Rear Design

- The rear design consists of slim-shaped rear combination lights placed at each side of the back door, which provide a large door opening, while achieving a wide look.
- To achieve an integrated look with the body, the rear bumper is designed with a continuous flow to the body.
- On some of the GL grade models, the front bumper is painted the same color as the exterior panels to achieve an integrated look with the body.
- A rear bumper with a step is provided on the model for Hong Kong and New Zealand.
- On some of the models, rear fog lights are provided as standard or optional equipment. For details, see page MO-40, in Equipment List.
