■ ENGINE MOUNTING

1. General

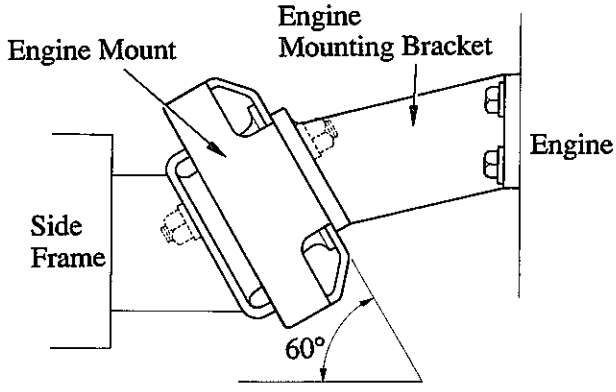

The new 3B and 14B engines are mounted at four points, in the same way as the previous model. However, the rubber characteristics and mounting methods of the front and rear engine mounts have been changed to make the vehicle quieter and the engine mounts lighter.

2. Front Engine Mount

The front engine mounts are basically the same as those of the previous model. However, their optimized rubber characteristics and changed mounting angle result in a quieter vehicle with smaller and lighter engine mounts.

3. Rear Engine Mount

Instead of being suspended from the No.3 crossmember as done previously, the rear engine mounts of the new Coaster are placed above the No.3 crossmember. Thus, the No.2 rear engine mounting brackets have been discontinued, reducing the vehicle weight. Their rubber characteristics have also been optimized to reduce vibration.
