■GLOW SYSTEM

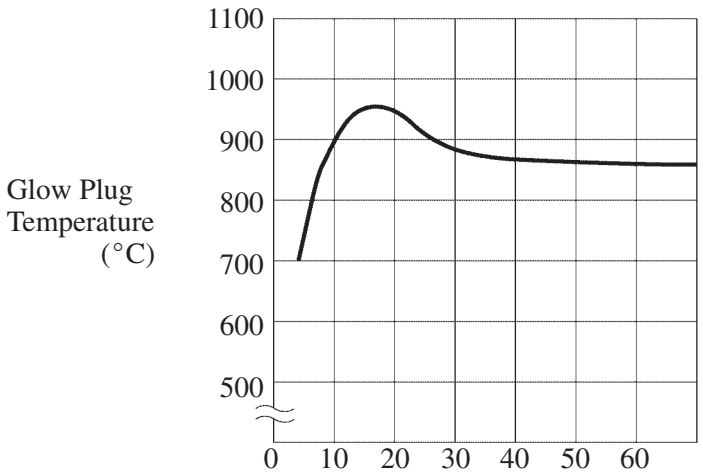

Glow Plug

- A glow plug that has a self-temperature control function, and which is made of a new metal, has been adopted.
- This glow plug has a built-in control coil that increases its resistance with the increase in the temperature of the glow plug. The increased resistance of the control coil then reduces the voltage that is applied to the thermal coil, a heating element that is connected in series to the control coil. In this manner, the glow plug itself provides the function to reduce its own temperature.
- The glow system offers a simplified system configuration in which the glow plug resistor and glow plug sub-relay have been discontinued.
