NEW FEATURES

■ EXTERIOR

1. Rear Design

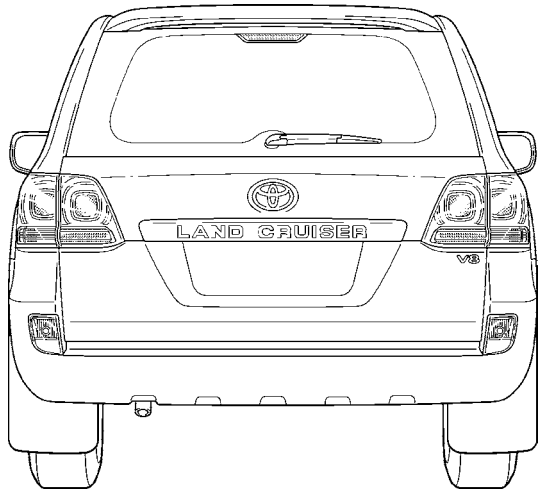

A model with swing type back door has been added for G.C.C. countries, Australia and general countries. Together with this, the following new components, which differ from those provided for models with the lift-up type Back Door, are provided exclusively for models with the swing type back door.

- The rear combination light has been given a new shape, and the installation location has been changed. The rear turn signal lights, which protrude in the wide direction, are provided in the upper area, giving the rear view silhouette a square shape (as opposed to the circular rear view silhouette of models with the lift-up type Back Door) and thus enhancing the rugged impression with an aim to strengthening the originality of the Land Cruiser Station Wagon.
- The back-up light has been moved from the back door to the rear bumper.

- A new rear bumper is provided. The specification of the step in the upper part of the rear bumper is exclusive to models with the swing type back door, in consideration of the appearance of the vehicle when the swing type back door is opened.
