Selector Lever

- A compact selector lever (transmission shift assembly), which has been designed under a new concept, has been adopted in the instrument panel.
  It is a momentary shift type that returns to the home position when the driver's hand is released from the selector lever after a shifting operation. It can be shifted with a fingertip, and the ergonomically designed shifting pattern offers excellent ease of operation.
- A shift-by-wire technology has been adopted for shift control.
- The new Prius has adopted a parking lock mechanism that is electrically operated, in the same way as the shift control. It can be shifted to the "P" position by simply pressing the parking switch provided above the selector lever.
