BODY STRUCTURE

■ AERODYNAMICS

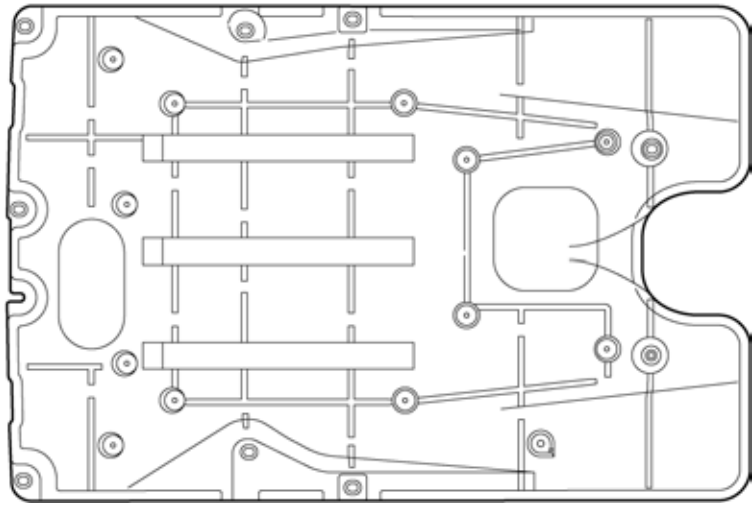

- Aero step and a fish-fin shape have been added to the No. 1 engine under cover, contributing to improved handling stability and a comfortable ride.
- The aero step arranged at the front of a vehicle generate vacuum by altering the direction of air flow under the vehicle, and the fish fins create “vortexes” to straighten the flow of air, as well as the fins increase the flow rate, thereby improving road holding capability and the stability of the flow of air under the vehicle.
