■ CONNECTING ROD AND CONNECTING ROD BEARING

1. Construction

- The connecting rod sub-assemblies are made of high tension material, and their shape is optimized to achieve weight reduction, reliability, improving quietness and reducing friction.
- The upper side of the connecting rod bearing has an attached overlay to ensure reliability against high internal cylinder pressure and to reduce friction.
- The connecting rod sub-assembly and connecting rod bearing both use lead-free materials, in consideration of environmental problems.
