■CEILING SPEAKER WITH EXCITER

- Two exciters are provided on either side of the ceiling behind the front seats.
- The sound is heard from above due to the exciters mounted on the ceiling. This helps create a better soundscape which otherwise cannot be provided only by the door speakers mounted in lower positions. This creates a wide acoustic space like a listening room.
- The ceiling speaker with exciter utilizes the ceiling (headliner) as a diaphragm. The adoption of the NXT®* flat panel speaker technology contributes to reduce the thickness of the speaker to approximately 48 % compared to conventional speakers. Furthermore, these exciters are mounted on the backside of the ceiling panel. This prevents the speakers from protruding into the cabin, providing a flat ceiling.
