EXTERIOR

Front Design

- The front design provides a continuous form from the front bumper to the roof panel. The layout of the parts gives the panel surfaces their firmness and the three-dimensional radiator grille and the front bumper achieve a fearless front form to realize a safe and professional appearance.
- The contoured, two-beam halogen headlights have a clearance light and turn signal light housed in the same lens.
- To achieve an integrated look, the radiator grille is designed with a continuous flow to the hood and headlights. On some of the GL grade models, the radiator grille is plated to realize an elegant look.
- On some of the GL grade models, the front bumper is painted the same color as the exterior panels to achieve an integrated look with the body.
- On the wide body model, the front bumper protrudes forward to realize a wide, dynamic look.
- On some models, compact, round fog lights are provided as standard or optional equipment. For details, see page MO-40, in Equipment List.
