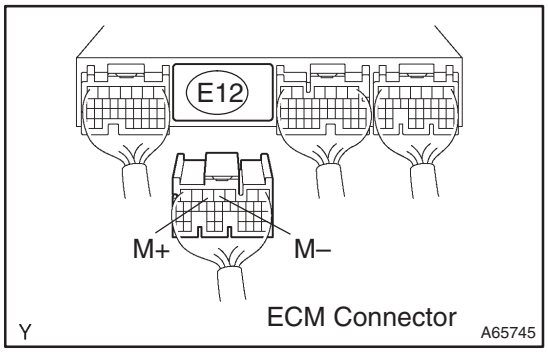
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT THROTTLE BODY ASSY(RESISTANCE OF THROTTLE ACTUATOR)

(a) Disconnect the T1 throttle body connector.
(b) Measure the resistance between the terminals of the throttle actuator.
Standard:



Tester Connection	Specified Condition
M+ (T1–2) – M– (T1–1)	0.3 to 100 Ω at 20°C (68°F)



(c) Reconnect the throttle body connector.

NG → **REPLACE THROTTLE BODY ASSY (See page 10–6)**

OK

2 CHECK HARNESS AND CONNECTOR(THROTTLE ACTUATOR – ECM)

(a) Disconnect the T1 throttle body connector.
(b) Disconnect the E12 ECM connector.
(c) Check the resistance.
Standard (Check for open):

Tester Connection	Specified Condition
M+ (T1–2) – M+ (E12–5)	Below 1 Ω
M– (T1–1) – M– (E12–4)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
M+ (T1–2) or M+ (E12–5) – Body ground	10 kΩ or higher
M– (T1–1) or M– (E12–4) – Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT THROTTLE BODY ASSY

(a) Visually check for foreign objects between the throttle valve and the housing.
Also, check if the valve can open and close smoothly.
OK: The throttle valve is not contaminated with foreign objects and can move smoothly.

NG → **REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P2111	THROTTLE ACTUATOR CONTROL SYSTEM – STUCK OPEN

DTC	P2112	THROTTLE ACTUATOR CONTROL SYSTEM – STUCK CLOSED

CIRCUIT DESCRIPTION

The throttle actuator is operated by the ECM and it opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the throttle position sensor which is mounted on the throttle body. And, it provides feedback to the ECM to control the throttle actuator in order to control the throttle valve opening angle properly in response to the driving condition. If this malfunction is detected, the ECM shuts down the power for the throttle actuator, and the throttle valve is locked at a certain angle by the return spring. Also, the whole electronically controlled throttle operation is cancelled until the system returns to normal and the ignition switch is turned to OFF.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2111	Throttle actuator locked during ECM ordering it to close (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve
P2112	Throttle actuator locked during ECM ordering it to open (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve

WIRING DIAGRAM

Refer to DTC P2102 on page 05–174.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P2111 AND/OR P2112)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.

Result:

Display (DTC Output)	Proceed To
P2111 or P2112	A
P2111 or P2112 and other DTCs	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → **GO TO RELEVANT DTC CHART (See page 05–27)**

A

2	INSPECT THROTTLE BODY ASSY(VISUALLY CHECK THROTTLE VALVE)

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.
OK: The throttle valve is not contaminated with foreign objects and can move smoothly.

NG → **REPLACE THROTTLE BODY ASSY (See page 10–6)**

OK

3	CHECK IF DTC OUTPUT RECURS(DTC P2111 AND/OR P2112)

(a) Clear the DTC(s) (see page 05–18).
(b) Start the engine, and depress and release the accelerator pedal quickly (to fully open and fully close the throttle valve).
(c) Connect the intelligent tester II to the DLC3.
(d) Turn the ignition switch to ON and turn the intelligent tester II ON.
(e) Select the following menu items: Powertrain / Engine and ECT / DTC.
(f) Read DTCs.
Result:

Display (DTC Output)	Proceed To
No DTC	A
P2111 and/or P2112	B

A

CHECK FOR INTERMITTENT PROBLEMS (See page 05–9)

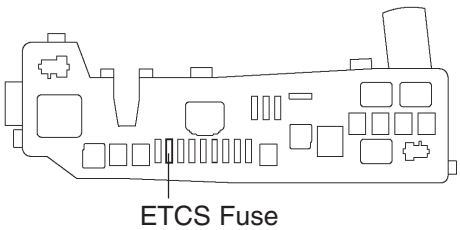
DTC	P2118	THROTTLE ACTUATOR CONTROL MOTOR CURRENT RANGE/PERFORMANCE

CIRCUIT DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when the voltage is low (less than 4 V), the ECM concludes that the ETCS has a fault and a current to the throttle actuator is cut.
When the voltage becomes unstable, the ETCS becomes unstable. For this reason, when the voltage is low, the current to the actuator is cut. If repairs are made and the system has returned to normal, turn the ignition switch to OFF. The ECM then allows the current to flow to the actuator and the actuator can be restarted.
HINT:
This ETCS does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2118	Open in ETCS power source circuit	• Open in ETCS power source circuit • ETCS fuse • ECM

WIRING DIAGRAM



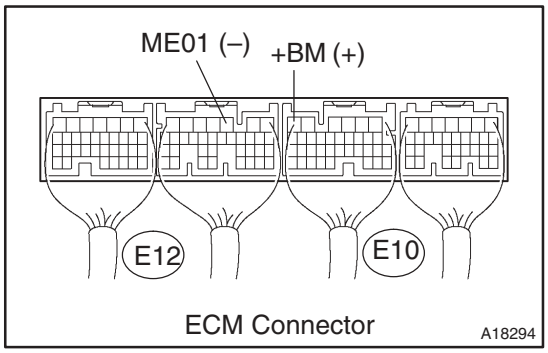
Refer to DTC P2102 on page 05–174.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK FUSE(ETCS FUSE)

Engine Room R/B No. 1:



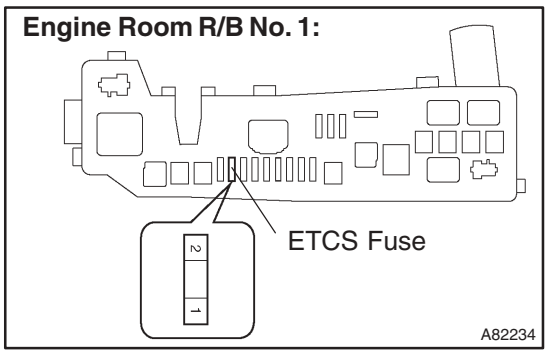
(a) Remove the ETCS fuse from the engine room R/B No. 1.
(b) Check the ETCS fuse resistance.
Standard: Below 1 Ω
(c) Reinstall the ETCS fuse.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

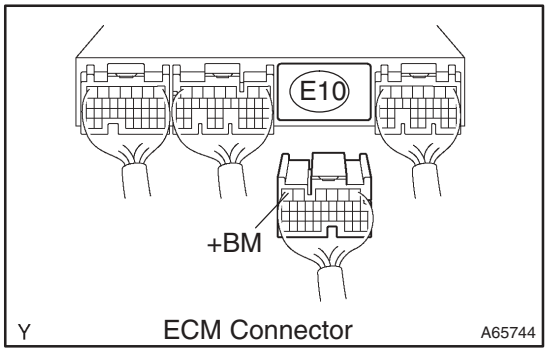
OK

2 INSPECT ECM(+BM VOLTAGE)

(a) Measure the voltage between the specified terminals of the E10 and E12 ECM connectors.



Standard:



Tester Connection	Specified Condition
+BM (E10–6) – ME01 (E12–3)	9 to 14 V

OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG

3	CHECK HARNESS AND CONNECTOR(ECM – ETCS FUSE, ETCS FUSE – BATTERY)

(a) Check the harness and connectors between the ETCS fuse and ECM.
  (1) Remove the ETCS fuse from the engine room R/B No. 1.
  (2) Disconnect the E10 ECM connector.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
ETCS fuse (2) – +BM (E10–6)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
ETCS fuse (2) or +BM (E10–6) – Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the ETCS fuse and positive battery cable.
  (1) Remove the ETCS fuse from the engine room R/B No. 1.
  (2) Disconnect the positive battery cable.
  (3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Positive battery cable terminal – ETCS fuse (1)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Positive battery cable terminal or ETCS fuse (1) – Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the positive battery cable.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK AND REPLACE ENGINE ROOM RELAY BLOCK

DTC	P2119	THROTTLE ACTUATOR CONTROL THROTTLE BODY RANGE/PERFORMANCE

CIRCUIT DESCRIPTION

The ETCS (Electronic Throttle Control System) is composed of the throttle actuator, the Throttle Position (TP) sensor, the Accelerator Pedal Position (APP) sensor, and the ECM. This system is the one valve type throttle body. In order to deliver the proper opening angle of the throttle valve in response to the driving condition, the TP sensor mounted on the throttle body detects the actual throttle valve opening angle, and provides feedback for the ECM in order that the ECM controls the actuator.
If the ETCS has a malfunction, the ECM shuts down the power for the actuator, and the throttle valve is locked at a certain angle by the return spring. Also, the whole electronically controlled throttle operation is cancelled until the system returns to normal and the ignition switch is turned to OFF.

DTC No.	DTC Detection Condition	Trouble Area
P2119	Throttle valve opening angle continues to vary greatly from target opening angle	• Electronic throttle control system • ECM

WIRING DIAGRAM

Refer to DTC P2102 on page 05–174.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK OTHER DTC OUTPUT(IN ADDITION TO DTC P2119)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Read DTCs.
Result:

Display (DTC Output)	Proceed To
P2119	A
P2119 and other DTCs	B

HINT:
If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO RELEVANT DTC CHART (See page 05–27)

A

2	CHECK IF DTC OUTPUT RECURS(DTC P2119)

(a) Clear the DTC(s) (see page 05–18).
(b) Allow the engine to idle for 15 seconds.
(c) Securely apply the parking brake, and place the shift position in D.
(d) Depress the brake pedal securely and the accelerator pedal fully for 5 seconds.
(e) Connect the intelligent tester II to the DLC3.
(f) Turn the ignition switch to ON and turn the intelligent tester ll ON.
(g) Select the following menu items: Powertrain / Engine and ECT / DTC.
(h) Read DTCs.

HINT:
Actual throttle valve angle can be confirmed in Throttle POS under the Data List menus on the intelligent tester II.

OK: No DTC output.

NG → **REPLACE THROTTLE BODY ASSY (See page 10–6)**

OK

NORMAL

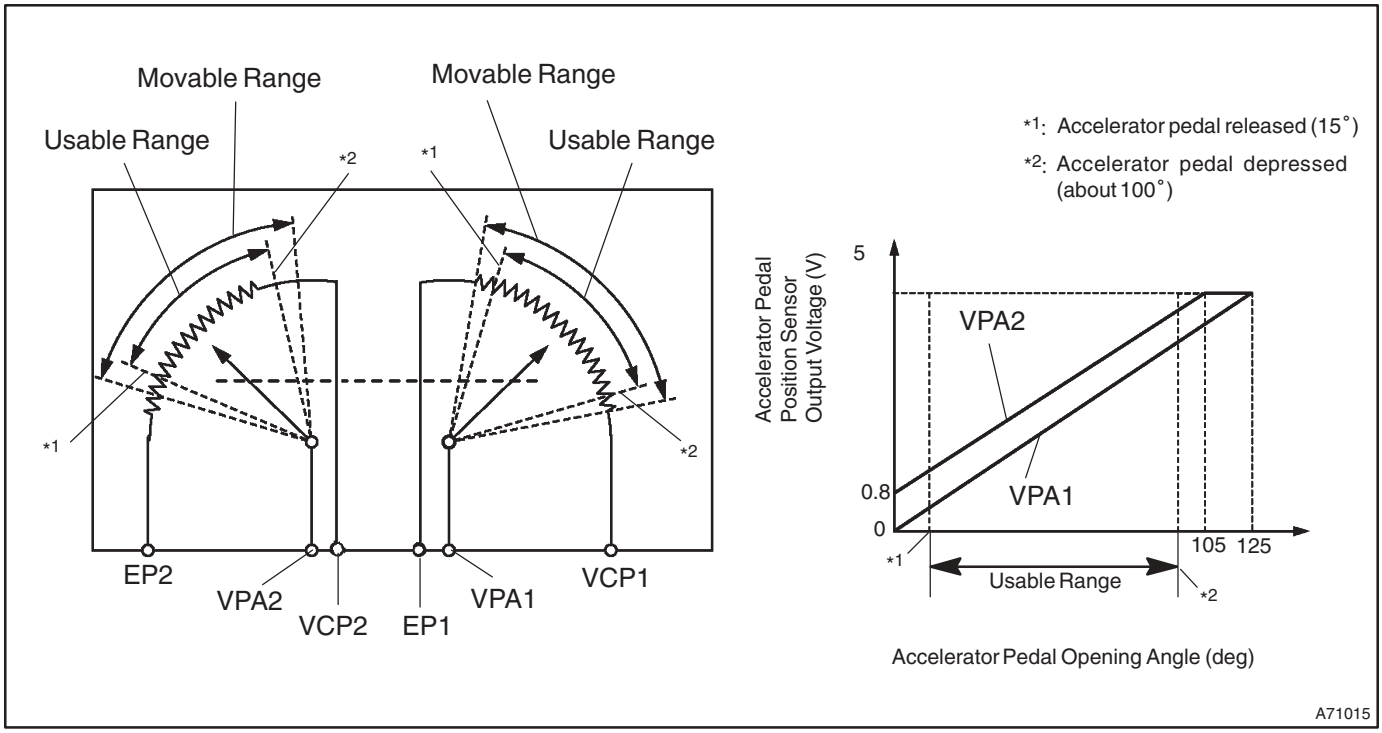
DTC	P2120	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”D” CIRCUIT

DTC	P2122	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”D” CIRCUIT LOW INPUT

DTC	P2123	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”D” CIRCUIT HIGH INPUT

DTC	P2125	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”E” CIRCUIT

DTC	P2127	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”E” CIRCUIT LOW INPUT



DTC	P2128	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”E” CIRCUIT HIGH INPUT

DTC	P2138	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”D”/”E” VOLTAGE CORRELATION

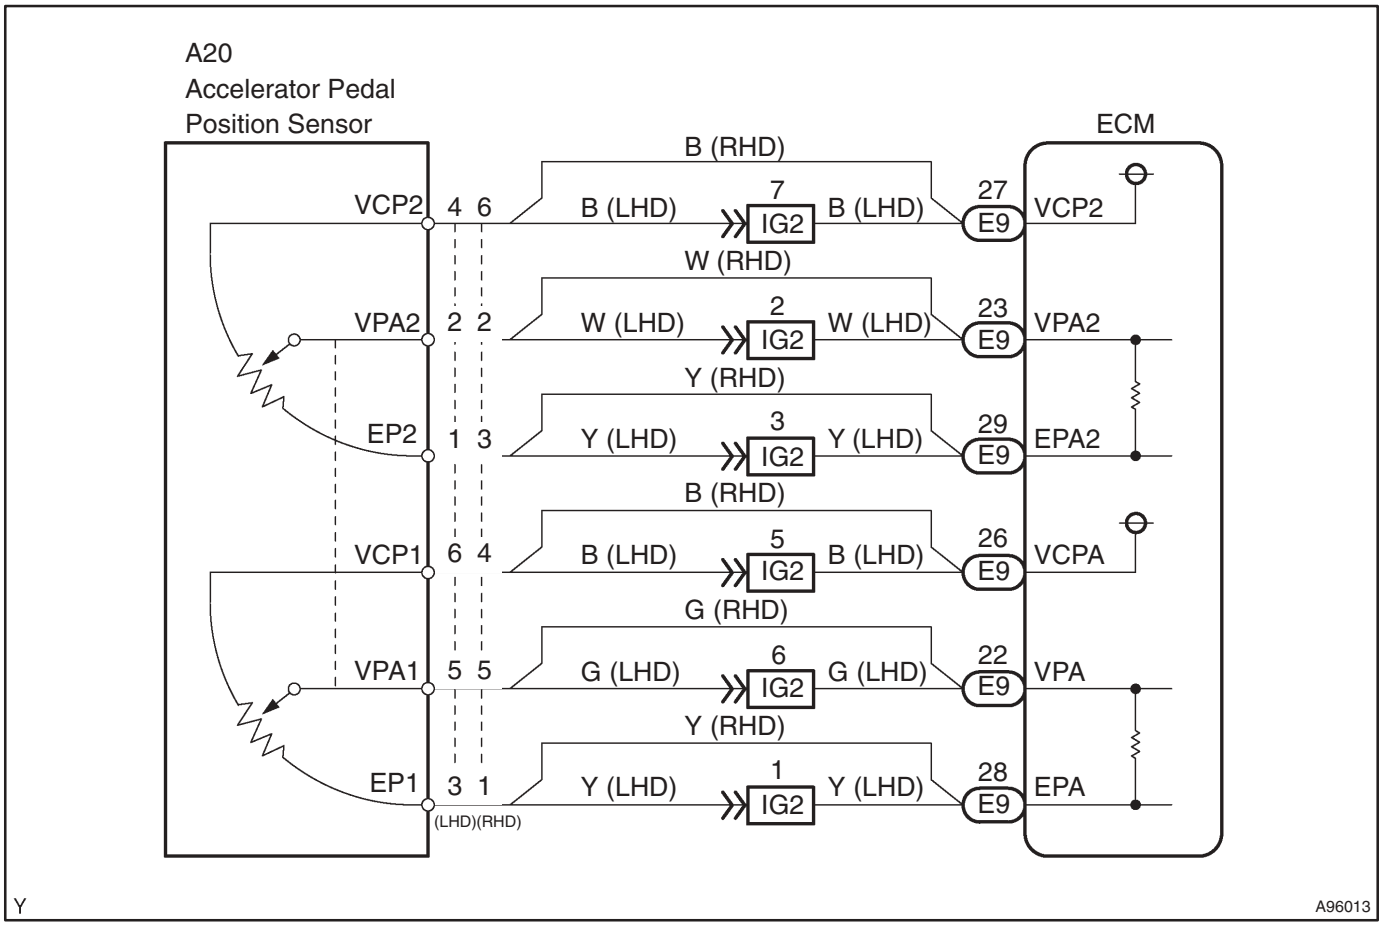
HINT:
These DTCs are related to the accelerator pedal position sensor.

CIRCUIT DESCRIPTION

The accelerator pedal position sensor is mounted on the accelerator pedal bracket and it has the 2 sensors to detect the accelerator position and malfunctions of the accelerator position sensor itself.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA1 and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA1 is a signal to indicate the actual accelerator pedal opening angle which is used for engine control, and the VPA2 is a signal to indicate the information about the opening angle which is used for detecting a malfunction in the sensor itself.
The ECM judges the current accelerator pedal opening angle with the signals from pedal terminals VPA1 and VPA2, and the ECM controls the throttle motor based on these signals.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2120	VPA1 quickly fluctuates up and down beyond upper and lower malfunction thresholds for 0.5 seconds or more	• Accelerator pedal position sensor • ECM
P2122	Condition (a) continues for 0.5 seconds or more when accelerator pedal is fully released: (a) VPA1 is 0.2 V or less	• Accelerator pedal position sensor • Open in VCP1 circuit • Open or ground short in VPA1 circuit • ECM
P2123	Condition (a) continues for 2.0 seconds or more: (a) VPA1 is 4.8 V or more	• Accelerator pedal position sensor • Open in EPA circuit • ECM
P2125	VPA2 quickly fluctuates up and down beyond upper and lower malfunction thresholds for 0.5 seconds or more	• Accelerator pedal position sensor • ECM
P2127	Condition (a) continues for 0.5 seconds or more when accelerator pedal is fully released: (a) VPA2 is 0.5 V or less	• Accelerator pedal position sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more: (a) VPA2 is 4.8 V or more (b) VPA1 is 0.2 V or more and VPA1 is 3.45 V or less	• Accelerator pedal position sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more: (a) Difference between VPA1 and VPA2 is 0.02 V or less (b) VPA1 is 0.2 V or less and VPA2 is 0.5 V or less	• VPA1 and VPA2 circuits are short–circuited • Accelerator pedal position sensor • ECM

HINT:



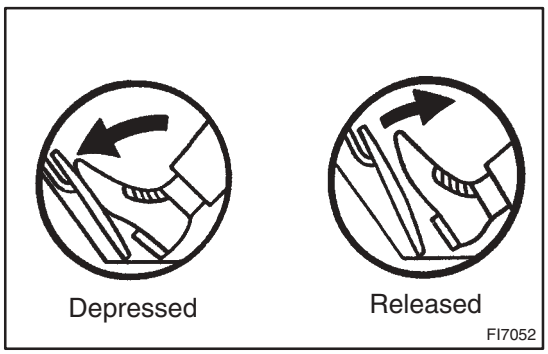
When DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 is detected, check the output voltage of the accelerator pedal position sensor by selecting Powertrain / Engine and ECT / Data List / Accelerator POS No. 1 and Accelerator POS No. 2 on the intelligent tester II.

Reference:

Trouble Area	Accelerator Pedal Position (Voltage Output)			
	Accelerator Pedal Released		Accelerator Pedal Depressed	
	Accelerator POS No. 1	Accelerator POS No. 2	Accelerator POS No. 1	Accelerator POS No. 2
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA1 circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V

Accelerator pedal position is expressed as voltages.

WIRING DIAGRAM



INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE OF INTELLIGENT TESTER II(ACCELERATOR POS NO.1 AND ACCELERATOR POS NO.2)

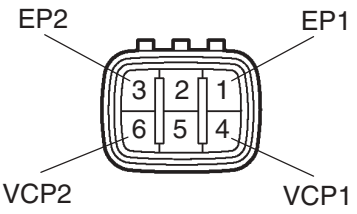
(a) Connect the intelligent tester II to the DLC3.

(b) Turn the ignition switch to ON and turn the intelligent tester II ON.

(c) Select the following menu items: Powertrain / Engine and ECT / Data List / Accelerator POS No. 1 and Accelerator POS No. 2.

(d) Read the value.

Standard:

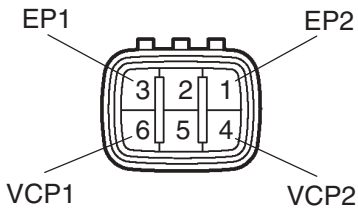


Accelerator Pedal	Accelerator POS No. 1	Accelerator POS No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK	Go to step 6

NG

2 INSPECT ACCELERATOR PEDAL ASSY(ACCELERATOR PEDAL POSITION SENSOR)



Component Side (RHD):

Accelerator Pedal Position Sensor

A84814

Component Side (LHD):

Accelerator Pedal Position Sensor

A84814

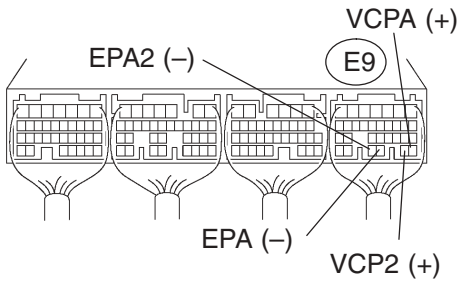
(a) Disconnect the A20 accelerator pedal position sensor connector.

(b) Measure the resistance between each pair of terminals.

Standard (RHD):

Tester Connection	Specified Condition
EP1 (1) – VCP1 (4)	2.25 to 4.75 kΩ at 20°C (68°F)
EP2 (3) – VCP2 (6)	2.25 to 4.75 kΩ at 20°C (68°F)

Standard (LHD):



Tester Connection	Specified Condition
EP1 (3) – VCP1 (6)	2.25 to 4.75 kΩ at 20°C (68°F)
EP2 (1) – VCP2 (4)	2.25 to 4.75 kΩ at 20°C (68°F)

(c) Reconnect the accelerator pedal position sensor connector.

NG	REPLACE ACCELERATOR PEDAL ASSY (See page 10–12)

OK

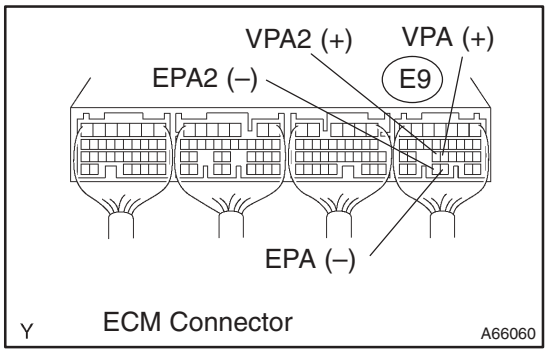
3 INSPECT ECM(VCPA AND VCP2 VOLTAGE)

Y ECM Connector

A66060

(a) Turn the ignition switch to ON.

(b) Measure the voltage between the specified terminals of the E9 ECM connector.



Standard:

Tester Connection	Specified Condition
VCPA (E9–26) – EPA (E9–28)	4.5 to 5.0 V
VCP2 (E9–27) – EPA2 (E9–29)	4.5 to 5.0 V

NG	REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

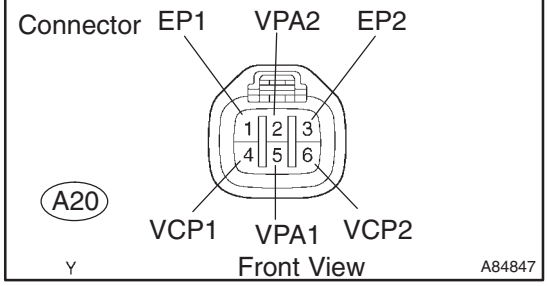
OK

4 INSPECT ECM(VPA AND VPA2 VOLTAGE)

(a) Turn the ignition switch to ON.
(b) Measure the voltage between the specified terminals of the E9 ECM connector.

Standard:

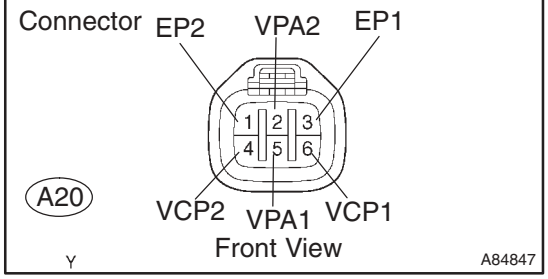
Accelerator Pedal Position	Tester Connection	Specified Condition
Released	VPA (E9–22) – EPA (E9–28)	0.5 to 1.1 V
Depressed	VPA (E9–22) – EPA (E9–28)	2.6 to 4.5 V
Released	VPA2 (E9–23) – EPA2 (E9–29)	1.2 to 2.0 V
Depressed	VPA2 (E9–23) – EPA2 (E9–29)	3.4 to 5.0 V



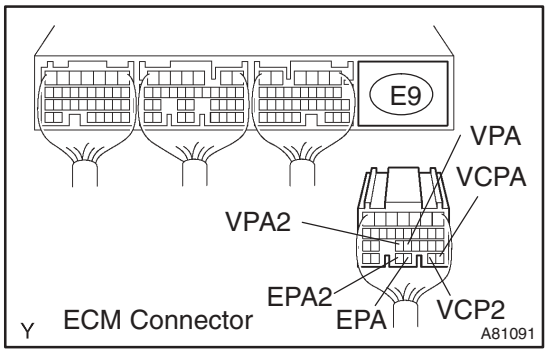
OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

NG

5	CHECK HARNESS AND CONNECTOR(ACCELERATOR PEDAL POSITION SENSOR – ECM)



Wire Harness Side (RHD):



Accelerator Pedal Position Sensor Connector

Wire Harness Side (LHD):

Accelerator Pedal Position Sensor Connector

(a) Disconnect the A20 accelerator pedal position sensor connector.

(b) Disconnect the E9 ECM connector.

(c) Check the resistance.

Standard (RHD) (Check for open):

Tester Connection	Specified Condition
VPA1 (A20–5) – VPA (E9–22)	Below 1 Ω
EP1 (A20–1) – EPA (E9–28)	Below 1 Ω
VCP1 (A20–4) – VCPA (E9–26)	Below 1 Ω
VPA2 (A20–2) – VPA2 (E9–23)	Below 1 Ω
EP2 (A20–3) – EPA2 (E9–29)	Below 1 Ω
VCP2 (A20–6) – VCP2 (E9–27)	Below 1 Ω

Standard (LHD) (Check for open):

Tester Connection	Specified Condition
VPA1 (A20–5) – VPA (E9–22)	Below 1 Ω
EP1 (A20–3) – EPA (E9–28)	Below 1 Ω
VCP1 (A20–6) – VCPA (E9–26)	Below 1 Ω
VPA2 (A20–2) – VPA2 (E9–23)	Below 1 Ω
EP2 (A20–1) – EPA2 (E9–29)	Below 1 Ω
VCP2 (A20–4) – VCP2 (E9–27)	Below 1 Ω

Standard (RHD) (Check for short):

Tester Connection	Specified Condition
VPA1 (A20–5) or VPA (E9–22) – Body ground	10 kΩ or higher
EP1 (A20–1) or EPA (E9–28) – Body ground	10 kΩ or higher
VCP1 (A20–4) or VCPA (E9–26) – Body ground	10 kΩ or higher
VPA2 (A20–2) or VPA2 (E9–23) – Body ground	10 kΩ or higher
EP2 (A20–3) or EPA2 (E9–29) – Body ground	10 kΩ or higher
VCP2 (A20–6) or VCP2 (E9–27) – Body ground	10 kΩ or higher

Standard (LHD) (Check for short):

Tester Connection	Specified Condition
VPA1 (A20–5) or VPA (E9–22) – Body ground	10 kΩ or higher
EP1 (A20–3) or EPA (E9–28) – Body ground	10 kΩ or higher
VCP1 (A20–6) or VCPA (E9–26) – Body ground	10 kΩ or higher
VPA2 (A20–2) or VPA2 (E9–23) – Body ground	10 kΩ or higher
EP2 (A20–1) or EPA2 (E9–29) – Body ground	10 kΩ or higher
VCP2 (A20–4) or VCP2 (E9–27) – Body ground	10 kΩ or higher

(d) Reconnect the accelerator pedal position sensor connector.

(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6	CHECK IF DTC OUTPUT RECURS(ACCELERATOR PEDAL POSITION SENSOR DTCS)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Clear the DTC(s) (see page 05–18).
(d) Start the engine.
(e) Run the engine at idling speed for 15 seconds or more.
(f) Select the following menu items: Powertrain / Engine and ECT / DTC.
(g) Read DTCs (see page 05–18).

Result:

Display (DTC Output)	Proceed To
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138	A
No output	B

B → **NORMAL**

A

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

DTC	P2121	THROTTLE/PEDAL POSITION SENSOR/SWITCH ”D” CIRCUIT RANGE/PERFORMANCE

HINT:
This DTC is related to the accelerator pedal position sensor.

CIRCUIT DESCRIPTION

Refer to DTC P2120 on page 05–184.

DTC No.	DTC Detection Condition	Trouble Area
P2121	Conditions (a) and (b) continue for 0.5 seconds: (a) Difference between VPA1 and VPA2 exceeds the threshold (b) IDL is OFF	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor • ECM

HINT:
When DTC P2121 is detected, check the output voltage of the accelerator pedal position sensor by selecting Powertrain / Engine and ECT / Data List / Accelerator POS No. 1 and Accelerator POS No. 2 on the intelligent tester II.

Reference:

Trouble Area	Accelerator Pedal Position (Voltage Output)			
	Accelerator Pedal Released		Accelerator Pedal Depressed	
	Accelerator POS No. 1	Accelerator POS No. 2	Accelerator POS No. 1	Accelerator POS No. 2

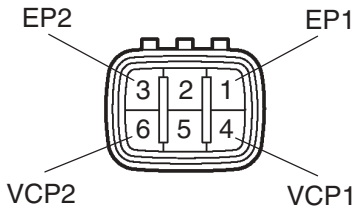
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
VPA circuit open or ground short	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
VPA2 circuit open or ground short	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V

WIRING DIAGRAM

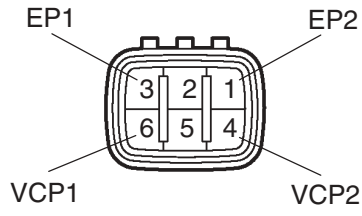


Refer to DTC P2120 on page 05–184.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester II. Freeze frame data record the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air–fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT ACCELERATOR PEDAL ASSY(ACCELERATOR PEDAL POSITION SENSOR)



Component Side (RHD):

Accelerator Pedal Position Sensor

A84814

Component Side (LHD):

Accelerator Pedal Position Sensor

A84814

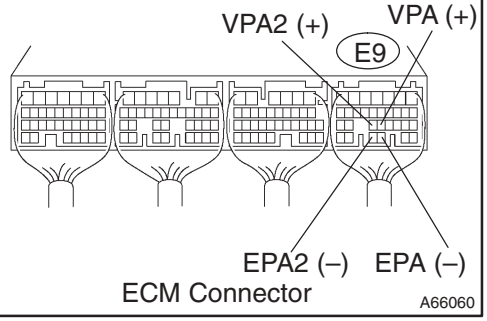
(a) Disconnect the A20 accelerator pedal position sensor connector.

(b) Measure the resistance between each pair of terminals.

Standard (RHD):

Tester Connection	Specified Condition
EP1 (1) – VCP1 (4)	2.25 to 4.75 kΩ at 20°C (68°F)
EP2 (3) – VCP2 (6)	2.25 to 4.75 kΩ at 20°C (68°F)

Standard (LHD):



Tester Connection	Specified Condition
EP1 (3) – VCP1 (6)	2.25 to 4.75 kΩ at 20°C (68°F)
EP2 (1) – VCP2 (4)	2.25 to 4.75 kΩ at 20°C (68°F)

(c) Reconnect the accelerator pedal position sensor connector.

NG → **REPLACE ACCELERATOR PEDAL ASSY (See page 10–12)**

OK

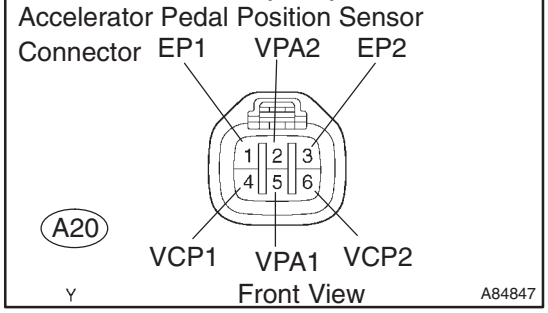
2 INSPECT ECM(VPA AND VPA2 VOLTAGE)

ECM Connector

A66060

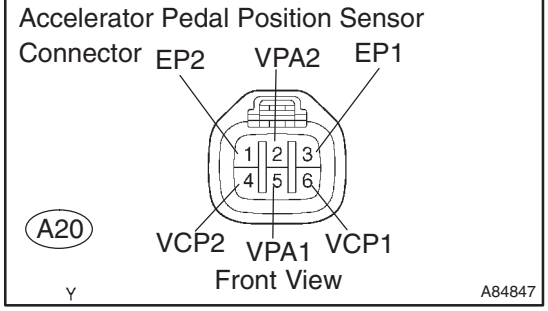
(a) Turn the ignition switch to ON.

(b) Measure the voltage between the specified terminals of the E9 ECM connector.

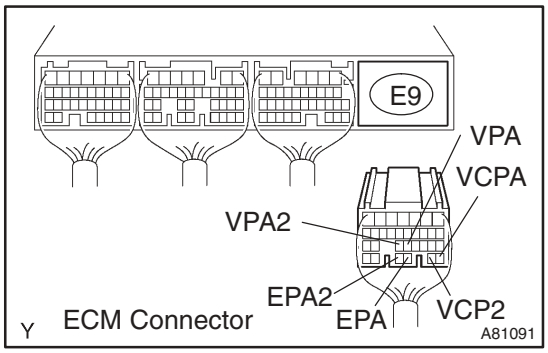


Accelerator Pedal Position	Tester Connection	Specified Condition
Released	VPA (E9–22) – EPA (E9–28)	0.5 to 1.1 V
Depressed	VPA (E9–22) – EPA (E9–28)	2.6 to 4.5 V
Released	VPA2 (E9–23) – EPA2 (E9–29)	1.2 to 2.0 V
Depressed	VPA2 (E9–23) – EPA2 (E9–29)	3.4 to 5.0 V

OK → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**



NG



3 CHECK HARNESS AND CONNECTOR(ACCELERATOR PEDAL POSITION SENSOR – ECM)

Wire Harness Side (RHD):

Wire Harness Side (LHD):

(a) Disconnect the A20 accelerator pedal position sensor connector.

(b) Disconnect the E9 ECM connector.

(c) Check the resistance.

Standard (RHD) (Check for open):

Tester Connection	Specified Condition
VPA1 (A20–5) – VPA (E9–22)	Below 1 Ω
EP1 (A20–1) – EPA (E9–28)	Below 1 Ω
VCP1 (A20–4) – VCPA (E9–26)	Below 1 Ω
VPA2 (A20–2) – VPA2 (E9–23)	Below 1 Ω
EP2 (A20–3) – EPA2 (E9–29)	Below 1 Ω
VCP2 (A20–6) – VCP2 (E9–27)	Below 1 Ω

Standard (LHD) (Check for open):

Tester Connection	Specified Condition
VPA1 (A20–5) – VPA (E9–22)	Below 1 Ω
EP1 (A20–3) – EPA (E9–28)	Below 1 Ω
VCP1 (A20–6) – VCPA (E9–26)	Below 1 Ω
VPA2 (A20–2) – VPA2 (E9–23)	Below 1 Ω
EP2 (A20–1) – EPA2 (E9–29)	Below 1 Ω
VCP2 (A20–4) – VCP2 (E9–27)	Below 1 Ω

Standard (RHD) (Check for short):

Tester Connection	Specified Condition
VPA1 (A20–5) or VPA (E9–22) – Body ground	10 kΩ or higher
EP1 (A20–1) or EPA (E9–28) – Body ground	10 kΩ or higher
VCP1 (A20–4) or VCPA (E9–26) – Body ground	10 kΩ or higher
VPA2 (A20–2) or VPA2 (E9–23) – Body ground	10 kΩ or higher
EP2 (A20–3) or EPA2 (E9–29) – Body ground	10 kΩ or higher
VCP2 (A20–6) or VCP2 (E9–27) – Body ground	10 kΩ or higher

Standard (LHD) (Check for short):

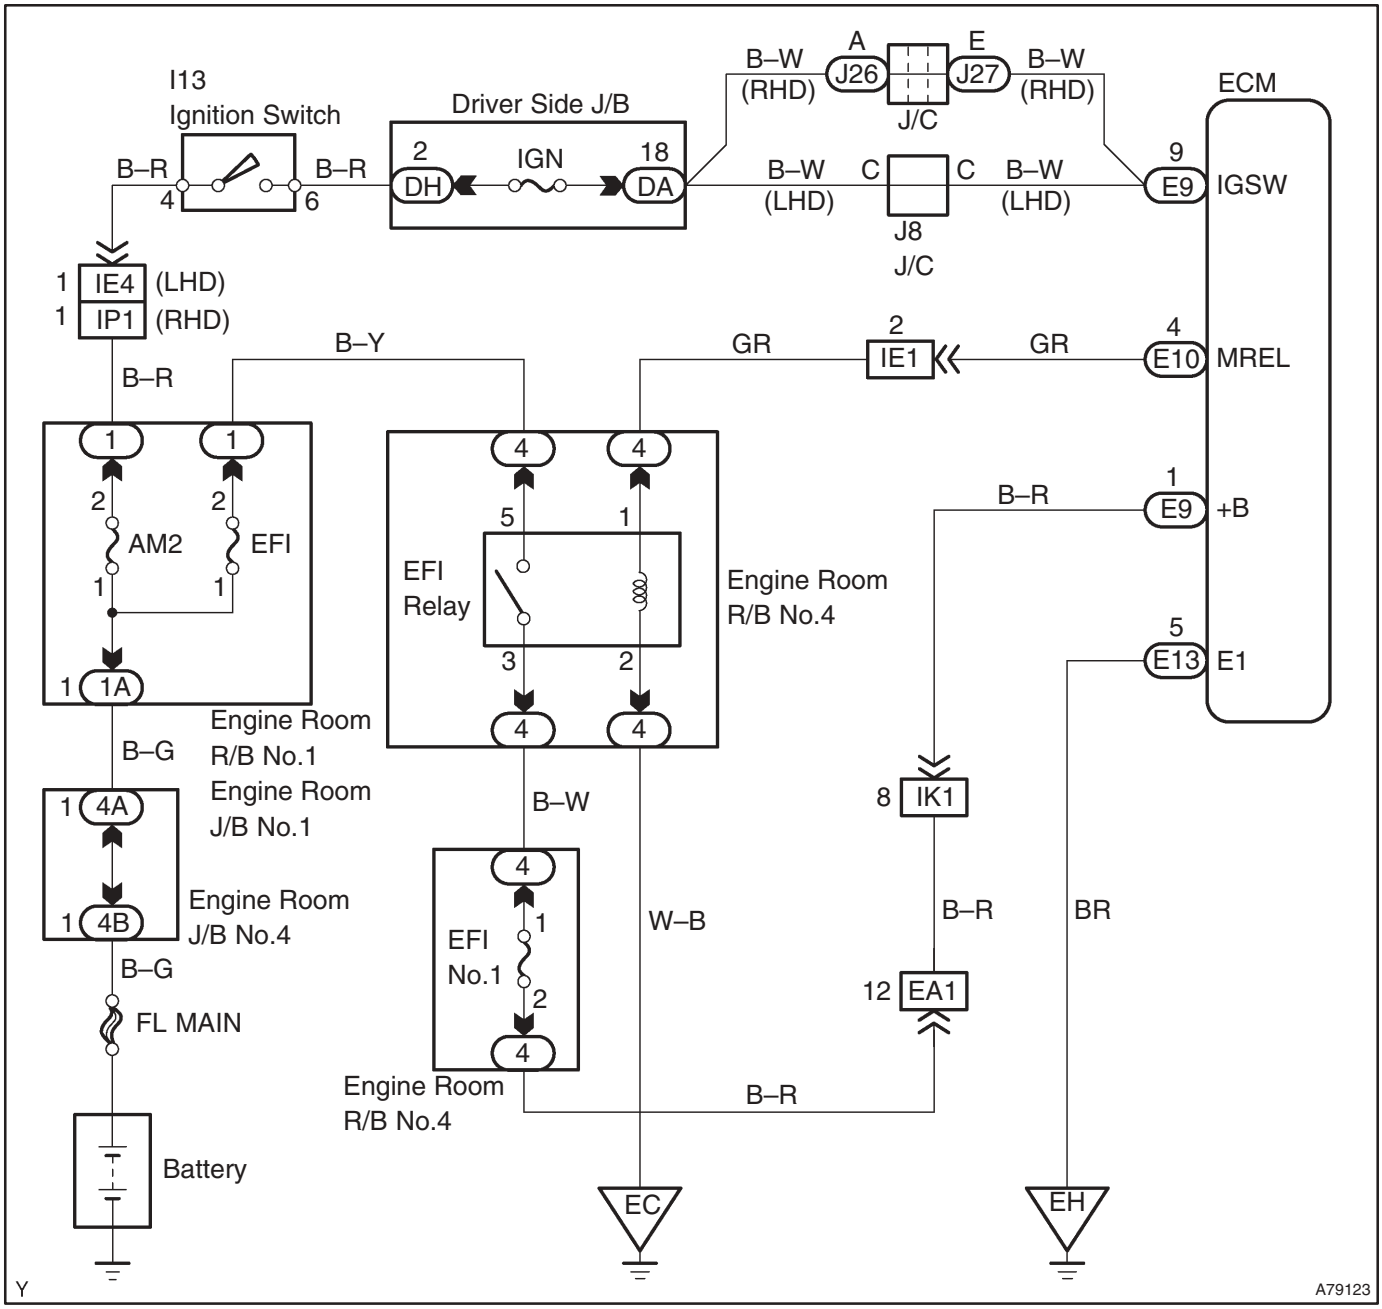
Tester Connection	Specified Condition
VPA1 (A20–5) or VPA (E9–22) – Body ground	10 kΩ or higher
EP1 (A20–3) or EPA (E9–28) – Body ground	10 kΩ or higher
VCP1 (A20–6) or VCPA (E9–26) – Body ground	10 kΩ or higher
VPA2 (A20–2) or VPA2 (E9–23) – Body ground	10 kΩ or higher
EP2 (A20–1) or EPA2 (E9–29) – Body ground	10 kΩ or higher
VCP2 (A20–4) or VCP2 (E9–27) – Body ground	10 kΩ or higher

(d) Reconnect the accelerator pedal position sensor connector.

(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

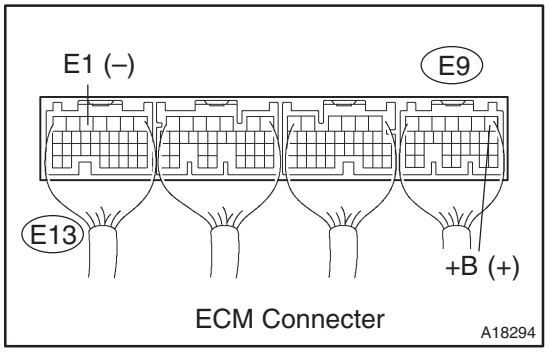
OK



REPLACE ACCELERATOR PEDAL ASSY (See page 10–12)

ECM POWER SOURCE CIRCUIT

CIRCUIT DESCRIPTION

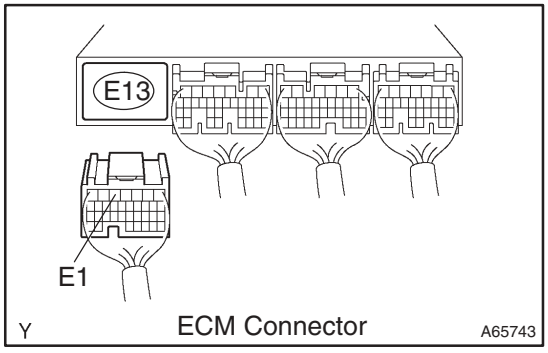


When the ignition switch is turned to ON, the battery voltage is applied to terminal IGSW of the ECM. The ECM "MREL" output signal causes a current to flow to the coil, closing the contacts of the EFI relay and supplying power to terminal +B of the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT ECM(+B VOLTAGE)



(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E9 and E13 ECM connectors.
Standard:

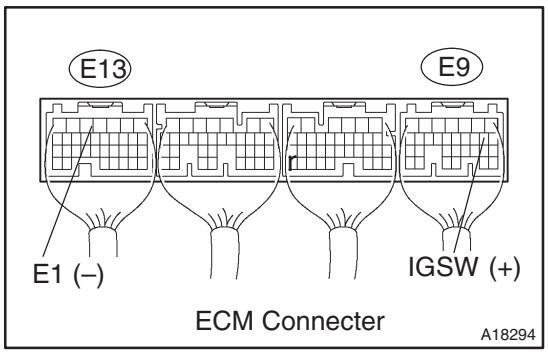
Tester Connection	Specified Condition
+B (E9–1) – E1 (E13–5)	9 to 14 V

OK → **PROCEED TO NEXT CIRCUIT INSPECTION SHOWN ON PROBLEM SYMPTOMS TABLE (See page 05–12)**

NG

2 CHECK HARNESS AND CONNECTOR(ECM – BODY GROUND)

(a) Disconnect the negative (–) battery cable.
(b) Disconnect the E13 ECM connector.
(c) Check the resistance.
Standard (Check for open):



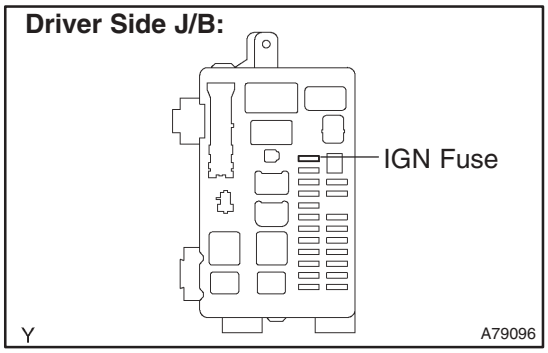
Tester Connection	Specified Condition
E1 (E13–5) – Body ground	Below 1 Ω

(d) Reconnect the ECM connector.
(e) Reconnect the negative battery cable.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 INSPECT ECM(IGSW VOLTAGE)



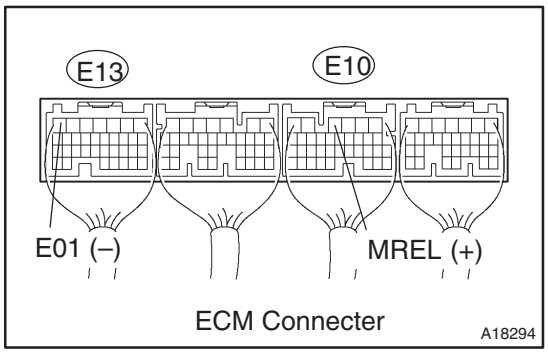
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E9 and E13 ECM connectors.
Standard:

Tester Connection	Specified Condition
IGSW (E9–9) – E1 (E13–5)	9 to 14 V

OK → **Go to step 5**

NG

4 CHECK FUSE(IGN FUSE)



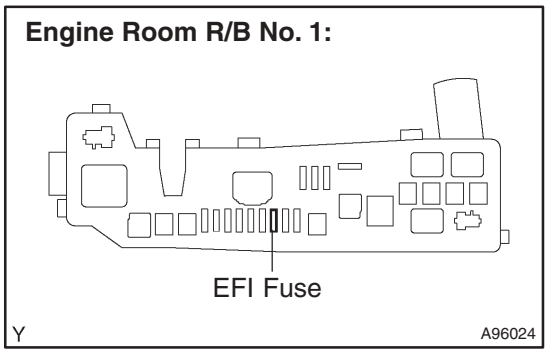
(a) Remove the IGN fuse from the driver side J/B.
(b) Check the IGN fuse resistance.
Standard: Below 1 Ω
(c) Reinstall the IGN fuse.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

OK

CHECK AND REPAIR HARNESS AND CONNECTOR (BATTERY – ECM)

5 INSPECT ECM(MREL VOLTAGE)



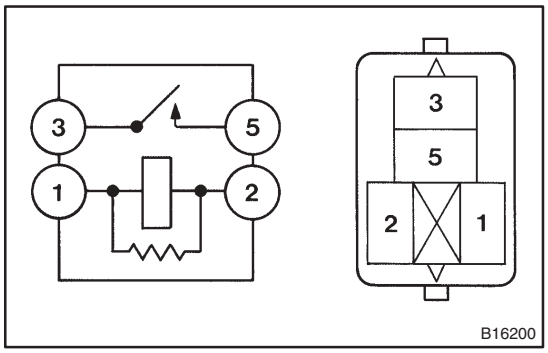
(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E10 and E13 ECM connectors.
Standard:

Tester Connection	Specified Condition
MREL (E10–4) – E01 (E13–7)	9 to 14 V

NG → **REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)**

OK

6 CHECK FUSE(EFI FUSE)



(a) Remove the EFI fuse from the engine room R/B No. 1.
(b) Check the EFI fuse resistance.
Standard: Below 1 Ω
(c) Reinstall the EFI fuse.

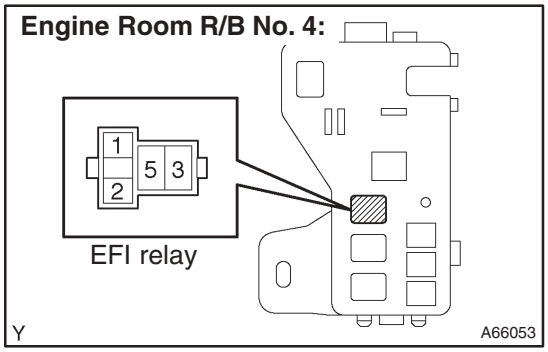
NG → **CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE**

OK

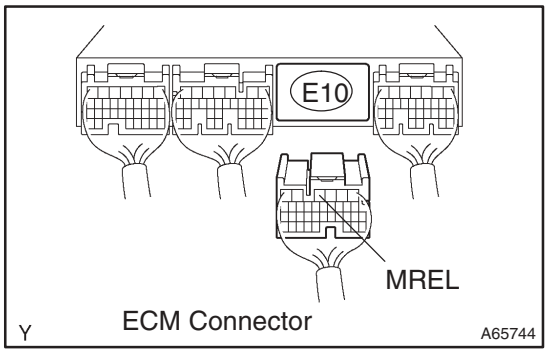
7 INSPECT EFI RELAY

(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Check the EFI relay resistance.

Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)



(c) Reinstall the EFI relay.

NG → **REPLACE EFI RELAY**

OK

8 CHECK HARNESS AND CONNECTOR(EFI RELAY – ECM, EFI RELAY – BODY GROUND)

(a) Check the harness and connectors between the EFI relay and the ECM connector.
(1) Remove the EFI relay from the engine room R/B No. 4.
(2) Disconnect the E10 ECM connector.
(3) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
EFI relay (1) – MREL (E10–4)	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
EFI relay (1) or MREL (E10–4) – Body ground	10 kΩ or higher

(4) Reinstall the EFI relay.
(5) Reconnect the ECM connector.

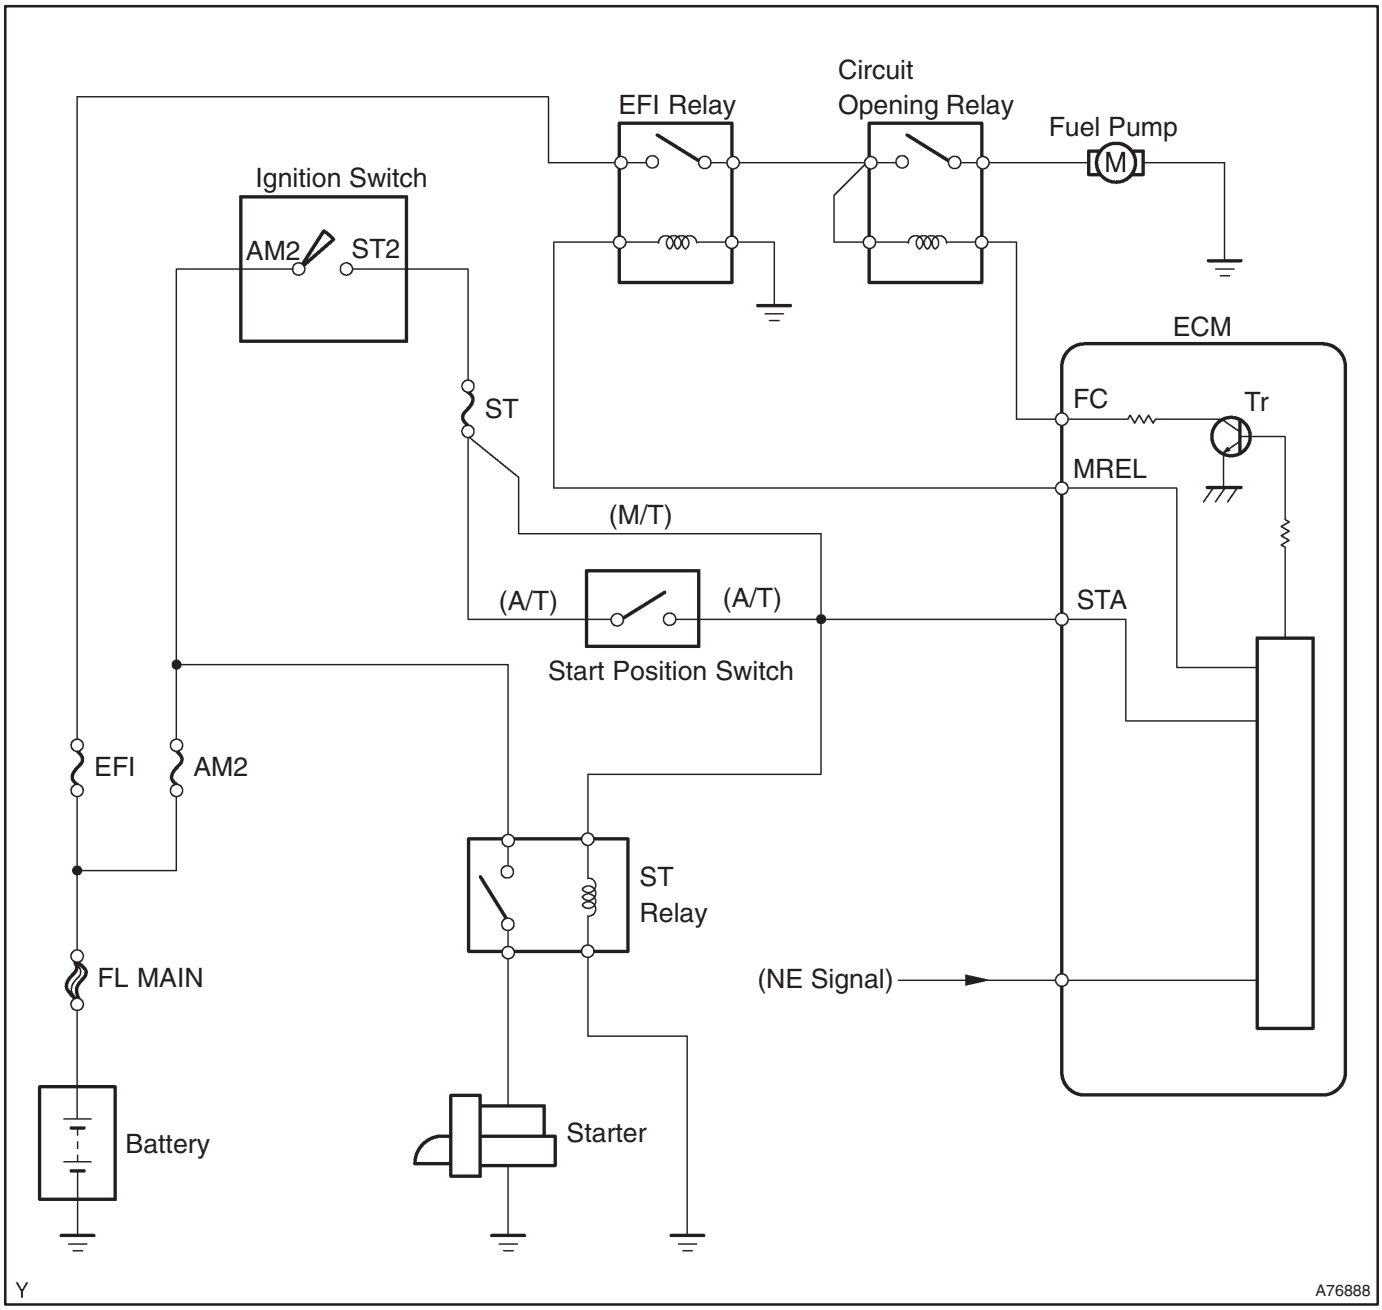
(b) Check the harness and connector between the EFI relay and the body ground.
(1) Remove the EFI relay from the engine room R/B No. 4.
(2) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
EFI relay (2) – Body ground	Below 1 Ω

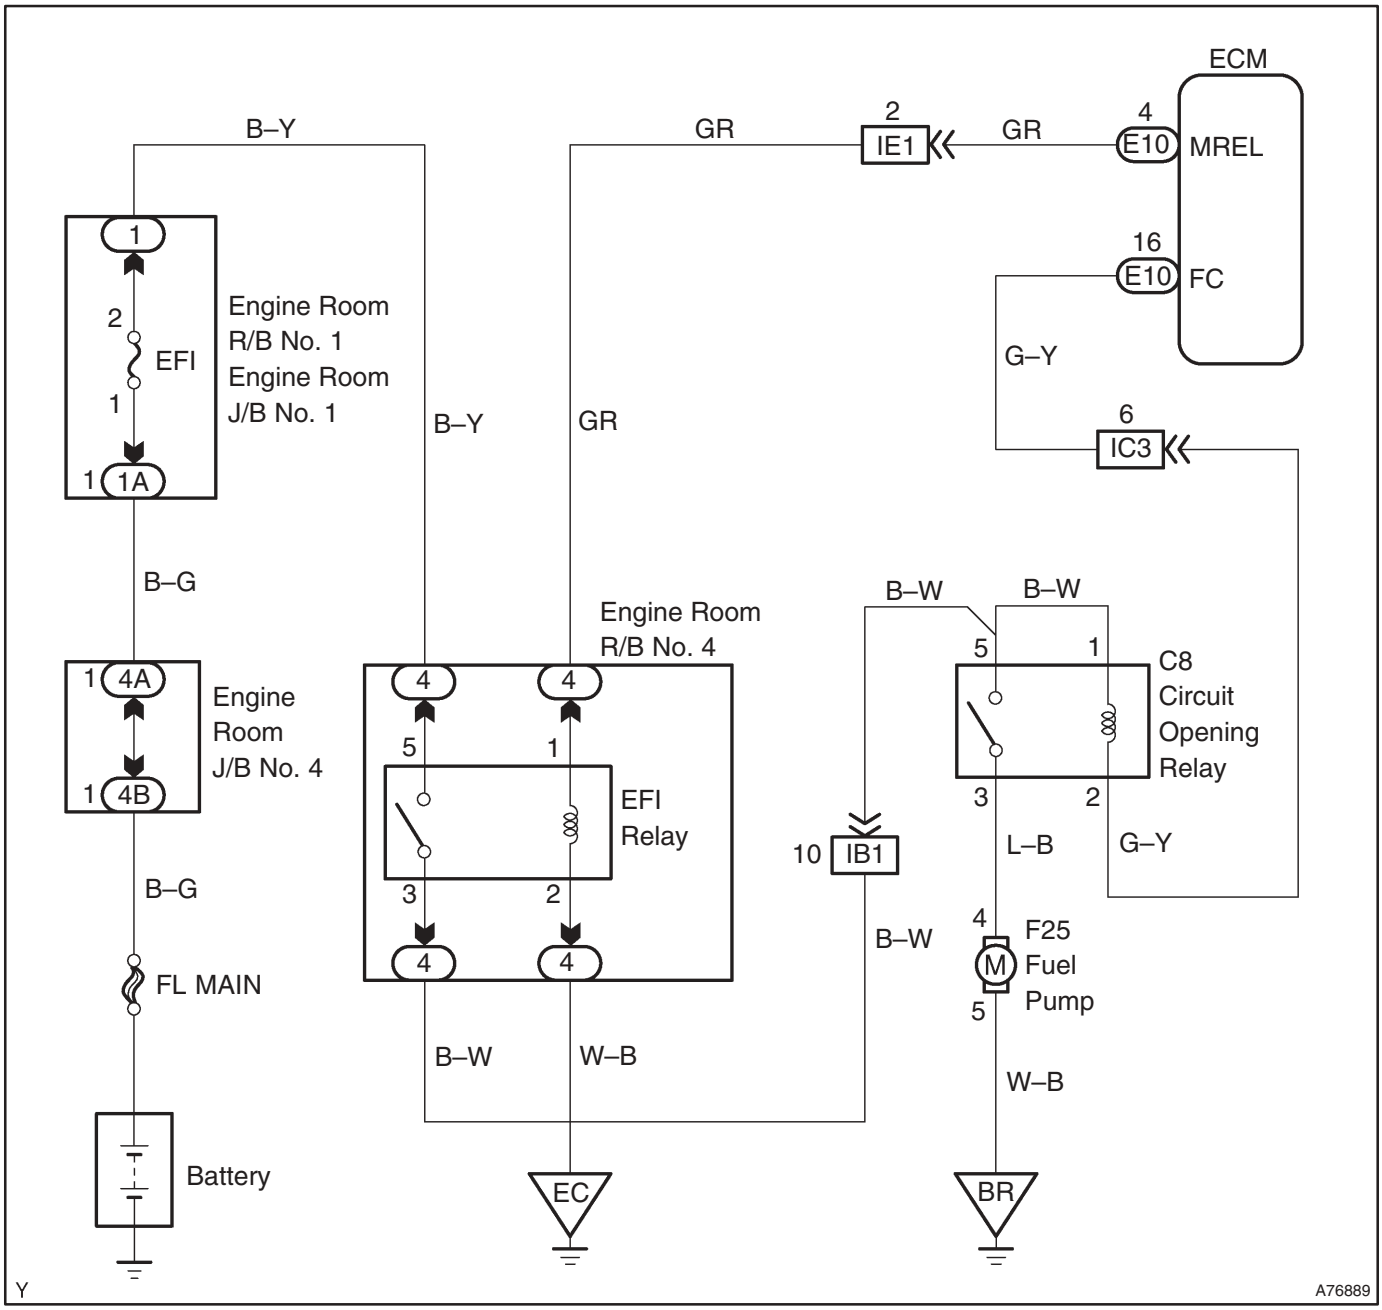
(3) Reinstall the EFI relay.

OK → **REPAIR OR REPLACE HARNESS OR CONNECTOR**



NG

CHECK AND REPAIR HARNESS AND CONNECTOR (TERMINAL +B OF ECM – BATTERY POSITIVE TERMINAL)



FUEL PUMP CONTROL CIRCUIT

CIRCUIT DESCRIPTION

In the diagram below, when the engine is cranked, a current flows from terminal ST2 of the ignition switch to the starter relay coil and also a current flows to terminal STA of the ECM (STA signal).
When the STA signal and NE signal are transmitted to the ECM, the power transistor (Tr) is turned ON, a current flows to the coil of the circuit opening relay, the relay switches on, the power is supplied to the fuel pump and the fuel pump operates.
While the NE signal is generated (when engine running), the ECM keeps Tr ON (circuit opening relay ON) and the fuel pump also keeps operating.

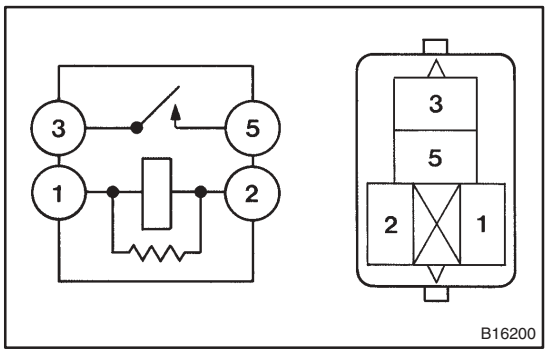
WIRING DIAGRAM

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER II(OPERATE CIRCUIT OPENING RELAY)

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / Active Test / Fuel Pump Relay.
(d) Check the operation of the relay while operating it using the intelligent tester II.
Standard: Operating sounds can be heard from the relay.

OK	PROCEED TO NEXT CIRCUIT INSPECTION SHOWN ON PROBLEM SYMPTOMS TABLE (See page 05–12)



NG

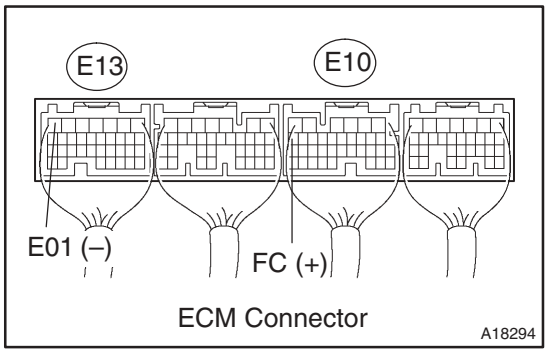
2	CHECK ECM POWER SOURCE CIRCUIT (See page 05–195)

NG	REPAIR OR REPLACE POWER SOURCE CIRCUIT

OK

3	INSPECT CIRCUIT OPENING RELAY

(a) Remove the C8 circuit opening relay.
(b) Check the circuit opening relay resistance.
Standard:



Tester Connection	Specified Condition
3 – 5	10 kΩ or higher
3 – 5	Below 1 Ω (Apply battery voltage to terminals 1 and 2)

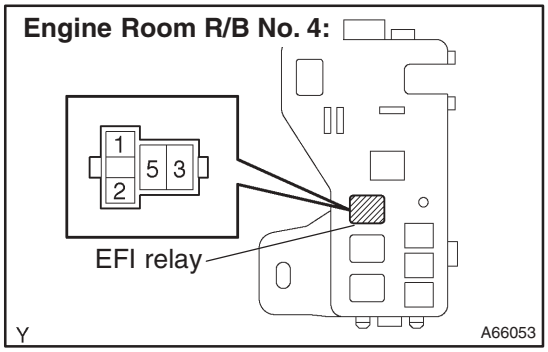
(c) Reinstall the circuit opening relay.

NG	REPLACE CIRCUIT OPENING RELAY

OK

4 INSPECT ECM(FC VOLTAGE)

(a) Turn the ignition switch to ON.
(b) Measure the voltage between the terminals of the E10 and E13 ECM connectors.



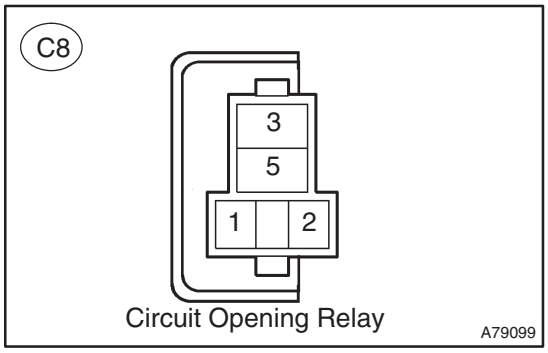
Standard:

Tester Connection	Specified Condition
FC (E10–16) – E01 (E13–7)	9 to 14 V

OK → **Go to step 6**

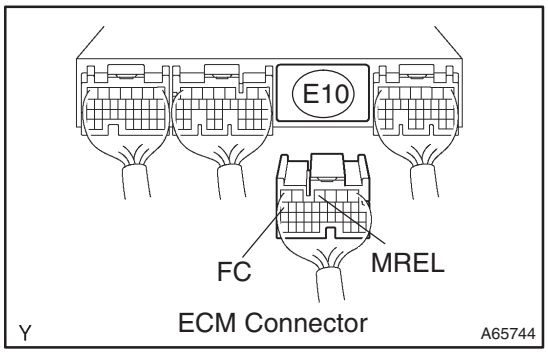
NG

5 CHECK HARNESS AND CONNECTOR(EFI RELAY – ECM, CIRCUIT OPENING RELAY – ECM, EFI RELAY – CIRCUIT OPENING RELAY)



(a) Remove the EFI relay from the engine room R/B No. 4.
(b) Remove the C8 circuit opening relay.
(c) Disconnect the E10 ECM connector.
(d) Check the resistance.

Standard (Check for open):



Tester Connection	Specified Condition
Engine room R/B No. 4 (EFI relay terminal 1) – MREL (E10–4)	Below 1 Ω
Circuit opening relay (C8–2) – FC (E10–16)	Below 1 Ω
Engine room R/B No. 4 (EFI relay terminal 3) – Circuit opening relay (C8–5)	Below 1 Ω

Standard (Check for short):

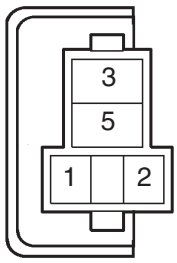
Tester Connection	Specified Condition
Engine room R/B No. 4 (EFI relay terminal 1) or MREL (E10–4) – Body ground	10 kΩ or higher
Circuit opening relay (C8–2) or FC (E10–16) – Body ground	10 kΩ or higher
Engine room R/B No. 4 (EFI relay terminal 3) or Circuit opening relay (C8–5) – Body ground	10 kΩ or higher

(e) Reinstall the EFI relay.
(f) Reinstall the circuit opening relay.
(g) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)



6	INSPECT FUEL PUMP (See page 11–9 of Pub. No. RM1018E AVENSIS)

NG → REPAIR OR REPLACE FUEL PUMP

OK

7	CHECK HARNESS AND CONNECTOR(CIRCUIT OPENING RELAY – FUEL PUMP, FUEL PUMP – BODY GROUND)

C8

Circuit Opening Relay

A79099

(a) Remove the C8 circuit opening relay.
(b) Disconnect the F25 fuel pump connector.
(c) Check the resistance.

Standard (Check for open):

Tester Connection	Specified Condition
Circuit opening relay (C8–3) – Fuel pump (F25–4)	Below 1 Ω
Fuel pump (F25–5) – Body ground	Below 1 Ω

Standard (Check for short):

Tester Connection	Specified Condition
Circuit opening relay (C8–3) or Fuel pump (F25–4) – Body ground	10 kΩ or higher

(d) Reinstall the circuit opening relay.
(e) Reconnect the fuel pump connector.

Wire Harness Side:

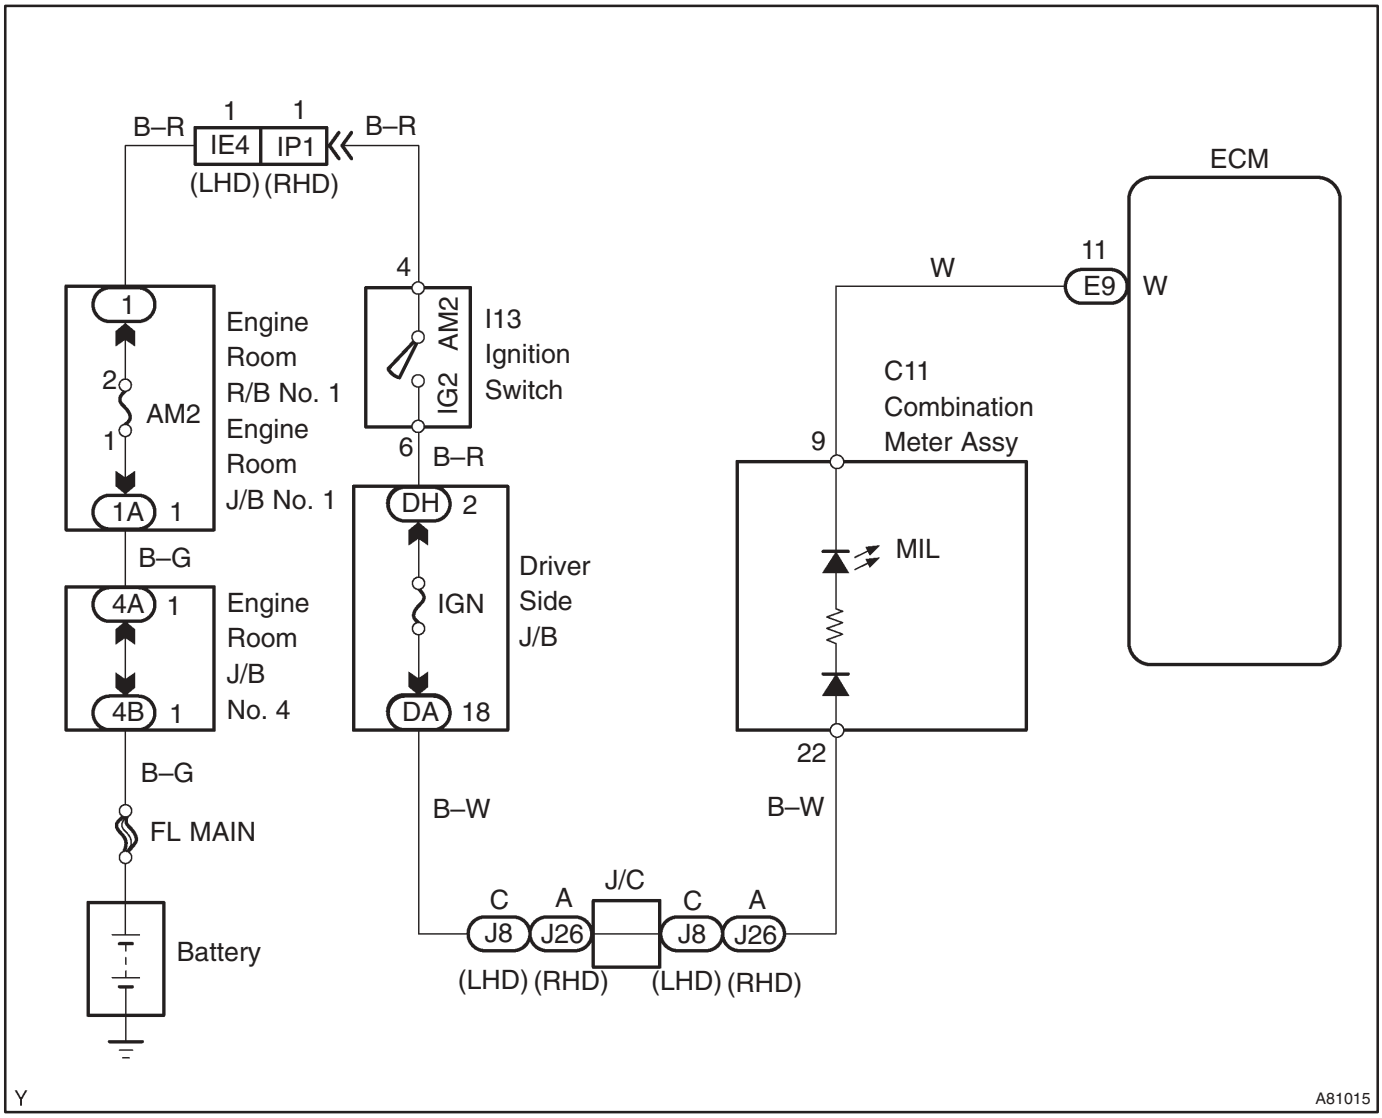
F25 Fuel Pump Connector

Front View

A66276

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

MIL CIRCUIT

CIRCUIT DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate the ECM detection of vehicle malfunctions.
By turning the ignition switch to ON, the power is supplied to the MIL circuit, and the ECM provides the circuit ground that illuminates the MIL.
Operation of the MIL should be checked visually:
When the ignition switch is first turned to ON, the MIL should be illuminated. If it is always OFF or ON, use the intelligent tester II and follow the procedure below to determine cause of the problem.

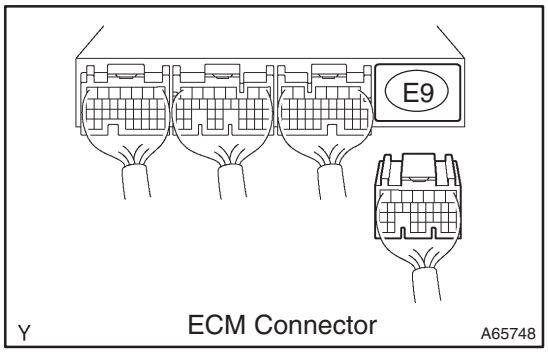
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Troubleshoot each trouble symptom in accordance with the chart below.

Reference:

Result	Proceed To
MIL remains on	Start inspection from step 1
MIL is not illuminated	Start inspection from step 3



1	CHECK IF MIL TURNS OFF

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester II ON.
(c) Select the following menu items: Powertrain / Engine and ECT / DTC.
(d) Check if DTCs have been stored. Note down if there are DTCs.
(e) Select the following menu items: Powertrain / Engine and ECT / DTC / Clear.
(f) Clear the DTC(s).
(g) Check if the MIL turns off.
Standard: The MIL should turn off.

OK	REPAIR CIRCUIT INDICATED BY OUTPUT DTC (See page 05–27)

NG

2	CHECK HARNESS AND CONNECTOR(CHECK FOR SHORT IN WIRE HARNESS)

(a) Disconnect the E9 ECM connector.
(b) Turn the ignition switch to ON.
(c) Check that the MIL is not illuminated.
Standard: MIL is not illuminated.
(d) Reconnect the ECM connector.

OK	REPLACE ECM (See page 10–65 of Pub. No. RM1018E AVENSIS)

NG

CHECK AND REPAIR HARNESS AND CONNECTOR

3	CHECK IF MIL ILLUMINATES

(a) Check if the MIL illuminates when turning the ignition switch to ON.
Standard: The MIL should illuminate.

OK	NORMAL

NG

4	INSPECT COMBINATION METER ASSY(MIL CIRCUIT)

(a) See the combination meter troubleshooting procedure on page 05–1510 of Pub. No. RM1018E AVENSIS.

NG → REPAIR OR REPLACE BULB OR COMBINATION METER ASSEMBLY

OK

CHECK AND REPAIR HARNESS AND CONNECTOR (COMBINATION METER – ECM)

ELECTRONIC CONTROLLED AUTOMATIC TRANSAXLE [ECT] (U341E) (From February, 2004)

05CVL–07

PRECAUTION

NOTICE:

Perform the RESET MEMORY (AT initialization) when replacing the automatic transaxle assy, engine assy or ECM (see page 05–225).

HINT:

Initialization can not be completed by only disconnecting the battery terminal.

05KAJ–01

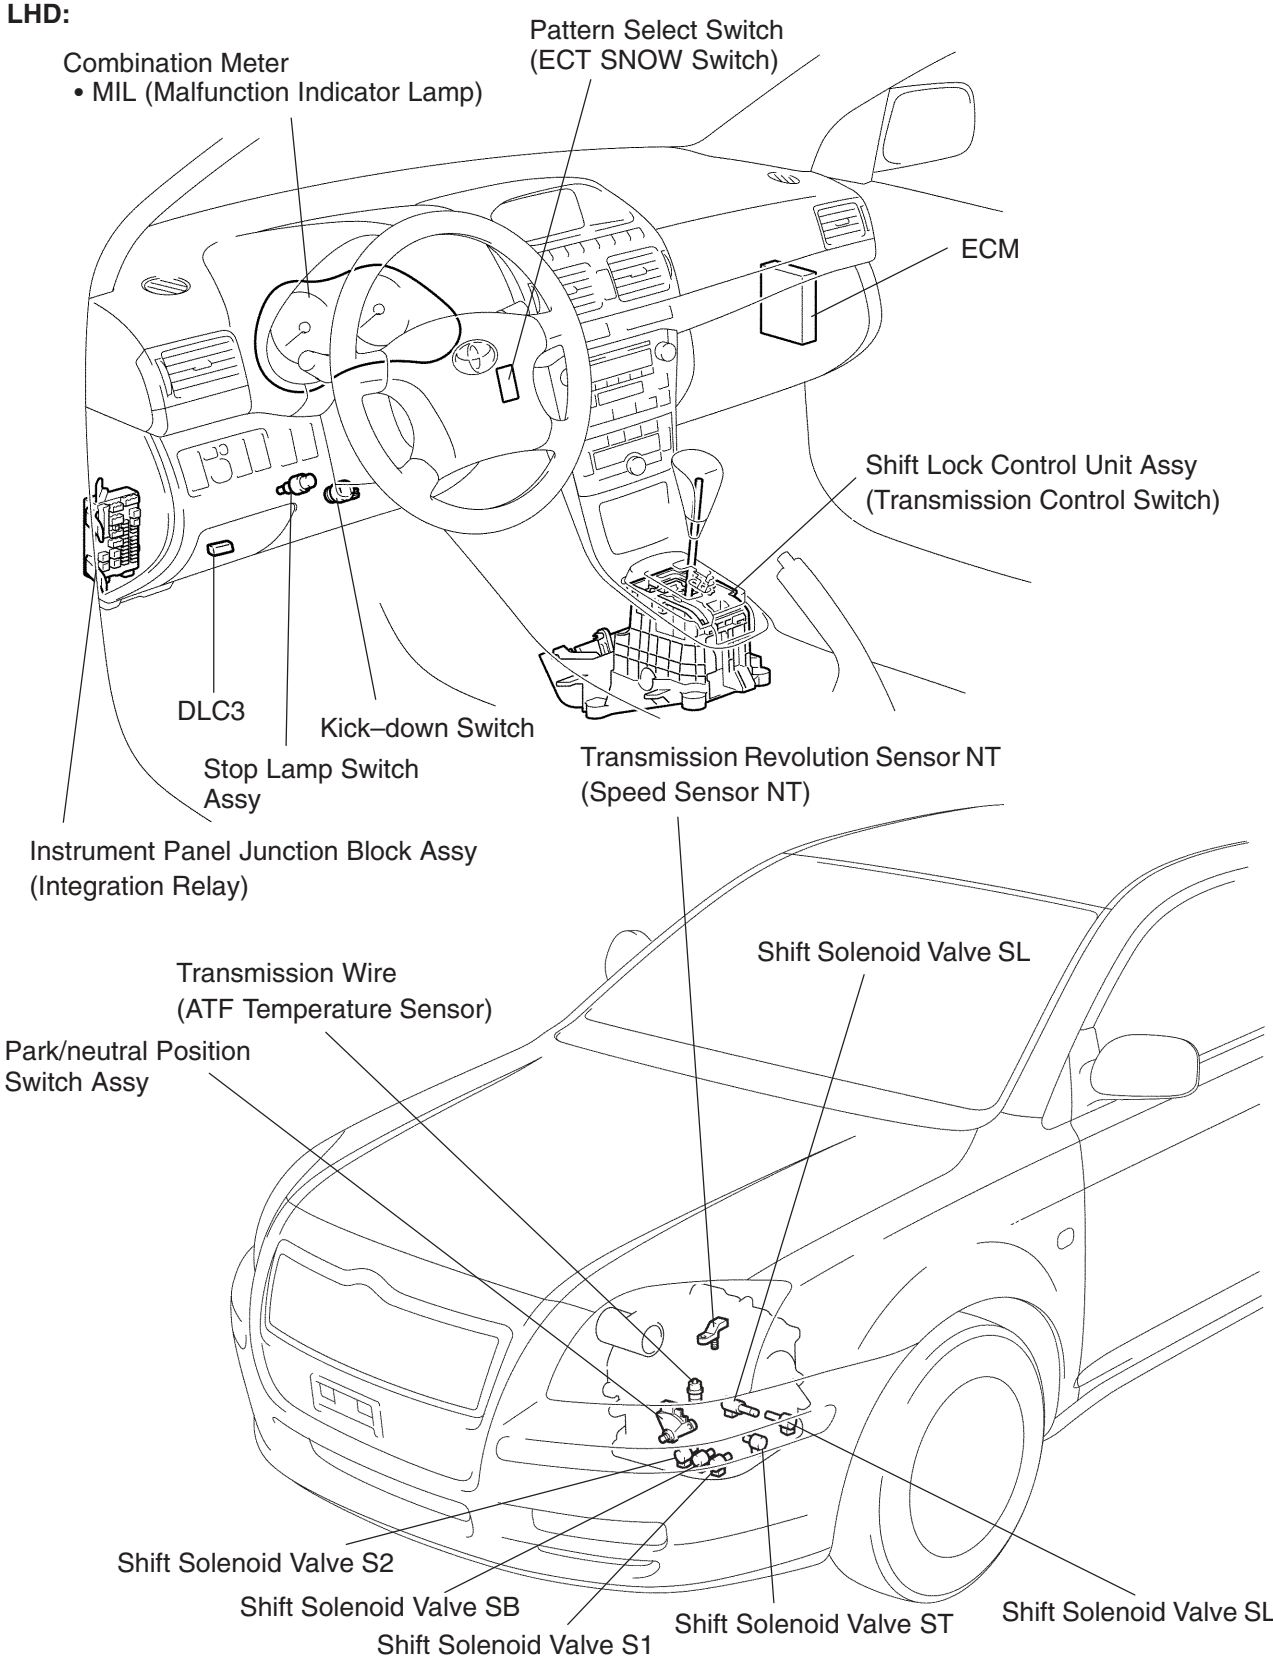
DEFINITION OF TERMS

Term	Definition
Monitor description	Description of what the ECM monitors and how it detects malfunctions (monitoring purpose and its details).

05KAK–01

PART AND SYSTEM NAME LIST

This reference list indicates the part names used in this manual along with their definitions.



Part and system name	Definition
Toyota HCAC system, Hydrocarbon adsorptive Catalyst (HCAC) system, HC adsorptive three–way catalyst	HC adsorptive three–way catalytic converter
Variable Valve Timing sensor, VVT sensor	Camshaft position sensor
Variable valve timing system, VVT system	Camshaft timing control system
Camshaft timing oil control valve, Oil control valve OCV, VVT, VSV	Camshaft timing oil control valve
Variable timing and lift, VVTL	Camshaft timing and lift control
Crankshaft position sensor ”A”	Crankshaft position sensor
Engine speed sensor	Crankshaft position sensor
THA	Intake air temperature
Knock control module	Engine knock control module
Knock sensor	Engine knock sensor
Mass or volume air flow circuit	Mass air flow sensor circuit
Vacuum sensor	Manifold air pressure sensor
Internal control module, Control module, Engine control ECU, PCM	Power train control module
FC idle	Deceleration fuel cut
Idle air control valve	Idle speed control
VSV for CCV, Canister close valve VSV for canister control	Evaporative emissions canister vent valve
VSV for EVAP, Vacuum switching valve assembly No. 1, EVAP VAV, Purge VSV	Evaporative emissions canister purge valve
VSV for pressure switching valve, Bypass VSV	Evaporative emission pressure switching valve
Vapor pressure sensor, EVAP pressure sensor, Evaporative emission control system pressure sensor	Fuel tank pressure sensor
Charcoal canister	Evaporative emissions canister
ORVR system	On–boad refueling vapor recovery system
Intake manifold runner control	Intake manifold tuning system
Intake manifold runner valve, IMRV, IACV (runner valve)	Intake manifold tuning valve
Intake control VSV	Intake manifold tuning solenoid valve
AFS	Air fuel ratio sensor
O2 sensor	Heater oxygen sensor
Oxygen sensor pumping current circuit	Oxygen sensor output signal
Oxygen sensor reference ground circuit	Oxygen sensor signal ground
Accel position sensor	Accelerator pedal position sensor
Throttle actuator control motor, Actuator control motor, Electronic throttle motor, Throttle control motor	Electronic throttle actuator
Electronic throttle control system, Throttle actuator control system	Electronic throttle control system
Throttle/pedal position sensor, Throttle/pedal position switch, Throttle position sensor/switch	Throttle position sensor
Turbo press sensor	Turbocharger pressure sensor
Turbo VSV	Turbocharger pressure control solenoid valve
P/S pressure switch	Power–steering pressure switch
VSV for ACM	Active control engine mount
Speed sensor, Vehicle speed sensor ”A”, Speed sensor for skid control ECU	Vehicle speed sensor
ATF temperature sensor, Trans. fluid temp. sensor, ATF temperature sensor ”A”	Transmission fluid temperature sensor
Electronic controlled automatic transmission, ECT	Electronically controlled automatic
Intermediate shaft speed sensor ”A”	Couter gear speed sensor

Part and system name	Definition
Output speed sensor	Output shaft speed sensor
Input speed sensor, Input turbine speed sensor ”A”, Speed sensor (NT), Turbine speed sensor	Input turbine speed sensor
PNP switch, NSW	Park/neutral position switch
Pressure control solenoid	Transmission pressure control solenoid
Shift solenoid	Transmission shift solenoid valve
Transmission control switch, Shift lock control unit	Shift lock control module
Engine immobilizer system, Immobilizer system	Vehicle anti–theft system

05KAM–02

SYSTEM DIAGRAM

The configuration of the electronic control system in the U341E automatic transaxles is as shown in the following chart.

05KAN–01

SYSTEM DESCRIPTION

1. SYSTEM DESCRIPTION

(a) The ECT (Electronic controlled automatic transmission/transaxle) is an automatic transmission/transaxle that electronically controls shift timing using the ECM. The ECM detects electrical signals that indicate engine and driving conditions, controls the shift point, and selects the appropriate shift pattern based on driver habits and road conditions. As a result, fuel efficiency and power transmission/transaxle performance are improved.

Shift shock has been reduced by controlling the engine and transmission/transaxle simultaneously.

In addition, the ECT has the following features:

- Diagnostic function.
- Fail–safe function when a malfunction occurs.

056IH–10

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:

- The intelligent tester II can be used at steps 3, 4, 6, and 9.

1	Vehicle Brought to Workshop

2	Customer Problem Analysis (SEE PAGE 05–218)

3	Connect the intelligent tester II to DLC3

4	Check and Clear DTC and Freeze Frame Data (SEE PAGE 05–239)

5	Visual Inspection

6	Setting the Check Mode Diagnosis (SEE PAGE 05–240)

7	Problem Symptom Confirmation (SEE PAGE 05–219)

- Symptom does not occur: Go to step 8
- Symptom occur: Go to step 9

8	Symptom Simulation (SEE PAGE 01–22)

9	DTC Check (SEE PAGE 05–239)

- DTC is not output: Go to step 10
- DTC is output: Go to step 17

10	Basic Inspection (See Pub. No. RM1018E, page 40–2, 40–8 and 40–69)

NG → Go to step 19

OK

11	Mechanical System Test (SEE PAGE 05–221)

NG → Go to step 16

OK

12	Hydraulic Test (SEE PAGE 05–223)

NG → Go to step 16

OK

13	Manual Shifting Test (SEE PAGE 05–224)

NG → Go to step 15

OK

14	Problem Symptoms Table Chapter 1 (SEE PAGE 05–229)

NG → Go to step 18

OK

15	Problem Symptoms Table Chapter 2 (SEE PAGE 05–229)

16	Part Inspection

→ Go to step 19

17	DTC Chart (SEE PAGE 05–245)

18	Circuit Inspection

19	Repair or Replace

20	Confirmation Test

End

056II–07

CUSTOMER PROBLEM ANALYSIS CHECK

Automatic Transaxle System Check Sheet

Inspector's Name :

Customer's Name		VIN	
		Production Date	/ /
		Licence Plate No.	
Date Vehicle Brought In	/ /	Odometer Reading	km mile

Date Problem Occurred	/ /
How Often Does Problem Occur?	☐ Continuous ☐ Intermittent (times a day)

Symptoms	☐ Vehicle does not move (☐ Any position ☐ Particular position)
	☐ No up–shift (☐ 1st → 2nd ☐ 2nd → 3rd ☐ 3rd → O/D)
	☐ No down–shift (☐ O/D → 3rd ☐ 3rd → 2nd ☐ 2nd → 1st)
	☐ Lock–up malfunction
	☐ Shift point too high or too low
	☐ Harsh engagement (☐ N → D ☐ Lock–up ☐ Any drive position)
	☐ Slip or shudder
	☐ No kick–down
	☐ Others ( )

Check Item	MIL	☐ Normal ☐ Remains ON

DTC Check	1st Time	☐ Normal code ☐ Malfunction code (DTC)
	2nd Time	☐ Normal code ☐ Malfunction code (DTC)

05KAO–02

ROAD TEST

1. PROBLEM SYMPTOM CONFIRMATION

(a) Based on the result of the customer problem analysis, try to reproduce the symptoms. If the problem is that the transaxle does not shift up, shift down, or the shift point is too high or too low, conduct the following road test referring to the automatic shift schedule and simulate the problem symptoms.

2. ROAD TEST

NOTICE:

Perform the test at the ATF (Automatic Transmission Fluid) temperature 50 to 80˚C (122 to 176˚F) in the normal operation.

(a) D position test:

Shift into the D position and fully depress the accelerator pedal and check the following points.

(1) Check up–shift operation.

Check that 1 → 2, 2 → 3 and 3 → 4 up–shifts take place, and that the shift points conform to the automatic shift schedule (See Pub. No. RM1018E, page 03–45).

HINT:

4th Gear Up–shift Prohibition Control

- Engine coolant temperature is 60 ˚C (140 ˚F) or less and vehicle speed is at 70 km/h (43 mph) or less.
- ATF temperature is 10 ˚C (50 ˚F) or less.

4th and 3rd Gear Lock–up Prohibition Control

- Brake pedal is depressed.
- Accelerator pedal is released.
- ATF temp. is 10˚C (50˚F) or less.
- Engine coolant temperature is 60 ˚C (140 ˚F) or less.

(2) Check for shift shock and slip.

Check for shock and slip at the 1 → 2, 2 → 3 and 3 → 4 up–shifts.

(3) Check for abnormal noise and vibration.

Check for abnormal noise and vibration when up–shifting from 1 → 2, 2 → 3 and 3 → 4 while driving with the shift lever in the D position, and check while driving in the lock–up condition.

HINT:

The check for the cause of abnormal noise and vibration must be done thoroughly as it could also be due to loss of balance in the differential, torque converter clutch, etc.

(4) Check kick–down operation.

Check vehicle speeds when the 2nd to 1st, 3rd to 2nd and 4th to 3rd kick–downs take place while driving with the shift lever in the D position. Confirm that each speed is within the applicable vehicle speed range indicated in the automatic shift schedule (See Pub. No. RM1018E, page 03–45).

(5) Check for abnormal shock and slip at kick–down.

(6) Check the lock–up mechanism.

- Drive in D position (4th gear), at a steady speed (lock–up ON).
- Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

- There is no lock–up function in the 1st and 2nd gear.
- If there is a big jump in engine speed, there is no lock–up.

(b) S position test

Shift to the S position, depress the accelerator pedal and check the following points:

(1) Check shift operation.

- While driving in the D position and 4th gear, shift into the S position and back to the D position. Check that the gear change 4 → 3 down–shift and 3 → 4 up–shift can be performed.
- With the shift lever in the S position (while the vehicle is stopped), shift into the "+" position to check that the shift position on the combination meter changes as follows: 1 → 2, 2 → 3 and 3 → 4.
- While driving in the 3(S) position and 3rd gear (at a vehicle speed of approximately 30 to 40 km/h (19 to 25 mph)), shift into the "–" position and check if the 2nd gear down–shift occurs and the engine brake performs properly.
- While driving in the 2(S) position and 2nd gear (at a vehicle speed of approximately 20 to 30 km/h (12 to 19 mph)), shift into the "–" position and check if the 1st gear down–shift occurs and the engine brake performs properly.

HINT:

Manual shift (S position) is prohibited under either of the following conditions:

- Down–shifting may cause engine overrun.
- The driver continuously down–shifts. (Down–shifting to 1st gear may not be performed.)

(c) R position test:

Shift into the R position, lightly depress the accelerator pedal, and check that the vehicle moves backward without any abnormal noise or vibration.

CAUTION:

Before conducting this test ensure that the test area is free from people and obstruction.

(d) P position test:

Stop the vehicle on the grade (more than 5°) and after shifting into the P position, release the parking brake. Then, check that the parking lock pawl holds the vehicle in place.

05KAP–02

MECHANICAL SYSTEM TESTS

1. PERFORM MECHANICAL SYSTEM TESTS

(a) Measure the stall speed.

The object of this test is to check the overall performance of the transaxle and engine by measuring the stall speeds in the D and R positions.

NOTICE:

- **Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature 50 to 80˚C (122 to 176˚F).**
- **Do not continuously run this test for longer than 10 seconds.**
- **To ensure safety, do this test in a wide, clear level area which provides good traction.**
- **The stall test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stoppers outside the vehicle while the other is doing the test.**

(1) Chock the 4 wheels.
(2) Connect an Intelligent Tester II to the DLC3.
(3) Fully apply the parking brake.
(4) Keep your left foot pressed firmly on the brake pedal.
(5) Start the engine.
(6) Shift into the D position. Press all the way down on the accelerator pedal with your right foot.
(7) Quickly read the stall speed at this time.

Stall speed: 2,400 ± 150 rpm

(8) Do the same test in the R position.

Stall speed: 2,400 ± 150 rpm

Evaluation:

Problem	Possible cause
(a) Stall engine speed is low in D and R positions	• Engine power output may be insufficient • Stator one–way clutch not operating properly HINT: If the value is less than the specified value by 600 rpm or more, the torque converter could be faulty.
(b) Stall engine speed is high in D position	• Line pressure is too low • Forward clutch slipping • One–way clutch No.2 not operating properly
(c) Stall engine speed is high in R position	• Line pressure is too low • Reverse clutch slipping • 1st and reverse brake slipping
(d) Stall engine speed is high in D and R positions	• Line pressure is too low • Improper fluid level

(b) Measure the time lag.

(1) When the shift lever is shifted while the engine is idling, there will be a certain time lapse or lag before the shock can be felt. This is used for checking the condition of the direct clutch, forward clutch, and 1st and reverse brake.

NOTICE:

- **Perform the test at the normal operating ATF temperature 50 to 80 °C (122 to 176 °F).**
- **Be sure to allow 1 minute interval between tests.**
- **Perform the test three times, and measure the time lags. Calculate the average value of the three time lags.**

(2) Connect an Intelligent Tester II to the DLC3.

(3) Fully apply the parking brake.

(4) Start and warm up the engine and check idle speed.

Idle speed: approx. 700 rpm (In N position and A/C OFF)

(5) Shift the lever from N to D position. Using a stop watch, measure the time from when the lever is shifted until the shock is felt.

Time lag: N → D less than 1.2 seconds

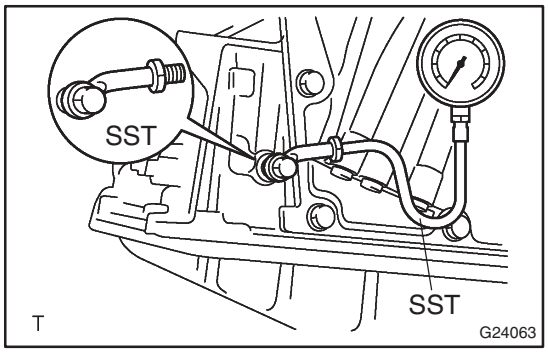
(6) In the same way, measure the time lag for N → R.

Time lag: N → R less than 1.5 seconds

Evaluation (If N → D or N → R time lag is longer than the specified):

Problem	Possible cause
N → D time lag is longer	• Line pressure is too low • Forward clutch worn • One–way clutch No.2 not operating properly
N → R time lag is longer	• Line pressure is too low • Reverse clutch worn • 1st and reverse brake worn

05KAQ–02



HYDRAULIC TEST

1. PERFORM HYDRAULIC TEST

(a) Measure the line pressure.

NOTICE:

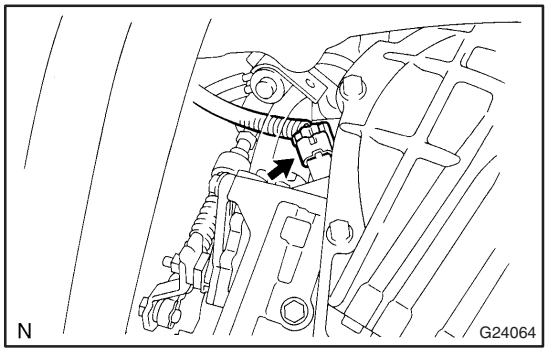
- **Perform the test at the normal operating ATF (Automatic Transmission Fluid) temperature 50 to 80˚C (122 to 176˚F).**
- **The line pressure test should always be carried out in pairs. One technician should observe the conditions of wheels or wheel stopper outside the vehicle while the other is doing the test.**
- **Be careful to prevent SST's hose from interfering with the exhaust pipe.**
- **This check must be conducted after checking and adjusting engine.**
- **Perform under condition that A/C is OFF.**
- **When conducting stall test, do not continue more than 10 seconds.**

(1) Warm up the ATF.
(2) Remove the test plug on the left side of the transaxle case and connect SST.

SST 09992–00095 (09992– 00231, 09992–00271)

(3) Fully apply the parking brake and chock the 4 wheels.
(4) Connect an Intelligent Tester II to the DLC3.
(5) Start the engine and check idling speed.
(6) Keep your left foot pressing firmly on the brake pedal and shift into D position.
(7) Measure the line pressure when the engine is idling.
(8) Depress the accelerator pedal all the way down. Quickly read the highest line pressure when engine speed reaches stall speed.
(9) In the same way, do the test in R position.

Specified line pressure:



Condition	D position kPa (kgf / cm^2, psi)	R position kPa (kgf / cm^2, psi)
Idling	372 to 412 kPa (3.8 to 4.2 kgf/cm^2, 54 to 60 psi)	553 to 623 kPa (5.6 to 6.4 kgf/cm^2, 80 to 90 psi)
Stall test	1,126 to 1,226 kPa (11.5 to 12.5 kgf/cm^2, 163 to 178 psi)	1,664 to 1,864 kPa (17.0 to 19.0 kgf/cm^2, 241 to 270 psi)

Evaluation:

Problem	Possible cause
If the measured values at all positions are higher	• Shift solenoid valve SLT defective • Regulator valve detective
If the measured values at all positions are lower	• Shift solenoid valve SLT defective • Regulator valve detective • Oil pump defective
If pressure is low in the D position only	• D position circuit fluid leak • Forward clutch defective
If pressure is low in the R position only	• R position circuit fluid leak • Reverse clutch defective • 1st and reverse brake defective

05KAR–02

MANUAL SHIFTING TEST

1. PERFORM MANUAL SHIFTING TEST

HINT:

- With this test, it can be determined whether the trouble occurs in the electrical circuit or is a mechanical problem in the transaxle.
- If any abnormalities are found in the following test, the problem is in the transaxle itself.

(a) Disconnect the transmission wire connector.

(b) Drive with the transmission wire disconnected.
Shifting the shift lever to the D position to check whether the shifting condition changes the table below.

Shift Position	Shifting Condition
D	No Shift (Not Change)

HINT:

When driving with the transmission wire disconnected, the gear position will be as follows:

- When the shift lever is in the D position, the gear is held in the 3rd position.
- When the shift lever is in the R or the P position, the gear is also in the R or the P position respectively.

(c) Connect the transmission wire connector.

(d) Clear the DTC (see page 05–239).

05KAS–02

INITIALIZATION

1. RESET MEMORY

CAUTION:

Perform the RESET MEMORY (AT initialization) when replacing the automatic transaxle assy, engine assy or ECM.

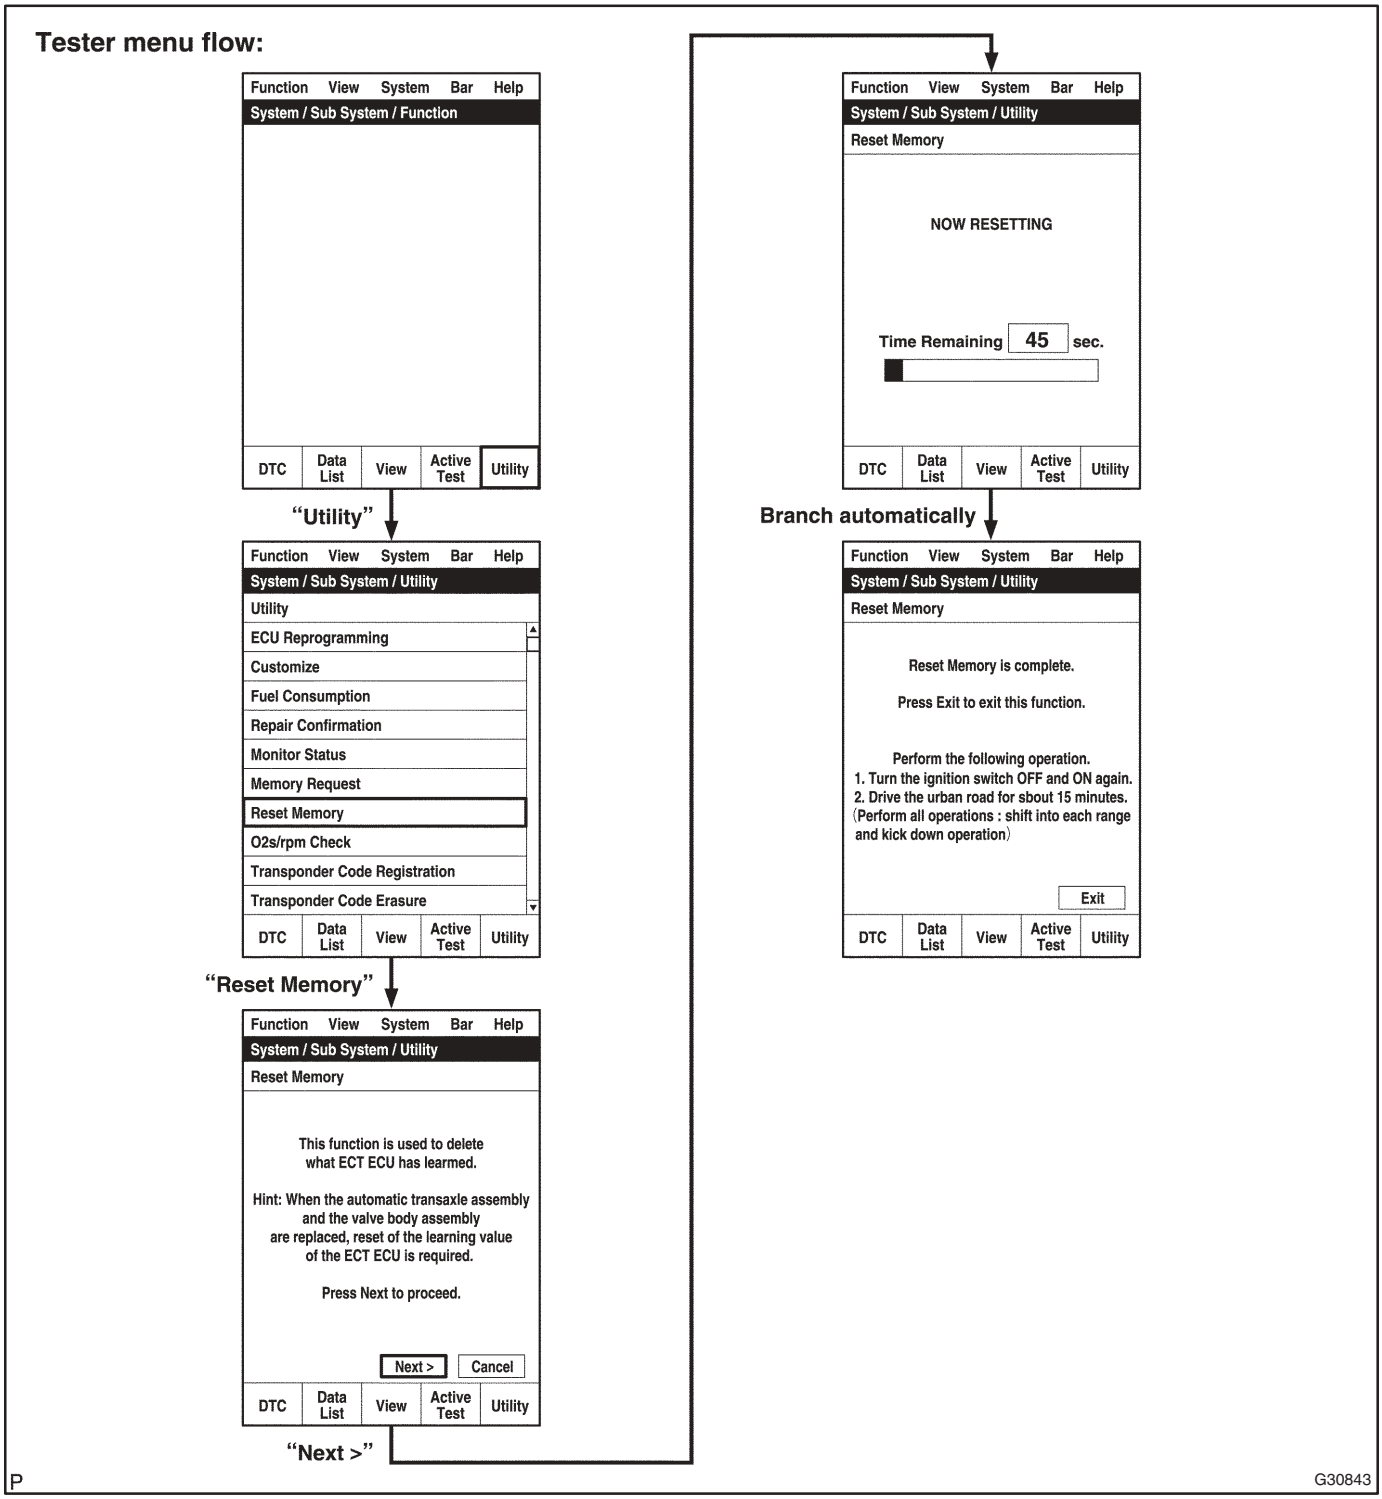
NOTICE:

Intelligent tester II only

HINT:

The ECM memorizes the condition that the ECT controls the automatic transaxle assy and engine assy according to those characteristics. Therefore, when the automatic transaxle assy, engine assy, or ECM has been replaced, it is necessary to reset the memory so that the ECM can memorize the new information. Reset procedure is as follows.

(a) Turn the ignition switch off.
(b) Connect the intelligent tester II to the DLC3.
(c) Turn the ignition switch to the ON position.
(d) Turn the intelligent tester II main switch on.
(e) Perform the reset memory procedure from the main menu.



CAUTION:

After performing the RESET MEMORY, be sure to perform the ROAD TEST (see page 05–219) described earlier.

HINT:

The ECM is learned by performing the ROAD TEST.

Tester menu flow:

05KAT–02

MONITOR DRIVE PATTERN

1. MONITOR DRIVE PATTERN FOR ECT TEST

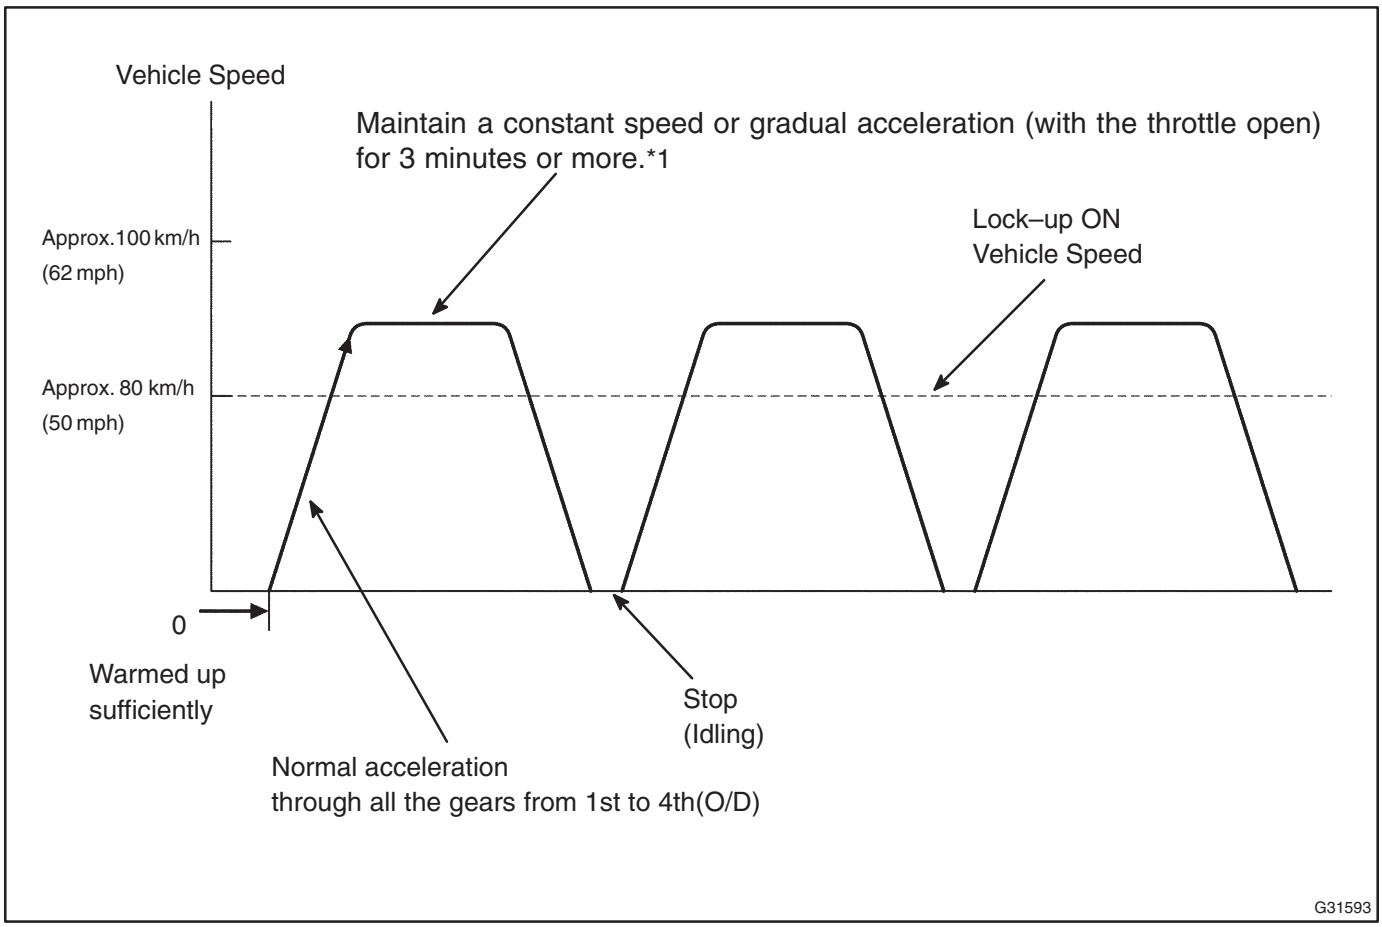
(a) Perform this drive pattern as one method to simulate the detection conditions of the ECT malfunctions. (The DTCs may not be detected due the actual driving conditions. And some codes may not be detected through this drive pattern).

HINT:

Preparation for driving

- Warm up the engine sufficiently. (Engine coolant temperature is 60 °C (140 °F) or higher)
- Drive the vehicle when the atmospheric temperature is –10 °C (14 °F) or higher. (Malfunction is not detected when the atmospheric temperature is –10 °C (14 °F) or less)

Driving note



- Drive the vehicle through all gears.
  Stop → 1st → 2nd → 3rd → 4th → 4th (lock–up ON).
- Perform engine brake test in the S position.
  While driving in the 4(S) position and 4th gear lock–up, shift into the "–" position and down–shift from 4th to 3rd, 3rd to 2nd, 2nd to 1st.
  Check that the engine brake performs properly whenever down–shift takes place.
- Repeat the above driving pattern three times or more.

NOTICE:

- **When using the intelligent tester II, monitor status can be found in the "Power train / Engine and ECT / Data List".**
- **In the event that the drive pattern must be interrupted (possibly due to traffic conditions or other factors) the drive pattern can be resumed and, in most cases, the monitor can be completed.**

CAUTION:

Perform this drive pattern on a level road as much as possible and strictly observe the posted speed limits and traffic laws while driving.

HINT:

*1: Drive at such a speed in the uppermost gear, to engage lock–up. The vehicle can be driven at a speed lower than that in the above diagram under the lock–up condition.

NOTICE:

It is necessary to drive the vehicle for approximately 30 minutes to detect DTC P0711 (ATF temperature sensor malfunction).

056IN–10

PROBLEM SYMPTOMS TABLE

HINT:

If a normal code is displayed during the diagnostic trouble code check although the trouble still occurs, check the electrical circuits for each symptom in the order given in the charts on the following pages and proceed to the page given for troubleshooting.

The Matrix Chart is divided into 2 chapters.

1. **Chapter 1: Electronic Circuit Matrix Chart**

- Refer to the table below when the trouble cause is considered to be electrical.
- If the instruction ”Proceed to next circuit inspection shown on matrix chart” is given in the flow chart of each circuit, proceed to the circuit with the next highest number in the table to continue the check.
- If the trouble still occurs even though there are no abnormalities in any of the other circuits, check and replace the ECM.

HINT:

*1: When the circuit on which mark *1 is attached is a malfunction, DTC could be output (see page 05–245).

*2: LHD

05L2J–01

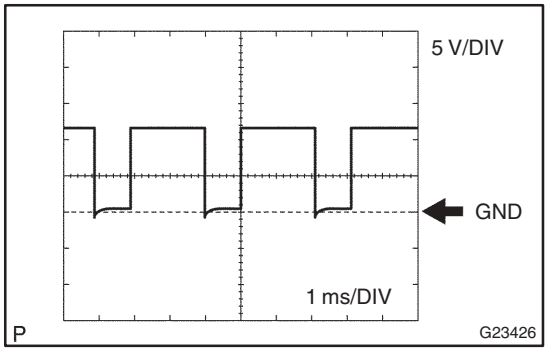
TERMINALS OF ECM

1. ECM

HINT:

Each ECM terminal's standard voltage is shown in the table below.

In the table, first follow the information under "Condition". Look under "Symbols (Terminal No.)" for the terminals to inspected. The standard voltage between the terminals is shown under "Specific Condition".



Use the illustration above as a reference for the ECM terminals.

Symbols (Terminals No.)	Wiring Color	Terminal Description	Condition	Specified Condition
SLT+ (E12–13) – SLT– (E12–12)	P–L – P	SLT solenoid signal	Engine idle speed	Pulse generation (See waveform 1)
THO (E12–32) – E2 (E13–28)	V – BR	ATF temperature sensor signal	ATF temperature: 115 °C (239 °F) or more	Below 1.5 V
ST (E12–20) – E1 (E13–5)	R–B – BR	ST solenoid signal	IG switch ON	Below 1 V
↑	↑	↑	IG switch ON and R gear	10 to 14 V
SL (E12–15) – E1 (E13–5)	R – BR	SL solenoid signal	IG switch ON	Below 1 V
↑	↑	↑	Vehicle driving under lock–up range	10 to 14 V
S2 (E12–10) – E1 (E13–5)	P – BR	S2 solenoid signal	IG switch ON	Below 1 V
↑	↑	↑	1st or O/D gear	10 to 14 V
↑	↑	↑	2nd or 3rd gear	Below 1 V
S1 (E12–11) – E1 (E13–5)	P–L – BR	S1 solenoid signal	IG switch ON	10 to 14 V
↑	↑	↑	1st or 2nd gear	10 to 14 V
↑	↑	↑	3rd or O/D gear	Below 1 V
SB (E12–8) – E1 (E13–5)	L – BR	SB solenoid signal	IG switch ON	Below 1 V
NT+ (E12–26) – NT– (E12–34)	B–O – B	Speed sensor (NT) signal	Vehicle speed 20 km/h (12 mph)	Pulse generation (See waveform 2)
SPT (E10–8) – E1 (E13–5)	L – BR	S shift position switch signal	IG switch ON and shift lever S position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except S position	Below 1 V
D (E10–10) – E1 (E13–5)	LG–B – BR	D shift position switch signal	IG switch ON and shift lever D and S position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except D and S position	Below 1 V
R (E10–11) – E1 (E13–5)	R–Y – BR	R shift position switch signal	IG switch ON and shift lever R position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except R position	Below 1 V

KD *1 (E10–31) – E1 (E13–5)	W – BR	Kick–down switch signal	IG switch ON and Accelerator pedal is depressed	Below 1 V
↑	↑	↑	IG switch ON and Accelerator pedal is released	10 to 14 V
SPD (E10–17) – E1 (E13–5)	V–W – BR	Speed signal	Vehicle speed 20 km/h (12 mph)	Pulse generation (See waveform 3)
STP (E10–19) – E1 (E13–5)	G–W – BR	Stop lamp switch signal	Brake pedal is depressed	7.5 to 14 V
↑	↑	↑	Brake pedal is released	Below 1.5 V
SFTU (E10–2) – E1 (E13–5)	R – BR	Up shift switch signal	IG switch ON and shift lever S position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever "+" position (Up shift)	Below 1 V
SFTD (E10–1) – E1 (E13–5)	B – BR	Down shift switch signal	IG switch ON and shift lever S position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever "–" position (Down shift)	Below 1 V
P (E9–13) – E1 (E13–5)	W–L – BR	Park position switch signal	IG switch ON and shift lever P position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except P position	Below 1 V
N (E10–20) – E1 (E13–5)	R – BR	Neutral position switch signal	IG switch ON and shift lever N position	10 to 14 V
↑	↑	↑	IG switch ON and shift lever except N position	Below 1 V
NSW (E13–23) – E1 (E13–5)	B–W – BR	Park neutral switch signal	IG switch ON and shift lever P and N position	Below 1 V
↑	↑	↑	IG switch ON and shift lever except P and N position	10 to 14 V

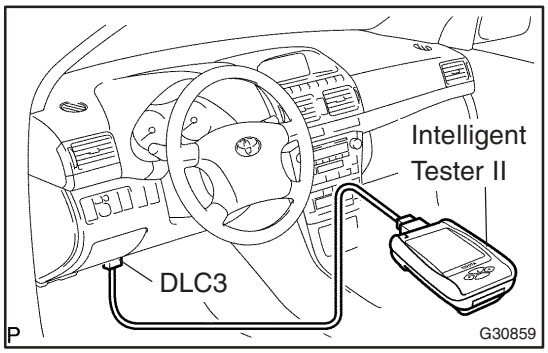
Tool setting	5V/DIV, 20ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

05KAV–02

DIAGNOSIS SYSTEM

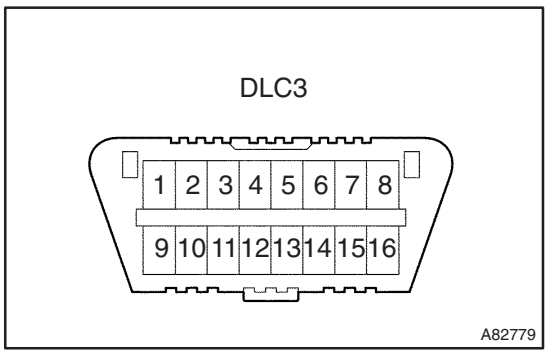
EURO–OBD (EUROPE)



When troubleshooting Europe On–Board Diagnostic (Euro–OBD) vehicles, the vehicle must be connected to an OBD scan tool (complying with ISO 15031–4). Various data output from the vehicle's ECM can then be read.

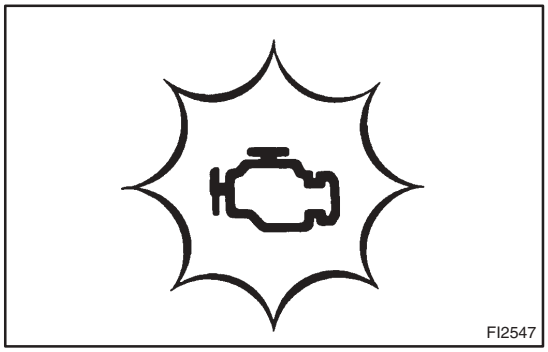
Euro–OBD regulations require that the vehicle's on–board computer illuminates the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

1) The emission control system/components.
2) The powertrain control components (which affect vehicle emissions).
3) The computer.



In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by ISO 15031–6 are recorded in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

To check DTCs, connect the Intelligent Tester II or OBD scan tool to the Data Link Connector 3 (DLC3) of the vehicle.



The scan tool displays DTCs, the freeze frame data and a variety of the engine data.

The DTCs and freeze frame data can be erased with the scan tool (see page 05–239).

M–OBD (EXCEPT EUROPEAN SPEC.)

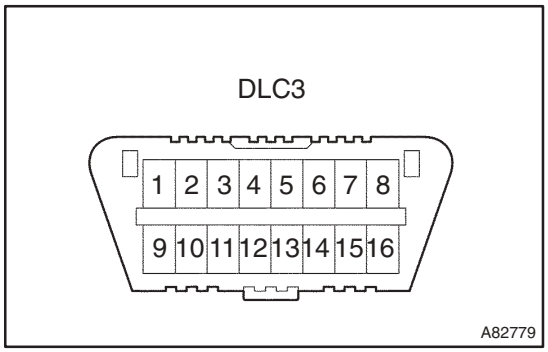
When troubleshooting Multiplex On–Board Diagnostic (M–OBD) vehicles, the vehicle must be connected to the Intelligent Tester II. Various data output from the ECM can then be read.

OBD II regulations require that the vehicle's on–board computer illuminates the MIL on the instrument panel when the computer detects a malfunction in:

1) The emission control system / components
2) The power train control components (which affect vehicle emissions)
3) The computer

In addition to, the applicable DTCs are recorded in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

NORMAL MODE AND CHECK MODE



The diagnosis system operates in "normal mode" during normal vehicle use. In normal mode, "2 trip detection logic" is used to ensure accurate detection of malfunctions. "Check mode" is also available to technicians as an option. In check mode, "1–trip detection logic" is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent malfunctions (Intelligent Tester II only).

2–TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the ignition switch is turned OFF and then ON again, and the same malfunction is detected again, the MIL will illuminate.

FREEZE FRAME DATA

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air/fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.

DLC3 (Data Link Connector 3)

The vehicle's ECM uses the ISO 9141–2 (Euro–OBD)/ ISO 14230(M–OBD) communication protocol. The terminal arrangement of the DLC3 complies with ISO 15031–03 and matches the ISO 9141–2/ ISO 14230 format.

HINT:

Connect the cable of the Intelligent Tester II to the DLC3, turn the ignition switch ON and attempt to use the Intelligent Tester II. If the screen displays UNABLE TO CONNECT TO VEHICLE, a problem exists in the vehicle side or the tester side.

If the communication is normal when the tool is connected to another vehicle, inspect the DLC3 on the original vehicle.

If the communication is still impossible when the tool is connected to another vehicle, the problem is probably in the tool itself. Consult the Service Department listed in the tool's instruction manual.

Symbol	Terminal No.	Name	Reference terminal	Result	Condition
SIL	7	Bus "+" line	5 – Signal ground	Pulse generation	During transmission
CG	4	Chassis ground	Body ground	1 Ω or less	Always
SG	5	Signal ground	Body ground	1 Ω or less	Always
BAT	16	Battery positive	Body ground	9 to 14 V	Always

INSPECT BATTERY VOLTAGE

Battery Voltage: 11 to 14 V

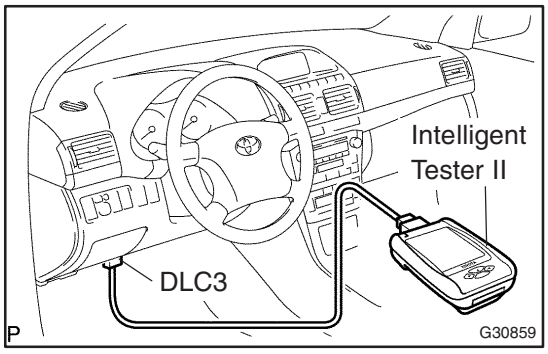
If voltage is below 11 V, replace the battery before proceeding.

CHECK MIL

(a) Check that the MIL illuminates when turning the ignition switch ON.

If the MIL does not illuminate, there is a problem in the MIL circuit (refer to MIL CIRCUIT on page 05–204).

(b) When the engine is started, the MIL should turn off.



05KAW–02

DTC CHECK/CLEAR

1. CHECK DTC WITH INTELLIGENT TESTER II

DTCs which are stored in the ECM can be displayed with the Intelligent Tester II and generic OBD scantool.

These scan tools can display pending DTCs and current DTCs. Some DTC aren't stored if the ECM doesn't detect a malfunction during consecutive driving. However, the detected malfunction during once driving is stored as pending DTC.

(a) Connect the Intelligent Tester II to the Data Link Connector 3 (DLC3).
(b) Turn the ignition switch ON.
(c) Enter the following menus: Enter/ Power train/ Engine and ECT/ DTC/ Current (or Pending).
(d) Confirm the DTCs and freeze frame data and then write them down.
(e) See page 05–245 to confirm the details of the DTCs.

NOTICE:

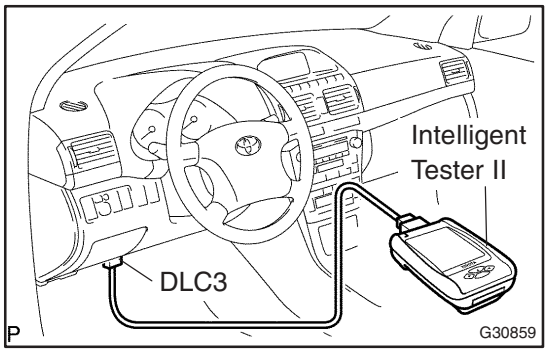
When simulating a symptom with the scan tool to check the DTCs, use normal mode. For codes on DIAGNOSTIC TROUBLE CODE CHART subject to "2–trip detection logic", perform the following actions.

Turn the ignition switch OFF after the symptom is simulated once. Then repeat the simulation process again. When the problem has been simulated twice, the MIL illuminates and the DTCs are recorded in the ECM.

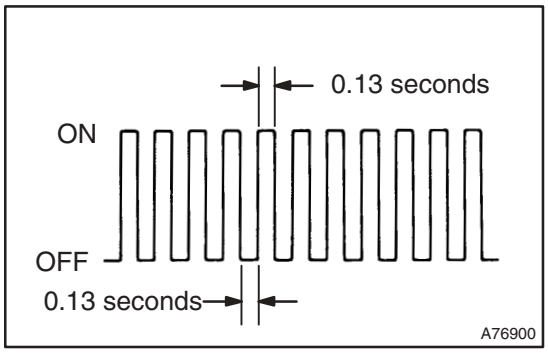
2. CLEAR DTC WITH INTELLIGENT TESTER II

(a) Connect the Intelligent Tester II to the DLC3.
(b) Turn the ignition switch ON.
(c) Enter the following menus: Enter/ Power train/ Engine and ECT/ DTC/ Clear.

3. CLEAR DTC WITHOUT INTELLIGENT TESTER II



Disconnecting the battery terminal or remove the EFI and ETCS fuses from the engine room R/B for 60 seconds or more. But if you disconnect the battery terminal, you should do the "INITIALIZE" procedure.



05KAX–02

CHECK MODE PROCEDURE

DESCRIPTION

Check mode has a higher sensitivity to malfunctions and can detect malfunctions that normal mode cannot detect. Check mode can also detect all the malfunctions that normal mode can detect. In check mode, DTCs are detected with 1–tirp detection logic.

CHECK MODE PROCEDURE

(a) Make sure that the items below are true:
  (1) Battery positive voltage 11 V or more
  (2) Throttle valve fully closed
  (3) Transmission in the P or N position
  (4) A/C switched OFF

(b) Turn the ignition switch OFF.

(c) Connect the Intelligent Tester II to the DLC3.

(d) Turn the ignition switch ON.

(e) Enter the following menues: Utility/ Check Mode.

(f) Change the ECM to check mode. Make sure the MIL flashes as shown in the illustration.

NOTICE:

All DTCs and freeze frame data recorded will be erased if: 1) the intelligent tester II is used to change the ECM from normal mode to check mode or vice versa; or 2) during check mode, the ignition switch is turned from ON to ACC or LOCK.

Before check mode, make notes of the DTCs and freeze frame data.

(g) Start the engine. The MIL should turn off after the engine starts.

(h) Perform ”MONITOR DRIVE PATTERN” for the ECT test (see page 05–227).
  (Or, simulate the conditions of the malfunction described by the customer).

(i) After simulating the malfunction conditions, use the Intelligent Tester II diagnosis selector to check the DTC and freeze frame data.

05KAY–02

FAIL–SAFE CHART

1. FAIL–SAFE

This function minimizes the loss of the ECT functions when any malfunction occurs in each sensor or solenoid.

(a) ATF (Automatic Transmission Fluid) temperature sensor:
When the ATF temperature sensor has a malfunction, 4th upshift is prohibited.

(b) Input turbine speed sensor NT (Speed sensor NT):
When the Input turbine speed sensor has a malfunction, 4th upshift is prohibited.

(c) Shift solenoid valve ST:
When the solenoid valve ST has a malfunction, 4th upshift is prohibited.

(d) Shift solenoid valve SLT:
When the solenoid valve SLT has a malfunction, 4th upshift is prohibited.

(e) Shift solenoid valve SB:
When the solenoid valve SB has a malfunction, S shift control is prohibited, and the driving mode turns to the normal D position.

(f) Shift solenoid valve S1 and S2:

Fail safe function:

If either of the shift solenoid valve circuits develops an open or short, the ECM turns the other shift solenoid ”ON” and ”OFF” in order to shift into the gear positions shown in the table below.

Manual shifting as shown in the following table must be done (In case of a short circuit, the ECM stops sending the current to the short circuit solenoid).

Even if starting the engine in the fail–safe mode, the gear position remain in the same position.

Position	NORMAL			SHIFT SOLENOID VALVE S1 MALFUNCTIONING			SHIFT SOLENOID VALVE S2 MALFUNCTIONING			BOTH SHIFT SOLENOID VALVES MALFUNCTIONING
	Solenoid valve		Gear	Solenoid valve		Gear	Solenoid valve		Gear	Gear when shift selector is manually operated
	S1	S2		S1	S2		S1	S2		
D	ON	ON	1st	X	OFF	3rd	ON	X	2nd	3rd
	ON	OFF	2nd	X	OFF	3rd	ON	X	2nd	3rd
	OFF	OFF	3rd	X	OFF	3rd	OFF	X	3rd	3rd
	OFF	ON	4th	X	ON	4th	OFF	X	3rd	3rd
2 (S position)	ON	ON	1st	X	OFF	3rd	ON	X	2nd	3rd
	ON	OFF	2nd	X	OFF	3rd	ON	X	2nd	3rd
	OFF	OFF	3rd	X	OFF	3rd	OFF	X	3rd	3rd
1 (S position)	ON	ON	1st	X	OFF	3rd	ON	X	2nd	3rd
	ON	OFF	2nd	X	OFF	3rd	ON	X	2nd	3rd

X: OFF (the ECM stops sending current to a malfunctioning solenoid valve)

05KAZ–02

DATA LIST/ACTIVE TEST

1. DATA LIST

HINT:

Using the Intelligent Tester II Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to shorten labor time.

NOTICE:

In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Select the item ”Enter / Power train / Engine and ECT / Data List”.
(g) Follow the instructions on the tester and read the Data List.

Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note
Stop Light Switch	Stop light SW Status/ ON or OFF	• Brake Pedal is depressed: ON • Brake Pedal is released: OFF	–
Neutral Position SW Signal	PNP SW Status/ ON or OFF	Shift lever position is; P and N: ON Except P and N: OFF	When the shift lever position displayed on the hand–held tester differs from the actual position, adjustment of the PNP switch or the shift cable may be incorrect. HINT: When the failure still occurs even after adjusting these parts, see page 05–247.
Shift SW Status (R Range)	PNP SW Status/ ON or OFF	Shift lever position is; R: ON Except R: OFF	↑
Shift SW Status (D Range)	PNP SW Status/ ON or OFF	Shift lever position is; D and S: ON Except D and S: OFF	↑
Shift Status	Actual Gear position/ 1st, 2nd, 3rd, 4th (O/D)	Shift lever position is; • D: 1st, 2nd, 3rd or 4th • S: 1st, 2nd, 3rd or 4th	–
Lock Up Solenoid Status	Lock Up Solenoid Status/ ON or OFF	• Lock Up: ON • Except Lock Up: OFF	–
SLT Solenoid Status	Shift Solenoid SLT Status/ ON or OFF	• Accelerator pedal is depressed: OFF • Accelerator pedal is released: ON	–
A/T Oil Temperature 1	ATF Temp. Sensor Value/ min.: –40°C (–40°F) max.: 215°C (419°F)	• After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when the engine is cold	If the value is ”–40°C (–40°F)” or ”215°C (419°F)”, ATF temp. sensor circuit is opened or shorted.

Kick Down Switch Status *1	Kick down SW Status/ ON or OFF	• Accelerator Pedal is depressed all the way down: ON • Accelerator Pedal is released: OFF	–
Snow Switch Status	Pattern SW (ECT SNOW) Status/ ON or OFF	• IG SW ON: OFF ↓ • Pattern SW (ECT SNOW) Push: ON ↓ • Pattern SW (ECT SNOW) Push: OFF	–

HINT:
*1: LHD

2. ACTIVE TEST

HINT:
Performing the Intelligent Tester II Active Test allows relay, Vacuum Switching Valve (VSV), actuator and other items to be operated without removing any parts. Performing the Active Test early in troubleshooting is one way to shorten labor time. The Data List can be displayed during the Active Test.
(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Select the item ”Enter / Power train / Engine and ECT / Active Test”.
(g) Follow the instructions on the tester and read the Active Test.

Item	Test Details	Diagnostic Note
Control the Shift Position	[Test Details] Operate the shift solenoid valve and set the each shift position by yourself. [Vehicle Condition] Less than 50 km/h (31 mph) [Others] • Press ”→” button: Shift up • Press ”←” button: Shift down	Possible to check the operation of the shift solenoid valves.
Control the Lock Up	[Test Details] Control the shift solenoid SL to set the automatic transaxle to the lock–up condition. [Vehicle Condition] Vehicle Speed: 58 km/h (36 mph) or more	Possible to check the SL operation.
Control the Line Pressure Up *	[Test Details] Operate the shift solenoid SLT and raise the line pressure. [Vehicle Condition] • Vehicle Stopped. • IDL: ON [HINT] OFF: Line pressure up (When the active test of ”LINE PRESS UP” is performed, the ECM commands the SLT solenoid to turn off). ON: No action (normal operation)	–

*: ”Control the Line Pressure Up” in the ACTIVE TEST is performed to check the line pressure changes by connecting the SST to the automatic transmission, which is used in the HYDRAULIC TEST (see page 05–223) as well.
HINT:
The pressure values in ACTIVE TEST and HYDRAULIC TEST are different from each other.

056IK–10

DIAGNOSTIC TROUBLE CODE CHART

If a DTC is displayed during the DTC check, check the parts listed in the table below and proceed to the page given.

HINT:

- *1 : ● ... MIL (Malfunction Indicator Lamp) light up
- *2 : "○" mark means ECM memorizes the malfunction code if the ECM detects the DTC detection condition.
- This DTC may be output when the clutch, brake and gear components etc. inside the automatic transaxle are damaged.

DTC No. (See Page)	Detection Item	Trouble Area	MIL *1	Memory *2
P0500 (05–158)	Vehicle Speed Sensor "A"	• Combination meter • Open or short in vehicle speed sensor circuit • Vehicle speed sensor • ECM	●	○
P0705 (05–247)	Transmission Range Sensor Circuit Malfunction (PRNDL Input)	• Open or short in park/neutral position switch circuit • Park/neutral position switch • ECM	●	○
P0710 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit	• Open or short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM	●	○
P0711 (05–255)	Transmission Fluid Temperature Sensor "A" Performance	• Open or short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM	●	○
P0712 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit Low Input	• Short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM	●	○
P0713 (05–252)	Transmission Fluid Temperature Sensor "A" Circuit High Input	• Open in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM	●	○
P0717 (05–258)	Turbine Speed Sensor Circuit No Signal	• Open or short in transmission revolution sensor NT (speed sensor NT) circuit • Transmission revolution sensor NT (speed sensor NT) • ECM • Automatic transaxle assembly	●	○
P0724 (05–261)	Brake Switch "B" Circuit High	• Short in stop light switch circuit • Stop light switch • ECM	●	○
P0741 (05–264)	Torque Converter Clutch Solenoid Performance (Shift Solenoid Valve SL)	• Shift solenoid valve SL remains open or closed • Valve body is blocked • Shift solenoid valve SL • Torque converter clutch • Automatic transaxle (clutch, brake or gear etc.) • Line pressure is too low • ECM	●	○
P0751 (05–268)	Shift Solenoid "A" Performance (Shift Solenoid Valve S1)	• Shift solenoid valve S1 remains open or closed • Valve body is blocked • Shift solenoid valve S1 • Automatic transaxle (clutch, brake or gear etc.) • ECM	●	○
P0756 (05–271)	Shift Solenoid "B" Performance (Shift Solenoid Valve S2)	• Shift solenoid valve S2 remains open or closed • Valve body is blocked • Shift solenoid valve S2 • Automatic transaxle (clutch, brake or gear etc.) • ECM	●	○

P0787 (05–274)	Shift/Timing Solenoid Low (Shift Solenoid Valve ST)	• Short in shift solenoid valve ST circuit • Shift solenoid valve ST • ECM	●	○

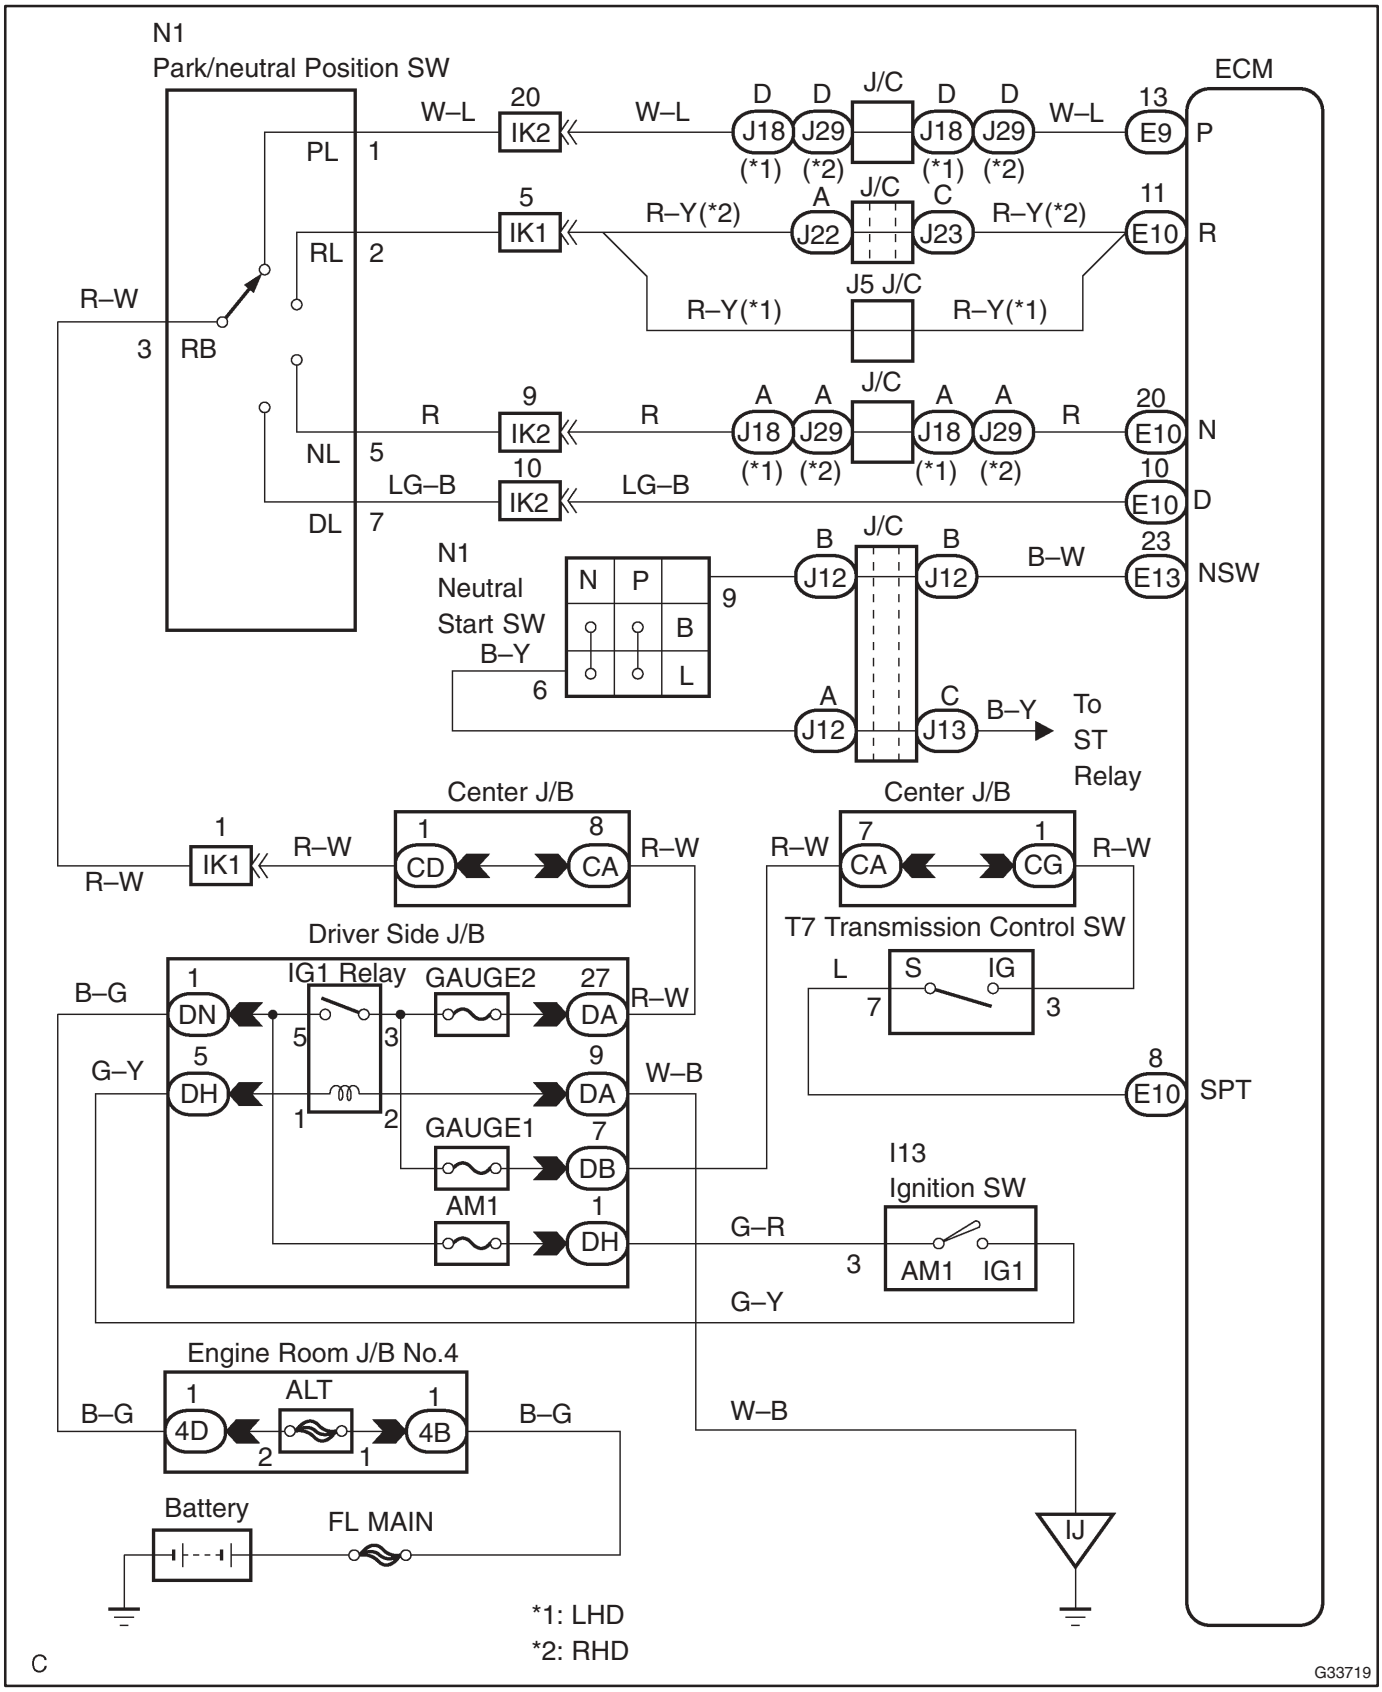
DTC	P0705	TRANSMISSION RANGE SENSOR CIRCUIT MALFUNCTION (PRNDL INPUT)

CIRCUIT DESCRIPTION



The park/neutral position switch detects the shift lever position and sends signals to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0705	(A) Any 2 or more signals of the following are ON simultaneously (2–trip detection logic) • P input signal is ON. • N input signal is ON. • R input signal is ON. • D input signal is ON. (B) When any of following conditions is met for 2.0 sec. or more in the S position (2–trip detection logic) • P input signal is ON. • N input signal is ON. • R input signal is ON.	• Open or short in park/neutral position switch circuit • Park/neutral position switch • ECM

MONITOR DESCRIPTION

The park/neutral position switch detects the shift lever position and sends a signal to the ECM.
For security, the park/neutral position switch detects the shift lever position so that engine can be started only when the vehicle is in P or N shift position.
When the park/neutral position switch sends more than one signal at a time from switch positions P, R, N or D, the ECM interprets this as a fault in the switch. The ECM will turn on the MIL and store the DTC.

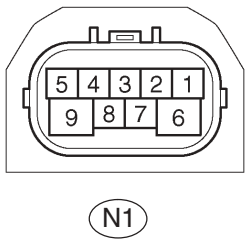
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Using the Intelligent Tester II Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to shorten labor time.

NOTICE:



In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

(a) Turn the ignition switch off.
(b) Connect the Intelligent Tester II to the DLC3.
(c) Turn the ignition switch to the ON position.
(d) Turn on the tester.
(e) Select the item ”Enter / Power train / Engine and ECT / Data List”.
(f) Follow the instructions on the tester and read the Data List.

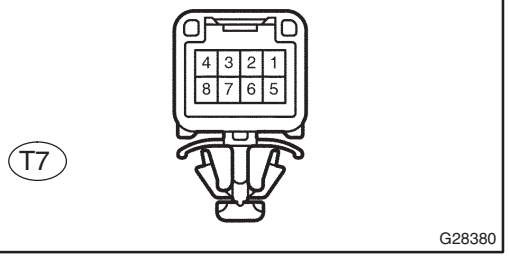
Item	Measurement Item/ Range (display)	Normal Condition	Diagnostic Note
Neutral Position SW Signal	PNP SW Status/ ON or OFF	Shift lever position is; P and N: ON Except P and N: OFF	When the shift lever position displayed on the hand–held tester differs from the actual position, adjustment of the PNP switch or the shift cable may be incorrect.
Shift SW Status (R Range)	PNP SW Status/ ON or OFF	Shift lever position is; R: ON Except R: OFF	↑
Shift SW Status (D Range)	PNP SW Status/ ON or OFF	Shift lever position is; D and S: ON Except D and S: OFF	↑

1 INSPECT PARK/NEUTRAL POSITION SWITCH ASSY

Switch Side:
(Connector Front View):

(a) Disconnect the park/neutral position switch connector.
(b) Measure resistance according to the value(s) in the table below when the shift lever is moved to each position.

Standard:



Shift Position	Tester Connection	Specified Condition
P	1 – 3 and 6 – 9	Below 1 Ω
Except P	↑	10 kΩ or higher
R	2 – 3	Below 1 Ω
Except R	↑	10 kΩ or higher
N	3 – 5 and 6 – 9	Below 1 Ω
Except N	↑	10 kΩ or higher
D, S, ”+” and ”–”	3 – 7	Below 1 Ω
Except D, S, ”+” and ”–”	↑	10 kΩ or higher

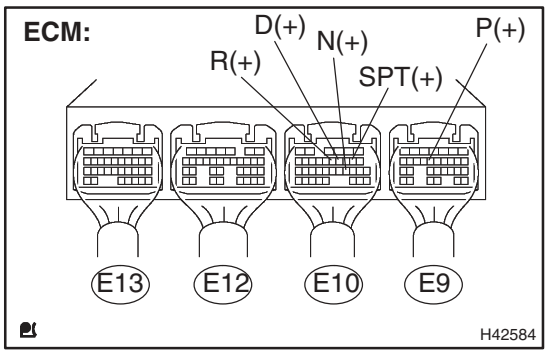
NG → **REPLACE PARK/NEUTRAL POSITION SWITCH ASSY (See Pub. No. RM1018E, page 40–3)**

OK

2 INSPECT SHIFT LOCK CONTROL UNIT ASSY

Switch Side:
(Connector Front View):

(a) Connect the park/neutral position switch connector.
(b) Disconnect the transmission control switch connector of shift lock control unit assy.
(c) Measure resistance according to the value(s) in the table below when the shift lever is moved to each position.



Standard:

Shift Position	Tester Connection	Specified Condition
S, "+" and "–"	3 – 7	Below 1 Ω
Except S, "+" and "–"	↑	10 kΩ or higher

NG → **REPLACE SHIFT LOCK CONTROL UNIT ASSY (See Pub. No. RM1018E, page 40–60)**

OK

3	CHECK HARNESS AND CONNECTOR(PARK/NEUTRAL POSITION SWITCH – ECM)

(a) Connect the transmission control switch connector of shift lock control unit assy.

(b) Turn the ignition switch to the ON position, and measure the voltage according to the value(s) in the table below when the shift lever is moved to each position.

Standard:

Shift Position	Tester connection	Specified condition
P	E9 – 13 (P) – Body ground	10 to 14 V
Except P	↑	Below 1 V
N	E10 – 20 (N) – Body ground	10 to 14 V
Except N	↑	Below 1 V
R	E10 – 11 (R) – Body ground	10 to 14 V*
Except R	↑	Below 1 V
D and S	E10 – 10 (D) – Body ground	10 to 14 V
Except D and S	↑	Below 1 V
S, "+" and "–"	E10 – 8 (SPT) – Body ground	10 to 14 V
Except S, "+" and "–"	↑	Below 1 V

HINT:

*: The voltage will drop slightly due to lighting up of the back up light.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK →

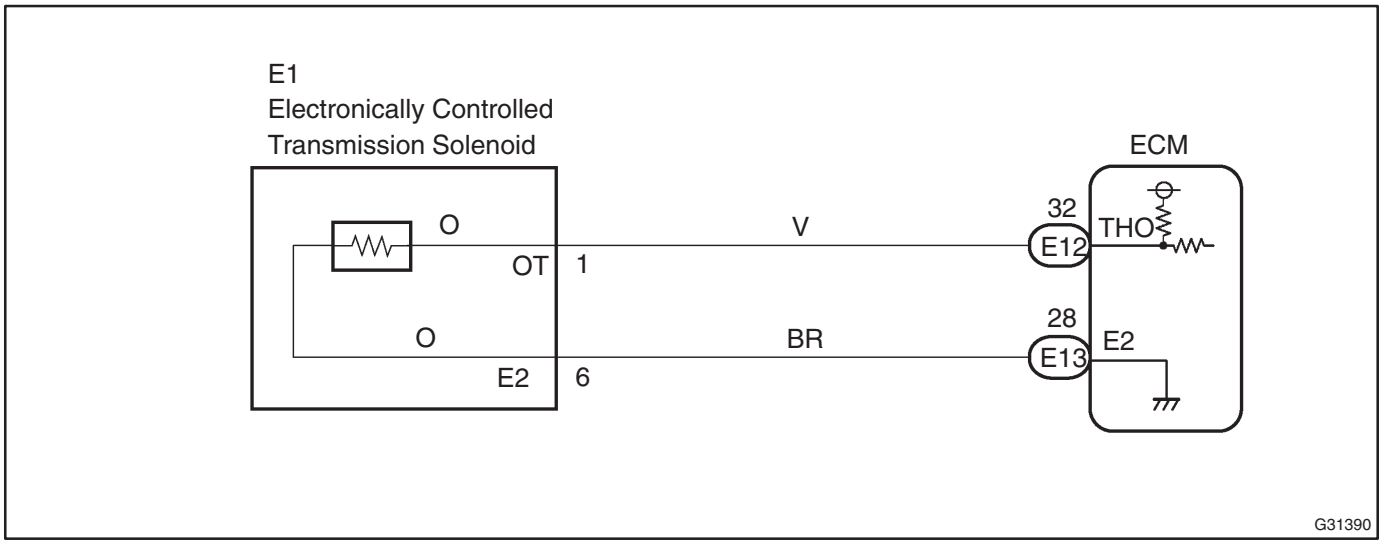
REPLACE ECM

DTC	P0710	TRANSMISSION FLUID TEMPERATURE SENSOR ”A” CIRCUIT

DTC	P0712	TRANSMISSION FLUID TEMPERATURE SENSOR ”A” CIRCUIT LOW INPUT

DTC	P0713	TRANSMISSION FLUID TEMPERATURE SENSOR ”A” CIRCUIT HIGH INPUT

CIRCUIT DESCRIPTION



The ATF (Automatic Transmission Fluid) temperature sensor converts the fluid temperature into a resistance value which is input into the ECM.
The ECM applies a voltage to the temperature sensor through ECM terminal THO.
The sensor resistance changes with the transmission fluid temperature. As the temperature becomes higher, the sensor resistance decreases.
One terminal of the sensor is grounded so that the sensor resistance decreases and the voltage goes down as the temperature becomes higher.
The ECM calculates the fluid temperature based on the voltage signal.

DTC No.	DTC Detection Condition	Trouble Area
P0710	(a) and (b) is detected momentary within 0.5 sec. when neither P0712 or P0713 is not detected (1–trip detection logic) (a) ATF temperature sensor resistance is less than 79 Ω. (b) ATF temperature sensor resistance is more than 156 kΩ. HINT: Within 0.5 sec., the malfunction switches from (a) to (b) or from (b) to (a)	• Open or short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM
P0712	ATF temperature sensor resistance is less than 79 Ω for 0.5 sec. or more (1–trip detection logic)	• Short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM
P0713	ATF temperature sensor resistance is more than 156 kΩ when 15 minutes or more after the engine start DTC is detected for 0.5 sec. or more (1–trip detection logic)	• Open in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM

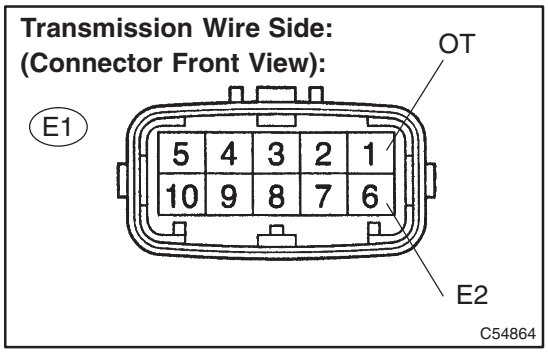
MONITOR DESCRIPTION

The automatic transmission fluid (ATF) temperature sensor converts ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature, and the ECM detects an opens or shorts in the ATF temperature circuit. If the resistance value of the ATF temperature is less than 79 Ω*1 or more than 156 kΩ*2, the ECM interprets this as a fault in the ATF sensor or wiring. The ECM will turn on the MIL and store the DTC.
*1: 150°C (302°F) or more is indicated regardless of the actual ATF temperature.
*2: –40°C (–40°F) is indicated regardless of the actual ATF temperature.
HINT:
The ATF temperature can be checked on the Intelligent Tester II display.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Using the Intelligent Tester II Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to shorten labor time.
NOTICE:
In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.
(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Select the item ”Enter / Power train / Engine and ECT / Data List”.
(g) Follow the instructions on the tester and read the Data List.



Item	Measurement Item/ Range (display)	Normal Condition
A/T Oil Temperature 1	ATF Temp. Sensor Value/ min.: –40°C (–40°F) max.: 215°C (419°F)	• After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:
When DTC P0712 is output and Intelligent Tester II output is 150°C (302°F) or more, there is a short circuit.
When DTC P0713 is output and Intelligent Tester II output is –40°C (–40°F), there is an open circuit.
Measure the resistance between terminal THO (OT) and body ground.

Temperature Displayed	Malfunction
–40˚C (–40˚F)	Open circuit
150˚C (302˚F) or more	Short circuit

HINT:
If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second).
When P0713 is set, P0711 cannot be detected.
It is not necessary to inspect the circuit when P0711 is set.

1 INSPECT TRANSMISSION WIRE(ATF TEMPERATURE SENSOR)

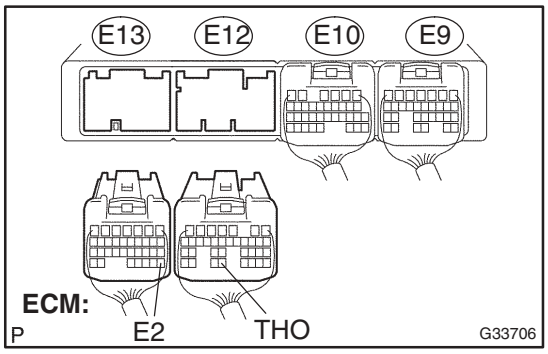
(a) Disconnect the transmission wire connector from the transaxle.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition
1 (OT) – 6 (E2)	79 Ω to 156 kΩ

(c) Measure the resistance according to the value(s) in the table below.



Standard (Check for short):

Tester Connection	Specified Condition
1 (OT) – Body ground	10 kΩ or higher
6 (E2) – Body ground	↑

NG → **REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)**

OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission wire connector to the transaxle.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition
E12 – 32 (THO) – E13 – 28 (E2)	79 Ω to 156 kΩ

(d) Measure the resistance according to the value(s) in the table below.

Standard (Check for short):

Tester Connection	Specified Condition
E12 – 32 (THO) – Body ground	10 kΩ or higher
E13 – 28 (E2) – Body ground	↑

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

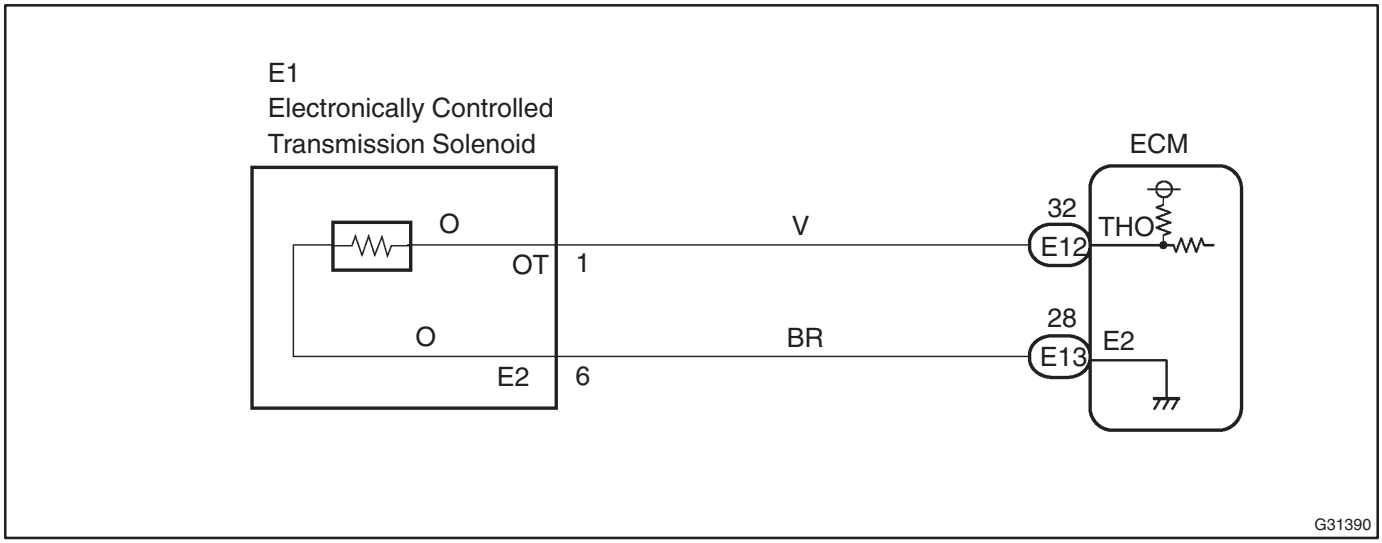
OK

REPLACE ECM

DTC	P0711	TRANSMISSION FLUID TEMPERATURE SENSOR ”A” PERFORMANCE

CIRCUIT DESCRIPTION

The ATF (Automatic Transmission Fluid) temperature sensor converts the fluid temperature into a resistance value which is input into the ECM.



DTC No.	DTC Detection Condition	Trouble Area
P0711	(A) Both (a) and (b) are detected: (2–trip detection logic) (a) Intake air and engine coolant temperatures are more than –10˚C (14°F) at engine start (b) After normal driving for over 19 min. and 8 km (5 mile) or more, ATF temp. is less than 10˚C (50°F)	• Open or short in ATF temperature sensor circuit • Transmission wire (ATF temperature sensor) • ECM

MONITOR DESCRIPTION

The ATF temperature sensor converts the ATF temperature to an electrical resistance value. Based on the resistance, the ECM determines the ATF temperature and detects an opens or shorts in the ATF temperature circuit or a fault of the ATF temperature sensor.

After running the vehicle for a certain period, the ATF temperature should increase. If the ATF temperature is below 10°C (50°F) after running the vehicle for a certain period, the ECM interprets this as a fault, and turns on the MIL.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Using the Intelligent Tester II Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to shorten labor time.
NOTICE:
In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.
(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Select the item ”Enter / Power train / Engine and ECT / Data List”.
(g) Follow the instructions on the tester and read the Data List.

Item	Measurement Item/ Range (display)	Normal Condition
A/T Oil Temperature 1	ATF Temp. Sensor Value/ min.: –40°C (–40°F) max.: 215°C (419°F)	• After Stall Test; Approx. 80°C (176°F) • Equal to ambient temperature when cold soak

HINT:
When DTC P0712 is output and Intelligent Tester II output is 150°C (302°F) or more, there is a short circuit.
When DTC P0713 is output and Intelligent Tester II output is –40°C (–40°F), there is an open circuit.
Measure the resistance between terminal THO (OT) and body ground.

Temperature Displayed	Malfunction
–40˚C (–40˚F)	Open circuit
150˚C (302˚F) or more	Short circuit

HINT:
If a circuit related to the ATF temperature sensor becomes open, P0713 is immediately set (in 0.5 second).
When P0713 is set, P0711 cannot be detected.
It is not necessary to inspect the circuit when P0711 is set.

1	CHECK OTHER DTCS OUTPUT(IN ADDITION TO DTC P0711)

(a) Connect the Intelligent Tester II to the DLC3.
(b) Turn the ignition switch to the ON position.
(c) Turn on the tester.
(d) Select the item ”Power train / Engine and ECT / DTC / Current or Pending”.
(e) Read the DTCs using the Intelligent Tester II.
Result:

Display (DTC output)	Proceed to
Only ”P0711” is output	A
”P0711” and other DTCs	B

HINT:
If any other codes besides ”P0711” are output, perform troubleshooting for those DTCs first.

B → **GO TO RELEVANT DTC CHART (SEE PAGE 05–245)**

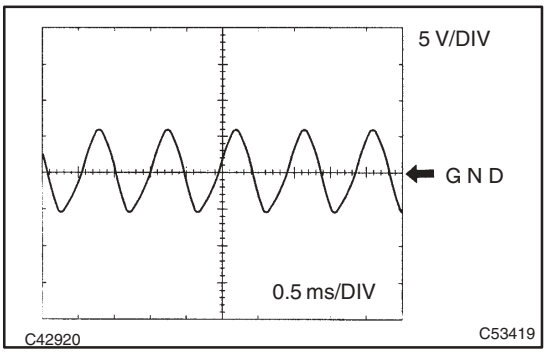
A

2	CHECK TRANSAXLE FLUID LEVEL (See Pub. No. RM1018E, page 40–2)

OK:
Automatic transaxle fluid level is correct.

NG → **ADD FLUID**

OK



REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

DTC P0717 TURBINE SPEED SENSOR CIRCUIT NO SIGNAL

CIRCUIT DESCRIPTION

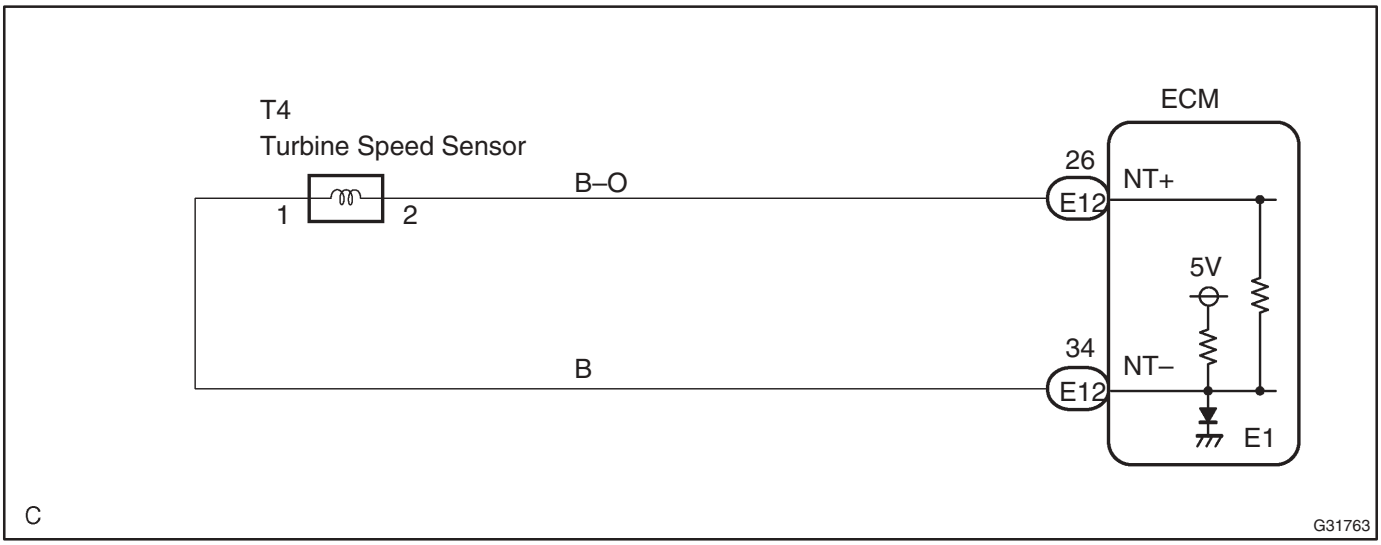
This sensor detects the rotation speed of the input turbine. By comparing the input turbine speed signal (NT) with the vehicle speed sensor signal, the ECM detects the shift timing of the gears and appropriately controls the engine torque and hydraulic pressure according to various conditions. Thus, providing smooth gear shift.

DTC No.	DTC Detection Condition	Trouble Area
P0717	ECM detects conditions (a), (b) and (c) continuity for 5 sec. or more: (1–trip detection logic) (a) Vehicle speed: 50 km/h (31 mph) or more (b) Park/neutral position switch (NSW, R and L) is OFF (c) Speed sensor (NT): less than 300 rpm	• Open or short in transmission revolution sensor NT (speed sensor NT) circuit • Transmission revolution sensor NT (speed sensor NT) • ECM

Reference (Using an oscilloscope):

Check the waveform between the terminals NT+ and NT– of the ECM connector.

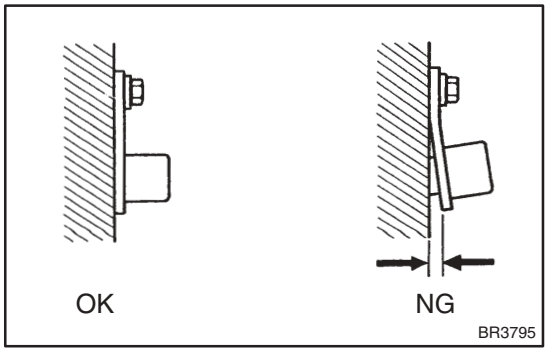
Standard: Refer to the illustration.



Terminal	NT+ – NT–
Tool setting	5V/DIV, 0.5ms/DIV
Vehicle condition	Vehicle speed 20 km/h (12 mph)

MONITOR DESCRIPTION

The input speed sensor detects the transmission input shaft speed. The ECM determines the gear shift timing based on a comparison of the input speed sensor (input shaft speed) with the output speed sensor (output shaft speed).

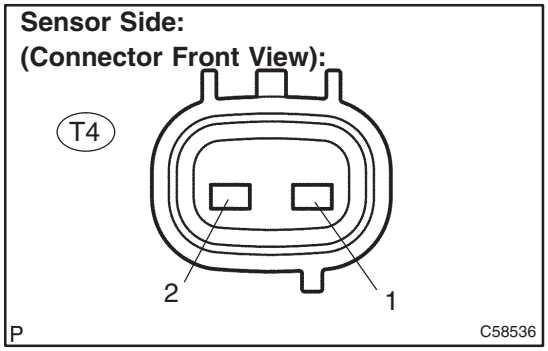


When the output shaft speed is higher then the expected value and the input shaft speed is 300 rpm or less while running with the shift in the D position, the ECM will conclude that there is malfunction of the input turbine speed sensor (NT). The ECM will illuminate the MIL.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT SPEED SENSOR INSTALLATION

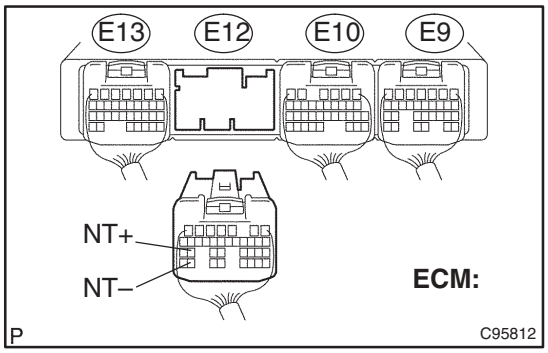


(a) Check the speed sensor installation.
OK:
The installation bolt is tightened properly and there is no clearance between the sensor and transaxle case.

NG → **REPLACE SPEED SENSOR(NT)**

OK

2 INSPECT SPEED SENSOR(NT)



(a) Disconnect the speed sensor connector from the transaxle.
(b) Measure the resistance according to the value(s) in the table below.
Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
1 – 2	560 to 680 Ω

NG → **REPLACE SPEED SENSOR(NT)**

OK

3 CHECK HARNESS AND CONNECTOR(SPEED SENSOR – ECM)

(a) Connect the speed sensor connector.
(b) Disconnect the ECM connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 26 (NT+) – E12 – 34 (NT–)	560 to 680 Ω

(d) Measure the resistance according to the value(s) in the table below.

Standard (Check for short):

Tester Connection	Specified Condition
E12 – 26 (NT+) – Body ground	10 kΩ or higher
E12 – 34 (NT–) – Body ground	↑

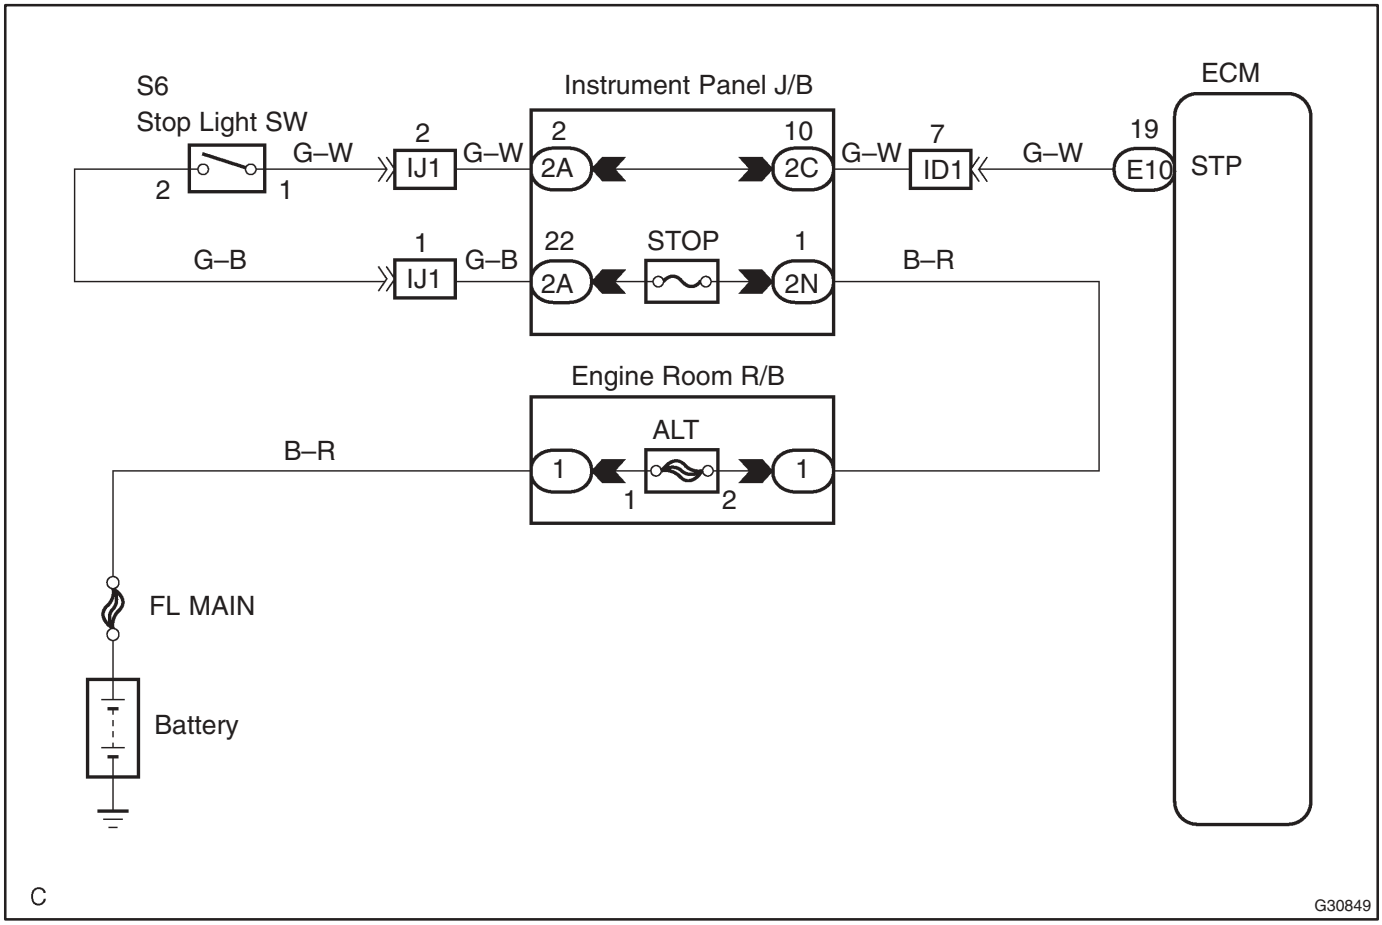
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

DTC P0724 BRAKE SWITCH ”B” CIRCUIT HIGH

CIRCUIT DESCRIPTION



The purpose of this circuit is to prevent the engine from stalling while driving in lock–up condition, when brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signals to the ECM. Then the ECM cancels the operation of the lock–up clutch while braking is in progress.

DTC No.	DTC Detecting Condition	Trouble Area
P0724	The stop light switch remains ON even when the vehicle is driven in a GO (30 km/h) and STOP (3 km/h) fashion 10 times. (2–trip detection logic).	• Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

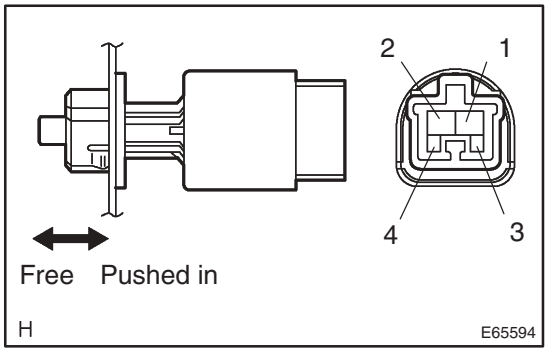
This DTC indicates that the stop light switch remains on. When the stop light switch remains ON during ”stop and go” driving, the ECM interprets this as a fault in the stop light switch and the MIL comes on and the ECM stores the DTC. The vehicle must stop (less than 3 km/h (2 mph)) and go (30 km/h (19 mph) or more) ten times for two driving cycles in order to detect malfunction.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Using the Intelligent Tester II Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to shorten labor time.



NOTICE:

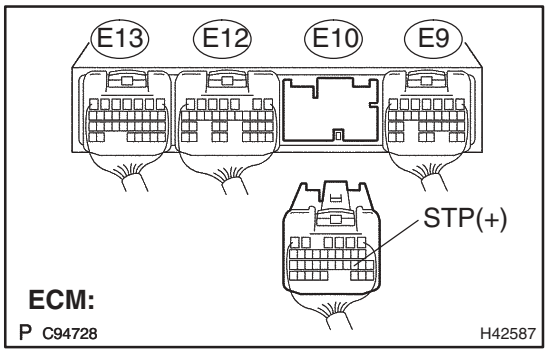
In the table below, the values listed under ”Normal Condition” are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Select the item ”Enter / Power train / Engine and ECT / Data List”.
(g) Follow the instructions on the tester and read the Data List.

Item	Measurement Item/ Range (display)	Normal Condition
Stop Light Switch	Stop light SW Status/ ON or OFF	• Brake Pedal is depressed: ON • Brake Pedal is released: OFF

1 INSPECT STOP LAMP SWITCH ASSY

(a) Remove the stop lamp switch assy.
(b) Measure the resistance according to the value(s) in the table below.



Standard:

Switch position	Tester Connection	Specified Condition
Switch pin free	1 – 2	Below 1 Ω
Switch pin pushed in	↑	10 kΩ or higher
Switch pin free	3 – 4	10 kΩ or higher
Switch pin pushed in	↑	Below 1 Ω

NG → **REPLACE STOP LAMP SWITCH ASSY**

OK

2	CHECK HARNESS AND CONNECTOR(STOP LAMP SWITCH ASSY – ECM)

(a) Install the stop lamp switch assy.
(b) Measure the voltage according to the value(s) in the table below when the brake pedal is depressed and released.

Standard:

Condition	Tester Connection	Specified Condition
Brake pedal is depressed	E10 – 19 (STP) – Body ground	10 to 14 V
Brake pedal is released	↑	Below 1 V

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

DTC	P0741	TORQUE CONVERTER CLUTCH SOLENOID PERFORMANCE (SHIFT SOLENOID VALVE SL)

SYSTEM DESCRIPTION

The ECM uses the signals from the throttle position sensor, Air–flow meter, turbine (input) speed sensor and crankshaft position sensor to monitor the engagement condition of the lock–up clutch.
Then the ECM compares the engagement condition of the lock–up clutch with the lock–up schedule in the ECM memory to detect a mechanical problems of the shift solenoid valve SL, valve body and torque converter clutch.

DTC No.	DTC Detection Condition	Trouble Area
P0741	Lock–up does not occur when driving in lock–up range (normal driving at 85 km/h [53 mph]), or lock–up remains ON in lock–up OFF range (2–trip detection logic)	• Shift solenoid valve SL remains open or closed • Valve body is blocked • Shift solenoid valve SL • Torque converter clutch • Automatic transaxle (clutch, brake or gear etc.) • Line pressure is too low • ECM

MONITOR DESCRIPTION

Based on the signals from the throttle position sensor, the airflow meter and the crankshaft position sensor, the ECM sends a signal to the shift solenoid valve SL to regulate the hydraulic pressure and provide smoother gearshifts. The shift–solenoid valve SL responds to commands from the ECM. The valve controls the lock–up relay valve to perform torque converter lock–up functions.
The ECM compares the engine rpm (NE) signal and the input turbine speed signal to detect torque converter lock–up. The ECM then compares the lock–up status against the lock–up schedule in the ECM memory. If the ECM does not detect lock–up at the appropriate time, it will conclude that there is a malfunction of shift solenoid SL. The ECM will illuminate the MIL.

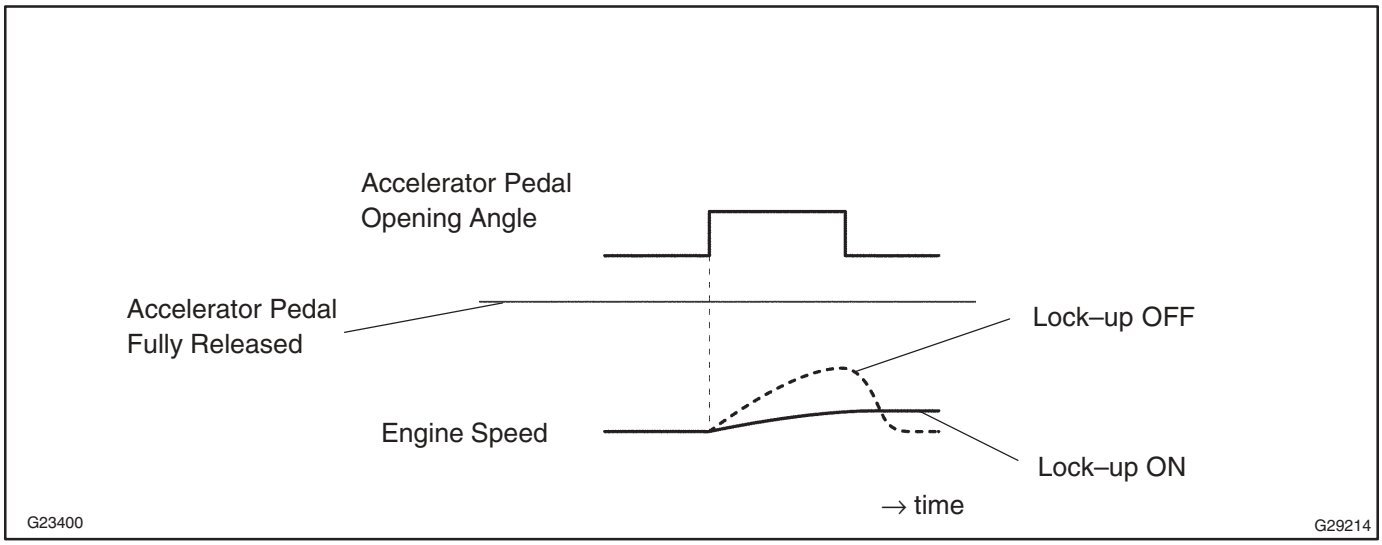
INSPECTION PROCEDURE

HINT:

Performing the Intelligent Tester II Active Test allows relay, Vacuum Switching Valve (VSV), actuator and other items to be operated without removing any parts. Performing the Active Test early in troubleshooting is one way to shorten labor time. The Data List can be displayed during the Active Test.

(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Clear the DTC.
(g) Select the item ”Enter / Power train / Engine and ECT / Active Test / Control the Lock Up”.
(h) Follow the instructions on the tester and read the Active Test.

Item	Test Details	Diagnostic Note
Control the Lock Up	[Test Details] Control the shift solenoid SL to set the automatic transaxle to the lock–up condition. [Vehicle Condition] Vehicle Speed: 58 km/h (36 mph) or more	Possible to check the SL operation.



HINT:

- This test can be conducted when the vehicle speed is 58 km/h (36 mph) or more.
- This test can be conducted with the 3rd or 4th gear.

(i) Lightly depress the accelerator pedal and check that the engine speed does not change abruptly.

HINT:

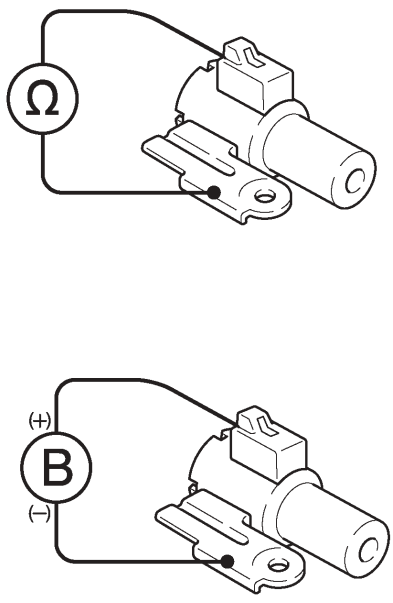
- When changing the accelerator pedal opening angle while driving, if the engine speed does not change, lock–up is on.
- Slowly release, but not fully, the accelerator pedal in order to decelerate. (Fully releasing the pedal will close the throttle valve and lock–up may be turned off.)

1 CHECK OTHER DTCS OUTPUT(IN ADDITION TO DTC P0741)

(a) Connect the Intelligent Tester II to the DLC3.
(b) Turn the ignition switch to the ON position.
(c) Turn on the tester.
(d) Select the item ”Power train / Engine and ECT / DTC / Current or Pending”.
(e) Read the DTCs using the Intelligent Tester II.

Result:

Display (DTC output)	Proceed to
Only ”P0741” is output	A
”P0741” and other DTCs	B



HINT:
If any other codes besides ”P0741” is output, perform the troubleshooting for those DTCs first.

B → **GO TO RELEVANT DTC CHART (SEE PAGE 05–245)**

A

2 INSPECT SHIFT SOLENOID VALVE(SL)

Shift Solenoid Valve SL:

(a) Remove the shift solenoid valve SL.
(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (SL) – Solenoid Body (SL)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(SL)**

OK

3	**INSPECT TRANSMISSION VALVE BODY ASSY(See chapter 2 in the problem symptoms table) (SEE PAGE 05–229)**

OK:

There are no foreign objects on each valve and they operate smoothly.

NG → **REPAIR OR REPLACE TRANSMISSION VALVE BODY ASSY (See Pub. No. RM1018E, page 40–42)**

OK

4	**INSPECT TORQUE CONVERTER CLUTCH ASSY (See Pub. No. RM1018E, page 40–37)**

OK:

The torque converter clutch operates normally.

NG → **REPLACE TORQUE CONVERTER CLUTCH ASSY**

OK

REPAIR OR REPLACE AUTOMATIC TRANSAXLE ASSY (See Pub. No. RM1018E, page 40–11)

DTC	P0751	SHIFT SOLENOID ”A” PERFORMANCE (SHIFT SOLENOID VALVE S1)

SYSTEM DESCRIPTION

The ECM uses signals from the vehicle speed sensor and speed sensor NT to detect the actual gear position (1st, 2nd, 3rd or 4th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves and valve body.

DTC No.	DTC Detecting Condition	Trouble Area
P0751	The gear required by the ECM does not match the actual gear when driving (2–trip detection logic)	• Shift solenoid valve S1 remains open or closed • Valve body is blocked • Shift solenoid valve S1 • Automatic transaxle (clutch, brake or gear etc.) • ECM

MONITOR DESCRIPTION

The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. According to the input shaft revolution, intermediate (counter) shaft revolution and output shaft revolution, the ECM detects the actual gear position (1st, 2nd, 3rd or 4th gear position). When the gear position commanded by the ECM and the actual gear position are not same, the ECM illuminates the MIL.

Example:

When either condition (a) or (b) is met, the ECM detects a malfunction.

(a) The ECM commands the 1st gear, but the actual gear is 2nd.

(b) The ECM commands the 2nd gear, but the actual gear is 1st.

INSPECTION PROCEDURE

HINT:

Performing the Intelligent Tester II Active Test allows relay, Vacuum Switching Valve (VSV), actuator and other items to be operated without removing any parts. Performing the Active Test early in troubleshooting is one way to shorten labor time. The Data List can be displayed during the Active Test.

(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Clear the DTC.
(g) Select the item "Enter / Power train / Engine and ECT / Active Test / Control the Shift Position".
(h) Follow the instructions on the tester and read the Active Test.

HINT:

While driving, the shift position can be forcibly changed with the Intelligent Tester II.
Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (see page 05–241).

Item	Test Details	Diagnostic Note
Control the Shift Position	[Test Details] Operate the shift solenoid valve and set the each shift position by yourself. [Vehicle Condition] • IDL: ON • Less than 50 km/h (31 mph) [Others] • Press "→" button: Shift up • Press "←" button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The shift position commanded by the ECM is shown in the DATA LIST (Shift Status) display on the Intelligent Tester II.

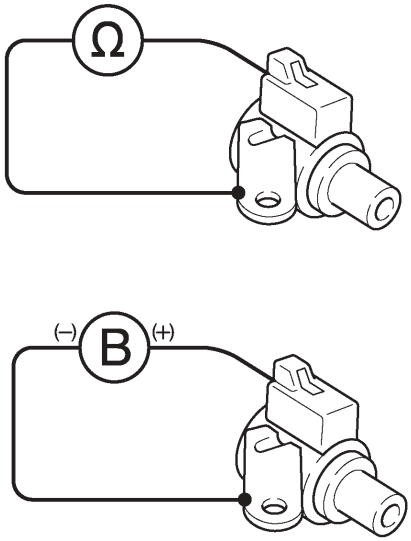
1	CHECK OTHER DTCS OUTPUT(IN ADDITION TO DTC P0751)

(a) Connect the Intelligent Tester II to the DLC3.
(b) Turn the ignition switch to the ON position.
(c) Turn on the tester.
(d) Select the item "Power train / Engine and ECT / DTC / Current or Pending".
(e) Read the DTCs using the Intelligent Tester II.

Result:

Display (DTC output)	Proceed to
Only "P0751" is output	A
"P0751" and other DTCs	B

HINT:



If any other codes besides "P0751" is output, perform the troubleshooting for those DTCs first.

B → GO TO RELEVANT DTC CHART (SEE PAGE 05–245)

A

2	INSPECT SHIFT SOLENOID VALVE(S1)

Shift Solenoid Valve S1:

(a) Remove the shift solenoid valve S1.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (S1) – Solenoid Body (S1)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(S1)**

OK

3	INSPECT TRANSMISSION VALVE BODY ASSY(See chapter 2 in the problem symptoms table) (SEE PAGE 05–229)

OK:

There are no foreign objects on each valve and they operate smoothly.

NG → **REPAIR OR REPLACE TRANSMISSION VALVE BODY ASSY (See Pub. No. RM1018E, page 40–42)**

OK

4	INSPECT TORQUE CONVERTER CLUTCH ASSY (See Pub. No. RM1018E, page 40–37)

OK:

The torque converter clutch operates normally.

NG → **REPLACE TORQUE CONVERTER CLUTCH ASSY**

OK

REPAIR OR REPLACE AUTOMATIC TRANSAXLE ASSY (See Pub. No. RM1018E, page 40–11)

DTC	P0756	SHIFT SOLENOID ”B” PERFORMANCE (SHIFT SOLENOID VALVE S2)

SYSTEM DESCRIPTION

The ECM uses signals from the vehicle speed sensor to detect the actual gear position (1st, 2nd, 3rd or 4th gear).

Then the ECM compares the actual gear with the shift schedule in the ECM memory to detect mechanical problems of the shift solenoid valves and valve body.

DTC No.	DTC Detecting Condition	Trouble Area
P0756	The gear required by the ECM does not match the actual gear when driving (2–trip detection logic)	• Shift solenoid valve S2 remains open or closed • Valve body is blocked • Shift solenoid valve S2 • Automatic transaxle (clutch, brake or gear etc.) • ECM

MONITOR DESCRIPTION

The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. According to the input shaft revolution, intermediate (counter) shaft revolution and output shaft revolution, the ECM detects the actual gear position (1st, 2nd, 3rd or 4th gear position). When the gear position commanded by the ECM and the actual gear position are not same, the ECM illuminates the MIL and stores the DTC.

INSPECTION PROCEDURE

HINT:

Performing the Intelligent Tester II Active Test allows relay, Vacuum Switching Valve (VSV), actuator and other items to be operated without removing any parts. Performing the Active Test early in troubleshooting is one way to shorten labor time. The Data List can be displayed during the Active Test.

(a) Warm up the engine.
(b) Turn the ignition switch off.
(c) Connect the Intelligent Tester II to the DLC3.
(d) Turn the ignition switch to the ON position.
(e) Turn on the tester.
(f) Clear the DTC.
(g) Select the item ”Enter / Power train / Engine and ECT / Active Test / Control the Shift Position”.
(h) Follow the instructions on the tester and read the Active Test.

HINT:

While driving, the shift position can be forcibly changed with the Intelligent Tester II.
Comparing the shift position commanded by the ACTIVE TEST with the actual shift position enables you to confirm the problem (see page 05–241).

Item	Test Details	Diagnostic Note
Control the Shift Position	[Test Details] Operate the shift solenoid valve and set the each shift position by yourself. [Vehicle Condition] • IDL: ON • Less than 50 km/h (31 mph) [Others] • Press ”→” button: Shift up • Press ”←” button: Shift down	Possible to check the operation of the shift solenoid valves.

HINT:

- This test can be conducted when the vehicle speed is 50 km/h (31 mph) or less.
- The shift position commanded by the ECM is shown in the DATA LIST (Shift Status) display on the Intelligent Tester II.

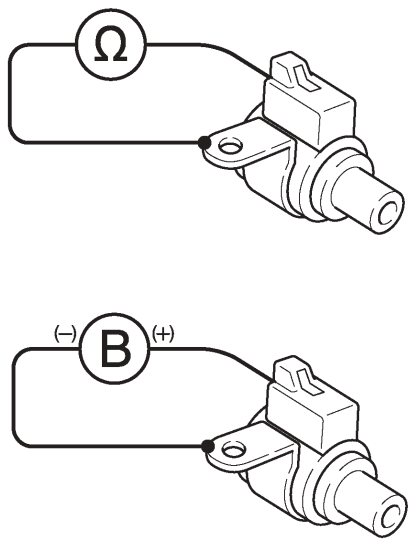
1	CHECK OTHER DTCS OUTPUT(IN ADDITION TO DTC P0756)

(a) Connect the Intelligent Tester II to the DLC3.
(b) Turn the ignition switch to the ON position.
(c) Turn on the tester.
(d) Select the item ”Power train / Engine and ECT / DTC / Current or Pending”.
(e) Read the DTCs using the Intelligent Tester II.

Result:

Display (DTC output)	Proceed to
Only ”P0756” is output	A
”P0756” and other DTCs	B

HINT:



If any other codes besides ”P0756” is output, perform the troubleshooting for those DTCs first.

B → GO TO RELEVANT DTC CHART (SEE PAGE 05–245)

A

2	INSPECT SHIFT SOLENOID VALVE(S2)

Shift Solenoid Valve S2:

(a) Remove the shift solenoid valve S2.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (S2) – Solenoid Body (S2)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(S2)**

OK

3	INSPECT TRANSMISSION VALVE BODY ASSY(See chapter 2 in the problem symptoms table) (SEE PAGE 05–229)

OK:

There are no foreign objects on each valve and they operate smoothly.

NG → **REPAIR OR REPLACE TRANSMISSION VALVE BODY ASSY (See Pub. No. RM1018E, page 40–42)**

OK

4	INSPECT TORQUE CONVERTER CLUTCH ASSY (See Pub. No. RM1018E, page 40–37)

OK:

The torque converter clutch operates normally.

NG → **REPLACE TORQUE CONVERTER CLUTCH ASSY**

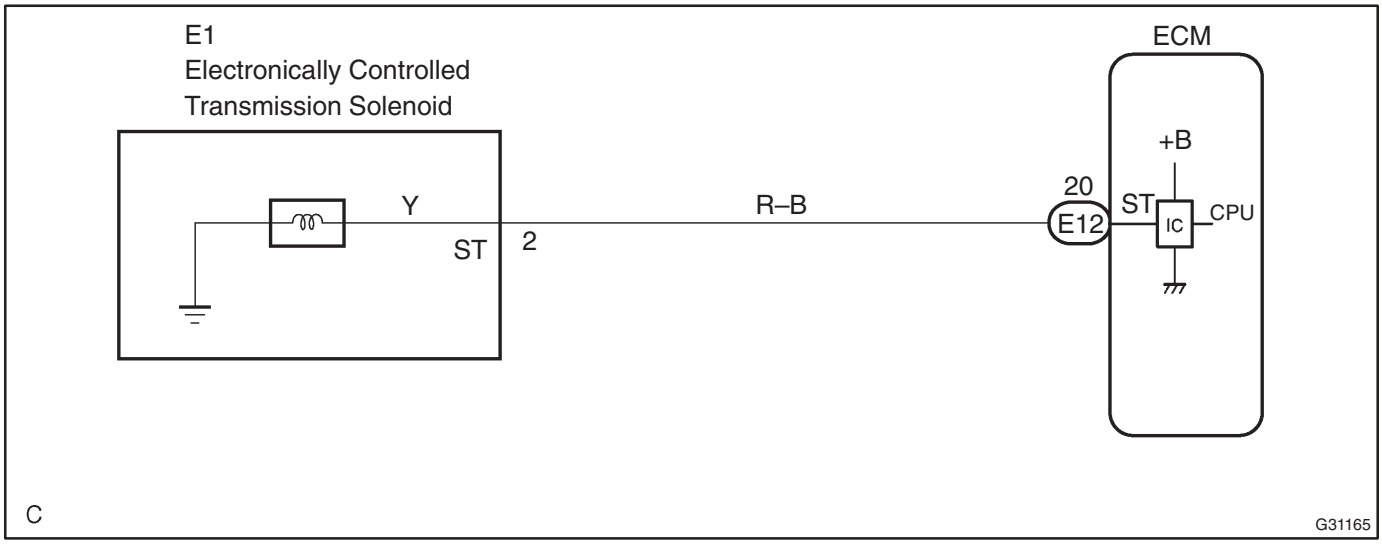
OK

REPAIR OR REPLACE AUTOMATIC TRANSAXLE ASSY (See Pub. No. RM1018E, page 40–11)

DTC	P0787	SHIFT/TIMING SOLENOID LOW (SHIFT SOLENOID VALVE ST)

DTC	P0788	SHIFT/TIMING SOLENOID HIGH (SHIFT SOLENOID VALVE ST)

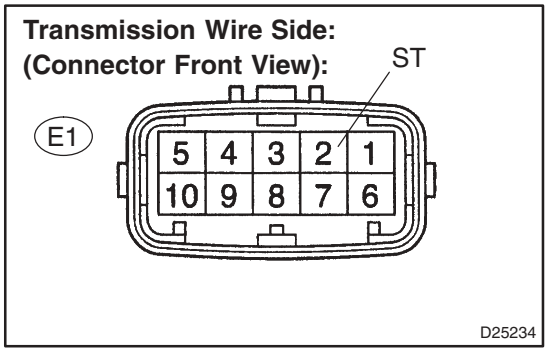
CIRCUIT DESCRIPTION



The shift solenoid valve ST is used for shifting from the 3rd to 4th gear, and from the 4th to 3rd gear. Actuates solenoid valves ST and SLT in accordance with the signals from the ECM, and guides this output pressure directly to 4–3 shift timing valve and 3–4 shift timing valve in order to regulate the line pressure that acts on the B_1 brake and C_1 clutch.

DTC No.	DTC Detection Condition	Trouble Area
P0787	ECM detects short in solenoid valve ST circuit 4 times when solenoid valve ST is operated (1–trip detection logic)	• Short in shift solenoid valve ST circuit • Shift solenoid valve ST • ECM
P0788	ECM detects open in solenoid valve ST circuit 4 times when solenoid valve ST is not operated (1–trip detection logic)	• Open in shift solenoid valve ST circuit • Shift solenoid valve ST • ECM

MONITOR DESCRIPTION



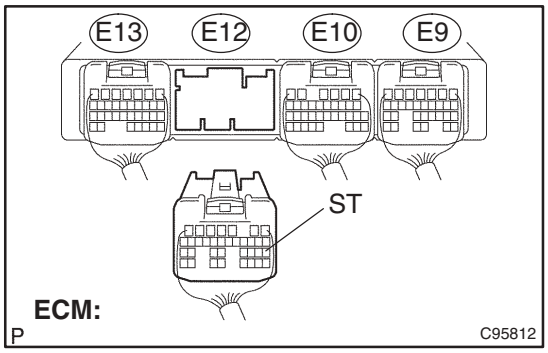
The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail–safe function and turns the other shift solenoid valves in good condition ”ON/OFF” (In case of an open or short circuit, the ECM stops sending current to the circuit.) (see page 05–241).

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(ST)

(a) Disconnect the transmission wire connector from the transaxle.
(b) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
2 – Body ground	11 to 15 Ω

NG → **Go to step 3**

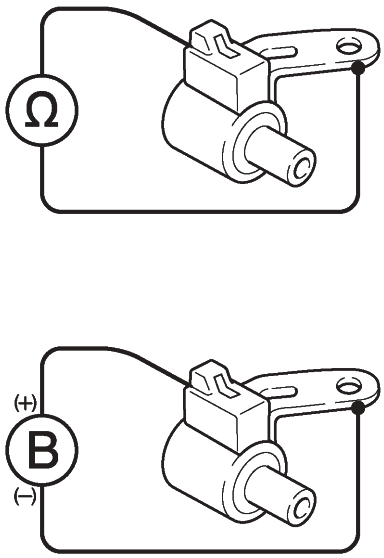
OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission connector to the transaxle.
(b) Disconnect the connector from the ECM.
(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 20 (ST) – Body ground	11 to 15 Ω



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(ST)

Shift Solenoid Valve ST:

N D09034

(a) Remove the shift solenoid valve ST.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (ST) – Solenoid Body (ST)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(ST)**

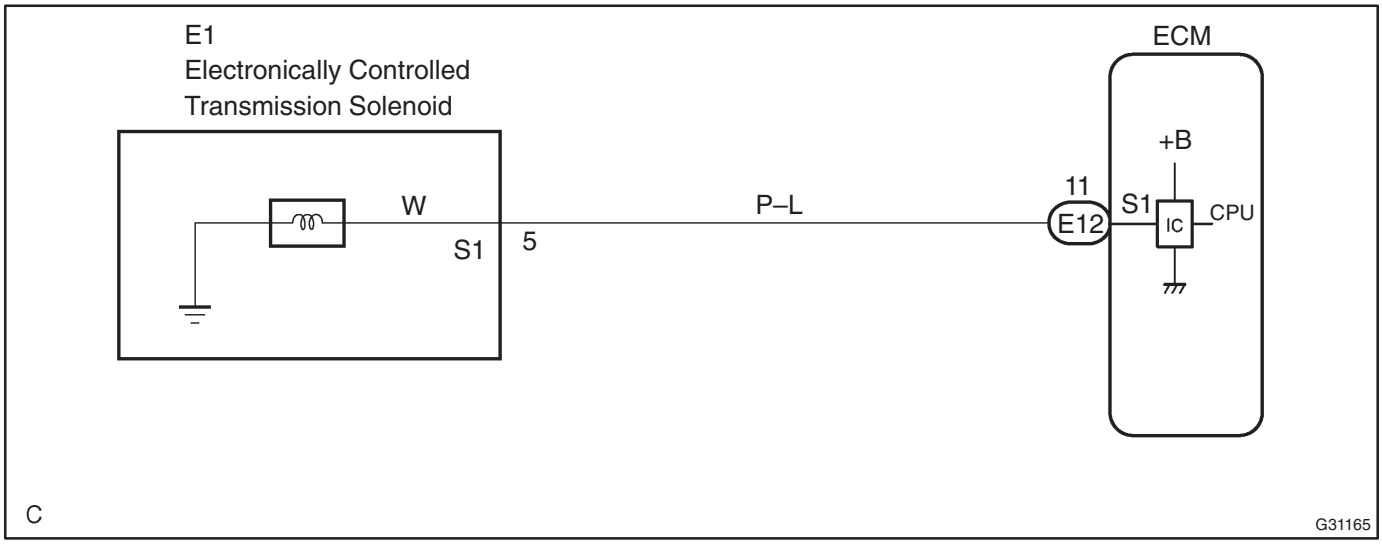
OK

REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

DTC	P0973	SHIFT SOLENOID ”A” CONTROL CIRCUIT LOW (SHIFT SOLENOID VALVE S1)

DTC	P0974	SHIFT SOLENOID ”A” CONTROL CIRCUIT HIGH (SHIFT SOLENOID VALVE S1)

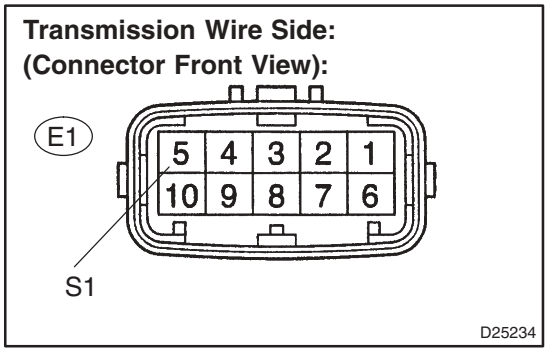
CIRCUIT DESCRIPTION



Shifting from 1st to 4th is performed in combination with ”ON” and ”OFF” operation of the shift solenoid valves S1 and S2 which is controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valve to allow the vehicle to be operated smoothly (Fail safe function).

DTC No.	DTC Detection Condition	Trouble Area
P0973	ECM detects short in solenoid valve S1 circuit 2 times when solenoid valve S1 is operated (1–trip detection logic)	• Short in shift solenoid valve S1 circuit • Shift solenoid valve S1 • ECM
P0974	ECM detects open in solenoid valve S1 circuit 2 times when solenoid valve S1 is not operated (1–trip detection logic)	• Open in shift solenoid valve S1 circuit • Shift solenoid valve S1 • ECM

MONITOR DESCRIPTION



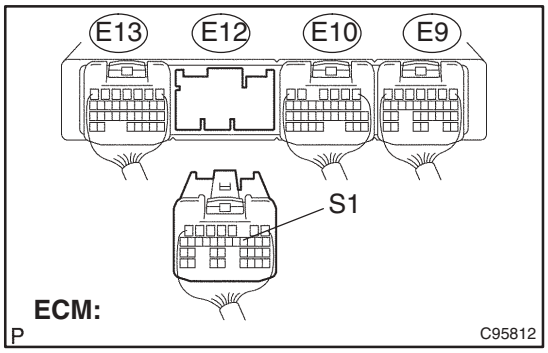
The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail–safe function and turns the other shift solenoid valves in good condition ”ON/OFF” (In case of an open or short circuit, the ECM stops sending current to the circuit.) (see page 05–241).

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(S1)

(a) Disconnect the transmission wire connector from the transaxle.
(b) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
5 – Body ground	11 to 15 Ω

NG → **Go to step 3**

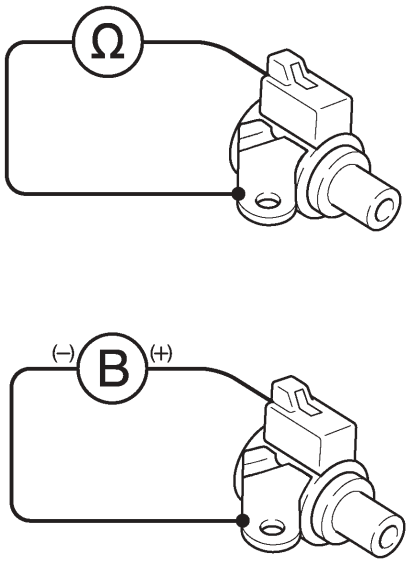
OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission connector to the transaxle.
(b) Disconnect the connector from the ECM.
(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 11 (S1) – Body ground	11 to 15 Ω



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(S1)

Shift Solenoid Valve S1:

(a) Remove the shift solenoid valve S1.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (S1) – Solenoid Body (S1)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(S1)**

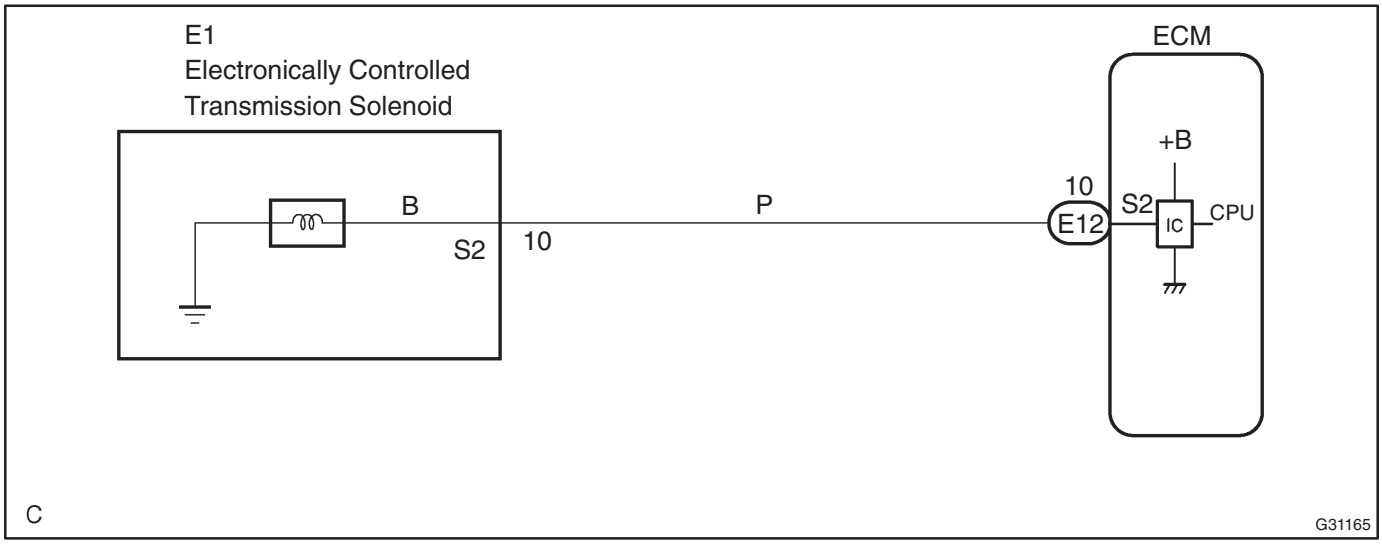
OK

REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

DTC	P0976	SHIFT SOLENOID ”B” CONTROL CIRCUIT LOW (SHIFT SOLENOID VALVE S2)

DTC	P0977	SHIFT SOLENOID ”B” CONTROL CIRCUIT HIGH (SHIFT SOLENOID VALVE S2)

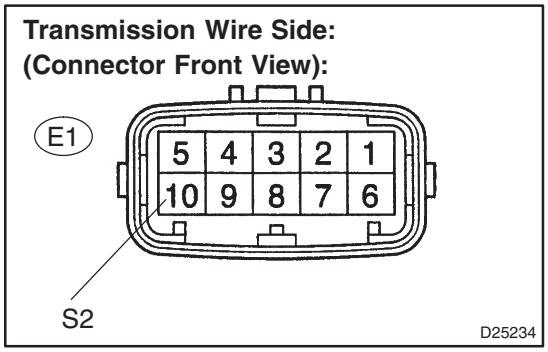
CIRCUIT DESCRIPTION



Shifting from 1st to 4th is performed in combination with ”ON” and ”OFF” operation of the shift solenoid valves S1 and S2 which is controlled by the ECM. If an open or short circuit occurs in either of the shift solenoid valves, the ECM controls the remaining normal shift solenoid valve to allow the vehicle to be operated smoothly (Fail safe function).

DTC No.	DTC Detection Condition	Trouble Area
P0976	ECM detects short in solenoid valve S2 circuit 2 times when solenoid valve S2 is operated (1–trip detection logic)	• Short in shift solenoid valve S2 circuit • Shift solenoid valve S2 • ECM
P0977	ECM detects open in solenoid valve S2 circuit 2 times when solenoid valve S2 is not operated (1–trip detection logic)	• Open in shift solenoid valve S2 circuit • Shift solenoid valve S2 • ECM

MONITOR DESCRIPTION



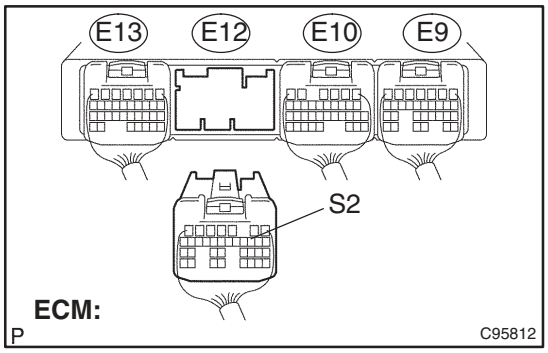
The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail–safe function and turns the other shift solenoid valves in good condition ”ON/OFF” (In case of an open or short circuit, the ECM stops sending current to the circuit.) (see page 05–241).

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(S2)

(a) Disconnect the transmission wire connector from the transaxle.
(b) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
10 – Body ground	11 to 15 Ω

NG → **Go to step 3**

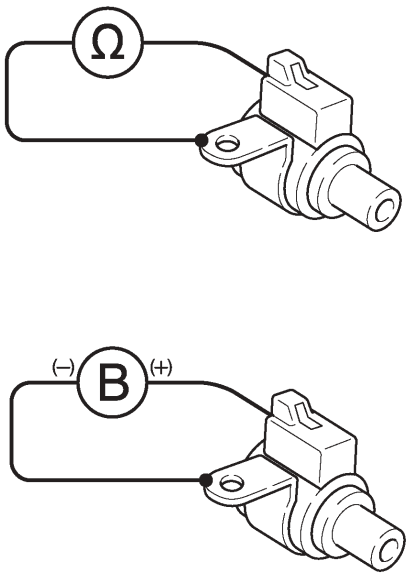
OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission connector to the transaxle.
(b) Disconnect the connector from the ECM.
(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 10 (S2) – Body ground	11 to 15 Ω



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(S2)

Shift Solenoid Valve S2:

(a) Remove the shift solenoid valve S2.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (S2) – Solenoid Body (S2)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(S2)**

OK

REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

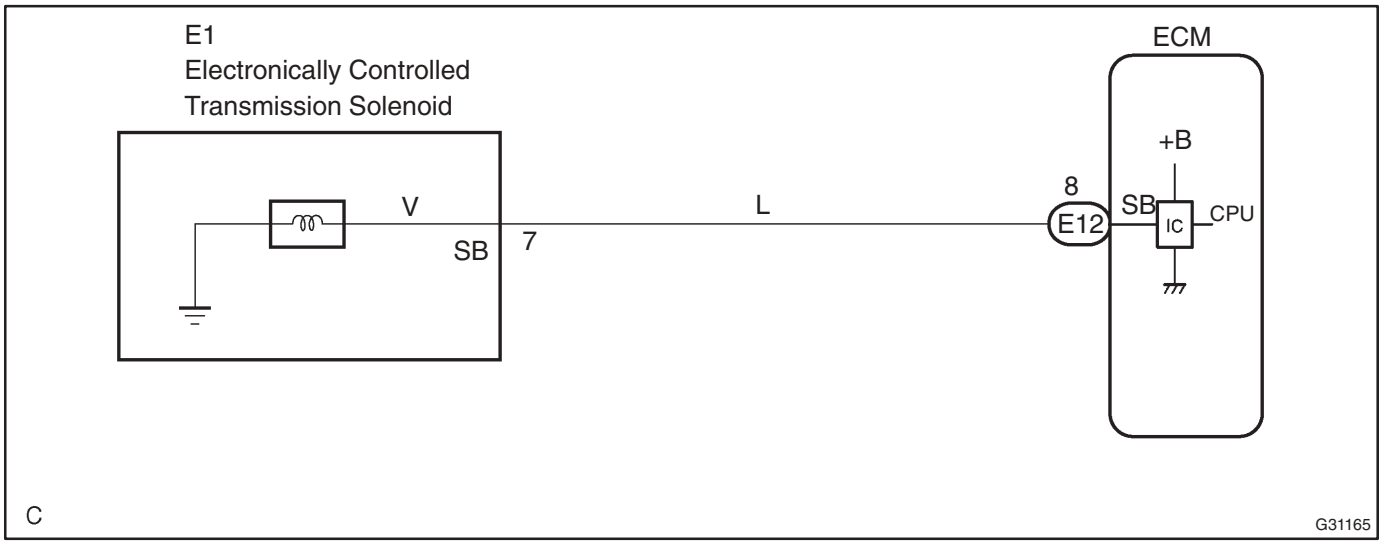
DTC	P0998	SHIFT SOLENOID ”F” CONTROL CIRCUIT LOW (SHIFT SOLENOID VALVE SB)

DTC	P0999	SHIFT SOLENOID ”F” CONTROL CIRCUIT HIGH (SHIFT SOLENOID VALVE SB)

CIRCUIT DESCRIPTION

Shift solenoid valve SB controls the 2nd brake (B_1) and 1st and reverse brake pressures and performs the 1st and 2nd engine brake control.

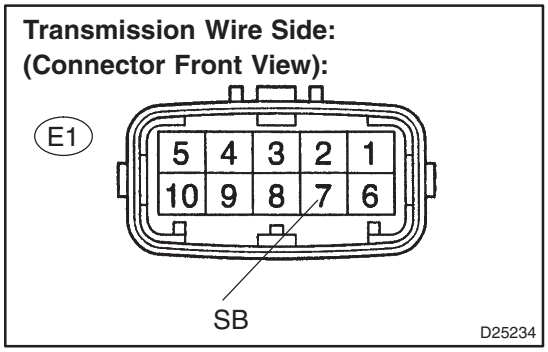
Fail safe function:



- S shift control prohibition.
- On activating the fail–safe function during S shift, the driving mode turns to the normal D position.

DTC No.	DTC Detection Condition	Trouble Area
P0998	ECM detects short in solenoid valve SB circuit 2 times when solenoid valve SB is operated (1–trip detection logic)	• Short in shift solenoid valve SB circuit • Shift solenoid valve SB • ECM
P0999	ECM detects open in solenoid valve SB circuit 2 times when solenoid valve SB is not operated (1–trip detection logic)	• Open in shift solenoid valve SB circuit • Shift solenoid valve SB • ECM

MONITOR DESCRIPTION



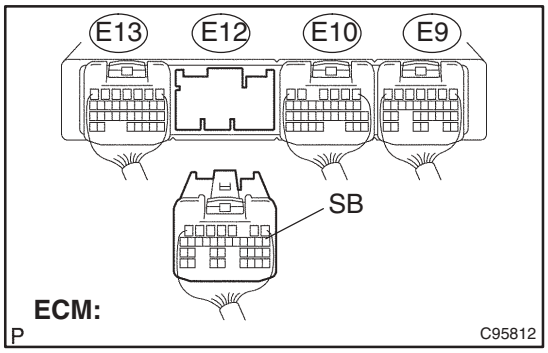
The ECM commands gear shifts by turning the shift solenoid valves ”ON/OFF”. When there is an open or short circuit in any shift solenoid valve circuit, the ECM detects the problem and illuminates the MIL and stores the DTC. And the ECM performs the fail–safe function and turns the other shift solenoid valves in good condition ”ON/OFF” (In case of an open or short circuit, the ECM stops sending current to the circuit.) (see page 05–241).

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(SB)

(a) Disconnect the transmission wire connector from the transaxle.
(b) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
7 – Body ground	11 to 15 Ω

NG → **Go to step 3**

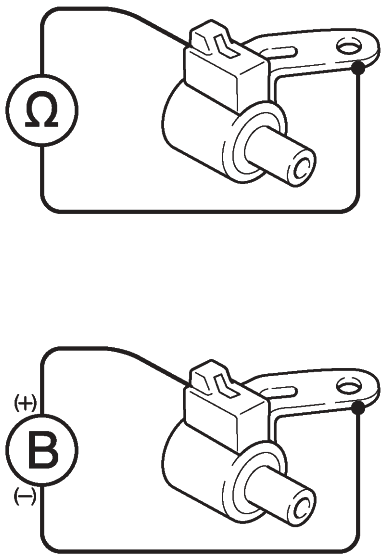
OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission connector to the transaxle.
(b) Disconnect the connector from the ECM.
(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 8 (SB) – Body ground	11 to 15 Ω



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(SB)

Shift Solenoid Valve SB:

(a) Remove the shift solenoid valve SB.

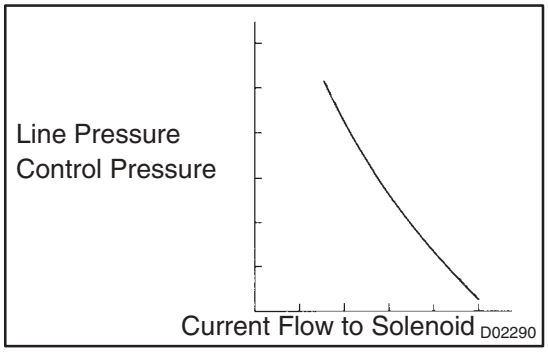
(b) Measure the resistance according to the value(s) in the table below.

Standard:

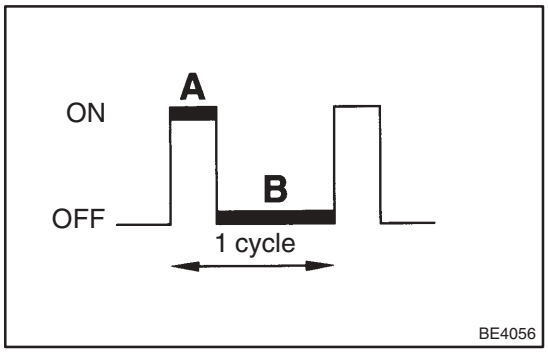
Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (SB) – Solenoid Body (SB)	11 to 15 Ω

(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:



The solenoid makes an operating noise.



NG → **REPLACE SHIFT SOLENOID VALVE(SB)**

OK

REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

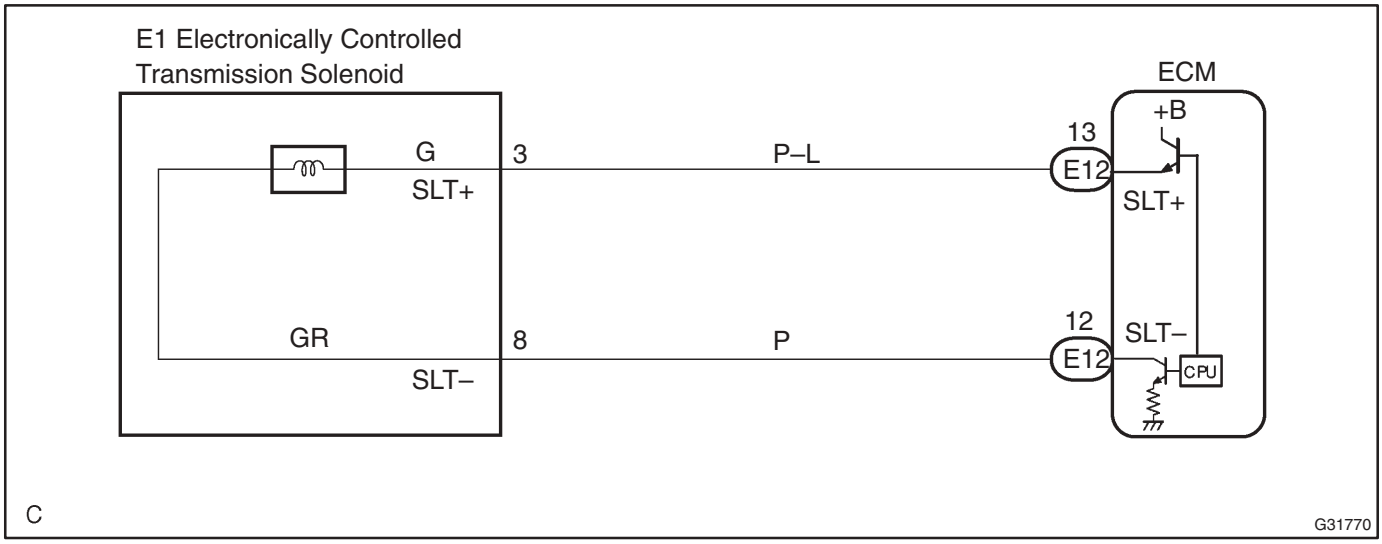
DTC	P2716	PRESSURE CONTROL SOLENOID ”D” ELECTRICAL (SHIFT SOLENOID SLT)

CIRCUIT DESCRIPTION

The linear solenoid valve (SLT) controls the transaxle line pressure for smooth transaxle operation based on signals from the throttle position sensor and the vehicle speed sensor. The ECM adjusts the duty cycle of the SLT solenoid valve to control hydraulic line pressure coming from the primary regulator valve. Appropriate line pressure assures smooth shifting with varying engine outputs.

(*): Duty Ratio

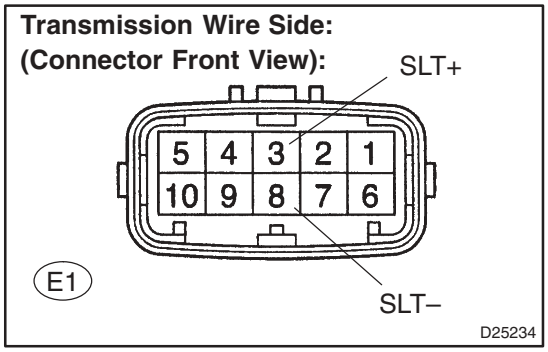
The duty ratio is the ratio of the period of continuity in one cycle. For example, if A is the period of continuity in one cycle, and B is the period of non–continuity, then



Duty Ratio=A/(A+B) x 100 (%)

DTC No.	DTC Detection Condition	Trouble Area
P2716	Condition (a) or (b) below is detected 1 sec. or more: (1–trip detection logic) (a) SLT– terminal: 0V (b) SLT– terminal: 12V	• Open or short in shift solenoid valve SLT circuit • Shift solenoid valve SLT • ECM

MONITOR DESCRIPTION



When an open or short in the linear solenoid valve (SLT) circuit is detected, the ECM interprets this as a fault. The ECM will turn ON the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(SLT)

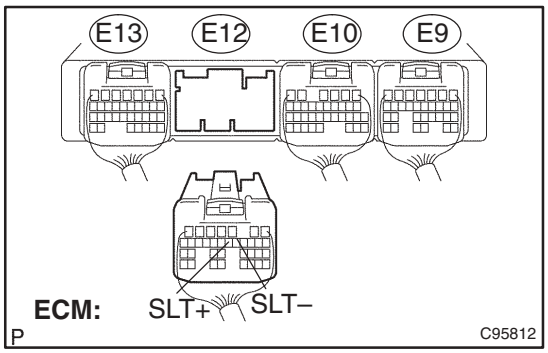
(a) Disconnect the transmission wire connector from the transaxle.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
3 (SLT+) – 8 (SLT–)	5.0 to 5.6 Ω

(c) Measure the resistance according to the value(s) in the table below.



Standard (Check for short):

Tester Connection	Specified Condition
3 (SLT+) – Body ground	10 kΩ or higher
8 (SLT–) – Body ground	↑

NG → **Go to step 3**

OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

(a) Connect the transmission wire connector to the transaxle.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

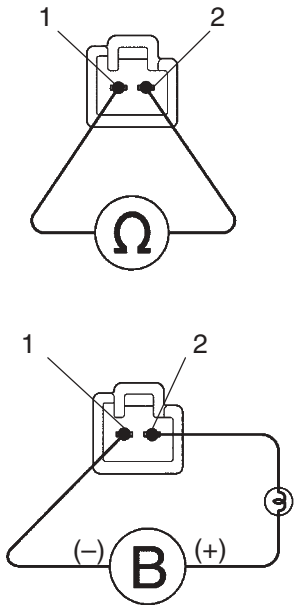
Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 13 (SLT+) – E12 – 12 (SLT–)	5.0 to 5.6 Ω

(d) Measure the resistance according to the value(s) in the table below.

Standard (Check for short):

Tester Connection	Specified Condition
E12 – 13 (SLT+) – Body ground	10 kΩ or higher
E12 – 12 (SLT–) – Body ground	↑



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(SLT)

Shift Solenoid Valve SLT:

(a) Remove the shift solenoid valve SLT.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
1 – 2	5.0 to 5.6 Ω

(c) Connect the positive (+) lead with a 21 W bulb to terminal 2 and the negative (–) lead to terminal 1 of the solenoid valve connector, then check the movement of the valve.

OK:

The solenoid makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(SLT)**

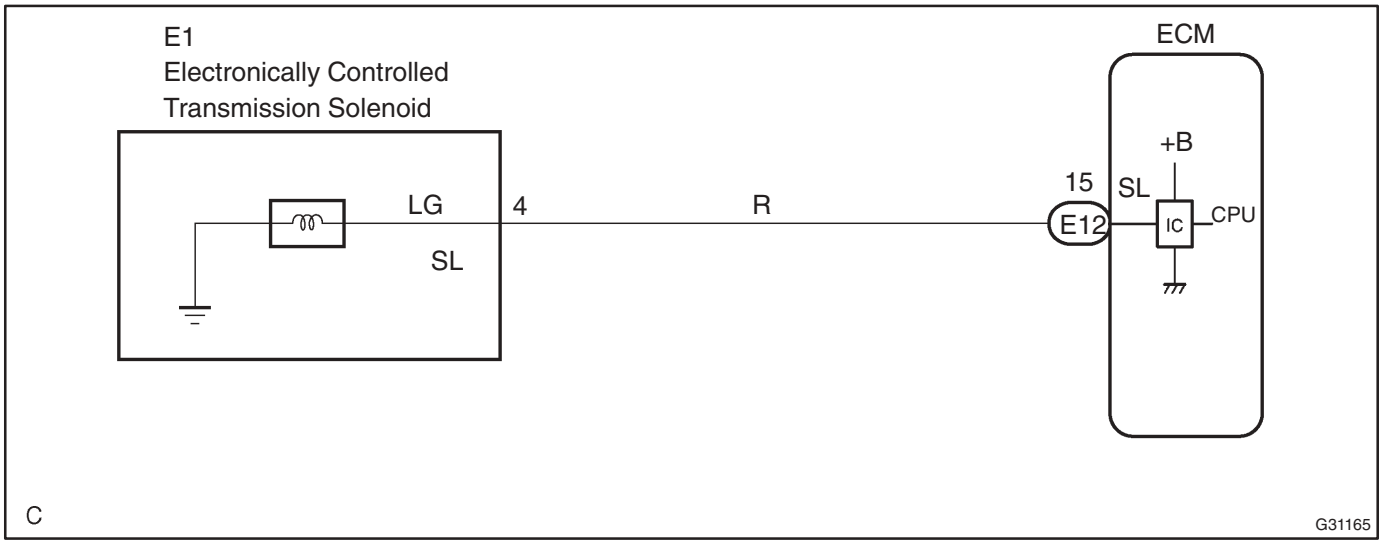
OK

REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

DTC	P2769	TORQUE CONVERTER CLUTCH SOLENOID CIRCUIT LOW (SHIFT SOLENOID VALVE SL)

DTC	P2770	TORQUE CONVERTER CLUTCH SOLENOID CIRCUIT HIGH (SHIFT SOLENOID VALVE SL)

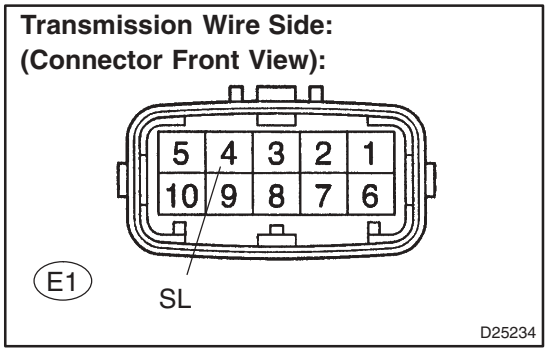
CIRCUIT DESCRIPTION



The shift solenoid valve SL is turned ”ON” and ”OFF” by signals from the ECM in order to control the hydraulic pressure operation, the lock–up relay valve, which then the controls operation of the lock–up clutch.

DTC No.	DTC Detection Condition	Trouble Area
P2769	ECM detects short in solenoid valve SL circuit (0.1 sec.) when solenoid valve SL is operated (2–trip detection logic)	• Short in shift solenoid valve SL circuit • Shift solenoid valve SL • ECM
P2770	ECM detects open in solenoid valve SL circuit (0.1 sec.) when solenoid valve SL is not operated (2–trip detection logic)	• Open in shift solenoid valve SL circuit • Shift solenoid valve SL • ECM

MONITOR DESCRIPTION



Based on the signals from the Throttle Position Sensor, the Airflow Meter and the Crankshaft Position Sensor, the ECM sends a signal to the shift solenoid valve SL to regulate the hydraulic pressure and provide smoother gearshifts. The shift solenoid valve SL responds to commands from the ECM. The valve controls the lock–up relay valve to perform the torque–converter lock–up function. If the ECM detects an open or short circuit for shift solenoid valve SL, it will illuminate the MIL.

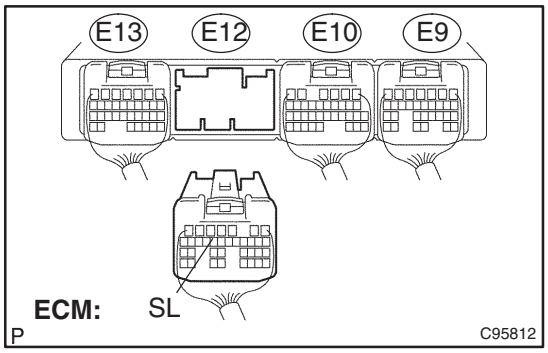
WIRING DIAGRAM

INSPECTION PROCEDURE

1 INSPECT TRANSMISSION WIRE(SL)

(a) Disconnect the transmission wire connector from the transaxle.

(b) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
4 – Body ground	11 to 15 Ω

NG → **Go to step 3**

OK

2 CHECK HARNESS AND CONNECTOR(TRANSMISSION WIRE – ECM)

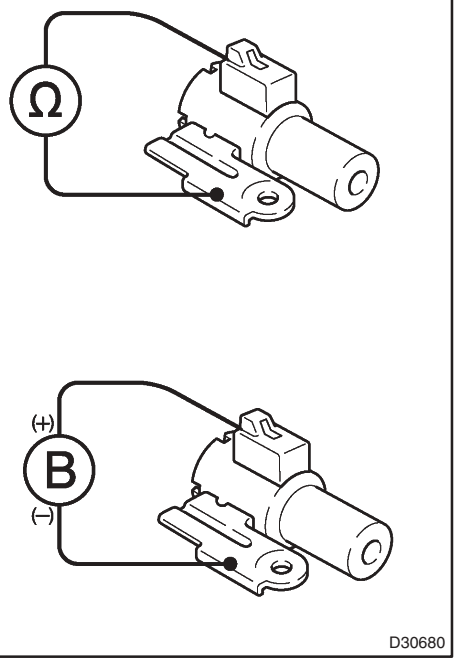
(a) Connect the transmission wire connector.

(b) Disconnect the ECM connector.

(c) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
E12 – 15 (SL) – Body ground	11 to 15 Ω



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

REPLACE ECM

3 INSPECT SHIFT SOLENOID VALVE(SL)

Shift Solenoid Valve SL:

(a) Remove the shift solenoid valve SL.

(b) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Specified Condition 20 °C (68 °F)
Solenoid Connector (SL) – Solenoid Body (SL)	11 to 15 Ω

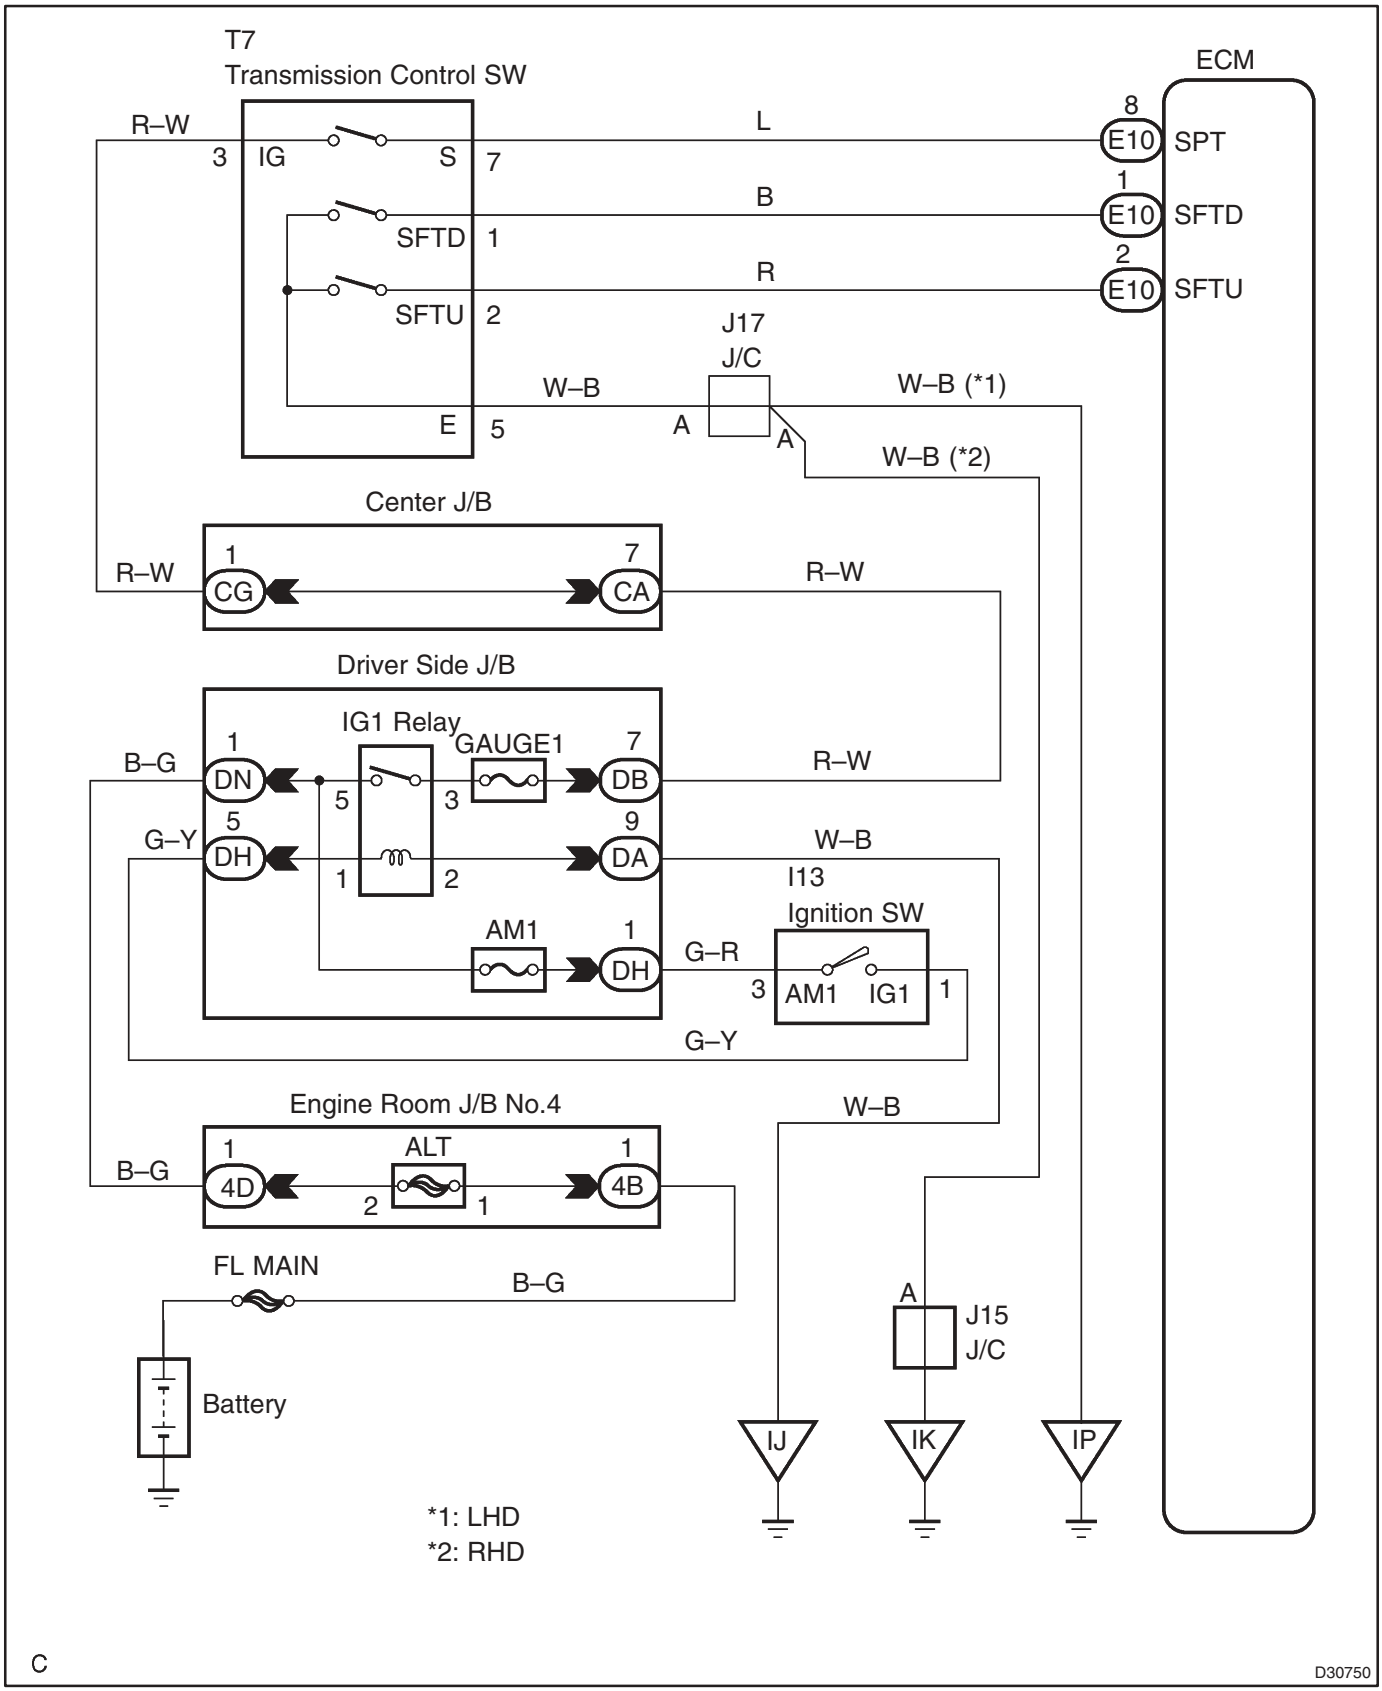
(c) Connect positive (+) lead to the terminal of solenoid connector, negative (–) lead to the solenoid body.

OK:

The solenoid valve makes an operating noise.

NG → **REPLACE SHIFT SOLENOID VALVE(SL)**

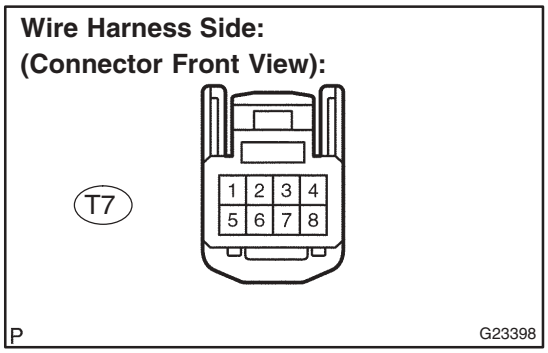
OK



REPAIR OR REPLACE TRANSMISSION WIRE (See Pub. No. RM1018E, page 40–51)

TRANSMISSION CONTROL SWITCH CIRCUIT

CIRCUIT DESCRIPTION



When moving the shift lever into the S position using the transmission control switch, it is possible to switch the shift range position between ”1” (first range) and ”4” (forth range).
Shifting up ”+” once raises one shift range position, and shifting down ”–” lowers one shift range position.

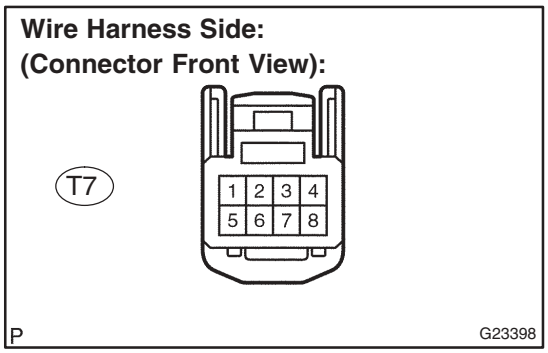
WIRING DIAGRAM

INSPECTION PROCEDURE

1	CHECK HARNESS AND CONNECTOR(BATTERY – TRANSMISSION CONTROL SWITCH)

(a) Disconnect the transmission control switch connector of shift lock control unit assy.

(b) Measure the voltage according to the value(s) in the table below.



Standard:

Switch Condition	Tester Connection	Specified Condition
IG switch ON	3 – Body ground	10 to 14 V
IG switch OFF	↑	Below 1 V

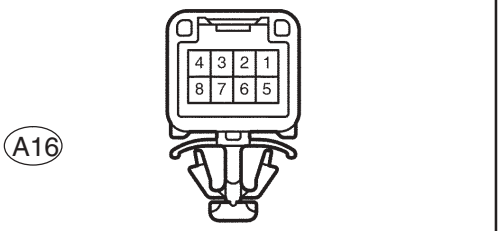
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

2	CHECK HARNESS AND CONNECTOR(TRANSMISSION CONTROL SWITCH – BODY GROUND)

(a) Measure the resistance according to the value(s) in the table below.

Standard:



Tester Connection	Specified Condition
5 – Body ground	Below 1 Ω

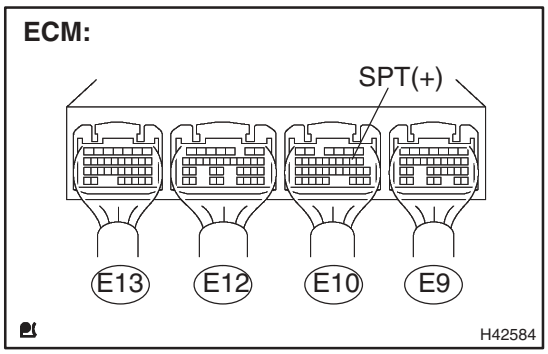
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

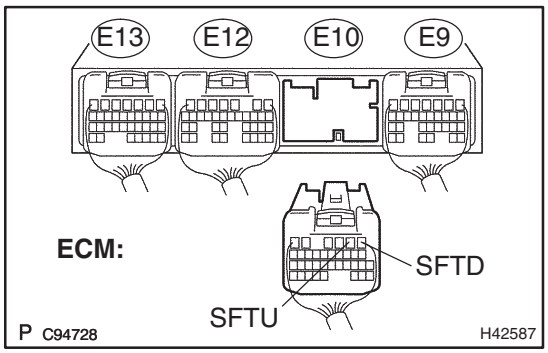
3 INSPECT SHIFT LOCK CONTROL UNIT ASSY

Switch Side:
(Connector Front View):

(a) Measure resistance between each terminal of shift lock control unit assy when the shift lever is moved to each position.



Standard:



Shift Position	Tester Connection	Specified Condition
S, "+" and "–"	3 – 7	Below 1 Ω
Except S, "+" and "–"	↑	10 kΩ or higher
Press continuously "+" (Up shift)	2 – 5	Below 1 Ω
S	↑	10 kΩ or higher
Press continuously "–" (Down shift)	1 – 5	Below 1 Ω
S	↑	10 kΩ or higher

NG → **REPLACE SHIFT LOCK CONTROL UNIT ASSY (See Pub. No. RM1018E, page 40–60)**

OK

4 CHECK HARNESS AND CONNECTOR(TRANSMISSION CONTROL SWITCH – ECM)

(a) Connect the transmission control switch connector of shift lock control unit assy.

(b) Turn the ignition switch to the ON position, and measure the voltage according to the value(s) in the table below when the shift lever is moved to each position.

Standard:

Shift Position	Tester Connection	Specified Condition
S, "+" and "–"	E10 – 8 (SPT) – Body ground	10 to 14 V
Except S, "+" and "–"	↑	Below 1 V

(c) Turn the ignition switch to the LOCK position.

(d) Disconnect the ECM connector.

(e) Measure the resistance according to the value(s) in the table below when the shift lever is moved to each position.

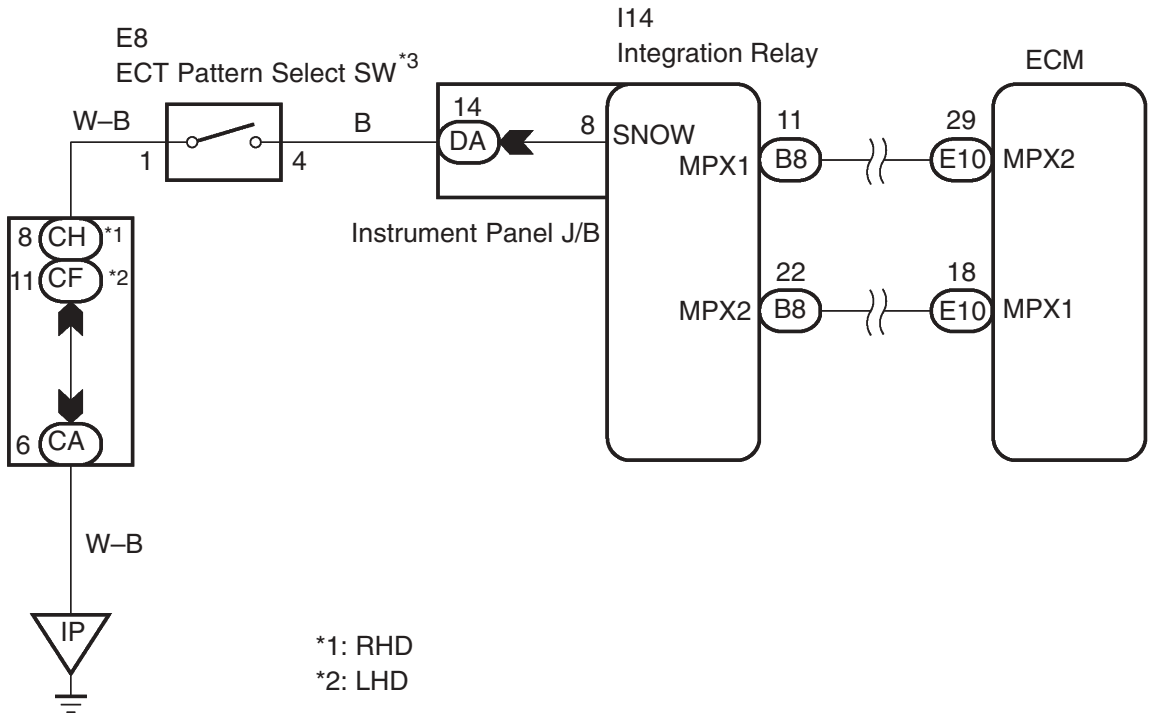
Standard:

Shift Position	Tester Connection	Specified Condition
Press continuously "+" (Up shift)	E10 – 2 (SFTU) – Body ground	Below 1 Ω
S	↑	10 kΩ or higher
Press continuously "–" (Down shift)	E10 – 1 (SFTD) – Body ground	Below 1 Ω
S	↑	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–229)



PATTERN SELECT SWITCH CIRCUIT

CIRCUIT DESCRIPTION

Integration relay receives pattern select switch information, and sends it through the multiplex communication system to the ECM.

ECT SNOW is the system that operates the throttle motor to control engine output to reduce skidding of the driving wheels, guarantee takeoff acceleration, driving straightness and turning stability.

WIRING DIAGRAM

(*3) Pattern Select Switch (ECT SNOW Switch)

When the ECT SNOW switch is pushed, the switch contact is made and the ECT SNOW mode is selected. To cancel the ECT SNOW mode, push the ECT SNOW switch once again. The ECT SNOW mode is automatically cancelledout when the ignition switch is turned ”OFF”.

C

D30688

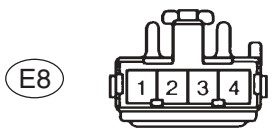
INSPECTION PROCEDURE

1	DRIVING TEST

(a) Start the engine.
(b) Turn the ECT SNOW switch ”OFF” (Normal drive mode).
(c) Confirm vehicle response by driving from a parked position to fully depressing the accelerator pedal.
(d) Turn the ECT SNOW switch ”ON” and perform the same check as (c).
Confirm that there is a difference between ECT SNOW switch ”ON” and ”OFF”.

HINT:
- Driving test should be done on a paved road (a nonskid road).
- Make sure not to use the TRAC system when testing a vehicle equipped with one.

OK:
There is a difference in acceleration between ”ON” and ”OFF”.



NG → **Go to step 2**

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–229)

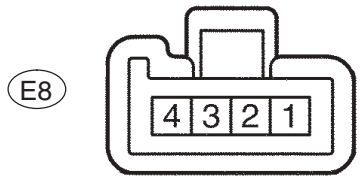
2	CHECK HARNESS AND CONNECTOR(PATTERN SELECT SWITCH ASSY NO.1 – BODY GROUND)

Wire Harness Side:
(Connector Front View):

B59192

(a) Disconnect the connector of pattern select switch.
(b) Measure the resistance according to the value(s) in the table below.

Standard:



Tester Connection	Specified Condition
1 – Body ground	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

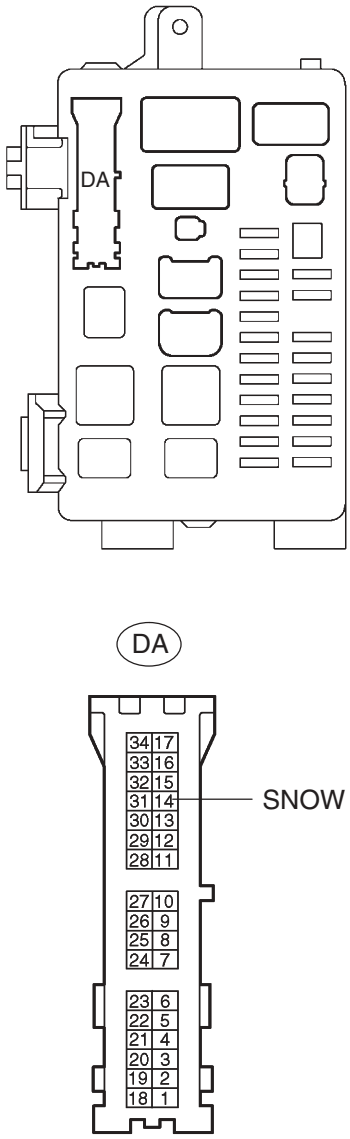
3	INSPECT PATTERN SELECT SWITCH ASSY

Switch Side:
(Connector Front View):

(a) Measure the resistance according to the value(s) in the table below.

Standard:

Switch Condition	Tester Connection	Specified Condition
Press continuously Pattern select switch (SNOW)	1 – 4	Below 1 Ω
Release Pattern select switch (SNOW)	↑	10 kΩ or higher



NG → **REPLACE PATTERN SELECT SWITCH ASSY**

OK

4	CHECK HARNESS AND CONNECTOR(PATTERN SELECT SWITCH ASSY NO.1 – MULTIPLEX NETWORK BODY ECU)

Instrument Panel J/B Assy

Vehicle Front Side:

(a) Connect the connector of pattern select switch.

(b) Disconnect the instrument panel J/B assy (integration relay) connector.

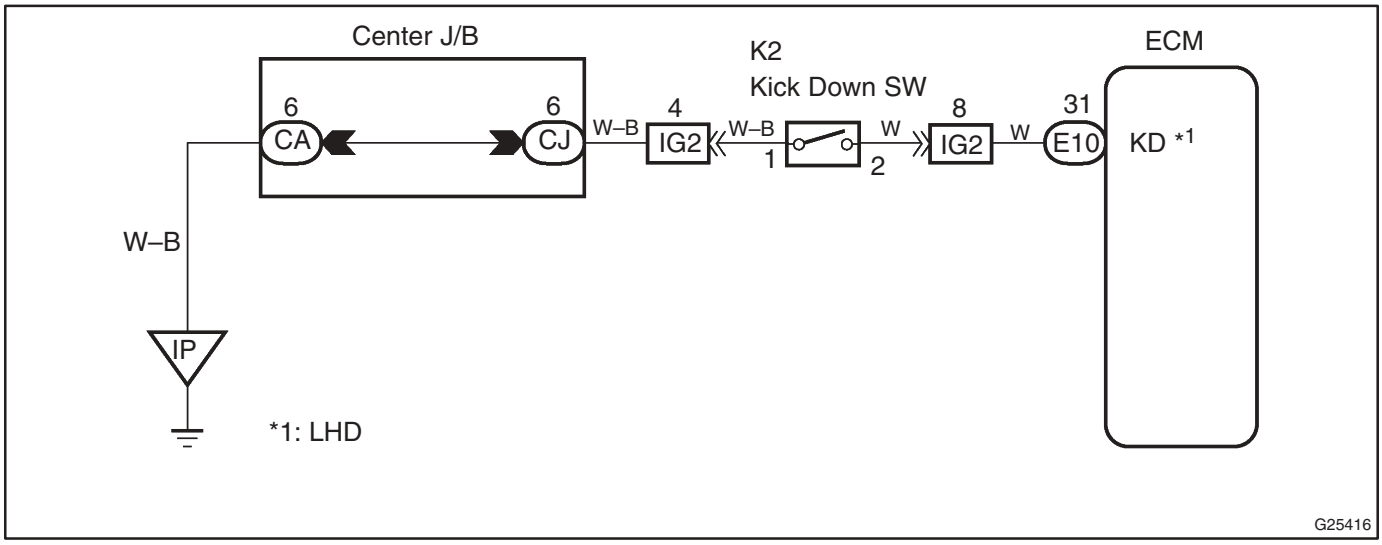
(c) Measure the resistance between terminal SNOW of instrument panel J/B assy (integration relay) connector and body ground.

Standard:

Switch Condition	Tester Connection	Specified Condition
Press continuously Pattern select switch (SNOW)	DA – 14 (SNOW) – Body ground	Below 1 Ω
Release Pattern select switch (SNOW)	↑	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

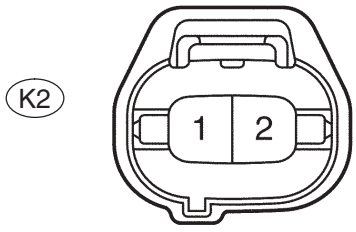


PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–229)

KICK–DOWN SWITCH CIRCUIT

CIRCUIT DESCRIPTION

The kick–down switch is turned ON when the accelerator pedal is fully depressed and a signal is sent to the ECM.
When the kick–down switch is turned ON, the ECM controls gear shifting according to the programmed shift diagrams.
If a short circuit develops in the kick–down switch, the ECM disregards the kick–down signals and controls shifting at the normal shift points.



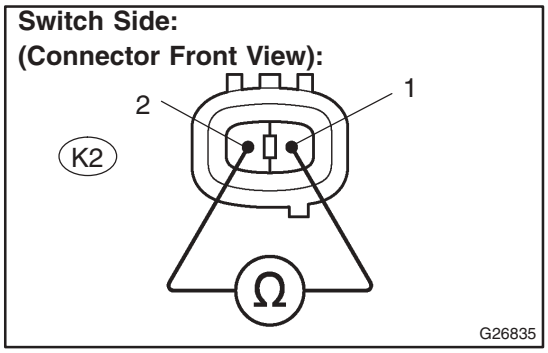
WIRING DIAGRAM

INSPECTION PROCEDURE

1	CHECK HARNESS AND CONNECTOR(KICK DOWN SWITCH – BODY GROUND)

Wire Harness Side:
(Connector Front View):

(a) Disconnect the kick–down switch connector.
(b) Measure the voltage according to the value(s) in the table below.



Standard:

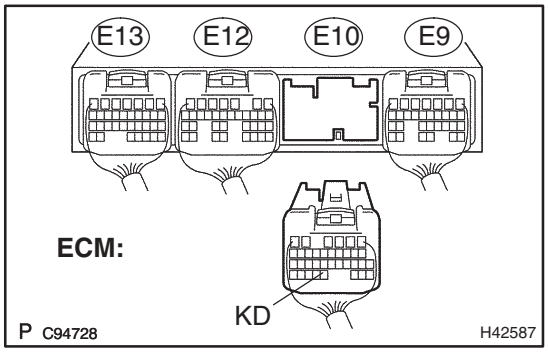
Tester Connection	Specified Condition
1 – Body ground	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK →

2 INSPECT KICK DOWN SWITCH

(a) Measure resistance according to the value(s) in the table below when kick–down switch is ON and OFF.



Standard:

Switch Condition	Tester Connection	Specified Condition
Press continuously (Kick–down switch is ON)	1 – 2	Below 1 Ω
Release (Kick–down switch is OFF)	↑	10 kΩ or higher

NG → **REPLACE KICK DOWN SWITCH**

OK

3 CHECK HARNESS AND CONNECTOR(KICK DOWN SWITCH – ECM)

(a) Connect the kick–down switch connector.
(b) Disconnect the ECM connector.
(c) Measure resistance according to the value(s) in the table below when accelerator pedal is fully depressed or not.

Standard:

Switch Condition	Tester Connection	Specified Condition
Fully depressed (Kick–down switch is ON)	E10 –31 (KD) – Body ground	Below 1 Ω
Release (Kick–down switch is OFF)	↑	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (SEE PAGE 01–32)**

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–229)

CRUISE CONTROL SYSTEM (2AZ–FSE)(From February, 2004)

HOW TO PROCEED WITH TROUBLESHOOTING

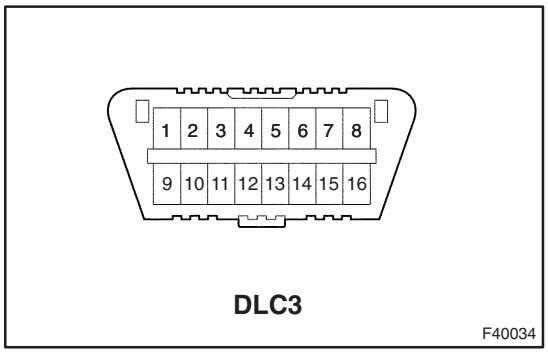
	2nd Time	☐ Normal System Code ☐ Trouble Code (Code)

05KYC–01

PRE–CHECK



1. DIAGNOSIS SYSTEM

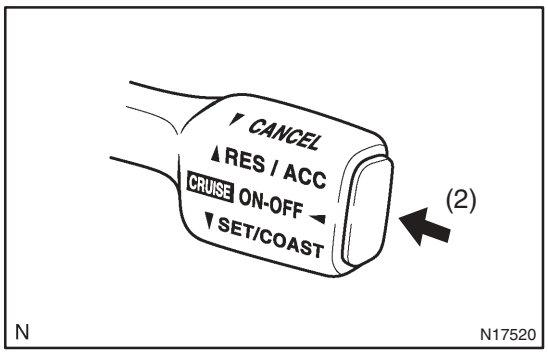
(a) Description

The ECM stores trouble codes when trouble occurs on the vehicle.

The diagnosis system allows for reading of the trouble codes from the DLC3. If the CRUISE main indicator light does not come on after DTC check, it means a malfunction has occurred in the cruise control system.

Use the intelligent tester II to check and solve the problem.

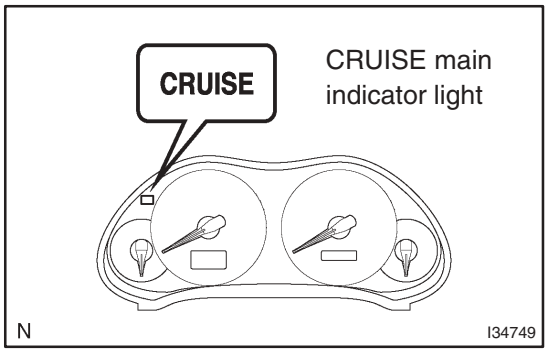
(b) Check the DLC3.



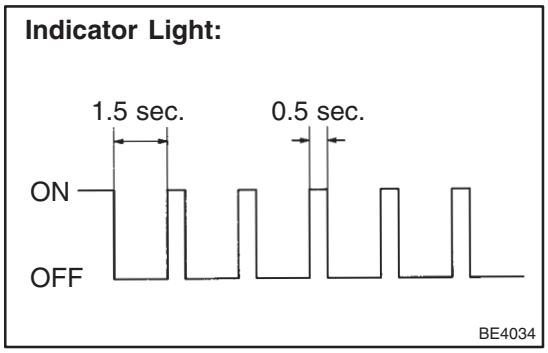
The vehicle's ECM uses ISO 9141–2 (Euro–OBD)/ISO 14230 (M–OBD) for communication protocol. The terminal arrangement of the DLC3 complies with ISO 15031–3 and matches the ISO 9141–2/ISO 14230 format.

Symbols (Terminals No.)	Terminal Description	Condition	Specified Condition
SIL(7) – SG(5)	Bus "+" line	During transmission	Pulse generation
CG(4) – Body ground	Chassis ground	Always	Below 1 Ω
SG(5) – Body ground	Signal ground	Always	Below 1 Ω
BAT(16) – Body ground	Battery positive	Always	11 to 14 V

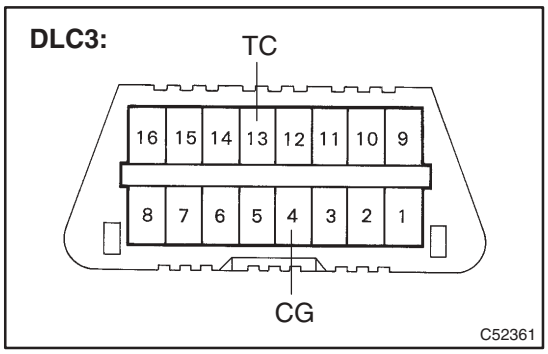
HINT:



If the display shows "UNABLE TO CONNECT TO VEHICLE" after connecting the intelligent tester II to the DLC3 and turning the ignition to the ON position, there is a problem with either the vehicle or the tool. (Intelligent tester II only)

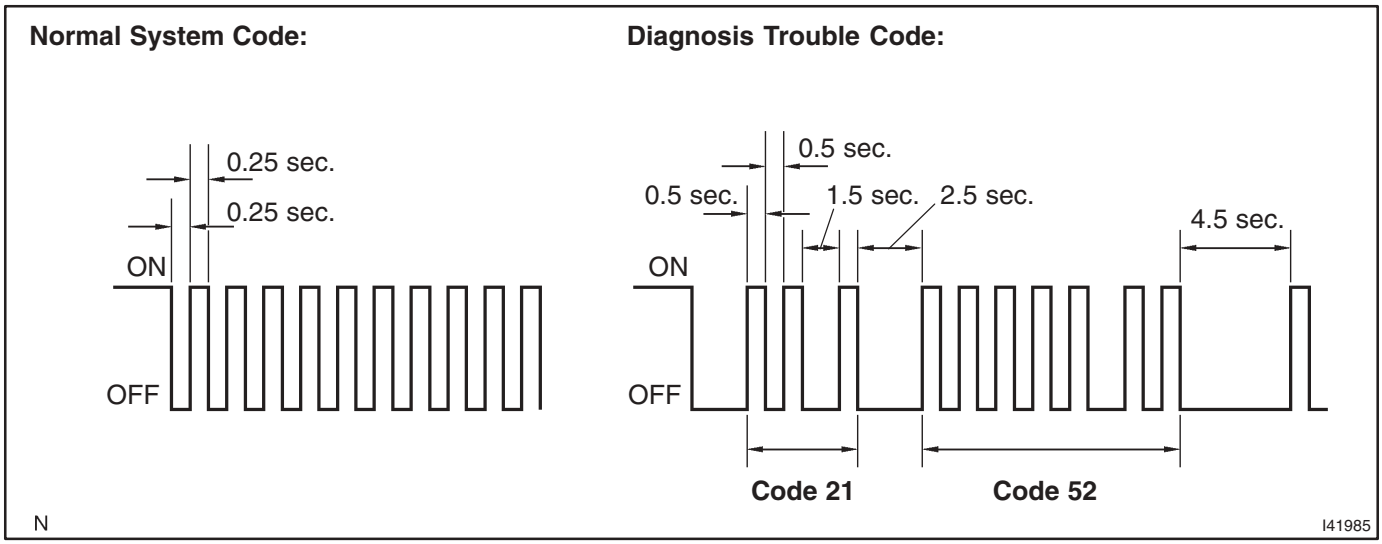


- If communication is normal when connecting the tool to another vehicle, inspect the DLC3 on the original vehicle.
- If communication is still not possible when connecting the tool to another vehicle, it suggests the problem is the tool's own. In this case, consult Service Department listed in the tool's instruction manual.

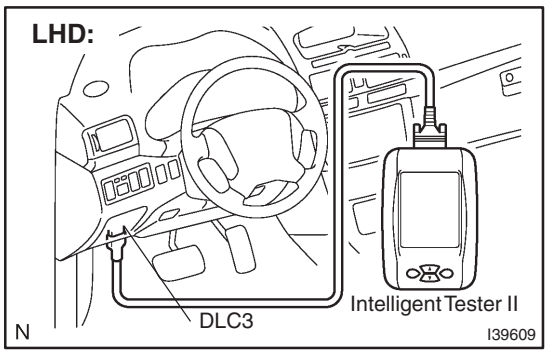


(c) Check the indicator.
(1) Turn the ignition switch to the ON position.
(2) Check that the CRUISE main indicator light comes on when the cruise control main switch ON–OFF button is pushed on, and that the indicator light goes off when the ON–OFF button is pushed off.

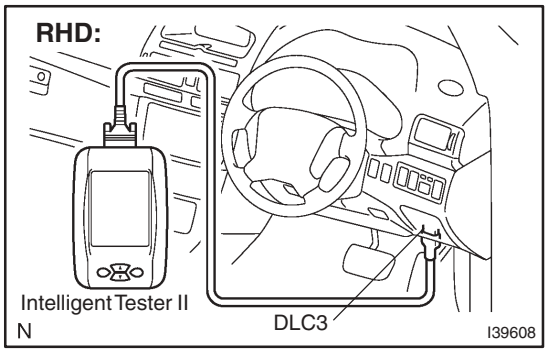
HINT:
If there is a problem with the indicator light, inspect the CRUISE main indicator light circuit (see page 05–327).



HINT:
If a malfunction occurs in the vehicle speed sensors, stop lamp switch assy or other related parts during cruise control driving, the ECM actuates AUTO CANCEL of the cruise control. Then the CRUISE main indicator light starts to blink, informing the driver of the malfunction. At the same time, data of the malfunction is stored as a diagnostic trouble code (DTC).



(d) Output DTCs using diagnosis check wire.
(1) Using SST, create a short–circuit between terminals TC and CG of the DLC3.
(2) Turn the ignition switch to the ON position.



(3) Read and record DTCs from the CRUISE main indicator light on the combination meter. As examples, refer to the chart below for the blinking patterns of the normal system code and diagnosis trouble code 21 and 52.

HINT:
If the CRUISE main indicator light does not blink because of any DTC or in the normal code blinking pattern, inspect the following circuits.

Relevant Circuit	See Page
Diagnosis circuit	05–328
CRUISE main indicator circuit	05–327

2. USING INTELLIGENT TESTER II

(a) Connect the intelligent tester II to the DLC3.

(b) Turn the ignition switch to the ON position.

(c) Read the DTCs on the tester screen.

HINT:

Intelligent tester II has a ”Snapshot” function which records the monitored data.

Refer to the intelligent tester II operator’s manual for further details.

3. DATA LIST

(a) While the intelligent tester II is connected to the DLC3 with the ignition switch in the ON position, the CRUISE CONTROL data list can be displayed. Follow the prompts on the tester screen to access the data list.

CC (ECM):

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
CCS Vehicle Spd	Vehicle speed / min.: 0 km/h (0 mph), max.: 255 km/h (158 mph)	Actual vehicle speed	–
CCS Mem Vehicle Spd	Cruise control memorized speed / min.: 36 km/h (22.5 mph), max.: 200 km/h (125 mph)	Actual stored vehicle speed	–
Throttle Opening Angle	Required throttle opening angle / min.: 0°, max.: 125°	Actual required throttle opening	–
Cruise Control	Cruise control system active condition / ON or OFF	ON: Cruise control activated OFF: Cruise control inactivated	–
Main SW M–CPU	Main SW signal (Main CPU) / ON or OFF	ON: Main SW ON (Pushed on) OFF: Main SW OFF (Pushed off)	”3”
Main SW S–CPU	Main SW signal (Sub CPU) / ON or OFF	ON: Main SW ON (Pushed on) OFF: Main SW OFF (Pushed off)	”3”
CCS Ready M–CPU	Cruise control system standby condition (Main CPU) / ON or OFF	ON ⇔ OFF: Change ON/OFF each time Main SW is pushed in.	”1”
CCS Ready S–CPU	Cruise control system standby condition (Sub CPU) / ON or OFF	ON ⇔ OFF: Change ON/OFF each time Main SW is pushed in.	”1”
CCS indicator M–CPU	Cruise indicator signal (Main CPU) / ON or OFF	ON: ”CRUISE” ON OFF: ”CRUISE” OFF	”2”
CCS indicator S–CPU	Cruise indicator signal (Sub CPU) / ON or OFF	ON: ”CRUISE” ON OFF: ”CRUISE” OFF	”2”

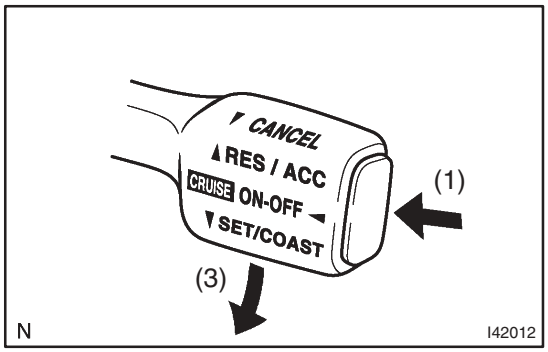
SET/COAST Switch	SET/COAST SW signal / ON or OFF	ON: SET/COAST SW ON OFF: SET/COAST SW OFF	–
RES/ACC Switch	RES/ACC SW signal / ON or OFF	ON: RES/ACC SW ON OFF: RES/ACC SW OFF	–
Stp Light SW M–CPU	Stop lamp SW signal (Main CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	–
Stp Light SW S1–CPU	Stop lamp SW signal (Sub CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	–
Stp Light SW S2–CPU	Stop light SW signal (Sub CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	–
Shift D Position	PNP SW signal (D position) / ON or OFF	ON: Shift D position OFF: Any shift position except D	–

HINT:

”3” is OK but ”1” is NG → ECM failure

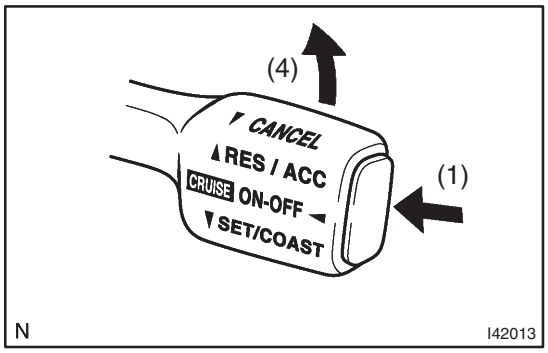
”1” is OK but ”2” is NG → DTC output or ECM failure



”3” is OK but the cruise indicator does not come on → CRUISE main indicator, wire harness or ECM failure

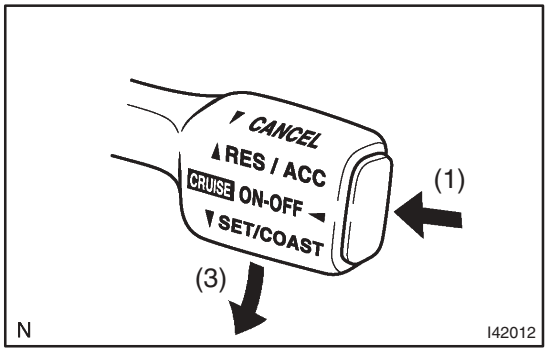
4. DTC CLEAR

(a) The following methods will erase the DTCs and freeze frame data.
  (1) The intelligent tester II can be used to erase the codes.
  (2) Disconnecting the battery terminal or EFI No.1 fuse can also erase the codes.

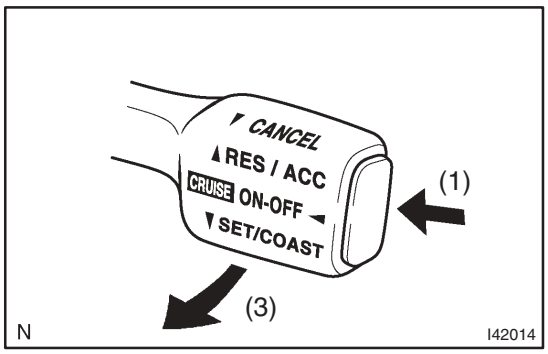


(b) After completing repair, the DTC retained in the memory can be cleared by removing the EFI No.1 fuse for 1 minute or more with the ignition switch off.

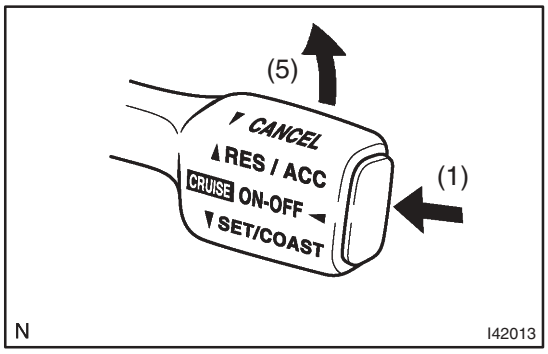
(c) Check that the normal system code is displayed after connecting the fuse.



5. PROBLEM SYMPTOM CONFIRMATION (ROAD TEST)



(a) Inspect the SET function.
  (1) Push the ON–OFF button on.
  (2) Drive at the required speed (40 km/h (25 mph) or higher).
  (3) Push down the cruise control main switch to SET/COAST.
  (4) After releasing the switch, check that the vehicle cruises at the set speed.



(b) Inspect the ACC (ACCEL) switch.
  (1) Push the ON–OFF button on.
  (2) Drive at the required speed (40 km/h (25 mph) or higher).
  (3) Push down the cruise control main switch to SET/COAST.
  (4) Check that vehicle speed increases while the cruise control main switch is pushed up to RES/ACC, and that the vehicle cruises at the newly set speed when the switch is released.
  (5) Momentarily push up the cruise control main switch to RES/ACC and then immediately release it. Check that vehicle speed increases by approximately 1.6 km/h (1.0 mph) (Tap–up function).

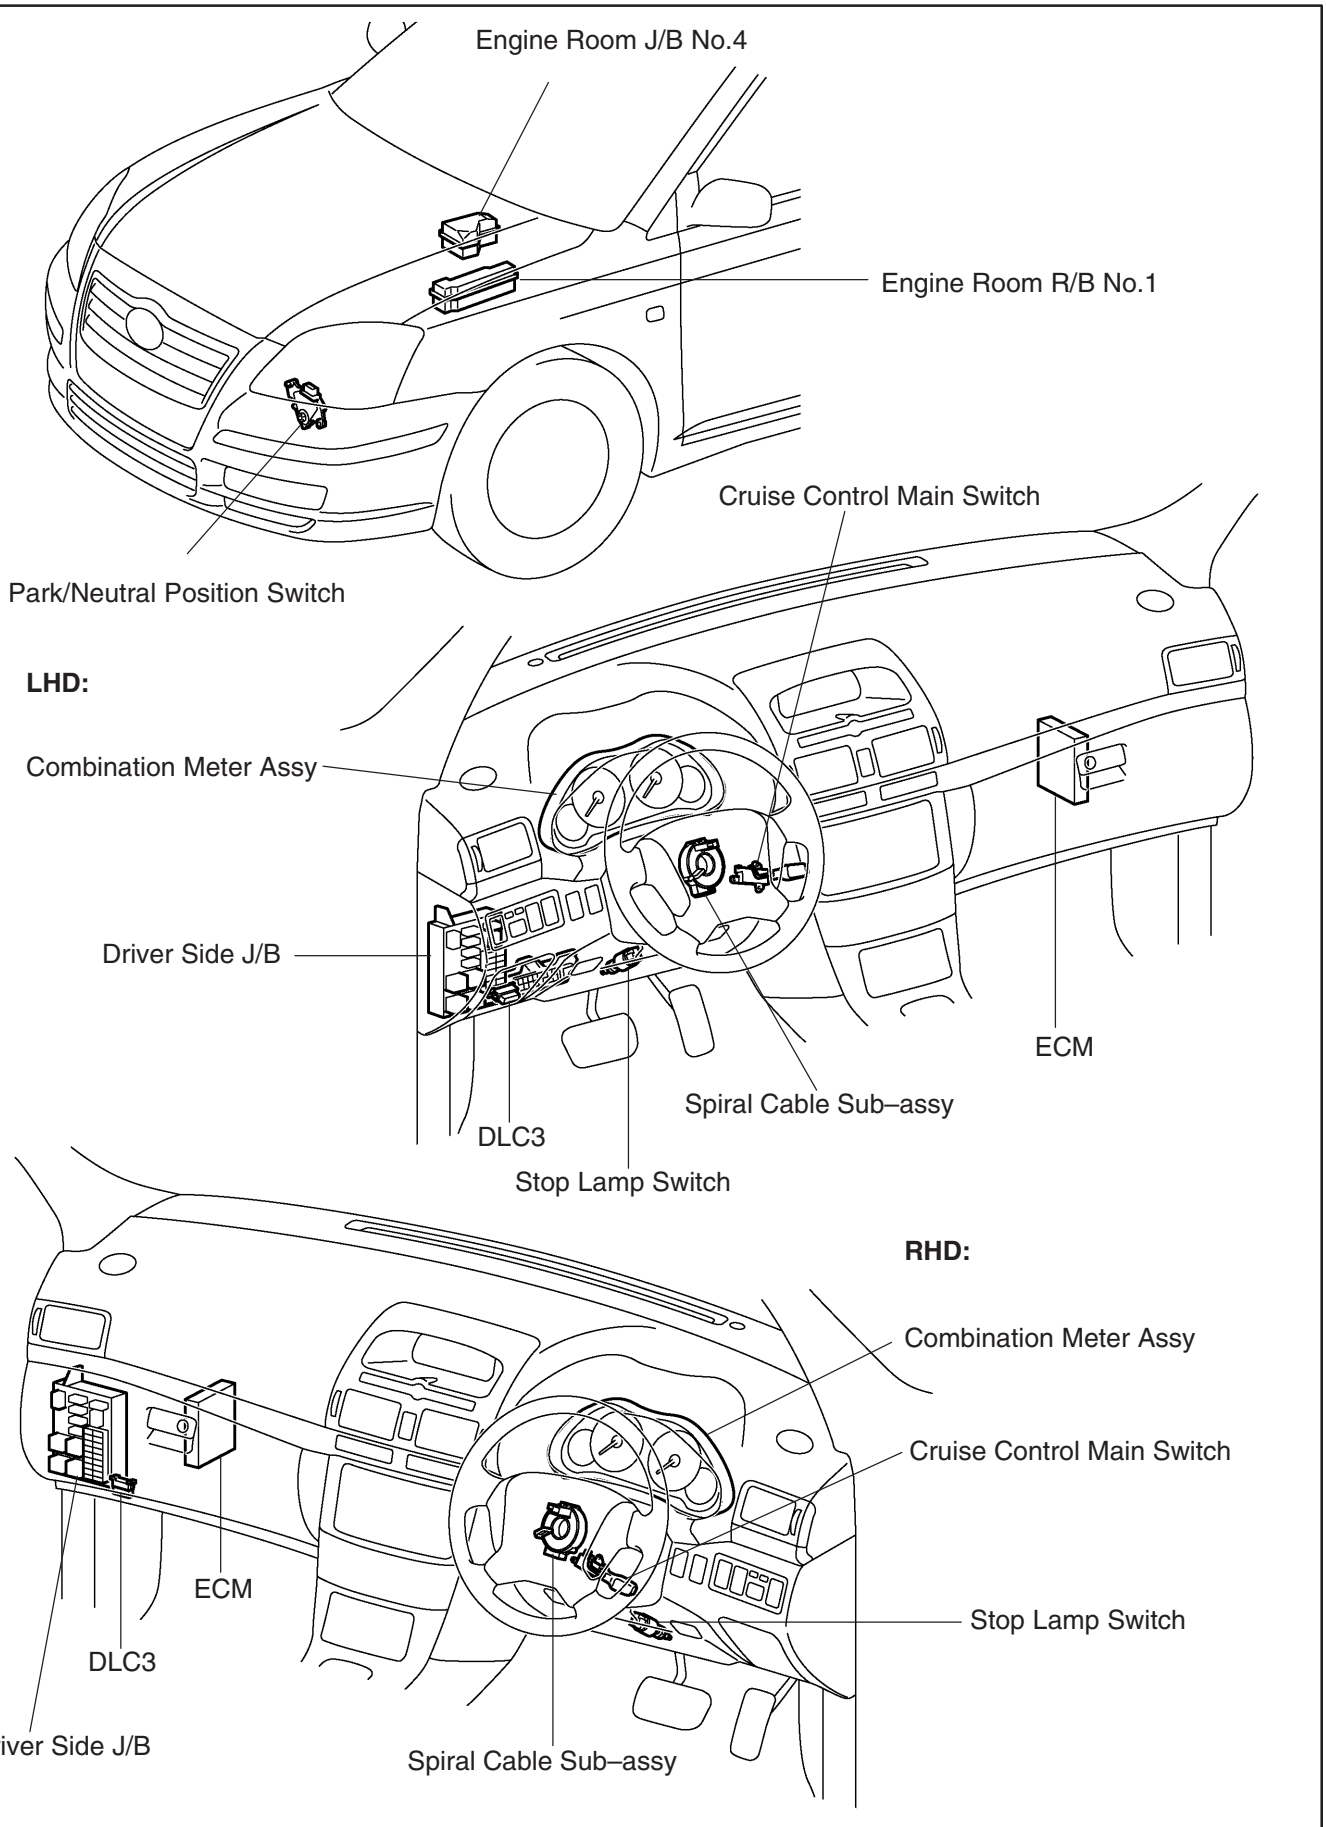
(c) Inspect the COAST function.
  (1) Push the ON–OFF button on.
  (2) Drive at the required speed (40 km/h (25 mph) or higher).
  (3) Push down the cruise control main switch to SET/COAST.
  (4) Check that vehicle speed decreases while the cruise control main switch is pushed down to SET/COAST, and that the vehicle cruises at the newly set speed when the switch is released.
  (5) Momentarily push down the cruise control main switch to SET/COAST, and then immediately release it.
  Check that vehicle speed decreases by approximately 1.6 km/h (1.0 mph) (Tap–down function).

(d) Inspect the CANCEL function.
(1) Push the ON–OFF button on.
(2) Drive at the required speed (40 km/h (25 mph) or higher).
(3) Push down the cruise control main switch to SET/COAST.
(4) When doing one of the following, check that the cruise control system is cancelled and that the normal driving mode is reset.
- Depressing the brake pedal
- Shifting into any position except D while driving
- Pushing the ON–OFF button off
- Pulling the cruise control main switch to CANCEL

(e) Inspect the RES (RESUME) function.
(1) Push the ON–OFF button on.
(2) Drive at the required speed (40 km/h (25 mph) or higher).
(3) Push down the cruise control main switch to SET/COAST.
(4) When doing one of the following, check that the cruise control system is cancelled and that the normal driving mode is reset.
- Depressing the brake pedal
- Shifting into any position except D while driving
- Pulling the cruise control main switch to CANCEL

(5) After pushing up the cruise control main switch to RES/ACC at a driving speed of more than 40 km/h (25 mph), check that the vehicle restores the speed prior to the cancellation.

056HH–07



DIAGNOSTIC TROUBLE CODE CHART

If a trouble code is indicated while checking DTCs, inspect the circuit listed for that code in the table below, and proceed to the applicable page.

DTC No. (See Page)	Circuit Inspection	Trouble Area
P0500/21 (05–317)	Vehicle speed sensor circuit	• Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM
P0503/23 (05–317)	Vehicle speed sensor circuit	• Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM
P0571/52 (05–318)	Stop light switch circuit	• Stop lamp switch assy • Stop lamp switch assy circuit • ECM
P0607/54 (05–321)	Input signal circuit	• ECM

PROBLEM SYMPTOMS TABLE

If a normal system code is displayed during the DTC check but the problem still occurs, check the circuits for each problem symptom in the order given in the table below and proceed to the relevant troubleshooting page.

HINT:

Inspect the ”Fuse” and ”Relay” before confirming the suspected areas as shown in the chart below.

Inspect each malfunction circuit in numerical order for the corresponding symptom.

Symptom	Suspected Area	See Page
Main switch cannot be turned ON. (Cruise indicator light in combination meter does not come on.)	1. Cruise control switch circuit 2. CRUISE main indicator light circuit 3. ECM 4. Combination meter assy	05–322 05–327 *2 *1
Vehicle speed setting cannot be done. (Although indicator light in combination meter comes on when the main switch is turned ON, it goes off when vehicle speed is set.)	1. Cruise control switch circuit 2. ECM	05–322 *2
Setting cannot be done. (Indicator light in combination meter comes on when the main switch is turned ON and it remains ON while setting.)	1. Cruise control switch circuit 2. Stop lamp switch circuit 3. Park/Neutral position switch circuit 4. Combination meter system 5. ECM	05–322 05–318 *2 *1 *2
While the vehicle is driven with cruise control, the set control is cancelled. (Indicator light and CRUISE remain ON.)	1. Cruise control switch circuit 2. Vehicle speed sensor circuit 3. DTC	P0500/21	VEHICLE SPEED SENSOR CIRCUIT

DTC	P0503/23	VEICLE SPEED SENSOR CIRCUIT

CIRCUIT DESCRIPTION

See Pub. No. RM1045E, page 05–183.

DTC No.	DTC Detection Condition	Trouble Area
P0500/21	This trouble code is output when the vehicle speed signal from the vehicle speed sensor is cut for 0.14 sec. or more while the cruise control is in operation.	• Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM
P0503/23	Momentary interruption and noise are detected when a rapid change of vehicle speed occurs while the cruise control is in operation.	• Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM

WIRING DIAGRAM

See Pub. No. RM1045E, page 05–183.

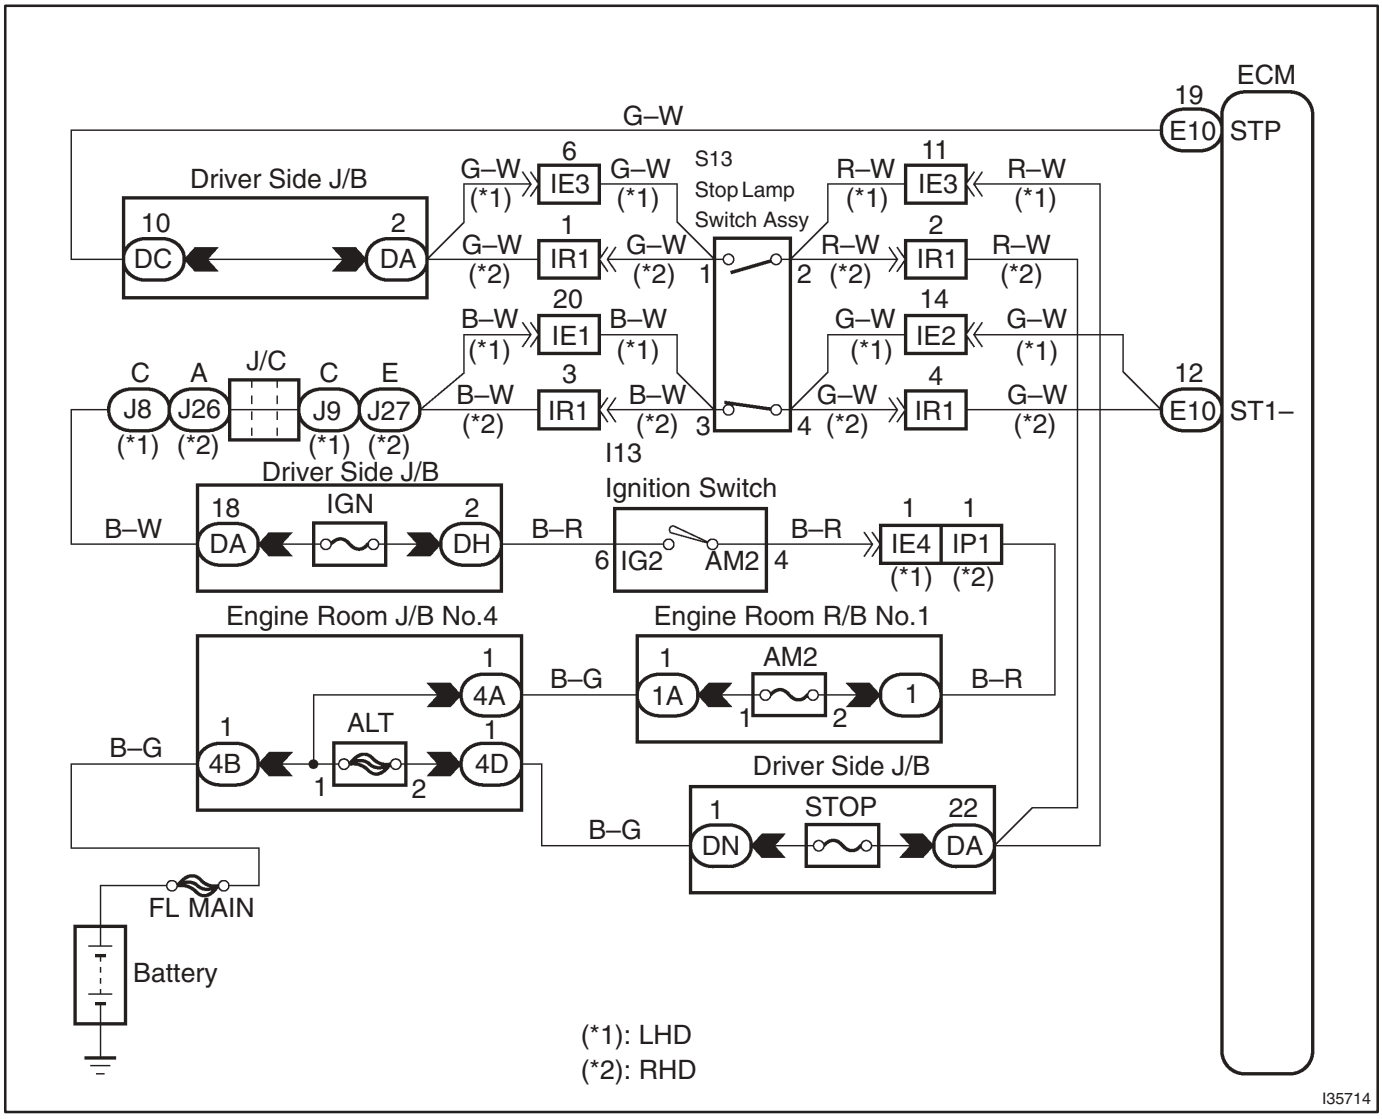
INSPECTION PROCEDURE

See Pub. No. RM1045E, page 05–183.

DTC P0571/52 STOP LIGHT SWITCH CIRCUIT

CIRCUIT DESCRIPTION

When the brake pedal is depressed, the stop lamp switch assy sends a signal to the ECM. When the ECM receives this signal, it cancels the cruise control.



Fail–safe function operates to enable normal driving even if there is a malfunction in the stop lamp signal circuit.

The cancel condition occurs when positive battery voltage is applied to terminal STP.

When the brake is applied, battery positive voltage is normally applied to terminal STP of the ECM through the STOP fuse and the stop lamp switch assy, and the ECM turns the cruise control off.

DTC No.	DTC Detection Condition	Trouble Area
P0571/52	This trouble code is output when the voltage of the STP terminal and that of the ST1– terminal on the ECM are below 1 V for 0.5 sec. or more.	• Stop lamp switch assy • Stop lamp switch assy circuit • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Start the inspection from step 1 when using the intelligent tester II and start from step 2 when not using the intelligent tester II.

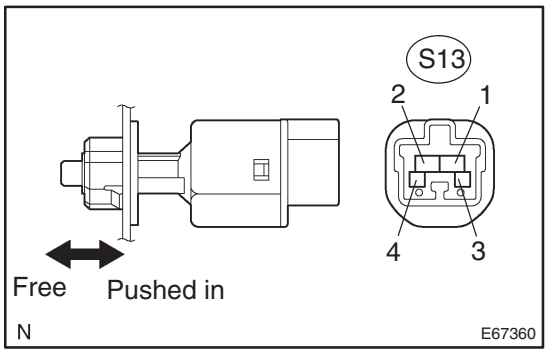
1 READ VALUE ON INTELLIGENT TESTER II

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to the ON position, and turn the intelligent tester II main switch on.
(c) Select the item "Stp Light SW M–CPU", "Stp Light SW S1–CPU" or "Stp Light SW S2–CPU" in the DATA LIST, and read its value displayed on the intelligent tester II.
(d) Check that the stop lamp comes on when the brake pedal is depressed, and goes off when the brake pedal is released.

ECM:

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
Stp Light SW M–CPU	Stop lamp SW signal (Main CPU) / ON or OFF	ON : Brake pedal depressed OFF : Brake pedal released	–
Stp Light SW S1–CPU	Stop lamp SW signal (Sub CPU) / ON or OFF	ON : Brake pedal depressed OFF : Brake pedal released	–
Stp Light SW S2–CPU	Stop lamp SW signal (Sub CPU) / ON or OFF	ON : Brake pedal depressed OFF : Brake pedal released	–

OK:



When the brake pedal is operated, the display changes as shown above.

NG > **Go to step 2**

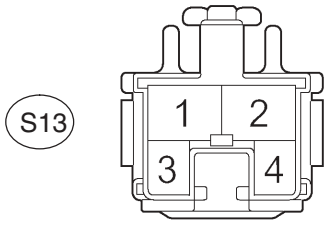
OK

REPLACE ECM (SEE PUB. NO. RM1045E, PAGE 10–29)

2 INSPECT STOP LAMP SWITCH ASSY

(a) Disconnect the stop lamp switch connector.
(b) Measure the resistance according to the value(s) in the table below.

Standard:



Tester Connection	Condition	Specified Condition
1 – 2	Switch pin free	Below 1 Ω
3 – 4	Switch pin free	10 kΩ or higher
1 – 2	Switch pin pushed in	10 kΩ or higher
3 – 4	Switch pin pushed in	Below 1 Ω

NG > **REPLACE STOP LAMP SWITCH ASSY**

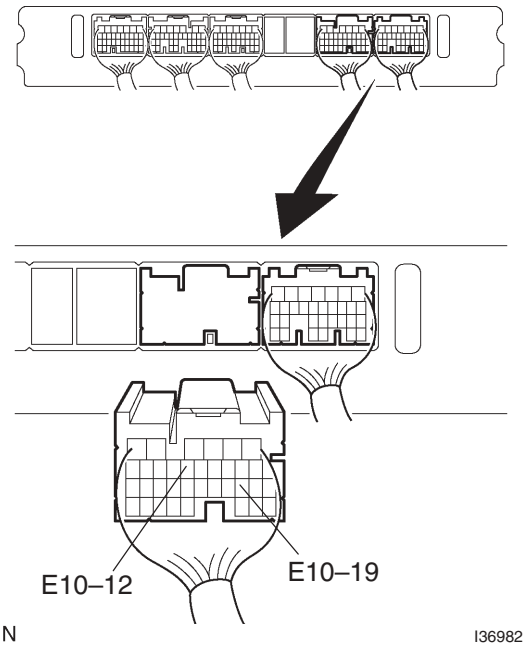
OK

3 CHECK HARNESS AND CONNECTOR (STOP LAMP SWITCH – BATTERY)

Stop Lamp Switch
Connector Front View:

(a) Measure the voltage according to the value(s) in the table below.

Standard:



Tester Connection	Condition	Specified Condition
2 – Body ground	Always	10 to 14 V
3 – Body ground	Ignition switch ON	10 to 14 V

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4 INSPECT ECM

ECM
Wire Harness View:

(a) Reconnect the stop lamp switch connector.
(b) Disconnect the E10 connector from the ECM.
(c) Measure the voltage according to the value(s) in the table below.

Standard:

Tester Connection	Condition	Specified Condition
E10–12 – Body ground	Ignition switch ON, depress brake pedal → release brake pedal	Below 1 V → 10 to 14 V
E10–19 – Body ground	Ignition switch ON, depress brake pedal → release brake pedal	10 to 14 V → Below 1 V

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (STOP LAMP SWITCH – ECM)**

OK

REPLACE ECM (SEE PUB. NO. RM1045E, PAGE 10–29)

DTC	P0607/54	INPUT SIGNAL CIRCUIT

CIRCUIT DESCRIPTION

This DTC indicates the internal abnormalities of the ECM.

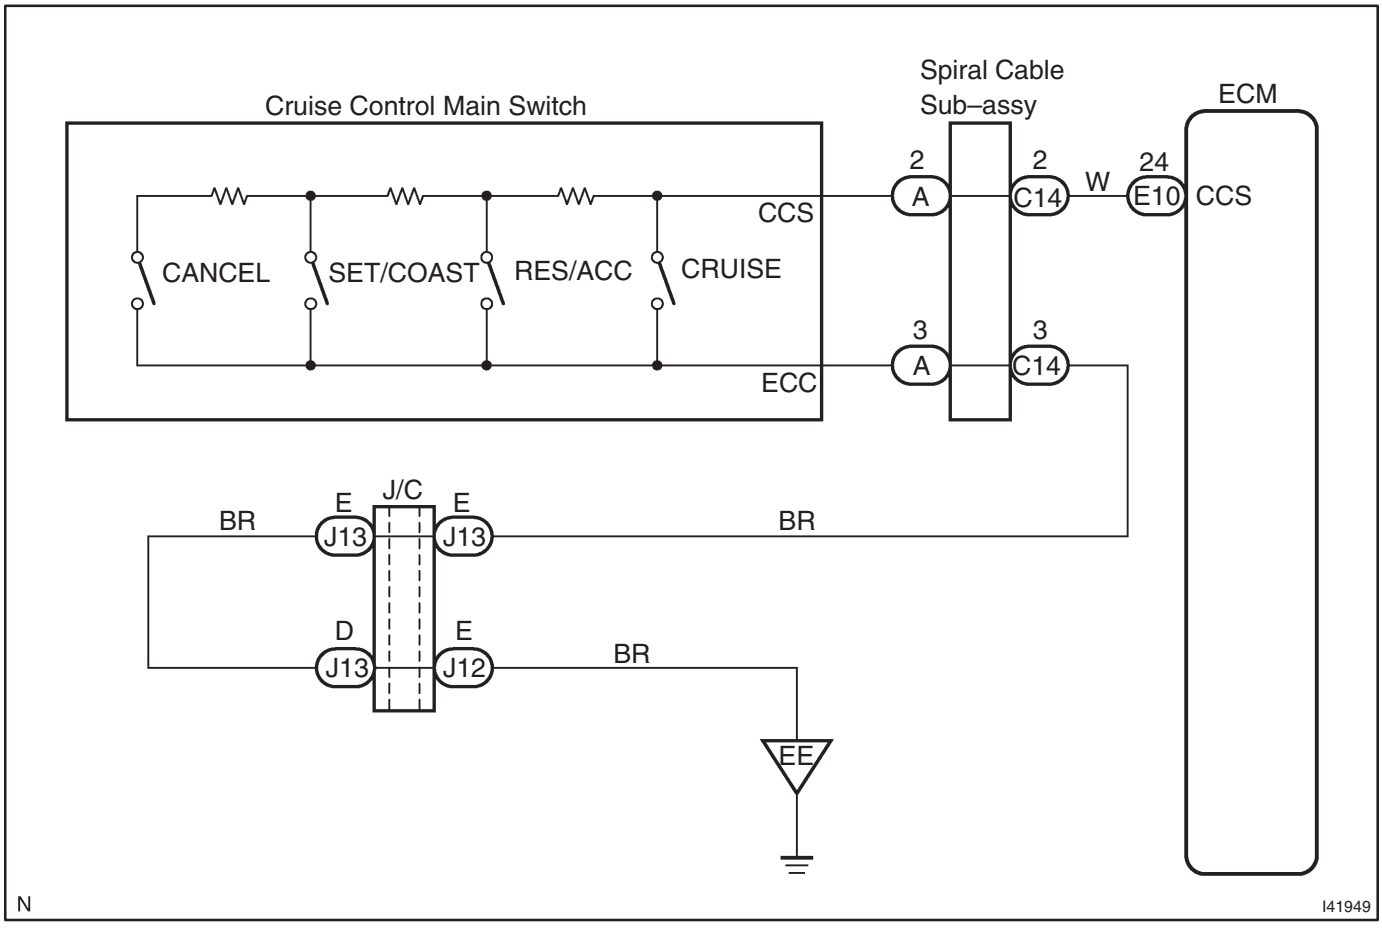
DTC No.	Detection Item	Trouble Area
P0607/54	The ECM has a supervisory CPU and a control ECU inside. When each input STP signal is different for 0.15 sec. or more, this trouble code is output. This trouble code is output after 0.4 sec. has passed from the time the cruise cancel input signal (STP input) is input into the ECM.	• ECM

HINT:

The ECM receives signals from each sensor to control all the functions of the cruise control with the micro-computer.

When a trouble code is detected, fail–safe remains on until the ignition switch is turned off.

INSPECTION PROCEDURE

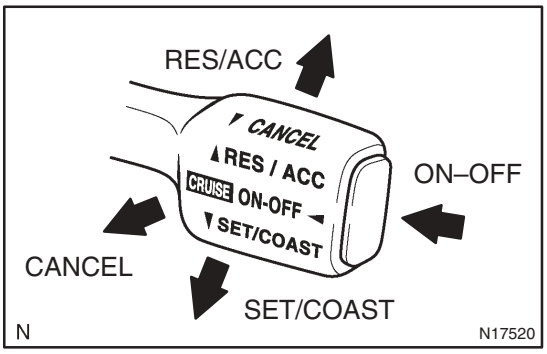


1	**REPLACE ECM (SEE PUB. NO. RM1045E, PAGE 10–29)**

CRUISE CONTROL SWITCH CIRCUIT

CIRCUIT DESCRIPTION

The cruise control main switch operates seven functions: SET, COAST, TAP–DOWN, RESUME, ACCEL, TAP–UP, and CANCEL. The SET, TAP–DOWN and COAST functions, and the RESUME, TAP–UP and ACCEL functions are operated with the same switch. The cruise control main switch is an automatic return type switch which turns on only while operating it in each arrow direction and turns off after releasing it. The internal contact point of the cruise control main switch is turned on with the switch operation. Then the ECM reads the voltage value that has been changed by the switch operation to control SET, COAST, RESUME, ACCEL and CANCEL.



WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Start the inspection from step 1 when using the intelligent tester II and start from step 2 when not using the intelligent tester II.

1	READ VALUE ON INTELLIGENT TESTER II

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to the ON position.
(c) According to the display on the intelligent tester II, read the "DATA LIST".

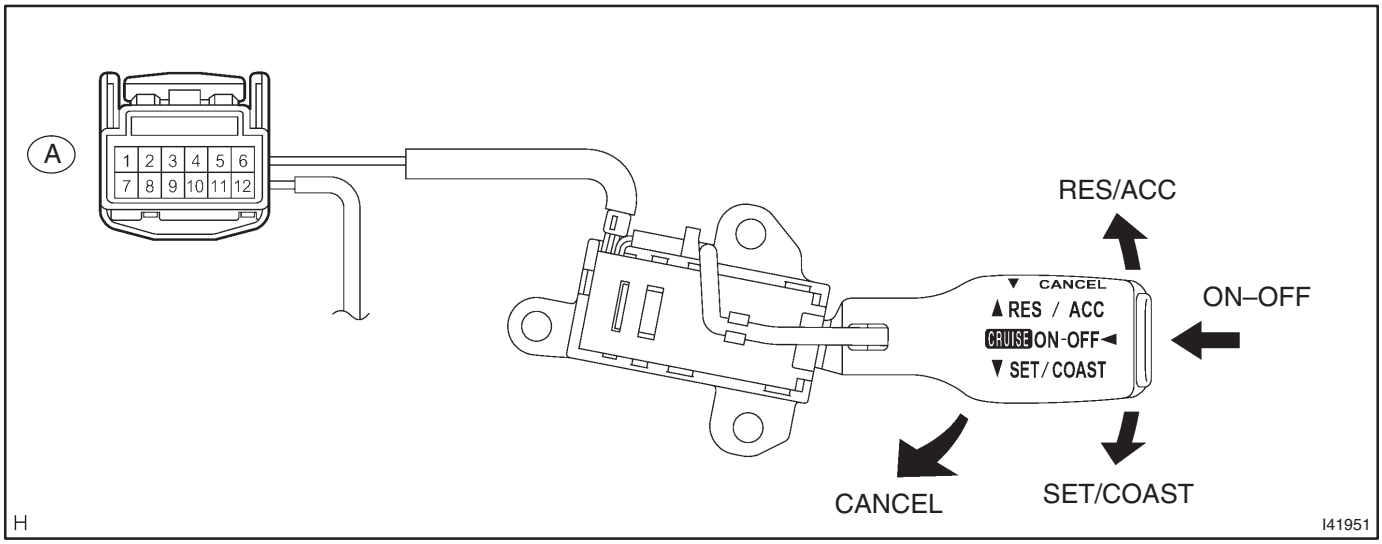
ECM:

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
Main SW M–CPU	Main SW signal (Main CPU) / ON or OFF	ON : Main SW ON (Pushed on) OFF Main SW OFF (Pushed off)	–
Main SW S–CPU	Main SW signal (Sub CPU) / ON or OFF	ON : Main SW ON (Pushed on) OFF Main SW OFF (Pushed off)	–
Cancel Switch	CANCEL SW signal / ON or OFF	ON : CANCEL SW ON OFF : CANCEL SW OFF	–
SET/COAST Switch	SET/COAST SW signal / ON or OFF	ON : SET/COAST SW ON OFF : SET/COAST SW OFF	–
RES/ACC Switch	RES/ACC SW signal / ON or OFF	ON : RES/ACC SW ON OFF : RES/ACC SW OFF	–

OK:
When the cruise control main switch is operated, the display changes as shown above.
Result:

OK	A
NG (All items are defective.)	B
NG (One to four items are defective.)	C

B → **Go to step 2**



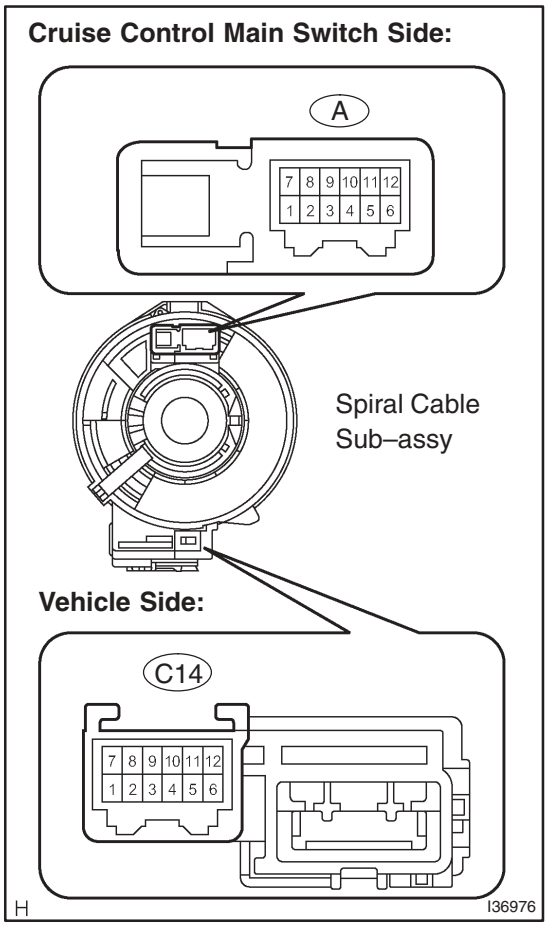
C → **REPLACE CRUISE CONTROL MAIN SWITCH ASSY**

A

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–316)

2	INSPECT CRUISE CONTROL MAIN SWITCH ASSY

(a) Disconnect the cruise control main switch connector.



(b) Measure the resistance according to the value(s) in the table below.
Standard:

Tester Connection	Condition	Specified Condition
2 – 3	Neutral	10 kΩ or higher
2 – 3	RES/ACC	210 to 270 Ω
2 – 3	SET/COAST	560 to 700 Ω
2 – 3	CANCEL	1,380 to 1,700 Ω
2 – 3	Main Switch OFF	10 kΩ or higher
2 – 3	Main Switch ON	Below 1 Ω

NG → **REPLACE CRUISE CONTROL MAIN SWITCH ASSY**

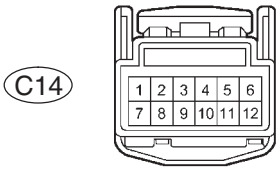
OK

3 INSPECT SPIRAL CABLE SUB–ASSY

(a) Disconnect the spiral cable sub–assy connector.

(b) Measure the resistance according to the value(s) in the table below.

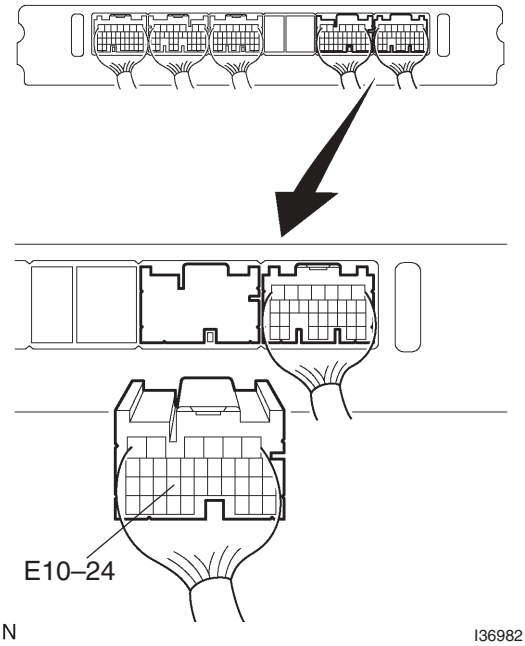
Standard:



Tester Connection	Specified Condition
A–2 – C14–2	Below 1 Ω
A–3 – C14–3	Below 1 Ω

NG → **REPLACE SPIRAL CABLE SUB–ASSY (SEE PUB. NO. RM1018E, PAGE 60–26)**

OK



4	CHECK HARNESS AND CONNECTOR (SPIRAL CABLE SUB–ASSY – ECM, BODY GROUND)

Spiral Cable Sub–assy (Vehicle Side)
Connector Front View:

I38526

ECM
Wire Harness View:

I36982

(a) Measure the resistance according to the value(s) in the table below.

Standard:

Tester Connection	Condition	Specified Condition
C14–2 – E10–24	Always	Below 1 Ω
E10–24 – Body ground	Always	10 kΩ or higher
C14–3 – Body ground	Always	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–316)

CRUISE MAIN INDICATOR LIGHT CIRCUIT

CIRCUIT DESCRIPTION

- The ECM detects a cruise control switch signal and sends it to the combination meter via BEAN. Then the CRUISE main indicator light comes on.
- The CRUISE main indicator light circuit uses BEAN for communication. If there are any malfunctions in this circuit, check for DTCs in the multiplex communication system.

INSPECTION PROCEDURE

1	READ VALUE ON INTELLIGENT TESTER II

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to the ON position and turn the intelligent tester II main switch on.
(c) Select the item below in the ”DATA LIST”, and read the display on the intelligent tester II.

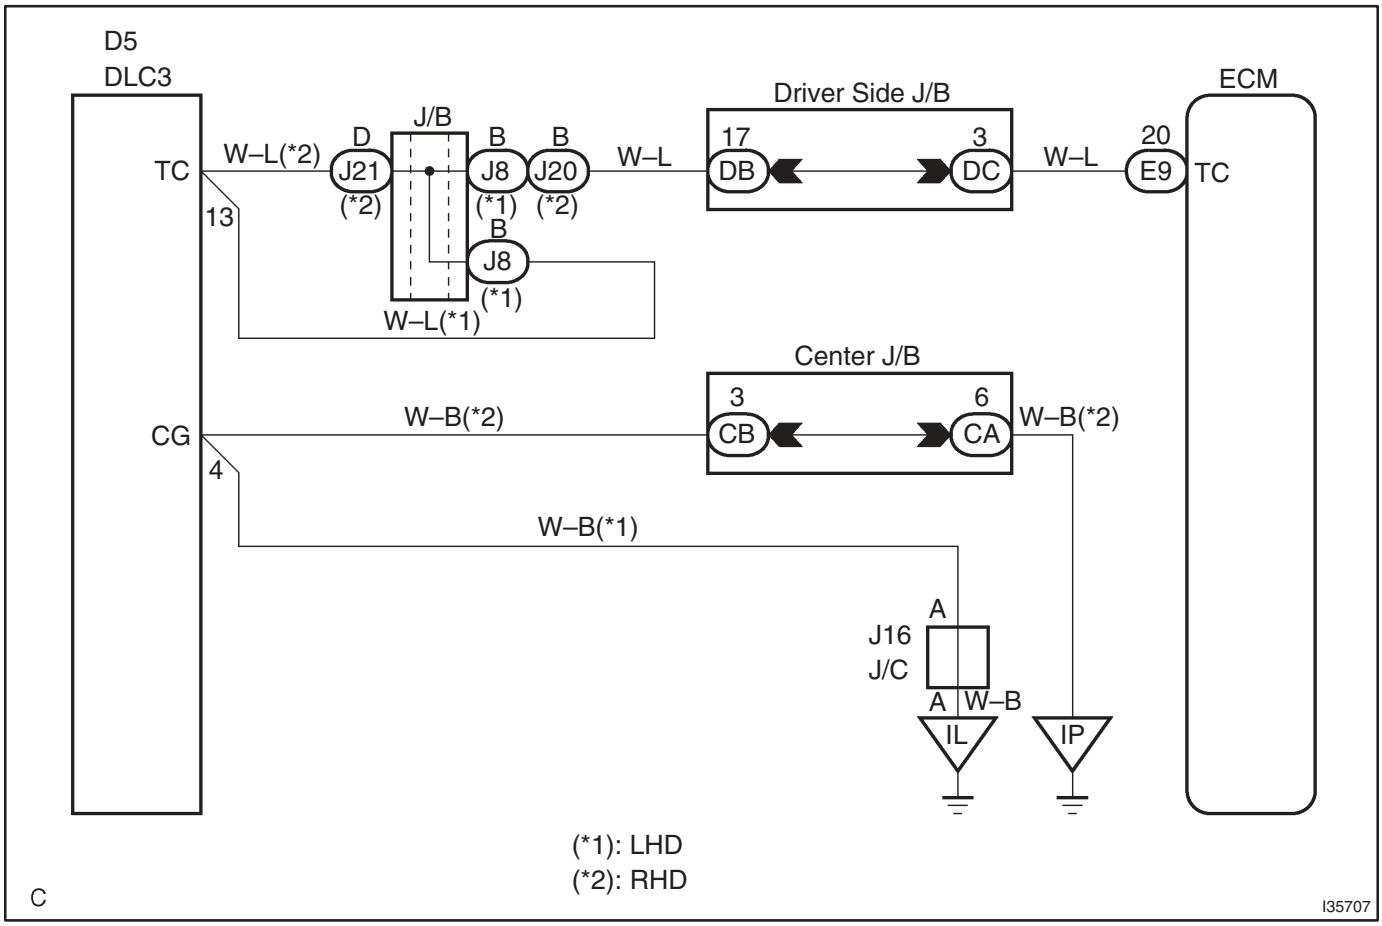
CC (ECM):

Item	Measurement Item / Display (Range)	Normal Condition	Diagnostic Note
CCS Indicator M–CPU	Cruise indicator signal (Main CPU) / ON or OFF	ON : ”CRUISE” ON OFF : ”CRUISE” OFF	–
CCS Indicator S–CPU	Cruise indicator signal (Sub CPU) / ON or OFF	ON : ”CRUISE” ON OFF : ”CRUISE” OFF	–

OK:
When the cruise control main switch is operated, the display changes as shown above.

NG → **REPLACE ECM (SEE PUB. NO. RM1045E, PAGE 10–29)**

OK



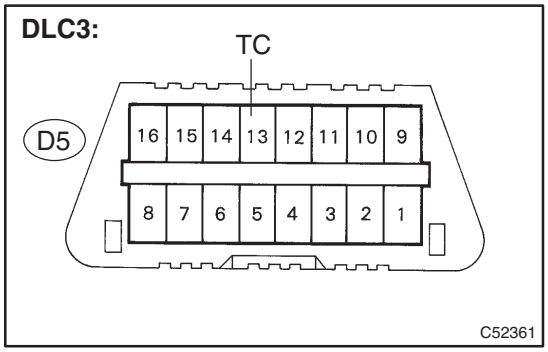
PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (SEE PAGE 05–316)

DIAGNOSIS CIRCUIT

CIRCUIT DESCRIPTION

Making a short circuit between terminals TC and CG of the DLC3 will output DTCs from the DLC3.

WIRING DIAGRAM

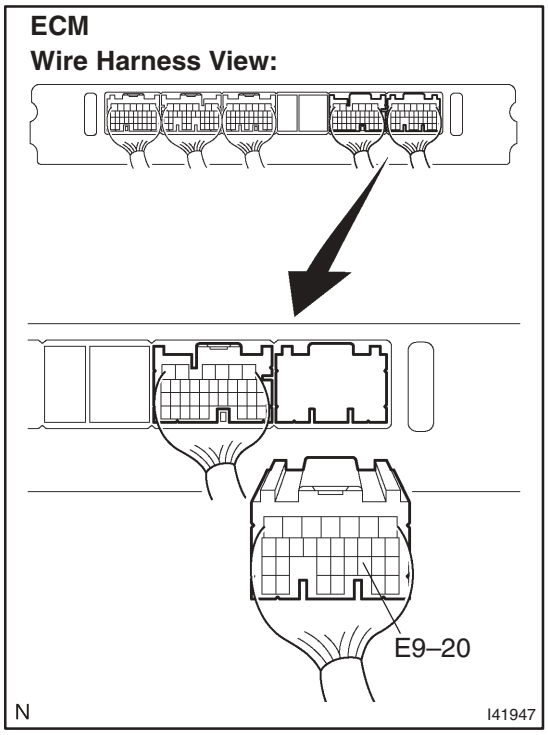


HINT:

When a particular warning light stays blinking, a ground short in the wiring of terminal TC of the DLC3 or an internal ground short in the relevant ECU is suspected.

INSPECTION PROCEDURE

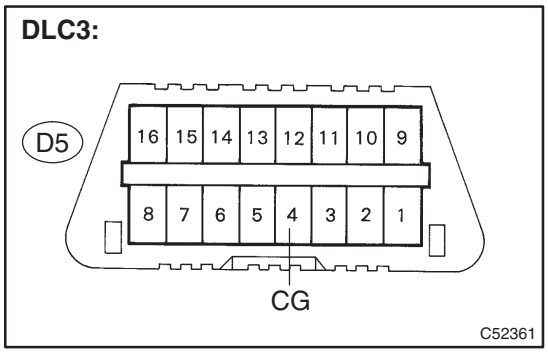
1	CHECK HARNESS AND CONNECTOR (TC of DLC3 – ECM)



(a) Disconnect the E9 connector from the ECM.

(b) Measure the resistance according to the value(s) in the table below.

Standard:



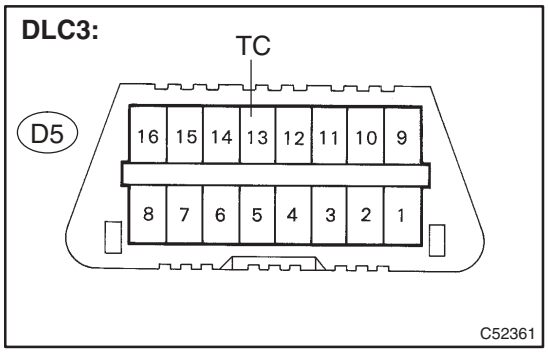
Tester Connection	Condition	Specified Condition
D5–13 – E9–20	Always	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (DLC3 – ECM)**

OK

2 CHECK HARNESS AND CONNECTOR (CG of DLC3 – BODY GROUND)

(a) Measure the resistance according to the value(s) in the table below.



Standard:

Tester Connection	Condition	Specified Condition
4 – Body ground	Always	Below 1 Ω

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (DLC3 – BODY GROUND)**

OK

3 CHECK HARNESS AND CONNECTOR (TC of DLC3 – BODY GROUND)

(a) Measure the resistance according to the value(s) in the table below.

Standard:

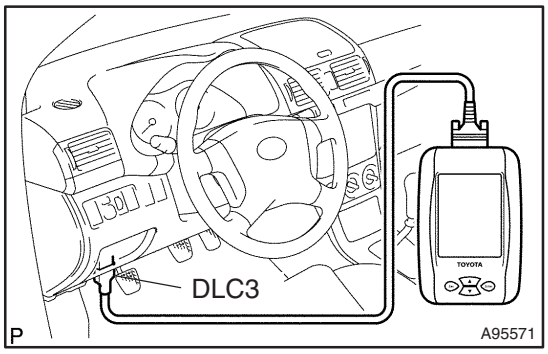
Tester Connection	Condition	Specified Condition
13 – Body ground	Ignition switch off	10 kΩ or higher

NG → **REPAIR OR REPLACE WIRE HARNESS OR EACH ECU**

OK

REPLACE ECM (SEE PUB. NO. RM1045E, PAGE 10–29)

SFI SYSTEM (1ZZ–FE/3ZZ–FE)(From February, 2004)



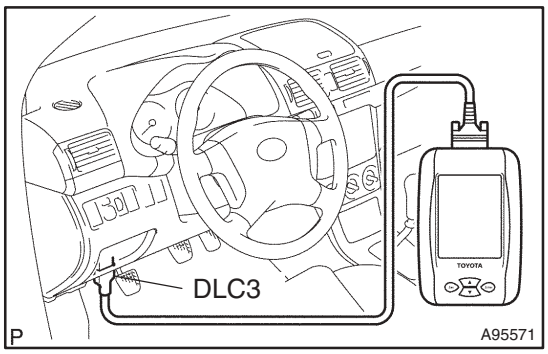
100P0–01

ON–VEHICLE INSPECTION

1. INSPECT THROTTLE BODY ASSY

(a) Listen to the throttle control motor operating sounds.
  (1) Turn the ignition switch to ON.
  (2) When pressing the accelerator pedal position sensor lever, listen to the running sound of the motor. Make sure no friction noise comes from the motor.

If friction noise exists, replace the throttle body.



(b) Inspect the throttle position sensor.
  (1) Connect the intelligent tester II to the DLC3.
  (2) Turn the ignition switch to ON.
  (3) Turn the intelligent tester II ON.
  (4) Check that the engine warning light does not light up.
  (5) Select the item: Powertrain / Engine and ECT / Data List / Throttle POS.
  (6) Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of the "Throttle POS" is within the specification.

Standard throttle valve opening percentage:
60 % or more

NOTICE:

When checking the standard throttle valve opening percentage, the transmission should be in the neutral position.

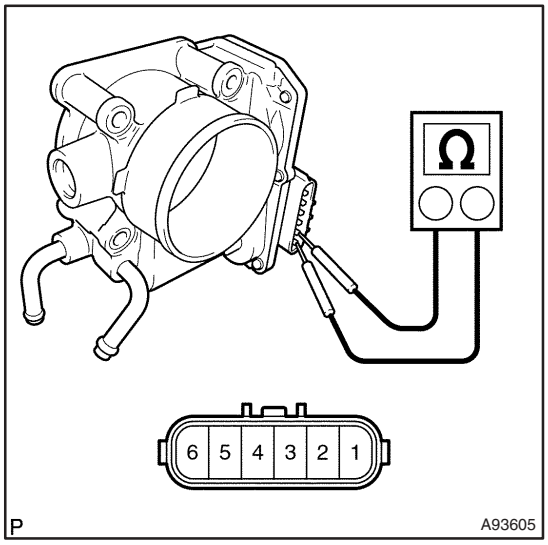
If the result is not as specified, check the throttle body, wire harness and ECM.

2. INSPECT ACCELERATOR PEDAL ASSY

(a) Connect the intelligent tester II to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester II ON.
(d) Select the item: Powertrain / Engine and ECT / Data List / Accelerator POS No. 1, Accelerator POS No. 2.
(e) Operate the accelerator pedal, then check that the values of the ”Accelerator POS No. 1” and ”Accelerator POS No. 2” are within the specification.

Accelerator POS No. 1:

Accelerator Pedal Condition	Specified Condition
Released	0.5 to 1.1 V
Depressed	2.6 to 4.5 V



Accelerator POS No. 2:

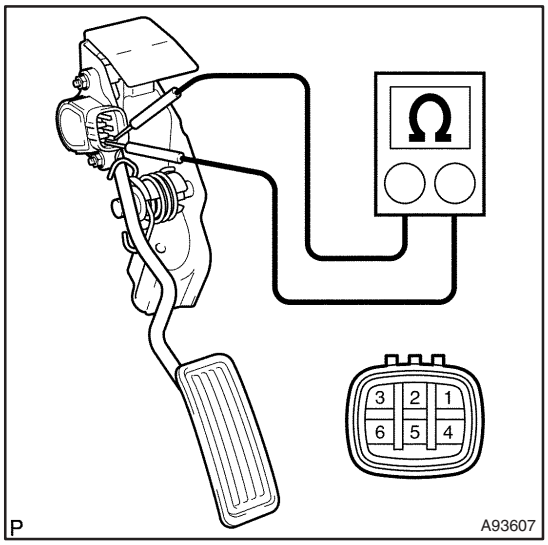
Accelerator Pedal Condition	Specified Condition
Released	1.2 to 2.0 V
Depressed	3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal, wire harness and ECM.

100P1–01

INSPECTION

1. INSPECT THROTTLE BODY ASSY



(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

Tester Connection	Specified Condition
1 (M–) – 2 (M+)	0.3 to 100 Ω at 20°C (68°F)
3 (E2) – 5 (VC)	1.2 to 3.2 kΩ at 20°C (68°F)

If the resistance is not as specified, replace the throttle body.

2. INSPECT ACCELERATOR PEDAL ASSY

(a) Inspect the resistance.

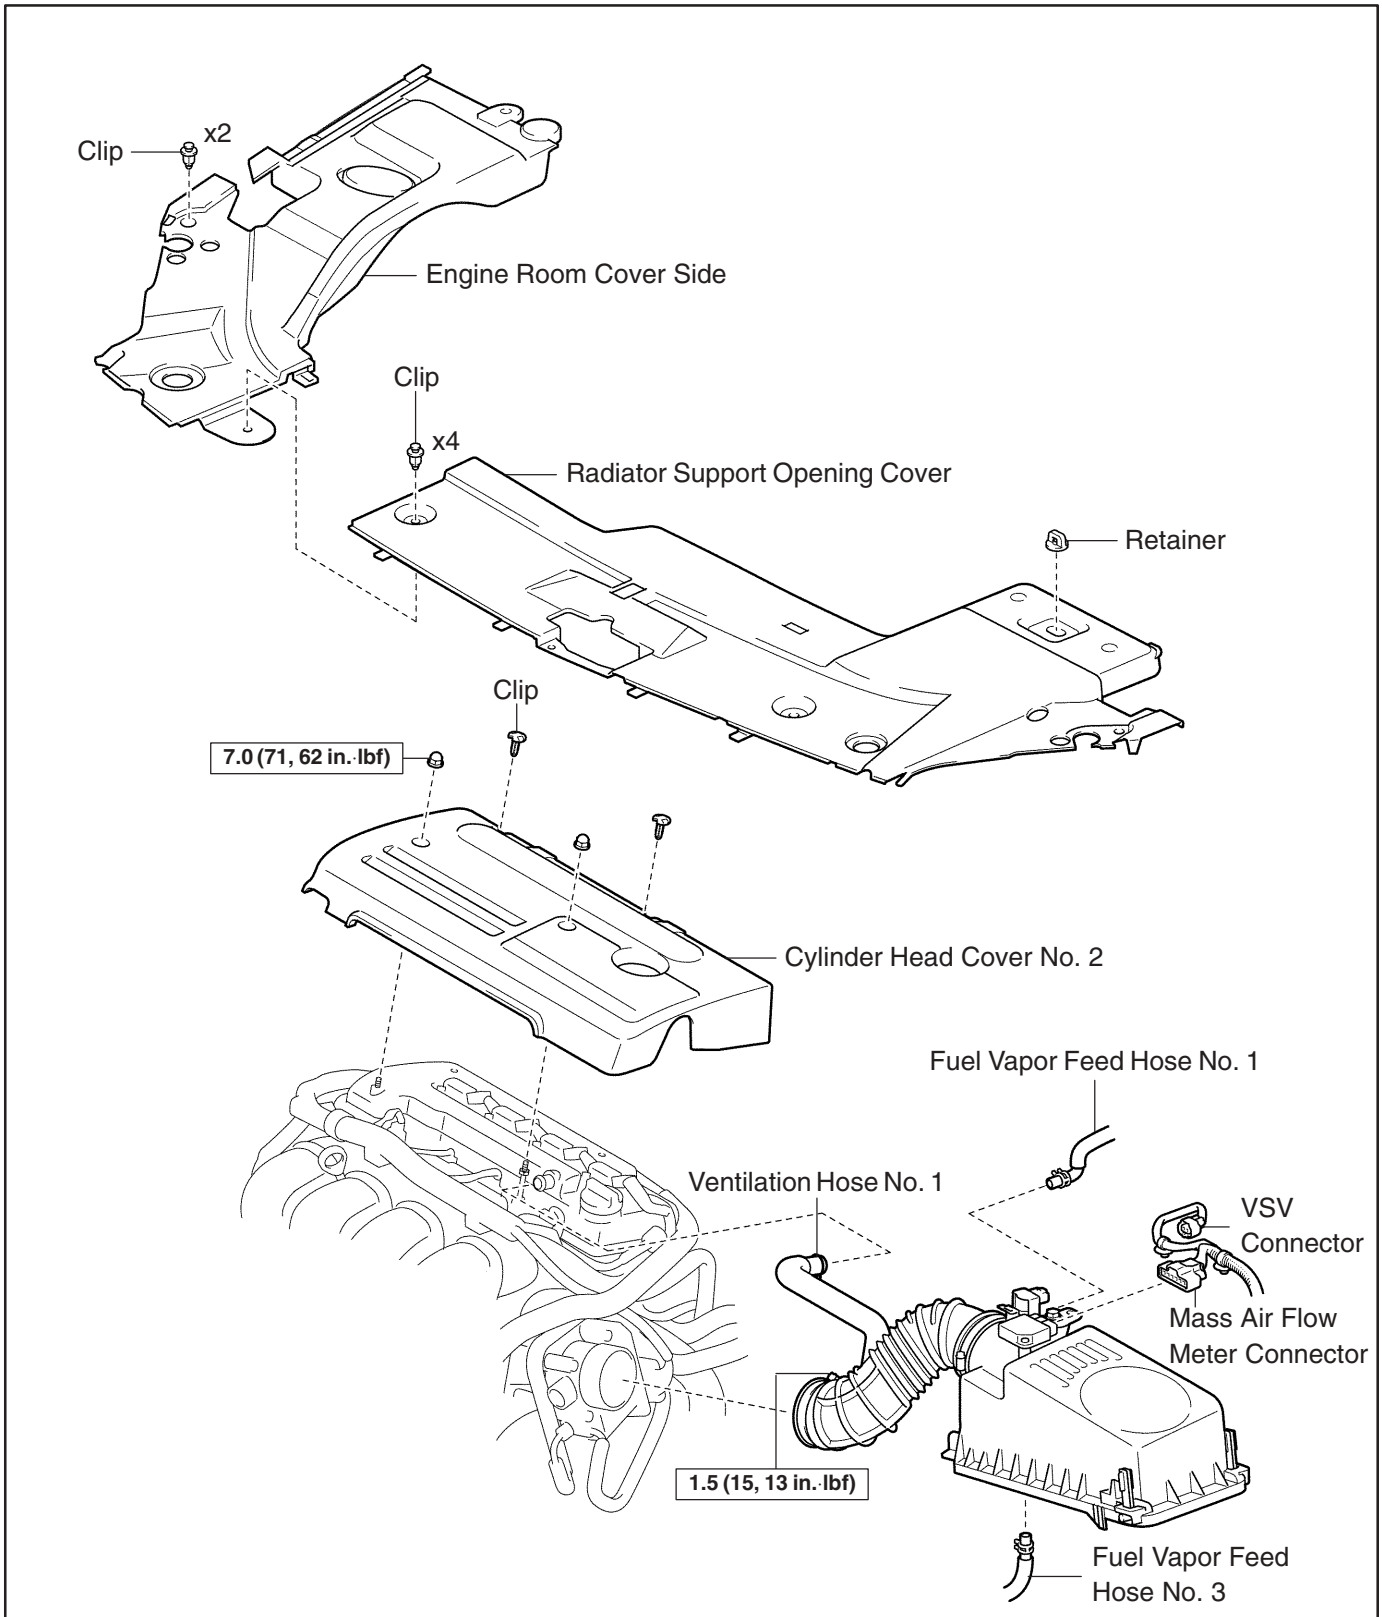
(1) Using an ohmmeter, measure the resistance between the terminals.

Standard:

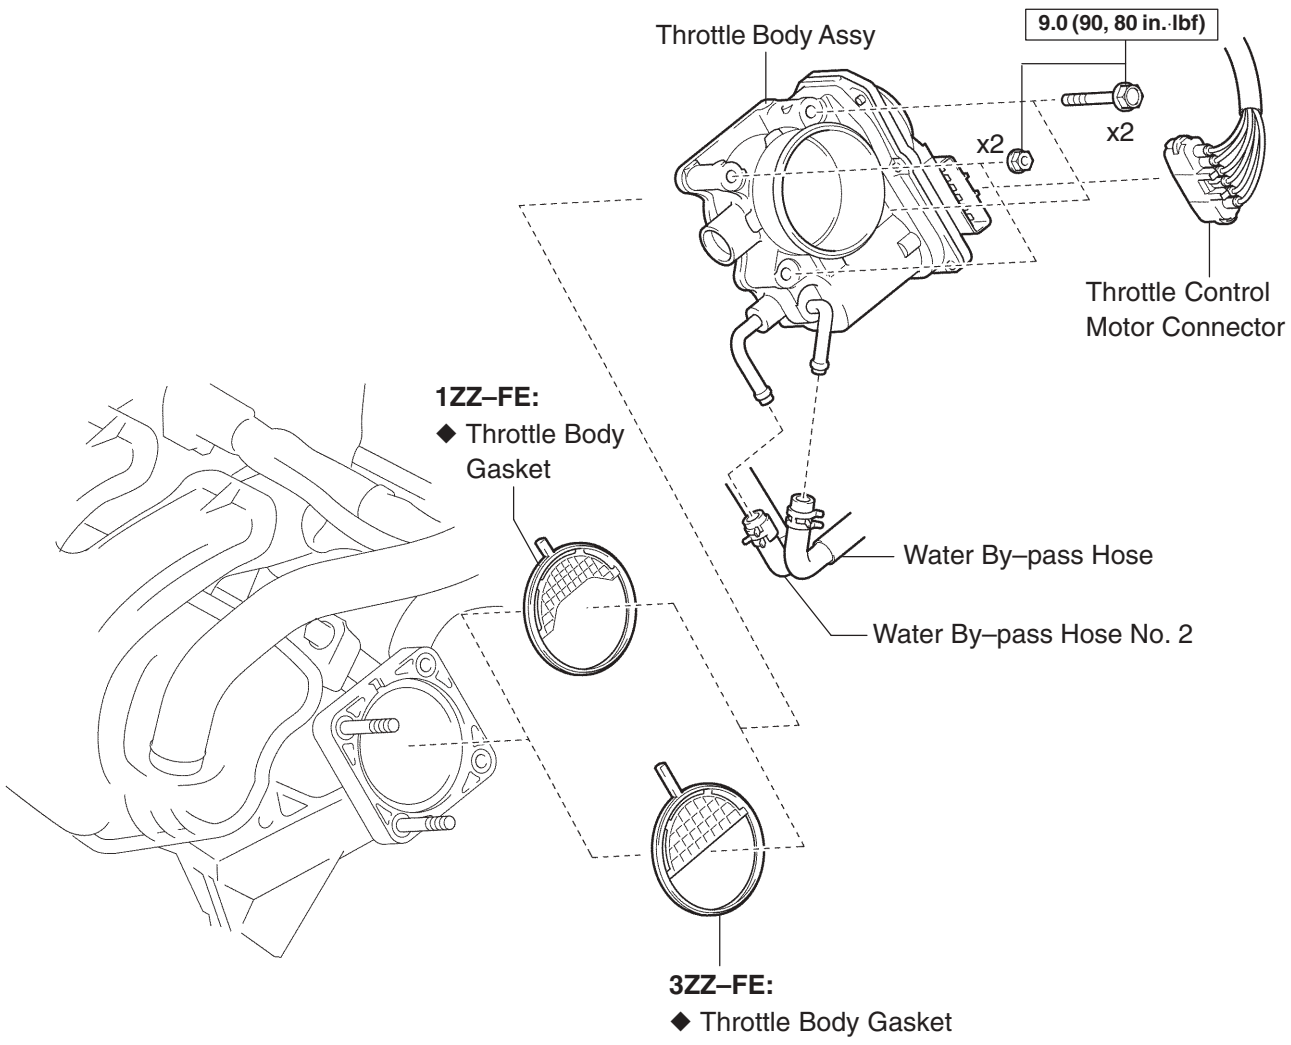
LHD Steering Position Type:

Tester Connection	Specified Condition
3 (EP1) – 6 (VCP1)	1.5 to 6.0 kΩ
1 (EP2) – 4 (VCP2)	1.5 to 6.0 kΩ

RHD Steering Position Type:



Tester Connection	Specified Condition
1 (EP1) – 4 (VCP1)	1.5 to 6.0 kΩ
3 (EP2) – 6 (VCP2)	1.5 to 6.0 kΩ

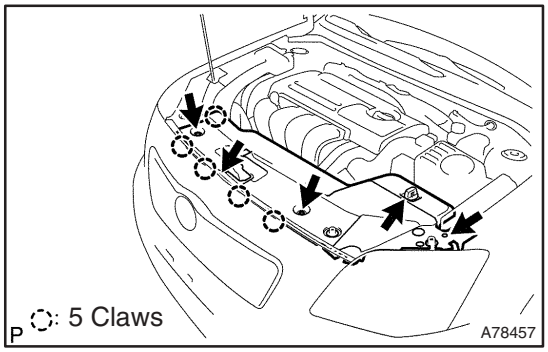


If the resistance is not as specified, replace the accelerator pedal.

THROTTLE BODY ASSY (1ZZ–FE/3ZZ–FE)(From February, 2004)

100P2–01

COMPONENTS

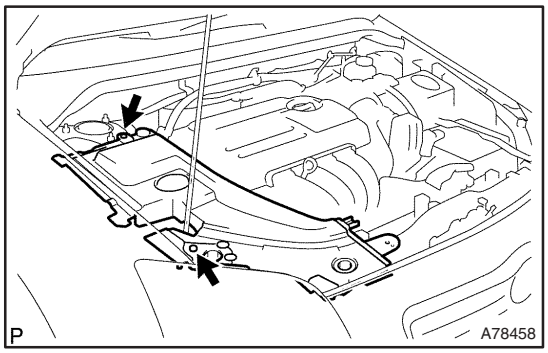


N·m (kgf·cm, ft·lbf): Specified torque

P ◆ Non–reusable part

A95569

100P3–01

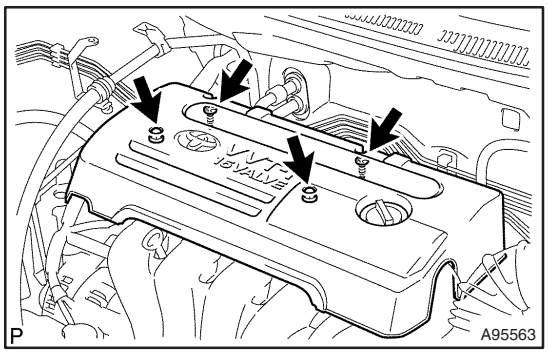


REPLACEMENT

1. REMOVE RADIATOR SUPPORT OPENING COVER

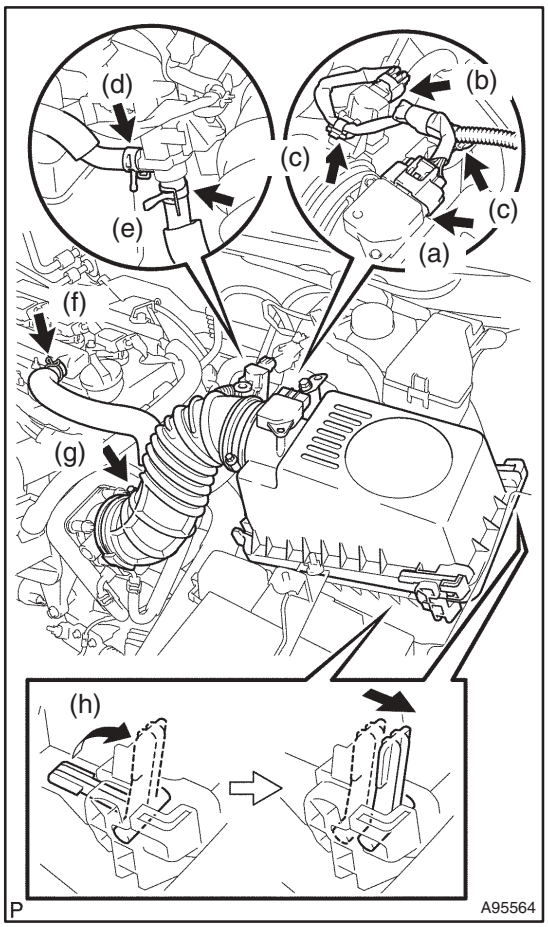
(a) Remove the retainer and 4 clips.

(b) Unfasten the 5 claws, then remove the radiator support opening cover.



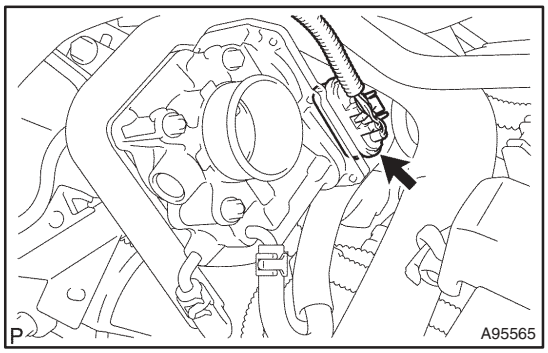
2. REMOVE ENGINE ROOM COVER SIDE

(a) Remove the 2 clips and engine room cover side.



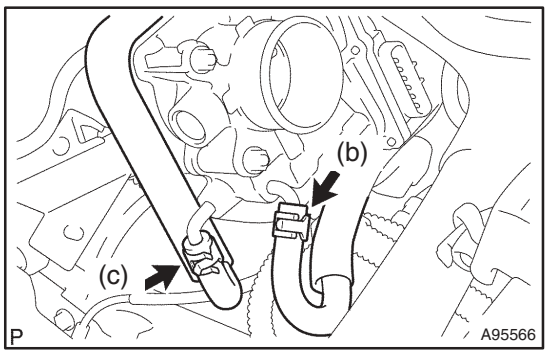
3. DISCONNECT BATTERY NEGATIVE TERMINAL

4. DRAIN ENGINE COOLANT (See page 16–5)



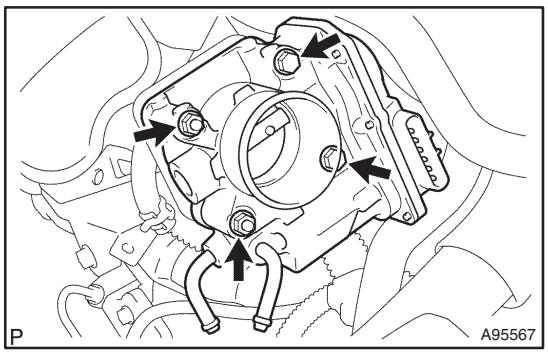
5. REMOVE CYLINDER HEAD COVER NO.2

(a) Remove the 2 nuts and 2 clips, then remove cylinder head cover No. 2.

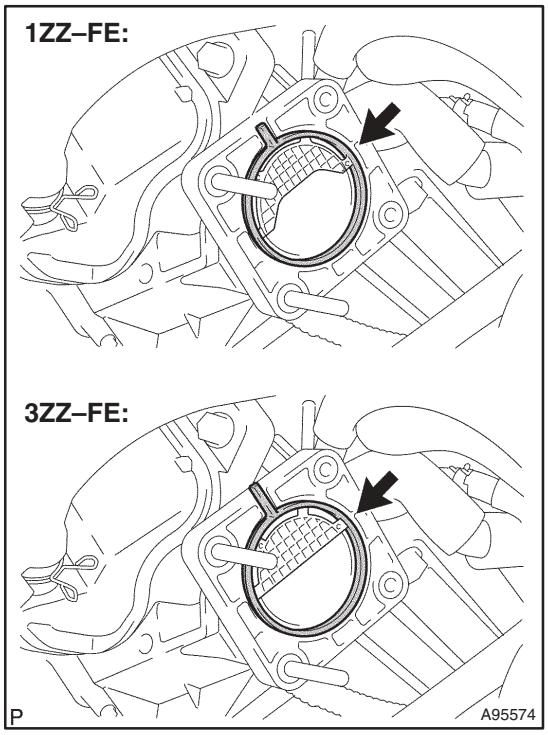


6. REMOVE AIR CLEANER CAP SUB–ASSY

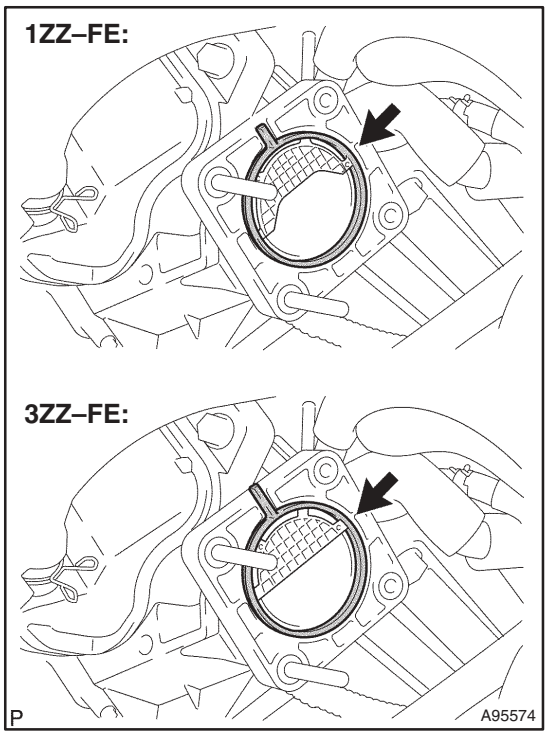
(a) Disconnect the mass air flow meter connector.
(b) Disconnect the VSV connector.
(c) Remove the 2 wire harness clamps.
(d) Disconnect fuel vapor feed hose No. 1 from the VSV.
(e) Disconnect fuel vapor feed hose No. 3 from the VSV.
(f) Disconnect ventilation hose No. 1 from the cylinder head cover.
(g) Loosen the hose clamp bolt, then disconnect the air cleaner hose.
(h) Raise the air cleaner clamp up, then slide it to the air cleaner cap.
(i) Remove the air cleaner cap together with the air cleaner hose.



7. REMOVE THROTTLE BODY ASSY

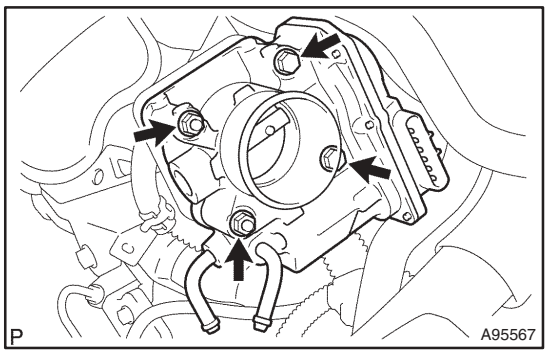


(a) Disconnect the throttle control motor connector.

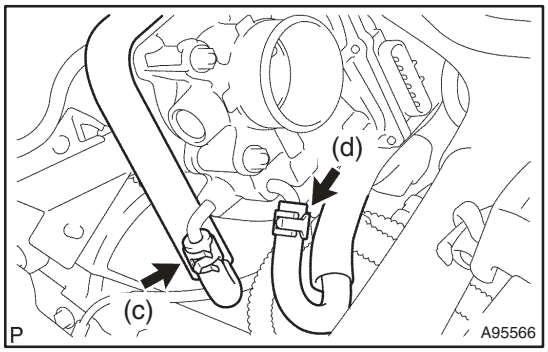


(b) Disconnect the water by–pass hose.
(c) Disconnect water by–pass hose No. 2.

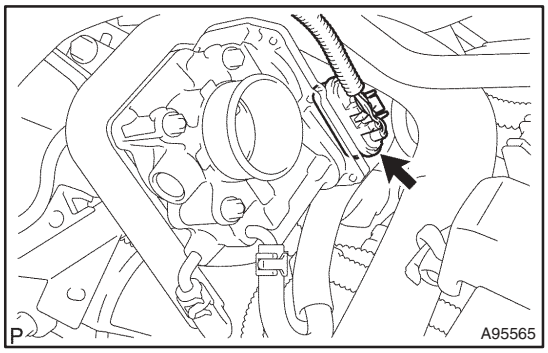
(d) Remove the 2 bolts and 2 nuts, then remove the throttle body.



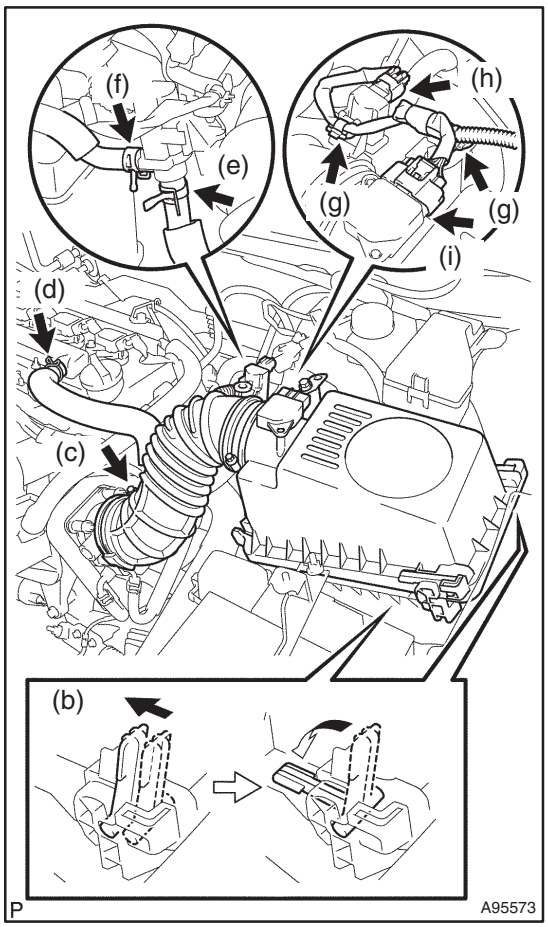
(e) Remove the gasket from the intake manifold.



8. INSTALL THROTTLE BODY ASSY



(a) Install a new gasket onto the intake manifold.



(b) Install the throttle body with the 2 bolts and 2 nuts.
Torque: 9.0 N·m (90 kgf·cm, 80 in.·lbf)

(c) Connect water by–pass hose No. 2 to the throttle body.
(d) Connect the water by–pass hose to the throttle body.

(e) Connect the throttle control motor connector.

9. INSTALL AIR CLEANER CAP SUB–ASSY

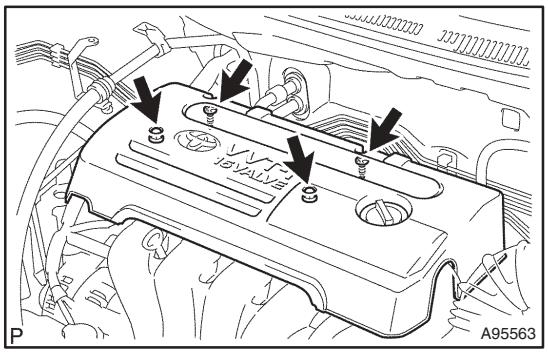
(a) Install the air cleaner cap together with the air cleaner hose.

(b) Slide the air cleaner clamp to the air cleaner case, then put it down.

(c) Tighten the hose clamp bolt, then connect the air cleaner hose.

Torque: 1.5 N·m (15 kgf·cm, 13 in.·lbf)

(d) Connect ventilation hose No. 1 to the cylinder head cover.



(e) Connect fuel vapor feed hose No. 3 to the VSV.

(f) Connect fuel vapor feed hose No. 1 to the VSV.

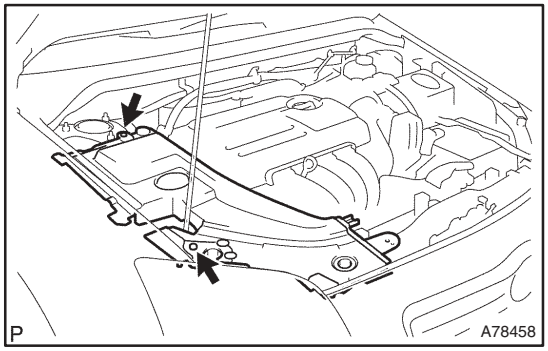
(g) Install the 2 wire harness clamps.

(h) Connect the VSV connector.

(i) Connect the mass air flow meter connector.

10. INSTALL CYLINDER HEAD COVER NO.2

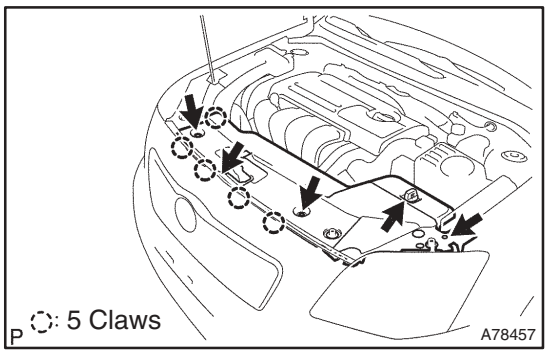
(a) Install cylinder head cover No. 2 with the 2 nuts and 2 clips.



Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)

11. CONNECT BATTERY NEGATIVE TERMINAL

Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)



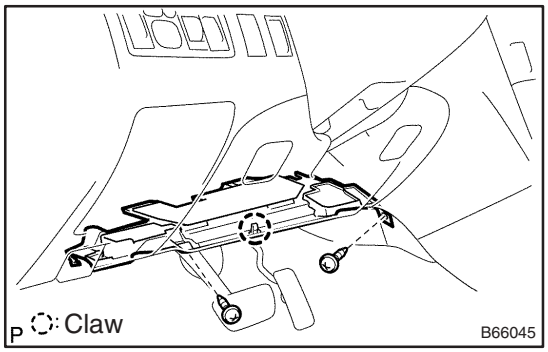
12. ADD ENGINE COOLANT (See page 16–5)

13. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)

14. INSTALL ENGINE ROOM COVER SIDE

(a) Install the engine room cover side with the 2 clips.

15. INSTALL RADIATOR SUPPORT OPENING COVER

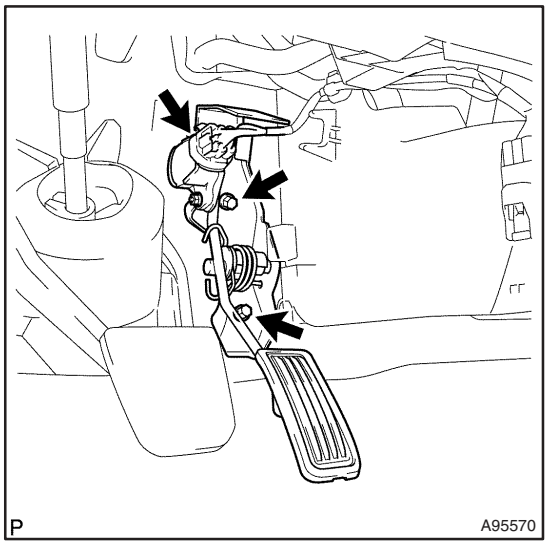


(a) Install the radiator support opening cover with the 4 clips and retainer.

ACCELERATOR PEDAL ASSY (1ZZ–FE/3ZZ–FE)(From February, 2004)

100P4–01

REPLACEMENT



1. DISCONNECT BATTERY NEGATIVE TERMINAL

2. REMOVE INSTRUMENT PANEL UNDER COVER SUB–ASSY NO.1

(a) Remove the 2 screws.

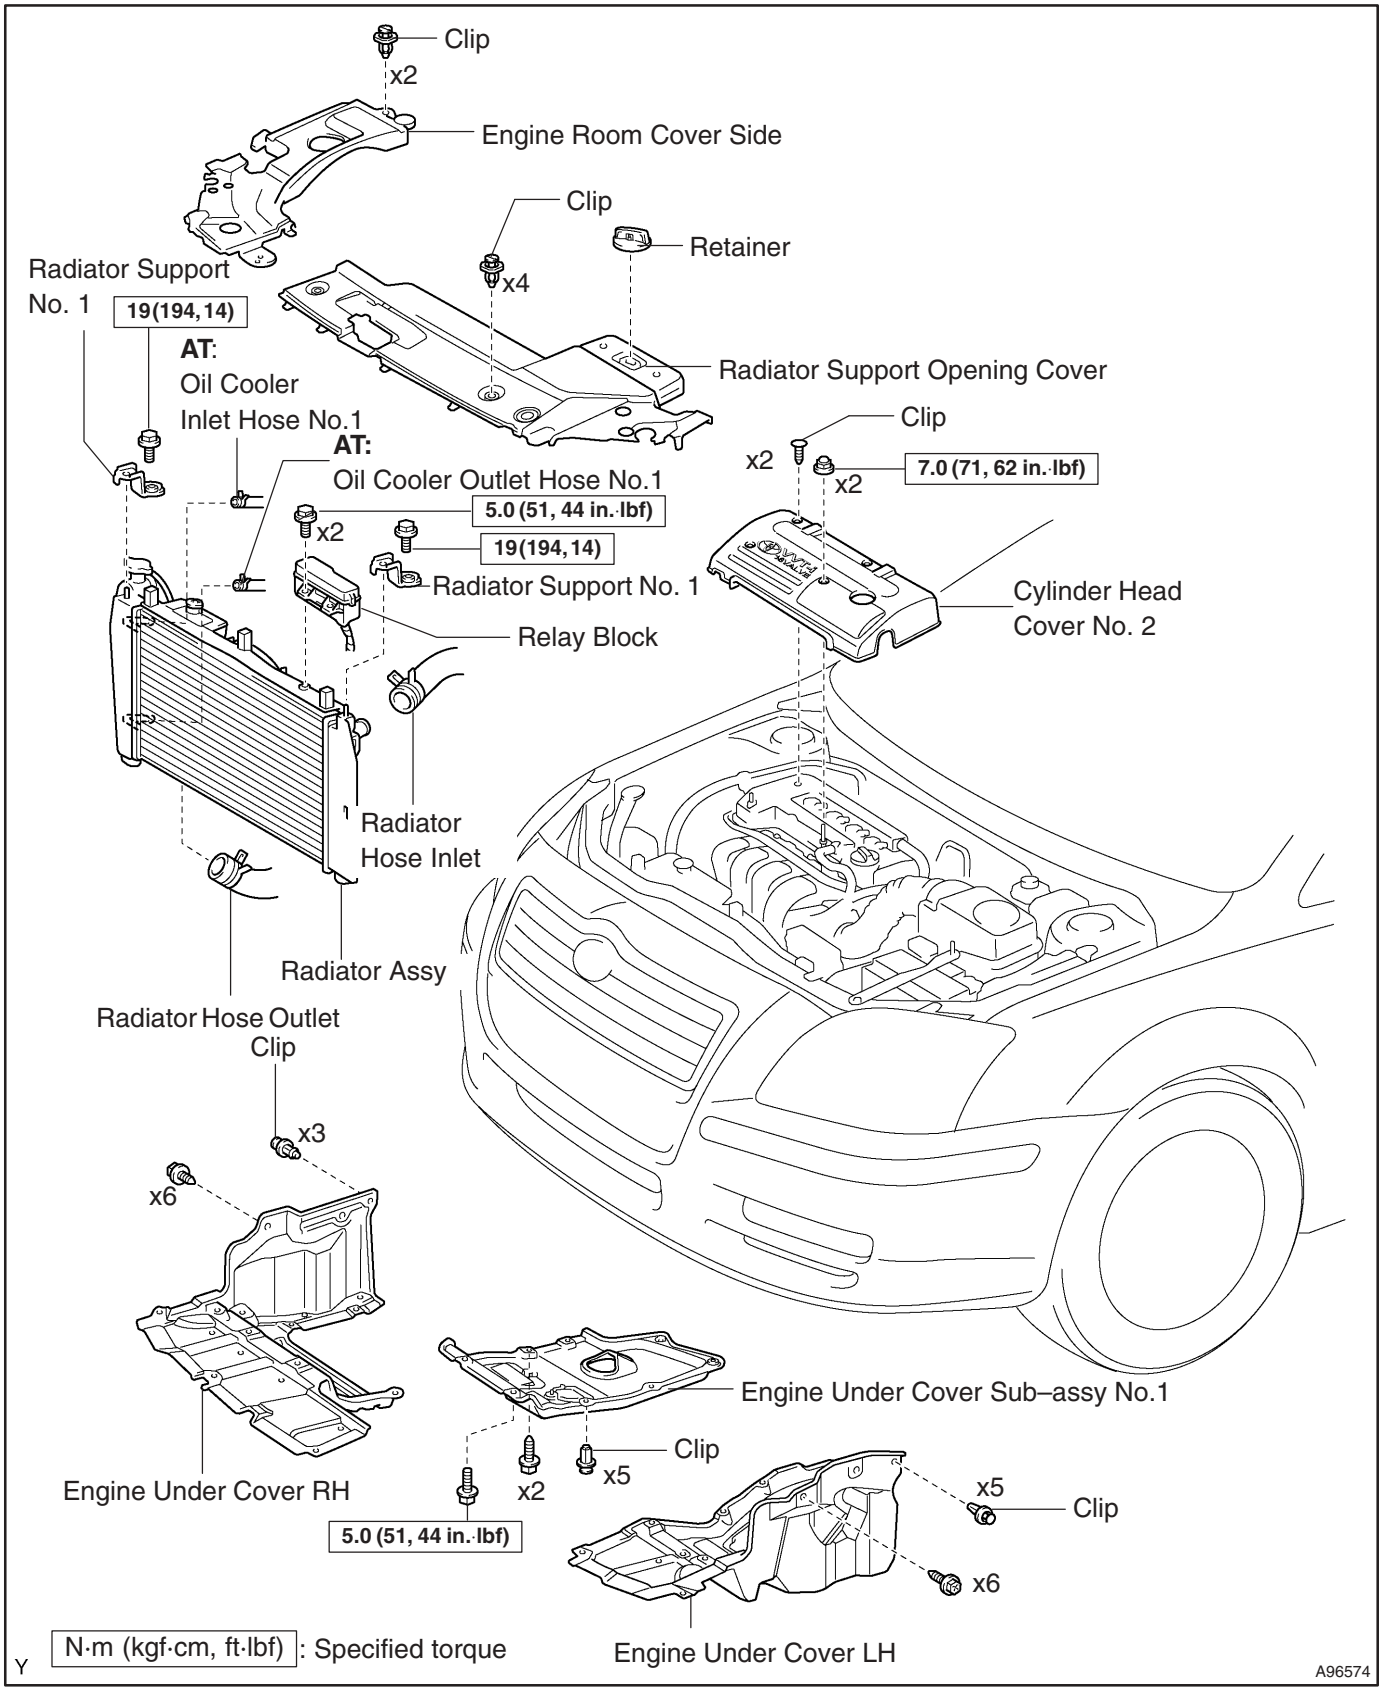
(b) Disengage the claw and remove instrument panel under cover sub–assembly No. 1.

3. REMOVE ACCELERATOR PEDAL ASSY

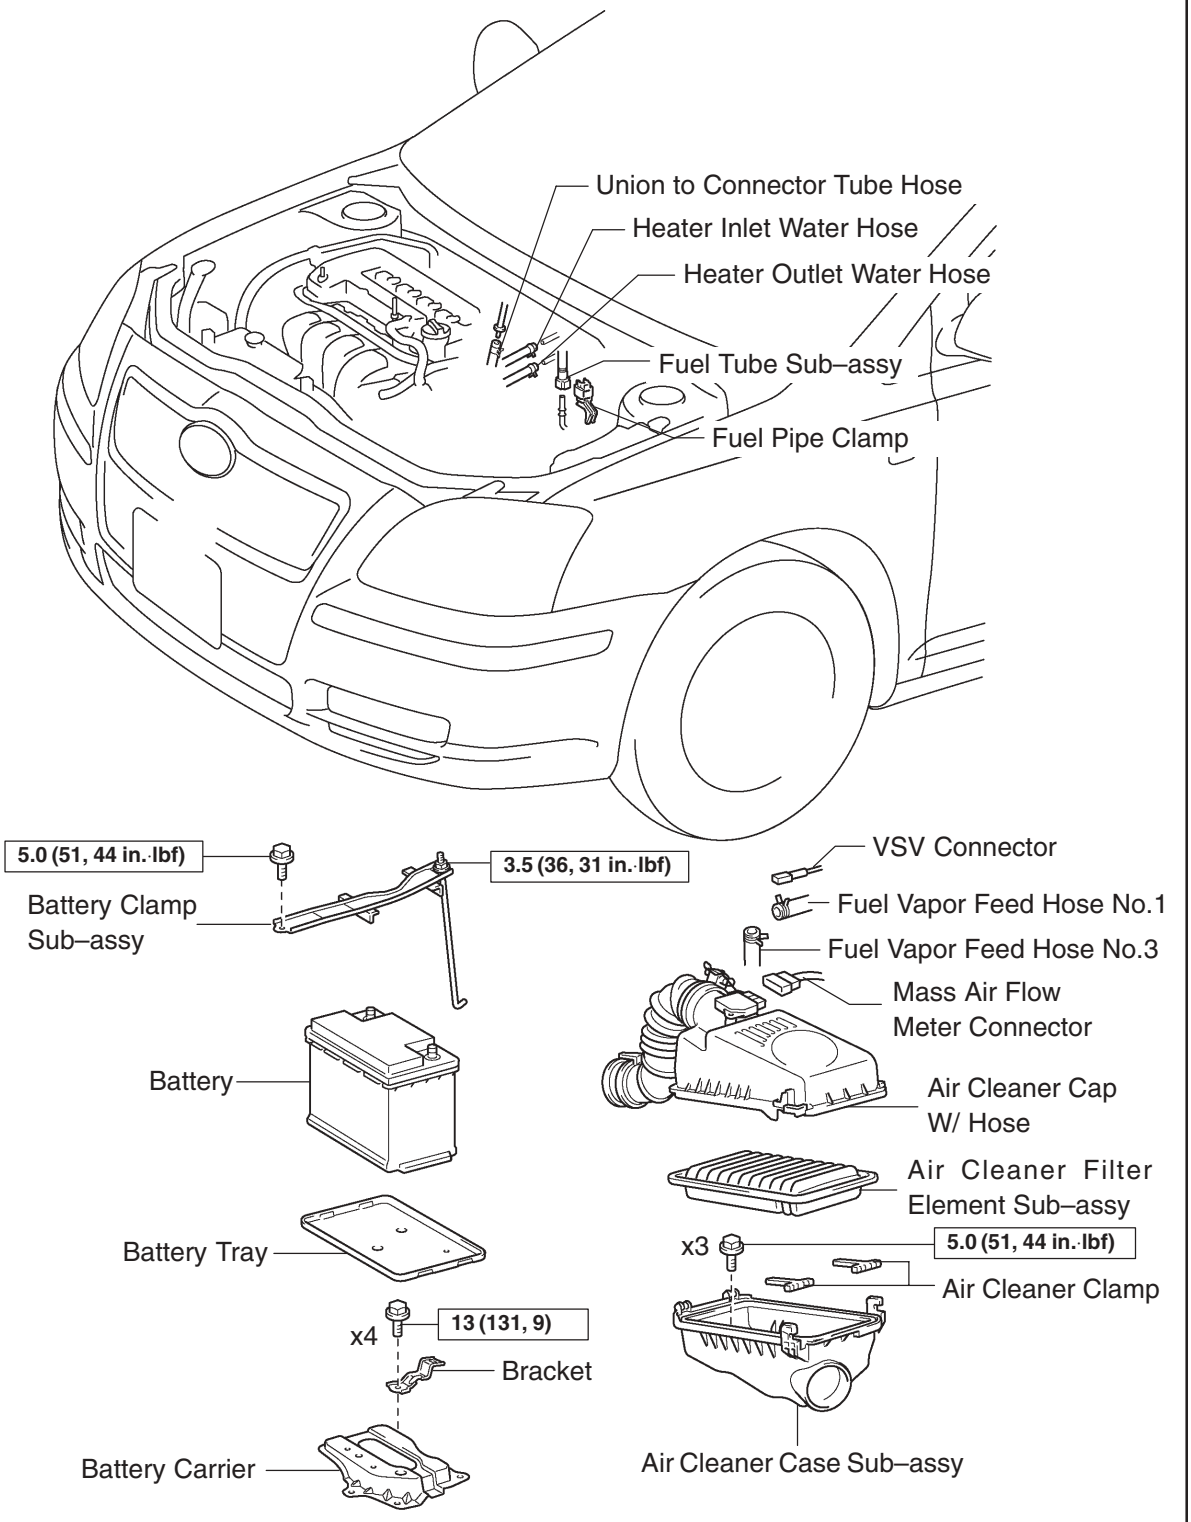
(a) Disconnect the accelerator pedal sensor connector.

(b) Remove the 2 bolts and accelerator pedal assembly.

4. INSTALL ACCELERATOR PEDAL ASSY
Torque: 5.4 N·m (55 kgf·cm, 48 in.·lbf)



5. INSTALL INSTRUMENT PANEL UNDER COVER SUB–ASSY NO.1



6. CONNECT BATTERY NEGATIVE TERMINAL
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)

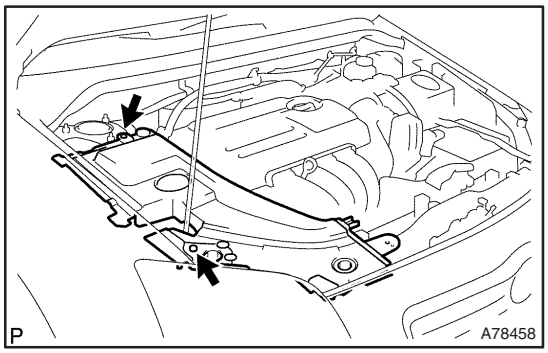
141UK–01

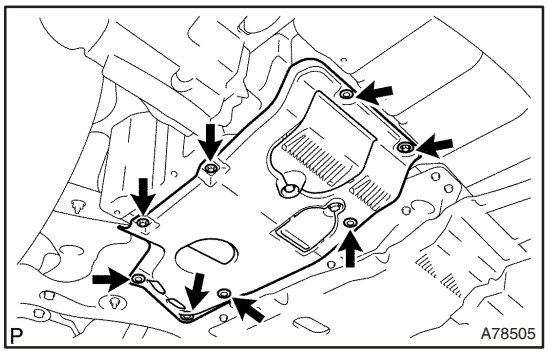
REPLACEMENT



1. DISCHARGE FUEL SYSTEM PRESSURE (See Pub. No. RM1018E on page 11–1)

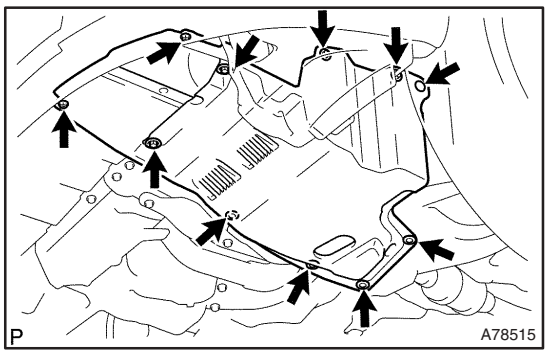
2. REMOVE RADIATOR SUPPORT OPENING COVER

(a) Remove the retainer and 4 clips.



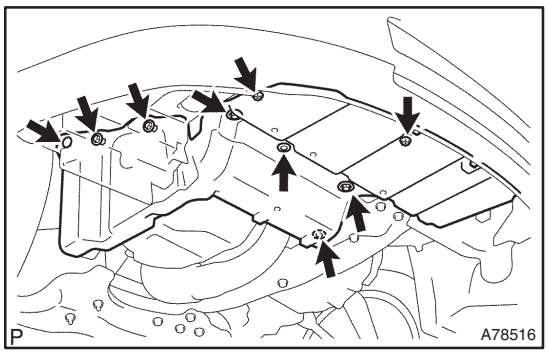
(b) Unfasten the 5 claws, then remove the radiator support opening cover.

3. REMOVE ENGINE ROOM COVER SIDE



(a) Remove the 2 clips and engine room cover side.

4. REMOVE FRONT WHEELS



5. REMOVE ENGINE UNDER COVER SUB–ASSY NO.1

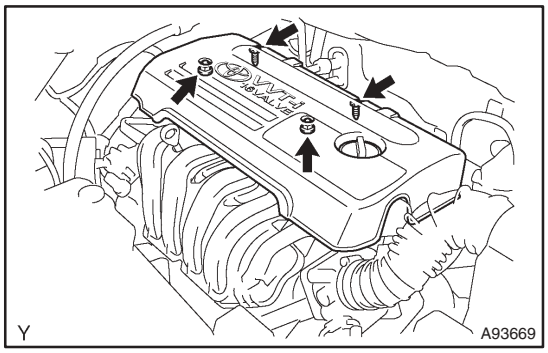
(a) Remove the 5 clips, 2 screws and bolt, then detach the engine under cover.

6. REMOVE ENGINE UNDER COVER LH

(a) Remove the 6 screws and 5 clips, then detach the engine under cover.

7. REMOVE ENGINE UNDER COVER RH

(a) Remove the 6 screws and 3 clips, then detach the engine under cover.



8. DRAIN ENGINE COOLANT (See page 16–5)

9. DRAIN ENGINE OIL

(a) Install a new gasket and the drain plug after draining engine oil.
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

10. DRAIN MANUAL TRANSAXLE OIL (M/T TRANSAXLE) (See Pub. No. RM1018E on page 41–15)

11. DRAIN AUTOMATIC TRANSAXLE FLUID (A/T TRANSAXLE) (See Pub. No. RM1018E on page 40–42)

12. REMOVE CYLINDER HEAD COVER NO.2

(a) Remove the 2 nuts and 2 clips, then detach cylinder head cover No.2.

13. REMOVE AIR CLEANER ASSEMBLY WITH HOSE (See page 10–6)

14. REMOVE AIR CLEANER FILTER ELEMENT SUB–ASSY

15. REMOVE AIR CLEANER CASE SUB–ASSY

(a) Remove the 3 bolts and air cleaner case.

16. DISCONNECT RADIATOR HOSE INLET

(a) Disconnect the radiator hose inlet from the radiator.

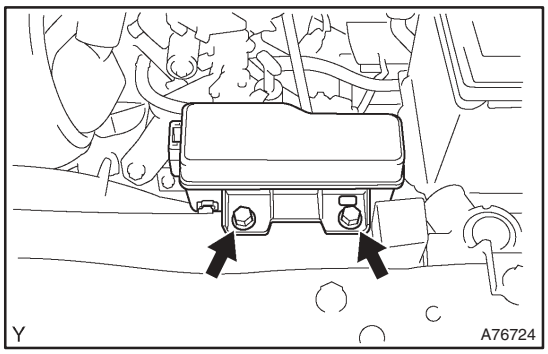
17. DISCONNECT RADIATOR HOSE OUTLET

(a) Disconnect the radiator hose outlet from the radiator.

18. DISCONNECT OIL COOLER INLET HOSE NO.1 (A/T TRANSAXLE)

(a) Disconnect the oil cooler inlet hose from the radiator.

19. DISCONNECT OIL COOLER OUTLET HOSE NO.1 (A/T TRANSAXLE)



(a) Disconnect the oil cooler outlet hose from the radiator.

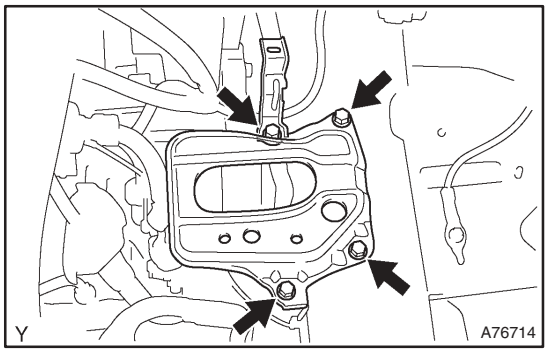
20. DISCONNECT OIL COOLER INLET TUBE NO.1 (A/T TRANSAXLE)

(a) Disconnect the oil cooler inlet tube from the radiator.

21. DISCONNECT OIL COOLER OUTLET TUBE NO.1 (A/T TRANSAXLE)

(a) Disconnect the oil cooler outlet tube from the radiator.

22. REMOVE RADIATOR ASSY



(a) Remove the 2 bolts and relay block.

(b) Disconnect the connector and 2 harness clamps.

(c) Remove the 2 bolts, 2 radiator support uppers and radiator.

23. REMOVE BATTERY

24. REMOVE BATTERY TRAY

25. REMOVE BATTERY CARRIER

(a) Remove the 4 bolts, battery carrier and bracket.

26. REMOVE EFI FUEL PIPE CLAMP
(See Pub. No. RM1018E on page 11–11)

27. DISCONNECT FUEL TUBE SUB–ASSY
(See Pub. No. RM1018E on page 11–11)

28. DISCONNECT UNION TO CONNECTOR TUBE HOSE

(a) Disconnect the union to connector tube hose.

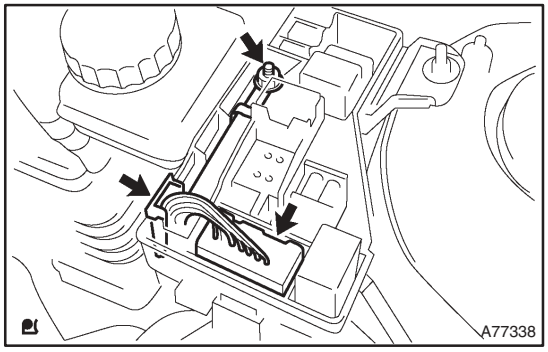
29. DISCONNECT HEATER INLET WATER HOSE

(a) Disconnect the heater inlet water hose from the heater core inlet tube.

30. DISCONNECT HEATER OUTLET WATER HOSE

(a) Disconnect the heater outlet water hose from the heater core outlet tube.

31. SEPARATE FLOOR SHIFT CABLE TRANSMISSION CONTROL SELECT (M/T TRANSAXLE)
(See Pub. No. RM1018E on page 41–15)



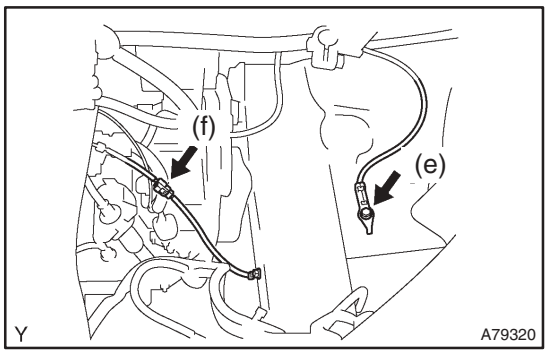
32. SEPARATE FLOOR SHIFT CABLE TRANSMISSION CONTROL SHIFT (M/T TRANSAXLE)
(See Pub. No. RM1018E on page 41–15)

33. SEPARATE FLOOR SHIFT CABLE TRANSMISSION CONTROL SHIFT (A/T TRANSAXLE)
(See Pub. No. RM1018E on page 40–11)

34. SEPARATE CLUTCH RELEASE CYLINDER ASSY (M/T TRANSAXLE)
(See Pub. No. RM1018E on page 41–15)

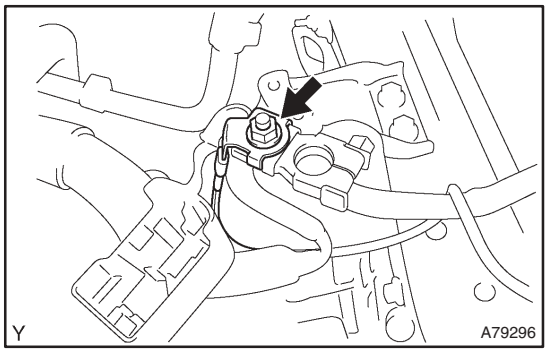
35. REMOVE GLOVE COMPARTMENT DOOR ASSY (See Pub. No. RM1018E on page 71–11)

36. REMOVE INSTRUMENT PANEL UNDER COVER SUB–ASSY NO.2



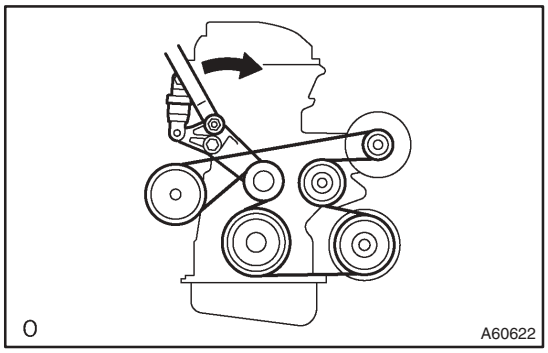
37. DISCONNECT ENGINE WIRE

(a) Disconnect the engine wire from the ECM and junction block.



(b) Pull out the engine wire.

(c) Remove the engine room relay block No.2 cover.



(d) Remove a nut, then disconnect a connector as shown in the illustration.

(e) Remove the bolt, then disconnect the ground terminal.
(f) Disconnect the ground terminal connector.

(g) Remove the nut and disconnect battery terminal B.

38. REMOVE FAN AND GENERATOR V BELT

(a) Turn the V–ribbed belt tensioner clockwise slowly and loosen it. Then, remove the fan and generator V belt and put back the V–ribbed belt tensioner carefully.

39. REMOVE GENERATOR ASSY (See Pub. No. RM1018E on page 19–7)

40. SEPARATE COMPRESSOR AND MAGNETIC CLUTCH (W/ AIR CONDITIONING)

HINT:

- Secure the compressor and hoses off to the side instead of discharging the A/C system.
- 1ZZ–FE (See Pub. No. RM1018E on page 55–74)
- 3ZZ–FE (See Pub. No. RM1018E on page 55–70)

41. REMOVE COLUMN HOLE COVER SILENCER SHEET

(a) Remove the 2 clips and column hole cover silencer sheet.

42. SEPARATE STEERING INTERMEDIATE SHAFT (See Pub. No. RM1018E on page 50–9)

43. REMOVE FRONT DOOR SCUFF PLATE RH (See Pub. No. RM1018E on page 71–11)

44. REMOVE COWL SIDE TRIM BOARD RH (See Pub. No. RM1018E on page 71–11)

45. REMOVE FRONT FLOOR FOOTREST (RHD STEERING POSITION TYPE)

46. REMOVE FLOOR PANEL BRACE FRONT

(a) Remove the 2 nuts and floor panel brace front.

47. REMOVE EXHAUST PIPE ASSY FRONT (See Pub. No. RM1018E on page 15–2)

48. REMOVE FRONT AXLE HUB LH NUT (See Pub. No. RM1018E on page 30–6)

SST 09930–00010

49. REMOVE FRONT AXLE HUB RH NUT

SST 09930–00010

HINT:

Perform the same procedure as above on the opposite side.

50. SEPARATE TIE ROD END SUB–ASSY LH (See Pub. No. RM1018E on page 30–6)

SST 09628–62011

51. SEPARATE TIE ROD END SUB–ASSY RH

SST 09628–62011

HINT:

Perform the same procedure as above on the opposite side.

52. SEPARATE FRONT STABILIZER LINK ASSY LH (See Pub. No. RM1018E on page 30–6)

53. SEPARATE FRONT STABILIZER LINK ASSY RH

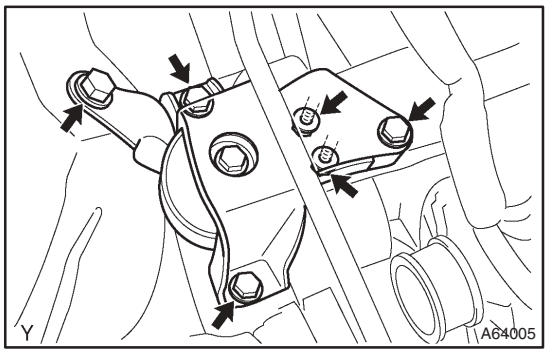
HINT:

Perform the same procedure as above on the opposite side.

54. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH (See Pub. No. RM1018E on page 30–6)

55. SEPARATE FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH

HINT:

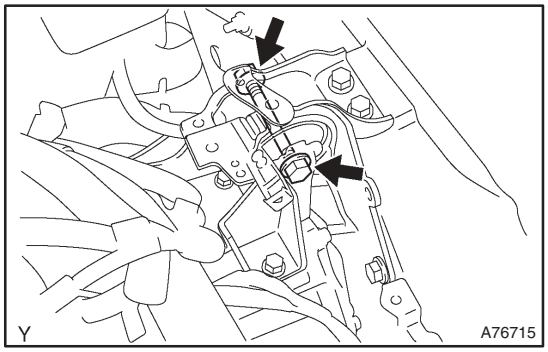


Perform the same procedure as above on the opposite side.

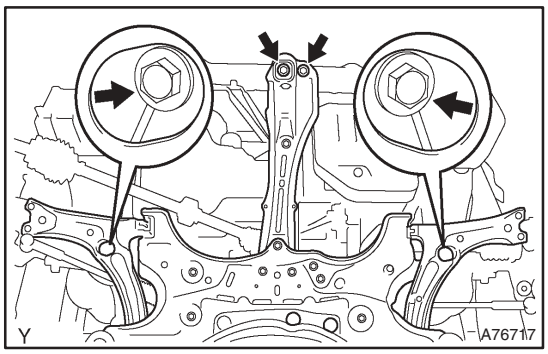
56. SEPARATE FRONT AXLE ASSY LH (See Pub. No. RM1018E on page 30–6)

57. SEPARATE FRONT AXLE ASSY RH

HINT:

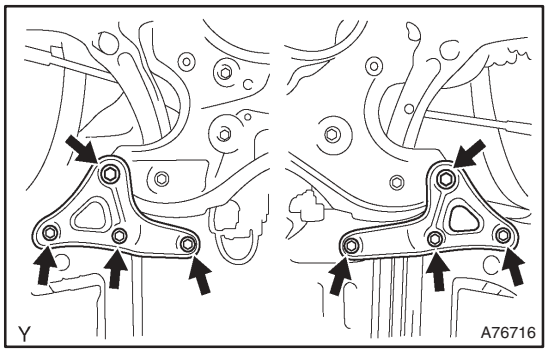


Perform the same procedure as above on the opposite side.



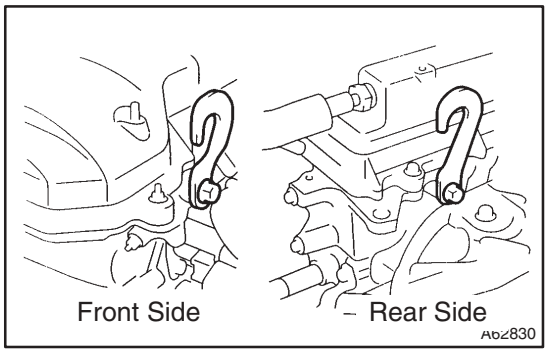
58. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Set the engine lifter.



(b) Remove the 4 bolts and 2 nuts, then detach the engine mounting insulator.

(c) Remove the through bolt and nut, then detach the engine mounting insulator from the vehicle.



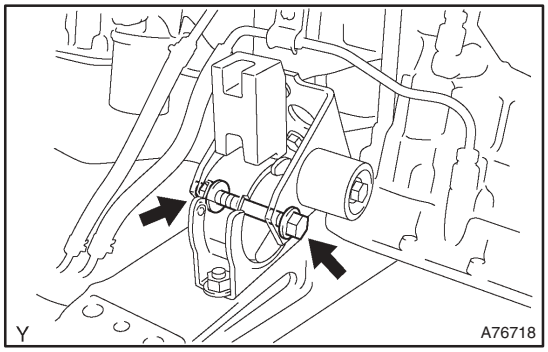
(d) Remove the 2 bolts and 2 nuts as shown in the illustration.

(e) Remove the 8 bolts and front suspension member brace rear RH and LH.

(f) Carefully remove the engine with transaxle from the engine compartment.

(g) Install the engine hanger No. 1 (12281–15040) and bolt (91512–B1016).

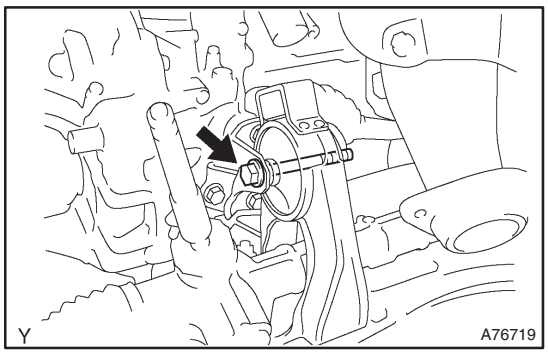
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)



(h) Install the engine hanger (12281–22021) and bolt (91512–B1016).

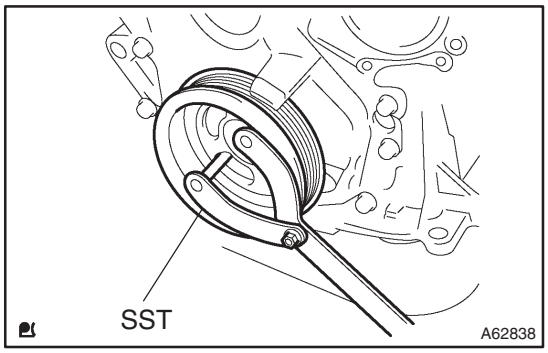
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)

HINT:



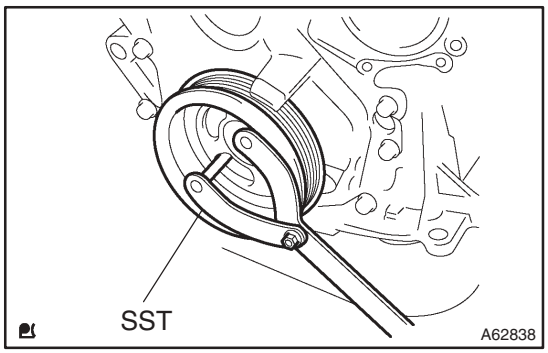
Securely install the front engine hanger (12281–22021) and rear engine hanger No. 1 (12281–15040) onto the engine assembly.

(i) Attach the engine sling, then hang the engine with the chain block.



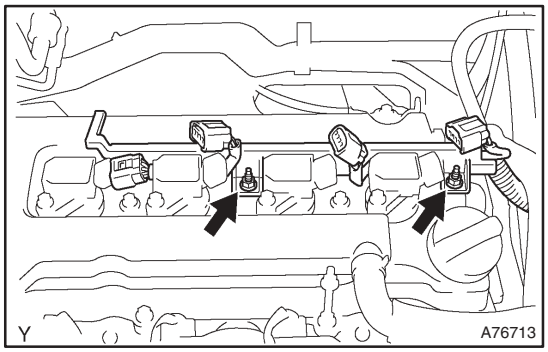
59. REMOVE FRONT SUSPENSION CROSSMEMBER W/CENTER MEMBER

(a) Remove the through bolt and nut, then detach the engine mounting insulator FR from the engine mounting bracket.

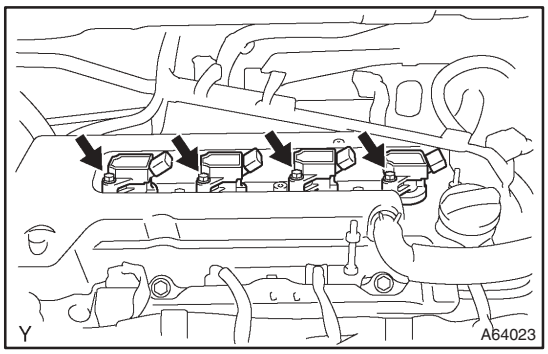


(b) Remove the through bolt, then detach the engine mounting insulator RR from the suspension crossmember.
(c) Separate the engine and the transaxle assembly from the suspension crossmember and engine mounting member.

60. REMOVE STARTER ASSY (See Pub. No. RM1018E on page 19–3)
61. REMOVE MANUAL TRANSAXLE ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 41–15)
62. REMOVE AUTOMATIC TRANSAXLE ASSY (A/T TRANSAXLE) (See Pub. No. RM1018E on page 40–11)
63. REMOVE CLUTCH COVER ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 42–26)
64. REMOVE CLUTCH DISC ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 42–26)

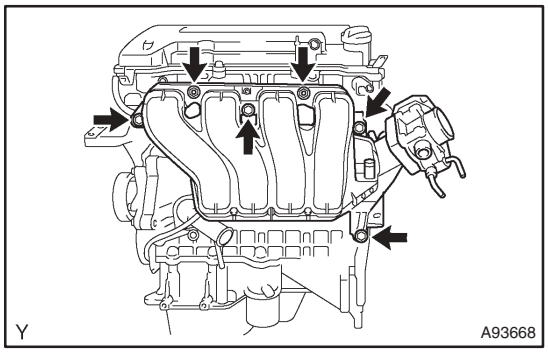


65. REMOVE FLYWHEEL SUB–ASSY (M/T TRANSAXLE)
(a) Hold the crankshaft with SST, then remove the 8 bolts and flywheel.
SST 09960–10010 (09962–01000, 09963–01000)



66. REMOVE DRIVE PLATE & RING GEAR SUB–ASSY (A/T TRANSAXLE)
(a) Hold the crankshaft with SST, then remove the 8 bolts and drive plate & ring gear.
SST 09960–10010 (09962–01000, 09963–01000)

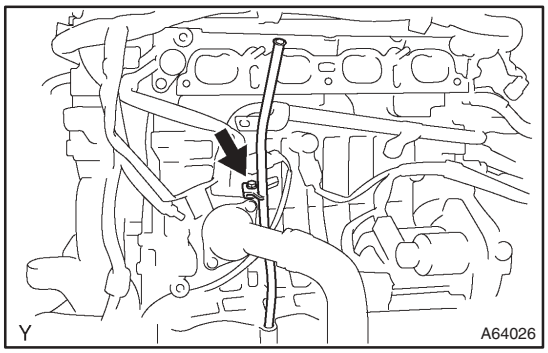
67. REMOVE IGNITION COIL ASSY
(a) Disconnect the 4 ignition coil connectors.



(b) Remove the 2 nuts which are used to secure the engine wire.

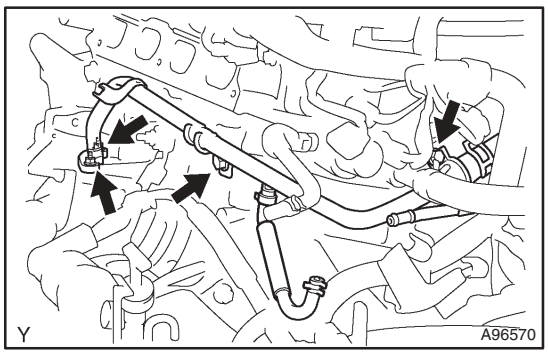
(c) Remove the 4 bolts and 4 ignition coils.

68. REMOVE FUEL DELIVERY PIPE SUB–ASSY
(See Pub. No. RM1018E on page 11–11)



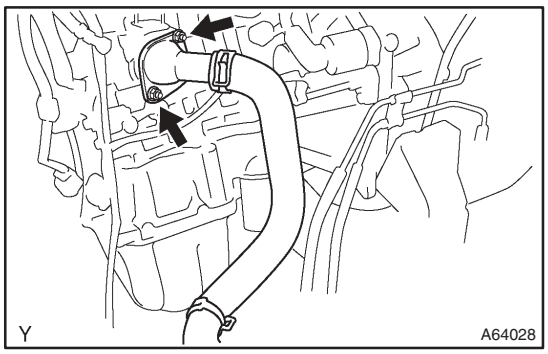
69. REMOVE INTAKE MANIFOLD

(a) Disconnect the throttle motor connector.
(b) Disconnect the 2 water hoses from the throttle body.
(c) Disconnect the ventilation hose and ventilation hose No. 2 from the cylinder head cover.
(d) Disconnect the vacuum hose from water by–pass pipe No. 1.
(e) Remove the 4 bolts, 2 nuts and 2 wire brackets,then remove the intake manifold and throttle body assembly.
(f) Remove the gasket from the intake manifold and the throttle body assembly.



70. REMOVE OIL LEVEL GAGE SUB–ASSY

(a) Remove the oil level gage from the oil level gage guide.

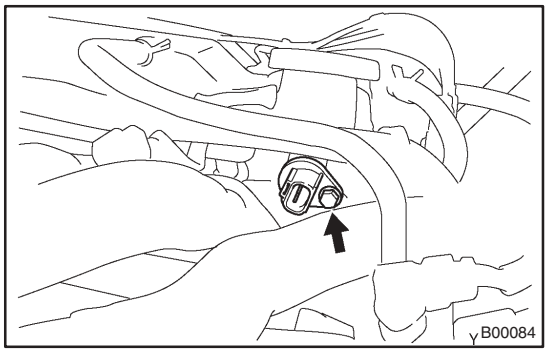


71. REMOVE OIL LEVEL GAGE GUIDE

(a) Disconnect the crankshaft position sensor clamp.
(b) Remove the bolt and oil level gage guide.

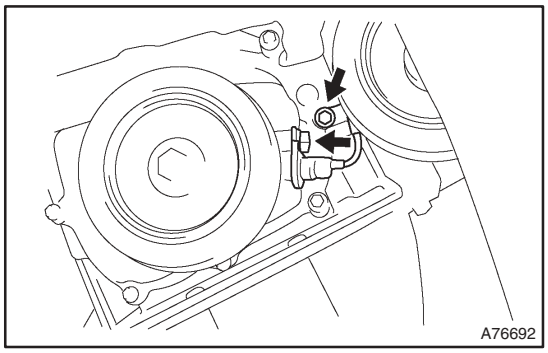
72. REMOVE WATER BY–PASS PIPE NO.1

(a) Disconnect the knock sensor clamp.
(b) Remove the 2 bolts and 2 nuts, then detach the water by–pass pipe and gasket.



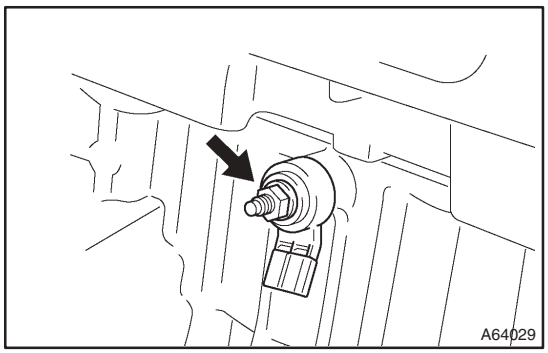
73. REMOVE WATER INLET

(a) Remove the 2 nuts and water inlet.



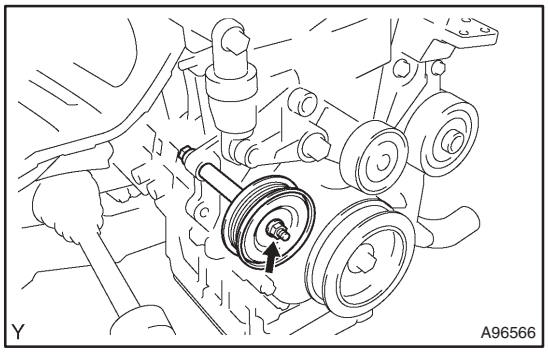
74. REMOVE THERMOSTAT

75. REMOVE ENGINE OIL PRESSURE SWITCH ASSY
(See Pub. No. RM1018E on page 17–1)



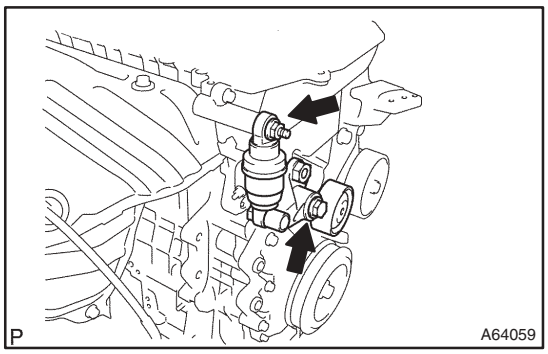
76. REMOVE CAMSHAFT POSITION SENSOR

(a) Remove the bolt and camshaft position sensor.



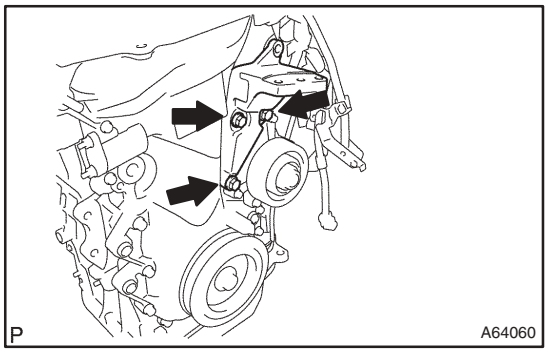
77. REMOVE CRANKSHAFT POSITION SENSOR

(a) Remove the 2 bolts and crankshaft position sensor.



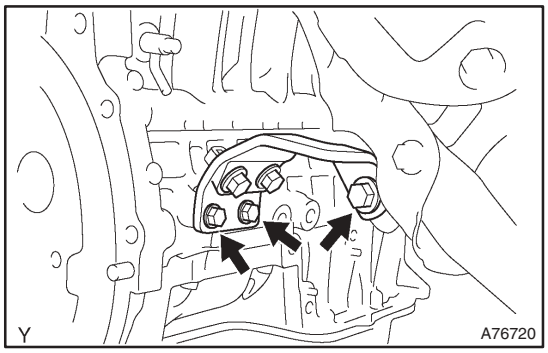
78. REMOVE KNOCK SENSOR

(a) Remove the nut and knock sensor.



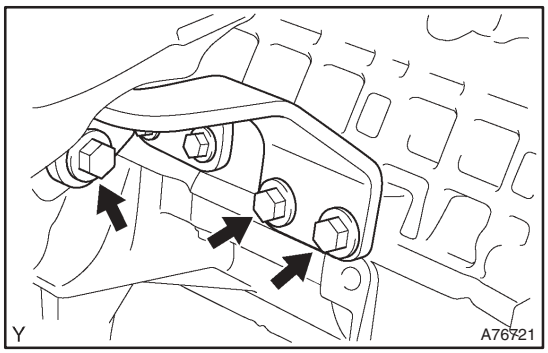
79. REMOVE V–RIBBED IDLER ASSY NO.1

(a) Remove the nut, bolt, tube and idler.



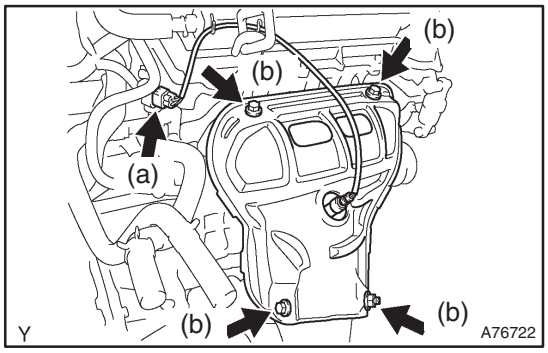
80. REMOVE V–RIBBED BELT TENSIONER ASSY

(a) Remove the bolt, nut and V–ribbed belt tensioner.



81. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

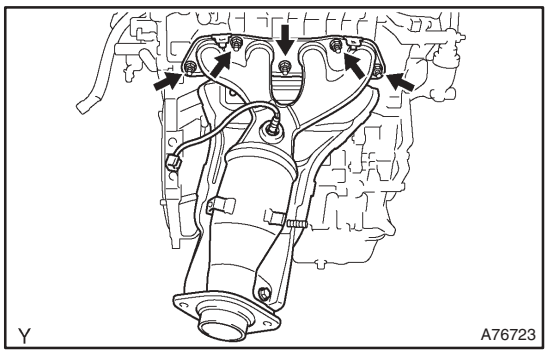
(a) Remove the 3 bolts and transverse engine mounting bracket.



82. REMOVE MANIFOLD STAY

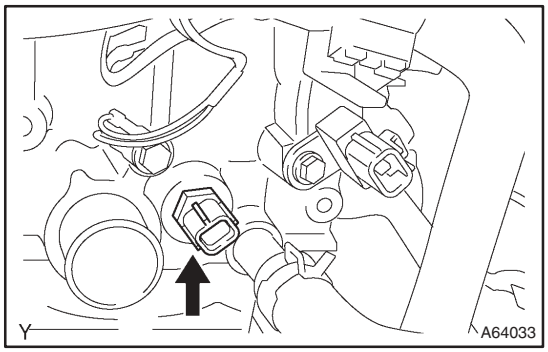
(a) Remove the 3 bolts and manifold stay.

83. REMOVE MANIFOLD STAY NO.2



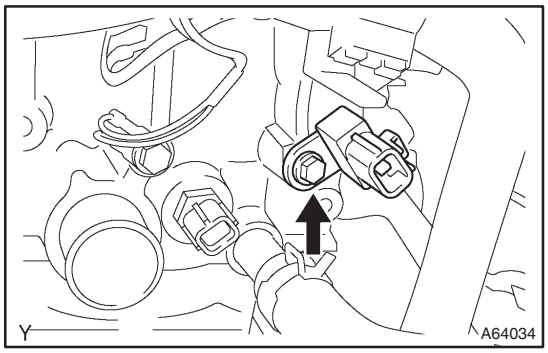
(a) Remove the 3 bolts and manifold stay.

84. REMOVE EXHAUST MANIFOLD HEAT INSULATOR NO.1



(a) Disconnect the heated oxygen sensor connector.

(b) Remove the 3 bolts and nut, then remove the exhaust manifold heat insulator.



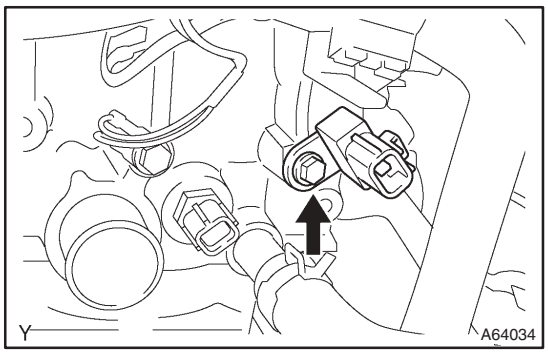
85. REMOVE EXHAUST MANIFOLD

(a) Remove the 5 nuts, then remove the exhaust manifold and gasket.

86. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

(a) Using SST, remove the engine coolant temperature sensor.
SST 09817–33190

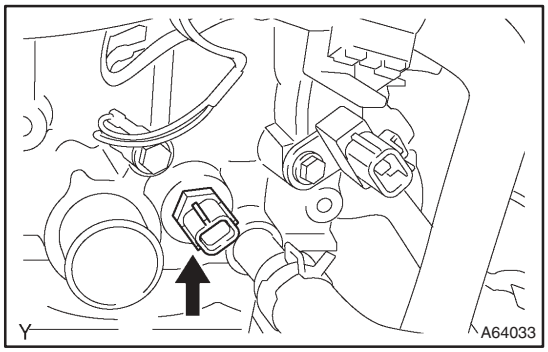
87. REMOVE RADIO SETTING CONDENSER



(a) Remove the bolt and condenser.

88. REMOVE WATER BY–PASS HOSE NO.2

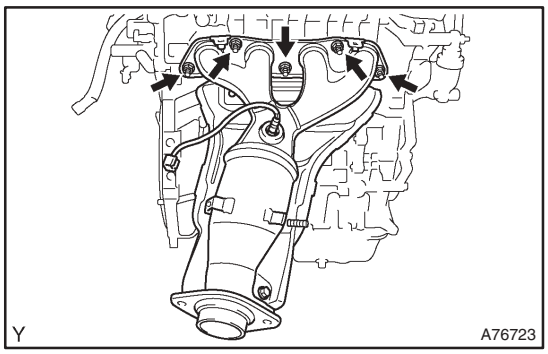
89. REMOVE RADIATOR HOSE INLET



90. REMOVE HEATER INLET WATER HOSE

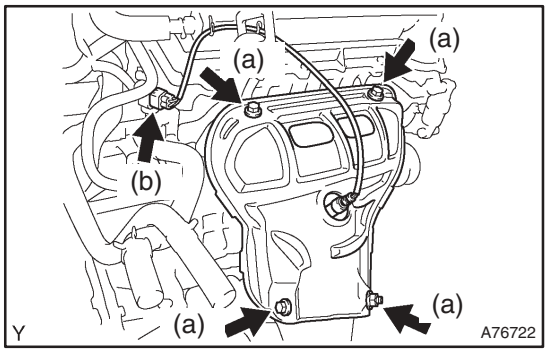
91. REPLACE PARTIAL ENGINE ASSY

92. INSTALL RADIO SETTING CONDENSER



(a) Install the condenser with the bolt.
Torque: 10 N·m (102 kgf·cm, 7 ft·lbf)

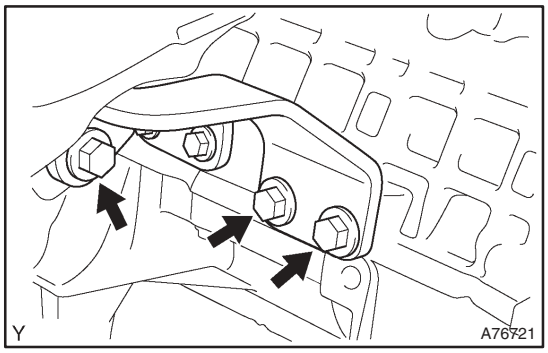
93. INSTALL ENGINE COOLANT TEMPERATURE SENSOR



(a) Install a new gasket onto the engine coolant temperature sensor.

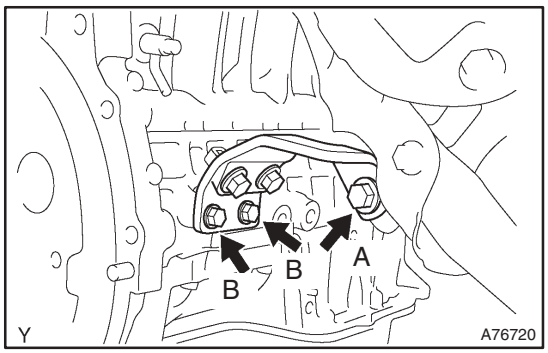
(b) Using SST, install the engine coolant temperature sensor.
SST 09817–33190
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

94. INSTALL EXHAUST MANIFOLD



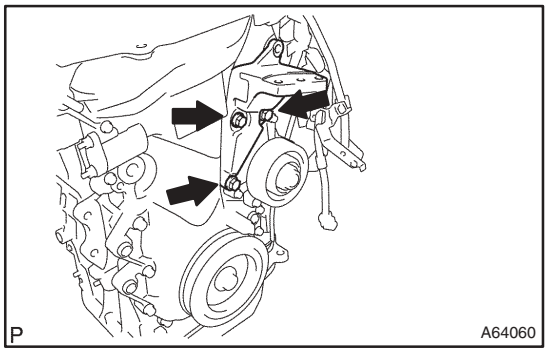
(a) Install a new gasket and the exhaust manifold with the 5 nuts.
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

95. INSTALL EXHAUST MANIFOLD HEAT INSULATOR NO.1



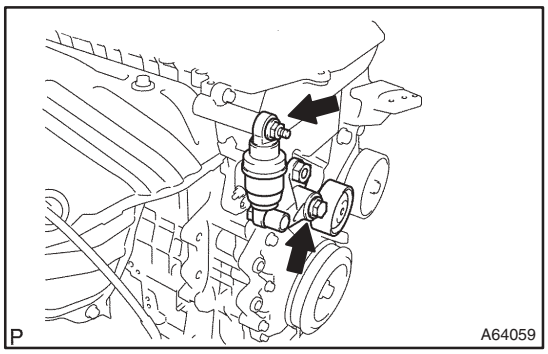
(a) Install the exhaust manifold heat insulator, then install the 3 bolts and nut.
Torque:
18 N·m (184 kgf·cm, 13 ft·lbf) for bolt
12 N·m (122 kgf·cm, 9 ft·lbf) for nut

(b) Connect the heated oxygen sensor connector.



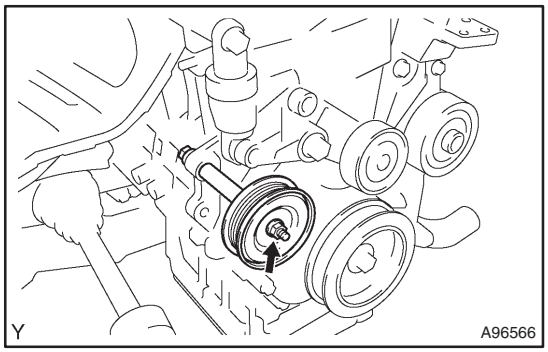
96. INSTALL MANIFOLD STAY NO.2

(a) Install the manifold stay with the 3 bolts.
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)



97. INSTALL MANIFOLD STAY

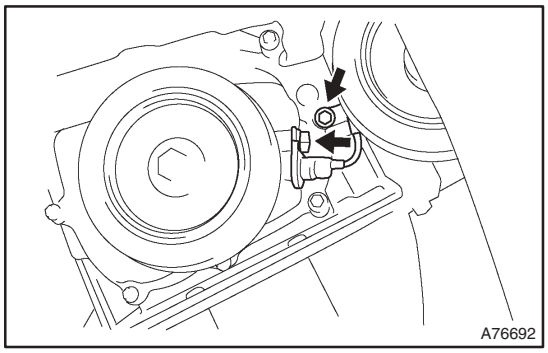
(a) Install the manifold stay with the 3 bolts.
Torque:
49 N·m (500 kgf·cm, 36 ft·lbf) for A
37 N·m (377 kgf·cm, 27 ft·lbf) for B



98. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

(a) Install the transverse engine mounting bracket with the 3 bolts.
Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)

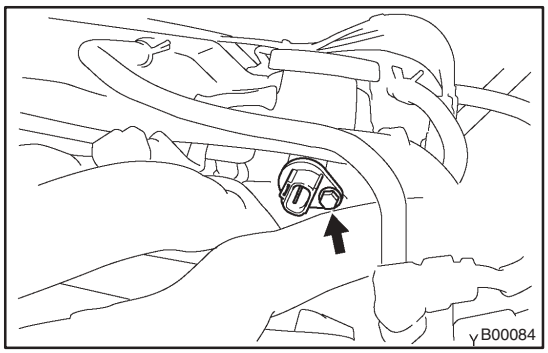
99. INSTALL V–RIBBED BELT TENSIONER ASSY



(a) Install the V–ribbed belt tensioner with the bolt and nut.
Torque:
29 N·m (296 kgf·cm, 21 ft·lbf) for nut
69 N·m (704 kgf·cm, 51 ft·lbf) for bolt

100. INSTALL V–RIBBED IDLER ASSY NO.1

(a) Install the tube and idler with the nut and bolt.
Torque: 39 N·m (400 kgf·cm, 29 ft·lbf)



101. INSTALL KNOCK SENSOR
(See Pub. No. RM1018E on page 10–17)

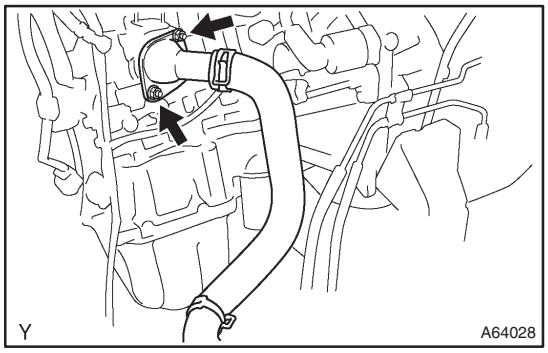
102. INSTALL CRANKSHAFT POSITION SENSOR

(a) Apply a light coat of engine oil to the O–ring on the crankshaft position sensor.

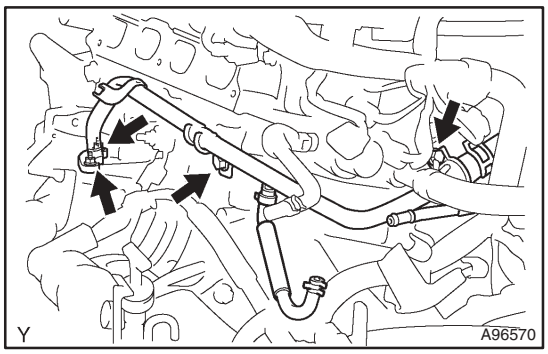
(b) Install the crankshaft position sensor with the 2 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

103. INSTALL CAMSHAFT POSITION SENSOR

(a) Apply a light coat of engine oil to the O–ring on the camshaft position sensor.



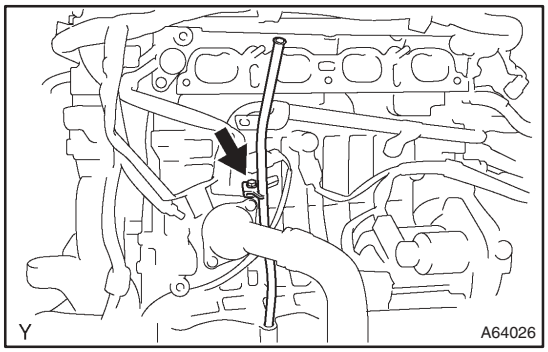
(b) Install the camshaft position sensor with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



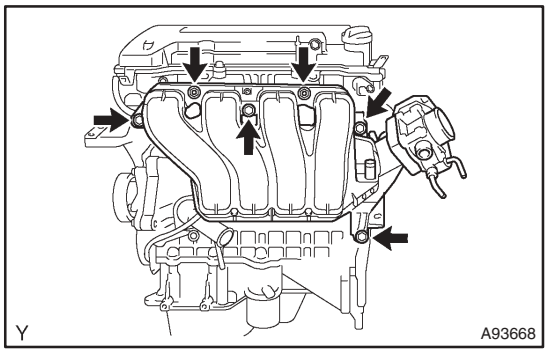
104. INSTALL ENGINE OIL PRESSURE SWITCH ASSY
(See Pub. No. RM1018E on page 17–1)
Adhesive: Part No.08833 – 00080, THREE BOND 1344.

105. INSTALL THERMOSTAT
(See Pub. No. RM1018E on page 16–9)

106. INSTALL WATER INLET



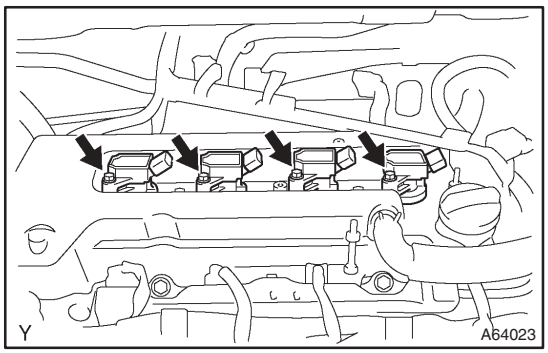
(a) Install the water inlet with the 2 nuts.
Torque: 11 N·m (112 kgf·cm, 8 ft·lbf)



107. INSTALL WATER BY–PASS PIPE NO.1

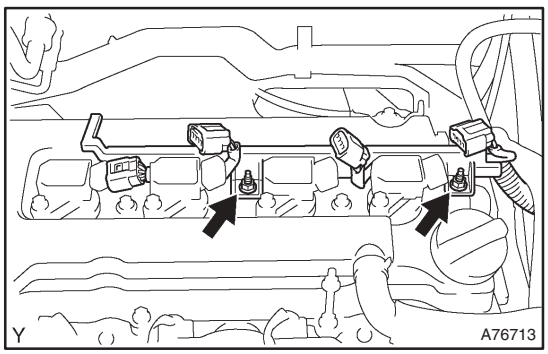
(a) Install a new gasket and water by–pass pipe with the 2 nuts and 2 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

108. INSTALL OIL LEVEL GAGE GUIDE



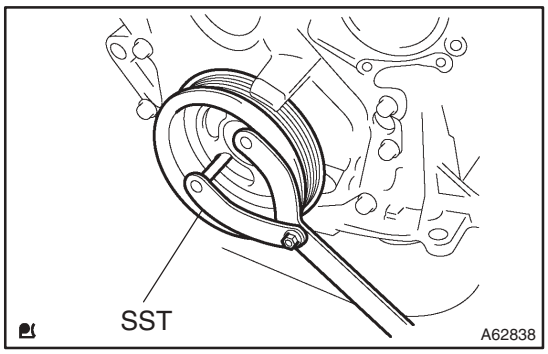
(a) Apply a light coat of engine oil to a new O–ring and install it onto the oil level gage guide.
(b) Install the oil level gage guide with the bolt.
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)

109. INSTALL INTAKE MANIFOLD



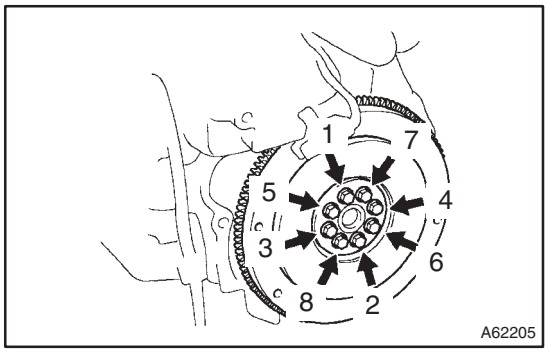
(a) Install a new gasket onto the intake manifold.
(b) Install the intake manifold and 2 clamp brackets with the 2 nuts and 4 bolts.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

110. INSTALL FUEL DELIVERY PIPE SUB–ASSY
(See Pub. No. RM1018E on page 11–11)

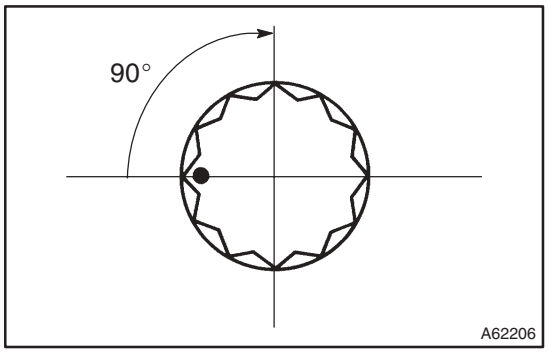


111. INSTALL IGNITION COIL ASSY

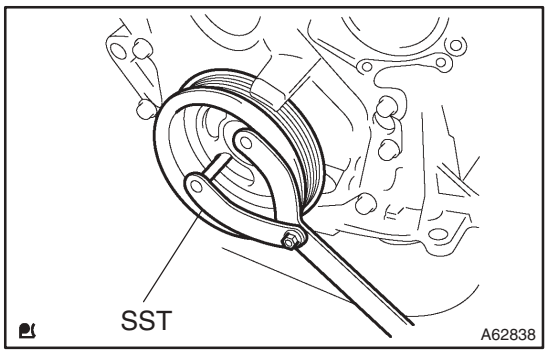
(a) Install the 4 ignition coils with the 4 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



(b) Install the engine wire with the 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

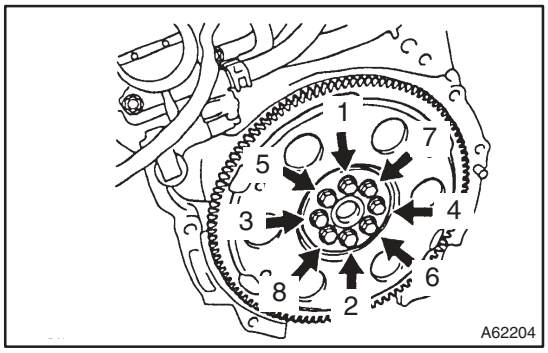


112. INSTALL FLYWHEEL SUB–ASSY (M/T TRANSAXLE)



(a) Hold the crankshaft with SST.
SST 09960–10010 (09962–01000, 09963–01000)

(b) Clean the bolt and bolt hole.
(c) Apply adhesive to the bolts.
Adhesive:
Part No. 09330–00070, THREE BOND or equivalent.
(d) Using several steps, install and tighten the 8 bolts uniformly in the sequence shown in the illustration.
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

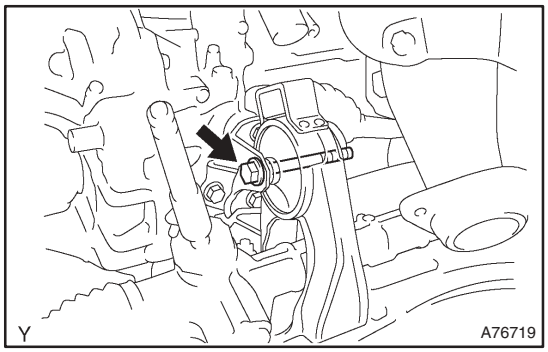


(e) Mark each bolt head with paint.
(f) Retighten the bolts by an additional 90° in the same sequence as step (d).
(g) Check that the paint marks are at a 90° angle to the original position.

113. INSTALL DRIVE PLATE & RING GEAR SUB–ASSY (A/T TRANSAXLE)

(a) Hold the crankshaft with SST.
SST 09960–10010 (09962–01000, 09963–01000)

(b) Clean the bolt and bolt hole.
(c) Apply adhesive to the bolts.
Adhesive:
Part No. 09330–00070, THREE BOND or equivalent.
(d) Using several steps, install and tighten the 8 bolts uniformly in the sequence shown in the illustration.
Torque: 88 N·m (897 kgf·cm, 65 ft·lbf)

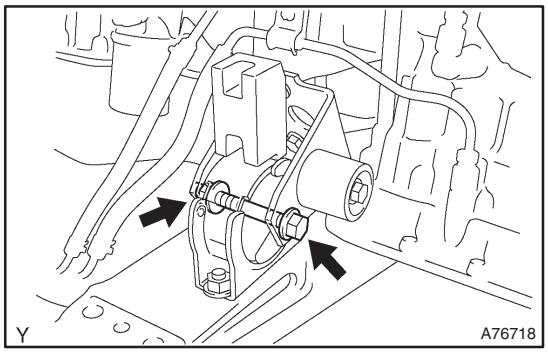


114. INSTALL CLUTCH DISC ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 42–26)
SST 09301–00210

115. INSTALL CLUTCH COVER ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 42–26)
SST 09301–00210

116. INSTALL MANUAL TRANSAXLE ASSY (M/T TRANSAXLE) (See Pub. No. RM1018E on page 41–15)

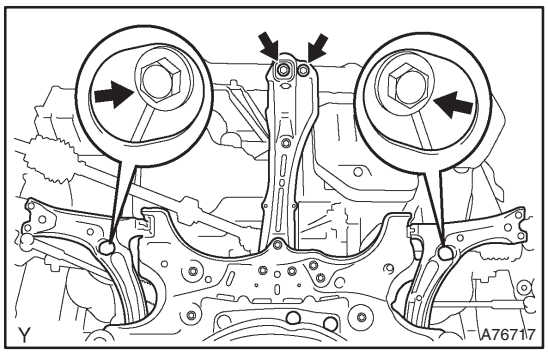
117. INSTALL AUTOMATIC TRANSAXLE ASSY (A/T TRANSAXLE) (See Pub. No. RM1018E on page 40–11)



118. INSTALL STARTER ASSY (See Pub. No. RM1018E on page 19–3)

119. INSTALL FRONT SUSPENSION CROSSMEMBER W/CENTER MEMBER

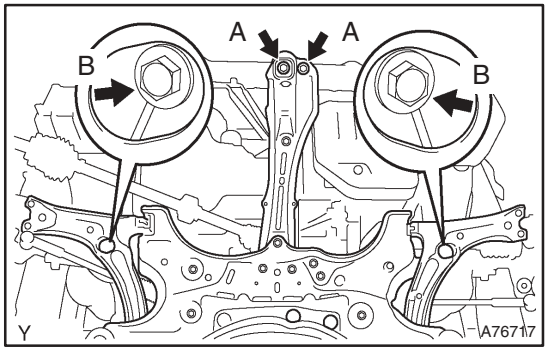
(a) Attach the engine and transaxle assembly to the suspension crossmember and engine mounting member.



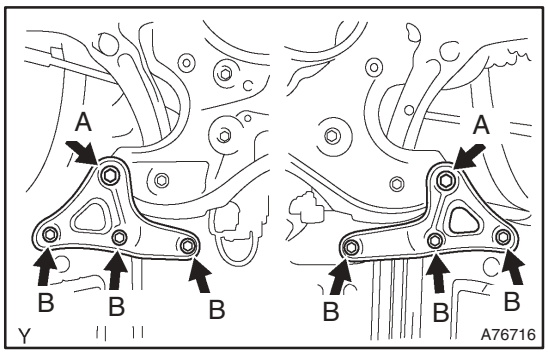
(b) Install the bolt which is used to secure the rear engine mounting bracket onto the mounting insulator.
Torque: 87 N·m (887 kgf·cm, 64 ft·lbf)

(c) Install the bolt which is used to secure the front engine mounting bracket onto the mounting insulator.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

120. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE
SST 09670–00010



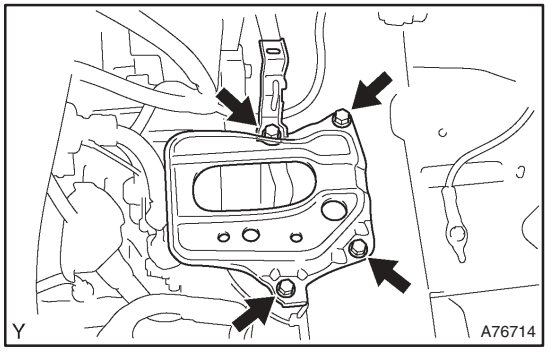
(a) Set the engine assembly with transaxle on the engine lifter.



(b) Temporarily install the suspension crossmember with the 2 bolts and 2 nuts.

(c) Install the engine mounting insulator LH.
Torque: 80 N·m (816 kgf·cm, 59 ft·lbf)

(d) Install the engine mounting insulator RH.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)



(e) Tighten the 2 bolts and 2 nuts.
Torque:
45 N·m (459 kgf·cm, 33 ft·lbf) for bolt A
133 N·m (1,356 kgf·cm, 98 ft·lbf) for nut B

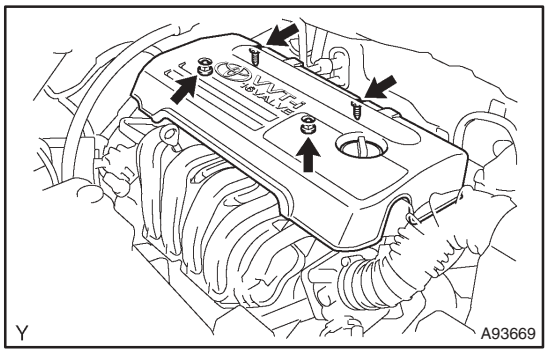
(f) Install the front suspension member brace LH and RH with the 8 bolts.
Torque:
133 N·m (1,356 kgf·cm, 98 ft·lbf) for bolt A
80 N·m (816 kgf·cm, 59 ft·lbf) for bolt B

121. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 LH
(See Pub. No. RM1018E on page 30–6)
122. INSTALL FRONT SUSPENSION ARM SUB–ASSY LOWER NO.1 RH
HINT:
Perform the same procedure as above on the opposite side.
123. INSTALL FRONT STABILIZER LINK ASSY LH (See Pub. No. RM1018E on page 30–6)
124. INSTALL FRONT STABILIZER LINK ASSY RH
HINT:
Perform the same procedure as above on the opposite side.
125. INSTALL TIE ROD END SUB–ASSY LH (See Pub. No. RM1018E on page 30–6)
126. INSTALL TIE ROD END SUB–ASSY RH
HINT:
Perform the same procedure as above on the opposite side.
127. INSTALL FRONT AXLE HUB LH NUT (See Pub. No. RM1018E on page 30–6)
128. INSTALL FRONT AXLE HUB RH NUT
HINT:
Perform the same procedure as above on the opposite side.
129. INSTALL EXHAUST PIPE ASSY FRONT (See Pub. No. RM1018E on page 15–2)
130. INSTALL FLOOR PANEL BRACE FRONT
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)
131. INSTALL STEERING INTERMEDIATE SHAFT (See Pub. No. RM1018E on page 50–9)
132. INSTALL GENERATOR ASSY (See Pub. No. RM1018E on page 19–7)
133. INSTALL COMPRESSOR AND MAGNETIC CLUTCH (W/ AIR CONDITIONING)
HINT:
- 1ZZ–FE (See Pub. No. RM1018E on page 55–74)
- 3ZZ–FE (See Pub. No. RM1018E on page 55–70)

134. INSTALL CLUTCH RELEASE CYLINDER ASSY (M/T TRANSAXLE)
(See Pub. No. RM1018E on page 41–15)
135. INSTALL FLOOR SHIFT CABLE TRANSMISSION CONTROL SHIFT (A/T TRANSAXLE)
(See Pub. No. RM1018E on page 40–11)

136. INSTALL BATTERY CARRIER
(a) Install the battery carrier and bracket with the 4 bolts.
Torque: 13 N·m (131 kgf·cm, 9 ft·lbf)

137. INSTALL BATTERY
Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for bolt
3.5 N·m (36 kgf·cm, 31 in.·lbf) for nut



138. INSTALL RADIATOR SUPPORT NO.1

(a) Install the 2 radiator supports with the 2 bolts.
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

139. INSTALL AIR CLEANER CASE SUB–ASSY

(a) Install the air cleaner case with the 3 bolts.
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)

140. INSTALL AIR CLEANER ASSEMBLY WITH HOSE (See page 10–6)

141. INSTALL CYLINDER HEAD COVER NO.2

(a) Install the cylinder head cover with the 2 nuts and 2 clips.
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)

142. INSTALL FRONT WHEELS
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

143. ADD AUTOMATIC TRANSAXLE FLUID (A/T TRANSAXLE)

144. ADD ENGINE OIL

145. ADD ENGINE COOLANT (See page 16–5)

146. CHECK FOR ENGINE OIL LEAKS

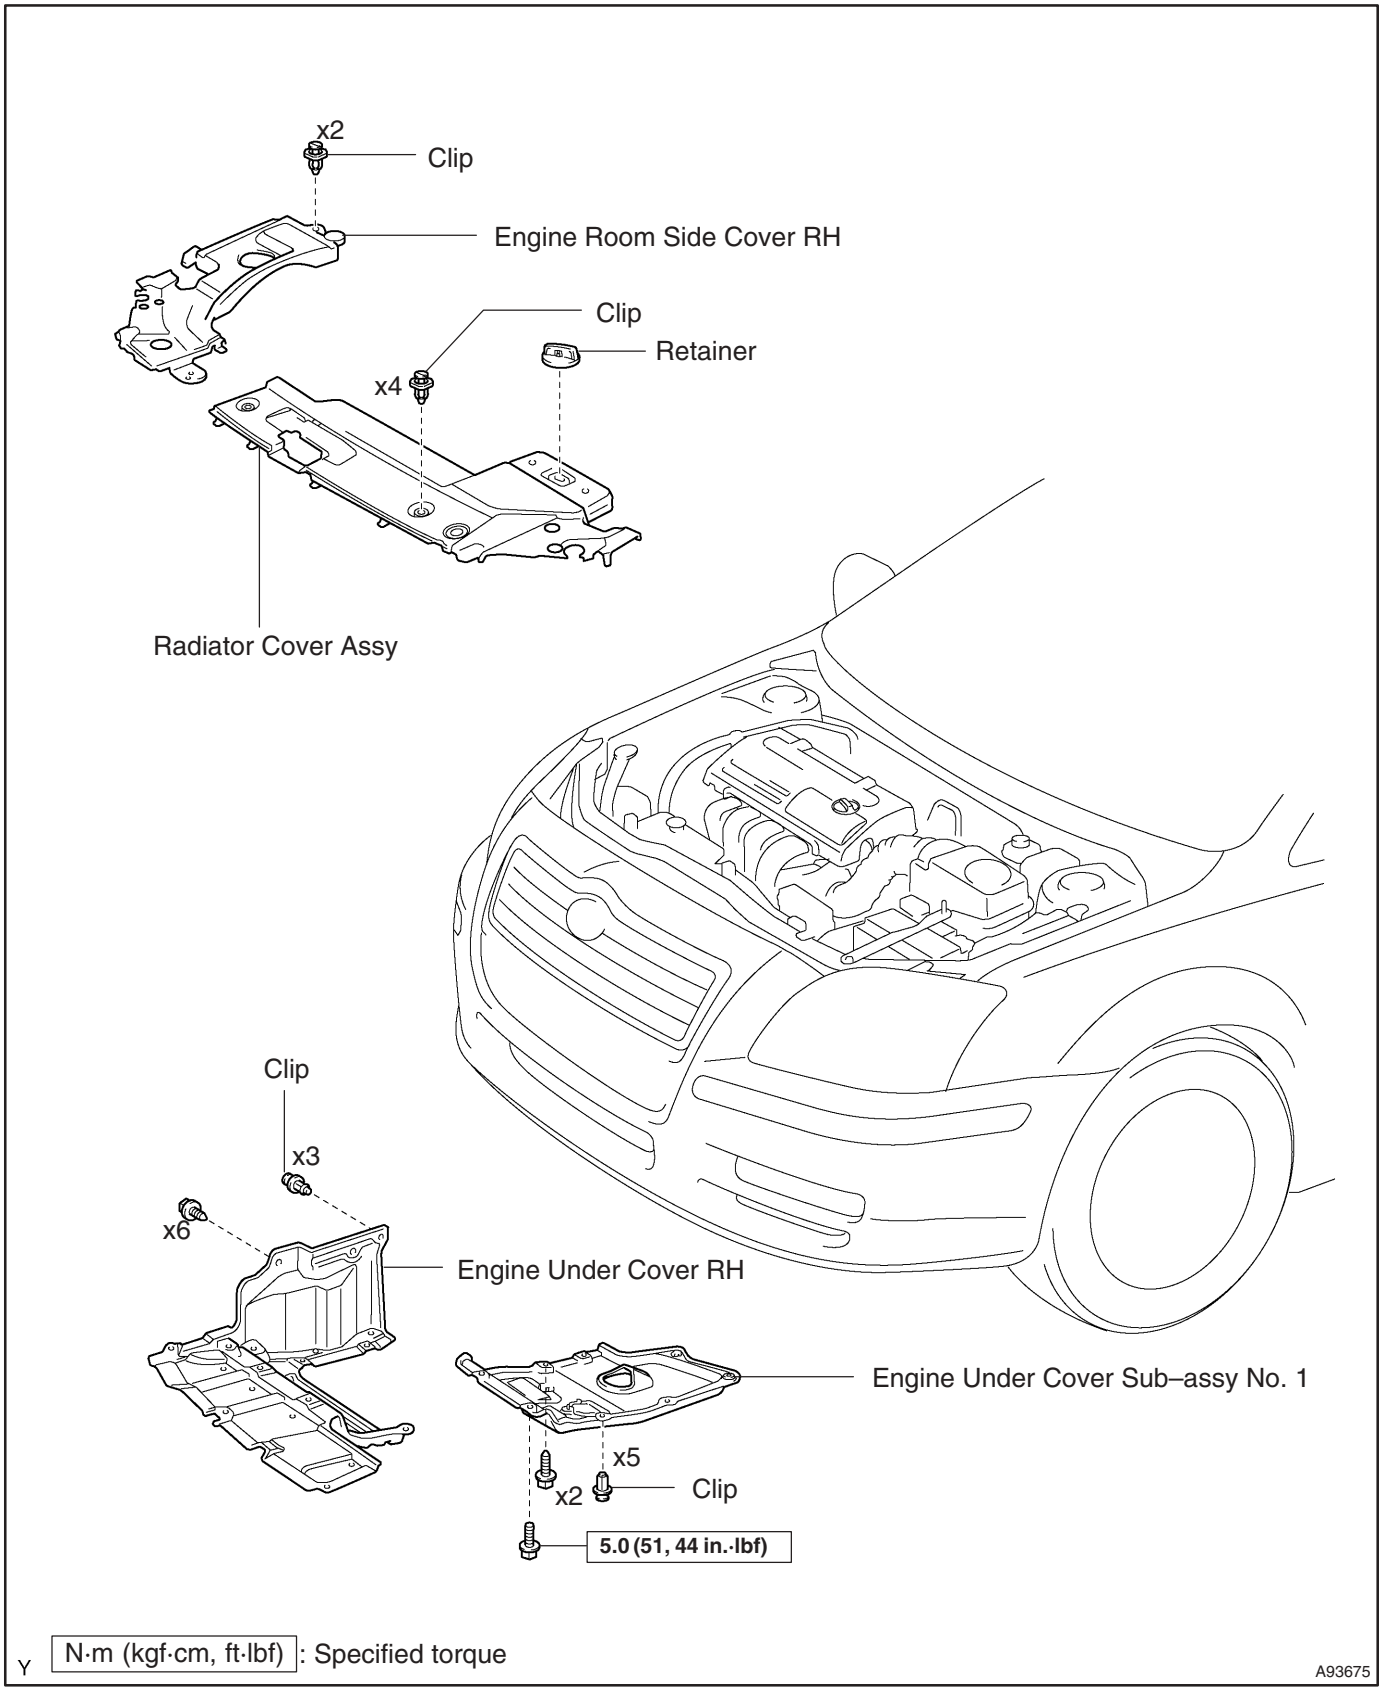
147. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)

148. CHECK FOR FUEL LEAKS

149. CHECK FOR EXHAUST GAS LEAKS

150. CHECK IDLE SPEED AND IGNITION TIMING (See Pub. No. RM1018E on page 14–1)
SST 09843–18040

151. INSPECT CO/HC (See Pub. No. RM1018E on page 14–1)



152. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT (See Pub. No. RM1018E on page 26–6)

153. CHECK ABS SPEED SENSOR SIGNAL

CYLINDER HEAD GASKET (1ZZ–FE/3ZZ–FE)(From February, 2004)

REPLACEMENT

1. **DISCHARGE FUEL SYSTEM PRESSURE (See Pub. No. RM1018E on page 11–1)**
2. **REMOVE RADIATOR SUPPORT OPENING COVER (See page 14–9)**
3. **REMOVE ENGINE ROOM COVER SIDE (See page 14–9)**
4. **REMOVE FRONT WHEEL RH**
5. **REMOVE ENGINE UNDER COVER SUB–ASSY NO.1 (See page 14–9)**
6. **REMOVE ENGINE UNDER COVER RH (See page 14–9)**
7. **DRAIN ENGINE COOLANT (See page 16–5)**

8. **REMOVE CYLINDER HEAD COVER NO.2**

(a) Remove the 2 nuts and 2 clips, then detach cylinder head cover No.2.

9. **REMOVE AIR CLEANER HOSE NO.1**

(a) Disconnect the VSV connector.
(b) Disconnect fuel vapor feed No. 1 hose from the VSV.
(c) Disconnect the fuel vapor feed hose from the VSV.
(d) Disconnect the ventilation hose from air cleaner hose No. 1.
(e) Loosen the 2 air cleaner hose clamp bolts, then remove the air cleaner hose.

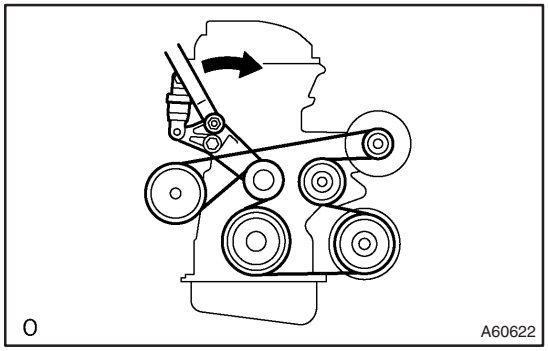
10. **DISCONNECT WATER BY–PASS HOSE**

(a) Disconnect the water by–pass hose from the throttle body.

11. **DISCONNECT WATER BY–PASS HOSE NO.2**

(a) Disconnect water by–pass hose No. 2 from the throttle body.

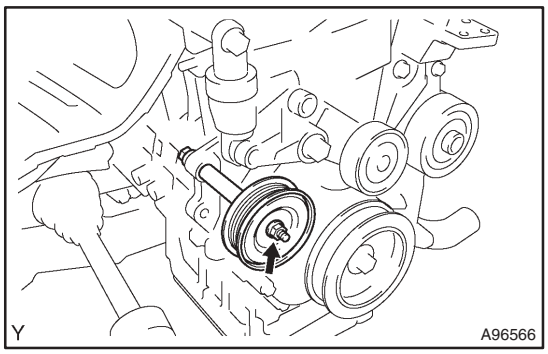
12. **REMOVE EFI FUEL PIPE CLAMP (See Pub. No. RM1018E on page 11–11)**
13. **DISCONNECT FUEL TUBE SUB–ASSY (See Pub. No. RM1018E on page 11–11)**
14. **DISCONNECT UNION TO CONNECTOR TUBE HOSE**



(a) Disconnect the union to connector tube hose from the hose to hose tube.

15. **DISCONNECT RADIATOR HOSE INLET**

(a) Disconnect the radiator hose inlet from the cylinder head.

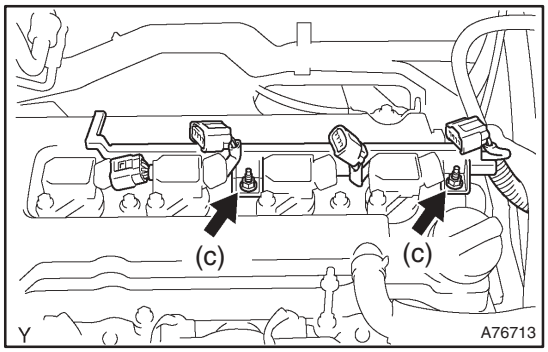


16. **DISCONNECT HEATER INLET WATER HOSE**

(a) Disconnect the heater inlet water hose from the cylinder head.

17. **REMOVE FAN AND GENERATOR V BELT**

(a) Turn the V–ribbed belt tensioner clockwise slowly and loosen it. Remove the fan and generator V belt, then put back the V–ribbed belt tensioner carefully.

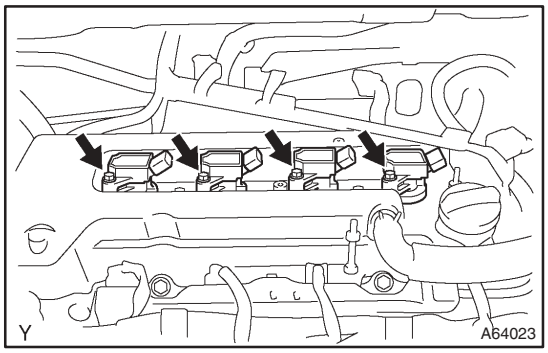


18. REMOVE V–RIBBED IDLER ASSY NO.1

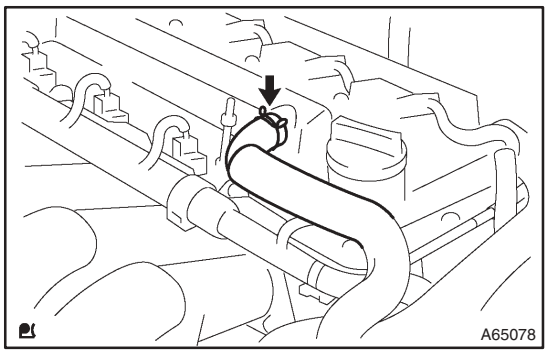
(a) Remove the nut, bolt, tube and idler.

19. REMOVE GENERATOR ASSY

(See Pub. No. RM1018E on page 19–7)



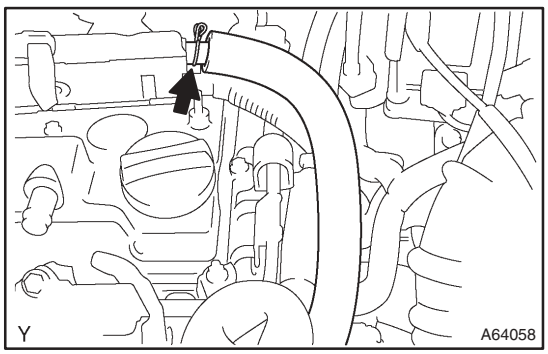
20. DISCONNECT IGNITION COIL ASSY



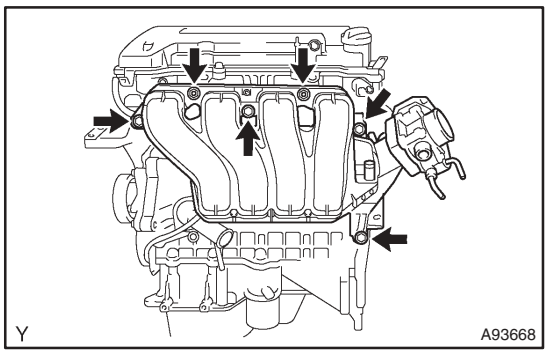
(a) Remove the 5 clamps from the 5 clamp brackets.

(b) Disconnect the 4 ignition coil connectors.

(c) Remove the 2 nuts which are used to secure the engine wire.



(d) Remove the 4 bolts and 4 ignition coils.



21. DISCONNECT VENTILATION HOSE

(a) Disconnect the ventilation hose from the cylinder head cover.

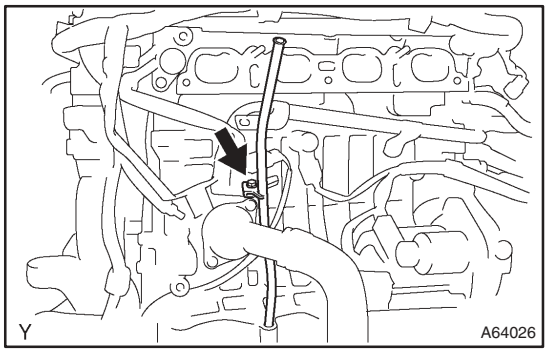
22. DISCONNECT VENTILATION HOSE NO.2

(a) Disconnect the ventilation hose from the cylinder head cover.

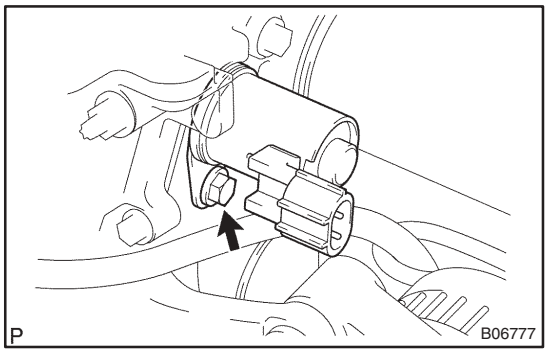
23. REMOVE INTAKE MANIFOLD

(a) Disconnect the throttle motor connector.
(b) Disconnect the vacuum hose from water by–pass pipe No. 1.
(c) Remove the 4 bolts, 2 nuts and 2 wire brackets.
(d) Remove the intake manifold and throttle body assembly.
(e) Remove the gasket from the intake manifold and the throttle body assembly.

24. REMOVE OIL LEVEL GAGE SUB–ASSY



(a) Remove the oil level gage from the oil level gage guide.

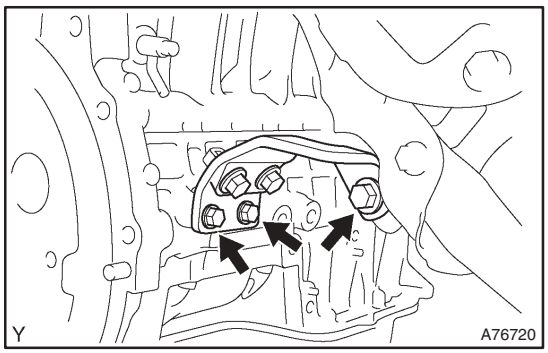


25. REMOVE OIL LEVEL GAGE GUIDE

(a) Disconnect the crankshaft position sensor clamp.
(b) Remove the bolt and oil level gage guide.

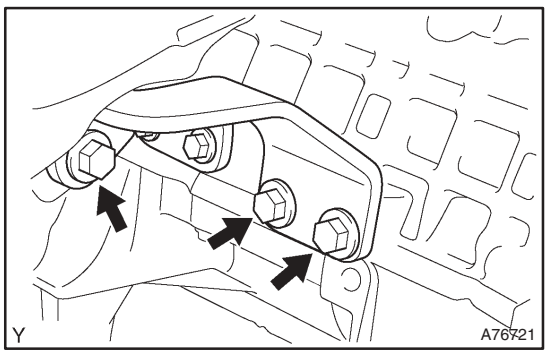
26. SEPARATE WATER BY–PASS PIPE NO.1

(a) Remove the 2 bolts which are used to secure the water by–pass pipe.



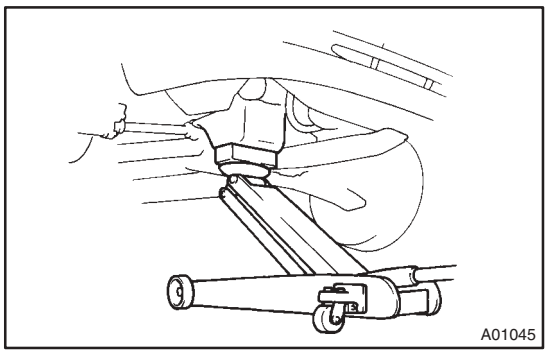
27. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSY

(a) Remove the bolt and camshaft timing oil control valve.



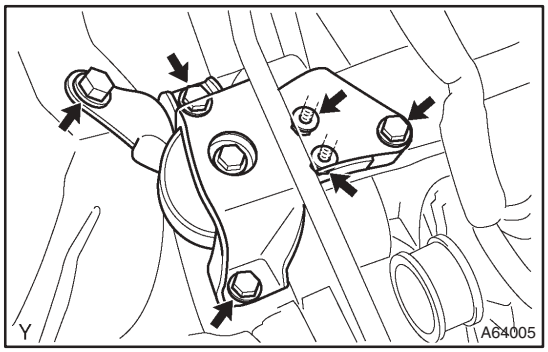
28. SEPARATE EXHAUST PIPE ASSY FRONT

(a) Remove the 2 bolts and 2 compression springs which are used to secure the front side of exhaust pipe.
(b) Remove the gasket.

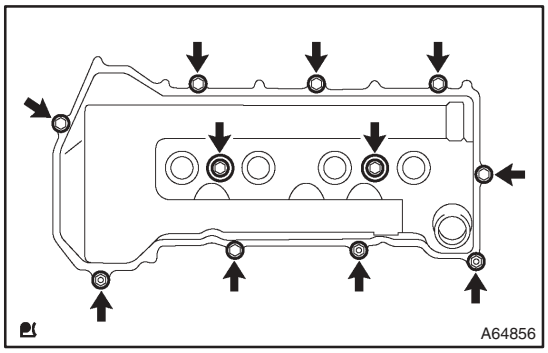


29. REMOVE MANIFOLD STAY

(a) Remove the 3 bolts and manifold stay.



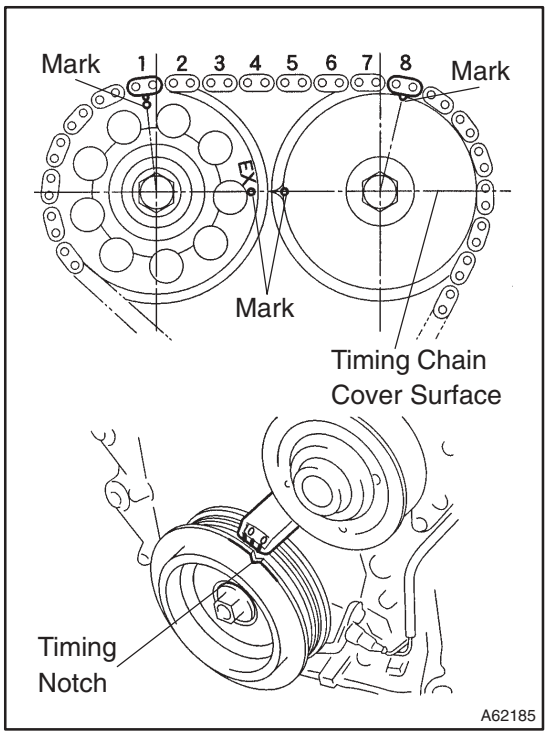
30. REMOVE MANIFOLD STAY NO.2



(a) Remove the 3 bolts and manifold stay No. 2.

31. REMOVE ENGINE MOUNTING INSULATOR SUB–ASSY RH

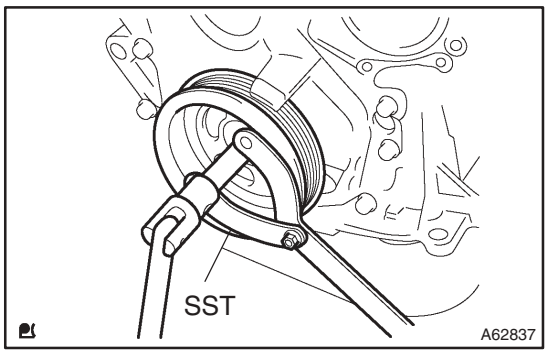
(a) Place a wooden block on a jack underneath the engine. Remove the 4 bolts and 2 nuts, then detach the engine mounting insulator RH.



32. REMOVE CYLINDER HEAD COVER SUB–ASSY

(a) Remove the 9 bolts, 2 seal washers, 2 nuts and 3 clamp brackets.

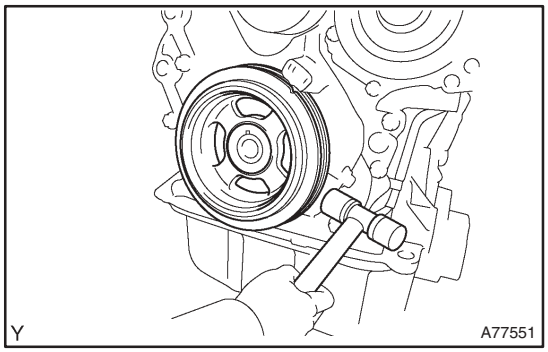
(b) Remove the cylinder head cover.



33. SET NO. 1 CYLINDER TO TDC/COMPRESSION

(a) Turn the crankshaft pulley until the timing notch is aligned with the timing mark ”0” of the timing chain cover.

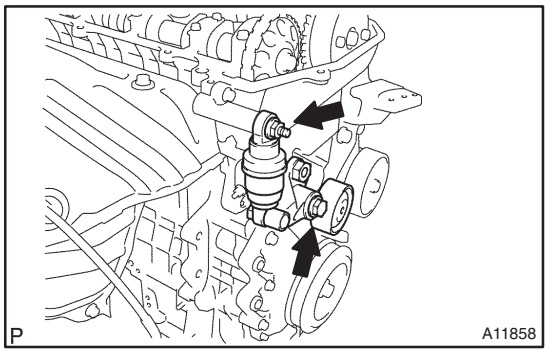
(b) Check that the point marks of the camshaft timing sprocket and VVT timing sprocket are in a straight line on the timing chain cover surface as shown in the illustration.



HINT:

If not, turn the crankshaft 1 revolution (360°) to align the marks as above.

34. REMOVE CRANKSHAFT PULLEY

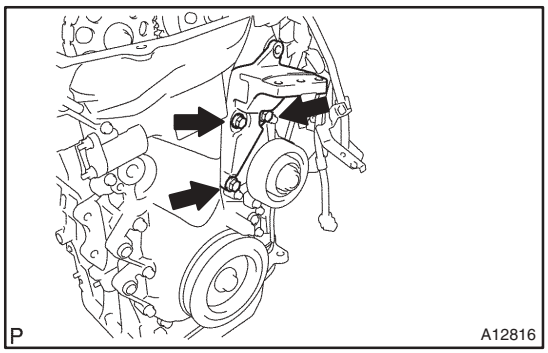


(a) Using SST, remove the pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)

(b) Remove the crankshaft pulley from the crankshaft.

HINT:

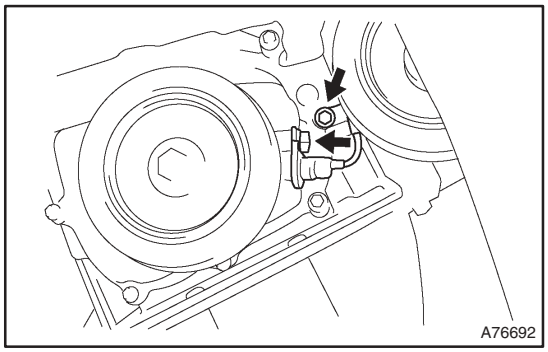
If the crankshaft pulley key is stuck, tap it with a plastic–surfaced hammer so that it can be removed.



35. REMOVE V–RIBBED BELT TENSIONER ASSY

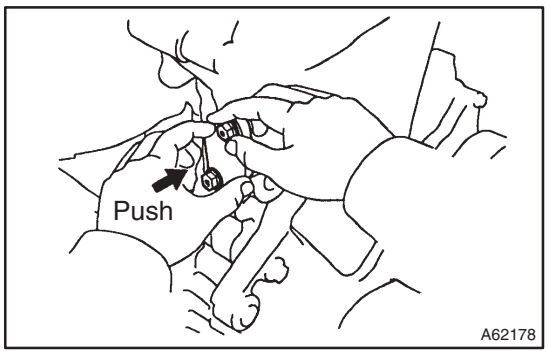
(a) Remove the bolt and nut, then detach the V–ribbed belt tensioner.

HINT:



Jack up and down to remove the bolt.

36. REMOVE WATER PUMP ASSY
(See Pub. No. RM1018E on page 16–9)

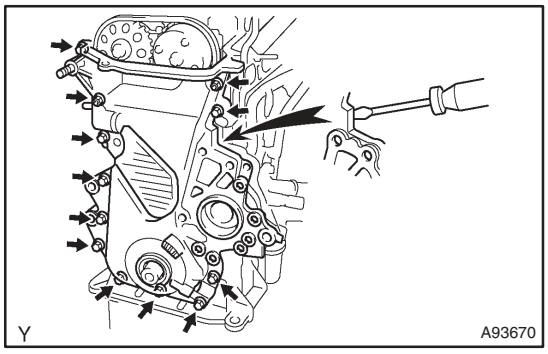


37. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

(a) Remove the 3 bolts and transverse engine engine mounting bracket.

38. REMOVE CRANKSHAFT POSITION SENSOR

(a) Remove the 2 bolts which are used to secure the crankshaft position sensor.



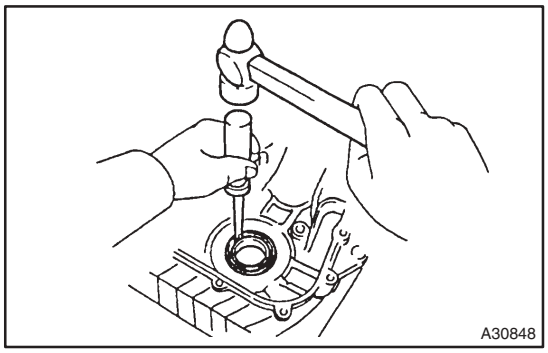
39. REMOVE CHAIN TENSIONER ASSY NO.1

(a) Remove the 2 nuts and chain tensioner.

NOTICE:

Do not revolve the crankshaft without the chain tensioner.

40. REMOVE TIMING CHAIN OR BELT COVER SUB–ASSY



(a) Remove the 10 bolts and 2 nuts.

(b) Using a torx wrench socket (E8), remove the stud bolt.

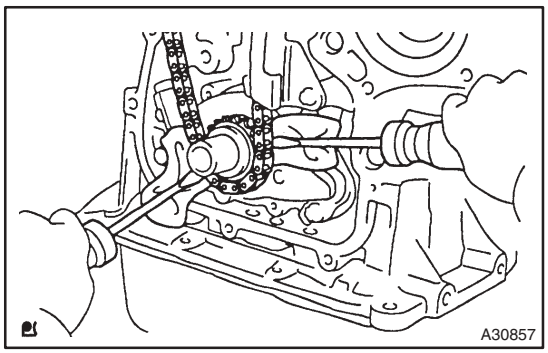
(c) Remove the timing chain cover by using a screwdriver to pry between the cylinder block and cylinder head.

NOTICE:

Be careful not to damage the timing chain cover, the cylinder head and the cylinder block.

41. REMOVE TIMING CHAIN OR BELT COVER OIL SEAL

(a) Using a screwdriver, remove the oil seal.



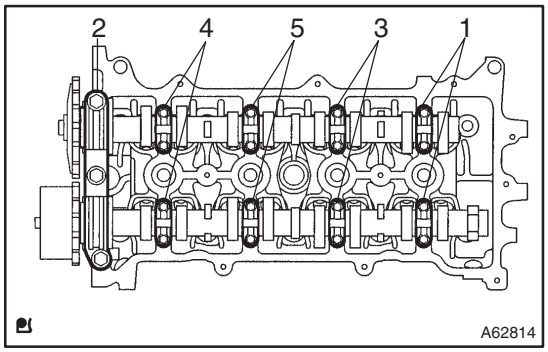
42. REMOVE CRANKSHAFT POSITION SENSOR PLATE NO.1

43. REMOVE CHAIN TENSIONER SLIPPER

(a) Remove the bolt and chain tensioner slipper.

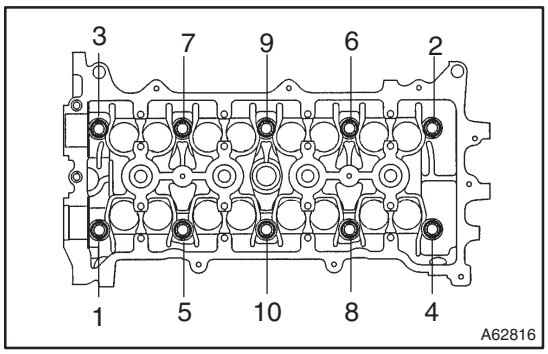
44. REMOVE CHAIN VIBRATION DAMPER NO.1

(a) Remove the 2 bolts and chain vibration damper.



45. REMOVE CHAIN SUB–ASSY

(a) Remove the timing chain by prying the crankshaft timing gear using screwdrivers as shown in the illustration.

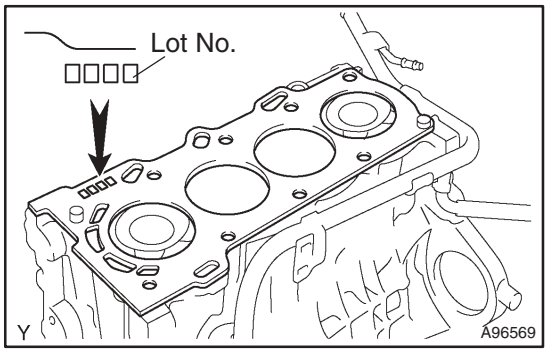


NOTICE:

- **Put a shop rag to protect the engine.**
- **In case of revolving the camshafts with the chain off the sprockets, turn the crankshaft 1/4 revolution counterclockwise to prevent the valves from touching the pistons.**

46. REMOVE CAMSHAFT

(a) Using several steps, loosen and remove the 19 bearing cap bolts uniformly in the sequence shown in the illustration. Remove the 9 bearing caps and both intake and exhaust camshafts.

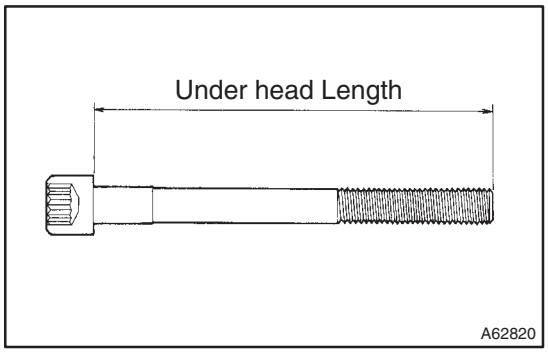


47. REMOVE CYLINDER HEAD SUB–ASSY

(a) Using several steps, loosen and remove the 10 cylinder head bolts with a 10 mm hexagon wrench uniformly in the sequence shown in the illustration. Remove the 10 cylinder head bolts and 10 plate washers.

(b) Remove the cylinder head.

48. REMOVE CYLINDER HEAD GASKET

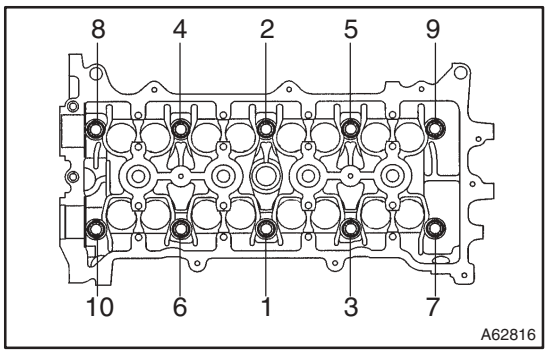


49. INSTALL CYLINDER HEAD GASKET

(a) Place a new cylinder head gasket on the cylinder block with the Lot No. stamp facing upward.

NOTICE:

- **Pay attention to the mounting orientation.**
- **Place the cylinder head on the gasket gently in order not to damage the gasket.**



50. INSPECT CYLINDER HEAD SET BOLT

(a) Using a vernier calipers, measure the length of cylinder head bolt from the seat to the end.

Standard length: 146.8 to 148.2 mm (5.780 to 5.835 in.)
Maximum length: 148.5 mm (5.846 in.)

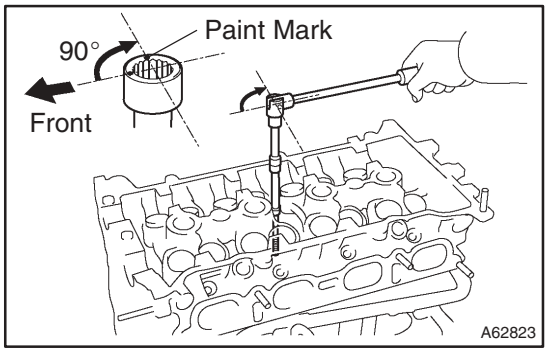
If the length exceeds the maximum, replace the bolt.

51. INSTALL CYLINDER HEAD SUB–ASSY

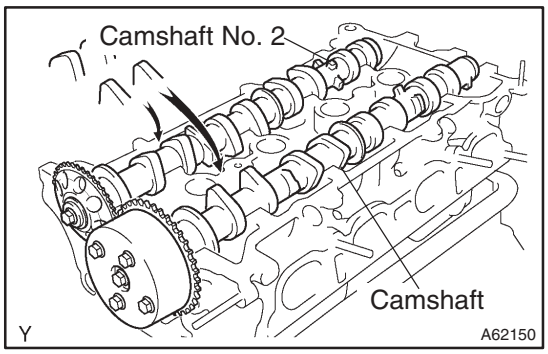
HINT:

The cylinder head bolts are tightened in 2 successive steps.

(a) Apply a light coat of engine oil to the threads of the cylinder head bolts.



(b) Using several steps, install and tighten the 10 cylinder head bolts and plate washers with a 10 mm hexagon wrench uniformly in the sequence shown in the illustration.

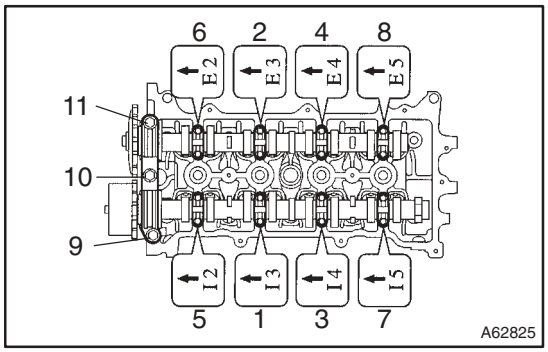


Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

(c) Mark the front of the cylinder head bolt with paint.

(d) Retighten the cylinder head bolts by an additional 90° in the same sequence as step (b).

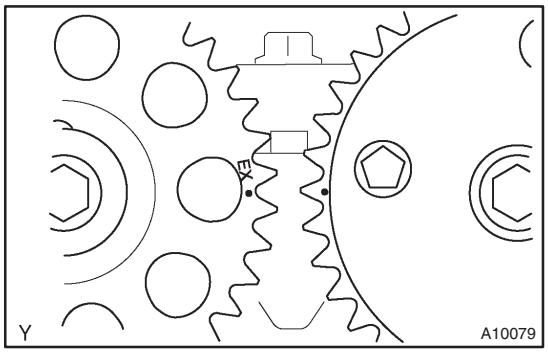
(e) Check that the paint mark of each bolt is at a 90° angle to the front.



52. INSTALL CAMSHAFT

(a) Apply a light coat of engine oil to the camshaft journals.

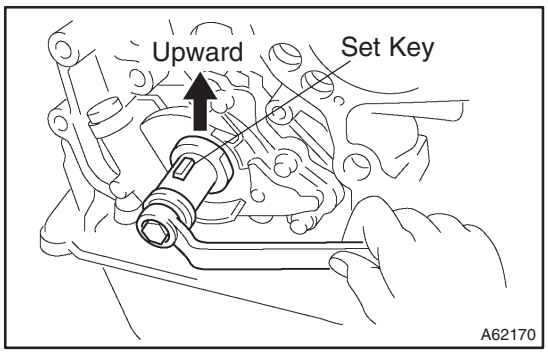
(b) Place the 2 camshafts on the cylinder head as shown in the illustration.



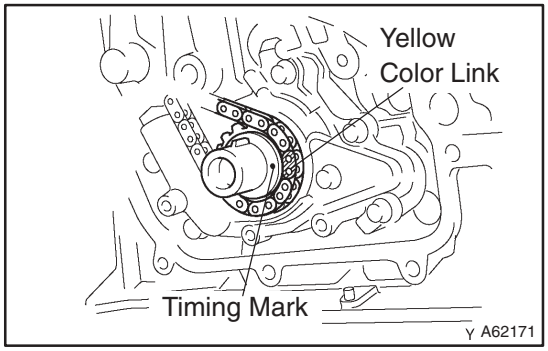
(c) Examine the front marks and numbers, then tighten the bolts in the sequence shown in the illustration.

Torque:

23 N·m (235 kgf·cm, 17 ft·lbf) for bearing cap No. 1



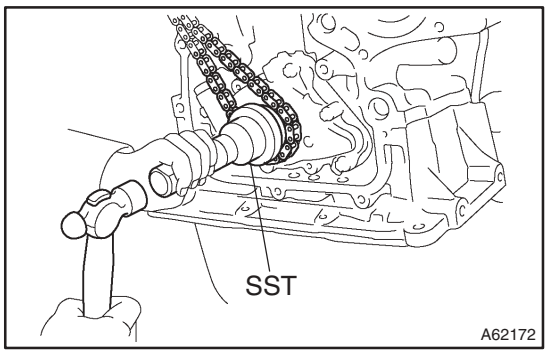
13 N·m (133 kgf·cm, 10 ft·lbf) for bearing cap No. 3



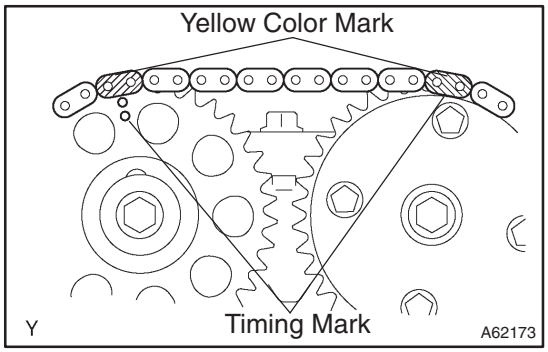
53. INSTALL CHAIN SUB–ASSY

(a) Set No. 1 cylinder to TDC/compression.

(1) Using a wrench, turn the camshafts until the timing marks of the 2 camshaft timing sprockets are aligned.



(2) Using a crankshaft pulley bolt, turn the crankshaft and set the set key on the crankshaft upward.

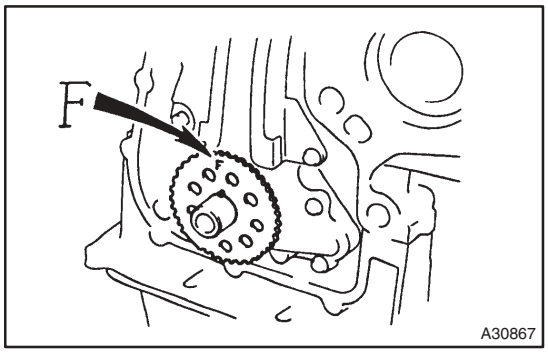


(b) Install the timing chain onto the crankshaft timing sprocket with the yellow color link and the timing mark on the crankshaft timing sprocket aligned.

HINT:

Three yellow color links are on the chain.

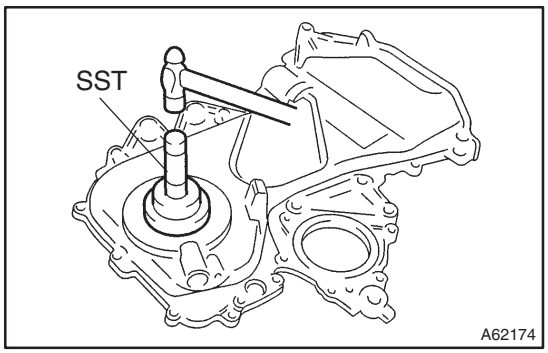
(c) Using SST, install the crankshaft timing sprocket.
SST 09223–22010



(d) Install the timing chain onto the camshaft timing sprockets with the yellow color links and timing marks on the camshaft timing sprockets aligned.

54. INSTALL CHAIN VIBRATION DAMPER NO.1

(a) Install the chain vibration damper with the 2 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

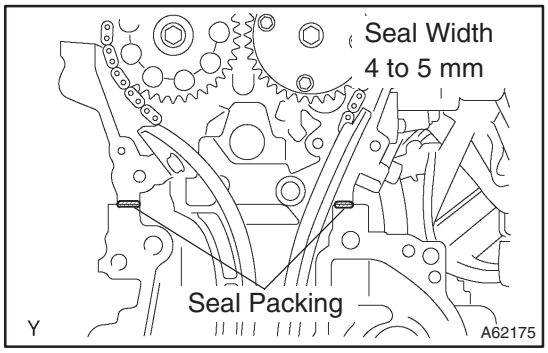


55. INSTALL CHAIN TENSIONER SLIPPER

(a) Install the chain tensioner slipper with the bolt.
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

56. INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1

(a) Install the plate with the ”F” mark facing forward.



57. INSTALL TIMING CHAIN OR BELT COVER OIL SEAL

(a) Apply multi–purpose grease to a new oil seal lip.

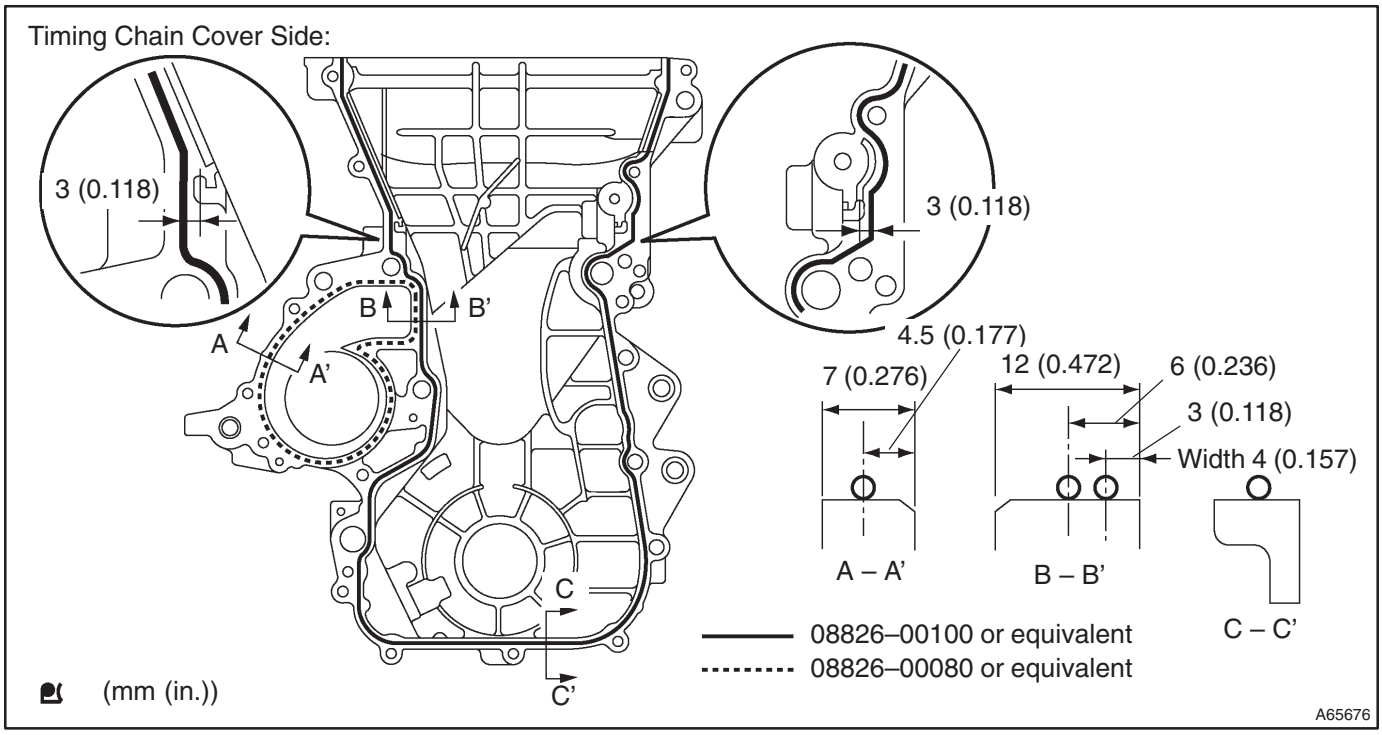
(b) Using SST, tap in the oil seal until its surface is flush with the timing chain cover edge.
SST 09223–22010

NOTICE:
Keep the lip free of foreign objects.

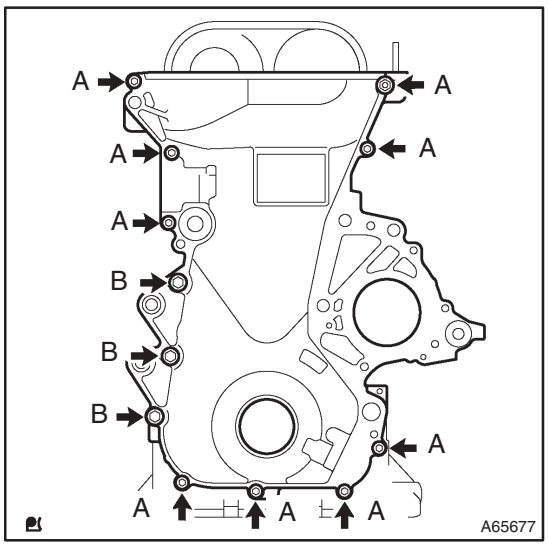
58. INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY

(a) Remove any old packing material (FIPG) from the contact surface.

(b) Apply a continuous bead of seal packing (Diameter 3.5 mm to 4.5 mm (0.1379 to 0.177 in.)) as shown in the illustration.



Seal packing:



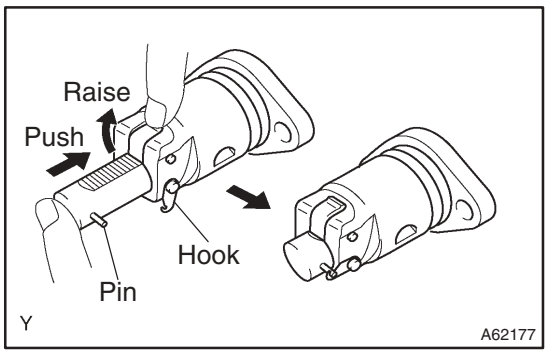
Water pump part: part No. 08826–00100 or equivalent

Other part: part No. 08826–00080 or equivalent.

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes after applying seal packing.**
- **Do not expose the seal to engine oil for at least 2 hours after installation.**
- **Do not apply seal packing too much more than the specified amount.**

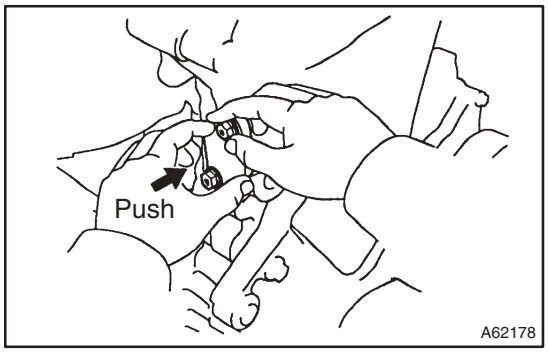
(c) Install the timing chain cover with the 10 bolts and 2 nuts.



Torque:

13 N·m (133 kgf·cm, 10 ft·lbf) for A

19 N·m (194 kgf·cm, 14 ft·lbf) for B

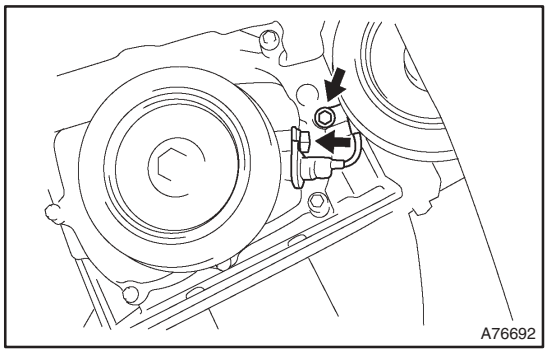


(d) Using a torx wrench socket (E8), install the stud bolt.

Torque: 9.5 N·m (97 kgf·cm, 84 in.·lbf)

59. INSTALL CHAIN TENSIONER ASSY NO.1

(a) Check that the O–ring is clean, then set the hook as shown in the illustration.

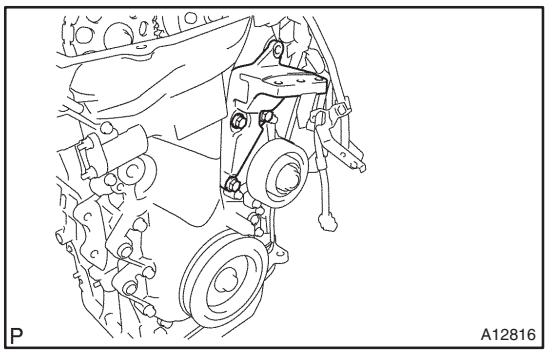


(b) Apply engine oil to the chain tensioner and install it with the 2 nuts.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:

If the hook released the plunger during installation, re–hook the plunger.

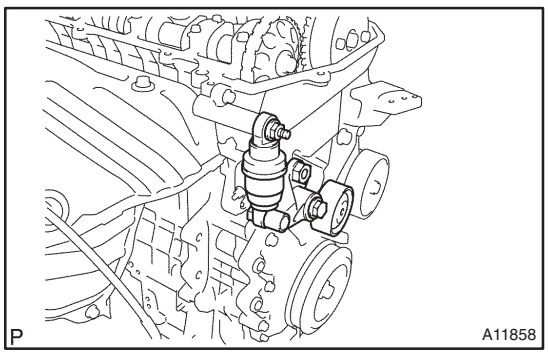


60. INSTALL CRANKSHAFT POSITION SENSOR

(a) Apply a light coat of the engine oil to the O–ring on the crankshaft position sensor.

(b) Install the crankshaft position sensor with the 2 bolts.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



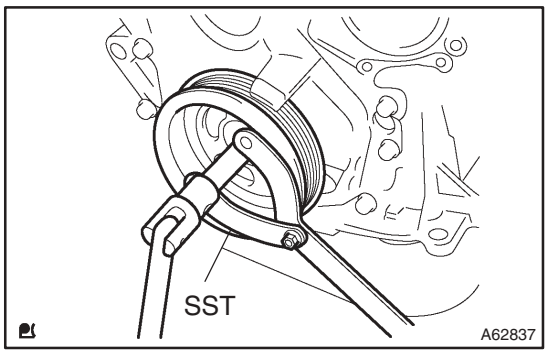
61. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

(a) Install the transverse engine engine mounting bracket with the 3 bolts.

Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)

62. INSTALL WATER PUMP ASSY

(See Pub. No. RM1018E on page 16–9)

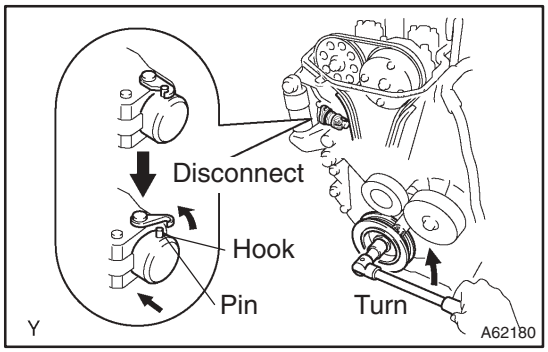


63. INSTALL V–RIBBED BELT TENSIONER ASSY

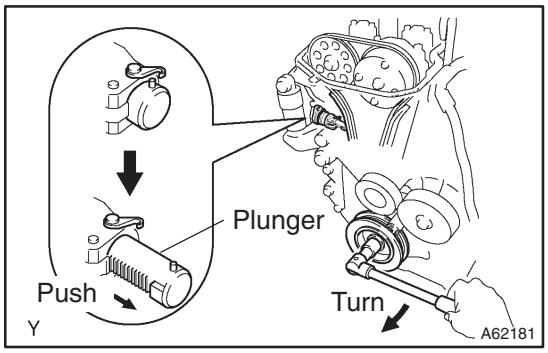
(a) Install the V–ribbed belt tensioner with the nut and bolt.

Torque:

29 N·m (296 kgf·cm, 21 ft·lbf) for nut



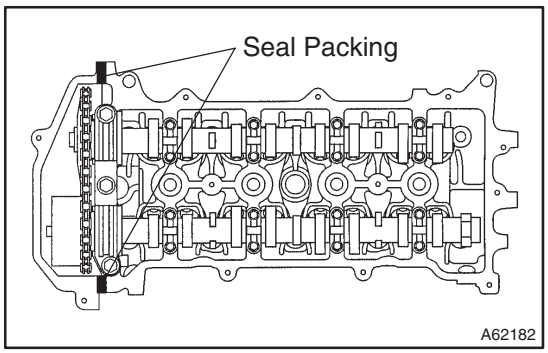
69 N·m (704 kgf·cm, 51 ft·lbf) for bolt



64. INSTALL CRANKSHAFT PULLEY

(a) Align the keyway of the pulley with the key located on the crankshaft, then slide the pulley into place.

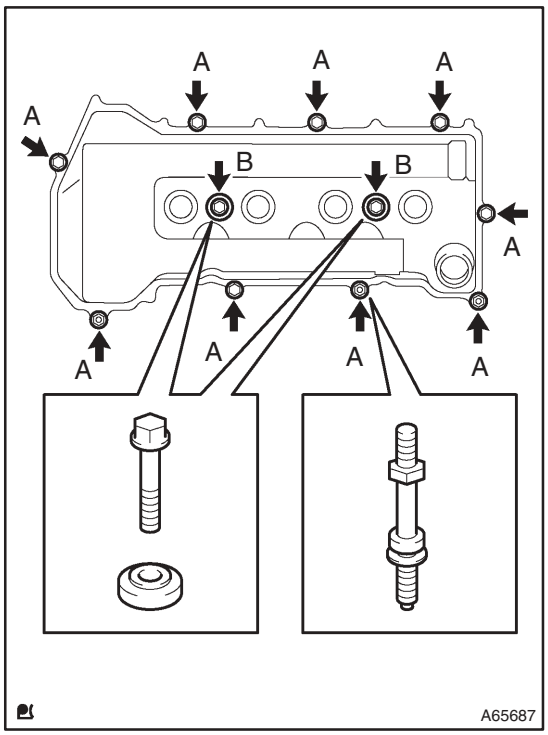
(b) Using SST, install the crankshaft pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
Torque: 138 N·m (1,407 kgf·cm, 102 ft·lbf)



(c) Turn the crankshaft counterclockwise, then take the hook off the knock pin to release the plunger.

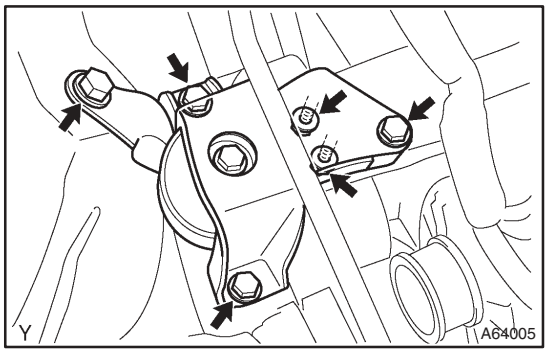
(d) Turn the crankshaft clockwise, then check that the plunger is extended.

HINT:
If the plunger is not extended, press the slipper into the chain tensioner using a screwdriver so that the hook is taken off from the knock pin and the plunger can be extended.



65. INSTALL CYLINDER HEAD COVER SUB–ASSY

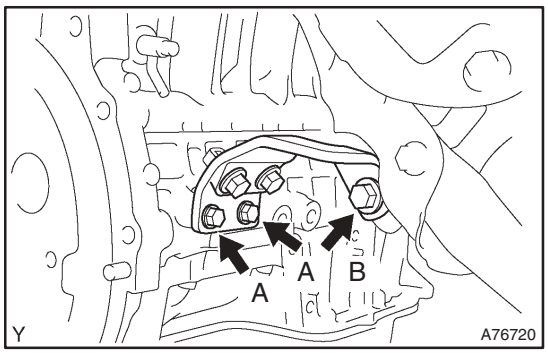
(a) Remove any old packing (FIPG) material.



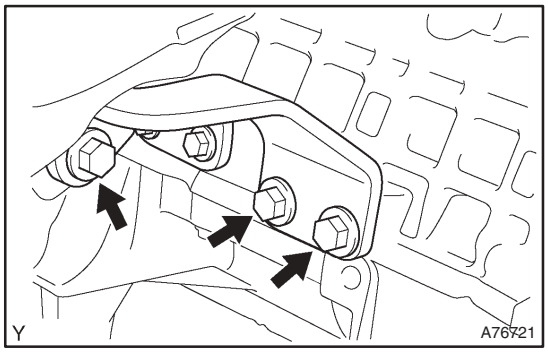
(b) Apply seal packing to the 2 locations as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 3 minutes of applying seal packing.**
- **Do not expose the seal to engine oil for at least 2 hours after installation.**



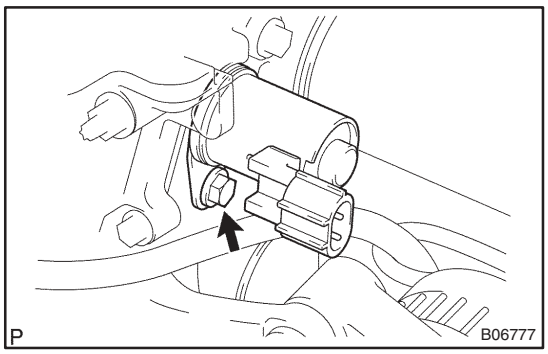
(c) Install the cylinder head cover and 3 cable brackets with the 9 bolts, 2 seal washers and 2 nuts. Tighten the bolts and nuts uniformly in several steps.
Torque:
11 N·m (112 kgf·cm, 8 ft·lbf) for A
9.0 N·m (92 kgf·cm, 80 in.·lbf) for B



66. INSTALL ENGINE MOUNTING INSULATOR SUB–ASSY RH

(a) Install the engine mounting insulator with the 4 bolts and 2 nuts.
Torque: 52 N·m (530 kgf·cm, 38 ft·lbf)

67. INSTALL MANIFOLD STAY

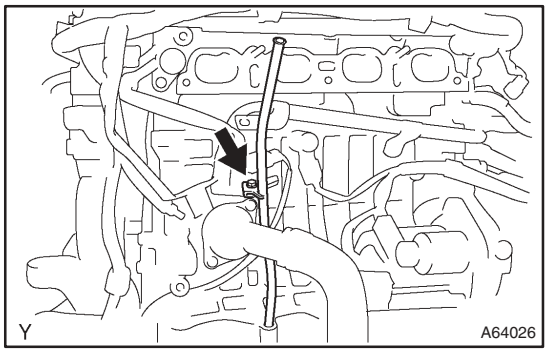


(a) Install the manifold stay with the 3 bolts.
Torque:
37 N·m (377 kgf·cm, 27 ft·lbf) for bolt A
49 N·m (500 kgf·cm, 36 ft·lbf) for bolt B

68. INSTALL MANIFOLD STAY NO.2

(a) Install the manifold stay with the 3 bolts.
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

69. INSTALL EXHAUST PIPE ASSY FRONT
(See Pub. No. RM1018E on page 15–2)

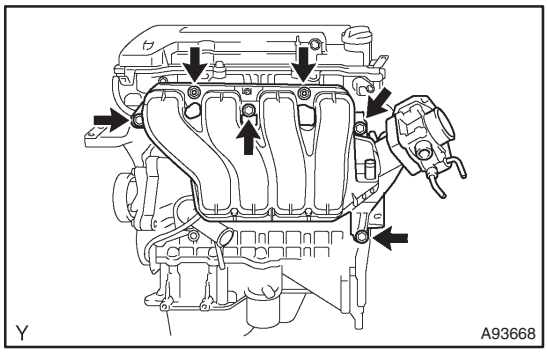


70. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSY

(a) Apply a light coat of engine oil on a new O–ring, then install it onto the camshaft timing oil control valve.

(b) Install the camshaft timing oil control valve with the bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

71. INSTALL WATER BY–PASS PIPE NO.1

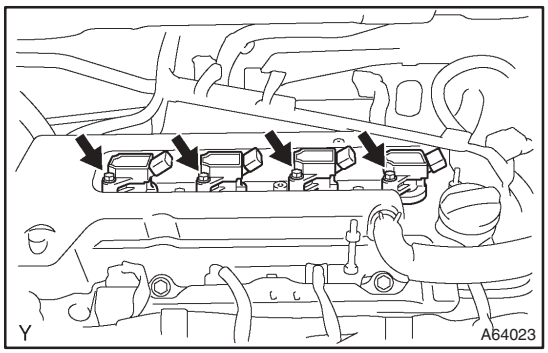


(a) Install a new gasket and water by–pass pipe with the 2 nuts and 2 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

72. INSTALL OIL LEVEL GAGE GUIDE

(a) Apply a light coat of engine oil on a new O–ring, then install it onto the oil level gage guide.

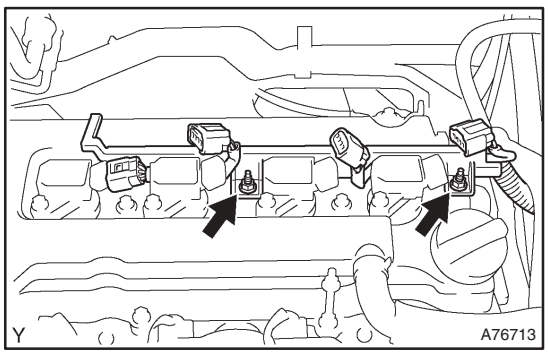
(b) Install the oil level gage guide with the bolt.
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)



73. INSTALL INTAKE MANIFOLD

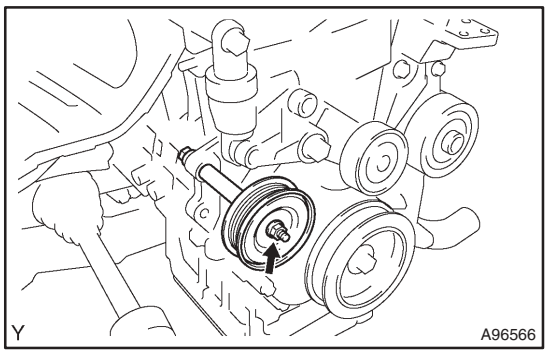
(a) Install a new gasket onto the intake manifold.

(b) Install the intake manifold and the throttle body assembly with the 2 brackets, 4 bolts and 2 nuts.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)



(c) Connect the vacuum hose to water by–pass pipe No. 1.

(d) Connect the throttle motor connector.

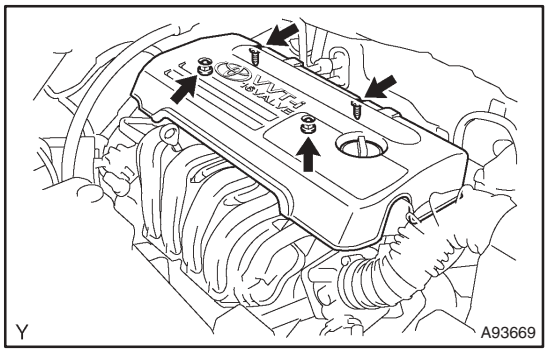


74. INSTALL IGNITION COIL ASSY

(a) Install the 4 ignition coils with the 4 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

(b) Install the engine wire with the 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

75. INSTALL GENERATOR ASSY
(See Pub. No. RM1018E on page 19–7)



76. INSTALL V–RIBBED IDLER ASSY NO.1

(a) Install the tube and idler with the nut and bolt.
Torque: 39 N·m (400 kgf·cm, 29 ft·lbf)

77. INSTALL FAN AND GENERATOR V BELT
(See Pub. No. RM1018E on page 14–5)

78. INSTALL AIR CLEANER HOSE NO.1
Torque: 1.5 N·m (15 kgf·cm, 13 in.·lbf)

79. INSTALL CYLINDER HEAD COVER NO.2

(a) Install the cylinder head cover with the 2 nuts and 2 clips.
Torque: 7.0 N·m (71 kgf·cm, 62 in.·lbf)

80. INSTALL FRONT WHEEL RH
Torque: 103 N·m (1,050 kgf·cm, 76 ft·lbf)

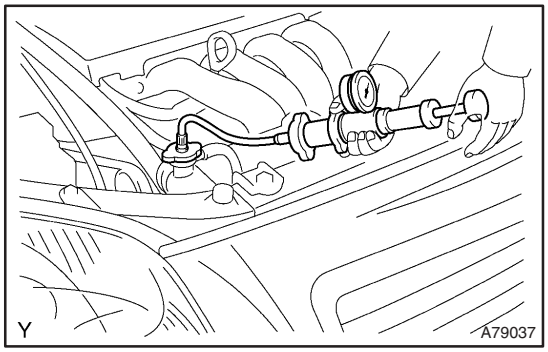
81. ADD ENGINE COOLANT (See page 16–5)

82. INSPECT COMPRESSION (See Pub. No. RM1018E on page 14–1)
SST 09992–00500

83. INSPECT CO/HC (See Pub. No. RM1018E on page 14–1)

84. INSPECT IGNITION TIMING (See Pub. No. RM1018E on page 14–1)
SST 09843–18040

85. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)



86. CHECK FOR ENGINE OIL LEAKS

87. CHECK FOR EXHAUST GAS LEAKS

COOLING SYSTEM (1ZZ–FE/3ZZ–FE)(From February, 2004)

160N4–02

ON–VEHICLE INSPECTION

1. INSPECT COOLING SYSTEM FOR LEAKS

CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(a) Remove the radiator support opening cover.
(b) Remove the engine room cover side.
(c) Fill the radiator with coolant, then attach a radiator cap tester.
(d) Warm up the engine.
(e) Pump it to 118 kPa (1.2 kgf/cm^2, 17.1 psi), then check that the pressure does not drop.

If the pressure drops, check the hoses, radiator and water pump for leaks. If there are no signs or traces of external coolant leaks, check the heater core, cylinder block and head.

(f) Reinstall the engine room cover side.
(g) Reinstall the radiator support opening cover.

2. CHECK ENGINE COOLANT LEVEL AT RESERVOIR

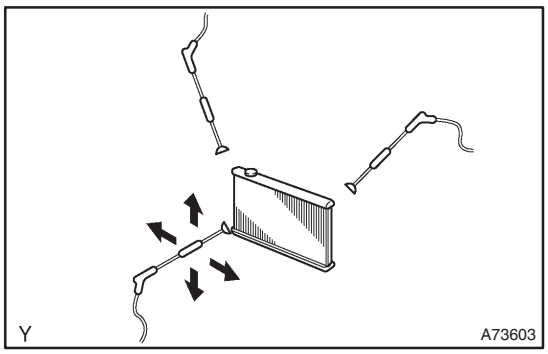
(a) The engine coolant level should be between the ”LOW” and ”FULL” lines when the engine is cold.

HINT:

If low, check for leaks and add ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate, non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology up to the ”FULL” line.

3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator cap.



CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(b) Check around the radiator cap and radiator filler hole for any excessive deposits of rust or scale. The coolant should be free from oil.

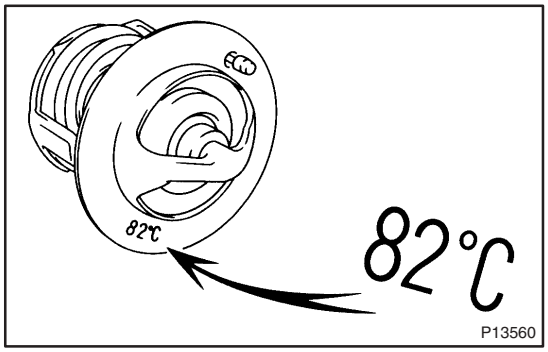
If excessively dirty, replace the coolant.

(c) Reinstall the radiator cap.

4. INSPECT FINS BLOCKAGE

(a) If the fins are clogged, wash them with water or a steam cleaner, then dry with compressed air.

NOTICE:

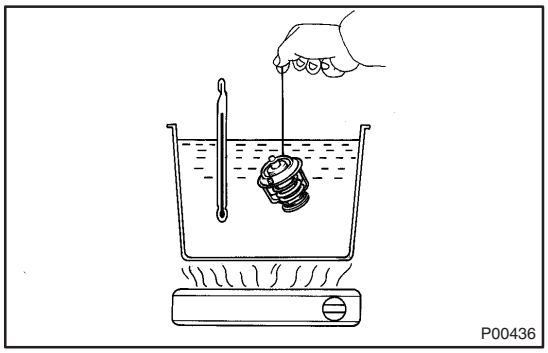


- **If the distance between the steam cleaner and the core is too close, there is a possibility of damaging the fins, so keep the following injection distance.**

Injection Pressure kPa (kgf/cm^2, psi)	Injection Distance mm (in.)
2,942 to 4,903 (30 to 50, 427 to 711)	300 (11.811)
4,903 to 7,845 (50 to 80, 711 to 1,138)	500 (19.685)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Be careful not to expose the electronic components to water.**

160N5–02

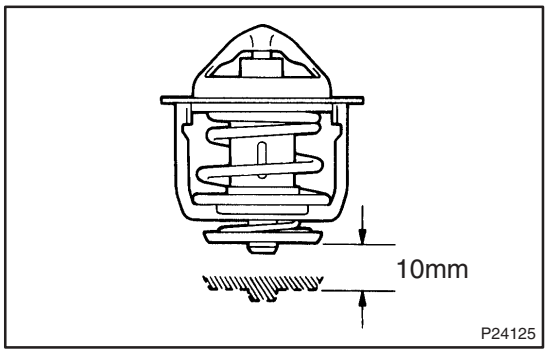


INSPECTION

1. INSPECT THERMOSTAT

HINT:

The valve opening temperature is inscribed on the thermostat.



(a) Immerse the thermostat in water, then gradually heat the water.

(b) Check the valve opening temperature.

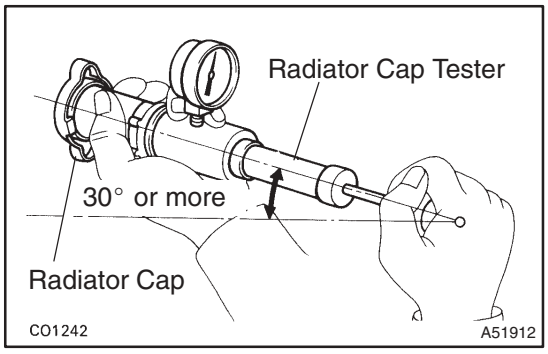
Valve opening temperature:
80 to 84°C (176 to 183°F)

If the valve opening temperature is not as specified, replace the thermostat.

(c) Inspect the valve lift.

Valve lift: 10 mm (0.39 in.) or more at 95°C (203°F)

If the valve lift is not as specified, replace the thermostat.



(d) Check that the valve is fully closed when the thermostat is at low temperatures (below 77°C (171°F)).

If not fully closed, replace the thermostat.

2. INSPECT RADIATOR CAP SUB–ASSY

NOTICE:

- **If the radiator cap is contaminated, rinse it with water.**
- **Before using a radiator cap tester, wet the relief valve and the pressure valve with engine coolant or water.**
- **When performing the following steps (a) and (b), keep the tester at an angle of over 30° or more above the horizontal.**

(a) Using a radiator cap tester, slowly pump the tester, then check that air is coming from the vacuum valve.

Pumping speed: 1 push / 3 seconds or more

NOTICE:

Push the pump at a constant speed.

If air is not coming from the vacuum valve, replace the radiator cap.

(b) Pump the tester, then measure the relief valve opening pressure.

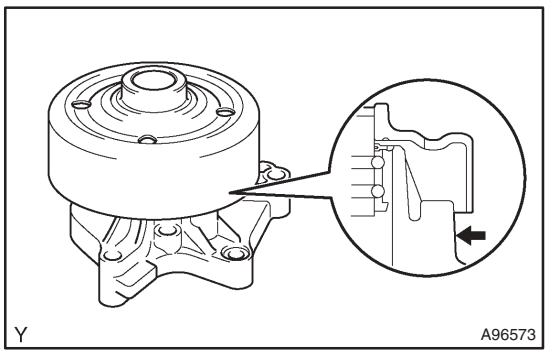
Pumping speed: 1 push within 1 second

NOTICE:

The above pumping speed is for the first pumping only (in order to close the vacuum valve). After the first pumping, the pumping speed can be reduced.

Standard opening pressure:

74 to 103 kPa (0.75 to 1.05 kgf/cm^2, 10.7 to 14.9 psi)



Minimum opening pressure:

59 kPa (0.6 kgf/cm^2, 8.6 psi)

If the opening pressure is less than minimum, replace the radiator cap.

HINT:

Use the tester's maximum reading as the opening pressure.

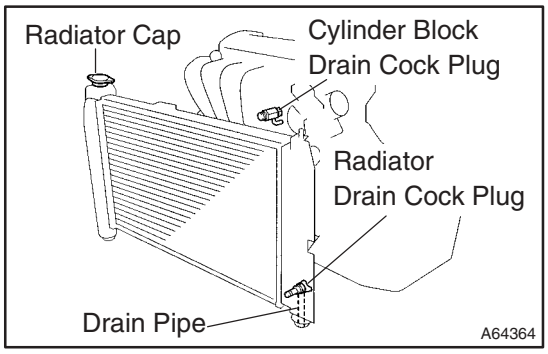
3. INSPECT WATER PUMP ASSY

(a) Check the area of the water pump assembly indicated in the illustration for traces of coolant leakage.

If leakage is found, replace the water pump.

ENGINE COOLANT (1ZZ–FE/3ZZ–FE)(From February, 2004)

160MH–02



REPLACEMENT

1. DRAIN ENGINE COOLANT

CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

(a) Remove the radiator cap.

(b) Loosen the radiator drain cock plug and cylinder block drain cock plug, and drain engine coolant.
(c) Close the radiator drain cock plug.
(d) Close the cylinder block drain plug.
Torque: 13 N·m (130 kgf·cm, 9 ft·lbf) for engine

2. ADD ENGINE COOLANT

(a) Tighten the radiator drain plug, then pour coolant into radiator until it overflows.
Capacity:

Transmission Type	Steering	Coolant Capacity [liters (US gts, Imp. gts)]
M/T	LHD	5.8 (6.1, 5.1)
M/T	RHD	5.9 (6.2, 5.2)
A/T	LHD	5.7 (6.0, 5.0)
A/T	RHD	5.8 (6.1, 5.1)

HINT:

- Improper coolants may damage the engine cooling system.
- Use only ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non–silicate,non–amine, non–nitrite, and non–borate coolant with long–life hybrid organic acid technology (coolant with long–life hybrid organic acid technology consists of the combination of low phosphates and organic acids).
- New Toyota vehicles are filled with Toyota Super Long Life Coolant. When replacing the coolant, Toyota Super Long Life Coolant is recommended.
- Observe the coolant level inside the radiator by pressing the inlet and outlet radiator hoses several times by hand. If the coolant level goes down, add the coolant.

NOTICE:

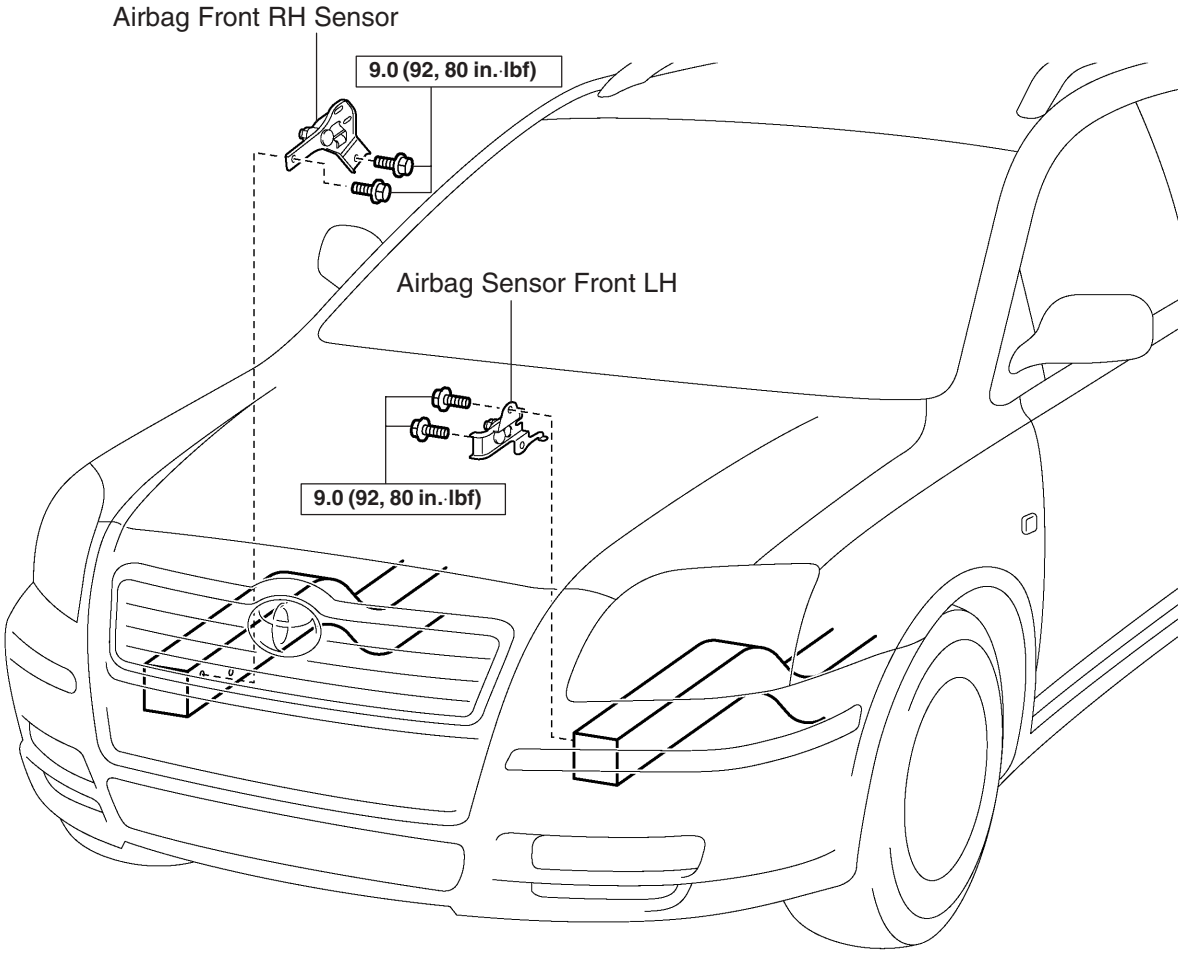
Do not use plain water alone.

(b) Tighten the radiator cap.
(c) Pour engine coolant into the reservoir tank until it reaches the full line.

(d) Warm up the engine until the thermostat valve begins to open.

HINT:

Press the radiator inlet and outlet hose several times by hand while warming up the engine.



(e) Stop the engine and wait until the coolant temperature gets cold. Then remove the radiator cap to check the coolant level.
- If the level goes down, perform the procedures from (a) through (e) again.
- If the level does not go down, fill the reservoir tank with engine coolant.

3. CHECK FOR ENGINE COOLANT LEAKS (See page 16–1)

AIR BAG SENSOR FRONT LH (From February, 2004)

600UN–01

COMPONENTS

N·m (kgf·cm, ft·lbf) : Specified torque

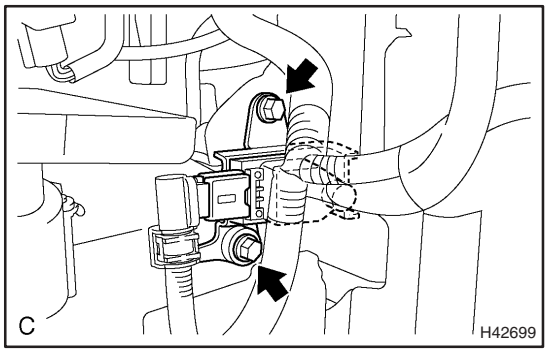
C

H42698

600K6–02

REPLACEMENT

HINT:



Use the same procedures for the RH side and LH side.

1. PRECAUTION (SEE PUB. NO. RM1018E, PAGE 60–1)

2. DISCONNECT BATTERY NEGATIVE TERMINAL

CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

3. REMOVE AIR BAG SENSOR FRONT LH

(a) Disconnect the connector from the airbag sensor front LH.

(b) Remove the 2 bolts and the airbag sensor front LH.

4. INSTALL AIR BAG SENSOR FRONT LH

(a) Check that the ignition switch is off.

(b) Check that the battery negative (–) terminal is disconnected.

CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

(c) Install the airbag sensor front LH with the 2 bolts.

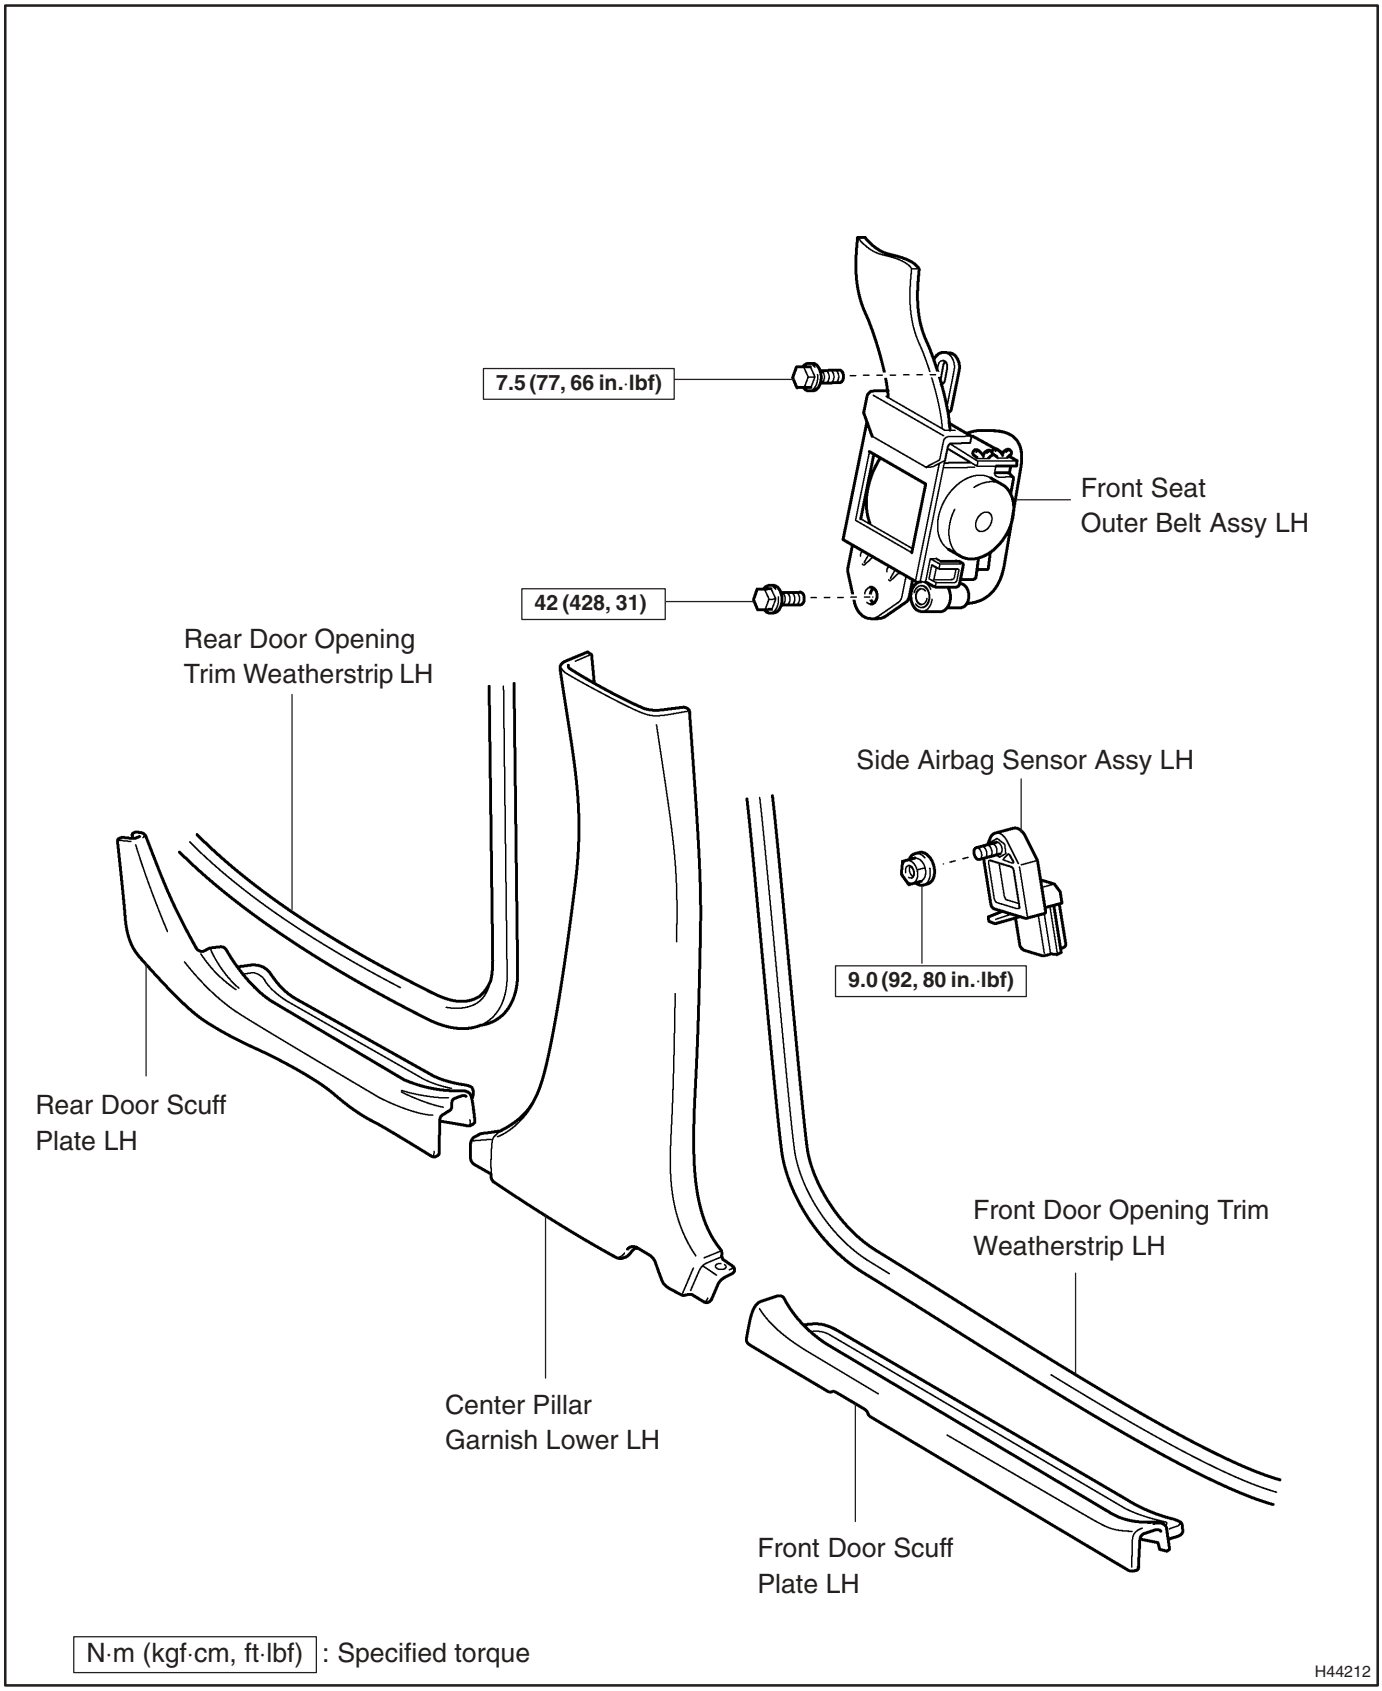
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:

- **If the airbag sensor front LH has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **When installing the airbag sensor front LH, be careful that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**

(d) Check that there is no looseness in the installation parts of the airbag sensor front LH.

(e) Connect the connector to the airbag sensor front LH.



5. CONNECT BATTERY NEGATIVE TERMINAL

6. INSPECT SRS WARNING LIGHT (SEE PUB. NO. RM1018E, PAGE 05–1184)

SIDE AIR BAG SENSOR ASSY LH (From February, 2004)

600UO–01

COMPONENTS

600A7–04

REPLACEMENT

HINT:

Use the same procedures for the RH side and LH side.

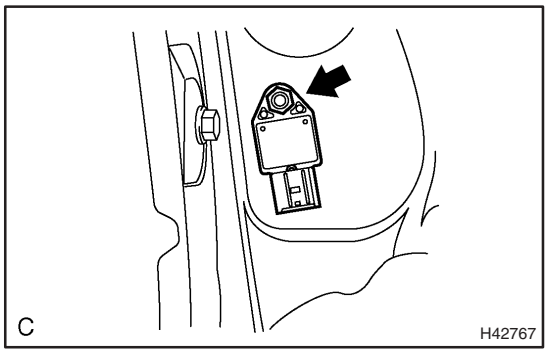
1. PRECAUTION (SEE PUB. NO. RM1018E, PAGE 60–1)

2. DISCONNECT BATTERY NEGATIVE TERMINAL

CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

3. REMOVE FRONT DOOR SCUFF PLATE LH (SEE PUB. NO. RM1018E, PAGE 76–36)



4. REMOVE REAR DOOR SCUFF PLATE LH (SEE PUB. NO. RM1018E, PAGE 76–36)

5. REMOVE FRONT DOOR WEATHERSTRIP LH (SEE PUB. NO. RM1018E, PAGE 76–36)

6. REMOVE REAR DOOR WEATHERSTRIP LH (SEE PUB. NO. RM1018E, PAGE 76–36)

7. REMOVE CENTER PILLAR GARNISH LOWER LH (SEE PUB. NO. RM1018E, PAGE 76–36)

8. REMOVE FRONT SEAT OUTER BELT ASSY LH (SEE PUB. NO. RM1018E, PAGE 61–7)

9. REMOVE SIDE AIR BAG SENSOR ASSY LH

(a) Disconnect the connector from the side airbag sensor assy LH.

(b) Remove the nut and the side airbag sensor assy LH.

10. INSTALL SIDE AIR BAG SENSOR ASSY LH

(a) Check that the ignition switch is off.

(b) Check that the battery negative (–) terminal is disconnected.

CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

(c) Install the side airbag sensor assy LH with the nut.

Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

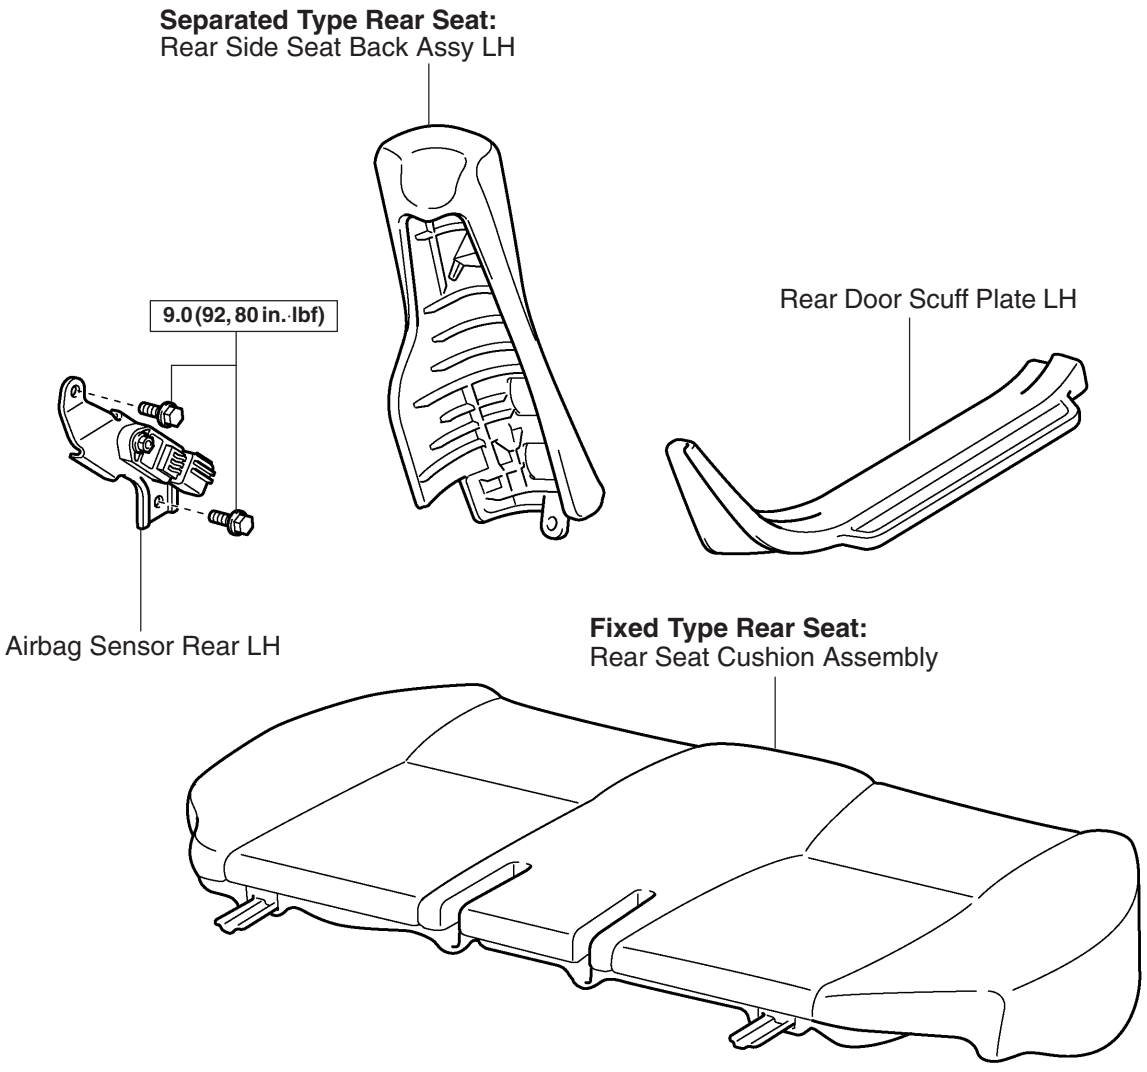
NOTICE:

- **If the side airbag sensor assy LH has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **When installing the side airbag sensor assy LH, be careful that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**

(d) Check that there is no looseness in the installation parts of the side airbag sensor assy LH.

(e) Connect the connector to the side airbag sensor assy LH.

11. INSTALL FRONT SEAT OUTER BELT ASSY LH (SEE PUB. NO. RM1018E, PAGE 61–7)



12. CONNECT BATTERY NEGATIVE TERMINAL

13. INSPECT SRS WARNING LIGHT (SEE PUB. NO. RM1018E, PAGE 05–1184)

AIR BAG SENSOR REAR LH (From February, 2004)

COMPONENTS

600K7–02

C N·m (kgf·cm, ft·lbf) : Specified torque

H42768

600K8–02

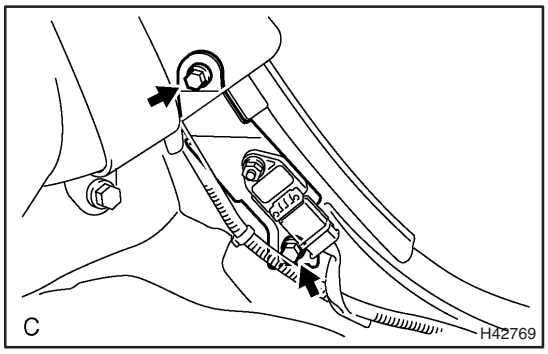
REPLACEMENT

HINT:

Use the same procedures for the RH side and LH side.

1. PRECAUTION (SEE PUB. NO. RM1018E, PAGE 60–1)

2. DISCONNECT BATTERY NEGATIVE TERMINAL



CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

3. REMOVE REAR DOOR SCUFF PLATE LH (SEE PUB. NO. RM1018E, PAGE 73–36)

4. REMOVE REAR SEAT CUSHION ASSEMBLY (FIXED TYPE REAR SEAT) (SEE PUB. NO. RM1018E, PAGE 72–33)

5. REMOVE REAR SIDE SEAT BACK ASSY LH (SEPARATED TYPE REAR SEAT) (SEE PUB. NO. RM1018E, PAGE 72–27)

6. REMOVE AIR BAG SENSOR REAR LH

(a) Disconnect the connector from the airbag sensor rear LH.

(b) Remove the 2 bolts and the airbag sensor rear LH.

7. INSTALL AIR BAG SENSOR REAR LH

(a) Check that the ignition switch is off.

(b) Check that the battery negative (–) terminal is disconnected.

CAUTION:

After removing the terminal, wait for at least 90 seconds before starting the operation.

(c) Install the airbag sensor rear LH with the 2 bolts.

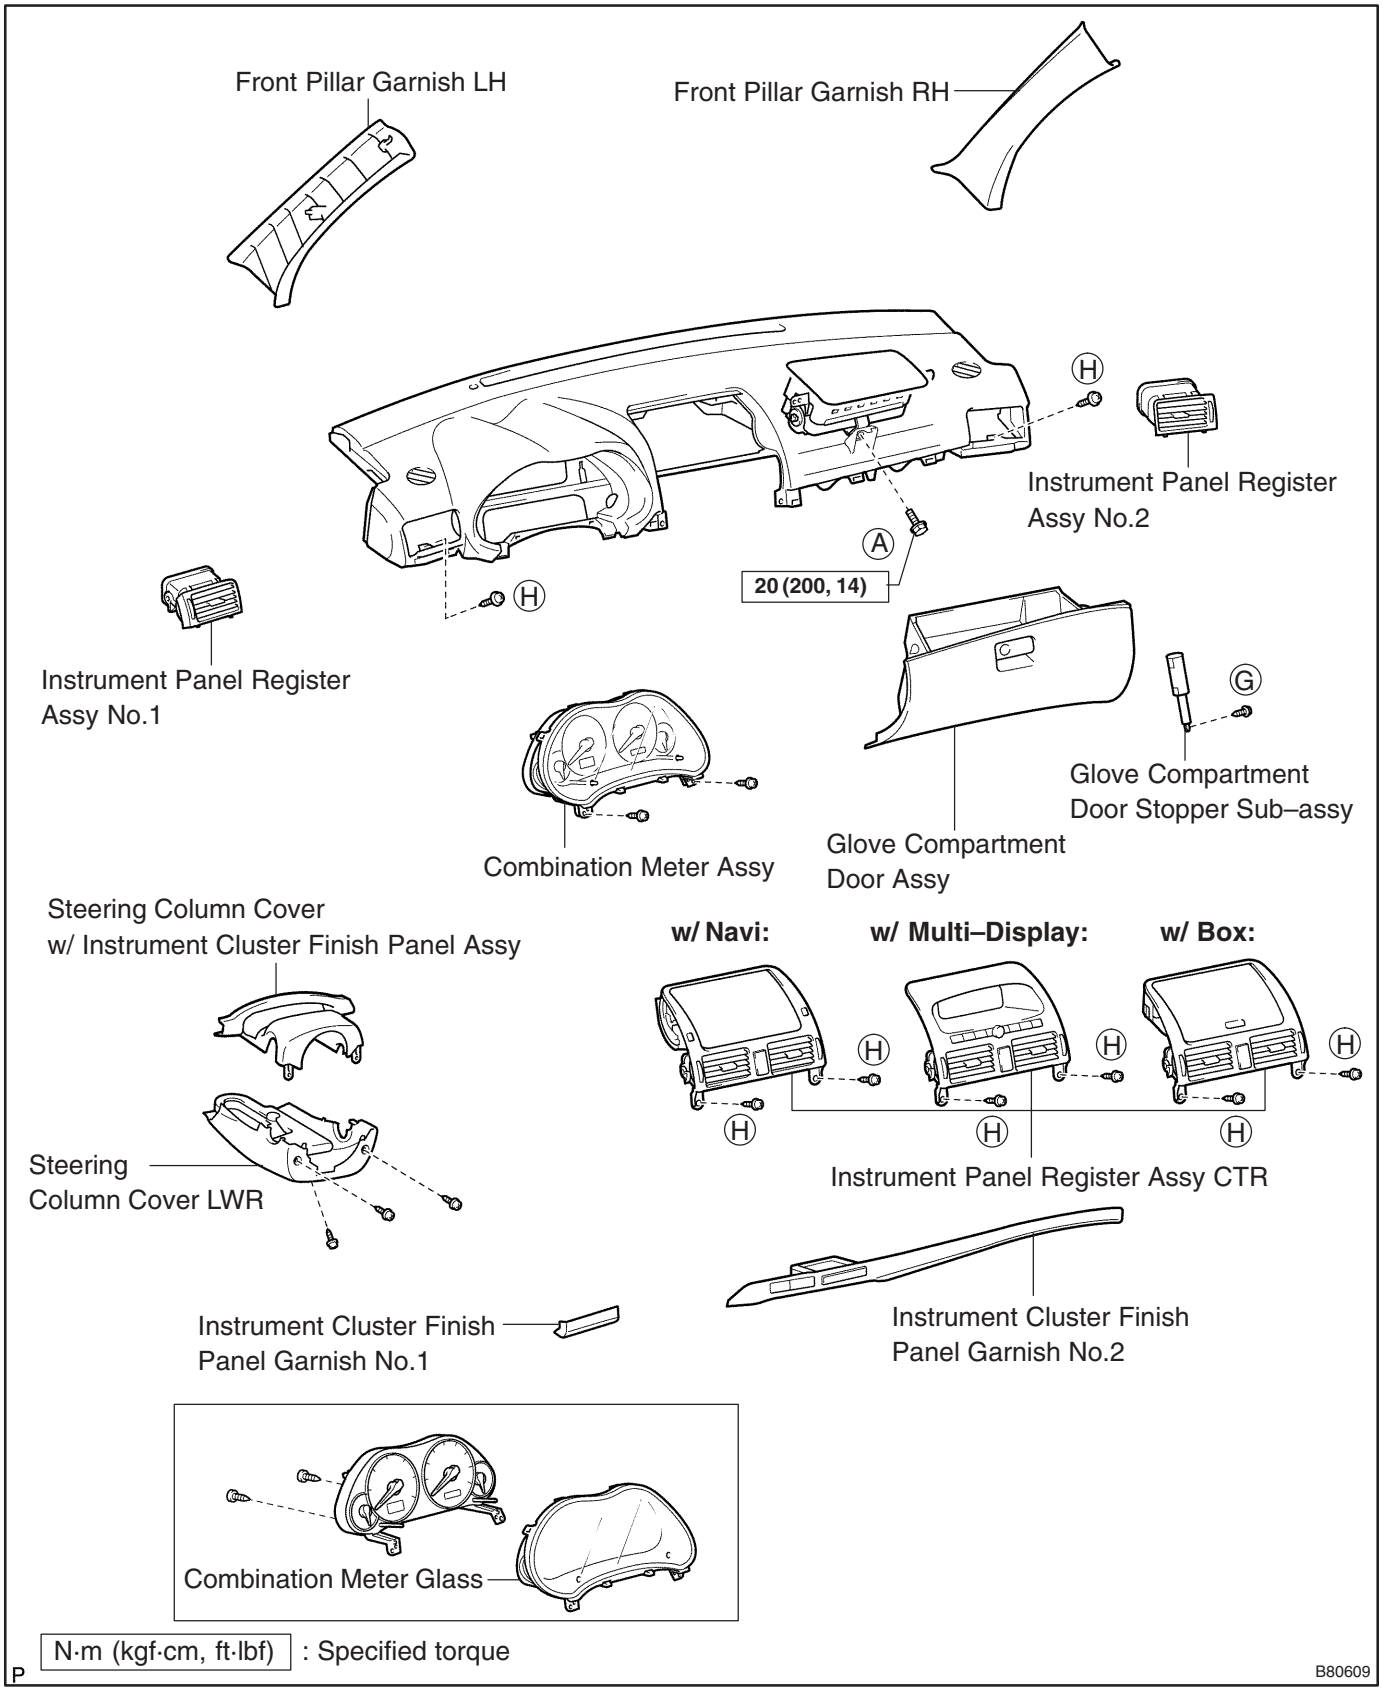
Torque: 9.0 N·m (92 kgf·cm, 80 ft·lbf)

NOTICE:

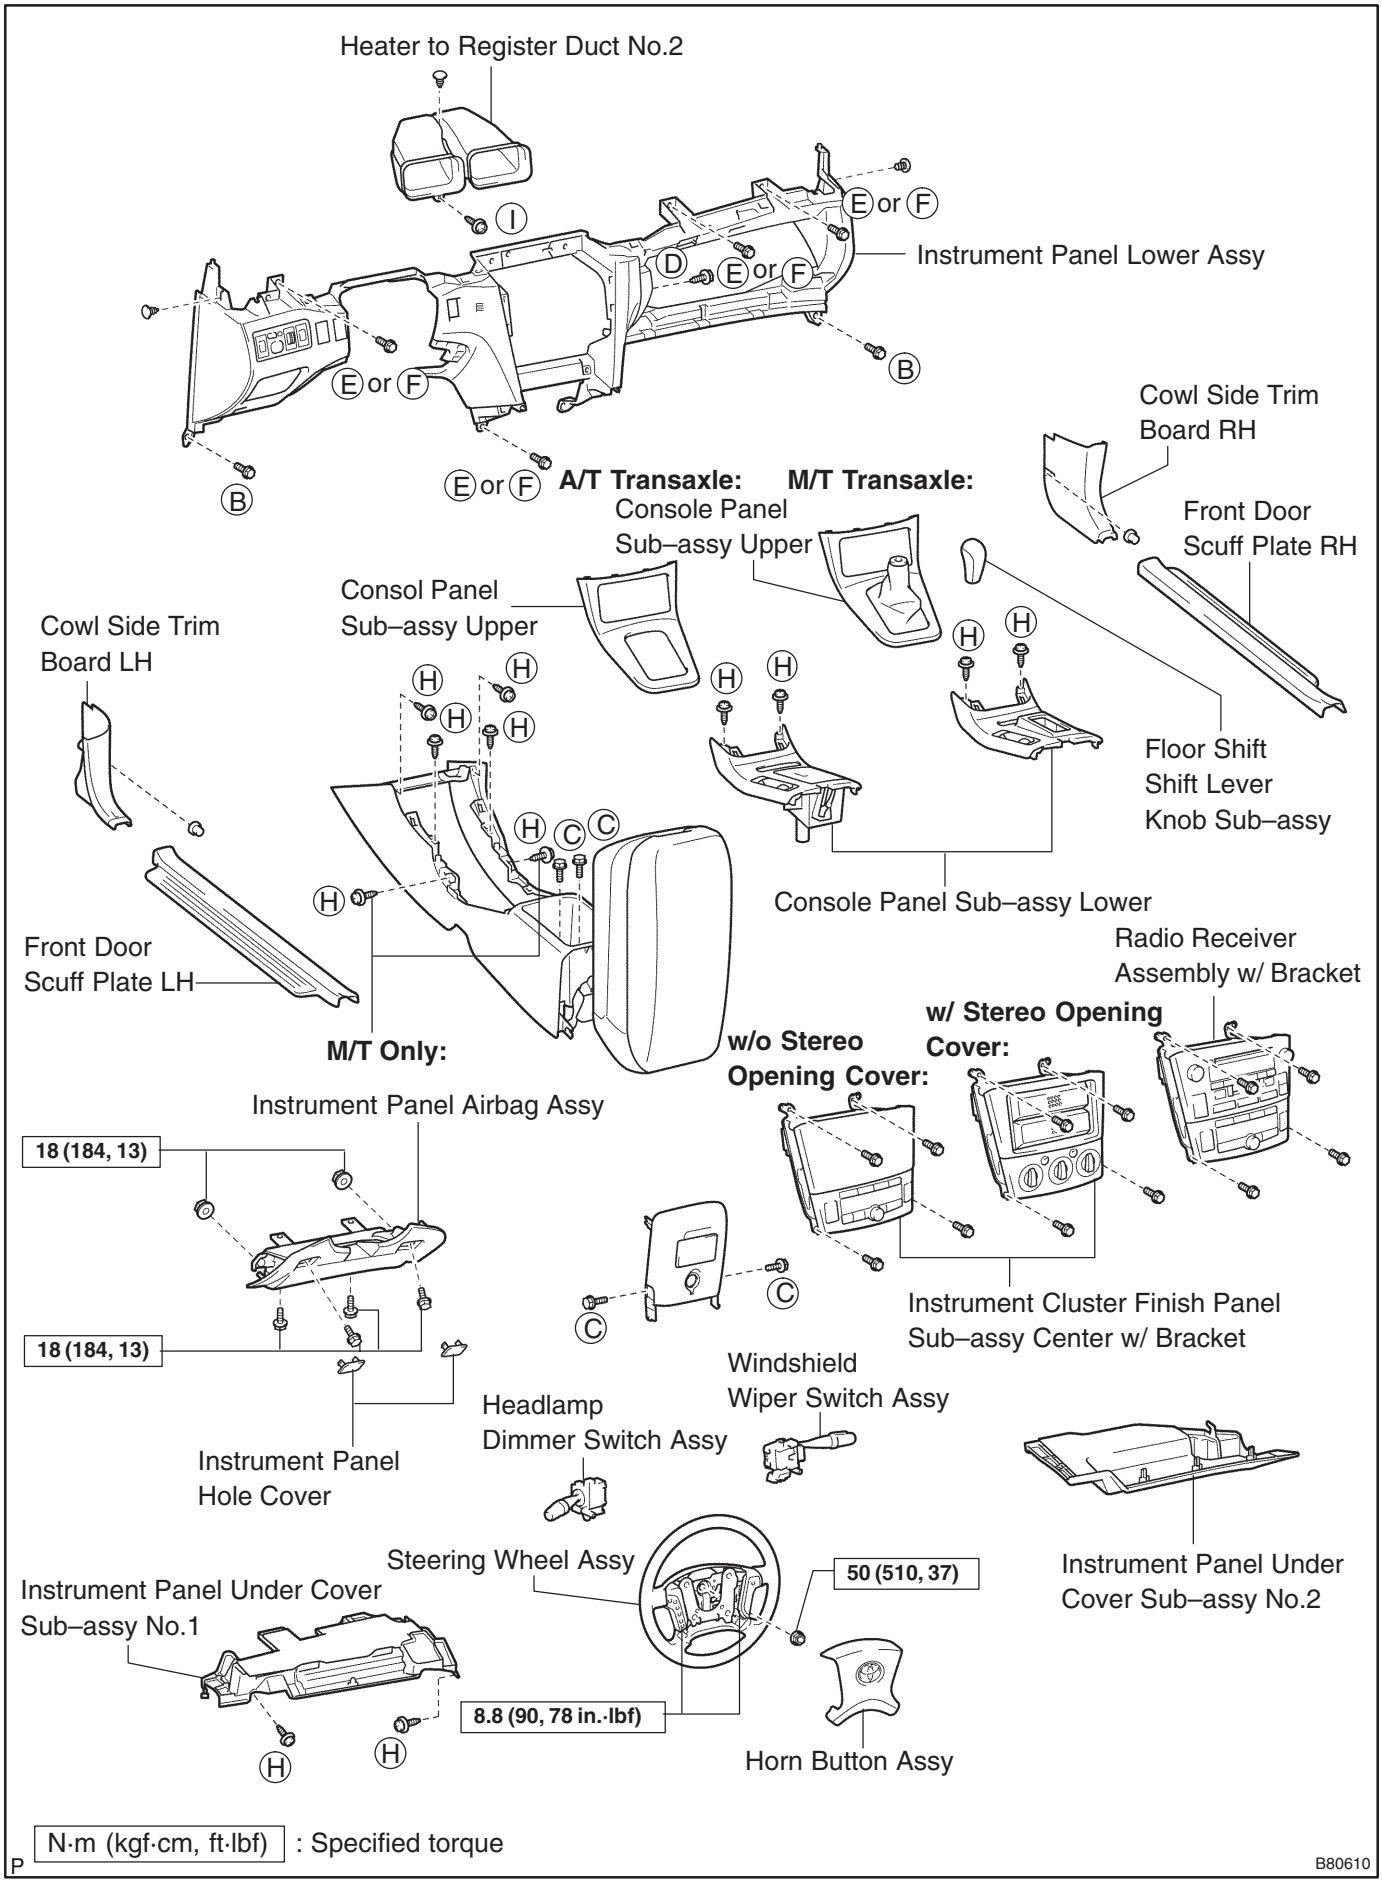
- **If the airbag sensor rear LH has been dropped, or there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **When installing the airbag sensor rear LH, be careful that the SRS wiring does not interfere with other parts and that it is not pinched between other parts.**

(d) Check that there is no looseness in the installation parts of the airbag sensor rear LH.

(e) Connect the connector to the airbag sensor rear LH.



8. CONNECT BATTERY NEGATIVE TERMINAL



9. INSPECT SRS WARNING LIGHT (SEE PUB. NO. RM1018E, PAGE 05–1184)

710FY–02

PRECAUTION

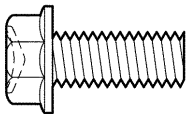
1. PRECAUTION FOR VEHICLE WITH SRS AIRBAG AND SEAT BELT PRETENSIONER

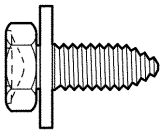
(a) Some operations in this section may affect the SRS airbags. Prior to performing the corresponding operations, read the SRS airbag NOTICE.

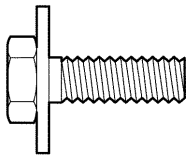
710NI–01

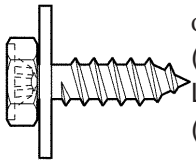
REPLACEMENT

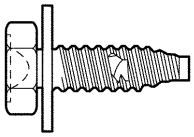
HINT:

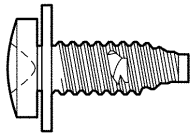


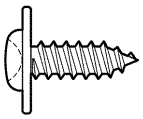


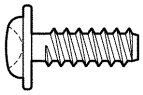


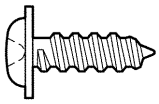








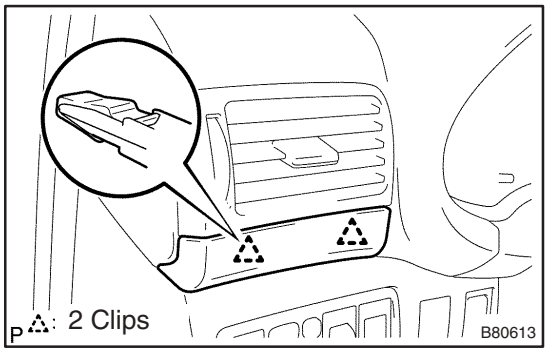




- COMPONENTS: See Pub. No. RM1018E, page 71–7.
- Installation is in the reverse order of removal.

1. TABLE OF BOLT, SCREW AND NUT

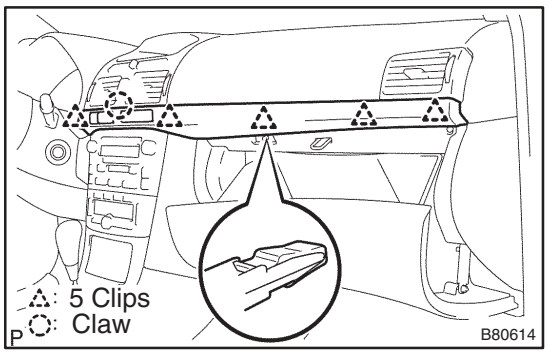
HINT:



The bolts, screws and nuts, which are necessary for installation and removal of the instrument panel, are shown in the illustration below with alphabets.

mm (in.) (L = Length)

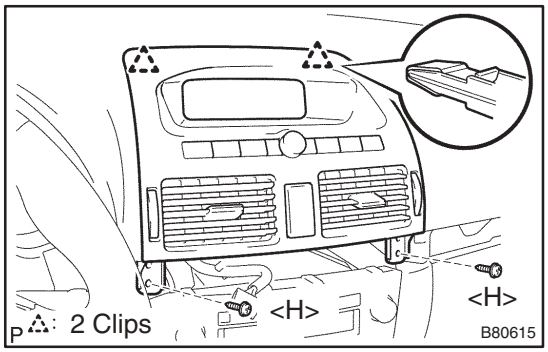
Code	Shape	Code	Shape	Code	Shape
<A>	 ϕ = 8 (0.31) L = 18 (0.71) B50533 91535-60816	<B>	 ϕ = 6 (0.24) L = 16 (0.63) 91635-60616	<C>	 ϕ = 6 (0.24) L = 20 (0.79) B50534 91635-60625
<D>	 ϕ = 6 (0.24) L = 20 (0.79) B52926 90159-W0014	<E>	 ϕ = 6 (0.24) L = 20 (0.79) B52928 90159-60546	<F>	 ϕ = 7 (0.28) L = 20 (0.79) B52927 90159-70004
<G>	 ϕ = 5 (0.20) L = 14 (0.55) B59217 90167-W0001	<H>	 ϕ = 5 (0.20) L = 14 (0.55) B32741 90167-W0007	<I>	 L = 16 (0.63) E33943 93560-15016



P B80612

2. DISCONNECT BATTERY NEGATIVE TERMINAL (See Pub. No. RM1018E, page 60–1)

3. REMOVE INSTRUMENT CLUSTER FINISH PANEL GARNISH NO.1

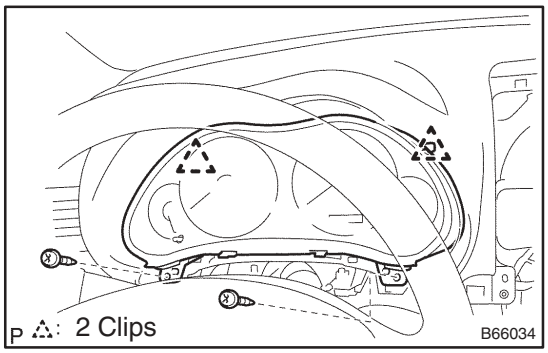


(a) Disengage the 2 clips and remove the instrument cluster finish panel garnish No.1.

4. REMOVE INSTRUMENT CLUSTER FINISH PANEL GARNISH NO.2

(a) Disengage the 5 clips and claw, and then remove the instrument cluster finish panel garnish No.2.

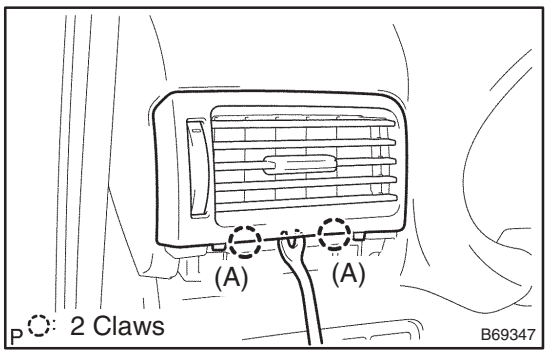
(b) Disconnect the connectors.



5. REMOVE INSTRUMENT PANEL REGISTER ASSY CTR

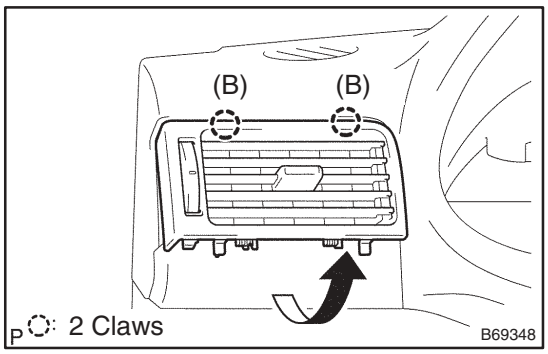
(a) Remove the 2 screws <H>.

(b) Disengage the 2 clips and remove the instrument panel register assy CTR, and then disconnect the connectors.



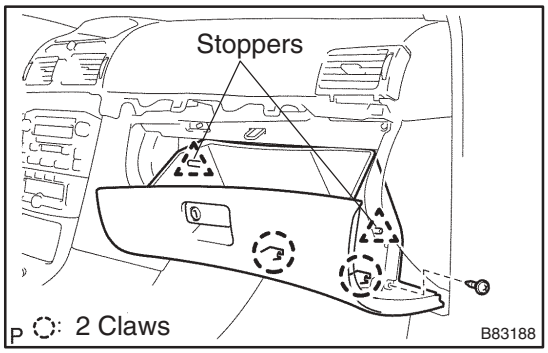
6. REMOVE STEERING COLUMN COVER W/INSTRUMENT CLUSTER FINISH PANEL ASSY (See Pub. No. RM1018E, page 50–9)

7. REMOVE COMBINATION METER ASSY



(a) Remove the 2 screws and disengage the 2 clips.

(b) Pull out the combination meter assy, and then disconnect the connectors.

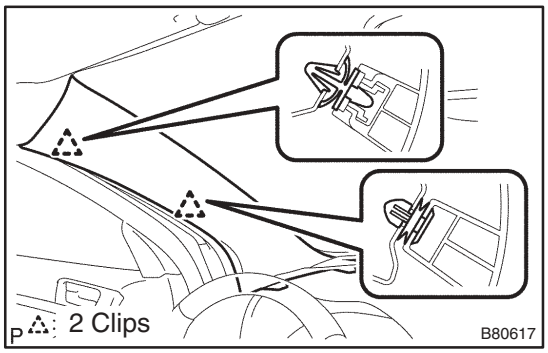


8. REMOVE INSTRUMENT PANEL REGISTER ASSY NO.1

(a) Insert a clip remover between the center of the instrument panel register assy No.1 lower and the instrument panel sub–assy upper to desengage the 2 claws (A) shown in the illustration.

(b) Disengage the 2 claws (B) and remove the instrument panel register assy No.1.

9. REMOVE INSTRUMENT PANEL REGISTER ASSY NO.2



10. REMOVE GLOVE COMPARTMENT DOOR ASSY

(a) Remove the screw.

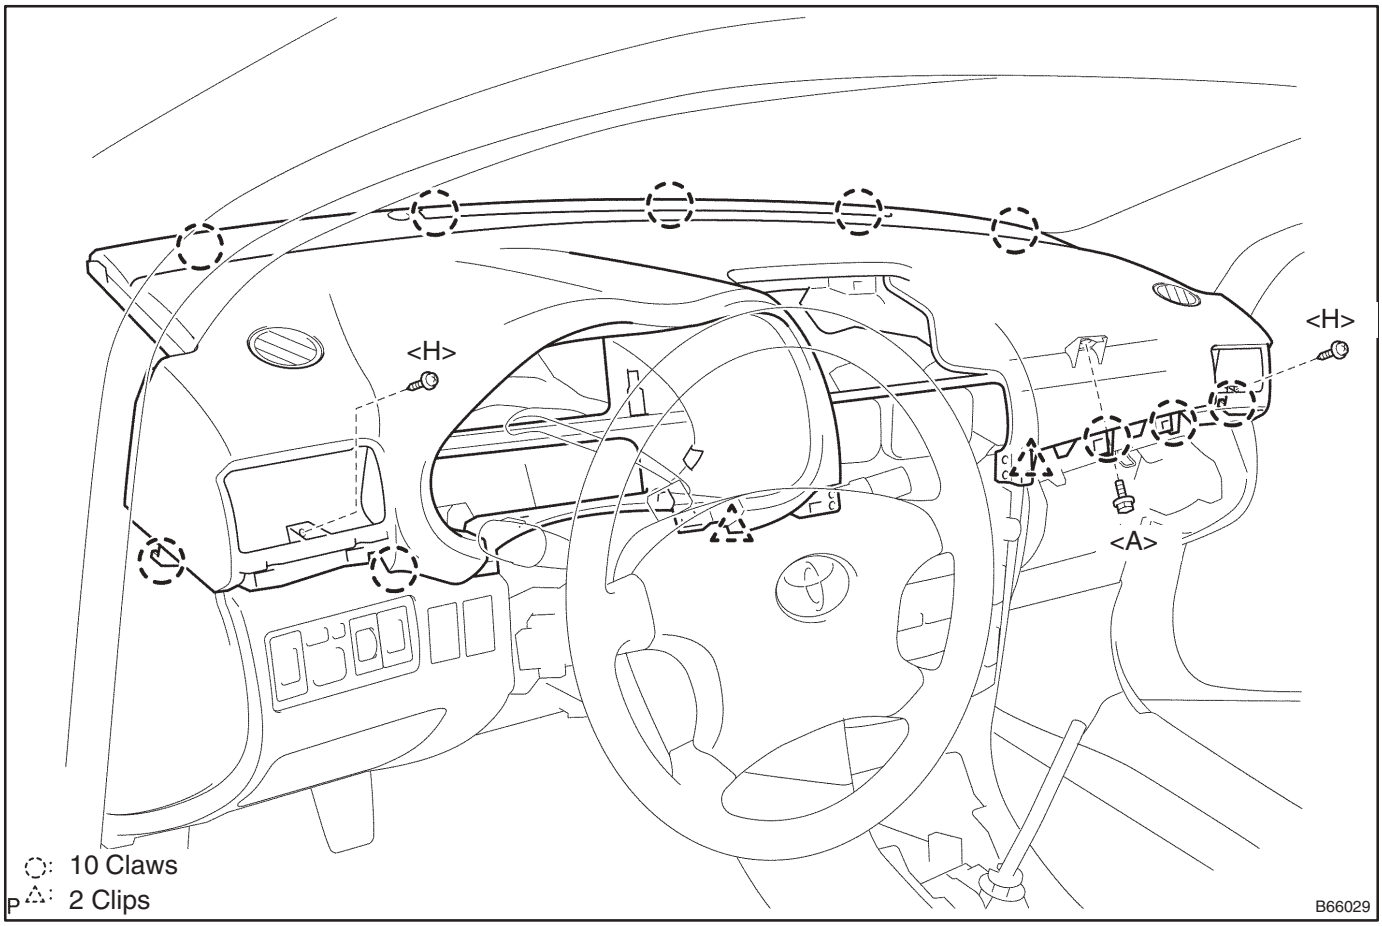
(b) Deform the upper part of the glove compartment door assy to release the stoppers.

(c) Pull the glove compartment door assy upward to remove it.

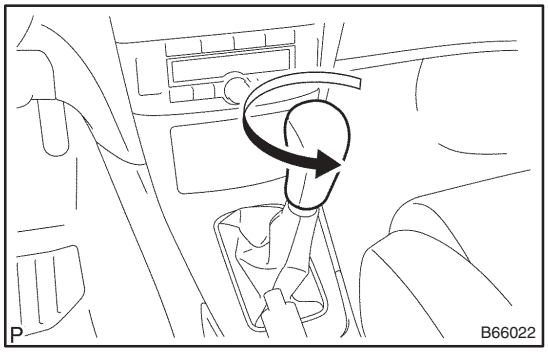
11. REMOVE FRONT PILLAR GARNISH LH

(a) Disengage the 2 clips, and remove the front pillar garnish LH.

12. REMOVE FRONT PILLAR GARNISH RH



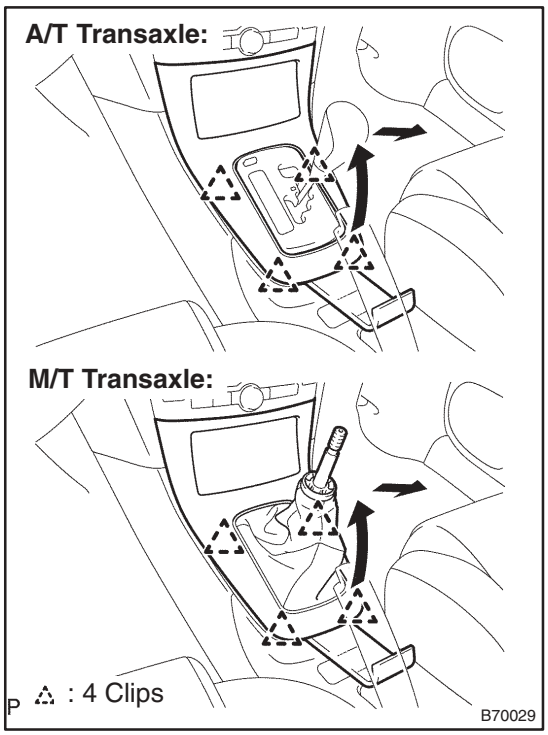
HINT:



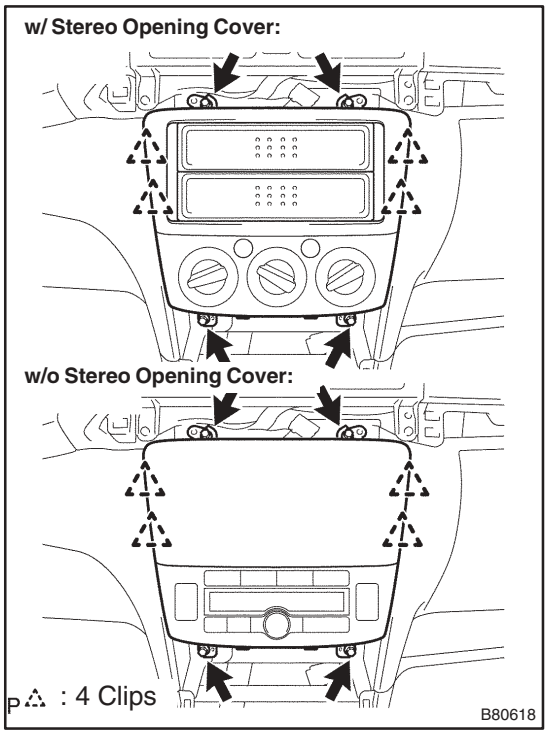
Use the same procedures for the RH side and LH side.

13. DISCONNECT PASSENGER AIRBAG CONNECTOR (See Pub. No. RM1018E, page 60–29)

14. REMOVE INSTRUMENT PANEL SUB–ASSY UPPER W/INSTRUMENT PANEL PASSENGER AIRBAG ASSY



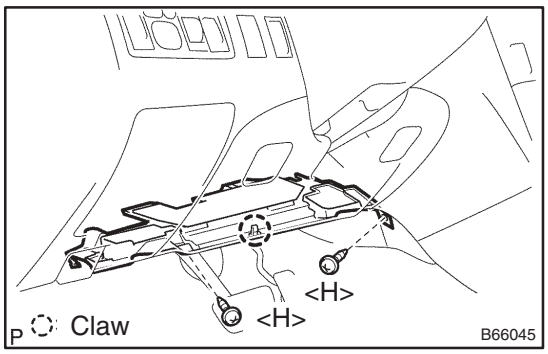
(a) Remove the 2 screws <H> and bolt <A>.
(b) Disengage the 2 clips and 10 claws.
(c) Pull the instrument panel sub–assy upper w/ instrument panel passenger airbag assy rearward to remove it.
(d) Disconnect the connectors.



15. REMOVE SHIFT LEVER KNOB SUB–ASSY (M/T TRANSAXLE)

(a) Remove the floor shift shift lever knob sub–assy.

16. REMOVE CONSOLE PANEL SUB–ASSY UPPER



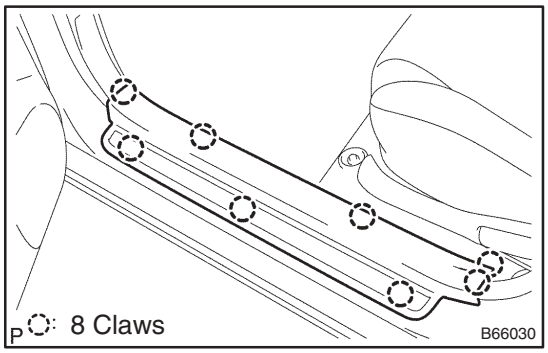
(a) Using a moulding remover, disengage the 4 clips.
(b) Disconnect the connectors, and remove the console panel sub–assy upper.

17. REMOVE INSTRUMENT CLUSTER FINISH PANEL SUB–ASSY CENTER W/BRACKET (W/O RADIO)

(a) Remove the 4 bolts.
(b) Using a moulding remover, disengage the 4 clips.
(c) Disconnect the connector and remove the instrument cluster finish panel sub–assy center w/ blacket.

18. REMOVE RADIO RECEIVER ASSEMBLY W/BRACKET (W/ RADIO) (See Pub. No. RM1018E, page 67–5)
19. REMOVE HORN BUTTON ASSY (See Pub. No. RM1018E, page 60–17)
20. REMOVE STEERING WHEEL ASSY (See Pub. No. RM1018E, page 50–9)
SST 09950–50013 (09951–05010, 09952–05010, 09953–05020, 09954–05021)
21. REMOVE HEADLAMP DIMMER SWITCH ASSY (See Pub. No. RM1018E, page 65–27)
22. REMOVE WINDSHIELD WIPER SWITCH ASSY (See Pub. No. RM1018E, page 66–24)

23. REMOVE INSTRUMENT PANEL UNDER COVER SUB–ASSY NO.1



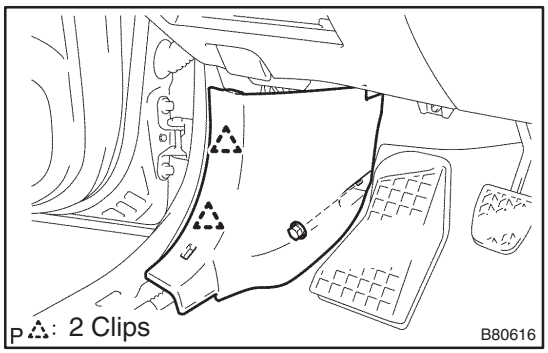
(a) Remove the 2 screws <H>.

(b) Disengage the claw and remove the instrument panel under cover sub–assy No.1.

24. REMOVE INSTRUMENT PANEL HOLE COVER (See Pub. No. RM1018E, page 60–54)

25. REMOVE INSTRUMENT PANEL AIR BAG ASSY (See Pub. No. RM1018E, page 60–54)

26. REMOVE STEERING COLUMN COVER LWR (See Pub. No. RM1018E, page 50–9)



27. REMOVE FRONT DOOR SCUFF PLATE LH

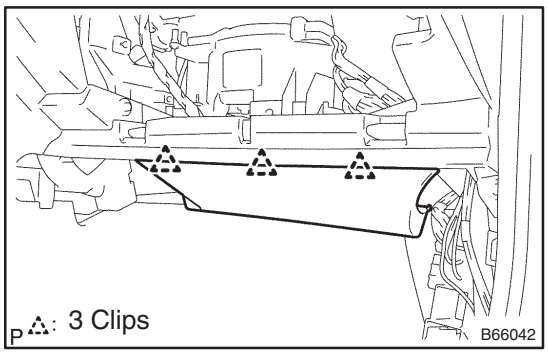
(a) Disengage the 8 claws and remove the front door scuff plate LH.

28. REMOVE FRONT DOOR SCUFF PLATE RH

HINT:

Use the same procedures for the RH side and LH side.

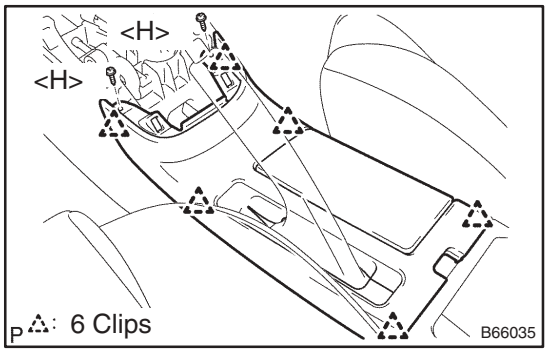
29. REMOVE COWL SIDE TRIM BOARD LH



(a) Remove the clip.

(b) Disengage the 2 clips and remove the cowl side trim board LH.

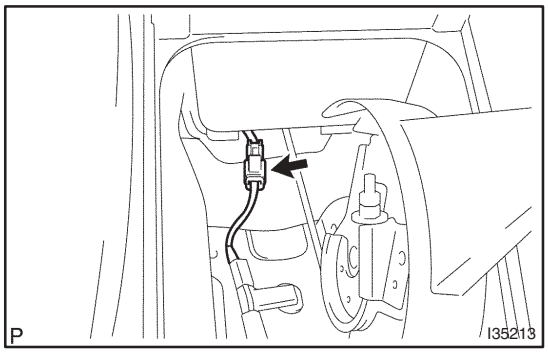
30. REMOVE COWL SIDE TRIM BOARD RH



HINT:

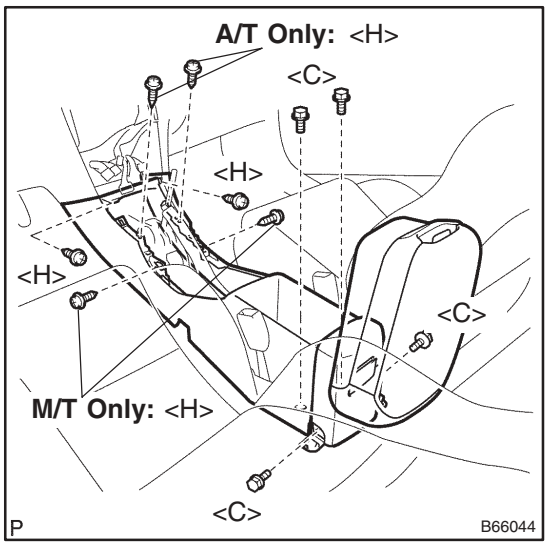
Use the same procedures for the RH side and LH side.

31. REMOVE INSTRUMENT PANEL UNDER COVER SUB–ASSY NO.2



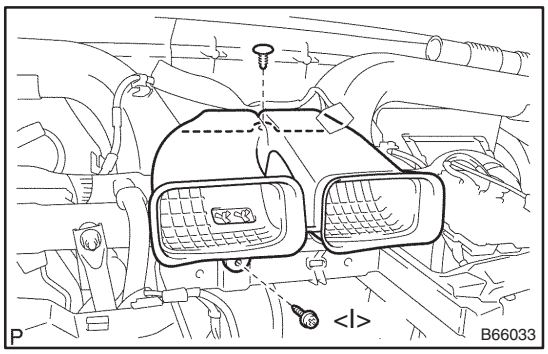
(a) Disengage the 3 clips and remove the instrument panel under cover sub–assy No.2.

32. REMOVE CONSOLE PANEL SUB–ASSY LOWER



(a) Remove the 2 screws <H>.

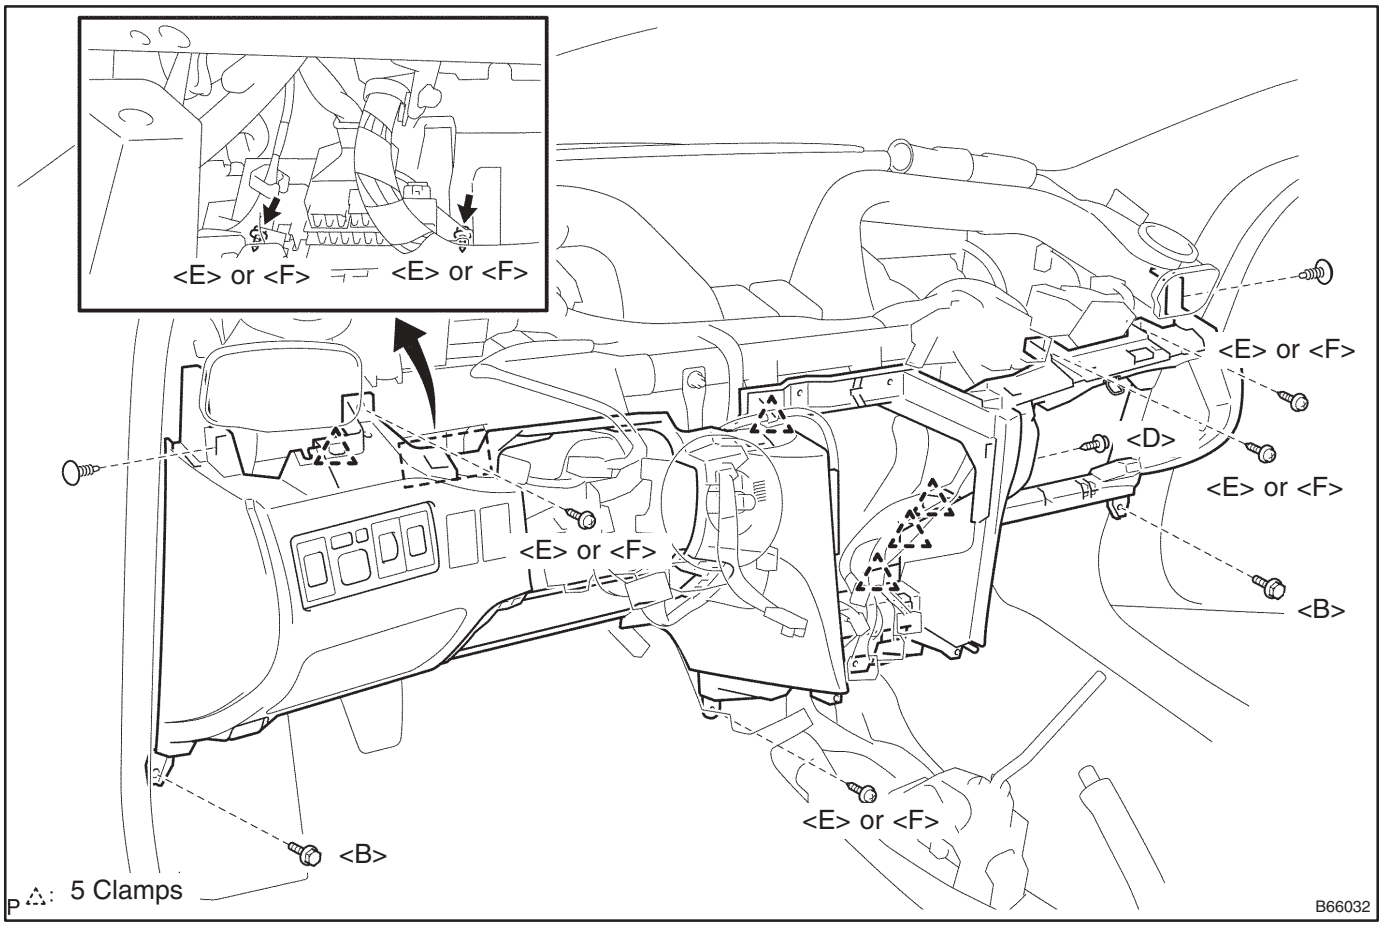
(b) Disengage the 6 clips and remove the console panel sub–assy lower.



33. REMOVE CONSOLE BOX ASSY RR

(a) Disconnect the connector.

(b) Remove the 4 bolts <C>, 4 screws <H> and the console box assy RR.



34. REMOVE HEATER TO REGISTER DUCT NO.2

(a) Remove the screw <I>, clip and the heater to register duct No.2.

35. REMOVE INSTRUMENT PANEL LOWER ASSY

(a) Disconnect the hood lock control cable.
(b) Using a clip remover, remove the 2 clips.
(c) Remove the 2 bolts <B> and 7 screws <D> <E> or <F>.
(d) Disengage the 5 wire harness clamps.
(e) Remove the instrument panel lower assy.

36. REMOVE OUTER MIRROR SWITCH ASSY W/BEZEL

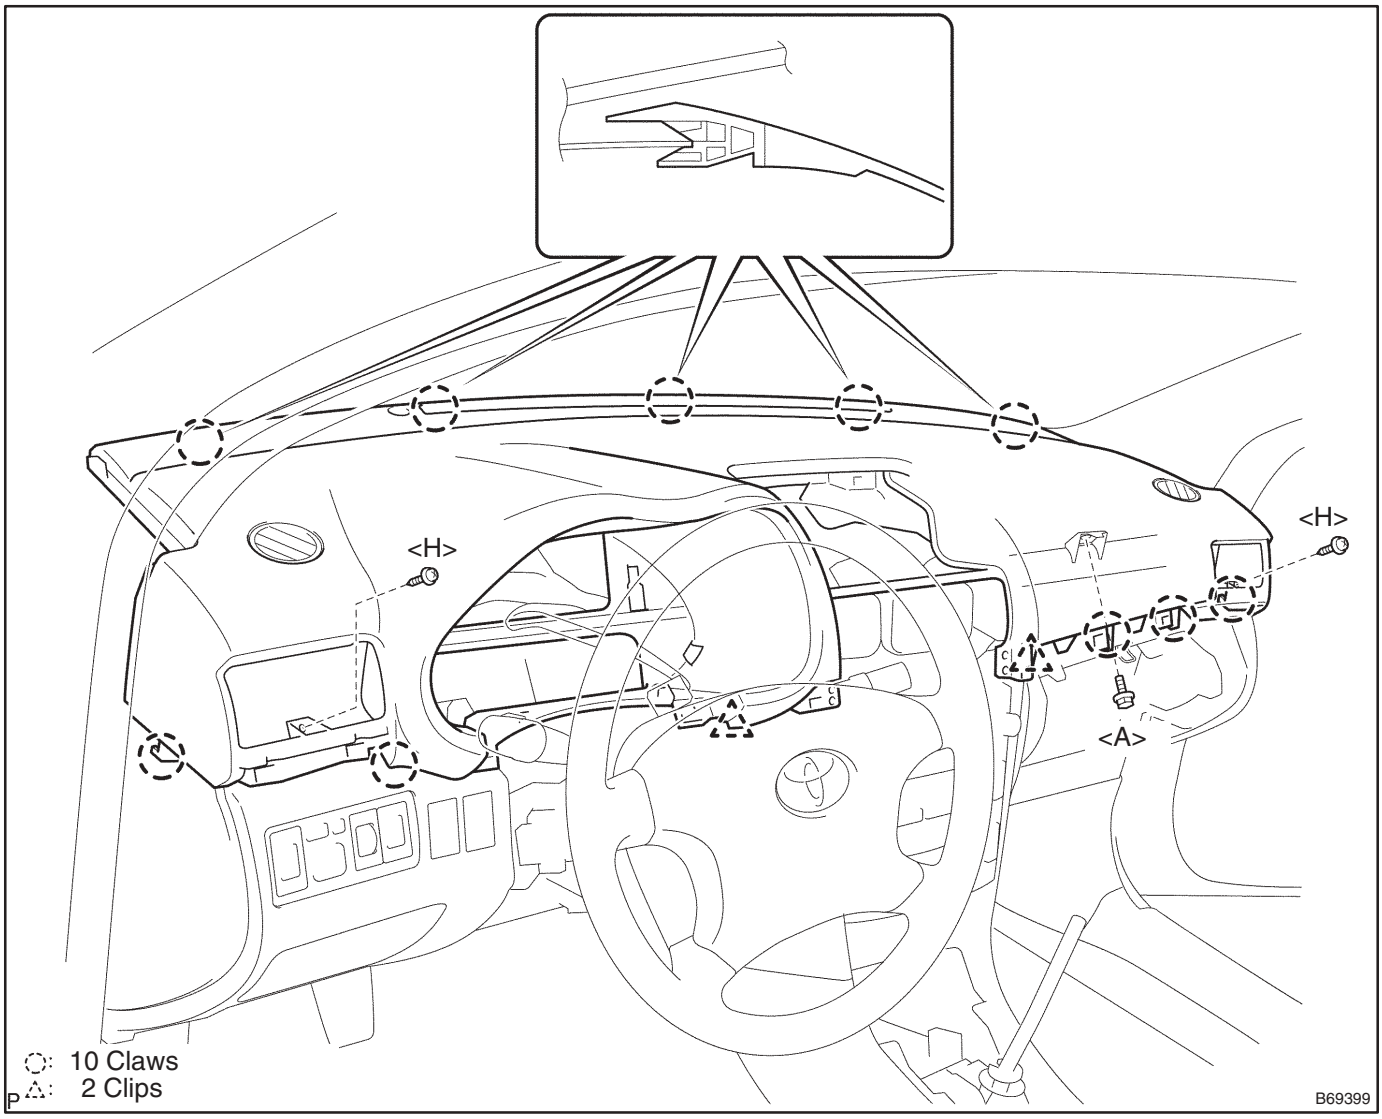
37. REMOVE FUSE BOX OPENING COVER

38. REMOVE GLOVE BOX LAMP ASSY

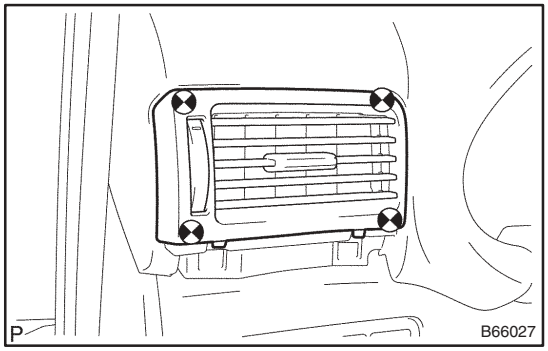
39. REMOVE INSTRUMENT PANEL BRACKET SUB–ASSY CENTER

(a) Remove the screw <H> and the instrument panel bracket sub–assy center.

40. REMOVE COOLER (ROOM TEMP. SENSOR) THERMISTOR



41. REMOVE INSTRUMENT PANEL SUB–ASSY LOWER



42. INSTALL INSTRUMENT PANEL AIR BAG ASSY (See Pub. No. RM1018E, page 60–29)

43. INSTALL INSTRUMENT PANEL SUB–ASSY UPPER W/INSTRUMENT PANEL PASSENGER AIRBAG ASSY

(a) Engage the 2 clips and 10 claws.

(b) Install the instrument panel sub–assy upper with the 2 screws <H> and bolt <A>.
Torque: Bolt: 20 N·m (204 kgf·cm, 15 ft·lbf)

44. INSTALL INSTRUMENT PANEL REGISTER ASSY NO.1

(a) Install the instrument panel register assy No.1 by pushing the 4 positions on the face panel shown in the illustration with fingers.

NOTICE:

Do not push on the dial, fin adjuster or fins.

45. INSTALL INSTRUMENT PANEL REGISTER ASSY NO.2
46. ADJUST SPIRAL CABLE SUB–ASSY (See Pub. No. RM1018E, page 60–26)
47. INSTALL STEERING WHEEL ASSY (See Pub. No. RM1018E, page 50–9)
48. INSTALL HORN BUTTON ASSY (See Pub. No. RM1018E, page 60–17)
49. INSPECT HORN BUTTON ASSY (See Pub. No. RM1018E, page 60–11)
50. INSPECT SRS WARNING LIGHT (See Pub. No. RM1018E, page 05–1184)

HOW TO USE THIS MANUAL

010B2–24

GENERAL INFORMATION

1. GENERAL DESCRIPTION

(a) This manual is made in accordance with SAE J2008.

(b) Generally repair operations can be separated in the following 3 main processes:
1. Diagnosis
2. Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting
3. Final Inspection

(c) This manual explains ”Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting”, but ”Final Inspection” is omitted.

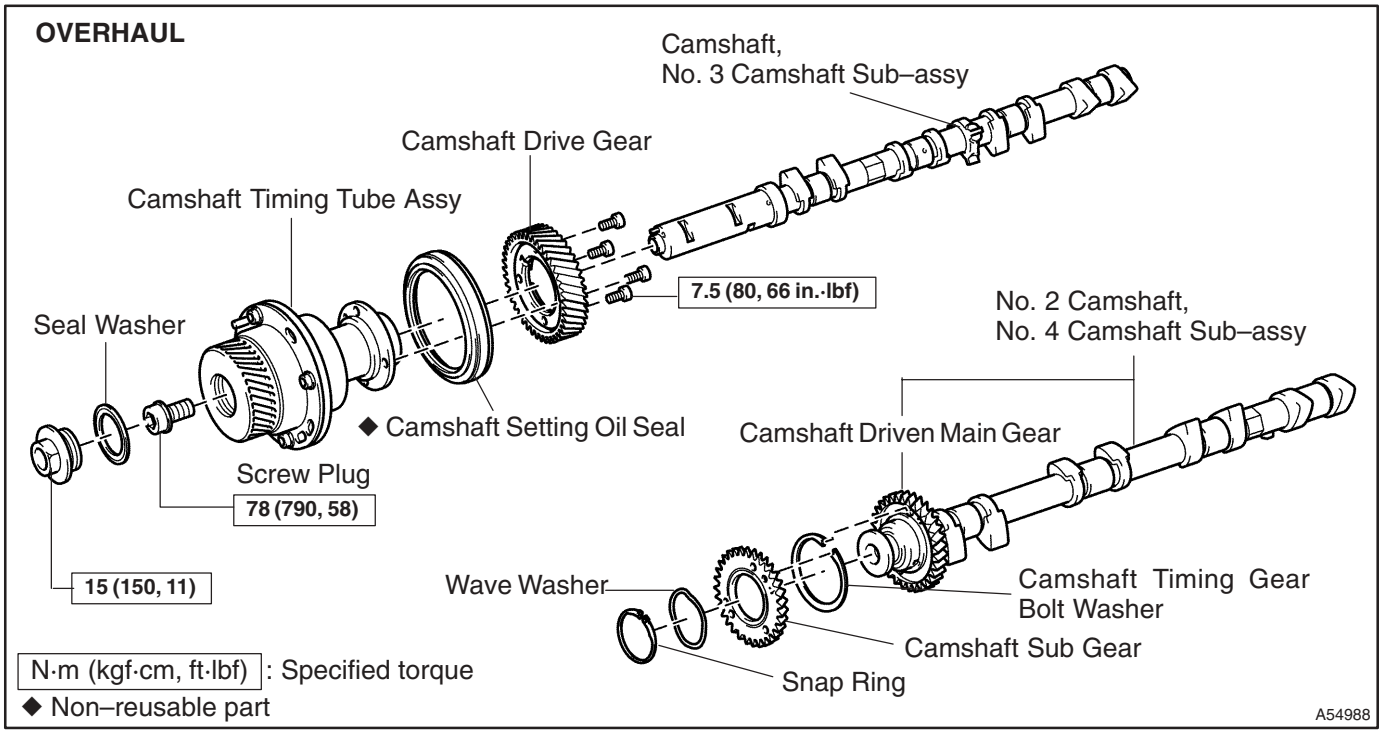
(d) The following essential operations are not written in this manual, however these operations must be done in the practical situation.
(1) Operation with a jack or lift
(2) Cleaning of a removed part when necessary
(3) Visual check

2. INDEX

(a) An alphabetical INDEX is provided as a section on the end of the book to guide you to the item to be repaired.

3. PREPARATION

(a) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the repairing condition. Be sure to use SST and SSM when they are required and follow the working procedure properly. A list of SST and SSM is in the Preparation section of this manual.



4. REPAIR PROCEDURES

(a) Component drawing is placed as the section or title when necessary.

(b) Illustrations of the parts catalog are placed as the ”disassembled parts drawing” so that it enables you to understand the fitting condition of the components.

(c) Non–reusable parts, grease applied parts, precoated parts and tightening torque are specified in the components drawing.

Example:

(d) Tightening torque, oil applying position, and non–reusable parts are described as important points in the procedure.

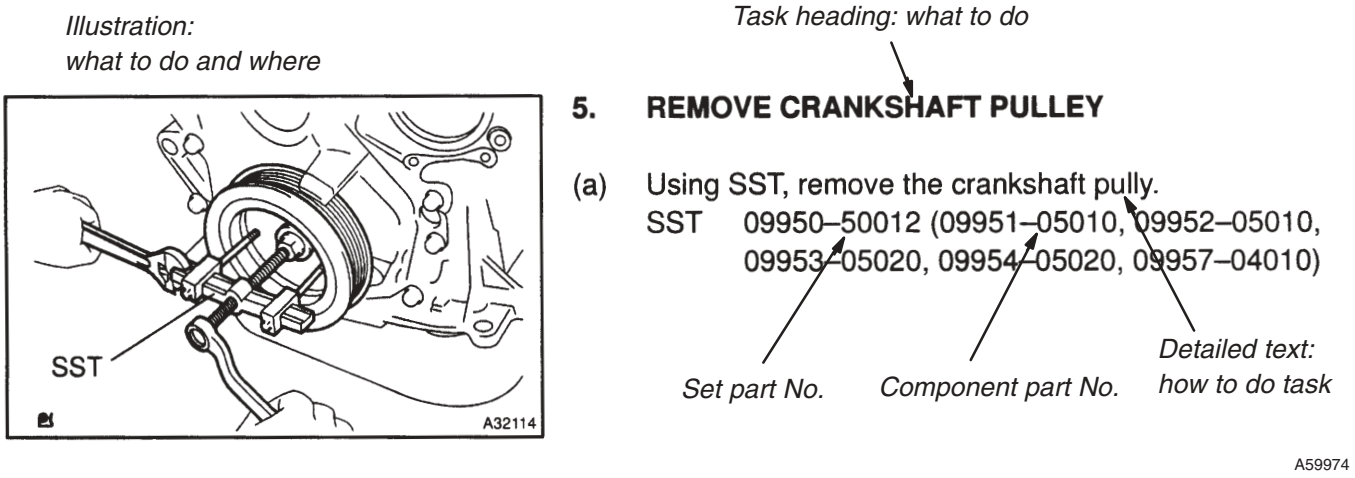
NOTICE:

There are cases where such information can only be indicated by an illustration. In that case, all the information such as torque, oil, etc. are described in the illustration.

(e) Installing procedure of operation items is performed in the reverse order of the removing, and only the important points are described.

(f) Only items with points are described in the procedure, and the operational portion and content are placed using an illustration. In the explanations, details of the operational method, standard value and notice are placed.

(g) There may be a case where the illustrations of similar models are used. In that case the details may be different from the actual vehicle.



(h) The procedures are presented in a step–by–step format:

(1) The illustration shows what to do and where to do it.

(2) The task heading tells what to do.

(3) The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

HINT:

This format provides an experienced technician with a FAST TRACK to the necessary information. The task heading can be read at a glance when necessary, and the text below provides detailed information. Important specifications and warnings always stand out in bold type.

5. SERVICE SPECIFICATIONS

(a) Specifications are presented in bold type throughout the manual. You never have to leave the procedure to look up your specifications. The specifications are also found in the Service Specifications section for a quick reference.

6. TERMS DEFINITION

CAUTION	Indicate the possibility of injury to you or other people.
NOTICE	Indicate the possibility of damage to the components being repaired.
HINT	Provide additional information to help you perform the repair efficiently.

7. SI UNIT

(a) The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and in the English System.

Example:

Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

REPAIR INSTRUCTION

010X0–01

PRECAUTION

1. TO PREVENT FROM ENTERING FOREIGN SUBSTANCES

(a) When foreign substances such as dust, grain of sand or metallic dust enter inside of engine, it often causes functional failure of the engine.
  (1) Precaution before disassembly.
    • Remove adequately all sand and mud adhere to the outside of engine .
  (2) Precaution at reassembly.
    • Protect disassembled parts from dust by using vinyl sheet to cover.

2. TO PREVENT SCRATCHES ON THE PARTS

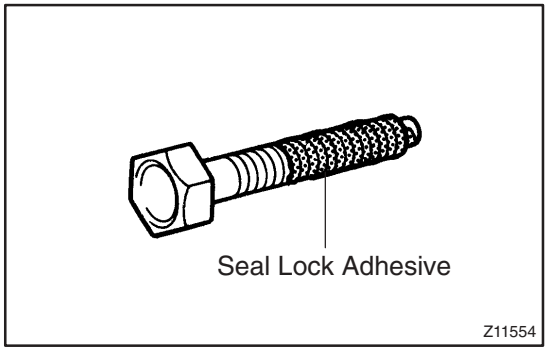
(a) The existence of scratches on the contact and revolving surfaces often causes oil leak and seisure.
  (1) Precautions at disassembly and reassembly.
    • When disassemble the contact surface of the parts, use plastic hummer striking lightly. (Do not pry out by screwdriver).
    • When fix the parts to the vise, do not directly catch it in the vise. Fix the parts through aluminum bar.

3. TO CLEAN AND WASH THE PARTS

(a) Each parts needs to be well cleaned, washed, and dried by air, and apply specified oil before reassembly.
  (1) Cleaning and washing by alkaline solvent is prohibited:
    • Parts made of aluminum and rubber. (ex. cylinder head cover gasket etc.)
  (2) Cleaning and washing by flushing oil (ex. kerosene, white gasoline etc.) is prohibited:
    • Parts made of rubber. (ex. cylinder head cover gasket etc.)

4. POSITION AND DIRECTION OF EACH PARTS

(a) Each parts needs to be reassembled as the same position and direction as it disassembled.
  (1) Precautions at disassembly and reassembly.
    • Follow the directions when the manual designates to mark the matchmark and/or direction mark.
    • Disassembled parts needs to be put in order as disassembled, not to change position and/or direction.
    • Follow the directions when the manual instructs the position and direction.



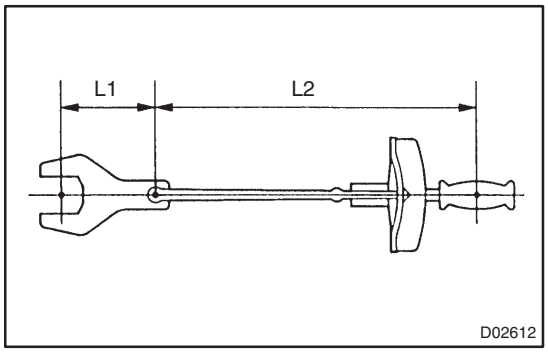
5. INSTALL ENGINE ASSEMBLY TO OVERHAUL STAND WHEN OVERHAUL THE ENGINE

6. PUT THE DISASSEMBLED PARTS IN ORDER AS THEY DISASSEMBLED

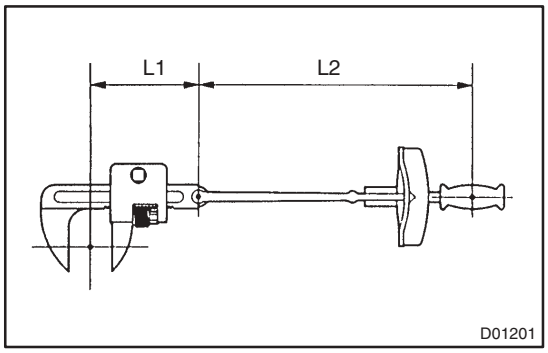
7. APPLY ENGINE OIL TO THE SLIDING AND ROTATING SURFACES

8. NON–REUSABLE PARTS SUCH AS GASKET AND SEAL NEEDS TO BE CHANGED TO THE NEW PARTS

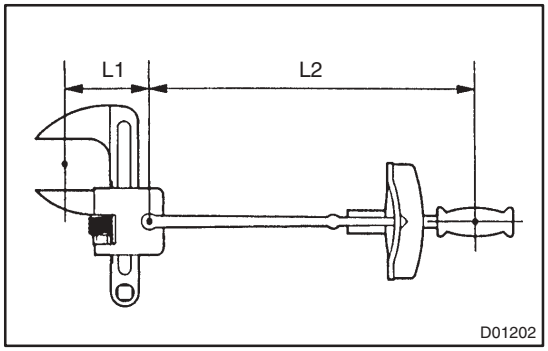
9. BASIC REPAIR HINT



(a) Precoated Parts:
  (1) Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.
  (2) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.
  (3) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.



NOTICE:
Do the torque checking with the lower limit value of the torque tolerance.

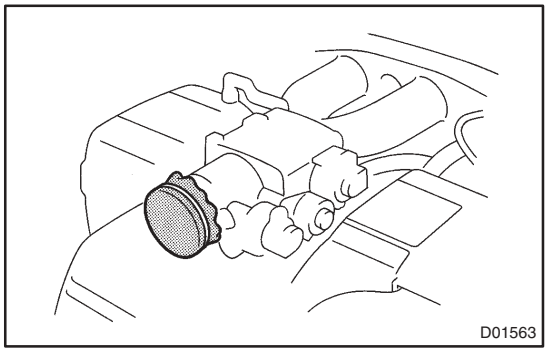


(4) Depending on the seal lock agent to apply, there may be a case where it is necessary to leave it for a specified time until it hardens.

(b) Gaskets:
When necessary, use a sealer on gaskets to prevent leaks.

(c) Bolts, Nuts and Screws:
Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.

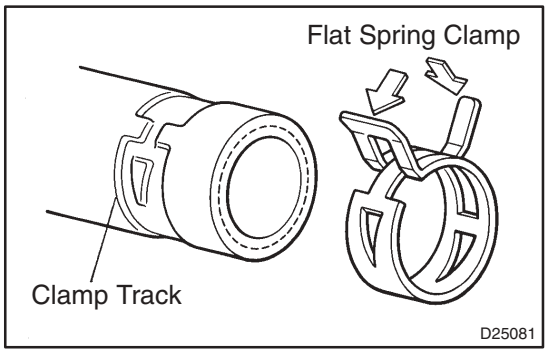
(d) Torque When Using Extension Tool with Torque Wrench:
(1) In case of tightening by extending the entire length of the torque wrench combined with SST or tool, if you tighten until the reading of the torque wrench reached the specified torque value, the actual torque becomes excessive.
(2) In this text, only the specified torque is described. In case of using SST or extension tool, find the reading of the torque wrench by the formula.
(3) Formula T' = T x L2/(L1 + L2)



T'	Reading of torque wrench {N·m (kgf·cm, ft·lbf)}
T	Torque {N·m (kgf·cm, ft·lbf)}
L1	Length of SST or tool (cm)
L2	Length of torque wrench (cm)

10. REMOVAL AND INSTALLATION OF FUEL CONTROL PARTS

(a) Place for Removing and Installing Fuel System Parts:
(1) Place with good air ventilation and without anything flammable such as welder, grinder, drill, electric motor or stove in the surroundings.
(2) Never work in a place like a pit or nearby pit as there is a possibility that vaporized fuel fills those places.



(b) Removing and Installing of Fuel System Parts:
(1) Prepare a fire extinguisher before starting the operation.
(2) For prevention of the static electricity, install a ground on the fuel changer, vehicle and fuel tank, and do not spray much water so as to prevent slipping.

(3) Never use any electric equipment like an electric motor or a working light as they may cause spark or high temperature.
(4) Never use an iron hammer as it may cause spark.
(5) Dispose the shop lag separately from any fuel deposit.

11. REMOVAL AND INSTALLATION OF ENGINE INTAKE PARTS

(a) If any metal tip is mixed in the inlet pass, that may give a bad effect to the engine and turbo charger.
(b) When removing and installing of the inlet system parts, close the opening of the removed inlet system parts and the engine with a clean shop lag or gum tape.
(c) When installing the inlet system parts, check that there is no mixing of a metal tip.

12. HANDLING OF HOSE CLAMPS

(a) Before removing the hose, check the depth of inserting portion and the clamp position to restore it surely.
(b) Change a deformed or dented into a new one.
(c) In case of reusing the hose, install the clamp on the hose where it has a clamp track.
(d) For a flat spring type clamp, make it adjust by adding force to the arrow mark direction after the installation.

TERMS

ABBREVIATIONS USED IN THIS MANUAL

010B9–21

Abbreviations	Meaning
ABS	Anti–Lock Brake System
A/C	Air Conditioner
AC	Alternating Current
ACC	Accessory
ACIS	Acoustic Control Induction System
ACSD	Automatic Cold Start Device
A.D.D.	Automatic Disconnecting Differential
A/F	Air–Fuel Ratio
AHC	Active Height Control Suspension
ALR	Automatic Locking Retractor
ALT	Alternator
AMP	Amplifier
ANT	Antenna
Approx.	Approximately
ASSY	Assembly
A/T, ATM	Automatic Transmission (Transaxle)
ATF	Automatic Transmission Fluid
AUTO	Automatic
AUX	Auxiliary
AVG	Average
AVS	Adaptive Variable Suspension
B+	Battery Voltage
BA	Brake Assist
BACS	Boost Altitude Compensation System
BAT	Battery
BDC	Bottom Dead Center
B/L	Bi–Level
B/S	Bore–Stroke Ratio
BTDC	Before Top Dead Center
BVSV	Bimetallic Vacuum Switching Valve
CAN	Controller Area Network
CB	Circuit Breaker
CCo	Catalytic Converter For Oxidation
CD	Compact Disc
CF	Cornering Force
CG	Center Of Gravity
CH	Channel
CKD	Complete Knock Down
COMB.	Combination
CPE	Coupe
CPS	Combustion Pressure Sensor
CPU	Central Processing Unit
CRS	Child Restraint System
CTR	Center
C/V	Check Valve
CV	Control Valve
CW	Curb Weight
DC	Direct Current

Abbreviations	Meaning
DEF	Defogger
DFL	Deflector
DIFF.	Differential
DIFF. LOCK	Differential Lock
D/INJ	Direct Injection
DLC	Data Link Connector
DLI	Distributorless Ignition
DOHC	Double Overhead Camshaft
DP	Dash Pot
DS	Dead Soak
DSP	Digital Signal Processor
DTC	Diagnostic Trouble Code
DVD	Digital Versatile Disc
EBD	Electric Brake Force Distribution
ECAM	Engine Control And Measurement System
ECD	Electronic Controlled Diesel
ECDY	Eddy Current Dynamometer
ECT	Electronic Control Transmission
ECU	Electronic Control Unit
ED	Electro–DepositedCoating
EDU	Electronic Driving Unit
EDIC	Electric Diesel Injection Control
EFI	Electronic Fuel Injection
E/G	Engine
EGR	Exhaust Gas Recirculation
EGR–VM	EGR–Vacuum Modulator
ELR	Emergency Locking Retractor
EMPS	Electric Motor Power Steering
ENG	Engine
ESA	Electronic Spark Advance
ETCS–i	Electronic Throttle Control System–intelligent
EVAP	Evaporative Emission Control
EVP	Evaporator
E–VRV	Electric Vacuum Regulating Valve
EX	Exhaust
FE	Fuel Economy
FF	Front–EngineFront–Wheel–Drive
F/G	Fuel Gauge
FIPG	Formed In Place Gasket
FL	Fusible Link
F/P	Fuel Pump
FPU	Fuel Pressure Up
Fr	Front
F/W	Flywheel
FW/D	Flywheel Damper
FWD	Front–Wheel–Drive
GAS	Gasoline
GND	Ground
GPS	Global Positioning System
HAC	High Altitude Compensator
H/B	Hatchback

Abbreviations	Meaning
H–FUSE	High Current Fuse
HI	High
HID	High Intensity Discharge (Head Lamp)
HSG	Housing
HT	Hard Top
HWS	Heated Windshield System
IC	Integrated Circuit
IDI	Indirect Diesel Injection
IFS	Independent Front Suspension
IG	Ignition
IIA	Integrated Ignition Assembly
IN	Intake (Manifold, Valve)
INT	Intermittent
I/P	Instrument Panel
IRS	Independent Rear Suspension
ISC	Idle Speed Control
J/B	Junction Block
J/C	Junction Connector
KD	Kick–Down
LAN	Local Area Network
LB	Liftback
LCD	Liquid Crystal Display
LED	Light Emitting Diode
LH	Left–Hand
LHD	Left–Hand Drive
L/H/W	Length, Height, Width
LLC	Long–Life Coolant
LNG	Liquified Natural Gas
LO	Low
LPG	Liquified Petroleum Gas
LSD	Limited Slip Differential
LSP & PV	Load Sensing Proportioning And Bypass Valve
LSPV	Load Sensing Proportioning Valve
MAP	Manifold Absolute Pressure
MAX.	Maximum
MIC	Microphone
MIL	Malfunction Indicator Lamp
MIN.	Minimum
MG1	Motor Generator No.1
MG2	Motor Generator No.2
MP	Multipurpose
MPI	Multipoint Electronic Injection
MPX	Multiplex Communication System
M/T, MTM	Manual Transmission (Transaxle)
MT	Mount
MTG	Mounting
N	Neutral
NA	Natural Aspiration
No.	Number
O2S	Oxygen Sensor
O/D	Overdrive

Abbreviations	Meaning
OEM	Original Equipment Manufacturing
OHC	Overhead Camshaft
OHV	Overhead Valve
OPT	Option
ORVR	On–board Refilling Vapor Recovery
O/S	Oversize
P & BV	Proportioning And Bypass Valve
PCS	Power Control System
PCV	Positive Crankcase Ventilation
PKB	Parking Brake
PPS	Progressive Power Steering
PTC	Positive Temperature Coefficient
PS	Power Steering
PTO	Power Take–Off
P/W	Power Window
R & P	Rack And Pinion
RAM	Random Access Memory
R/B	Relay Block
RBS	Recirculating Ball Type Steering
R/F	Reinforcement
RFS	Rigid Front Suspension
RH	Right–Hand
RHD	Right–Hand Drive
RLY	Relay
ROM	Read Only Memory
Rr	Rear
RRS	Rigid Rear Suspension
RWD	Rear–Wheel Drive
SDN	Sedan
SEN	Sensor
SICS	Starting Injection Control System
SOC	State Of Charge
SOHC	Single Overhead Camshaft
SPEC	Specification
SPI	Single Point Injection
SRS	Supplemental Restraint System
SSM	Special Service Materials
SST	Special Service Tools
STD	Standard
STJ	Cold–Start Fuel Injection
SW	Switch
SYS	System
T/A	Transaxle
TACH	Tachometer
TBI	Throttle Body Electronic Fuel Injection
TC	Turbocharger
TCCS	TOYOTA Computer–Controlled System
TCV	Timing Control Valve
TDC	Top Dead Center
TEMP.	Temperature
TEMS	TOYOTA Electronic Modulated Suspension

Abbreviations	Meaning
TFT	Toyota Free–Tronic
TIS	Total Information System For Vehicle Development
T/M	Transmission
TMC	TOYOTA Motor Corporation
TMMK	TOYOTA Motor Manufacturing Kentucky, Inc.
TRC	Traction Control System
TURBO	Turbocharge
TWC	Three–Way Catalyst
U/D	Underdrive
U/S	Undersize
VCV	Vacuum Control Valve
VENT	Ventilator
VIN	Vehicle Identification Number
VPS	Variable Power Steering
VSC	Vehicle Stability Control
VSV	Vacuum Switching Valve
VTV	Vacuum Transmitting Valve
VVT–i	Variable Valve Timing–intelligent
w/	With
WGN	Wagon
W/H	Wire Harness
w/o	Without
WU–TWC	Warm Up Three–way Catalytic Converter
WU–OC	Warm Up Oxidation Catalytic Converter
1st	First
2nd	Second
2WD	Two Wheel Drive Vehicle (4 x 2)
3rd	Third
4th	Fourth
4WD	Four Wheel Drive Vehicle (4 x 4)
4WS	Four Wheel Steering System
5th	Fifth

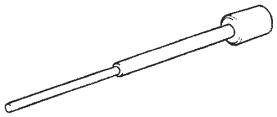
010BA–22

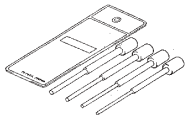
GLOSSARY OF SAE AND TOYOTA TERMS

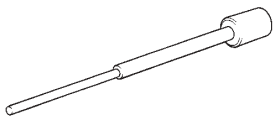
This glossary lists all SAE–J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their TOYOTA equivalents.

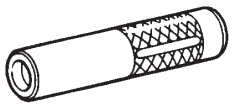
SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ( )—ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner, A/CL
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	–
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	HAC
CAC	Charge Air Cooler	Intercooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	–
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft Position	Cam Angle
CPP	Clutch Pedal Position	–
CTOX	Continuous Trap Oxidizer	–
CTP	Closed Throttle Position	LL ON, Idle ON
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI/INJ)
DI	Distributor Ignition	–
DLC1 DLC2 DLC3	Data Link Connector 1 Data Link Connector 2 Data Link Connector 3	1: Check Connector 2: Total Diagnosis Communication Link (TDCL) 3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Trouble Code
DTM	Diagnostic Test Mode	–
ECL	Engine Control Level	–
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Coolant Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	Distributorless Ignition (DLI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	–
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	–
FEPROM	Flash Erasable Programmable Read Only Memory	–
FF	Flexible Fuel	–
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)

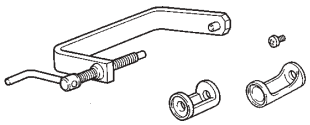
HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO_2S)
IAC	Idle Air Control	Idle Speed Control (ISC)
IAT	Intake Air Temperature	Intake or Inlet Air Temperature
ICM	Ignition Control Module	–
IFI	Indirect Fuel Injection	Indirect Injection (IDL)
IFS	Inertia Fuel–Shutoff	–
ISC	Idle Speed Control	–
KS	Knock Sensor	Knock Sensor
MAF	Mass Air Flow	Air Flow Meter
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)
MDP	Manifold Differential Pressure	–
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)
MIL	Malfunction Indicator Lamp	Check Engine Lamp
MST	Manifold Surface Temperature	–
MVZ	Manifold Vacuum Zone	–
NVRAM	Non–Volatile Random Access Memory	–
O2S	Oxygen Sensor	Oxygen Sensor, O_2 Sensor (O_2S)
OBD	On–Board Diagnostic	On–Board Diagnostic System (OBD)
OC	Oxidation Catalytic Converter	Oxidation Catalyst Convert (OC) Catalytic Converter for Oxidation (CCo)
OP	Open Loop	Open Loop
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)
PCM	Powertrain Control Module	–
PNP	Park/Neutral Position	–
PROM	Programmable Read Only Memory	–
PSP	Power Steering Pressure	–
PTOX	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)
RAM	Random Access Memory	Random Access Memory (RAM)
RM	Relay Module	–
ROM	Read Only Memory	Read Only Memory (ROM)
RPM	Engine Speed	Engine Speed
SC	Supercharger	Supercharger
SCB	Supercharger Bypass	E–ABV
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection
SPL	Smoke Puff Limiter	–
SRI	Service Reminder Indicator	–
SRT	System Readiness Test	–
ST	Scan Tool	–
TB	Throttle Body	Throttle Body
TBI	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)
TC	Turbocharger	Turbocharger
TCC	Torque Converter Clutch	Torque Converter

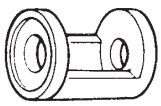


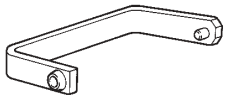


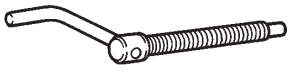


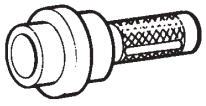












TCM	Transmission Control Module	Transmission ECU, ECT ECU
TP	Throttle Position	Throttle Position
TR	Transmission Range	–
TVV	Thermal Vacuum Valve	Bimetallic Vacuum Switching Valve (BVSV) Thermostatic Vacuum Switching Valve (TVSV)
TWC	Three–Way Catalytic Converter	Three–Way Catalytic (TWC) Manifold Converter CC_{RO}
TWC+OC	Three–Way + Oxidation Catalytic Converter	CC_R + CCo
VAF	Volume Air Flow	Air Flow Meter
VR	Voltage Regulator	Voltage Regulator
VSS	Vehicle Speed Sensor	Vehicle Speed Sensor
WOT	Wide Open Throttle	Full Throttle
WU–OC	Warm Up Oxidation Catalytic Converter	–
WU–TWC	Warm Up Three–Way Catalytic Converter	–
3GR	Third Gear	–
4GR	Fourth Gear	–

 8N			8N
 10N		 No Mark	10N (7T)
 11N			11N
 12N			12N

*: Nut with 1 or more marks on one side surface of the nut.

B06432

HINT:

Use the nut with the same number of the nut strength classification or the greater than the bolt strength classification number when tightening parts with a bolt and nut.

Example: Bolt = 4T

Nut = 4N or more

ENGINE MECHANICAL

SERVICE DATA

031H1–05

Chain sub–assy		
Length at 15 links	Maximum	115.3 mm (4.539 in.)
Camshaft timing gear or sprocket		
Diameter (w/ chain)	Minimum	96.8 mm (3.811 in.)
Crankshaft timing gear or sprocket		
Diameter (w/ chain)	Minimum	51.0 mm (2.008 in.)
Chain tensioner slipper		
Wear	Maximum	1.0 mm (0.039 in.)
Chain vibration damper No. 1		
Wear	Maximum	1.0 mm (0.039 in.)
Cylinder head set bolt		
Length	Standard	146.8 to 148.2 mm (5.780 to 5.835 in.)
	Maximum	148.5 mm (5.846 in.)
Camshaft		
Circle runout	Maximum	0.03 mm (0.0012 in.)
Lobe height	Standard	
	Intake	44.333 to 44.433 mm (1.7454 to 1.7493 in.)
	Exhaust	43.761 to 43.861 mm (1.7229 to 1.7268 in.)
	Minimum	
	Intake	44.18 mm (1.7394 in.)
	Exhaust	43.61 mm (1.7169 in.)
Journal diameter	No. 1	34.449 to 34.465 mm (1.3563 to 1.3569 in.)
	Others	22.949 to 22.965 mm (0.9035 to 0.9041 in.)
Thrust clearance	Standard	0.040 to 0.095 mm (0.0009 to 0.0023 in.)
	Maximum	0.110 mm (0.0043 in.)
Oil clearance	Standard	0.035 to 0.072 mm (0.0014 to 0.0028 in.)
	Maximum	0.10 mm (0.0039 in.)
Valve clearance (Cold)	Intake	0.15 to 0.25 mm (0.0059 to 0.0098 in.)
	Exhaust	0.25 to 0.35 mm (0.0098 to 0.0138 in.)
Cylinder head sub–assy		
Warpage	Maximum	
	Cylinder block side	0.05 mm (0.0020 in.)
	Intake manifold side	0.10 mm (0.0039 in.)
	Exhaust manifold side	0.10 mm (0.0039 in.)
Valve guide bushing		
Inside diameter		5.510 to 5.530 mm (0.2169 to 0.2177 in.)
Oil clearance	Standard	
	Intake	0.025 to 0.060 mm (0.0010 to 0.0024 in.)
	Exhaust	0.030 to 0.065 mm (0.0012 to 0.0026 in.)
	Maximum	
	Intake	0.08 mm (0.0031 in.)
	Exhaust	0.10 mm (0.0039 in.)
Bore diameter		10.285 to 10.306 mm (0.4049 to 0.4058 in.)
Protrusion height		8.7 to 9.1 mm (0.342 to 0.358 in.)
Valve stem		
Diameter	Intake	5.470 to 5.485 mm (0.2154 to 0.2159 in.)
	Exhaust	5.465 to 5.480 mm (0.2152 to 0.2158 in.)
Inner compression spring		
Free length		43.40 mm (1.7087 in.)
Deviation	Maximum	1.6 mm (0.063 in.)
Angle (reference)	Maximum	2°

Valve		
Overall length	Standard	
	Intake	88.65 mm (3.4902 in.)
	Exhaust	88.69 mm (3.4917 in.)
	Minimum	
	Intake	88.35 mm (3.4784 in.)
	Exhaust	88.39 mm (3.4799 in.)
Head margin thickness	Standard	1.0 mm (0.039 in.)
	Minimum	0.7 mm (0.028 in.)
Valve lifter		
Diameter		30.966 to 30.976 mm (1.2191 to 1.2195 in.)
Bore diameter		31.000 to 31.025 mm (1.2205 to 1.2215 in.)
Oil clearance	Standard	0.024 to 0.059 mm (0.0009 to 0.0023 in.)
	Maximum	0.079 mm (0.0031 in.)
Straight pin		
Protrusion height		5 mm (0.20 in.)
Union protrusion		
Protrusion height	Standard	
	A	14 mm (0.551 in.)
	B	23.2 mm (0.913 in.)
	C	9 mm (0.354 in.)
Connecting rod sub–assy		
Thrust clearance	Standard	0.160 to 0.342 mm (0.063 to 0.0135 in.)
	Maximum	0.342 mm (0.0135 in.)
Oil clearance	Standard	0.028 to 0.060 mm (0.0011 to 0.0024 in.)
	Maximum	0.080 mm (0.0031 in.)
Out–of alignment	Maximum per/100 mm (3.94 in.)	0.05 mm (0.0020 in.)
Twist	Maximum per/100 mm (3.94 in.)	0.05 mm (0.0020 in.)
Connecting rod bearing		
Center wall thickness	Reference Mark 1	1.486 to 1.490 mm (0.0585 to 0.0587 in.)
	Mark 2	1.491 to 1.494 mm (0.0587 to 0.0588 in.)
	Mark 3	1.495 to 1.498 mm (0.0589 to 0.0590 in.)
Crankshaft		
Thrust clearance	Standard	0.04 to 0.24 mm (0.0016 to 0.0094 in.)
	Maximum	0.30 mm (0.0118 in.)
Circle runout	Maximum	0.03 mm (0.0012 in.)
Main journal diameter		47.988 to 48.000 mm (1.8893 to 1.8898 in.)
	Maximum taper and out–of–round	0.02 mm (0.0008 in.)
Oil clearance	Standard	0.015 to 0.032 mm (0.0006 – 0.0012 in.)
	Maximum	0.05 mm (0.0020 in.)
Cylinder block sub–assy		
Warpage	Maximum	0.05 mm (0.0020 in.)
Bore diameter	Standard	79.000 to 79.013 mm (3.1073 to 3.1107 in.)
	Maximum	79.133 mm (3.1155 in.)
Piston		
Diameter (at 29.8 mm (1.173 in.) from the piston head)	1ZZ–FE	78.955 to 78.965 mm (3.1085 to 3.1089 in.)
	3ZZ–FE	78.960 to 78.975 mm (3.1087 to 3.1091 in.)
Oil clearance	Standard	0.073 to 0.096 mm (0.0029 to 0.0038 in.)
	Maximum	0.10 mm (0.0039 in.)
Piston ring		
Groove clearance	No. 1	0.020 to 0.070 mm (0.0008 to 0.0028 in.)
	No. 2	0.030 to 0.070 mm (0.0012 to 0.0028 in.)
	Oil	0.03 to 0.011 mm (0.0012 to 0.0043 in.)
End gap	Standard	
	No. 1	0.25 to 0.35 mm (0.0098 to 0.0138 in.)
	No. 2	0.35 to 0.50 mm (0.0138 to 0.0197 in.)
	Oil	0.15 to 0.40 mm (0.0059 to 0.0157 in.)
	Maximum	
	No. 1	0.74 mm (0.029 in.)
	No. 2	0.89 mm (0.035 in.)
Piston pin		
Diameter		20.006 to 20.015 mm (0.7876 to 0.7880 in.)

Connecting rod bolt		
Diameter	Standard	6.6 to 6.7 mm (0.260 to 0.264 in.)
	Maximum	6.4 mm (0.252 in.)
Crank pin		
Diameter		43.992 to 44.000 mm (1.7320 to 1.7323 in.)
	Maximum taper and out–of–round	0.02 mm (0.0008 in.)
Crankshaft bearing cap set bolt		
Diameter	Standard	7.3 to 7.5 mm (0.287 to 0.295 in.)
	Maximum	7.3 mm (0.287 in.)
Connecting rod small end bush		
Oil clearance	Standard	0.005 to 0.011 mm (0.0002 to 0.0004 in.)
	Maximum	0.011 mm (0.0004 in.)

STARTING & CHARGING

031E6–07

SERVICE DATA

STARTER:

Magnetic switch resistance	Terminal 50 – C	Below 1 Ω
	Terminal 50 – Switch body	Below 1.5 Ω
Starter armature resistance	Segments	Below 1 Ω
	Commutator – Armature coil	10 kΩ or higher
Starter armature assy		
Circle runout	Standard	0.02 mm (0.0008 in.)
	Maximum	0.05 mm (0.0020 in.)
Commutatordiameter	Standard	29 mm (1.142 in.)
	Minimum	28 mm (1.102 in.)
Starter brush holder assy		
Brush length	Standard	15.5 mm (0.610 in.)
	Minimum	9.0 mm (0.354 in.)
Resistance (See page 19–2)	Standard	
	A – B	10 kΩ or higher
	A – C	10 kΩ or higher
	A – D	Below 1 Ω
	B – C	Below 1 Ω
	B – D	10 kΩ or higher
	C – D	10 kΩ or higher

GENERATOR (DENSO MADE):

Generator regulator assy		
Resistance	B and F	When the positive and negative poles of terminals F and B are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction
	E and F	When the positive and negative poles of terminals F and E are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction
Generator holder w/ rectifier		
Resistance	Positive (+) and each rectifier terminal	When the positive and negative poles of the positive (+) terminal and each rectifier terminal are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction
	Negative (–) and each rectifier terminal	When the positive and negative poles of the negative (–) terminal and each rectifier terminal are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction
Generator rotor assy		
Resistance	Slip rings	2.55 to 2.95 Ω at 20°C (68°F)
	Slip ring and rotor	10 kΩ or higher
Slip ring diameter	Standard	14.2 to 14.4 mm (0.559 to 0.567 in.)
	Minimum	14 mm (0.551 in.)
Generator drive end frame		
Resistance	Coil wires	Below 1 Ω
	Coil wire and body	10 kΩ or higher

GENERATOR (BOSCH MADE):

Generator rotor assy		
Rotor coil resistance	at 20°C (68°F)	2.27 to 2.53 Ω
Slip ring diameter	Standard	15.3 to 15.5 mm (0.602 to 0.610 in.)
	Minimum	14.3 mm (0.561 in.)
Stator sub–assy generator with rectifier		
Positive rectifier	Positive (+) tester probe – Positive (+) terminal Negative (–) tester probe – Rectifier terminal	Below 1 Ω
	Negative (–) tester probe – Positive (+) terminal Positive (+) tester probe – Rectifier terminal	10 kΩ or higher
Negative rectifier	Positive (+) tester probe – Negative (–) terminal Negative (–) tester probe – Rectifier terminal	10 kΩ or higher
	Negative (–) tester probe – Negative (–) terminal Positive (+) tester probe – Rectifier terminal	Below 1 Ω
Stator for open circuit	Between rectifier terminals	Below 1 Ω
Generator brush holder assy		
Brush exposed length	Standard	11.0 to 13.6 mm (0.433 to 0.535 in.)
	Minimum	6.0 mm (0.236 in.)

031E7–08

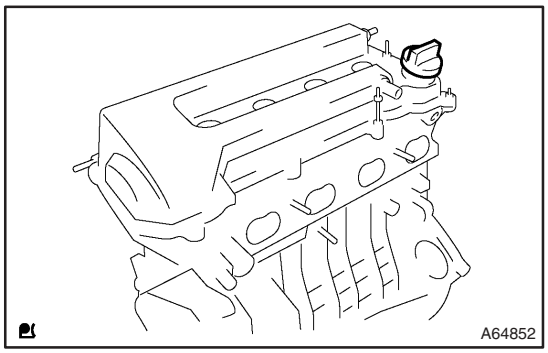
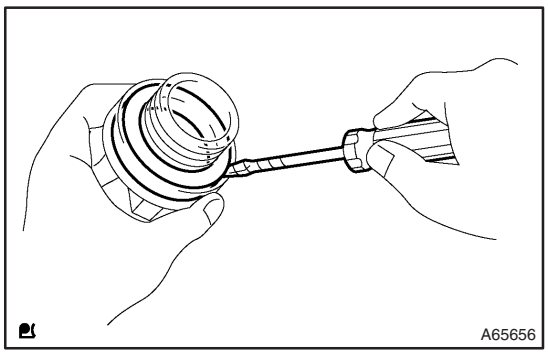
141TM–01

OVERHAUL



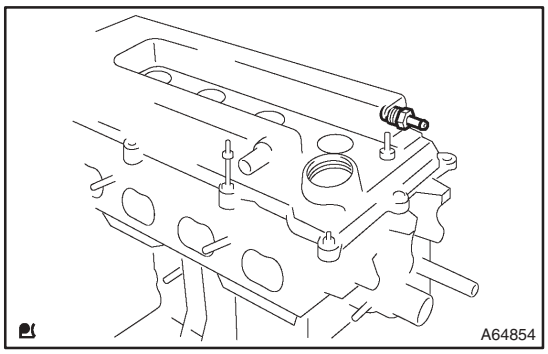
1. REMOVE ENGINE HANGER NO.1

(a) Remove the bolt, then remove engine hanger No. 1.



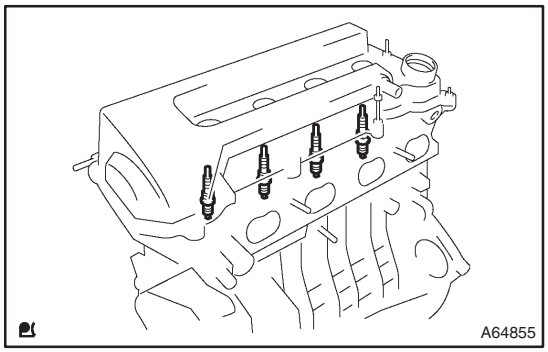
2. REMOVE ENGINE HANGER NO.2

(a) Remove the bolt, then remove engine hanger No. 2.



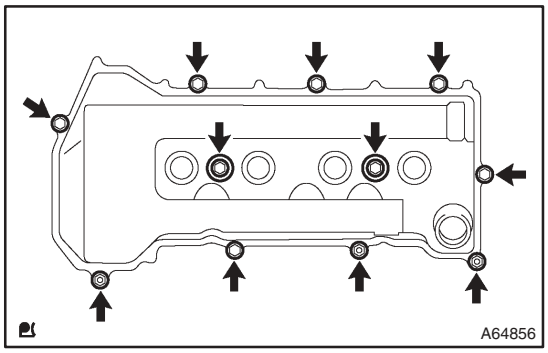
3. REMOVE OIL FILLER CAP SUB–ASSY

(a) Remove the oil filler cap from the cylinder head cover.



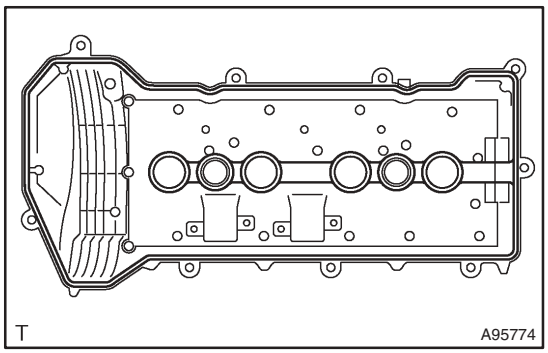
4. REMOVE OIL FILLER CAP GASKET

(a) Using a screwdriver, remove the oil filler cap gasket from the oil filler cap.



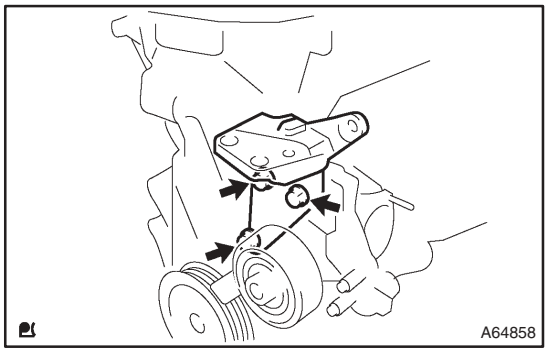
5. REMOVE VENTILATION VALVE SUB–ASSY

(a) Remove the ventilation valve from the cylinder head cover.



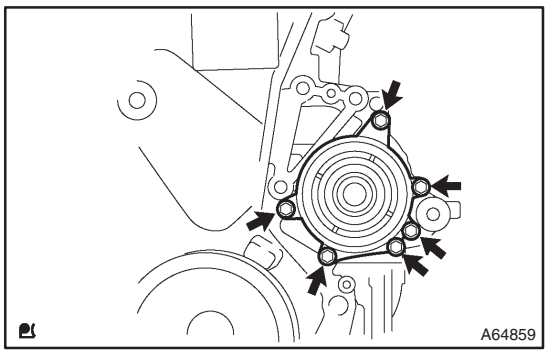
6. REMOVE SPARK PLUG

(a) Using a spark plug wrench, remove the 4 spark plugs.



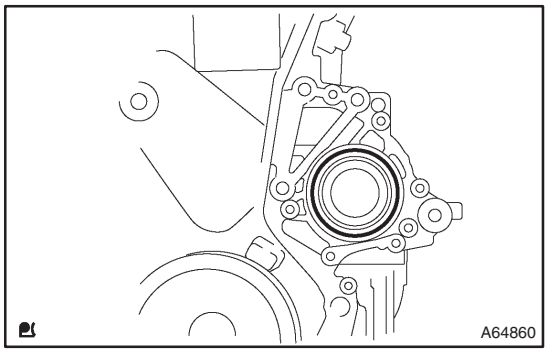
7. REMOVE CYLINDER HEAD COVER SUB–ASSY

(a) Remove the 9 bolts, 2 seal washers, and 2 nuts, then remove the cylinder head cover.



8. REMOVE CYLINDER HEAD COVER GASKET

(a) Remove the cylinder head cover gasket from the cylinder head cover.



9. REMOVE TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

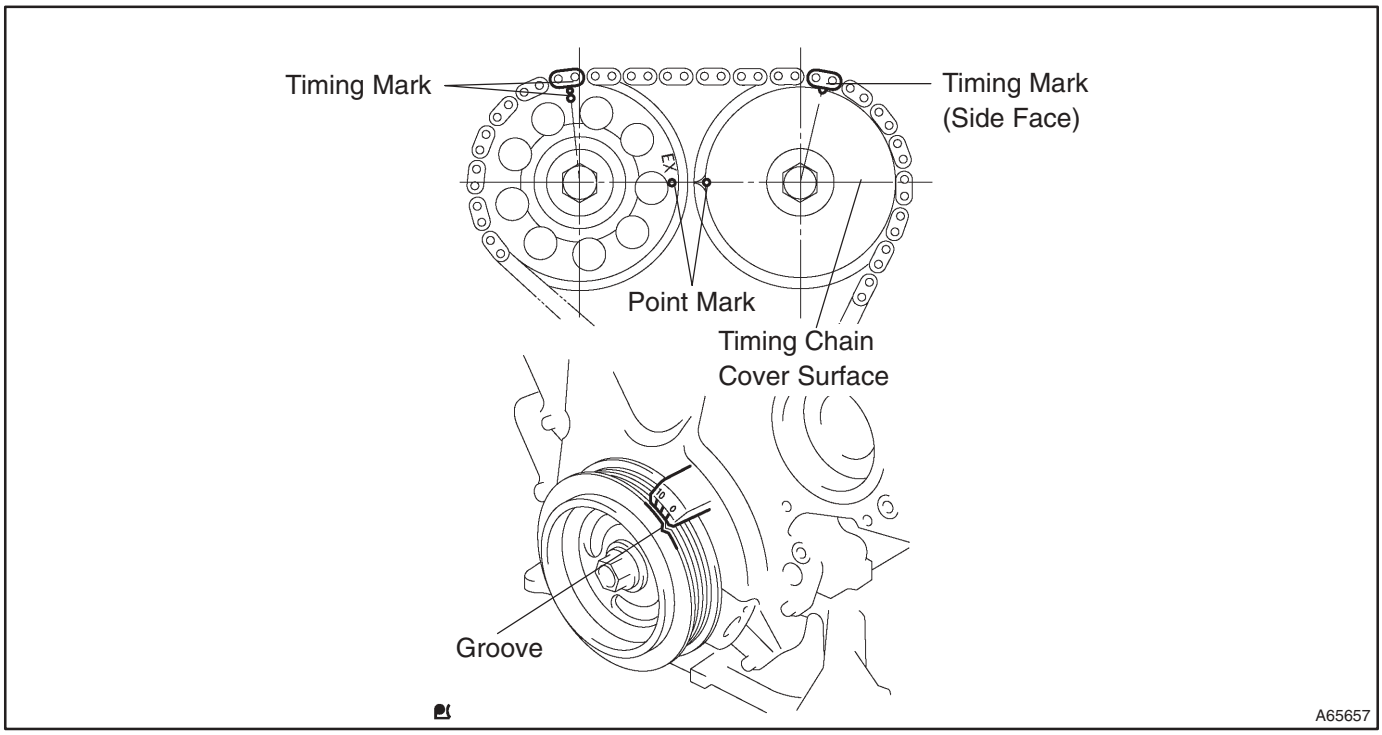
(a) Remove the 3 bolts, then remove the transverse engine engine mounting bracket.

10. REMOVE WATER PUMP ASSY

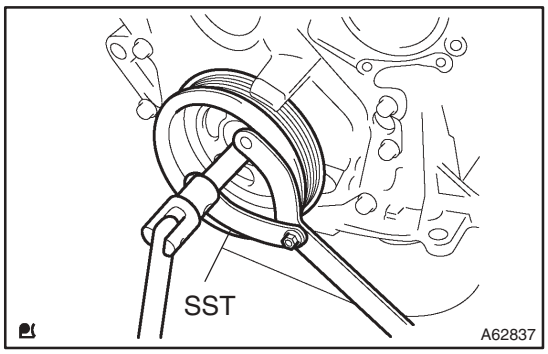
(a) Remove the 6 bolts, then remove the water pump.

11. REMOVE WATER PUMP O–RING

(a) Remove the water pump O–ring from the timing chain cover.

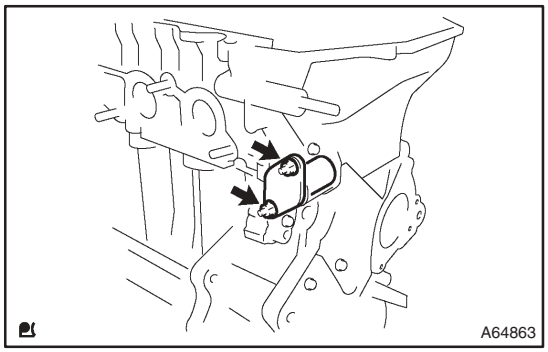


12. REMOVE CRANKSHAFT PULLEY



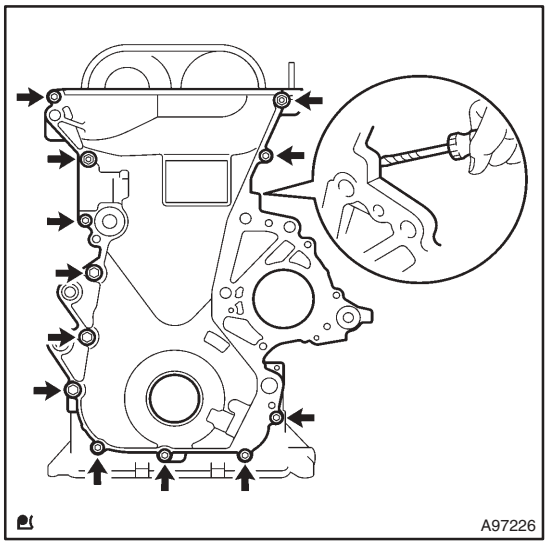
(a) Set the No. 1 cylinder to the TDC/compression.

(1) Turn the crankshaft pulley, then adjust the crankshaft so that the groove and the timing mark ”0” of the timing chain are aligned.



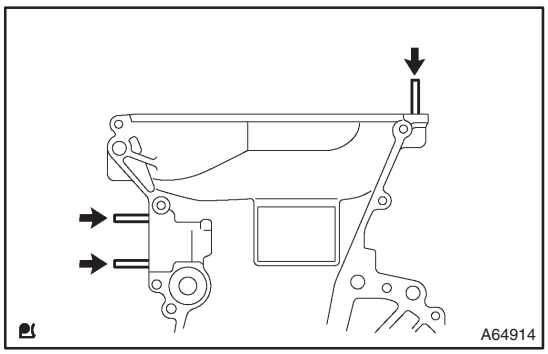
(2) Check that the point marks of the camshaft timing gears are in a straight line on the timing chain cover surface as shown in the illustration.

If not, turn the crankshaft 1 revolution (360°), then adjust the crankshaft so that the marks are aligned as above.

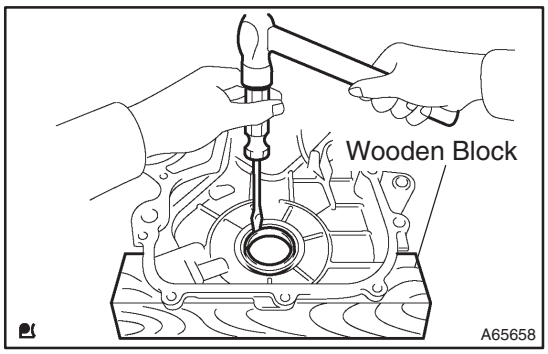


(b) Using SST, remove the crankshaft pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
(c) Remove the crankshaft pulley from the crankshaft.

13. REMOVE CHAIN TENSIONER ASSY NO.1



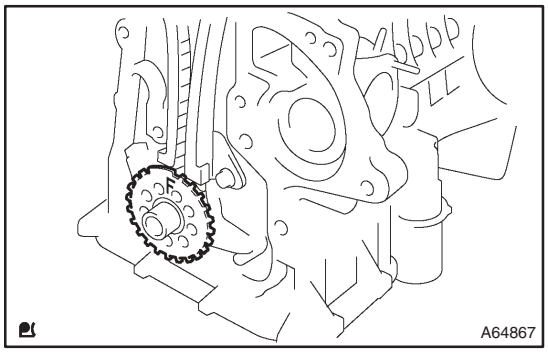
(a) Remove the 2 nuts, then remove chain tensioner No. 1.



14. REMOVE TIMING CHAIN OR BELT COVER SUB–ASSY

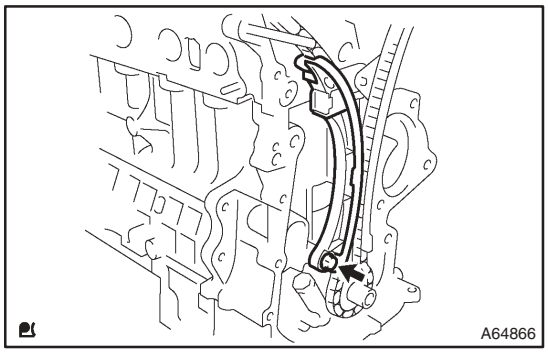
(a) Remove the 10 bolts and 2 nuts.
(b) Remove the timing chain cover by prying the portions between the timing chain cover, cylinder head and cylinder block with a screwdriver.

NOTICE:
Be careful not to damage the contact surfaces of the timing chain cover, cylinder head and cylinder block.



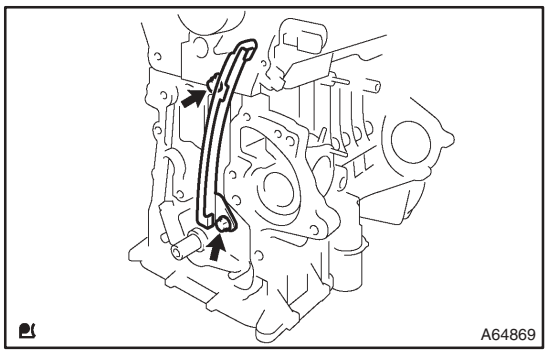
(c) Using a Torx socket wrench E5, remove the 3 stud bolts.

15. REMOVE TIMING CHAIN OR BELT COVER OIL SEAL



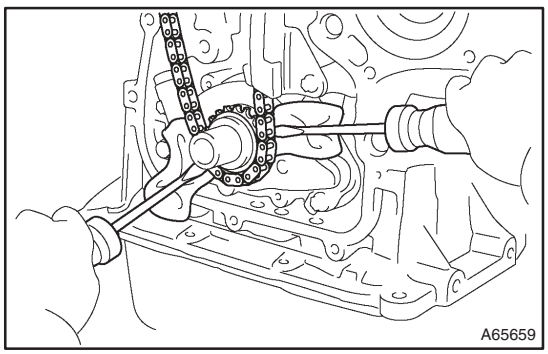
(a) Place the timing chain cover on wooden blocks.

(b) Using a screwdriver, remove the timing chain or belt cover oil seal.



16. REMOVE CRANKSHAFT POSITION SENSOR PLATE NO.1

(a) Remove crankshaft position sensor plate No. 1 from the crankshaft.

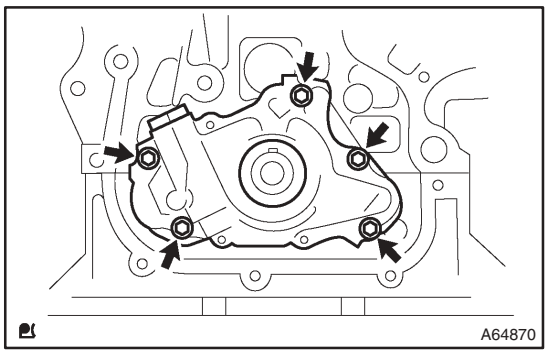


17. REMOVE CHAIN TENSIONER SLIPPER

(a) Remove the bolt, then remove the chain tensioner slipper.

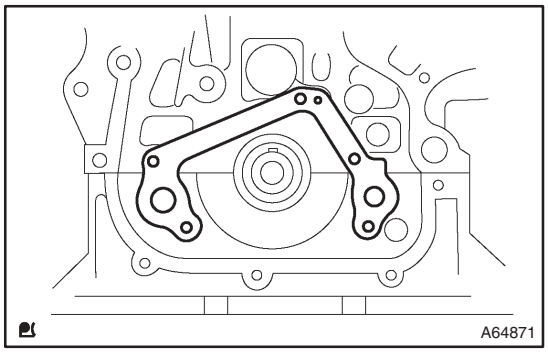
18. REMOVE CHAIN VIBRATION DAMPER NO.1

(a) Remove the 2 bolts, then remove chain vibration damper No. 1.



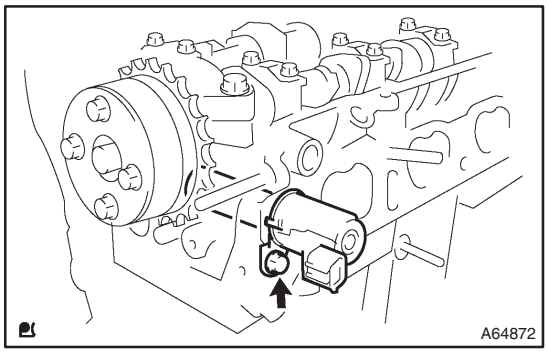
19. REMOVE CHAIN SUB–ASSY

(a) Using 2 screwdrivers, pry out the chain together with the crankshaft timing gear as shown in the illustration.



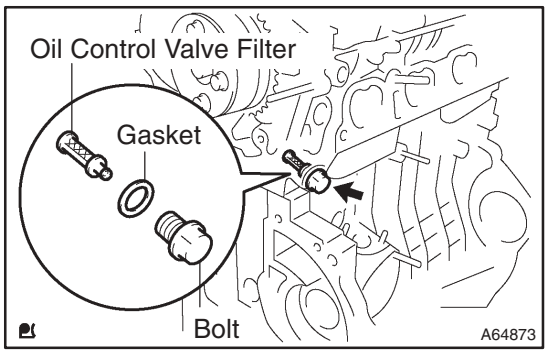
NOTICE:

- **Put a shop rag to protect the engine.**
- **In case of revolving the camshafts with the chain off the gears, turn the crankshaft 1/4 revolution to prevent contact of the valves with the pistons.**



20. REMOVE OIL PUMP ASSY

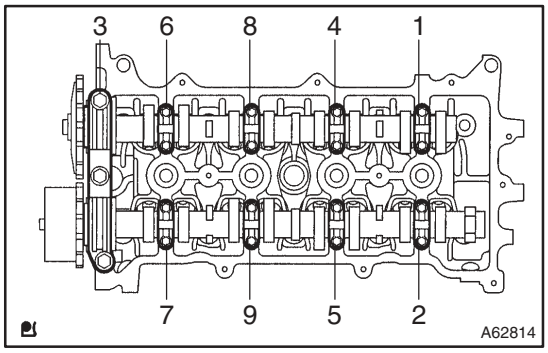
(a) Remove the 5 bolts, then remove the oil pump.



21. REMOVE OIL PUMP GASKET

(a) Remove the oil pump gasket from the cylinder block.

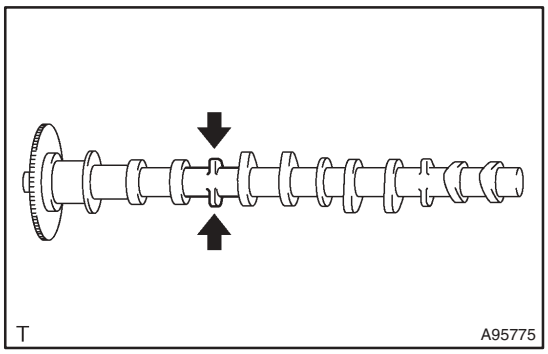
22. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSY



(a) Remove the bolt, then remove the camshaft timing oil control valve.

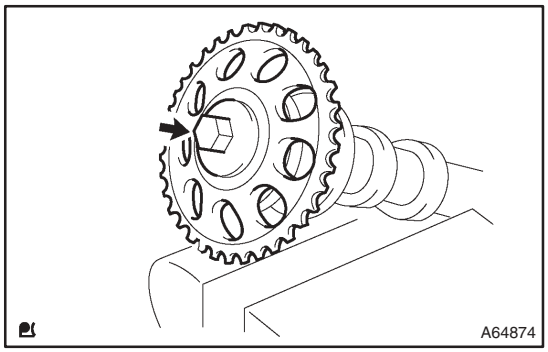
23. REMOVE OIL CONTROL VALVE FILTER

(a) Remove the bolt with the gasket and oil control valve filter.



(b) Remove the gasket and oil control valve filter from the bolt.

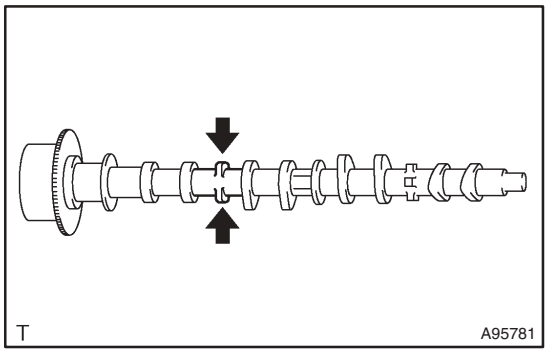
24. REMOVE CAMSHAFT



(a) Using several steps, loosen and remove the 19 bolts uniformly in the sequence shown in the illustration.

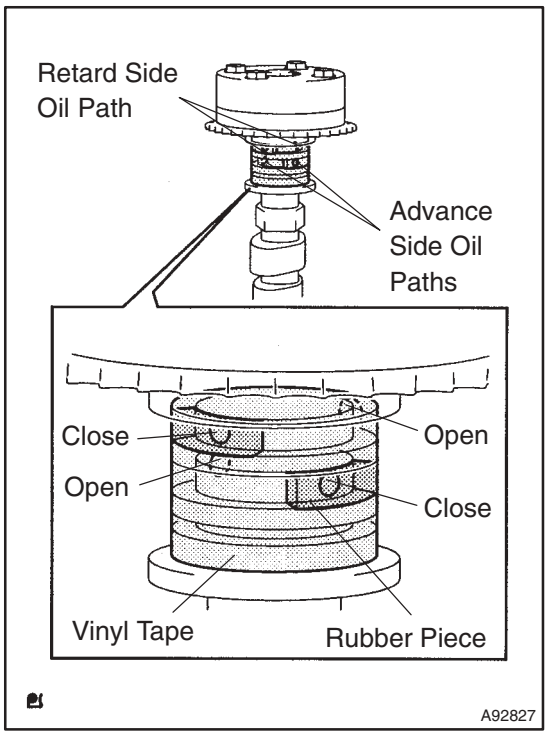
(b) Remove the 2 camshafts from the cylinder head.

25. REMOVE CAMSHAFT TIMING GEAR OR SPROCKET



(a) Clamp the portion of the No. 2 camshaft indicated with arrow in a vise.

(b) Remove the bolt, then remove the camshaft timing gear or sprocket.



NOTICE:

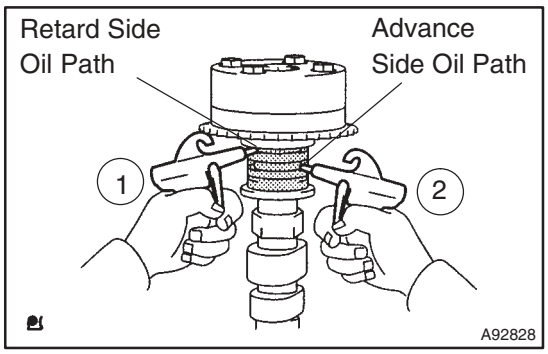
Be careful not to damage the camshaft.

26. REMOVE CAMSHAFT TIMING GEAR ASSY

(a) Clamp the portion of the camshaft indicated with arrow in a vise.

(b) Check that the camshaft timing gear assembly does not rotate.

NOTICE:



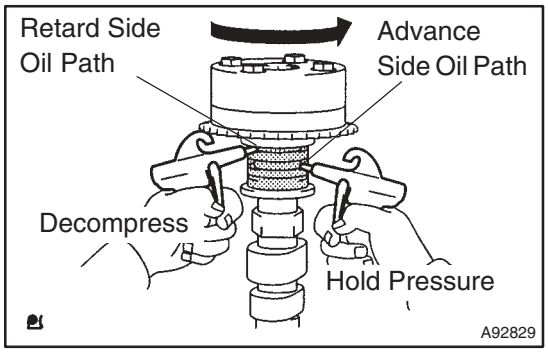
Do not damage the camshaft by clamping it in a vise too tightly.

(c) Cover the 4 oil paths of the cam journal with vinyl tape as shown in the illustration.

HINT:

One of the 2 grooves located on the cam journal is for retarding cam timing (upper) and the other is for advancing cam timing (lower). Each groove has 2 oil paths. Plug one of the 2 oil paths for each groove with rubber pieces before wrapping the cam journal with the tape.

(d) Punctuate the tape which covers the advance side path and retard side path on the opposite side.



(e) Apply approximately 150 kPa (1.5 kgf/cm^2) of air pressure into the retard side oil path.

NOTICE:

When applying air pressure, cover the paths with a shop rag to prevent oil splashes.

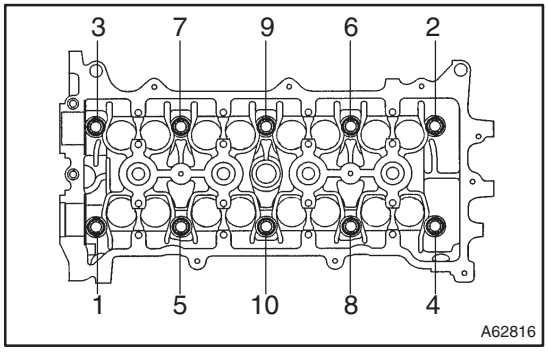
(f) Apply approximately 150 kPa (1.5 kgf/cm^2) of air pressure into the advance side oil path.

(g) Confirm that the camshaft timing gear assembly revolves in the advance direction when reducing the air pressure of the retard side path.

HINT:

- If the timing gear assembly does not revolve in the advance direction by air pressure, turn it forcibly by hand after air pressure is applied to both oil pathes. When revolving, first turn it in the retard direction, then in the advance direction.
- The lock pin is released, and the camshaft timing gear revolves in the advance direction.

(h) When the camshaft timing gear assembly reaches the most advanced position, release the air pressure of the retard side path, then release the air pressure of the advance side path.



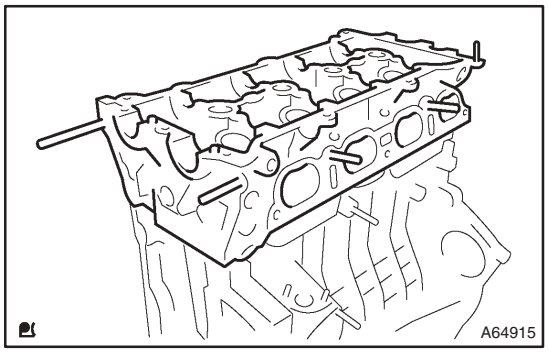
NOTICE:

If the air pressure of the advance side path is released first, the camshaft timing gear assembly occasionally shifts in the retard direction abruptly, which may damage the lock pin. Be sure to release the air pressure of the retard side path first.

(i) Remove the bolt and camshaft timing gear assembly.

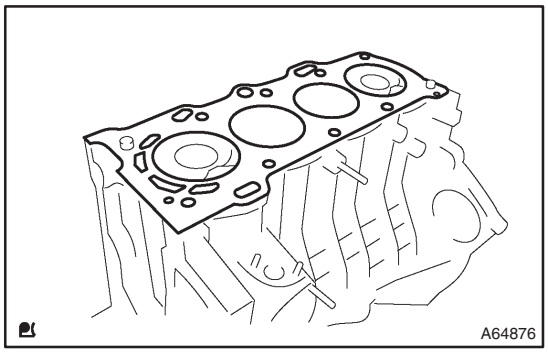
NOTICE:

- **Do not remove the other 4 bolts.**
- **If reusing the camshaft timing gear assembly, unlock the lock pin inside the camshaft timing gear first.**



27. REMOVE CYLINDER HEAD SUB–ASSY

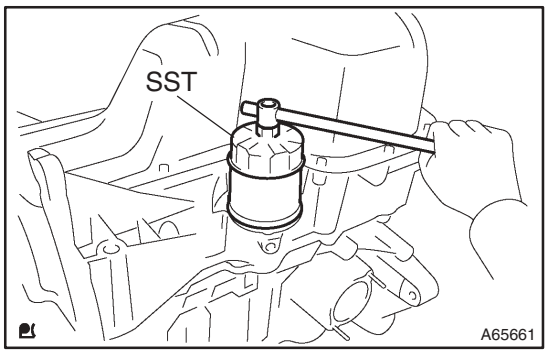
(a) Using a bi–hexagon wrench 10, uniformly loosen the 10 cylinder head bolts, in several passes, in the sequence shown.



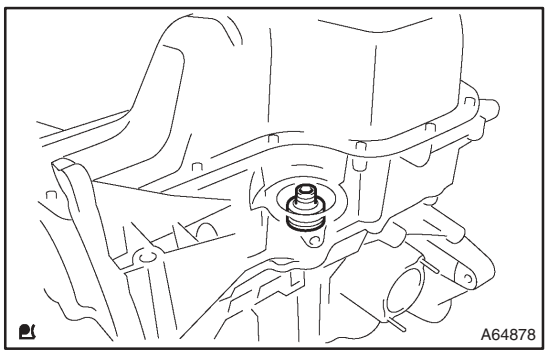
(b) Remove the 10 cylinder head bolts and 10 plate washers.

NOTICE:

- **Be careful not to drop the plate washers into the cylinder head.**
- **Head warpage or cracking could result from removing bolts in the wrong order.**

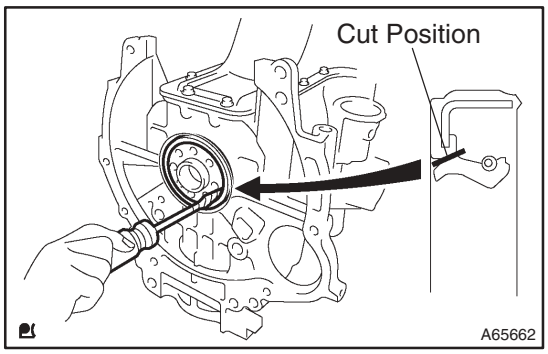


(c) Remove the cylinder head from the cylinder block.



28. REMOVE CYLINDER HEAD GASKET

(a) Remove the cylinder head gasket from the cylinder block.

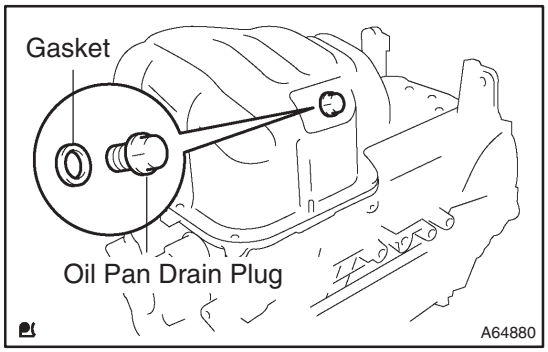


29. REMOVE OIL FILTER SUB–ASSY

(a) Using SST, remove the oil filter.
SST 09228–06501

30. REMOVE OIL FILTER UNION

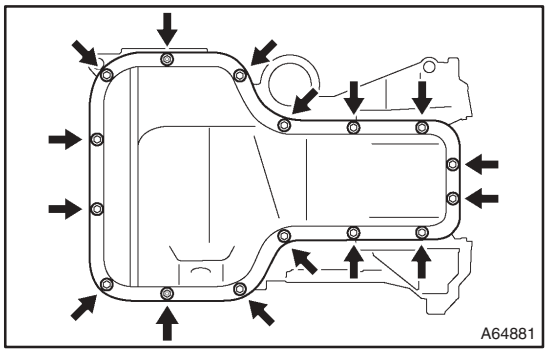
(a) Using a socket hexagon wrench 12, remove the oil filter union.



31. REMOVE ENGINE REAR OIL SEAL

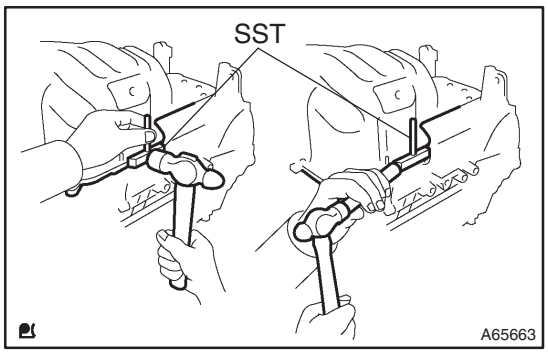
(a) Using a knife, cut off the oil seal lip.

(b) Using a screwdriver with its tip taped, pry out the oil seal.



NOTICE:

After the removal, check if the crankshaft is not damaged. If damaged, smooth the surface with a 400–grit sandpaper.

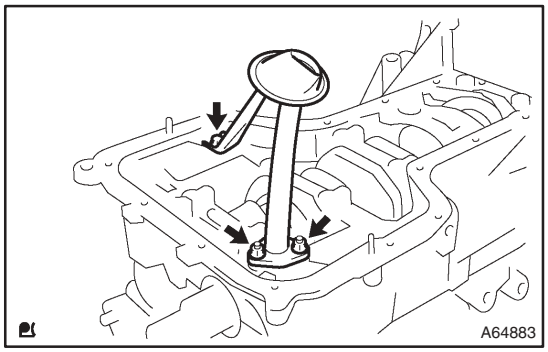


32. REMOVE OIL PAN DRAIN PLUG

(a) Remove the oil pan drain plug and gasket from the oil pan.

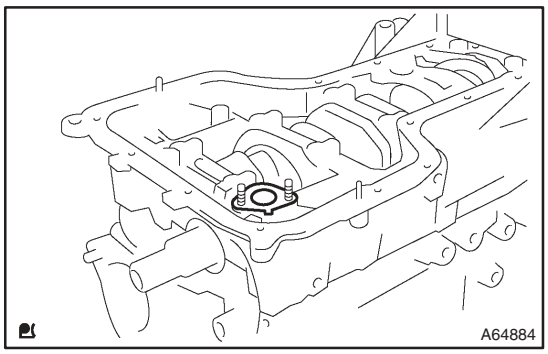
33. REMOVE OIL PAN SUB–ASSY

(a) Remove the 14 bolts and 2 nuts.



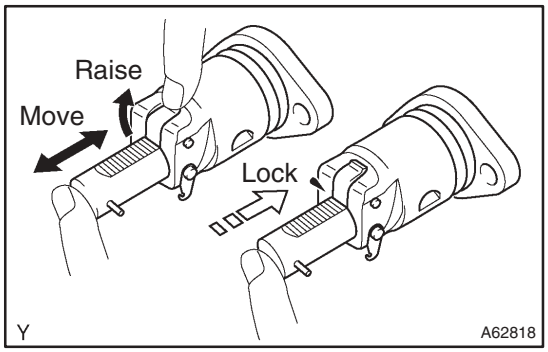
(b) Insert the blade of SST between the bearing cap and oil pan, then cut off the applied sealer and remove the oil pan.

SST 09032–00100



NOTICE:

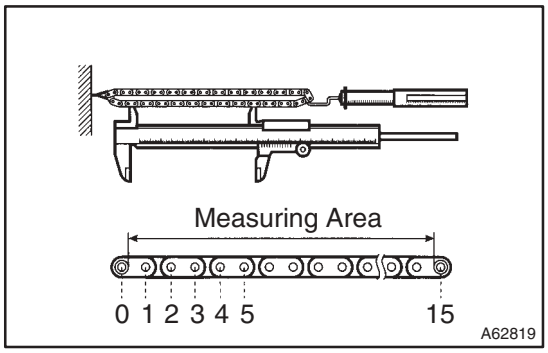
Be careful not to damage the oil pan contact surface of the bearing cap and oil pan.



34. REMOVE OIL STRAINER SUB–ASSY

(a) Remove the bolt and 2 nuts, then remove the oil strainer.

35. REMOVE OIL STRAINER FLANGE GASKET



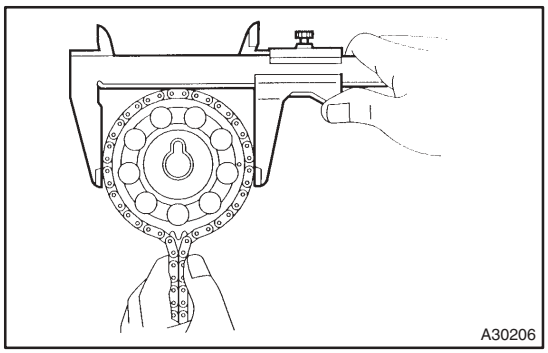
(a) Remove the oil strainer flange gasket from the cylinder block.

36. INSPECT CHAIN TENSIONER ASSY NO.1

(a) Check that the plunger moves smoothly when the ratchet pawl is raised with your finger.

(b) Release the ratchet pawl, then check that the plunger is locked in place by the ratchet pawl and does not move when pushed with your finger.

37. INSPECT CHAIN SUB–ASSY



(a) Using a spring tension gauge and vernier calipers, pull the timing chain with 140 N (14.3 kgf, 31.5 lb), then measure its length.

Maximum chain elongation: 115.3 mm (4.539 in.)

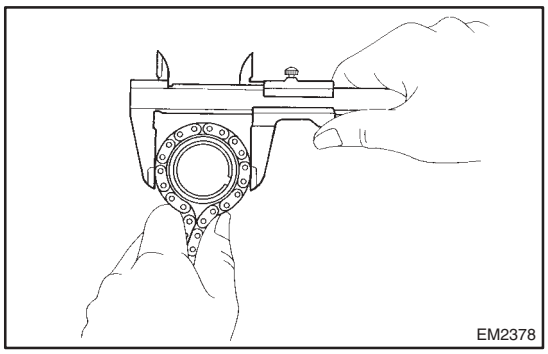
If the chain elongation is greater than maximum, replace the chain.

HINT:

Take the same measurements by pulling at 3 or more places selected at random.

38. INSPECT CAMSHAFT TIMING GEAR OR SPROCKET

(a) Wrap the chain around the camshaft timing gear.



(b) Using vernier calipers, measure the camshaft timing gear diameter with the chain.

Minimum gear diameter (w/ chain): 96.8 mm (3.811 in.)

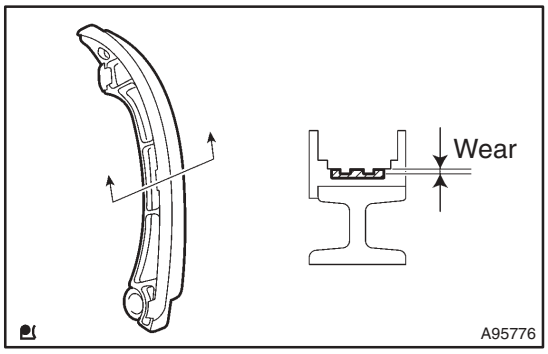
NOTICE:

Vernier calipers must be in contact with the chain rollers when measuring.

If the gear diameter is less than minimum, replace the chain and camshaft timing gear.

39. INSPECT CRANKSHAFT TIMING GEAR OR SPROCKET

(a) Wrap the chain around the crankshaft timing gear.



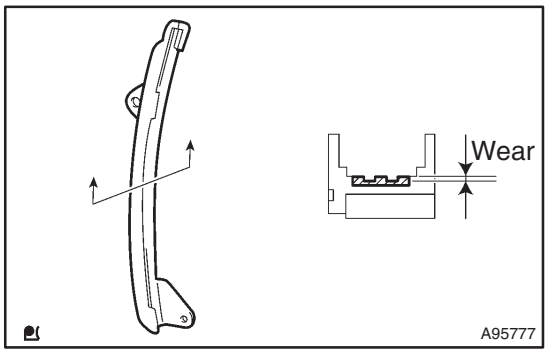
(b) Using vernier calipers, measure the crankshaft timing gear diameter with the chain.

Minimum gear diameter (w/ chain): 51.0 mm (2.008 in.)

NOTICE:

Vernier calipers must be in contact with the chain rollers when measuring

If the gear diameter is less than minimum, replace the chain and crankshaft timing gear.

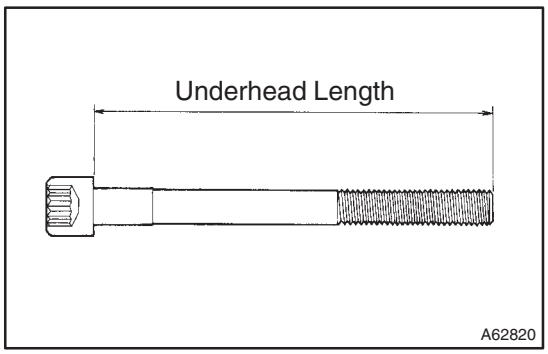


40. INSPECT CHAIN TENSIONER SLIPPER

(a) Using vernier calipers, measure the chain tensioner slipper wear.

Maximum wear: 1.0 mm (0.039 in.)

If the wear is greater than maximum, replace the chain tensioner slipper.



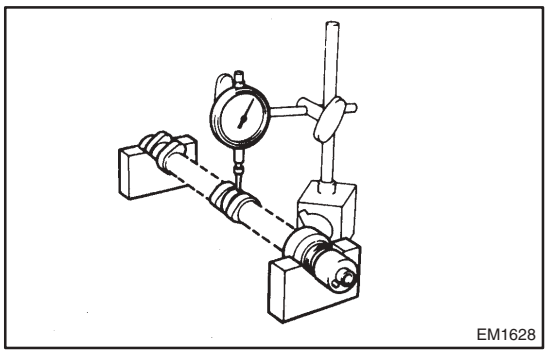
41. INSPECT CHAIN VIBRATION DAMPER NO.1

(a) Using vernier calipers, measure the vibration damper wear.

Maximum wear: 1.0 mm (0.039 in.)

If the wear is greater than maximum, replace the chain vibration damper.

42. INSPECT CYLINDER HEAD SET BOLT



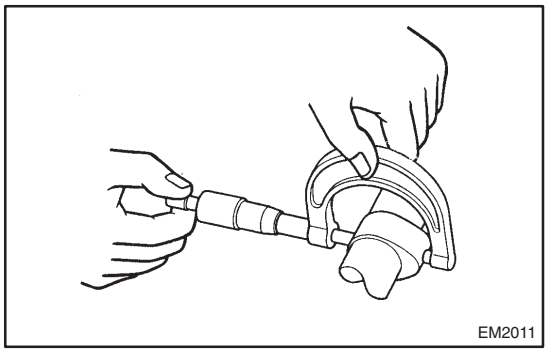
(a) Using vernier calipers, measure the length of the cylinder head bolts from the seat to end.

Standard bolt length:

146.8 to 148.2 mm (5.780 to 5.835 in.)

Maximum bolt length: 148.5 mm (5.846 in.)

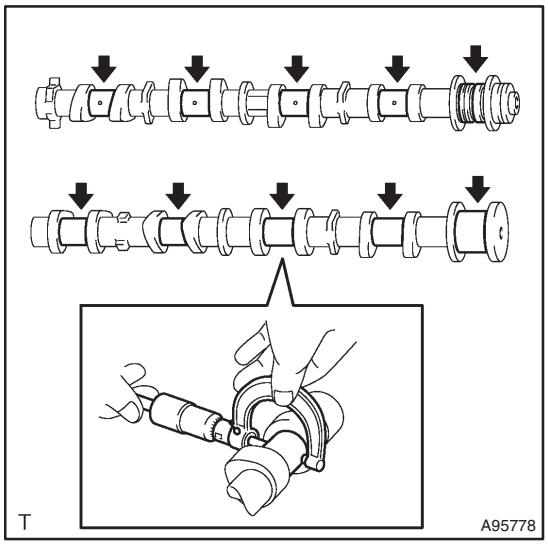
If the bolt length is greater than maximum, replace the cylinder head set bolt.



43. INSPECT CAMSHAFT

(a) Inspect the camshaft for runout.
  (1) Place the camshaft on V–blocks.
  (2) Using a dial indicator, measure the circle runout at the center journal.

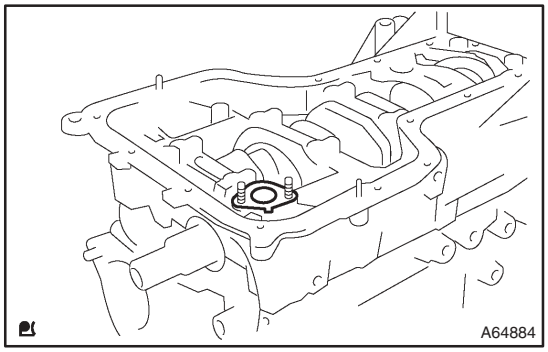
Maximum circle runout: 0.03 mm (0.0012 in.)



If the circle runout is greater than maximum, replace the camshaft.

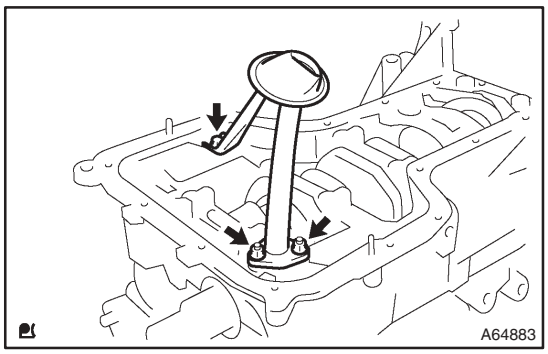
(b) Inspect the cam lobes.
  (1) Using a micrometer, measure the cam lobe height.

Standard cam lobe height:
44.333 to 44.433 mm (1.7454 to 1.7493 in.) for intake
43.761 to 43.861 mm (1.7229 to 1.7268 in.) for exhaust
Minimum cam lobe height:
44.18 mm (1.7394 in.) for intake
43.61 mm (1.7169 in.) for exhaust



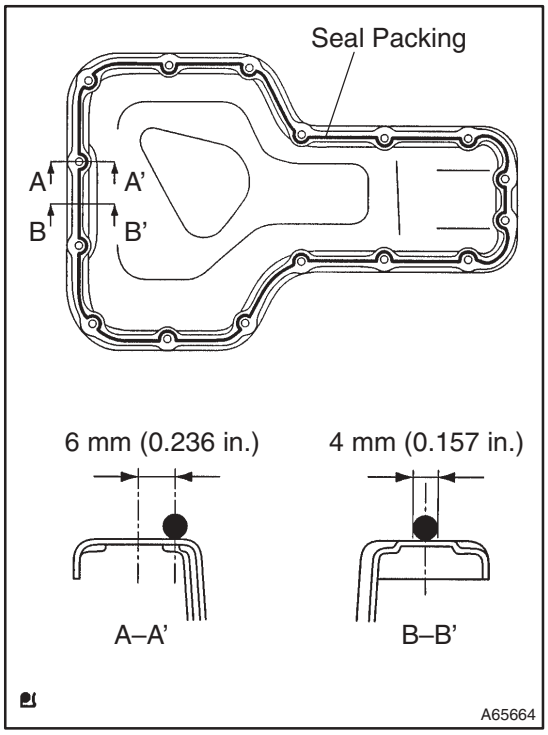
If the cam lobe height is less than minimum, replace the camshaft.

(c) Inspect the camshaft journals.
  (1) Using a micrometer, measure the journal diameter.



No. 1 journal diameter:
34.449 to 34.465 mm (1.3563 to 1.3569 in.)
Other journal diameter:
22.949 to 22.965 mm (0.9035 to 0.9041 in.)

If the journal diameter is not as specified, check the oil clearance.

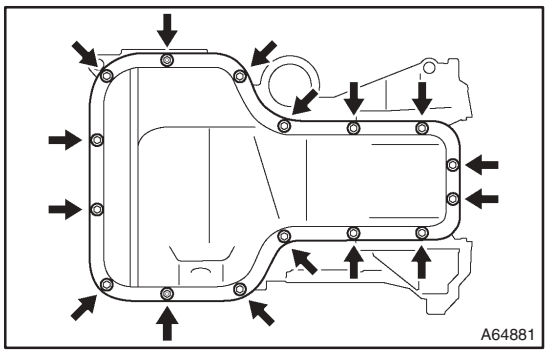


44. INSTALL OIL STRAINER FLANGE GASKET

(a) Install a new oil strainer flange gasket onto the cylinder block.

45. INSTALL OIL STRAINER SUB–ASSY

(a) Install the oil strainer with the 2 nuts and bolt.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

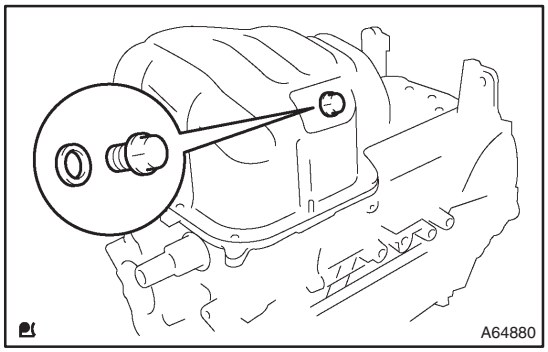


46. INSTALL OIL PAN SUB–ASSY

(a) Remove any old packing material from the contact surface and thread holes.

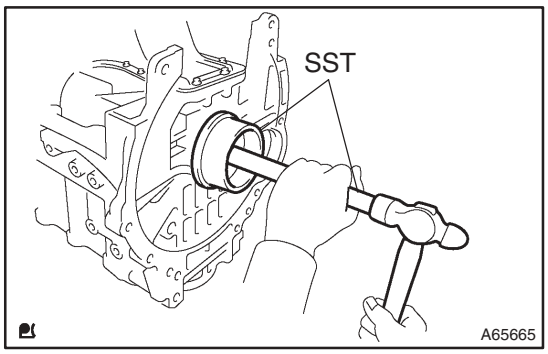
(b) Apply a continuous bead of seal packing (Diameter 3.5 to 4.5 mm (0.138 to 0.177 in.)) as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:



- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes after applying seal packing.**
- **Do not put into engine oil for at least 2 hours after installation.**

(c) Install the oil pan with the 14 bolts and 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



NOTICE:

- **Tighten the bolts and nuts in twice to the specified torque.**
- **Tighten bolts and nuts within 15 minutes after applying sealant (if possible within 3 minutes).**

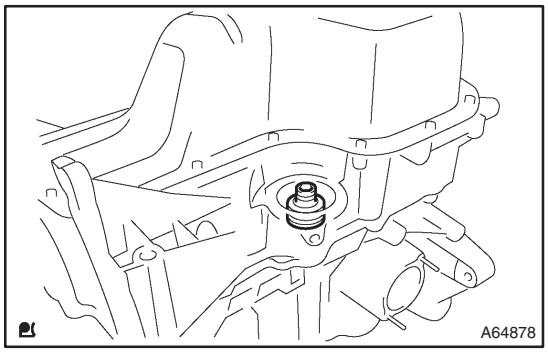
47. INSTALL OIL PAN DRAIN PLUG

(a) Place a new gasket on the oil pan drain plug, then install it onto the oil pan.
Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

48. INSTALL ENGINE REAR OIL SEAL

(a) Apply a light coat of multi–purpose grease to a new oil seal lip.

NOTICE:

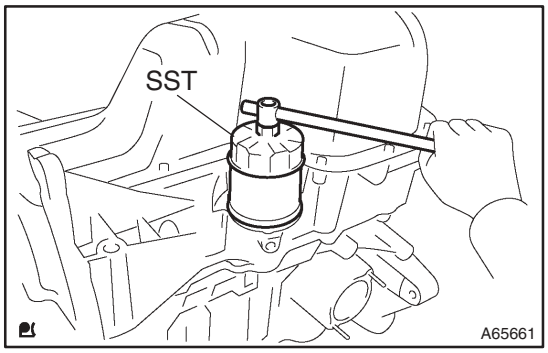


Keep the lip free of foreign materials.

(b) Using SST, tap in the oil seal until its surface is flush with the oil seal retainer edge.

SST 09223–15020, 09950–70010 (09951–07100)

NOTICE:



Wipe off extra grease on the crankshaft.

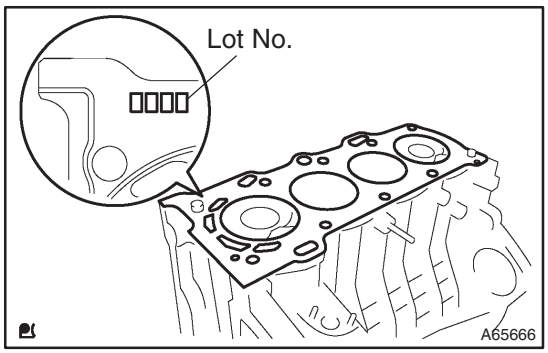
49. INSTALL OIL FILTER UNION

(a) Using a socket hexagon wrench 12, install the oil filter union.

Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)

50. INSTALL OIL FILTER SUB–ASSY

(a) Check and clean the oil filter installation surface.



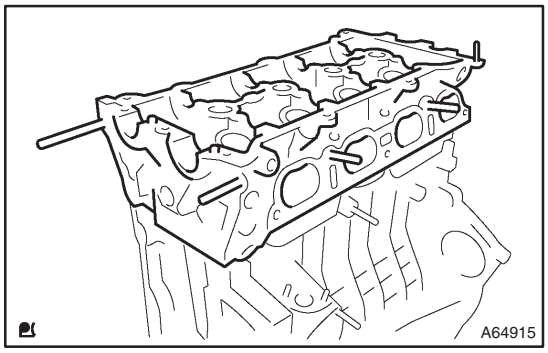
(b) Apply clean engine oil to the gasket of a new oil filter.

(c) Lightly screw the oil filter into place, then tighten it until the gasket comes into contact with the seat.

(d) Using SST, tighten it an additional 3/4 turn.

SST 09228–06501

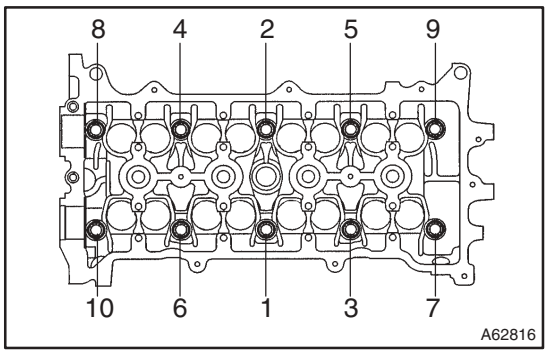
Torque: 13 N·m (133 kgf·cm, 9.6 ft·lbf)



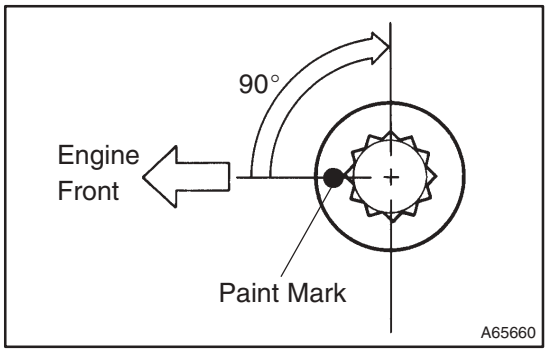
51. INSTALL CYLINDER HEAD GASKET

(a) Place a new cylinder head gasket on the cylinder block surface with the Lot No. stamp upward.

NOTICE:

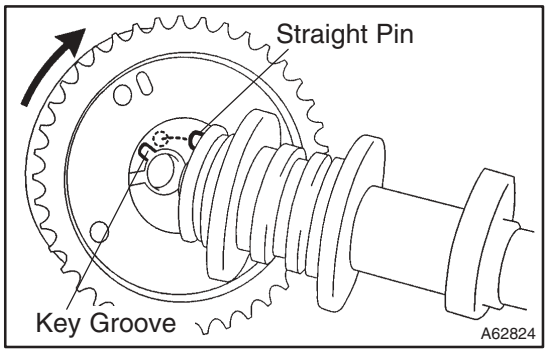


- **Pay attention to the installation direction.**
- **Place the cylinder head gently in order not to damage the gasket.**



52. INSTALL CYLINDER HEAD SUB–ASSY

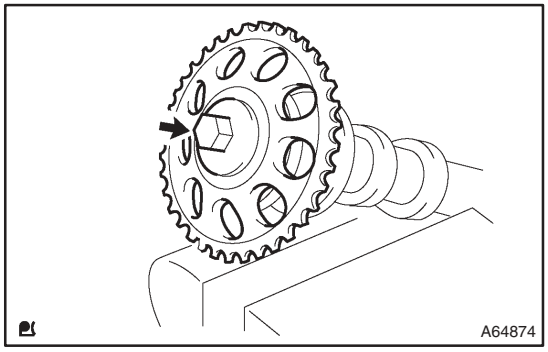
(a) Place the cylinder head on the cylinder block.



(b) Apply a light coat of engine oil to the threads and the bottom of the heads of the cylinder head bolts.

(c) Using a bi–hexagon wrench 10, install and uniformly tighten the 10 cylinder head bolts with plate washers, in several passes, in the sequence shown.
Torque: 49 N·m (500 kgf·cm, 36 ft·lbf)

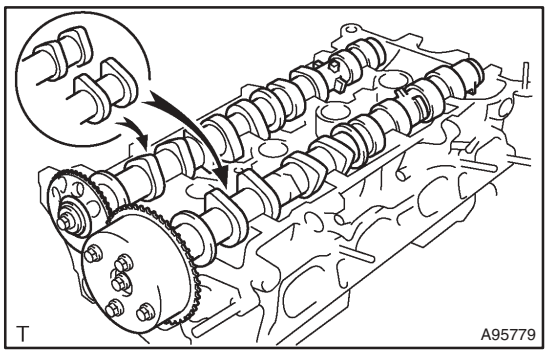
(d) Mark the front of the cylinder head bolt with paint.
(e) Retighten the cylinder head bolts by an additional 90° in the numerical order shown.
(f) Check that the point mark of each bolt is at a 90° angle to the front.



53. INSTALL CAMSHAFT TIMING GEAR ASSY

(a) Put the camshaft timing gear together with the camshaft with the straight pin off the key groove.
(b) Turn the camshaft timing gear in the left direction as shown in the illustration while pushing it lightly against the camshaft. Push the camshaft timing gear until its pin is fitted into the key.

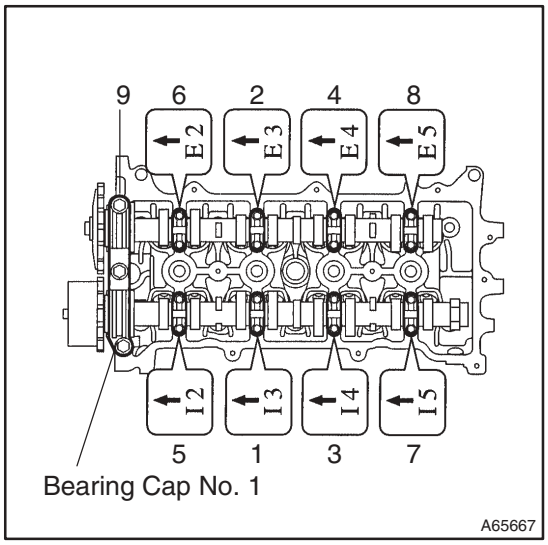
CAUTION:
Be sure not to turn the camshaft timing gear to the retard angle side (the right angle).



(c) Check that there is no clearance between the gear's fringe and camshaft.
(d) Tighten the fringe bolt with the camshaft timing gear fixed.
Torque: 54 N·m (551 kgf·cm 40 ft·lbf)
(e) Check that the camshaft timing gear assembly can move to the retard angle side (the right angle), and is locked at the most retarded position.

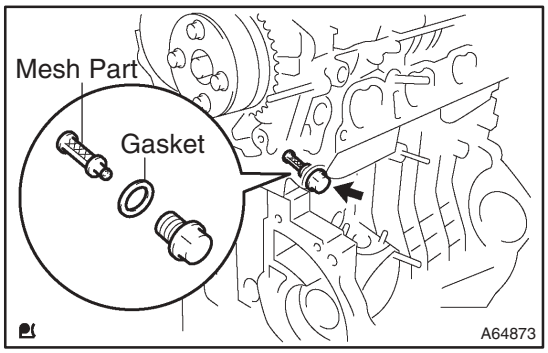
54. INSTALL CAMSHAFT TIMING GEAR OR SPROCKET

(a) Clamp the camshaft in a vise, then install the camshaft timing gear with the bolt.
Torque: 54 N·m (551 kgf·cm 40 ft·lbf)



NOTICE:
Be careful not to damage the camshaft.

55. INSTALL CAMSHAFT

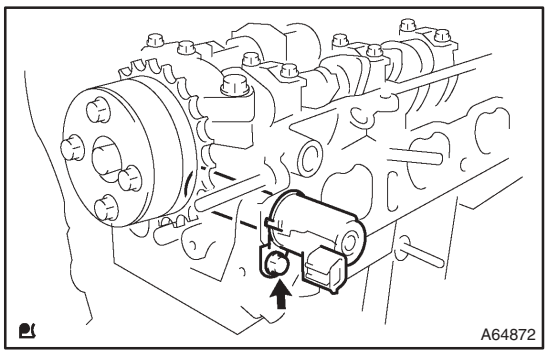


(a) Apply a light coat of engine oil to the camshaft journals.

(b) Place the 2 camshafts on the cylinder head with the No. 1 cylinder cam lobes facing as shown in the illustration.

(c) Examine the front marks and numbers, then tighten the bolts in the order shown in the illustration.

Torque:
23 N·m (235 kgf·cm, 17 ft·lbf) for bearing cap No. 1
13 N·m (133 kgf·cm, 10 ft·lbf) for the other bearing caps

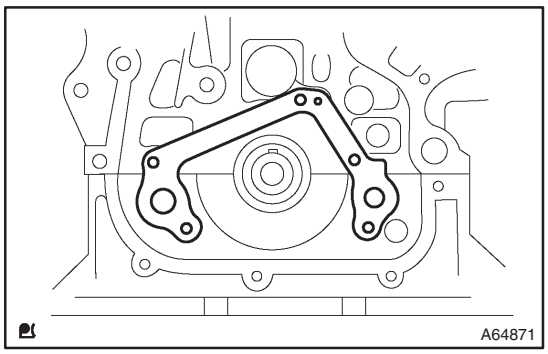


56. INSTALL OIL CONTROL VALVE FILTER

(a) Check that there is no foreign objects on the mesh part of the oil control valve filter.

(b) Install a new gasket and the oil control valve filter onto the bolt, then install it.

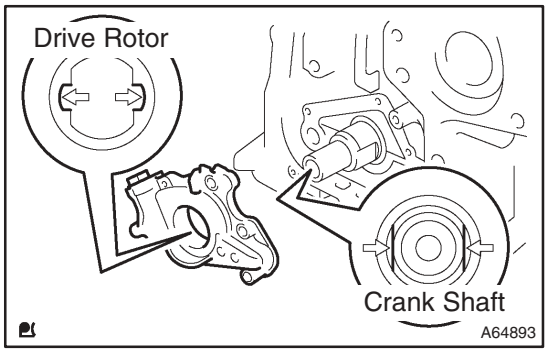
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)



57. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSY

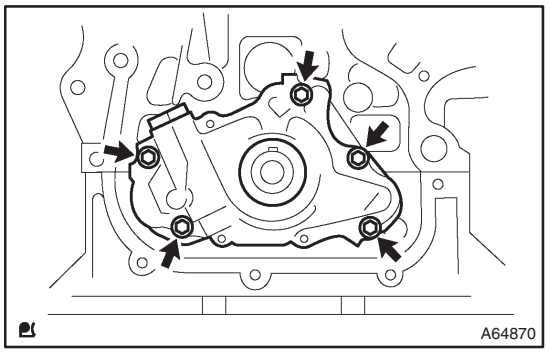
(a) Apply a light coat of engine oil to a new O–ring, then install it onto the camshaft timing oil control valve.

(b) Install the camshaft timing oil control valve with the bolt.



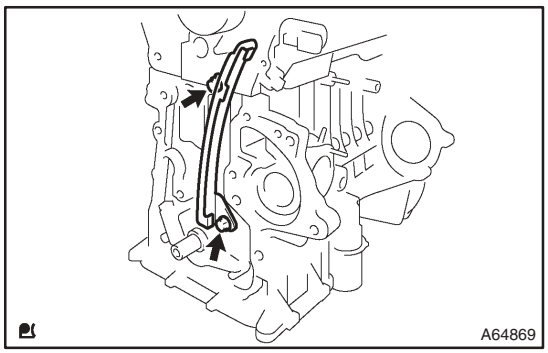
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:
Be careful not to twist the O–ring.



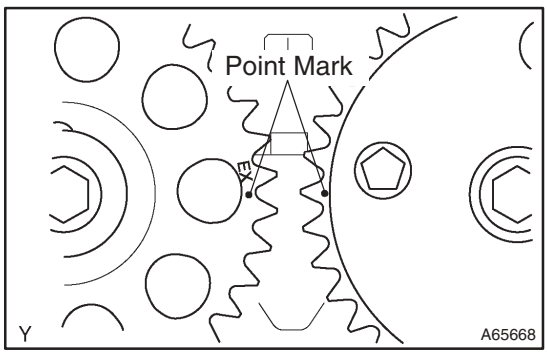
58. INSTALL OIL PUMP GASKET

(a) Install a new gasket onto the cylinder block.

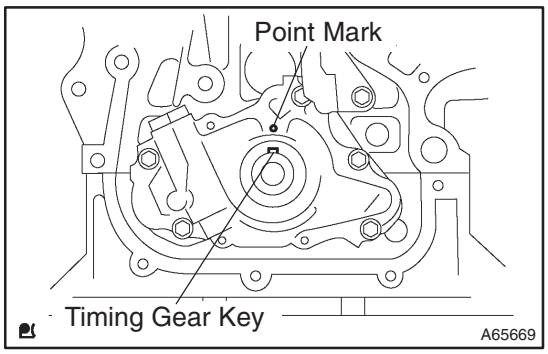


59. INSTALL OIL PUMP ASSY

(a) Align the spline teeth of the oil pump drive rotor with the large teeth of the crankshaft, then slide the oil pump.

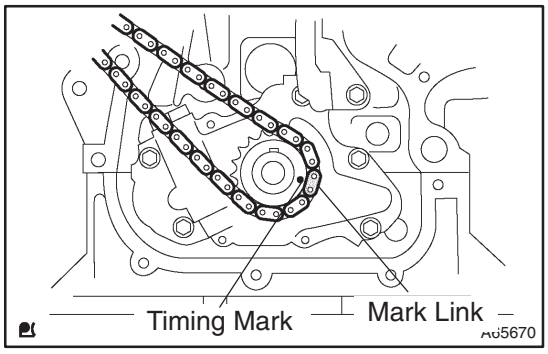


(b) Install the oil pump with the 5 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

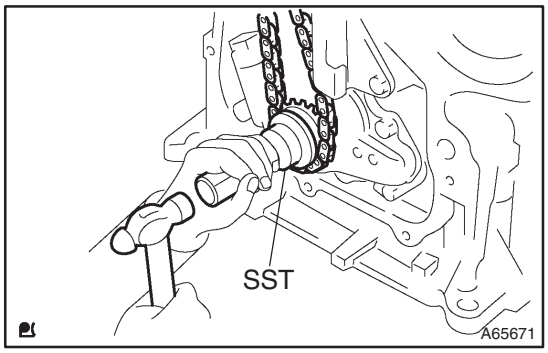


60. INSTALL CHAIN VIBRATION DAMPER NO.1

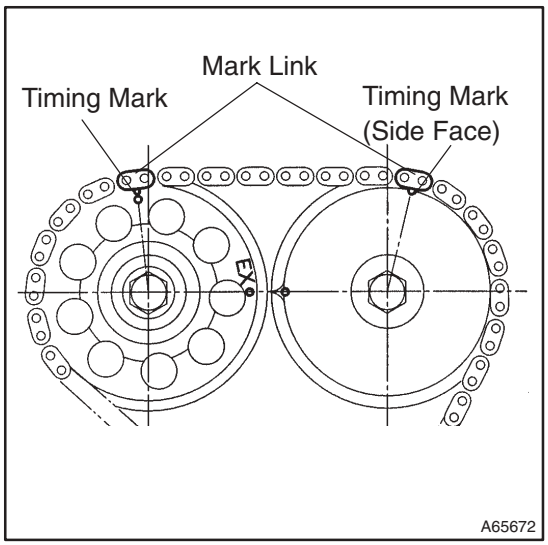
(a) Install chain vibration damper No. 1 with the 2 bolts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)



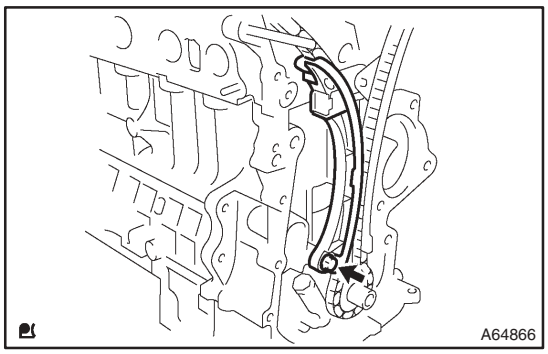
61. INSTALL CHAIN SUB–ASSY



(a) Set No. 1 cylinder to the TDC/compression.
(1) Turn the hexagonal wrench head portion of the camshafts until the point marks of the camshaft timing gears are aligned.

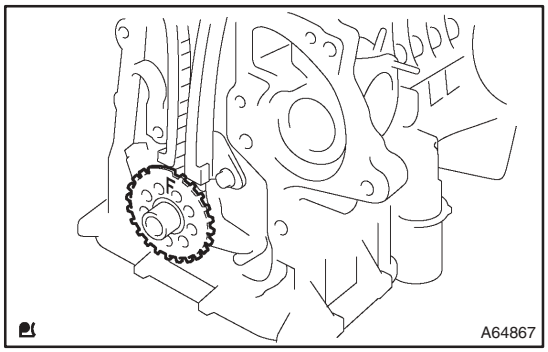


(2) Using a crankshaft pulley bolt, turn the crankshaft to align the timing gear key with the point mark on the oil pump.

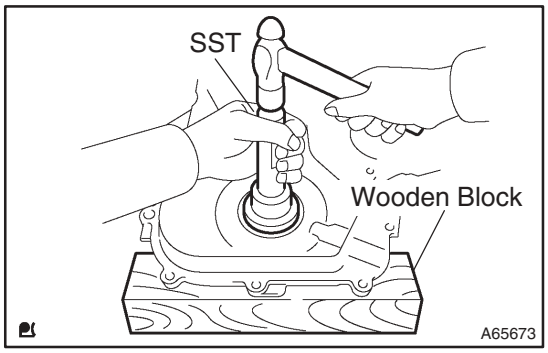


(b) Install the chain onto the crankshaft timing gear with the yellow mark link aligned with the timing mark on the crankshaft timing gear.

(c) Using SST, install the crankshaft timing gear.
SST 09223–22010



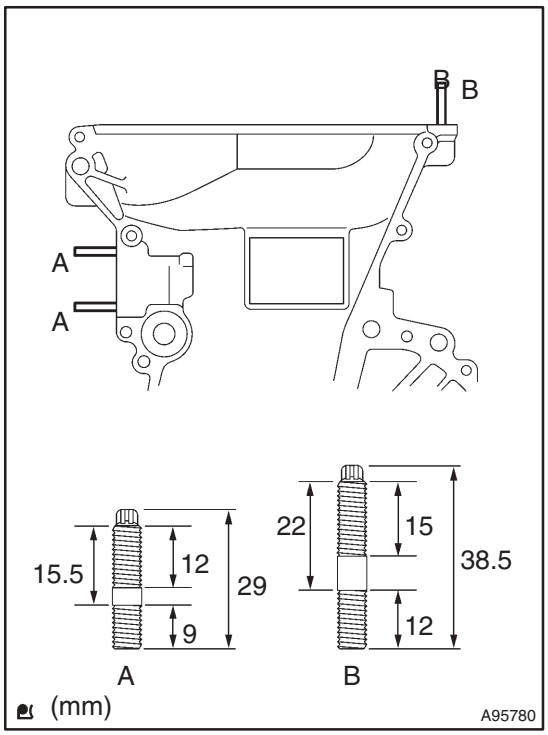
(d) Install the chain onto the camshaft timing gears with the yellow mark links aligned with the timing marks on the camshaft timing gears.



62. INSTALL CHAIN TENSIONER SLIPPER

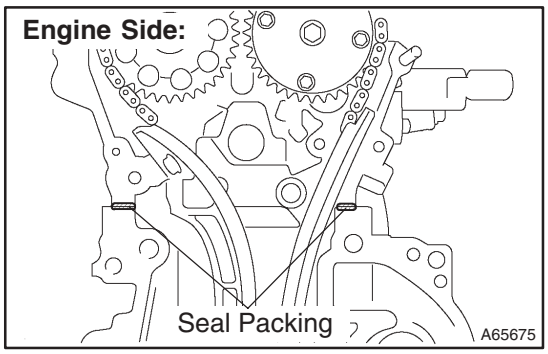
(a) Install the chain tensioner slipper with the bolt.
Torque: 19 N·m (189 kgf·cm, 14 ft·lbf)

63. INSTALL CRANKSHAFT POSITION SENSOR PLATE NO.1



(a) Install the crankshaft position sensor plate with the ”F” mark facing forward.

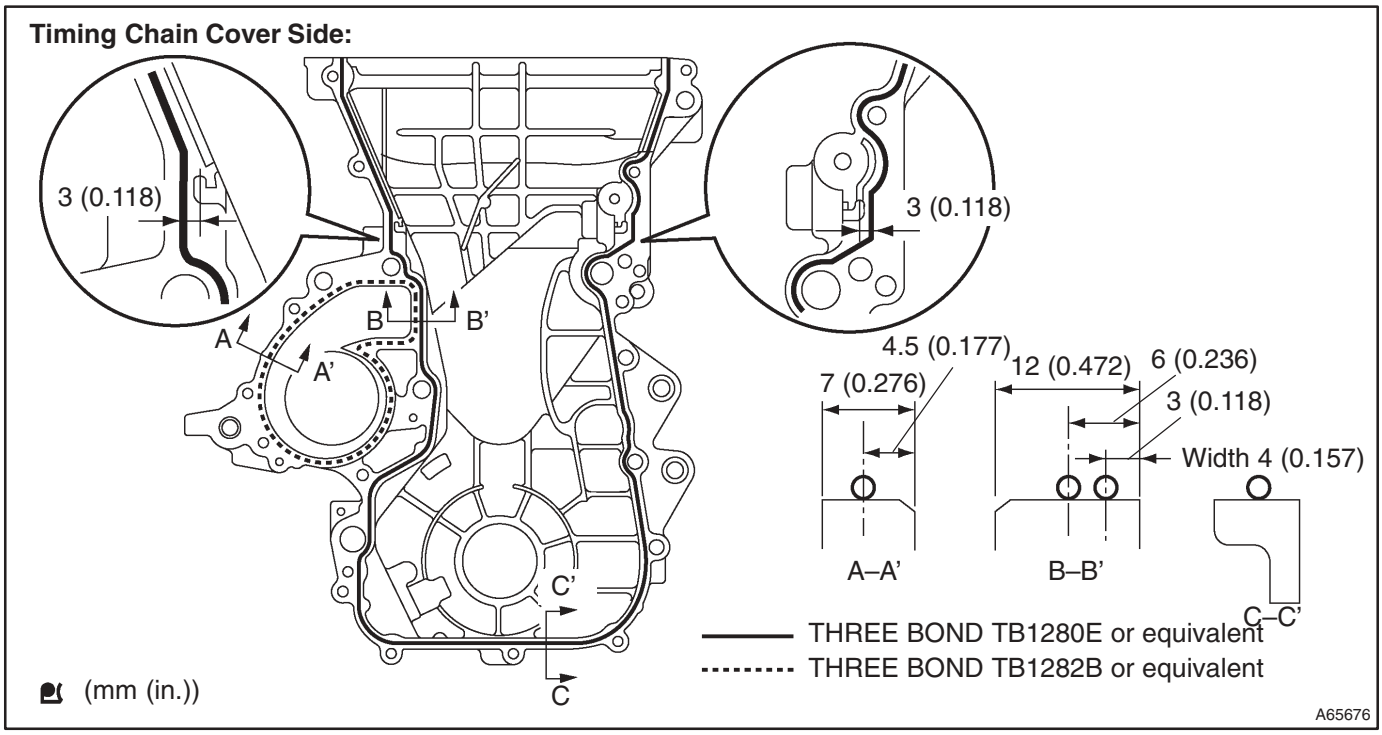
64. INSTALL TIMING CHAIN OR BELT COVER OIL SEAL



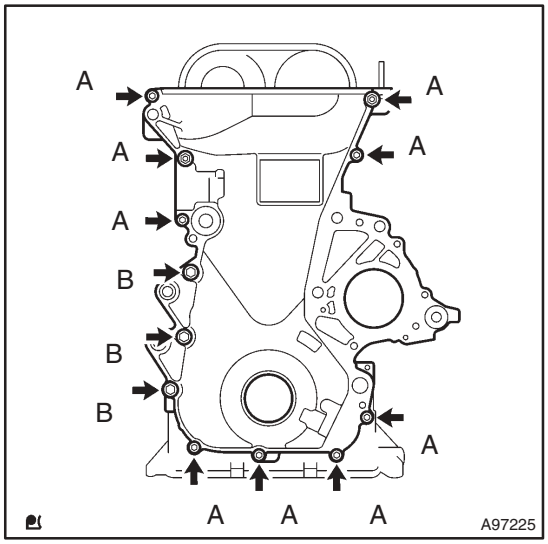
(a) Apply a light coat of multi–purpose grease to a new oil seal lip.
(b) Place the timing chain cover on wooden blocks.
(c) Using SST, tap in the new oil seal until its surface is flush with the timing chain cover edge.
SST 09223–22010

NOTICE:
Keep the lip free of foreign objects.

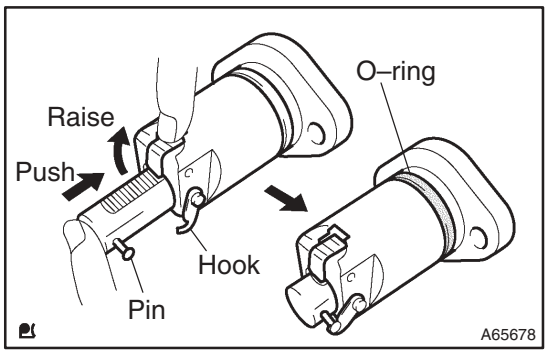
65. INSTALL TIMING CHAIN OR BELT COVER SUB–ASSY



(a) Remove any old packing material from the contact surface.
(b) Using a Torx socket wrench E5, install the 3 stud bolts.
Torque: 5.0 N·m (51 kgf·cm, 44 in.·lbf)

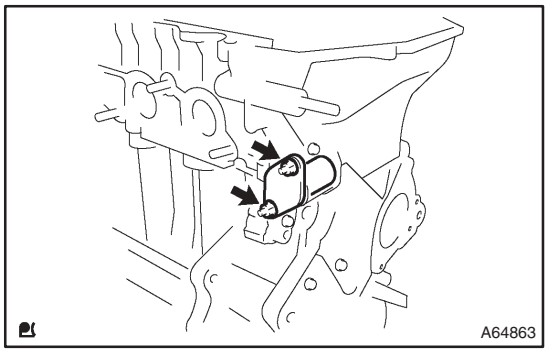


(c) Apply a continuous bead of seal packing (Diameter; 3.5 to 4.5 mm (0.138 to 0.177 in.)) as shown in the illustration.
Seal packing:
Water pump part: THREE BOND TB1282B or equivalent
Other part: THREE BOND TB1280E or equivalent



NOTICE:

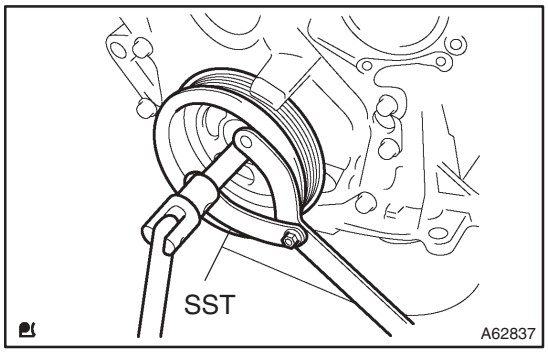
- **Remove any oil from the contact surface.**
- **Install the chain cover within 3 minutes after applying seal packing.**
- **Do not put into engine oil for at least 2 hours after installation.**
- **Be careful to only apply the specified thickness/volume of seal packing.**



(d) Install the timing chain cover with the 10 bolts and 2 nuts.
Torque:
13 N·m (133 kgf·cm, 10 ft·lbf) for A
19 N·m (189 kgf·cm, 14 ft·lbf) for B

66. INSTALL CHAIN TENSIONER ASSY NO.1

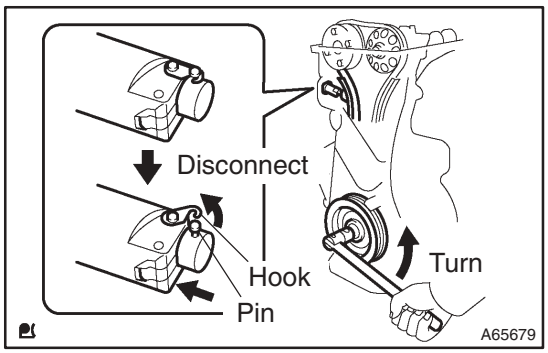
(a) Check that the O–ring is clean, then set the hook as shown in the illustration.



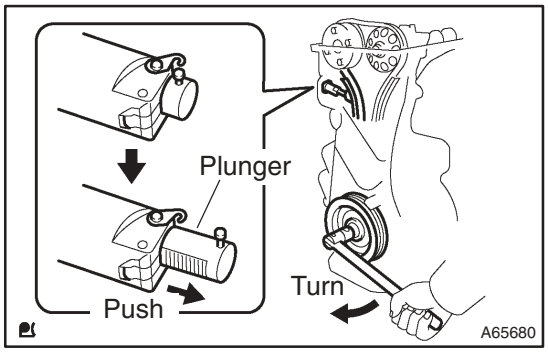
(b) Apply a light coat of engine oil to the O–ring.

(c) Install the chain tensioner with the 2 nuts.
Torque: 9.0 N·m (92 kgf·cm, 80 in.·lbf)

NOTICE:



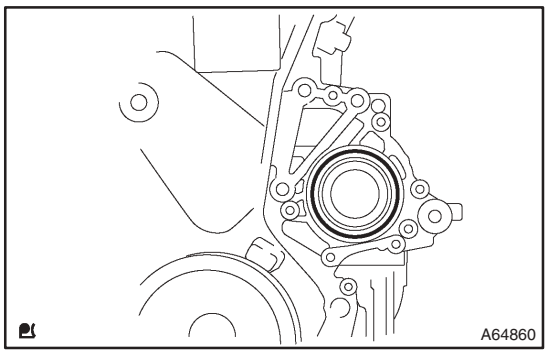
- **Be careful not to twist the O–ring.**
- **When installing the chain tensioner, reset the hook if the hook releases the plunger.**



67. INSTALL CRANKSHAFT PULLEY

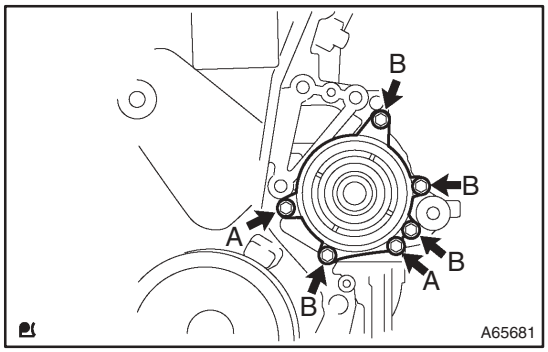
(a) Align the pulley set key with the key groove of the crankshaft pulley, then slide it on the crankshaft pulley.

(b) Using SST, install the crankshaft pulley bolt.
SST 09960–10010 (09962–01000, 09963–01000)
Torque: 138 N·m (1,407 kgf·cm, 102 ft·lbf)



(c) Turn the crankshaft counterclockwise, then disconnect the plunger knock pin from the hook.

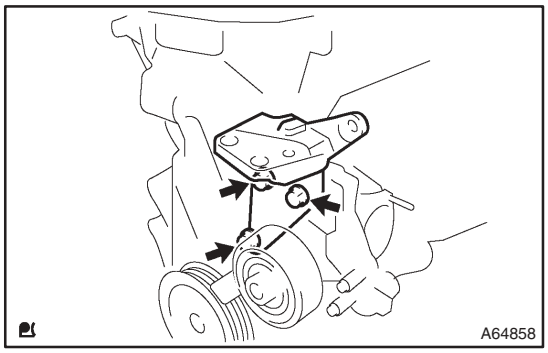
(d) Turn the crankshaft clockwise, then check that the slipper is pushed by the plunger.



HINT:

If the plunger is not extended, press the slipper into the chain tensioner using a screwdriver so that the hook is taken from the knock pin and that the plunger can be extended.

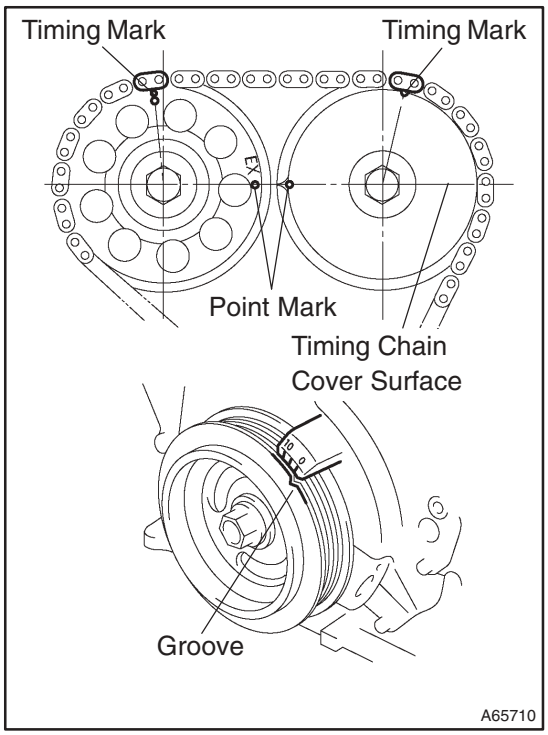
68. INSTALL WATER PUMP O–RING



(a) Install a new water pump O–ring onto the timing chain cover.

69. INSTALL WATER PUMP ASSY

(a) Install the water pump with the 6 bolts.

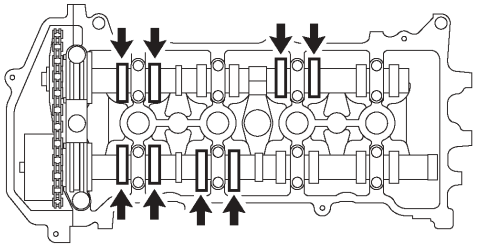


Torque:
9.0 N·m (92 kgf·cm, 80 in·lbf) for bolt A
11 N·m (112 kgf·cm, 8 ft·lbf) for bolt B

70. INSTALL TRANSVERSE ENGINE ENGINE MOUNTING BRACKET

(a) Install the transverse engine engine mounting bracket with the 3 bolts.

Torque: 47 N·m (479 kgf·cm, 35 ft·lbf)



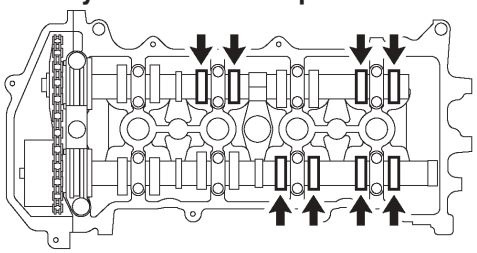
71. INSPECT VALVE CLEARANCE

(a) Set the No. 1 cylinder to the TDC/compression.
  (1) Turn the crankshaft pulley until the groove is aligned with the timing mark ”0” of the timing chain cover.
  (2) Check that the point marks of the camshaft timing gears are in a straight line on the timing chain cover surface as shown in the illustration.

HINT:
If not, turn the crankshaft 1 revolution (360°) to align the marks as above.

No. 1 Cylinder TDC/Compression:

A65682



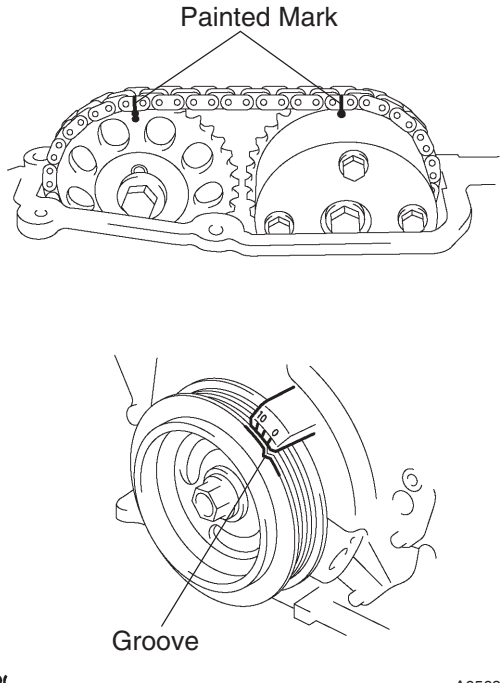
(b) Check the valves indicated with arrow.
(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.
(2) Record the out–of–specification valve clearance measurements. They will be used later to determine the required replacement valve lifters.

Valve clearance (Cold):
0.15 to 0.25 mm (0.0059 to 0.0098 in.) for intake
0.25 to 0.35 mm (0.0098 to 0.0138 in.) for exhaust

If the valve clearance is not as specified, replace the valve lifters.

(c) Turn the crankshaft 1 revolution (360°) and set the No. 4 cylinder to the TDC/compression.

No. 4 Cylinder TDC/Compression:

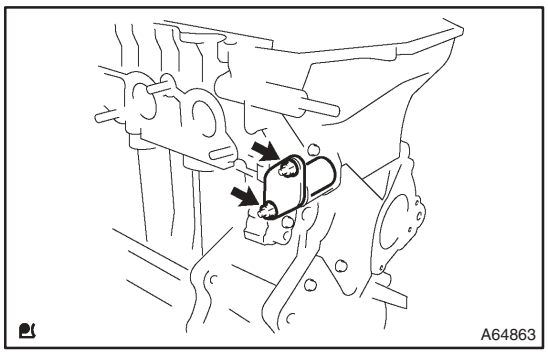


A65683

(d) Check only the valves indicated.
(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.
(2) Record the out–of–specification valve clearance measurements. They will be used later to determine the required replacement valve lifters.

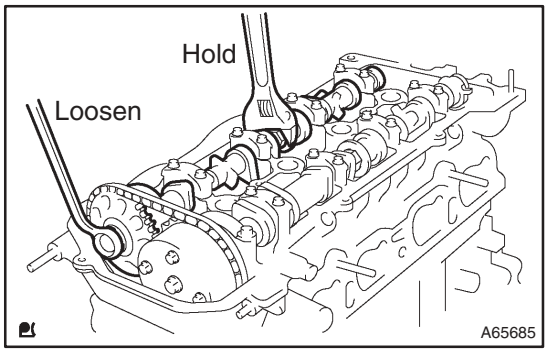
Valve clearance (Cold):
0.15 to 0.25 mm (0.0059 to 0.0098 in.) for intake
0.25 to 0.35 mm (0.0098 to 0.0138 in.) for exhaust

If the valve clearance is not as specified, replace the valve lifters.



A65684

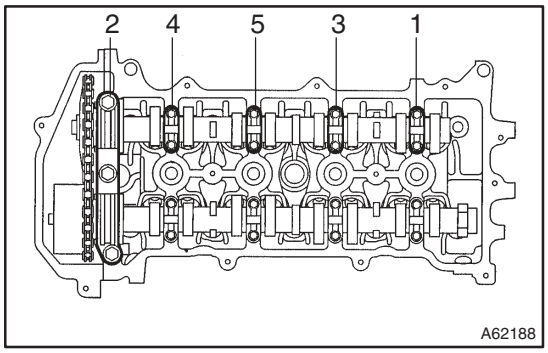
72. ADJUST VALVE CLEARANCE



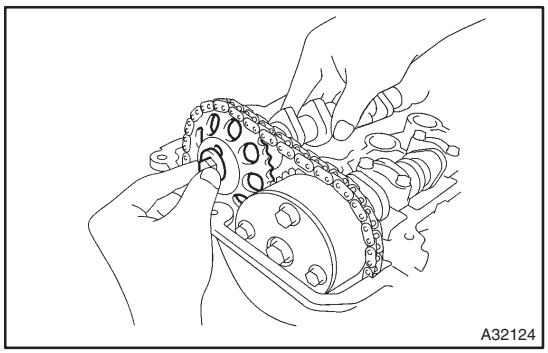
NOTICE:

Be sure not to revolve the crankshaft without the chain tensioner.

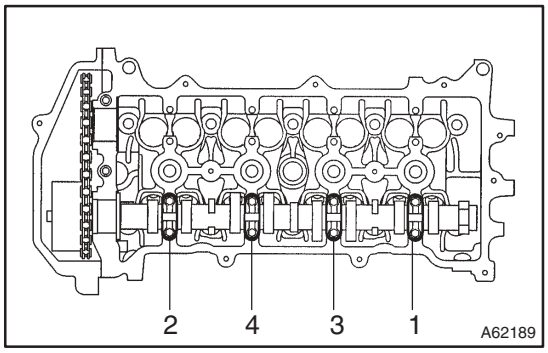
(a) Set the No. 1 cylinder to the TDC/compression.
(b) Place painted marks on the chain and camshaft timing gears.



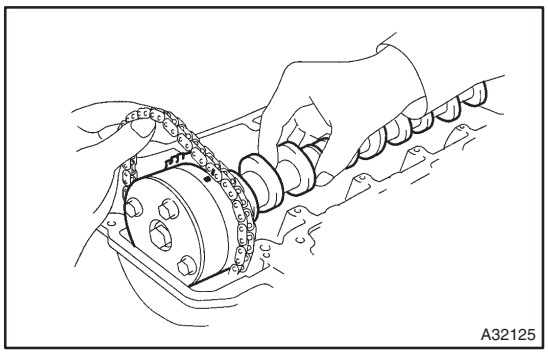
(c) Remove the 2 nuts and chain tensioner.



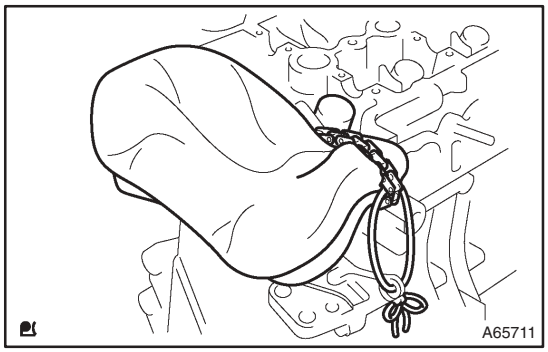
(d) Hold the camshaft with a wrench and so on, then loosen the camshaft timing gear set bolt.



NOTICE:
Be careful not to damage the valve lifter.



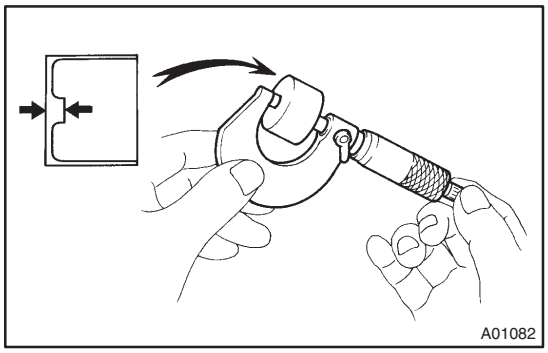
(e) Loosen the bearing cap bolts on the No. 2 camshaft in the order as shown in the illustration, in several passes, then remove the bearing caps.



(f) Remove the camshaft timing gear as shown in the illustration.

(g) Loosen the bearing cap bolts on the camshaft in the order as shown in the illustration, in several passes, then remove the bearing caps.

(h) Remove the camshaft while holding the chain.



(i) Tie the chain with a string as shown in the illustration.

NOTICE:

Be careful not to drop anything inside the timing chain cover.

(j) Remove the valve lifters.

(k) Using a micrometer, measure the thickness of the removed valve lifters.

(l) Calculate the thickness of a new lifter so that the valve clearance comes within the specified value.

A	Thickness of new lifter
B	Thickness of used lifter
C	Measured valve clearance

Valve clearance:

Intake A = B + (C – 0.20 mm (0.0079 in.))

Exhaust A = B + (C – 0.30 mm (0.0118 in.))

Example (Intake):
Measured intake valve clearance = 0.40 mm (0.0158 in.)
0.40 mm (0.0158 in.) – 0.20 mm (0.0079 in.) = 0.20 mm (0.0079 in.)
(Measured – Specification = Excess clearance)
Used lifter measurement = 5.250 mm (0.2067 in.)
0.20 mm (0.0079 in.) + 5.250 mm (0.2067 in.) = 5.450 mm (0.2146 in.)
(Excess clearance + Used lifter = Ideal new lifter)
Closest new lifter = 5.460 mm (0.2150 in.)
Select No. 46 lifter

HINT:

- Select a new lifter with a thickness as close to the calculated values as possible.
- Lifter are available in 35 sizes in increments of 0.020 mm (0.0008 in.), from 5.060 mm (0.1992 in.) to 5.740 mm (0.2260 in.).
- Refer to the New Lifter Thickness Table on the next 2 pages.

A79322

Valve Lifter Selection Chart (Intake)

Measured Clearance mm (in.) \ Installed Lifter Thickness mm (in.)	5.060 (0.1992)	5.080 (0.2000)	5.100 (0.2008)	5.120 (0.2016)	5.140 (0.2024)	5.160 (0.2031)	5.180 (0.2039)	5.200 (0.2047)	5.210 (0.2051)	5.220 (0.2055)	5.230 (0.2059)	5.240 (0.2063)	5.250 (0.2067)	5.260 (0.2071)	5.270 (0.2075)	5.280 (0.2079)	5.290 (0.2083)	5.300 (0.2087)	5.310 (0.2091)	5.320 (0.2094)	5.330 (0.2098)	5.340 (0.2102)	5.350 (0.2106)	5.360 (0.2110)	5.370 (0.2114)	5.380 (0.2118)	5.390 (0.2122)	5.400 (0.2126)	5.410 (0.2130)	5.420 (0.2134)	5.430 (0.2138)	5.440 (0.2142)	5.450 (0.2146)	5.460 (0.2150)	5.470 (0.2154)	5.480 (0.2157)	5.490 (0.2161)	5.500 (0.2165)	5.510 (0.2169)	5.520 (0.2173)	5.530 (0.2177)	5.540 (0.2181)	5.550 (0.2185)	5.560 (0.2189)	5.570 (0.2193)	5.580 (0.2197)	5.590 (0.2201)	5.600 (0.2205)	5.620 (0.2213)	5.640 (0.2220)	5.660 (0.2228)	5.680 (0.2236)	5.700 (0.2244)	5.720 (0.2252)	5.740 (0.2260)

Intake valve clearance (Cold):
0.15 to 0.25 mm (0.006 to 0.010 in.)

EXAMPLE: The 5.250 mm (0.2067 in.) lifter is installed, and the measured clearance is 0.400 mm (0.0157 in.).
Replace the 5.250 mm (0.2067 in.) lifter with a new No. 46 lifter.

New Lifter Thickness mm (in.)

Lifter No.	Thickness	Lifter No.	Thickness	Lifter No.	Thickness

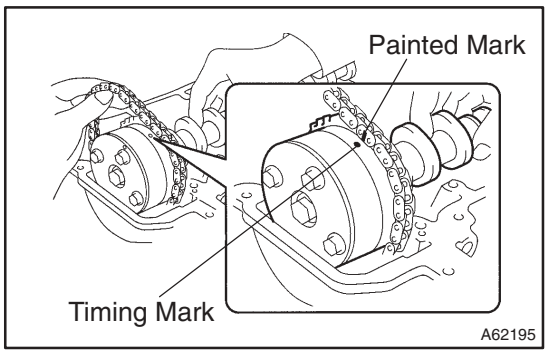
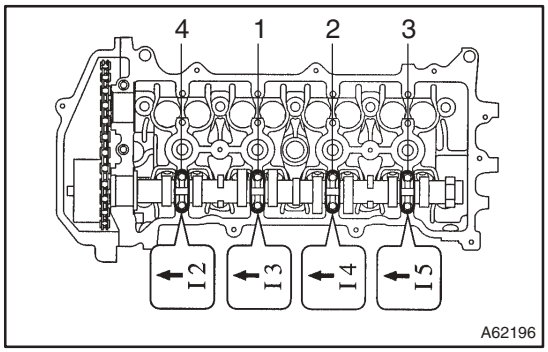
Exhaust valve clearance (Cold):



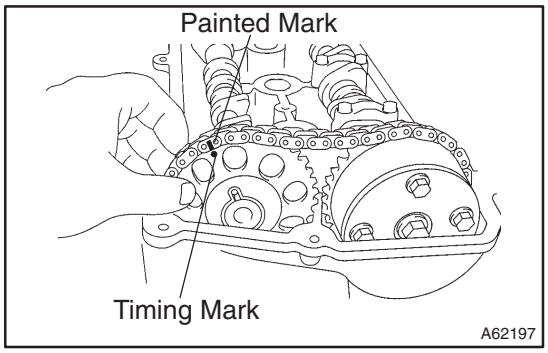
0.25 to 0.35 mm (0.010 to 0.014 in.)

EXAMPLE: The 5.340 mm (0.2102 in.) lifter is installed, and the measured clearance is 0.440 mm (0.0173 in.).
Replace the 5.340 mm (0.2102 in.) lifter with a new No. 48 lifter.

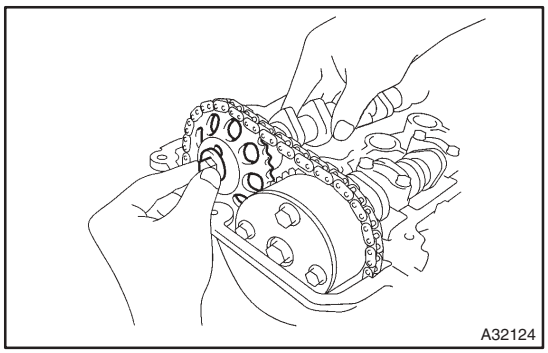


New Lifter Thickness mm (in.)

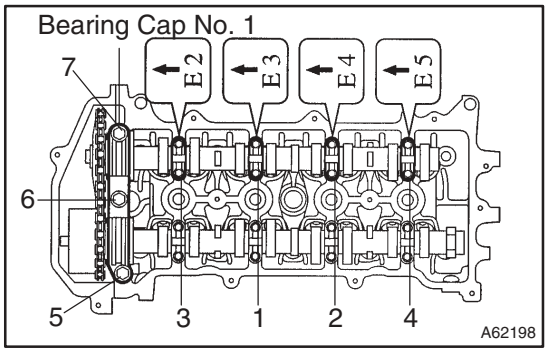
Lifter No.	Thickness	Lifter No.	Thickness	Lifter No.	Thickness
06	5.060 (0.1992)	30	5.300 (0.2087)	54	5.540 (0.2181)
08	5.080 (0.2000)	32	5.320 (0.2094)	56	5.560 (0.2189)
10	5.100 (0.2008)	34	5.340 (0.2102)	58	5.580 (0.2197)
12	5.120 (0.2016)	36	5.360 (0.2110)	60	5.600 (0.2205)
14	5.140 (0.2024)	38	5.380 (0.2118)	62	5.620 (0.2213)
16	5.160 (0.2031)	40	5.400 (0.2126)	64	5.640 (0.2220)
18	5.180 (0.2039)	42	5.420 (0.2134)	66	5.660 (0.2228)
20	5.200 (0.2047)	44	5.440 (0.2142)	68	5.680 (0.2236)
22	5.220 (0.2055)	46	5.460 (0.2150)	70	5.700 (0.2244)
24	5.240 (0.2063)	48	5.480 (0.2157)	72	5.720 (0.2252)
26	5.260 (0.2071)	50	5.500 (0.2165)	74	5.740 (0.2260)
28	5.280 (0.2079)	52	5.520 (0.2173)		



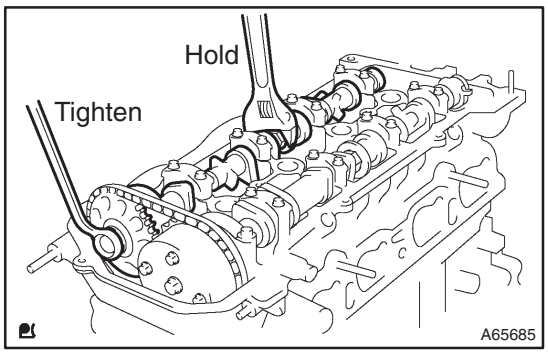
A96653



(m) As shown in the illustration, install the chain onto the camshaft timing gear with the painted mark aligned with the timing mark on the camshaft timing gear.



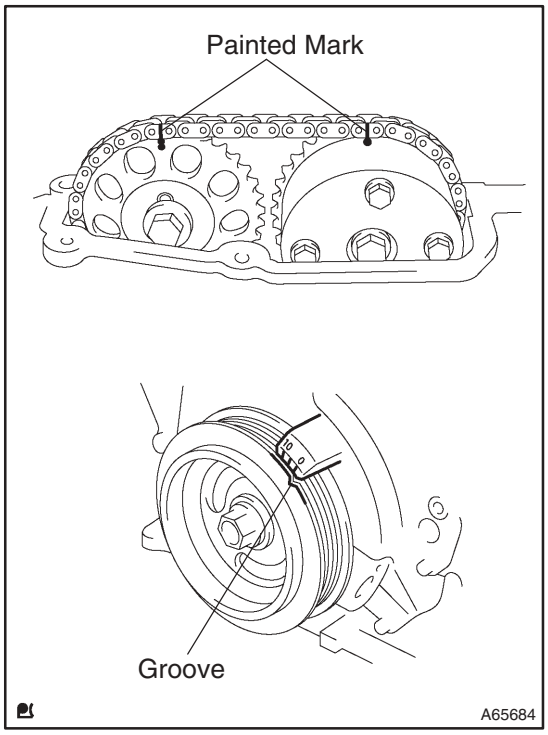
(n) Examine the front marks and numbers, then tighten the bolts in the order shown in the illustration.
Torque: 13 N·m (133 kgf·cm, 10 ft·lbf)



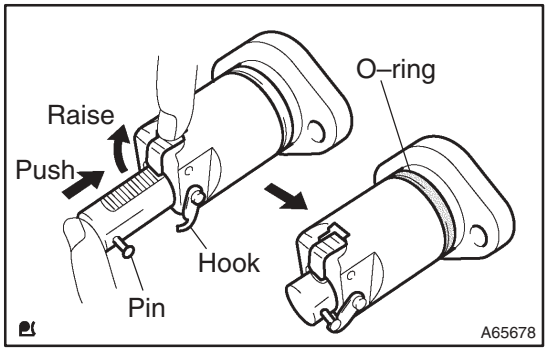
(o) Put the camshaft No. 2 on the cylinder head with the painted mark of the chain aligned with the timing mark on the camshaft timing gear.

(p) Tighten the set bolt temporarily while raising the camshaft.

(q) Examine the front marks and numbers, then tighten the bolts in the order shown in the illustration.
Torque:
23 N·m (235 kgf·cm, 17 ft·lbf) for bearing cap No. 1
13 N·m (133 kgf·cm, 10 ft·lbf) for the other bearing caps.



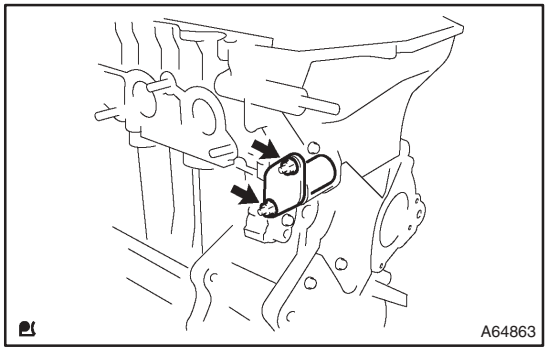
(r) Hold the camshaft with a wrench and so on, then tighten the camshaft timing gear set bolt.



Torque: 54 N·m (551 kgf·cm, 40 ft·lbf)

NOTICE:

Be careful not to damage the valve lifter.

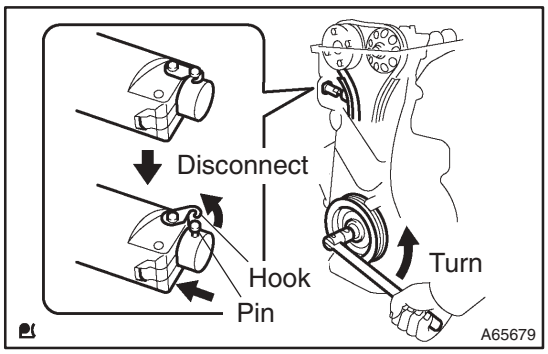


(s) Check the painted marks on the chain and camshaft timing gears, and that the camshaft pulley groove is aligned with the timing mark ”0” of the timing chain cover.

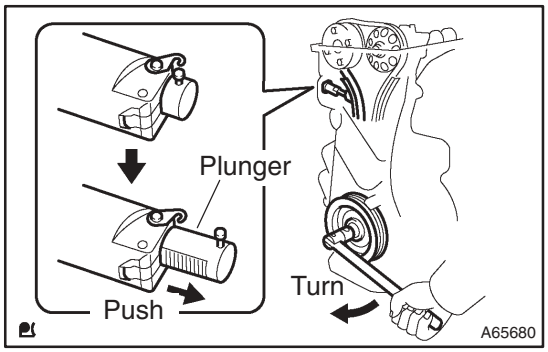
(t) Check the chain tensioner.

(1) Check that the O–ring is clean, then set the hook as shown in the illustration.

(2) Apply a light coat of engine oil to the O–ring.



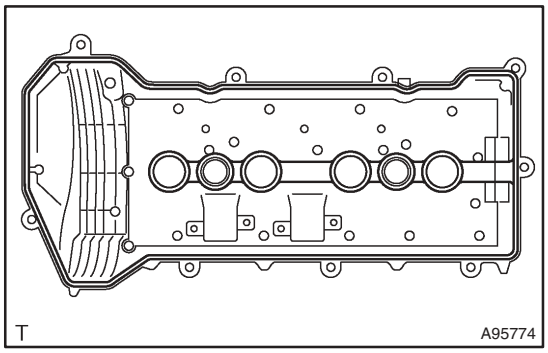
(3) Install the chain tensioner with the 2 nuts.



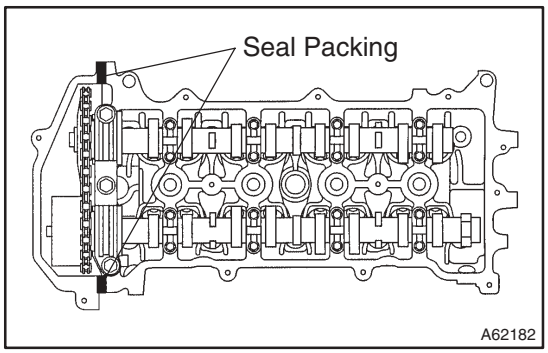
Torque: 9.0 N·m (92 kgf·cm, 80 in·lbf)

NOTICE:

- **Be careful not to twist the O–ring.**
- **When installing the tensioner, reset the hook if the hook releases the plunger.**



(4) Turn the crankshaft counterclockwise, then disconnect the plunger knock pin from the hook.



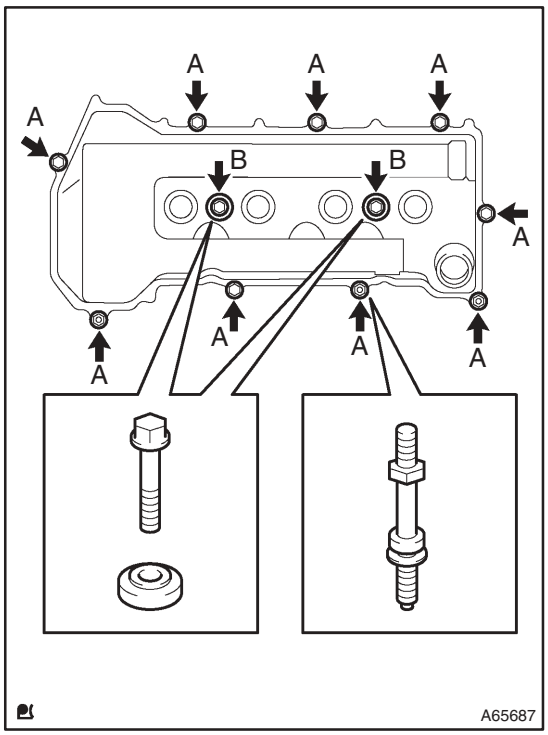
(5) Turn the crankshaft clockwise, then check that the slipper is pushed by the plunger.

HINT:
If the plunger is not extended, press the slipper into the chain tensioner using a screwdriver so that the hook is taken from the knock pin and that the plunger can be extended.

73. INSTALL CYLINDER HEAD COVER GASKET

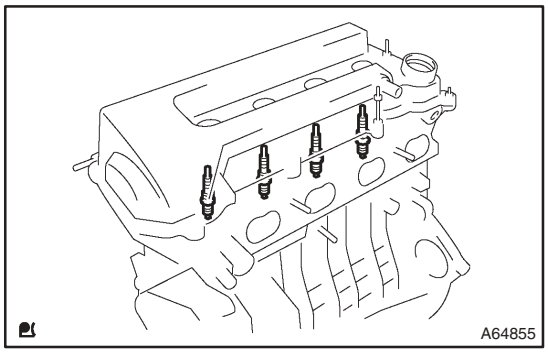
(a) Install the gasket onto the cylinder head cover.

74. INSTALL CYLINDER HEAD COVER SUB–ASSY



(a) Remove any old packing (FIPG) material.

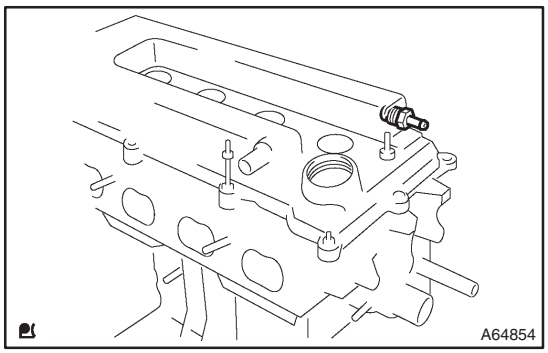
(b) Apply seal packing to 2 locations as shown in the illustration.



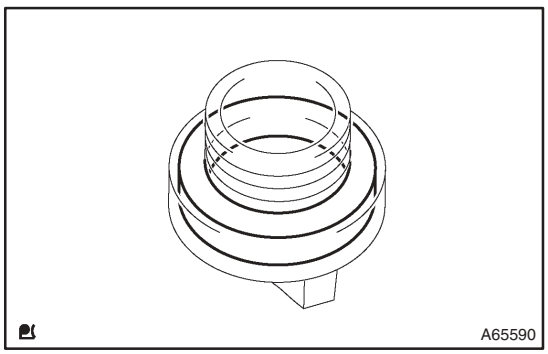
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 3 minutes after applying seal packing.**
- **Do not put into engine oil for at least 2 hours after installation.**

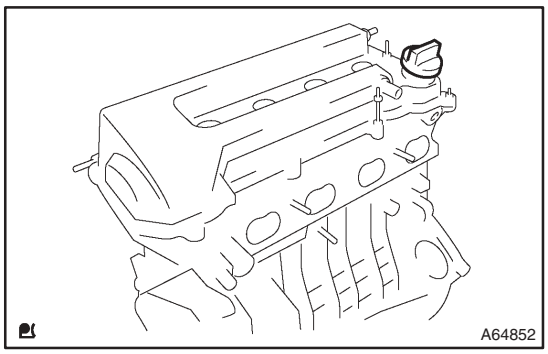


(c) Install the cylinder head cover with the 9 bolts, 2 seal washers and 2 nuts.
Torque:
11 N·m (112 kgf·cm, 8 ft·lbf) for A
9.0 N·m (92 kgf·cm, 80 in·lbf) for B



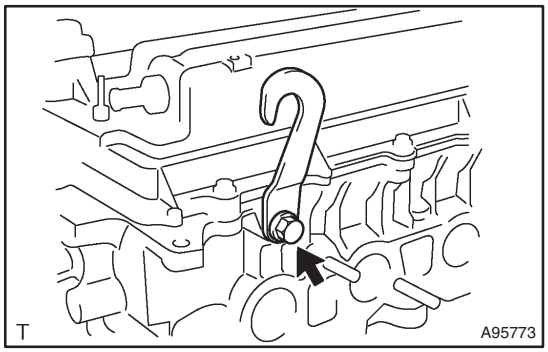
75. INSTALL SPARK PLUG

(a) Using a spark plug wrench, install the 4 spark plugs.
Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)



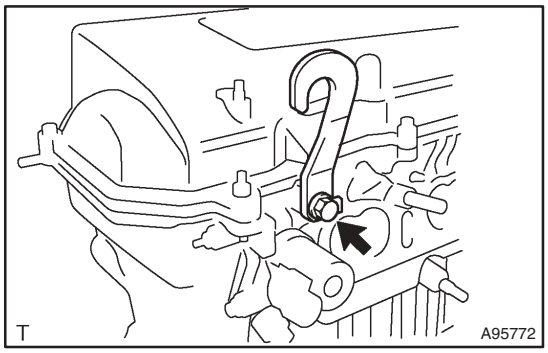
76. INSTALL VENTILATION VALVE SUB–ASSY

(a) Install the ventilation valve into the cylinder head cover.
Torque: 30 N·m (306 kgf·cm, 22 ft·lbf)



77. INSTALL OIL FILLER CAP GASKET

(a) Install the gasket onto the oil filler cap.

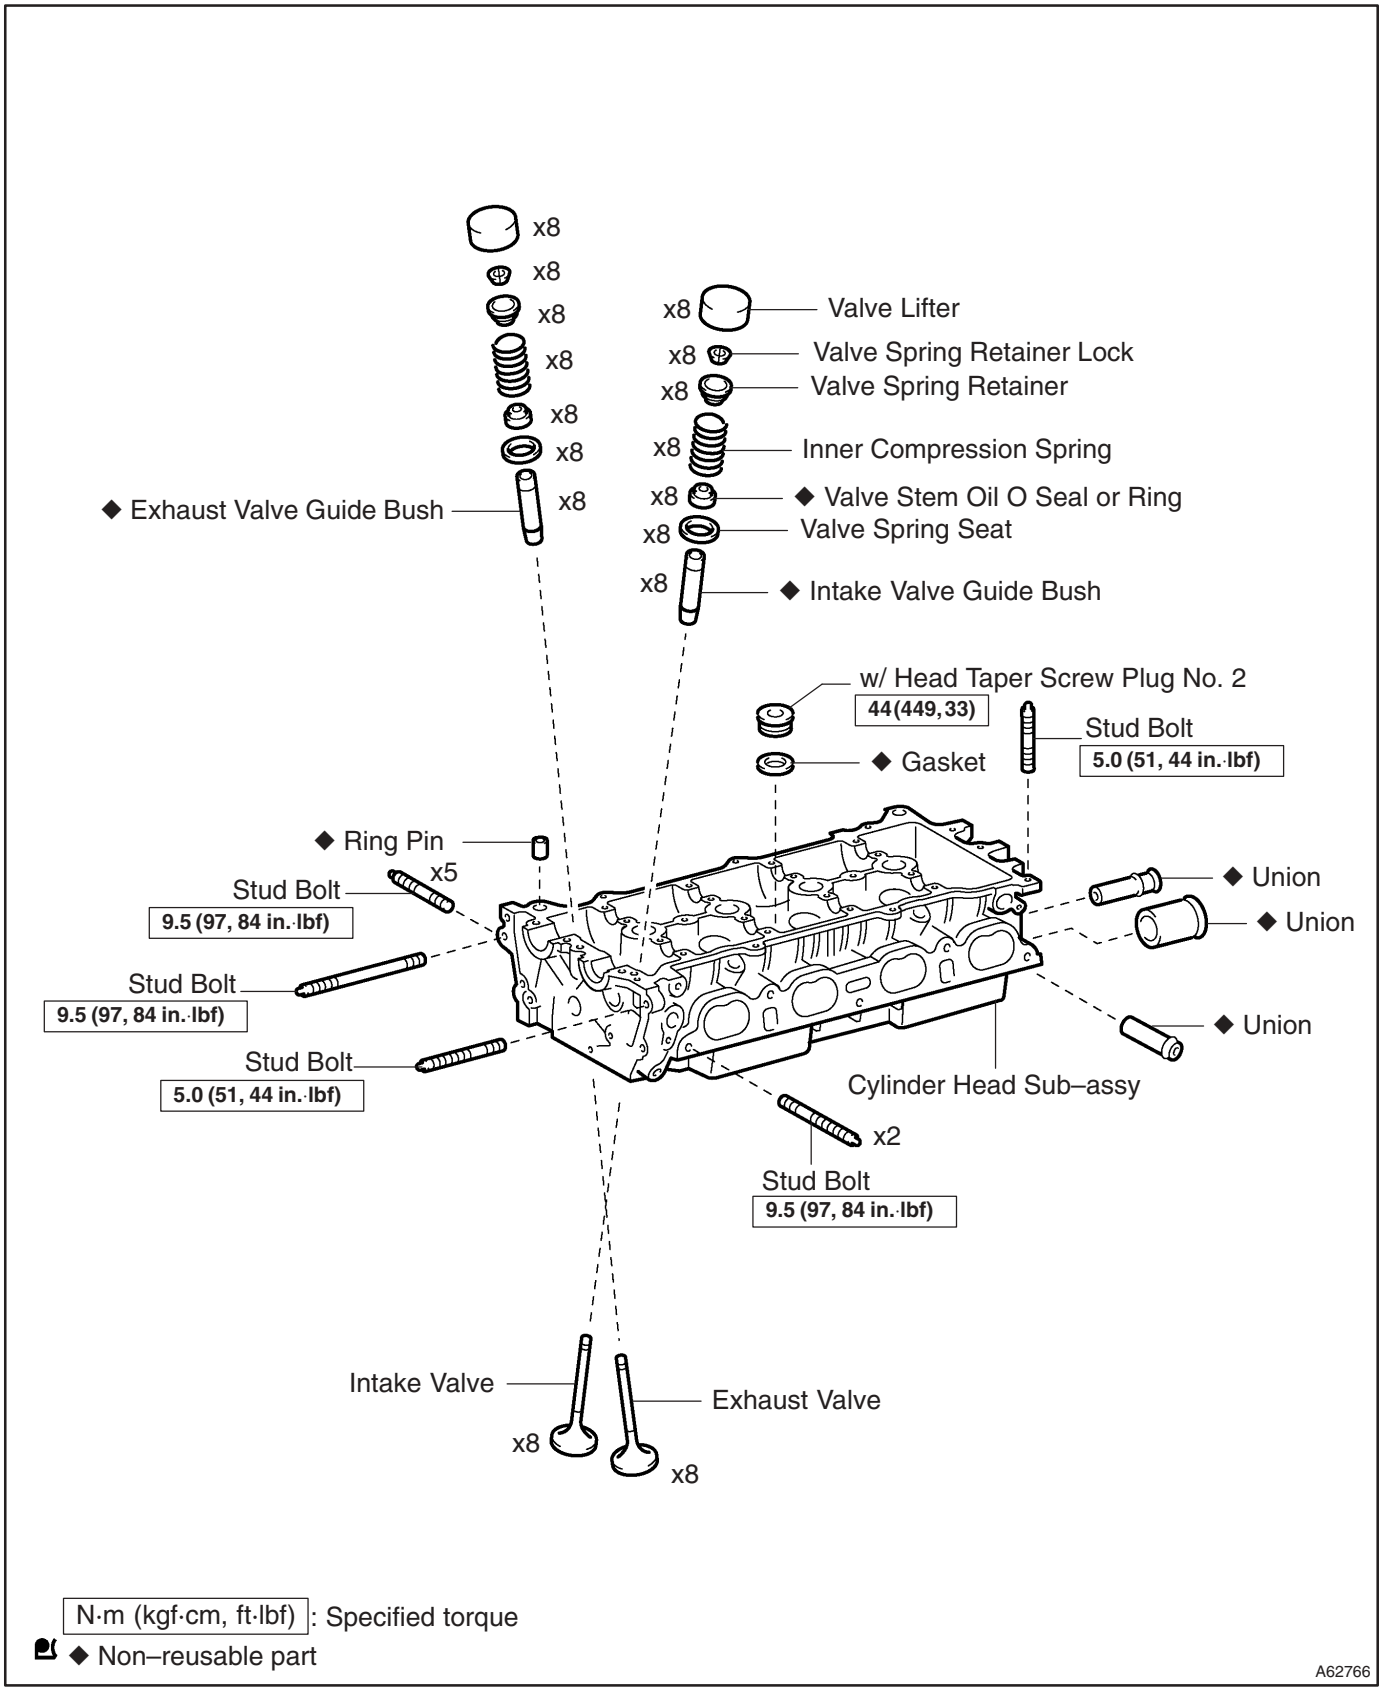


78. INSTALL OIL FILLER CAP SUB–ASSY

(a) Install the oil filler cap onto the cylinder head cover.

79. INSTALL ENGINE HANGER NO.2

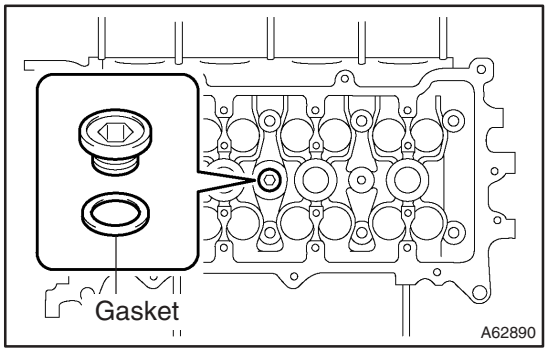
(a) Install engine hanger No. 2 with the bolt.
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)



80. INSTALL ENGINE HANGER NO.1

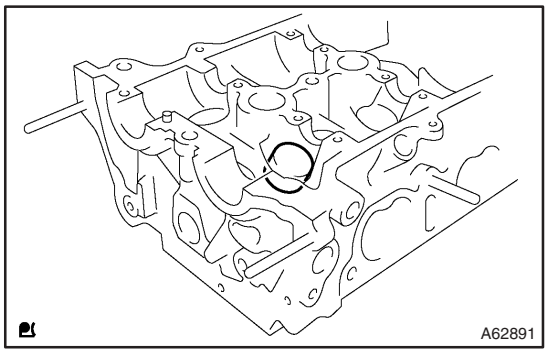
(a) Install engine hanger No. 1 with the bolt.
Torque: 38 N·m (387 kgf·cm, 28 ft·lbf)

CYLINDER HEAD ASSY (1ZZ–FE/3ZZ–FE)



141TN–01

COMPONENTS



141TO–01

OVERHAUL

1. REMOVE W/HEAD TAPER SCREW PLUG NO.2

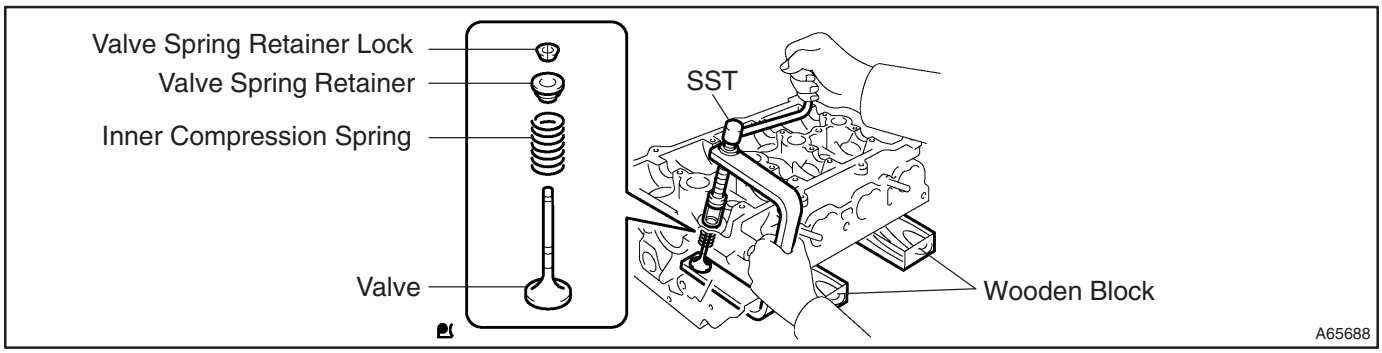
(a) Using a socket hexagon wench 10, remove the taper screw plug and gasket.

2. REMOVE VALVE LIFTER

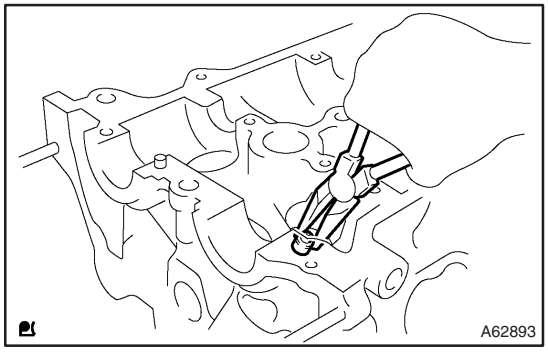
(a) Remove the 16 valve lifters from the cylinder head.

3. REMOVE VALVE

HINT:



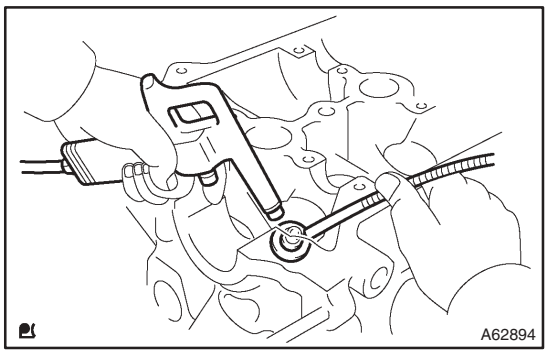
Remove all the valves from the cylinder head according to the procedure below.



(a) Place the cylinder head on wooden blocks.

(b) Using SST, compress the inner compression spring, then remove the 2 valve spring retainer locks.

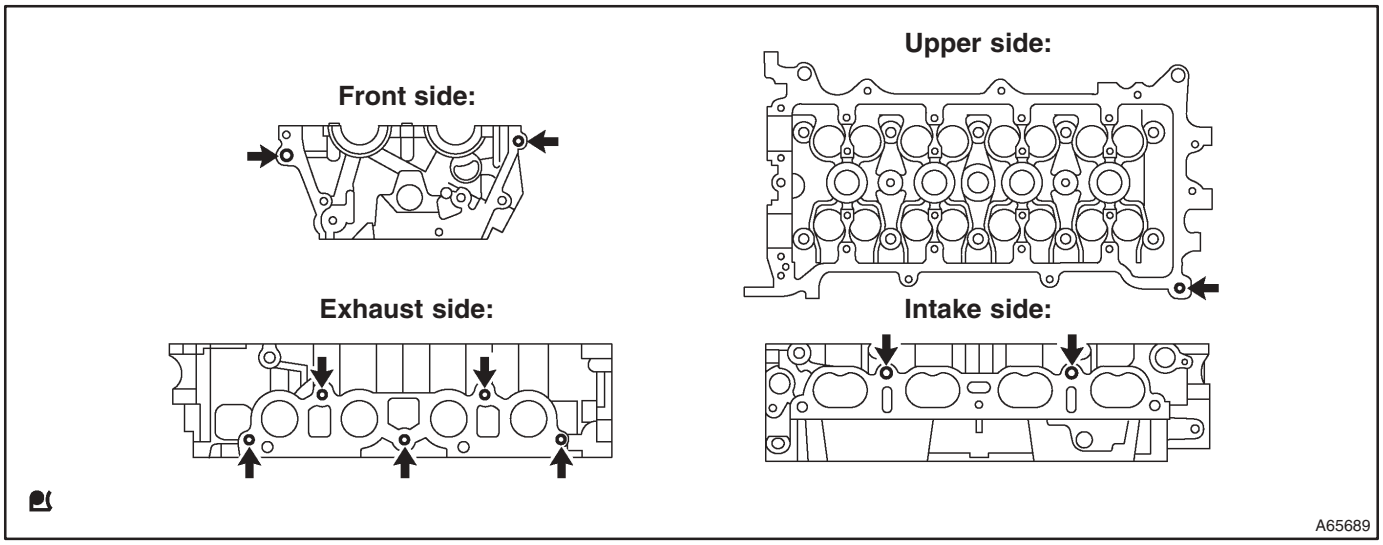
SST 09202–70020 (09202–00010, 09202–01010, 09202–01020)

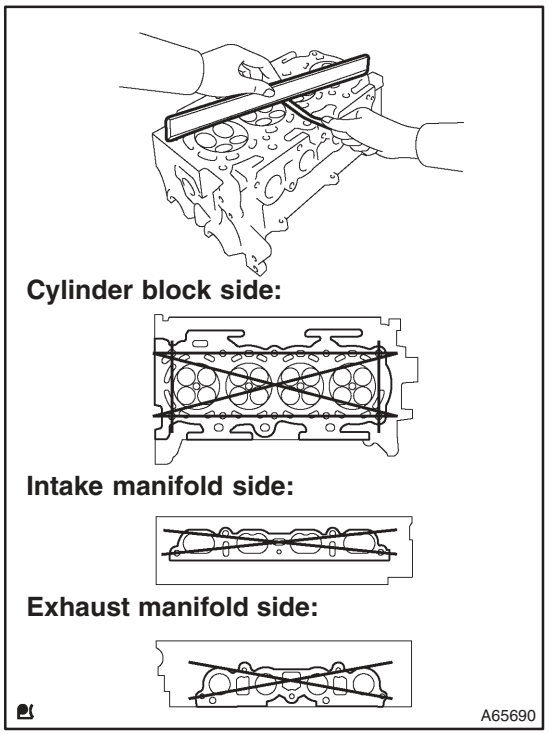


(c) Remove the valve spring retainers, inner compression springs and valves from the cylinder head.

4. REMOVE VALVE STEM OIL O SEAL OR RING

(a) Using needle–nose pliers, remove the 8 valve stem oil seals.



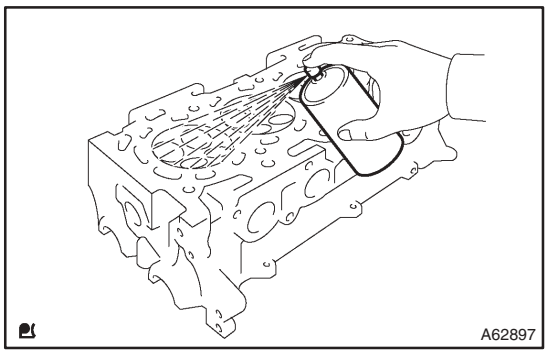


5. REMOVE VALVE SPRING SEAT

(a) Using a compressed air and a magnetic finger, remove the 8 valve spring seats.

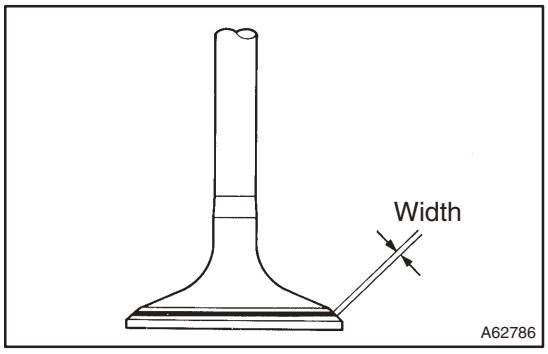
6. REMOVE STUD BOLT

(a) Using torx socket wrenches E5 and E7, remove the 10 stud bolts.



7. INSPECT CYLINDER HEAD FOR FLATNESS

(a) Using a precision straight edge and a feeler gauge, measure the surface contacting the cylinder block and the manifolds for warpage.



Maximum warpage:
Cylinder block side 0.05 mm (0.0020 in.)
Intake manifold side 0.10 mm (0.0039 in.)
Exhaust manifold side 0.10 mm (0.0039 in.)

If the warpage is greater than maximum, replace the cylinder head.

8. INSPECT CYLINDER HEAD FOR CRACKS

(a) Using a dye penetrate, check the combustion chamber, intake ports, exhaust ports and cylinder block surface for cracks.

9. INSPECT VALVE SEATS

(a) Apply a light coat of prussian blue (or white lead) to the valve face.

(b) Lightly press the valve against the seat.

NOTICE:

Do not rotate the valve.

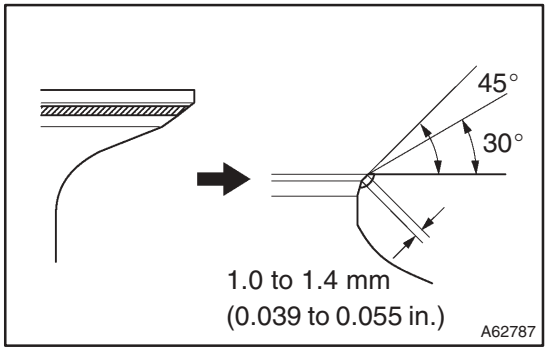
(c) Check the valve face and seat according to the following procedure.

(1) If blue appears 360° around the face, the valve is concentric. If not, replace the valve.

(2) If blue appears 360° around the valve seat, the guide and face are concentric. If not, resurface the seat.

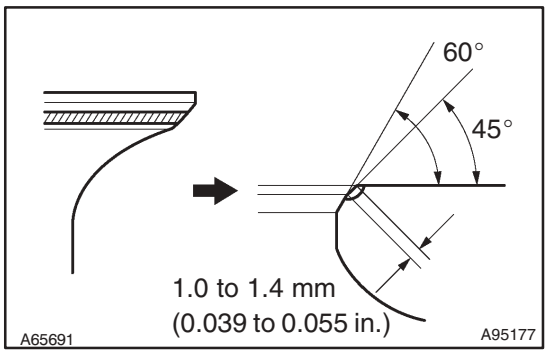
(3) Check that the seat contact is in the middle of the valve face with the width between 1.0 to 1.4 mm (0.039 to 0.055 in.).

10. REPAIR INTAKE VALVE SEATS



NOTICE:

Releasing the seat cutter pressure makes the valve seat faces smooth.



(a) Using a 45° cutter, cut the valve face of the cylinder head a little wider than the specified valve seating width.

(b) Confirm that the valve fits the valve seat center portion. If not, re–cut the valve face with the 45° cutter.

(c) Adjust the valve face with a 30° or 60° cutter so that the valve seat is in the valve seat center portion.

(1) If the seating is too high on the valve face, use the 30° and 45° cutters to correct the seat.

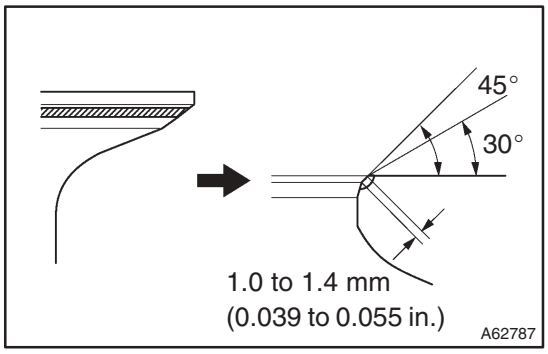
(2) If the seating is too low on the valve face, use the 60° and 45° cutters to correct the seat.

(d) Lap the valve and valve seat with an abrasive compound. Do this work by hand.

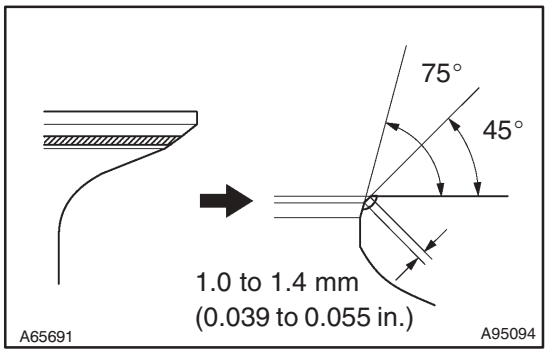
(e) Recheck the valve seating position.

11. REPAIR EXHAUST VALVE SEATS

NOTICE:



Releasing the seat–cutter pressure gradually make the valve seat faces smooth.

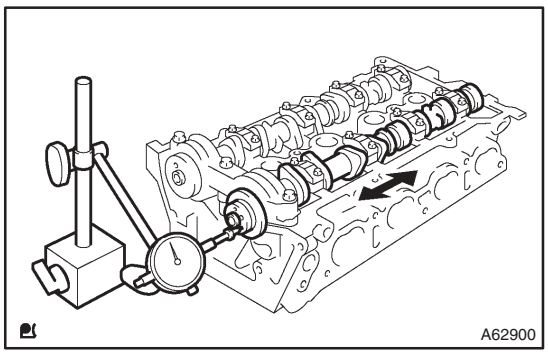


(a) Using the 45° cutter, cut the valve face of the cylinder head a little wider than the specified valve seating width.

(b) Confirm that the valve fits the valve seat center portion. If not, re–cut the valve face with the 45° cutter.

(c) Adjust the valve face with the 30° or 75° cutter to accurately fit the valve seat center portion.

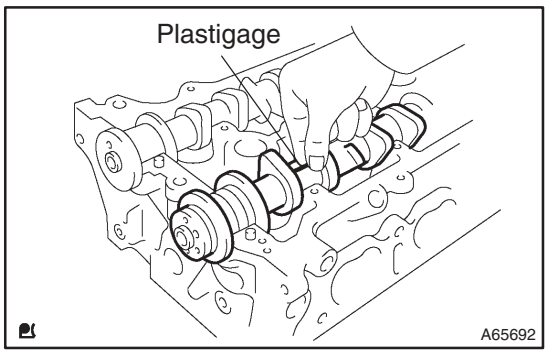
(1) If the seating is too high on the valve face, use the 30° and 45° cutters to correct the seat.



(2) If the seating is too low on the valve face, use the 75° and 45° cutters to correct the seat.

(d) Lap the valve and valve seat with an abrasive compound. Do this work by hand.

(e) Recheck the valve seating position.



12. INSPECT CAMSHAFT THRUST CLEARANCE

(a) Install the 2 camshafts.

(b) Using a dial indicator, measure the thrust clearance while moving the camshaft back and forth.

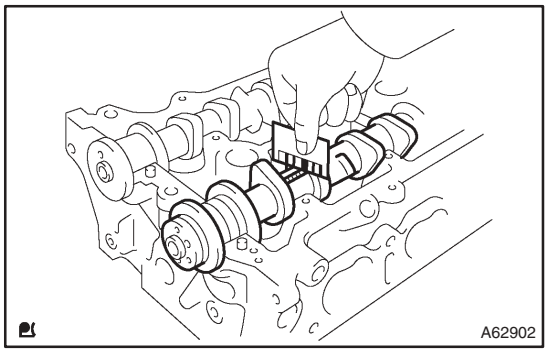
Standard thrust clearance:
0.040 to 0.095 mm (0.0016 to 0.0037 in.)
Maximum thrust clearance: 0.110 mm (0.0043 in.)

If the thrust clearance is greater than maximum, replace the cylinder head. If damages are found on the camshaft thrust surfaces, replace the camshaft.

13. INSPECT CAMSHAFT OIL CLEARANCE

(a) Clean the 9 bearing caps and camshaft journals.

(b) Place the camshafts on the cylinder head.



(c) Lay a strip of Plastigage across each of the camshaft journal.

(d) Install the 9 bearing caps. (See page 14–4)

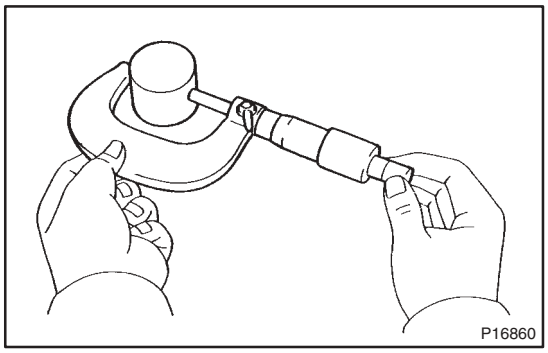
NOTICE:

Do not turn the camshaft.

(e) Remove the 9 bearing caps. (See page 14–4)

(f) Measure the Plastigage at its widest point.

Standard oil clearance:



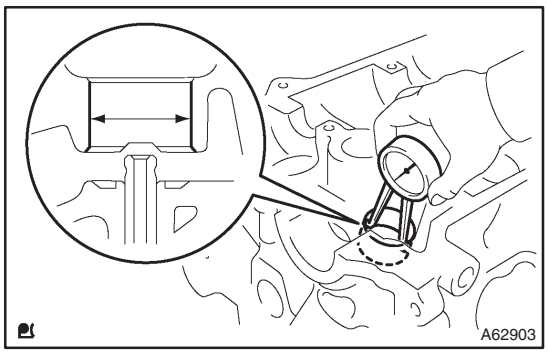
0.035 to 0.072 mm (0.0014 to 0.0028 in.)

Maximum oil clearance: 0.10 mm (0.0039 in.)

NOTICE:

Completely remove the Plastigage after measuring.

If the oil clearance is greater than maximum, replace the cylinder head or the camshaft.



14. INSPECT VALVE LIFTER

(a) Using a micrometer, measure the valve lifter diameter.

Lifter diameter:

30.966 to 30.976 mm (1.2191 to 1.2195 in.)

If the diameter is not as specified, replace the valve lifter.

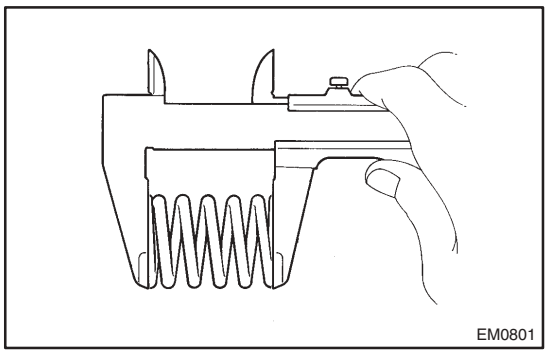
15. INSPECT VALVE LIFTER OIL CLEARANCE

(a) Using a caliper gauge, measure the valve lifter bore diameter of the cylinder head.

Lifter bore diameter:

31.000 to 31.025 mm (1.2205 to 1.2215 in.)

If the diameter is not as specified, replace the cylinder head.



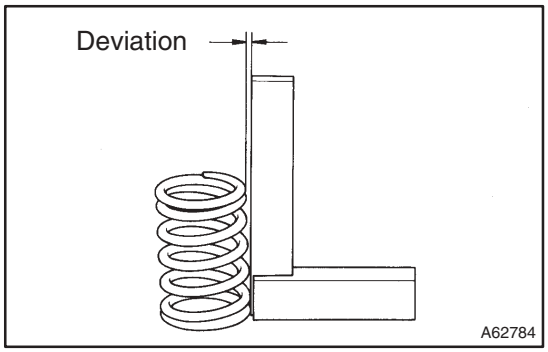
(b) Subtract the valve lifter diameter measurement from the valve lifter bore diameter measurement.

Standard oil clearance:

0.024 to 0.059 mm (0.0009 to 0.0023 in.)

Maximum oil clearance: 0.079 mm (0.0031 in.)

If the oil clearance is greater than maximum, replace the valve lifter. If necessary, replace the cylinder head.



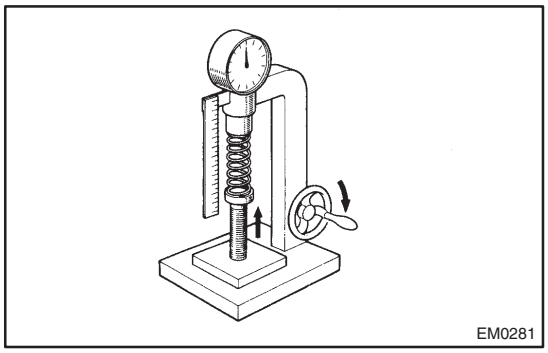
EM0801

16. INSPECT INNER COMPRESSION SPRING

(a) Using a vernier caliper, measure the free length of the inner compression spring.

Free length: 43.40 mm (1.7087 in.)

If the length is not as specified, replace the inner compression spring.



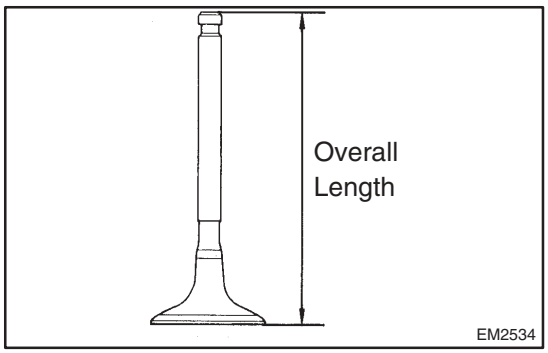
A62784

(b) Using a steel square, measure the deviation of the inner compression spring.

Maximum deviation: 1.6 mm (0.063 in.)

Maximum angle (reference) : 2°

If the deviation is greater than maximum, replace the inner compression spring.



EM0281

(c) Using a spring tester, measure the tension of the inner compression spring at the specified installed length.

Installed tension:
158.6 to 175.4 N (16.2 to 17.9 kgf, 35.7 to 39.5 lbf)
at 33.6 mm (1.323 in.)

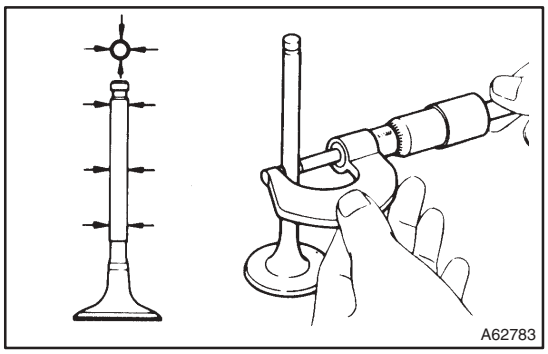
Maximum working tension:
335.3 to 370.7 N (34.2 to 37.8 kgf, 75.4 to 83.3 lbf)
at 24.1 mm (0.949 in.)

If the installed tension is not as specified, replace the inner compression spring.

EM2534

17. INSPECT VALVE

(a) Using a vernier calipers, check the valve overall length.



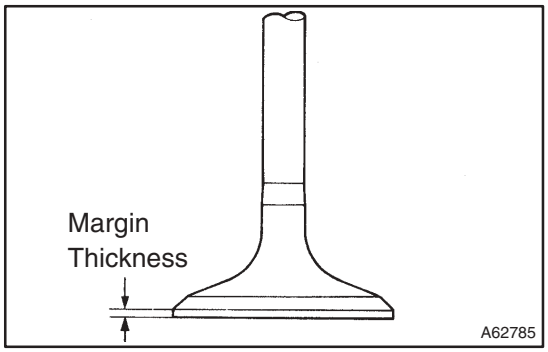
Standard overall length:

Item	Specification
Intake	88.65 mm (3.4902 in.)
Exhaust	88.69 mm (3.4917 in.)

Minimum overall length:

Item	Specification
Intake	88.35 mm (3.4784 in.)
Exhaust	88.39 mm (3.4799 in.)

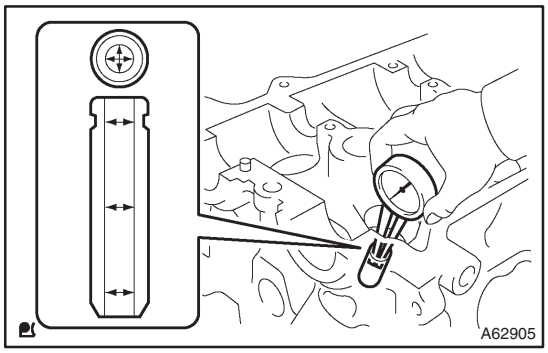
If the overall length is less than minimum, replace the valve.



(b) Using a micrometer, measure the diameter of the valve stem.

Valve stem diameter:

Item	Specification
Intake	5.470 to 5.485 mm (0.2154 to 0.2159 in.)
Exhaust	5.465 to 5.480 mm (0.2152 to 0.2158 in.)



If the diameter is not as specified, replace the valve.

(c) Using a vernier calipers, check the valve head margin thickness.

Standard margin thickness: 1.0 mm (0.039 in.)
Minimum margin thickness: 0.7 mm (0.028 in.)

If the overall length is less than minimum, replace the valve.

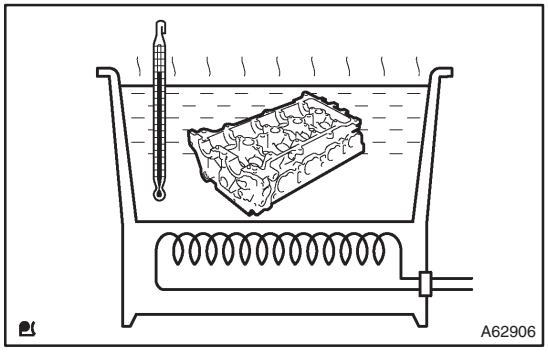
18. INSPECT VALVE GUIDE BUSHING OIL CLEARANCE

(a) Using a caliper gauge, measure the inside diameter of the valve guide bushing.

Busing inside diameter:
5.510 to 5.530 mm (0.2169 to 0.2177 in.)

If the diameter is not as specified, replace the valve guide bushing.

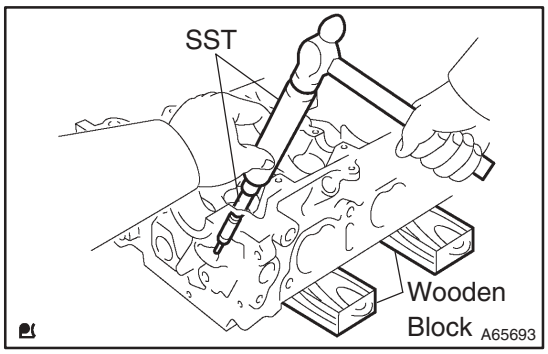
(b) Subtract the valve stem diameter measurement from the guide bushing inside diameter measurement.



Standard oil clearance:

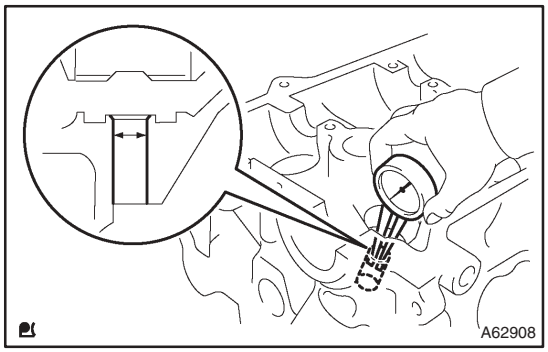
Item	Specification
Intake	0.025 to 0.060 mm (0.0010 to 0.0024 in.)
Exhaust	0.030 to 0.065 mm (0.0012 to 0.0026 in.)

Maximum oil clearance:



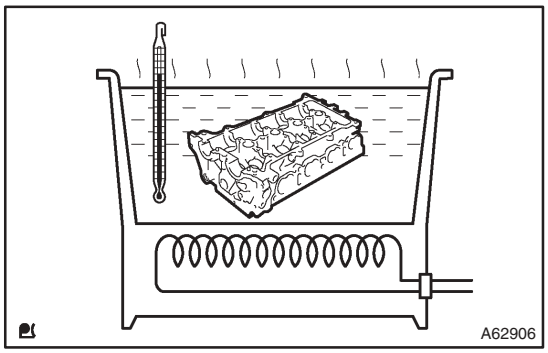
Item	Specification
Intake	0.08 mm (0.0032 in.)
Exhaust	0.10 mm (0.0039 in.)

If the oil clearance is greater than maximum, replace the valve and valve guide bushing.

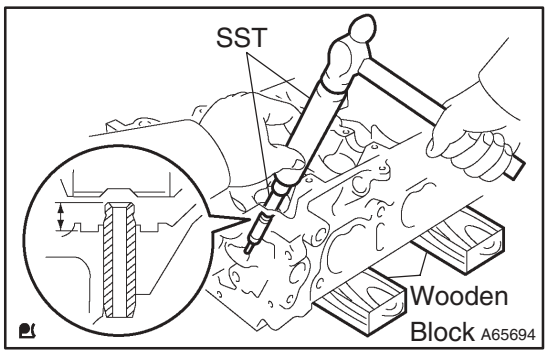


19. REPLACE VALVE GUIDE BUSHING

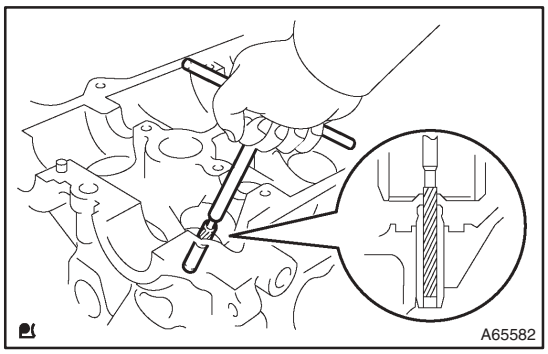
(a) Heat the cylinder head up to 80 to 100°C (176 to 212°F).



(b) Place the cylinder head on the wooden blocks.
(c) Using SST, tap out the valve guide bushing.
SST 09201–10000 (09201–01050), 09201–01055, 09950–70010 (09951–07100)

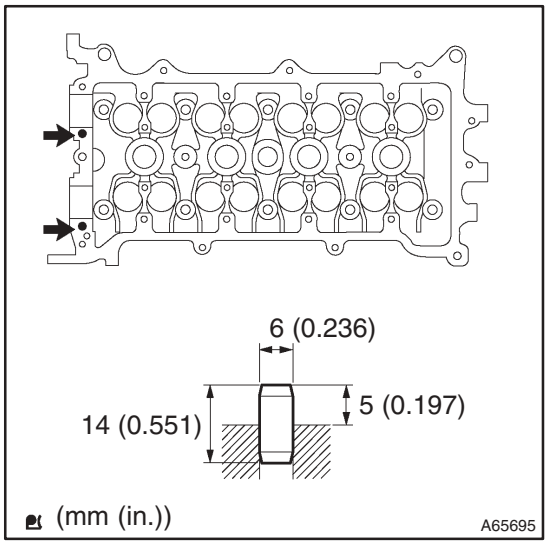


(d) Using a caliper gauge, measure the bushing bore diameter of the cylinder head.
Diameter: 10.285 to 10.306 mm (0.4049 to 0.4058 in.)
If the bushing bore diameter of the cylinder head is greater than 10.306 mm (0.4058 in.), machine the bushing bore to the dimension of 10.335 to 10.356 mm (0.4069 to 0.4077 in.) to install an over size valve guide bushing.
HINT:

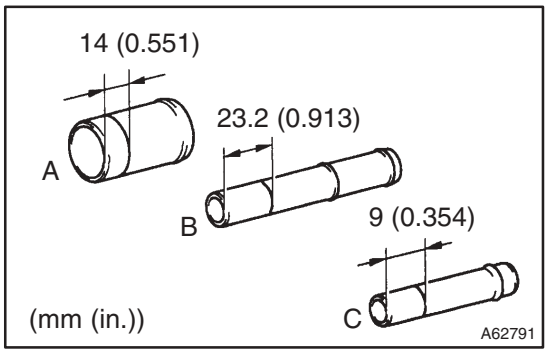


Valve guide bushing size	Bushing bore diameter mm (in.)
STD	10.285 to 10.306 (0.4049 to 0.4058)
O/S 0.05	10.335 to 10.356 (0.4069 to 0.4077)

(e) Heat the cylinder head up to 80 to 100°C (176 to 212°F).

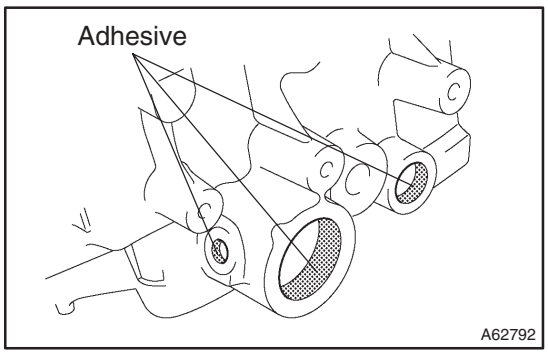


(f) Place the cylinder head on wooden blocks.
(g) Using SST, tap in a new valve guide bushing to the specified height.
SST 09201–10000 (09201–01050), 09201–01055, 09950–70010 (09951–07100)
Height: 8.7 to 9.1 mm (0.343 to 0.358 in.)



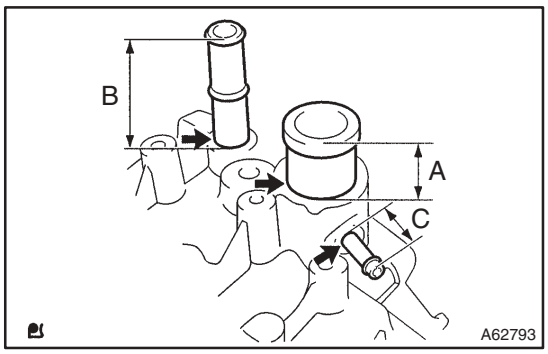
(h) Using a sharp 5.5 mm reamer, ream the valve guide bushing to obtain the standard specified clearance.
Standard oil clearance:

Item	Specification
Intake	0.025 to 0.060 mm (0.0010 to 0.0024 in.)
Exhaust	0.030 to 0.065 mm (0.0012 to 0.0026 in.)



20. INSTALL STRAIGHT PIN

(a) Using a plastic hammer, install the new 2 straight pins.
Standard protrusion: 5 mm (0.197 in.)



21. INSTALL UNION

(a) Mark the standard position on the union with paint.

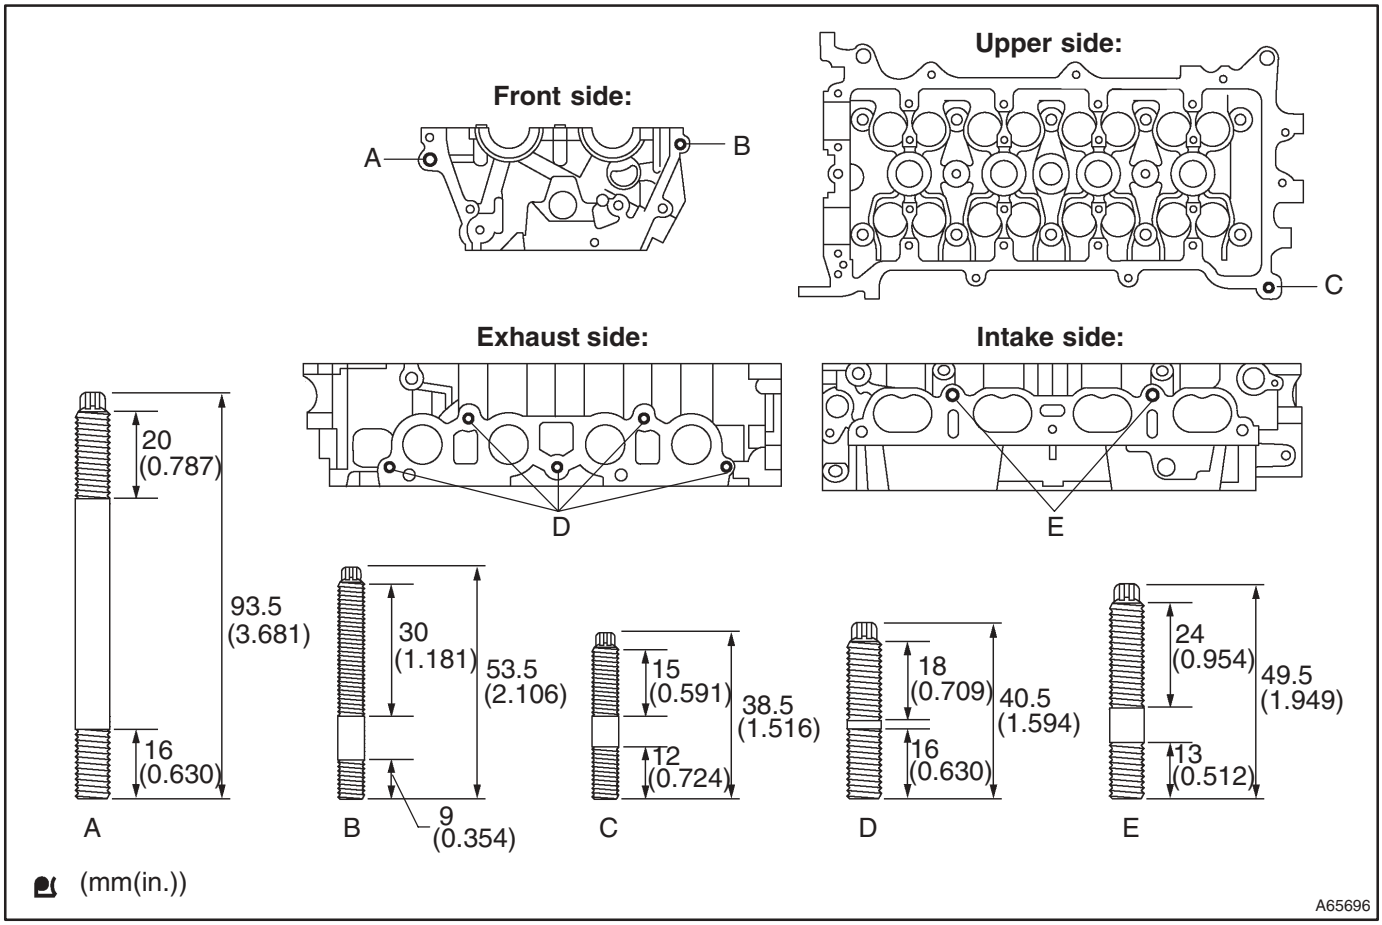
(b) Apply adhesive to the union hole of the cylinder head.
Adhesive:
Part No. 08833–00070, THREE BOND 1324 or equivalent.

(c) Using a press, press in a new union until the standard marks come to the level of the cylinder head surface.

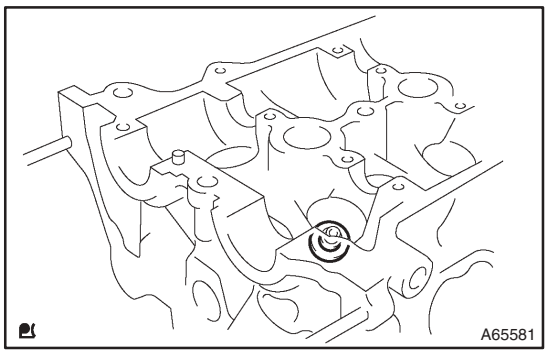
Standard protrusion:

Item	Specification
A	29 mm (1.142 in.)
B	66.5 mm (2.618 in.)
C	24 mm (0.945 in.)

NOTICE:



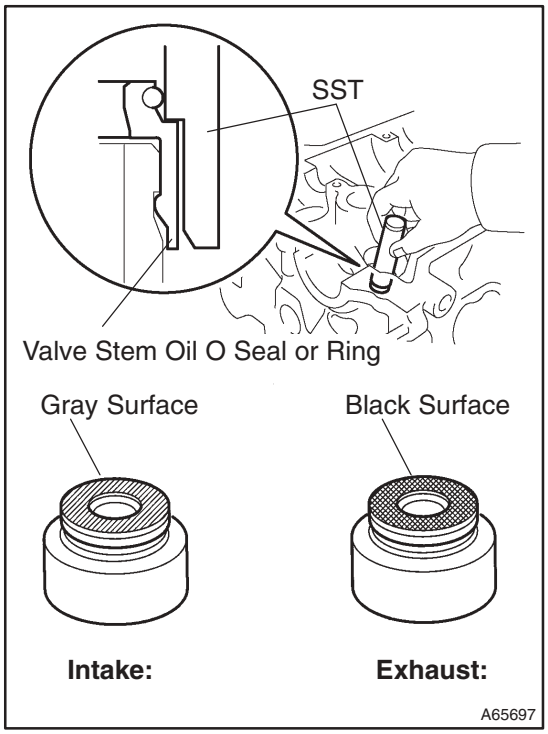
- **Install the union within 3 minutes after applying adhesive.**
- **Do not put into coolant at least for an hour after installation.**



22. INSTALL STUD BOLT

(a) Using torx socket wrenches E5 and E7, install the 11 stud bolts.

Torque:



Item	Specification
A	9.5 N·m (97 kgf·cm, 84 in.·lbf)
B	5.0 N·m (51 kgf·cm, 44 in.·lbf)
C	5.0 N·m (51 kgf·cm, 44 in.·lbf)
D	9.5 N·m (97 kgf·cm, 84 in.·lbf)
E	9.5 N·m (97 kgf·cm, 84 in.·lbf)

23. INSTALL VALVE SPRING SEAT

(a) Install the 8 valve spring seats onto the cylinder head.

24. INSTALL VALVE STEM OIL O SEAL OR RING

(a) Apply a light coat of engine oil to a new valve stem oil seals.

NOTICE:

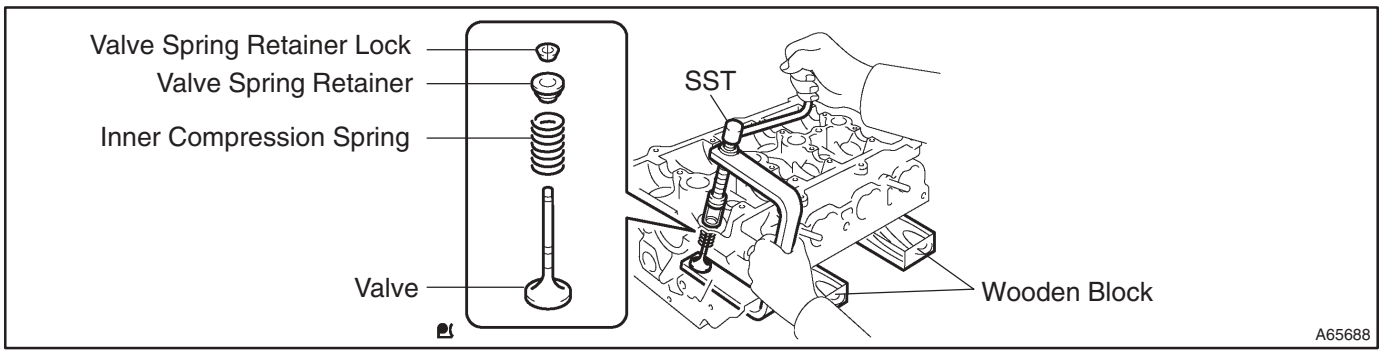
Be careful to assemble the oil seal for intake and exhaust. Assembling the wrong one may cause a failure.

HINT:

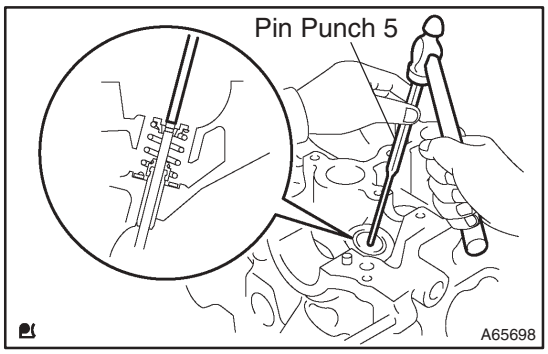
The intake valve stem oil seal is gray and exhaust valve stem oil seal is black.

(b) Using SST, push in the valve stem oil seals by hand.
SST 09201–41020

25. INSTALL VALVE



HINT:

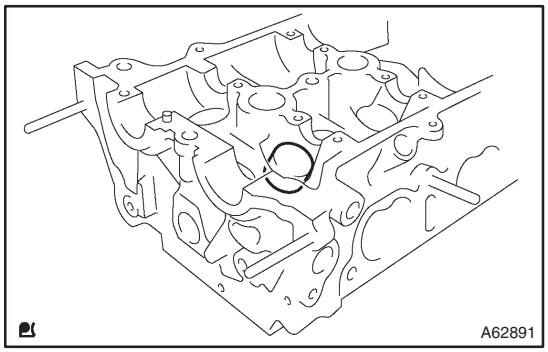


Remove all the valves from the cylinder head according to the procedure below.

(a) Place the cylinder head on wooden blocks.

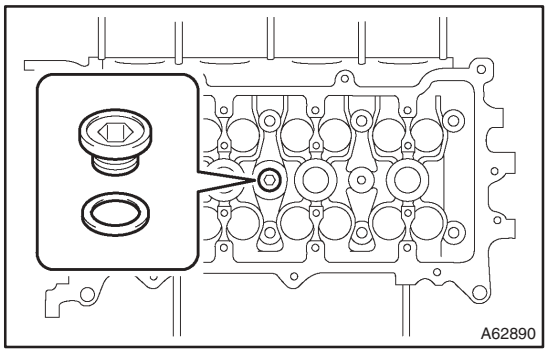
(b) Install the valves, inner compression springs and valve spring retainers onto the cylinder head.

(c) Using SST, compress the inner compression spring, and place the 2 valve spring retainer locks around the valve stem.
SST 09202–70020 (09202–00010, 09202–01010, 09202–01020)



(d) Using a pin punch 5, lightly tap the valve stem tip to ensure a proper fit.

NOTICE:

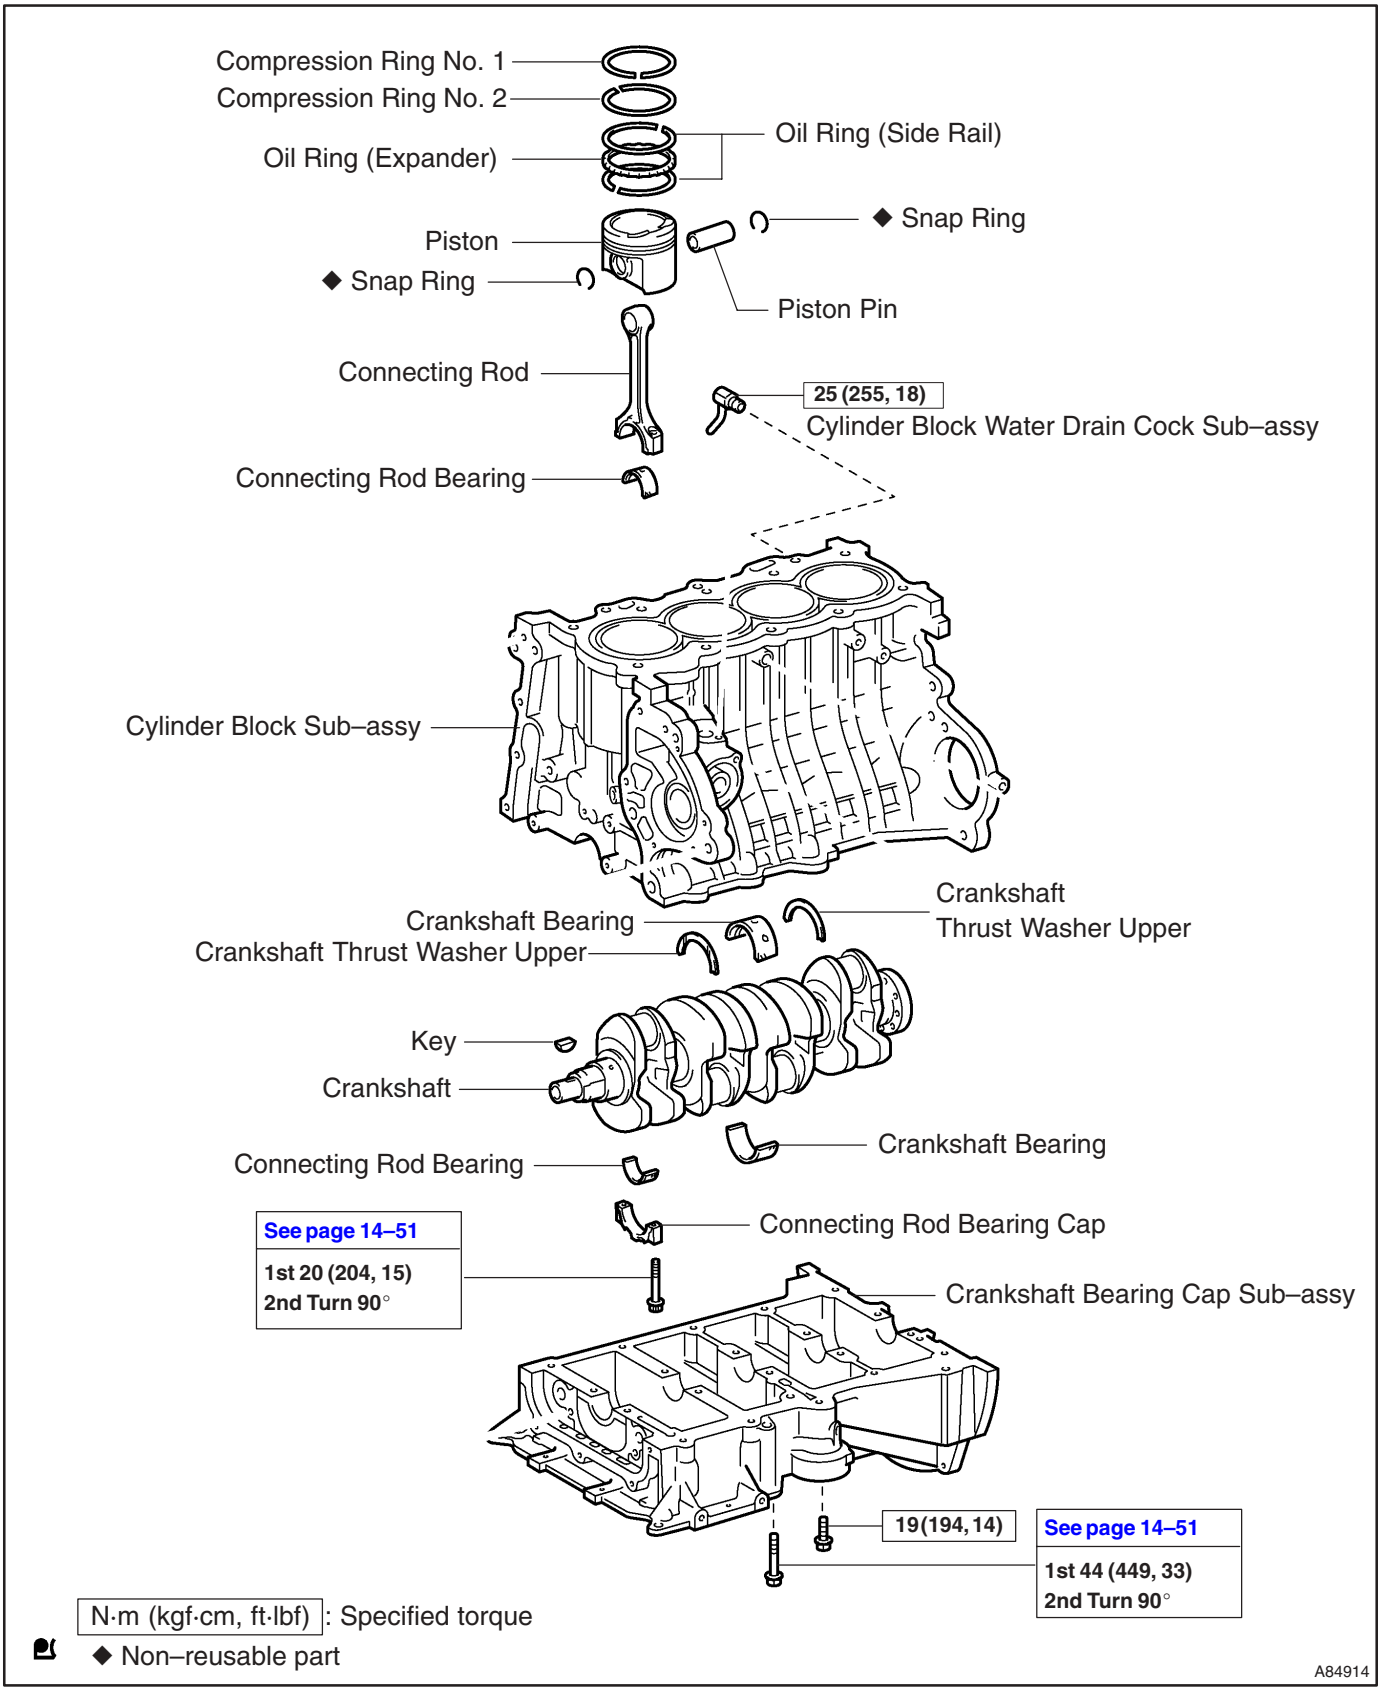


Be careful not to damage the valve stem tip.

26. INSTALL VALVE LIFTER

(a) Apply a light coat of engine oil to the 16 valve lifters.

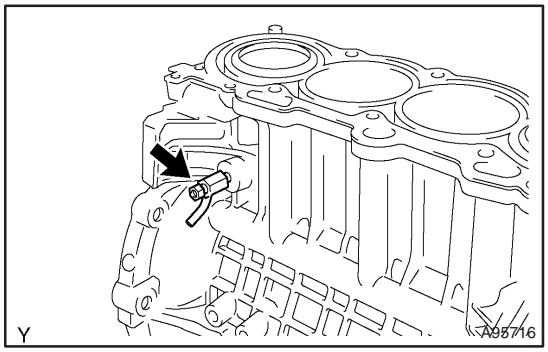
(b) Install the 16 valve lifters onto the cylinder head.



27. INSTALL W/HEAD TAPER SCREW PLUG NO.2

(a) Using a socket hexagon wrench 10, install the taper screw plug with a new gasket.
Torque: 44 N·m (449 kgf·cm, 33 ft·lbf)

CYLINDER BLOCK ASSY (1ZZ–FE/3ZZ–FE)

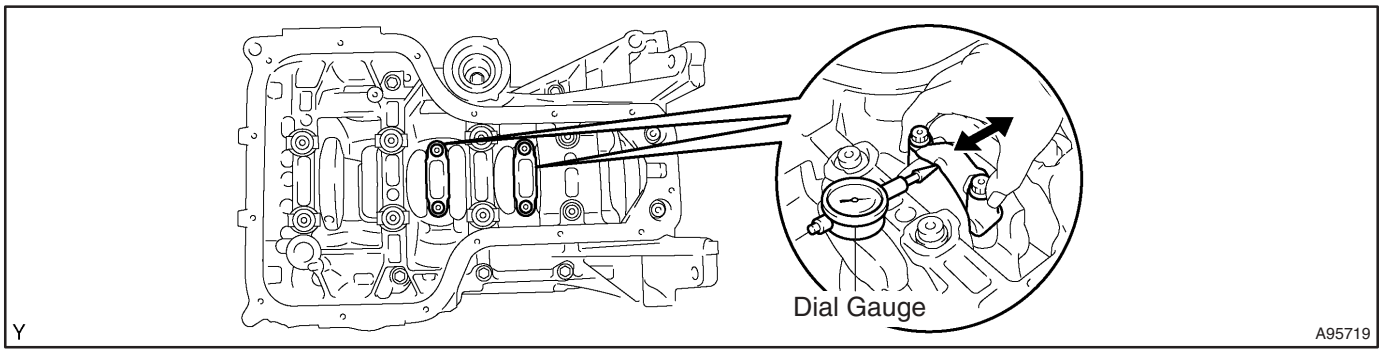


141TJ–01

COMPONENTS

141TK–01

OVERHAUL

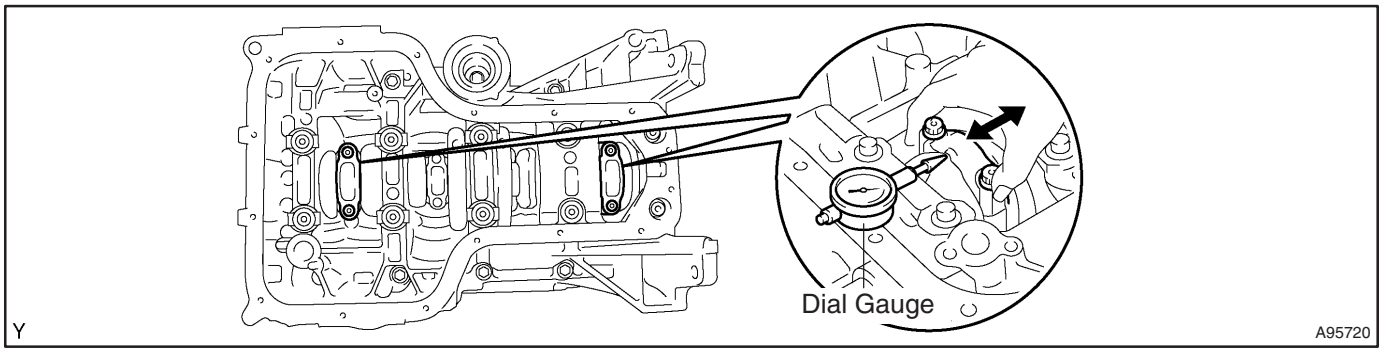


1. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB–ASSY

(a) Remove the cylinder block water drain cock from the cylinder block.

2. INSPECT CONNECTING ROD THRUST CLEARANCE

(a) Turn the crankshaft and set the No. 1 cylinder to the TDC/compression.



(b) Using a dial indicator, measure the thrust clearance of the No. 2 and No. 3 cylinders while moving the connecting rod back and forth.

Standard thrust clearance:
0.160 to 0.342 mm (0.0063 to 0.0135 in.)
Maximum thrust clearance:
0.342 mm (0.0135 in.)

- If the thrust clearance is greater than maximum, replace the connecting rod.
- If necessary, replace the crankshaft.

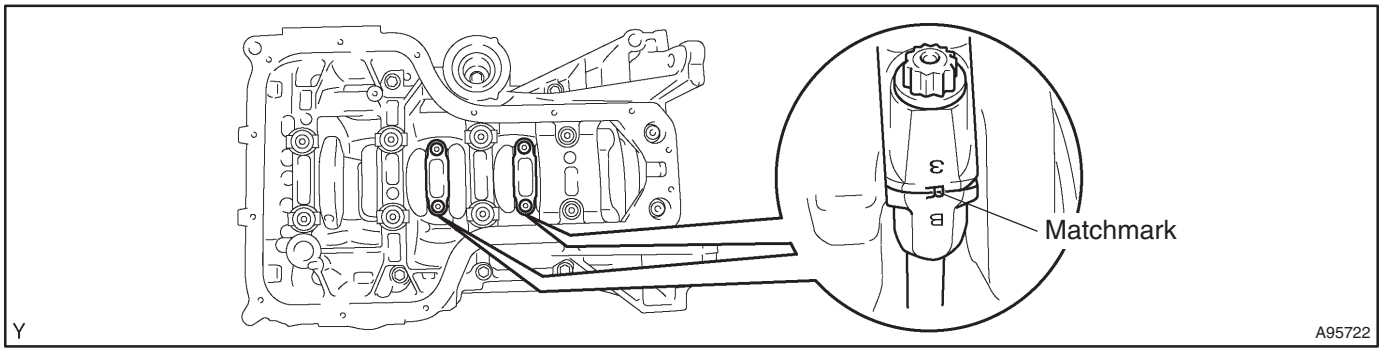
(c) Turn the crankshaft and set the No. 2 cylinder to the TDC/compression.

(d) Using a dial indicator, measure the thrust clearance of the No. 1 and No. 4 cylinders while moving the connecting rod back and forth.

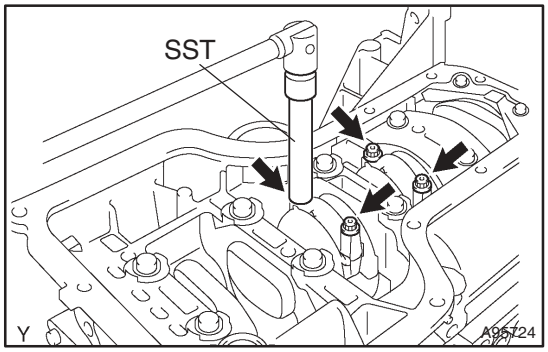
Standard thrust clearance:
0.160 to 0.342 mm (0.0063 to 0.0135 in.)
Maximum thrust clearance:
0.342 mm (0.0135 in.)

- If the thrust clearance is greater than maximum, replace the connecting rod.
- If necessary, replace the crankshaft.

3. INSPECT CONNECTING ROD OIL CLEARANCE



(a) Turn the crankshaft and set the No. 1 cylinder to the TDC/compression.

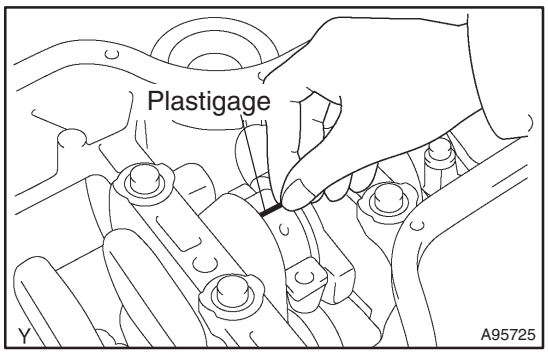


(b) Measure the oil clearance of the No. 2 and No. 3 cylinders.

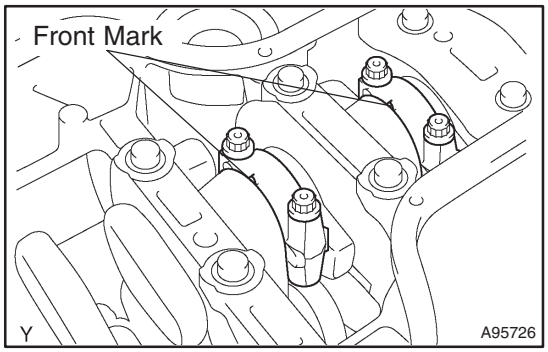
NOTICE:
Do not turn the crankshaft during the measurement.

(1) Using marking paint, write the matched cylinder number on each connecting rod and cap.

HINT:
The matchmarks on the connecting rods and caps are for ensuring correct reassembling.

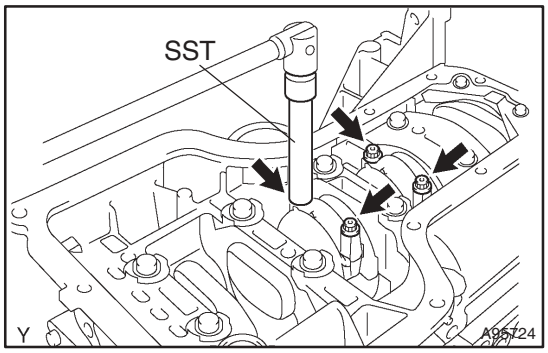


(2) Using SST, remove the 4 bolts and 2 connecting rod caps as shown.



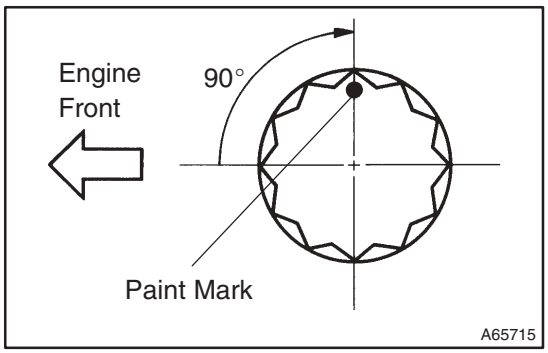
SST 09205–16010

(3) Clean the crank pin and bearing.

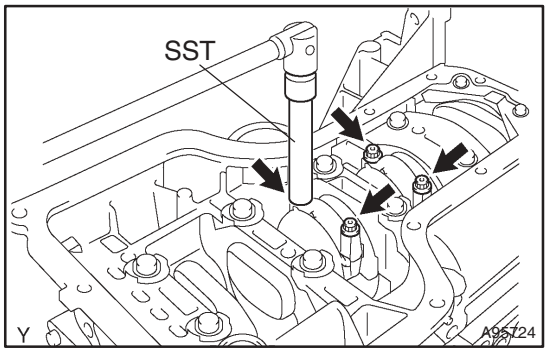


(4) Check the crank pin and bearing for pitting and scratches.

(5) Lay a strip of Plastigage across the crank pin.

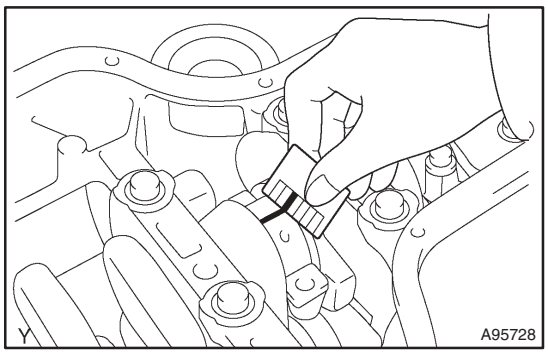


(6) Check that the front marks of the 2connecting rod caps are facing in the correct direction.
(7) Apply a light coat of engine oil to the threads and under the heads of the connecting rod cap bolts.



(8) Using SST, tighten the 2 bolts in several passes to the specified torque.

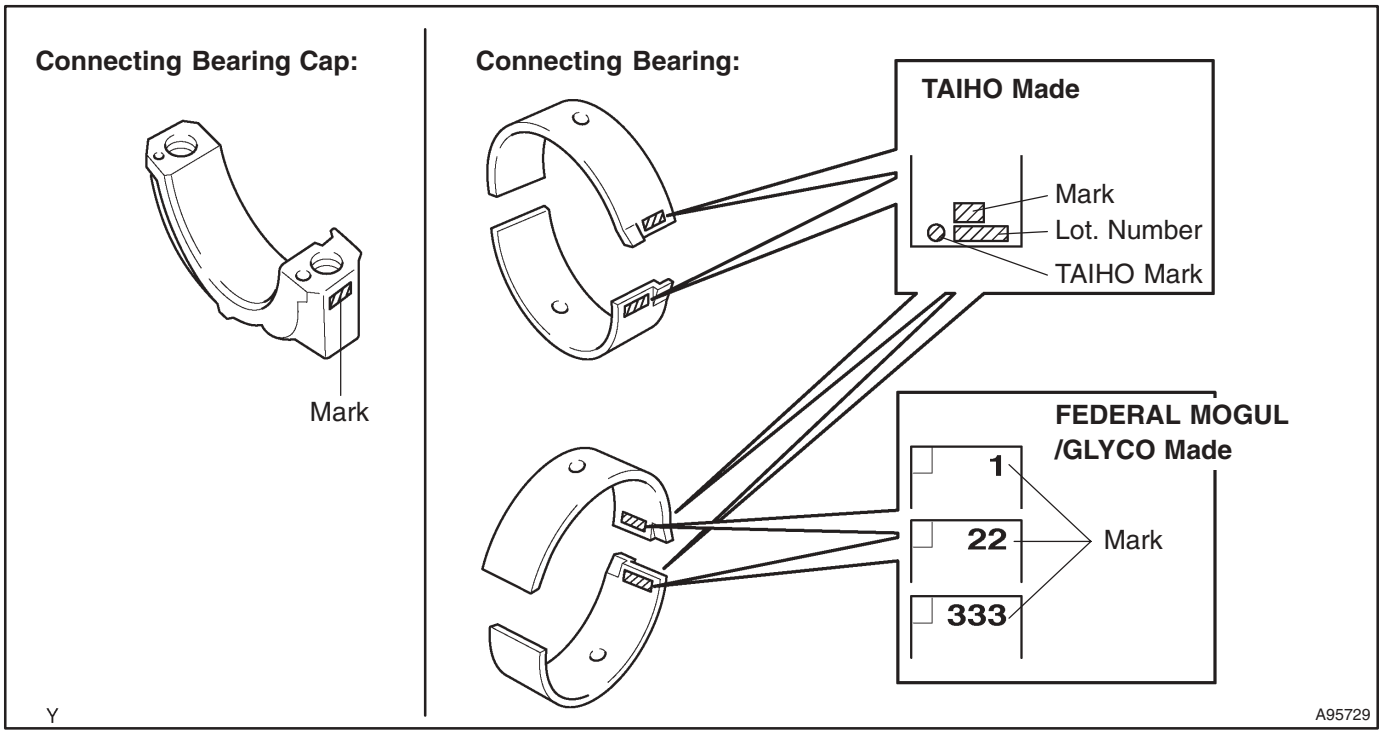
SST 09205–16010



Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

(9) Mark the front of the connecting cap bolts with paint.
(10) Retighten the cap bolts by an additional 90° as shown in the illustration.
(11) Check that the crankshaft turns smoothly.

(12) Remove the 4 bolts and 2 connecting rod caps.



(13) Measure the Plastigage at its widest point.

Standard oil clearance:
0.028 to 0.060 mm (0.0011 to 0.0024 in.)
Maximum oil clearance: 0.080 mm (0.0031 in.)

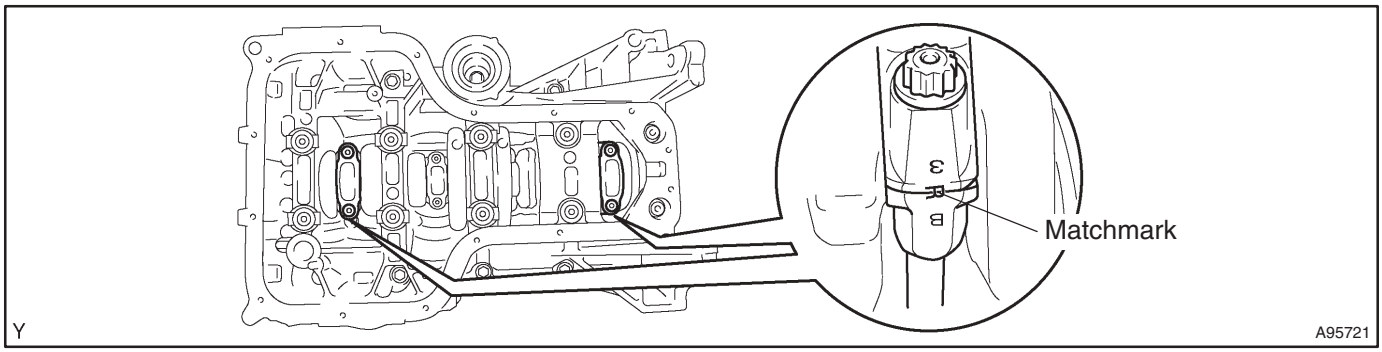
NOTICE:
Remove the Plastigage completely after the measurement.

- If the oil clearance is greater than maximum, replace the connecting rod bearing.
- If necessary, grind or replace the crankshaft.

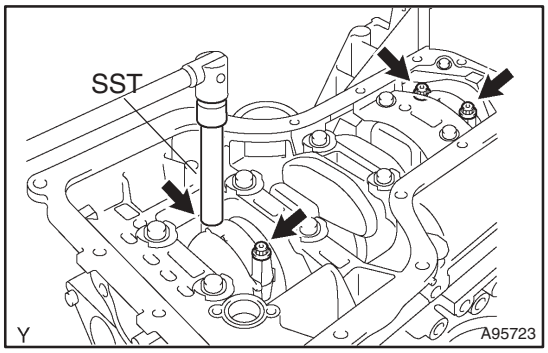
HINT:

- The TAIHO mark is either on the claw side or the opposite side.
- If replacing a bearing, select a new one having the same number as marked on the connecting rod. There are 3 sizes of standard bearings, marked ”1”, ”2” and ”3” accordingly.

Item	Mark	Specification
Connecting rod bearing cap bore diameter	1 2 3	47.000 to 47.008 mm (1.8504 to 1.8507 in.) 47.009 to 47.016 mm (1.8507 to 1.8510 in.) 47.017 to 47.024 mm (1.8511 to 1.8513 in.)
Connecting rod bearing thickness	1 2 3	1.486 to 1.490 mm (0.0585 to 0.0587 in.) 1.491 to 1.494 mm (0.0587 to 0.0588 in.) 1.495 to 1.498 mm (0.0589 to 0.0590 in.)
Crankshaft pin outer diameter	–	43.992 to 44.000 mm (1.7320 to 1.7323 in.)

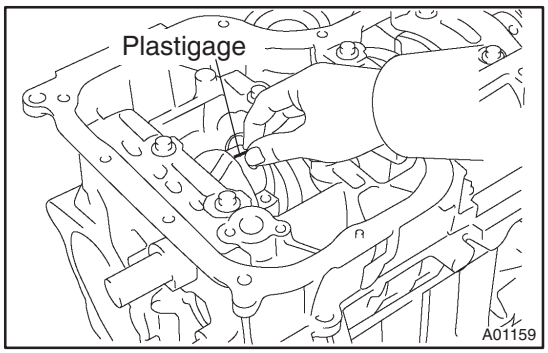


(c) Turn the crankshaft and set the No. 2 cylinder to the TDC/compression.



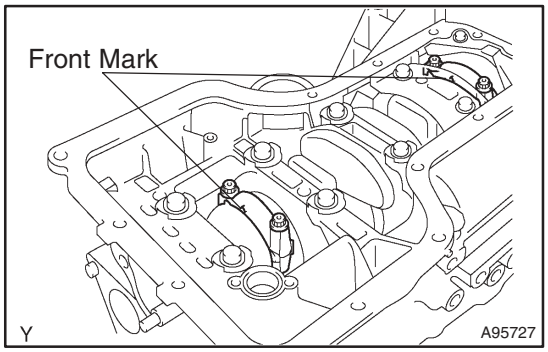
(d) Measure the oil clearance of the No. 1 and No. 4 cylinders.

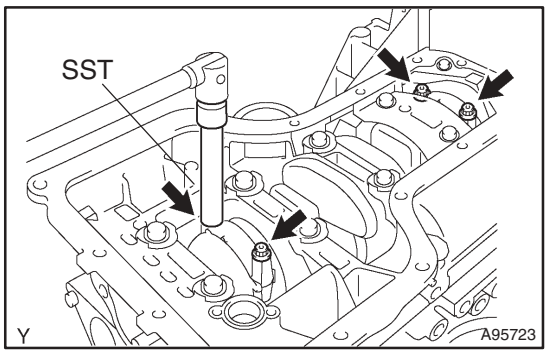
NOTICE:
Do not turn the crankshaft during the measurement.



(1) Using marking paint, write the matched cylinder number on each connecting rod and cap.

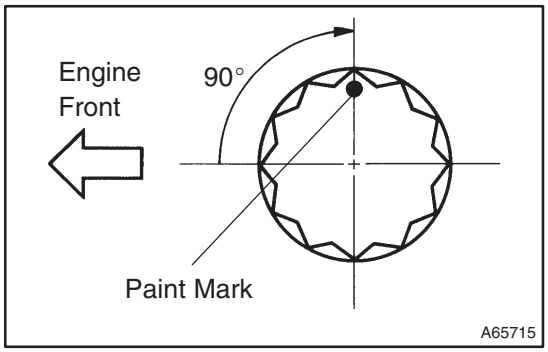
HINT:
The matchmarks on the connecting rods and caps are for ensuring correct reassembling.





(2) Using SST, remove the 4 bolts and 2 connecting rod caps as shown.
SST 09205–16010
(3) Clean the crank pin and bearing.
(4) Check the crank pin and bearing for pitting and scratches.

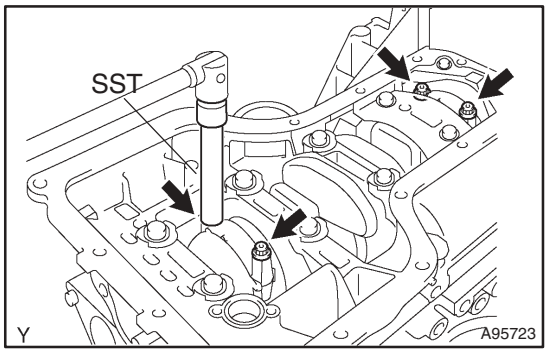
(5) Lay a strip of Plastigage across the crank pin.



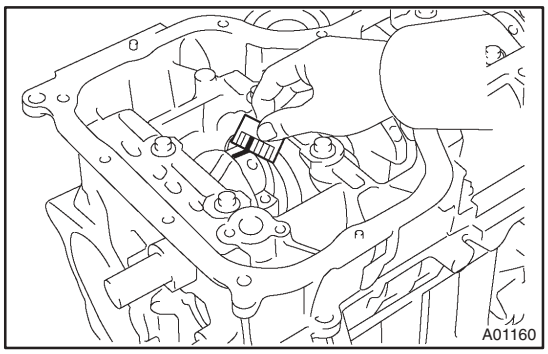
(6) Check that the front marks of the connecting rod cap are facing in the correct direction.
(7) Apply a light coat of engine oil to the threads and under the heads of the connecting rod cap bolts.

(8) Using SST, tighten the 2 bolts in several passes to the specified torque.

SST 09205–16010



Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

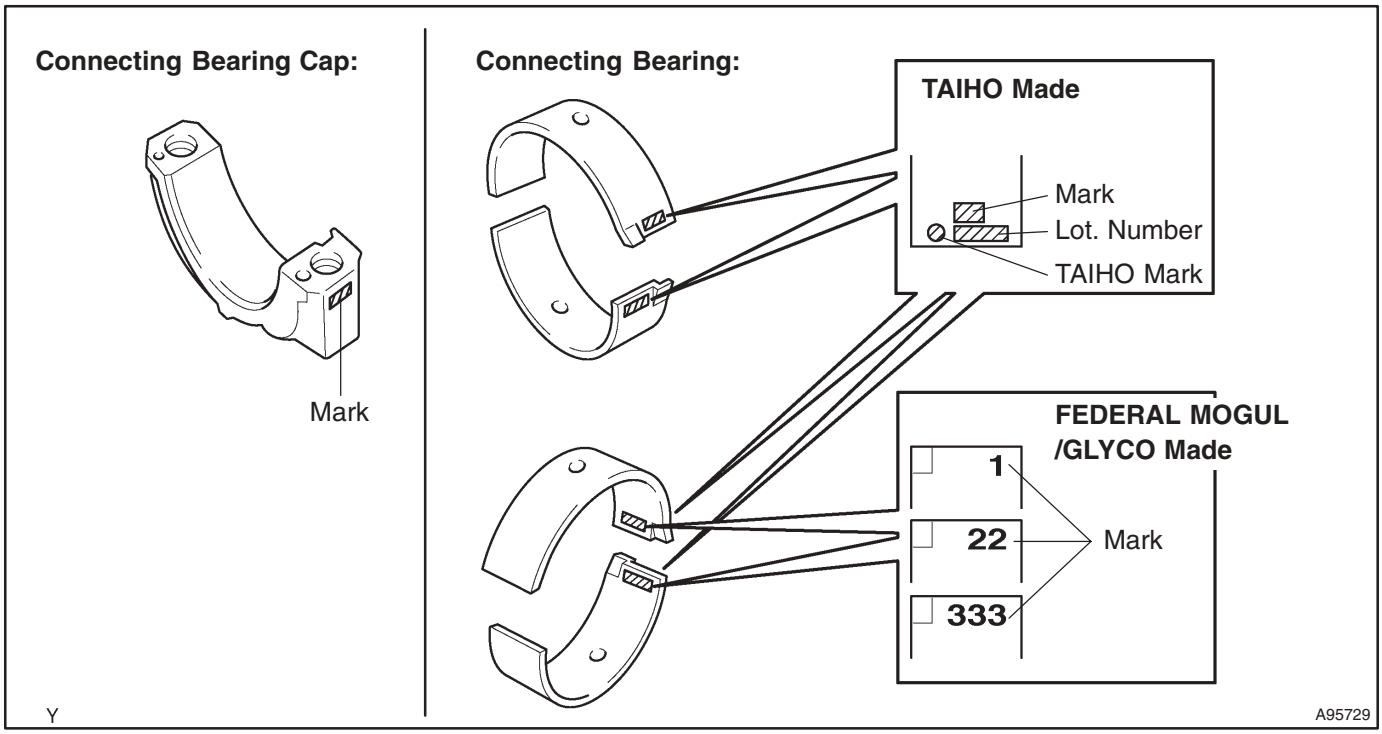


(9) Mark the front of the connecting cap bolts with paint.

(10) Retighten the cap bolts by an additional 90° as shown in the illustration.

(11) Check that the crankshaft turns smoothly.

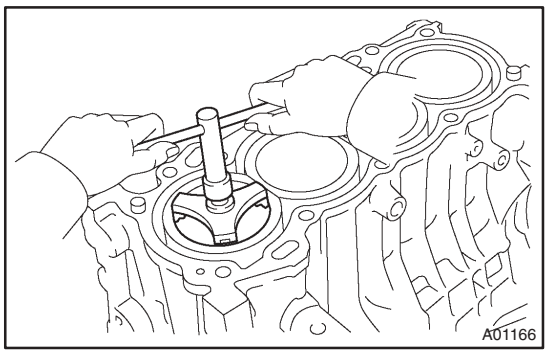
(12) Remove the 4 bolts and 2 connecting rod caps.



(13) Measure the Plastigage at its widest point.

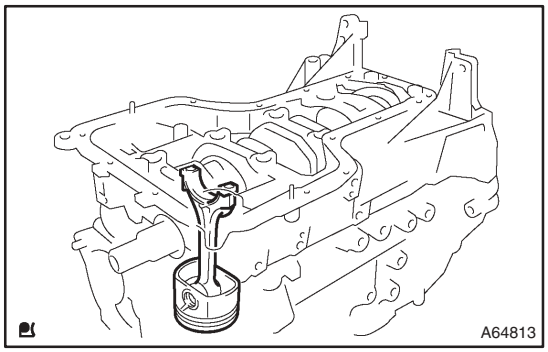
Standard oil clearance:
0.028 to 0.060 mm (0.0011 to 0.0024 in.)
Maximum oil clearance: 0.080 mm (0.0031 in.)

NOTICE:
Remove the Plastigage completely after the measurement.



- If the oil clearance is greater than maximum, replace the connecting rod bearing.
- If necessary, grind or replace the crankshaft.

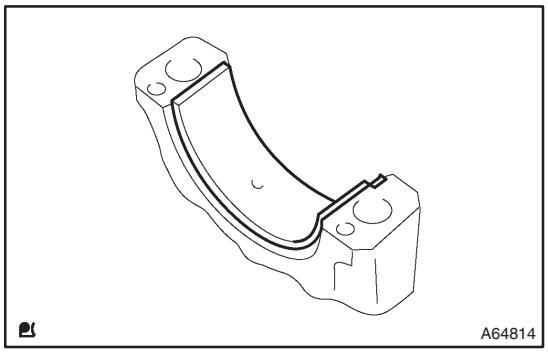
HINT:



- The TAIHO mark is either on the claw side or the opposite side.
- If replacing a bearing, select a new one having the same number as marked on the connecting rod. There are 3 sizes of standard bearings, marked ”1”, ”2” and ”3” accordingly.

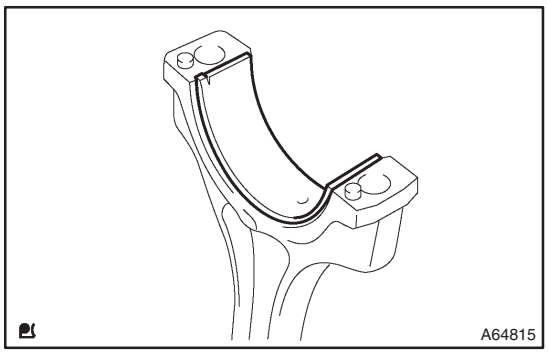
Item	Mark	Specification
Connecting rod bearing cap bore diameter	1	47.000 to 47.008 mm (1.8504 to 1.8507 in.)
	2	47.009 to 47.016 mm (1.8507 to 1.8510 in.)
	3	47.017 to 47.024 mm (1.8511 to 1.8513 in.)
Connecting rod bearing thickness	1	1.486 to 1.490 mm (0.0585 to 0.0587 in.)
	2	1.491 to 1.494 mm (0.0587 to 0.0588 in.)
	3	1.495 to 1.498 mm (0.0589 to 0.0590 in.)
Crankshaft pin outer diameter	–	43.992 to 44.000 mm (1.7320 to 1.7323 in.)

4. REMOVE CONNECTING ROD SUB–ASSY



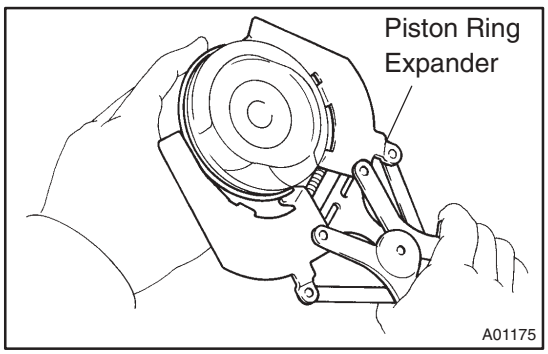
(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.

(b) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.



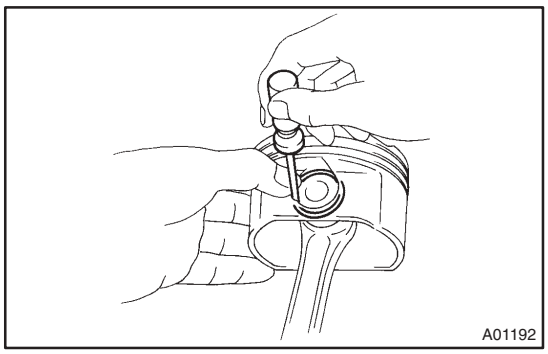
HINT:

- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.



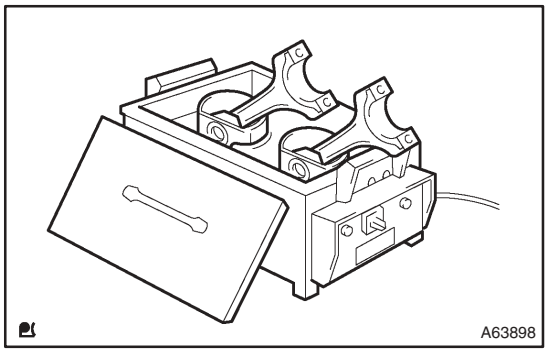
5. REMOVE CONNECTING ROD BEARING

(a) Remove the connecting rod bearing from the connecting rod cap.



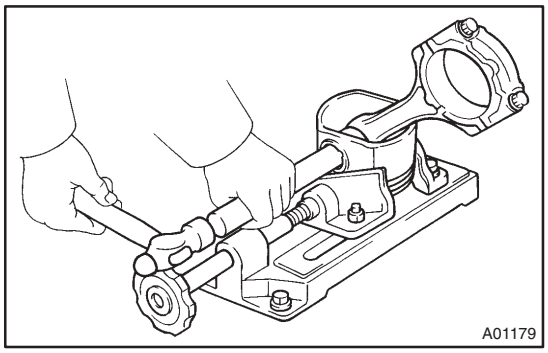
(b) Remove the connecting rod bearing from the connecting rod.

6. REMOVE PISTON RING SET



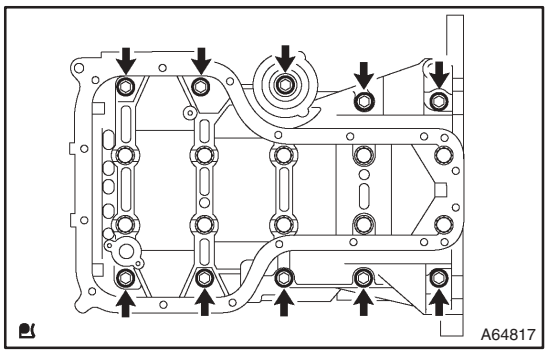
(a) Using a piston ring expander, remove the 2 compression rings.

(b) Remove the 2 side rails and oil ring by hand.



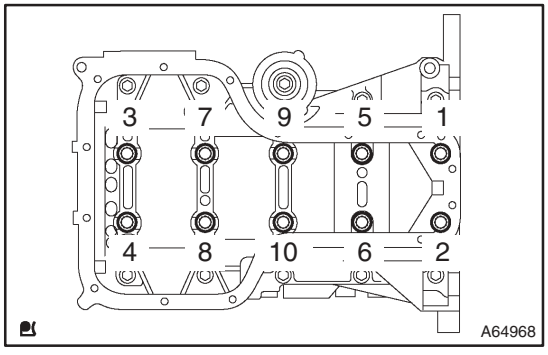
7. REMOVE W/PIN PISTON SUB–ASSY

(a) Using a small screwdriver, pry out the 2 snap rings.



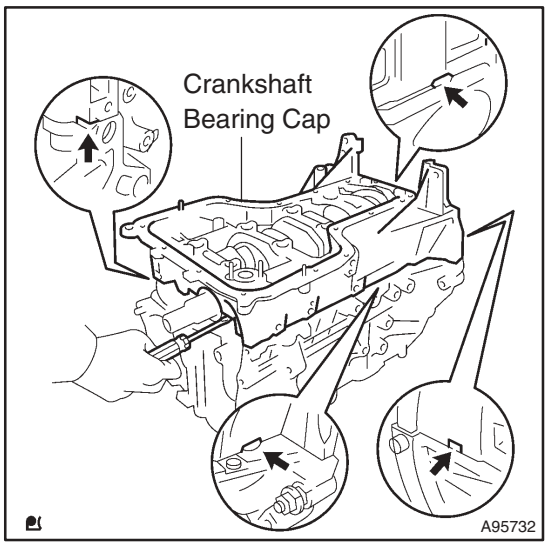
(b) Heat the piston up to 80 to 90°C (176 to 194°F).

(c) Using a plastic hammer and brass bar, lightly tap out the piston pin, then remove the connecting rod.



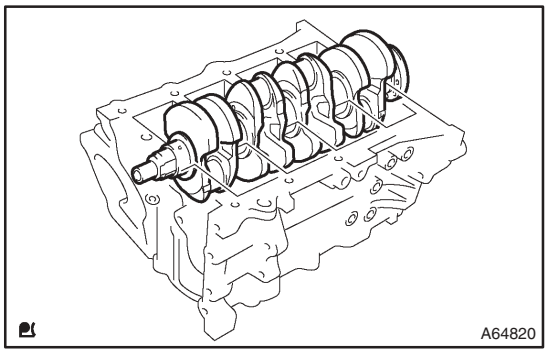
HINT:

- The piston and pin are a matched set.
- Arrange the piston, pins, ring, connecting rod and bearings in the correct order.

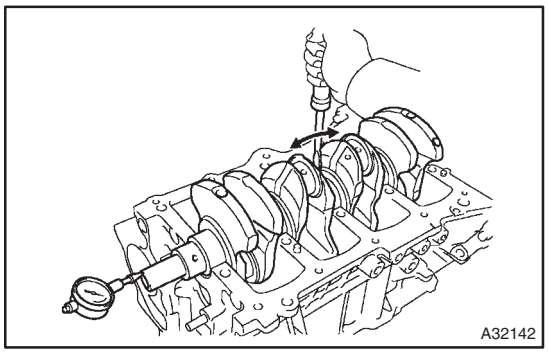


8. REMOVE CRANKSHAFT

(a) Remove the 10 bolts from the crankshaft bearing cap.



(b) Uniformly loosen the 10 bearing cap bolts in several passes in the sequence shown in the illustration.

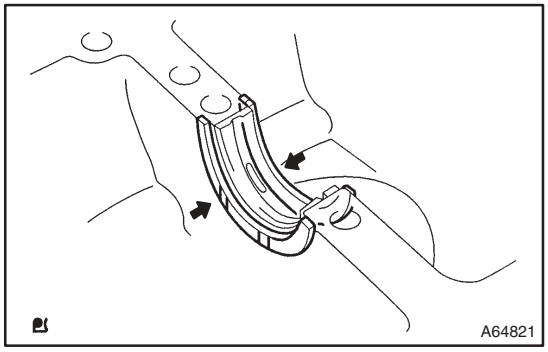


(c) Using a screwdriver, remove the crankshaft bearing cap by prying the indicated portions between the cylinder block and bearing cap.

NOTICE:

Be careful not to damage the contact surfaces of the cylinder block and bearing cap.

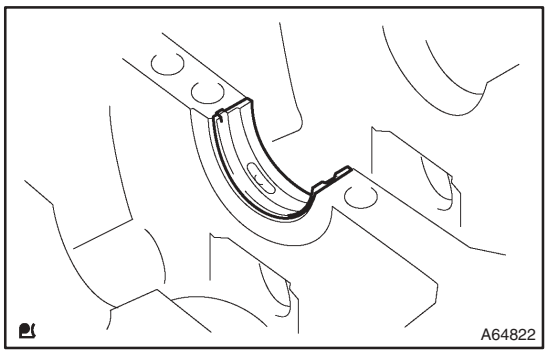
(d) Remove the crankshaft from the cylinder block.



9. INSPECT CRANKSHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

Standard thrust clearance:
0.04 to 0.24 mm (0.0016 to 0.0094 in.)
Maximum thrust clearance: 0.30 mm (0.0118 in.)

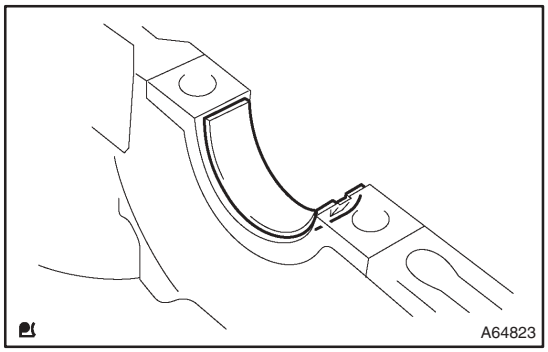


- If the thrust clearance is greater than maximum, measure the thrust washer thickness.
- If the thickness is not as specified, replace the thrust washer.

HINT:
Thrust washer thickness: 2.430 to 2.480 mm (0.0957 to 0.0976 in.).

10. REMOVE CRANKSHAFT THRUST WASHER UPPER

(a) Remove the 2 crankshaft thrust washers from the cylinder block.

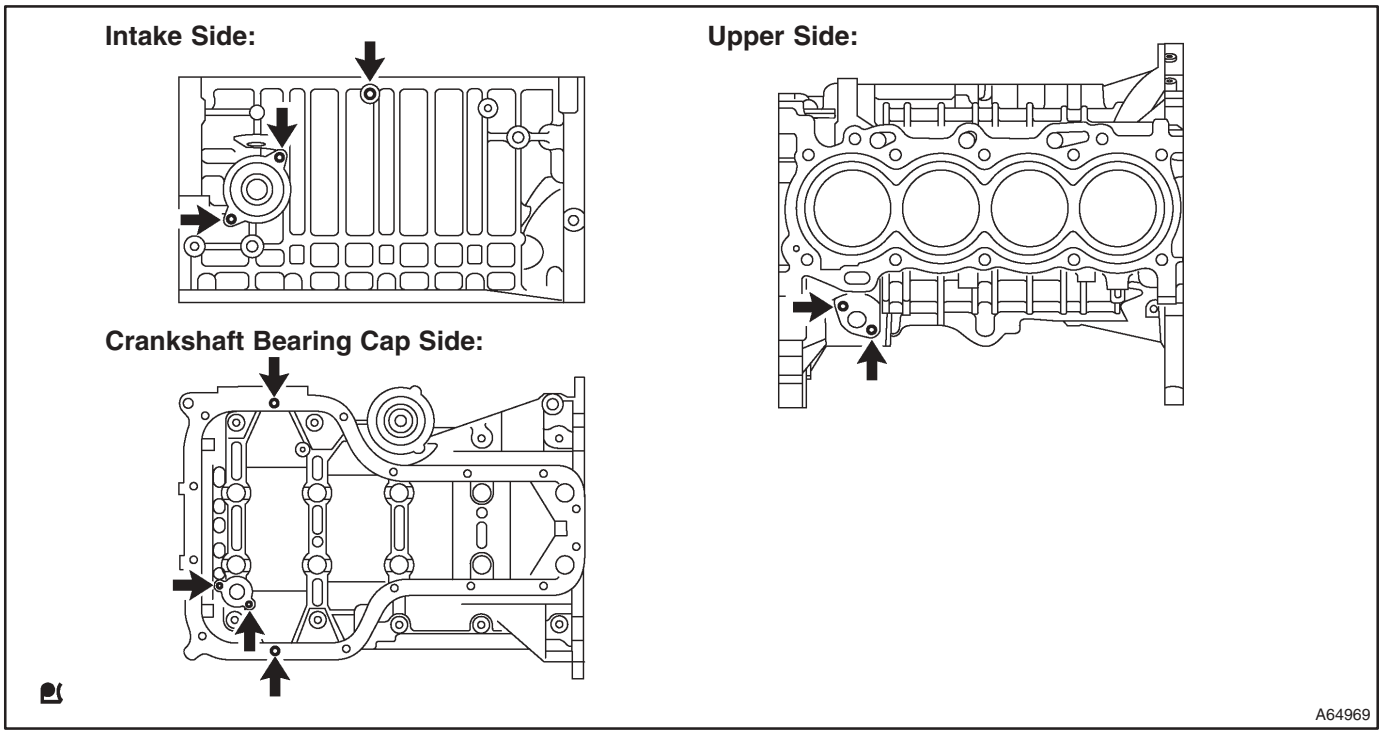


11. REMOVE CRANKSHAFT BEARING

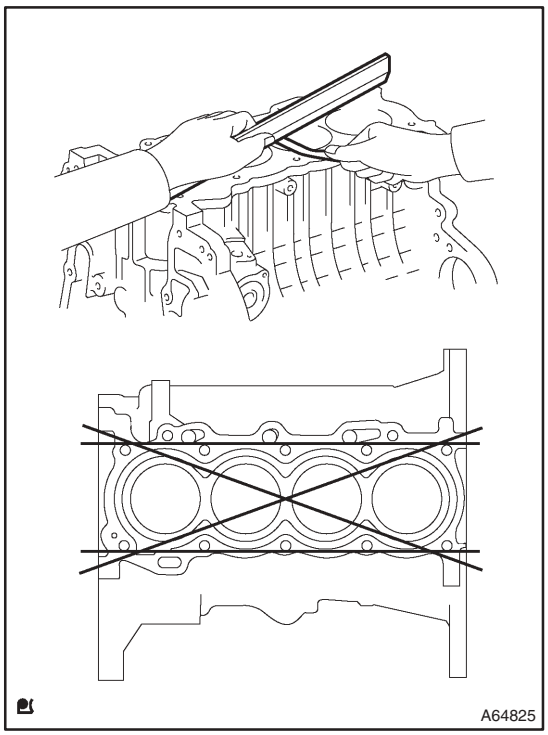
(a) Remove the 5 crankshaft bearings from the cylinder block.

NOTICE:

Arrange the main bearings and thrust washers in the correct order.



(b) Remove the 5 crankshaft bearings from the crankshaft bearing cap.

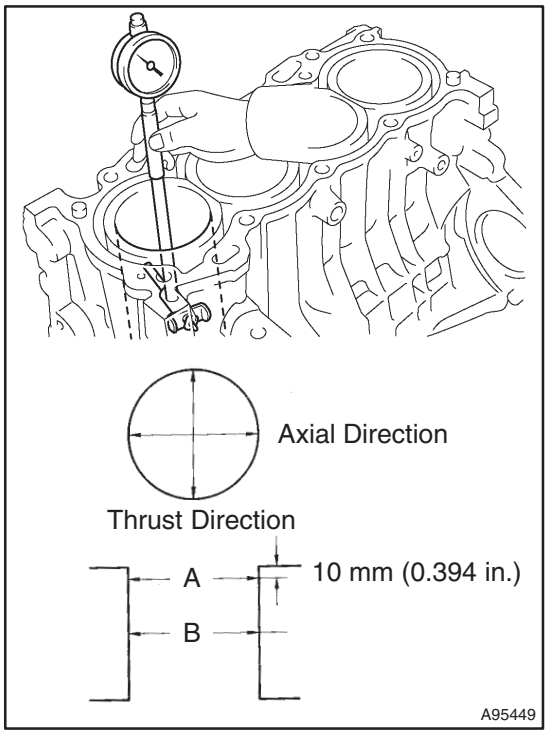


NOTICE:

Arrange the main bearings and thrust washers in the correct order.

12. REMOVE STUD BOLT

(a) Using Torx socket wrenches E5 and E7, remove the 9 stud bolts.

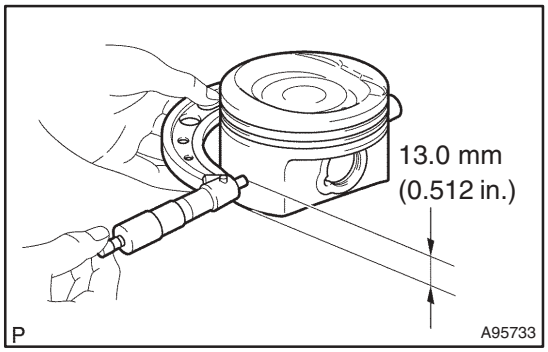


13. INSPECT CYLINDER BLOCK FOR FLATNESS

(a) Using a precision straight edge and feeler gauge, measure the warpage on the surface which comes into contact with the cylinder head gasket.

Maximum warpage: 0.05 mm (0.0020 in.)

If the warpage is greater than maximum, replace the cylinder block.

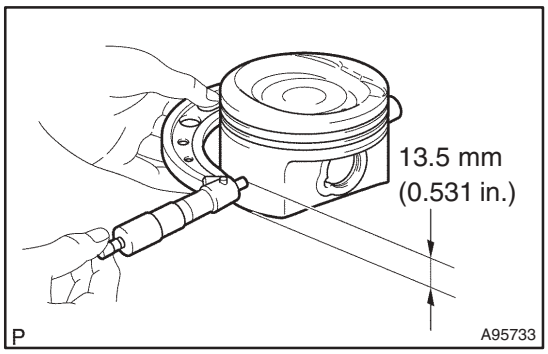


14. INSPECT CYLINDER BORE

(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A and B in the thrust and axial directions.

Standard diameter:
79.000 to 79.013 mm (3.1102 to 3.1107 in.)
Maximum diameter: 79.133 mm (3.1155 in.)

If the average diameter of 4 positions is greater than maximum, replace the cylinder block.



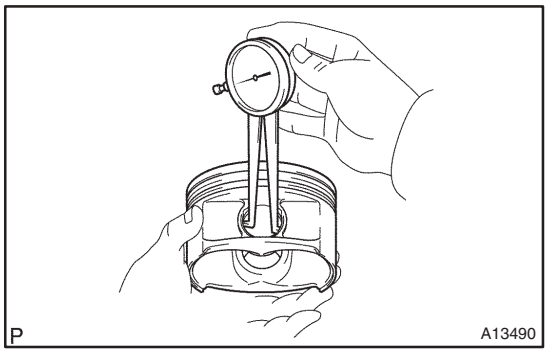
15. INSPECT W/PIN PISTON SUB–ASSY

(a) For engine type 1ZZ–FE.

(1) Using a micrometer, measure the diameter of the piston. Align the micrometer so it is 13.0 mm (0.512 in.) from the bottom of the piston and at right angles (90°) to the piston pin holes as illustrated.

Piston diameter:
78.955 to 78.965 mm (3.1085 to 3.1089 in.)

If the diameter is not as specified, replace the piston.

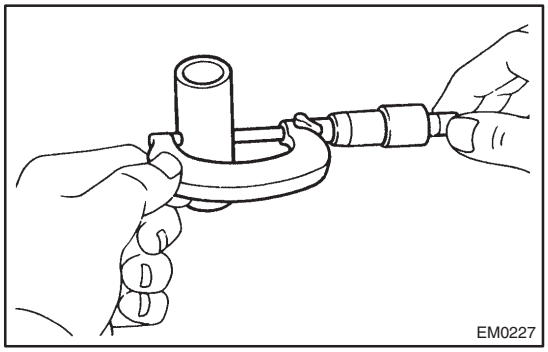


(b) For engine type 3ZZ–FE.
(1) Using a micrometer, measure the diameter of the piston. Align the micrometer so it is 13.5 mm (0.531 in.) from the bottom of the piston and at right angles (90°) to the piston pin holes as illustrated.
Piston diameter:
78.960 to 78.975 mm (3.1087 to 3.1091 in.)

If the diameter is not as specified, replace the piston.

16. INSPECT PISTON OIL CLEARANCE

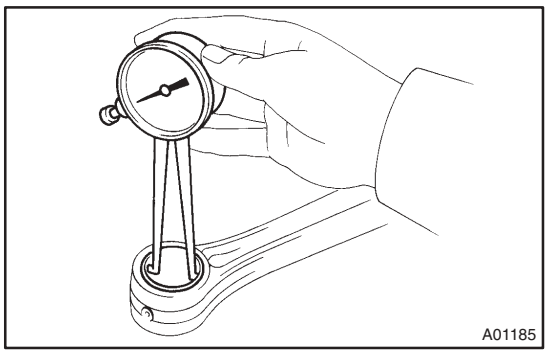
(a) Subtract the piston diameter measurement from the cylinder bore diameter measurement.
Standard oil clearance: 0.073 to 0.096 mm (0.0029 to 0.0038 in.)
Maximum oil clearance: 0.10 mm (0.0039 in.)
- If the oil clearance is greater than maximum, replace all of the piston assembly.
- If necessary, replace the cylinder block.



17. INSPECT PISTON PIN OIL CLEARANCE

(a) Using a caliper gauge, measure the piston pin bore diameter.
Piston pin bore diameter:
20.006 to 20.015 mm (0.7876 to 0.7880 in.)

Mark	mm (in.)
A	20.006 to 20.009 (0.7876 to 0.7878)
B	20.010 to 20.012 (0.7878 to 0.7879)
C	20.013 to 20.015 (0.7879 to 0.7880)

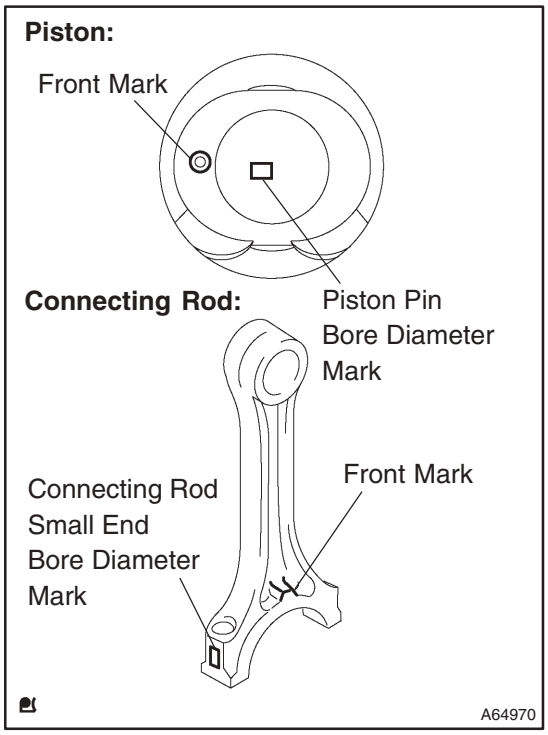


If the diameter is not as specified, replace the piston assembly.

(b) Using a micrometer, measure the piston pin outer diameter.
Piston pin outer diameter:
20.004 to 20.013 mm (0.7876 to 0.7879 in.)

Mark	mm (in.)
A	20.004 to 20.007 (0.7876 to 0.7877)
B	20.008 to 20.010 (0.7877 to 0.7878)
C	20.011 to 20.013 (0.7878 to 0.7879)

If the diameter is not as specified, replace the piston assembly.



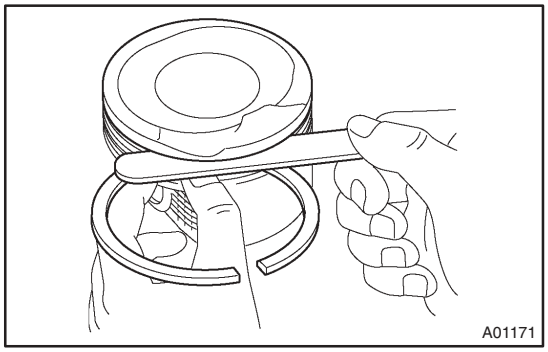
(c) Using a caliper gauge, measure the connecting rod small end bore diameter.

Connecting rod small end bore diameter:
20.012 to 20.021 mm (0.7879 to 0.7882 in.)

Mark	mm (in.)
A	20.012 to 20.015 (0.7879 to 0.7880)
B	20.016 to 20.018 (0.7880 to 0.7881)
C	20.019 to 20.021 (0.7881 to 0.7882)

If the diameter is not as specified, replace the connecting rod assembly.

(d) Subtract the piston pin outer diameter measurement from the piston pin bore diameter measurement.



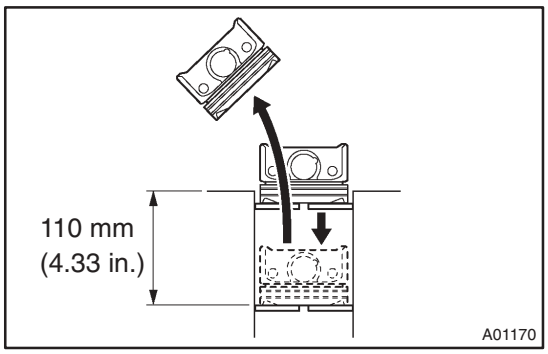
Standard oil clearance:
–0.001 to 0.017 mm (–0.00004 to 0.0007 in.)
Maximum oil clearance: 0.017 mm (0.0007 in.)

- If the oil clearance is greater than maximum, replace the connecting rod assembly.
- If necessary, replace the piston pin.

(e) Subtract the piston pin outer diameter measurement from the connecting rod small end bore diameter measurement.

Standard oil clearance:
0.005 to 0.011 mm (0.0002 to 0.0004 in.)
Maximum oil clearance: 0.011 mm (0.0004 in.)

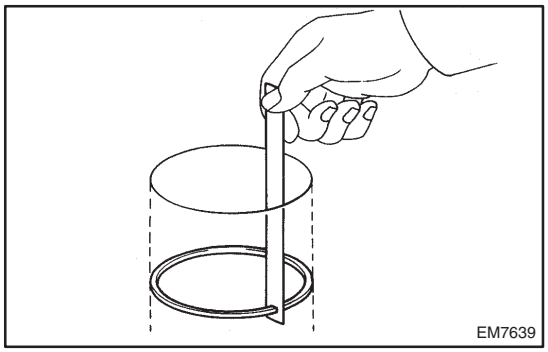
- If the oil clearance is greater than maximum, replace the connecting rod assembly.
- If necessary, replace the connecting rod and piston pin.



18. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between the new piston ring and wall of the ring groove.

Ring groove clearance:



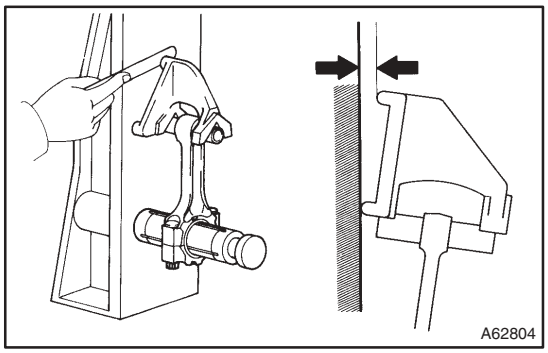
Item	Specification
No. 1 ring	0.02 to 0.07 mm (0.0008 to 0.0028 in.)
No. 2 ring	0.03 to 0.07 mm (0.0012 to 0.0028 in.)
Oil ring	0.03 to 0.11 mm (0.0012 to 0.0043 in.)

If the groove clearance is not as specified, replace the piston assembly.

19. INSPECT PISTON RING END GAP

(a) Using a piston, push the piston ring a little beyond the bottom of the ring travel, which is 110 mm (4.33 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.



Standard end gap:

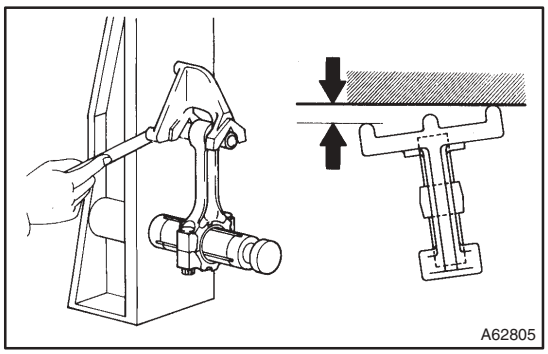
Item	Specification
No. 1 ring	0.25 to 0.35 mm (0.0098 to 0.0138 in.)
No. 2 ring	0.35 to 0.50 mm (0.0138 to 0.0197 in.)
Oil ring	0.15 to 0.40 mm (0.0059 to 0.0157 in.)

Maximum end gap:

Item	Specification
No. 1 ring	1.05 mm (0.0413 in.)
No. 2 ring	1.20 mm (0.0472 in.)

- If the end gap is greater than maximum, replace the piston ring.
- If the end gap is greater than maximum, even with a new piston ring, replace the cylinder block.

20. INSPECT CONNECTING ROD SUB–ASSY



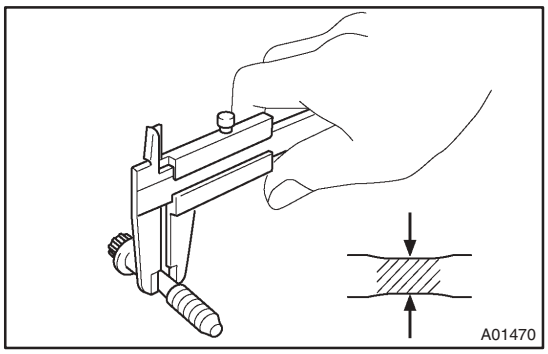
(a) Using a connecting rod aligner and feeler gauge, check the connecting rod alignment.

(1) Check for out–of–alignment.

Maximum out–of–alignment:

0.05 mm (0.0020 in.) per 100 mm (3.94 in.)

If the out–of–alignment is greater than maximum, replace the connecting rod assembly.

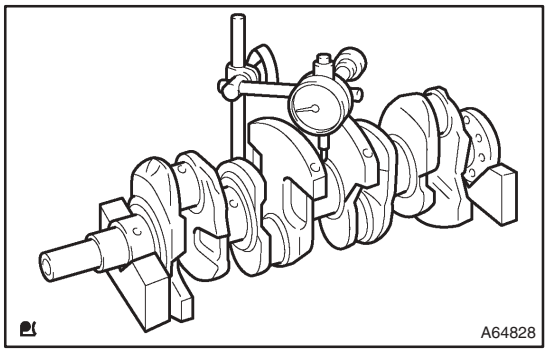


(2) check for twist.

Maximum twist:

0.05mm (0.0020 in.) per 100 mm (3.94 in.)

If the twist is greater than maximum, replace the connecting rod assembly.

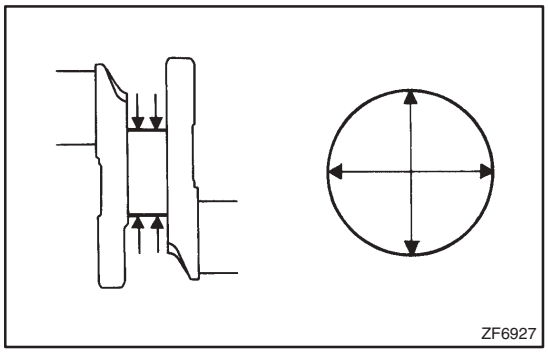


21. INSPECT CONNECTING ROD BOLT

(a) Using vernier calipers, measure the tension portion diameter of the bolts.

Standard diameter:
6.6 to 6.7 mm (0.260 to 0.264 in.)
Minimum diameter: 6.4 mm (0.252 in.)

If the diameter is less than minimum, replace the connecting rod bolt.



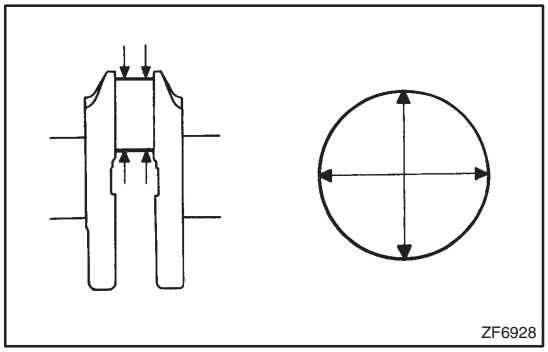
22. INSPECT CRANKSHAFT

(a) Using a dial indicator and V–blocks, measure the circle runout as shown in the illustration.

Maximum circle runout: 0.03 mm (0.0012 in.)

If the circle runout is greater than maximum, replace the crankshaft.

(b) Using a micrometer, measure the diameter of each main journal at the points shown in the illustration.



Diameter: 47.988 to 48.000 mm (1.8893 to 1.8898 in.)

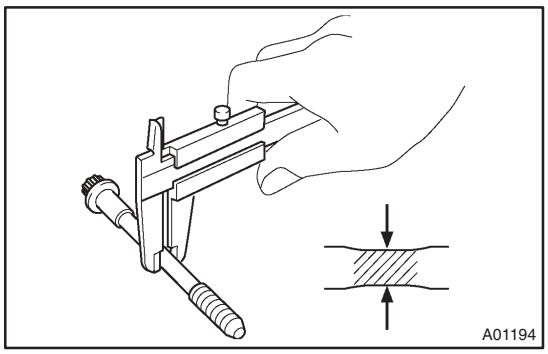
If the diameter is not as specified, check the crankshaft oil clearance.

(c) Check each main journal for taper and out–of–round as shown.

Maximum taper and out–of–round:
0.02 mm (0.0008 in.)

If the taper or out–of–round is greater than maximum, replace the crankshaft.

(d) Using a micrometer, measure the diameter of each crank pin at the points shown in the illustration.



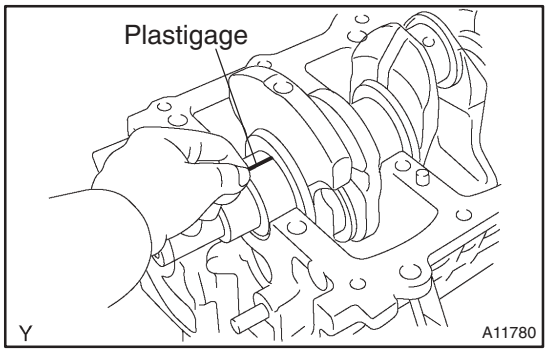
Diameter: 43.992 to 44.000 mm (1.7320 to 1.7323 in.)

If the diameter is not as specified, check the connecting rod oil clearance.

(e) Check each crank pin for taper and out–of–round as shown.

Maximum taper and out–of–round:
0.02 mm (0.0008 in.)

If the taper or out–of–round is greater than maximum, replace the crankshaft.

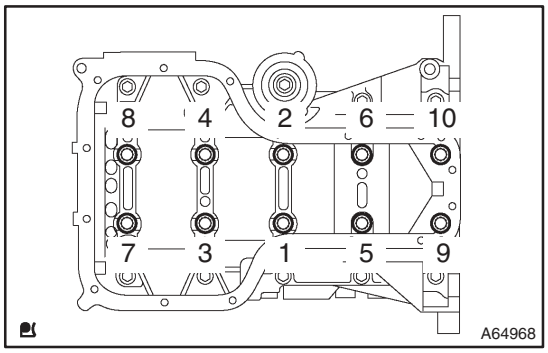


23. INSPECT CRANKSHAFT BEARING CAP SET BOLT

(a) Using vernier calipers, measure the tension portion diameter of the bolts.

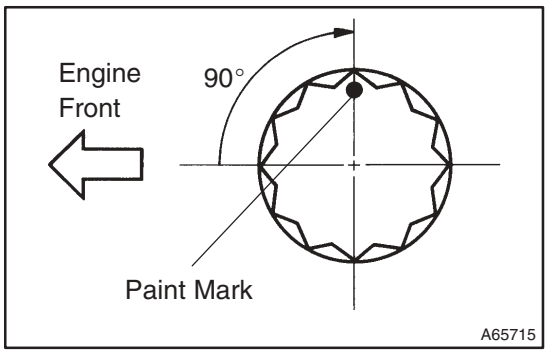
Standard diameter: 7.3 to 7.5 mm (0.287 to 0.295 in.)
Minimum diameter: 7.3 mm (0.287 in.)

If the diameter is greater than minimum, replace the crankshaft bearing cap set bolt.



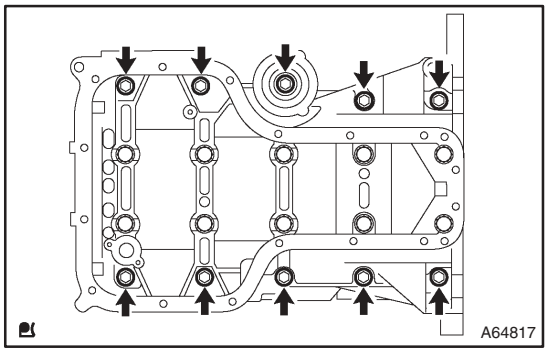
24. INSPECT CRANKSHAFT OIL CLEARANCE

NOTICE:



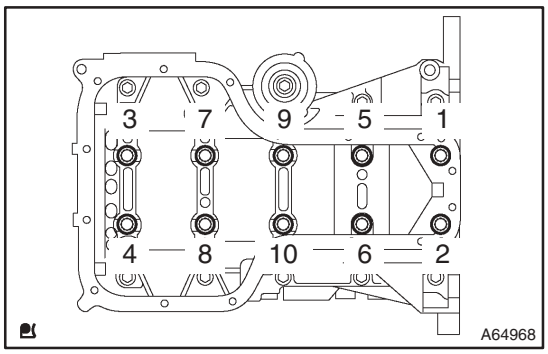
Do not turn the crankshaft.

(a) Clean each main journal and bearing.
(b) Place the crankshaft on the cylinder block.
(c) Lay a strip of Plastigage across each journal.

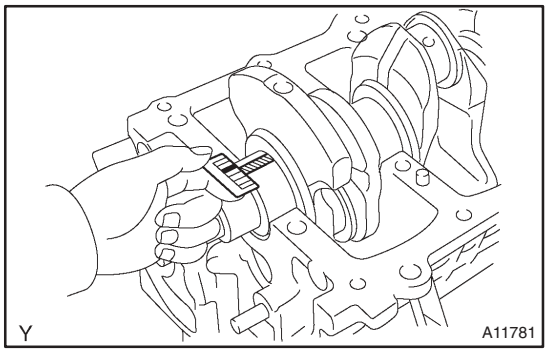


(d) Using SST, tighten the bolts to the specified torque in the several passes in the sequence shown.

Torque: 44 N·m (449 kgf·cm, 33 ft·lbf)



(e) Mark the front of the bearing cap bolts with paint.
(f) Retighten the bearing cap bolts by an additional 90° as shown in the illustration.
(g) Check that the painted mark is now at a 90° angle to the front.

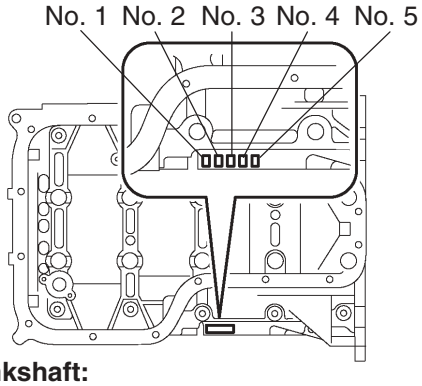


(h) Tighten the 10 other bolts for the bearing cap.

Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)

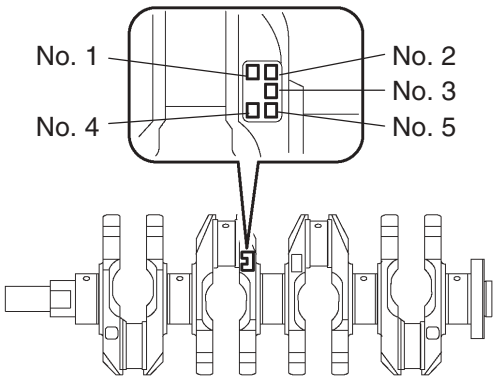
(i) Remove the 10 bolts.

(j) Uniformly loosen the 10 bearing cap bolts in several passes in the sequence shown in the illustration.



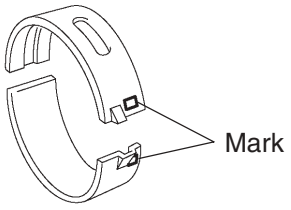
(k) Measure the Plastigage at its widest point.
Standard oil clearance:
0.015 to 0.032 mm (0.0006 to 0.0012 in.)
Maximum oil clearance: 0.05 mm (0.0020 in.)

NOTICE:
Completely remove the Plastigage.



- If the oil clearance is greater than minimum, replace the crankshaft bearing.
- If necessary, replace the crankshaft.

HINT:
If replacing a bearing, select a new one having the same number. If the number of the bearing cannot be determined, calculate the correct use bearing number by adding together the numbers imprinted on the cylinder block and crankshaft, then select a new bearing having the calculated number. There are 4 sizes of standard bearings, marked "1", "2", "3" and "4" accordingly.



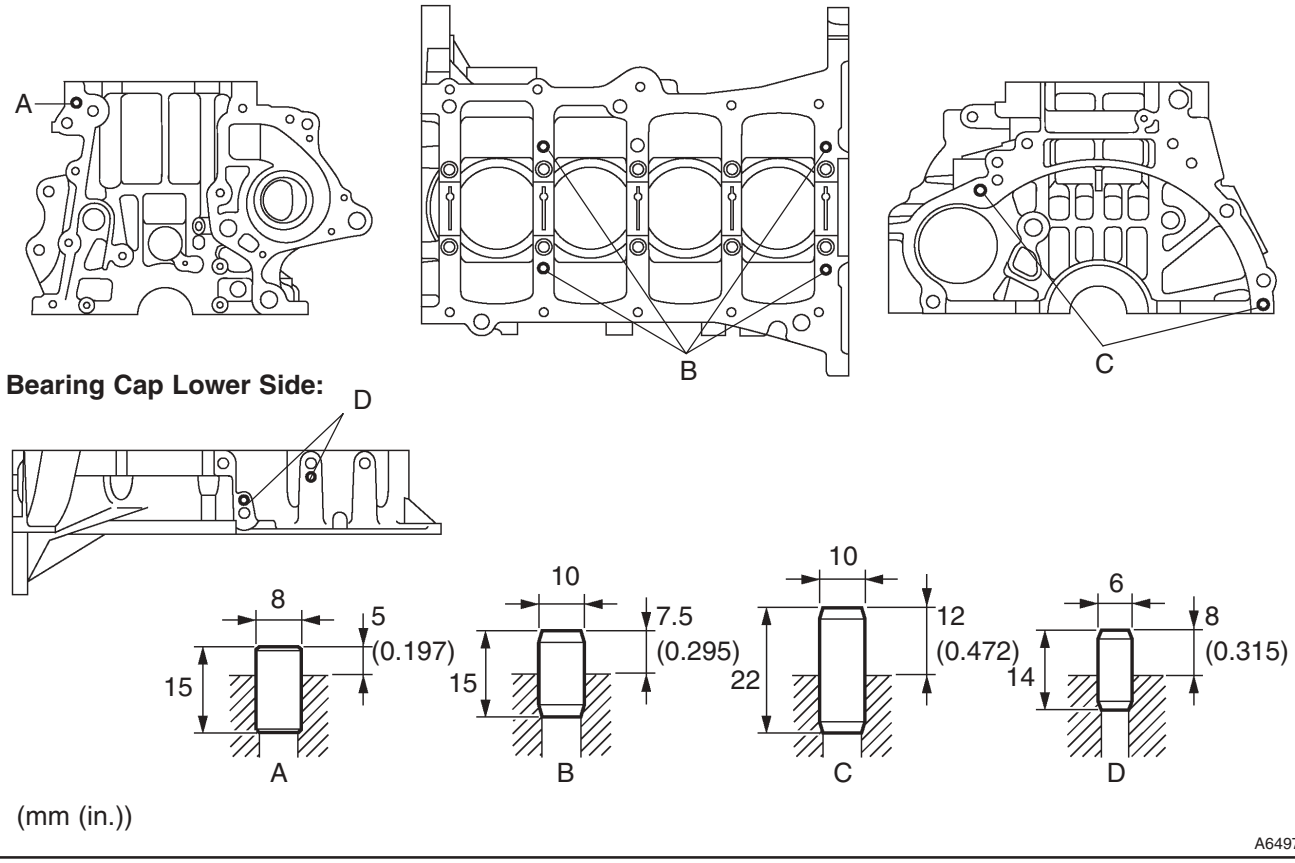
Cylinder Block:

Crankshaft:

Bearing:

Cylinder block (A) + Crankshaft (B)	0 to 2	3 to 5	6 to 8	9 to 11
Use bearing	"1"	"2"	"3"	"4"

EXAMPLE:
Cylinder block "3" (A) + Crankshaft "4" (B) = Total number 7 (Use bearing "3")



Item	Mark	mm (in.)
Cylinder block journal bore diameter (A)	"0"	52.000 to 52.002 (2.0472 to 2.0473)
	"1"	52.003 to 52.004 (2.0474 to 2.0474)
	"2"	52.005 to 52.006 (2.0474 to 2.0475)
	"3"	52.007 to 52.009 (2.0475 to 2.0476)
	"4"	52.010 to 52.011 (2.0476 to 2.0477)
	"5"	52.012 to 52.013 (2.0477 to 2.0478)
	"6"	52.014 to 52.015 (2.0478 to 2.0478)
Crankshaft journal diameter (B)	"0"	47.999 to 48.000 (1.8897 to 1.8898)
	"1"	47.997 to 47.998 (1.8896 to 1.8897)
	"2"	47.995 to 47.996 (1.8896 to 1.8896)

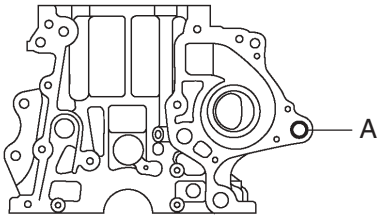
	"3"	2.001 to 2.003 (0.0788 to 0.0789)
	"4"	2.004 to 2.006 (0.0789 to 0.0790)

25. INSTALL STRAIGHT PIN

(a) Using a plastic hammer, install 9 new straight pins into the cylinder block.

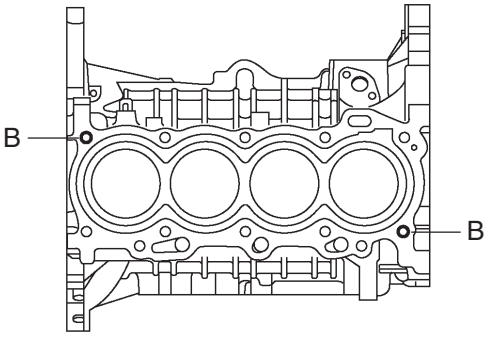
Standard protrusion:

Item	Specification
A	5.0 mm (0.197 in.)
B	7.5 mm (0.295 in.)
C	12.0 mm (0.472 in.)
D	8.0 mm (0.315 in.)



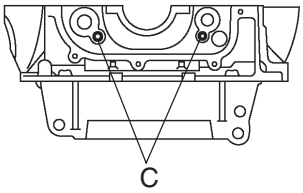
26. INSTALL RING PIN

(a) Using a plastic hammer, install 5 new ring pins into the cylinder block.

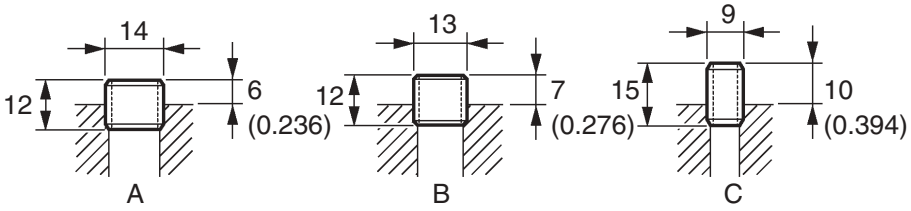


Standard protrusion:

Item	Specification
A	6.0 mm (0.236 in.)
B	7.0 mm (0.276 in.)
C	10.0 mm (0.394 in.)

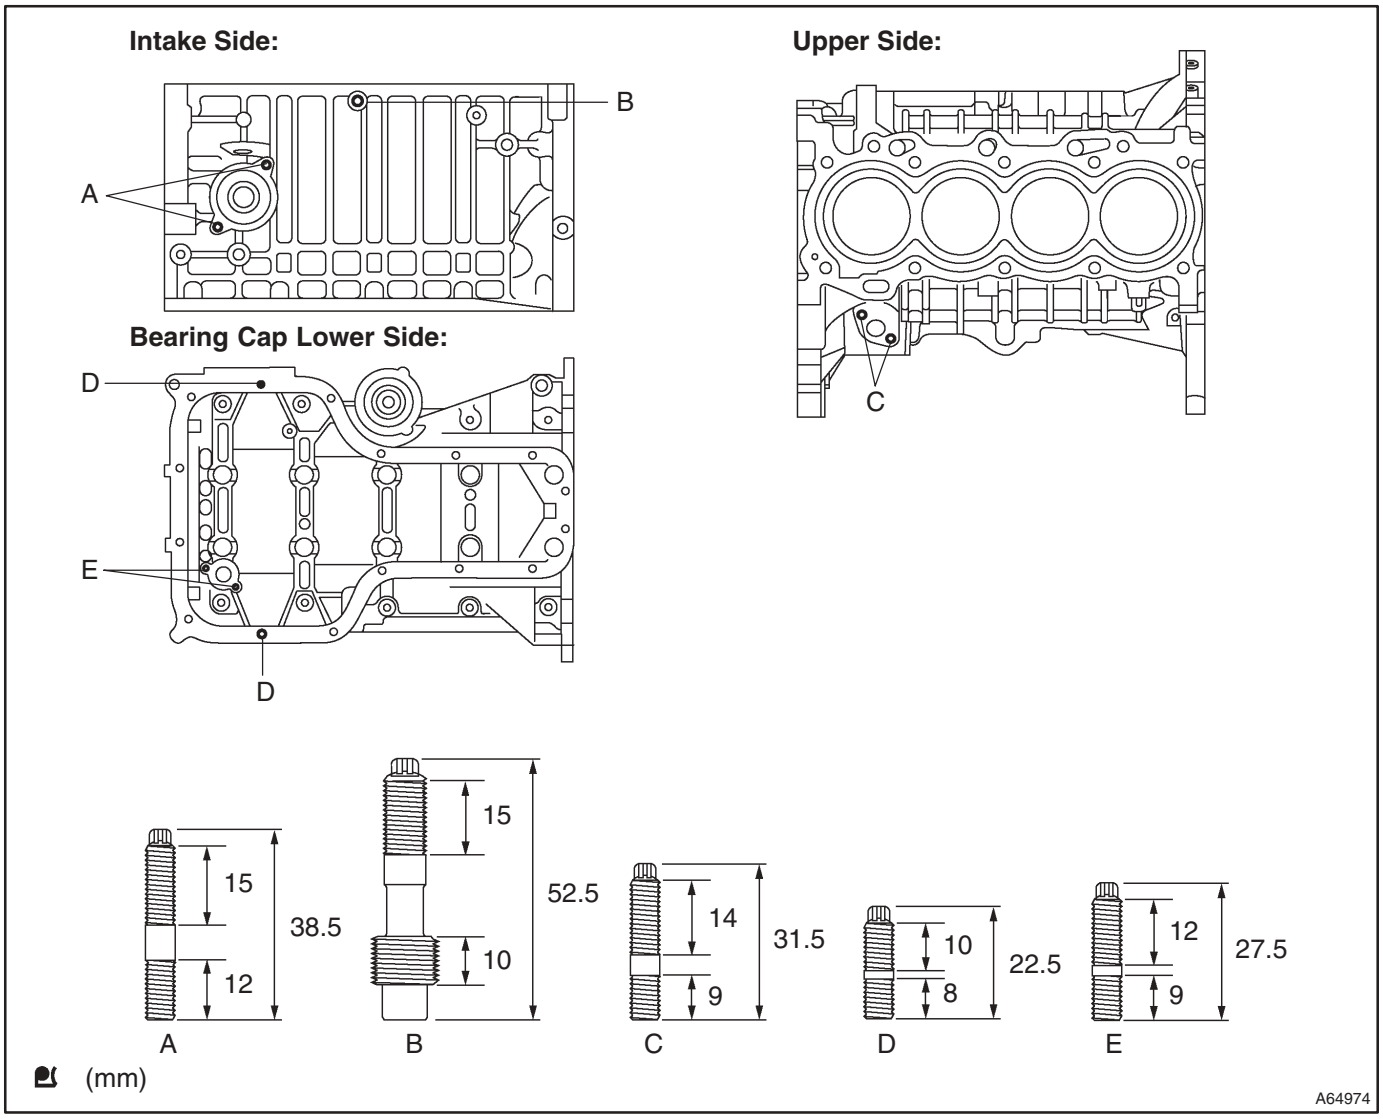


Front Side:

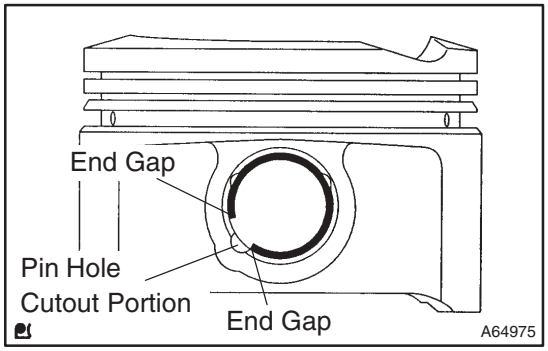


Upper Side:

Bearing Cap Front Side:



(mm (in.))

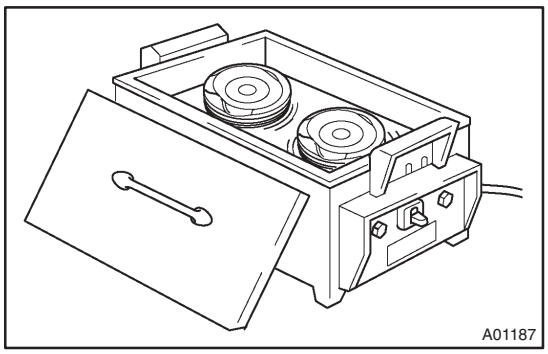


A64973

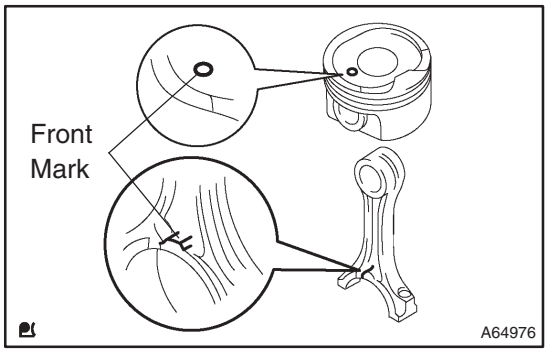
27. INSTALL STUD BOLT

(a) Using Torx socket wrenches E5 and E7, install the 9 stud bolts into the cylinder block.

Torque:
5.0 N·m (51 kgf·cm, 44 in.·lbf) for A
11 N·m (112 kgf·cm, 8 ft·lbf) for B
5.0 N·m (51 kgf·cm, 44 in.·lbf) for C
5.0 N·m (51 kgf·cm, 44 in.·lbf) for D
5.0 N·m (51 kgf·cm, 44 in.·lbf) for E

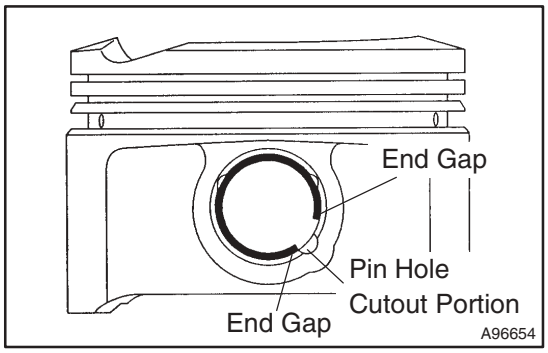


28. INSTALL W/PIN PISTON SUB–ASSY



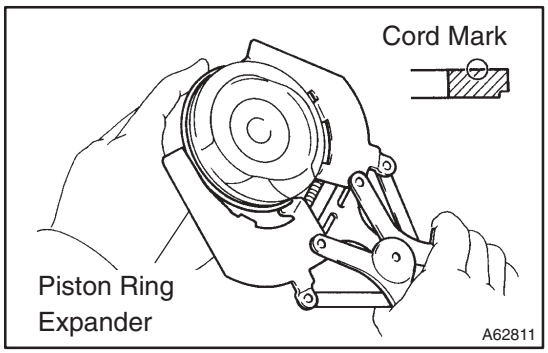
(a) Using a small screwdriver, install a new snap ring onto one end of the piston pin hole.

HINT:



Be sure that the end gap of the snap ring is aligned with the pin hole cutout portion of the piston.

(b) Gradually heat the piston up to 80 to 90°C (176 to 194°F).



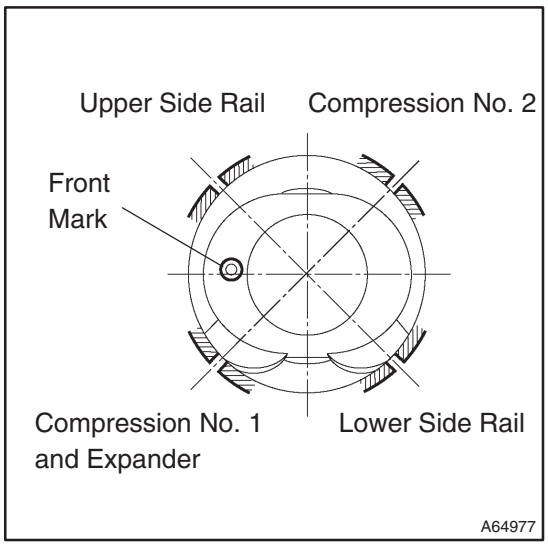
(c) Align the front marks on the piston with the connecting rod, then push in the piston with your thumb.

(d) Using a small screwdriver, install a new snap ring onto one end of the piston pin hole.

HINT:

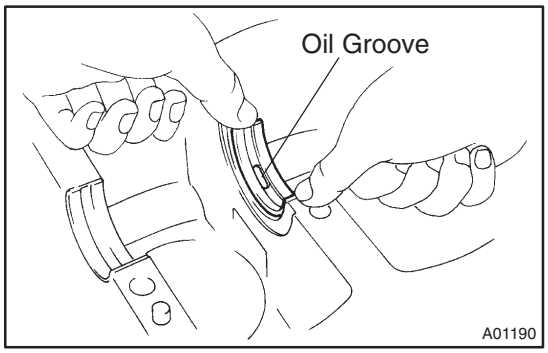
Be sure that the end gap of the snap ring is aligned with the pin hole cutout portion of the piston.

29. INSTALL PISTON RING SET



HINT:

In case of reusing the piston rings, install them onto the matched pistons with the surfaces facing upward correctly.

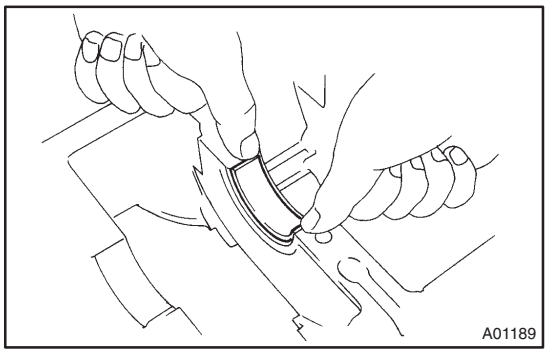


(a) Install the oil ring expander and 2 side rails by hand.

(b) Using a piston ring expander, install the 2 compression rings with the code mark facing upward.

Code mark (No. 2 only): 2R

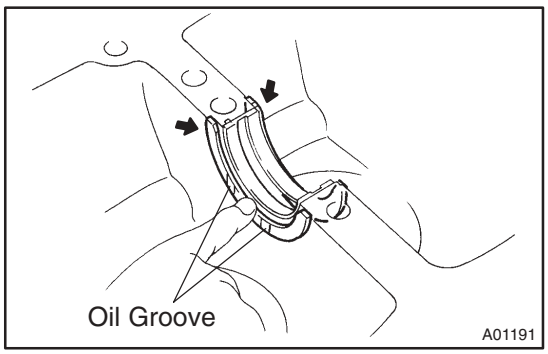
(c) Position the piston rings so that the ring ends are as shown.



30. INSTALL CRANKSHAFT BEARING

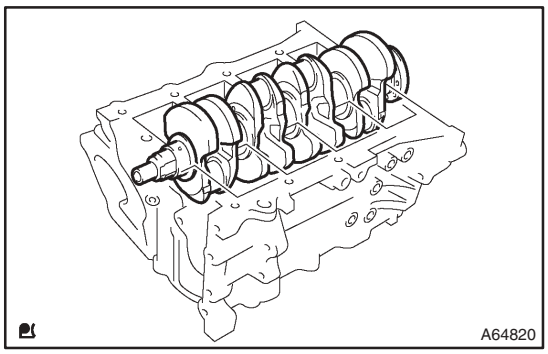
(a) Install the upper bearing with an oil groove onto the cylinder block.

NOTICE:



Do not apply engine oil to the bearing and its contact surface.

(b) Install the lower bearing onto the bearing cap.

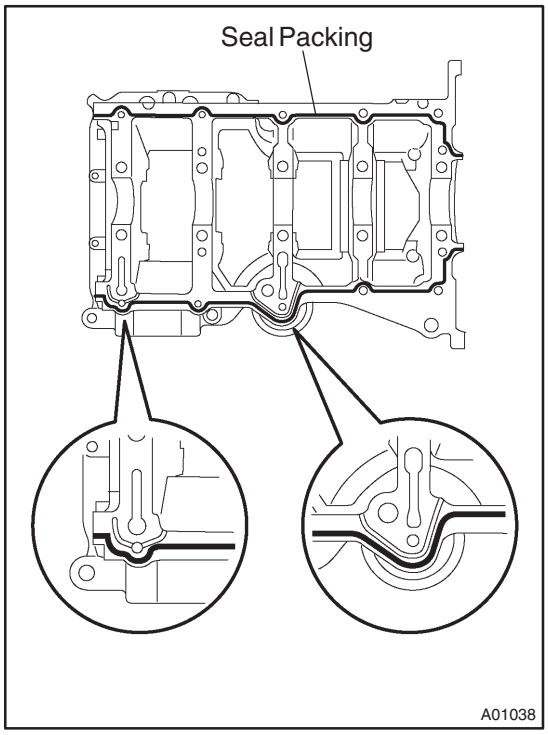


NOTICE:

Do not apply engine oil to the bearing and its contact surface.

31. INSTALL CRANKSHAFT THRUST WASHER UPPER

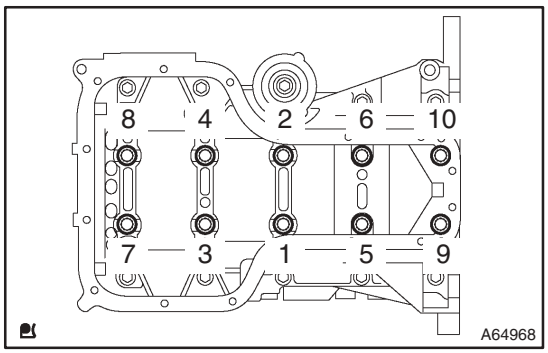
(a) Install the 2 thrust washers onto the No. 3 journal position of the cylinder block with the oil grooves facing outward.



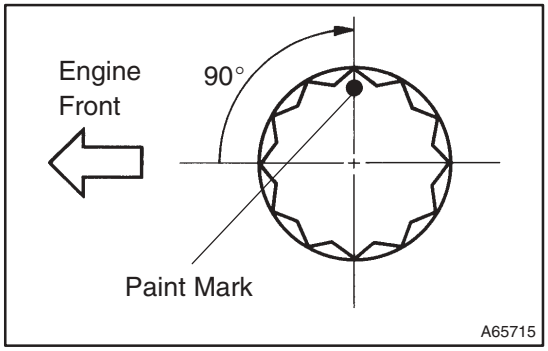
32. INSTALL CRANKSHAFT

(a) Apply engine oil to the upper bearing, then install the crankshaft onto the cylinder block.

(b) Apply a light coat of engine oil to the bolt threads, bolt seats, and bearings of the bearing cap.



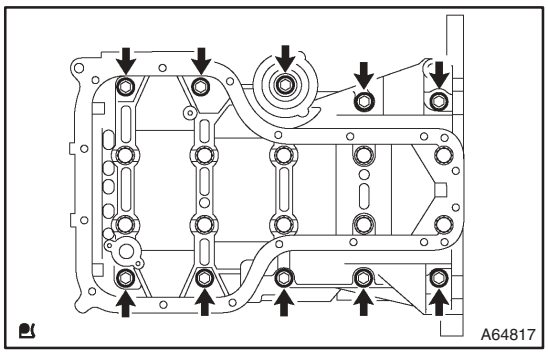
(c) Install the crankshaft onto the cylinder block.



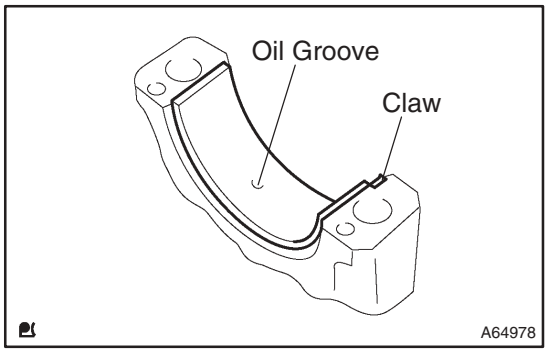
(d) Apply a continuous bead of seal packing (Diameter; 2.5 to 3.5 mm (0.098 to 0.138 in.)) as shown in the illustration.
Seal packing: Part No. 08826–00080 or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the bearing cap sub–assembly within 3 minutes after applying seal packing.**
- **Do not put into engine oil for at least 2 hours after installation.**



(e) Tighten the bolts in several passes in the sequence shown to the specified torque.
Torque: 44 N·m (449 kgf·cm, 33 ft·lbf)

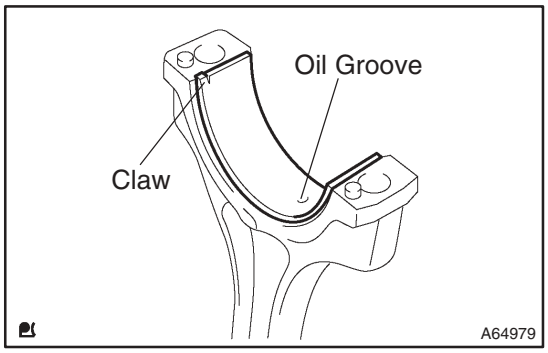


(f) Mark the front of the bearing cap bolts with paint.

(g) Retighten the bearing cap bolts by an additional 90° as shown in the illustration.

(h) Check that the painted mark is now at a 90° angle to the front.

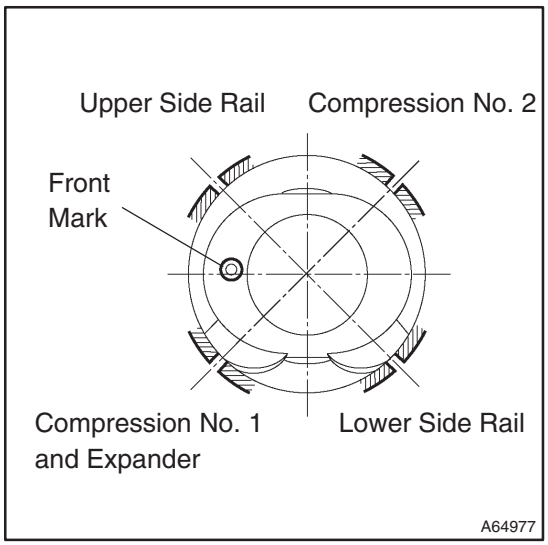
(i) Tighten the 10 other bolts for the bearing cap.
Torque: 19 N·m (194 kgf·cm, 14 ft·lbf)



33. INSTALL CONNECTING ROD BEARING

(a) Align the connecting rod bearing claw with the oil groove of the connecting rod cap.

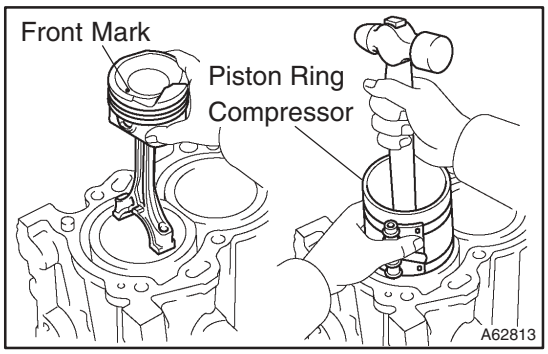
(b) Install the connecting rod bearing onto the connecting rod cap.



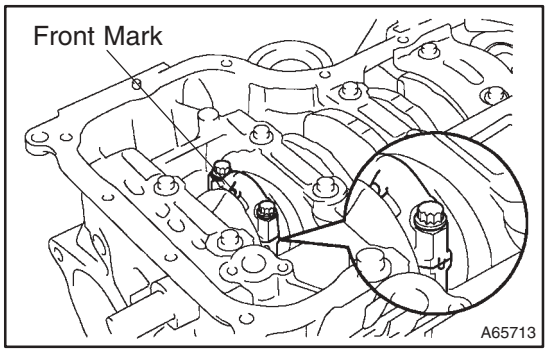
NOTICE:
Do not apply engine oil to the bearing and its contact surface.

(c) Align the connecting rod bearing claw with the oil groove of the connecting rod.

(d) Install the connecting rod bearing onto the connecting rod.



NOTICE:
Do not apply engine oil to the bearing and its contact surface.

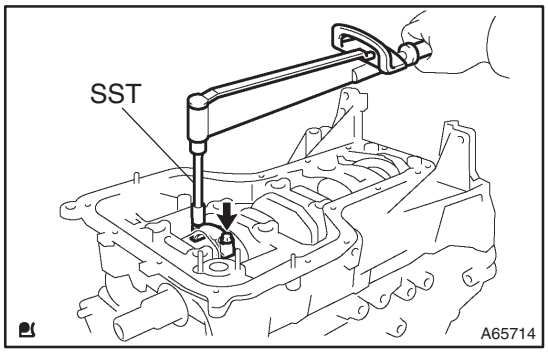


34. INSTALL CONNECTING ROD SUB–ASSY

(a) Position the piston rings so that the ring ends are as shown.

(b) Apply engine oil to the cylinder walls, pistons, and surfaces of the connecting rod bearings.

(c) Using a piston ring compressor, correctly push the numbered piston and connecting rod assemblies into each cylinder with the front mark of the piston facing forward.

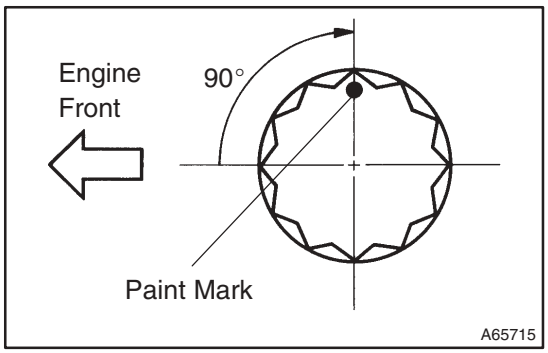


(d) Align the pin dowels of the connecting rod cap with the pins of the connecting rod, then install the connecting rod.

NOTICE:

Match the numbered connecting rod cap with the same numbered connecting rod.

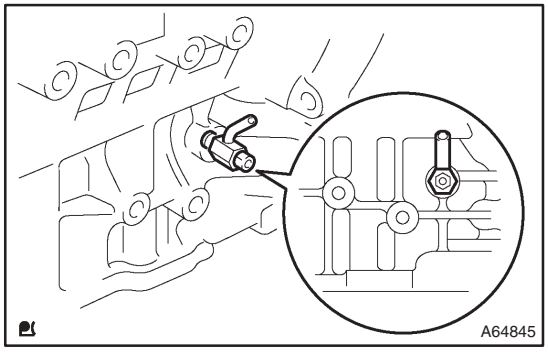
(e) Check that the protrusion of the connecting rod cap is facing in the correct direction.



(f) Apply a light coat of engine oil to the threads and the bottom of the heads of the connecting rod cap bolts.

(g) Using SST, tighten the bolts in several passes to the specified torque.

SST 09205–16010

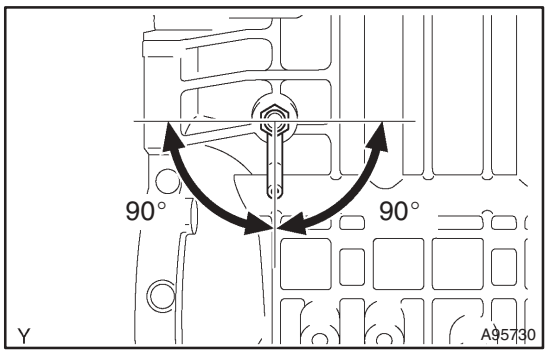


Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

(h) Mark the front of the connecting cap bolts with paint.

(i) Retighten the cap bolts by an additional 90° as shown in the illustration.

(j) Check that the crankshaft turns smoothly.



35. INSTALL CYLINDER BLOCK WATER DRAIN COCK SUB–ASSY

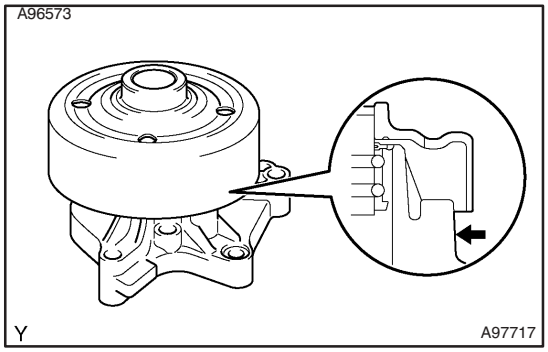
(a) Apply adhesive to 2 or 3 threads of the cylinder block water drain cock, then install it within 3 minutes as shown in the illustration.

Torque: 25 N·m (255 kgf·cm, 18 ft·lbf)

Adhesive:

Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

(b) After applying the specified torque, rotate the cylinder block water drain cock clockwise until its drain port faces downward.



NOTICE:

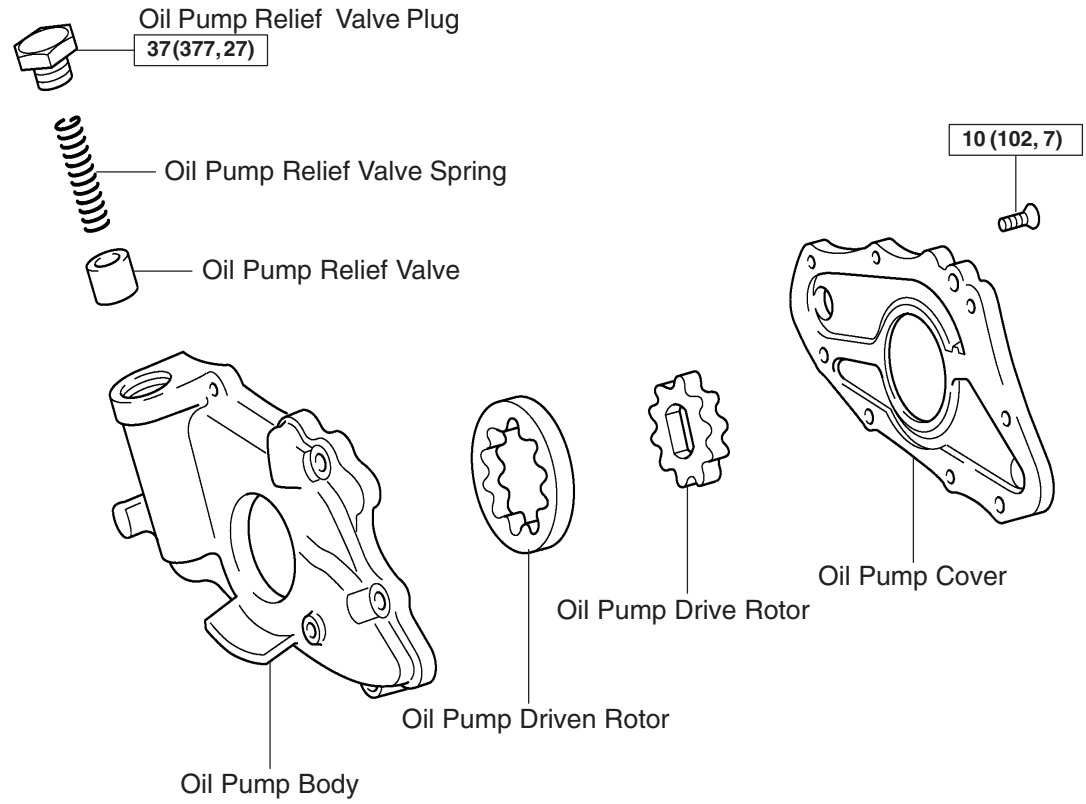
- **Do not put into coolant for at least an hour after installation.**
- **Do not rotate the drain union more than 360° in (b), and never loosen it after setting the union correctly.**

WATER PUMP ASSY (1ZZ–FE/3ZZ–FE)

160WF–01

INSPECTION

1. INSPECT WATER PUMP ASSY



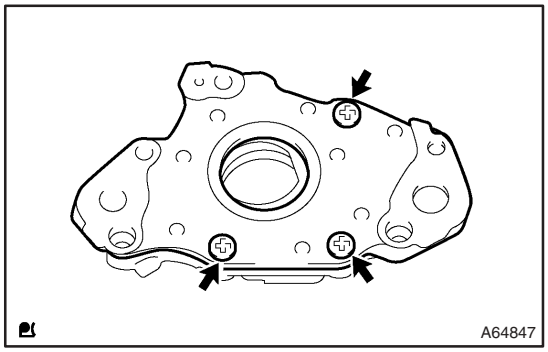
(a) Check the area of the water pump assembly indicated in the illustration for traces of coolant leakage.

If leakage is found, replace the water pump.

OIL PUMP ASSY (1ZZ–FE/3ZZ–FE)

170KW–01

COMPONENTS

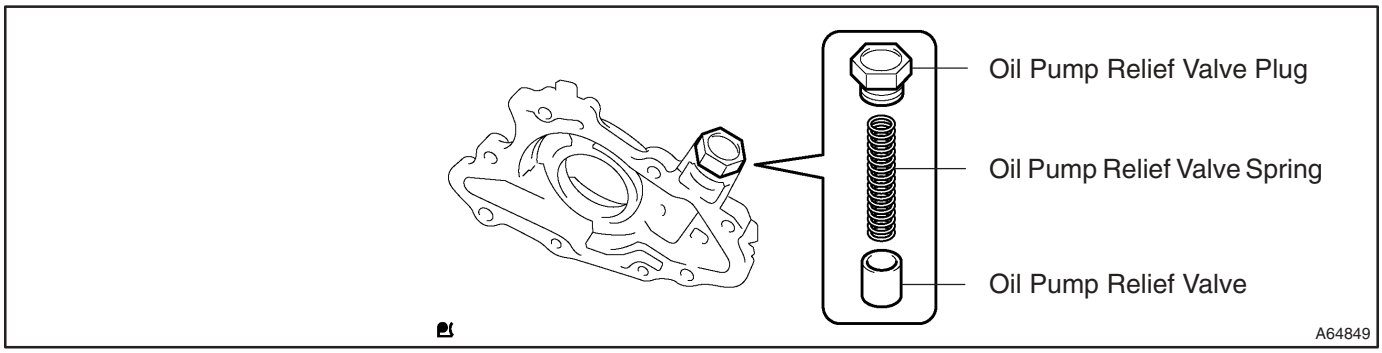


N·m (kgf·cm, ft·lbf) : Specified torque

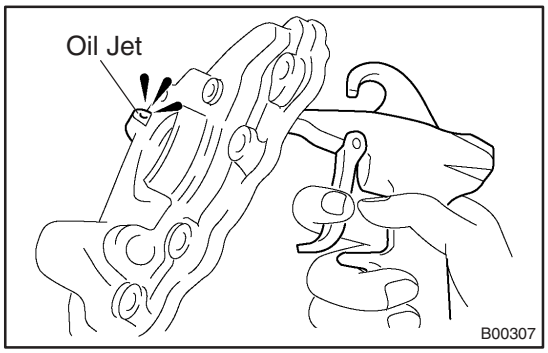
A62218

170KX–01

OVERHAUL



1. REMOVE OIL PUMP DRIVE AND DRIVEN ROTORS

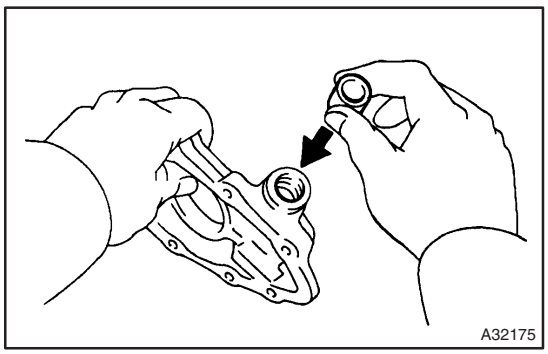


(a) Remove the 3 screws, then remove the oil pump cover.

(b) Remove the oil pump drive and driven rotors from the oil pump.

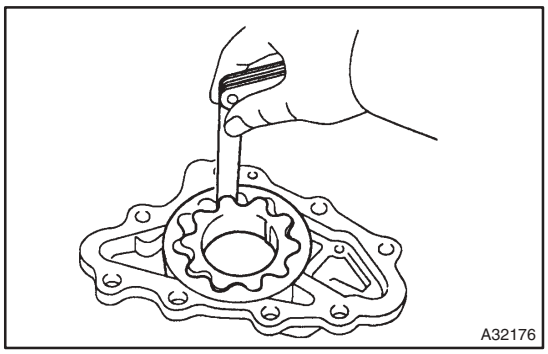
2. REMOVE OIL PUMP RELIEF VALVE

(a) Remove the oil pump relief valve plug, then remove the oil pump relief valve spring and oil pump relief valve from the oil pump.



3. INSPECT OIL JET

(a) Apply air pressure to the path in the illustration, then check the oil jet for damage or clogging.

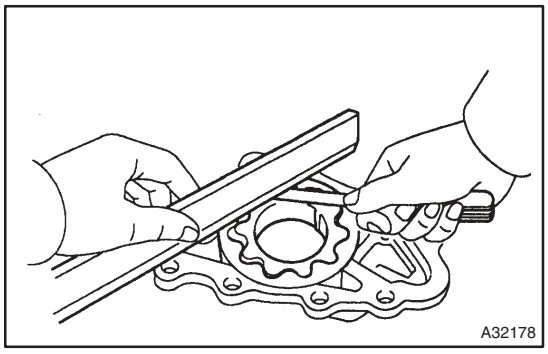


If air does not blow out of the oil jet, replace the oil pump.

4. INSPECT VALVE, OIL PUMP RELIEF

(a) Coat the oil pump relief valve with engine oil, then check that it falls smoothly into the valve hole under its own weight.

If this does not occur, replace the oil pump.

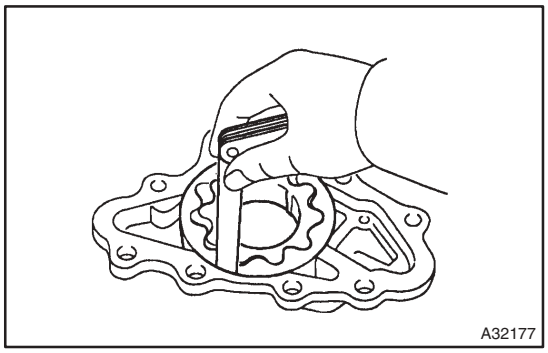


5. INSPECT ROTOR TIP CLEARANCE

(a) Using a feeler gauge, measure the clearance between the drive and driven rotor tips.

Standard tip clearance:
0.040 to 0.160 mm (0.0016 to 0.0063 in.)
Maximum tip clearance: 0.160 mm (0.0063 in.)

If the tip clearance is greater than maximum, then replace the oil pump.



6. INSPECT ROTOR SIDE CLEARANCE

(a) Using a feeler gauge and precision straight edge, measure the clearance between the 2 rotors and precision straight edge.

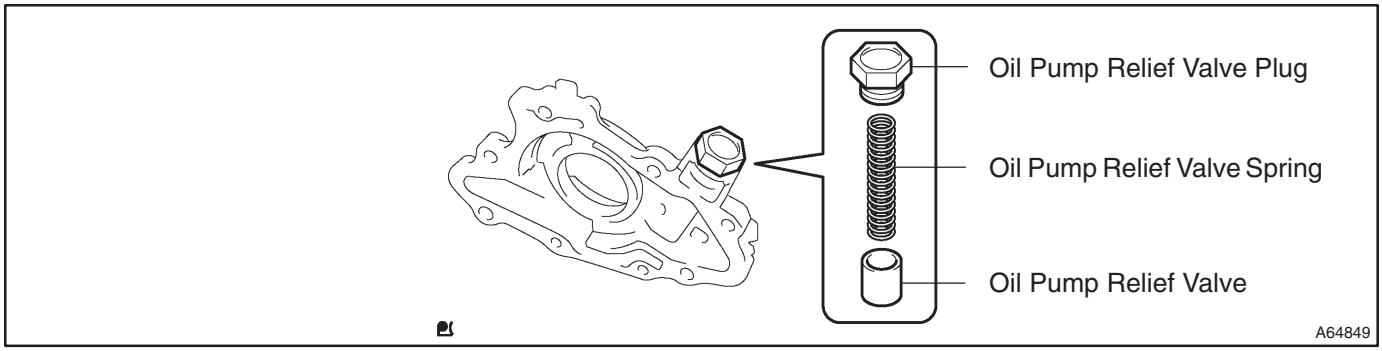
Standard side clearance:
0.025 to 0.071 mm (0.0010 to 0.0028 in.)
Maximum side clearance: 0.071 mm (0.0028 in.)

If the side clearance is greater than maximum, then replace the oil pump.

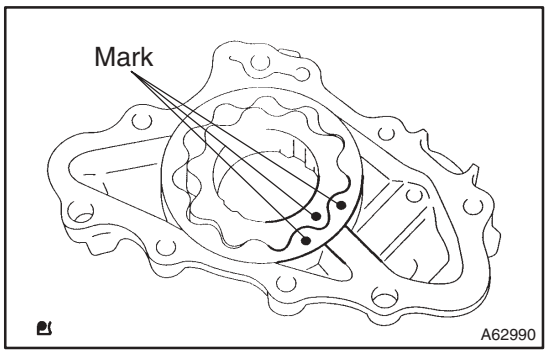
7. INSPECT ROTOR BODY CLEARANCE

(a) Using a feeler gauge, measure the clearance between the driven rotor and oil pump body.

Standard body clearance:
0.260 to 0.325 mm (0.0102 to 0.0128 in.)
Maximum body clearance: 0.325 mm (0.0128 in.)



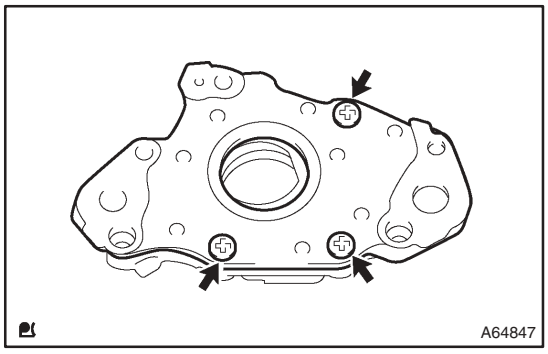
If the body clearance is greater than maximum, then replace the oil pump.



8. INSTALL OIL PUMP RELIEF VALVE

(a) Coat the oil pump relief valve with engine oil, then insert the oil pump relief valve and oil pump relief spring onto the valve hole.

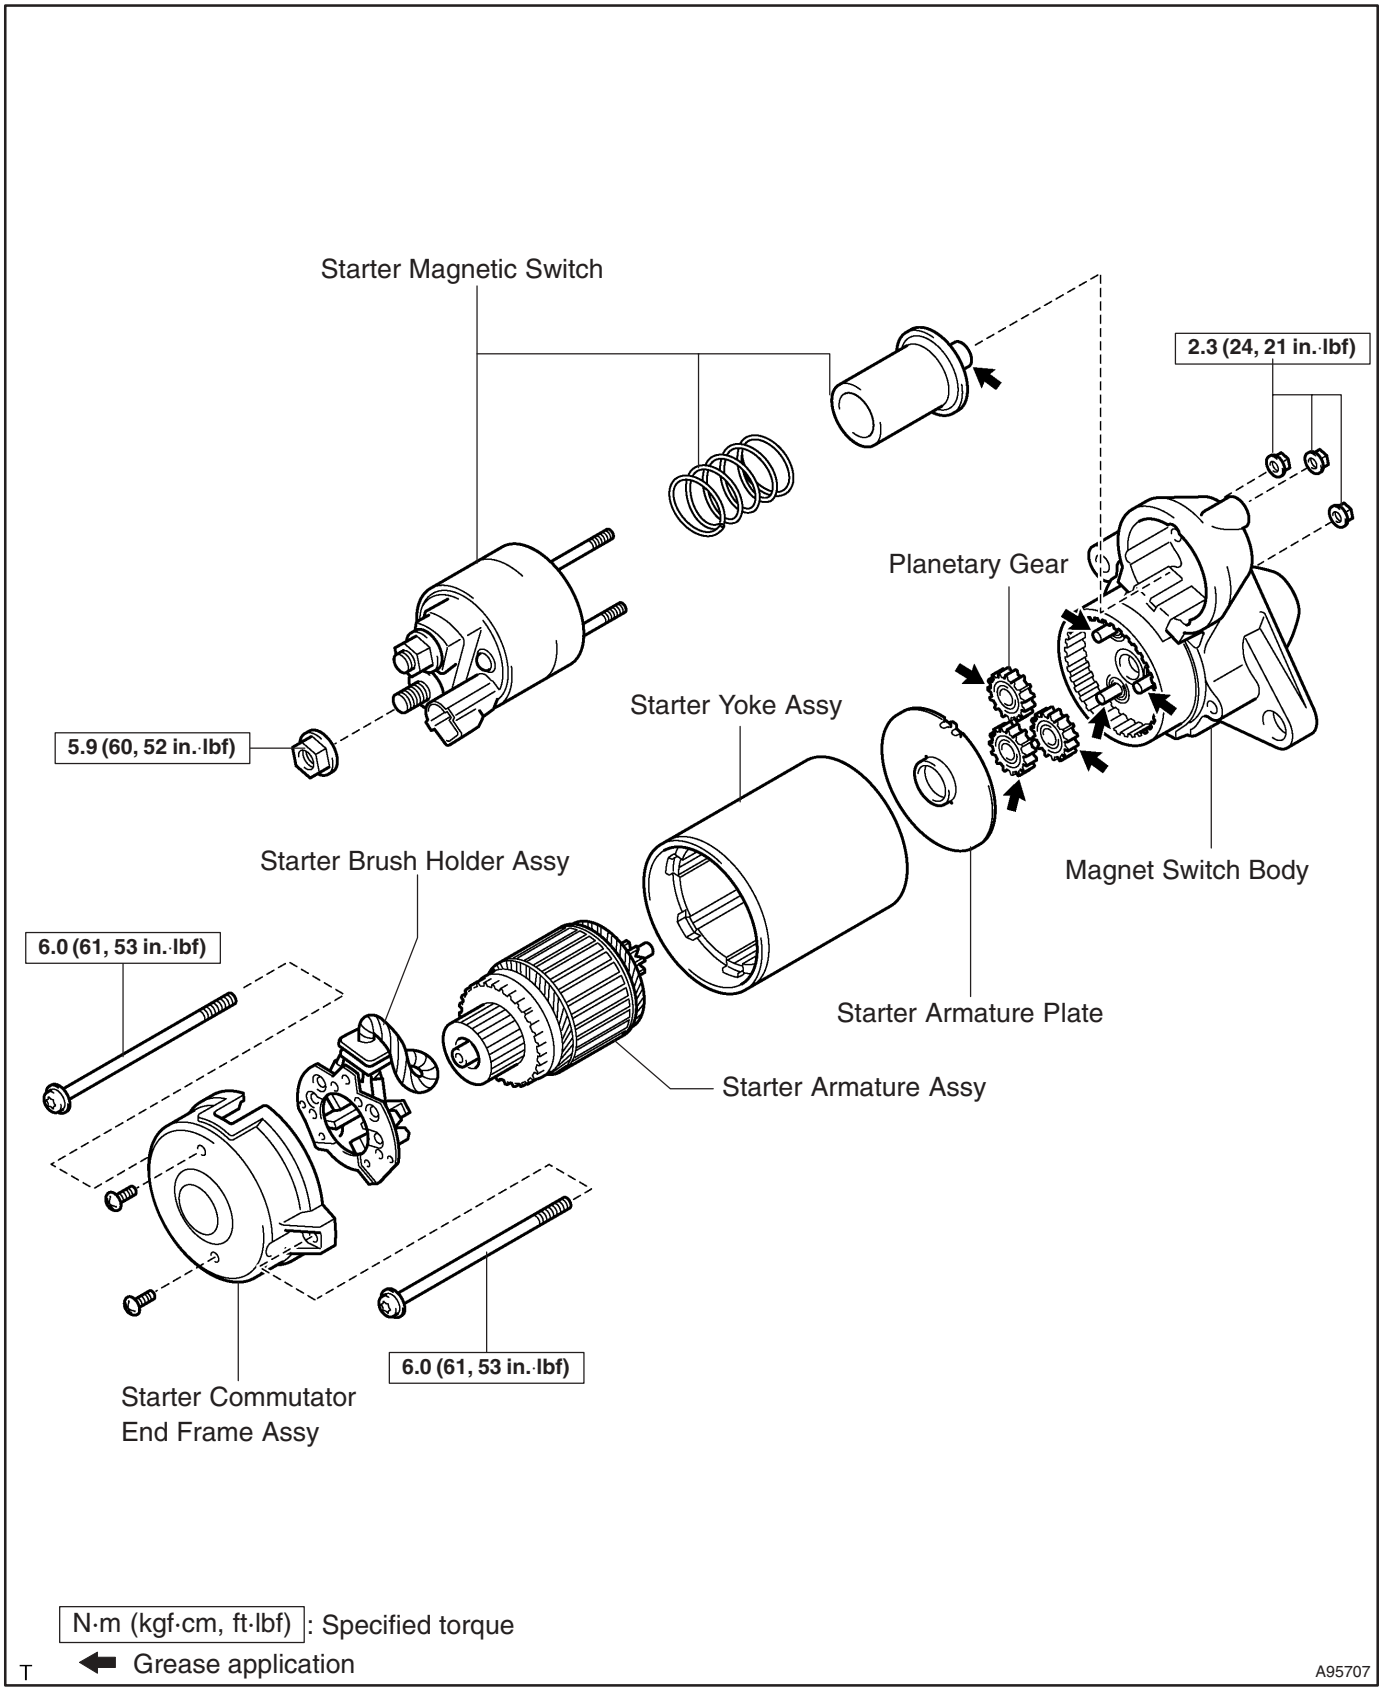
(b) Install the oil pump relief valve plug.



Torque: 37 N·m (377 kgf·cm, 27 ft·lbf)

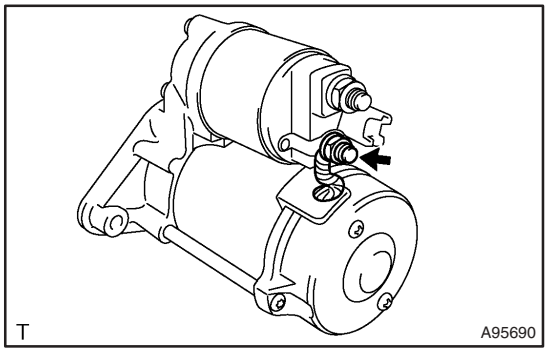
9. INSTALL OIL PUMP DRIVE AND DRIVEN ROTORS

(a) Coat the oil pump drive and driven rotors with engine oil, and place them into the oil pump with the marks facing the oil pump cover side.



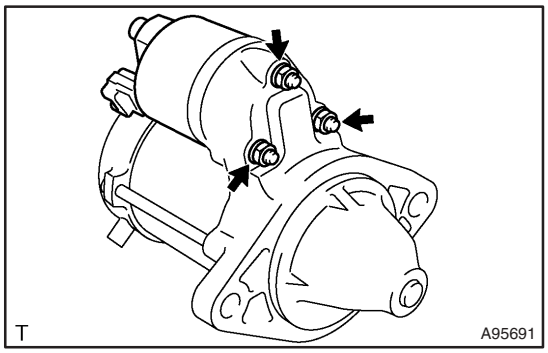
(b) Install the oil pump cover with the 3 screws.
Torque: 10 N·m (102 kgf·cm, 7.0 ft·lbf)

STARTER ASSY (1ZZ–FE/3ZZ–FE)



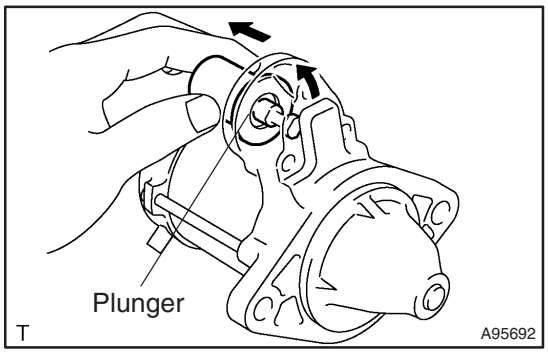
COMPONENTS

190OH–02

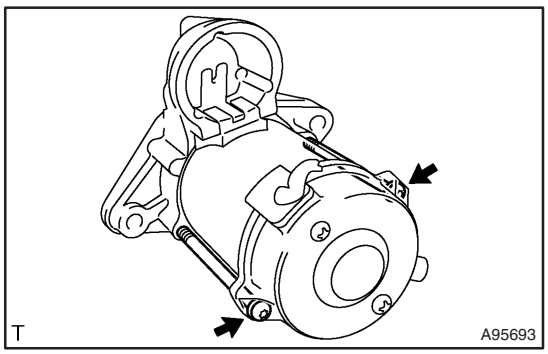


190YB–01

OVERHAUL

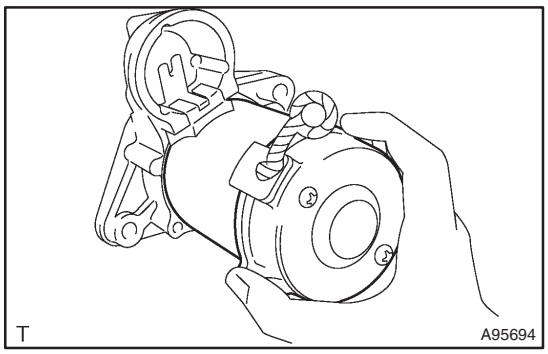


1. REMOVE STARTER MAGNETIC SWITCH ASSY

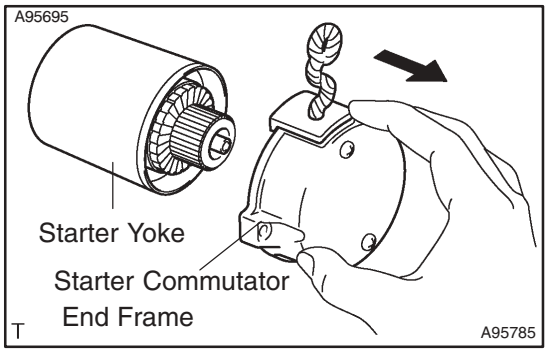


(a) Remove the nut, then disconnect the lead wire from the starter magnetic switch.

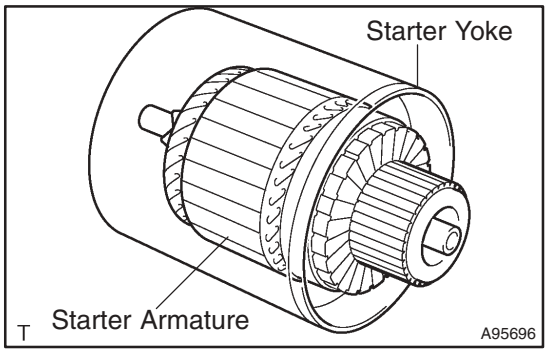
(b) Remove the 3 nuts from the magnet switch body while holding the starter magnetic switch.
(c) Remove the starter magnetic switch.
(d) Remove the return spring.



(e) Pull up the housing side of the plunger, then remove the plunger.



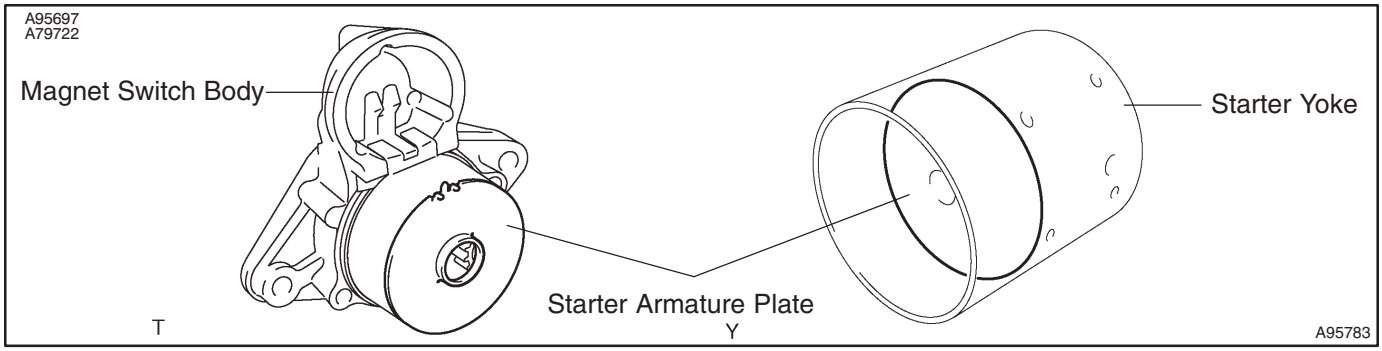
2. REMOVE STARTER YOKE ASSY

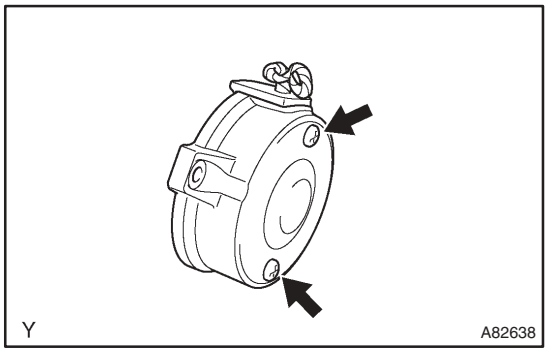


(a) Using a torx driver T25, remove the 2 through bolts.

(b) Pull out the starter yoke together with the starter commutator end frame.

(c) Pull out the starter yoke from the starter commutator end frame.

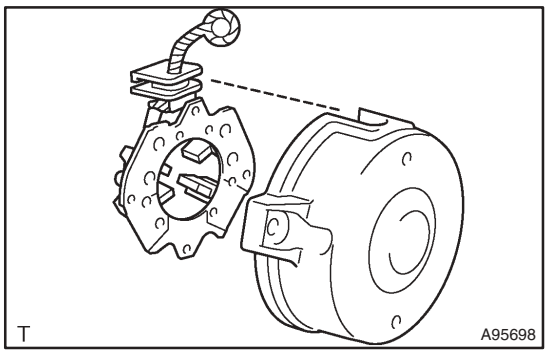




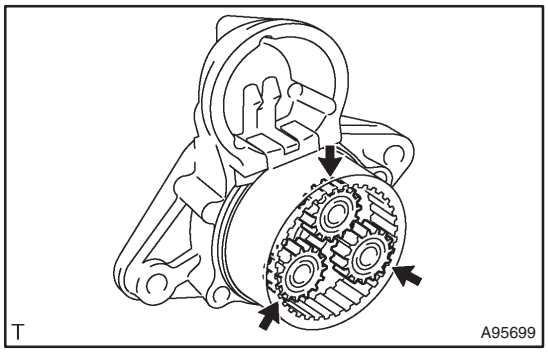
3. REMOVE STARTER ARMATURE ASSY

(a) Remove the starter armature assembly from the starter yoke assembly.

4. REMOVE STARTER ARMATURE PLATE

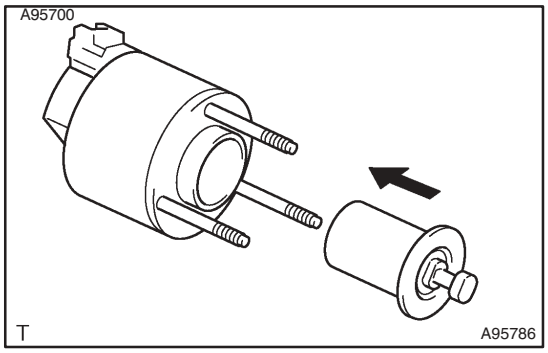


(a) Remove the armature plate from the magnet switch body or the starter yoke.



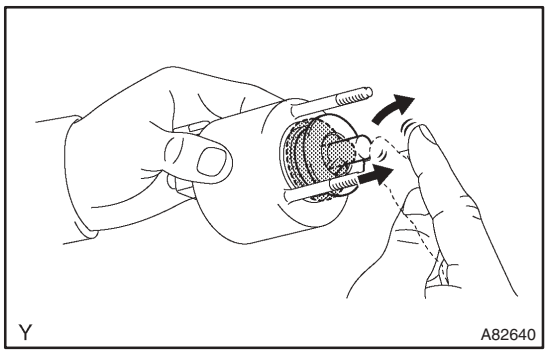
5. REMOVE STARTER BRUSH HOLDER ASSY

(a) Remove the 2 screws from the commutator end frame.



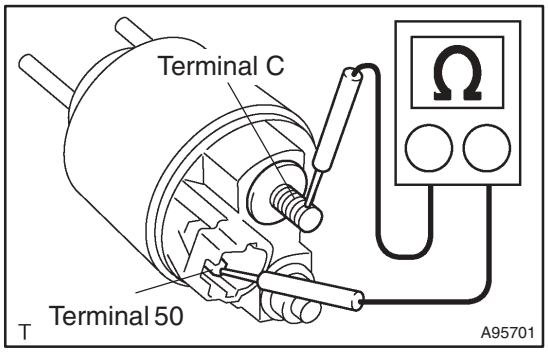
(b) Remove the claw of the clamp, then remove the brush holder from the commutator end frame.

6. REMOVE PLANETARY GEAR



(a) Remove the 3 planetary gears from the magnet switch body.

7. INSPECT STARTER MAGNETIC SWITCH ASSY

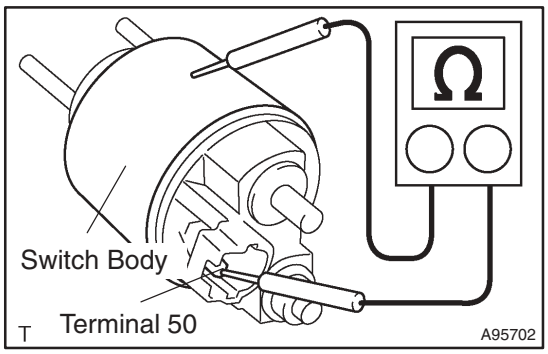


(a) Check the plunger.

(1) Install the plunger onto the switch body.

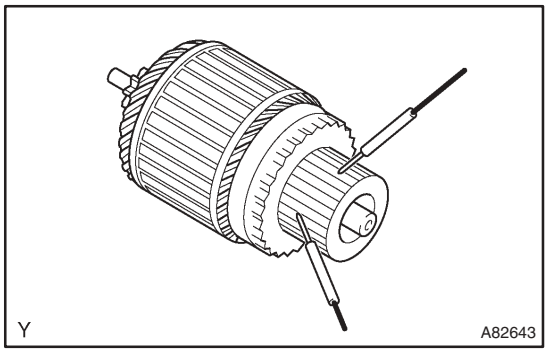
(2) Push in the plunger, then check that it returns quickly to its original position.

If necessary, replace the starter magnetic switch.



(b) Check the pull–in coil for open circuit.

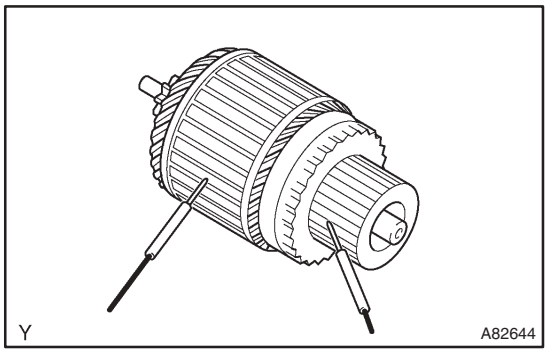
(1) Using an ohmmeter, measure the resistance between terminals 50 and C.



Standard: Below 1 Ω

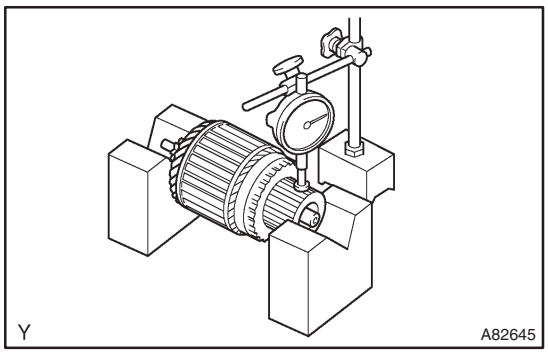
If the standard is not met, replace the starter magnetic switch.

(c) Check if the hold–in coil has an open circuit.
(1) Using an ohmmeter, measure the resistance between terminal 50 and the switch body.
Standard: Below 1.5 Ω



If the standard is not met, replace the starter magnetic switch.

8. INSPECT STARTER ARMATURE ASSY

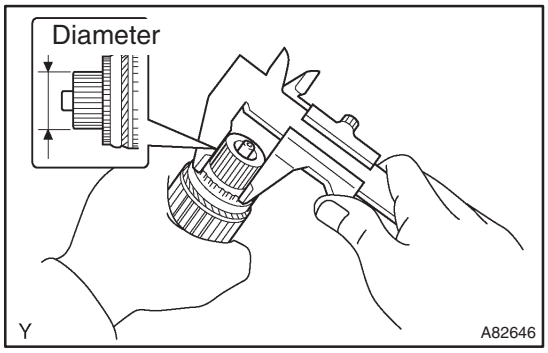


(a) Check the commutator for open circuit.
(1) Using an ohmmeter, measure the resistance between the segments of the commutator.
Standard: Below 1 Ω

If the standard is not met, replace the starter armature.

(b) Check the commutator for ground.
(1) Using an ohmmeter, measure the resistance between the commutator and the armature coil.
Standard: 10 kΩ or higher

If the standard is not met, replace the starter armature.



(c) Check the appearance.

If the surface is dirty or burnt, smooth the surface with 400–grit sandpaper.

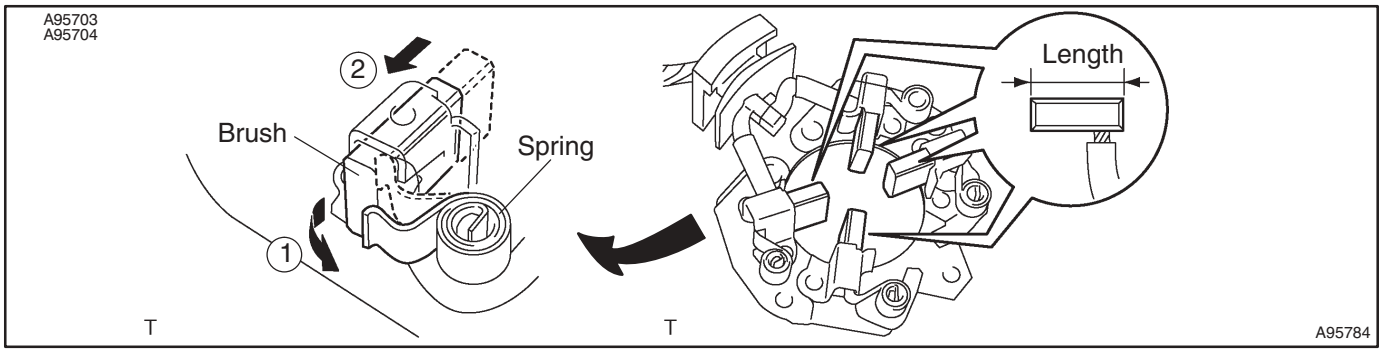
(d) Check for the commutator circuit runout.
(1) Place the commutator on V–blocks.
(2) Using a dial indicator, measure the circle runout.
Standard runout: 0.02 mm (0.0008 in.)
Maximum runout: 0.05 mm (0.0020 in.)

If the runout is greater than maximum, replace the armature.

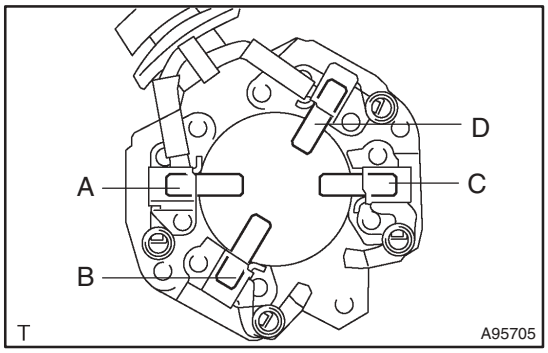
(e) Using vernier calipers, measure the commutator diameter.
Standard diameter: 29 mm (1.142 in.)
Minimum diameter: 28 mm (1.102 in.)

If the diameter is less than minimum, replace the armature.

9. INSPECT STARTER BRUSH HOLDER ASSY



(a) Remove the claw of the spring, then remove the 4 brushes.



(b) Using vernier calipers, measure the brush length.

Standard length: 15.5 mm (0.610 in.)

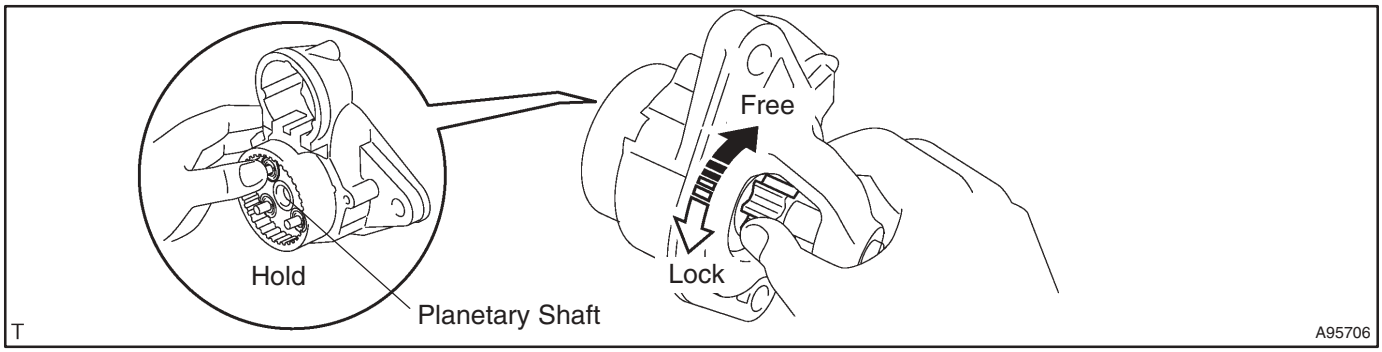
Minimum length: 9.0 mm (0.354 in.)

If the length is less than minimum, replace the starter brush holder assembly.

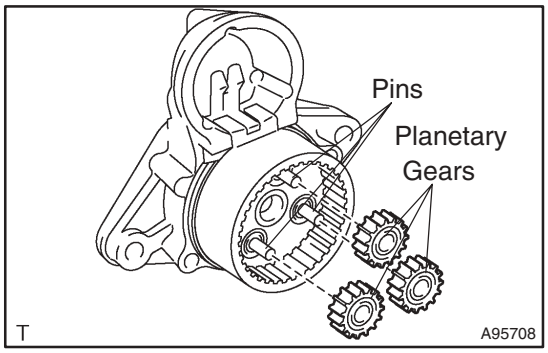
(c) Check the brush holder.

(1) Using an ohmmeter, measure the resistance between the brushes.

Standard:



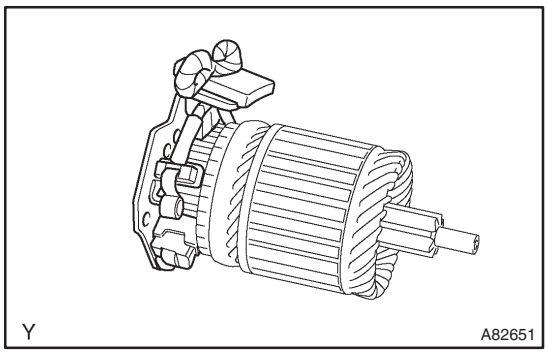
Tester Connection	Specified Condition
A – B	10 kΩ or higher
A – C	10 kΩ or higher
A – D	Below 1 Ω
B – C	Below 1 Ω
B – D	10 kΩ or higher
C – D	10 kΩ or higher



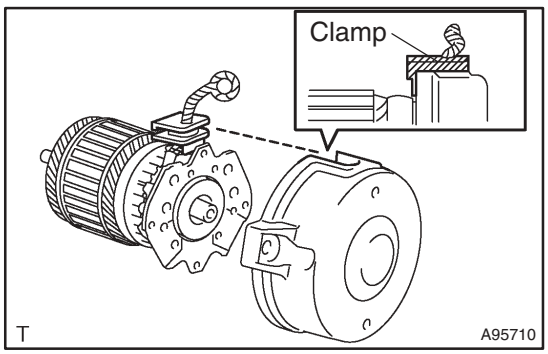
If the standard is not met, replace the starter brush holder.

10. INSPECT MAGNET SWITCH BODY

(a) Check the starter clutch.
  (1) Hold the planetary shaft so that it may not rotate.
  (2) Rotate the clutch pinion gear clockwise and check that it turns freely. Try to rotate the clutch pinion gear counterclockwise and check that it locks.

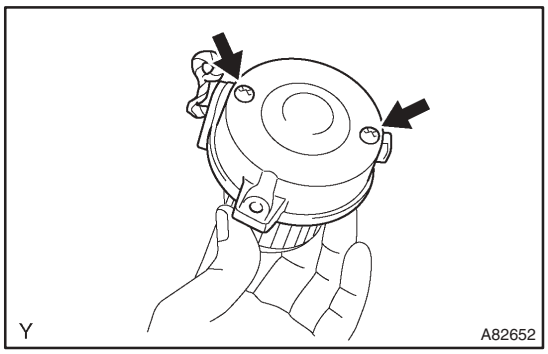


If necessary, replace the magnet switch body.



11. INSTALL PLANETARY GEAR

(a) Apply grease to the planetary gears and pin parts of the planetary shaft.
(b) Install the 3 planetary gears.



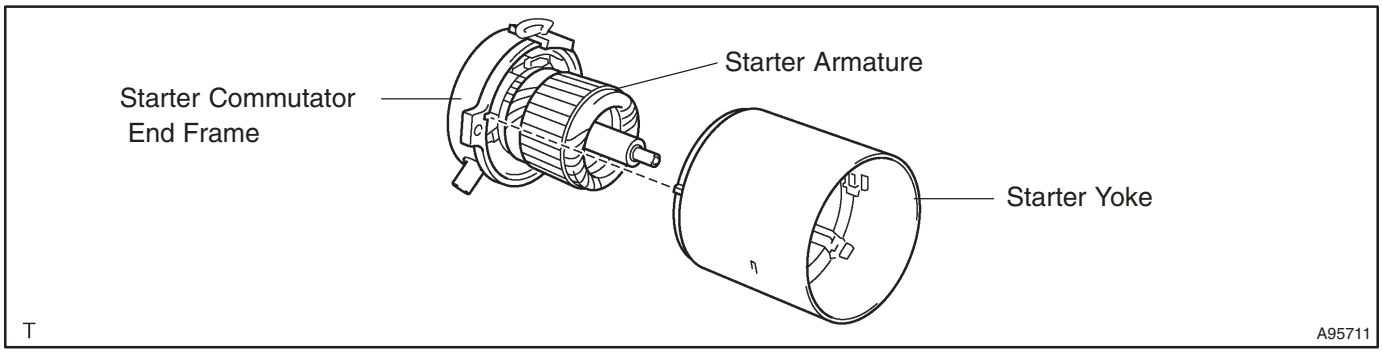
12. INSTALL STARTER BRUSH HOLDER ASSY

(a) Install the brush holder onto the starter armature assy.

13. INSTALL STARTER COMMUTATOR END FRAME ASSY

(a) Fit the clamp of the brush holder into the starter commutator end frame.

(b) Install the commutator end frame with the 2 screws.

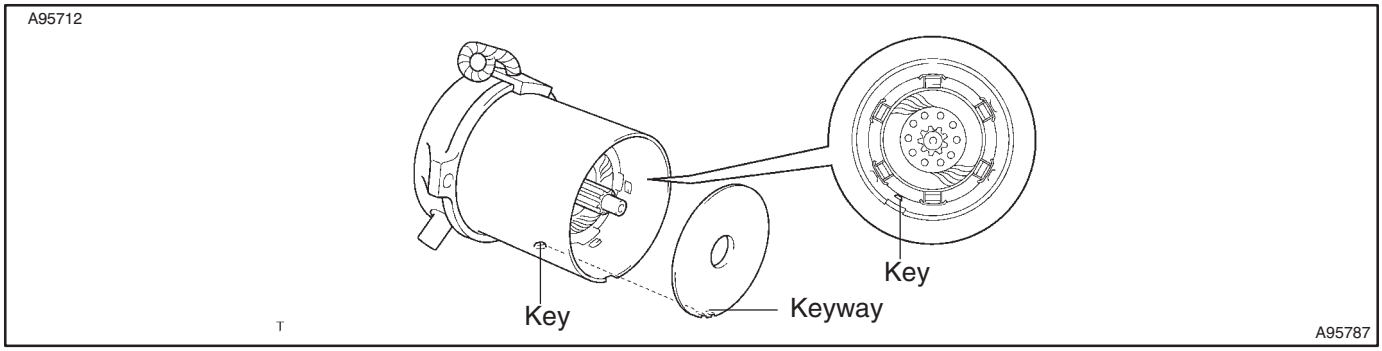


14. INSTALL STARTER ARMATURE ASSY

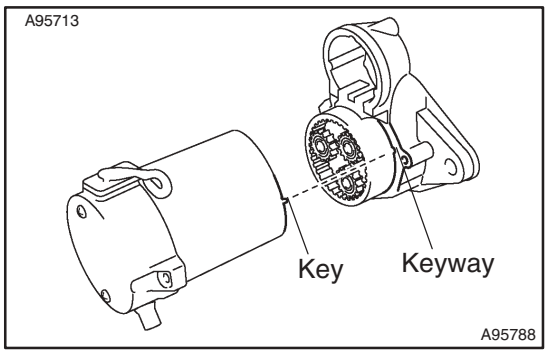
(a) Align the rubber with the convex cutout of the starter yoke.

(b) Install starter armature with the brush holder onto the starter yoke.

HINT:

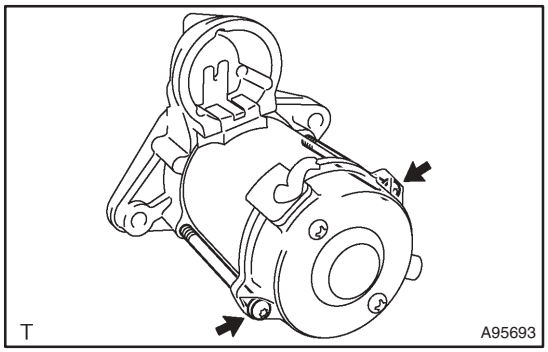


Support the starter armature so that it may not be pulled out from the starter brush holder by magnetic force of the starter yoke.

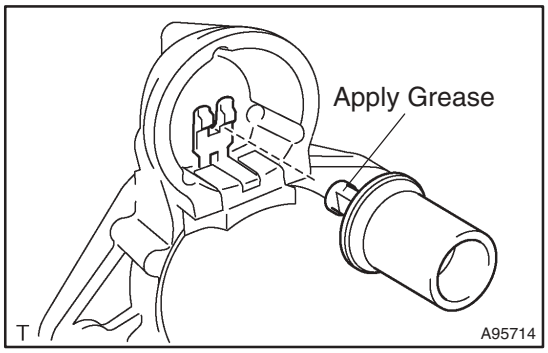


15. INSTALL STARTER ARMATURE PLATE

(a) Insert the starter armature plate onto the starter yoke.

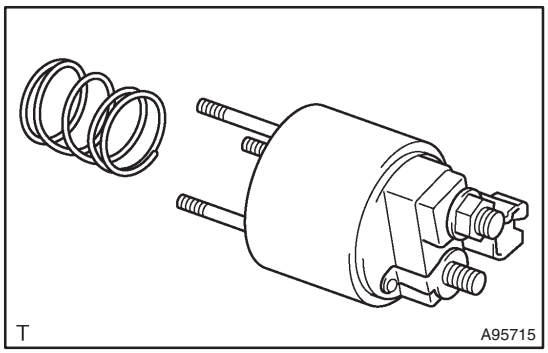


(b) Align the keyway of the starter plate with the key inside the starter yoke, then install the starter plate.

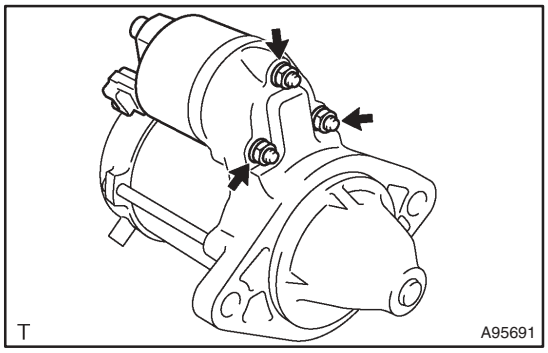


16. INSTALL STARTER YOKE ASSY

(a) Align the key of the starter yoke with the keyway located on the magnet switch body.

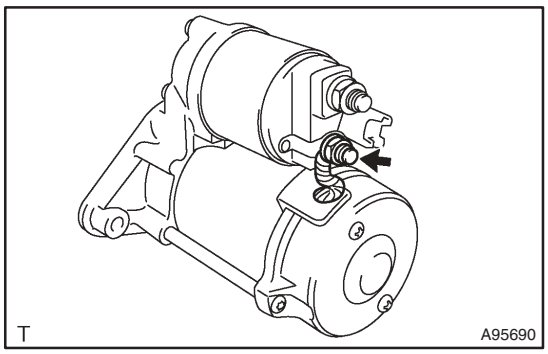


(b) Using a torx driver T25, install the starter yoke using the 2 through bolts.
Torque: 6.0 N·m (61 kgf·cm, 53 in.·lbf)



17. INSTALL STARTER MAGNETIC SWITCH ASSY

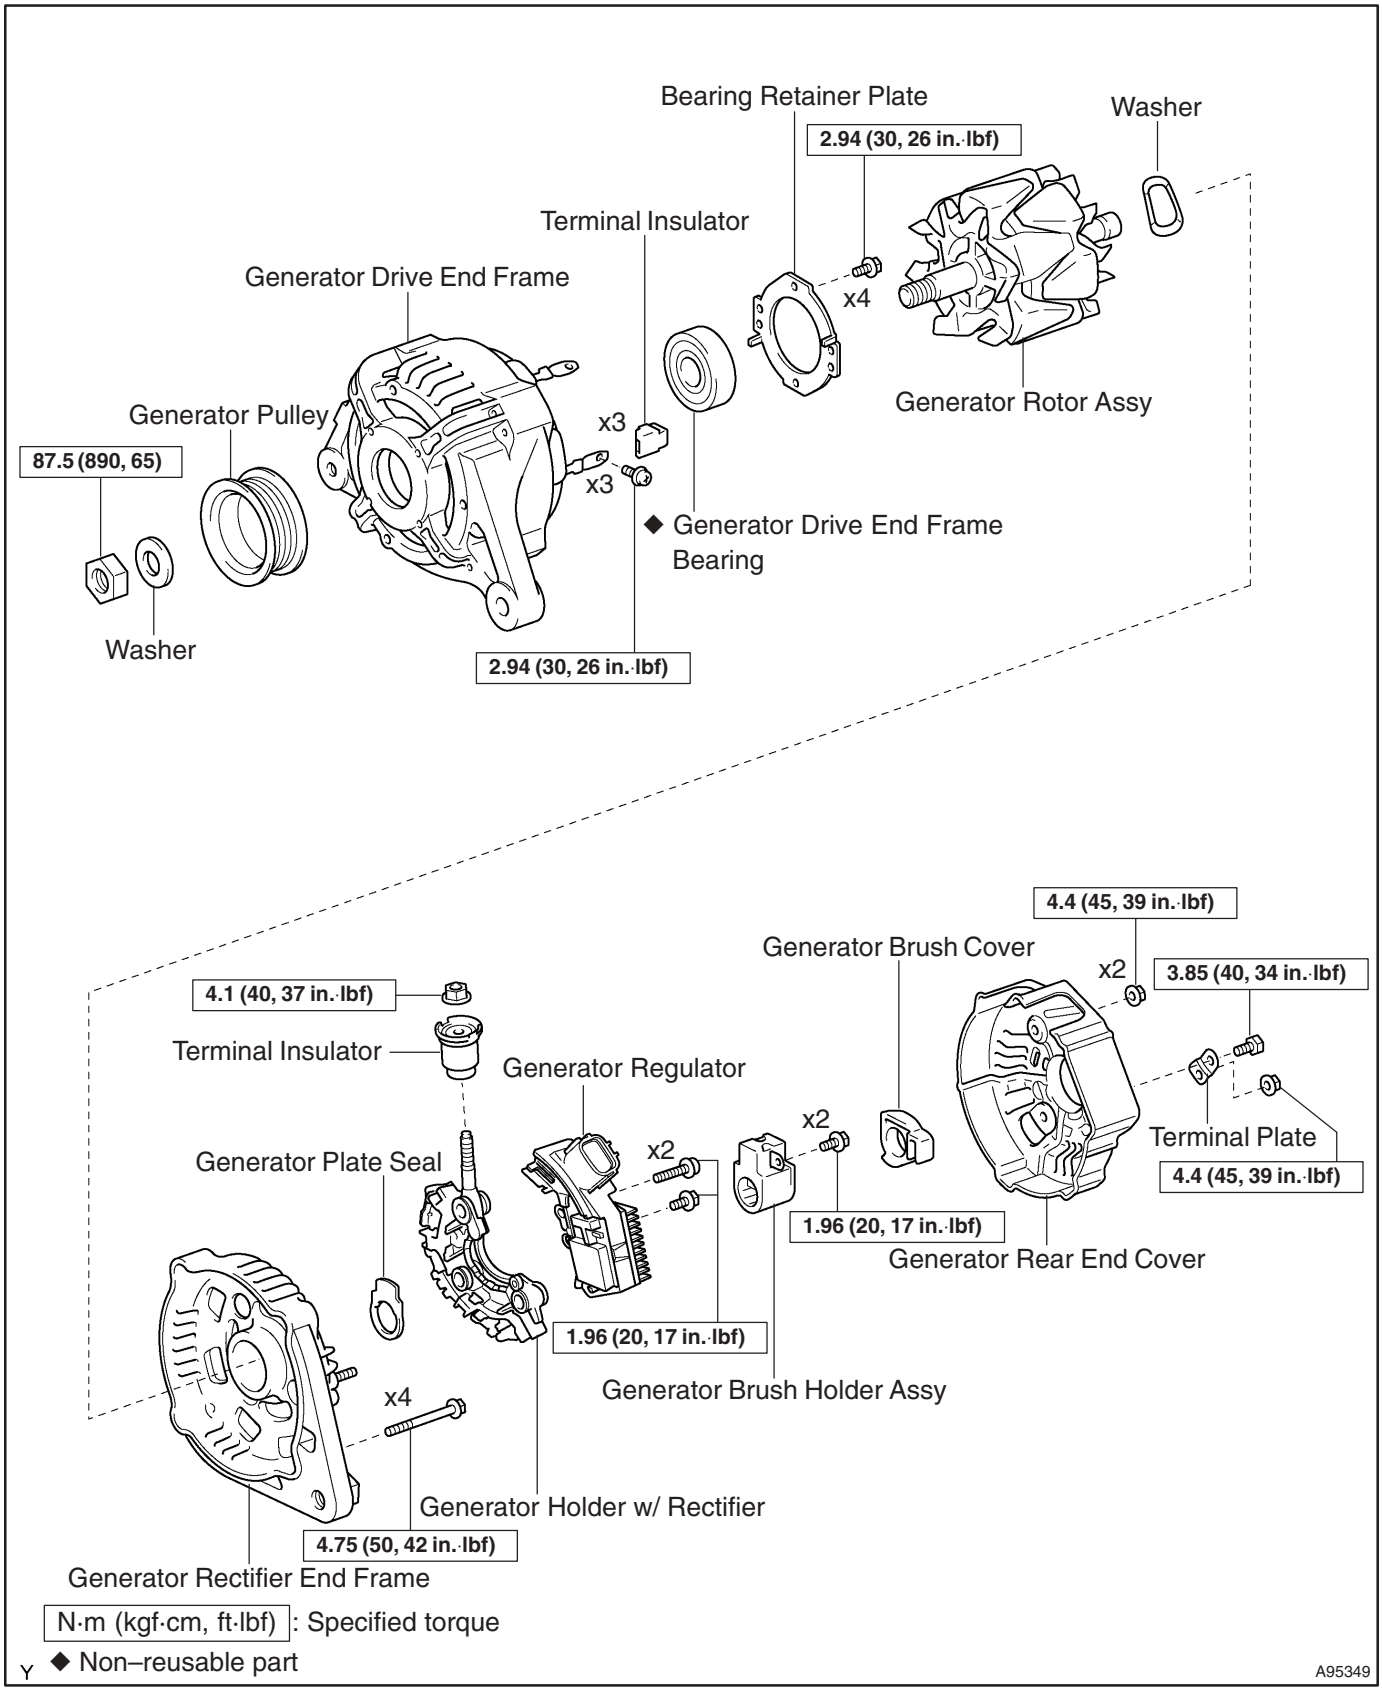
(a) Apply grease to the hook.



(b) Connect the plunger and hook of the starter housing to the drive lever.

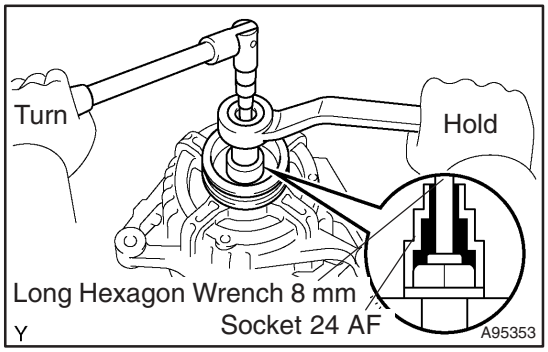
(c) Install the plunger and return spring.

(d) Install the starter magnetic switch with the 3 nuts.
Torque: 2.3 N·m (24 kgf·cm, 21 in.·lbf)



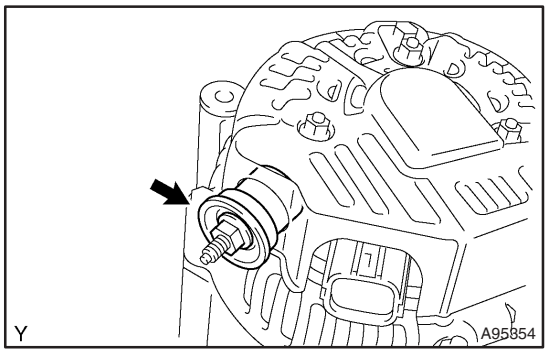
(e) Connect the lead wire to the starter magnetic switch, then fasten it with the nut.
Torque: 5.9 N·m (60 kgf·cm, 52 in.·lbf)

GENERATOR ASSY (DENSO MADE) (1ZZ–FE/3ZZ–FE)



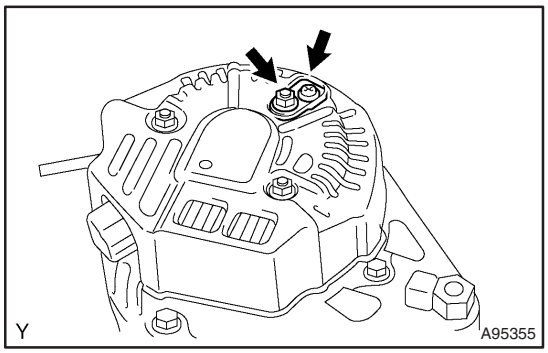
190ZR–01

COMPONENTS



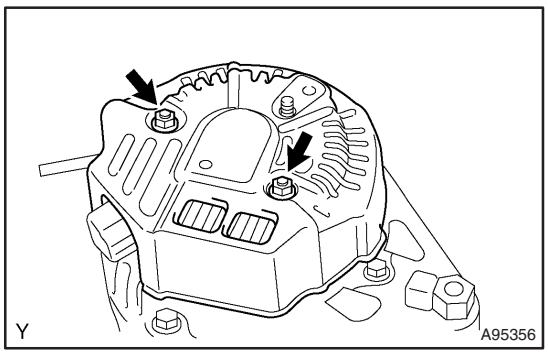
190ZS–01

OVERHAUL



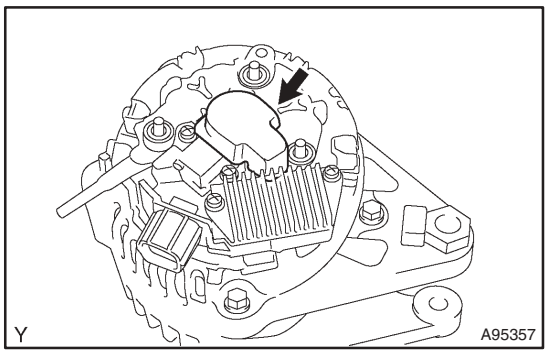
1. REMOVE GENERATOR PULLEY

(a) Using a socket 24 AF and long hexagon wrench 8 mm, remove the nut, then remove the washer and generator pulley.



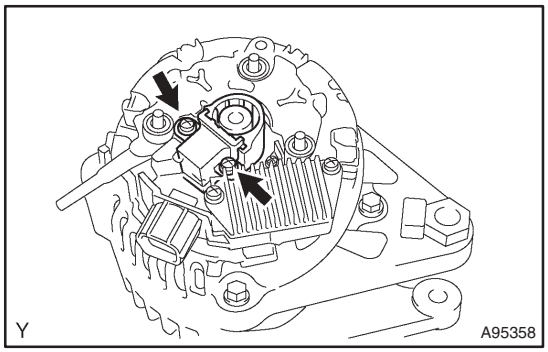
2. REMOVE TERMINAL INSULATOR

(a) Remove the nut, then remove the terminal insulator.



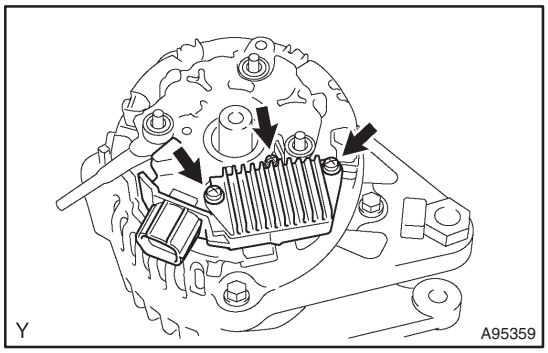
3. REMOVE TERMINAL PLATE

(a) Remove the screw and nut, then remove the terminal plate.



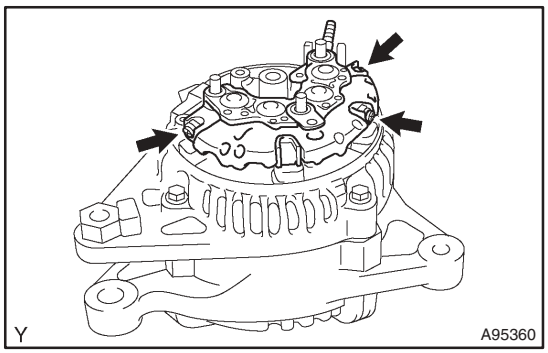
4. REMOVE GENERATOR REAR END COVER

(a) Remove the 2 nuts, then remove the generator rear end cover.



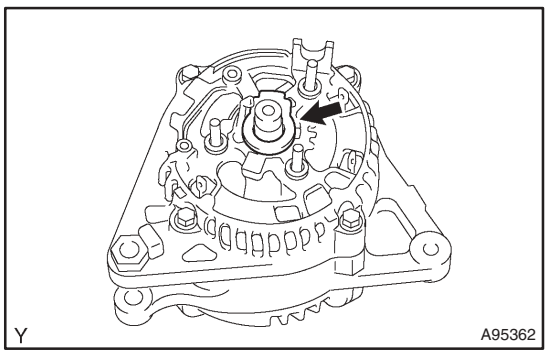
5. REMOVE GENERATOR BRUSH COVER

(a) Remove the generator brush cover from the generator brush holder.



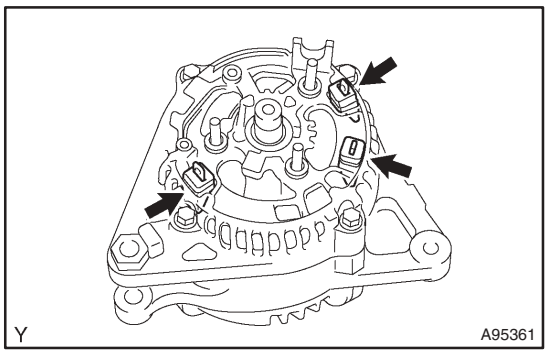
6. REMOVE GENERATOR BRUSH HOLDER ASSY

(a) Remove the 2 screws, then remove the generator brush holder.



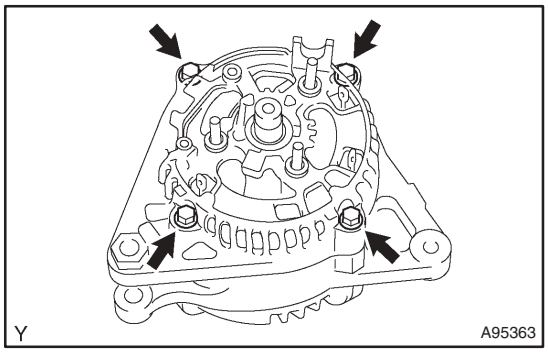
7. REMOVE GENERATOR REGULATOR ASSY

(a) Remove the 3 screws, then remove the generator regulator.



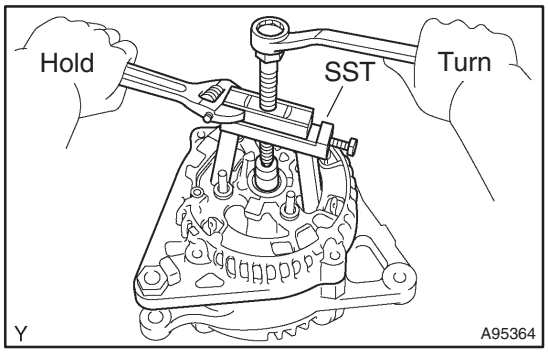
8. REMOVE GENERATOR HOLDER W/ RECTIFIER

(a) Remove the 3 screws, then remove the generator holder with rectifier.

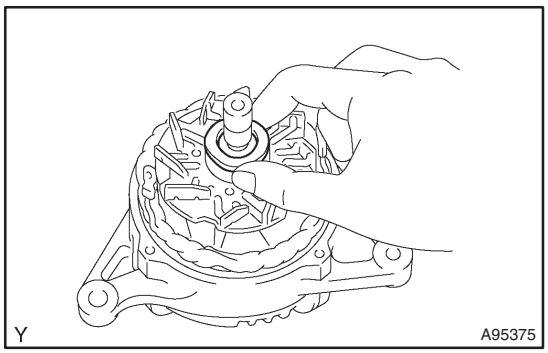


9. REMOVE GENERATOR PLATE SEAL

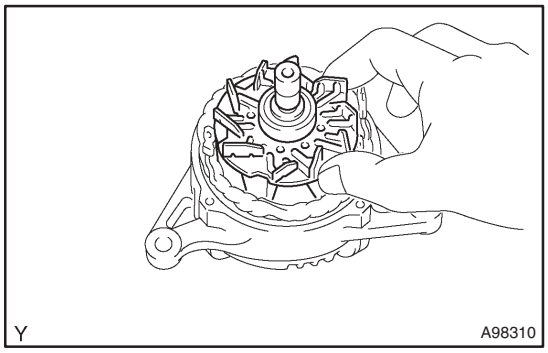
(a) Remove the generator plate seal from the generator rectifier end frame.



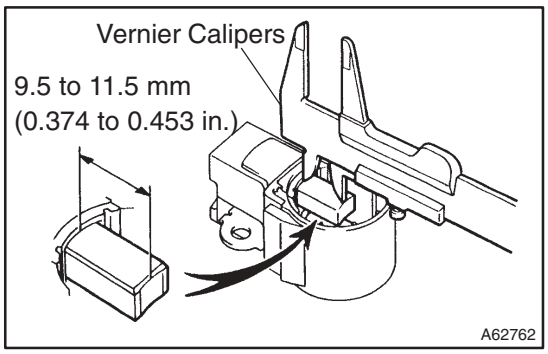
10. REMOVE GENERATOR ROTOR ASSY



(a) Remove the 3 terminal insulators from the generator rectifier end frame.



(b) Remove the 4 bolts.

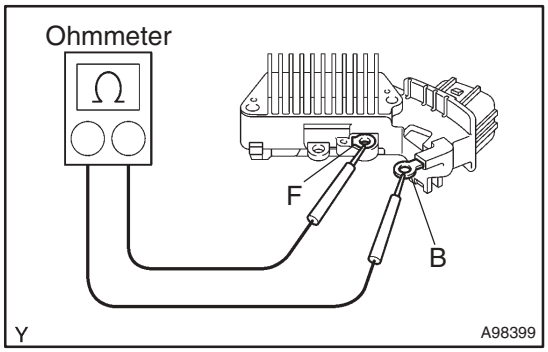


(c) Using SST, remove the rectifier end frame.
SST 09286–46011

(d) Remove the washer from the generator rotor.

(e) Remove the generator rotor from the generator drive end frame.

11. INSPECT GENERATOR BRUSH HOLDER ASSY



(a) Inspect the brush length.

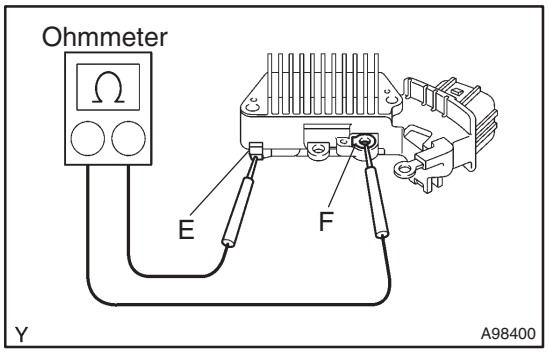
(1) Using vernier calipers, measure the brush length.

Standard: 9.5 to 11.5 mm (0.374 to 0.453 in.)

Minimum: 4.5 mm (0.177 in.)

If the brush length is less than minimum, replace the generator brush holder.

12. INSPECT GENERATOR REGULATOR ASSY



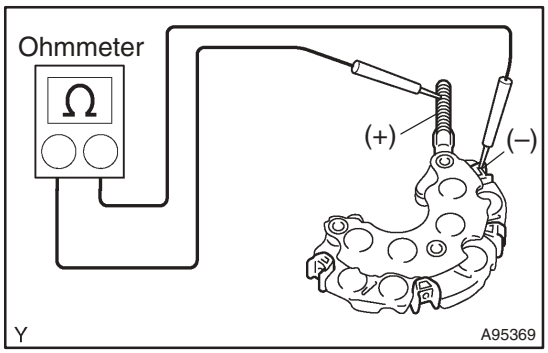
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between terminals B and F.

Standard:

When the positive and negative poles of terminals F and B are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction.

If the result is not as specified, replace the generator regulator.



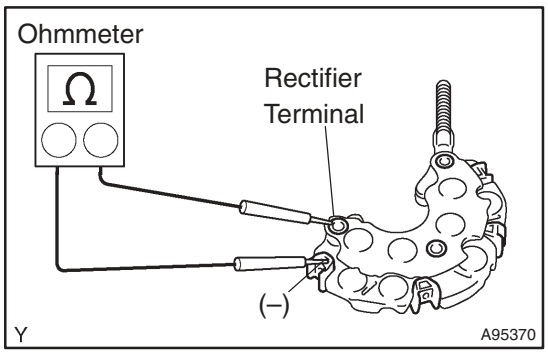
(2) Using an ohmmeter, measure the resistance between terminals E and F.

Standard:

When the positive and negative poles of terminals F and E are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction.

If the result is not as specified, replace the generator regulator.

13. INSPECT GENERATOR HOLDER W/ RECTIFIER



(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the positive (+) terminal and each rectifire terminal.

Standard:

When the positive and negative poles of the positive (+) terminal and each rectifire terminal are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction.

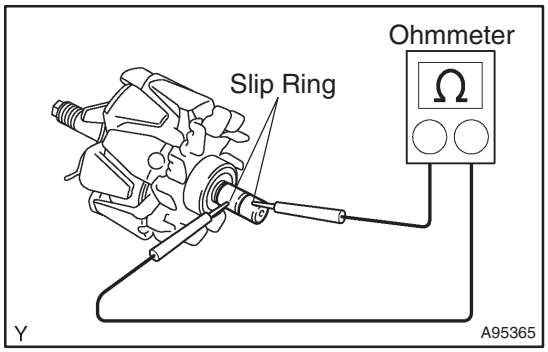
If the result is not as specified, replace the generator holder with rectifier.

(2) Using an ohmmeter, measure the resistance between the negative (–) terminal and each rectifier terminal.

Standard:

When the positive and negative poles of the negative (–) terminal and each rectifire terminal are switched over, there is a resistance of below 1 Ω in one direction but 10 kΩ or higher in the other direction.

If the result is not as specified, replace the generator holder with rectifier.



14. INSPECT GENERATOR ROTOR ASSY

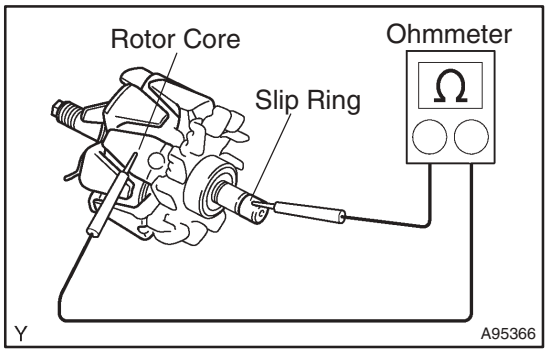
(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the slip rings.

Standard: 2.55 to 2.95 Ω at 20°C (68°F)

If the result is not as specified, replace the generator rotor shaft.

(2) Using an ohmmeter, measure the resistance between the slip ring and rotor.



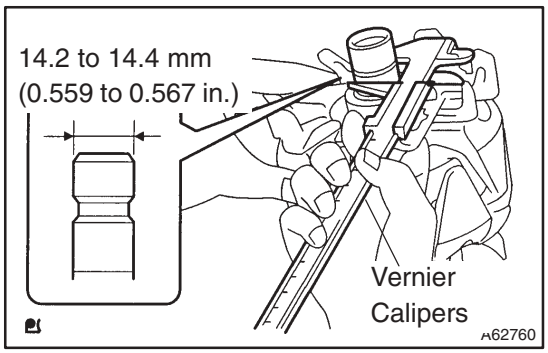
Standard: 10 kΩ or higher

If the result is not as specified, replace the generator rotor shaft.

(b) Check the appearance.

(1) Check that the slip rings are not rough or scored.

If rough or scored, replace the generator rotor.



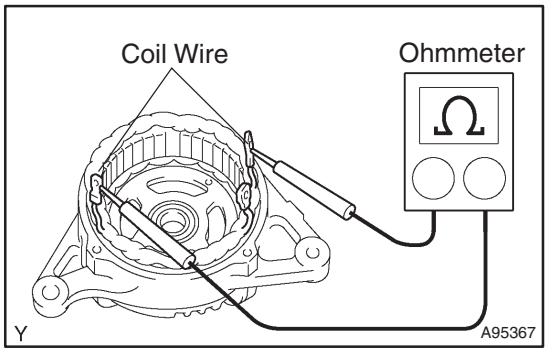
(c) Inspect the slip ring diameter.

(1) Using vernier calipers, measure the slip ring diameter.

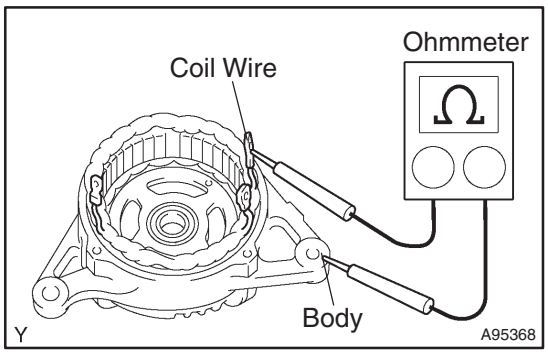
Standard: 14.2 to 14.4 mm (0.559 to 0.567 in.)

Minimum: 14 mm (0.551 in.)

If the slip ring diameter is less than minimum, replace the generator rotor.



15. INSPECT GENERATOR DRIVE END FRAME

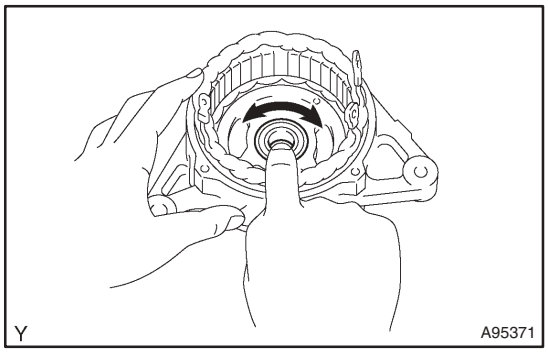


(a) Inspect the resistance.

(1) Using an ohmmeter, measure the resistance between the coil wires.

Standard: Below 1 Ω

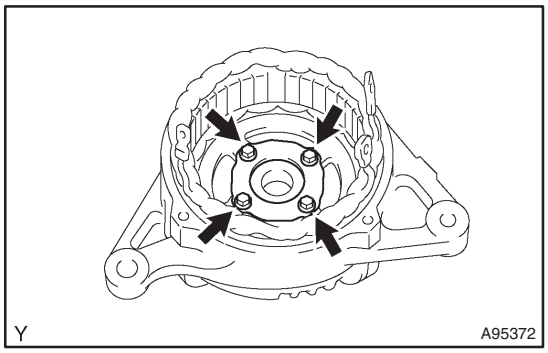
If the result is not as specified, replace the generator drive end frame.



(2) Using an ohmmeter, measure the resistance between the coil wire and body.

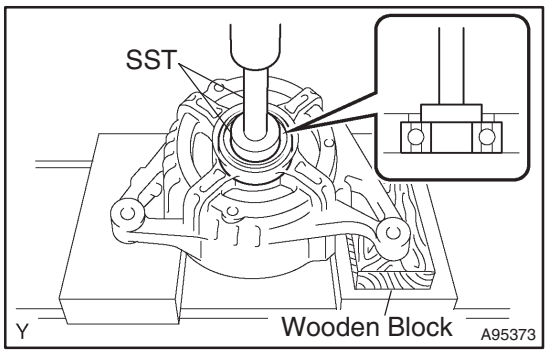
Standard: 10 kΩ or higher

If the result is not as specified, replace the generator drive end frame.



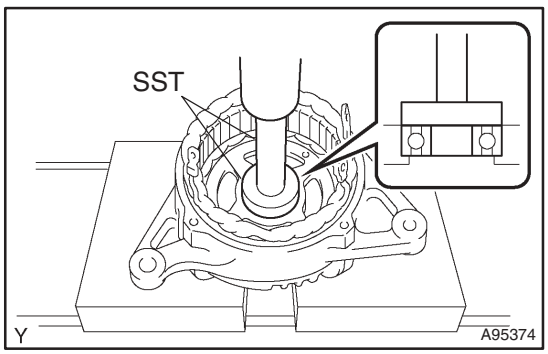
16. INSPECT GENERATOR DRIVE END FRAME BEARING

(a) Check the appearance.



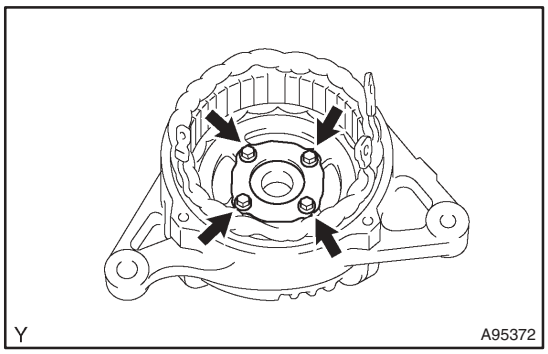
(1) Check that the bearing is not rough or worn.

If necessary, replace the bearing.



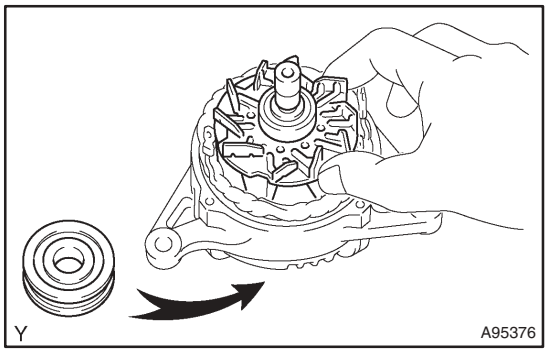
(b) Replace the generator drive end frame bearing.

(1) Remove the 4 screws, then remove the bearing retainer plate.



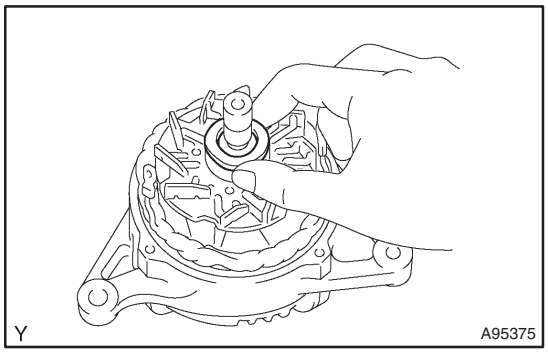
(2) Using SST and a press, push out the bearing,

SST 09950–60010 (09951–00250), 09950–70010 (09951–07100)

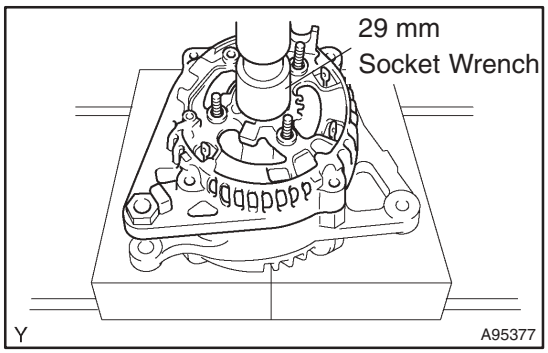


(3) Using SST and a press, press a new bearing into the generator drive end frame.

SST 09950–60010 (09951–00470), 09950–70010 (09951–07100)

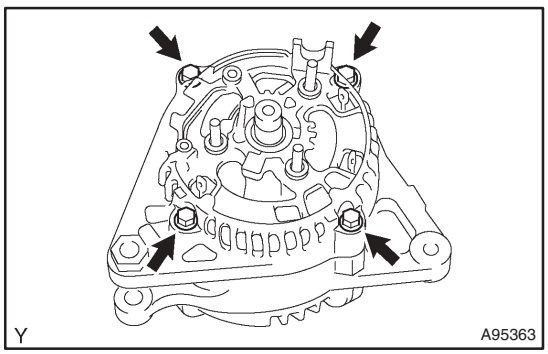


(4) Install the bearing retainer plate with the 4 screws.
Torque: 2.94 N·m (30 kgf·cm, 26 in.·lbf)

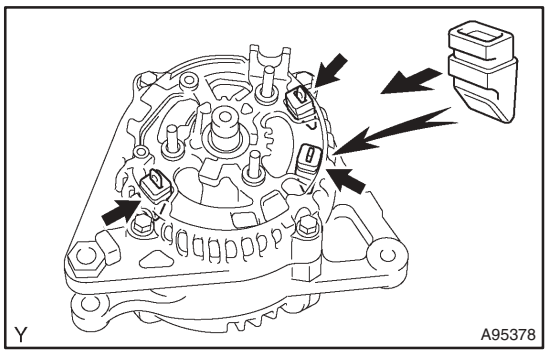


17. INSTALL GENERATOR ROTOR ASSY

(a) Place the generator drive end frame on the generator pulley.

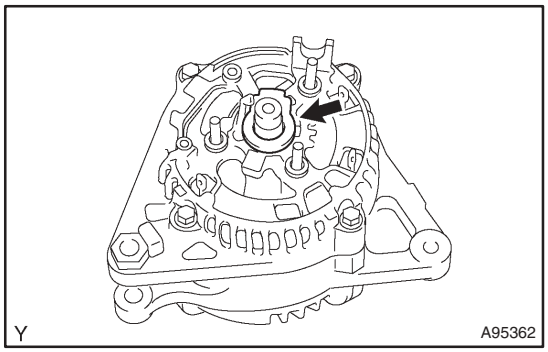


(b) Install the generator rotor onto the generator drive end frame.



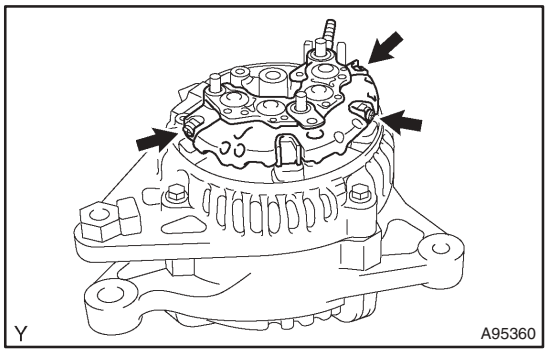
(c) Install the washer onto the generator rotor.

(d) Using a 29 mm socket wrench and press, slowly press the generator rectifier end frame onto the generator drive end frame.



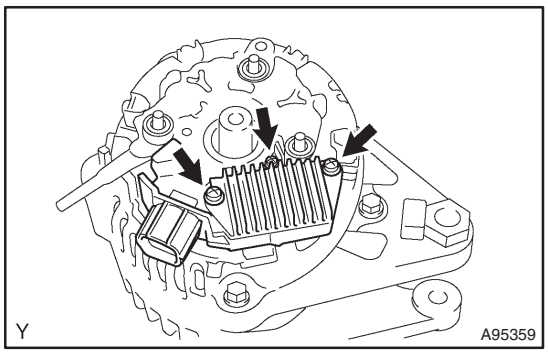
(e) Tighten the 4 bolts.
Torque: 4.75 N·m (50 kgf·cm, 42 in.·lbf)

(f) Install the 3 terminal insulators onto the generator rectifier end frame.



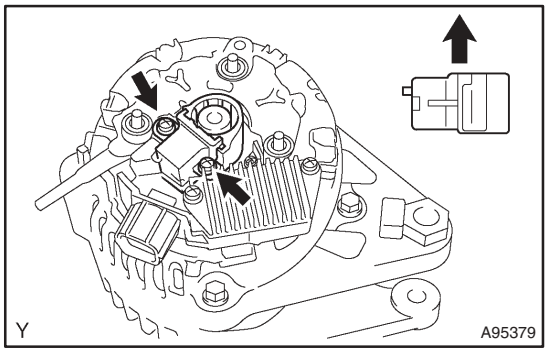
NOTICE:

Be careful of the installation direction of the terminal insulators.



18. INSTALL GENERATOR PLATE SEAL

(a) Install the generator plate seal onto the generator rectifier end frame.

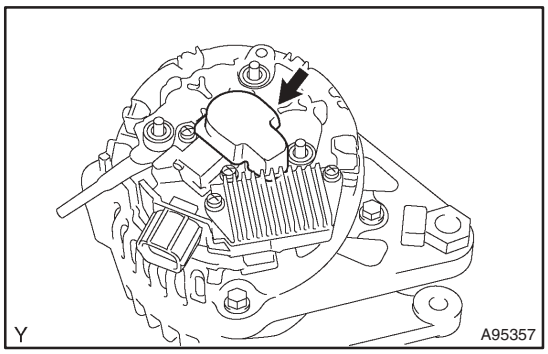


19. INSTALL GENERATOR HOLDER W/ RECTIFIER

(a) Install the generator holder with rectifier with the 3 screws.
Torque: 2.94 N·m (30 kgf·cm, 26 in.·lbf)

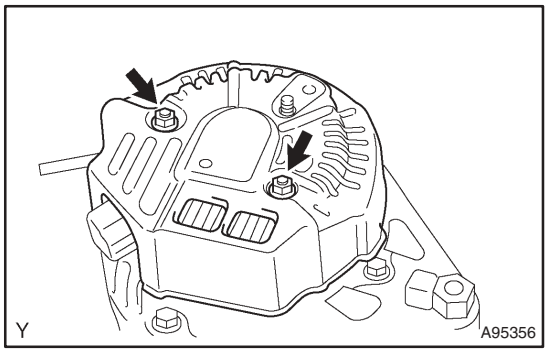
20. INSTALL GENERATOR REGULATOR ASSY

(a) Install the generator regulator with the 3 screws.
Torque: 1.96 N·m (20 kgf·cm, 17 in.·lbf)



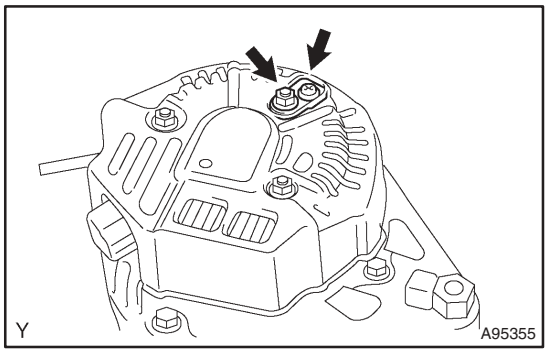
21. INSTALL GENERATOR BRUSH HOLDER ASSY

(a) Install the generator brush holder with the 2 screws.
Torque: 1.96 N·m (20 kgf·cm, 17 in.·lbf)



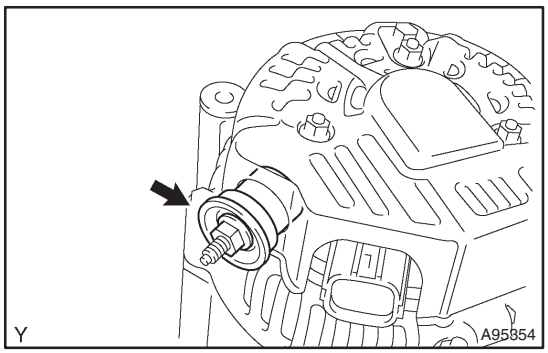
NOTICE:

Pay attention to the position of the protrusion as shown in the illustration.



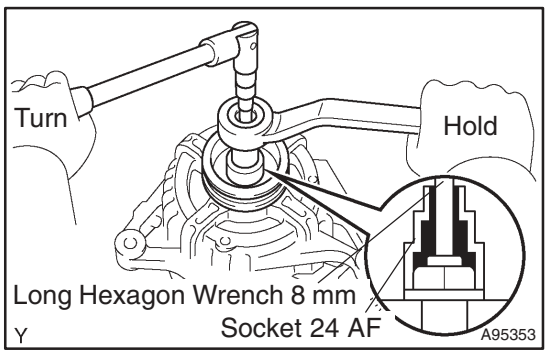
22. INSTALL GENERATOR BRUSH COVER

(a) Install the generator brush cover onto the generator brush holder.



23. INSTALL GENERATOR REAR END COVER

(a) Install the generator rear end frame cover with the 2 nuts.
Torque: 4.4 N·m (45 kgf·cm, 39 in.·lbf)



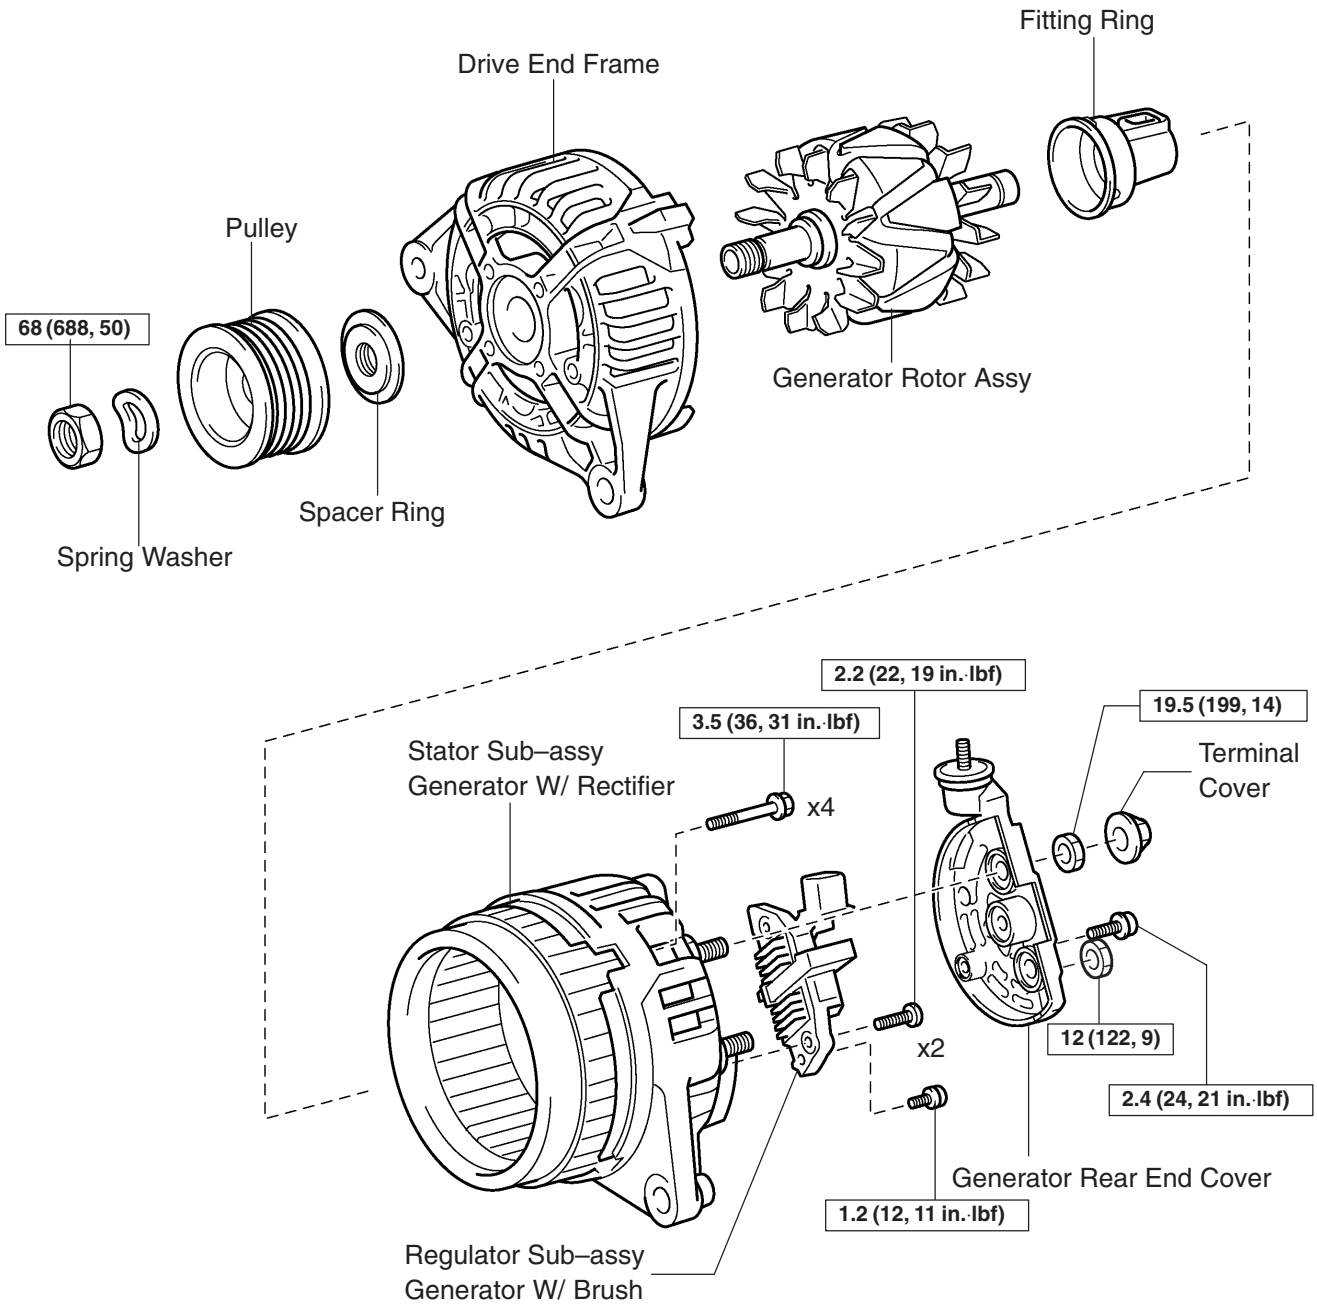
24. INSTALL TERMINAL PLATE

(a) Install the terminal plate with the screw and nut.
Torque:
3.85 N·m (40 kgf·cm, 34 in.·lbf) for screw
4.4 N·m (45 kgf·cm, 39 in.·lbf) for nut

25. INSTALL TERMINAL INSULATOR

(a) Install the terminal insulator with the nut.
Torque: 4.1 N·m (40 kgf·cm, 37 in.·lbf)

26. INSTALL GENERATOR PULLEY



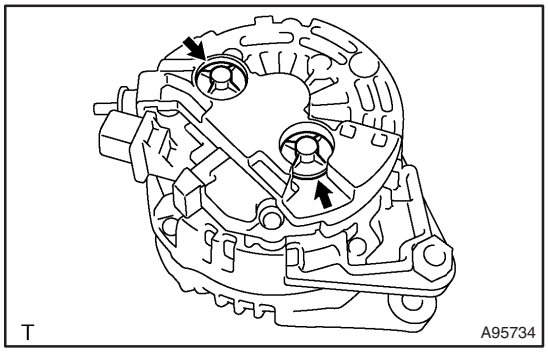
(a) Using a socket 24 AF and long hexagon wrench 8 mm, remove the nut, then remove the washer and generator pulley.
Torque: 87.5 N·m (890 kgf·cm, 65 ft·lbf)

(b) Rotate the generator pulley, then check that the generator pulley moves smoothly.

GENERATOR ASSY (BOSCH MADE)(1ZZ–FE/3ZZ–FE)

190OJ–03

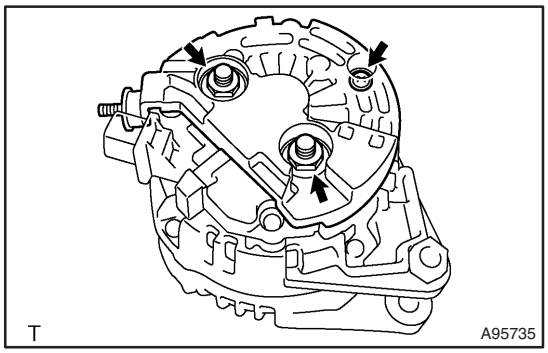
COMPONENTS



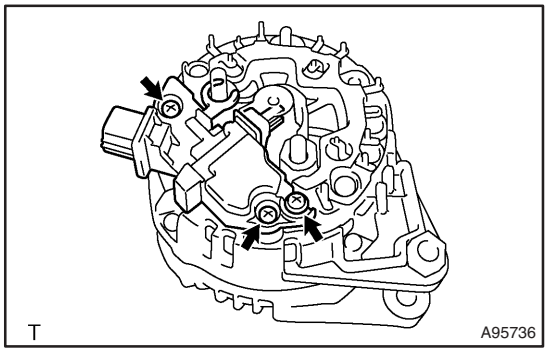
N·m (kgf·cm, ft·lbf) : Specified torque

T ◆ Non–reusable part

A95771



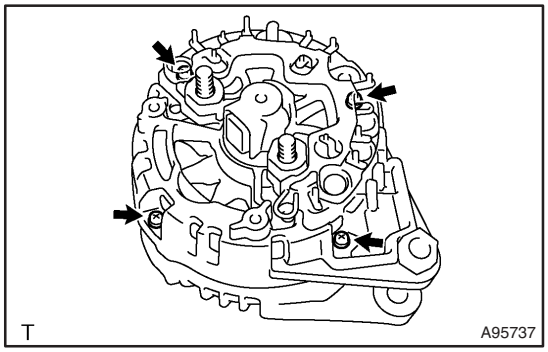
OVERHAUL



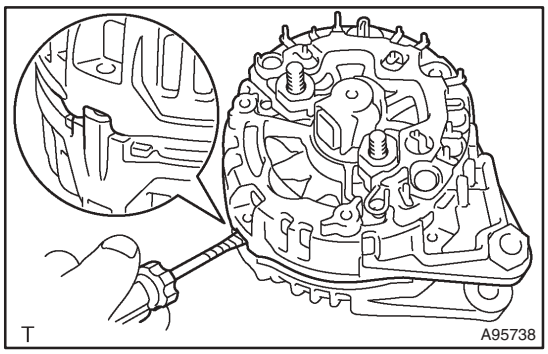
190YJ–01

1. REMOVE GENERATOR REAR END COVER

(a) Remove the 2 terminal covers by turning them counterclockwise.

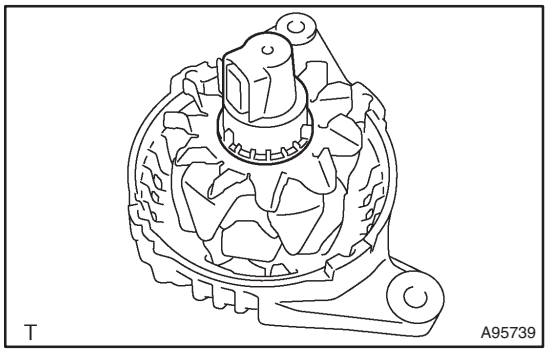


(b) Using a 15 mm socket wrench, remove the screw and 2 nuts, then detach the generator rear end cover.



2. REMOVE REGULATOR SUB–ASSY GENERATOR W/BRUSH

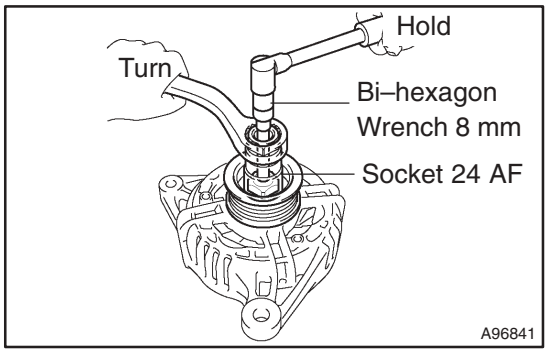
(a) Remove the 3 screws and regulator generator with brush.



3. REMOVE STATOR SUB–ASSY GENERATOR W/RECTIFIER

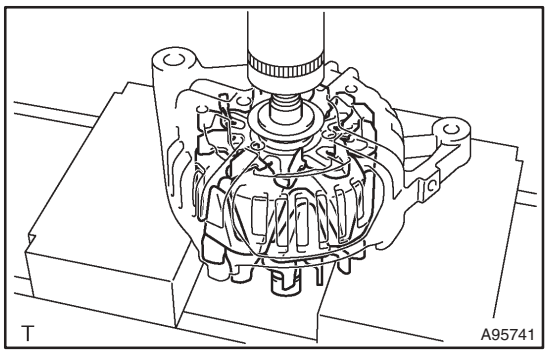
(a) Remove the 4 screws.

(b) Using a screwdriver, pry out the stator generator with rectifier.



4. REMOVE BEARING SET GENERATOR

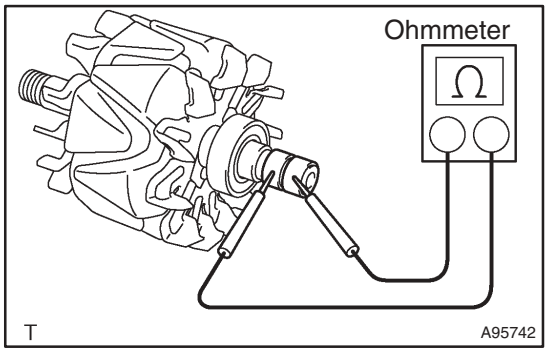
5. REMOVE PULLEY SET GENERATOR



(a) Clamp the swivel arm in a vise.

NOTICE:

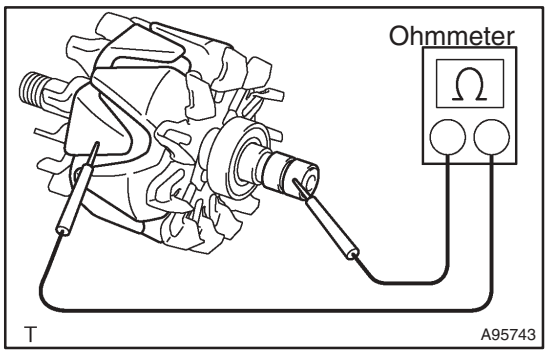
Do not clamp the generator rotor in a vise.



(b) Using a socket 24 AF and bi–hexagon wrench 8 mm, remove the nut and spring washer, then detach the pulley.

6. REMOVE GENERATOR ROTOR ASSY

(a) Using a press, press out the generator rotor assembly and spacer ring.



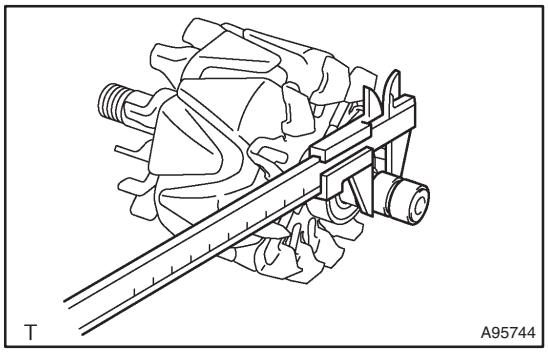
7. INSPECT GENERATOR ROTOR ASSY

(a) Inspect the generator rotor assy for open circuit.

(1) Using an ohmmeter, measure the resistance between the slip rings.

Standard: 2.27 to 2.53 Ω at 20°C (68°F)

If the standard is not met, replace the generator rotor.



(b) Inspect the generator rotor assy for ground.

(1) Using an ohmmeter, measure the resistance between the slip ring and generator rotor assembly.

Standard: 10 kΩ or higher

If the standard is not met, replace the generator rotor.

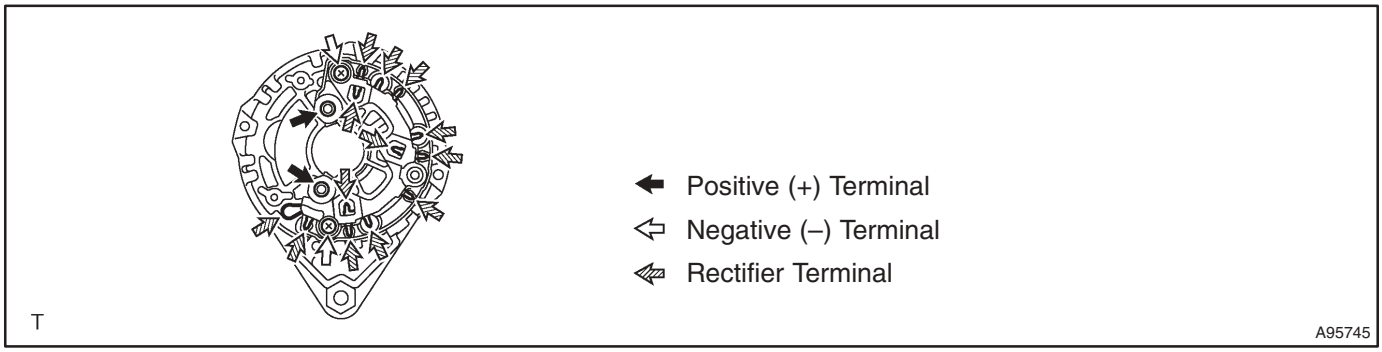
(c) Check the appearance.

(1) Check that the slip rings are not rough or scored.

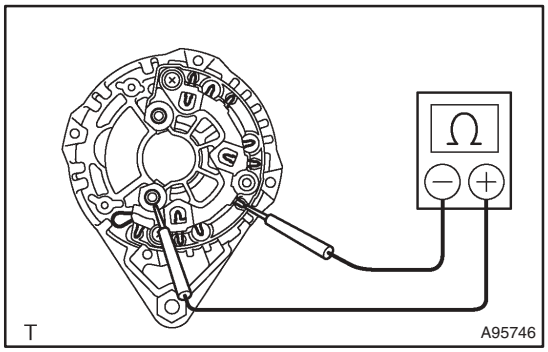
If rough or scored, replace the generator rotor.

(2) Using vernier calipers, measure the slip ring diameter.

Standard diameter: 15.3 to 15.5 mm (0.602 to 0.610 in.)



Minimum diameter: 14.3 mm (0.561 in.)



If the diameter is less than minimum, replace the generator rotor.

8. INSPECT STATOR SUB–ASSY GENERATOR W/RECTIFIER

HINT:

According to the terminal position of the stator generator, refer to the illustration below.

(a) Inspect the positive (+) rectifier.

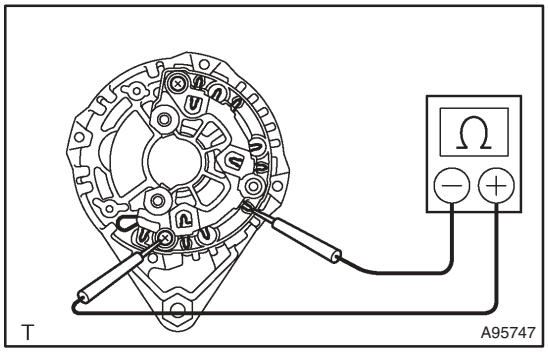
HINT:

Inspect the positive terminal after pulling up.

(1) Using an ohmmeter, connect the positive (+) tester probe to the positive (+) terminal and the negative (–) tester probe to each rectifier terminal.

(2) Measure the resistance between the positive (+) terminal and rectifier terminal.

Standard: Below 1 Ω



If standard is not met, replace the stator generator.

(3) Reverse the polarity of the tester probes and repeat step (1).

(4) Measure the resistance between the positive (+) terminal and rectifier terminal.

Standard: 10 kΩ or higher

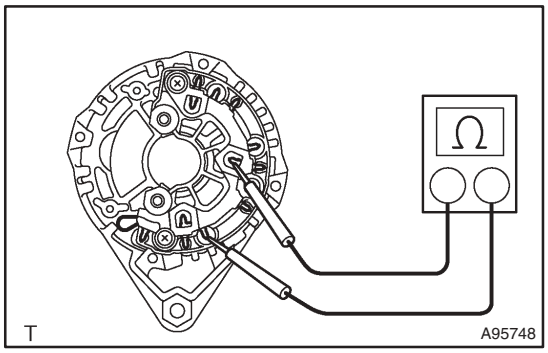
If the standard is not met, replace the stator generator.

(b) Inspect the negative (–) rectifier.

(1) Using an ohmmeter, connect the positive (+) tester probe to each negative (–) terminal and the negative (–) tester prove to each rectifier terminal.

(2) Measure the resistance between the negative (–) terminal and rectifier terminal.

Standard: 10 kΩ or higher



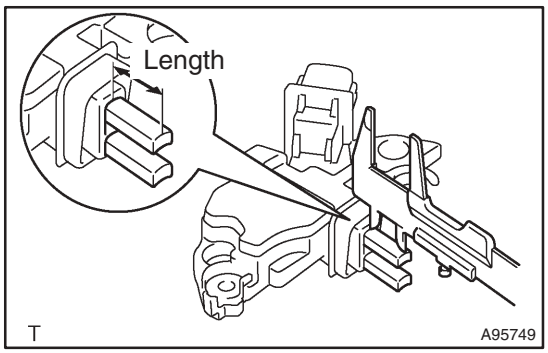
If the standard is not met, replace the stator generator.

(3) Reverse the polarity of the tester probes and repeat step (1).

(4) Measure the resistance between the negative (–) terminal and rectifier terminal.

Standard: Below 1 Ω

If the standard is not met, replace the stator generator.

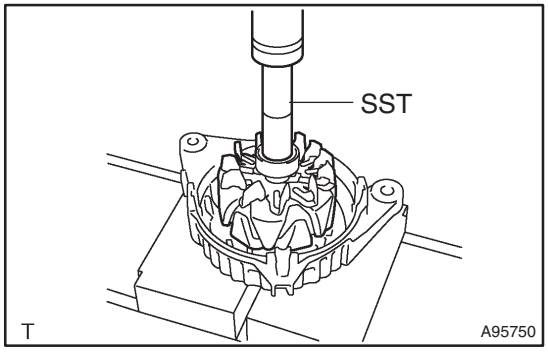


(c) Inspect the stator for open circuit.

(1) Using an ohmmeter, measure the resistance between the rectifier terminals.

Standard: Below 1 Ω

If the standard is not met, replace the stator generator.

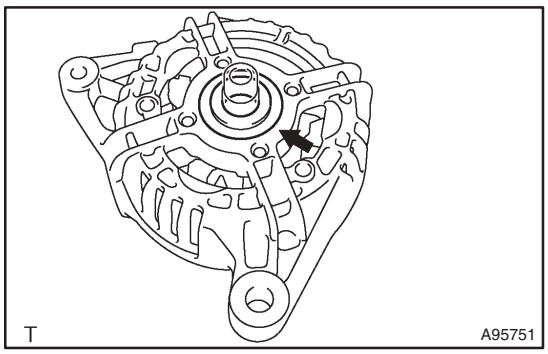


9. INSPECT BRUSH

(a) Using vernier calipers, measure the brush length.

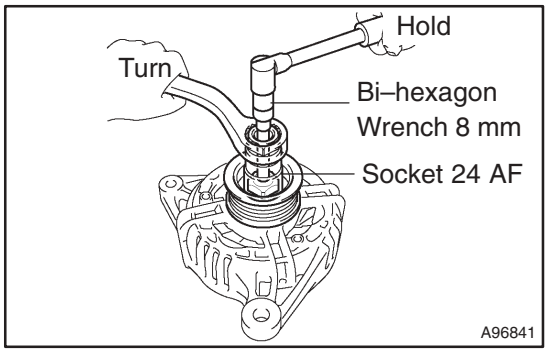
Standard exposed length:
11.0 to 13.6 mm (0.433 to 0.535 in.)
Minimum exposed length: 1.5 mm (0.059 in.)

If the exposed length is less than minimum, replace the voltage regulator and brush assembly.



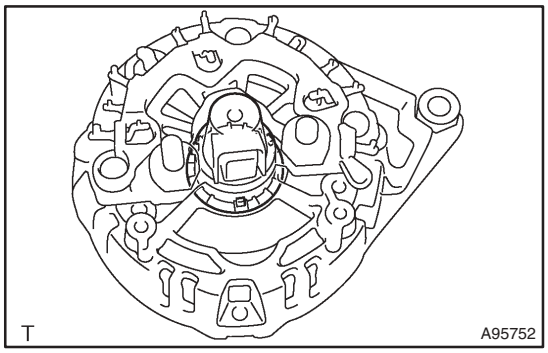
10. INSTALL GENERATOR ROTOR ASSY

(a) Using SST and a press, press in the generator rotor assembly.



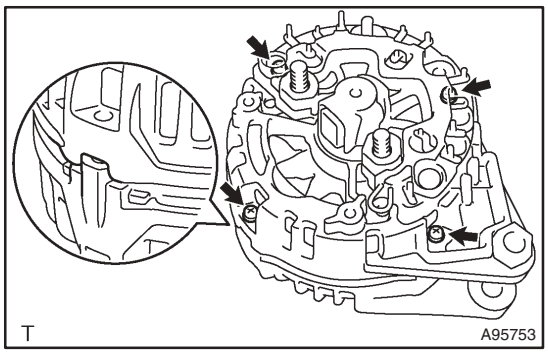
SST 09285–76010

NOTICE:
Avoid misalignment during pressing



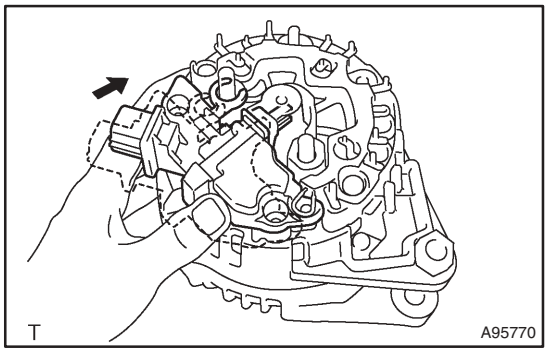
11. INSTALL PULLEY SET GENERATOR

(a) Install the spacer ring.



(b) Using a socket 24 AF and a bi–hexagon wrench 8 mm, install the pulley with the spring washer and nut.
Torque: 68 N·m (688 kgf·cm, 50 ft·lbf)

12. INSTALL BEARING SET GENERATOR

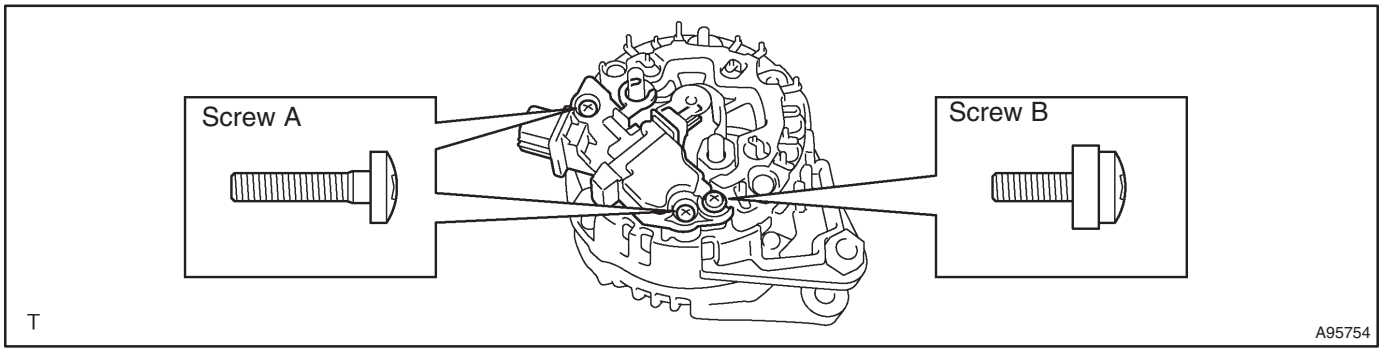


(a) Align the 3 cutouts of the bearing set generator with the stator generator with rectifier.

13. INSTALL STATOR SUB–ASSY GENERATOR W/RECTIFIER

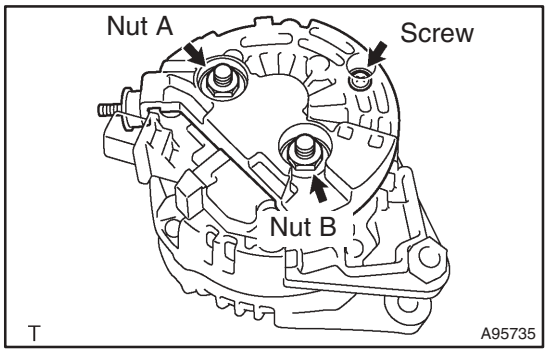
(a) Align the key of the drive end frame with the keyway of the stator sub–assembly generator with rectifier.

(b) Install the stator generator with rectifier with the 4 bolts.
Torque: 3.5 N·m (36 kgf·cm, 31 in.·lbf)



14. INSTALL REGULATOR SUB–ASSY GENERATOR W/BRUSH

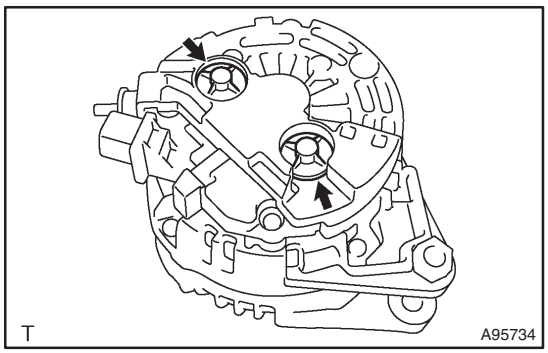
(a) Attach the brushes and terminals to the rectifier end frame of the regulator generator with brush.



(b) Install the regulator generator with brush with the 3 screws.

HINT:

Install the screw with the plate washer into the position shown in the illustration.



Torque:
2.2 N·m (22 kgf·cm, 19 in.·lbf) for screw A
1.2 N·m (12 kgf·cm, 11 in.·lbf) for screw B

15. INSTALL GENERATOR REAR END COVER

(a) Install the generator rear end cover with the 2 nuts and screw.

Torque:
19.5 N·m (199 kgf·cm, 14 ft·lbf) for nut A
12 N·m (122 kgf·cm, 9 ft·lbf) for nut B
2.4 N·m (24 kgf·cm, 21 in.·lbf) for screw

(b) Install the 2 terminal covers by turning them clockwise.

HOW TO USE THIS MANUAL TRANSAXLE REPAIR MANUAL

010BW–03

GENERAL INFORMATION

1. GENERAL DESCRIPTION

(a) This manual is made in accordance with SAE J2008.

(b) Generally repair operations can be separated in the following 3 main processes:
1. Diagnosis
2. Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting
3. Final Inspection

(c) This manual explains ”Removing and Installing, Replacing, Disassembling, Installing and Checking, Adjusting”, but ”Final Inspection” is omitted.

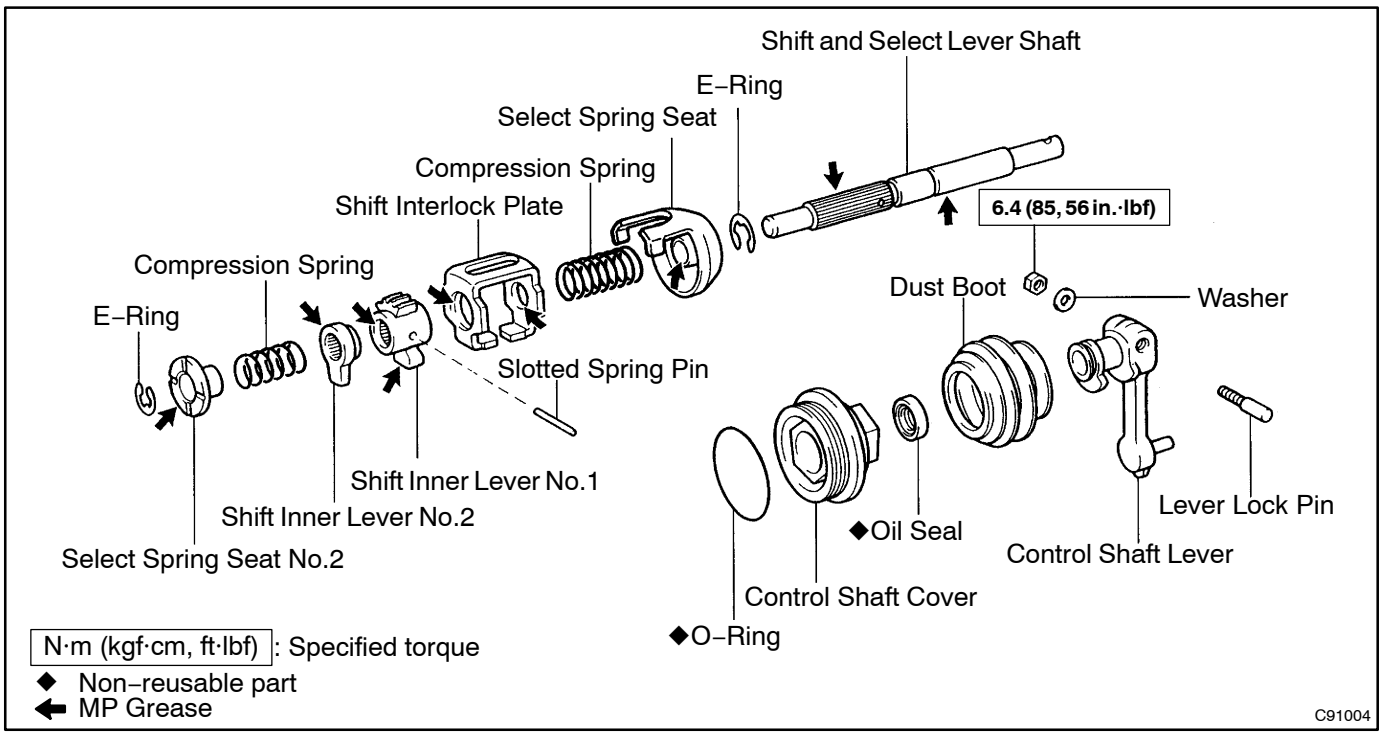
(d) The following essential operations are not written in this manual, however these operations must be done in the practical situation.
(1) Operation with a jack or lift
(2) Cleaning of a removed part when necessary
(3) Visual check

2. INDEX

(a) An alphabetical INDEX is provided as a section on the end of the book to guide you to the item to be repaired.

3. PREPARATION

(a) Use of special service tools (SST) and special service materials (SSM) may be required, depending on the repairing condition. Be sure to use SST and SSM when they are required and follow the working procedure properly. A list of SST and SSM is in the Preparation section of this manual.



4. REPAIR PROCEDURES

(a) Component drawing is placed as the section or title when necessary.

(b) Illustrations of the parts catalog are placed as the ”disassembled parts drawing” so that it enables you to understand the fitting condition of the components.

(c) Non–reusable parts, grease applied parts, precoated parts and tightening torque are specified in the components drawing.

Example:

(d) Tightening torque, oil applying position, and non–reusable parts are described as important points in the procedure.

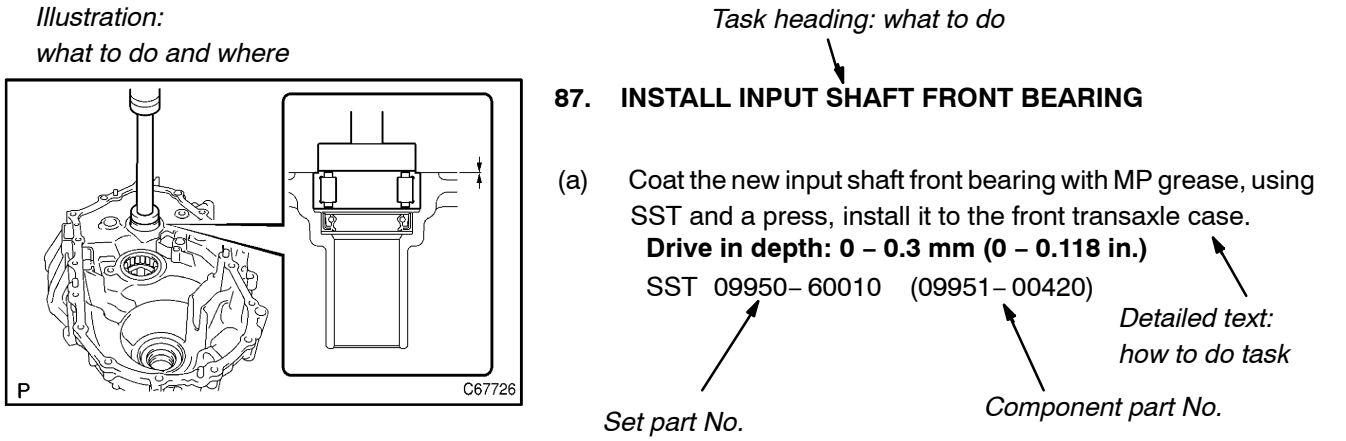
NOTICE:

There are cases where such information can only be indicated by an illustration. In that case, all the information such as torque, oil, etc. are described in the illustration.

(e) Installing procedure of operation items is performed in the reverse order of the removing, and only the important points are described.

(f) Only items with points are described in the procedure, and the operational portion and content are placed using an illustration. In the explanations, details of the operational method, standard value and notice are placed.

(g) There may be a case where the illustrations of similar models are used. In that case the details may be different from the actual vehicle.



(h) The procedures are presented in a step–by–step format:

(1) The illustration shows what to do and where to do.

(2) The task heading tells what to do.

(3) The detailed text tells how to perform the task and gives other information such as specifications and warnings.

Example:

HINT:

This format provides an experienced technician with a FAST TRACK to the necessary information. The task heading can be read at a glance when necessary, and the text below provides detailed information. Important specifications and warnings always stand out in bold type.

5. SERVICE SPECIFICATIONS

(a) Specifications are presented in bold type throughout the manual. You never have to leave the procedure to look up your specifications. The specifications are also found in the Service Specifications section for a quick reference.

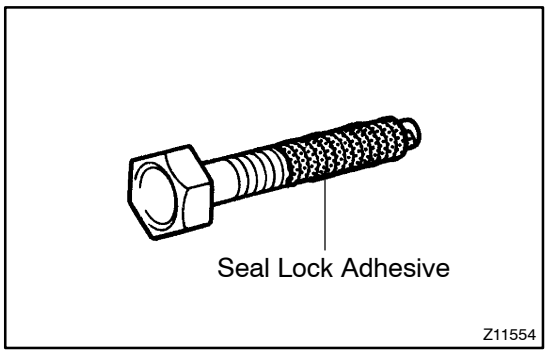
6. TERMS DEFINITION

CAUTION	Indicate the possibility of injury to you or other people.
NOTICE	Indicate the possibility of damage to the components being repaired.
HINT	Provide additional information to help you perform the repair efficiently.

7. SI UNIT

(a) The UNITS given in this manual are primarily expressed according to the SI UNIT (International System of Unit), and alternately expressed in the metric system and the English System.

Example:



Torque: 30 N·m (310 kgf·cm, 22 ft·lbf)

REPAIR INSTRUCTION FOR MANUAL TRANSAXLE REPAIR MANUAL

010BX–03

PRECAUTION

1. BASIC REPAIR HINT

(a) PRECOATED PARTS

(1) Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.

(2) If a precoated part is retightened, loosened or caused to move in any way, it must be recoated with the specified adhesive.

(3) When reusing precoated parts, clean off the old adhesive and dry with compressed air. Then apply the specified seal lock adhesive to the bolt, nut or threads.

NOTICE:

Do the torque checking with the lower limit value of the torque tolerance.

(4) Depending on the seal lock agent to apply, there may be a case where it is necessary to leave it for a specified time until it hardens.

(b) GASKETS

When necessary, use a sealer on gaskets to prevent leaks.

(c) BOLTS, NUTS AND SCREWS

Carefully observe all specifications for bolt tightening torques. Always use a torque wrench.

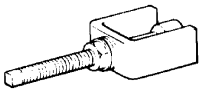
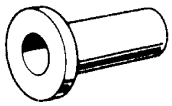
GLOSSARY OF SAE AND TOYOTA TERMS

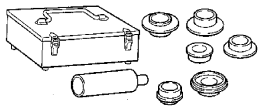
This glossary lists all SAE–J1930 terms and abbreviations used in this manual in compliance with SAE recommendations, as well as their Toyota equivalents.

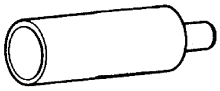
SAE ABBREVIATIONS	SAE TERMS	TOYOTA TERMS ( )––ABBREVIATIONS
A/C	Air Conditioning	Air Conditioner
ACL	Air Cleaner	Air Cleaner
AIR	Secondary Air Injection	Air Injection (AI)
AP	Accelerator Pedal	–
B+	Battery Positive Voltage	+B, Battery Voltage
BARO	Barometric Pressure	–
CAC	Charge Air Cooler	Inter cooler
CARB	Carburetor	Carburetor
CFI	Continuous Fuel Injection	–
CKP	Crankshaft Position	Crank Angle
CL	Closed Loop	Closed Loop
CMP	Camshaft position	Cam Angle
CPP	Clutch Pedal Position	–
CTOX	Continuous Trap Oxidizer	–
CTP	Closed Throttle Position	–
DFI	Direct Fuel Injection (Diesel)	Direct Injection (DI)
DI	Distributor Ignition	–
DLC1 DLC2 DLC3	Data Link Connector 1 Data Link Connector 2 Data Link Connector 3	1: Check Connector 2: Total Diagnosis Communication Link (TDCL) 3: OBD II Diagnostic Connector
DTC	Diagnostic Trouble Code	Diagnostic Code
DTM	Diagnostic Test Mode	–
ECL	Engine Control Level	–
ECM	Engine Control Module	Engine ECU (Electronic Control Unit)
ECT	Engine Control Temperature	Coolant Temperature, Water Temperature (THW)
EEPROM	Electrically Erasable Programmable Read Only Memory	Electrically Erasable Programmable Read Only Memory (EEPROM), Erasable Programmable Read Only Memory (EPROM)
EFE	Early Fuel Evaporation	Cold Mixture Heater (CMH), Heat Control Valve (HCV)
EGR	Exhaust Gas Recirculation	Exhaust Gas Recirculation (EGR)
EI	Electronic Ignition	Distributorless Ignition (DI)
EM	Engine Modification	Engine Modification (EM)
EPROM	Erasable Programmable Read Only Memory	Programmable Read Only Memory (PROM)
EVAP	Evaporative Emission	Evaporative Emission Control (EVAP)
FC	Fan Control	–
FEEPROM	Flash Electrically Erasable Programmable Read Only Memory	–
FEPROM	Flash Erasable Programmable Read Only Memory	–
FF	Flexible Fuel	–
FP	Fuel Pump	Fuel Pump
GEN	Generator	Alternator
GND	Ground	Ground (GND)
HO2S	Heated Oxygen Sensor	Heated Oxygen Sensor (HO2S)
IAC	Idol Air Control	Idol Speed Control (ISC)
IAT	Intake Air Temperature	Intake or Inlet Air Temperature
ICM	Ignition Control Module	–
IFI	Indirect Fuel Injection	Indirect Injection
IFS	Inertia Fuel–Shutoff	–

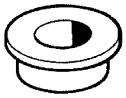
ISC	Idle Speed Control	–
KS	Knock Sensor	Knock Sensor
MAF	Mass Air Flow	Air Flow Meter
MAP	Manifold Absolute Pressure	Manifold Pressure Intake Vacuum
MC	Mixture Control	Electric Bleed Air Control Valve (EBCV) Mixture Control Valve (MCV) Electric Air Control Valve (EACV)
MDP	Manifold Differential Pressure	–
MFI	Multiport Fuel Injection	Electronic Fuel Injection (EFI)
MIL	Malfunction Indicator Lamp	Check Engine Light
MST	Manifold Surface Temperature	–
MVZ	Manifold Vacuum Zone	–
NVRAM	Non–Volatile Random Access Memory	–
O2S	Oxygen Sensor	Oxygen Sensor, O_2 Sensor (O_{2S})
OBD	On–Board Diagnostic	On–Board Diagnostic (OBD)
OC	Oxidation Catalytic Converter	Oxidation Catalyst Converter (OC), CC_O
OP	Open Loop	Open Loop
PAIR	Pulsed Secondary Air Injection	Air Suction (AS)
PCM	Powertrain Control Module	–
PNP	Park/Neutral Position	–
PROM	Programmable Read Only Memory	–
PSP	Power Steering Pressure	–
PTOX	Periodic Trap Oxidizer	Diesel Particulate Filter (DPF) Diesel Particulate Trap (DPT)
RAM	Random Access Memory	Random Access Memory (RAM)
RM	Relay Module	–
ROM	Read Only Memory	Read Only Memory (ROM)
RPM	Engine Speed	Engine Speed
SC	Supercharger	Supercharger
SCB	Supercharger Bypass	–
SFI	Sequential Multiport Fuel Injection	Electronic Fuel Injection (EFI), Sequential Injection
SPL	Smoke Puff Limiter	–
SRI	Service Reminder Indicator	–
SRT	System Readiness Test	–
ST	Scan Tool	–
TB	Throttle Body	Throttle Body
TBI	Throttle Body Fuel Injection	Single Point Injection Central Fuel Injection (Ci)
TC	Turbocharger	Turbocharger
TCC	Torque Converter Clutch	Torque Converter
TCM	Transmission Control Module	Transmission ECU (Electronic Control Unit)
TP	Throttle Position	Throttle Position
TR	Transmission Range	–
TVV	Thermal Vacuum Valve	Bimetallic Vacuum Switching Valve (BVSV) Thermostatic Vacuum Switching Valve (TVSV)
TWC	Three–Way Catalytic Converter	Three–Way Catalytic (TWC) CC_{RO}
TWC+OC	Three–Way + Oxidation Catalytic Converter	CC_R + CC_O
VAF	Volume Air Flow	Air Flow Meter
VR	Voltage Regulator	Voltage Regulator
VSS	Vehicle Speed Sensor	Vehicle Speed Sensor (Read Switch Type)
WOT	Wide Open Throttle	Full Throttle

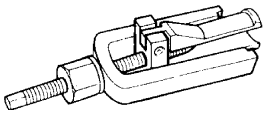


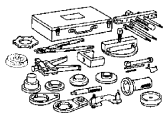


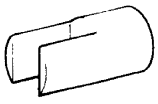


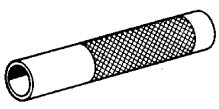












WU–OC	Warm Up Oxidation Catalytic Converter	–
WU–TWC	Warm Up Three–Way Catalytic Converter	Manifold Converter
3GR	Third Gear	–
4GR	Fourth Gear	–

	5	2.60 mm (0.1024 in.)
Input shaft rear bearing shaft snap ring clearance		0.1 mm (0.0039 in.) or less
Input shaft rear bearing shaft snap ring thickness	A	2.29 mm (0.0902 in.)
	B	2.35 mm (0.0925 in.)
	C	2.41 mm (0.0949 in.)
	D	2.47 mm (0.0972 in.)
	E	2.53 mm (0.0996 in.)
	F	2.59 mm (0.1020 in.)

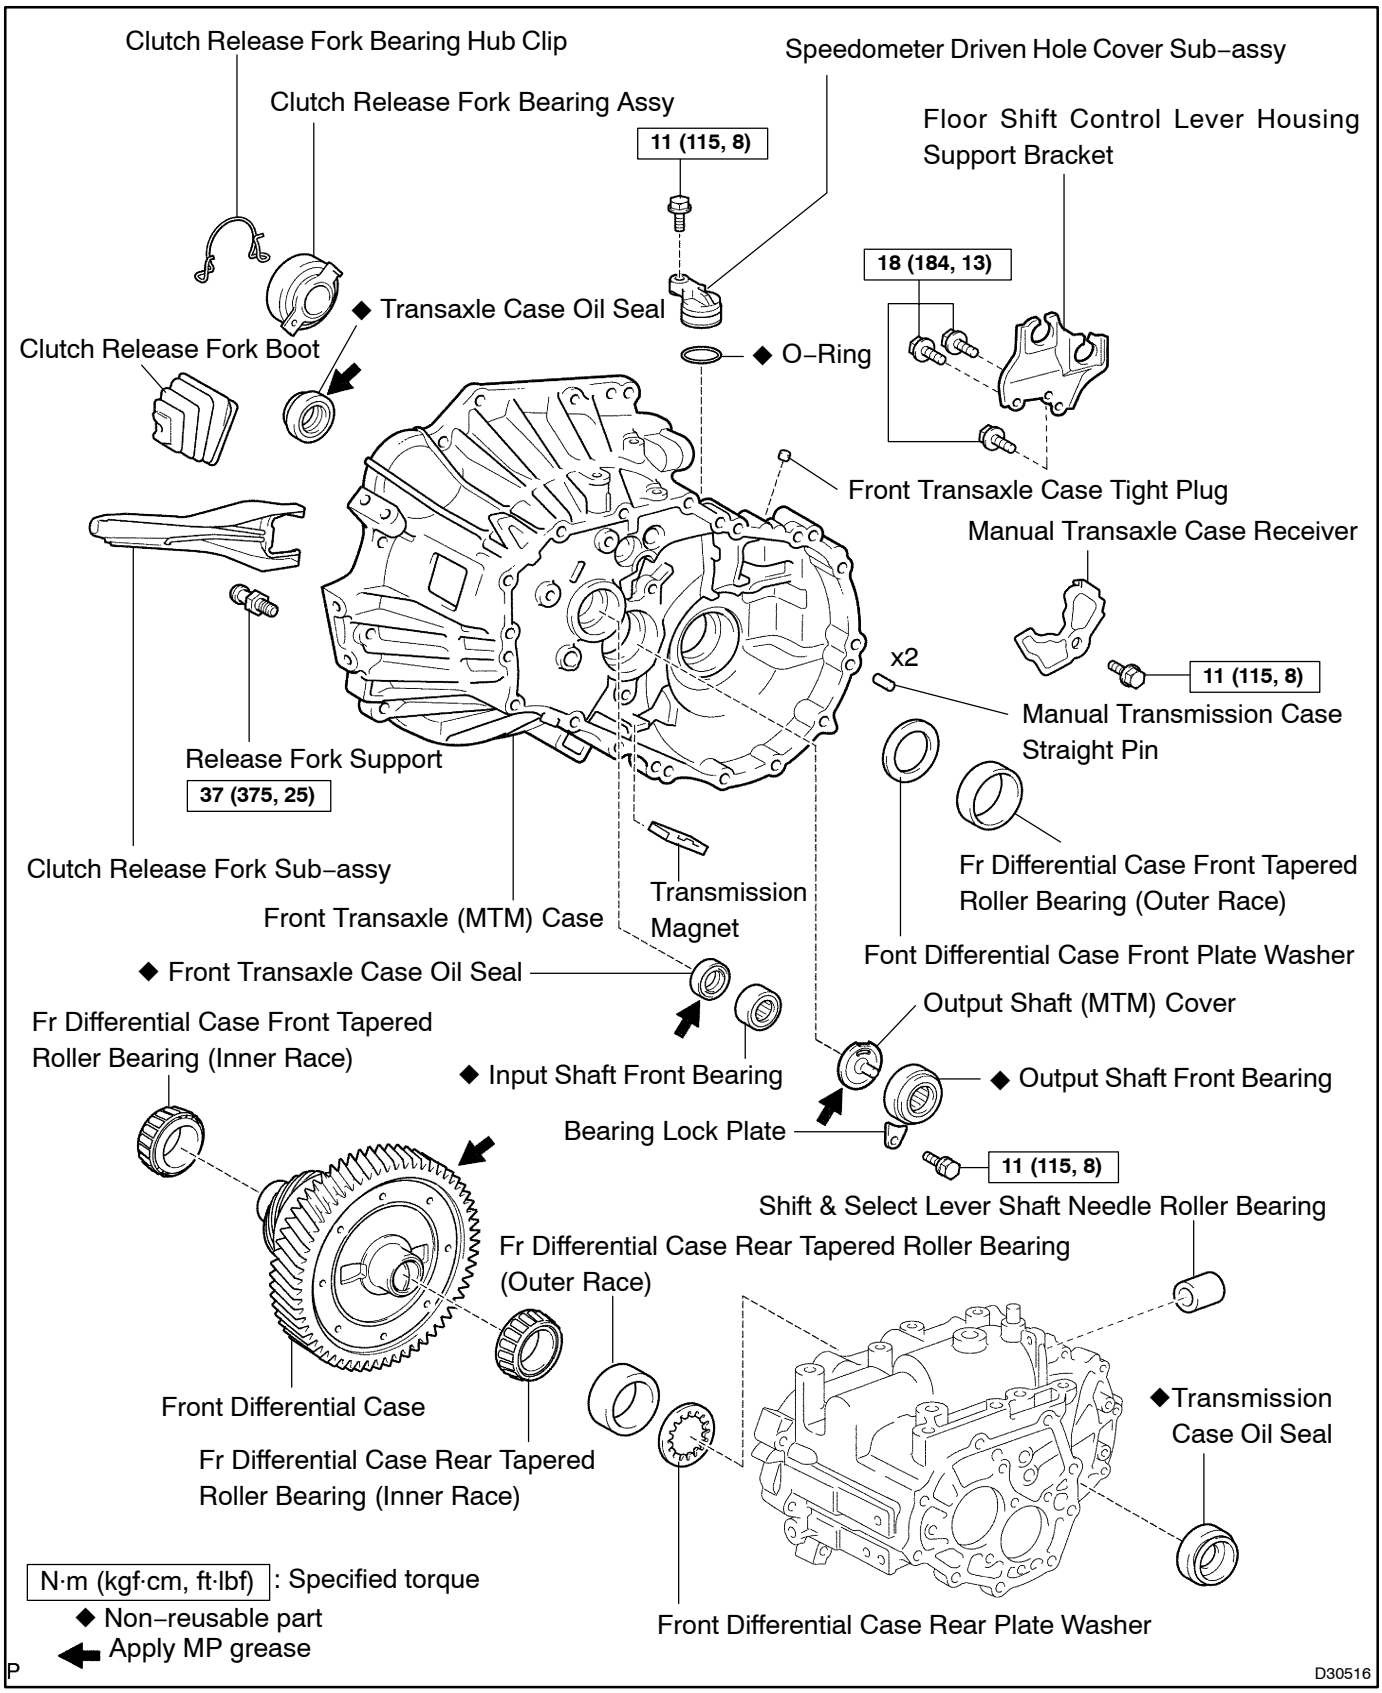
Output shaft assy		
1st gear thrust clearance	STD	0.10 to 0.40 mm (0.0039 to 0.0157 in.)
	MAX	0.40 mm (0.0157 in.)
2nd gear thrust clearance	STD	0.1 to 0.45 mm (0.0039 to 0.0177 in.)
	MAX	0.45 mm (0.0177 in.)
1st gear radial clearance	STD	0.015 to 0.058 mm (0.0006 to 0.0023 in.)
	MAX	0.058 mm (0.0023 in.)
2nd gear radial clearance	STD	0.015 to 0.058 mm (0.0006 to 0.0023 in.)
	MAX	0.058 mm (0.0023 in.)
Input shaft runout	MIN	0.015 mm (0.0006 in.)
Input shaft outer diameter	Part A	31.985 to 32.000 mm (1.2592 to 1.2598 in.)
	Part B	37.985 to 38.000 mm (1.4955 to 1.2598 in.)
	Part C	32.985 to 33.000 mm (1.2986 to 1.2992 in.)
2nd gear clearance	STD	38.015 to 38.013 mm (1.4966 to 1.4972 in.)
	MAX	38.031 mm (1.4972 in.)
1st gear clearance	STD	44.015 to 44.031 mm (1.7328 to 1.7335 in.)
	MAX	44.031 mm (1.7335 in.)
1st gear thrust washer thickness	STD	5.975 to 6.025 mm (0.2352 to 0.2372 in.)
	MIN	5.975 mm (0.2352 in.)
Synchronizer ring No.1 (for 2nd gear)clearance	STD	0.70 to 1.30 mm (0.0276 to 0.0512 in.)
	MIN	0.70 mm (0.0276in.)
Synchronizer ring No.1 (for 1st gear)clearance	STD	0.75 to 1.65 mm (0.0295 to 6.8898 in.)
	MIN	0.75 mm (0.0295 in.)
reverse gear and shift fork clearance	MAX	0.35 mm (0.014 in.)

Clutch hub No.1 shaft snap ring clearance		0.1 mm (0.039 in.) or less
Clutch hub No.1 shaft snap ring thickness	A	2.50 mm (0.0984 in.)
	B	2.56 mm (0.1008 in.)
	C	2.62 mm (0.1031 in.)
	D	2.68 mm (0.1055 in.)
	E	2.74 mm (0.1079 in.)
	F	2.80 mm (0.1102 in.)

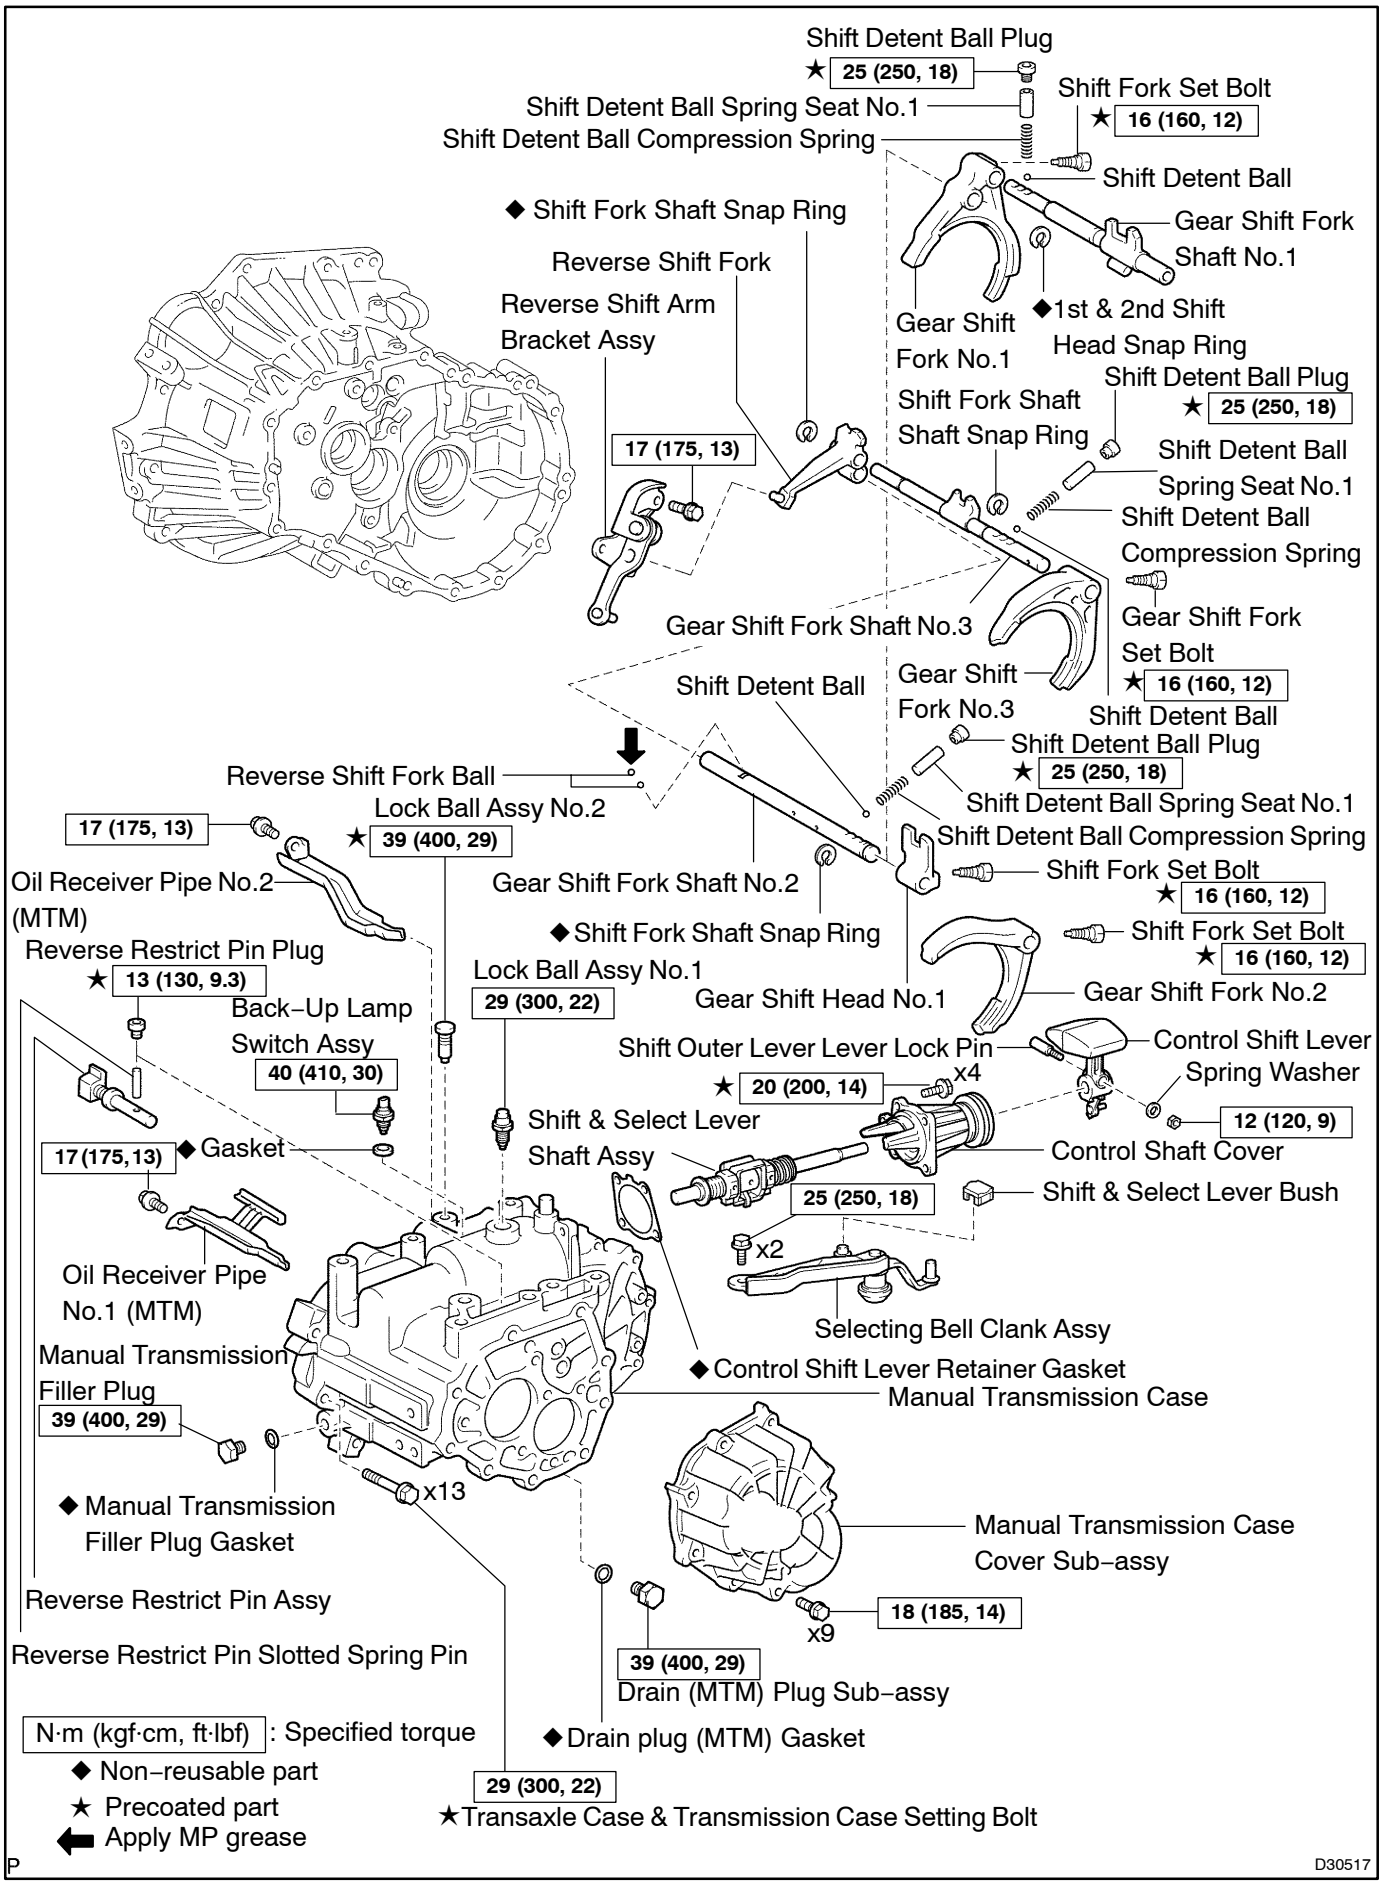
Sift & Select lever shaft assy		
Contorol shaft cover oil seal drive in depth		0.2 to 1.2 mm (0.079 to 0.0472 in.)
Sift lever slotted pin (for select inner lever) drivein depth		3.0 to 4.0 mm (0.1181 to 0.1575 in)
Sift lever slotted pin (for sift lever inner No.1) drivein depth		–0.5 to 0.5 mm (–0.0197 to 0.0197 in)
Sift lever slotted pin (for sift lever inner No.2) drivein depth		–0.5 to 0.5 mm (–0.0197 to 0.0197 in)

Differential case assy		
Front differential side gear backlash		0.05 to 0.20 mm (0.0020 to 0.0079 in.)
Front differential pinion thrust washer	MIN	0.94 mm (0.03701 in.)
Front differential pinion shaft No.1 outer diameter	MIN	16.982 mm (0.6685 in.)

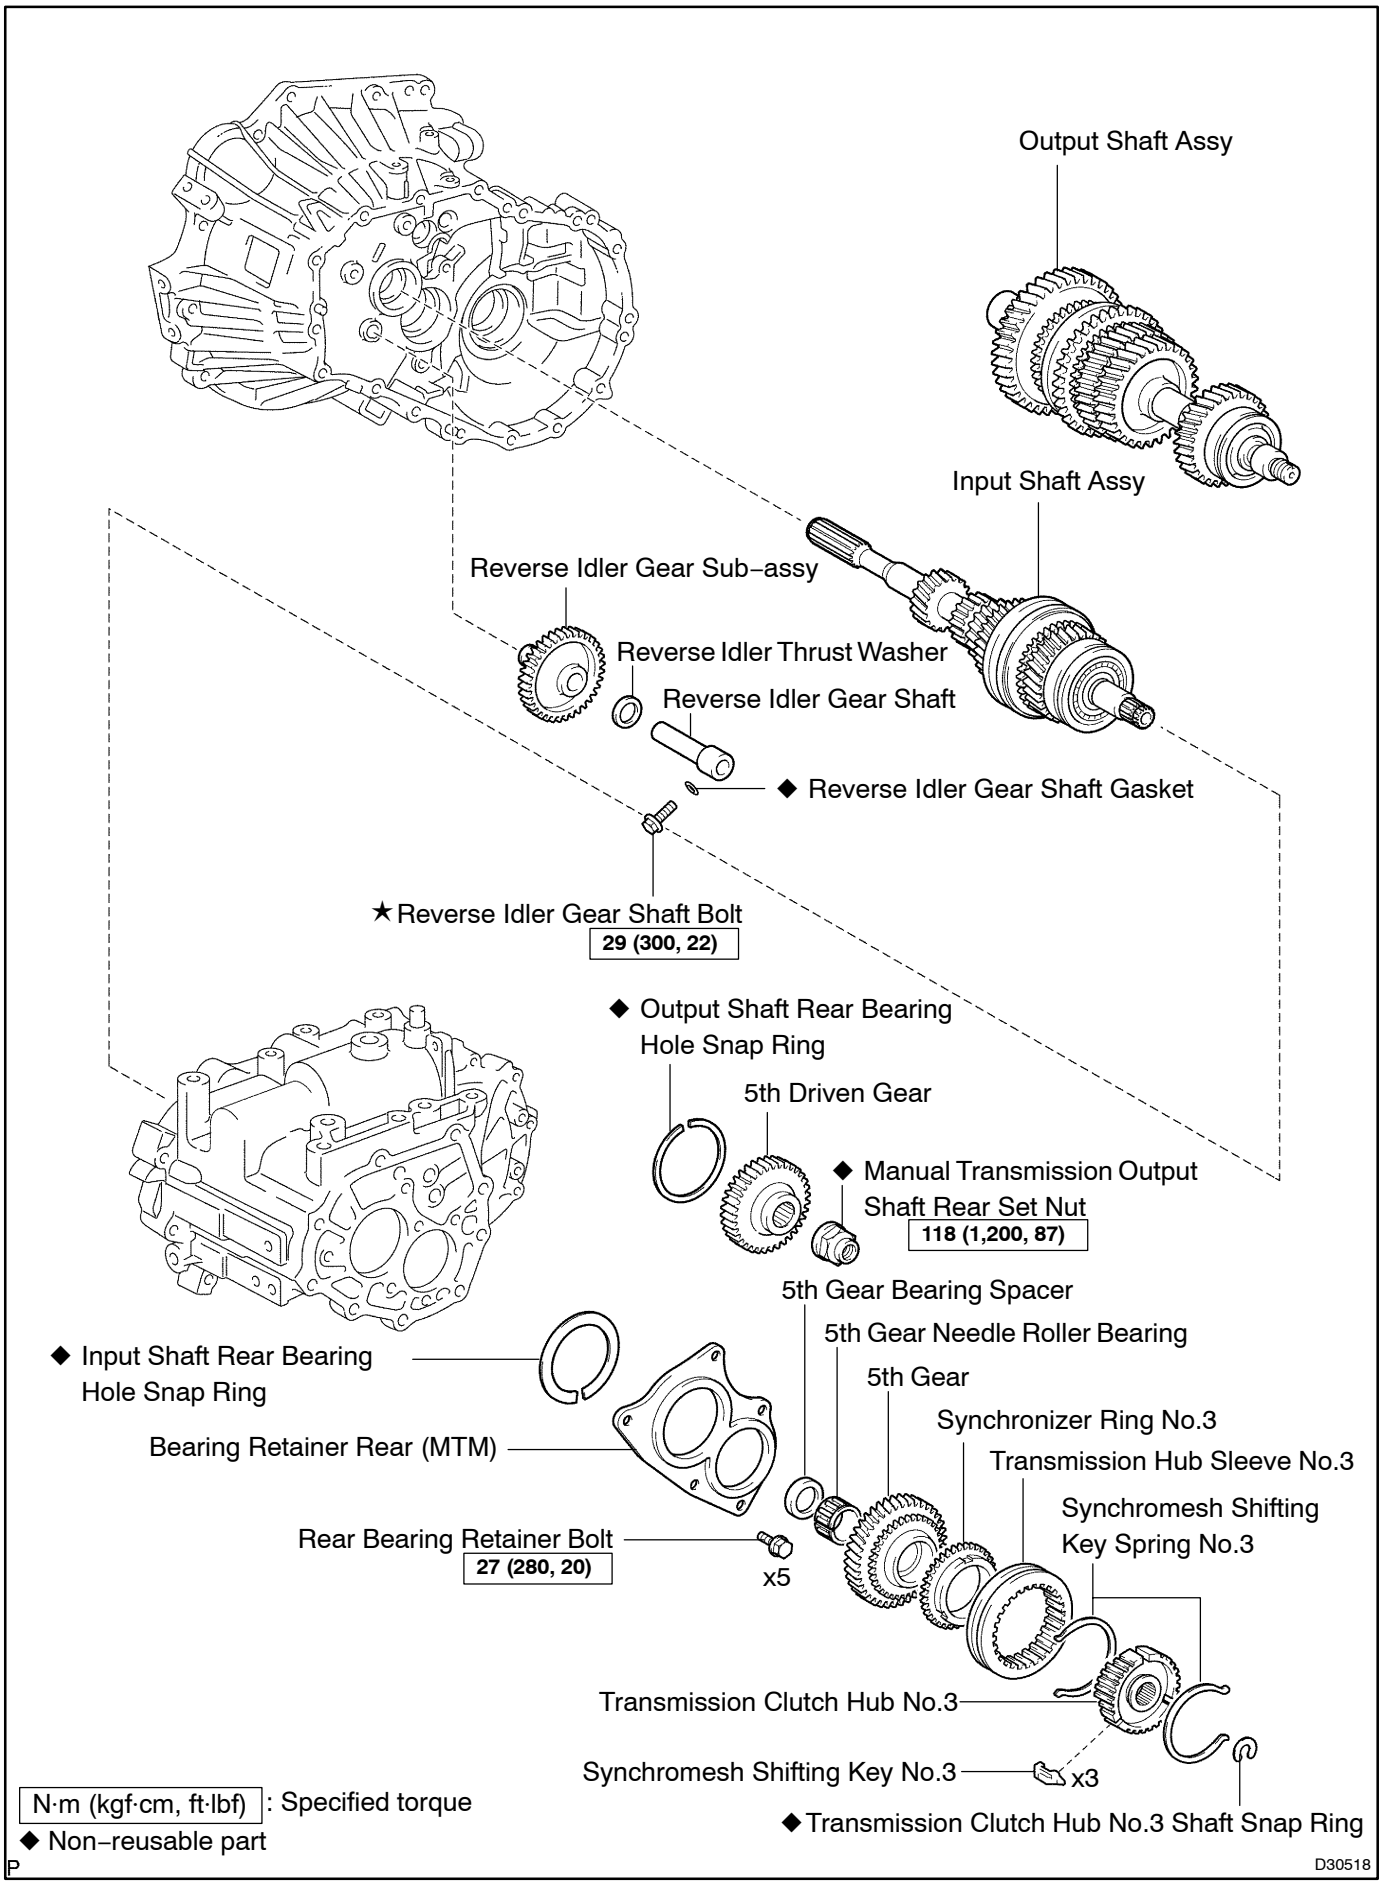
031EP–02



TORQUE SPECIFICATION



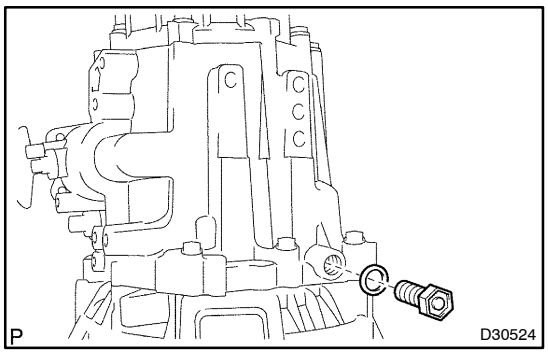
Part Tightened		N·m	kgf·cm	ft·lbf
Bearing lock plate × Front transaxle case		11	115	8
Oil receiver pipe No.1 × Manual transmission case		17	175	13
Oil receiver pipe No.2 × Manual transmission case		17	175	13
Reverse restrict pin plug × Manual transmission case		13	130	9.3
manual transaxle case receiver × Manual transmission case		11	115	8
Gear shift fork No.1 × Gear shift fork shaft No.1		16	160	12
Gear shift fork No.2 × Gear shift fork shaft No.2		16	160	12
Gear shift head No.1 × Gear shift fork shaft No.2		16	160	12
Reverse shift arm bracket assy × Front transaxle case		17	175	13
Manual transmission case × Front transaxle case	bolt	29	300	22
	nut	29	300	22
Reverse idler gear shaft bolt × Manual transmission case		29	300	22
Lock ball assy No.2 × Manual transmission case		39	400	29
Shift detent ball × Manual transmission case		25	250	18
Shift detent ball × Front transaxle case		25	250	18
Bearing retainer rear × Manual transmission case		27	280	20
Gear shift fork No.3 × Gear shift fork shaft		16	160	12
Manual transmission output shaft rear set nut × output shaft		118	1200	87
Manual transmission case cover × Manual transmission case		18	185	14
Control shaft cover × Manual transmission case		20	200	14
Control shift lever lock nut		12	122	9
Lock ball assy No.1 × Manual transmission case		29	300	22
Selecting bell crank assy × Manual transmission case		25	250	18
Floor shift control lever housing support bracket × Front transaxle case		18	184	13
Back–up lamp switch assy × Manual transmission case		40	410	30
Speedometer driven hole cover sub–assy × Manual transaxle		11	115	8
Release fork support × Front transaxle case		37	375	25
Manual transmission filler plug × Manual transaxle		39	400	29
Drain plug sub–assy × Manual transmission case		39	400	29
Selecting bell crank No.2 plate washer × Selecting bell crank		12	120	9
Front defferential ring gear × Front differential case		77	790	57



MANUAL TRANSAXLE ASSY (C50)

COMPONENTS

410DC–02



Shift Detent Ball Plug
★ 25 (250, 18)
Shift Fork Set Bolt
★ 16 (160, 12)
Shift Detent Ball Spring Seat No.1
Shift Detent Ball Compression Spring
Shift Detent Ball
◆ Shift Fork Shaft Snap Ring
Gear Shift Fork Shaft No.1
Reverse Shift Fork
Reverse Shift Arm Bracket Assy
◆1st & 2nd Shift Head Snap Ring
Gear Shift Fork No.1
Shift Detent Ball Plug
★ 25 (250, 18)
Shift Fork Shaft Shaft Snap Ring
17 (175, 13)
Shift Detent Ball Spring Seat No.1
Shift Detent Ball Compression Spring
Gear Shift Fork Shaft No.3
Gear Shift Fork Set Bolt
★ 16 (160, 12)
Shift Detent Ball
Gear Shift Fork No.3
Shift Detent Ball
Shift Detent Ball Plug
★ 25 (250, 18)
Reverse Shift Fork Ball
Lock Ball Assy No.2
★ 39 (400, 29)
17 (175, 13)
Shift Detent Ball Spring Seat No.1
Shift Detent Ball Compression Spring
Shift Fork Set Bolt
★ 16 (160, 12)
Oil Receiver Pipe No.2 (MTM)
Gear Shift Fork Shaft No.2
◆Shift Fork Shaft Snap Ring
Shift Fork Set Bolt
★ 16 (160, 12)
Reverse Restrict Pin Plug
★ 13 (130, 9.3)
Lock Ball Assy No.1
29 (300, 22)
Gear Shift Head No.1
Gear Shift Fork No.2
Back–Up Lamp Switch Assy
40 (410, 30)
Shift Outer Lever Lever Lock Pin
★ 20 (200, 14)
x4
Control Shift Lever
Spring Washer
12 (120, 9)
Shift & Select Lever Shaft Assy
17 (175, 13)
◆ Gasket
Control Shaft Cover
25 (250, 18)
Shift & Select Lever Bush
x2
Oil Receiver Pipe No.1 (MTM)
Selecting Bell Clank Assy
Manual Transmission Filler Plug
39 (400, 29)
◆ Control Shift Lever Retainer Gasket
Manual Transmission Case
x13
◆ Manual Transmission Filler Plug Gasket
Manual Transmission Case Cover Sub–assy
18 (185, 14)
x9
Reverse Restrict Pin Assy
Reverse Restrict Pin Slotted Spring Pin
39 (400, 29)
Drain (MTM) Plug Sub–assy
◆ Drain plug (MTM) Gasket
N·m (kgf·cm, ft·lbf) : Specified torque
◆ Non–reusable part
★ Precoated part
Apply MP grease
29 (300, 22)
★Transaxle Case & Transmission Case Setting Bolt
P
D30517

Output Shaft Assy
Input Shaft Assy
Reverse Idler Gear Sub–assy
Reverse Idler Thrust Washer
Reverse Idler Gear Shaft
◆ Reverse Idler Gear Shaft Gasket
★Reverse Idler Gear Shaft Bolt
29 (300, 22)
◆ Output Shaft Rear Bearing Hole Snap Ring
5th Driven Gear
◆ Manual Transmission Output Shaft Rear Set Nut
118 (1,200, 87)
5th Gear Bearing Spacer
5th Gear Needle Roller Bearing
5th Gear
Synchronizer Ring No.3
Transmission Hub Sleeve No.3
Synchromesh Shifting Key Spring No.3
◆ Input Shaft Rear Bearing Hole Snap Ring
Bearing Retainer Rear (MTM)
Rear Bearing Retainer Bolt
27 (280, 20)
x5
Transmission Clutch Hub No.3
Synchromesh Shifting Key No.3
x3
◆Transmission Clutch Hub No.3 Shaft Snap Ring
N·m (kgf·cm, ft·lbf) : Specified torque
◆ Non–reusable part

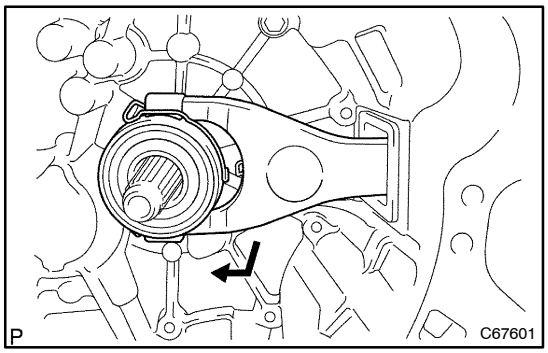
410FF–01

OVERHAUL

1. REMOVE MANUAL TRANSMISSION FILLER PLUG

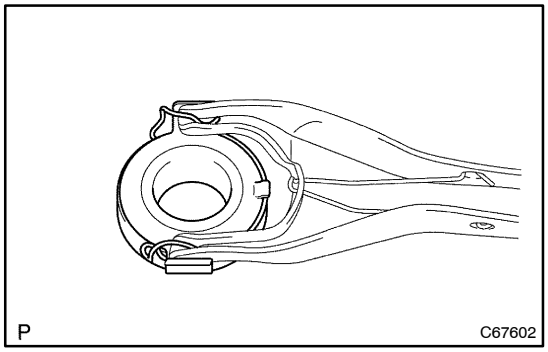
(a) Remove the manual transmission filler plug and gasket from the manual transmission case.



2. REMOVE DRAIN (MTM) PLUG SUB–ASSY

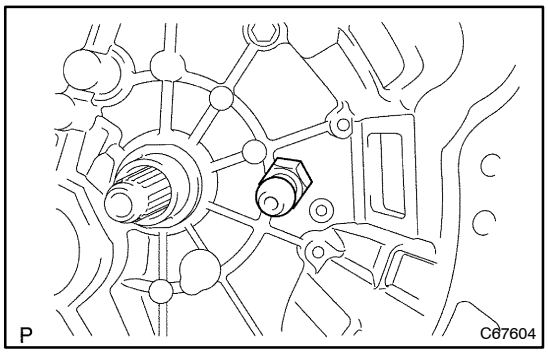
(a) Remove the drain plug and gasket from the manual transmission case.

3. REMOVE SPEEDOMETER DRIVEN HOLE COVER SUB–ASSY



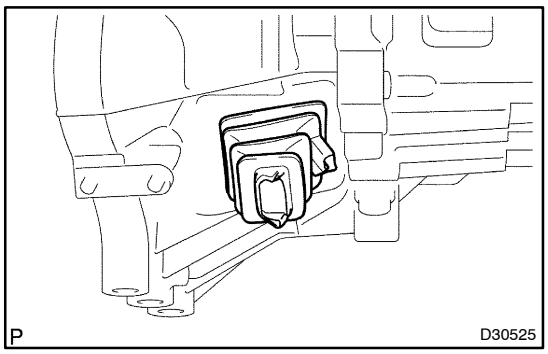
(a) Remove the bolt and speedometer driven hole cover sub–assy.

(b) Remove the O–ring from the speedometer driven hole cover sub–assy.



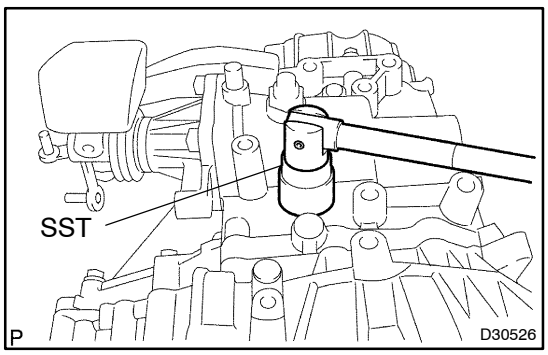
4. REMOVE CLUTCH RELEASE FORK SUB–ASSY

(a) Remove the clutch release fork sub–assy with clutch release bearing assy from the front transaxle case.



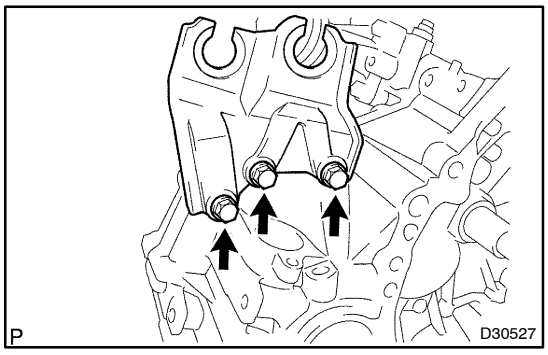
5. REMOVE CLUTCH RELEASE BEARING ASSY

(a) Remove the clutch release bearing hub clip and clutch release bearing assy from the clutch release fork sub–assy.



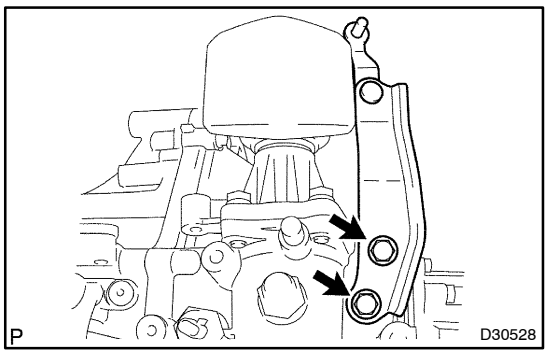
6. REMOVE RELEASE FORK SUPPORT

(a) Remove the clutch release fork support from the front transaxle case.



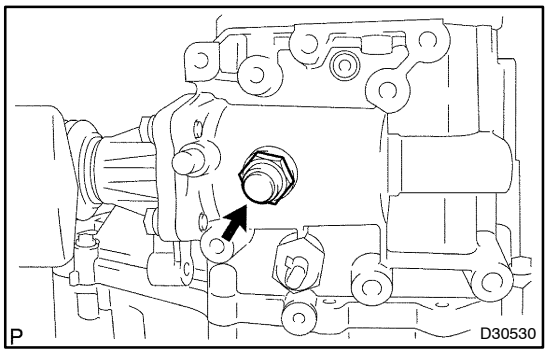
7. REMOVE CLUTCH RELEASE FORK BOOT

(a) Remove the clutch release fork boot from the front transaxle case.



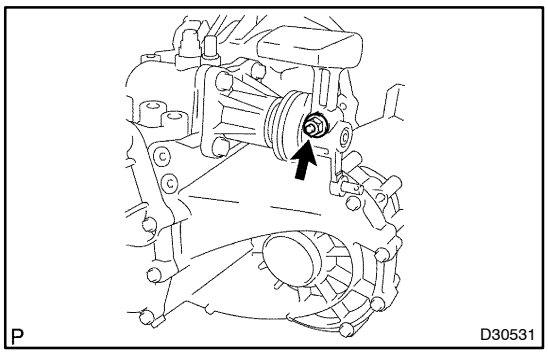
8. REMOVE BACK UP LAMP SWITCH ASSY

(a) Using SST, remove the back–up lamp switch assy and gasket from the manual transmission case.
SST 09817–16011



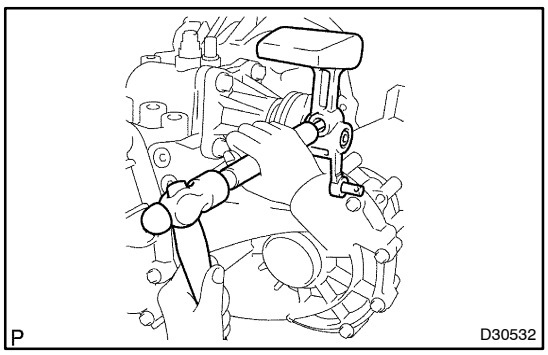
9. REMOVE FLOOR SHIFT CONTROL LEVER HOUSING SUPPORT BRACKET

(a) Remove the 3 bolts and floor shift control lever housing support bracket from the front transaxle case.



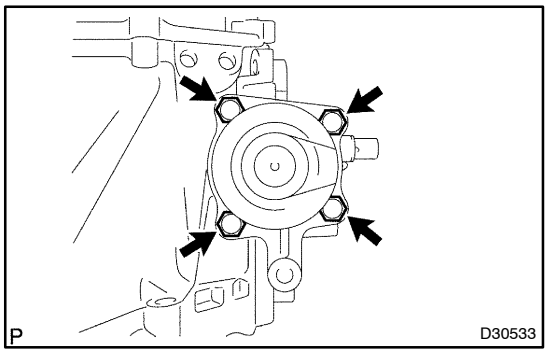
10. REMOVE SELECTING BELL CRANK ASSY

(a) Remove the 2 bolts and selecting bell crank assy from the manual transmission case.



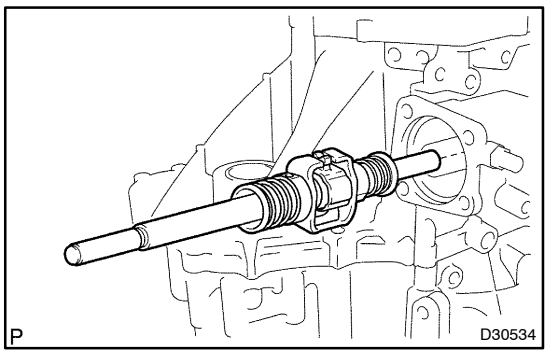
11. REMOVE LOCK BALL ASSY NO.1

(a) Remove the lock ball assy No.1 from the manual transmission case.



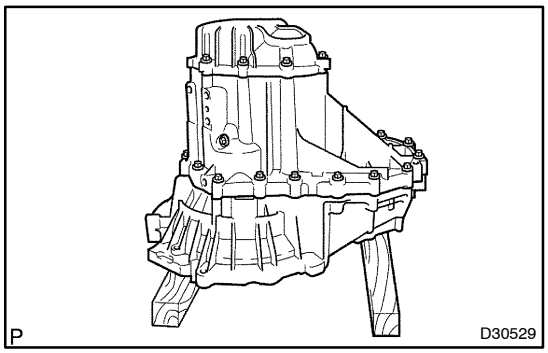
12. REMOVE CONTROL SHIFT LEVER

(a) Remove the nut and spring washer.



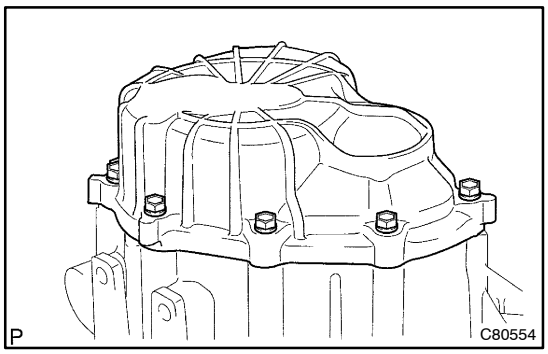
(b) Using a brass bar and a hammer, remove the shift outer lever lever lock pin.

(c) Remove the control shift lever.



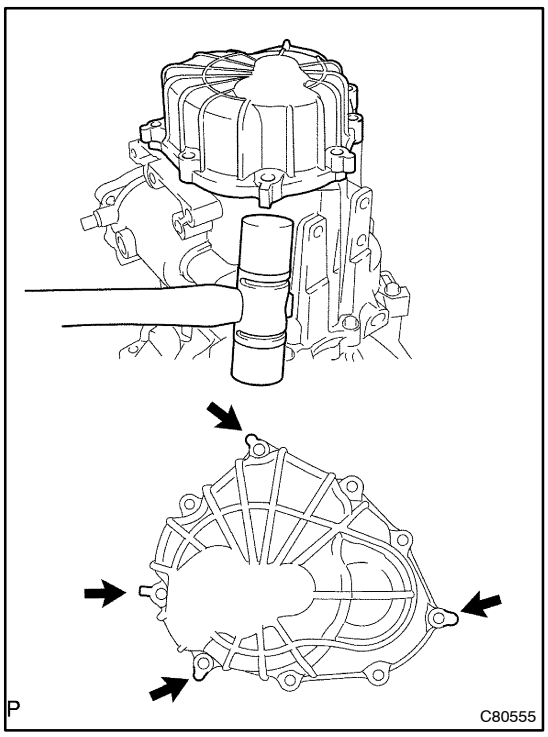
13. REMOVE CONTROL SHAFT COVER

(a) Remove the 4 bolts, control shaft cover and gasket from the manual transmission case.



14. REMOVE SHIFT & SELECT LEVER SHAFT ASSY

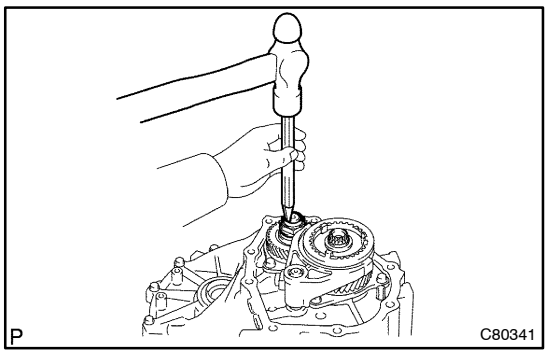
(a) Remove the shift & select lever shaft assy from the manual transmission case.



15. FIX MANUAL TRANSAXLE ASSY

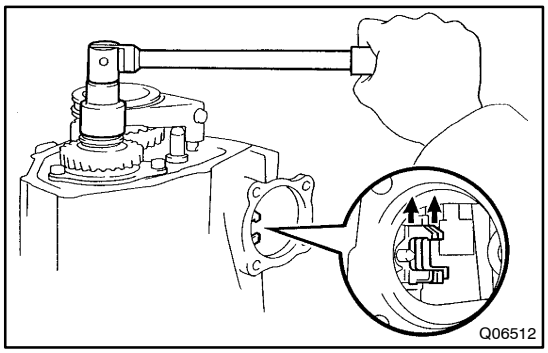
(a) Using 2 wooden blocks, fix the manual transaxle assy.

16. REMOVE MANUAL TRANSMISSION CASE COVER SUB–ASSY



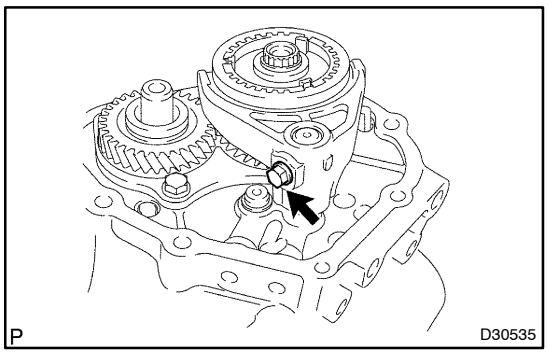
(a) Remove the 9 bolts.

(b) Gently tap the protrusion of the manual transmission case cover sub–assy with a hammer and remove it.



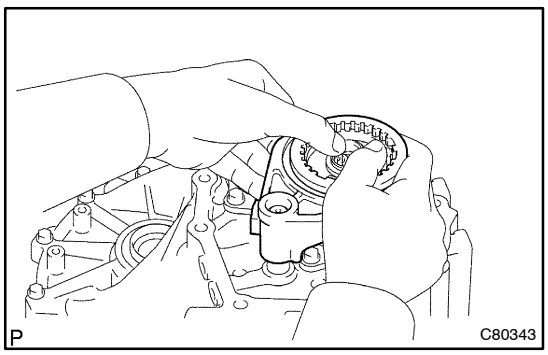
NOTICE:

Be careful not to damage the manual transmission case sub–assy.

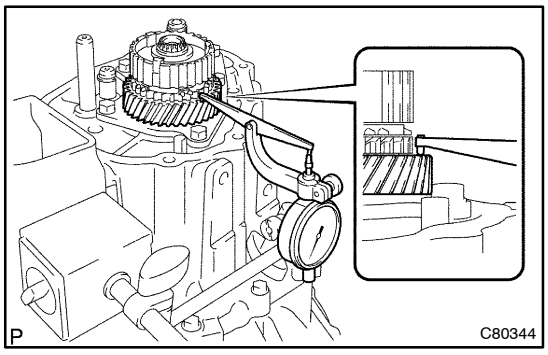


17. REMOVE MANUAL TRANSMISSION OUTPUT SHAFT REAR SET NUT

(a) Using a chisel and a hammer, loosen the staked part of the manual transmission output shaft rear set nut.

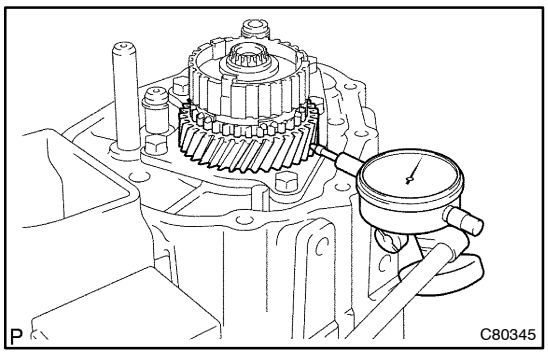


(b) Engage the gears to make them double meshed.
(c) Remove the manual transmission output shaft rear set nut.
(d) Disengage the double meshing of the gear.



18. REMOVE GEAR SHIFT FORK NO.3

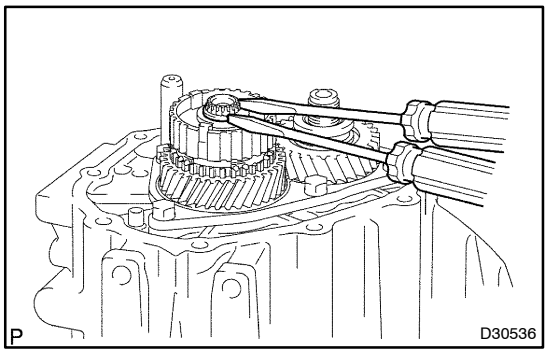
(a) Remove the gear shift fork lock bolt from the gear shift fork No.3.



(b) Remove the hub sleeve No.3 and gear shift fork No.3 from the transmission clutch hub No.3.

19. INSPECT 5TH GEAR THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance.
Standard clearance:
0.10 to 0.57 mm (0.0039 to 0.0224 in.)
Maximum clearance:
0.57 mm (0.0224 in.)

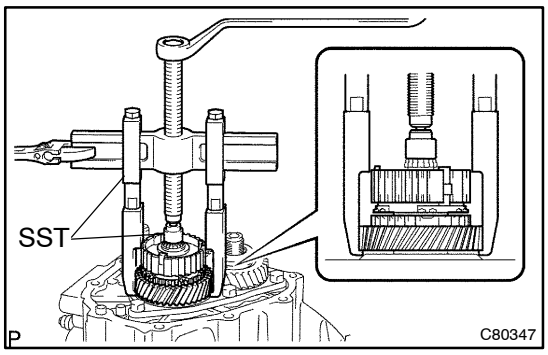


If the clearance exceeds the maximum, replace the transmission clutch hub No.3, 5th gear or input shaft rear radial ball bearing.

20. INSPECT 5TH GEAR RADIAL CLEARANCE

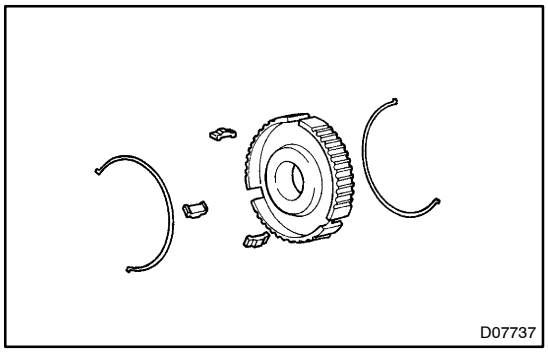
(a) Using a dial indicator, measure the radial clearance.
Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 5the gear, 5the gear needle roller bearing or input shaft.



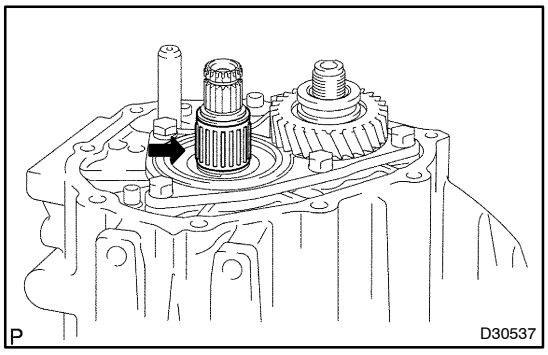
21. REMOVE TRANSMISSION CLUTCH HUB NO.3

(a) Using 2 screwdrivers and a hammer, tap out the snap ring.



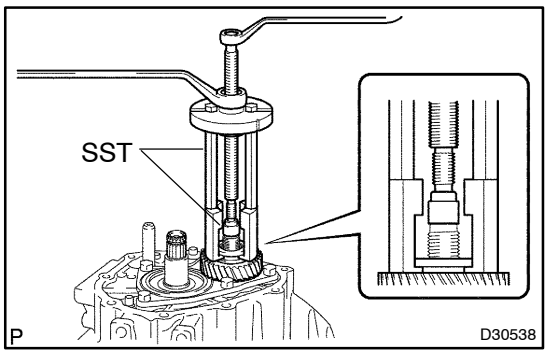
HINT:

Use a shop rag to keep the snap ring from flying.



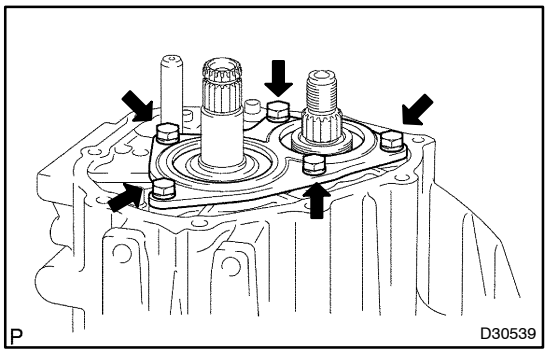
(b) Using SST, remove the transmission clutch hub No.3, 5th gear and synchronizer ring No.3 from the input shaft.

SST 09950–40011 (09951–04020, 09952–04010, 09953–04030, 09954–04010, 09955–04071, 09957–04010), 09950–60010 (09951–00200)



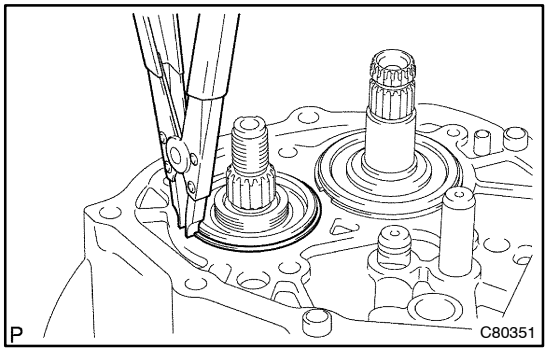
(c) Remove the 3 synchromesh shifting keys and 2 synchromesh shifting key springs from the transmission clutch hub No.3.

22. REMOVE 5TH GEAR NEEDLE ROLLER BEARING



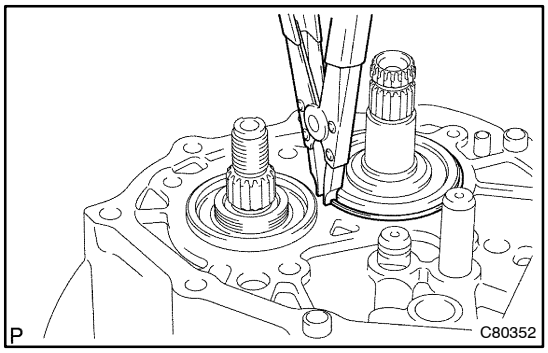
(a) Remove the 5th gear needle roller bearing and 5th gear bearing spacer from the input shaft.

23. REMOVE 5TH DRIVEN GEAR



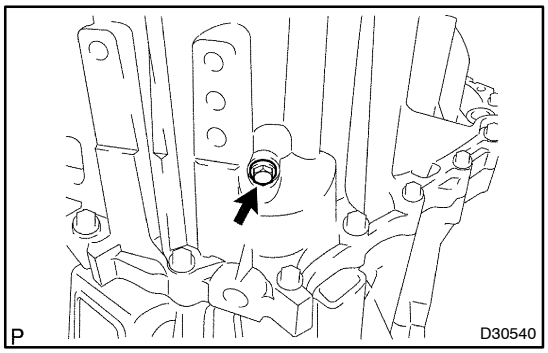
(a) Using SST, remove the 5th driven gear from the output shaft.

SST 09950–30012 (09951–03010, 09953–03010, 09954–03010, 09955–03011, 09957–04010), 09950–60010 (09951–00190)



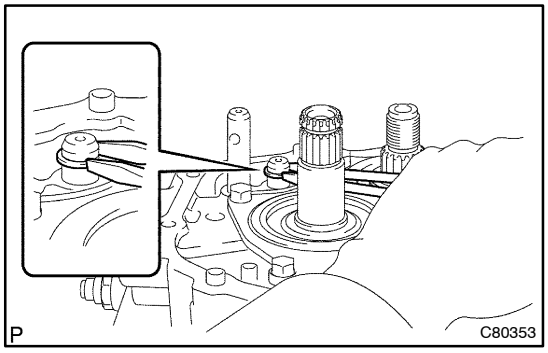
24. REMOVE BEARING RETAINER REAR (MTM)

(a) Remove the 5 bolts and bearing retainer rear from the manual transmission case.



25. REMOVE OUTPUT SHAFT REAR BEARING HOLE SNAP RING

(a) Using a snap ring expander, remove the output shaft rear bearing hole snap ring from the output shaft.

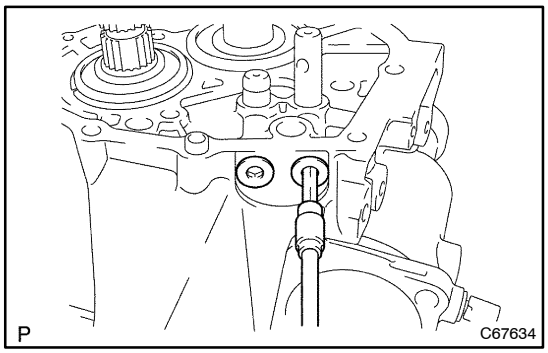


26. REMOVE INPUT SHAFT REAR BEARING HOLE SNAP RING

(a) Using a snap ring expander, remove the input shaft rear bearing hole snap ring from the input shaft.

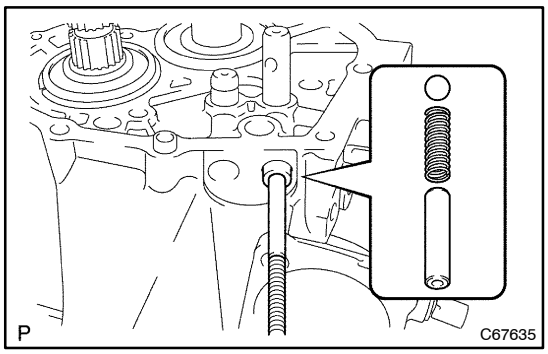
27. REMOVE REVERSE IDLER GEAR SHAFT BOLT

(a) Remove the reverse idler gear shaft bolt and reverse idler gear shaft gasket from the manual transmission case.



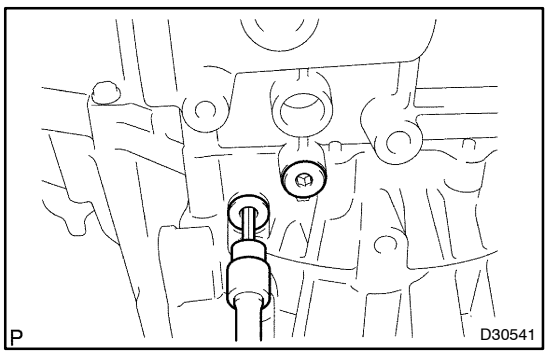
28. REMOVE SHIFT FORK SHAFT SHAFT SNAP RING

(a) Using 2 screwdrivers and a hammer, tap out the snap ring.

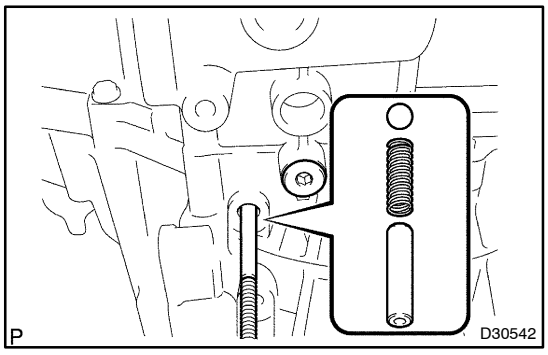


HINT:

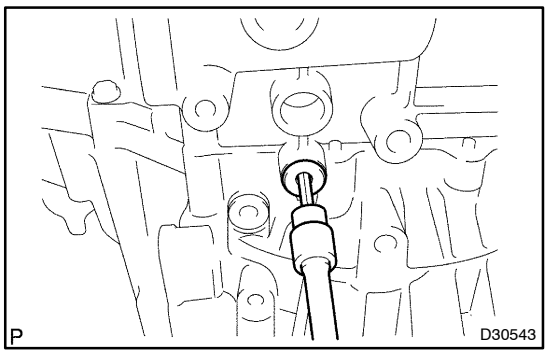
Use a shop rag to keep the shifting key spring from flying.



29. REMOVE SHIFT DETENT BALL

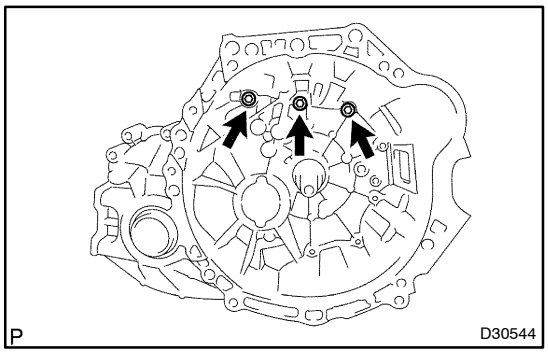


(a) Using a hexagon wrench, remove the 2 shift detent ball plugs from the manual transmission case.

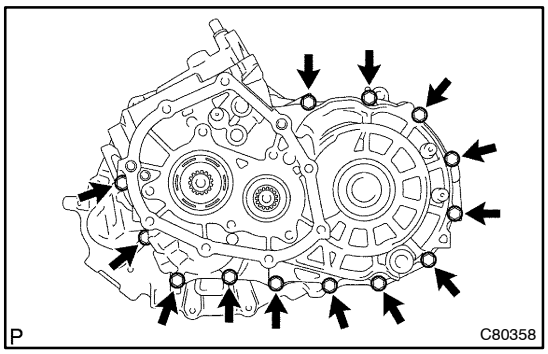


(b) Using a magnetic finger, remove the 2 seats, springs and balls from the manual transmission case.

(c) Using a hexagon wrench, remove the shift detent ball plug from the front transaxle case.

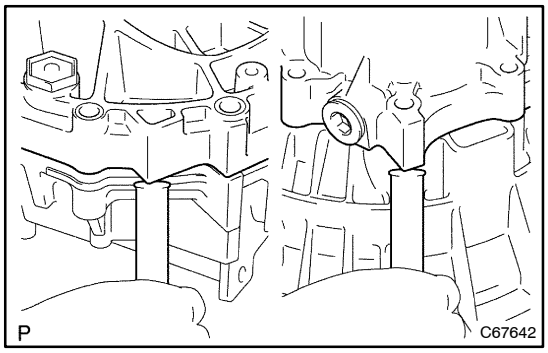


(d) Using a magnetic finger, remove the seat, spring and ball from the front transaxle case.



30. REMOVE LOCK BALL ASSY NO.2

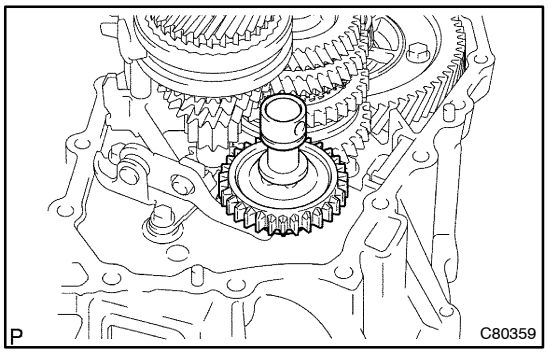
(a) Using a hexagon wrench, remove the lock ball assy No.2 from the manual transmission case.



31. REMOVE MANUAL TRANSMISSION CASE

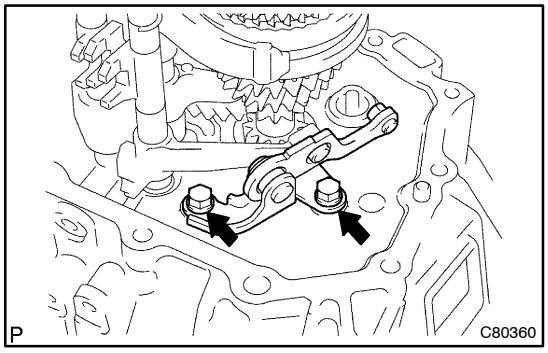
(a) Remove the 3 bolts from the front transaxle case.

(b) Remove the 13 bolts from the manual transmission case.



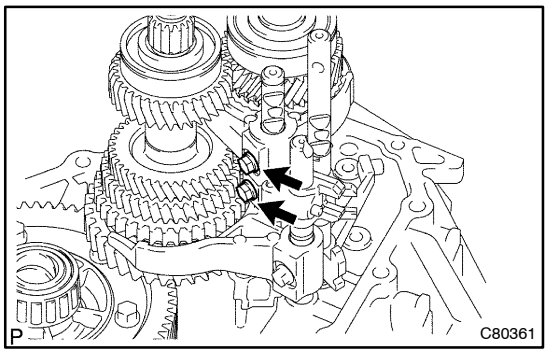
(c) Gently tap the transmission case with a brass bar and hammer and remove it from the transaxle case.

NOTICE:



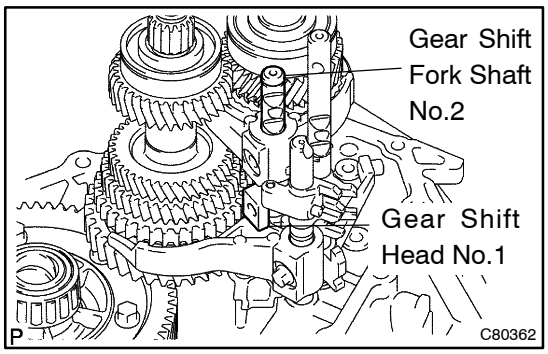
Do not damage the manual transmission case and transaxle case.

(d) Remove the 2 manual transmission case straight pins from the front transaxle case.



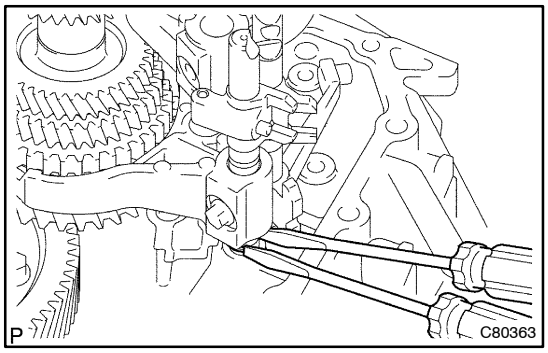
32. REMOVE REVERSE IDLER GEAR SUB–ASSY

(a) Remove the reverse idler gear, thrust washer and reverse idler gear shaft from the front transaxle case.



33. REMOVE REVERSE SHIFT ARM BRACKET ASSY

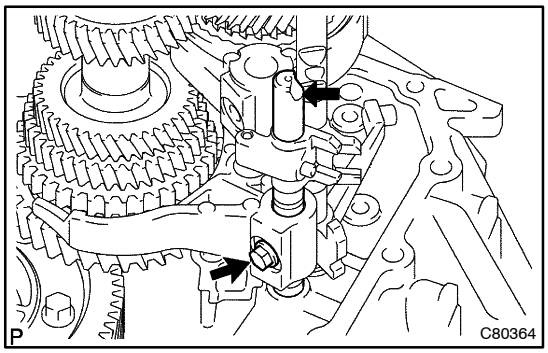
(a) Remove the 2 bolts and reverse shift arm bracket assy from the front transaxle case.



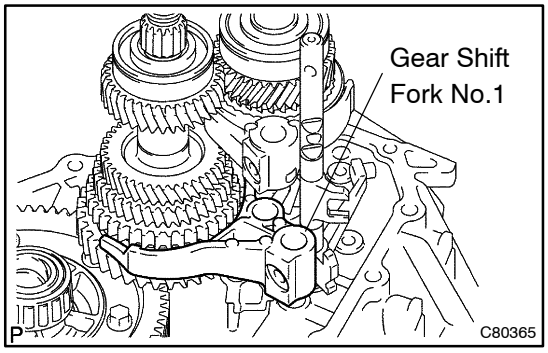
34. REMOVE GEAR SHIFT FORK SHAFT NO.2

(a) Remove the 2 bolts from the gear shift fork No.2 and gear shift head No.1.

(b) Remove the gear shift fork shaft No.2 and gear shift head No.1 from the front transaxle case.

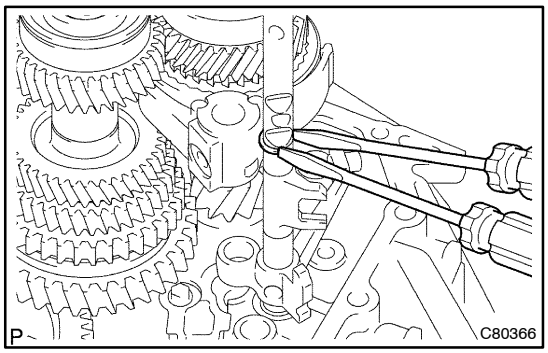


35. REMOVE GEAR SHIFT FORK SHAFT NO.1



(a) Using 2 screwdrivers and a hammer, tap out the snap rings.

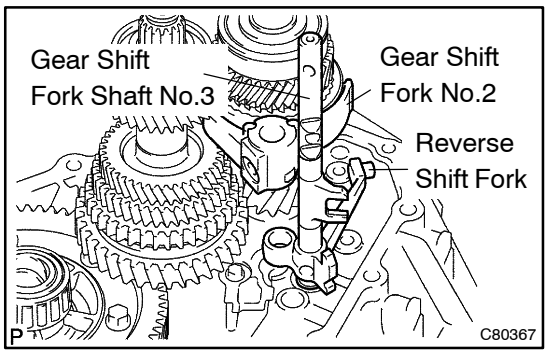
HINT:



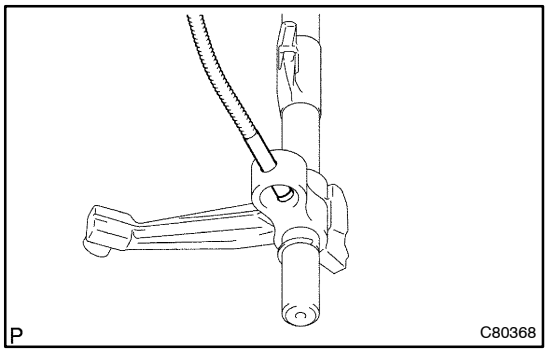
Use a shop rag to keep the snap ring from flying.

(b) Remove the shift fork set bolt and gear shift fork shaft No.1 from the gear shift fork No.1.

(c) Remove the shift fork No.1.

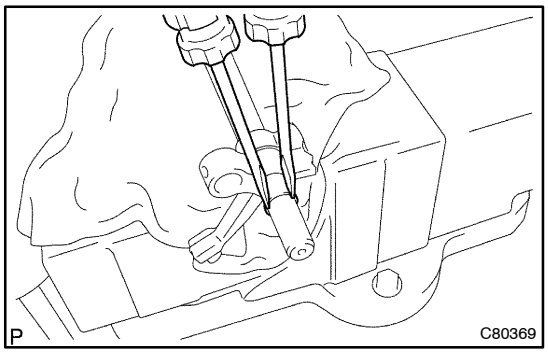


36. REMOVE GEAR SHIFT FORK SHAFT NO.3



(a) Using 2 screwdrivers and a hammer, tap out the snap ring from the gear shift fork shaft No.3.

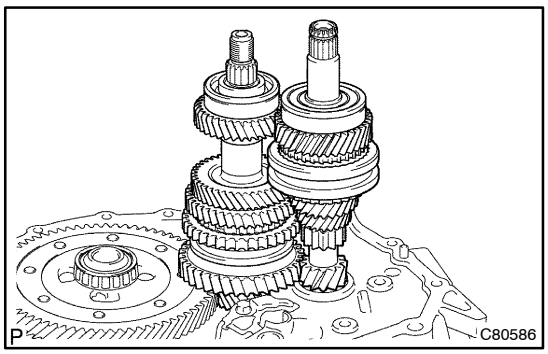
HINT:



Use a shop rag to keep the snap ring from flying.

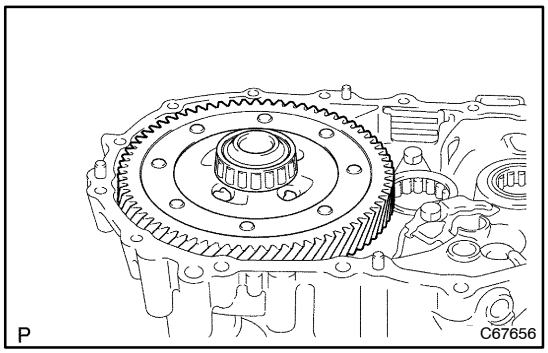
(b) Remove the shift fork shaft No.3 with reverse shift fork and gear shift fork No.2 from the manual transaxle case.

(c) Using a magnetic finger, remove the 2 reverse shift fork balls from the reverse shift fork.



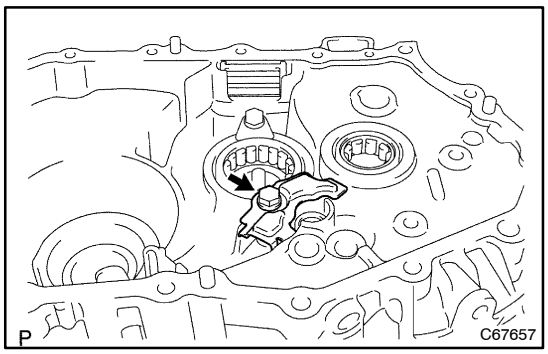
(d) Using 2 screwdrivers and a hammer, tap out the snap ring from the shift fork shaft No.3.

HINT:



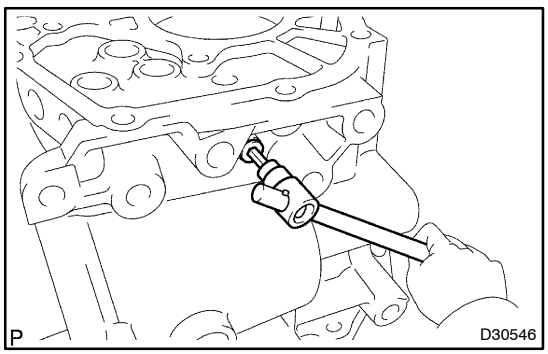
Use a shop rag to keep the snap ring from flying.

(e) Remove the reverse shift fork from the gear shift fork shaft No.3.



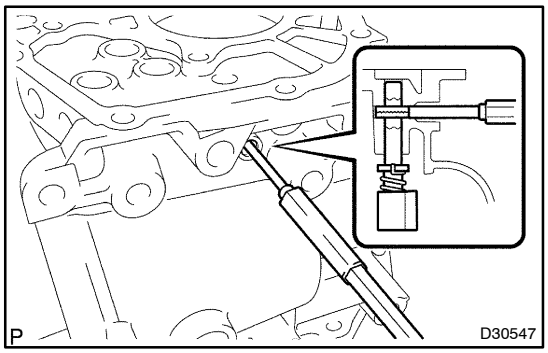
37. REMOVE INPUT SHAFT ASSY

(a) Remove the input shaft assy and output shaft assy from the front transaxle case.



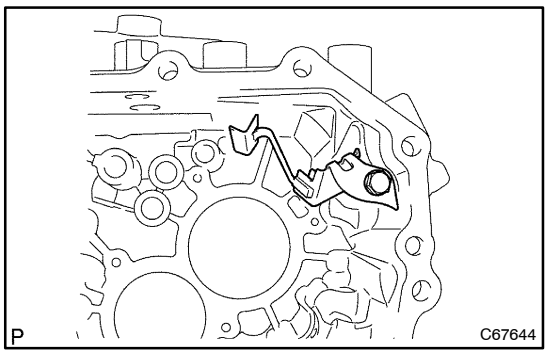
38. REMOVE DIFFERENTIAL CASE ASSY

(a) Remove the differential case assy from the front transaxle case.



39. REMOVE MANUAL TRANSAXLE CASE RECEIVER

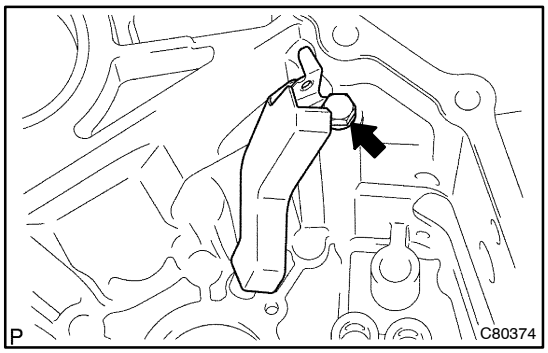
(a) Remove the bolt and manual transaxle case receiver from the front transaxle case.



40. REMOVE REVERSE RESTRICT PIN ASSY

(a) Using a hexagon wrench, remove the reverse restrict pin plug from the manual transmission case.

(b) Using a pin punch (ϕ 5 mm) and a hammer, drive out the slotted spring pin and reverse restrict pin assy from the manual transmission case.

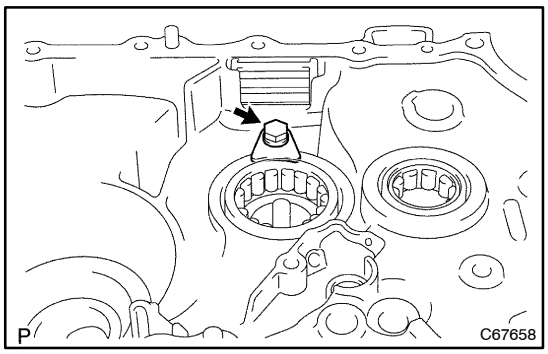


41. REMOVE OIL RECEIVER PIPE NO.1 (MTM)

(a) Remove the bolt and oil receiver pipe No.1 from the manual transmission case.

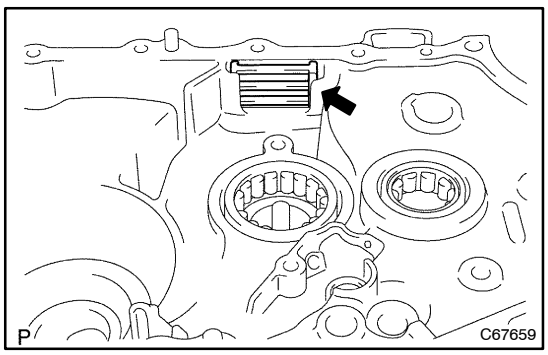
NOTICE:

Be careful not to damage the oil receiver pipe No.1.



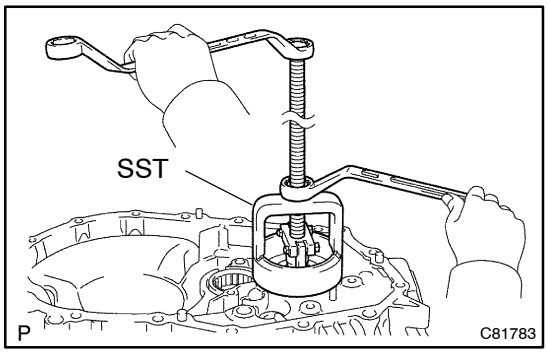
42. REMOVE OIL RECEIVER PIPE NO.2 (MTM)

(a) Remove the bolt and oil receiver pipe No.2 from the manual transmission case.



NOTICE:

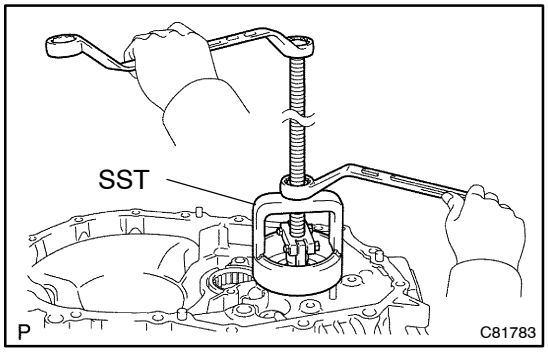
Be careful not to damage the oil receiver pipe No.2.



43. REMOVE BEARING LOCK PLATE

(a) Remove the bolt and bearing lock plate from the front transaxle case.

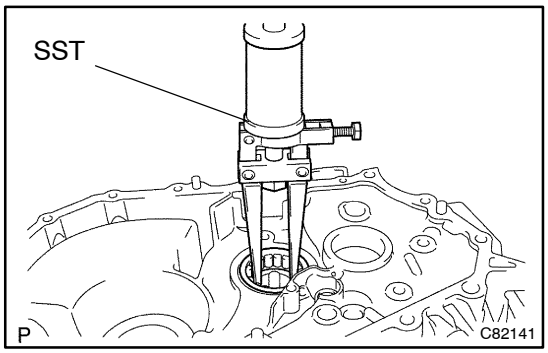
44. REMOVE TRANSMISSION MAGNET



(a) Remove the transmission magnet from the front transaxle case.

45. REMOVE INPUT SHAFT FRONT BEARING

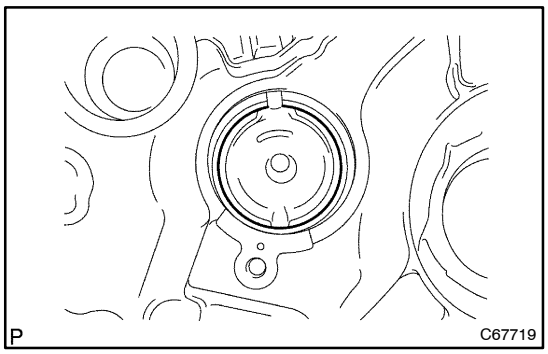
(a) Using SST, remove the input shaft front bearing from the front transaxle case.



SST 09612–65014 (09612–01050, 09612–01060)

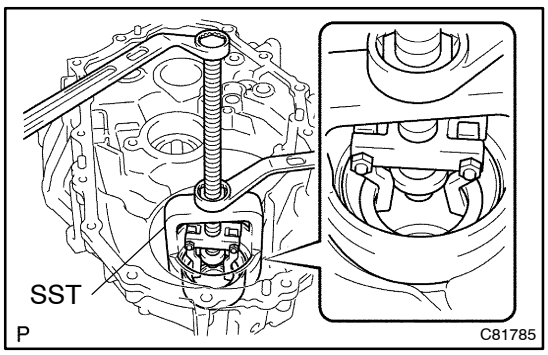
46. REMOVE FRONT TRANSAXLE CASE OIL SEAL

(a) Using SST, remove the front transaxle case oil seal from the front transaxle case.



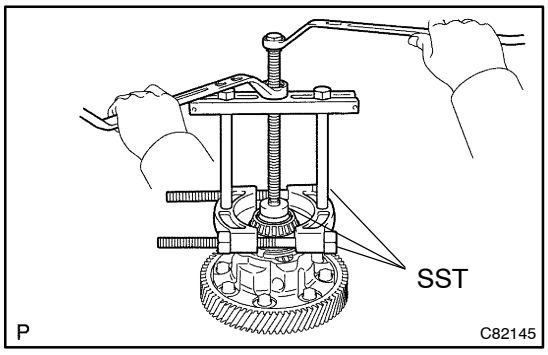
SST 09612–65014 (09612–01040, 09612–01050)

47. REMOVE OUTPUT SHAFT FRONT BEARING



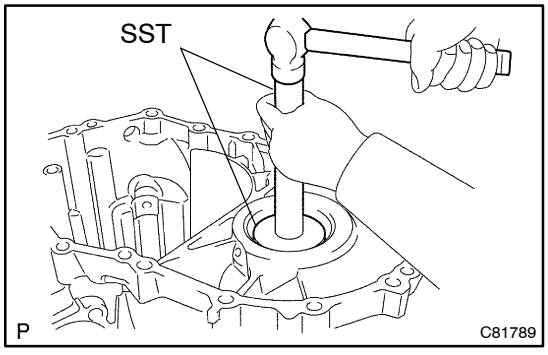
(a) Using SST, remove the output shaft front bearing from the front transaxle case.
SST 09308–00010

NOTICE:
Do not apply excessive force to the front transaxle case when installing it.



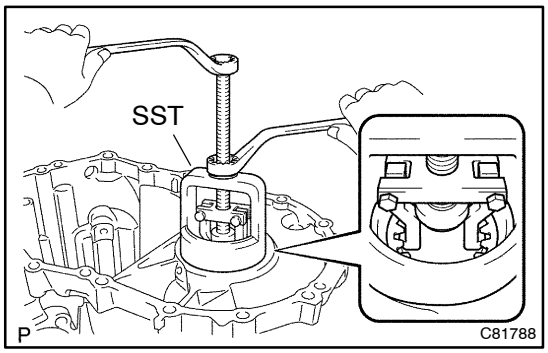
48. REMOVE OUTPUT SHAFT (MTM) COVER

(a) Remove the output shaft cover from the front transaxle case.



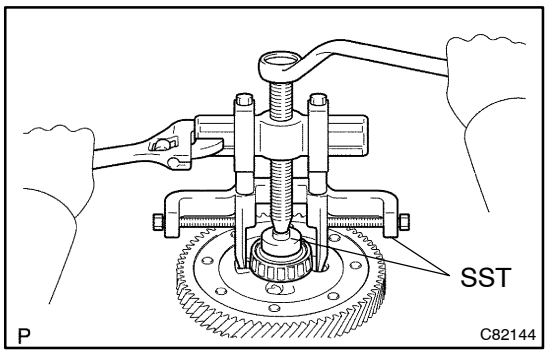
49. REMOVE FR DIFFERENTIAL CASE FRONT TAPERED ROLLER BEARING

(a) Using SST, remove the front differential case front tapered roller bearing (outer race) and plate washer from the front transaxle case.
SST 09612–65014 (09612–01040, 09612–01050),



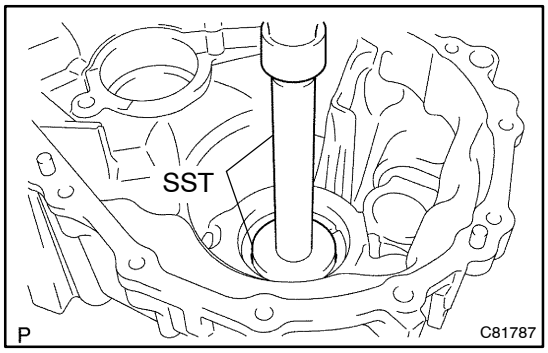
(b) Using SST, remove the front differential case front tapered roller bearing (inner race) from the front differential case.
SST 09950–00020, 09950–00030, 09950–40011 (09957–04010), 09950–60010 (09951–00360)

NOTICE:
Be careful not to damage the bearing.



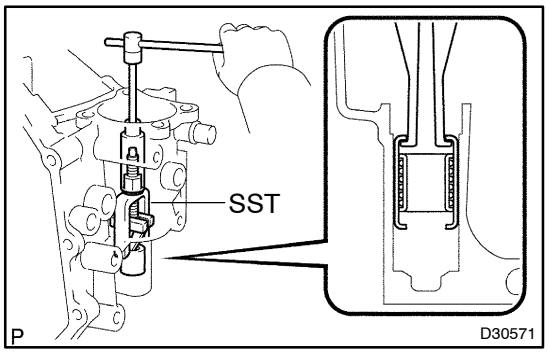
50. REMOVE TRANSAXLE CASE OIL SEAL

(a) Using SST and a hammer, remove the transaxle case oil seal from the front transaxle case.
SST 09950–60010 (09951–00530), 09950–70010 (09951–07150)



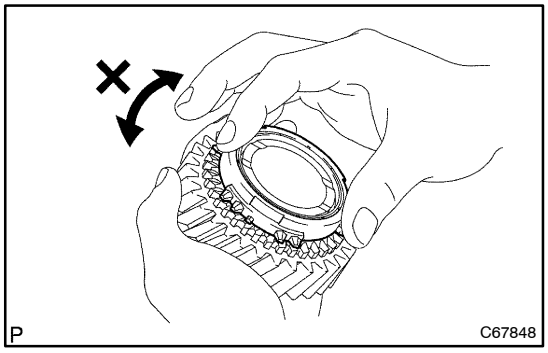
51. REMOVE FR DIFFERENTIAL CASE REAR TAPERED ROLLER BEARING

(a) Using SST, remove the front differential case rear tapered roller bearing (outer race) and plate washer from the transmission case.
SST 09612–65014 (09612–01040, 09612–01050)



(b) Using SST and hammer, remove the front differential case rear tapered roller bearing (inner race) from the front differential case.
SST 09950–40011 (09951–04010, 09952–04010, 09953–04020, 09954–04010, 09955–04061, 09957–04010, 09958–04011), 09950–60010 (09951–00360)

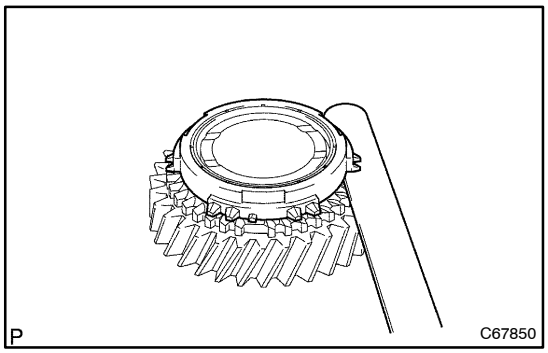
NOTICE:
Be careful not to damage bearing.



52. REMOVE TRANSMISSION CASE OIL SEAL

(a) Using SST and a hammer, drive out the transmission case oil seal from the manual transmission case.
SST 09950–60010 (09951–00600), 09950–70010 (09951–07100)

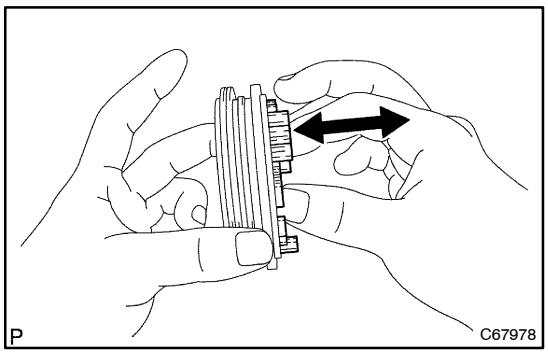
53. REMOVE SHIFT & SELECT LEVER SHAFT NEEDLE ROLLER BEARING



(a) Using SST, remove the shift & select lever shaft needle roller bearing.
SST 09319–60020

54. INSPECT SYNCHRONIZER RING NO.3

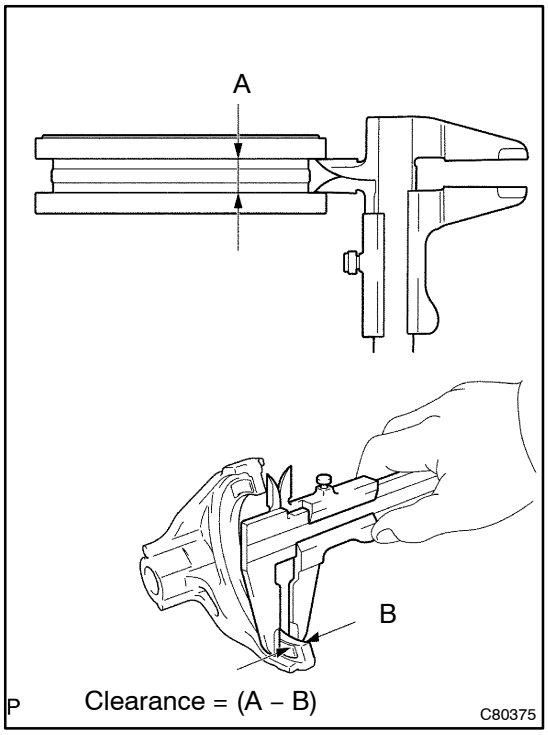
(a) Check for any wear or damage.



(b) Apply gear oil to the cone of the 5th gear and check with the synchronizer ring No.3 contacted by pressure that the gear does not turn in the direction as shown in the illustration.

(c) Using a feeler gauge, check the clearance between the synchronizer ring No.3 and 5th gear with the synchronizer ring No.3 contacted to the cone of the 5th gear.

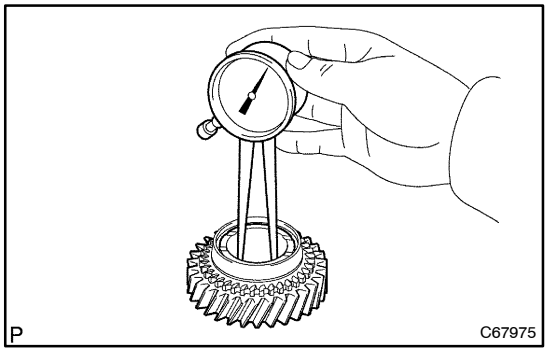
Standard clearance:
0.75 to 1.65 mm (0.0295 to 0.0649 in.)
Minimum clearance: 0.75 mm (0.0295 in.)



If the clearance is less than the minimum, replace the synchronizer ring No.3.

55. INSPECT TRANSMISSION HUB SLEEVE NO.3

(a) Check the sliding condition between the transmission hub sleeve No.3 and transmission clutch hub No.3.

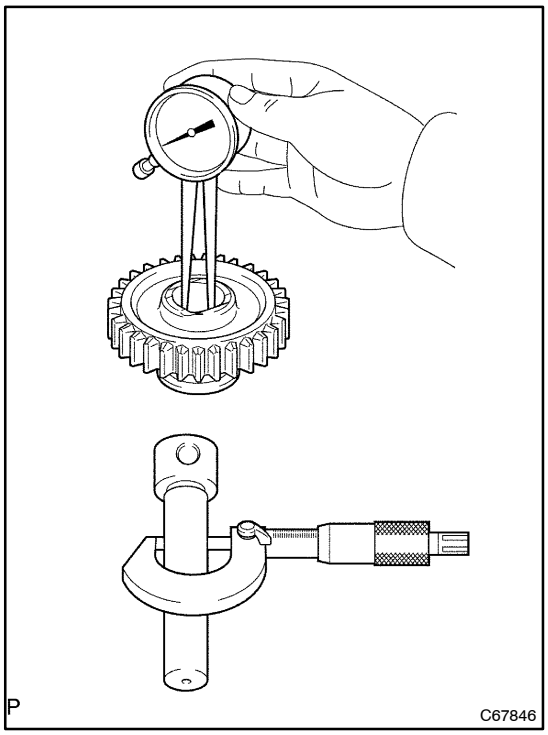


(b) Check that the spline gear's edges of the transmission hub sleeve No.3 are not worn down.

(c) Using vernier calipers, measure the clearance between the transmission hub sleeve No.3 and gear shift fork No.3.

Standard clearance:
0.3 to 0.5 mm (0.0012 to 0.0020 in.)

If the clearance exceeds the standard clearance, replace the transmission hub sleeve No.3 and gear shift fork No.3.



56. INSPECT 5TH GEAR

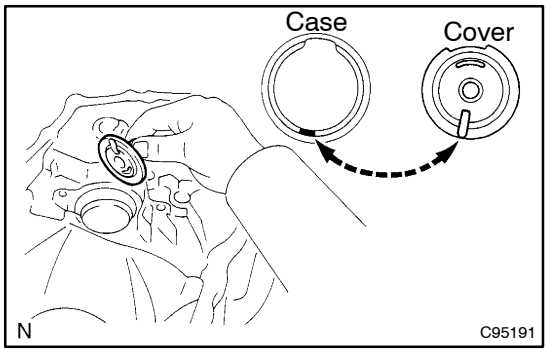
(a) Using a caliper gauge, inspect 5th gear as shown in the illustration.

Standard diameter:
29.915 to 29.931 mm (1.1778 to 1.1783 in.)

If the diameter exceeds the standard diameter, replace the 5th gear.

57. INSPECT REVERSE IDLER GEAR SUB–ASSY

(a) Using a caliper gauge, inspect the reverse idler gear sub–assy as shown in the illustration.

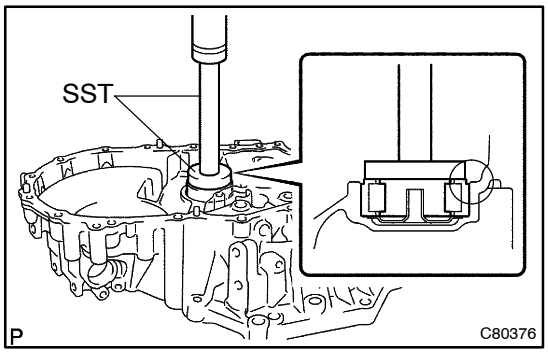


Standard diameter:
18.040 to 18.058 mm (0.7102 to 0.7109 in.)
Maximum diameter:
18.058 mm (0.7109 in.)

If the diameter exceeds the maximum, replace the reverse idler gear sub–assy.

(b) Using a micrometer, inspect the reverse idler gear shaft as shown in the illustration.

Standard outer diameter:
17.966 to 17.984 mm (0.7073 to 0.7080 in.)
Minimum outer diameter:
17.966 mm (0.7073 in.)

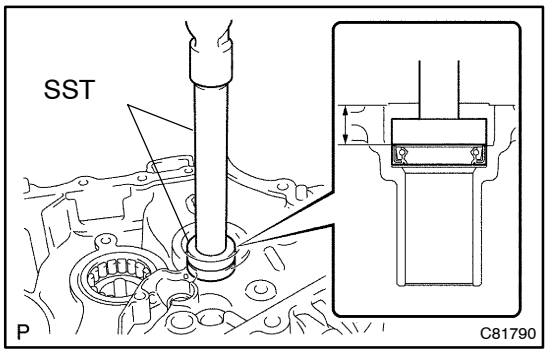


If the outer diameter is less than the minimum, replace the reverse idler gear shaft.

58. INSTALL OUTPUT SHAFT (MTM) COVER

(a) Coat the output shaft cover with MP grease and install it to the front transaxle case.

NOTICE:
Install the output shaft cover projection into the case side hollow.



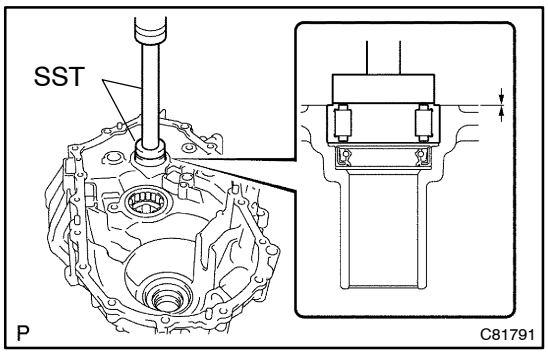
59. INSTALL OUTPUT SHAFT FRONT BEARING

(a) Coat a new output shaft front bearing with gear oil, using SST and a press, install it.

SST 09950–60010 (09951–00550), 09950–70010 (09951–07150)

NOTICE:

- **Be sure to install a new bearing in the correct direction, as shown in the illustration.**
- **When replacing the output shaft front bearing, replace the output shaft front bearing inner race along with it.**



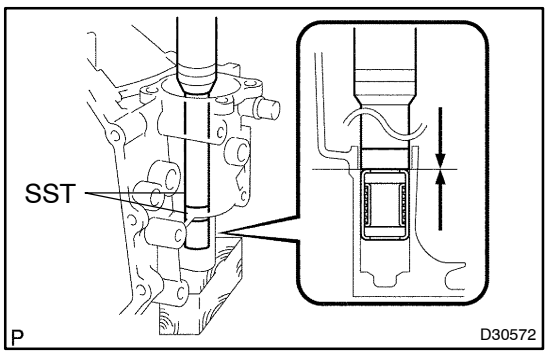
60. INSTALL FRONT TRANSAXLE CASE OIL SEAL

(a) Using SST and a hammer, install a new front transaxle case oil seal to the front transaxle case.

SST 09950–60010 (09951–00370), 09950–70010 (09951–07150)

Drive in depth: 15.6 to 16.0 mm (0.6141 to 0.6299 in.)

(b) Coat the lip of the front transaxle case oil seal with MP grease.

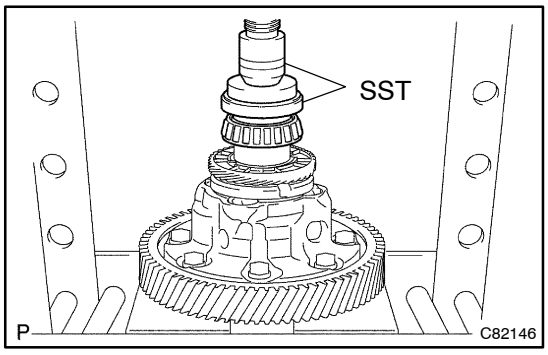


61. INSTALL INPUT SHAFT FRONT BEARING

(a) Coat a new input shaft front bearing with MP grease. Using SST and a press, install it to the front transaxle case.

SST 09950–60010 (09951–00420), 09950–70010 (09951–07150)

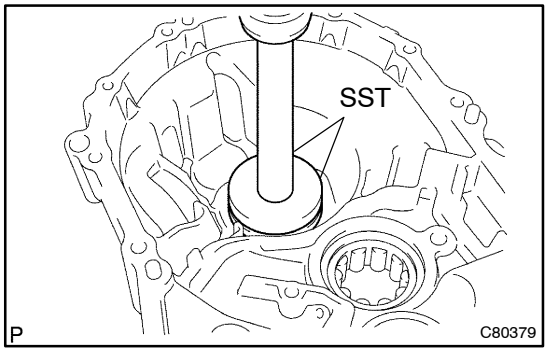
Drive in depth: 0 to 0.3 mm (0 to 0.0118 in.)



62. INSTALL SHIFT & SELECT LEVER SHAFT NEEDLE ROLLER BEARING

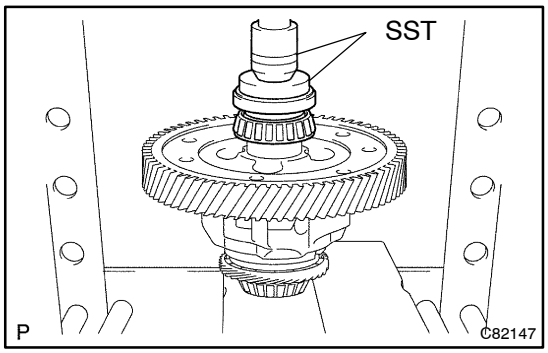
(a) Using SST, install the shift & select lever shaft needle roller bearing.

SST 09950–60010 (09951–00220), 09950–70010 (09951–07100)



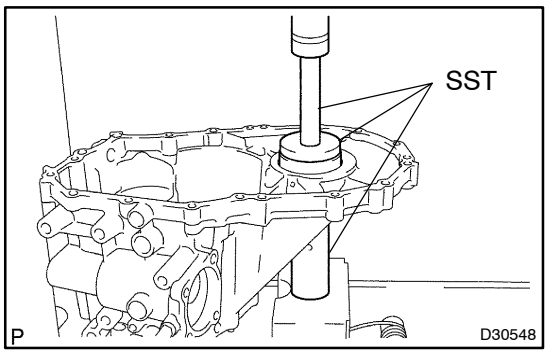
Drive in depth: 0 to 0.5 mm (0 to 00020 in.)

63. INSTALL FR DIFFERENTIAL CASE FRONT TAPERED ROLLER BEARING



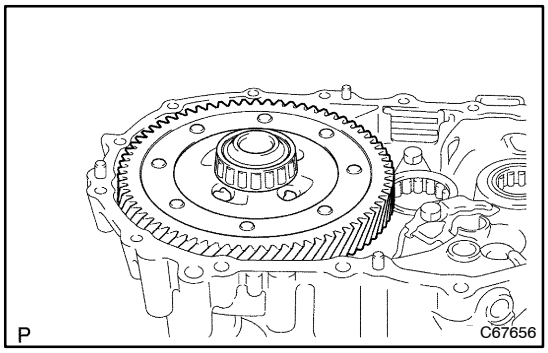
(a) Using SST and a press, install the front differential case front tapered roller bearing (inner race) to the front differential case.

SST 09350–32014 (09351–32120), 09950–60010 (09951–00530)



(b) Using SST and a press, install the front differential case front tapered roller bearing (outer race) with plate washer to the front transaxle case.

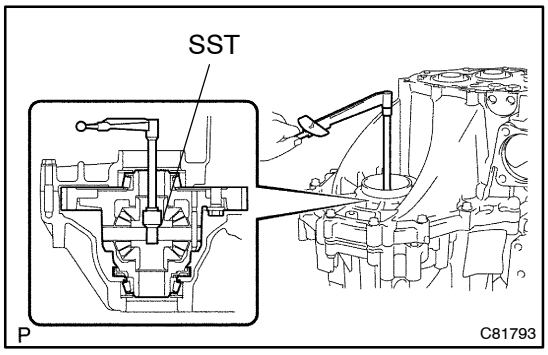
SST 09950–60020 (09951–00680), 09950–70010 (09951–07150)



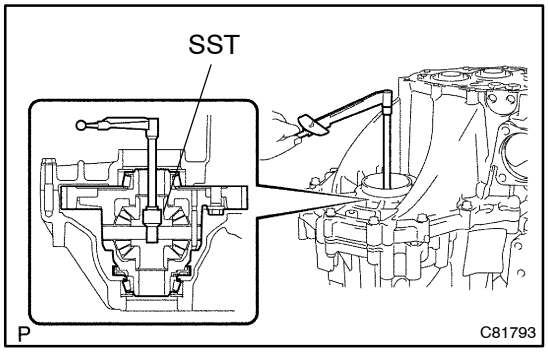
64. INSTALL FR DIFFERENTIAL CASE REAR TAPERED ROLLER BEARING

(a) Using SST and a press, install the front differential case rear tapered roller bearing (inner race) to the front differential case.
SST 09350–32014 (09351–32120), 09950–60010 (09951–00530)

(b) Using SST and a press, install the front differential case rear tapered roller bearing (outer race) with shim to the transmission case.
SST 09309–36010, 09950–60020 (09951–00710), 09950–70010 (09951–07150)



HINT:
Use a front differential case washer rear of the same thickness as the removed one.

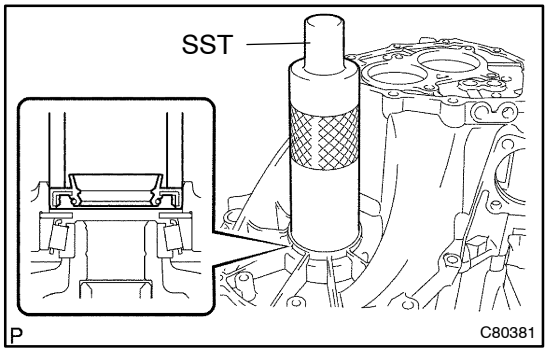


65. ADJUST DIFFERENTIAL SIDE BEARING PRELOAD

(a) Coat the differential case assy with gear oil, and install it to the front transaxle case.

(b) Install the manual transmission case with 16 bolts.
Torque: 29 N·m (300 kgf·cm, 22 ft·lbf)

(c) Using SST and a torque wrench, turn the differential case assy to the right and left 2 or 3 times to allow the bearings to settle.
SST 09564–32011

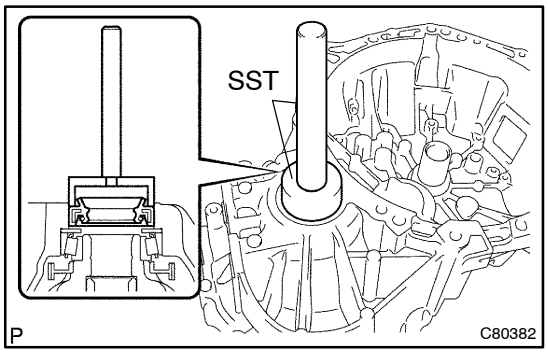


(d) Using SST and a torque wrench, measure the preload.
SST 09564–32011
Preload (at starting):
New bearing:
0.78 to 1.57 N·m (7.95 to 16.0 kgf·cm, 6.9 to 13.89 in.·lbf)
Reuse bearing:
0.49 to 0.98 N·m (5.0 to 10.0 kgf·cm, 4.34 to 8.67 in.·lbf)

(e) Select another plate washer.

Mark	Thickness mm (in.)	Mark	Thickness mm (in.)
01	1.10 (0.0433)	11	1.60 (0.0630)
02	1.15 (0.0453)	12	1.65 (0.0650)
03	1.20 (0.0472)	13	1.70 (0.1060)
04	1.25 (0.0492)	14	1.75 (0.0689)
05	1.30 (0.0512)	15	1.80 (0.0709)
06	1.35 (0.0531)	16	1.85 (0.0728)
07	1.40 (0.0551)	17	1.90 (0.0748)
08	1.45 (0.0571)	18	1.95 (0.0768)
09	1.50 (0.0591)	19	2.00 (0.0787)
10	1.55 (0.0610)	–	–

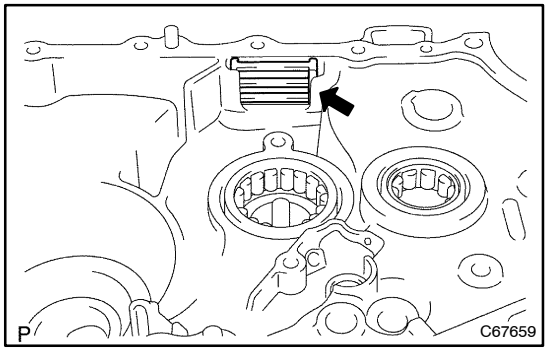
(f) Remove the 16 bolts and manual transmission case from the transaxle case.



(g) Remove the differential case assy from the transaxle case.

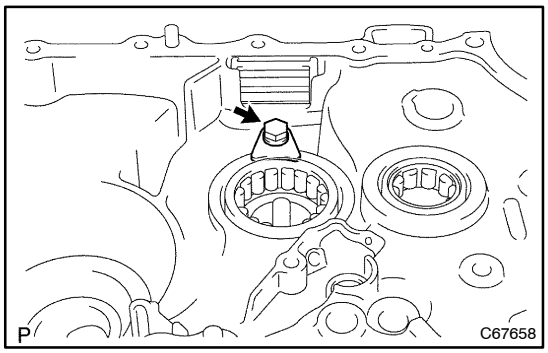
66. INSTALL TRANSMISSION CASE OIL SEAL

(a) Using SST and a hammer, install a new transmission case oil seal to the manual transmission case.
SST 09316–60011 (09316–00011)
Drive in depth: 9.6 to 10.2 mm (0.3779 to 0.4015 in.)



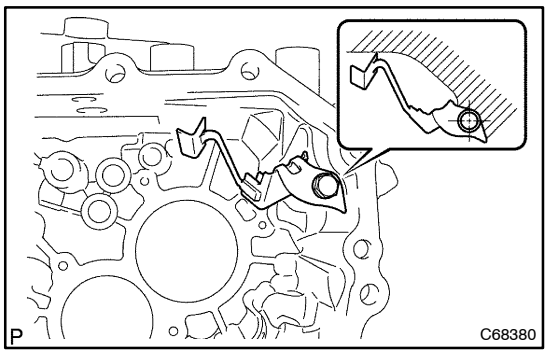
(b) Coat the lip of the front transmission case oil seal with MP grease.

67. INSTALL TRANSAXLE CASE OIL SEAL



(a) Using SST and a hammer, install a new transaxle case oil seal to the front transaxle case.
Drive in depth: 1.6 to 2.2 mm (0.0629 to 0.0866 in.)
SST 09710–20011 (09710–06071), 09950–70010 (09951–07150)

(b) Coat the lip of the transaxle case oil seal with MP grease.

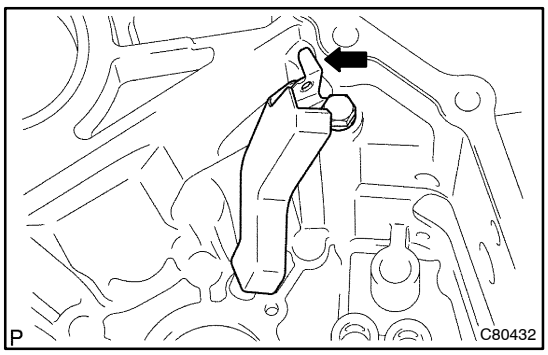


68. INSTALL TRANSMISSION MAGNET

(a) Clean the transmission magnet and install it to the front transaxle case.

69. INSTALL BEARING LOCK PLATE

(a) Install the bearing lock plate with the bolt.
Torque: 11 N·m (115 kgf·cm, 8 ft·lbf)

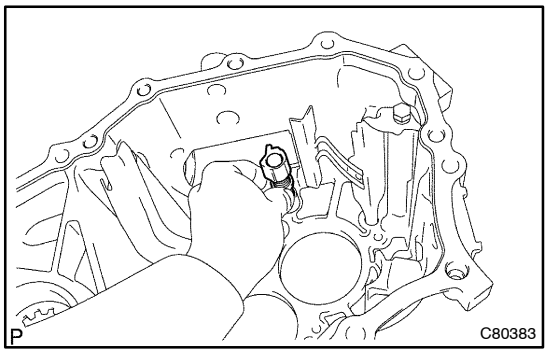


70. INSTALL OIL RECEIVER PIPE NO.1 (MTM)

(a) Install the oil receiver pipe No.1 with the bolt to the manual transmission case.
Torque: 17 N·m (175 kgf·cm, 13 ft·lbf)

NOTICE:

- **Prevent the oil receiver pipe No.1 from being deformed.**
- **Install the oil receiver pipe No.1 while placing it against the manual transmission case, as shown in the illustration.**

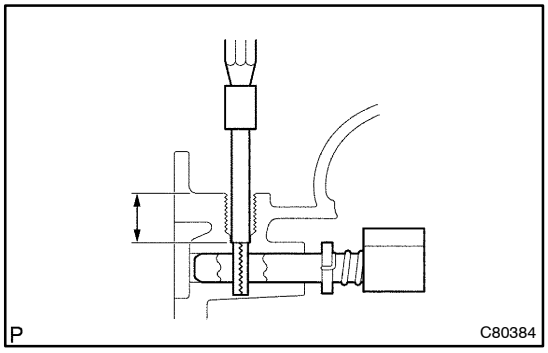


71. INSTALL OIL RECEIVER PIPE NO.2 (MTM)

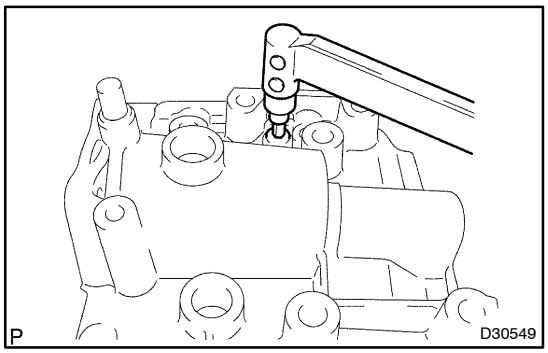
(a) Install the oil receiver pipe No.2 with the bolt to the manual transmission case.
Torque: 17 N·m (175 kgf·cm, 13 ft·lbf)

NOTICE:

- **Prevent the oil receiver pipe No.2 from being deformed.**
- **Install the oil receiver pipe No.2 while placing it against the manual transmission case, as shown in the illustration.**



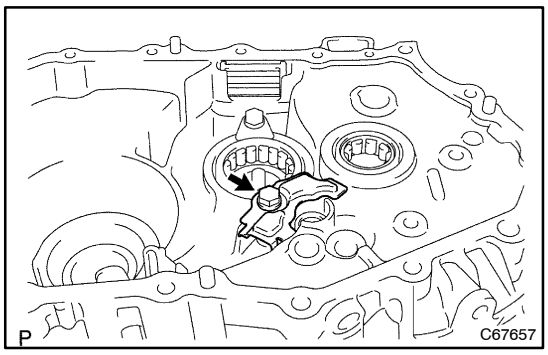
72. INSTALL REVERSE RESTRICT PIN ASSY



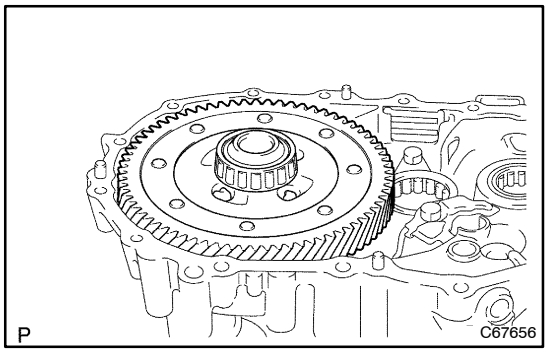
(a) Install the reverse restrict pin assy to the manual transmission case.

HINT:

Do not set the reverse restrict pin assy in incorrect orientation.

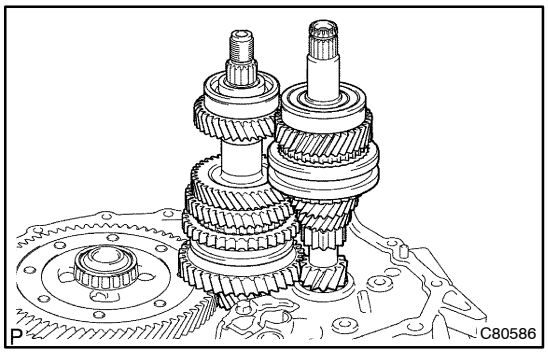


(b) Using a pin punch (ϕ 5 mm) and a hammer, install the slotted pin to the restrict pin assy.
Drive in depth: 15.5 to 16.5 mm (0.6102 to 0.6496 in.)



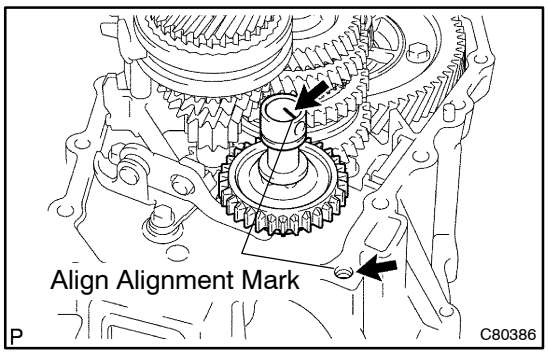
(c) Apply sealant to the reverse restrict pin plug.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

(d) Using a hexagon wrench and a torque wrench install the reverse restrict pin plug to the manual transmission case.
Torque: 13 N·m (130 kgf·cm, 9.3 ft·lbf)



73. INSTALL MANUAL TRANSAXLE CASE RECEIVER

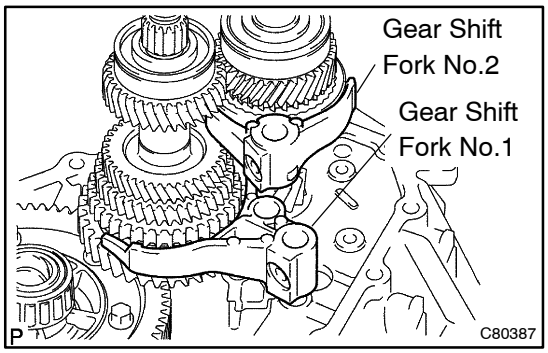
(a) Install the manual transaxle case receiver with the bolt to the front transaxle case.
Torque: 11 N·m (115 kgf·cm, 8 ft·lbf)



74. INSTALL DIFFERENTIAL CASE ASSY

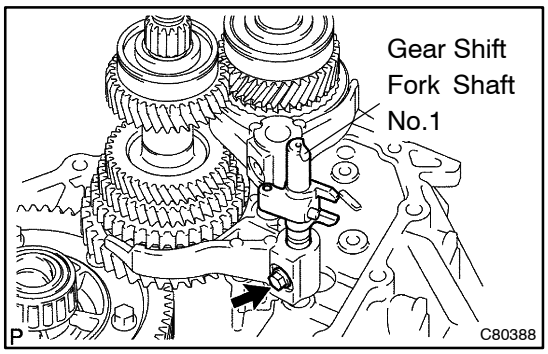
(a) Coat the differential case tapered roller bearings with gear oil, install them to the front transaxle case.

75. INSTALL INPUT SHAFT ASSY



(a) Coat the sliding and rotating surface of the input and output shafts with gear oil, install them to the transaxle case.

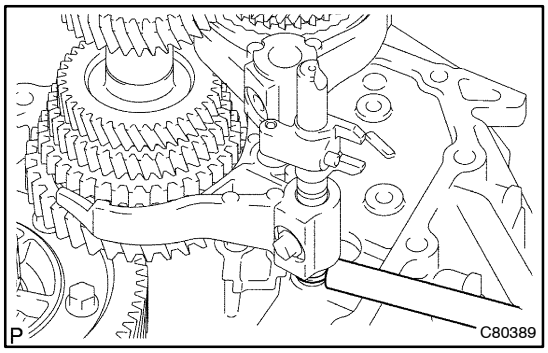
76. INSTALL REVERSE IDLER GEAR SUB–ASSY



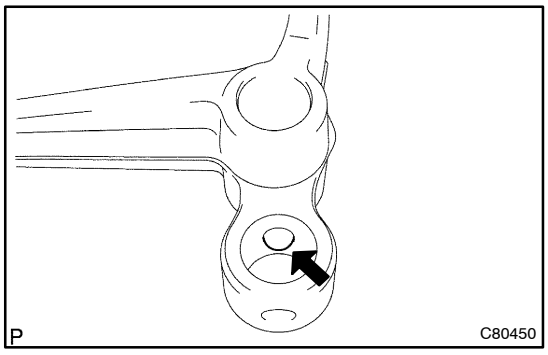
(a) Coat the reverse idler gear, thrust washer and reverse idler gear shaft with gear oil, and install them.

HINT:
Align the mark on the reverse idler gear shaft with the bolt hole as shown in the illustration.

77. INSTALL GEAR SHIFT FORK SHAFT NO.1



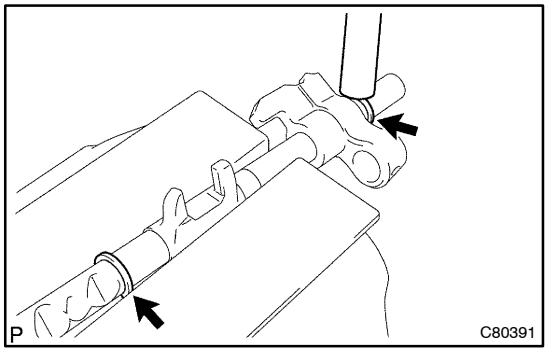
(a) Coat the gear shift fork No.1 and gear shift fork No.2 with gear oil, and install them.



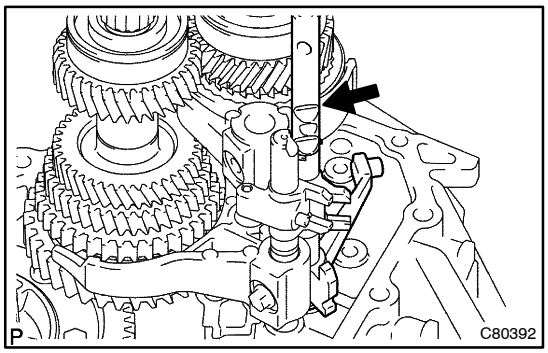
(b) Coat the gear shift fork shaft No.1 with gear oil, and install it.

(c) Apply sealant to the shift fork set bolt.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

(d) Install the gear shift fork set bolt.
Torque: 16 N·m (160 kgf·cm, 12 ft·lbf)

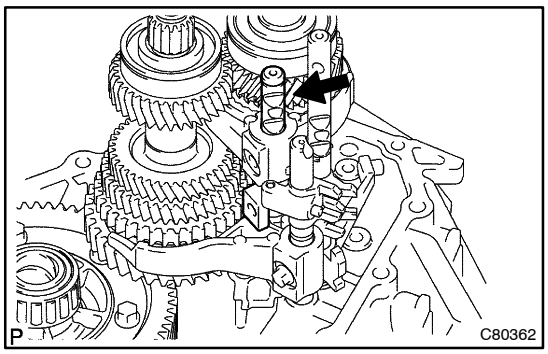


(e) Using a brass bar and a hammer, install a shaft snap ring to the gear shift fork shaft No.1.



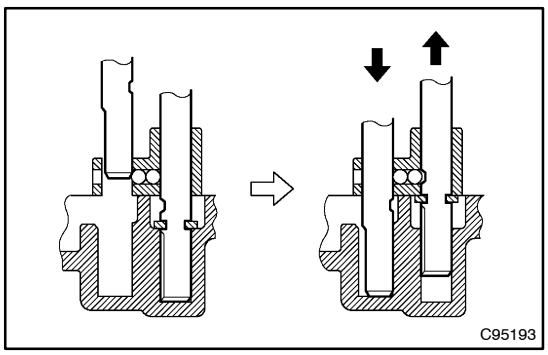
78. INSTALL GEAR SHIFT FORK SHAFT NO.3

(a) Coat the 2 shift fork balls with MP grease, and install them to the reverse shift fork.

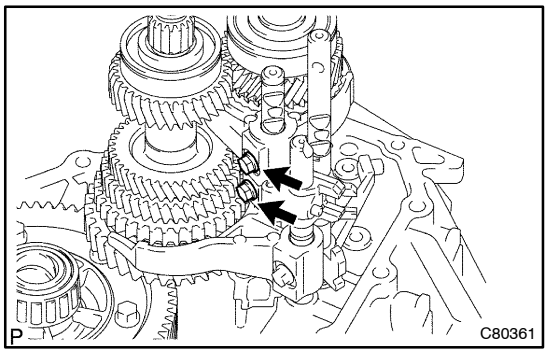


(b) Install the reverse shift fork to the gear shift fork shaft No.3.

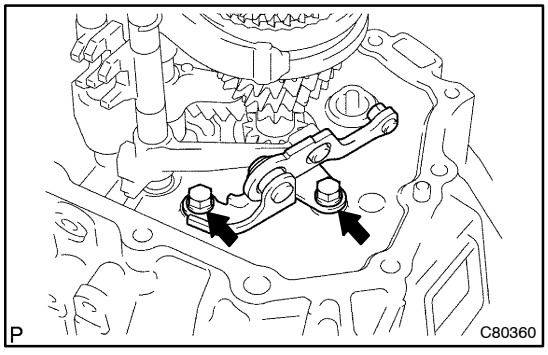
(c) Using a brass bar and a hammer, install 2 new shift fork shaft snap rings to the shift fork shaft No.3.



(d) Coat the shift fork shaft No.3 with gear oil, and install it.

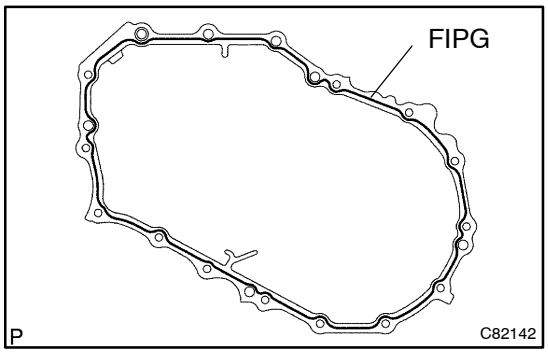


79. INSTALL GEAR SHIFT FORK SHAFT NO.2



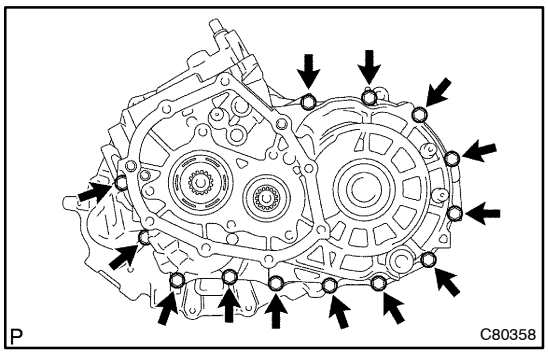
(a) Coat the gear shift head No.1 and gear shift fork shaft No.2 with gear oil, and install them.

NOTICE:
To avoid the interference of the 2 shift fork balls, lift up the gear shift fork shaft NO.3 at the position shown in the illustration.



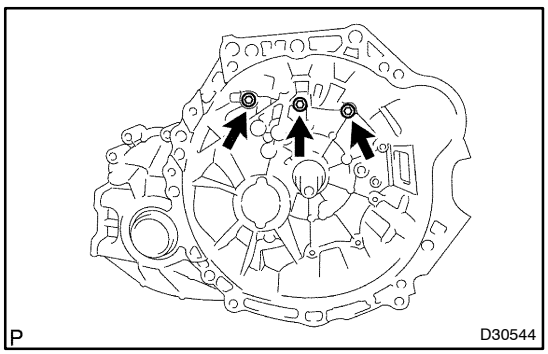
(b) Coat the 2 shift lock bolts with sealant, and install them to the gear shift fork No.2 and shift head No.1.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 16 N·m (160 kgf·cm, 12 ft·lbf)

80. INSTALL REVERSE SHIFT ARM BRACKET ASSY



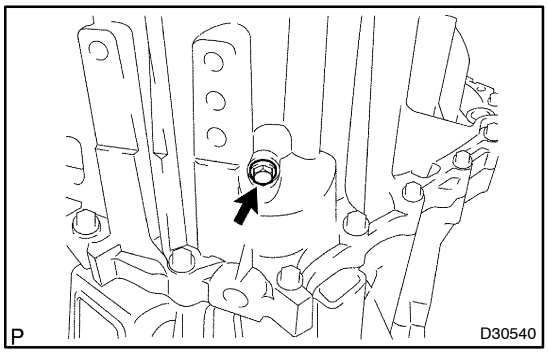
(a) Install the reverse shift arm bracket assy with the 2 bolts to the front transaxle case.
Torque: 17 N·m (175 kgf·cm, 13 ft·lbf)

81. INSTALL MANUAL TRANSMISSION CASE



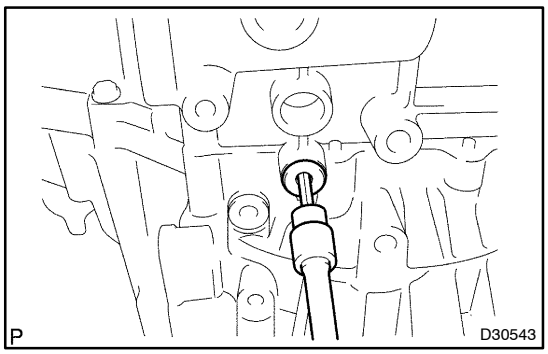
(a) Apply FIPG to the manual transmission case, as shown in the illustration.
FIPG:
Part No. 08826–00090, THREE BOND 1281 or equivalent

NOTICE:
Parts must be assembled within 10 minutes of application. Otherwise, the packing (FIPG) material must be removed and reapplied.

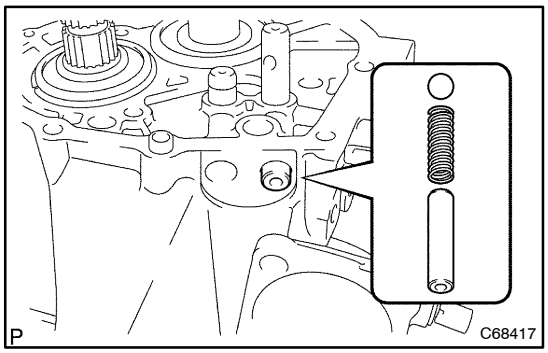


(b) Install the manual transmission case straight pin to the front transaxle case.

(c) Coat the 13 bolts with sealant, and install them to the manual transmission case.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 29 N·m (300 kgf·cm, 22 ft·lbf)

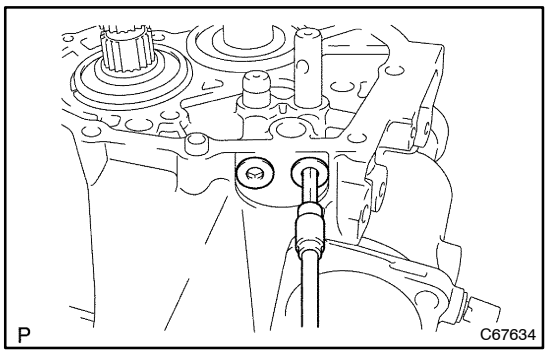


(d) Coat the 3 bolts with sealant, and install them to the front transaxle case.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 29 N·m (300 kgf·cm, 22 ft·lbf)



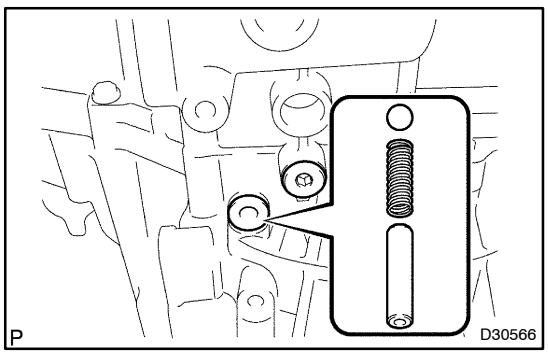
82. INSTALL REVERSE IDLER GEAR SHAFT BOLT

(a) Coat the reverse idler gear shaft bolt with sealant, and install it with a new gasket.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 29 N·m (300 kgf·cm, 22 ft·lbf)

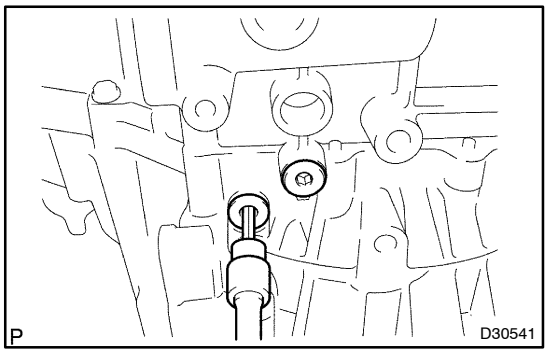


83. INSTALL LOCK BALL ASSY NO.2

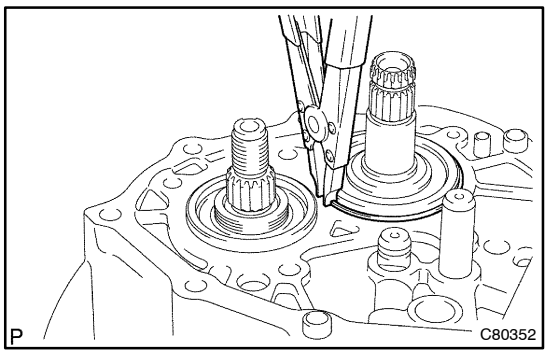
(a) Coat the lock ball assy No.2 with sealant, and install it with a hexagon wrench.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 39 N·m (400 kgf·cm, 29 ft·lbf)



84. INSTALL SHIFT DETENT BALL

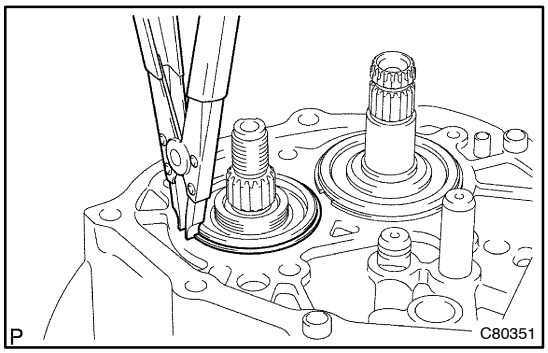


(a) Install the 2 shift detent balls, 2 shift detent ball springs with 2 shift detent ball spring seats No.1 to the manual transmission case.

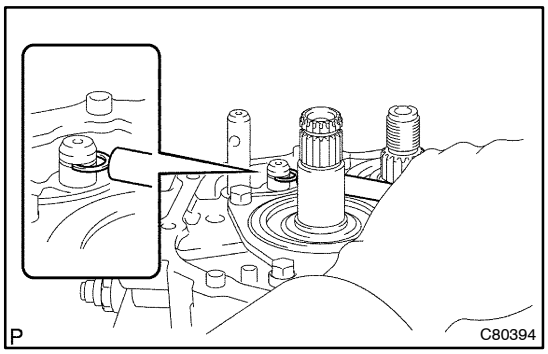


(b) Coat the 2 shift detent ball plugs with sealant, and install them using a hexagon wrench.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 25 N·m (250 kgf·cm, 18 ft·lbf)

(c) Install the shift detent ball, shift detent ball compression spring and shift detent ball spring seat No.1 to the front transaxle case.

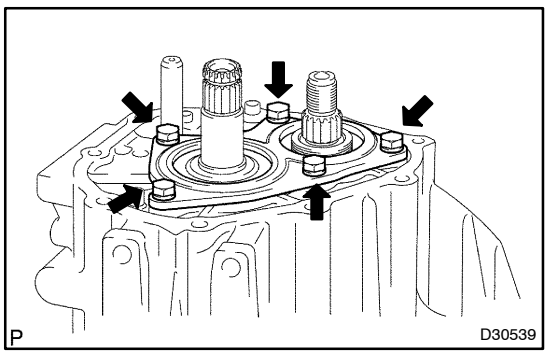


(d) Coat the shift detent ball plug with sealant, and install it using a hexagon wrench.
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 25 N·m (250 kgf·cm, 18 ft·lbf)



85. INSTALL INPUT SHAFT REAR BEARING HOLE SNAP RING

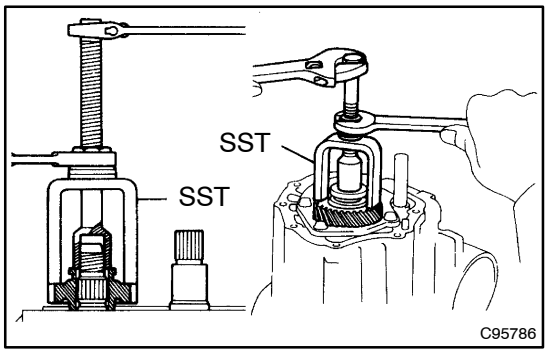
(a) Using a snap ring expander, install the input shaft rear bearing hole snap ring to the input shaft.



86. INSTALL OUTPUT SHAFT REAR BEARING HOLE SNAP RING

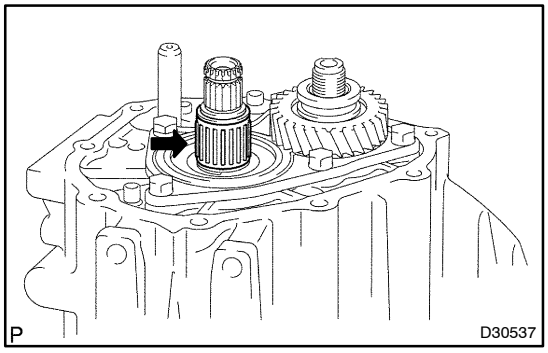
(a) Using a snap ring expander, install the output shaft rear bearing hole snap ring to the output shaft.

87. INSTALL SHIFT FORK SHAFT SHAFT SNAP RING



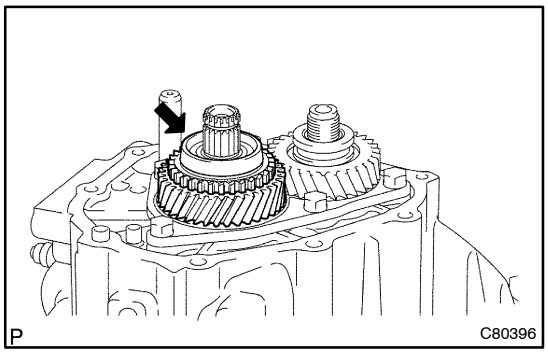
(a) Using a brass bar and a hammer, install a new shift fork shaft snap ring to the shift fork shaft No.2.

88. INSTALL BEARING RETAINER REAR (MTM)



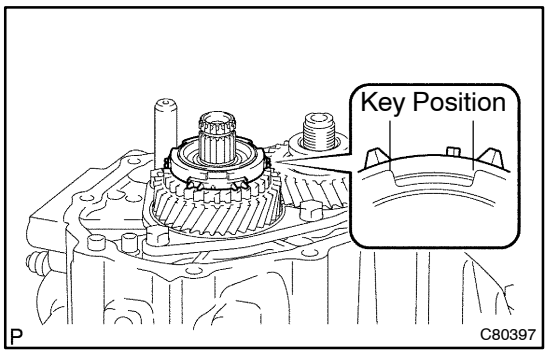
(a) Coat the 5 bolts with sealant, and install the bearing retainer rear with the 5 bolts to the manual transmission case.

Torque: 27 N·m (280 kgf·cm, 20 ft·lbf)



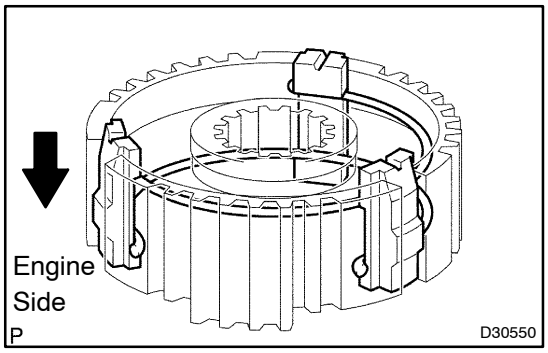
89. INSTALL 5TH DRIVEN GEAR

(a) Using SST, install the 5th driven gear to the output shaft.
SST 09309–12020



90. INSTALL 5TH GEAR NEEDLE ROLLER BEARING

(a) Coat the 5th gear needle roller bearing and spacer with gear oil, and install them to the input shaft.

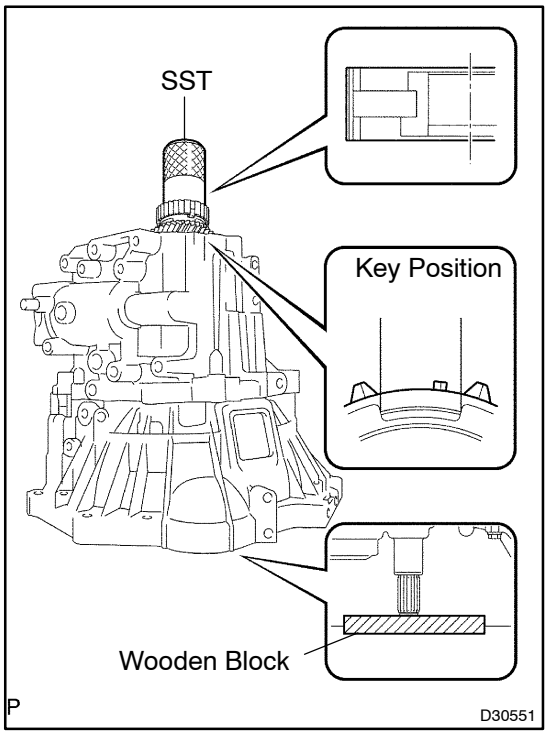


91. INSTALL 5TH GEAR

(a) Coat the 5th gear with gear oil, and install it to the input shaft.

92. INSTALL SYNCHRONIZER RING NO.3

(a) Coat the synchronizer ring No.3 with gear oil, and install it to the 5th gear.



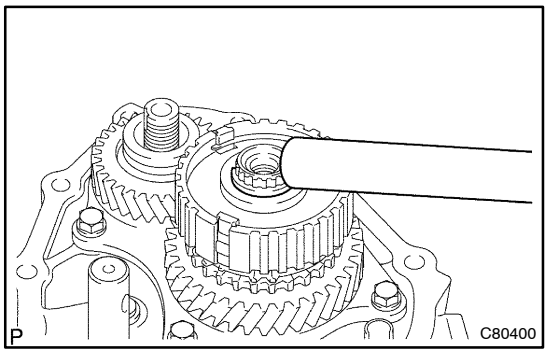
93. INSTALL TRANSMISSION CLUTCH HUB NO.3

(a) Install the 3 synchromesh shifting keys and 2 synchromesh shifting key springs to the transmission clutch hub No.3.

NOTICE:

Do not set both openings of the shifting key springs in the same position.

(b) Using SST and a hammer, install the transmission clutch hub No.3 to the input shaft.



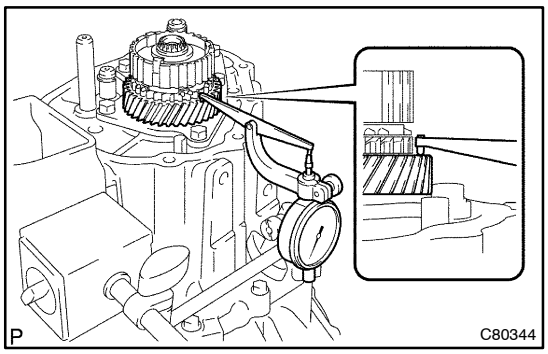
SST 09636–20010

NOTICE:

- **Do not install the transmission clutch hub No.3 with it facing the wrong direction.**
- **Install the transmission clutch hub No.3 checking the positions of the synchronizer ring No.3 key groove and the synchromesh shifting key No.3.**
- **Check that the 5th gear is rotating.**

NOTICE:

Place the suitable sized wooden block to support the input shaft.

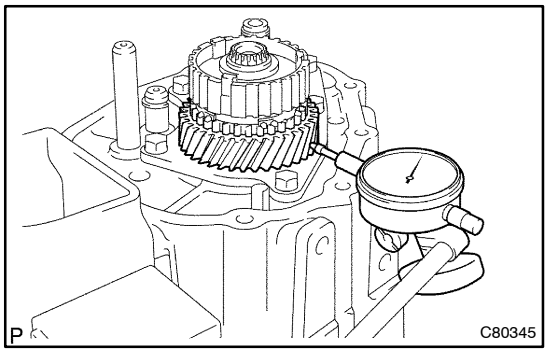


(c) Select a clutch hub No.3 shaft snap ring that will allow minimum axial play.

Clearance: 0.1 mm (0.0039 in.) or less

Mark	Thickness mm (in.)	Mark	Thickness mm (in.)
A	2.25 (0.0886)	E	2.49 (0.0980)
B	2.31 (0.0909)	F	2.55 (0.1004)
C	2.37 (0.0933)	G	2.61 (0.1028)
D	2.43 (0.0957)		

(d) Using a brass bar and a hammer, install the snap ring to the input shaft.

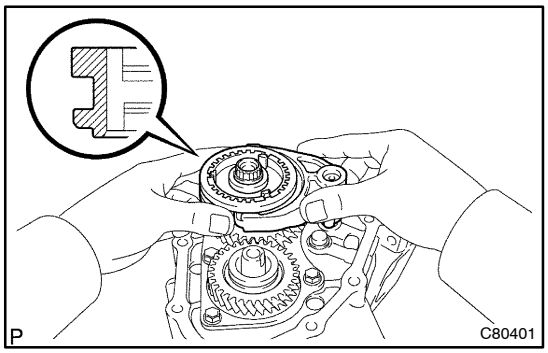


94. INSPECT 5TH GEAR THRUST CLEARANCE

(a) Using a dial indicator, inspect the 5th gear thrust clearance.

Standard clearance:
0.1 to 0.57 mm (0.0039 to 0.02244 in.)
Maximum clearance:
0.57 mm (0.02244 in.)

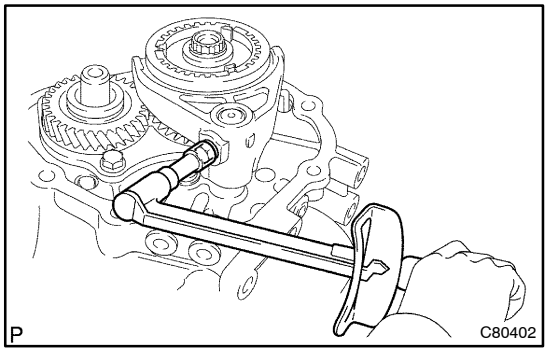
If the clearance exceeds the maximum, replace the transmission clutch hub No.3, 5th gear or input shaft rear radial ball bearing.



95. INSPECT 5TH GEAR RADIAL CLEARANCE

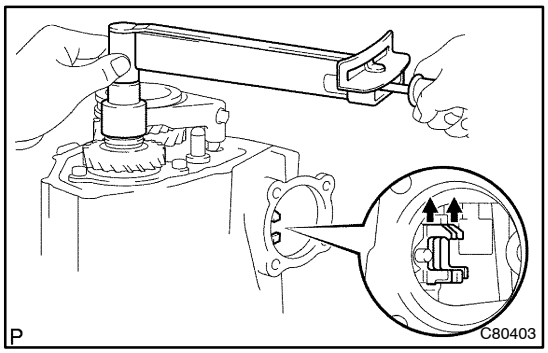
(a) Using a dial indicator, inspect the 5th gear radial clearance.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)



If the clearance exceeds the maximum, replace the 5th gear, 5th gear needle roller bearing or input shaft.

96. INSTALL GEAR SHIFT FORK NO.3

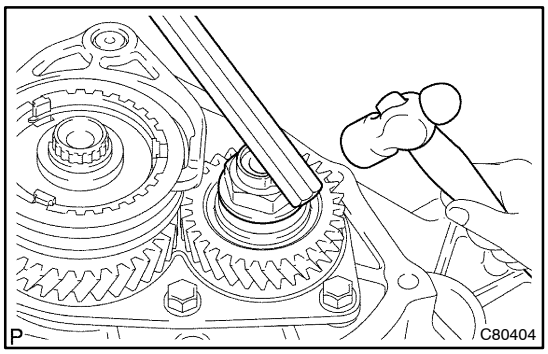


(a) Coat the transmission clutch hub sleeve No.3 with gear oil, and install it and gear shift fork No.3 to the transmission clutch hub No.3.

HINT:
Do not set the transmission clutch hub No.3 in incorrect orientation.

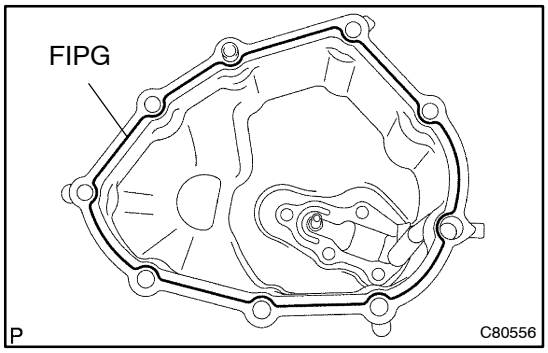
(b) Coat the gear shift fork lock bolt with sealant, and install it to the gear shift fork No.3.

Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent
Torque: 16 N·m (160 kgf·cm, 12 ft·lbf)



97. INSTALL MANUAL TRANSMISSION OUTPUT SHAFT REAR SET NUT

(a) Engage the gears to make them double meshed.



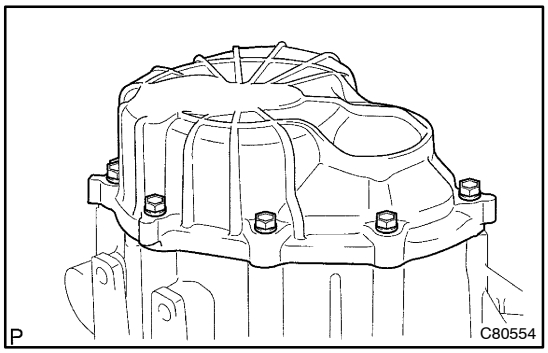
(b) Install a new manual transmission output shaft rear set nut.

Torque: 118 N·m (1200 kgf·cm, 87 ft·lbf)

(c) Using a chisel and a hammer, stake the manual transmission output shaft rear set nut.

(d) Disengage the gears.

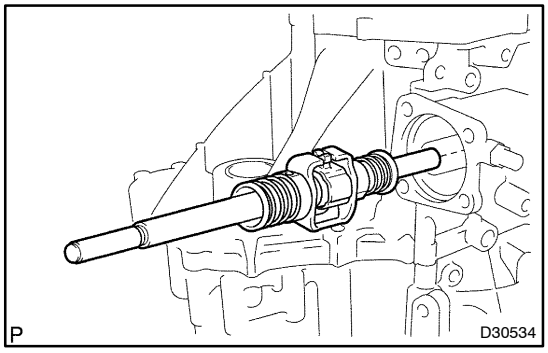
98. INSTALL MANUAL TRANSMISSION CASE COVER SUB–ASSY



(a) Apply FIPG to the transaxle case cover as shown in the illustration.

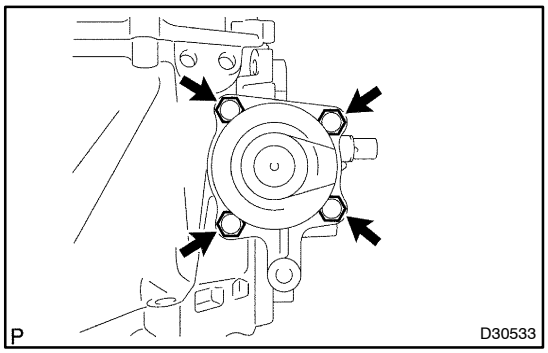
FIPG:

Part No. 08826–00090, THREE BOND 1281



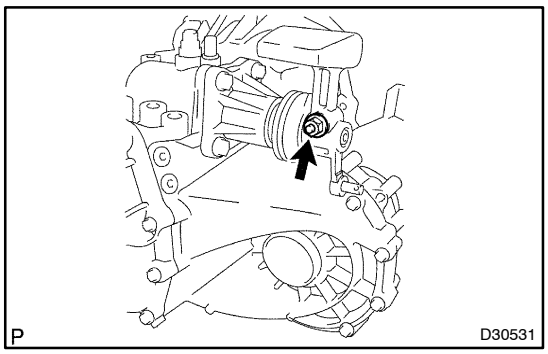
NOTICE:

Parts must be assembled within 10 minutes of application. Otherwise, the packing (FIPG) material must be removed and reapplied.



(b) Install the manual transmission case cover to the manual transmission case with the 9 bolts.

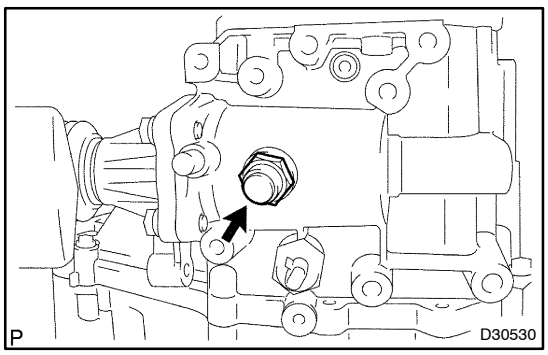
Torque: 18 N·m (185 kgf·cm, 14 ft·lbf)



99. INSTALL SHIFT & SELECT LEVER SHAFT ASSY

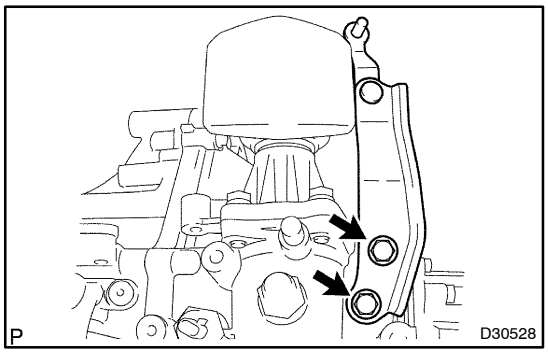
(a) Coat the sift & select lever shaft assy with gear oil, and install it to the manual transmission case.

100. INSTALL CONTROL SHAFT COVER



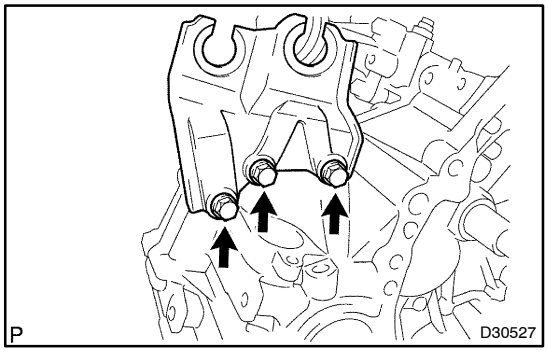
(a) Coat the 4 bolts with sealant. Install a new gasket and control shaft cover with the 4 bolts.
Torque: 20 N·m (200 kgf·cm, 14 ft·lbf)
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

101. INSTALL CONTROL SHIFT LEVER



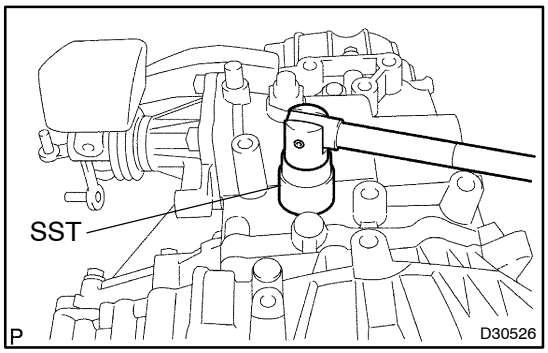
(a) Install the control shift lever with the shift outer lever lever lock pin to the shift & select lever shaft assy.

(b) Install the spring washer with the nut.
Torque: 12 N·m (122 kgf·cm, 9 ft·lbf)



102. INSTALL LOCK BALL ASSY NO.1

(a) Coat the lock ball assy No.1 with sealant, and install it to the manual transmission case.
Torque: 29 N·m (300 kgf·cm, 22 ft·lbf)
Sealant:
Part No. 08833–00080, THREE BOND 1344, LOCTITE 242 or equivalent

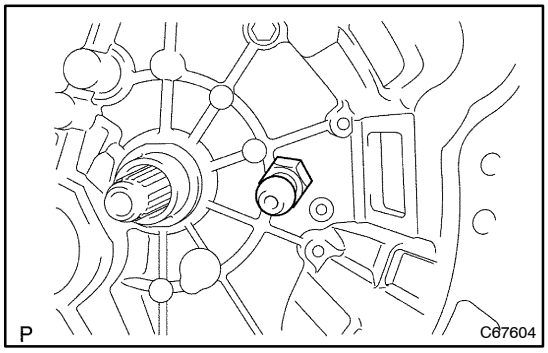


103. INSTALL SELECTING BELL CRANK ASSY

(a) Install the selecting bell crank assy to the manual transmission case with the 2 bolts.
Torque: 25 N·m (250 kgf·cm, 18 ft·lbf)

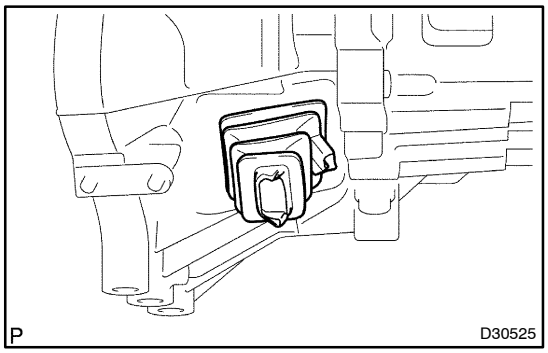
104. INSTALL FLOOR SHIFT CONTROL LEVER HOUSING SUPPORT BRACKET

(a) Install the floor shift control lever housing support bracket to the front transaxle case with the 3 bolts.
Torque: 18 N·m (184 kgf·cm, 13 ft·lbf)



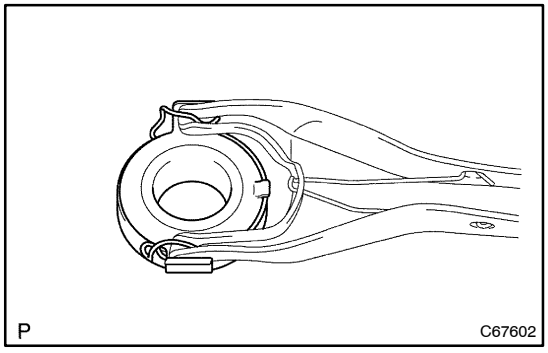
105. INSTALL BACK UP LAMP SWITCH ASSY

(a) Using SST, install the back–up lamp switch assy with a new gasket to the manual transmission case.
SST 09817–16011
Torque: 40 N·m (410 kgf·cm, 30 ft·lbf)



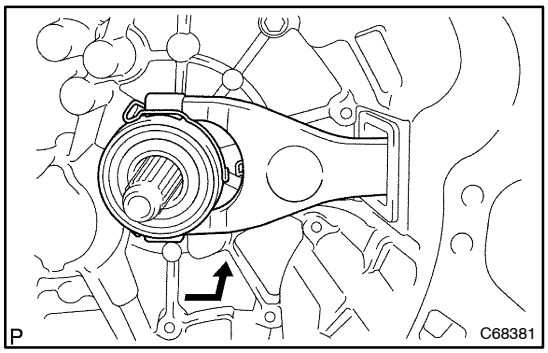
106. INSTALL SPEEDOMETER DRIVEN HOLE COVER SUB–ASSY

(a) Install a new O–ring to the speedometer driven hole cover sub–assy.
(b) Install the speedometer driven hole cover sub–assy to the manual transaxle case with the bolt.
Torque: 11 N·m (115 kgf·cm, 8.3 ft·lbf)



107. INSTALL RELEASE FORK SUPPORT

(a) Install the release fork support to the front transaxle case.
Torque: 37 N·m (375 kgf·cm, 25 ft·lbf)

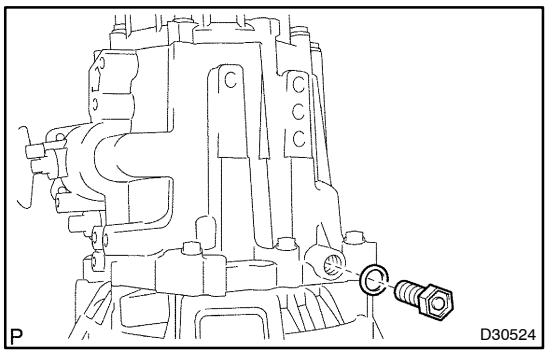


108. INSTALL CLUTCH RELEASE FORK BOOT

(a) Install the clutch release fork boot to the front transaxle case.

109. INSTALL CLUTCH RELEASE BEARING ASSY

(a) Coat the clutch release bearing assy with release hub grease, and install it to the clutch release fork sub–assy with the clip.
Sealant:
Part No. 08887–01806, RELEASE HUB GREASE or equivalent

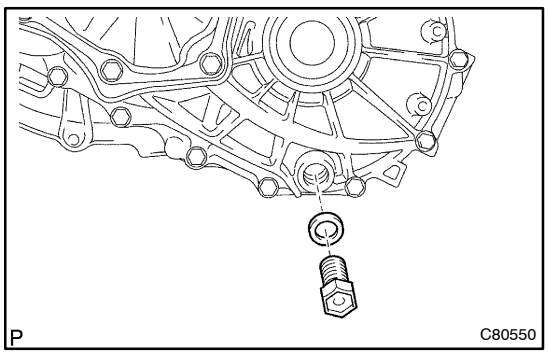


110. INSTALL CLUTCH RELEASE FORK SUB–ASSY

(a) Install the clutch release fork sub–assy to the input shaft.

(b) Apply clutch spline grease to the input shaft spline.

Sealant:



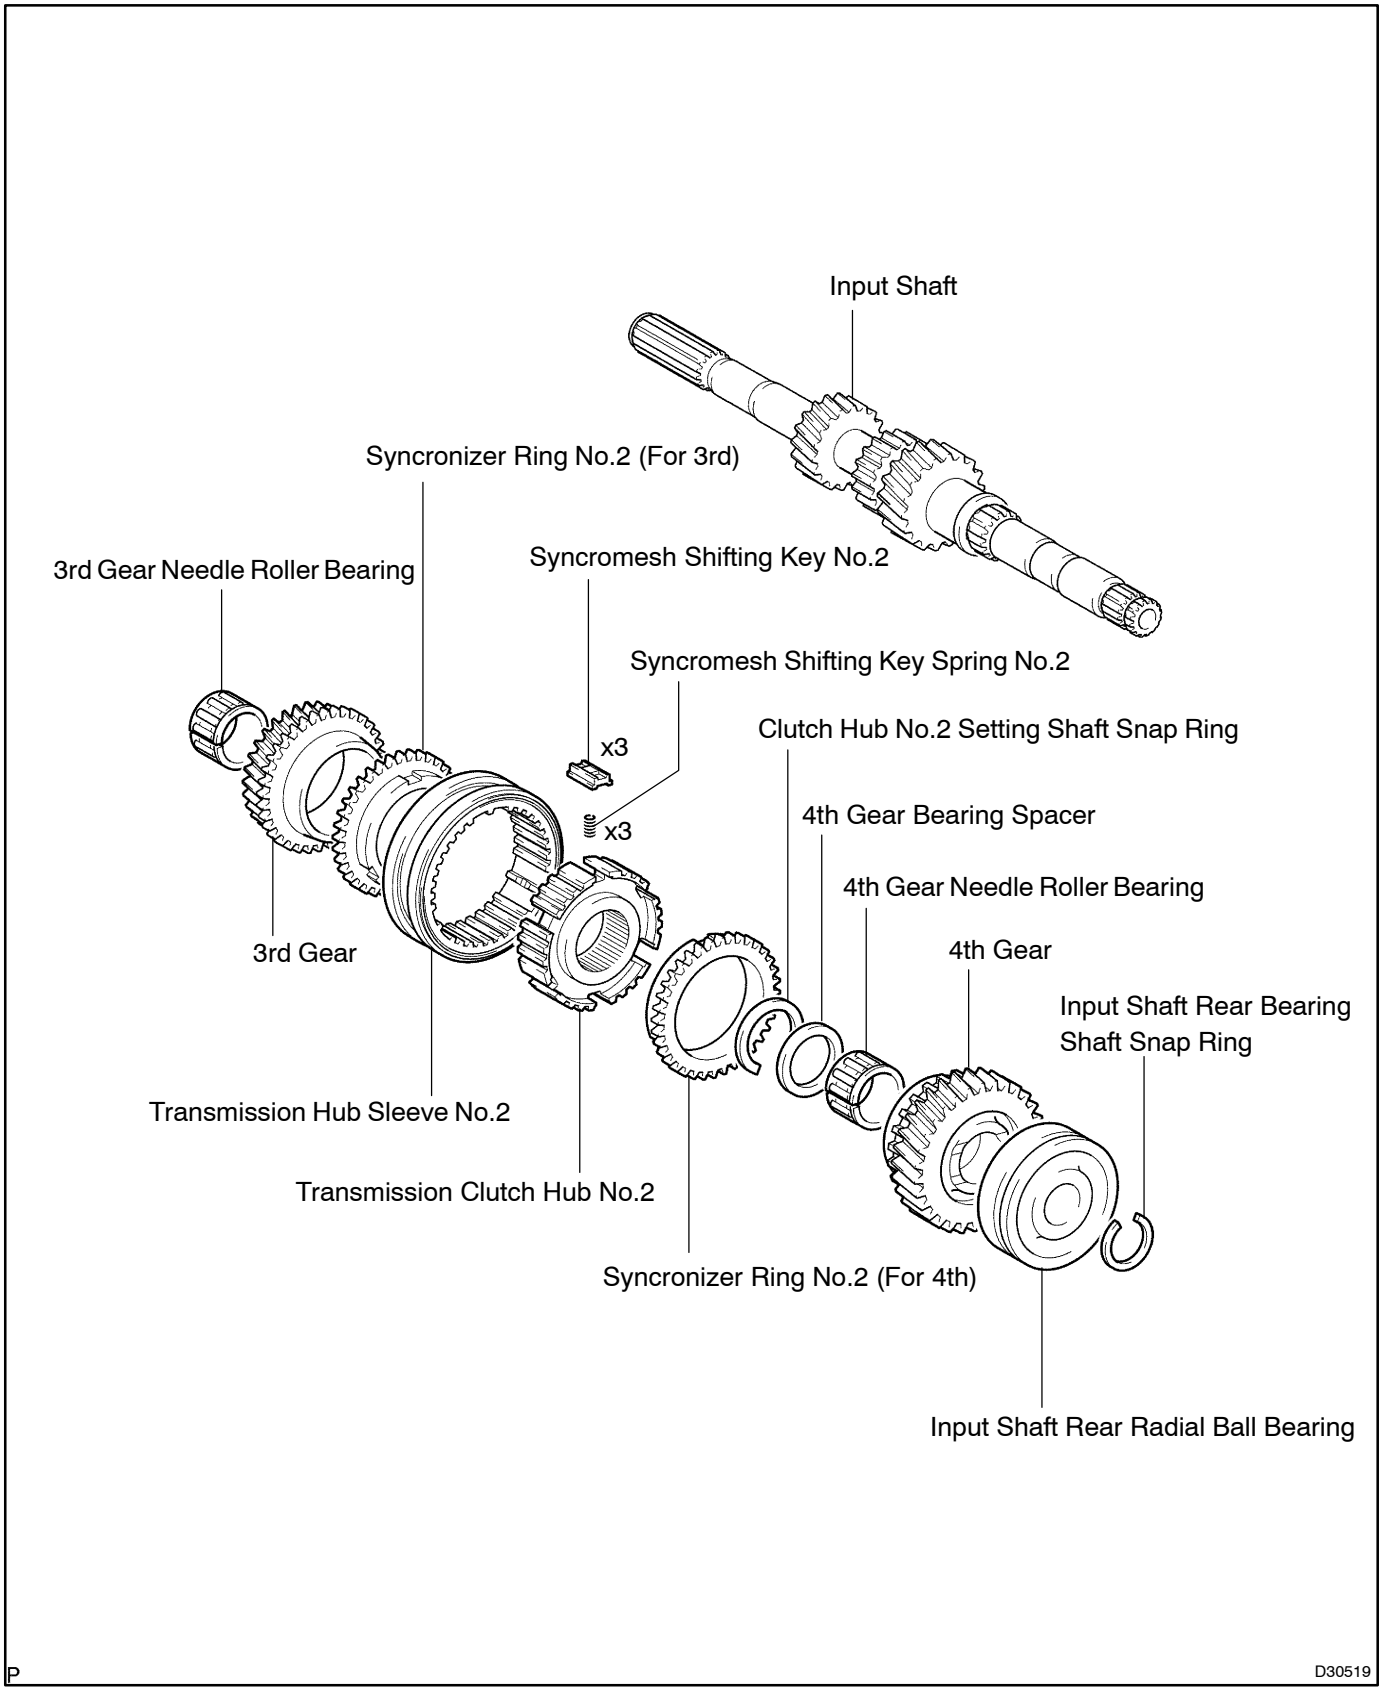
Part No. 08887–01806, CLUTCH SPLINE GREASE or equivalent

111. INSTALL MANUAL TRANSMISSION FILLER PLUG

(a) Install the manual transmission filler plug with a new gasket to the manual transmission case.

Torque: 39 N·m (400 kgf·cm, 29 ft·lbf)

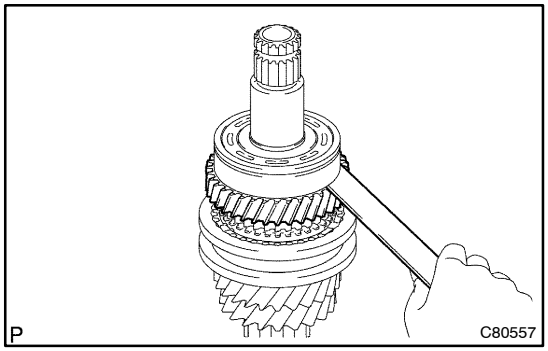
112. INSTALL DRAIN (MTM) PLUG SUB–ASSY



(a) Install the drain plug with a new gasket to the manual transmission case.

Torque: 39 N·m (400 kgf·cm, 29 ft·lbf)

INPUT SHAFT ASSY (C50)

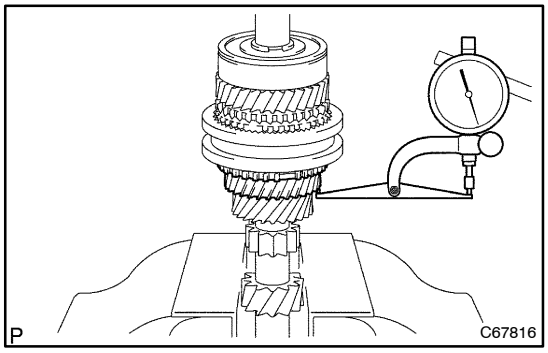


COMPONENTS

410DE–02

410DF–02

OVERHAUL

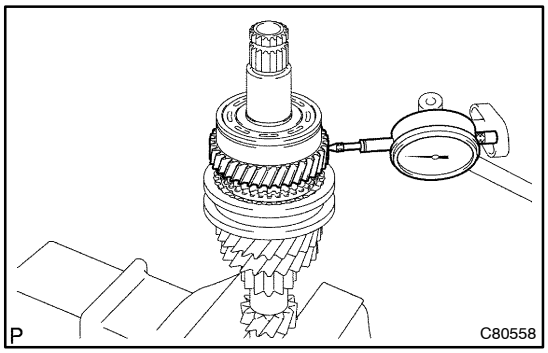


1. INSPECT 4TH GEAR THRUST CLEARANCE

(a) Using a feeler gauge, measure the 4th gear thrust clearance.

Standard clearance:
0.1 to 0.55 mm (0.0039 to 0.0217 in.)
Maximum clearance:
0.55 mm (0.0217 in.)

If the clearance exceeds the maximum, replace the transmission clutch hub No.2, 4th gear or input shaft rear radial ball bearing.

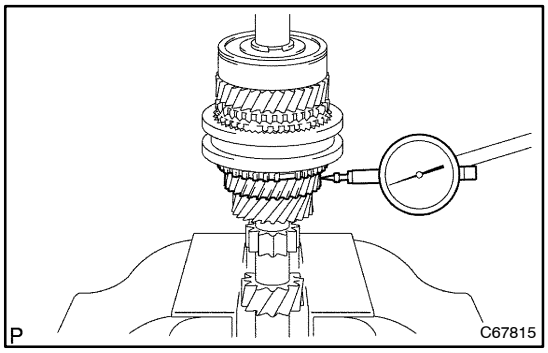


2. INSPECT 3RD GEAR THRUST CLEARANCE

(a) Using a dial indicator, measure the 3rd gear thrust clearance.

Standard clearance:
0.1 to 0.35 mm (0.0039 to 0.0138 in.)
Maximum clearance:
0.35 mm (0.0138 in.)

If the clearance exceeds the maximum, replace the transmission clutch hub No.2, 3rd gear or input shaft.

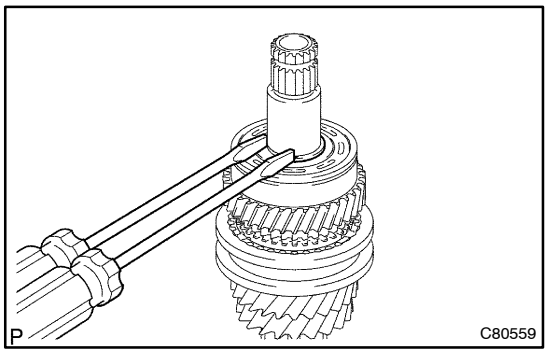


3. INSPECT 4TH GEAR RADIAL CLEARANCE

(a) Using a dial indicator, measure the 4th gear radial clearance between the gear and shaft.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 4th gear, needle roller bearing or input shaft.

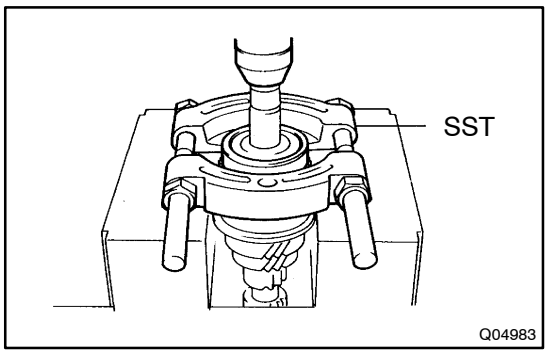


4. INSPECT 3RD GEAR RADIAL CLEARANCE

(a) Using a dial indicator, measure the 3rd gear radial clearance between the gear and shaft.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

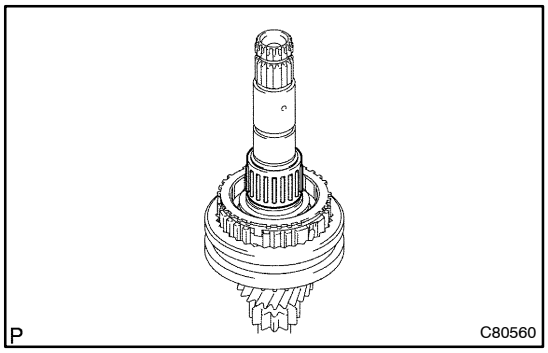
If the clearance exceeds the maximum, replace the 3rd gear, needle roller bearing or input shaft.



5. REMOVE 4TH GEAR

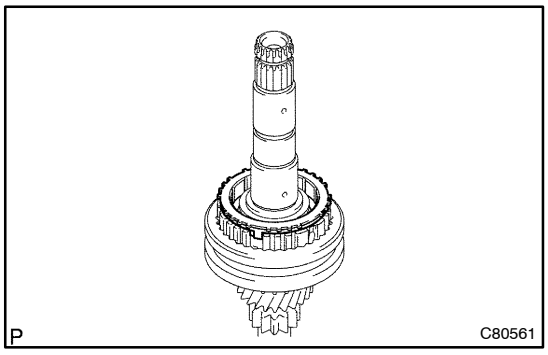
(a) Using 2 screwdrivers and a hammer, remove the input shaft rear bearing shaft snap ring from the input shaft.

NOTICE:



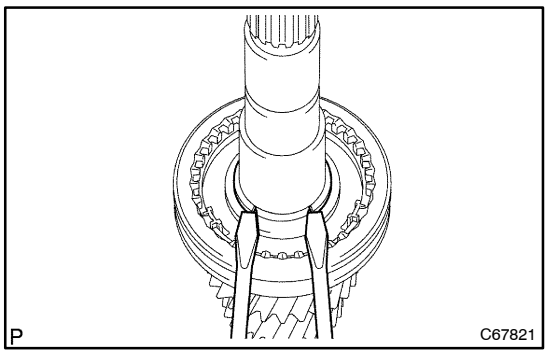
Use a shop rag to keep the snap ring from flying.

(b) Using SST and a press, remove the input shaft rear radial ball bearing rear and 4th gear from input shaft.
SST 09950–00020



NOTICE:

- **Do not tighten SST excessively.**
- **Support the input shaft assy by hand so that it will not be dropped off.**

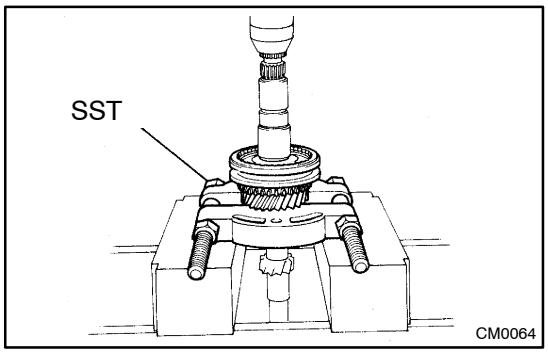


6. REMOVE 4TH GEAR NEEDLE ROLLER BEARING

(a) Remove the 4th gear needle roller bearing and 4th gear bearing spacer from input shaft.

7. REMOVE SYNCHRONIZER RING NO.2 (FOR FOURTH SYNCHRONIZER RING)

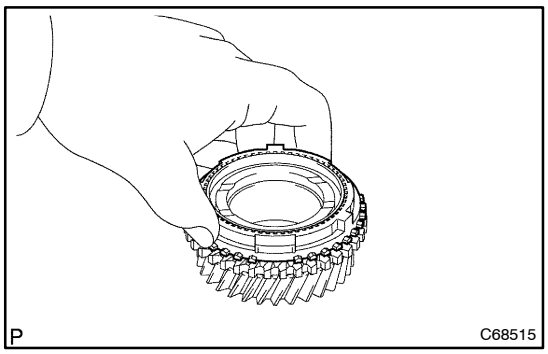
(a) Remove the synchronizer ring No.2 from the transmission clutch hub No.2.



8. REMOVE 3RD GEAR

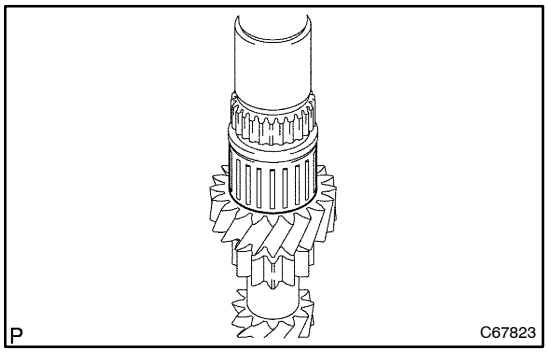
(a) Using 2 screwdrivers and a hammer, remove the clutch hub No.2 setting shaft snap ring from the input shaft.

NOTICE:



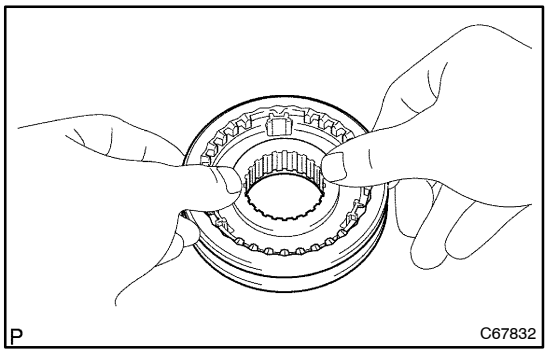
Use a shop rag to keep the snap ring from flying.

(b) Using SST and a press, remove the transmission clutch hub No.2 and 3rd gear from the input shaft.
SST 09950–00020



NOTICE:

- **Do not tighten SST excessively.**
- **Support the input shaft by hand so that it will not be dropped off.**

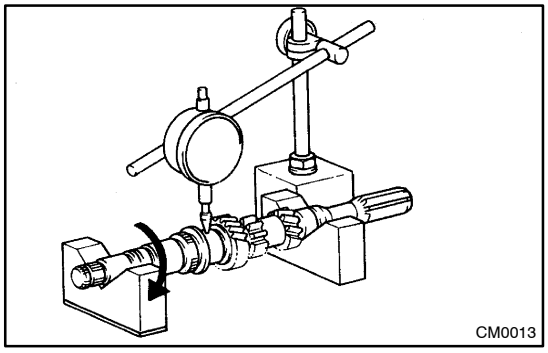


9. REMOVE SYNCHRONIZER RING NO.2 (FOR THIRD SYNCHRONIZER RING)

(a) Remove the synchronizer ring No.2 from the 3rd gear.

10. REMOVE 3RD GEAR NEEDLE ROLLER BEARING

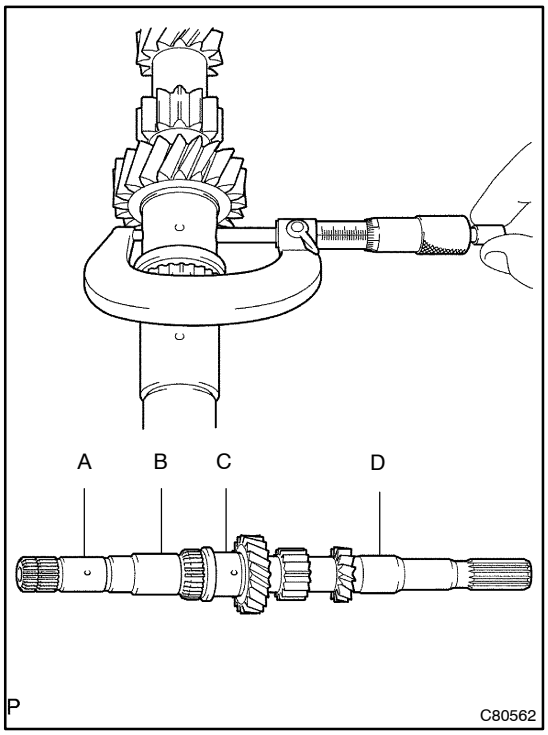
(a) Remove the 3rd gear needle roller bearing from the input shaft.



11. REMOVE TRANSMISSION HUB SLEEVE NO.2

(a) Remove the transmission hub sleeve No.2, 3 synchromesh shifting keys No.2 and 3 synchromesh shifting key springs No.2 from the transmission clutch hub No.2.

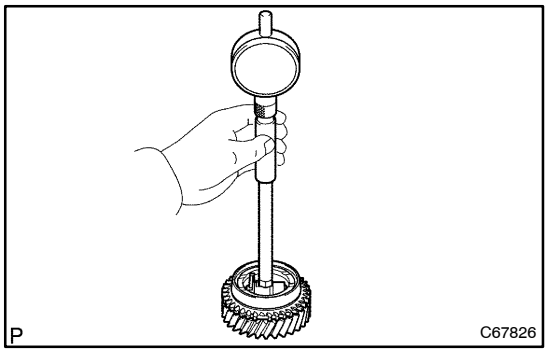
NOTICE:



Use a shop rag to keep the shifting key and shifting key spring from flying.

12. INSPECT INPUT SHAFT

(a) Using a dial indicator, check the input shaft runout.
Maximum runout: 0.015 mm (0.00059 in.)

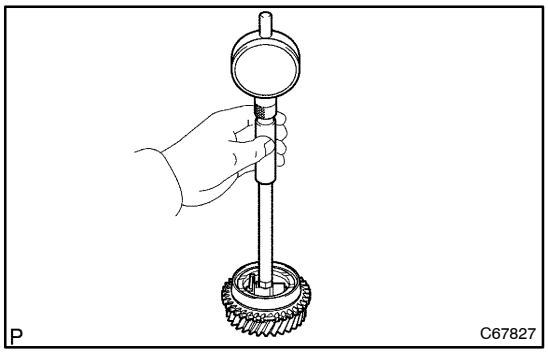


If the runout exceeds the maximum, replace the input shaft.

(b) Using a micrometer, measure the outer diameter of the input shaft journal surface.

Standard outer diameter:
Part A: 24.885 to 24.900 mm (0.9797 to 0.9803 in.)
Part B: 28.991 to 29.006 mm (1.1413 to 1.1419 in.)
Part C: 30.985 to 31.000 mm (1.2198 to 1.2204 in.)
Part D: 24.985 to 25.000 mm (0.9836 to 0.9842 in.)
Minimum outer diameter:
Part A: 24.885 mm (0.9797 in.)
Part B: 28.991 mm (1.1413 in.)
Part C: 30.985 mm (1.2198 in.)
Part D: 24.985 mm (0.9836 in.)

If the outer diameter is less than the minimum, replace the input shaft.

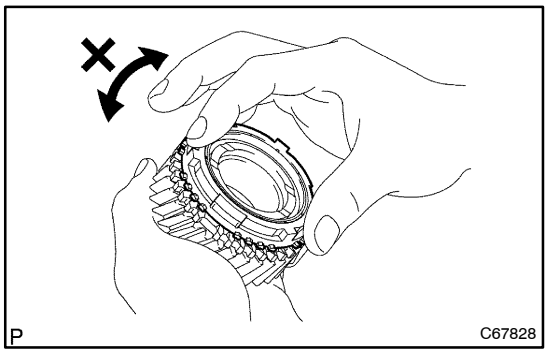


13. INSPECT 4TH GEAR

(a) Using a cylinder gauge, measure the inside diameter of the 4th gear.

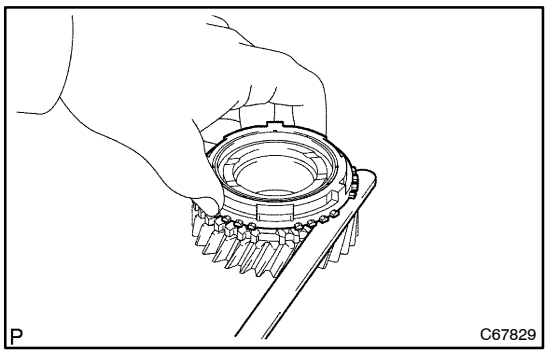
Standard inside diameter:
34.015 to 34.031 mm (1.3391 to 1.3398 in.)
Maximum inside diameter:
34.031 mm (1.3398 in.)

If the diameter exceeds the maximum, replace the 4th gear.



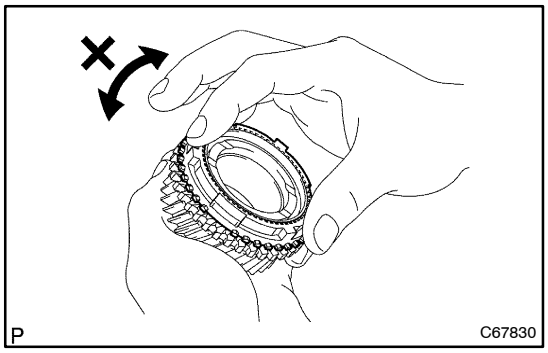
14. INSPECT 3RD GEAR

(a) Using a cylinder gauge, measure the inside diameter of the 3rd gear.



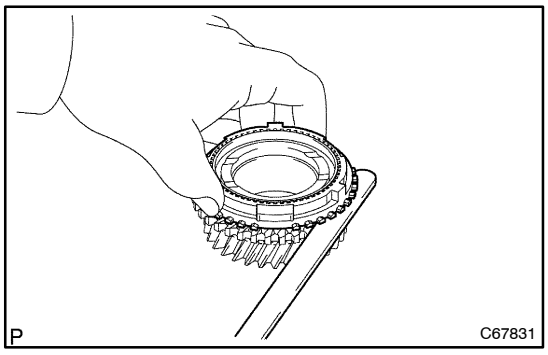
Standard inside diameter:
36.015 to 36.031 mm (1.4179 to 1.4185 in.)
Maximum inside diameter:
36.031 mm (1.4185 in.)

If the diameter exceeds the maximum, replace the 3rd gear.



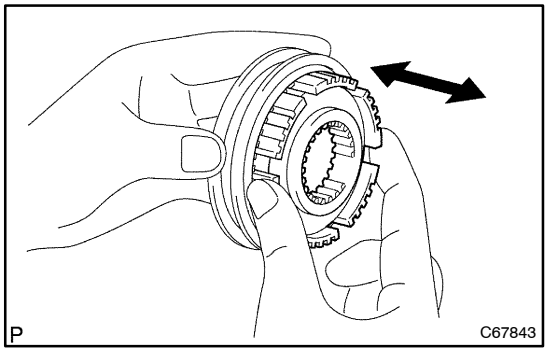
15. INSPECT SYNCHRONIZER RING NO.2 (FOR FOURTH SYNCHRONIZER RING)

(a) Apply gear oil to the cone of the 4th gear and check with the synchronizer ring No.2 contacted by pressure that the gear does not turn in the direction as shown in the illustration.



(b) Using a feeler gauge, check the clearance between the synchronizer ring No.2 and 4th gear with the synchronizer ring No.2 contacted to the cone of the 4th gear.
Standard clearance:
0.75 to 1.65 mm (0.0295 to 0.0649 in.)
Minimum clearance:
0.75 mm (0.0295 in)

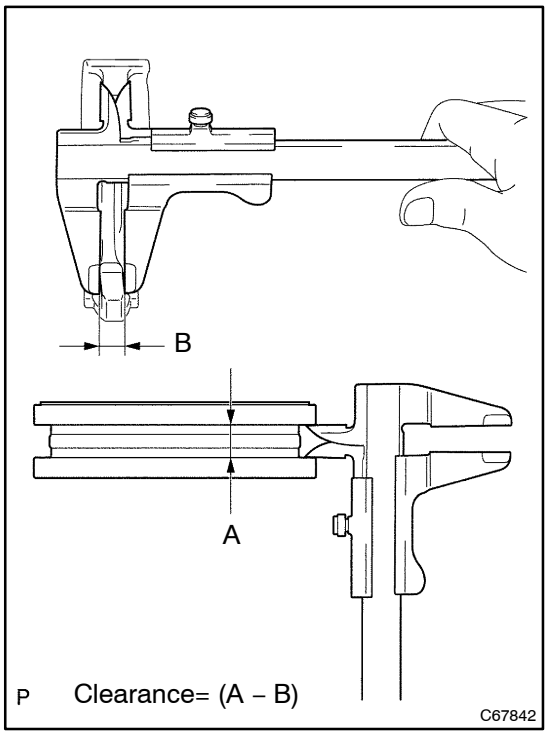
If the clearance is less than the minimum, replace the synchronizer ring.



16. INSPECT SYNCHRONIZER RING NO.2 (FOR THIRD SYNCHRONIZER RING)

(a) Apply gear oil to the cone of the 3rd gear and check with the synchronizer ring No.2 contacted by pressure that the gear does not turn in the direction as shown in the illustration.

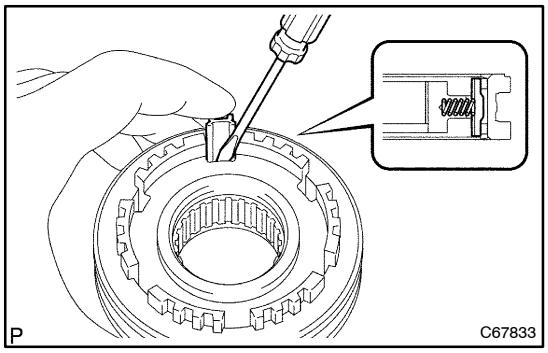
(b) Using a feeler gauge, check the clearance between the synchronizer No.2 and 3rd gear with the synchronizer ring No.2 contacted to the cone of the 3rd gear.
Standard clearance:
0.75 to 1.65 mm (0.0295 to 0.0649 in.)
Minimum clearance:
0.75 mm (0.0295 in)



If the clearance is less than the minimum, replace the synchronizer ring.

17. INSPECT TRANSMISSION HUB SLEEVE NO.2

(a) Check the sliding condition between the transmission hub sleeve No.2 and transmission clutch hub No.2.

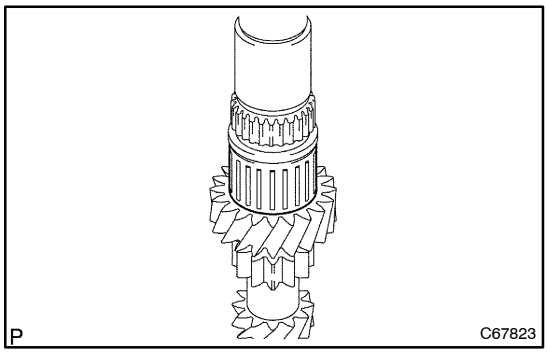


(b) Check that the spline gear's edges of the transmission hub sleeve No.2 are not worn down.

(c) Using vernier calipers, measure the clearance between the transmission hub sleeve No.2 and gear shift fork No.2.

Standard clearance:
0.15 to 0.35 mm (0.0059 to 0.0137 in.)

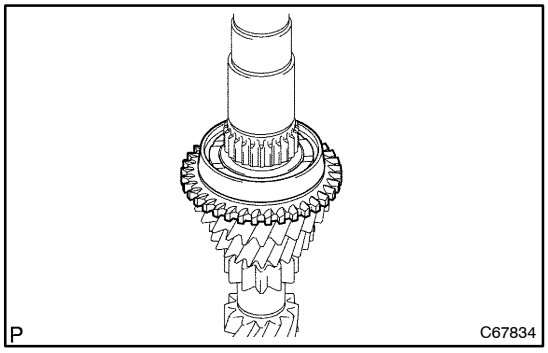
If the clearance exceeds the standard clearance, replace the transmission hub sleeve No.2 and gear shift fork No.2.



18. INSTALL TRANSMISSION HUB SLEEVE NO.2

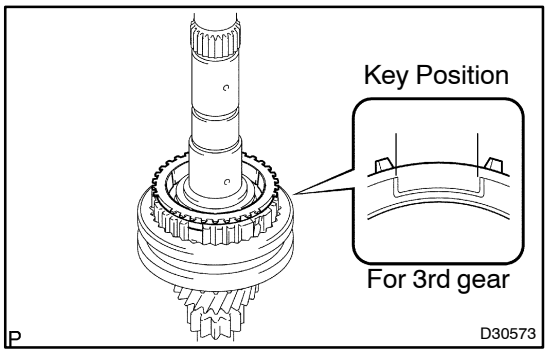
(a) Coat the transmission hub sleeve No.2 with gear oil, and install it to the transmission clutch hub No.2.

NOTICE:



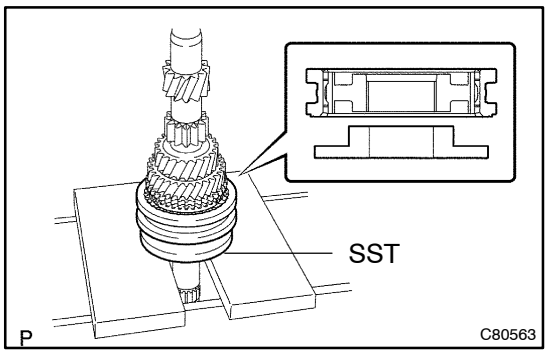
Do not set the transmission hub sleeve No.2 and the transmission clutch hub No.2 in incorrect orientation.

(b) Install the 3 synchromesh key springs with 3 synchromesh shifting keys No.2 to the transmission clutch hub No.2.



19. INSTALL 3RD GEAR NEEDLE ROLLER BEARING

(a) Coat the 3rd gear needle roller bearing with gear oil, and install it to the input shaft.

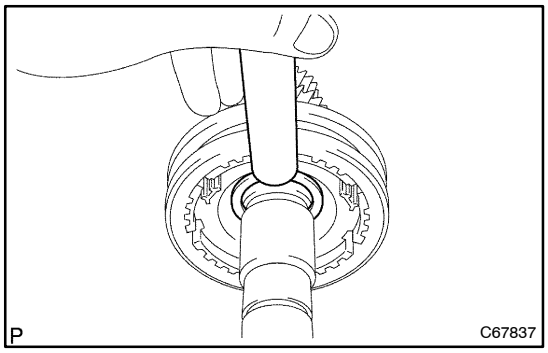


20. INSTALL 3RD GEAR

(a) Coat the 3rd gear with gear oil, and install it to the input shaft.

21. INSTALL SYNCHRONIZER RING NO.2 (FOR THIRD SYNCHRONIZER RING)

(a) Coat the synchronizer ring No.2 with gear oil, and install it to the 3rd gear.



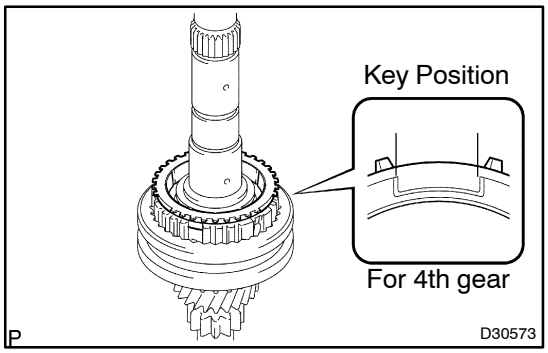
22. INSTALL TRANSMISSION CLUTCH HUB NO.2

(a) Using SST and a press, install the transmission clutch hub No.2 to the input shaft.

SST 09316–60011 (09316–00021)

NOTICE:

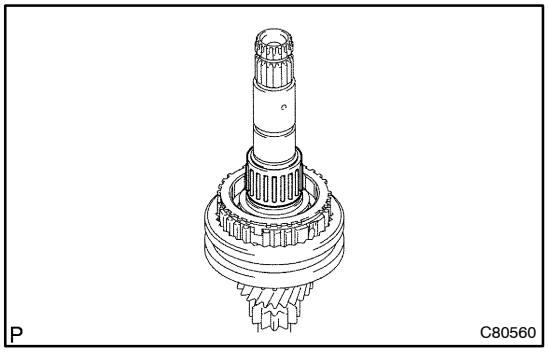
Fit the synchromesh shifting key into the groove of the synchronizer ring correctly.



(b) Select a snap ring that will allow the minimum axial play.

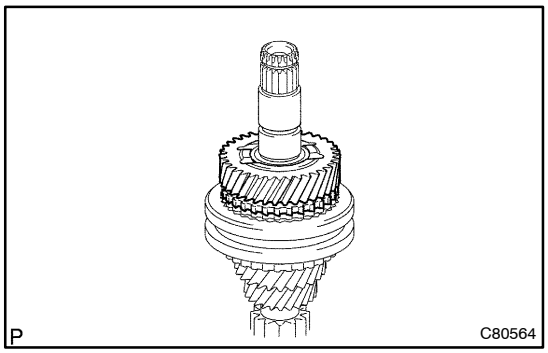
Standard clearance:

0.1 mm (0.0039 in.) or less.



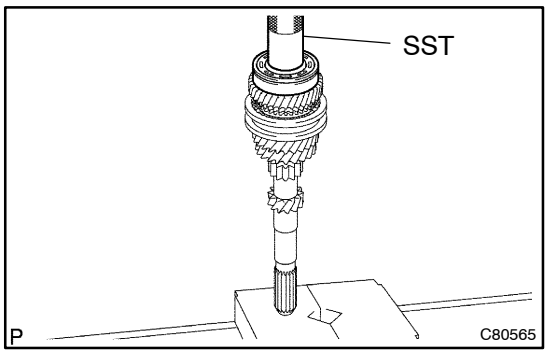
Mark	Thickness mm (in)	Mark	Thickness mm (in)
0	2.30 (0.0906)	3	2.48 (0.0976)
1	2.36 (0.0929)	4	2.54 (0.1000)
2	2.42 (0.0953)	5	2.60 (0.1024)

(c) Using a brass bar and a hammer, install the snap ring to the input shaft.



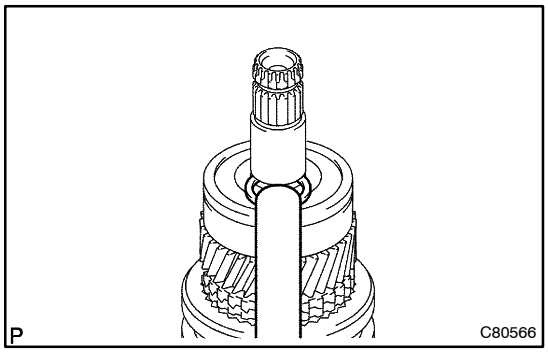
23. INSTALL SYNCHRONIZER RING NO.2 (FOR FOURTH SYNCHRONIZER RING)

(a) Coat the synchronizer ring No.2 with gear oil, and install it to the transmission clutch hub No.2.



24. INSTALL 4TH GEAR NEEDLE ROLLER BEARING

(a) Coat the 4th gear needle roller bearing and 4th gear bearing spacer with gear oil, and install them to the transmission clutch hub No.2.

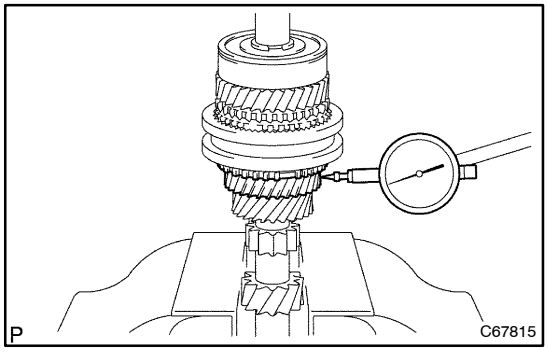


25. INSTALL 4TH GEAR

(a) Coat the 4th gear with gear oil, and install it to the input shaft.

26. INSTALL INPUT SHAFT REAR RADIAL BALL BEARING

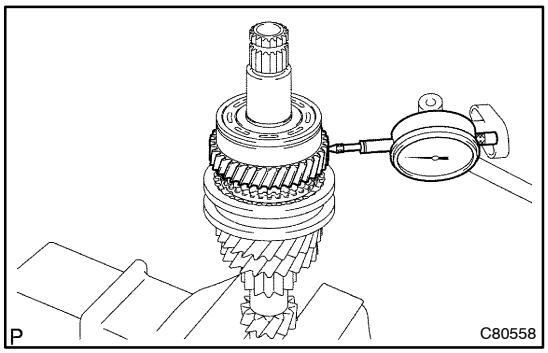
(a) Using SST and a press, install the input shaft rear radial ball bearing to the input shaft.
SST 09636–20010



(b) Select a snap ring from the table below that will make the thrust clearance of the input shaft rear radial ball bearing below 0.1 mm (0.0039 in.).

Snap ring thickness:

Mark	Thickness mm (in)	Mark	Thickness mm (in)
A	2.29 (0.0901)	D	2.47 (0.0972)
B	2.35 (0.0925)	E	2.53 (0.0996)
C	2.41 (0.0948)	F	2.59 (0.1019)

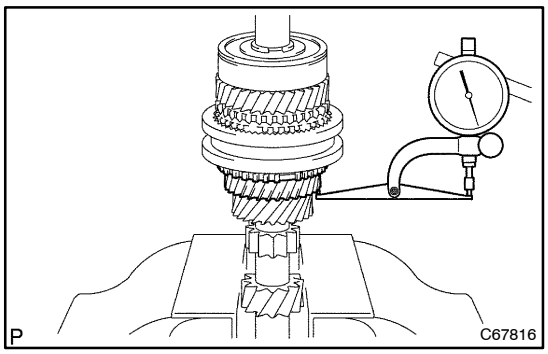


(c) Using a brass bar and a hammer, install the snap ring to the input shaft.

27. INSPECT 3RD GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the radial clearance between the 3rd gear.
Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum diameter:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 3rd gear, needle roller bearing or input shaft.

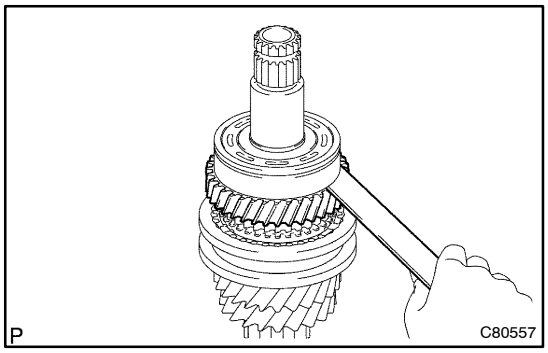


28. INSPECT 4TH GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the radial clearance between the 4th gear.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum diameter:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 4th gear, needle roller bearing or input shaft.



29. INSPECT 3RD GEAR THRUST CLEARANCE

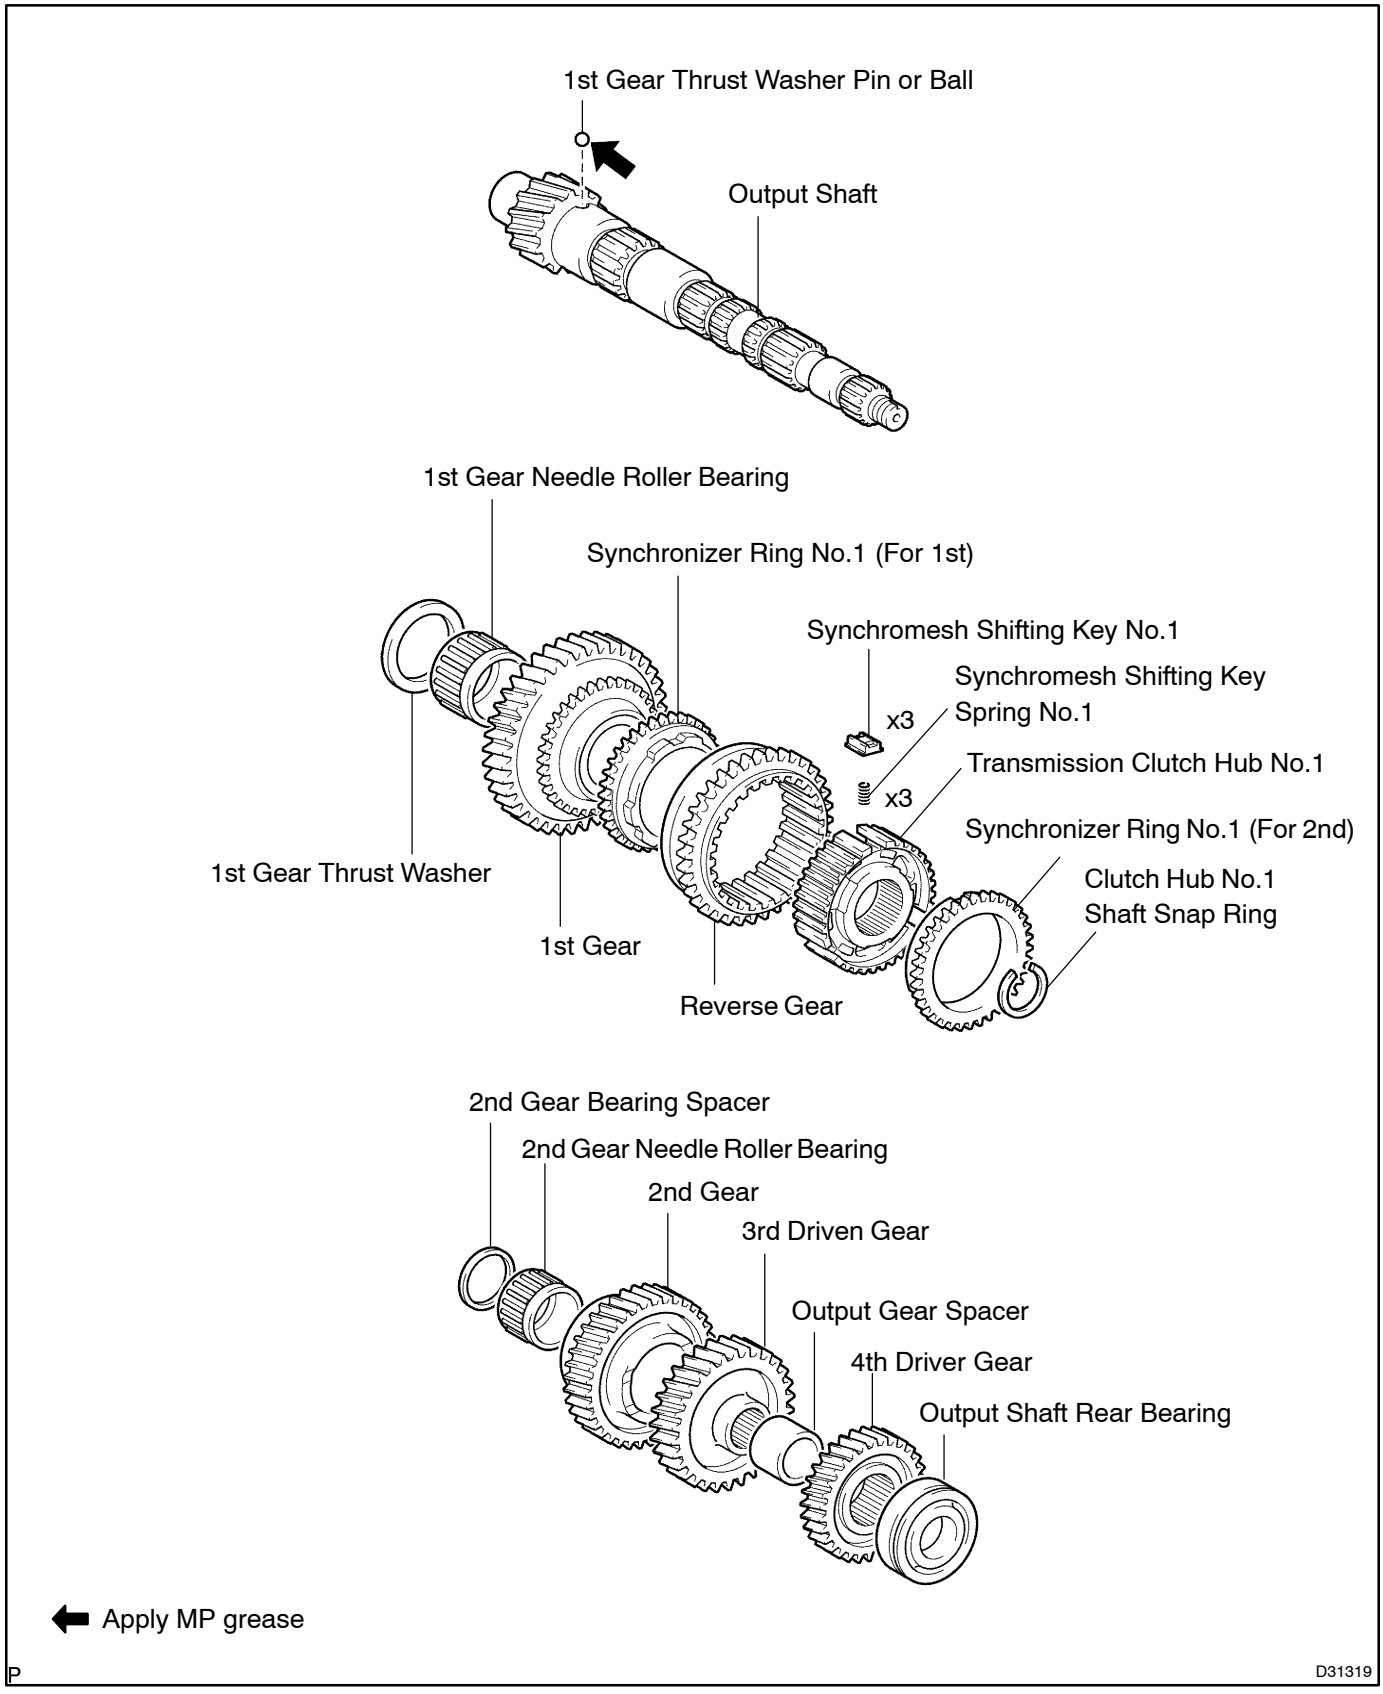
(a) Using a dial gauge, measure the 3rd thrust clearance.

Standard clearance:
0.1 to 0.35 mm (0.0039 to 0.0138 in.)
Maximum diameter:
0.35 mm (0.0138 in.)

If the clearance exceeds the maximum, replace the transmission clutch hub No.2, 3rd gear or input shaft.

30. INSPECT 4TH GEAR THRUST CLEARANCE

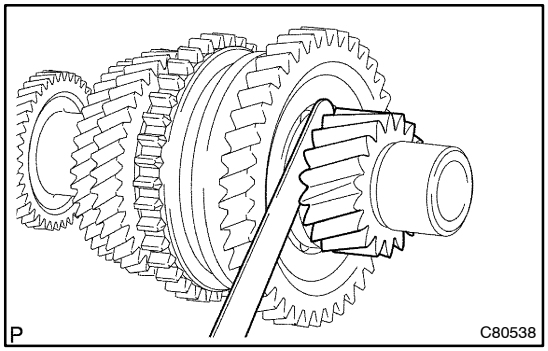
(a) Using a feeler gauge, measure the 4th thrust clearance.



Standard clearance:
0.1 to 0.55 mm (0.0039 to 0.0217 in.)
Maximum diameter:
0.055 mm (0.00217 in.)

If the clearance exceeds the maximum, replace the transmission clutch hub No.2, 4th gear or input shaft rear radial ball bearing.

OUTPUT SHAFT ASSY (C50)

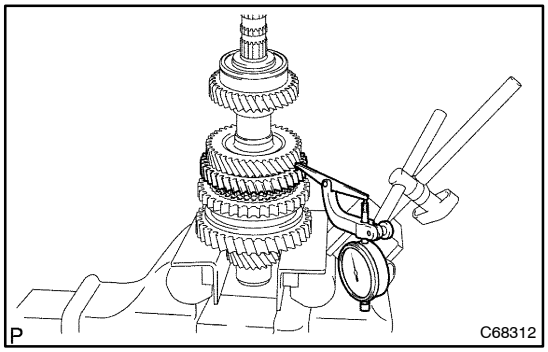


COMPONENTS

410DG–02

410DH–02

OVERHAUL

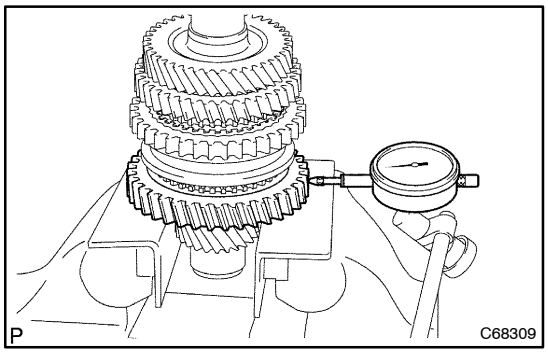


1. INSPECT 1ST GEAR THRUST CLEARANCE

(a) Using a feeler gauge, measure the 1st gear thrust clearance.

Standard clearance:
0.10 to 0.40 mm (0.0039 to 0.0157 in.)
Maximum clearance:
0.40 mm (0.0157 in.)

If the clearance exceeds the maximum, replace the 1st gear thrust washer, 1st gear or transmission clutch hub No.1.

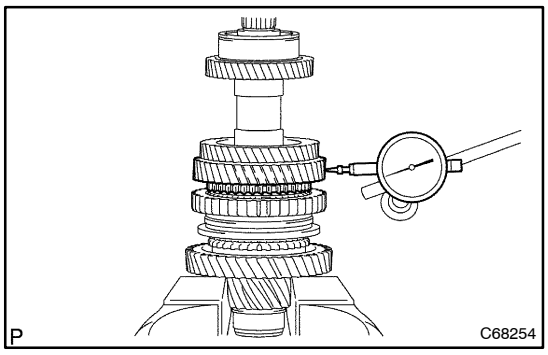


2. INSPECT 2ND GEAR THRUST CLEARANCE

(a) Using a dial gauge, measure the 2nd gear thrust clearance.

Standard clearance:
0.1 to 0.45 mm (0.0039 to 0.0177 in.)
Maximum clearance:
0.45 mm (0.0177 in.)

If the clearance exceeds the maximum, replace the transmission clutch hub No.1, 2nd gear or 3rd driven gear.

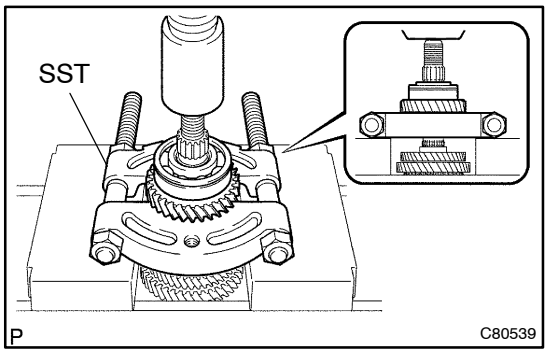


3. INSPECT 1ST GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the 1st gear radial clearance between the gear and shaft.

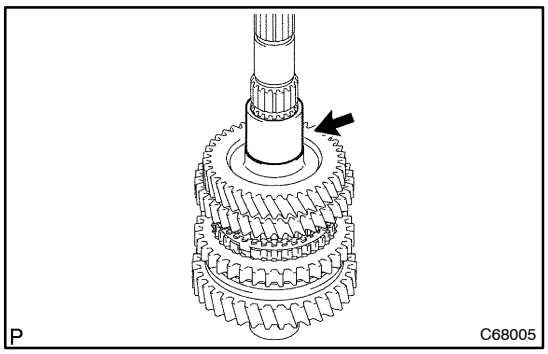
Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 1st gear and 1st gear needle roller bearing.



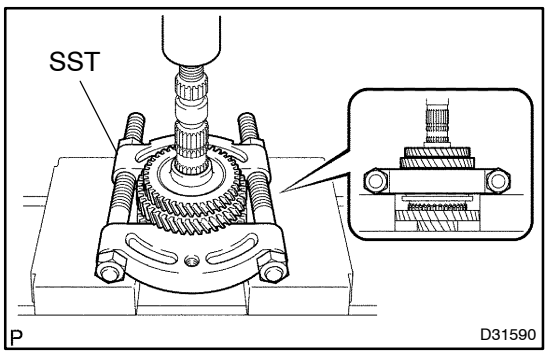
4. INSPECT 2ND GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the 2nd gear radial clearance between the gear and shaft.



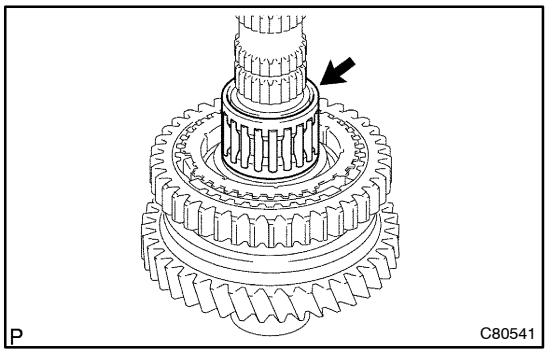
Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 2nd gear and 2nd gear needle roller bearing.



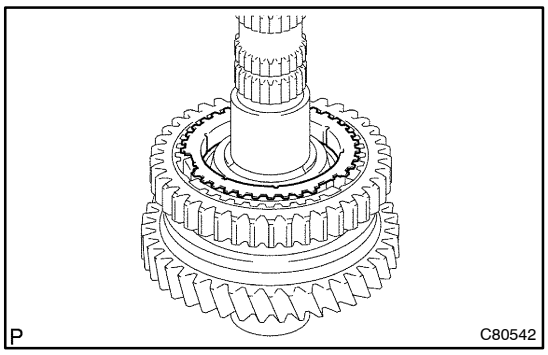
5. REMOVE 4TH DRIVEN GEAR

(a) Using SST and a press, remove the output shaft rear bearing and 4th driven gear from the output shaft.
SST 09950–00020



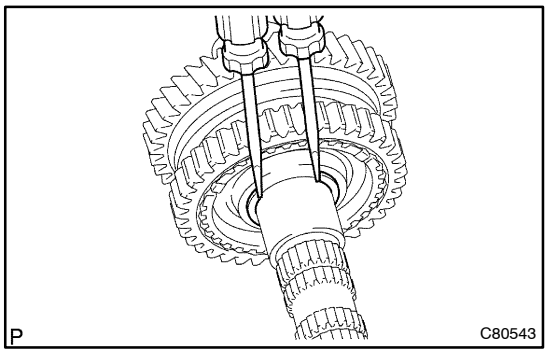
6. REMOVE OUTPUT GEAR SPACER

(a) Remove the output gear spacer from the output shaft.



7. REMOVE 2ND GEAR

(a) Using SST, remove the 3rd driven gear and 2nd gear from the out put shaft.
SST 09950–00020

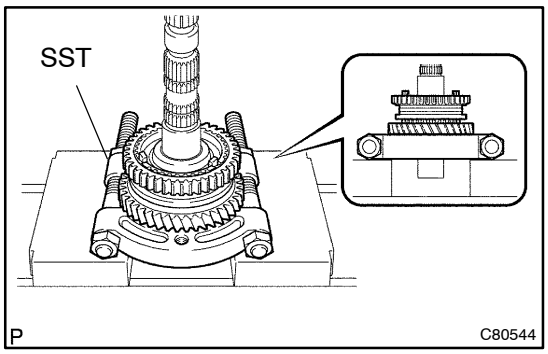


8. REMOVE 2ND GEAR NEEDLE ROLLER BEARING

(a) Remove the 2nd gear needle roller bearing and 2nd gear bearing spacer from the output shaft.

9. REMOVE SYNCHRONIZER RING NO.1 (FOR SECOND SYNCHRONIZER RING)

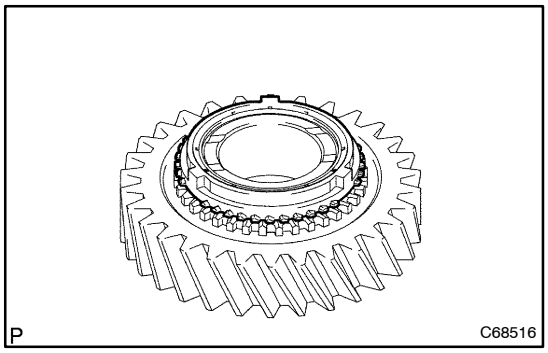
(a) Remove the synchronizer ring No.1 from the output shaft.



10. REMOVE 1ST GEAR

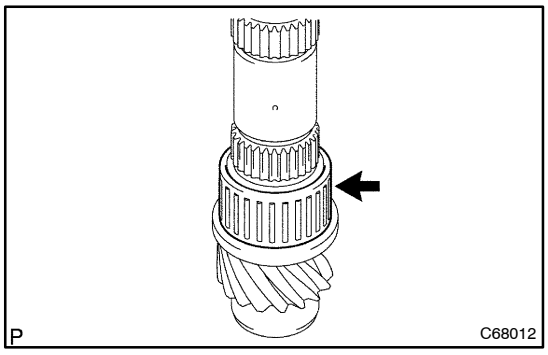
(a) Using 2 screwdrivers and a hammer, remove the clutch hub No.1 shaft snap ring from the output shaft.

NOTICE:



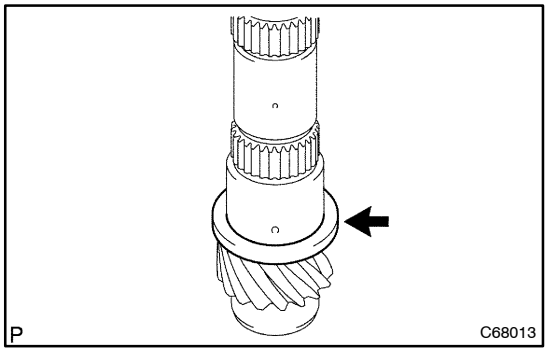
Use a shop rag to keep the shaft snap ring from flying.

(b) Using SST and a press, remove the clutch hub No.1 assy and 1st gear from the output shaft.
SST 09950–00020



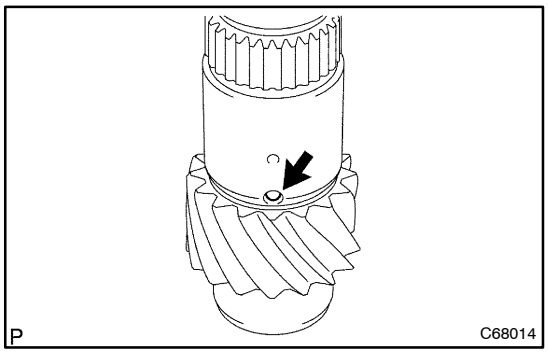
NOTICE:

- **Do not tighten SST excessively.**
- **Support the input shaft by hand so that it will not be dropped off.**



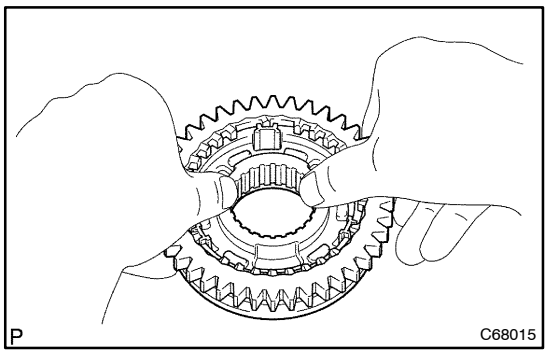
11. REMOVE SYNCHRONIZER RING NO.1 (FOR FIRST SYNCHRONIZER RING)

(a) Remove the synchronizer ring No.1 from the 1st gear.



12. REMOVE 1ST GEAR NEEDLE ROLLER BEARING

(a) Remove the 1st gear needle roller bearing from the output shaft.

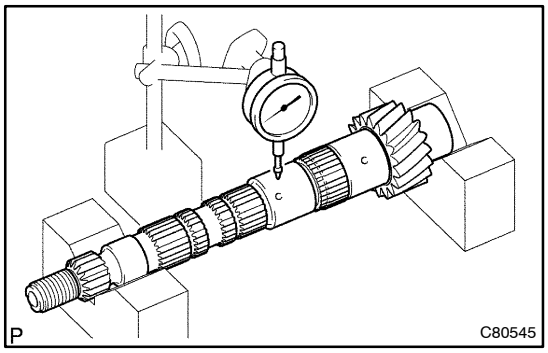


13. REMOVE 1ST GEAR THRUST WASHER

(a) Remove the 1st gear thrust washer from the output shaft.

14. REMOVE 1ST GEAR THRUST WASHER PIN OR BALL

(a) Remove the 1st gear thrust washer pin or ball from the output shaft.

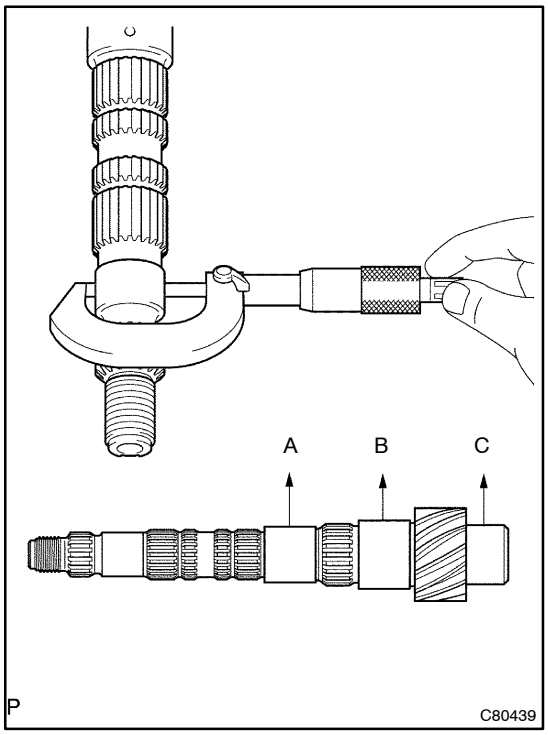


15. REMOVE REVERSE GEAR

(a) Remove the reverse gear, 3 synchromesh shifting keys and 3 synchromesh key springs.

NOTICE:

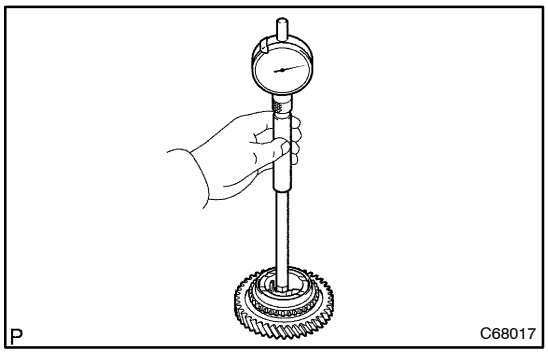
Use a shop rag to keep the shifting key and shifting key spring from flying.



16. INSPECT OUTPUT SHAFT

(a) Using a dial gauge, check the output shaft runout.

Minimum runout: 0.015 mm (0.0006 in.)

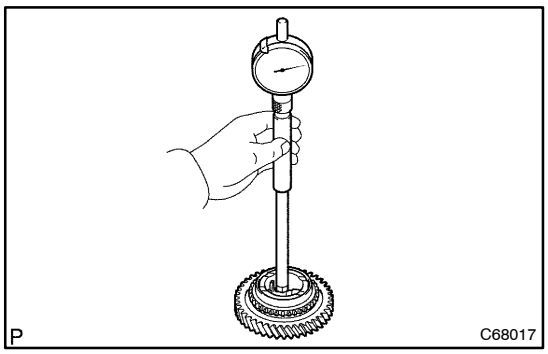


If the runout exceeds the maximum, replace the output shaft.

(b) Using a micrometer, measure the outer diameter of the output shaft journal surface.

Standard outer diameter:
Part A: 31.985 to 32.000 mm (1.2592 to 1.2598 in.)
Part B: 37.985 to 38.000 mm (1.4955 to 1.2598 in.)
Part C: 32.985 to 33.000 mm (1.2986 to 1.2992 in.)
Minimum outer diameter:
Part A: 31.985 mm (1.2592 in.)
Part B: 37.985 mm (1.4955 in.)
Part C: 32.985 mm (1.2986 in.)

If the outer diameter is less than the minimum, replace the output shaft.

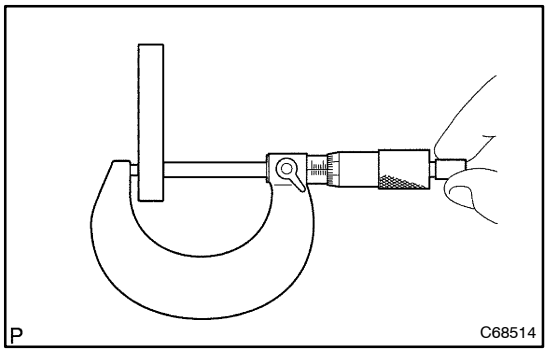


17. INSPECT 2ND GEAR

(a) Using a cylinder gauge, measure the inside diameter of the 2nd gear.

Standard inside diameter:
38.015 to 38.031 mm (1.4966 to 1.4972 in.)
Maximum inside diameter:
38.031 mm (1.4972 in.)

If the inside diameter exceeds the maximum, replace the 2nd gear.

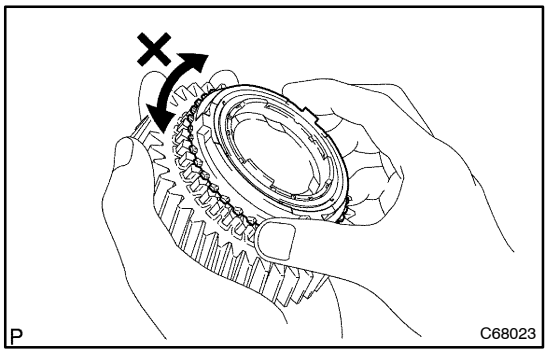


18. INSPECT 1ST GEAR

(a) Using a cylinder gauge, measure the clearance of the 1st gear.

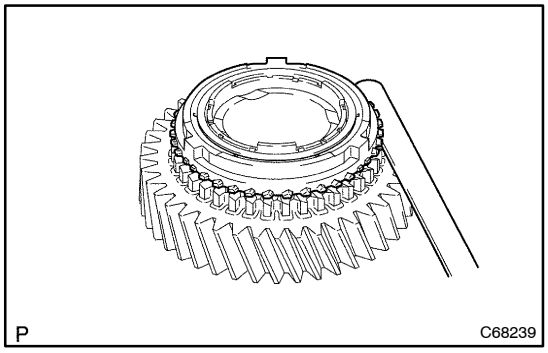
Standard inside diameter:
44.015 to 44.031 mm (1.7328 to 1.7335 in.)
Maximum inside diameter:
44.031 mm (1.7335 in.)

If the inside diameter exceeds the maximum, replace the 1st gear.



19. INSPECT 1ST GEAR THRUST WASHER

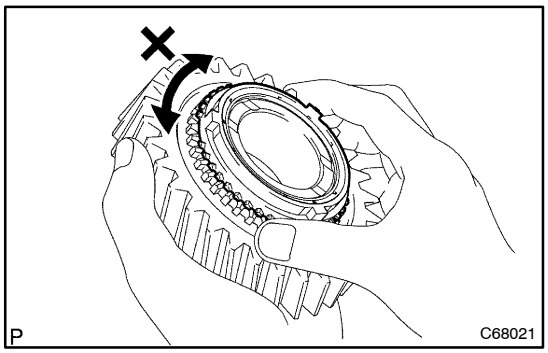
(a) Using a micrometer, measure the 1st gear thrust washer.



Standard thickness:
5.975 to 6.025 mm (0.2352 to 0.2372 in.)
Minimum thickness:
5.975 mm (0.2352 in.)

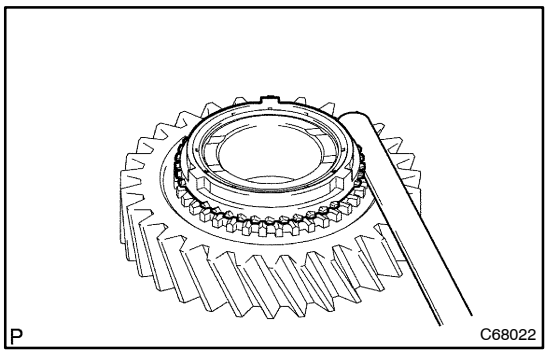
If the clearance is less than the minimum, replace the 1st gear.

20. INSPECT SYNCHRONIZER RING NO.1 (FOR SECOND SYNCHRONIZER RING)



(a) Coat the 2nd gear cone with gear oil. Check the braking effect of the synchronizer ring. Turn the synchronizer ring in one direction while pushing it to the gear cone. Check that the ring locks.

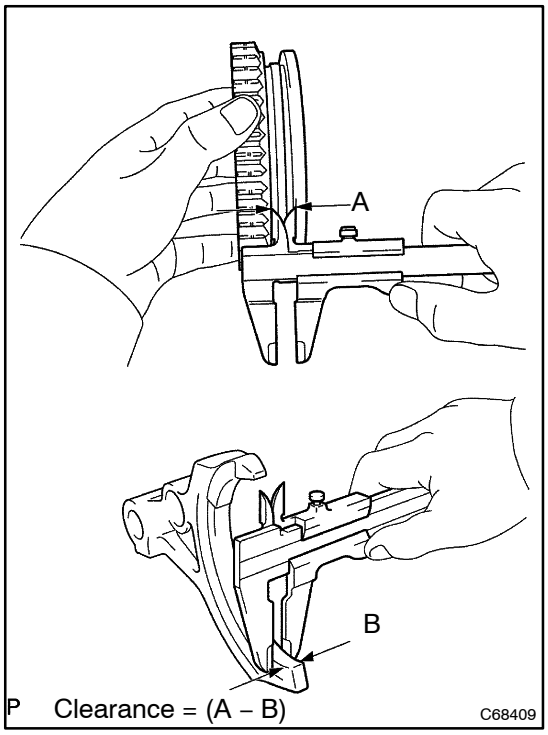
(b) Using a feeler gauge, measure the clearance between the back of the synchronizer ring back and gear spline end.



Standard clearance:
0.70 to 1.30 mm (0.0276 to 0.0512 in.)
Minimum clearance:
0.70 mm (0.0276in.)

If the clearance is less than the minimum, replace the synchronizer ring.

21. INSPECT SYNCHRONIZER RING NO.1 (FOR FIRST SYNCHRONIZER RING)

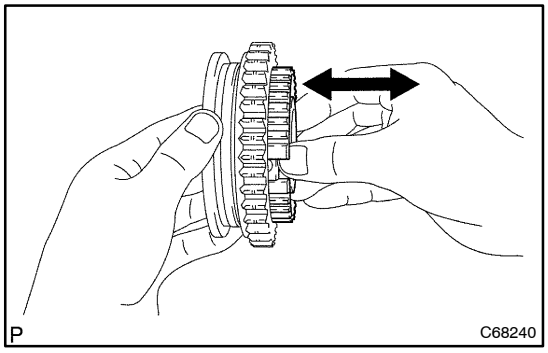


(a) Coat the 1st gear cone with gear oil. Check the braking effect of the synchronizer ring. Turn the synchronizer ring in one direction while pushing it to the gear cone. Check that the ring locks.

(b) Using a feeler gauge, measure the clearance between the synchronizer ring back and gear spline end.

Standard clearance:
0.75 to 1.65 mm (0.0295 to 0.0650 in.)
Minimum clearance:
0.75 mm (0.0295 in.)

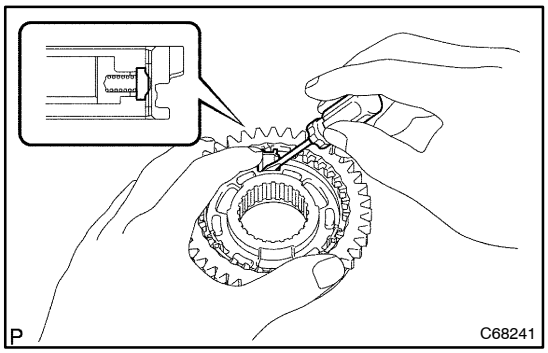
If the clearance is less than the minimum, replace the synchronizer ring.



22. INSPECT REVERSE GEAR

(a) Using vernier calipers, measure the clearance between the reverse gear and shift fork.

Maximum clearance: 0.35 mm (0.014 in.)

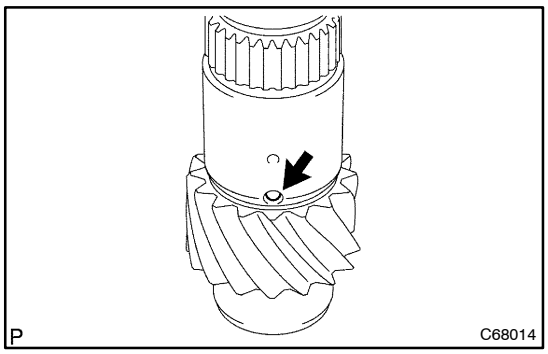


If the clearance exceeds the maximum, replace the shift fork and reverse gear.

23. INSPECT TRANSMISSION CLUTCH HUB NO.1

(a) Check that the transmission clutch hub No.1 and reverse gear slide smoothly.

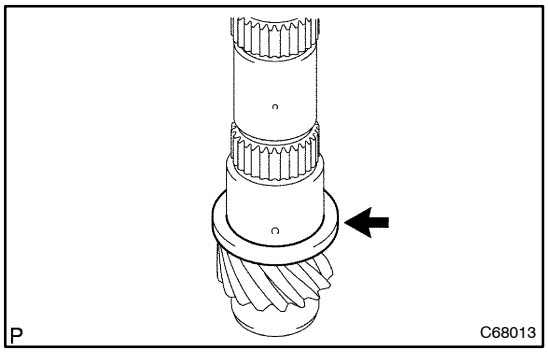
(b) Check that the spline gear's edges of the reverse gear are not worn down.



24. INSTALL REVERSE GEAR

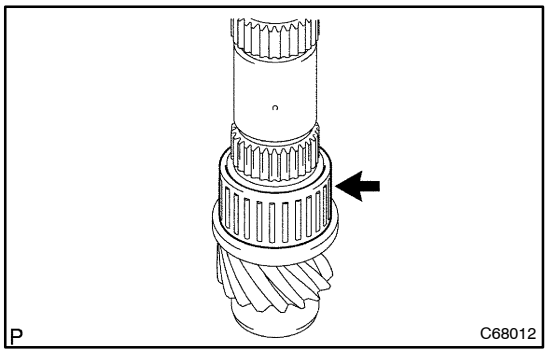
(a) Coat the reverse gear with gear oil, and install it to the transmission clutch hub No.1.

NOTICE:



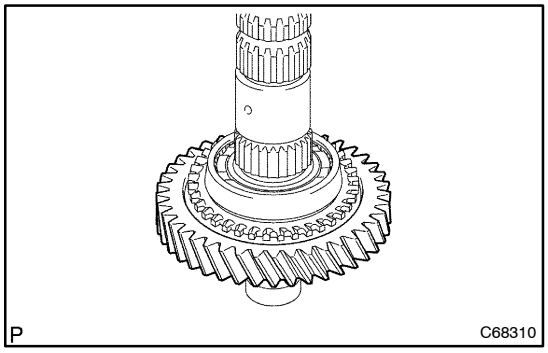
Do not set the reverse gear and transmission clutch hub No.1 in incorrect orientation.

(b) Install the 3 synchromesh shifting key springs and 3 synchromesh shifting keys.



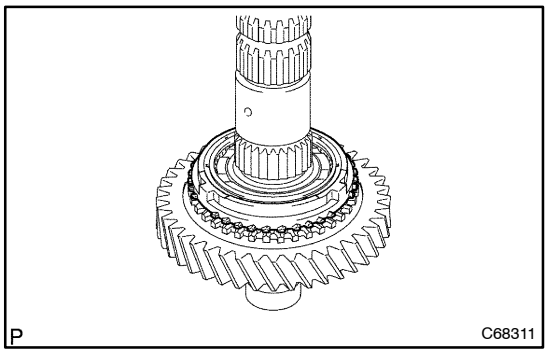
25. INSTALL 1ST GEAR THRUST WASHER PIN OR BALL

(a) Coat the 1st gear thrust washer pin or ball with gear oil, and install it to the output shaft.



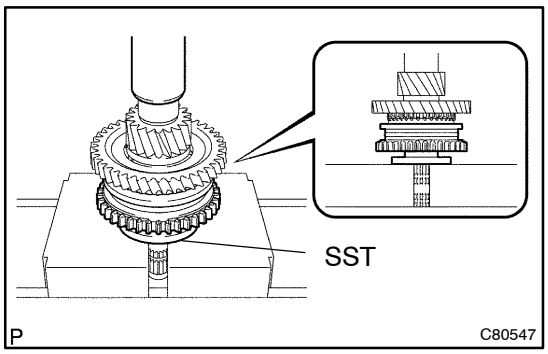
26. INSTALL 1ST GEAR THRUST WASHER

(a) Coat the 1st gear thrust washer with gear oil, and install it to the output shaft.



27. INSTALL 1ST GEAR NEEDLE ROLLER BEARING

(a) Coat the 1st gear needle roller bearing with gear oil, and install it to the output shaft.

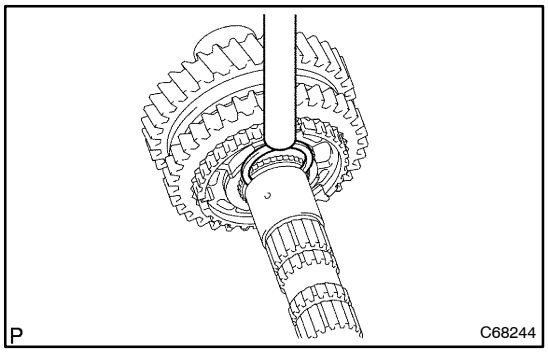


28. INSTALL 1ST GEAR

(a) Coat the 1st gear with gear oil, and install it to the output shaft.

29. INSTALL SYNCHRONIZER RING NO.1 (FOR FIRST SYNCHRONIZER RING)

(a) Coat the synchronizer ring No.1 with gear oil, and install it to the 1st gear.



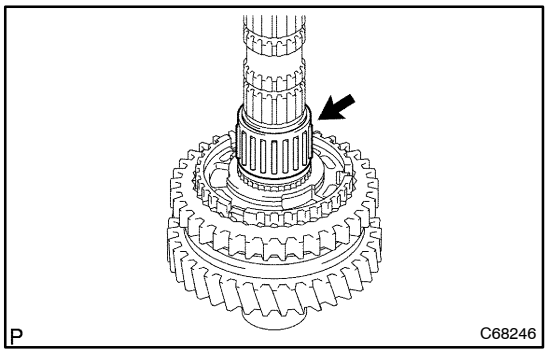
30. INSTALL TRANSMISSION CLUTCH HUB NO.1

(a) Using SST and a press, install the transmission clutch hub No.1 to the output shaft

SST 09316–60011 (09316–00031)

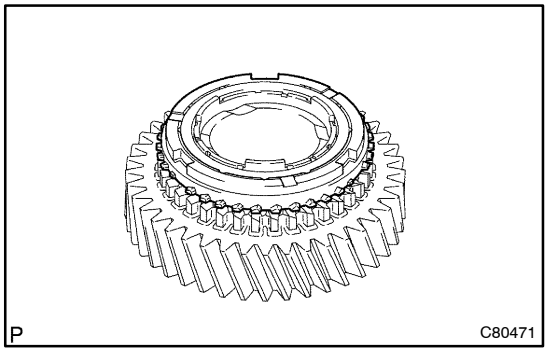
HINT:

- The 1st gear can be turned.
- While checking that the 1st gear thrust washer pin or ball is inserted into the groove of the 1st gear thrust washer, press and fit the clutch hub No.1.



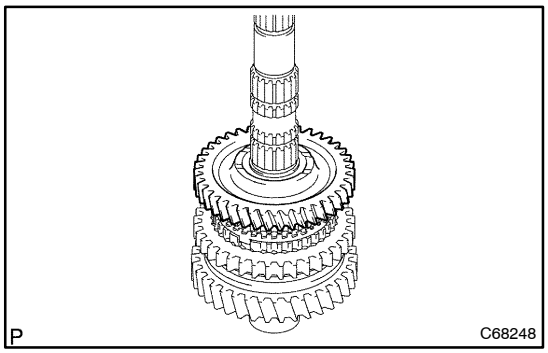
(b) Select a snap ring that will allow the minimum axial play.

Standard clearance:
0.1 mm (0.039 in.) or less



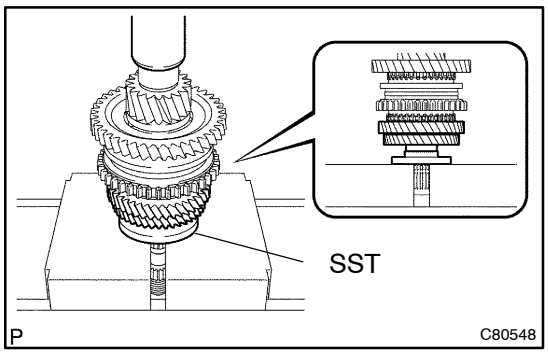
Mark	Thickness mm (in.)	Mark	Thickness mm (in.)
A	2.50 (0.0984)	D	2.68 (0.1055)
B	2.56 (0.1008)	E	2.74 (0.1079)
C	2.62 (0.1031)	F	2.80 (0.1102)

(c) Using a brass bar and a hammer, install the snap ring to the output shaft.



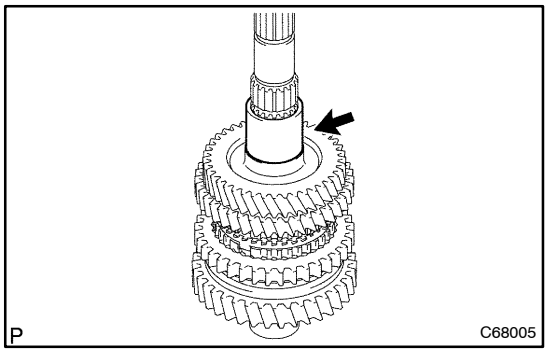
31. INSTALL 2ND GEAR NEEDLE ROLLER BEARING

(a) Coat the 2nd gear needle roller bearing and 2nd gear bearing spacer with gear oil, and install them to the output shaft.



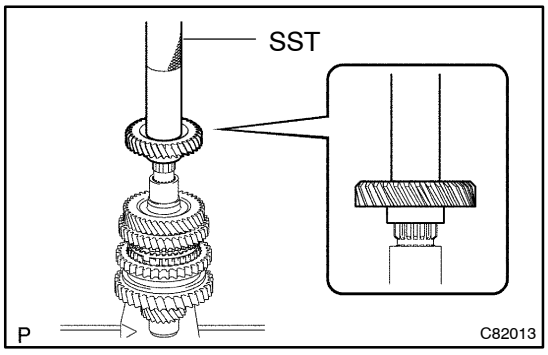
32. INSTALL SYNCHRONIZER RING NO.1 (FOR SECOND SYNCHRONIZER RING)

(a) Coat the synchronizer ring No.1 with gear oil, and install it to the 2nd gear.



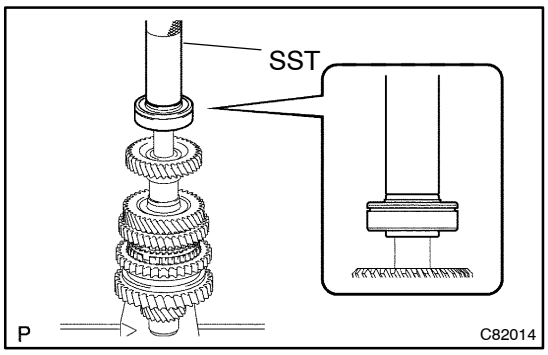
33. INSTALL 2ND GEAR

(a) Coat the 2nd gear with gear oil, and install it to the output shaft.



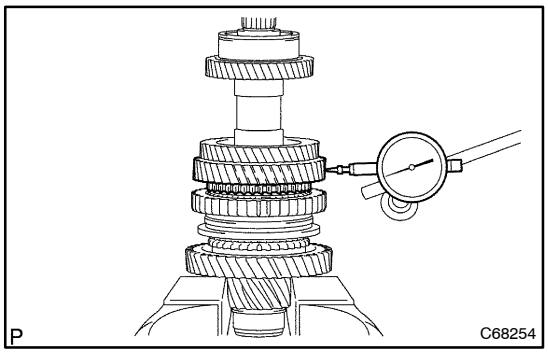
34. INSTALL 3RD DRIVEN GEAR

(a) Using SST and a press, install the 3rd driven gear to the output shaft.
SST 09950–00020



35. INSTALL OUTPUT GEAR SPACER

(a) Install the output gear spacer to the output shaft.

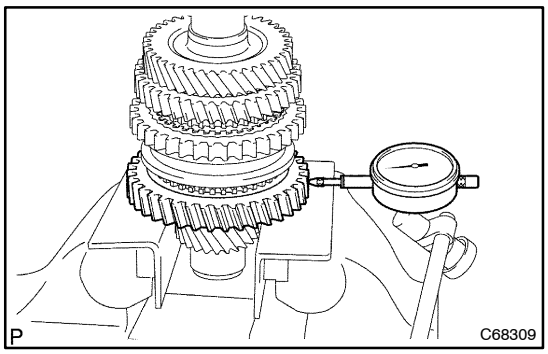


36. INSTALL 4TH DRIVEN GEAR

(a) Using SST and a press, install the 4th driven gear to the output shaft.
SST 09612–22011

37. INSTALL OUTPUT SHAFT REAR BEARING

(a) Using SST and a press, install the output shaft rear bearing to the output shaft.
SST 09612–22011

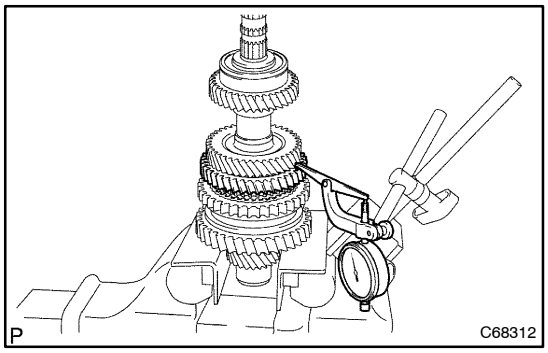


38. INSPECT 2ND GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the 2nd gear radial clearance between the gear and shaft.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 2nd gear and 2nd gear needle roller bearing.

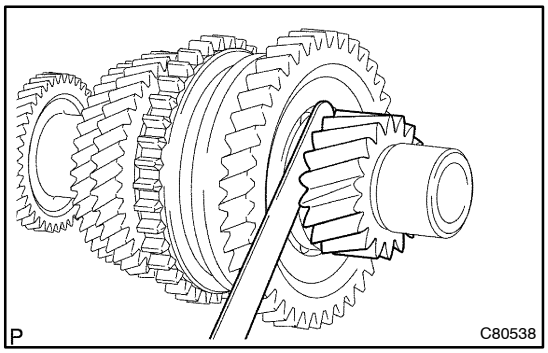


39. INSPECT 1ST GEAR RADIAL CLEARANCE

(a) Using a dial gauge, measure the 1st gear radial clearance between the gear and shaft.

Standard clearance:
0.015 to 0.058 mm (0.0006 to 0.0023 in.)
Maximum clearance:
0.058 mm (0.0023 in.)

If the clearance exceeds the maximum, replace the 1st gear and 1st gear needle roller bearing.



40. INSPECT 2ND GEAR THRUST CLEARANCE

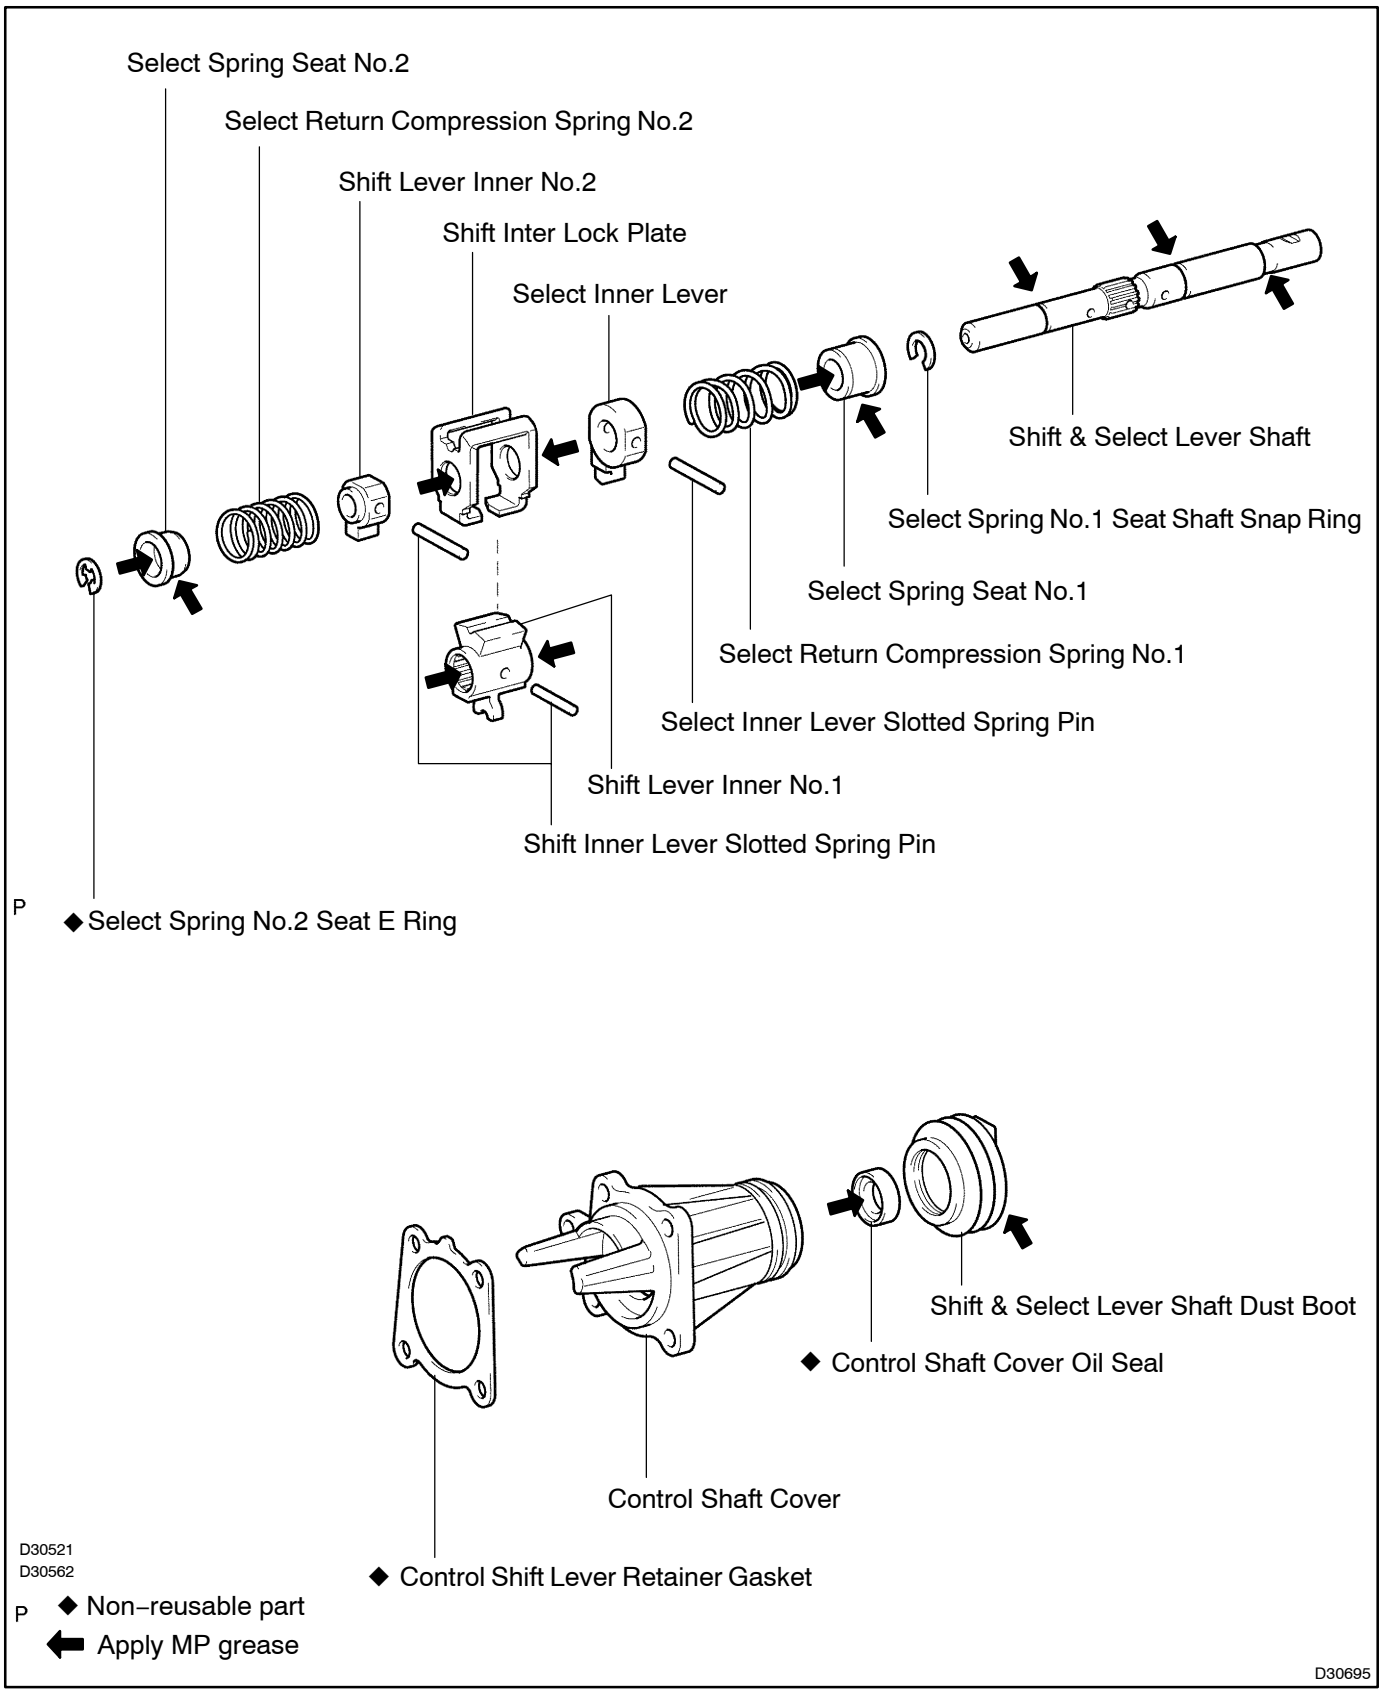
(a) Using a dial gauge, measure the 2nd gear thrust clearance.

Standard clearance:
0.10 to 0.45 mm (0.0039 to 0.0177 in.)
Maximum clearance:
0.45 mm (0.0177 in.)

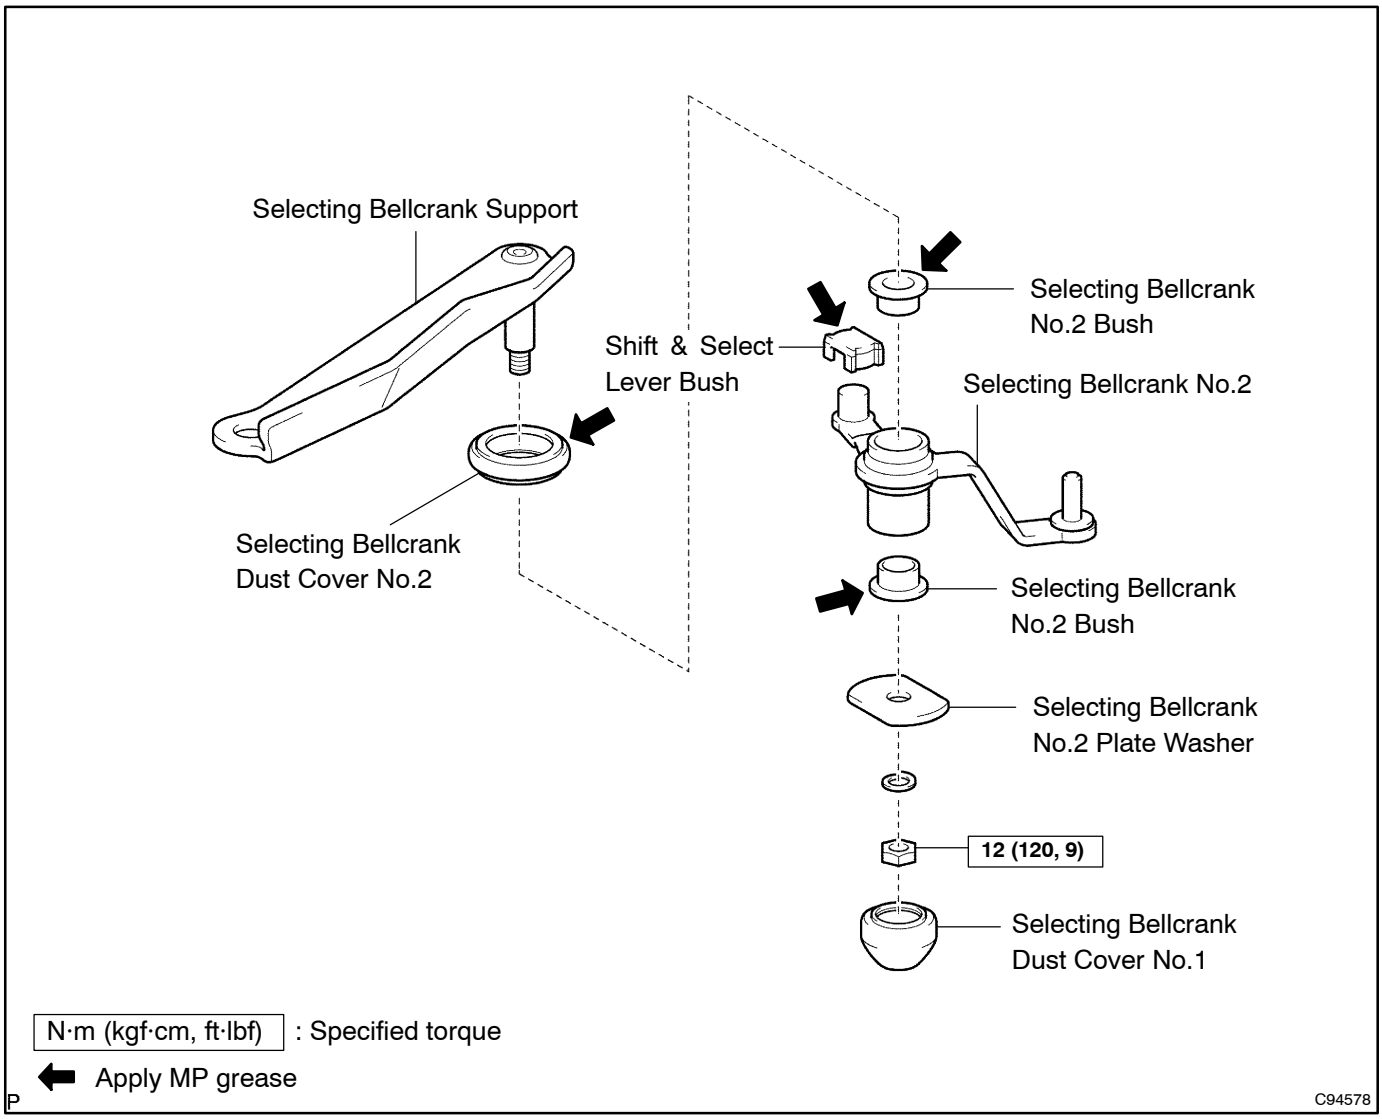
If the clearance exceeds the maximum, replace the transmission clutch hub No.1, 2nd gear or 3rd driven gear.

41. INSPECT 1ST GEAR THRUST CLEARANCE

(a) Using a feeler gauge, measure the 1st gear thrust clearance.



Standard clearance:
0.10 to 0.40 mm (0.0039 to 0.0157 in.)
Maximum clearance:
0.40 mm (0.0157 in.)



If the clearance exceeds the maximum, replace the 1st gear thrust washer, 1st gear or transmission clutch hub No.1.

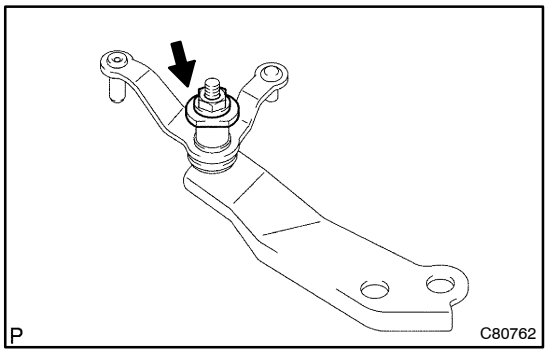
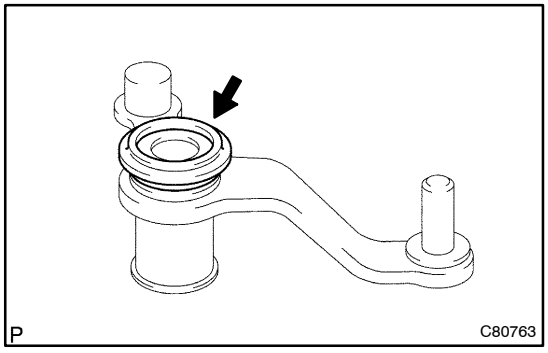
OVERHAUL



1. REMOVE SHIFT & SELECT LEVER BUSH

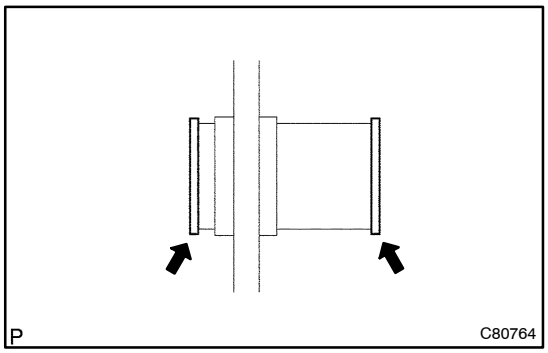
(a) Remove the shift & select lever bush from the selecting bell crank assy.

2. REMOVE SELECTING BELLCRANK DUST COVER NO.1



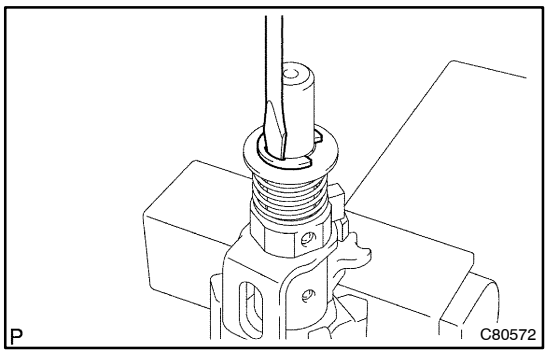
(a) Remove the selecting bellcrank dust cover No.1 from the selecting bellcrank assy.

3. REMOVE SELECTING BELL CRANK NO.2



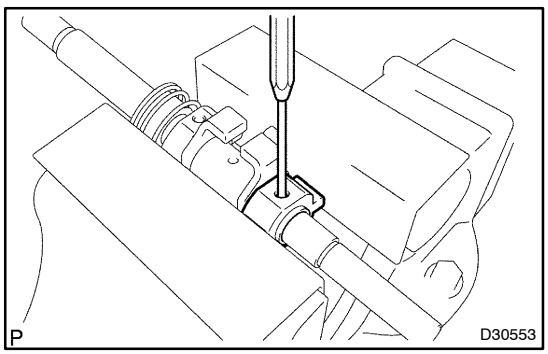
(a) Remove the nut, spring washer and selecting bellcrank No.2 plate washer.

(b) Remove selecting bellcrank No.2 from the selecting bellcrank support.



4. REMOVE SELECTING BELLCRANK DUST COVER NO.2

(a) Remove the selecting bellcrank dust cover No.2 from the selecting bellcrank No.2.

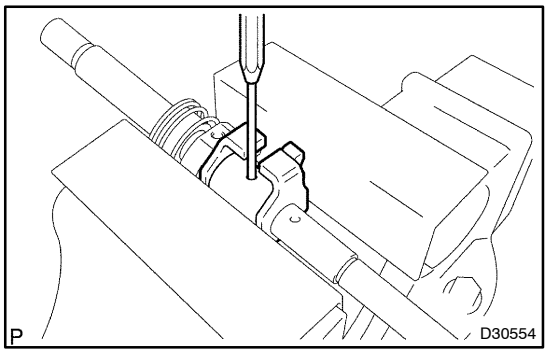


5. REMOVE SELECTING BELLCRANK NO.2 BUSH

(a) Remove the 2 selecting bellcrank No.2 bushes from the selecting bellcrank No.2.

6. REMOVE SELECT SPRING SEAT NO.2

(a) Using a screwdriver, remove the select spring seat No.2 E–ring, select spring seat No.2 and select return spring No.2 from the shift & select lever shaft.

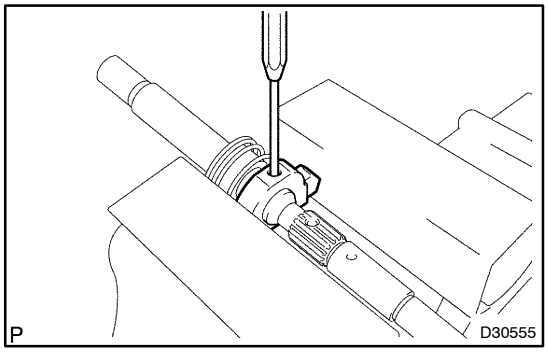


7. REMOVE SHIFT LEVER INNER NO.2

(a) Using a pin punch (ϕ 5 mm) and a hammer, remove the shift inner lever slotted spring pin and shift lever inner No.2 from the shift & select lever shaft.

HINT:

Make sure of the orientation of the shift lever inner No.2.

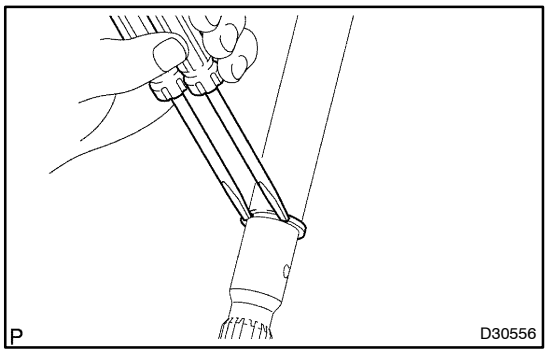


8. REMOVE SHIFT LEVER INNER NO.1

(a) Using a pin punch (ϕ 5 mm) and a hammer, remove the shift inner lever slotted spring pin, shift lever inner No.1 and shift inter lock plate from the shift & select lever shaft.

HINT:

Make sure of the orientation of the shift lever inner No.1.



9. REMOVE SELECT INNER LEVER

(a) Using a pin punch (ϕ 5 mm) and a hammer, remove the select inner lever slotted spring pin, select inner lever select return compression spring No.1 and select return spring No.1 seat from shift & select lever shaft.

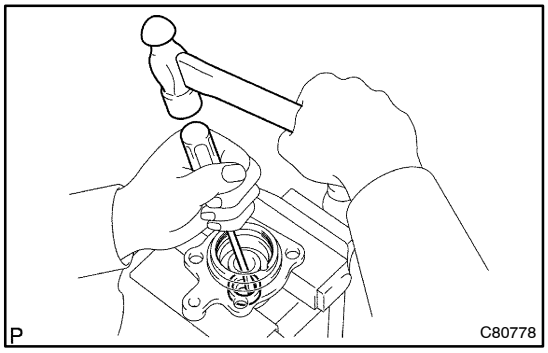
HINT:

Make sure of the orientation of the select inner lever.

10. REMOVE SELECT SPRING NO.1 SEAT SHAFT SNAP RING

(a) Using 2 screwdrivers and a hammer, remove the select spring No.1 seat shaft snap ring.

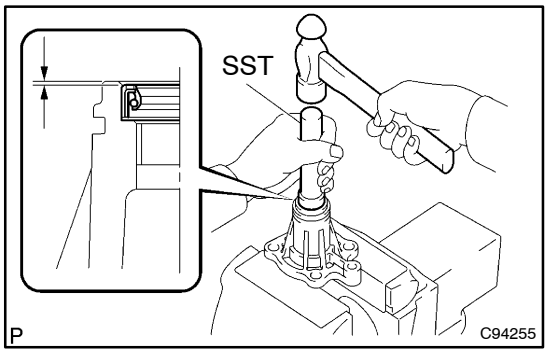
NOTICE:



Do not damage the shaft.

HINT:

Use a shop rag to keep the shaft snap ring from flying.



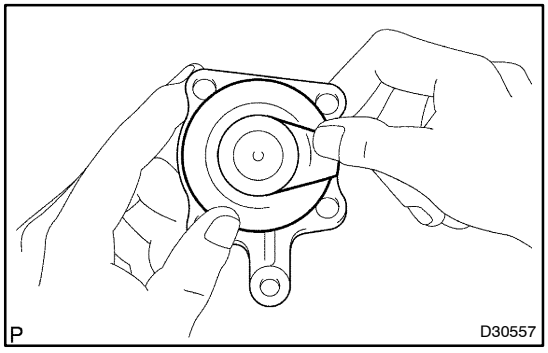
11. REMOVE SHIFT & SELECT LEVER SHAFT DUST BOOT

(a) Remove the shift & select lever shaft dust boot from the shift & select lever shaft.

12. REMOVE CONTROL SHAFT COVER OIL SEAL

(a) Using a screwdriver, remove the control shaft cover oil seal from the control shaft cover.

13. INSTALL CONTROL SHAFT COVER OIL SEAL



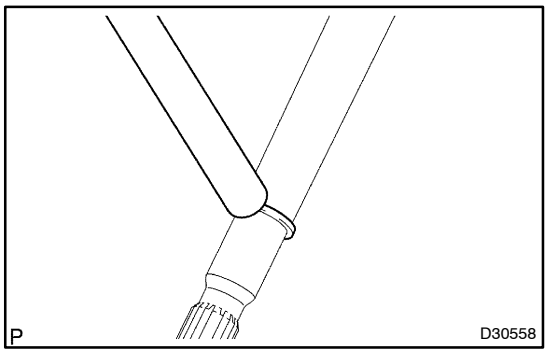
(a) Using SST and a hammer, install a new control shaft cover oil seal to the control shaft cover.

SST 09950–60010 (09951–00220), 09950–70010 (09951–07100)

Drive in depth:

0.2 to 1.2 mm (0.079 to 0.0472 in.)

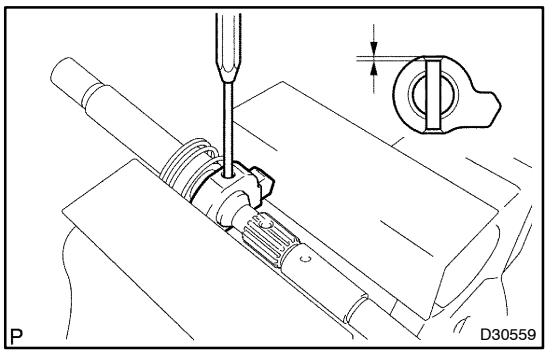
(b) Coat the control shaft cover oil seal with MP grease.



14. INSTALL SHIFT & SELECT LEVER SHAFT DUST BOOT

(a) Coat the shift & select lever shaft dust boot with MP grease.

(b) Install the shift & select lever shaft dust boot to the shift & select lever shaft.

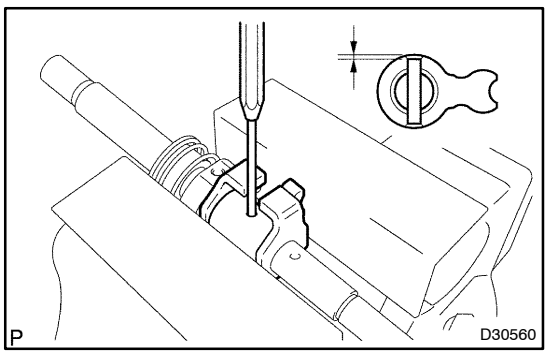


HINT:

Install the boot with the projection facing up and the hole side down.

15. INSTALL SELECT SPRING NO.1 SEAT SHAFT SNAP RING

(a) Coat the shift & select lever shaft with MP grease, and install it and snap ring with a brass bar and a hammer.

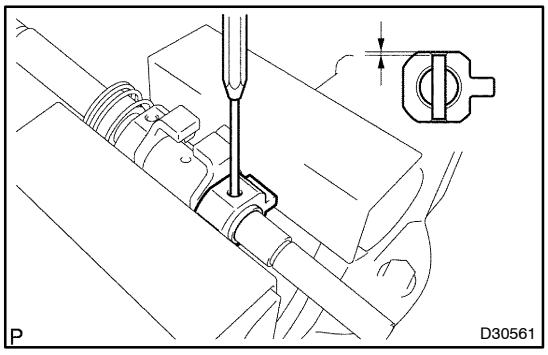


16. INSTALL SELECT INNER LEVER

(a) Coat the select spring No.1 seat with MP grease.

(b) Using a pin punch (ϕ 5 mm) and a hammer, install the select spring No.1 seat, select return compression spring No.1, select inner lever and select inner lever slotted spring pin to the shift & select lever.

Drive in depth: 3.0 to 4.0 mm (0.1181 to 0.1575 in)

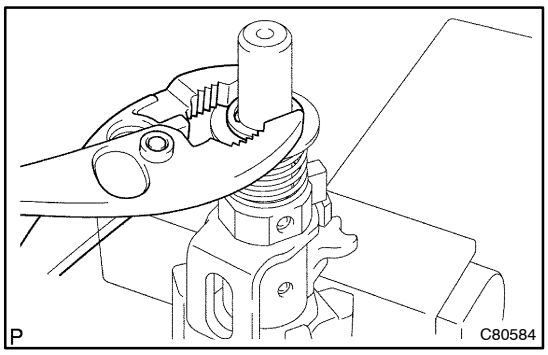


17. INSTALL SHIFT LEVER INNER NO.1

(a) Coat the shift inter lock plate and shift lever inner No.1 with MP grease.

(b) Using a pin punch (ϕ 5 mm) and a hammer, install the shift inter lock plate, shift lever inner No.1 and shift inner lever slotted spring pin to the shift & select lever shaft.

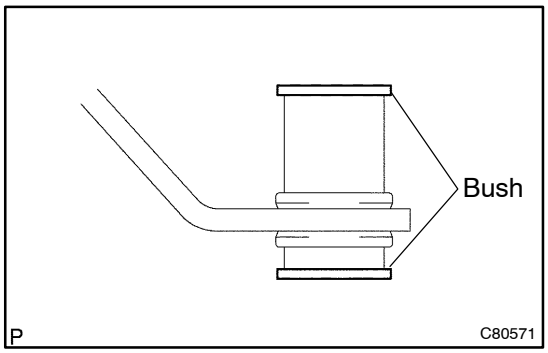
Drive in depth: –0.5 to 0.5 mm (–0.0197 to 0.0197 in)



18. INSTALL SHIFT LEVER INNER NO.2

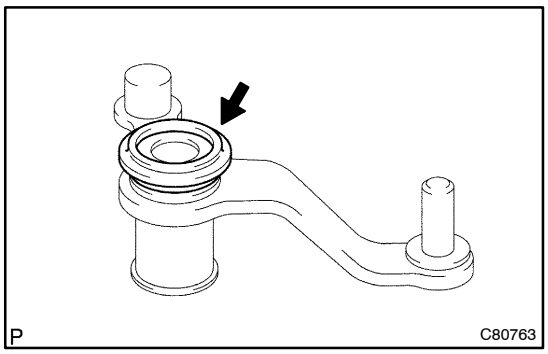
(a) Coat the shift lever inner No.2 with Mp grease.

(b) Using a pin punch (ϕ 5 mm) and a hammer, install the shift lever inner No.2 and shift inner lever slotted spring pin to the shift & select lever shaft.



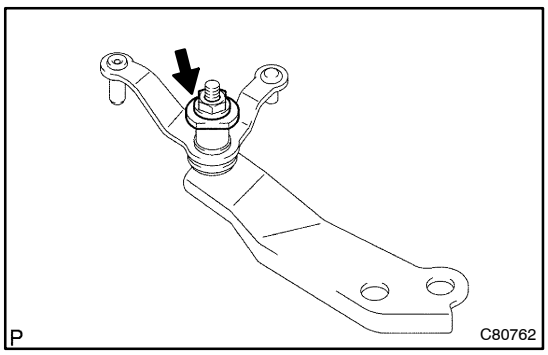
Drive in depth: –0.5 to 0.5 mm (–0.0197 to 0.0197 in)

19. INSTALL SELECT SPRING SEAT NO.2



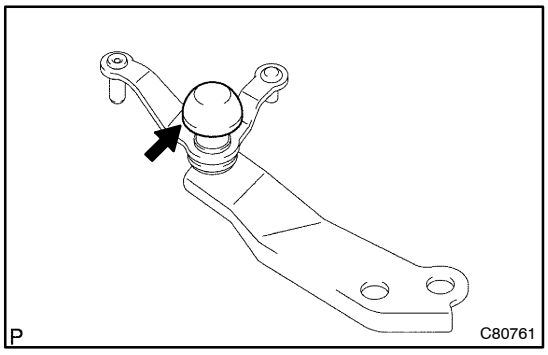
(a) Coat the select spring seat No.2 with MP grease.

(b) Install the select spring seat No.2 and select return compression spring No.2. Using a plier, install a new select spring No.2 seat E–ring to the shift & select lever shaft.



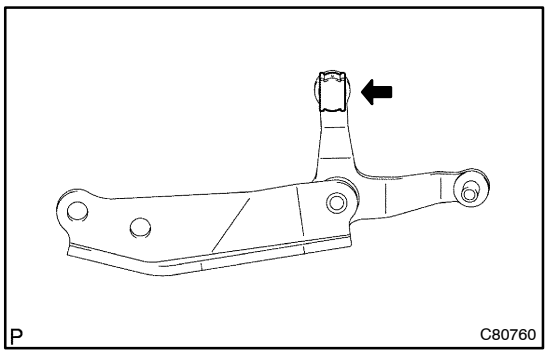
20. INSTALL SELECTING BELLCRANK NO.2 BUSH

(a) Coat the 2 selecting bellcrank No.2 bushes with MP grease, and install it to the selecting bellcrank No.2.



21. INSTALL SELECTING BELLCRANK DUST COVER NO.2

(a) Coat the selecting bellcrank dust cover No.2 with MP grease, and install it to the selecting bellcrank support.

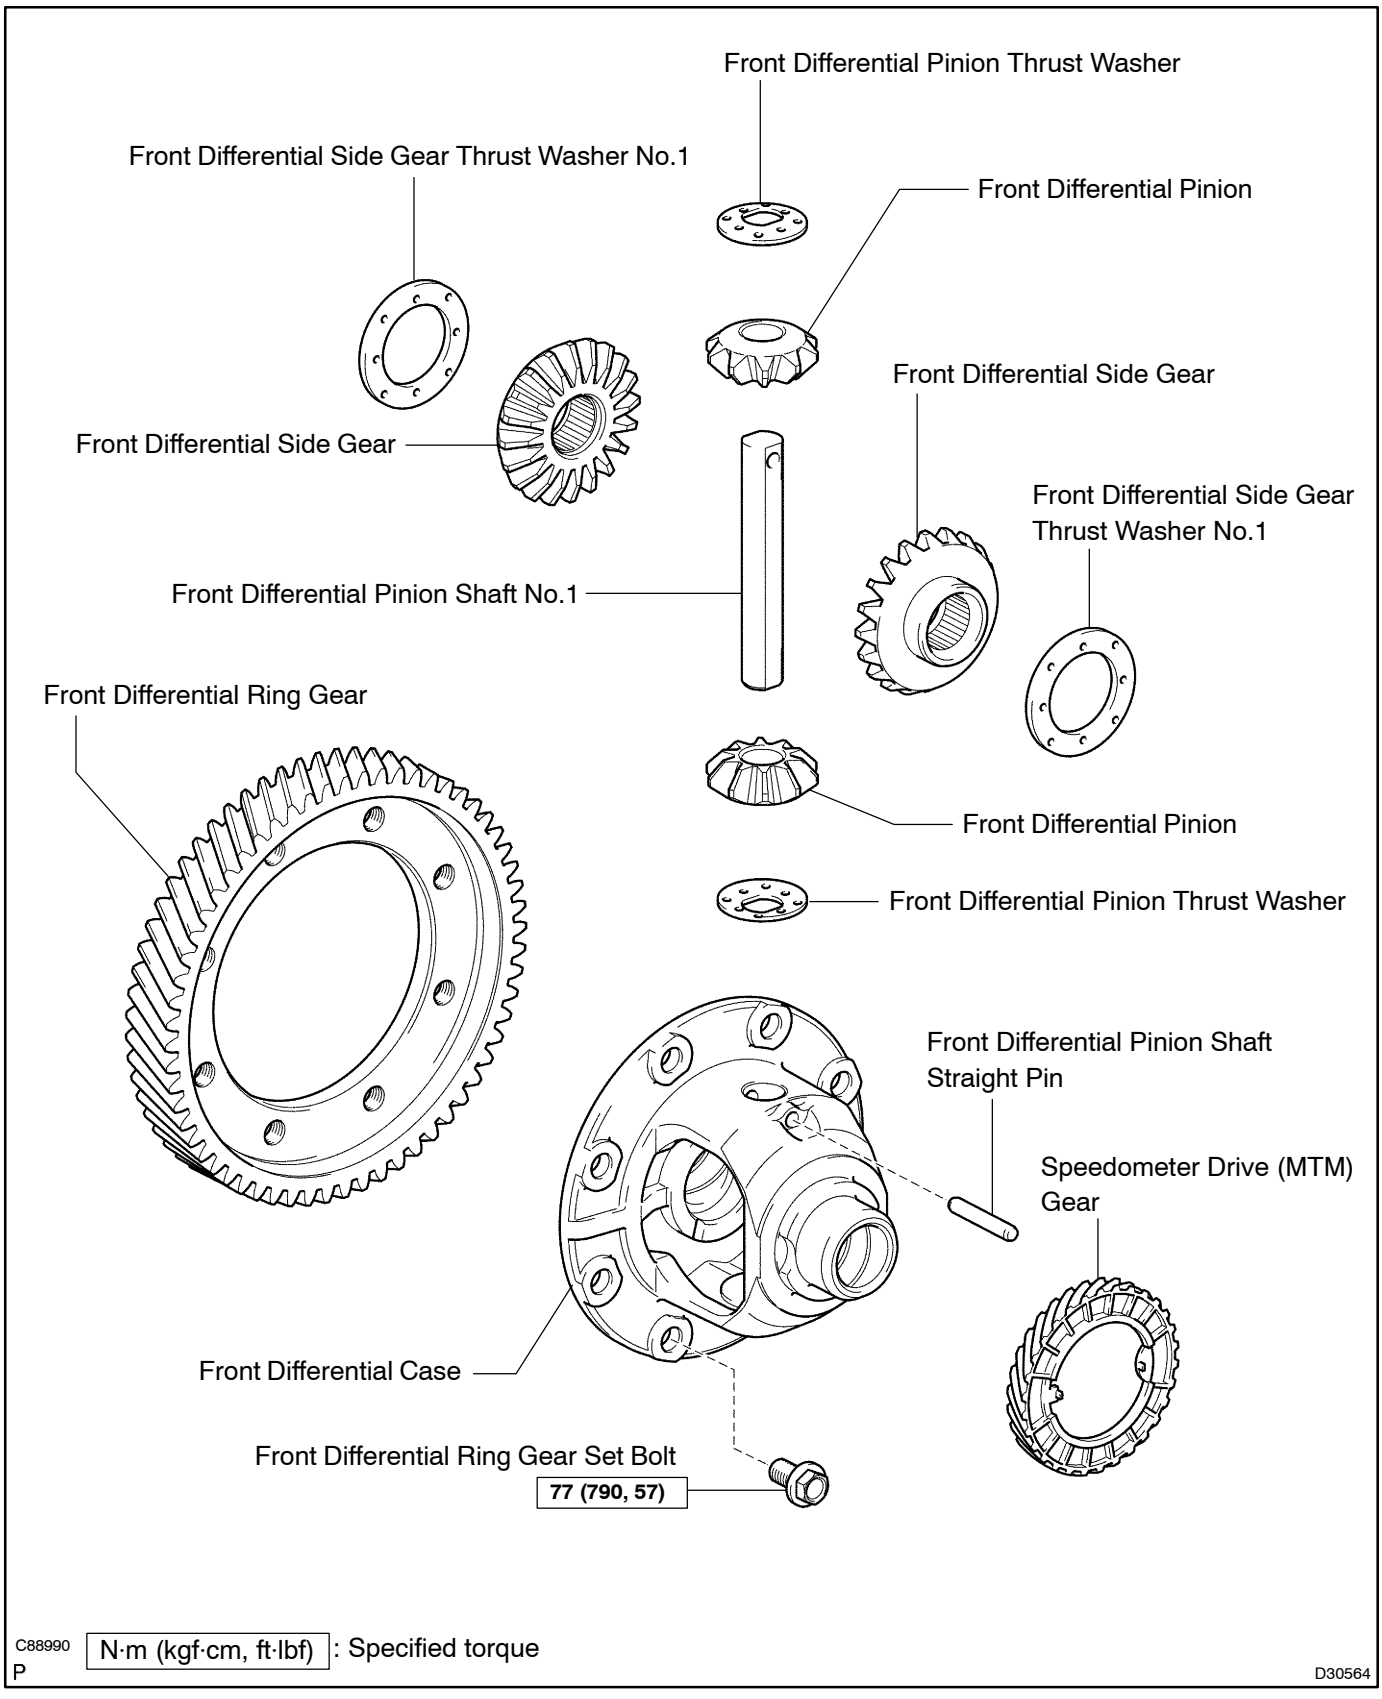


22. INSTALL SELECTING BELL CRANK NO.2

(a) Install the selecting bellcrank support, selecting bellcrank No.2 plate washer, spring washer and nut.
Torque: 12 N·m (120 kgf·cm, 9 ft·lbf)

23. INSTALL SELECTING BELLCRANK DUST COVER NO.1

(a) Install the selecting bellcrank dust cover No.1 to the selecting bell crank assy.



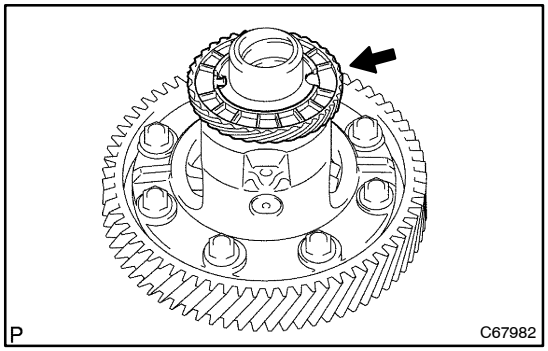
24. INSTALL SHIFT & SELECT LEVER BUSH

(a) Install shift & select lever bush to the selecting bellcrank assy.

DIFFERENTIAL CASE ASSY (C50)

COMPONENTS

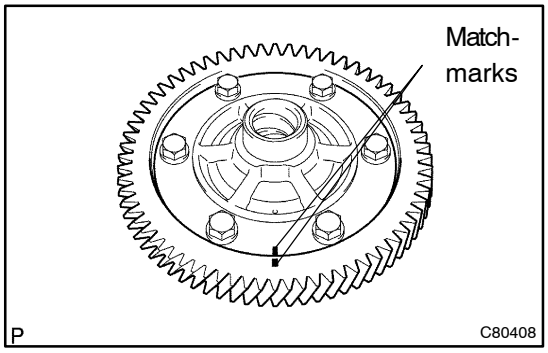
410DK–02



C88990
P

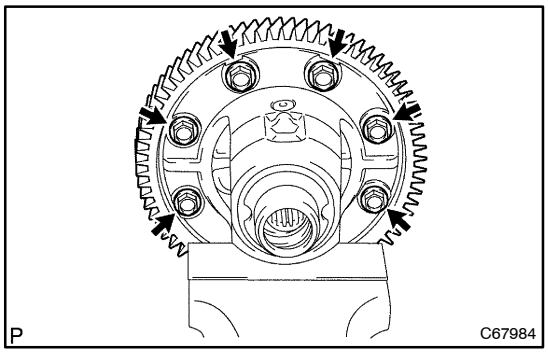
N·m (kgf·cm, ft·lbf) : Specified torque

D30564



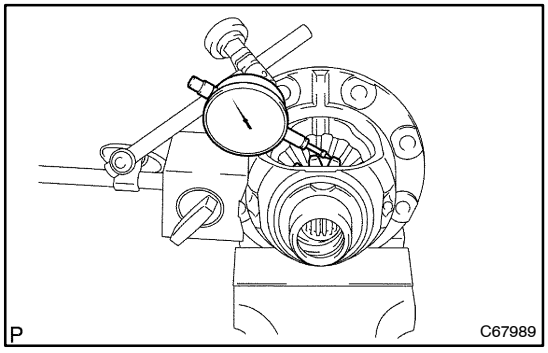
4101E–03

OVERHAUL



1. REMOVE SPEEDOMETER DRIVE (MTM) GEAR

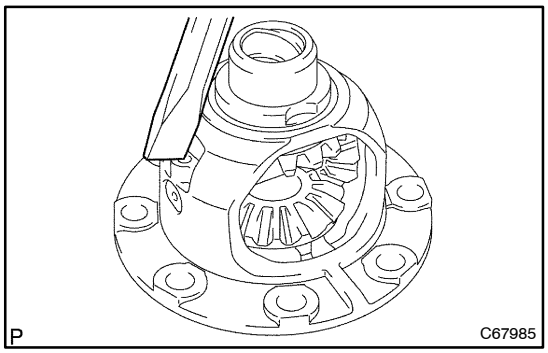
(a) Remove the speedometer drive gear from the front differential case.



2. REMOVE FRONT DIFFERENTIAL RING GEAR

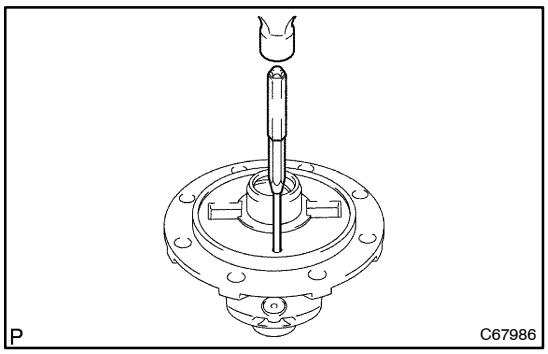
(a) Put matchmarks on the front differential ring gear and the front differential case.

(b) Remove the 8 bolts. Using a hammer, remove the front differential ring gear from the front differential case.



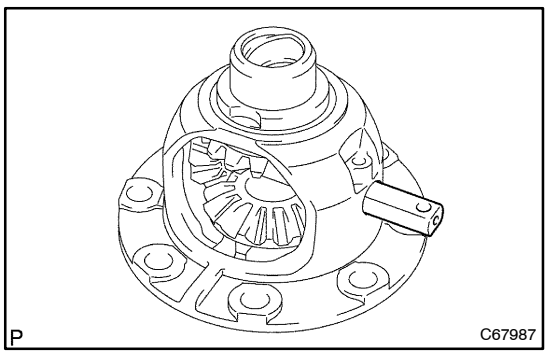
3. INSPECT FRONT DIFFERENTIAL SIDE GEAR BACKLASH

(a) Fixing the front differential pinion to the front differential case side. Using a dial indicator, measure the front differential side gear backlash.



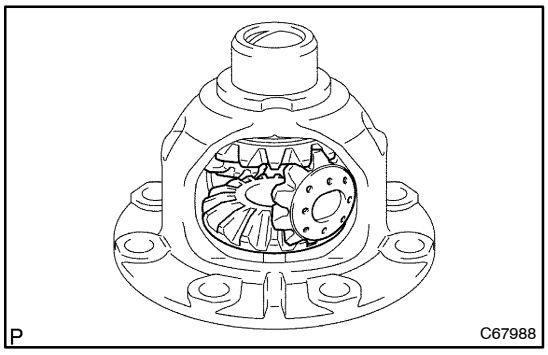
Standard backlash:
0.05 to 0.20 mm (0.0020 to 0.0079 in.)

If the backlash is not within the specification, install the connect side gear thrust washers.



4. REMOVE FRONT DIFFERENTIAL PINION SHAFT STRAIGHT PIN

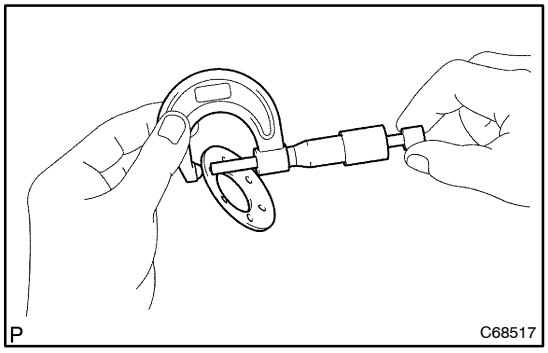
(a) Using a chisel and a hammer, loosen the staked part of the front differential case.



(b) Using a pin punch (ϕ 3 mm) and a hammer, remove the front differential pinion shaft straight pin from the front differential case.

5. REMOVE FRONT DIFFERENTIAL PINION SHAFT NO.1

(a) Remove the front differential pinion shaft No.1 from the front differential case.

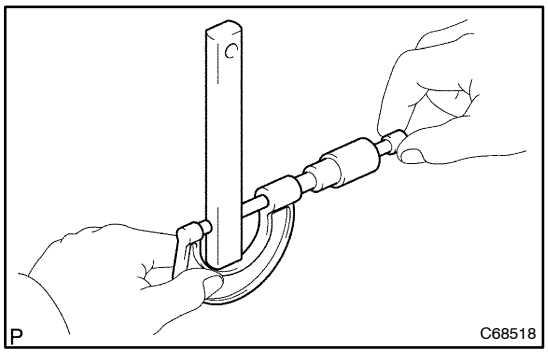


6. REMOVE FRONT DIFFERENTIAL SIDE GEAR

(a) Remove the 2 front differential pinions, front differential pinion thrust washers and front differential side gear thrust washers No.1 from the front differential case.

HINT:

Revolving the front differential pinion, remove the 2 pinions, pinion thrust washers and side gear thrust washers.

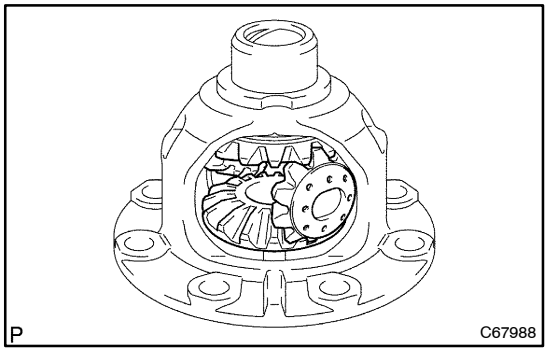


7. INSPECT FRONT DIFFERENTIAL PINION THRUST WASHER

(a) Using a micrometer, measure the thickness of the front differential pinion thrust washer.

Minimum thickness: 0.94 mm (0.03701 in.)

If the thickness is less than the minimum, replace the front differential pinion thrust washer.



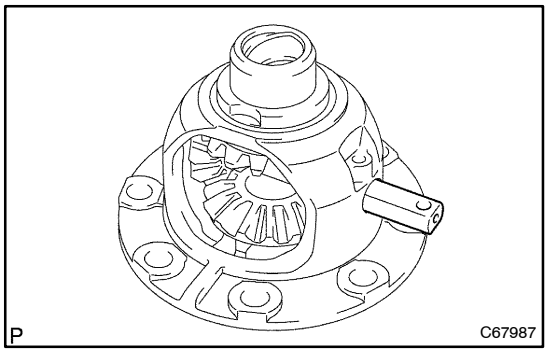
8. INSPECT FRONT DIFFERENTIAL PINION SHAFT NO.1

(a) Using a micrometer, measure the outer diameter of the front differential pinion shaft No.1.

Minimum outer diameter: 16.982 mm (0.6685 in.)

If the outer diameter is less than the minimum, replace the front differential pinion shaft No.1.

9. INSTALL FRONT DIFFERENTIAL SIDE GEAR

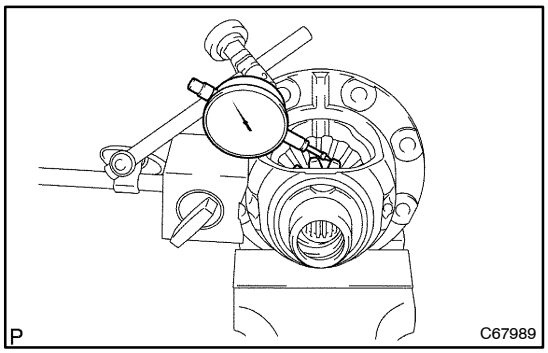


(a) Coat the sliding and rotating surface of the front differential side gear with MP grease.

(b) Install the 2 front differential side gear thrust washers to the 2 front differential side gear.

(c) Install the 2 front differential pinions with front differential pinion thrust washers to the front differential case.

HINT:



Revolving the front differential pinion, install the 2 front differential pinions with front differential pinion thrust washers.

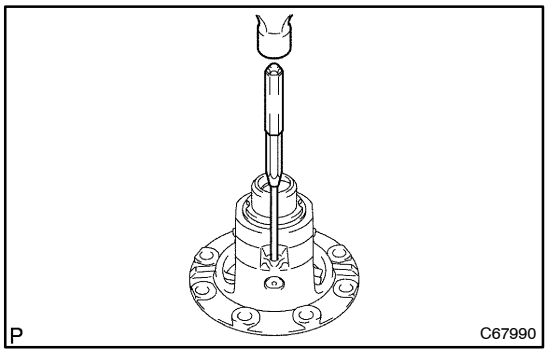
10. INSTALL FRONT DIFFERENTIAL PINION SHAFT NO.1

(a) Coat the front differential pinion shaft No.1 with MP grease.

(b) Install the front differential pinion shaft No.1 to the front differential case so that the hole for the front differential pinion shaft straight pin is aligned with the hole in the front differential case.

11. ADJUST FRONT DIFFERENTIAL SIDE GEAR BACKLASH

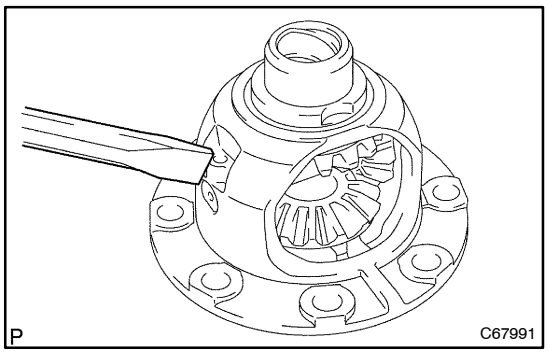
(a) Fix the front differential pinion to the front differential case side. Using a dial gauge, measure the front differential side gear backlash.



Standard backlash:
0.05 to 0.20 mm (0.0020 to 0.0079 in.)

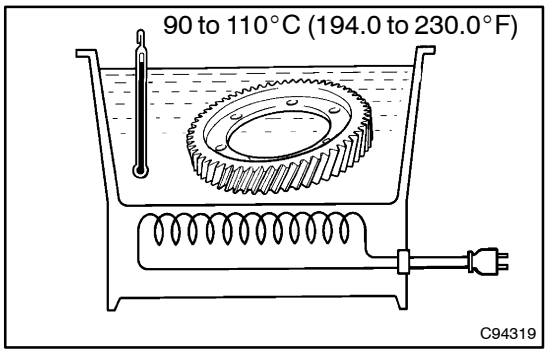
HINT:

- Because the thrust washer does not have any marks for distinction, measure the thickness with a micrometer to select a proper thrust washer.
- Select washers of the same thickness for both the right and left.



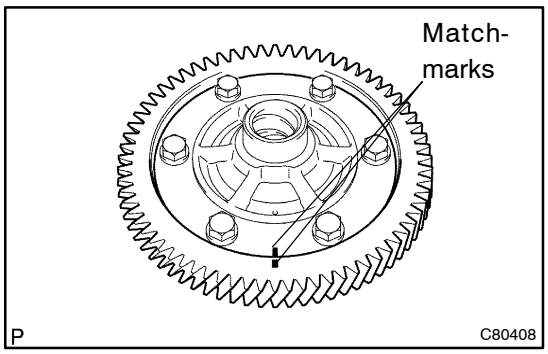
Thrust washer thickness

Parts No.	Thickness mm (in.)
41361 – 22140	0.95 (0.0374 in.)
41361 – 22020	1.00 (0.0394 in.)
41361 – 22150	1.05 (0.0413 in.)
41361 – 22030	1.10 (0.0433 in.)
41361 – 22160	1.15 (0.0452 in.)
41361 – 22040	1.20 (0.0472 in.)



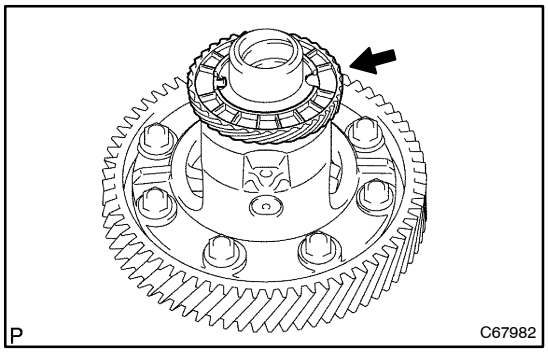
12. INSTALL FRONT DIFFERENTIAL PINION SHAFT STRAIGHT PIN

(a) Using a pin punch (ϕ 3 mm) and a hammer, install the front differential pinion shaft straight pin to the front differential case.



(b) Using a chisel and a hammer, stake the front differential case hole.

13. INSTALL FRONT DIFFERENTIAL RING GEAR



(a) Using a heater, heat the front differential ring gear to 90 to 110 °C (194.0 to 230.0 °F.)

(b) Clean the contact surface of the front differential case.

(c) Aligning the both matchmarks, quickly install the front differential ring gear to the front differential case.

(d) Install the 8 bolts.
Torque: 77 N·m (790 kgf·cm, 57 ft·lbf)

14. INSTALL SPEEDOMETER DRIVE (MTM) GEAR

(a) Install the speedometer drive gear to the front differential case.
