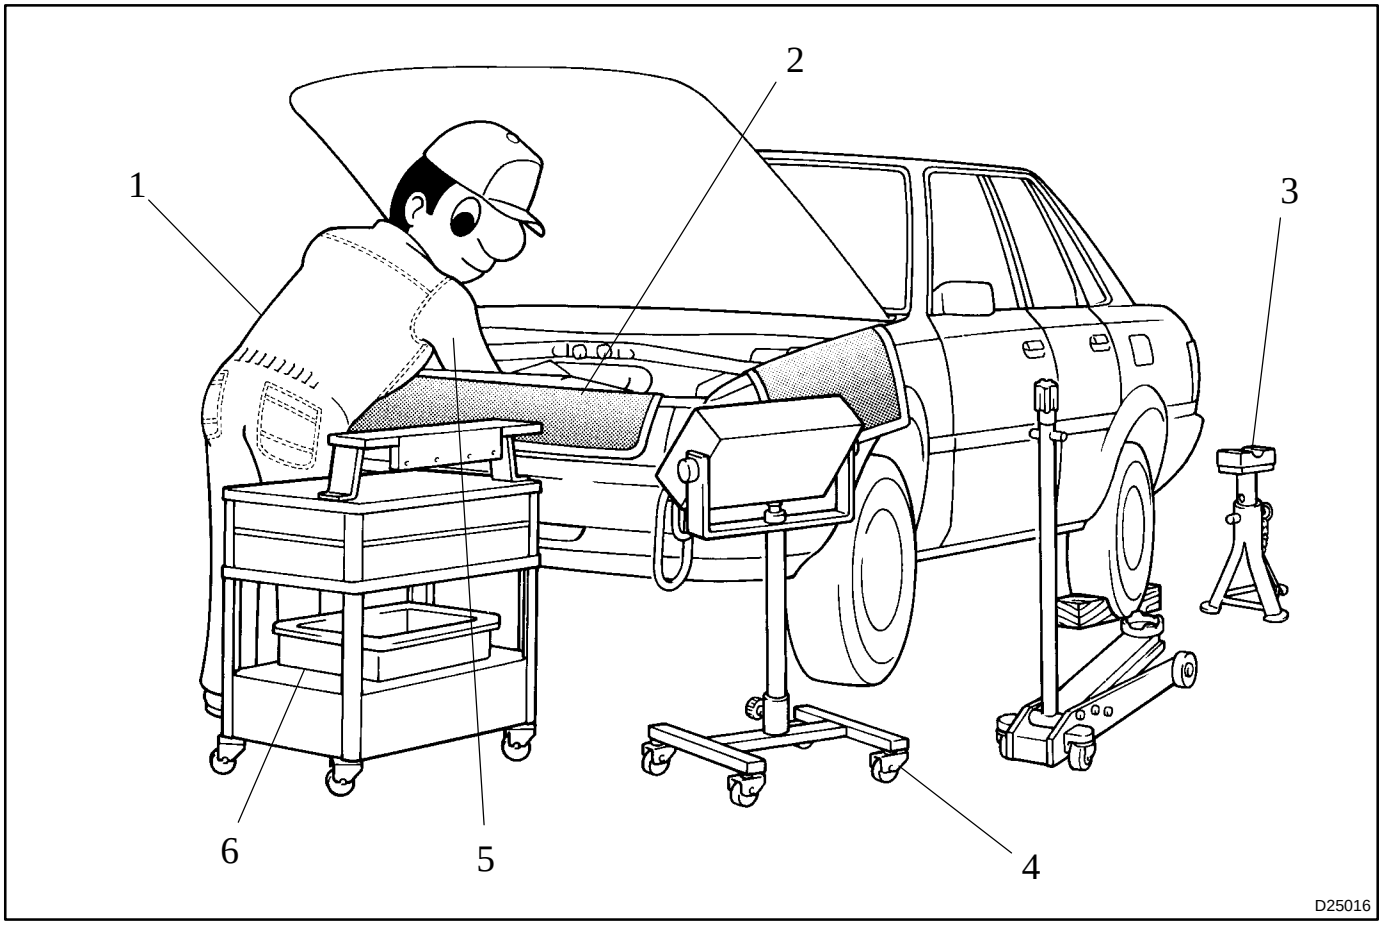
PRECAUTION

1. BASIC REPAIR HINT

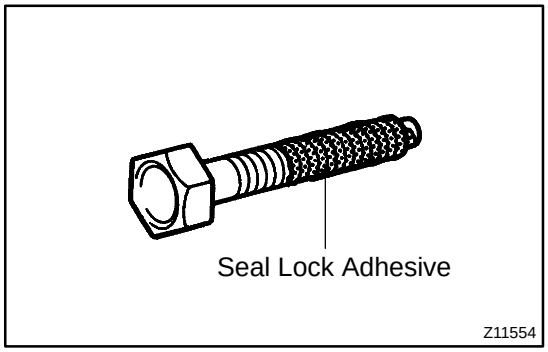
(a) HINTS ON OPERATIONS



1	Looks	●Always wear a clean uniform. ●Hat and safety shoes must be worn.
2	Vehicle protection	●Prepare a grille cover, fender cover, seat cover and floor mat before starting the operation.
3	Safe operation	●When working with 2 or more persons, be sure to check safety in one another. ●When working with the engine running, pay attention to the providing ventilation for exhaust fumes in the workshop. ●If working on high temperature, high pressure, rotating, moving, or vibrating parts, wear appropriate safety equipment and take extra care not to injure yourself or others. ●When jacking up the vehicle, be sure to support the specified location with a safety stand. ●When lifting up the vehicle, use appropriate safety equipment.
4	Preparation of tools and measuring gauge	●Before starting operation, prepare a tool stand, SST, gauge, oil, shop rag and parts for replacement.
5	Removal and installation, disassembly and assembly operations	●Diagnose with a thorough understanding of proper procedures and of the reported problem. ●Before removing the parts, check the general condition of the assembly and for deformation and damage. ●When the assembly is complicated, take notes. For example, note the total number of electrical connectio−ns, bolts, or hoses removed. Add matchmarks to insure re−assembly of components in the original positions. Temporarily mark hoses and their fittings, if needed. ●Clean and wash the removed parts if necessary and assemble them after a thorough check.
6	Removed parts	●Place the removed parts in a separate box to avoid mixing them up with the new parts or contaminating the new parts. ●As for non−reusable parts such as a gasket, an O−ring, and a self−locking nut, replace them with new ones following the instruction of this manual. ●Retain the removed parts for customer inspection, if requested.

(b) JACKING UP AND SUPPORTING VEHICLE

(1) Care must be taken when jacking up and supporting the vehicle. Be sure to lift and support the vehicle at the proper locations (see page 01−19).



(c) PRECOATED PARTS

(1) Precoated parts are bolts, nuts, etc. that are coated with a seal lock adhesive at the factory.

(2) If a precoated part is retightened, loosened or moved in anyway, it must be recoated with the specified adhesive.

(3) When reusing precoated parts, clean off the old adhesive and dry the part with compressed air. Then apply new seal lock adhesive appropriate to the bolt, nut, or threads.

NOTICE:

Perform the torque with the lower limit value of the torque tolerance.

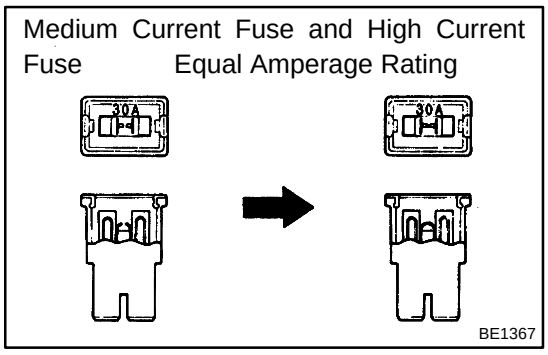
(4) Some seal lock agents harden slowly. You may have to wait for the seal lock agent to harden.

(d) GASKETS

(1) When necessary, use a sealer on gaskets to prevent leaks.

(e) BOLTS, NUTS AND SCREWS

(1) Carefully follow all the specifications for tightening torques. Always use a torque wrench.



(f) FUSES

(1) When replacing fuses, be sure that the new fuse has the correct amperage rating. DO NOT exceed the rating or use one with a lower rating.

Illustration	Symbol	Part Name	Abbreviation
 BE5594	IN0365	FUSE	FUSE
 BE5595	IN0366	MEDIUM CURRENT FUSE	M−FUSE
 D27353	IN0367	HIGH CURRENT FUSE	H−FUSE

(g) CLIPS

(1) The removal and installation methods of typical clips used in body parts are shown in the table below.

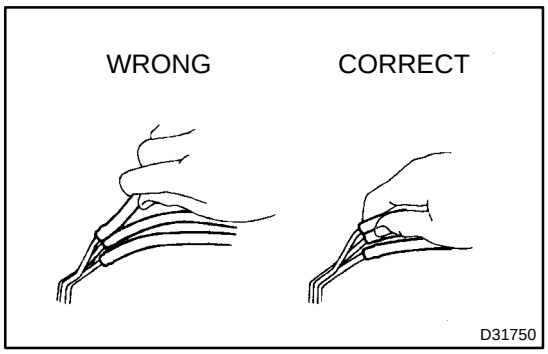
HINT:

If clips are damaged during a procedure, always replace the damaged clip with a new clip.

Shape (Example)	Removal/Installation
	 Remove clips from front or rear using clip remover or pliers.
	 Remove fasteners with a clip remover or screwdriver.
	 Remove clips with a wide scraper to prevent panel damage.

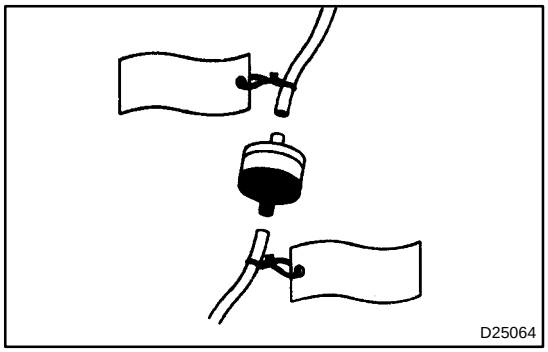
D25786

Shape (Example)	Removal/Installation
	 Remove rivet by pushing the center pin through and prying out the rivet shell.
	 Remove rivet by unscrewing the center pin and prying out the rivet shell.
	 Remove rivet by prying out the pin and then prying out the rivet shell.



(h) REMOVAL AND INSTALLATION OF VACUUM HOSES

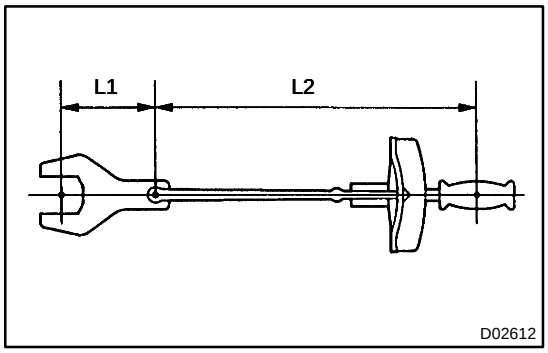
(1) To disconnect vacuum hose, pull and twist from the end of the hose. Do not pull from the middle of the hose as this may cause damage.



(2) When disconnecting vacuum hoses, use tags to identify where they should be reconnected.

(3) After completing the job, double check that the vacuum hoses are properly connected. The label under the hood shows the proper layout.

(4) When using a vacuum gauge, never force the hose onto a connector that is too large. Use a step−down adapter for adjustment. Once the hose has been stretched, it may leak air.

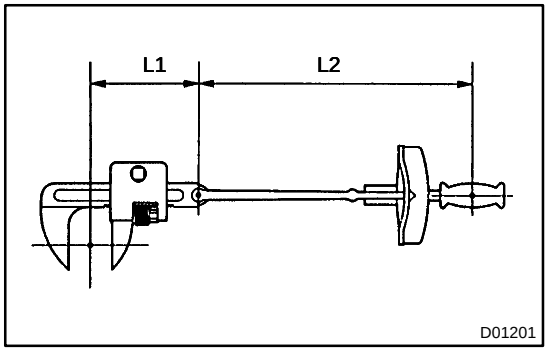


(i) TORQUE WHEN USING TORQUE WRENCH WITH EXTENSION TOOL

(1) If SST or an extension tool is combined with the torque wrench to extend its length, do not tighten the torque wrench to the specified torque values in this manual. The actual torque will be excessive.

(2) Use the formula below to calculate special torque values for situations where SST or an extension tool is combined with the torque wrench.

(3) Formula: T'=T x L2/(L1 + L2)



T'	Reading of torque wrench {N·m (kgf·cm, ft·lbf)}
T	Torque {N·m (kgf·cm, ft·lbf)}
L1	Length of SST or extension tool (cm)
L2	Length of torque wrench (cm)

2. FOR VEHICLES EQUIPPED WITH SRS AIRBAG AND SEAT BELT PRETENSIONER

HINT:

The CAMRY is equipped with a Supplemental Restraint System (SRS) and seat belt pretensioner.
Failure to carry out the service operations in the correct sequence could cause the SRS to unexpectedly deploy during servicing and lead to serious injury.
Furthermore, if a mistake is made when servicing the SRS, it is possible that the SRS may fail to operate properly. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the following section carefully.

(a) GENERAL NOTICE

(1) Malfunction symptoms of the SRS are difficult to confirm so the Diagnostic Trouble Codes (DTCs) become the most important source of information when troubleshooting. When troubleshooting the SRS, always check the DTCs before disconnecting the battery.

(2) To avoid serious injury, servicing the SRS must be started 90 seconds after:

- The ignition switch is turned to the LOCK position.
- The negative (−) terminal cable is disconnected from the battery.

(The SRS is equipped with a back−up power source. If work is started within 90 seconds of disconnecting the negative (−) terminal cable from the battery, the SRS may deploy).
Disconnecting the negative (−) terminal cable will erase clock memory and audio system presets. Mark down data as necessary before disconnecting the cable.

CAUTION:
Never use a back−up power source (battery or other) avoid erasing system memory. The back−up power source may power the SRS, leading to a possible SRS and cause it to deploy.

(3) In minor collisions where the SRS does not deploy, the horn button assembly, instrument panel passenger airbag assembly front seat airbag assembly, curtain shield airbag assembly and seat belt pretensioner should be inspected before further use of the vehicle (See pages 60−27, 60−40, 60−53, 60−47 and 61−7).

(4) Never use SRS parts from another vehicle. When replacing parts, use new parts.

(5) Before repairs, remove the airbag sensor if impacts are likely to be applied to the sensor during repairs.

(6) Never disassemble and repair the airbag sensor assembly, horn button assembly, instrument panel passenger airbag assembly front seat airbag assembly, curtain shield airbag assembly or seat belt pretensioner.

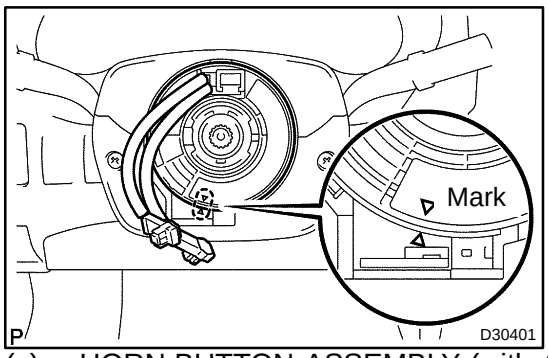
(7) Replace the center airbag sensor assembly, side airbag sensor assembly, horn button assembly or the instrument panel passenger airbag assembly front seat airbag assembly or curtain shield airbag assembly: 1) if damage has occurred from being dropped, or 2) if there are cracks, dents or other defects in the case, bracket or connector.

(8) Do not directly expose the airbag sensor assembly, front seat airbag assembly, curtain shield airbag assembly the horn button assembly, the instrument panel passenger airbag assembly or the seat belt pretensioner to hot air or flames.

(9) Use a voltmeter/ohmmeter with high impedance (10 kΩ/V minimum) for troubleshooting electrical circuits.

(10) Information labels are attached to the SRS components. Follow the instructions on the labels.

(11) After work on the SRS is completed, check the SRS warning light (see page 05−1456).



(b) SPIRAL CABLE (in Combination Switch)

(1) The steering wheel must be fitted correctly to the steering column with the spiral cable at the neutral position, otherwise cable disconnection and other problems may occur. Refer to page 60−34 concerning the correct installation of the steering wheel.

(c) HORN BUTTON ASSEMBLY (with Airbag)

(1) When removing the horn button assembly or handling a new horn button, it should be placed with the pad surface facing up. See illustration below.
Placing the horn button with the pad surface facing down may lead to a serious accident if the airbag accidently inflates. Also, do not place anything on top of the horn button.

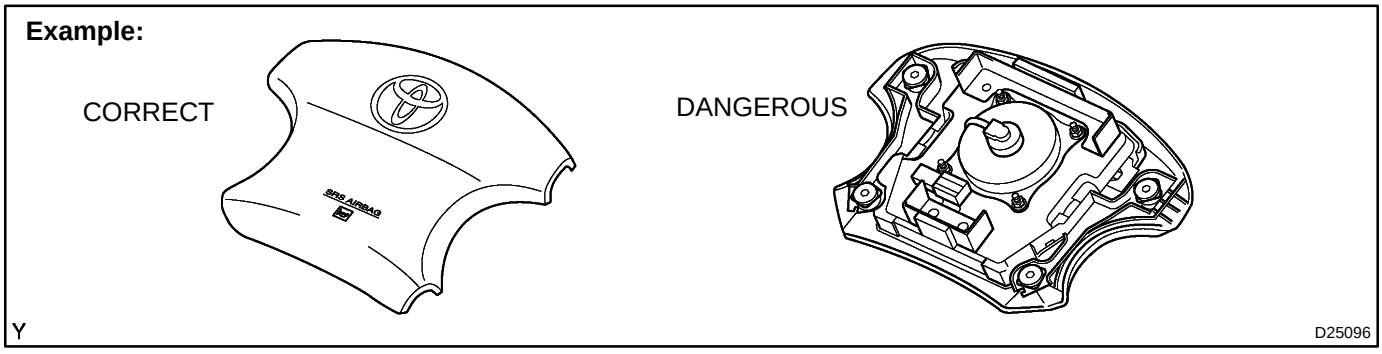
(2) Never measure the resistance of the airbag squib. This may cause the airbag to inflate, which could cause serious injury.

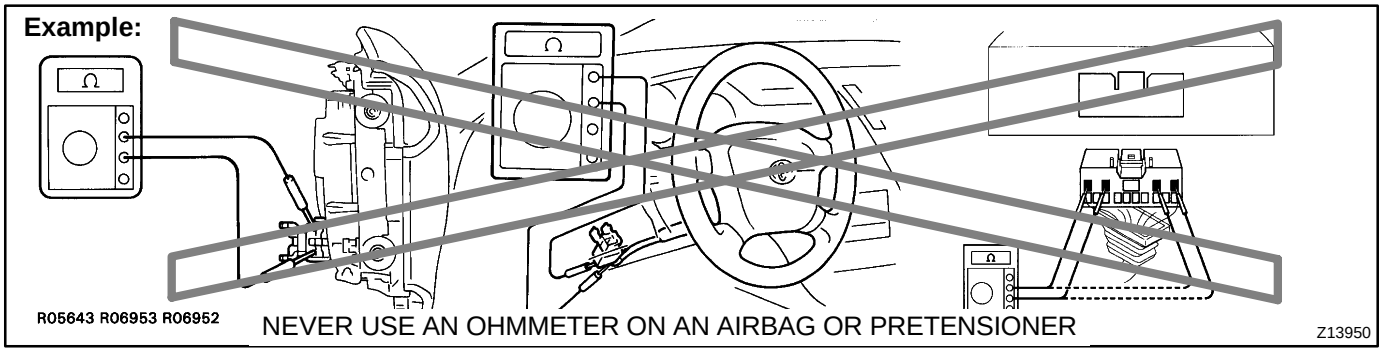
(3) Grease or detergents of any kind should not be applied to the steering wheel pad.

(4) Store the horn button assembly where the ambient temperature remains below 93˚C (200˚F), has low humidity and is away from electrical noise.

(5) When using electric welding anywhere on the vehicle, disconnect the airbag ECU connectors (4 yellow pins). These connectors contain shorting springs. This feature reduces the possibility of the airbag or seat belt pretensioner deploying due to currents entering the squib wiring.

(6) When disposing of the vehicle or the horn button assembly by itself, the airbag should be inflated using an SST before disposal (see page 60−27). Perform the operation in a safe place away from electrical noise.





(d) INSTRUMENT PANEL PASSENGER AIRBAG ASSY

(1) Always place a removed or new instrument panel passenger airbag assembly with the airbag inflation direction facing upward.
Placing the airbag assembly with the airbag inflation direction facing downward could cause a serious accident if the airbag inflates.

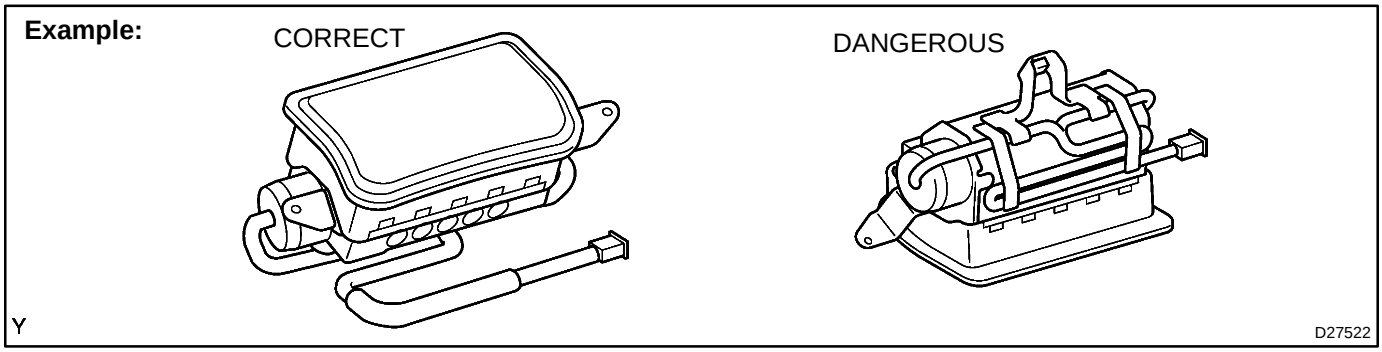
(2) Never measure the resistance of the airbag squib. This may cause the airbag to inflate, which could cause serious injury.

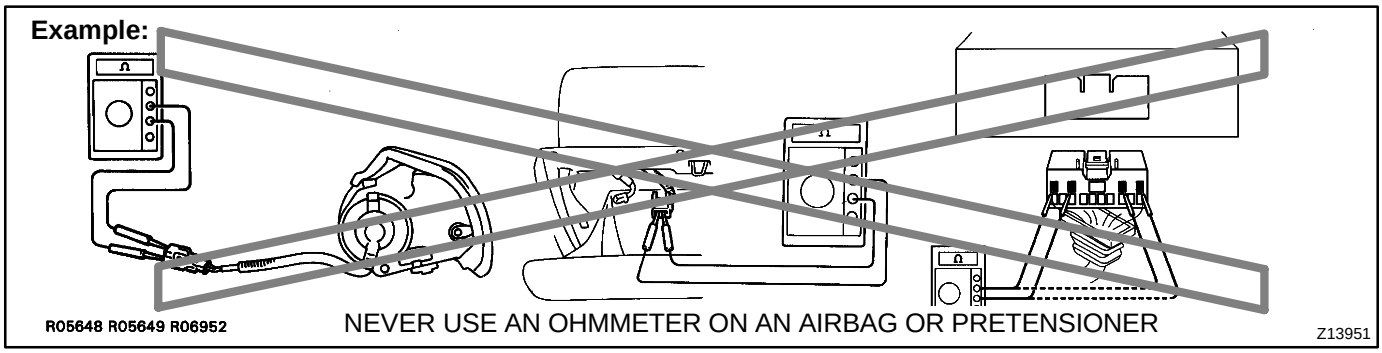
(3) Grease or detergents of any kinds should not be applied to the instrument panel passenger airbag assembly.

(4) Store the airbag assembly where the ambient temperature remains below 93˚C (200˚F), has low humidity and away from electrical noise.

(5) When using electric welding anywhere on the vehicle, disconnect the airbag ECU connectors (4 yellow pins). These connectors contain shorting springs. This feature reduces the possibility of the airbag deploying due to currents entering the squib wiring.

(6) When disposing of a vehicle or the airbag assembly unit by itself, the airbag should be deployed using SST before disposal (see page 60−40).
Activate in a safe place away from electrical noise.





(e) FRONT SEAT AIRBAG ASSEMBLY

(1) Always place a removed or new front seat airbag assembly with the airbag inflation direction facing upward. Placing the airbag assembly with the airbag inflation direction facing downward could cause a serious accident if the airbag deploys.

(2) Never measure the resistance of the airbag squib. This may cause the airbag to inflate, which is very dangerous.

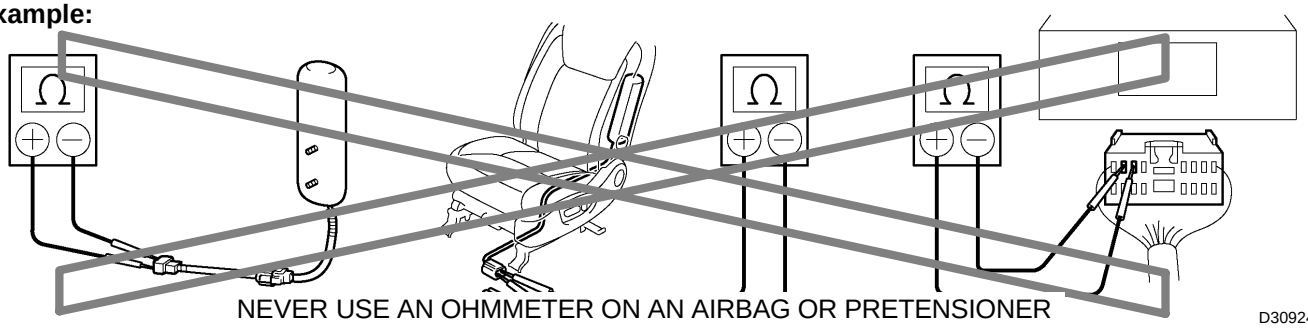
(3) Grease should not be applied to the front seat airbag assembly, and the airbag door should not be cleaned with detergents of any kind.

(4) Store the airbag assembly where the ambient temperature remains below 93˚C (200˚F), without high humidity and away from electrical noise.

(5) When using electric welding anywhere on the vehicle, disconnect the airbag ECU connectors (2 yellow pins). These connectors contain shorting springs. This feature reduces the possibility of the airbag deploying due to currents entering the squib wiring.

(6) When disposing of a vehicle or the airbag assembly unit, the airbag should be deployed using SST before disposal (see page 60−53).
Activate in a safe place away from electrical noise.

Example:



(f) CURTAIN SHIELD AIRBAG ASSEMBLY

(1) Always place the removed or new curtain shield airbag assembly in a clear plastic bag, and keep it in a safe place.

NOTICE:

Plastic bag is not re−useable.

CAUTION:

Never disassemble the curtain shield airbag assembly.

(2) Never measure the resistance of the airbag squib. This may cause the airbag to inflate, which is very dangerous.

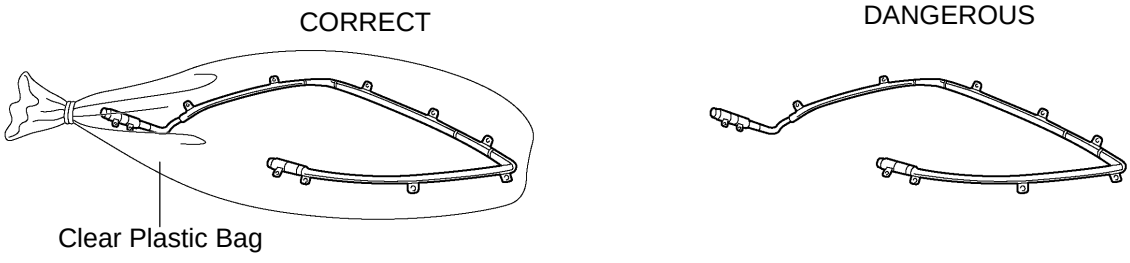
(3) Grease should not be attached to the curtain shield airbag assembly, and the surface should not be cleared with detergents of any kind.

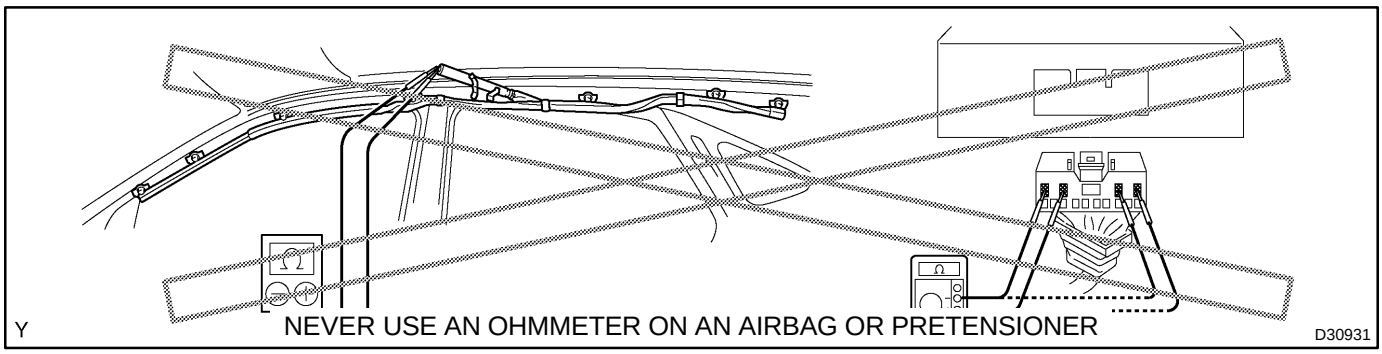
(4) Store the airbag assembly where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.

(5) When using electric welding anywhere on the vehicle, disconnect the airbag ECU connectors (2 yellow pins). These connectors contain shorting springs. This feature reduces the possibility of the airbag deploying due to currents entering the squib wiring.

(6) When disposing of a vehicle or the curtain shield airbag assembly unit, the airbag should be deployed using SST before disposal (see page 05−346).
Activate in a safe place away from electrical noise.

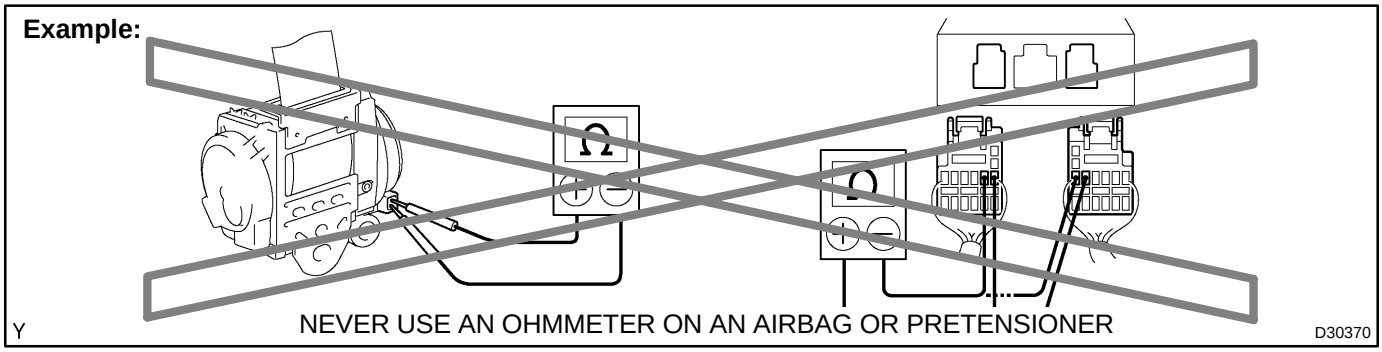
Example:





(g) SEAT BELT PRETENSIONER

(1) Never measure the resistance of the seat belt pretensioner (This may cause the seat belt pretensioner to activate, which is very dangerous).
(2) Never disassemble the seat belt pretensioner.
(3) Never install the seat belt pretensioner on another vehicle.
(4) Store the seat belt pretensioner where the ambient temperature remains below 80°C (176°F) without high humidity and away from electrical noise.
(5) When using electric welding anywhere on the vehicle, disconnect the airbag ECU connectors (2 yellow pins). These connectors contain shorting springs. This feature reduces the possibility of the airbag deploying due to currents entering the squib wiring.
(6) When disposing of a vehicle or the seat belt pretensioner unit, the seat belt pretensioner should be activated before disposal (see page 61−7). Perform the operation in a safe place away from electrical noise.
(7) The seat belt pretensioner is hot after being activated, so allow some time for it to cool down sufficiently before disposal. Never apply water to cool down the seat belt pretensioner.
(8) Oil or water should not be put on the front seat outer belt, and the front seat outer belt should not be cleaned with detergents of any kind.

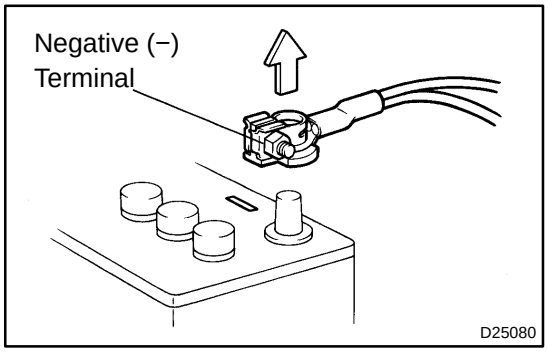


(h) AIRBAG SENSOR ASSEMBLY

(1) Never reuse an airbag sensor assembly that has been involved in a collision where the SRS has deployed.
(2) The connectors to the airbag sensor assembly should be connected or disconnected with the sensor mounted on the floor. If the connectors are connected or disconnected while the airbag sensor assembly is not mounted to the floor, it could cause accidental deployment of the SRS.
(3) Work must be started at last 90 seconds after the ignition switch is turned to the LOCK position and the negative (−) terminal cable is disconnected from the battery, even if only loosening the set bolts of the airbag sensor assembly.

(i) WIRE HARNESS AND CONNECTOR

(1) The SRS wire harness is integrated with the instrument panel wire harness assembly. All the connectors in the system are a standard yellow color. If the SRS wire harness becomes disconnected or the connector becomes broken, repair or replace it.



3. ELECTRONIC CONTROL

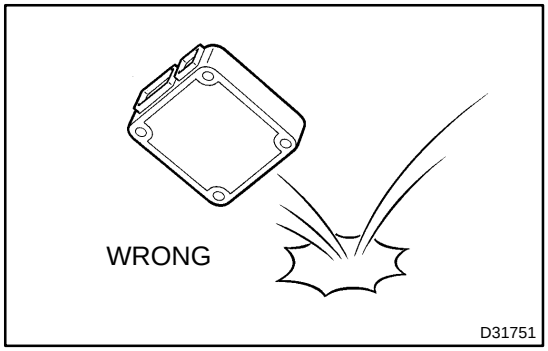
(a) REMOVAL AND INSTALLATION OF BATTERY TERMINAL

(1) Before performing electronic work, disconnect the battery negative (−) terminal cable beforehand to prevent component and wire damage caused by accidental short circuits.

(2) When disconnecting and installing the terminal cable, turn the ignition switch and lighting switch OFF and loosen the terminal nut completely. Perform these operations without twisting or prying the terminal. Remove the battery cable from battery post.

(3) Clock settings, radio settings, DTCs and other data are erased when the battery cable is removed. Before removing the battery cable, record any necessary data.

(4) When disconnecting the battery's negative (−) terminal cable, re−initialize the following systems after the completion of the operation.



(b) HANDLING OF ELECTRONIC PARTS

(1) Do not open the cover or case of the ECU unless absolutely necessary. If the IC terminals are touched, the IC may be rendered inoperative by static electricity.

(2) To disconnect electronic connectors, pull the connector itself, not the wires.

(3) Be careful not to drop electronic components, such as sensors or relays. If they are dropped on a hard floor, they should be replaced.

(4) When cleaning the engine with steam, protect the electronic components, air filter and emission−related components from water.

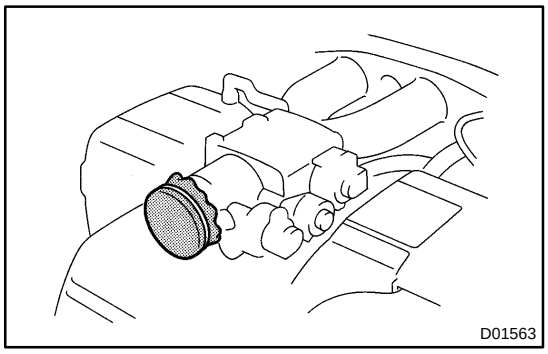
(5) Never use an impact wrench to remove or install temperature switches or temperature sensors.

(6) When checking the continuity at the wire connector, insert the tester probe carefully to prevent terminals from bending.

4. REMOVAL AND INSTALLATION OF FUEL CONTROL PARTS

(a) PLACE FOR REMOVING AND INSTALLING OF FUEL SYSTEM PARTS
  (1) Work in a place with good air ventilation and without any ignition sources, such as a welder, grinder, drill, electric motor or stove.
  (2) Never work in a place such as a pit or near a pit because vaporized fuel will collect in those places.

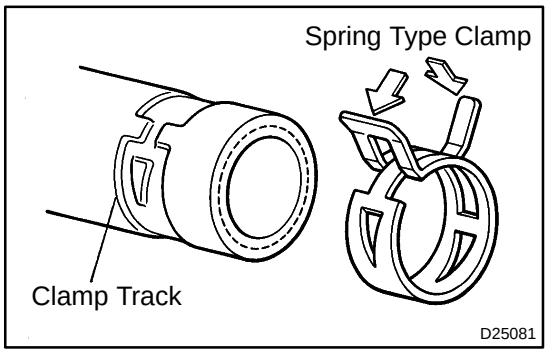
(b) REMOVING AND INSTALLING OF FUEL SYSTEM PARTS
  (1) Prepare a fire extinguisher before starting operation.
  (2) To prevent static electricity, install a ground on the fuel changer, vehicle and fuel tank, and do not spray the area with water. The work surface will become slippery. Do not clean up spills with water as this will spread and gasoline and create a fire hazard.
  (3) Never use any electric equipment like an electric motor or a working light, as they may create sparks or high temperatures.
  (4) Never use an iron hammer, as it may create sparks.
  (5) Dispose of fuel−contaminated shop rags separately using a fire restraint container.



D01563

5. REMOVAL AND INSTALLATION OF ENGINE INTAKE PARTS

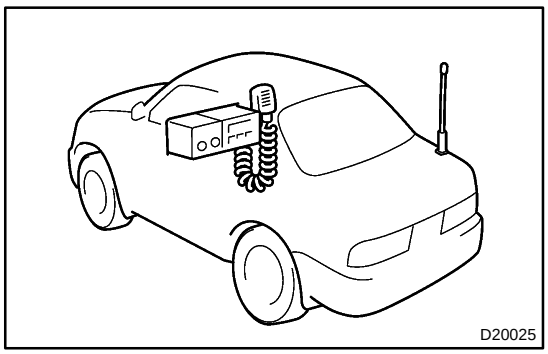
(a) If any metal particle enters the inlet pass, this may damage the engine.
(b) When removing and installing the inlet system parts, cover the openings of the removed parts and engine openings. Use clean shop rags, gummed tape, or other suitable materials.
(c) When installing the inlet system parts, check that no metal particles have entered the engine or the installed part.



D25081

6. HANDLING OF HOSE CLAMPS

(a) Before removing the hose, check the clamp position so that you can restore it in the same way.
(b) Replace deformed or dented clamps with a new one.
(c) When reusing a hose, attach the clamp on the clamp track portion of the hose.
(d) For a spring type clamp, you may want to spread the tabs slightly after installation by pushing in the direction of the arrow marks as shown in the illustration.



D20025

7. FOR VEHICLES EQUIPPED WITH MOBILE COMMUNICATION SYSTEMS

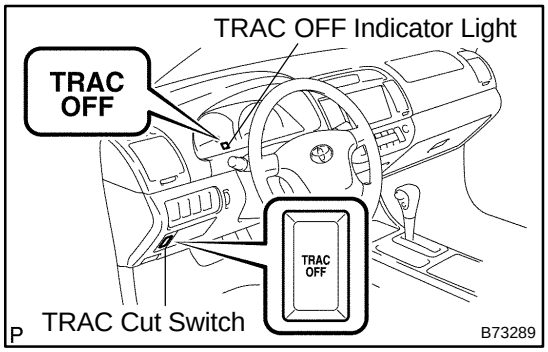
(a) Install the antenna as far away from the ECU and sensors of the vehicle electronic systems as possible.
(b) Install an antenna feeder at least 20 cm (7.87 in.) away from the ECU and sensors of the vehicle electronic systems. For details of the ECU and sensors locations, refer to the section on applicable components.
(c) Keep the antenna and feeder separate from other wirings as much as possible. This will prevent signals from the communication equipment from affecting vehicle equipment and vice−versa.
(d) Check that the antenna and feeder are correctly adjusted.
(e) Do not install any high−powered mobile communication system.

8. FOR VEHICLES EQUIPPED WITH TRACTION CONTROL (TRAC) SYSTEM

When using a 2−wheel drum tester such as a speedometer tester, a combination tester of speedometer and brake, chassis dynamometer, or jacking up the front wheels and driving the wheels, always turn the TRAC system off via the TRAC OFF switch before testing.

NOTICE:

TRAC system OFF condition can be confirmed by the "TRAC OFF" warning indicator light in the combination meter.



(a) Confirm TRAC system is OFF

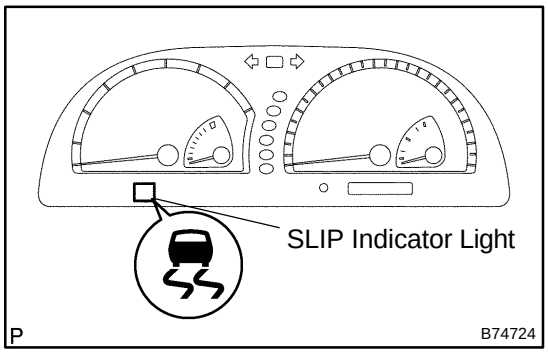
(1) Press the TRAC cut ("TRAC OFF") switch to turn off the TRAC system.

(2) Check if the TRAC OFF indicator light illuminates.

HINT:

The SLIP indicator light should always operate right after the engine is restarted.

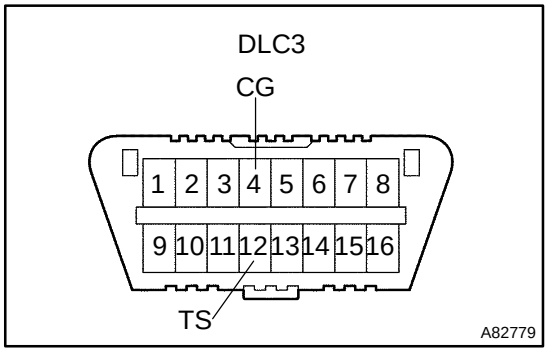
(3) Begin testing.



(4) Press the TRAC cut switch to turn on the TRAC system and check that the TRAC OFF indicator light turns off.

HINT:

The SLIP indicator light blinks when the TRAC system is operating.



9. FOR VEHICLES EQUIPPED WITH VEHICLE SKID CONTROL (VSC) SYSTEM

(a) NOTICES WHEN USING DRUM TESTER

(1) Before beginning testing, disable the Vehicle Skid Control system (VSC). To disable the VSC, turn the ignition switch OFF and connect SST to terminals TS and CG of DLC3.

SST 09843−18040

NOTICE:

- **Confirm that the VSC warning light blinks.**
- **VSC system will be reset when the engine is restarted.**
- **For safety, secure the vehicle with restraint chains while using a wheel dynamometer.**

(b) NOTICES OF RELATED OPERATIONS TO VSC

(1) Do not carry out unnecessary installation and removal as it might affect the adjustment of VSC related parts.

(2) Be sure to follow the instructions for work preparation and final confirmation of proper operation of the VSC system.

10. FOR VEHICLES EQUIPPED WITH CATALYTIC CONVERTER

CAUTION:

If a large amount of unburned gasoline or gasoline vapors flow into the converter, it may cause overheat and create a fire hazard. To prevent this, observe the following precautions.

(a) Use only unleaded gasoline.

(b) Avoid prolonged idling.
Avoid idling the engine for more than 20 minutes.

(c) Avoid a spark jump test.
(1) Perform a spark jump test only when absolutely necessary. Perform this test as rapidly as possible.
(2) While testing, never race the engine.

(d) Avoid a prolonged engine compression measurement.
Engine compression measurements must be performed as rapidly as possible.

(e) Do not run the engine when the fuel tank is nearly empty. This may cause the engine to misfire and create an extra load on the converter.

01043−07

VEHICLE LIFT AND SUPPORT LOCATIONS

1. NOTICE ABOUT VEHICLE CONDITION WHEN JACKING UP THE VEHICLE

(a) The vehicle must be unloaded before jacking up the vehicle. Never jack up/lift up a heavily loaded vehicle.

(b) When removing heavy equipment such as the engine and transmission, the center of gravity of the vehicle may shift. To stabilize the vehicle: place a balance weight in a location where it will not roll or shift; or use a mission jack to hold the jacking support.

2. NOTICE FOR USING 4 POST LIFT

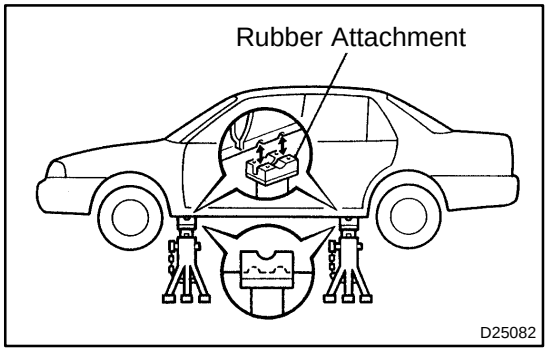
(a) Follow the safety procedures outlined in its instruction manual.

(b) Use precautionary measures to prevent the free wheel beam from damaging tires or wheels.

(c) Use wheel chocks to secure the vehicle.

3. NOTICE FOR USING JACK AND SAFETY STAND

(a) Work in a flat area using wheel chocks at all times.



(b) Use a safety stand with a rubber attachment, as shown in the illustration.

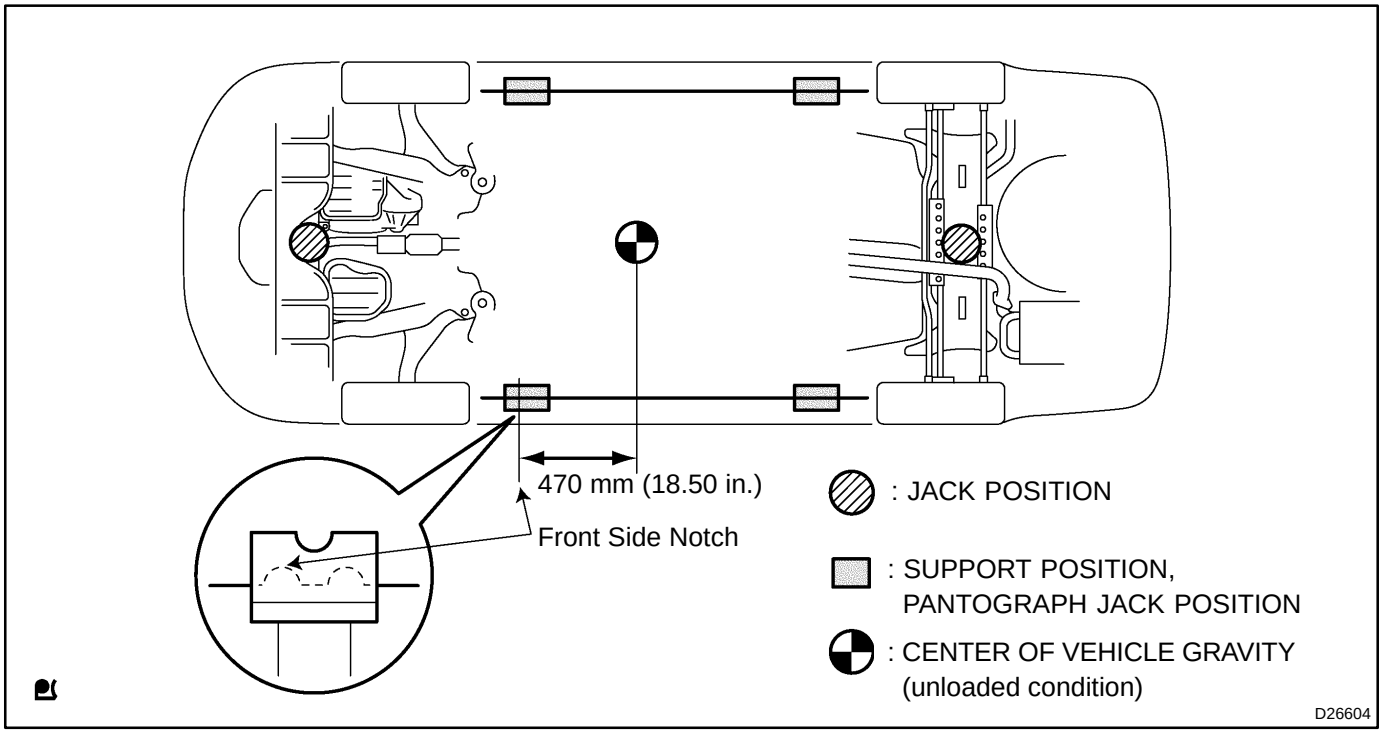
(c) Apply the jack and rigid rack to the specified location on the vehicle.

(d) When jacking up the front wheels, release the parking brake and place wheel chocks only behind the rear wheels. When jacking up the rear wheels, place wheel chocks only in front of the front wheels.

(e) The jack should not be used without the rigid rack.

(f) When jacking up only the front wheels or only the rear wheels, place wheel chocks on both sides of the wheels touching the ground.

(g) When lowering the vehicle with its front wheels jacked up, release the parking brake and place wheel chocks only in front of the rear wheels. When lowering a vehicle with its rear wheels jacked up, place wheel chocks only behind the front wheels.



4. NOTICE FOR USING SWING ARM TYPE LIFT

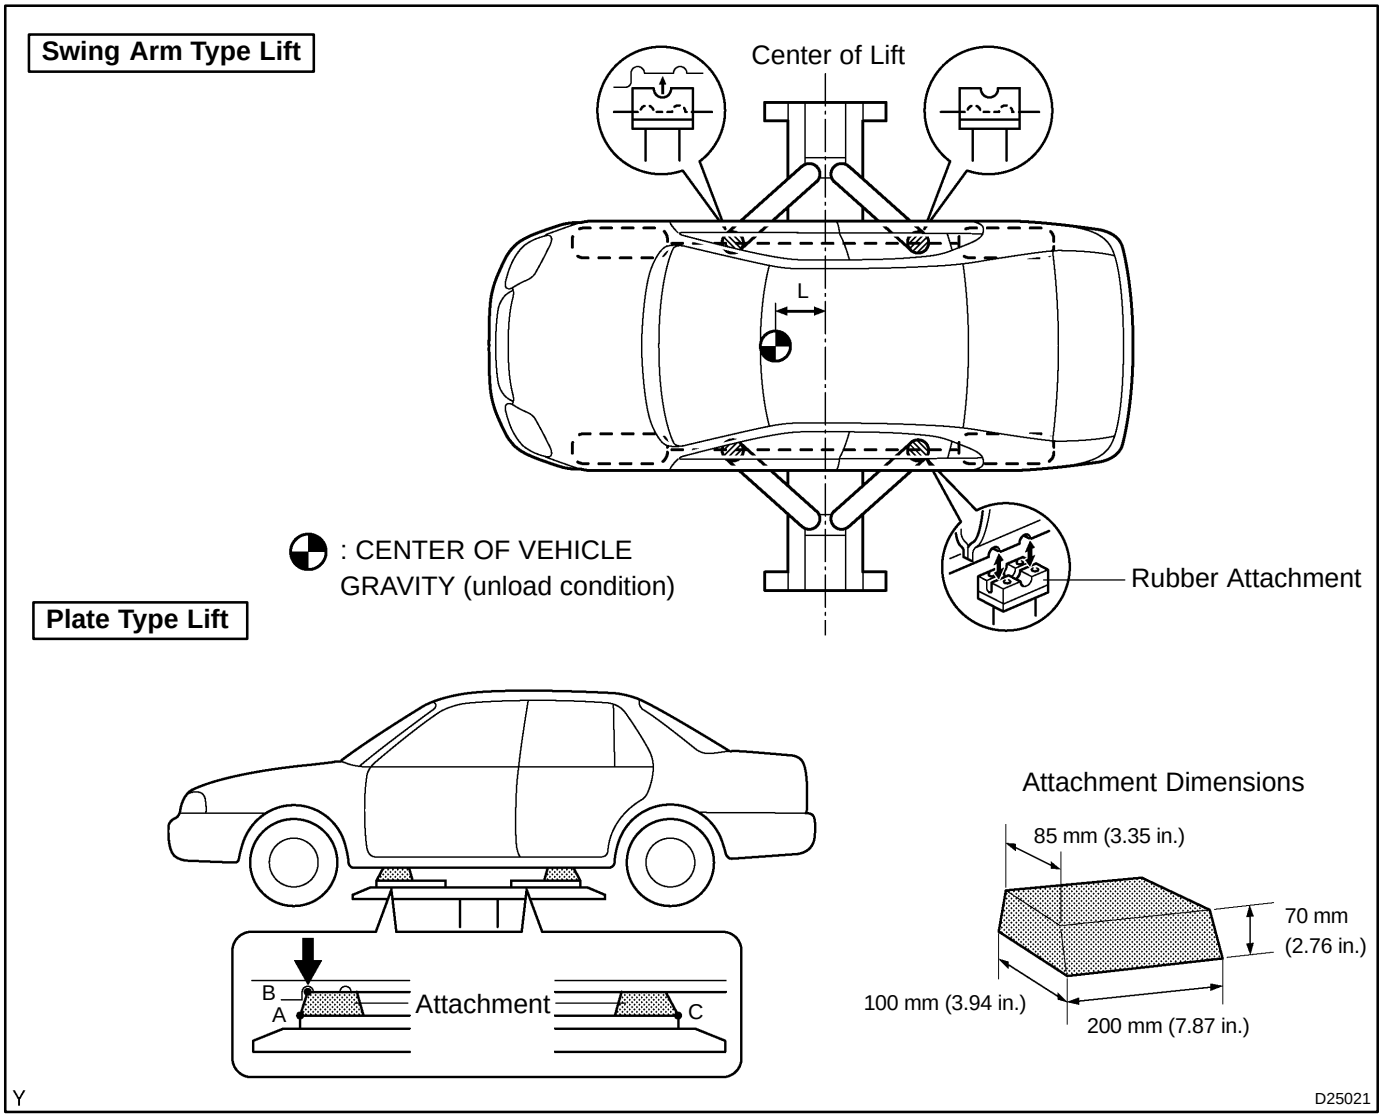
(a) Follow safety procedures outlined in its instruction manual.
(b) Use a swing arm equipped with a rubber attachment, as shown in the illustration.
(c) When using the lift, its center should be as close to the vehicle's center of gravity as possible.
(d) Set the vehicle on the lift as level as possible. Then match the groove of the cradle to the rigid rack support location.
(e) Be sure to lock the swing arms before lifting and during work (if equipped with arm locks).
(f) Lift the vehicle up off the ground. Stand at a safe distance and shake the vehicle to check its stability.

5. NOTICE FOR USING PLATE TYPE LIFT

(a) Follow safety procedures outlined in its instruction manual.
(b) Use a plate lift attachments (rubber lifting blocks) on top of the plate surface.
(c) Refer to the table below to determine how to properly set the vehicle.

Right and left set position	Place the vehicle over the center of the lift.
Front and rear set position	Place the attachments at the ends of the rubber plate surface, under the vehicle lift pad (A and C in the illustration). Raise the plate slightly and reposition the vehicle so the top of the attachment (B in the illustration) is aligned with the front side notch in the vehicle rocker flange.

(d) Lift the vehicle up off the ground, and shake it to make sure that it is stable.



HOW TO TROUBLESHOOT ECU CONTROLLED SYSTEMS

01044–19

GENERAL INFORMATION

A large number of ECU controlled systems are used in the CAMRY. In general, ECU controlled systems are considered to be very intricate, requiring a high level of technical knowledge to troubleshoot. However, most problem checking procedures only involve inspecting the ECU controlled system's circuits one by one. An adequate understanding of the system and a basic knowledge of electricity is enough to perform effective troubleshooting, accurate diagnoses and necessary repairs. Detailed information and troubleshooting procedures on major ECU controlled systems in this vehicle are outlined below:

FOR USING OBD II SCAN TOOL OR HAND−HELD TESTER

- Before using the scan tool or tester, the scan tool's instruction book or tester's operator manual should be read thoroughly.
- If scan tool or tester cannot communicate with the ECU controlled systems when you have connected the cable of the tester to the DLC3 with the ignition switch and tester turned ON, there is a problem on the vehicle side or tester side.
  (1) If communication is normal when the tester is connected to another vehicle, inspect the diagnosis data link line (Bus ± line) or ECU power circuit of the vehicle.
  (2) If communication is still impossible when the tester is connected to another vehicle, the problem is probably in the tester itself, so perform the Self Test procedures outlined in the Tester Operator's Manual.

CUSTOMER PROBLEM ANALYSIS

HINT:

In troubleshooting, the problem symptoms must be confirmed accurately. Preconceptions should be discarded in order to give an accurate judgement. To clearly understand what the problem symptoms are, it is extremely important to ask the customer about the problem and the conditions at the time it occurred.

As much information as possible should be gathered for the reference, even past problems that seem unrelated may help in some cases. In the Diagnostic section, a customer problem analysis table is provided for each system.

5 items are important points in the problem analysis:

SYMPTOM CONFIRMATION AND DIAGNOSTIC TROUBLE CODE

HINT:

The diagnostic system in the CAMRY has various functions.

The first function is the Diagnostic Trouble Code (DTC) check. In a DTC check, a previous malfunction's DTC can be checked by a technician during troubleshooting. (A DTC is a code stored in the ECU memory whenever a malfunction in the signal circuits to the ECU occurs.)

Another function is the Input Signal Check, which checks if the signals from various switches are sent to the ECU correctly.

By using these functions, the problem areas can be narrowed down and troubleshooting is more effective.

Diagnostic functions are incorporated in the following systems in the CAMRY:

System	Diagnostic Trouble Code Check	Input Signal Check (Sensor Check)	Diagnostic Test Mode (Active Test)
SFI System	○ (with Check Mode)	○	○
Electronically Controlled Automatic Transmission [ECT]	○ (with Check Mode)	○	
Engine Immobiliser System	○		

In the DTC check, it is very important to determine whether the problem indicated by the DTC is: 1) still occurring, or 2) occurred in the past but has since returned to normal. In addition, the DTC should be compared to the problem symptom to see if they are related. For this reason, DTCs should be checked before and after confirmation of symptoms (i.e., whether or not problem symptoms exist) to determine current conditions, as shown in the table below.

Never skip the DTC check. Failure to check DTCs may, depending on the case, result in unnecessary troubleshooting for systems operating normally or lead to repairs not pertinent to the problem. Follow the procedures listed above in the correct order.

A flow chart showing how to proceed with troubleshooting using the DTC check is shown below. Directions from the flow chart will indicate how to proceed either to DTC troubleshooting or to the troubleshooting of the problem symptoms table.

TROUBLESHOOTING OF EACH PROBLEM SYMPTOM

The problem is still occurring in a place other than the diagnostic circuit (the DTC displayed first is either for a past problem or a secondary problem).

SYMPTOM SIMULATION

HINT:

The most difficult case in troubleshooting is when no problem symptoms occur. In such cases, a thorough customer problem analysis must be carried out. A simulation of the same or similar conditions and environment in which the problem occurred in the customer's vehicle should be carried out. No matter how much skill or experience a technician has, troubleshooting without confirming the problem symptoms will lead to important repairs being overlooked and lead to mistakes or delays.

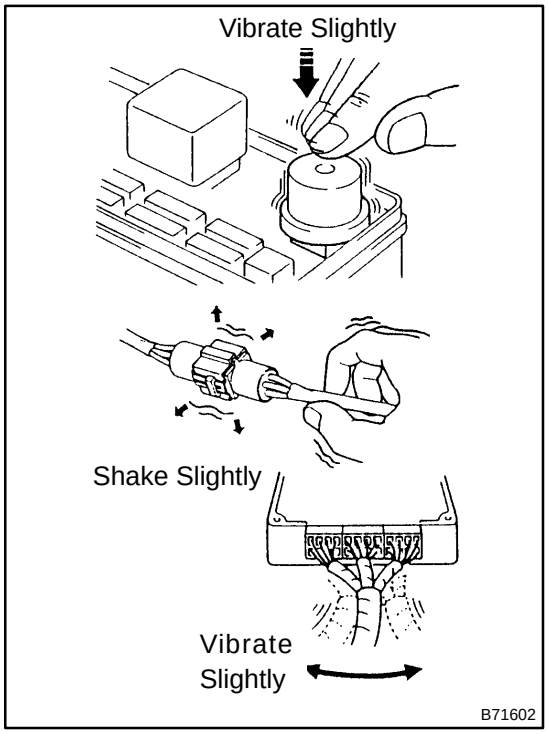
For example:

With a problem that only occurs when the engine is cold or occurs as a result of vibration caused by the road during driving, the problem can never be determined if the symptoms are being checked on a stationary vehicle or a vehicle with a warmed−up engine.

Vibration, heat or water penetration (moisture) is difficult to reproduce. The symptom simulation tests below are effective substitutes for the conditions and can be applied on a stationary vehicle.

Important points in the symptom simulation test:

In the symptom simulation test, the problem symptoms as well as the problem area or parts must be confirmed. First, narrow down the possible problem circuits according to the symptoms. Then, connect the tester and carry out the symptom simulation test, judging whether the circuit being tested is defective or normal. Also, confirm the problem symptoms at the same time. Refer to the problem symptoms table for each system to narrow down the possible causes.



1. VIBRATION METHOD: When vibration seems to be the major cause.

(a) PART AND SENSOR

(1) Apply slight vibration with a finger to the part of the sensor considered to be the cause of the problem and check whether or not the malfunction occurs.

HINT:

Applying strong vibration to relays may open relays.

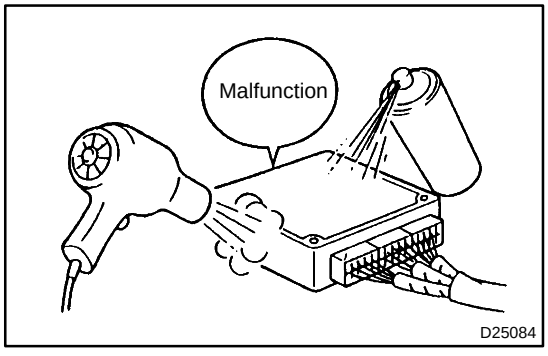
(b) CONNECTORS

(1) Slightly shake the connector vertically and horizontally.

(c) WIRE HARNESS

(1) Slightly shake the wire harness vertically and horizontally.

The connector joint and fulcrum of the vibration are the major areas that should be checked thoroughly.

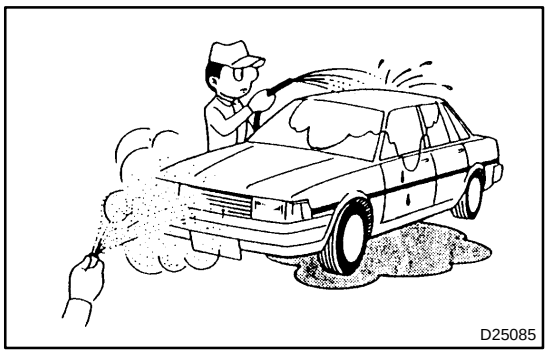


2. HEAT METHOD: If the problem seems to occur when the area in question is heated.

(a) Heat the component that is the possible cause of the malfunction with a hair dryer or similar device. Check if the malfunction occurs.

NOTICE:

- **Do not heat to more than 60°C (140°F). Exceeding this temperature may damage components.**
- **Do not apply heat directly to the parts in the ECU.**



3. WATER SPRINKLING METHOD: When the malfunction seems to occur on a rainy day or in high−humidity.

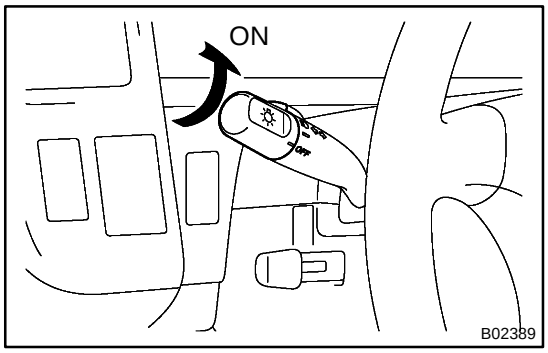
(a) Sprinkle water onto the vehicle and check if the malfunction occurs.

NOTICE:

- **Never sprinkle water directly into the engine compartment. Indirectly change the temperature and humidity by applying water spray onto the front of the radiator.**
- **Never apply water directly onto the electronic components.**

HINT:

If the vehicle has or had a water leakage problem, the leakage may have damaged the ECU or connections. Look for evidence of corrosion or shorts. Proceed with caution during water tests.



4. HIGH ELECTRICAL LOAD METHOD: When a malfunction seems to occur when electrical load is excessive.

(a) Turn on all the electrical loads including the heater blower, headlights, rear window defogger, etc., and check if the malfunction occurs.

PROBLEM SYMPTOMS TABLE

The suspected circuits or parts for each problem symptom are shown in the table below. Use this table to troubleshoot when, during a DTC check, a ”Normal” code is displayed but the problem is still occurring. Numbers in the table show the inspection order in which the circuits or parts should be checked.

HINT:

In some cases, the problem is not detected by the diagnostic system even though a problem symptom is present. It is possible that the problem is occurring outside the detection range of the diagnostic system, or that the problem is occurring in a completely different system.

DTC P0500/42 VEHICLE SPEED SENSOR MALFUNCTION

CIRCUIT DESCRIPTION

The vehicle speed sensor outputs a 4–pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. After this signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter, it is then transmitted to the Engine ECU. The Engine ECU determines the vehicle speed based on the frequency of these pulse signals

DTC No.	DTC Detecting Condition	Trouble Area
P0500/42	During vehicle is being driven, no vehicle speed sensor signal to engine ECU (2 trip detection logic)	• Combination meter • Open or short in No.1 vehicle speed sensor circuit • No.1 vehicle speed sensor • Engine ECU

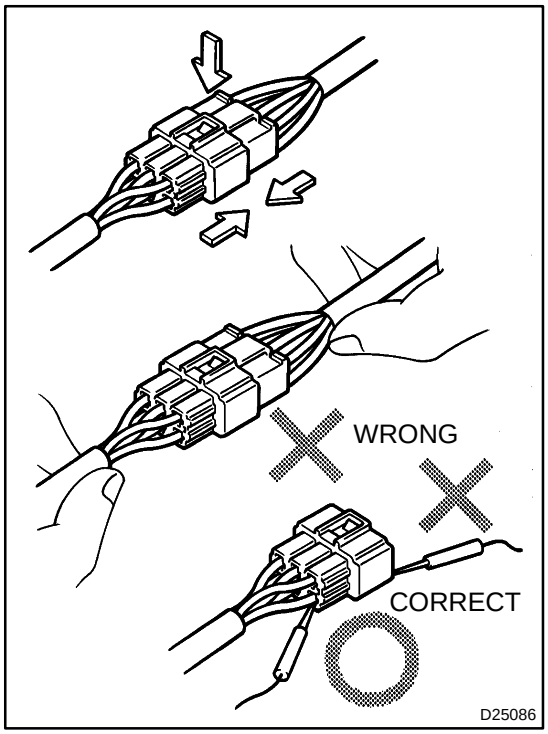
ELECTRONIC CIRCUIT INSPECTION PROCEDURE

1. BASIC INSPECTION

(a) RESISTANCE MEASURING CONDITION OF ELECTRONIC PARTS

(1) Unless stated, all resistance is measured at an ambient temperature of 20°C (68°F). Resistances measured may be outside the specifications if measured at high temperatures, i.e. immediately after the vehicle has been running. Measurements should be made after the engine has cooled down.



(b) HANDLING CONNECTORS

(1) When disconnecting a connector, first squeeze the mating halves tightly together to release the lock, then press the lock claw and separate the connector.

(2) When disconnecting a connector, do not pull on the harnesses. Grasp the connector directly and separate it.

(3) Before connecting the connector, check that there are no deformed, damaged, loose or missing terminals.

(4) When connecting a connector, press firmly until you hear the lock close with a ”click” sound.

(5) If checking the connector with a TOYOTA electrical tester, check it from the backside (harness side) of the connector using a mini test lead.

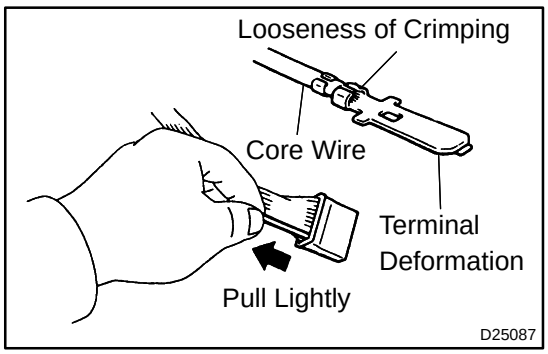
NOTICE:

- **As a waterproof connector cannot be checked from the backside, check by connecting a sub−harness.**
- **Do not damage the terminals by moving the inserted tester needle.**

(c) CHECKING CONNECTORS

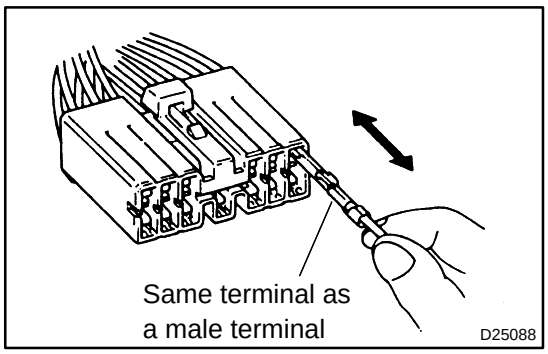
(1) Checking when the connector is connected:
Squeeze the connector together to confirm that it is fully inserted and locked.

(2) Checking when the connector is disconnected:
Check by pulling the wire harness lightly from the backside of the connector. Look for unlatched terminals, missing terminals, loose crimps or broken conductor wires.
Check visually for corrosion, metallic or foreign objects and water; and bent, rusted, overheated, contaminated, and deformed terminals.

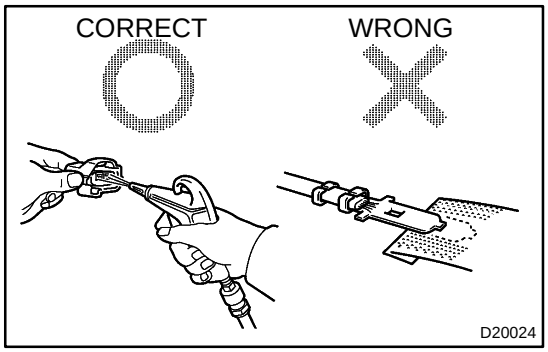


NOTICE:

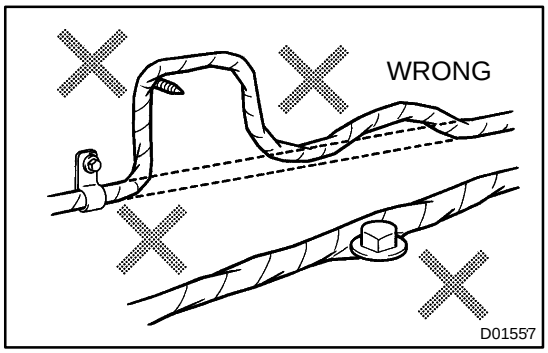
When testing a gold−plated female terminal, always use a gold−plated male terminal.



(3) Checking the contact pressure of the terminal:
Prepare a spare male terminal. Insert it into a female terminal, and check for good tension when inserting and after full engagement.

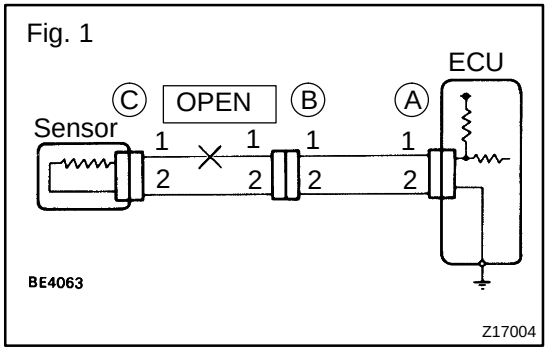


(d) REPAIR METHOD OF CONNECTOR TERMINAL
(1) If there is any dirt on the terminal, clean the contact point using an air gun or shop rag. Never polish the contact point using a sandpaper as the platings may come off.
(2) If there is abnormal contact pressure, replace the female terminal. If the male terminal is gold−plated (gold color), use a gold−plated female terminal; if it is silver−plated (silver color), use a silver−plated female terminal.
(3) Damaged, deformed, or corroded terminals should be replaced. If the terminal will not lock into the housing, the housing may have to be replaced.



(e) HANDLING OF WIRE HARNESS
(1) If removing a wire harness, check the wiring and clamping before proceeding so that it can be restored in the same way.
(2) Never twist, pull or slacken the wire harness more than necessary.
(3) Never make the wire harness come into contact with a high temperature part, rotating, moving, vibrating or sharp−edged parts. Avoid panel edges, screw tips and similar sharp items.
(4) When installing parts, never pinch the wire harness.
(5) Never cut or break the cover of the wire harness. If it is cut or broken, replace it or securely repair it with vinyl tape.

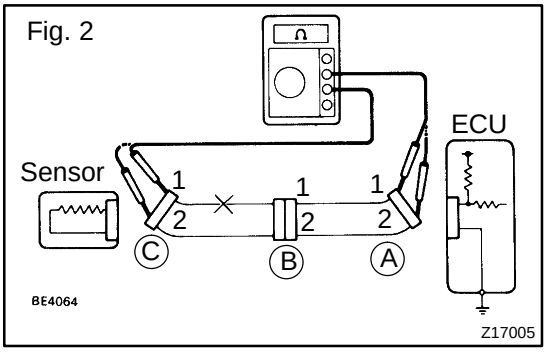
Fig. 1



2. CHECK OPEN CIRCUIT

(a) For an open circuit in the wire harness in Fig. 1, perform a resistance check (step b) or a voltage check (step c).

Fig. 2



(b) Check the resistance.

(1) Disconnect connectors A and C and measure the resistance between them.

Resistance: Below 1 Ω

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

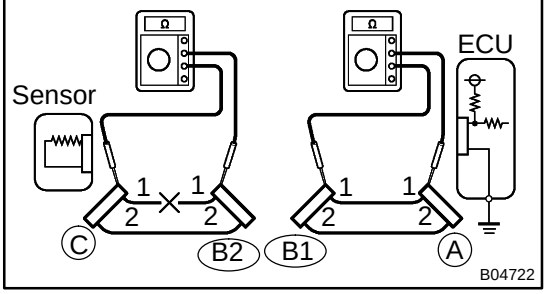
Fig. 2:

Between terminal 1 of connector A and terminal 1 of connector C → 10 kΩ or higher

Between terminal 2 of connector A and terminal 2 of connector C → Below 1 Ω

If your results match the examples above, an open circuit exists between terminal 1 of connector A and terminal 1 of connector C.

Fig. 3



(2) Disconnect connector B and measure the resistance between the connectors.

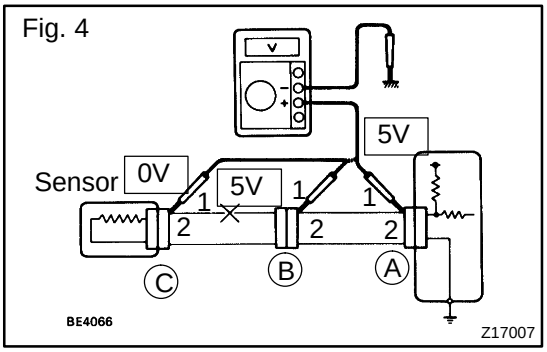
Fig. 3:

Between terminal 1 of connector A and terminal 1 of connector B1 → Below 1 Ω

Between terminal 1 of connector B2 and terminal 1 of connector C → 10 kΩ or higher

If your results match the examples above, an open circuit exists between terminal 1 of connector B2 and terminal 1 of connector C.

Fig. 4



(c) Check the voltage.

(1) In a circuit in which voltage is applied to the ECU connector terminal, an open circuit can be checked by conducting a voltage check.

Fig. 4:

With each connector still connected, measure the voltage between the body ground and terminal 1 of connector A at the ECU 5 V output terminal, terminal 1 of connector B and terminal 1 of connector C, in that order.

(2) Example results:

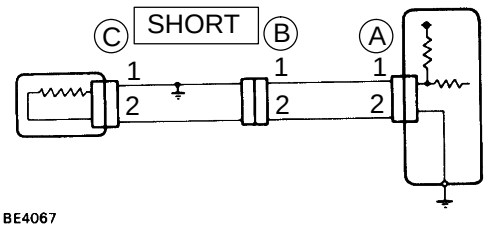
5 V: Between terminal 1 of connector A and body ground

5 V: Between terminal 1 of connector B and body ground

0 V: Between terminal 1 of connector C and body ground

If your results match the examples above, an open circuit exists in the wire harness between terminal 1 of B and terminal 1 of C.

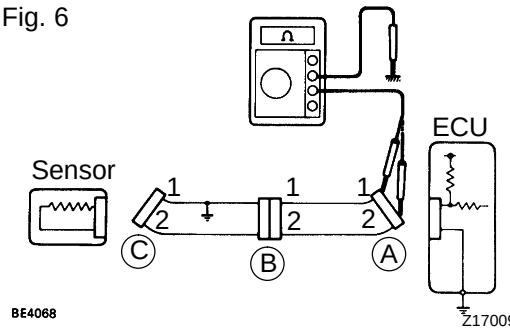
Fig. 5



3. CHECK SHORT CIRCUIT

(a) If the wire harness is ground shorted (Fig. 5), locate the section by conducting a resistance check with the body ground (below).

Fig. 6



(b) Check the resistance with the body ground.

(1) Disconnect connectors A and C and measure the resistance between terminals 1 and 2 of connector A and the body ground.

Resistance: 10 kΩ or higher

HINT:

Measure the resistance while lightly shaking the wire harness vertically and horizontally.

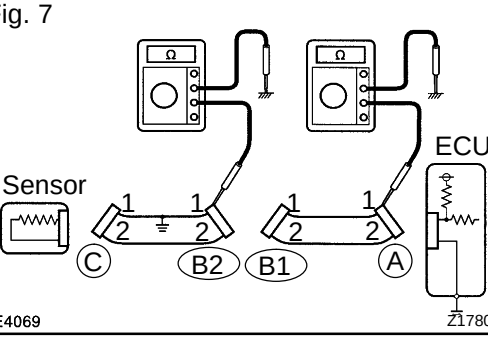
Fig. 6:

Between terminal 1 of connector A and body ground → Below 1 Ω

Between terminal 2 of connector A and body ground → 10 kΩ or higher

If your results match the examples above, a short circuit exists between terminal 1 of connector A and terminal 1 of connector C.

Fig. 7



(2) Disconnect connector B and measure the resistance between terminal 1 of connector A and the body ground, and terminal 1 of connector B2 and the body ground.

Fig. 7:

Between terminal 1 of connector A and body ground → 10 kΩ or higher

Between terminal 1 of connector B2 and body ground → Below 1 Ω

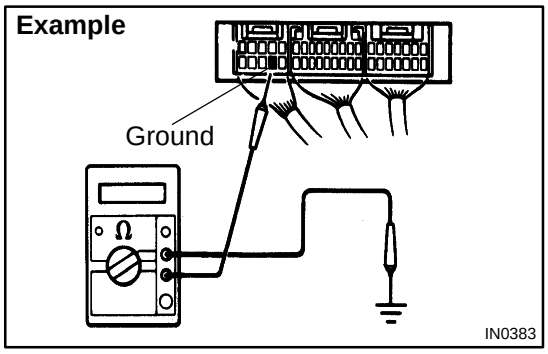
If your results match the examples above, a short circuit exists between terminal 1 of connector B2 and terminal 1 of connector C.

4. CHECK AND REPLACE ECU

NOTICE:

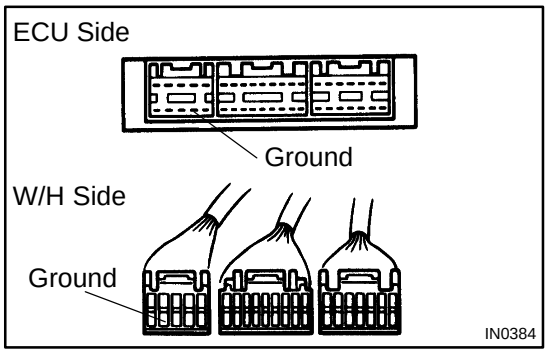
- **Start an inspection of the connector from the backside of the connector at the wire harness side with the connector connected to the ECU.**
- **When no measuring condition is specified, perform the inspection with the engine stopped and the ignition switch ON.**
- **Check that the connectors are fully seated. Check for loose, corroded or broken wires.**

(a) First check the ECU ground circuit. If it is faulty, repair it. If it is normal, the ECU could be faulty. Replace the ECU with a normal functioning one and check if the symptoms occur. If the trouble symptoms stop, replace the ECU.



(1) Measure the resistance between the ECU ground terminal and body ground.

Resistance: Below 1 Ω



(2) Disconnect the ECU connector. Check the ground terminals (on the ECU side and wire harness side) for evidence of bending, corrosion or foreign material. Lastly check the contact pressure of the female terminals.

ADJUSTMENT

1. **REMOVE FRONT WHEEL RH**
2. **REMOVE FRONT FENDER APRON SEAL RH**
3. **REMOVE ENGINE COVER SUB−ASSY NO.1**
4. **REMOVE SPARK PLUG**
5. **DISCONNECT VENTILATION HOSE**

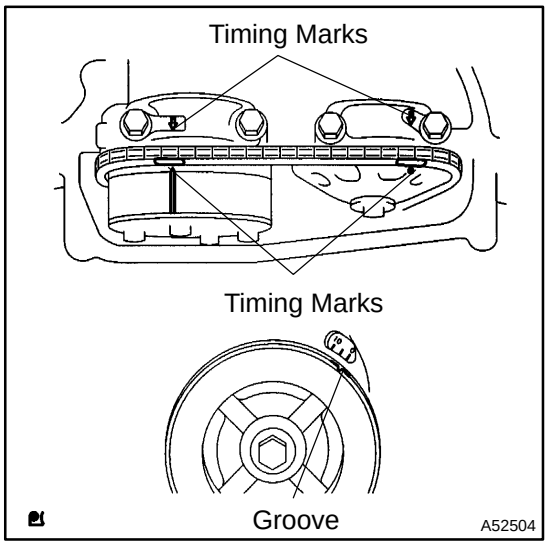
8. REMOVE CYLINDER HEAD COVER SUB−ASSY

(a) Remove the bolt and disconnect the engine wire harness clamp.

(b) Remove the 8 bolts, 2 nuts, cylinder head cover and gasket.



9. SET NO. 1 CYLINDER TO TDC/COMPRESSION

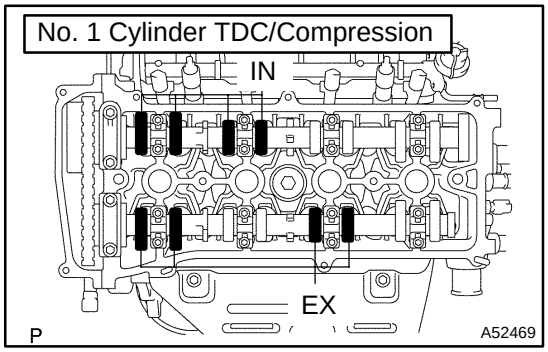
(a) Turn the crankshaft pulley, and align its groove with timing mark 0 of the timing chain cover.

(b) Check that the timing marks of the camshaft timing gear and sprocket are aligned with the timing marks of bearing caps No. 1 and No. 2, as shown in the illustration.

10. INSPECT VALVE CLEARANCE

HINT:

Inspect and adjust the valve clearance when the engine is cold.

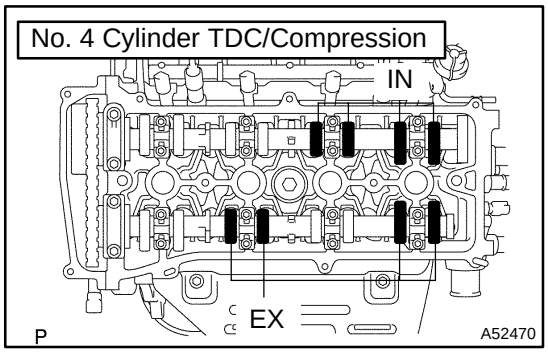


(a) Check only the valves indicated on the left.
   (1) Using a feeler gauge, measure the clearance between each valve lifter and camshaft.
   (2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.19 to 0.29 mm (0.008 to 0.011 in.)
Exhaust	0.30 to 0.40 mm (0.012 to 0.016 in.)

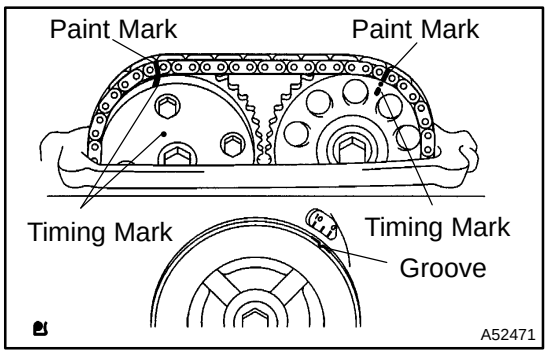
(b) Turn the crankshaft clockwise 1 revolution (360) and set the No. 4 cylinder to TDC/compression.



(c) Check only the valves indicated on the left.
   (1) Using a feeler gauge, measure the clearance between each valve lifter and camshaft.
   (2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.19 to 0.29 mm (0.008 to 0.011 in.)
Exhaust	0.30 to 0.40 mm (0.012 to 0.016 in.)



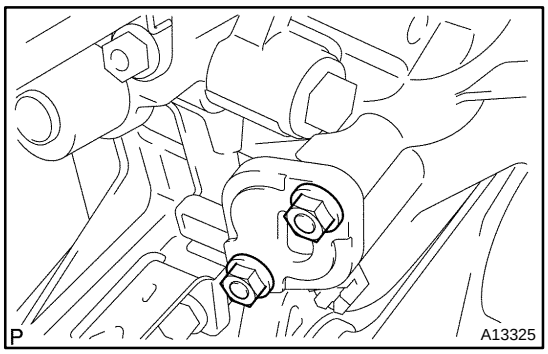
11. ADJUST VALVE CLEARANCE

NOTICE:

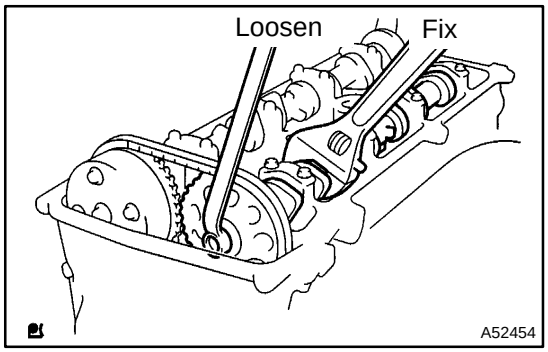
Be sure not to turn the crankshaft without the chain tensioner.

(a) Turn the crankshaft clockwise 1 revolution (360) and set the No. 1 cylinder to the TDC/compression.

(b) Place paint marks on the timing chain and camshaft timing gear/sprocket.



(c) Remove the 2 bolts and chain tensioner.

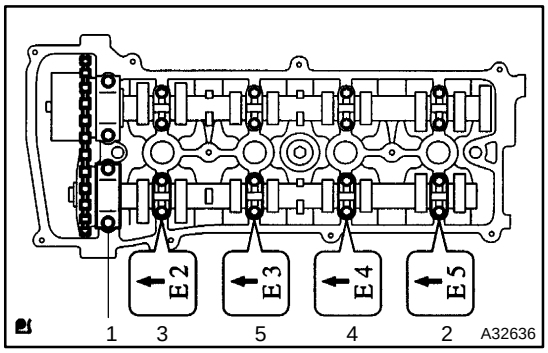


(d) Remove the No. 2 camshaft.

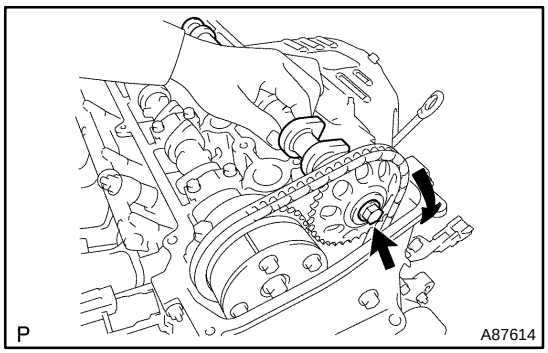
(1) Fix the camshaft with a wrench and then loosen the sproket bolt.

NOTICE:

Be careful not to damage the valve lifter.



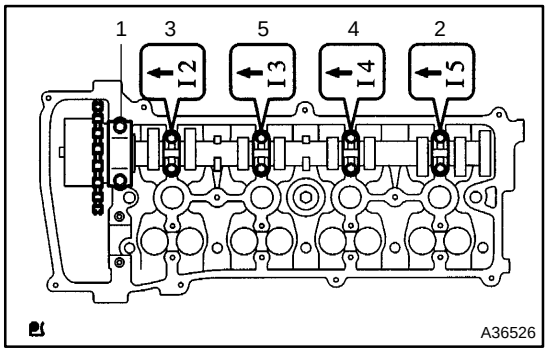
(2) Uniformly loosen and remove the No. 2 camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearing caps.



(3) Raise the No. 2 camshaft and remove it. Then remove the sprocket bolt.

(4) Remove the camshaft timing sprocket and the timing chain from the No. 2 camshaft.

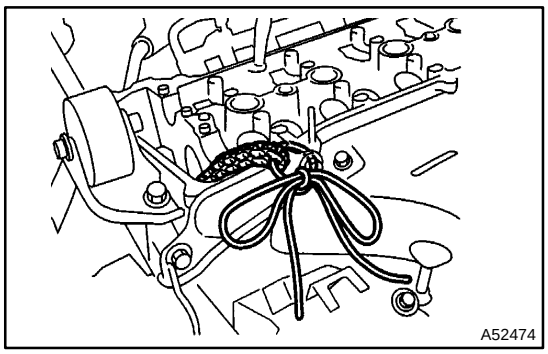
(5) Remove the camshaft timing sprocket from the timing chain.



(e) Remove the camshaft.

(1) Uniformly loosen and remove the camshaft's 10 bearing cap bolts in the sequence shown in the illustration. Then remove the 5 bearing caps.

(2) Remove the camshaft.

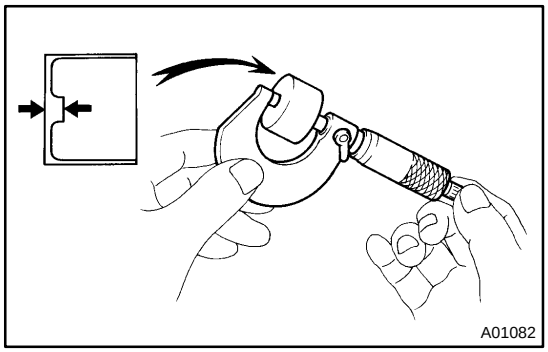


(f) Tie the timing chain with a string.

NOTICE:

Be careful not to drop anything inside the timing chain cover.

(g) Remove the valve lifters.



(h) Adjust the valve clearance.

(1) Using a micrometer, measure the thickness of the removed lifter.

(2) Calculate the thickness of a new lifter so that the valve clearance comes within the specified value.

A	Thickness of new lifter
B	Thickness of used lifter
C	Measured valve clearance

Valve clearance:

Item	Specified Condition
Intake	A = B + (C − 0.24 mm (0.0094 in.))
Exhaust	A = B + (C − 0.35 mm (0.0138 in.))

EXAMPLE: (Intake)
Measured valve clearance = 0.44 mm (0.0173 in.)
0.44 mm (0.0173 in.) − 0.24 mm (0.0094 in.) = 0.20 mm (0.0079 in.)
(Measured − Specification = Excess clearance)
Used shim measurement = 5.30 mm (0.2087 in.)
0.20 mm (0.0079 in.) + 5.30 mm (0.2087 in.) = 5.50 mm (0.2165 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 5.50 mm (0.2165 in.) = Shim No. ”50”

(3) Select a new lifter with a thickness as close as possible to the calculated values.

HINT:

- Lifters are available in 35 sizes in increments of 0.020 mm (0.0008 in.), from 5.060 mm (0.1992 in.) to 5.740 mm (0.2260 in.).
- Refer to valve lifter selection chart on the following 2 pages.

Exhaust valve clearance (Cold):
0.30 to 0.40 mm (0.012 to 0.016 in.)

EXAMPLE:

The 5.340 mm (0.2102 in.) lifter is installed, and the measured clearance is 0.440 mm (0.0173 in.). Replace the 5.340 mm (0.2102 in.) lifter with a new No. 44 lifter.

New lifter thickness mm (in.)

(a) Start the engine.

(b) Rev the engine at 2,500 rpm for approximately 180 seconds.

(c) Insert CO/HC meter testing probe at least 40 cm (1.3 ft) into the tailpipe during idling.

(d) Check CO/HC concentration at idle and/or 2,500 rpm.

HINT:

Check regulations and restrictions in your area when performing 2 mode CO/HC concentration testing (engine check at both idle speed and at 2,500 rpm).

If the CO/HC concentration does not comply with regulations, troubleshoot in the order given below.

(1) Check A/F sensor operation (see page 05−791).

(2) See the table below for possible causes, and then inspect and repair.

CO	HC	Problems	Causes
Normal	High	Rough idle	1. Faulty ignitions: ●Incorrect timing ●Fouled, shorted or improperly gapped plugs 2. Incorrect valve clearance 3. Leaks in intake and exhaust valves 4. Leaks in cylinders
Low	High	Rough idle (fluctuating HC reading)	1. Vacuum leaks: ●PCV hoses ●Intake manifold ●Throttle body ●Brake booster line 2. Lean mixture causing misfire
High	High	Rough idle (black smoke from exhaust)	1. Restricted air filter 2. Plugged PCV valve 3. Faulty SFI system: ●Faulty fuel pressure regulator ●Defective ECT sensor ●Defective MAF meter ●Faulty ECM ●Faulty injectors ●Faulty throttle position sensor

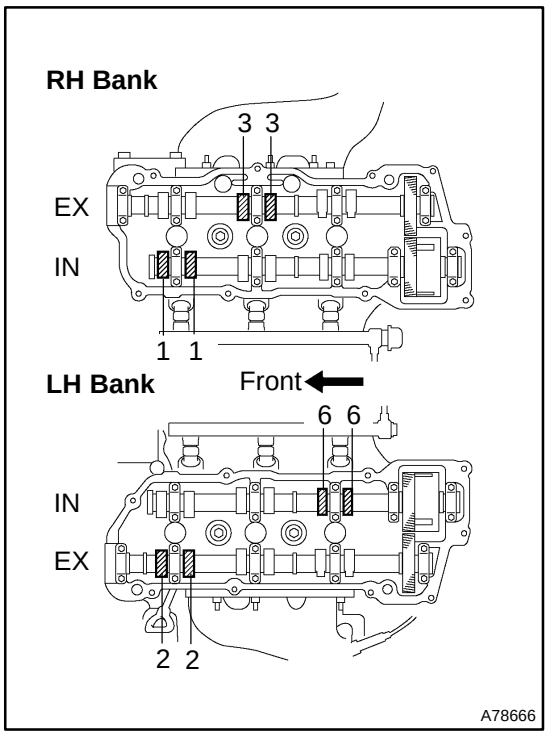
12. INSPECT VALVE CLEARANCE

(a) Turn the crankshaft pulley, and align the timing notch with timing mark 0 of the No. 1 timing belt cover.
(b) Check that the valve lifters on the No. 1 timing belt cover (IN and EX) are both loose.

If not, turn the crankshaft 1 revolution (360) and align the mark as above.



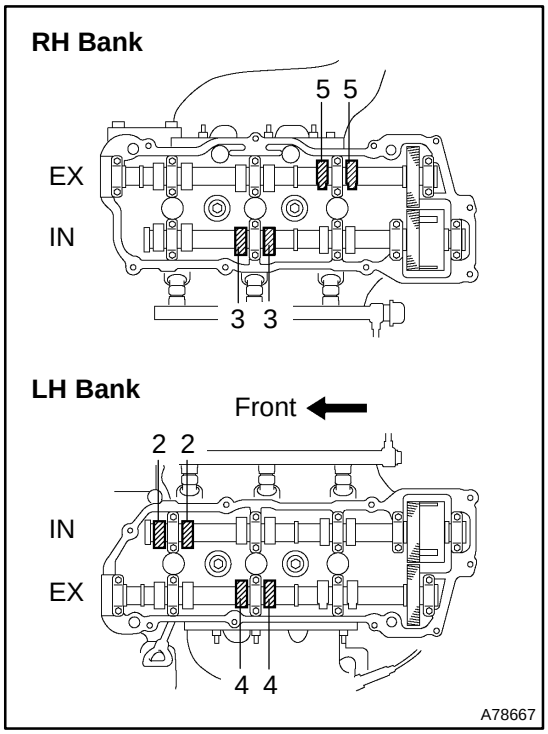
(c) Check the valves indicated in the illustration on the left.

(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.15 to 0.25 mm (0.006 to 0.010 in.)
Exhaust	0.25 to 0.35 mm (0.010 to 0.014 in.)

(2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.



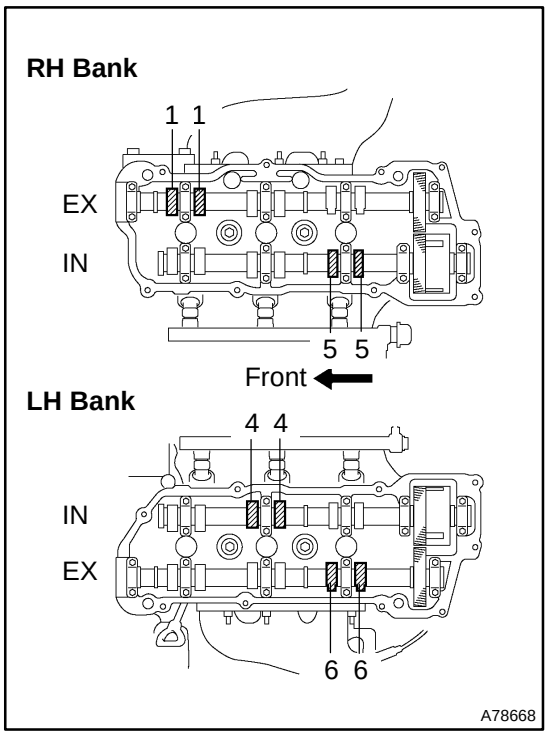
(d) Turn the crankshaft 2/3 of a revolution (240), and check the valves indicated in the illustration on the left.

(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.15 to 0.25 mm (0.006 to 0.010 in.)
Exhaust	0.25 to 0.35 mm (0.010 to 0.014 in.)

(2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.



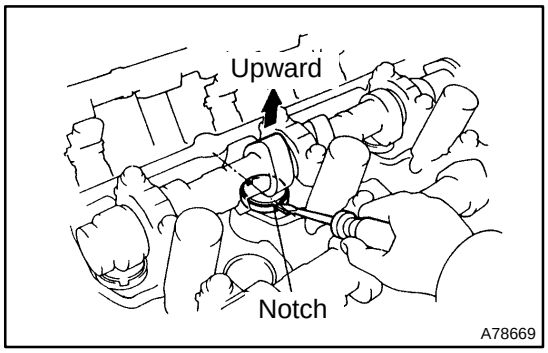
(e) Turn the crankshaft 2/3 of a revolution (240), and check the valves indicated in the illustration on the left.

(1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.

Valve clearance (Cold):

Item	Specified Condition
Intake	0.15 to 0.25 mm (0.006 to 0.010 in.)
Exhaust	0.25 to 0.35 mm (0.010 to 0.014 in.)

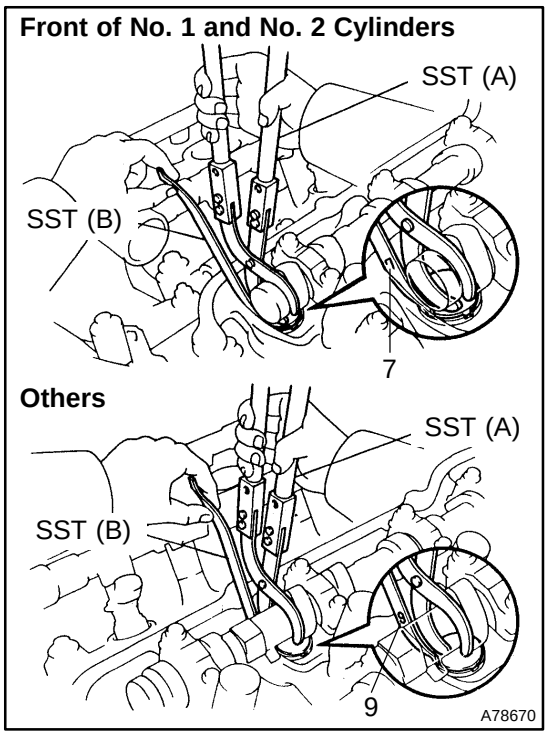
(2) Record valve clearance measurements that are out of the specified range. These measurements will be used later to determine the size of the adjustment shim to be installed.



13. ADJUST VALVE CLEARANCE

(a) Turn the camshaft so that the cam lobe faces upward.

(b) Turn the valve lifter with a screwdriver so that the notches are perpendicular to the camshaft.

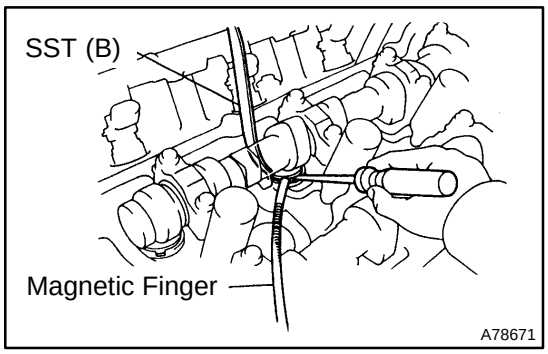


(c) Using SST (A), press down the valve lifter and place SST (B) between the camshaft and valve lifter. Remove SST (A).

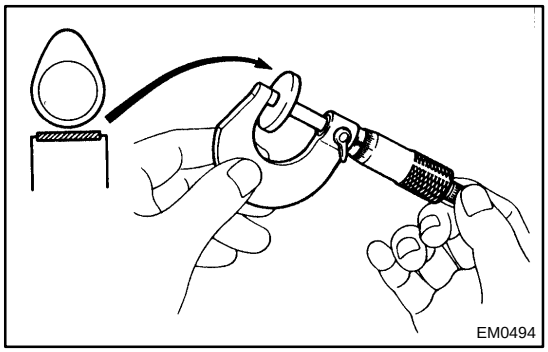
SST 09248−55040 (09248−05410, 09248−05420)

HINT:

- Apply SST (B) at a slight angle on the side marked with ”9” or ”7” at the position shown in the illustration.
- When SST (B) is inserted too deeply, it will get pinched by the shim. To prevent it from being stuck, insert it gently from the intake side at a slight angle.



(d) Using a small screwdriver and magnetic finger, remove the adjusting shim.



(e) Using a micrometer, measure the thickness of the removed shim.

(f) Calculate the thickness of a new shim so that the valve clearance comes within the specified value.

A	Thickness of new shim
B	Thickness of used shim
C	Measured valve clearance

Specified value (Cold):
Intake A = B + (C − 0.20 mm (0.0079 in.))
Exhaust A = B + (C − 0.30 mm (0.0118 in.))

(g) Select a new shim with a thickness as close as possible to the calculated values.

EXAMPLE (Intake):
Measured valve clearance = 0.45 mm (0.0177 in.)
0.45 mm (0.0177 in.) − 0.20 mm (0.0079 in.) = 0.25 mm (0.0098 in.)
(Measured − Specification = Excess clearance)
Used shim measurement = 2.80 mm (0.1102 in.)
0.25 mm (0.0098 in.) + 2.80 mm (0.1102 in.) = 3.05 mm (0.1201 in.)
(Excess clearance + Used shim = Ideal new shim)
Closest new shim = 3.05 mm (0.1201 in.)
Select No. 12 shim

HINT:

- Shims are available in 17 sizes in increments of 0.05 mm (0.0020 in.), from 2.50 mm (0.0984 in.) to 3.30 mm (0.1299 in.).
- Refer to adjusting shim selection chart on the following 2 pages.

If water is entering through cracks or breaks in the gasket, repair according to these guidelines: 1) if the crack length is within 2 to 3 cm (0.79 to 1.18 in.), repair with seal packing; or 2) if the crack length is over 3 cm (1.18 in.), replace the gasket.

(b) When repairing the timing belt cover gasket, follow the procedure below.

(1) Repair the cracks and breaks by applying the seal packing to the damaged area.

Seal packing: Part No. 08826−00080 or equivalent

NOTICE:

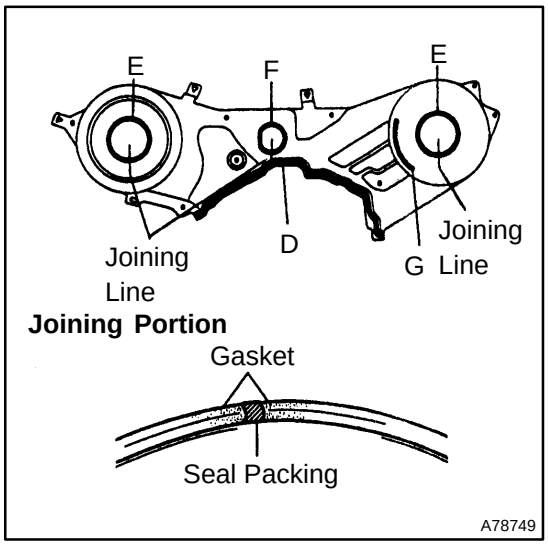
When applying the seal packing, apply it as wide and high as the gasket.

(c) If the timing belt cover gasket needs to be replaced, follow the procedure below.

(1) Using a screwdriver and gasket scraper, remove the remaining gasket.

NOTICE:

Be careful not to damage the timing belt cover.



(2) Remove the backing paper from a new gasket, and affix the gasket along the groove of the timing belt cover as shown in the illustration.

NOTICE:

- **Affix the gasket in the center of the groove.**
- **At the corners, try to keep the gasket thickness uniform.**

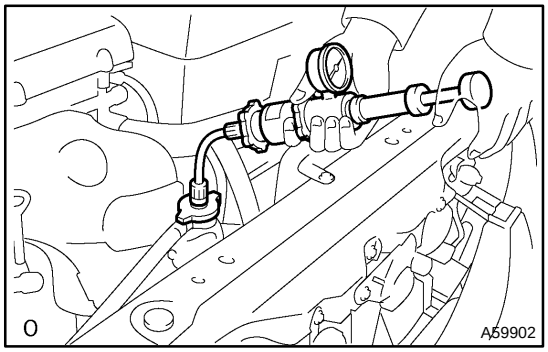
COOLING SYSTEM (2AZ−FE)(From July, 2003)

1602Y−06

ON−VEHICLE INSPECTION



1. INSPECT COOLING SYSTEM FOR LEAKS

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

(a) Fill the radiator with coolant and attach a radiator cap tester.

(b) Warm up the engine.

(c) Using the radiator cap tester, increase the pressure inside the radiator to 118 kPa (1.2 kgf/cm^2, 17.1 psi), and check that the pressure does not drop.

If the pressure drops, check the hoses, radiator or water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

2. CHECK ENGINE COOLANT LEVEL AT RESERVOIR

(a) The engine coolant level should be between the ”LOW” and ”FULL” lines, when the engine is cold.

If low, check for leaks and add ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non−silicate, non−amine, non−nitrite, and non−borate coolant with long−life hybrid organic acid technology up to the ”FULL” line.

3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator cap.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

(b) Check if there is any excessive deposits of rust or scale around the radiator cap and radiator filler hole. Also, the coolant should be free from oil.

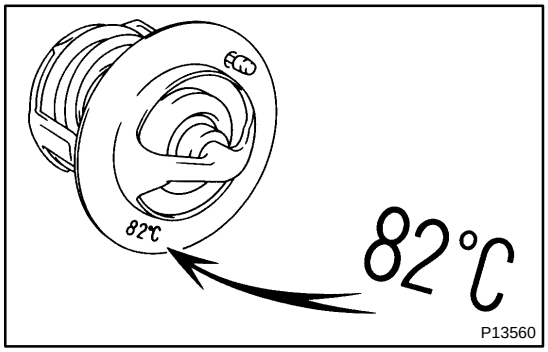
HINT:

If excessively dirty, replace the coolant.

(c) Reinstall the radiator cap.

1602Z−07

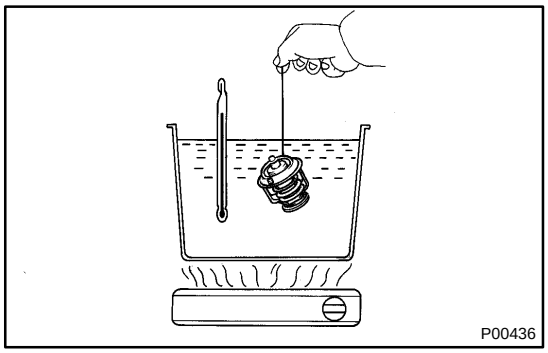
INSPECTION



1. INSPECT THERMOSTAT

HINT:

The thermostat is numbered with the valve opening temperature.

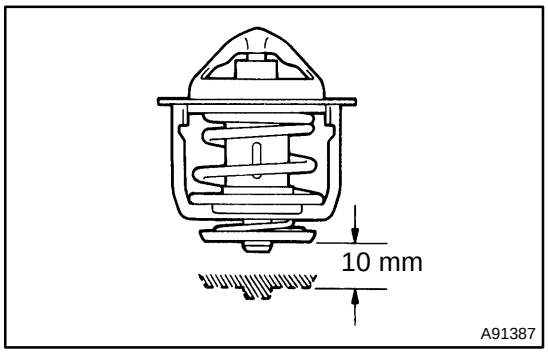


(a) Immerse the thermostat in water and gradually heat the water.

(b) Check the valve opening temperature.

Valve opening temperature: 80 to 84●C (176 to 183●F)

If the valve opening temperature is not as specified, replace the thermostat.



(c) Check the valve lift.

Valve lift: 10 mm (0.394 in.) or more at 95●C (203●F)

If the valve lift is not as specified, replace the thermostat.

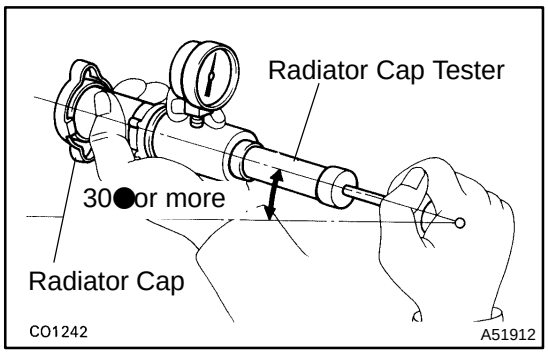
(d) Check that the valve is fully closed when the thermostat is at low temperatures (below 77●C (171●F)).

If not closed, replace the thermostat.

2. INSPECT RADIATOR CAP SUB−ASSY

NOTICE:

- **If the reservoir cap has contaminations, always rinse it with water.**
- **Before using a radiator cap tester, wet the relief valve and pressure valve with engine coolant or water.**
- **When performing steps (a) and (b) below, keep the tester at an angle of over 30●above the horizontal.**



(a) Using a radiator cap tester, slowly pump the tester and check that air is being released from the vacuum valve.

Pump speed: 1 push every 3 seconds or more

NOTICE:

Push the pump at a constant speed.

If air is not being released from the vacuum valve, replace the reservoir cap.

(b) Pump the tester and measure the relief valve opening pressure.

Pump speed: 1 push within 1 second

NOTICE:

The pump speed above should be followed for the first pump only. It will close the vacuum valve. Once the vacuum valve is closed, the pump speed can be reduced.

Standard opening pressure:

78 to 122 kPa (0.80 to 1.25 kgf/cm^2, 11.3 to 17.8 psi)

HINT:

Use the tester's maximum reading as the opening pressure. If the maximum reading is less than the minimum opening pressure above, replace the radiator cap.

COOLING FAN SYSTEM (2AZ−FE)(From July, 2003)

16030−06

ON−VEHICLE INSPECTION

HINT:

sThe cooling fan may rotate when the ignition switch is turned from ACC to ON. This is nornal.

1. CHECK COOLING FAN OPERATION WITH LOW TEMPERATURE (Below 83●C (181●F))

(a) Turn the ignition switch ON.

(b) Check that the cooling fan stops.

If not, check the cooling fan relay and ECT sensor, and check for disconnected connector or wire breaks between the cooling fan relay and ECT sensor.

(c) Disconnect the ECT sensor connector.

(d) Check that the cooling fan rotates.

If not, check the fuses, cooling fan relay, ECM and cooling fan, and check for a short circuit between the cooling fan relay and ECT Sensor..

(e) Reconnect ECT sensor connector.

2. CHECK COOLING FAN OPERATION WITH HIGH TEMPERATURE (Above 98●C (208●F))

(a) Start the engine, and raise ECT to above 98●C (208●F).

(b) Check that the cooling fan rotates.

If not, replace the ECT sensor.

3. INSPECT COOLING FAN

(a) Disconnect the cooling fan connector.

(b) Connect battery and ammeter to the cooling fan connector.

(c) Check that the cooling fan rotates smoothly, and check the reading on the ammeter.

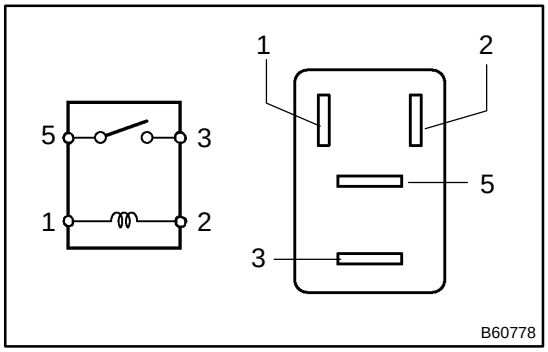
Standard amperage: 4.9 to 8.5 A at 20●C (68●F)

If not, replace the cooling fan.

(d) Reconnect the cooling fan connector.

160Q7−02

INSPECTION



1. INSPECT RELAY (FAN NO. 1, FAN NO. 3)

(a) Check the resistance of the relay.

Standard:

Tester Connection	Specified Condition
3 − 5	10 kΩ or higher

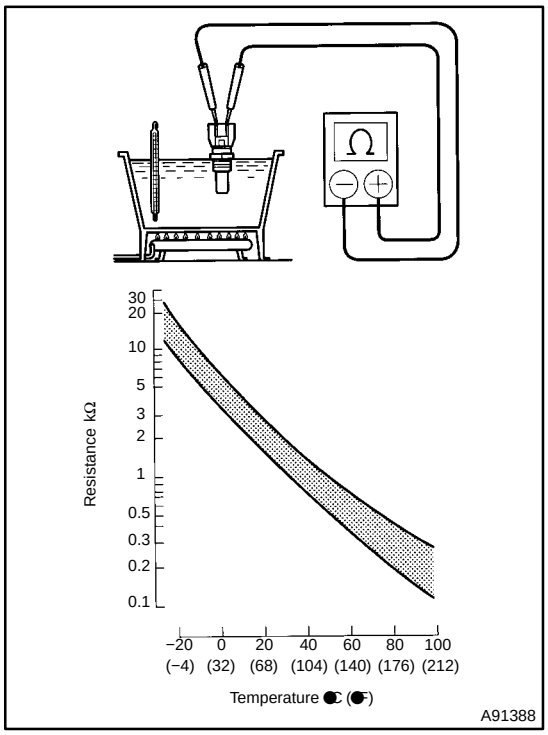
(a) Check the resistance of the relay.

Standard:

Tester Connection	Specified Condition
3 − 4	Below 1 Ω
3 − 5	10 kΩ or higher
3 − 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.



3. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

(a) Check the resistance between terminals 1 and 2.

Standard:

Condition	Specified Condition
Approx. 20●C (68●F)	2.29 to 2.6 kΩ
Approx. 80●C (176●F)	0.300 to 0.327 kΩ

If the result is not as specified, replace the sensor.

When checking the ECT sensor in the water, the terminals should be kept dry. After the check, dry the sensor.

COOLANT (2AZ−FE)(From July, 2003)

16032−07

REPLACEMENT

1. DRAIN ENGINE COOLANT

(a) Remove the radiator cap.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

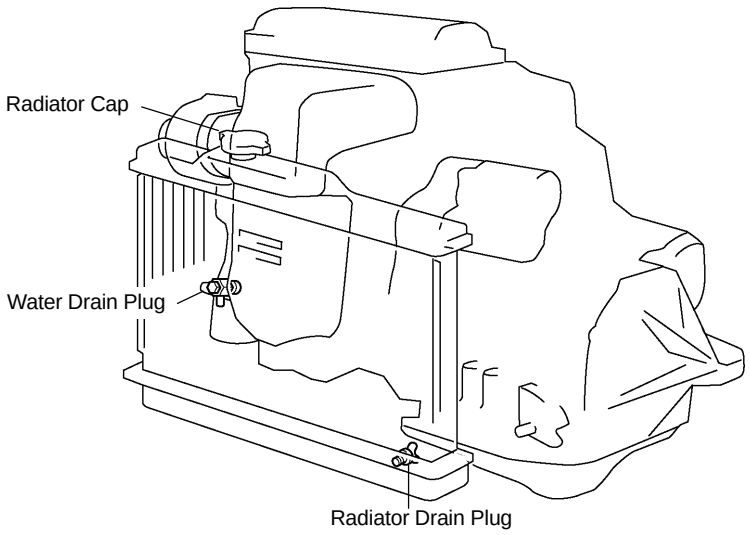
(b) Drain engine coolant by loosening the radiator drain plug and the engine's water drain plug.

HINT:

Engine coolant inside the radiator is drained from the drain hole located on the bottom of the engine under cover.

(c) Tighten the cylinder block drain cock plugs.

Torque: 13 N·m (130 kgf·cm, 10 ft·lbf)



0 A52575

2. ADD ENGINE COOLANT

(b) Add engine coolant into the radiator until it overflows.

Capacity: 6.2 liters (6.6 US qts, 5.4 lmp. qts)

HINT:

- Use of improper coolants may damage the engine cooling system.
- Use "Toyota Super Long Life Coolant" or similar high quality ethylene glycol based non−silicate, non−amine, non−nitrite, and non−borate coolant with long−life hybrid organic acid technology.
- New Toyota vehicles are filled with Toyota Super Long Life Coolant (color is pink, premixed ethylene−glycol concentration is approximately 50% and freezing temperature is −35 C (−31 F)). When replacing the coolant, Toyota Super Long Life Coolant is recommended.
- Observe the coolant level inside the radiator by pressing the inlet and outlet radiator hoses several times by hand. If the coolant level goes down, add the coolant.

NOTICE:

Do not use plain water alone.

(c) Pour coolant into the radiator reservoir tank until the coolant reaches the full line.

(d) Install the radiator cap.
(e) Start the engine and run the engine for 10 seconds.
(f) Remove the radiator cap after 10 seconds. Pour coolant if the coolant level is lower.
(g) Repeat (d) to (f) until the coolant level remains the same from steps (d) to (f).

HINT:

Perform the procedures above before the engine warms up. A warmed up engine causes the thermostat valve to open, and the air inside of the engine circulates between the radiator and the engine.

(h) Install the radiator cap.
(i) Warm up the engine until the thermostat valve begins to open.

HINT:

As the engine warms up, press the radiator inlet and outlet hose several times by hand.

(j) Stop the engine and wait until the coolant cools down to room temperature. If the coolant is below the full line, add coolant.

(c) Using the radiator cap tester, increase the pressure inside the radiator to 118 kPa (1.2 kgf/cm^2, 17.1 psi), and check that the pressure does not drop.

If the pressure drops, check the hoses, radiator or water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

2. CHECK ENGINE COOLANT LEVEL AT RESERVOIR

(a) The engine coolant level should be between the ”LOW” and ”FULL” lines, when the engine is cold.

If low, check for leaks and add ”Toyota Super Long Life Coolant” or similar high quality ethylene glycol based non−silicate, non−amine, non−nitrite, and non−borate coolant with long−life hybrid organic acid technology up to the ”FULL” line.

NOTICE:

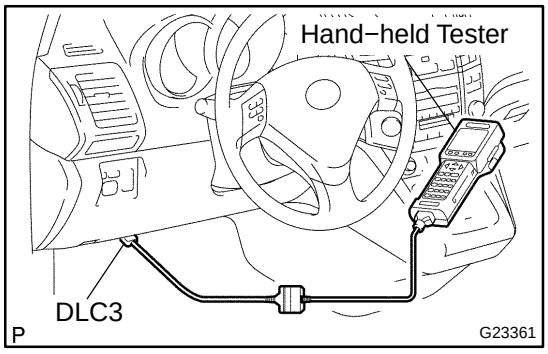
After performing the usual air bleeding in the brake system, if the height or feel of the brake pedal cannot be obtained, perform air bleeding in the BRAKE actuator assy with a hand−held tester by following procedures below.

(a) Depress the brake pedal more than 20 times with the engine off.



(b) Connect the hand−held tester to the DLC3, then turn the ignition switch to the ON position.

NOTICE:

Do not start the engine.

(c) Select ”AIR BLEEDING” on the hand−held tester.

HINT:

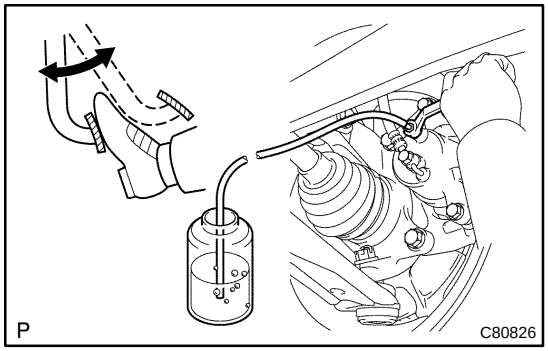
Please refer to the Hand−Held Tester Operator’s Manual for further details.

(d) Bleed the air out of the regular brake line in ”Step1: Increase” on the hand−held tester display.

NOTICE:

- **Perform the air bleeding by following the steps displayed on the hand−held tester.**
- **Make sure that the brake fluid in the master cylinder reservoir tank does not become empty.**

(1) Connect the vinyl tube to either one of the bleeder plugs.



(2) Depress the brake pedal several times, then loosen the bleeder plug of one of the above wheels with the pedal depressed.

(3) When fluid stops coming out, tighten the bleeder plug, then release the brake pedal.

(4) Repeat (2) and (3) until all air in the fluid is completely bled out.

(5) Tighten the bleeder plug completely.

Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)

(6) Repeat the above procedure to bleed the air out of the brake line for each wheel.

(e) Bleed the air out of the suction line in ”Step2: Inhalation” on the hand−held tester display.

NOTICE:

- **Perform the air bleeding by following the steps displayed on the hand−held tester.**
- **Make sure that the brake fluid in the master cylinder reservoir tank does not become empty.**

(1) Connect the vinyl tube to the bleeder plug at the right front wheel or the right rear wheel and loosen the bleeder plug.
(2) Operate the BRAKE actuator assy using the hand−held tester to bleed the air.

NOTICE:

- **The operation stops automatically in 4 seconds.**
- **At this time, be sure to release the brake pedal.**

(3) Check that the operation has stopped, by referring to the hand−held tester display.
(4) Repeat (2) and (3) until all the air in the fluid is completely bled out.
(5) Tighten the bleeder plug completely.

Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)

(6) For the rest of the wheels, bleed the air in the same way as stated in the above procedure.

(f) Bleed the air out of the pressure reduction line in ”Step3: Decrease” on the hand−held tester display.

NOTICE:

- **Perform air bleeding by following the steps displayed on the hand−held tester.**
- **Make sure that the brake fluid in the master cylinder reservoir tank does not become empty.**

(1) Connect a vinyl tube to either one of the bleeder plugs.
(2) Loosen the bleeder plug.
(3) Using the hand−held tester, operate the BRAKE actuator assy using hand−held tester, completely depress the brake pedal and keep it.

NOTICE:

- **The operation stops automatically in 4 seconds. When performing this procedure continuously, an interval of at least 20 seconds is required.**
- **When the operation is completed, the brake pedal slightly goes down. This is a normal phenomenon caused when the solenoid opens.**
- **During this procedure, the pedal seems heavy, but completely depress it so that the brake fluid comes out from the bleeder plug.**
- **Be sure to keep depressing the brake pedal. Never depress and release the pedal repeatedly.**

(4) Tighten the bleeder plug, then release the brake pedal.
(5) Repeat (2) to (4) until all the air in the fluid is completely bled out.
(6) Tighten the bleeder plug completely.

Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)

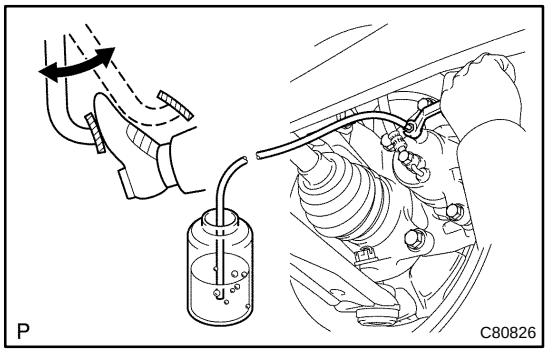
(7) Repeat the above procedure to bleed the air out of the brake line for each wheel.

(g) Bleed the air out of the regular brake line again in ”Step4: Increase” on the hand−held tester display.

NOTICE:

- **Perform air bleeding by following the steps displayed on the hand−held tester.**
- **Make sure that the brake fluid in the master cylinder reservoir tank does not become empty.**

(1) Connect the vinyl tube to either one of the bleeder plug.



(2) Depress the brake pedal several times, then loosen the bleeder plug of one of the above wheels with the pedal depressed.
(3) When fluid stops coming out, tighten the bleeder plug, then release the brake pedal.
(4) Repeat (2) and (3) until all the air in the fluid is completely bled out.
(5) Tighten the bleeder plug completely.

Torque: 8.3 N·m (85 kgf·cm, 73 in.·lbf)

ON−VEHICLE INSPECTION

1. INSPECT BRAKE BOOSTER

(a) Air tightness check.

(1) Start the engine and stop it after 1 or 2 minutes. Depress the brake pedal several times slowly.

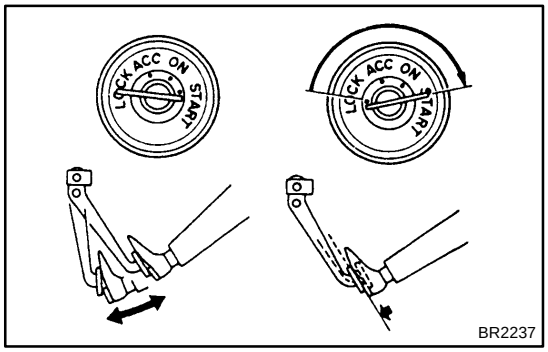
HINT:

If the pedal goes down farthest the 1st time, but gradually rises after the 2nd or 3rd time, the booster is air tight.

(2) Depress the brake pedal while the engine is running, and stop the engine with the pedal depressed.

HINT:

If there is no change in the pedal reserve distance after holding the pedal for 30 seconds, the booster is air−tight.



(b) Operating check.

(1) Depress the brake pedal several times with the ignition switch OFF and check that there is no change in the pedal reserve distance.

(2) Depress the brake pedal and start the engine.

HINT:

If the pedal goes down slightly, operation is normal.

2. INSPECT VACUUM CHECK VALVE

(a) Check vacuum check valve.

AUTOMATIC TRANSAXLE ASSY (ATM)

4005T−07

PRECAUTION

1. The automatic transaxle is composed of highly precision−finished parts which need careful inspection before reassembly because even a small nick could cause fluid leakage or affect the performance. The instructions here are organized in order to work on only one component group at a time. This will help avoid confusion which comes from similar−looking parts of different sub−assemblies being on your workbench at the same time. Inspect and repair the component groups from the converter housing side. Complete the inspection, repair and reassembly before proceeding to the next component group. If a defect is found in a certain component group during reassembly, inspect and repair this group immediately. If a component group cannot be assembled because the necessary parts are being ordered, be sure to keep all the parts of the group in a separate container while proceeding with disassembly, inspection, repair and reassembly of the other component groups.
   Recommended ATF: T−IV
2. All the disassembled parts should be washed clean and any fluid passages and holes should be blown through with compressed air.
3. Dry all parts with compressed air. Never use shop rags to dry them.
4. Be careful of ATF or kerosene not to be sprayed over your face when using compressed air.
5. The recommended automatic transaxle fluid or kerosene should be used for cleaning.
6. After cleaning, the parts should be arranged in the correct order for efficient inspection, repair, and reassembly.
7. When disassembling the valve body, be sure to match each valve together with the corresponding spring.
8. New discs for the replacement of the brakes and clutches must be soaked in ATF for at least 15 minutes before reassembly.
9. All the oil seal rings, clutch discs, clutch plates, rotating parts, and sliding surfaces should be coated with ATF prior to reassembly.
10. Replace all the gaskets and rubber O−rings.
11. Do not apply adhesive cements to the gaskets and similar parts.
12. Make sure that the ends of the snap ring are not aligned with one of the cutouts and are installed in the groove correctly.
13. If a worn bushing is to be replaced, the sub−assembly containing the bushing must also be replaced.
14. Check the thrust bearings and races for wear or damage. Replace them as necessary.
15. Use petroleum jelly to keep the parts in place.
16. When working with FIPG material, you must follow the procedure below.

- Remove all the old packing (FIPG) material from the gasket surface using a razor blade and a gasket scraper.
- Thoroughly clean all the components to remove all the loose material.
- Clean both the sealing surfaces with non−residue solvent.
- Parts must be reassembled within 10 minutes of application. Otherwise, the packing (FIPG) material must be removed and reapplied.

AUTOMATIC TRANSAXLE FLUID (ATM)

4005R−10

ON−VEHICLE INSPECTION

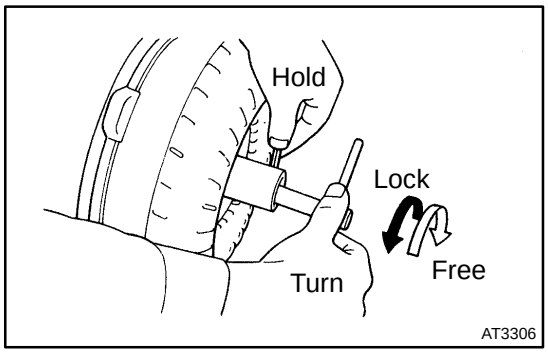
SST 09350−32014 (09351−32010)

(2) Install SST so that it fits in the notch of the converter hub and outer race of the one−way clutch.

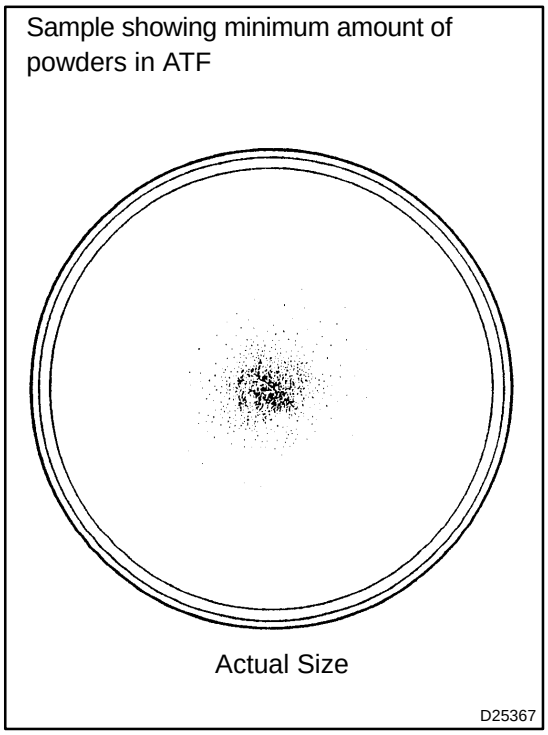
SST 09350−32014 (09351−32020)



(3) With the torque converter clutch setting up on its side, check that the one−way clutch locks when it is turned counterclockwise, and rotates smoothly clockwise.

If necessary, clean the converter and retest the one−way clutch.

Replace the converter if the one−way clutch still fails the test.



(b) Determine the condition of the torque converter clutch assy.

(1) If the inspection result of the torque converter clutch assy meets the following item, replace the torque converter clutch.

Malfunction item:

Any metallic sound is heard from the torque converter clutch during stall test or when the shift lever is in neutral position.

One−way clutch is free or locked in both directions.

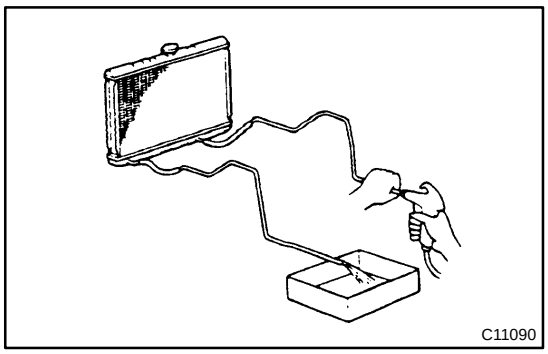
Fine powders exceeding the sample limit is identified in ATF. (See the sample.)

HINT:

The sample shows the auto fluid of approx. 0.25 liters (0.26 US qts, 0.22 Imp. qts) that is taken out from the removed torque converter clutch

(c) Replace the ATF in the torque converter clutch.

(1) If the ATF is discolored and/or has a foul odor, completely stir the ATF in the torque converter clutch and drain it with the face for installation facing up.



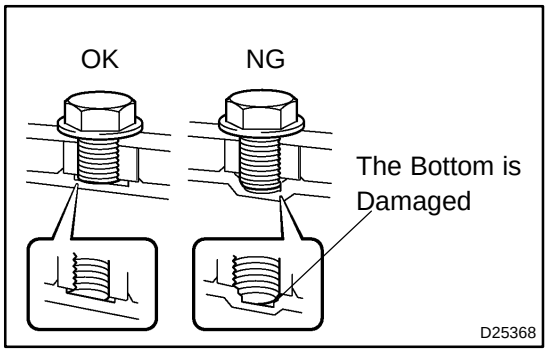
C11090

(d) Clean and check the oil cooler and oil pipe line.
(1) If the torque converter clutch is inspected or the ATF is exchanged, clean the oil cooler and oil pipe line.

HINT:

- Spray compressed air of 196 kPa (2 kgf/cm^2, 28 psi) from the inlet hose.
- If plenty of fine powders are identified in the ATF, add new ATF using a bucket pump and clean it again.

(2) If the ATF is cloudy, inspect the oil cooler (radiator).



D25368

(e) Prevent deformation of the torque converter clutch and damage to the oil pump gear.
(1) When any marks due to interference are found on the end of the bolt for the torque converter clutch and on the bottom of the bolt hole, replace the bolt and the torque converter clutch.
(2) All of the bolts shall have the same length.
(3) No missing spring washer.

6	Immediately after air conditioning is turned off, refrigerant foams and then becomes clear	Correct	−

*: Bubbles in the sight glass with ambient temperatures higher than usual can be considered normal if cooling is sufficient.

2. INSPECT REFRIGERANT PRESSURE WITH MANIFOLD GAUGE SET

(b) Connect the battery positive lead to the terminal 3 of magnet clutch connector and the negative lead to the earth wire. Turn on and off the magnet clutch and measure the clearance.

Standard clearance:

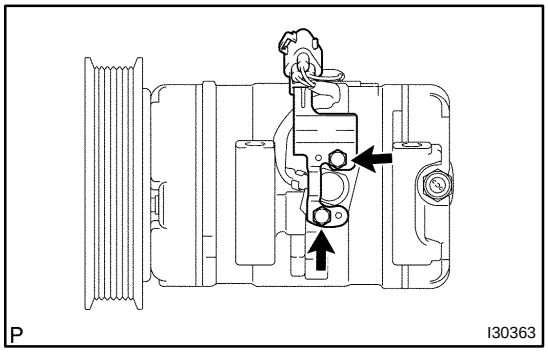
0.35 − 0.60 mm (0.014 − 0.024 in.)

If the measured value is out of the standard range, remove the magnet clutch hub and adjust it with magnet clutch washers.

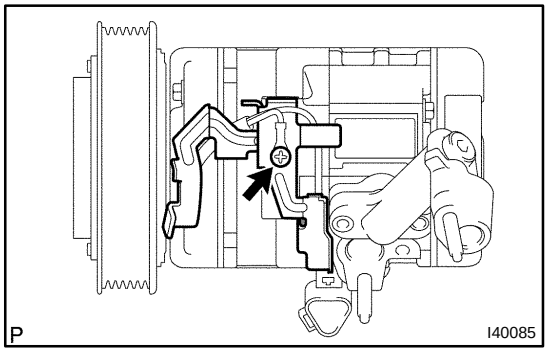
NOTICE:

Adjustment shall be performed with 3 or less magnet clutch washers.

(c) Remove the compressor and magnetic clutch from the vise.



(d) Install the bolt and bracket.



11. INSTALL COOLER COMPRESSOR BRACKET

(a) Install the earth wire and cooler compressor bracket with the screw.

12. INSPECT COMPRESSOR OIL

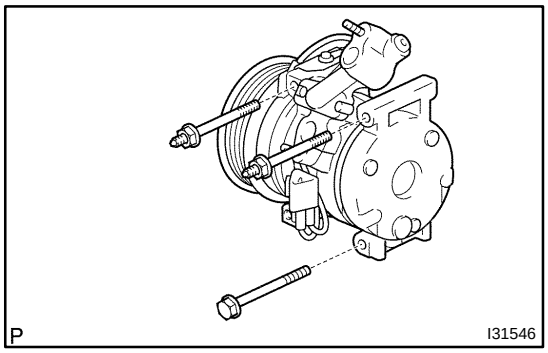
(a) When replacing the compressor and magnetic clutch with new one, after gradually removing the refrigerant gas from the service valve, drain the following amount of oil from the new compressor and magnetic clutch before installation.

Standard:

(Oil capacity inside new compressor and magnetic clutch: 120 + 15 cc (4.1 + 0.51 fl.oz.)) − (Remaining oil amount in the removed compressor and magnetic clutch) = (Oil amount to be removed when replacing)

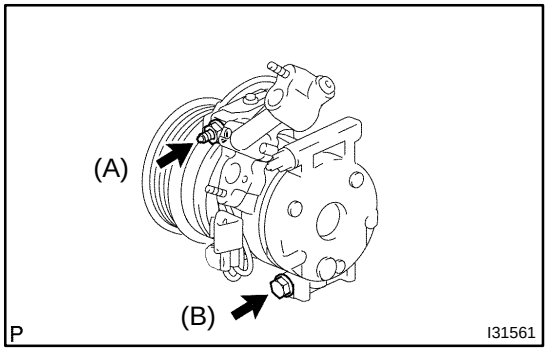
NOTICE:

- **When checking the compressor oil level, observe the precautions on the cooler removal/installation.**
- **Because compressor oil remains in the pipes of the vehicle, if a new compressor and magnetic clutch is installed without removing some oil inside, the oil amount becomes too much, preventing heat exchange in the refrigerant cycle and causing refrigerant failure.**
- **If the remaining oil in the removed compressor and magnetic clutch is too small in volume, check for oil leakage.**
- **Be sure to use ND−OIL8 for compressor oil.**



13. TEMPORARILY TIGHTEN COMPRESSOR AND MAGNETIC CLUTCH

(a) Temporarily tighten the compressor and magnetic clutch with the 3 bolts.



14. FULLY TIGHTEN COMPRESSOR AND MAGNETIC CLUTCH

(b) Install the cooler compressor bracket with the 2 bolts and nut.

Torque:

25 N·m (250 kgf·cm, 18 ft·lbf) (Bolt (C))

25 N·m (250 kgf·cm, 18 ft·lbf) (Nut (D))

18 N·m (184 kgf·cm, 13 ft·lbf) (Bolt (E))

PRECAUTION

CAUTION:

- **The vehicle is equipped with SRS, which consists of a driver airbag, front passenger airbag, side airbag and curtain shield airbag. Failure to carry out service operations in the correct sequence could cause the SRS to unexpectedly deploy during servicing, possibly leading to a serious accident. Further, if a mistake is made in servicing the SRS, it is possible that the SRS may fail to operate when required. Before performing servicing (including removal or installation of parts, inspection or replacement), be sure to read the following items carefully, then follow the correct procedures indicated in the repair manual.**
- **Wait at least 90 seconds after the ignition switch is turned to the ”LOCK” position and the negative (−) terminal cable is disconnected from the battery before starting the operation.**
  (The SRS is equipped with a back−up power source, so that if work is started within 90 seconds after disconnecting the negative (−) terminal cable of the battery, the SRS may be deployed.)
- **Do not expose the horn button assy, front passenger airbag assy, airbag sensor assy center, airbag sensor front, front seat airbag assy, side airbag sensor assy, curtain shield airbag assy, airbag sensor rear or seat position airbag sensor directly to hot air or flames.**
- **Be sure to perform the initialization of the occupant classification ECU under the conditions listed below (See page 05−1452). If the initialization is not performed, the SRS may not operate properly.**
  - **The occupant classification ECU is replaced.**
  - **Accessories (seatback tray or seat cover, etc.) are installed to the vehicle.**
  - **The passenger seat is removed from the vehicle.**
  - **Both the SRS warning light and passenger airbag ON/OFF indicator light (”OFF”) come on.**
  - **The vehicle is brought to the workshop for repair purpose due to an accident or collision.**

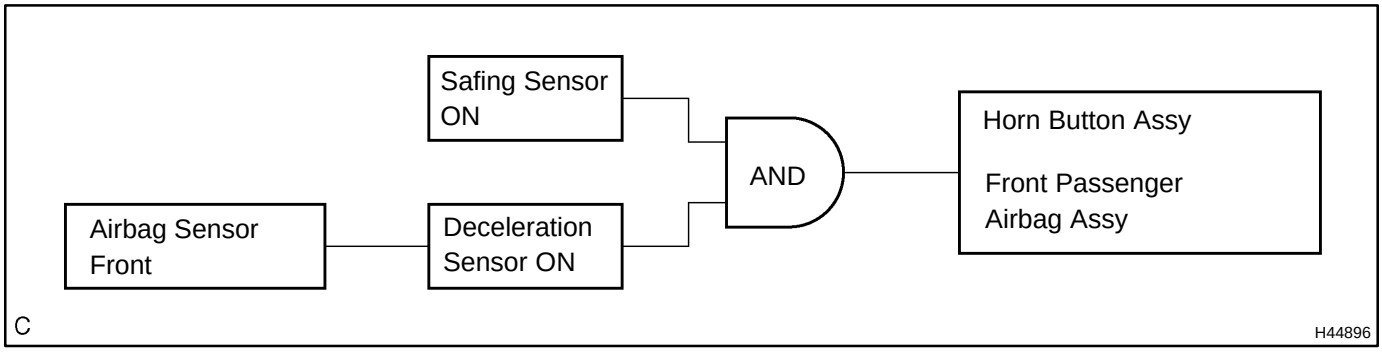
NOTICE:

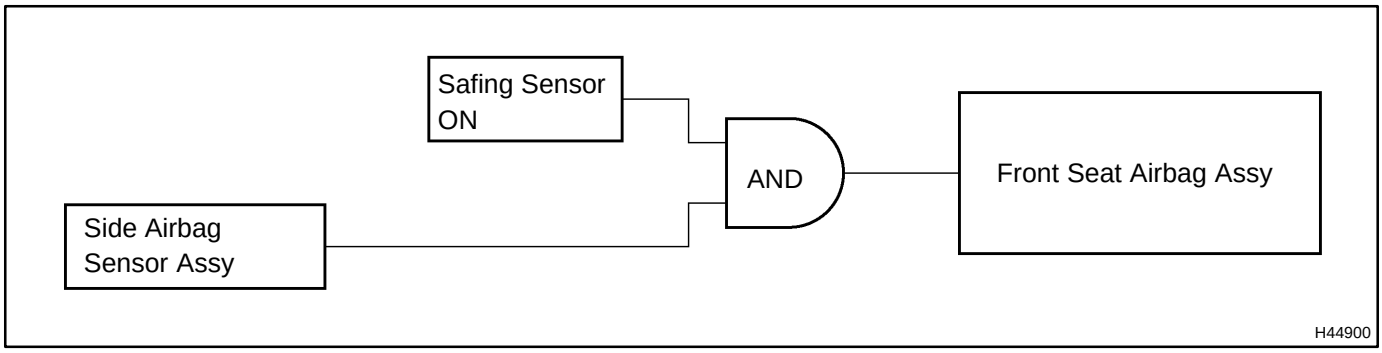
- **Malfunction symptoms of the SRS are difficult to confirm, so DTCs are the most important source of information when troubleshooting. When troubleshooting the SRS, always inspect DTCs before disconnecting the battery.**
- **Even in the case of a minor collision when the SRS does not deploy, the horn button assy, front passenger airbag assy, airbag sensor assy center, airbag sensor front, front seat airbag assy, side airbag sensor assy, curtain shield airbag assy, airbag sensor rear and seat position airbag sensor should be inspected (see page 60−17).**
- **Before repair work, remove the airbag sensor if any kind of shock is likely to occur to the airbag sensor during the operation.**
- **Never use SRS parts from another vehicle. When replacing the parts, replace them with new ones.**
- **Never disassemble or repair the horn button assy, front passenger airbag assy, airbag sensor assy center, airbag sensor front, front seat airbag assy, side airbag sensor assy, curtain shield airbag assy, airbag sensor rear or seat position airbag sensor in order to reuse it.**
- **If the horn button assy, front passenger airbag assy, airbag sensor assy center, airbag sensor front, front seat airbag assy, side airbag sensor assy, curtain shield airbag assy, airbag sensor rear or seat position airbag sensor has been dropped, or if there are any cracks, dents or other defects in the case, bracket or connector, replace it with a new one.**
- **Use a volt/ohmmeter with high impedance (10 kΩ/V minimum) for troubleshooting the electrical circuits.**

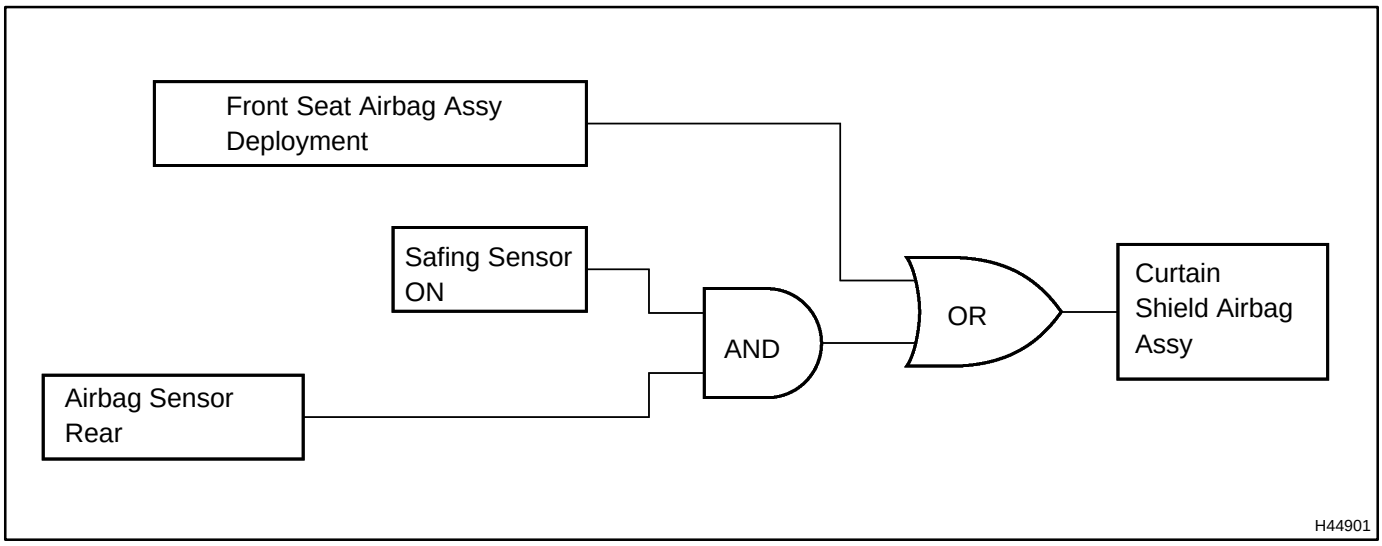
- **Information labels are attached to the periphery of the SRS components. Follow the instructions in the caution.**
- **After work on the SRS is completed, perform the SRS warning light check (See page 05−1456).**
- **When the negative (−) terminal cable is disconnected from the battery, the memory will be cleared. Because of this, be sure to make a record of the contents memorized in each system before starting work. When work is finished, adjust each system as it was before. Never use a back−up power supply from outside the vehicle to avoid erasing the memory in any system.**
- **If the vehicle is equipped with a mobile communication system, see page 01−5.**

1. DEPLOYMENT CONDITION

(a) When the vehicle collides and the shock is greater than the specified value, the SRS is activated automatically. The airbag sensor assy center includes the safing sensor and deceleration sensor. The safing sensor was designed to be turned on at a smaller deceleration rate than the deceleration sensor. The deceleration sensor determines whether or not ignition is necessary based on signals from the airbag sensor front. Current flows to the squibs to deploy the SRS when the conditions shown in the illustrations below are met.







2. SRS CONNECTORS

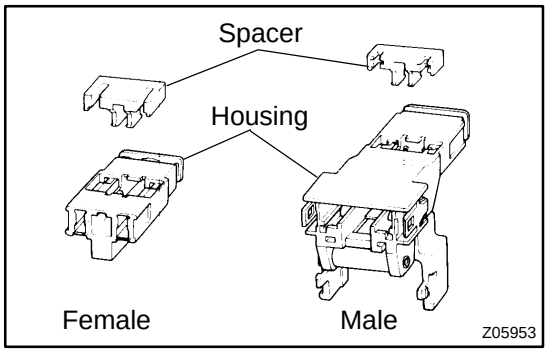
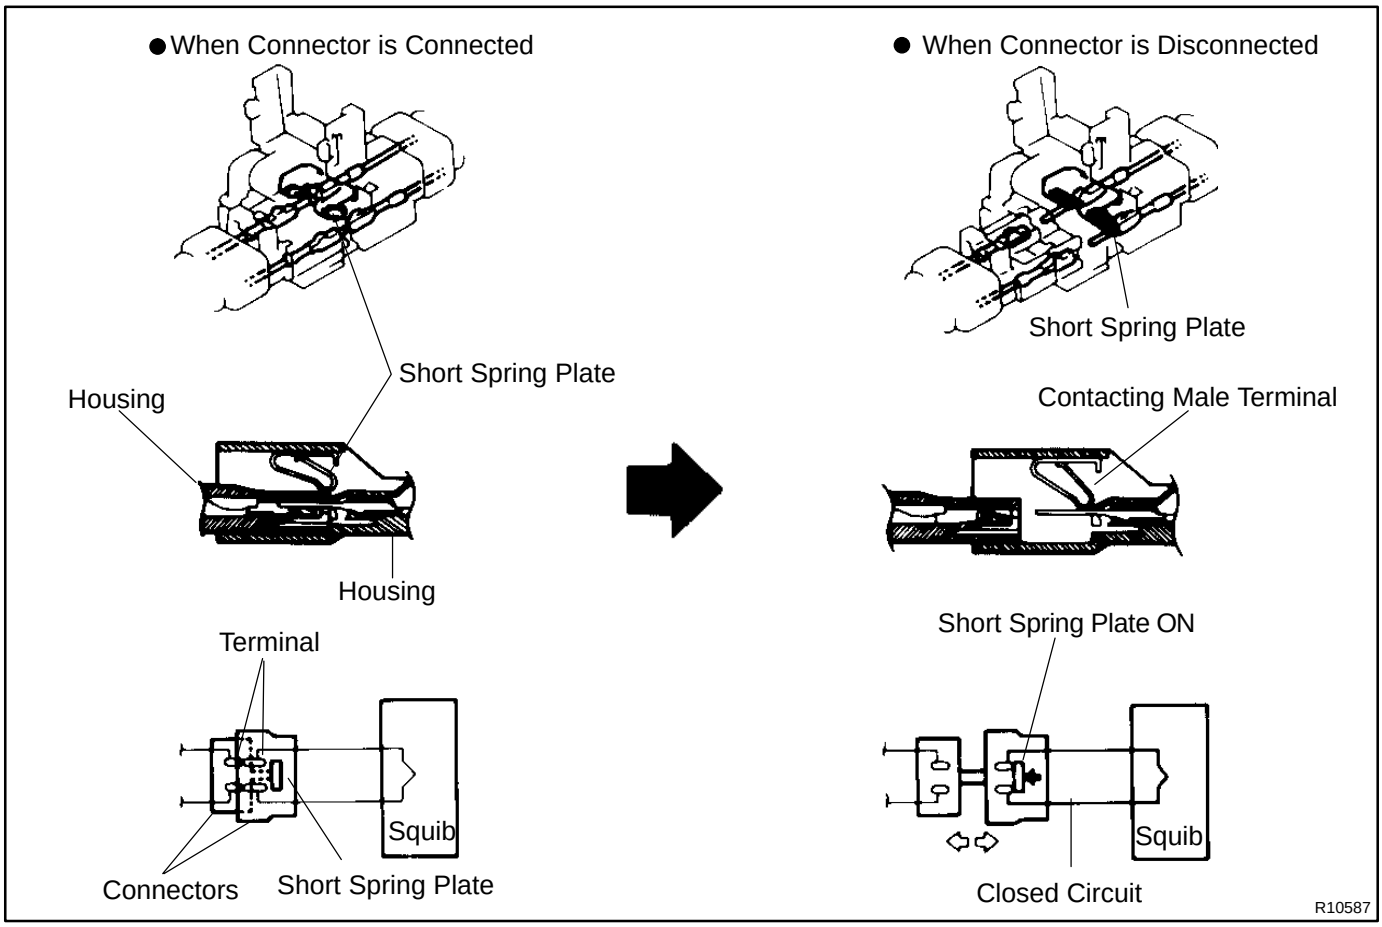
(a) All connectors in the SRS are colored yellow to distinguish them from other connectors, except seat position airbag sensor connector and occupant classification ECU connector. Some connectors have special functions, and are specially designed for the SRS. These connectors use durable gold−plated terminals, and are placed in the locations shown on the previous page to ensure high reliability.

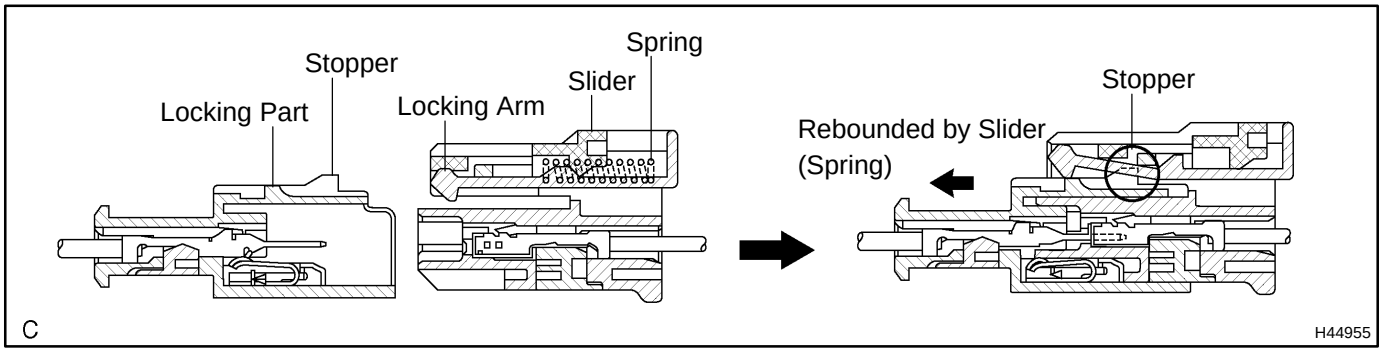


(1) Terminal twin−lock mechanism:
Each connector has a two−piece component consisting of a housing and a spacer. This design enables the terminal to be locked securely by two locking devices (the retainer and the lance) to prevent terminals from coming out.

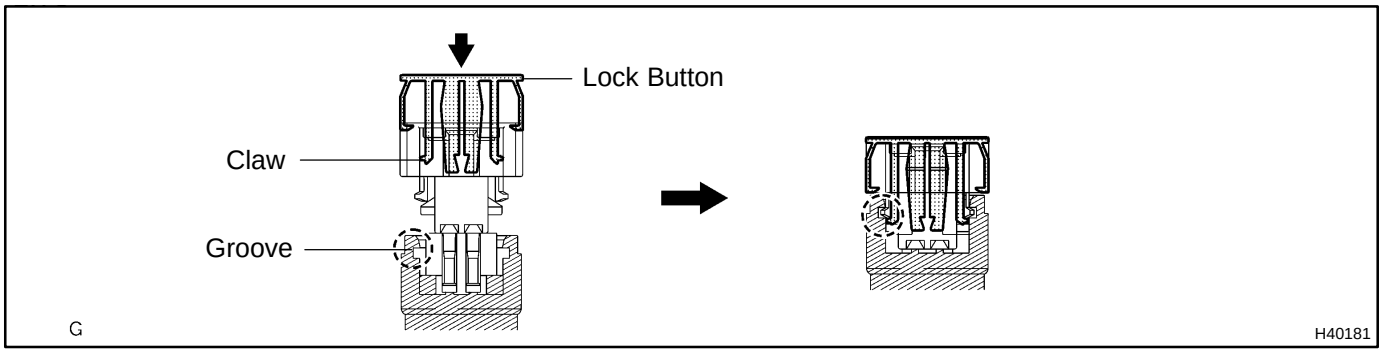
(2) Activation prevention mechanism:
Each connector contains a short spring plate. When the connector is disconnected, the short spring plate automatically connects the positive (+) terminal and the negative (−) terminal of the squib.



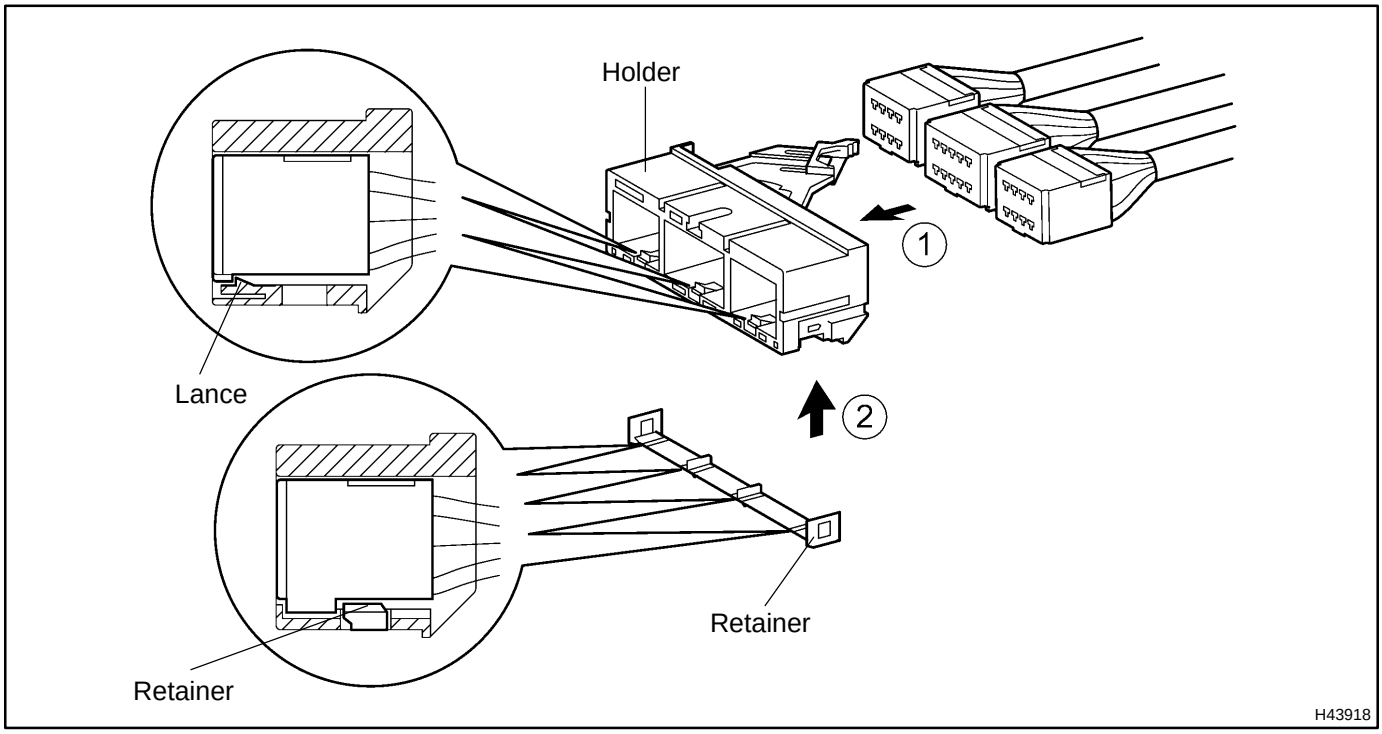
(3) Half connection prevention mechanism:
If the connector is not completely connected, the connector is disconnected due to the spring operation so that no continuity exists.



(4) Connector lock mechanism (1):
Locking the connector lock button connects the connector securely.



(5) Connector lock mechanism (2):
Both the primary lock with holder lances and the secondary lock with retainer prevent the connectors from becoming disconnected.



(6) Improper connection prevention lock mechanism:
When connecting the holder, the lever is pushed into the end by rotating around the A axis to lock the holder securely.

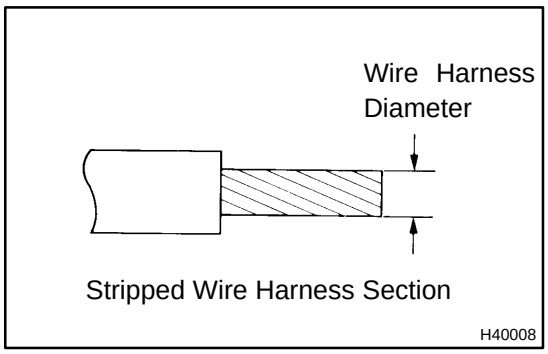
- **When storing the horn button assy, keep the airbag deployment side facing upward.**



(c) Using a service−purpose wire harness for the vehicle, tie down the horn button assy to the disc wheel.

Wire harness: Stripped wire harness section 1.25 mm^2 or more (0.0019 in.^{2} or more)

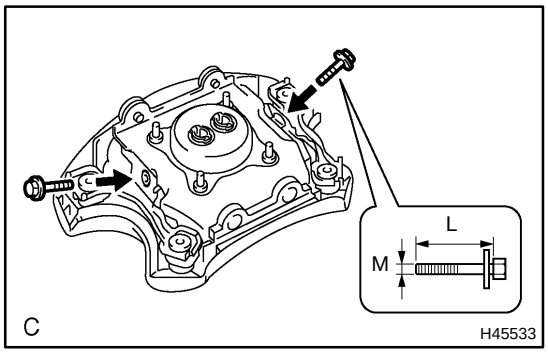
CAUTION:

If the wire harness is too thin or an alternative object is used to tie down the horn button assy, it may be snapped by the shock when the airbag is deployed. Always use a wire harness for vehicle use with an area of at least 1.25 mm^2 (0.0019 in.^{2}).

HINT:

To calculate the area of the stripped wire harness section:

Area = 3.14 x (Diameter)^2 divided by 4



(1) Install the 2 bolts with washers into the 2 bolt holes on the horn button assy.

Bolt:

L: 35.0 mm (1.387 in.)

M: 6.0 mm (0.236 in.)

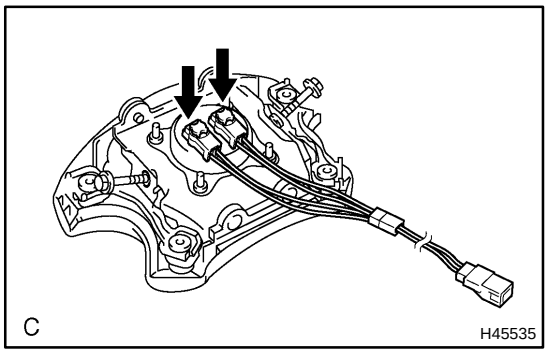
Pitch: 1.0 mm (0.039 in.)

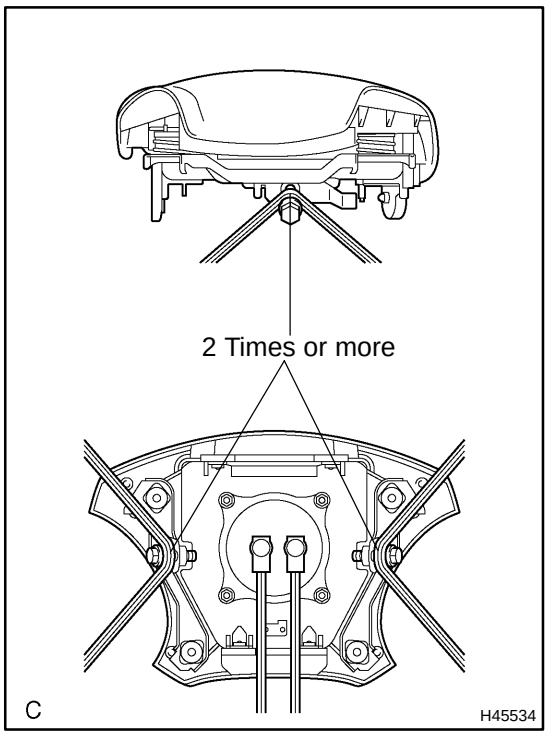
NOTICE:

- **Tighten the bolts by hand until they become difficult to turn.**
- **Do not tighten the bolts excessively.**

(2) After connecting the SST below to each other, connect them to the horn button assy.

SST 09082−00802 (09082−10801, 09082−30801)

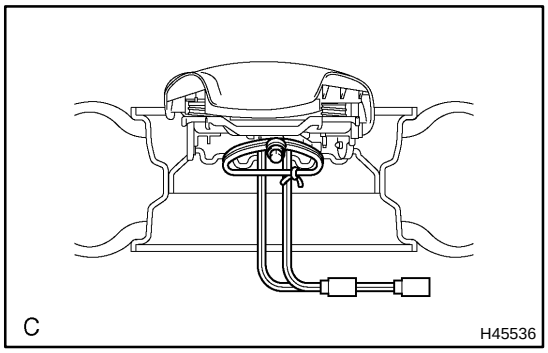




(3) Using 3 wire harnesses, wind wire harness at least 2 times each around the bolts installed on the left and right sides of the horn button assy.

CAUTION:

- **Tightly wind the wire harness around the bolts so that there is no slack.**
- **Make sure that the wire harness is tight. If there is slack in wire harness, the horn button assy may become loose due to the shock when the airbag is deployed.**



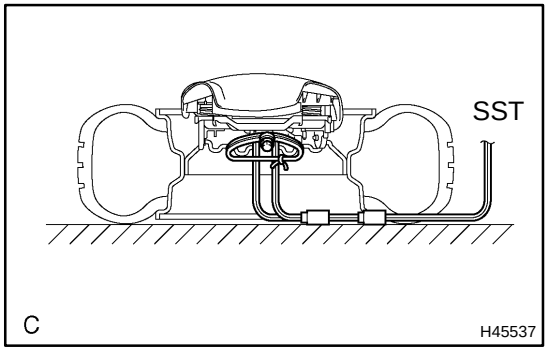
(4) Face the airbag deployment side of the horn button assy upward. Separately tie the left and right sides of the horn button assy to the disc wheel through the hub nut holes. Position the SST connector so that it hangs downward through the hub hole in the disc wheel.

CAUTION:

- **Make sure that the wire harness is tight. If there is slack in wire harness, the horn button assy may become loose due to the shock when the airbag is deployed.**
- **Always tie down the horn button assy with the airbag deployment side facing upward.**

NOTICE:

The disc wheel will be marked by the airbag deployment, so use an extra disc wheel.



(d) Install the SST.
SST 09082−00700

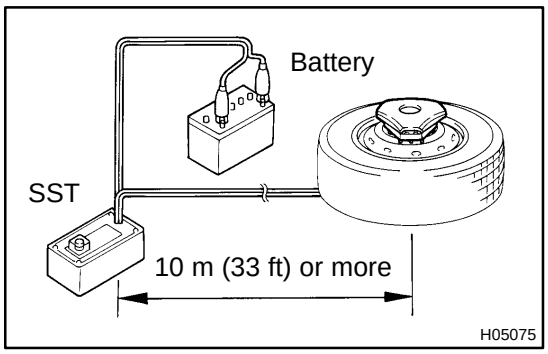
CAUTION:

Place the disc wheel on level ground.

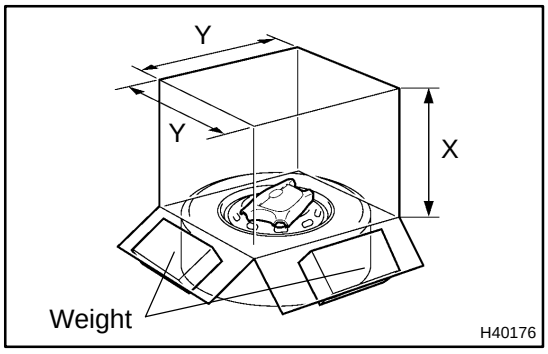
(1) Connect the connector of the SST.

NOTICE:

To avoid damaging the SST connector and wire harness, do not lock the secondary lock of the twin lock. Also, secure some slack for the SST wire harness inside the disc wheel.



(2) Move the SST to at least 10 m (33 ft) away from the horn button assy tied down to the disc wheel.



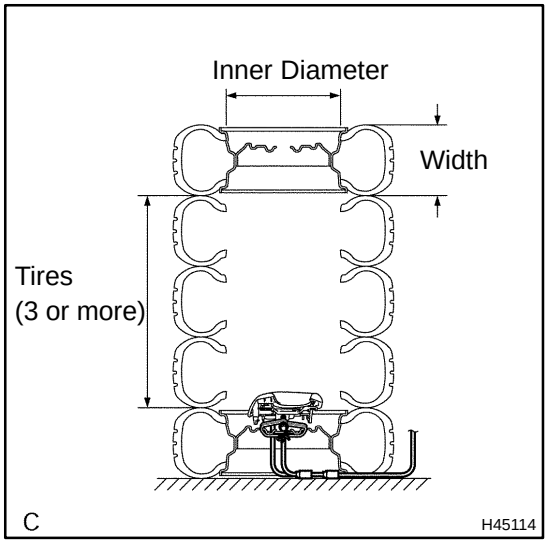
(e) Cover the horn button assy with a cardboard box or tires.

(1) Covering method using a cardboard box:
Cover the horn button assy with the cardboard box and place weights on the cardboard box in 4 places totalling at least 190 N (20 kg, 44 lb).

Size of cardboard box:
Must exceed the following dimensions:
X = 460 mm (18.11 in.)
Y = 650 mm (25.59 in.)

NOTICE:

- **When the dimension Y of the cardboard box exceeds the diameter of the disc wheel with tire which the horn button assy is tied to, X should be the following size.**
  X = 460 mm (18.11 in.) + width of tire
- **If a cardboard box which is smaller than the specified size is used, the cardboard box will be broken by the shock from the airbag deployment.**



(2) Covering method using tires:
Place at least 3 tires without disc wheels on the tire with disc wheel which the horn button assy is tied to. Place the tire with disc wheel on them.

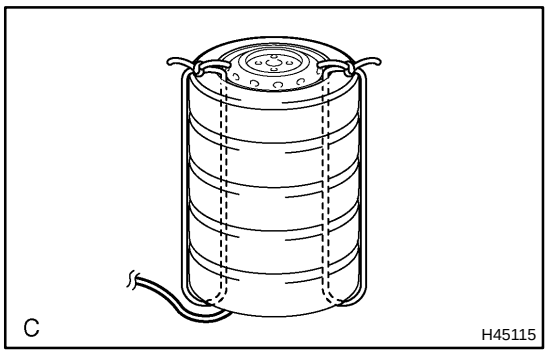
Tire size: Must exceed the following dimensions
Width: 185 mm (7.28 in.)
Inner diameter: 360 mm (14.17 in.)

CAUTION:

Do not use tires with disc wheels except on the top and bottom.

NOTICE:

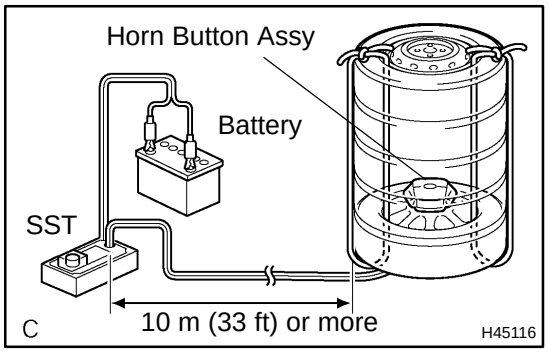
- **The tires may be marked by the airbag deployment, so use an extra tire.**
- **Do not place the SST connector under the tire because it could be damaged.**



(3) Tie the tires together with 2 wire harnesses.

CAUTION:

Make sure that the wire harness is tight. Looseness in the wire harness results in the tires coming free due to the shock when the airbag is deployed.



(f) Deploy the airbag.

(1) Connect the red clip of the SST to the battery positive (+) terminal and the black clip of the SST to the battery negative (−) terminal.

(2) Check that no one is within a 10 m (33 ft) radius of the disc wheel which the horn button assy is tied to.

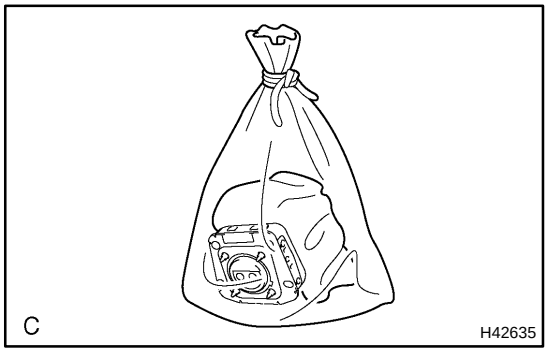
(3) Press the SST activation switch and deploy the airbag.

CAUTION:

When deploying the airbag, make sure that no one is near the tire.

HINT:

The airbag is deployed as the LED of the SST activation switch comes on.



(g) Dispose of the horn button assy.

CAUTION:

- **The horn button assy becomes extremely hot when the airbag is deployed, so do not touch it for at least 30 minutes after deployment.**
- **Use gloves and safety glasses when handling a horn button assy with a deployed airbag.**
- **Do not apply water, etc. to a horn button assy with a deployed airbag.**
- **Always wash your hands with water after completing the operation.**

(1) Remove the horn button assy from the disc wheel.

(2) Place the horn button assy in a plastic bag, tie it tightly and dispose of it as other general part disposal.

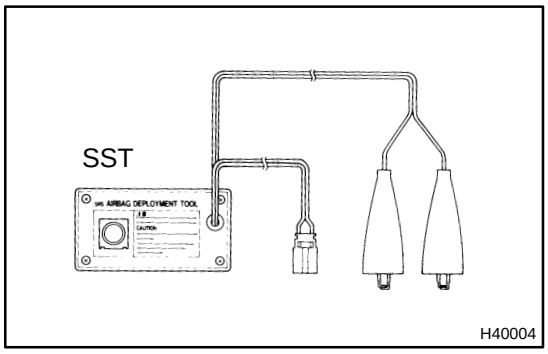
DISPOSAL

HINT:

When scrapping a vehicle equipped with SRS or disposing of the front passenger airbag assy, be sure to deploy the airbag first in accordance with the procedure described below. If any abnormality occurs with the airbag deployment, contact the SERVICE DEPT. of TOYOTA MOTOR SALES, U.S.A., INC.

CAUTION:

- **Never dispose of the front passenger airbag assy that has an undeployed airbag.**
- **The airbag produces an exploding sound when it is deployed, so perform the operation outdoors and where it will not create a nuisance to nearby residents.**



- **When deploying the airbag, always use the specified SST (SRS Airbag Deployment Tool). Perform the operation in a place away from electrical noise.**
- **When deploying the airbag, perform the operation at least 10 m (33 ft) away from the front passenger airbag assy.**
- **The front passenger airbag assy is extremely hot when the airbag is deployed, so do not touch it for at least 30 minutes after deployment.**
- **Use gloves and safety glasses when handling the front passenger airbag assy with the deployed airbag.**
- **Do not apply water, etc. to the front passenger airbag assy with the deployed airbag.**
- **Always wash your hands with water after completing the operation.**

1. DISPOSE OF FRONT PASSENGER AIRBAG ASSY (WHEN INSTALLED IN VEHICLE)

   (2) Connect the connector of the SST to the front passenger airbag assy.

SST 09082−00700, 09082−00780

NOTICE:

To avoid damaging the SST connector and wire harness, do not lock the secondary lock of the twin lock.

   (3) Move the SST at least 10 m (33 ft) away from the vehicle front side window.
   (4) Maintaining enough clearance for the SST wire harness in the front side window, close all doors and windows of the vehicle.

NOTICE:

Take care not to damage the SST wire harness.

   (5) Connect the red clip of the SST to the battery positive (+) terminal and the black clip of the SST to the negative (−) terminal.

(j) Deploy the airbag.
   (1) Check that no one is inside the vehicle or within a 10 m (33 ft) radius of the vehicle.
   (2) Press the activation switch of the SST and deploy the airbag.

HINT:

The airbag is deployed as the LED of the SST activation switch comes on.

CAUTION:

- **The front passenger airbag assy is extremely hot when the airbag is deployed, so do not touch it for at least 30 minutes after deployment.**
- **Use gloves and safety glasses when handling the front passenger airbag assy with the deployed airbag.**
- **Do not apply water, etc. to the front passenger airbag assy with the deployed airbag.**

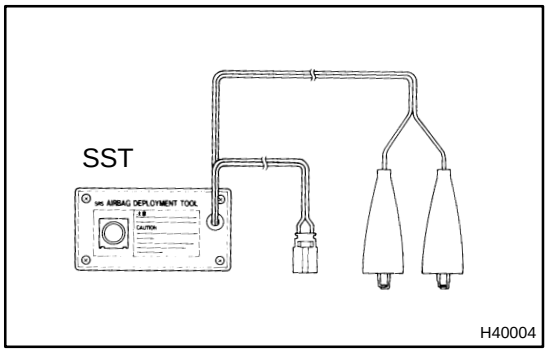
2. DISPOSE OF FRONT PASSENGER AIRBAG ASSY (WHEN NOT INSTALLED IN VEHICLE)

NOTICE:

- **When disposing of the front passenger airbag assy, never use the customer's vehicle to deploy the airbag.**
- **Be sure to follow the procedure detailed below when deploying the airbag.**

HINT:

Prepare a battery as the power source to deploy the airbag.



(a) Check the function of the SST (See step 1−(a) on page 60−27).

(b) Remove the front passenger airbag assy.

CAUTION:

(c) Using a service−purpose wire harness for the vehicle, tie down the front passenger airbag assy to the tire.

Wire harness: Stripped wire harness section 1.25 mm^2 or more (0.0019 $in.^2$ or more)

CAUTION:

If a wire harness which is too thin or an alternative object is used to tie down the front passenger airbag assy, it may be snapped by the shock when the airbag is deployed. This is highly dangerous. Always use a wire harness for vehicle use which has a section of at least 1.25 mm^2 (0.0019 $in.^2$).

HINT:

- To calculate the square of the stripped wire harness section:

  Square = 3.14 x $(Diameter)^2$ divided by 4

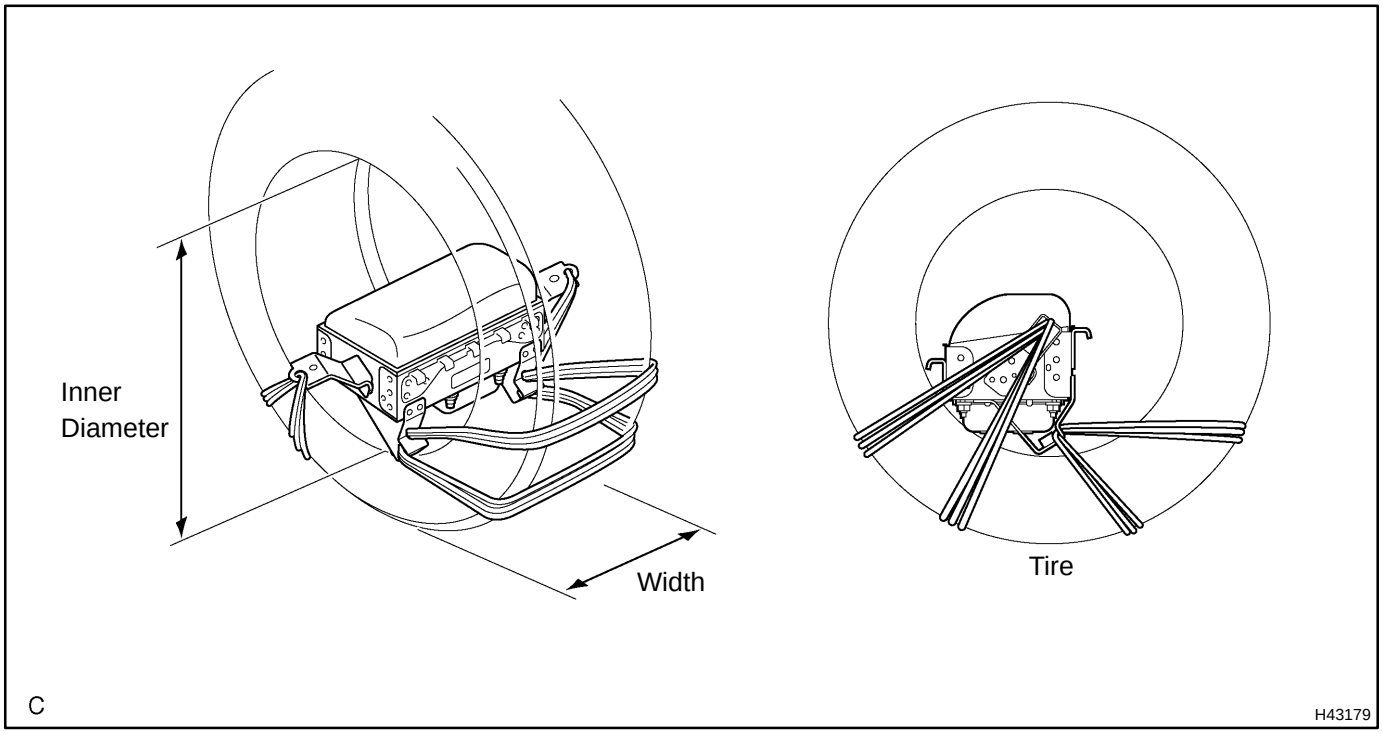
  Tire size: Must exceed the following dimensions
  Width: 185 mm (7.28 in.)
  Inner diameter: 360 mm (14.17 in.)

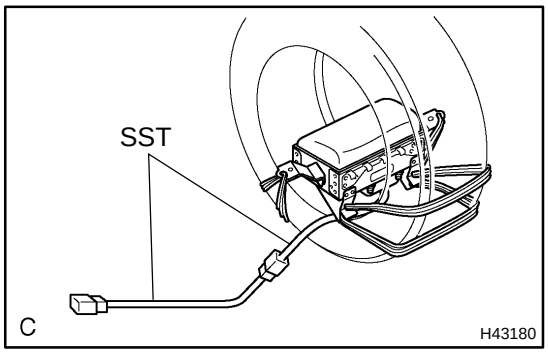
CAUTION:

- **Make sure that the wire harness is tight. It is highly dangerous when looseness in the wire harness results in the front passenger airbag assy coming free due to the shock from the airbag deployment.**

- **Always tie down the front passenger airbag assy with the airbag deployment side facing inside the tire.**

NOTICE:
The tire will be marked by the airbag deployment, so use a redundant tire.





(d) Install the SST.

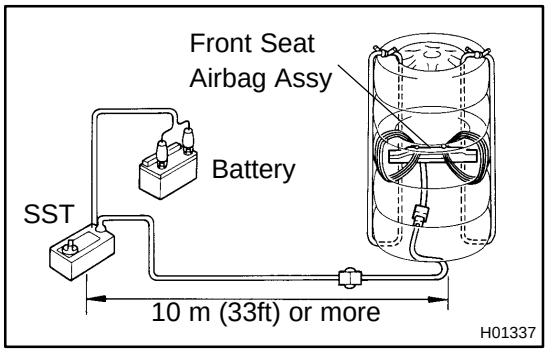
Make sure that the wire harness is tight. It is very dangerous if looseness in the wire harness results in the tires coming free due to the shock from the airbag deploying.

HINT:

Place the SST connector and wire harness inside tires. Secure at least 1 m (3 ft) of slack for the wire harness.



H01337

(e) Install the SST.

Connect the connectors of the 2 SST to the front seat airbag assy connector.

SST 09082−00700, 09082−00750

(f) Deploy the airbag.

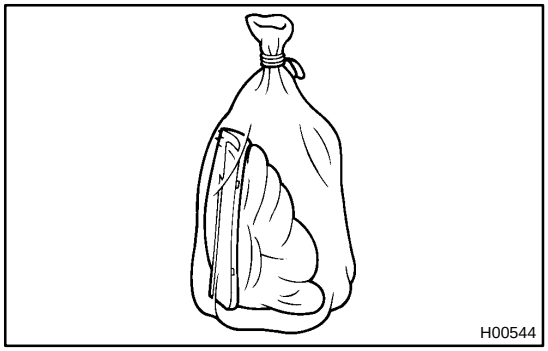
(1) Connect the SST red clip to the battery positive (+) terminal and the black clip to the battery negative (−) terminal.

(2) Check that no one is within 10 m (33 ft) area around the tire which the front seat airbag assy is tied to.

(3) Press the SST activation switch and deploy the airbag.

HINT:

The airbag deploys simultaneously as the LED of the SST activation switch lights up.



H00544

(g) Dispose of the front seat airbag assy.

CAUTION:

- **The front seat airbag assy is very hot when the airbag is deployed, so leave it alone for at least 30 minutes after deployment.**
- **Use gloves and safety glasses when handling a front seat airbag assy with the deployed airbag.**
- **Do not apply water etc. to a front seat airbag assy with the deployed airbag.**
- **Always wash your hands with water after completing the operation.**

(1) Remove the front seat airbag assy from the tire.

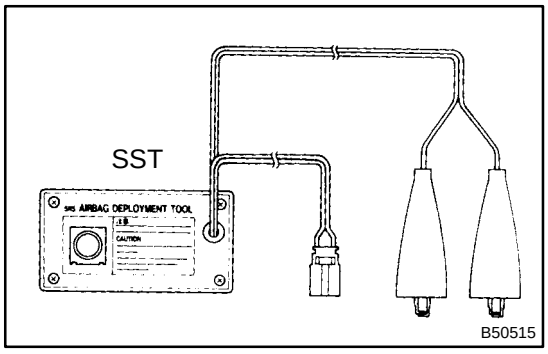
DISPOSAL

HINT:

When scrapping vehicles equipped with a seat belt pretensioner or disposing of a front seat outer belt (with seat belt pretensioner) always first active the seat belt pretensioner in accordance with the procedures described below. If any abnormality occurs in the seat belt pretensioner operation, contact the SERVICE DEPT. of the TOYOTA MOTOR SALES, U.S.A., INC. When disposing of a front seat outer belt (with seat belt pretensioner) activated in a collision, follow the same procedures given in step 1−(d) in DISPOSAL.



CAUTION:

- **Never dispose of front seat outer belt which has an inactivated pretensioner.**
- **The seat belt pretensioner produces a sizeable exploding sound when it activates, so perform operation out−of−door and where it will not create a nuisance to nearby residents.**
- **When activating a front seat outer belt (with seat belt pretensioner), perform the operation at least 10 m (33 ft) away from the front seat outer belt.**
- **Use gloves and safety glasses when handling a front seat belt with an activated pretensioner.**
- **Always wash your hands with water after completing operation.**
- **Do not apply water, etc. to a front seat outer belt with an activated pretensioner.**
- **When activating the seat belt pretensioner, always use the specified SST. (09062−00700, 09082−00770) (SRS Airbag Deployment Tool) Perform the operation in a place away from electrical noise.**

PRECAUTION

1. PRECAUTION OF HEADLIGHT BULB REPLACEMENT

(a) If the adhered oil is left unremoved from the halogen lamp surface, the lamp service life is shortened as it becomes hot when it is turned on.

(b) Since the internal pressure of a halogen lamp is high, dropping, hitting or damaging the bulb may cause the glass to scatter. Therefore, handle it with great care.

(c) When replacing bulbs, do not remove until a new bulb is prepared.
Because if it is left being removed for a long period of time, the lens may be covered with dirt or moisture.

(d) For replacement, be sure to use a bulb of the same watt.

(e) Firmly reinstall the socket after bulb replacement. Otherwise, cloudy lens or invasion by water will be caused.

14. FOG LAMP AIMING ADJUSTMENT (SEE PAGE 65−17)

651AN−01

ADJUSTMENT

1. VEHICLE PREPARATION FOR HEADLAMP AIM ADJUSTMENT

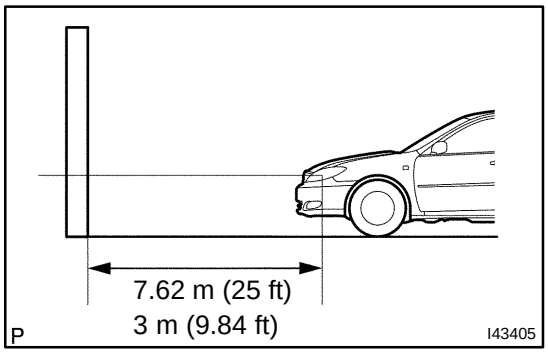
(a) Prepare the vehicle:

- Ensure there is no damage or deformation to the body around the headlamps.
- Fill the fuel tank.
- Make sure that the oil is filled to the specified level.
- Make sure that the coolant is filled to the specified level.
- Inflate the tires to the appropriate pressure.
- Place the spare tire, tools, and jack in their original positions.
- Unload the trunk.
- Sit a person of average weight (68 kg, 150 lb) in the driver's seat.

2. PREPARATION FOR HEADLAMP AIMING (Using a tester)

(a) Prepare the vehicle for headlamp aim check.

(b) Adjust in accordance with headlamp tester instructions.



3. PREPARATION FOR HEADLAMP AIMING (Using a screen)

(a) Prepare the vehicle according to the following conditions:

- Place the vehicle in a location that is dark enough to clearly observe the cutoff line. The cutoff line is a distinct line, below which light from the headlamps can be observed and above which it cannot.
- Place the vehicle at a 90 angle to the wall.
- Create a 7.62 m (25 ft) distance between the vehicle (headlamp bulb center) and the wall.
- Place the vehicle on a level surface.
- Bounce the vehicle up and down to settle the suspension.

NOTICE:

A distance of 7.62 m (25 ft) between the vehicle (headlamp bulb center) and the wall is necessary for proper aim adjustment. If unavailable, secure a distance of exactly 3 m (9.84 ft) for check and adjustment. (The target zone will change with the distance so follow the instructions in the illustration.)

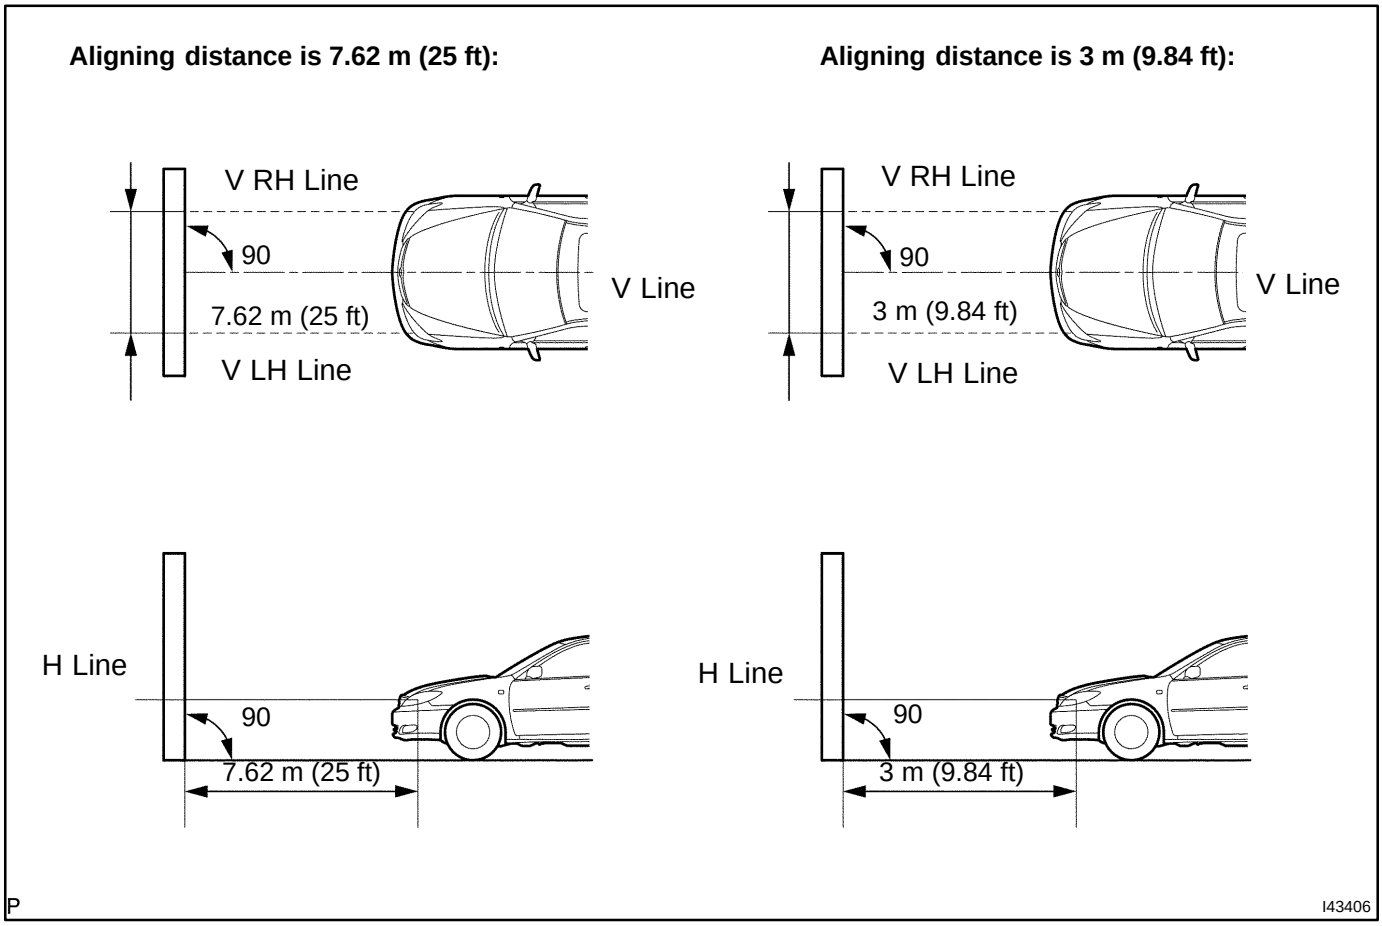
(b) Prepare a piece of thick white paper (approximately 2 m (6.6 ft) (height) x 4 m (13.1 ft) (width)) to use as a screen.

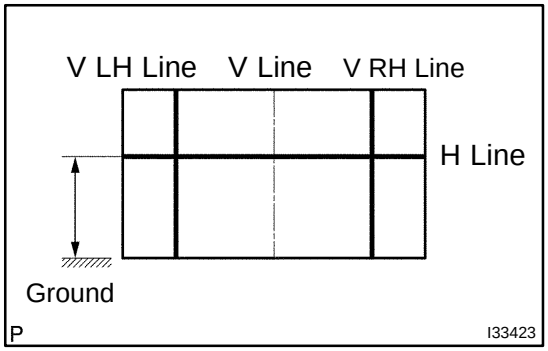
(c) Draw a vertical line down the center of screen (V line).

(d) Set the screen as shown in the illustration.

HINT:

- Stand the screen perpendicular to the ground.
- Align the V line on the screen with the center of the vehicle.





(e) Draw base lines (H line, V LH, V RH lines) on the screen as shown in the illustration.

HINT:

- The base lines differ for ”low−beam inspection” and ”high−beam inspection”.
- Mark the headlamp bulb center marks on the screen. If the center mark cannot be observed on the headlamp, use the center of the headlamp bulb or the manufacturer’s name marked on the headlamp as the center mark.
  (1) H Line (Headlamp height):
  Draw a horizontal line across the screen so that it passes through the center marks. The H line should be at the same height as the headlamp bulb center marks of the low−beam headlamps.
  (2) V LH Line, V RH Line (Center mark position of left−hand (LH) and right−hand (RH) headlamps):
  Draw two vertical lines so that they intersect the H line at each center mark (aligned with the center of the low−beam headlamp bulbs).

4. HEADLAMP AIMING INSPECTION

(a) Cover or disconnect the connector of the headlamp on the opposite side to prevent light from the headlamp not being inspected from affecting headlamp aiming inspection.

NOTICE:

Do not keep the headlamp covered for more than 3 minutes. The headlamp lens is made of synthetic resin, and may easily melt or be damaged due to heat.

HINT:

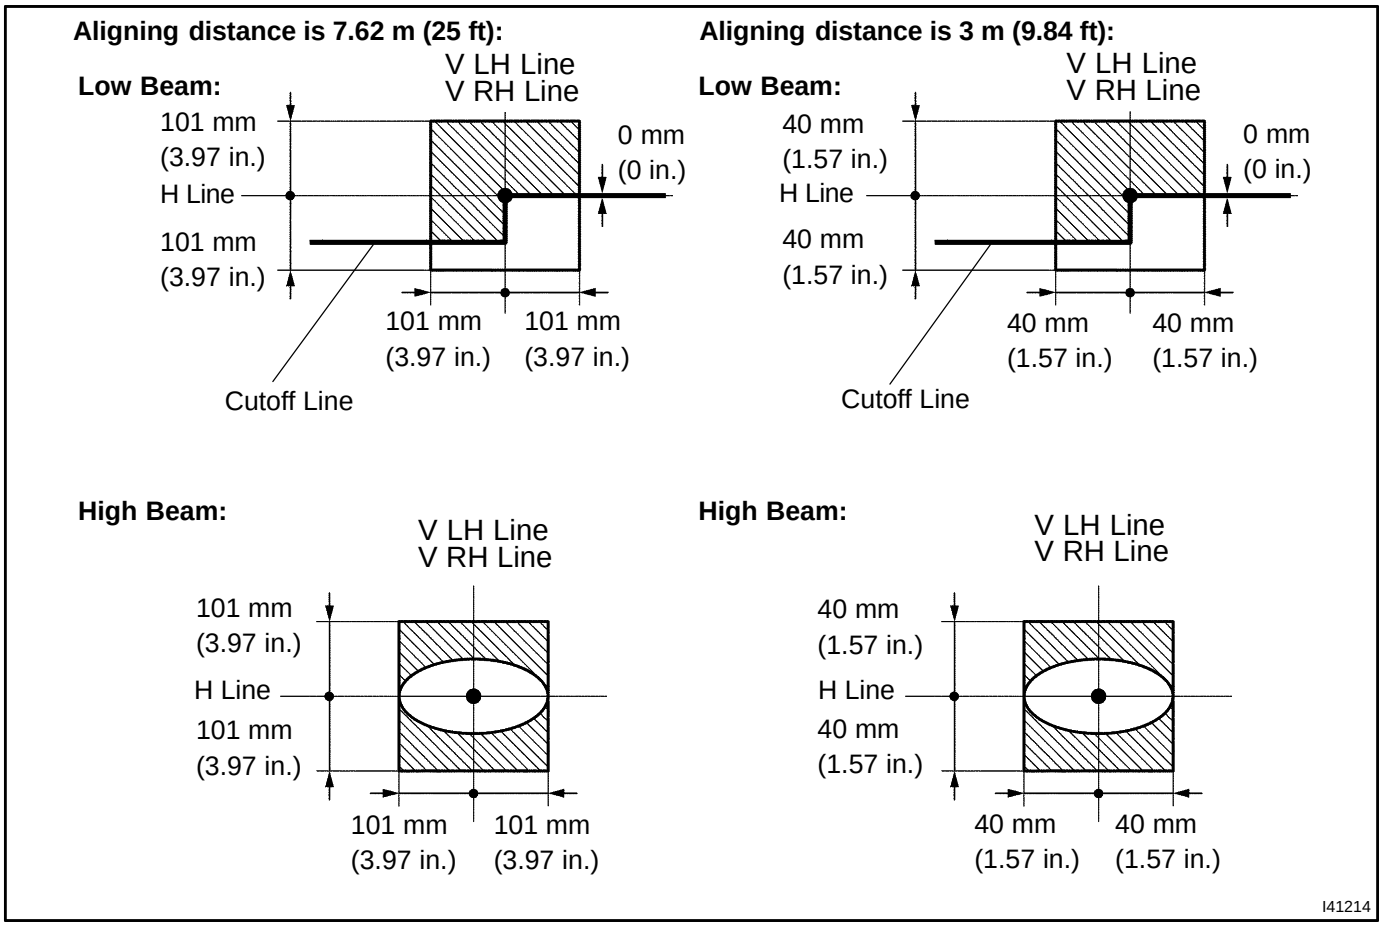
When checking the aim of the high−beam, cover the low−beam or disconnect the connector.

(b) Start the engine.

NOTICE:

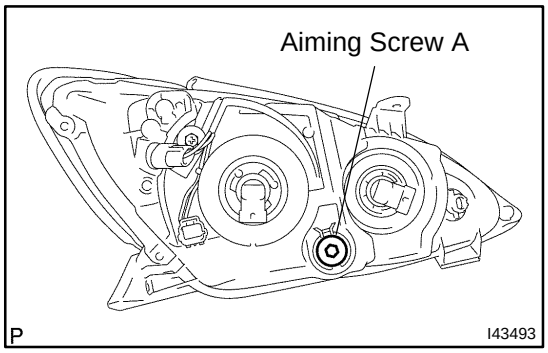
Engine rpm must be 1,500 or more.

(c) Turn on the headlamp and make sure that the cutoff line falls within the specified area, as shown in the illustration.



HINT:

- Since the low−beam light and the high−beam light are a unit, if the aim on one is correct, the other should also be correct. However, check both beams just to make sure.
- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 101 mm (3.97 in.) above and below the H line as well as left and right of the V line with low−beam (SAE J599).
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 40 mm (1.57 in.) above and below the H line as well as left and right of the V line with low−beam (SAE J599).
- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 101 mm (3.97 in.) above and below the H line as well as left and right of the V line with high−beam (SAE J599).
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 40 mm (1.57 in.) above and below the H line as well as left and right of the V line with high−beam (SAE J599).
- Alignment distance is 7.62 m (25 ft):
  The cutoff line is 53 mm (2.08 in.) below the H line with low−beam.
- Alignment distance is 3 m (9.84 ft):
  The cutoff line is 21 mm (0.82 in.) below the H line with low−beam.



5. HEADLAMP AIMING ADJUSTMENT

(a) Adjust the aim vertically:
Adjust the headlamp aim into the specified range by turning aiming screw A with a screwdriver.

NOTICE:

The final turn of the aiming screw should be made in the clockwise direction. If the screw is tightened excessively, loosen it and then retighten it, so that the final turn of the screw is in the clockwise direction.

HINT:

- Perform low−beam aim adjustment.
- The headlamp aim moves up when turning the aiming screw clockwise, and moves down when turning the aiming screw counterclockwise.

651AO−01

REPAIR

HINT:

- COMPONENTS: SEE PAGE 65−7.
- Use the same procedures for the RH side and LH side.
- The procedures listed below are for the LH side.
- If the area where the headlamp unit LH is installed is broken, the repairs listed below can be performed inexpensively through the use of a repair use bracket. This may only be done if the headlamp assy LH itself is not damaged.

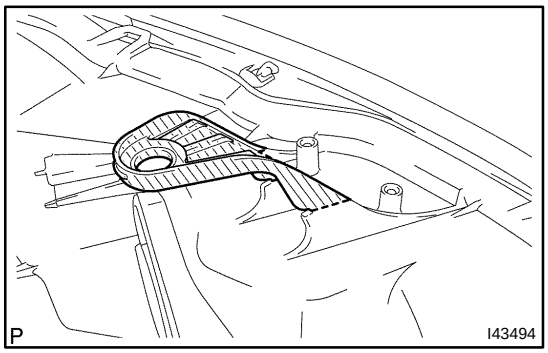
1. REMOVE FRONT BUMPER ASSY (SEE PAGE 76−2)

2. REMOVE HEADLAMP ASSY LH (SEE PAGE 65−8)

3. INSTALL HEADLAMP PROTECTOR RETAINER UPPER LH

HINT:

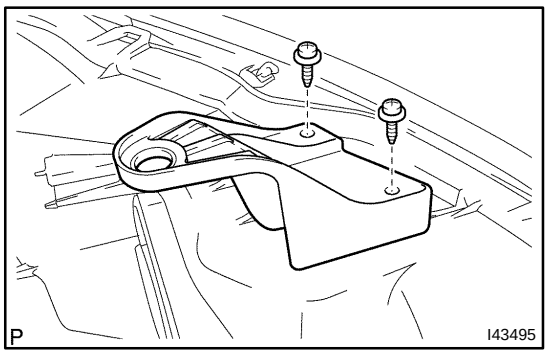
- If the installation area of the headlamp assy LH is damaged, use the supply bracket for low−cost repair.
- Ensure that the headlamp assy LH is not damaged.



(a) Cut off the part shaded in the illustration and sand smooth with sandpaper.

NOTICE:

After cutting off the part, place the headlamp protector retainer UPPER LH against the bosses and gradually file away until installation is possible.



(b) Install the headlamp protector retainer UPPER LH with the 2 screws.

INSPECTION

1. INSPECT RELAY (HORN)

(a) Remove the HORN relay from the engine room R/B.

(b) Check the HORN relay resistance.

Standard:

Tester Connection	Specified Condition
3 − 5	1 kΩ or higher
3 − 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

HORN ASSY

69090−01

REPLACEMENT

1. REMOVE HIGH PITCHED HORN ASSY

(a) Disconnect the connector.

(b) Remove the bolt and horn.

3. INSTALL HIGH PITCHED HORN ASSY

(a) Place the stay onto the baffle part in the radiator support upper. Then install the horn with the bolt.
Torque: 20 N·m (204 kgf·cm, 15 ft·lbf)

(b) Connect the connector.

4. INSTALL LOW PITCHED HORN ASSY

GARAGE DOOR OPENER SYSTEM

69059−01

REGISTRATION

1. NEW CODE REGISTRATION

HINT:

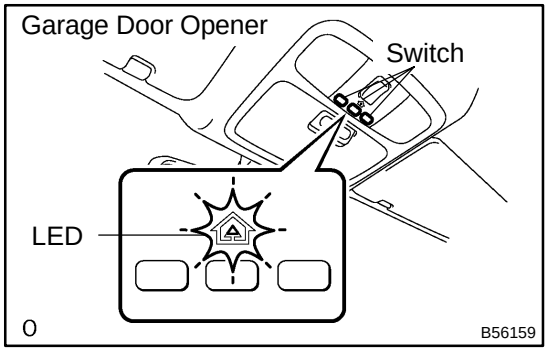
- The garage door opener is built in the map lamp assy. When transmitter codes for garage door, gate, entry gate, door lock, home lighting system or security system are registered with the garage door opener, be sure to register them again whenever replacing the map lamp assy.
- After the map lamp assy has been replaced, register transmitter codes with the garage door opener (Registration mode).

NOTICE:

- **While the transmitter code for a system (garage, door, gate, etc.) is being registered, the system may operate. During code registration and while the system is in operation, be sure that no people or objects are in the way.**
- **Be sure to stop the engine and remove the key from the ignition switch before transmitter code registration.**
- **The garage door opener does not apply to systems manufactured before April 1, 1982 and systems that do not comply with the Federal Safety Standards.**
- **Garage doors without a jam protection function do not meet the Federal Safety Standards.**

HINT:

- Every one of the garage door opener switches can have only one transmitter code; total 3 transmitter codes can be registered with the garage door opener.
- Even if the battery is disconnected, transmitter codes registered with the garage door opener will not be erased.
- Even if you attempt to rewrite the transmitter code registered with the garage door opener and the attempt has failed, the registered transmitter code will not be erased.

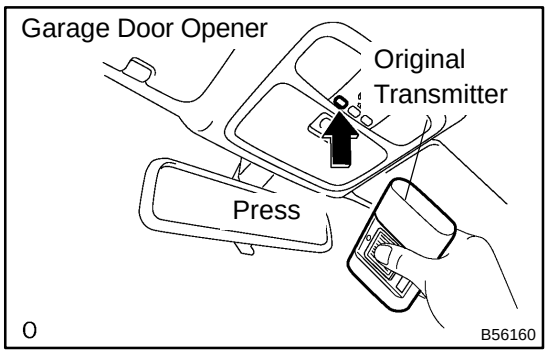


(a) Select a switch of the garage door opener for transmitter code registration.

(b) Press and hold the selected switch for 20 seconds. Then, the garage door opener enters registration mode.

HINT:

When the garage door opener is in registration mode, the LED changes from ON to flashing at a cycle of 1 Hz. (In the case of the ”rolling code” type, the LED will flash at a cycle of 8.8 Hz for 1.6 seconds at first and then change the flash cycle to 1 Hz after the garage door opener has entered registration mode.)



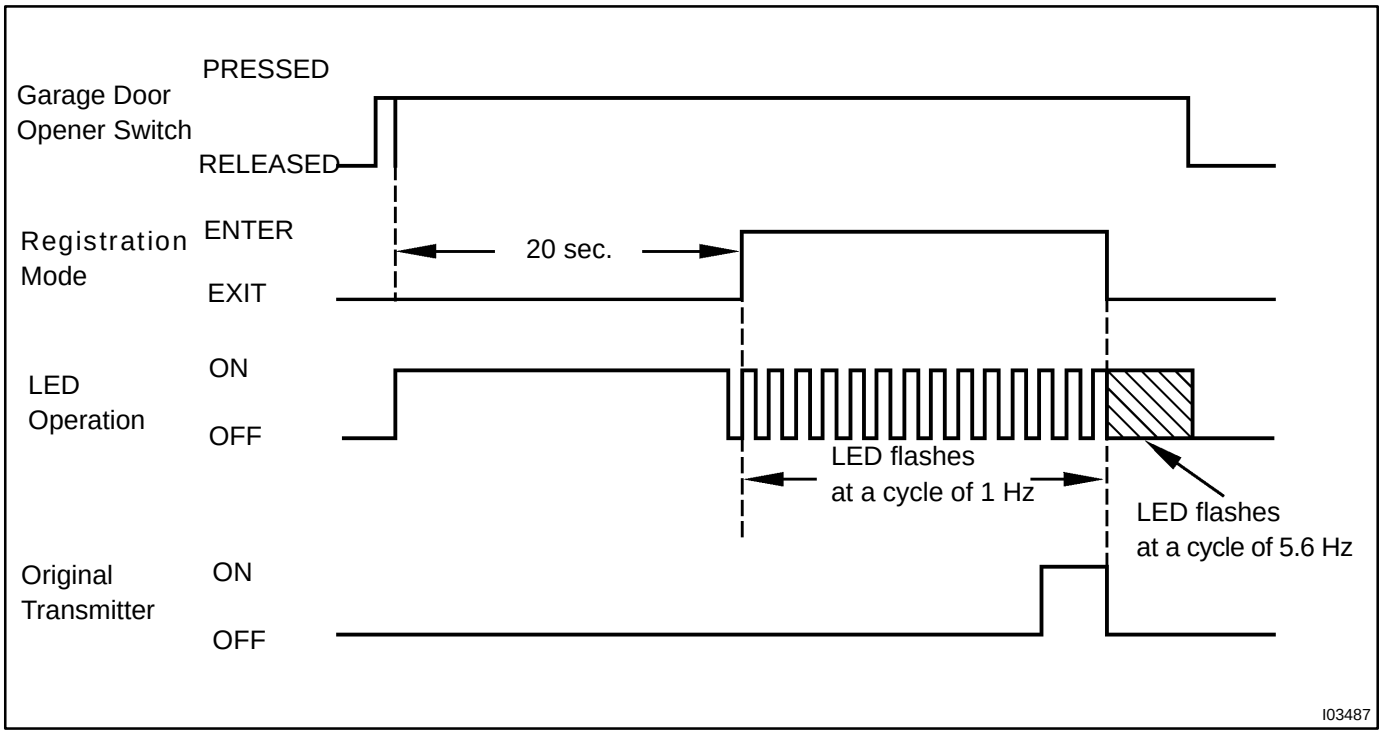
(c) After the garage door opener has entered registration mode, bring the original transmitter of the system within 1−inch of the garage door opener while pressing the switch of the garage door opener. Under this condition, press the original transmitter.

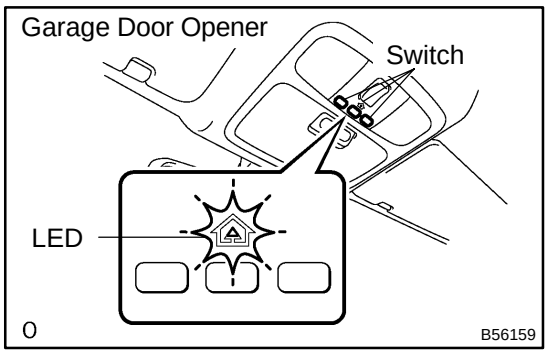
(d) When the transmitter code registration has been completed correctly, the LED of the garage door opener flashes at a cycle of 5.6 Hz. When this happens, release both the switch and the original transmitter.

HINT:

- If the code registration has failed, the battery of the original transmitter may be weak or the system may not meet the garage door opener. In this case, press the original transmitter repeatedly. Some transmitters may need 1 to 2 seconds to stop transmitting signals.
- If the transmitter code registration has not been completed in 90 seconds after the garage door opener has entered registration mode, the garage door opener will enter low power mode (See step c).

Timing Chart of Registration Mode:





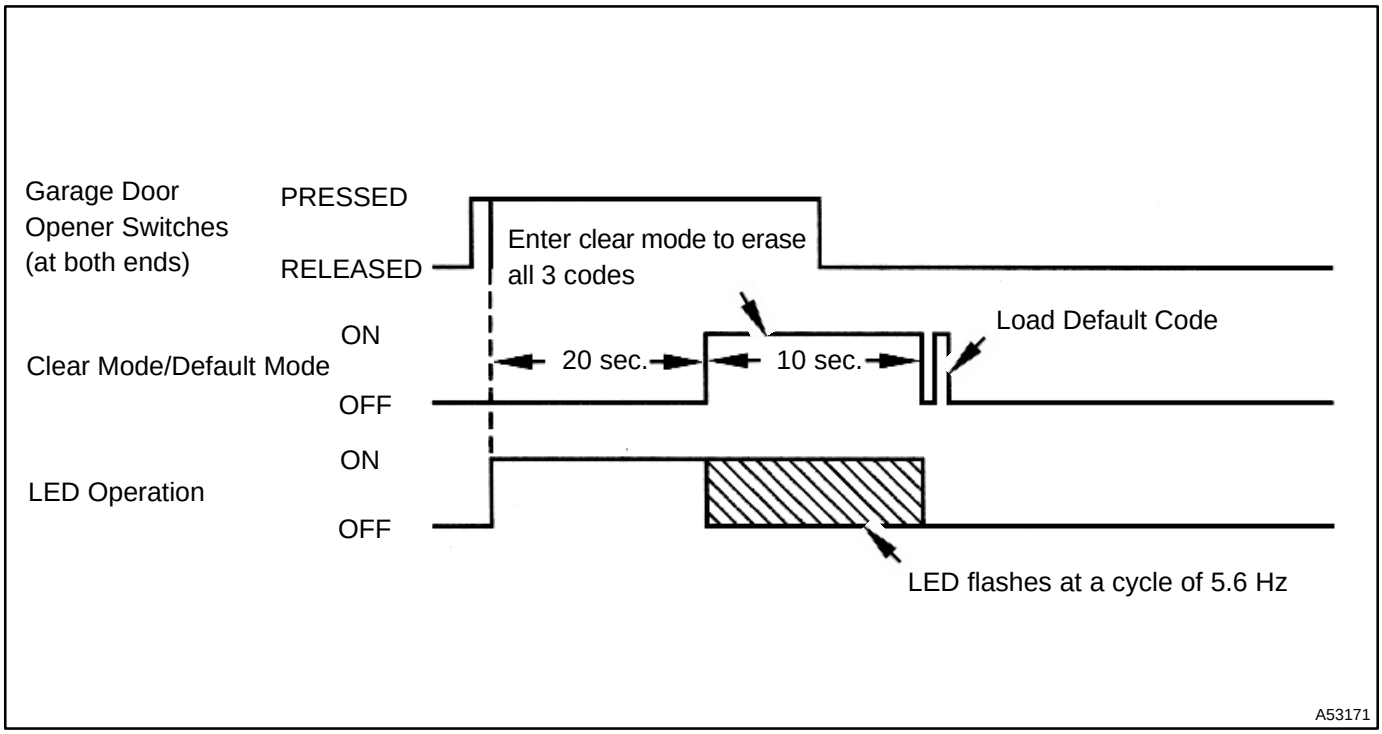
2. Erase the transmitter codes (Clear mode).

HINT:

- All the transmitter codes registered in the garage door opener are erased at the same time (maximum 3 codes).
- If the switches are released within 10 seconds after the transmitter codes have been erased, the garage door opener will enter registration mode.
- If the switches are held for 10 seconds or more after the transmitter codes have been erased, default codes will be set to all the 3 switches of the garage door opener. With this default code, you can check operation of the garage door opener using a tester.

(a) Press and hold the 2 switches at both ends of the garage door opener simultaneously for 20 seconds. Then, the LED starts flashing at a cycle of 5.6 Hz. Releasing the switches will end clear mode.

Timing Chart of Clear Mode:

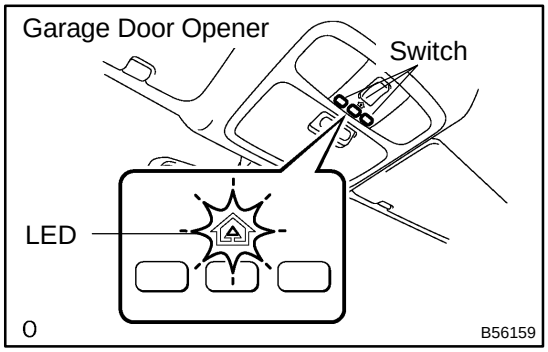


3. Low power mode:

(a) If the switch of the garage door opener is held for 100 seconds or more, the garage door opener will enter low power mode to economize the power consumption. When the garage door opener has entered low power mode, the LED goes off.

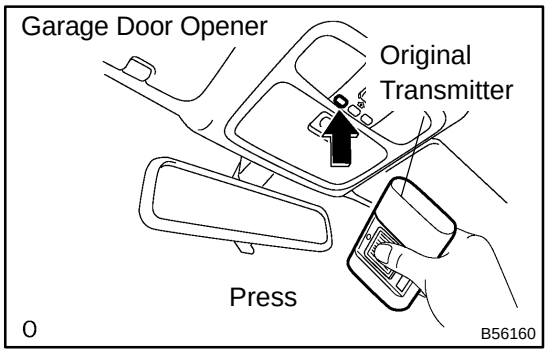
6902T−03

INSPECTION



1. INSPECT GARAGE DOOR OPENER

(a) Press the switch and check that each LED (red) lights up. Even if only one switch is found not to light up, replace it.



2. INSPECT GARAGE DOOR OPENER REGISTRATION AND TRANSMITTING

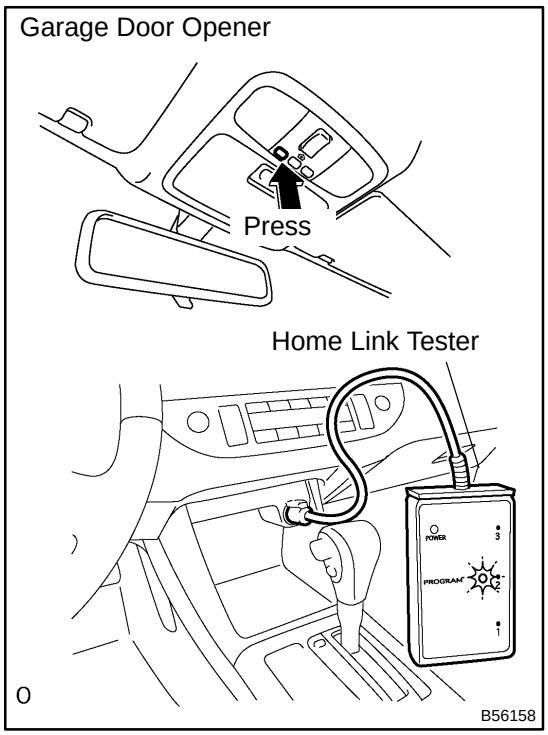
HINT:

Use the home link tester made by KENT MORE for this test. As it is necessary to register the transmitter code of the home link tester, erase the customer's code. When the inspection completes, please register the customer's code again.

(a) Register the transmitter code of the home link tester for inspection (See page 69−5 for further details).

HINT:

If the transmitter code can not be registered, replace the garage door opener.



(b) Press the switch in which an inspection code has been registered and check that the LED (green) of the home link tester lights up.

HINT:

If the LED (green) does not light up, replace the garage door opener.

POWER WINDOW CONTROL SYSTEM

700H6−02

ON−VEHICLE INSPECTION

1. CHECK POWER WINDOW (MANUAL OPERATION FUNCTION)

(a) Turn the ignition switch ON.

(b) Check that the door glass moves up when the power window regulator master switch is pulled UP halfway, and the door glass moves down when the switch is pushed DOWN halfway.

(c) Check that the door glass moves up when the power window regulator switch is pulled UP, and the door glass moves down when the switch is pushed DOWN.

(d) Check that the door glasses other than the driver side door glass do not operate when the window lock switch is turned to LOCK.

2. CHECK AUTOMATIC OPERATION FUNCTION

HINT:

Only steps (a), (b), and (d) are applicable to the models without the jam protection function.

(a) Turn the ignition switch ON.

(b) Check that the AUTO UP function operates to fully close the door glass when each window switch of the regulator master switch is pulled UP fully.

(c) Check that the AUTO DOWN function operates to fully open the door glass when each window switch of the regulator master switch is pushed DOWN fully.

(d) Check that the door glass stops when the applicable switch is pulled UP during AUTO DOWN operation. (However, if the switch is held in the UP position, it will change to manual operation.)

(e) Check that the door glass stops when the applicable switch is pushed DOWN during AUTO UP operation. (However, if the switch is held in the DOWN position, it will change to manual operation.)

3. CHECK JAM PROTECTION FUNCTION (FOR DRIVER SIDE DOOR GLASS OF MODELS W/ JAM PROTECTION FUNCTION)

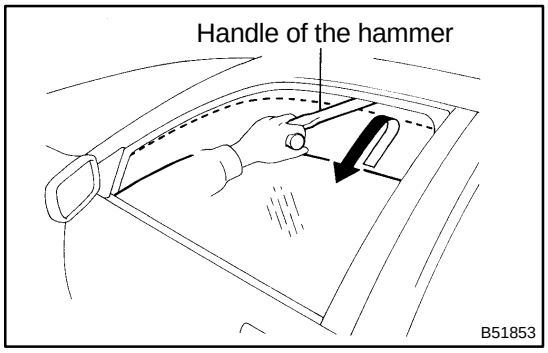
(a) Check the basic function.

NOTICE:

- **Do not check this function using a part of your body such as a hand. Also, pay thorough attention that nothing gets caught by accident in this process.**
- **If the power window regulator motor assembly has just been reset, raise and lower the door glass several times using AUTO and MANUAL operation before performing check.**

HINT:

The jam protection function only works during UP operation.



(1) Fully open the door glass.

(2) Insert the handle of the hammer when the door glass is almost in the fully closed position.

(3) Try to close the door glass with AUTO UP and MANUAL UP operation, check that the door glass moves down about 200 mm (7.87 in.) and stops there, so that the hammer handle is not caught.

HINT:

The door glass goes down by about 50 mm. However, when the opening between the glass and body is less than 200 mm, the door glass goes down by 200 mm or keeps going down for 5 seconds, and then stops.

(4) During DOWN operation, check that the door glass does not move up even when the window regulator master switch is pulled UP.

700H7−02

PRE−CHECK

1. SELECTING COMPASS DISPLAY MODE

(a) The comp switch allows you to select a Display or Non−display mode of the compass.

2. SETTING ZONE

(a) Deviation between the ”magnetic north” and ”actual north” differs depending on the location. Therefore, adjustment of the magnetism is required. Since the magnetic condition differs depending on the area where the vehicle is used, it is necessary for each user to set the zone. (Refer to ”Compass Zone Map”). The zone setting can be changed using the comp switch of the inner mirror.

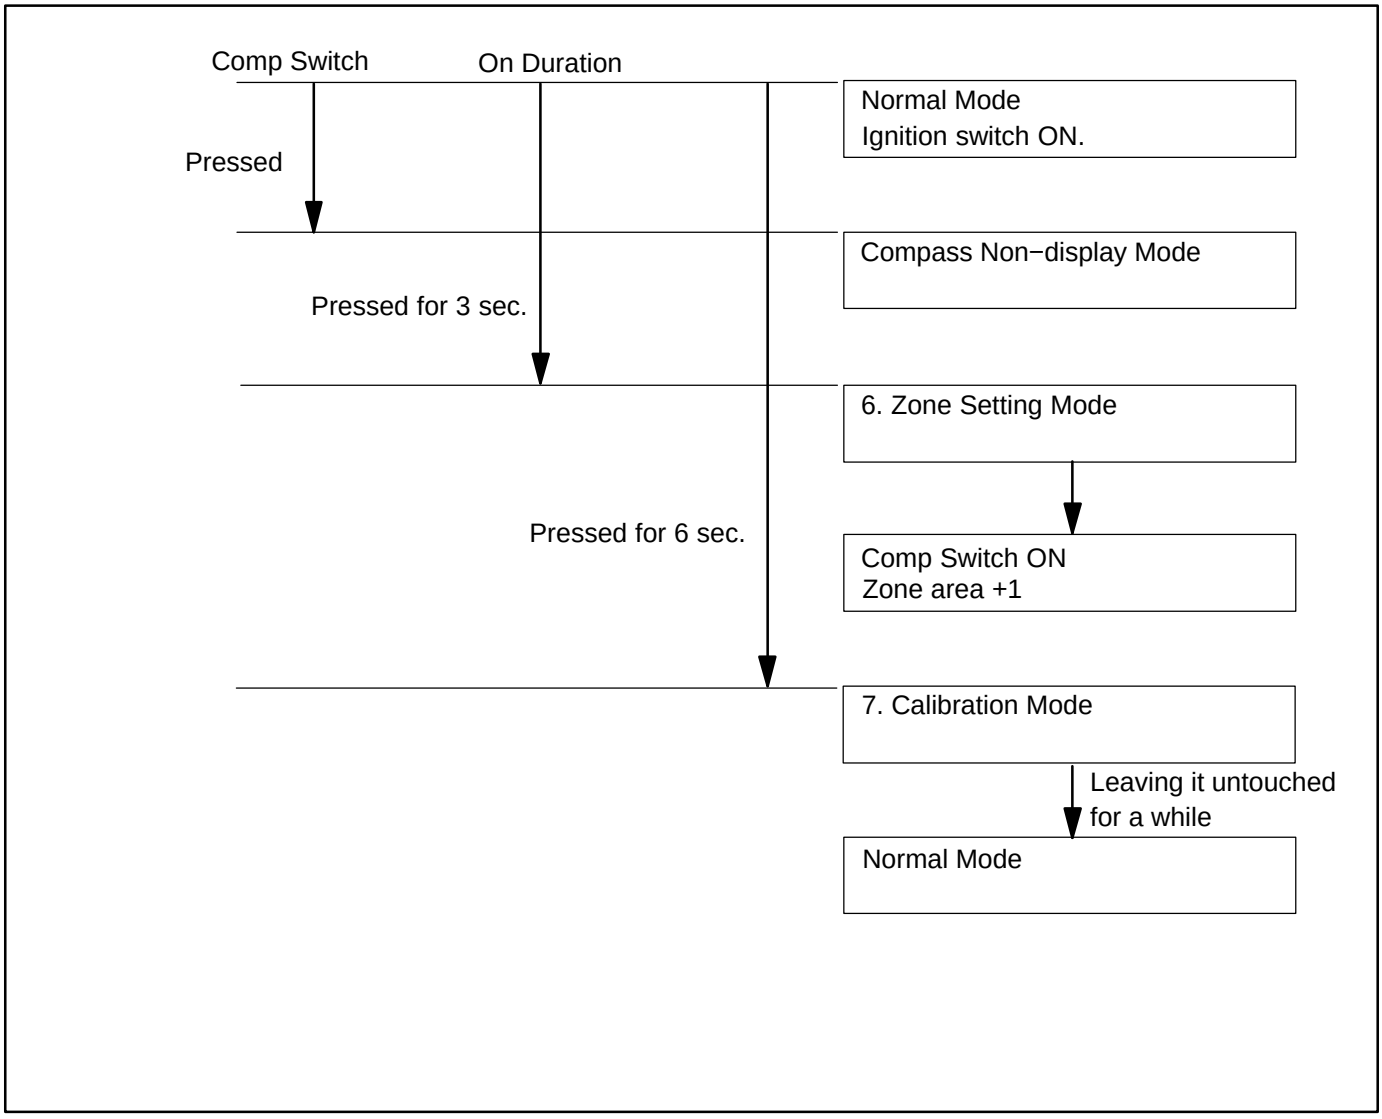
3. PERFORMING CALIBRATION

(a) Since each vehicle has its own magnetic field, calibration should be performed for each vehicle. This compass function is used when storing the record of the magnetic field of the vehicle.

4. WHEN COMPASS MAGNETIZED:

(a) A compass could be magnetized during shipping by vessels or freight cars. Before delivery, therefore, make sure to perform calibration and ensure that calibration is done properly. If it cannot be done (cannot be complete in spite of driving around several times), it may be caused by magnetization. Demagnetize the vehicle using a demagnetizer and perform calibration again.

5. SETTING COMPASS



6. ZONE SETTING MODE

(a) Press the comp switch for 3 seconds. In the normal mode, the zone setting mode will activate. A number (1−15) is displayed on the compass display.

HINT:

In the initial status, ”8” is displayed.

(b) The displayed number increases +1 every time the comp switch is pressed. Referring to the map, check the number for the area where the vehicle will be used and set the zone number.

(c) Leave it untouched for several seconds after setting and check that the compass display shows an azimuthal direction (N, NE, E, SE, S, SW, W or NW) or ”C”.

7. CALIBRATION SETTING MODE

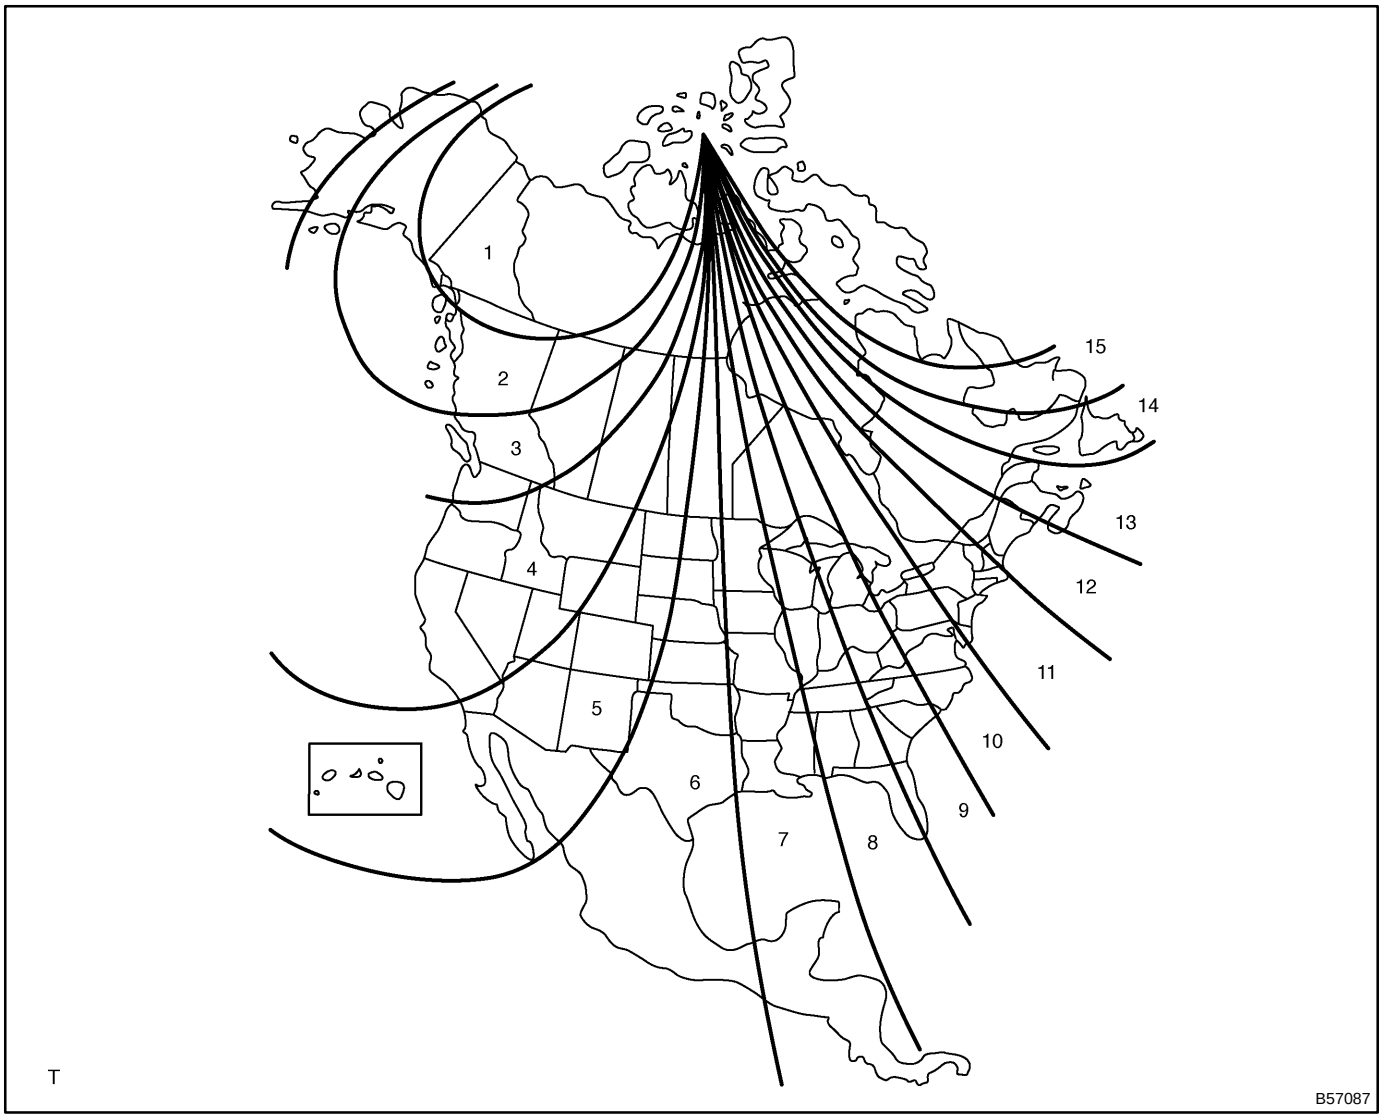
(a) Press the comp switch for 6 seconds. in the normal mode, this mode will also activate.

(b) Drive the vehicle at a slow speed of 8 km/h (5 MPH) or less in the circular direction.

(c) Driving around the circle 1 to 3 times will display the azimuthal direction on the display, completing the calibration.

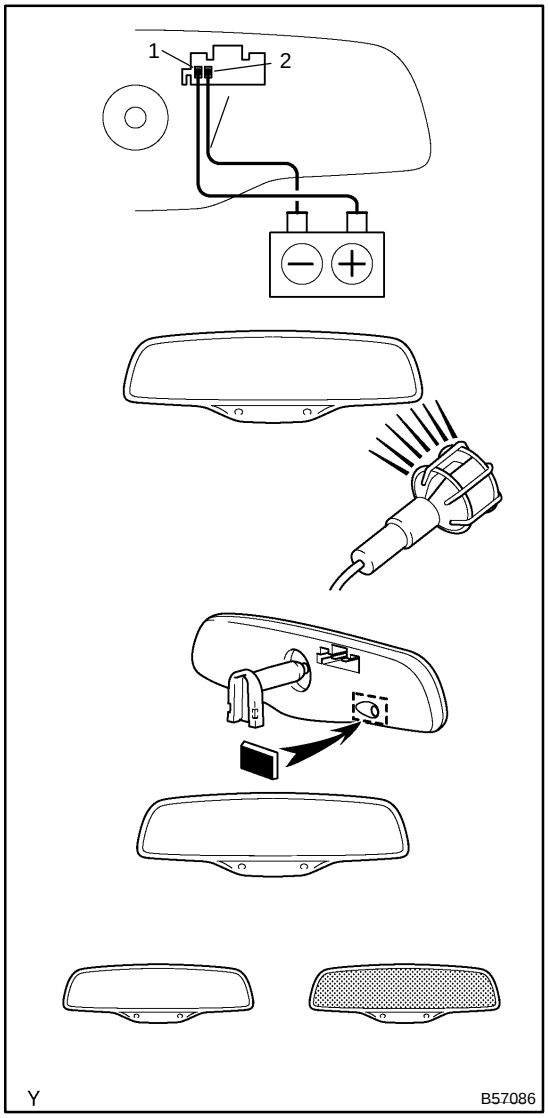
HINT:

Once calibration is completed, it is not necessary to perform the above procedures unless the magnetic field strength is drastically changed. If this happens, the azimuthal display will be changed to ”C”.



700B4−02

INSPECTION



1. INSPECT INNER REAR VIEW MIRROR ASSY

(a) Inspect operation of the elector chromic inner mirror.

(1) Connect the positive (+) lead from the battery to terminal 1 and the negative (−) lead to terminal 2.

(2) Attach a black colored tape to the forward sensor to prevent it from sensing.

(3) Light up the mirror with an electric light, and check that the mirror surface changes from ”bright” to ”dark”.

If operation is not as specified, replace the inner mirror.

ON−VEHICLE INSPECTION

1. CHECK POWER SEAT FUNCTION

(a) Check the basic functions.

(1) Operate the power seat switches and check to make sure each seat function works:

- Sliding
- Front vertical
- Rear vertical
- Reclining
- Lumbar support (driver's seat only)

2. CHECK POWER SEAT MOTOR ASSY (SLIDING, FRONT VERTICAL, REAR VERTICAL AND RECLINING FUNCTIONS)

(a) Check the PTC operation inside the power seat motor.

HINT:

The PTC thermistor's resistance increases when the power seat switch is held down even after the power seat has been moved to the maximum in one direction. after the resistance increases, current is shut off to prevent a short circuit.

NOTICE:

Perform steps (1) to (4) for the full range of motion for each power seat function.

(1) Choose a power seat function. Operate the power seat switch and move the seat to the maximum in one direction. Keep the seat in that position for approximately 60 seconds.

(2) Operate the power seat switch again and continue to try to move the seat in the same direction as in step (1). Measure the amount of time elapsed before the electrical current is automatically cut. Check if electrical current has shut off by making sure the sound of the motor has stopped.

Standard: 4 to 90 seconds

(3) After the current has stopped, release the power seat switch and wait for approximately 60 seconds.

(4) Operate the same power seat switch and move the seat to the opposite extreme of the direction in step (1). Check that the motor operates.

(5) Repeat steps (1) to (4) for the remaining power seat functions.

3. Driver's seat only:

CHECK LUMBAR SUPPORT ADJUSTER ASSY LH

(a) Check the PTC operation inside the power seat motor.

NOTICE:

The inspection should be performed with the seat installed in the vehicle.

(1) Operate the lumbar support switch and move the lumbar support to either the foremost or rearmost position. Keep the seat in that position for approximately 60 seconds.

(2) Operate the lumbar support switch again and continue to try to move the lumbar support in the same direction as in step (1). Measure the amount of time elapsed before the electrical current is automatically cut. Check if electrical current has shut off by making sure the sound of the motor has stopped.

Standard: 4 to 90 seconds

(3) After the current has stopped, release the lumbar support switch and wait for approximately 60 seconds.

(4) Operate the lumbar support switch and move the seat to the opposite extreme of the direction in step (1). Check that the motor operates.

WIRELESS DOOR LOCK CONTROL SYSTEM

73085−02

ON−VEHICLE INSPECTION

1. CHECK WIRELESS DOOR LOCK CONTROL FUNCTION

HINT:

The switch described in this text is a switch for transmitting signals (LOCK switch and UNLOCK switch), built in the door control transmitter.

(a) Vehicle initial condition (conditions that allow the wireless control function to be operated)
- No key in the ignition key cylinder
- All doors closed (door open indicator off)
- All doors locked

(b) Check the basic function.
(1) Check whether the LED lights up 3 times when each switch is pressed 3 times.

HINT:

In case that the LED does not light up when the switch has been pressed 3 times or more, it may have a dead battery.

(2) In the remote control operational area, check that all the doors lock or unlock when the switch has been pressed for approximately 1 second. However, this will not happen when the key is in the ignition key cylinder or any of the doors is open.

HINT:

The UNLOCK function operates even when any of the doors is open.

(3) Check that the luggage compartment door opens when the trunk switch has been pressed for 1 second (this function operates even when a door is open).

(c) Check the automatic locking function.
(1) Check that all doors lock automatically as long as none of the doors have been opened or all doors have not been locked within approximately 30 seconds after all doors are unlocked by pressing the switch.
(2) Under the above condition, check that the automatic locking function does not operate when any of the doors has been opened or all doors have been locked within approximately 30 seconds after all doors are unlocked by pressing the switch.

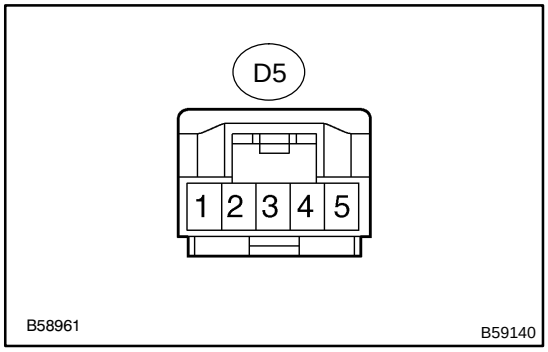
(d) Check the switch operation fail−safe function.
(1) Check that doors can not be locked or unlocked by the switch while the key is in the ignition key cylinder. However, this does not apply when the system is in the recognition code registration mode.

(e) Check the chattering prevention function.
(1) Check that the corresponding operation occurs only once, and not repeated continuously while the switch is kept pressed. However, when the switch is operated repeatedly at one second intervals, check that the corresponding operation is carried out.

(f) Check the repeat function.
(1) Check that all doors attempt to automatically lock once again, 1 second after the lock switch has been pressed while the movement of the driver side door control knob, which is in the unlocked state, is being restricted.

(g) Check the operation stop function when a door is open or not completely closed.
(1) Check that doors are not locked or unlocked by the switch while the doors are open or not completely closed.

(h) Check the hazard flashing and buzzer sounding function (answer−back).
(1) Check that the hazard lights flash and also the buzzer sounds once (when locked) or twice (when unlocked) simultaneously with locking or unlocking operation of all doors, when the switch is pressed.



2. CHECK WIRELESS CONTROL RECEIVER

(a) Disconnect the D5 receiver connector, and check the voltage or continuity of each terminal of the wire harness side connector

Standard :

Symbols (Terminals No.)	Wiring color	Condition	Specification
GND (D5−1) ⇔ Body ground	W−B ⇔ −	Constant	Continuity
+B (D5−5) ⇔ Body ground	R ⇔ −	Constant	10 − 14 V

If the result is not as specified, there may be a malfunction on the wire harness side.

(b) Using an oscilloscope, connect the receiver connector and check the voltage.
Standard :

Symbols (Terminal No.)	Wiring color	Condition	Specification
RDA (D5−2) ⇔ Body ground	L−W ⇔ −	All doors are closed → Door control transmitter ON	Below 1 V → 6 − 7 V → Below 1 V

If the result is not as specified, there may be a malfunction on the wire harness side.

DOOR CONTROL TRANSMITTER

73084−02

REPLACEMENT

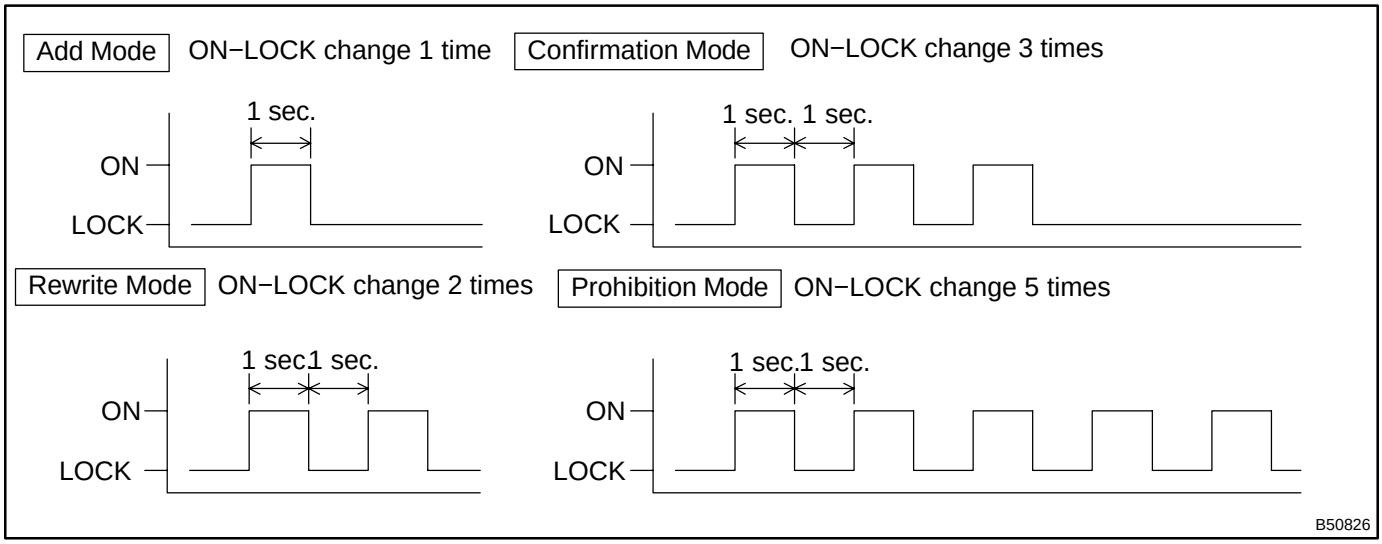
1. REGISTRATION OF RECOGINITION CODE

HINT:

- The add mode is used to register a new recognition codes while still retaining codes already registered. This mode is used to add a new transmitter. If the number of registered codes exceeds 4, the previously registered codes will be erased in order, starting from the first registered code.
- The rewrite mode is used to erase all the previously registered codes in order to register all new recognition codes. This mode is used to exchange the transmitter or the door control receiver for a new one.
- The prohibition mode is used to erase all the registered codes and disables the wireless door lock function. Use this mode when the transmitter is lost.
- The confirmation mode is used to confirm how many recognition codes have already been registered before an additional registration of the recognition codes.

(a) Make sure that the vehicle fulfills the following conditions.
  (1) No key is inserted in the ignition key cylinder.
  (2) The driver side door is opened (The other doors are closed).
  (3) The driver side door is unlocked.

(b) Select a mode.
  (1) Insert the key into the ignition key cylinder, then pull it out (Perform this operation once again within 5 seconds).
  (2) Close and open the driver side door twice.
  (3) Insert the key into the ignition key cylinder, then pull it out.
  (4) Close and open the driver side door twice.
  (5) Insert the key into the ignition key cylinder, then close the driver side door.
  (6) To select a mode, turn the ignition switch from ON to LOCK at approximately 1 second intervals according to the number of times shown below. Then remove the key from the ignition key cylinder.



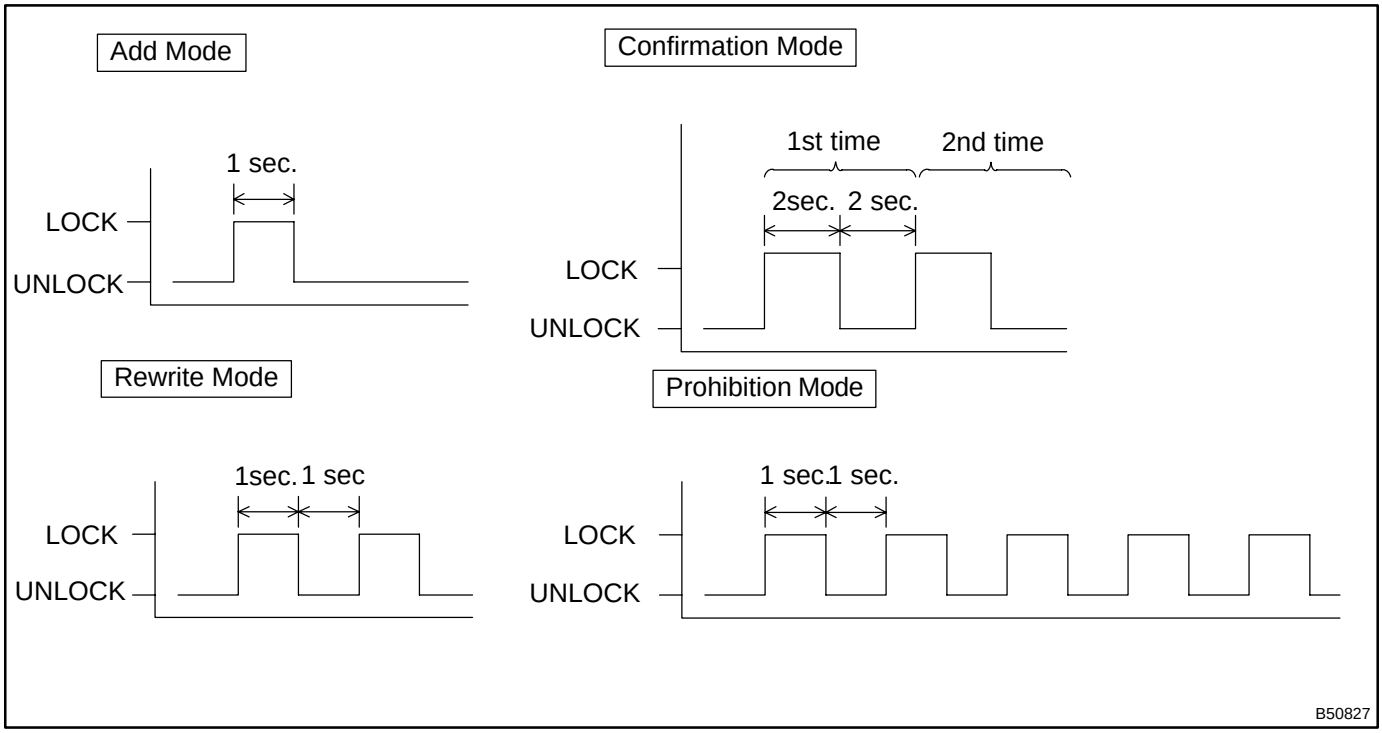
NOTICE:

- **If the number of ON−LOCK operations of the ignition switch is 4 or more than 5, the registration will end without any signs.**

(7) Within 3 seconds after a mode has been selected, the theft warning ECU automatically performs LOCK−UNLOCK operation to inform the operator which mode has been selected.

HINT:

- When the confirmation mode has been selected and 0 codes are registered, LOCK−UNLOCK operation is automatically performed 5 times.
- When the confirmation mode has been selected and LOCK−UNLOCK operation has been performed twice as shown in the illustration below, the number of the registered recognition codes is 2.



HINT:

When the prohibition mode or the confirmation mode is selected, the registration mode ends.

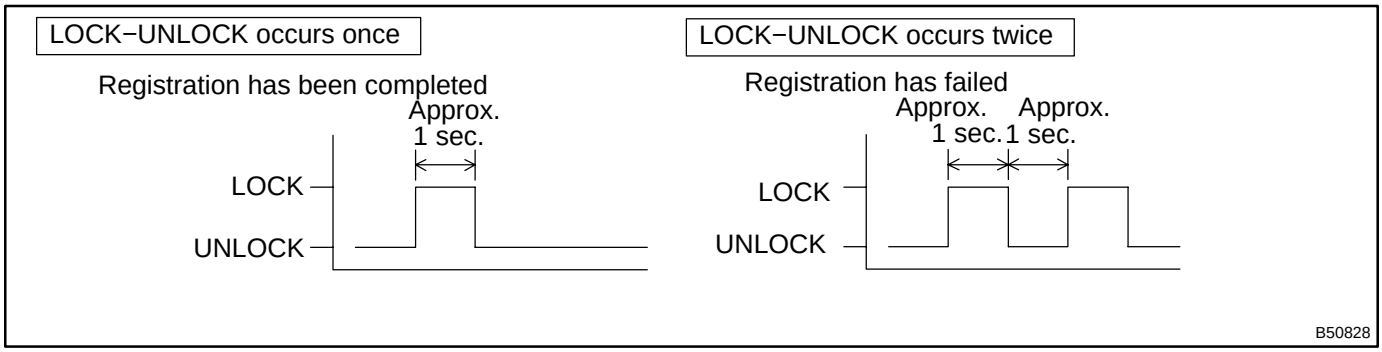
(c) Register the transmitter.

(1) Within 40 seconds after the add mode or the rewrite mode has been selected, simultaneously press the LOCK and UNLOCK switches twice.

NOTICE:

Press and hold both switches for 1 second or more during each press. However, the time between the 1st press and the 2nd press must be under 3 seconds.

(2) LOCK−UNLOCK operation is automatically performed once within 3 seconds after above operation (step 1), when the recognition code of the transmitter has been registered correctly. If the LOCK−UNLOCK operation is performed twice, the registration of the recognition code has failed. In this case, register the recognition code from the beginning of the registration procedures once again.



(3) In order to continue in registration mode, start the next registration within 40 seconds after the previous one.

HINT:

The maximum number of the recognition codes that can be registered is 4.

(d) If even one of the following conditions is satisfied, the registration mode will end.

(1) 40 seconds have elapsed under the condition that the registration mode is ready.

(2) The driver side door is opened

(3) The key is inserted in the ignition key cylinder.

(4) 4 recognition codes are registered at once.

Target ECU	See step
Transponder key ECU	5.

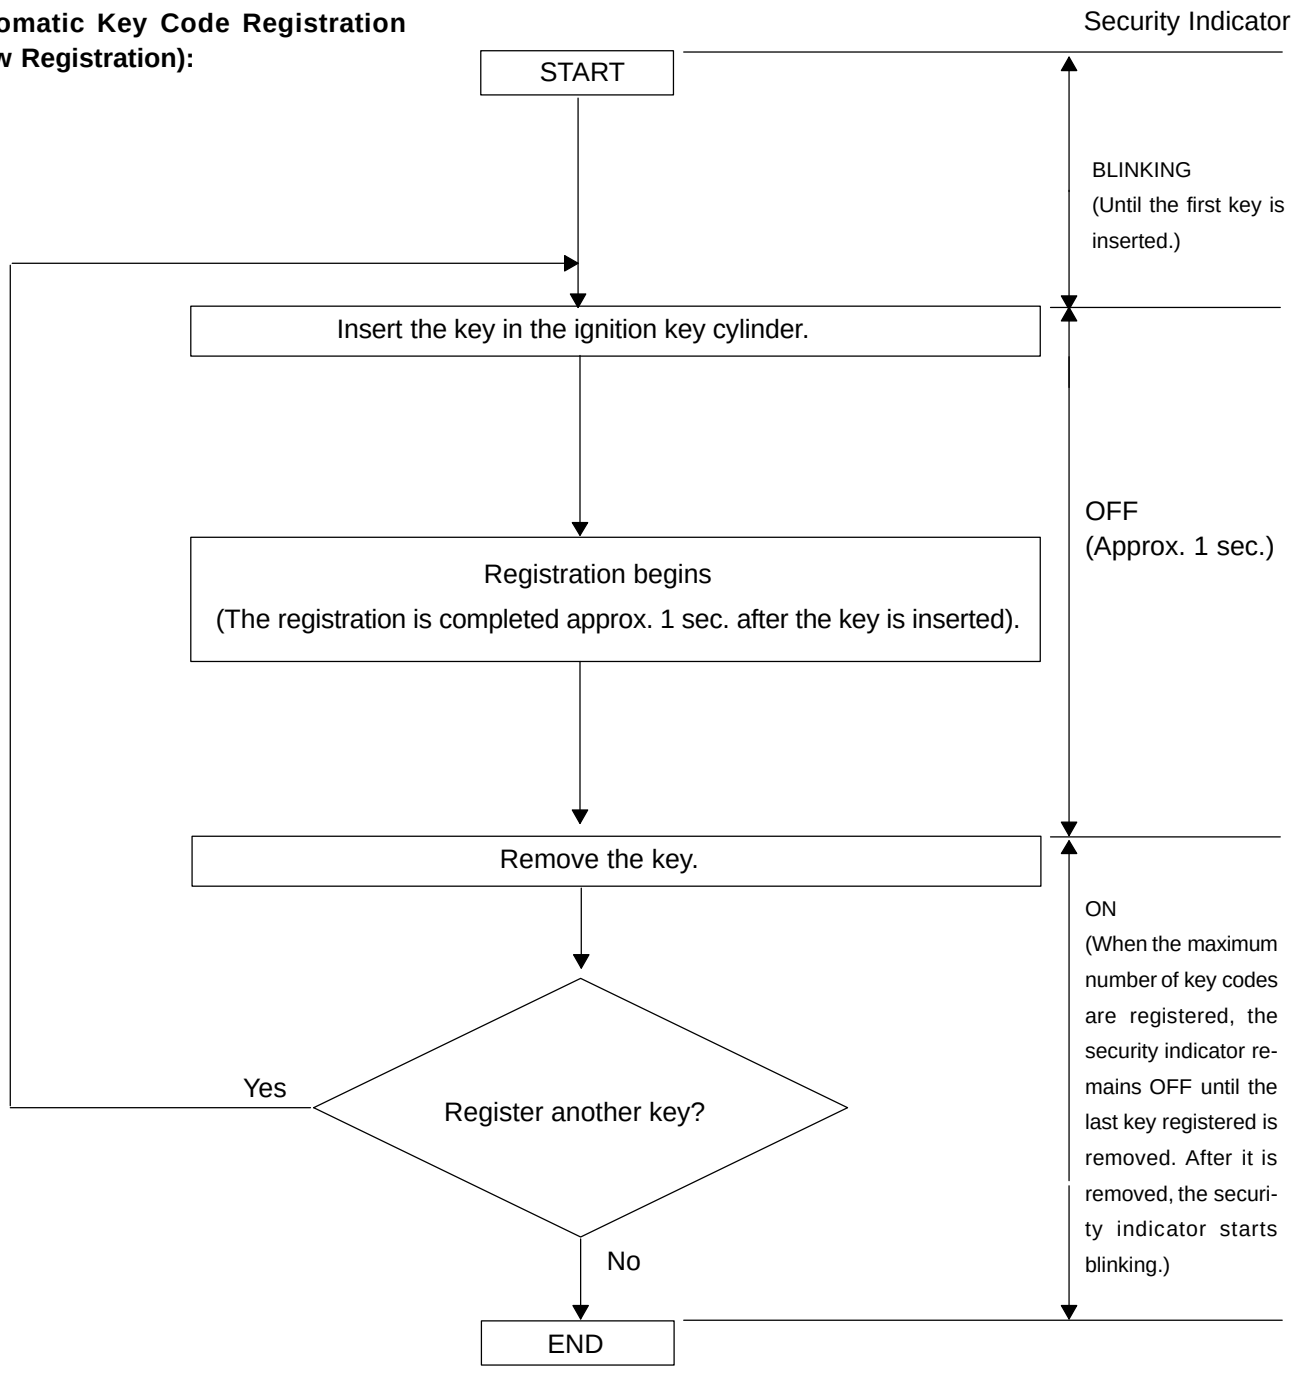
2. KEY REGISTRATION IN AUTOMATIC REGISTRATION (New Registration)

(a) The new registration of the key codes (immobiliser codes) is made automatically.

HINT:

- When you install a new transponder key ECU, the key codes (immobiliser codes) must be registered.
- A new transponder key ECU starts in the automatic key code registration mode. In this mode, a maximum of 4 key codes for 3 master keys and 1 sub−key can be registered. Since the transponder key ECU can distinguish types of keys, the registration order is not specified.

Automatic Key Code Registration (New Registration):



HINT:

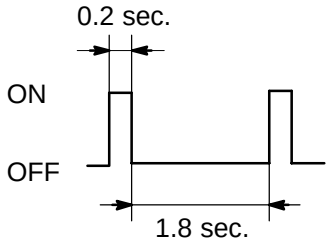
- When no key is inserted in the ignition key cylinder in the automatic key code registration mode, the security indicator remains on.
- When the immobiliser system is operates normally and the key is pulled out, the security indicator blinks.

NOTICE:

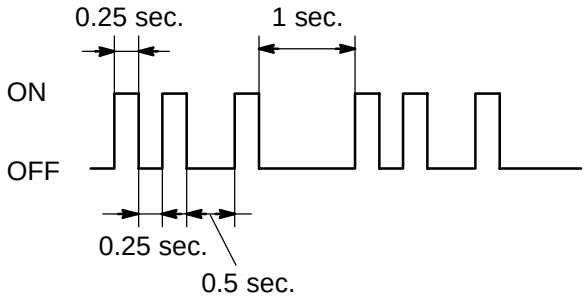
If the key code registration has failed in the automatic key code registration mode, code 2−1 will be output from the security indicator. Trying to re−register an already registered key will cause code 2−2 to be output when the key is inserted. The output details are shown below.

Security Indicator:

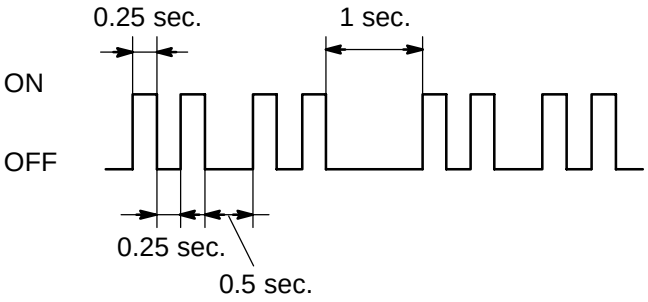
Normal
(Immobiliser system is operating normally.)



Code 2−1



Code 2−2



(b) Finish the automatic key code registration mode.
The automatic key code registration mode can be forced to end when at least 1 key code (immobiliser code) for the master key has been registered.

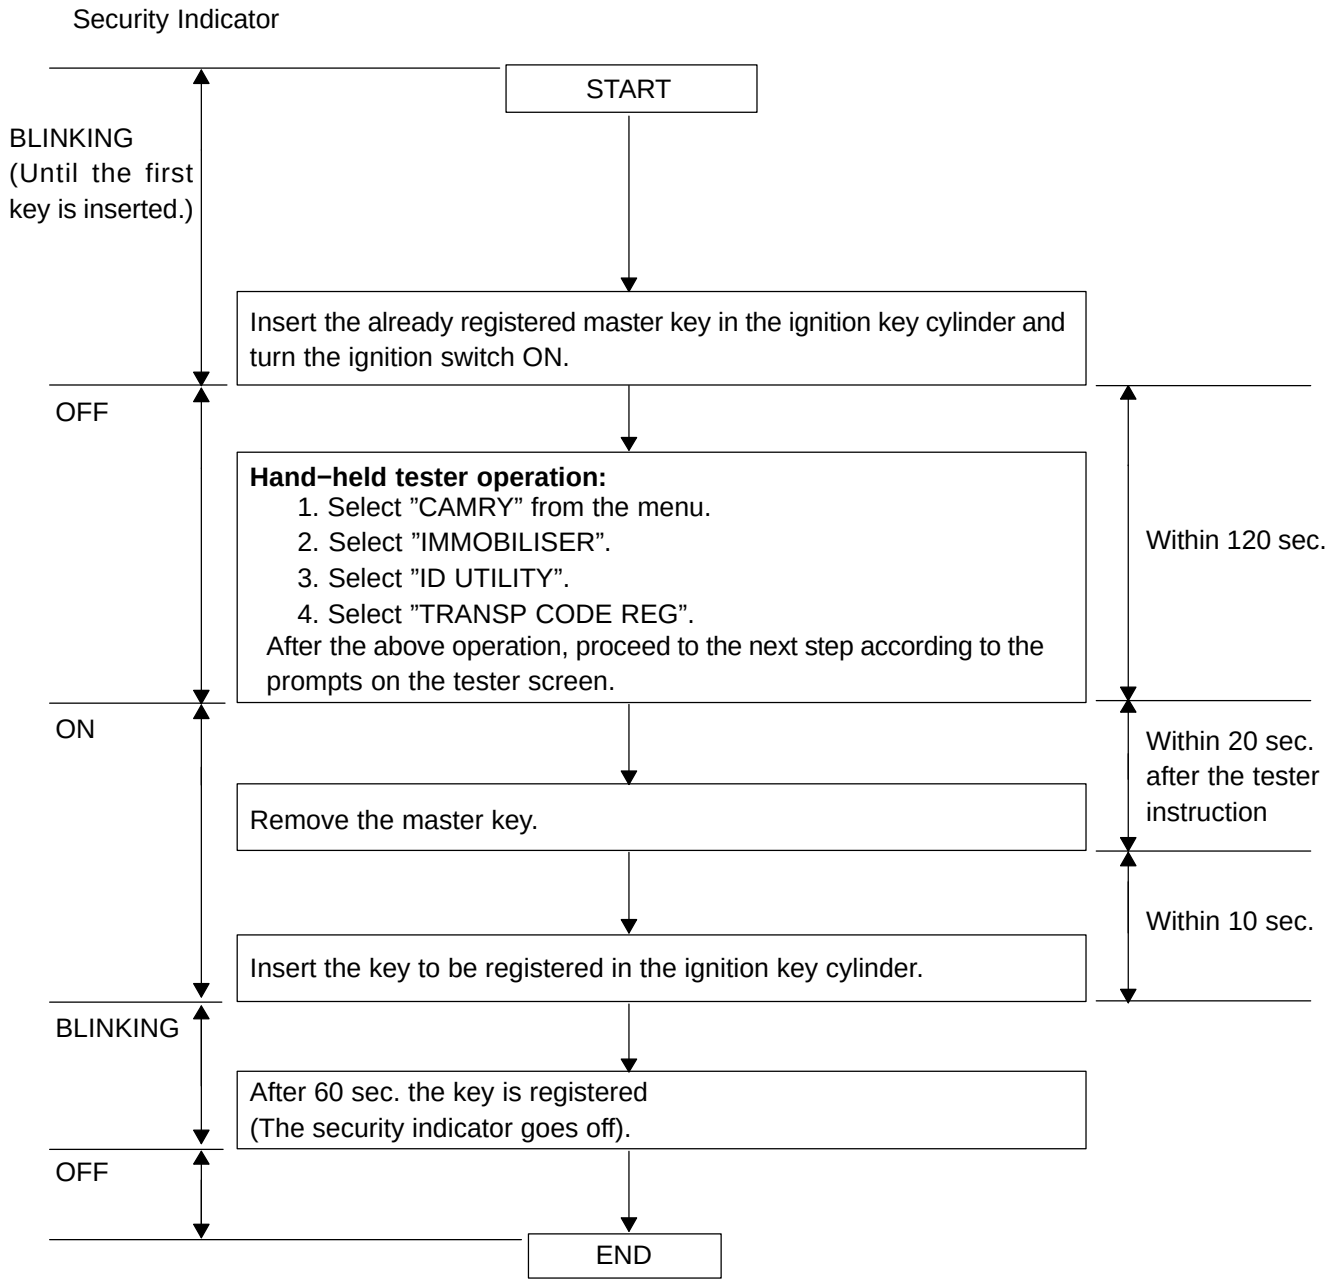
(1) Turn the ignition switch ON/OFF alternately 5 times within 10 seconds using the already registered master key.

3. REGISTRATION OF ADDITIONAL KEY (Additional Registration)

HINT:

- A maximum of 5 master key codes and 3 sub−key codes can be registered.
- Registration mode will end if each step is not completed within the specified time.
- When the ignition cylinder or the key cylinder set is replaced, remove the transmitter module from the original master key in which a transmitter is built. Then install this transmitter module to a new key and use it as master key. If necessary, use this master key to register other keys.

Additional Registration:



HINT:

- A brief outline of procedures for key code registration is shown on this page. For detailed information, please refer to the prompts on the screen of the hand−held tester.
- When the immobiliser system is operating normally and the key is pulled out, the security indicator blinks.

NOTICE:

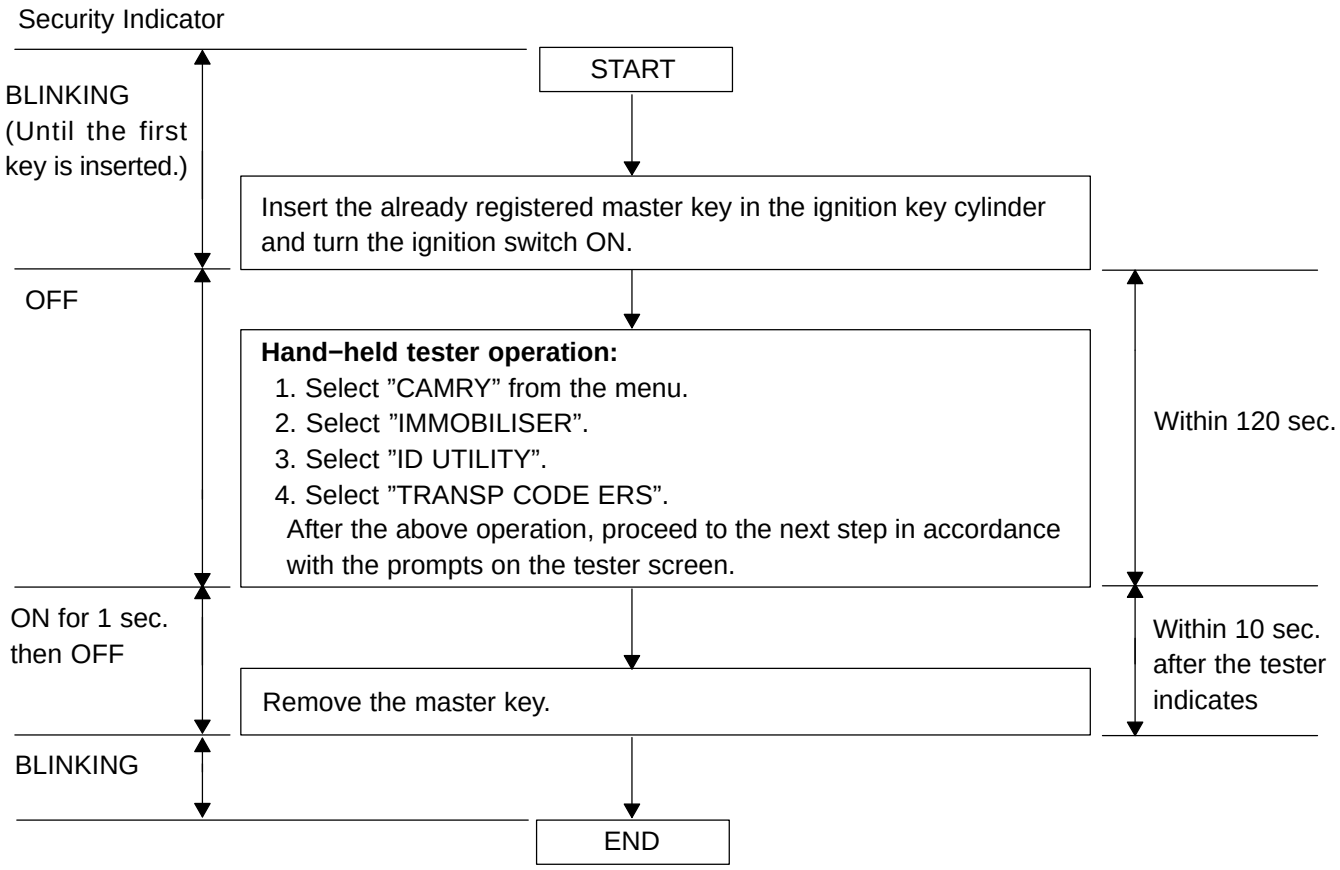
If the key code registration has failed in the automatic key code registration mode, code 2−1 will be output from the security indicator. Trying to re−register an already registered key will cause code 2−2 to be output when the key is inserted. The output details are shown in step 2 (New Registration).

4. ERASURE OF KEY CODE

HINT:

- All key codes are erased except for the master key which is used for erasure operation.
  In order to use a key for which the code has been erased, it is necessary to register the key code again.
- Registration operation will be cancelled if each step is not completed within the specified time.

Erasing Key Code:



HINT:

- A brief outline of procedures for key code registration is shown on this page. For detailed information, please refer to the prompts on the screen of the hand−held tester.
- When the immobiliser system is operating normally and the key is pulled out, the security indicator blinks.

5. ECU COMMUNICATION ID REGISTRATION

NOTICE:

- **The ECU communication ID should be registered when the transponder key ECU and/or the ECM is replaced, in order to match these ECM COMMUNICATION ID.**
- **The engine cannot be started unless the ECM COMMUNICATION ID matches.**

(a) Register the ECU communication ID.

(1) After the transponder key ECU and/or the ECM is replaced, turn the ignition switch ON (the engine is not running).

(2) Short the Tc and CG terminals of the DLC3 and leave it as is for 30 minutes.

(3) Check that the engine starts.

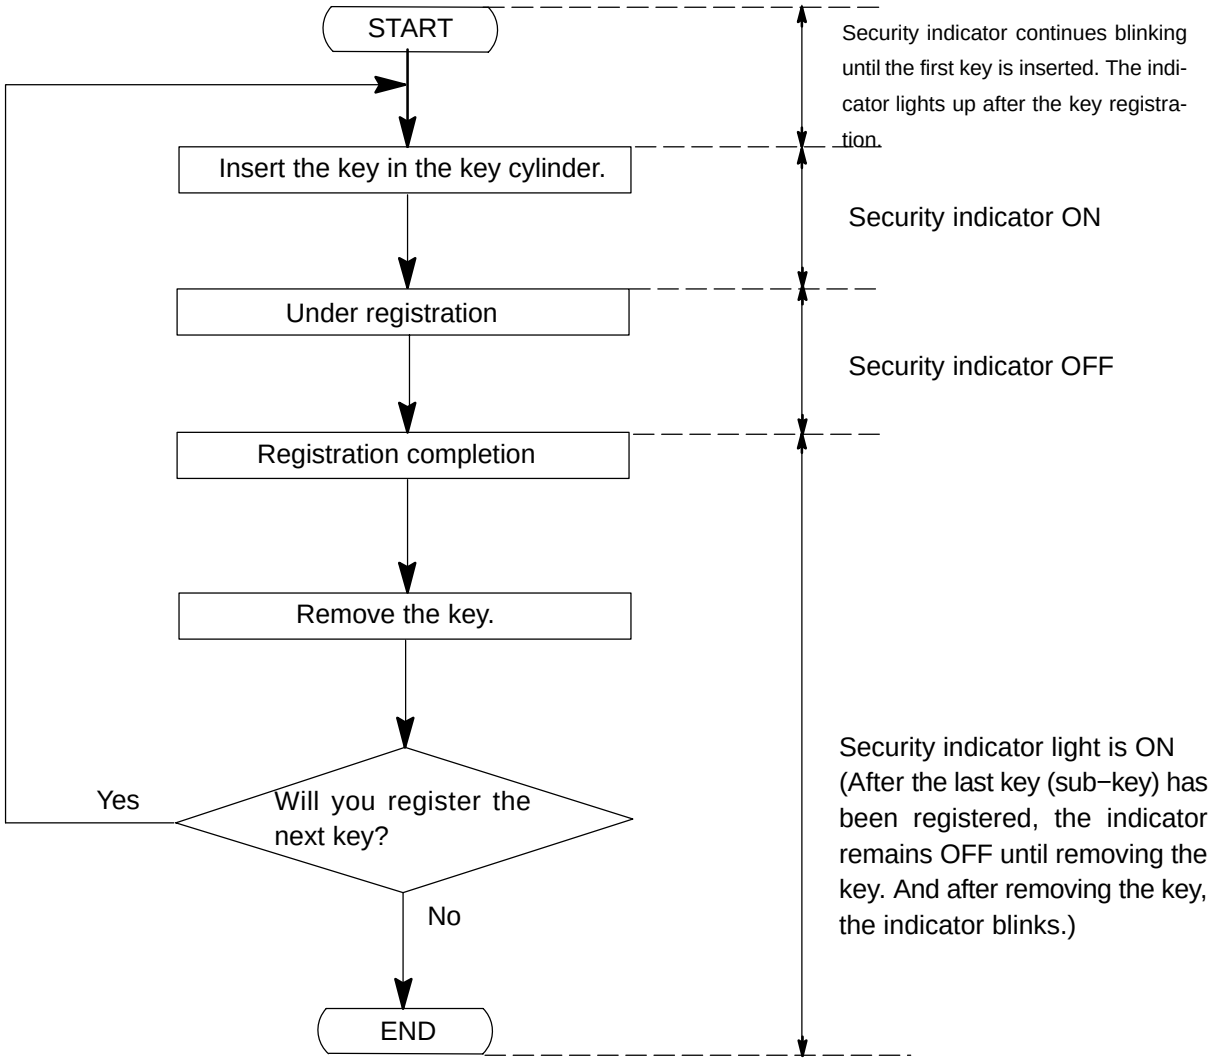
REGISTRATION

1. KEY REGISTRATION IN AUTOMATIC REGISTRATION

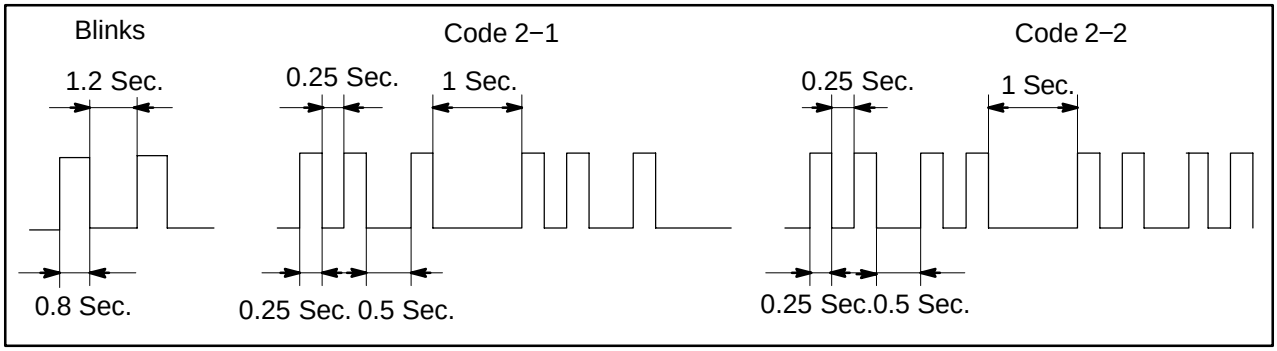
(a) Registration of a new transponder key.

- This must be done when you install a new ECM.
- The new ECM is in the automatic key code registration mode. The number of key codes for this ECM is already fixed, and so it can be registered.
  On this type of vehicle, up to 3 key codes can be registered.
- In the automatic registration mode, the key registered last becomes the sub−key.



HINT:

- When no key is inserted in the key cylinder in the automatic registration mode, the security indicator always lights on.
- When the immobiliser system operates normally and the key is pull out, the security indicator blinks.
- When key code registration could not be performed in the automatic registration mode, code 2−1 is output from the security indicator. And when inserting the already registered key, code 2−2 is output.



(b) Automatic registration mode completion

If finishing the mode forcibly after registering more than 1 key codes in the automatic registration mode, perform the following procedures.

After 1 more key code has been registered with the master key, perform step (1) or (2) without pulling the key out or inserting the already registered key.

(1) Depress and release the brake pedal 5 times or more within 15 seconds.

(2) With the hand−held tester, require the automatic registration mode completion.

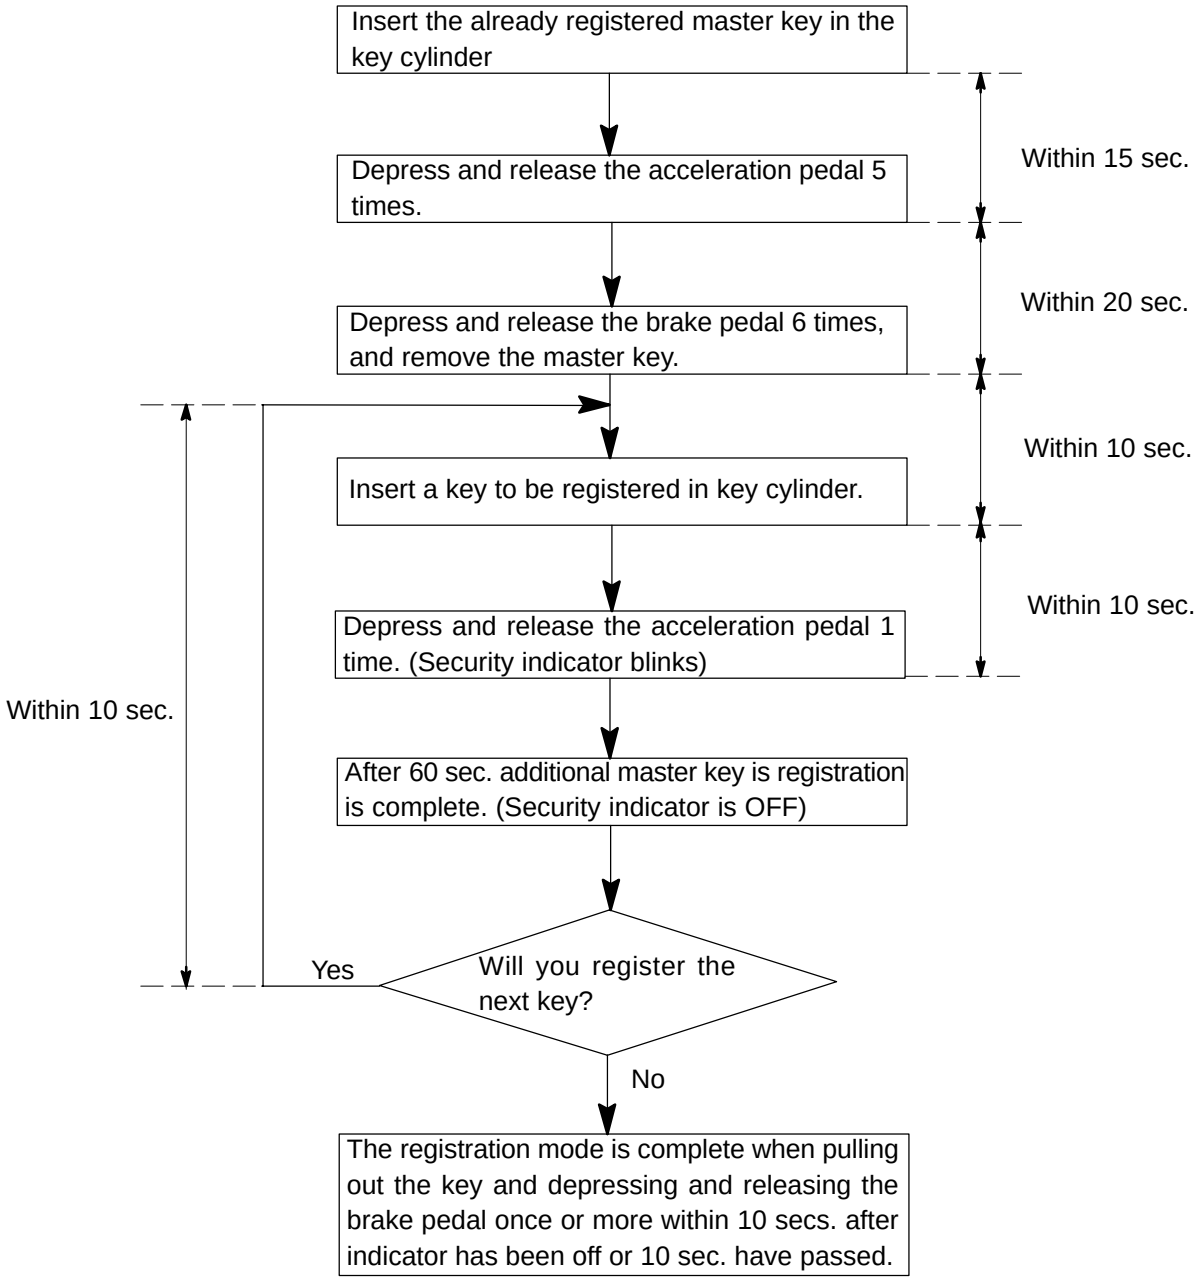
2. REGISTRATION OF ADDITIONAL KEY

There are 2 ways for registration of additional master key; one way is depressing the brake pedal and acceleration pedal and the other way is using the hand−held tester.

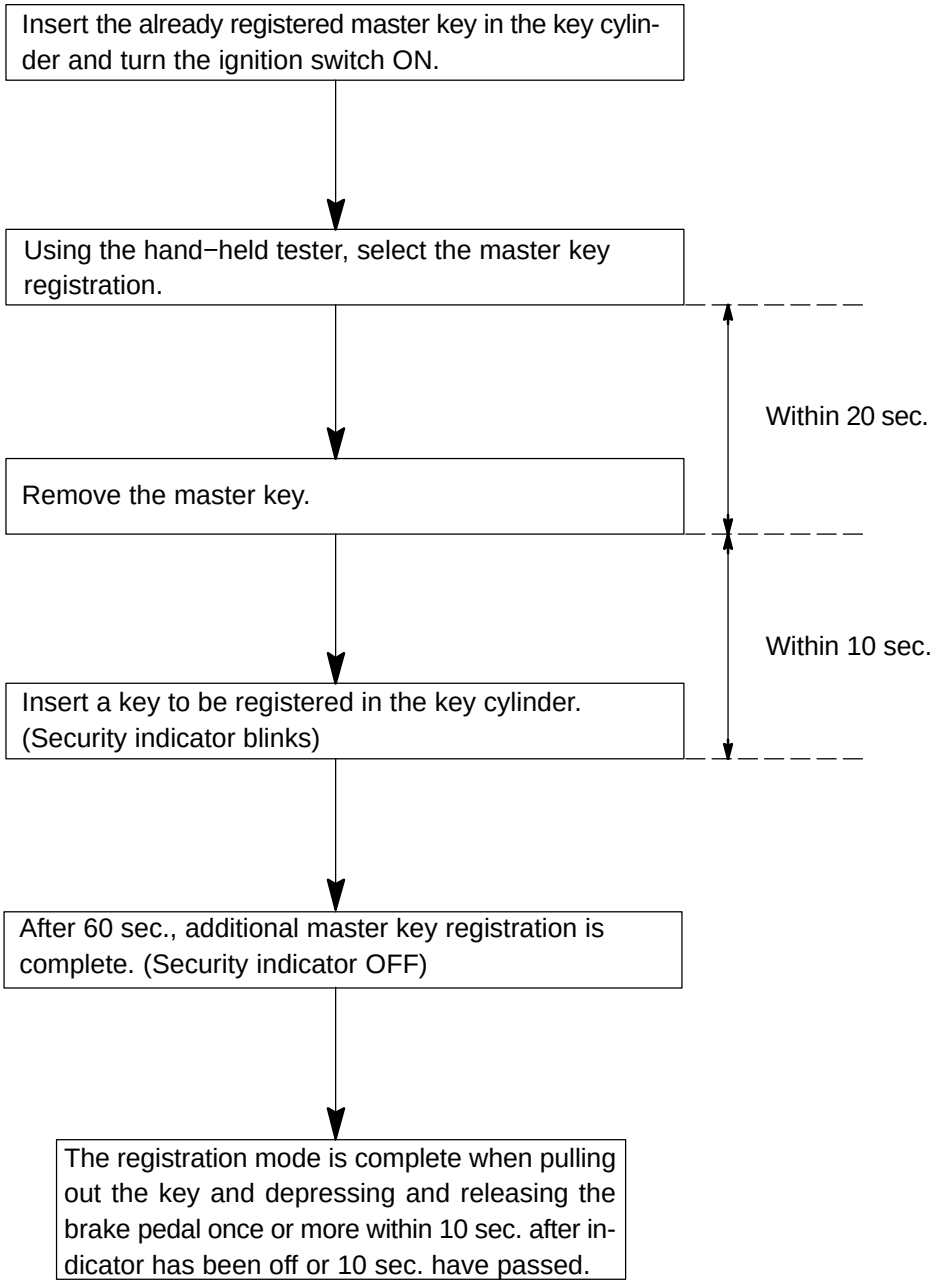
HINT:

- It is possible to register up to 7 master key codes including the already registered key code.
- When any operation time described below is over, registration mode will be stopped forcibly.
- When the next procedure is started while the timer is working, the timer stops working, then the next timer starts.
- When replacing ”Ignition Cylinder Key Set” or ”Lock Cylinder Set” and register according to the following procedure using the original master key. However, after the registration of the additional master key, the original master key and the original sub−key are not necessary any more, and there fore registration of those key codes should be deleted.

  (1) Depressing the brake pedal and acceleration pedal:



(2) Using the hand−held tester:



HINT:
Follow the screen of the hand−held tester for more detailed procedure.

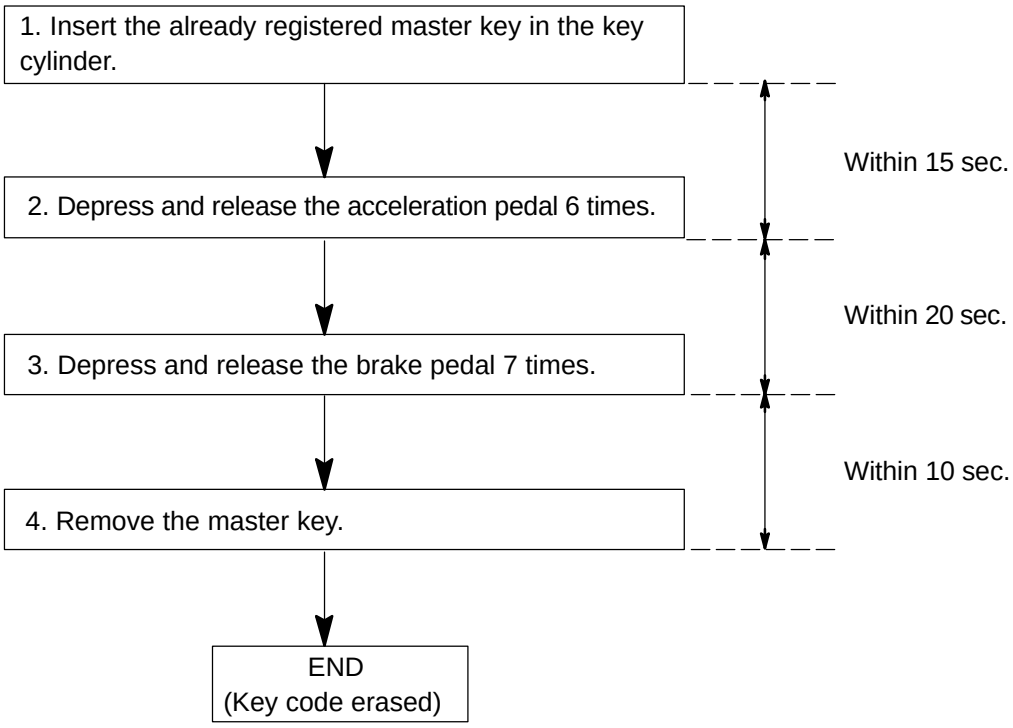
3. ERASURE OF KEY CODE

There are 2 ways for erasure of transponder key codes; one way is depressing the brake pedal and acceleration pedal and the other way is using hand−held tester.

HINT:

- Delete all the other master and sub−key codes than a master key code to use the erasing operation. When using the key which was used for deletion, it is necessary to register the code again.
- When any operation time described below is over, registration mode will be stopped forcibly.
- When the next procedure is started while the timer is working, the timer stops working, then the next timer starts.

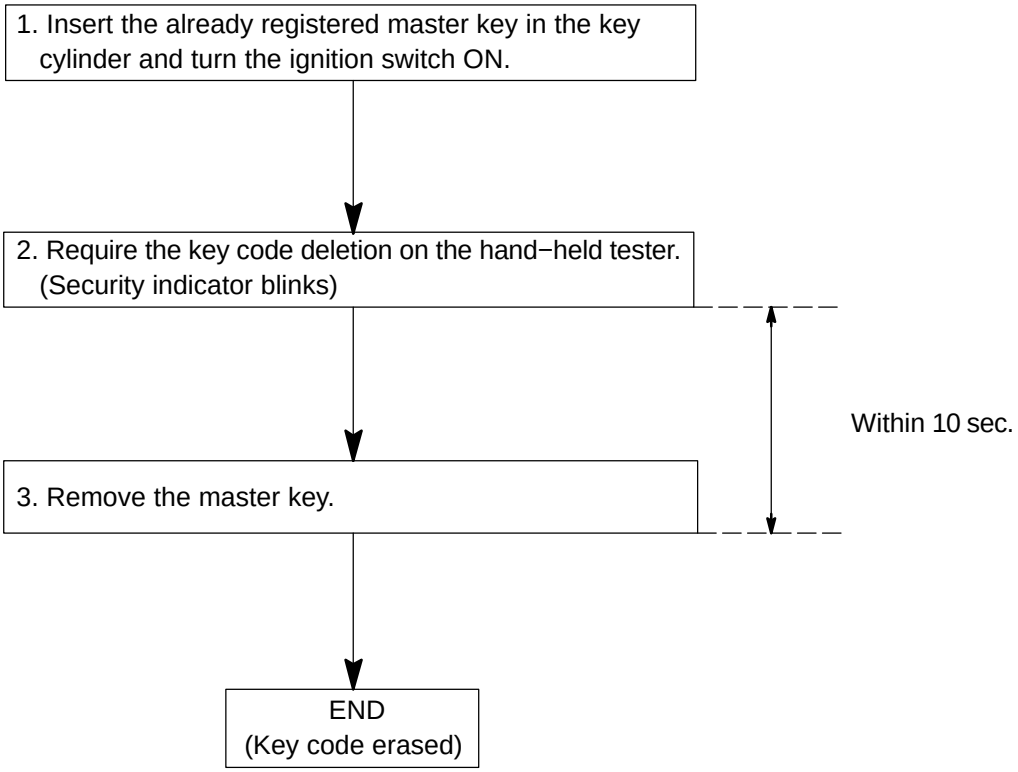
(1) Depressing the brake pedal and acceleration pedal:



HINT:

When the key cannot be pulled out in step 4, key code deletion is canceled.

(2) Using the hand−held tester:



HINT:

- When the key cannot be pulled out in step 3, key code deletion is canceled. (Security indicator is OFF.)
- Follow the screen of the hand−held tester for more detailed procedure.

HINT:

If the vehicle remains in a condition that sets off the alarm (any door remains open, engine hood remains open, luggage compartment door remains open, ignition switch remains directly connected) after the alarm ends, the alarm will be set off repeatedly a maximum of 10 times for every one of the above specified conditions.

Alarm time: (60 sec. ± 5 sec.) x 10

(4) Alarm sounding state:
When the theft deterrent system detects that the vehicle is being tampered with while in the armed state, the system causes the horns to sound and the lights to light up or blink in order to alert people around the vehicle to the theft.

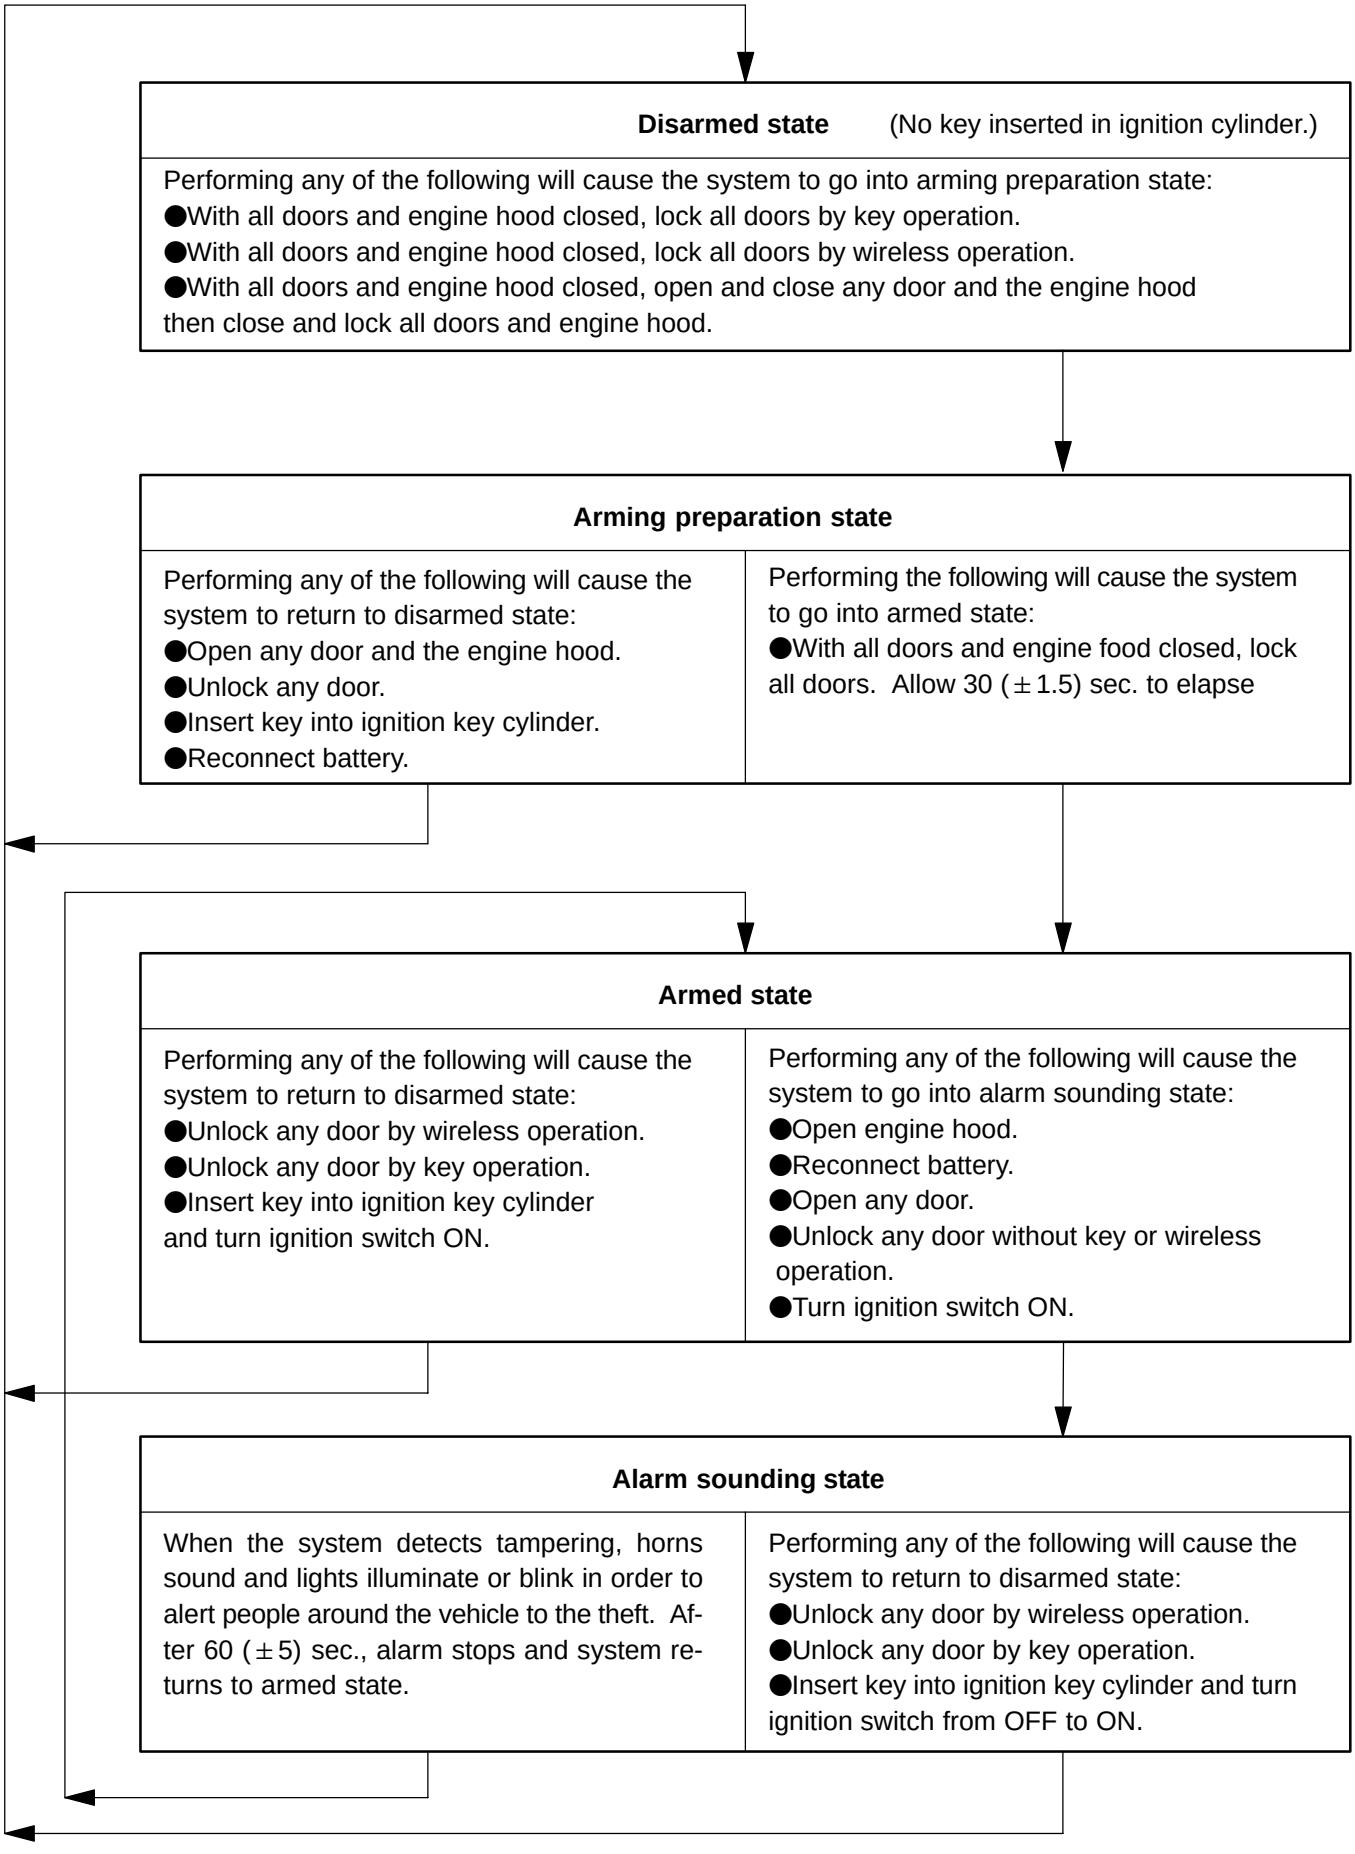
	Vehicle Horn	Sounding (cycle of 0.4 sec.)
	Theft Deterrent Horn	Sounding (cycle of 0.4 sec.)
Alarm Time	60 sec. ± 5 sec. (maximum 10 times)	

HINT:
If either of the doors is unlocked and there is also no key in the ignition key cylinder during the armed state, a forced door lock signal will be output (See step 4).

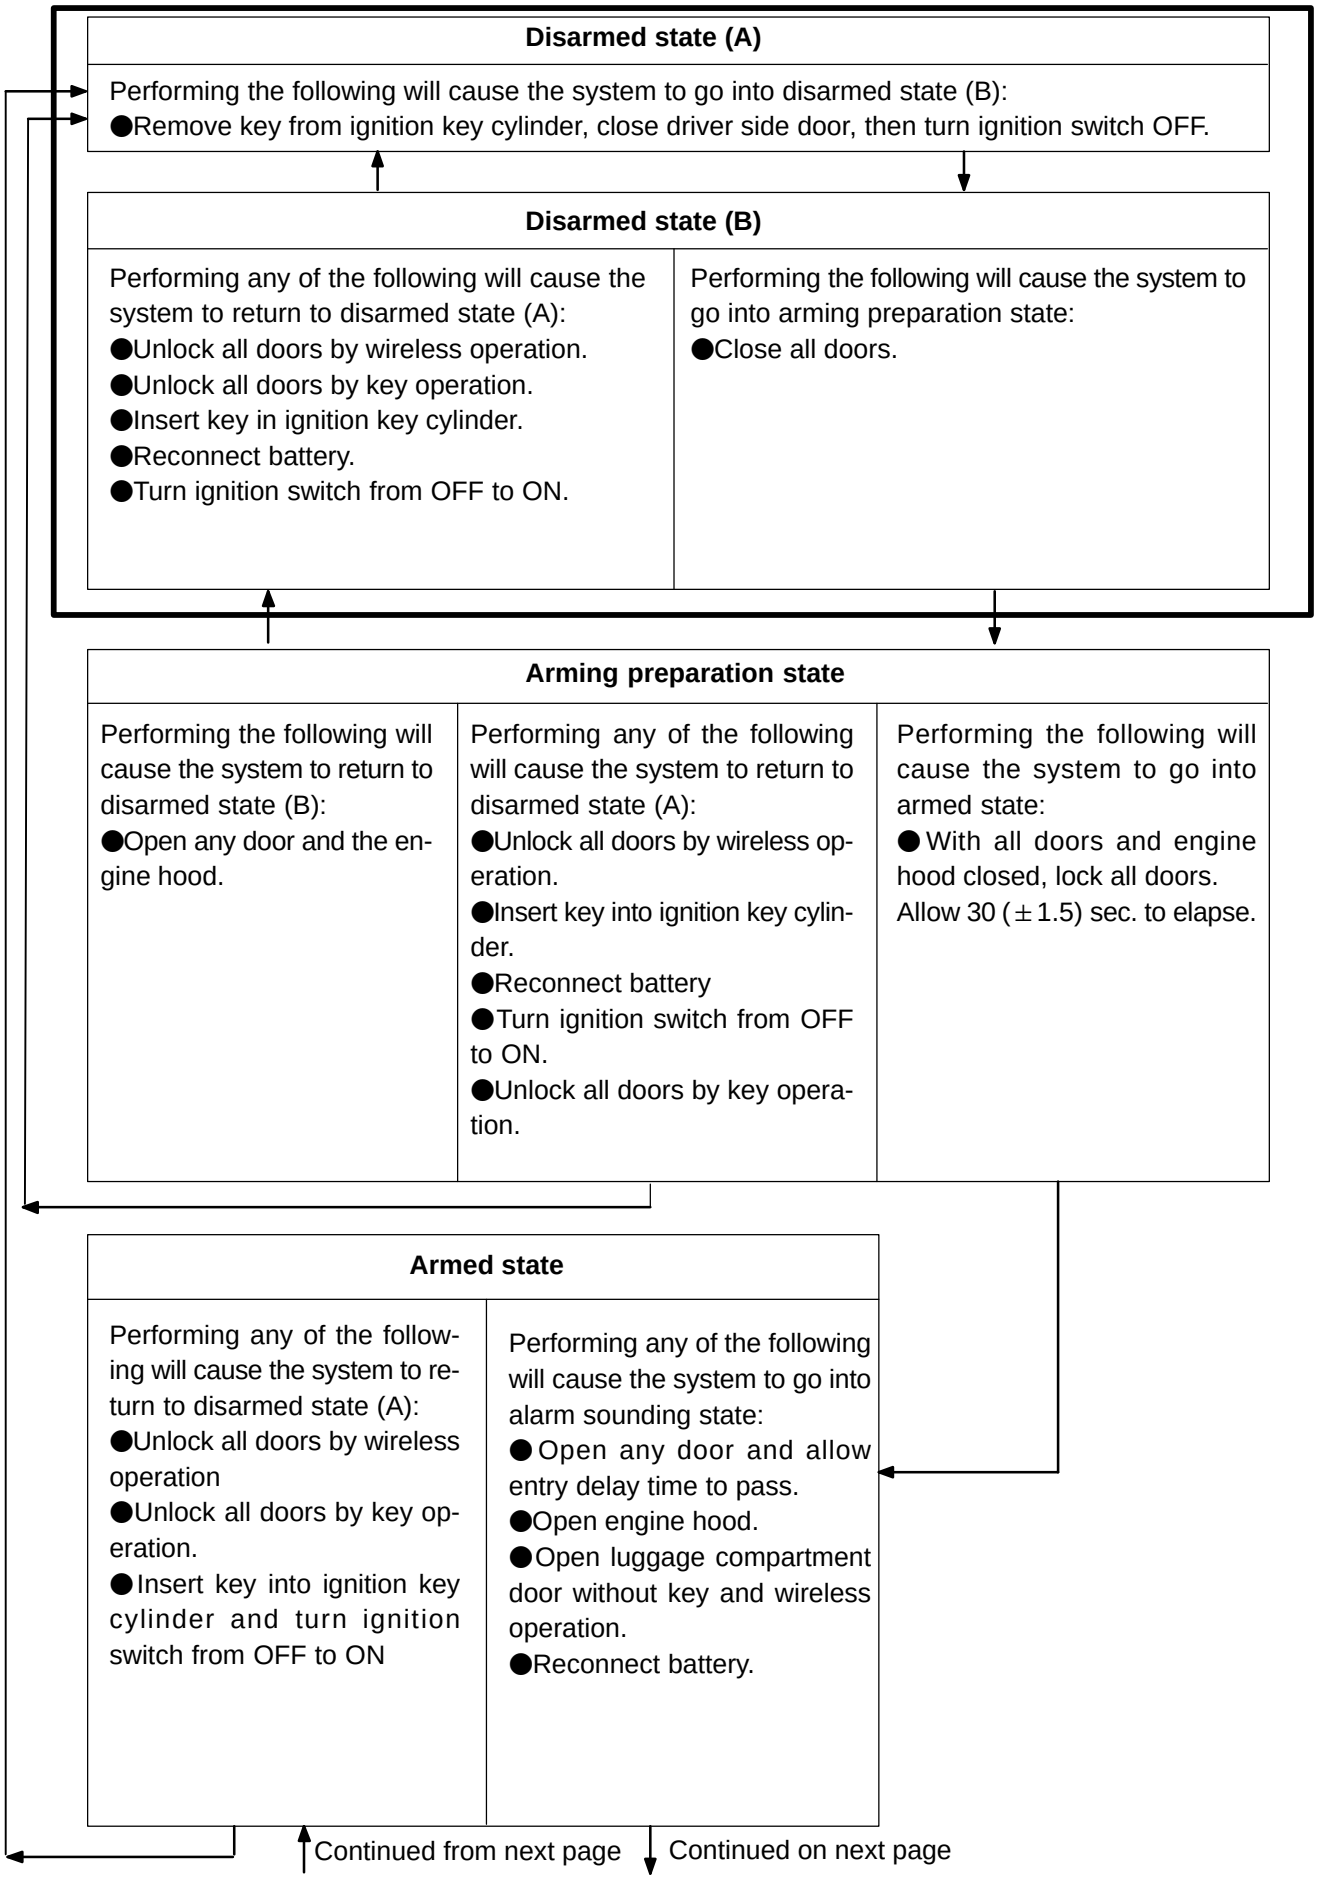
2. ACTIVE ARMING MODE



3. PASSIVE ARMING MODE

Passive arming mode can be switched ON/OFF by the specified method (See step 6).
The mode set initially (shipped from factory) is active arming mode (not passive arming mode).
During passive arming mode, the theft deterrent system goes into the armed state even if the doors are not locked.
Passive arming mode starts the alarm control after the key is removed from the ignition key cylinder and the doors are closed.
Detecting that the doors are unlocked does not set off the alarm during passive arming mode.
A forced door lock signal is not output during passive arming mode (See step 4).
When the theft deterrent system detects that the doors are opened during passive arming mode, the alarm is not set off immediately because an entry delay time is set.
If either of the following conditions is fulfilled during passive arming mode, the theft deterrent system will switch to active arming mode.

With all doors and engine hood closed, lock all doors by key operation.
With all doors and engine hood closed, lock all doors by wireless operation.
With all doors and engine hood closed, open and close any door and the engine hood then close and lock all doors and engine hood.



Disarmed state (A)
Performing the following will cause the system to go into disarmed state (B):
●Remove key from ignition key cylinder, close driver side door, then turn ignition switch OFF.
Disarmed state (B)
Performing any of the following will cause the system to return to disarmed state (A):
●Unlock all doors by wireless operation.
●Unlock all doors by key operation.
●Insert key in ignition key cylinder.
●Reconnect battery.
●Turn ignition switch from OFF to ON.
Performing the following will cause the system to go into arming preparation state:
●Close all doors.
Arming preparation state
Performing the following will cause the system to return to disarmed state (B):
●Open any door and the engine hood.
Performing any of the following will cause the system to return to disarmed state (A):
●Unlock all doors by wireless operation.
●Insert key into ignition key cylinder.
●Reconnect battery
●Turn ignition switch from OFF to ON.
●Unlock all doors by key operation.
Performing the following will cause the system to go into armed state:
● With all doors and engine hood closed, lock all doors.
Allow 30 (±1.5) sec. to elapse.
Armed state
Performing any of the following will cause the system to return to disarmed state (A):
●Unlock all doors by wireless operation
●Unlock all doors by key operation.
● Insert key into ignition key cylinder and turn ignition switch from OFF to ON
Performing any of the following will cause the system to go into alarm sounding state:
● Open any door and allow entry delay time to pass.
●Open engine hood.
●Open luggage compartment door without key and wireless operation.
●Reconnect battery.

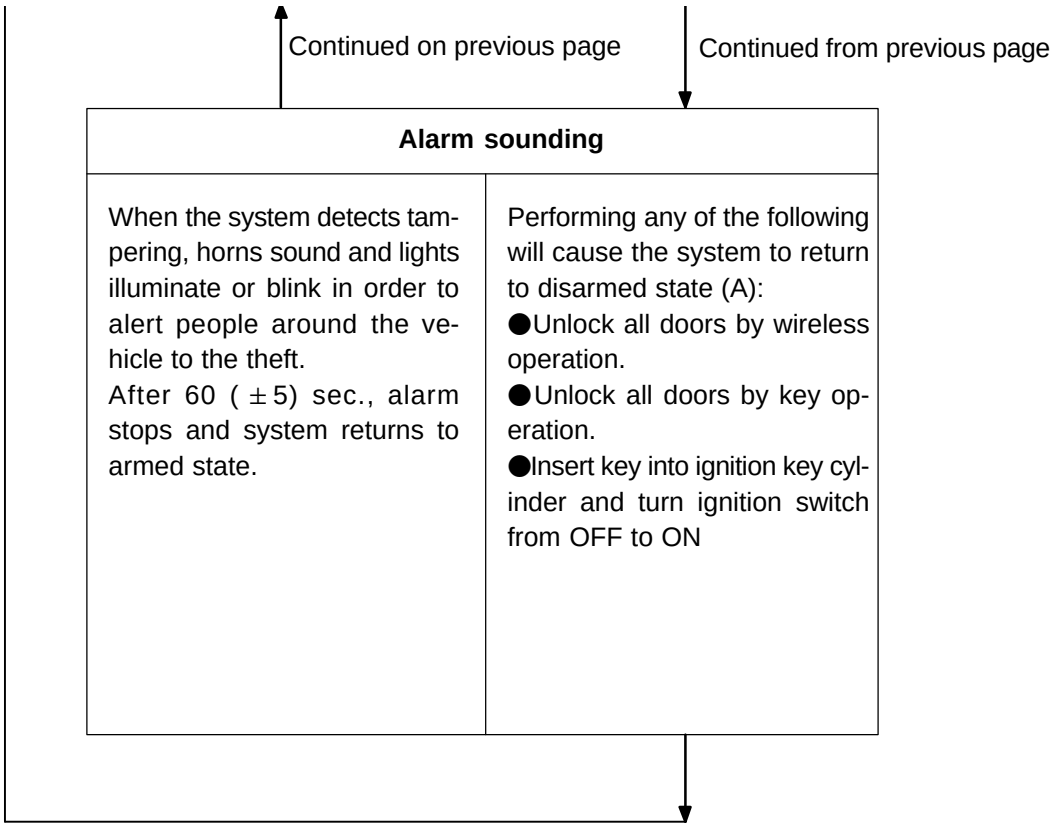
Continued on next page



*3: When any door is opened while all the doors are closed during the armed state in passive arming mode, the entry delay time starts. If the switch condition (armed state → disarmed state) is fulfilled during the entry delay time, the theft deterrent system will return to the disarmed state. However, if the switch condition to the disarmed state is not fulfilled, the theft deterrent system will recognize it as a theft and go into alarm sounding state.
Entry delay time of 0, 14 or 30 sec. can be selected by the customizing function.

4. FORCED DOOR LOCK CONTROL

(a) The forced door lock control prevents the vehicle from being tampered with. Immediately after a door is unlocked (alarm starts), the door is forced to lock by a forced door lock signal.

(1) Conditions that force the doors to lock:

When no key is in the ignition key cylinder and 0.4 second has elapsed after the previous output of a forced door lock signal, the doors will be forced to lock if any of the following conditions is fulfilled.

The theft deterrent system is in the armed state of active arming mode.

All the doors are locked. → Any door is unlocked.

Any door is unlocked state.

5. SECURITY INDICATOR LIGHT OUTPUT

(a) The theft deterrent ECU outputs a signal to light up the security indicator light, according to the state of the theft deterrent system. However, some of the actual lighting conditions of the security indicator light are different from the outputs of the theft deterrent ECU.

	Security indicator light	
State of theft deterrent system*1	Output signals from the theft deterrent ECU	Actual lighting condition
Disarmed state	OFF	**OFF** (Immobiliser system unset) **BLINKING** (Immobiliser system set)
Arming preparation state	ON	**ON**
Armed state	OFF	**BLINKING**
Alarm sounding state	ON	**ON**

*1: Common to active arming mode and passive arming mode

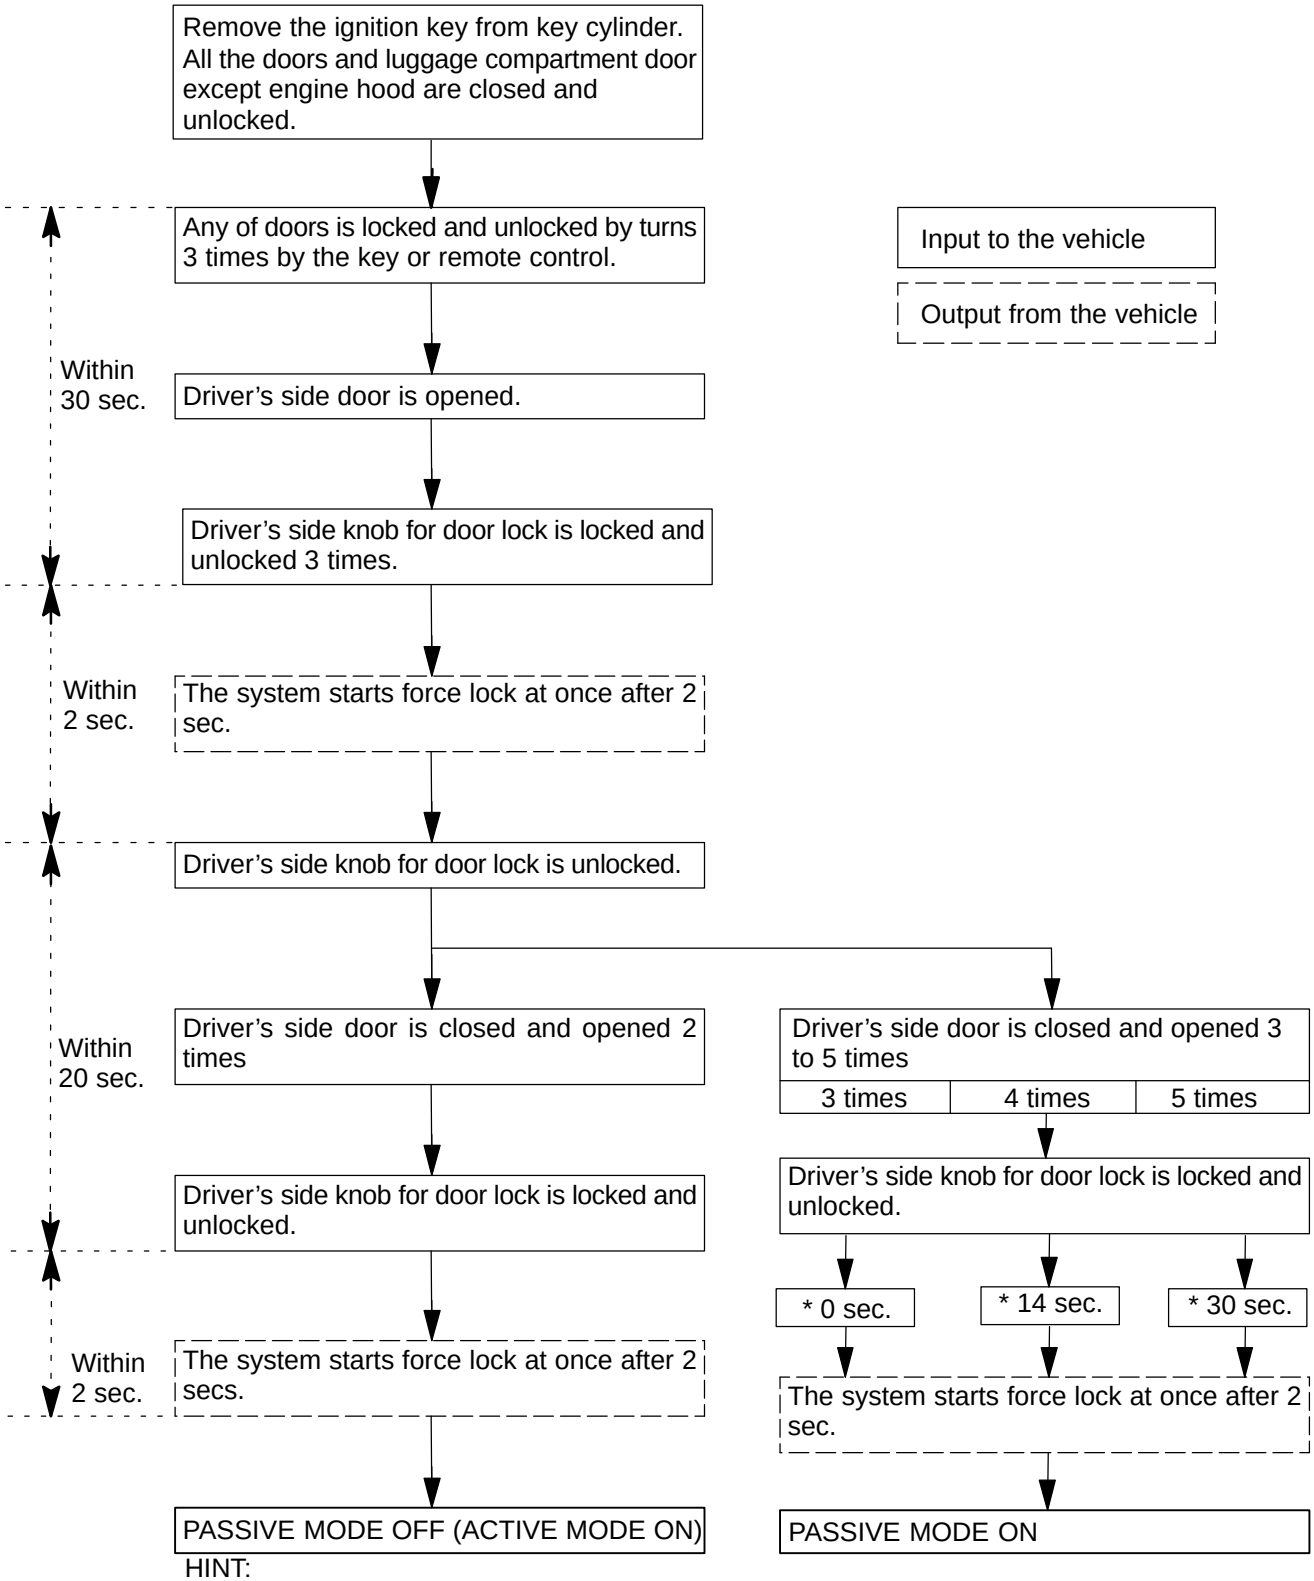
Blinking cycle:

Time	Security indicator light
0.2 sec.	ON
1.8 sec.	OFF

HINT:

When the immobiliser system is set, the security indicator light blinks during the disarmed state and the armed state, due to the output signals from the immobiliser system.

6. CHANGING METHOD OF PASSIVE MODE (ON or OFF)



HINT:
- Initial mode is PASSIVE MODE OFF.
- If the ignition switch is turned ON, changing operation will be canceled.

ON−VEHICLE INSPECTION

1. INSPECTION SLIDING ROOF FUNCTION

(a) Check the AUTO sliding open operation function.
  (1) Turn the ignition switch ON.
  (2) Slide close and tilt down the roof glass to the fully closed position.
  (3) Check that the roof glass automatically slides open and stops just before the roof glass is fully opened by operating the sliding roof switch OPEN for 0.3 seconds or more.

(b) Check the AUTO sliding close operation function.
  (1) Turn the ignition switch ON.
  (2) Check that the roof glass automatically slides close to the fully closed position by operating the sliding roof switch CLOSE for 0.3 seconds or more.
  (3) The roof glass stops sliding when the sliding roof switch is operated CLOSE or OPEN while the glass is moving.

(c) Check the AUTO tilting UP operation function.
  (1) Turn the ignition switch ON.
  (2) Slide close and tilt down the roof glass to the fully closed position.
  (3) Check that the roof glass automatically tilts up to the fully up position by operating the sliding roof switch UP for 0.3 seconds or more.

(d) Check the AUTO tilting DOWN operation function.
  (1) Turn the ignition switch ON.
  (2) Check that the roof glass automatically tilts down by operating the sliding roof switch DOWN when the roof glass is in the up position.

(e) Check the operation function after key−OFF.
  (1) After turning the ignition switch from ON to OFF, check that the roof glass can be operated via the sliding roof switch. However, operation is disabled after either of the front doors is opened.
  (2) When approximately 45 seconds have passed after the ignition switch is turned from ON to OFF, check that the roof glass can not be operated via the sliding roof switch.
  (3) After turning the ignition switch from ON to OFF with either of the front doors open, check that AUTO operation stops immediately.

(f) Check the jam protection function.

NOTICE:

- **Do not check this function using a part of your body such as a hand.**
- **Pay thorough attention that nothing gets caught by accident in this process.**
- **The roof might be deformed if something hard, such as a handle of hammer, is inserted in between.**

HINT:

The jam protection functions operate only during the following AUTO operations; AUTO close or AUTO down operation and AUTO close or AUTO down operation after key−OFF.

  (1) Fully close the roof glass.
  (2) Insert the handle of the hammer when the roof glass is almost in the fully closed position.

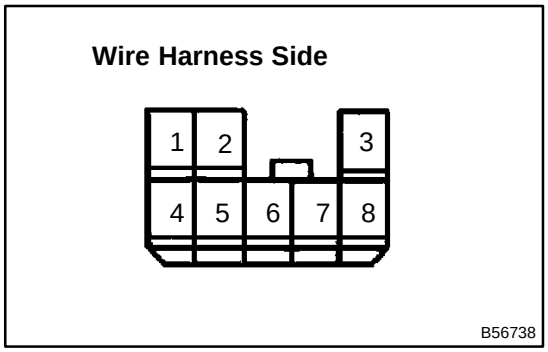
HINT:

Wrap the hammer handle well with cloth or something before use.

(3) When trying to operate the roof glass to the fully closed position via the AUTO close or down function, check that the glass movement is reversed by detecting the handle, so that the hammer handle is not caught

HINT:

- The reverse movement when the roof glass is sliding close stops when the glass slides open 200 mm or before the glass reaches the fully open position (for a maximum 20 seconds).
- The reverse movement when the roof glass is tilting down stops when the glass is in the fully up position or 2 seconds have passed.



2. INSPECT SLIDING ROOF RELAY AND SWITCH (TMMK MADE)

(a) Inspect the sliding roof relay and switch.
