Pollen Removal Mode

- The pollen removal mode quickly removes pollen from the front seat occupant area with the pressing of the pollen removal mode switch on the heater control panel, without requiring any complex air conditioner operation.
- When the user pushes the pollen removal mode switch, the air conditioner operates in the recirculation mode. The clean air that has passed through the clean air filter blows out from the face outlet to the occupant area.
  The filtered clean air quickly removes pollen from the occupant area. After that, the air in the cabin recirculates and continues to remove pollen in the air by allowing the clean air filter to capture the pollen. When the amount of pollen in the cabin as a whole diminishes to a certain level, the air conditioner automatically resumes operating in the auto mode.
