

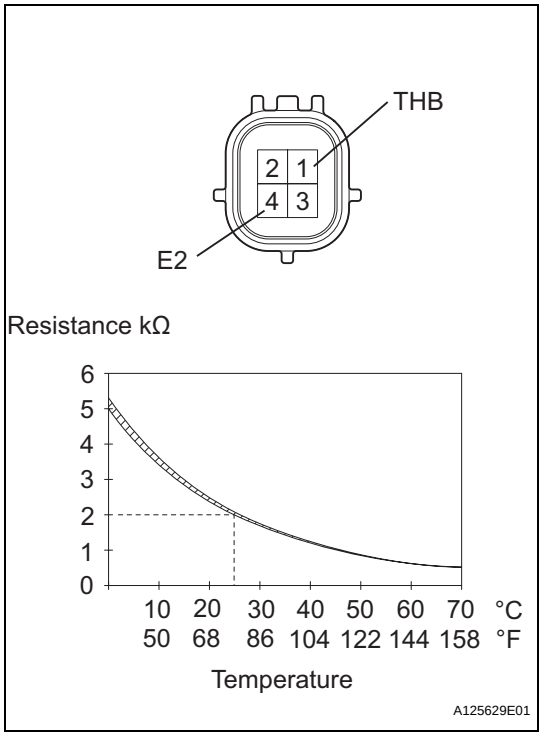
BATTERY CURRENT SENSOR

ON-VEHICLE INSPECTION



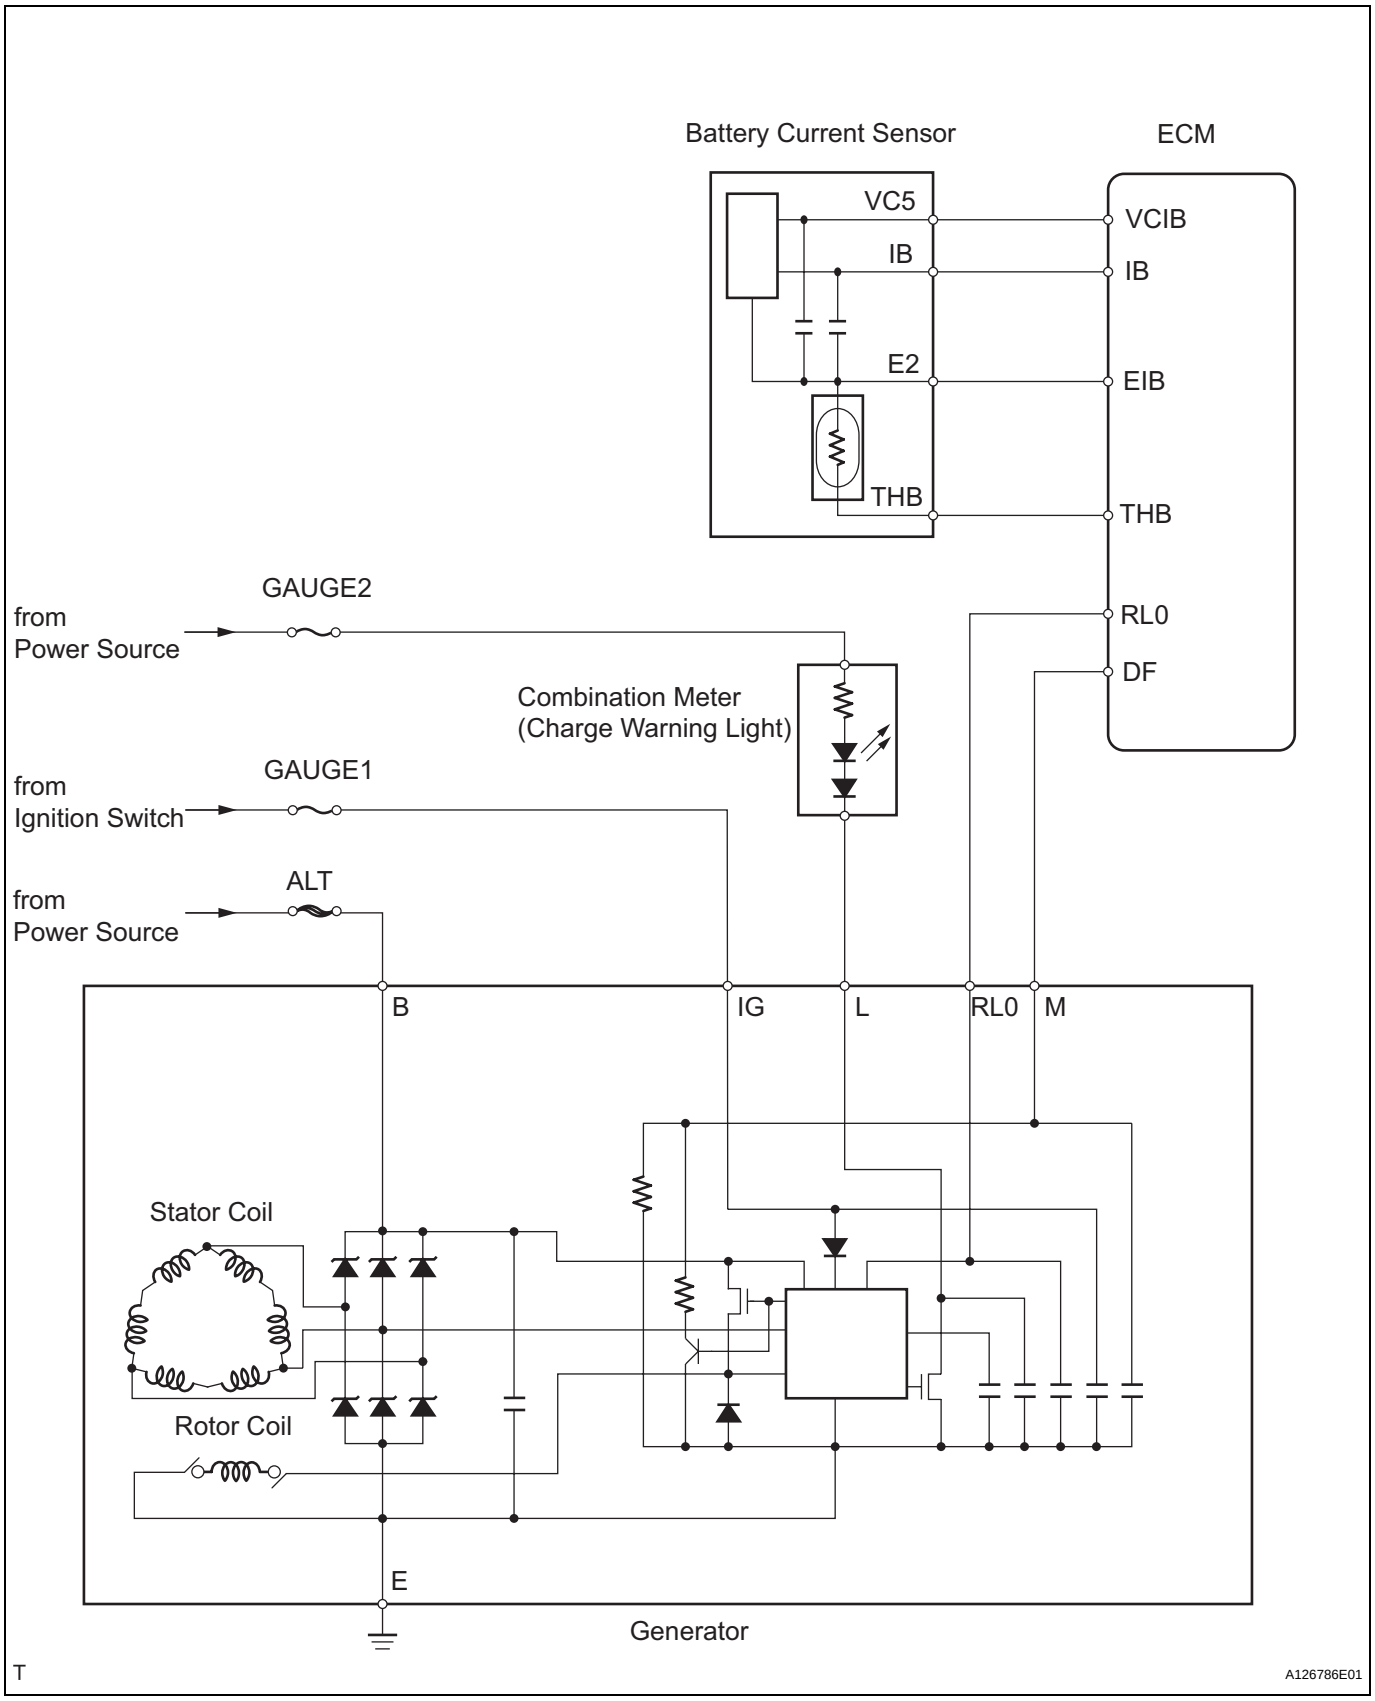
1. CHECK BATTERY CURRENT SENSOR ASSEMBLY

(a) Measure the resistance of the sensor.

Standard resistance

Tester Connection	Specified Condition
2 (VC5) - 4 (E2)	3 to 10 kΩ
2 (VC5) - 3 (IB)	Below 0.5 kΩ
3 (IB) - 4 (E2)	3 to 10 kΩ

If the result is not as specified, replace the sensor assembly.



(b) Measure the resistance of the sensor.

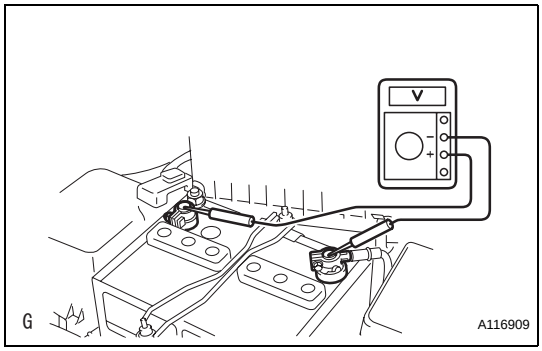
Standard resistance

Tester Connection	Condition	Specified Condition
1 (THB) - 4 (E2)	20 to 30°C (68 to 86°F)	1.5 to 2.5 kΩ

If the result is not as specified, replace the sensor assembly.

SYSTEM DIAGRAM

CH



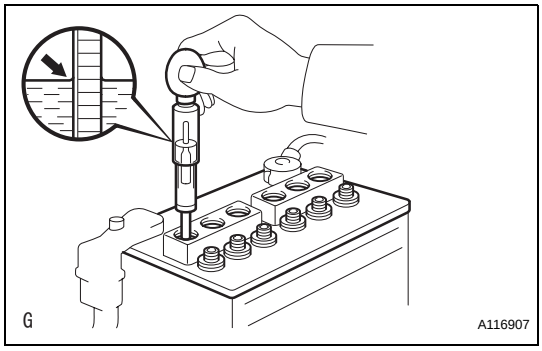
ON-VEHICLE INSPECTION

1. CHECK BATTERY CONDITION

NOTICE:

If the battery is weak or if the engine is difficult to start, perform the following procedures.

(a) Check the battery for damage and deformation. If severe damage, deformation or leakage is found, replace the battery.



(b) Check the electrolyte quantity of each cell.

(1) For maintenance-free batteries:

- If the electrolyte quantity is below the lower line, replace the battery.
- If the electrolyte quantity is above the lower line, check the battery voltage when cranking the engine. If the voltage is less than 9.6 V, recharge or replace the battery.

HINT:

Before checking the battery voltage, turn off all the electrical systems (headlights, blower motor, rear defogger, etc.).

(2) For non-maintenance-free batteries:

- If the electrolyte quantity is below the lower line, add distilled water to each cell. Then, recharge the battery and check the electrolyte's specific gravity.

Standard specific gravity:

1.25 to 1.29 at 20°C (68°F)

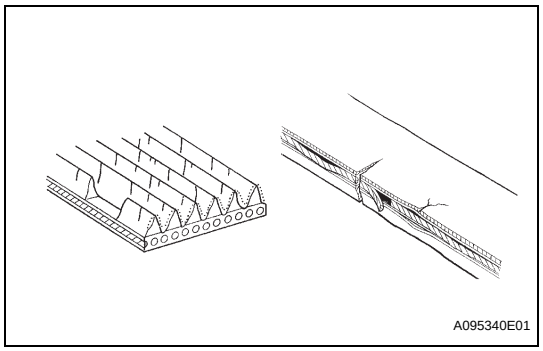
If the electrolyte quantity is above the lower line, check the battery voltage when cranking the engine. If the voltage is less than 9.6 V, recharge or replace the battery.

HINT:

Before checking the battery voltage, turn off all the electrical systems (headlights, blower motor, rear defogger, etc.).

2. INSPECT BATTERY TERMINAL AND FUSE

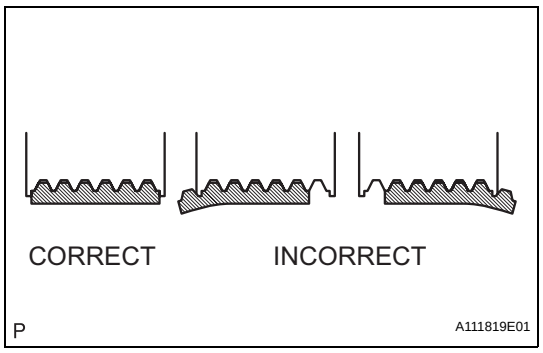
(a) Visually check the battery terminals.



(1) Check that the battery terminals are not loose or corroded.

(b) Measure the resistance of the H-fuses and fuses.

Standard resistance:



Below 1 Ω

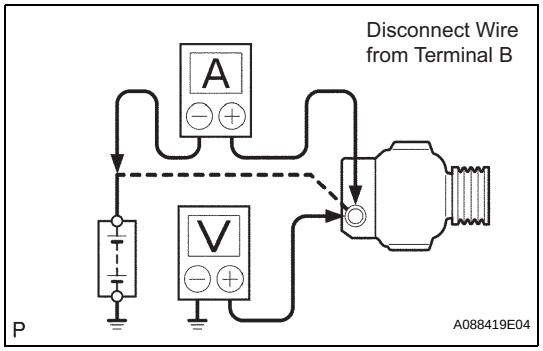
If the results are not as specified, replace the fuses as necessary.

3. INSPECT V-RIBBED BELT

(a) Visually check the belt for excessive wear, frayed cords, etc.
If any defects are found, replace the V-ribbed belt.
HINT:
Cracks on the rib side of the belt are considered acceptable. If the belt has chunks missing from the ribs, it should be replaced.

(b) Check that the belt fits properly in the ribbed grooves.
HINT:
Confirm by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

4. INSPECT GENERATOR WIRING



(a) Visually check the generator wiring.
(1) Check that the wiring is in good condition.

5. CHECK FOR ABNORMAL NOISES

(a) Listen for abnormal noises from the generator.
(1) Check that no abnormal noises are heard from the generator while the engine is running.

6. INSPECT CHARGE WARNING LIGHT CIRCUIT

(a) Turn the ignition switch ON. Check that the charge warning light comes on.
(b) Start the engine and check that the light goes off.
If the light does not operate as specified, troubleshoot the charge warning light circuit.

7. INSPECT CHARGING CIRCUIT WITHOUT LOAD

(a) Connect a voltmeter and ammeter to the charging circuit as follows.
(1) Disconnect the wire from terminal B of the generator, then connect it to the negative (-) lead of an ammeter.
(2) Connect the positive (+) lead of the ammeter to terminal B of the generator.
(3) Connect the positive (+) lead of a voltmeter to terminal B of the generator.
(4) Ground the negative (-) lead of the voltmeter.
(b) Check the charging circuit.
(1) Keep the engine speed at 2,000 rpm and check the reading on the ammeter and voltmeter.
Standard amperage:
10 A or less
Standard voltage:
12.1 to 15.4 V
If the result is not as specified, replace the generator.
HINT:
If the battery is not fully charged, the ammeter reading will sometimes be more than the standard amperage.

8. INSPECT CHARGING CIRCUIT WITH LOAD

(a) With the engine running at 2,000 rpm, turn the high beam headlights ON and turn the heater blower switch to the "HI" position.

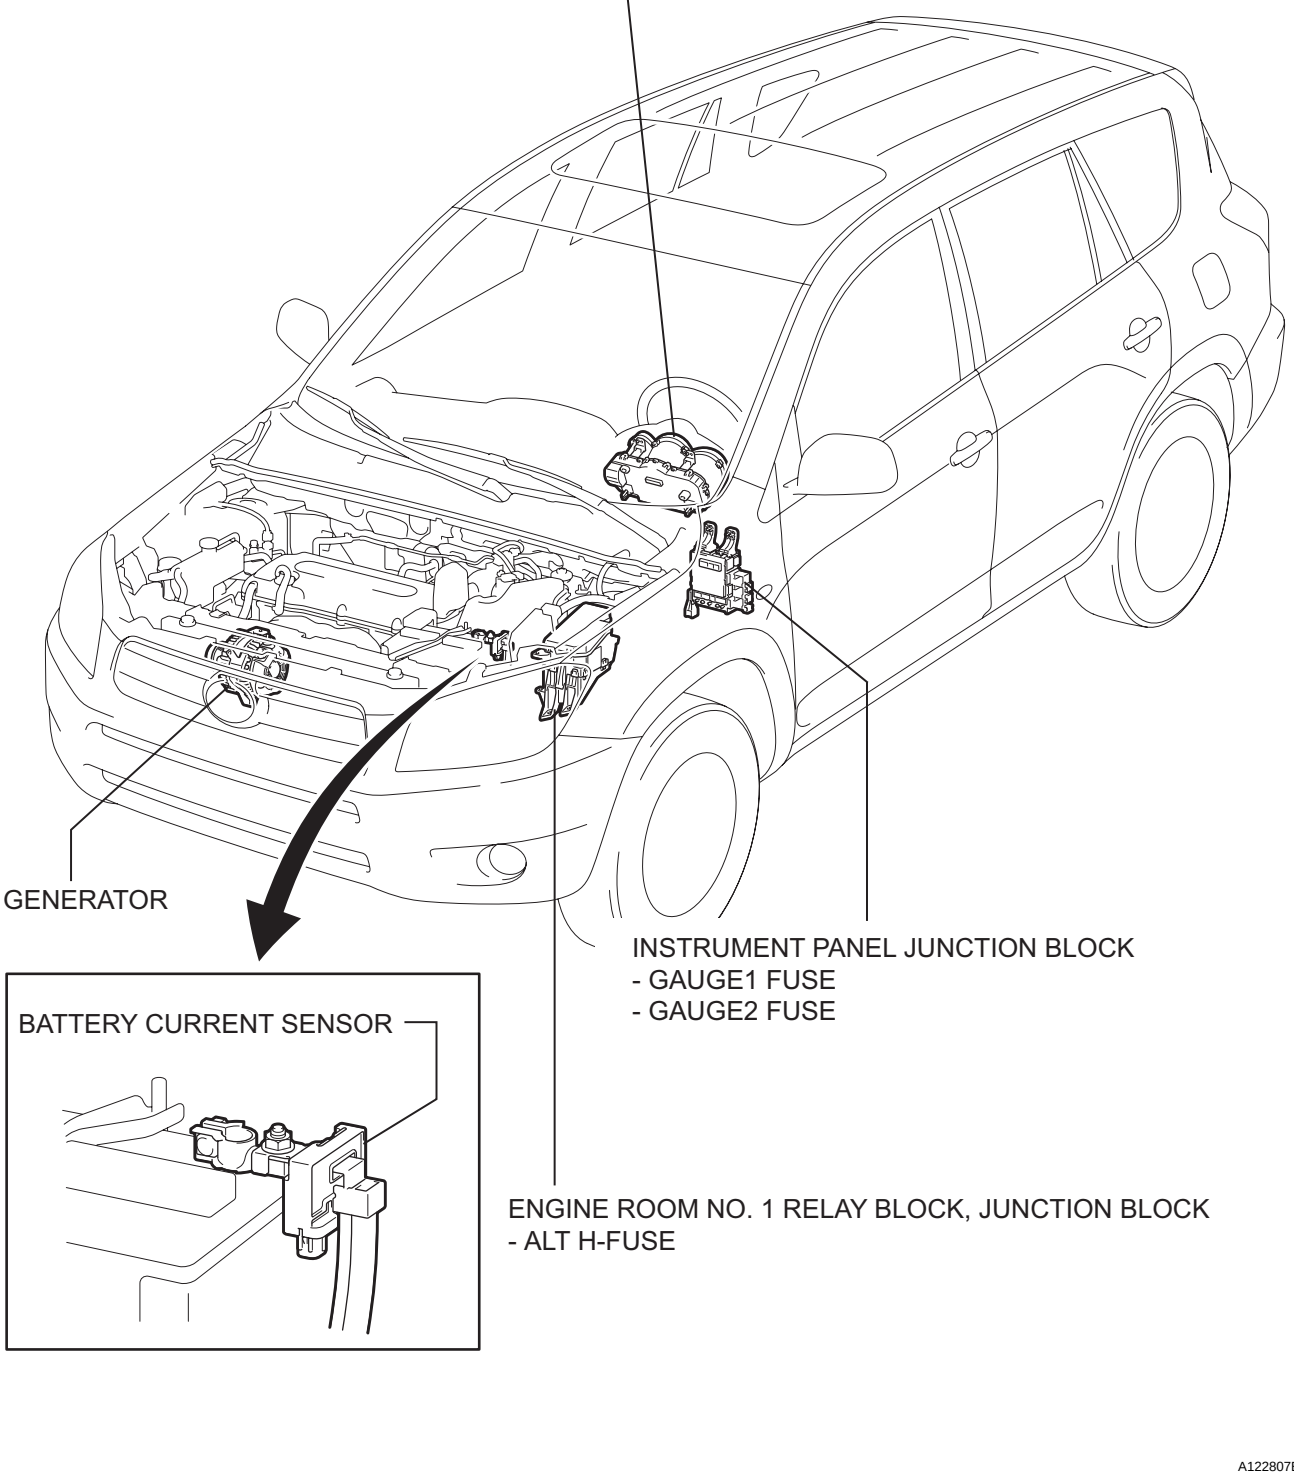
(b) Check the reading on the ammeter.

Standard amperage:

30 A or more

If the ammeter reading is less than the standard amperage, repair the generator.

HINT:



If the battery is fully charged, the indication will sometimes be less than the standard amperage. If this is the case, add more electrical load (operate the wipers, rear window defogger, etc.) and check the reading on the ammeter again.

CHARGING SYSTEM

PRECAUTION

1. **Check that the battery cables are connected to the correct terminals.**
2. **Disconnect the battery cables if a quick charge is given to the battery.**
3. **Do not perform tests with a high voltage insulation resistance tester.**
4. **Never disconnect the battery while the engine is running.**
5. **Check that the charging cable is tightly connected onto terminal B of the generator and the fuse box.**
6. **Do not check whether the generator generates current or not while terminal F is connected to the other terminals.**

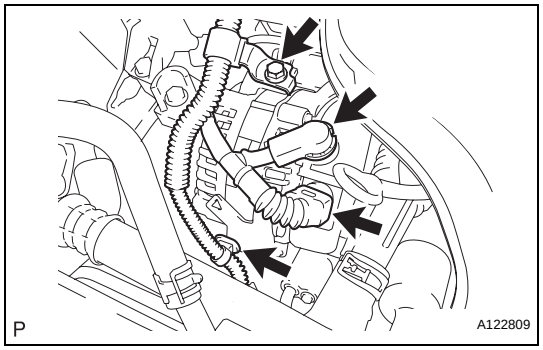
PARTS LOCATION

CH

REMOVAL

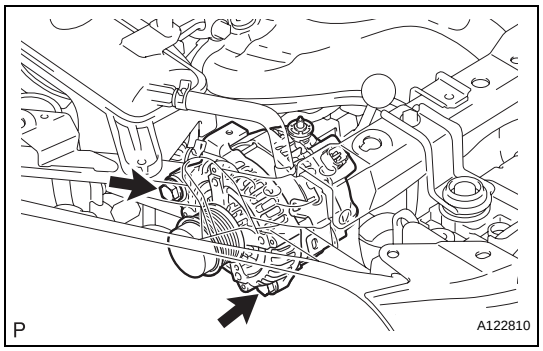
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

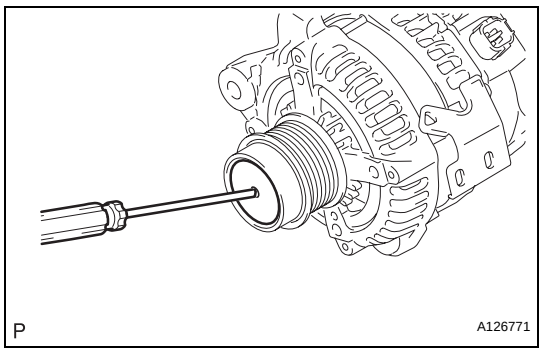
2. REMOVE FAN AND GENERATOR V BELT



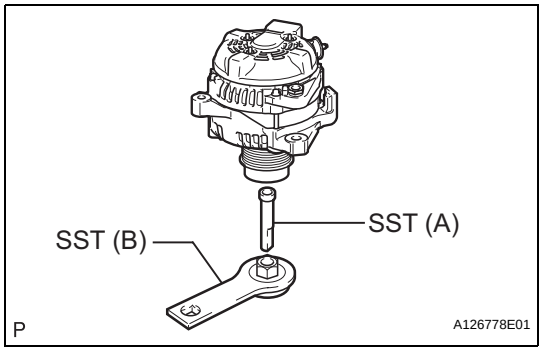
(a) Remove the belt (see page EM-6).

3. REMOVE GENERATOR ASSEMBLY

(a) Disconnect the generator connector.
(b) Remove the terminal cap.
(c) Remove the nut and disconnect the generator wire.
(d) Remove the bolt and wire harness clamp bracket.
(e) Remove the wire harness clamps.

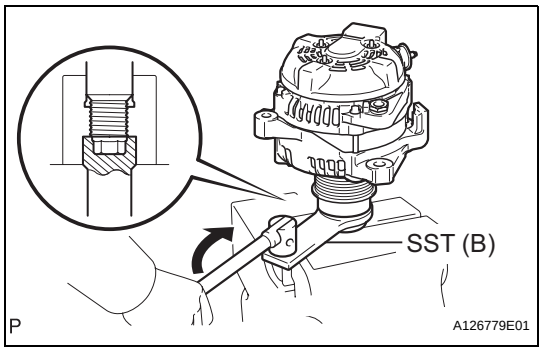


(f) Remove the 2 bolts and generator.

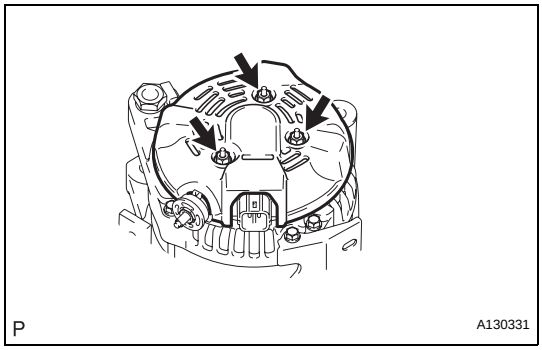


DISASSEMBLY

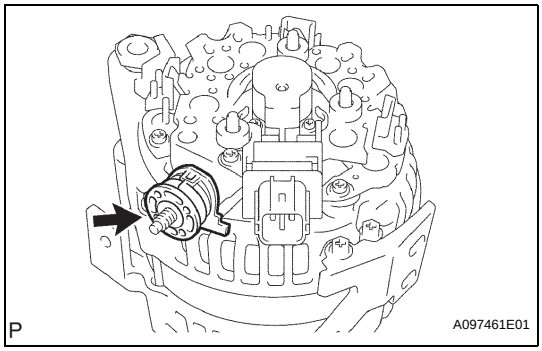
1. REMOVE GENERATOR PULLEY WITH CLUTCH



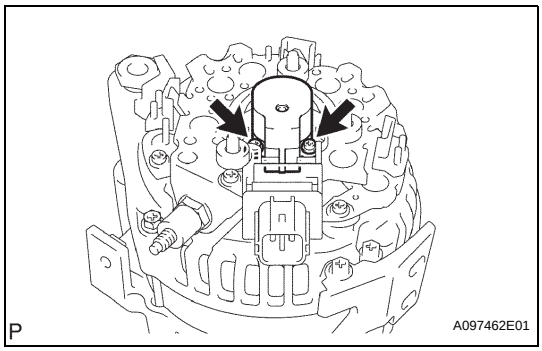
(a) Remove the cap from the pulley.
  (1) Using a screwdriver, puncture the center of the cap and pry it off.
  NOTICE:
  Do not reuse the cap.



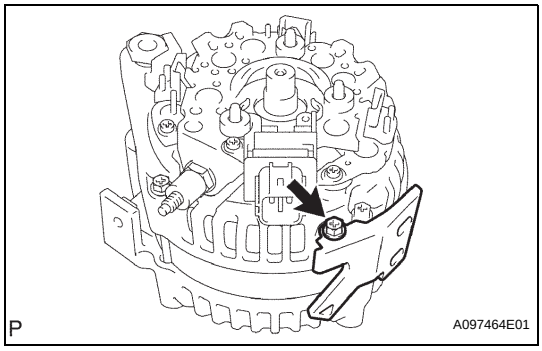
(b) Install SST to the pulley and vise as shown in the illustration.
  SST 09820-63020
(c) Mount SST (A) in a vise.



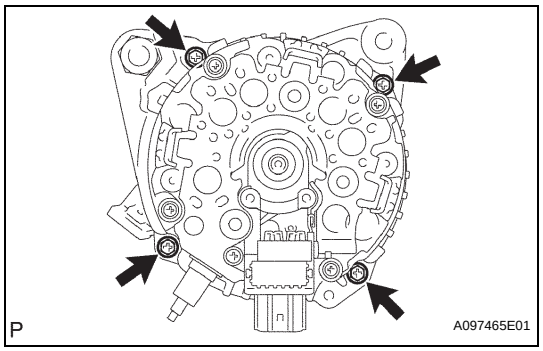
CH



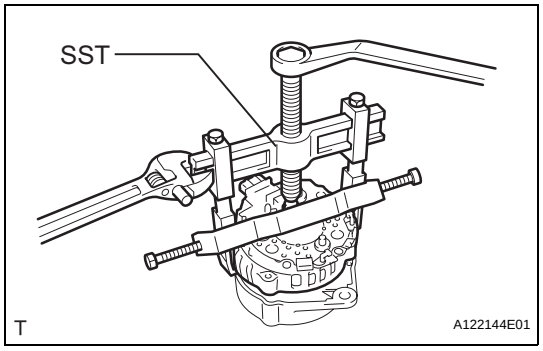
(d) Turn SST (B) clockwise to loosen the pulley.
(e) Remove the pulley.



2. REMOVE GENERATOR BRUSH HOLDER ASSEMBLY
(a) Remove the 3 nuts and generator rear end cover.

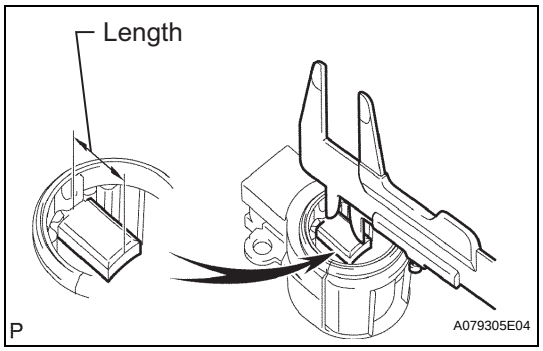


(b) Remove the terminal insulator.



(c) Remove the 2 screws and generator brush holder.

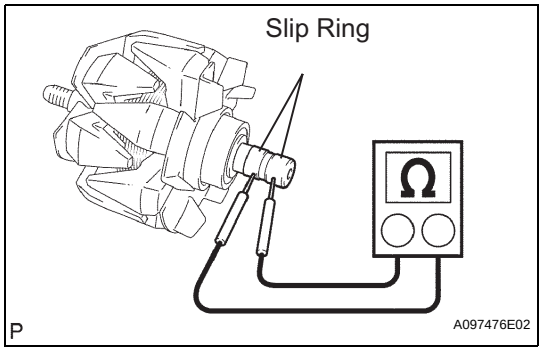
3. REMOVE GENERATOR ROTOR ASSEMBLY
(a) Remove the bolt and cord clip.



(b) Remove the 4 bolts.

(c) Using SST, remove the coil.
SST 09950-40011 (09951-04020, 09952-04010, 09953-04020, 09954-04010, 09955-04071, 09957-04010)

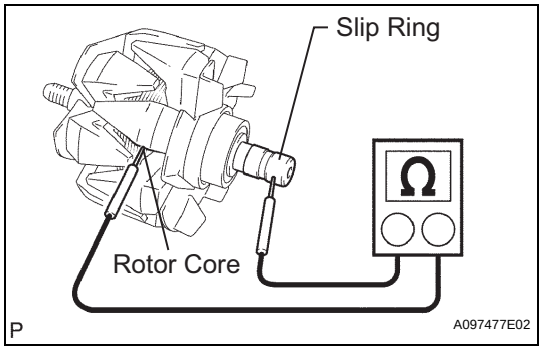
(d) Remove the washer.



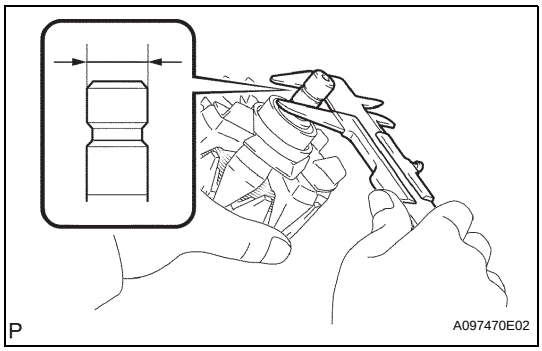
(e) Remove the generator rotor.

INSPECTION

1. INSPECT GENERATOR BRUSH HOLDER ASSEMBLY

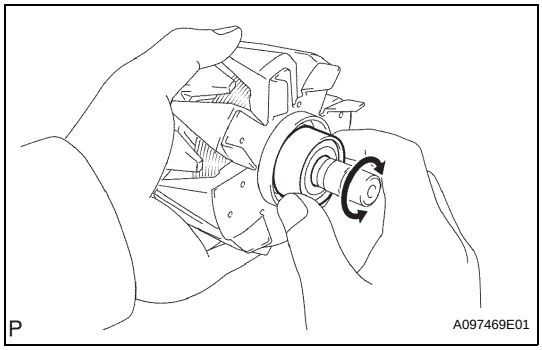


(a) Using a vernier caliper, measure the brush length.
Standard length:
9.5 to 11.5 mm (0.374 to 0.453 in.)
Minimum length:
4.5 mm (0.177 in.)
If the brush length is less than the minimum, replace the generator brush holder assembly.

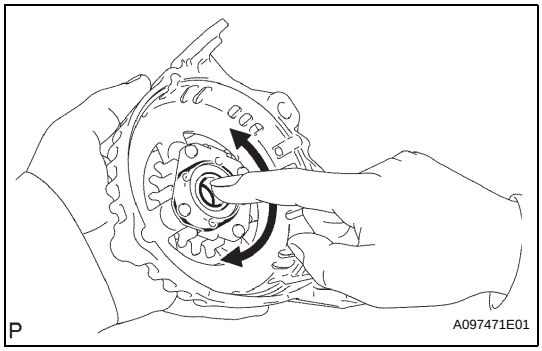


2. INSPECT GENERATOR ROTOR ASSEMBLY

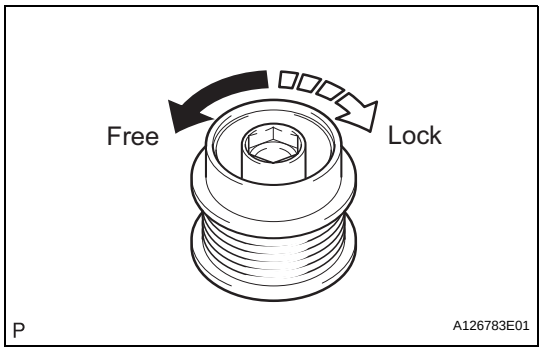
(a) Check the resistance.



(1) Measure the resistance between the slip rings.
Standard resistance:
2.3 to 2.7 Ω at 20°C (68°F)
If the result is not as specified, replace the generator rotor assembly.

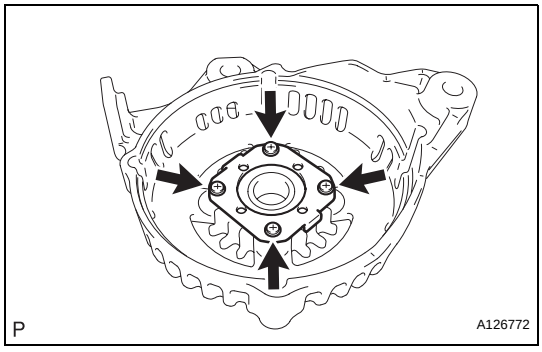


(2) Measure the resistance between the slip ring and rotor core.
Standard resistance:
1 MΩ or higher
If the result is not as specified, replace the generator rotor assembly.

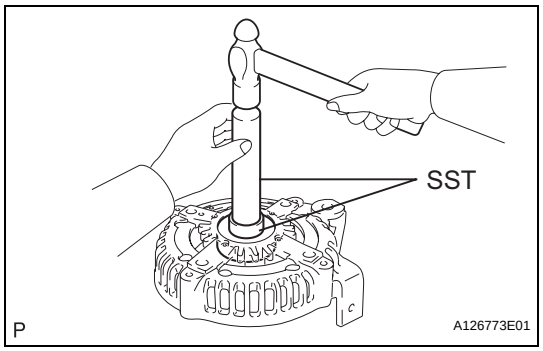


(b) Check the slip ring diameter.
(1) Using a vernier caliper, measure the slip ring diameter.
Standard diameter:
14.2 to 14.4 mm (0.559 to 0.567 in.)
Minimum diameter:
14 mm (0.551 in.)
If the diameter is less than the minimum, replace the generator rotor assembly.

(c) Check the appearance.
(1) Check that the bearing is not rough or worn.
OK:
The bearing rotates smoothly.
If the result is not as specified, replace the generator rotor assembly.

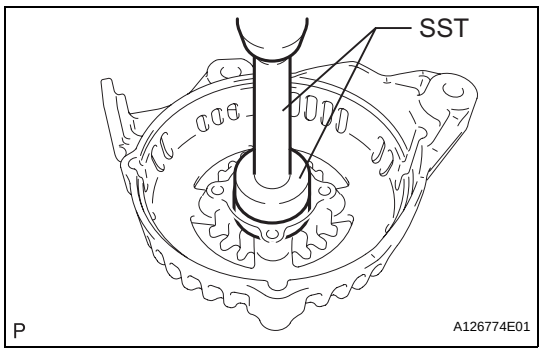


3. INSPECT GENERATOR DRIVE END FRAME BEARING
(a) Check that the bearing is not rough or worn.
OK:
The bearing rotates smoothly.
If the bearing does not rotate smoothly, replace the bearing.

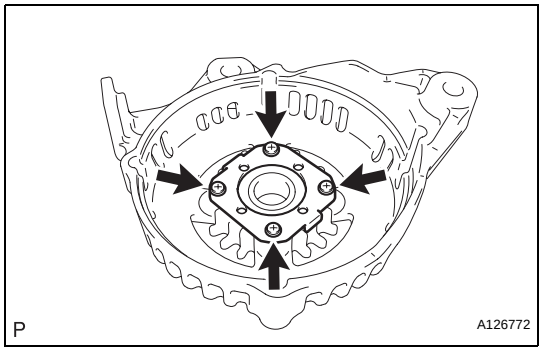


4. INSPECT GENERATOR PULLEY WITH CLUTCH
(a) Hold the center of the pulley, and confirm that the outer ring turns counterclockwise and does not turn clockwise.
If the result is not as specified, replace the generator pulley with clutch.

REPLACEMENT



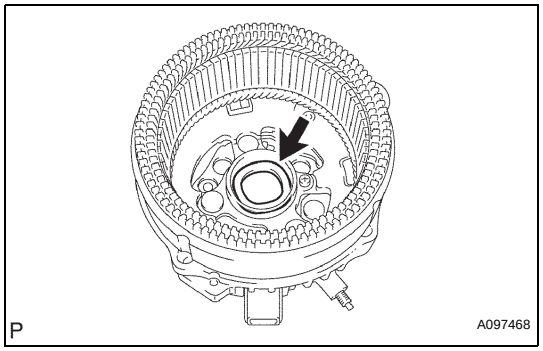
1. REPLACE GENERATOR DRIVE END FRAME BEARING
(a) Remove the 4 screws and bearing retainer.



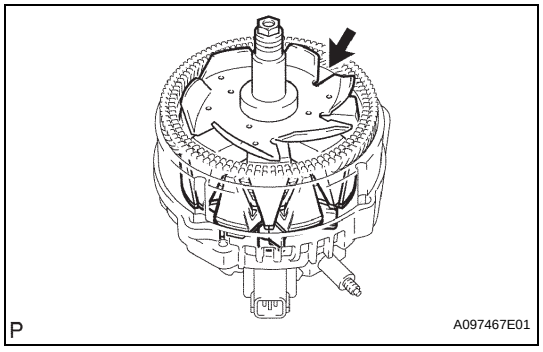
CH

(b) Using SST and a hammer, tap out the bearing.
SST 09950-60010 (09951-00250), 09950-70010 (09951-07100)

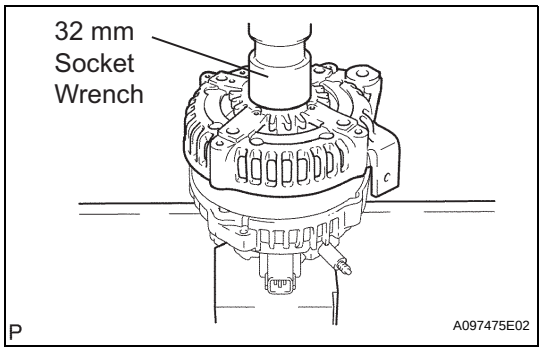
(c) Using SST and a press, press in a new bearing.
SST 09950-60010 (09951-00250), 09950-70010 (09951-07100)



(d) Install the bearing retainer with the 4 screws.
Torque: 2.3 N*m (23 kgf*cm, 20 in.*lbf)

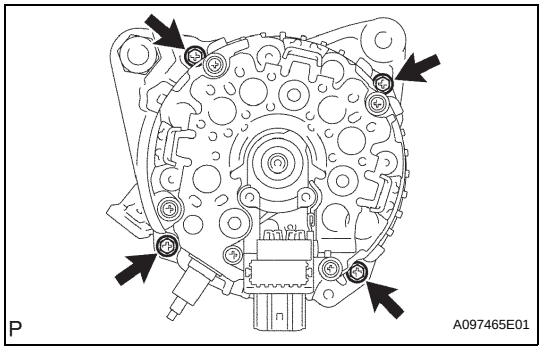


REASSEMBLY

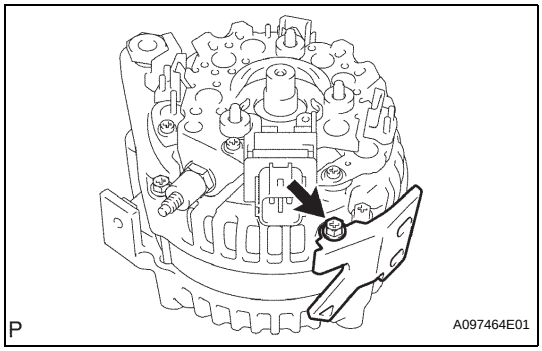


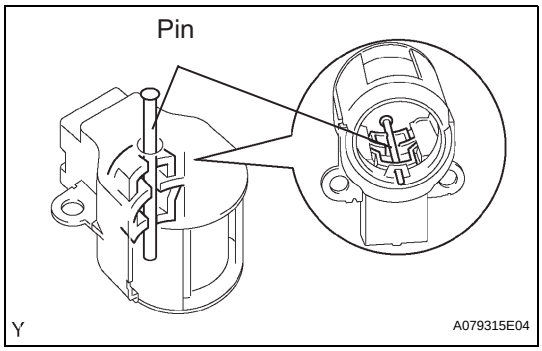
1. INSTALL GENERATOR ROTOR ASSEMBLY

(a) Install the washer onto the generator rectifier end frame.



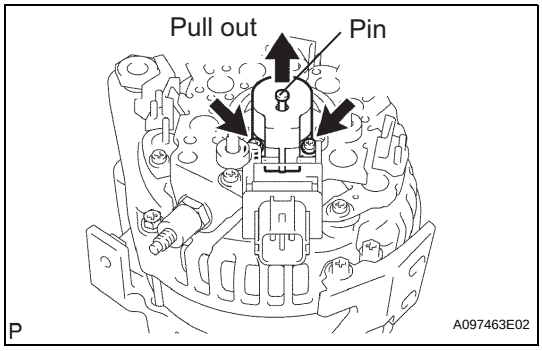
(b) Install the generator rotor onto the generator rectifier end frame.





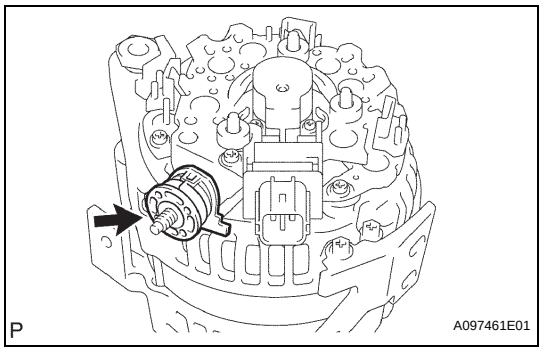
(c) Using a 32 mm socket wrench and press, slowly push the generator drive end frame onto the generator rectifier end frame.

(d) Tighten the 4 bolts.
Torque: 5.8 N*m (59 kgf*cm, 51 in.*lbf)

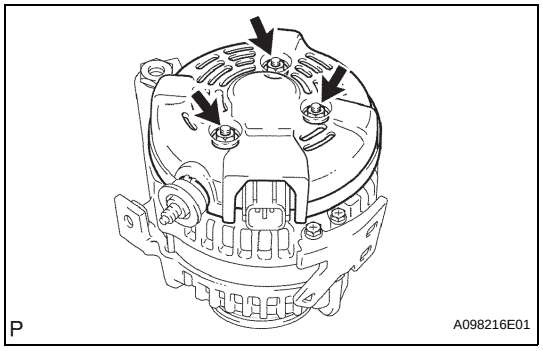


(e) Install the cord clip with the bolt.
Torque: 4.6 N*m (47 kgf*cm, 41 in.*lbf)

2. INSTALL GENERATOR BRUSH HOLDER ASSEMBLY



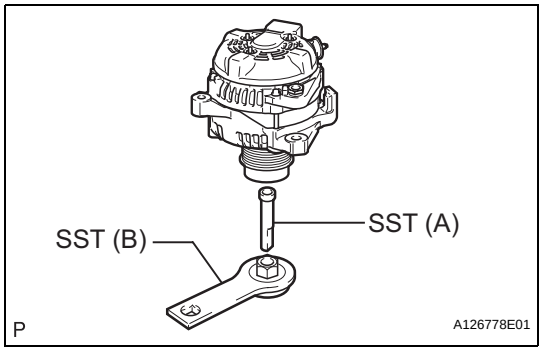
(a) While pushing the 2 brushes into the generator brush holder, insert a 1.0 mm (0.039 in.) pin into the generator brush holder.



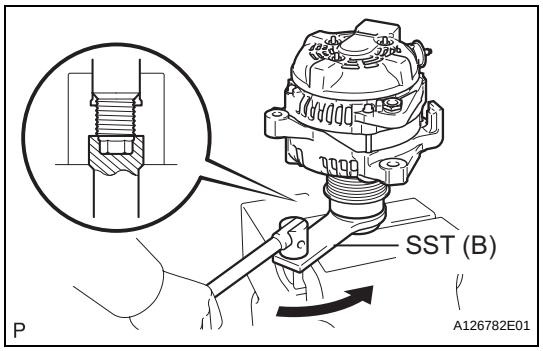
(b) Install the generator brush holder with the 2 screws.
Torque: 1.8 N*m (18 kgf*cm, 16 in.*lbf)

(c) Pull the pin out of the generator brush holder.

CH



(d) Install the terminal insulator onto the generator rectifier end frame.

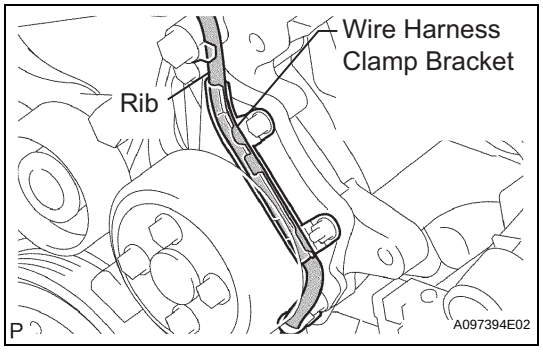


(e) Install the generator rear end cover with the 3 nuts.
Torque: 4.6 N*m (47 kgf*cm, 41 in.*lbf)

3. INSTALL GENERATOR PULLEY WITH CLUTCH

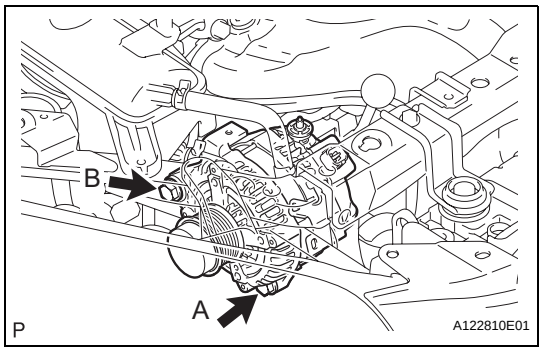
(a) Install the pulley by hand.

(b) Install SST to the pulley and vise as shown in the illustration.
SST 09820-63020



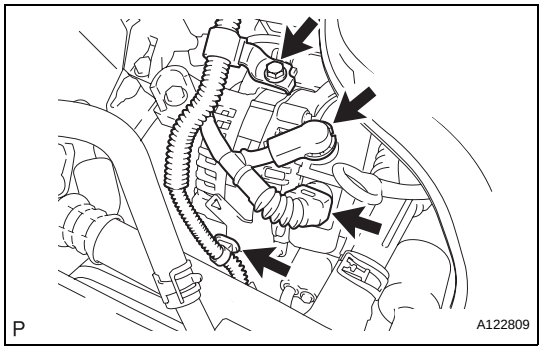
(c) Turn SST (B) counterclockwise to tighten the pulley.
Torque: 111 N*m (1125 kgf*cm, 81 ft.*lbf)

(d) Install a new cap to the pulley.



(e) Check that the generator pulley rotates smoothly.

INSTALLATION

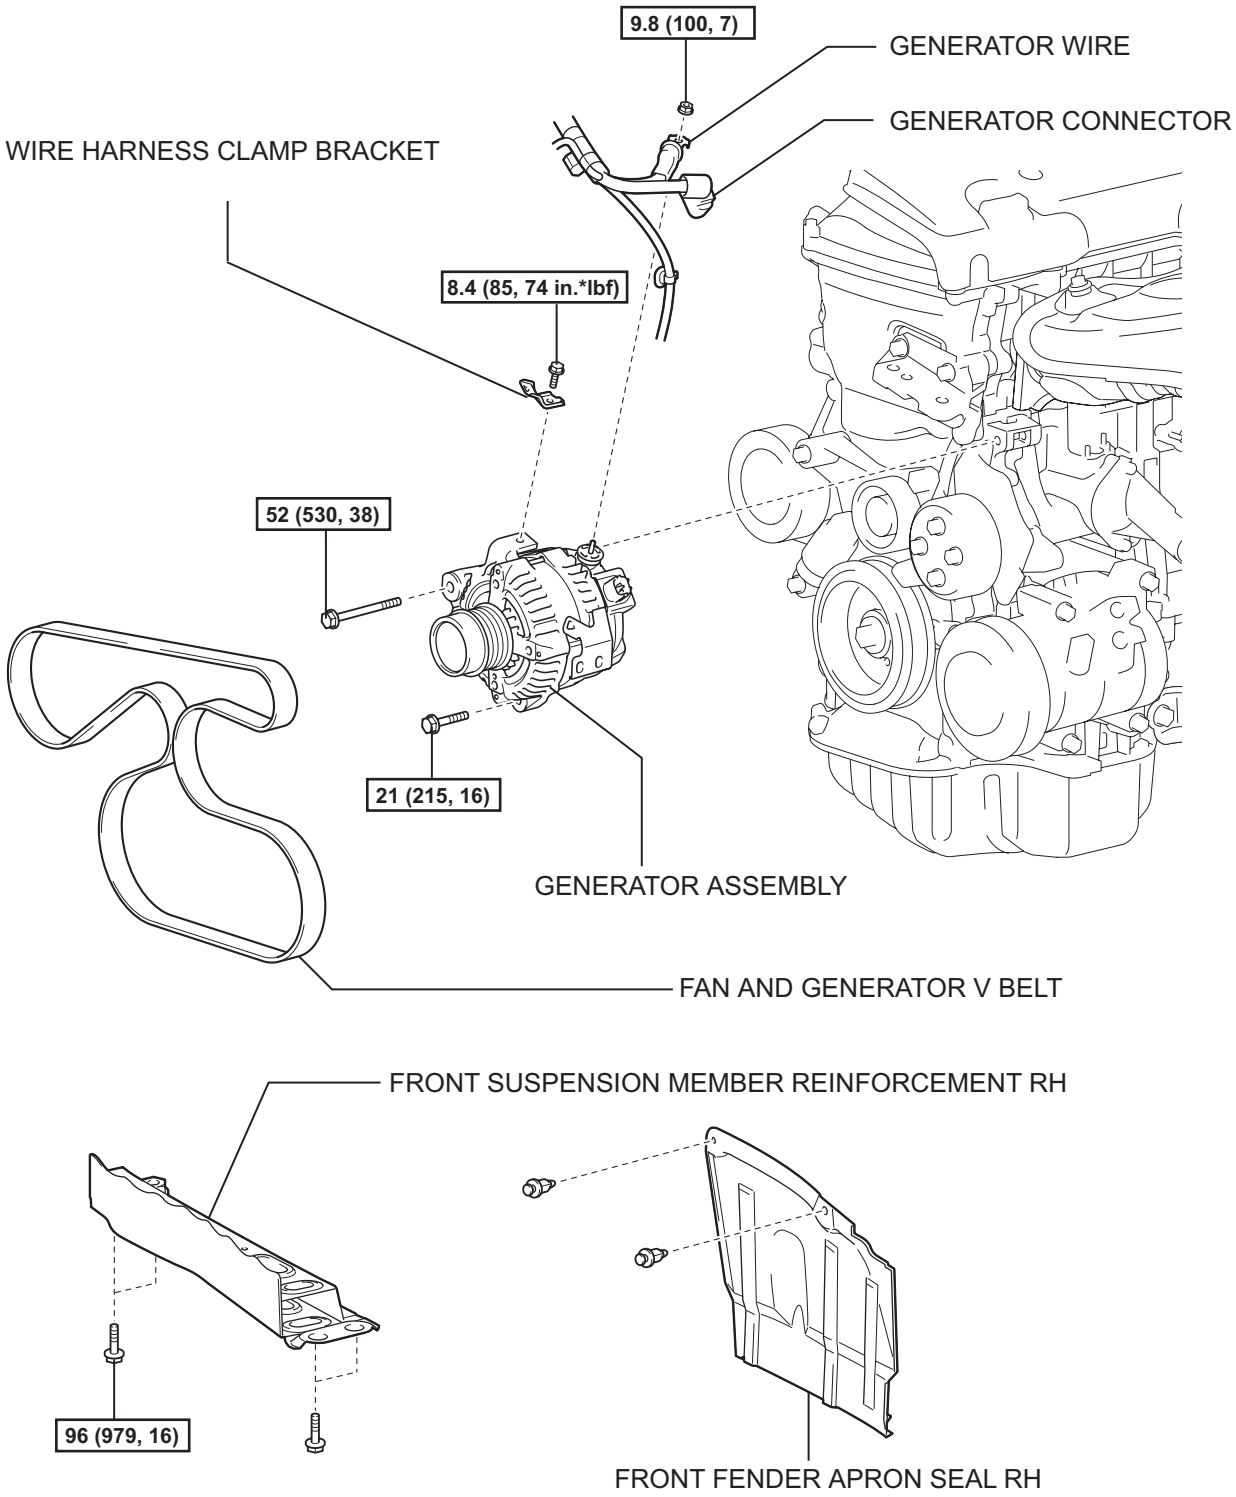


1. INSTALL GENERATOR ASSEMBLY

(a) Confirm that the wire harness of the crankshaft position sensor is secured to the wire harness clamp bracket through the back of the rib of the timing chain cover.

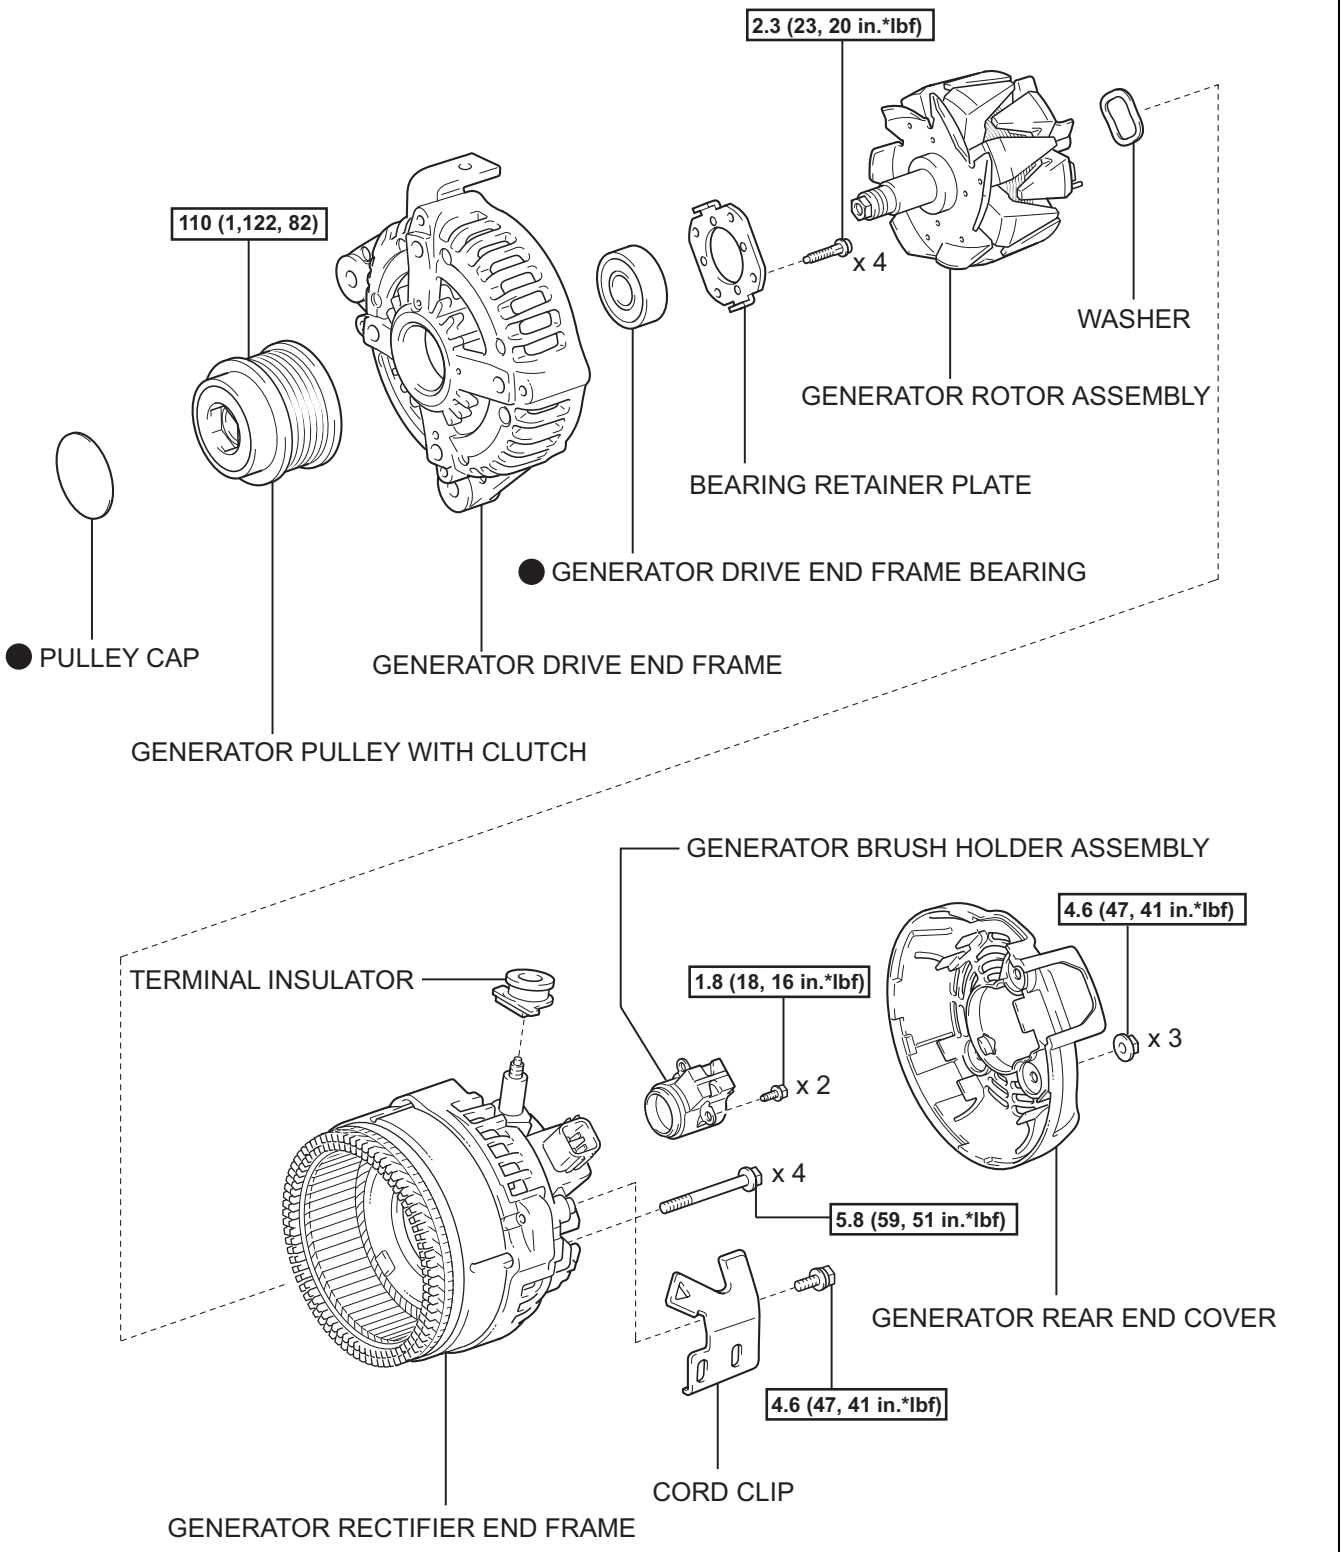
(b) Install the generator with the 2 bolts.
Torque: 21 N*m (215 kgf*cm, 16 ft.*lbf) for bolt A
52 N*m (530 kgf*cm, 38 ft.*lbf) for bolt B

(c) Install the wire harness clamp.
(d) Install the wire harness clamp bracket with the bolt.
Torque: 8.4 N*m (85 kgf*cm, 74 in.*lbf)
(e) Connect the generator wire with the nut.
Torque: 9.8 N*m (100 kgf*cm, 7 ft.*lbf)
(f) Install the terminal cap.
(g) Connect the generator connector.



2. INSTALL FAN AND GENERATOR V BELT

(a) Install the belt (see page EM-7).



3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

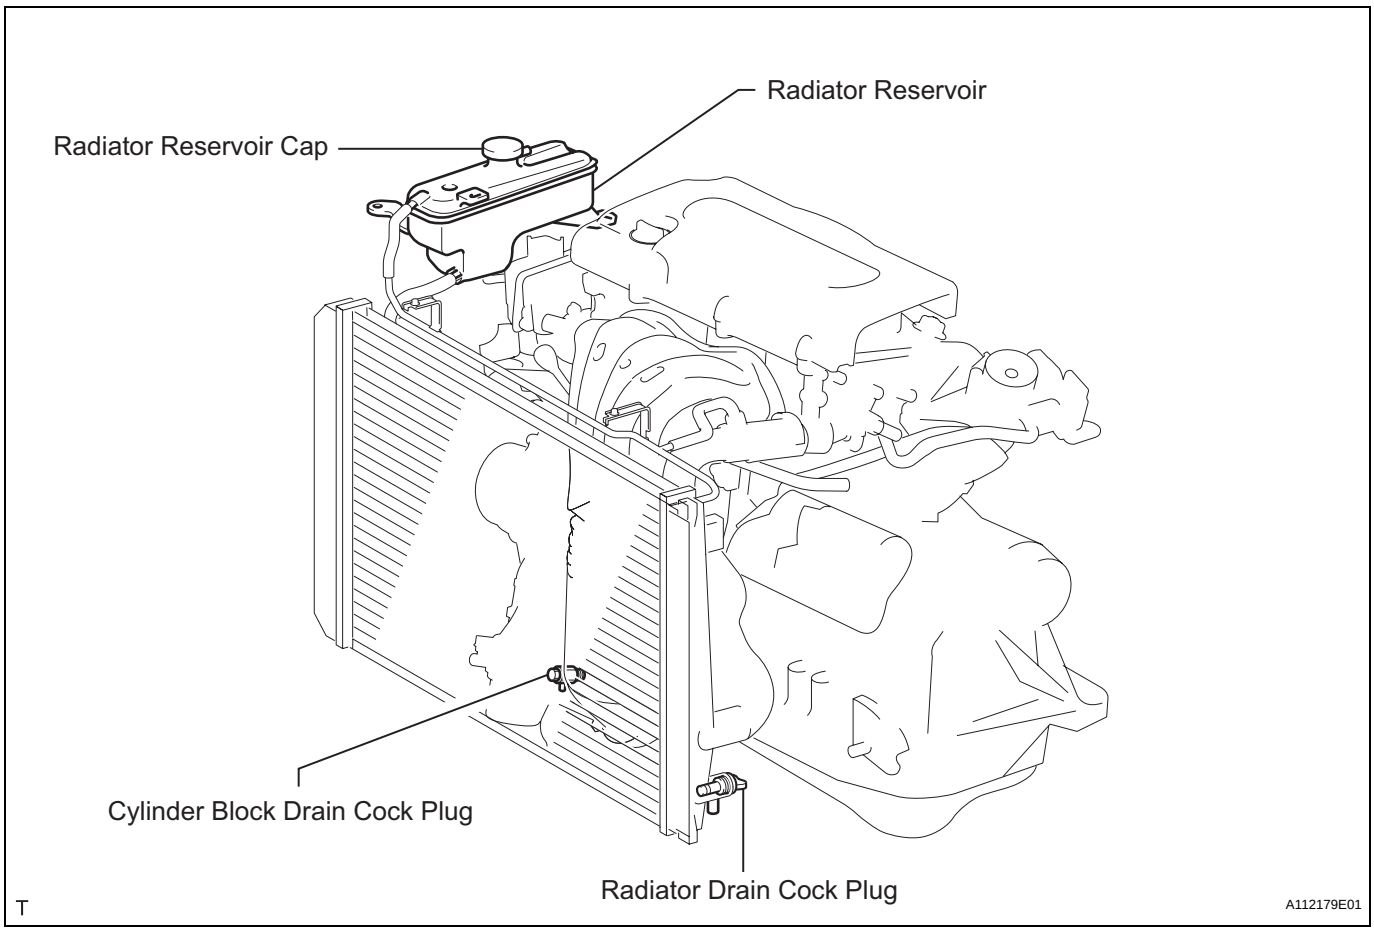
COOLANT

REPLACEMENT



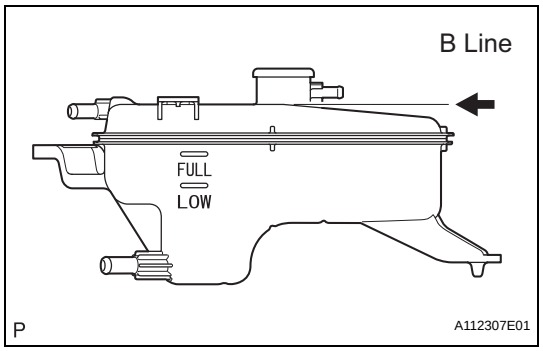
1. REMOVE NO. 1 ENGINE UNDER COVER

2. DRAIN ENGINE COOLANT

(a) Loosen the radiator drain cock plug.
HINT:
Collect the coolant in a container and dispose of it according to the regulations in your area.

(b) Remove the radiator reservoir cap.
CAUTION:
Do not remove the radiator reservoir cap while the engine and radiator are still hot.
Pressurized, hot engine coolant and steam may be released and cause serious burns.

(c) Loosen the cylinder block drain cock plug.



3. ADD ENGINE COOLANT

(a) Tighten the radiator drain cock plug by hand.

(b) Tighten the cylinder block drain cock plug.
Torque: 12.7 N*m (130 kgf*cm, 10 ft.*lbf)

(c) Add TOYOTA Super Long Life Coolant (SLLC) to the radiator reservoir filler opening.

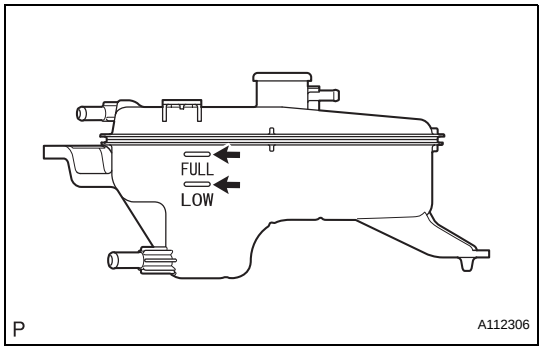
(d) Continue adding TOYOTA SLLC until it is filled to the B line at the base of the reservoir's filler neck.
HINT:
The B line is the lower edge of the inner wall of the filler neck.
Standard capacity:
6.8 liters (7.2 Us qts, 5.9 Imp. qts)
HINT:
TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).
NOTICE:
Never use water as a substitute for engine coolant.

(e) Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the level of the coolant. If the coolant level drops below the B line, add TOYOTA SLLC to the B line.

(f) Install the radiator reservoir cap.

(g) Start the engine and warm it up until the cooling fan operates.

(1) Set the air conditioning as follows while warming up the engine.



Item	Specified Condition
Manual Air Conditioning System	Fan speed: Any setting except OFF Temperature: Toward WARM Air conditioning switch: OFF
Automatic Air Conditioning System	Temperature: Toward MAX Air conditioning switch: OFF

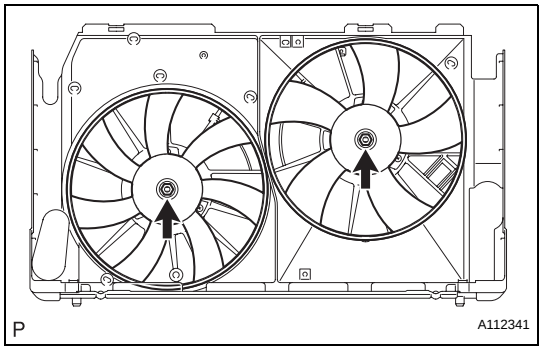
(2) Maintain the engine speed at 2,000 to 2,500 rpm and warm up the engine until the cooling fan operates.
NOTICE:
- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the B line.**

- **Run the engine at 2,000 rpm until the coolant level has stabilized.**

(h) Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.
CAUTION:
When pressing the radiator hoses:
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan.**

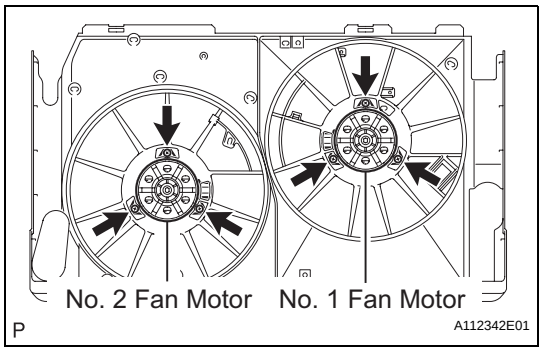
(i) Stop the engine and wait until the coolant cools down to ambient temperature.

(j) Check that the coolant level is between the FULL and LOW line.
If the coolant level is below the LOW line, repeat all of the procedures above.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and LOW line.



4. CHECK FOR ENGINE COOLANT LEAKS

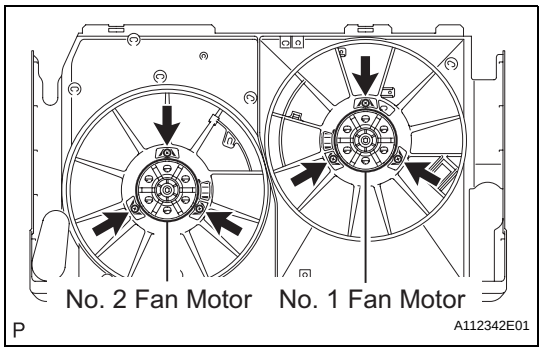
5. INSTALL NO. 1 ENGINE UNDER COVER



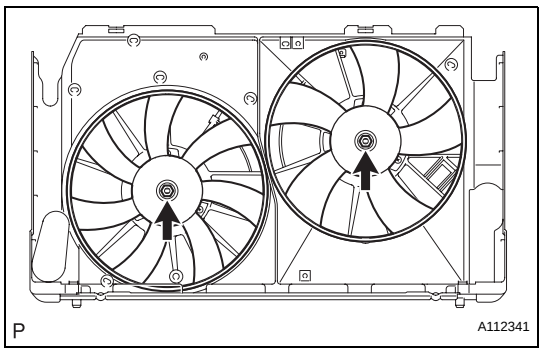
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE RADIATOR ASSEMBLY**
   (a) Remove the radiator (see page CO-29).

DISASSEMBLY



1. **REMOVE FAN**
   (a) Remove the 2 nuts and 2 fans.

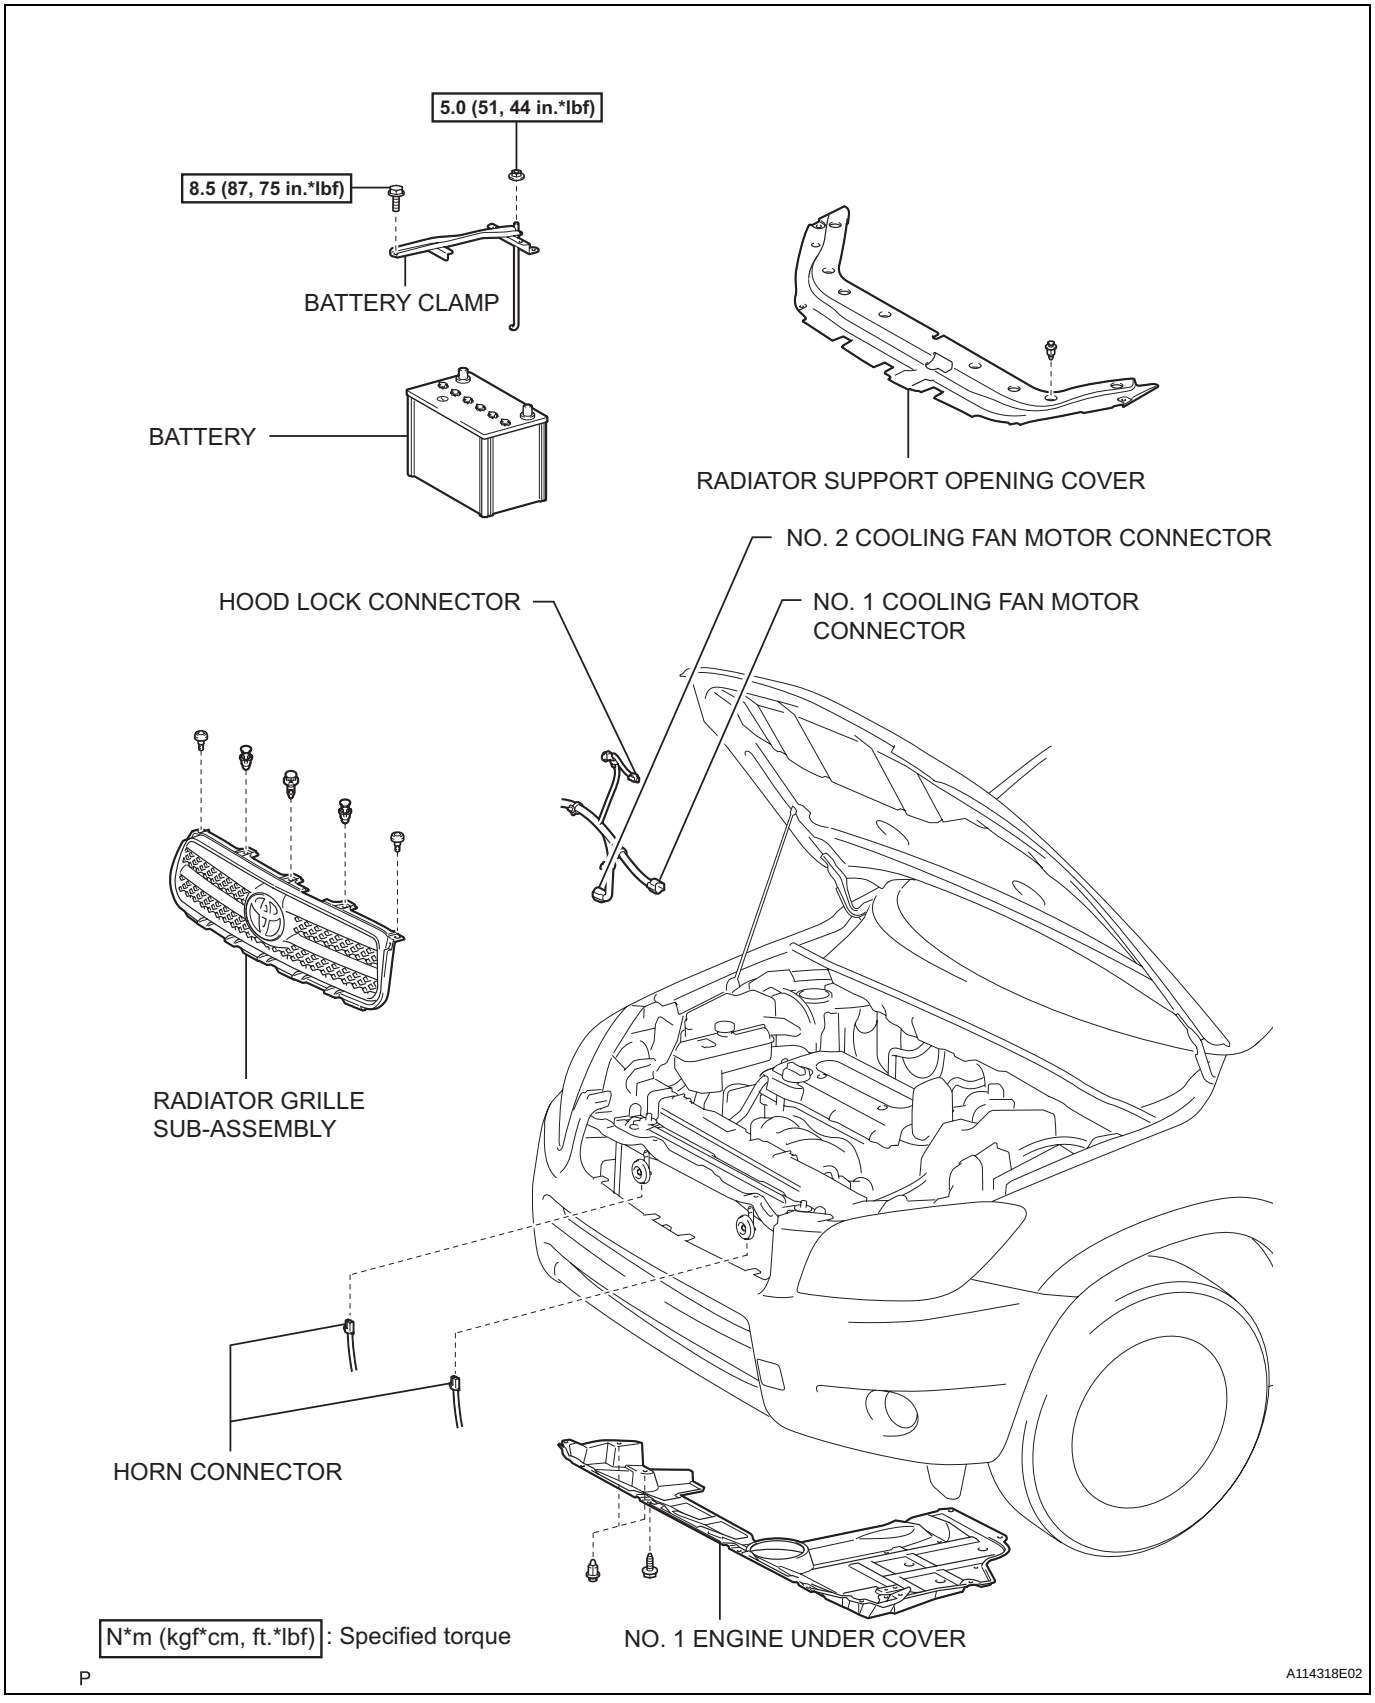


2. **REMOVE NO. 1 COOLING FAN MOTOR**
   (a) Remove the 3 screws and fan motor.
3. **REMOVE NO. 2 COOLING FAN MOTOR**
   (a) Remove the 3 screws and fan motor.

CO

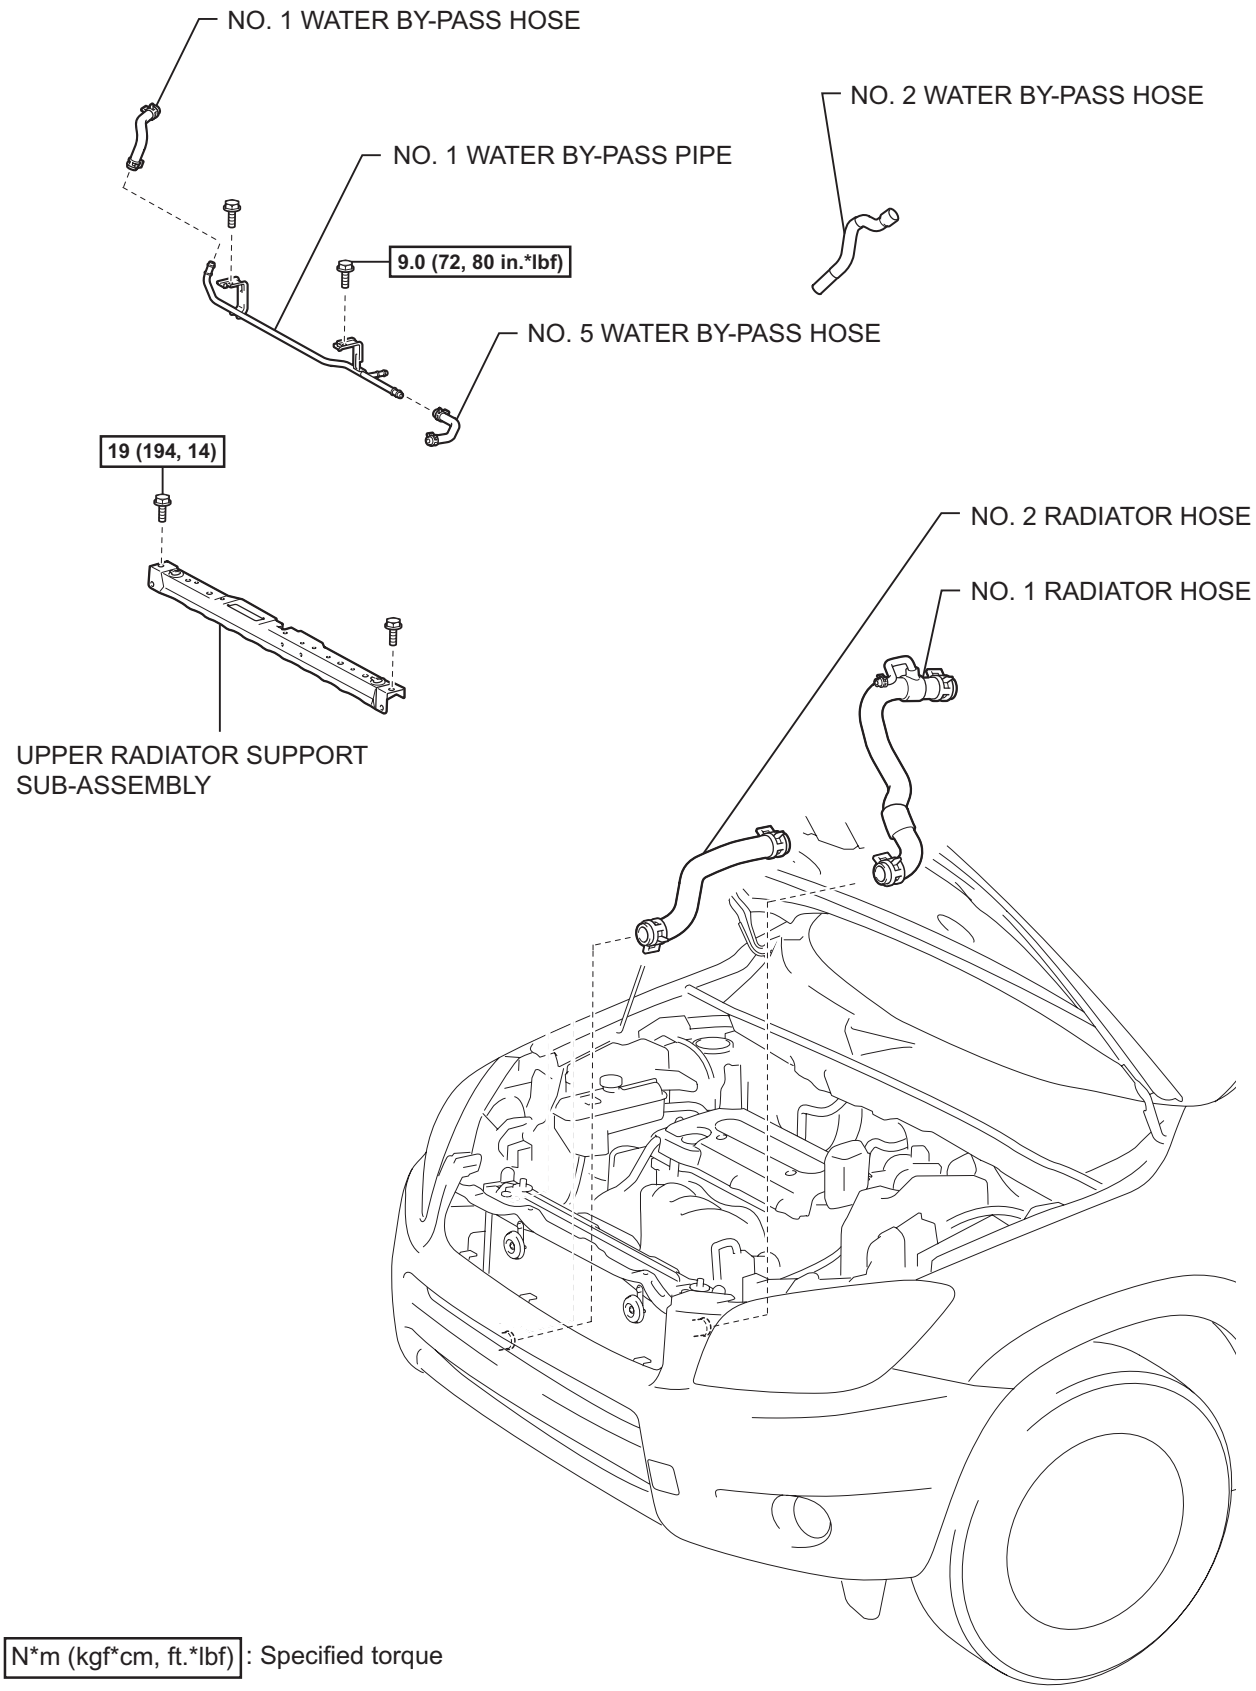
REASSEMBLY

1. **INSTALL NO. 2 COOLING FAN MOTOR**
   (a) Install the fan motor with the 3 screws.
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
2. **INSTALL NO. 1 COOLING FAN MOTOR**
   (a) Install the fan motor with the 3 screws.
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)



3. **INSTALL FAN**
   (a) Install the 2 fans with the 2 nuts.
   Torque: 6.3 N*m (64 kgf*cm, 55 in.*lbf)
   (b) Check the fan motor operation.

INSTALLATION



1. **INSTALL RADIATOR ASSEMBLY**
   (a) Install the radiator (see page CO-32).
2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
3. **ADD ENGINE COOLANT (See page CO-6)**
4. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**

ON-VEHICLE INSPECTION

1. INSPECT NO. 1 COOLING FAN MOTOR

(a) Disconnect the No. 1 fan connector.

(b) Connect the battery and ammeter to the No. 1 fan motor connector.

(c) Check that the No. 1 fan rotates smoothly, and then check the reading on the ammeter.

Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
B, C	160 W	At 20°C (68°F)	11.7 to 14.7 A

HINT:

Refer to the illustration for the indication mark location.

If the result is not as specified, replace the No. 1 cooling fan motor.

(d) Reconnect the No. 1 fan motor connector.

2. INSPECT NO. 2 COOLING FAN MOTOR

(a) Disconnect the No. 2 fan connector.

(b) Connect the battery and ammeter to the No. 2 fan motor connector.

(c) Check that the No. 2 fan rotates smoothly, and then check the reading on the ammeter.

Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
B	120 W	At 20°C (68°F)	8.4 to 10.4 A
C	160 W	At 20°C (68°F)	11.7 to 14.7 A

HINT:

Refer to the illustration for the indication mark location.

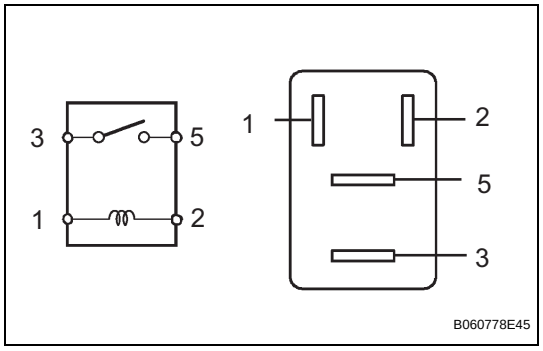
If the result is not as specified, replace the No. 2 cooling fan motor.

(d) Reconnect the No. 2 fan motor connector.

CO

COOLING FAN RELAY

ON-VEHICLE INSPECTION



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

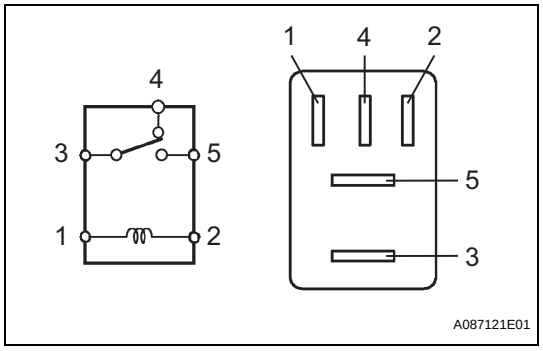
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE ENGINE ROOM NO. 2 RELAY BLOCK COVER

3. INSPECT NO. 1 FAN RELAY (Marking: FAN NO. 1)

(a) Remove the relay from the engine room No. 2 relay block.

(b) Measure the resistance of the relay.



Standard resistance

Tester Connection	Specified Condition
3 - 5	10 Ω or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

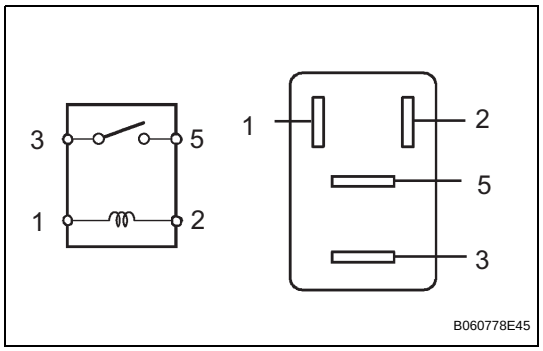
If the result is not as specified, replace the relay.

(c) Install the relay.

4. INSPECT NO. 2 FAN RELAY (Marking: FAN NO. 2)

(a) Remove the relay from the engine room No. 2 relay block.

(b) Measure the resistance of the relay.



Standard resistance

Tester Connection	Specified Condition
3 - 4	Below 1 Ω
3 - 5	10 Ω or higher
3 - 4	10 Ω or higher (when battery voltage is applied to terminals 1 and 2)
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

(c) Install the relay.

5. INSPECT NO. 3 FAN RELAY (Marking: FAN NO. 3)

(a) Remove the relay from the engine room No. 2 relay block.

(b) Measure the resistance of the relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 Ω or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

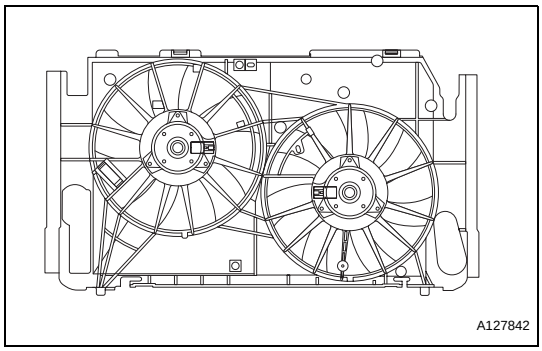
If the result is not as specified, replace the relay.

CO

(c) Install the relay.

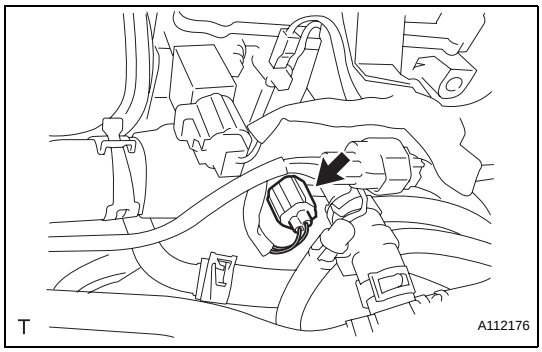
6. **INSTALL ENGINE ROOM NO. 2 RELAY BLOCK COVER**

7. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**



ON-VEHICLE INSPECTION

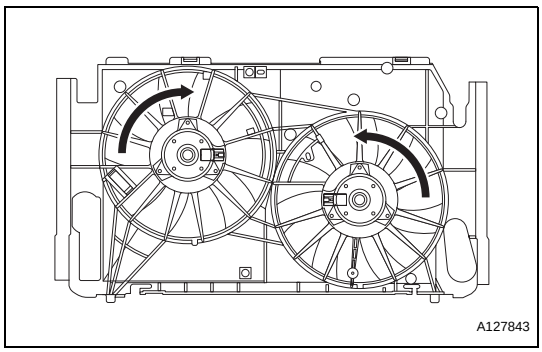
HINT:
It is normal for the cooling fan to sometimes rotate when the ignition switch is turned from ACC to ON.



1. CHECK COOLING FAN OPERATION AT LOW TEMPERATURES (Below 94°C (201°F))

(a) Turn the ignition switch ON with the A/C switch OFF.

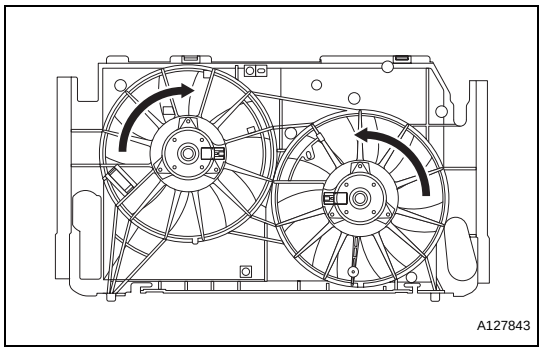
(b) Check that the cooling fan stops.
If it does not, check the cooling fan relays and engine coolant temperature sensor, and then check for disconnection of the connector or a wire break between the cooling fan relay and engine coolant temperature sensor.



(c) Disconnect the engine coolant temperature sensor connector.

(d) Check that the cooling fan rotates.
If it does not, check the fuses, cooling fan relays, ECM and cooling fan, and then check for an open circuit between the cooling fan relay and engine coolant temperature sensor.

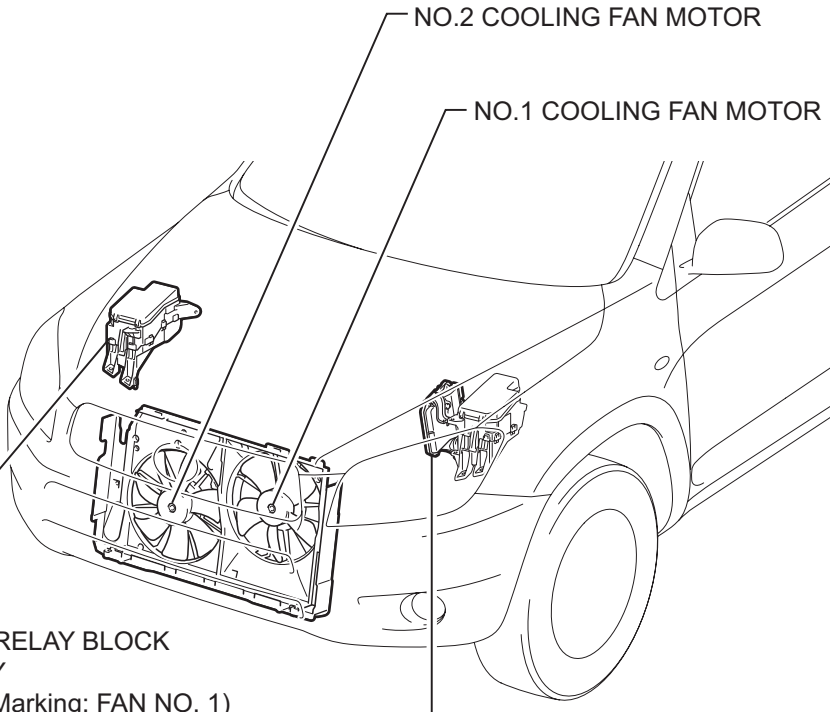
(e) Reconnect the engine coolant temperature sensor connector.



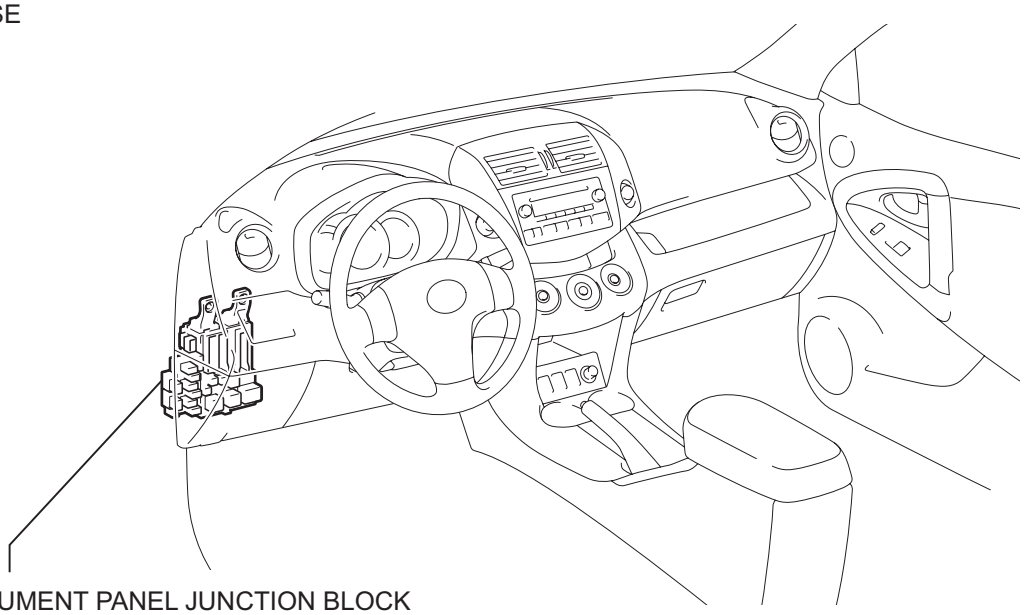
2. CHECK COOLING FAN OPERATION AT HIGH TEMPERATURES (Above 96°C (205°F))

(a) Start the engine, and then raise the coolant temperature to above 96°C (205°F).
HINT:
Coolant temperature is the value detected by the engine coolant temperature sensor on the cylinder head.

(b) Check that the A/C switch is OFF.



CO



(c) Check that the cooling fan rotates.
If it does not, check the engine coolant temperature sensor, cooling fan, harness or connector.

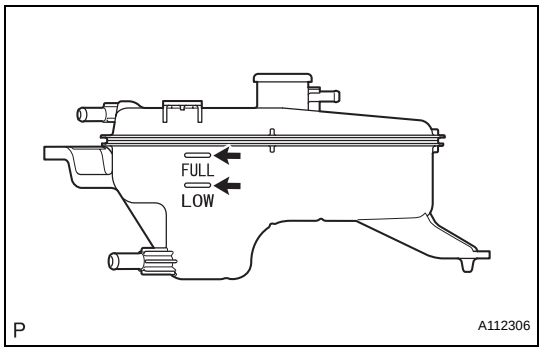
COOLING SYSTEM

ON-VEHICLE INSPECTION

1. CHECK COOLING SYSTEM FOR LEAKS

(a) Remove the radiator reservoir cap.

CAUTION:
To avoid the danger of being burned, do not remove the radiator reservoir cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator reservoir.



(b) Fill the radiator and reservoir with coolant, and then attach a radiator cap tester.

(c) Warm up the engine.

(d) Pump the radiator cap tester to 118 kPa (1.2 kgf/cm^2, 17.1 psi), and then check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leakage.
If there are no signs of external coolant leaks, check the heater core, cylinder block and head.

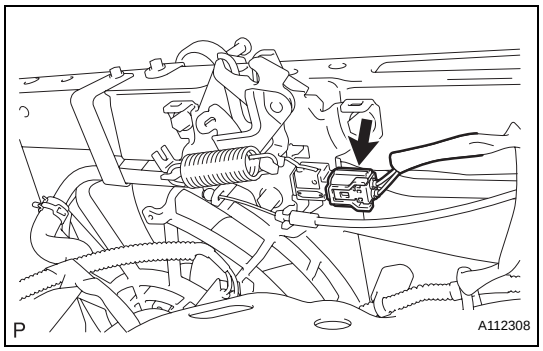
(e) Reinstall the radiator reservoir cap.

2. CHECK ENGINE COOLANT LEVEL OF RESERVOIR

(a) The engine coolant should be between the LOW and FULL lines when the engine is cold.
If low, check for leakage and add TOYOTA Super Long Life Coolant (SLLC) or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology up to the FULL line.

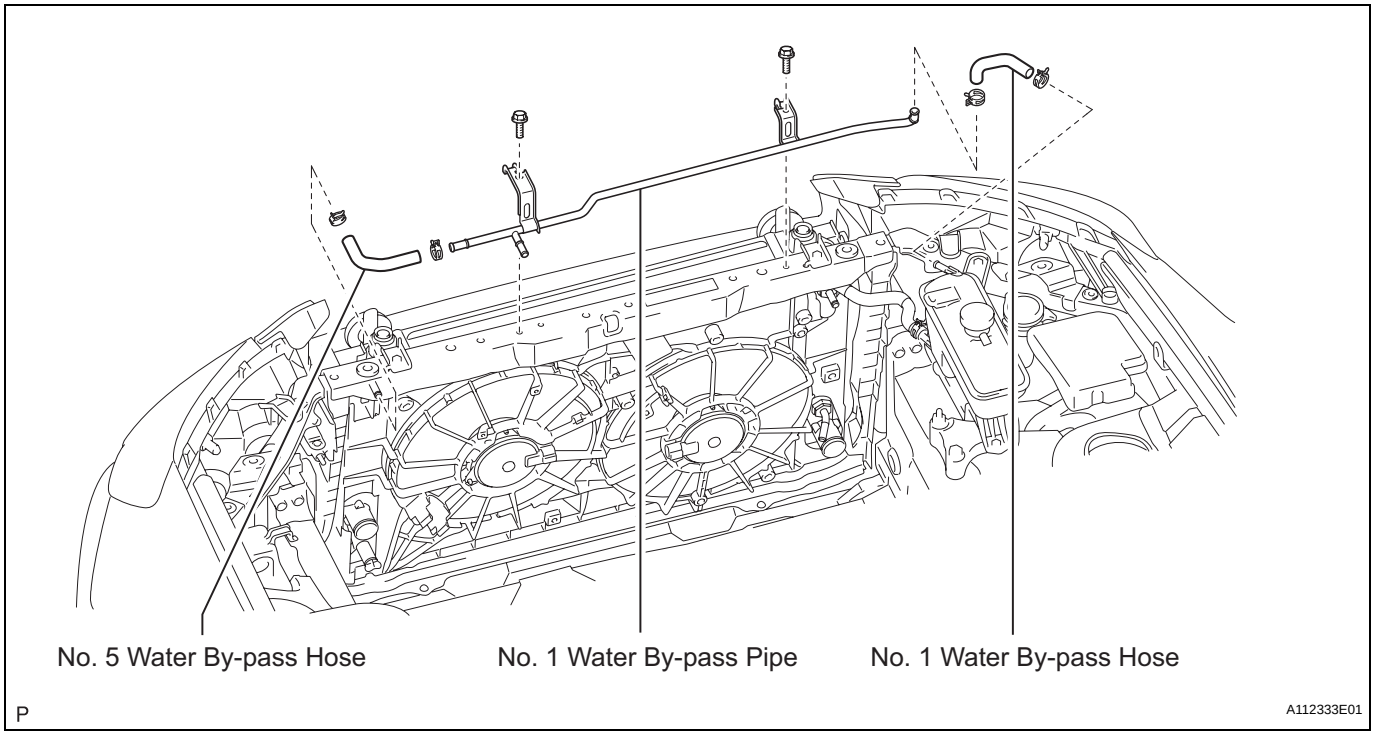
3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator reservoir cap.



CAUTION:
To avoid the danger of being burned, do not remove the radiator reservoir cap while the engine and radiator are still hot. Thermal expansion will cause hot engine coolant and steam to blow out from the radiator.

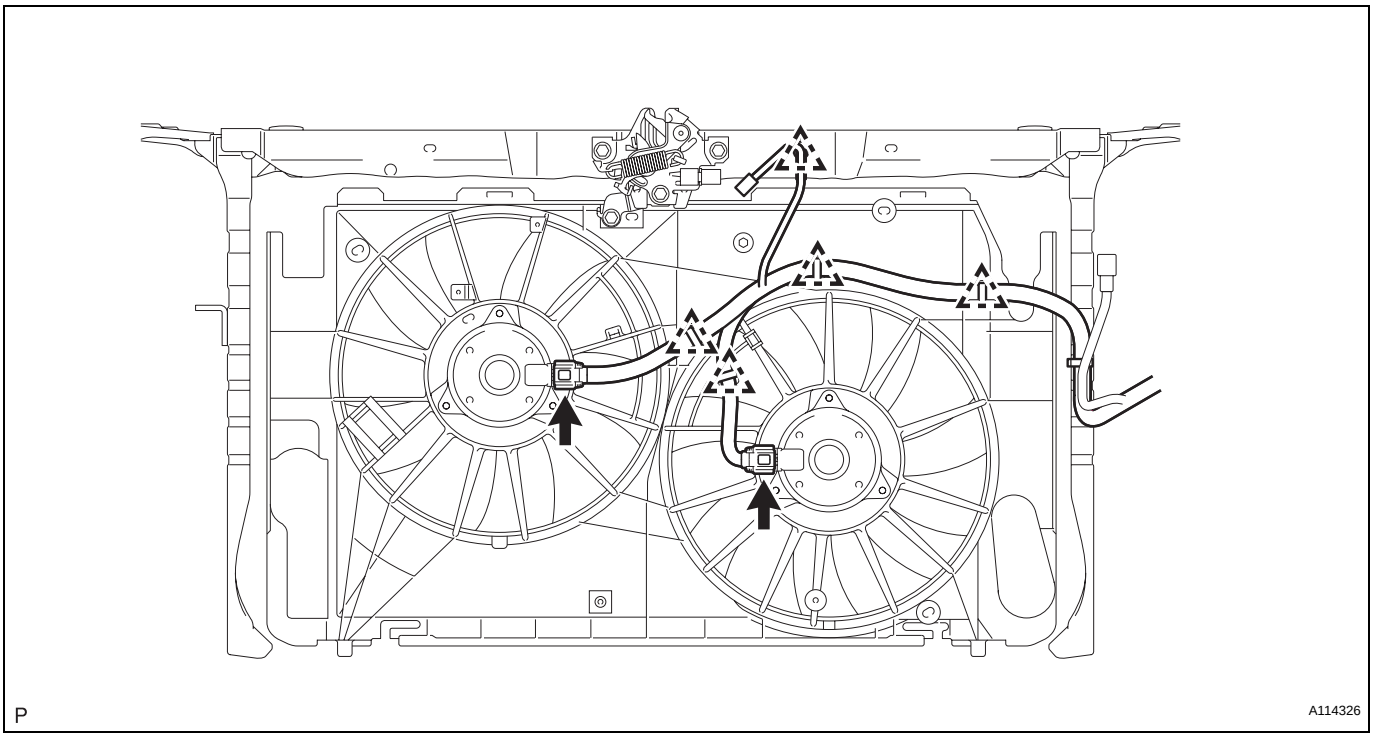
(b) Check for any excessive deposits of rust or scale around the radiator reservoir cap and radiator filler hole; the coolant should be free of oil.
If excessively dirty, replace the coolant.



(c) Install the radiator reservoir cap.

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE RADIATOR SUPPORT OPENING COVER**
3. **REMOVE BATTERY CLAMP**
   (a) Remove the bolt, nut and clamp.
4. **REMOVE BATTERY**
5. **REMOVE NO. 1 ENGINE UNDER COVER**
6. **DRAIN ENGINE COOLANT (See page CO-6)**
7. **REMOVE RADIATOR GRILLE SUB-ASSEMBLY (See page ET-6)**
8. **DISCONNECT HOOD LOCK SWITCH CONNECTOR**

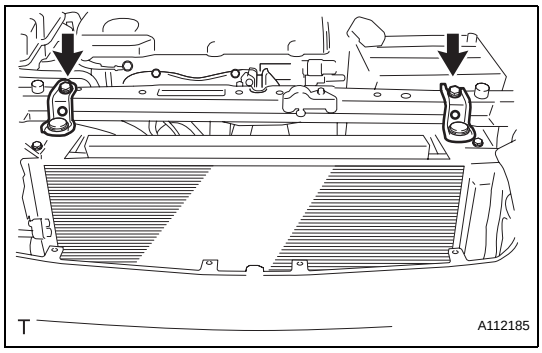


9. **DISCONNECT NO. 1 WATER BY-PASS HOSE**
   (a) Disconnect the hose from the radiator reservoir.
10. **DISCONNECT NO. 5 WATER BY-PASS HOSE**
    (a) Disconnect the hose from the radiator.
11. **REMOVE NO. 1 WATER BY-PASS PIPE**
    (a) Disconnect the pipe from the No. 1 radiator hose.
    (b) Remove the 2 bolts and the pipe.

12. **DISCONNECT COOLING FAN MOTOR HARNESS**
    (a) Disconnect the 2 fan motor connectors from the 2 fan motors.

CO

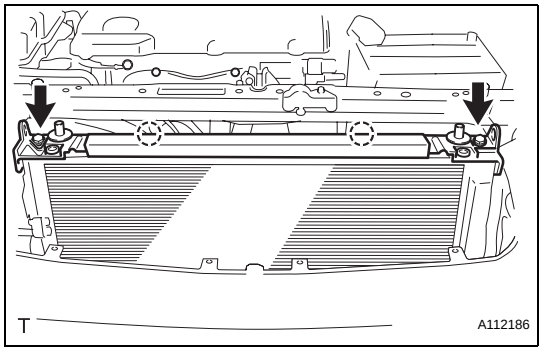
(b) Detach the 5 harness clamps from the fan shroud and upper radiator support.



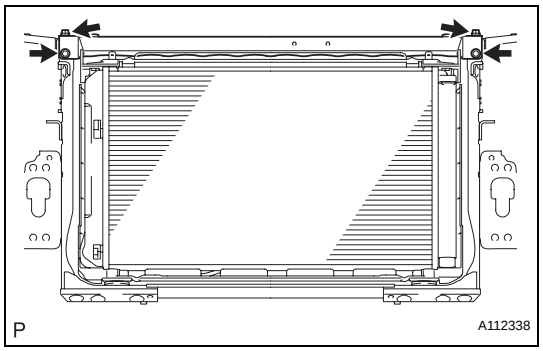
13. DISCONNECT HORN CONNECTOR

(a) Disconnect the 2 horn connectors.

14. REMOVE UPPER RADIATOR SUPPORT BRACKET



(a) Remove the 2 bolts and the 2 upper radiator support brackets.



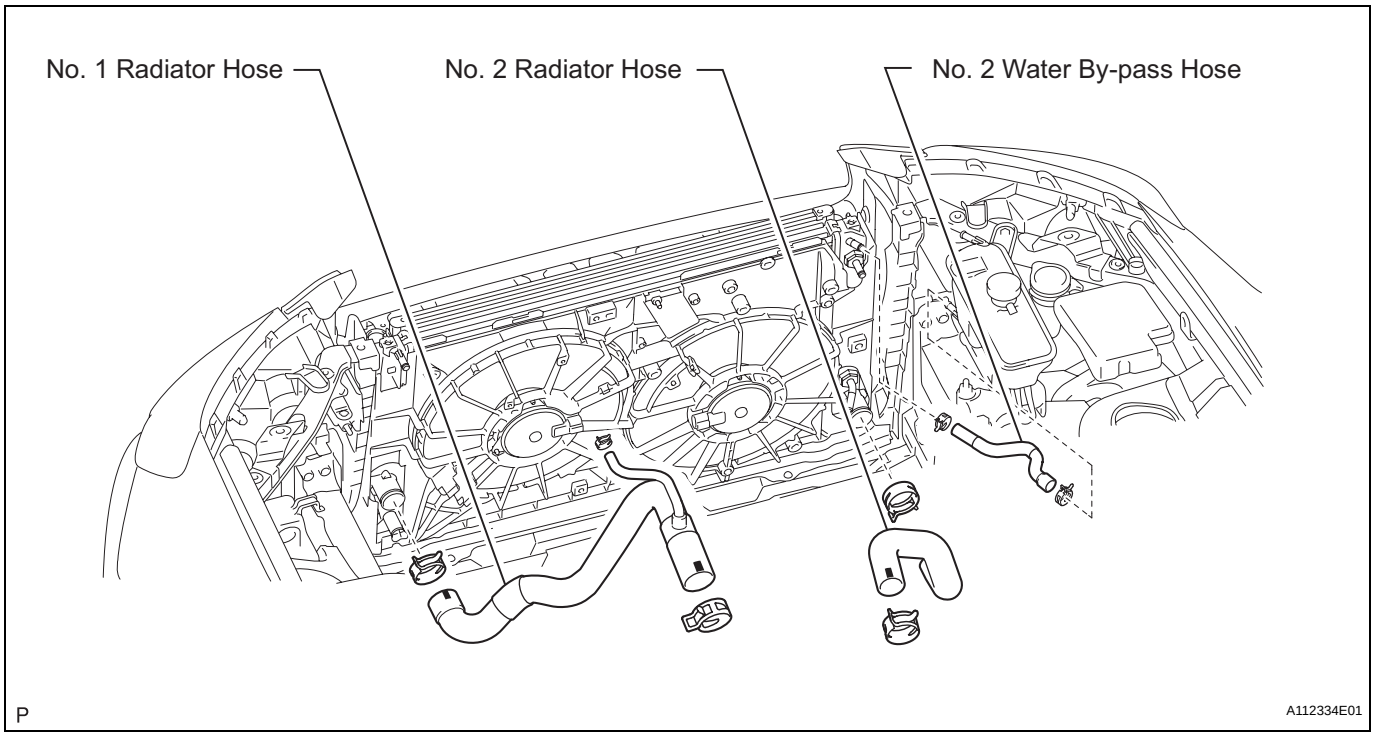
15. REMOVE NO. 2 FAN SHROUD

(a) Remove the 2 bolts.

(b) Detach the 2 claws and No. 2 shroud.

CO

16. REMOVE UPPER RADIATOR SUPPORT SUB-ASSEMBLY



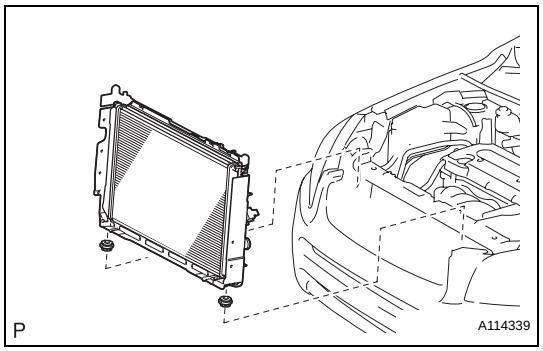
(a) Remove the 4 bolts and upper radiator support with hood lock.

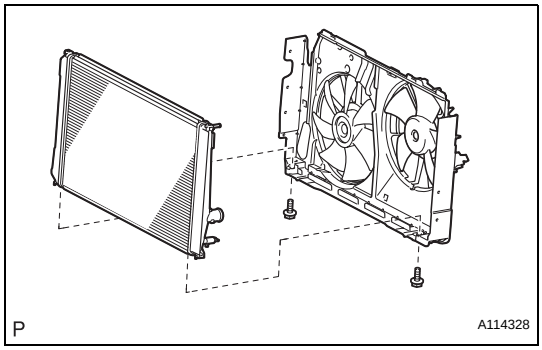
17. DISCONNECT NO. 1 RADIATOR HOSE

18. DISCONNECT NO. 2 RADIATOR HOSE

19. DISCONNECT NO. 2 WATER BY-PASS HOSE

Disconnect the by-pass hose from the radiator reservoir and radiator.



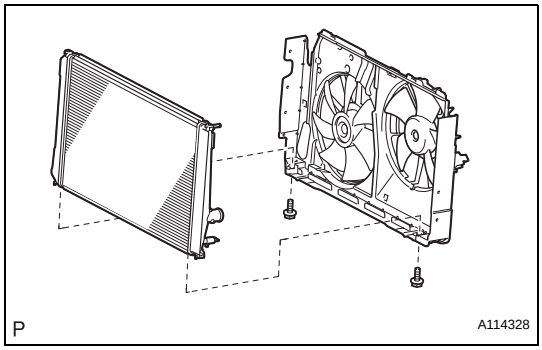


CO

20. REMOVE RADIATOR ASSEMBLY

(a) Separate the cooler condenser from the radiator.
HINT:
After detaching the condenser, make sure that all 4 fan shroud cushions are present.

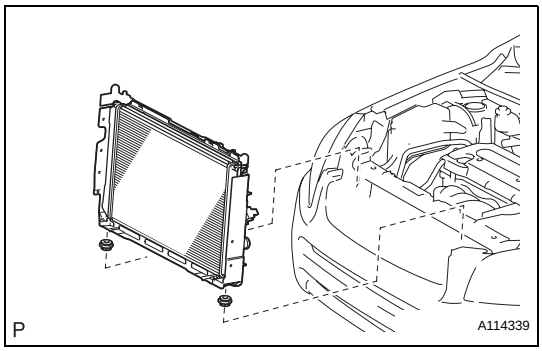
(b) Remove the radiator with the 2 radiator support lowers.
HINT:
After detaching the radiator, make sure that both radiator support lowers are present.



21. REMOVE FAN SHROUD WITH COOLING FAN

(a) Remove the 2 bolts and radiator from the fan shroud.

INSTALLATION

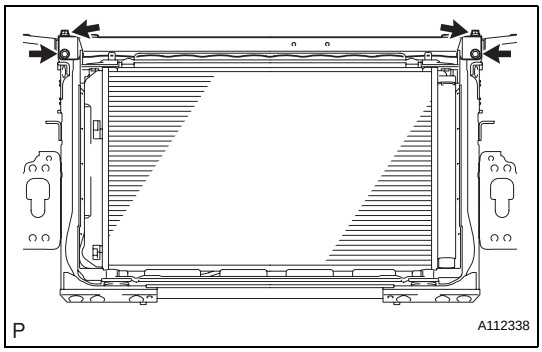


1. INSTALL FAN SHROUD WITH COOLING FAN

(a) Install the fan shroud with cooling fan with the 2 bolts to the radiator.
Torque: 10.5 N*m (107 kgf*cm, 8 ft.*lbf)

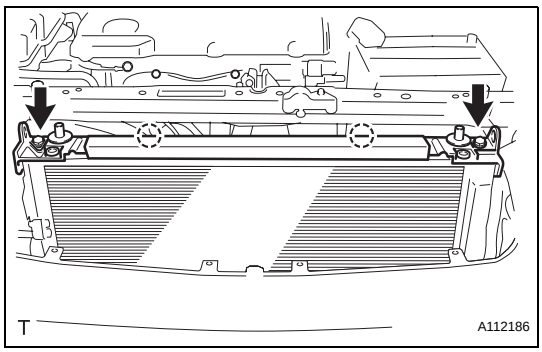
2. INSTALL RADIATOR ASSEMBLY

(a) Install the 4 fan shroud cushions to the cooler condenser.



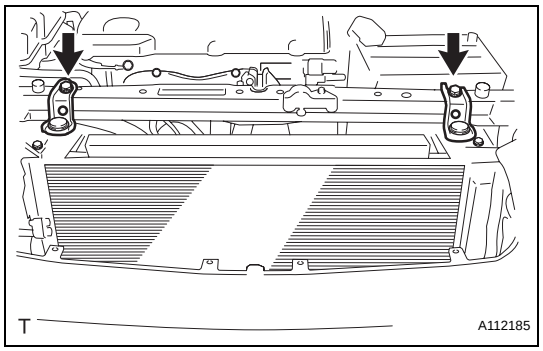
(b) Set the cooler condenser to the fan shroud.

(c) Install the 2 radiator support lower cushions to the fan shroud.



(d) Install the radiator with cooler condenser and fan shroud to the radiator support lower.

CO



3. INSTALL UPPER RADIATOR SUPPORT SUB-ASSEMBLY

(a) Install the upper radiator support with the 4 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

4. INSTALL NO. 2 FAN SHROUD

(a) Attach the 2 claws to install the No. 2 fan shroud and install the 2 bolts.
Torque: 10.5 N*m (107 kgf*cm, 8 ft.*lbf)

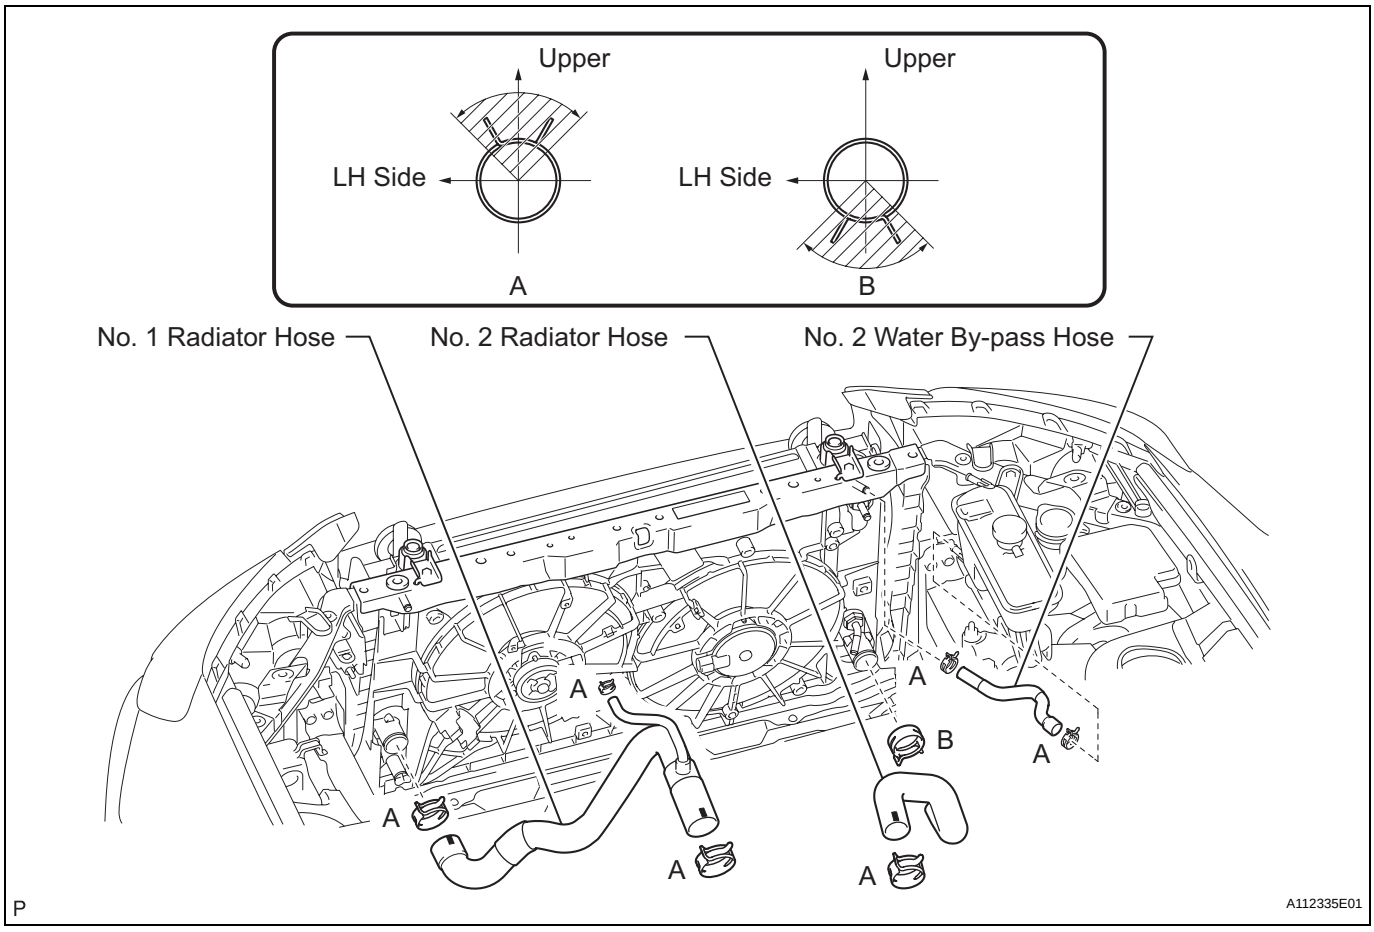
5. INSTALL UPPER RADIATOR SUPPORT BRACKET

(a) Install the bracket with the 2 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

6. CONNECT HORN CONNECTOR

(a) Connect the 2 horn connectors.

7. CONNECT NO. 2 WATER BY-PASS HOSE

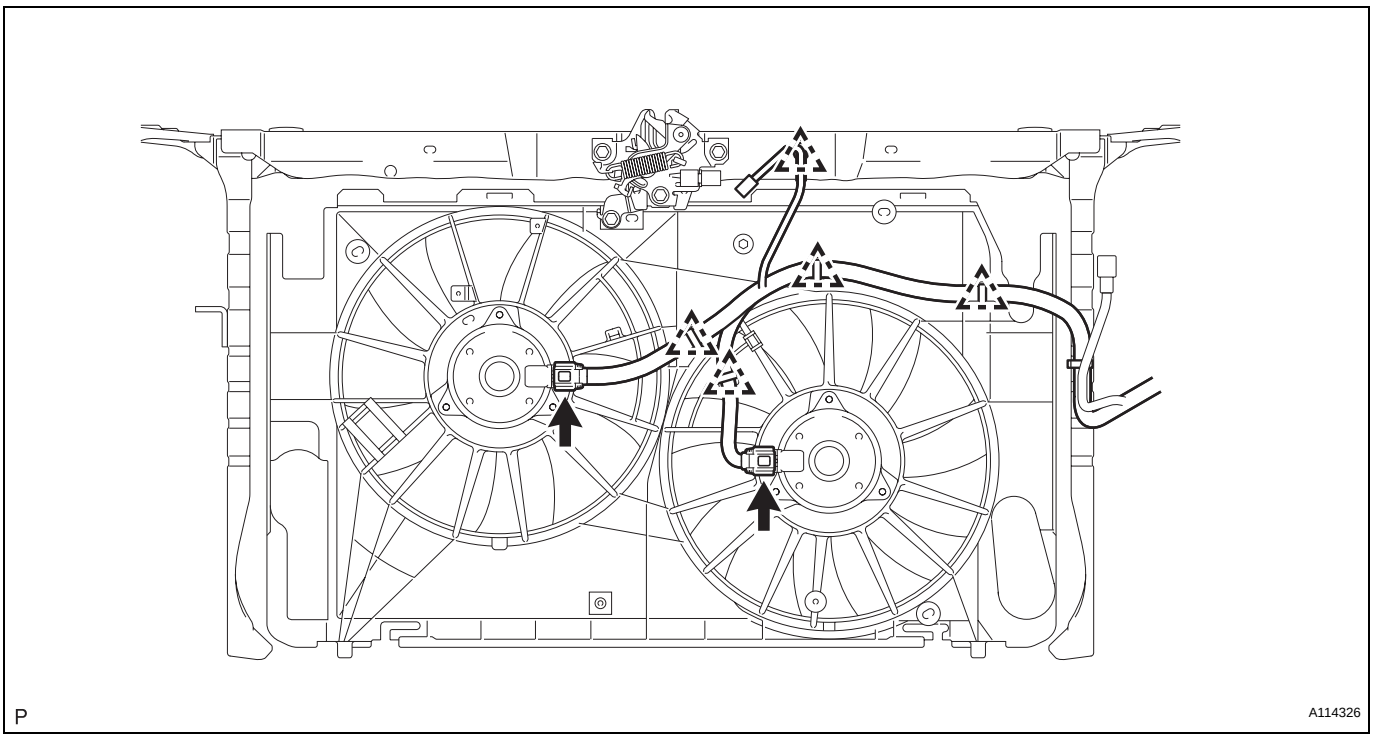


(a) Connect the by-pass hose to the radiator and radiator reservoir.
HINT:
The direction of the hose clamp is indicated in the illustration.

8. CONNECT NO. 2 RADIATOR HOSE

HINT:
The direction of the hose clamp is indicated in the illustration.

9. CONNECT NO. 1 RADIATOR HOSE



HINT:
The direction of the hose clamp is indicated in the illustration.

10. CONNECT COOLING FAN MOTOR HARNESS

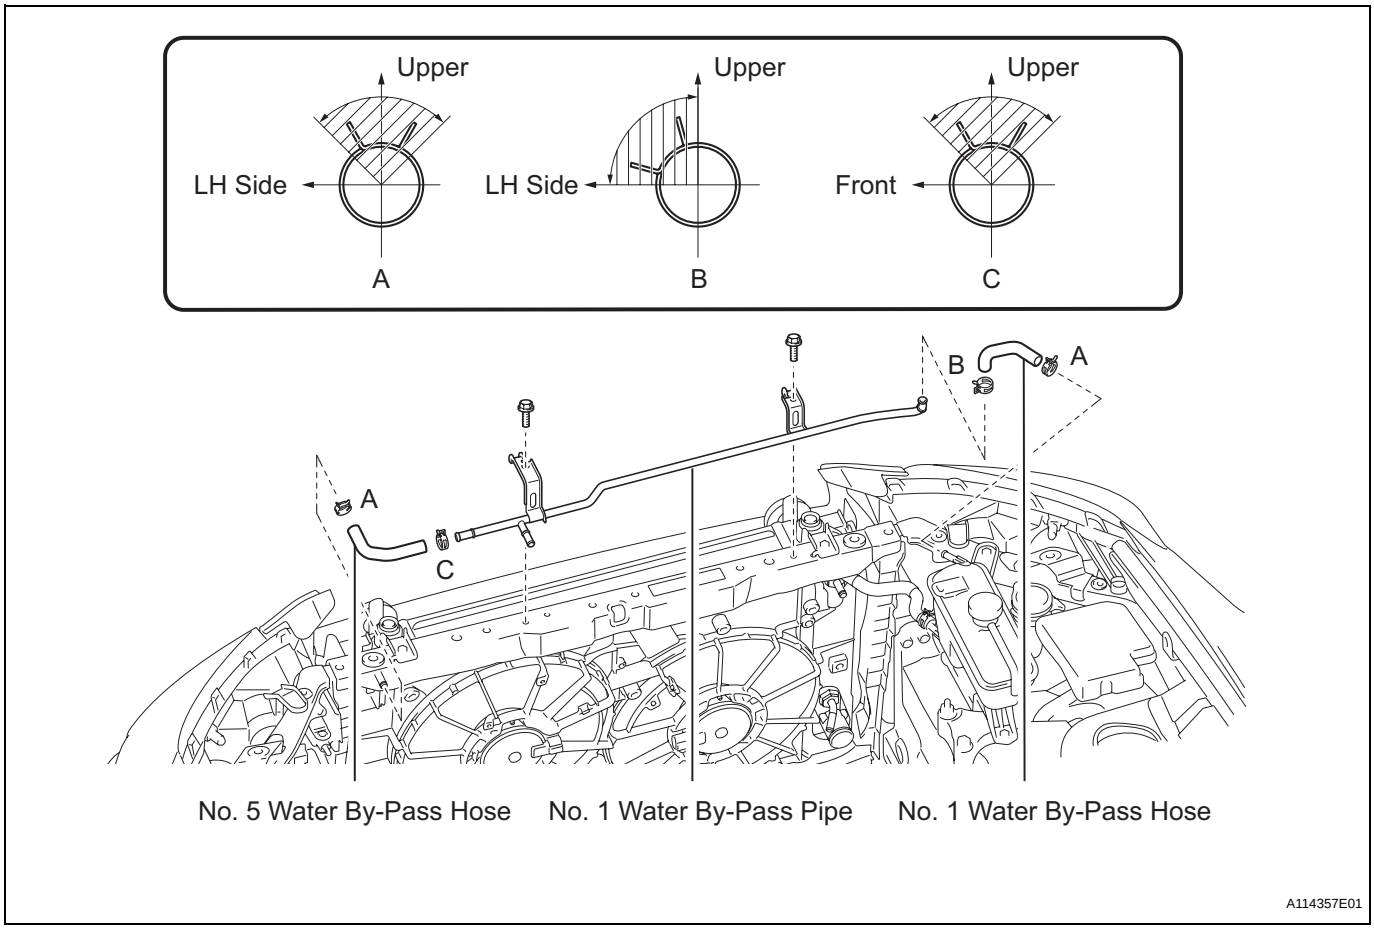
(a) Attach the harness with the 5 clamps.

(b) Connect the 2 fan motor connectors.

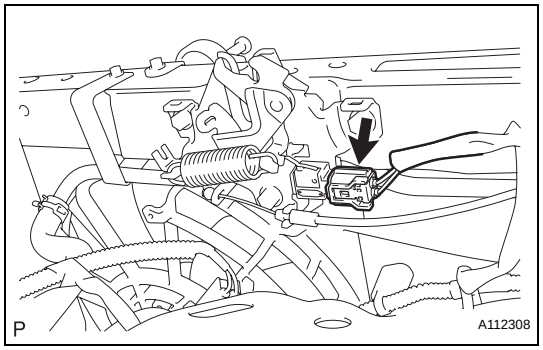
11. INSTALL NO. 1 WATER BY-PASS PIPE

(a) Install the by-pass pipe with the 2 bolts to the upper radiator support.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

(b) Connect the No. 1 radiator hose to the pipe.
HINT:
The direction of the hose clamp is indicated in the lustration.



12. CONNECT NO. 5 WATER BY-PASS HOSE



(a) Connect the by-pass hose to the radiator.
HINT:
The direction of the hose clamp is indicated in the lustration.

13. CONNECT NO. 1 WATER BY-PASS HOSE

(a) Connect the by-pass hose to the radiator and radiator reservoir.
HINT:
The direction of the hose clamp is indicated in the illustration.

CO

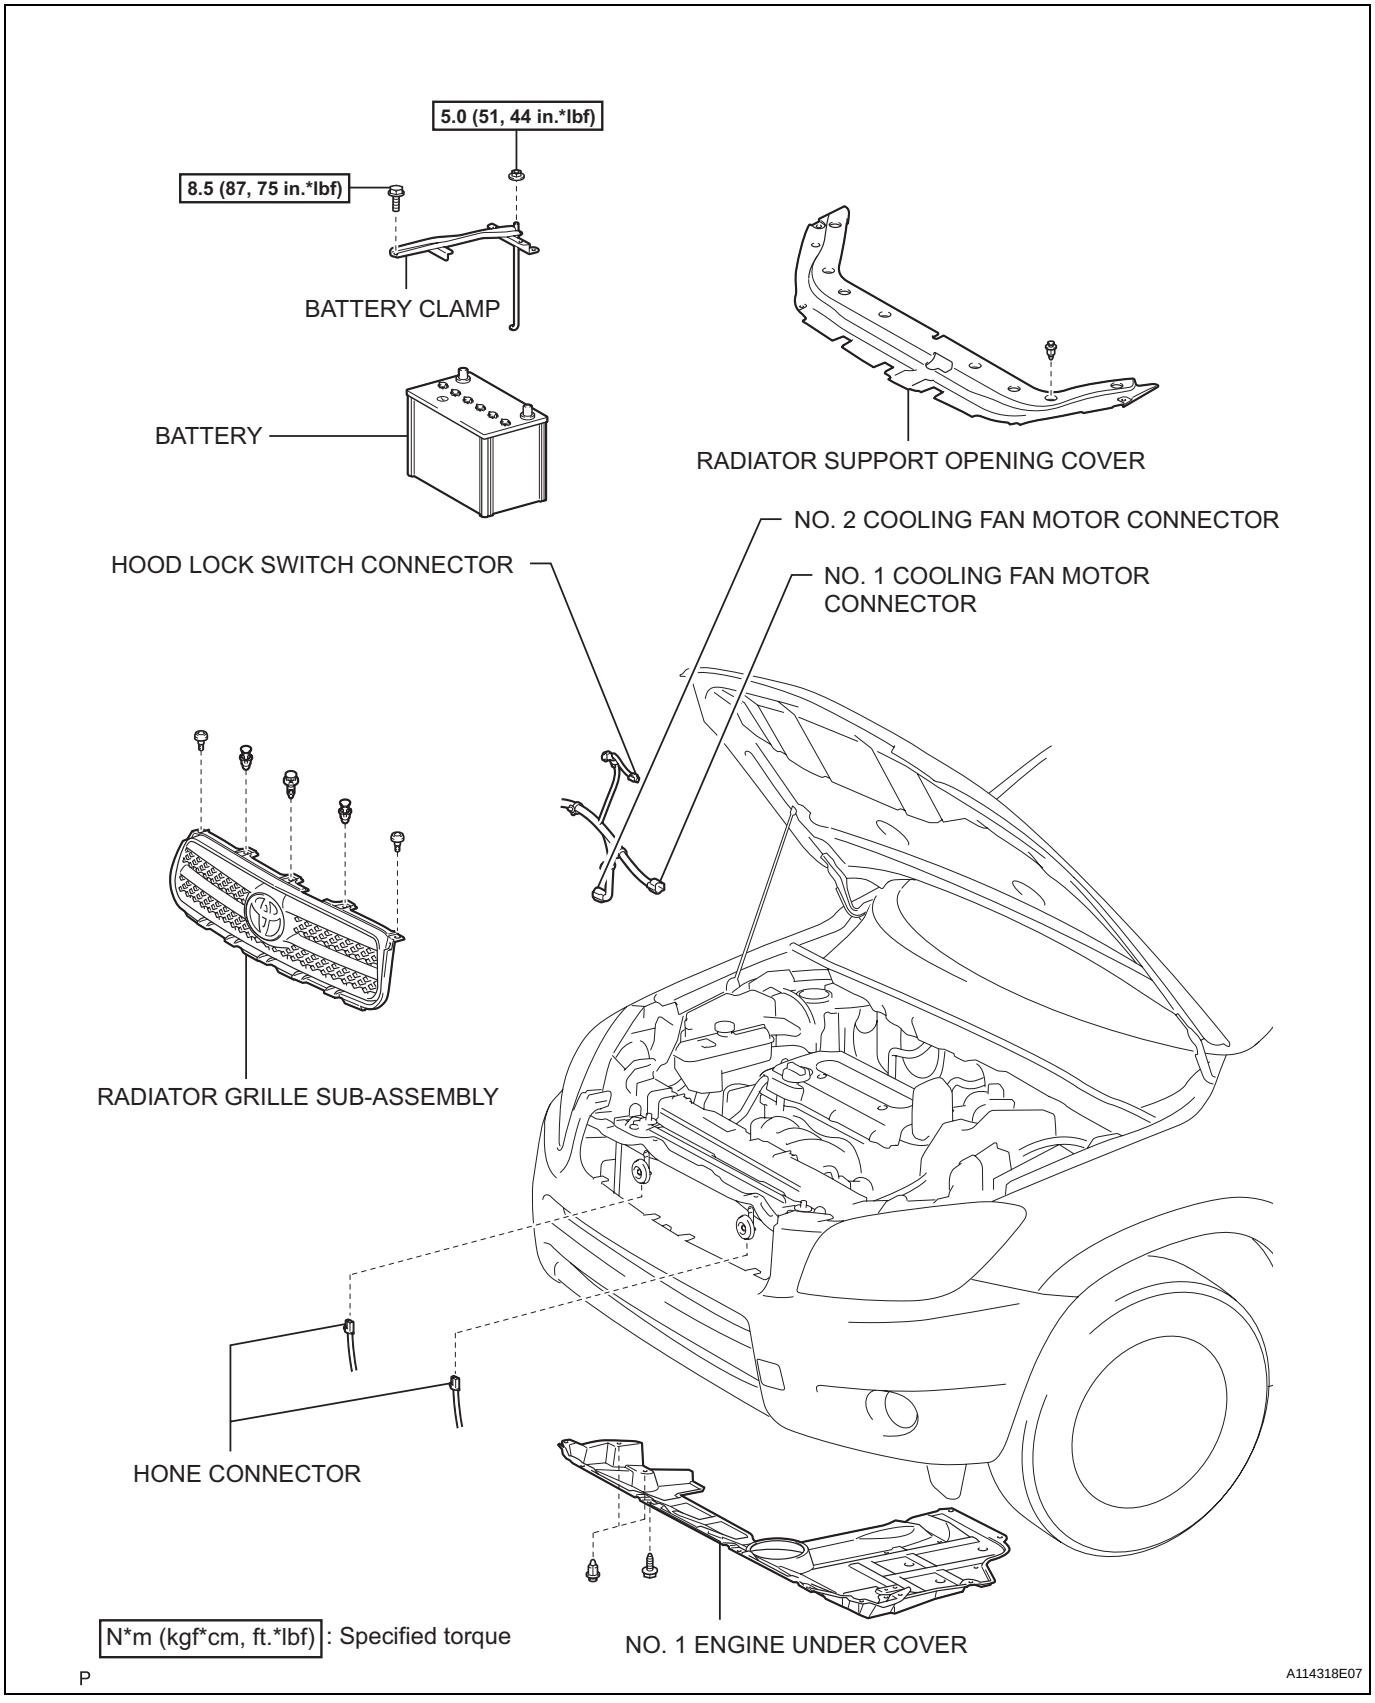
14. **CONNECT HOOD LOCK SWITCH CONNECTOR**

15. **INSTALL RADIATOR GRILLE SUB-ASSEMBLY (See page ET-10)**

16. **INSTALL BATTERY**

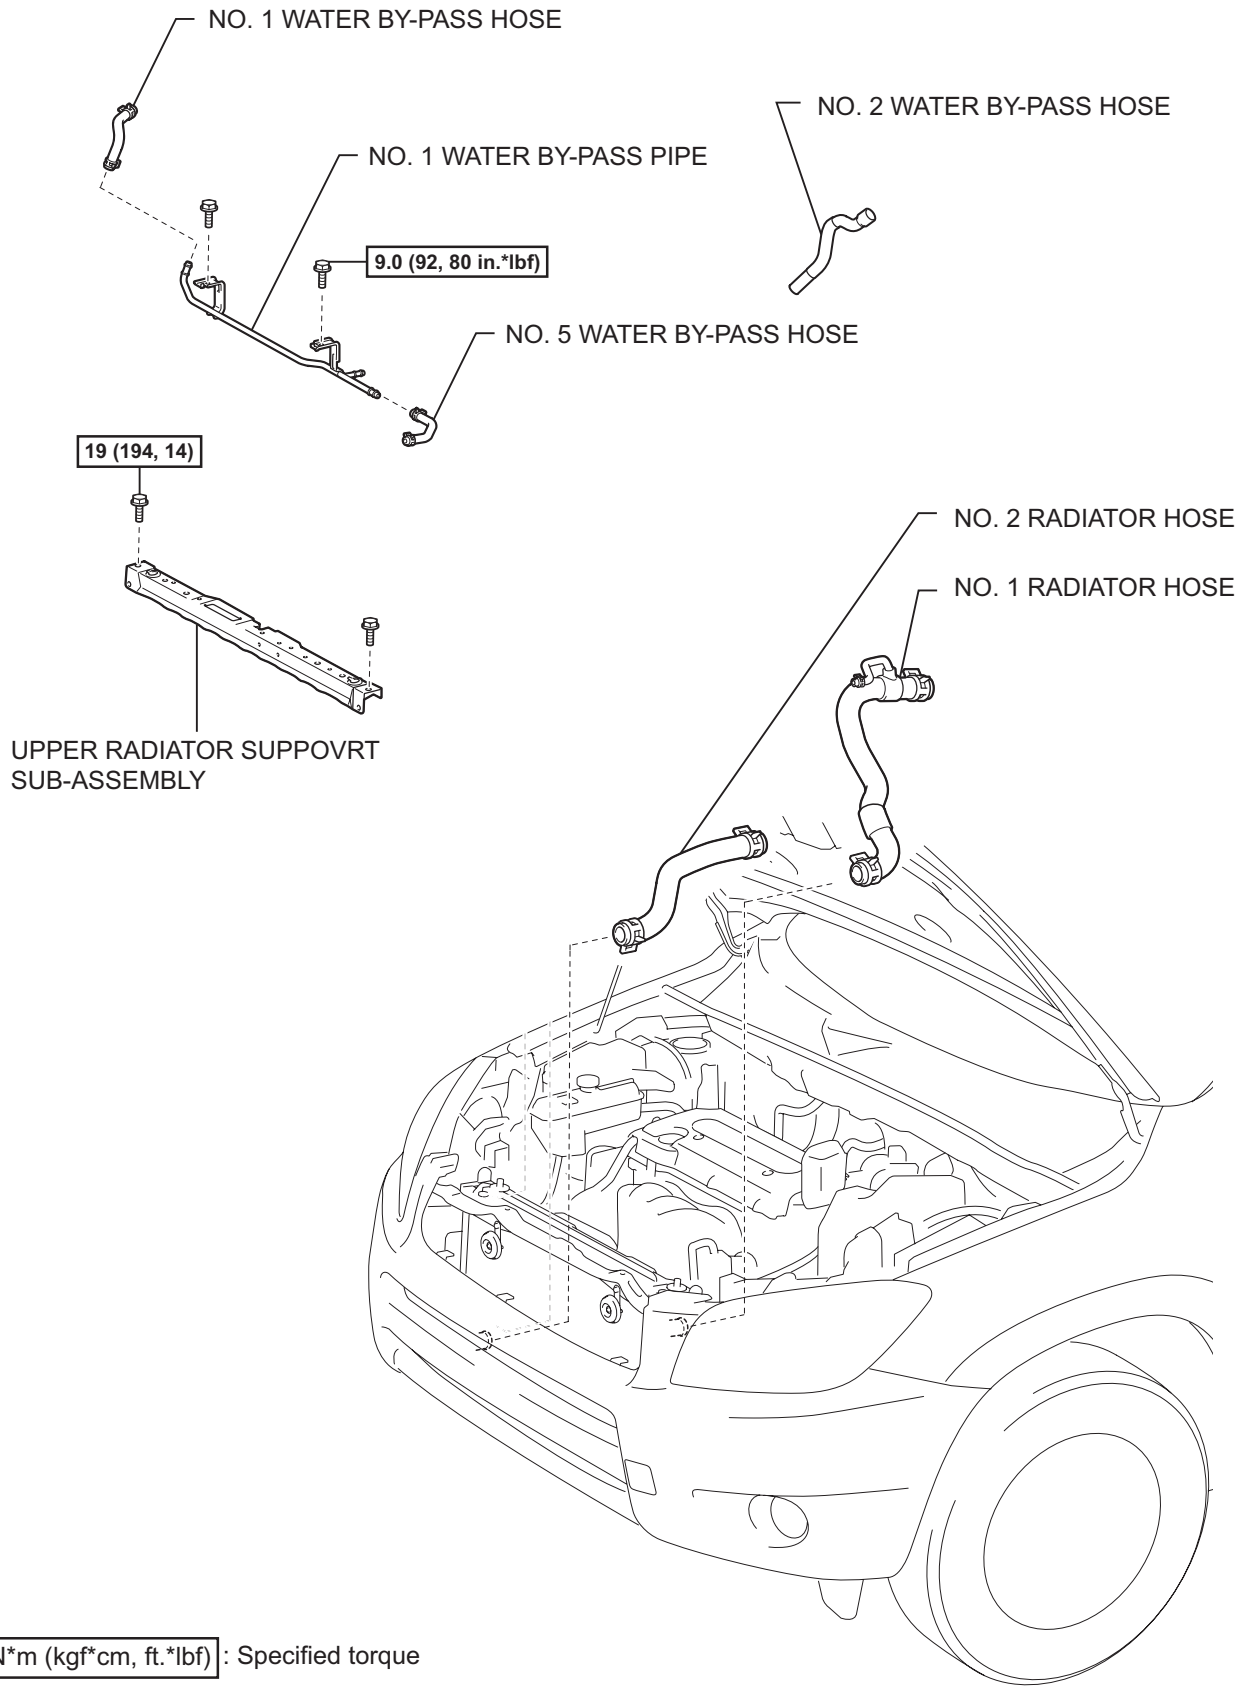
17. **INSTALL BATTERY CLAMP**
    (a) Attach the hook of the battery clamp to the battery bracket.
    (b) Temporarily tighten the nut and install the bolt.
    (c) Adjust the battery clamp's position.
    (d) Fully tighten the bolt and nut.
    Torque: 8.5 N*m (87 kgf*cm, 75 in.*lbf) for bolt
    5.0 N*m (51 kgf*cm, 44 in.*lbf) for nut

18. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**



19. **ADD ENGINE COOLANT (See page CO-6)**

20. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**



21. **INSTALL RADIATOR SUPPORT OPENING COVER**

ON-VEHICLE INSPECTION

1. CHECK RADIATOR RESERVOIR CAP SUB-ASSEMBLY

(a) Measure the valve opening pressure.

(1) If there are water stains or foreign matter on O-ring 1, clean it with water and finger scouring.

(2) Check that O-ring 1 is not deformed, cracked or swollen.

(3) Apply engine coolant to O-ring 1 and rubber packing 2 before using a radiator cap tester.

(4) When using the cap tester, tilt it more than 30 degrees.

(5) Pump the cap tester several times, and check the maximum pressure*.

Pump speed:

1 pump per second

*: Even if the cap cannot maintain the maximum pressure, it is not a defect.

Judgment criterion

Item	Specified Condition
Standard value (for brand-new cap)	93.3 to 122.7 kPa (0.95 to 1.25 kgf/cm^2, 13.5 to 17.8 psi)
Minimum standard value (after using cap)	78.5 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator reservoir cap sub-assembly.

ON-VEHICLE CLEANING

1. INSPECT RADIATOR ASSEMBLY

(a) Check that the radiator and condenser are not blocked with leaves, dirt, or insects. Clean the hose connections.

If the fins are blocked, wash them with water or a steam cleaner.

NOTICE:

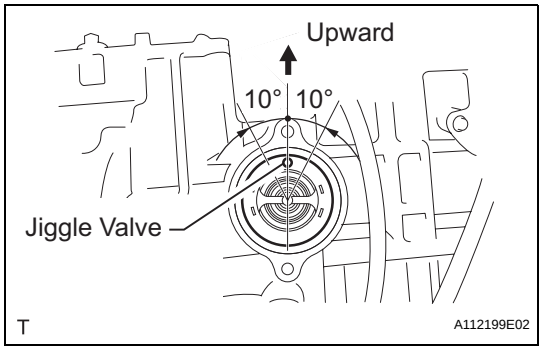
- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**
- **Keep the following injection distance.**

Standard injection distance

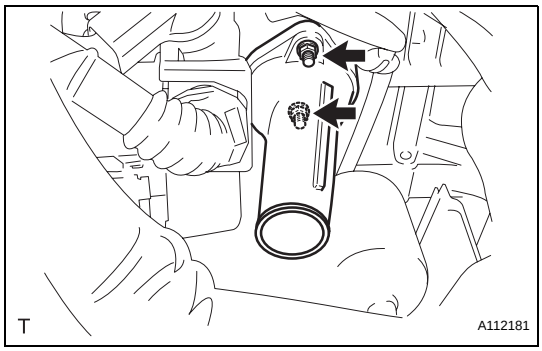
Injection Pressure	Specified Condition
2,942 to 4,903 kPa (30 to 50 kgf/cm^2, 427 to 711 psi)	300 mm (11.81 in.)
4,903 to 7,845 kPa (50 to 80 kgf/cm^2, 711 to 1,138 psi)	500 mm (19.69 in.)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electronic components.**

(b) Dry the fins with compressed air.



CO



INSTALLATION

1. INSTALL THERMOSTAT

(a) Install a new gasket onto the thermostat.

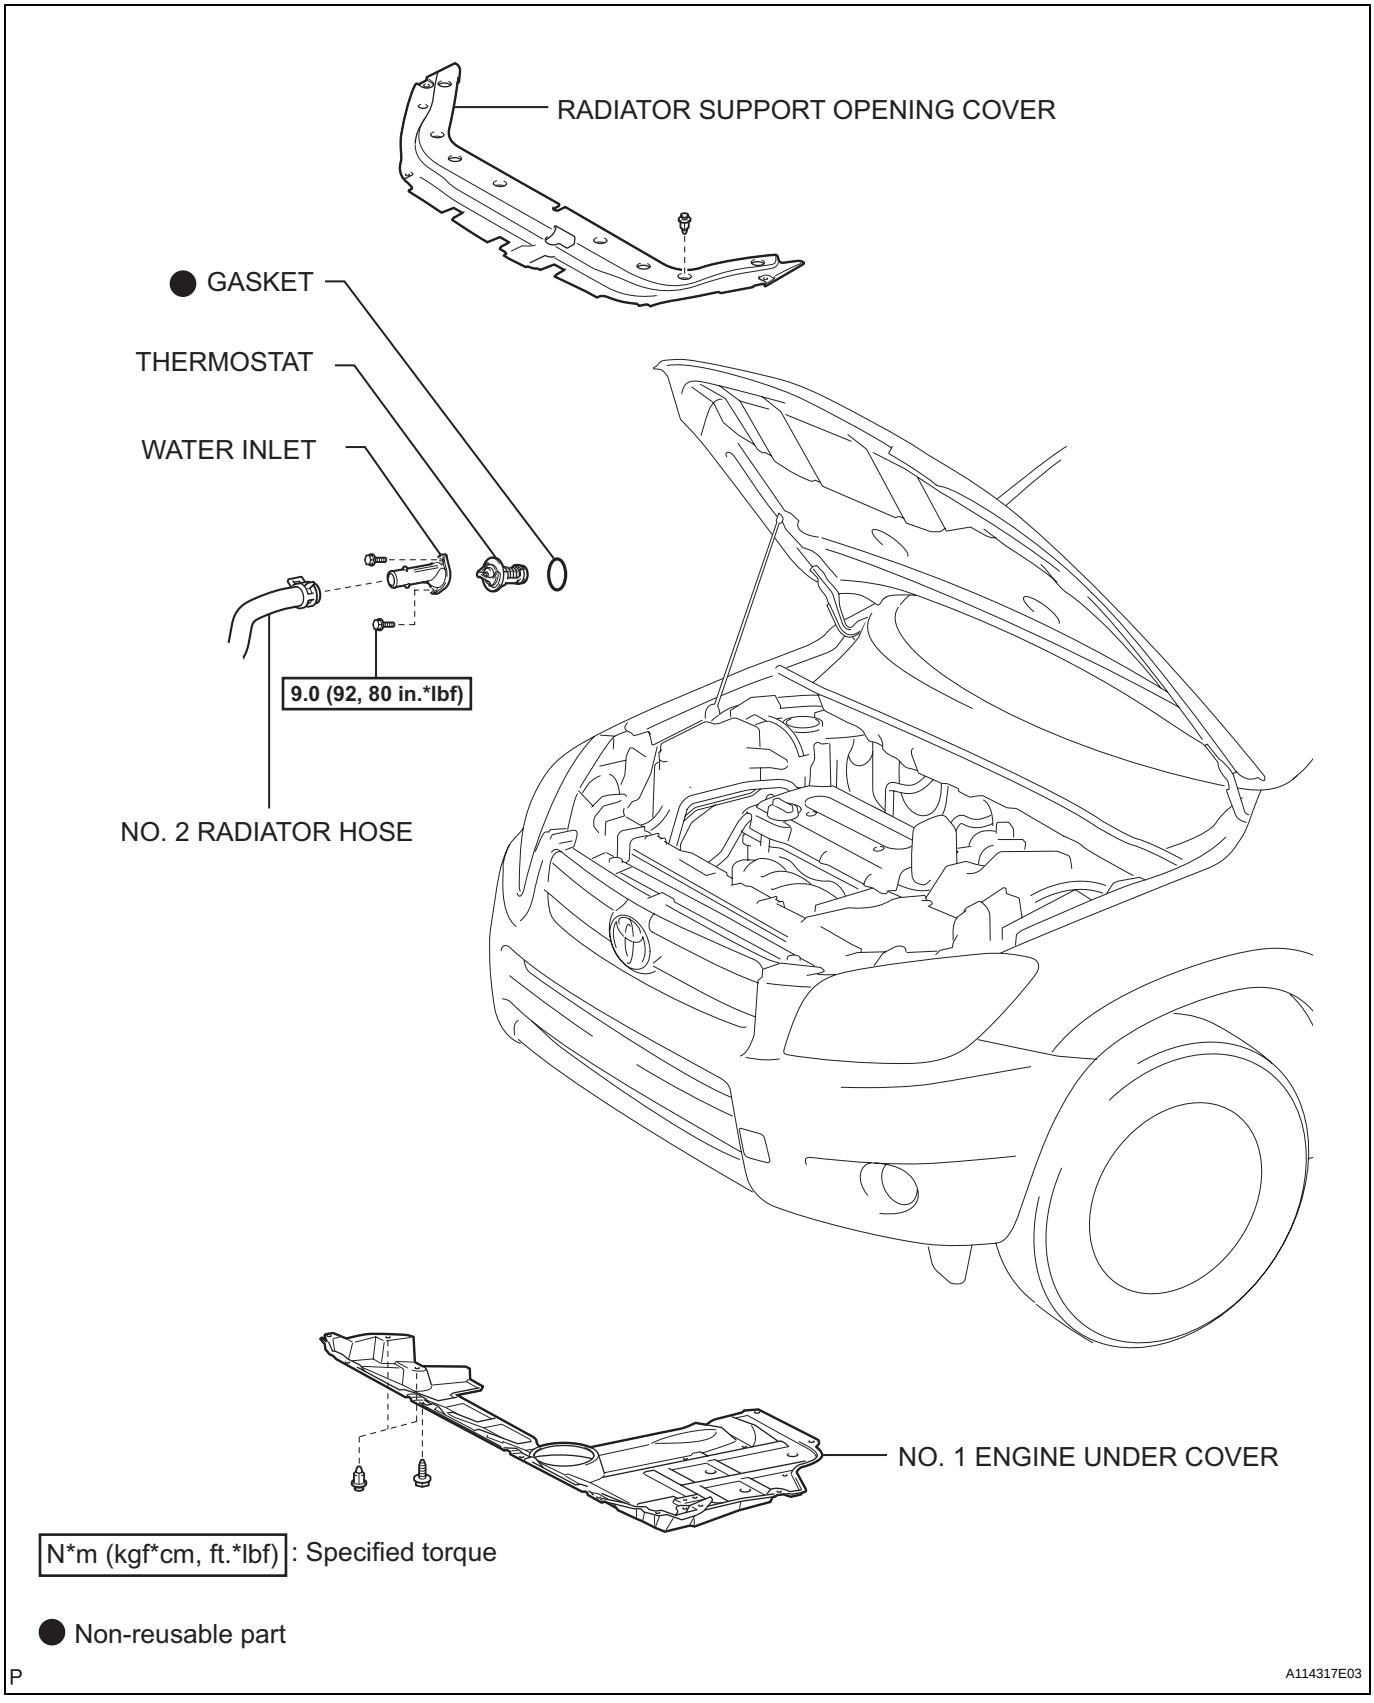
(b) Install the thermostat with the jiggle valve upward.
HINT:
The jiggle valve may be set to within 10° on either side of the prescribed position.

2. INSTALL WATER INLET

(a) Install the water inlet with the 2 nuts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

3. CONNECT NO. 2 RADIATOR HOSE

4. ADD ENGINE COOLANT (See page CO-6)

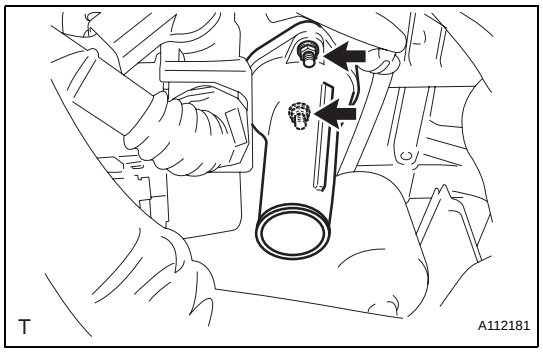


5. CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)

6. INSTALL RADIATOR SUPPORT OPENING COVER

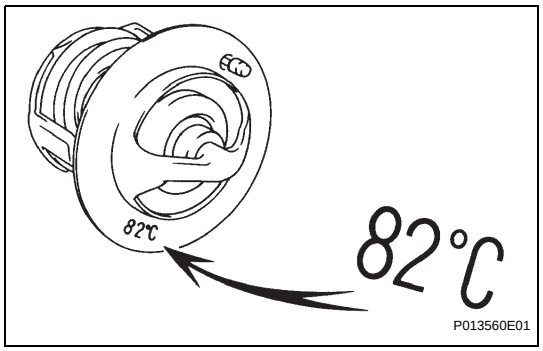
7. INSTALL NO. 1 ENGINE UNDER COVER

THERMOSTAT



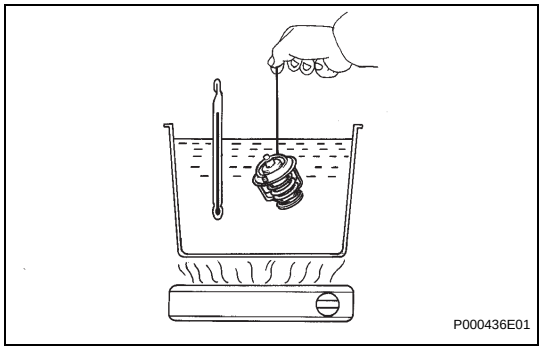
COMPONENTS

CO

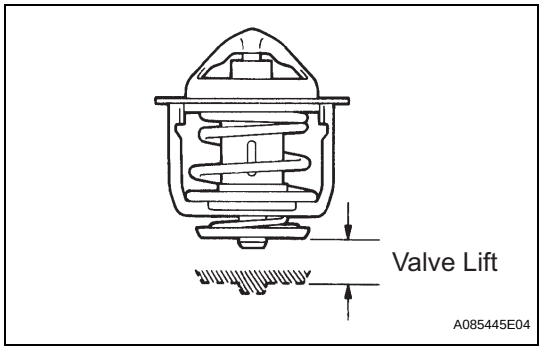


REMOVAL

1. **REMOVE NO. 1 ENGINE UNDER COVER**
2. **DRAIN ENGINE COOLANT (See page CO-6)**
3. **REMOVE RADIATOR SUPPORT OPENING COVER**
4. **DISCONNECT NO. 2 RADIATOR HOSE**
5. **REMOVE WATER INLET**
   (a) Remove the 2 nuts and disconnect the water inlet from the cylinder block.
6. **REMOVE THERMOSTAT**
   (a) Remove the gasket from the thermostat.

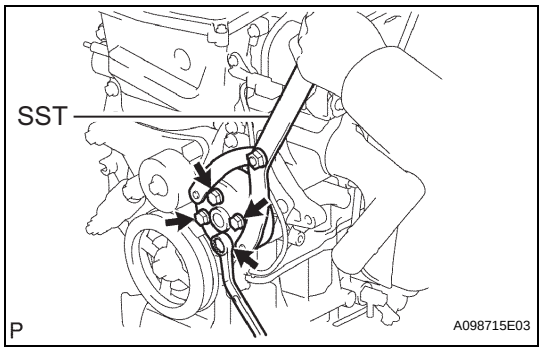


INSPECTION

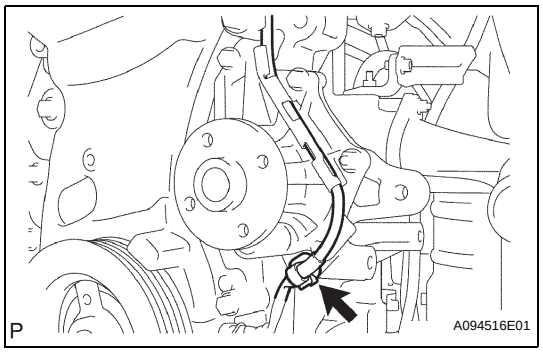


1. **INSPECT THERMOSTAT**
   HINT:
   The valve opening temperature is inscribed on the thermostat.

(a) Immerse the thermostat in water, and then gradually heat the water.
(b) Check the valve opening temperature of the thermostat.
Standard valve opening temperature:
80 to 84°C (176 to 183°F)
If the valve opening temperature is not as specified, replace the thermostat.

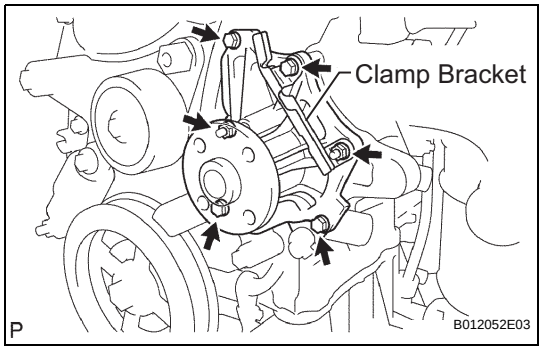


(c) Check the valve lift.
Standard valve lift:
10 mm (0.39 in.) or more at 95°C (203°F)
If the valve lift is not as specified, replace the thermostat.
(d) Check that the valve is fully closed when the thermostat is at low temperatures (below 77°C (171°F).
If it is not fully closed, replace the thermostat.

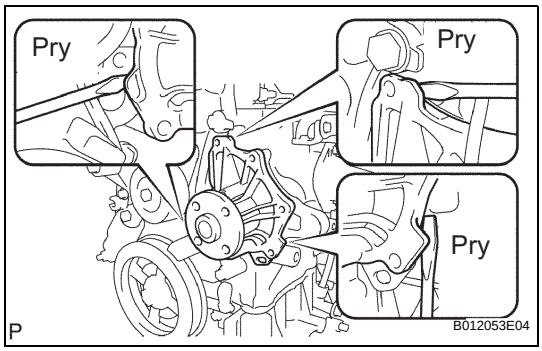


CO

REMOVAL



1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE NO. 1 ENGINE UNDER COVER**
3. **REMOVE FRONT FENDER APRON RH**
4. **REMOVE RADIATOR SUPPORT OPENING COVER**
5. **DRAIN ENGINE COOLANT (See page CO-6)**
6. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-6)**
7. **REMOVE FAN AND GENERATOR V BELT (See page EM-6)**
8. **REMOVE GENERATOR ASSEMBLY (See page CH-9)**
9. **REMOVE WATER PUMP PULLEY**
   (a) Using SST, remove the 4 bolts and water pump pulley.
   SST 09960-10010 (09962-01000, 09963-00700)



10. **REMOVE WATER PUMP ASSEMBLY**
    (a) Remove the clamp of the crankshaft position sensor from the water pump.
    (b) Disconnect the wire of the crankshaft position sensor from the clamp bracket.

    (c) Remove the 4 bolts, 2 nuts and clamp bracket.

CO

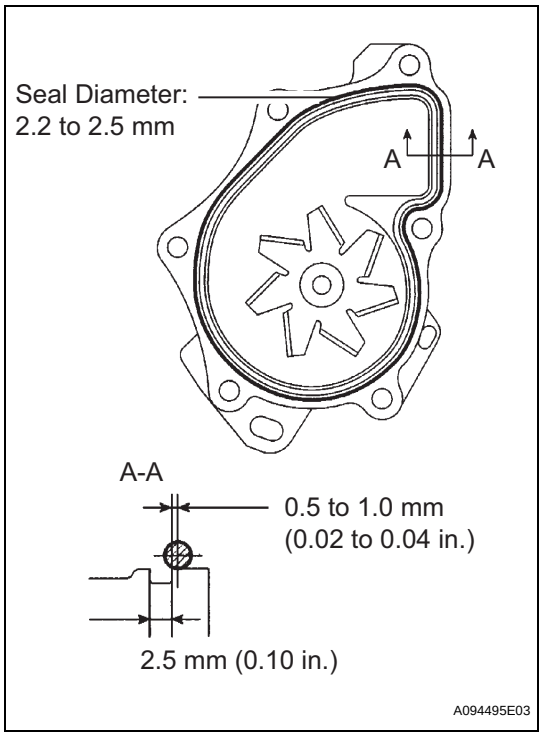
(d) Using a screwdriver, pry between the water pump and cylinder block, and then remove the water pump.
NOTICE:
Be careful not to damage the contact surfaces of the water pump and cylinder block.

INSPECTION

1. INSPECT WATER PUMP ASSEMBLY

(a) Visually check the drain hole for coolant leakage.
If leakage is found, replace the water pump assembly.

(b) Turn the pulley, and then check that the water pump bearing moves smoothly without making a "click" noise.
If it does not move smoothly, replace the water pump assembly.

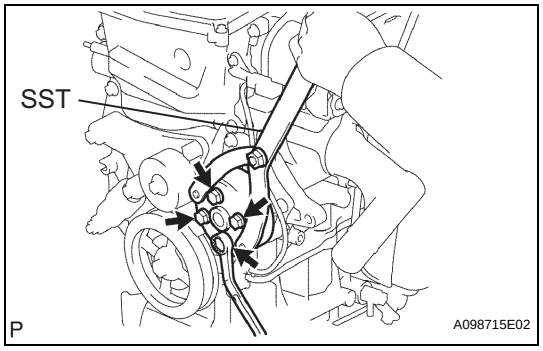


INSTALLATION

1. INSTALL WATER PUMP ASSEMBLY

(a) Remove any old seal packing material from the contact surface.

(b) Apply a continuous line of seal packing as shown in the illustration.



Seal packing:
Toyota Genuine Seal Parking Black, Three Bond 1207B or equivalent
Standard seal diameter:
2.2 to 2.5 mm (0.09 to 0.10 in.)
NOTICE:
- **Remove any oil from the contact surface.**
- **The parts must be set within 3 minutes after applying seal packing. Otherwise, the material must be removed and reapplied.**

(c) Install the water pump and clamp bracket with the 4 bolts and 2 nuts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

(d) Install the wire of the crankshaft position sensor onto the clamp bracket.

(e) Install the clamp of the crankshaft position sensor onto the water pump.

2. INSTALL WATER PUMP PULLEY

(a) Using SST, install the water pump pulley with the 4 bolts.
SST 09960-10010 (09962-01000, 09963-00700)
Torque: 26 N*m (265 kgf*cm, 19 ft.*lbf)

3. INSTALL GENERATOR ASSEMBLY (See page CH-15)

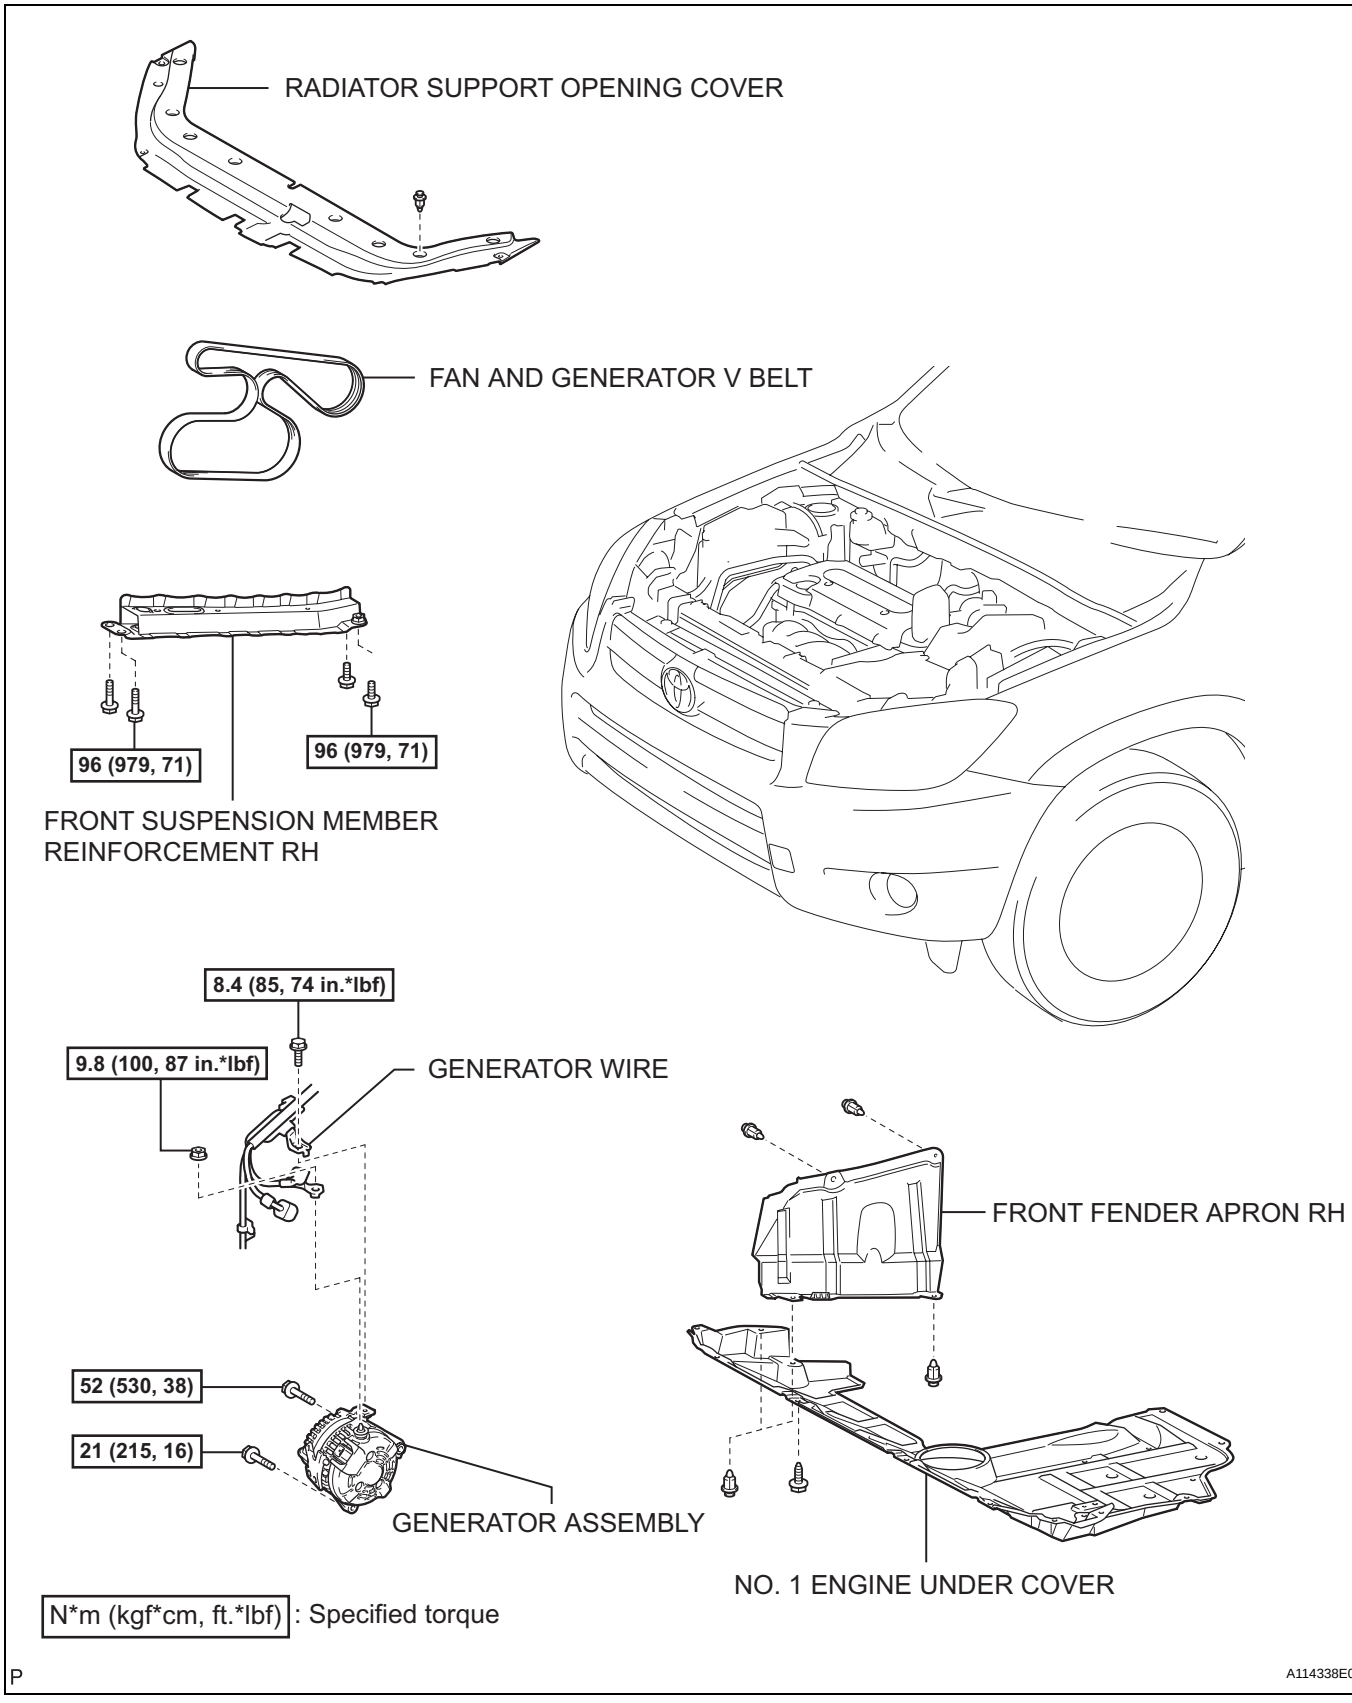
4. INSTALL FAN AND GENERATOR V BELT (See page EM-7)

5. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)

6. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

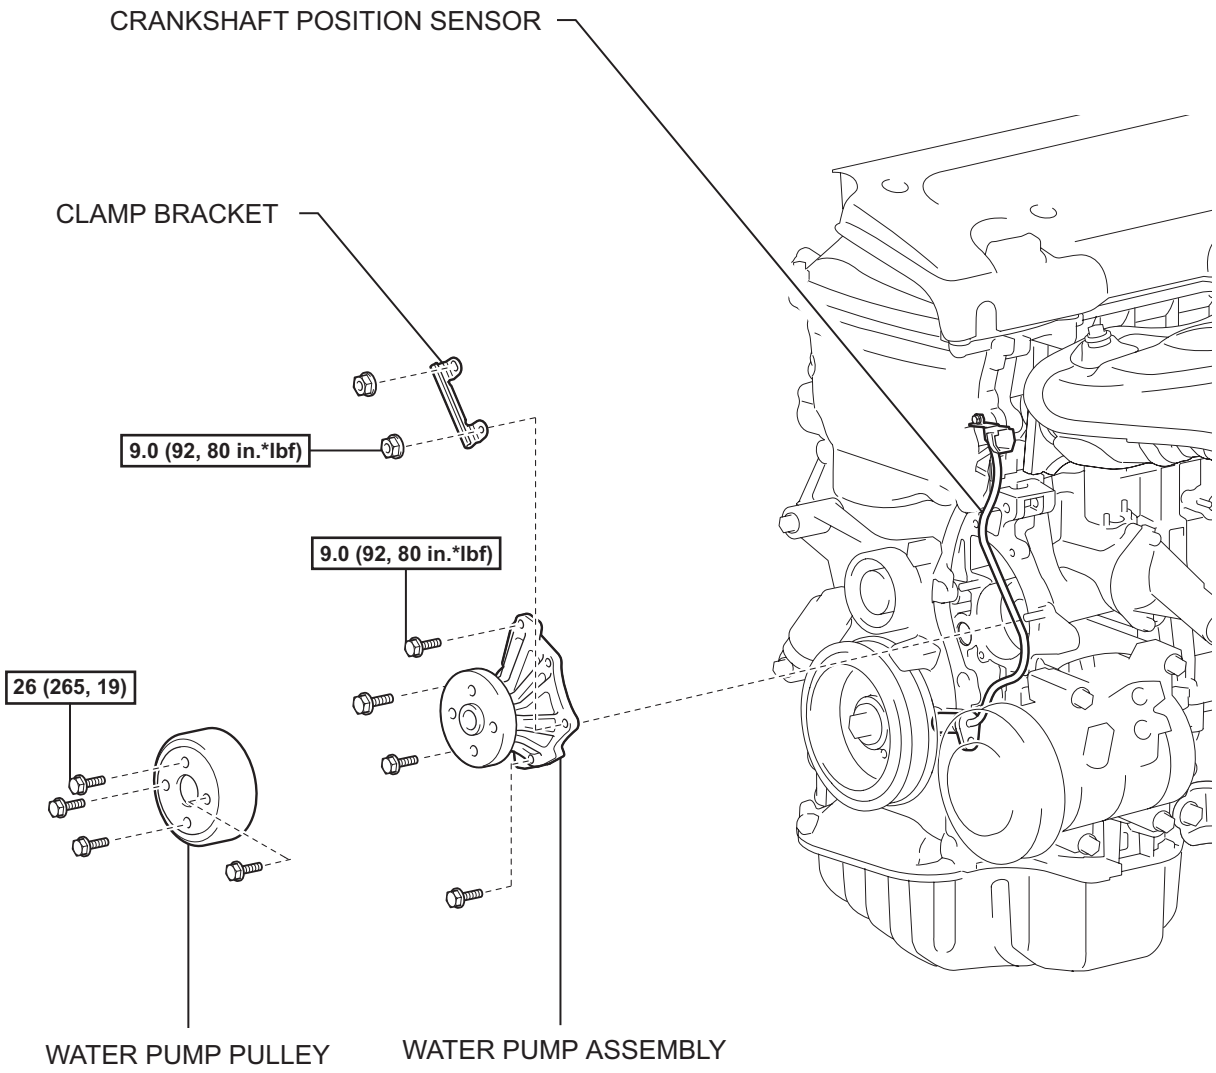
7. ADD ENGINE COOLANT (See page CO-6)

8. CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)



9. INSTALL RADIATOR SUPPORT OPENING COVER

10. INSTALL FRONT FENDER APRON RH



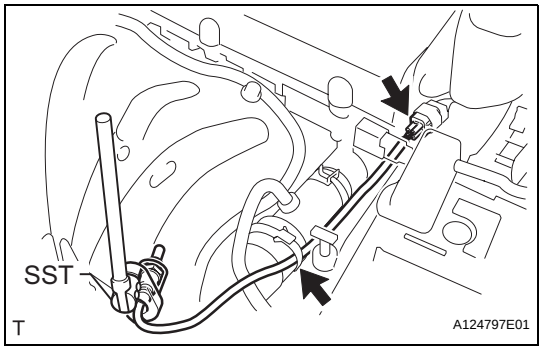
11. INSTALL NO. 1 ENGINE UNDER COVER

WATER PUMP

COMPONENTS

CO

CO



N*m (kgf*cm, ft.*lbf) : Specified torque

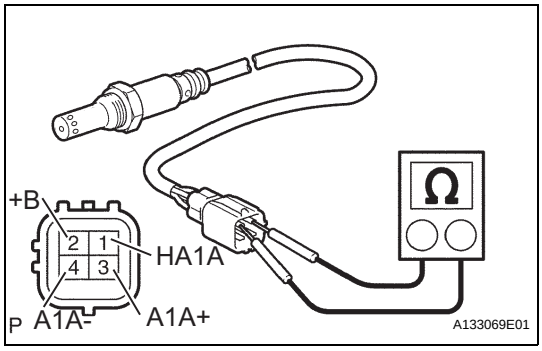
A114324E03

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)**
   (a) Disconnect the sensor connector.
   (b) Using SST, remove the sensor from the exhaust manifold.
   SST 09224-00010



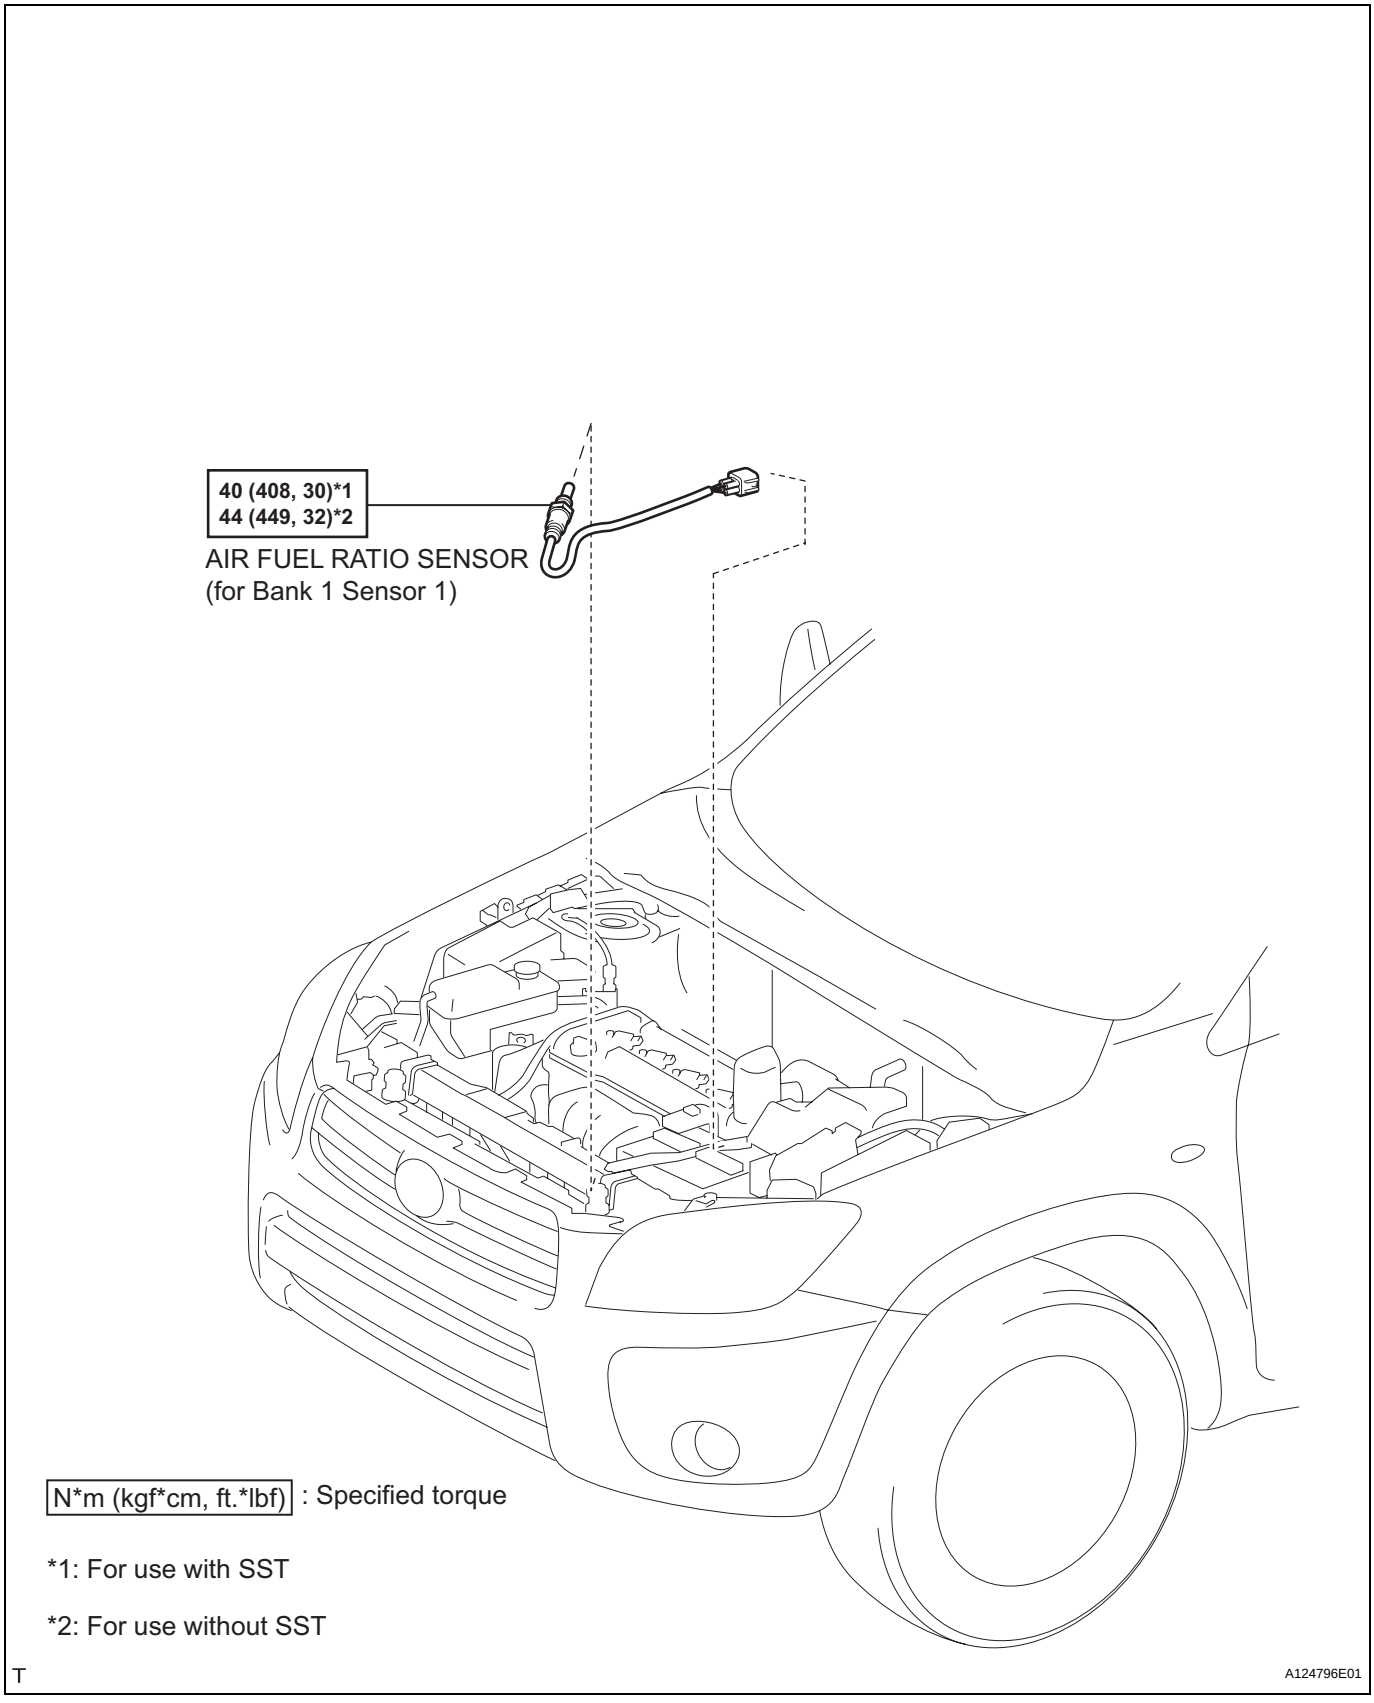
INSPECTION

1. **INSPECT AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)**
   (a) Measure the resistance of the sensor.
   Standard resistance

Tester Connection	Specified Condition
1 (HA1A) - 2 (+B)	1.8 to 3.4 Ω at 20°C (68°F)
1 (HA1A) - 4 (A1A-)	10 kΩ or higher

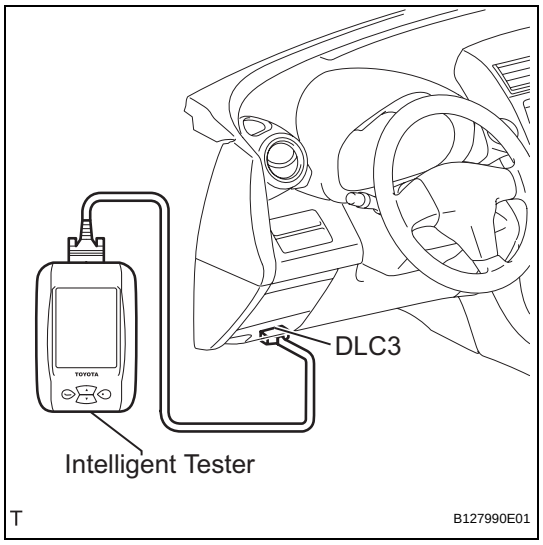
   If the resistance is not as specified, replace the sensor.

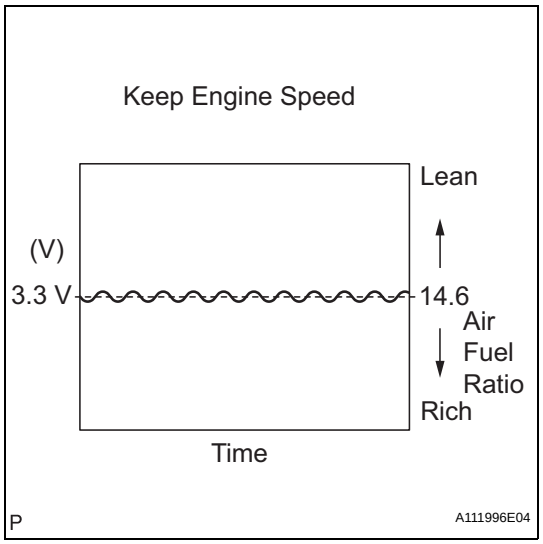
INSTALLATION



1. **INSTALL AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)**
   (a) Using SST, install the sensor to the exhaust manifold.
   SST 09224-00010
   Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf) for use with SST
   44 N*m (449 kgf*cm, 32 ft.*lbf) for use without SST
   HINT:
   - Use a torque wrench with a fulcrum length of 30 cm (11.81 in.).
   - Make sure SST and wrench are connected in a straight line.

   (b) Connect the sensor connector.
2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
3. **CHECK FOR EXHAUST GAS LEAKS**





AIR FUEL RATIO SENSOR

COMPONENTS

EC

ON-VEHICLE INSPECTION

1. CHECK AIR FUEL RATIO COMPENSATION SYSTEM

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.

(c) Select the following menu items: Data List / A/FS B1 S1 and O2S B1 S2.

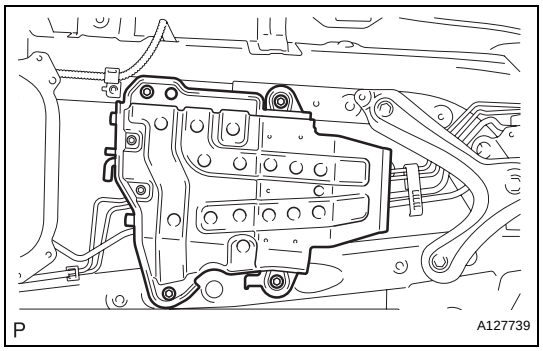
(d) Warm up the A/F sensor with the engine speed at 2,500 rpm for approximately 2 minutes.

(e) Keep the engine speed at 2,500 rpm and confirm that the display of "A/FS B1 S1" is as shown in the illustration.

HINT:

- The illustration may slightly differ from the display on the intelligent tester.
- Only the intelligent tester displays the waveform of the A/F sensor.

(f) Confirm that the display of "O2S B1 S2" changes between 0 to 1 V with the engine speed at 2,500 rpm.



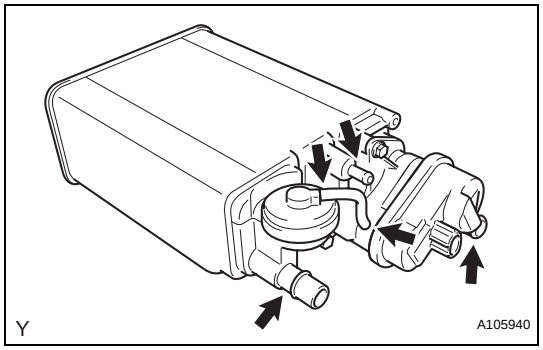
OK:

The voltage output oscillates more than 8 times in 10 seconds.

NOTICE:

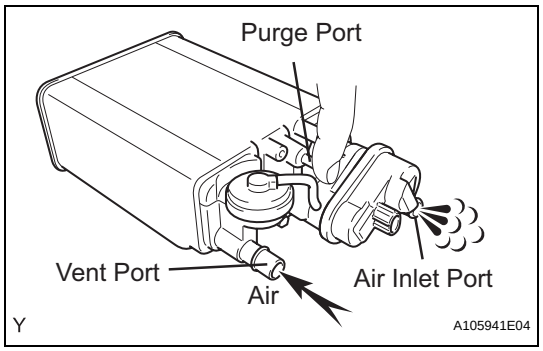
- **Perform the check immediately after warming the engine up.**
- **If the voltage variation could not be verified, warm up the A/F sensor again. If it could not be verified even after warming up the sensor again, check for DTCs (see page ES-292).**

EC



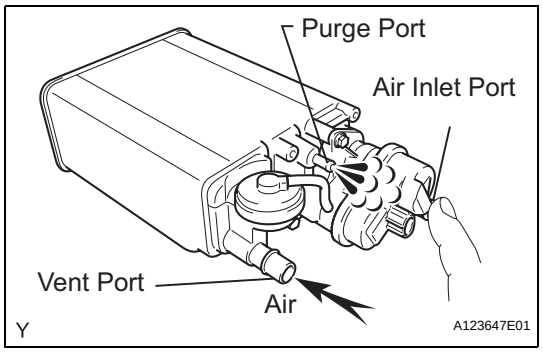
(b) Remove the 4 bolts, clip and canister.

INSPECTION

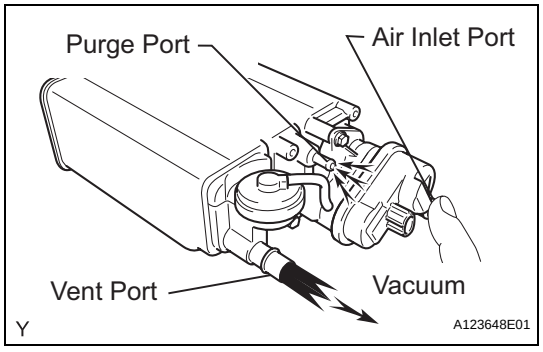


1. INSPECT CANISTER

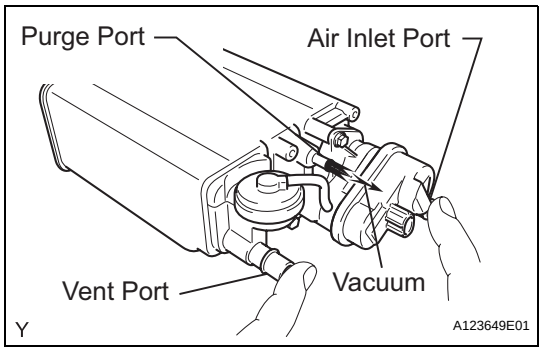
(a) Visually check the canister for cracks or damage.
If cracks or damage is found, replace the canister.



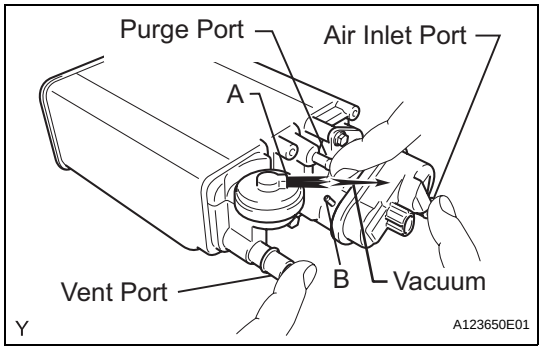
(b) Check the canister operation.



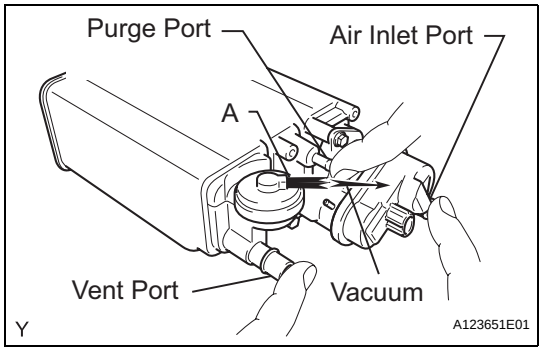
(1) While holding the purge port closed, blow air 0.39 kPa (4.0 kgf/cm^2, 3 mmHg) into the vent port, and check that air flows from the air inlet port.
If the result is not as specified, replace the canister.



(2) While holding the air inlet port closed, blow air 0.39 kPa (4.0 kgf/cm^2, 3 mmHg) into the vent port, and check that air flows from the purge port.
If the result is not as specified, replace the canister.

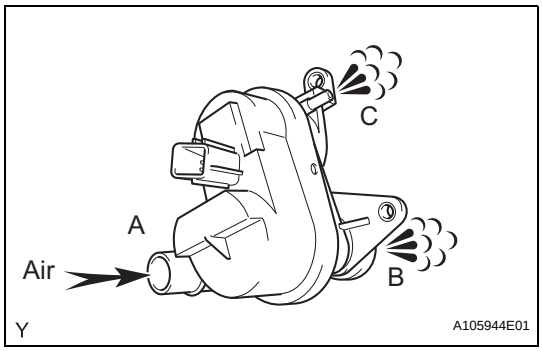


(3) While holding the air inlet port closed, apply vacuum 3.43 kPa (35.0 kgf/cm^2, 25.7 mmHg) to the vent port, and check that air is sucked into the purge port.
If the result is not as specified, replace the canister.

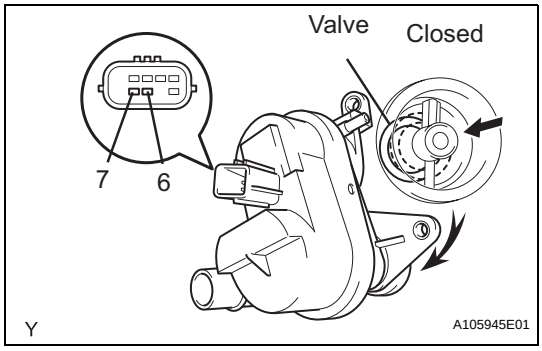


EC

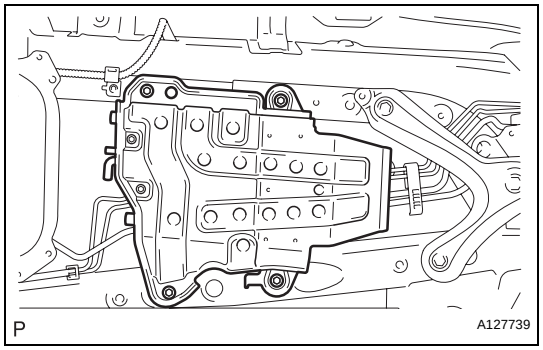
(c) Check the air tightness.
(1) While holding the vent and air inlet ports closed, apply vacuum 3.43 kPa (35.0 kgf/cm^2, 25.7 mmHg) to the purge port, and check that the vacuum is maintained for 1 minute.
If the result is not as specified, replace the canister.



(d) Check the diaphragm.
(1) Remove the air hose between ports A and B.
(2) While holding the vent, purge and air inlet ports closed, apply vacuum 1.42 kPa (14.5 kgf/cm^2, 10.6 mmHg) to port A, and check that air is not sucked into port B.



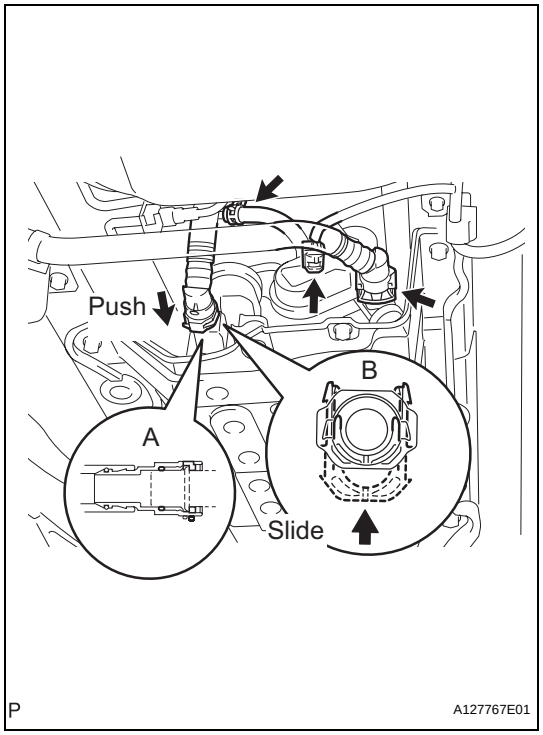
EC



(3) While holding the vent, purge and air inlet ports closed, apply vacuum 1.42 kPa (14.5 kgf/cm^2, 10.6 mmHg) to port A, and measure how long it takes for the vacuum to drop.
Vacuum drop time:
10 seconds or more
If the result is not as specified, replace the canister.

(e) Check the leak detection pump.
(1) Check that air flows from port A to port B and C.
If the result is not as specified, replace the canister.

(2) Connect the positive (+) lead of the battery to terminal 7 and the negative (-) lead to terminal 6.
(3) Check that the valve is closed.
If the result is not as specified, replace the canister.
(4) Install the canister pump module.



INSTALLATION

1. INSTALL CANISTER

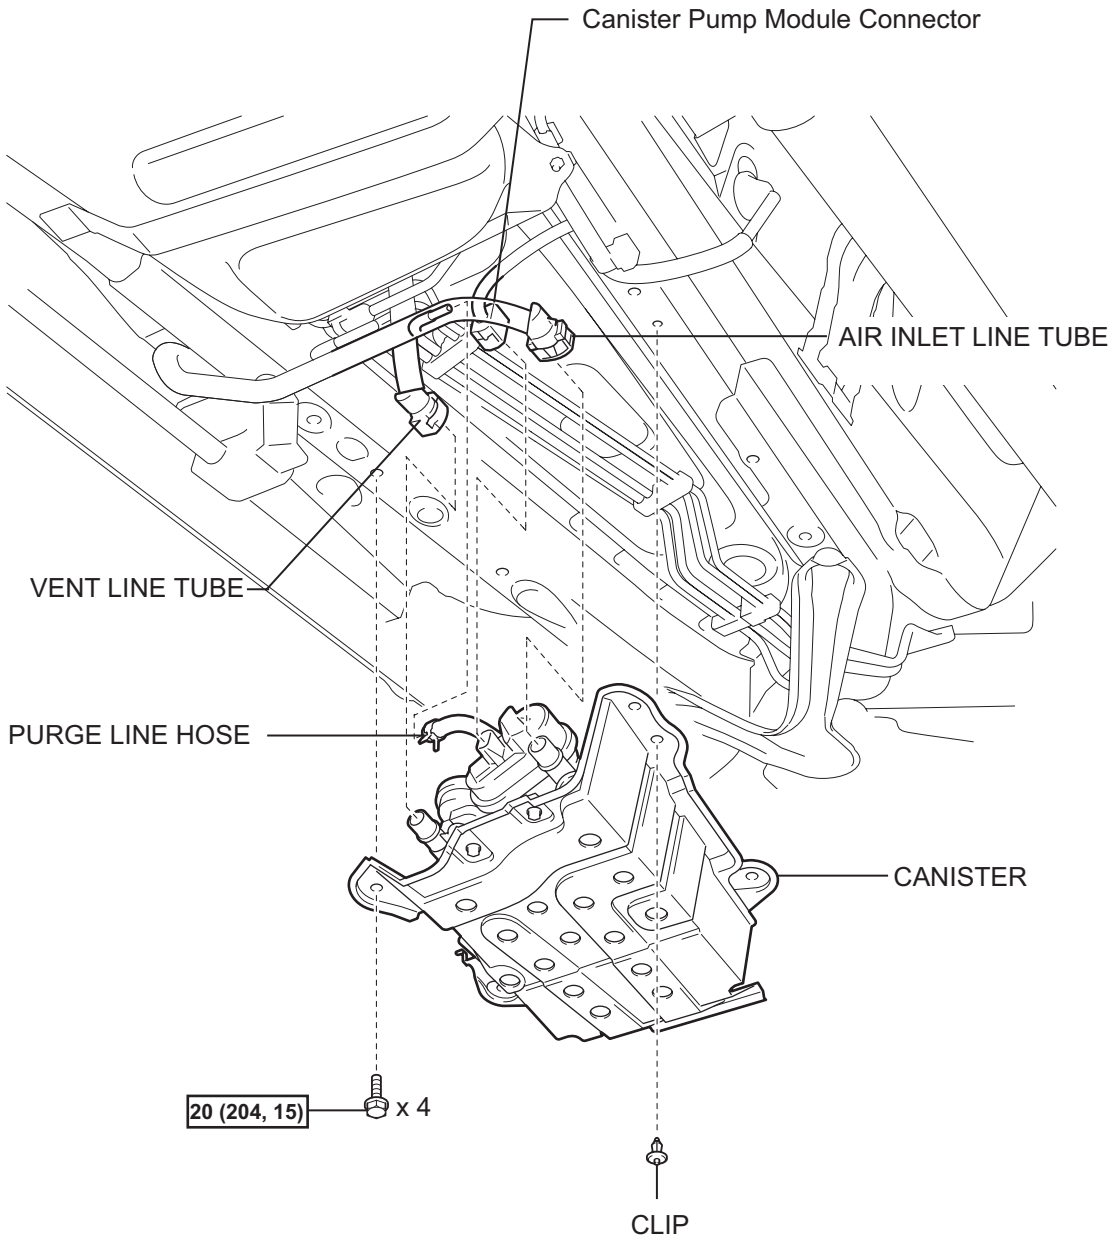
(a) Install the canister with the 4 bolts and clip.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

(b) Connect the air inlet line tube to the canister (leak detection pump).

(c) Install the vent line tube.

(1) Connect the pipe to the fuel tube connector, as shown in A in the illustration. Then push up the retainer to lock the claws, as shown in B in the illustration.
NOTICE:
- **Check that there are no scratches or foreign objects around the connected part of the fuel tube connector and pipe before performing this work.**
- **After connecting the fuel tank vent tube, check that the fuel tank vent tube is securely connected by pulling the fuel tube connector and pipe.**

(d) Connect the purge line hose.
HINT:
Install the hose to the canister, and then attach the retainer.



(e) Connect the connector to the canister (leak detection pump).

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

EC

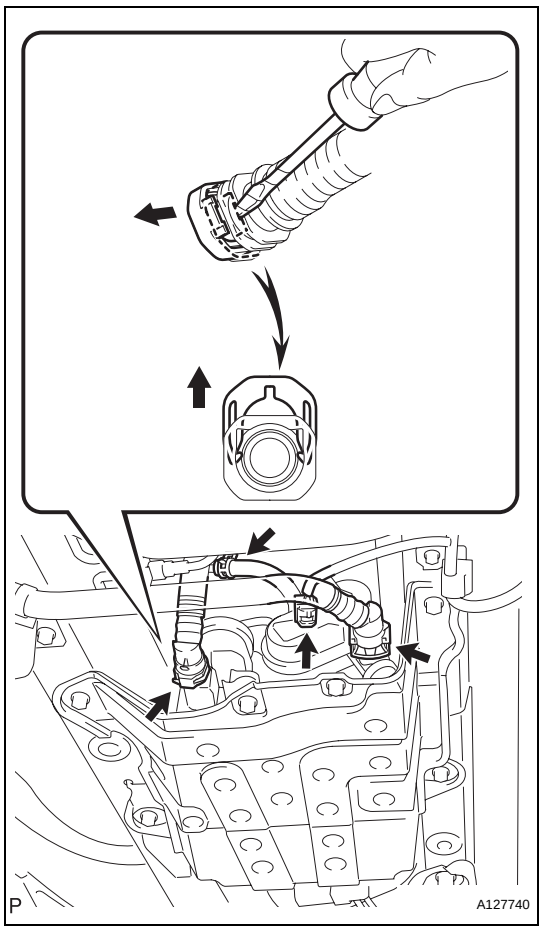
CANISTER

COMPONENTS

N*m (kgf*cm, ft.*lbf) : Specified torque

P

A127737E01



EC

REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

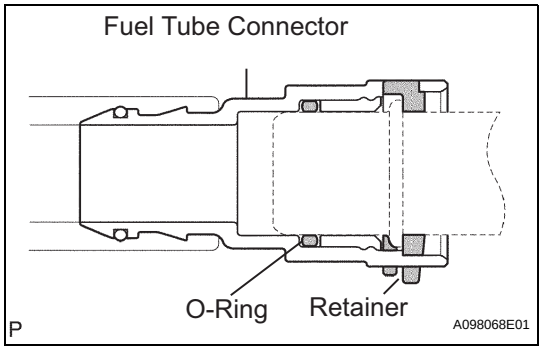
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE CANISTER

(a) Disconnect the 2 tubes, hose and connector.

(1) Using a screwdriver, pry up the retainer.
HINT:
Do not remove the retainer.

(2) Disconnect the purge line hose.

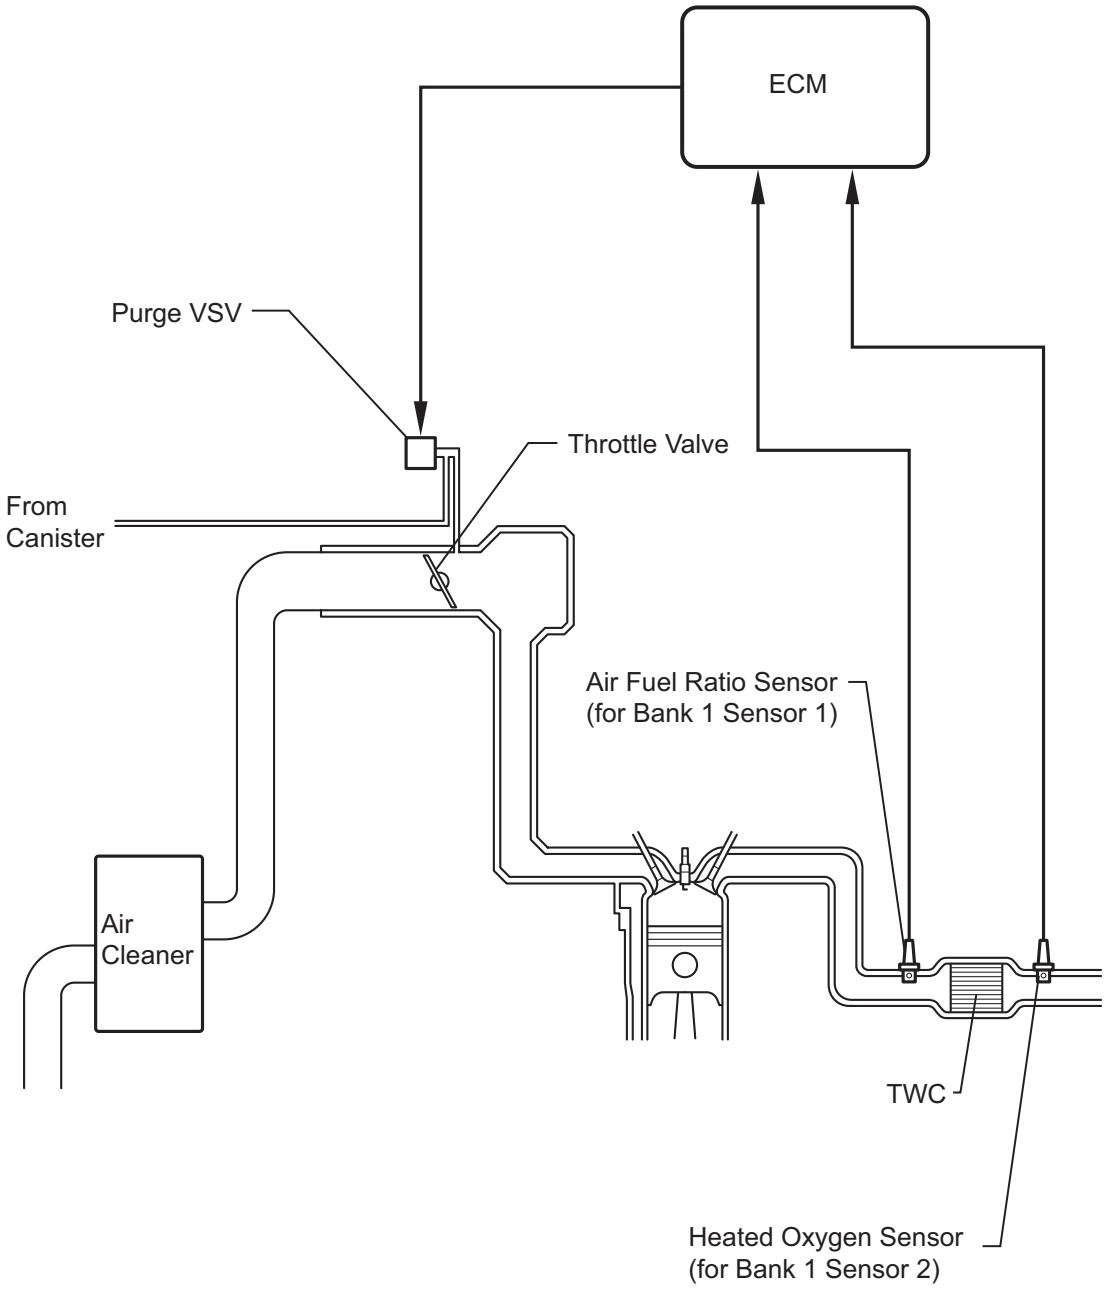


(3) Disconnect the air inlet line tube from the canister.

(4) Disconnect the vent line tube from the canister (leak detection pump).

(5) Disconnect the connector from the canister (leak detection pump).

NOTICE:



- **Remove any dirt or foreign objects on the fuel tube connector before performing this work.**

- **Do not allow any scratches or foreign objects on the parts when disconnecting as the fuel tube connector has the O-ring that seals the pipe.**
- **Perform this work by hand. Do not use any tools.**
- **Do not forcibly bend, twist or turn the nylon tube.**
- **Protect the disconnected part by covering it with a plastic bag after disconnecting the fuel tank vent hose.**
- **If the fuel tube connector and pipe are stuck, push and pull to release them.**

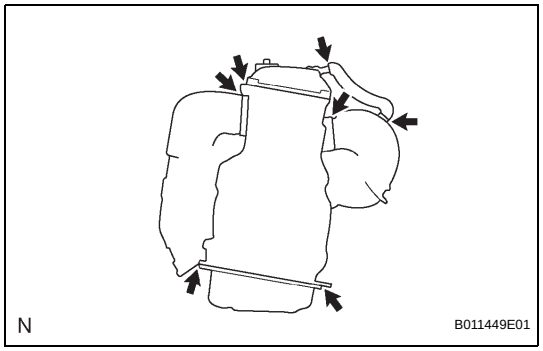
ON-VEHICLE INSPECTION

1. CHECK FUEL CUT RPM

(a) Increase the engine speed to at least 3,500 rpm.

(b) Use a sound scope to check for injector operating noise.



(c) Check that the operating sounds stop momentarily and then resume when the throttle lever is released.

HINT:

Measure with the A/C OFF.

Fuel return rpm:

1,400 rpm

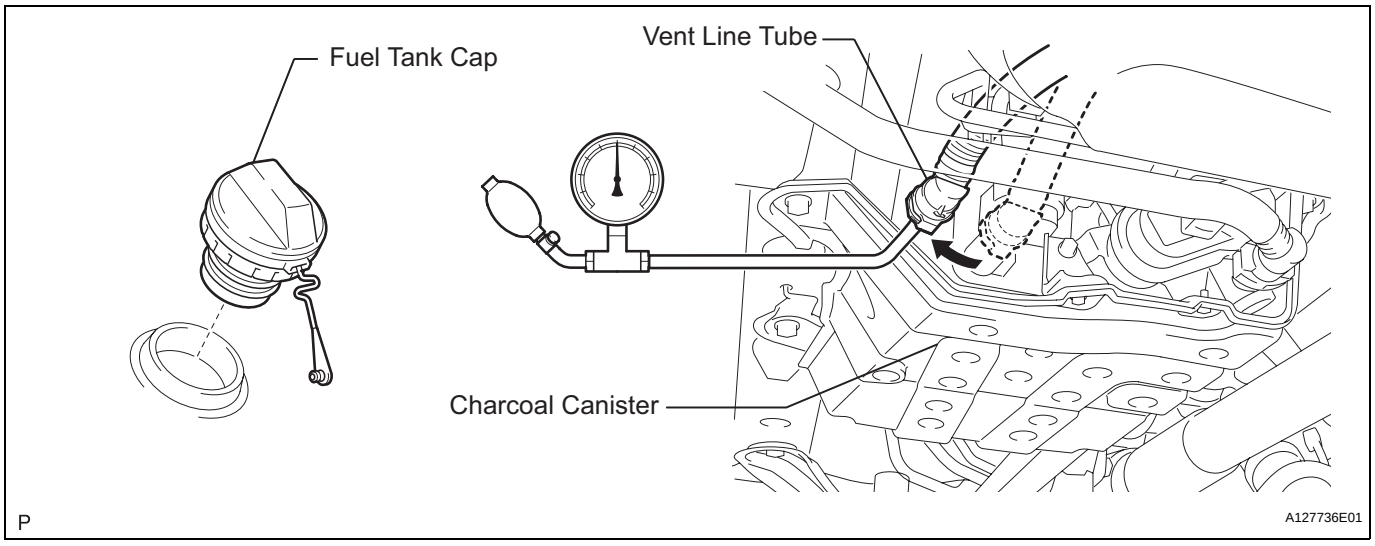
2. CHECK FOR LEAKS

(a) Visually check that the hoses, connections and gaskets have no cracks, leaks or damage.

NOTICE:

- **Detachment or other problems with the engine oil dipstick, filler cap, PCV hose and other components may cause the engine to run improperly.**
- **Disconnection, looseness or cracks in the parts of the air induction system between the throttle body and cylinder head will allow air suction and cause an engine failure or engine malfunctions.**

If the result is not as specified, replace parts as necessary.



3. CHECK LINE AND CONNECTORS

(a) Visually check for loose connections, sharp bends or damage.

4. CHECK FUEL TANK ASSEMBLY

(a) Visually check for deformation, cracks or fuel leakage.

5. CHECK FUEL TANK AND VENT LINE

(a) Disconnect the vent line tube from the canister.

(b) Connect a pressure gauge to the vent line tube.

EC

(c) Apply 4 kPa (41 kgf/cm^2, 30 mmHg) of pressure to the vent line of the fuel tank.
HINT:
Perform this inspection with the fuel tank less than 90% full. When the fuel tank is full, the fuel cutoff valve closes and pressure is released through the 1.5 mm orifice. As a result, when the fuel tank cap is removed, the pressure does not decrease smoothly.

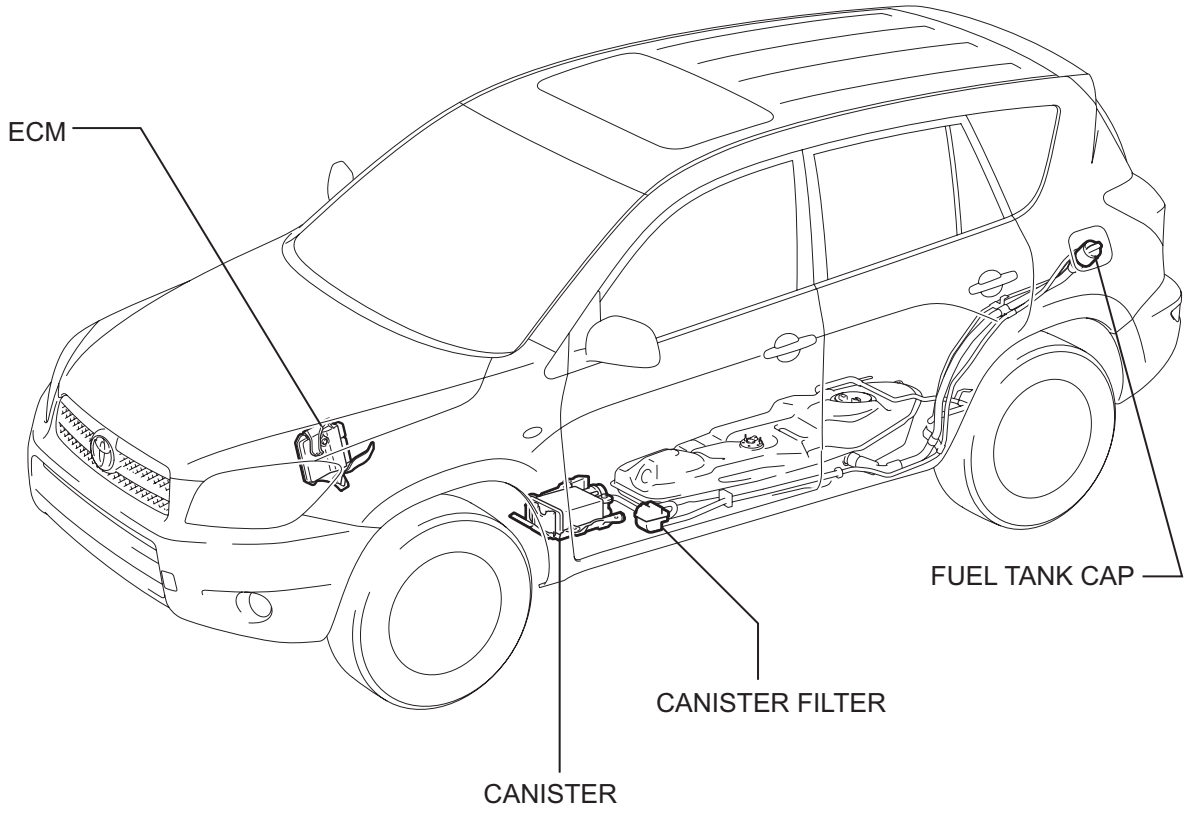
(d) Check that the fuel tank pressure is maintained for some time, and does not decrease immediately.
HINT:
If the pressure decreases immediately, one of the following may be the cause:
- The fuel tank cap is not completely tightened.
- The fuel tank cap is damaged.
- Air is leaking from the vent line.
- The fuel tank is damaged.

(e) When the fuel tank cap is removed, check that pressure is released smoothly.
HINT:
If the pressure does not drop, replace the fuel tank assembly.

(f) Reconnect the vent line tube to the canister.

EC

6. CHECK AIR INLET LINE



(a) Disconnect the air inlet line hose from the charcoal canister.

(b) Check that air flows freely into the air inlet line.
HINT:
If air does not flow freely into the air inlet line, repair or replace it.

(c) Reconnect the air inlet line hose to the charcoal canister.

EC

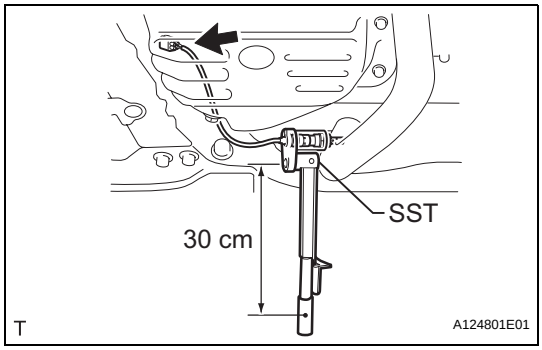
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. **REMOVE HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)**
   (a) Disconnect the sensor connector.
   (b) Using SST, remove the sensor from the front exhaust pipe.
   SST 09224-00010

INSPECTION



1. **INSPECT HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)**
   (a) Measure the resistance of the sensor.
   Standard resistance

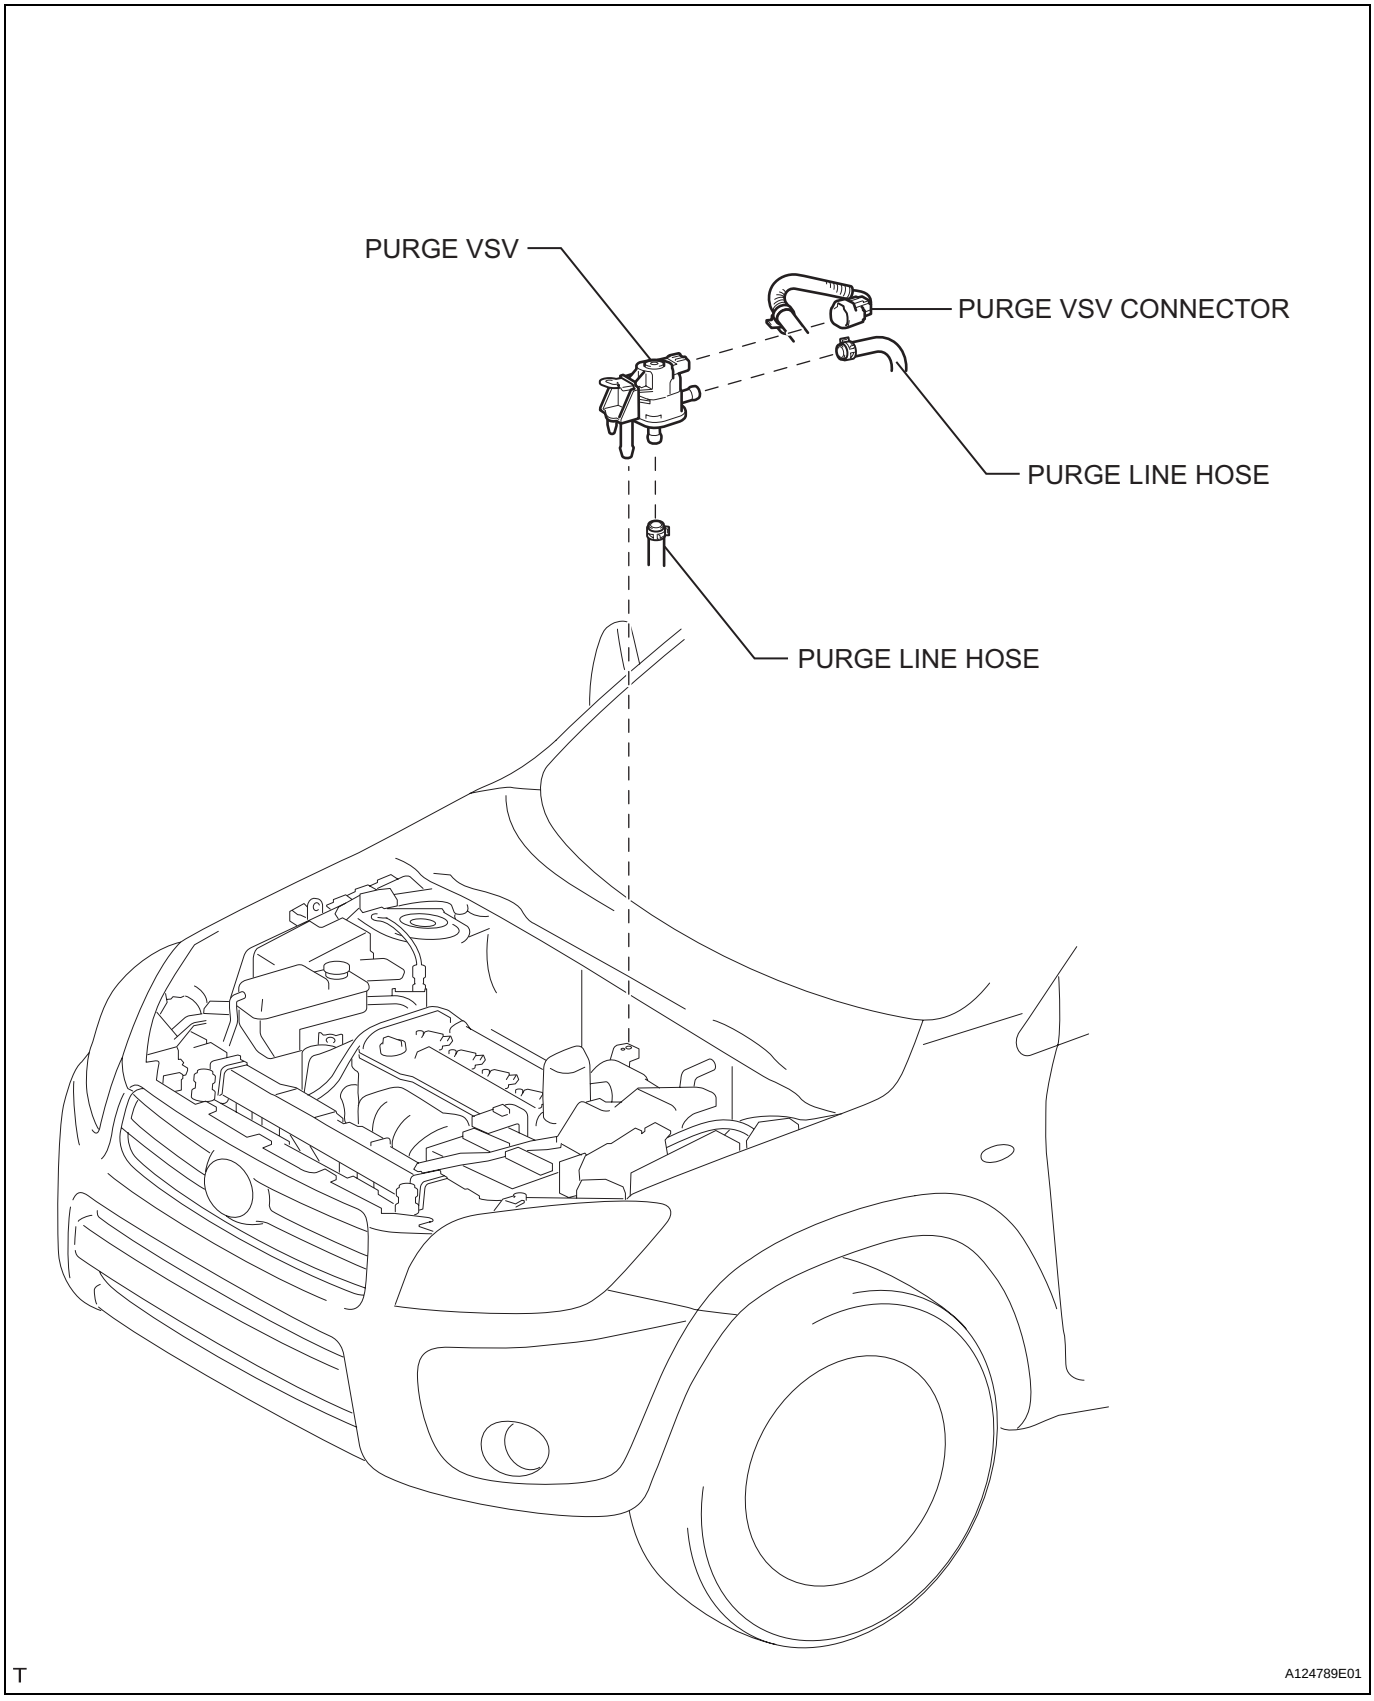
Tester Connection	Specified Condition
1 (HT1B) - 2 (+B)	11 to 16 Ω at 20°C (68°F)
1 (HT1B) - 4 (E2)	10 kΩ or higher

   If the resistance is not as specified, replace the sensor.

INSTALLATION

1. **INSTALL HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)**
   (a) Using SST, install the sensor to the front exhaust pipe.
   SST 09224-00010
   Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf) for use with SST
   44 N*m (449 kgf*cm, 32 ft.*lbf) for use without SST
   HINT:
   - Use a torque wrench with a fulcrum length of 30 cm (11.81 in.).
   - Make sure SST and wrench are connected in a straight line.

   (b) Connect the sensor connector.



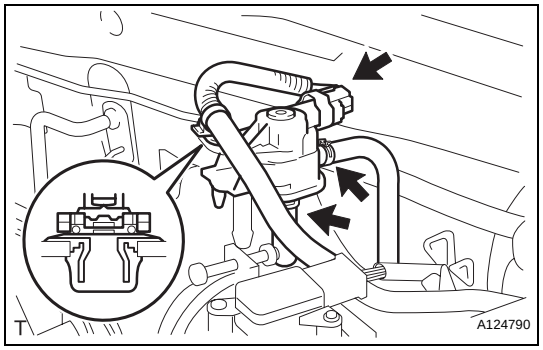
2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

3. **CHECK FOR EXHAUST GAS LEAKS**

EC

VACUUM SWITCHING VALVE

COMPONENTS



EC

REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

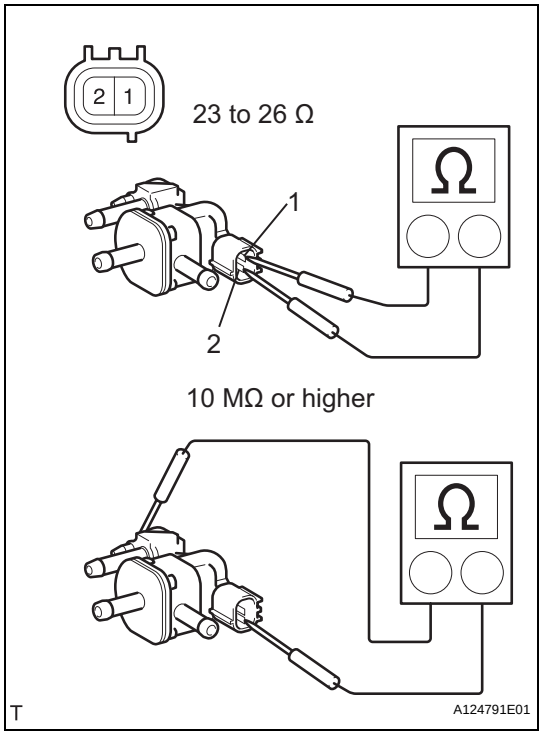
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE PURGE VSV

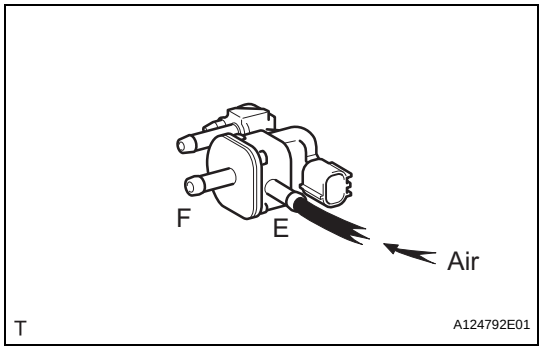
(a) Disconnect the purge VSV connector.
(b) Disconnect the wire harness clamp.
(c) Disconnect the 2 purge line hoses from the purge VSV.
(d) Remove the purge VSV from the air cleaner hose.

INSPECTION



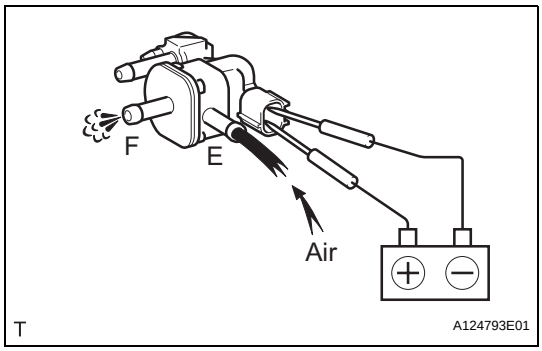
1. INSPECT PURGE VSV

(a) Measure the resistance of the purge VSV.

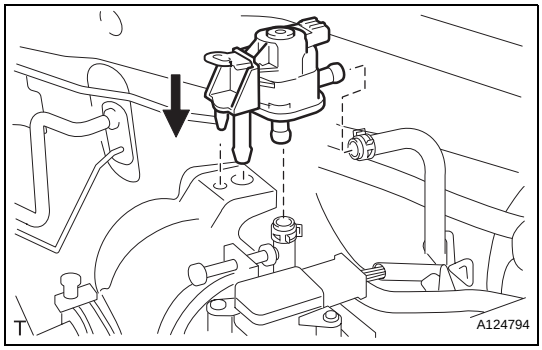


Standard resistance

Tester Connection	Specified Condition
1 - 2	23 to 26 Ω at 20°C (68°F)
1 - Body ground 2 - Body ground	10 MΩ or higher

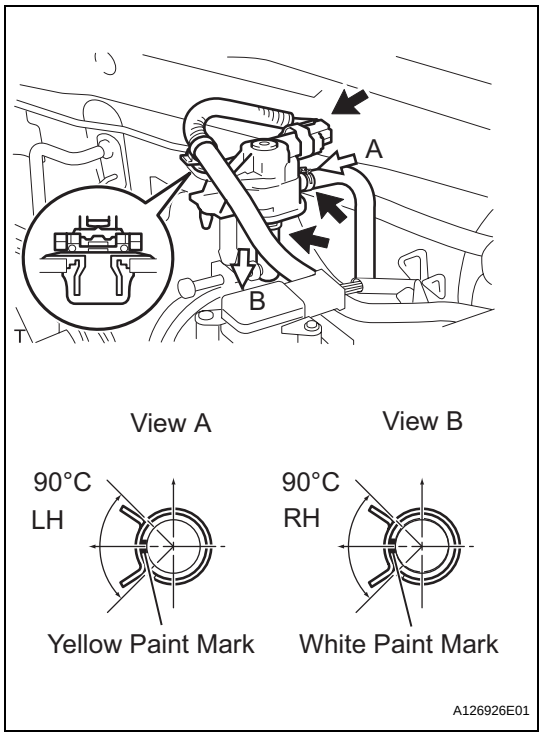


If the result is not as specified, replace the purge VSV.



(b) Check the operation of the purge VSV.
(1) Check that air does not flow from port E to port F.

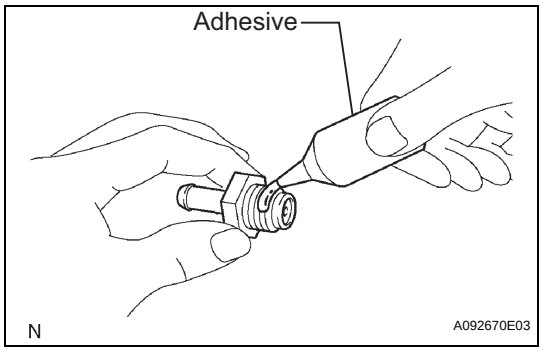
EC



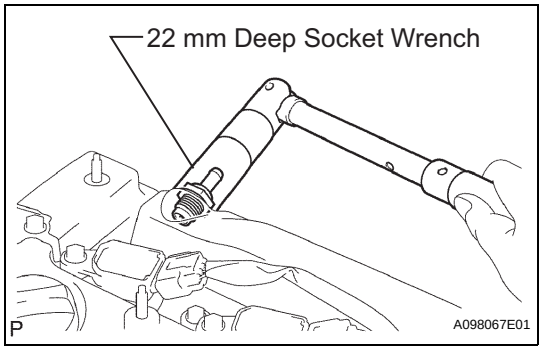
(2) Apply battery voltage across terminals.
(3) Check that air flows from port E to port F.
If the result is not as specified, replace the purge VSV.

INSTALLATION

1. INSTALL PURGE VSV



(a) Install the purge VSV onto the air cleaner hose.



(b) Connect the 2 purge line hoses to the purge VSV.
(c) Connect the wire harness clamp.
(d) Connect the purge VSV connector.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

EC

INSTALLATION

1. INSTALL VENTILATION VALVE SUB-ASSEMBLY

(a) Apply adhesive to 2 or 3 threads of the ventilation valve.

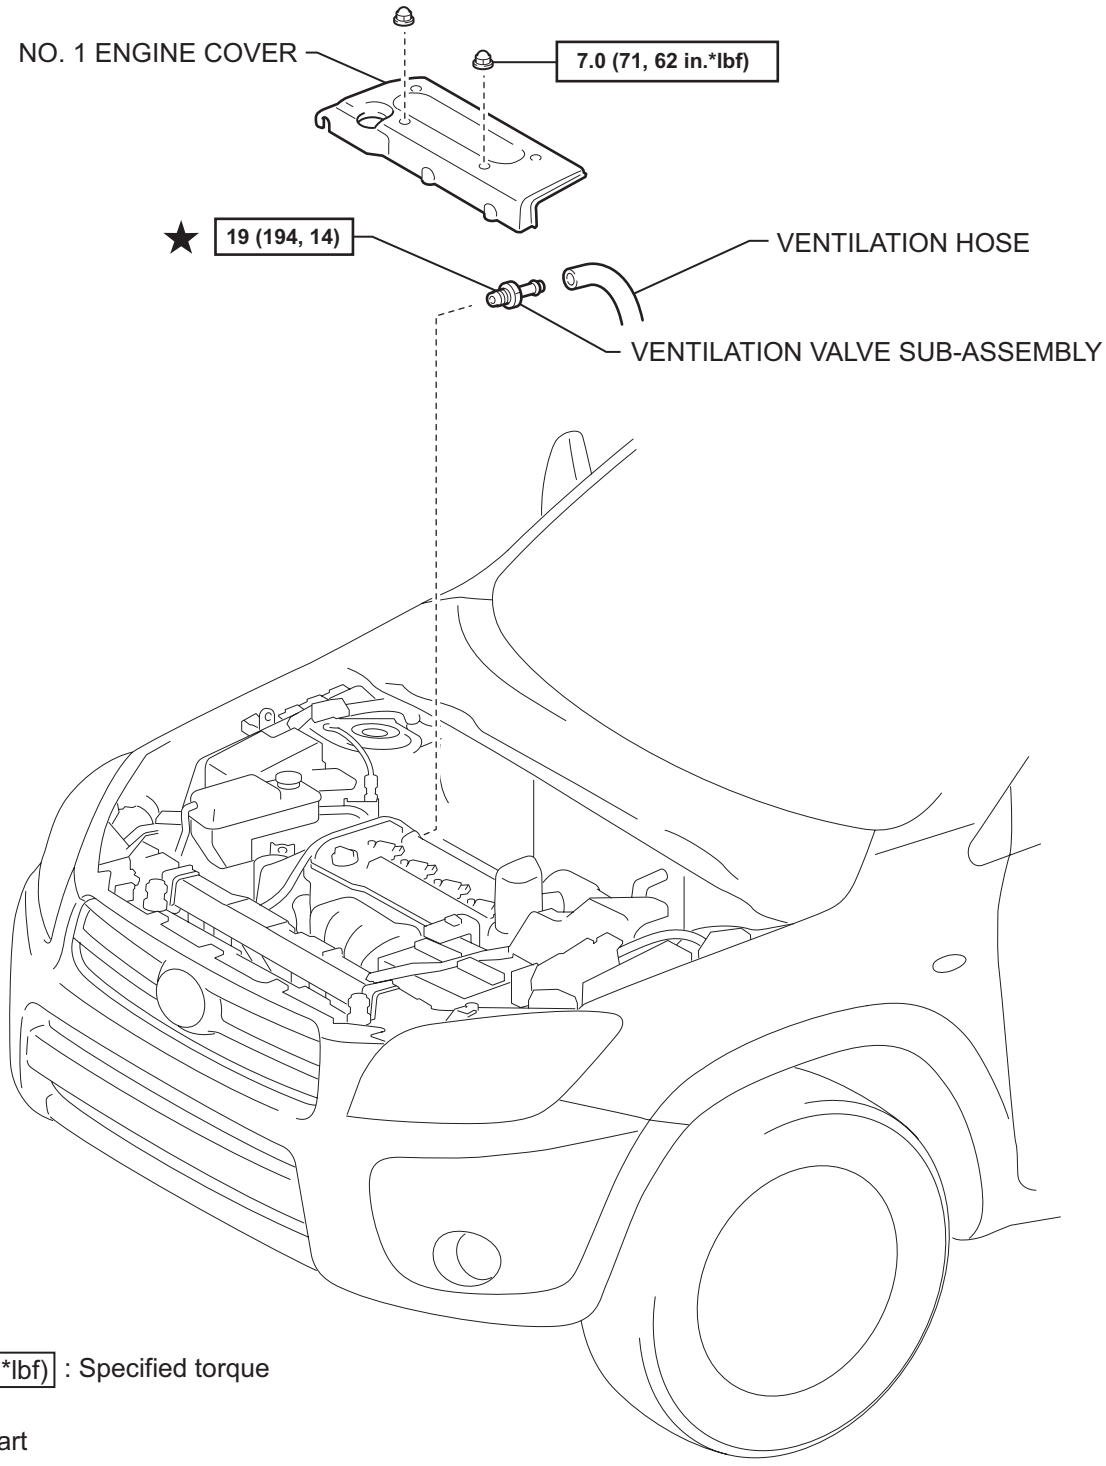
Adhesive:

Toyota genuine adhesive 1324, three bond 1324 or equivalent

(b) Using a 22 mm deep socket wrench, install the ventilation valve.

Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

(c) Connect the ventilation hose.



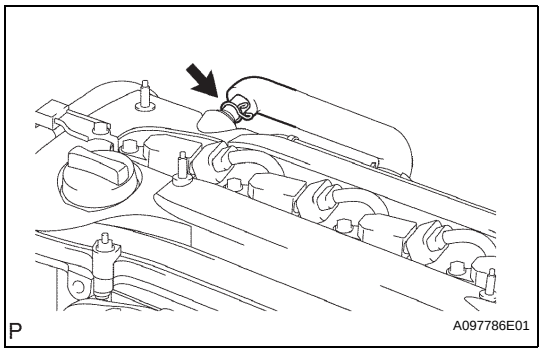
2. INSTALL NO. 1 ENGINE COVER (See page EM-43)

3. CHECK FOR ENGINE OIL LEAKS

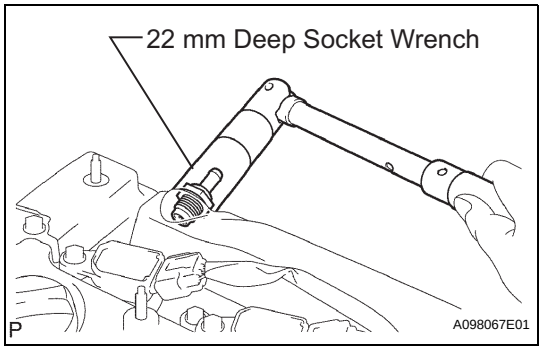
EC

VENTILATION VALVE

COMPONENTS



EC

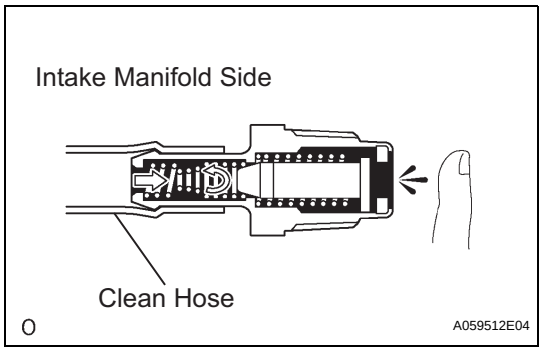


T

REMOVAL

1. **REMOVE NO. 1 ENGINE COVER (See page EM-22)**
2. **REMOVE VENTILATION VALVE SUB-ASSEMBLY**
   (a) Disconnect the ventilation hose from the ventilation valve.

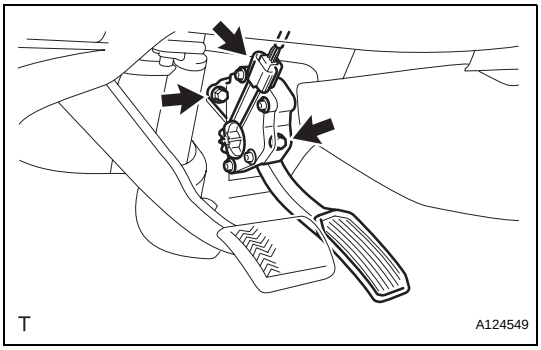
   (b) Using a 22 mm deep socket wrench, remove the ventilation valve.



INSPECTION

1. **INSPECT VENTILATION VALVE SUB-ASSEMBLY**
   (a) Install a clean hose to the ventilation valve.
   (b) Check the ventilation valve operation.
      (1) Blow air into the cylinder head side, and check that air passes through easily.
      CAUTION:
      Do not suck air through the valve.
      Petroleum substances inside the valve are hazardous to your health.

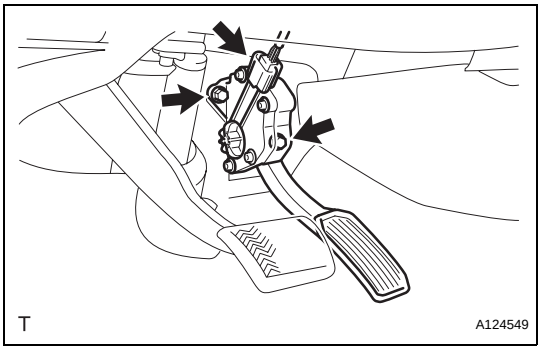
      (2) Blow air into the intake manifold side, and check that air passes through with difficulty.
      If the result is not as specified, replace the ventilation valve sub-assembly.
   (c) Remove the clean hose from the ventilation valve.



ES

REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

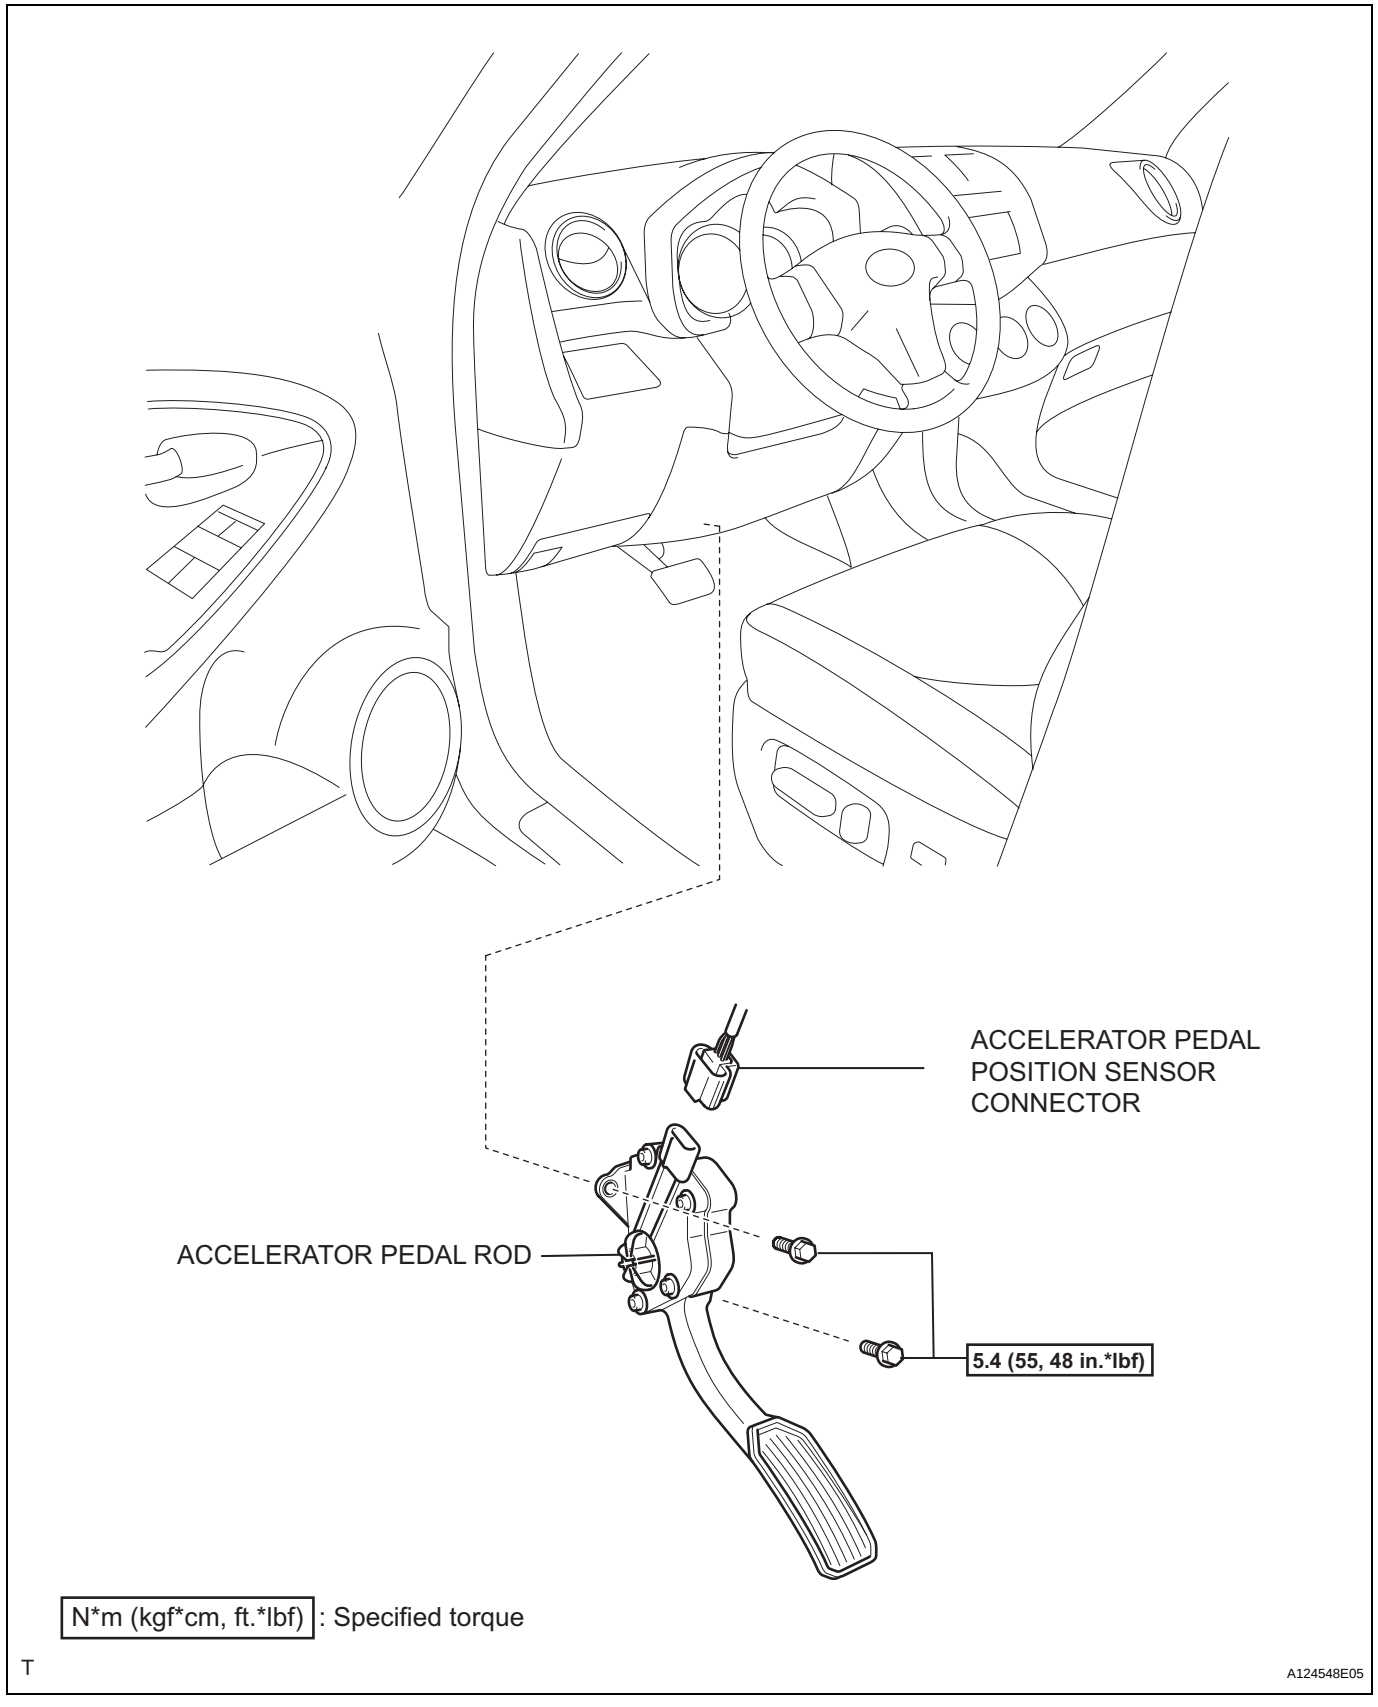


CAUTION:
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

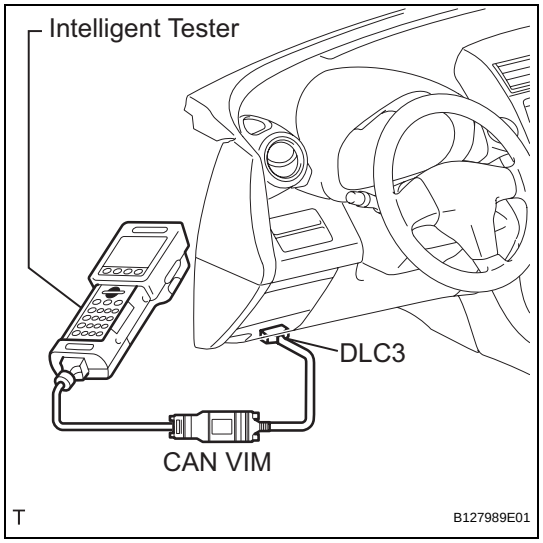
2. REMOVE ACCELERATOR PEDAL ROD

(a) Disconnect the accelerator pedal position sensor connector.
(b) Remove the 2 bolts and accelerator pedal rod.

INSTALLATION



1. INSTALL ACCELERATOR PEDAL ROD



(a) Install the accelerator pedal rod with the 2 bolts.
Torque: 5.4 N*m (55 kgf*cm, 48 in.*lbf)
(b) Connect the accelerator pedal position sensor connector.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ACCELERATOR PEDAL ROD

COMPONENTS

ON-VEHICLE INSPECTION

1. CHECK ACCELERATOR PEDAL ROD

(a) Check the voltage.

(1) Connect the intelligent tester to the DLC3.

(2) Turn the ignition switch ON.

(3) Turn the intelligent tester ON.

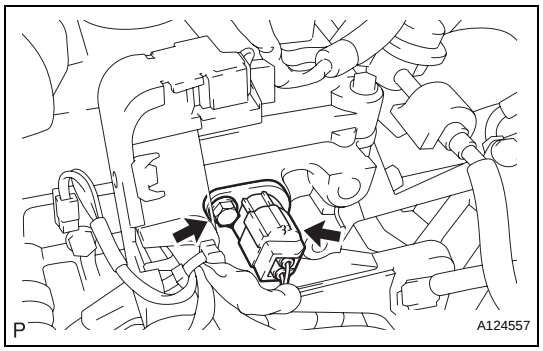
(4) Select the menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ACCEL POS #1, ACCEL POS #2.

(5) Operate the accelerator pedal, and then check that the ACCEL POS #1 and ACCEL POS #2 values are within the specifications.

Standard voltage (ACCEL POS #1)

Accelerator Pedal Condition	Specified Condition
Released	0.5 to 1.1 V
Depressed	2.5 to 4.5 V

Standard voltage (ACCEL POS #2)

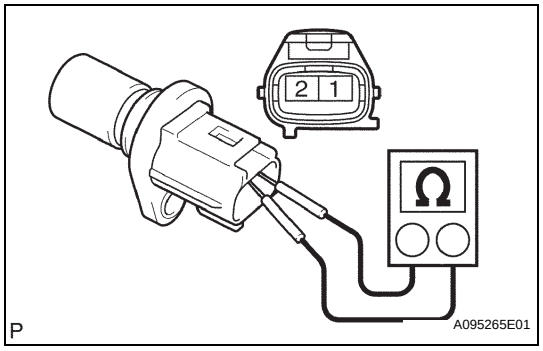


Accelerator Pedal Condition	Specified Condition
Released	1.2 to 2.0 V
Depressed	3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal rod, wire harness or ECM.

ES

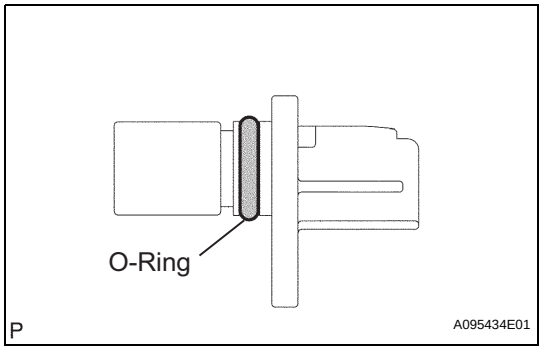
REMOVAL



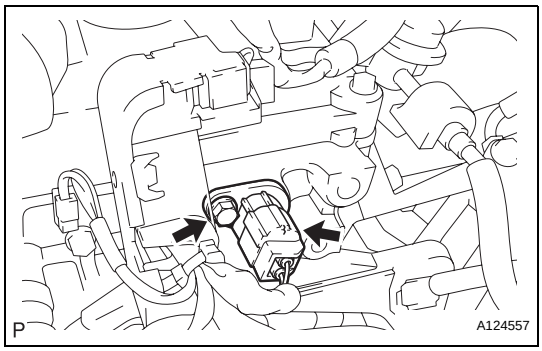
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE NO. 1 ENGINE COVER (See page ES-410)**
3. **REMOVE AIR CLEANER CAP (See page ES-411)**
4. **REMOVE CAMSHAFT POSITION SENSOR**
   (a) Disconnect the sensor connector.
   (b) Remove the bolt and sensor.

INSPECTION

1. **INSPECT CAMSHAFT POSITION SENSOR**
   (a) Measure the resistance of the sensor.
   Standard resistance



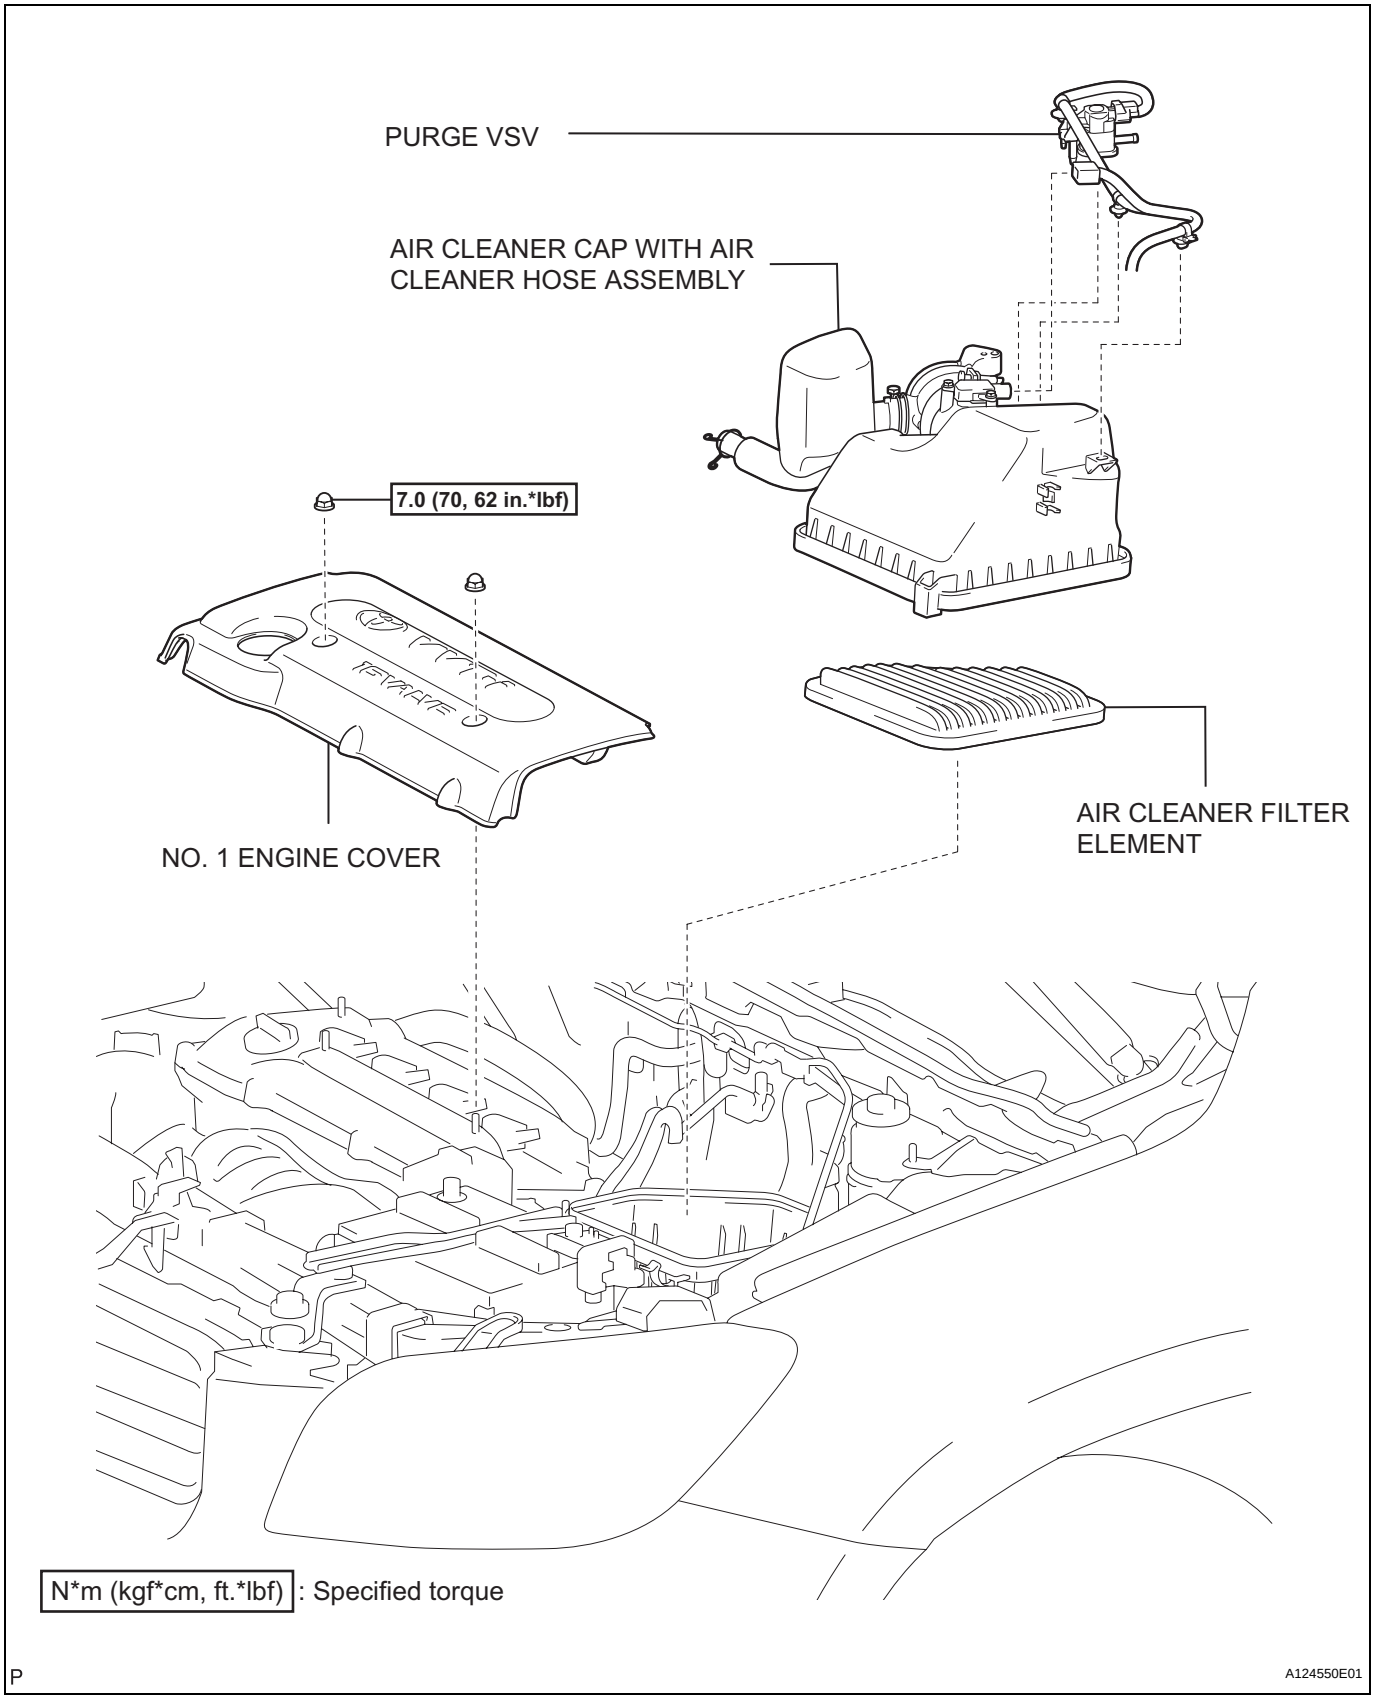
Tester Connection	Specified Condition
1 (G+) - 2 (G-)	835 to 1,400 Ω at Cold
1 (G+) - 2 (G-)	1,060 to 1,645 Ω at Hot



NOTICE:
Cold and Hot mean the temperature of the coils themselves. Cold is from -10 to 50°C (14 to 122 °F) and Hot is from 50 to 100°C (122 to 212°F).
If the result is not as specified, replace the camshaft position sensor.

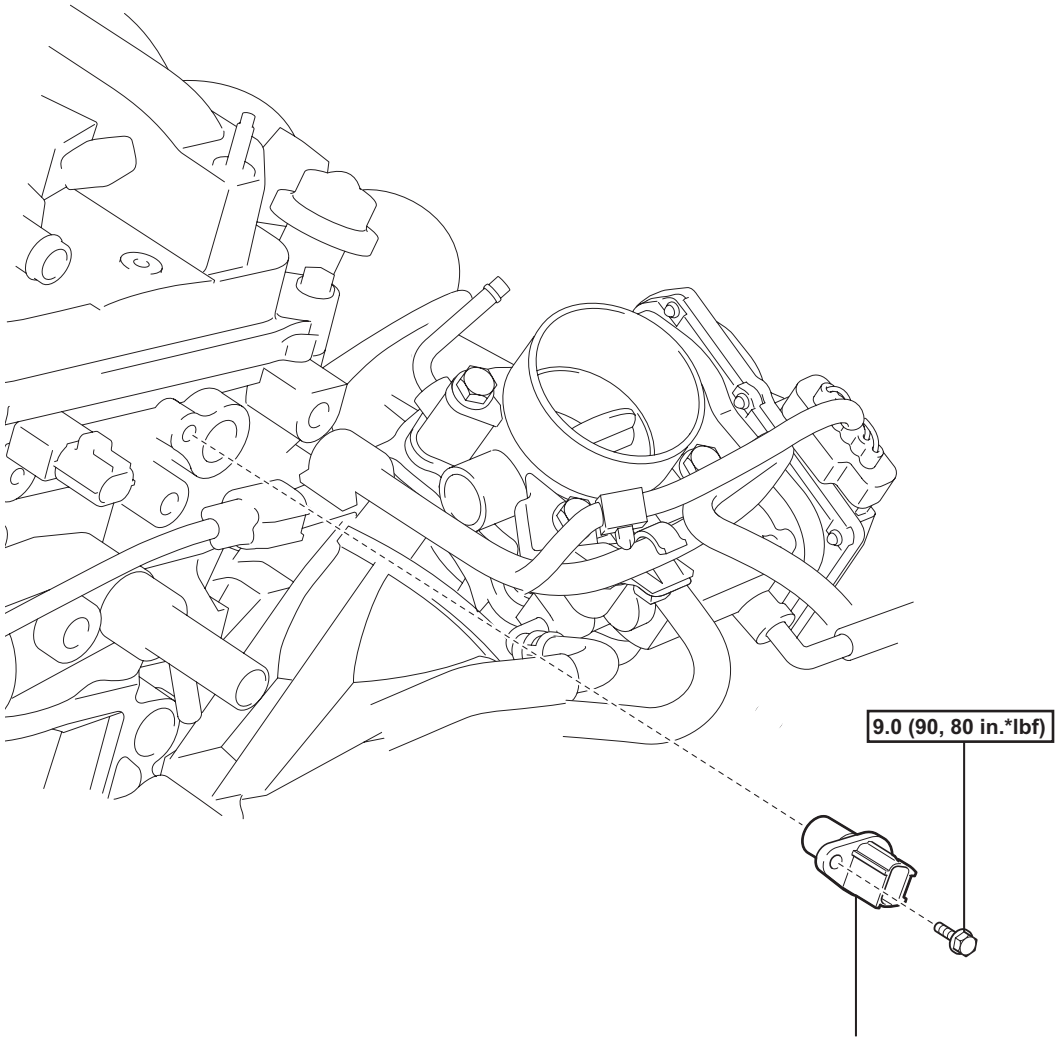
INSTALLATION

1. **INSTALL CAMSHAFT POSITION SENSOR**
   NOTICE:
   Make sure that the O-ring is not cracked or jammed when installing it.
   (a) Apply a light coat of engine oil to the O-ring of the sensor.



(b) Install the sensor with the bolt.
Torque: 9.0 N*m (90 kgf*cm, 80 in.*lbf)
(c) Connect the sensor connector.

2. **INSTALL AIR CLEANER CAP (See page ES-413)**
3. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
4. **CHECK FOR ENGINE OIL LEAKAGE**
5. **INSTALL NO. 1 ENGINE COVER (See page ES-414)**



CAMSHAFT POSITION SENSOR

COMPONENTS

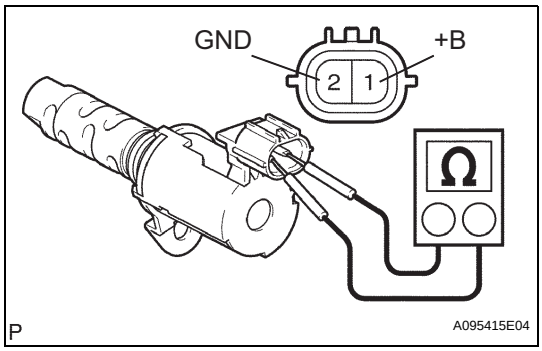
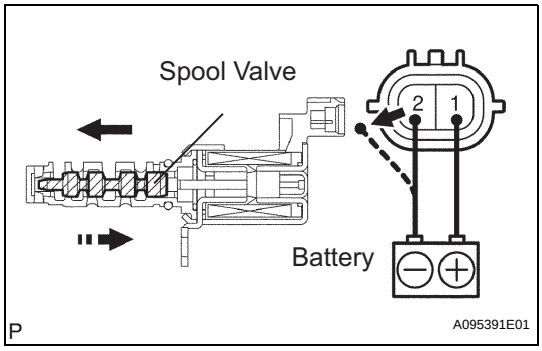
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE NO. 1 ENGINE COVER (See page ES-410)**
3. **REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Disconnect the oil control valve connector.
   (b) Remove the bolt and oil control valve.



INSPECTION



1. **INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Measure the resistance of the oil control valve.
   Standard resistance

Tester Connection	Specified Condition
1 (+B) - 2 (GND)	6.9 to 7.9 Ω at 20°C (68°F)

   If the result is not as specified, replace the oil control valve assembly.

   (b) Check the operation.
   (1) Apply battery voltage across the terminals and check that the spool valve operates.
   NOTICE:
   Check that the spool valve is not stuck.
   HINT:
   The spool valve may not return if foreign objects are caught in it. This may cause subtle pressure leaks to the advance side, and a DTC may be set.

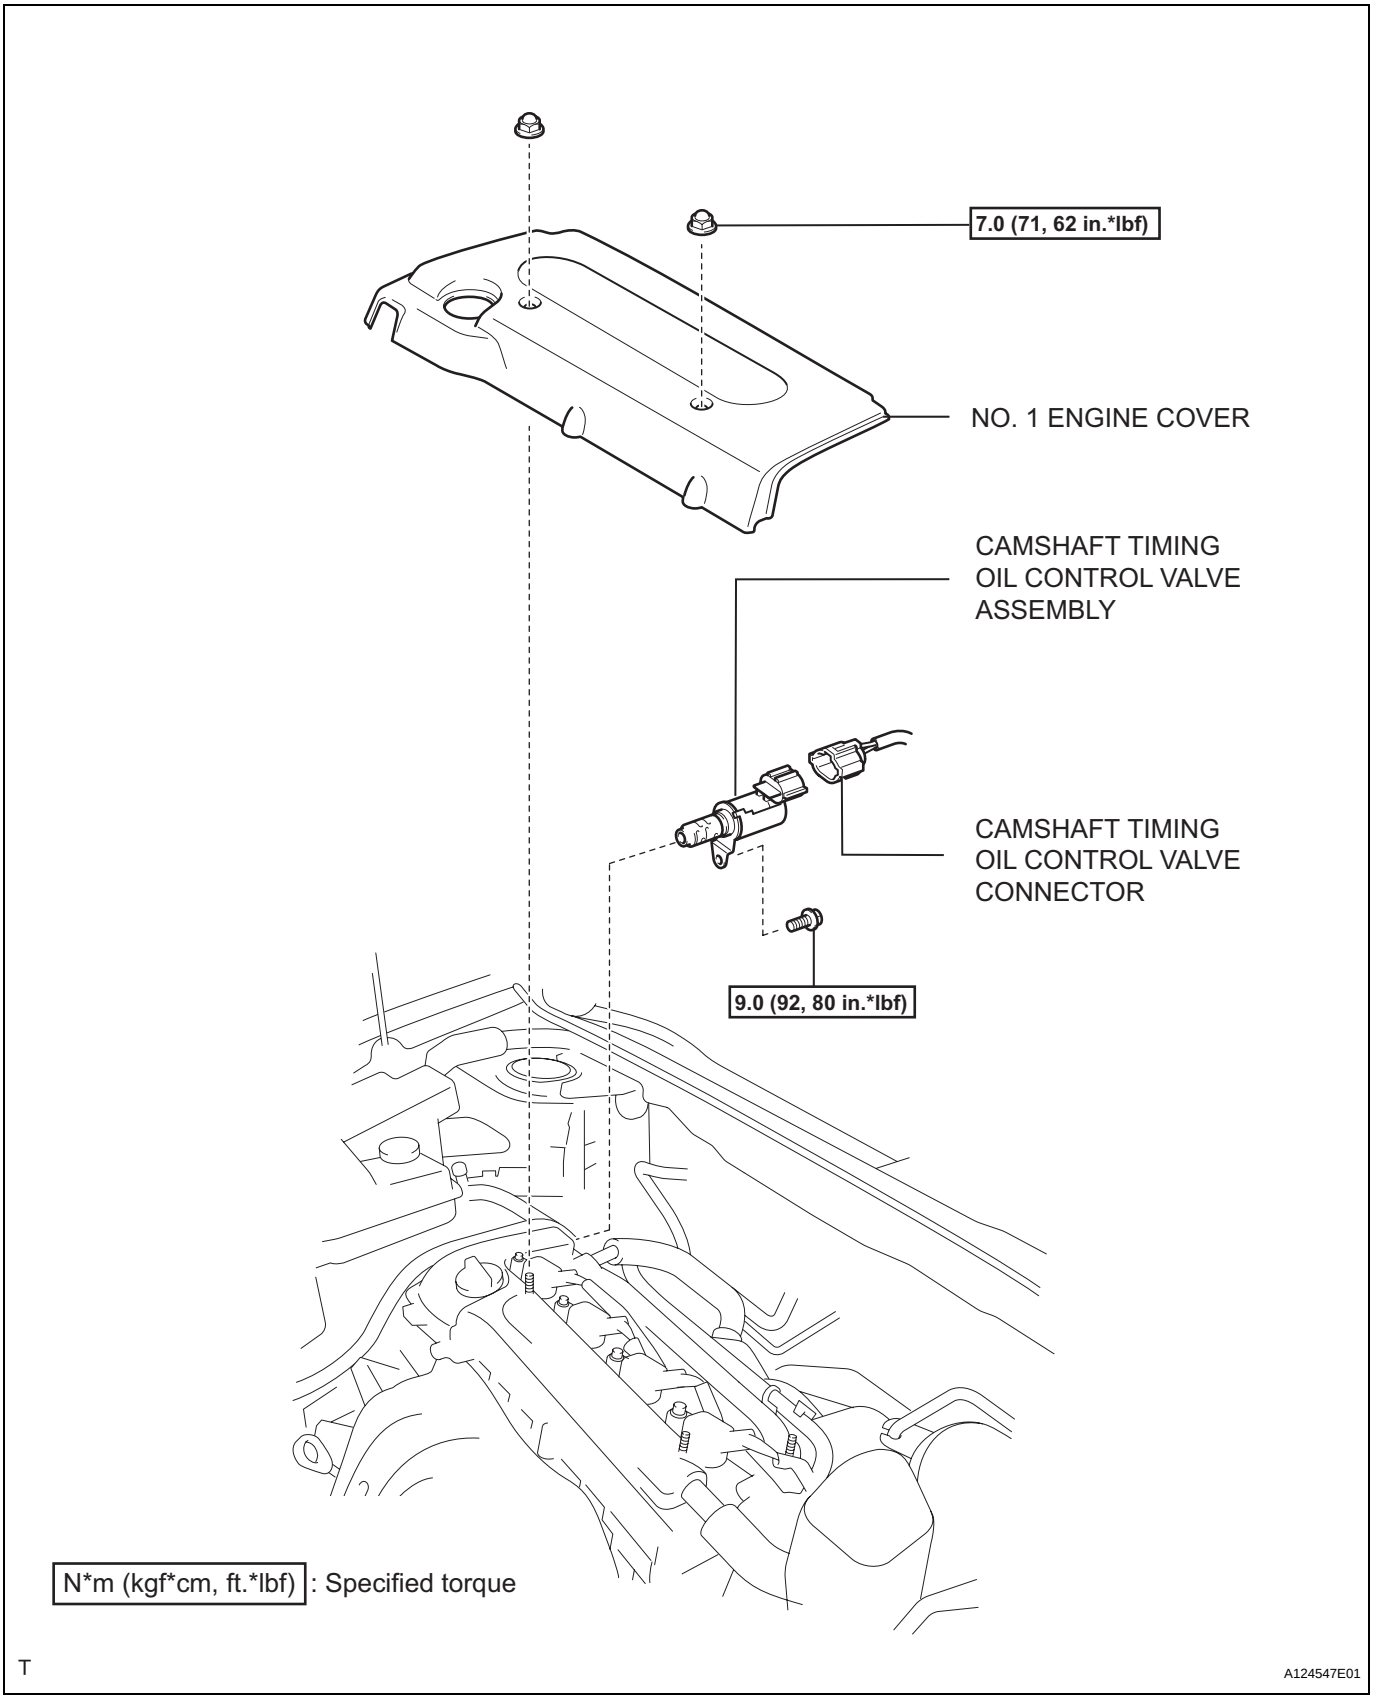
INSTALLATION

1. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Apply a light coat of engine oil to the O-ring of the oil control valve.

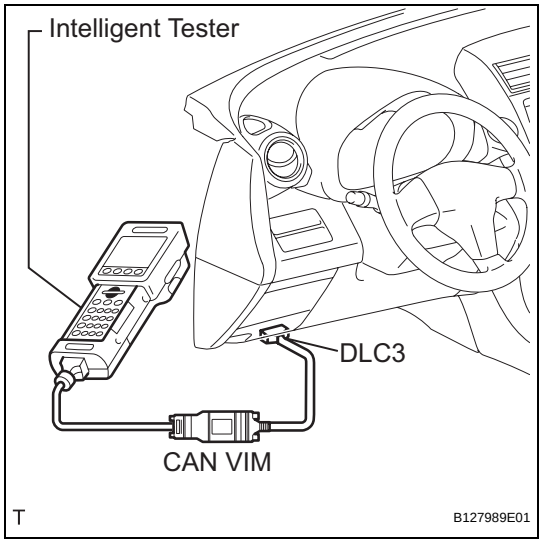
(b) Install the oil control valve with the bolt.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
NOTICE:
Make sure that the O-ring is not cracked or jammed.

(c) Connect the oil control valve connector.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



3. CHECK FOR ENGINE OIL LEAKS



(a) Start the engine, and check that there are no oil leaks.

4. INSTALL NO. 1 ENGINE COVER (See page ES-414)

CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

COMPONENTS

ON-VEHICLE INSPECTION

1. CHECK CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

(a) Check the operation.

(1) Connect the intelligent tester to the DLC3.

(2) Turn the ignition switch ON.

(3) Turn the intelligent tester main switch ON.

(4) Start and warm up the engine.

(5) Select the menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.

(6) Operate the OCV using the intelligent tester, and then check the engine speed.

Standard condition

Tester Operation	Specified Condition
OCV is OFF	**Normal engine speed**
OCV is ON	**Rough idling or engine stalls**

If the operation is not as specified, check the oil control valve, wire harness and ECM.

ES

CIRCUIT OPENING RELAY

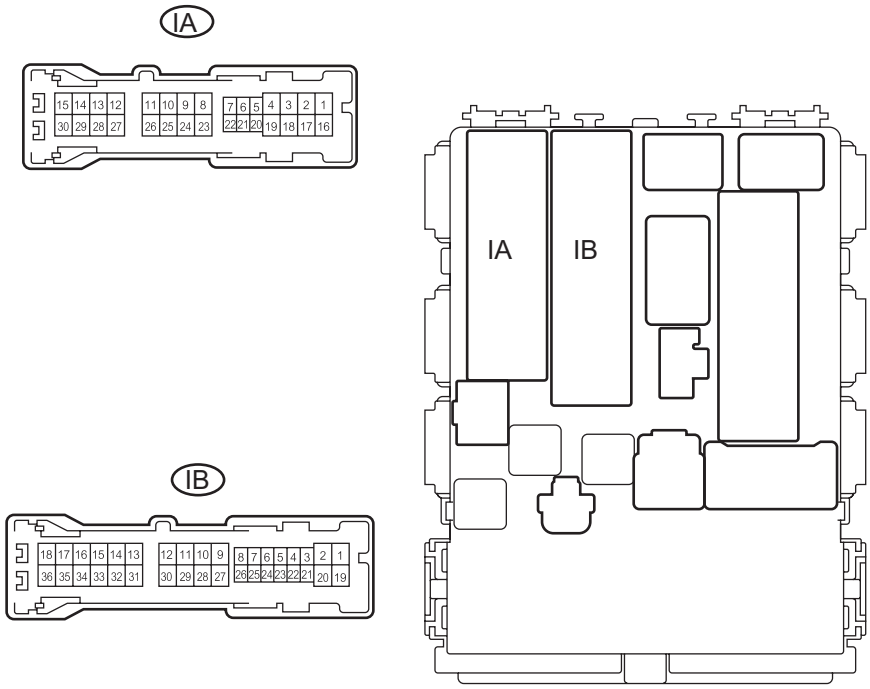
ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. INSPECT INSTRUMENT PANEL JUNCTION BLOCK



NOTICE:

The circuit opening relay is built into the instrument panel junction block.

(a) Measure the resistance between the terminals.

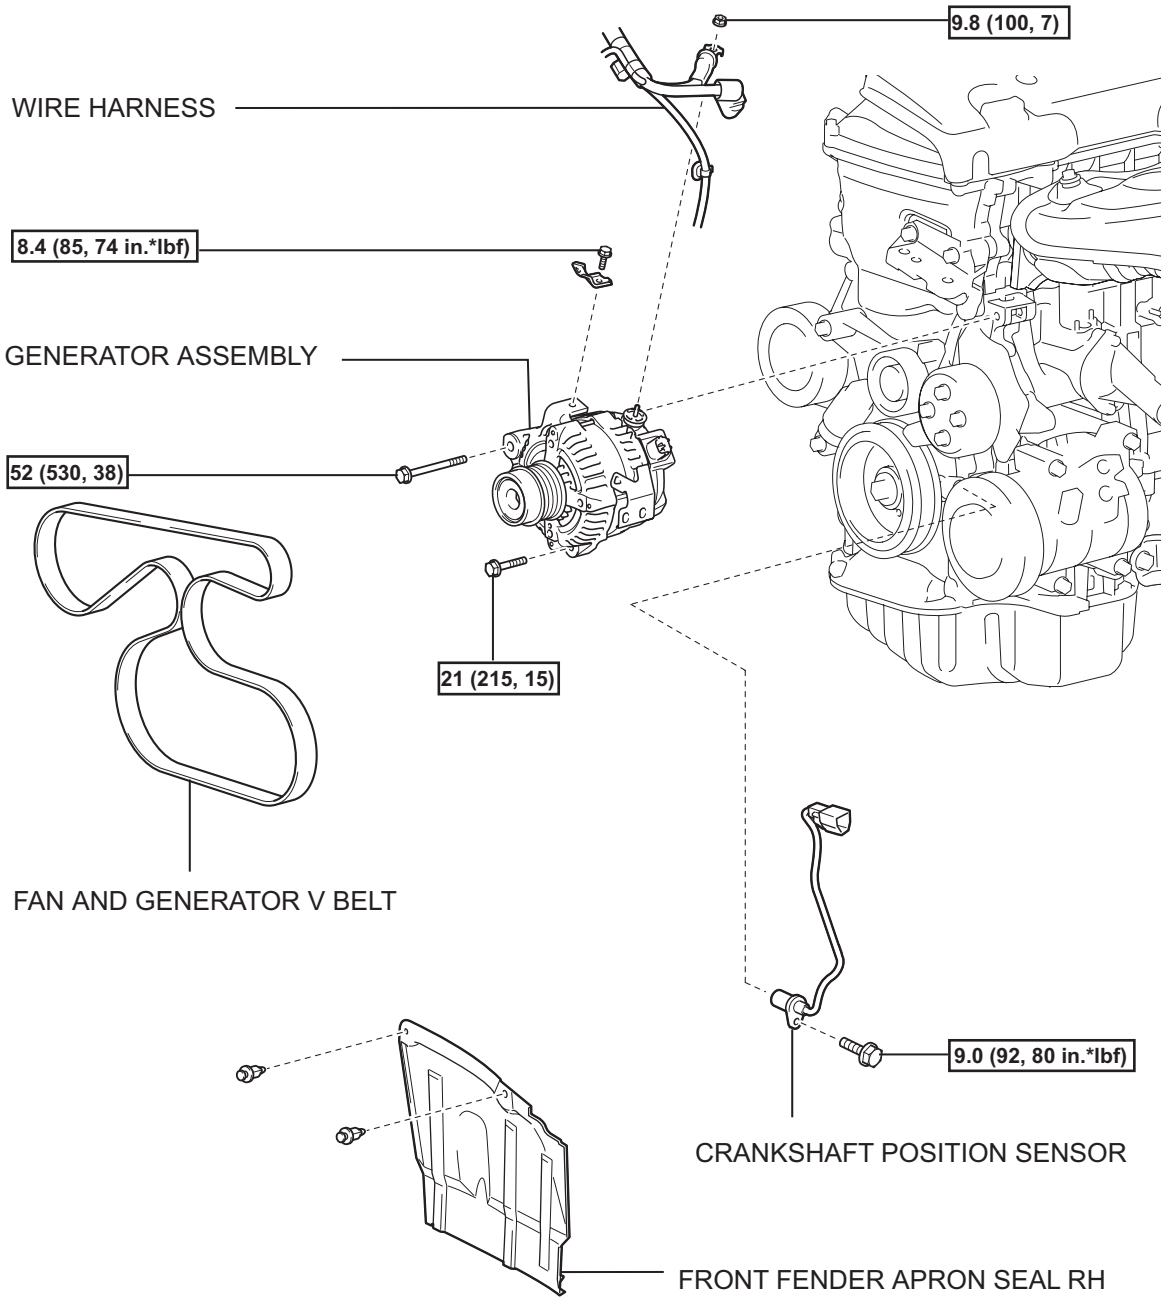
ES

Instrument Panel Junction Block (Front View)

H

E114510E25

Standard resistance



Tester Connection	Specified Condition
1B-11 - 1A-8	10 kΩ or higher
1B-11 - 1A-8	Below 1 Ω (when battery voltage is applied to terminals 1E-5 and 1D-1)

If the result is not as specified, replace the instrument panel junction block.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

CRANKSHAFT POSITION SENSOR

COMPONENTS

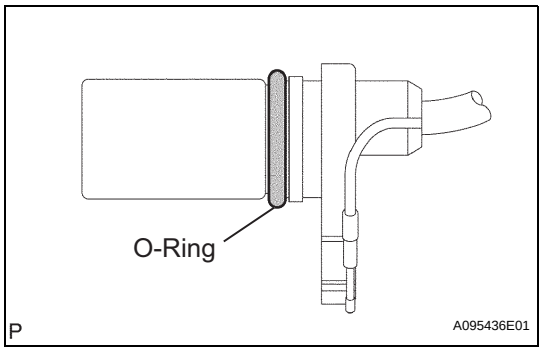
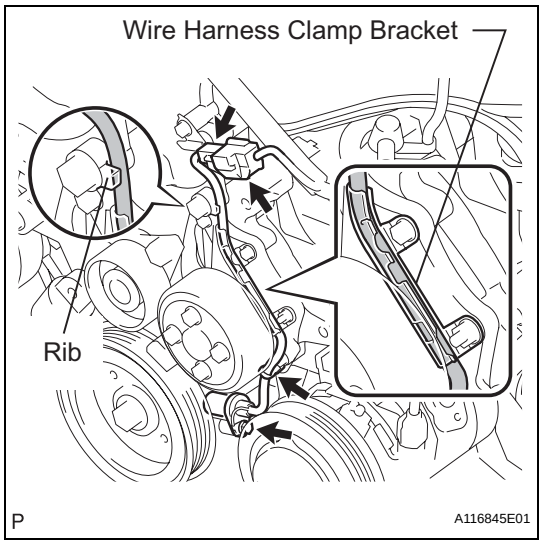
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE GENERATOR ASSEMBLY**
   (a) Remove the generator assembly from the vehicle (see page CH-9).
3. **REMOVE CRANKSHAFT POSITION SENSOR**
   (a) Disconnect the sensor connector.
   (b) Remove the connector clamp.
   (c) Remove the wire harness from the wire harness clamp bracket.
   (d) Remove the wire harness clamp.
   (e) Remove the bolt and sensor.

INSPECTION



1. **INSPECT CRANKSHAFT POSITION SENSOR**
   (a) Measure the resistance of the sensor.
   Standard resistance



Tester Connection	Specified Condition
1 (NE+) - 2 (NE-)	985 to 1,600 Ω at Cold
1 (NE+) - 2 (NE-)	1,265 to 1,890 Ω at Hot

NOTICE:
Cold and Hot mean the temperature of the coils themselves. Cold is from -10 to 50°C (14 to 122°F) and Hot is from 50 to 100°C (122 to 212°F).
If the result is not as specified, replace the crankshaft position sensor.

INSTALLATION

1. **INSTALL CRANKSHAFT POSITION SENSOR**
   NOTICE:
   Make sure that the O-ring is not cracked or jammed when installing it.
   (a) Apply a light coat of engine oil to the O-ring of the sensor.

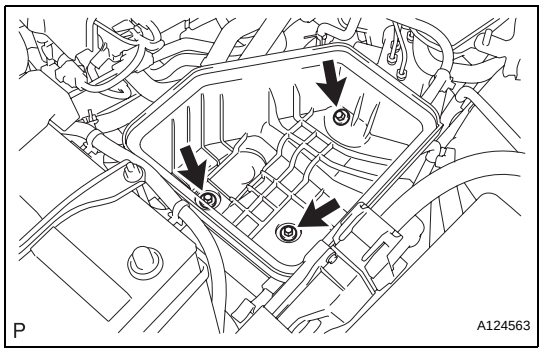
(b) Install the sensor with the bolt.
Torque: 9.0 N*m (90 kgf*cm, 80 in.*lbf)
(c) Install the wire harness clamp.
(d) Install the connector clamp.
(e) Connect the sensor connector.
(f) Confirm that the wire harness of the sensor is secured to the wire harness clamp bracket through the back of the rib of the timing chain cover.

2. INSTALL GENERATOR ASSEMBLY

(a) Install the generator to the vehicle (see page CH-15).

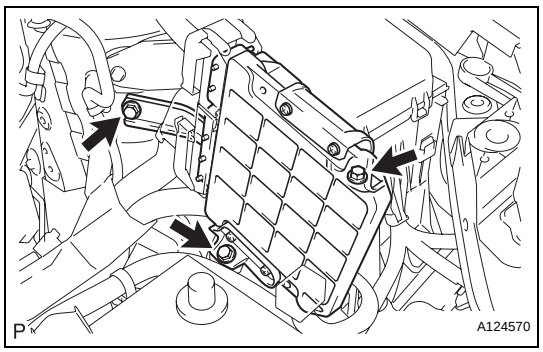
3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

4. CHECK FOR ENGINE OIL LEAKAGE



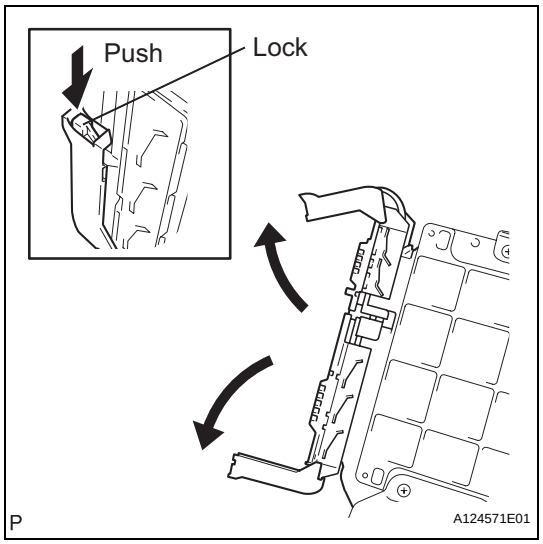
ES

REMOVAL

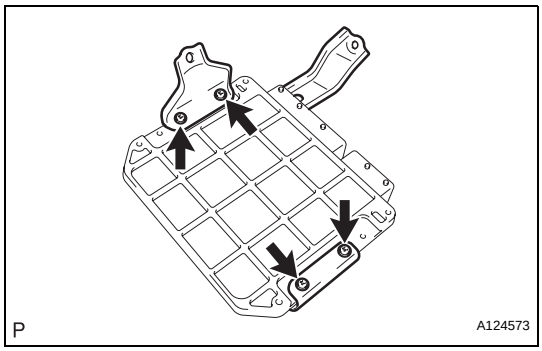


1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. **REMOVE AIR CLEANER CAP (See page ES-411)**

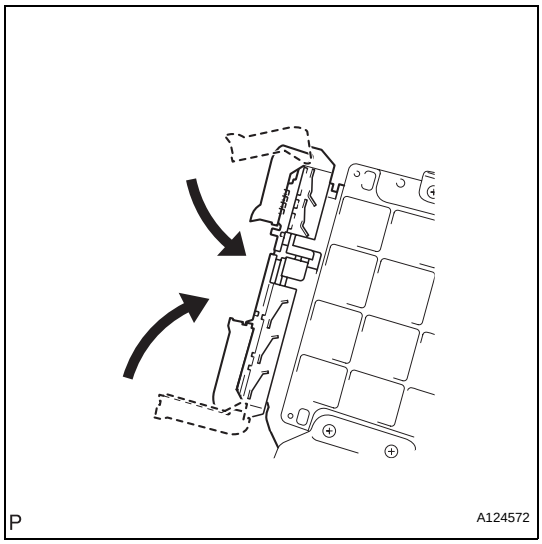


3. **REMOVE AIR CLEANER CASE**
   (a) Disconnect the harness clamp.
   (b) Remove the 3 bolts and air cleaner case.



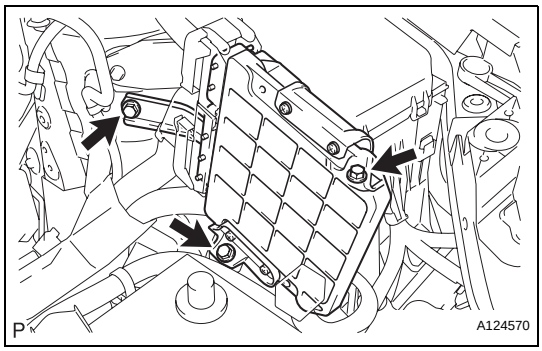
4. **REMOVE ECM**
   (a) Remove the 3 bolts of the ECM with bracket.

   (b) Disconnect the 2 ECM connectors.
   NOTICE:
   After disconnecting the connector, make sure that dirt, water and other foreign matter does not contact the connecting part of the connector.
      (1) Raise the 2 levers while pushing the locks on the 2 levers, and disconnect the 2 ECM connectors.
   (c) Remove the ECM with bracket.

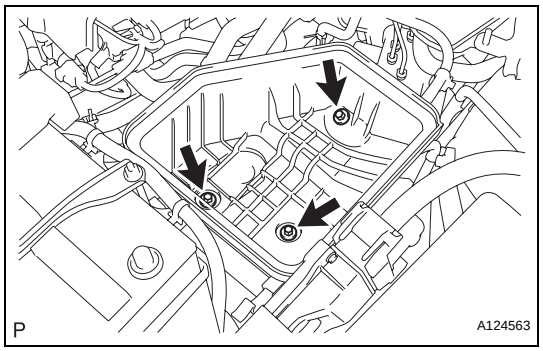


(d) Remove the 4 screws and 2 ECM brackets.

INSTALLATION



1. INSTALL ECM



(a) Install the 2 brackets to the ECM with the 4 screws.
Torque: 3.0 N*m (30 kgf*cm, 27 in.*lbf)

(b) Connect the 2 ECM connectors.
NOTICE:
When connecting the connector, make sure that dirt, water and other foreign matter does not become stuck between the connector and other part.
(1) Connect the 2 ECM connectors and lower the 2 levers.
NOTICE:
Make sure that the 2 levers are securely lowered.

(c) Install the ECM with the 3 bolts.
Torque: 6.5 N*m (66 kgf*cm, 57 in.*lbf)

2. INSTALL AIR CLEANER CASE

(a) Install the air cleaner case with the 3 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

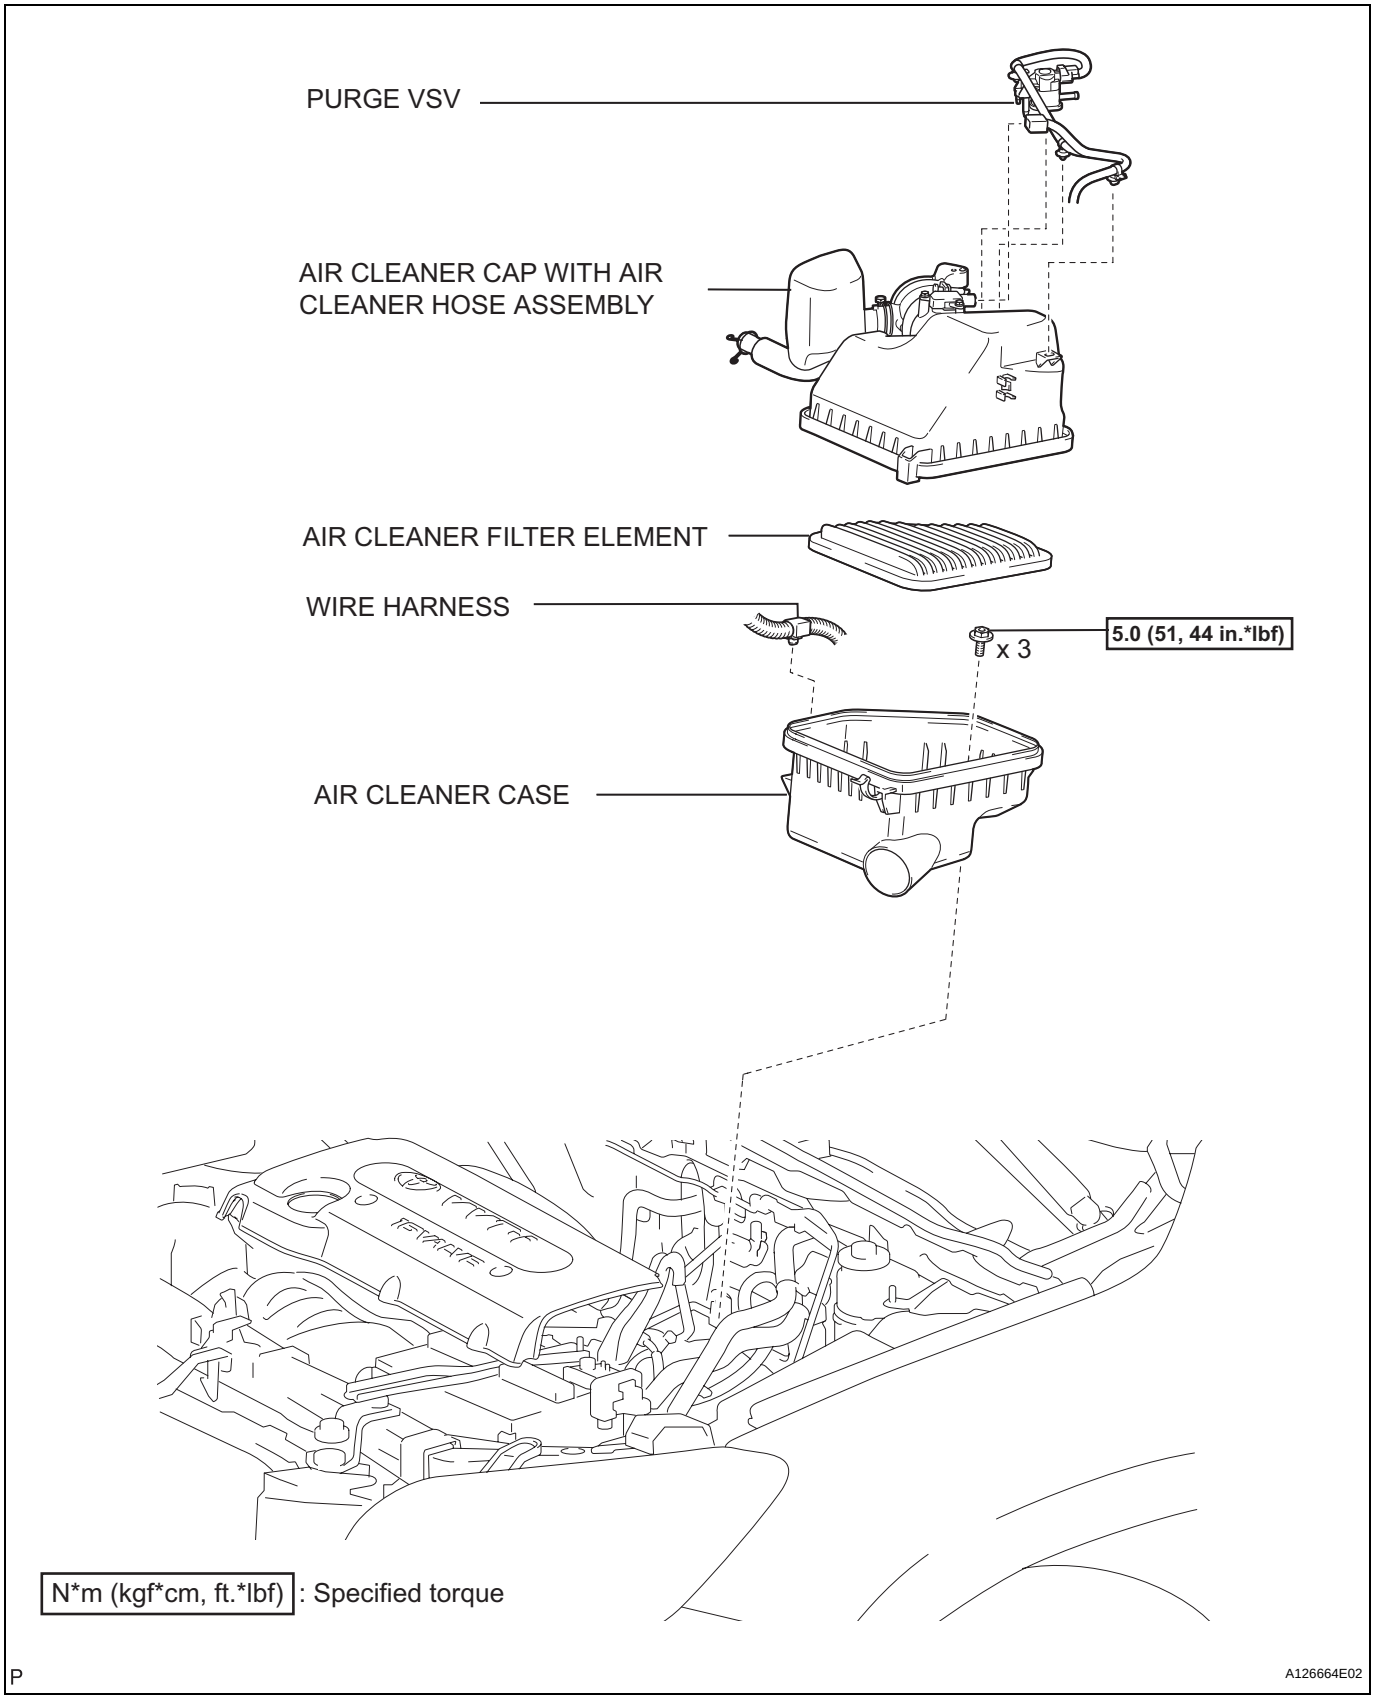
(b) Connect the harness clamp.

3. INSTALL AIR CLEANER CAP (See page ES-413)

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

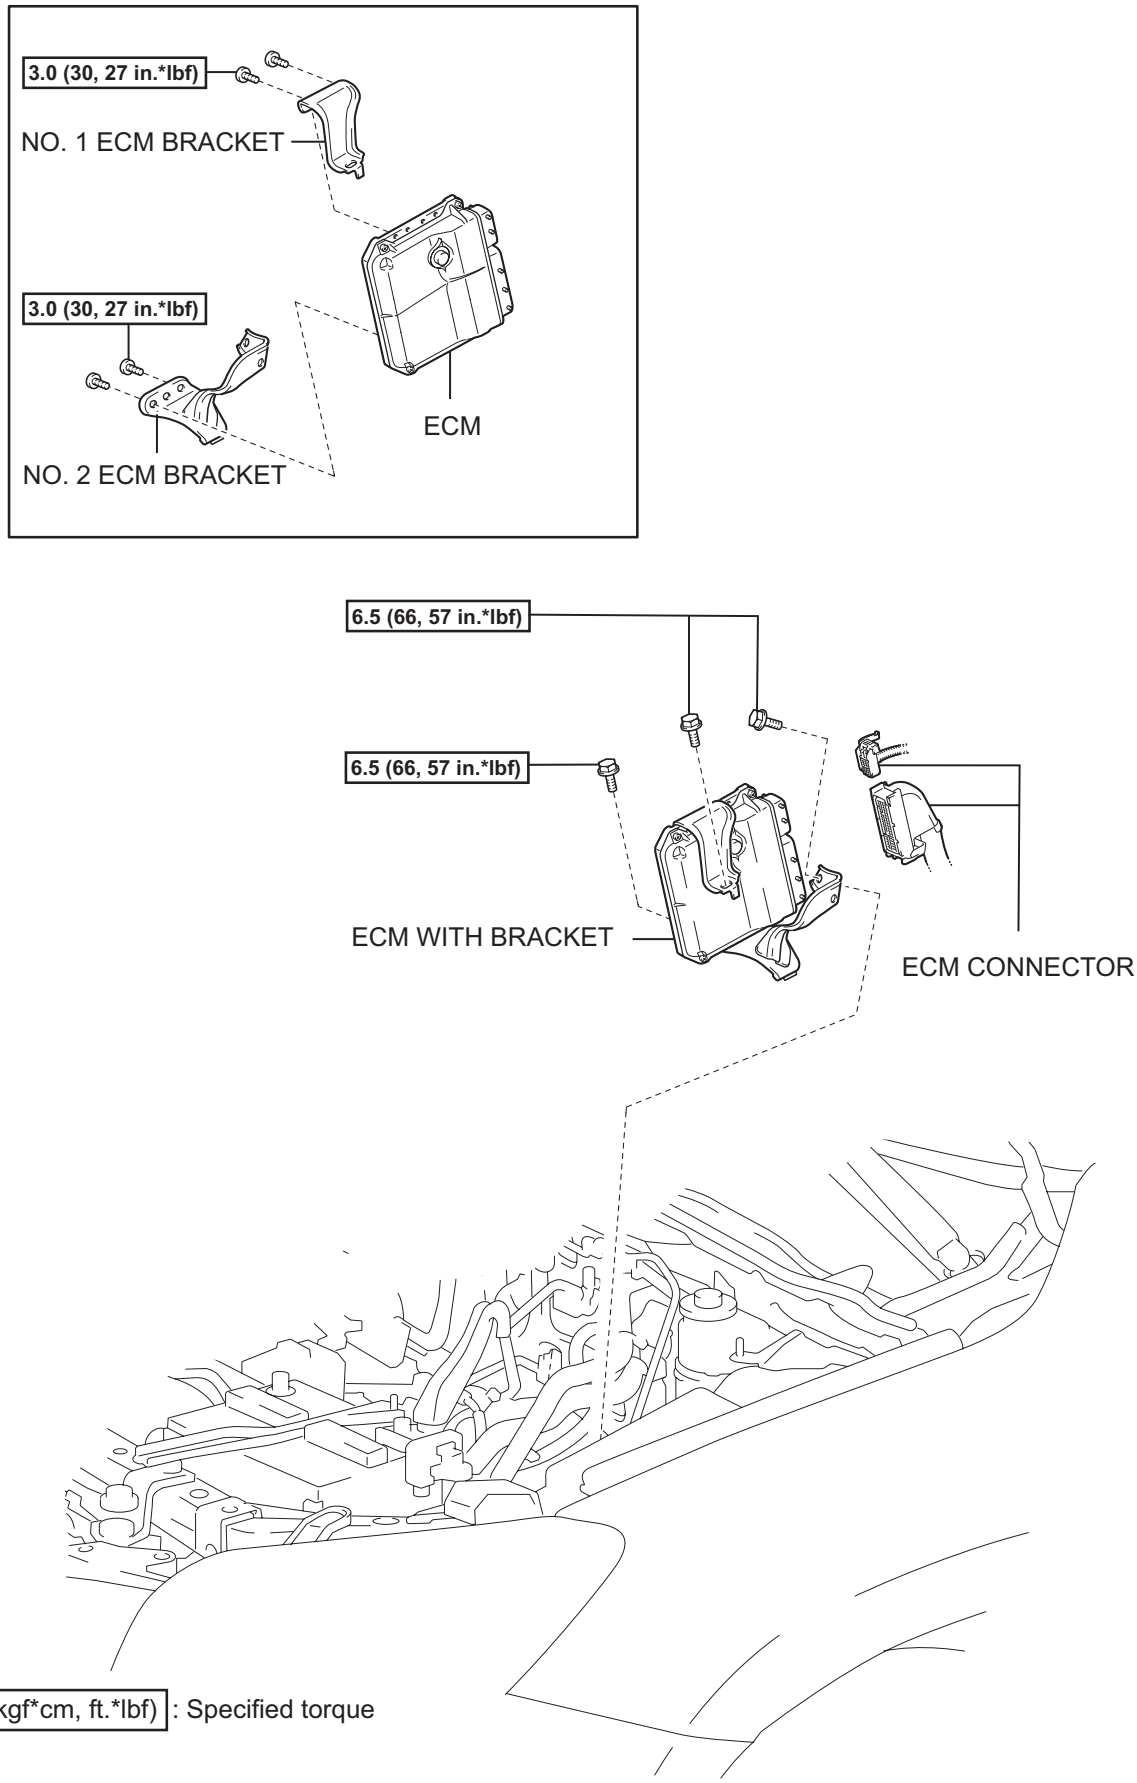
5. PERFORM REGISTRATION

(a) When replacing the ECM, the Vehicle Identification Number (VIN) must be input into the replacement ECM (see page ES-13).



(b) When replacing the ECM, perform the vehicle stability control system recognition in the ECM (see page CC-12).

6. RESET MEMORY



(a) When replacing the ECM, perform the RESET MEMORY procedure (A/T initialization) (see page AX-18).

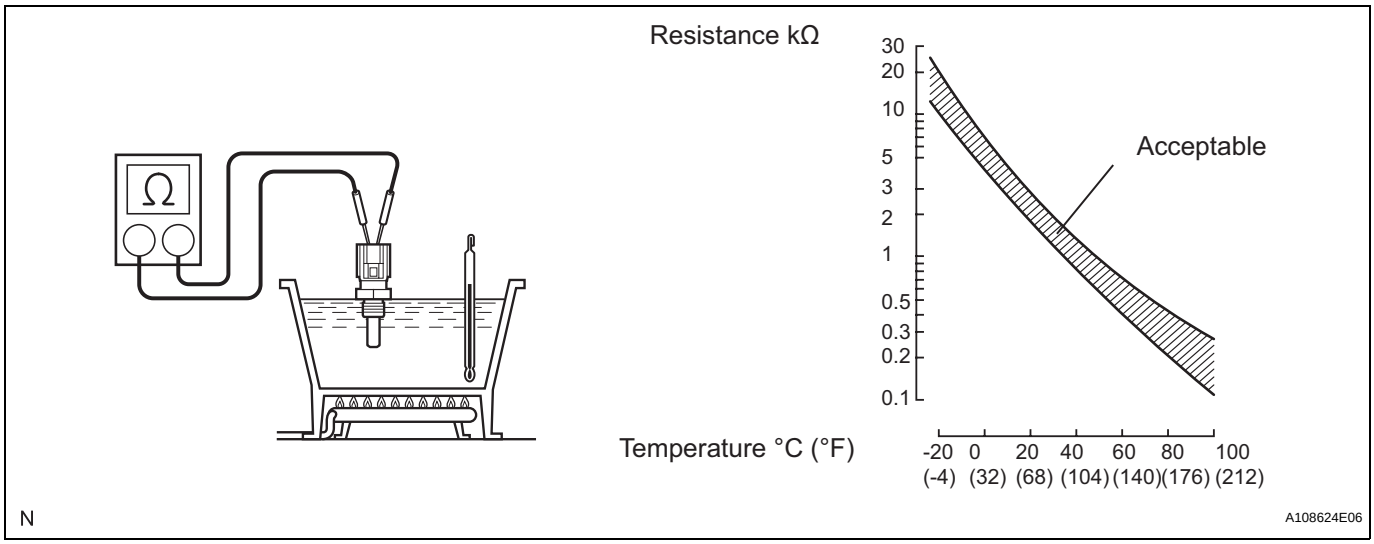
REMOVAL

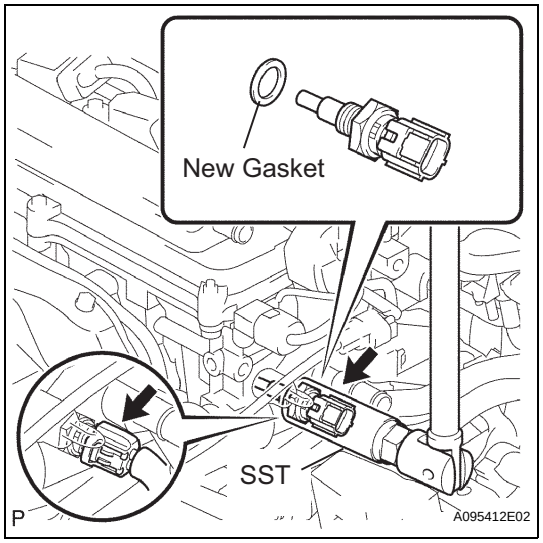


1. **DRAIN ENGINE COOLANT (See page CO-6)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE AIR CLEANER CAP (See page ES-411)**
4. **REMOVE AIR CLEANER CASE (See page ES-429)**
5. **REMOVE ENGINE COOLANT TEMPERATURE SENSOR**
   (a) Disconnect the sensor connector.
   (b) Using SST, remove the sensor and gasket.
   SST 09817-33190

INSPECTION

1. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

(a) Measure the resistance of the sensor.



Standard resistance

Tester Connection	Specified Condition
1 (E2) - 2 (THW)	2.32 to 2.59 kΩ at 20°C (68°F)
1 (E2) - 2 (THW)	0.310 to 0.326 kΩ at 80°C (176°F)

NOTICE:
If checking the sensor in water, be careful not to allow water to contact the terminals. After checking, wipe the water off the sensor.

If the result is not as specified, replace the sensor.

INSTALLATION

1. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

(a) Install a new gasket onto the sensor.

(b) Using SST, install the sensor.

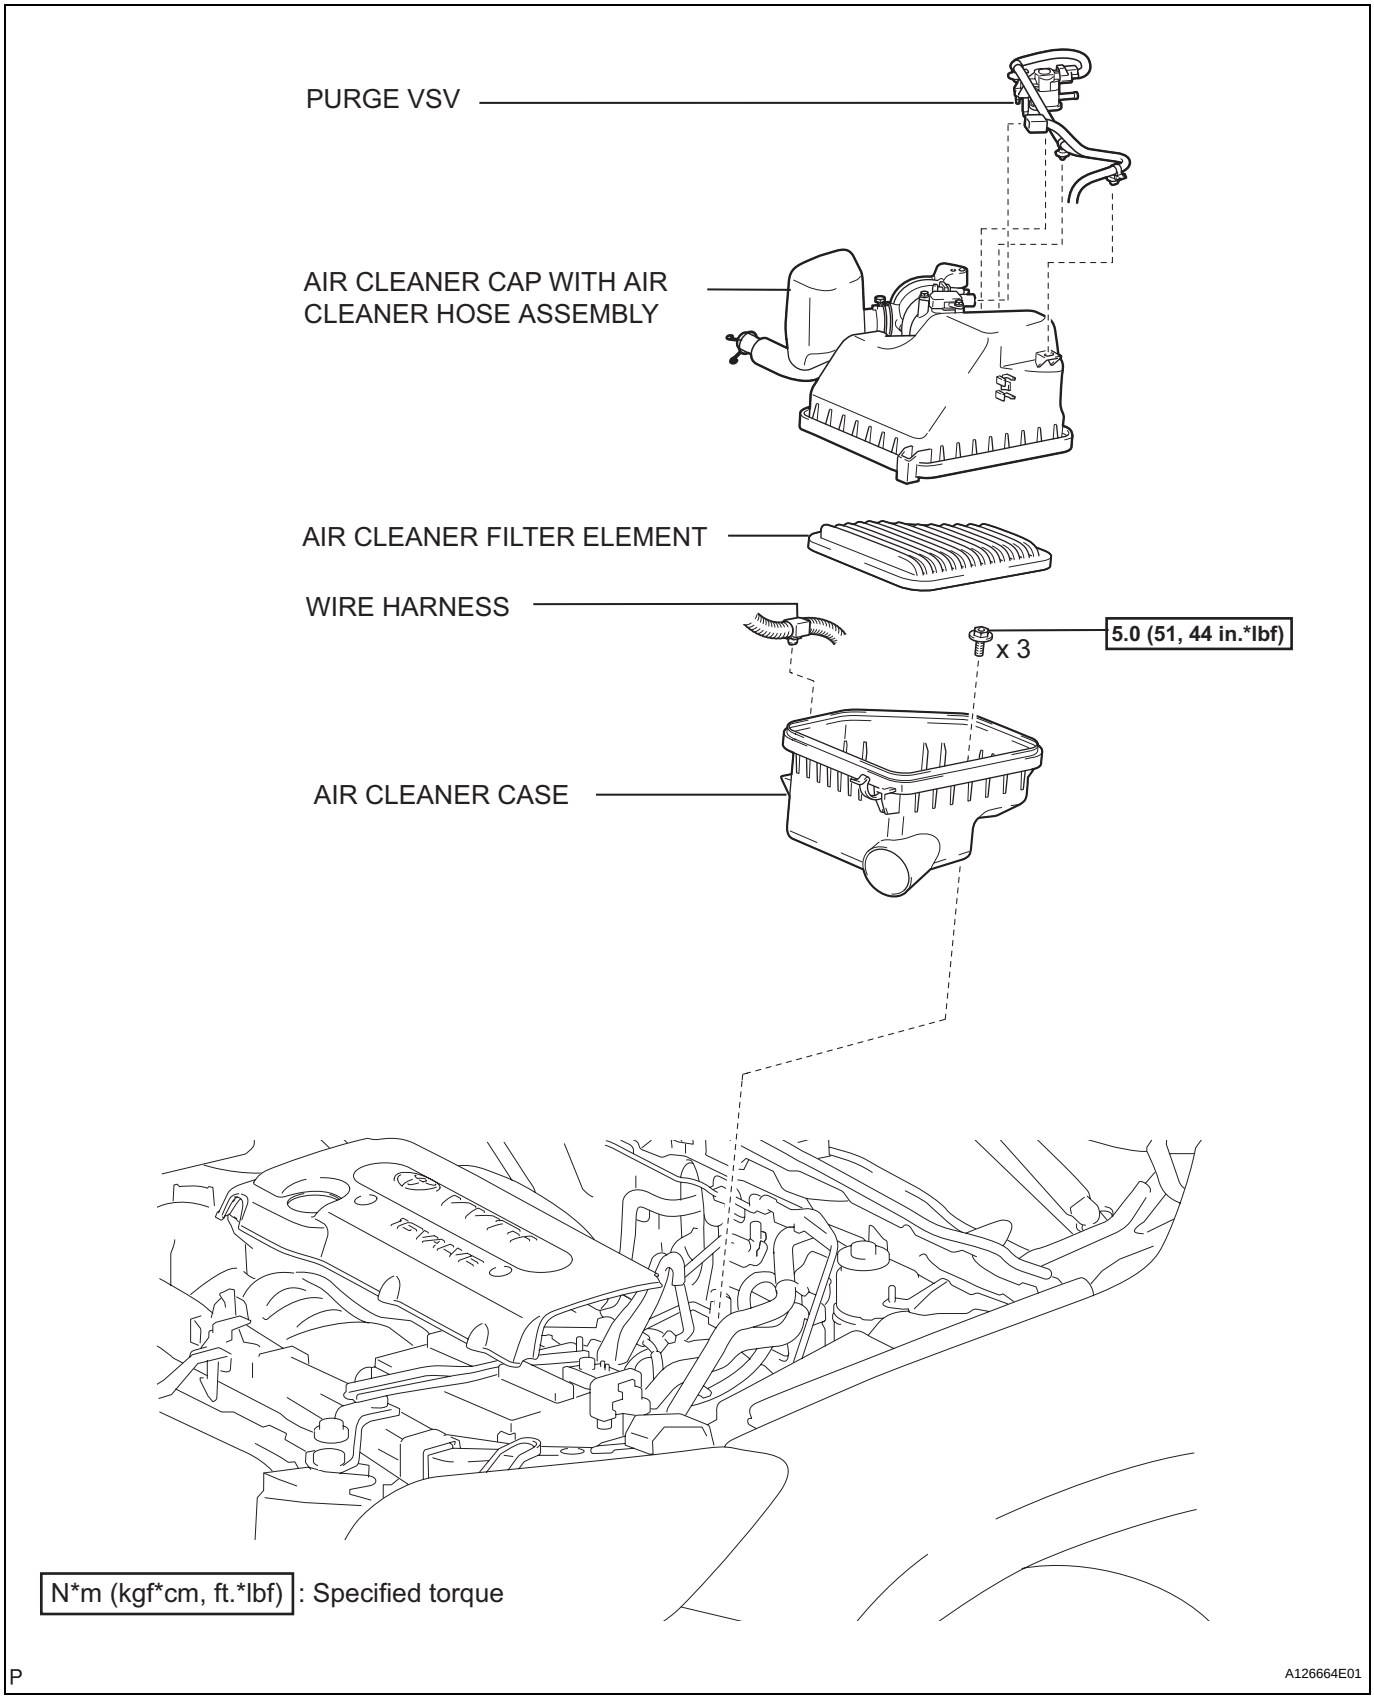
SST 09817-33190

Torque: 19.6 N*m (200 kgf*cm, 14 ft.*lbf)

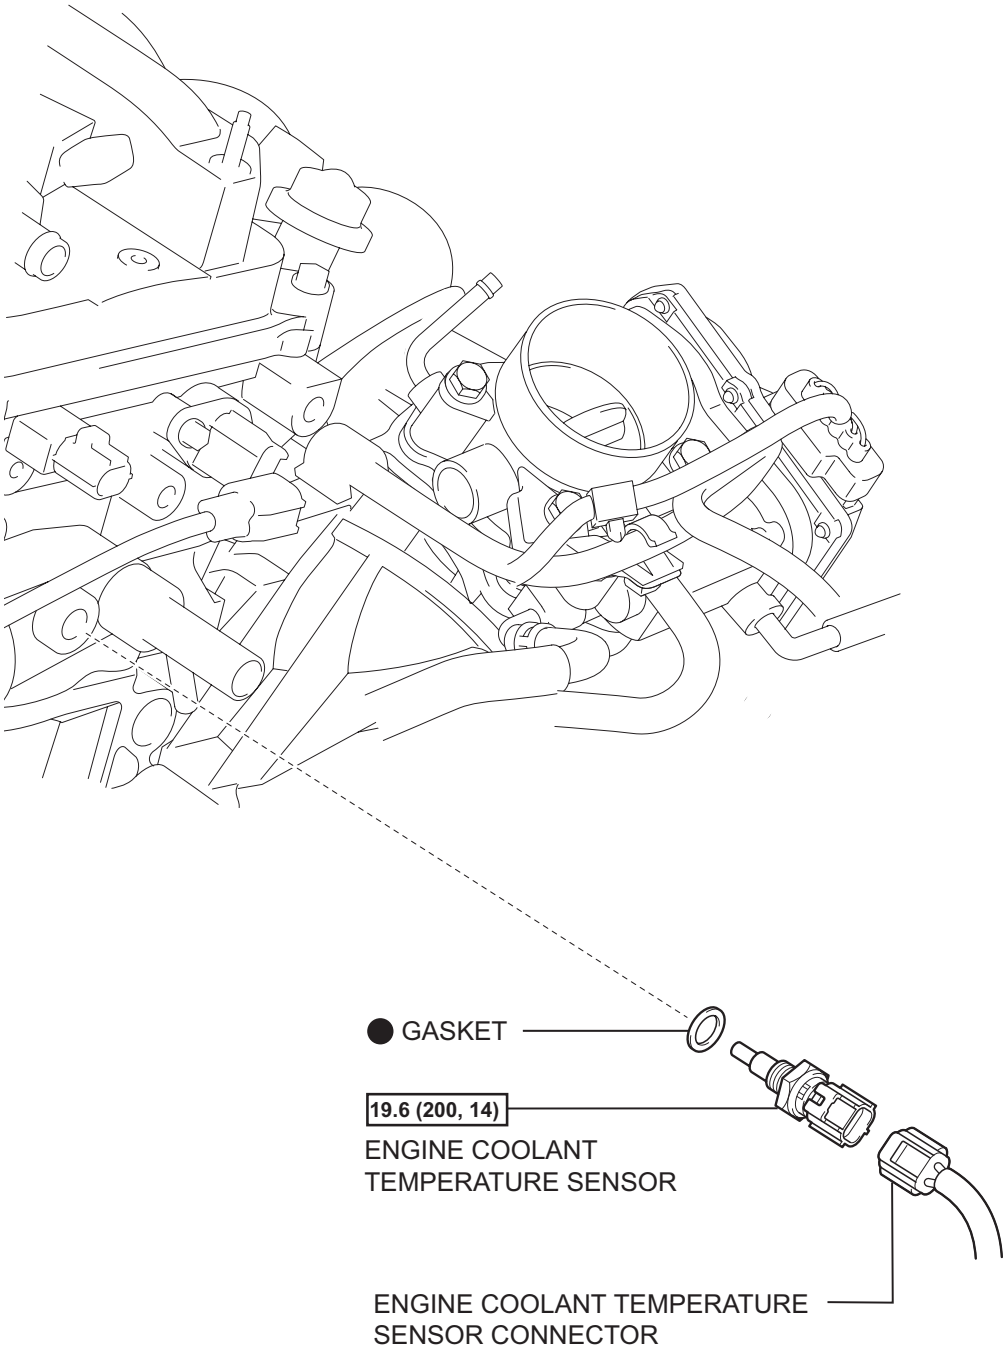
(c) Connect the sensor connector.

2. INSTALL AIR CLEANER CASE (See page ES-431)

3. INSTALL AIR CLEANER CAP (See page ES-413)



4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



5. ADD ENGINE COOLANT (See page CO-6)

6. CHECK FOR COOLANT LEAKAGE (See page CO-1)

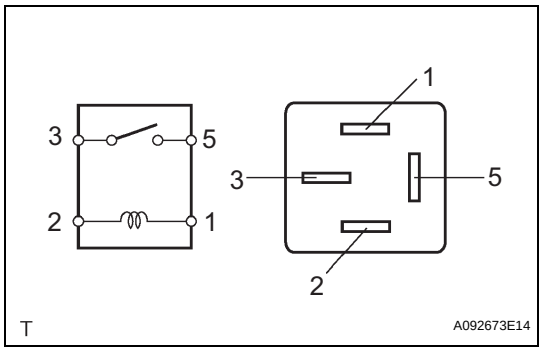
IG1 RELAY

ON-VEHICLE INSPECTION



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE IG1 RELAY

(a) Remove the IG1 relay from the instrument panel junction block.

3. INSPECT RELAY

(a) Measure resistance of the IG1 relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

4. INSTALL IG1 RELAY

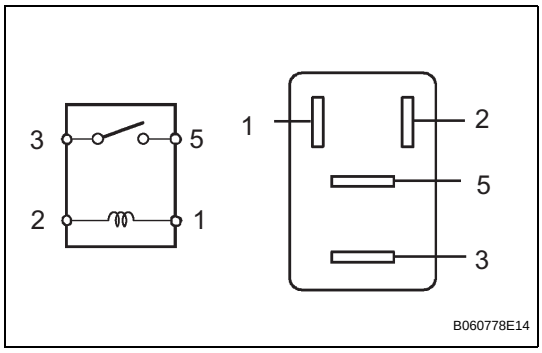
5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ES

IG2 RELAY

ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL



CAUTION:
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE IG2 RELAY

(a) Remove the No. 1 engine room relay block cover.
(b) Remove the IG2 relay from the engine room relay block.

3. INSPECT IG2 RELAY

(a) Measure the resistance of the IG2 relay.
Standard resistance

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

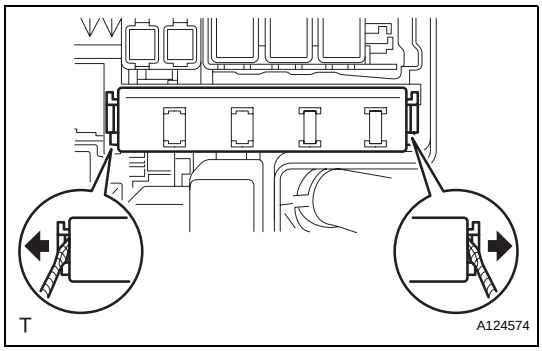
4. INSTALL IG2 RELAY

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

INTEGRATION RELAY

ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL



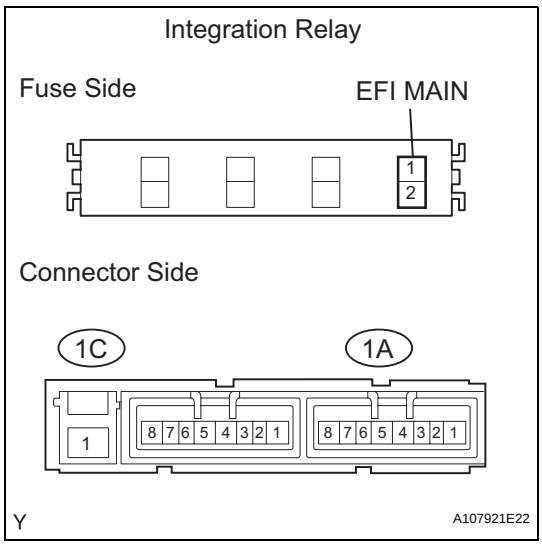
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. INSPECT INTEGRATION RELAY

NOTICE:

- **The EFI relay is built into the integration relay (unit A: EFI MAIN).**
- **Some relays are built into the integration relay. The integration relay cannot be disassembled. If there is a malfunction in the circuit of the integration relay, replace the integration relay.**



(a) Using a screwdriver, detach the 2 claws and disconnect the integration relay from the No. 1 engine room junction block.

HINT:

Tape the screwdriver tip before use.

(b) Disconnect the 3 connectors from the integration relay.

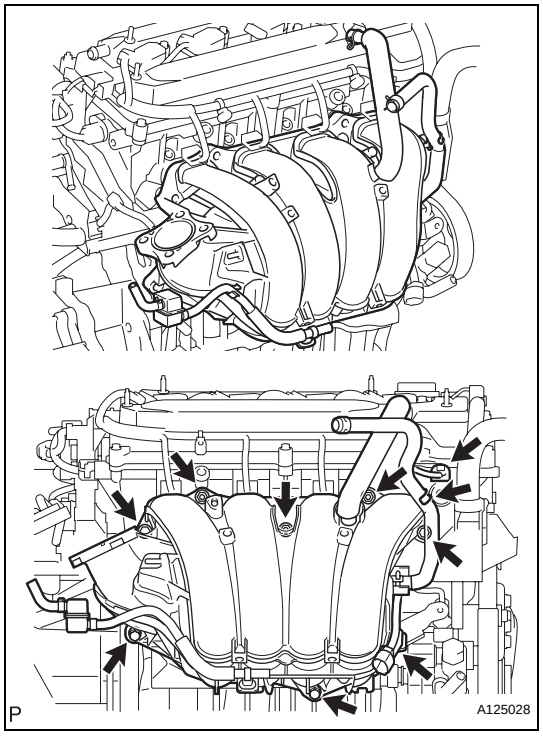
(c) Inspect the EFI relay.

(1) Check the resistance of the EFI MAIN fuse.

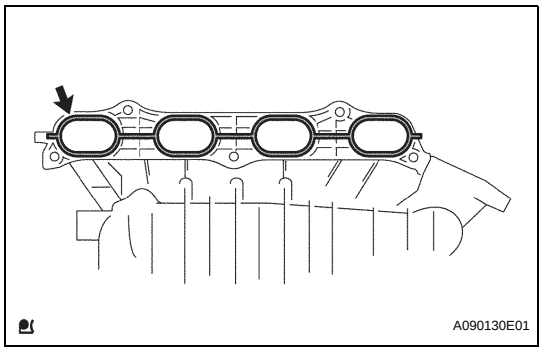
If the result is not as specified, replace the EFI MAIN fuse.

(2) Measure the resistance of the integration relay.

Standard resistance

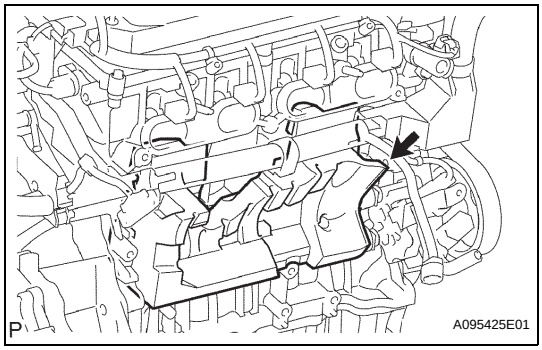


Tester Connection	Specified Condition
1A-4 - 1C-1	10 kΩ or higher
1A-4 - 1A-1	
1A-4 - 1C-1	Below 1 Ω (when battery voltage is applied to terminals 1A-3 and 1A-2)
1A-4 - 1A-1	



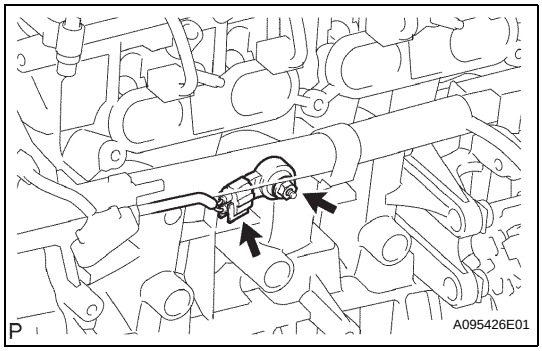
If the result is not as specified, replace the integration relay.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



REMOVAL

1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**
2. **DRAIN COOLANT (See page CO-6)**
3. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
4. **REMOVE NO. 1 ENGINE COVER (See page ES-410)**
5. **REMOVE AIR CLEANER CAP (See page ES-411)**
6. **REMOVE THROTTLE BODY (See page ES-412)**
7. **REMOVE FUEL DELIVERY PIPE (See page FU-10)**
8. **DISCONNECT FUEL TUBE**
9. **REMOVE HEATER WATER INLET HOSE**
   (a) Remove the hose clamp.
   (b) Remove the heater water inlet hose from the heater radiator unit and cylinder head.
10. **REMOVE HEATER WATER OUTLET HOSE**
    (a) Remove the heater water outlet hose from the heater radiator unit and water by-pass pipe.
11. **REMOVE INTAKE MANIFOLD**
    (a) Disconnect the union to check valve hose from the brake booster.
    (b) Disconnect the camshaft timing oil control valve connector.
    (c) Remove the wire harness clamp.
    (d) Remove the union to check valve hose from the vacuum hose clamp.
    (e) Remove the 5 bolts, 2 nuts and intake manifold.



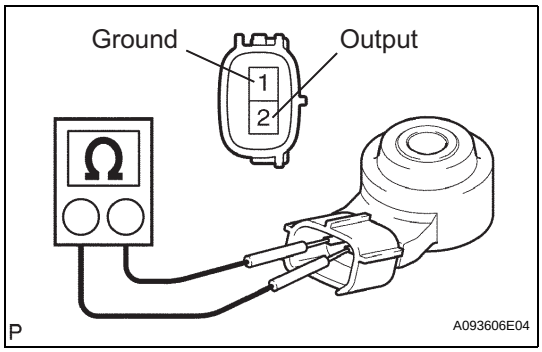
(f) Remove the gasket from the intake manifold.

12. REMOVE INTAKE MANIFOLD INSULATOR

(a) Remove the intake manifold insulator from the cylinder block.

13. REMOVE KNOCK SENSOR

(a) Disconnect the sensor connector.
(b) Remove the nut and sensor.



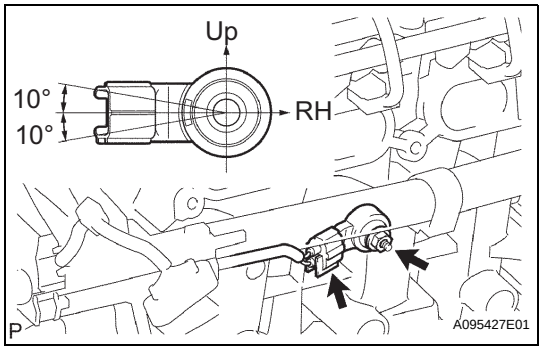
INSPECTION

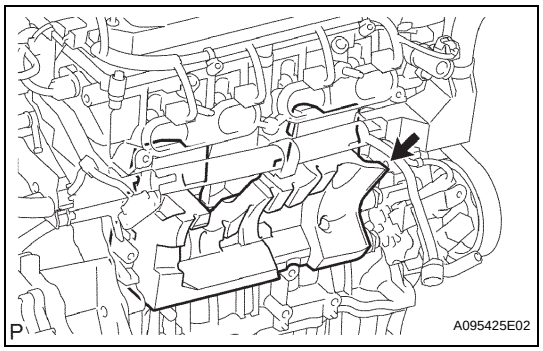
1. INSPECT KNOCK SENSOR

(a) Measure the resistance of the sensor.
Standard resistance

Tester Connection	Specified Condition
1 (Ground) - 2 (Output)	120 to 280 kΩ at 20°C (68°F)

If the result is not as specified, replace the knock sensor.

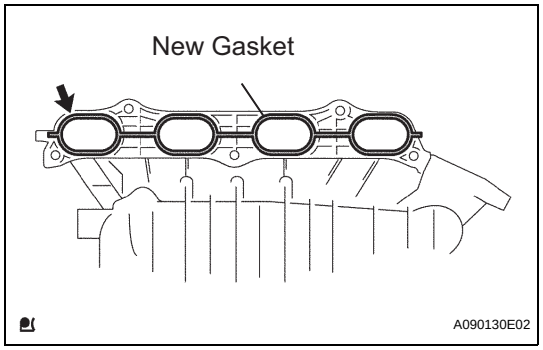




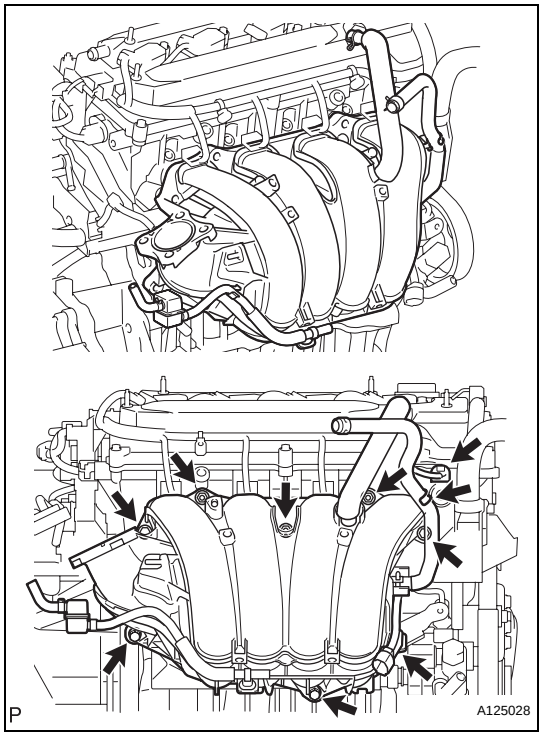
INSTALLATION

1. INSTALL KNOCK SENSOR

(a) Install the sensor with the nut.
Torque: 20 N*m (205 kgf*cm, 15 ft.*lbf)
NOTICE:
Make sure that the knock sensor is in the correct position.



(b) Connect the sensor connector.



2. INSTALL INTAKE MANIFOLD INSULATOR

(a) Install the intake manifold insulator onto the cylinder block.

3. INSTALL INTAKE MANIFOLD

(a) Install a new gasket into the intake manifold.

(b) Install the intake manifold with the 5 bolts and 2 nuts.
Torque: 30 N*m (305 kgf*cm, 22 ft.*lbf)

(c) Fit the union to check valve hose into the vacuum hose clamp.

(d) Install the wire harness clamp.

(e) Connect the camshaft timing oil control valve connector.

(f) Connect the union to check valve hose to the brake booster.

4. CONNECT HEATER WATER OUTLET HOSE

(a) Install the heater water outlet hose to the water by-pass pipe and heater radiator unit.

5. CONNECT HEATER WATER INLET HOSE

(a) Install the heater water inlet hose to the cylinder head and heater radiator unit.

(b) Install the hose clamp.

6. INSTALL FUEL TUBE

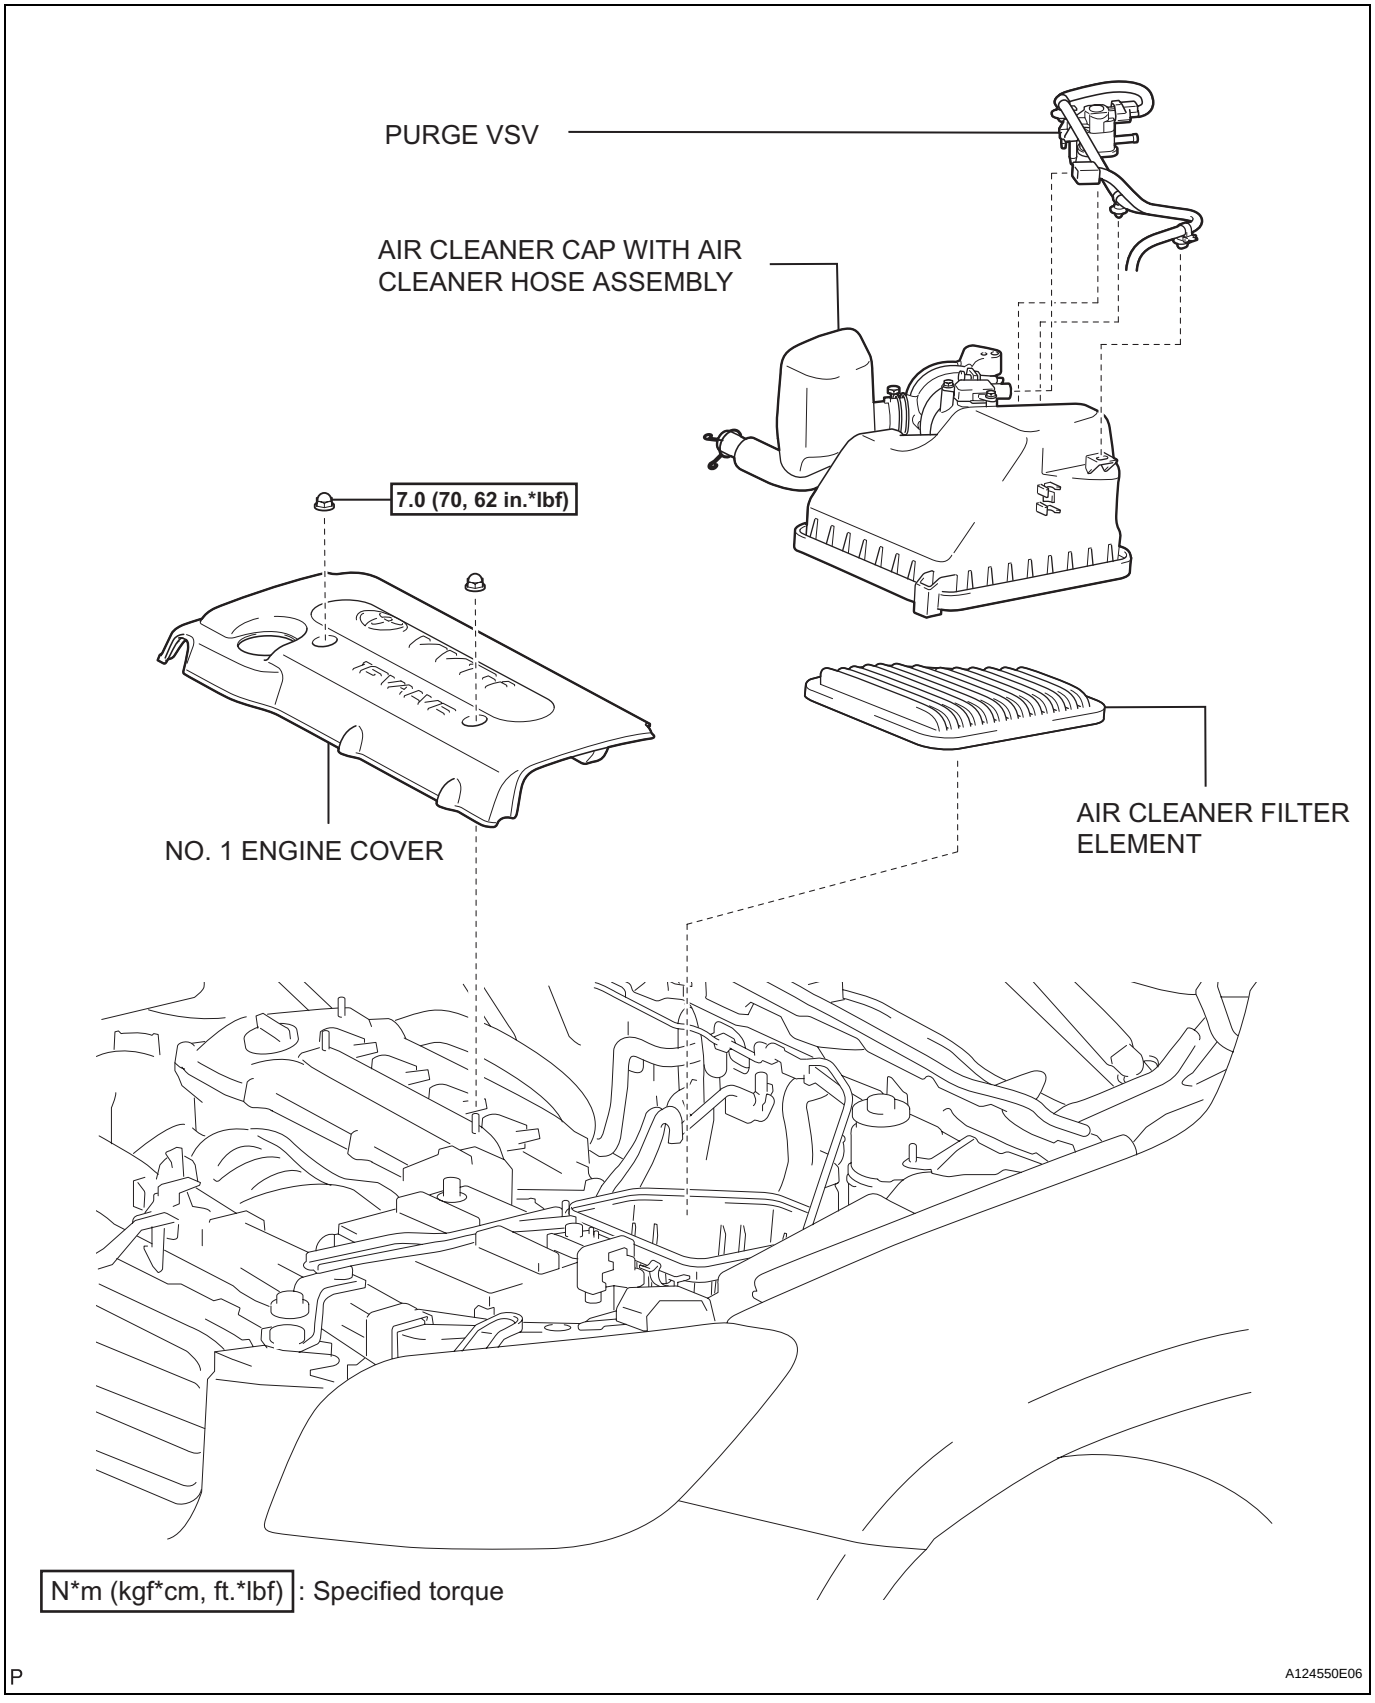
7. INSTALL FUEL DELIVERY PIPE (See page FU-13)

8. INSTALL THROTTLE BODY (See page ES-413)

9. INSTALL AIR CLEANER CAP (See page ES-413)

10. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

11. ADD ENGINE COOLANT (See page CO-6)



12. CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-1)

13. CHECK FOR FUEL LEAKAGE (See page FU-14)

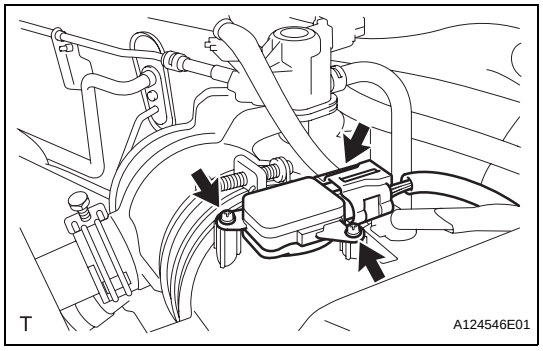
REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE MASS AIR FLOW METER

(a) Disconnect the mass air flow meter connector.

(b) Remove the 2 screws and mass air flow meter.

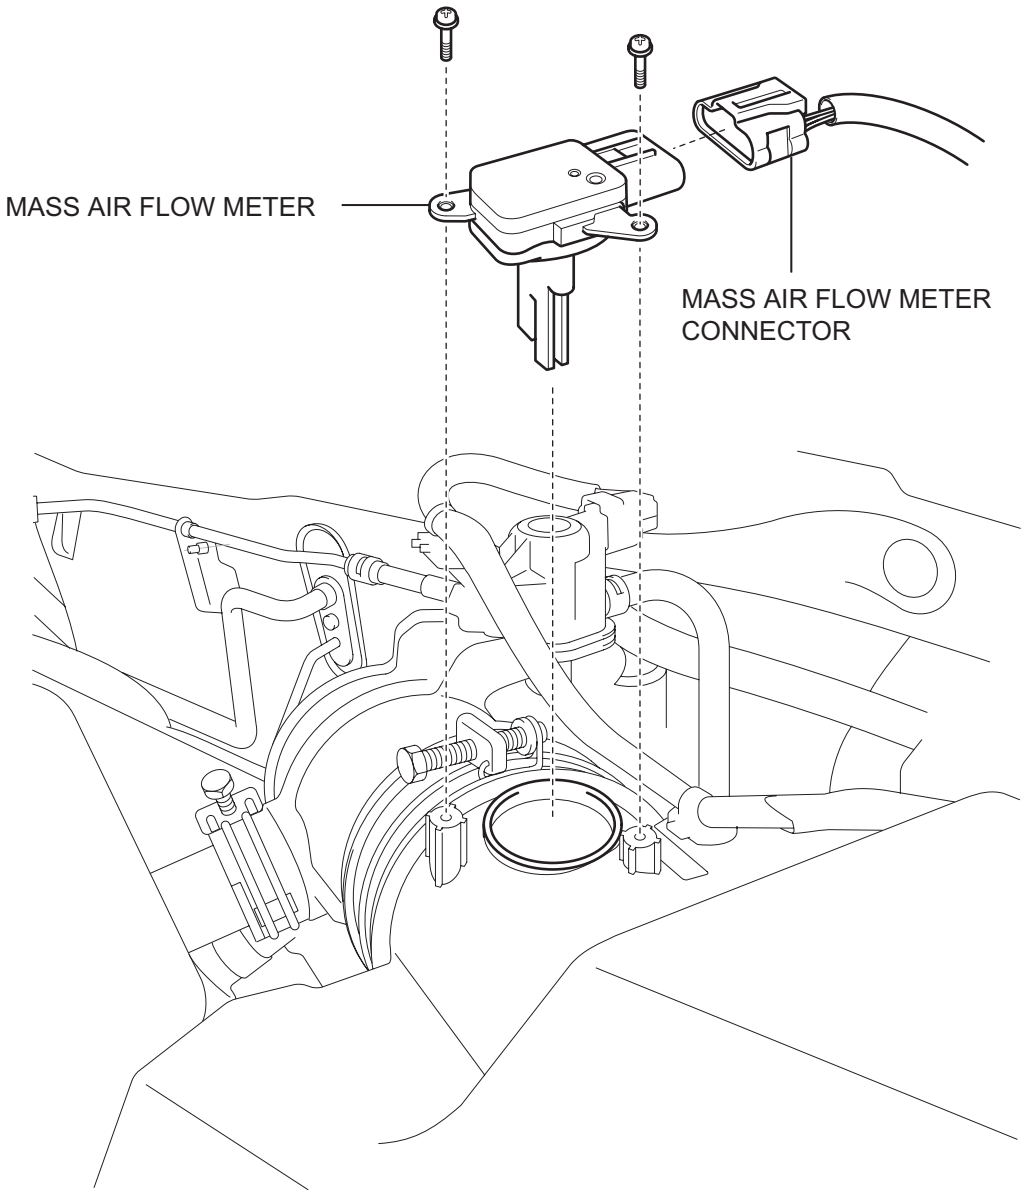
INSTALLATION

1. INSTALL MASS AIR FLOW METER

(a) Install the mass air flow meter with the 2 screws.

NOTICE:

Make sure that the O-ring is not cracked or jammed when installing it.



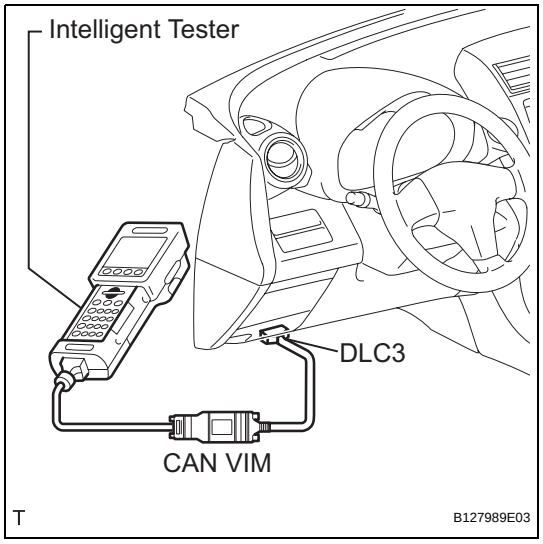
(b) Connect the mass air flow meter connector.

2. CONNECT CABLE TO BATTERY NEGATIVE TERMINAL

MASS AIR FLOW METER

COMPONENTS

ES



T

A124545E01

ON-VEHICLE INSPECTION

NOTICE:

- **Perform the MAF meter inspection according to the procedures below.**
- **Only replace the MAF meter when both the LONG FT#1 value and MAF value in the DATA LIST (with the engine stopped) are not within the normal operating range.**

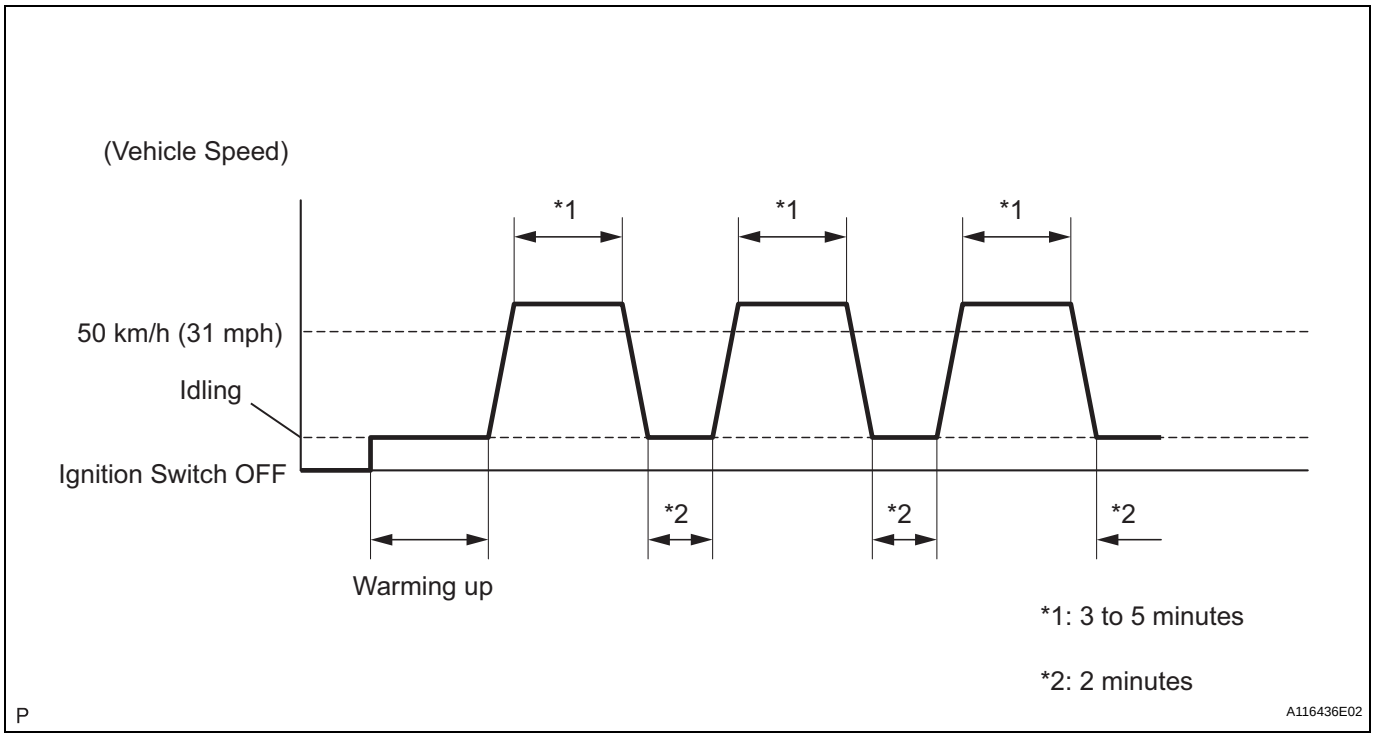
1. INSPECT MASS AIR FLOW METER

(a) Perform confirmation driving pattern.

(1) Connect the intelligent tester to the DLC3.

(2) Turn the ignition switch ON.

(3) Turn the tester ON.



(4) Clear the DTCs (see page ES-35).

(5) Start the engine and warm it up with all accessory switches OFF until the engine coolant temperature is 75°C (167°F) or more.

(6) Drive the vehicle at 50 km/h (31 mph) or more for 3 to 5 minutes*1.

(7) Allow the engine to idle for 2 minutes*2.

(8) Perform steps *1 and *2 at least 3 times.

(b) Read the value using the intelligent tester (LONG FT#1).

(1) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / LONG FT#1.

(2) Read the values displayed on the tester.

Standard value:

Within -15 to +15%

If the result is not within the specified range, perform the inspection below.

(c) Read the value using the intelligent tester (MAF).

NOTICE:

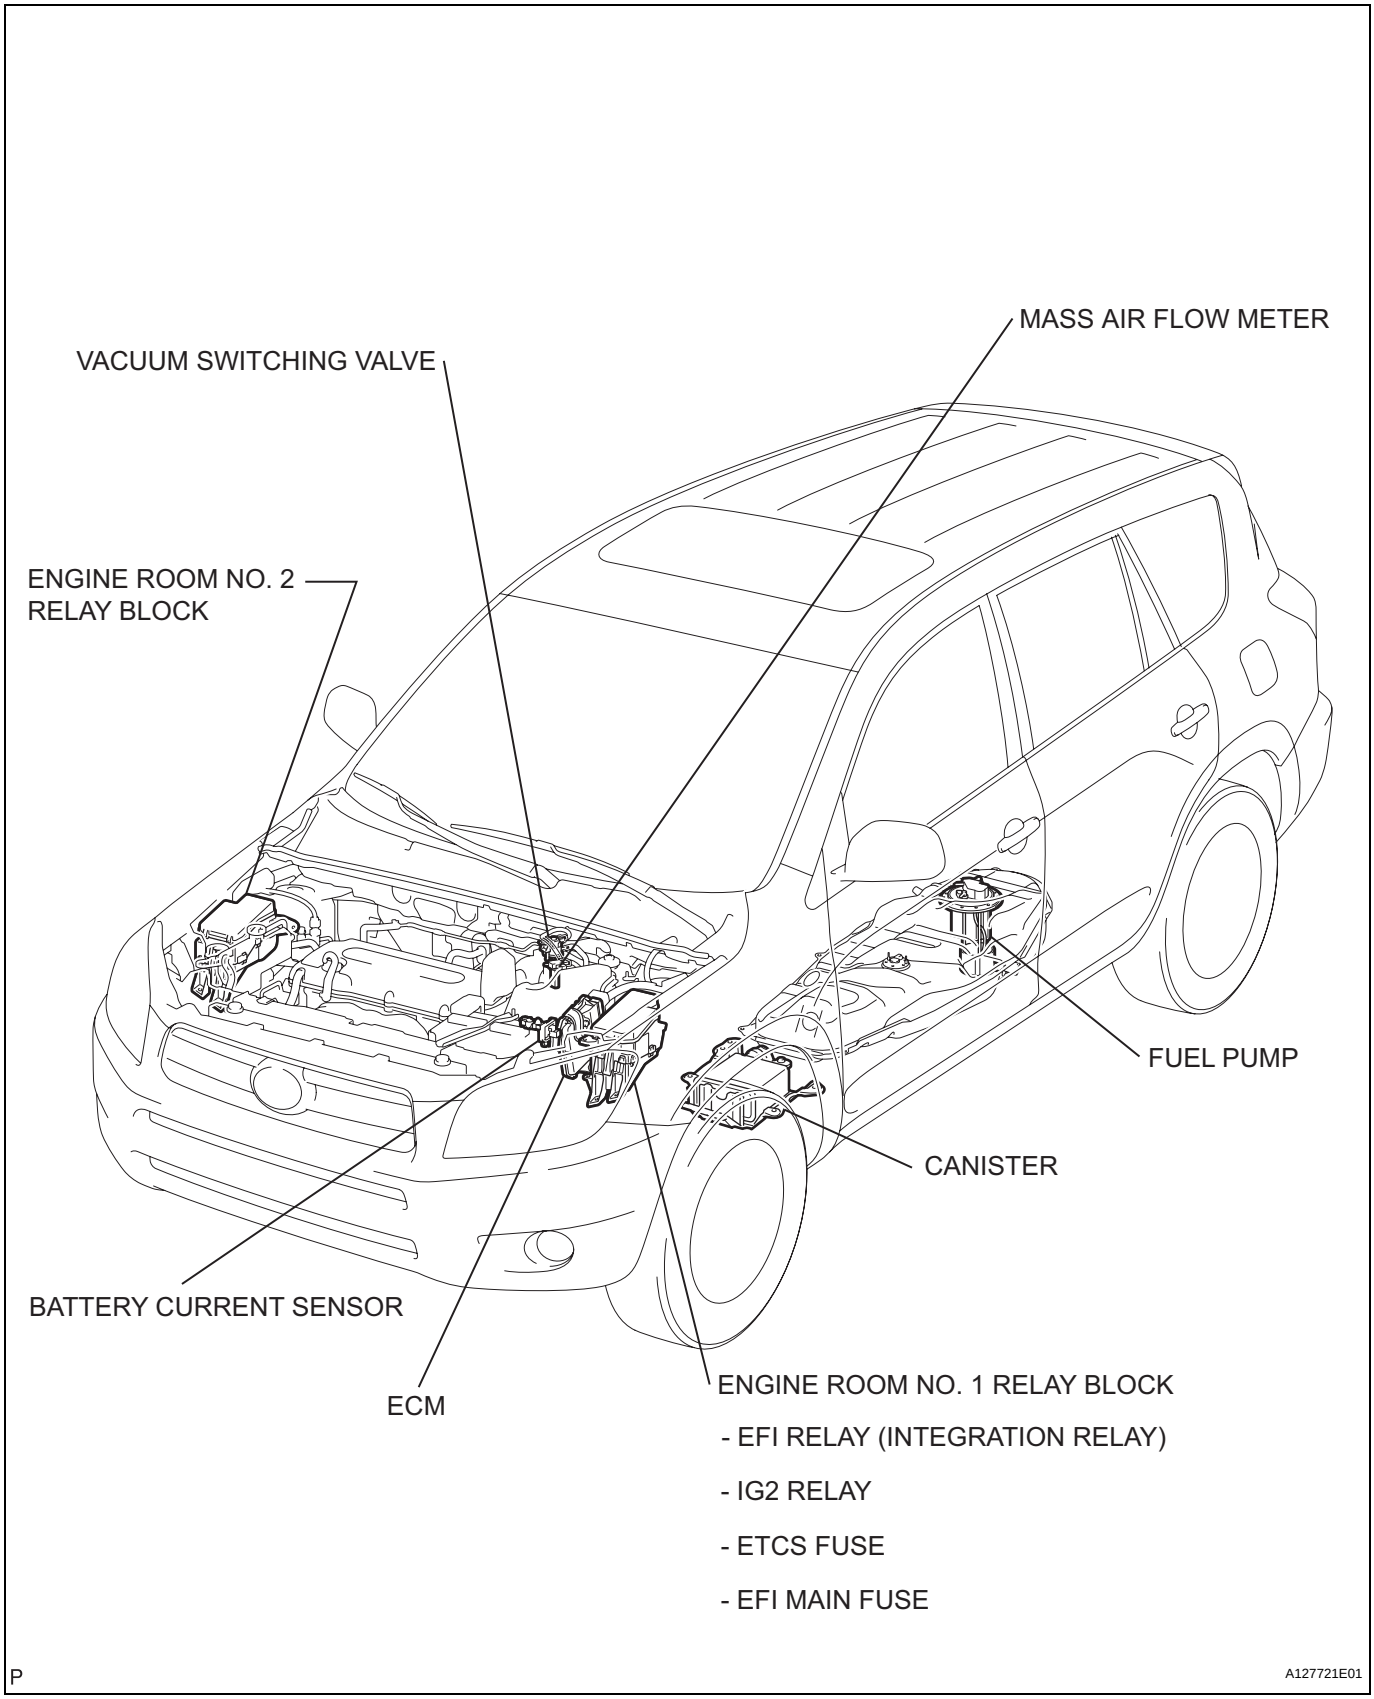
- **Turn off the engine.**
- **Perform the inspection with the vehicle indoors and on a level surface.**
- **Perform the inspection of the MAF meter while it is installed to the air cleaner case (installed to the vehicle).**
- **During the test, do not use the exhaust air duct to perform suction on the exhaust pipe.**

(1) Turn the ignition switch to ACC.

(2) Turn the ignition switch ON (do not run the engine).

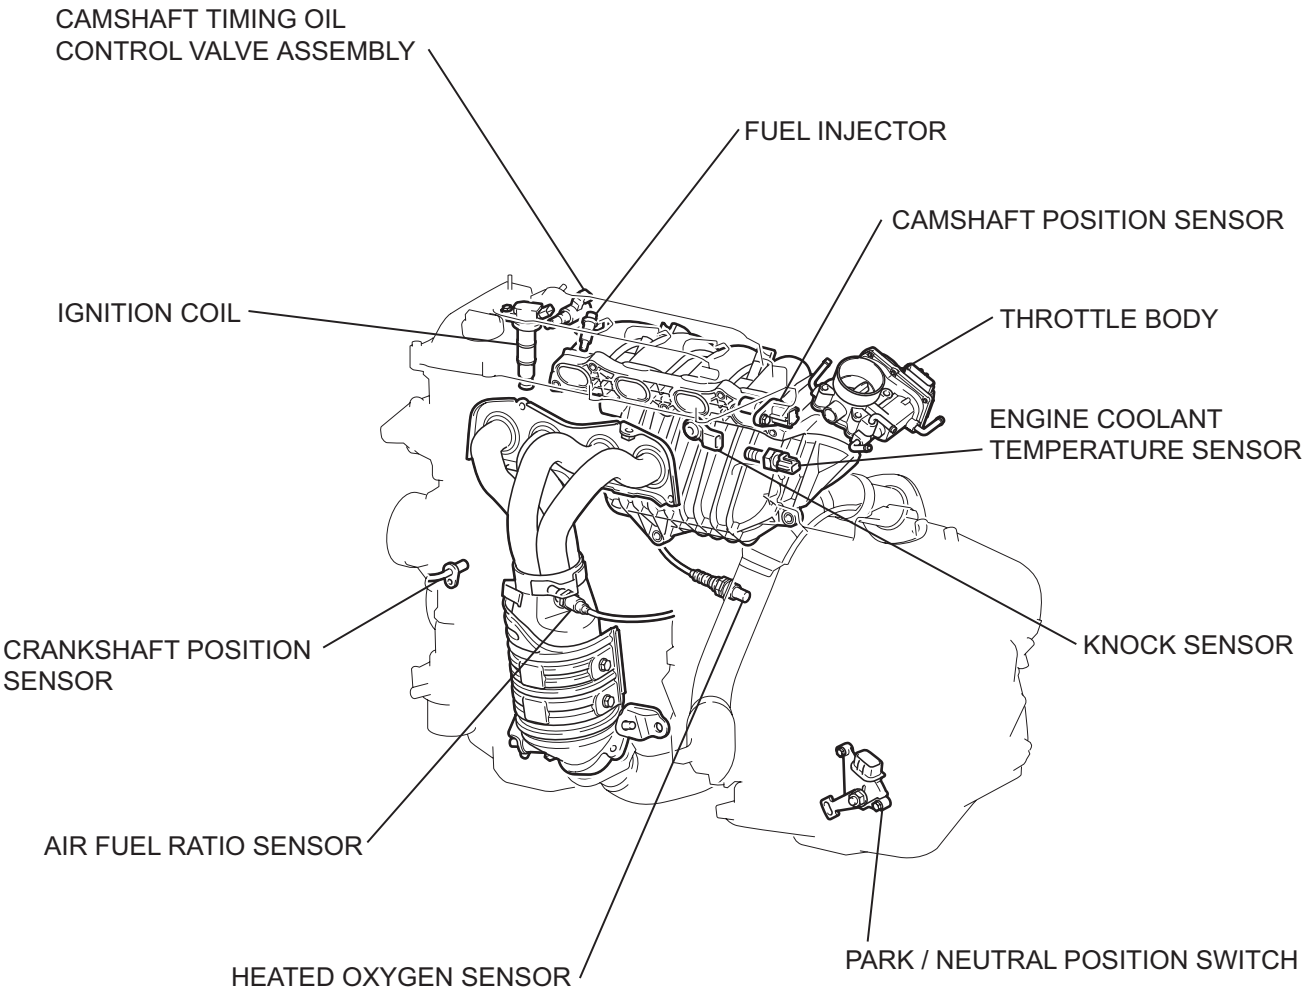
(3) Turn the tester ON.

(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.



(5) Wait 30 seconds, and read the values on the intelligent tester.

Standard condition:



Less than 0.45 g/sec.

- If the result is not as specified, replace the MAF meter.
- If the result is within the specified range, inspect the cause of the extremely rich or lean air-fuel ratio (see page ES-147).

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:
*: Use the intelligent tester.

1	VEHICLE BROUGHT TO WORKSHOP

NEXT

2	CUSTOMER PROBLEM ANALYSIS

NEXT

3	CONNECT INTELLIGENT TESTER TO DLC3*

HINT:
If the display indicates a communication fault in the tester, inspect the DLC3.

NEXT

4	CHECK DTC AND FREEZE FRAME DATA*

HINT:
Record or print DTCs and freeze frame data, if necessary.

NEXT

5	CLEAR DTC AND FREEZE FRAME DATA*

NEXT

6	CONDUCT VISUAL INSPECTION

NEXT

7	SET CHECK MODE DIAGNOSIS*

NEXT

8	CONFIRM PROBLEM SYMPTOMS

HINT:
If the engine does not start, first perform the "CHECK DTC" procedures and "CONDUCT BASIC INSPECTION" procedures below.

Result	Proceed to
Malfunction does not occur	A
Malfunction occurs	B

B → GO TO STEP 10

A

9	SIMULATE SYMPTOMS

NEXT

10	CHECK DTC*

Result	Proceed to
Malfunction code	A
No code	B

B → GO TO STEP 12

NEXT

ES

20	**CONDUCT CONFIRMATION TEST**

NEXT

END

CHECK FOR INTERMITTENT PROBLEMS

HINT:
Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. Clear the DTCs (see page ES-35).
2. Switch the ECM from normal mode to check mode using the intelligent tester (see page ES-38).
3. Perform a simulation test.
4. Check and wiggle the harness(es), connector(s) and terminal(s).

BASIC INSPECTION

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when engine troubleshooting.

ES

1 CHECK BATTERY VOLTAGE

NOTICE:
Conduct this check with the engine stopped and ignition switch OFF.

Result	Proceed to
11 V or more	OK
Below 11 V	NG

NG → **CHARGE OR REPLACE BATTERY**

OK

2 CHECK WHETHER ENGINE WILL CRANK

NG → **PROCEED TO PROBLEM SYMPTOMS TABLE**

OK

3 CHECK WHETHER ENGINE STARTS

NG → **GO TO STEP 6**

OK

4 CHECK AIR FILTER

(a) Visually check that the air filter is not excessively contaminated with dirt or oil.

NG → **REPLACE AIR FILTER**

OK

5 CHECK IDLING SPEED

NG → **TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP**

OK

6	CHECK FUEL PRESSURE

NG → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7	CHECK FOR SPARK

NG → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

REGISTRATION

NOTICE:
The Vehicle Identification Number (VIN) must be input into the replacement ECM.
HINT:
The VIN is a 17-digit alphanumeric number. The intelligent tester is required to register the VIN.

1. DESCRIPTION

This registration section consists of 3 parts: Input Instructions, Read VIN and Write VIN.

(a) Input Instructions: Explains the general VIN input instructions when using the intelligent tester.

(b) Read VIN: Explains the VIN reading process in a flowchart. This process allows the VIN stored in the ECM to be read in order to confirm that the two VINs, provided with the vehicle and stored in the vehicle's ECM, are the same.

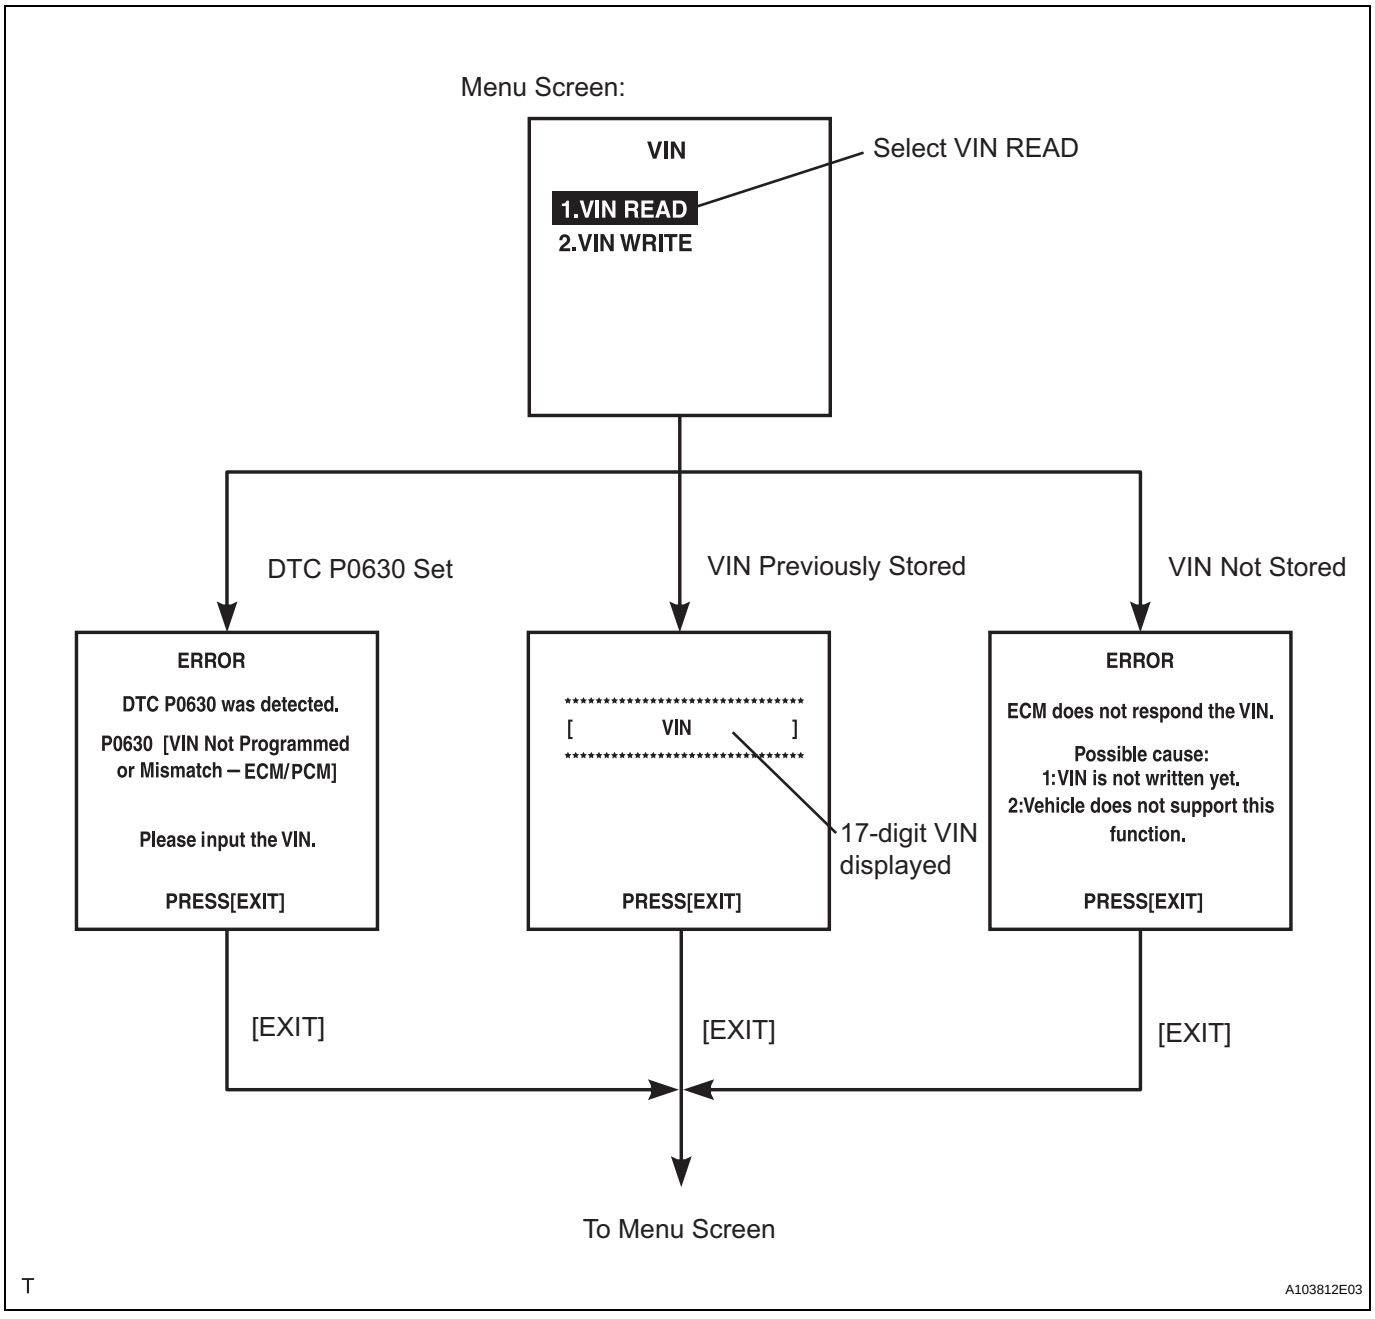
(c) Write VIN: Explains the VIN writing process in a flowchart. This process allows the VIN to be input into the ECM. If the ECM is changed, or the vehicle VIN and ECM VIN do not match, the VIN can be registered or overwritten in the ECM by following this procedure.

2. INPUT INSTRUCTIONS

(a) Intelligent tester
The arrow buttons (UP, DOWN, RIGHT and LEFT) and numerical buttons (0 to 9) are used to input the VIN.

(b) Cursor Operation
To move the cursor around the tester screen, press the RIGHT and LEFT buttons.

(c) Alphabetical Character Input
(1) Press the UP and DOWN buttons to select the desired alphabetical character.
(2) After selection, the cursor should move.

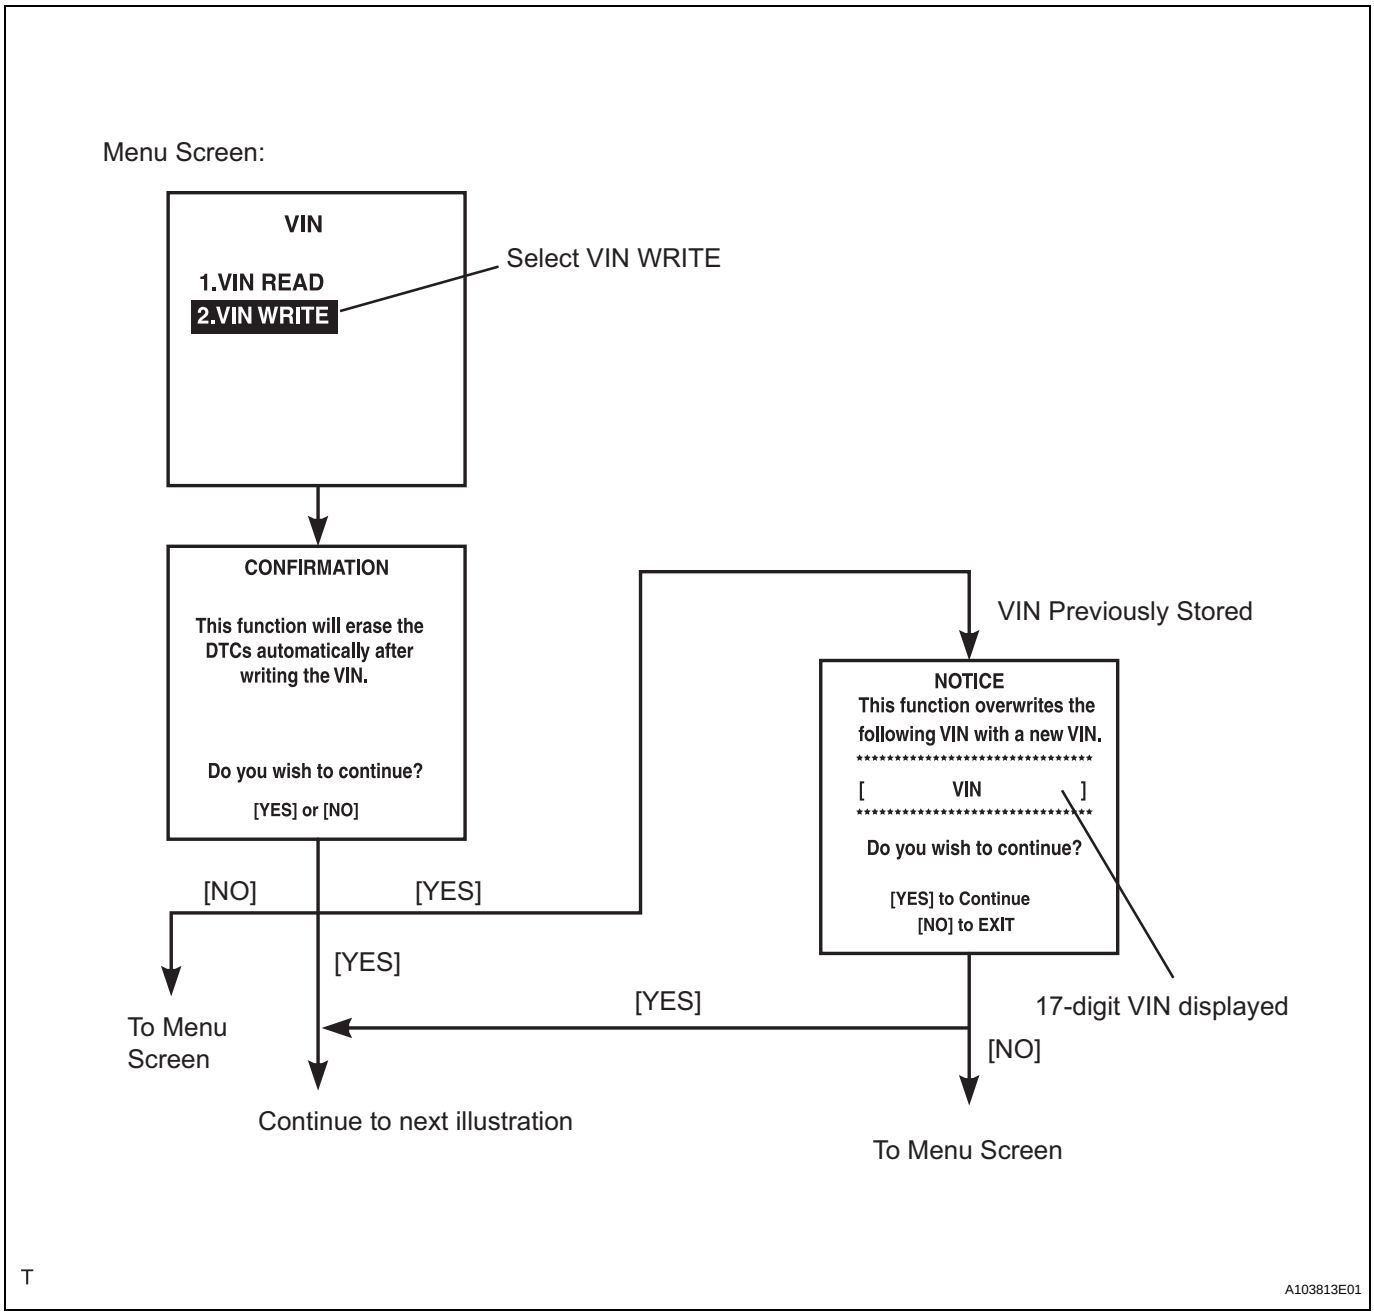


(d) Numeric Character Input
(1) Press the numerical button corresponding to the number that you want to input.
(2) After input, the cursor should move.
HINT:
Numerical characters can also be selected by using the UP and DOWN buttons.

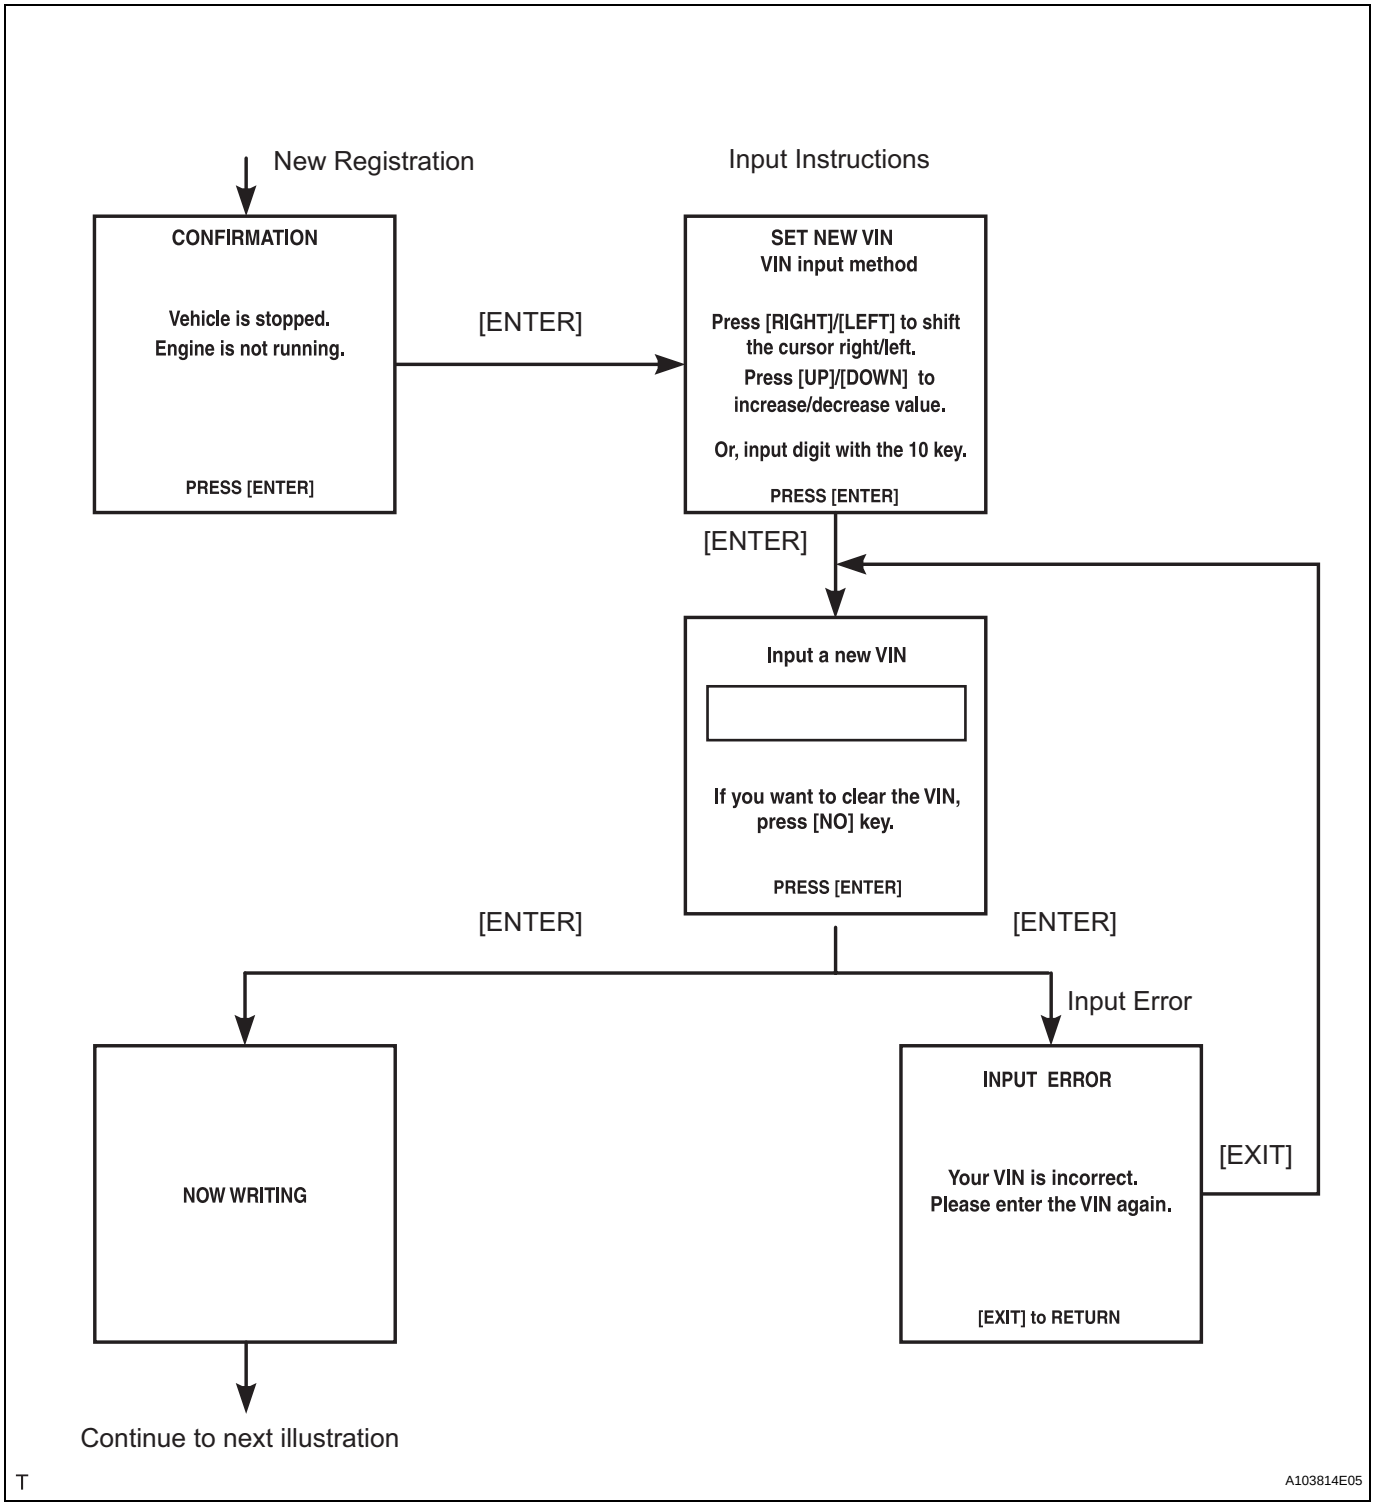
(e) Correction
(1) When correcting the input character(s), put the cursor onto the character using the RIGHT and LEFT buttons.
(2) Select or input the correct character using the UP/DOWN buttons, or the numerical buttons.

(f) Finishing Input Operation
(1) Make sure that the input VIN matches the vehicle VIN after input.
(2) Press the ENTER button on the tester.

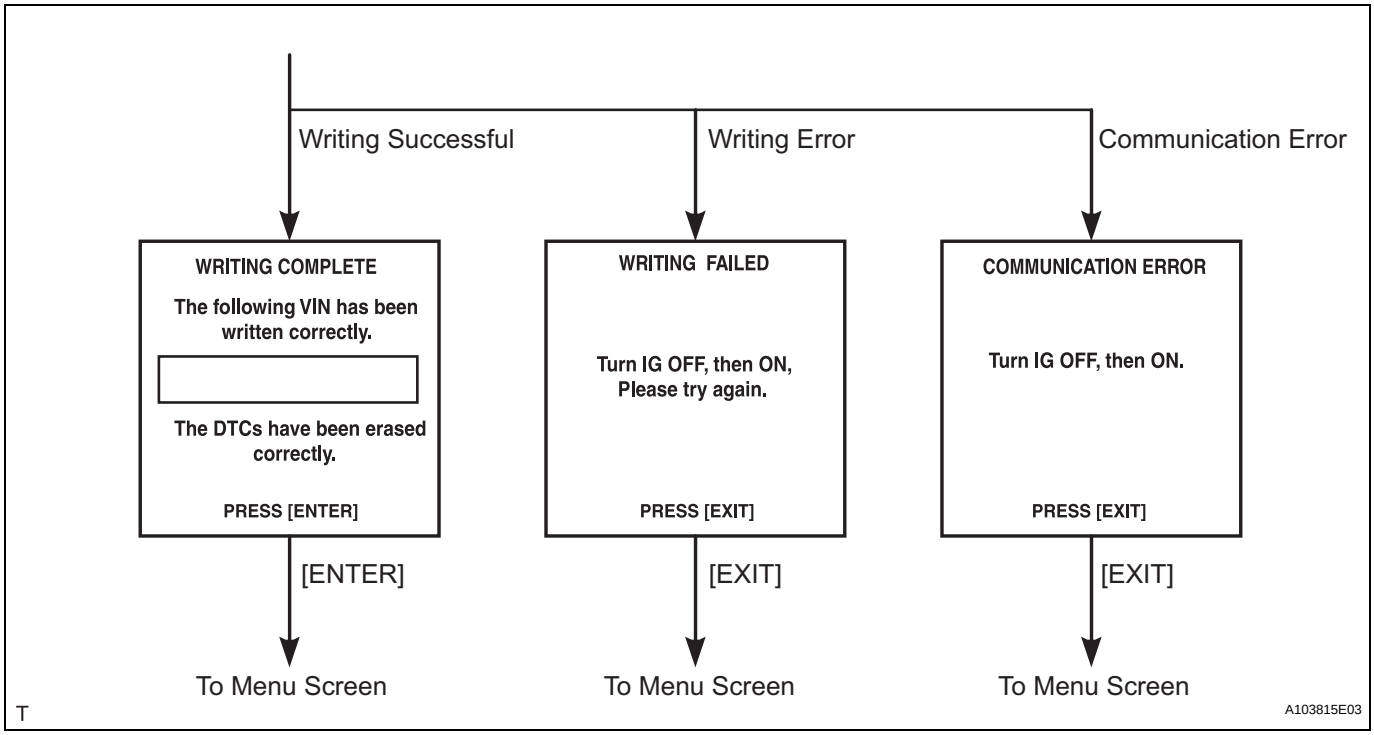
3. READ VIN



(a) Confirm the vehicle VIN.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II/ VIN.



4. WRITE VIN



(a) Confirm the vehicle VIN.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.

(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II/ VIN.

CHECKING MONITOR STATUS

The purpose of the monitor result (mode 06) is to allow access to the results of on-board diagnostic monitoring tests of specific components/systems that are not continuously monitored. Examples are catalysts, evaporative emissions (EVAP) and thermostats.

The monitor result allows the OBD II scan tool to display the monitor status, test value, minimum test limit and maximum test limit. These data are displayed after the vehicle has been driven to run the monitor.

When the test value is not between the minimum and maximum test limits, the ECM (PCM) interprets this as a malfunction. If the test value is on the borderline of the test limits, the component is likely to malfunction in the near future.

Perform the following instruction to view the monitor status. Although this instruction refers to the Lexus/Toyota diagnostic tester, it can be checked using a generic OBD II scan tool. Refer to your scan tool operator's manual for specific procedural information.

1. PERFORM MONITOR DRIVE PATTERN

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch and the tester ON.

(c) Clear the DTCs (see page ES-35).

(d) Run the vehicle in accordance with the applicable drive pattern described in READINESS MONITOR DRIVE PATTERN (see page ES-19). Do not turn the ignition switch OFF.

NOTE:

The test results will be lost if the ignition switch is turned OFF.

2. ACCESS MONITOR RESULT

(a) Select the following items from the intelligent tester menus: DIAGNOSIS, ENHANCED OBD II, MONITOR INFO and MONITOR RESULT. The monitor status appears after the component name.

- INCMP: The component has not been monitored yet.
- PASS: The component is functioning normally.
- FAIL: The component is malfunctioning.

(b) Confirm that the component is either PASS or FAIL.

(c) Select the component and press ENTER. The accuracy test value appears if the monitor status is either PASS or FAIL.

3. CHECK COMPONENT STATUS

(a) Compare the test value with the minimum test limit (MIN LIMIT) and maximum test limit (MAX LIMIT).

(b) If the test value is between the minimum and maximum test limits, the component is functioning normally. If not, the component is malfunctioning. The test value is usually not near the test limits. If the test value is near the test limits, the component is likely to malfunction in the near future.
HINT:
The monitor result might on rare occasions be PASS even if the malfunction indicator lamp (MIL) is illuminated. This indicates the system malfunctioned on a previous driving cycle. This might be caused by an intermittent problem.

4. MONITOR RESULT INFORMATION

If you use a generic scan tool, multiply the test value by the scaling value listed below.

A/F Sensor (Sensor 1)

Monitor ID	Test ID	Scaling	Unit	Description
$01	$8E	Multiply by 0.001	V	A/F sensor deterioration level
$01	$91	Multiply by 0.004	mA	A/F sensor current

HO2 Sensor (Sensor 2)

Monitor ID	Test ID	Scaling	Unit	Description
$02	$07	Multiply by 0.001	V	Minimum sensor voltage
$02	$08	Multiply by 0.001	V	Maximum sensor voltage
$02	$8F	Multiply by 0.0003	g	Maximum oxygen storage capacity

Catalyst

Monitor ID	Test ID	Scaling	Unit	Description
$21	$A9	Multiply by 0.0003	No dimension	Oxygen storage capacity of catalyst

EVAP

Monitor ID	Test ID	Scaling	Unit	Description
$3D	$C9	Multiply by 0.001	kPa	Test value for small leak (P0456)
$3D	$CA	Multiply by 0.001	kPa	Test value for gross leak (P0455)
$3D	$CB	Multiply by 0.001	kPa	Test value for leak detection pump stuck OFF (P2401)
$3D	$CD	Multiply by 0.001	kPa	Test value for leak detection pump stuck ON (P2402)
$3D	$CE	Multiply by 0.001	kPa	Test value for vent valve stuck OFF (P2420)
$3D	$CF	Multiply by 0.001	kPa	Test value for vent valve stuck ON (P2419)
$3D	$D0	Multiply by 0.001	kPa	Test value for reference orifice low flow (P043E)
$3D	$D1	Multiply by 0.001	kPa	Test value for reference orifice high flow (P043F)
$3D	$D4	Multiply by 0.001	kPa	Test value for purge VSV stuck closed (P0441)
$3D	$D5	Multiply by 0.001	kPa	Test value for purge VSV stuck open (P0441)
$3D	$D7	Multiply by 0.001	kPa	Test value for purge flow insufficient (P0441)

Misfire

Monitor ID	Test ID	Scaling	Unit	Description
$A1	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for all cylinders: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A1	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - all cylinders

Monitor ID	Test ID	Scaling	Unit	Description
$A2	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 1: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A2	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - cylinder 1
$A3	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 2: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A3	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - cylinder 2
$A4	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 3: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A4	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - cylinder 3
$A5	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 4: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A5	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - cylinder 4

READINESS MONITOR DRIVE PATTERN

1. PURPOSE OF READINESS TESTS

- The On-Board Diagnostic (OBD II) system is designed to monitor the performance of emission related components, and indicate any detected abnormalities with DTC (Diagnostic Trouble Codes). Since various components need to be monitored during different driving conditions, the OBD II system is designed to run separate monitoring programs called Readiness Monitors.
- The intelligent tester's software must be version 9.0 or newer to view the Readiness Monitor Status. To view the status, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
- When the Readiness Monitor status reads COMPL (complete), the necessary conditions have been met for running the performance tests for that Readiness Monitor.
- A generic OBD II scan tool can also be used to view the Readiness Monitor status.

HINT:

Many state Inspection and Maintenance (I/M) programs require a vehicle's Readiness Monitor status to show COMPL before beginning emission tests.

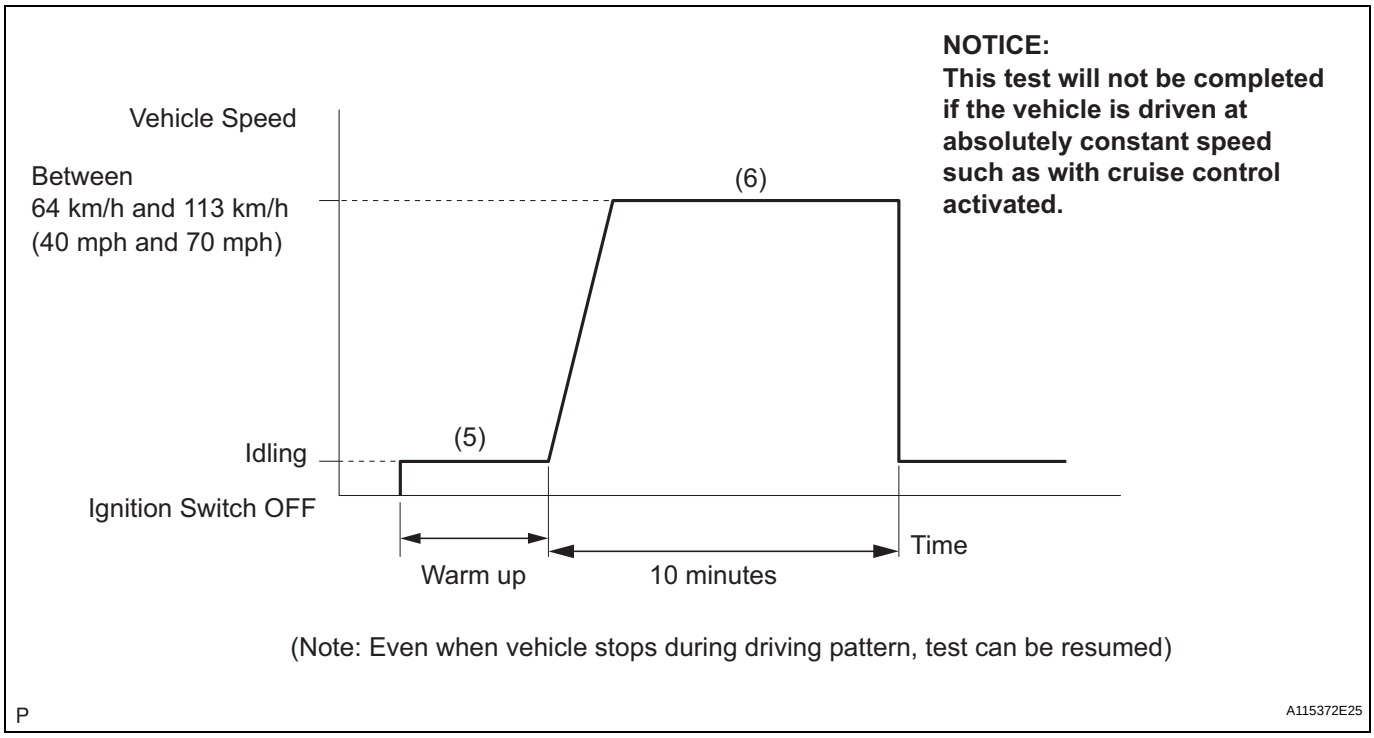
The Readiness Monitor will be reset to INCMPL (incomplete) if:

- The ECM has lost battery power or blown a fuse.
- DTCs have been cleared.
- The conditions for running the Readiness Monitor have not been met.

If the Readiness Monitor status shows INCMPL, follow the appropriate Readiness Monitor Drive Pattern to change the status to COMPL.

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.



NOTICE:

These drive patterns represent the fastest method of satisfying all conditions necessary to achieve complete status for each specific Readiness Monitor.

In the event of a drive pattern being interrupted (possibly due to factors such as traffic conditions), the drive pattern can be resumed. In most cases, the Readiness Monitor will still achieve complete status upon completion of the drive pattern.

To ensure completion of the Readiness Monitors, avoid sudden changes in vehicle load and speed (driving up and down hills and/or sudden acceleration).

2. CATALYST MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions
The monitor will not run unless:
- The MIL is OFF.

(b) Drive Pattern
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (if set) (see page ES-35).
(5) Start the engine and warm it up.
(6) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.

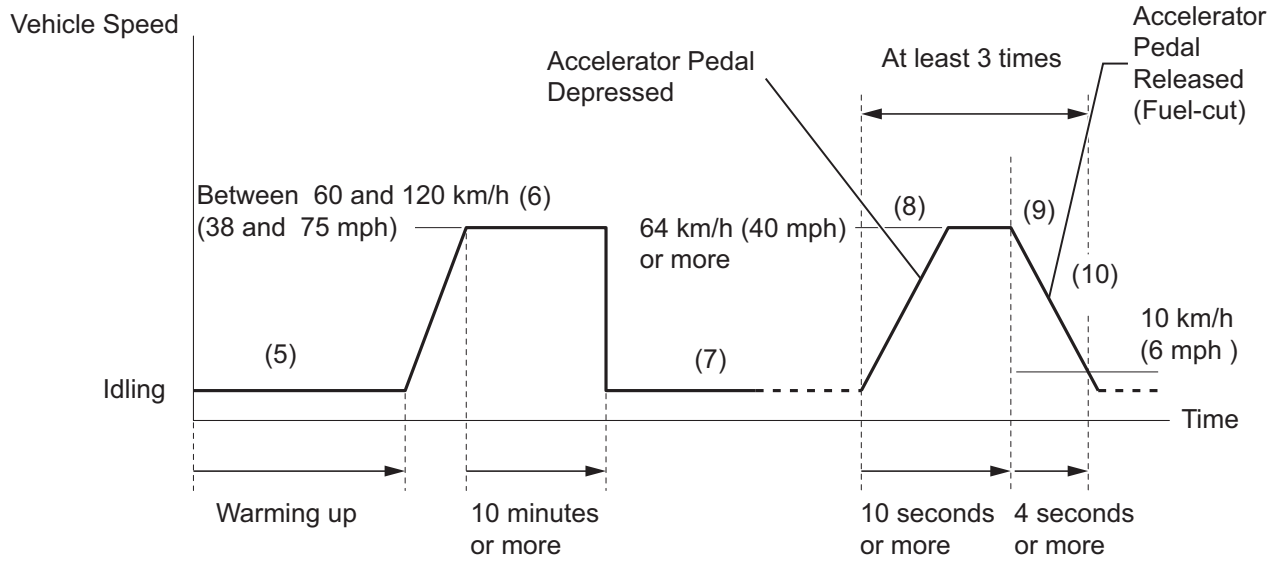
(c) Monitor Status
Check the Readiness Monitor status displayed on the tester.
If the status does not switch to COMPL (complete), extend the driving time.

3. EVAP SYSTEM MONITOR (KEY OFF TYPE)

(a) Preconditions
The monitor will not run unless:
– The fuel tank is less than 90% full.
– The altitude is less than 8,000 ft. (2,450 m).
– The vehicle is stationary.
– The engine coolant temperature is between 4.4°C and 35°C (40°F and 95°F).
– The intake air temperature is between 4.4°C and 35°C (40°F and 95°F).
– Vehicle was driven in a city area (or on freeway) for 10 minutes or more.

(b) Monitor Conditions
(1) Turn the ignition switch OFF and wait for 6 hours.
HINT:
Do not start the engine until checking Readiness Monitor status. If the engine is started, the step described above must be repeated.

(c) Monitor Status
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Check the Readiness Monitor status displayed on the tester.



ES

If the status does not switch to COMPL (complete), restart the engine, make sure that the preconditions have been met, and then perform the Monitor Conditions again.

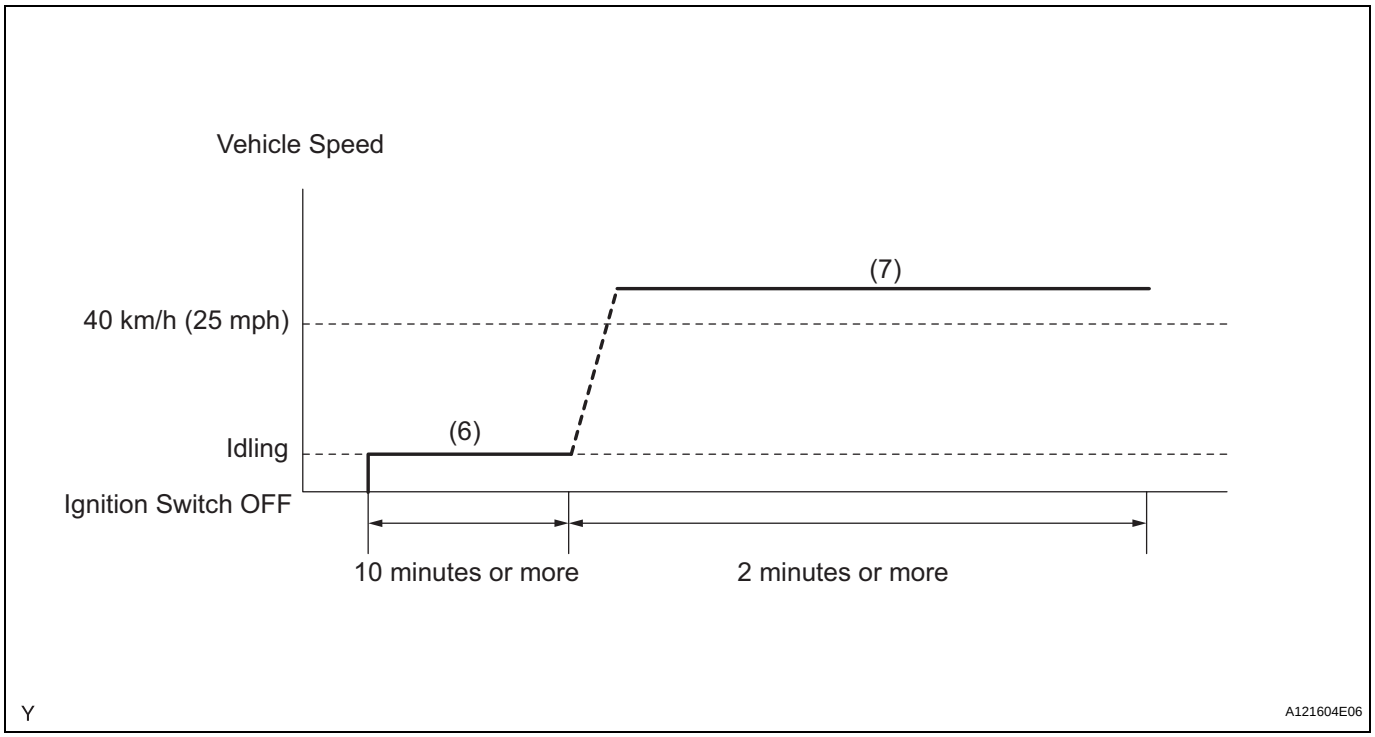
4. AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSOR MONITORS (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

Monitor Drive Pattern

ECT: 75°C (167°F) or more

P

A115374E04



(a) Preconditions
The monitor will not run unless:
– 2 minutes or more have elapsed since the engine was started.
– The Engine Coolant Temperature (ECT) is 75°C (167°F) or more.
– Cumulative driving time at a vehicle speed of 48 km/h (30 mph) or more exceeds 6 minutes.

– Air-fuel ratio feedback control is performed.

(b) Drive Pattern for front A/F sensor and HO2 sensor
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (see page ES-35).
(5) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(6) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(7) Change the transmission to 2nd gear.
(8) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(9) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(10) Allow the vehicle to decelerate until the vehicle speed declines to less than 10 km/h (6 mph).
(11) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

(c) Monitor Status
(1) Check the Readiness Monitor status displayed on the tester.
(2) If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and then perform steps from (5) through (11) in the Drive Pattern above.

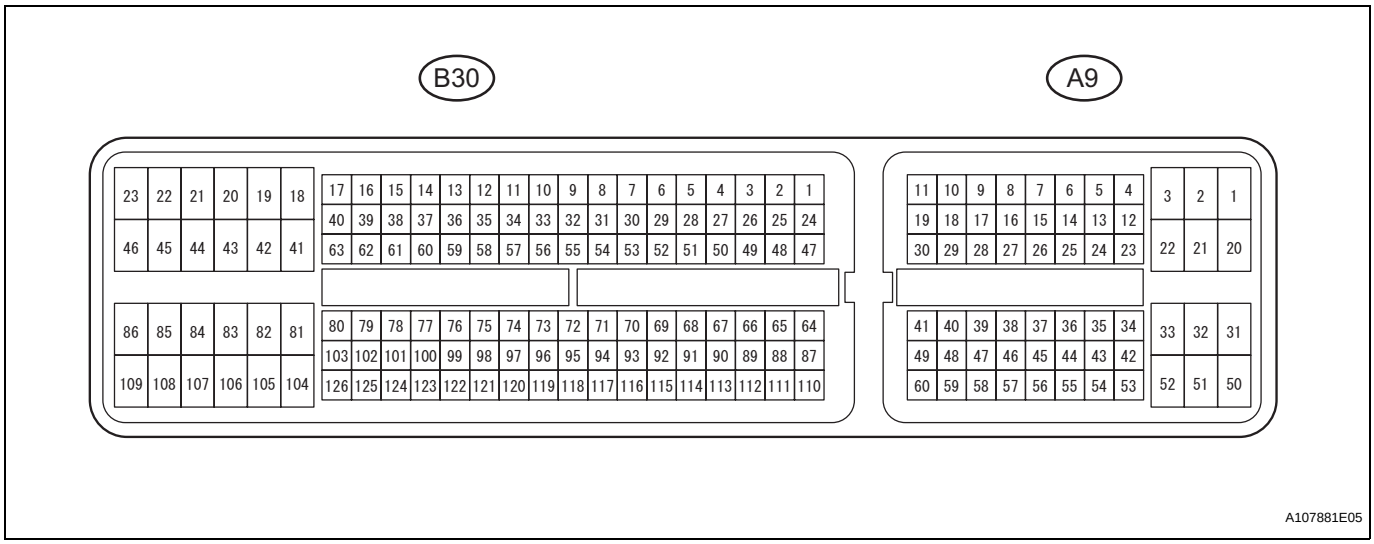
5. AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSOR HEATER MONITORS (FRONT A/F AND REAR HO2 SENSOR TYPE)

(a) Preconditions
The monitor will not run unless:
– The MIL is OFF.

(b) Drive Pattern
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (if set) (see page ES-35).
(5) Start the engine.
(6) Allow the engine to idle for 10 minutes or more.
(7) Drive the vehicle at 40 km/h (25 mph) or more for at least 2 minutes.

(c) Monitor Status
(1) Check the Readiness Monitor status displayed on the tester.
If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and repeat steps from (5) to (7) described in the Drive Pattern above.

PROBLEM SYMPTOMS TABLE



HINT:
Use the table below to help determine the cause of the problem symptom. The potential causes of the symptoms are listed in order of probability in the "Suspected area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

SFI system

Symptom	Suspected area	See page
Engine does not crank (Does not start)	1. Battery	CH-4
	2. Starter	ST-8
	3. Starter relay	ST-16
	4. Park/neutral position switch	AX-108
	5. Immobiliser system	EI-3
No initial combustion (Does not start)	1. ECM power source circuit	ES-366
	2. Crankshaft position sensor	ES-402
	3. Camshaft position sensor	ES-399
	4. Ignition system	IG-4
	5. Fuel pump control circuit	ES-378
	6. ECM	ES-26
	7. VC output circuit	ES-373
Engine cranks normally but difficult to start	1. Fuel pump control circuit	ES-378
	2. Compression	EM-3
Difficult to start with cold engine	1. Ignition system	IG-4
	2. Spark plug	IG-7
	3. Fuel pump control circuit	ES-378
	4. Injector	FU-11
Difficult to start with warm engine	1. Injector	FU-11
	2. Ignition system	IG-4
	3. Spark plug	IG-7
	4. Fuel pump control circuit	ES-378
High engine idle speed	1. Electronic throttle control system	ES-265
	2. A/C signal circuit	-
	3. ECM power source circuit	ES-366
Low engine idle speed (Poor idling)	1. Electronic throttle control system	ES-265
	2. A/C signal circuit	-
	3. Fuel pump control circuit	ES-378
	4. Air induction system	EC-7
	5. PCV hose	EC-7
Rough idling	1. Compression	EM-3
	2. Spark plug	IG-7
	3. Injector	FU-11
	4. Ignition system	IG-4
	5. Fuel pump control circuit	ES-378
	6. Electronic throttle control system	ES-265
	7. Air induction system	EC-7
	8. PCV hose	EC-7
	9. Mass air flow meter	ES-391

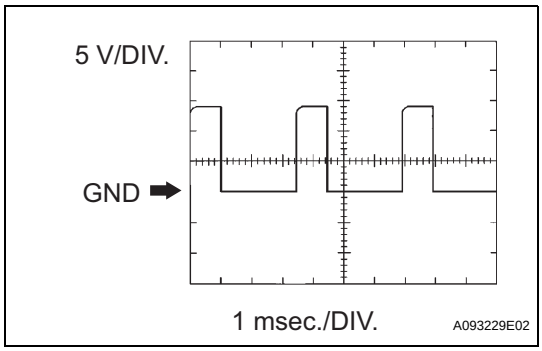
Symptom	Suspected area	See page
Idle hunting	1. Electronic throttle control system	ES-265
	2. Air induction system	EC-7
	3. ECM power source circuit	ES-366
Hesitation/Poor acceleration	1. Fuel pump control circuit	ES-378
	2. Spark plug	IG-7
	3. Ignition system	IG-4
	4. Injector	FU-11
	5. Mass air flow meter	ES-391
	6. Electronic throttle control system	ES-265
	7. Air induction system	EC-7
	8. Compression	EM-3
Surging (Poor driveability)	1. Spark plug	IG-7
	2. Fuel pump control circuit	ES-378
	3. Ignition system	IG-4
	4. Injector	FU-11
	5. Mass air flow meter	ES-391
	6. Variable valve timing system	ES-66
	7. Compression	EM-3
Engine stalls soon after starting	1. Fuel pump control circuit	ES-378
	2. Spark plug	IG-7
	3. Ignition system	IG-4
	4. Injector	FU-11
	5. Variable valve timing system	ES-66
	6. Electronic throttle control system	ES-265
	7. Air induction system	EC-7
	8. PCV hose	EC-7
	9. Compression	EM-3
Engine stalls only during A/C operation	1. A/C signal circuit	-
	2. ECM	ES-26
Unable/difficult to refuel	1. Refueling valve (canister)	-

TERMINALS OF ECM

A107881E05

HINT:
The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column. The illustration above can be used as a reference to identify the ECM terminal locations.

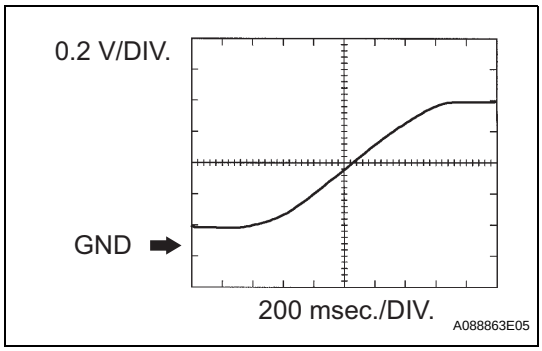
Symbols (Terminal No.)	Wiring Colors	Terminal Descriptions	Conditions	Specified Conditions
BATT (A9-20) - E1 (B30-104)	W - BR	Battery (for measuring battery voltage and for ECM memory)	Always	9 to 14 V
+BM (A9-3) - E1 (B30-104)	LG - BR	Power source of throttle actuator	Always	9 to 14 V
IGSW (A9-28) - E1 (B30-104)	B - BR	Ignition switch	Ignition switch ON	9 to 14 V
+B (A9-2) - E1 (B30-104)	B - BR	Power source of ECM	Ignition switch ON	9 to 14 V
+B2 (A9-1) - E1 (B30-104)	B - BR	Power source of ECM	Ignition switch ON	9 to 14 V
OC1+ (B30-100) - OC1- (B30-123)	BR - L	Camshaft timing oil control valve (OCV)	Idling	Pulse generation (see waveform 1)
MREL (A9-44) - E1 (B30-104)	O - BR	EFI relay	Ignition switch ON	9 to 14 V
VG (B30-118) - E2G (B30-116)	R - LG	Mass air flow meter	Idling, Shift lever position P or N, A/C switch OFF	0.5 to 3.0 V
THA (B30-65) - ETHA (B30-88)	W - BR	Intake air temperature sensor	Idling, Intake air temperature 20°C (68°F)	0.5 to 3.4 V
THW (B30-97) - ETHW (B30-96)	GR - BR	Engine coolant temperature sensor	Idling, Engine coolant temperature 80°C (176°F)	0.2 to 1.0 V
VCTA (B30-67) - ETA (B30-91)	Y - BR	Power source of throttle position sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
VTA1 (B30-115) - ETA (B30-91)	G - BR	Throttle position sensor (for engine control)	Ignition switch ON, Throttle valve fully closed	0.5 to 1.1 V
			Ignition switch ON, Throttle valve fully open	3.3 to 4.9 V
VTA2 (B30-114) - ETA (B30-91)	L - BR	Throttle position sensor (for sensor malfunction detection)	Ignition switch ON, Throttle valve fully closed	2.1 to 3.1 V
			Ignition switch ON, Throttle valve fully open	4.6 to 5.0 V



ES

Symbols (Terminal No.)	Wiring Colors	Terminal Descriptions	Conditions	Specified Conditions
VPA (A9-55) - EPA (A9-59)	W - Y	Accelerator pedal position sensor (for engine control)	Ignition switch ON, Accelerator pedal released	0.5 to 1.1 V
			Ignition switch ON, Accelerator pedal fully depressed	2.6 to 4.5 V
VPA2 (A9-56) - EPA2 (A9-60)	R - O	Accelerator pedal position sensor (for sensor malfunctioning detection)	Ignition switch ON, Accelerator pedal released	1.2 to 2.0 V
			Ignition switch ON, Accelerator pedal fully depressed	3.4 to 5.0 V
VCPA (A9-57) - EPA (A9-59)	B - Y	Power source of accelerator pedal position sensor (for VPA)	Ignition switch ON	4.5 to 5.5 V
VCP2 (A9-58) - EPA2 (A9-60)	L - O	Power source of accelerator pedal position sensor (for VPA2)	Ignition switch ON	4.5 to 5.5 V
HA1A (B30-109) - E04 (B30-46)	L - W-B	A/F sensor heater	Idling	Below 3.0 V
			Ignition switch ON	9 to 14 V
A1A+ (B30-112) - E1 (B30-104)	B -BR	A/F sensor	Ignition switch ON	3.3 V*
A1A- (B30-113) - E1 (B30-104)	R - BR	A/F sensor	Ignition switch ON	3.0 V*
HT1B (B30-47) - E03 (B30-86)	R - W-B	Heated oxygen sensor heater	Idling	Below 3.0 V
			Ignition switch ON	9 to 14 V
OX1B (B30-64) - EX1B (B30-87)	B - BR	Heated oxygen sensor	Engine speed maintained at 2,500 rpm for 2 minutes after warming up sensor	Pulse generation (see waveform 2)
#10 (B30-108) - E01 (B30-45) #20 (B30-107) - E01 (B30-45) #30 (B30-106) - E01 (B30-45) #40 (B30-105) - E01 (B30-45)	L - W-B G - W-B B - W-B W - W-B	Injector	Ignition switch ON	9 to 14 V
			Idling	Pulse generation (see waveform 3)
KNK1 (B30-110) - EKNK (B30-111)	B - W	Knock sensor	Engine speed maintained at 4,000 after warming up engine	Pulse generation (see waveform 4)
G2+ (B30-99) - G2- (B30-98)	L - Y	Camshaft position sensor	Idling	Pulse generation (see waveform 5)
NE+ (B30-122) - NE- (B30-121)	W - B	Crankshaft position sensor	Idling	Pulse generation (see waveform 5)
IGT1 (B30-85) - E1 (B30-104) IGT2 (B30-84) - E1 (B30-104) IGT3 (B30-83) - E1 (B30-104) IGT4 (B30-82) - E1 (B30-104)	R - BR P - BR G - BR L - BR	Ignition coil (ignition signal)	Idling	Pulse generation (see waveform 6)
IGF1 (B30-81) - E1 (B30-104)	W - BR	Ignition coil (ignition confirmation signal)	Ignition switch ON	4.5 to 5.5 V
			Idling	Pulse generation (see waveform 6)
PRG (B30-49) - E1 (B30-104)	G - BR	Purge VSV	Ignition switch ON	9 to 14 V
			Idling	Pulse generation (see waveform 7)
SPD (A9-8) - E1 (B30-104)	V - BR	Speed signal from combination meter	Driving at 20 km/h (12 mph)	Pulse generation (see waveform 8)
STA (A9-48) - E1 (B30-104)	LG - BR	Starter signal	Cranking	5.5 V or more
STAR (B30-52) - E1 (B30-104)	W - BR	Starter relay control	Ignition switch ON	Below 1.5 V
			Cranking	6.0 V or more
STP (A9-36) - E1 (B30-104)	L - BR	Stop light switch	Brake pedal depressed	7.5 to 14 V
			Brake pedal released	Below 1.5 V
ST1- (A9-35) - E1 (B30-104)	GR - BR	Stop light switch (opposite to STP terminal)	Ignition switch ON, Brake pedal depressed	Below 1.5 V
			Ignition switch ON, Brake pedal released	7.5 to 14 V
M+ (B30-42) - ME01 (B30-43)	B - W-B	Throttle actuator	Idling with warm engine	Pulse generation (see waveform 9)

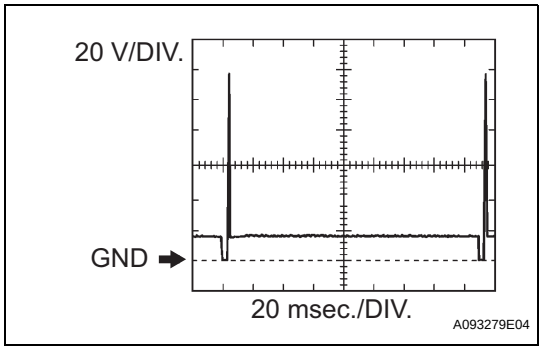
Symbols (Terminal No.)	Wiring Colors	Terminal Descriptions	Conditions	Specified Conditions
M- (B30-41) - ME01 (B30-43)	W - W-B	Throttle actuator	Idling with warm engine	Pulse generation (see waveform 10)
FC (A9-7) - E1 (B30-104)	W - BR	Fuel pump control	Ignition switch ON	9 to 14 V
			Idling	Below 1.5 V
W (A9-24) - E1 (B30-104)	R - BR	MIL	Ignition switch ON	Below 1.5 V
			Idling	9 to 14 V
TC (A9-27) - E1 (B30-104)	G - BR	Terminal TC of DLC3	Ignition switch ON	9 to 14 V
TACH (A9-15) - E1 (B30-104)	GR - BR	Engine speed	Idling	Pulse generation (see waveform 11)
VPMP (A9-42) - E1 (B30-104)	W - BR	Vent valve (built into canister pump module)	Ignition switch ON	9 to 14 V
MPMP (A9-34) - E1 (B30-104)	B - BR	Leak detection pump (built into canister pump module)	Leak detection pump OFF	Below 3 V
			Leak detection pump ON	9 to 14 V
VCPP (B30-70) - EPPM (B30-94)	Y - BR	Power source for canister pressure sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
PPMP (B30-71) - EPPM (B30-94)	V - BR	Canister pressure sensor (built into canister pump module)	Ignition switch ON	3 to 3.6 V
ELS1 (A9-31) - E1 (B30-104)	O - BR	Electric load	Taillight switch ON	7.5 to 14 V
			Taillight switch OFF	Below 1.5 V
ELS3 (A9-33) - E1 (B30-104)	G - BR	Electric load	Defogger switch ON	7.5 to 14 V
			Defogger switch OFF	Below 1.5 V
FANL (A9-21) - E1 (B30-104)	R - BR	Fan No. 1 relay	Ignition switch ON	9 to 14 V
			Idling with A/C ON, or high engine coolant temperature	Below 1.5 V
FANH (A9-22) - E1 (B30-104)	W - BR	Fan No. 2 relay	Idling with high engine coolant temperature	Below 1.5 V
ALT (B30-50) - E1 (B30-104)	B - BR	Generator	Ignition switch ON	9 to 14 V
CANH (A9-41) - E1 (B30-104)	Y - BR	CAN communication line	Ignition switch ON	Pulse generation (see waveform 12)
CANL (A9-49) - E1 (B30-104)	W - BR	CAN communication line	Ignition switch ON	Pulse generation (see waveform 13)
VCIB (B30-69) - EIB (B30-92)	R - BR	Battery current sensor	Ignition switch ON	4.5 to 5.5 V
IB (B30-68) - EIB (B30-92)	B - BR	Battery current sensor	Ignition switch ON	0.5 to 2.5 V
THB (B30-120) - EIB (B30-92)	LG - BR	Battery temperature sensor	Ignition switch ON, Battery temperature -30 to 80°C (-22 to 176°F)	0.5 to 4.5 V
RLO (B30-51) - E1 (B30-104)	GR - BR	Generator	After engine warmed up, during charging control, vehicle driven at constant speed	Pulse generation (see waveform 14)
RLO (B30-51) - E1 (B30-104)	GR - BR	Generator	After engine warmed up, during charging control, vehicle accelerated	Pulse generation (see waveform 15)
RLO (B30-51) - E1 (B30-104)	GR - BR	Generator	After engine warmed up, during charging control, vehicle decelerated	Pulse generation (see waveform 16)



HINT:
*: The ECM terminal voltage is constant regardless of the output voltage from the sensor.

ES

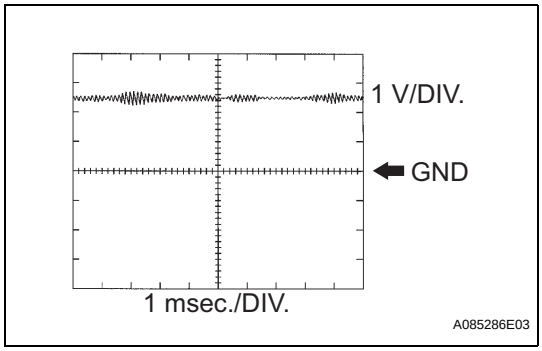
1. WAVEFORM 1
Camshaft timing oil control valve (OCV)



ECM Terminal Names	Between OC1+ and OC1-
Tester Ranges	5 V/DIV., 1 msec./DIV.
Conditions	Idling

2. WAVEFORM 2
Heated oxygen sensor

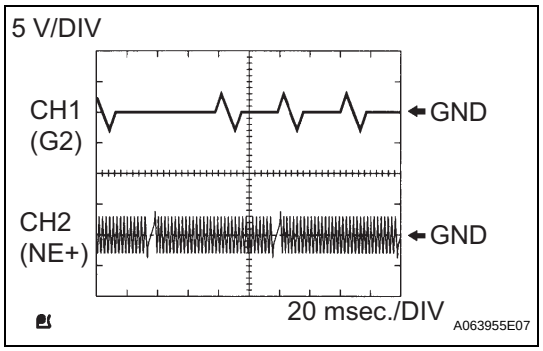
ECM Terminal Names	Between OX1B and EX1B
Tester Ranges	0.2 V/DIV., 200 msec./DIV.
Conditions	Engine speed maintained at 2,500 rpm for 2 minutes after warming up sensor



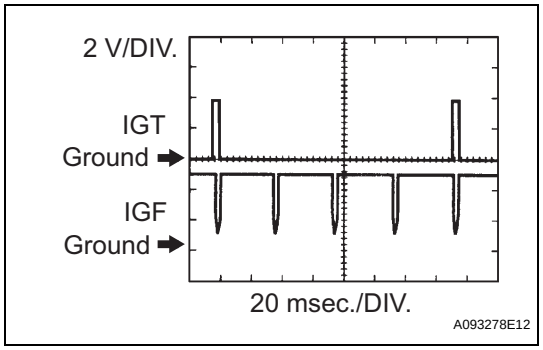
HINT:
In DATA LIST, item O2S B1 S2 shows the ECM input values from the heated oxygen sensor.

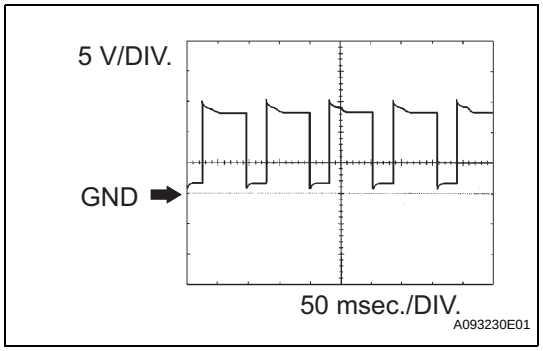
3. WAVEFORM 3
Injector No. 1 (to No. 4) injection signal

ECM Terminal Names	Between #10 (to #40) and E01
Tester Ranges	20 V/DIV., 20 msec./DIV.
Conditions	Idling

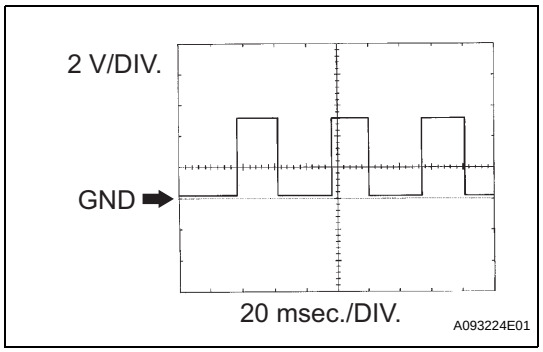


HINT:
The wavelength becomes shorter as the engine rpm increases.

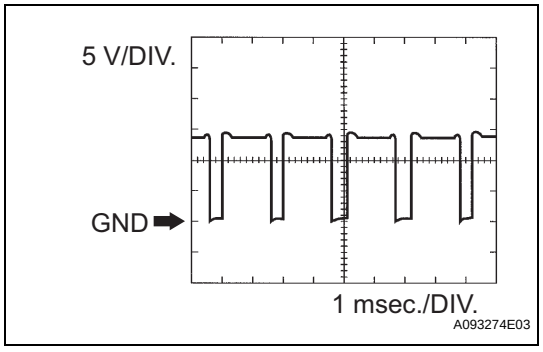




4. WAVEFORM 4
Knock sensor



ECM Terminal Names	Between KNK1 and EKNK
Tester Ranges	1 V/DIV., 1 msec./DIV.
Conditions	Engine speed maintained at 4,000 rpm after warming up engine



HINT:
- The wavelength becomes shorter as the engine rpm increases.
- The waveforms and amplitudes displayed differ slightly depending on the vehicle.

5. WAVEFORM 5
Crankshaft position sensor and Camshaft position sensor

ECM Terminal Names	CH1: Between G2+ and G2- CH2: Between NE+ and NE-
Tester Ranges	5 V/DIV., 20 msec./DIV.
Conditions	Idling

HINT:
The wavelength becomes shorter as the engine rpm increases.

6. WAVEFORM 6
Igniter IGT signal (from ECM to igniter) and Igniter IGF signal (from igniter to ECM)

ECM Terminal Names	Between IGT (1 to 4) and E1 Between IGF1 and E1
Tester Ranges	2 V/DIV., 20 msec./DIV.
Conditions	Idling

HINT:
The wavelength becomes shorter as the engine rpm increases.

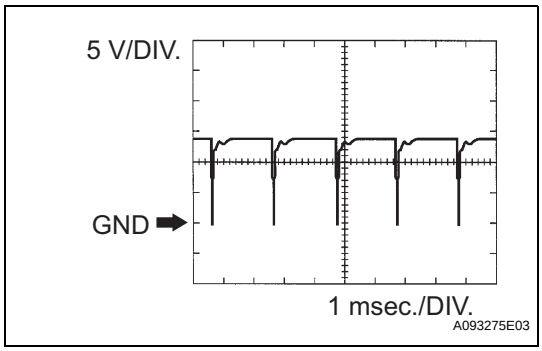
7. WAVEFORM 7
Purge VSV

ECM Terminal Names	Between PRG and E1
Tester Ranges	5 V/DIV., 50 msec./DIV.
Conditions	Idling

HINT:
If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

8. WAVEFORM 8
Vehicle speed signal

ECM Terminal Names	Between SPD and E1
Tester Ranges	2 V/DIV., 20 msec./DIV.
Conditions	Driving at 20 km/h (12 mph)

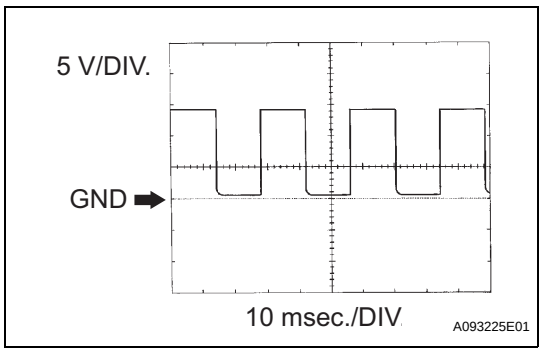


HINT:
The wavelength becomes shorter as the vehicle speed increases.

9. WAVEFORM 9
Throttle actuator positive terminal

ECM Terminal Names	Between M+ and ME01
Tester Ranges	5 V/DIV., 1 msec./DIV.
Conditions	Idling with warm engine

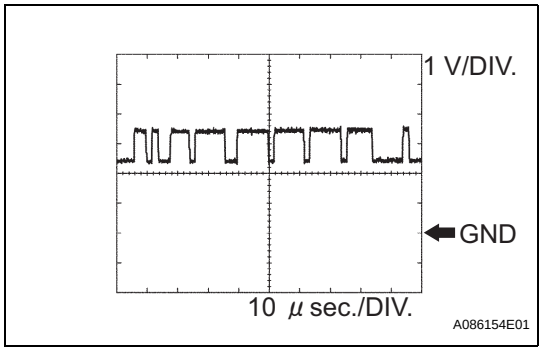
HINT:
The duty ratio varies depending on the throttle actuator operation.



ES

10. WAVEFORM 10
Throttle actuator negative terminal

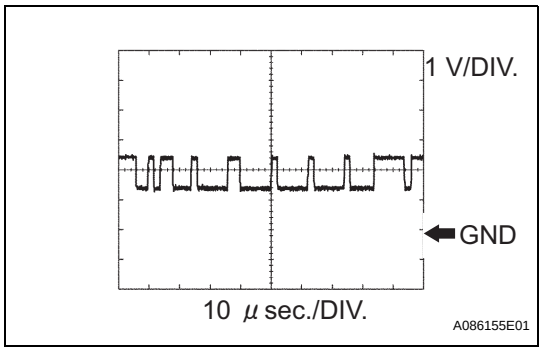
ECM Terminal Names	Between M- and ME01
Tester Ranges	5 V/DIV., 1 msec./DIV.
Conditions	Idling with warm engine



HINT:
The duty ratio varies depending on the throttle actuator operation.

11. WAVEFORM 11
Engine speed signal

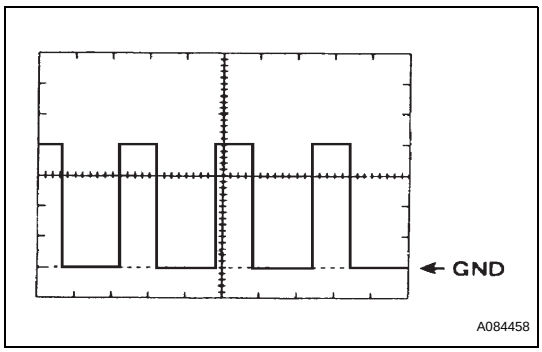
ECM Terminal Names	Between TACH and E1
Tester Ranges	5 V/DIV., 10 msec./DIV.
Conditions	Idling



HINT:
The wavelength becomes shorter as the engine rpm increases.

12. WAVEFORM 12
CAN communication signal

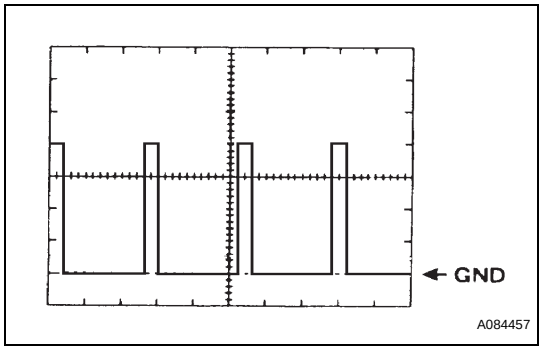
ECM Terminal Names	Between CANH and E1
Tester Ranges	1 V/DIV., 10 μsec./DIV.
Conditions	Engine stops and ignition switch ON



HINT:
The waveform varies depending on the CAN communication signal.

13. WAVEFORM 13
CAN communication signal

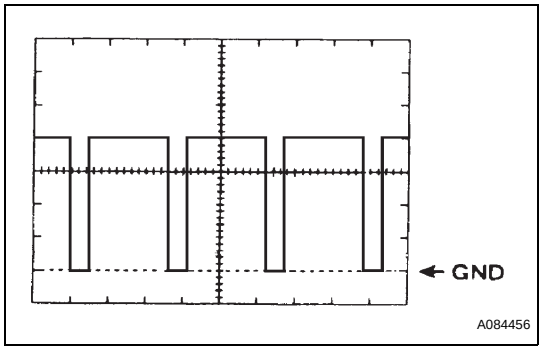
ECM Terminal Names	Between CANL and E1
Tester Ranges	1 V/DIV., 10 μsec./DIV.
Conditions	Engine stops and ignition switch ON



HINT:
The waveform varies depending on the CAN communication signal.

14. WAVEFORM 14
Generator

ECM Terminal Names	Between RLO and E1
Tester Ranges	2 V/DIV., 50 msec./DIV.
Conditions	After engine warmed up, during charging control, vehicle driven at constant speed



HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

15. WAVEFORM 15
Generator

ECM Terminal Names	Between RLO and E1
Tester Ranges	2 V/DIV., 50 msec./DIV.
Conditions	After engine warmed up, during charging control, vehicle accelerated

HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

16. WAVEFORM 16
Generator

ECM Terminal Names	Between RLO and E1
Tester Ranges	2 V/DIV., 50 msec./DIV.
Conditions	After engine warmed up, during charging control, vehicle decelerated

HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

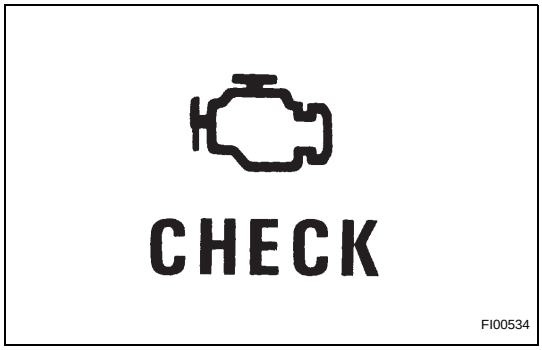
DIAGNOSIS SYSTEM

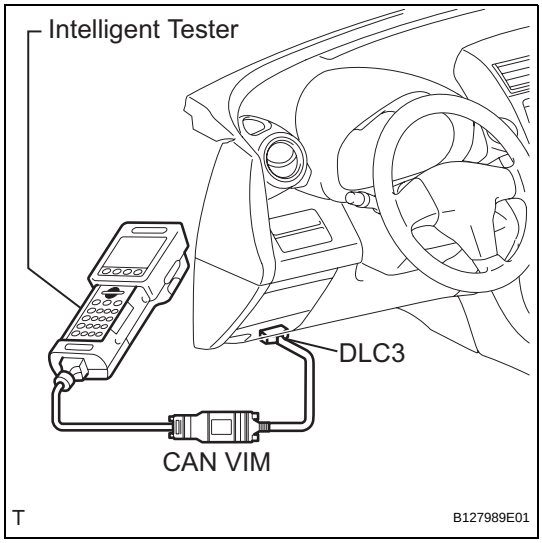
1. DESCRIPTION

When troubleshooting OBD II (On-Board Diagnostics) vehicles, the intelligent tester (complying with SAE J1987) must be connected to the DLC3 (Data Link Connector 3) of the vehicle. Various data in the vehicle's ECM (Engine Control Module) can be then read.

OBD II regulations require that the vehicle's on-board computer illuminate the MIL (Malfunction Indicator Lamp) on the instrument panel when the computer detects a malfunction in:



(a) The emission control system components.
(b) The powertrain control components (which affect vehicle emissions).
(c) The computer itself.



In addition, if the applicable DTCs (Diagnostic Trouble Codes) prescribed by SAE J2012 are not recorded on 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

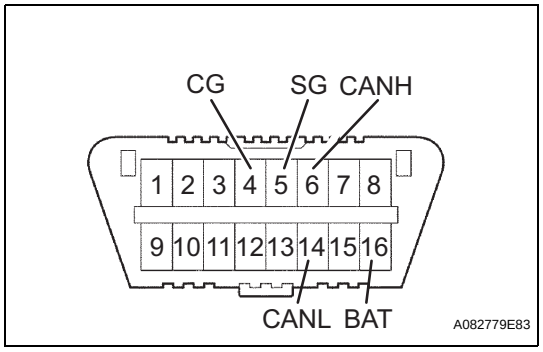
To check DTCs, connect the intelligent tester to the DLC3. The tester displays DTCs, freeze frame data, and a variety of the engine data. The DTCs and freeze frame data can be erased with the tester (see page ES-35).

In order to enhance OBD function on vehicles and develop the Off-Board diagnosis system, CAN (Controller Area Network) communication is introduced in this system. It minimizes the gap between technician skills and vehicle technology. CAN is a network, which uses a pair of data transmission lines, spanning multiple computers and sensors. It allows high speed communication between the systems and simplifies the wire harness connection.

Since this system is equipped with the CAN communication, connecting the CAN VIM (Vehicle Interface Module) to the intelligent tester is necessary to display any information from the ECM. (Also the communication between the intelligent tester and the ECM uses CAN communication signals.) When confirming the DTCs and any data of the ECM, connect the CAN VIM between the DLC3 and the intelligent tester.

2. NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent problems (intelligent tester only) (see page ES-38).



3. 2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent drive cycle, the MIL is illuminated (2nd trip).

4. FREEZE FRAME DATA

Freeze frame data records the engine conditions (fuel system, calculated engine load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

5. DLC3 (Data Link Connector 3)

Symbols	Terminal No.	Names	Reference terminal	Results	Condition
SIL	7	Bus "+" line	5 - Signal ground	Pulse generation	During transmission
CG	4	Chassis ground	Body ground	1 Ω or less	Always
SG	5	Signal ground	Body ground	1 Ω or less	Always
BAT	16	Battery positive	Body ground	9 to 14 V	Always
CANH	6	CAN "High" line	14 - CANL	54 to 69 Ω	Ignition switch OFF*
			Battery positive	6 kΩ or higher	Ignition switch OFF*
			4 - CG	200 Ω or higher	Ignition switch OFF*
CANL	14	CAN "Low" line	Battery positive	6 kΩ or higher	Ignition switch OFF*
			4 - CG	200 Ω or higher	Ignition switch OFF*

CAUTION:

***: Before measuring the resistance, leave the vehicle as is for at least 1 minute and do not operate the ignition switch, any other switches or the doors.**

If the result is not as specified, the DLC3 may have a malfunction. Repair or replace the harness and connector.

HINT:

The DLC3 is the interface prepared for reading various data from the vehicle's ECM. After connecting the cable of the intelligent tester to the CAN VIM, turn the ignition switch ON and turn the tester ON. If a communication failure message is displayed on the tester screen (on the tester: UNABLE TO CONNECT TO VEHICLE), a problem exists in either the vehicle or tester. In order to identify the location of the problem, connect the tester to another vehicle.

If communication is normal: Inspect the DLC3 on the original vehicle.
If communication is still not possible: The problem is probably in the tester itself. Consult the Service Department listed in the instruction manual.

6. BATTERY VOLTAGE

Standard battery voltage:

11 to 14 V

If the voltage is below 11 V, replace or recharge the battery before proceeding.

7. MIL (Malfunction Indicator Lamp)

(a) The MIL is illuminated when the ignition switch is first turned ON (the engine is not running).

(b) The MIL should turn OFF when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.
HINT:
If the MIL is not illuminated when the ignition switch is first turned ON, check the MIL circuit (see page ES-386).

8. ALL READINESS

For the vehicle, using the intelligent tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Select the following menu items on the intelligent tester: ENHANCED OBD II / MONITOR STATUS.

DTC CHECK / CLEAR

NOTICE:
When the diagnosis system is changed from normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are erased. Before changing modes, always check and make a note of any DTCs and freeze frame data.

HINT:

- DTCs which are stored in the ECM can be displayed on the intelligent tester. The intelligent tester can display current and pending DTCs.
- Some DTCs are not set if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.

1. CHECK DTC (Using intelligent tester)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES or PENDING CODES.
(e) Check the DTC(s) and freeze frame data, and then write them down.
(f) Check the details of the DTC(s) (see page ES-51).

2. CLEAR DTC (Using intelligent tester)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES.
(e) Press the YES button.

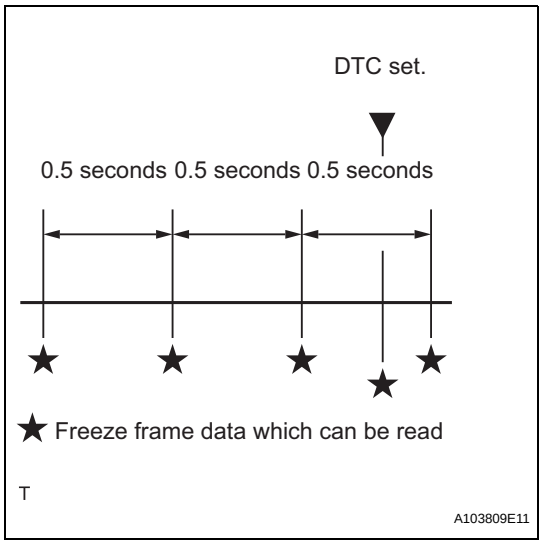
3. CLEAR DTC (Without using intelligent tester)

(a) Perform either of the following operations.
(1) Disconnect the cable from the negative (-) battery terminal for more than 1 minute.
(2) Remove the EFI and ETCS fuses from the engine room relay block (located inside the engine compartment) for more than 1 minute.

FREEZE FRAME DATA

1. DESCRIPTION

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.



HINT:

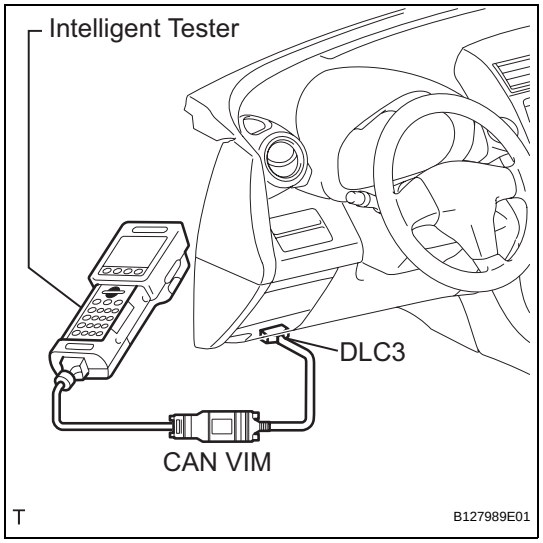
If it is impossible to duplicate the problem even though a DTC is detected, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

– 3 data sets before the DTC was set.
– 1 data set when the DTC was set.
– 1 data set after the DTC was set.

These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

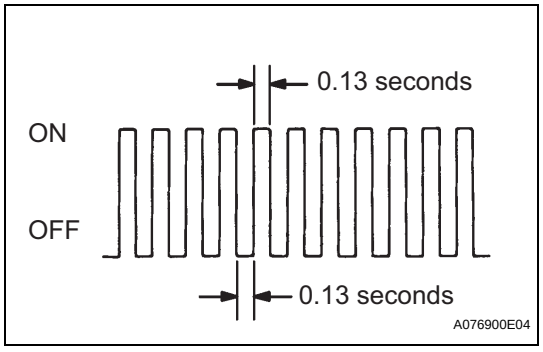
2. LIST OF FREEZE FRAME DATA



LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder	-
IGN ADVANCE	Ignition advance	-
CALC LOAD	Calculated load	Calculated load by ECM
VEHICLE LOAD	Vehicle load	-
MAF	Mass air flow volume	If approximately 0.0 g/sec.: • Mass air flow meter power source circuit open or short • VG circuit open or short If 160.0 g/sec. or more: • E2G circuit open
ENGINE SPD	Engine speed	-
VEHICLE SPD	Vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature	If -40°C (-40°F), sensor circuit open If 140°C (284°F) or more, sensor circuit shorted
INTAKE AIR	Intake air temperature	If -40°C (-40°F), sensor circuit open If 140°C (284°F) or more, sensor circuit shorted
AIR-FUEL RATIO	Ratio compared to stoichiometric level	-
PURGE DENSITY	Learning value of purge density	-
EVAP PURGE FLOW	Ratio of evaporative purge flow to intake air volume	-
EVAP PURGE VSV	EVAP purge VSV duty ratio	-
KNOCK CRRT VAL	Correction learning value of knocking	-

LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
KNOCK FB VAL	Feedback value of knocking	-
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No.1	-
ACCEL POS #2	Absolute APP No. 2	-
THROTTLE POS	Throttle sensor positioning	-
THROTTLE POS	Throttle position	-
THROTTLE POS #2	Throttle sensor positioning #2	-
THROTTLE MOT	Throttle motor	-
O2S B1 S2	Heated oxygen sensor output	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
AFS B1 S1	A/F sensor output	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
TOTAL FT #1	Total fuel trim	-
SHORT FT #1	Short-term fuel trim	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim	Overall fuel compensation carried out in long-term to compensate a continual deviation of short-term fuel trim from central valve
FUEL SYS #1	Fuel system status	• OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using A/F sensor as feedback for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but A/F sensor, which used for fuel control malfunctioning
O2FT B1 S2	Fuel trim at heated oxygen sensor	-
AF FT B1 S1	Fuel trim at A/F sensor	-
AFS B1 S1	A/F sensor current	-
CAT TEMP B1S1	Estimated catalyst temperature (sensor 1)	-
CAT TEMP B1S2	Estimated catalyst temperature (sensor 2)	-
S O2S B1S2	Sub heated oxygen sensor impedance (sensor 2)	-
INI COOL TEMP	Engine coolant temperature at engine start	-
INI INTAKE TEMP	Intake air temperature at engine start	-
INJ VOL	Injection volume	-
STARTER SIG	Starter switch (STSW) signal	-
PS SW	Power steering signal	-
PS SIGNAL	Power steering signal (history)	Signal status usually ON until ignition switch turned OFF
CTP SW	Closed throttle position switch	-
A/C SIGNAL	A/C signal	-
PNP SW (NSW)	Park/Neutral Position (PNP) switch signal	-
ELECT LOAD SIG	Electrical load signal	-
STOP LIGHT SW	Stop light switch	-
BATTERY VOLTAGE	Battery voltage	-
ATM PRESSURE	Atmosphere pressure	-
EVAP (Purge) VSV	EVAP Purge VSV	-
FUEL PUMP/SPD	Fuel pump/speed status	-

LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
VVT CTRL B1	VVT control status	-
VACUUM PUMP	Key-off EVAP system leak detection pump status	(see page ES-333)
EVAP VENT VAL	Key-off EVAP system vent valve status	-
FAN MOTOR	Electric fan motor	-
TC/TE1	TC and CG (TE1) terminals of DLC3	-
ENG SPEED #1	Engine rpm during No. 1 cylinder fuel cut	Output only when FUEL CUT #1 is performed using ACTIVE TEST
ENG SPEED #2	Engine rpm during No. 2 cylinder fuel cut	Output only when FUEL CUT #2 is performed using ACTIVE TEST
ENG SPEED #3	Engine rpm during No. 3 cylinder fuel cut	Output only when FUEL CUT #3 is performed using ACTIVE TEST
ENG SPEED #4	Engine rpm during No. 4 cylinder fuel cut	Output only when FUEL CUT #4 is performed using ACTIVE TEST
ENG SPEED ALL	Average of engine rpm values during fuel cut of No. 1 to No. 4 cylinders	Output only when ACTIVE TEST is performed
VVTL AIM ANGL#1	VVT aim angle	-
VVT CHNG ANGL#1	VVT angle	-
VVT OCV DUTY B1	VVT OCV operation duty	-
FC IDL	Fuel cut idle	ON: when throttle valve fully closed and engine speed over 3,500 rpm
FC TAU	Fuel cut during very light load	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
IGNITION	Ignition counter	-
CYL #1	Cylinder #1 misfire	Only displayed during idling
CYL #2	Cylinder #2 misfire	Only displayed during idling
CYL #3	Cylinder #3 misfire	Only displayed during idling
CYL #4	Cylinder #4 misfire	Only displayed during idling
CYL ALL	All cylinders misfire	Only displayed during idling
MISFIRE RPM	Engine speed when misfire occurred	-
MISFIRE LOAD	Engine load when misfire occurred	-
MISFIRE MARGIN	Margin to detect engine misfire	-
MIL ON RUN DIST	Distance after DTC is detected	-
ENG RUN TIME	Accumulated engine running time	-
TIME DTC CLEAR	Cumulative time after DTC cleared	-
DIST DTC CLEAR	Accumulated distance from DTC cleared	-
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared	-



CHECK MODE PROCEDURE

HINT:
Intelligent tester only:
Compared to normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected by normal mode.
NOTICE:
All the stored DTCs and freeze frame data are erased if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the ignition switch is turned from ON to ACC or OFF while in check mode. Before changing modes, always check and make a note of any DTCs and freeze frame data.

1. CHECK MODE PROCEDURE (Using intelligent tester)

(a) Check and ensure the following conditions:
  (1) Battery positive voltage 11 V or more.
  (2) Throttle valve fully closed.
  (3) Transmission in the P or N position.
  (4) A/C switch OFF.
(b) Turn the ignition switch OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II/ CHECK MODE.
(g) Switch the ECM from normal mode to check mode.

(h) Make sure the MIL flashes as shown in the illustration.
(i) Start the engine.
(j) Make sure the MIL turns off.
(k) Simulate the conditions of the malfunction described by the customer.
(l) Check DTCs and freeze frame data using the tester.

FAIL-SAFE CHART

If any of the following DTCs are set, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTCs	Components	Fail-Safe Operations	Fail-Safe Deactivation Conditions
P0031 and P0032	Air-Fuel Ratio (A/F) Sensor Heater	ECM turns off A/F sensor heater.	Ignition switch OFF
P0037 and P0038	Heated Oxygen (HO2) Sensor Heater	ECM turns off HO2 sensor heater.	Ignition switch OFF
P0100, P0102 and P0103	Mass Air Flow (MAF) Meter	ECM calculates ignition timing according to engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Intake Air Temperature (IAT) Sensor	ECM estimates IAT to be 20°C (68°F).	Pass condition detected
P0115, P0117 and P0118	Engine Coolant Temperature (ECT) Sensor	ECM estimates ECT to be 80°C (176°F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0604, P0606, P0607, P0657, P2102, P2103, P2111, P2112, P2118, P2119 and P2135	Electronic Throttle Control System (ETCS)	ECM cuts off throttle actuator current and throttle valve returned to 6° throttle position by return spring. ECM then adjusts engine output by controlling fuel injection (intermittent fuel-cut) and ignition timing in accordance with accelerator pedal opening angle to allow vehicle to continue at minimal speed*.	Pass condition detected and then ignition switch turned OFF
P0327 and P0328	Knock Sensor	ECM sets ignition timing to maximum retard.	Ignition switch OFF
P0351 to P0354	Igniter	ECM cuts fuel.	Pass condition detected
P1550, P1551, P1552 and P1602	Generator	Alternator command is fixed.	Pass condition detected
P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138	Accelerator Pedal Position (APP) Sensor	APP sensor has 2 sensor circuits: Main and Sub. If either circuit malfunctions, ECM controls engine using other circuit. If both circuits malfunction, ECM regards accelerator pedal as being released. As result, throttle valve closed and engine idles.	Pass condition detected and then ignition switch turned OFF

HINT:

*: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on an intelligent tester, values can be checked, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Condition are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

(a) Warm up the engine.
(b) Turn the ignition switch OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
(g) Check the values by referring to the table below.

ECM:

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	1.0 to 3.0 ms: Idling	-
IGN ADVANCE	Ignition timing advance for No. 1 cylinder: Min.: -64 deg, Max.: 63.5 deg	BTDC 0 to 14 deg: Idling	-
CALC LOAD	Calculated load by ECM: Min.: 0 %, Max.: 100 %	• 10 to 30 %: Idling • 10 to 30 %: Running without load at 2,500 rpm	Load value
VEHICLE LOAD	Vehicle load: Min.: 0 %, Max.: 25,700 %	Actual vehicle load	Load percentage in terms of maximum intake air flow amount
MAF	Air flow rate from Mass Air Flow (MAF) meter: Min.: 0 g/sec., Max.: 655.35 g/sec.	1 to 3 g/sec.: Idling 2 to 6 g/sec.: Running without load at 2,500 rpm	If value approximately 0.0 g/sec.: • MAF meter power source circuit open • VG circuit open or short If value 160.0 g/sec. or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383.75 rpm	650 to 750 rpm: Idling	-
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If -40°C (-40°F): sensor circuit open • If 140°C (284°F) or more: sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If -40°C (-40°F): sensor circuit open • If 140°C (284°F) or more: sensor circuit shorted
AIR-FUEL RATIO	Ratio compared to stoichiometric level: Min.: 0, Max.: 1.999	0.8 to 1.2: Idling	• Less than 1 (0 to 0.999) = Lean • Stoichiometric air-fuel ratio = 1 • Greater than 1 (1.001 to 1.999) = Rich

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
PURGE DENSITY	Learning value of purge density: Min.: -50, Max.: 350	-40 to 10: Idling	-
EVAP PURGE FLOW	Ratio of evaporative purge flow to intake air volume: Min.: 0 %, Max.: 102.4 %	0 to 10 %: Idling	-
EVAP PURGE VSV	EVAP (PURGE) VSV control duty: Min.: 0 %, Max.: 100 %	10 to 50 %: Idling	Order signal from ECM
VAPOR PRES PUMP	Vapor pressure: Min.: 33.853 kPa, Max.: 125.596 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
VAPOR PRES CALC	Vapor pressure (calculated): Min.: -5.632 kPa, Max.: 715.264 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
KNOCK CRRT VAL	Knock correction learning value: Min: -64°CA, Max.: 1,984°CA	0 to 20°CA: Driving at 70 km/h (44 mph)	Service data
KNOCK FB VAL	Knock feedback value: Min: -64°CA, Max.: 1,984°CA	-20 to 0°CA: Driving at 70 km/h (44 mph)	Service data
CLUTCH	Clutch current: Min.: 0 A, Max.: 2.49 A	-	-
EVAP VAPOR PRES	EVAP vapor pressure: Min.: 0 kPa, Max.: 327.675 kPa	Approximately 100 kPa: Ignition switch ON	EVAP system pressure monitored by canister pressure sensor
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No. 1: Min.: 0 %, Max.: 100 %	10 to 22 %: Accelerator pedal released 52 to 90 %: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #2	Absolute APP No. 2: Min.: 0 %, Max.: 100 %	24 to 40 %: Accelerator pedal released 68 to 100 %: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Accelerator pedal released 2.6 to 4.5 V: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: Accelerator pedal released 3.4 to 5.0 V: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL LEARN VAL	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	-
ACCEL SSR #1 AD	APP sensor No. 1 voltage (AD): Min.: 0 V, Max.: 4.98 V	-	ETCS service data
ACCEL LRN VAL#1	Accelerator fully closed learning value No. 1: Min.: 0 deg, Max.: 124.512 deg	-	ETCS service data
ACCEL LRN VAL#2	Accelerator fully closed learning value No. 2: Min.: 0 deg, Max.: 124.512 deg	-	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
ST1	Brake pedal signal: ON or OFF	ON: Brake pedal depressed	-
SYS GUARD JUDGE	System guard: ON or OFF	-	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	-	ETCS service data
THROTTLE POS	Throttle position sensor: Min.: 0%, Max.: 100 %	• 10 to 22 %: Throttle fully closed • 66 to 98 %: Throttle fully open	• Calculated value based on VTA1 • Read value with ignition switch ON (Do not start engine)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
THROTTLE POS	Throttle position: Min.: 0 %, Max.: 100 %	• 0 %: Throttle fully closed • 50 to 80 %: Throttle fully open	• Recognition value for throttle opening angle on ECM • Read value with ignition switch ON (Do not start engine)
THROTTLE POS #2	Throttle position No. 2 sensor: Min.: 0 %, Max.: 100 %	• 42 to 62 %: Throttle fully closed • 92 to 100 %: Throttle fully open	• Calculated value based on VTA2 • Read value with ignition switch ON (Do not start engine)
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
THROTTLE POS #2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 5 V	• 0.5 to 1.1 V: Throttle fully closed • 3.3 to 4.9 V: Throttle fully open	Read value with ignition switch ON (Do not start engine)
THROTTLE POS #2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 5 V	• 2.1 to 3.1 V: Throttle fully closed • 4.6 to 5.0 V: Throttle fully open	Read value with ignition switch ON (Do not start engine)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.9804 V	0.5 to 4.9 V	Read value with ignition switch ON (Do not start engine)
THROTTLE SSR #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.9804 V	-	ETCS service data
THROTTLE SSR #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.9804 V	-	ETCS service data
THRTL SSR #1 AD	Throttle position sensor No. 1 output voltage (AD): Min.: 0 V, Max.: 4.9804 V	0.5 to 4.9 V	Read value with ignition switch ON (Do not start engine)
THROTTLE MOT	Whether or not throttle actuator control permitted: ON or OFF	ON: Idling	Read value with ignition switch ON (Do not start engine)
THROTTLE MOT	Throttle actuator current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	-
THROTTLE MOT	Throttle actuator: Min.: 0 %, Max.: 100 %	0.5 to 40 %: Idling	-
THROTTLE MOT	Throttle actuator current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
THROTL OPN DUTY	Throttle actuator opening duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	• When accelerator pedal depressed, duty ratio increased • Read value with ignition switch ON (Do not start engine)
THROTL CLS DUTY	Throttle actuator closed duty ratio: Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	• When accelerator pedal released quickly, duty ratio increased • Read value with ignition switch ON (Do not start engine)
THRTL MOT (OPN)	Throttle actuator duty ratio (open): Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	ETCS service data
THRTL MOT (CLS)	Throttle actuator duty ratio (closed): Min.: 0 %, Max.: 100 %	0 to 40 %: During idling	ETCS service data
O2S B1 S2	Heated oxygen sensor output voltage for sensor 2: Min.: 0 V Max.: 1.275 V	0.1 to 0.9 V: Driving at 70 km/h (44 mph)	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
AFS B1 S1	A/F sensor output voltage for sensor 1: Min.: 0 V Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
TOTAL FT #1	Total fuel trim value for fuel system: Min.: -0.5, Max.: 0.496	-0.2 to 0.2	-
SHORT FT #1	Short-term fuel trim: Min.: -100 %, Max.: 99.2 %	-20 to 20 %	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim: Min.: -100 %, Max.: 99.2 %	-20 to 20 %	Overall fuel compensation carried out in long-term to compensate continual deviation of short-term fuel trim from central value
FUEL SYS #1	Fuel system status: OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using A/F sensor as feedback for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but A/F sensor, which used for fuel control malfunctioning
O2FT B1 S2	Short-term fuel trim associated with sensor 2: Min.: -100 %, Max.: 99.2 %	-	-
AF FT B1 S1	Short-term fuel trim associated with sensor 1: Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) =Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = Rich	-
AFS B1 S1	A/F sensor current: Min.: -128 mA, Max.: 127.99 mA	-	-
CAT TEMP B1S1	Estimated catalyst temperature (sensor 1): Min.: -40°C, Max.: 6,513.5°C	-	-

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
CAT TEMP B1S2	Estimated catalyst temperature (sensor 2): Min.: -40°C, Max.: 6,513.5°C	-	-
S O2S B1S2	Sub heated oxygen sensor impedance (sensor2): Min.: 0 Ω, Max.: 21247.68 Ω	-	-
INI COOL TEMP	Engine coolant temperature at engine start: Min.: -40°C, Max.: 120°C	Close to ambient air temperature	-
INI INTAKE TEMP	Intake air temperature at engine start: Min.: -40°C, Max.: 120°C	Close to ambient air temperature	-
INJ VOL	Injection volume (Cylinder 1): Min.: 0 ml, Max.: 2.048 ml	0 to 0.15 ml: Idling	Quantity of fuel injection volume for 10 times
STARTER SIG	Starter switch (STSW) signal: ON or OFF	ON: Cranking	-
PS SW	Power steering signal: ON or OFF	ON: Power steering operation	-
PS SIGNAL	Power steering signal (history): ON or OFF	ON: When steering wheel first turned after battery terminals connected	Signal status usually ON until battery terminals disconnected
CTP SW	Closed throttle position switch: ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	-
A/C SIGNAL	A/C signal: ON or OFF	ON: A/C ON	-
PNP SW [NSW]	PNP switch status: ON or OFF	ON: P or N position	-
ELECT LOAD SIG	Electrical load signal: ON or OFF	ON: Headlights or defogger turned ON	-
STOP LIGHT SW	Stop light switch: ON or OFF	ON: Brake pedal depressed	-
+BM	Whether or not electric throttle control system power inputted: ON or OFF	ON: Ignition switch ON and system normal	-
+BM VOLTAGE	+BM voltage: Min.: 0, Max.: 19.922	9 to 14 (V): Ignition switch ON and system normal	ETCS service data
BATTERY VOLTAGE	Battery voltage: Min.: 0 V, Max.: 65.535 V	9 to 14 V: Ignition switch ON	-
ACTUATOR POWER	Actuator power supply: ON or OFF	ON: Idling	ETCS service data
ATM PRESSURE	Atmospheric pressure: Min.: 0 kPa, Max.: 255 kPa	Approximately 100 kPa: Ignition switch ON	-
BATTERY CURRENT	Battery current: Min.: -100 A, Max.: 100 A	-	-
BATTERY TEMP	Battery temperature: Min.: -45 °C, Max.: 156.4 °F	-	-
ALT OUTPUT DUTY	Generator output duty ratio: Min.: 0 %, Max.: 100 %	-	During charge control
ALT V NORMAL	Request voltage when regulator not under forced activation: Min.: 0 V, Max.: 20 V	Battery electrolyte temperature varies (12.5 to 14.8 V) while driving: After engine start	Alternator regulator output voltage is out put When performing Active Test, value is 0V
ALT V TST	Request voltage when regulator under forced activation: Min.: 0 V, Max.: 20 V	Request instruction voltage value: After engine start	Charging control service data When not performing Active Test, value is 0V
EVAP (Purge) VSV	Purge VSV status: ON or OFF	-	-
FUEL PUMP / SPD	Fuel pump status: ON or OFF	ON: Engine running	Active Test support data

ES

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
VVT CTRL B1	VVT control (bank 1) status: ON or OFF	-	-
VACUUM PUMP	Key-off EVAP system leak detection pump status: ON or OFF	-	Active Test support data
EVAP VENT VAL	Key-off EVAP system vent valve status: ON or OFF	-	Active Test support data
FAN MOTOR	Electric fan motor: ON or OFF	ON: Electric fan motor operating	-
TC/TE1	TC and CG (TE1) terminal of DLC3: ON or OFF	-	Active Test support data
ENG SPEED #1	Engine rpm during No. 1 cylinder fuel cut: Min.: 0 rpm, Max.: 25,600 rpm	-	Output only when FUEL CUT #1 is performed using ACTIVE TEST
ENG SPEED #2	Engine rpm during No. 2 cylinder fuel cut: Min.: 0 rpm, Max.: 25,600 rpm	-	Output only when FUEL CUT #2 is performed using ACTIVE TEST
ENG SPEED #3	Engine rpm during No. 3 cylinder fuel cut: Min.: 0 rpm, Max.: 25,600 rpm	-	Output only when FUEL CUT #3 is performed using ACTIVE TEST
ENG SPEED #4	Engine rpm during No. 4 cylinder fuel cut: Min.: 0 rpm, Max.: 25,600 rpm	-	Output only when FUEL CUT #4 is performed using ACTIVE TEST
ENG SPEED ALL	Average of engine rpm values during fuel cut of No. 1 to No. 4 cylinders: Min.: 0 rpm, Max.: 25,600 rpm	-	Output only when ACTIVE TEST is performed
VVTL AIM ANGL#1*2	VVT aim angle: Min.: 0 %, Max.: 100 %	0 to 100 %	VVT duty signal value during intrusive operation
VVT CHNG ANGL#1*2	VVT angle: Min.: 0°FR, Max.: 60°FR	0 to 56°FR	Displacement angle during intrusive operation
VVT OCV DUTY B1*2	VVT OCV operation duty: Min.: 0 %, Max.: 100 %	0 to 100 %	Requested duty value for intrusive operation
FC IDL	Fuel cut idle: ON or OFF	ON: Fuel cut operation	FC IDL = "ON" when throttle valve fully closed and engine speed over 3,500 rpm
FC TAU	Fuel cut TAU (Fuel cut during very light load): ON or OFF	ON: Fuel cut operating	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
IGNITION	Ignition counter: Min.: 0, Max.: 800	0 to 800	-
CYL #1, #2, #3, #4	Misfire of cylinder 1 to 4: Min.: 0, Max.: 255	0	-
CYL ALL	All cylinders misfire: Min.: 0, Max.: 255	0	-
MISFIRE RPM	Engine speed when misfire occur: Min.: 0 rpm, Max.: 6,375 rpm	-	-
MISFIRE LOAD	Engine load when misfire occur: Min.: 0 g/rev, Max.: 3.98 g/rev	-	-
MISFIRE MARGIN	Margin to detect engine misfire: Min.: -100 %, Max.: 99.22 %	-100 to 99.22 %	Misfire detecting margin
#CODES	Number of codes: Min.: 0, Max.: 255	-	Number of detected DTCs
CHECK MODE	Check mode: ON or OFF	ON: Check mode ON	(see page ES-38)

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
SPD TEST	Check mode result for vehicle speed sensor: COMPL or INCMPL	-	-
MISFIRE TEST	Check mode result for misfire monitor: COMPL or INCMPL	-	-
OXS1 TEST	Check mode result for HO2 sensor: COMPL or INCMPL	-	-
A/F SSR TEST B1	Check mode result for air-fuel ratio sensor: COMPL or INCMPL	-	-
MIL	MIL status: ON or OFF	ON: MIL ON	-
MIL ON RUN DIST	MIL ON run distance: Min.: 0 km, Max.: 65,535 km	Distance after DTC detected	-
MIL ON RUN TIME	Running time from MIL ON: Min.: 0 minutes, Max.: 65,535 minutes	Equivalent to running time after MIL ON	-
ENG RUN TIME	Engine run time: Min.: 0 seconds, Max.: 65,535 seconds	Time after engine start	-
TIME DTC CLEAR	Time after DTC cleared: Min.: 0 minutes, Max.: 65,535 minutes	Equivalent to time after DTCs erased	-
DIST DTC CLEAR	Distance after DTC cleared: Min.: 0 km, Max.: 65,535 km	Equivalent to drive distance after DTCs erased	-
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	-	Number of warm-up cycles after DTC cleared
OBD CERT	OBD requirement	OBD2	-
#CARB CODES	Emission related DTCs	-	Number of emission related DTCs
COMP MON	Comprehensive component monitor: NOT AVL or AVAIL	-	-
FUEL MON	Fuel system monitor: NOT AVL or AVAIL	-	-
MISFIRE MON	Misfire monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) HTR	O2S (A/FS) heater monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) HTR	O2S (A/FS) heater monitor: COMPL or INCMPL	-	-
O2S (A/FS) MON	O2S (A/FS) monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) MON	O2S (A/FS) monitor: COMPL or INCMPL	-	-
EVAP MON	EVAP monitor: NOT AVL or AVAIL	-	-
EVAP MON	EVAP monitor: COMPL or INCMPL	-	-
CAT MON	Catalyst monitor: NOT AVL or AVAIL	-	-
CAT MON	Catalyst monitor: COMPL or INCMPL	-	-
CCM ENA	Comprehensive component monitor: UNABLE or ENABLE	-	-

Intelligent Tester Display	Measurement: Range (Display)	Normal Condition*1	Diagnostic Note
CCM CMPL	Comprehensive component monitor: COMPL or INCMPL	-	-
FUEL ENA	Fuel system monitor: UNABLE or ENABLE	-	-
FUEL CMPL	Fuel system monitor: COMPL or INCMPL	-	-
MISFIRE ENA	Misfire monitor: UNABLE or ENABLE	-	-
MISFIRE CMPL	Misfire monitor: COMPL or INCMPL	-	-
HTR ENA	O2S (A/FS) heater monitor: UNABLE or ENABLE	-	-
HTR CMPL	O2S (A/FS) heater monitor: COMPL or INCMPL	-	-
O2S (A/FS) ENA	O2S (A/FS) monitor: UNABLE or ENABLE	-	-
O2S (A/FS) CMPL	O2S (A/FS) monitor: COMPL or INCMPL	-	-
EVAP ENA	EVAP monitor: UNABLE or ENABLE	-	-
EVAP CMPL	EVAP monitor: COMPL or INCMPL	-	-
CAT ENA	Catalyst monitor: UNABLE or ENABLE	-	-
CAT CMPL	Catalyst monitor: COMPL or INCMPL	-	-
MODEL CODE	Identifying model code	ACA3#	-
ENGINE TYPE	Identifying engine type	2AZFE	-
CYLINDER NUMBER	Identifying cylinder number: Min.: 0, Max.: 255	4	-
TRANSMISSION	Identifying transmission type	4AT	-
DESTINATION	Identifying destination	A (America)	-
MODEL YEAR	Identifying model year: Min.: 1900, Max.: 2155	200#	-
SYSTEM	Identifying engine system	GASLIN (gasoline engine)	-

ES

HINT:

- *1: If no idling conditions are specified, the transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.
- *2: DATA LIST values are only displayed when performing the following ACTIVE TEST: VVT B1. For other ACTIVE TESTs, the DATA LIST value will be 0.

2. ACTIVE TEST

HINT:

Performing an ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve) and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with the intelligent tester. Performing the ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

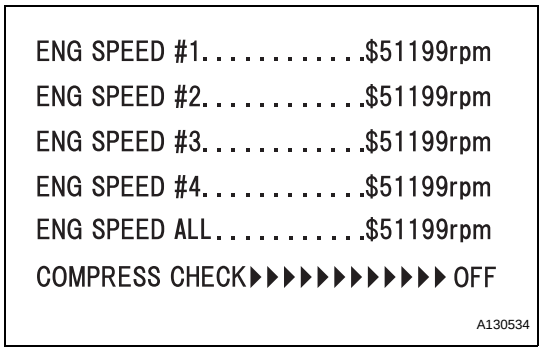
DATA LIST can be displayed during ACTIVE TEST.

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.

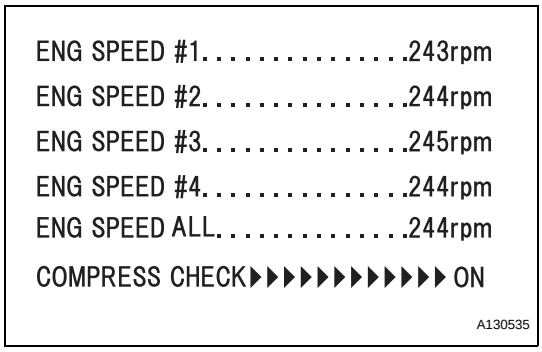
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
(e) Perform the ACTIVE TEST by referring to the table below.

ECM:



Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
INJ VOL	Change injection volume	Between -12.5 and 24.8 %	• All injectors tested at same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 0.1 % graduations within control range
A/F CONTROL	Change injection volume	Decrease by 12.5 % or increase by 24.8 %	• Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air-Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2; then press YES and ENTER followed by F4.
EVAP VSV (ALONE)	Activate purge VSV control	ON/OFF	-
VVT B1	Control VVT (bank 1)	-128 to 127 % This value added to present OCV control duty 100 %: Maximum advance -100 %: Maximum retard	Engine stall or rough idle when VVT actuator operated by 100 %. Test possible while vehicle stopped and engine idling
VVT CTRL B1	Turn on and off OCV (Oil Control Valve)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV OFF • Test possible while vehicle stopped and engine idling
FUEL PUMP / SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	Test possible when engine stopped
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	-
COOLING FAN	Control electric cooling fan	ON/OFF	-
ETCS OPEN SLOW	Throttle actuator	ON: Throttle valve opens slowly	Test possible when following conditions met: • Engine stopped • Shift position in P • Fully depressing accelerator pedal (APP: 59° or more)
ETCS CLOSE SLOW	Throttle actuator	ON: Throttle valve closes slowly	
ETCS OPEN FAST	Throttle actuator	ON: Throttle valve opens fast	
ETCS CLOSE FAST	Throttle actuator	ON: Throttle valve closes fast	
FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	Test possible during vehicle stopping and engine idling ON: All cylinder injector fuel cut and ignition stop
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	
FUEL CUT ALL	All cylinder injector fuel cut	ON/OFF	ON: All cylinder injector fuel cut
VACUUM PUMP	Leak detection pump	ON/OFF	-
VENT VALVE	Vent valve	ON/OFF	-

ES



Intelligent Tester Displays	Test Details	Control Ranges	Diagnostic Notes
ALT VOL	Request output voltage of generator regulator during forced activation	Between 12.5 and 14.8 V	Engine running
COMPRESS CHECK	All cylinder injector fuel cut and ignition stop	ON/OFF	*

HINT:
*: When cranking the engine, each cylinder measures the engine rpm.
In this ACTIVE TEST, the fuel and ignition of all cylinders is cut, and cranking occurs for approximately 10 seconds. Then, each cylinder measures the engine rpm. If a cylinder's engine rpm is higher than the others, that cylinder's compression pressure is compared to the others, and whether or not the compression pressure is low can be determined.

1. Warm up the engine.
2. Turn the ignition switch OFF.
3. Connect the intelligent tester to the DLC3.
4. Turn the ignition switch ON and turn the intelligent tester ON.
5. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / COMPRESS CHECK.
   HINT:
   If the results are not displayed normally, select the display items from the DATA LIST before performing the ACTIVE TEST. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / ENG SPEED #1 and ENG SPEED #2, ENG SPEED #3, ENG SPEED #4 (Press the YES button to change the ENG SPEED #1 to #4 is YES) and then press the ENTER button.

6. While the engine is not running, press the RIGHT or LEFT button to change the COMPRESS CHECK to ON.
   HINT:
   After performing the above procedure, the ACTIVE TEST's COMPRESS CHECK will start. Fuel injection for all cylinders is prohibited, and the each cylinder's engine rpm measurement will enter standby.
7. Fully open the throttle.
8. Crank the engine for about 10 seconds.
9. Monitor the engine speed (ENG SPEED #1 to #4) displayed on the tester.
   HINT:
   At first, the tester's display will show each cylinder's engine rpm measurement to be extremely high. After approximately 10 seconds of engine cranking, each cylinder's engine rpm measurement will change to the actual engine rpm.
   NOTICE:
   - **After the ACTIVE TEST's COMPRESS CHECK is turned ON, it will automatically turn off after 255 seconds.**

- **When the COMPRESS CHECK test is OFF and the engine is cranked, the engine will start.**
- **If the COMPRESS CHECK test needs to be performed after it is turned ON and performed once, press EXIT to return to the ACTIVE TEST menu screen. Then perform the COMPRESS CHECK test again.**
- **Use a fully-charged battery.**

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system. The SYSTEM CHECK can be performed with the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
(e) Perform the SYSTEM CHECK by referring to the table below.

ECM:

Intelligent Tester Display	Test Detail	Recommended Fuel Temperature	Diagnostic Note
EVAP SYS CHECK (AUTO OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	35°C (95°F) or less	• If no DTCs in PENDING CODE after performing this test, system functioning normally • Refer to EVAP system
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	35°C (95°F) or less	• Used to detect malfunctioning parts • Refer to EVAP system

DIAGNOSTIC TROUBLE CODE CHART

HINT:
Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.
If any DTCs are displayed during a check mode DTC check, check the circuit for the DTCs listed in the table below. For details of each DTC, refer to the page indicated.

DTC No.	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in Oil Control Valve (OCV) circuit - OCV - ECM	Comes on	DTC stored	ES-62
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - OCV - OCV filter - Camshaft timing gear assembly - ECM	Comes on	DTC stored	ES-66
P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)	- Same as DTC P0011	Comes on	DTC stored	ES-66
P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on	DTC stored	ES-72
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	- Open in Air-Fuel Ratio (A/F) sensor heater circuit - A/F sensor heater (sensor 1) - Integration relay (EFI MAIN relay) - ECM	Comes on	DTC stored	ES-74
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (sensor 1) - Integration relay (EFI MAIN relay) - ECM	Comes on	DTC stored	ES-74
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	- Open in Heated Oxygen (HO2) sensor heater circuit - HO2 sensor heater (sensor 2) - Integration relay (EFI MAIN relay) - ECM	Comes on	DTC stored	ES-80
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (sensor 2) - Integration relay (EFI MAIN relay) - ECM	Comes on	DTC stored	ES-80

DTC No.	Detection Item	Trouble Areas	MIL	Memory	See page
P0100	Mass or Volume Air Flow Circuit	- Open or short in Mass Air Flow (MAF) meter circuit - MAF meter - ECM	Comes on	DTC stored	ES-86
P0101	Mass Air Flow Circuit Range / Performance Problem	- MAF meter - Air induction system - PCV hose connections	Comes on	DTC stored	ES-93
P0102	Mass or Volume Air Flow Circuit Low Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	ES-86
P0103	Mass or Volume Air Flow Circuit High Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	ES-86
P0110	Intake Air Temperature Circuit Malfunction	- Open or short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	ES-96
P0111	Intake Air Temperature Sensor Gradient Too High	- Mass air flow meter assembly	Comes on	DTC stored	ES-102
P0112	Intake Air Temperature Circuit Low Input	- Short in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	ES-96
P0113	Intake Air Temperature Circuit High Input	- Open in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	ES-96
P0115	Engine Coolant Temperature Circuit Malfunction	- Open or short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor - ECM	Comes on	DTC stored	ES-105
P0116	Engine Coolant Temperature Circuit Range / Performance Problem	- Thermostat - ECT sensor	Comes on	DTC stored	ES-111
P0117	Engine Coolant Temperature Circuit Low Input	- Short in ECT sensor circuit - ECT sensor - ECM	Comes on	DTC stored	ES-105
P0118	Engine Coolant Temperature Circuit High Input	- Open in ECT sensor circuit - ECT sensor - ECM	Comes on	DTC stored	ES-105
P0120	Throttle Pedal Position Sensor / Switch "A" Circuit Malfunction	- Throttle Position (TP) sensor (built into throttle body) - ECM	Comes on	DTC stored	ES-114
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	- TP sensor (built into throttle body)	Comes on	DTC stored	ES-121

DTC No.	Detection Item	Trouble Areas	MIL	Memory	See page
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA1 circuit - Open in VC circuit - ECM	Comes on	DTC stored	ES-114
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA1 circuit - Open in E2 circuit - Short between VC and VTA1 circuits - ECM	Comes on	DTC stored	ES-114
P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control	- Cooling system - ECT sensor - Thermostat	Comes on	DTC stored	ES-123
P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)	- Thermostat - Cooling system - ECT sensor - ECM	Comes on	DTC stored	ES-126
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor (sensor 2) circuit - HO2 sensor (sensor 2) - HO2 sensor heater (sensor 2) - Air-Fuel Ratio (A/F) sensor (sensor 1) - Integration relay (EFI MAIN relay) - Gas leakage from exhaust system	Comes on	DTC stored	ES-129
P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	- Open in HO2 sensor (sensor 2) circuit - HO2 sensor (sensor 2) - HO2 sensor heater (sensor 2) - Integration relay (EFI MAIN relay) - Gas leakage from exhaust system	Comes on	DTC stored	ES-129
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	- Short in HO2 sensor (sensor 2) circuit - HO2 sensor (sensor 2) - ECM internal circuit malfunction	Comes on	DTC stored	ES-129
P0141	Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor heater circuit - HO2 sensor heater (sensor 2) - Integration relay (EFI MAIN relay) - ECM	Comes on	DTC stored	ES-80

DTC No.	Detection Item	Trouble Areas	MIL	Memory	See page
P0171	System Too Lean (Bank 1)	- Air induction system - Injector blockage - MAF meter - ECT sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (sensor 1) circuit - A/F sensor (sensor 1) - A/F sensor heater (sensor 1) - Integration relay (EFI MAIN relay) - A/F sensor heater and EFI MAIN relay circuits - PCV hose connections - PCV valve and hose - ECM	Comes on	DTC stored	ES-147
P0172	System Too Rich (Bank 1)	- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (sensor 1) circuit - A/F sensor (sensor 1) - A/F sensor heater (sensor 1) - Integration relay (EFI MAIN relay) - A/F sensor heater and EFI MAIN relay circuits - ECM	Comes on	DTC stored	ES-147

HINT:
*: MIL flashes when a catalyst damaged misfire is detected.

DTC	P0010	Camshaft Position "A" Actuator Circuit (Bank 1)

DESCRIPTION

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC No.	DTC Detection Conditions	Trouble Areas
P0010	Open or short in OCV circuit (1 trip detection logic)	• Open or short in OCV circuit • OCV • ECM

HINT:

This DTC relates to the Oil Control Valve (OCV).

MONITOR DESCRIPTION

The ECM optimizes the valve timing using the VVT system to control the intake camshaft. The VVT system includes the ECM, the OCV and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
After the ECM sends the target duty-cycle control signal to the OCV, the ECM monitors the OCV current to establish an actual duty-cycle. The ECM determines the existence of a malfunction and sets the DTC when the actual duty-cycle ratio varies from the target duty-cycle ratio.

MONITOR STRATEGY

Related DTCs	P0010: VVT OCV range check
Required Sensors/Components (Main)	VVT OCV
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
All of following conditions met	-
Starter	OFF
Ignition switch	ON
Time after ignition switch OFF to ON	0.5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
A. All of following conditions met	-
Battery voltage	11 to 13 V
Target duty ratio	Less than 70 %
Output signal duty ratio	100 %
B. All of following conditions met	-
Battery voltage	13 V or more
Target duty ratio	Less than 80 %
Output signal duty ratio	100 %
C. Both of following conditions met	-
Current cut status	Not cut
Output signal duty ratio	3 % or less

COMPONENT OPERATING RANGE

VVT OCV duty ratio	3 to 100 %

WIRING DIAGRAM

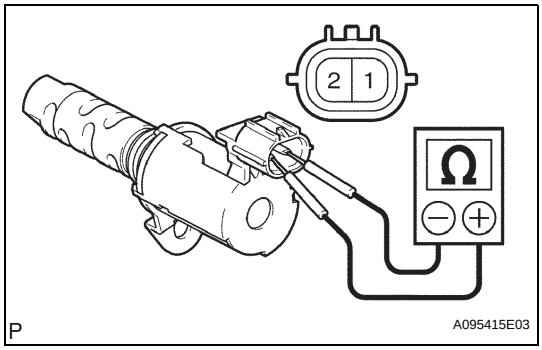
ES

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.



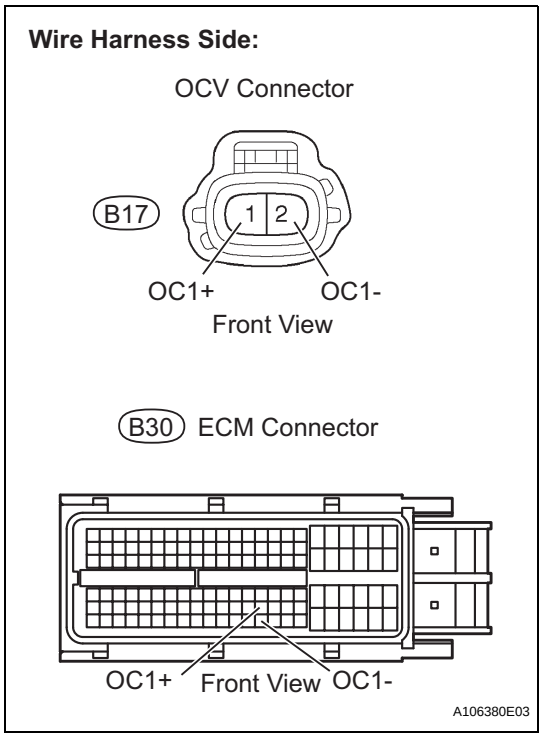
OK

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

OK → CHECK FOR INTERMITTENT PROBLEMS

NG

2	INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY



(a) Disconnect the B17 OCV connector.
(b) Measure the resistance between the terminals of the OCV.
Standard resistance:
6.9 to 7.9 Ω at 20°C (68°F)
(c) Reconnect the OCV connector.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

3	CHECK HARNESS AND CONNECTOR (OCV - ECM)

(a) Disconnect the B17 OCV connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance of the wire harness side connectors.
Standard resistance (check for open)

Tester Connections	Specified Conditions
B17-1 (OC1+) - B30-100 (OC1+)	Below 1 Ω
B17-2 (OC1-) - B30-123 (OC1-)	Below 1 Ω

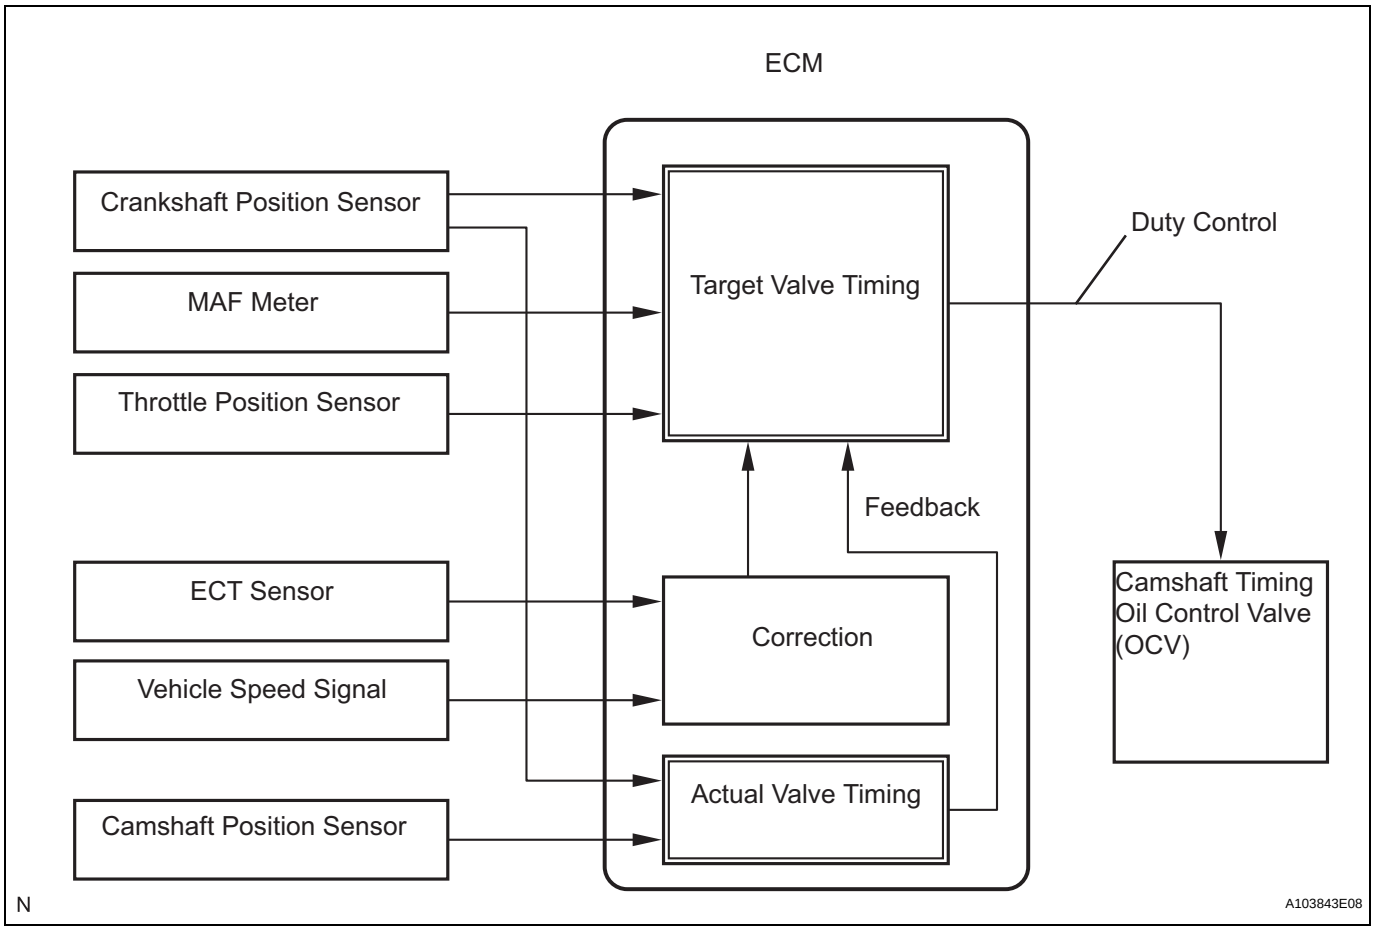
Standard resistance (check for short)

Tester Connections	Specified Conditions
B17-1 (OC1+) or B30-100 (OC1+) - Body ground	10 kΩ or higher
B17-2 (OC1-) or B30-123 (OC1-) - Body ground	10 kΩ or higher

(d) Reconnect the OCV connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK



REPLACE ECM

DTC	P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC	P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)

DESCRIPTION

The VVT system includes the ECM, Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC No.	DTC Detection Conditions	Trouble Areas
P0011	Advanced camshaft timing: With warm engine and engine speed of between 550 rpm and 4,000 rpm, all conditions (1), (2) and (3) met (1 trip detection logic): 1. Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) for 4.5 seconds 2. Current intake valve timing fixed (timing changes less than 5°CA in 5 seconds) 3. Variations in VVT controller timing more than 19°CA of maximum delayed timing (malfunction in advance timing)	• Valve timing • OCV • OCV filter • Camshaft timing gear assembly • ECM
P0012	Retarded camshaft timing: With warm engine and engine speed of between 550 rpm and 4,000 rpm, all conditions (1), (2) and (3) met (2 trip detection logic): 1. Difference between target and actual intake valve timings more than 5°CA (Crankshaft Angle) for 4.5 seconds 2. Current intake valve timing fixed (timing changes less than 5°CA in 5 seconds) 3. Variations in VVT controller timing 19°CA or less of maximum delayed timing (malfunction in retarded timing)	• Valve timing • OCV • OCV filter • Camshaft timing gear assembly • ECM

ES

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and sets a DTC.

Example:

A DTC is set when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 (Advanced Cam Timing) is subject to 1 trip detection logic.

DTC P0012 (Retarded Cam Timing) is subject to 2 trip detection logic.

These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.

The monitor will run if all of the following conditions are met:

– The engine is warm (the engine coolant temperature is 75°C [167°F] or more).
– The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
– The engine has idled for 3 minutes.

MONITOR STRATEGY

Related DTCs	P0011: Advanced camshaft timing P0012: Retarded camshaft timing
Required Sensors/Components (Main)	VVT OCV and VVT Actuator
Required Sensors/Components (Related)	Crankshaft position sensor, camshaft position sensor and Engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	Within 10 seconds
MIL Operation	Advanced camshaft timing: Immediate Retarded camshaft timing: 2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0354 (Igniter)
Battery voltage	11 V or more
Engine RPM	550 to 4,000 rpm
ECT	75°C (167°F) to 100°C (212°F)

TYPICAL MALFUNCTION THRESHOLDS

Advanced camshaft timing:

All of following conditions met	-
Crank angle between reference position and actual intake camshaft angle	67°CA or more
Valve timing	No change at advanced valve timing

Retard camshaft timing:

All of following conditions met	-
Crank angle between reference point and actual intake camshaft angle	Less than 67°CA
Valve timing	No change at retarded valve timing

If the difference between the target and actual camshaft timings is greater than the specified value, the ECM operates the VVT actuator.
Then, the ECM monitors the camshaft timing change for 5 seconds.

WIRING DIAGRAM

Refer to DTC P0010 (see page ES-64).

INSPECTION PROCEDURE

NOTICE:
DTC P0011 or P0012 may be set when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain set even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.
HINT:
If DTC P0011 or P0012 is present, check the VVT (Variable Valve Timing) system.
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011 OR P0012)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To

P0011 or P0012	A
P0011 or P0012 and other DTCs	B

HINT:
If any DTCs other than P0011 or P0012 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

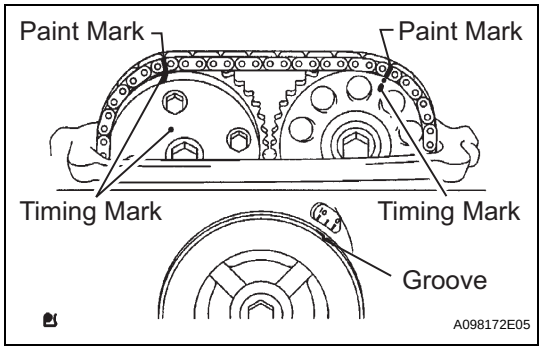
OK

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 4

OK

3 CHECK WHETHER DTC OUTPUT RECURS (DTC P0011 OR P0012)



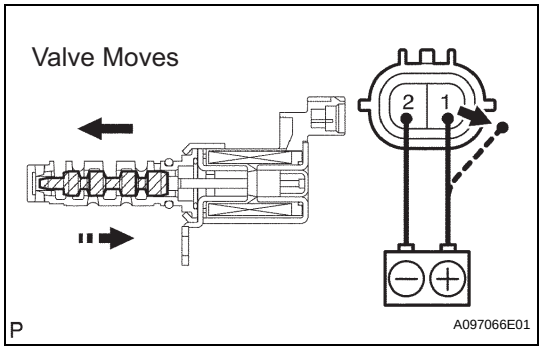
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester.
(f) Drive the vehicle for more than 10 minutes.
(g) Read DTCs using the tester.
OK:
No DTC output.

NG → Go to step 4

OK

END

4 CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)



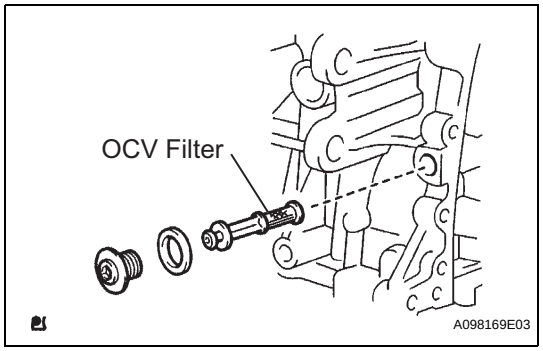
(a) Remove the cylinder head cover.
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" on the timing chain cover.
(c) Check that the timing marks on the camshaft timing sprocket and camshaft timing gear are facing upward as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.
OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.
(d) Reinstall the cylinder head cover.

ES

NG → **ADJUST VALVE TIMING**

OK

5 INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV)



(a) Remove the OCV.
(b) Measure the resistance between the terminals of the OCV.
Standard resistance:
6.9 to 7.9 Ω at 20°C (68°F)
(c) Apply the positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.
OK:
Valve moves quickly.
(d) Reinstall the OCV.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

6 INSPECT OIL CONTROL VALVE FILTER

(a) Remove the generator.
(b) Remove the OCV filter.
(c) Check that the filter is not clogged.
OK:
Filter is not clogged.
(d) Reinstall the OCV filter.
(e) Reinstall the generator.

NG → **CLEAN OIL CONTROL VALVE FILTER**

OK

7	REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester.
(f) Drive the vehicle for more than 10 minutes.
(g) Read output DTCs using the tester.
Standard:
No DTC output.
HINT:
DTC P0011 or P0012 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay registered even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

OK → **SYSTEM OK**

NG

REPLACE ECM

DTC	P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake valve open and close timing is controlled by the ECM. The ECM performs intake valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the gaps between the camshaft and crankshaft.

DTC No.	DTC Detection Conditions	Trouble Areas
P0016	Deviation in crankshaft and camshaft position sensor signals (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM

ES

MONITOR DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller.
The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
The ECM calibrates the intake valve timing by setting the intake camshaft to the most retarded angle while the engine is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as the VVT learning value. When the difference between the target and actual intake valve timings is 5°CA (Crankshaft Angle) or less, the ECM stores it.
If the VVT learning value matches the following conditions, the ECM determines the existence of a malfunction in the VVT system, and sets the DTC.

- VVT learning value: Less than 25°CA, or more than 51°CA.
- Above condition continues for 18 seconds or more.

This DTC indicates that the angle between the intake camshaft and the crankshaft is incorrect due to factors such as the timing chain having jumped a tooth.
This monitor begins to run after the engine has idled for 5 minutes.

MONITOR STRATEGY

Related DTCs	P0016: Camshaft timing misalignment at idling
Required Sensors/Components	VVT actuator
Required Sensors/Components	Camshaft position sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	Within 1 minute
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0011 (VVT system 1 - advance) P0012 (VVT system 1 - retarded) P0115 - P0118 (ECT sensor)
Engine RPM	550 to 1,000 rpm

TYPICAL MALFUNCTION THRESHOLDS

One of following conditions met	-
VVT learning value when camshaft maximum retarded	Less than 27.8°CA
VVT learning value when camshaft maximum retarded	More than 48°CA

WIRING DIAGRAM

Refer to DTC P0335 (see page ES-172).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1	**CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN) (See page ES-77)**

NG → **Go to step 3**

OK

2	**REPLACE ECM**

NEXT → **Go to step 4**

3	**ADJUST VALVE TIMING**

NEXT

4	**CHECK WHETHER DTC OUTPUT RECURS**

NOTICE:

After replacing the ECM or adjusting intake valve timing, confirm that the DTC output does not recur.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Switch the ECM from normal mode to check mode using the tester (see page ES-38).
(f) Start the engine and warm it up.
(g) Allow the engine to idle for 1 minute or more, and then drive the vehicle for 1 minute or more.
(h) Confirm that no DTC is set, using the tester.

OK:

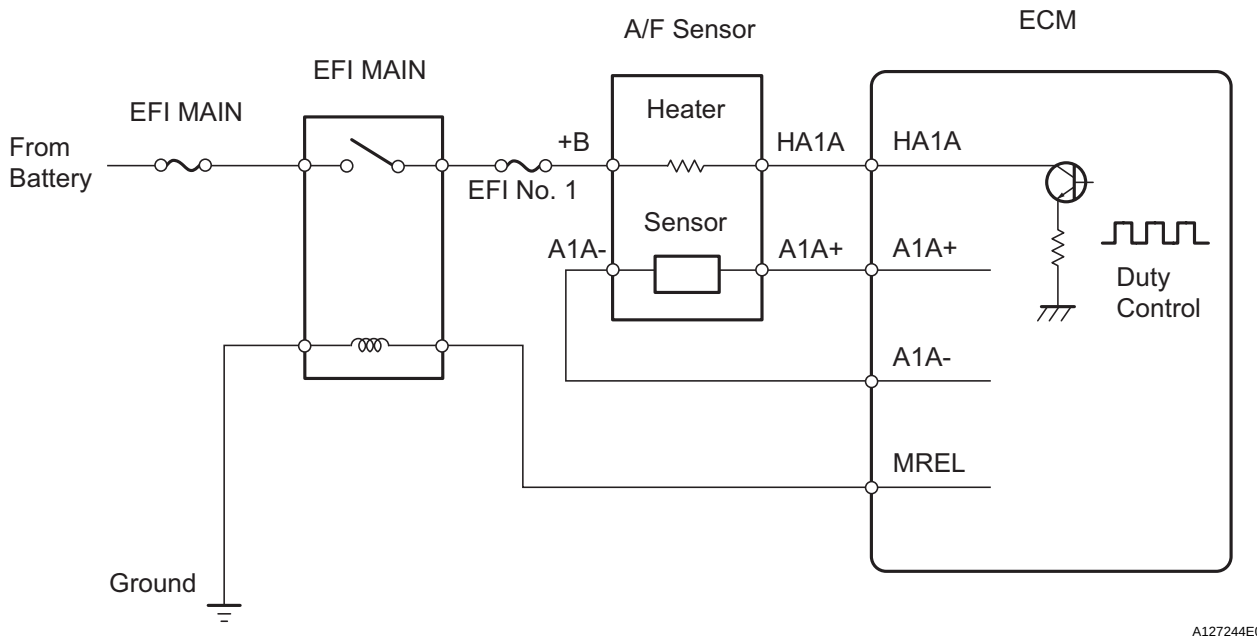
No DTC output

NEXT

END

DTC	P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC	P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)



HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

ES

DESCRIPTION

Refer to DTC P2195 (see page ES-292).
HINT:
- When either of these DTCs is set, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the B+ side of the circuit.

Reference (System Diagram of Sensor 1):

DTC No.	DTC Detection Conditions	Trouble Areas
P0031	Air-Fuel Ratio (A/F) sensor heater current less than 0.8 A (1 trip detection logic)	• Open in A/F sensor heater circuit • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • ECM
P0032	Air-Fuel Ratio (A/F) sensor heater current more than 10 A (1 trip detection logic)	• Short in A/F sensor heater circuit • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • ECM

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.

The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate, as a result, the ECM is unable to regulate air-fuel ratio properly.

When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.

Example:

The ECM sets DTC P0032 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is less than 0.8 A, DTC P0031 is set.

MONITOR STRATEGY

Related DTCs	P0031: A/F sensor heater open/short (Low electrical current) P0032: A/F sensor heater open/short (High electrical current)
Required Sensors/Components (Main)	A/F sensor heater
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P0031:

Battery voltage	10.5 V or more
A/F sensor heater duty-cycle ratio	50 % or more
Time after engine start	10 seconds or more

P0032:

Time after engine start	10 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0031:

A/F sensor heater current	Less than 0.8 A

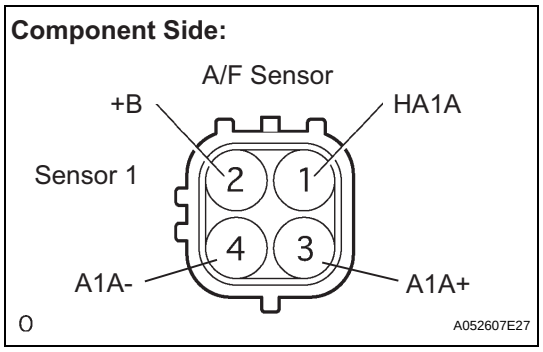
P0032:

A/F sensor heater current	More than 10 A

COMPONENT OPERATING RANGE

A/F sensor heater current	0.9 to 9.9 A

WIRING DIAGRAM



Refer to DTC P2195 (see page ES-296).

INSPECTION PROCEDURE

HINT:

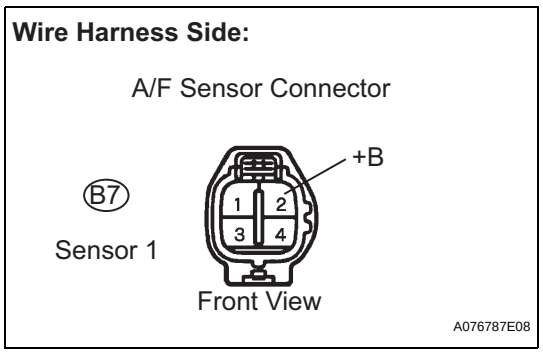
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)

(a) Disconnect the B7 A/F sensor connector.

(b) Measure the resistance of the A/F sensor connector.

Standard resistance



Tester Connections	Specified Conditions
1 (HA1A) - 2 (+B)	1.8 Ω to 3.4 Ω at 20°C (68°F)
1 (HA1A) - 4 (A1A-)	10 kΩ or higher

(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR-FUEL RATIO SENSOR**

OK

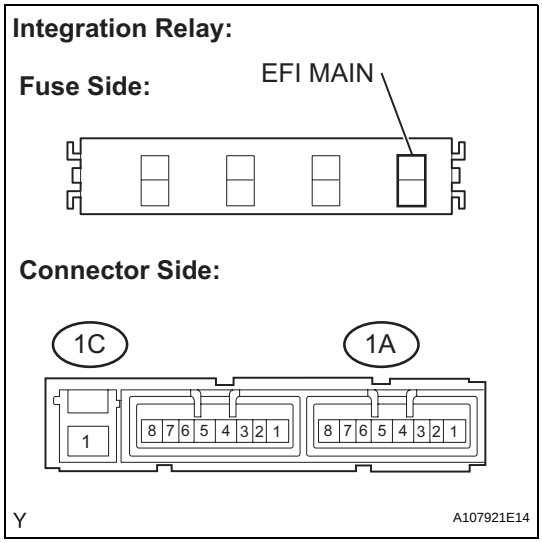
2 CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

(a) Disconnect the B7 A/F sensor connector.

(b) Turn the ignition switch ON.

(c) Measure the voltage between the terminals of the B7 A/F sensor connector and body ground.

Standard voltage



Tester Connections	Specified Conditions
B7-2 (+B) - Body ground	9 to 14 V

(d) Reconnect the A/F sensor connector.

OK → **Go to step 5**

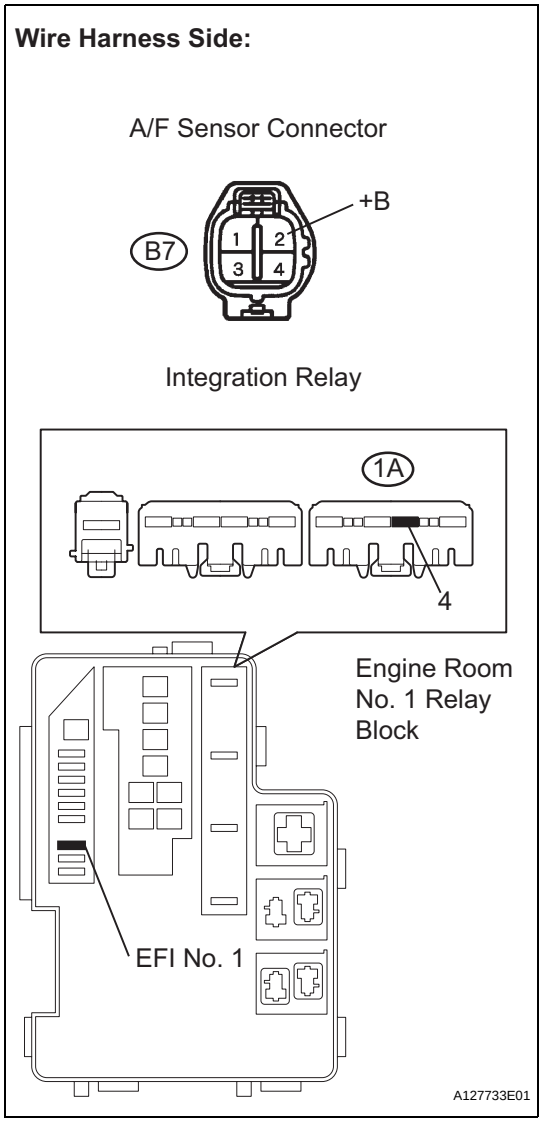
NG

3	INSPECT INTEGRATION RELAY (EFI MAIN RELAY)

(a) Remove the integration relay from the engine room No. 1 relay block.

(b) Inspect the EFI MAIN fuse.
  (1) Remove the EFI MAIN fuse from the integration relay.
  (2) Measure the EFI MAIN fuse resistance.
    Standard resistance:
    Below 1 Ω
  (3) Reinstall the EFI MAIN fuse.

(c) Inspect the EFI MAIN relay.
  (1) Measure the EFI MAIN relay resistance.
    Standard resistance



Tester Connections	Specified Conditions
1C-1 - 1A-4	10 kΩ or higher
	Below 1 Ω (Apply battery voltage between terminals 1A-2 and 1A-3)

(d) Reinstall the integration relay.

NG → **REPLACE INTEGRATION RELAY**

OK

4	CHECK HARNESS AND CONNECTOR (A/F SENSOR - EFI RELAY)

(a) Check the EFI No. 1 fuse.
(b) Disconnect the B7 A/F sensor connector.
(c) Remove the integration relay from the engine room No. 1 relay block.
(d) Check the resistance.

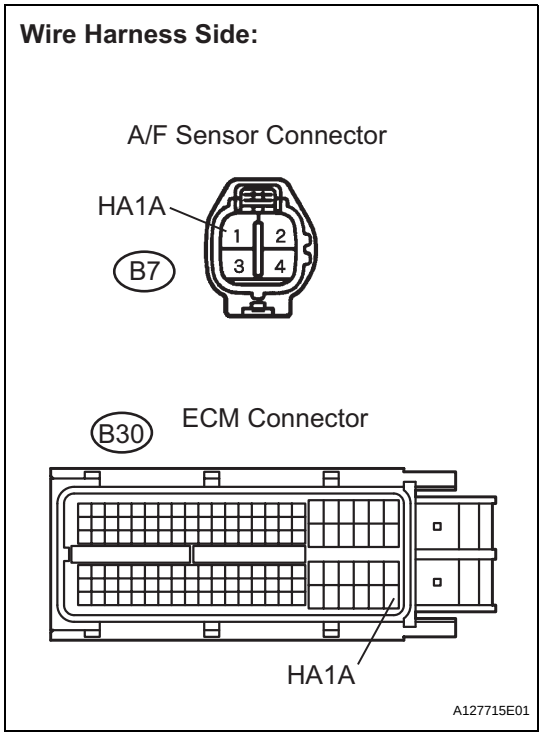
Standard resistance (Check for open)

Tester Connections	Specified Conditions
B7-2 (+B) - 1A-4 (Engine room No. 1 R/B)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B7-2 (+B) or 1A-4 (Engine room No. 1 R/B) - Body ground	10 kΩ or higher

(e) Reconnect the A/F sensor connector.
(f) Reinstall the integration relay.



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK ECM POWER SOURCE CIRCUIT

ES

5 CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

(a) Disconnect the B7 A/F sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B7-1 (HA1A) - B30-109 (HA1A)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B7-1 (HA1A) or B30-109 (HA1A) - Body ground	10 kΩ or higher

(d) Reconnect the A/F sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6 CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine.
(f) Allow the engine to idle for 1 minute or more.
(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(h) Read DTCs.

Result

Display (DTC Output)	Proceed To
No output	A
P0031 or P0032	B

B → **REPLACE ECM**

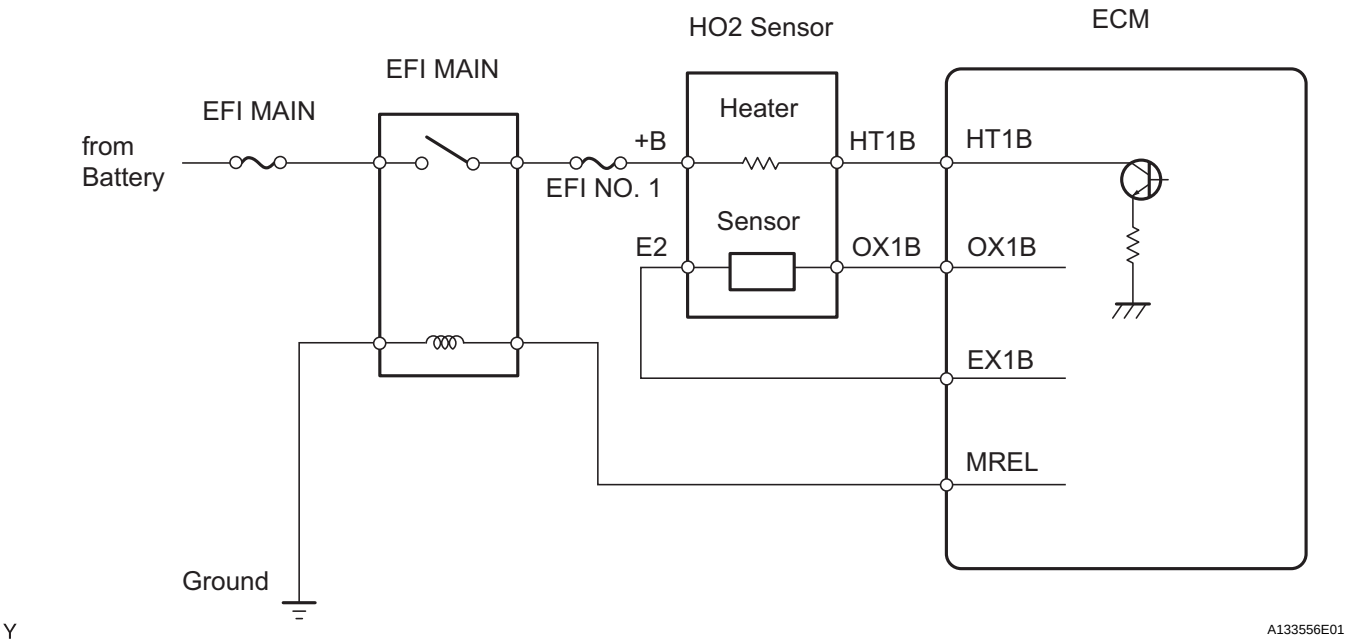
A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC	P0141	Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)



DESCRIPTION

Refer to DTC P0136 (see page ES-129).

HINT:

- When any of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the B+ side of the circuit.

Reference (System Diagram of Sensor 2):

DTC No.	DTC Detection Conditions	Trouble Areas
P0037	Heated Oxygen (HO2) sensor heater current less than 0.3 A (1 trip detection logic)	• Open in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM
P0038	Heated Oxygen (HO2) sensor heater current more than 2 A (1 trip detection logic)	• Short in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM
P0141	Cumulative heater resistance correction value exceeds threshold (2 trip detection logic)	• Open or short in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM

MONITOR DESCRIPTION

The sensing position of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037 and P0038):

The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is above the threshold value, the ECM determines that there is a short circuit in the heater.

ES

The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and sets a DTC.

If a malfunction is detected, the ECM cuts off the current applied to the heater.

Example:

The ECM sets DTC P0038 when the current in the HO2 sensor heater is more than 2 A. Conversely, when the heater current is less than 0.3 A, DTC P0037 is set.

Heated oxygen sensor heater performance (P0141):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater.

If the resistance is above the threshold value, the ECM determines that there is a malfunction in the HO2 sensor heater and set DTC P0141.

MONITOR STRATEGY

Related DTCs	P0037: Heated oxygen sensor heater range check (Low electrical current) P0038: Heated oxygen sensor heater range check (High electrical current) P0141: Heated oxygen sensor heater performance
Required Sensors/Components (Main)	Heated oxygen sensor heater
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous: P0037 and P0038 Once per driving cycle: P0141
Duration	1 second: P0037 and P0038 10 seconds: P0141
MIL Operation	Immediate: P0037 and P0038 2 driving cycles: P0141
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P0037:

Battery voltage	10.5 to 20 V

P0038:

Battery voltage	10.5 to 20 V

P0141 (Heater performance monitor check):

All of following conditions met:	-
Battery voltage	10.5 V or more
Fuel cut	OFF
Time after fuel cut ON to OFF	30 seconds or more

Accumulated heater ON time	100 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0037:

Heater current	Less than 0.3 A

P0038:

Heater current	More than 2 A

P0141 (Heater performance monitor check):

Accumulated heater resistance	Varies with sensor element temperature (Example: More than 23 Ω)

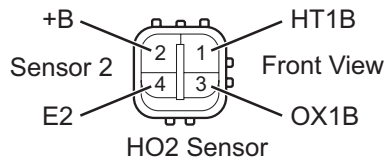
COMPONENT OPERATING RANGE

Heated Oxygen (HO2) sensor heater current	0.4 to 1 A (when engine idles, HO2 sensor warmed up and battery voltage 11 to 14 V)

WIRING DIAGRAM

Refer to DTC P0136 (see page ES-136).

CONFIRMATION DRIVING PATTERN



These DTCs are detected when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

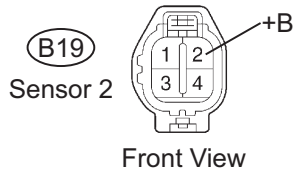
1 INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

Component Side :

A115661E02

(a) Disconnect the B19 Heated Oxygen (HO2) sensor connector.
(b) Measure the resistance of the HO2 sensor connector.
Standard resistance

Tester Connections	Specified Conditions
1 (HT1B) - 2 (+B)	11 to 16 Ω at 20°C (68°F)
1 (HT1B) - 4 (E2)	10 kΩ or higher



(c) Reconnect the HO2 sensor connector.

NG → **REPLACE HEATED OXYGEN SENSOR**

OK

2	CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

Wire Harness Side:

A072895E07

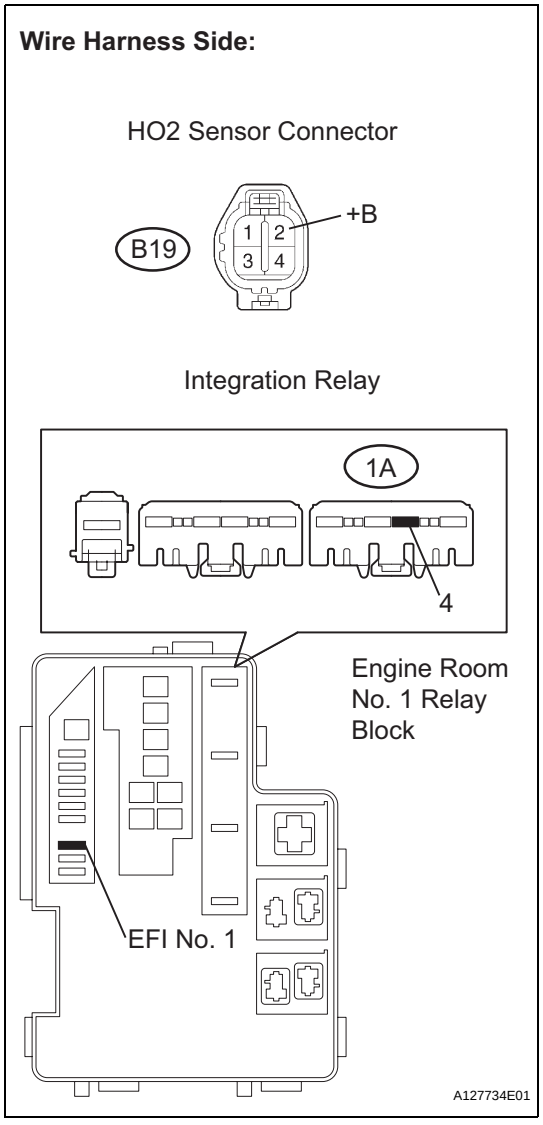
(a) Disconnect the B19 HO2 sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the B19 HO2 sensor connector and body ground.

Standard voltage

Tester Connections	Specified Conditions
B19-2 (+B) - Body ground	9 to 14 V

(d) Reconnect the HO2 sensor connector.

OK → **Go to step 5**



NG

3	INSPECT INTEGRATION RELAY (EFI MAIN RELAY) (See page ES-84)

NG → **REPLACE INTEGRATION RELAY**

OK

4	CHECK HARNESS AND CONNECTOR (HO2 SENSOR - EFI RELAY)

(a) Check the EFI No. 1 fuse.
(b) Disconnect the B19 HO2 sensor connector.
(c) Remove the integration relay from the engine room No. 1 relay block.
(d) Check the resistance.

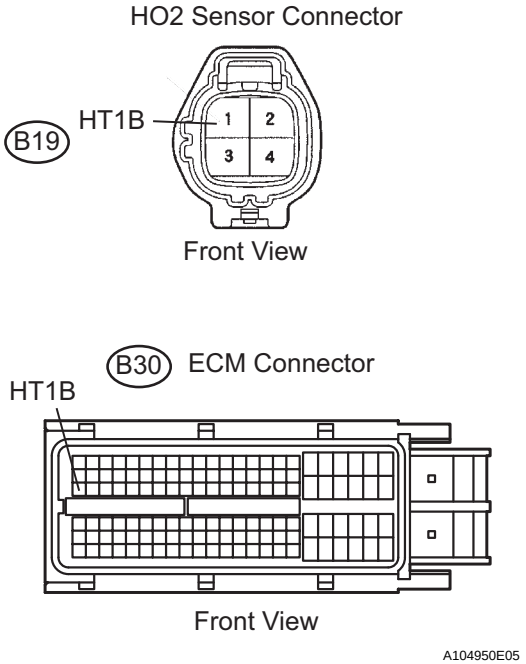
Standard resistance (Check for open)

Tester Connections	Specified Conditions
B19-2 (+B) - 1A-4 (Engine room No. 1 R/B)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B19-2 (+B) or 1A-4 (Engine room No. 1 R/B) - Body ground	10 kΩ or higher

(e) Reconnect the HO2 sensor connector.
(f) Reinstall the integration relay.



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK ECM POWER SOURCE CIRCUIT

ES

5 CHECK HARNESS AND CONNECTOR (HO2 SENSOR - ECM)

(a) Disconnect the B19 HO2 sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B19-1 (HT1B) - B30-47 (HT1B)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B19-1 (HT1B) or B30-47 (HT1B) - Body ground	10 kΩ or higher

(d) Reconnect the HO2 sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6 CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine.
(f) Allow the engine to idle for 2 minutes or more.
(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(h) Read DTCs.

Result

Display (DTC Output)	Proceed To
No output	A
P0037, P0038 and/or P0141	B

B → **REPLACE ECM**

A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0100	Mass or Volume Air Flow Circuit

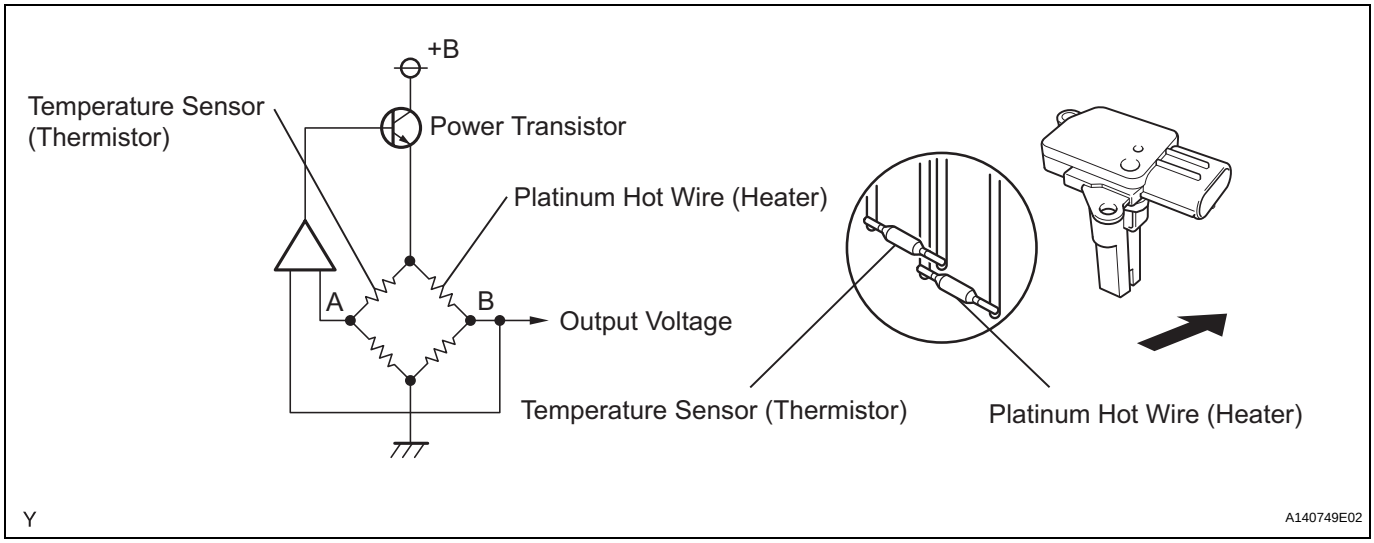
DTC	P0102	Mass or Volume Air Flow Circuit Low Input

DTC	P0103	Mass or Volume Air Flow Circuit High Input

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.

The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.



Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.

By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.

The circuit is constructed so that the platinum hot wire and the temperature sensor create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine RPM and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Conditions	Trouble Areas
P0100	MAF meter voltage less than 0.2 V, or more than 4.9 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM
P0102	MAF meter voltage less than 0.2 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM
P0103	MAF meter voltage more than 4.9 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:
When any of these DTCs are set, check the air-flow rate by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II/ DATA LIST / PRIMARY / MAF.

Mass Air Flow Rate (g/sec.)	Malfunctions
Approximately 0.0	• Open in Mass Air Flow (MAF) meter power source circuit • Open or short in VG circuit
271.0 or more	• Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets a DTC.
Example:
When the sensor output voltage remains less than 0.2 V, or more than 4.9 V, for more than 3 seconds, the ECM sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 3 seconds after the engine is next started.

MONITOR STRATEGY

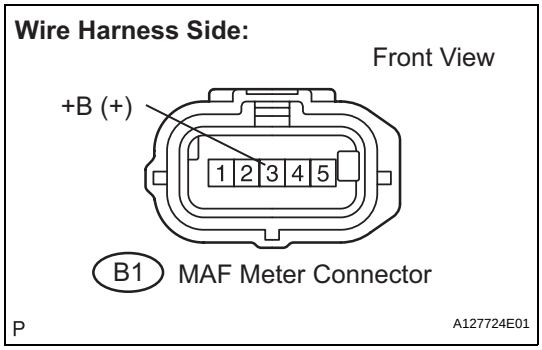
INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.
(e) Read the values displayed on the tester.

Result



Mass Air Flow Rate (g/sec.)	Proceed To
0.0	A
271.0 or more	B
Between 1.0 and 270.0 (*1)	C

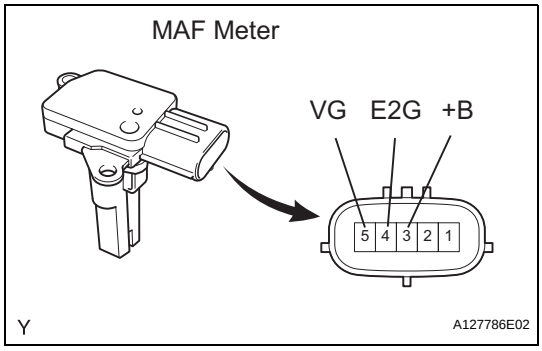
HINT:
*1: The value must change when the throttle valve is open or closed with the engine running.

B	Go to step 6
C	CHECK FOR INTERMITTENT PROBLEMS

A

2 INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)

(a) Disconnect the B1 Mass Air Flow (MAF) meter connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminal of the wire harness side connector and body ground.
Standard voltage



Tester Connections	Specified Conditions
B1-3 (+B) - Body ground	9 to 14 V

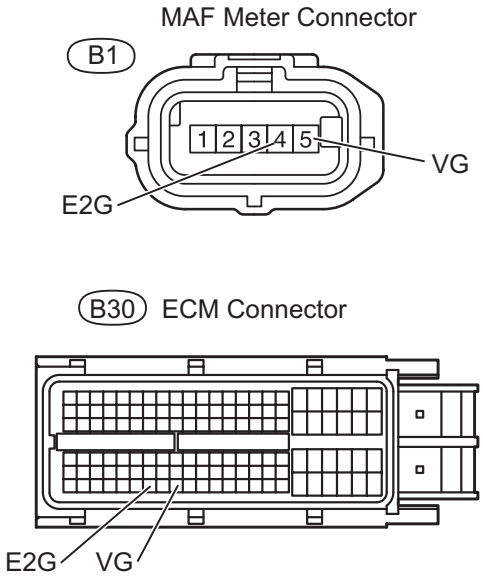
(d) Reconnect the MAF meter connector.

NG → **Go to step 5**

OK

3 INSPECT MASS AIR FLOW METER (VG VOLTAGE)

(a) Output voltage inspection.
(1) Apply battery voltage across terminals +B and E2G.
(2) Connect the positive (+) tester probe to terminal VG, and negative (-) tester probe to terminal E2G.
(3) Measure the voltage.
Standard voltage



Tester Connections	Specified Conditions
5 (VG) - 4 (E2G)	0.2 to 4.9 V

NG → **REPLACE MASS AIR FLOW METER**

OK

4	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

Wire Harness Side:

(a) Disconnect the B1 MAF meter connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

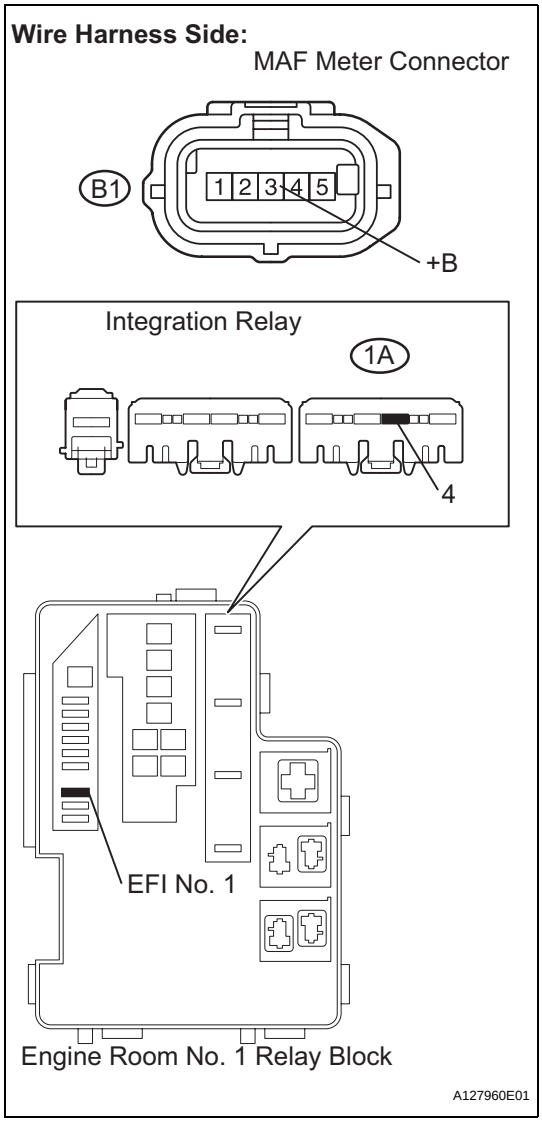
Standard resistance (Check for open)

Tester Connections	Specified Conditions
B1-5 (VG) - B30-118 (VG)	Below 1 Ω
B1-4 (E2G) - B30-116 (E2G)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B1-5 (VG) or B30-118 (VG) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

ES

5	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - INTEGRATION RELAY)

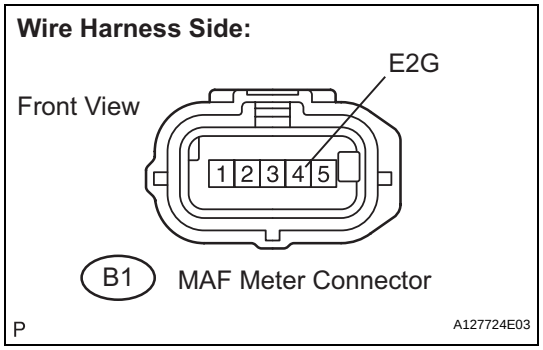
(a) Check the EFI No. 1 fuse.
(b) Disconnect the B1 MAF meter connector.
(c) Remove the integration relay from the engine room No. 1 relay block.
(d) Check the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B1-3 (+B) - 1A-4	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B1-3 (+B) or 1A-4 - Body ground	10 kΩ or higher



(e) Reconnect the MAF meter connector.
(f) Reinstall the integration relay.

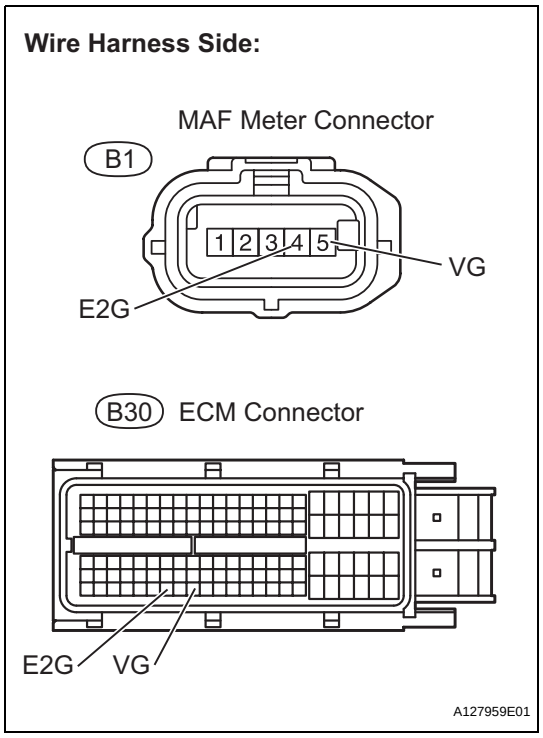
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

CHECK ECM POWER SOURCE CIRCUIT

6 CHECK HARNESS AND CONNECTOR (SENSOR GROUND)

(a) Disconnect the B1 MAF meter connector.
(b) Measure the resistance.



Standard resistance

Tester Connections	Specified Conditions
B1-4 (E2G) - Body ground	Below 1 Ω

OK → **REPLACE MASS AIR FLOW METER**

NG

7 CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

(a) Disconnect the B1 MAF meter connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B1-5 (VG) - B30-118 (VG)	Below 1 Ω
B1-4 (E2G) - B30-116 (E2G)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B1-5 (VG) or B30-118 (VG) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

DTC	P0101	Mass Air Flow Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0100 (see page ES-86).

DTC No.	DTC Detection Conditions	Trouble Areas
P0101	Conditions (a), (b), (c), (d) and (e) continue for more than 10 seconds (2 trip detection logic): (a) Engine running (b) Engine coolant temperature 70°C (158°F) or higher (c) Throttle Position (TP) sensor voltage 0.24 V or more (d) Average engine load value ratio less than 0.85, or more than 1.15 (varies with estimated engine load) Average engine load value ratio = Average engine load based on MAF meter output / Average engine load estimated from driving conditions (e) Average air-fuel ratio less than -20 %, or more than 20 %	• Mass Air Flow (MAF) meter • Air induction system • PCV hose connections

ES

MONITOR DESCRIPTION

The MAF meter is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and to provide an appropriate air-fuel ratio. Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a specific temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components of the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The ECM monitors the average engine load value ratio to check the MAF meter for malfunctions. The average engine load value ratio is obtained by comparing the average engine load calculated from the MAF meter output to the average engine load estimated from the driving conditions, such as the engine speed and the throttle opening angle. If the average engine load value ratio is below the threshold value, the ECM determines that the intake air volume is low, and if the average engine load value ratio is above the threshold value, the ECM determines that the intake air volume is high.
If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0101: Mass air flow meter rationality
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Crankshaft Position (CKP) sensor, Engine Coolant Temperature (ECT) sensor and Throttle Position (TP) sensor
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

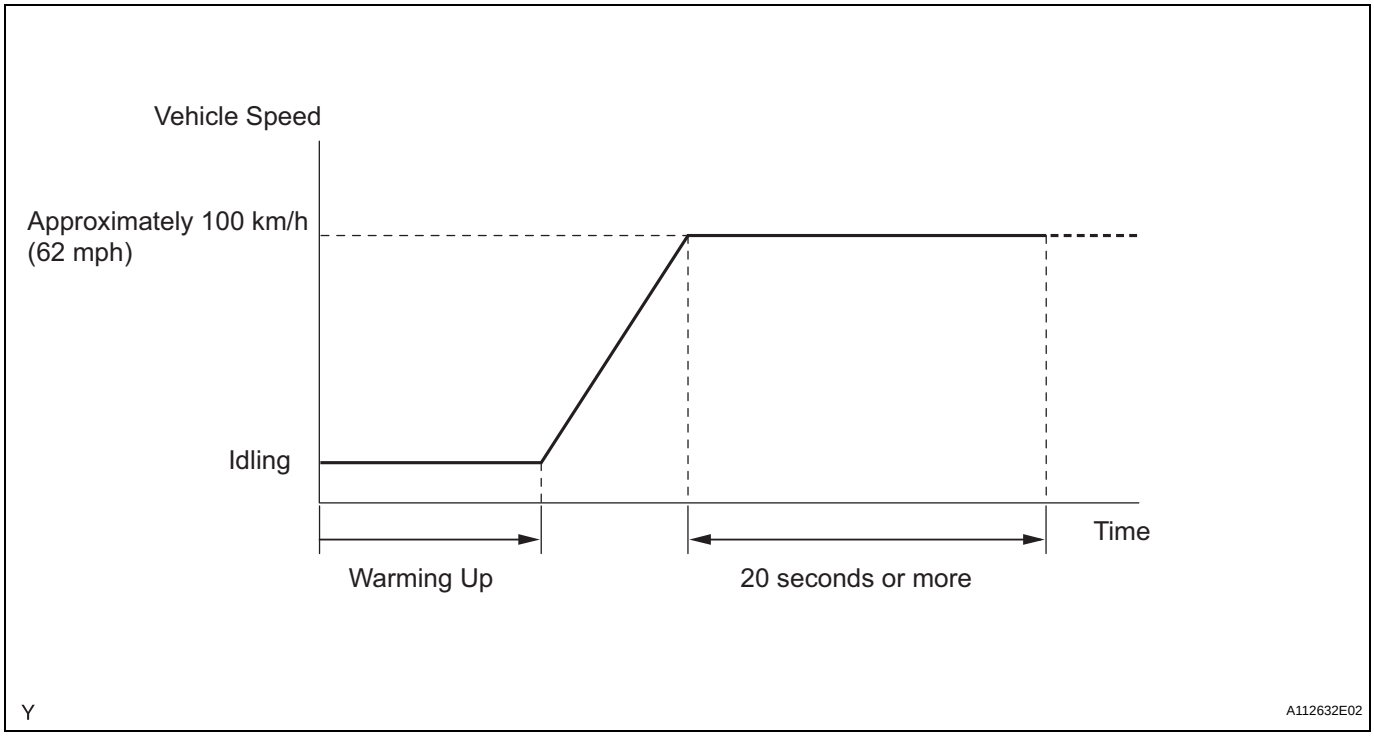
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor)
Throttle position (TP sensor voltage)	0.24 V or more
Engine	Running
Battery voltage	10.5 V or more

Engine coolant temperature	70°C (158°F) or more
IAT sensor circuit	OK
ECT sensor circuit	OK
CKP sensor circuit	OK
TP sensor circuit	OK
Canister pressure sensor circuit	OK
EVAP leak detection pump	OK
EVAP vent valve	OK

TYPICAL MALFUNCTION THRESHOLDS

Both of following conditions 1 and 2 met	-
1. Averaged engine load value ratio	Less than 0.85, or more than 1.15 (varies with estimated engine load)
2. Averaged air-fuel ratio	Less than -20 %, or more than 20 %



ES

WIRING DIAGRAM

Refer to DTC P0100 (see page ES-88).

CONFIRMATION DRIVING PATTERN

HINT:
Performing this confirmation pattern will activate the mass air flow performance monitor.

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON.
3. Turn the tester ON.
4. Clear DTCs (see page ES-35).
5. Start the engine, and warm it up until the engine coolant temperature reaches 70°C (158°F) or higher.
6. Drive the vehicle at approximately 100 km/h (62 mph) for 20 seconds or more.
7. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0101)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0101	A
P0101 and other DTCs	B

HINT:
If any DTCs other than P0101 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

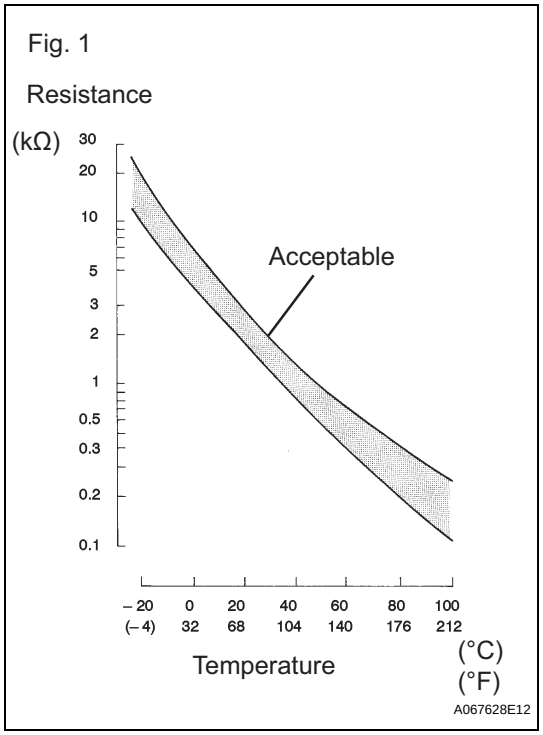
OK

3 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK



REPLACE MASS AIR FLOW METER

DTC	P0110	Intake Air Temperature Circuit Malfunction

DTC	P0112	Intake Air Temperature Circuit Low Input

DTC	P0113	Intake Air Temperature Circuit High Input

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).

The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.

Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve drivability.

HINT:

When any of DTCs P0110, P0112 and P0113 are set, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Conditions	Trouble Areas
P0110	Open or short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0112	Short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	Open in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:
When any of these DTCs are set, check the IAT by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and sets a DTC.

ES

Example:
If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and sets DTC P0113. Conversely, if the output voltage is less than 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0112.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0110: IAT sensor range check (Fluctuating) P0112: IAT sensor range check (Low voltage) P0113: IAT sensor range check (High voltage)
Required Sensors/Components (Main)	IAT sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

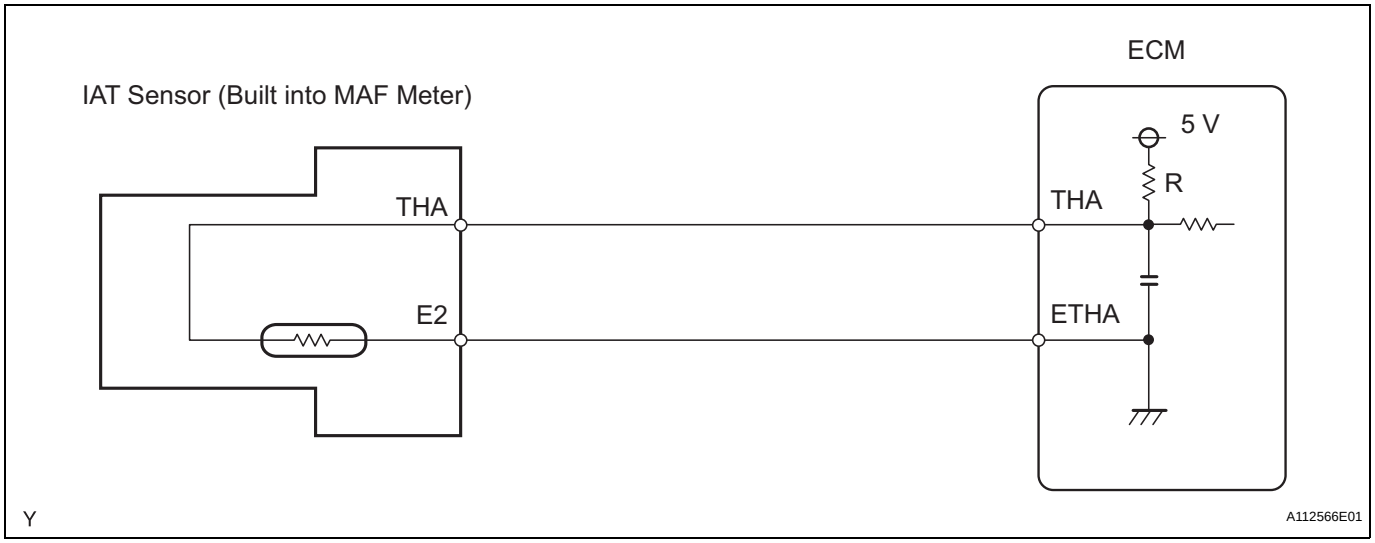
TYPICAL MALFUNCTION THRESHOLDS

P0110:

IAT sensor voltage	Less than 0.18 V, or more than 4.91 V

P0112:

IAT sensor voltage [IAT]	Less than 0.18 V [More than 140°C (284°F)]



P0113:

IAT sensor voltage [IAT]	More than 4.91 V [Less than -40°C (-40°F)]

COMPONENT OPERATING RANGE

IAT sensor voltage [IAT]	0.18 to 4.91 V [-40°C to 140°C (-40°F to 284°F)]

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ OUTPUT DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the intelligent tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0110	A
P0112	B
P0113	C

B → Go to step 6

C → Go to step 3

A

2	READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

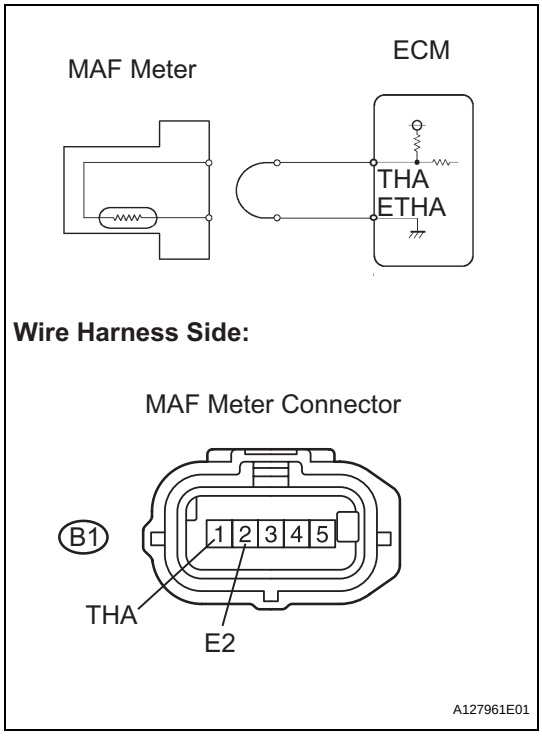
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.

(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.
(e) Read the value displayed on the tester.
Standard:
Same as actual Intake Air Temperature (IAT).

Result

Temperature Displayed	Proceed To
-40°C (-40°F)	A
140°C (284°F) or higher	B
Same as actual IAT	C

ES



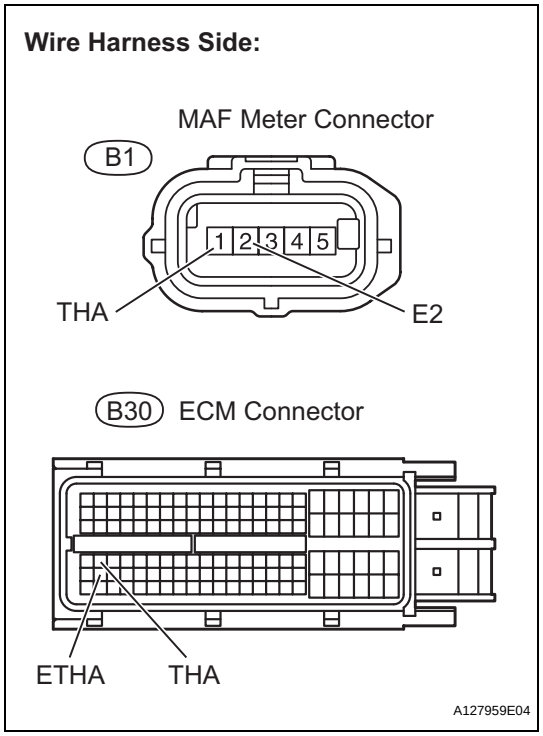
HINT:
- If there is an open circuit, the intelligent tester indicates -40°C (-40°F).
- If there is a short circuit, the intelligent tester indicates 140°C (284°F) or higher.

B → **Go to step 5**

C → **CHECK FOR INTERMITTENT PROBLEMS**

A

3 READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)



(a) Disconnect the B1 Mass Air Flow (MAF) meter connector.
(b) Connect terminals THA and E2 of the MAF meter wire harness side connector.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.
(g) Read the value displayed on the tester.
Standard value:
140°C (284°F) or higher
(h) Reconnect the MAF meter connector.

OK → **CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE MASS AIR FLOW METER**

NG

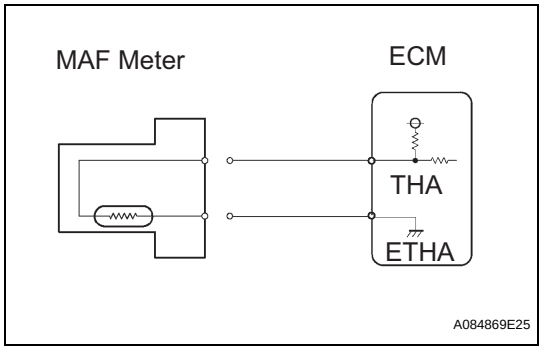
4 CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

(a) Disconnect the B1 MAF meter connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connections	Specified Conditions
B1-1 (THA) - B30-65 (THA)	Below 1 Ω
B1-2 (E2) - B30-88 (ETHA)	Below 1 Ω

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.



ES

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

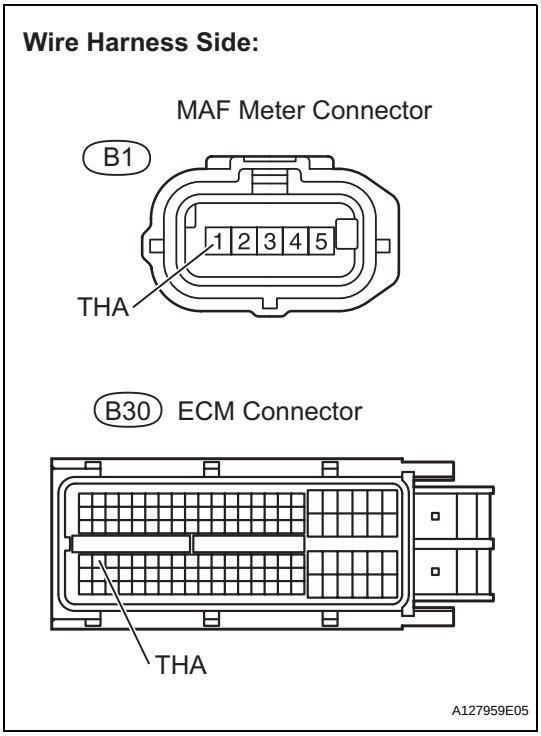
OK

CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM

5 READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

(a) Disconnect the B1 MAF meter connector.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.
(f) Read the value displayed on the tester.

Standard value:
-40°C (-40°F)



(g) Reconnect the MAF meter connector.

OK → **REPLACE MASS AIR FLOW METER**

NG

6	CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

Wire Harness Side:

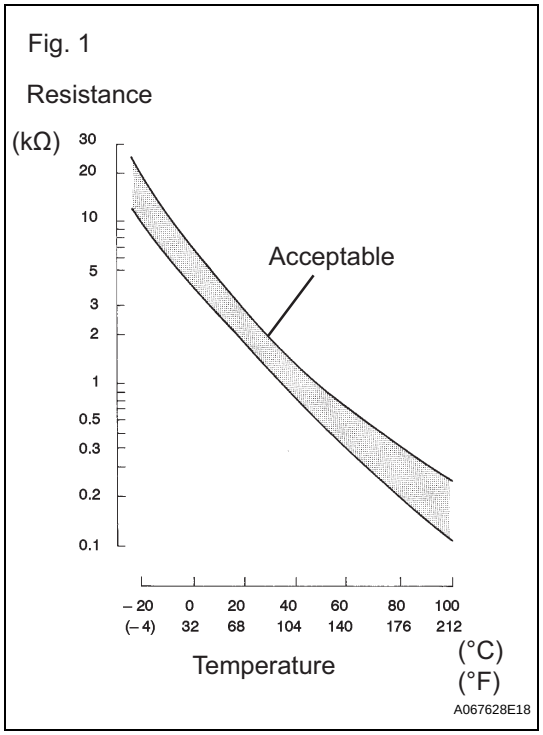
(a) Disconnect the B1 MAF meter connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connections	Specified Conditions
B1-1 (THA) or B30-65 (THA) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**



OK

REPLACE ECM

ES

DTC	P0111	Intake Air Temperature Sensor Gradient Too High

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).

The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R. Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

DTC No.	DTC Detection Condition	Trouble Area
P0111	When either condition below is met: 1. The intake air temperature rise is large, from the previous trip warm-up to the following trip (2 trip detection logic). 2. When the change in the intake air temperature after engine start is less than the threshold value.	Mass air flow meter assembly

MONITOR DESCRIPTION

The ECM performs OBD II monitoring based on the values from the intake air temperature sensor. If there is no change of the sensor value within the normal range, the ECM will not be able to perform OBD II monitoring or will misdiagnose that there is a malfunction in the sensor. The ECM detects the stuck intake air temperature sensor value by performing monitoring after the ignition switch is turned OFF or the engine is started (short soak or long soak).

MONITOR STRATEGY

Related DTCs	P0111: Intake air temperature sensor rationality (After engine stop) P0111: Intake air temperature sensor rationality (After cold engine start)
Required Sensors/Components (Main)	Intake Air Temperature (IAT) sensor
Required Sensors/Components (Sub)	-
Frequency of Operation	Once per driving cycle
Duration	5 hours or more
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs are not present	None

After engine stop:

Time after engine start	10 seconds or more
Battery voltage	10.5 V or more
ECT sensor circuit	OK
ECT change since engine	Less than 180°C (356°F)
ECT before engine stop	70°C (158°F) or more
Time that MAF is low before engine stop	70 minutes
Accumulated MAF amount before engine stop	3,451 g or more
Key-off duration	30 minutes

After cold engine start:

Key-off duration	5 hours
Time after engine start	10 seconds or more
ECT sensor circuit	OK
ECT	70°C (158°F) or more
Accumulated MAF amount	3,451 g or more
One of the following conditions 1 or 2 is met:	-
1. Duration while engine load is low	120 seconds or more
2. Duration while engine load is high	10 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

After engine stop:

IAT change	Less than 1°C (2°F)

After cold engine start:

IAT change	Less than 1°C (2°F)

WIRING DIAGRAM

Refer to DTC P0110 (see page ES-88).

INSPECTION PROCEDURE

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0111)**

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0111 and other DTCs	A
P0111	B

HINT:
If any DTCs other than P0111 are output, troubleshoot those DTCs first.

B → **REPLACE MASS AIR FLOW METER**

A → **GO TO DTC CHART**

DTC	P0115	Engine Coolant Temperature Circuit Malfunction

DTC	P0117	Engine Coolant Temperature Circuit Low Input

DTC	P0118	Engine Coolant Temperature Circuit High Input

DESCRIPTION

A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.

ES

The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are set, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Conditions	Trouble Areas
P0115	Open or short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in ECT sensor circuit • ECT sensor • ECM
P0117	Short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in ECT sensor • ECT sensor • ECM
P0118	Open in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:

When any of these DTCs are set, check the ECT by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.

Temperature Displayed	Malfunctions
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Example:

If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and sets DTC P0118. Conversely, if the voltage output is less than 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0117.

If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0115: ECT sensor range check (Fluctuating) P0117: ECT sensor range check (Low voltage) P0118: ECT sensor range check (High voltage)

DTC	P0116	Engine Coolant Temperature Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0115 (see page ES-105).

DTC No.	DTC Detection Conditions	Trouble Areas
P0116	When either of following conditions met (2 trip detection logic): • When cold engine started and engine warmed up, Engine Coolant Temperature (ECT) sensor value does not change. • After warmed up engine started, ECT sensor value does not change when engine stopped and then next cold engine start performed.	• Thermostat • ECT sensor

ES

MONITOR DESCRIPTION

Engine coolant temperature (ECT) sensor cold start monitor

When a cold engine start is performed and then the engine is warmed up, if the ECT sensor value does not change, it is determined that a malfunction has occurred. If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

ECT sensor soak monitor

After a warmed up engine is started, if the ECT sensor value does not change when the engine is stopped and then the next cold engine start is performed, it is determined that a malfunction has occurred. If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0116: Engine coolant temperature (ECT) sensor cold start monitor P0116: ECT sensor soak monitor
Required Sensors/Components (Main)	ECT sensor
Required Sensors/Components (Related)	None
Frequency of Operation	Once per driving cycle
Duration	5 hours or more
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

ECT Sensor cold start monitor:

Monitor runs whenever following DTCs not present	P0100 to P0103: Mass Air Flow (MAF) meter P0110 to P0113: Intake Air Temperature (IAT) sensor
Battery voltage	10.5 V or more
Time after engine start	1 second or more
ECT at engine start	Less than 60°C (140°F)
IAT sensor circuit	OK
Soak time	5 hours or more
Accumulated MAF	604.75 g or more
Engine	Running
Fuel cut	OFF
Difference between ECT at engine start and IAT	Less than 40°C (72°F)

ECT Sensor soak monitor:

Monitor runs whenever following DTCs not present	P0100 to P0103: MAF meter P0110 to P0113: IAT sensor

Battery voltage	10.5 V or more
Engine	Running
Soak time	5 hours or more
Either (a) or (b) condition met	-
(a) ECT	60°C (140°F) or more
(b) Accumulated MAF	1128.55 g or more

TYPICAL MALFUNCTION THRESHOLDS

ECT Sensor cold start monitor:

ECT sensor value change	Less than 5°C (9°F)

ECT Sensor soak monitor:

Difference between current ECT sensor value and previous ECT sensor value when engine stopped	Less than 5°C (9°F)

ES

COMPONENT OPERATING RANGE

ECT	ECT sensor value changes in accordance with actual ECT

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0117, P0118 or P0125 are set simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED II / DTC INFO / CURRENT CODES.
(e) Read the DTC.

Result

Display (DTC Output)	Proceed To
P0116	A
P0116 and other DTCs	B

B → GO TO DTC CHART

A

2	INSPECT THERMOSTAT

(a) Remove the thermostat (see page CO-15).
(b) Measure the valve opening temperature of the thermostat.

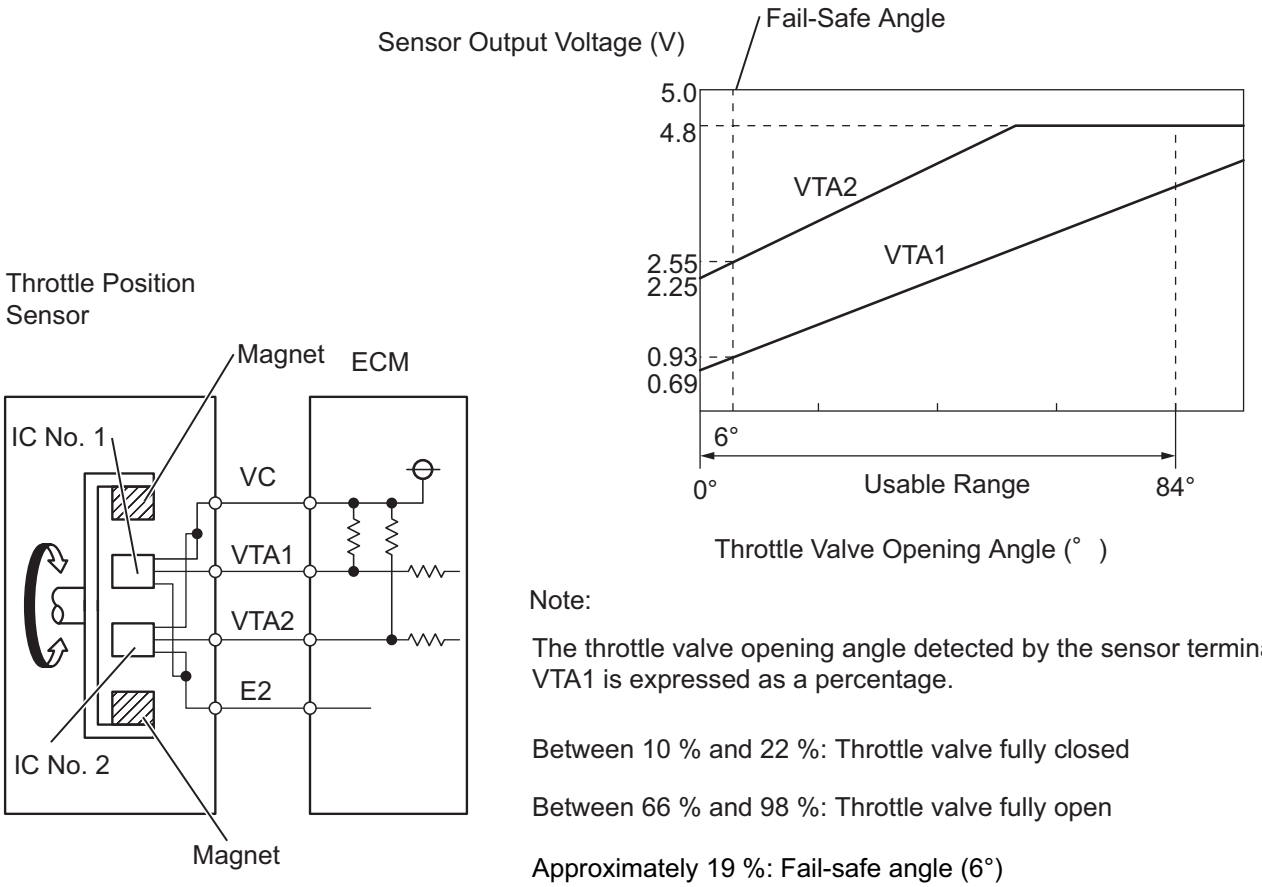
Standard value:
80°C to 84°C (176°F to 183°F)

HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

(c) Reinstall the thermostat (see page CO-15).

NG → **REPLACE THERMOSTAT**

OK



REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input
DTC	P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input
DTC	P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

HINT:
These DTCs relate to the Throttle Position (TP) sensor.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has two sensor circuits which each transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

Note:

The throttle valve opening angle detected by the sensor terminal VTA1 is expressed as a percentage.

Between 10 % and 22 %: Throttle valve fully closed

Between 66 % and 98 %: Throttle valve fully open

Approximately 19 %: Fail-safe angle (6°)

A122493E04

DTC No.	DTC Detection Conditions	Trouble Areas
P0120	Output voltage of VTA1 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• Throttle Position (TP) sensor (built into throttle body) • ECM
P0122	Output voltage of VTA1 0.2 V or less for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	Output voltage of VTA1 4.535 V or more for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	Output voltage of VTA2 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • ECM

DTC No.	DTC Detection Conditions	Trouble Areas
P0222	Output voltage of VTA2 1.75 V or less for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	Output voltage of VTA2 4.8 V or more, and VTA1 between 0.2 V and 2.02 V for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) met (1 trip detection logic): (a) Difference between output voltages of VTA1 and VTA2 0.02 V or less for 0.5 seconds or more (b) Output voltage of VTA1 0.2 V or less, and VTA2 1.75 V or less, for 0.4 seconds or more	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

ES

HINT:

- When any of these DTCs are set, check the throttle valve opening angle by selecting the following menu items the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1 AND THROTTLE POS #2.
- THROTTLE POS #1 denotes the VTA1 signal, and THROTTLE POS #2 denotes the VTA2 signal.

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
THROTTLE POS #1	**0.5 to 1.1 V**	**3.3 to 4.9 V**
THROTTLE POS #2	**2.1 to 3.1 V**	**4.6 to 5.0 V**

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.

- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0120: Throttle position sensor 1 range check (Fluctuating) P0122: Throttle position sensor 1 range check (Low voltage) P0123: Throttle position sensor 1 range check (High voltage) P0220: Throttle position sensor 2 range check (Fluctuating) P0222: Throttle position sensor 2 range check (Low voltage) P0223: Throttle position sensor 2 range check (High voltage) P2135: Throttle position sensor range check (Correlation)

TYPICAL MALFUNCTION THRESHOLDS

P0120:

VTA1 voltage	0.2 V or less, or 4.535 V or more

ES

P0122:

VTA1 voltage	0.2 V or less

P0123:

VTA1 voltage	4.535 V or more

P0220:

VTA2 voltage	1.75 V or less, or 4.8 V or more

P0222:

VTA2 voltage	1.75 V or less

P0223:

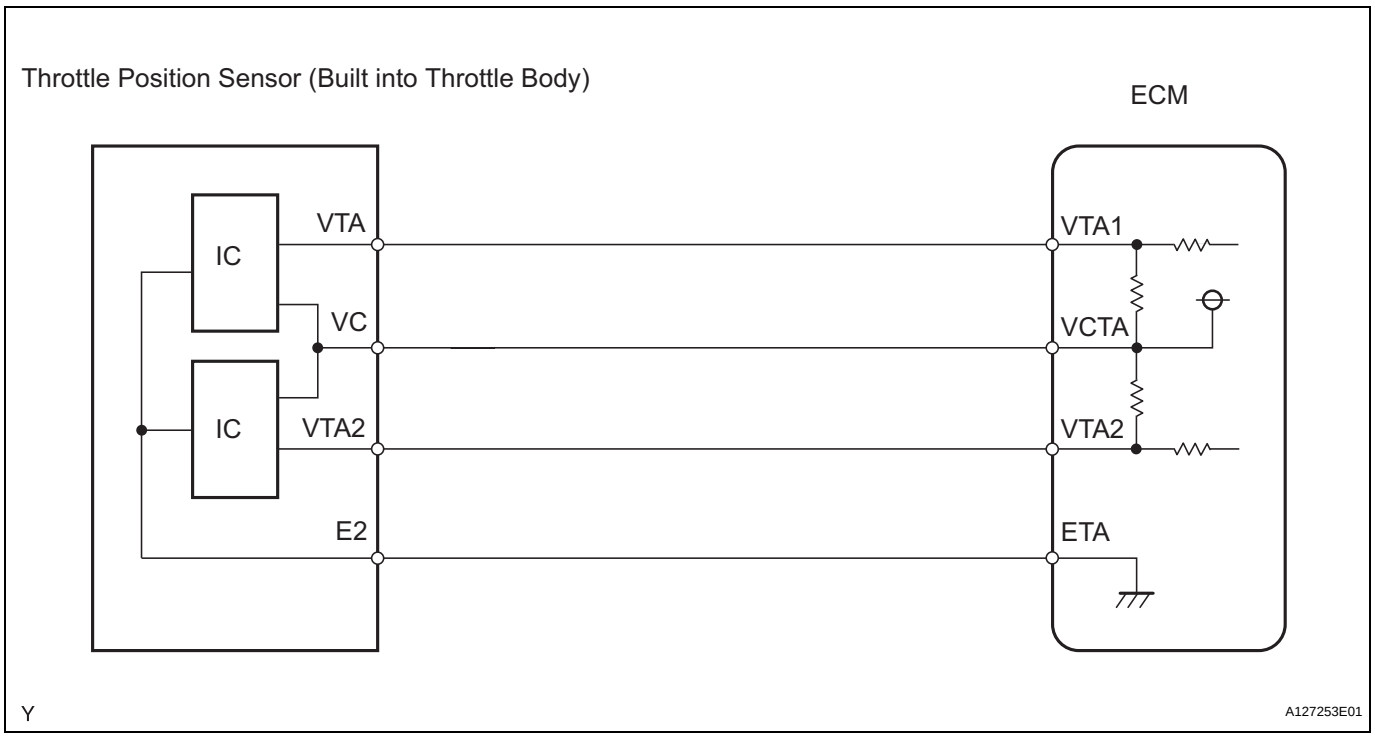
VTA2 voltage when VTA1 0.2 V or more, and 2.02 V or less	4.8 V or more

P2135 Case 1:

Difference between VTA1 and VTA2 voltages	0.02 V or less

P2135 Case 2:

VTA1 voltage	0.2 V or less
VTA2 voltage	1.75 V or less



COMPONENT OPERATING RANGE

VTA1 voltage	0.69 to 4.05 V
VTA2 voltage	2.25 to 4.8 V

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (THROTTLE POS #1 AND THROTTLE POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1 and THROTTLE POS #2.
(d) Check the values displayed on the tester.

Result

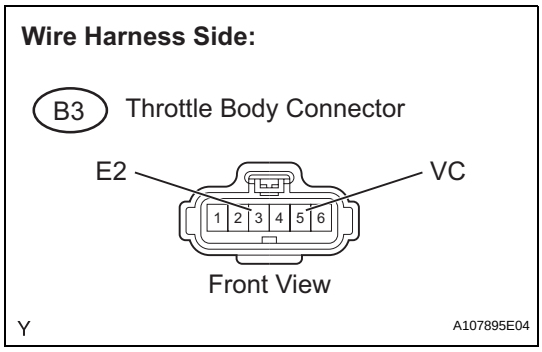
2 CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B3-5 (VC) - B30-67 (VCTA)	Below 1 Ω
B3-6 (VTA) - B30-115 (VTA1)	Below 1 Ω
B3-4 (VTA2) - B30-114 (VTA2)	Below 1 Ω
B3-3 (E2) - B30-91 (ETA)	Below 1 Ω

Standard resistance (Check for short)



Tester Connections	Specified Conditions
B3-5 (VC) or B30-67 (VCTA) - Body ground	10 kΩ or higher
B3-6 (VTA) or B30-115 (VTA1) - Body ground	10 kΩ or higher
B3-4 (VTA2) or B30-114 (VTA2) - Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3 INSPECT ECM (VC VOLTAGE)

(a) Disconnect the B3 throttle body connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the throttle body connector.

Standard voltage

Tester Connections	Specified Conditions
B3-5 (VC) - B3-3 (E2)	4.5 to 5.5 V

(d) Reconnect the throttle body connector.

NG → REPLACE ECM

OK

4	REPLACE THROTTLE BODY ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (THROTTLE POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds or more.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

ES

REPLACE ECM

DTC	P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

HINT:
This DTC relates to the Throttle Position (TP) sensor.

DESCRIPTION

Refer to DTC P0120 (see page ES-114).

DTC No.	DTC Detection Conditions	Trouble Areas
P0121	Difference between VTA1 and VTA2 voltages less than 0.8 V, or more than 1.6 V for 2 seconds (1 trip detection logic)	TP sensor (built into throttle body)

ES

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0121: TP sensor rationality

A

REPLACE THROTTLE BODY ASSEMBLY

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control

DESCRIPTION

Refer to DTC P0115 (see page ES-105).

DTC No.	DTC Detection Conditions	Trouble Areas
P0125	Engine Coolant Temperature (ECT) does not reach closed-loop enabling temperature for 20 minutes (this period varies with engine start ECT) (2 trip detection logic)	• ECT sensor • Cooling system • Thermostat

ES

MONITOR DESCRIPTION

The resistance of the ECT sensor varies in proportion to the actual ECT. The ECT supplies a constant voltage to the sensor and monitors the signal output voltage of the sensor. The signal voltage output varies according to the changing resistance of the sensor. After the engine is started, the ECT is monitored through this signal. If the ECT sensor indicates that the engine is not yet warm enough for closed-loop fuel control, despite a specified period of time having elapsed since the engine was started, the ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.
Example:
The ECT is 0°C (32°F) at engine start. After about 1 minute running time, the ECT sensor still indicates that the engine is not warm enough to begin closed-loop fuel (air-fuel ratio feedback) control. The ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0125: Insufficient engine coolant temperature for closed-loop fuel control
Required Sensors/Components (Main)	Thermostat, cooling system
Required Sensors/Components (Related)	Engine coolant temperature sensor and mass air flow meter
Frequency of Operation	Once per driving cycle
Duration	72.38 seconds or more: Engine coolant temperature at engine start 1.7°C (35°F) or more 122.73 seconds or more: Engine coolant temperature at engine start -9.45° to 1.7°C (15° to 35°F) 20 minutes or more: Engine coolant temperature at engine start less than -9.45°C (15°F)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor)
Thermostat failure	Not detected

TYPICAL MALFUNCTION THRESHOLDS

Time until actual engine coolant temperature reaches closed-loop fuel control enabling temperature	72.38 seconds or more: Engine coolant temperature at engine start 1.7°C (35°F) or more 122.73 seconds or more: Engine coolant temperature at engine start -9.45° to 1.7°C (15° to 35°F) 20 minutes or more: Engine coolant temperature at engine start less than -9.45°C (15°F)

WIRING DIAGRAM

Refer to DTC P0115 (see page ES-106).

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0116, P0117 or P0118 are set simultaneously with DTC P0125, the Engine Coolant Temperature (ECT) sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 **CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0125)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0125	A

If any DTCs other than P0125 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 **INSPECT THERMOSTAT**

(a) Remove the thermostat (see page CO-15).
(b) Check the valve opening temperature of the thermostat.
Standard value:
80 to 84°C (176 to 183°F)
HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.
(c) Reinstall the thermostat (see page CO-15).

NG → **REPLACE THERMOSTAT**

OK

3	CHECK COOLING SYSTEM

(a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or any modifications.

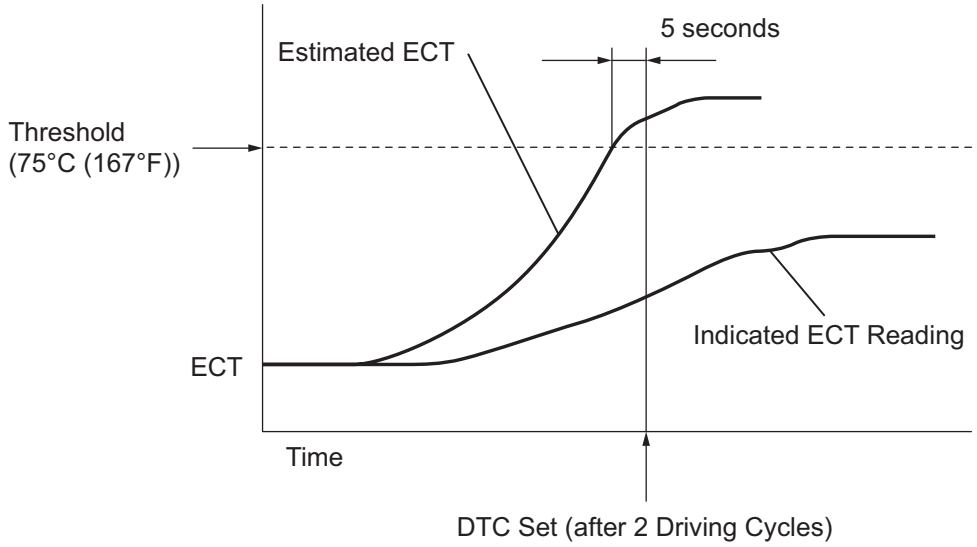
NG → **REPAIR OR REPLACE COOLING SYSTEM**

OK

REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)

HINT:
This DTC relates to the thermostat.



DESCRIPTION

This DTC is set when the Engine Coolant Temperature (ECT) does not reach 75°C (167°F) despite sufficient engine warm-up time having elapsed.

DTC No.	DTC Detection Conditions	Trouble Areas
P0128	Conditions (a), (b) and (c) met for 5 seconds (2 trip detection logic): (a) Cold start (b) Engine warmed up (c) ECT less than 75°C (167°F)	• Thermostat • Cooling system • ECT sensor • ECM

ES

MONITOR DESCRIPTION

Y A121605E02

The ECM estimates the ECT based on the starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT. When the estimated ECT reaches 75°C (167°F), the ECM checks the actual ECT. If the actual ECT is less than 75°C (167°F), the ECM interprets this as a malfunction in the thermostat or the engine cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0128: Coolant Thermostat

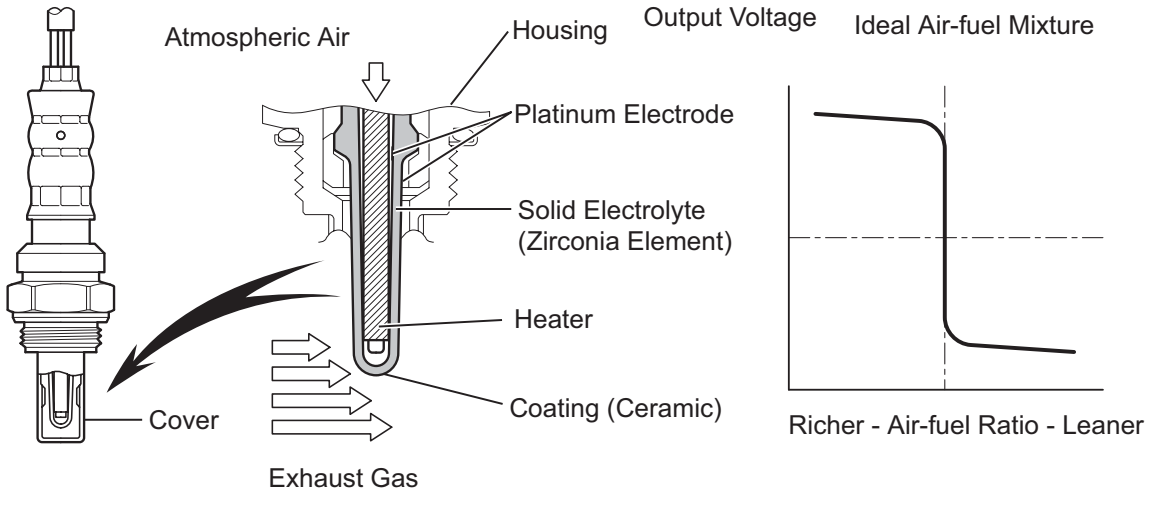
DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)

DTC	P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)

DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)

ES



DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

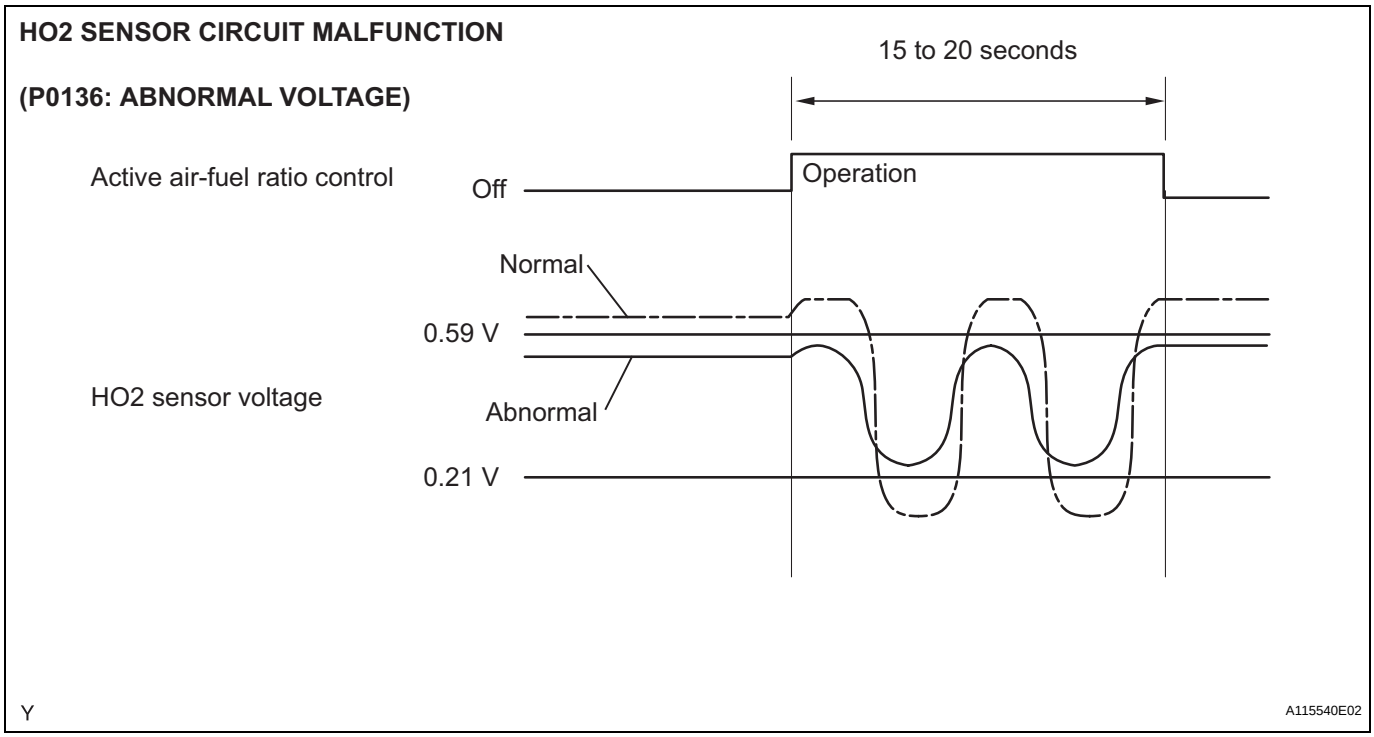
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V). Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC No.	DTC Detection Conditions	Trouble Areas
P0136	• Abnormal voltage output: During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) Heated Oxygen (HO2) sensor voltage does not decrease to less than 0.59 V (b) HO2 sensor voltage does not increase to more than 0.21 V • Low impedance: Sensor impedance less than 5 Ω for more than 30 seconds when ECM presumes sensor to be warmed up and operating normally (2 trip detection logic)	• Open or short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor heater (sensor 2) • Air-fuel Ratio (A/F) sensor (sensor 1) • Integration relay (EFI MAIN relay) • Gas leakage from exhaust system
P0137	• Low voltage (open): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) HO2 sensor voltage output less than 0.21 V (b) Target air-fuel ratio rich • High impedance: Sensor impedance 15 kΩ or more for more than 90 seconds when ECM presumes sensor to be warmed up and operating normally (2 trip detection logic)	• Open in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • Gas leakage from exhaust system
P0138	• High voltage (short): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) HO2 sensor voltage output more than 0.59 V (b) Target air-fuel ratio lean • Extremely high voltage (short): HO2 sensor voltage output exceeds 1.2 V for more than 10 seconds (2 trip detection logic)	• Short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • ECM internal circuit malfunction

ES

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136 (abnormal voltage output), P0137 (open circuit) and P0138 (short circuit).

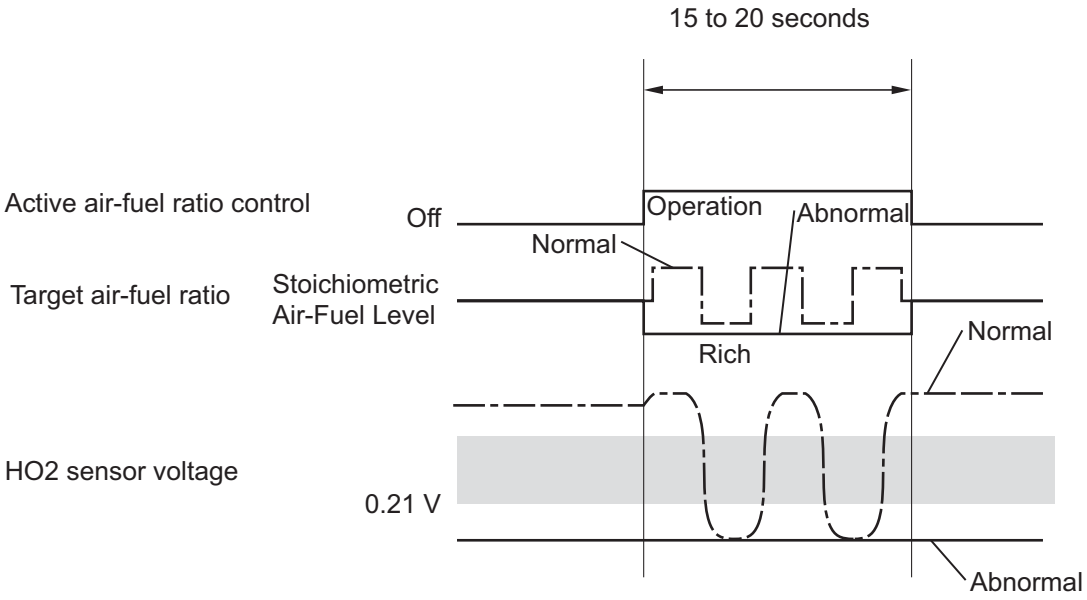
Abnormal Voltage Output of HO2 Sensor (DTC P0136)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTC P0136.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 or P0138)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

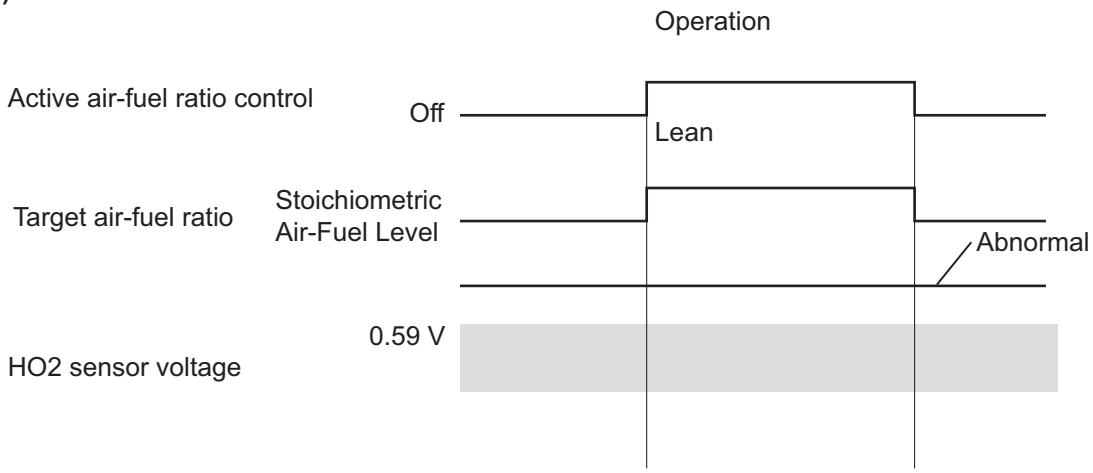
While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138.



HINT:

DTC P0138 is also set if the HO2 sensor voltage output is more than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (see page ES-191).



HO2 SENSOR CIRCUIT LOW VOLTAGE

(P0137: OPEN)

HO2 SENSOR CIRCUIT HIGH VOLTAGE

(P0138: SHORT)

ES

High or Low Impedance of Heated Oxygen (HO2) Sensor (DTC P0136 or P0137)

During normal air-fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variations in the HO2 sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.
*: The effective resistance in an alternating current electrical circuit.
HINT:

- The impedance cannot be measured using an ohmmeter.
- DTC P0136 indicates the deterioration of the HO2 sensor. The ECM sets this DTC by calculating the impedance of the sensor when the typical enabling conditions are satisfied (2 driving cycles).
- DTC P0137 indicates an open or short circuit in the HO2 sensor (2 driving cycles). The ECM sets this DTC when the impedance of the sensor exceeds the threshold 15 kΩ.

MONITOR STRATEGY

Related DTCs	P0136: Heated oxygen sensor output voltage (Abnormal voltage output) P0136: Heated oxygen sensor impedance (Low) P0137: Heated oxygen sensor output voltage (Low voltage) P0137: Heated oxygen sensor impedance (High) P0138: Heated oxygen sensor output voltage (High voltage) P0138: Heated oxygen sensor output voltage (Extremely high)

ES

Heated Oxygen Sensor Output Voltage (Abnormal Voltage Output, High Voltage and Low Voltage):

Active air-fuel ratio control	Executing
Active air-fuel ratio control begins when all of following conditions met:	-
Battery voltage	11 V or more
Engine coolant temperature	75°C (167°F) or more
Idling	OFF
Engine RPM	Less than 4,000 rpm
A/F sensor status	Activated
Fuel system status	Closed loop
Fuel cut	OFF
Engine load	10 to 80 %
Shift position	4th

Heated Oxygen Sensor Impedance (Low):

Battery voltage	11 V or more
Estimated rear HO2 sensor temperature	Less than 700°C (1,292°F)
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Impedance (High):

Battery voltage	11 V or more
Estimated rear HO2 sensor temperature	450°C (842°F) or more
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Output Voltage (Extremely High):

Battery voltage	11 V or more
Time after engine start	2 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Heated Oxygen Sensor Output Voltage (Abnormal Voltage Output):

Either of following conditions met:	1 or 2
1. All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	0.21 to 0.59 V
(c) OSC (Oxygen Storage Capacity of Catalyst)	2 g or more
2. All of following conditions (d), (e) and (f) met	-
(d) Commanded air-fuel ratio	14.9 or more

(e) Rear HO2 sensor voltage	0.21 to 0.59 V
(f) OSC	2 g or more

Heated Oxygen Sensor Output Voltage (Low):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	Less than 0.21 V
(c) OSC	2 g or more

Heated Oxygen Sensor Output Voltage (High):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.9 or more
(b) Rear HO2 sensor voltage	More than 0.59 V
(c) OSC	2 g or more

ES

Heated Oxygen Sensor Impedance (Low):

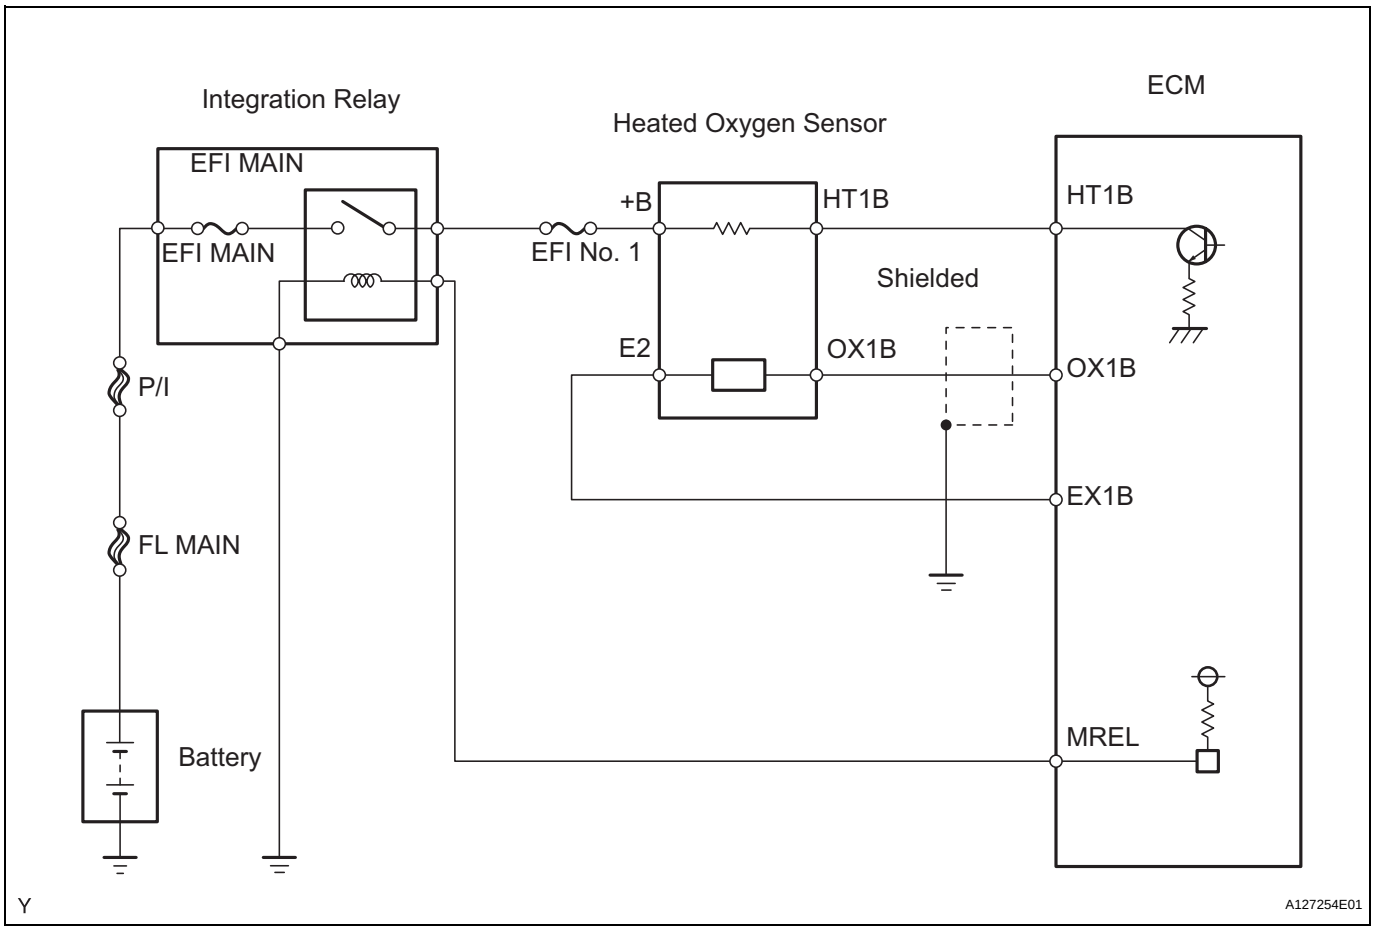
Duration of following condition met	30 seconds or more
Heated oxygen sensor impedance	Less than 5 Ω

Heated Oxygen Sensor Impedance (High):

Duration of following condition met	90 seconds or more
Heated oxygen sensor impedance	15 kΩ or more

Heated Oxygen Sensor Output Voltage (Extremely High):

Duration of following condition met	10 seconds or more
Heated oxygen sensor voltage	1.2 V or more

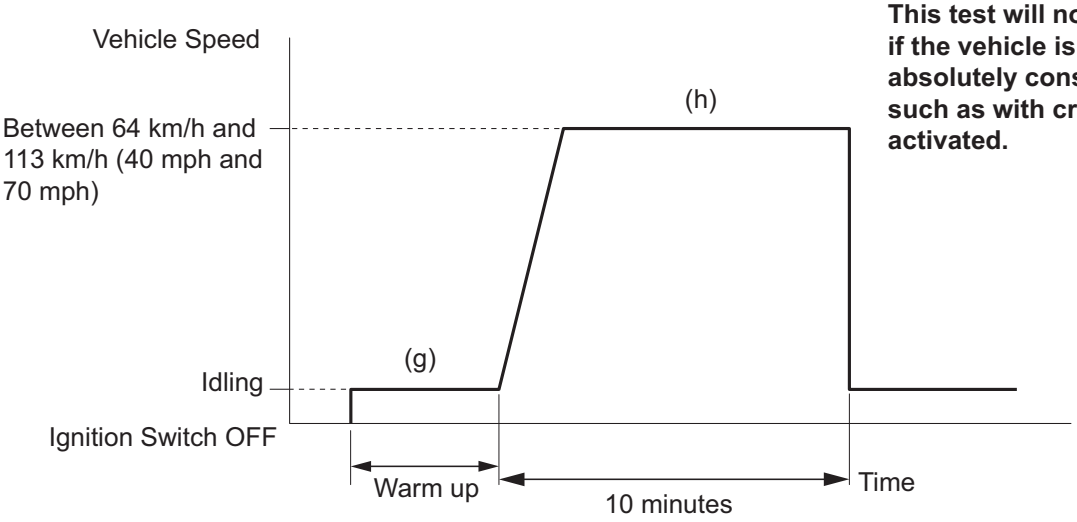


COMPONENT OPERATING RANGE

Duration of following condition met	30 seconds or more
Heated oxygen sensor voltage	Varies between 0.1 and 0.9 V

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).

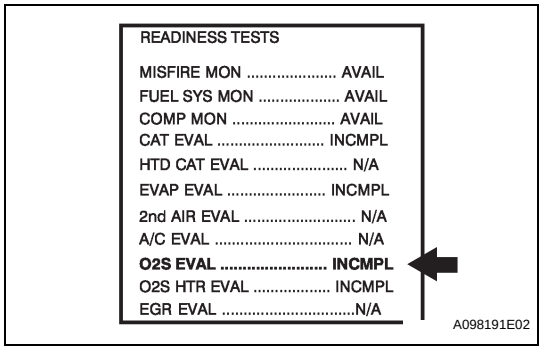


WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

HINT:

- This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.
- Performing this confirmation pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.



NOTICE:
This test will not be completed if the vehicle is driven at absolutely constant speed such as with cruise control activated.

(Note: Even if vehicle stops during driving pattern, test can be resumed)

P

A115372E26

A098191E02

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-35).
(e) Select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
(f) Check that O2S EVAL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as the O2S EVAL monitor operates.
(j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.
HINT:
If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

INSPECTION PROCEDURE

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.
HINT:
Intelligent tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2) displayed on the tester.

HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1 S1 (A/F)	+25 %	Rich	Less than 3.0
	-12.5 %	Lean	More than 3.35
O2S B1 S2 (HO2)	+25 %	Rich	More than 0.5
	-12.5 %	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction	 NG	Output Voltage Almost no reaction	 NG	

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2; then press the YES button and then the ENTER button followed by the F4 button.

ES

HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0138 will be set.

1 READ OUTPUT DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed To
P0138	A
P0137	B
P0136	C

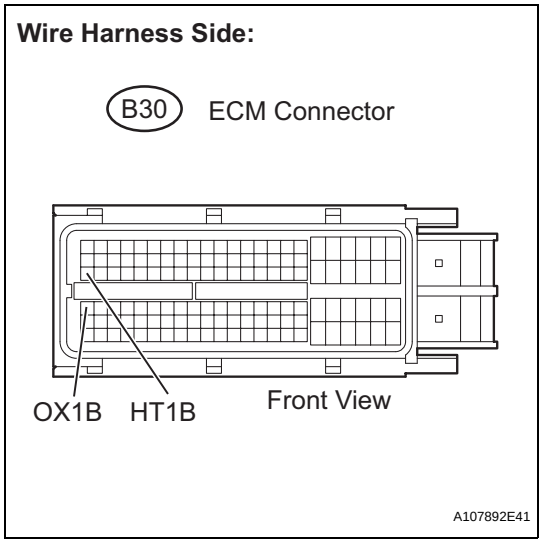
B → **Go to step 14**

C → **Go to step 7**

A

2 READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / O2S B1 S2.
(d) Allow the engine to idle.
(e) Read the Heated Oxygen (HO2) sensor output voltage while idling.



Result

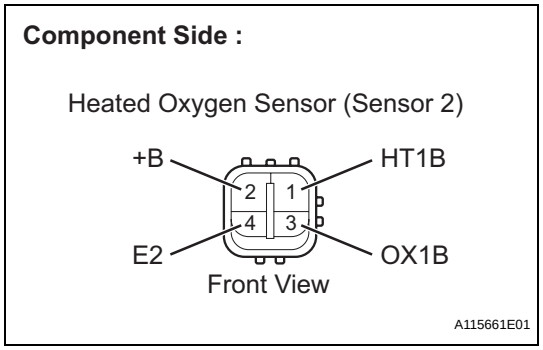
HO2 Sensor Output Voltages	Proceed To
More than 1.2 V	A
Less than 1.0 V	B

B → Go to step 5

A

3 CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

(a) Turn the ignition switch OFF and wait for 5 minutes.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance



Tester Connections	Specified Conditions
B30-47 (HT1B) - B30-64 (OX1B)	10 kΩ or higher

(d) Reconnect the ECM connector.

OK → REPLACE ECM

NG

4 INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

(a) Disconnect the B19 HO2 sensor connector.
(b) Measure the resistance.
Standard resistance

Tester Connections	Specified Conditions
2 (+B) - 4 (E2)	10 kΩ or higher
2 (+B) - 3 (OX1B)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.

NG → REPLACE HEATED OXYGEN SENSOR

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

ES

13	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.
(e) Change the fuel injection volume using the tester, monitoring the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- Change the fuel injection volume within the range of -12 % and +12 %. The injection volume can be changed in 1 % graduations within the range.
- The A/F sensor is displayed as AFS B1 S1, and the HO2 sensor is displayed as O2S B1 S2, on the intelligent tester.

Result

Tester Display (Sensor)	Voltage Variations	Proceed To
AFS B1 S1 (A/F)	Alternates between more and less than 3.3 V	OK
	Remains at more than 3.3 V	NG
	Remains at less than 3.3 V	NG

HINT:
A normal HO2 sensor voltage (O2S B1 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	REPLACE AIR-FUEL RATIO SENSOR

OK

CHECK AND REPAIR EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

14	CHECK FOR EXHAUST GAS LEAK

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

15	INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE) (See page ES-89)

NG → REPLACE HEATED OXYGEN SENSOR

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR

DTC	P0171	System Too Lean (Bank 1)

DTC	P0172	System Too Rich (Bank 1)

DESCRIPTION

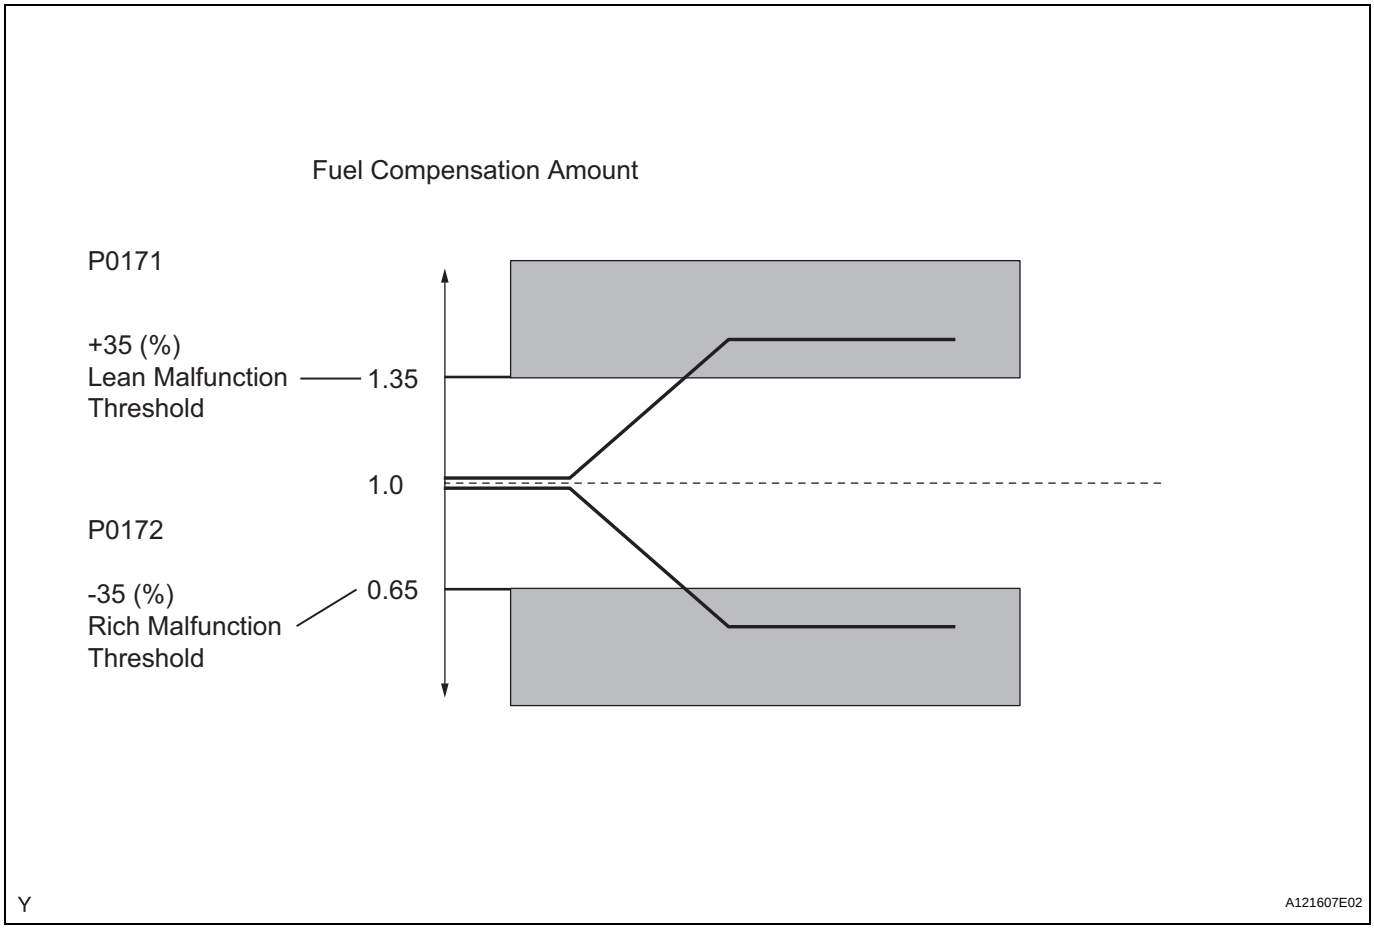
The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

ES

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.

If both the short-term and long-term fuel trims are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.



DTC No.	DTC Detection Conditions	Trouble Areas
P0171	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to lean side (2 trip detection logic)	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • A/F sensor heater and EFI MAIN relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to rich side (2 trip detection logic)	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • A/F sensor heater and EFI MAIN relay circuits • ECM

HINT:

- When DTC P0171 is set, the actual air-fuel ratio is on the lean side. When DTC P0172 is set, the actual air-fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 may be set. The MIL is then illuminated.
- When the total of the short-term and long-term fuel trim values is within 20 % (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and sets a DTC.
Example:
The average fuel trim learning value is +35 % or more or -35 % or less, the ECM interprets this as a fuel system malfunction.

MONITOR STRATEGY

Related DTCs	P0171: Fuel trim lean P0172: Fuel trim rich
Required Sensors/Components (Main)	Fuel system
Required Sensors/Components (Related)	A/F sensor, Mass air flow meter, Crankshaft position sensor
Frequency of Operation	Continuous
Duration	Within 10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

TYPICAL MALFUNCTION THRESHOLDS

Purge-cut	Executing
Either of following conditions 1 or 2 met	-
1. Average of short-term fuel trim and long-term fuel trim	35 % or more (varies with ECT)
2. Average of short-term fuel trim and long-term fuel trim	-35 % or less (varies with ECT)

WIRING DIAGRAM

Refer to DTC P2195 (see page ES-296).

INSPECTION PROCEDURE

HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171 OR P0172)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0171 or P0172	A
P0171 or P0172 and other DTCs	B

HINT:
If any DTCs other than P0171 or P0172 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of A/F and HO2 sensors (AFS B1S1 and O2S B1S2) displayed on the tester.

Result:

The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25 % = Rich output:
Less than 3.0 V
-12.5 % = Lean output:
More than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V	 OK	Output Voltage More than 0.5 V Less than 0.4 V	 OK	
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction	NG	Output Voltage More than 0.5 V Less than 0.4 V	 OK	

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
3	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		Extremely rich or lean actual air-fuel ratio • Injector leakage or blockage • Gas leakage from exhaust system • Fuel pressure • MAF meter • ECT sensor • Air induction system • PCV hose connections
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

ES

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2; then press the YES button and then the ENTER button followed by the F4 button.

Result

Result	Proceed To
Case 1	C
Case 2	B
Case 3	A

B → **Go to step 11**

C → **Go to step 15**

A

3 READ VALUE USING INTELLIGENT TESTER (MAF)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(e) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.
Standard:
MAF while engine idling: Between 1 g/sec. and 3 g/sec. (shift position: N, A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 2 g/sec. and 6 g/sec. (shift position: N, A/C: OFF).

NG → **REPLACE MASS AIR FLOW METER**

OK

4	READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(d) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.
Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 75°C and 100°C (167°F and 212°F).

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

5	CHECK PCV HOSE CONNECTIONS

(a) Check for PCV hose connections.
OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

6	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

7	CHECK FOR SPARKS AND IGNITION (See page ES-171)

NG → **REPAIR OR REPLACE IGNITION SYSTEM**

OK

8	CHECK FOR EXHAUST GAS LEAK

(a) Check for exhaust gas leakage.

OK:
No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST SYSTEM**

OK

9	CHECK FUEL PRESSURE

(a) Check the fuel pressure (see page FU-6).
Standard pressure:
304 to 343 kPa (3.1 to 3.5 kgf/cm^2, 44.1 to 49.7 psi)

NG → **REPAIR OR REPLACE FUEL SYSTEM**

OK

10	INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

(a) Check the injection volume (see page FU-11).
Standard injection volume:
45 to 58 cm^3 (2.9 to 3.5 cu in.) per 15 seconds

NG → **REPLACE FUEL INJECTOR**

OK

11	INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE) (See page ES-83)

NG → **REPLACE AIR-FUEL RATIO SENSOR**

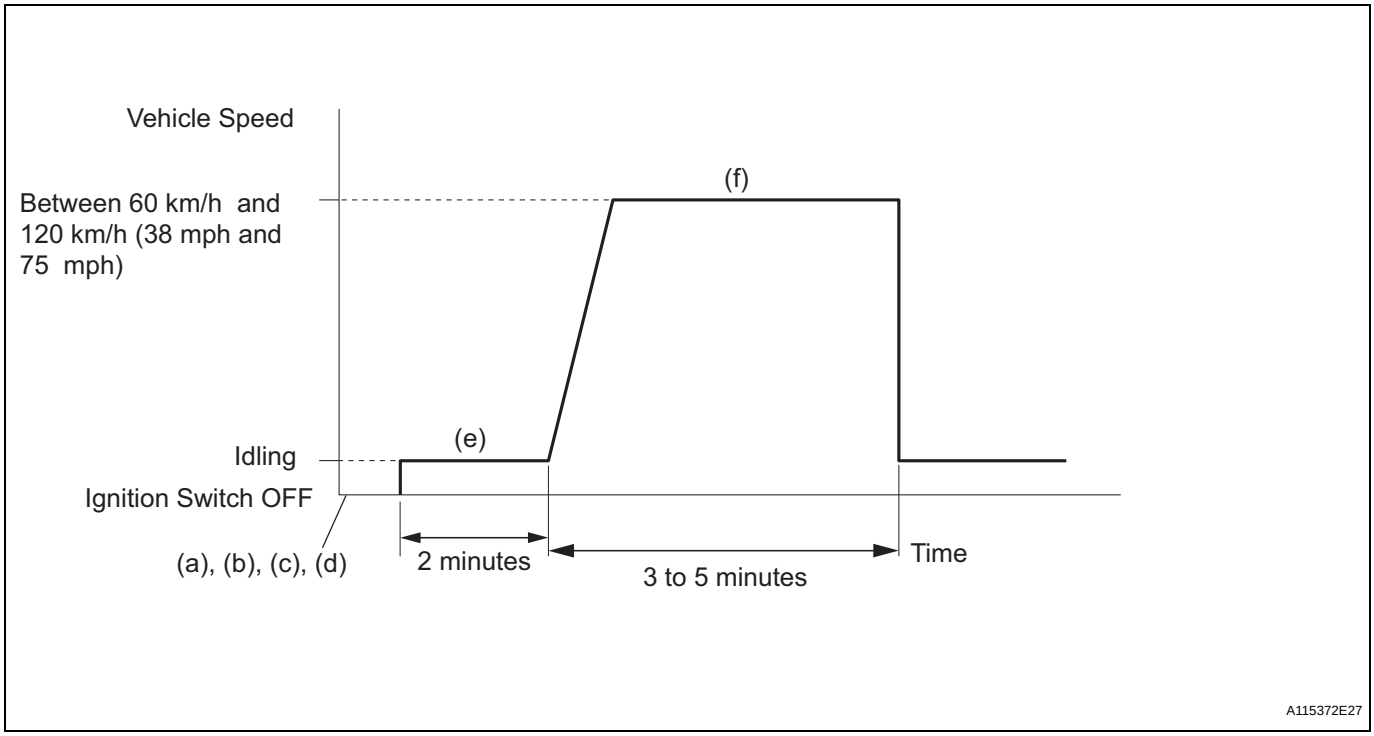
OK

12	INSPECT INTEGRATION RELAY (EFI RELAY) (See page ES-84)

NG → **REPLACE INTEGRATION RELAY**

OK

13	CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM) (See page ES-310)



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

14	REPLACE AIR-FUEL RATIO SENSOR

NEXT

15	PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Switch the ECM from normal mode to check mode using the tester (see page ES-38).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1,400 rpm and 3,200 rpm for 3 to 5 minutes.
HINT:
If the system is still malfunctioning, the MIL will be illuminated during step (f).
NOTICE:
If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16	CHECK WHETHER DTC OUTPUT RECURS (DTC P0171 OR P0172)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.

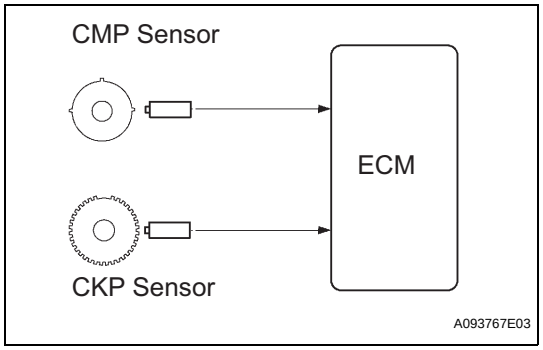
Result

Display (DTC Output)	Proceed To
No output	A
P0171 or P0172	B

B → Go to step 3

A → END

DTC	P0300	Random / Multiple Cylinder Misfire Detected



DTC	P0301	Cylinder 1 Misfire Detected

DTC	P0302	Cylinder 2 Misfire Detected

DTC	P0303	Cylinder 3 Misfire Detected

DTC	P0304	Cylinder 4 Misfire Detected

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire rate exceeds the threshold level, and could cause emission deterioration, the ECM illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0300	Simultaneous misfiring of several cylinders detected (2 trip detection logic)	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304	Misfiring of specific cylinder detected (2 trip detection logic)	

When DTCs for misfiring cylinders are randomly set, but DTC P0300 is not set, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only set when several misfiring cylinders are detected at the same time.

MONITOR DESCRIPTION

The ECM illuminates the MIL and sets a DTC when either of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1,000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs once.
- After the first 1,000 crankshaft revolutions, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs 4 times in sequential crankshaft revolutions.

The ECM flashes the MIL and sets a DTC when either of the following conditions, which could cause Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- In every 200 crankshaft revolutions at a high engine rpm, the threshold misfiring percentage is recorded once.
- In every 200 crankshaft revolutions at a normal engine rpm, the threshold misfiring percentage is recorded 3 times.

ES

MONITOR STRATEGY

Related DTCs	P0300: Multiple cylinder misfire P0301: Cylinder 1 misfire P0302: Cylinder 2 misfire P0303: Cylinder 3 misfire P0304: Cylinder 4 misfire
Required Sensors/Components (Main)	Crankshaft position sensor and Camshaft position sensor
Required Sensors/Components (Related)	Engine coolant temperature and intake air temperature sensors and Mass air flow meter
Frequency of Operation	Continuous
Duration	1,000 to 4,000 crankshaft revolutions: Emission related misfire 200 to 600 crankshaft revolutions: Catalyst damaged misfire
MIL Operation	2 driving cycles: Emission related misfire MIL flashes immediately: Catalyst damaged misfire
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Misfire:

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0327, P0328 (Knock sensor) P0335 (CKP sensor) P0340 (CMP sensor) P0500 (VSS)
Battery voltage	8 V or more
VVT system	Not operated by scan tool
Engine RPM	400 to 6,400 rpm
Either of following conditions (a) or (b) met	-
(a) ECT at engine start	More than -7°C (19°F)
(b) ECT	More than 20°C (68°F)
Fuel cut	OFF

Monitor period of emission-related-misfire:

First 1,000 revolutions after engine start, or Check Mode	Crankshaft 1,000 revolutions
Except above	Crankshaft 1,000 revolutions x 4

Monitor period of catalyst-damaged-misfire (MIL blinks):

All of following conditions 1, 2 and 3 met	Crankshaft 200 revolutions x 3
1. Driving cycles	1st

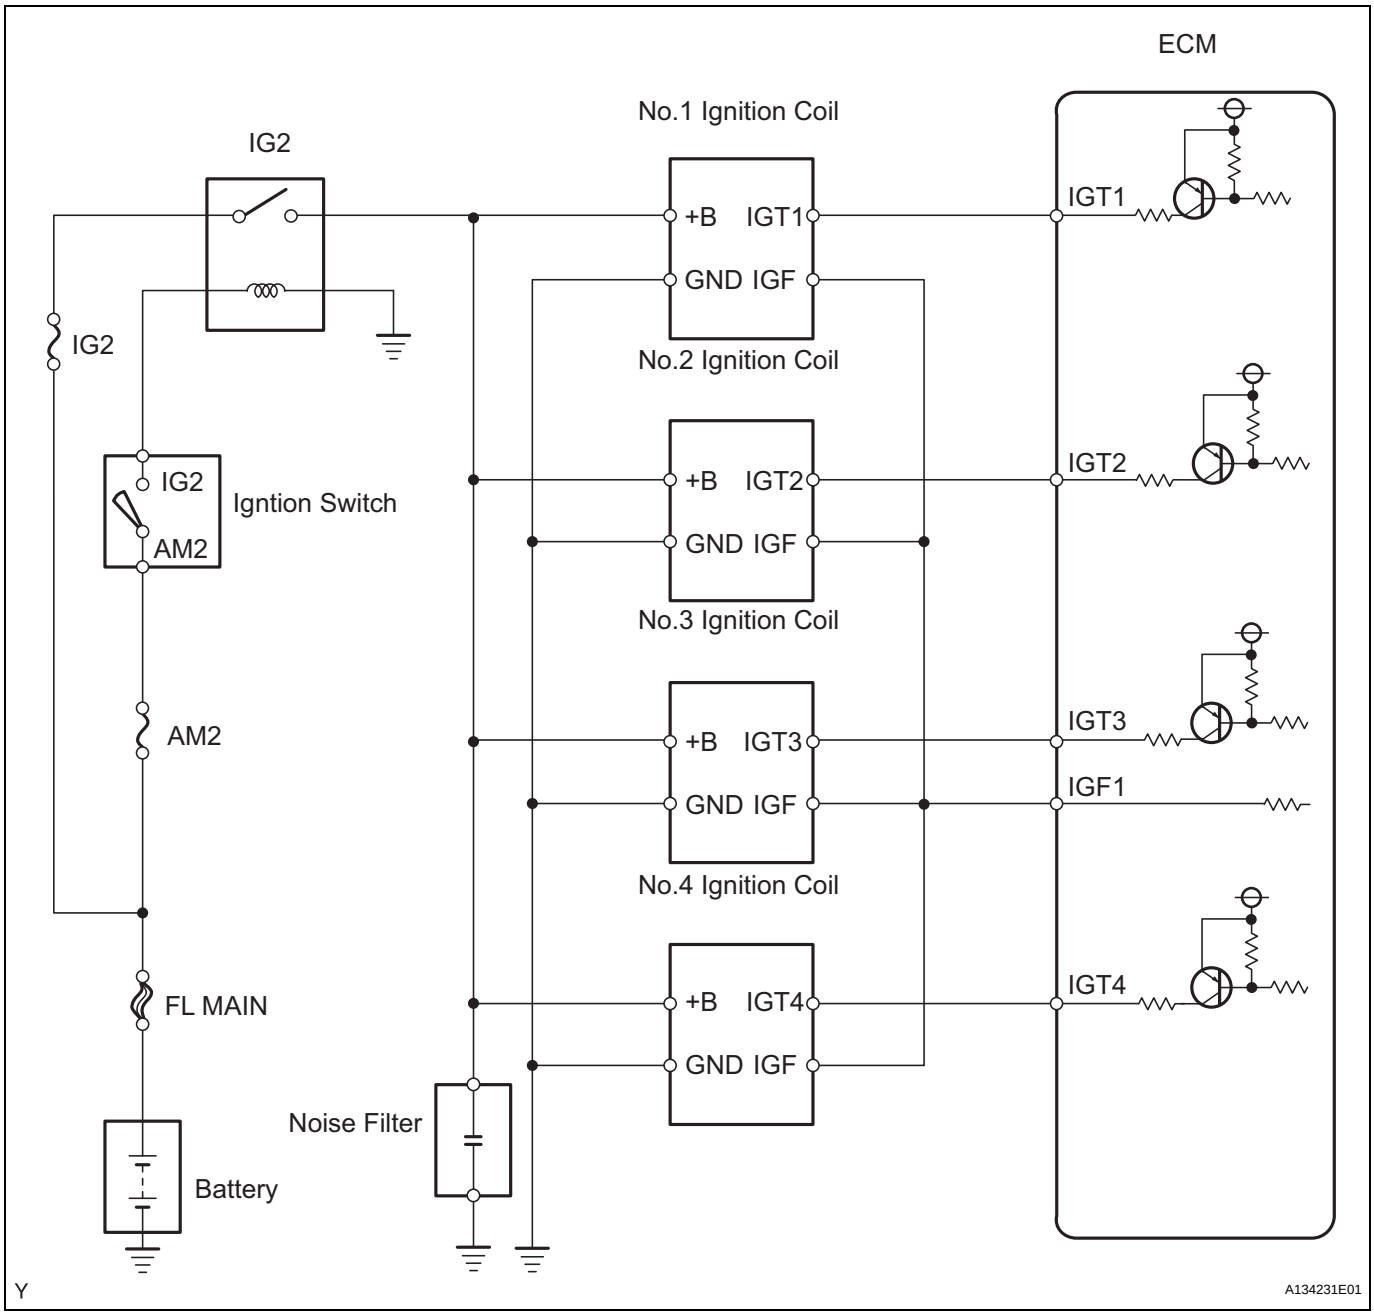
2. Check mode	OFF
3. Engine RPM	Less than 2,300 rpm
Except above	Crankshaft 200 revolutions

TYPICAL MALFUNCTION THRESHOLDS

Monitor period of emission-related-misfire:

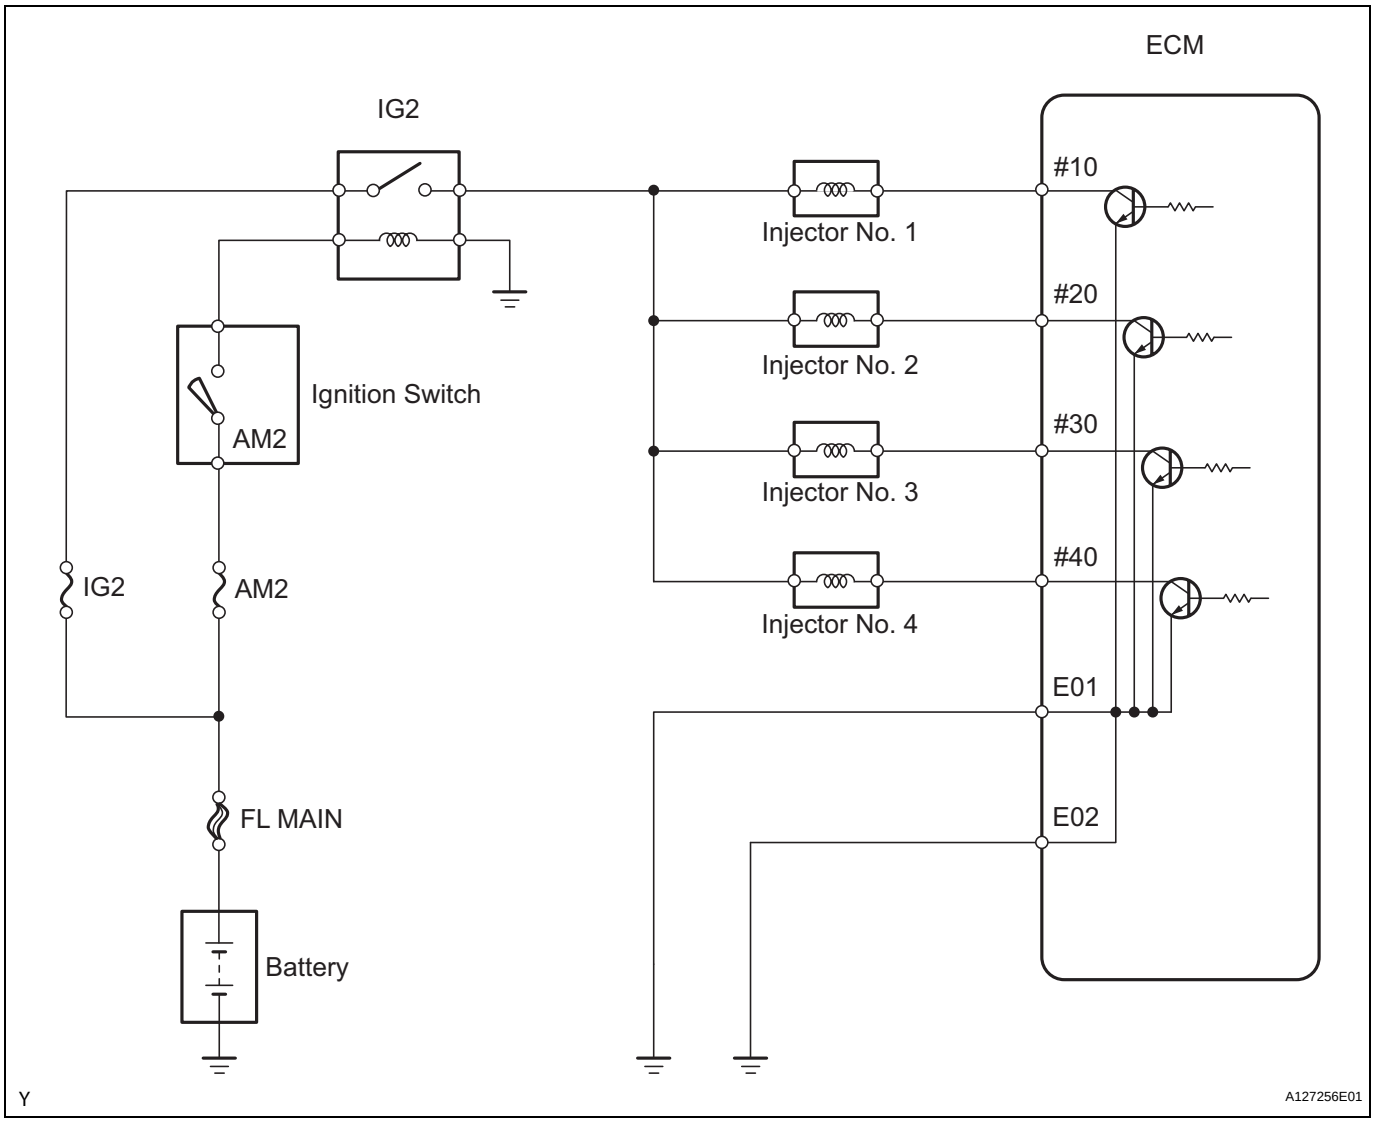
Misfire rate	1.3 % or more

Monitor period of catalyst-damaged-misfire (MIL blinks):



Number of misfire per 200 revolutions	118 or more (varies with intake air amount and RPM)

MONITOR RESULT



Refer to CHECKING MONITOR STATUS (see page ES-17).

WIRING DIAGRAM

Wiring diagram of the ignition system.

Wiring diagram of the injector circuit.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON.
3. Turn the tester ON.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (see page ES-38).
6. Read the misfire counts of each cylinder (CYL #1 to #4) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine rpm and engine load, shown in MISFIRE RPM and MISFIRE LOAD in the DATA LIST.
   HINT:
   In order to store misfire DTCs, it is necessary to drive the vehicle for the period of time shown in the table below, with the MISFIRE RPM and MISFIRE LOAD in the DATA LIST.

Engine RPM	Duration
Idling	3.5 minutes or more
1,000	3 minutes or more
2,000	1.5 minutes or more
3,000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.
   HINT:
   Do not turn the ignition switch OFF until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be erased.
9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the ignition switch OFF and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.
- If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:
  (a) The fuel level is low.
  (b) Improper fuel is used.
  (c) The spark plugs are dirty.
  (d) The problem is complex due to multiple factors.
- After finishing repairs, check that no misfires occur in each cylinder (CYL #1, #2, #3 and #4).
- Be sure to confirm that no misfiring cylinder DTCs are set again by conducting the confirmation driving pattern, after the repairs.
- For 6 and 8 cylinder engines, the ECM intentionally does not set the specific misfiring cylinder DTCs at high engine RPM. If misfires only occur during high engine RPM driving, only DTC P0300 is set.
  In the event of DTC P0300 being present, perform the following operations:
  (a) Clear the DTC (see page ES-35).
  (b) Start the engine and conduct the confirmation driving pattern.
  (c) Read the misfiring rates of each cylinder or DTC(s) using the tester.
  (d) Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.
  (e) After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not set.
- When either SHORT FT #1 or LONG FT #1 in the freeze frame data is outside the range of +-20 %, the air-fuel ratio may be rich (-20 % or less) or lean (+20 % or more).
- When the COOLANT TEMP in the freeze frame data is less than 75°C (167°F), the misfires occurred only while warming up the engine.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0300, P0301, P0302, P0303 and/or P0304	A
P0300, P0301, P0302, P0303 and/or P0304 and other DTCs	B

HINT:
If any DTCs other than P0300, P0301, P0302, P0303 and P0304 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

(a) Connect the intelligent tester the DLC3.
(b) Turn the ignition switch to ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / MISFIRE RPM and MISFIRE LOAD.
(d) Read and note the MISFIRE RPM and MISFIRE LOAD (engine load) values.
HINT:
The MISFIRE RPM and MISFIRE LOAD indicate the vehicle conditions under which the misfire occurred.

NEXT

3	CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4	CHECK MISFIRE COUNT (CYL #1, #2, #3 AND #4)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1, #2, #3 and #4.
(f) Allow the engine to idle.
(g) Read each value for CYL #1 to #4 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:
  (1) Shift the gear selector lever to the D position.
  (2) Check the CYL #1 to #4.
  (3) If misfire counts are still not displayed, perform steps (h) and (i) and then check the misfire counts again.
(h) Drive the vehicle with the MISFIRE RPM and MISFIRE LOAD noted in the "READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)" procedures above.

(i) Read the CYL #1 to #4 or DTCs displayed on the tester.

Result

Misfire Count	Proceed To
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- If it is difficult to reproduce misfires for each cylinder, check the DATA LIST item called MISFIRE MARGIN. Try to find vehicle driving conditions that lower the MISFIRE MARGIN value. Values above 30 % are considered normal.
- If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.
- If the freeze frame data's record of the ENGINE RUN TIME is below 120 seconds, the misfire may be detected immediately after the engine is started.

ES

B → **Go to step 14**

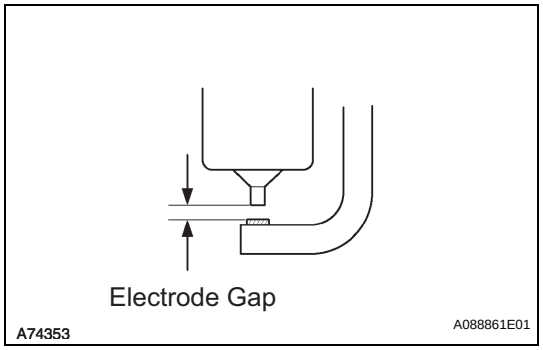
A

5	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT #1 TO #4)

(a) Allow the engine to idle.
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL CUT#1 (to #4).
(c) If a cylinder has a high misfire count, cut fuel to that cylinder. Compare the misfire count of the cylinder before fuel cut and after fuel cut.

Result

Misfire Count in Each Cylinder	Proceed To
Misfire count of cylinder before fuel cut and after fuel cut roughly same	A
Misfire count of cylinder before fuel cut lower than after fuel cut	B



NOTICE:
This ACTIVE TEST cannot be performed while the vehicle is being driven.

HINT:
If the misfire count of the cylinder before and after the fuel cut are roughly the same, the cylinder is misfiring.
If the misfire count of the cylinder before the fuel cut is lower than after the fuel cut, the cylinder misfires sometimes.

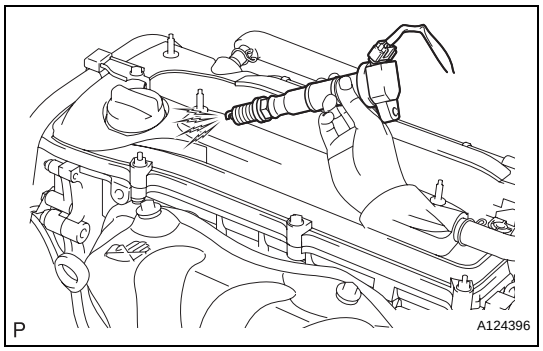
B → **Go to step 11**

A

6 CHECK SPARK PLUG

(a) Remove the ignition coil and the spark plug of the misfiring cylinder.
(b) Measure the spark plug electrode gap.
Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)
(c) Check the electrode for carbon deposits.
Recommended spark plug:

Manufacturers	Products
DENSO	SK20R11
NGK	IFR6A11



ES

NOTICE:
If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → **REPLACE SPARK PLUG**

OK

7 CHECK FOR SPARKS AND IGNITION

(a) Remove the ignition coil from the cylinder head.
(b) Install the spark plug onto the ignition coil.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON and turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL CUT ALL.
(f) Attach the spark plug assembly to the cylinder head.
(g) Perform the FUEL CUT ALL operation (press the RIGHT or LEFT button to change the ON).
NOTICE:
When FUEL CUT ALL is OFF and the engine is cranked, fuel injection will occur.
(h) Crank the engine for less than 2 seconds and check the spark.
OK:
Sparks jump across electrode gap.
(i) Install the ignition coil.

NG → **Go to step 9**

OK

8 CHECK CYLINDER COMPRESSION PRESSURE OF MISFIRING CYLINDER

(a) Measure the cylinder compression pressure of the misfiring cylinder.

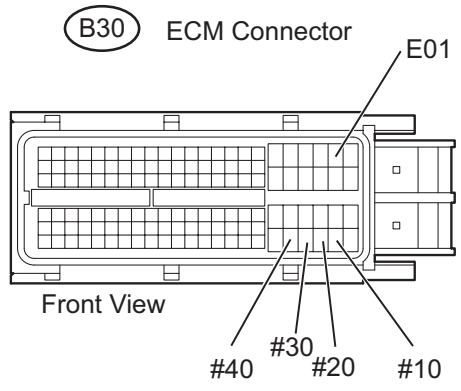
OK → **Go to step 10**

NG

CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

9	CHANGE NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

(a) Change the installed spark plug to a spark plug that functions normally.
(b) Perform a spark test.
CAUTION:
Always disconnect all injector connectors.
NOTICE:
Do not crank the engine for more than 2 seconds.
(1) Install the spark plug to the ignition coil and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if sparks occur while the engine is being cranked.
OK:
Sparks jump across electrode gap.



NG → **REPLACE IGNITION COIL ASSEMBLY THEN CONFIRM THAT THERE IS NO MISFIRE**

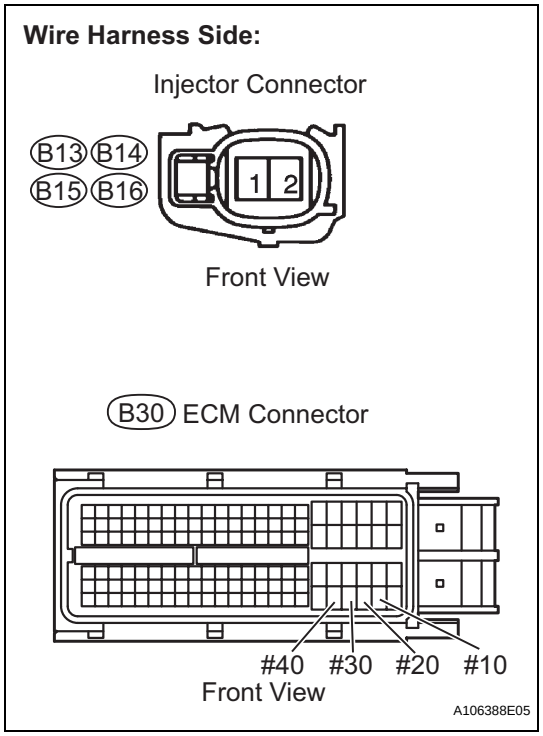
OK

REPLACE SPARK PLUG

10	INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, AND /OR #40 VOLTAGE)

Wire Harness Side:

A107892E42



(a) Disconnect the B30 ECM connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the ECM connector.
Standard voltage

Tester Connections	Specified Conditions
B30-108 (#10) - B30-45 (E01)	9 to 14 V
B30-107 (#20) - B30-45 (E01)	9 to 14 V
B30-106 (#30) - B30-45 (E01)	9 to 14 V
B30-105 (#40) - B30-45 (E01)	9 to 14 V

OK → **Go to step 12**

NG

11	CHECK HARNESS AND CONNECTOR (INJECTOR - ECM)

(a) Disconnect the injector connector (of the misfiring cylinder).
(b) Disconnect the B30 ECM connector.
(c) Turn the ignition switch ON.
(d) Measure the resistance and voltage between the injector and the ECM connector terminals.

Standard voltage

Cylinder	Tester Connections	Specified Conditions
No. 1	B16-1 - Ground	9 to 14 V
No. 2	B15-1 - Ground	9 to 14 V
No. 3	B14-1 - Ground	9 to 14 V
No. 4	B13-1 - Ground	9 to 14 V

Standard resistance

Cylinder	Tester Connections	Specified Conditions
No. 1	B16-2 - Ground	10 kΩ or higher
	B16-2 - B30-108 (#10)	Below 1 Ω
No. 2	B15-2 - Ground	10 kΩ or higher
	B15-2 - B30-107 (#20)	Below 1 Ω
No. 3	B14-2 - Ground	10 kΩ or higher
	B14-2 - B30-106 (#30)	Below 1 Ω
No. 4	B13-2 - Ground	10 kΩ or higher
	B13-2 - B30-105 (#40)	Below 1 Ω

(e) Reconnect the injector connector.
(f) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK ↓

12	CHECK FUEL INJECTOR OF MISFIRING CYLINDER

(a) Check the injector injection (whether fuel volume is high or low, and whether injection pattern is poor).

NG → **REPLACE FUEL INJECTOR ASSEMBLY**

OK ↓

13	CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

NG → **ADJUST VALVE CLEARANCE**

OK ↓

14	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK ↓

ES

15	CHECK VALVE TIMING (See page ES-77)

NG → **ADJUST VALVE TIMING**

OK ↓

16	CHECK FUEL PRESSURE

(a) Check the fuel pressure (see page FU-6).

NG → **CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER**

OK ↓

17	READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP) (See page ES-159)

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK ↓

18	READ VALUE USING INTELLIGENT TESTER (MAF) (See page ES-158)

NG → **REPLACE MASS AIR FLOW METER**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)

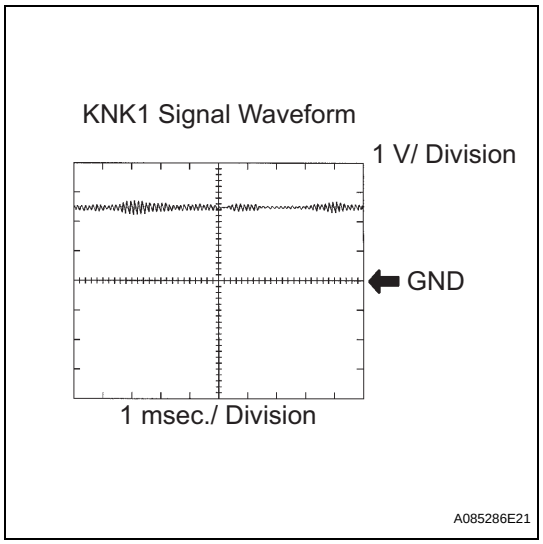
DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)

DESCRIPTION

Flat type knock sensors (non-resonant type) have structures that can detect vibrations over a wide band of frequencies: between approximately 6 kHz and 15 kHz.

A knock sensor is fitted onto the engine block to detect engine knocking.

The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed. The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0327	Output voltage of knock sensor less than 0.5 V (1 trip detection logic)	• Short in knock sensor circuit • Knock sensor • ECM
P0328	Output voltage of knock sensor more than 4.5 V (1 trip detection logic)	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

When any of DTCs P0327 and P0328 are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned OFF.

Reference: Inspection using an oscilloscope

The correct waveform is as shown.

Items	Contents
Terminals	KNK1 - EKNK
Equipment Settings	1 V/Division 1 msec./Division
Conditions	Keep engine speed at 4,000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
The monitor for DTCs P0327 and P0328 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, either DTC P0327 or P0328 is set 5 seconds after the engine is next started.

MONITOR STRATEGY

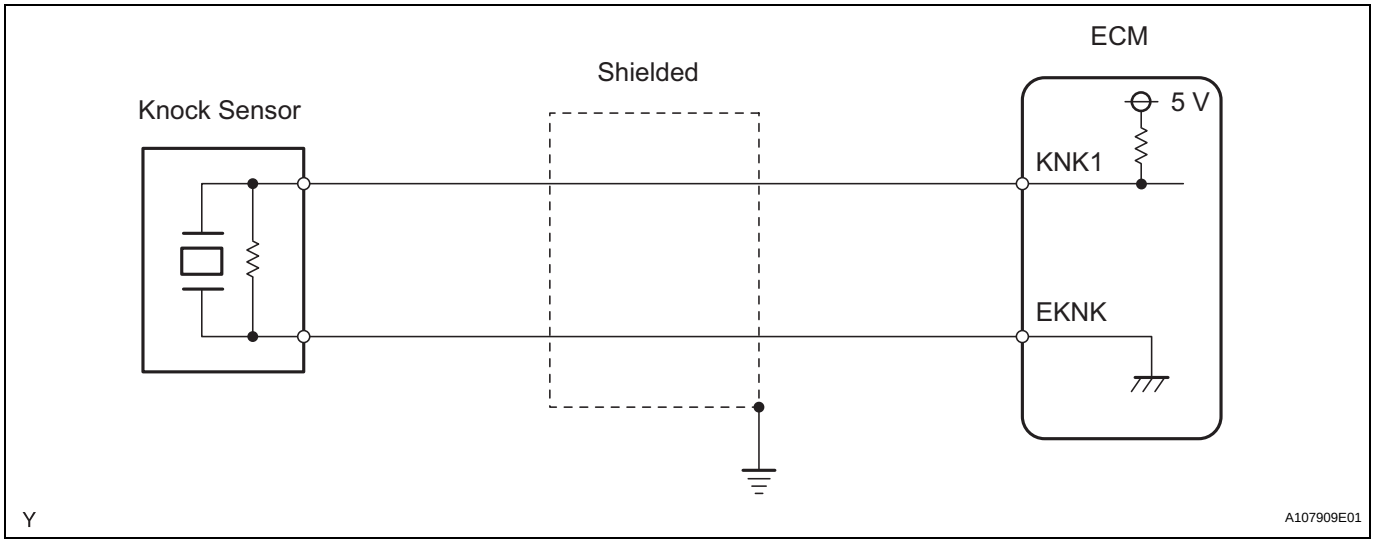
Related DTCs	P0327: Knock sensor range check (Low voltage) P0328: Knock sensor range check (High voltage)
Required Sensors/Components (Main)	Knock sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

ES

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Time after engine start	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS



Knock Sensor Range Check (Low voltage) P0327:

Knock sensor voltage	Less than 0.5 V

Knock Sensor Range Check (High voltage) P0328:

Knock sensor voltage	More than 4.5 V

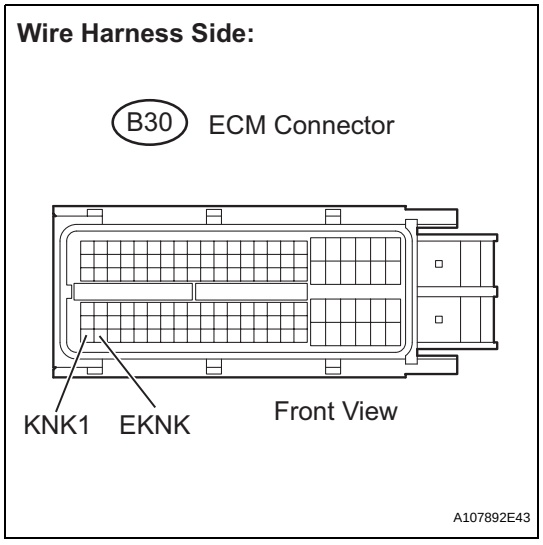
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (KNOCK FB VAL)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / KNOCK FB VAL.
(e) Read the values displayed on the tester while driving the vehicle.
Standard:
The values change.
HINT



Malfunction does not occur	Knock Feedback Values change
Malfunctions occur	Knock Feedback Values do not change

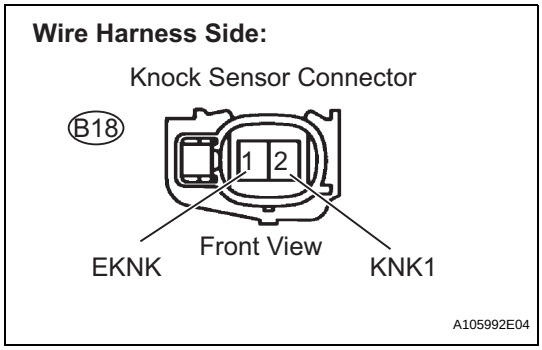
HINT:
The knock feedback value change can be confirmed by running the engine at high load, for example, by activating the air conditioning system and revving up the engine.

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

2	CHECK HARNESS AND CONNECTOR (ECM - KNOCK SENSOR)

(a) Disconnect the B30 ECM connector.
(b) Measure the resistance between the terminals.
Standard



Tester Connections	Specified Conditions
B30-110 (KNK1) - B30-111 (EKNK)	120 to 280 kΩ at 20°C (68°F)

(c) Reconnect the ECM connector.

NG → **Go to step 4**

OK

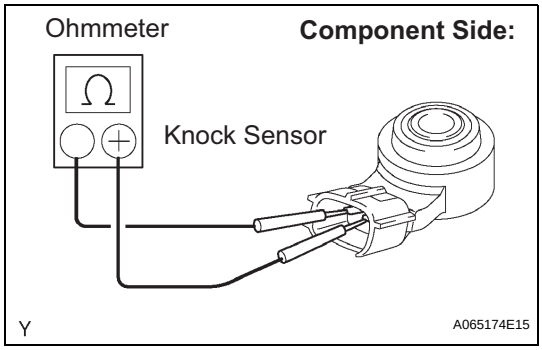
3	INSPECT ECM (KNK1 VOLTAGE)

(a) Disconnect the B18 knock sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the knock sensor terminals.

Standard voltage

Tester Connections	Specified Conditions
B18-2 (KNK1) - B18-1 (EKNK)	4.5 to 5.5 V

(d) Reconnect the knock sensor connector.



NOTICE:
Fault may be intermittent. Check the wire harness and connectors carefully and retest.

NG → **REPLACE ECM**

OK

CHECK FOR INTERMITTENT PROBLEMS

4	INSPECT KNOCK SENSOR

(a) Remove the knock sensor.
(b) Measure the resistance between the terminals.

Standard resistance

Tester Connections	Specified Conditions
2 (KNK1) - 1 (EKNK)	120 to 280 kΩat 20°C (68°F)

(c) Reinstall the knock sensor.

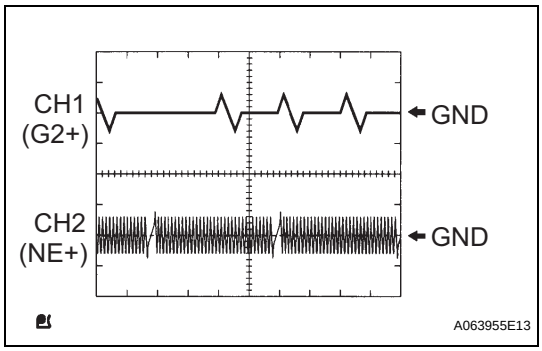
NG → **REPLACE KNOCK SENSOR**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC	P0335	Crankshaft Position Sensor "A" Circuit

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent



DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil.
The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes through the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P0335	When either condition below is met: • No CKP sensor signal to ECM while cranking (1 trip detection logic) • No CKP sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal to ECM for 0.05 seconds or more (1 trip detection logic): (a) Engine speed 1,000 rpm or more (b) Starter signal OFF (c) 3 seconds or more have elapsed since starter signal switched from ON to OFF	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

HINT:
- The correct waveform is as shown.
- G2+ stands for the Camshaft Position (CMP) sensor signal, and NE+ stands for the CKP sensor signal.
- Grounding failure of the shielded wire may cause noise in waveforms.

Items	Contents
Terminals	CH1: G2+ - G2- CH2: NE+ - NE-
Equipment Settings	5 V/Division, 20 msec./Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0335: CKP sensor range check or rationality
Required Sensors/Components (Main)	CKP sensor
Required Sensors/Components (Related)	CMP sensor
Frequency of Operation	Continuous
Duration	3 times
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

Case 1:

Time after starter OFF to ON	0.3 seconds or more
Number of CMP sensor signal pulse	6 times
Battery voltage	7 V or more
CMP sensor circuit failure	Not detected
Ignition switch	ON

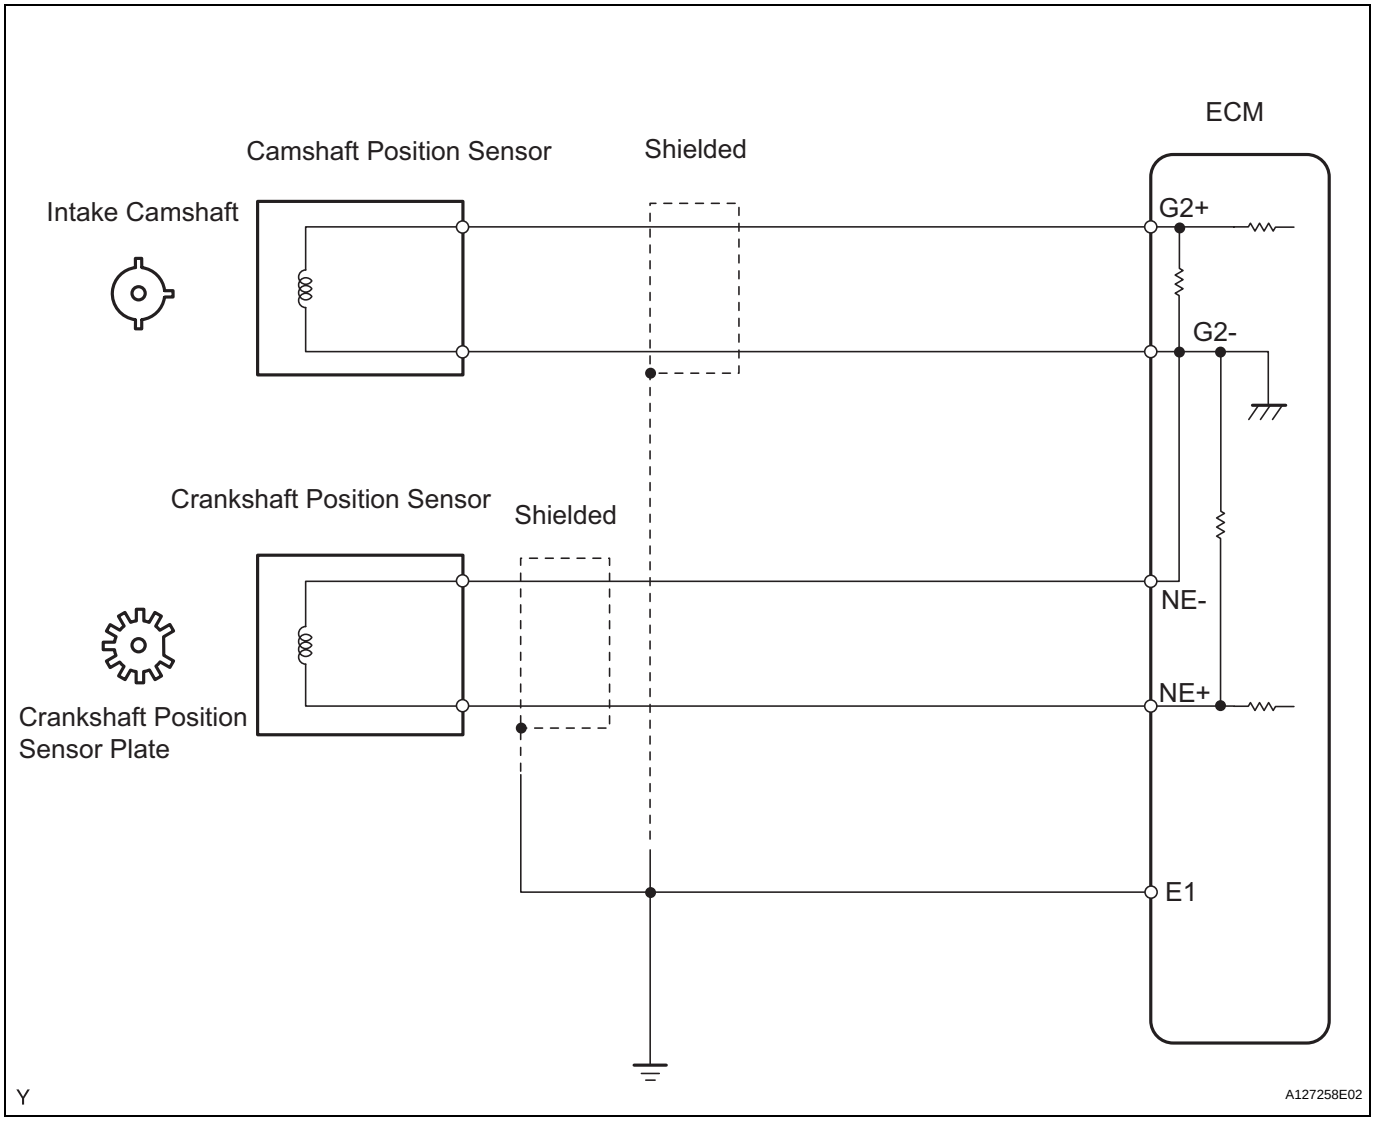
Case 2:

Starter	OFF
Engine speed	600 rpm or more
Time after starter from ON to OFF	3 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Case 1:

Number of CKP sensor signal pulse	132 or less, and 174 or more



Case 2:

Engine speed signal	No signal

COMPONENT OPERATING RANGE

CKP sensor	• CKP sensor output voltage fluctuates while crankshaft revolving • 34 CKP sensor signals per crankshaft revolution

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

HINT:

- If no problem is found through this diagnostic troubleshoot procedure, troubleshoot the engine mechanical systems.
- Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:
  (a) Connect the intelligent tester to the DLC3.
  (b) Start the engine.
  (c) Turn the tester ON
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
  The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed if the CKP sensor output voltage is insufficient.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

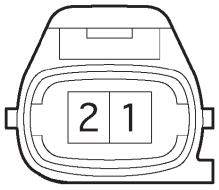
1	READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
(e) Start the engine.
(f) Read the values displayed on the tester while the engine is running.

Standard:

Correct values are displayed.

HINT:



- To check the engine speed change, display the graph on the tester.
- If the engine does not start, check the engine speed while cranking.
- If the engine speed indicated on the tester remains zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

2	INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)

Component Side:

CKP Sensor

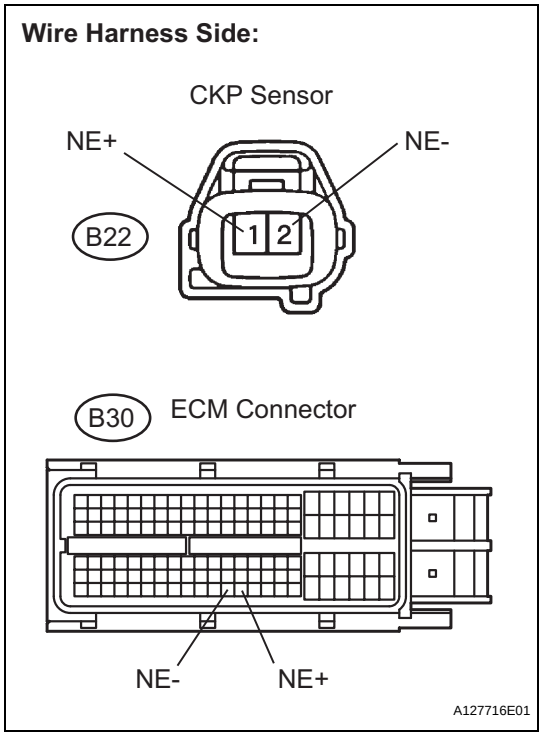
G037727E07

(a) Disconnect the B22 CKP sensor connector.
(b) Measure the resistance between terminals 1 and 2.

Standard resistance

Tester Connections	Conditions	Specified Conditions
1 - 2	Cold	985 to 1,600 Ω
1 - 2	Hot	1,265 to 1,890 Ω

HINT:



Terms cold and hot refer to the temperature of the sensor. Cold means approximately -10 to 50°C (14 to 122°F). Hot means approximately 50 to 100°C (122 to 212°F).

(c) Reconnect the CKP sensor connector.

NG → **REPLACE CRANKSHAFT POSITION SENSOR**

OK

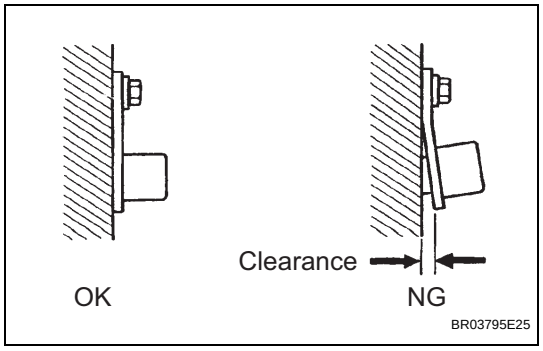
3 CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

(a) Disconnect the B22 CKP sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B22-1 (NE+) - B30-122 (NE+)	Below 1 Ω
B22-2 (NE-) - B30-121 (NE-)	Below 1 Ω

Standard resistance (Check for short)



Tester Connections	Specified Conditions
B22-1 (NE+) or B30-122 (NE+) - Body ground	10 kΩor higher
B22-2 (NE-) or B30-121 (NE-) - Body ground	10 kΩor higher

(d) Reconnect the ECM connector.
(e) Reconnect the CKP sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4 CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

(a) Check the CKP sensor installation.

OK:

Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

5 CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

(a) Check the teeth of the sensor plate.

OK:

Sensor plate does not have any cracks or deformation.

NG → **REPLACE CRANKSHAFT POSITION SENSOR PLATE**

OK

6	REPLACE CRANKSHAFT POSITION SENSOR

NEXT

7	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

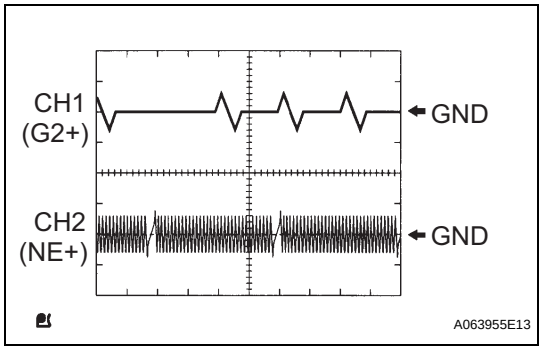
Display (DTC Output)	Proceed To
No output	A
P0335 or P0339	B

HINT:
If the engine does not start, replace the ECM.

B → REPLACE ECM

A

END



DTC	P0340	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)

DESCRIPTION

The Camshaft Position (CMP) sensor consists of a magnet and an iron core which is wrapped with copper wire, and is installed onto the cylinder head. When the camshaft rotates, each of 3 teeth on the camshaft passes through the CMP sensor. This activates the internal magnet in the sensor, generating a voltage in the copper wire. The camshaft rotation is synchronized with the crankshaft rotation. When the crankshaft turns twice, the voltage is generated 3 times in the CMP sensor. The generated voltage in the sensor acts as a signal, allowing the ECM to locate the camshaft position. This signal is then used to control ignition timing, fuel injection timing, and the VVT system.

DTC No.	DTC Detection Conditions	Trouble Areas
P0340	Case 1 • No Camshaft Position (CMP) sensor signal to ECM while cranking (2 trip detection logic) Case 2 • Camshaft/Crankshaft misalignment detected at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CMP sensor circuit • CMP sensor • Camshaft • Jumped tooth of timing chain • ECM

HINT:
DTC P0340 indicates a malfunction relating to the CMP sensor (+) circuit (the wire harness between the ECM and CMP sensor, and the CMP sensor itself).
Reference: Inspection using an oscilloscope

HINT:
- The correct waveform is as shown in the illustration.
- G2+ stands for the CMP sensor signal, and NE+ stands for the Crankshaft Position (CKP) sensor signal.
- Grounding failure of the shielded wire may cause noise in waveforms.

Items	Contents
Terminals	CH1: G2+ - G2- CH2: NE+ - NE-
Equipment Settings	5 V/Division, 20 ms/Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If no signal is transmitted by the CMP sensor despite the engine revolving, or the rotation of the camshaft and the crankshaft is not synchronized, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0340: Camshaft position sensor range check P0340: Camshaft position/crankshaft position misalignment

Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

Camshaft Position Sensor Range Check:

Starter	ON
Minimal battery voltage while starter ON	Less than 11 V

Camshaft Position/Crankshaft Position Misalignment:

Engine speed	600 rpm or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

Camshaft Position Sensor Range Check:

CMP sensor signal	No signal

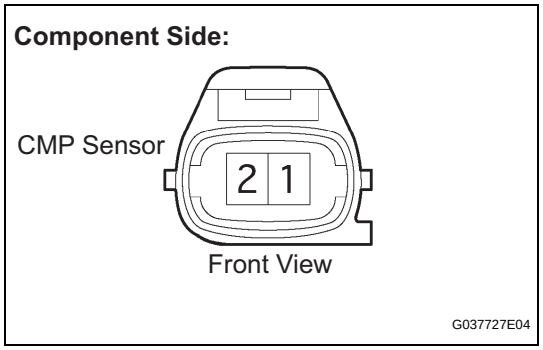
Camshaft Position/Crankshaft Position Misalignment:

Camshaft position and crankshaft position phase	Misaligned

COMPONENT OPERATING RANGE

CMP sensor	• CMP sensor output voltage fluctuates while camshaft revolving • 3 CMP sensor signals per 2 crankshaft revolutions

WIRING DIAGRAM



Refer to DTC P0335 (see page ES-174).

INSPECTION PROCEDURE

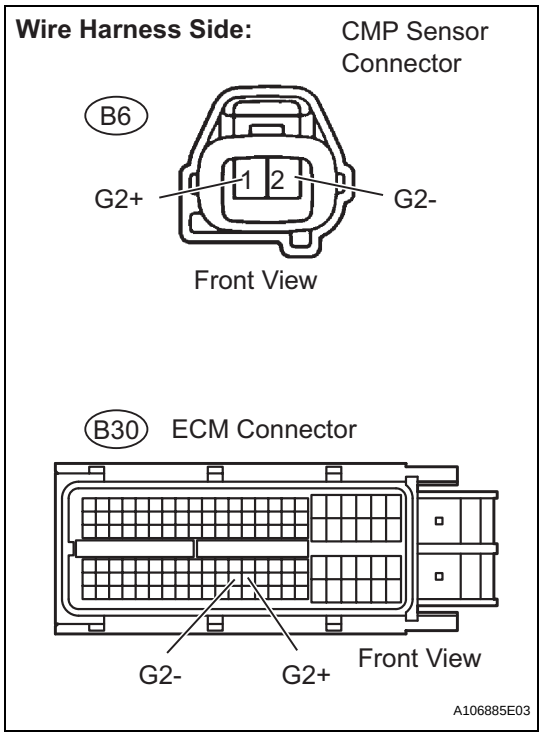
HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT CAMSHAFT POSITION SENSOR (RESISTANCE)

(a) Disconnect the B6 Camshaft Position (CMP) sensor connector.
(b) Measure the resistance between terminals 1 and 2.
Standard resistance

Tester Connections	Conditions	Specified Conditions
1 - 2	Cold	1,630 to 2,740 Ω
1 - 2	Hot	2,065 to 3,225 Ω



HINT:
Terms cold and hot refer to the temperature of the sensor. Cold means approximately -10° to 50°C (14 °to 122°F). Hot means approximately 50° to 100°C (122°to 212°F).

(c) Reconnect the CMP sensor connector.

NG → **REPLACE CAMSHAFT POSITION SENSOR**

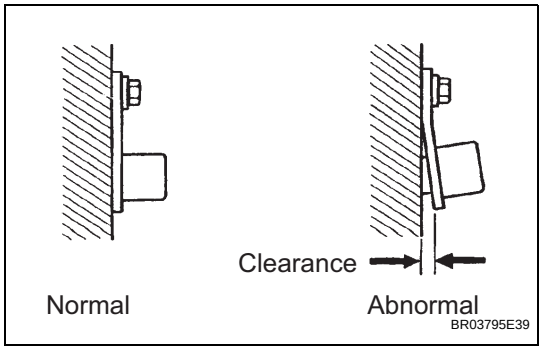
OK

2 CHECK HARNESS AND CONNECTOR (CAMSHAFT POSITION SENSOR - ECM)

(a) Disconnect the B6 CMP sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance (Check for open)

Tester Connections	Specified Conditions
B6-1 (G2+) - B30-99 (G2+)	Below 1 Ω
B6-2 (G2-) - B30-98 (G2-)	Below 1 Ω

Standard resistance (Check for short)



Tester Connections	Specified Conditions
B6-1 (G2+) or B30-99 (G2+) - Body ground	10 kΩor higher
B6-2 (G2-) or B30-98 (G2-) - Body ground	10 kΩor higher

(d) Reconnect the ECM connector.
(e) Reconnect the CMP sensor connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	CHECK SENSOR INSTALLATION (CAMSHAFT POSITION SENSOR)

(a) Check the CMP sensor installation.
OK:
Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4	CHECK VALVE TIMING (See page ES-77)

NG → **ADJUST VALVE TIMING**

OK

5	CHECK CAMSHAFT

(a) Check the teeth of the camshaft.
OK:
Camshaft teeth do not have any cracks or deformation.

NG → **REPLACE CAMSHAFT**

OK

6	REPLACE CAMSHAFT POSITION SENSOR

NEXT

7	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To
No output	A

Display (DTC Output)	Proceed To
P0340	B

HINT:
If the engine does not start, replace the ECM.

B → **REPLACE ECM**

A

END

DTC	P0351	Ignition Coil "A" Primary / Secondary Circuit

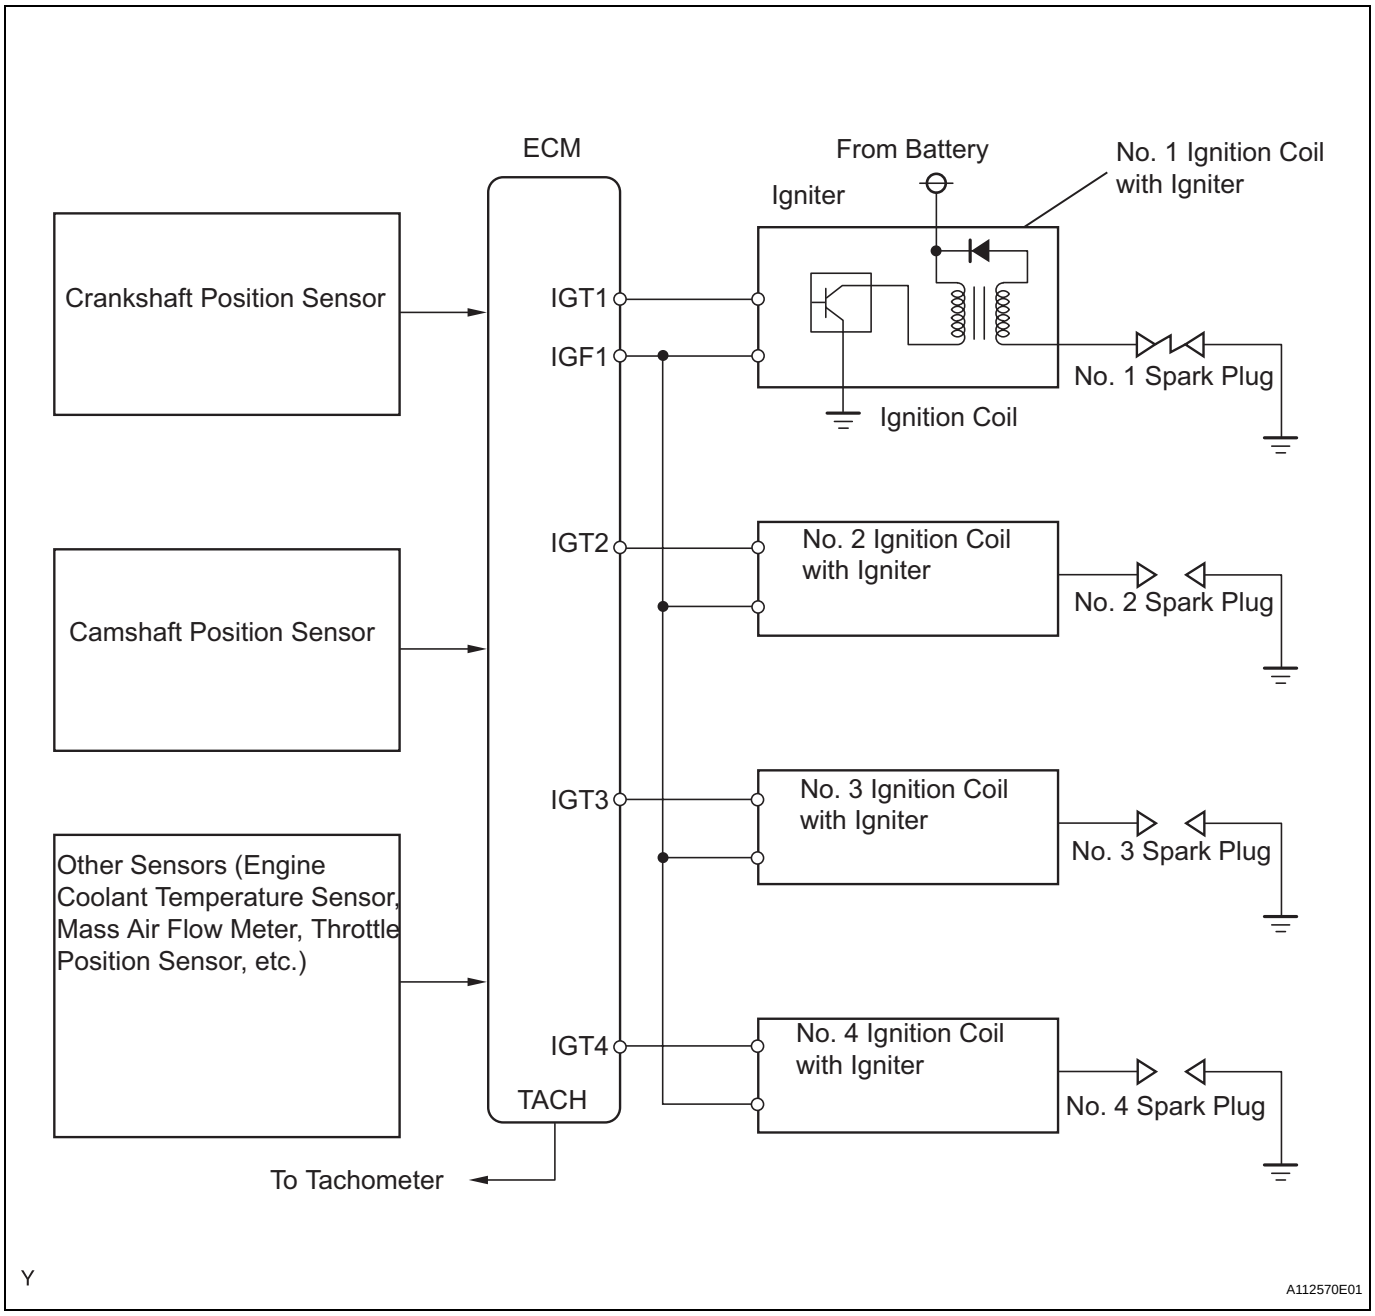
DTC	P0352	Ignition Coil "B" Primary / Secondary Circuit

DTC	P0353	Ignition Coil "C" Primary / Secondary Circuit

DTC	P0354	Ignition Coil "D" Primary / Secondary Circuit

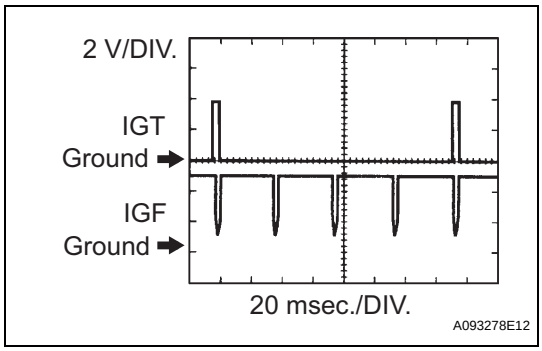
DESCRIPTION

HINT:



ES

- These DTCs indicate malfunctions relating to the primary circuit.
- If DTC P0351 is set, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is set, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is set, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is set, check No. 4 ignition coil with igniter circuit.

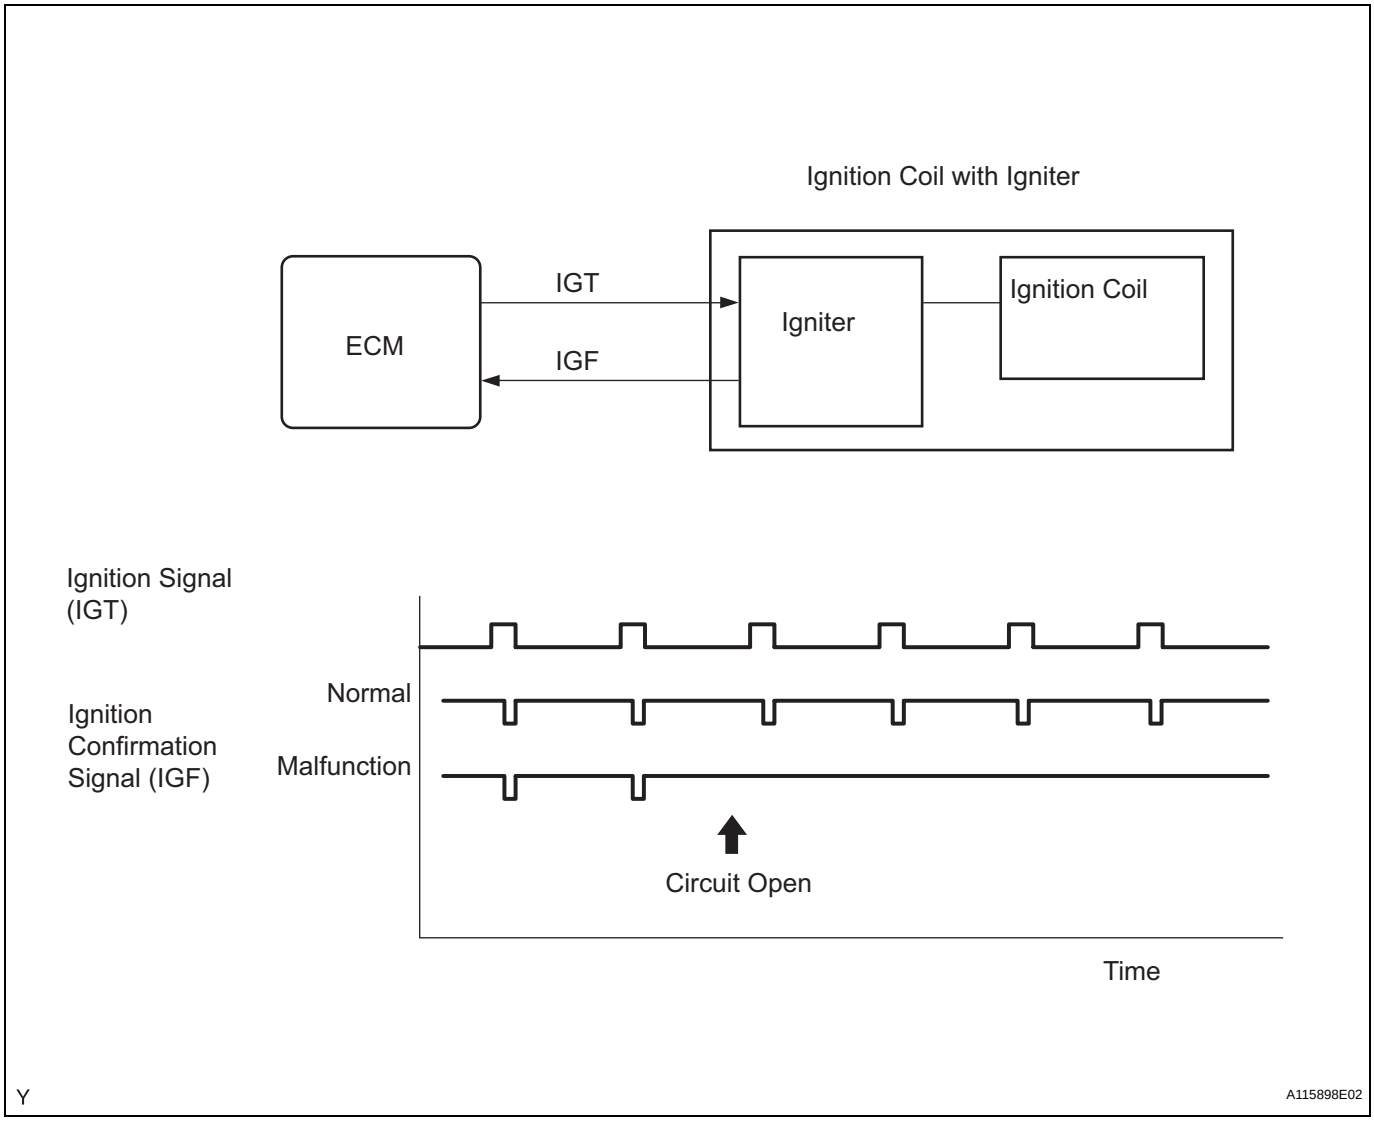


A Direct Ignition System (DIS) is used on this vehicle.

The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.

The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM, for each cylinder ignition.

DTC No.	DTC Detection Conditions	Trouble Areas
P0351 P0352 P0353 P0354	No IGF signal to ECM while engine running (1 trip detection logic)	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 4) between ignition coil with igniter and ECM • No. 1 to No. 4 ignition coils with igniters • ECM



Reference: Inspection using an oscilloscope.

While cranking or idling the engine, check the waveform between terminals IGT (1 to 4) and E1, and IGF1 and E1 of the ECM connector.

ES

Items	Contents
Terminals	CH1: IGT1, IGT2, IGT3, IGT4 - E1 CH2: IGF1 - E1
Equipment Settings	2 V/Division 20 msec./Division
Conditions	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 1 second after the engine is next started.

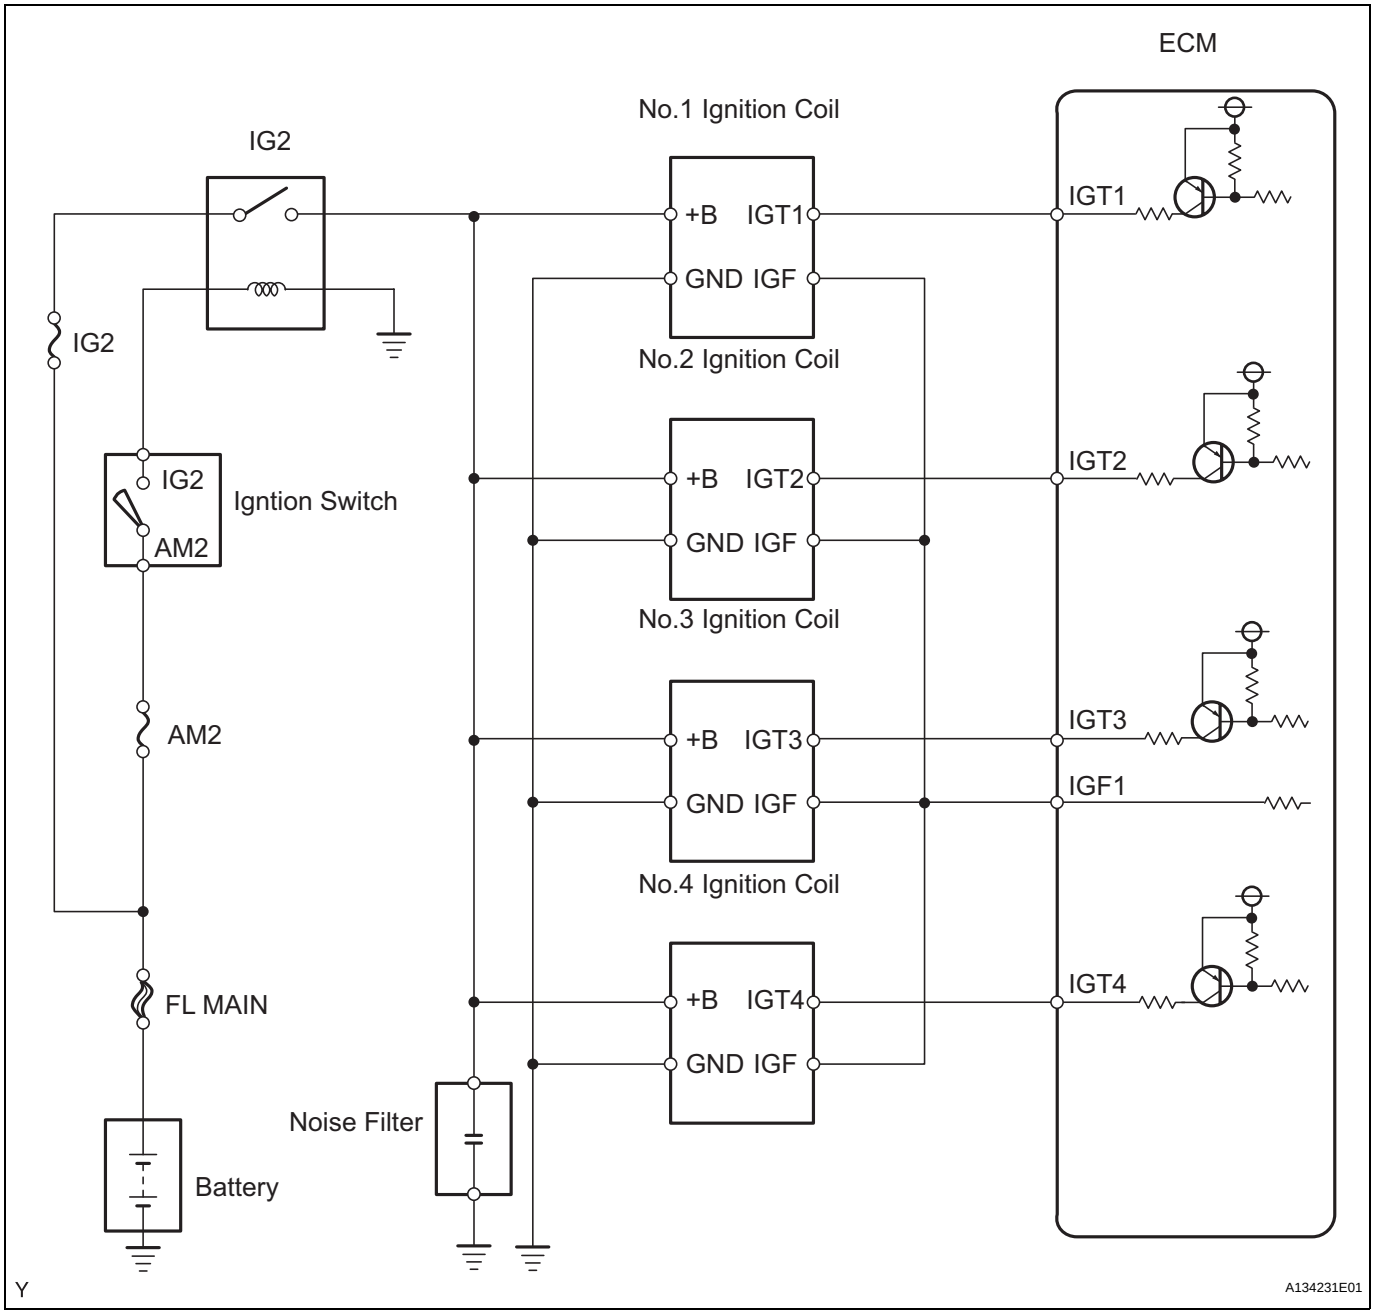
MONITOR STRATEGY

Related DTCs	P0351: Igniter (cylinder 1) malfunction P0352: Igniter (cylinder 2) malfunction P0353: Igniter (cylinder 3) malfunction P0354: Igniter (cylinder 4) malfunction
Required Sensors/Components (Main)	Igniter
Required Sensors/Components (Related)	Crankshaft position sensor
Frequency of Operation	Continuous
Duration	0.512 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions A or B met	-

A. Engine RPM	1,500 rpm or less
B. Starter	OFF
Either of following conditions C or D met	-
C. Both of following conditions (a) and (b) met	-
(a) Engine speed	500 rpm or less
(b) Battery voltage	6 V or more
D. All of following conditions (a), (b) and (c) met	-
(a) Engine speed	More than 500 rpm
(b) Battery voltage	10 V or more
(c) Number of sparks after CPU reset	5 sparks or more



TYPICAL MALFUNCTION THRESHOLDS

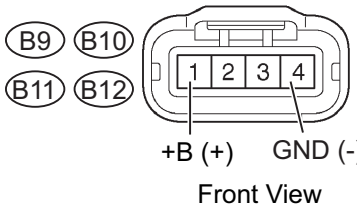
IGF signal	ECM does not receive any IGF signal despite ECM sending IGT signal to igniter

COMPONENT OPERATING RANGE

IGF signal	Igniter transmits IGF signal when it receives IGT signal from ECM

WIRING DIAGRAM

INSPECTION PROCEDURE



HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

Wire Harness Side:

Ignition Coil with Igniter Connector

Y

A054393E62

(a) Disconnect the ignition coil with igniter connector.
(b) Measure the resistance.

Standard resistance (Check for open)

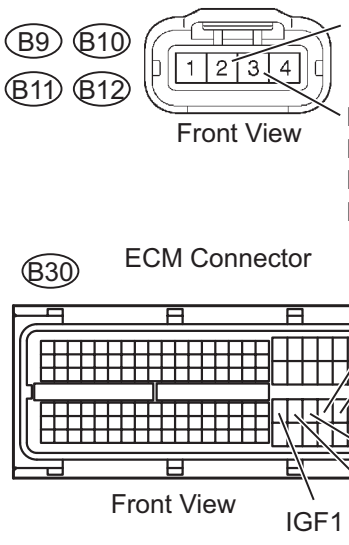
Tester Connections	Specified Conditions
B9-4 (GND) - Body ground	Below 1 Ω
B10-4 (GND) - Body ground	Below 1 Ω
B11-4 (GND) - Body ground	Below 1 Ω
B12-4 (GND) - Body ground	Below 1 Ω

(c) Turn the ignition switch ON.
(d) Measure the voltage between the terminals of the wire harness side connector.

Standard voltage

Tester Connections	Specified Conditions
B9-1 (+B) - B9-4 (GND)	9 to 14 V
B10-1 (+B) - B10-4 (GND)	9 to 14 V
B11-1 (+B) - B11-4 (GND)	9 to 14 V
B12-1 (+B) - B12-4 (GND)	9 to 14 V

(e) Reconnect the ignition coil with igniter connector.



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

2 CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

Wire Harness Side:

Ignition Coil with Igniter Connector

A105983E04

(a) Disconnect the ignition coil with connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B9-2 (IGF) - B30-81 (IGF1)	Below 1 Ω
B10-2 (IGF) - B30-81 (IGF1)	Below 1 Ω
B11-2 (IGF) - B30-81 (IGF1)	Below 1 Ω
B12-2 (IGF) - B30-81 (IGF1)	Below 1 Ω

Standard resistance (Check for open)

Tester Connections	Specified Conditions
B12-3 (IGT1) - B30-85 (IGT1)	Below 1 Ω
B11-3 (IGT2) - B30-84 (IGT2)	Below 1 Ω
B10-3 (IGT3) - B30-83 (IGT3)	Below 1 Ω
B9-3 (IGT4) - B30-82 (IGT4)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B9-2 (IGF) or B30-81 (IGF1) - Body ground	10 kΩor higher

Tester Connections	Specified Conditions
B10-2 (IGF) or B30-81 (IGF1) - Body ground	10 kΩor higher
B11-2 (IGF) or B30-81 (IGF1) - Body ground	10 kΩor higher
B12-2 (IGF) or B30-81 (IGF1) - Body ground	10 kΩor higher

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B12-3 (IGT1) or B30-85 (IGT1) - Body ground	10 kΩor higher
B11-3 (IGT2) or B30-84 (IGT2) - Body ground	10 kΩor higher
B10-3 (IGT3) or B30-83 (IGT3) - Body ground	10 kΩor higher
B9-3 (IGT4) or B30-82 (IGT4) - Body ground	10 kΩor higher

(d) Reconnect the ECM connector.
(e) Reconnect the ignition coil with igniter connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3 CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353 OR P0354)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Shuffle arrangement of the ignition coils with igniters (among No. 1 to No. 4 cylinders).
NOTICE:
Do not shuffle the connectors.
(e) Perform a simulation test.
(f) Check DTCs displayed on the tester.

Result

Display (DTC Output)	Proceed To
Same DTC output	A
Different ignition coil DTC output	B

B → **REPLACE IGNITION COIL ASSEMBLY**

A

REPLACE ECM

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.
In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control, rather than the conventional detecting method, which uses the locus ratio.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Conditions	Trouble Areas
P0420	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Front exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (sensor 1) • Heated Oxygen (HO2) sensor (sensor 2)

MONITOR STRATEGY

Related DTCs	P0420: Catalyst Deterioration
Required Sensors/Components (Main)	A/F sensor and HO2 sensor
Required Sensors/Components (Related)	Intake air temperature sensor, mass air flow meter, crankshaft position sensor and engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	About 30 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

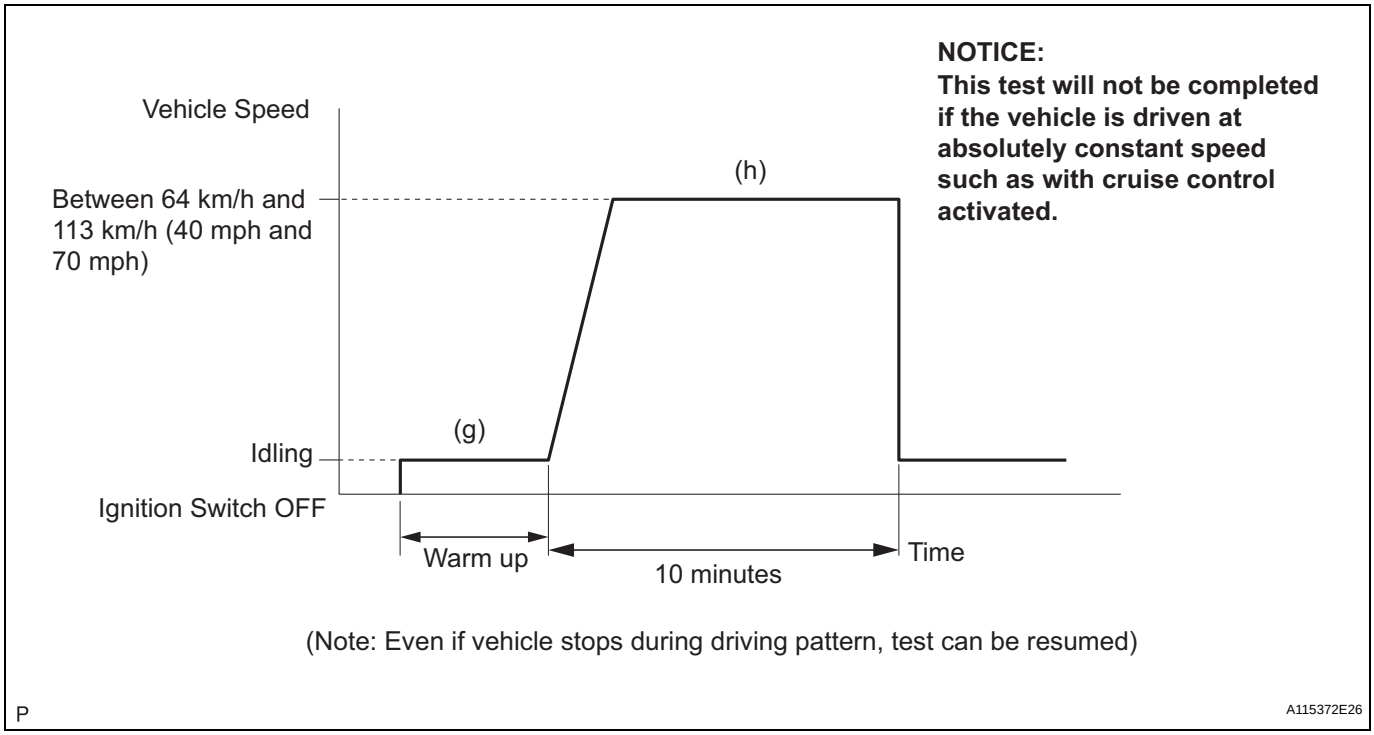
Monitor runs whenever following DTCs not present	P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0031, 32 (A/F Sensor heater - Sensor 1) P0037, 38 (O2 Sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0136 (O2 Sensor - Sensor 2) P0171, P0172 (Fuel system) P0300 - P0304 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0354 (Igniter) P0500 (VSS) P2196 (A/F Sensor - rationality) P2A00 (A/F Sensor - slow response)
Battery voltage	11 V or more
Intake air temperature	-10°C (14°F) or more

Engine coolant temperature	75°C (167°F) or more
Atmospheric pressure	76 kPa (570 mmHg) or more
Idling	OFF
Engine RPM	Less than 4,000 rpm
A/F sensor status	Activated
Fuel system status	Closed loop
Engine load	10 to 80 %
All of following conditions (a), (b) and (c) met	-
(a) Mass air flow rate	2.5 to 40 g/sec.
(b) Estimated front catalyst temperature	650° to 840°C (1,202° to 1,544°F)
(c) Estimated rear catalyst temperature	400° to 770°C (752° to 1,418°F)
Rear HO2 sensor heater monitor	Completed
Shift position	4th

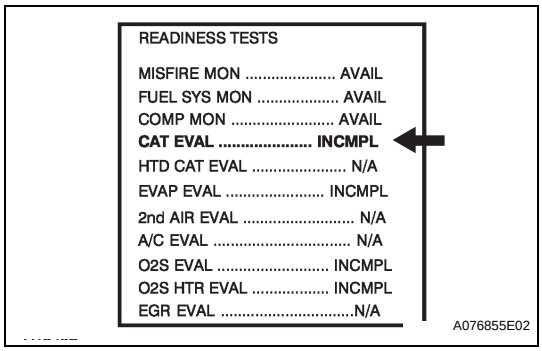
ES

TYPICAL MALFUNCTION THRESHOLDS

Oxygen Storage Capacity (OSC) of Three-Way Catalytic Converter (TWC)	Less than 0.07 g



MONITOR RESULT

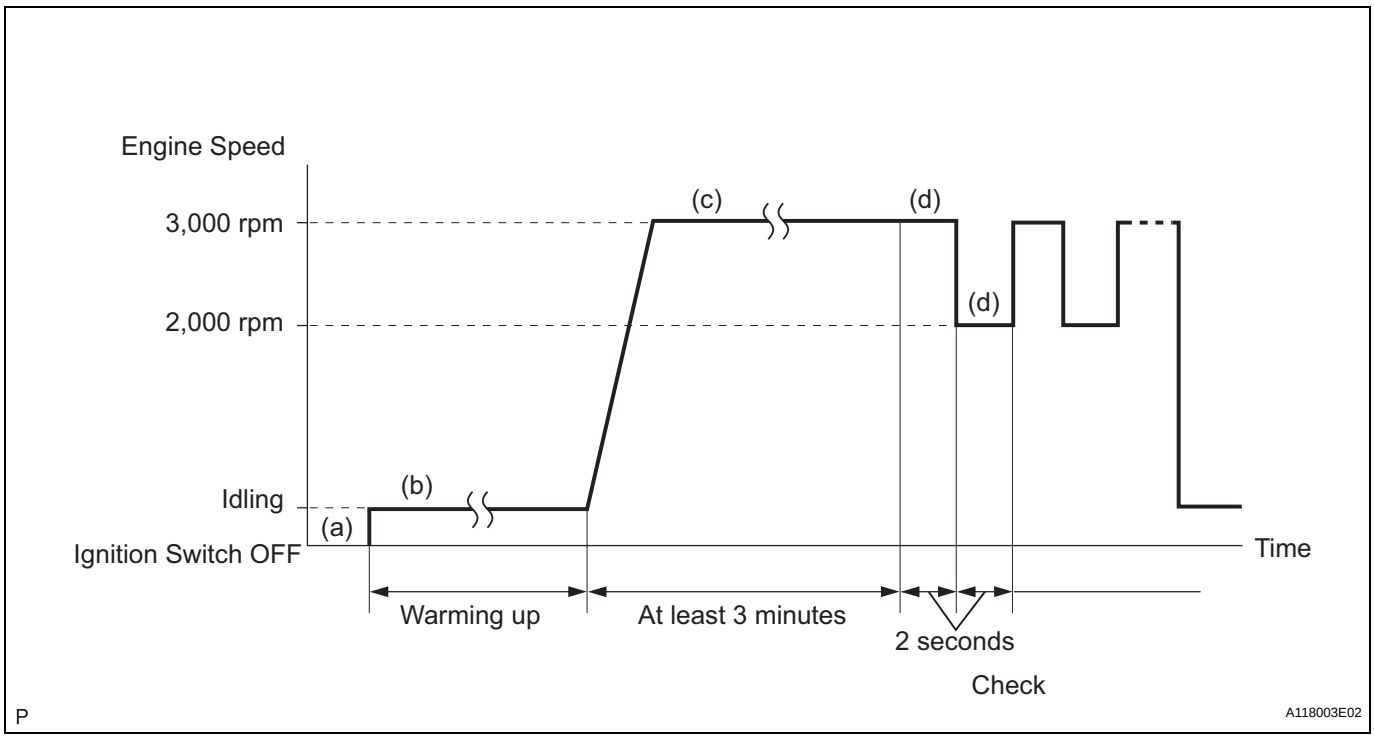


Refer to CHECKING MONITOR STATUS (see page ES-17).

CONFIRMATION DRIVING PATTERN

HINT:

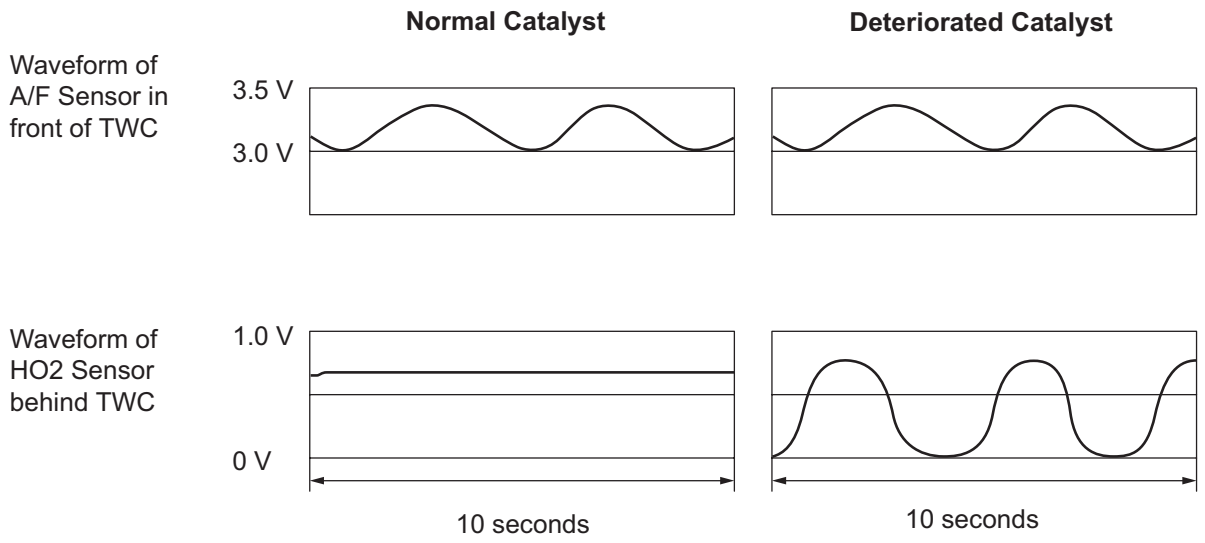
Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-35).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / CAT CMPL.
(f) Check that CAT CMPL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as CAT CMPL monitor operates.
(j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.
HINT:
If CAT CMPL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:
Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.



(a) Connect the intelligent tester to the DLC3.

(b) Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
(d) While running the engine at 3,000 rpm and 2,000 rpm alternating at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.
HINT:

- If either voltage output of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using the intelligent tester.
- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).

ES

Voltage output when active air-fuel ratio control not performed:

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0420	A

Display (DTC Output)	Proceed To
P0420 and other DTCs	B

HINT:
If any DTCs other than P0420 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

ES

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2) displayed on the tester.

Result:

A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25 % = Rich output:
Less than 3.0 V
-12.5 % = Lean output:
More than 3.35 V

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Catalyst • Exhaust gas leakage
	Output Voltage More than 3.35 V Less than 3.0 V	 OK	Output Voltage More than 0.5 V Less than 0.4 V	 OK	
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction	 NG	Output Voltage More than 0.5 V Less than 0.4 V	 OK	

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		Extremely rich or lean actual air-fuel ratio • Injector • Fuel pressure • Gas leakage from exhaust system
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

ES

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2; then press the YES button and then the ENTER button followed by the F4 button.

Result

Result	Proceed To

DTC	P043E	Evaporative Emission System Reference Orifice Clog Up

DTC	P043F	Evaporative Emission System Reference Orifice High Flow

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P043E	Reference orifice clogged	P043E, P043F, P2401, P2402 and P2419 present when one of following conditions met during key-off EVAP monitor: • EVAP pressure just after reference pressure measurement greater than -1 kPa-g (-7.5 mmHg-g) • Reference pressure less than -4.85 kPa-g (-36.4 mmHg-g) • Reference pressure greater than -1.057 kPa-g (-7.93 mmHg-g) • Reference pressure not saturated • Reference pressure difference between first and second 0.7 kPa-g (5.25 mmHg-g) or more HINT: Typical example values	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip
P043F	Reference orifice high-flow		• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip

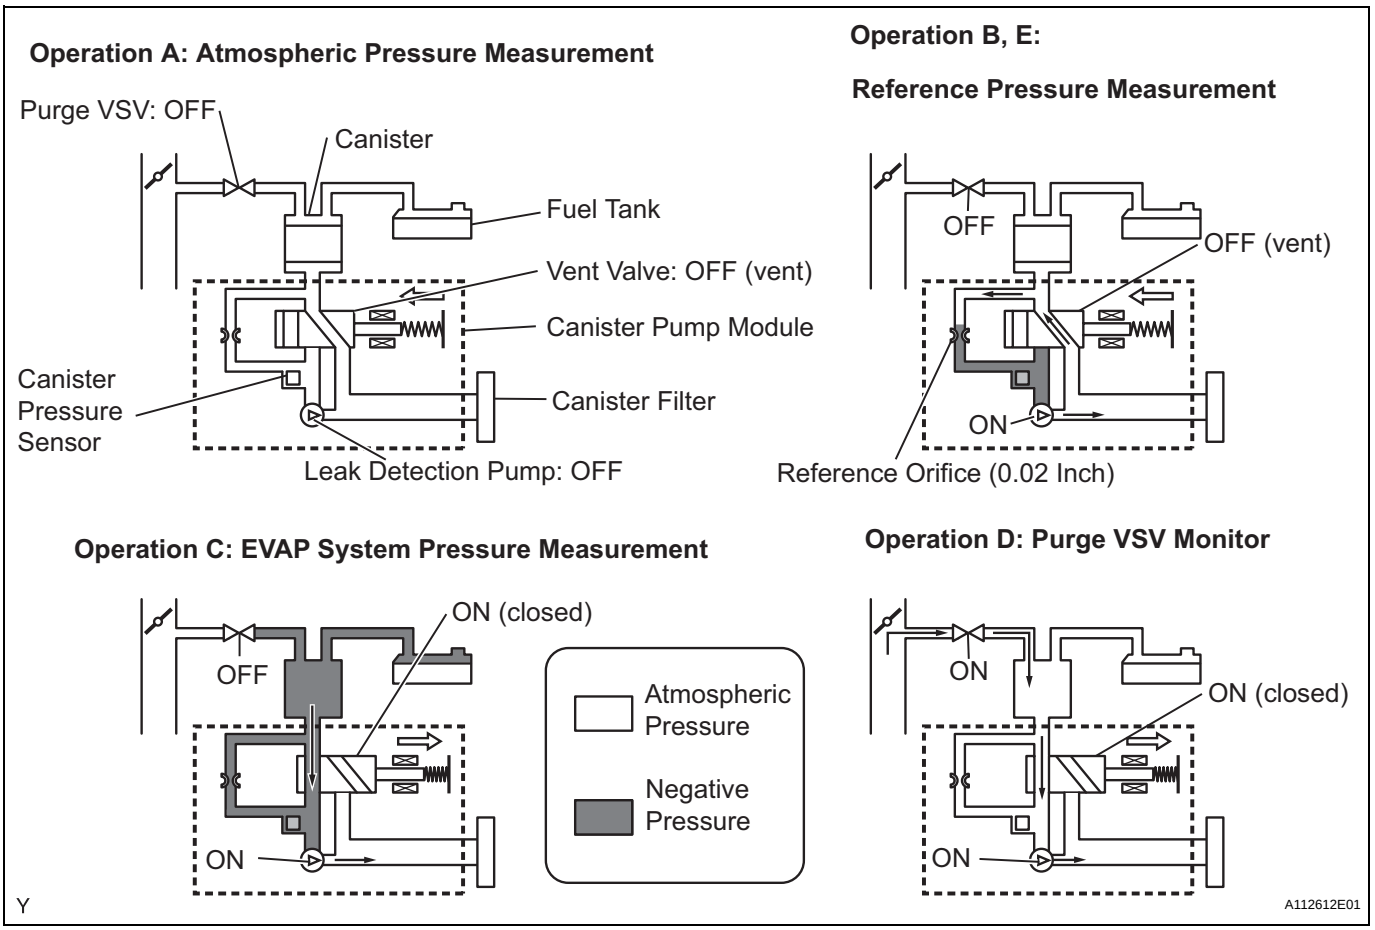
HINT:
The reference orifice is located inside the canister pump module.

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

INSPECTION PROCEDURE

Refer to the EVAP System (see page ES-340).

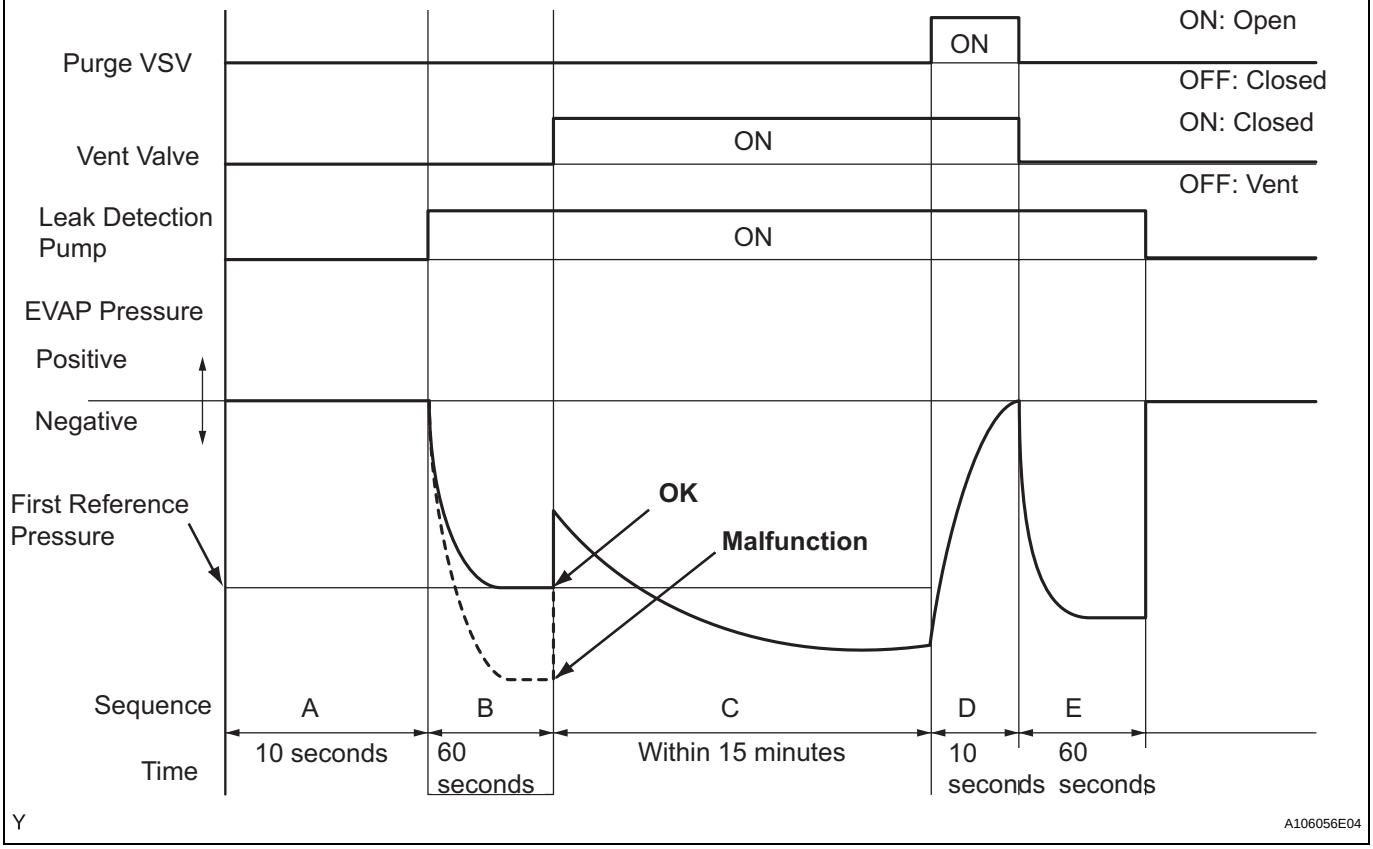


MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-

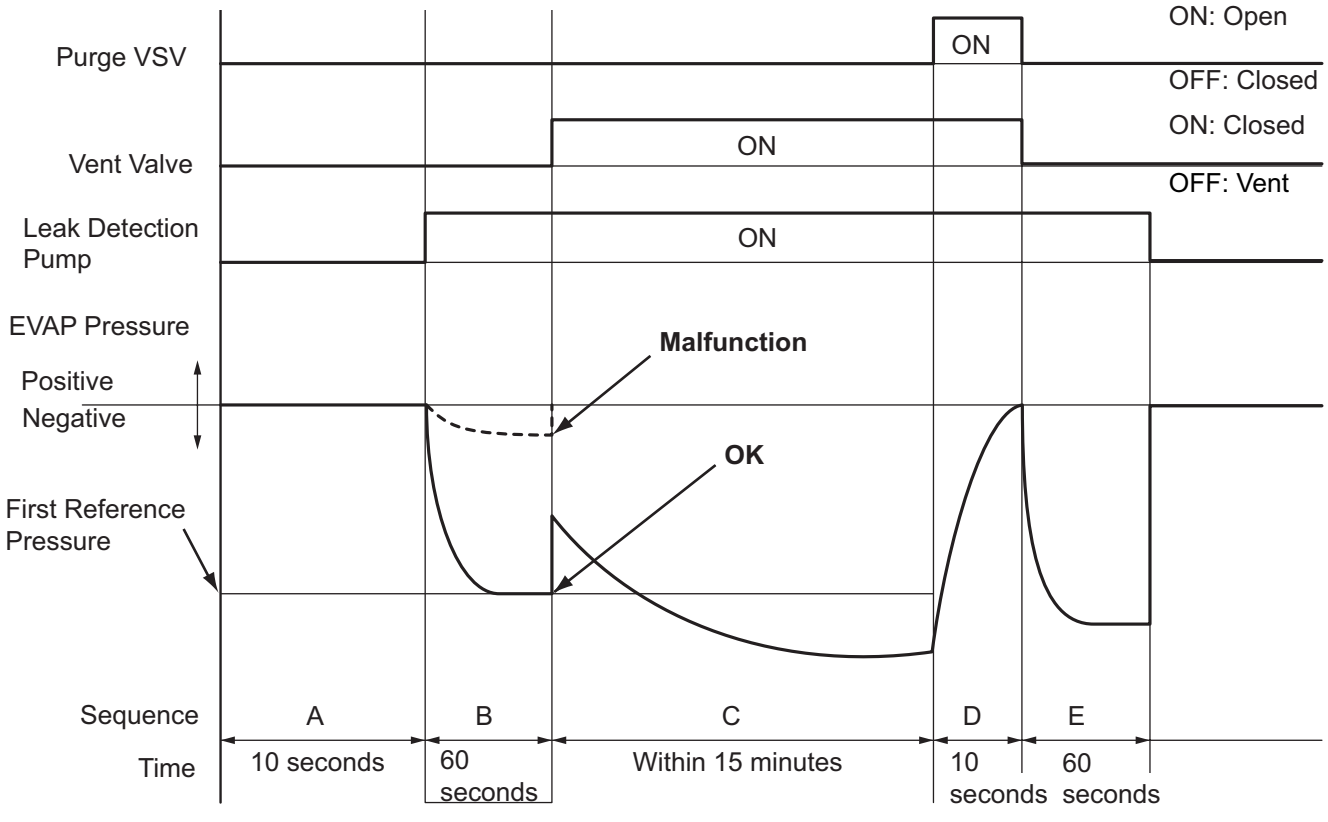
Sequence	Operations	Descriptions	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-



*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

(a) P043E: Reference orifice clogged

In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to determine the reference pressure. If the pressure is lower than -4.85 kPa-g (-36.4 mmHg-g), the ECM interprets this as a clog malfunction in the reference orifice, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).



EVAP Pressure when Reference Orifice Clogged:

(b) P043F: Reference orifice high-flow

In operation B, the leak detection pump creates negative pressure (vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM using the canister pressure sensor to determine the reference pressure. If the pressure is higher than -1.057 kPa-g (-7.93 mmHg-g), the ECM interprets this as a high-flow malfunction in the reference orifice, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Reference Orifice High-flow Malfunction:

ES

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed

ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement start	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

TYPICAL MALFUNCTION THRESHOLDS

"Saturated" indicates that the EVAP pressure change is less than 0.286 kPa-g (2.14 mmHg-g) in 60 seconds.

One of following conditions met	-
EVAP pressure just after reference pressure measurement start	More than -1 kPa-g (-7.5 mmHg-g)
Reference pressure	Less than -4.85 kPa-g (-36.4 mmHg-g)
Reference pressure	-1.057 kPa-g (-7.93 mmHg-g) or more
Reference pressure	Not saturated within 60 seconds
Reference pressure difference between first and second	0.7 kPa-g (5.25 mmHg-g) or more

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than [second reference pressure x 0.2], ECM determines that purge VSV stuck open.	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. Reference pressure measured at start and at end of check. If pressure does not return to near atmospheric pressure, ECM determines that purge VSV stuck closed.	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
	Purge flow	While engine running, following conditions successively met: • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa-g (3.75 mmHg-g) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa-g (0.75 mmHg-g)	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • Leakage from EVAP line (Purge VSV - Intake manifold) • ECM	While engine running	2 trip

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

INSPECTION PROCEDURE

Refer to the EVAP System (see page ES-340).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

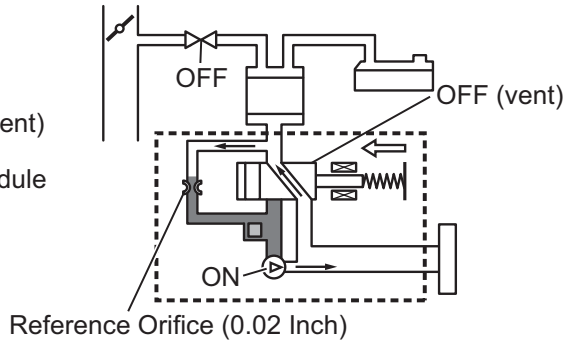
   5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

   HINT:

   *: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

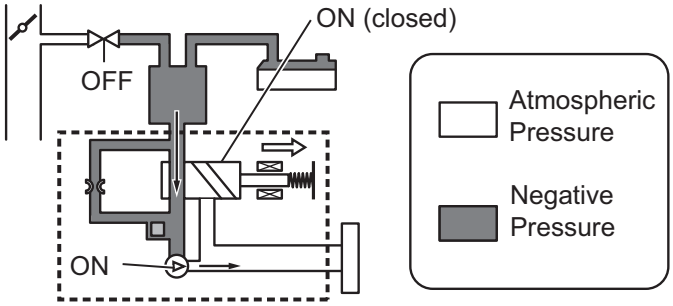
Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-

Sequence	Operations	Descriptions	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

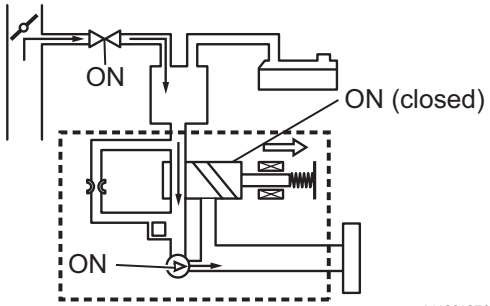


*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement



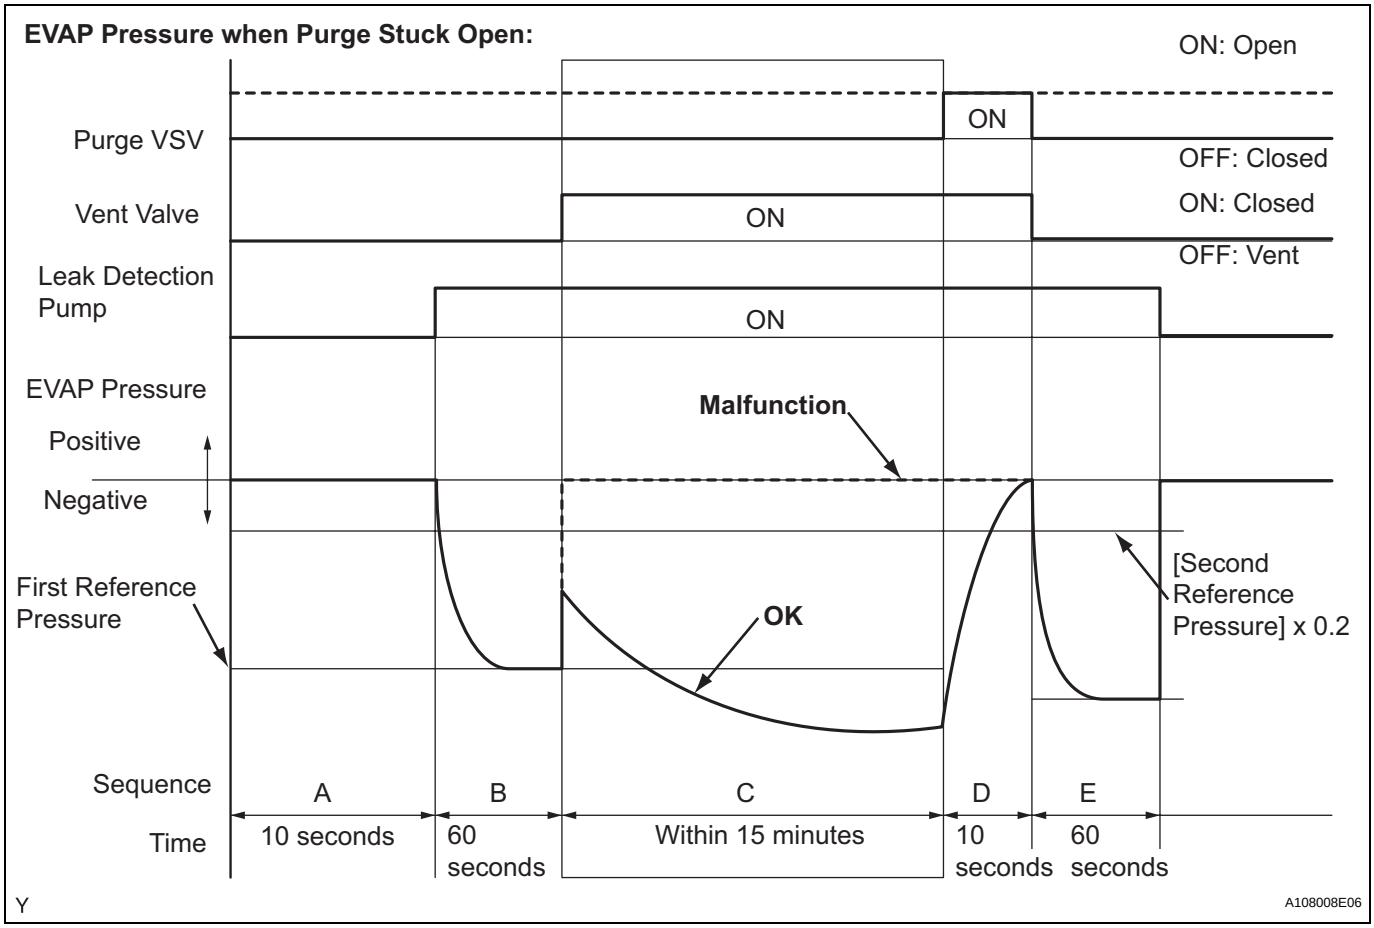
Operation B, E:



Reference Pressure Measurement

Operation C: EVAP System Pressure Measurement

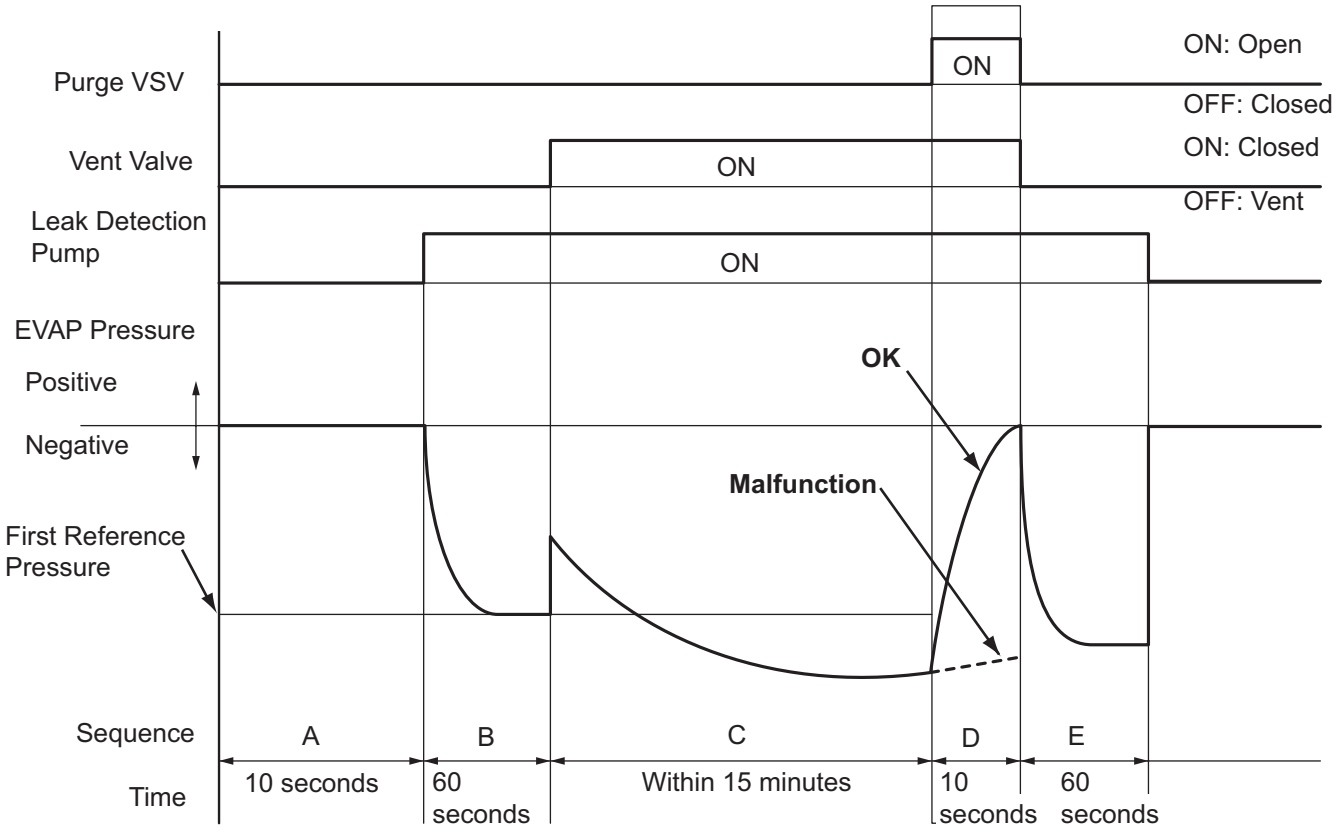
Operation D: Purge VSV Monitor



Y

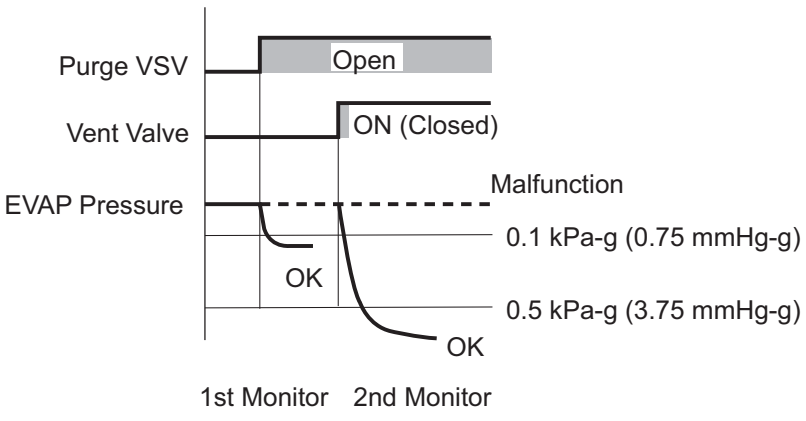
A112612E01

(a) Purge VSV stuck open



In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The EVAP system pressure is then measured by the ECM using the canister pressure sensor. If the stabilized system pressure is higher than [second reference pressure x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

(b) Purge VSV stuck closed



In operation D, the canister pressure sensor measures the EVAP system pressure. The pressure measurement for purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa-g (2.25 mmHg-g) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Purge VSV Stuck Closed:

2. PURGE FLOW MONITOR

EVAP Pressure During Purge Flow Monitor:

The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa-g (3.75 mmHg-g), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

OBD II MONITOR SPECIFICATIONS

1. Key-off Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

Typical Enabling Conditions

EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4°to 35°C (40° to 95°F)

2. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement start	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

Typical Malfunction Thresholds

Purge VSV stuck open:	-
EVAP pressure when vacuum introduction complete	Higher than reference pressure x 0.2

Purge VSV stuck closed:	-
EVAP pressure change after purge VSV ON (open)	Less than 0.3 kPa-g (2.25 mmHg-g)

OBD II MONITOR SPECIFICATIONS

1. Purge Flow Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

Typical Enabling Conditions

Monitor runs whenever following DTCs not present	P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0171, P0172 (Fuel system) P0300 - P0304 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0354 (Igniter) P0450 - P0453 (EVAP press sensor) P0500 (VSS)
Engine	Running
ECT	4.4°C (40°F) or more
IAT	4.4°C (40°F) or more

Canister pressure sensor malfunction	Not detected
Purge VSV	Not operated by scan tool
EVAP system check	Not operated by scan tool
Battery voltage	10 V or more
Purge duty cycle	8 % or more

Typical Malfunction Thresholds

Both of following conditions met	Conditions 1 and 2
1. EVAP pressure change when purge operation started	Less than 0.1 kPa-g (0.75 mmHg-g)
2. EVAP pressure change during purge operation when vent valve closed	Less than 0.5 kPa-g (3.75 mmHg-g)

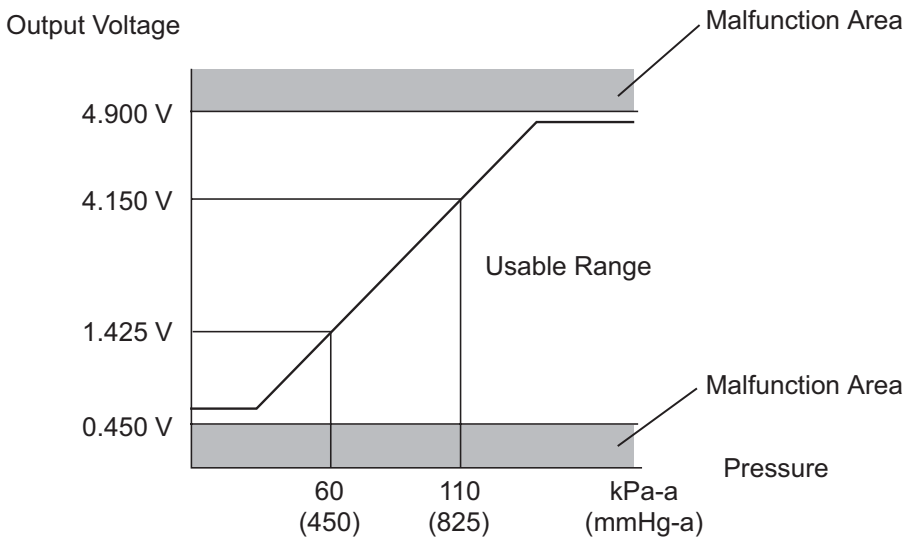
DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0450	Canister pressure sensor voltage fluctuation abnormal	Sensor output voltage rapidly fluctuates beyond upper and lower malfunction thresholds for 0.5 seconds.	• Canister pump module • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition OFF) • Ignition ON	1 trip
P0451	Canister pressure sensor noise	Sensor output voltage fluctuates frequently within certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition OFF) • Engine running	2 trip
	Canister pressure sensor signal becomes fixed/flat	Sensor output voltage does not vary within certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition OFF)	2 trip
P0452	Canister pressure sensor low input	EVAP pressure less than 42.1 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0453	Canister pressure sensor high input	EVAP pressure more than 123.8 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• Ignition ON • EVAP monitoring (ignition OFF)	1 trip

HINT:

The canister pressure sensor is built into the canister pump module.



ES

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

MONITOR DESCRIPTION

Canister Pressure Sensor Specification:

HINT:

Standard atmospheric pressure is 101.3 kPa-a (760 mmHg-a)

A115543E05

1. DTC P0450: Canister pressure sensor abnormal fluctuation
   If the canister pressure sensor output [pressure] rapidly fluctuates between less than 42.1 kPa-a (315.9 mmHg-a) and more than 123.8 kPa-a (928.4 mmHg-a), the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

2. DTC P0451: Canister pressure sensor noise or fixed/flat
   If the canister pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the canister pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
   Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being fixed/flat, and stops the monitor. The ECM then illuminates the MIL and sets the DTC. (Both the malfunctions are detected by 2 trip detection logic).
3. DTC P0452: Canister pressure sensor voltage low
   If the canister pressure sensor output [pressure] is below 42.1 kPa-a (315.9 mmHg-a), the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
4. DTC P0453: Canister pressure sensor voltage high
   If the canister pressure sensor output [pressure] is 123.8 kPa-a (928.4 mmHg-a) or more, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

ES

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle: P0451 sensor fixed/flat Continuous: P0451 sensor noise, P0450, P0452 and P0453
Duration	0.5 seconds: P0450, P0452 and P0453 2 minutes: P0451
MIL Operation	Immediate: P0450, P0452 and P0453 2 driving cycles: P0451
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P0451 (Noise monitor):

Monitor runs whenever following DTCs not present	None
Atmospheric pressure (absolute pressure)	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Intake air temperature	4.4°to 35°C (40° to 95°F)
Canister pressure sensor malfunction (P0450, P0452, 0453)	Not detected
Either of following conditions met	A or B
A. Engine condition	Running
B. Time after key off	5 or 7 or 9.5 hours

P0451 (Fixed/flat monitor):

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Intake air temperature	4.4°to 35°C (40° to 95°F)
Canister pressure sensor malfunction (P0450, P0452, 0453)	Not detected
Atmospheric pressure (absolute pressure)	70 to 110 kPa-a (525 to 825 mmHg-a)
Time after key off	5 or 7 or 9.5 hours

P0450, P0452 and P0453:

Monitor runs whenever following DTCs not present	None
Either of following conditions met	(a) or (b)
(a) Ignition switch	ON
(b) Soak timer	ON

TYPICAL MALFUNCTION THRESHOLDS

P0450: Canister pressure sensor chattering

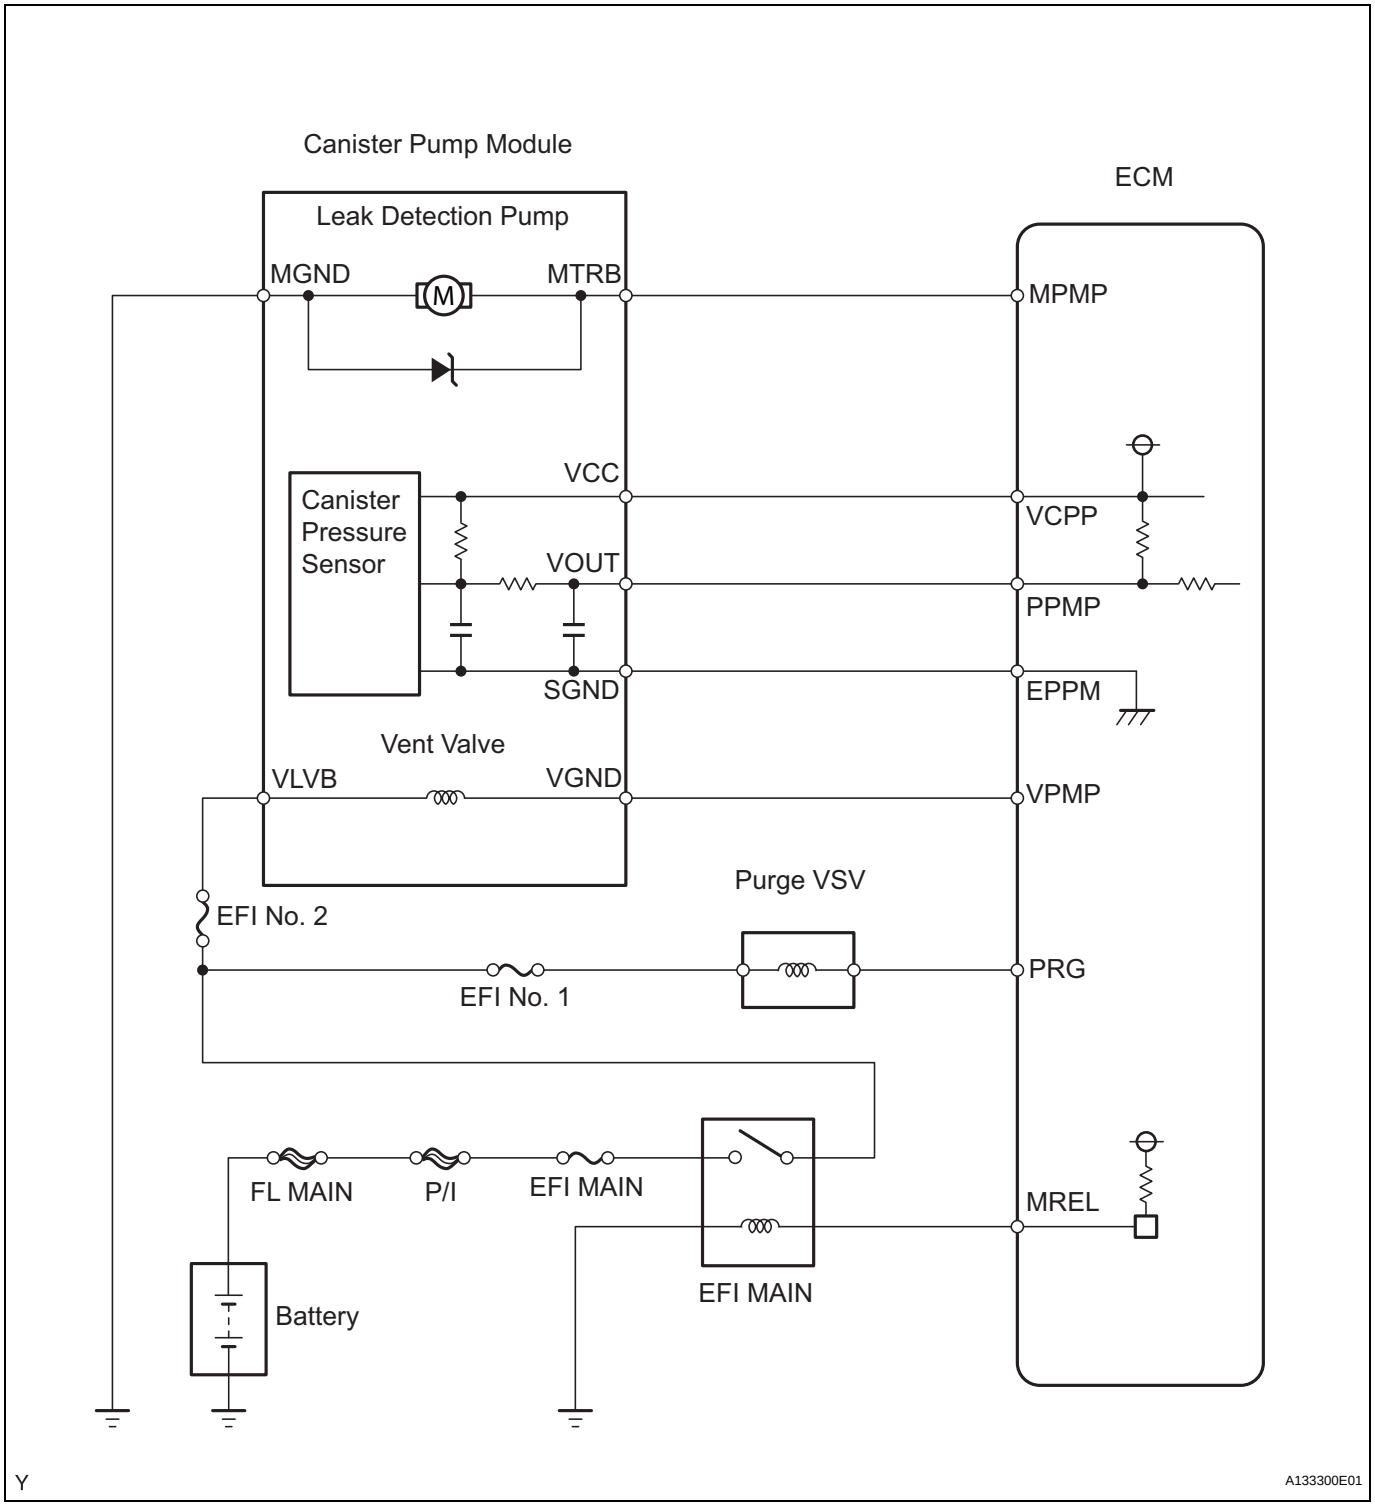
EVAP pressure	Less than 42.1 kPa-a (315.9 mmHg-a), or more than 123.8 kPa-a (928.4 mmHg-a)

P0451: Canister pressure sensor noise

Frequency that EVAP pressure change 0.3 kPa-g (2.25 mmHg-g) or more	10 times or more in 10 seconds

P0451: Canister pressure sensor fixed/flat

EVAP pressure change during reference pressure	Less than 0.65 kPa-g (4.87 mmHg-g)



P0452: Canister pressure sensor low voltage

EVAP pressure	Less than 42.1 kPa-a (315.9 mmHg-a)

P0453: Canister pressure sensor high voltage

EVAP pressure	More than 123.8 kPa-a (928.4 mmHg-a)

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

- **When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel cap.**
- **Do not disassemble the canister pump module.**
- **The intelligent tester is required to conduct the following diagnostic troubleshooting procedure.**

1	CONFIRM DTC AND EVAP PRESSURE

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON (do not start the engine).
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / EVAP / EVAP VAPOR PRESS.
(g) Read the EVAP (Evaporative Emission) pressure displayed on the tester.

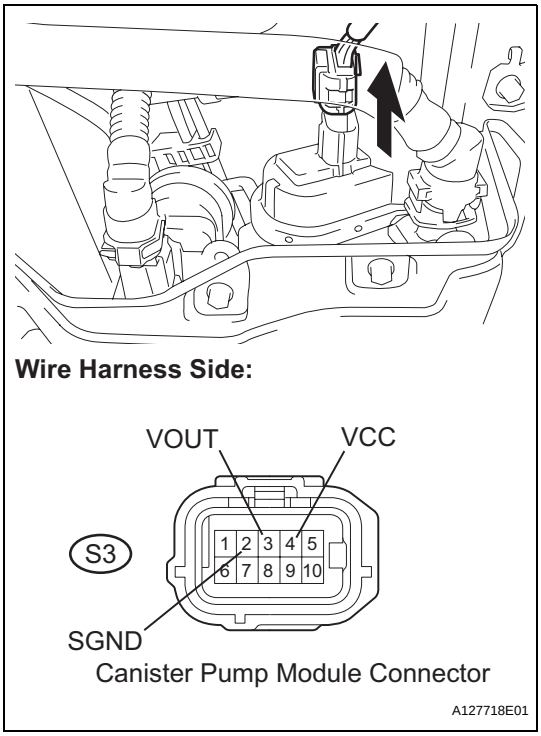
3 CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)

Wire Harness Side:

A127717E01

(a) Disconnect the S3 canister pump module connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance between PPMP terminal of the ECM connector and the body ground.

Result



Test Results	Suspected Trouble Areas	Proceed To
10 kΩ or more	Short in canister pressure sensor circuit	A
10 Ω or less	Short in wire harness/connector (ECM - Canister pressure sensor)	B

(d) Reconnect the canister pump module connector.
(e) Reconnect the ECM connector.

A → **Go to step 5**

B → **Go to step 6**

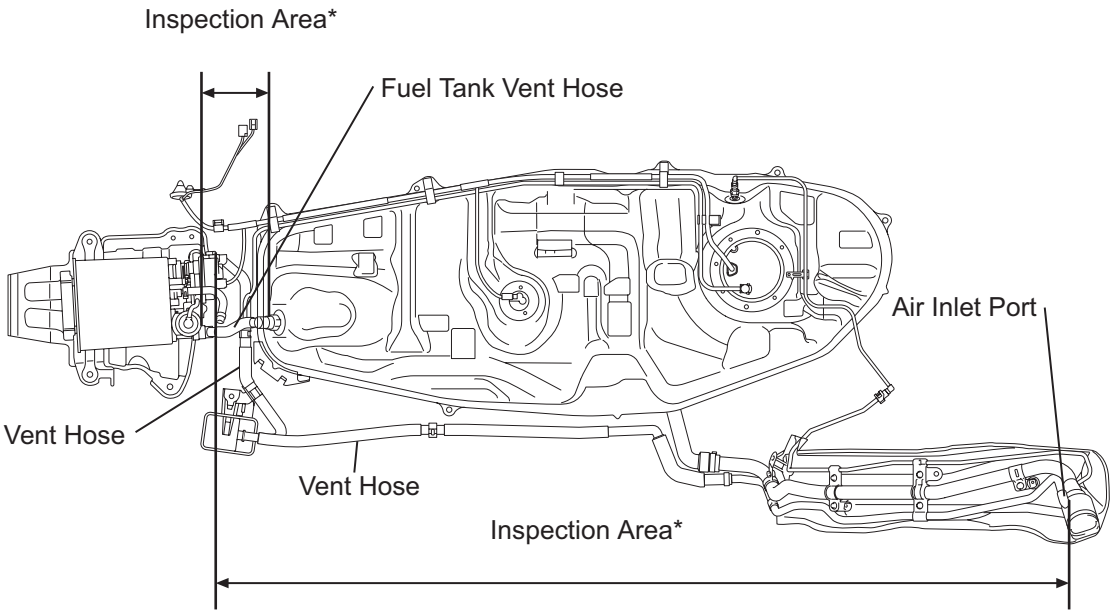
4	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - ECM)

(a) Disconnect the S3 canister pump module connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage and resistance of the canister connector.

Standard

Tester Connections	Specified Conditions
S3-4 (VCC) - Body ground	4.5 to 5.5 V
S3-3 (VOUT) - Body ground	4.5 to 5.5 V
S3-2 (SGND) - Body ground	100 Ω or less

Result



Test Results	Suspected Trouble Areas	Proceed To
Voltage and resistance within standard ranges	Open in canister pressure sensor circuit	A
Voltage and resistance outside standard ranges	Open in wire harness/connector (ECM - Canister pressure sensor)	B

(d) Reconnect the canister pump module connector.

A	Go to step 5
B	Go to step 6

5	REPLACE CHARCOAL CANISTER ASSEMBLY

(a) Replace the canister assembly (see page EC-10).
NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel and other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.

*: Check for disconnection and/or cracks

P A127720E01

ES

NEXT → Go to step 8

6	REPAIR OR REPLACE HARNESS OR CONNECTOR

HINT:
If the exhaust tailpipe has been removed, go to the next step before reinstalling it.

NEXT → Go to step 8

7	REPLACE ECM

(a) Replace the ECM (see page ES-429).

NEXT → Go to step 8

8	CHECK WHETHER DTC OUTPUT RECURS (AFTER REPAIR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Wait for at least 60 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:
If no pending DTCs are displayed on the tester, the repair has been successfully completed.

NEXT

COMPLETED

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P0455	EVAP gross leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than [second reference pressure x 0.2], ECM determines that EVAP system has large leak.	• Fuel cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip
P0456	EVAP small leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than second reference pressure, ECM determines that EVAP system has small leak.	• Fuel cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip

ES

DESCRIPTION

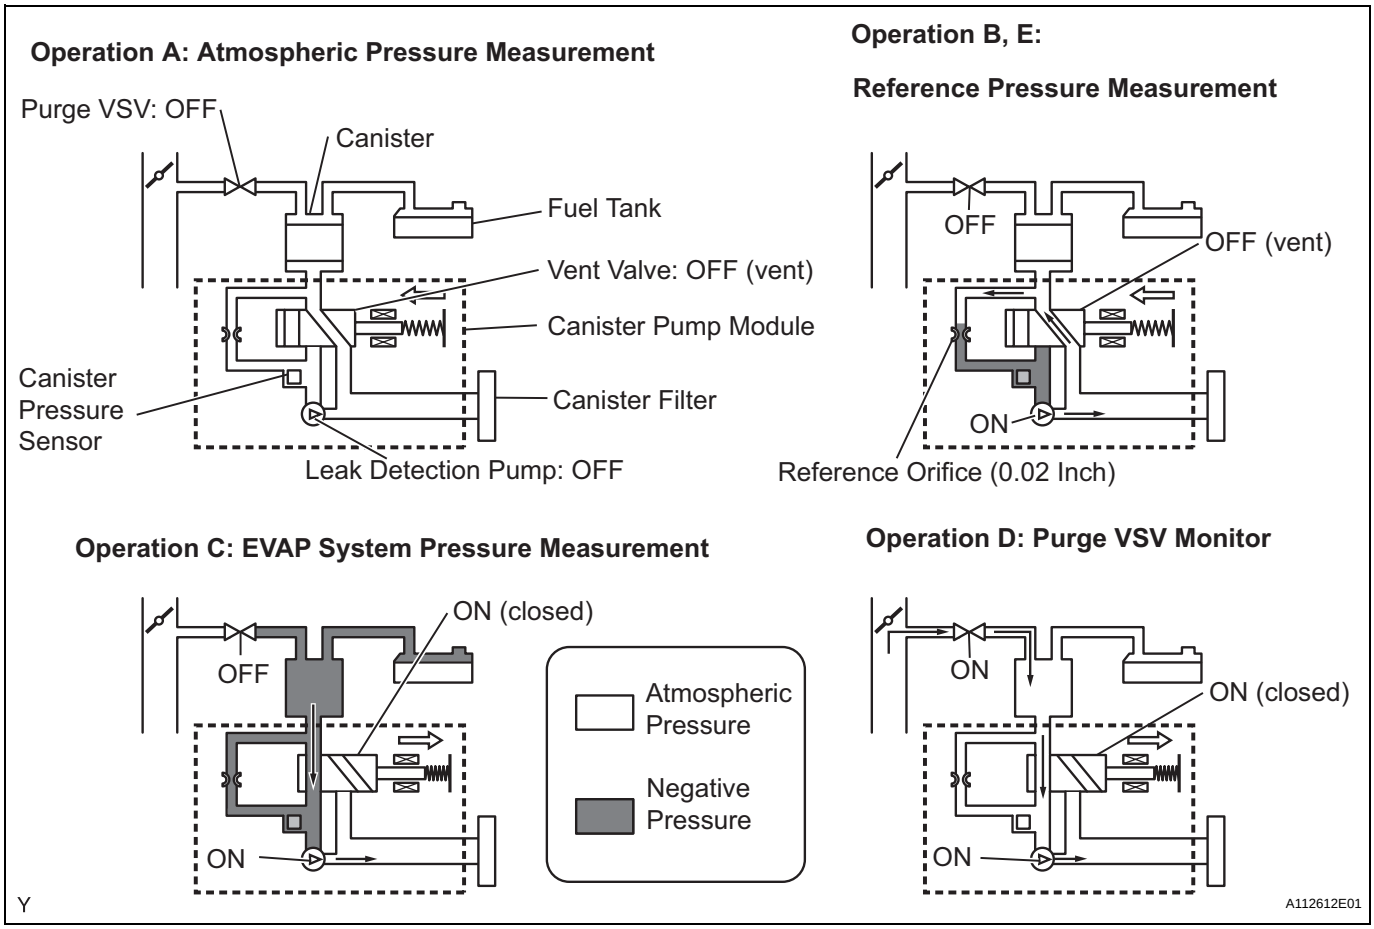
The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

INSPECTION PROCEDURE

Refer to the EVAP System (see page ES-340).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.



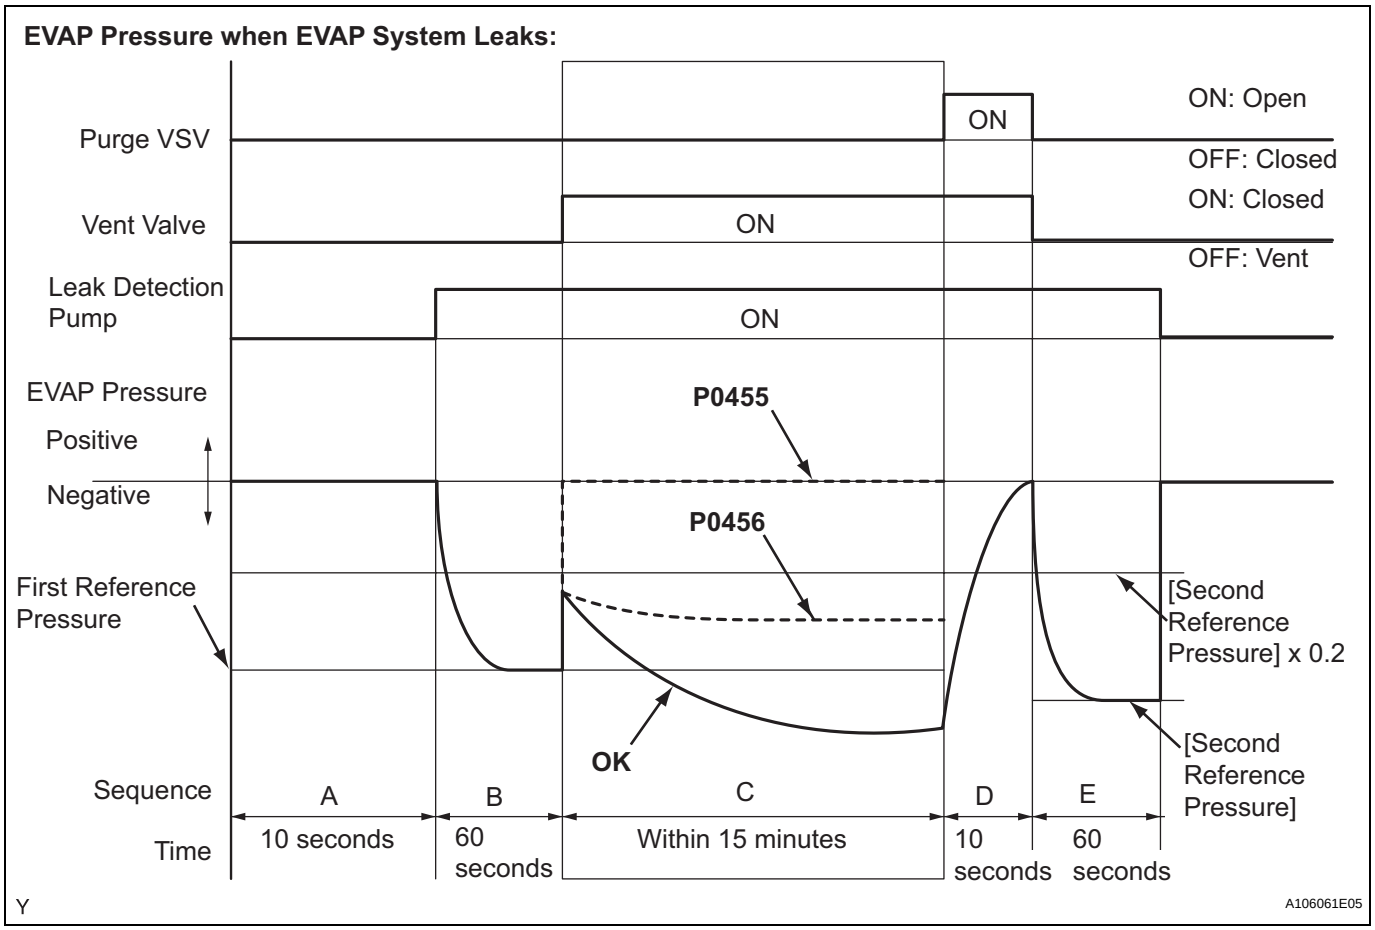
HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*

Sequence	Operations	Descriptions	Duration
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



(a) P0455: EVAP gross leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second reference pressure x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

(b) P0456: EVAP very small leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than the second reference pressure, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool

Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4°to 35°C (40° to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement start	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

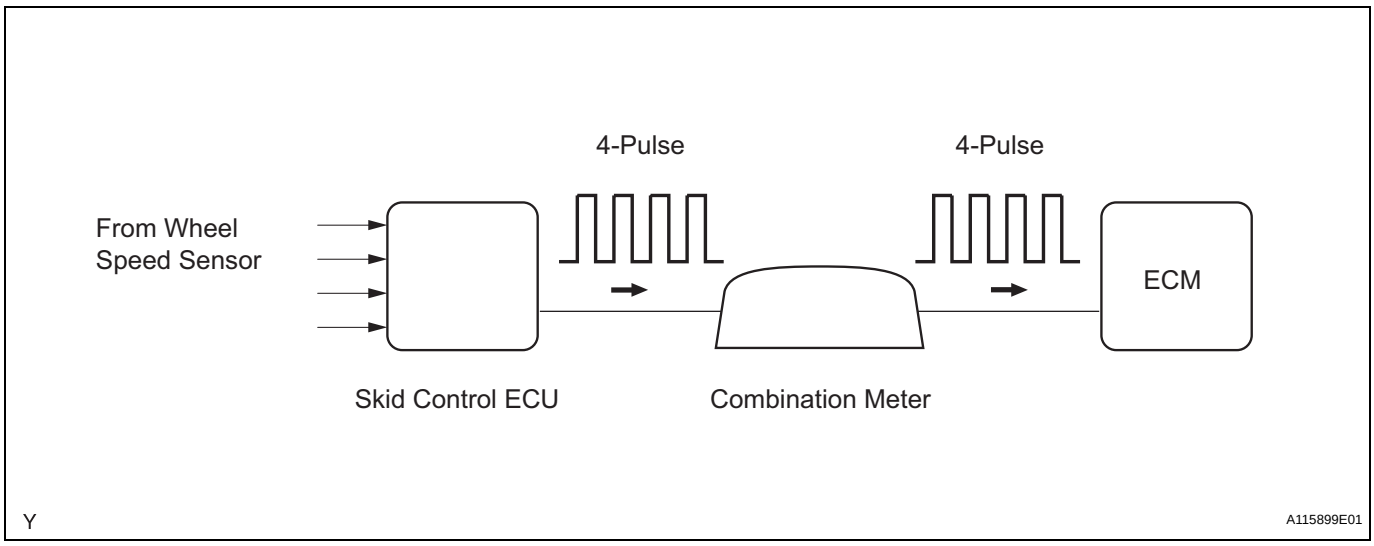
TYPICAL MALFUNCTION THRESHOLDS

P0455: EVAP gross leak

EVAP pressure when vacuum introduction complete	Higher than reference pressure x 0.2

P0456: EVAP small leak

EVAP pressure when vacuum introduction complete	Between reference pressure and reference pressure x 0.2



MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).

DTC	P0500	Vehicle Speed Sensor "A"

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	DTC Detection Conditions	Trouble Areas
P0500	While vehicle being driven, no vehicle speed sensor signal transmitted to ECM (1 trip detection logic)	• Open or short in speed signal circuit • Vehicle speed sensor • Combination meter • ECM • Skid control ECU

MONITOR DESCRIPTION

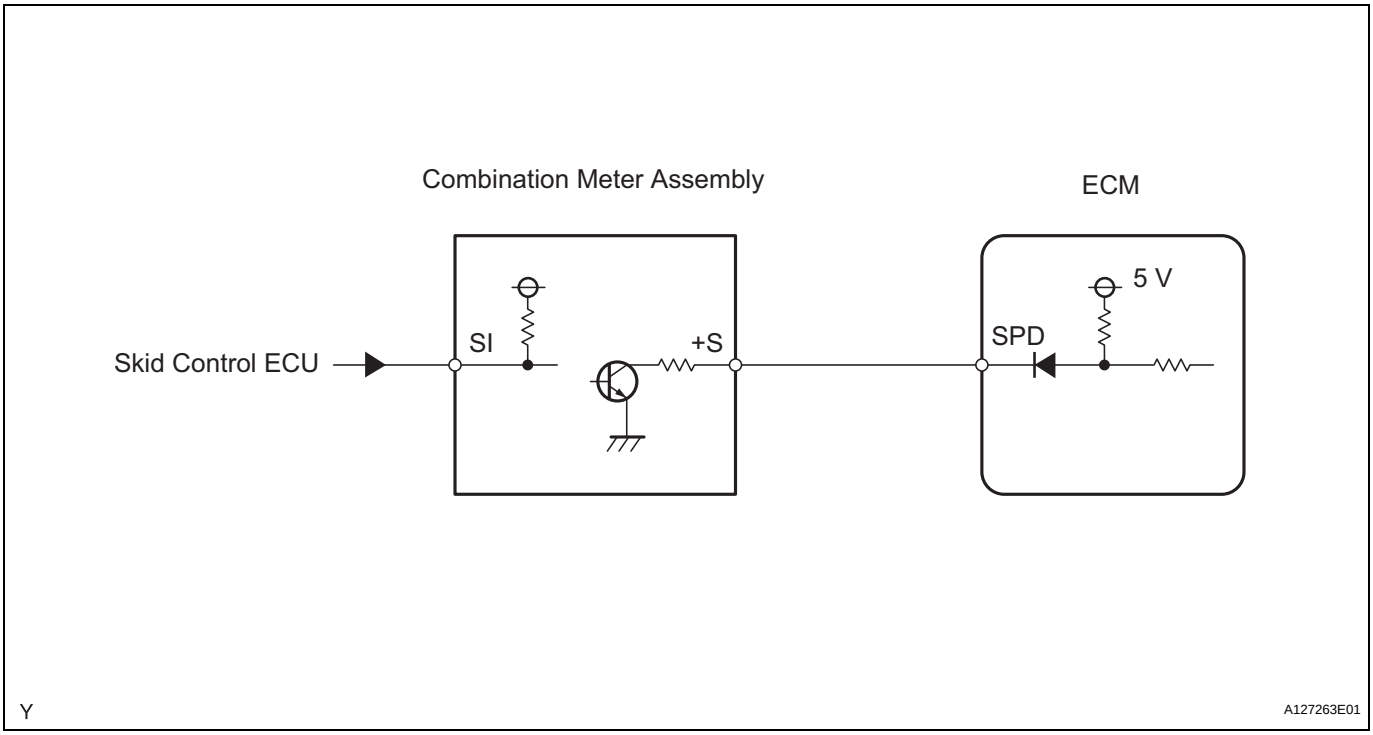
The ECM assumes that the vehicle is being driven, when the indicated engine speed is more than 2,300 rpm and 30 seconds have elapsed since the Park/Neutral Position (PNP) switch was turned OFF. If there is no speed signal from the combination meter, despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0500: Vehicle speed sensor "A" pulse input error
Required Sensors/Components (Main)	Vehicle Speed Sensor (VSS), Combination meter and Skid control ECU
Required Sensors/Components (Related)	Park/Neutral Position (PNP) switch, Engine Coolant Temperature (ECT) sensor, Crankshaft Position (CKP) sensor, Throttle Position (TP) sensor and Mass Air Flow (MAF) meter
Frequency of Operation	Continuous
Duration	2 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0120 - P0223, P2135 (TP sensor)
Either of following conditions (a) or (b) met:	-



(a) Following conditions 1 and 2 met:	-
1. ECT and ECT sensor	20°C (68°F) or more, and sensor does not malfunction (P0115 or P0116)
2. Time after PNP switch turned OFF	10 seconds or more
(b) Following conditions 1 and 2 met:	-
1. ECT and ECT sensor	Less than 20°C (68°F), and sensor malfunction (P0115 or P0116)
2. Time after PNP switch turned OFF	30 seconds or more
Time after ignition switch turned ON	More than 0.5 seconds

TYPICAL MALFUNCTION THRESHOLDS

Vehicle speed sensor signal	No pulse input

ES

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK OPERATION OF SPEEDOMETER

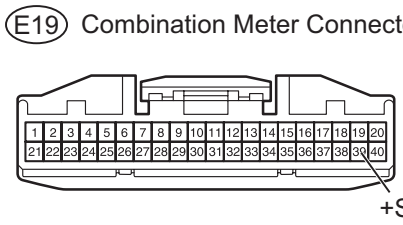
(a) Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.
HINT:
- The vehicle speed sensor is operating normally if the speedometer reading is normal.

- If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction (see page ME-41).

NG → **GO TO MALFUNCTION IN SPEEDOMETER**

OK

2 READ VALUE USING INTELLIGENT TESTER (VEHICLE SPD)



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / VEHICLE SPD.
(e) Drive the vehicle.
(f) Read the value displayed on the tester.
OK:
Vehicle speeds displayed on tester and speedometer display are equal.

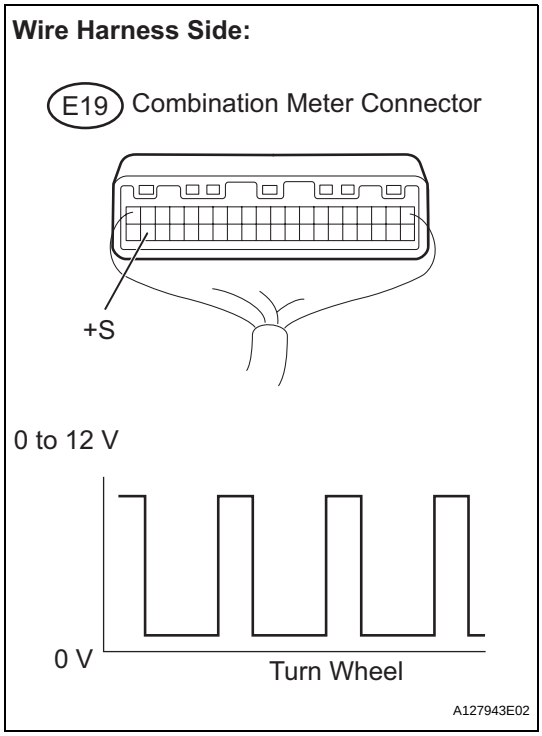
OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

3 CHECK COMBINATION METER ASSEMBLY (+S VOLTAGE)

Wire Harness Side:

(a) Disconnect the E19 combination meter connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminal of the combination meter and the body ground.
Standard voltage



Tester Connections	Specified Conditions
E19-39 (+S) - Body ground	4.5 to 5.5 V

(d) Reconnect the combination meter connector.

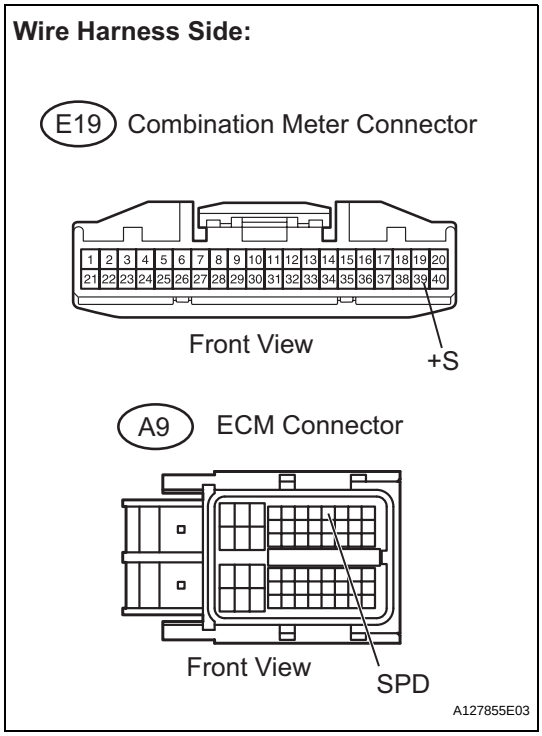
NG → **Go to step 5**

OK

4 CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL WAVEFORM)

(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch ON.
(d) Check the voltage between the terminal of the combination meter and the body ground while the wheel is turned slowly.

Standard voltage



Tester Connections	Specified Conditions
E19-39 (+S) - Body ground	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

NG → **REPLACE COMBINATION METER ASSEMBLY**

OK

5 CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)

(a) Disconnect the E19 combination meter connector.
(b) Disconnect the A9 ECM connector.
(c) Check the resistance.

Standard resistance (check for open)

Tester Connections	Specified Conditions
E19-39 (+S) - A9-8 (SPD)	Below 1 Ω

Standard resistance (check for short)

Tester Connections	Specified Conditions
E19-39 (+S) or A9-8 (SPD) - Body ground	10 kΩ or higher

(d) Reconnect the combination meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

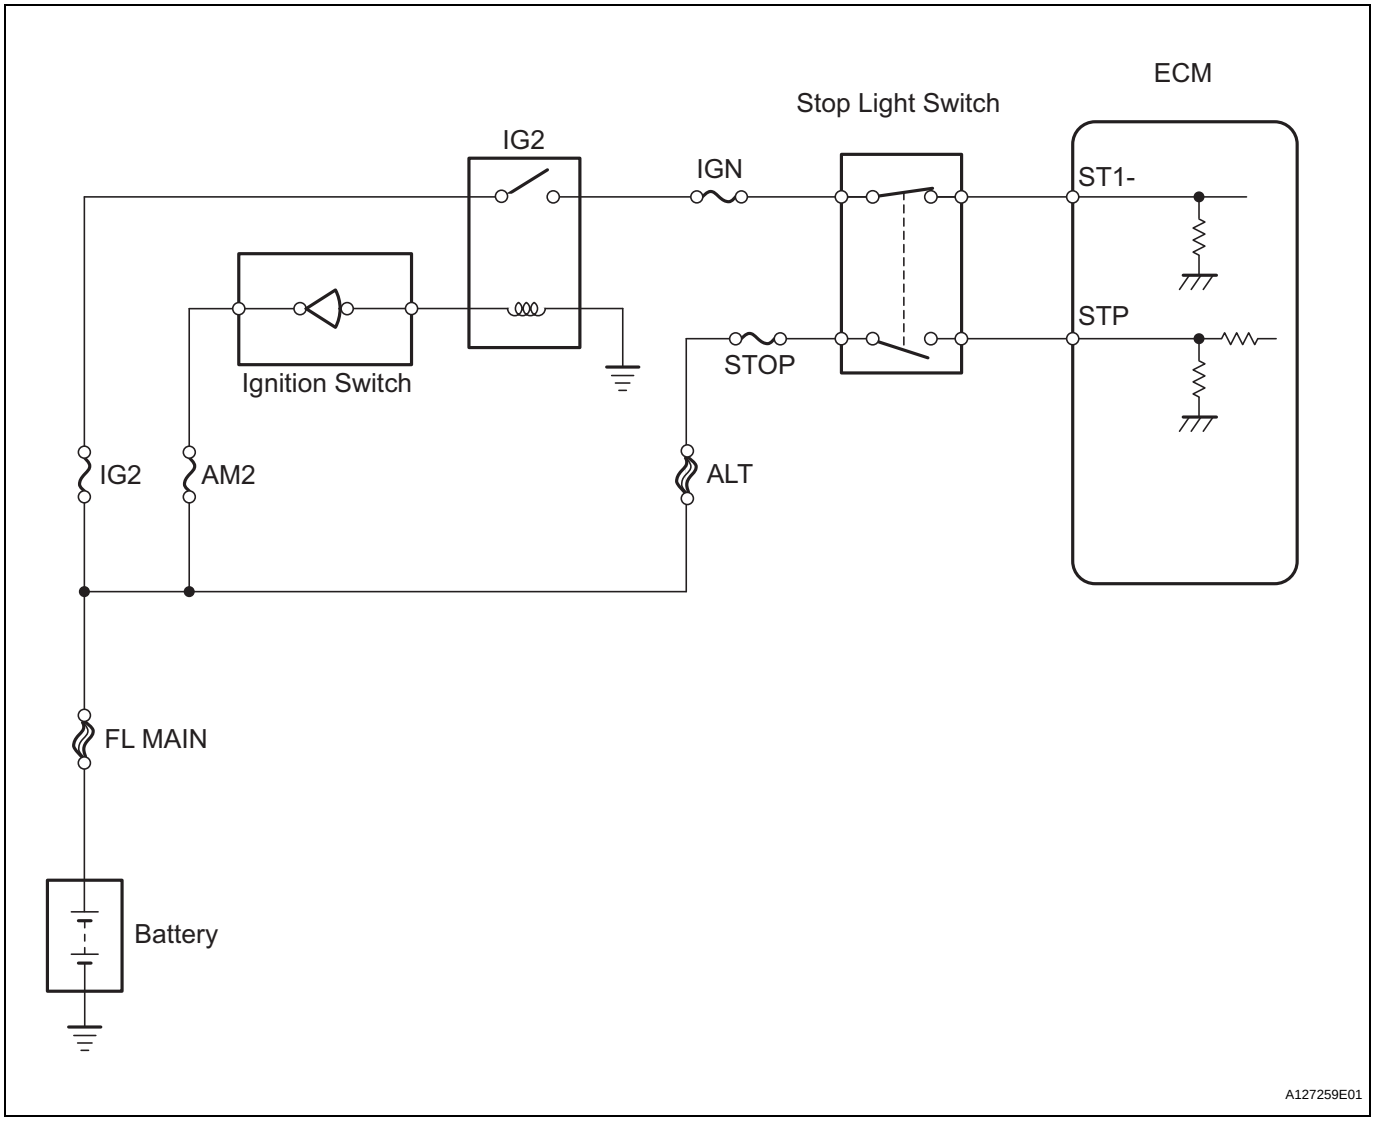
OK

REPLACE ECM

DTC	P0504	Brake Switch "A" / "B" Correlation

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and sets the DTC.



HINT:

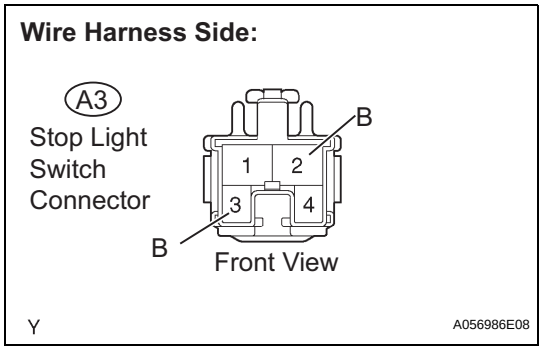
The normal conditions are as shown in the table below. The signals can be read using the intelligent tester.

Signals	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

DTC No.	DTC Detection Conditions	Trouble Areas
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) Ignition switch ON (b) Brake pedal released (c) STP signal OFF when ST1- signal OFF	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

WIRING DIAGRAM

ES



INSPECTION PROCEDURE

HINT:

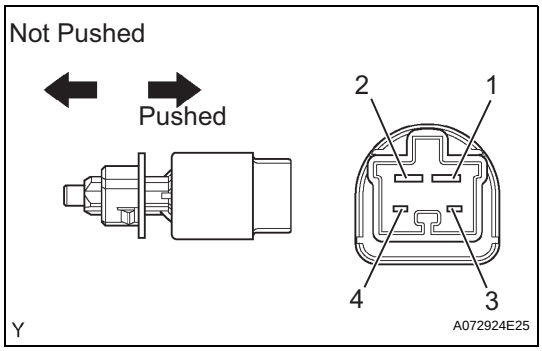
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- STP signal conditions can be checked using the intelligent tester.
  (a) Connect the intelligent tester to the DLC3.
  (b) Turn the ignition switch ON.
  (c) Turn the tester ON.
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STOP LIGHT SW.
  (e) Check the STP signal when the brake pedal is depressed and released.

Brake Pedal Operation	Specified Conditions
Depressed	STP signal ON
Released	STP signal OFF

1 CHECK STOP LIGHT SWITCH ASSEMBLY (TERMINAL B VOLTAGE)

(a) Disconnect the A3 stop light switch connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the A3 stop light switch connector and body ground.

Standard voltage



Tester Connections	Specified Conditions
A3-2 (B) - Body ground	9 to 14 V
A3-3 (B) - Body ground	9 to 14 V

(d) Reconnect the stop light switch connector.

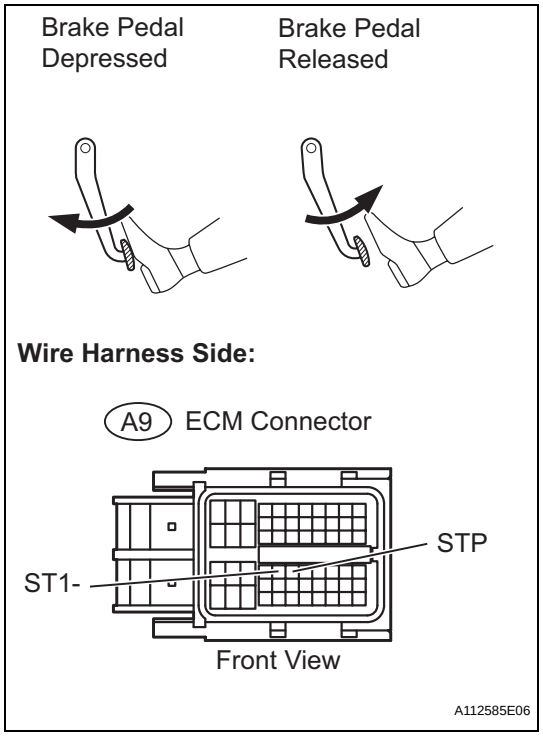
NG → **Go to step 4**

OK

2 INSPECT STOP LIGHT SWITCH ASSEMBLY

(a) Remove the stop light switch.
(b) Check the resistance.

Standard resistance



Tester Connections	Switch Positions	Specified Conditions
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

(c) Reinstall the stop light switch.

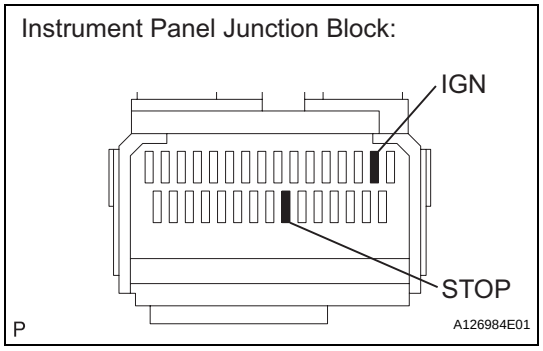
NG → **REPLACE STOP LIGHT SWITCH ASSEMBLY**

OK

3 CHECK ECM (STP AND ST1 - VOLTAGE)

(a) Disconnect the A9 ECM connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals ST1- and STP of the A9 ECM connector and body ground.
Standard voltage

Tester Connections	Brake Pedal Operations	Specified Conditions
A9-35 (ST1-) - Body ground	Released	9 to 14 V
	Depressed	0 to 3 V
A9-36 (STP) - Body ground	Released	0 to 3 V
	Depressed	9 to 14 V



(d) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

REPLACE ECM

4 INSPECT FUSE (STOP AND IGN FUSE)

(a) Remove the STOP and IGN fuses from the instrument panel junction block.
(b) Measure the resistance.
Standard resistance:
Below 1 Ω
(c) Reinstall the STOP and IGN fuses.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

ES

DTC	P0505	Idle Control System Malfunction

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

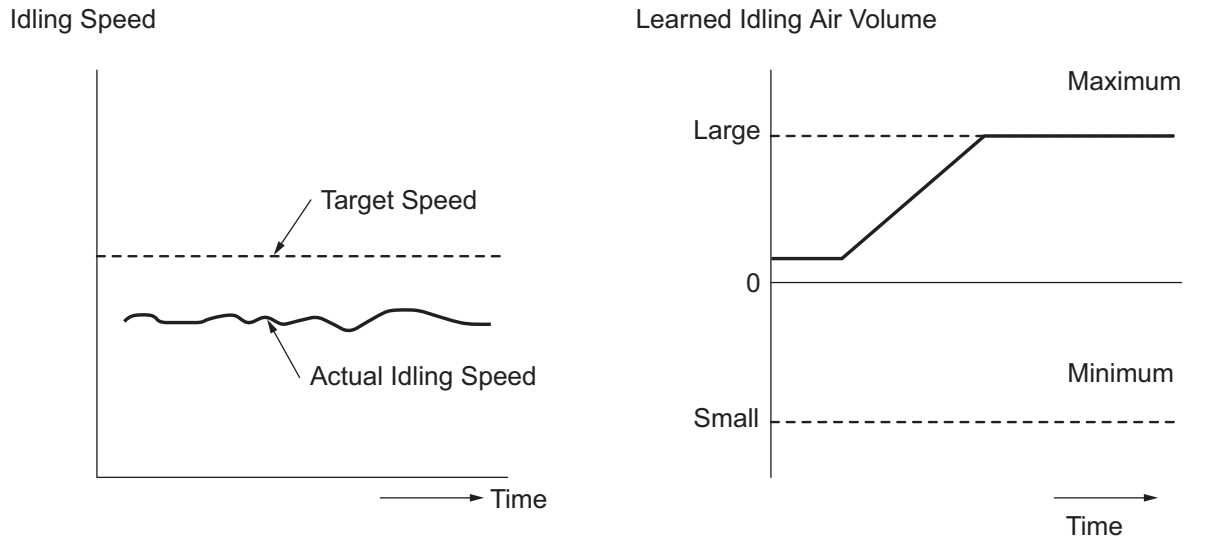
DTC No.	DTC Detection Conditions	Trouble Areas
P0505	Idling speed continues to vary greatly from target idling speed (2 trip detection logic)	• ETCS • Air induction system • PCV hose connections • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

- The learned idling air flow volume remains at the maximum or minimum volume 5 times or more during a drive cycle.
- After driving at 10 km/h (6.25 mph) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 200 rpm, 5 times or more during a drive cycle.



Example:

If the actual idling speed varies from the target idling speed by more than 200 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and sets the DTC.

HINT:

*: Threshold idling speed varies with engine load.

Example:

Y

A121611E02

ES

MONITOR STRATEGY

Related DTCs	P0505: ISC function
Required Sensors/Components (Main)	ETCS
Required Sensors/Components (Related)	Crankshaft position sensor, Engine coolant temperature sensor, and Vehicle speed sensor
Frequency of Operation	Once per driving cycle: Functional check Continuous: Range check
Duration	10 minutes: Functional check 10 seconds: Range check
MIL Operation	2 driving cycles: Functional check Immediate: Range check
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Engine	Running

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions 1 or 2 met	-
1. Frequency that both of following conditions (a) and (b) set	5 times or more
(a) Engine rpm - Target engine rpm	Less than -100 rpm, or more than 150 rpm
(b) Vehicle condition	Stop after vehicle was driven by 10 km/h (6.25 mph) or more
2. Frequency that both of following conditions (c) and (d) set	Once
(c) Engine rpm - Target engine rpm	Less than -100 rpm, or more than 150 rpm

(d) IAC flow rate learning value	1.3 L/sec. or less, or 6 L/sec. or more

INSPECTION PROCEDURE

HINT:

- The following conditions may also cause DTC P0505 to be set:
  (a) The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.
  (b) The accelerator pedal being not fully released.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following the menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0505	A
P0505 and other DTCs	B

HINT:
If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

2 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

3 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

4	CHECK THROTTLE VALVE

(a) Check the throttle valve condition.
OK:
Throttle valve is not contamainated with foreign objects and moves smoothly.

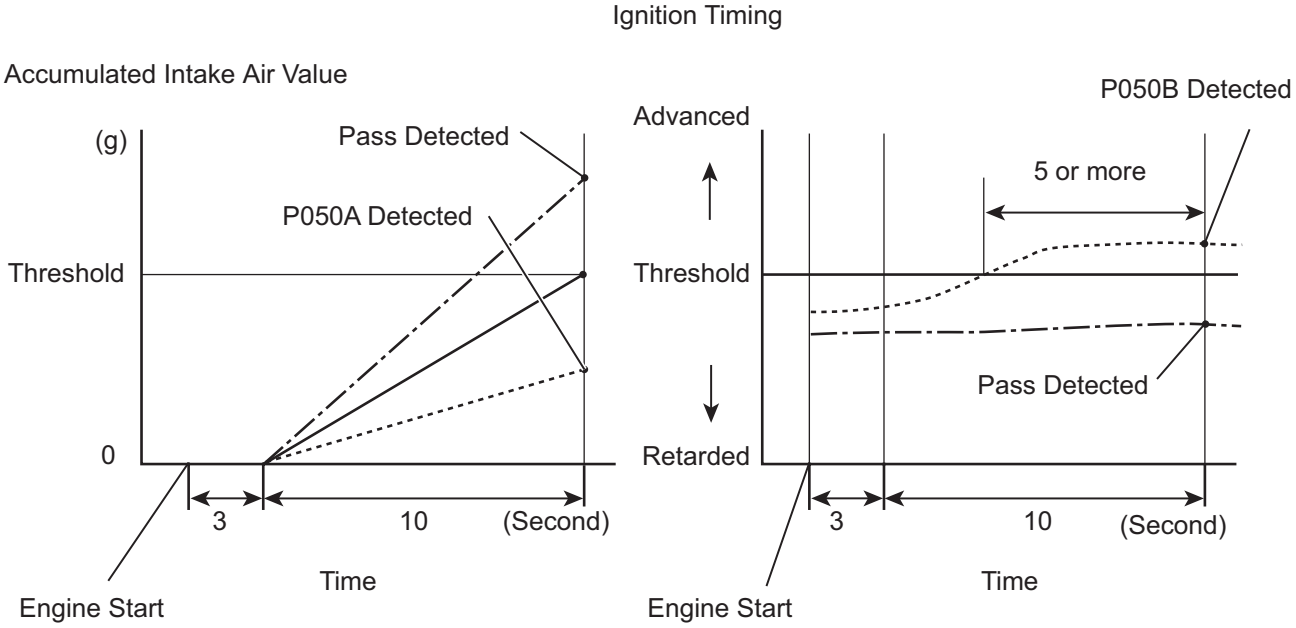
NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

REPLACE ECM

DTC	P050A	Cold Start Idle Air Control System Performance

DTC	P050B	Cold Start Ignition Timing Performance



DESCRIPTION

The Electronic Throttle Control System (ETCS) controls the engine idling speed. The ETCS operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idling speed.
In addition, the ECM retards the ignition timing and the ETCS increases the intake air amount to quickly increase the catalyst temperature at cold start to reduce emissions.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P050A	Accumulated intake air amount during 10 seconds of idling after cold start is less than threshold (2 trip detection logic)	• Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • VVT system • Air cleaner filter element • ECM
P050B	Ignition timing retard value insufficient for 5 seconds or more during 10 seconds of P050A monitoring duration at cold start (2 trip detection logic)	• Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • VVT system • Air cleaner filter element • ECM

MONITOR DESCRIPTION

The ECM monitors the intake air amount during idling and the ignition timing.
When the Engine Coolant Temperature (ECT) is between -10°C and 50 °C (14°F and 122°F), the ECM calculates the idling intake air amount for 10 seconds, beginning 3 seconds after the engine starts.
When the accumulated value is below the threshold, the ECM interprets this as a malfunction in the Idle Speed Control (ISC) system at cold start.
The ECM also monitors the ignition timing at cold start, and judges it to be incorrect when it is advanced to the same value for a warm engine for 5 seconds or more of the 10 second monitoring period.
Example:
P050A is detected when all conditions below are met (2 trip detection logic).
1. The ECT is between -10°C and 50 °C (14°F and 122°F) when the engine starts.
2. The engine idles for 13 seconds after engine start.
3. The accumulated intake air amount is below the threshold.

The ECM sets the DTC and illuminates the MIL 13 seconds after the engine is next started.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the ISC learning values are cleared. The ISC learning must be performed by warming up the engine and idling for 5 minutes with the ECT at 75°C (167°F) or more because DTCs cannot be detected with the ISC learning values cleared.

ES

MONITOR STRATEGY

Related DTCs	P050A: Idle speed control problem at cold P050B: Idle ignition timing problem at cold
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Throttle position sensor, Vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P050A:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10°C to 50°C (14°F to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 3 km/h (1.875 mph)
Time after shift position changed (A/T)	1 second or more
Atmospheric pressure	76 kPa (570 mmHg) or more

P050B:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10°C to 50°C (14°F to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 3 km/h (1.875 mph)

TYPICAL MALFUNCTION THRESHOLDS

P050A:

Accumulated air flow amount (A/T)	Varies with ECT (Example: Less than 1.44 g)

P050B:

Accumulated time when ignition timing retard value insufficient	5 seconds or more

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P050A AND/OR P050B)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following the menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read the DTCs.

Result

Display (DTC Output)	Proceed To
P050A and/or P050B	A
P050A and/or P050B and other DTCs	B

HINT:
If any DTCs other than P050A and P050B are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	READ VALUE USING INTELLIGENT TESTER (FUEL TRIM)

HINT:
Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter.
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / SHORT FT #1 and LONG FT #1.
(e) Read the values displayed on the tester.
(f) Add together the SHORT FT #1 and LONG FT #1 values to obtain the total FUEL TRIM.
OK:
Total of SHORT FT #1 and LONG FT #1 values is between -20 % and 20 %.

OK → Go to step 12

NG

3	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

ES

OK

Tester Operations	Specified Conditions
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 8

OK

4	CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → Go to step 9

OK

5	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → Go to step 10

OK

6	CHECK AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

(a) Visually check that the air cleaner filter element is not excessively contaminated with dirt or oil.
OK:
Air cleaner filter element is not excessively contaminated with dirt or oil.

NG → Go to step 11

OK

7	REPLACE MASS AIR FLOW METER

NEXT → Go to step 15

8	CHECK AND REPAIR VVT SYSTEM

NEXT → Go to step 15

ES

9	REPAIR OR REPLACE PCV HOSE

NEXT → Go to step 15

10	REPAIR OR REPLACE AIR INDUCTION SYSTEM

NEXT → Go to step 15

11	REPLACE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

NEXT → Go to step 15

12	CHECK THROTTLE VALVE

(a) Check for deposits around the throttle valve and throttle valve condition.

OK:

No deposits around throttle valve and throttle valve moves smoothly.

NG → Go to step 14

OK

13	REPLACE ECM

NEXT → Go to step 15

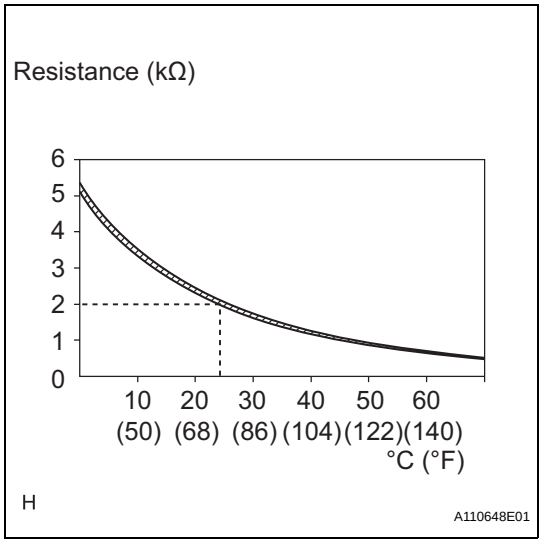
14	REPAIR OR REPLACE THROTTLE BODY ASSEMBLY

NEXT → Go to step 15

15	CHECK WHETHER DTC OUTPUT RECURS (DTC P050A AND/OR P050B)

NOTICE:
In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Switch the ECM from normal mode to check mode using the tester (see page ES-38).
(f) Start the engine to idle for a minute.
OK:
Stable fast idling.
(g) Read DTCs.
OK:
No DTC output.



NEXT

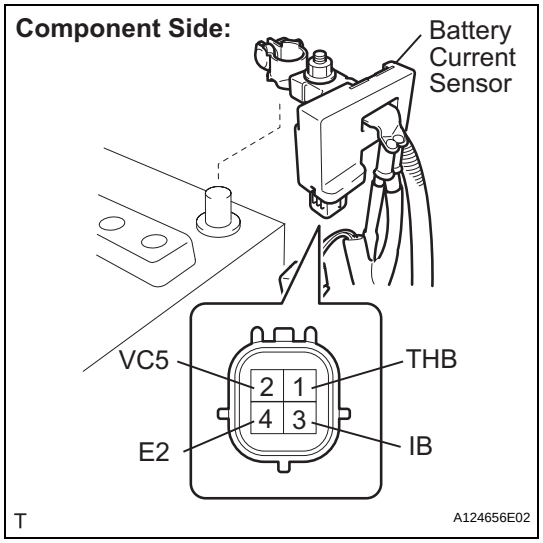
END

DTC	P0516	Battery Temperature Sensor Circuit Low

DTC	P0517	Battery Temperature Sensor Circuit High

DESCRIPTION

The battery temperature sensor installed on the battery current sensor detects battery temperature.
A thermistor is integrated into the battery temperature sensor, and the resistance in the battery temperature sensor changes according to the battery temperature.
The resistance of the thermistor in the battery temperature sensor decreases as the battery temperature increases. The resistance increases as the temperature decreases.
The battery temperature sensor is connected to the ECM. The ECM supplies 5 V from the THB terminal to the battery temperature sensor through resistor R.
The battery temperature sensor and resistor R are connected in series. This results in fluctuations in the voltage supplied from the THB terminal when the resistance changes according to the battery temperature.
The ECM determines the battery temperature according to fluctuations in voltage. When the battery temperature is high, the ECM determines to reduce the amount of current supplied from the generator in order to protect the battery.



DTC No.	DTC Detection Condition	Trouble Area
P0516	Battery temperature sensor output value is 0.2 V or less for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Battery temperature sensor • Short in battery temperature sensor circuit • ECM
P0517	Battery temperature sensor output value is 4.8 V or more for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Battery temperature sensor • Open in battery temperature sensor circuit • ECM

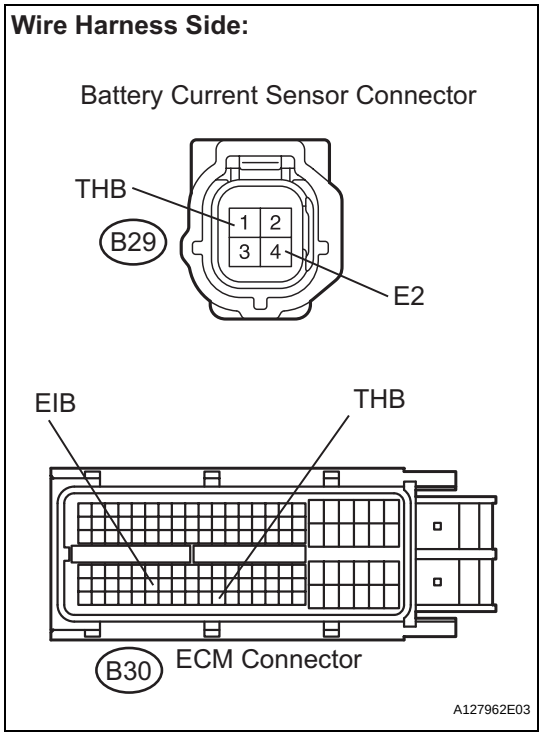
WIRING DIAGRAM

Refer to DTC P1550 (see page ES-262)

INSPECTION PROCEDURE

1 INSPECT BATTERY CURRENT SENSOR

(a) Disconnect the B29 battery current sensor connector.
(b) Measure the resistance.



Standard resistance

Tester Connection	Condition	Specified Condition
1 (THB) - 4 (E2)	24 to 26°C (75.2 to 78.8°F)	1.91 to 2.065 kΩ

NG → **REPLACE BATTERY CURRENT SENSOR**

OK

2 CHECK HARNESS AND CONNECTOR (BATTERY CURRENT SENSOR - ECM)

(a) Disconnect the B29 battery current sensor connector.
(b) Disconnect the B30 ECM connectors.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance (Check for open)

Tester Connection	Specified Condition
B29-1 (THB) - B30-120 (THB)	Below 1 Ω
B29-4 (E2) - B30-92 (EIB)	Below 1 Ω

Standard resistance (Check for short)

Tester Connection	Specified Condition
B29-1 (THB) or B30-120 (THB) - Body ground	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

ES

DTC	P0560	System Voltage

DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is in the OFF position. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and sets the DTC.

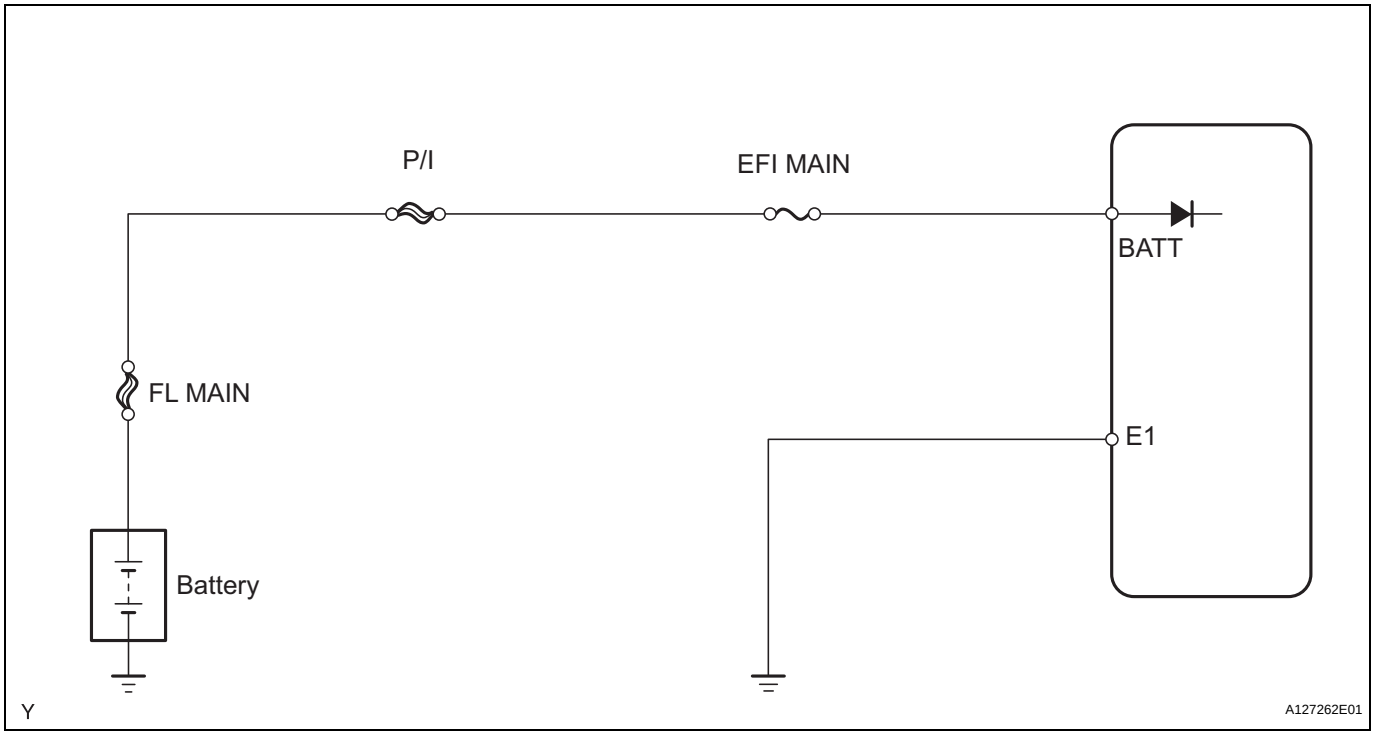
DTC No.	DTC Detection Conditions	Trouble Areas
P0560	Open in ECM back up power source circuit (1 trip detection logic)	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

ES

HINT:
If DTC P0560 is set, the ECM does not store other DTCs or the data stored in the ECM are partly erased.

MONITOR STRATEGY

Related DTCs	P0560: ECM system voltage
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate (MIL illuminated after next engine start)
Sequence of Operation	None



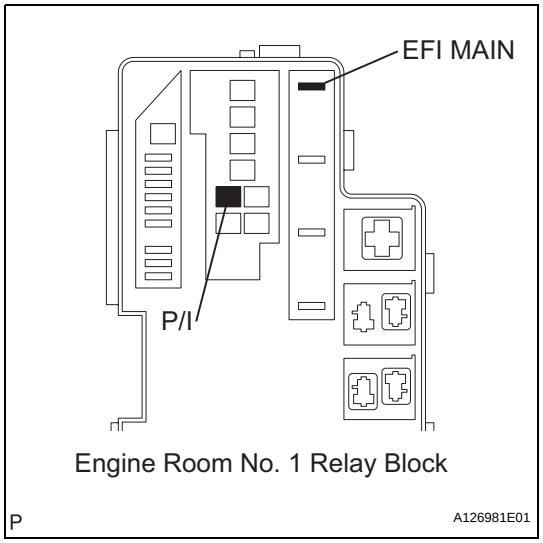
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM power source	Less than 3.5 V

WIRING DIAGRAM

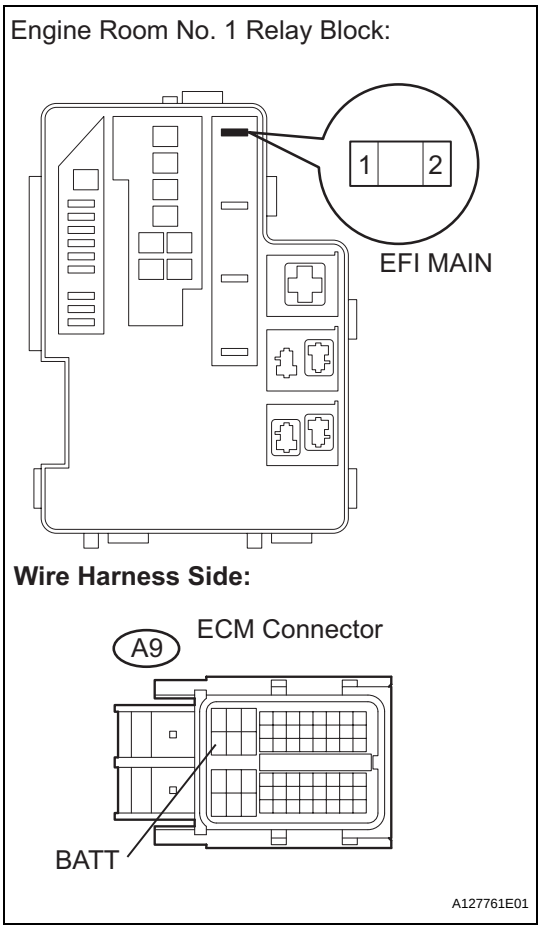


ES

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK FUSE (EFI MAIN AND P/I)



Engine Room No. 1 Relay Block

(a) Remove the EFI MAIN fuse and P/I fuse from the engine room No. 1 relay block.
(b) Measure the resistance of the EFI MAIN fuse and P/I fuse.
Standard resistance:
Below 1 Ω
(c) Reinstall the EFI MAIN fuse and P/I fuse.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

2	CHECK HARNESS AND CONNECTOR (ECM - EFI MAIN FUSE, EFI MAIN FUSE - BATTERY)

(a) Check the harness and the connector between the EFI MAIN fuse and ECM.
  (1) Remove the EFI MAIN fuse from the engine No. 1 room relay block.
  (2) Disconnect the A9 ECM connector.
  (3) Measure the resistance.
  Standard resistance (Check for open)

Tester Connections	Specified Conditions
2 (EFI MAIN fuse) - A9-20 (BATT)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
2 (EFI MAIN fuse) or A9-20 (BATT) - Body ground	10 kΩ or higher

  (4) Reconnect the ECM connector.
  (5) Reinstall the EFI MAIN fuse.

(b) Check the harness and the connector between the EFI MAIN fuse and battery.
  (1) Remove the EFI MAIN fuse from the engine room No. 1 relay block.
  (2) Disconnect the positive battery terminal.
  (3) Check the resistance.
  Standard resistance (Check for open)

Tester Connections	Specified Conditions
Battery positive terminal - 1 (EFI MAIN fuse)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
Battery positive terminal or 1 (EFI MAIN fuse) - Body ground	10 kΩ or higher

  (4) Reconnect the positive battery terminal.
  (5) Reinstall the EFI MAIN fuse.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT BATTERY

(a) Check that the battery is not depleted.
  OK:
  Battery is not depleted

NG → **REPLACE BATTERY**

OK

4	CHECK BATTERY TERMINAL

(a) Check that the battery terminals are not loose or corroded.
OK:
Battery terminals are not loose or corroded

NG → **REPAIR OR REPLACE BATTERY TERMINAL**

OK ↓

5	CHECK WHETHER DTC OUTPUT RECURS

ES

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Turn the ignition switch OFF and turn the tester OFF.
(e) Start the engine and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0560	A
No output	B

B → **CHECK FOR INTERMITTENT PROBLEMS**

A ↓

REPLACE ECM

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error

DTC	P0606	ECM / PCM Processor

DTC	P0607	Control Module Performance

DTC	P0657	Actuator Supply Voltage Circuit / Open

DESCRIPTION

The ECM continuously monitors its own internal memory status, internal circuits, and output signals transmitted to the throttle actuator. This self-check ensures that the ECM is functioning properly. If any malfunction is detected, the ECM sets the appropriate DTC and illuminates the MIL.
The ECM memory status is diagnosed by internal mirroring of the main CPU and the sub CPU to detect Random Access Memory (RAM) errors. The two CPUs also perform continuous mutual monitoring. The ECM illuminates the MIL and sets a DTC if: 1) outputs from the two CPUs are different or deviate from the standards, 2) the signals sent to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

DTC No.	DTC Detection Conditions	Trouble Areas
P0604 P0606 P0607 P0657	ECM internal error (1 trip detection logic)	ECM

MONITOR STRATEGY

Related DTCs	P0604: ECM RAM error P0606: ECM range check P0607: ECM CPU malfunction P0657: ETCS power supply
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Once per driving cycle: P0657 Continuous: P0604, P0606 and P0607
Duration	Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM RAM errors (P0604):

RAM mirror check	Fail

ECM CPU range check (P0606):

Either of following conditions met:	-
Difference between throttle valve position of main CPU and throttle valve position of sub CPU	0.3 V or more
Difference between accelerator pedal position of main CPU and accelerator pedal position of sub CPU	0.3 V or more

ECM CPU malfunction (P0607):

Either A or B met	-
A. All of following conditions (a), (b) and (c) met	-
(a) CPU reset	1 time or more
(b) Learned TP - learned APP	0.4 V or more
(c) Electronic throttle actuator	OFF
B. CPU reset	2 times or more

ETCS power supply (P0657):

ETCS power supply when ignition switch turned ON	7 V or more

INSPECTION PROCEDURE

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0604, P0606, P0607 or P0657)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0604, P0606, P0607 or P0657	A
P0604, P0606, P0607 or P0657 and other DTCs	B

B → **GO TO DTC CHART**

A →

REPLACE ECM

DTC	P0617	Starter Relay Circuit High

DESCRIPTION

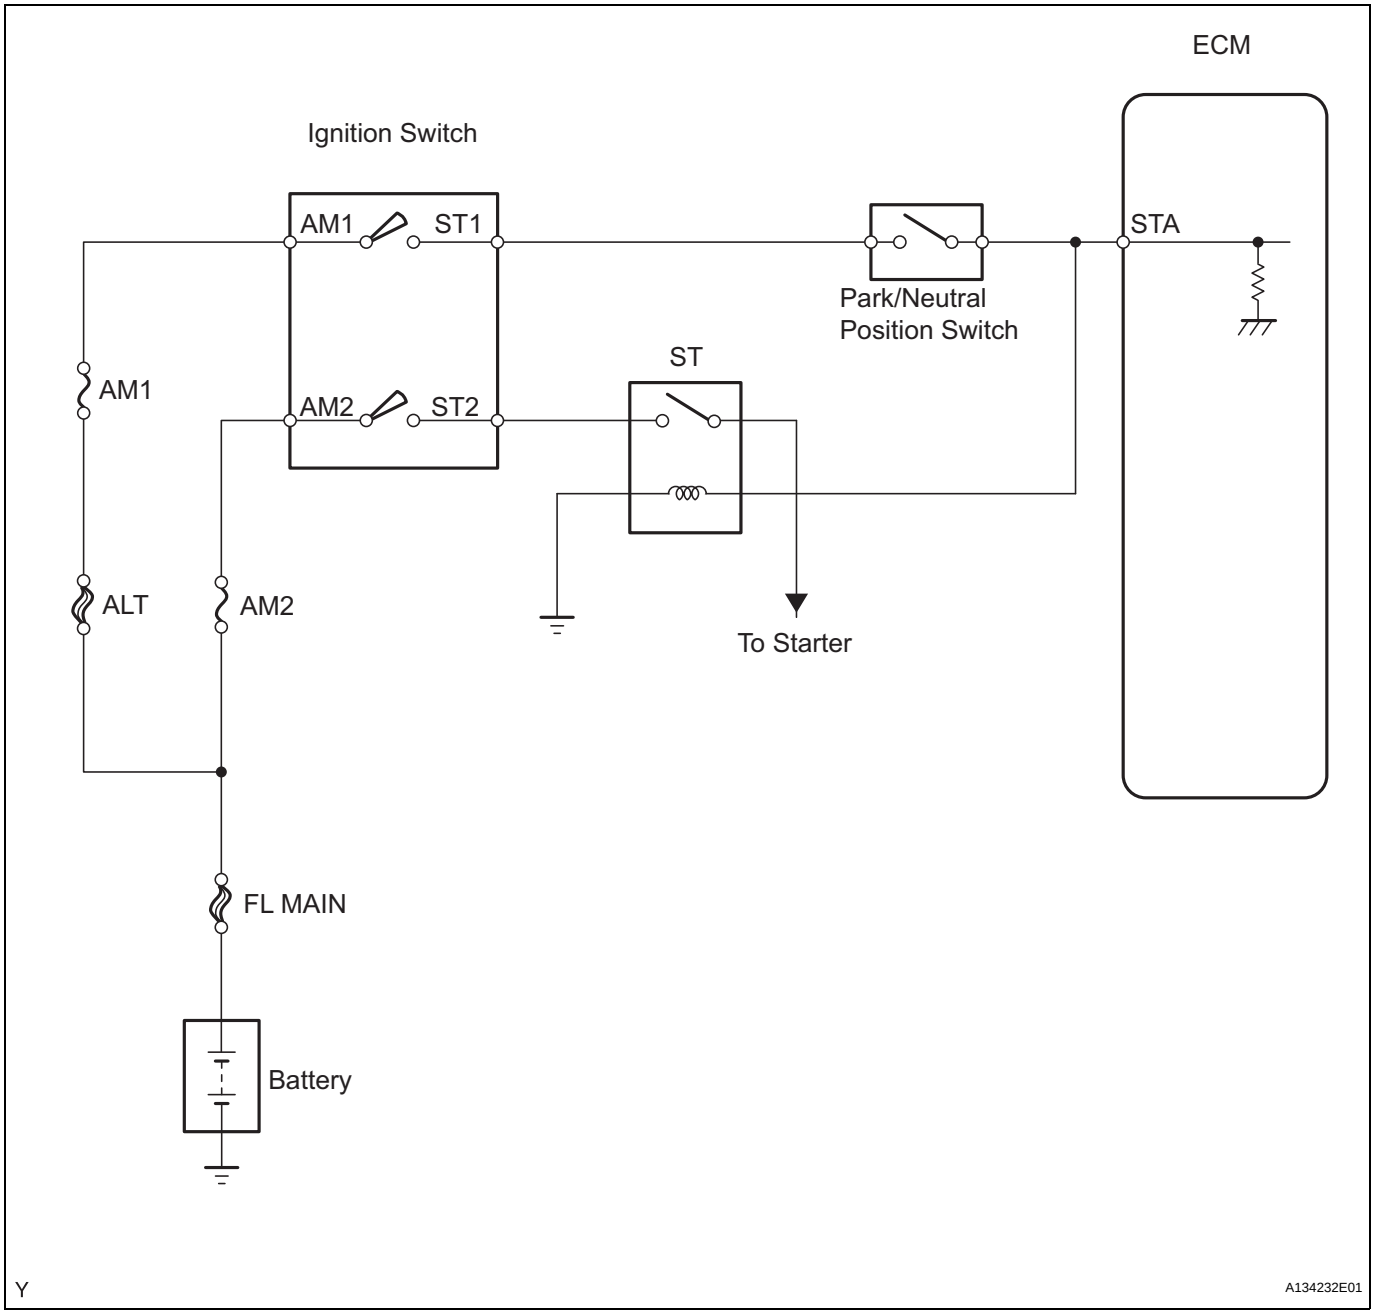
While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and sets the DTC.
This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.

DTC No.	DTC Detection Conditions	Trouble Areas
P0617	When conditions (a), (b) and (c) met, positive (+B) battery voltage 10.5 V or more applied to ECM for 20 seconds (1 trip detection logic) (a) Vehicle speed 20 km/h (12.4 mph) or more (b) Engine speed 1,000 rpm or more (c) STA signal ON	• Park/Neutral Position (PNP) switch • Starter relay circuit • Ignition switch • ECM

ES

MONITOR STRATEGY

Related DTCs	P0617: Starter signal
Required Sensors/Components (Main)	STARTER relay, PNP switch, Clutch start switch and Ignition switch
Required Sensors/Components (Related)	Vehicle Speed Sensor (VSS), Crankshaft Position (CKP) sensor
Frequency of Operation	Continuous
Duration	20 seconds
MIL Operation	Immediate
Sequence of Operation	None



TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Vehicle speed	20 km/h (12.43 mph) or more
Engine speed	1,000 rpm or more

TYPICAL MALFUNCTION THRESHOLDS

Starter signal	ON

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- The following troubleshooting flowchart is based on the premise that the engine is cranked normally. If the engine will not crank, proceed to the problem symptoms table (see page ES-24).
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

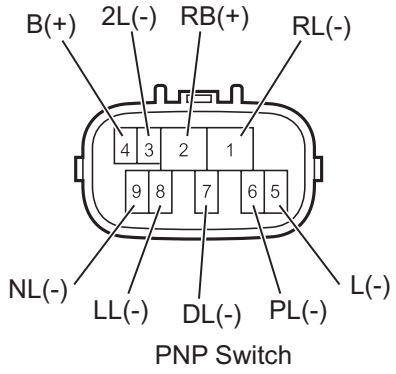
1	**READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.

(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

OK

Ignition Switch Positions	STARTER SIG
ON	OFF
START	ON



OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

ES

2 INSPECT PARK/NEUTRAL POSITION SWITCH ASSEMBLY

Component Side:

(a) Disconnect the B26 PNP switch connector.
(b) Measure the resistance when the transmission gear selector lever is moved to each position.

Standard resistance

Gear Selector Lever Positions	Tester Connections	Specified Conditions
P	2 - 6, 4 - 5	Below 1 Ω
R	1 - 2	Below 1 Ω
N	2 - 9, 4 - 5	Below 1 Ω
D	2 - 7	Below 1 Ω
2	2 - 3	Below 1 Ω
L	2 - 8	Below 1 Ω

(c) Reconnect the PNP switch connector.

OK → **Go to step 5**

NG

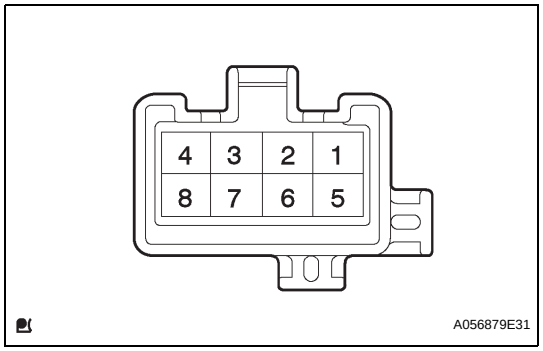
3 REPLACE PARK/NEUTRAL POSITION SWITCH ASSEMBLY

NEXT

4 READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

OK



Ignition Switch Positions	STARTER SIG
ON	OFF

Ignition Switch Positions	STARTER SIG
START	ON

OK → SYSTEM OK

NG

5 INSPECT IGNITION OR STARTER SWITCH ASSEMBLY

(a) Disconnect the E3 ignition switch connector.
(b) Check the resistance.
Standard resistance

Tester Connections	Ignition Switch Positions	Specified Conditions
All Terminals	LOCK	10 kΩ or higher
2 - 3	ACC	Below 1 Ω
2 - 3, 2 - 4, 6 - 7	ON	
1 - 2, 2 - 4, 6 - 7, 7 - 8	START	

(c) Reconnect the ignition switch connector.

OK → Go to step 7

NG

6 REPLACE IGNITION OR STARTER SWITCH ASSEMBLY

NEXT

7 READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

OK

Ignition Switch Positions	STARTER SIG
ON	OFF
START	ON

OK → SYSTEM OK

NG

8	REPAIR OR REPLACE HARNESS OR CONNECTOR (PNP SWITCH - STA TERMINAL OF ECM)

NEXT

9	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Drive the vehicle at more than 20 km/h (12.43 mph) for over 20 seconds.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0617	A
No DTC	B

B → SYSTEM OK

A

REPLACE ECM

DTC	P0630	VIN not Programmed or Mismatch - ECM / PCM

DESCRIPTION

DTC P0630 is set when the Vehicle Identification Number (VIN) is not stored in the Engine Control Module (ECM) or the input VIN is incorrect. Input the VIN with the intelligent tester.

DTC No.	DTC Detection Conditions	Trouble Areas
P0630	• VIN not stored in ECM • Input VIN incorrect (1 trip detection logic)	ECM

MONITOR STRATEGY

Related DTCs	P0630: VIN not programmed
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.325 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Battery voltage	8 V or more
Ignition switch	ON
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

VIN code	Not programmed

COMPONENT OPERATING RANGE

VIN code	Programmed

INSPECTION PROCEDURE

1	READ CURRENT DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed To
P0630	A
P0630 and other DTCs	B

If any DTCs other than P0630 are output, troubleshoot those DTCs first.

NOTICE:
If P0630 is set, the VIN must be input to the ECM using the intelligent tester. However, all DTCs are cleared automatically by the tester when the VIN is input. If DTCs other than P0630 are set, check them first.

DTC	P0724	Brake Switch "B" Circuit High

DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling while driving in the lock-up condition when the brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC No.	DTC Detection Condition	Trouble Area
P0724	Stop light switch remains ON even when vehicle is driven in GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) pattern 5 times (2 trip detection logic)	• Short in stop light switch signal circuit • Stop light switch • ECM

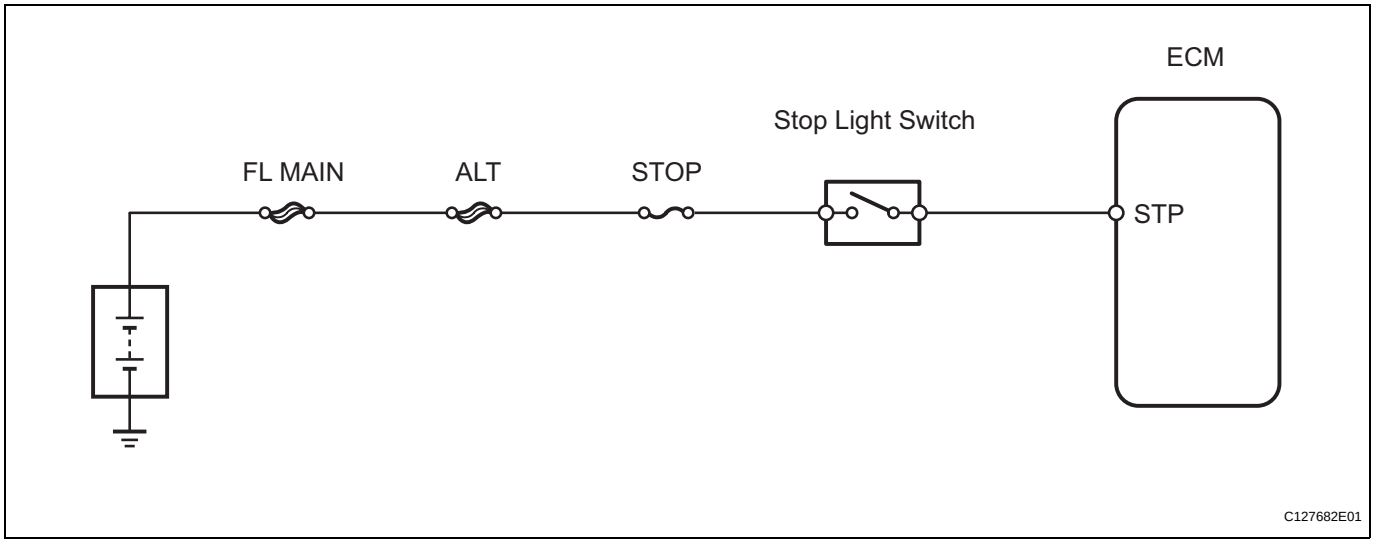
ES

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains ON. When the stop light switch remains ON during GO and STOP driving, the ECM interprets this as a fault in the stop light switch. Then the MIL illuminates and the ECM stores the DTC. The vehicle must GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) 5 times for 2 driving cycles in order for the DTC to be output.

MONITOR STRATEGY

Related DTCs	P0724: Stop light switch/Range check/Rationality
Required sensors/Components	Stop light switch, Vehicle speed sensor
Frequency of operation	Continuous
Duration	GO and STOP 5 times
MIL operation	2 driving cycles
Sequence of operation	None



TYPICAL ENABLING CONDITIONS

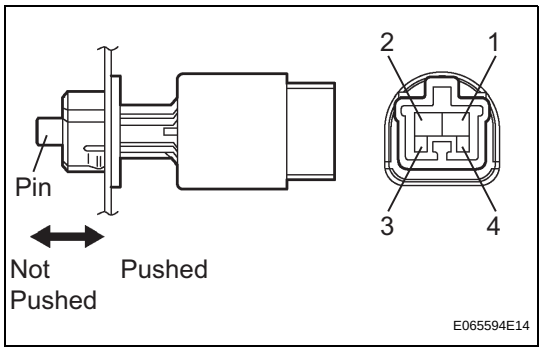
The monitor will run whenever this DTC is not present.	None
Battery voltage	8 V or more
Starter	OFF
Ignition switch	ON
GO (Vehicle speed is 30 km/h (18.63 mph) or more)	Once
STOP (Vehicle speed is less than 3 km/h (1.86 mph))	Once

TYPICAL MALFUNCTION THRESHOLDS

Brake switch	Stuck ON

WIRING DIAGRAM

ES



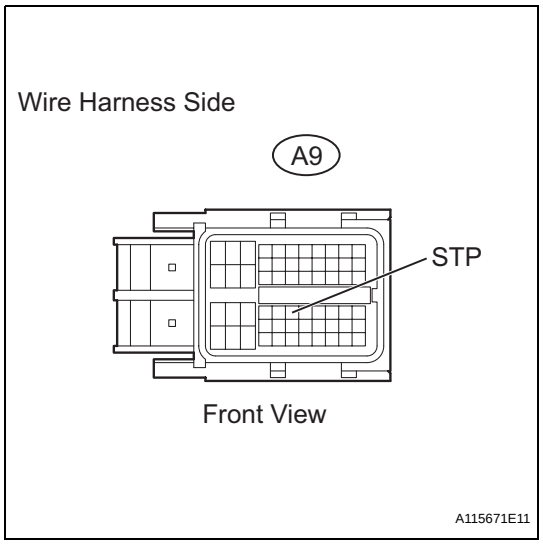
INSPECTION PROCEDURE

HINT:
Using the intelligent tester's DATA LIST allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the DATA LIST early in troubleshooting is one way to save time.
NOTICE:
In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

1. Warm up the engine.
2. Turn the ignition switch OFF.
3. Connect the intelligent tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
4. Turn the ignition switch ON.
5. Turn the intelligent tester ON.
6. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
7. Follow the instructions on the tester and read the DATA LIST.

Item	Measurement Item/ Range (Display)	Normal Condition	Diagnostic Note
STOP LIGHT SW	Stop light switch status/ ON or OFF	• Brake pedal is depressed: ON • Brake pedal is released: OFF	-

1	INSPECT STOP LIGHT SWITCH



(a) Remove the A3 stop light switch.
(b) Measure the resistance of the switch.
Standard resistance

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pin pushed (pedal released)	Below 1 Ω
1 - 2	Pin not pushed (pedal depressed)	10 kΩ or higher
3 - 4	Pin pushed (pedal released)	10 kΩ or higher
3 - 4	Pin not pushed (pedal depressed)	Below 1 Ω

NG → REPLACE STOP LIGHT SWITCH

OK

2 CHECK WIRE HARNESS (ECM - BATTERY)

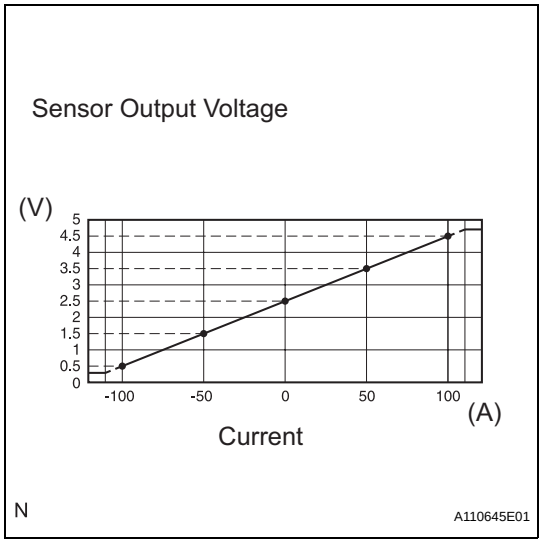
(a) Measure the voltage of the wire harness side connector.
Standard voltage

Tester Connection	Condition	Specified Condition
A9-36 (STP) - Body ground	Brake pedal is depressed	10 to 14 V
A9-36 (STP) - Body ground	Brake pedal is released	Below 1 V

NG → REPAIR OR REPLACE HARNESS AND CONNECTOR

OK

REPLACE ECM

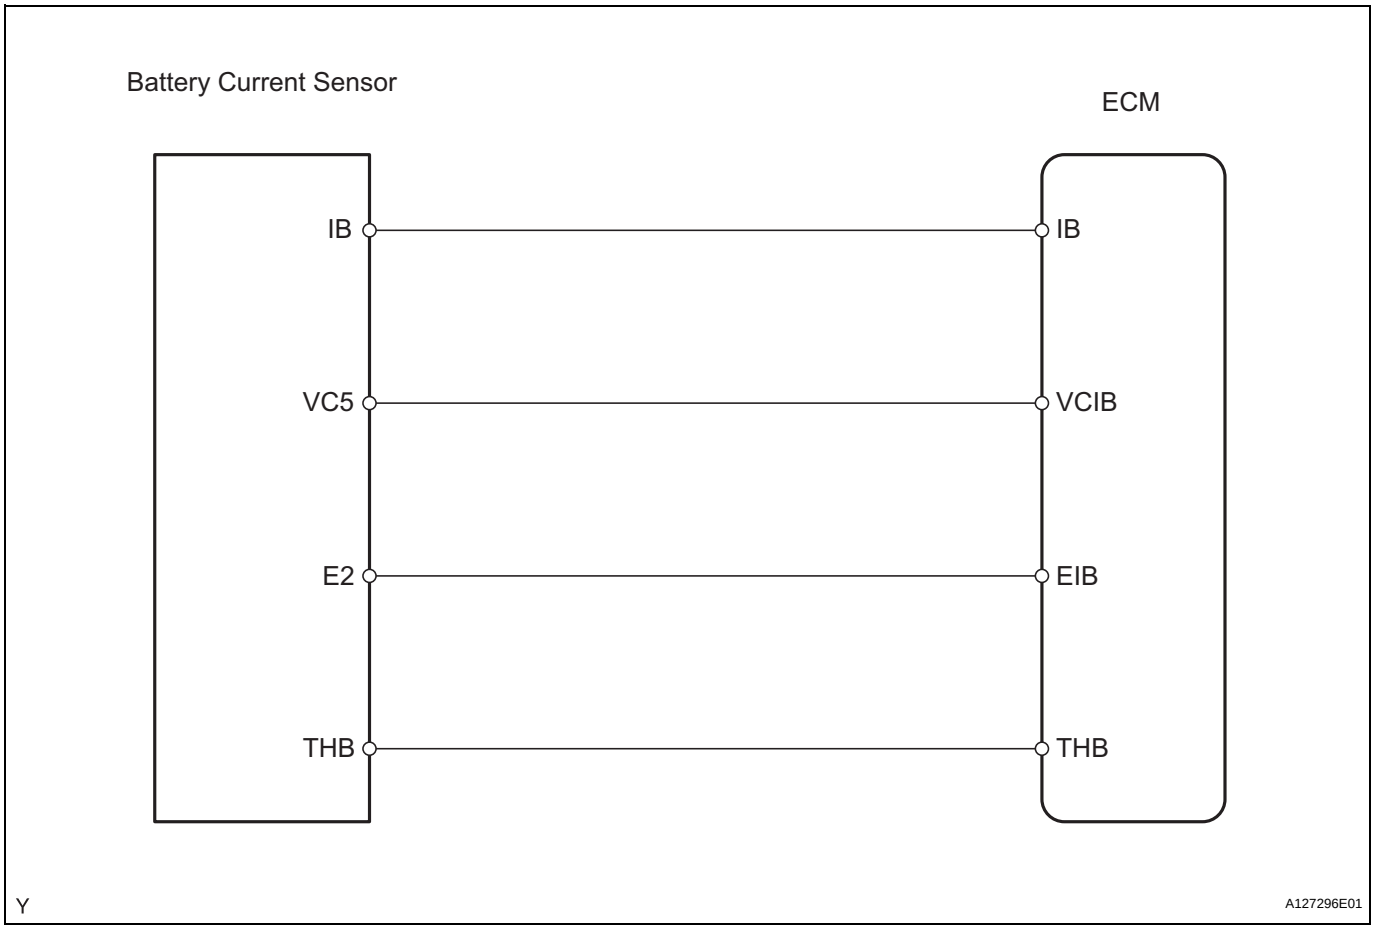


ES

DTC	P1550	Battery Current Sensor Circuit

DTC	P1551	Battery Current Sensor Circuit Low

DTC	P1552	Battery Current Sensor Circuit High

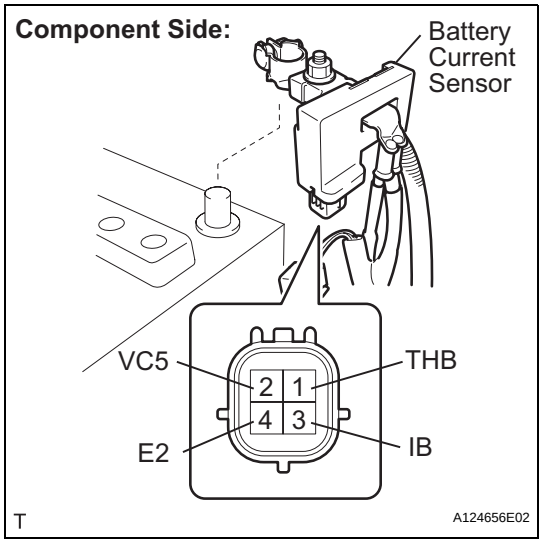


DESCRIPTION

The battery current sensor installed on the positive (+) battery terminal detects the amount of current supplied from the generator.
The battery current sensor changes current to voltage (at the positive (+) battery terminal) and sends it to the ECM. The ECM controls the voltage of the generator based on the signals from the battery current sensor.

DTC No.	DTC Detection Condition	Trouble Area
P1550	The following condition continues for 10 seconds or more with the ignition switch ON (1 trip detection logic): • Difference between the maximum and minimum current values of the battery current sensor is 1 A or less	• Open or short in battery current sensor circuit • Battery current sensor assembly • ECM
P1551	Battery current sensor output value is 0.2 V or less for 0.5 seconds or more with the ignition switch ON (1 trip detection logic):	• Short in battery current sensor circuit • Battery current sensor assembly • ECM
P1552	Battery current sensor output value is 4.8 V or more for 0.5 seconds or more with the ignition switch ON (1 trip detection logic):	• Open in battery current sensor circuit • Battery current sensor assembly • ECM

WIRING DIAGRAM



INSPECTION PROCEDURE

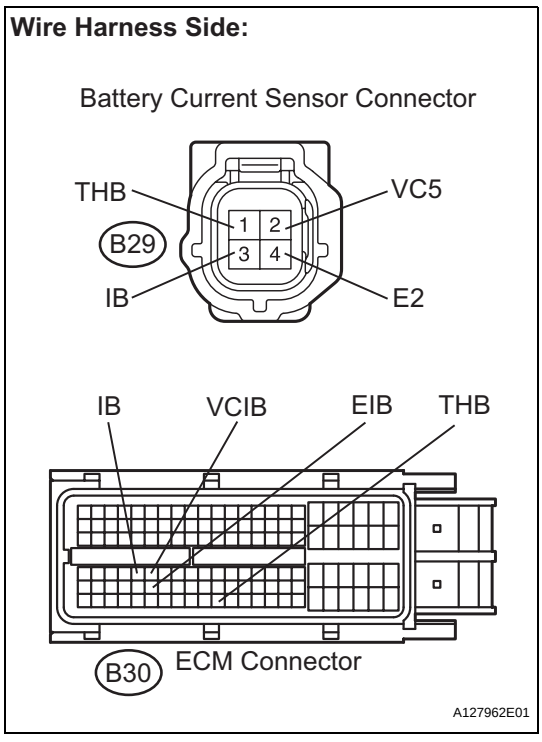
HINT:

- If different DTCs that are related to a different system are output simultaneously while terminal E2 is used as a ground terminal, terminal E2 may be open.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT BATTERY CURRENT SENSOR ASSEMBLY

(a) Disconnect the B29 battery current sensor connector.
(b) Measure the resistance of the battery current sensor.

Standard resistance



Tester Connection	Specified Condition
2 (VC5) - 4 (E2)	3 to 10 kΩ
2 (VC5) - 3 (IB)	Below 0.5 kΩ
3 (IB) - 4 (E2)	3 to 10 kΩ

HINT:
The resistance differs according to the tester type.

NG → **REPLACE BATTERY CURRENT SENSOR ASSEMBLY**

OK

2 CHECK HARNESS AND CONNECTOR (BATTERY CURRENT SENSOR - ECM)

(a) Disconnect the B29 battery current sensor connector.
(b) Disconnect the B30 ECM connectors.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance (Check for open)

Tester Connection	Specified Condition
B29-3 (IB) - B30-68 (IB)	Below 1 Ω
B29-2 (VC5) - B30-69 (VCIB)	Below 1 Ω
B29-4 (E2) - B30-92 (EIB)	Below 1 Ω
B29-1 (THB) - B30-120 (THB)	Below 1 Ω

Standard resistance (Check for short)

Tester Connection	Specified Condition
B29-3 (IB) or B30-68 (IB) - Body ground	10 kΩ or higher
B29-2 (VC5) or B30-69 (VCIB) - Body ground	10 kΩ or higher
B29-1 (THB) or B30-120 (THB) - Body ground	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

DTC	P1602	Deterioration of Battery

DESCRIPTION

The ECM determines the battery power according to the voltage of the BATT terminal while the engine is running (not cranking).

DTC No.	DTC Detection Condition	Trouble Area
P1602	Battery power is 0 % (1 trip detection logic)	• Battery • ECM back-up power source circuit

INSPECTION PROCEDURE

1	INSPECT BATTERY

(a) Inspect the battery specific gravity.
  (1) Check the specific gravity of each cell.
    Standard gravity:
    1.25 to 1.29 at 20°C (68°F)

(b) Inspect the battery voltage.
  (1) After the vehicle is driven for 20 minutes, stop the engine.
  (2) Turn the ignition switch ON, and turn on the headlights, blower fan and defogger for 1 minute.
  (3) Turn the ignition switch OFF.
  (4) Measure the battery voltage.
    Standard voltage:
    9.6 V or more

NG → **REPLACE BATTERY**

OK

CHECK ECU POWER SOURCE CIRCUIT

DTC	P2102	Throttle Actuator Control Motor Circuit Low

DTC	P2103	Throttle Actuator Control Motor Circuit High

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

ES

DTC No.	DTC Detection Conditions	Trouble Areas
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) Throttle actuator duty ratio 80 % or more (b) Throttle actuator current 0.5 A or less	• Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Either of following conditions met (1 trip detection logic): • Hybrid IC diagnosis signal failure • Hybrid IC current limiter port failure	• Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and sets a DTC.
Example:
When the electrical current is less than 0.5 A and the throttle actuator duty ratio exceeds 80 %, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and sets a DTC. If the malfunction is not repaired successfully, a DTC is set when the engine is quickly revved to a high rpm several times after the engine has idled for 5 seconds after engine start.

MONITOR STRATEGY

Related DTCs	P2102: Throttle actuator current (low current) P2103: Throttle actuator current (high current)
Required Sensors/Components (Main)	Throttle actuator (throttle body)
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	2 seconds: P2102 0.1 seconds or 0.6 seconds: P2103
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

P2102:

Throttle actuator	Activated
Duty-cycle ratio to open throttle actuator	80 % or more

Throttle actuator power supply	8 V or more

P2103:

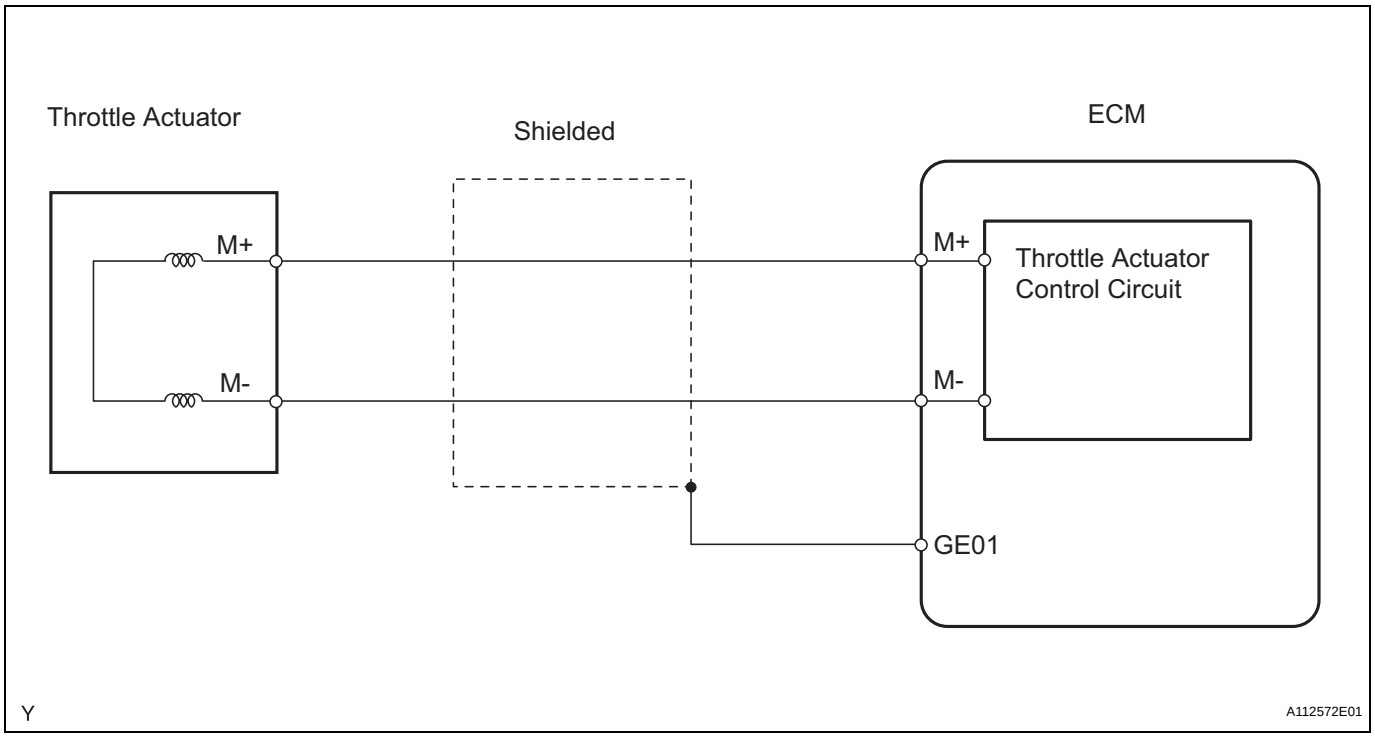
Throttle actuator	Activated
Throttle actuator power supply	8 V or more
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

P2102:

Throttle actuator current	Less than 0.5 A

P2103:



Hybrid IC current limiter port	Fail

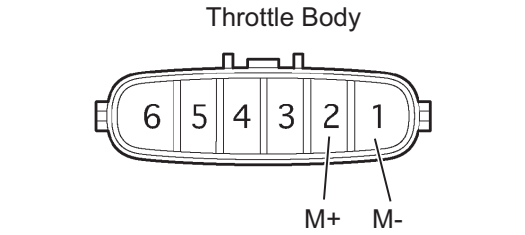
ES

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

INSPECTION PROCEDURE



HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- The throttle actuator current (THROTTLE MOT) and the throttle actuator duty ratio (THROTL OPN DUTY / THROTL CLS DUTY) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.

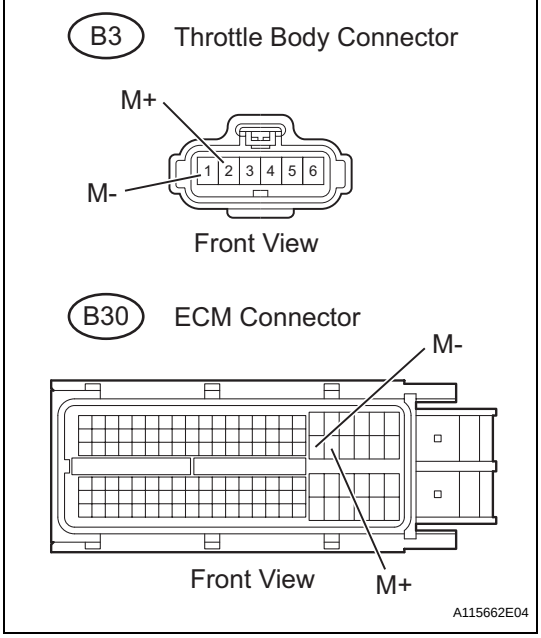
1 INSPECT THROTTLE BODY (RESISTANCE OF THROTTLE ACTUATOR)

ES

Component Side:

(a) Disconnect the B3 throttle body connector.
(b) Measure the resistance of the throttle actuator.
Standard resistance

Tester Connections	Specified Conditions
2 (M+) - 1 (M-)	0.3 to 100 Ω at 20°C (68°F)



(c) Reconnect the throttle body connector.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

2 CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)

Wire Harness Side:

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance (Check for open)

Tester Connections	Specified Conditions
B3-2 (M+) - B30-42 (M+)	Below 1 Ω
B3-1 (M-) - B30-41 (M-)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
B3-2 (M+) or B30-42 (M+) - Body ground	10 kΩ or higher
B3-1 (M-) or B30-41 (M-) - Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	INSPECT THROTTLE BODY ASSEMBLY

(a) Check for foreign objects between the throttle valve and the housing.
OK:
No foreign objects between throttle valve and housing.

NG → **REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY**

OK

4	INSPECT THROTTLE VALVE

(a) Check if the throttle valve opens and closes smoothly.
OK:
Throttle valve opens and closes smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

REPLACE ECM

DTC	P2111	Throttle Actuator Control System - Stuck Open

DTC	P2112	Throttle Actuator Control System - Stuck Closed

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM in order that it can control the throttle actuator, and therefore the throttle valve, appropriately in response to driver inputs.

HINT:

ES

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Conditions	Trouble Areas
P2111	Throttle actuator does not close when signaled by ECM (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve
P2112	Throttle actuator does not open when signaled by ECM (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2111: Throttle actuator stuck open P2112: Throttle actuator stuck closed
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P2111 (Throttle actuator stuck open):

All of following conditions met	-
Throttle actuator current	2 A or more
Duty cycle to close throttle	80 % or more

P2112 (Throttle actuator stuck closed):

All of following conditions met	-
Throttle actuator current	2 A or more
Duty cycle to open throttle	80 % or more

TYPICAL MALFUNCTION THRESHOLDS

P2111 (Throttle actuator stuck open):

TP sensor voltage change	No change

P2112 (Throttle actuator stuck closed):

TP sensor voltage change	No change

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

Refer to DTC P2102 (see page ES-266).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2111 or P2112	A
P2111 or P2112 and other DTCs	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

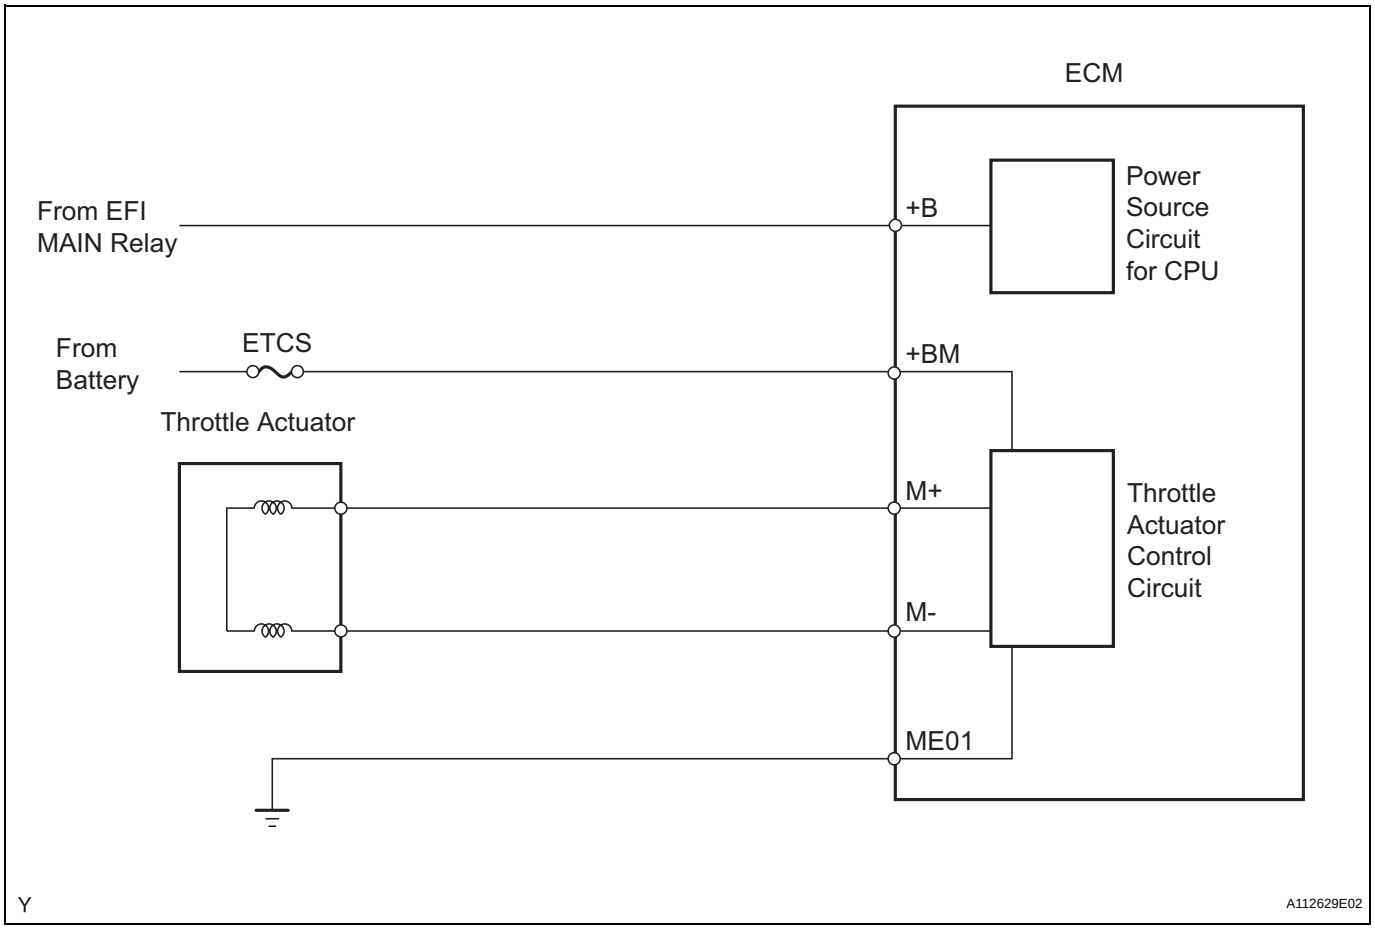
3 CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed To
No DTC	A
P2111 or P2112	B

B → **REPLACE ECM**



A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P2118	Throttle Actuator Control Motor Current Range / Performance

DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (less than 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the ignition switch OFF. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.
HINT:
The ETCS does not use a throttle cable.

DTC No.	DTC Detection Conditions	Trouble Areas
P2118	Open in ETCS power source (+BM) circuit (1 trip detection logic)	• Open in ETCS power source circuit • Battery • Battery terminals • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 5 seconds after the engine is next started.

MONITOR STRATEGY

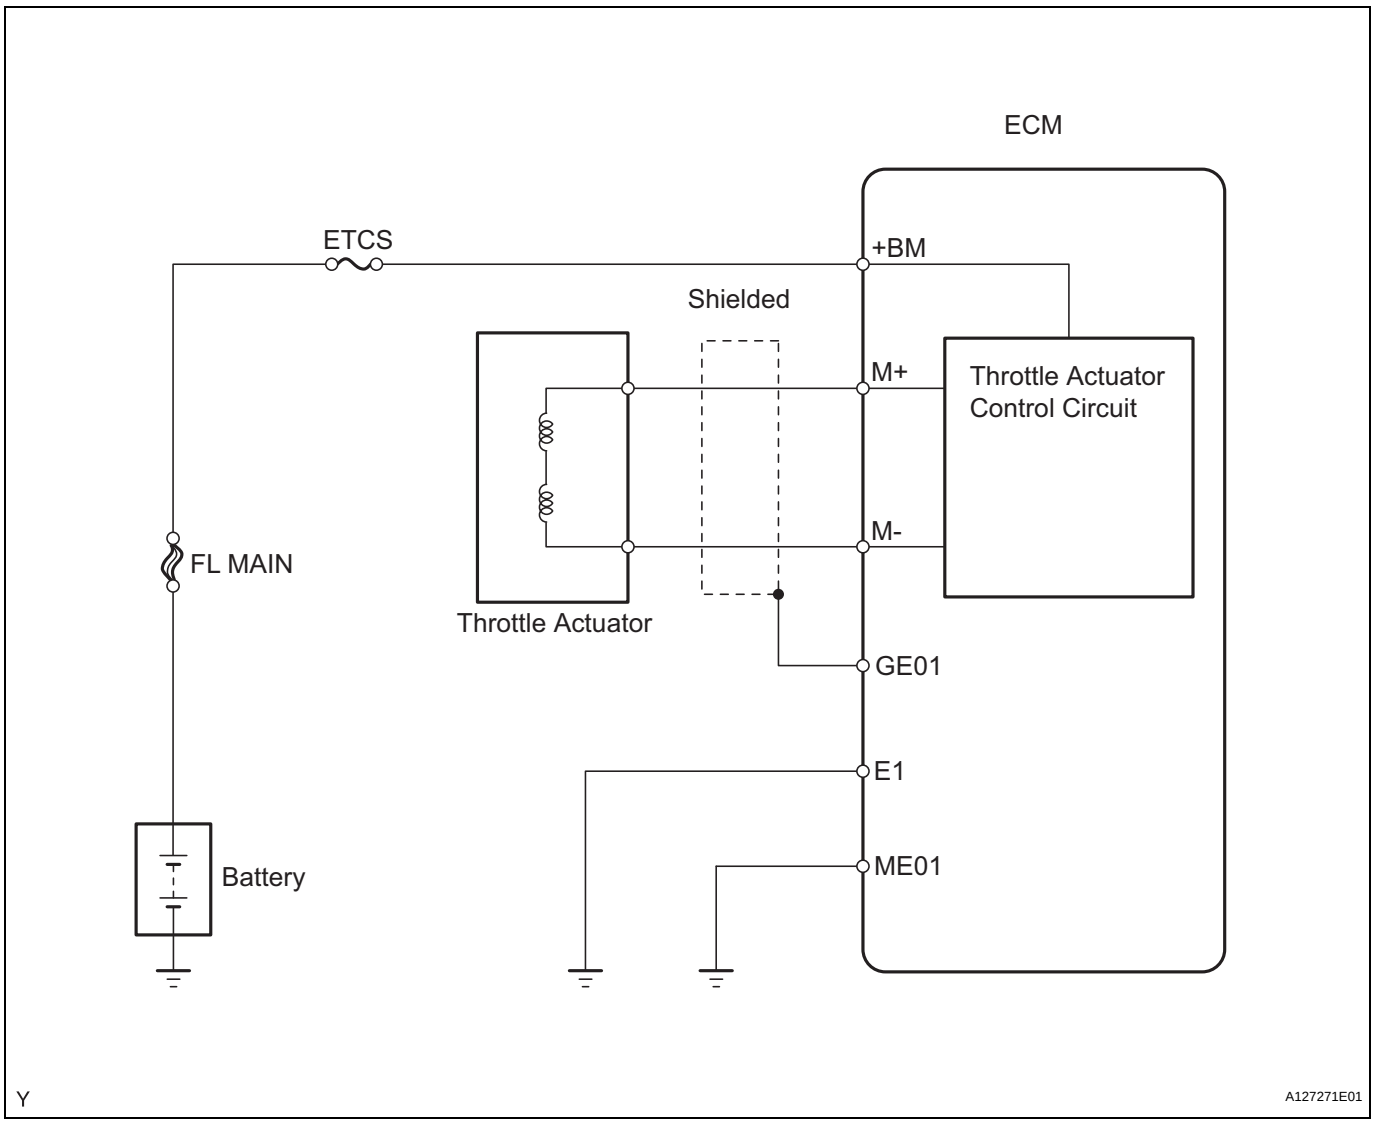
Related DTCs	P2118: Throttle actuator power supply
Required Sensors/Components (Main)	Throttle actuator, throttle valve, ETCS fuse
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	0.8 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	8 V or more
Electronic throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

Throttle actuator power supply voltage (+BM)	Less than 4 V



COMPONENT OPERATING RANGE

Throttle actuator power supply voltage (+BM)	9 to 14 V

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

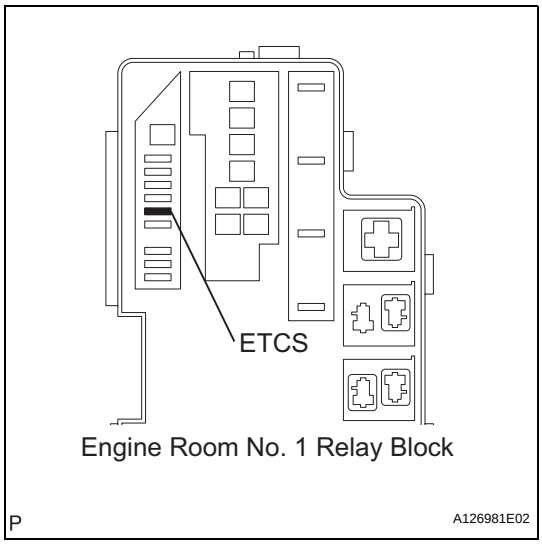
WIRING DIAGRAM

ES

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



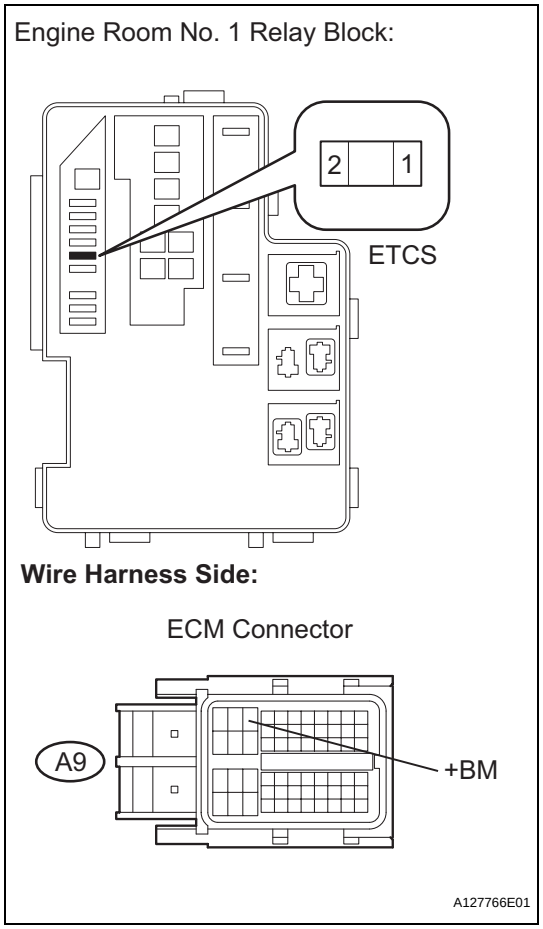
1	READ VALUE USING INTELLIGENT TESTER (+BM VOLTAGE)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / +BM VOLTAGE.
(e) Read the value displayed on the tester.
Standard voltage:
9 to 14 V

OK → Go to step 5

NG

2	CHECK FUSE (ETCS FUSE)



(a) Remove the ETCS fuse from the engine room No. 1 relay block.
(b) Measure the ETCS fuse resistance.
Standard resistance:
Below 1 Ω
(c) Reinstall the ETCS fuse.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

ES

3	CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, ETCS FUSE - BATTERY)

(a) Check the harness and connector between the ETCS fuse and ECM.
  (1) Remove the ETCS fuse from the engine room No. 1 relay block.
  (2) Disconnect the A9 ECM connector.
  (3) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
2 (ETCS fuse) - A9-3 (+BM)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
2 (ETCS fuse) or A9-3 (+BM) - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the ETCS fuse and positive battery cable.
  (1) Remove the ETCS fuse from the engine room No. 1 relay block.
  (2) Disconnect the cable from the positive (+) battery terminal.
  (3) Check the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
Positive battery cable - 1 (ETCS fuse)	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
Positive battery cable or 1 (ETCS fuse) - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the cable to the positive (+) battery terminal.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

ES

4	INSPECT ECM (+BM VOLTAGE)

(a) Disconnect the A9 and B30 ECM connectors.
(b) Measure the voltage between the terminals of the A9 and B30 ECM connectors.
Standard voltage

Tester Connections	Specified Conditions
A9-3 (+BM) - B30-104 (E1)	9 to 14 V

(c) Reconnect the ECM connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR (TERMINAL E1 - BODY GROUND)**

OK

REPLACE ECM

5	INSPECT BATTERY

(a) Check that the battery is not depleted.
OK:
Battery is not depleted

NG → **REPLACE BATTERY**

OK

6	CHECK BATTERY TERMINAL

(a) Check that the battery terminals and ECM ground are not loose or corroded.
OK:
Battery terminals and ECM ground are not loose or corroded

NG → **REPAIR OR REPLACE BATTERY TERMINAL**

OK

CHECK FOR INTERMITTENT PROBLEMS

DTC	P2119	Throttle Actuator Control Throttle Body Range / Performance

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC No.	DTC Detection Conditions	Trouble Areas
P2119	Throttle valve opening angle continues to vary greatly from target opening angle (1 trip detection logic)	• ETCS • ECM

ES

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5,000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

MONITOR STRATEGY

Related DTCs	P2119: ETCS malfunction
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions A or B met	-
A. Difference between commanded closed throttle position and current closed throttle position	0.3 V or more for 1 second
B. Difference between commanded open throttle position and current open throttle position	0.3 V or more for 0.6 seconds

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.

Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned to OFF.

WIRING DIAGRAM

Refer to DTC P2102 (see page ES-266).

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2119	A
P2119 and other DTCs	B

HINT:
If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

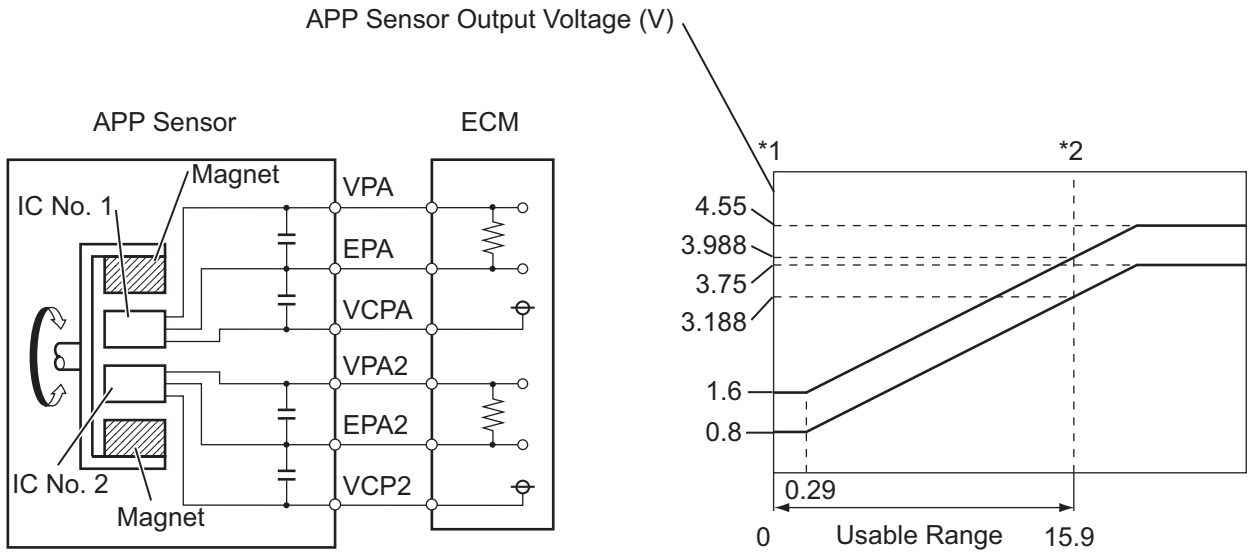
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Allow the engine to idle for 15 seconds.
CAUTION:
Exercise extreme care and take precautions in steps (f) and (g) below. Failure to do so may result in the vehicle unexpectedly rolling away.
(f) Securely apply the parking brake and move the gear selector lever to the D position.
(g) While depressing the brake pedal securely, fully depress the accelerator pedal for 5 seconds.
(h) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.

(i) Read DTCs.
HINT:
The output voltage of the throttle position sensor can be checked during step (g) using the intelligent tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1.
OK:
No DTC output.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

ES

OK



CHECK FOR INTERMITTENT PROBLEMS

DTC	P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit
DTC	P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input
DTC	P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input
DTC	P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit
DTC	P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input
DTC	P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input
DTC	P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

HINT:
These DTCs relate to the Accelerator Pedal Position (APP) sensor.

DESCRIPTION

HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.
The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0 V and 5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.
The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

Y

A112620E03

DTC No.	DTC Detection Conditions	Trouble Areas
P2120	VPA fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2122	VPA 0.4 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA 4.8 V or more for 2.0 seconds or more (1 trip detection logic)	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2127	VPA2 1.2 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 4.8 V or more (b) VPA between 0.4 V and 3.45 V	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) Difference between VPA and VPA2 0.02 V or less (b) VPA 0.4 V or less and VPA2 1.2 V or less	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:
When any of these DTCs are set, check the APP sensor voltage by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ACCEL POS #1 and ACCEL POS #2.

Trouble Areas	ACCEL POS #1 When AP Released	ACCEL POS #2 When AP Released	ACCEL POS #1 When AP Depressed	ACCEL POS #2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:
- Accelerator pedal positions are expressed as voltages.
- AP denotes for Accelerator Pedal.

ES

MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and sets a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is set.
If the malfunction is not repaired successfully, a DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2120: APP sensor 1 range check (fluctuating) P2122: APP sensor 1 range check (low voltage) P2123: APP sensor 1 range check (high voltage) P2125: APP sensor 2 range check (fluctuating) P2127: APP sensor 2 range check (low voltage) P2128: APP sensor 2 range check (high voltage) P2138: APP sensor range check (correlation)

Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds: P2120, P2122, P2125 and P2127 2.0 seconds: P2123, P2128 and P2138
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met:	-
1. Ignition switch	ON
2. Throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

P2120:

Either of following conditions 1 or 2 met:	-
1. VPA voltage when VPA2 voltage 0.04 V or more	0.4 V or less
2. VPA voltage	4.8 V or more

P2122:

VPA voltage when VPA2 voltage 0.04 V or more	0.4 V or less

P2123:

VPA voltage	4.8 V or more

P2125:

Either of following conditions 1 or 2 met:	-
1. VPA2 voltage when VPA voltage 0.04 V or more	1.2 V or less
2. VPA2 voltage when VPA 0.4 to 3.45 V	4.8 V or more

P2127:

VPA2 voltage when VPA voltage 0.04 V or more	1.2 V or less

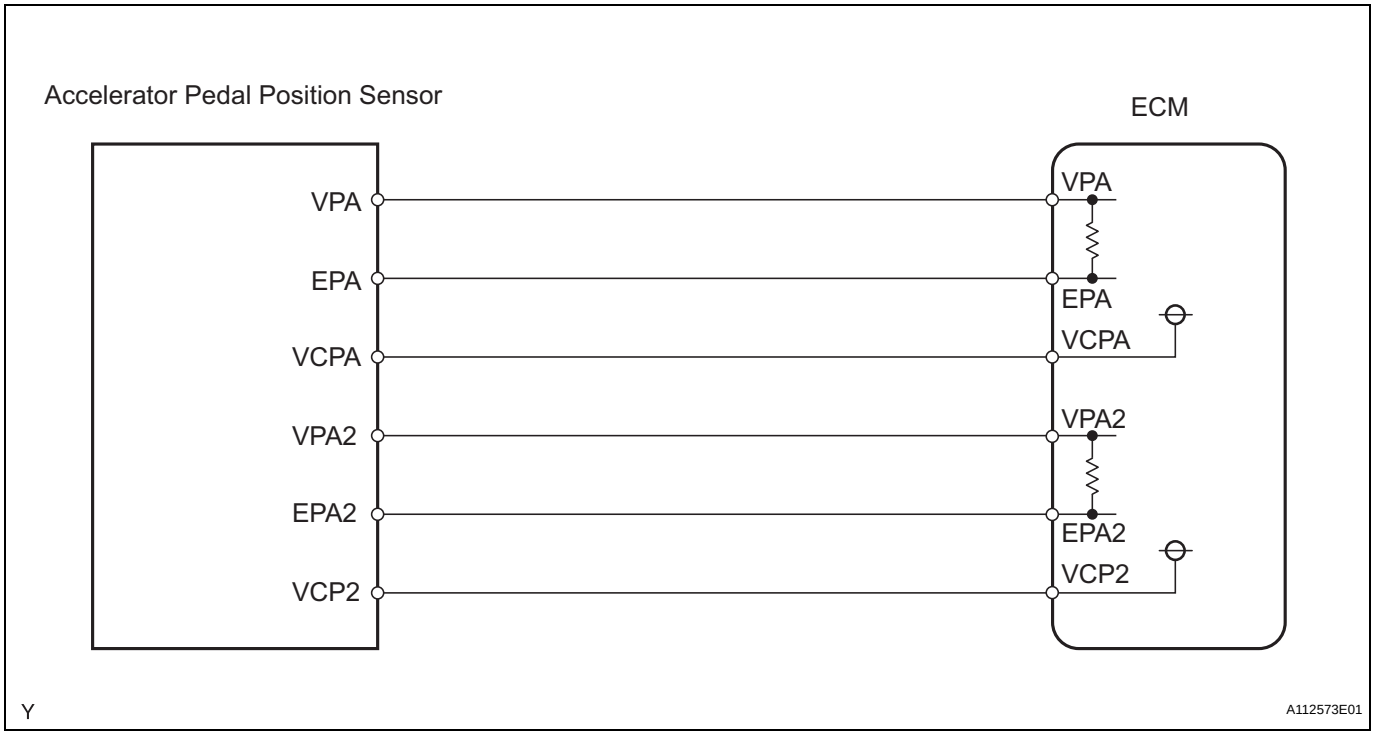
ES

P2128:

VPA2 voltage when VPA 0.4 to 3.45 V	4.8 V or more

P2138:

Either of following conditions A or B met:	-
Condition A	-
Difference between VPA and VPA 2 voltages	0.02 V or less
Condition B	-
VPA voltage	0.4 V or less
VPA2 voltage	1.2 V or less



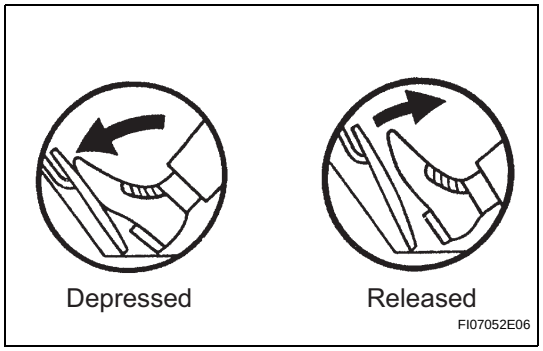
COMPONENT OPERATING RANGE

VPA voltage	0.5 V to 4.5 V
VPA2 voltage	1.2 V to 5.0 V
Difference between VPA and VPA2 voltages	More than 0.02 V

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are set, the ECM enters fail-safe mode. If either of the 2 sensor circuit malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned OFF.

WIRING DIAGRAM



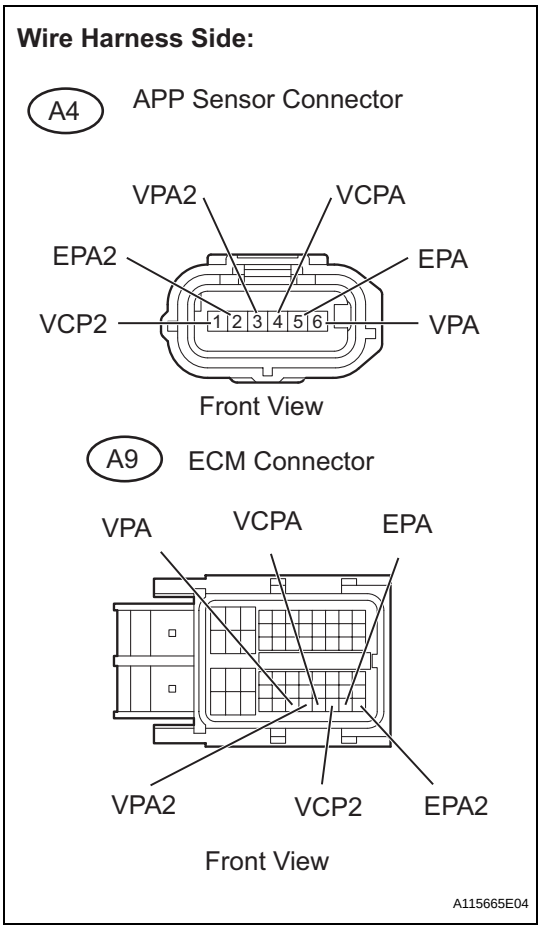
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.
(d) Read the value displayed on the tester.



Standard voltage

Accelerator Pedal Operations	ACCEL POS #1	ACCEL POS #2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between ACCEL POS #1 and ACCEL POS #2 is greater than 0.02 V	Difference between ACCEL POS #1 and ACCEL POS #2 is greater than 0.02 V

OK → **Go to step 5**

NG

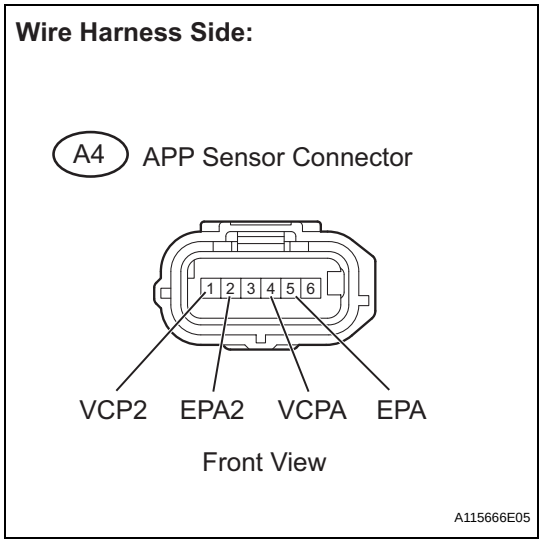
2	CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

(a) Disconnect the A4 Accelerator Pedal Position (APP) sensor connector.
(b) Disconnect the A9 ECM connector.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
A4-6 (VPA) - A9-55 (VPA)	Below 1 Ω
A4-5 (EPA) - A9-59 (EPA)	Below 1 Ω
A4-4 (VCPA) - A9-57 (VCPA)	Below 1 Ω
A4-3 (VPA2) - A9-56 (VPA2)	Below 1 Ω
A4-2 (EPA2) - A9-60 (EPA2)	Below 1 Ω
A4-1 (VCP2) - A9-58 (VCP2)	Below 1 Ω

Standard resistance (Check for short)



Tester Connections	Specified Conditions
A4-6 (VPA) or A9-55 (VPA) - body ground	10 kΩ or higher
A4-5 (EPA) or A9-59 (EPA) - body ground	10 kΩ or higher
A4-4 (VCPA) or A9-57 (VCPA) - body ground	10 kΩ or higher
A4-3 (VPA2) or A9-56 (VPA2) - body ground	10 kΩ or higher
A4-2 (EPA2) or A9-60 (EPA2) - body ground	10 kΩ or higher
A4-1 (VCP2) or A9-58 (VCP2) - body ground	10 kΩ or higher

(d) Reconnect the APP sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

3	CHECK ECM (VCPA AND VCP2 VOLTAGE)

(a) Disconnect the A4 APP sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the A4 APP sensor connector.

Standard voltage

Tester Connections	Specified Conditions
A4-4 (VCPA) - A4-5 (EPA)	4.5 to 5.5 V
A4-1 (VCP2) - A4-2 (EPA2)	4.5 to 5.5 V

(d) Reconnect the APP sensor connector.

ES

NG → **REPLACE ECM**

OK

4	REPLACE ACCELERATOR PEDAL ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

ES

MONITOR DESCRIPTION

When the difference between the output voltages of VPA and VPA2 deviates from the standard, the ECM determines that the Accelerator Pedal Position (APP) sensor is malfunctioning. The ECM turns on the MIL and the DTC is set.

MONITOR STRATEGY

Related DTCs	P2121: APP sensor rationality
Required Sensors/Components (Main)	APP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met:	-
1. Ignition switch	ON
2. Throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

Difference between VPA voltage (learned value) and VPA2 voltage (learned value)	Less than 0.4 V, or more than 1.2 V

FAIL-SAFE

The APP sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.

If a pass condition is detected and then the ignition switch is turned OFF, the fail-safe operation stops and the system returns to a normal condition.

WIRING DIAGRAM

Refer to DTC P2120 (see page ES-286).

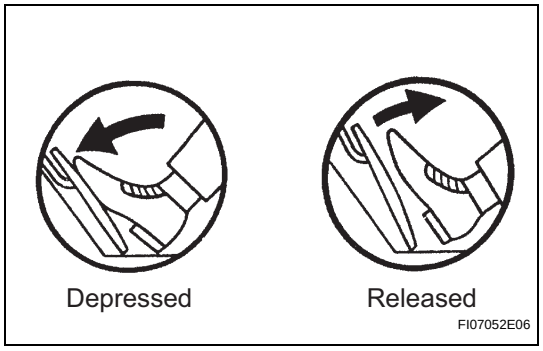
INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2121)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result



Display (DTC Output)	Proceed To
P2121	A
P2121 and other DTCs	B

HINT:
If any DTCs other than P2121 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 READ VALUE USING INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ACCEL POS #1 and ACCEL POS #2.
(d) Read the values displayed on the tester.

Standard voltage

Accelerator Pedal Operations	ACCEL POS #1	ACCEL POS #2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

OK → CHECK FOR INTERMITTENT PROBLEMS

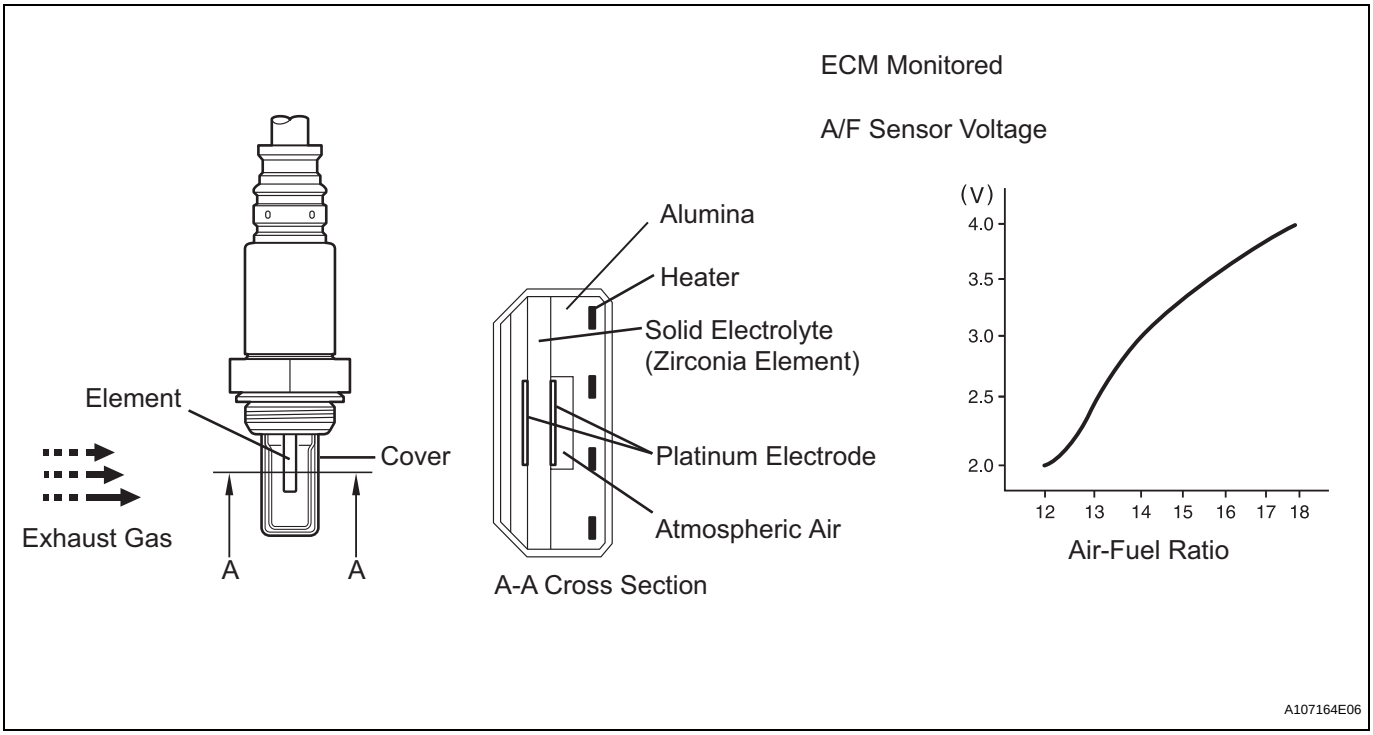
DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

ES



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is of the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor, in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC No.	DTC Detection Conditions	Trouble Areas
P2195	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) A/F sensor voltage more than 3.8 V (b) Heated Oxygen (HO2) sensor voltage 0.15 V or more	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • A/F sensor heater and EFI MAIN relay circuits • ECM
	While fuel-cut operation performed (during vehicle deceleration), A/F sensor current 3.6 mA or more for 3 seconds (2 trip detection logic)	• A/F sensor • ECM
P2196	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) A/F sensor voltage less than 2.8 V for 10 seconds (b) HO2 sensor voltage less than 0.6 V	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • A/F sensor heater and EFI MAIN relay circuits • ECM
	While fuel-cut operation performed (during vehicle deceleration), A/F sensor current less than 1.0 mA for 3 seconds (2 trip detection logic)	• A/F sensor • ECM

ES

HINT:

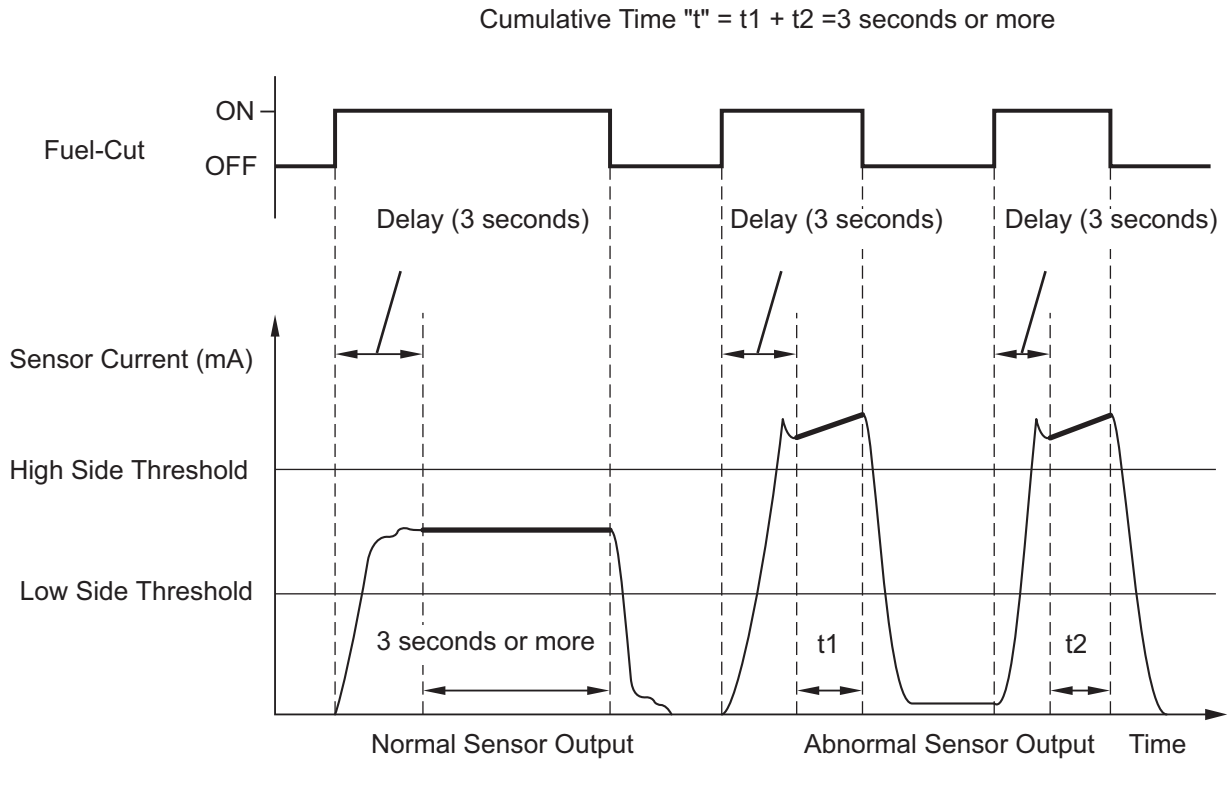
- When either of these DTCs is set, check the A/F sensor output voltage by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / AFS B1 S1.
- Short-term fuel trim values can also be read using the intelligent tester.
- The ECM regulates the voltages at the A1A+ and A1A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.
- If the A/F sensor is malfunctioning, the ECM sets the DTC P2195 or P2196.

MONITOR DESCRIPTION

Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and sets a DTC.

Example:



If the A/F sensor output voltage is less than 2.8 V (very rich condition) for 10 seconds, despite the rear HO2 sensor output voltage being less than 0.6 V, the ECM sets DTC P2196. Alternatively, if the A/F sensor output voltage is more than 3.8 V (very lean condition) for 10 seconds, despite the rear HO2 sensor output voltage being 0.15 V or more, DTC P2195 is set.

Sensor current detection monitor

A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or more for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and sets DTC P2195 (high-side stuck). If the A/F sensor output is less than 1.0 mA for more than 3 seconds of cumulative time, the ECM sets DTC P2196 (low-side stuck).

A/F Sensor Current Monitor:

MONITOR STRATEGY

Related DTCs	P2195: A/F sensor signal stuck lean P2196: A/F sensor signal stuck rich
Required Sensors/Components (Main)	A/F sensor

All

Monitor runs whenever following DTCs not present	P0031, P0032 (A/F sensor heater - Sensor 1) P0037, P0038 (O2 sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0136 (O2 Sensor - Sensor 2) P0171, P0172 (Fuel system) P0300 - P0304 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0455, P0456 (EVAP system) P0500 (VSS)

Sensor voltage detection monitor (Lean side malfunction P2195):

Duration while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	0.15 V or more
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor voltage detection monitor (Rich side malfunction P2196):

Duration while all of following conditions met	2 seconds or more
Rear HO2 sensor voltage	Below 0.6 V
Time after engine start	30 seconds or more
A/F sensor status	Activated
Fuel system status	Closed-loop
Engine	Running

Sensor current detection monitor P2195 and P2196

Battery voltage	11 V or more
Atmospheric pressure	76 kPa (570 mmHg) or more
A/F sensor status	Activated
Continuous time of fuel cut	3 to 10 seconds
ECT	75°C (167°F) or more

TYPICAL MALFUNCTION THRESHOLDS

Sensor voltage detection monitor (Lean side malfunction P2195):

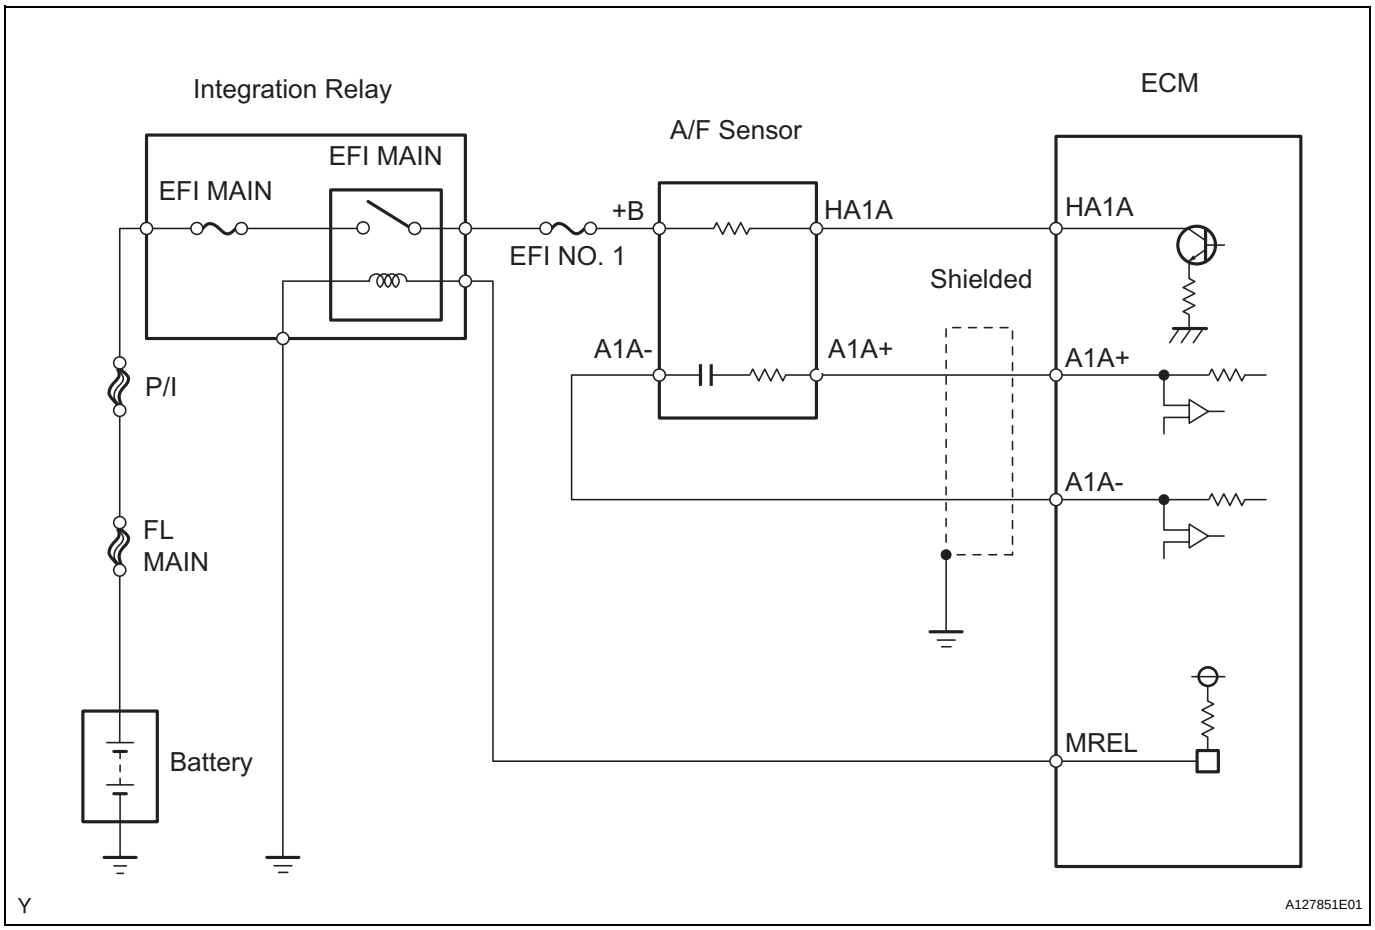
A/F sensor voltage	More than 3.8 V for 10 seconds

Sensor voltage detection monitor (Rich side malfunction P2196):

A/F sensor voltage	Less than 2.8 V for 10 seconds

Sensor current detection monitor (High side malfunction P2195):

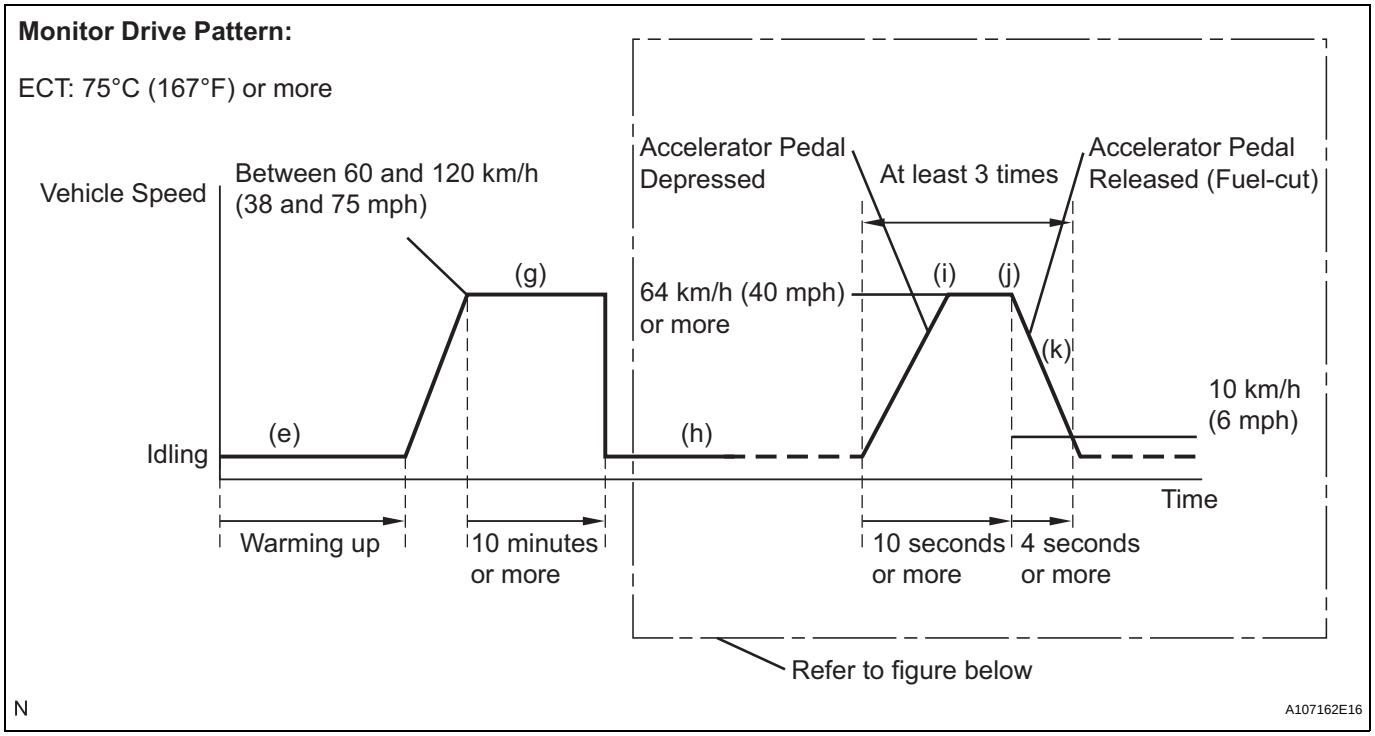
A/F sensor current during fuel cut	3.6 mA or more



Sensor current detection monitor (Rich side malfunction P2196):

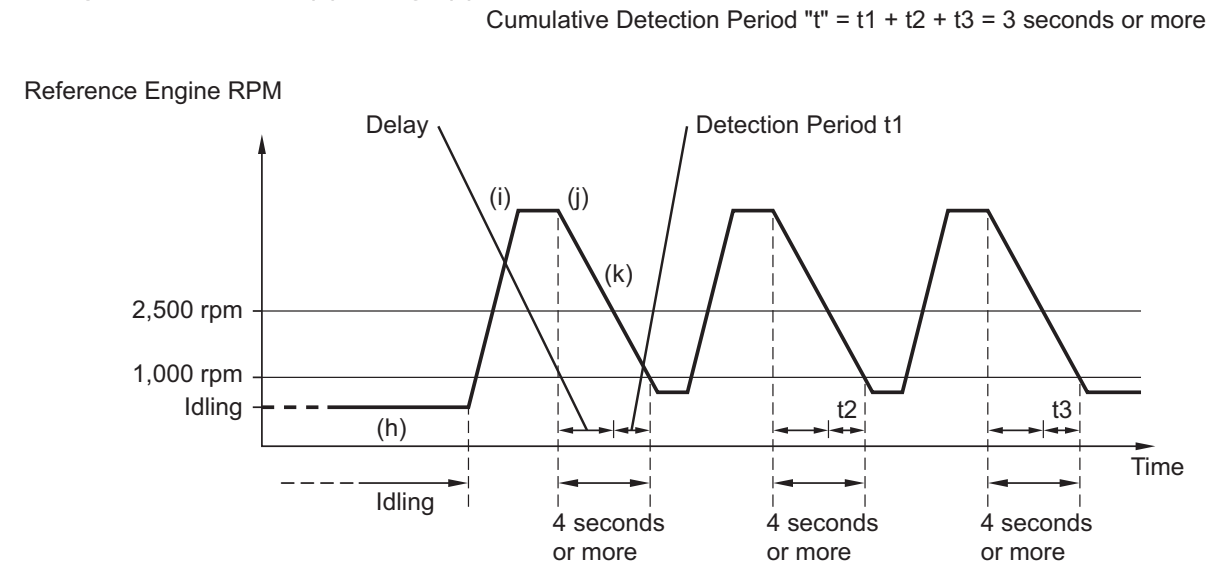
A/F sensor current during fuel cut	Less than 1 mA

MONITOR RESULT



Refer to CHECKING MONITOR STATUS (see page ES-17).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

Driving Pattern Detail for (h) through (k):

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) On the intelligent tester, select the following menu items to check the fuel-cut status: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / FC IDL.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at proper vehicle speed to perform fuel-cut operation.
HINT:
Fuel-cut is performed when the following conditions are met:
- Accelerator pedal fully released.
- Engine speed is 2,500 rpm or more (fuel injection returns at 1,000 rpm).

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed declines to less than 10 km/h (6 mph).
(m) Repeat steps from (h) through (k) above at least 3 times in one driving cycle.
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
CAUTION:
Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

INSPECTION PROCEDURE

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volume	Status	Voltages
AFS B1 S1 (A/F)	+25 %	Rich	Less than 3.0
	-12.5 %	Lean	More than 3.35
O2S B1 S2 (HO2)	+25 %	Rich	More than 0.5
	-12.5 %	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor (sensor 2) output has a maximum output delay of approximately of 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2, and press the YES button and then the ENTER button followed by the F4 button.
HINT:

- DTC P2A00 may be set when the air-fuel ratio is stuck rich or lean.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195 OR P2196)

(a) Connect an intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed To
P2195 or P2196	A
P2195 or P2196 and other DTCs	B

HINT:
If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-35).
(d) Drive the vehicle in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
(f) Check that the status of O2S MON is COMPL.
If the status is still INCMPL, drive the vehicle according to the driving pattern again.
HINT:
- AVAIL indicates that the component has not been monitored yet.

- COMPL indicates that the component is functioning normally.
- INCMPL indicates that the component is malfunctioning.

(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT / RANGE B1 S1; then press the ENTER button.
(h) Check the test value of the A/F sensor output current during fuel-cut.

Result

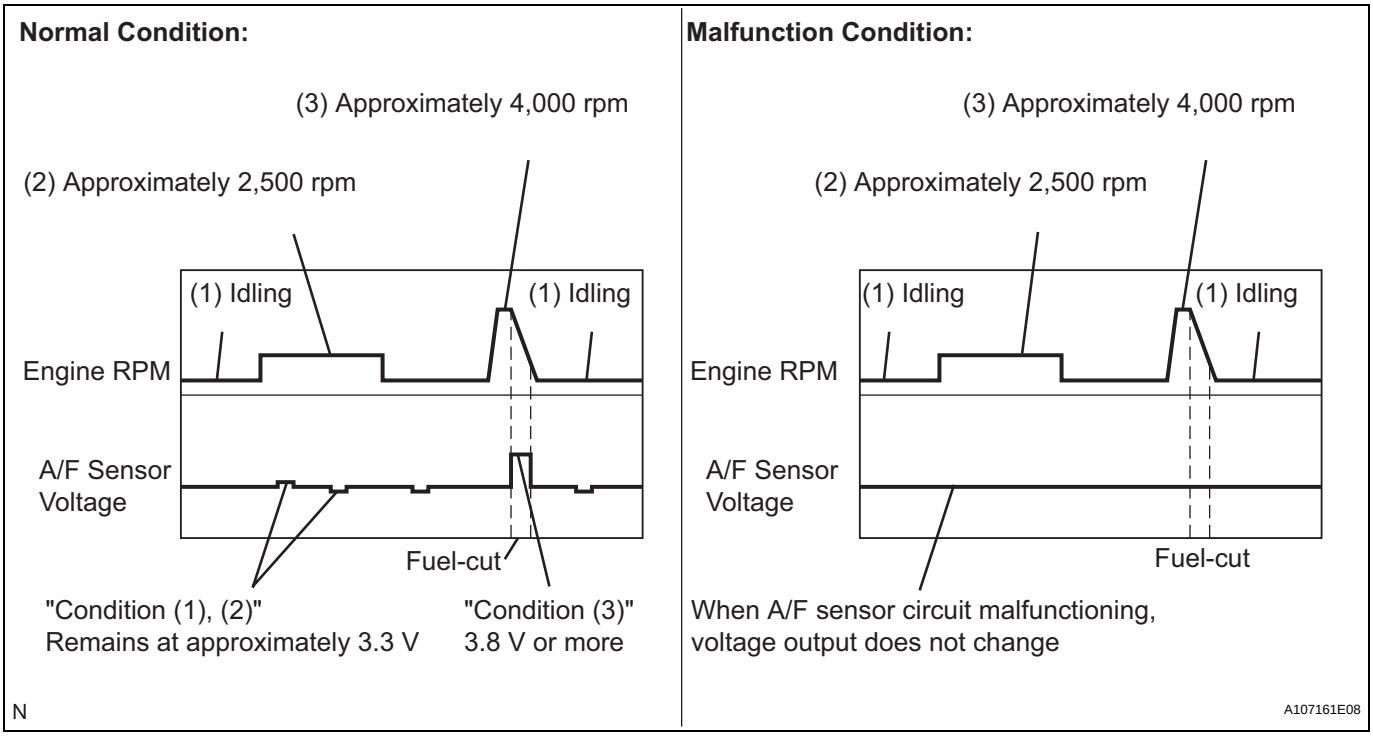
Test Value	Proceed To
Within normal range (1.0 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.0 mA, or 3.6 mA or more)	B

ES

B → **Go to step 12**

A

3	READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)



(a) Connect the intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.
(d) Warm up the A/F sensor at an engine speed of 2,500 rpm for 90 seconds.
(e) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SNAPSHOT / MANUAL SNAPSHOT / USER DATA / AFS B1 S1 and ENGINE SPD.
(f) Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:
(1) While idling (check for at least 30 seconds)
(2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed)
(3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.

Standard voltage

Conditions	A/F Sensor Voltage Variations	Reference
(1) and (2)	Remains at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:

- For more information, see the diagrams below.

- If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.
- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and result in a momentary increase in the A/F sensor output voltage.
- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

P2253	AF- voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay (EFI MAIN relay) • A/F sensor heater and EFI MAIN relay circuits • ECM

MONITOR DESCRIPTION

The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

AF- terminal voltage	0.5 V or less

P2253 (Short circuit between AF- and +B):

AF- terminal voltage	More than 4.5 V

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

HINT:

Intelligent tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.

(b) Start the engine and turn the tester ON.

(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.

(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

ES

Tester Display (Sensor)	Injection Volume	Status	Voltages
AFS B1 S1 (A/F)	+25 %	Rich	Less than 3.0
	-12.5 %	Lean	More than 3.35
O2S B1 S2 (HO2)	+25 %	Rich	More than 0.5
	-12.5 %	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2; then press the YES button and then the ENTER button followed by the F4 button.

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

DTC	P2401	Evaporative Emission Leak Detection Pump Stuck OFF

DTC	P2402	Evaporative Emission Leak Detection Pump Stuck ON

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2401	Leak detection pump stuck OFF	P043E, P043F, P2401, P2402 and P2419 present when one of following conditions met during key-off EVAP monitor: • EVAP pressure just after reference pressure measurement greater than -1 kPa-g (-7.5 mmHg-g) • Reference pressure less than -4.85 kPa-g (-36.4 mmHg-g) • Reference pressure greater than -1.057 kPa-g (-7.93 mmHg-g) • Reference pressure not saturated • Reference pressure difference between first and second 0.7 kPa-g (5.25 mmHg-g) or more HINT: Typical example values	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip
P2402	Leak detection pump stuck ON		• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip

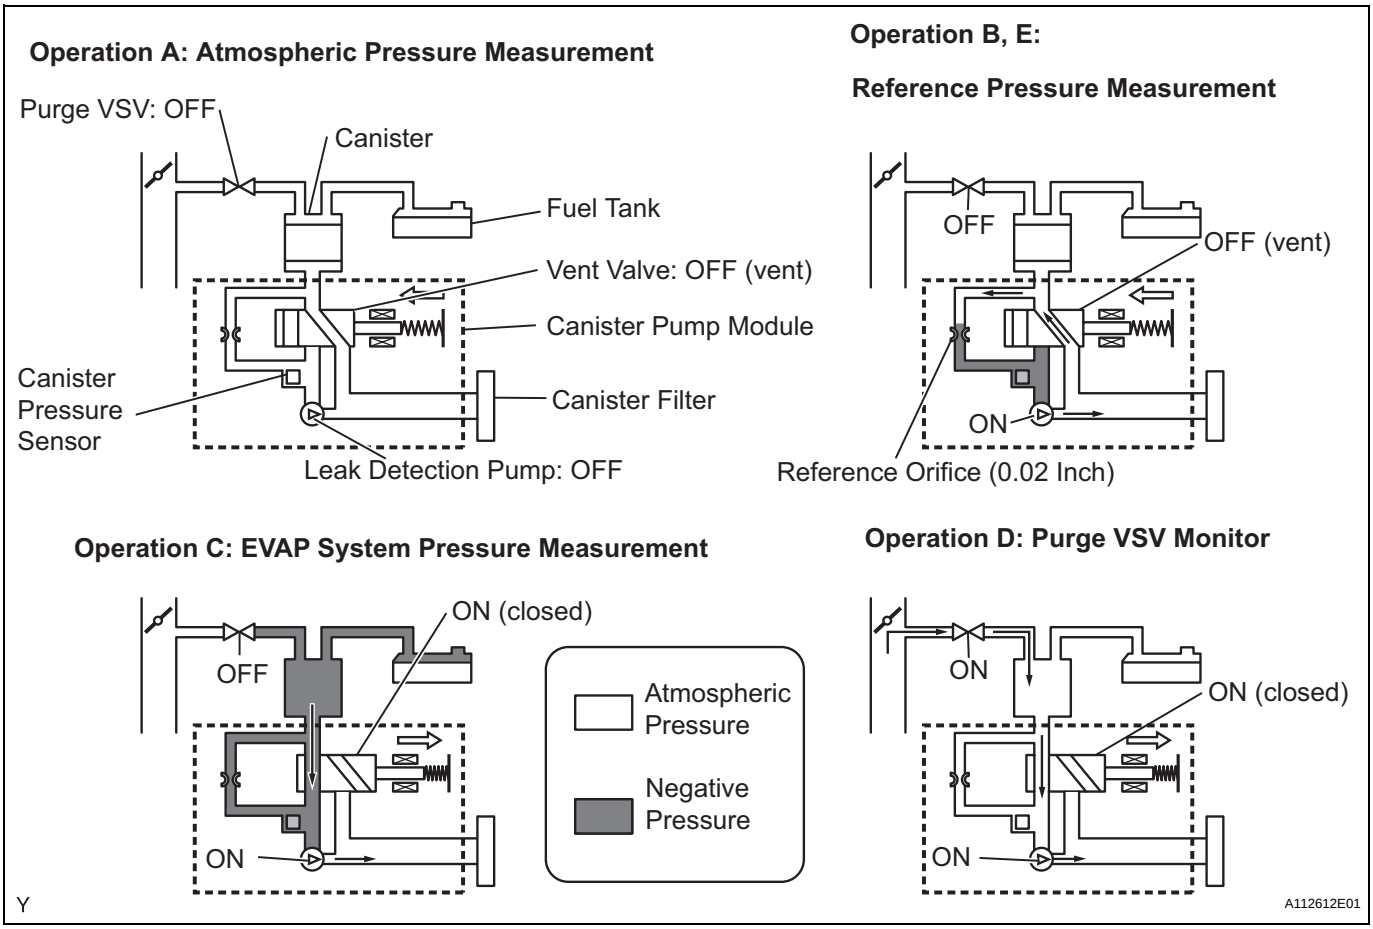
HINT:
The leak detection pump is built into the canister pump module.

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

INSPECTION PROCEDURE

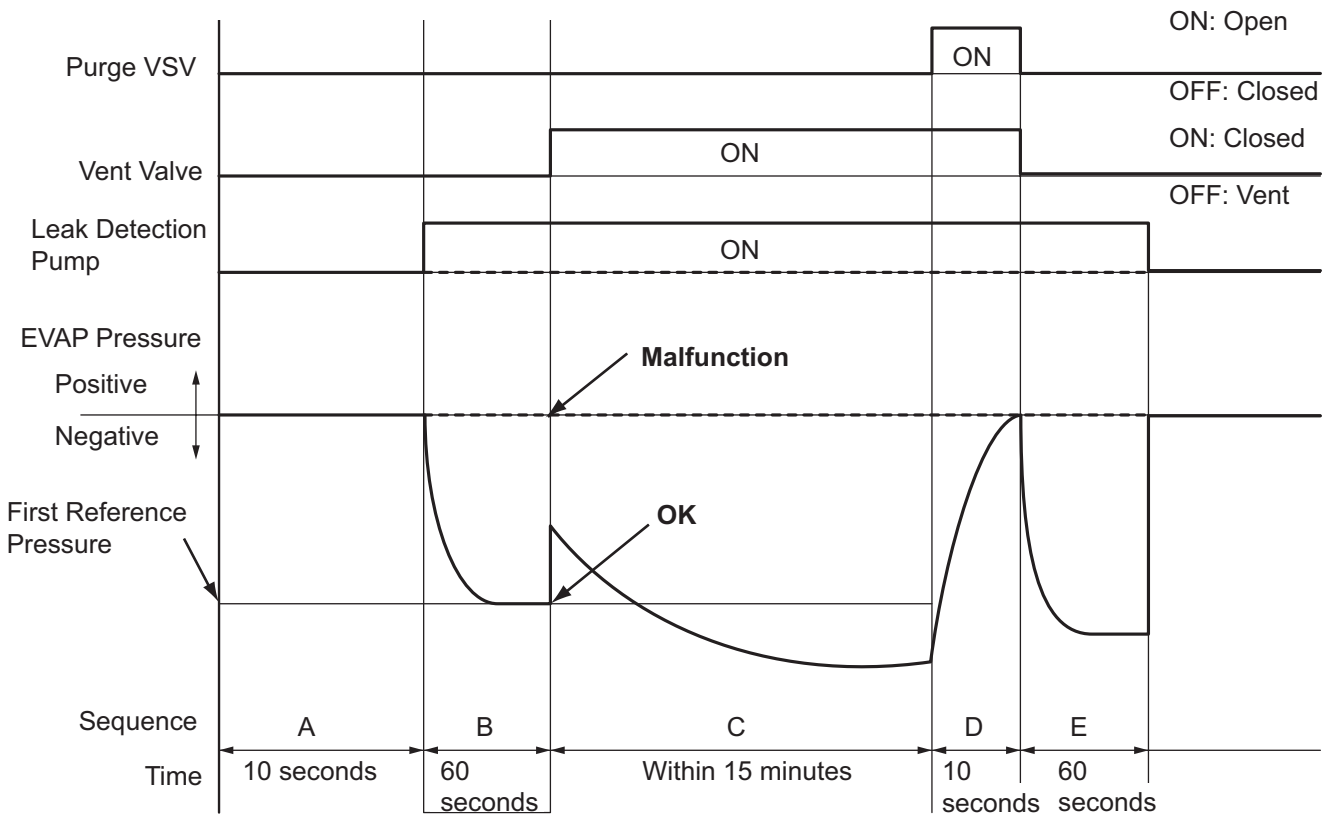
Refer to the EVAP System (see page ES-340).



MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned to OFF, the monitor check starts 2.5 hours later.

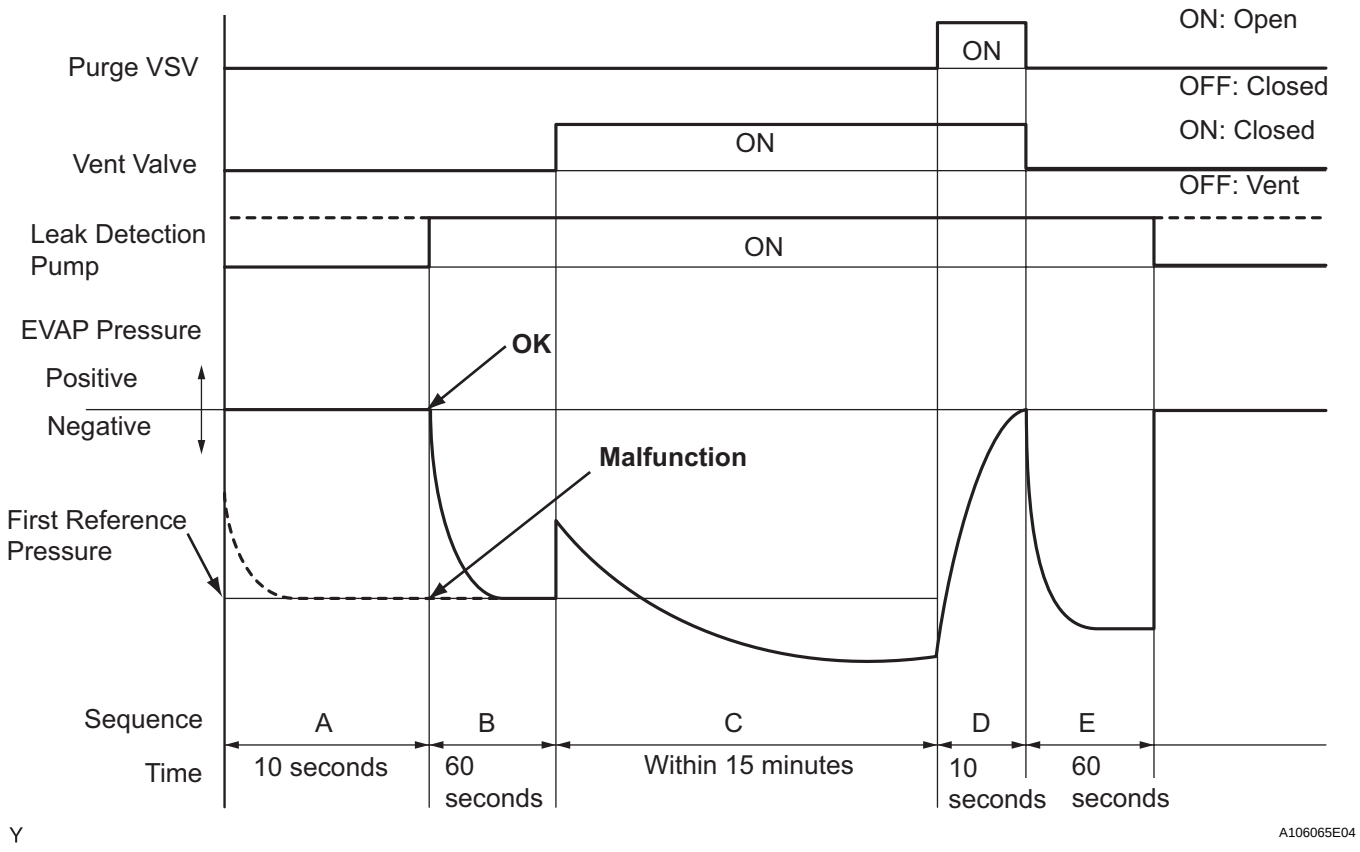
Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-



Sequence	Operations	Descriptions	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

1. P2401: Leak detection pump stuck OFF
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to determine the reference pressure. If the pressure is higher than -1.057 kPa-g (-7.93 mmHg-g), or lower than -4.85 kPa-g (-36.4 mmHg-g), the ECM interprets this as the leak detection pump being stuck OFF (not operating). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).



EVAP Pressure when Leak Detection Pump Stuck OFF:

ES

2. P2402: Leak detection pump stuck ON
In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP (Evaporative Emission) system pressure is then measured by the ECM, using the canister pressure sensor, to determine the reference pressure. If the pressure is higher than -1.057 kPa-g (-7.93 mmHg-g), or lower than -4.85 kPa-g (-36.4 mmHg-g), the ECM interprets this as the leak detection pump being stuck ON (remaining ON all the time). The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Leak Detection Pump Stuck ON:

HINT:
The detection logic of DTCs P2401 and P2402 is the same because in both cases the reference pressure measured in operation B is compared to the atmospheric pressure registered in operation A. The ECM calculates the difference between these pressures by deducting [the reference pressure] from [the stored atmospheric pressure], and uses this to monitor the EVAP system pressure change.

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more

Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4°to 35°C (40° to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement start	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

TYPICAL MALFUNCTION THRESHOLDS

"Saturated" indicates that the EVAP pressure change is less than 0.286 kPa-g (2.14 mmHg-g) in 60 seconds.

One of following conditions met	-
EVAP pressure just after reference pressure measurement start	More than -1 kPa-g (-7.5 mmHg-g)
Reference pressure	Less than -4.85 kPa-g (-36.4 mmHg-g)
Reference pressure	-1.057 kPa-g (-7.93 mmHg-g) or more
Reference pressure	Not saturated within 60 seconds
Reference pressure difference between first and second	0.7 kPa-g (5.25 mmHg-g) or more

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).

DTC	P2419	Evaporative Emission System Switching Valve Control Circuit Low

DTC	P2420	Evaporative Emission System Switching Valve Control Circuit High

DTC SUMMARY

DTCs	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2419	Vent valve stuck closed	P043E, P043F, P2401, P2402 and P2419 present when one of following conditions met during key-off EVAP monitor: • EVAP pressure just after reference pressure measurement greater than -1 kPa-g (-7.5 mmHg-g) • Reference pressure less than -4.85 kPa-g (-36.4 mmHg-g) • Reference pressure greater than -1.057 kPa-g (-7.93 mmHg-g) • Reference pressure not saturated • Reference pressure difference between first and second 0.7 kPa-g (5.25 mmHg-g) or more HINT: Typical example values	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip
P2420	Vent valve stuck open (vent)	Following condition met during key-off EVAP monitor: • EVAP pressure change when vent valve closed (ON) less than 0.3 kPa-g (2.25 mmHg-g)	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • ECM	While ignition switch OFF	2 trip

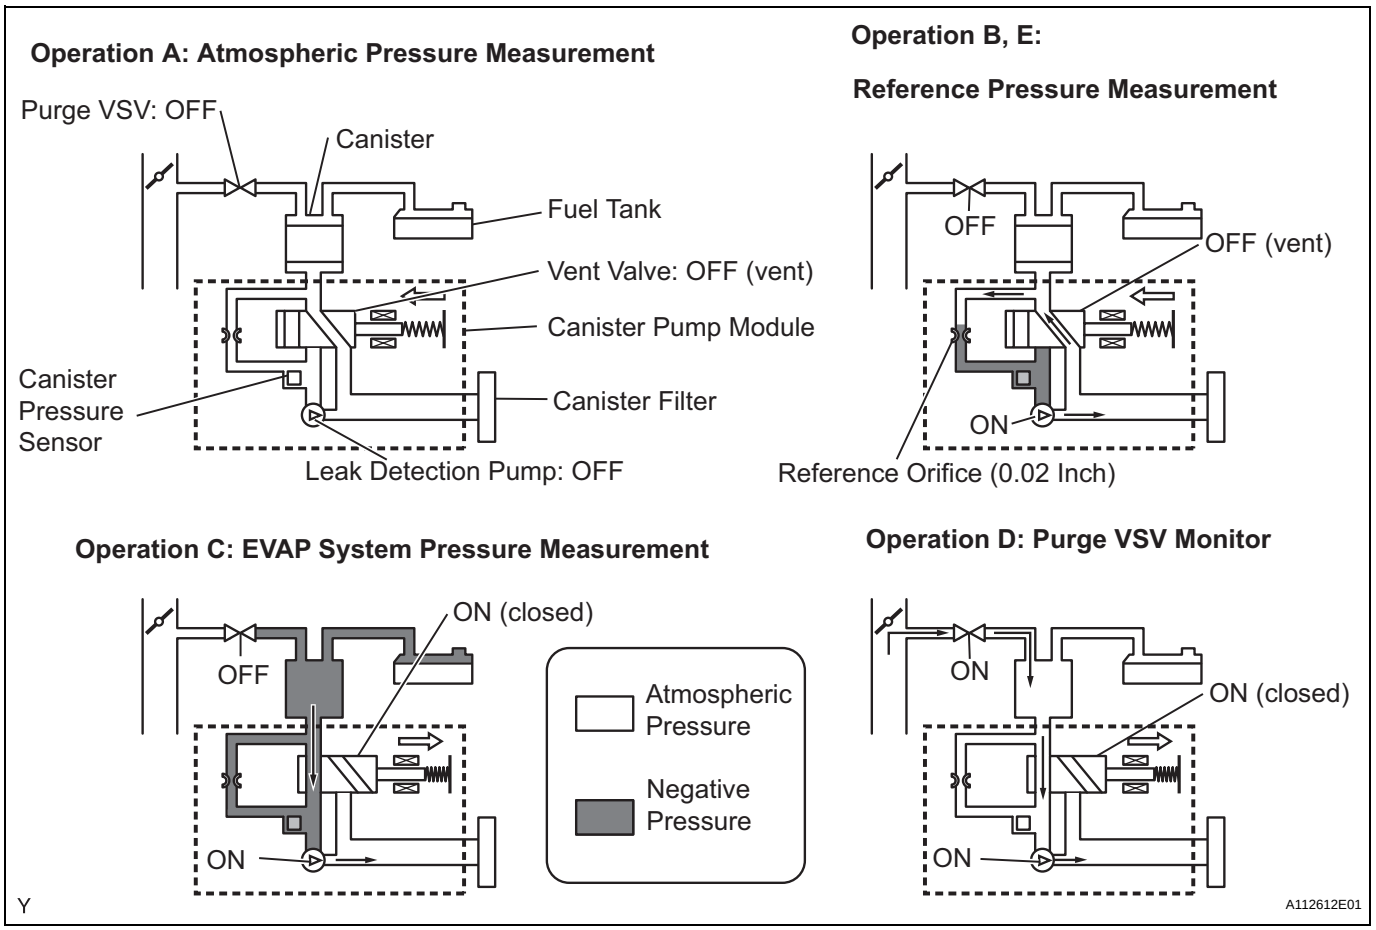
HINT:
The vent valve is built into the canister pump module.

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-335).

INSPECTION PROCEDURE

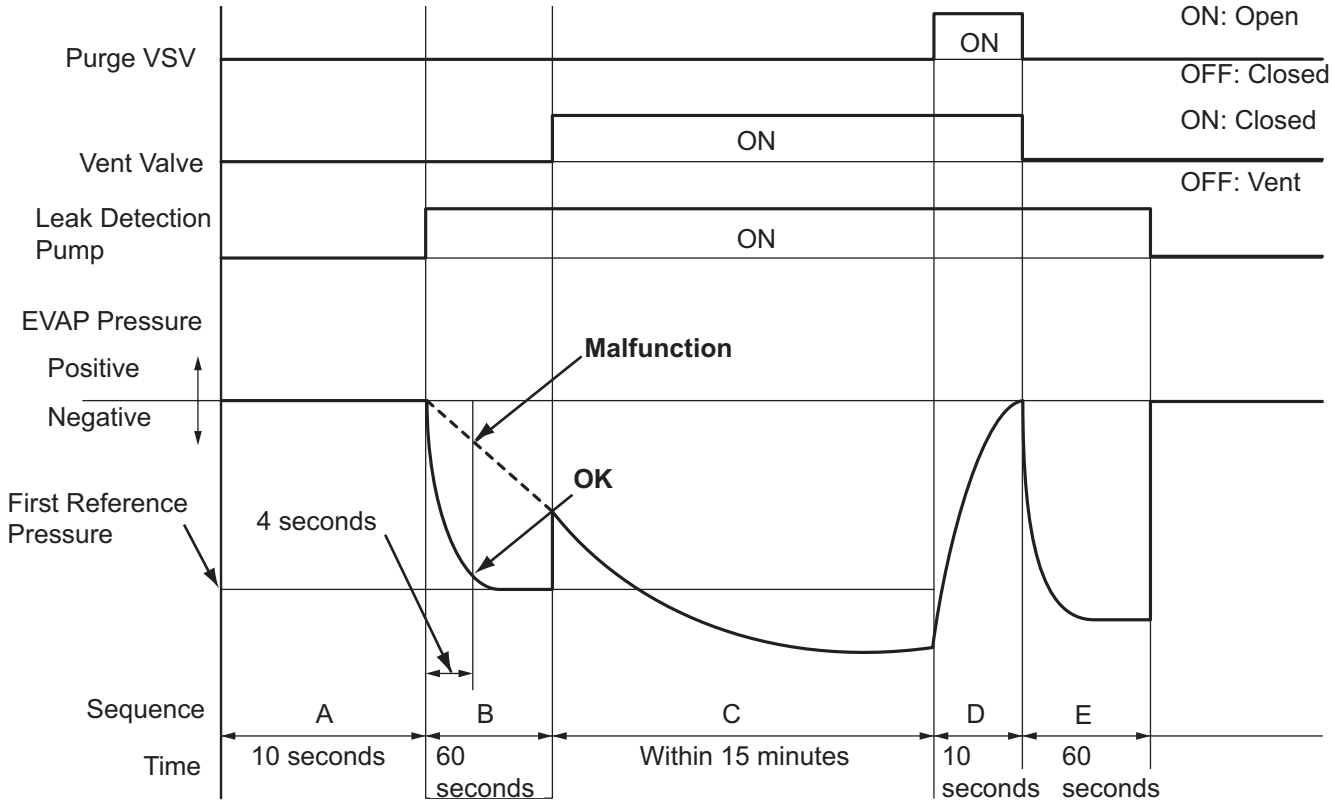
Refer to the EVAP System (see page ES-340).



MONITOR DESCRIPTION

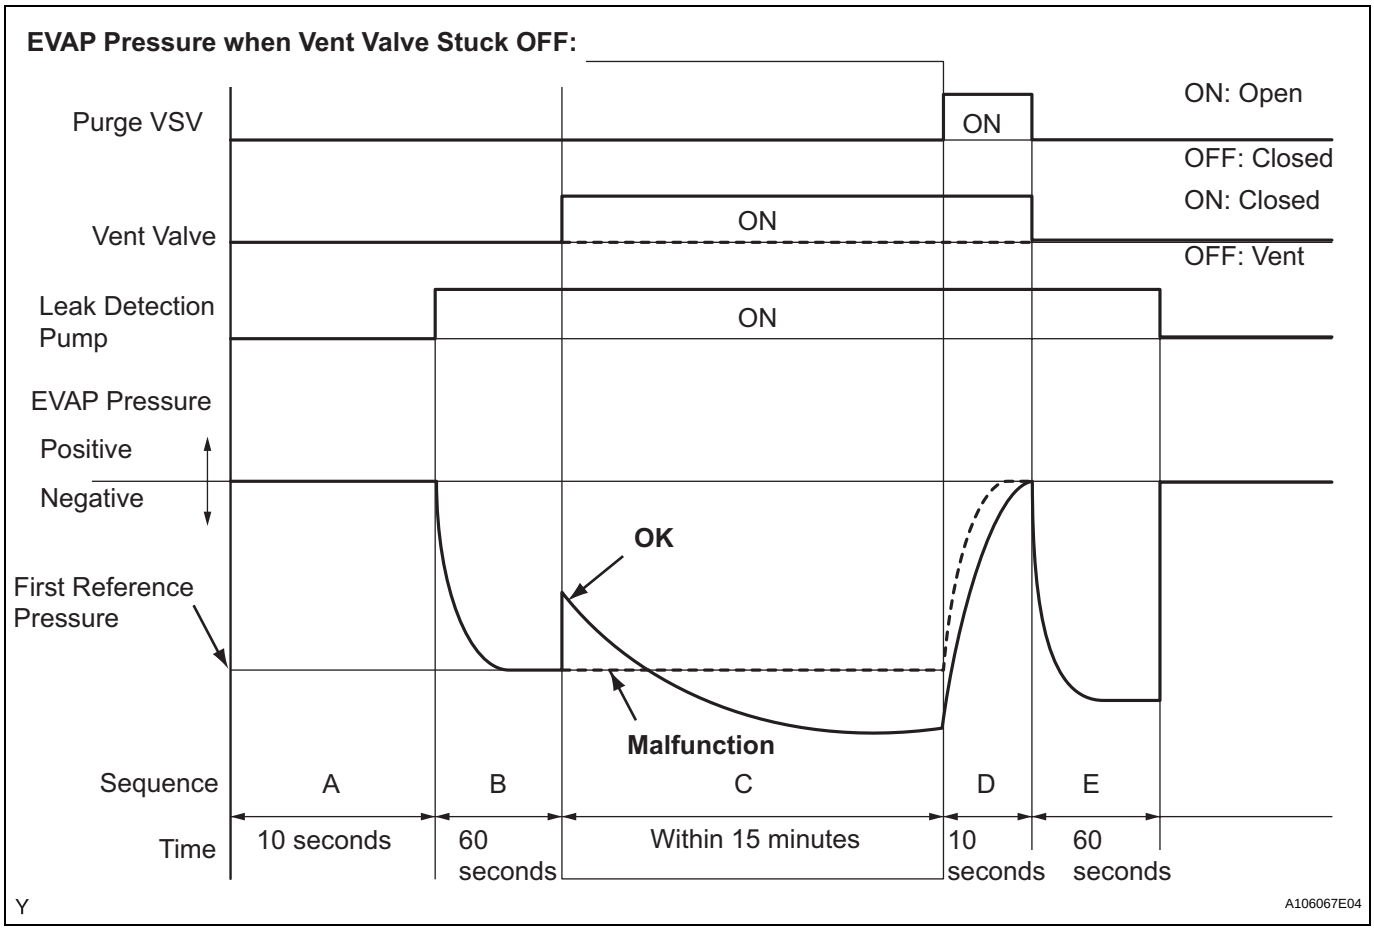
5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operations	Descriptions	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-



Sequence	Operations	Descriptions	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
F	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



1. P2419: Vent valve stuck closed
   In operation B, the leak detection pump creates negative pressure (a vacuum) through the reference orifice. The EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to determine the reference pressure. If the pressure exceeds -1.057 kPa-g (-7.93 mmHg-g) 4 seconds after the leak detection pump is turned ON, the ECM interprets this as the vent valve being stuck closed.
   The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

EVAP Pressure when Vent Valve Stuck ON:

ES

2. P2420: Vent valve stuck open (vent)
In operation C, the vent valve turns ON (closes) and the EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve is open, the ECM interprets this as the vent valve being stuck open. The ECM illuminates the MIL and sets the DTC.

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected

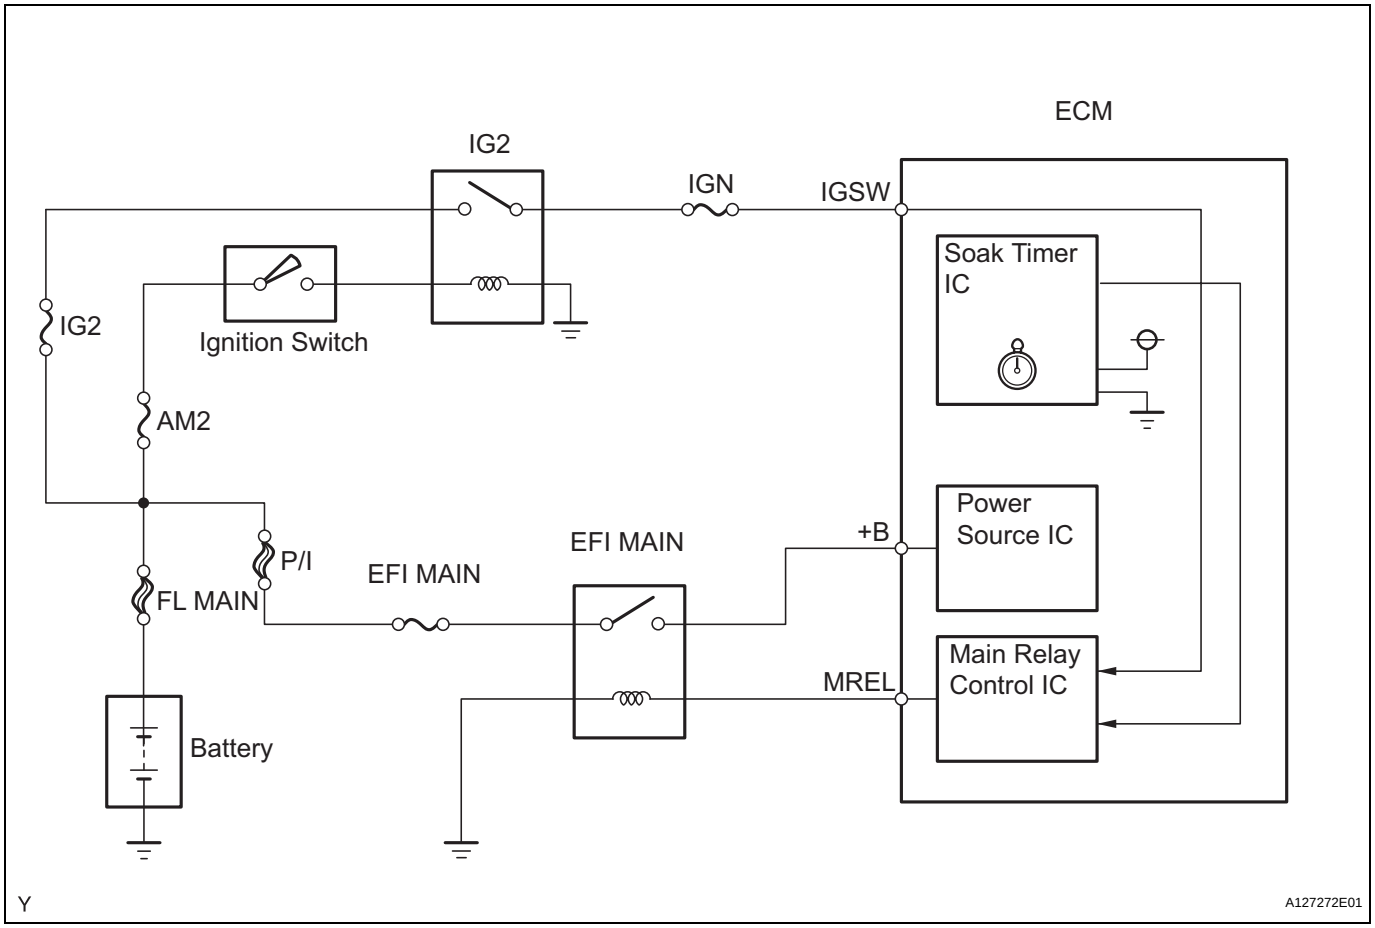
EVAP pressure change after EVAP canister vent valve ON	Less than 0.3 kPa-g (2.25 mmHg-g)

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).



DTC	P2610	ECM / PCM Internal Engine Off Timer Performance

DTC SUMMARY

DTC	Monitoring Items	Malfunction Detection Conditions	Trouble Areas	Detection Timings	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

DESCRIPTION

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (+-15 minutes) from when the ignition switch is turned OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the EVAP pressure. When 5 hours have elapsed, the ECM turns on.

MONITOR DESCRIPTION

5 hours after the ignition switch is turned OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	ECM
Frequency of Operation	Once per driving cycle

Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTC not present	None
Ignition switch	ON
Engine	Running
Battery voltage	8 V or more
Starter	OFF

ES

TYPICAL MALFUNCTION THRESHOLDS

Soak timer measurement when ECM CPU clock counts 10 minutes	Less than 7 minutes, or more than 13 minutes

INSPECTION PROCEDURE

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is necessary.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**REPLACE ECM**

(a) Replace the ECM (see page ES-429).

NEXT

2	**CHECK WHETHER DTC OUTPUT RECURS**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-35).
(e) Start the engine and wait for 10 minutes or more.
(f) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(g) If no pending DTC is displayed, the repair has been successfully completed.

NEXT

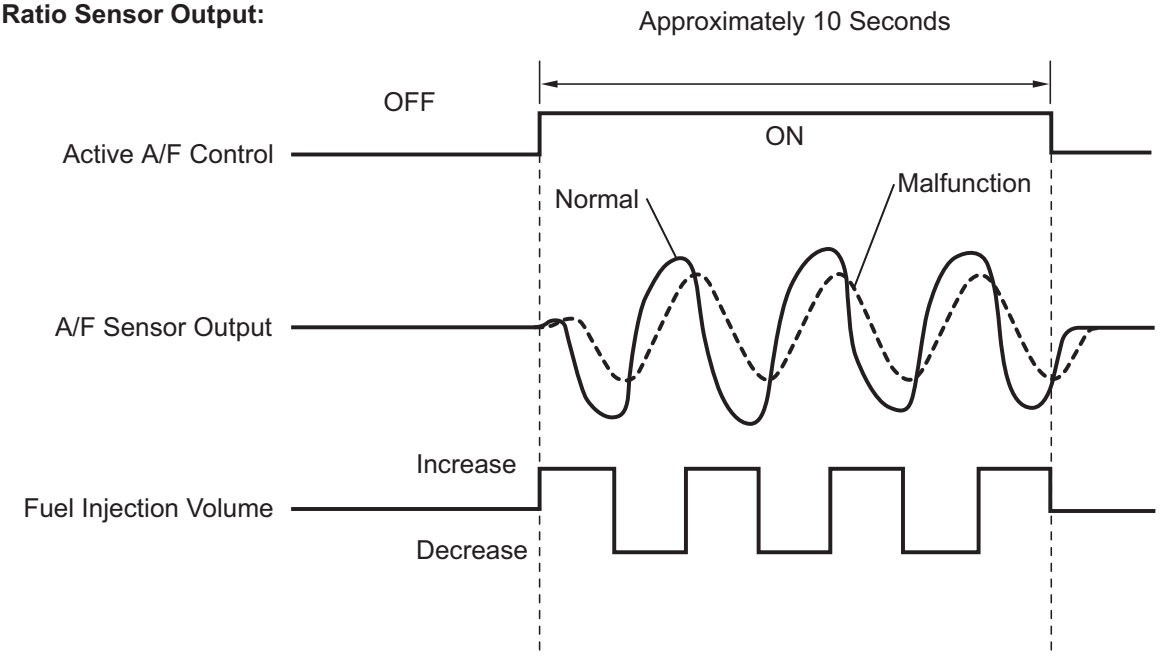
END

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

HINT:
Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

DESCRIPTION

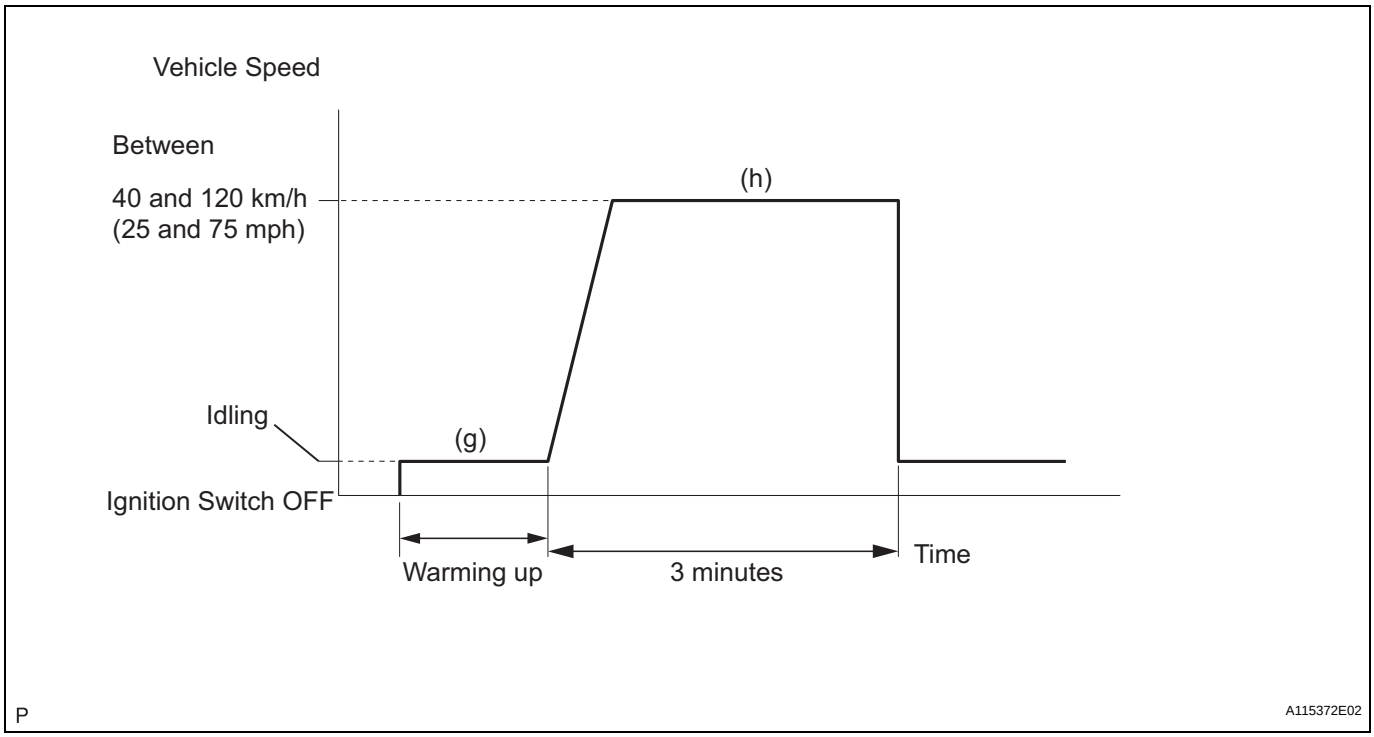
Refer to DTC P2195 (see page ES-292).



DTC No.	DTC Detection Conditions	Trouble Areas
P2A00	Calculated value of air-fuel ratio (A/F) sensor response rate deterioration level less than threshold (2 trip detection logic)	• Open or short in A/F sensor circuit • A/F sensor • ECM

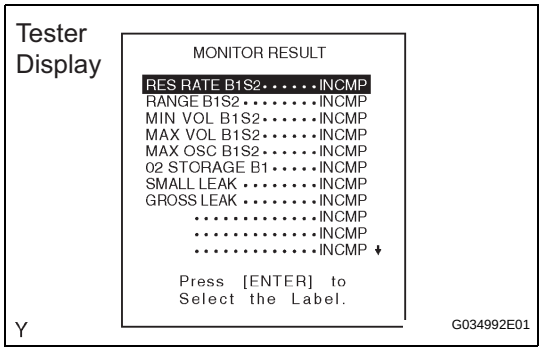
ES

MONITOR DESCRIPTION



After the engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F control is performed for approximately 10 seconds after the preconditions are met in order to measure the A/F sensor response rate. During active A/F control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F control and uses it to calculate the A/F sensor response rate deterioration level.
If the A/F sensor response rate deterioration level is less than the threshold, the ECM interprets this as a malfunction and sets the DTC.

Air-Fuel Ratio Sensor Output:



CONFIRMATION DRIVING PATTERN

HINT:
Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-35).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR RESULT.
(f) Check that RES RATE B1S1 is INCOMP.
(g) Start the engine and warm it up.
(h) Drive the vehicle at a constant speed of between 40 km/h and 120 km/h (25 mph and 75 mph) for 3 minutes.
(i) Check the monitor result values on the intelligent tester by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT.
(j) If the values indicated on the tester do not change, perform READINESS MONITOR DRIVE PATTERN for the A/F sensor and the heated oxygen sensor (see page ES-19).
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
(k) Note the value of the Monitor Result.
(l) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(m) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

TYPICAL MALFUNCTION THRESHOLDS

Response rate deterioration level	Less than 0.12 V

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-17).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2) displayed on the tester.
HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5 % or increases the injection volume by 25 %.

- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volumes	Status	Voltages
AFS B1 S1 (A/F)	+25 %	Rich	Less than 3.0
	-12.5 %	Lean	More than 3.35
O2S B1 S2 (HO2)	+25 %	Rich	More than 0.5
	-12.5 %	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Areas
1	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25 % -12.5 %		Injection Volume +25 % -12.5 %		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2; and press the YES button and then the ENTER button followed by the F4 button.
HINT:

- DTC P2A00 may be set when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

ES

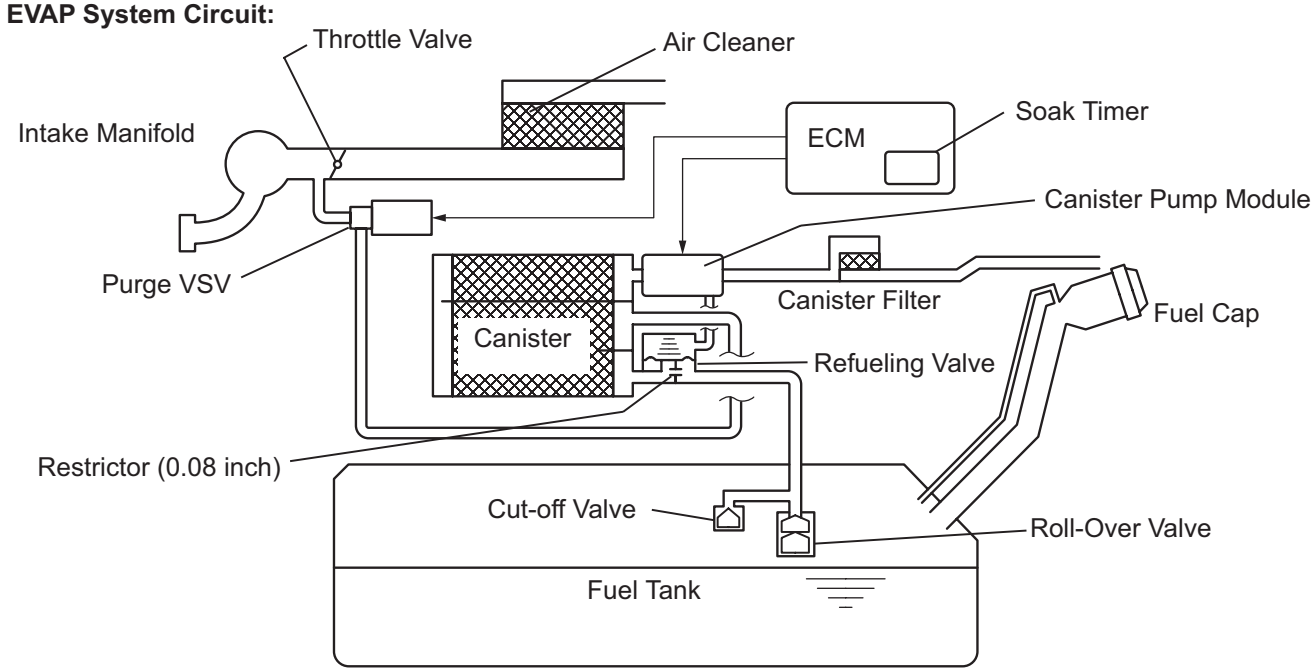
NOTICE:
If the reference pressure difference between the first and second checks is greater than the specification, all the DTCs relating to the reference pressure (P043E, P043F, P2401, P2402 and P2419) are stored.

ES

DESCRIPTION

Location of EVAP (Evaporative Emission) System:



NOTE:

The canister is located near the fuel tank, underneath the body.

A128152E01

EVAP System Circuit:

NOTICE:

In this vehicle's EVAP system, turning ON the vent valve does not seal off the EVAP system. To check for leaks in the EVAP system, disconnect the air inlet vent hose and apply pressure from the atmospheric side of the canister.

While the engine is running, if a predetermined condition (closed-loop, etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged into the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume.

The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister.

The following two monitors run to confirm the appropriate EVAP system operation.

1. Key-off monitor

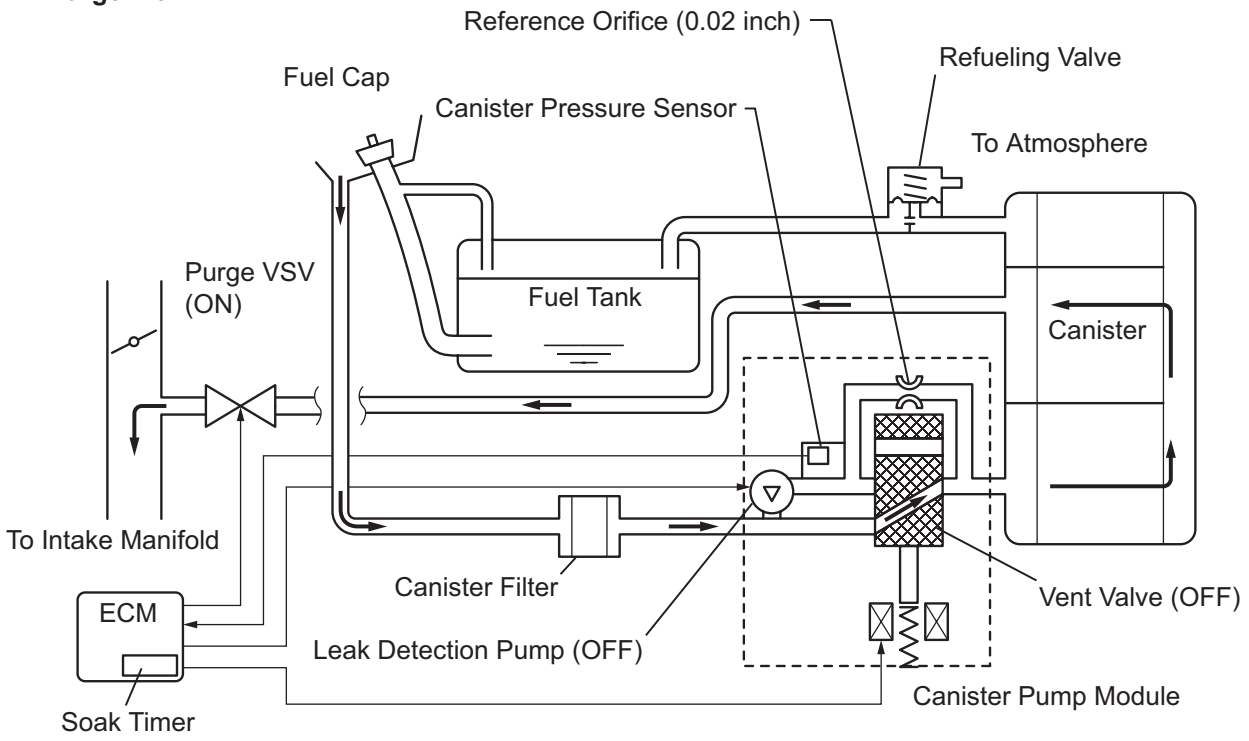
This monitor checks for EVAP (Evaporative Emission) system leaks and canister pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned OFF. At least 5 hours are required for the fuel to cool down to stabilize the EVAP pressure, thus making the EVAP system monitor more accurate.

The leak detection pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the canister pump module and purge VSV, based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

2. Purge flow monitor

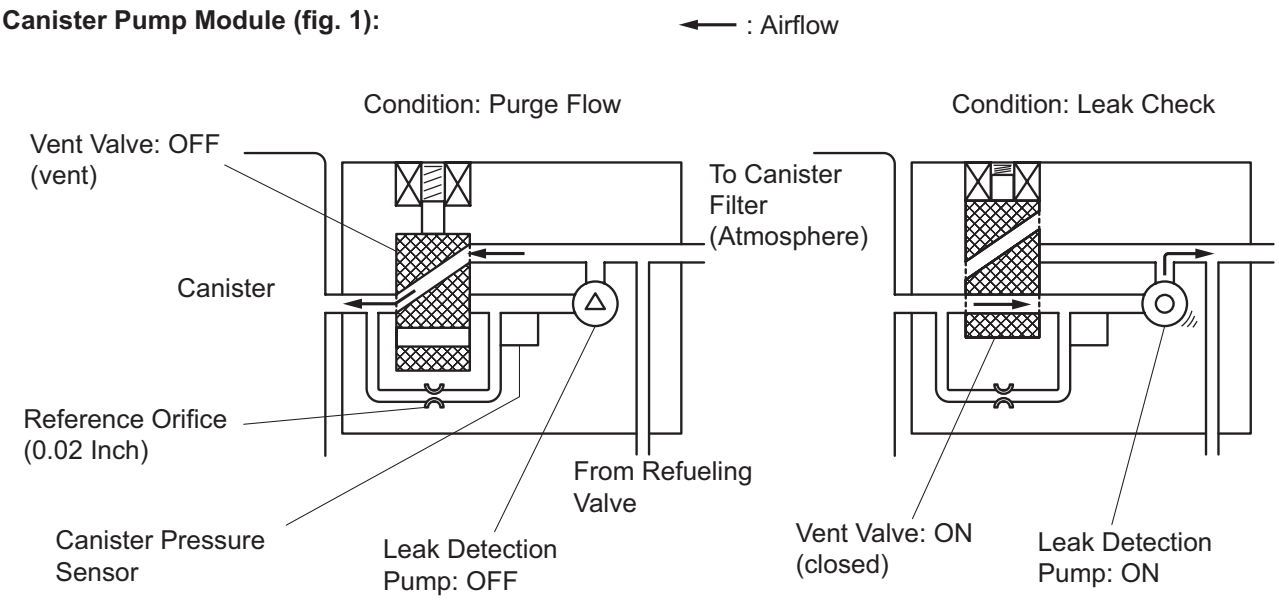


The purge flow monitor consists of the two monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.

- The 2nd monitor
  The vent valve is turned OFF (open) and the EVAP pressure is measured. If the variation in the pressure is less than 0.5 kPa-g (3.75 mmHg-g), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

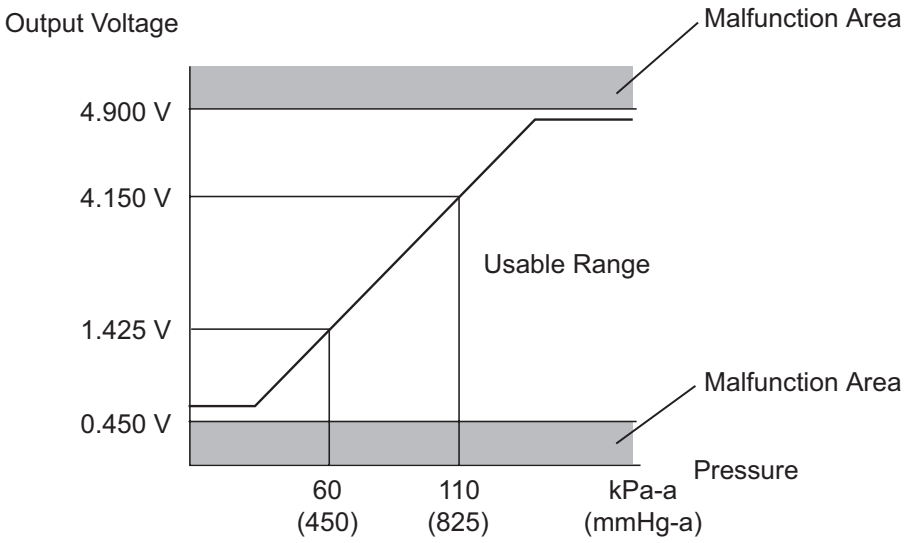
Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.



EVAP Purge Flow:

Components	Operations
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank 100 % full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time) (Open: ON; Closed: OFF).
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling.
Roll-over valve	Located in fuel tank. Valve closed by its own weight when vehicle overturns to prevent fuel from spilling out.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours (+-15 min) after ignition switch turned OFF. This allows fuel to cool down, stabilizing EVAP pressure. When approximately 5 hours elapsed, ECM activates (refer to fig. 3).
Canister pump module	Consists of (a) to (d) below. Canister pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating leak detection pump (refer to fig. 1).
(b) Canister pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to canister pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig. 2).

Components	Operations
(c) Leak detection pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) Reference orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating leak detection pump, to monitor reference pressure. Reference pressure indicates small leak of EVAP.

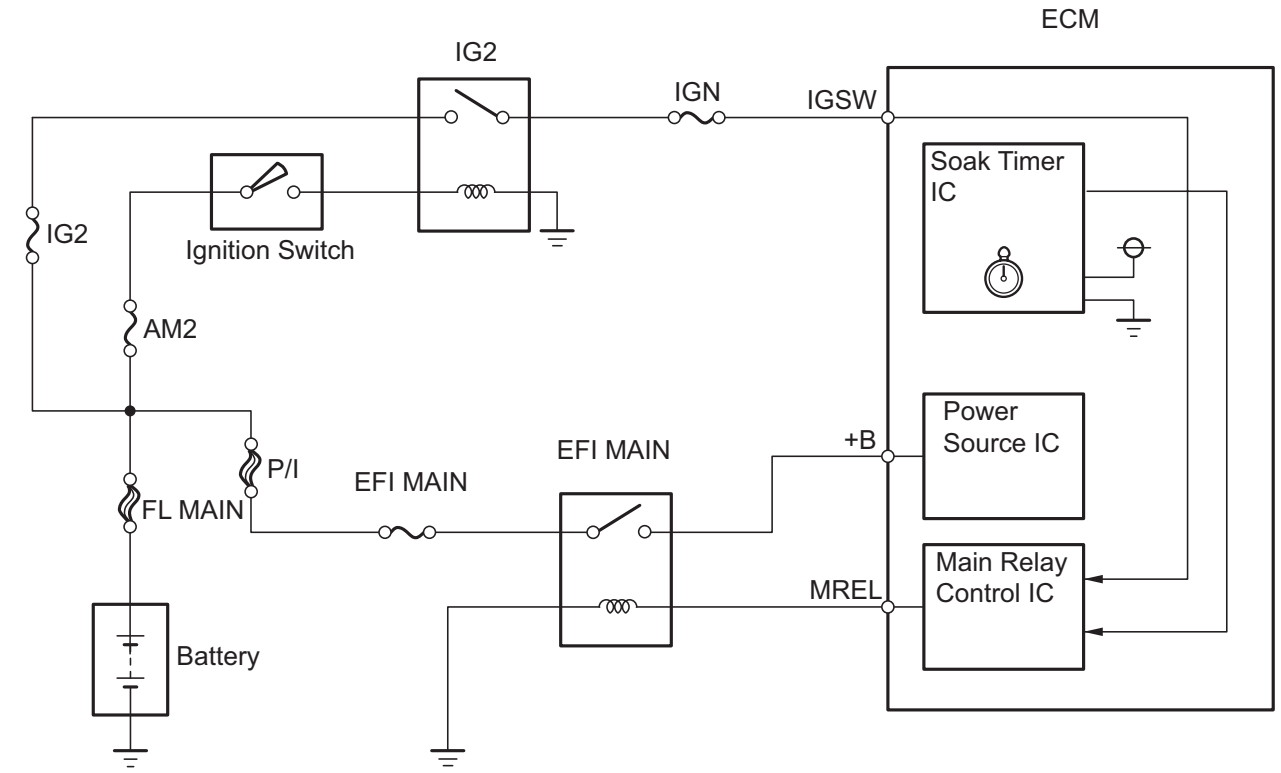


Canister Pump Module (fig. 1):

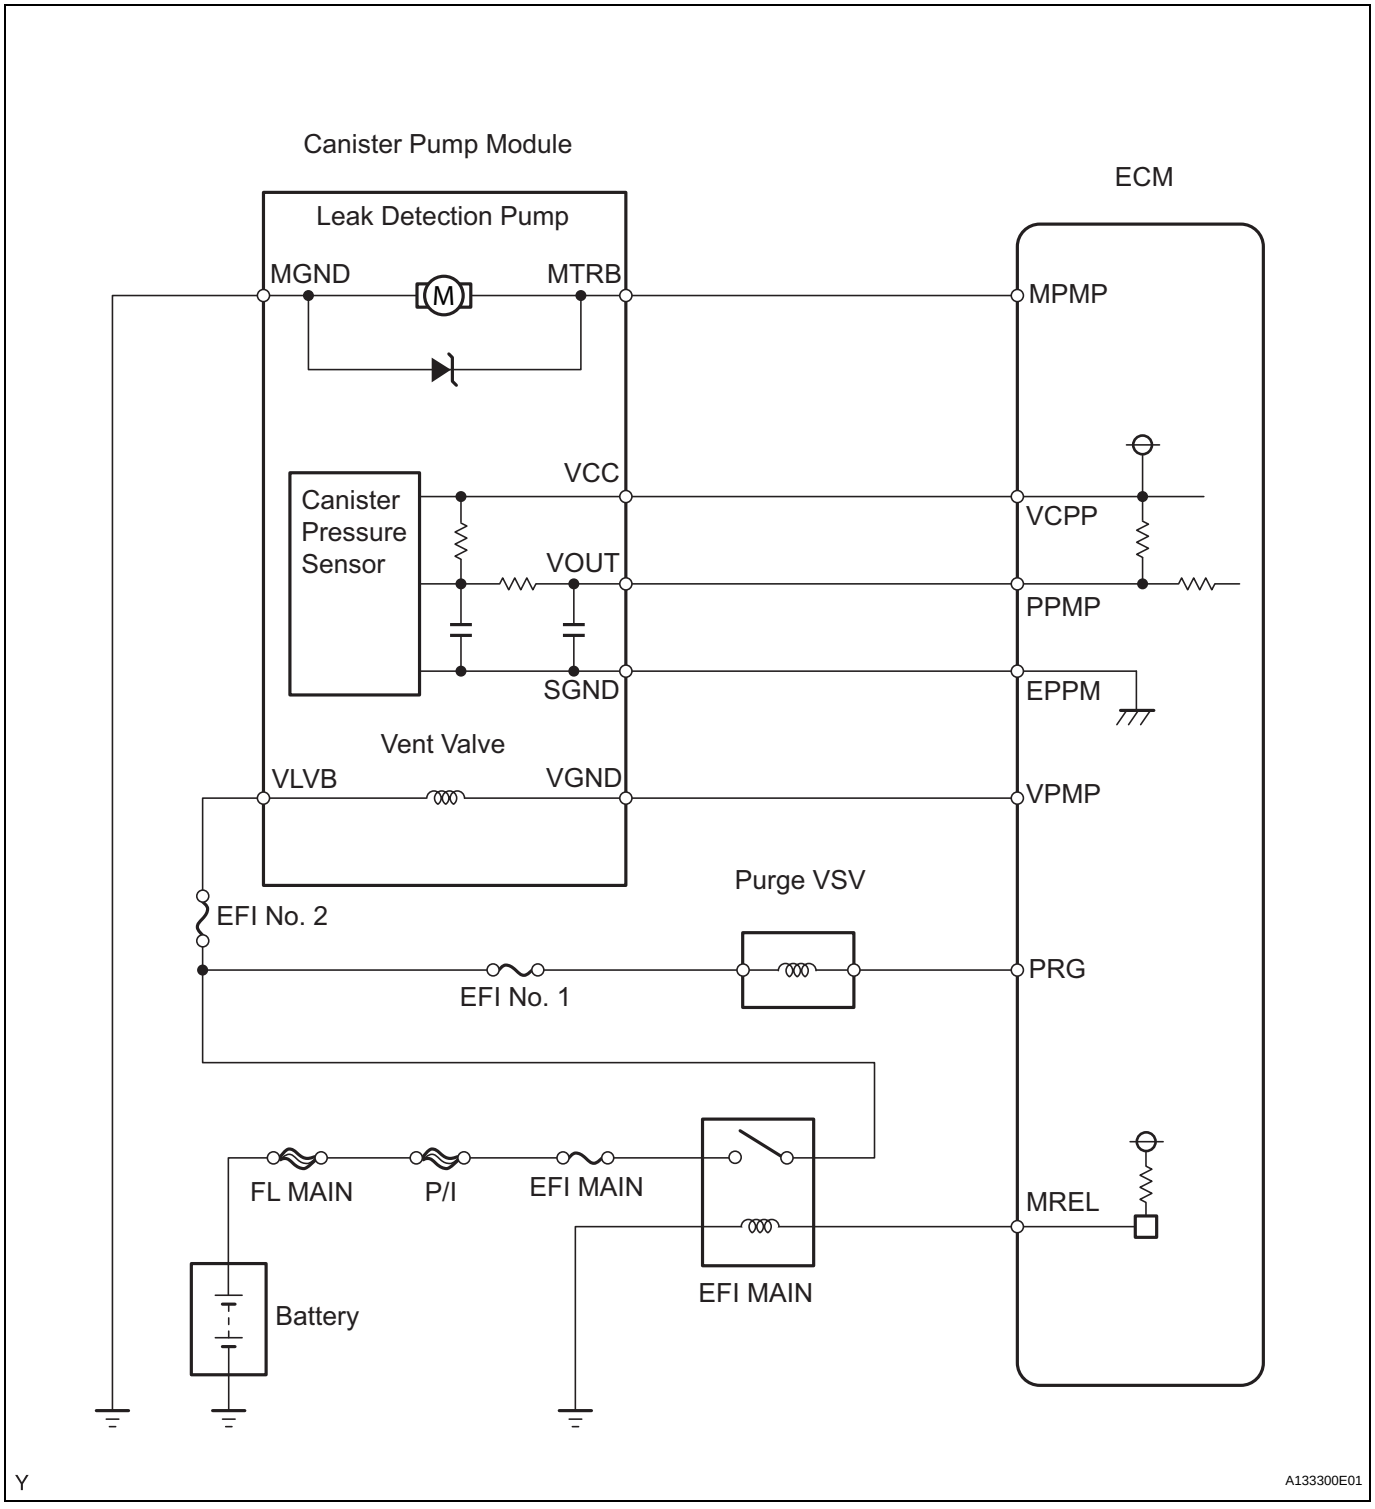
Y

A115902E02

Canister Pressure Sensor Specification (fig. 2):



HINT:



Standard atmospheric pressure is 101.3 kPa-a (760 mmHg-a)

Soak Timer Circuit (fig. 3):

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

NOTICE:

The intelligent tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using intelligent tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**CONFIRM DTC**

(a) Turn the ignition switch OFF and wait for 10 seconds.
(b) Turn the ignition switch ON.
(c) Turn the ignition switch OFF and wait for 10 seconds.
(d) Connect an intelligent tester to the DLC3.
(e) Turn the ignition switch ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Confirm DTCs and freeze frame data.
If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.
NOTICE:
If the reference pressure difference between the first and second checks is greater than the specification, all the DTCs relating to the reference pressure (P043E, P043F, P2401, P2402 and P2419) are stored.

DTCs / Malfunctioning Areas	P043E P043F	P0441	P0450	P0451	P0452	P0453	P0455	P0456	P2401 P2402	P2419	P2420

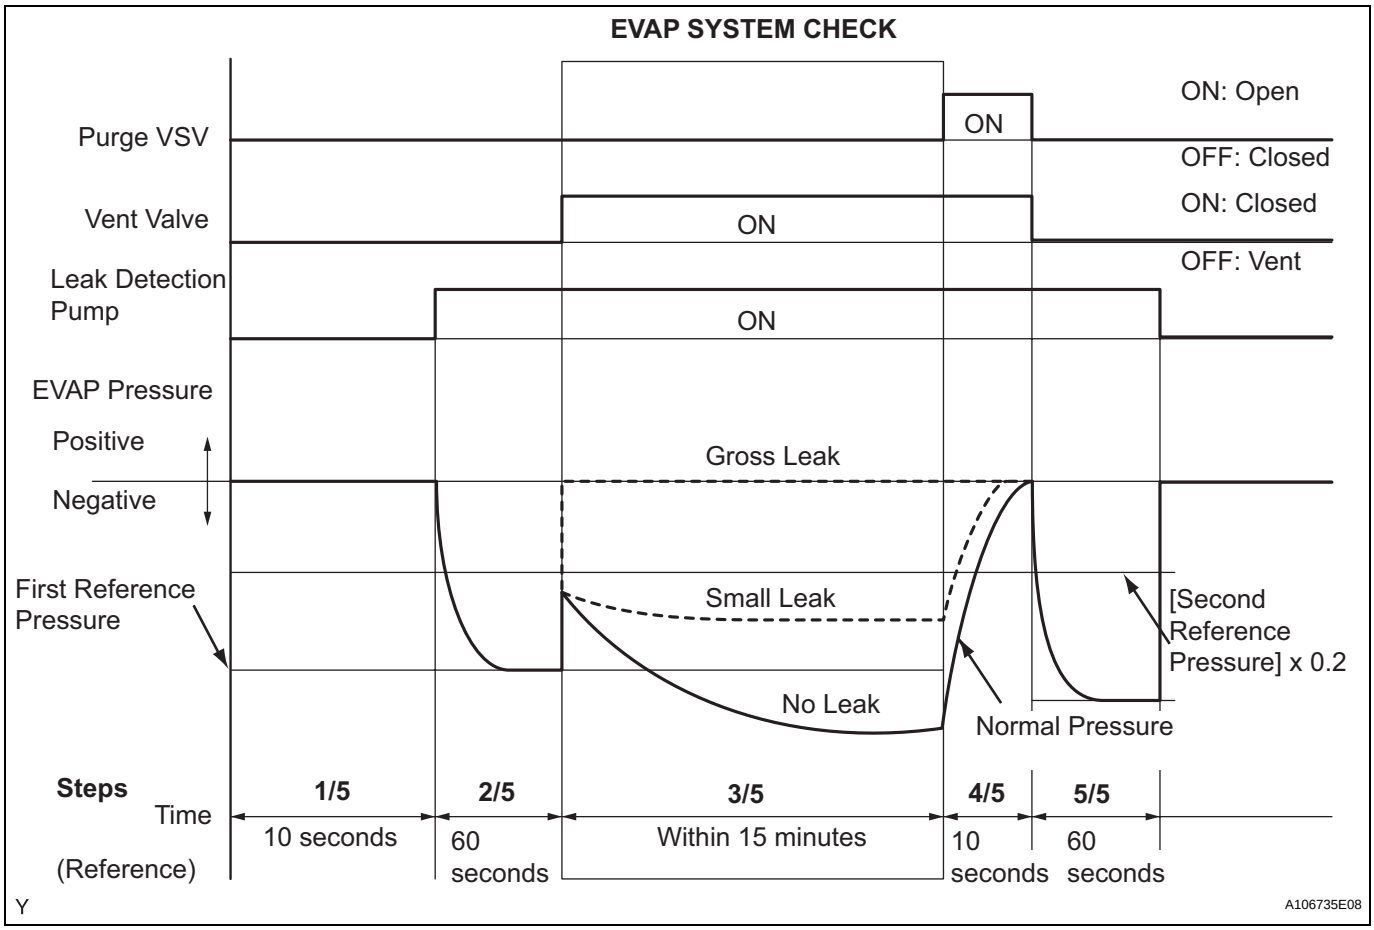
2	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of 5 steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine during this operation.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**



(a) Clear DTCs (see page ES-35).

(b) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
(c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTCs are displayed, perform the MONITOR CONFIRMATION (see "Diagnostic Help" menu). After this confirmation, check for pending DTCs. If no DTCs are displayed, the EVAP system is normal.

ES

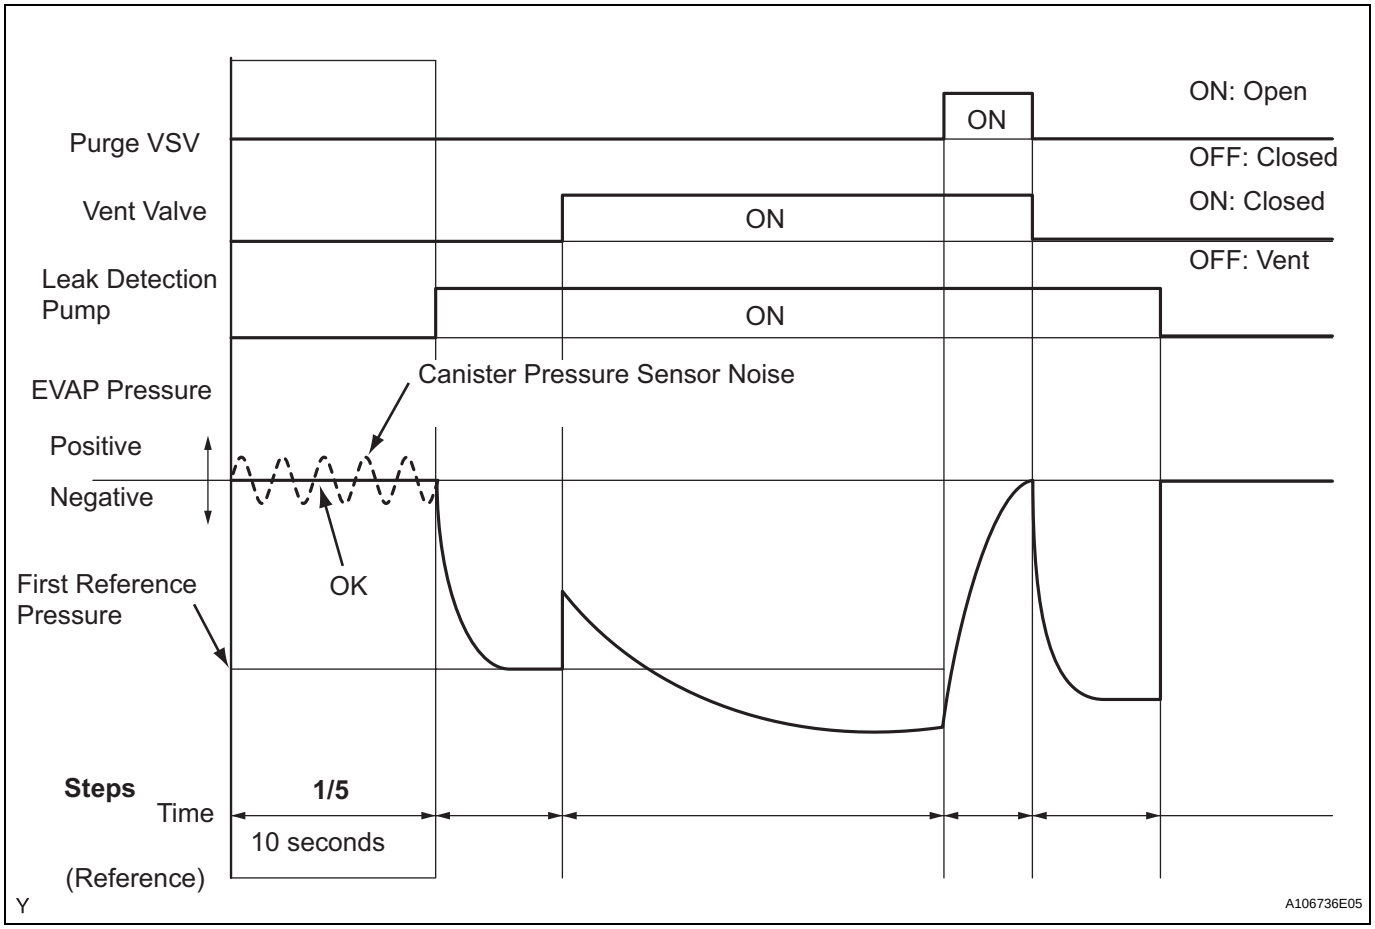
NEXT

3	PERFORM EVAP SYSTEM CHECK (MANUAL OPERATION)

NOTICE:

- **In the EVAP SYSTEM CHECK (MANUAL OPERATION), perform the series of 5 EVAP SYSTEM CHECK steps manually using the intelligent tester.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine during this operation.**

- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**



(a) Clear DTCs (See page ES-35).

(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

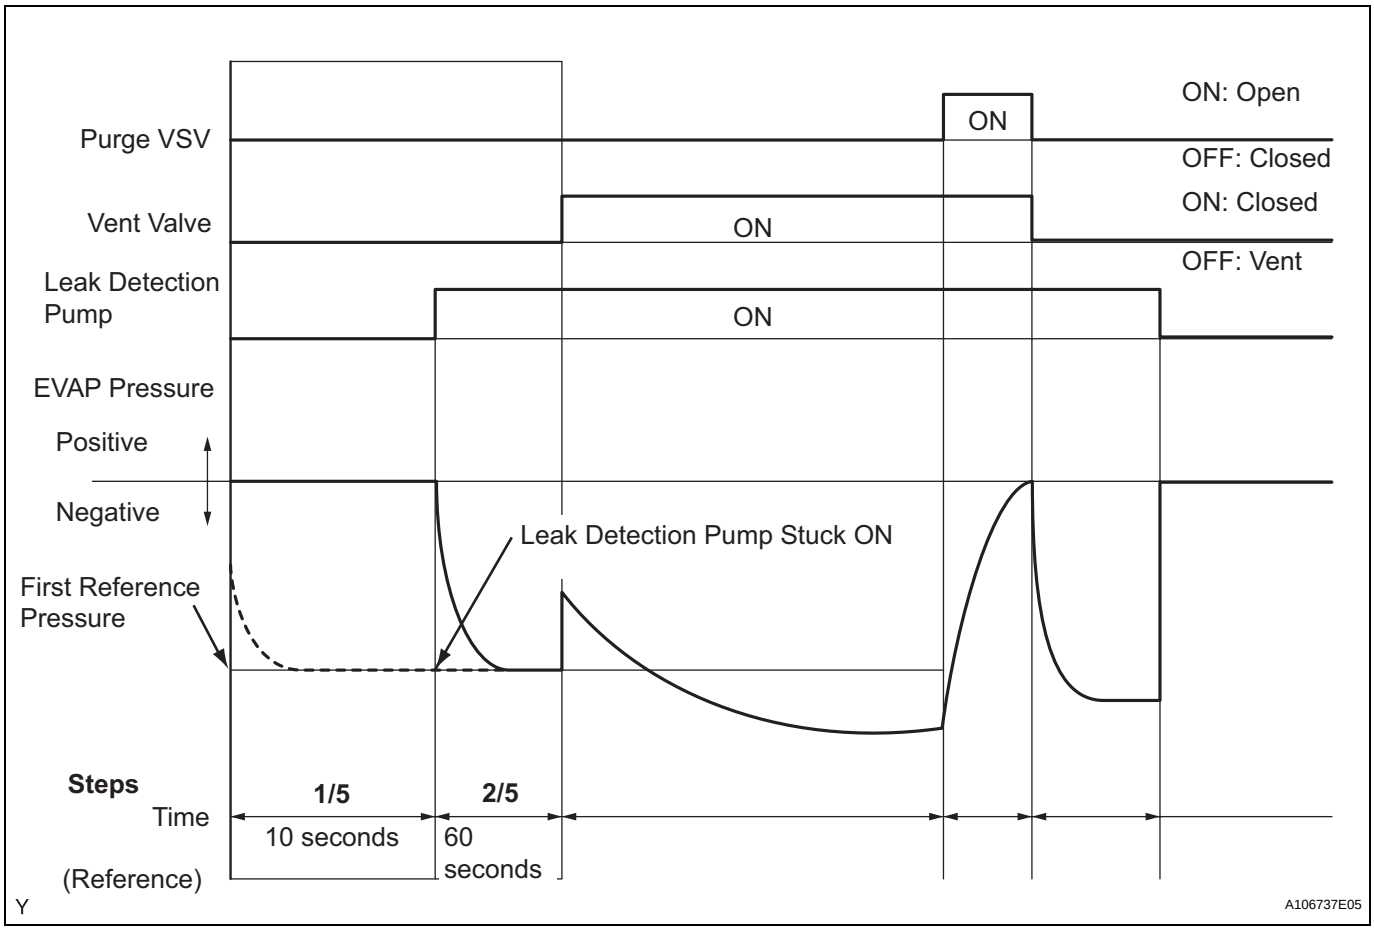
NEXT

4	PERFORM EVAP SYSTEM CHECK (STEP 1/5)

ES

(a) Check the EVAP pressure in step 1/5.

Result



DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure	Not yet determined	A
P0451	EVAP pressure fluctuates by +-0.3 kPa-g (2.25 mmHg-g) or more	Canister pressure sensor noise	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

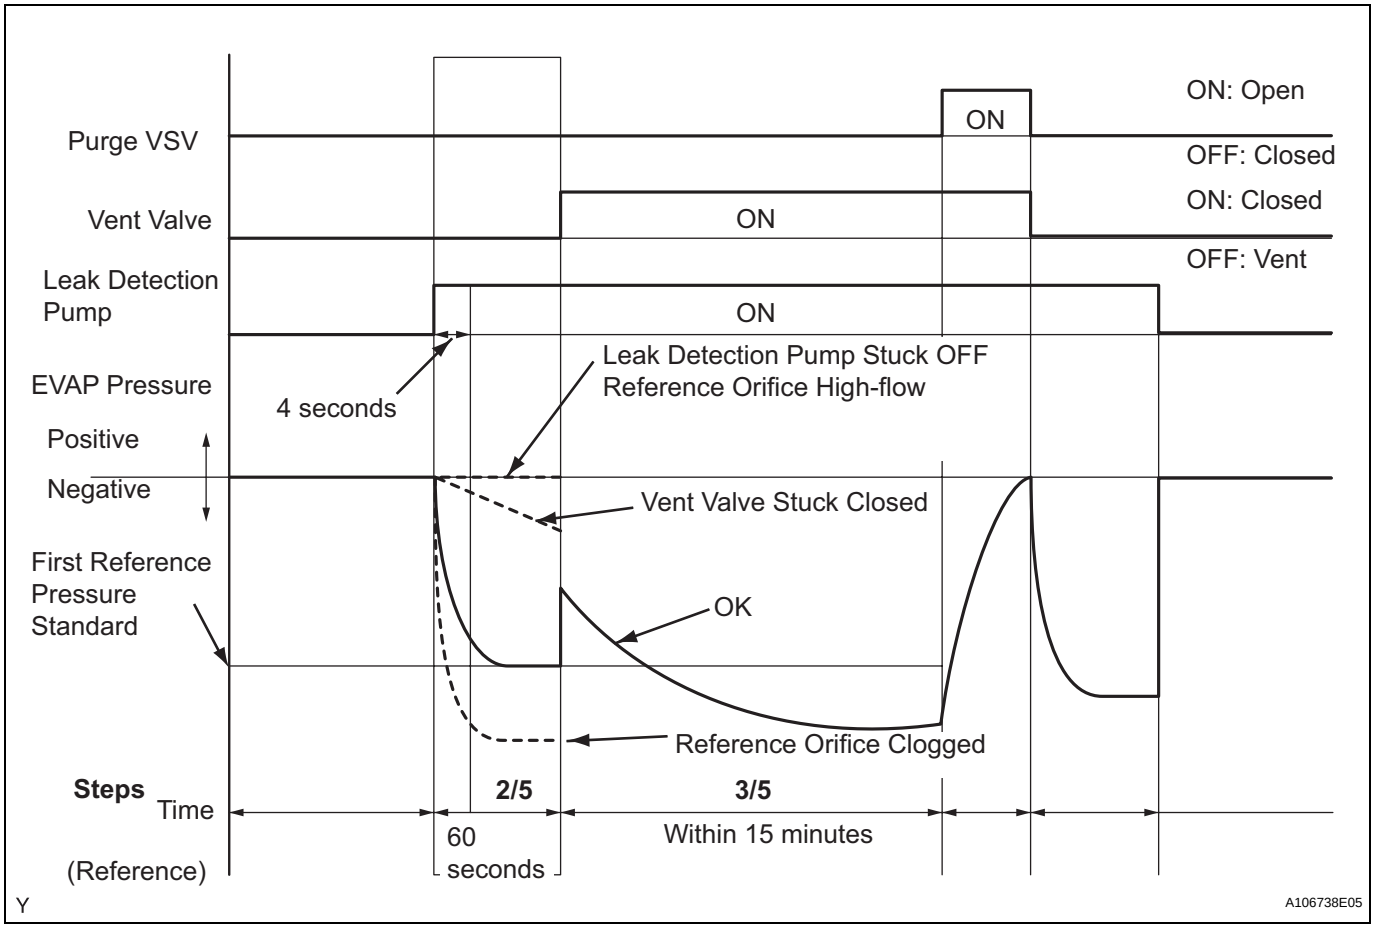
B → **Go to step 29**

A

5	PERFORM EVAP SYSTEM CHECK (STEP 1/5 TO 2/5)

(a) Check the EVAP pressure in steps 1/5 and 2/5.

Result



DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	Virtually no variation in EVAP pressure during step 1/5. Then decreases to reference pressure	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Leak detection pump stuck ON	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.
HINT:
The first reference pressure is the value determined in step 2/5.

B → **Go to step 22**

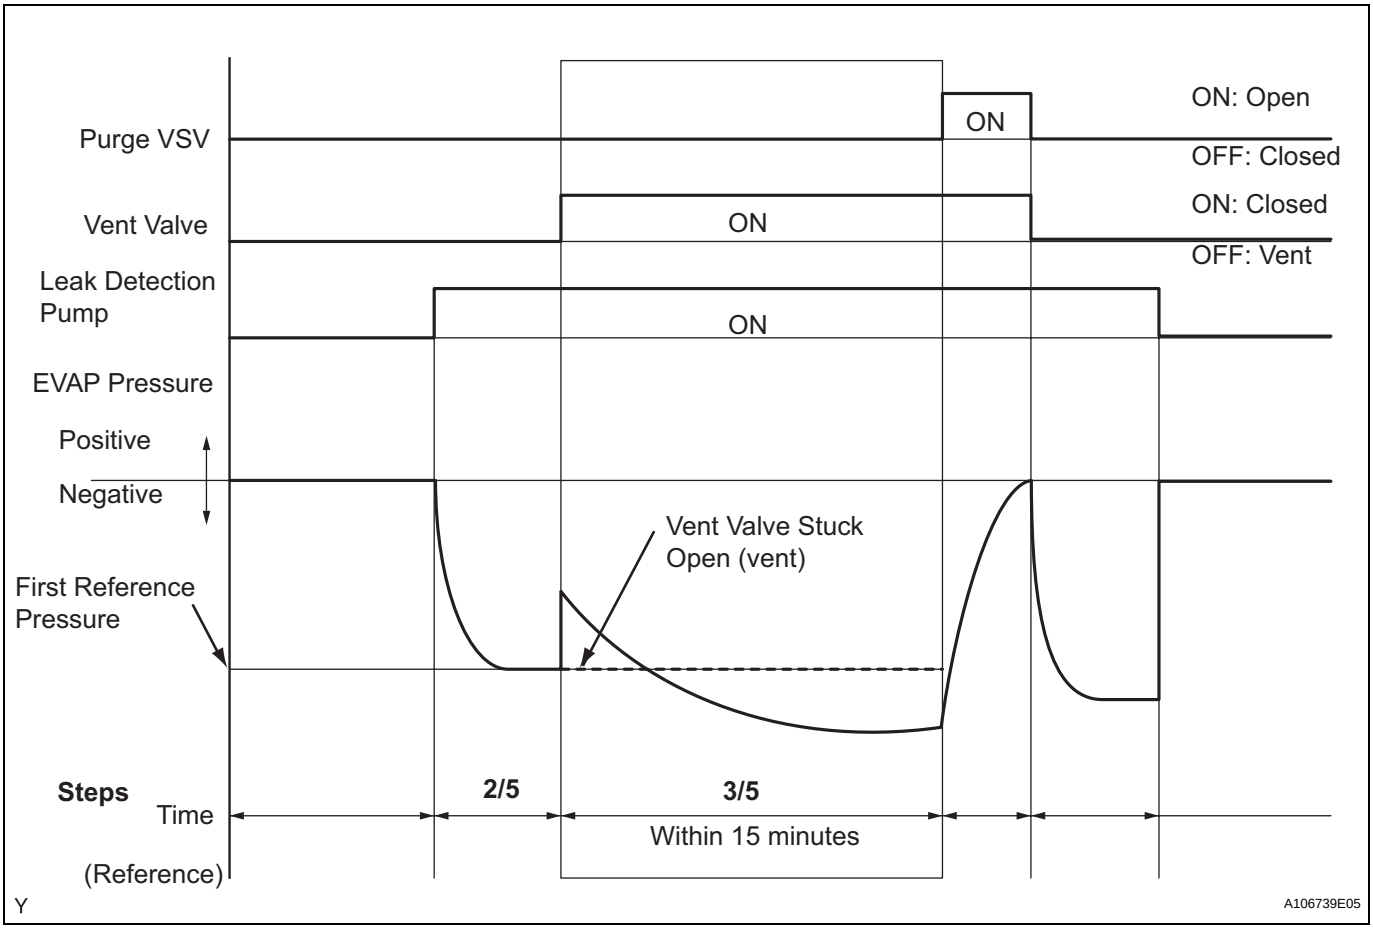
A

6	PERFORM EVAP SYSTEM CHECK (STEP 2/5)

HINT:
Make a note of the pressures checked in steps (a) and (b) below.
(a) Check the EVAP pressure 4 seconds after the leak detection pump is activated*.
*: The leak detection pump begins to operate as step 1/5 finishes and step 2/5 starts.
(b) Check the EVAP pressure again when it has stabilized. This pressure is the reference pressure.

Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure in step (b) between -4.85 kPa-g and -1.057 kPa-g (-36.4 mmHg-g and -7.93 mmHg-g)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.057 kPa-g (-7.93 mmHg-g) or more	• Reference orifice high-flow • Leak detection pump stuck OFF	B
P043E	EVAP pressure in step (b) below -4.85 kPa-g (-36.4 mmHg-g)	Reference orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.057 kPa-g (-7.93 mmHg-g)	Vent valve stuck closed	D



*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

B	Go to step 11
C	Go to step 29
D	Go to step 20

A

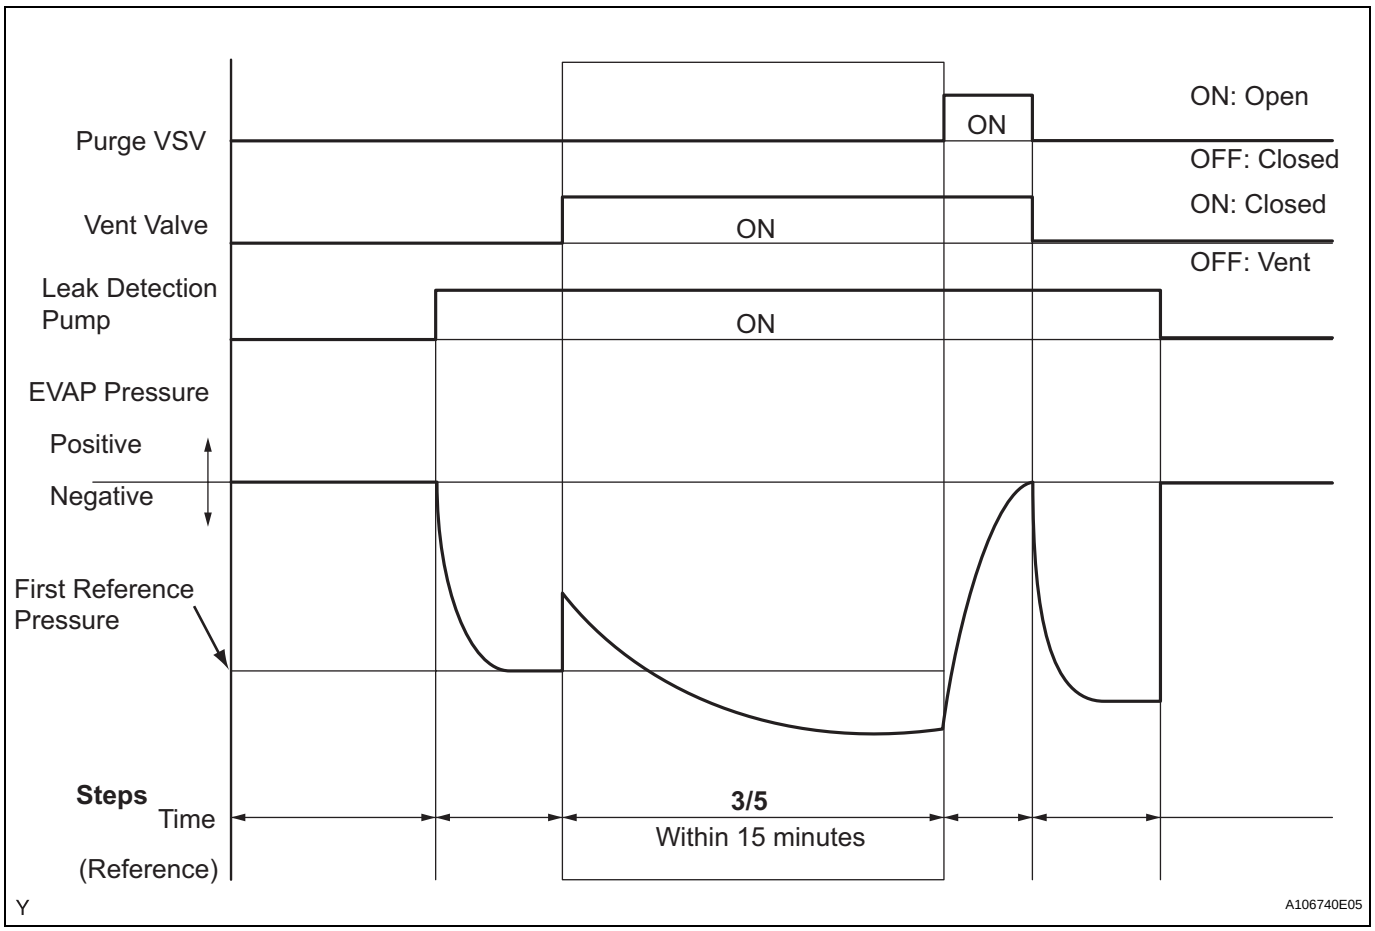
7	PERFORM EVAP SYSTEM CHECK (STEP 2/5 TO 3/5)

ES

(a) Check the EVAP pressure increase in step 3/5.

Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B
P0451	No variation in EVAP pressure during steps 1/5 through 3/5	Canister pressure sensor malfunction fixed	C



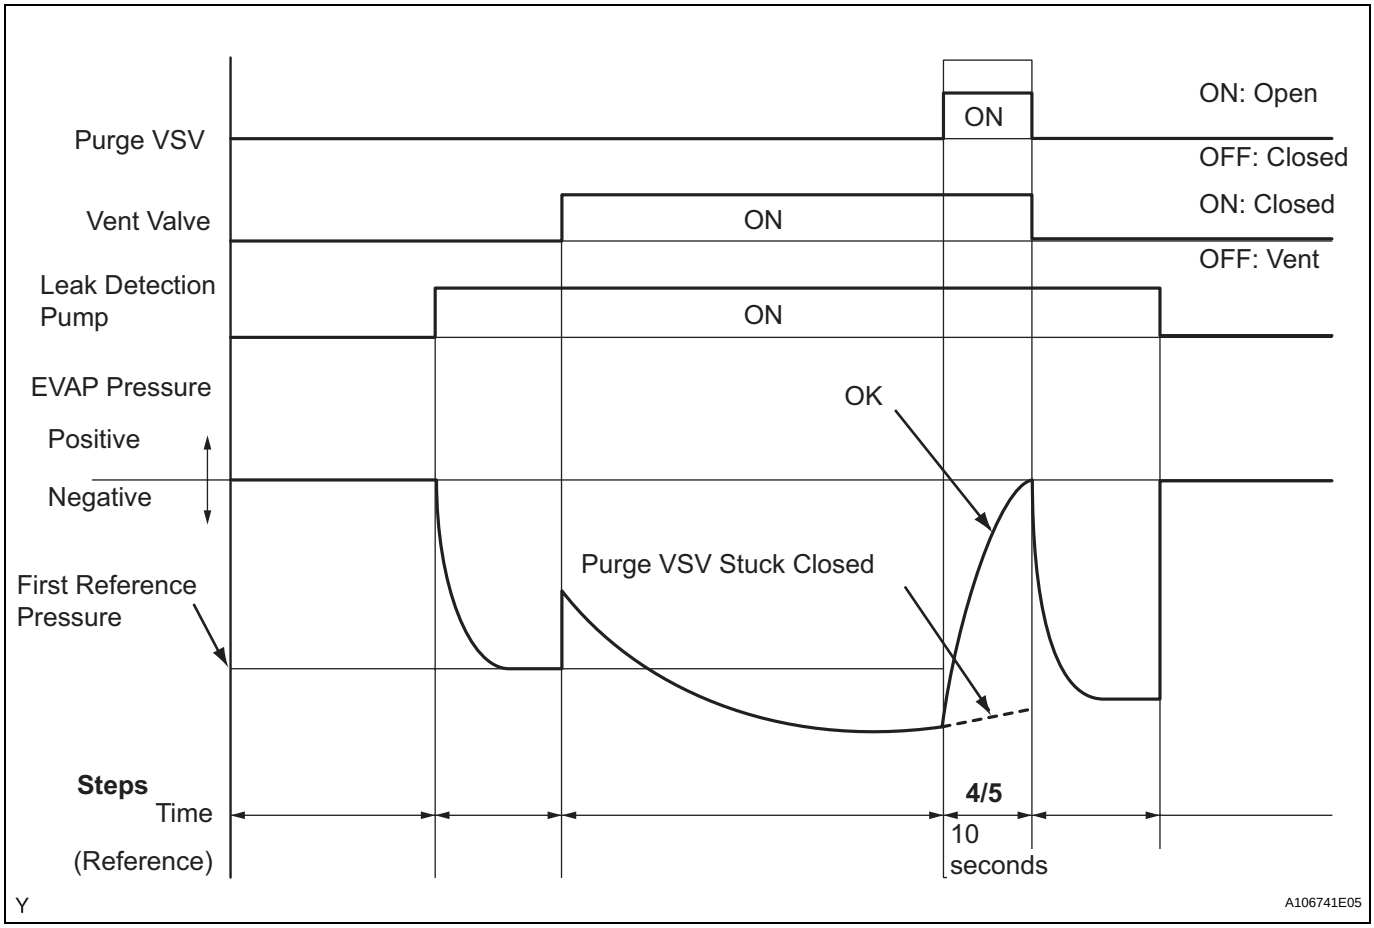
*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

B	Go to step 19

C	Go to step 29

A

8	PERFORM EVAP SYSTEM CHECK (STEP 3/5)



(a) Wait until the EVAP pressure change is less than 0.1 kPa-g (0.75 mmHg-g) for 30 seconds.
(b) Measure the EVAP pressure and record it.
HINT:
A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 15 minutes.

NEXT

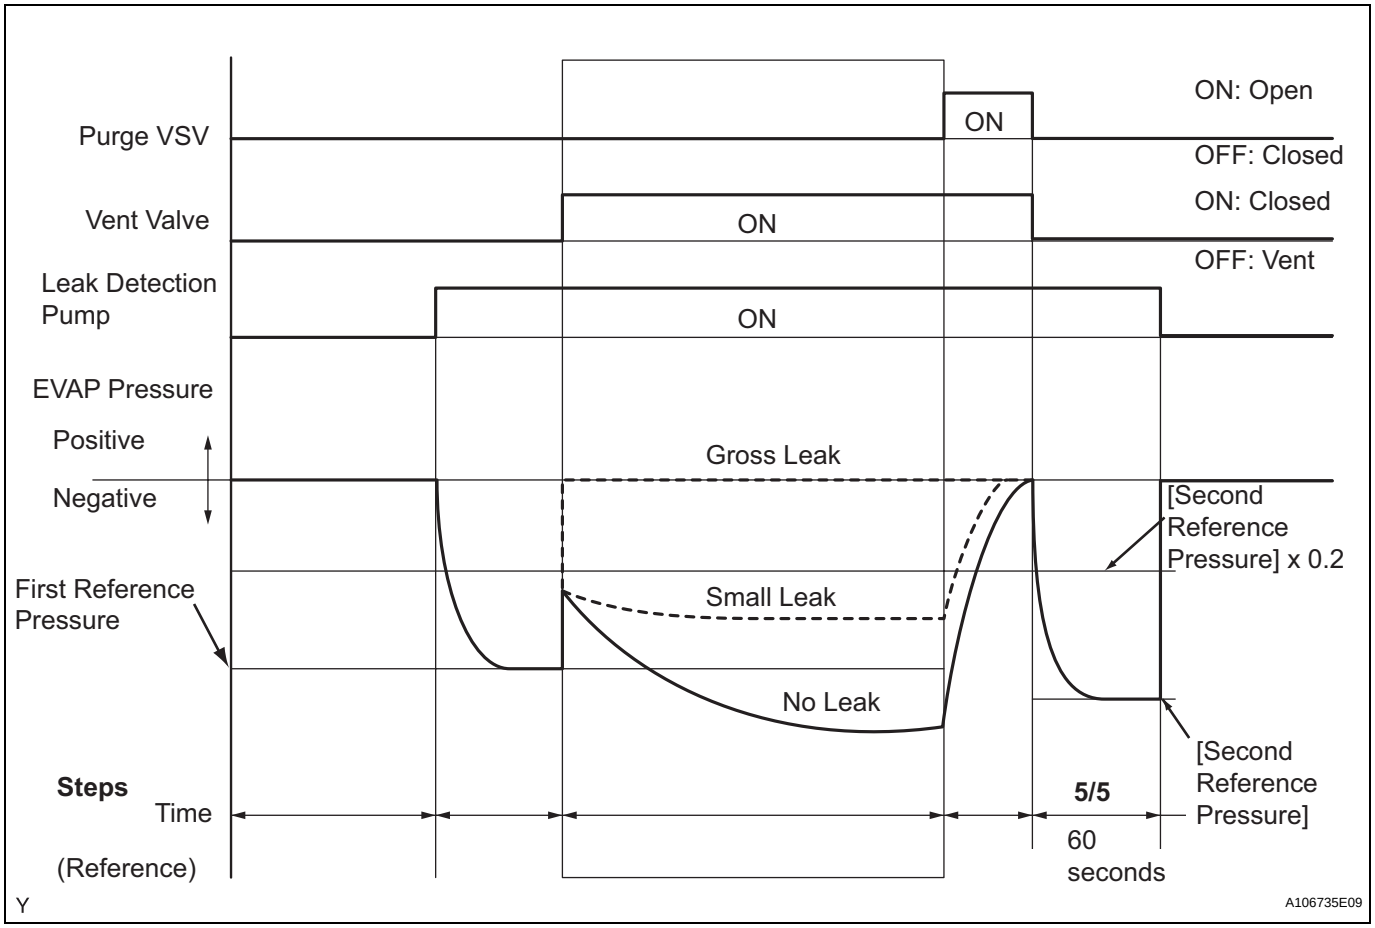
ES

9	PERFORM EVAP SYSTEM CHECK (STEP 4/5)

(a) Check the EVAP pressure in step 4/5.

Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between purge VSV and intake manifold	B
P0441	Variation in EVAP pressure less than 0.3 kPa-g (2.25 mmHg-g) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C



*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

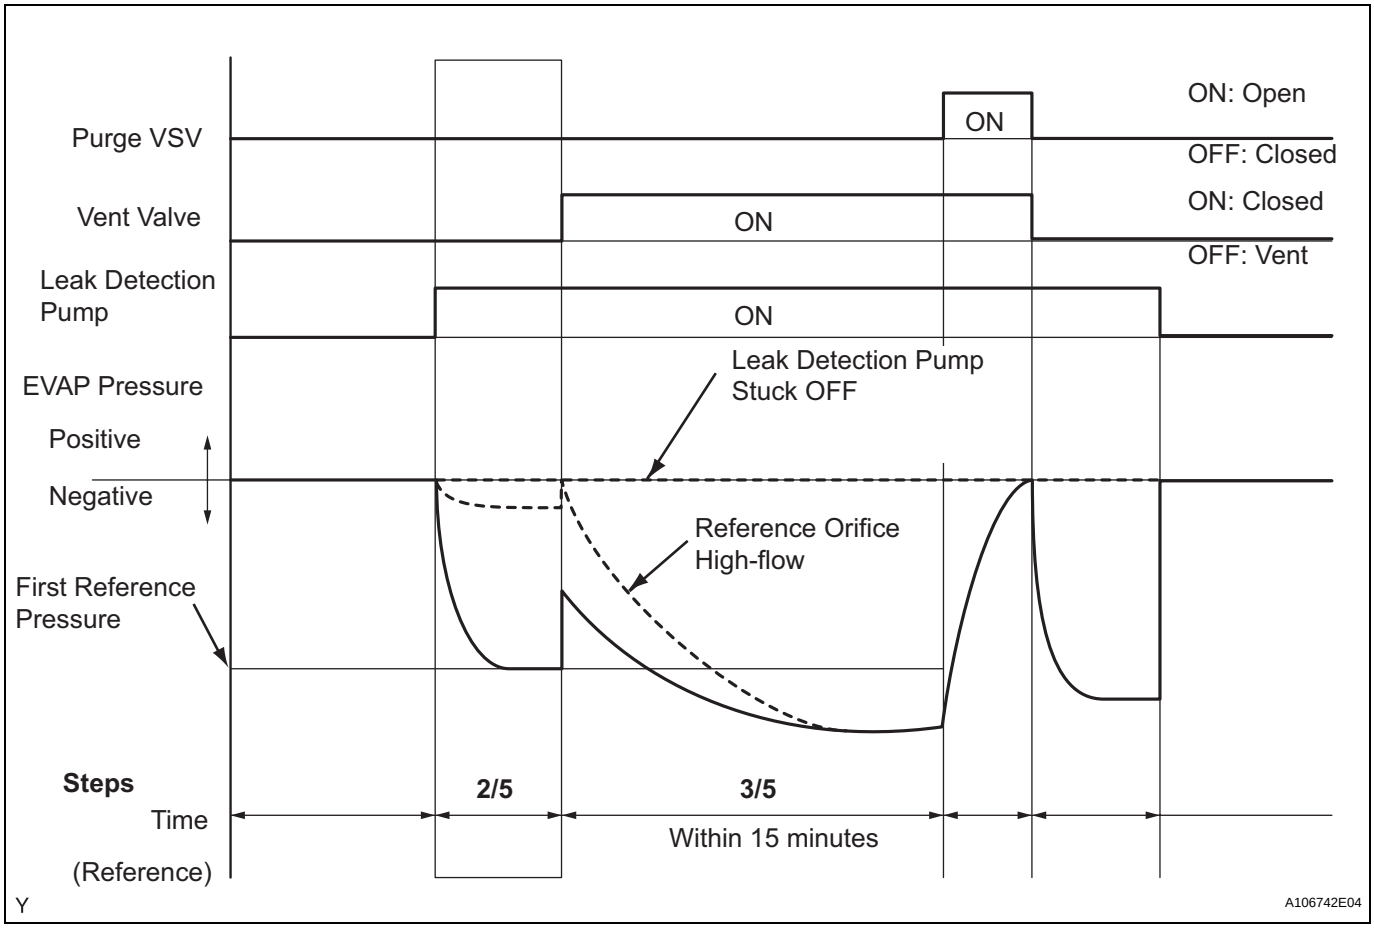
B → Go to step 15

C → Go to step 12

A

10	PERFORM EVAP SYSTEM CHECK (STEP 5/5)

(a) Check the EVAP pressure in step 5/5.
(b) Compare the EVAP pressure in step 3/5 and the second reference pressure (step 5/5).



Result

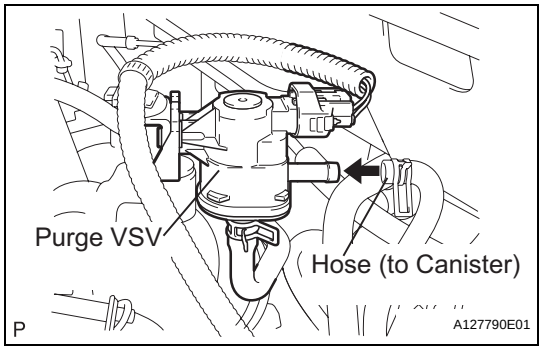
DTCs*	Test Results	Suspected Trouble Areas	Proceed To
-	EVAP pressure (step 3/5) lower than second reference pressure (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second reference pressure (step 5/5) x 0.2]	• Purge VSV stuck open • EVAP gross leak	B
P0456	EVAP pressure (step 3/5) higher than second reference pressure (step 5/5)	EVAP small leak	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

A	Go to step 35
B	Go to step 12

11	PERFORM EVAP SYSTEM CHECK (STEP 3/5)

(a) Check the EVAP pressure in step 3/5.



Result

DTCs*	Test Results	Suspected Trouble Areas	Proceed To
P043F	EVAP pressure less than [reference pressure] measured at 2/5	Reference orifice high-flow	A
P2401	EVAP pressure almost same as [reference pressure] measured at 2/5	Leak detection pump stuck OFF	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.
HINT:
The first reference pressure is the value determined in step 2/5.

A	Go to step 29
B	Go to step 22

12 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (PURGE VSV)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / EVAP VSV (ALONE).
(b) Disconnect the hose (connected to the canister) from the purge VSV.
(c) Start the engine.
(d) Using the tester, turn off the purge VSV (EVAP VSV: OFF).
(e) Use your finger to confirm that the purge VSV has no suction.
(f) Using the tester, turn on the purge VSV (EVAP VSV: ON).
(g) Use your finger to confirm that the purge VSV has suction.

ES

Result

Test Results	Suspected Trouble Areas	Proceed To
No suction when purge VSV turned OFF, and suction applied when turned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	• Purge VSV stuck closed • Problems with EVAP hose between purge VSV and intake manifold	C

(h) Reconnect the hose.

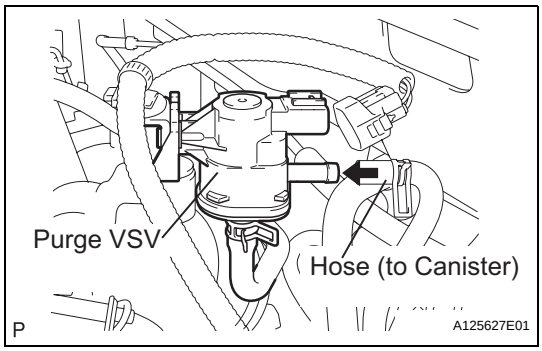
B	Go to step 14
C	Go to step 15

A

13 CHECK FUEL CAP ASSEMBLY

(a) Check that the fuel cap is correctly installed and confirm the fuel cap meets OEM specifications.
(b) Tighten the fuel cap until a few click sounds are heard.
HINT:
If an EVAP tester is available, check the fuel cap using the tester.
1. Remove the fuel cap and install it onto a fuel cap adapter.
2. Connect an EVAP tester pump hose to the adapter, and pressurize the cap to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
3. Seal the adapter and wait for 2 minutes.
4. Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel cap is normal.

Result



Test Results	Suspected Trouble Areas	Proceed To
Fuel cap correctly installed	-	A

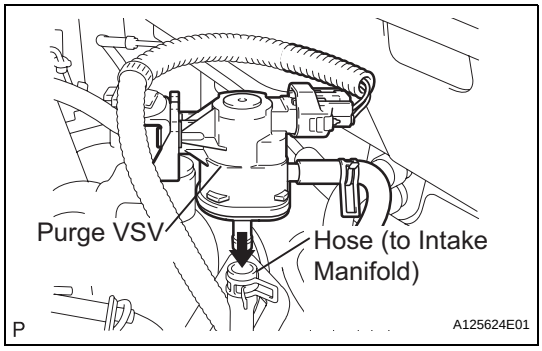
Test Results	Suspected Trouble Areas	Proceed To
Fuel cap loose	• Fuel cap improperly installed • Defective fuel cap • Fuel cap does not meet OEM specifications	B
Defective fuel cap	-	B
No fuel cap	-	C

(c) Reinstall the fuel cap.

A	Go to step 28
B	Go to step 26
C	Go to step 27

14 INSPECT DUTY VACUUM SWITCHING VALVE (PURGE VSV)

(a) Turn the ignition switch OFF.
(b) Disconnect the B2 purge VSV connector.
(c) Disconnect the hose (connected to the canister) from the purge VSV.
(d) Start the engine.
(e) Use your finger to confirm that the purge VSV has no suction.



Result

Test Results	Suspected Trouble Areas	Proceed To
No suction	ECM	A
Suction applied	Purge VSV	B

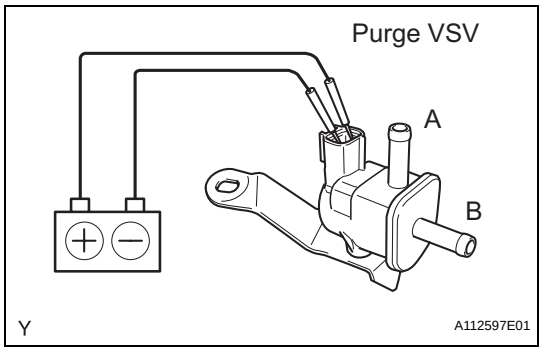
(f) Reconnect the purge VSV connector.
(g) Reconnect the hose.

A	Go to step 34
B	Go to step 30

15 CHECK EVAP HOSE (PURGE VSV - INTAKE MANIFOLD)

(a) Disconnect the hose (connected to the intake manifold) from the purge VSV.
(b) Start the engine.
(c) Use your finger to confirm that the hose has suction.

Result



Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between purge VSV and intake manifold normal	A
No suction	• Intake manifold port • EVAP hose between purge VSV and intake manifold	B

(d) Reconnect the hose.

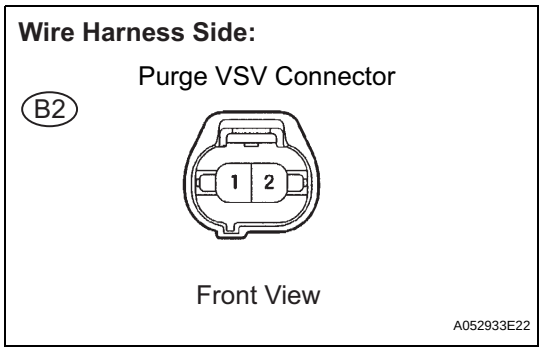
B → Go to step 25

A

16 INSPECT DUTY VACUUM SWITCHING VALVE (PURGE VSV)

(a) Remove the purge VSV.
(b) Apply the battery voltage to the terminals of the purge VSV.
(c) Using an air gun, confirm that air flows from port A to port B.

Result



Test Results	Suspected Trouble Areas	Proceed To
Air flows	Purge VSV normal	A
No air flow	Purge VSV	B

(d) Install the purge VSV.

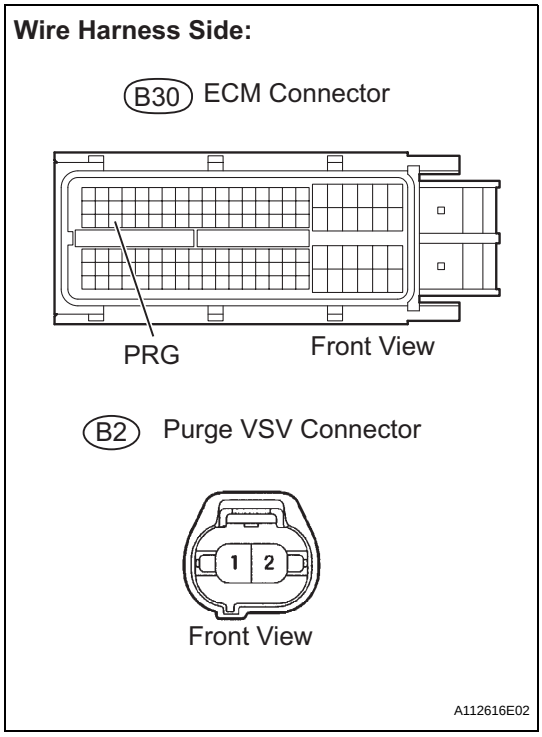
B → Go to step 30

A

17 CHECK HARNESS AND CONNECTOR (POWER SOURCE OF PURGE VSV)

(a) Disconnect the B2 purge VSV connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between terminal 2 of the purge VSV connector and the body ground.

Result



Test Results	Suspected Trouble Areas	Proceed To
9 to 14 V	Normal	A
Other than result above	Wire harness or connectors between purge VSV and ECM	B

(d) Reconnect the purge VSV connector.

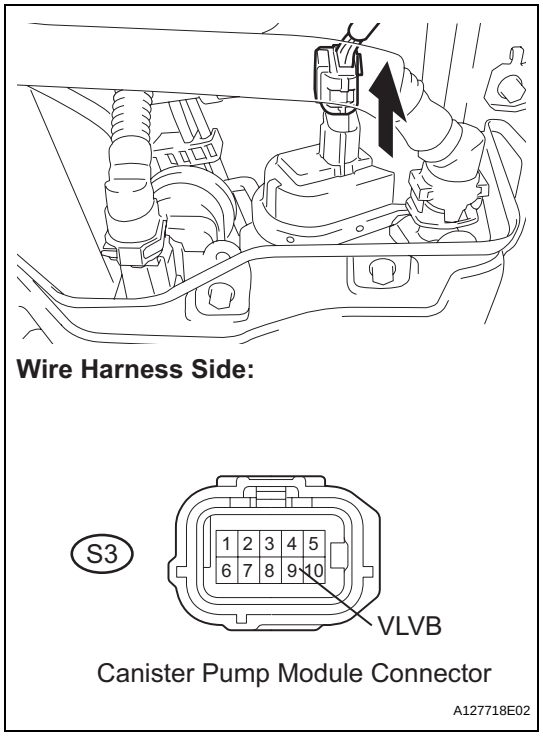
B	Go to step 31

A

18	CHECK HARNESS AND CONNECTOR (PURGE VSV - ECM)

(a) Disconnect the B30 ECM connector and the B2 purge VSV connector.
(b) Measure the resistance.

Standard resistance



Tester Connections	Specified Conditions
B30-49 (PRG) - B2-2 (Purge VSV)	Below 1 Ω
B30-49 (PRG) - Body ground	10 kΩ or higher
B2-2 (Purge VSV) - Body ground	10 kΩ or higher

(c) Reconnect the purge VSV connector.
(d) Reconnect the ECM connector.

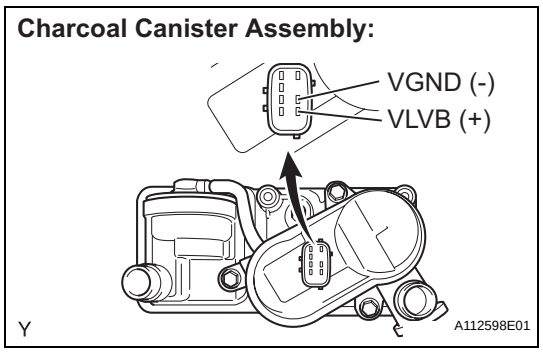
OK	Go to step 34
NG	Go to step 31

ES

19 INSPECT CANISTER PUMP MODULE (POWER SOURCE FOR VENT VALVE)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Turn the ignition switch ON.
(d) Measure the voltage between VLVB terminal of the canister pump module connector and the body ground.

Result



Test Results	Suspected Trouble Areas	Proceed To
9 to 14 V	1. Wire harness between vent valve and ECM 2. Vent valve 3. ECM	A
Below 3 V	Power source wire harness of vent valve	B

(e) Reconnect the canister pump module connector.

B → Go to step 31

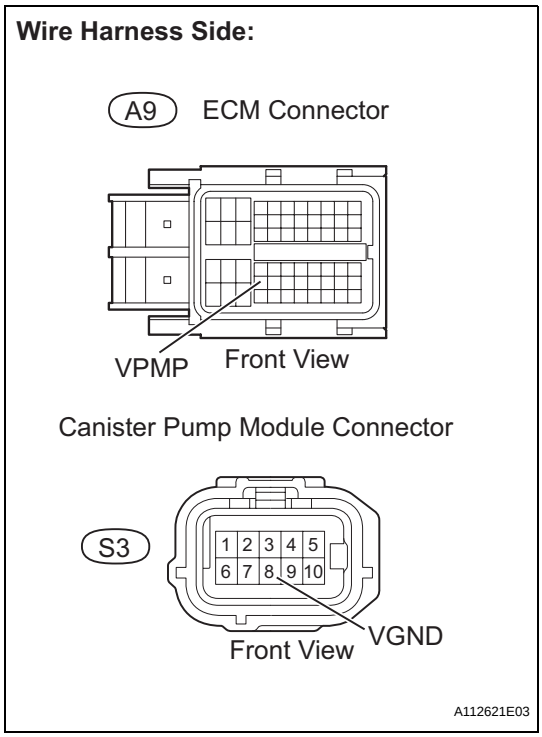
A

20 INSPECT CANISTER PUMP MODULE (VENT VALVE OPERATION)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Apply the battery voltage to VLVB and VGND terminals of the canister pump module.
(d) Touch the canister pump module to confirm the vent valve operation.

Result

Test Results	Suspected Trouble Areas	Proceed To
Operating	1. Wire harness between vent valve and ECM 2. ECM	A



Test Results	Suspected Trouble Areas	Proceed To
Not operating	Vent valve	B

(e) Reconnect the canister connector.

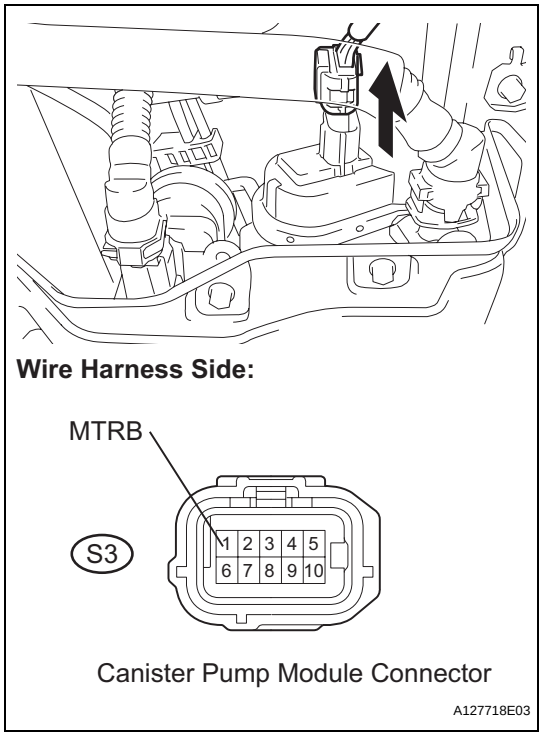
B → Go to step 29

A

21 CHECK HARNESS AND CONNECTOR (ECM - CANISTER PUMP MODULE)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the S3 canister pump module connector.
(c) Measure the resistance between VPMP terminal of the ECM connector and VGND terminal of the canister pump module connector.

Result



Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	ECM	A
10 kΩ or higher	Wire harness between ECM and canister pump module	B

(d) Reconnect the ECM connector.
(e) Reconnect the canister pump module connector.

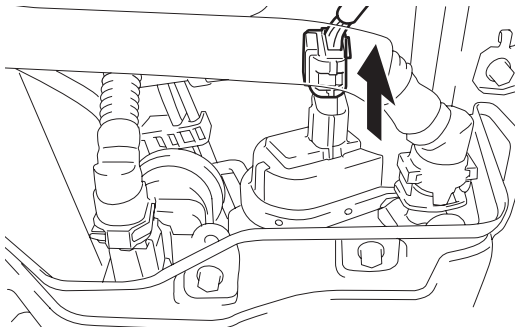
A → Go to step 34

B → Go to step 31

22	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (VACUUM PUMP (ALONE))

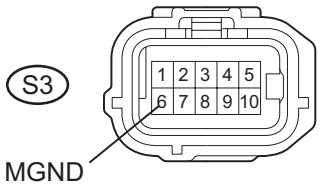
(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Turn the ignition switch ON.
(d) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP.
(e) Measure the voltage between MTRB terminal 1 of the canister pump module connector and the body ground when the leak detection pump is turned ON and OFF using the tester.

ES



Result

Test Results	Suspected Trouble Areas	Proceed To
Below 3 V when OFF 9 to 14 V when ON	1. Wire harness between leak detection pump and body ground 2. Leak detection pump	A
Below 3 V when OFF and ON	1. Wire harness between leak detection pump and ECM 2. ECM	B



B → Go to step 24

A

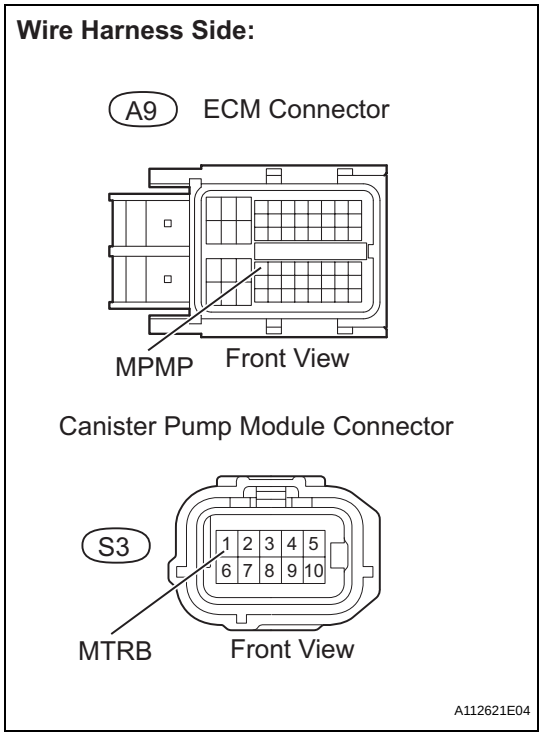
23	CHECK HARNESS AND CONNECTOR (CANISTER PUMP MODULE - BODY GROUND)

Wire Harness Side:

Canister Pump Module Connector

A127718E04

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Check the resistance between MGND terminal of the canister pump module connector and the body ground.



Result

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	**Leak detection pump**	**A**
10 kΩ or higher	**Wire harness between canister pump module and body ground**	**B**

(d) Reconnect the canister pump module connector.

A	**Go to step 29**
B	**Go to step 31**

24 CHECK HARNESS AND CONNECTOR (ECM - CANISTER PUMP MODULE)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Disconnect the A9 ECM connector.
(d) Measure the resistance between MPMP terminal of the ECM connector and MTRB terminal of the canister pump module connector.

ES

Result

Test Results	Suspected Trouble Areas	Proceed To
Below 1 Ω	ECM	A
10 kΩ or higher	Wire harness between ECM and canister pump module	B

(e) Reconnect the canister pump module connector.
(f) Reconnect the ECM connector.

A	Go to step 34
B	Go to step 31

25 INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Stop the engine.
(b) Disconnect the EVAP hose from the intake manifold.
(c) Start the engine.
(d) Use your finger to confirm that the port of the intake manifold has suction.

Result

Test Results	Suspected Trouble Areas	Proceed To
Suction applied	EVAP hose between intake manifold and purge VSV	A
No suction	Intake manifold	B

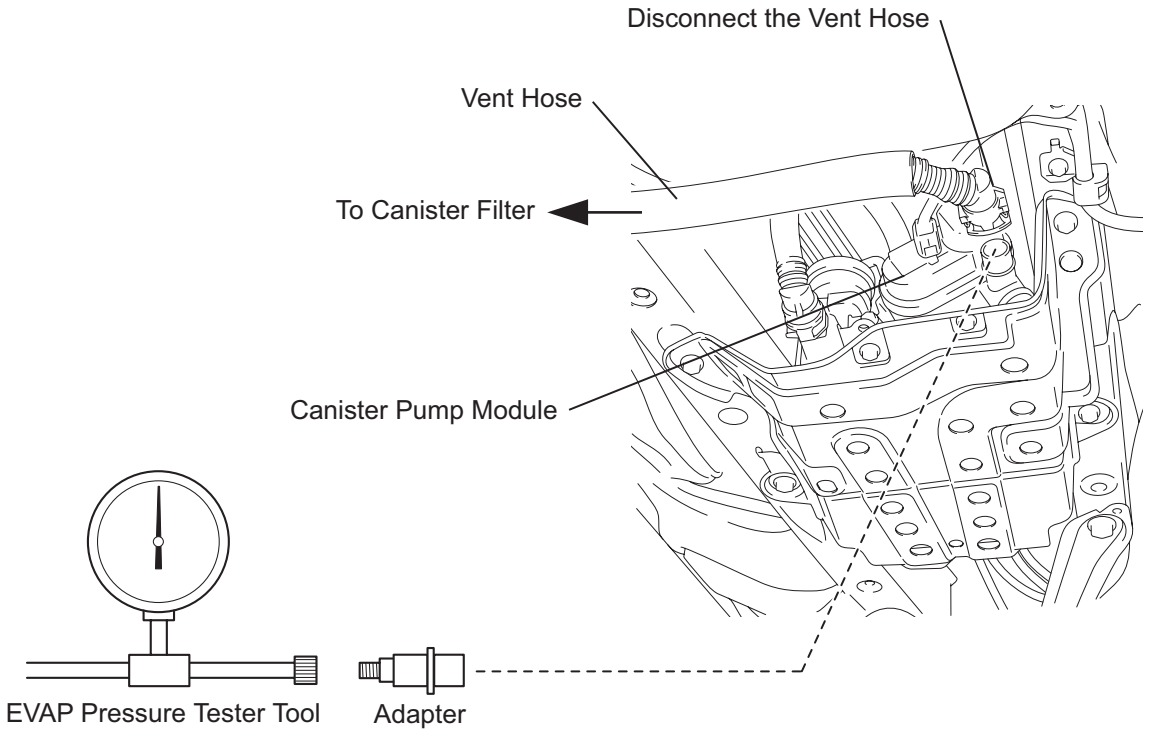
(e) Reconnect the EVAP hose.

A	Go to step 32
B	Go to step 33

26	CORRECTLY REINSTALL OR REPLACE FUEL CAP

HINT:
- When reinstalling the fuel cap, tighten it until a few click sounds are heard.
- When replacing the fuel cap, use a fuel cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT	Go to step 36



ES

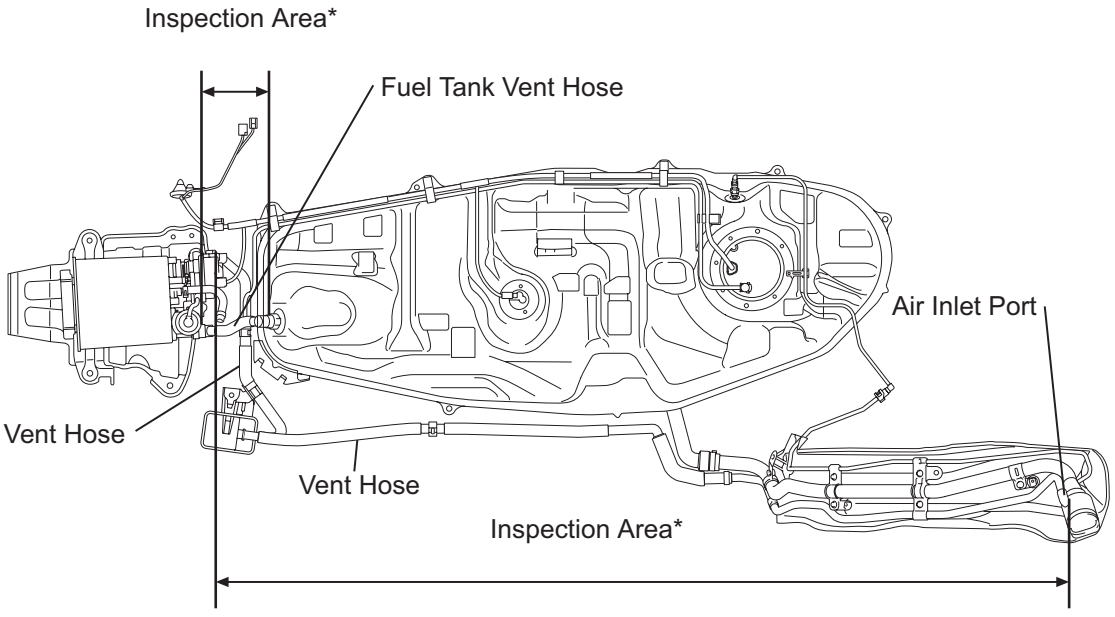
27	REPLACE FUEL CAP

HINT:
When installing the fuel cap, tighten it until a few click sounds are heard.

NEXT	Go to step 36

28	LOCATE EVAP LEAK PART

(a) Disconnect the vent hose.
(b) Connect the EVAP pressure tester tool to the canister pump module with the adapter.



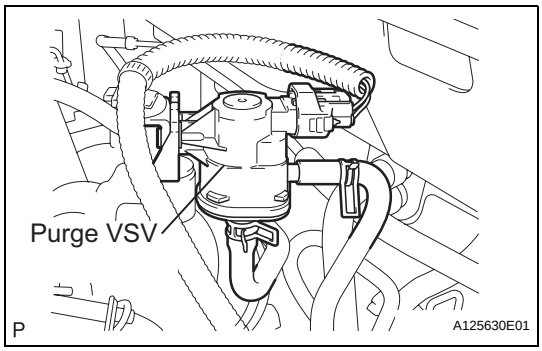
(c) Pressurize the EVAP system to 3.2 to 3.7 kPa (24 to 28 mmHg).
(d) Apply soapy water to the piping and connecting parts of the EVAP system.
(e) Look for areas where bubbles appear. This indicates the leak point.
(f) Repair or replace the leak point.
HINT:
Disconnect the hose between the canister and the fuel tank from the canister. Block the canister side and conduct an inspection. In this way, the fuel tank can be excluded as an area suspected of causing fuel leaks.

NEXT → Go to step 36

ES

29	REPLACE CHARCOAL CANISTER ASSEMBLY

(a) Replace the canister assembly (see page EC-10).
NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel and other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.



*: Check for disconnection and/or cracks

P A127720E01

NEXT → Go to step 36

30 REPLACE DUTY VACUUM SWITCHING VALVE (PURGE VSV)

(a) Disconnect the connector and the hoses from the purge VSV.
(b) Remove the purge VSV.
(c) Install a new purge VSV.
(d) Reconnect the connector and hoses.

NEXT → Go to step 36

31 REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 36

32 REPLACE EVAP HOSE (INTAKE MANIFOLD - PURGE VSV)

NEXT → Go to step 36

33 INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Check that the EVAP purge port of the intake manifold is not clogged. If necessary, replace the intake manifold.

NEXT → Go to step 36

34 REPLACE ECM

(a) Replace the ECM (see page ES-429).

NEXT → Go to step 36

35 REPAIR OR REPLACE PARTS AND COMPONENTS INDICATED BY OUTPUT DTCS

(a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT → Go to step 36

36	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of 5 steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (see page ES-35).

(b) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.

(c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTCs are found, the repair has been successfully completed.

NEXT

COMPLETED

CONFIRMATION DRIVING PATTERN

HINT:
After a repair, check Monitor Status by performing the Key-Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY-OFF MONITOR CONFIRMATION

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway)
- The fuel tank is less than 90 % full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- The vehicle remains stationary (the vehicle speed is 0 km/h [0 mph])

(b) Monitor Conditions
1. Allow the engine to idle for at least 5 minutes.
2. Turn the ignition switch OFF and wait for 6 hours (8 or 10.5 hours).
HINT:
Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status
1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON and turn the tester ON.
3. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
4. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

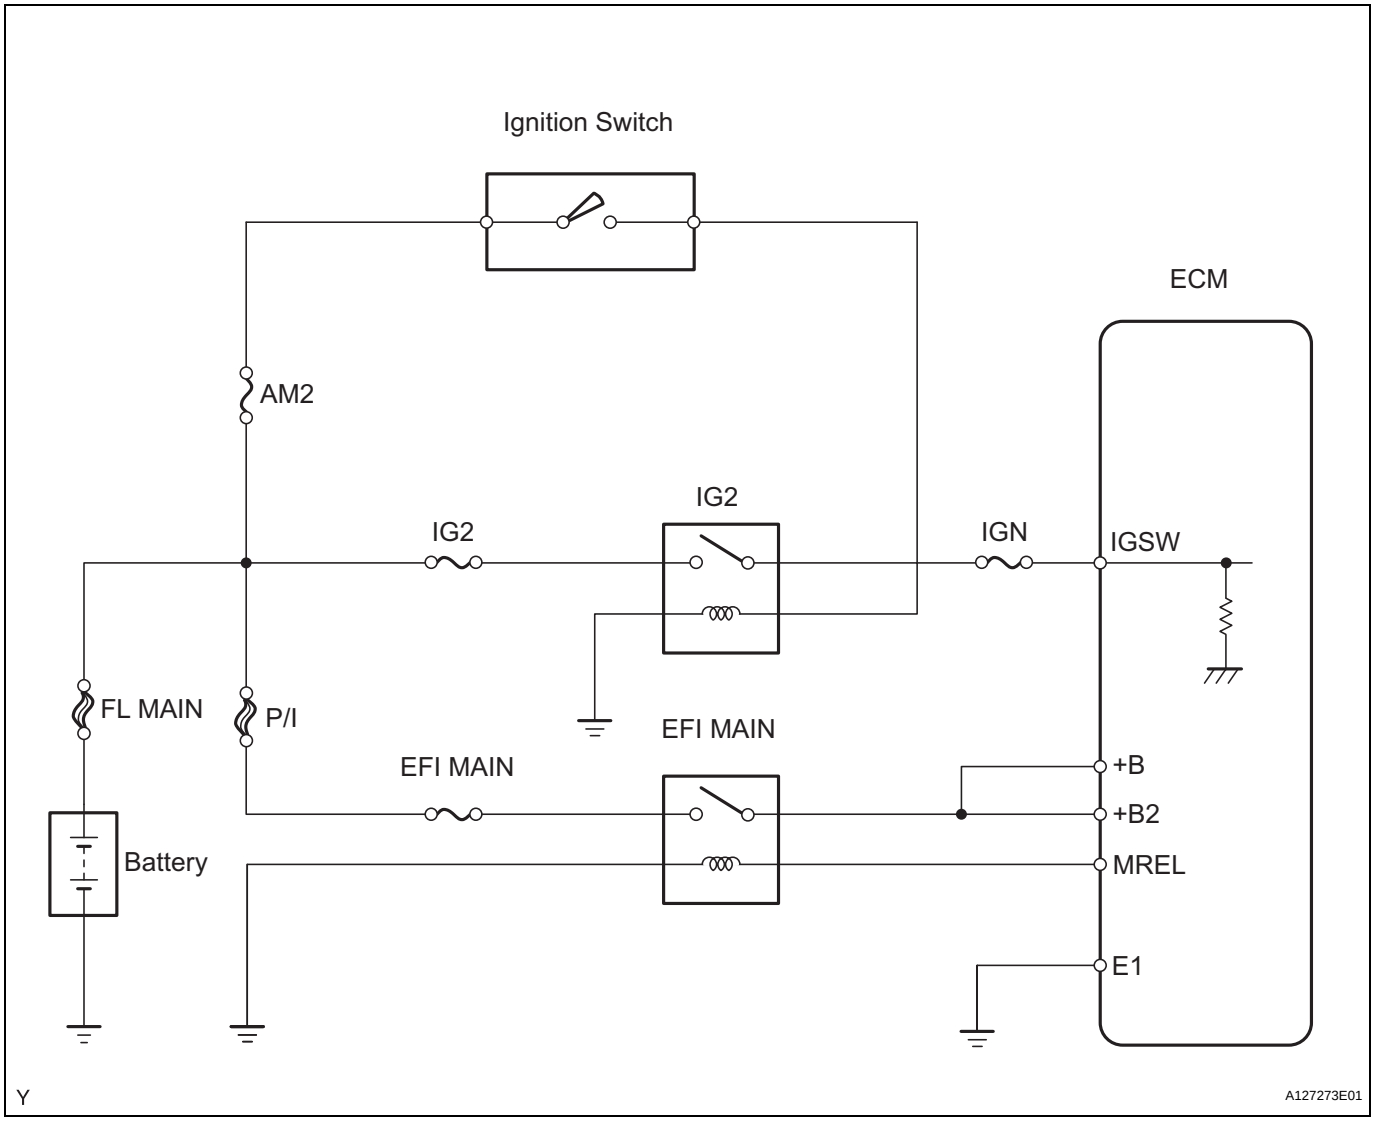
HINT:
Perform this monitor confirmation after the Key-Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway)
- The ECT is between 4.4°C and 35°C (40°F and 95°F)
- The IAT is between 4.4°C and 35°C (40°F and 95°F)

(b) Monitor Conditions
1. Release the pressure from the fuel tank by removing and reinstalling the fuel cap.
2. Warm the engine up until the ECT reaches more than 75°C (167°F).
3. Increase the engine speed to 3,000 rpm once.
4. Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status
1. Turn the ignition switch OFF (if ON or the engine is running).
2. Connect the intelligent tester to the DLC3.
3. Turn the ignition switch ON and turn the tester ON.
4. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
5. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

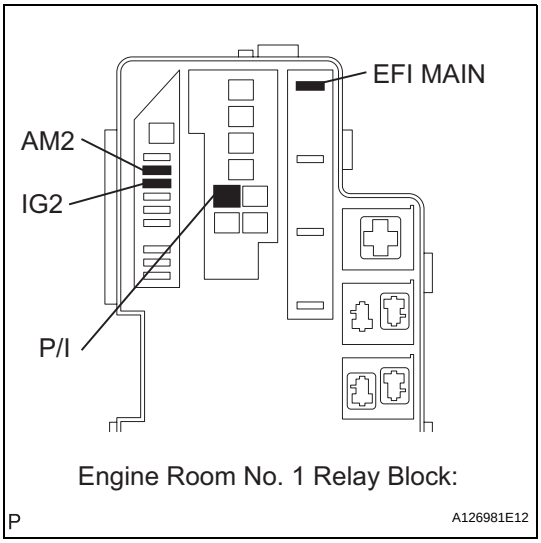


Refer to CHECKING MONITOR STATUS (See page ES-17).

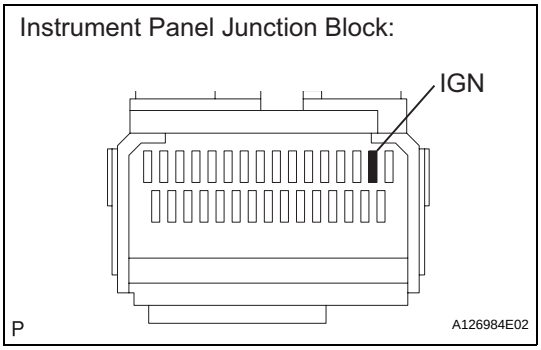
ECM Power Source Circuit

DESCRIPTION

When the ignition switch is turned ON, the battery voltage is applied to the IGSW of the ECM. The output signal from the MREL terminal of the ECM causes a current to flow to the coil, closing the contacts of the integration relay (EFI MAIN relay) and supplying power to either terminal +B or +B2 of the ECM.



WIRING DIAGRAM

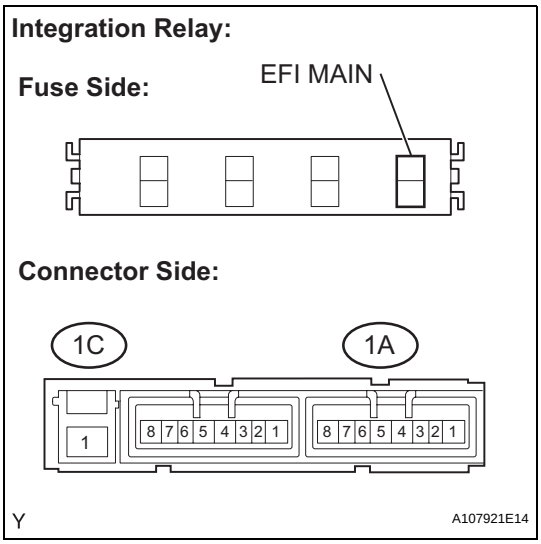


ES

INSPECTION PROCEDURE

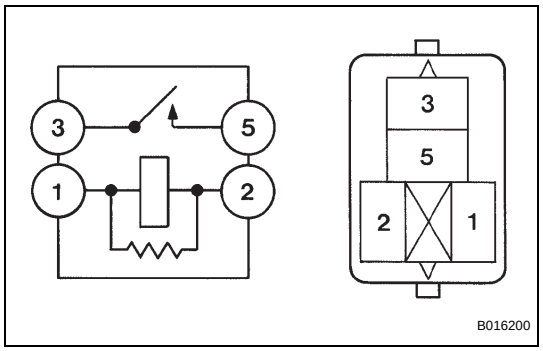
1	INSPECT FUSES (P/I, AM2, IG2, EFI MAIN, IGN)

(a) Remove the P/I fuse, AM2 fuse, IG2 fuse and EFI MAIN fuse from the engine room No. 1 relay block.



(b) Remove the IGN fuse from the instrument panel junction block.
(c) Measure the resistance of the fuses.
Standard resistance:
Below 1Ω
(d) Reinstall the fuses.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**



OK

2	INSPECT RELAY (IG2, EFI MAIN)

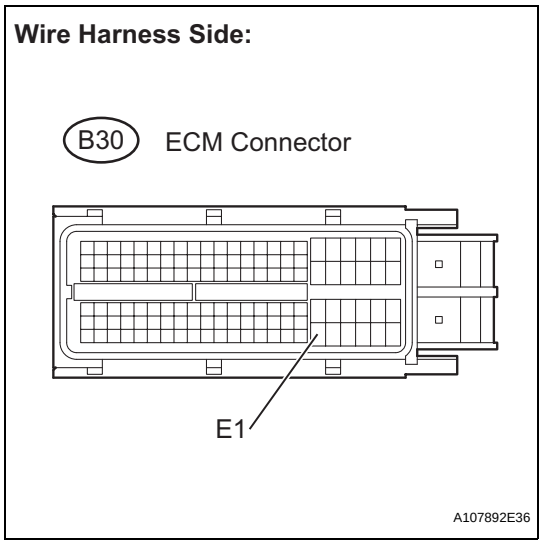
(a) Remove the integration relay and IG2 relay from the engine room No. 1 relay block.
(b) Measure the resistance between the terminal of the integration relay.
Standard resistance

Tester Connections	Specified Conditions
1C-1 - 1A-4	10 kΩ or higher
	Below 1 Ω (When battery voltage is applied to terminals 1A-2 and 1A-3)

(c) Measure the resistance between the terminal of the IG2 relay.

Standard resistance

Tester Connections	Specified Conditions
3 - 5	10 kΩ or higher
	Below 1 Ω (When battery voltage is applied to terminals 1 and 2)



(d) Reinstall the relay.

NG → **REPLACE RELAY**

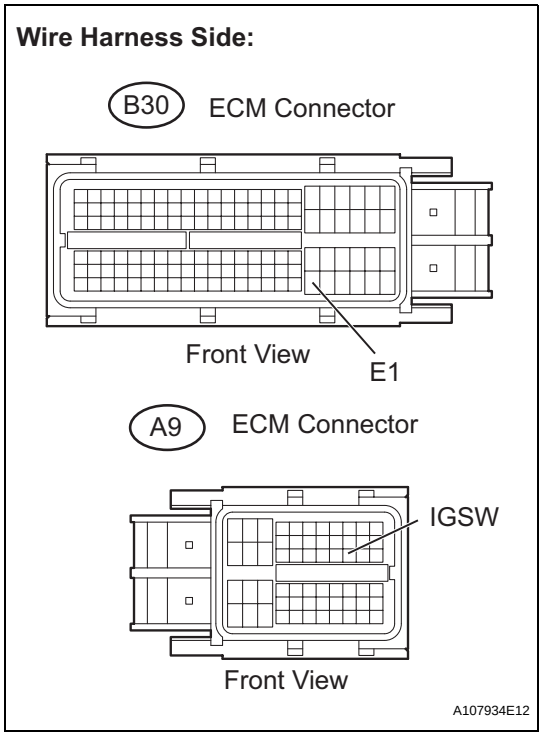
OK

ES

3 CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)

(a) Disconnect the B30 ECM connector.
(b) Measure the resistance.

Standard resistance



Tester Connection	Specified Condition
B30-104 (E1) - Body ground	Below 1 Ω

(c) Reconnect the ECM connector.

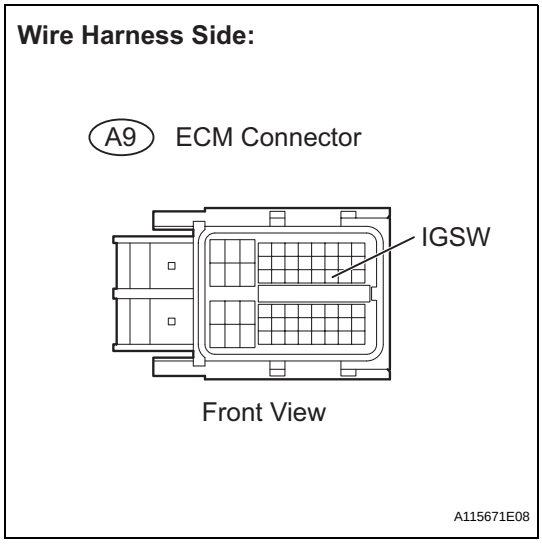
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

4	INSPECT ECM (IGSW VOLTAGE)

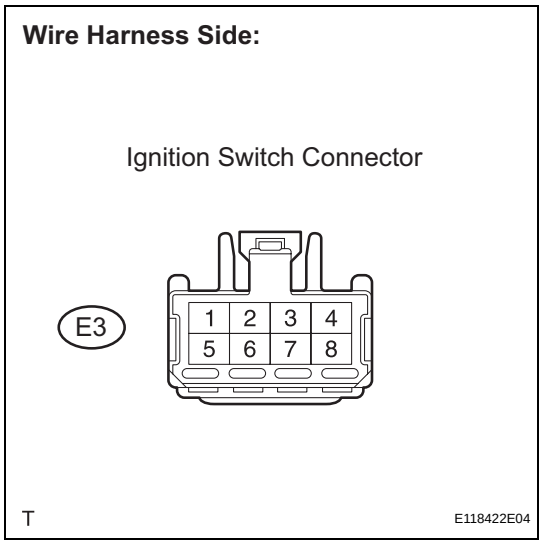
(a) Disconnect the B30 and A9 ECM connectors.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the B30 and A9 ECM connectors.

Standard voltage



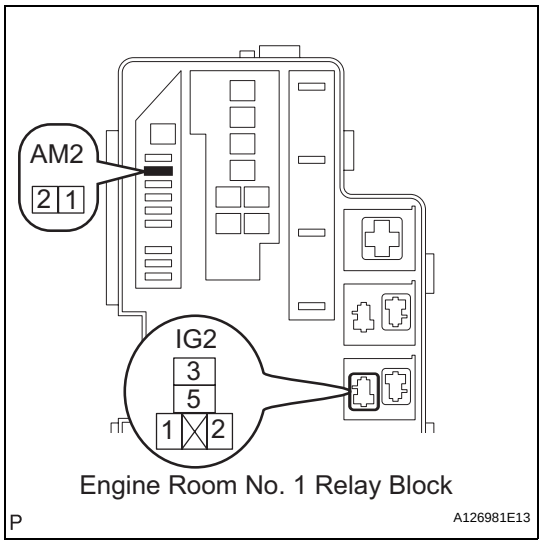
Tester Connections	Specified Conditions
A9-28 (IGSW) - B30-104 (E1)	9 to 14 V

(d) Reconnect the ECM connector.



OK → **REPLACE ECM**

NG



5	CHECK HARNESS AND CONNECTOR (RELAY BLOCK - ECM, IGNITION SWITCH, BATTERY)

(a) Disconnect the A9 ECM connector.

(b) Disconnect the E3 ignition switch connector.
(c) Disconnect the battery positive terminal.

(d) Remove the AM2 fuse and IG2 relay.
(e) Measure the resistance between the terminals.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
A9-28 (IGSW) - Engine room No. 1 relay block IG2 relay terminal 5	Below 1 Ω
Engine room No. 1 relay block IG2 relay terminal 2 - Body ground	Below 1 Ω
Positive (+) battery cable - Engine room relay block No. 1 AM2 fuse terminal 1	Below 1 Ω
Positive (+) battery cable - Engine room relay block No. 1 IG2 relay terminal 3	Below 1 Ω
E3-7 (AM2) - Engine room No. 1 relay block AM2 fuse terminal 2	Below 1 Ω
E3-6 (IG2) - Engine room No. 1 relay block IG2 relay terminal 1	Below 1 Ω

Standard resistance (Check for short)

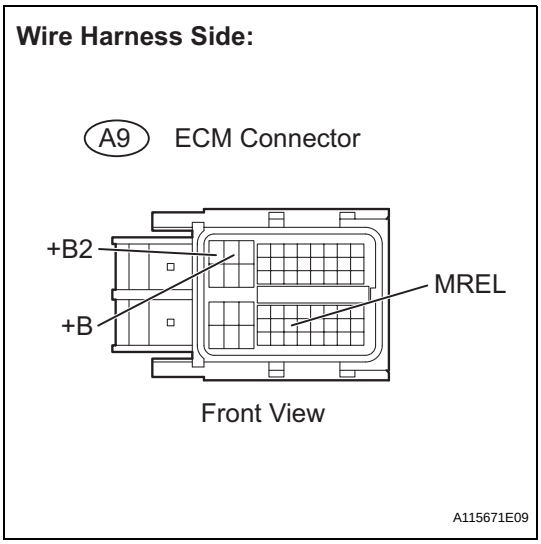
Tester Connections	Specified Conditions
A9-28 (IGSW) or Engine room No. 1 relay block IG2 relay terminal 5 - Body ground	10 kΩ or higher
Positive (+) battery cable or Engine room No. 1 relay block AM2 fuse terminal 1 - Body ground	10 kΩ or higher
Positive (+) battery cable or Engine room No. 1 relay block IG2 relay terminal 3 - Body ground	10 kΩ or higher
E3-7 (AM2) or Engine room No. 1 relay block AM2 fuse terminal 2 - Body ground	10 kΩ or higher
E3-6 (IG2) or Engine room No. 1 relay block IG2 relay terminal 1 - Body ground	10 kΩ or higher

(f) Reinstall the relay and fuse.
(g) Reconnect the connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

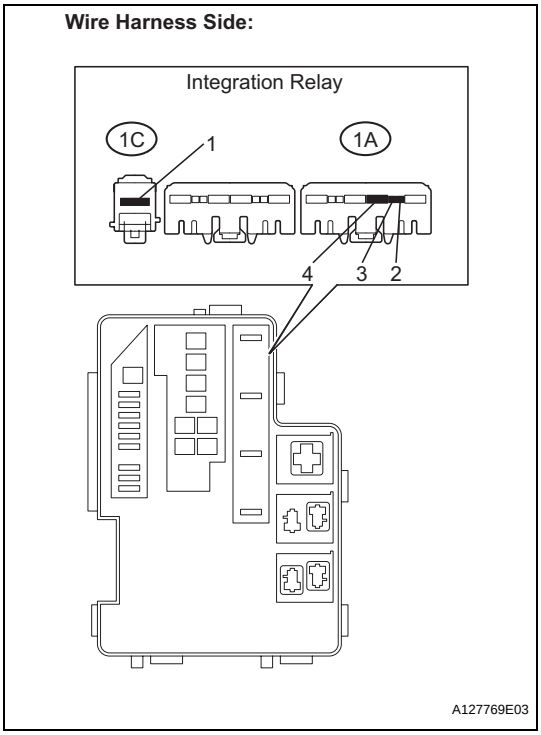
ES

OK



6	INSPECT IGNITION SWITCH (See page ES-261)

NG → REPLACE IGNITION SWITCH



OK

7	CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - ECM, BATTERY, BODY GROUND)

ES

(a) Disconnect the A9 ECM connector.

(b) Remove the integration relay from the engine room No. 1 relay block.
(c) Disconnect the integration relay connector.
(d) Remove the P/I fuse from the engine room No. 1 relay block.
(e) Check the resistance between the terminals.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
A9-2 (+B) - 1A-4	Below 1 Ω
A9-1 (+B2) - 1A-4	Below 1 Ω
A9-44 (MREL) - 1A-2	Below 1 Ω
Engine room relay block No. 1 P/I fuse terminal 2 - 1C-1	Below 1 Ω
1A-3 - Body ground	Below 1 Ω

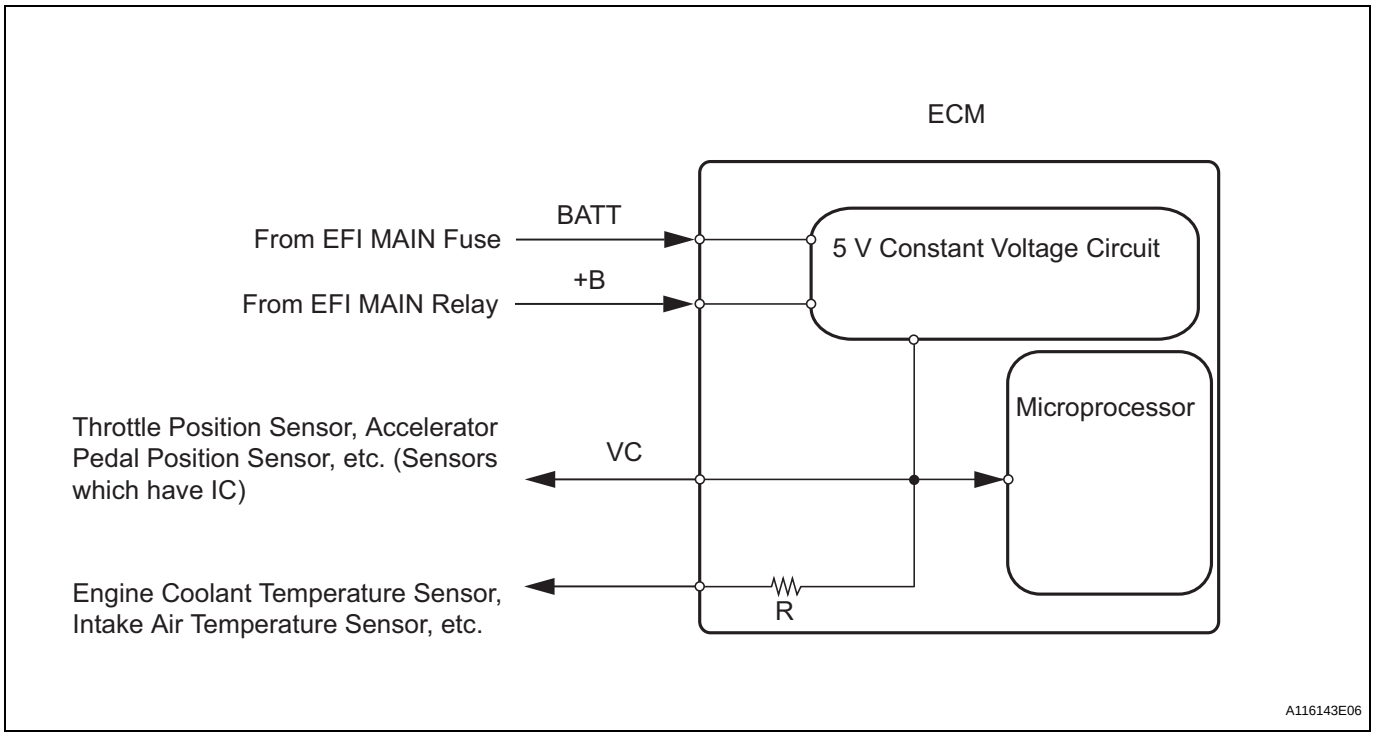
Standard resistance (Check for short)

Tester Connections	Specified Conditions
A9-2 (+B) or 1A-4 - Body ground	10 kΩ or higher
A9-1 (+B2) or 1A-4 - Body ground	10 kΩ or higher
A9-44 (MREL) or 1A-2 - Body ground	10 kΩ or higher
Engine room No. 1 relay block P/I fuse terminal 2 or 1C-1 - Body ground	10 kΩ or higher

(f) Reconnect the connectors.

(g) Reinstall the integration relay and P/I fuse.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**



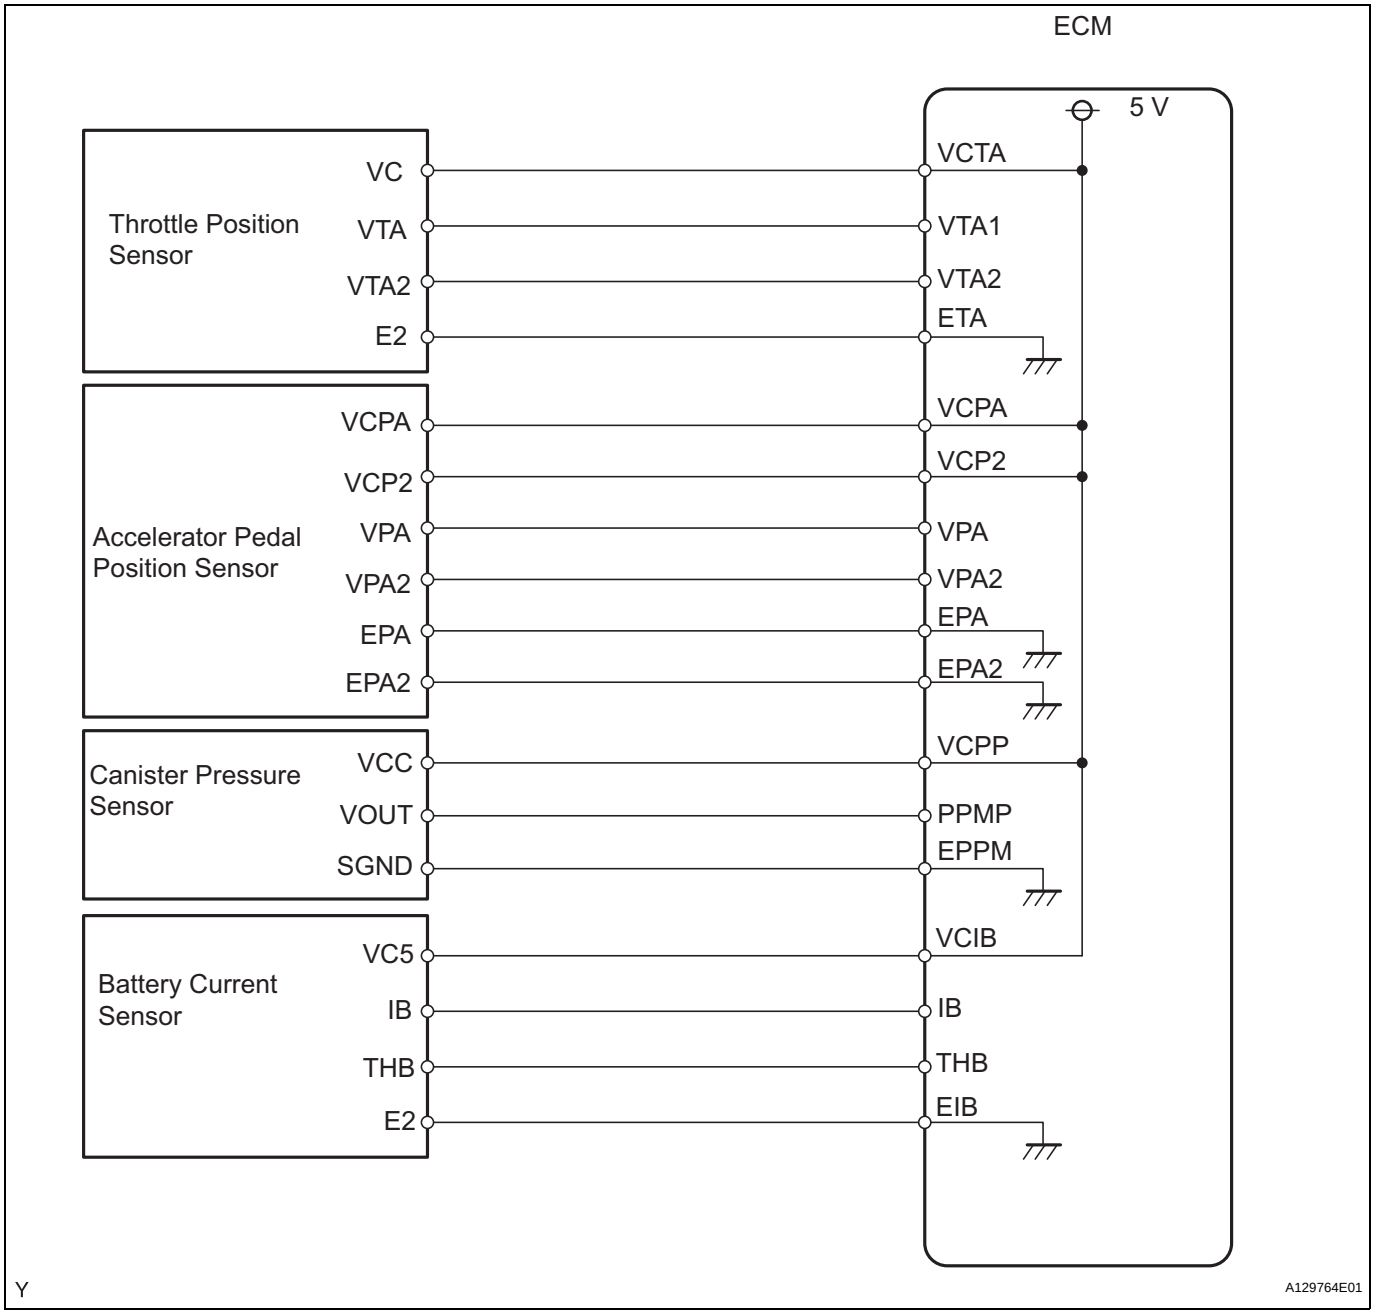
OK

REPAIR OR REPLACE ENGINE ROOM NO. 1 RELAY BLOCK

VC Output Circuit

DESCRIPTION

The ECM constantly generates 5 V power from the battery voltages supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied with power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the ignition switch is first turned ON. The MIL goes off when the engine is started.

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

1	CHECK MIL

(a) Check that the Malfunction Indicator Lamp (MIL) lights up when turning the ignition switch ON.
OK:
MIL lights up

OK	SYSTEM OK

NG

2	CHECK COMMUNICATION BETWEEN INTELLIGENT TESTER AND ECM

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and tester ON.
(c) Check the communication between the tester and ECM.

Result

Result	Proceed To
Communication is possible	A
Communication is not possible	B

A → GO TO MIL CIRCUIT

B

3	CHECK MIL (THROTTLE POSITION SENSOR)

(a) Disconnect the B3 throttle body connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed To
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the throttle body connector.

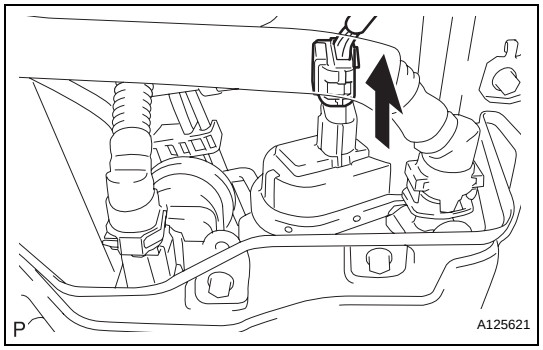
A → REPLACE THROTTLE BODY ASSEMBLY

B

4	CHECK MIL (ACCELERATOR PEDAL POSITION SENSOR)

(a) Disconnect the A4 accelerator pedal position sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result



Result	Proceed To
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the accelerator pedal position sensor connector.

A → REPLACE ACCELERATOR PEDAL POSITION SENSOR

B

5	CHECK MIL (CANISTER PUMP MODULE)

(a) Disconnect the S3 canister pump module connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed To
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the canister pump module connector.

A → REPLACE CHARCOAL CANISTER ASSEMBLY

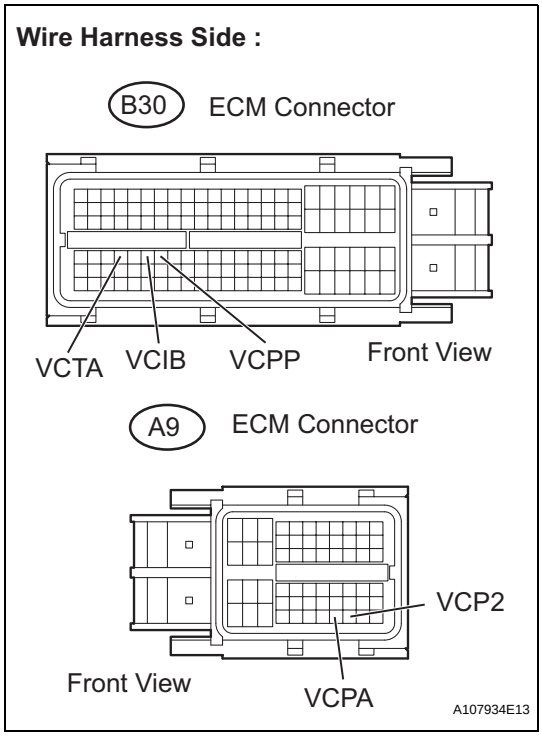
B

6	CHECK MIL (BATTERY CURRENT SENSOR)

(a) Disconnect the B29 battery current sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed To
MIL illuminates	A
MIL does not illuminate	B



(d) Reconnect the battery current sensor connector.

A → REPLACE BATTERY CURRENT SENSOR

B

7	CHECK HARNESS AND CONNECTOR

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the A4 accelerator pedal position sensor connector.
(c) Disconnect the S3 canister pump module connector.
(d) Disconnect the B29 battery current sensor connector.

(e) Disconnect the A9 and B30 ECM connectors.
(f) Measure the resistance.

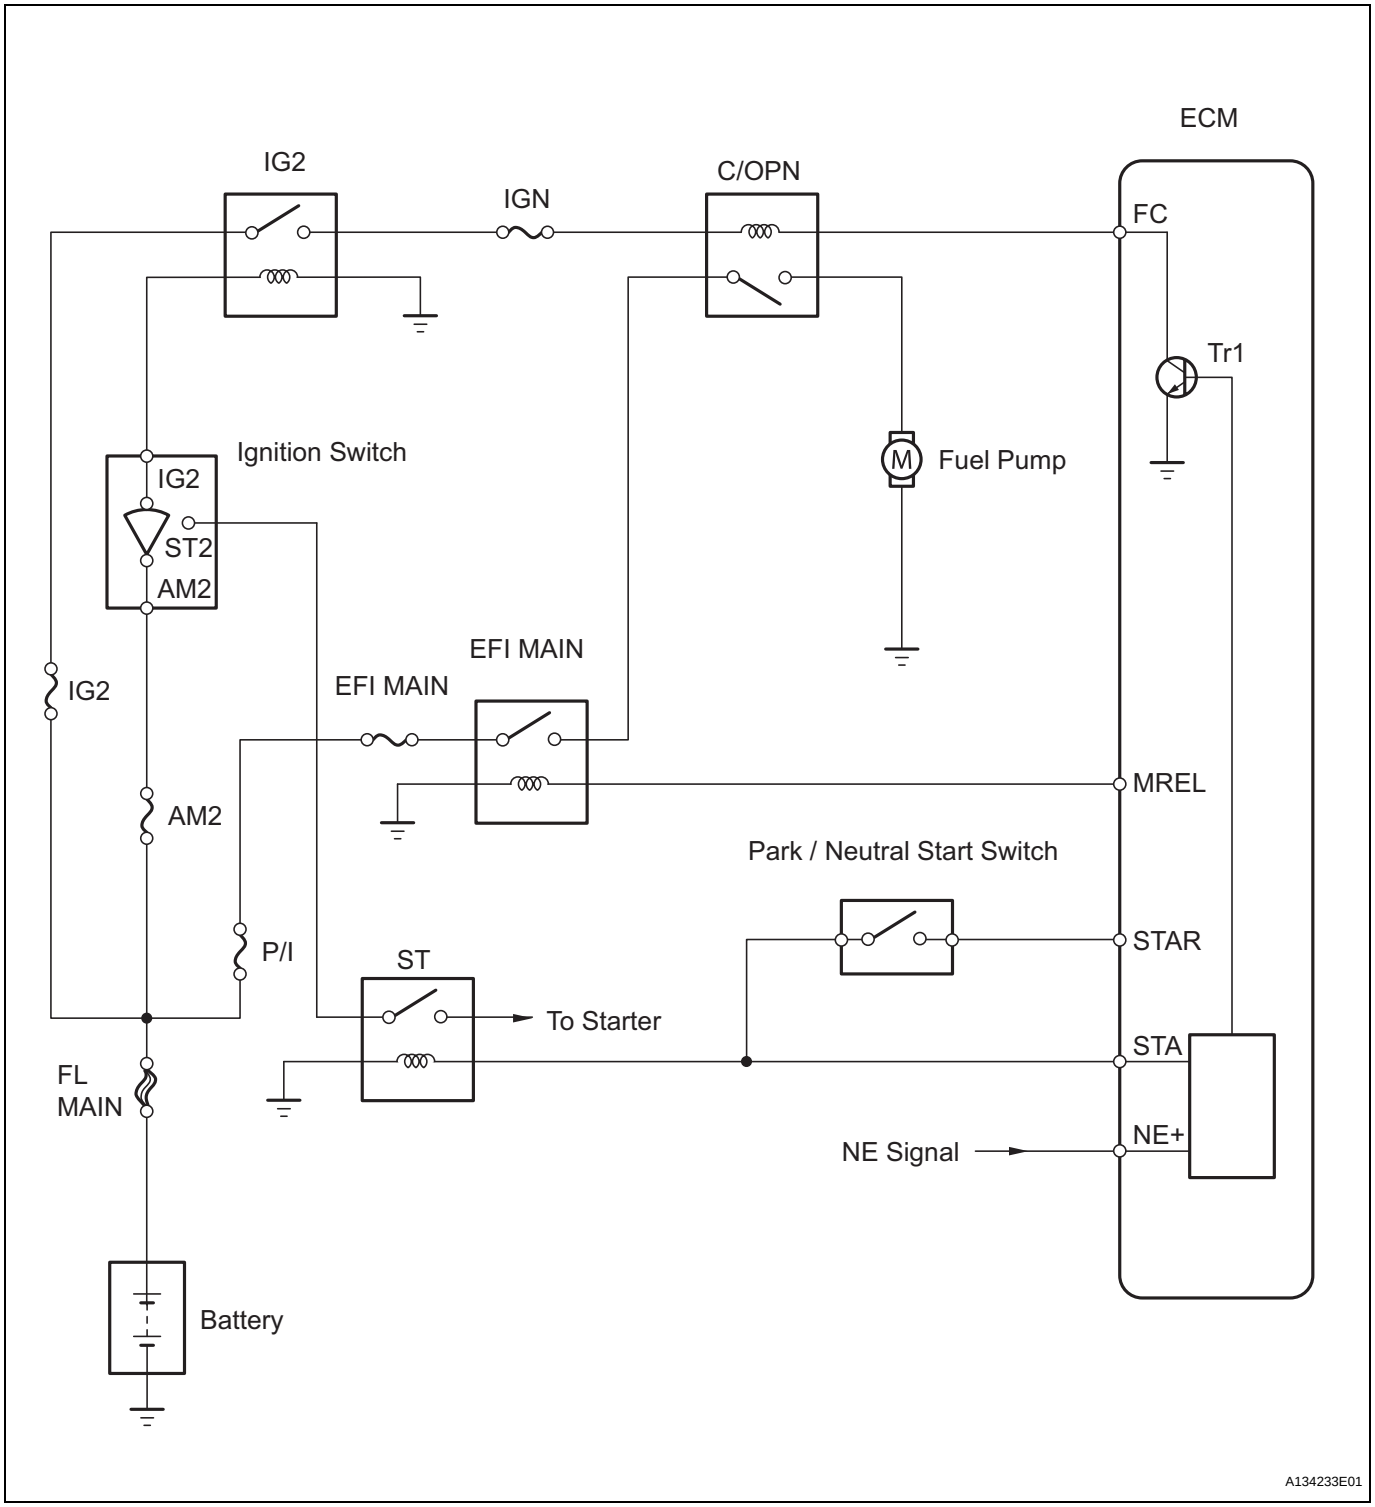
Standard resistance (check for short)

Tester Connections	Specified Conditions
B30-67 (VCTA) - Body ground	10 kΩ or higher
A9-57 (VCPA) - Body ground	10 kΩ or higher
A9-58 (VCP2) - Body ground	10 kΩ or higher
B30-70 (VCPP) - Body ground	10 kΩ or higher
B30-69 (VCIB) - Body ground	10 kΩ or higher

(g) Reconnect the throttle body connector.
(h) Reconnect the accelerator pedal position sensor connector.
(i) Reconnect the canister pump module connector.
(j) Reconnect the battery current sensor connector.
(k) Reconnect the ECM connectors.

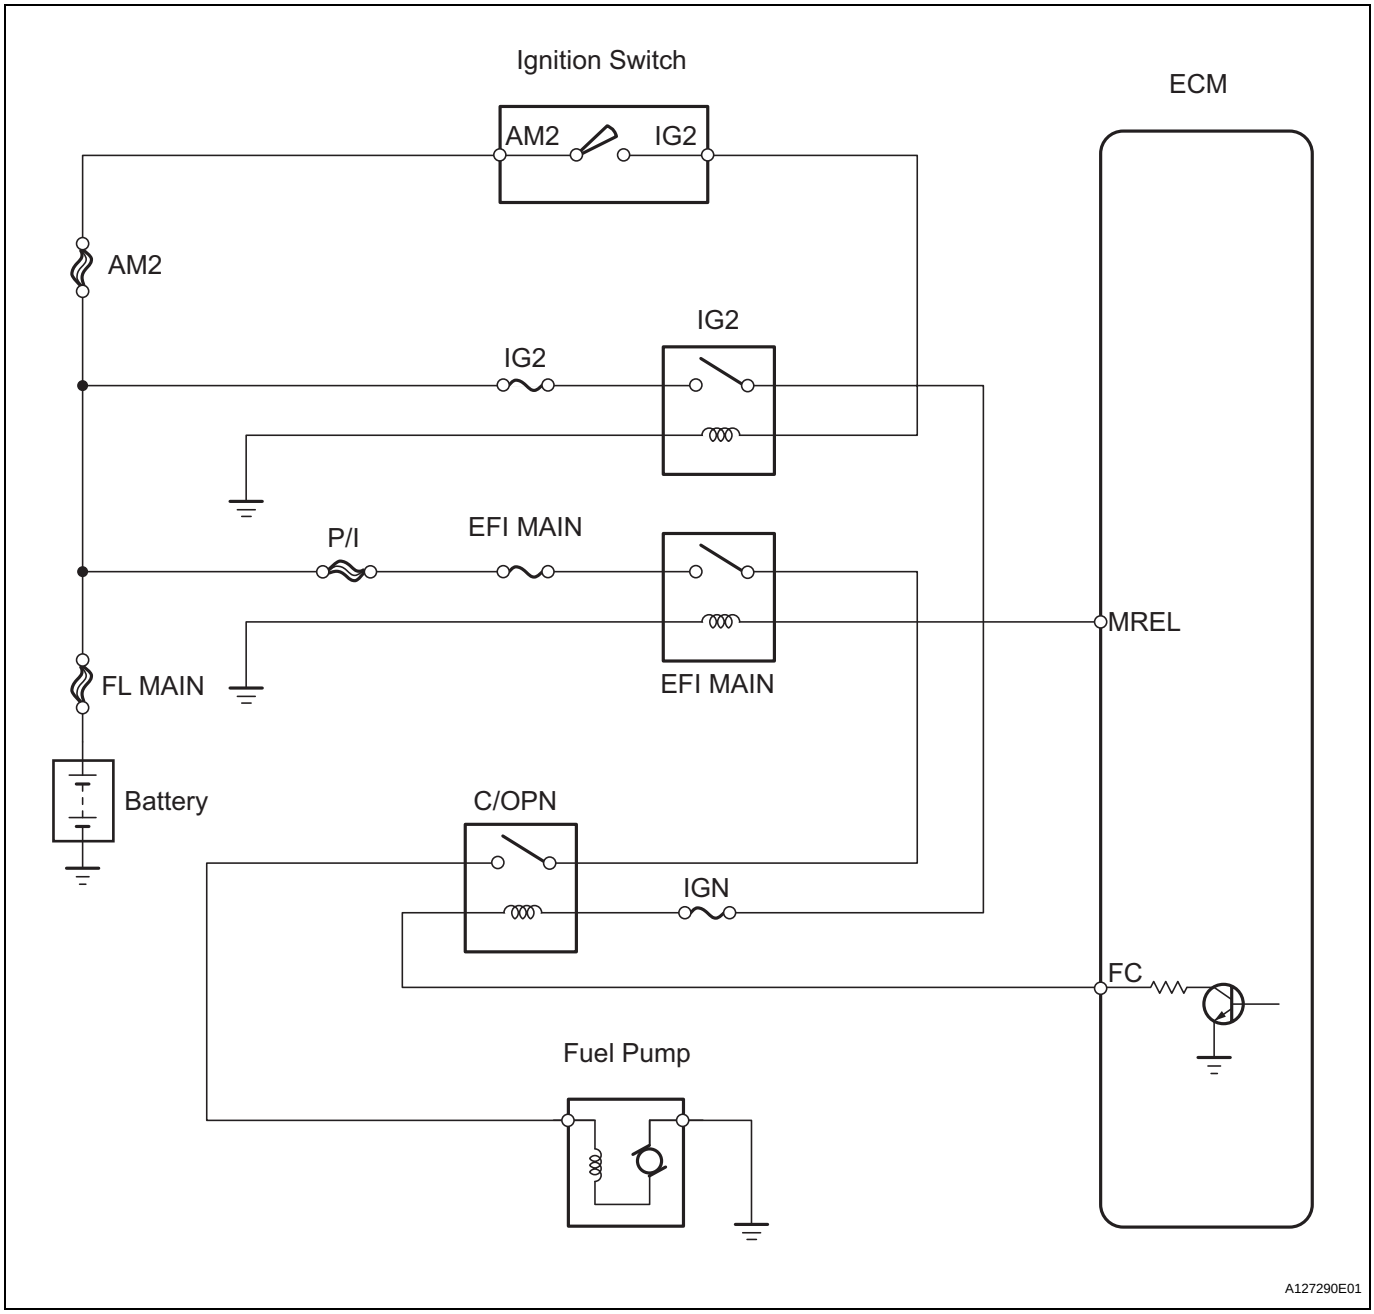
NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK



REPLACE ECM

Fuel Pump Control Circuit



DESCRIPTION

When the engine is cranked, the starter relay drive signal output from the STAR terminal of the ECM is input into the STA terminal of the ECM, and NE signal generated by the crankshaft position sensor is also input into the NE+ terminal. Thus, the ECM interprets that the engine is cranked, and turns the transistor Tr1 in the ECM internal circuit ON. The current flows to the C/OPN (Circuit Opening) relay by turning the Tr1 ON. Then, the fuel pump operates.

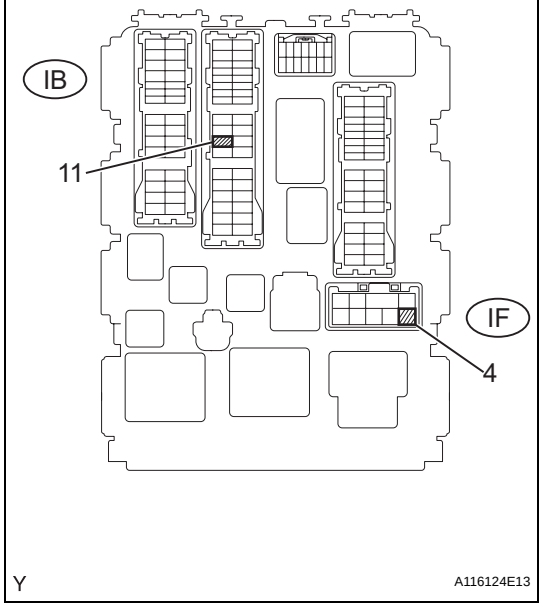
While the NE signal is input into the ECM, when the engine is running, the ECM turns the Tr1 on continuously.

WIRING DIAGRAM

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP/SPD)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP / SPD.
(d) Check whether the fuel pump operating sound occurs when performing the Active Test on the tester.



OK:
Fuel pump operating sound occurs.

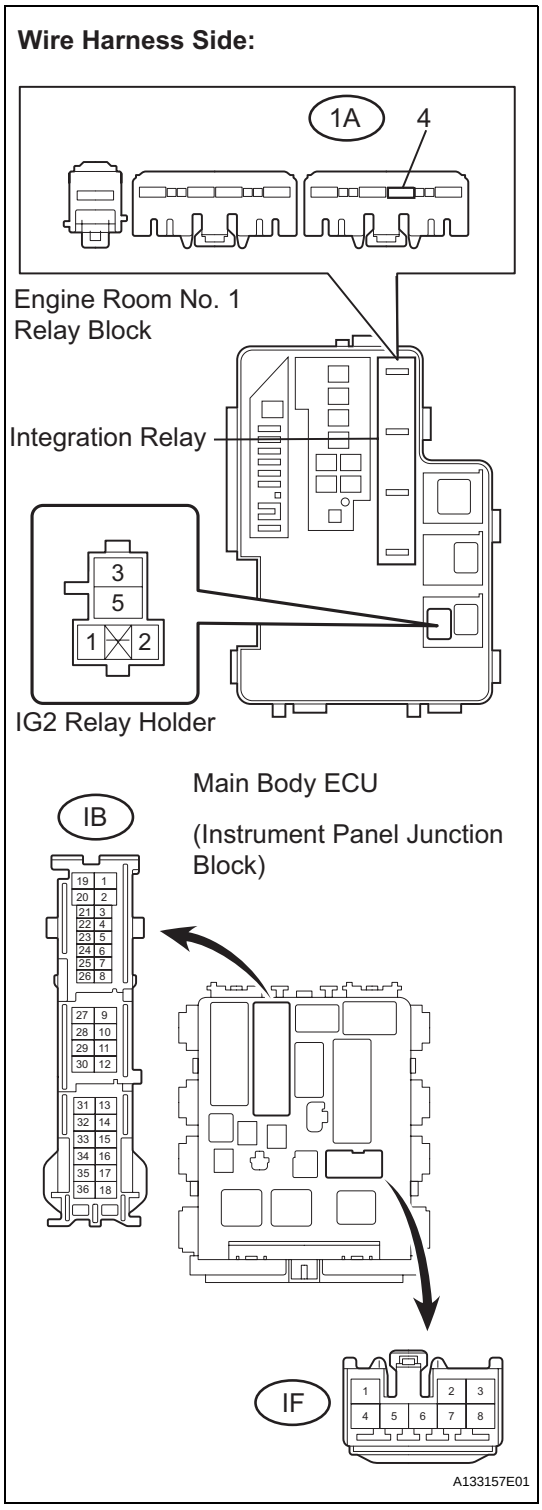
OK → **Go to step 8**

NG

2	INSPECT INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY (C/OPN RELAY INPUT VOLTAGE)

Instrument Panel J/B:

(a) Measure the voltage between the terminal of the instrument panel Junction Block (J/B) and the body ground when the ignition switch is turned ON and OFF.
Standard voltage



Tester Connections	Ignition Switch Conditions	Specified Conditions
IB-11 - Body ground	OFF	Below 1 V
IF-4 - Body ground		
IB-11 - Body ground	ON	9 to 14 V
IF-4 - Body ground		

OK → **Go to step 4**

NG

ES

3	CHECK HARNESS AND CONNECTOR (INSTRUMENT PANEL J/B - INTEGRATION RELAY, IG2 RELAY)

(a) Remove the integration relay and IG2 relay from the engine room No. 1 relay block.
(b) Disconnect the instrument panel junction block connector.
(c) Check the resistance.

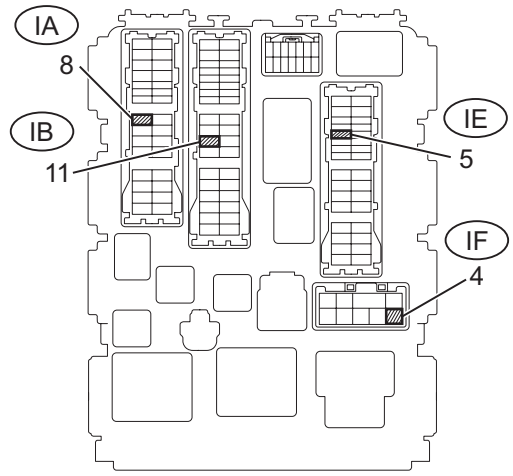
Standard resistance (Check for open)

Tester Connections	Specified Conditions
IG2 relay 5 - IF-4	Below 1 Ω
1A-4 - IB-11	Below 1 Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
IF-4 - Body ground	10 kΩor higher
IB-11 - Body ground	10 kΩor higher

(d) Reinstall the integration relay and IG2 relay.
(e) Reconnect the instrument panel junction block connector.



NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

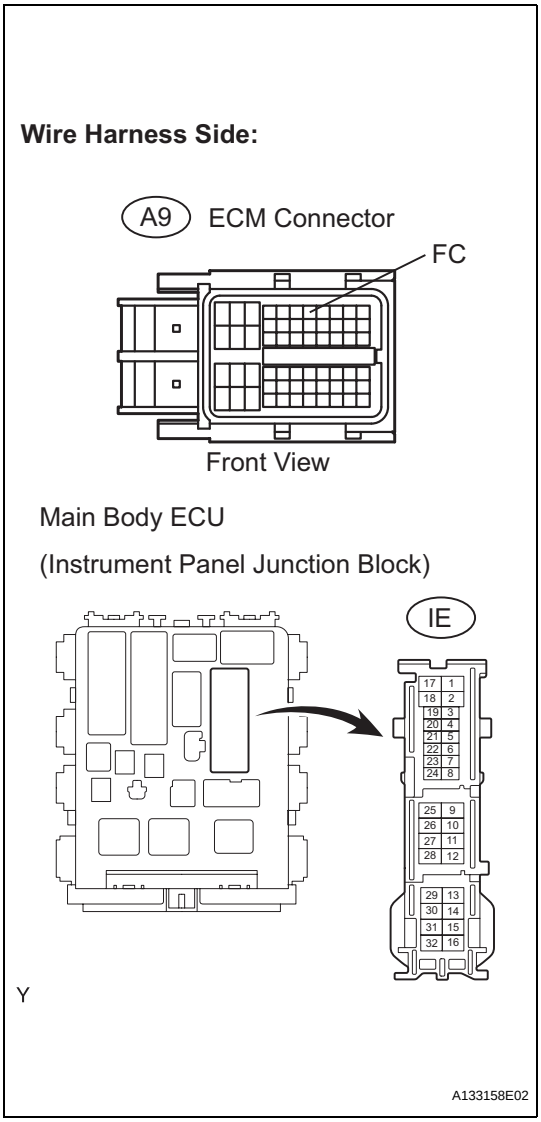
GO TO ECM POWER SOURCE CIRCUIT

4	INSPECT INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY (C/OPN RELAY)

Instrument Panel J/B:

(a) Remove the instrument panel junction block.
(b) Measure the C/OPN relay resistance.
Standard resistance

Tester Connections	Specified Conditions
IB-11 - IA-8	10 kΩ or higher
	Below 1 Ω (when battery voltage is applied to terminals IF-4 and IE-5)



HINT:
Relay coil circuit between IF-4 and IE-5 is not through IGN fuse.
(c) Reinstall the instrument panel junction block.

NG → **REPLACE INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY**

OK

ES

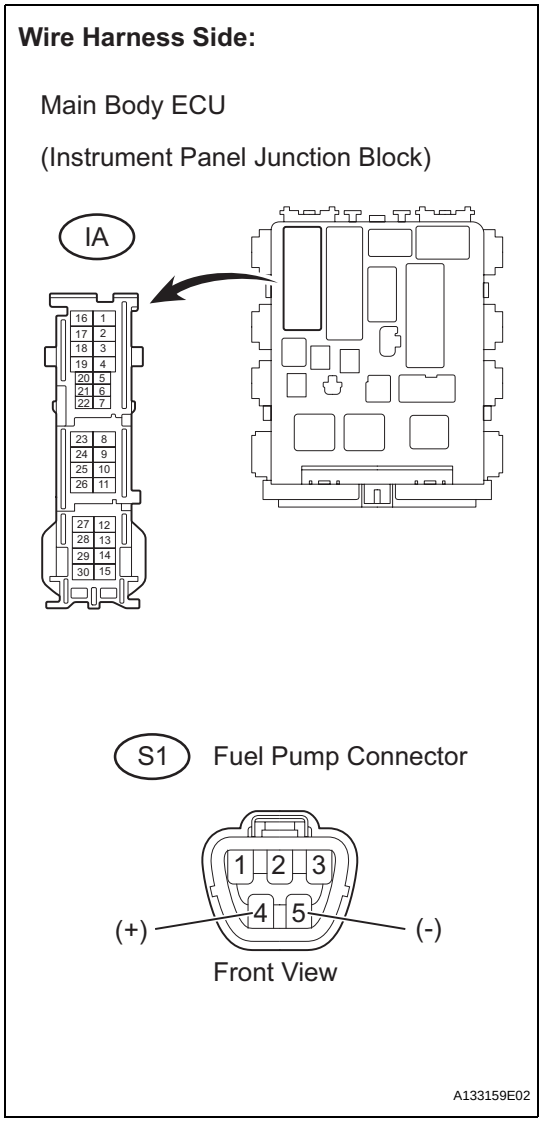
5	CHECK HARNESS AND CONNECTOR (INSTRUMENT PANEL J/B - ECM)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the IE connector from instrument panel junction block.
(c) Measure the resistance.

Standard resistance (Check for open)

Tester Connections	Specified Conditions
IE-5 (Instrument panel J/B) - A9-7 (FC)	Below 1Ω

Standard resistance (Check for short)



Tester Connections	Specified Conditions
IE-5 (Instrument panel J/B) or A9-7 (FC) - Body ground	10 kΩ or higher

(d) Reconnect the instrument panel junction block and the ECM connectors.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

6 CHECK HARNESS AND CONNECTOR (C/OPN RELAY - FUEL PUMP - BODY GROUND)

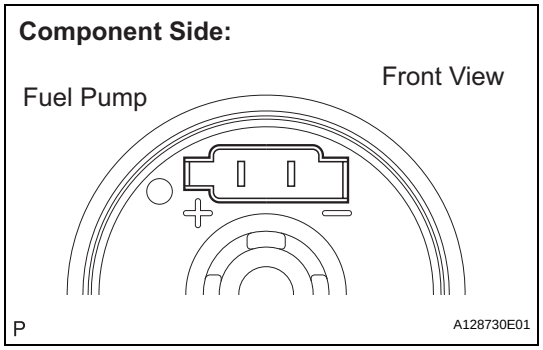
(a) Check the harness and the connectors between the instrument panel junction block assembly and the fuel pump.
  (1) Disconnect the IA instrument panel junction block connector.
  (2) Disconnect the S1 fuel pump connector.
  (3) Measure the resistance.
  Standard resistance (Check for open)

Tester Connections	Specified Conditions
IA-8 (Instrument panel J/B) - S1-4 (Fuel pump)	Below 1Ω

Standard resistance (Check for short)

Tester Connections	Specified Conditions
IA-8 (Instrument panel J/B) or S1-4 (Fuel pump) - Body ground	10 kΩ or higher

(b) Check the harness and the connectors between the fuel pump and the body ground.
  (1) Disconnect the S1 fuel pump connector.
  (2) Measure the resistance.
  Standard resistance (Check for open)



Tester Connections	Specified Conditions
S1-5 (Fuel pump) - Body ground	Below 1 Ω

(c) Reconnect the instrument panel junction block connector.
(d) Reconnect the fuel pump connector.

NG → **REPAIR OR REPLACE HARNESS OR CONNECTOR**

OK

7 INSPECT FUEL PUMP

(a) Inspect fuel pump resistance.
  (1) Measure the resistance between the terminals.
  Standard resistance:
  0.2 to 3.0 Ω at 20°C(68°F)
(b) Inspect fuel pump operation.
  (1) Apply the battery voltage to both the terminals. Check that the pump operates.
  NOTICE:
  - **These tests must be done quickly (within 10 seconds) to prevent the coil from burning out.**
  - **Keep the fuel pump as far away from the battery as possible.**

- **Always turn the voltage on and off on the battery side, not the fuel pump side.**

NG → **REPLACE FUEL PUMP**

OK

REPLACE ECM

8	READ VALUE USING INTELLIGENT TESTER (STARTER SIG)

ES

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the result when the ignition switch is turned to ON and START.
OK

Ignition Switch Position	Starter Signal
ON	OFF
START	ON

NG → **REPAIR OR REPLACE STARTING SYSTEM**

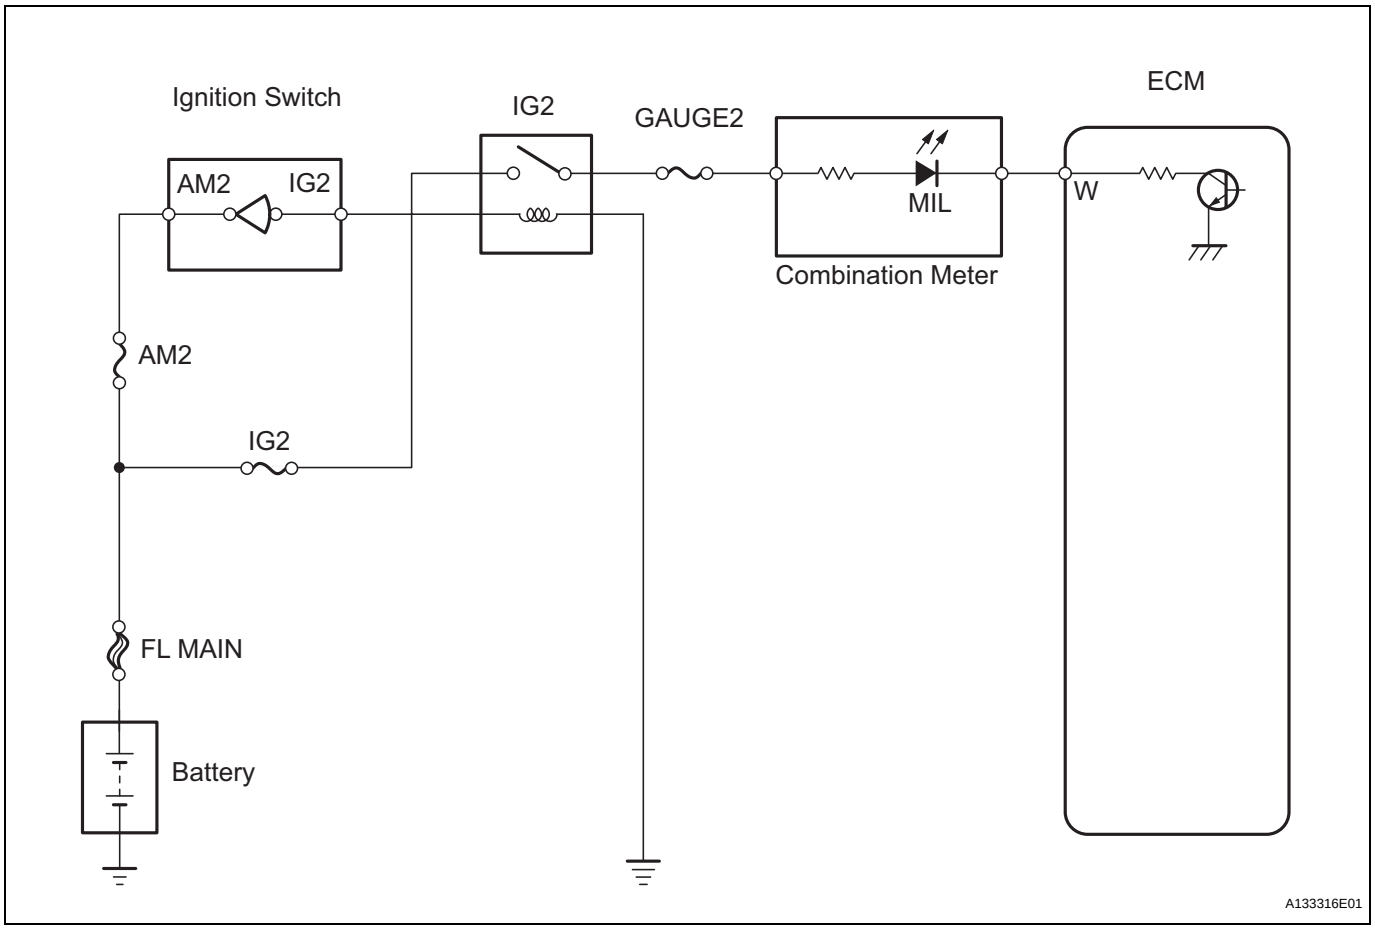
OK

9	READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
(d) Read the values displayed on the tester while cranking.
Standard:
Values are displayed continuously.

NG → **REPAIR OR REPLACE CRANKSHAFT POSITION SENSOR CIRCUIT**

OK



REPLACE ECM

MIL Circuit

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM. When the ignition switch is turned ON, power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the ignition switch is first turned ON, the MIL should be illuminated and should then turn off. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the intelligent tester.

WIRING DIAGRAM

INSPECTION PROCEDURE

1	CHECK THAT MIL IS ILLUMINATED

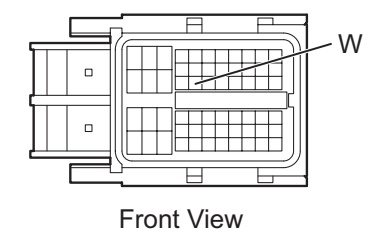
(a) Perform troubleshooting in accordance with the table below.

Conditions	Proceed To
MIL remains ON	A
MIL does not illuminate	B

B	Go to step 5

A

2	CHECK WHETHER MIL TURNS OFF



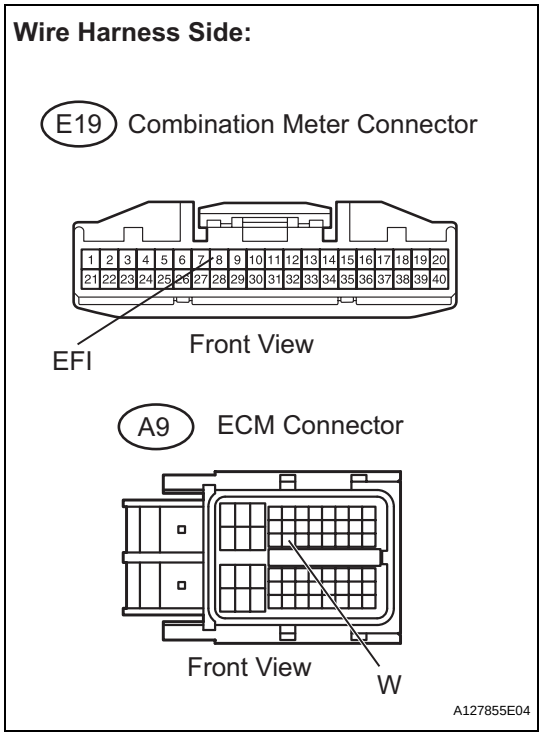
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Check if any DTCs have been stored. Note down any DTCs.
(e) Clear DTCs (see page ES-35).
(f) Check if the MIL goes off.
Standard:
MIL should go off.

OK → **REPAIR CIRCUITS INDICATED BY OUTPUT DTCS**

NG

3	CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)

Wire Harness Side:



(a) Disconnect the A9 ECM connector.
(b) Turn the ignition switch ON.
(c) Check that the MIL is not illuminated.
OK:
MIL is not illuminated.
(d) Reconnect the ECM connector.

OK → **REPLACE ECM**

NG

4 CHECK HARNESS AND CONNECTOR (COMBINATION METER - ECM)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the E19 combination meter connector.
(c) Measure the resistance.
Standard resistance (Check for short)

Tester Connections	Specified Conditions
A9-24 (W) or E19-8 (combination meter) - Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the combination meter connector.

OK → **REPAIR OR REPLACE COMBINATION METER ASSEMBLY**

NG

REPAIR OR REPLACE HARNESS OR CONNECTOR

5 CHECK THAT MIL IS ILLUMINATED

(a) Check if the MIL is illuminated when the ignition switch is turned ON.
OK:
MIL should be illuminated.

OK → **SYSTEM OK**

NG

6 CHECK THAT ENGINE STARTS

(a) Turn the ignition switch ON.
(b) Start the engine.

Result	Proceed To
Engine starts	A
Engine does not start*	B

HINT:
*: The intelligent tester cannot communicate with the ECM.

B → GO TO VC OUTPUT CIRCUIT

A

7	INSPECT COMBINATION METER ASSEMBLY (MIL CIRCUIT)

(a) Check the MIL circuit (see page ME-15).

NG → REPAIR OR REPLACE COMBINATION METER ASSEMBLY

OK

ES

CHECK AND REPLACE HARNESS OR CONNECTOR (COMBINATION METER - ECM)

SFI SYSTEM

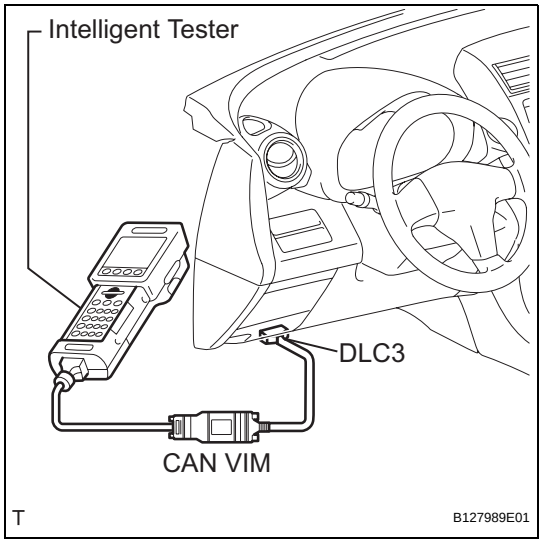
PRECAUTION

NOTICE:

- **Perform RESET MEMORY (AT initialization) when replacing the automatic transmission assembly, engine assembly or ECM (see page AX-18).**
- **Perform REGISTRATION (VIN registration) when replacing the ECM (see page ES-13).**

HINT:

Initialization cannot be completed by only removing the battery.



DEFINITION OF TERMS

Terms	Definition
Monitor Description	Description of what ECM monitors and how detects malfunctions (monitoring purpose and details).
Related DTCs	Group of diagnostic trouble codes that are output by ECM based on same malfunction detection logic.
Typical Enabling Condition	Preconditions that allow ECM to detect malfunctions. With all preconditions satisfied, ECM sets DTC when monitored value(s) exceeds malfunction threshold(s).
Sequence of Operation	Order of monitor priority, applied if multiple sensors and components involved in single malfunction detection process. Each sensor and component monitored in turn, when previous detection operation completed.
Required Sensor/Components	Sensors and components used by ECM to detect each malfunction.
Frequency of Operation	Number of times ECM checks for each malfunction during each driving cycle. "Once per driving cycle" means ECM only performs checks for that malfunction once during single driving cycle. "Continuous" means ECM performs checks for that malfunction whenever enabling conditions met.
Duration	Minimum time for which ECM must detect continuous deviation in monitored value(s) in order to set DTC. Timing begins when Typical Enabling Conditions met.
Malfunction Thresholds	Value, beyond which, ECM determines malfunctions exist and sets DTCs.
MIL Operation	Timing of MIL illumination after malfunction detected. "Immediate" means ECM illuminates MIL as soon as malfunction detected. "2 driving cycle" means ECM illuminates MIL if same malfunction detected second time during next sequential driving cycle.

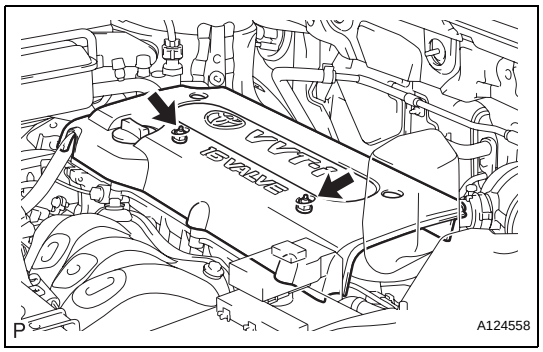
ON-VEHICLE INSPECTION

1. CHECK THROTTLE BODY

(a) Check the throttle control motor operating sounds.
  (1) Turn the ignition switch ON.
  (2) When pressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises emit from the motor. If friction noise exists, replace the throttle body.

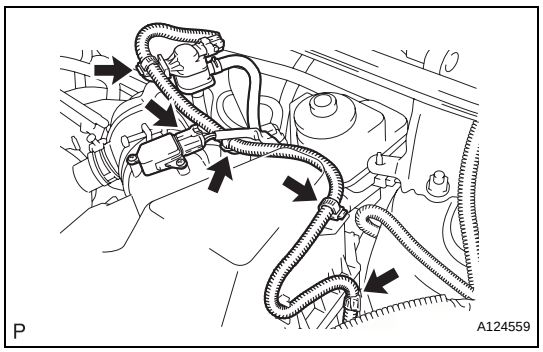
(b) Check the throttle position sensor.
  (1) Connect the intelligent tester to the DLC3.
  (2) Turn the ignition switch ON.
  (3) Push the intelligent tester main switch ON.
  (4) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / THROTTLE POS.
  (5) Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of "THROTTLE POS" is within the specification.

Standard throttle valve opening percentage:
60% or more



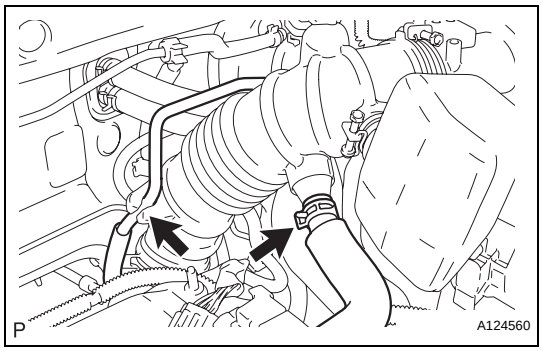
NOTICE:

When checking the standard throttle valve opening percentage, the shift lever should be in the N position.

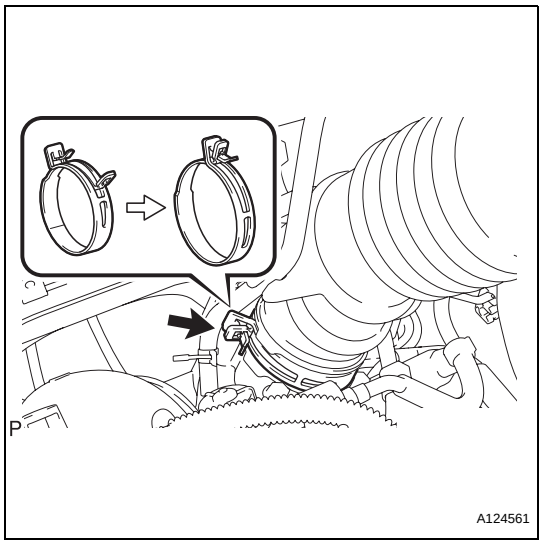


If the percentage is less than 60%, replace the throttle body.

REMOVAL

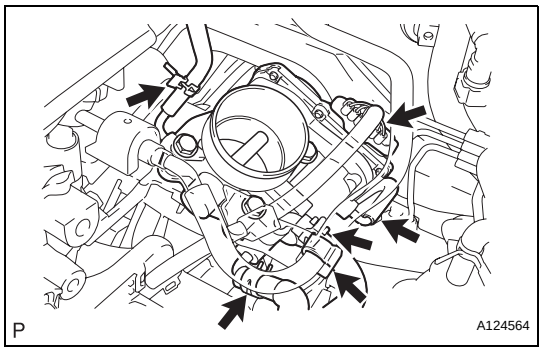


1. **DRAIN ENGINE COOLANT (See page CO-6)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE NO. 1 ENGINE COVER**
   (a) Remove the 2 nuts and engine cover.



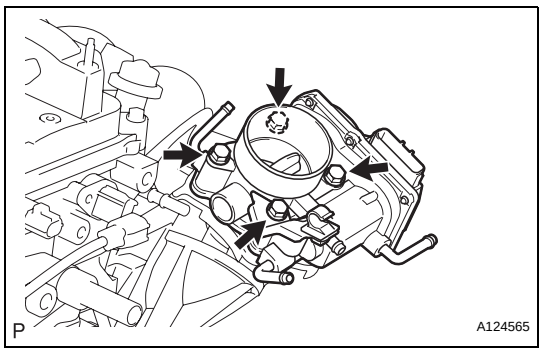
4. **REMOVE AIR CLEANER CAP**
   (a) Disconnect the mass air flow meter connector.
   (b) Disconnect the purge VSV connector.
   (c) Disconnect the 4 wire harness clamps.

   (d) Disconnect the No. 2 ventilation hose from the air cleaner hose.
   (e) Disconnect the purge line hose from the clamp.

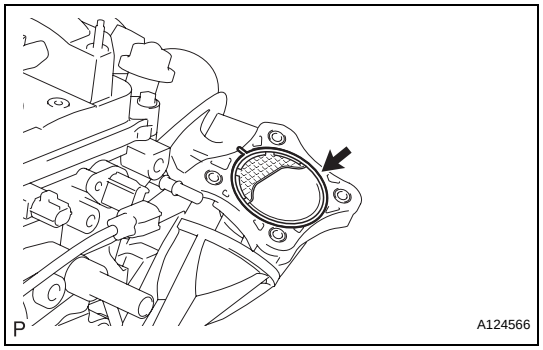


ES

(f) Lock the No. 1 air cleaner hose clamp, and then disconnect the No. 1 air cleaner hose from the throttle body.



(g) Unfasten the 2 hook clamps, and then remove the air cleaner cap.
(h) Remove the air cleaner filter element from the air cleaner case.



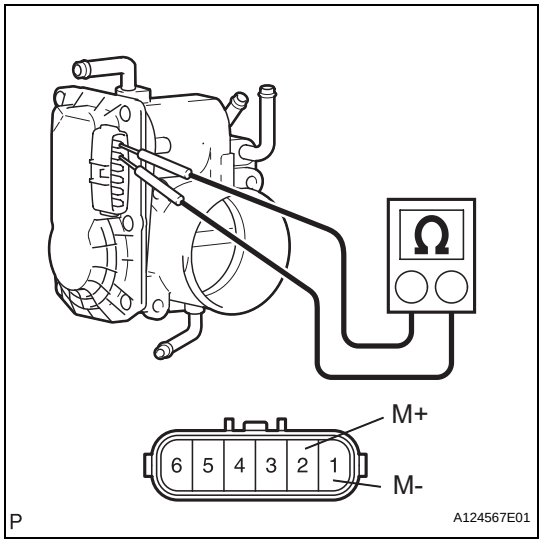
5. REMOVE THROTTLE BODY

(a) Disconnect the purge line hose from the throttle body.
(b) Disconnect the water by-pass hose from the throttle body.
(c) Disconnect the No. 2 water by-pass hose from the throttle body.
(d) Disconnect the No. 1 throttle body hose from the throttle body.
(e) Disconnect the throttle position sensor and control motor connector.
(f) Disconnect the wire harness clamp.
(g) Disconnect the fuel tube from the clamp.

(h) Remove the 4 bolts, and then remove the fuel pipe support and throttle body.

(i) Remove the gasket from the intake manifold.

INSPECTION

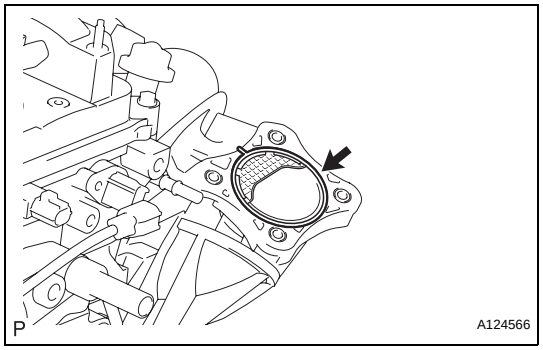


1. INSPECT THROTTLE BODY

(a) Measure the resistance of the throttle control motor.

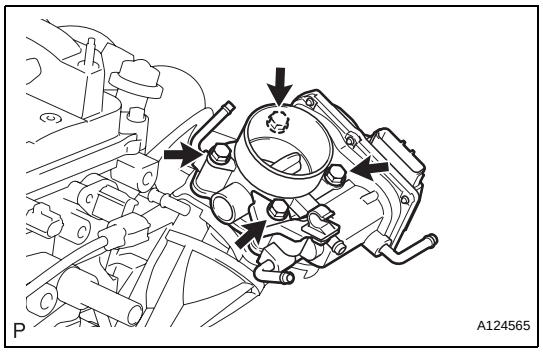
Standard resistance

Tester Connection	Specified Condition
1 (M-) - 2 (M+)	0.3 to 100 Ω at 20°C (68°F)

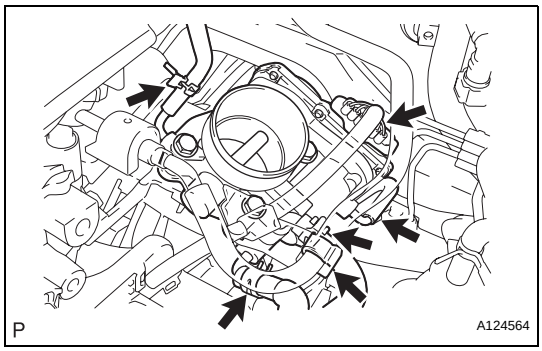


If the result is not as specified, replace the throttle body.

INSTALLATION



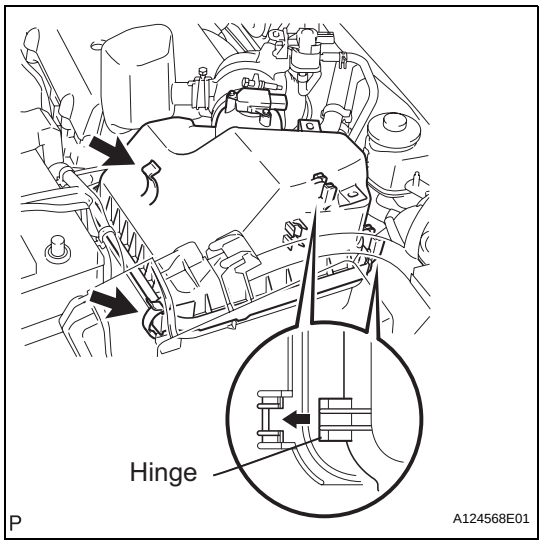
1. INSTALL THROTTLE BODY

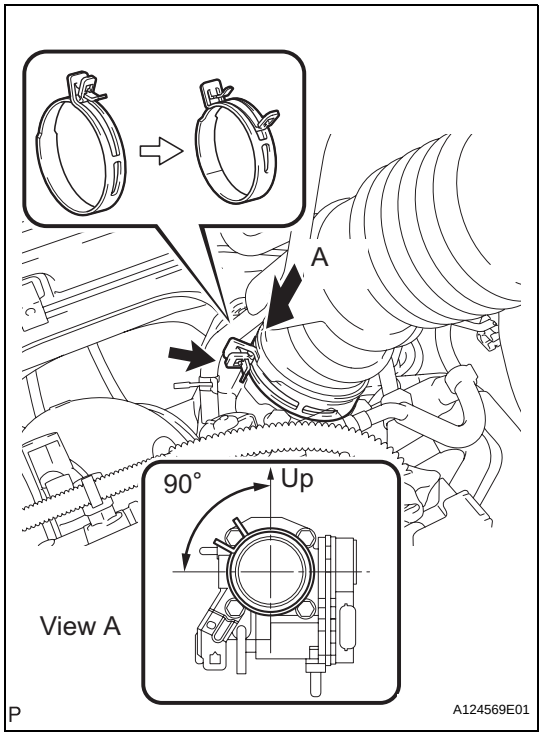


(a) Install a new gasket onto the intake manifold.

(b) Install the throttle body and fuel pipe clamp with the 4 bolts.

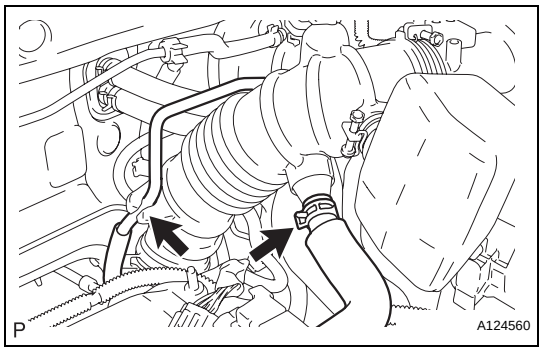
Torque: 30 N*m (305 kgf*cm, 22 ft.*lbf)





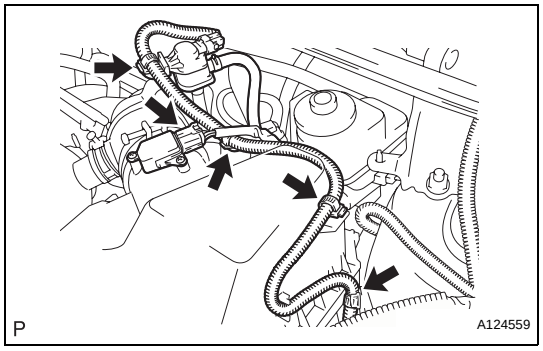
(c) Connect the fuel tube into the clamp.
(d) Connect the wire harness clamp.
(e) Connect the throttle position sensor and control motor connector.
(f) Connect the No. 1 throttle body hose to the throttle body.
(g) Connect the No. 2 water by-pass hose to the throttle body.
(h) Connect the water by-pass hose to the throttle body.
(i) Connect the purge line hose to the throttle body.

2. INSTALL AIR CLEANER CAP



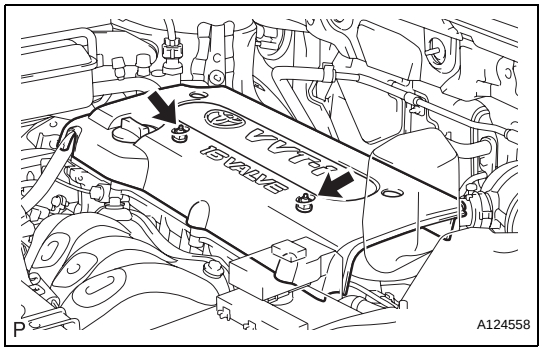
(a) Install the air cleaner filter element onto the air cleaner case.

(b) Insert the hinge part of the air cleaner cap into the air cleaner case, then hang the 2 hook clamps.



(c) Align the matchmarks of the No. 1 air cleaner hose and throttle body, and then connect the air cleaner hose No. 1 to the throttle body and unfasten the No. 1 air cleaner hose clamp.
NOTICE:
Make sure that the hose clamp is at the correct angle.

(d) Connect the purge line hose to the clamp.
(e) Connect the No. 2 ventilation hose to the air cleaner hose.

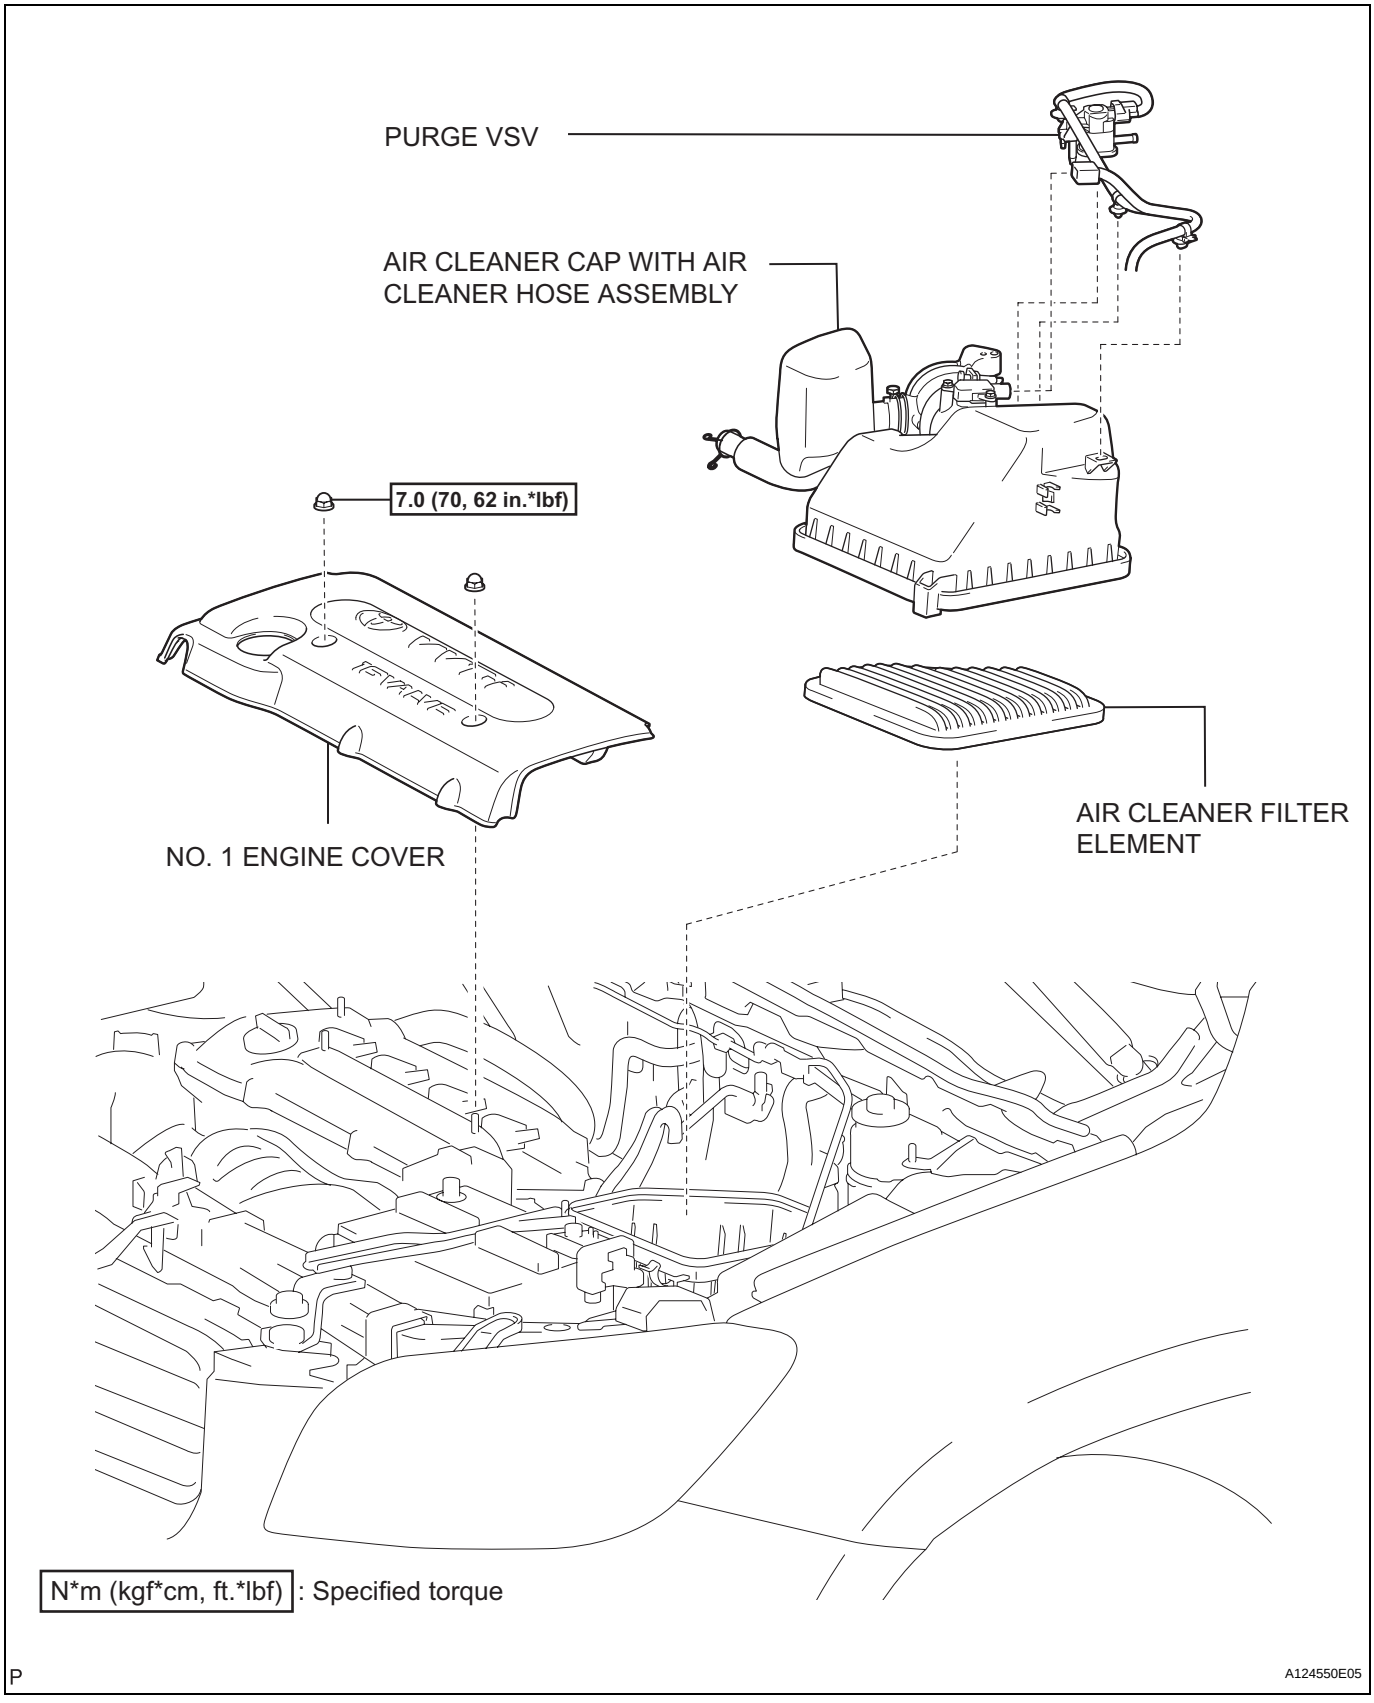


(f) Install the 4 wire harness clamps.
(g) Connect the mass air flow meter connector.

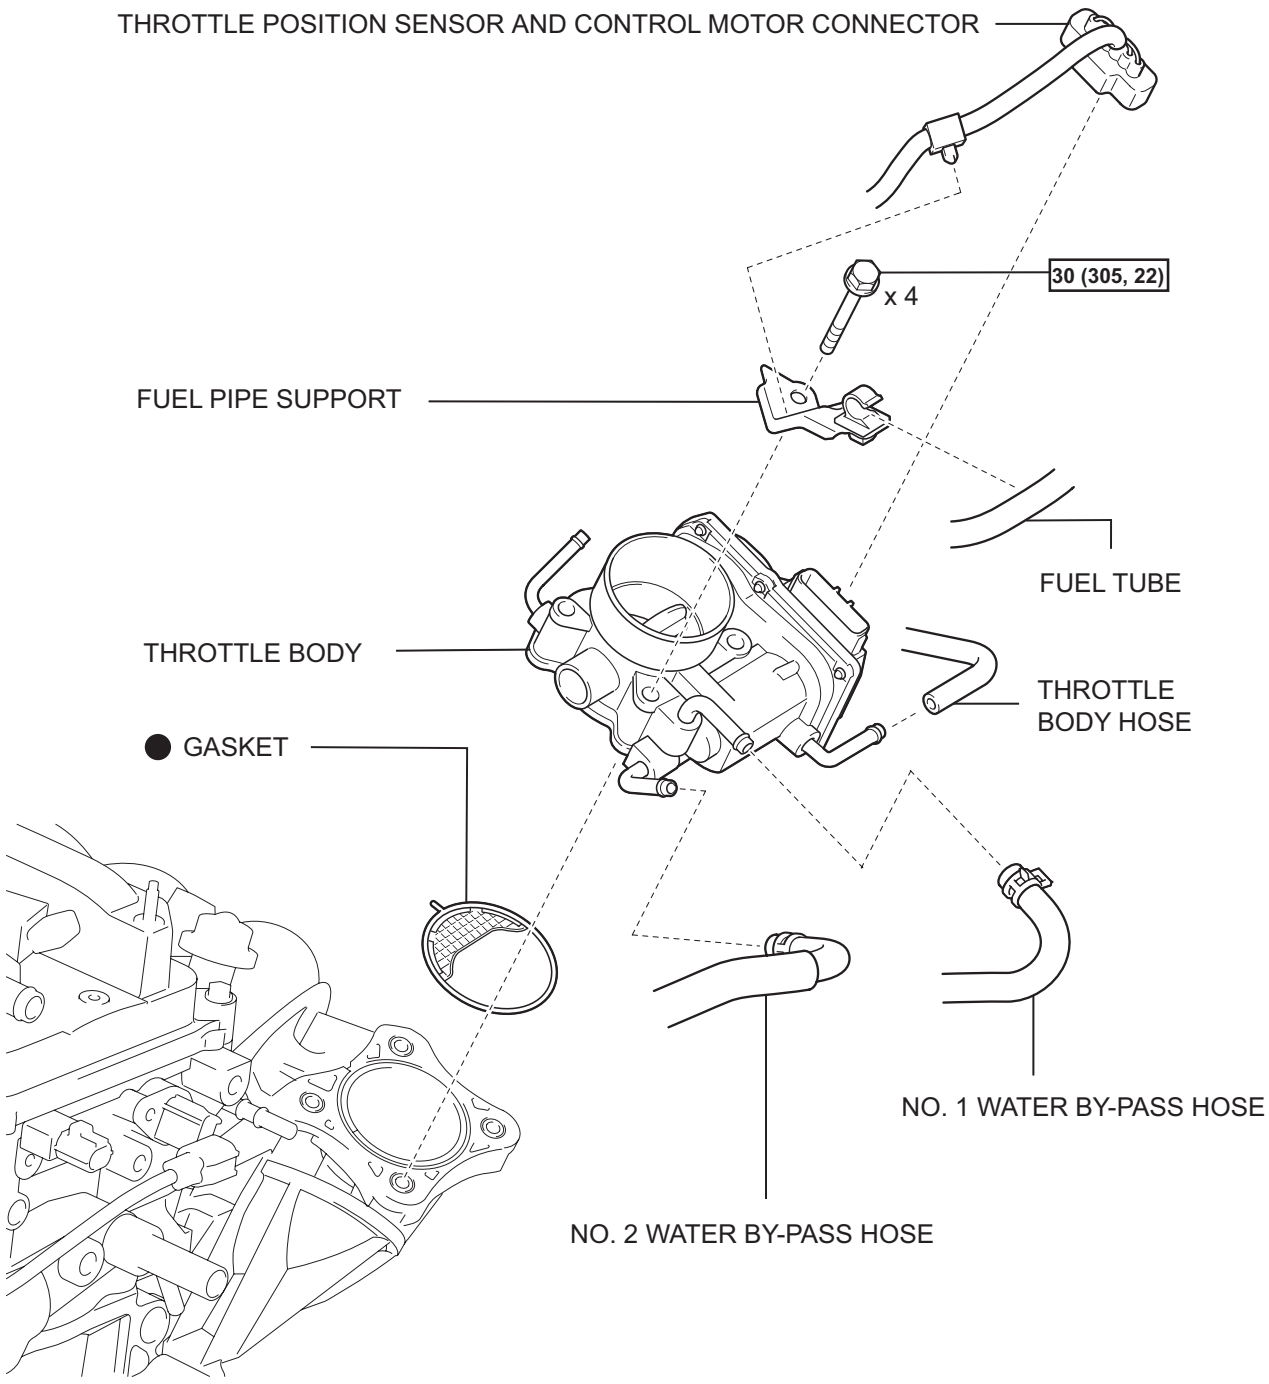
3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

4. ADD ENGINE COOLANT (See page CO-6)

5. CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-1)



6. INSTALL NO. 1 ENGINE COVER



(a) Install the cover with the 2 nuts.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

ES

THROTTLE BODY

COMPONENTS

N*m (kgf*cm, ft.*lbf) : Specified torque

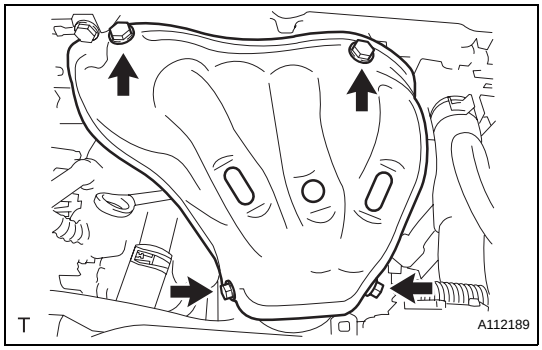
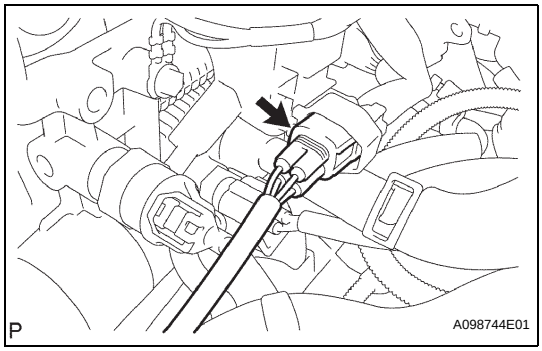
REMOVAL

1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE RADIATOR SUPPORT OPENING COVER**
4. **REMOVE FRONT WHEEL RH**
5. **REMOVE NO. 1 ENGINE UNDER COVER**
6. **REMOVE FRONT FENDER APRON RH**
7. **REMOVE NO. 1 ENGINE COVER (See page EM-22)**
8. **DRAIN ENGINE COOLANT (See page CO-6)**
9. **DRAIN ENGINE OIL (See page LU-4)**
10. **REMOVE AIR CLEANER CAP (See page ES-411)**
11. **REMOVE THROTTLE BODY (See page ES-412)**
12. **REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-10)**
13. **REMOVE INTAKE MANIFOLD (See page ES-419)**
14. **REMOVE INTAKE MANIFOLD INSULATOR (See page ES-420)**
15. **REMOVE FRONT EXHAUST PIPE (See page EX-3)**
16. **REMOVE OIL DIPSTICK**
17. **REMOVE OIL DIPSTICK GUIDE**
    (a) Remove the bolt and guide.
    (b) Remove the O-ring from the guide.

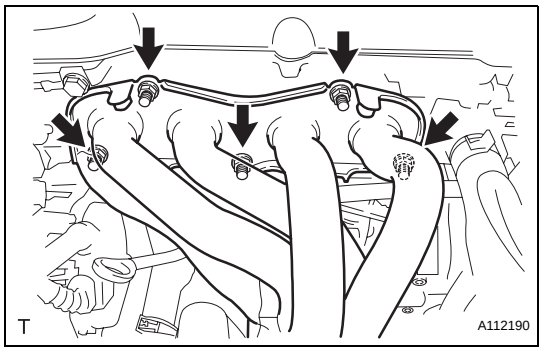


18. **REMOVE MANIFOLD STAY**
    (a) Remove the bolt, nut and stay.



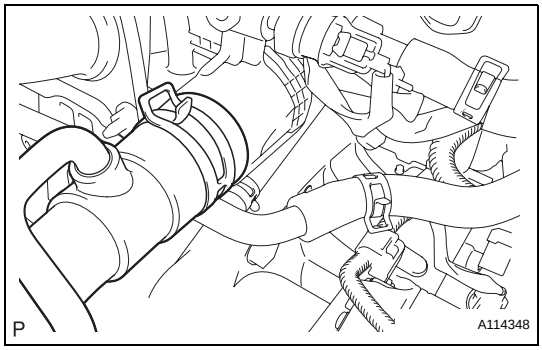
19. REMOVE NO. 2 MANIFOLD STAY

(a) Remove the bolt, nut and stay.



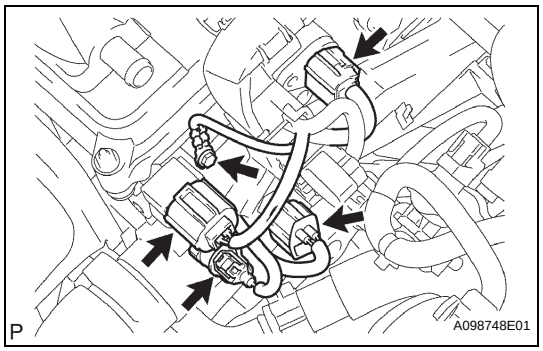
20. REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR

(a) Remove the 4 bolts and heat insulator.

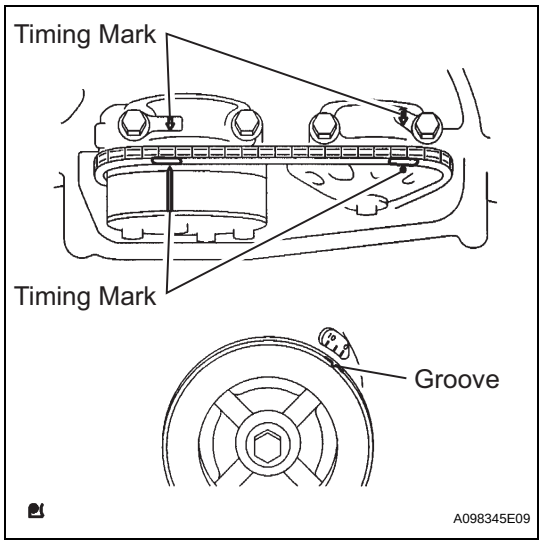


21. REMOVE EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY

(a) Disconnect the air-fuel ratio sensor connector.

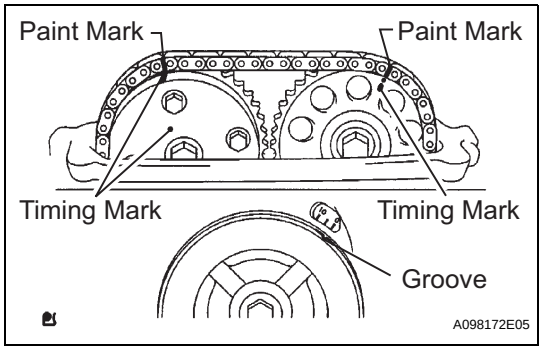


(b) Remove the 5 nuts, manifold converter and gasket.

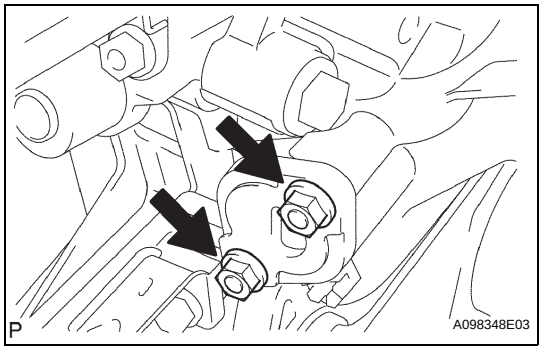


22. DISCONNECT NO. 1 RADIATOR HOSE

(a) Disconnect the No. 1 radiator hose.

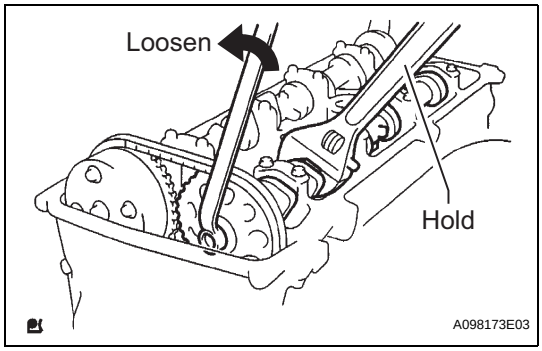


23. **DISCONNECT ENGINE WIRE**
    (a) Disconnect the radio setting condenser connector.
    (b) Disconnect the engine oil pressure switch connector.
    (c) Disconnect the engine coolant temperature sensor connector.
    (d) Disconnect the camshaft position sensor connector.
    (e) Remove the bolt and ground cable.
24. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-6)**
25. **REMOVE FAN AND GENERATOR V BELT (See page EM-6)**
26. **REMOVE GENERATOR ASSEMBLY (See page CH-9)**
27. **REMOVE ENGINE MOUNTING INSULATOR RH (See page EM-22)**
28. **REMOVE IDLER PULLEY (See page EM-23)**
29. **REMOVE IGNITION COIL ASSEMBLY (See page IG-9)**
30. **REMOVE SPARK PLUG (See page EM-8)**
31. **REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-24)**
32. **REMOVE V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-26)**
33. **REMOVE CRANKSHAFT POSITION SENSOR (See page ES-402)**
34. **REMOVE OIL PAN SUB-ASSEMBLY (See page EM-24)**

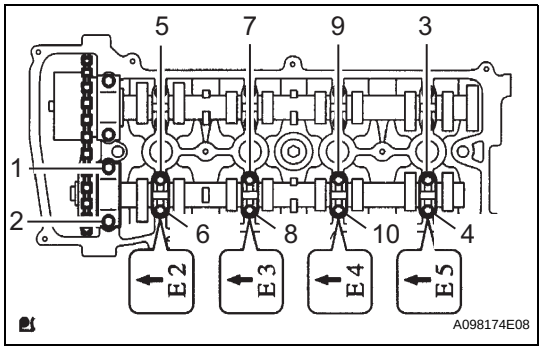


35. **SET NO. 1 CYLINDER TO TDC/COMPRESSION**
    (a) Turn the crankshaft pulley until its groove and the timing mark "0" of the timing chain cover are aligned.
    (b) Check that each timing mark of the camshaft timing gear and sprocket is aligned with each timing mark located on the No. 1 and No. 2 bearing caps as shown in the illustration.
    If not, turn the crankshaft by 1 revolution (360°) to align the timing marks as above.

EM

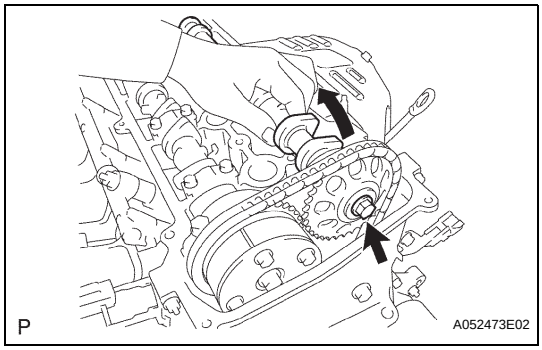


36. REMOVE NO. 2 CAMSHAFT



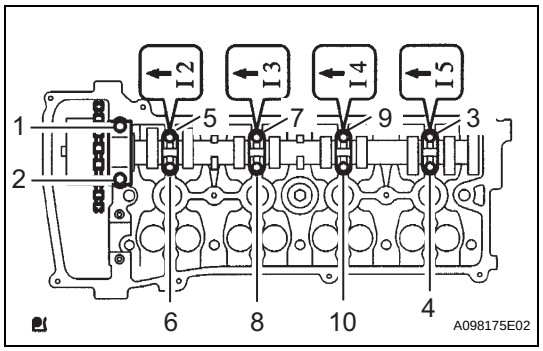
(a) Place paint marks on the chain in alignment with the timing marks on the camshaft timing gear and camshaft timing sprocket.

(b) Remove the 2 nuts, tensioner and gasket.

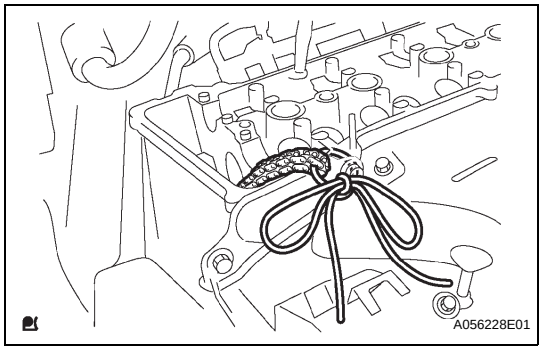


(c) While holding the camshaft with a wrench, loosen the camshaft timing set bolt.

(d) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.



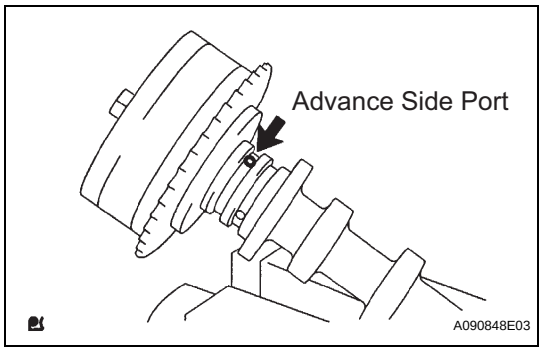
(e) Remove the 5 bearing caps.



(f) While holding the No. 2 camshaft by hand, remove the camshaft timing sprocket set bolt.

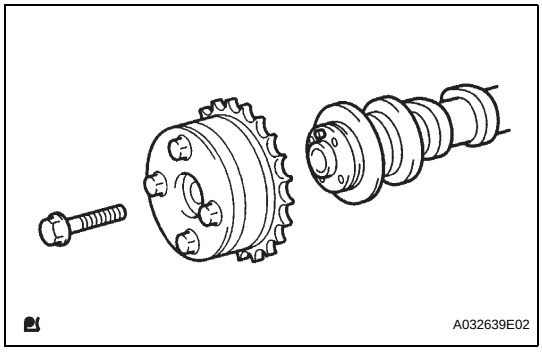
(g) Remove the camshaft timing sprocket from the No. 2 camshaft with the timing chain wrapped on the sprocket.

(h) Remove the camshaft timing sprocket from the timing chain.



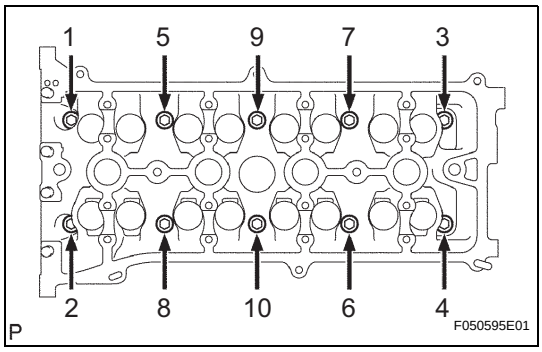
37. **REMOVE CAMSHAFT**
    (a) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.
    (b) Remove the 5 bearing caps.
    (c) Remove the camshaft and camshaft timing gear while holding the timing chain by hand.

    (d) Tie the timing chain with a string as shown in the illustration.
    NOTICE:
    Be careful not to drop anything inside the timing chain cover.

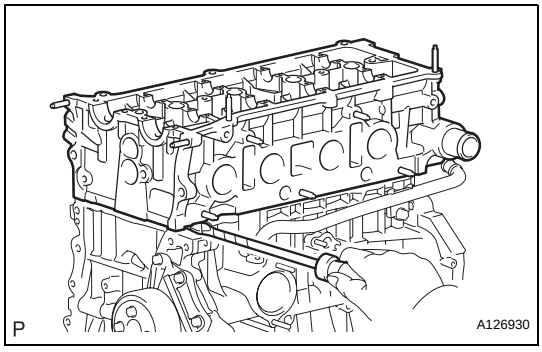


38. **REMOVE CRANKSHAFT PULLEY (See page EM-25)**
39. **REMOVE ENGINE MOUNTING BRACKET RH (See page EM-26)**
40. **REMOVE TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-26)**
41. **REMOVE NO. 1 CRANKSHAFT POSITION SENSOR PLATE**
42. **REMOVE TIMING CHAIN GUIDE (See page EM-28)**
43. **REMOVE CHAIN TENSIONER SLIPPER (See page EM-28)**
44. **REMOVE NO. 1 CHAIN VIBRATION DAMPER (See page EM-28)**
45. **REMOVE CHAIN SUB-ASSEMBLY**
46. **REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-395)**
47. **REMOVE CAMSHAFT TIMING GEAR ASSEMBLY**
    (a) Clamp the camshaft in a vise, and make sure that the camshaft timing gear does not rotate.
    (b) Cover all the oil ports with vinyl tape except the advance side port shown in the illustration.

EM

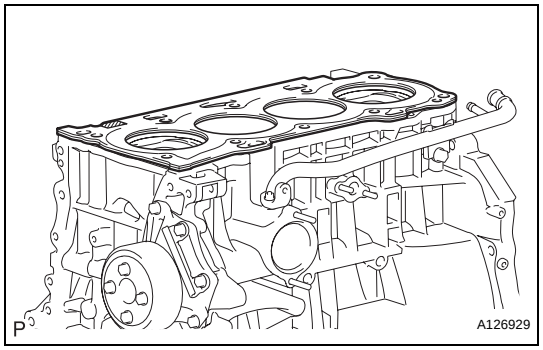


(c) Apply air pressure of 100 kPa (1.0 kgf/cm^2, 14 psi) to the oil path, then turn the camshaft timing gear to the advance direction (counterclockwise) by hand.
CAUTION:
Cover the paths with a shop rag to avoid oil splashes.
HINT:
Depending on the air pressure, the camshaft timing gear will turn to the advance angle side without applying force by hand. Also, under the condition that the pressure is difficult to apply because of air leakage from the port, there may be the case that the lock pin is difficult to release.



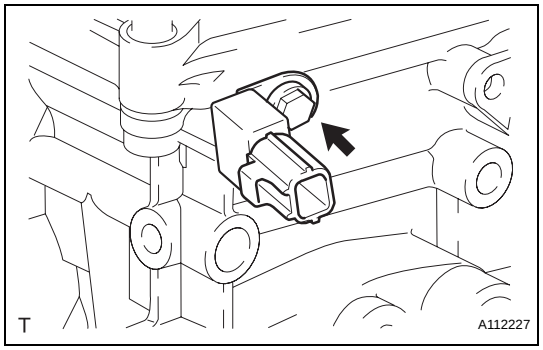
(d) Remove the flange bolt of the camshaft timing gear.
NOTICE:
- **Be sure not to remove the other 4 bolts.**
- **When reusing the camshaft timing gear, release the straight pin lock first, then install the gear.**

EM

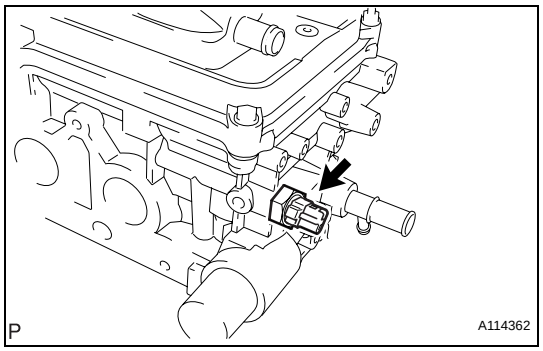


48. REMOVE CYLINDER HEAD SUB-ASSEMBLY

(a) Using several steps, uniformly loosen and remove the 10 cylinder head bolts and 10 plate washers with a 10 mm bi-hexagon wrench in the sequence shown in the illustration.
NOTICE:
Head warpage or cracking could result from removing the bolts in the wrong order.

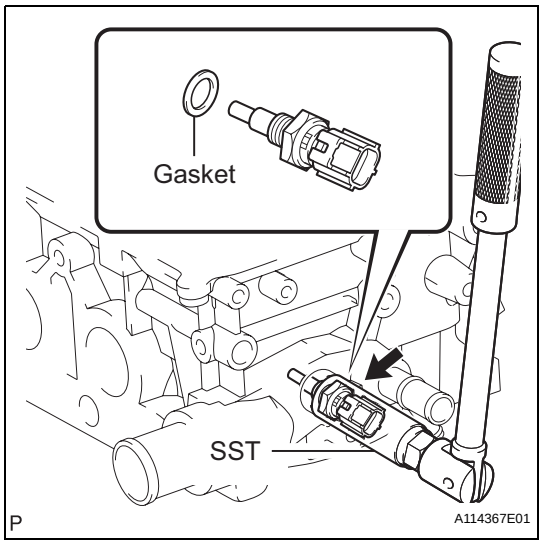


(b) Using a screwdriver with its tip wrapped with tape, pry between the cylinder head and cylinder block, and remove the cylinder head.
NOTICE:
Be careful not to damage the contact surfaces of the cylinder head and cylinder block.



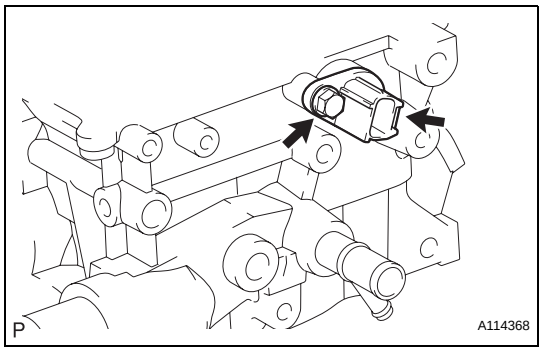
49. REMOVE CYLINDER HEAD GASKET

DISASSEMBLY



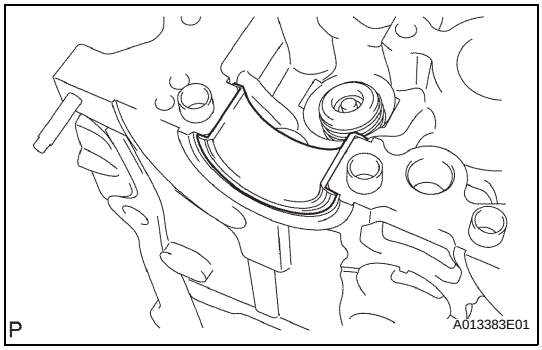
1. REMOVE RADIO SETTING CONDENSER

(a) Remove the bolt and condenser.



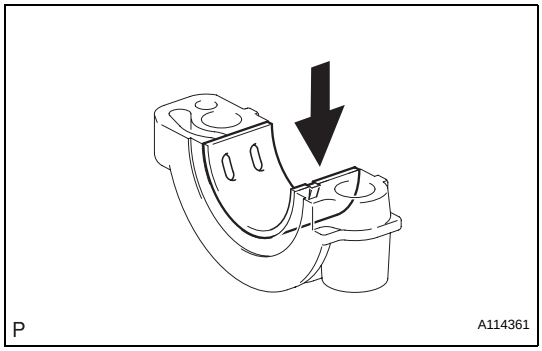
2. REMOVE OIL PRESSURE SWITCH

(a) Using a 24 mm deep socket wrench, remove the sensor.



3. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

(a) Using SST, remove the sensor and gasket.
SST 09817-33190



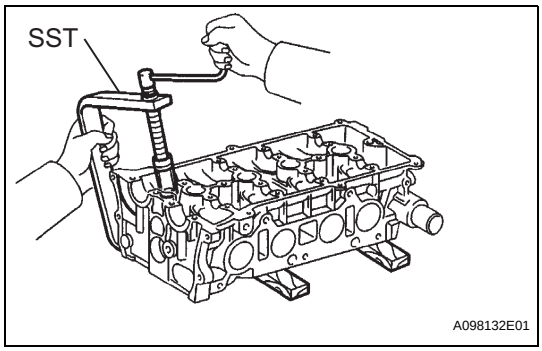
4. REMOVE CAMSHAFT POSITION SENSOR

(a) Remove the bolt and sensor.

5. REMOVE NO. 2 CAMSHAFT BEARING

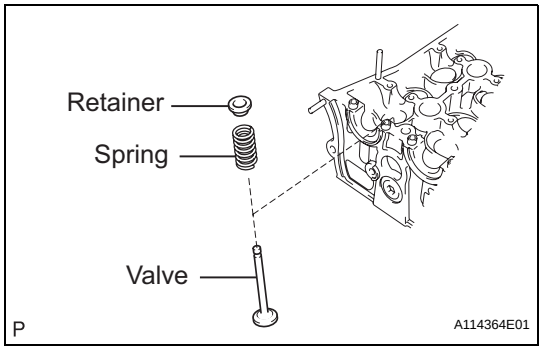
(a) Remove the No. 2 camshaft bearing.

6. REMOVE NO. 1 CAMSHAFT BEARING



(a) Remove the No. 1 camshaft bearing.

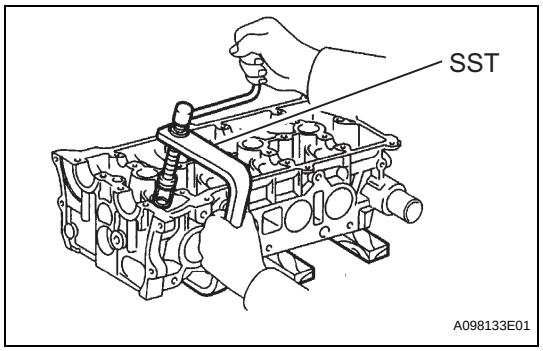
7. REMOVE VALVE LIFTER



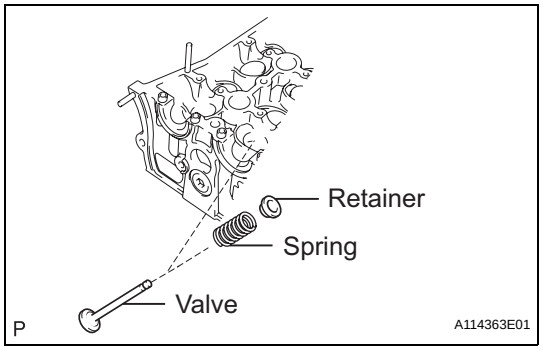
HINT:
Arrange the valve lifters in the correct order.

8. REMOVE INTAKE VALVE

(a) Place the cylinder head on wooden blocks.



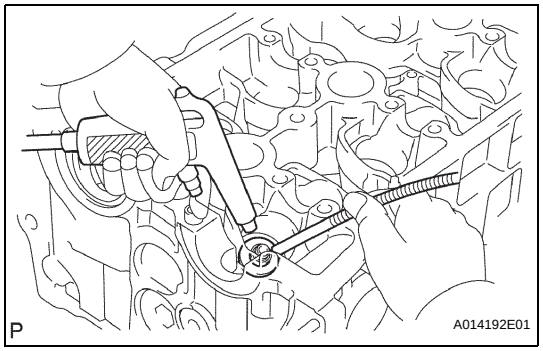
(b) Using SST, compress the spring, then remove the 2 retainer locks.
SST 09202-70020 (09202-00010)



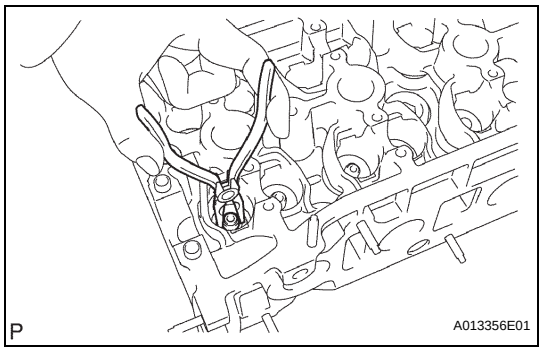
(c) Remove the retainer, spring and valve from the cylinder head.
HINT:
Arrange the removed parts in the correct order.

9. REMOVE EXHAUST VALVE

(a) Place the cylinder head on wooden blocks.

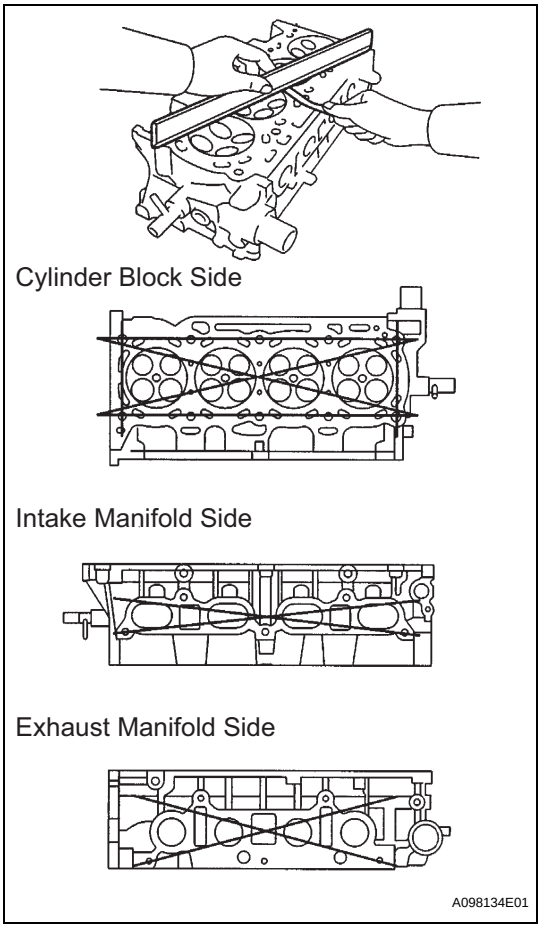


(b) Using SST, compress the spring, then remove the 2 retainer locks.
SST 09202-70020 (09202-00010)



(c) Remove the retainer, spring and valve from the cylinder head.
HINT:
Arrange the removed parts in the correct order.

EM



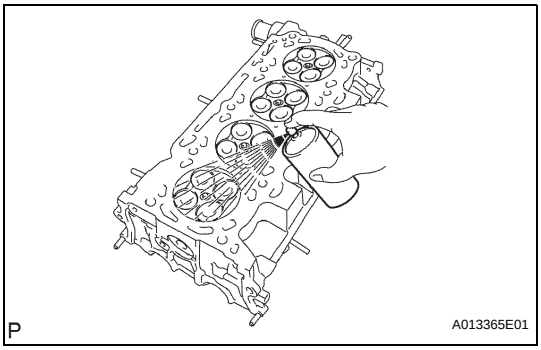
10. REMOVE VALVE SPRING SEAT

(a) Using compressed air and a magnetic finger, remove the spring seat by blowing air.
HINT:
Arrange the valves, valve springs, spring seats and spring retainers in the correct order.

11. REMOVE VALVE STEM OIL SEAL

(a) Using needle-nose pliers, remove the 16 oil seals.

INSPECTION



1. INSPECT CYLINDER HEAD FOR WARPAGE

(a) Using a precision straightedge and feeler gauge, measure the warpage of the contact surfaces of the cylinder block and manifolds.

Maximum warpage:

0.08 mm (0.0032 in.)

If the warpage is greater than the maximum, replace the cylinder head sub-assembly.

2. INSPECT CYLINDER HEAD FOR CRACKS

(a) Using a dye penetrant, inspect the combustion chamber, intake ports, exhaust ports and cylinder block surface for cracks.

If cracked, replace the cylinder head.

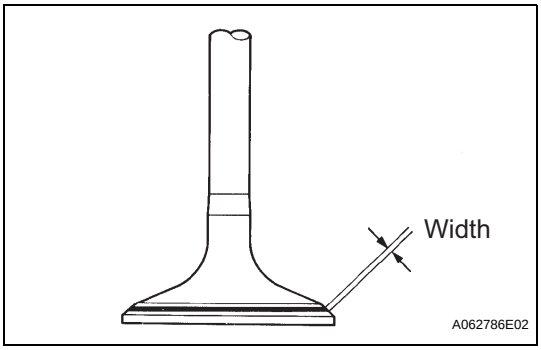
3. INSPECT VALVE SEAT

(a) Apply a light coat of Prussian blue to the valve face.

(b) Lightly press the valve against the seat.

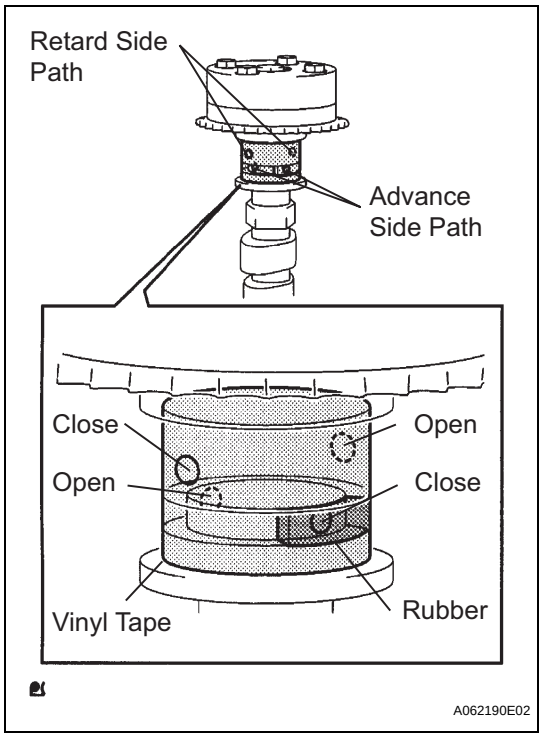
NOTICE:

Do not turn the valve.

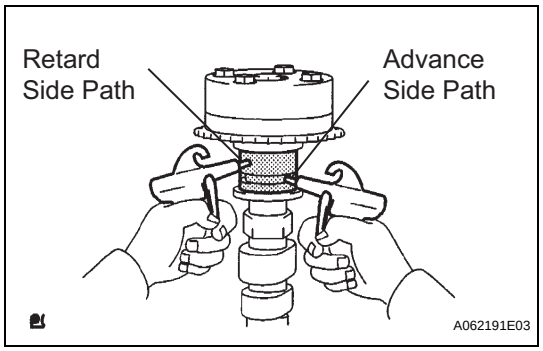


(c) Check the valve face and seat in accordance with the following procedure.

(1) If blue appears 360° around the face, the valve is concentric. If not, replace the valve.



(2) If blue appears 360° around the valve seat, the guide and face are concentric. If not, resurface the valve seat (see page EM-87).



(3) Check that the seat contact is in the middle of the valve face with a width.

Standard width

Item	Standard Condition
Intake	1.0 to 1.4 mm (0.0039 to 0.0551 in.)
Exhaust	1.2 to 1.6 mm (0.0472 to 0.0630 in.)

4. INSPECT CAMSHAFT TIMING GEAR ASSEMBLY

(a) Check the lock of the camshaft timing gear.

(1) Clamp the camshaft in a vise, and confirm that the camshaft timing gear is locked.

NOTICE:

Be careful not to damage the camshaft.

(b) Release the lock pin.

(1) Cover the 4 oil paths of the cam journal with vinyl tape as shown in the illustration.

HINT:

The 2 advance side paths are provided in the groove of the camshaft. Plug one of the paths with a rubber piece.

(2) Break through the tape of the advance side path and the retard side path on the opposite side of the groove.

EM

(3) Apply approximately 200 kPa (2.0 kgf/cm^2, 28 psi) of air pressure to the paths whose tape was broken in the procedure above.

CAUTION:

Some oil spraying will occur. Contain the spray with a shop rag.

(4) Check that the camshaft timing gear revolves in the advance direction when weakening the air pressure of the retard side path.

OK:

Gear rotates in advance direction.

HINT:

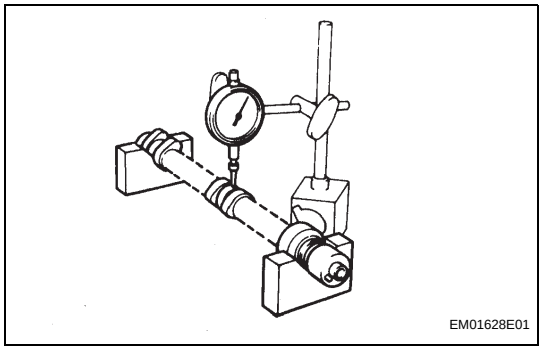
This operation releases the lock pin for the extreme retard position.

(5) When the camshaft timing gear reaches the extreme advance position, remove the air gun from the retard side path and advance side path, in that order.

NOTICE:

Do not remove the air gun from the advance side path first. The gear may abruptly shift in the retard direction and break the lock pin.

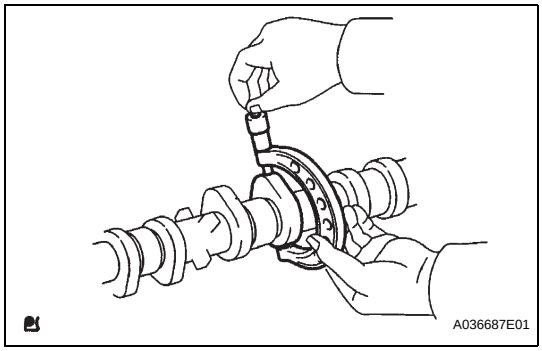
(c) Check for smooth rotation.



(1) Rotate the camshaft timing gear within its movable range several times, but do not turn it to the extreme retard position. Check that the gear rotates smoothly.

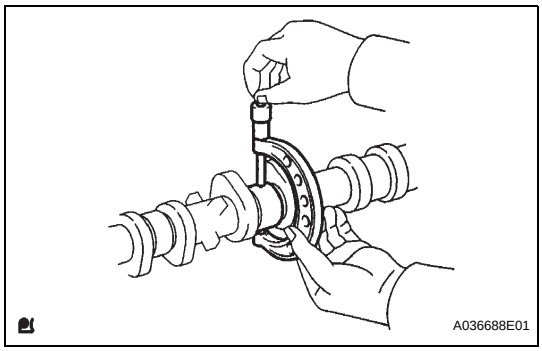
OK:

Gear rotates smoothly.



NOTICE:
Do not use an air gun to perform the smooth operation check.

(d) Check the lock in the extreme retard position.
(1) Confirm that the camshaft timing gear is locked at the extreme retard position.

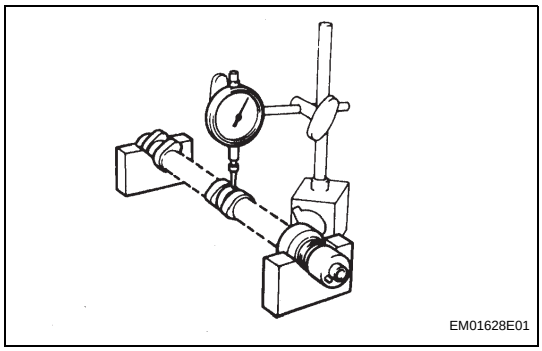


EM01628E01

5. INSPECT CAMSHAFT

(a) Inspect the camshaft for runout.
(1) Place the camshaft on V-blocks.
(2) Using a dial indicator, measure the circle runout at the center journal.
Maximum circle runout:
0.03 mm (0.0012 in.)
If the circle runout is greater than the maximum, replace the camshaft.

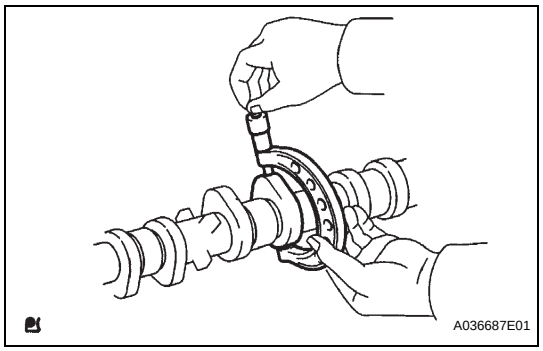
A036687E01



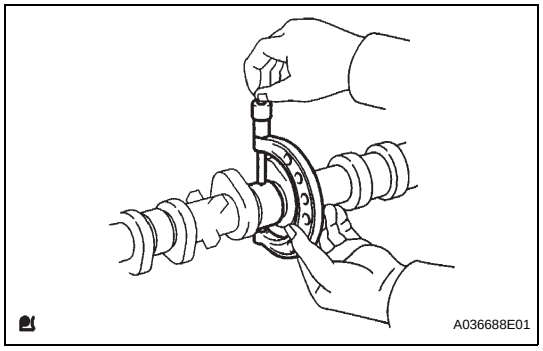
(b) Inspect the cam lobes.
(1) Using a micrometer, measure the cam lobe height.
Standard cam lobe height:
47.306 to 47.406 mm (1.8624 to 1.8664 in.)
Minimum cam lobe height:
47.196 mm (1.8581 in.)
If the cam lobe height is less than the minimum, replace the camshaft.

A036688E01

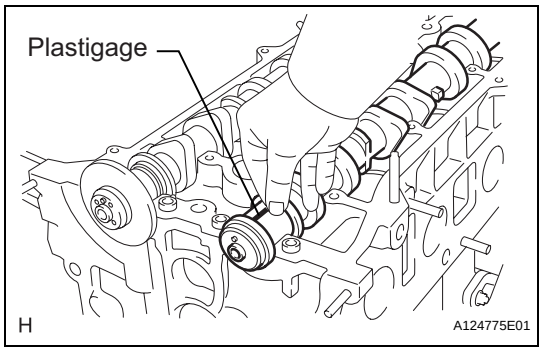
(c) Inspect the camshaft journals.
(1) Using a micrometer, measure the journal diameter.
Standard journal diameter



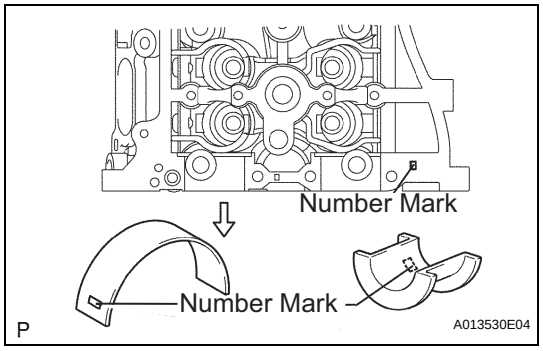
Journal Position	Specified Condition
No. 1	35.971 to 35.985 mm (1.4162 to 1.4167 in.)
Other	22.959 to 22.975 mm (0.9039 to 0.9045 in.)



If the journal diameter is not as specified, check the oil clearance.



EM01628E01



6. INSPECT NO. 2 CAMSHAFT

(a) Inspect the camshaft for runout.
(1) Place the camshaft on V-blocks.
(2) Using a dial indicator, measure the circle runout at the center journal.
Maximum circle runout:
0.03 mm (0.0012 in.)
If the circle runout is greater than the maximum, replace the No. 2 camshaft.

(b) Inspect the cam lobes.

(1) Using a micrometer, measure the cam lobe height.

Standard cam lobe height:
45.983 to 46.083 mm (1.8104 to 1.8143 in.)
Minimum cam lobe height:
45.873 mm (1.8060 in.)

If the cam lobe height is less than the minimum, replace the No. 2 camshaft.

(c) Inspect the camshaft journals.

(1) Using a micrometer, measure the journal diameter.

Standard journal diameter

Journal Position	Specified Condition
No. 1	35.971 to 35.985 mm (1.4162 to 1.4167 in.)
Other	22.959 to 22.975 mm (0.9039 to 0.9045 in.)

If the journal diameter is not as specified, check the oil clearance.

7. INSPECT CAMSHAFT OIL CLEARANCE

(a) Clean the 10 bearing caps and camshaft journals.

(b) Place the 2 camshafts on the cylinder head.

(c) Lay a strip of Plastigage across each of the camshaft journals.

(d) Install the 10 bearing caps (see page EM-84).

NOTICE:
Do not turn the camshaft.

(e) Remove the 10 bearing caps for the No. 2 camshaft (see page EM-60) and camshaft (see page EM-61).

(f) Measure the Plastigage at its widest point.

Standard oil clearance

Item	Standard Condition
Intake No. 1 journal	0.007 to 0.038 mm (0.0003 to 0.0015 in.)
Exhaust No. 1 journal	0.040 to 0.079 mm (0.0016 to 0.0031 in.)
Other journal	0.025 to 0.062 mm (0.0010 to 0.0024 in.)

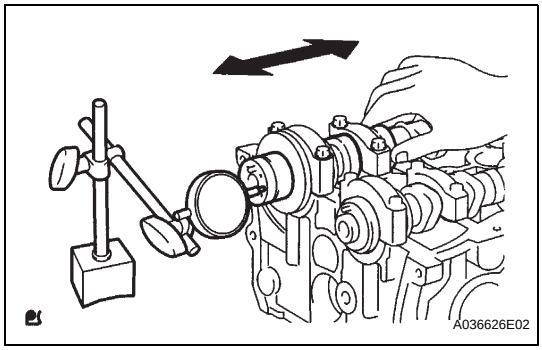
Maximum oil clearance

Item	Standard Condition
Intake No. 1 journal	0.07 mm (0.0028 in.)
Other journal	0.10 mm (0.0039 in.)

NOTICE:
Completely remove the Plastigage after the measurement.

EM

If the oil clearance on the No. 1 journal is greater than the maximum, choose a new bearing and install it.
If the oil clearance on the other journals is greater than the maximum, replace the cylinder head sub-assembly or the camshaft.



Standard cylinder head journal bore diameter

Mark	Standard Condition
Mark 1	40.000 to 40.008 mm (1.5748 to 1.5751 in.)
Mark 2	40.009 to 40.017 mm (1.5752 to 1.5755 in.)
Mark 3	40.018 to 40.025 mm (1.5755 to 1.5758 in.)

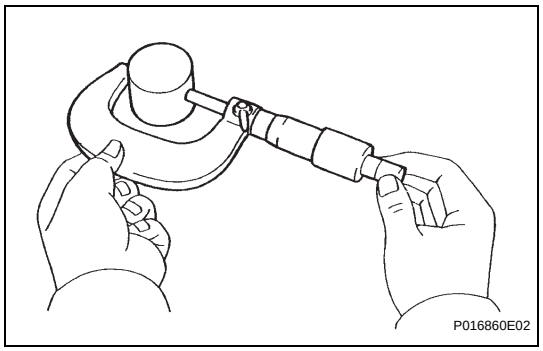
Standard bearing center wall thickness

Mark	Standard Condition
Mark 1	2.000 to 2.004 mm (0.0787 to 0.0789 in.)
Mark 2	2.005 to 2.008 mm (0.0789 to 0.0791 in.)
Mark 3	2.009 to 2.012 mm (0.0791 to 0.0792 in.)

Standard camshaft journal diameter:
35.971 to 35.985 mm (1.4162 to 1.4167 in.)

8. INSPECT CAMSHAFT THRUST CLEARANCE

(a) Install the 2 camshafts (see page EM-84).
(b) Using a dial indicator, measure the thrust clearance while moving the camshaft back and forth.



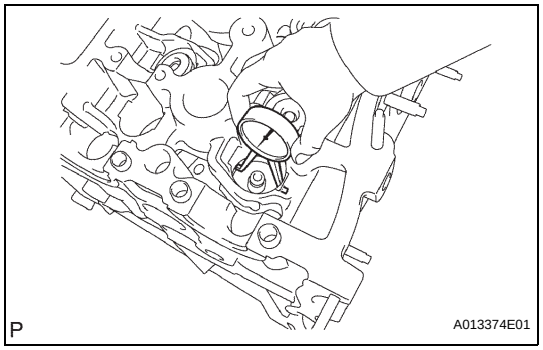
Standard thrust clearance

Item	Standard Condition
Intake	0.040 to 0.095 mm (0.0016 to 0.0037 in.)
Exhaust	0.080 to 0.135 mm (0.0032 to 0.0053 in.)

Maximum thrust clearance

Item	Standard Condition
Intake	0.11 mm (0.0043 in.)
Exhaust	0.15 mm (0.0059 in.)

If the thrust clearance is greater than the maximum, replace the cylinder head.
If damage is found on the camshaft thrust surfaces, replace the camshaft.



9. INSPECT VALVE LIFTER

(a) Using a micrometer, measure the lifter diameter.

Standard lifter diameter:

30.966 to 30.976 mm (1.2191 to 1.2195 in.)

If the diameter is not as specified, replace the valve lifter.

10. INSPECT VALVE LIFTER OIL CLEARANCE

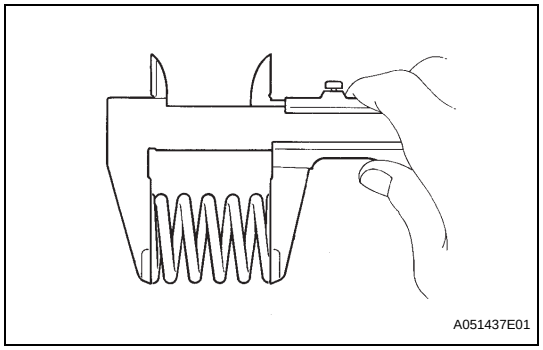
(a) Using a caliper gauge, measure the valve lifter bore diameter of the cylinder head.

Standard lifter bore diameter:

31.009 to 31.025 mm (1.2208 to 1.2215 in.)

If the diameter is not as specified, replace the cylinder head sub-assembly.

(b) Subtract the valve lifter diameter measurement from the valve lifter bore diameter measurement.



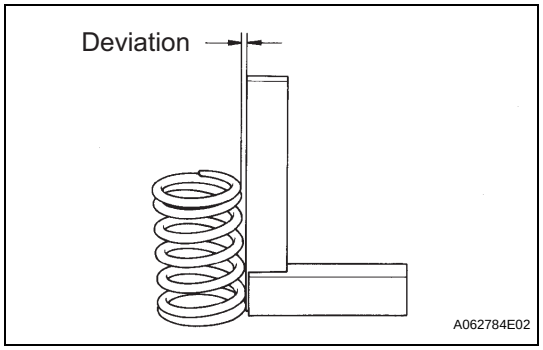
Standard oil clearance:

0.033 to 0.059 mm (0.0013 to 0.0023 in.)

Maximum oil clearance:

0.079 mm (0.0031 in.)

If the oil clearance is greater than the maximum, replace the valve lifter. If necessary, replace the cylinder head sub-assembly.



11. INSPECT INNER COMPRESSION SPRING

(a) Using a vernier caliper, measure the free length of the valve spring.

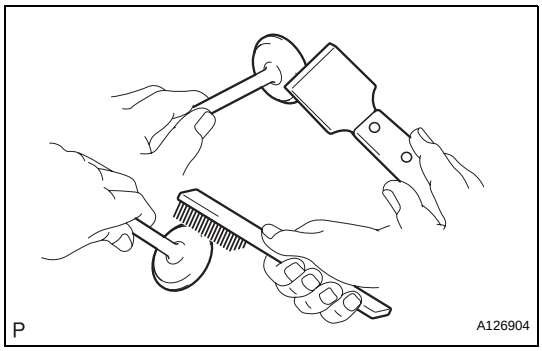
Standard free length:

47.43 mm (1.8673 in.)

If the length is not as specified, replace the inner compression spring.

(b) Using a steel square, measure the deviation of the inner compression spring.

Maximum deviation:

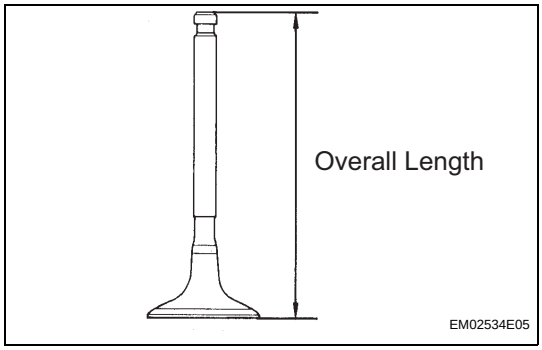


1.6 mm (0.063 in.)

Maximum angle (Reference):

2°

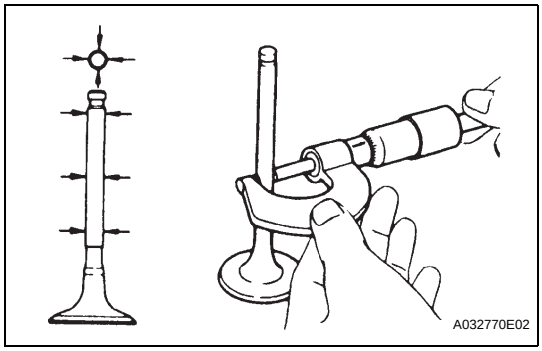
If the deviation is greater than the maximum, replace the inner compression spring.



EM

12. INSPECT INTAKE VALVE

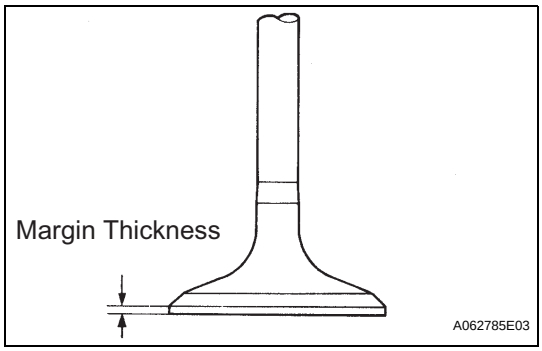
(a) Using a gasket scraper, chip off any carbon on the valve head.



(b) Using a wire brush, thoroughly clean the valve.

(c) Using a vernier caliper, measure the valve overall length.

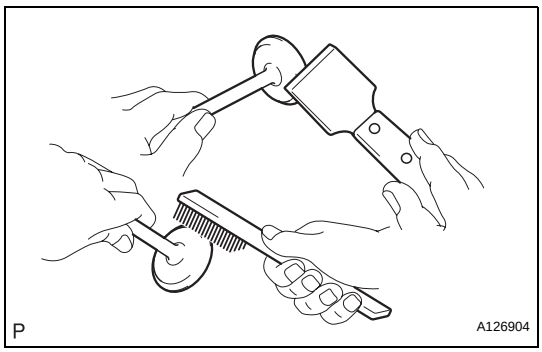
Standard overall length:
101.71 mm (4.0043 in.)
Minimum overall length:
101.21 mm (3.9846 in.)



If the overall length is less than the minimum, replace the intake valve.

(d) Using a micrometer, measure the diameter of the valve stem.

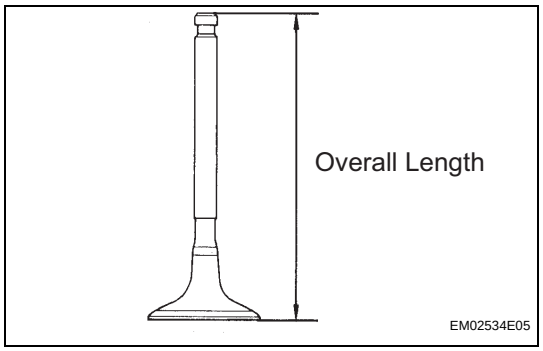
Standard valve stem diameter:
5.470 to 5.485 mm (0.2154 to 0.2159 in.)



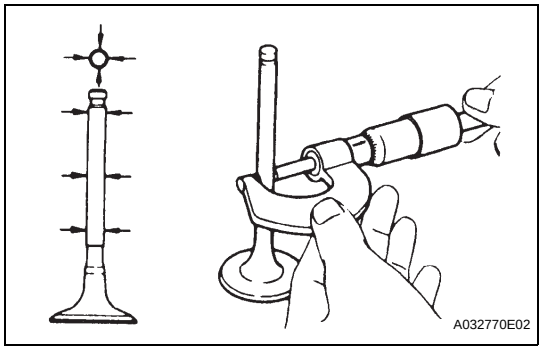
If the diameter is not as specified, replace the intake valve.

(e) Using a vernier caliper, measure the valve head margin thickness.

Standard margin thickness:
1.25 mm (0.0492 in.)
Minimum margin thickness:
1.05 mm (0.0413 in.)



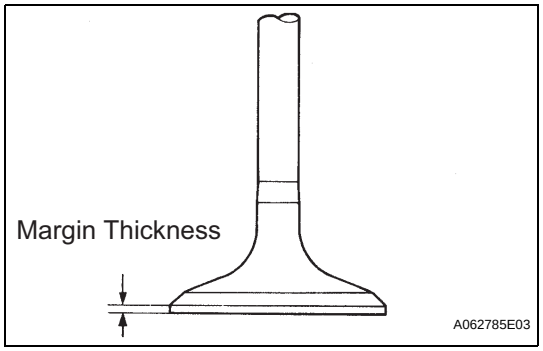
If the diameter is not as specified, replace the intake valve.



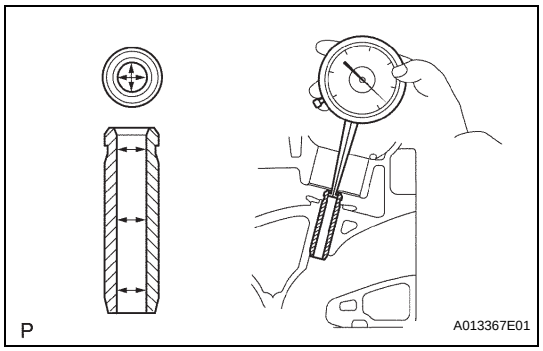
13. INSPECT EXHAUST VALVE

(a) Using a gasket scraper, chip off any carbon on the valve head.

(b) Using a wire brush, thoroughly clean the valve.

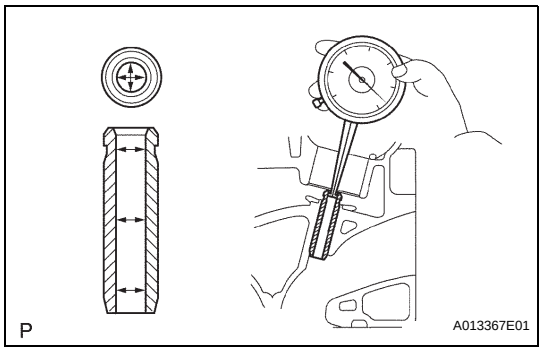


(c) Using a vernier caliper, measure the valve overall length.
Standard overall length:
101.15 mm (3.9823 in.)
Minimum overall length:
100.70 mm (3.9646 in.)
If the overall length is less than the minimum, replace the exhaust valve.



(d) Using a micrometer, measure the diameter of the valve stem.
Standard valve stem diameter:
5.465 to 5.480 mm (0.2152 to 0.2158 in.)
If the overall length is less than the minimum, replace the exhaust valve.

EM



(e) Using a vernier caliper, measure the valve head margin thickness.
Standard margin thickness:
1.40 mm (0.0551 in.)
Minimum margin thickness:
1.20 mm (0.0472 in.)
If the overall length is less than the minimum, replace the exhaust valve.

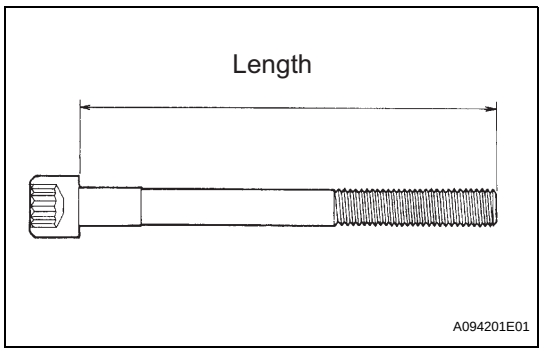
14. INSPECT INTAKE VALVE GUIDE BUSH

(a) Using a caliper gauge, measure the inside diameter of the guide bush.
Standard bush inside diameter:
5.510 to 5.530 mm (0.2169 to 0.2177 in.)
If the inside diameter is not as specified, replace the intake valve guide bush.

(b) Subtract the valve stem diameter measurement from the guide bush inside diameter measurement.
Standard oil clearance:
0.025 to 0.060 mm (0.0010 to 0.0024 in.)
Maximum oil clearance:
0.08 mm (0.0032 in.)
If the clearance is greater than the maximum, replace the valve and intake guide bush.

15. INSPECT EXHAUST VALVE GUIDE BUSH

(a) Using a caliper gauge, measure the inside diameter of the guide bush.



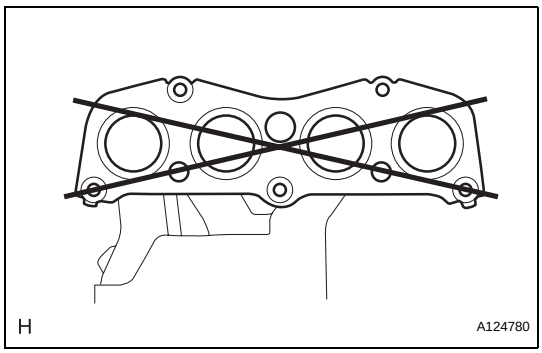
Standard bush inside diameter:
5.510 to 5.530 mm (0.2169 to 0.2177 in.)

If the inside diameter is not as specified, replace the exhaust valve guide bush.

(b) Subtract the valve stem diameter measurement from the guide bush inside diameter measurement.

Standard oil clearance:
0.030 to 0.065 mm (0.0012 to 0.0026 in.)
Maximum oil clearance:
0.10 mm (0.004 in.)

If the clearance is greater than the maximum, replace the valve and exhaust valve guide bush.

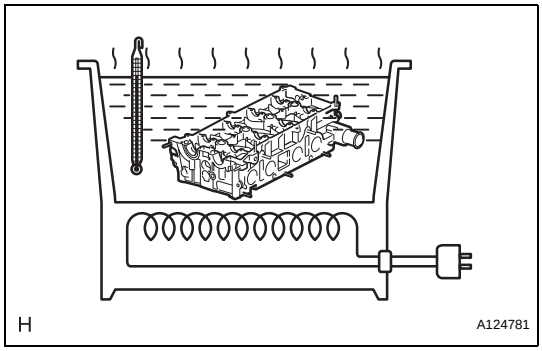


16. INSPECT CYLINDER HEAD SET BOLT

(a) Using a vernier caliper, measure the length of the head bolts from the seat to the end.

Standard bolt length:
141.3 to 142.7 mm (5.563 to 5.618 in.)
Maximum bolt length:
144.2 mm (5.677 in.)

If the bolt length is greater than the maximum, replace the cylinder head set bolt.

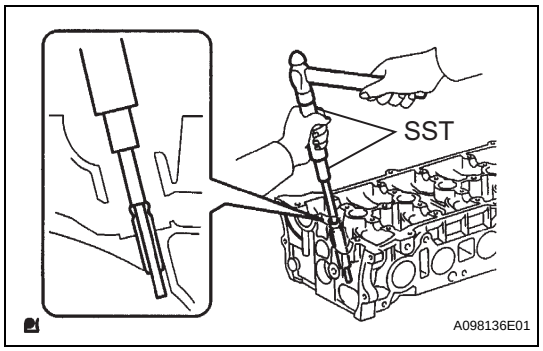


17. INSPECT EXHAUST MANIFOLD

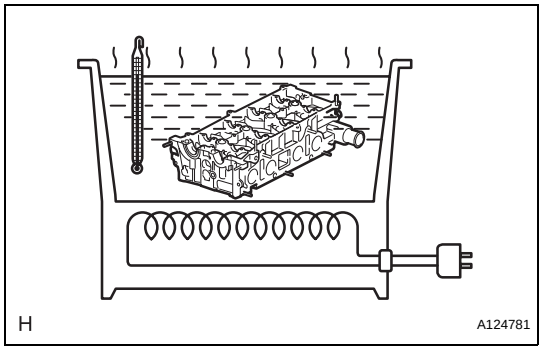
(a) Using a precision straightedge and a feeler gauge, measure the surface contacting the cylinder head for warpage.

Maximum warpage:
0.70 mm (0.028 in.)

If the warpage is greater than the maximum, replace the exhaust manifold.

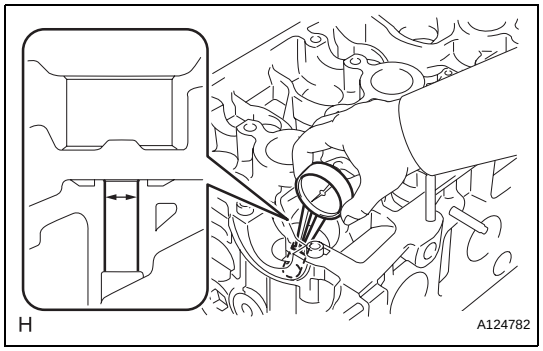


REPLACEMENT



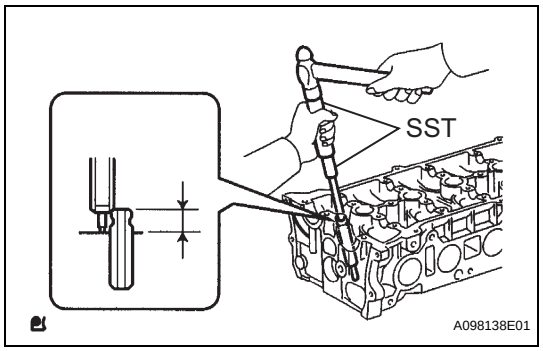
1. REPLACE INTAKE VALVE GUIDE BUSH

(a) Heat the cylinder head to 80 to 100°C (176 to 212°F).



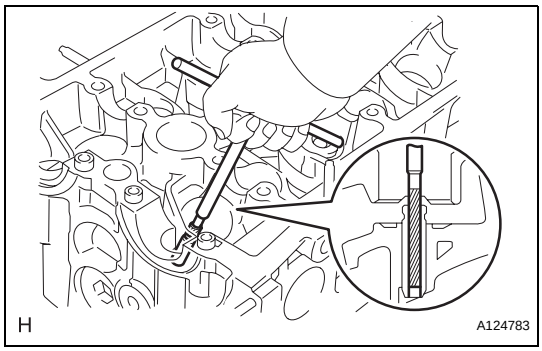
(b) Place the cylinder head on wooden blocks.

(c) Using SST and a hammer, tap out the guide bush.
SST 09201-10000 (09201-01050), 09950-70010 (09951-07100)



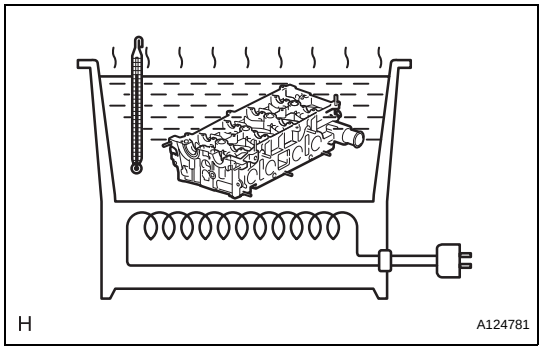
(d) Heat the cylinder head to 80 to 100°C (176 to 212°F).
(e) Place the cylinder head on wooden blocks.

(f) Using a caliper gauge, measure the bush bore diameter of the cylinder head.
Standard diameter:
10.285 to 10.306 mm (0.4049 to 0.4058 in.)
If the bush bore diameter of the cylinder head is greater than 10.306 mm (0.4058 in.), machine the bush bore to the dimension of 10.335 to 10.365 mm (0.4068 to 0.4077 in.).
Standard valve guide bush diameter



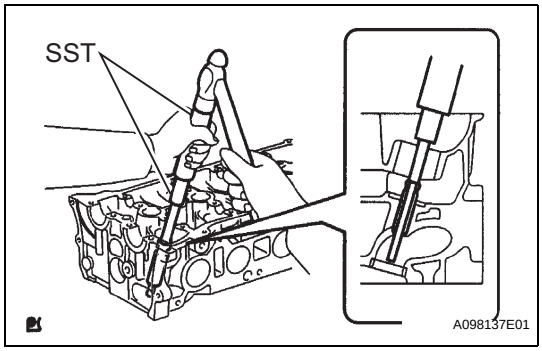
Condition	Specified Condition
STD	10.333 to 10.344 mm (0.4068 to 0.4072 in.)
O/S (0.05 mm)	10.383 to 10.394 mm (0.4088 to 0.4092 in.)

If the bushing bore diameter of the cylinder head is greater than 10.394 mm (0.4092 in.), replace the cylinder head.

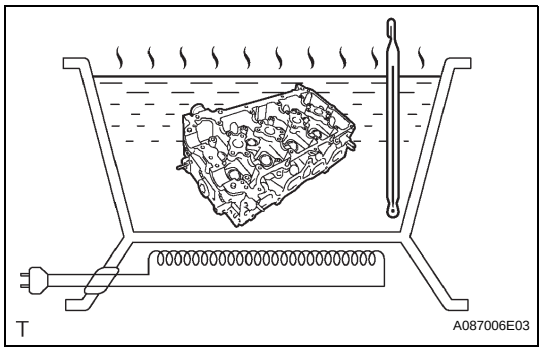


(g) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.
SST 09201-10000 (09201-01050), 09950-70010 (09951-07100)
Standard protrusion height:
9.6 to 10.0 mm (0.378 to 0.394 in.)

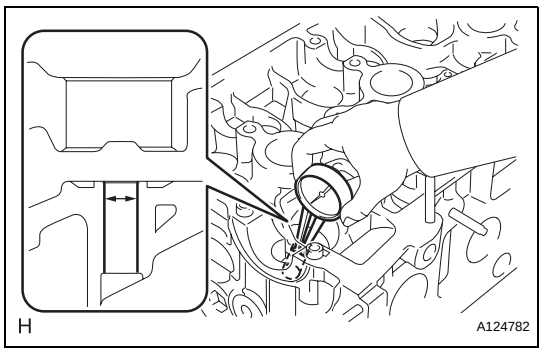
EM



(h) Using a sharp 5.5 mm reamer, ream the valve guide bush to the standard specified clearance between the valve guide bush and valve stem.
Standard oil clearance:
0.025 to 0.060 mm (0.0010 to 0.0024 in.)



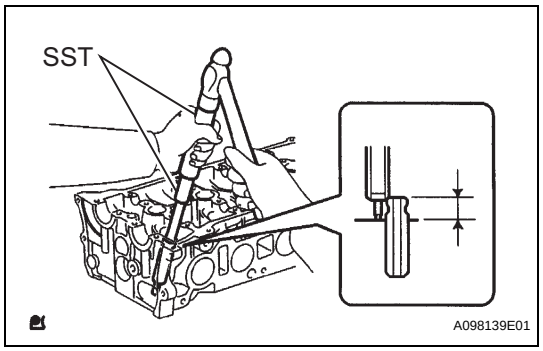
2. REPLACE EXHAUST VALVE GUIDE BUSH



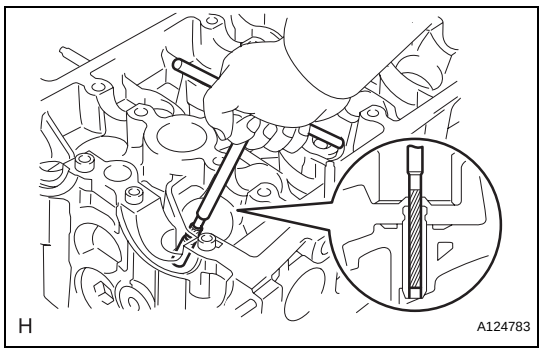
(a) Heat the cylinder head to 80 to 100°C (176 to 212°F).
(b) Place the cylinder head on wooden blocks.

(c) Using SST and a hammer, tap out the guide bush.
SST 09201-10000 (09201-01050), 09950-70010 (09951-07100)

(d) Heat the cylinder head to 80 to 100°C (176 to 212°F).
(e) Place the cylinder head on wooden blocks.



(f) Using a caliper gauge, measure the bush bore diameter of the cylinder head.
Standard diameter:
10.285 to 10.306 mm (0.4049 to 0.4058 in.)
If the bush bore diameter of the cylinder head is greater than 10.306 mm (0.4058 in.), machine the bush bore to the dimension of 10.335 to 10.365 mm (0.4068 to 0.4077 in.).



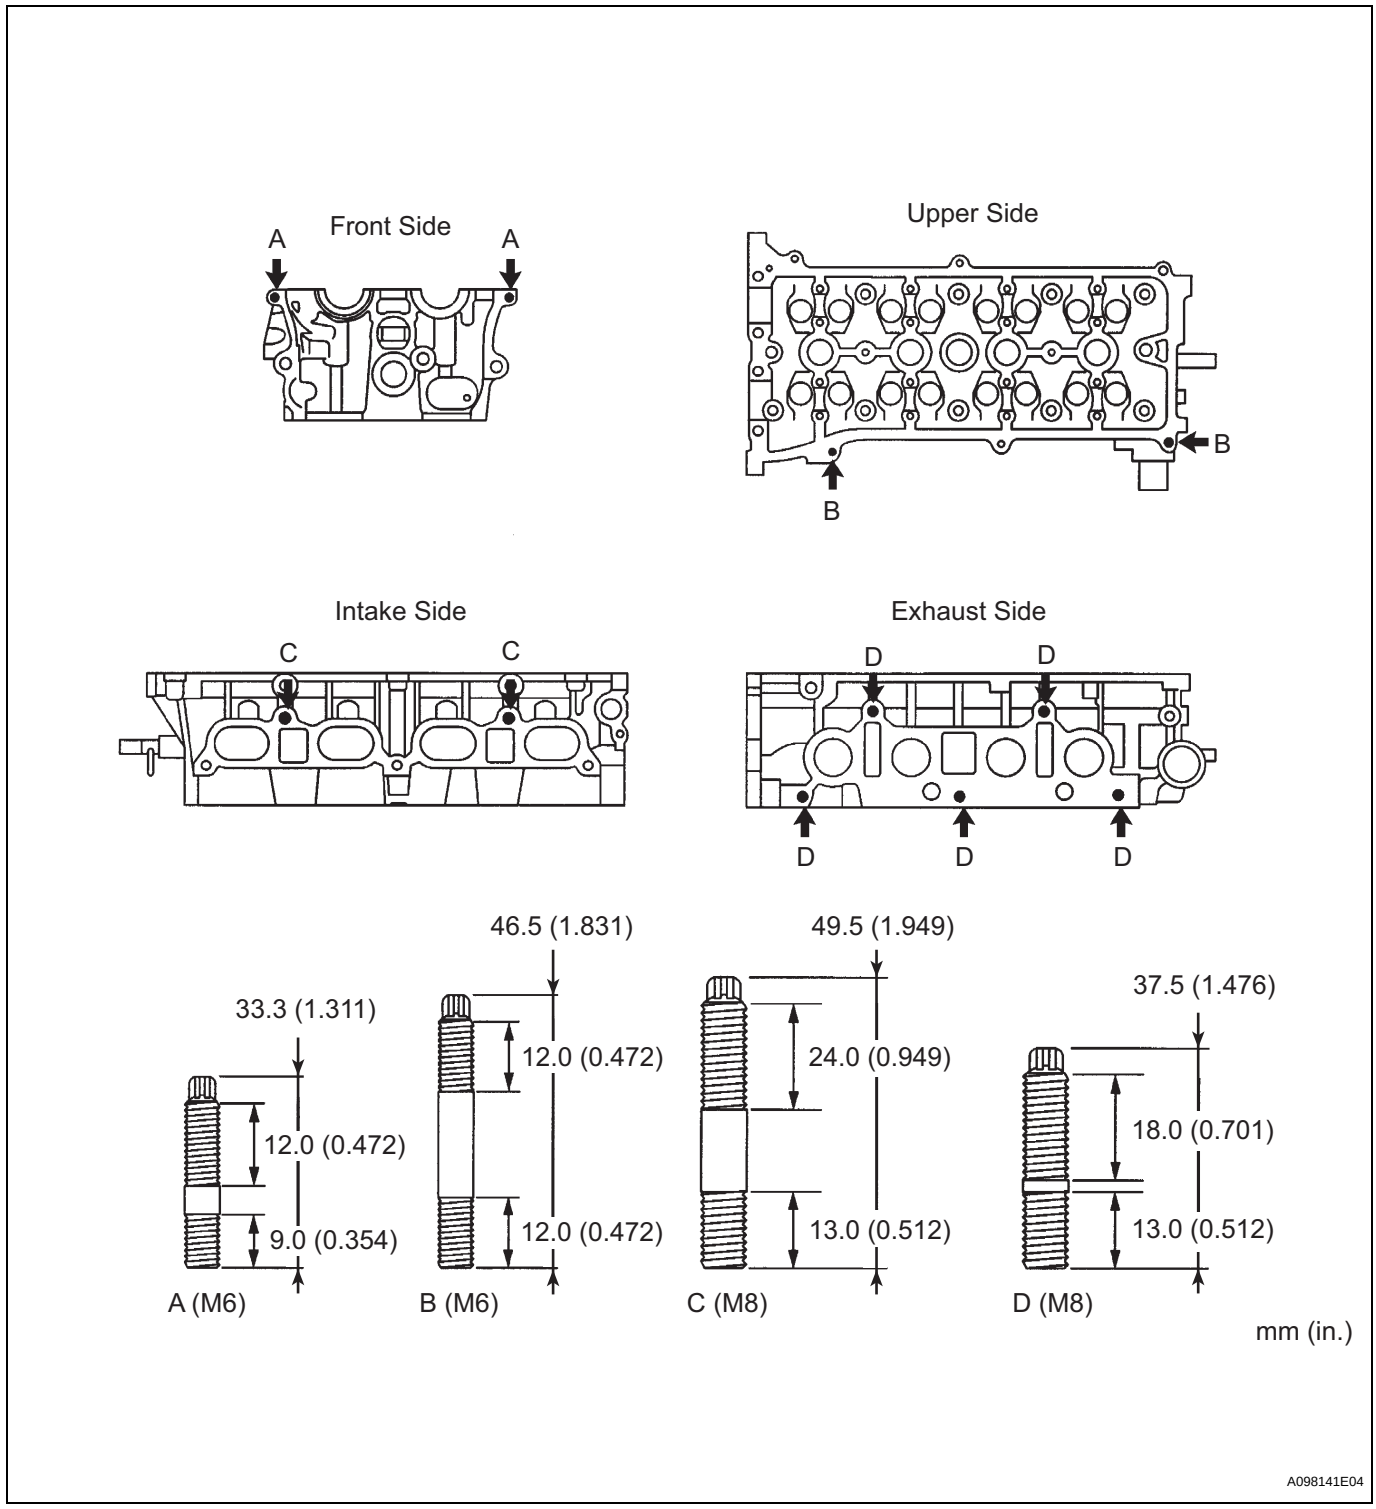
Standard valve guide bush diameter

Condition	Specified Condition
STD	10.333 to 10.344 mm (0.4068 to 0.4072 in.)
O/S (0.05 mm)	10.383 to 10.394 mm (0.4088 to 0.4092 in.)

If the bushing bore diameter of the cylinder head is greater than 10.394 mm (0.4092 in.), replace the cylinder head.

(g) Using SST and a hammer, tap in a new guide bush to the specified protrusion height.
SST 09201-10000 (09201-01050), 09950-70010 (09951-07100)
Standard protrusion height:
9.6 to 10.0 mm (0.378 to 0.394 in.)

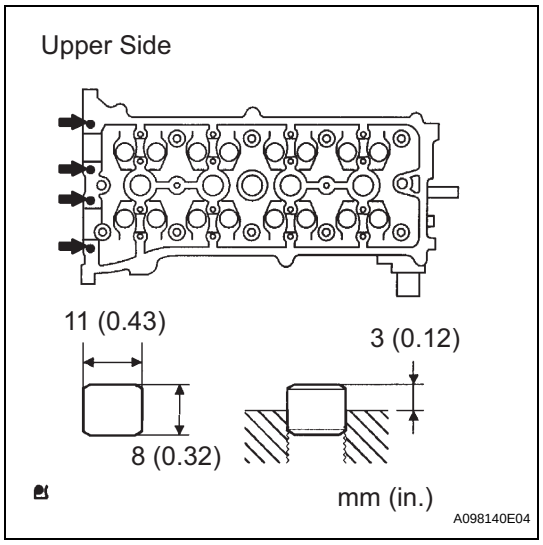
(h) Using a sharp 5.5 mm reamer, ream the valve guide bush to the standard specified clearance between the valve guide bush and valve stem.
Standard oil clearance:
0.030 to 0.065 mm (0.0012 to 0.0026 in.)



3. REPLACE STUD BOLT

NOTICE:
If the stud bolt is deformed or threads are damaged, replace it.

(a) Using E5 and E7 "torx" socket wrenches, remove the 11 stud bolts.

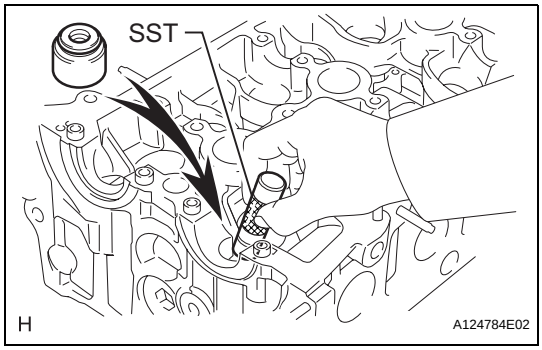


EM

(b) Using E5 and E7 "torx" socket wrenches, install the 11 stud bolts.

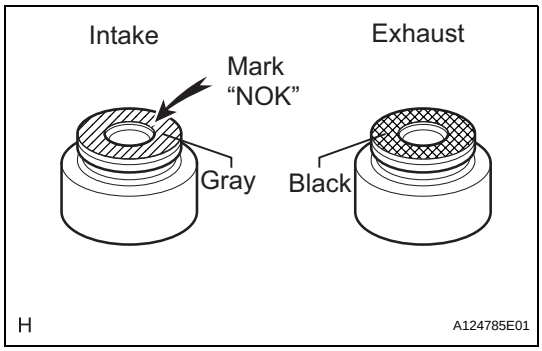
4. REPLACE RING PIN

(a) Remove the 4 ring pins.



(b) Using a plastic-faced hammer, tap in 4 new ring pins to the specified protrusion height.
Protrusion height:
3.0 mm (0.12 in.)

EM

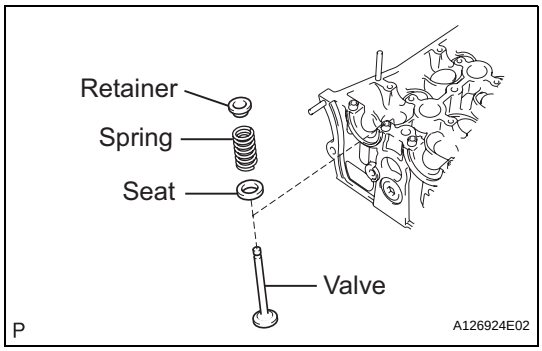


REASSEMBLY

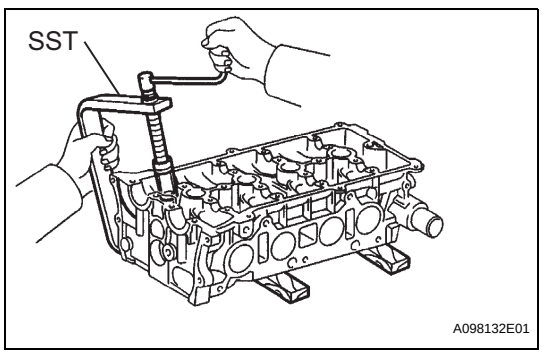
HINT:
- Thoroughly clean all parts to be assembled.
- Before installing the parts, apply fresh engine oil to all sliding and rotating surfaces.
- Replace oil seals with new ones.

1. INSTALL VALVE STEM OIL SEAL

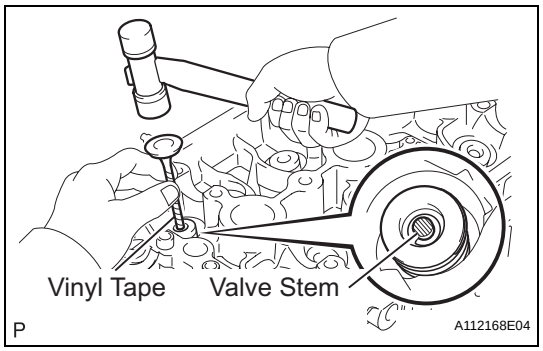
(a) Using SST, push in a new oil seal.
SST 09201-41020



HINT:
The intake valve oil seal is gray and the exhaust valve oil seal is black.
NOTICE:
Pay close attention when installing the intake and exhaust oil seals. For example, installing the intake oil seal into the exhaust or installing the exhaust oil seal to the intake can cause installation problems later.



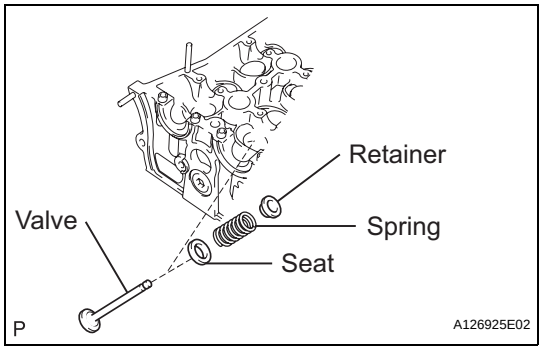
2. INSTALL INTAKE VALVE

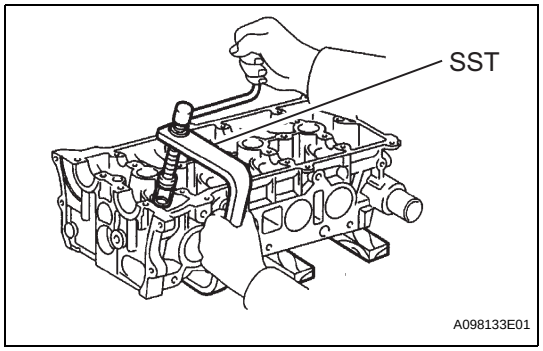


(a) Place the cylinder head on wooden blocks.

(b) Install the valve, seat, spring and retainer onto the cylinder head.

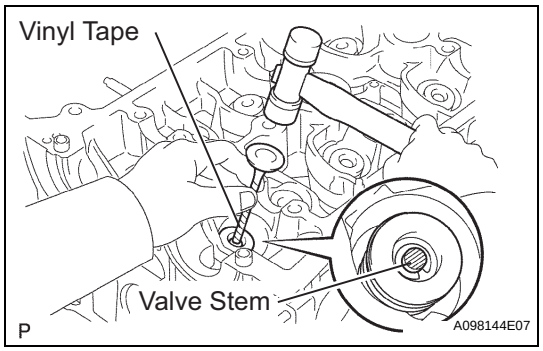
(c) Using SST, compress the spring, and place the 2 retainer locks around the valve stem.
SST 09202-70020 (09202-00010)





(d) Using a plastic-faced hammer and discarded valve (with its tip wrapped with tape), lightly tap the installed valve to fit it into place.
NOTICE:
Be careful not to damage the valve stem tip.

3. INSTALL EXHAUST VALVE

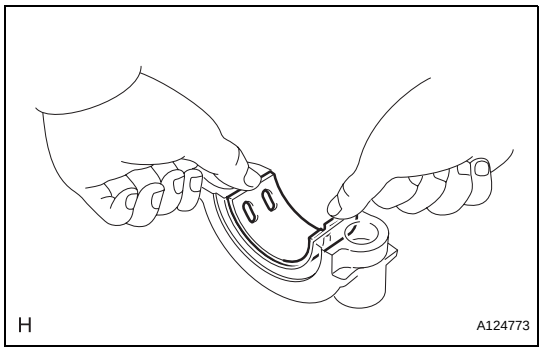


(a) Place the cylinder head on wooden blocks.

(b) Install the valve, seat, spring and retainer onto the cylinder head.

(c) Using SST, compress the spring, and place the 2 retainer locks around the valve stem.
SST 09202-70020 (09202-00010)

(d) Using a plastic-faced hammer and discarded valve (with its tip wrapped with tape), lightly tap the installed valve to fit it into place.
NOTICE:
Be careful not to damage the valve stem tip.



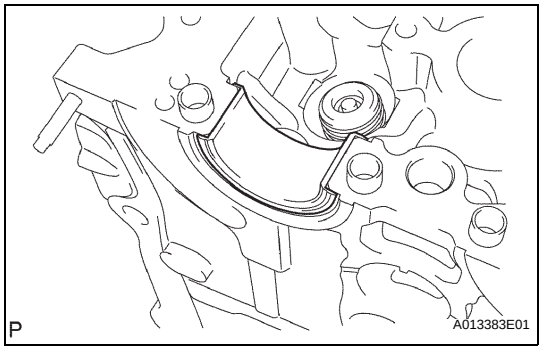
4. INSTALL VALVE LIFTER

(a) Assemble the valve lifter and the tip of the valve stem with a light coat of engine oil applied.
NOTICE:
Install the valve lifters in their original places.

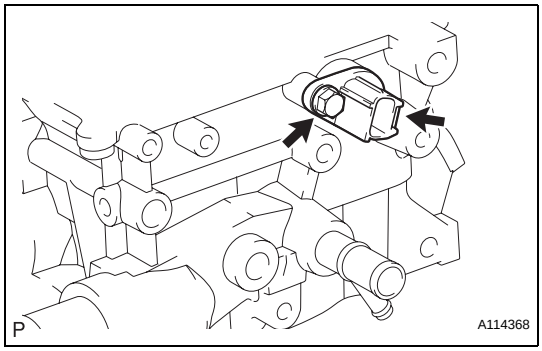
5. INSTALL NO. 1 CAMSHAFT BEARING

(a) Clean the contact surface of the bearing and the bearing cap.
NOTICE:
Do not apply engine oil to the contact surfaces of the camshaft bearing and bearing cap.

EM



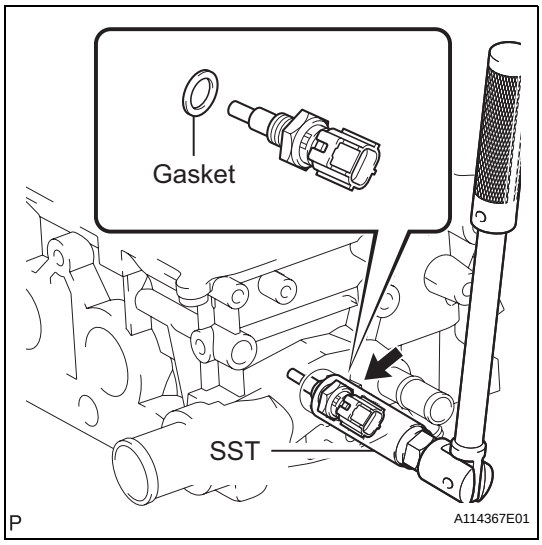
(b) Align the bearing claw with the claw groove of No. 1 and No. 2 bearing cap, and push in the No. 1 camshaft bearing.



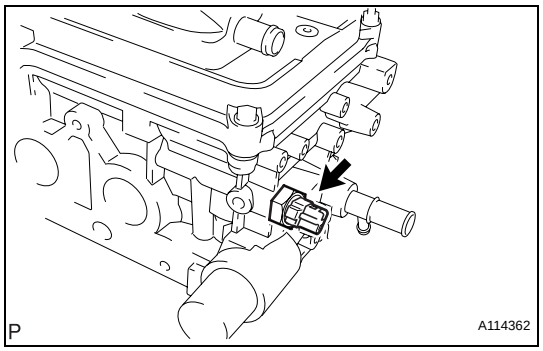
6. INSTALL NO. 2 CAMSHAFT BEARING

(a) Clean the contact surface of the bearing and the bearing cap.

NOTICE:
Do not apply engine oil to the contact surfaces of the camshaft bearing and cylinder block.



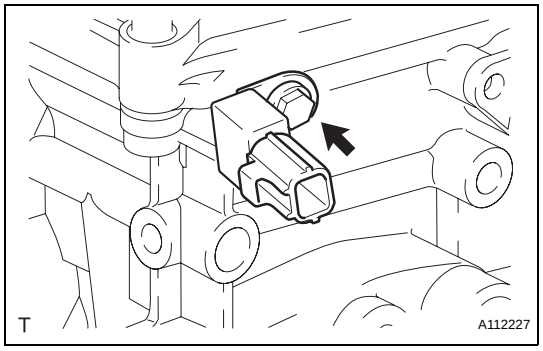
(b) Install the No. 2 camshaft bearing onto the cylinder head.



7. INSTALL CAMSHAFT POSITION SENSOR

(a) Install the camshaft position sensor with the bolt.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

8. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

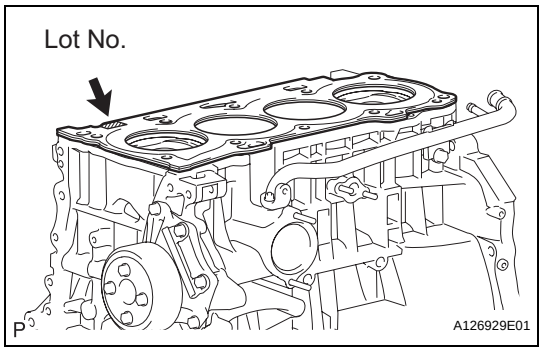


(a) Using SST, install a new gasket and the ECT sensor.
SST 09817-33190
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

9. INSTALL OIL PRESSURE SWITCH

(a) Apply adhesive to 2 or 3 threads of the oil pressure switch.
Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

(b) Using a 24 mm deep socket wrench, install the oil pressure switch.
Torque: 13 N*m (133 kgf*cm, 10 ft.*lbf)



10. INSTALL RADIO SETTING CONDENSER

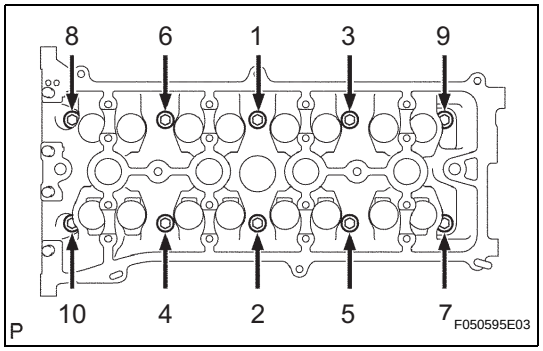
(a) Install the condenser with the bolt.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)

EM

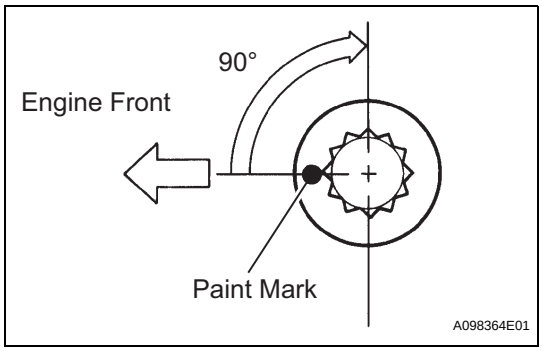
INSTALLATION

1. INSTALL CYLINDER HEAD GASKET

(a) Place a new gasket on the cylinder block surface with the Lot No. stamp facing upward.
NOTICE:
- **Remove any oil from contact surface.**
- **Be careful of the installation direction.**

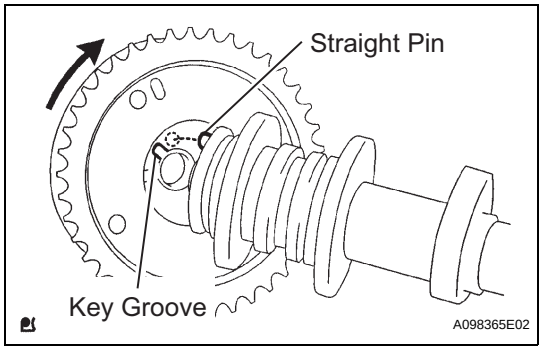


2. INSTALL CYLINDER HEAD SUB-ASSEMBLY



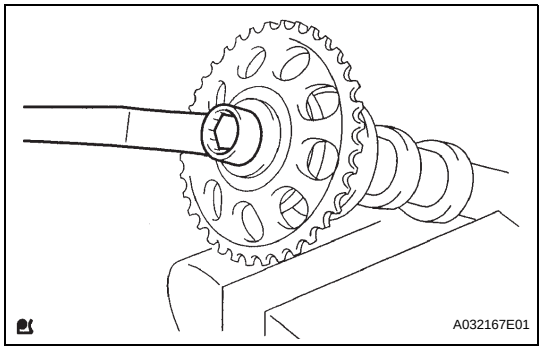
(a) Place the cylinder head on the head gasket.
NOTICE:
Place the cylinder head gently in order to avoid damaging the gasket.

(b) Install the cylinder head bolts.
NOTICE:
The cylinder head bolts are tightened in 2 successive steps.



(1) Apply a light coat of engine oil to the threads and under the heads of the cylinder head set bolts.

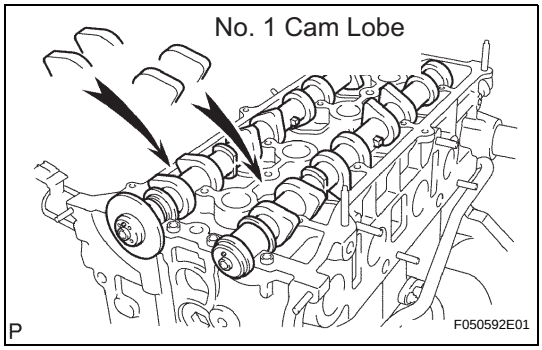
(2) Using several steps, uniformly install and tighten the 10 cylinder head set bolts and plate washers with a 10 mm bi-hexagon wrench in the order shown in the illustration.
Torque: 70 N*m (714 kgf*cm, 52 ft.*lbf)



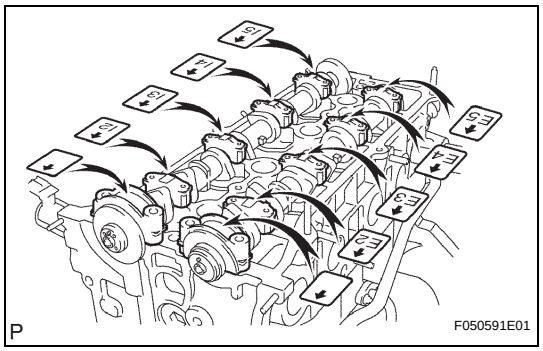
(c) Mark the front of the cylinder head bolts with paint.
(d) Retighten the cylinder head bolts by 90° as shown in the illustration.
(e) Check that the paint mark is now at a 90° angle to the front.

3. INSTALL CAMSHAFT TIMING GEAR ASSEMBLY

(a) Put the camshaft timing gear and camshaft together with the straight pin and key groove misaligned, as shown in the illustration.
(b) Turn the camshaft timing gear as shown in the illustration while pushing it gently against the camshaft. Push further at the position where the pin fits into the groove.
NOTICE:
Be sure not to turn the camshaft timing gear to the retard angle side (the right angle).
(c) Check that there is no clearance between the gear fringe and camshaft.
(d) Tighten the flange bolt with the camshaft timing gear fixed in place.
Torque: 54 N*m (551 kgf*cm, 40 ft.*lbf)
(e) Check that the camshaft timing gear can move to the retard angle side (the right direction) and is locked in the most retarded position.



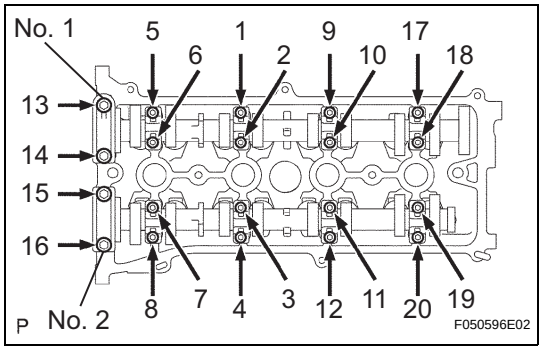
4. INSTALL NO. 2 CAMSHAFT TIMING SPROCKET



(a) Clamp the camshaft in a vise, then install the camshaft timing sprocket with the bolt.
Torque: 54 N*m (551 kgf*cm, 40 ft.*lbf)
NOTICE:
Do not damage the camshaft.

5. INSTALL CAMSHAFT

(a) Apply a light coat of engine oil to the journal portion of the camshaft.



(b) Place the 2 camshafts on the cylinder head with the No. 1 cam lobes facing the directions shown in the illustration.

(c) Examine the front marks and numbers, and check that the order is as shown in the illustration. Then install the bearing caps onto the cylinder head.

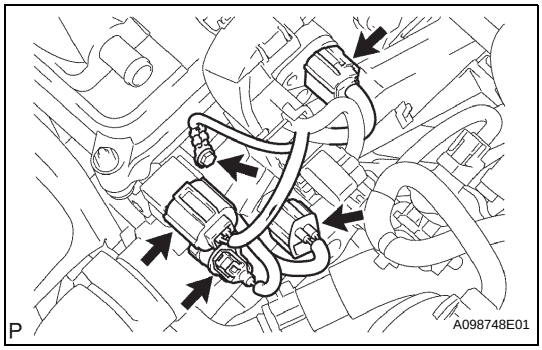
(d) Apply a light coat of engine oil to the threads and under the heads of the bearing cap bolts.

(e) Using several steps, uniformly tighten the 20 bearing cap bolts in the sequence shown in the illustration.

Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf) for No. 1 and No. 2 bearing cap
9.0 N*m (92 kgf*cm, 80 in.*lbf) for No. 3 bearing cap

NOTICE:
Install the camshaft with the timing mark of the camshaft timing gear on top.

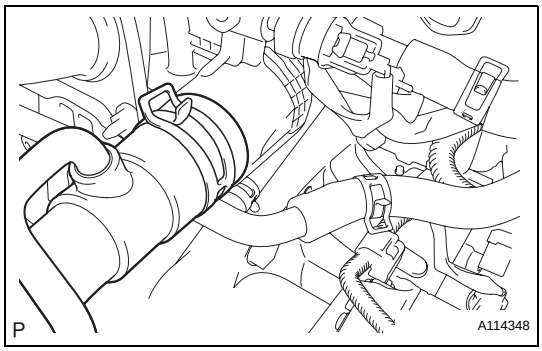
6. **INSTALL NO. 1 CHAIN VIBRATION DAMPER (See page EM-33)**
7. **INSTALL CHAIN SUB-ASSEMBLY (See page EM-33)**
8. **INSTALL CHAIN TENSIONER SLIPPER (See page EM-34)**
9. **INSTALL TIMING CHAIN GUIDE (See page EM-34)**
10. **INSTALL NO. 1 CRANKSHAFT POSITION SENSOR PLATE (See page EM-35)**
11. **INSTALL TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-35)**
12. **INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-37)**
13. **INSTALL V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-38)**
14. **INSTALL ENGINE MOUNTING BRACKET RH (See page EM-38)**
15. **INSTALL CRANKSHAFT PULLEY (See page EM-38)**
16. **INSTALL OIL PAN SUB-ASSEMBLY (See page EM-39)**
17. **INSTALL CRANKSHAFT POSITION SENSOR (See page ES-402)**
18. **INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-40)**
19. **INSTALL SPARK PLUG (See page EM-16)**
20. **INSTALL IGNITION COIL ASSEMBLY (See page IG-9)**
21. **INSTALL IDLER PULLEY (See page EM-41)**



22. INSTALL ENGINE MOUNTING INSULATOR RH (See page EM-41)

23. INSTALL RADIATOR RESERVOIR (See page EM-112)

24. INSTALL GENERATOR ASSEMBLY (See page CH-15)

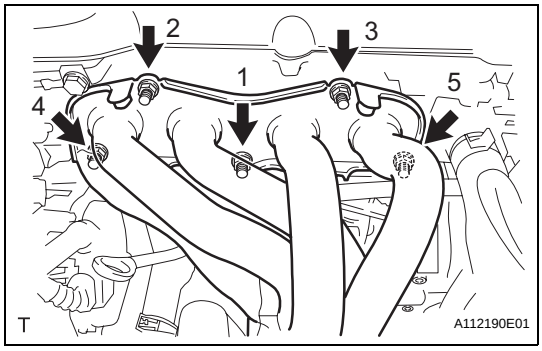


25. INSTALL FAN AND GENERATOR V BELT (See page EM-7)

26. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)

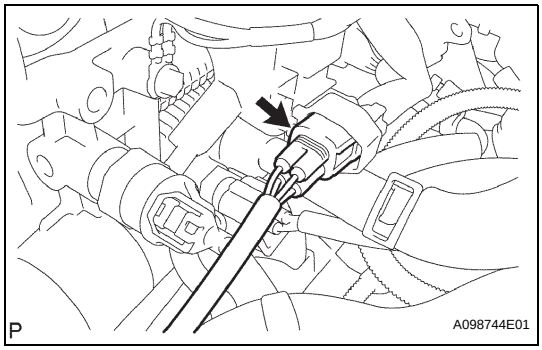
27. CONNECT ENGINE WIRE

(a) Connect the ground cable with the bolt.
Torque: 8.4 N*m (86 kgf*cm, 74 in.*lbf)
(b) Connect the camshaft position sensor connector.
(c) Connect the engine coolant temperature sensor connector.
(d) Connect the engine oil pressure switch connector.
(e) Connect the radio setting condenser connector.
(f) Connect the heater water inlet hose.



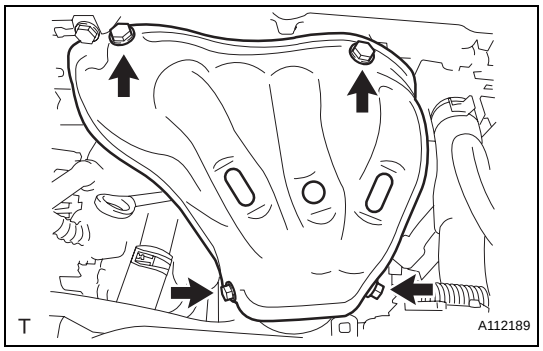
28. CONNECT NO. 1 RADIATOR HOSE

(a) Connect the hose to the cylinder head.

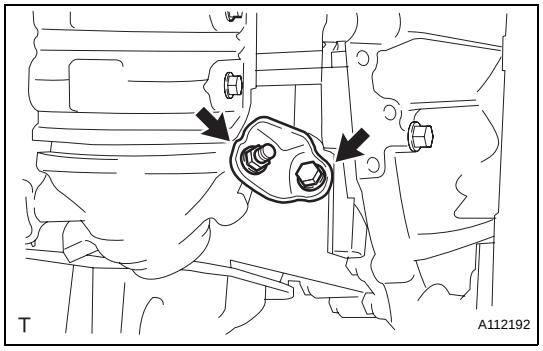


29. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-396)

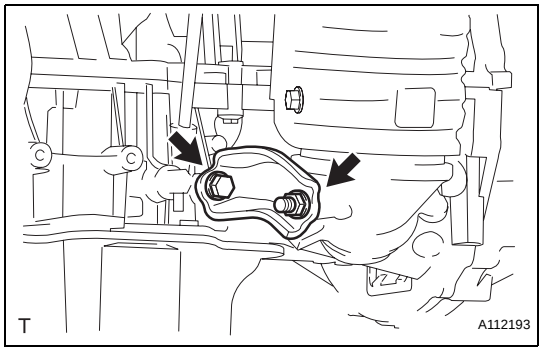
30. INSTALL EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY



(a) Install a new gasket onto the cylinder head.
(b) Temporarily tighten the exhaust manifold converter with the 5 nuts.

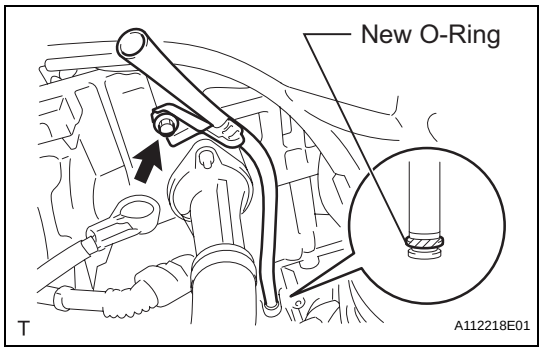


(c) Tighten the 5 nuts in the sequence shown in the illustration.
Torque: 37 N*m (377 kgf*cm, 27 ft.*lbf)



(d) Connect the air-fuel ratio sensor connector.

31. **INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR**
    (a) Install the exhaust manifold heat insulator with the 4 bolts.
    Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)



32. **INSTALL NO. 2 MANIFOLD STAY**
    (a) Install the stay with the bolt and nut.
    Torque: 44 N*m (449 kgf*cm, 32 ft.*lbf)

33. **INSTALL MANIFOLD STAY**
    (a) Install the stay with the bolt and nut.
    Torque: 44 N*m (449 kgf*cm, 32 ft.*lbf)

34. **INSTALL FRONT EXHAUST PIPE (See page EX-4)**

35. **INSTALL OIL DIPSTICK GUIDE**
    (a) Apply a light coat of engine oil to a new O-ring and install it onto the guide.

    (b) Install the guide with the bolt.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

36. **INSTALL OIL DIPSTICK**

37. **INSTALL INTAKE MANIFOLD INSULATOR (See page ES-421)**

38. **INSTALL INTAKE MANIFOLD (See page ES-421)**

39. **INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-13)**

40. **INSTALL THROTTLE BODY (See page ES-413)**

41. **INSTALL AIR CLEANER CAP (See page ES-413)**

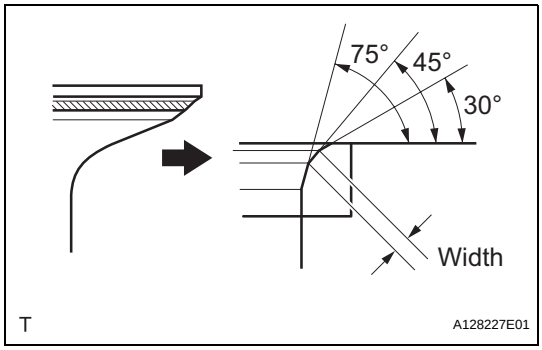
42. **ADD ENGINE OIL (See page LU-4)**

43. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

44. **CHECK FOR FUEL LEAKS**

45. **ADD ENGINE COOLANT (See page CO-6)**

46. **CHECK FOR ENGINE COOLANT LEAKS**
    (a) Check for engine coolant leaks (see page CO-1).



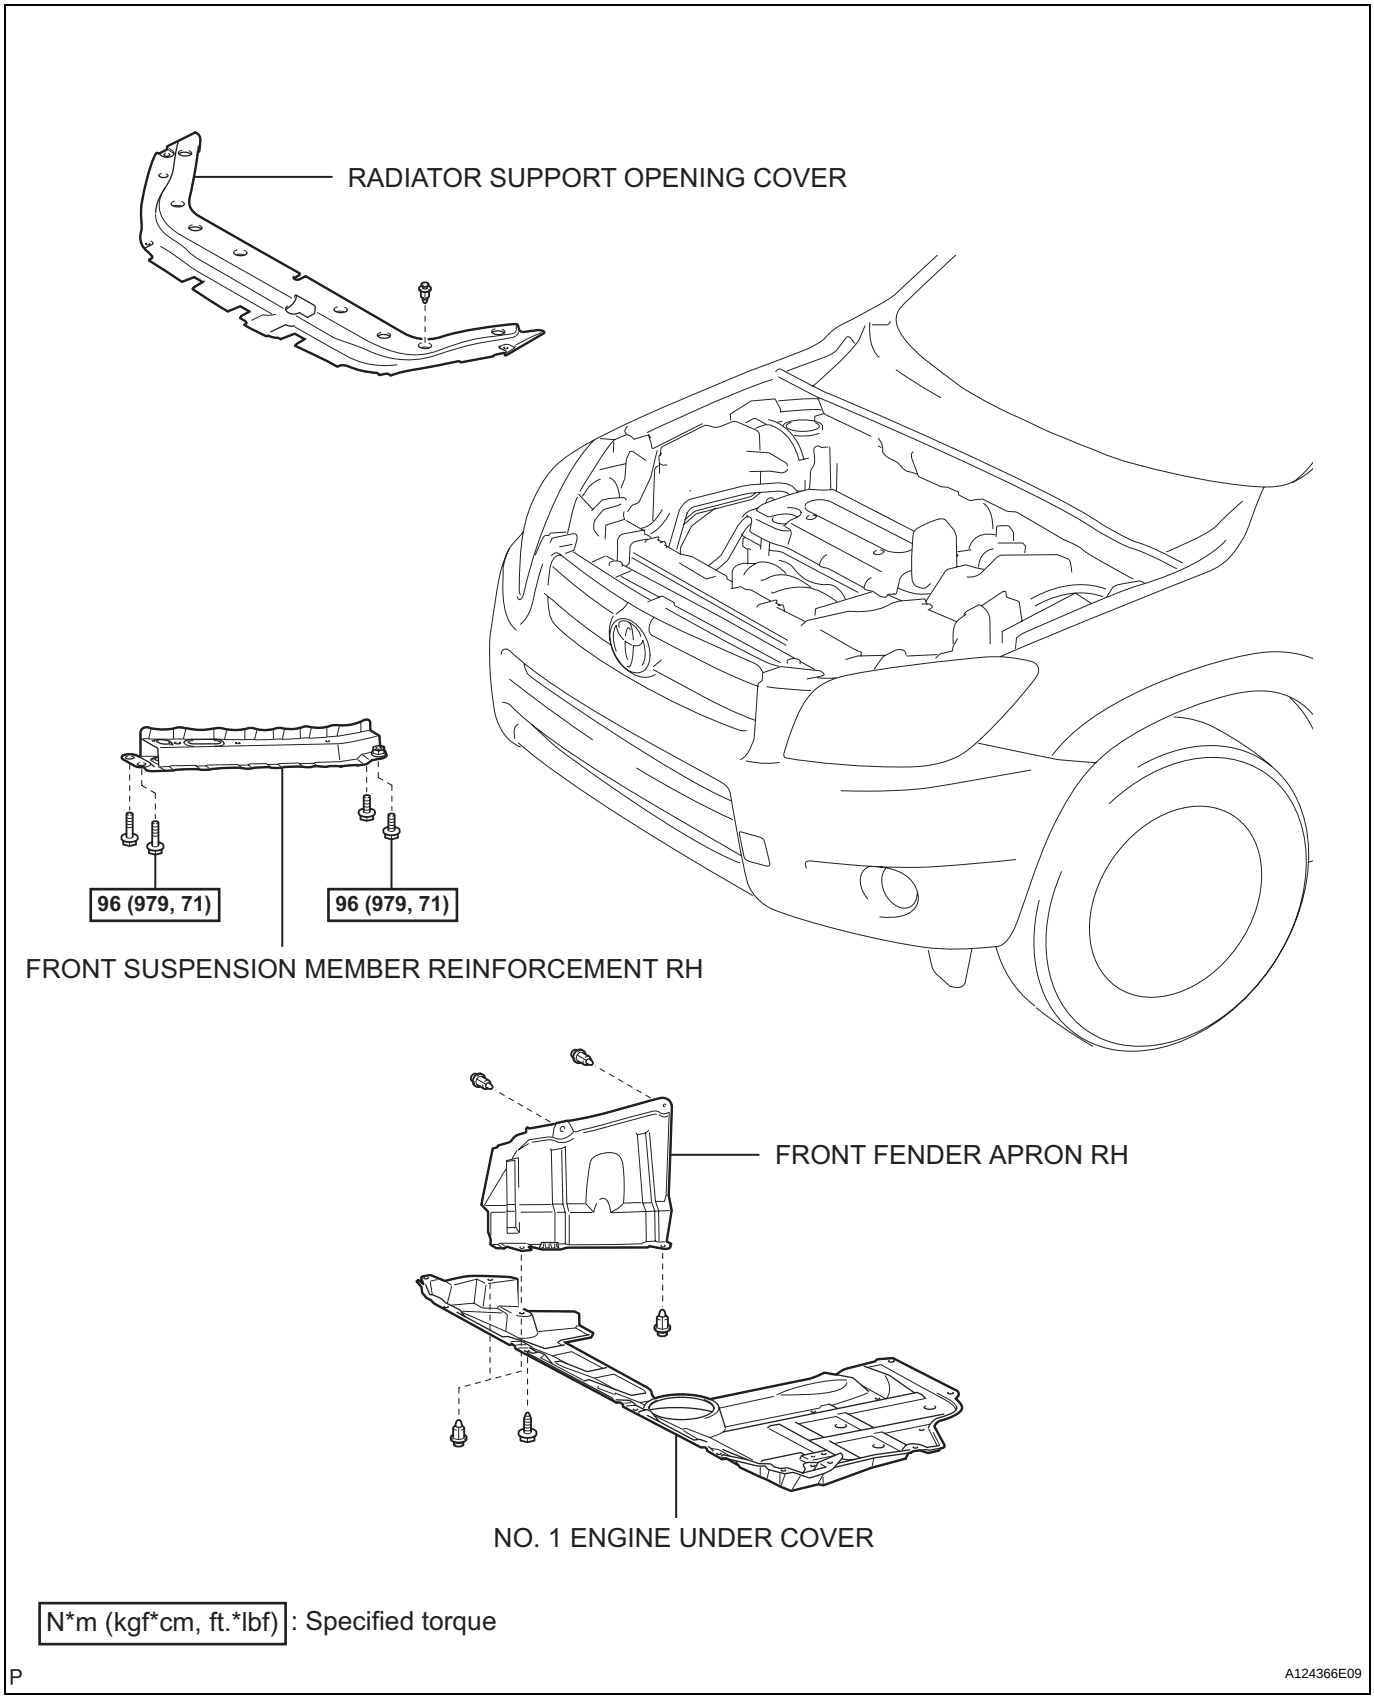
EM

47. **CHECK FOR ENGINE OIL LEAKS**
48. **CHECK FOR EXHAUST GAS LEAKS**
49. **INSPECT IGNITION TIMING (See page EM-1)**
50. **INSPECT ENGINE IDLING SPEED (See page EM-2)**
51. **INSPECT COMPRESSION (See page EM-3)**
52. **INSPECT CO/HC (See page EM-4)**
53. **INSTALL NO. 1 ENGINE COVER (See page EM-43)**
54. **INSTALL FRONT FENDER APRON RH**
55. **INSTALL NO. 1 ENGINE UNDER COVER**
56. **INSTALL FRONT WHEEL RH**
57. **INSTALL RADIATOR SUPPORT OPENING COVER**

EM

REPAIR

1. **REPAIR VALVE SEATS**
   (a) If the seating is too high on the valve face, use 30° and 45° cutters to correct the seat.
   (b) If the seating is too low on the valve face, use 75° and 45° cutters to correct the seat.
   Standard width



Item	Standard Condition
Intake	1.0 to 1.4 mm (0.0394 to 0.0551 in.)
Exhaust	1.2 to 1.6 mm (0.0427 to 0.0630 in.)

   (c) Lap the valve and valve seat by hand with an abrasive compound.
   (d) Recheck the valve seating position.

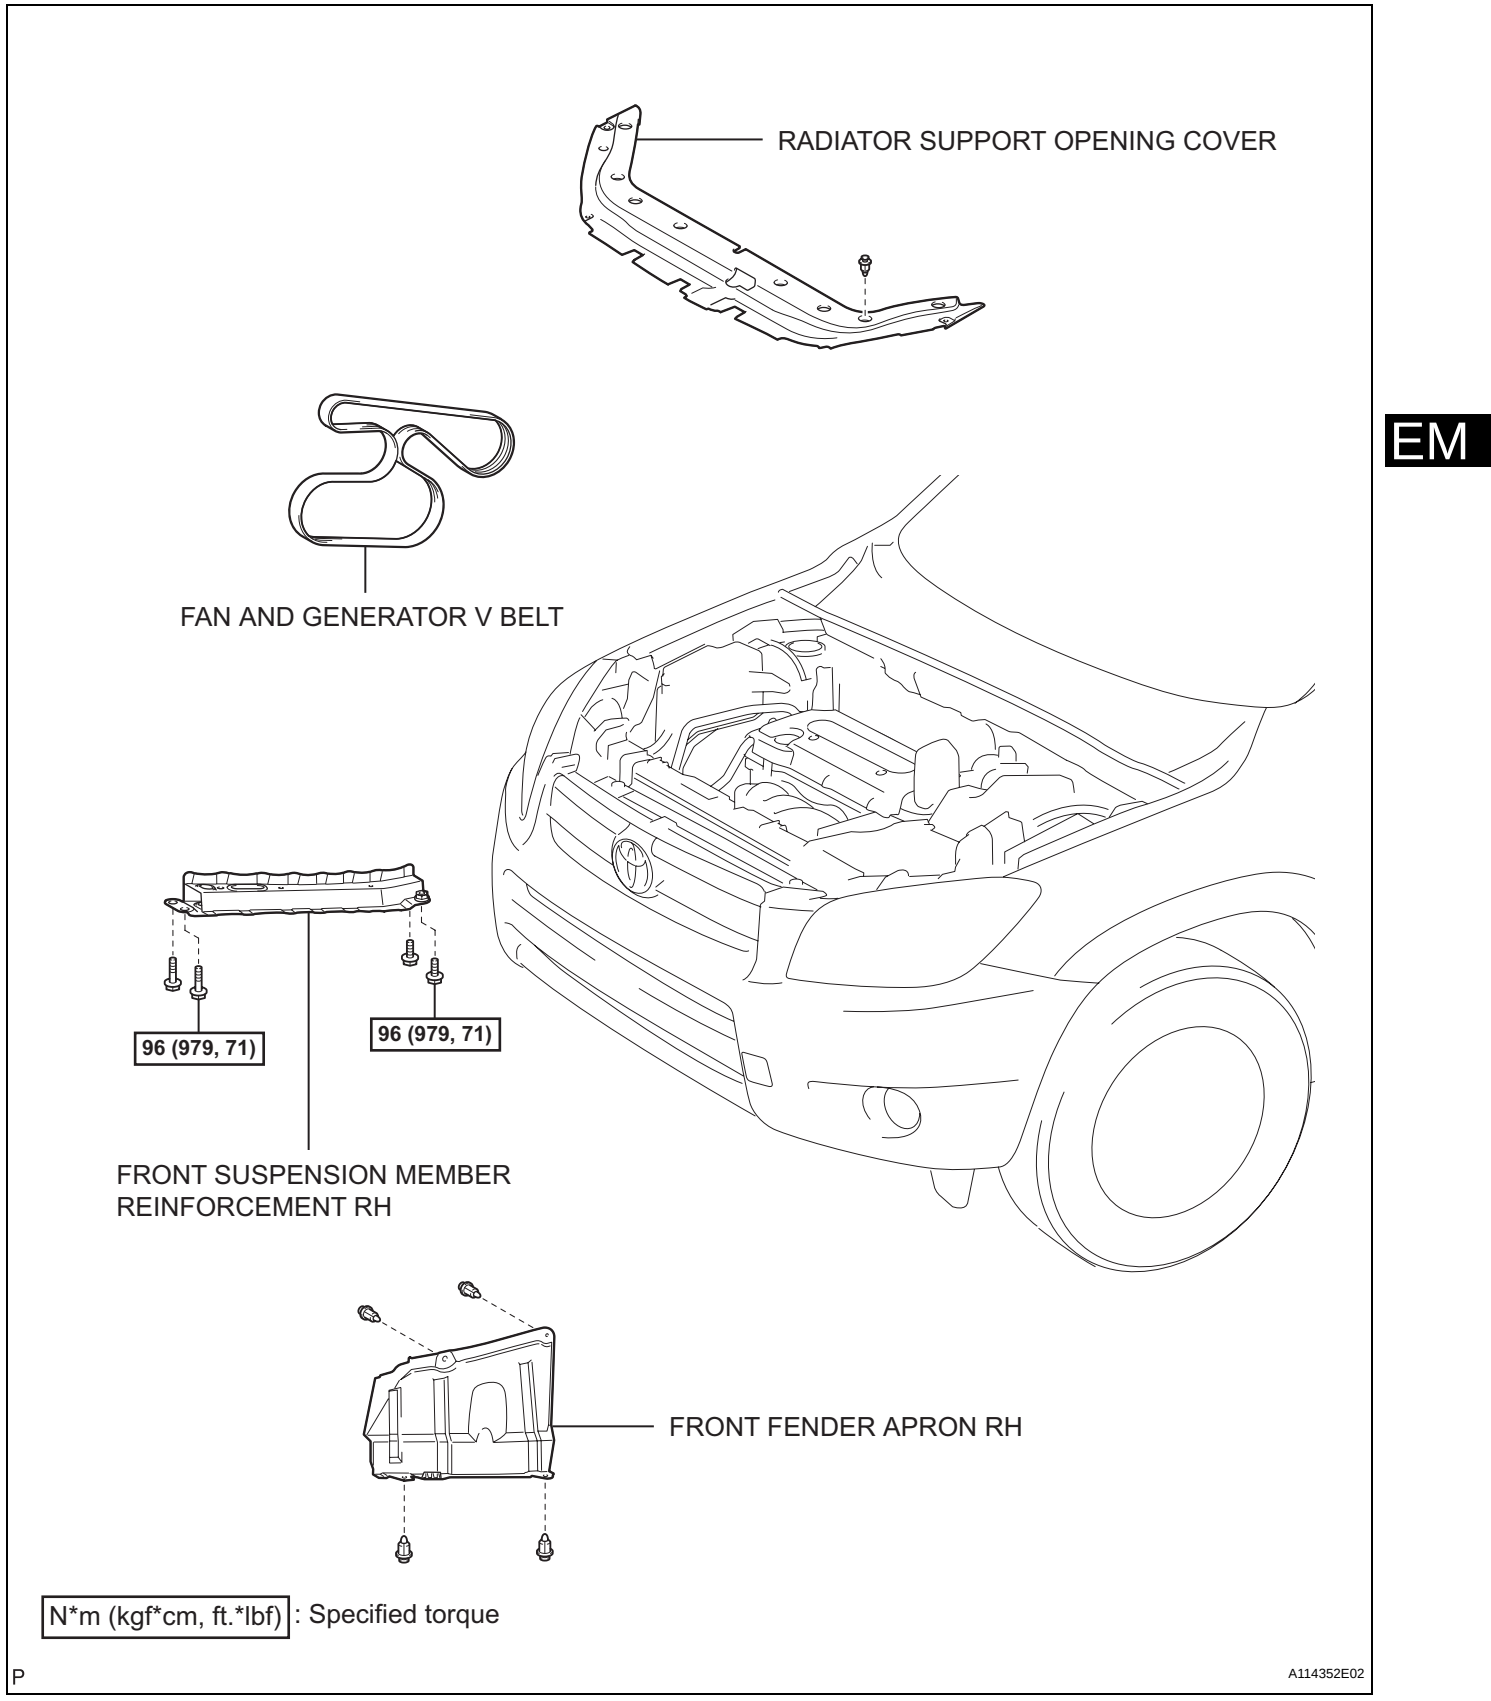
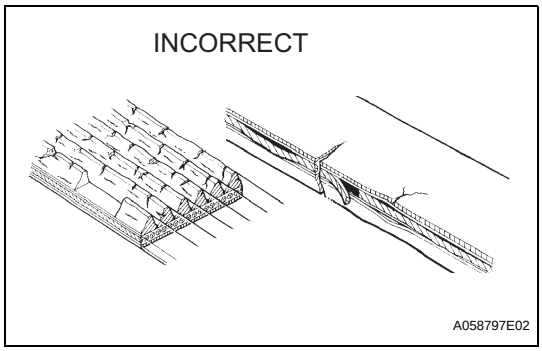
REMOVAL

1. **REMOVE RADIATOR SUPPORT OPENING COVER**
2. **REMOVE FRONT WHEEL RH**
3. **REMOVE FRONT FENDER APRON RH**
4. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH**
   (a) Remove the 4 bolts and reinforcement RH.
5. **REMOVE FAN AND GENERATOR V BELT**
   (a) Using SST and 19 mm socket wrench, loosen the V-ribbed belt tensioner arm clockwise, then remove the fan and generator V belt.
   SST 09216-42010
   NOTICE:
   - **Be sure to connect SST and the tools so that they are in line during use.**
   - **When retracting the tensioner, turn it clockwise slowly for 3 seconds or more. Do not apply force rapidly.**
   - **After the tensioner is fully retracted, do not apply force any more than necessary.**

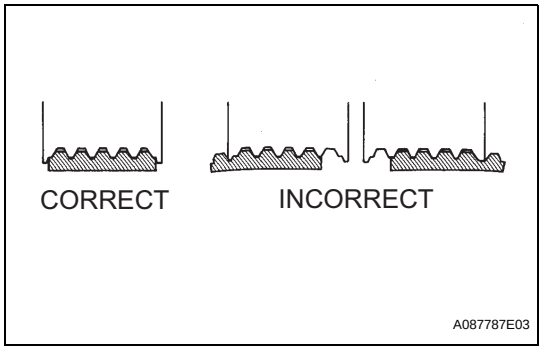
INSTALLATION



1. **INSTALL FAN AND GENERATOR V BELT**
   (a) Using SST and 19 mm socket wrench, loosen the V-ribbed belt tensioner arm clockwise, then install the fan and generator V belt.
   SST 09216-42010
   NOTICE:
   - **Be sure to connect SST and the tools so that they are in line during use.**
   - **When retracting the tensioner, turn it clockwise slowly for 3 seconds or more. Do not apply force rapidly.**
   - **After the tensioner is fully retracted, do not apply force any more than necessary.**
2. **INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH**
   (a) Install the reinforcement RH with the 4 bolts.
   Torque: 96 N*m (979 kgf*cm, 71 ft.*lbf)
3. **INSTALL FRONT FENDER APRON RH**
4. **INSTALL FRONT WHEEL RH**
5. **INSTALL RADIATOR SUPPORT OPENING COVER**



EM

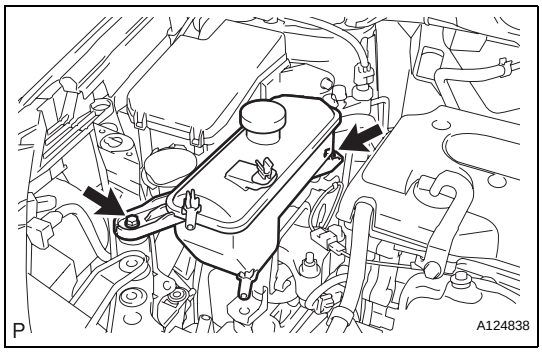


DRIVE BELT

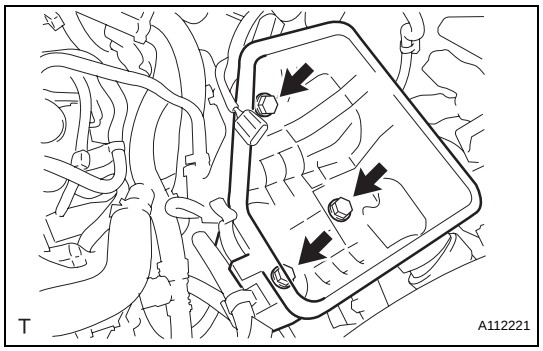
COMPONENTS

EM

ON-VEHICLE INSPECTION



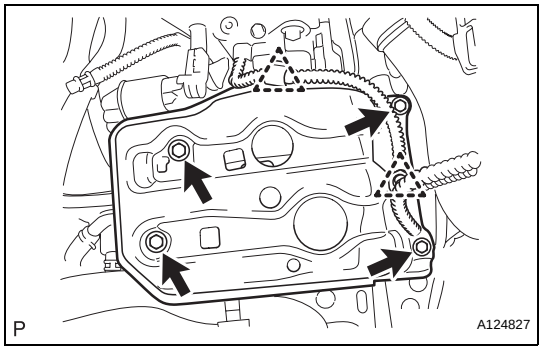
1. CHECK FAN AND GENERATOR V BELT



(a) Visually check the drive belt for excessive wear, frayed cords, etc.
If any defect has been found, replace the drive belt.
HINT:
Cracks on the rib side of a drive belt are considered acceptable.
If the drive belt has chunks missing from the ribs, it should be replaced.

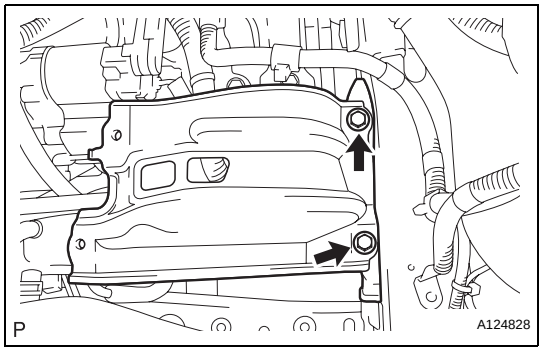
(b) After installing the drive belt, check that it fits properly in the ribbed grooves.
Check with your hand to confirm that the belt has not slipped out of the grooves on the bottom of the crank pulley.
HINT:
- A "new belt" is a belt which has been used for less than 5 minutes on a running engine.
- A "used belt" is a belt which has been used on a running engine for 5 minutes or more.
- After installing a new belt, run the engine for approximately 5 minutes and then recheck the tension.

REMOVAL



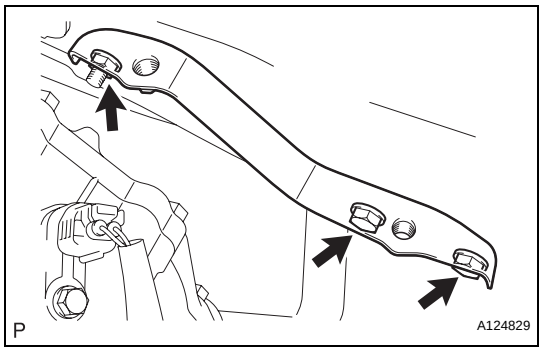
1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE HOOD SUB-ASSEMBLY (See page ED-4)**
4. **REMOVE RADIATOR SUPPORT OPENING COVER**
5. **REMOVE BATTERY CLAMP SUB-ASSEMBLY**
   (a) Loosen the bolt and nut, and remove the battery clamp.
6. **REMOVE BATTERY**
7. **REMOVE BATTERY TRAY**
8. **REMOVE FRONT WHEEL**
9. **REMOVE NO. 1 ENGINE UNDER COVER**
10. **REMOVE NO. 2 ENGINE UNDER COVER**
11. **REMOVE FRONT FENDER APRON RH**
12. **REMOVE NO. 1 ENGINE COVER (See page EM-22)**
13. **DRAIN ENGINE COOLANT (See page CO-6)**
14. **DRAIN AUTOMATIC TRANSAXLE FLUID**
    (a) Drain automatic transaxle fluid for U241E (2WD) (see page AX-146).
    (b) Drain automatic transaxle fluid for U140F (4WD) (see page AX-147).
15. **REMOVE RADIATOR ASSEMBLY**
    (a) Remove the radiator (see page CO-29).
16. **REMOVE RADIATOR RESERVOIR**
    (a) Remove the 2 bolts and reservoir.
17. **REMOVE PURGE VSV (See page EC-15)**
18. **REMOVE AIR CLEANER CAP (See page ES-411)**
19. **REMOVE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY**

20. REMOVE AIR CLEANER CASE SUB-ASSEMBLY



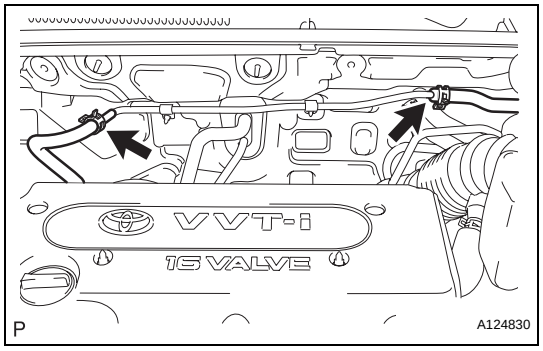
(a) Remove the 3 bolts from the air cleaner case.
(b) Disconnect the case from the NO. 1 air cleaner inlet.

21. REMOVE FRONT BATTERY CARRIER



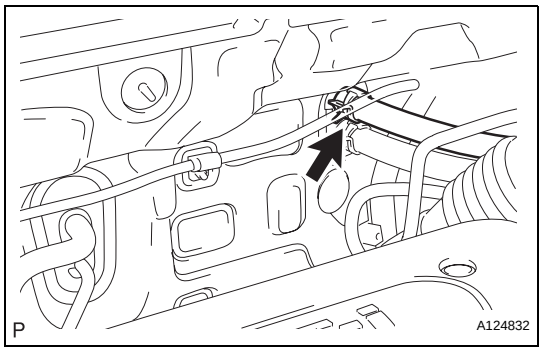
(a) Disconnect the 2 clamps of the engine wire.
(b) Remove the 4 bolts and front battery carrier.

EM



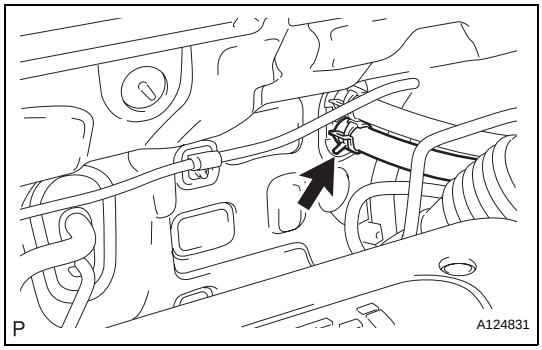
22. REMOVE BATTERY BRACKET REINFORCEMENT

(a) Remove the 2 bolts and battery bracket reinforcement.



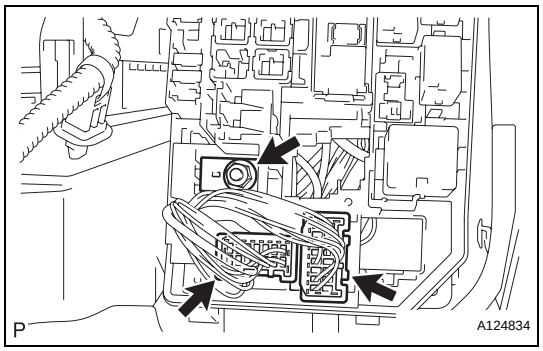
23. REMOVE BATTERY CARRIER BRACKET

(a) Remove the 2 bolts, nut and battery carrier bracket.

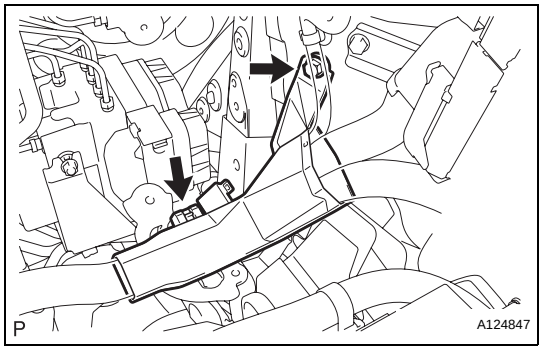


24. DISCONNECT UNION TO CONNECTOR TUBE HOSE

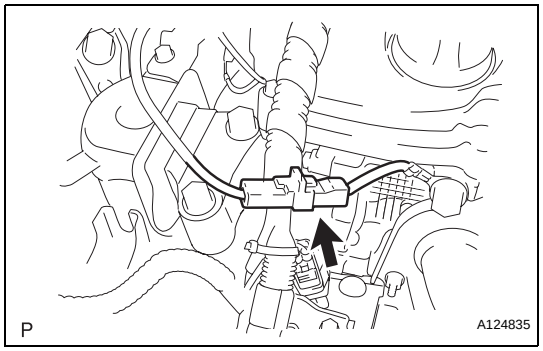
(a) Disconnect the 2 union to connector tube hoses from the booster vacuum tube.



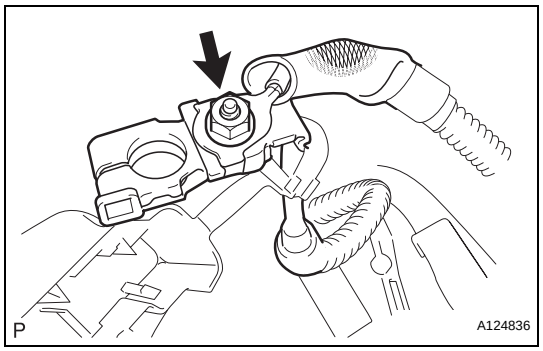
25. **DISCONNECT HEATER WATER INLET HOSE**
    (a) Disconnect the heater water inlet hose from the heater unit.



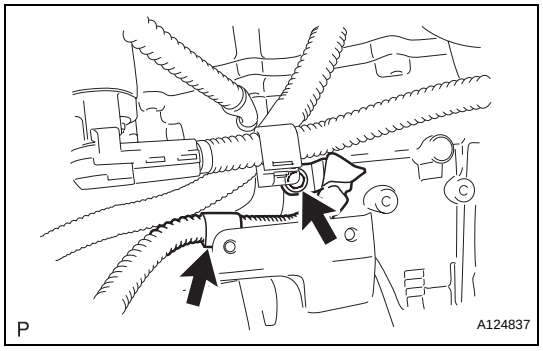
26. **DISCONNECT HEATER WATER OUTLET HOSE**
    (a) Disconnect the heater water outlet hose from the heater unit.
27. **DISCONNECT FUEL TUBE (See page FU-10)**
28. **REMOVE THROTTLE BODY (See page ES-412)**
29. **DISCONNECT NO. 2 VENTILATION HOSE (See page FU-10)**
30. **REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-10)**
31. **REMOVE INTAKE MANIFOLD (See page ES-419)**
32. **REMOVE INTAKE MANIFOLD INSULATOR (See page ES-420)**
33. **REMOVE TRANSAXLE CONTROL CABLE ASSEMBLY**
    (a) Remove the transaxle control cable for U241E (2WD) (see page AX-129).
    (b) Remove the transaxle control cable for U140F (4WD) (see page AX-129).
34. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-6)**
35. **REMOVE FAN AND GENERATOR V BELT (See page EM-6)**
36. **REMOVE GENERATOR ASSEMBLY (See page CH-9)**
37. **REMOVE COOLER COMPRESSOR ASSEMBLY**
    (a) Remove the cooler compressor (see page AC-216).
    HINT:
    Disconnect the compressor together with the low-pressure and high-pressure hoses, then secure it to the vehicle side using rope.
38. **REMOVE ECM (See page ES-429)**
39. **DISCONNECT ENGINE WIRE**
    (a) Remove the engine room relay block cover.



EM



(b) Remove the nut and disconnect the 2 engine wire connectors.



(c) Remove the bolt and engine wire cover. Then disconnect the engine wire from the engine wire cover.

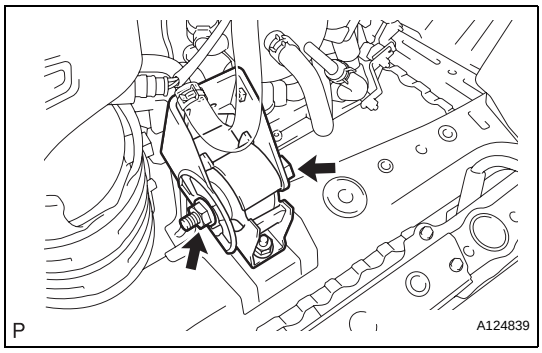
(d) Disconnect the ground cable connector.

(e) Remove the nut from the positive (+) battery terminal to disconnect the engine wire.

(f) Disconnect the ground cable from the clamp located near the starter.
(g) Remove the bolt and ground cable located near the starter.

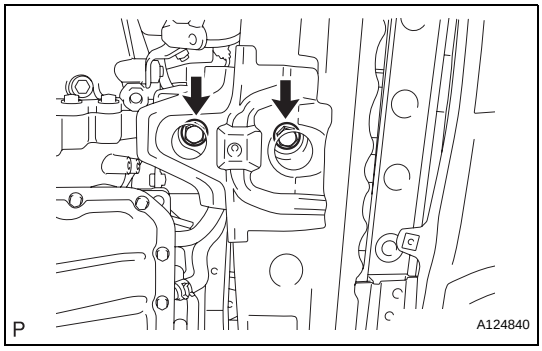
40. REMOVE FRONT EXHAUST PIPE ASSEMBLY (See page EX-3)

41. REMOVE FRONT DRIVE SHAFT ASSEMBLY



(a) Remove the front drive shaft (for 2WD) (see page DS-7).

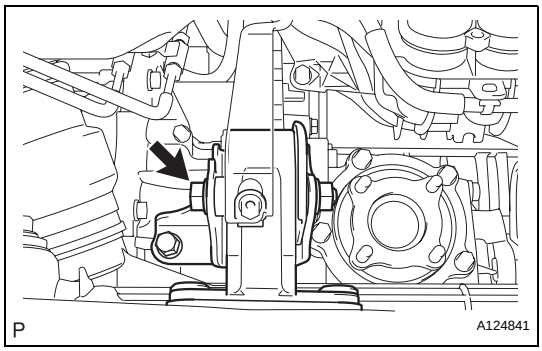
(b) Remove the front drive shaft (for 4WD) (see page DS-40).



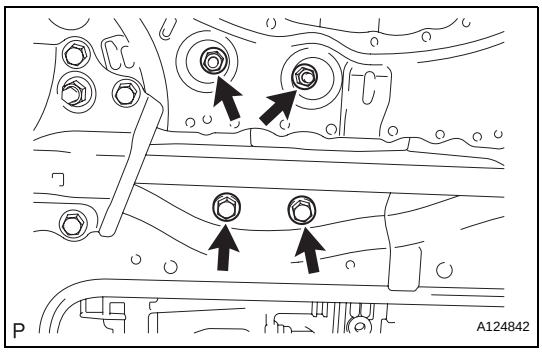
42. REMOVE PROPELLER SHAFT ASSEMBLY (for 4WD) (See page PR-3)

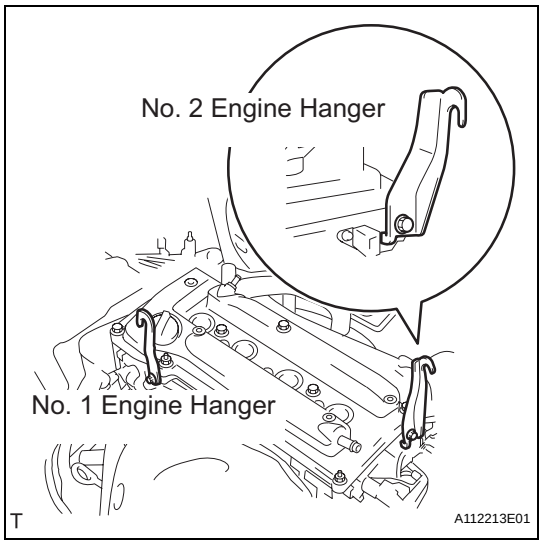
43. REMOVE ENGINE MOUNTING INSULATOR FR

(a) Remove the through bolt and nut.



(b) Remove the 2 bolts and engine mounting insulator FR.

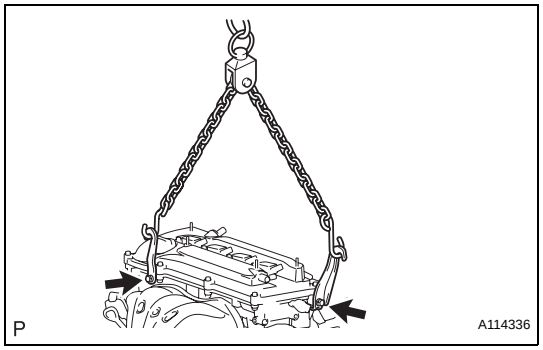


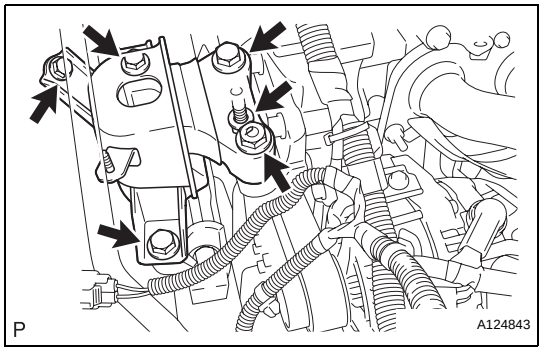


44. REMOVE ENGINE MOUNTING INSULATOR RR

(a) Remove the through bolt.

(b) Remove the 2 nuts, 2 bolts and engine mounting insulator RR.

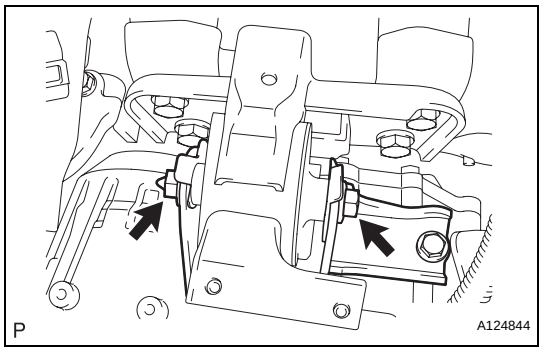




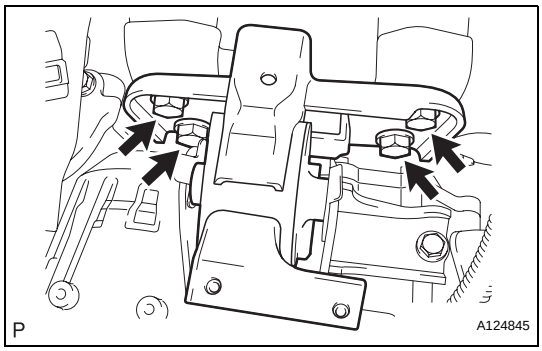
45. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Install the No. 1 and No. 2 engine hangers with the bolts as shown in the illustration.
Torque: 38 N*m (387 kgf*cm, 28 ft.*lbf)
Part No.

Item	Part No.
No. 1 engine hanger	12281-28010
No. 2 engine hanger	12282-28010
Bolt	91512-61020

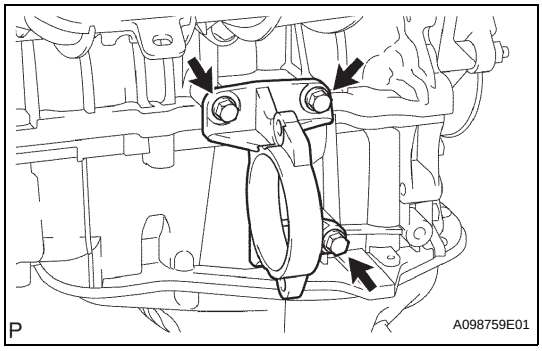


(b) Attach the sling device to the engine hangers and chain block.
(c) Carefully remove the engine with transaxle from the vehicle.



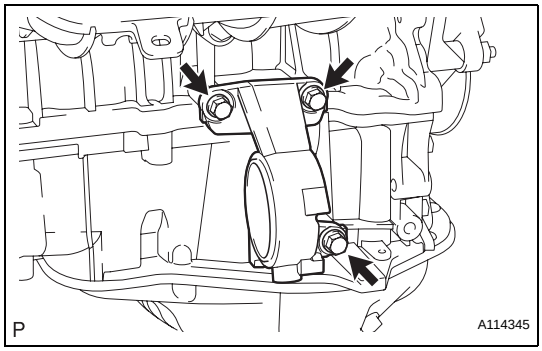
46. REMOVE ENGINE MOUNTING INSULATOR RH

(a) Remove the 2 nuts, 4 bolts and engine mounting insulator RH.



47. REMOVE ENGINE MOUNTING INSULATOR LH

(a) Remove the through bolt and nut.



(b) Remove the 4 bolts and engine mounting insulator LH.

48. REMOVE DRIVE SHAFT BEARING BRACKET (for 2WD)

(a) Remove the 3 bolts and bracket.

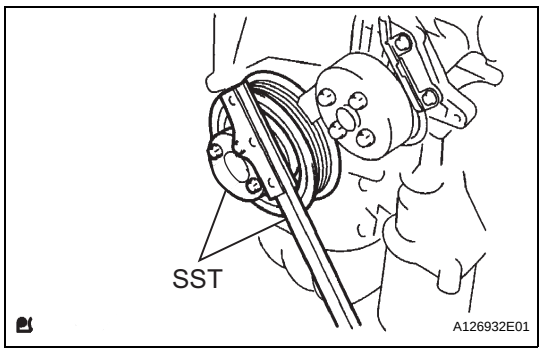
49. REMOVE DRIVE SHAFT BEARING BRACKET (for 4WD)

(a) Remove the 3 bolts and bracket.

50. REMOVE TRANSFER ASSEMBLY (for 4WD) (See page TF-59)

51. REMOVE STARTER ASSEMBLY (See page ST-7)

52. REMOVE AUTOMATIC TRANSAXLE ASSEMBLY

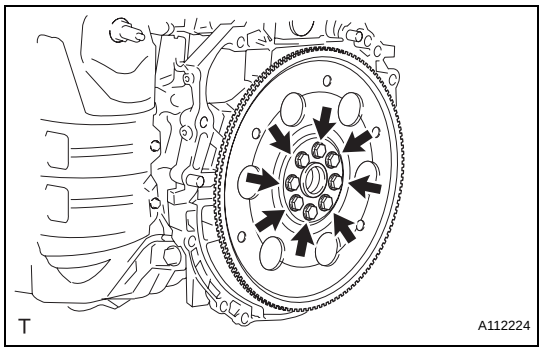


(a) Remove the automatic transaxle for U241E (2WD) (see page AX-147).

(b) Remove the automatic transaxle for U140F (4WD) (see page AX-148).

53. REMOVE TORQUE CONVERTER CLUTCH ASSEMBLY

(a) Remove the torque converter clutch for U241E (2WD) (see page AX-148).



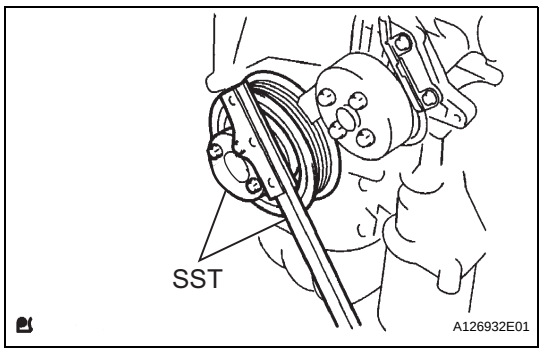
(b) Remove the torque converter clutch for U140F (4WD) (see page AX-149).

54. REMOVE DRIVE PLATE SUB-ASSEMBLY

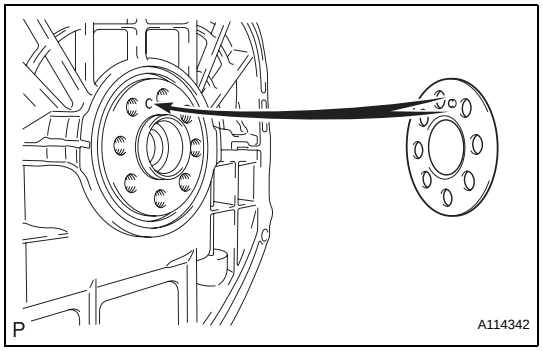
(a) Using SST, hold the crankshaft.

SST 09213-54015 (91651-60855), 09330-00021

(b) Remove the 8 bolts, rear spacer, drive plate and front spacer.

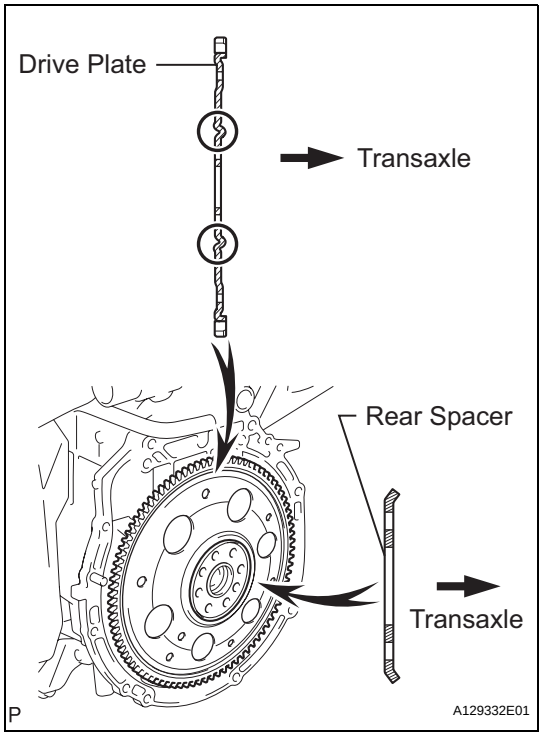


INSTALLATION



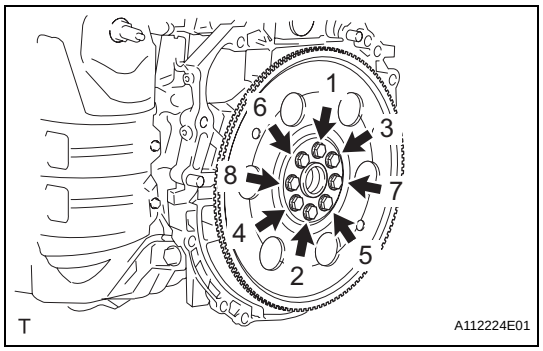
1. INSTALL DRIVE PLATE SUB-ASSEMBLY

(a) Clean the 8 bolts and 8 bolt holes.



(b) Apply adhesive to 2 or 3 threads of the 8 bolts.
Adhesive:
Toyota Genuine Adhesive 1342, Three Bond 1342 or Equivalent

(c) Using SST, hold the crankshaft.
SST 09213-54015 (91651-60855), 09330-00021



(d) Install the front spacer.
HINT:
Align the pin of the front spacer with the pin hole of the crankshaft.

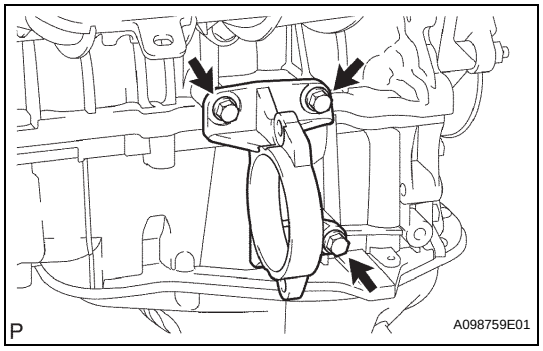
(e) Install the drive plate and rear spacer onto the crankshaft.

(f) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 98 N*m (1,000 kgf*cm, 72 ft.*lbf)

2. INSTALL TORQUE CONVERTER CLUTCH ASSEMBLY

(a) Install the torque converter clutch for U241E (2WD) (see page AX-148).

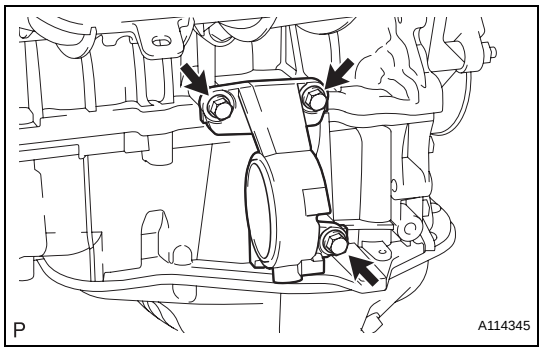
(b) Install the torque converter clutch for U140F (4WD) (see page AX-149).



3. INSTALL AUTOMATIC TRANSAXLE ASSEMBLY

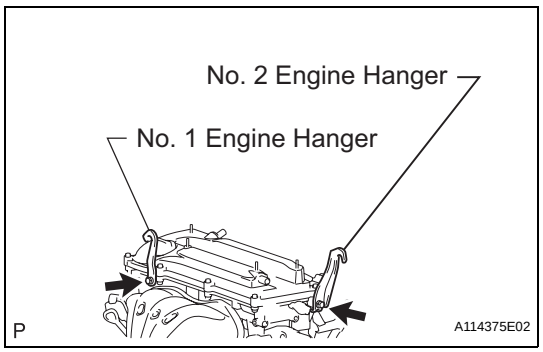
(a) Install the automatic transaxle for U241E (2WD) (see page AX-149).

(b) Install the automatic transaxle for U140F (4WD) (see page AX-150).



4. INSTALL STARTER ASSEMBLY (See page ST-14)

5. INSTALL TRANSFER ASSEMBLY (for 4WD) (See page TF-75)

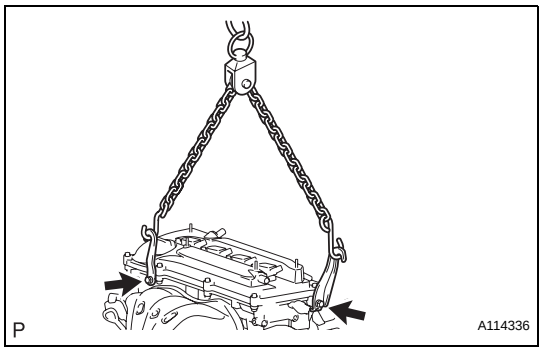


6. INSTALL DRIVE SHAFT BEARING BRACKET (for 2WD)

(a) Install the bracket with the 3 bolts.
Torque: 64 N*m (653 kgf*cm, 47 ft.*lbf)

7. INSTALL DRIVE SHAFT BEARING BRACKET (for 4WD)

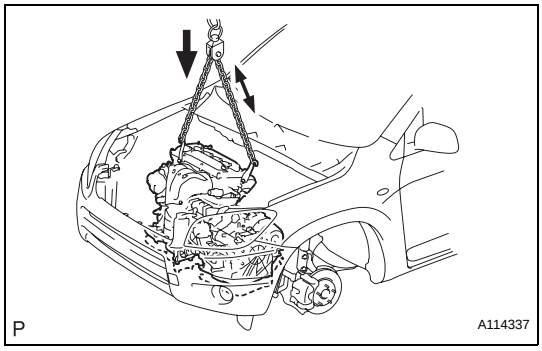
(a) Install the bracket with the 3 bolts.
Torque: 64 N*m (653 kgf*cm, 47 ft.*lbf)



8. INSTALL ENGINE HANGER

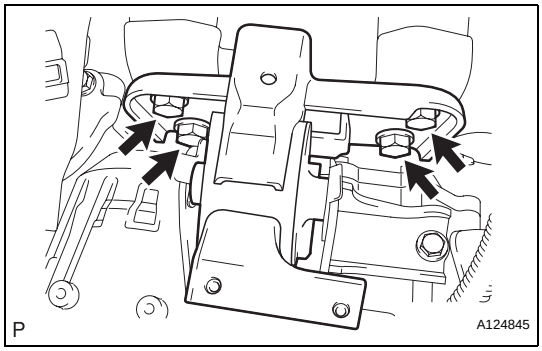
(a) Install the No. 1 and No. 2 engine hangers.
Torque: 38 N*m (387 kgf*cm, 28 ft.*lbf)
Part No.

ITEM	Part No.
No. 1 engine hanger	12281-28010
No. 2 engine hanger	12282-28010
Bolt	91512-61020



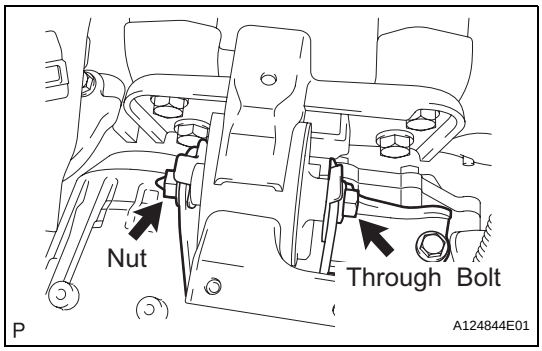
EM

(b) Attach the sling device and the engine with the chain block.



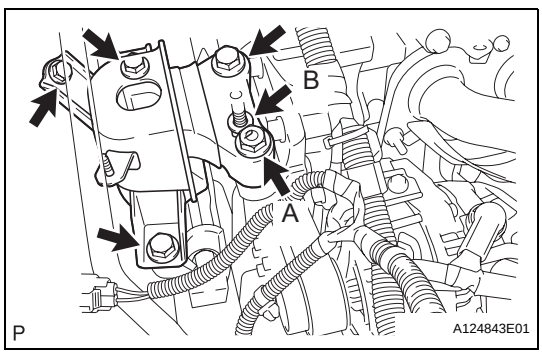
9. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE

(a) Lift the engine assembly (with transaxle) with the chain block.



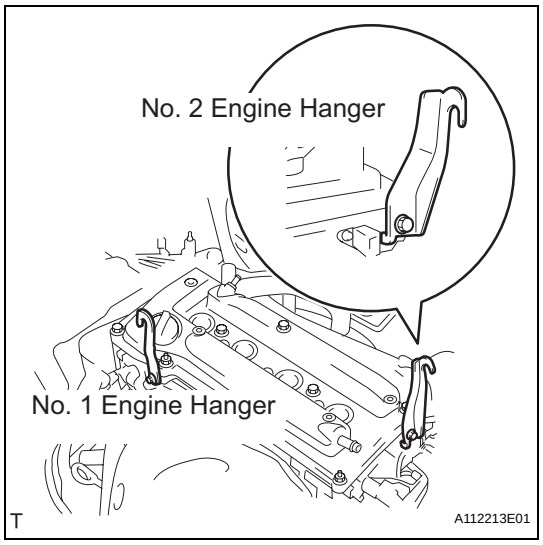
(b) Lower the engine out of the vehicle slowly and carefully.
NOTICE:
Make sure the engine is clear of all wiring, hoses and cables.

EM

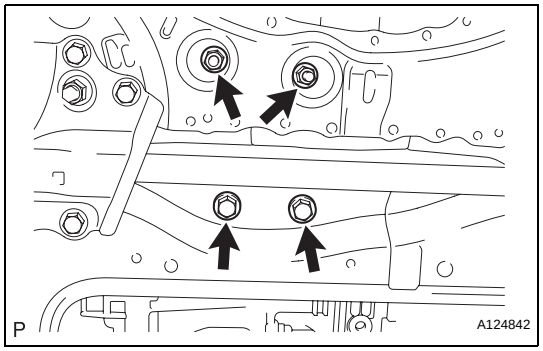


10. INSTALL ENGINE MOUNTING INSULATOR LH

(a) Install the engine mounting insulator LH with the 4 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

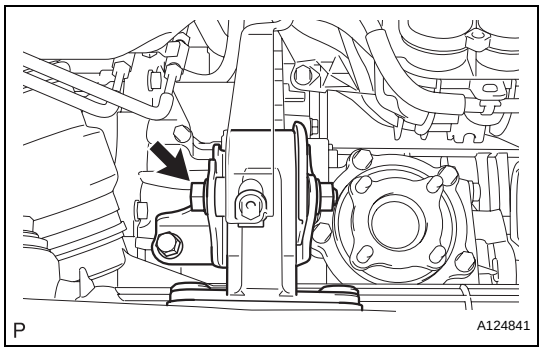


(b) Install the engine mounting insulator LH with the through bolt and nut.
HINT:
Install the through bolt by tightening the nut.
Torque: 56 N*m (571 kgf*cm, 41 ft.*lbf)



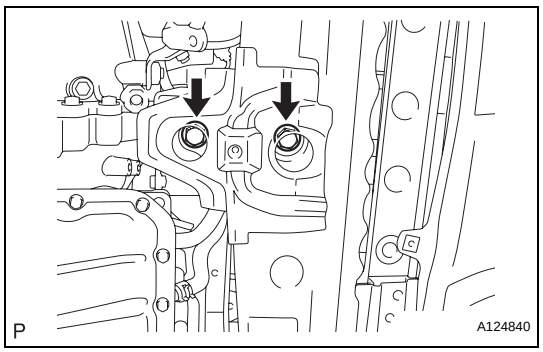
11. INSTALL ENGINE MOUNTING INSULATOR RH

(a) Install the engine mounting insulator RH with the 2 bolts and 2 nuts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf) for bolt
95 N*m (969 kgf*cm, 70 ft.*lbf) for nut A
52 N*m (530 kgf*cm, 38 ft.*lbf) for nut B



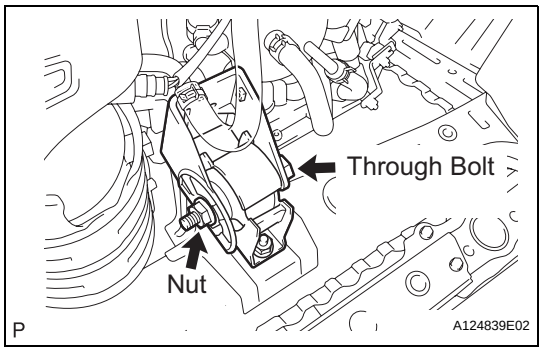
12. REMOVE ENGINE HANGER

(a) Remove the No. 1 and No. 2 engine hangers.



13. INSTALL ENGINE MOUNTING INSULATOR RR

(a) Install the engine mounting insulator RR with the 2 nuts and 2 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)



(b) Install the through bolt which is used to secure the rear engine mounting insulator, into the rear engine mounting bracket.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

14. INSTALL ENGINE MOUNTING INSULATOR FR

(a) Install the engine mounting insulator FR with the 2 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

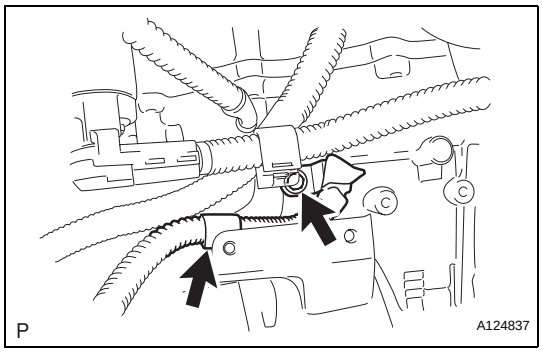
(b) Install the through bolt and nut which is used to secure the front engine mounting bracket FR.
HINT:
Install the through bolt by tightening the nut.
Torque: 145 N*m (1,479 kgf*cm, 107 ft.*lbf)

15. INSTALL PROPELLER SHAFT ASSEMBLY (for 4WD)

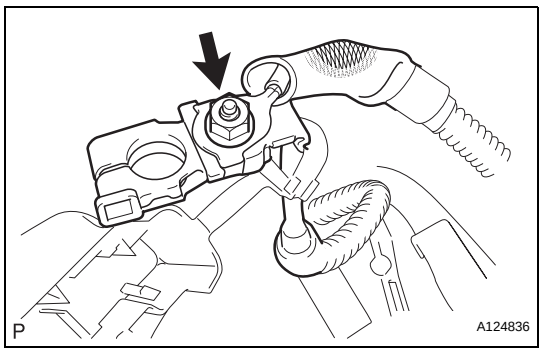
(a) Install the propeller shaft (see page PR-5).

16. INSTALL FRONT DRIVE SHAFT ASSEMBLY

(a) Install the front drive shaft RH (for 2WD) (see page DS-32).

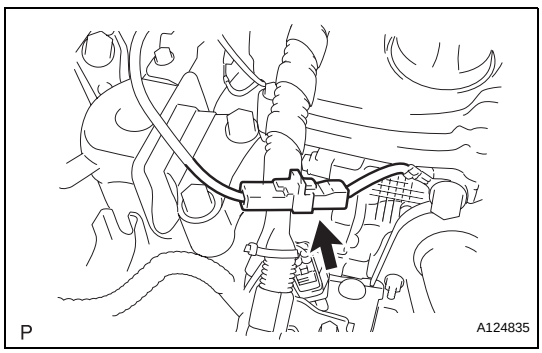


(b) Install the front drive shaft RH (for 4WD) (see page DS-65).



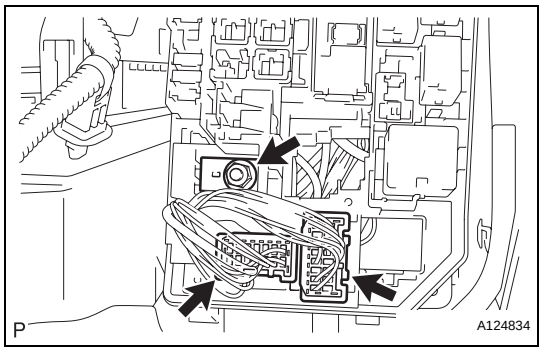
17. INSTALL FRONT EXHAUST PIPE (See page EX-4)

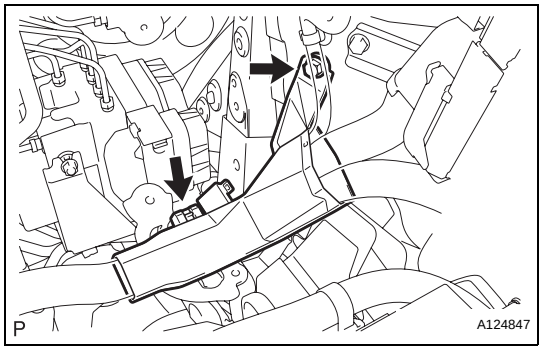
18. CONNECT ENGINE WIRE



(a) Install the ground cable with the bolt located near the starter.
Torque: 13 N*m (133 kgf*cm, 10 ft.*lbf)

(b) Connect the ground cable to the clamp located near the starter.





(c) Connect the engine wire to the positive (+) battery terminal with the nut.
Torque: 13 N*m (133 kgf*cm, 10 ft.*lbf)

(d) Connect the ground cable connector.

(e) Connect the 2 engine wire connectors and install the nut.
(f) Install the engine room relay block cover.

(g) Attach the clamp of the engine wire cover.
(h) Install the engine wire cover to with the bolt.

19. INSTALL ECM (See page ES-430)

20. INSTALL COOLER COMPRESSOR ASSEMBLY (See page AC-217)

21. INSTALL GENERATOR ASSEMBLY (See page CH-15)

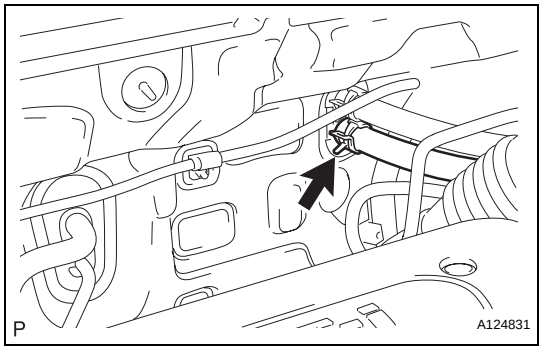
22. INSTALL FAN AND GENERATOR V BELT (See page EM-7)

23. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)

24. INSTALL TRANSAXLE CONTROL CABLE ASSEMBLY

(a) Install the transaxle control cable for U241E (see page AX-130).
(b) Install the transaxle control cable for U140F (see page AX-130).

25. INSTALL INTAKE MANIFOLD INSULATOR (See page ES-421)

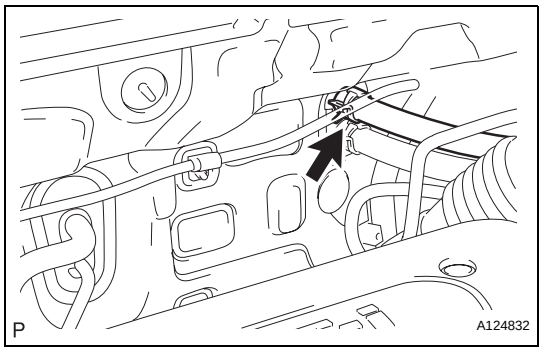


26. INSTALL INTAKE MANIFOLD (See page ES-421)

27. INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-13)

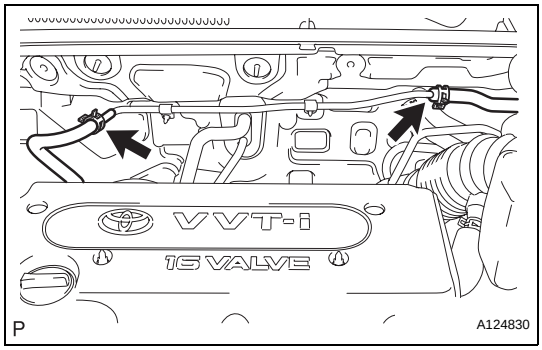
28. CONNECT NO. 2 VENTILATION HOSE (See page FU-14)

29. INSTALL THROTTLE BODY ASSEMBLY (See page ES-413)



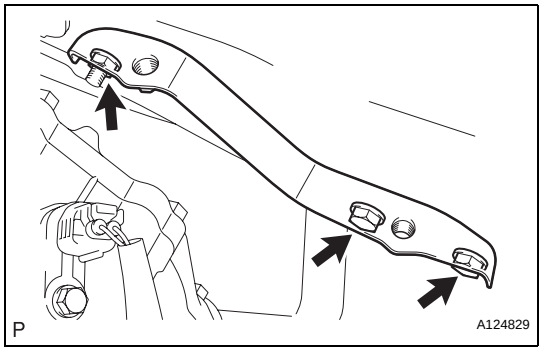
30. CONNECT FUEL TUBE (See page FU-14)

31. CONNECT HEATER WATER OUTLET HOSE



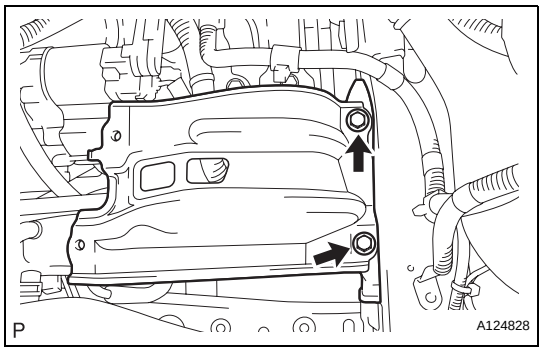
(a) Connect the heater water outlet hose to the air conditioner tube.

EM



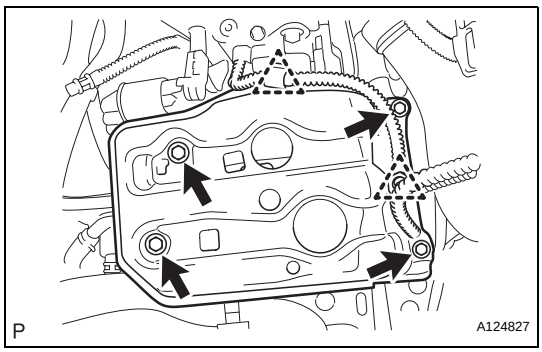
32. CONNECT HEATER WATER INLET HOSE

(a) Connect the heater water inlet hose to the air conditioner tube.



33. CONNECT UNION TO CONNECTOR TUBE HOSE

(a) Connect the 2 union to connector tube hoses to the booster vacuum tube.

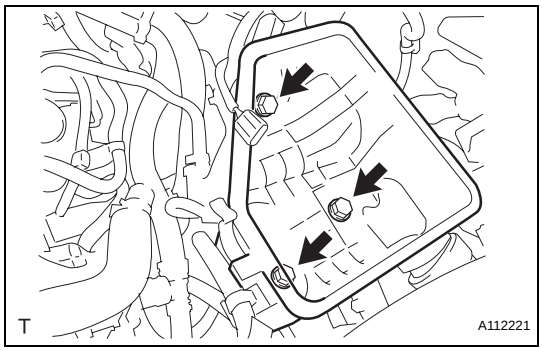


34. INSTALL BATTERY CARRIER BRACKET

(a) Install the battery carrier bracket with the nut and 2 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

35. INSTALL BATTERY BRACKET REINFORCEMENT

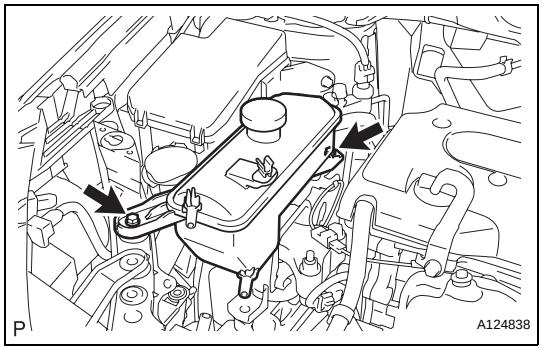
(a) Install the battery bracket reinforcement with the 2 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)



36. INSTALL FRONT BATTERY CARRIER

(a) Install the front battery carrier with the 4 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

(b) Connect the 2 clamps of the engine wire.



37. INSTALL AIR CLEANER CASE SUB-ASSEMBLY

(a) Connect the air cleaner case to the No. 1 air cleaner inlet.

(b) Install the air cleaner case with the 3 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

38. **INSTALL AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY**
39. **INSTALL AIR CLEANER CAP (See page ES-413)**
40. **INSTALL PURGE VSV (See page EC-16)**

41. **INSTALL RADIATOR RESERVOIR**
    (a) Install the reservoir with the 2 bolts.
    Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
42. **INSTALL RADIATOR ASSEMBLY**
    (a) Install the radiator (see page CO-32).
43. **INSTALL BATTERY TRAY**
44. **INSTALL BATTERY**
    (a) Install the battery.
    (b) Install the battery clamp with the bolt and nut.
    Torque: 8.5 N*m (87 kgf*cm, 75 in.*lbf) for bolt
    5.0 N*m (51 kgf*cm, 44 in.*lbf) for nut
45. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
46. **ADD AUTOMATIC TRANSAXLE FLUID**
    (a) Add automatic transaxle fluid for U241E (2WD) (see page AX-151).
    (b) Add automatic transaxle fluid for U140F (4WD) (see page AX-152).
47. **CHECK FOR FUEL LEAKS (See page FU-14)**
48. **ADD ENGINE COOLANT (See page CO-6)**
49. **CHECK FOR ENGINE COOLANT LEAKS**
    (a) Check for engine coolant leaks (see page CO-1).
50. **CHECK FOR AUTOMATIC TRANSAXLE FLUID LEAKS**
51. **ADJUST SHIFT LEVER POSITION**
    (a) Adjust the shift lever position for U241E (2WD) (see page AX-138).
    (b) Adjust the shift lever position for U140F (4WD) (see page AX-138).
52. **INSTALL NO. 1 ENGINE COVER (See page EM-43)**
53. **INSTALL FRONT FENDER APRON RH**
54. **INSTALL NO. 2 ENGINE UNDER COVER**
55. **INSTALL NO. 1 ENGINE UNDER COVER**
56. **INSTALL FRONT WHEEL**
57. **INSTALL RADIATOR SUPPORT OPENING COVER**

58. INSTALL HOOD SUB-ASSEMBLY

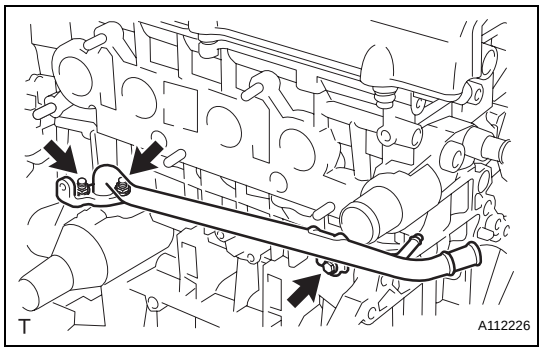
(a) Install the hood (see page ED-7).

(b) Adjust the hood (see page ED-5).

59. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT

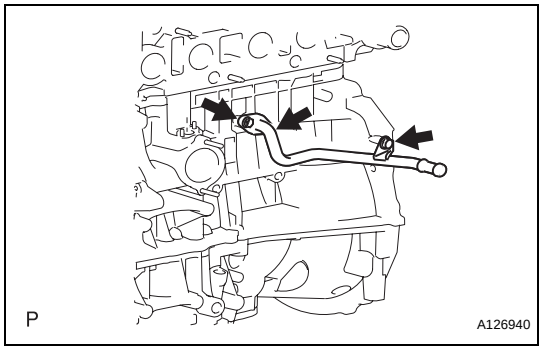
(a) Inspect and adjust the front wheel alignment (see page SP-3).

60. PERFORM REGISTRATION



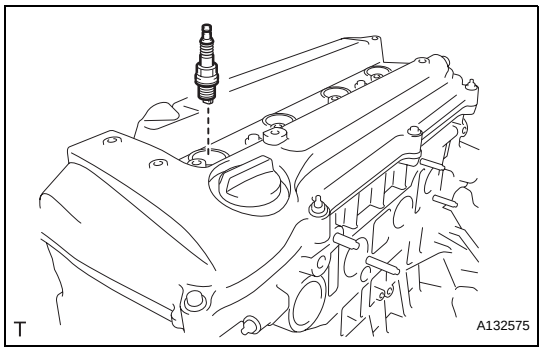
(a) When replacing the engine assembly, perform vehicle stability control system recognition in ECM (see page CC-12).

61. RESET MEMORY (for Automatic Transaxle)

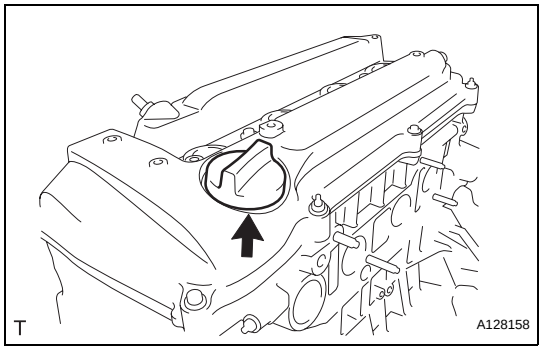


(a) When replacing the engine assembly, perform the RESET MEMORY procedure (A/T initialization) for U241E (2WD) (see page AX-18) and for U140F (4WD) (see page AX-18).

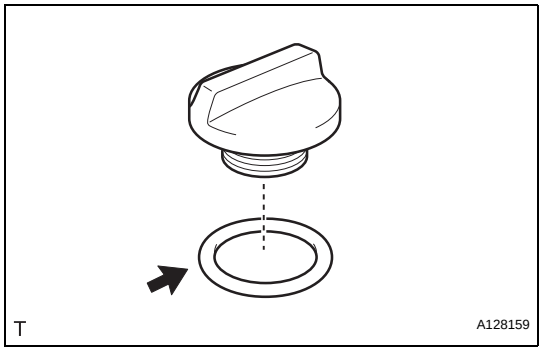
DISASSEMBLY



1. **REMOVE IDLER PULLEY (See page EM-23)**
2. **REMOVE OIL DIPSTICK**
3. **REMOVE OIL DIPSTICK GUIDE (See page EM-57)**
4. **REMOVE MANIFOLD STAY (See page EM-57)**
5. **REMOVE NO. 2 MANIFOLD STAY (See page EM-58)**
6. **REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (See page EM-58)**
7. **REMOVE EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY (See page EM-58)**
8. **REMOVE WATER INLET (See page CO-15)**
9. **REMOVE THERMOSTAT**
10. **REMOVE NO. 1 WATER BY-PASS PIPE**
    (a) Remove the bolt, 2 nuts, pipe and gasket.

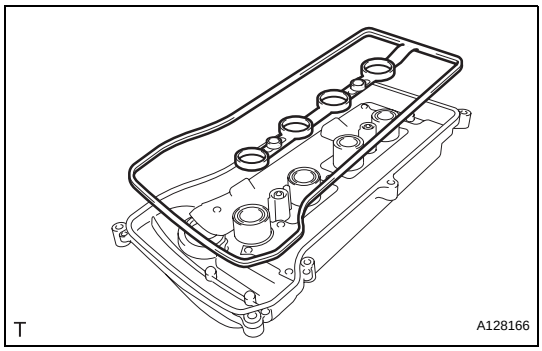


11. **REMOVE NO. 3 WATER BY-PASS PIPE**
    (a) Remove the bolt, 2 nuts, pipe and gasket.
12. **REMOVE V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-26)**
13. **REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-395)**
14. **REMOVE KNOCK SENSOR (See page ES-420)**
15. **REMOVE RADIO SETTING CONDENSER (See page EM-63)**
16. **REMOVE OIL PRESSURE SWITCH ASSEMBLY (See page EM-63)**
17. **REMOVE ENGINE COOLANT TEMPERATURE SENSOR (See page EM-63)**
18. **REMOVE CAMSHAFT POSITION SENSOR (See page EM-64)**
19. **REMOVE IGNITION COIL ASSEMBLY (See page IG-9)**



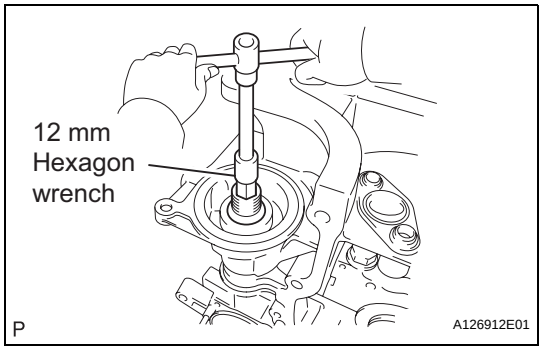
EM

20. REMOVE SPARK PLUG



21. REMOVE OIL FILLER CAP SUB-ASSEMBLY

22. REMOVE OIL FILLER CAP GASKET

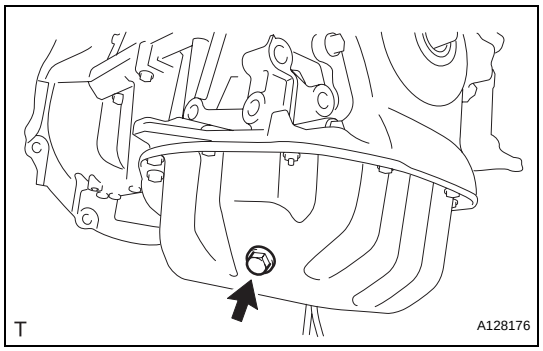


23. REMOVE VENTILATION VALVE SUB-ASSEMBLY (See page EC-18)

24. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-24)

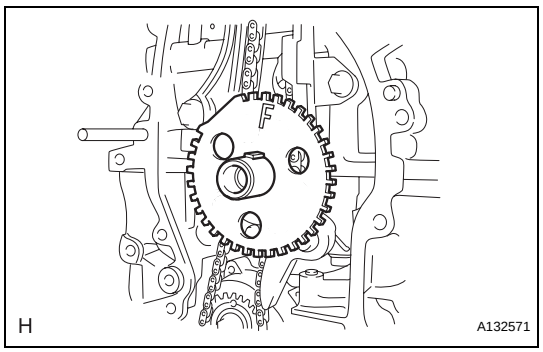
25. REMOVE CYLINDER HEAD COVER GASKET

26. REMOVE OIL FILTER SUB-ASSEMBLY (See page LU-4)



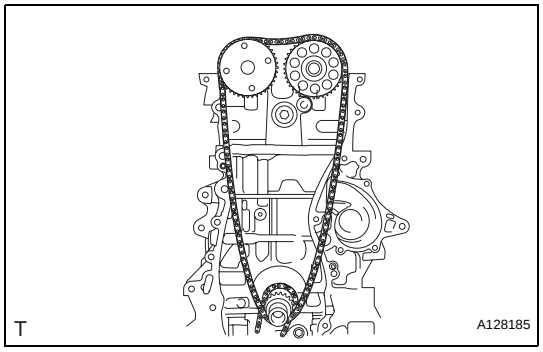
27. REMOVE OIL FILTER UNION

(a) Using a 12 mm hexagon wrench, remove the oil filter union.

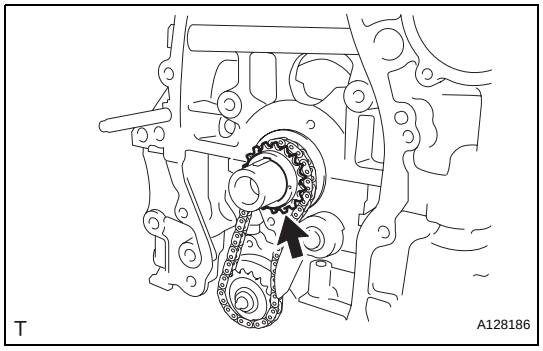


28. REMOVE CRANKSHAFT POSITION SENSOR (See page ES-402)

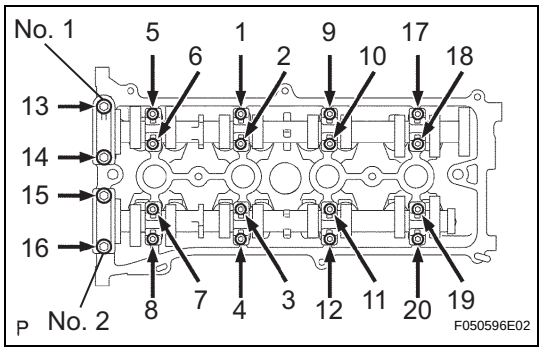
29. REMOVE WATER PUMP PULLEY (See page CO-11)



30. REMOVE WATER PUMP ASSEMBLY (See page CO-11)

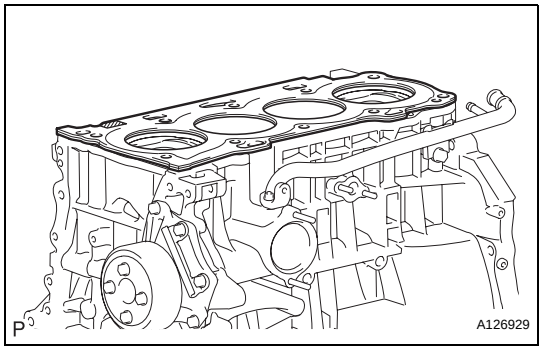


31. **REMOVE OIL PAN DRAIN PLUG**
    (a) Remove the oil pan drain plug and gasket.
32. **REMOVE OIL PAN SUB-ASSEMBLY (See page EM-24)**
33. **REMOVE CRANKSHAFT PULLEY (See page EM-25)**
34. **REMOVE NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-26)**
35. **REMOVE TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-26)**
36. **REMOVE NO. 1 CRANKSHAFT POSITION SENSOR PLATE**

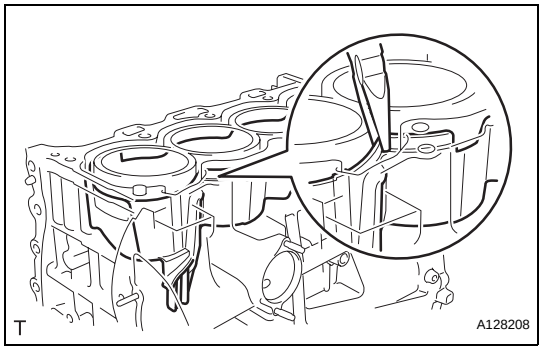


37. **REMOVE TIMING CHAIN GUIDE (See page EM-28)**
38. **REMOVE CHAIN TENSIONER SLIPPER (See page EM-28)**
39. **REMOVE NO. 1 CHAIN VIBRATION DAMPER (See page EM-28)**

40. **REMOVE CHAIN SUB-ASSEMBLY**

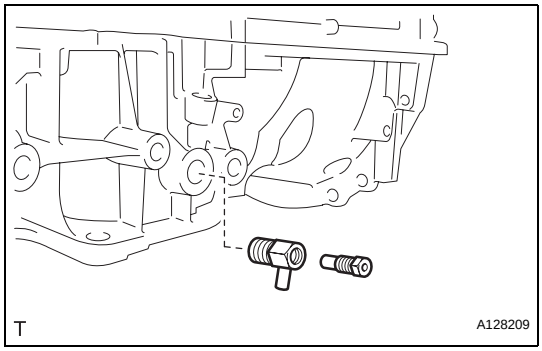


41. **REMOVE CRANKSHAFT TIMING SPROCKET**
42. **REMOVE NO. 2 CHAIN SUB-ASSEMBLY (See page EM-29)**
43. **REMOVE OIL PUMP DRIVE GEAR**
44. **REMOVE OIL PUMP ASSEMBLY (See page LU-12)**

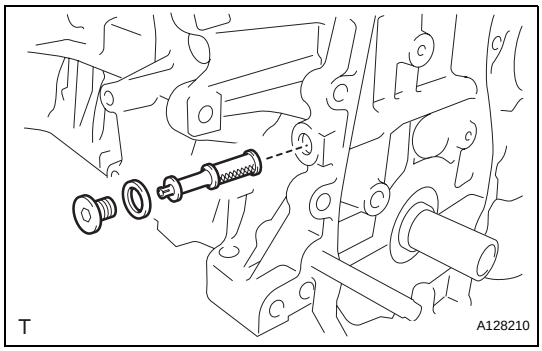


45. **REMOVE CAMSHAFT**
    (a) Using several steps, uniformly loosen and remove the 20 bearing cap bolts in the sequence shown in the illustration.
    (b) Remove the 10 bearing caps, then remove the camshaft and No. 2 camshaft.
46. **REMOVE CYLINDER HEAD SUB-ASSEMBLY (See page EM-62)**

EM



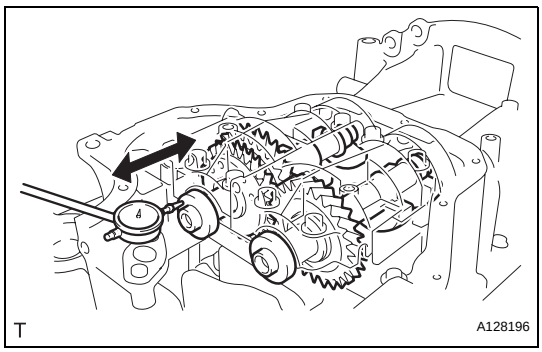
47. REMOVE CYLINDER HEAD GASKET



48. REMOVE CYLINDER BLOCK WATER JACKET SPACER

(a) Using needle-nose pliers, remove the cylinder block water jacket spacer from the water jacket.

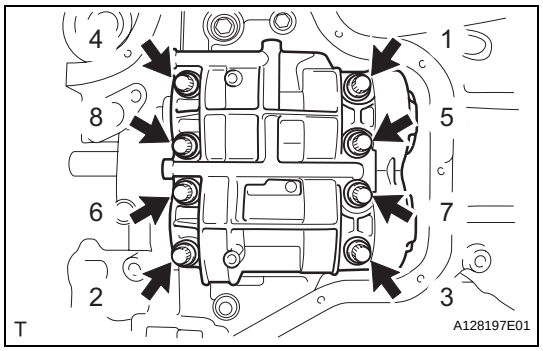
NOTICE:
Before turning the cylinder block upside down, make sure that the water jacket spacer is removed, as it will fall out.



49. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY

50. REMOVE OIL CONTROL VALVE FILTER

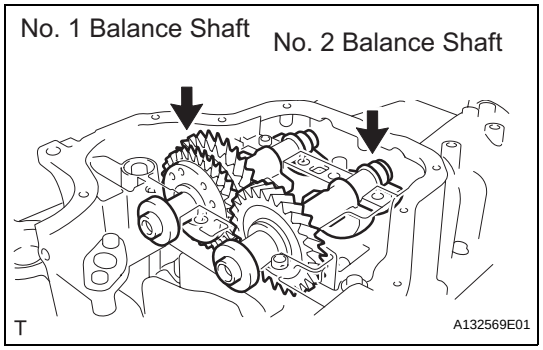
(a) Using a 6 mm socket hexagon wrench, remove the plug and gasket.
(b) Remove the oil control valve filter.



51. INSPECT BALANCE SHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the balance shaft back and forth.

Standard thrust clearance:
0.05 to 0.09 mm (0.0020 to 0.0035 in.)
Maximum thrust clearance:
0.09 mm (0.0035 in.)

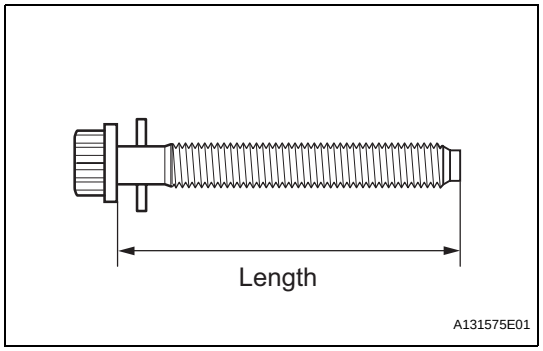


If the thrust clearance is greater than the maximum, replace the balance shaft housing and bearings. If necessary, replace the balance shaft.

52. INSPECT BALANCE SHAFT OIL CLEARANCE

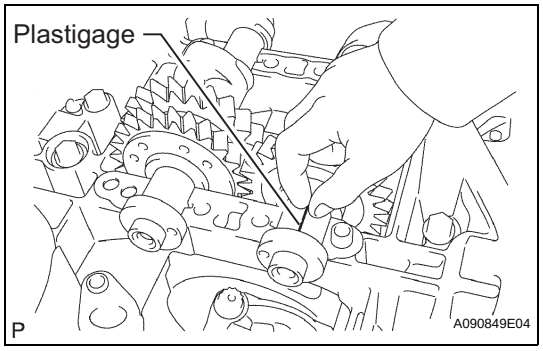
(a) Using several steps, uniformly loosen and remove the 8 bolts in the sequence shown in the illustration.

(b) Remove the balance shaft housing from the crankcase.
HINT:
Keep the lower bearing and balance shaft housing together.



(c) Lift out the No. 1 and No. 2 balance shafts.
HINT:
Keep the upper bearing with the crankcase.

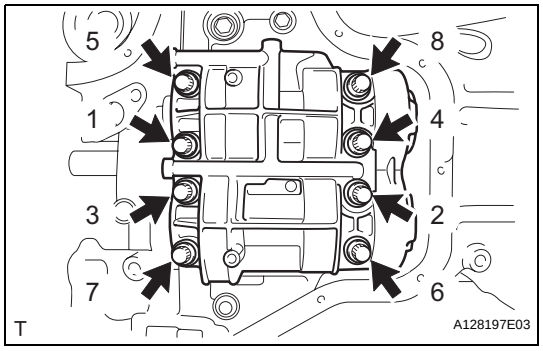
(d) Clean each bearing and journal.



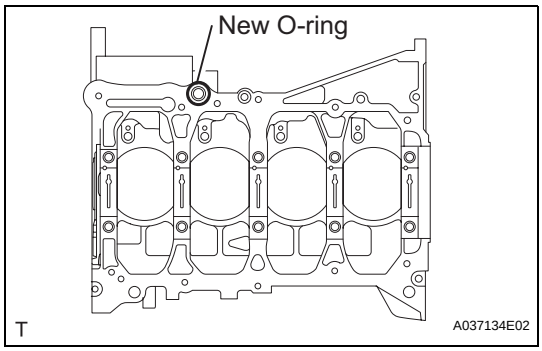
(e) Check each bearing and journal for pitting and scratches.
If a bearing or journal is damaged, replace the bearings. If necessary, replace the balance shaft.

EM

(f) Inspect the balance shaft housing bolt.
(1) Using a vernier caliper, measure the length of the bolts from the seat to the end.
Standard bolt length:
58.3 to 59.7 mm (2.295 to 2.350 in.)
Maximum bolt length:
60.3 mm (2.374 in.)
If the bolt length is greater than the maximum, replace the balance shaft bolt.



(g) Place the No. 1 and No. 2 balance shafts onto the crankcase.



(h) Lay a strip of Plastigage across each journal.

(i) Install the balance shaft housing.

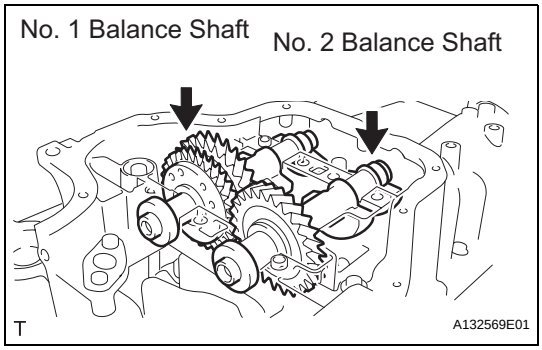
(j) Apply a light coat of engine oil on the threads and under the heads of the bolts.

(k) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 21.6 N*m (220 kgf*cm, 16 ft.*lbf)

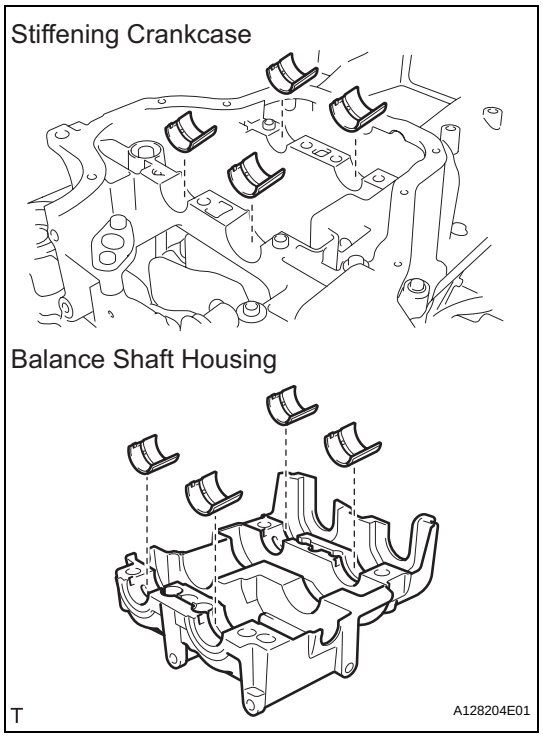
(l) Mark the front of the bolts with paint.
(m) Retighten the bolts 90° as shown in the illustration.
(n) Check that the paint mark is now at a 90° angle to the front.
(o) Remove the balance shaft housing from the crankcase.
(p) Measure the Plastigage at its widest point.

Standard oil clearance:
0.004 to 0.049 mm (0.0002 to 0.0019 in.)
Maximum oil clearance:
0.049 mm (0.0019 in.)
NOTICE:
Remove the Plastigage completely after the measurement.
If the oil clearance is greater than the maximum, replace the bearing. If necessary, replace the balance shaft.
HINT:
If replacing a bearing, select a new one with the same number.

Standard balance shaft housing journal bore diameter

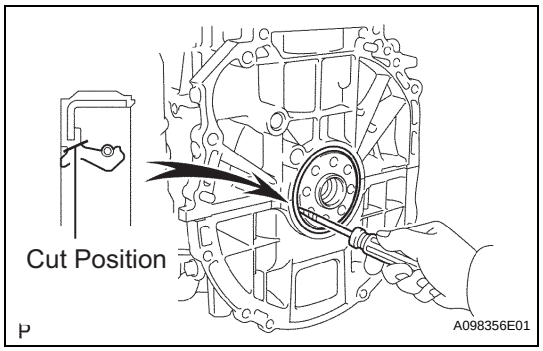


Item	Specified Condition
Mark 1	26.000 to 26.006 mm (1.0236 to 1.0239 in.)
Mark 2	26.007 to 26.012 mm (1.0239 to 1.0214 in.)
Mark 3	26.013 to 26.018 mm (1.0241 to 1.0243 in.)



Standard balance shaft journal diameter:
22.985 to 23.000 mm (0.9049 to 0.9055 in.)

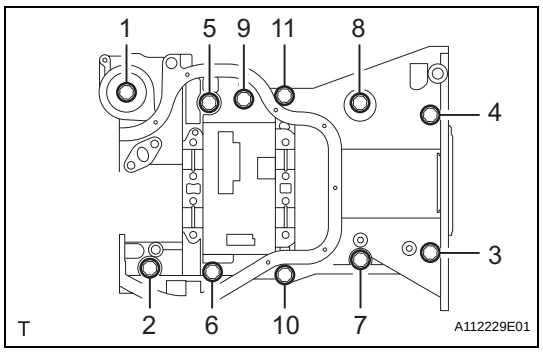
Standard bearing center wall thickness



Item	Specified Condition
Mark 1	1.486 to 1.489 mm (0.05850 to 0.05862 in.)
Mark 2	1.490 to 1.492 mm (0.05866 to 0.05874 in.)
Mark 3	1.493 to 1.495 mm (0.0585 to 0.0586 in.)

53. REMOVE BALANCE SHAFT

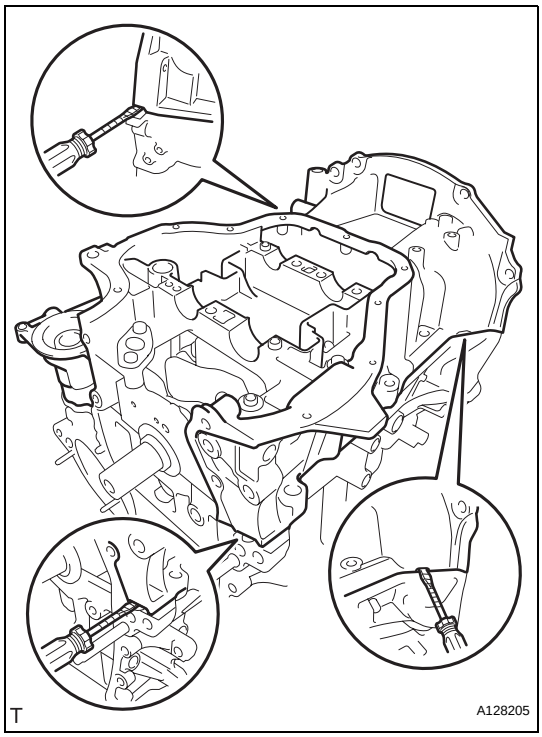
54. REMOVE NO. 1 BALANCE SHAFT BEARING



55. REMOVE ENGINE REAR OIL SEAL

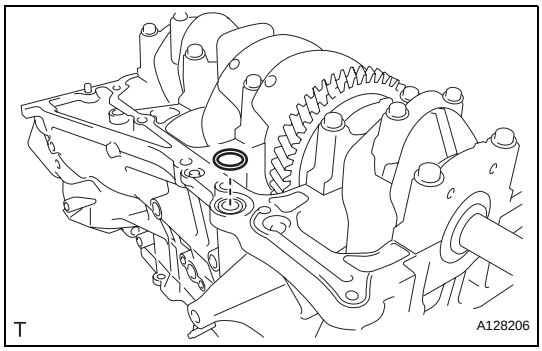
(a) Using a knife, cut off the lip of the oil seal.

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

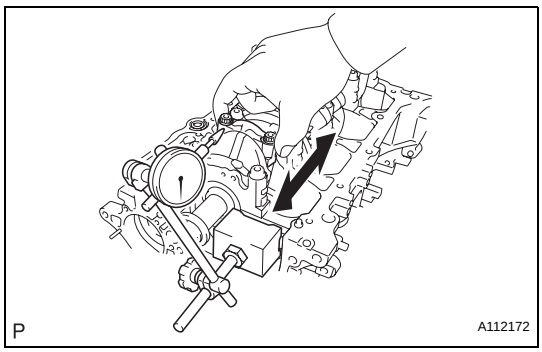


NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

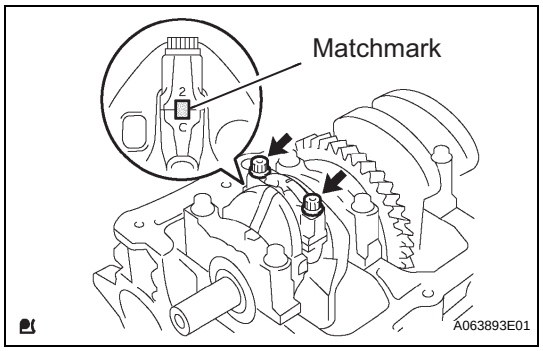


56. REMOVE STIFFENING CRANKCASE ASSEMBLY

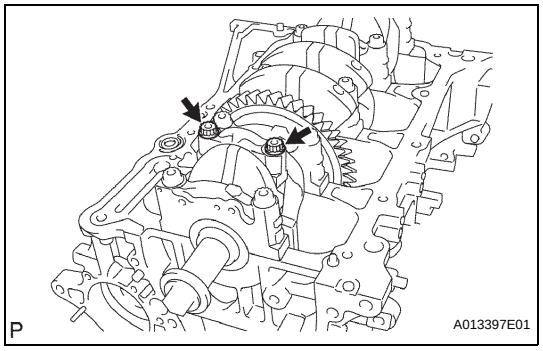


(a) Using several steps, uniformly loosen and remove the 11 bolts in the sequence shown in the illustration.

(b) Remove the crankcase by prying the portions between the crankcase and cylinder block.
NOTICE:
Be careful not to damage the contact surfaces of the crankcase and cylinder bock.



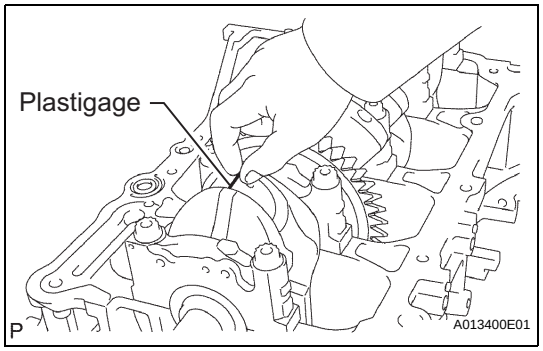
(c) Remove the O-ring from the cylinder block.



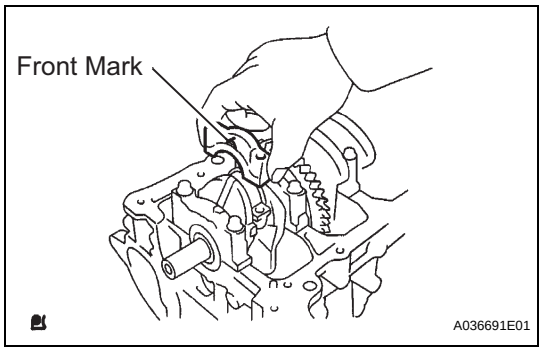
57. INSPECT CONNECTING ROD THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the connecting rod back and forth.
Standard thrust clearance:
0.160 to 0.362 mm (0.0063 to 0.0143 in.)
Maximum thrust clearance:
0.362 mm (0.0143 in.)
If the thrust clearance is greater than the maximum, replace the connecting rod. If necessary, replace the crankshaft.

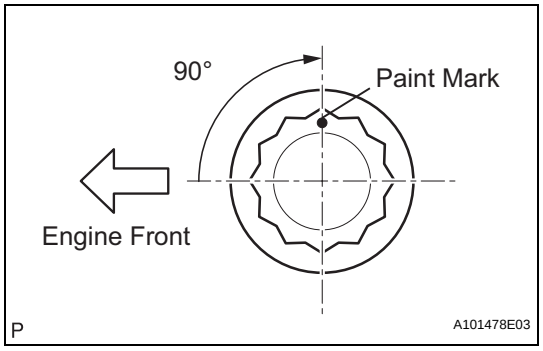
58. INSPECT CONNECTING ROD OIL CLEARANCE
NOTICE:
Do not turn the crankshaft during the measurement.



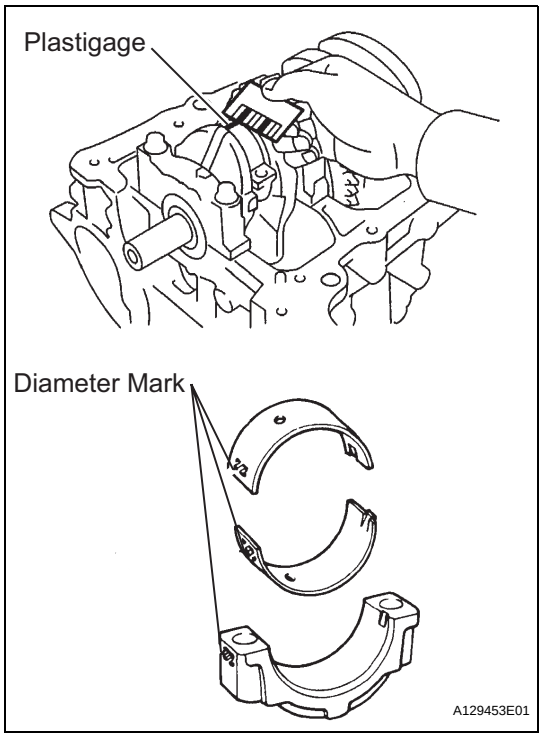
(a) Using marking paint, write the matched cylinder number on each connecting rod and cap.
HINT:
The matchmarks in the connecting rods and caps are for ensuring correct reassembly.



(b) Using a 12 mm socket wrench, remove the 2 bolts and connecting rod cap.
(c) Clean the crank pin and bearing.
(d) Check the crank pin and bearing for pitting and scratches.



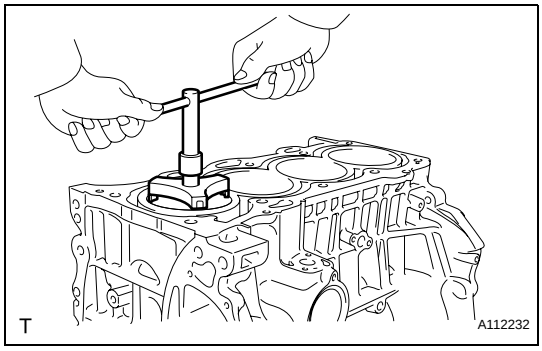
EM



(e) Lay a strip of Plastigage on the crank pin.

(f) Check that the front mark of the connecting rod cap is facing in the correct direction.
(g) Apply a light coat of engine oil to the threads and under the heads of the connecting rod bolts.
(h) Using a 12 mm socket wrench, tighten the bolts in several passes to the specified torque.
Torque: 24.5 N*m (250 kgf*cm, 18 ft.*lbf)

(i) Mark the front of the connecting rod bolts with paint.
(j) Retighten the cap bolts 90° as shown in the illustration.
(k) Check that the crankshaft turns smoothly.
(l) Using a 12 mm socket wrench, remove the 2 bolts and connecting rod cap.

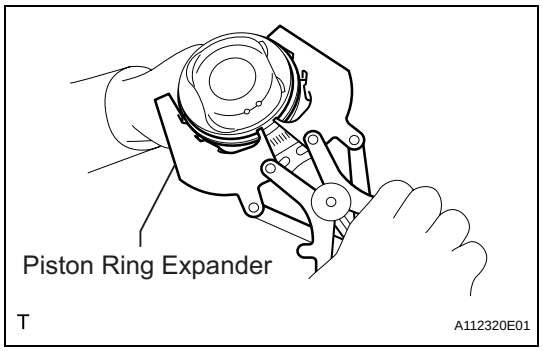


(m) Measure the Plastigage at its widest point.
Standard oil clearance:
0.024 to 0.048 mm (0.0009 to 0.0019 in.)
Maximum oil clearance:
0.08 mm (0.0032 in.)
NOTICE:
Remove the Plastigage completely after the measurement.
If the oil clearance is greater than the maximum, replace the connecting rod bearing. If necessary, grind or replace the crankshaft.
HINT:
If replacing a bearing, select a new one with the same number as marked on the connecting rod. There are 3 sizes of standard bearings, marked "1", "2" and "3" accordingly.
Standard connecting rod large end bore diameter

Mark	Specified Condition
Mark 1	51.000 to 51.007 mm (2.0079 to 2.0082 in.)
Mark 2	51.008 to 51.013 mm (2.0082 to 2.0084 in.)
Mark 3	51.014 to 51.020 mm (2.0084 to 2.0087 in.)

Standard connecting rod bearing thickness

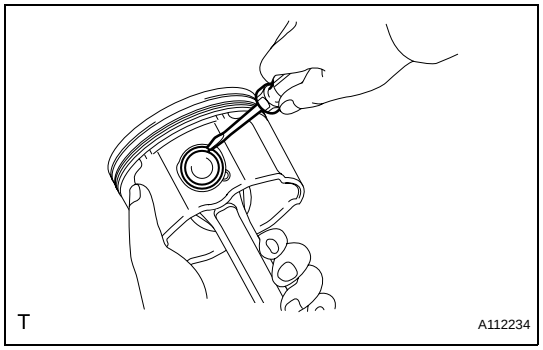
Mark	Specified Condition
Mark 1	1.485 to 1.488 mm (0.0585 to 0.0586 in.)
Mark 2	1.489 to 1.491 mm (0.0586 to 0.0587 in.)
Mark 3	1.492 to 1.494 mm (0.0587 to 0.0588 in.)



Standard crankshaft pin diameter:
47.990 to 48.000 (1.8894 to 1.8898 in.)

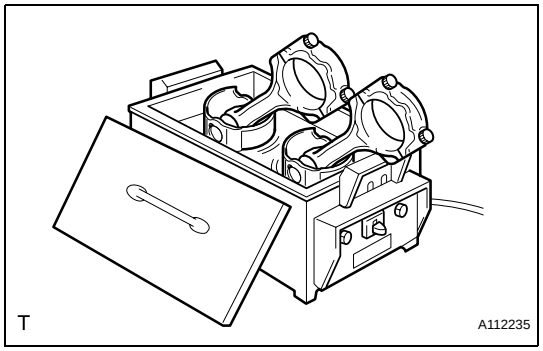
59. REMOVE PISTON WITH CONNECTING ROD

(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.
(b) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.
HINT:
- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.



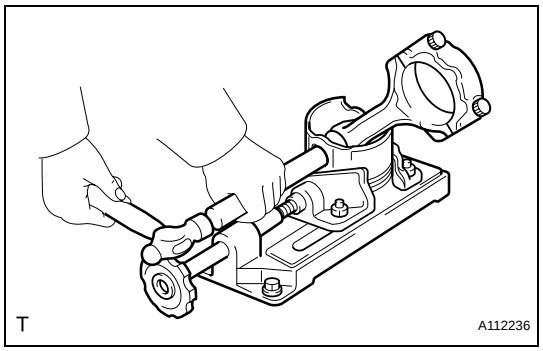
60. REMOVE CONNECTING ROD BEARING

61. REMOVE PISTON RING SET



(a) Using a piston ring expander, remove the 2 compression rings.

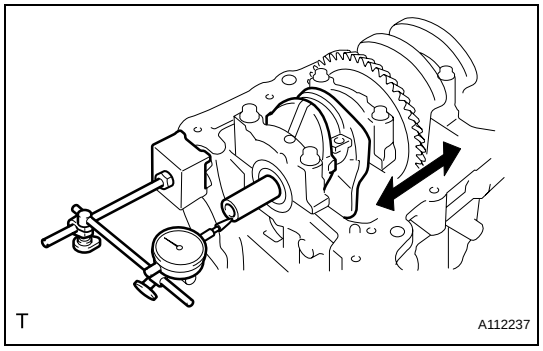
(b) Remove the oil ring and expander by hand.



62. REMOVE PISTON PIN HOLE SNAP RING

(a) Using a small screwdriver, pry out the 2 snap rings.

63. REMOVE PISTON



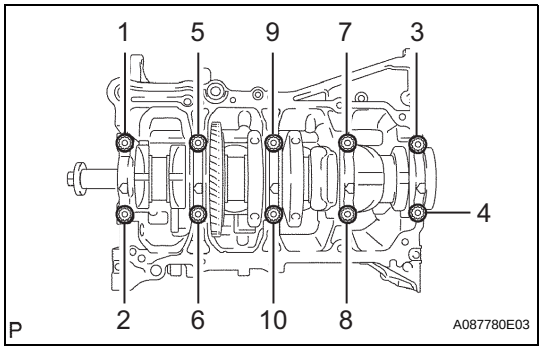
(a) Gradually heat the piston up to 80 to 90°C (176 to 194°F).

(b) Using a plastic-faced hammer and brass bar, lightly tap out the piston pin, then remove the connecting rod.

HINT:

- The piston and pin are a matched set.
- Arrange the piston, pin, ring, connecting rod and bearings in the correct order.

64. INSPECT CRANKSHAFT THRUST CLEARANCE

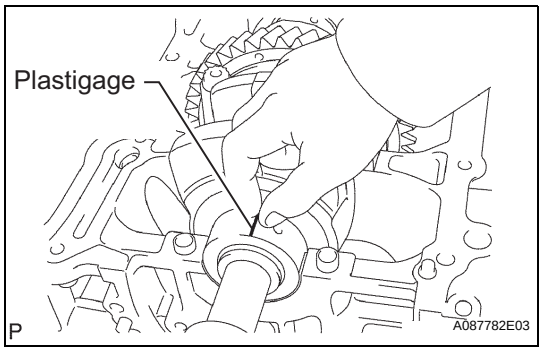


(a) Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

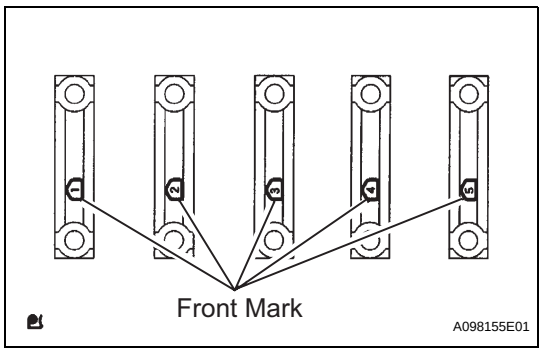
Standard thrust clearance:
0.04 to 0.24 mm (0.0016 to 0.0095 in.)
Maximum thrust clearance:
0.30 mm (0.012 in.)

If the thrust clearance is greater than the maximum, replace the thrust washers as a set.

HINT:
The thrust washer thickness is 1.93 to 1.98 mm (0.0760 to 0.0780 in.).



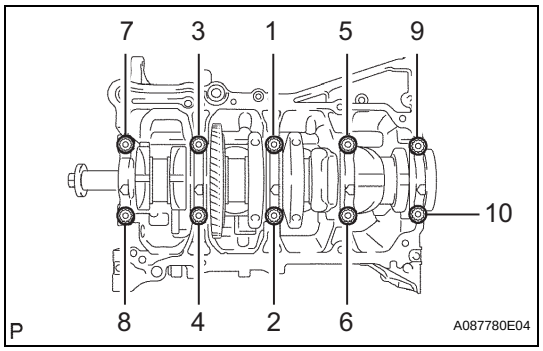
65. INSPECT CRANKSHAFT OIL CLEARANCE
NOTICE:
Do not turn the crankshaft during the measurement.



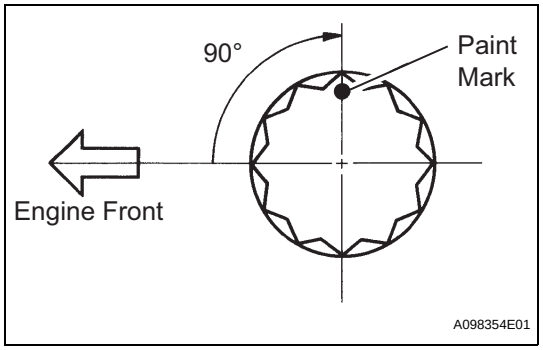
(a) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.
(b) Remove the 5 bearing caps from the cylinder block.
HINT:
- Keep the No. 2 crankshaft bearings and crankshaft bearing caps together.
- Arrange the bearing caps in correct order.

(c) Remove the crankshaft.
HINT:
Keep the crankshaft bearings and crankshaft thrust washer uppers together with the cylinder block.
(d) Clean each main journal and bearing.
(e) Check each main journal and bearing for pitting and scratches.
- If the journal or bearing is damaged, replace the bearings.
- If necessary, replace the crankshaft.

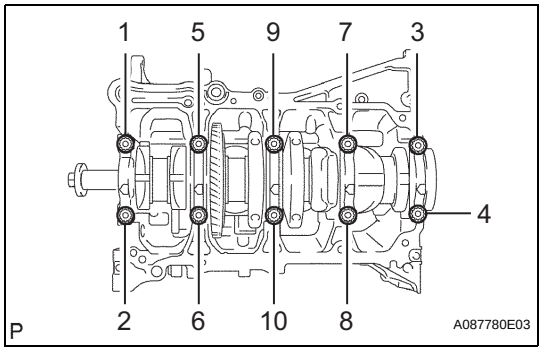
(f) Place the crankshaft onto the cylinder block.



(g) Lay a strip of Plastigage across each journal.

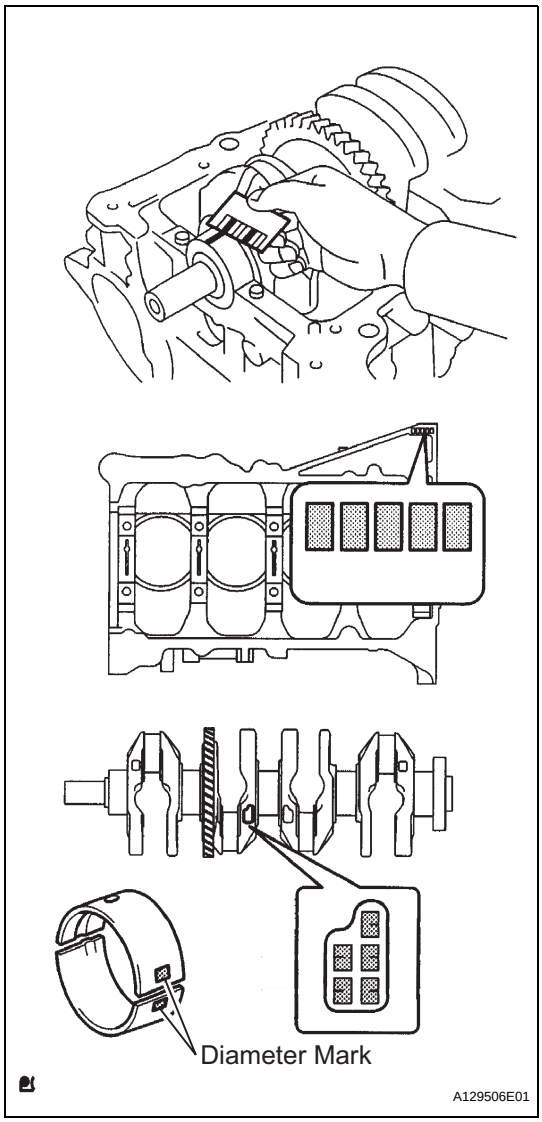


(h) Examine the front marks and numbers, and install the bearing caps onto the cylinder block in the order shown in the illustration.
(i) Apply a light coat of engine oil to the threads and under the heads of the crankshaft bearing cap set bolts.



EM

(j) Using several steps, uniformly install and tighten the 10 bearing cap bolts in the sequence shown in the illustration.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)



(k) Mark the front of the bearing cap bolts with paint.
(l) Retighten the 10 bearing cap bolts by 90°.
(m) Check that the paint marks are at a 90° angle to the front.

(n) Remove the crankshaft bearing caps.

EM

(o) Measure the Plastigage at its widest point.

Standard oil clearance:
0.008 to 0.024 mm (0.0003 to 0.0010 in.)
Maximum oil clearance:
0.050 mm (0.0020 in.)
NOTICE:
Remove the Plastigage completely after the measurement.

If the oil clearance is greater than the maximum, replace the crankshaft bearing. If necessary, replace the crankshaft.

HINT:

If replacing a bearing, select a new one with the same number. If the number of the bearing cannot be determined, calculate the correct bearing number by adding together the numbers imprinted on the cylinder block and crankshaft. Then select a new bearing with the calculated number. There are 4 sizes of standard bearings, marked "1", "2", "3" and "4" accordingly.

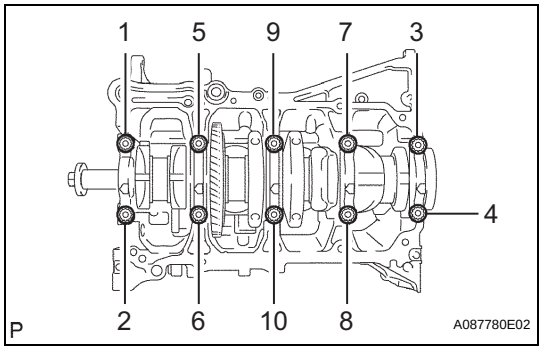
Cylinder block + Crankshaft	0 to 2	3 to 5	6 to 8	9 to 11
Use bearing	"1"	"2"	"3"	"4"

EXAMPLE

- Imprinted number on the cylinder block is 3.
- Imprinted number on the crankshaft is 4.
  3 + 4 = 7
  Select the bearing marked "3".

Standard cylinder block journal bore diameter

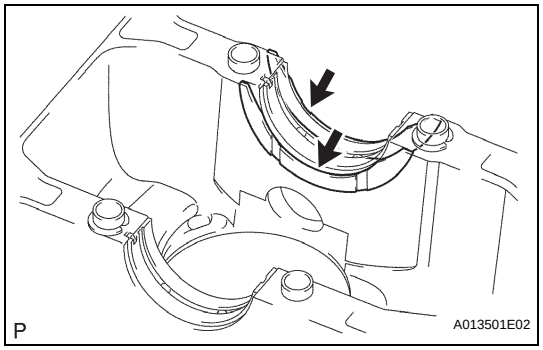
Mark	Specified Condition
0	59.000 to 59.002 mm (2.3228 to 2.3229 in.)
1	59.003 to 59.004 mm (2.3230 to 2.3230 in.)
2	59.005 to 59.006 mm (2.3230 to 2.3231 in.)
3	59.007 to 59.009 mm (2.3231 to 2.3232 in.)
4	59.010 to 59.011 mm (2.3232 to 2.3233 in.)
5	59.012 to 59.013 mm (2.3233 to 2.3234 in.)
6	59.014 to 59.016 mm (2.3234 to 2.3235 in.)



Standard crankshaft journal diameter

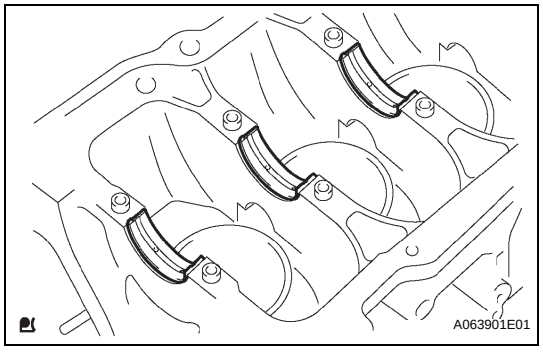
Mark	Specified Condition
0	54.999 to 55.000 mm (2.1653 to 2.1654 in.)
1	54.997 to 54.998 mm (2.1652 to 2.1653 in.)
2	54.995 to 54.996 mm (2.1652 to 2.1652 in.)
3	54.993 to 54.994 mm (2.1651 to 2.1651 in.)

Mark	Specified Condition
4	54.991 to 54.992 mm (2.1650 to 2.1650 in.)
5	54.988 to 54.990 mm (2.1649 to 2.1650 in.)



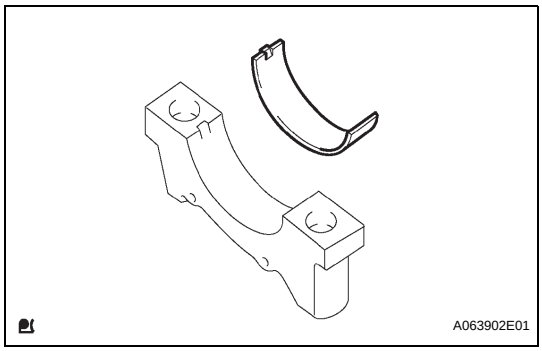
Standard bearing center wall thickness

Mark	Specified Condition
1	1.993 to 1.996 mm (0.0785 to 0.0786 in.)
2	1.997 to 1.999 mm (0.0786 to 0.0787 in.)
3	2.000 to 2.002 mm (0.0787 to 0.0788 in.)
4	2.003 to 2.005 mm (0.0789 to 0.0789 in.)



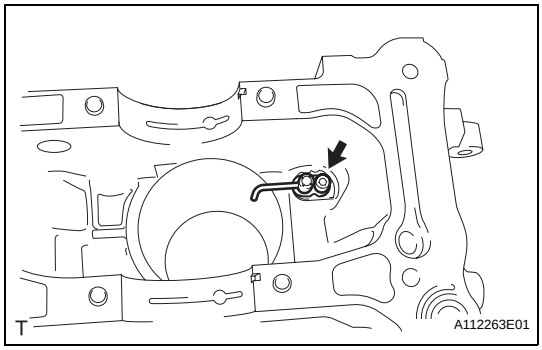
66. REMOVE CRANKSHAFT

(a) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.
(b) Remove the 5 bearing caps from the cylinder block.
(c) Remove the crankshaft from the cylinder block.



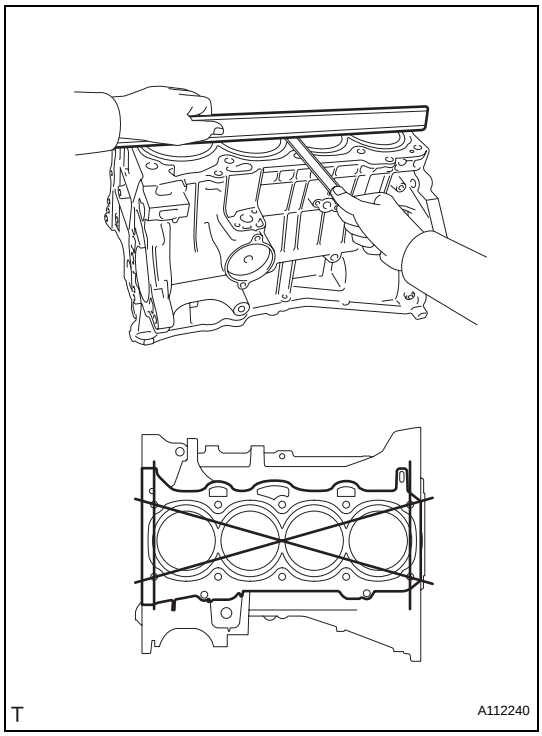
67. REMOVE CRANKSHAFT THRUST WASHER UPPER

68. REMOVE CRANKSHAFT BEARING



HINT:
Arrange the bearings in the correct order.

69. REMOVE NO. 2 CRANKSHAFT BEARING



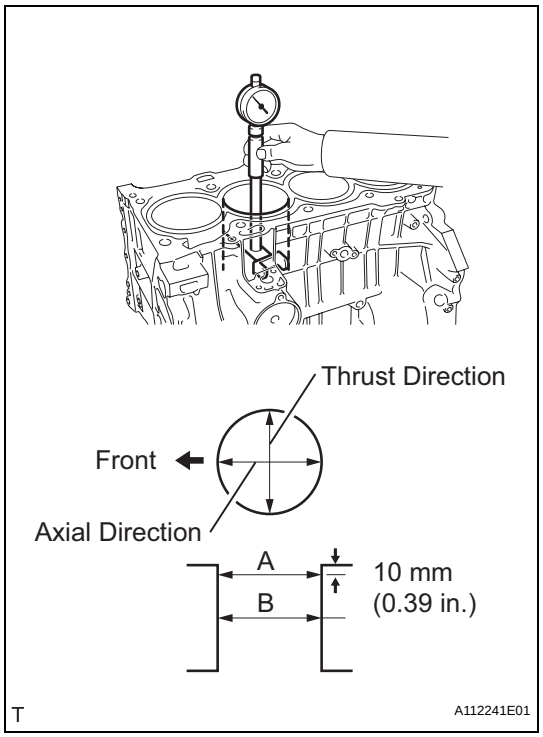
HINT:

Arrange the bearings in the correct order.

70. REMOVE NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Remove the 4 bolts and 4 oil nozzles.

INSPECTION



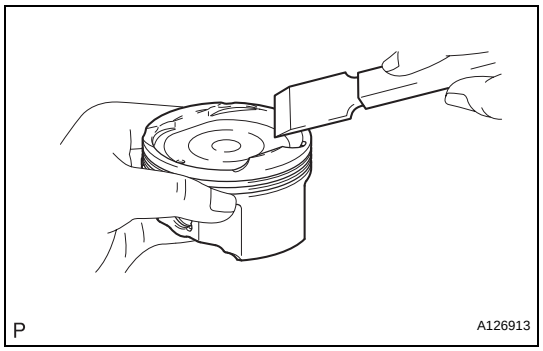
1. INSPECT CYLINDER BLOCK FOR WARPAGE

(a) Using a precision straightedge and feeler gauge, measure the warpage of the surface that is in contact with the cylinder head gasket.

Maximum warpage:

0.05 mm (0.0020 in.)

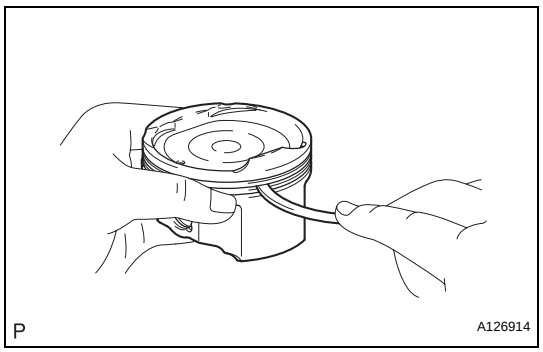
If the warpage is greater than the maximum, replace the cylinder block.



2. INSPECT CYLINDER BORE

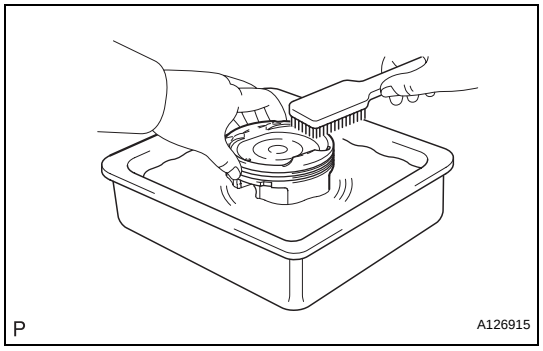
(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A and B in the thrust and axial directions.

Standard diameter:
88.500 to 88.513 mm (3.4843 to 3.4847 in.)
Maximum diameter:
88.633 mm (3.4894 in.)



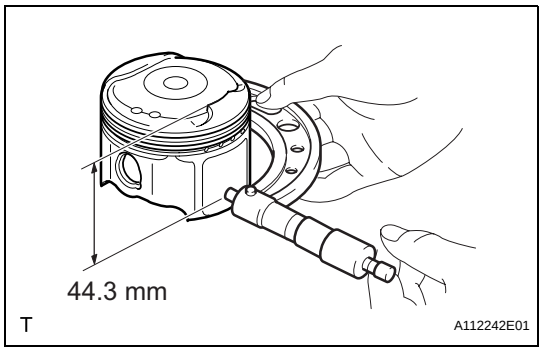
If the average diameter of the 4 positions is greater than the maximum, replace the cylinder block.

EM



3. INSPECT PISTON

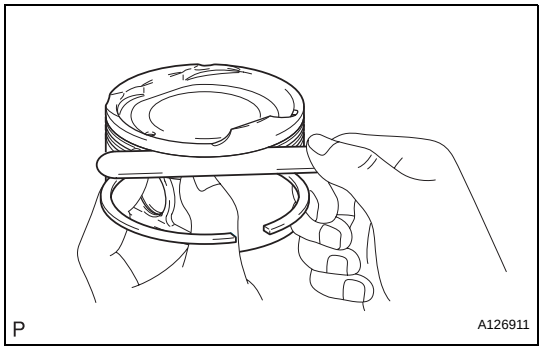
(a) Using a gasket scraper, remove the carbon from the piston top.



(b) Using a groove cleaning tool or a broken ring, clean the piston ring grooves.

(c) Using a brush and solvent, thoroughly clean the piston.

NOTICE:
Do not use a wire brush.

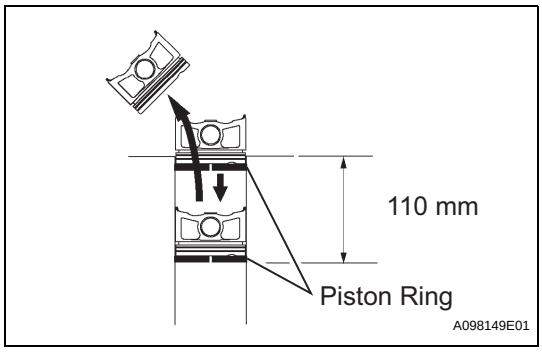


(d) Using a micrometer, measure the piston diameter at right angles to the piston pin hole, and at the piston 44.3 mm (1.7587 in.) from the piston head.
Standard piston diameter:
88.477 to 88.487 mm (3.5125 to 3.5129 in.)
If the diameter is not as specified, replace the piston.

4. INSPECT PISTON OIL CLEARANCE

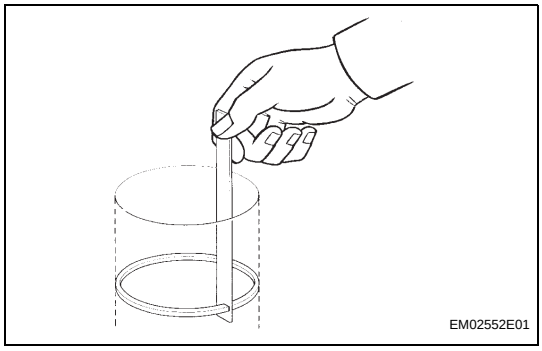
(a) Subtract the piston diameter measurement from the cylinder bore diameter measurement.
Standard oil clearance:
0.021 to 0.044 mm (0.0008 to 0.0017 in.)
Maximum oil clearance:
0.10 mm (0.0039 in.)
If the oil clearance is greater than the maximum, replace all the pistons. If necessary, replace the cylinder block.

EM



5. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between the new piston ring and wall of the ring groove.
Standard ring groove clearance



Item	Specified Condition
No. 1 ring	0.020 to 0.070 mm (0.0008 to 0.0028 in.)
No. 2 ring	0.020 to 0.060 mm (0.0008 to 0.0024 in.)
Oil ring	0.020 to 0.070 mm (0.0008 to 0.0028 in.)

If the groove clearance is not as specified, replace the piston.

6. INSPECT PISTON RING END GAP

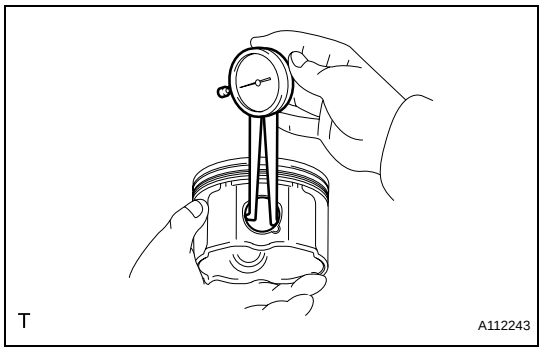
(a) Using a piston, push the piston ring a little beyond the bottom of the ring travel, 110 mm (4.33 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.
Standard end gap

Item	Specified Condition
No. 1 ring	0.24 to 0.31 mm (0.0094 to 0.0122 in.)
No. 2 ring	0.33 to 0.43 mm (0.0130 to 0.0169 in.)
Oil ring	0.10 to 0.30 mm (0.0040 to 0.0119 in.)

Maximum end gap

Item	Specified Condition
No. 1 ring	0.89 mm (0.0350 in.)



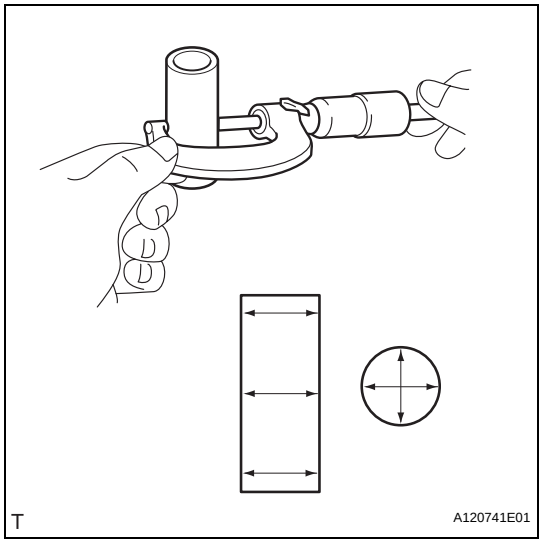
Item	Specified Condition
No. 2 ring	1.37 mm (0.0539 in.)
Oil ring	0.73 mm (0.0287 in.)

If the end gap is greater than the maximum, replace the piston ring. If the end gap is greater than the maximum, even with a new piston ring, replace the cylinder block.

7. INSPECT PISTON PIN OIL CLEARANCE

(a) Using a caliper gauge, measure the piston pin bore diameter.

Standard piston pin bore diameter:
22.001 to 22.010 mm (0.8662 to 0.8665 in.)

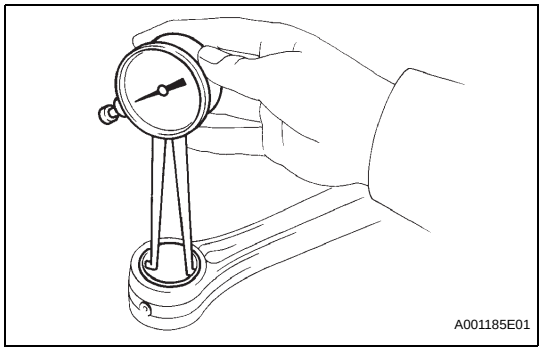


Item	Specified Condition
A	22.001 to 22.004 mm (0.8662 to 0.8663 in.)
B	22.005 to 22.007 mm (0.8663 to 0.8664 in.)
C	22.008 to 22.010 mm (0.8665 to 0.8665 in.)

If the diameter is not as specified, replace the piston.

(b) Using a micrometer, measure the piston pin diameter.

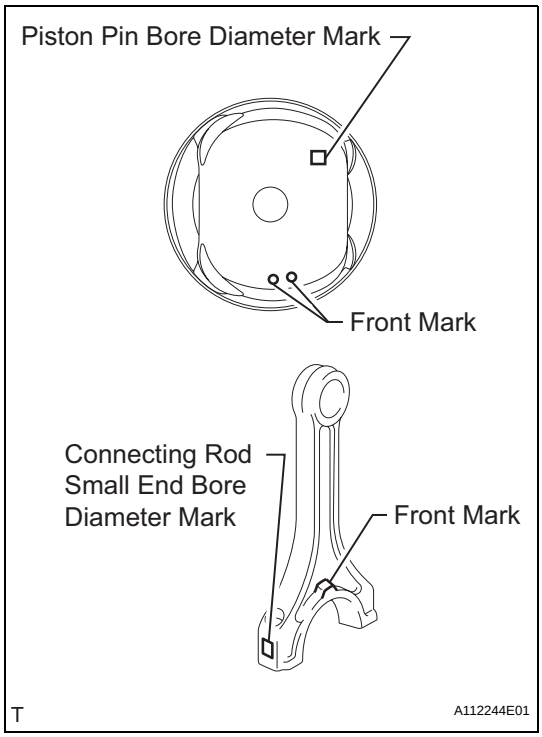
Standard piston pin diameter:
21.997 to 22.006 mm (0.8660 to 0.8664 in.)



Item	Specified Condition
A	21.997 to 22.000 mm (0.8660 to 0.8661 in.)
B	22.001 to 22.003 mm (0.8662 to 0.8663 in.)
C	22.004 to 22.006 mm (0.8663 to 0.8664 in.)

If the diameter is not as specified, replace the piston pin.

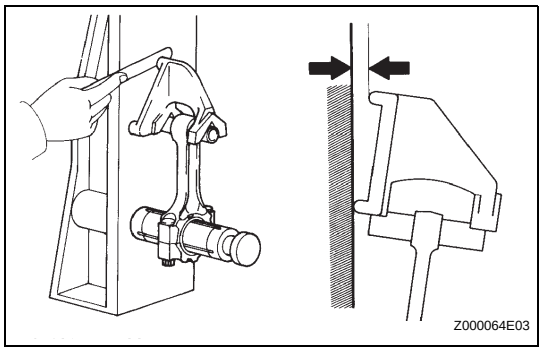
(c) Using a caliper gauge, measure the connecting rod small end bore diameter.



Standard connecting rod small end bore diameter:
22.005 to 22.014 mm (0.8663 to 0.8667 in.)

Item	Specified Condition
A	22.005 to 22.008 mm (0.8663 to 0.8665 in.)
B	22.009 to 22.011 mm (0.8665 to 0.8666 in.)
C	22.012 to 22.014 mm (0.8666 to 0.8667 in.)

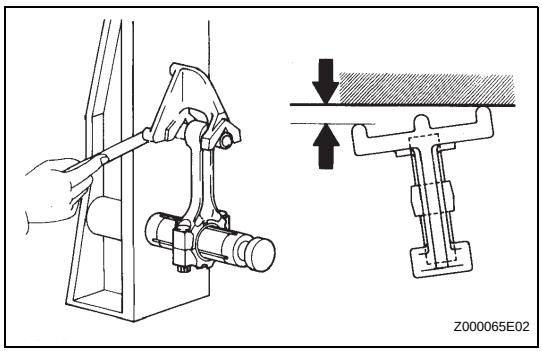
If the diameter is not as specified, replace the connecting rod.



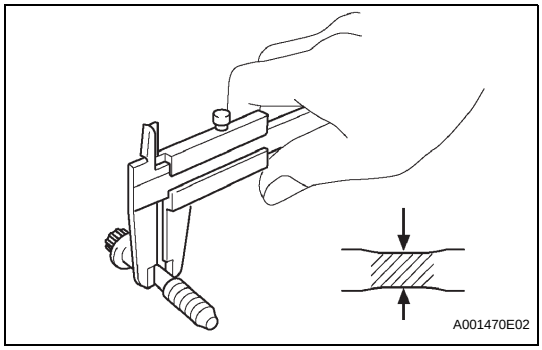
EM

(d) Subtract the piston pin diameter measurement from the piston pin bore diameter measurement.
Standard oil clearance:
0.001 to 0.007 mm (0.00004 to 0.0003 in.)
Maximum oil clearance:
0.013 mm (0.0005 in.)
If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the piston and piston pin as a set.

(e) Subtract the piston pin diameter measurement from the connecting rod small end bore diameter measurement.
Standard oil clearance:
0.005 to 0.011 mm (0.0002 to 0.0004 in.)
Maximum oil clearance:
0.017 mm (0.0007 in.)
If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the connecting rod and piston pin as a set.



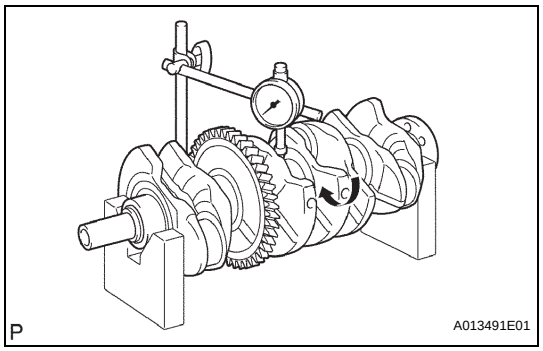
EM



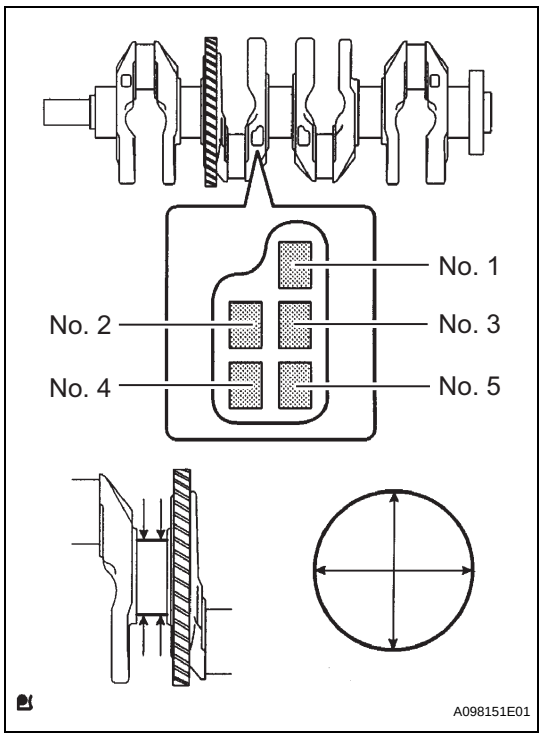
8. INSPECT CONNECTING ROD SUB-ASSEMBLY

(a) Using a connecting rod aligner and feeler gauge, check the connecting rod alignment.

(1) Check for misalignment.
Maximum misalignment:
0.05 mm (0.0020 in.) per 100 mm (3.94 in.)
If the misalignment is greater than the maximum, replace the connecting rod.



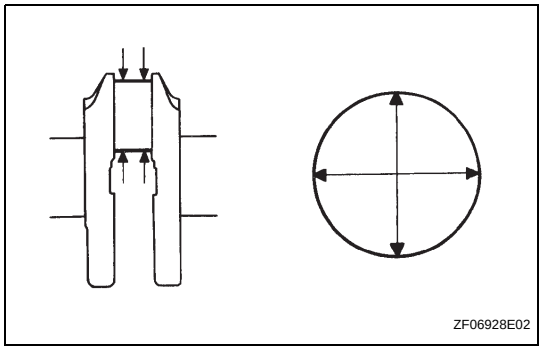
(2) Check for twist.
Maximum twist:
0.15 mm (0.0059 in.) per 100 mm (3.94 in.)
If the twist is greater than the maximum, replace the connecting rod.



9. INSPECT CONNECTING ROD BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolt.
Standard diameter:
7.2 to 7.3 mm (0.283 to 0.287 in.)
Maximum diameter:
7.0 mm (0.276 in.)
If the diameter is less than the minimum, replace the connecting rod bolt.

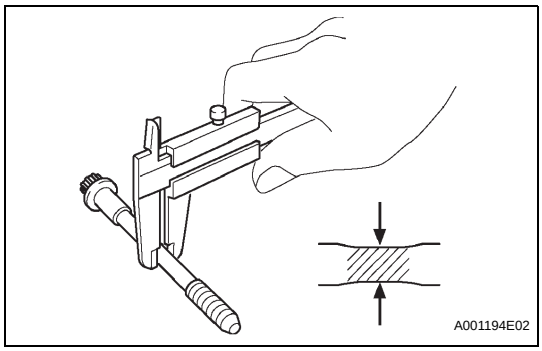
10. INSPECT CRANKSHAFT



(a) Using a dial indicator and V-blocks, measure the circle runout as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.

(b) Using a micrometer, measure the diameter of each main journal.
Standard diameter:
54.988 to 55.000 mm (2.1830 to 2.1654 in.)
If the diameter is not as specified, check the crankshaft oil clearance.

(c) Check each main journal for taper and distortion as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.
Standard diameter (Reference)



Mark	Specified Condition
0	54.999 to 55.000 mm (2.1653 to 2.1654 in.)
1	54.997 to 54.998 mm (2.1652 to 2.1653 in.)
2	54.995 to 54.996 mm (2.1652 to 2.1652 in.)
3	54.993 to 54.994 mm (2.1651 to 2.1651 in.)
4	54.991 to 54.992 mm (2.1650 to 2.1650 in.)
5	54.998 to 54.990 mm (2.1649 to 2.1650 in.)

(d) Using a micrometer, measure the diameter of each crank pin.
Standard diameter:
47.990 to 48.000 mm (1.8894 to 1.8898 in.)
If the diameter is not as specified, check the connecting rod oil clearance.

(e) Inspect each crank pin for taper and distortion as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.

EM

11. INSPECT CRANKSHAFT BEARING CAP SET BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolts.

Standard diameter:

7.5 to 7.6 mm (0.295 to 0.299 in.)

Minimum diameter:

7.5 mm (0.295 in.)

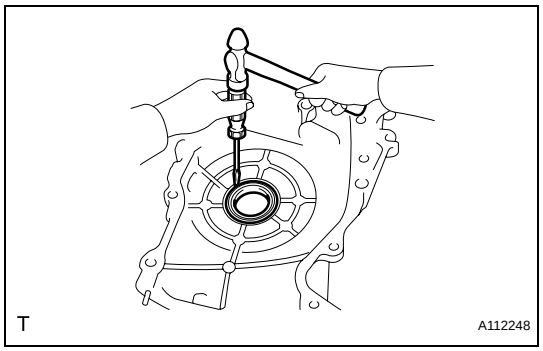
If the diameter is less than the minimum, replace the bolt.

REPLACEMENT

1. REPLACE TIMING CHAIN COVER OIL SEAL

HINT:

There are 2 methods to replace the oil seal.



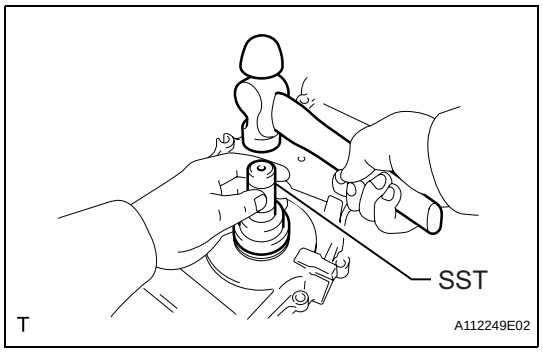
(a) If the timing chain cover is removed from the cylinder block:

(1) Using a screwdriver and hammer, tap out the oil seal.

(2) Apply multi-purpose grease to the lip of a new oil seal.

NOTICE:

Keep the lip free of foreign objects.



(3) Using SST and a hammer, tap in the new oil seal until its surface is flush with the timing chain cover edge.

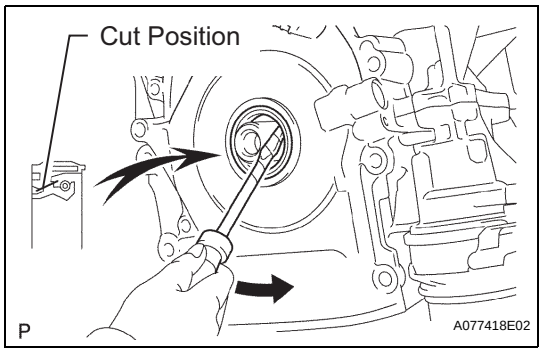
SST 09223-22010

NOTICE:

Do not tap the oil seal at an angle.

(b) If the timing chain cover oil seal is installed to the cylinder block:

(1) Remove the fan and generator V belt (see page EM-6).



(2) Remove the crankshaft pulley (see page EM-25).

(3) Using a knife, cut off the lip of the oil seal.

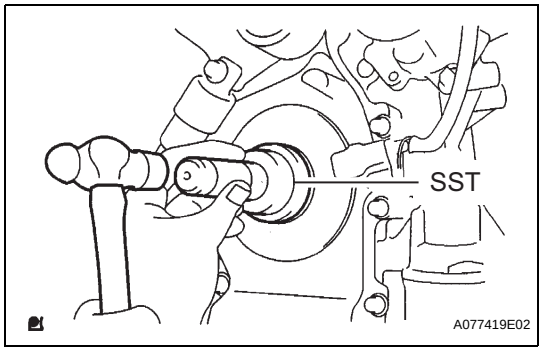
(4) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

(5) Apply multi-purpose grease to the lip of a new oil seal.

NOTICE:

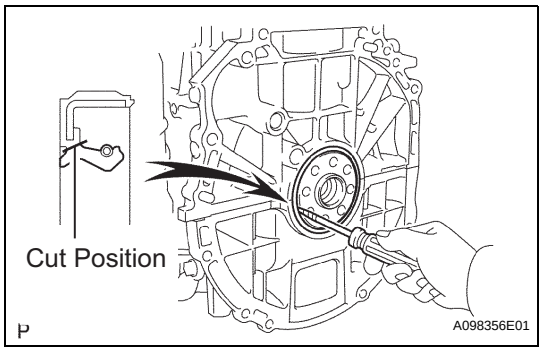


Keep the lip free of foreign objects.

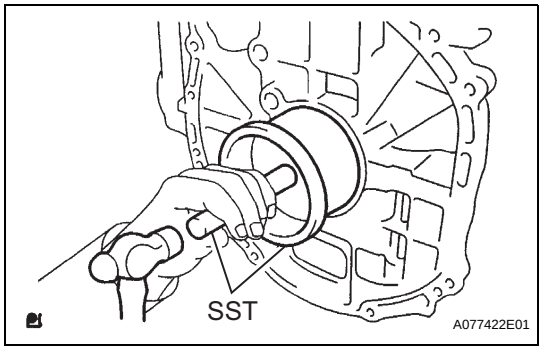
(6) Using SST and a hammer, tap in the new oil seal until its surface is flush with the timing chain cover edge.

SST 09223-22010

NOTICE:



Do not tap the oil seal at an angle.



(7) Install the crankshaft pulley (see page EM-38).

(8) Install the fan and generator V belt (see page EM-7).

EM

2. REPLACE ENGINE REAR OIL SEAL

(a) Using a knife, cut off the lip of the oil seal.

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

NOTICE:
After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

(c) Apply multi-purpose grease to the lip of a new oil seal.

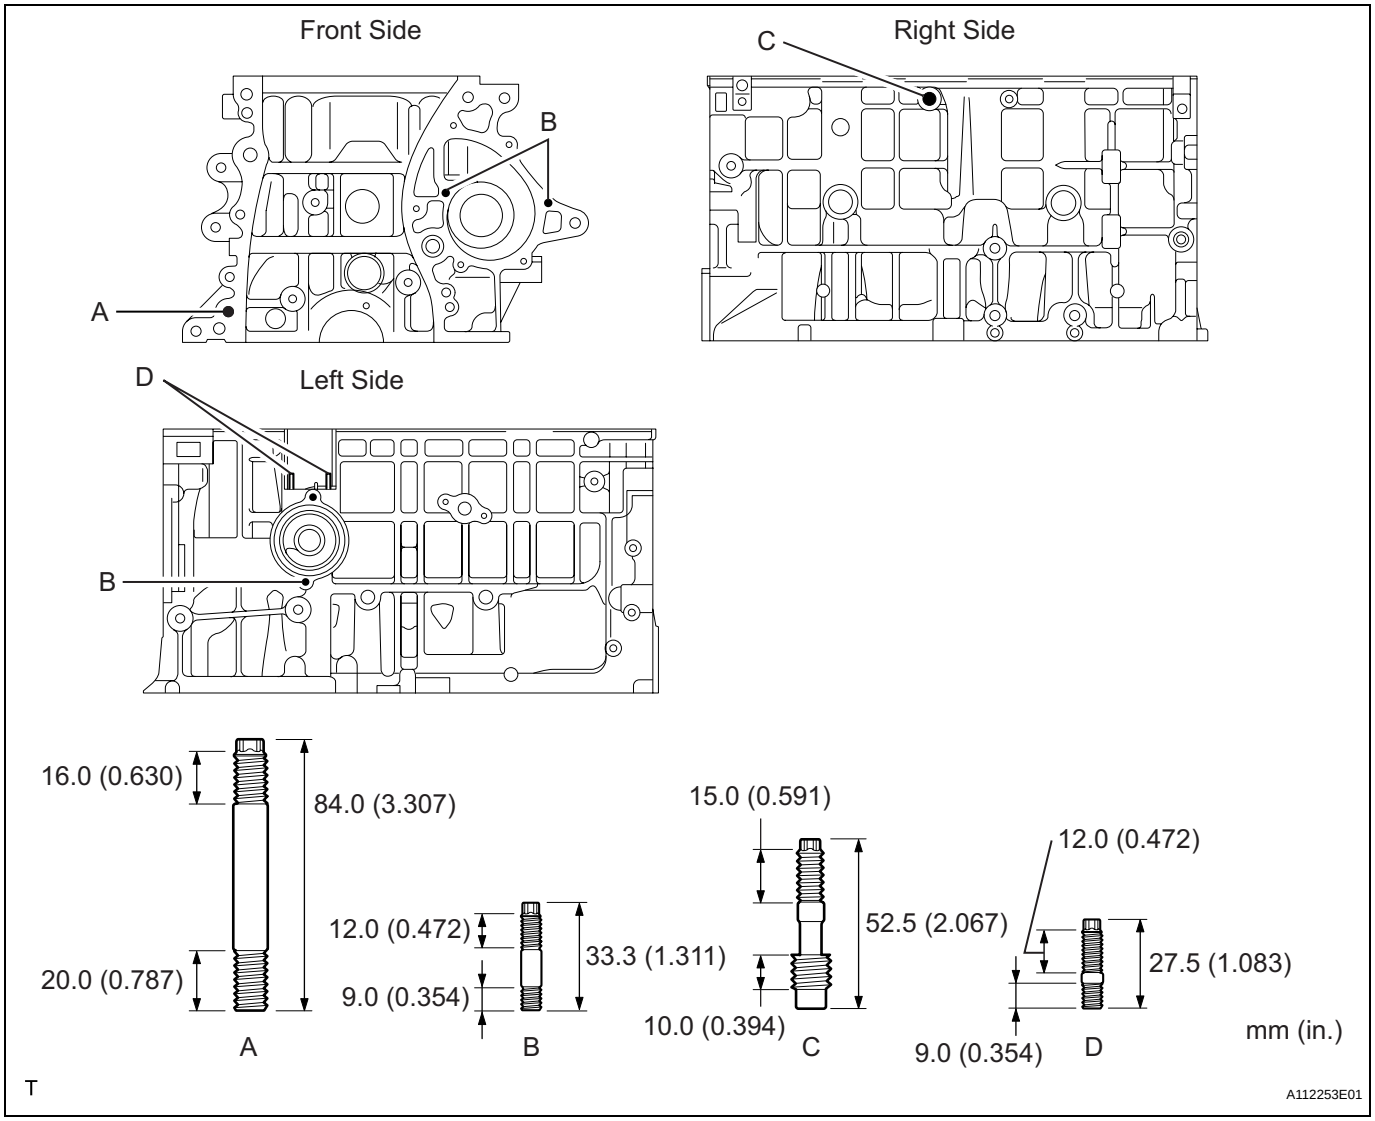
NOTICE:
Keep the lip free of foreign objects.

(d) Using SST and a hammer, tap in the new oil seal until its surface is flush with the rear oil seal retainer edge.

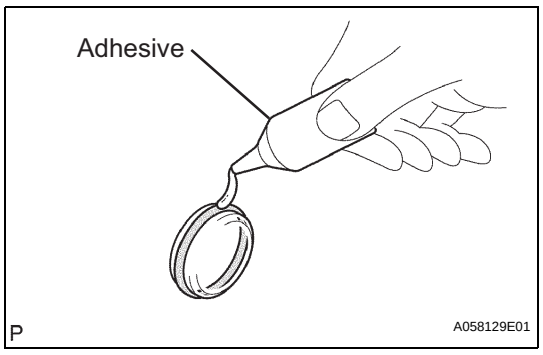
SST 09223-15030, 09950-70010 (09951-07100)

NOTICE:
- **Wipe any extra grease off the crankshaft.**
- **Do not tap the oil seal at an angle.**

3. REPLACE STUD BOLT (for Cylinder Block)



NOTICE:
If the stud bolt is deformed or the threads are damaged, replace it.



(a) Remove the 8 stud bolts.

(b) Install the 8 stud bolts into the cylinder block.

Torque

Item	Specified Condition
A	5.0 N*m (51 kgf*cm, 44 in.*lbf)
B	21.5 N*m (219 kgf*cm, 16 ft.*lbf)
C	5.0 N*m (51 kgf*cm, 44 in.*lbf)
D	5.0 N*m (51 kgf*cm, 44 in.*lbf)

4. REPLACE TIGHT PLUG (for Cylinder Block)

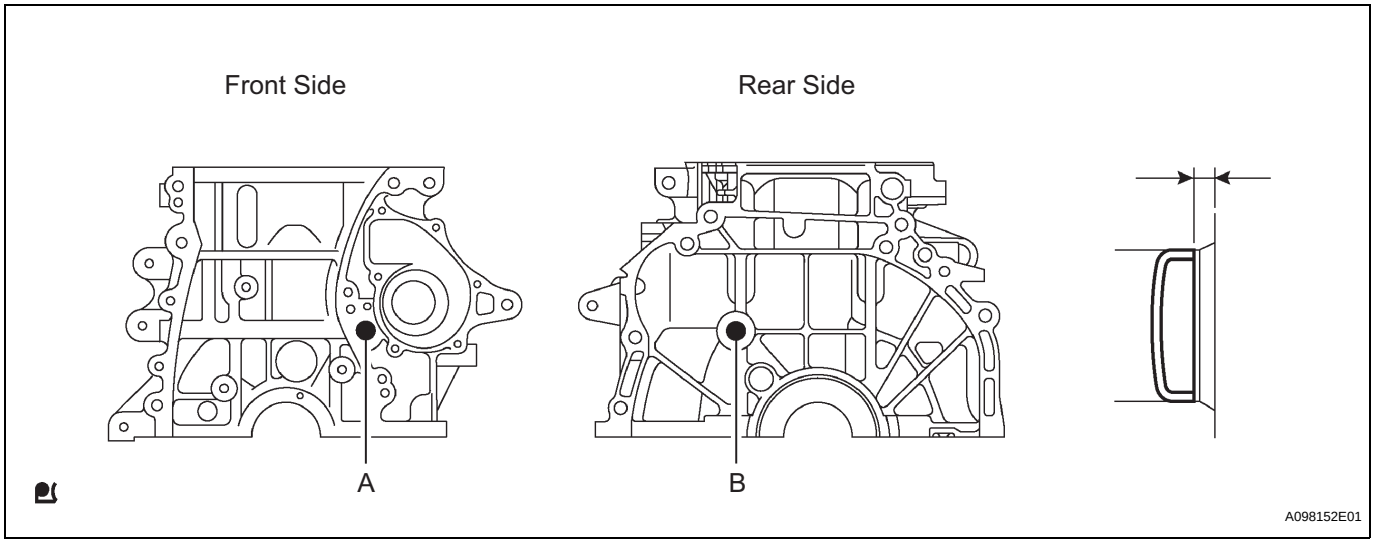
NOTICE:

If water leaks from the tight plug or the plug corrodes, replace it.

(a) Remove the 2 tight plugs from the engine front and rear side.

(b) Apply adhesive around new tight plugs.

Adhesive:



Toyota Genuine Adhesive 1342, Three Bond 1342 or Equivalent

(c) Using SST, install the 2 tight plugs.

SST 09950-60010 (09951-00200), 09950-70010 (09951-07100)

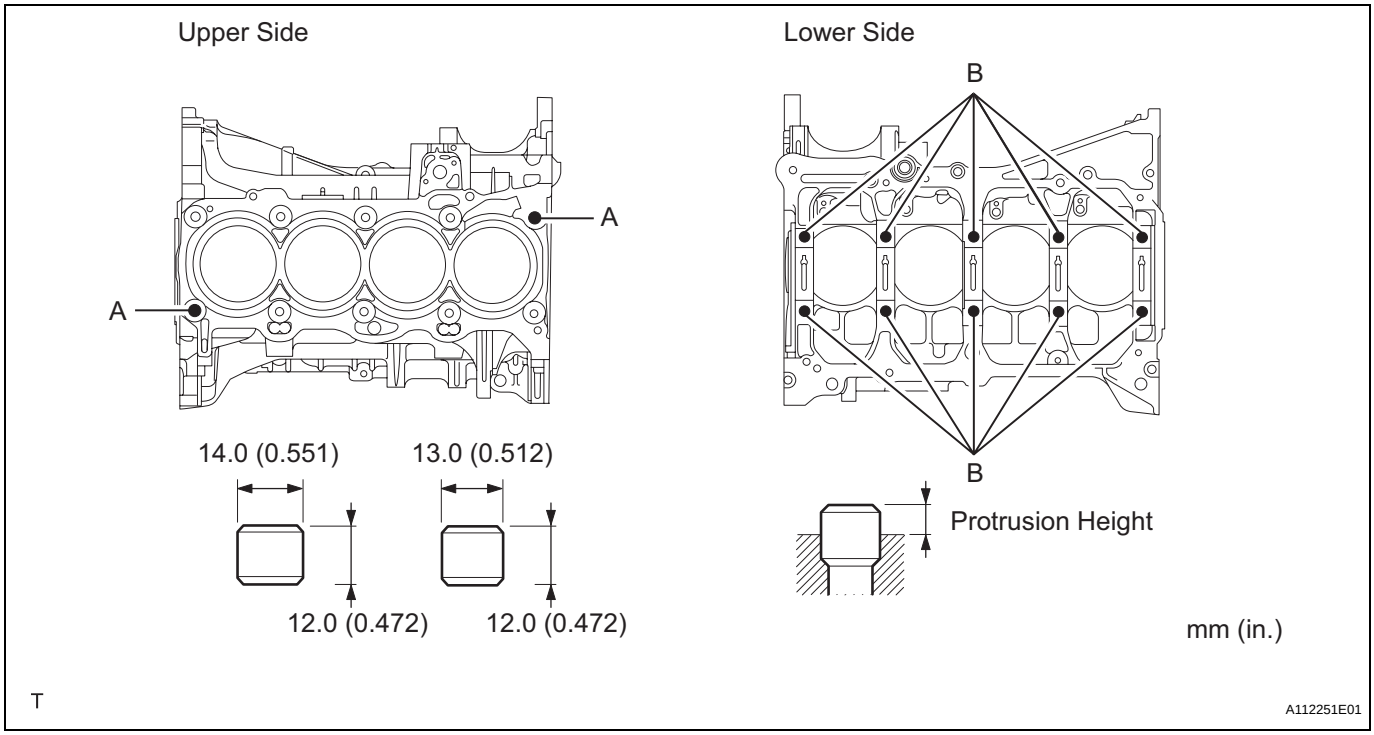
Standard depth

Item	Specified Condition
A	1.7 to 2.7 mm (0.067 to 0.106 in.)
B	2.2 to 3.2 mm (0.087 to 0.126 in.)

EM

5. REPLACE RING PIN (for Cylinder Block)

NOTICE:



It is not necessary to remove with head pin unless it is being replaced.

(a) Remove the 12 ring pins.

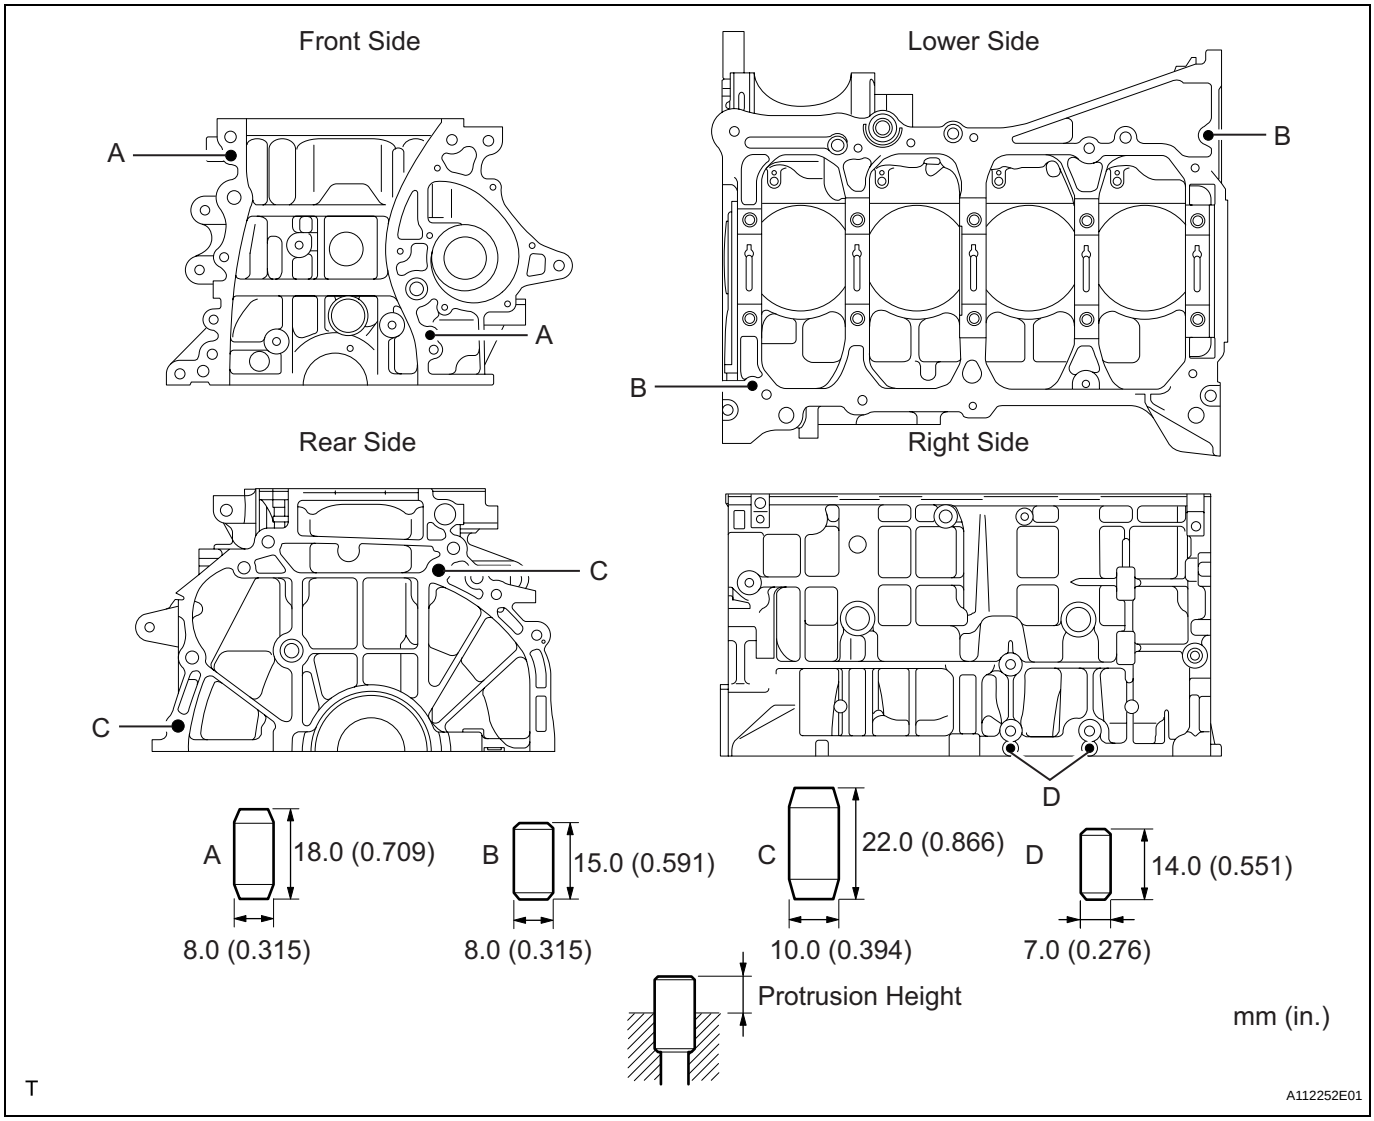
(b) Using a plastic-faced hammer, install 12 new ring pins.

Standard protrusion height

Item	Specified Condition
A	6.0 mm (0.236 in.)
B	5.0 mm (0.197 in.)

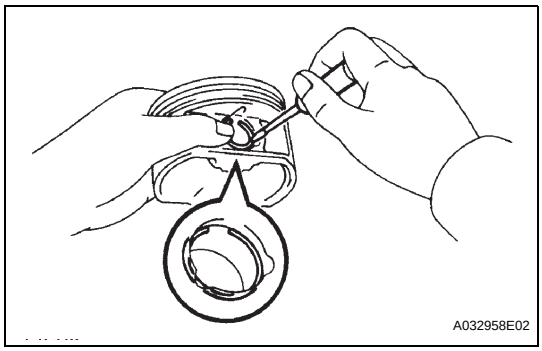
6. REPLACE STRAIGHT PIN (for Cylinder Block)

NOTICE:



It is not necessary to remove with straight pin unless it is being replaced.

(a) Remove the 8 straight pins.

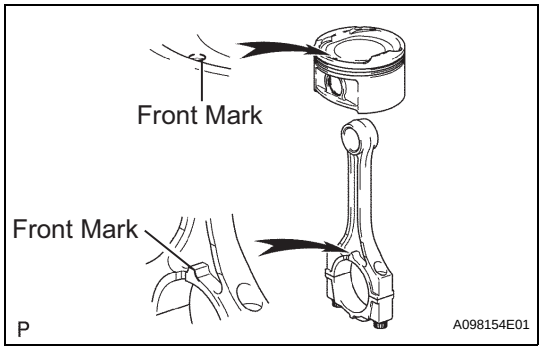


(b) Using a plastic-faced hammer, install 8 new straight pins.

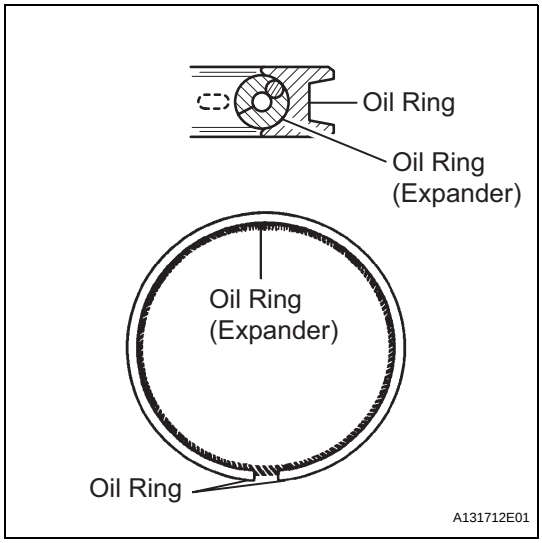
Standard protrusion height

Item	Specified Condition
A	8.0 mm (0.315 in.)
B	7.5 mm (0.295 in.)
C	12.0 mm (0.472 in.)
D	5.0 mm (0.197 in.)

EM



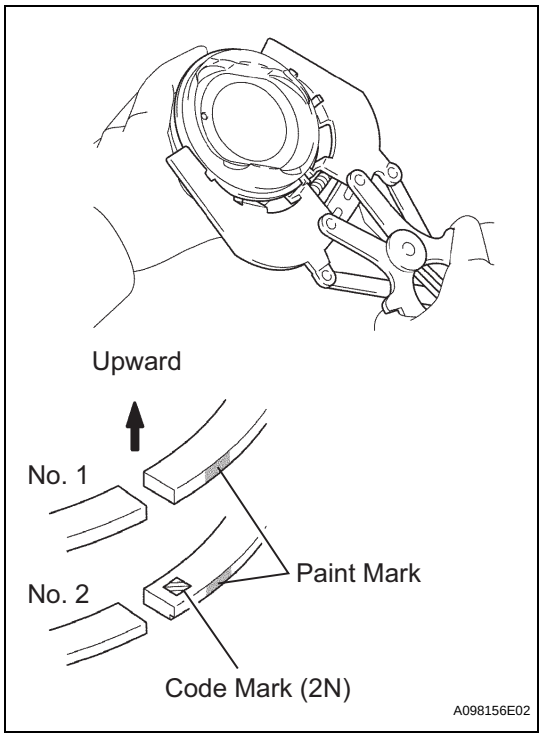
REASSEMBLY



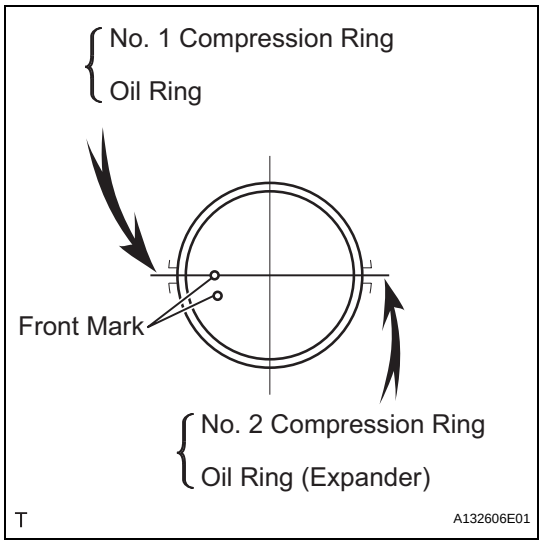
1. INSTALL PISTON

(a) Using a small screwdriver, install a new snap ring onto one end of the piston pin hole.
HINT:
Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

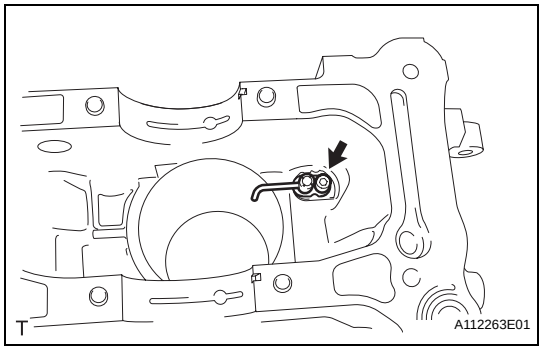
(b) Gradually heat the piston up to 80 to 90°C (176 to 194°F).



(c) Align the front marks of the piston and connecting rod, then push in the piston pin with your thumb until the pin comes into contact with the snap pin hole.
HINT:
Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

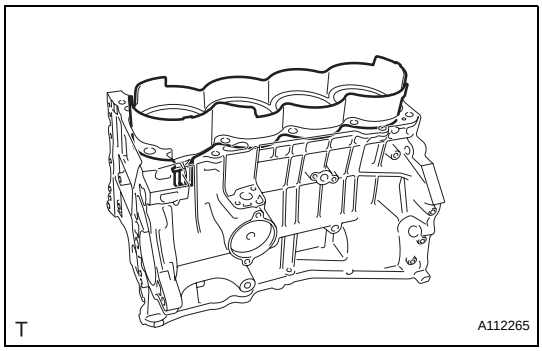


2. INSTALL PISTON RING SET

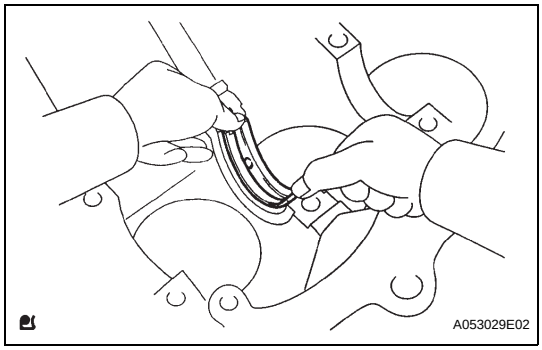


(a) Install the expander and oil ring by hand.

(b) Using a piston ring expander, install the 2 compression rings with the paint mark as shown in the illustration.
NOTICE:
Install the No. 2 compression ring with the code mark (2N) facing upward.



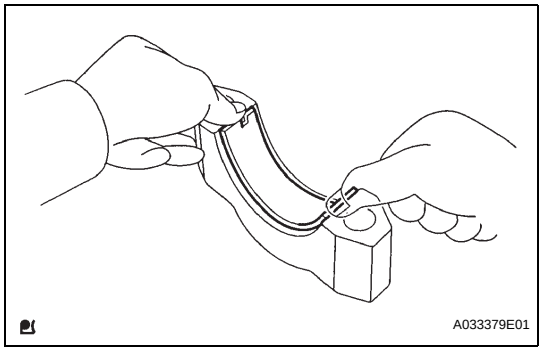
(c) Position the piston rings so that the ring ends are as shown in the illustration.



3. INSTALL NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Install the 4 oil nozzles with the 4 bolts.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

4. INSTALL CYLINDER BLOCK WATER JACKET SPACER

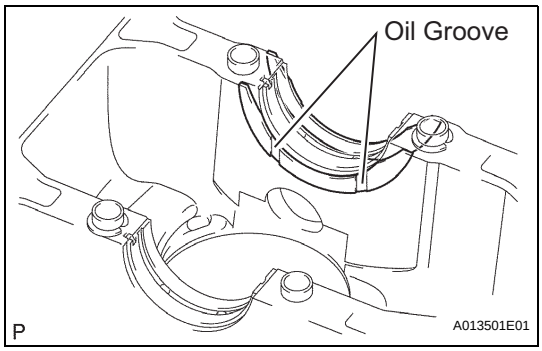


5. INSTALL CRANKSHAFT BEARING

(a) Install the upper bearing with an oil groove onto the cylinder block.

NOTICE:

Do not apply engine oil to the contact surfaces of the cylinder block and crankshaft bearing.



6. INSTALL NO. 2 CRANKSHAFT BEARING

(a) Install the lower bearing onto the bearing cap.

NOTICE:

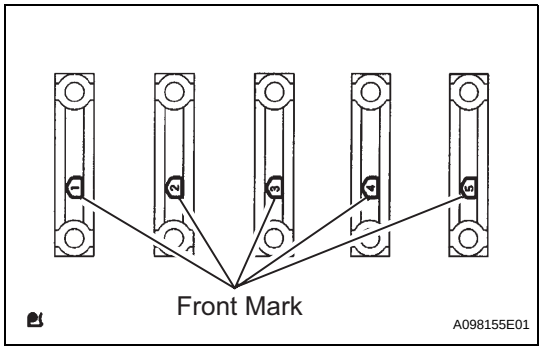
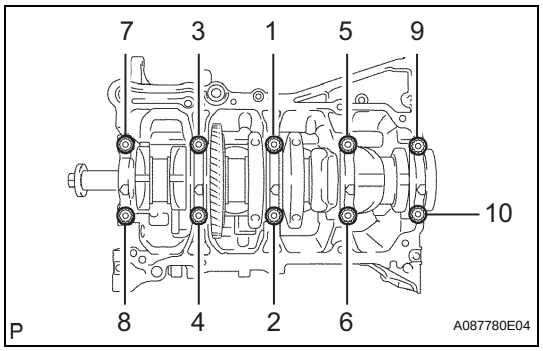
Do not apply engine oil to the contact surfaces of the cylinder block and crankshaft bearing cap..



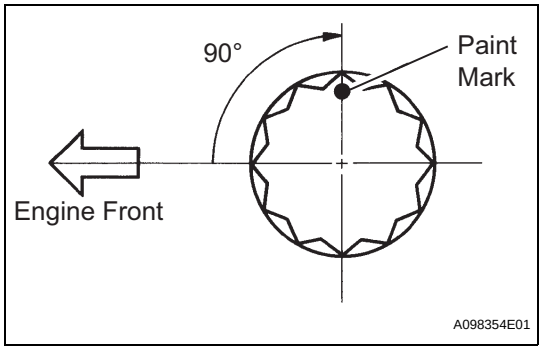
7. INSTALL CRANKSHAFT THRUST WASHER UPPER

(a) Install the 2 thrust washers onto the No. 3 journal position of the cylinder block with the oil groove facing outward.



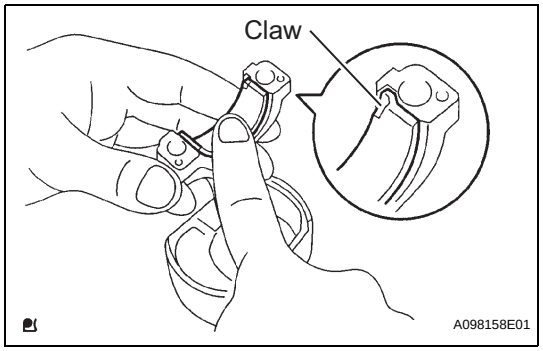
8. INSTALL CRANKSHAFT

(a) Apply engine oil to the upper bearing, and install the crankshaft onto the cylinder block.



(b) Examine the front marks and numbers, and install the bearing caps onto the cylinder block in the order shown in the illustration.

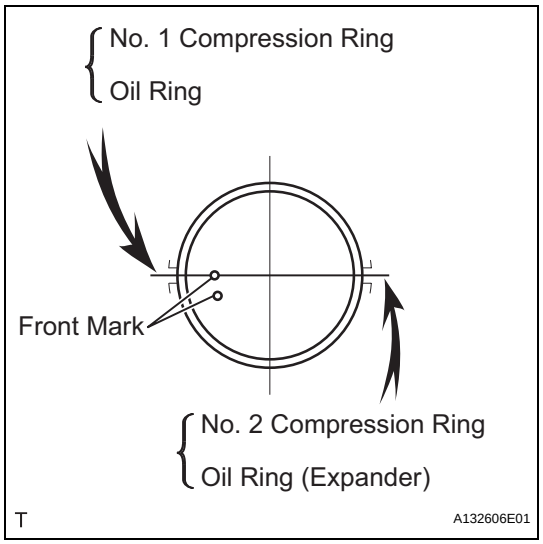
(c) Apply a light coat of engine oil to the threads and under the heads of the bearing cap bolts.



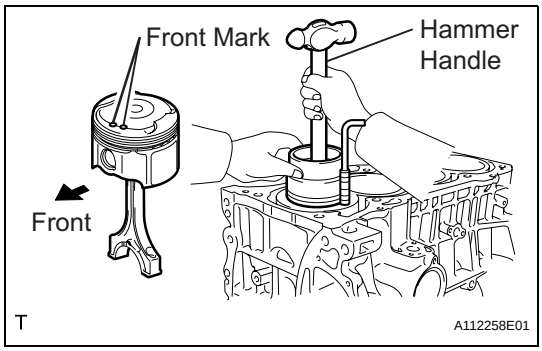
(d) Using several steps, uniformly install and tighten the 10 bearing cap bolts in the sequence shown in the illustration.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)

(e) Mark the front of the bearing cap bolts with paint.
(f) Retighten the 10 bearing cap bolts by 90° in the same sequence.
(g) Check that the paint marks are now at a 90° angle to the front.
(h) Check that the crankshaft turns smoothly.

EM



9. INSTALL CONNECTING ROD BEARING



(a) Align the bearing claw with the oil groove of the connecting rod or connecting rod cap.
NOTICE:
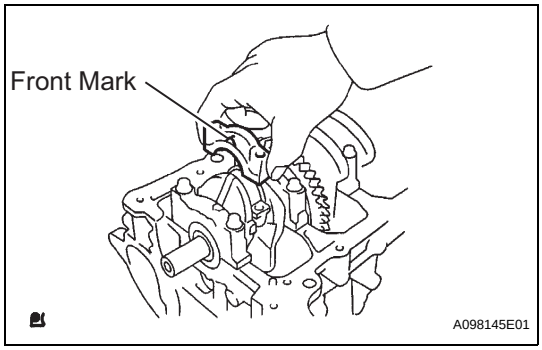
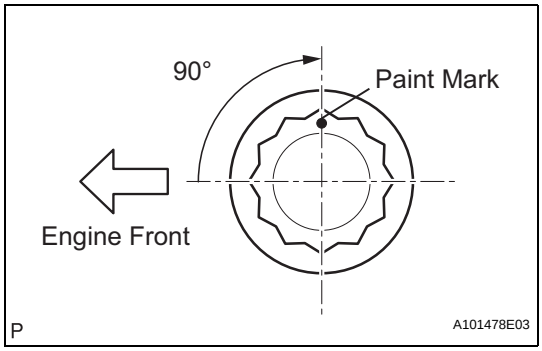
- **Do not apply engine oil to the contact surfaces of the connecting rod cap and bearing.**
- **Do not apply engine oil to the contact surfaces of the connecting rod and bearing.**

10. INSTALL PISTON WITH CONNECTING ROD



(a) Apply engine oil to the cylinder walls, pistons, and surfaces of connecting rod bearings.

(b) Check the position of the piston ring ends.



(c) Using a hammer handle and piston ring compressor, press a piston and connecting rod into each cylinder with the front mark of the piston facing forward.

(d) Check that the front mark of the connecting rod cap is facing in the correct direction.
NOTICE:
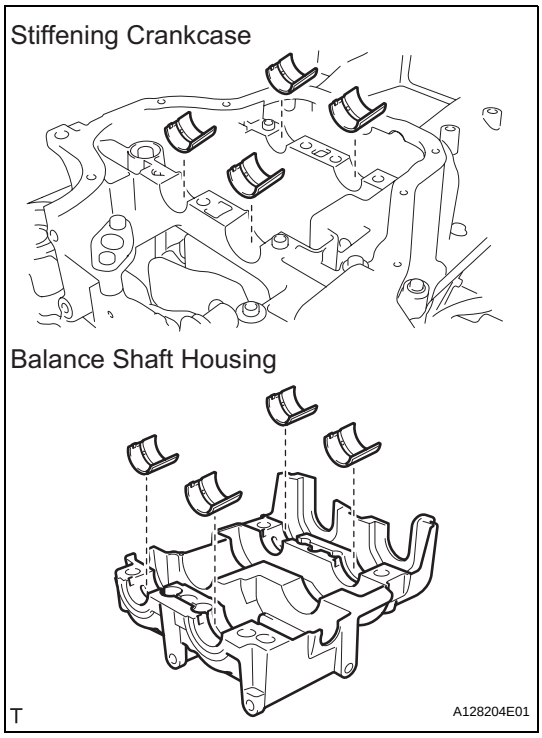
Match the numbered connecting rod cap with the connecting rod.

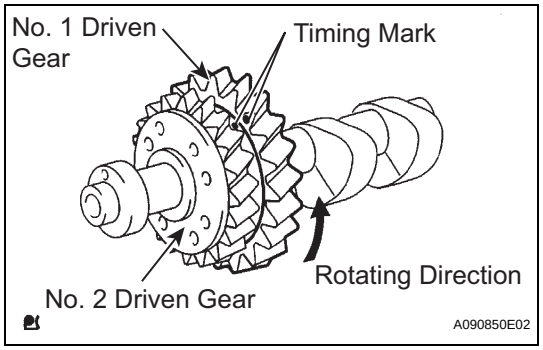
(e) Apply a light coat of engine oil to the threads and under the heads of the connecting rod bolts.



(f) Using a 12 mm socket wrench, tighten the bolts in several passes to the specified torque.
Torque: 24.5 N*m (250 kgf*cm, 18 ft.*lbf)

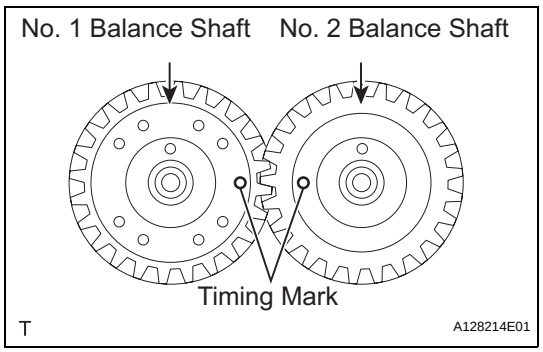
(g) Mark the front of the connecting rod bolts with paint.

(h) Retighten the cap bolts 90° as shown in the illustration.



(i) Check that the crankshaft turns smoothly.

11. INSTALL NO. 1 BALANCE SHAFT BEARING



(a) Align the bearing claw with the claw groove, and push in the 8 bearings.
NOTICE:
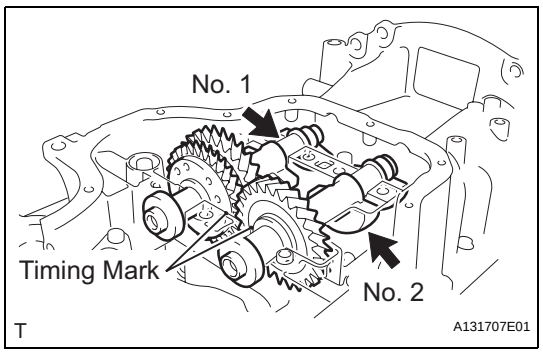
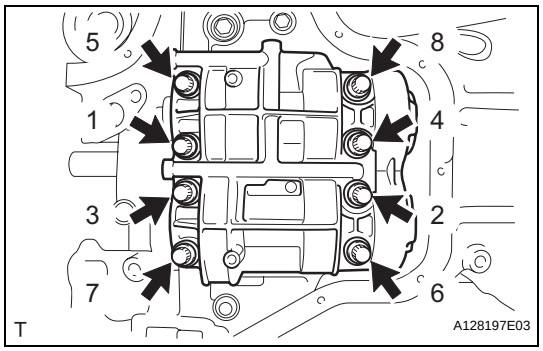
- **Do not apply engine oil to the contact surfaces of the balance shaft bearing and balance shaft housing.**
- **Do not apply engine oil to the contact surfaces of the balance shaft bearing and stiffening crankcase.**

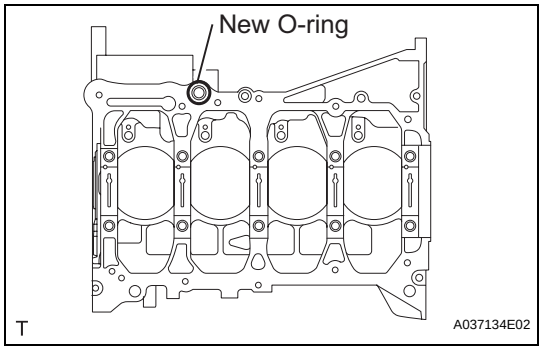
(b) Apply light coat of engine oil to the bearings.



12. INSTALL BALANCE SHAFT



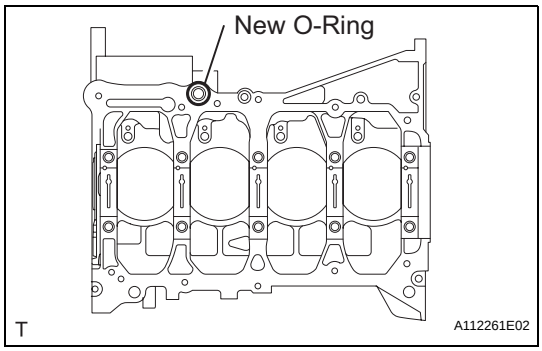
(a) Rotate the No. 1 driven gear of the No. 1 balance shaft in the rotating direction until it hits the stopper.



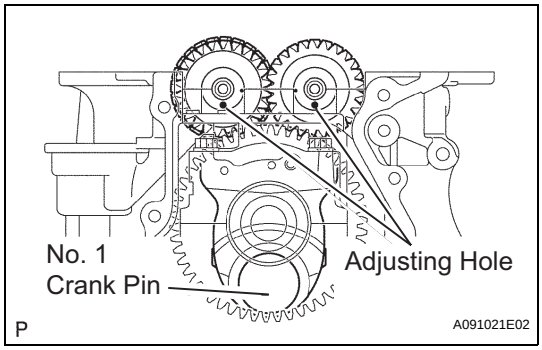
(b) Confirm that the timing marks on the No. 1 and No. 2 driven gears are aligned.

(c) Align the timing marks of the No. 1 and No. 2 balance shafts as shown in the illustration.
(d) Place the No. 1 and No. 2 balance shafts onto the crankcase.
(e) Apply a light coat of engine oil to the threads and under the heads of the bolts.

(f) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 21.6 N*m (220 kgf*cm, 16 ft.*lbf)
(g) Mark the front of the bolts with paint.
(h) Retighten the bolts 90° as shown in the illustration.

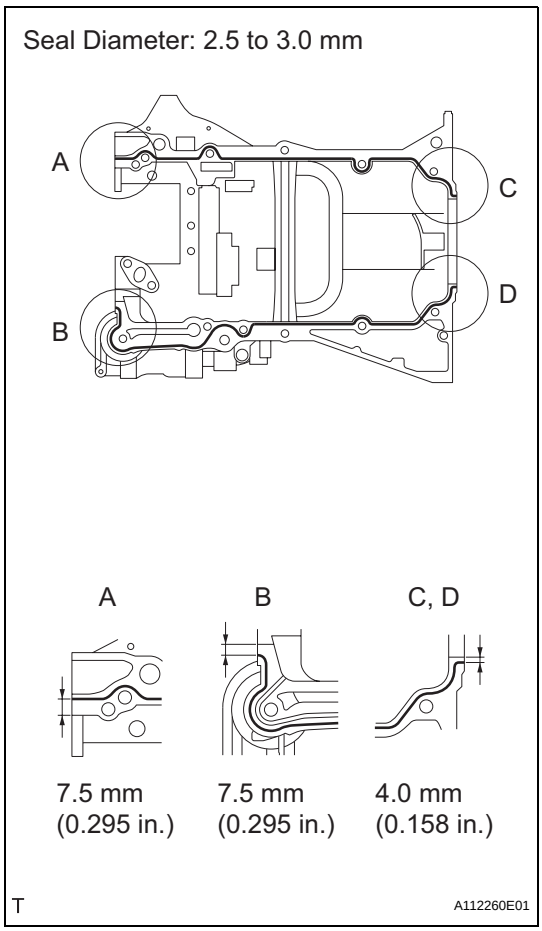


(i) Check that the paint mark is now at a 90° angle to the front.



13. INSTALL STIFFENING CRANKCASE ASSEMBLY

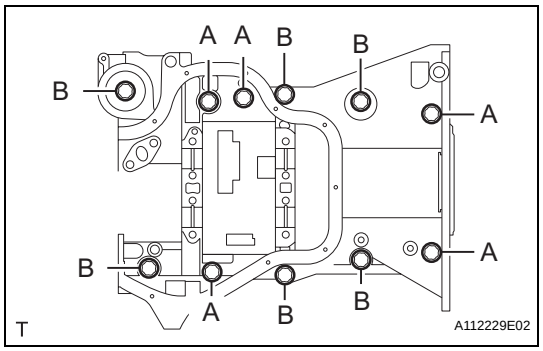
(a) Remove any old packing material and be careful not to drop any oil on the contact surfaces of the cylinder block and crankcase.



EM

(b) Place a new O-ring on the cylinder block as shown in the illustration.

(c) With the No. 1 crank pin of the crankshaft placed at the 6 o'clock position, install the No. 1 and No. 2 balance shafts and align the adjusting holes as shown in the illustration.



(d) Apply a continuous bead of seal packing (Diameter 2.5 to 3.0 mm (0.098 to 0.118 in.)) as shown in the illustration.

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

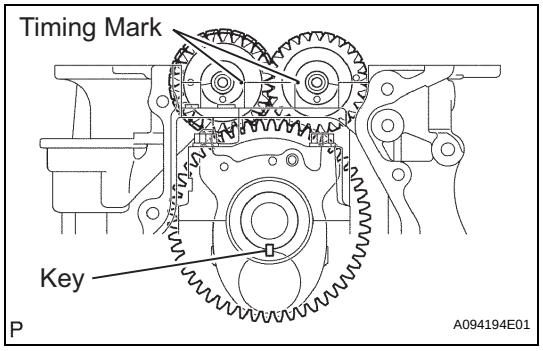
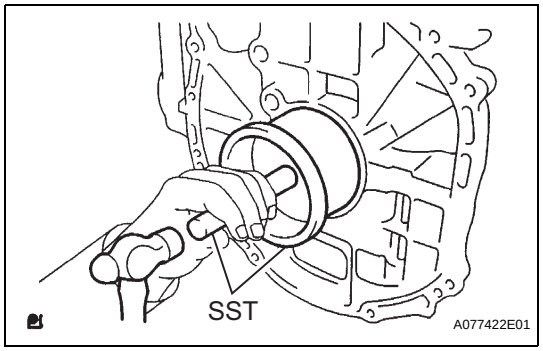
- **Remove any oil from the contact surface.**
- **Install the crankcase within 3 minutes of applying seal packing.**
- **Do not add engine oil for at least 2 hours after installing the crankcase.**

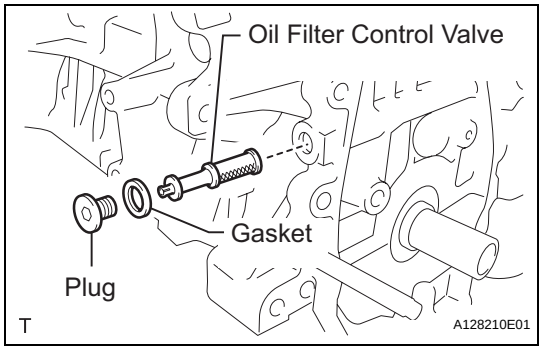


(e) Temporarily install the crankcase with the 11 bolts.
Standard bolt length

Item	Specified Condition
For bolt A (12 mm head)	112 mm (4.41 in.)
For bolt B (12 mm head)	35 mm (1.38 in.)



(f) Uniformly tighten the bolts.
Torque: 24 N*m (245 kgf*cm, 18 ft.*lbf)



(g) Confirm that the timing marks of the balance shafts are aligned when the key groove is placed at the 6 o'clock position, as shown in the illustration.

14. INSTALL ENGINE REAR OIL SEAL

(a) Apply multi-purpose grease to the lip of a new oil seal.
NOTICE:
Keep the lip free of foreign object.

(b) Using SST and hammer, tap in the new oil seal until its surface is flush with the rear oil seal retainer edge.
SST 09223-15030, 09950-70010 (09951-07100)
NOTICE:
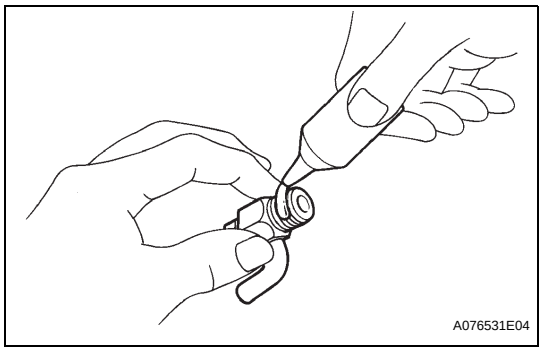
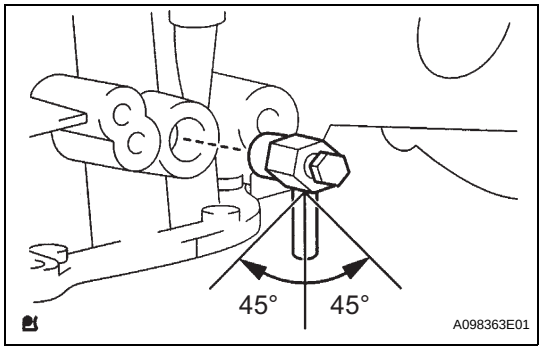
- **Wipe any extra grease off the crankshaft.**
- **Do not tap the oil seal at an angle.**



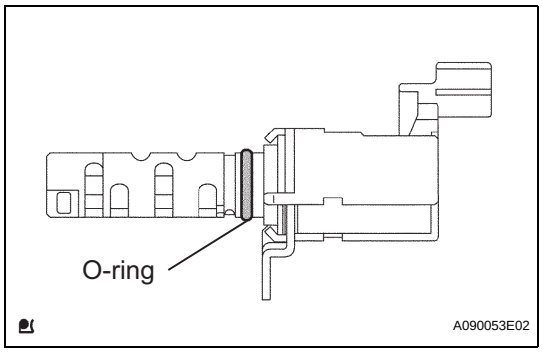
15. INSTALL OIL CONTROL VALVE FILTER



(a) Check that there are no foreign objects on the mesh part of the oil control valve filter.

(b) Using a 6 mm socket hexagon wrench, install a new gasket and the oil control valve filter with the plug.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)

EM



16. **INSTALL CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY**
    (a) Apply adhesive to 2 or 3 threads of the drain cock.
    Adhesive:
    Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

    (b) After tightening the drain cock to the specified torque, turn the drain cock clockwise as shown in the illustration.
    Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)
    NOTICE:
    - **Install the drain cock within 3 minutes of applying adhesive.**
    - **Do not add coolant for at least an hour after installing the drain cock.**
    - **Do not turn the drain cock by more than 1 revolution (360°) after tightening the drain cock to the specified torque.**
    - **Do not loosen the drain cock after setting it correctly.**

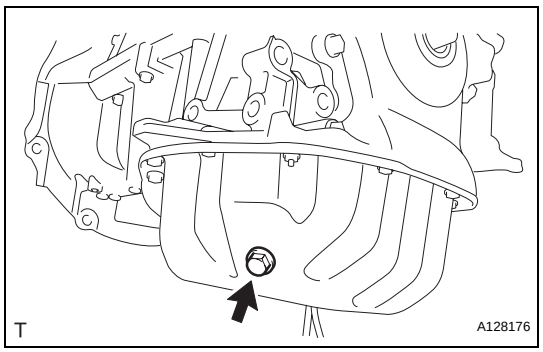
17. **INSTALL CYLINDER HEAD GASKET (See page EM-82)**

18. **INSTALL CYLINDER HEAD SUB-ASSEMBLY (See page EM-82)**

19. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
    (a) Apply a light coat of engine oil to a new O-ring, then install it onto the camshaft timing oil control valve.

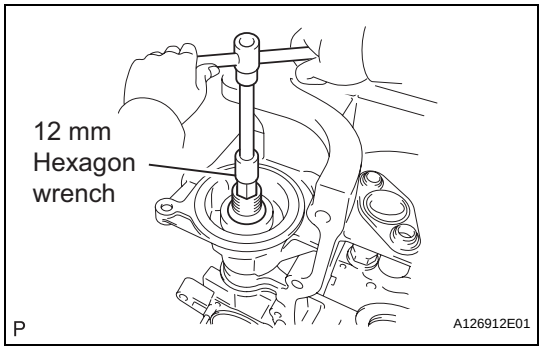
    (b) Install the camshaft timing oil control valve with the bolt.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

20. **INSTALL CAMSHAFT TIMING GEAR ASSEMBLY (See page EM-83)**



21. **INSTALL NO. 2 CAMSHAFT TIMING SPROCKET (See page EM-84)**

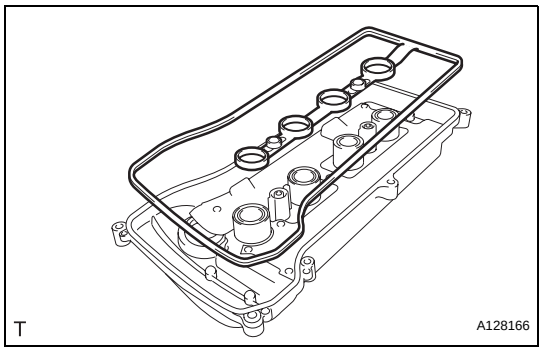
22. **INSTALL NO. 2 CAMSHAFT BEARING (See page EM-81)**



23. **INSTALL NO. 1 CAMSHAFT BEARING (See page EM-81)**

24. **INSTALL CAMSHAFT (See page EM-84)**
25. **INSTALL OIL PUMP ASSEMBLY (See page LU-15)**
26. **INSTALL OIL PUMP DRIVE GEAR**
27. **INSTALL NO. 2 CHAIN SUB-ASSEMBLY (See page EM-32)**
28. **INSTALL CRANKSHAFT TIMING SPROCKET**
29. **INSTALL NO. 1 CHAIN VIBRATION DAMPER (See page EM-33)**
30. **INSTALL CHAIN SUB-ASSEMBLY (See page EM-33)**
31. **INSTALL CHAIN TENSIONER SLIPPER (See page EM-34)**
32. **INSTALL TIMING CHAIN GUIDE (See page EM-34)**
33. **INSTALL NO. 1 CRANKSHAFT POSITION SENSOR PLATE (See page EM-35)**
34. **REPLACE TIMING CHAIN COVER OIL SEAL (See page EM-144)**
35. **INSTALL TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-35)**
36. **INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-37)**
37. **INSTALL CRANKSHAFT PULLEY (See page EM-38)**
38. **INSTALL OIL PAN SUB-ASSEMBLY (See page EM-39)**

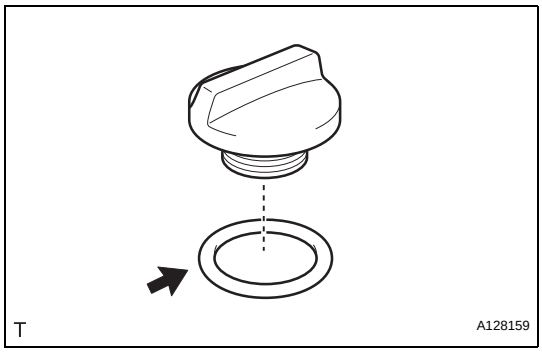
39. **INSTALL OIL PAN DRAIN PLUG**
    (a) Place a new gasket on the oil pan drain plug, then install it onto the oil pan.
    Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)
40. **INSTALL WATER PUMP ASSEMBLY (See page CO-12)**
41. **INSTALL WATER PUMP PULLEY (See page CO-13)**
42. **INSTALL CRANKSHAFT POSITION SENSOR (See page ES-402)**



43. **INSTALL OIL FILTER UNION**
    (a) Using a 12 mm hexagon wrench, install the oil filter union.
    Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf)
44. **INSTALL OIL FILTER SUB-ASSEMBLY (See page LU-4)**
45. **SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page EM-25)**
46. **CHECK VALVE CLEARANCE (See page EM-8)**
47. **ADJUST VALVE CLEARANCE (See page EM-8)**
48. **INSTALL CAMSHAFT (See page EM-13)**

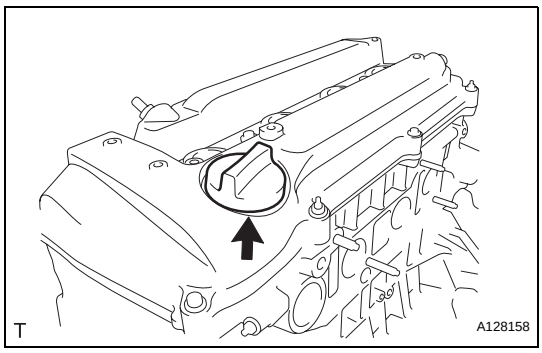
EM

49. INSTALL NO. 2 CAMSHAFT (See page EM-14)



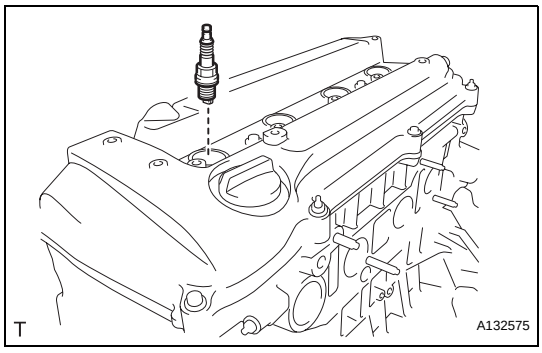
50. INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-37)

51. INSTALL CYLINDER HEAD COVER GASKET



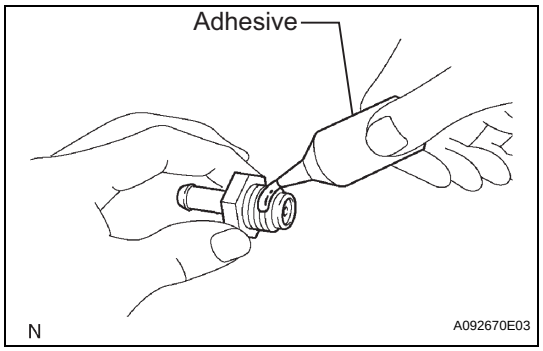
(a) Install the gasket onto the cylinder head cover.

52. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-40)

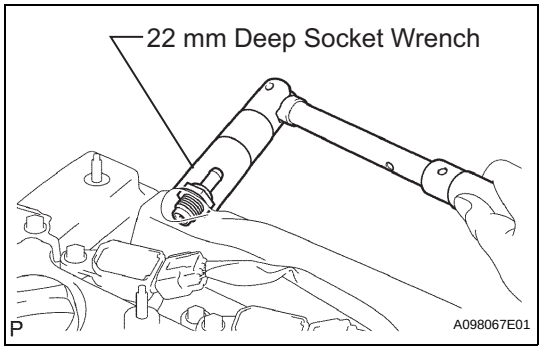


53. INSTALL OIL FILLER CAP SUB-ASSEMBLY

(a) Install the gasket to the cap.

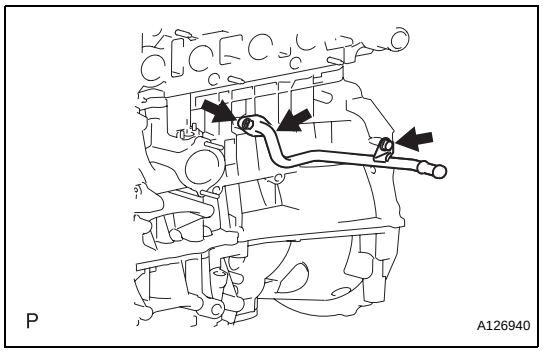


(b) Install the oil filler cap.
Torque: 3.0 N*m (31 kgf*cm, 26 in.*lbf)



54. INSTALL SPARK PLUG
Torque: 25 N*m (254 kgf*cm, 18 ft.*lbf)

55. INSTALL IGNITION COIL ASSEMBLY (See page IG-9)



56. **INSTALL VENTILATION VALVE SUB-ASSEMBLY**
    (a) Apply adhesive to the threads of the ventilation valve.
    Adhesive:
    Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

    (b) Using a 22 mm deep socket wrench, install the ventilation valve.
    Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

57. **INSTALL OIL DIPSTICK GUIDE (See page EM-86)**
58. **INSTALL OIL DIPSTICK**
59. **INSTALL CAMSHAFT POSITION SENSOR (See page EM-81)**
60. **INSTALL ENGINE COOLANT TEMPERATURE SENSOR (See page EM-82)**
61. **INSTALL OIL PRESSURE SWITCH ASSEMBLY (See page EM-82)**
62. **INSTALL RADIO SETTING CONDENSER (See page EM-82)**
63. **INSTALL KNOCK SENSOR (See page ES-420)**
64. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-396)**
65. **INSTALL V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-38)**

66. **INSTALL NO. 3 WATER BY-PASS PIPE**
    (a) Install a new gasket and pipe with the bolt and 2 nuts.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

67. **INSTALL NO. 1 WATER BY-PASS PIPE**
    (a) Install a new gasket and the pipe with the bolt and 2 nuts.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
68. **INSTALL THERMOSTAT (See page CO-15)**
69. **INSTALL WATER INLET (See page CO-16)**
70. **INSTALL EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY (See page EM-85)**

EM

71. **INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (See page EM-86)**
72. **INSTALL NO. 2 MANIFOLD STAY (See page EM-86)**
73. **INSTALL MANIFOLD STAY (See page EM-86)**
74. **INSTALL IDLER PULLEY (See page EM-41)**

ENGINE

ON-VEHICLE INSPECTION

1. INSPECT ENGINE COOLANT

2. INSPECT ENGINE OIL

3. INSPECT BATTERY

4. INSPECT AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

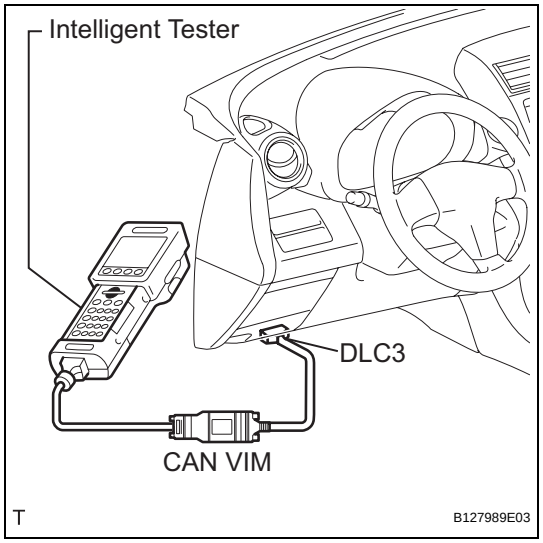
(a) Remove the air cleaner cap.
(b) Remove the air filter element.
(c) Visually check that the air filter is not excessively damaged or oily.
If necessary, replace the air filter.

5. INSPECT SPARK PLUG

6. INSPECT FAN AND GENERATOR V BELT

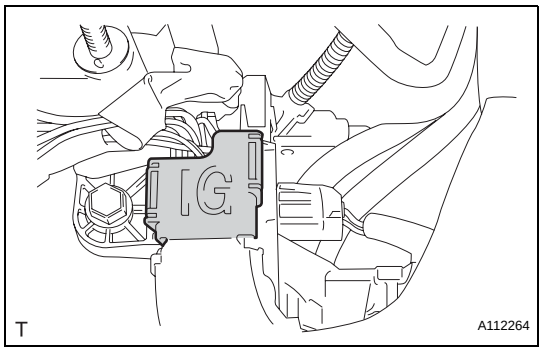
HINT:
You do not need to check the belt deflection because the auto tensioner has been adopted.

7. INSPECT IGNITION TIMING



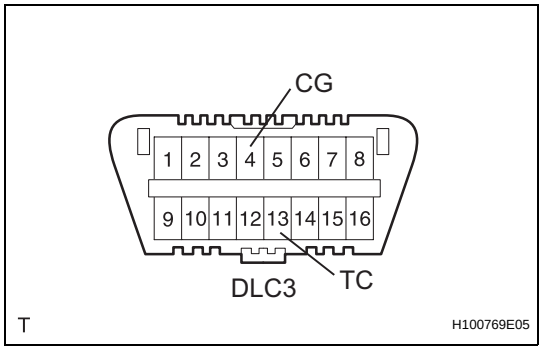
NOTICE:

- **Turn all the electrical systems and the A/C OFF.**
- **Inspect the ignition timing with the cooling fan OFF.**
- **When checking the ignition timing, shift the transmission to the neutral position.**

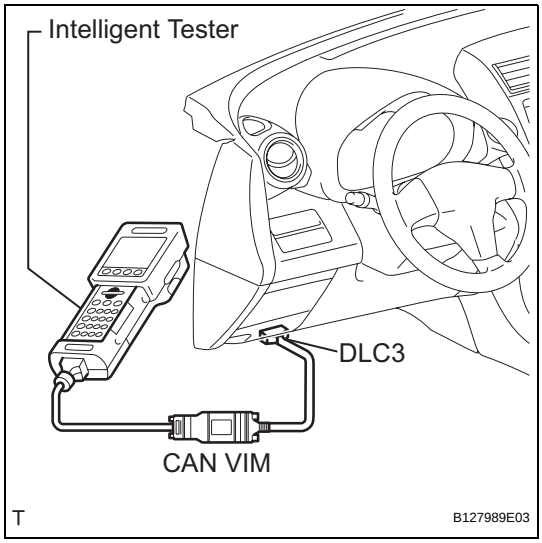


(a) Warm up and stop the engine.

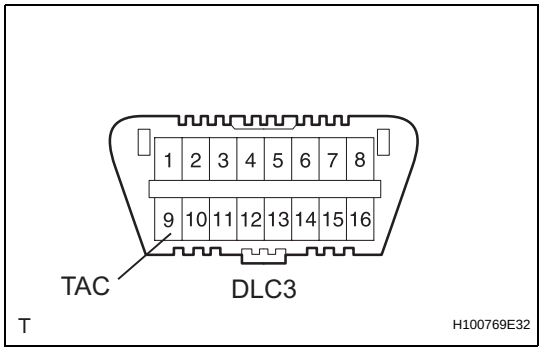
(b) When using intelligent tester:
(1) Connect the intelligent tester to the DLC3.
(2) Allow the engine to idle.
(3) Select the following menu items:
DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / IGN ADVANCE.
(4) Read IGN ADVANCE to check the ignition timing.
Standard ignition timing:
5 to 15° BTDC @ idle
(5) Check that the ignition timing advances immediately when the engine speed is increased.
(6) Turn the ignition switch OFF.
(7) Disconnect the intelligent tester from the DLC3.



(c) When not using intelligent tester:
(1) Remove the No. 1 engine cover (see page EM-22).



EM



(2) Open the ignition cover located to the right of the No. 4 ignition coil.
(3) Pull out the wire harness from the IG cover.
(4) Connect a timing light to the wire harness.
NOTICE:
Use a timing light that detects the first signal.

(5) Using SST, connect terminals 13 (TC) and 4 (CG) of the DLC3.
SST 09843-18040
(6) Allow the engine to idle and check the ignition timing.
Standard ignition timing:
8 to 12° BTDC @ idle
HINT:
Run the engine at 1,000 to 1,300 rpm for 5 seconds, then check that the engine speed returns to the idling speed.
(7) Remove SST from the DLC3.
(8) Allow the engine to idle and check the ignition timing.
Standard ignition timing:
5 to 15° BTDC
(9) Check that the ignition timing advances immediately when the engine speed is increased.
(10) Turn the ignition switch OFF.
(11) Remove the timing light.
(12) Close the IG cover.
(13) Install the No. 1 engine cover (see page EM-43).

8. INSPECT ENGINE IDLE SPEED
(a) When using intelligent tester:
(1) Turn OFF all the accessories and air conditioning.
(2) Move the shift lever to P or neutral.
(3) Connect the intelligent tester to the DLC3.
(4) Warm up the engine.
(5) Select the tester menus:
DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
(6) Read ENGINE SPEED to check the idle speed while the radiator-cooling fan is not rotating.
Standard idle speed:
600 to 700 rpm
(7) Turn the ignition switch OFF.
(8) Disconnect the tester from the DLC3.
(b) When not using intelligent tester:
(1) Turn OFF all the accessories and air conditioning.

(2) Move the shift lever to P or neutral.

(3) Connect SST to 9 (TAC) of the DLC3 terminal, and then connect a tachometer to SST.
SST 09843-18030

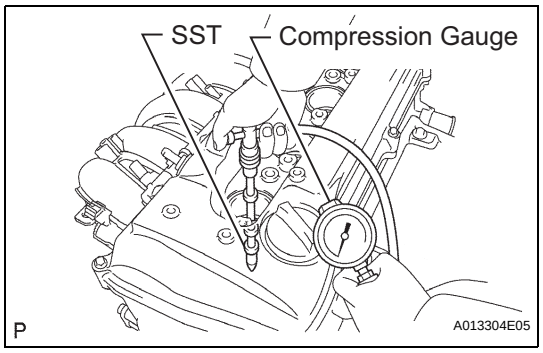
(4) Warm up the engine.

(5) Check the idle speed while the radiator-cooling fan is not rotating.
Standard idle speed:
600 to 700 rpm

(6) Turn the ignition switch OFF.

(7) Remove the tachometer and disconnect SST from the DLC3.

9. INSPECT COMPRESSION



(a) Warm up and stop the engine.

(b) Remove the No. 1 engine under cover.

(c) Remove the 4 ignition coils (see page IG-9).

(d) Remove the 4 spark plugs.

(e) Disconnect the 4 fuel injector connectors.

(f) Set SST and a compression gauge.
SST 09992-00500

(g) Insert the compression gauge into the spark plug hole.

(h) While cranking the engine, measure the compression pressure.
Standard compression pressure:
1,300 kPa (13.8 kgf/cm^2, 196 psi)
Minimum pressure:
1,000 kPa (10 kgf/cm^2, 142 psi)
Standard difference between each cylinder:
100 kPa (1.0 kgf/cm^2, 14 psi)
NOTICE:
- **Always use a fully charged battery to obtain an engine speed of 250 rpm or more.**
- **Check the other cylinders' compression pressures in the same way.**
- **This measurement must be done as quickly as possible.**

If the cylinder compression is low, pour a small amount of engine oil into the cylinder through the spark plug hole and inspect again.
HINT:
- If adding oil increases the compression, the piston rings and/or cylinder bore may be worn or damaged.
- If pressure stays low, a valve may be stuck or seated improperly, or there may be leakage in the gasket.

(i) Connect the 4 fuel injector connectors.

(j) Install the 4 spark plugs.
Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)

(k) Install the 4 ignition coils (see page IG-9).

(l) Install the No. 1 engine under cover.

EM

10. INSPECT CO/HC

HINT:

The ECM properly controls the CO/HC concentration in the emission gas.

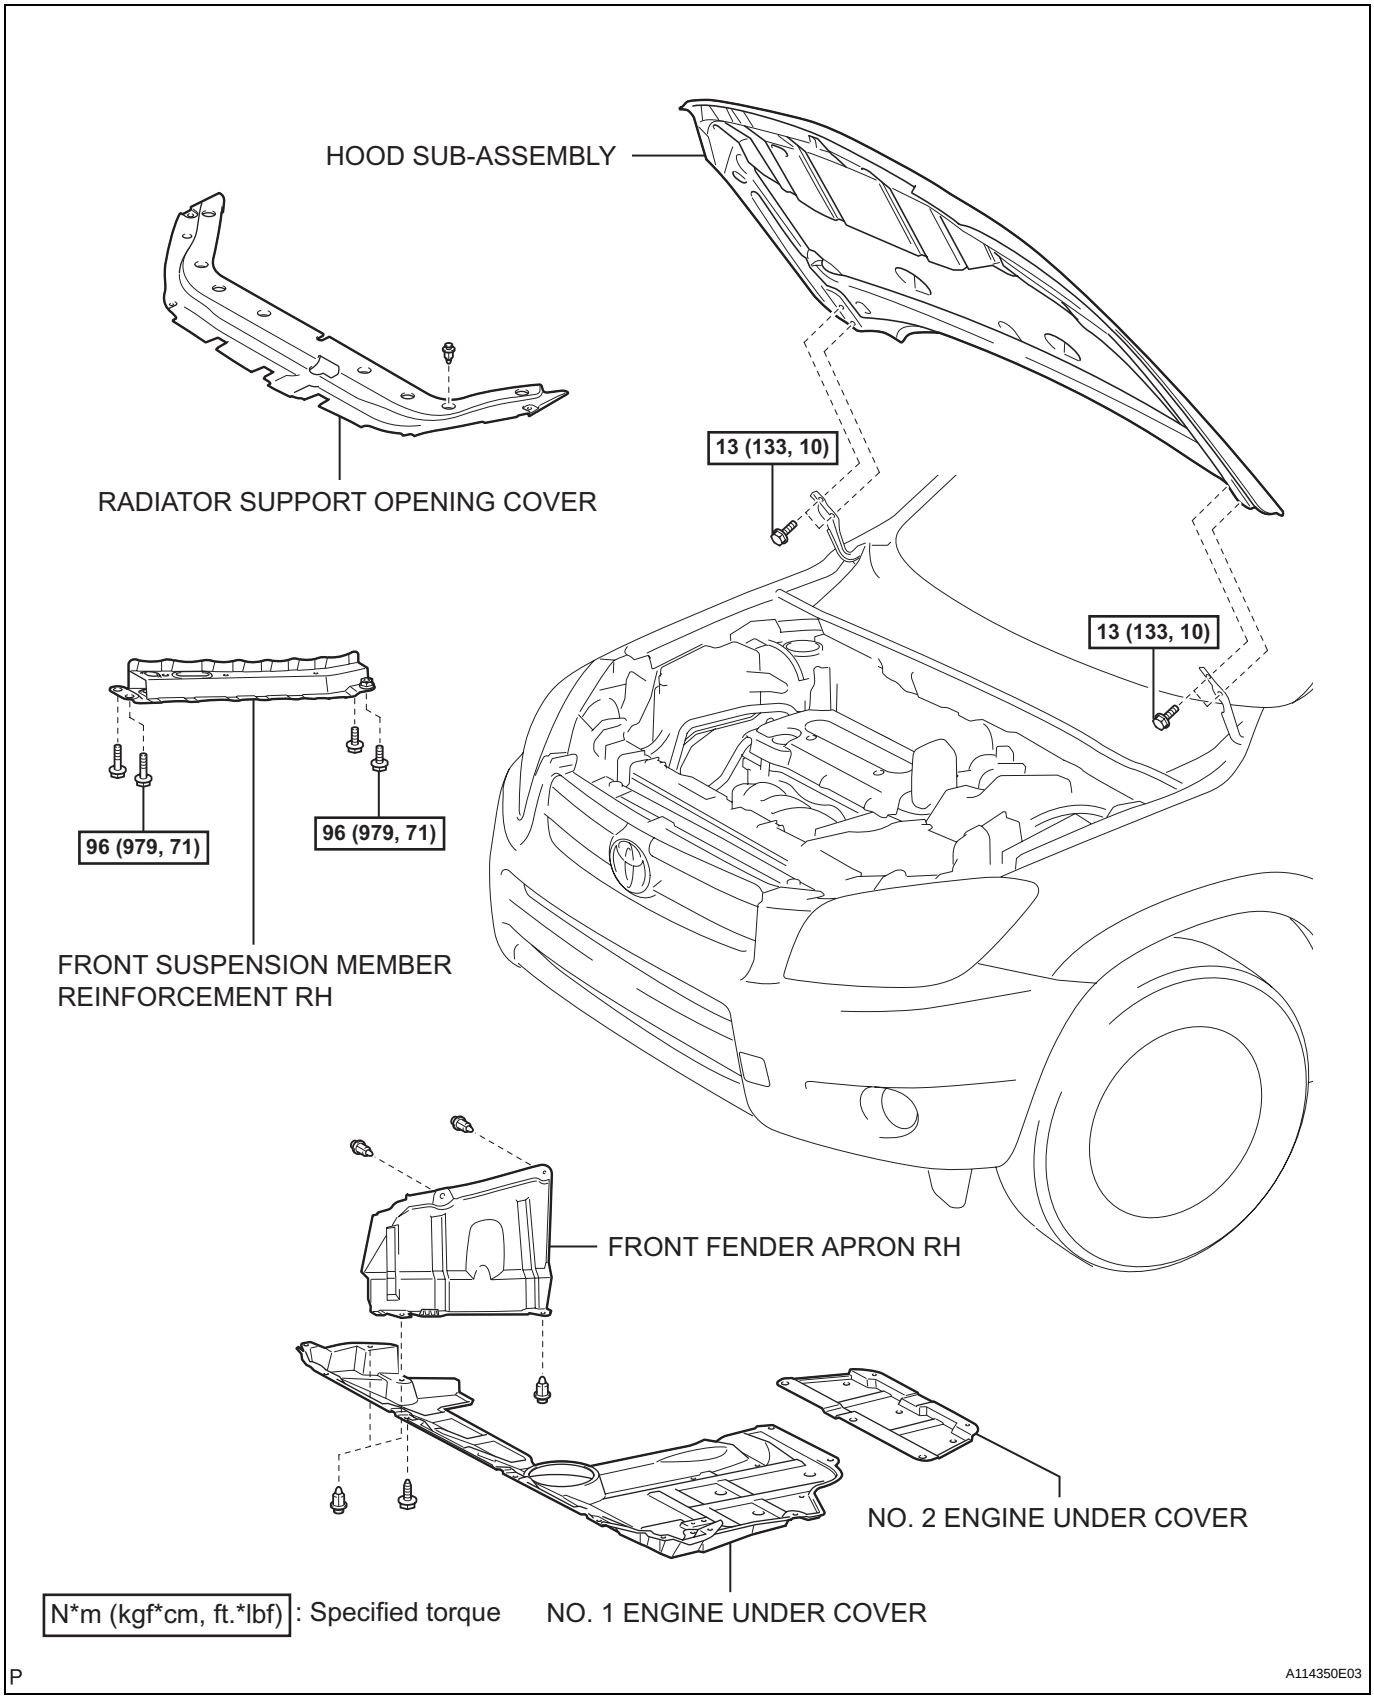
(a) Start and warm up the engine.

(b) Run the engine at 2,500 rpm for approximately 180 seconds.

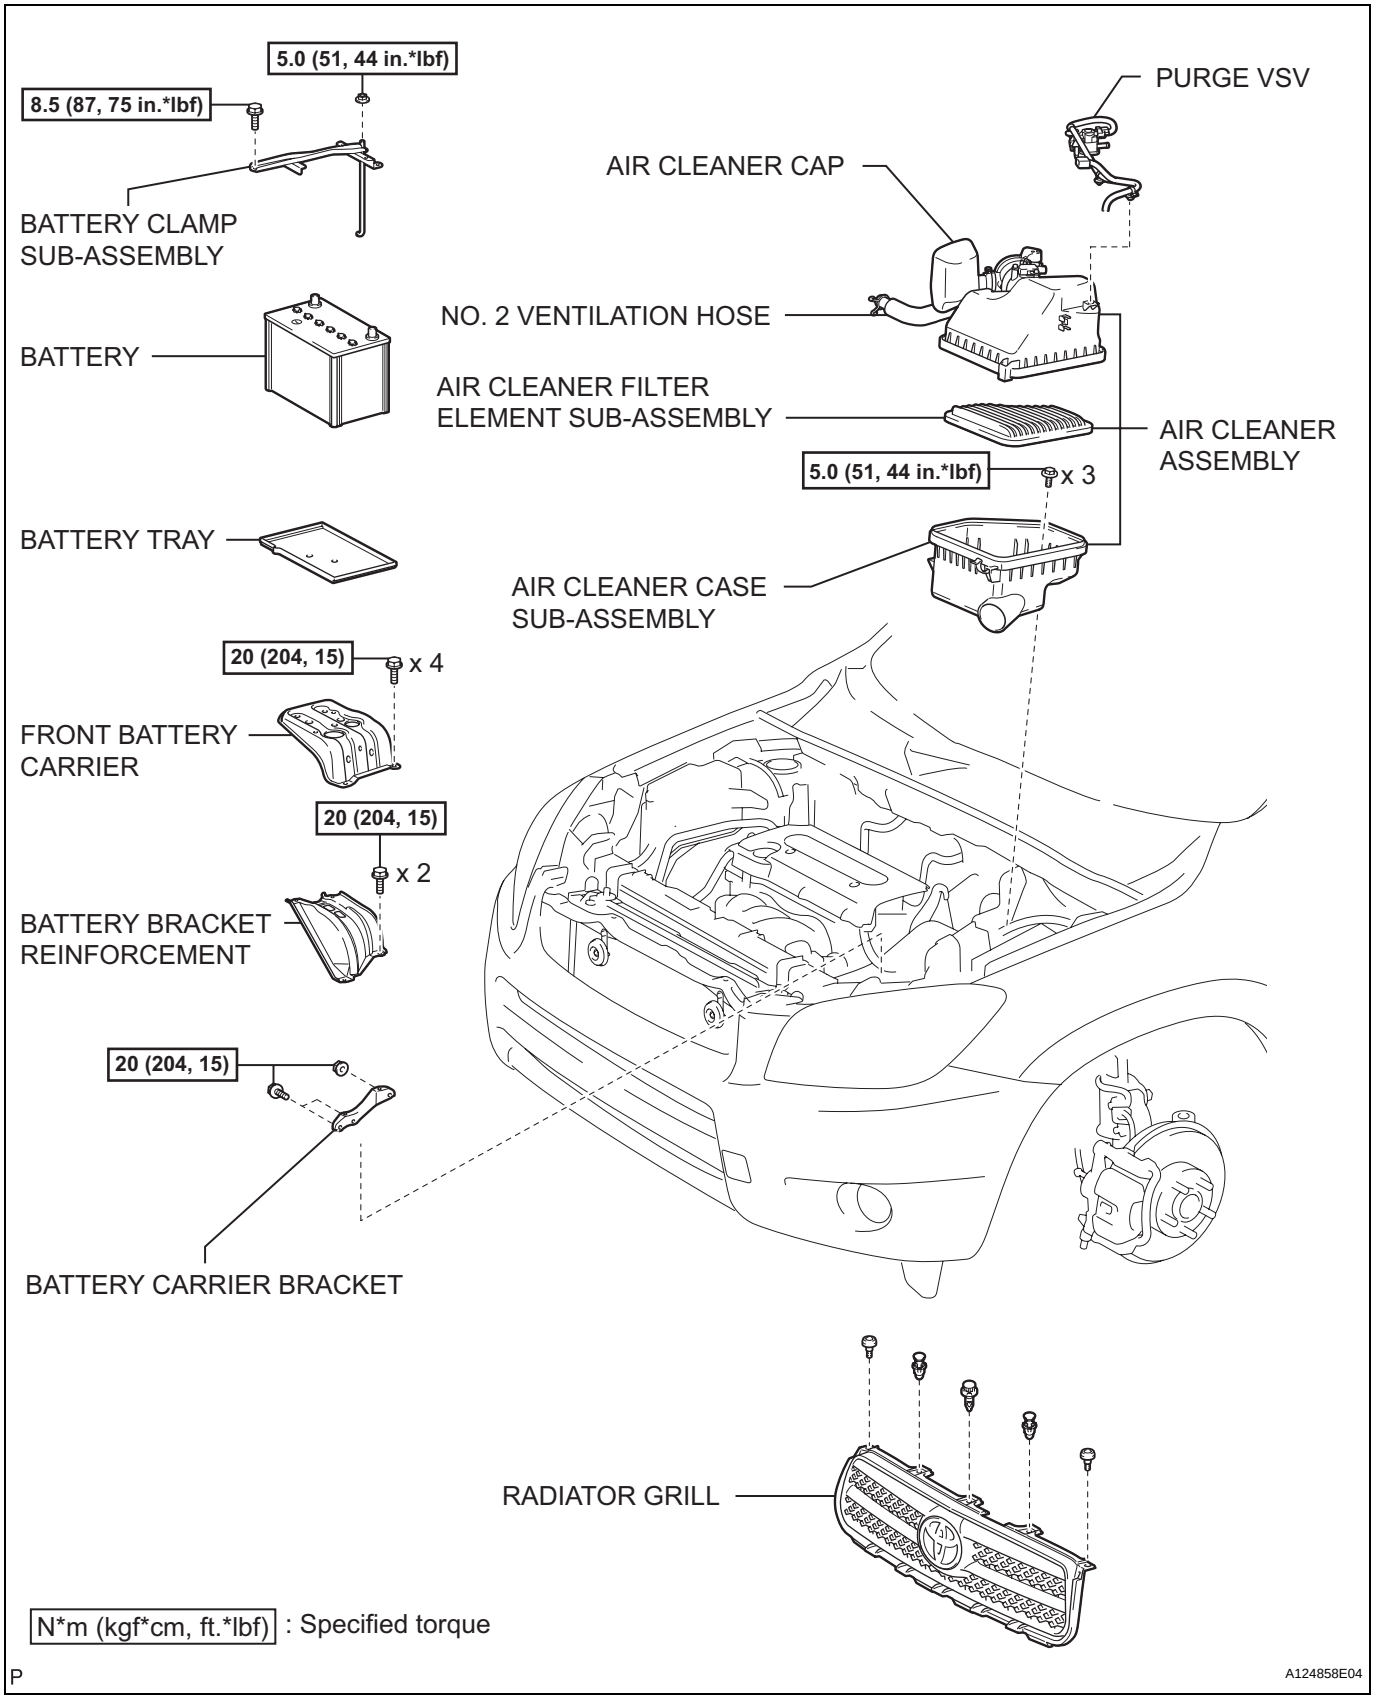
(c) Insert the CO/HC meter testing probe at least 40 cm (1.3 ft.) into the tailpipe while idling.

(d) Inspect the CO/HC concentration while idling and/or at 2,500 rpm.

If the CO/HC concentration is not as specified, perform troubleshooting.



HINT:



See the table below for possible causes, and then inspect and repair the applicable causes if necessary.

CO	HC	Problems	Causes
Normal	High	Rough idle	1. Faulty ignition: - Incorrect timing - Plugs are contaminated, shorted, or gaps are defective 2. Incorrect valve clearance 3. Leaks in intake and exhaust valve 4. Leaks in cylinders
Low	High	Rough idle (Fluctuating HC reading)	1. Vacuum leakage: - Ventilation hoses - Intake manifold - Throttle body - Brake booster line 2. Lean mixture causing misfire
High	High	Rough idle (Black smoke from exhaust)	1. Restricted air filter 2. Plugged PCV valve 3. Faulty SFI system: - Faulty pressure regulator - Faulty engine coolant temperature sensor - Faulty mass air flow meter - Faulty ECM - Faulty injectors - Faulty throttle body

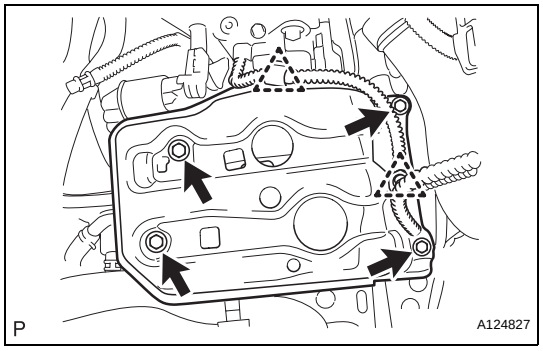
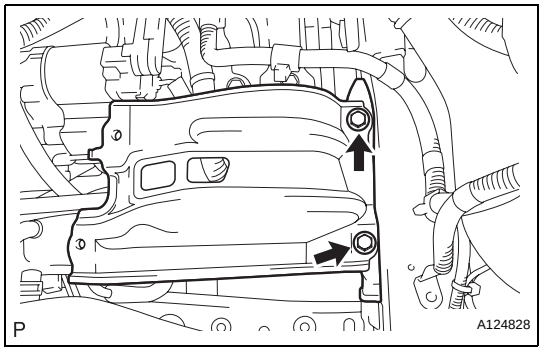
REMOVAL



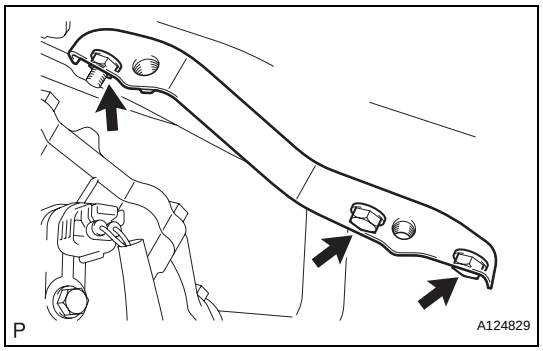
1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE HOOD SUB-ASSEMBLY (See page ED-4)**
4. **REMOVE RADIATOR SUPPORT OPENING COVER**
5. **REMOVE BATTERY CLAMP SUB-ASSEMBLY**
   (a) Loosen the bolt and nut, and remove the battery clamp.
6. **REMOVE BATTERY**
7. **REMOVE BATTERY TRAY**
8. **REMOVE FRONT WHEEL**
9. **REMOVE NO. 1 ENGINE UNDER COVER**
10. **REMOVE NO. 2 ENGINE UNDER COVER**
11. **REMOVE FRONT FENDER APRON RH**
12. **REMOVE NO. 1 ENGINE COVER (See page EM-22)**
13. **DRAIN ENGINE COOLANT (See page CO-6)**
14. **DRAIN AUTOMATIC TRANSAXLE FLUID**
    (a) Drain automatic transaxle fluid for U241E (2WD) (see page AX-146).
    (b) Drain automatic transaxle fluid for U140F (4WD) (see page AX-147).
15. **REMOVE RADIATOR ASSEMBLY**
    (a) Remove the radiator (see page CO-29).
16. **REMOVE RADIATOR RESERVOIR**
    (a) Remove the 2 bolts and reservoir.
17. **REMOVE PURGE VSV (See page EC-15)**
18. **REMOVE AIR CLEANER CAP (See page ES-411)**
19. **REMOVE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY**

20. REMOVE AIR CLEANER CASE SUB-ASSEMBLY



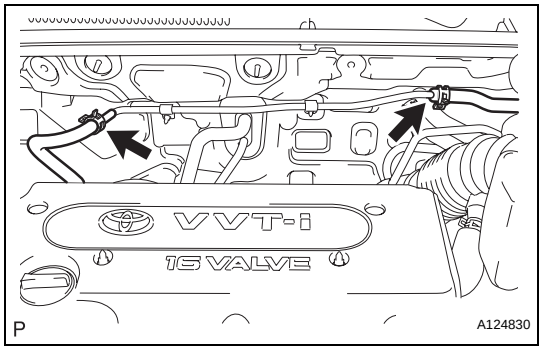
(a) Remove the 3 bolts from the air cleaner case.
(b) Disconnect the case from the NO. 1 air cleaner inlet.

21. REMOVE FRONT BATTERY CARRIER



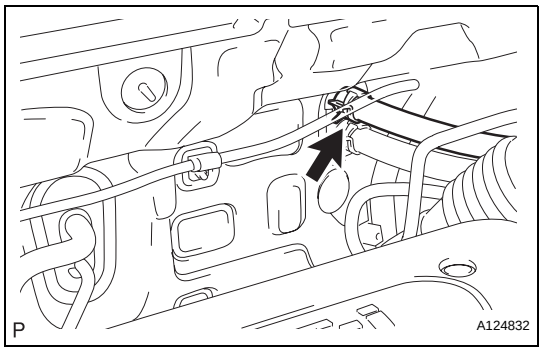
(a) Disconnect the 2 clamps of the engine wire.
(b) Remove the 4 bolts and front battery carrier.

EM



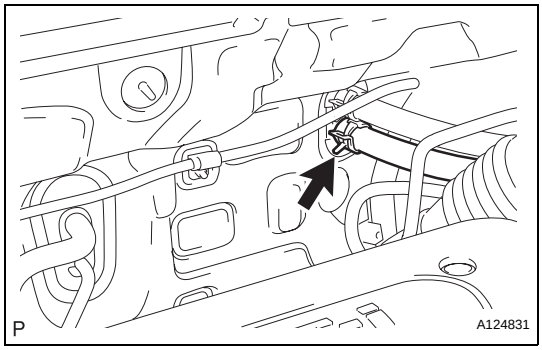
22. REMOVE BATTERY BRACKET REINFORCEMENT

(a) Remove the 2 bolts and battery bracket reinforcement.



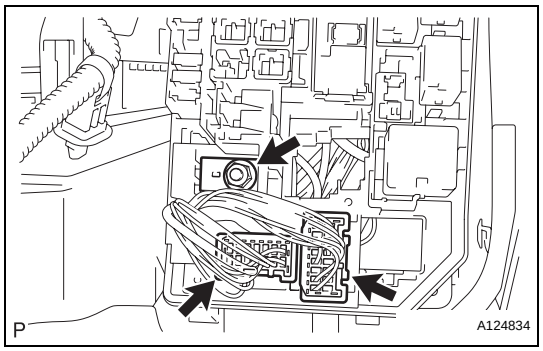
23. REMOVE BATTERY CARRIER BRACKET

(a) Remove the 2 bolts, nut and battery carrier bracket.

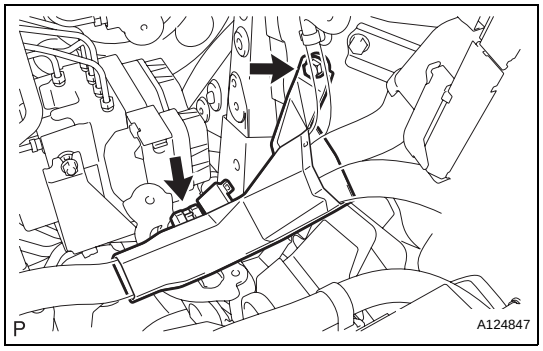


24. DISCONNECT UNION TO CONNECTOR TUBE HOSE

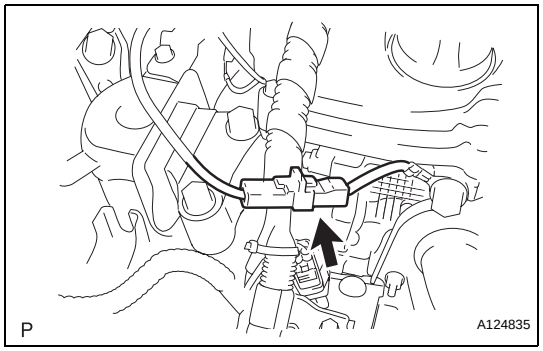
(a) Disconnect the 2 union to connector tube hoses from the booster vacuum tube.



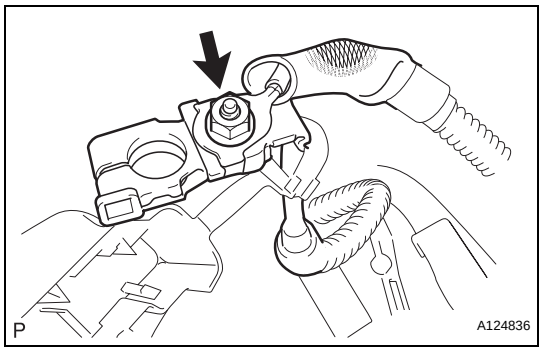
25. **DISCONNECT HEATER WATER INLET HOSE**
    (a) Disconnect the heater water inlet hose from the heater unit.



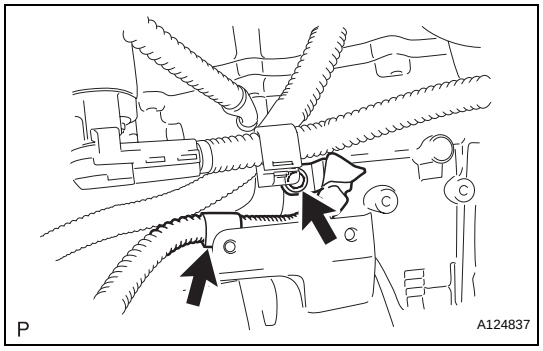
26. **DISCONNECT HEATER WATER OUTLET HOSE**
    (a) Disconnect the heater water outlet hose from the heater unit.
27. **DISCONNECT FUEL TUBE (See page FU-10)**
28. **REMOVE THROTTLE BODY (See page ES-412)**
29. **DISCONNECT NO. 2 VENTILATION HOSE (See page FU-10)**
30. **REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-10)**
31. **REMOVE INTAKE MANIFOLD (See page ES-419)**
32. **REMOVE INTAKE MANIFOLD INSULATOR (See page ES-420)**
33. **REMOVE TRANSAXLE CONTROL CABLE ASSEMBLY**
    (a) Remove the transaxle control cable for U241E (2WD) (see page AX-129).
    (b) Remove the transaxle control cable for U140F (4WD) (see page AX-129).
34. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-6)**
35. **REMOVE FAN AND GENERATOR V BELT (See page EM-6)**
36. **REMOVE GENERATOR ASSEMBLY (See page CH-9)**
37. **REMOVE COOLER COMPRESSOR ASSEMBLY**
    (a) Remove the cooler compressor (see page AC-216).
    HINT:
    Disconnect the compressor together with the low-pressure and high-pressure hoses, then secure it to the vehicle side using rope.
38. **REMOVE ECM (See page ES-429)**
39. **DISCONNECT ENGINE WIRE**
    (a) Remove the engine room relay block cover.



EM



(b) Remove the nut and disconnect the 2 engine wire connectors.



(c) Remove the bolt and engine wire cover. Then disconnect the engine wire from the engine wire cover.

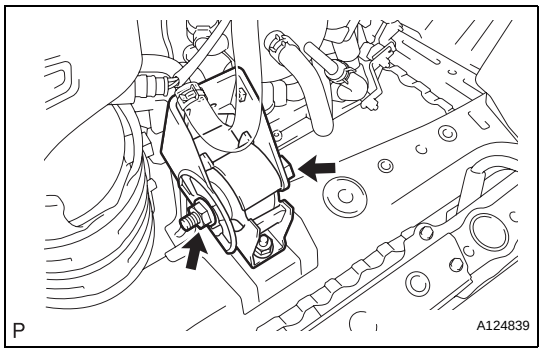
(d) Disconnect the ground cable connector.

(e) Remove the nut from the positive (+) battery terminal to disconnect the engine wire.

(f) Disconnect the ground cable from the clamp located near the starter.
(g) Remove the bolt and ground cable located near the starter.

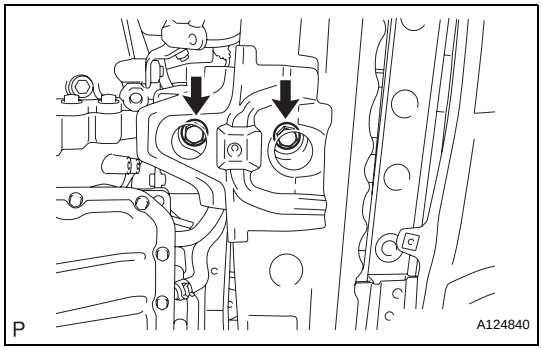
40. REMOVE FRONT EXHAUST PIPE ASSEMBLY (See page EX-3)

41. REMOVE FRONT DRIVE SHAFT ASSEMBLY



(a) Remove the front drive shaft (for 2WD) (see page DS-7).

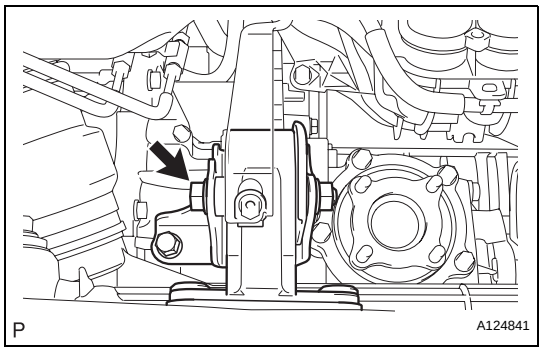
(b) Remove the front drive shaft (for 4WD) (see page DS-40).



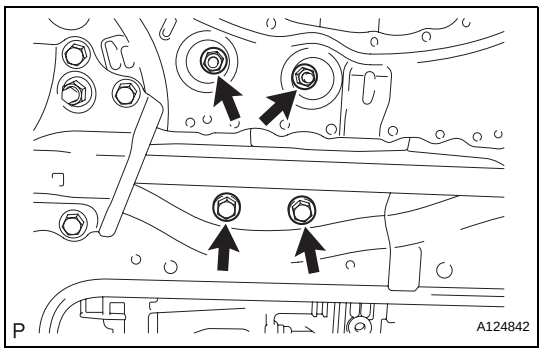
42. REMOVE PROPELLER SHAFT ASSEMBLY (for 4WD) (See page PR-3)

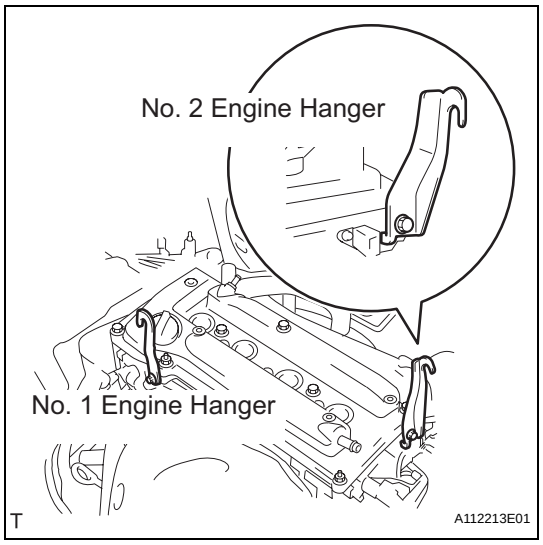
43. REMOVE ENGINE MOUNTING INSULATOR FR

(a) Remove the through bolt and nut.



(b) Remove the 2 bolts and engine mounting insulator FR.

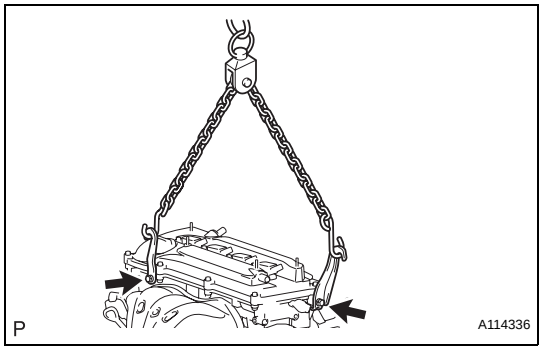


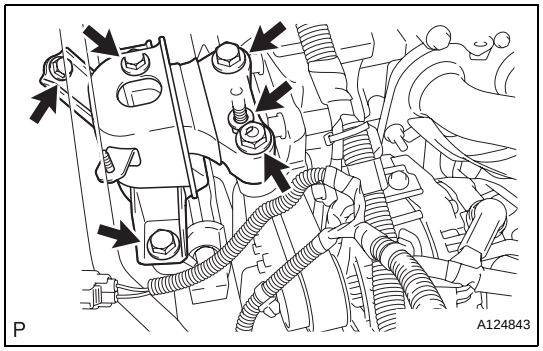


44. REMOVE ENGINE MOUNTING INSULATOR RR

(a) Remove the through bolt.

(b) Remove the 2 nuts, 2 bolts and engine mounting insulator RR.

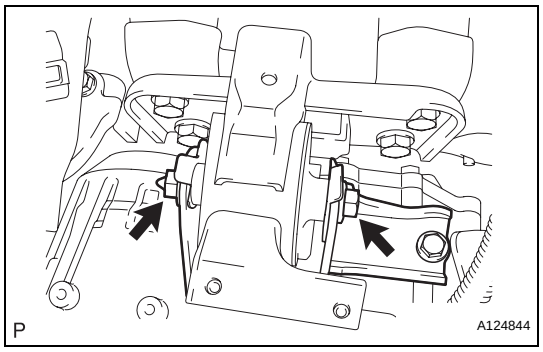




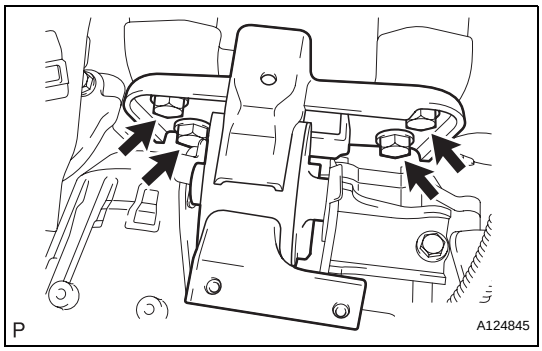
45. REMOVE ENGINE ASSEMBLY WITH TRANSAXLE

(a) Install the No. 1 and No. 2 engine hangers with the bolts as shown in the illustration.
Torque: 38 N*m (387 kgf*cm, 28 ft.*lbf)
Part No.

Item	Part No.
No. 1 engine hanger	12281-28010
No. 2 engine hanger	12282-28010
Bolt	91512-61020

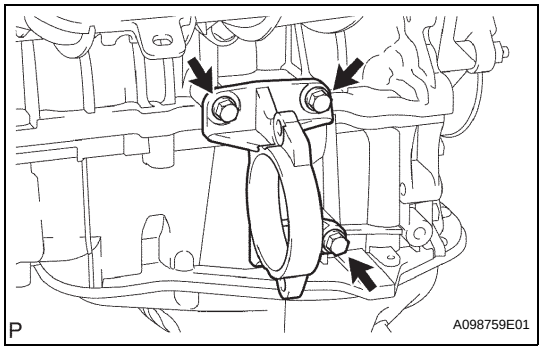


(b) Attach the sling device to the engine hangers and chain block.
(c) Carefully remove the engine with transaxle from the vehicle.



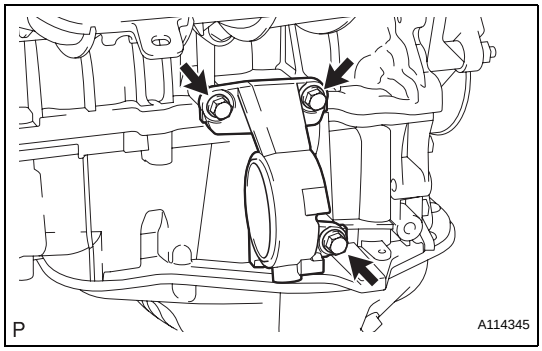
46. REMOVE ENGINE MOUNTING INSULATOR RH

(a) Remove the 2 nuts, 4 bolts and engine mounting insulator RH.



47. REMOVE ENGINE MOUNTING INSULATOR LH

(a) Remove the through bolt and nut.



(b) Remove the 4 bolts and engine mounting insulator LH.

48. REMOVE DRIVE SHAFT BEARING BRACKET (for 2WD)

(a) Remove the 3 bolts and bracket.

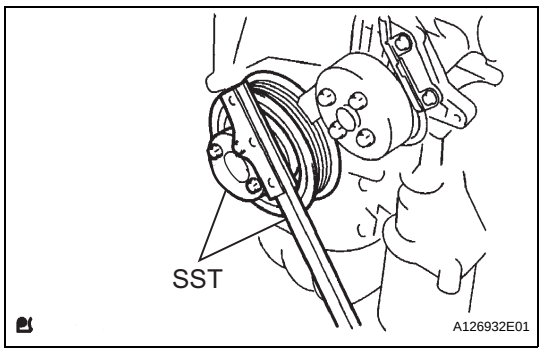
49. REMOVE DRIVE SHAFT BEARING BRACKET (for 4WD)

(a) Remove the 3 bolts and bracket.

50. REMOVE TRANSFER ASSEMBLY (for 4WD) (See page TF-59)

51. REMOVE STARTER ASSEMBLY (See page ST-7)

52. REMOVE AUTOMATIC TRANSAXLE ASSEMBLY

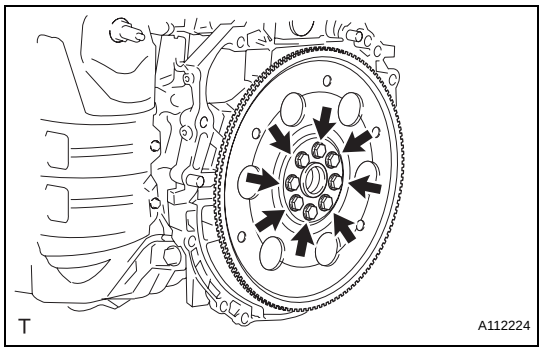


(a) Remove the automatic transaxle for U241E (2WD) (see page AX-147).

(b) Remove the automatic transaxle for U140F (4WD) (see page AX-148).

53. REMOVE TORQUE CONVERTER CLUTCH ASSEMBLY

(a) Remove the torque converter clutch for U241E (2WD) (see page AX-148).



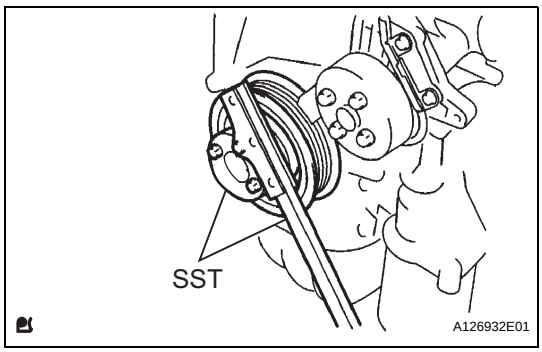
(b) Remove the torque converter clutch for U140F (4WD) (see page AX-149).

54. REMOVE DRIVE PLATE SUB-ASSEMBLY

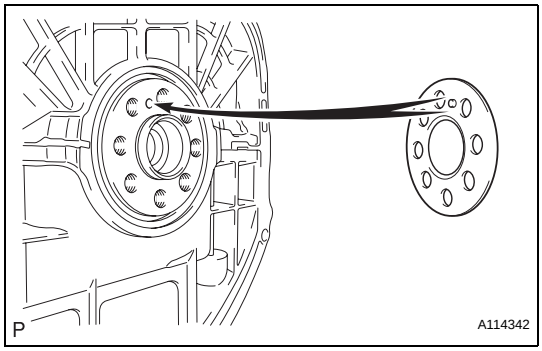
(a) Using SST, hold the crankshaft.

SST 09213-54015 (91651-60855), 09330-00021

(b) Remove the 8 bolts, rear spacer, drive plate and front spacer.

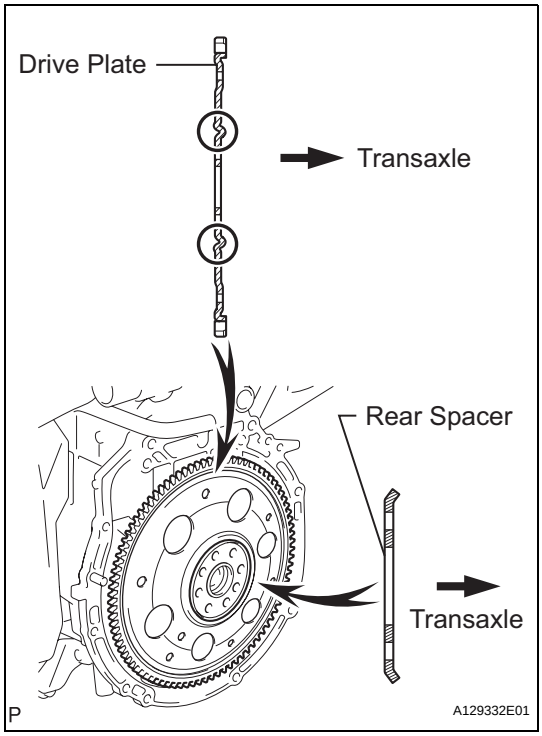


INSTALLATION



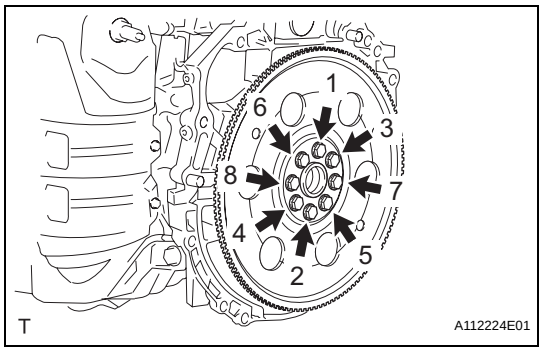
1. INSTALL DRIVE PLATE SUB-ASSEMBLY

(a) Clean the 8 bolts and 8 bolt holes.



(b) Apply adhesive to 2 or 3 threads of the 8 bolts.
Adhesive:
Toyota Genuine Adhesive 1342, Three Bond 1342 or Equivalent

(c) Using SST, hold the crankshaft.
SST 09213-54015 (91651-60855), 09330-00021



(d) Install the front spacer.
HINT:
Align the pin of the front spacer with the pin hole of the crankshaft.

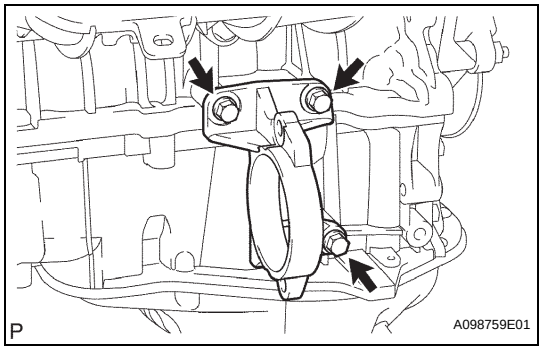
(e) Install the drive plate and rear spacer onto the crankshaft.

(f) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 98 N*m (1,000 kgf*cm, 72 ft.*lbf)

2. INSTALL TORQUE CONVERTER CLUTCH ASSEMBLY

(a) Install the torque converter clutch for U241E (2WD) (see page AX-148).

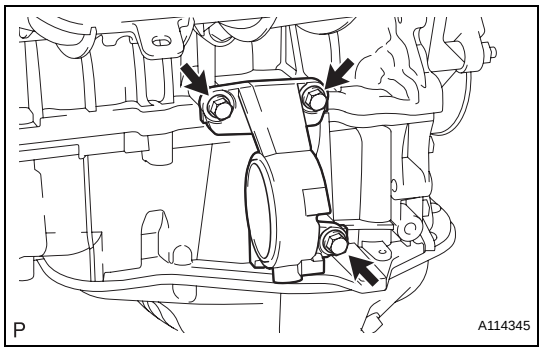
(b) Install the torque converter clutch for U140F (4WD) (see page AX-149).



3. INSTALL AUTOMATIC TRANSAXLE ASSEMBLY

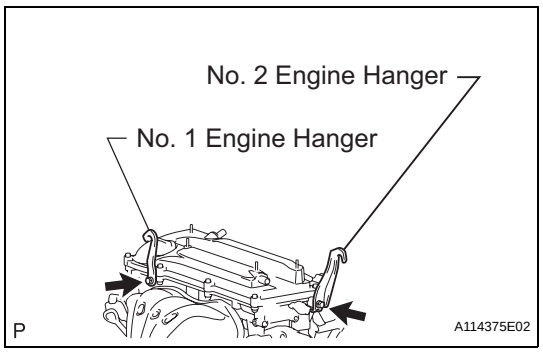
(a) Install the automatic transaxle for U241E (2WD) (see page AX-149).

(b) Install the automatic transaxle for U140F (4WD) (see page AX-150).



4. INSTALL STARTER ASSEMBLY (See page ST-14)

5. INSTALL TRANSFER ASSEMBLY (for 4WD) (See page TF-75)

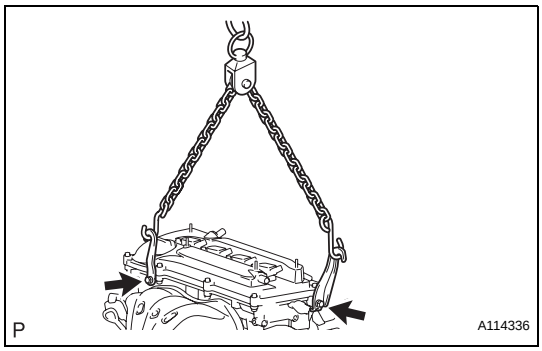


6. INSTALL DRIVE SHAFT BEARING BRACKET (for 2WD)

(a) Install the bracket with the 3 bolts.
Torque: 64 N*m (653 kgf*cm, 47 ft.*lbf)

7. INSTALL DRIVE SHAFT BEARING BRACKET (for 4WD)

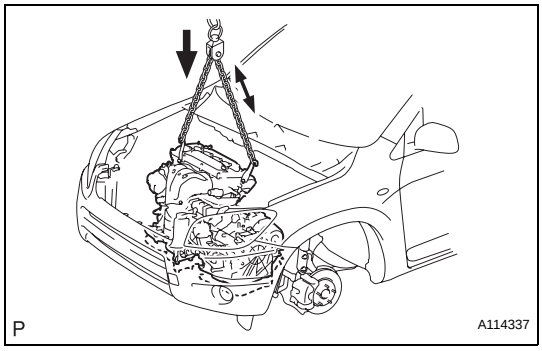
(a) Install the bracket with the 3 bolts.
Torque: 64 N*m (653 kgf*cm, 47 ft.*lbf)



8. INSTALL ENGINE HANGER

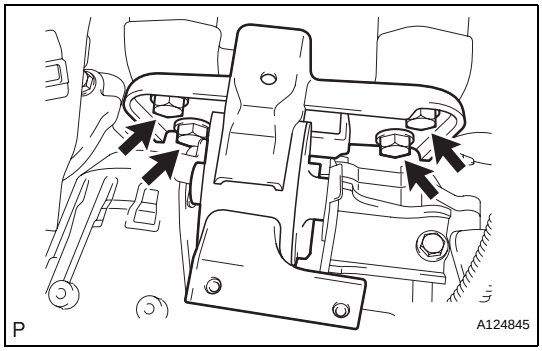
(a) Install the No. 1 and No. 2 engine hangers.
Torque: 38 N*m (387 kgf*cm, 28 ft.*lbf)
Part No.

ITEM	Part No.
No. 1 engine hanger	12281-28010
No. 2 engine hanger	12282-28010
Bolt	91512-61020



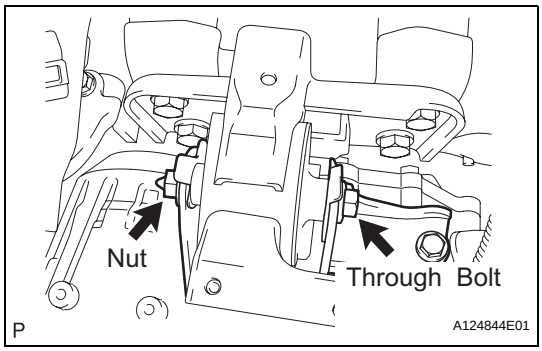
EM

(b) Attach the sling device and the engine with the chain block.



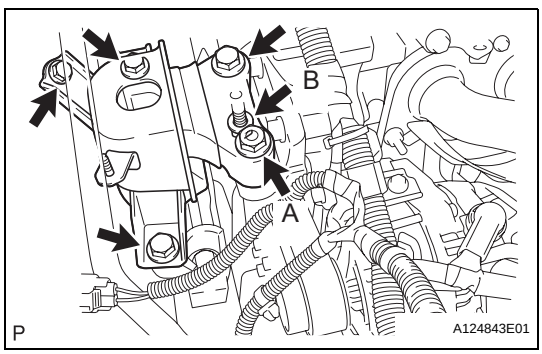
9. INSTALL ENGINE ASSEMBLY WITH TRANSAXLE

(a) Lift the engine assembly (with transaxle) with the chain block.



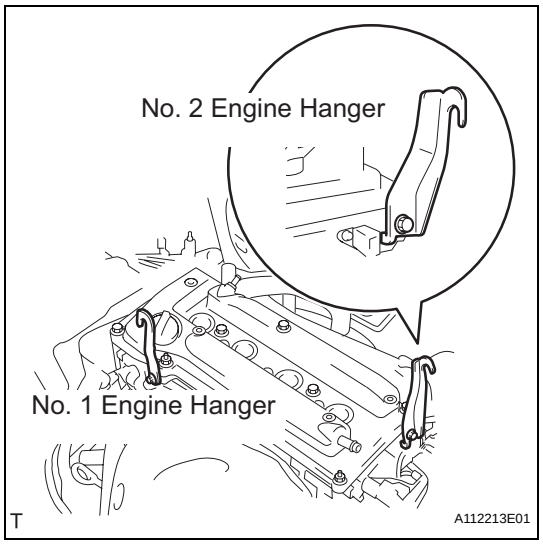
(b) Lower the engine out of the vehicle slowly and carefully.
NOTICE:
Make sure the engine is clear of all wiring, hoses and cables.

EM

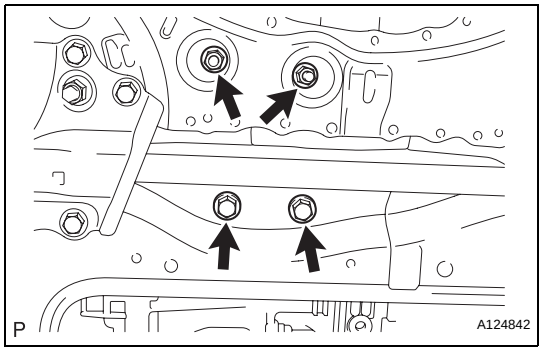


10. INSTALL ENGINE MOUNTING INSULATOR LH

(a) Install the engine mounting insulator LH with the 4 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

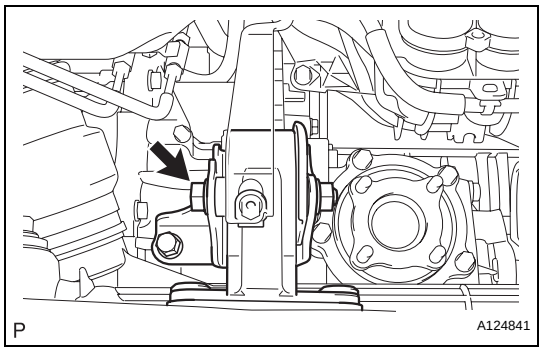


(b) Install the engine mounting insulator LH with the through bolt and nut.
HINT:
Install the through bolt by tightening the nut.
Torque: 56 N*m (571 kgf*cm, 41 ft.*lbf)



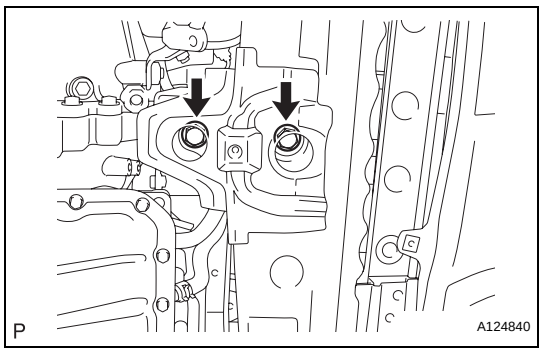
11. INSTALL ENGINE MOUNTING INSULATOR RH

(a) Install the engine mounting insulator RH with the 2 bolts and 2 nuts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf) for bolt
95 N*m (969 kgf*cm, 70 ft.*lbf) for nut A
52 N*m (530 kgf*cm, 38 ft.*lbf) for nut B



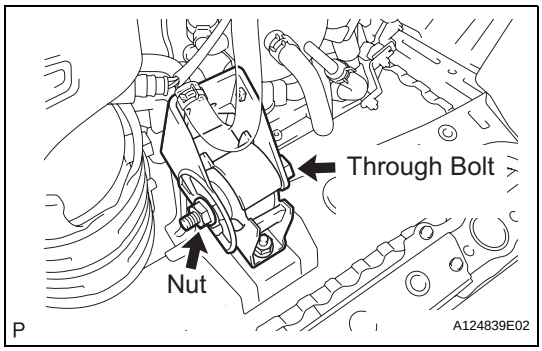
12. REMOVE ENGINE HANGER

(a) Remove the No. 1 and No. 2 engine hangers.



13. INSTALL ENGINE MOUNTING INSULATOR RR

(a) Install the engine mounting insulator RR with the 2 nuts and 2 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)



(b) Install the through bolt which is used to secure the rear engine mounting insulator, into the rear engine mounting bracket.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

14. INSTALL ENGINE MOUNTING INSULATOR FR

(a) Install the engine mounting insulator FR with the 2 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

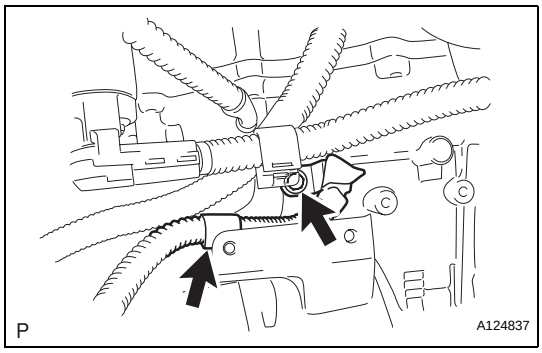
(b) Install the through bolt and nut which is used to secure the front engine mounting bracket FR.
HINT:
Install the through bolt by tightening the nut.
Torque: 145 N*m (1,479 kgf*cm, 107 ft.*lbf)

15. INSTALL PROPELLER SHAFT ASSEMBLY (for 4WD)

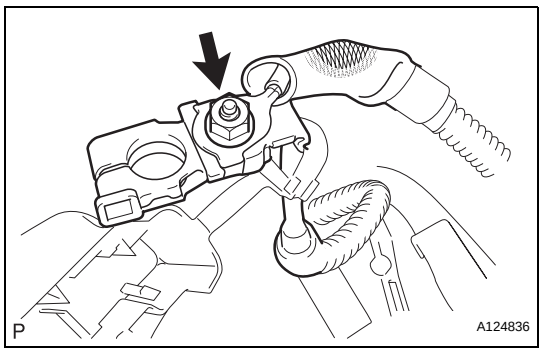
(a) Install the propeller shaft (see page PR-5).

16. INSTALL FRONT DRIVE SHAFT ASSEMBLY

(a) Install the front drive shaft RH (for 2WD) (see page DS-32).

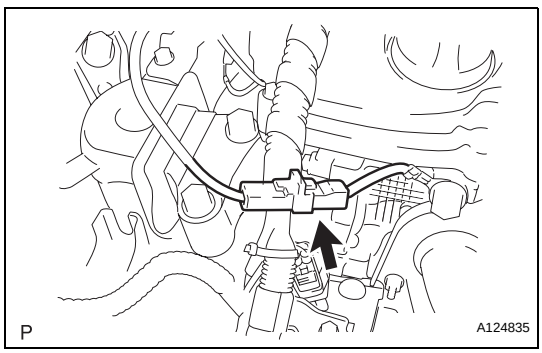


(b) Install the front drive shaft RH (for 4WD) (see page DS-65).



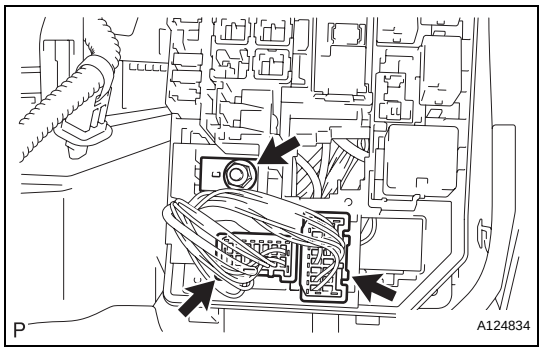
17. INSTALL FRONT EXHAUST PIPE (See page EX-4)

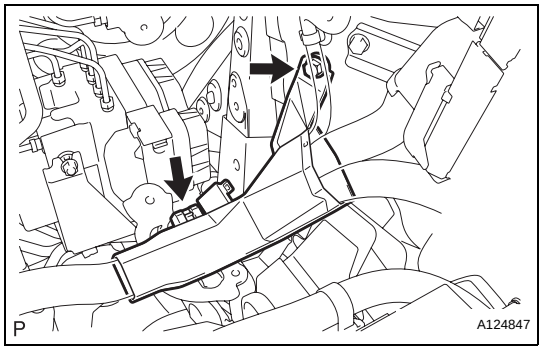
18. CONNECT ENGINE WIRE



(a) Install the ground cable with the bolt located near the starter.
Torque: 13 N*m (133 kgf*cm, 10 ft.*lbf)

(b) Connect the ground cable to the clamp located near the starter.





(c) Connect the engine wire to the positive (+) battery terminal with the nut.
Torque: 13 N*m (133 kgf*cm, 10 ft.*lbf)

(d) Connect the ground cable connector.

(e) Connect the 2 engine wire connectors and install the nut.
(f) Install the engine room relay block cover.

(g) Attach the clamp of the engine wire cover.
(h) Install the engine wire cover to with the bolt.

19. INSTALL ECM (See page ES-430)

20. INSTALL COOLER COMPRESSOR ASSEMBLY (See page AC-217)

21. INSTALL GENERATOR ASSEMBLY (See page CH-15)

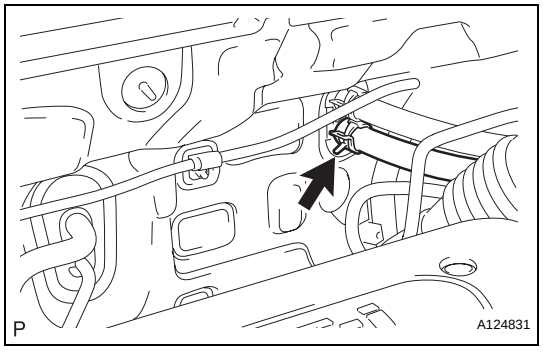
22. INSTALL FAN AND GENERATOR V BELT (See page EM-7)

23. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)

24. INSTALL TRANSAXLE CONTROL CABLE ASSEMBLY

(a) Install the transaxle control cable for U241E (see page AX-130).
(b) Install the transaxle control cable for U140F (see page AX-130).

25. INSTALL INTAKE MANIFOLD INSULATOR (See page ES-421)

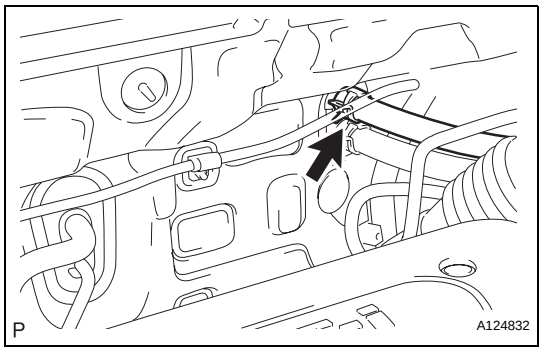


26. INSTALL INTAKE MANIFOLD (See page ES-421)

27. INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY (See page FU-13)

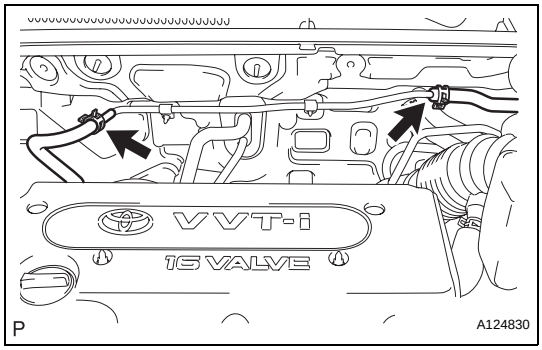
28. CONNECT NO. 2 VENTILATION HOSE (See page FU-14)

29. INSTALL THROTTLE BODY ASSEMBLY (See page ES-413)



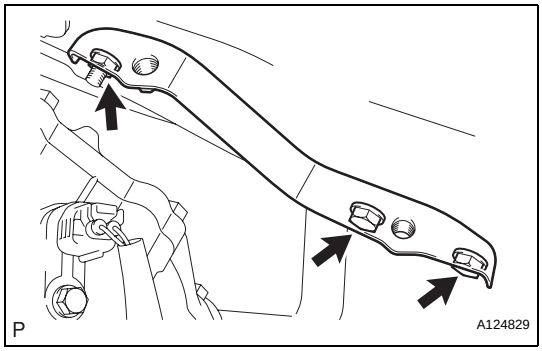
30. CONNECT FUEL TUBE (See page FU-14)

31. CONNECT HEATER WATER OUTLET HOSE



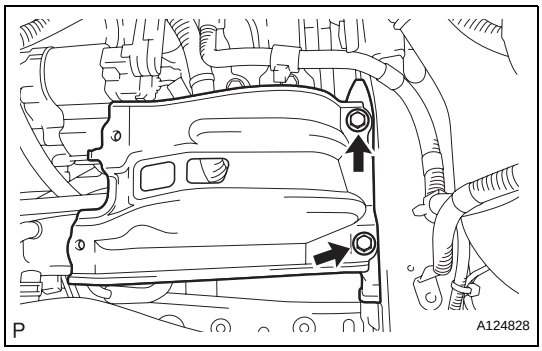
(a) Connect the heater water outlet hose to the air conditioner tube.

EM



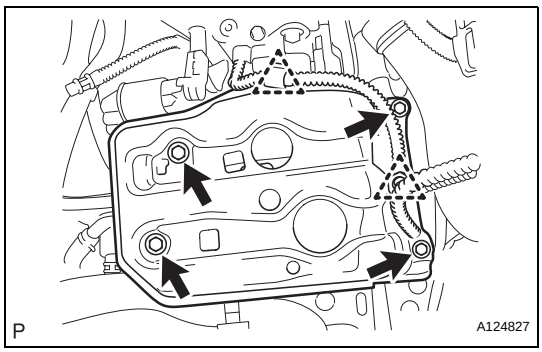
32. CONNECT HEATER WATER INLET HOSE

(a) Connect the heater water inlet hose to the air conditioner tube.



33. CONNECT UNION TO CONNECTOR TUBE HOSE

(a) Connect the 2 union to connector tube hoses to the booster vacuum tube.

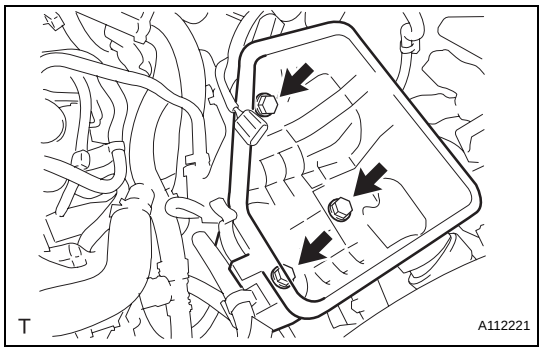


34. INSTALL BATTERY CARRIER BRACKET

(a) Install the battery carrier bracket with the nut and 2 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

35. INSTALL BATTERY BRACKET REINFORCEMENT

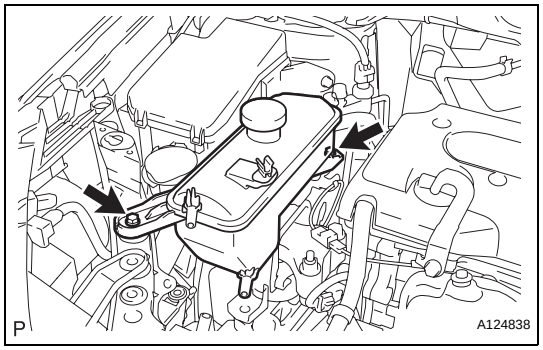
(a) Install the battery bracket reinforcement with the 2 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)



36. INSTALL FRONT BATTERY CARRIER

(a) Install the front battery carrier with the 4 bolts.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

(b) Connect the 2 clamps of the engine wire.



37. INSTALL AIR CLEANER CASE SUB-ASSEMBLY

(a) Connect the air cleaner case to the No. 1 air cleaner inlet.

(b) Install the air cleaner case with the 3 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

38. **INSTALL AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY**
39. **INSTALL AIR CLEANER CAP (See page ES-413)**
40. **INSTALL PURGE VSV (See page EC-16)**

41. **INSTALL RADIATOR RESERVOIR**
    (a) Install the reservoir with the 2 bolts.
    Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
42. **INSTALL RADIATOR ASSEMBLY**
    (a) Install the radiator (see page CO-32).
43. **INSTALL BATTERY TRAY**
44. **INSTALL BATTERY**
    (a) Install the battery.
    (b) Install the battery clamp with the bolt and nut.
    Torque: 8.5 N*m (87 kgf*cm, 75 in.*lbf) for bolt
    5.0 N*m (51 kgf*cm, 44 in.*lbf) for nut
45. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
46. **ADD AUTOMATIC TRANSAXLE FLUID**
    (a) Add automatic transaxle fluid for U241E (2WD) (see page AX-151).
    (b) Add automatic transaxle fluid for U140F (4WD) (see page AX-152).
47. **CHECK FOR FUEL LEAKS (See page FU-14)**
48. **ADD ENGINE COOLANT (See page CO-6)**
49. **CHECK FOR ENGINE COOLANT LEAKS**
    (a) Check for engine coolant leaks (see page CO-1).
50. **CHECK FOR AUTOMATIC TRANSAXLE FLUID LEAKS**
51. **ADJUST SHIFT LEVER POSITION**
    (a) Adjust the shift lever position for U241E (2WD) (see page AX-138).
    (b) Adjust the shift lever position for U140F (4WD) (see page AX-138).
52. **INSTALL NO. 1 ENGINE COVER (See page EM-43)**
53. **INSTALL FRONT FENDER APRON RH**
54. **INSTALL NO. 2 ENGINE UNDER COVER**
55. **INSTALL NO. 1 ENGINE UNDER COVER**
56. **INSTALL FRONT WHEEL**
57. **INSTALL RADIATOR SUPPORT OPENING COVER**

58. INSTALL HOOD SUB-ASSEMBLY

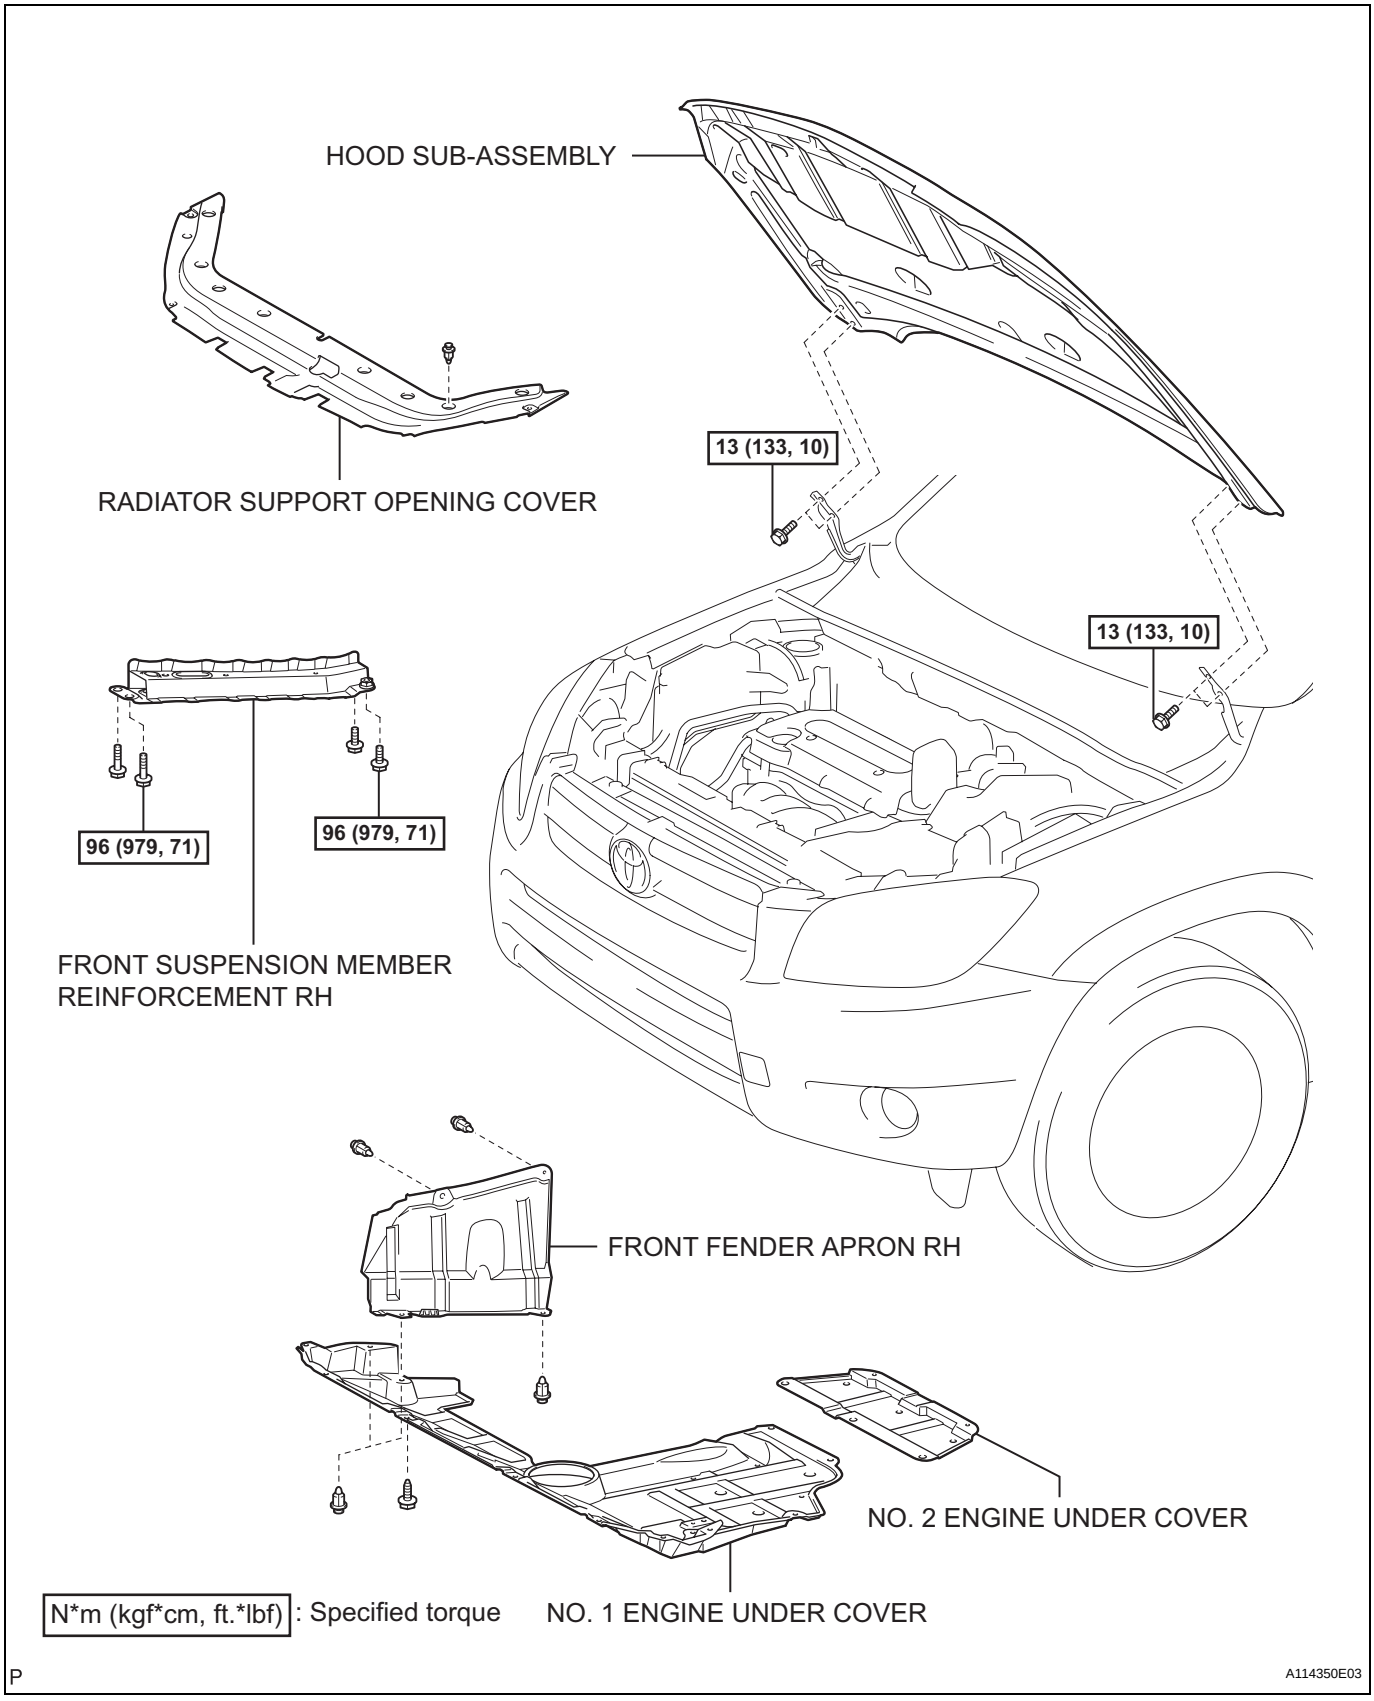
(a) Install the hood (see page ED-7).

(b) Adjust the hood (see page ED-5).

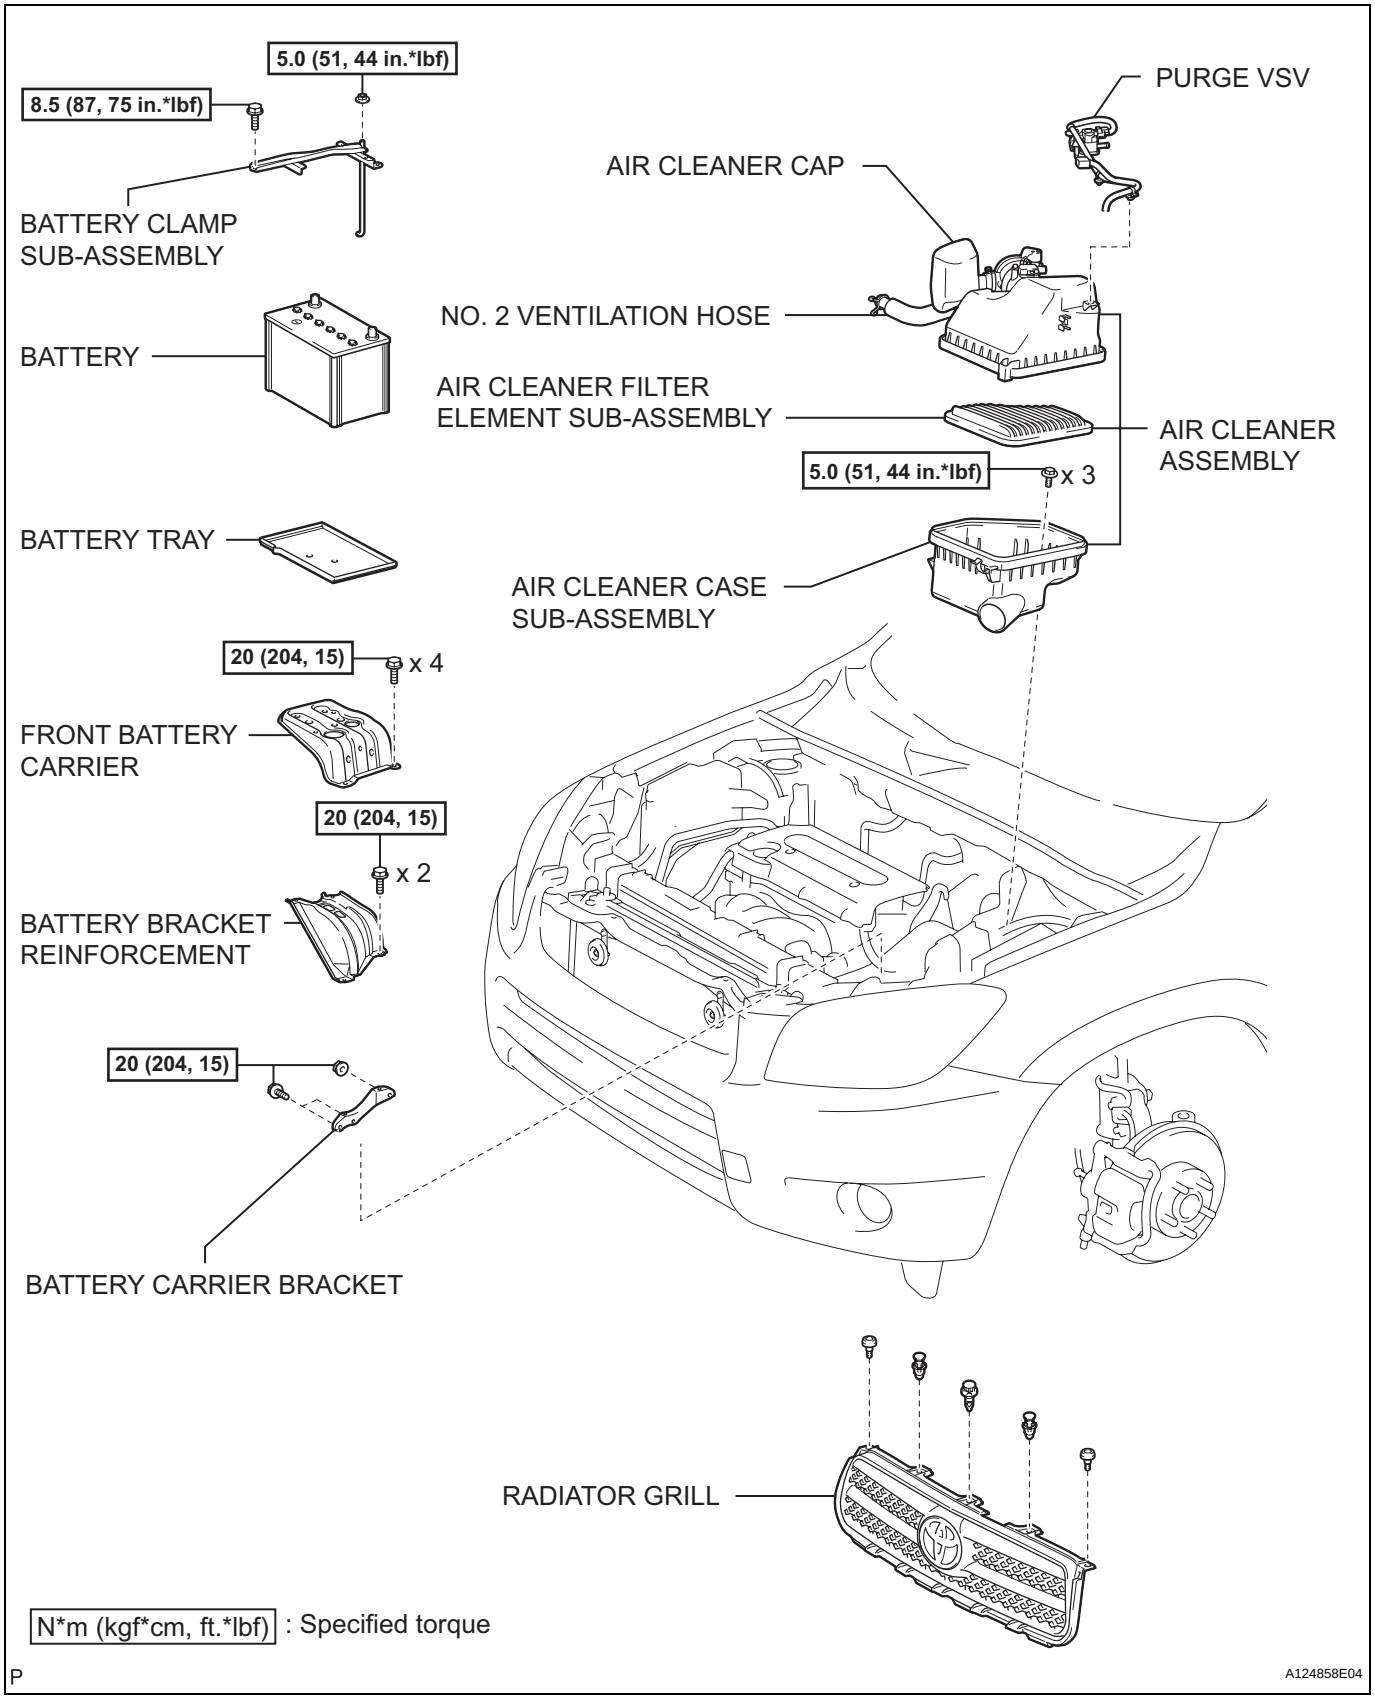
59. INSPECT AND ADJUST FRONT WHEEL ALIGNMENT

(a) Inspect and adjust the front wheel alignment (see page SP-3).

60. PERFORM REGISTRATION



(a) When replacing the engine assembly, perform vehicle stability control system recognition in ECM (see page CC-12).



61. RESET MEMORY (for Automatic Transaxle)

(a) When replacing the engine assembly, perform the RESET MEMORY procedure (A/T initialization) for U241E (2WD) (see page AX-18) and for U140F (4WD) (see page AX-18).

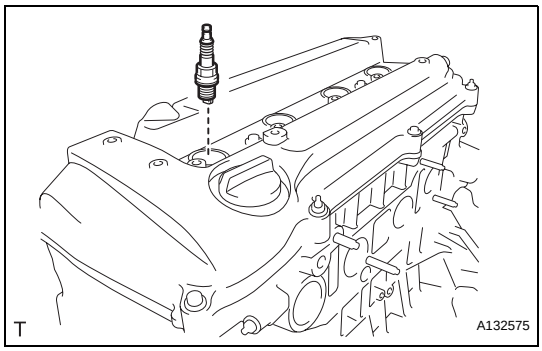
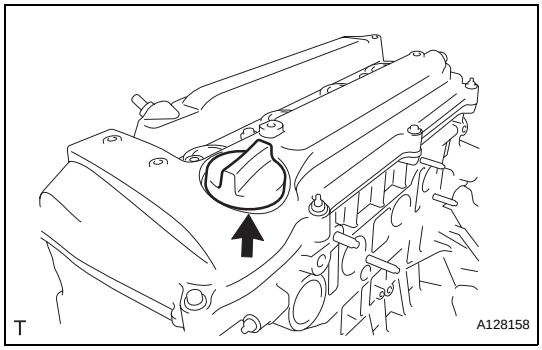
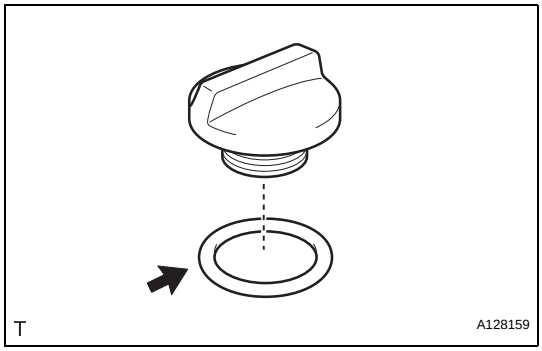
DISASSEMBLY



1. **REMOVE IDLER PULLEY (See page EM-23)**
2. **REMOVE OIL DIPSTICK**
3. **REMOVE OIL DIPSTICK GUIDE (See page EM-57)**
4. **REMOVE MANIFOLD STAY (See page EM-57)**
5. **REMOVE NO. 2 MANIFOLD STAY (See page EM-58)**
6. **REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (See page EM-58)**
7. **REMOVE EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY (See page EM-58)**
8. **REMOVE WATER INLET (See page CO-15)**
9. **REMOVE THERMOSTAT**
10. **REMOVE NO. 1 WATER BY-PASS PIPE**
    (a) Remove the bolt, 2 nuts, pipe and gasket.

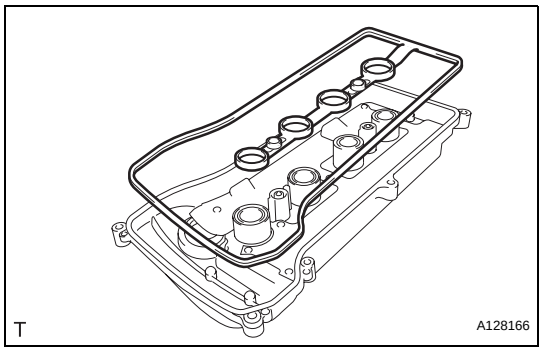


11. **REMOVE NO. 3 WATER BY-PASS PIPE**
    (a) Remove the bolt, 2 nuts, pipe and gasket.
12. **REMOVE V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-26)**
13. **REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-395)**
14. **REMOVE KNOCK SENSOR (See page ES-420)**
15. **REMOVE RADIO SETTING CONDENSER (See page EM-63)**
16. **REMOVE OIL PRESSURE SWITCH ASSEMBLY (See page EM-63)**
17. **REMOVE ENGINE COOLANT TEMPERATURE SENSOR (See page EM-63)**
18. **REMOVE CAMSHAFT POSITION SENSOR (See page EM-64)**
19. **REMOVE IGNITION COIL ASSEMBLY (See page IG-9)**



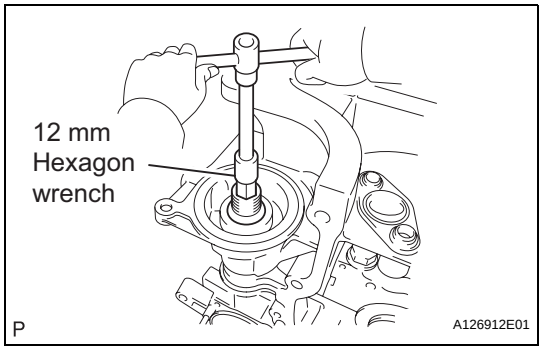
EM

20. REMOVE SPARK PLUG



21. REMOVE OIL FILLER CAP SUB-ASSEMBLY

22. REMOVE OIL FILLER CAP GASKET

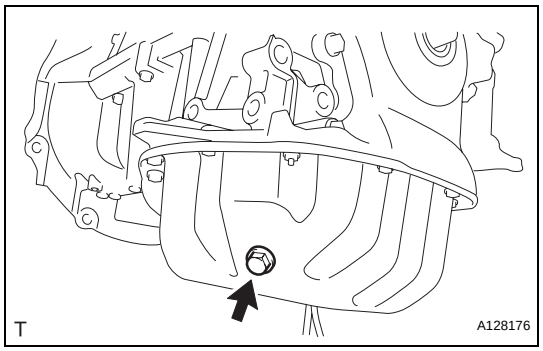


23. REMOVE VENTILATION VALVE SUB-ASSEMBLY (See page EC-18)

24. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-24)

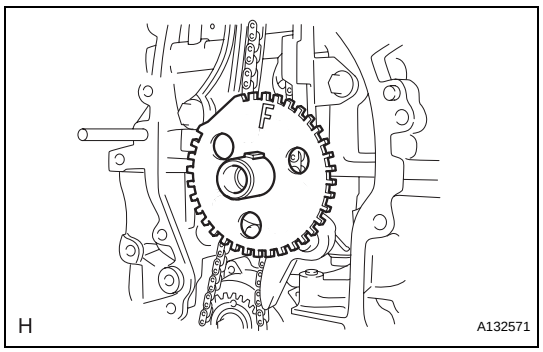
25. REMOVE CYLINDER HEAD COVER GASKET

26. REMOVE OIL FILTER SUB-ASSEMBLY (See page LU-4)



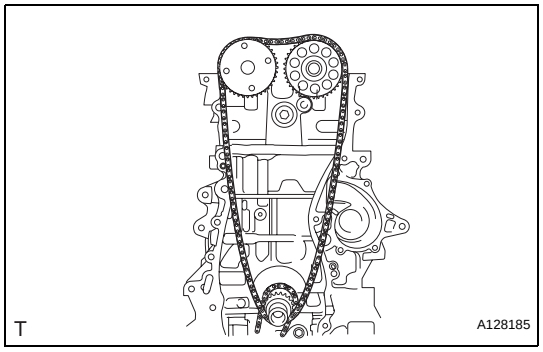
27. REMOVE OIL FILTER UNION

(a) Using a 12 mm hexagon wrench, remove the oil filter union.

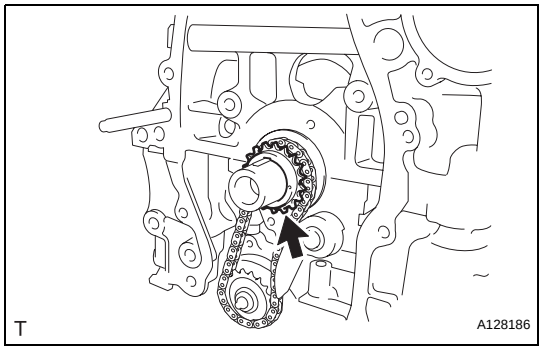


28. REMOVE CRANKSHAFT POSITION SENSOR (See page ES-402)

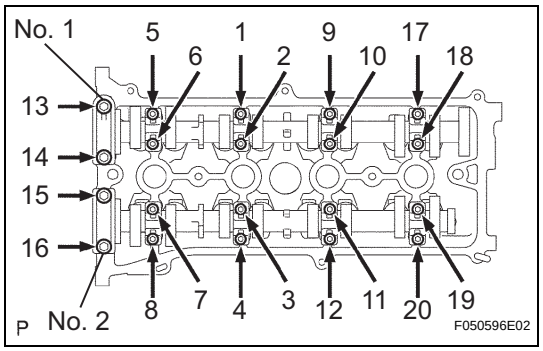
29. REMOVE WATER PUMP PULLEY (See page CO-11)



30. REMOVE WATER PUMP ASSEMBLY (See page CO-11)

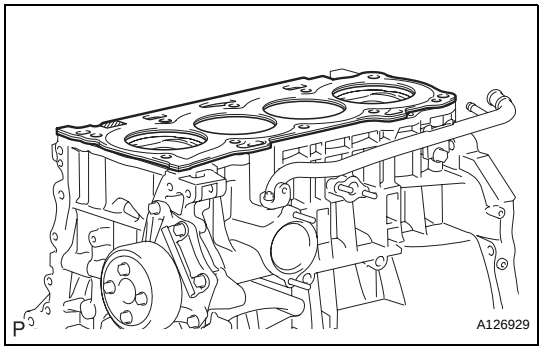


31. **REMOVE OIL PAN DRAIN PLUG**
    (a) Remove the oil pan drain plug and gasket.
32. **REMOVE OIL PAN SUB-ASSEMBLY (See page EM-24)**
33. **REMOVE CRANKSHAFT PULLEY (See page EM-25)**
34. **REMOVE NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-26)**
35. **REMOVE TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-26)**
36. **REMOVE NO. 1 CRANKSHAFT POSITION SENSOR PLATE**

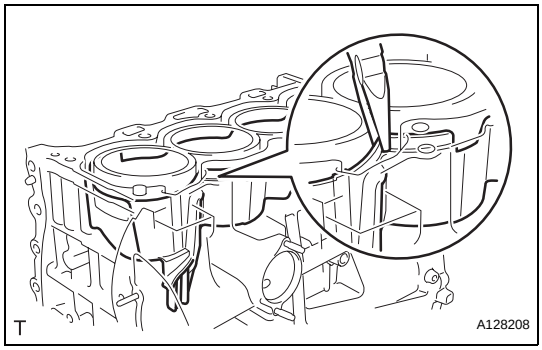


37. **REMOVE TIMING CHAIN GUIDE (See page EM-28)**
38. **REMOVE CHAIN TENSIONER SLIPPER (See page EM-28)**
39. **REMOVE NO. 1 CHAIN VIBRATION DAMPER (See page EM-28)**

40. **REMOVE CHAIN SUB-ASSEMBLY**

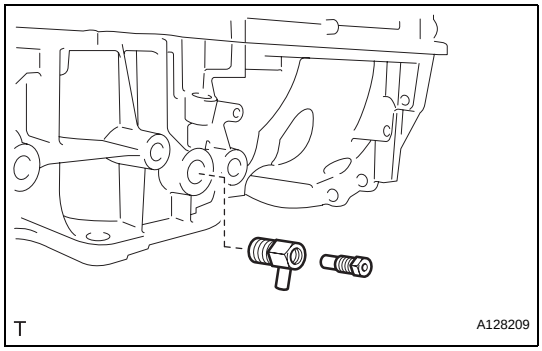


41. **REMOVE CRANKSHAFT TIMING SPROCKET**
42. **REMOVE NO. 2 CHAIN SUB-ASSEMBLY (See page EM-29)**
43. **REMOVE OIL PUMP DRIVE GEAR**
44. **REMOVE OIL PUMP ASSEMBLY (See page LU-12)**

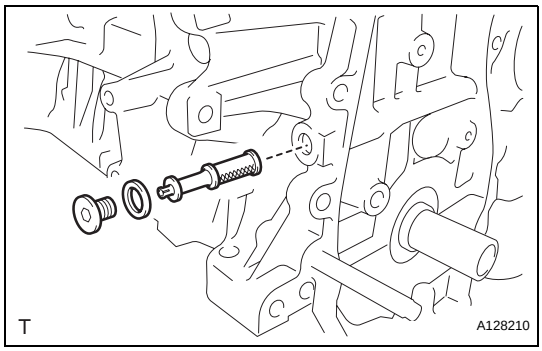


45. **REMOVE CAMSHAFT**
    (a) Using several steps, uniformly loosen and remove the 20 bearing cap bolts in the sequence shown in the illustration.
    (b) Remove the 10 bearing caps, then remove the camshaft and No. 2 camshaft.
46. **REMOVE CYLINDER HEAD SUB-ASSEMBLY (See page EM-62)**

EM



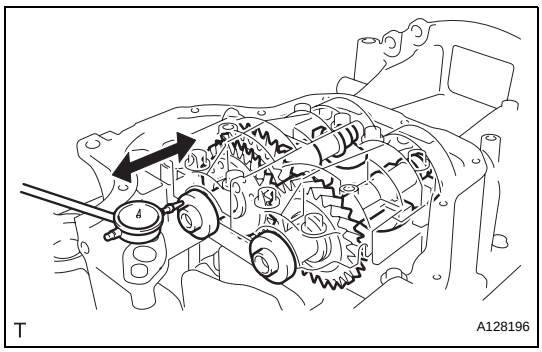
47. REMOVE CYLINDER HEAD GASKET



48. REMOVE CYLINDER BLOCK WATER JACKET SPACER

(a) Using needle-nose pliers, remove the cylinder block water jacket spacer from the water jacket.

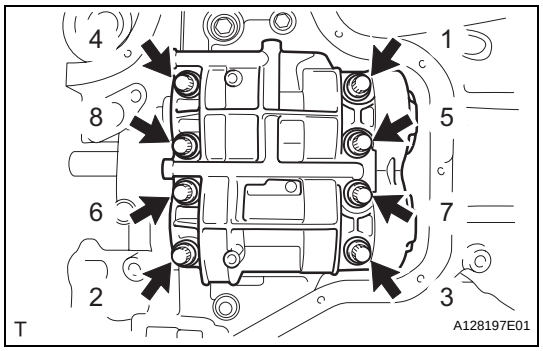
NOTICE:
Before turning the cylinder block upside down, make sure that the water jacket spacer is removed, as it will fall out.



49. REMOVE CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY

50. REMOVE OIL CONTROL VALVE FILTER

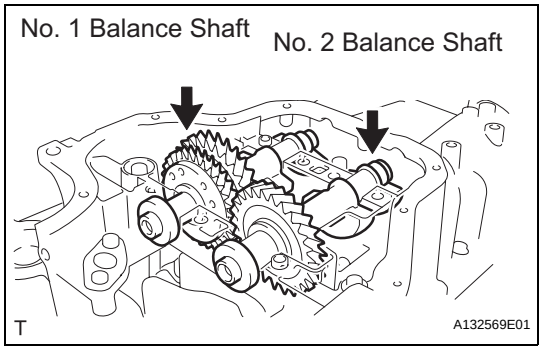
(a) Using a 6 mm socket hexagon wrench, remove the plug and gasket.
(b) Remove the oil control valve filter.



51. INSPECT BALANCE SHAFT THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the balance shaft back and forth.

Standard thrust clearance:
0.05 to 0.09 mm (0.0020 to 0.0035 in.)
Maximum thrust clearance:
0.09 mm (0.0035 in.)

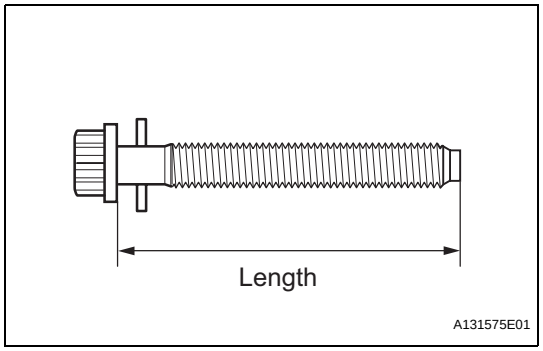


If the thrust clearance is greater than the maximum, replace the balance shaft housing and bearings. If necessary, replace the balance shaft.

52. INSPECT BALANCE SHAFT OIL CLEARANCE

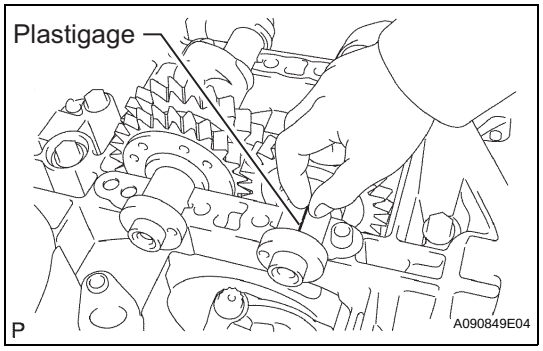
(a) Using several steps, uniformly loosen and remove the 8 bolts in the sequence shown in the illustration.

(b) Remove the balance shaft housing from the crankcase.
HINT:
Keep the lower bearing and balance shaft housing together.



(c) Lift out the No. 1 and No. 2 balance shafts.
HINT:
Keep the upper bearing with the crankcase.

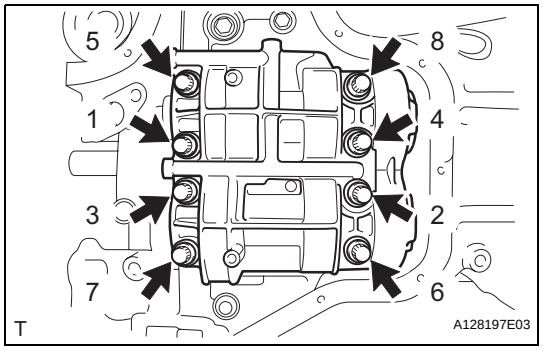
(d) Clean each bearing and journal.



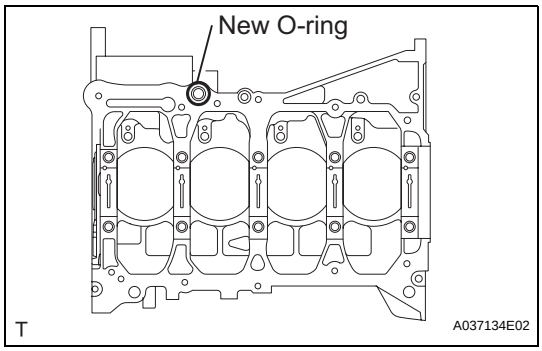
(e) Check each bearing and journal for pitting and scratches.
If a bearing or journal is damaged, replace the bearings. If necessary, replace the balance shaft.

EM

(f) Inspect the balance shaft housing bolt.
(1) Using a vernier caliper, measure the length of the bolts from the seat to the end.
Standard bolt length:
58.3 to 59.7 mm (2.295 to 2.350 in.)
Maximum bolt length:
60.3 mm (2.374 in.)
If the bolt length is greater than the maximum, replace the balance shaft bolt.



(g) Place the No. 1 and No. 2 balance shafts onto the crankcase.



(h) Lay a strip of Plastigage across each journal.

(i) Install the balance shaft housing.

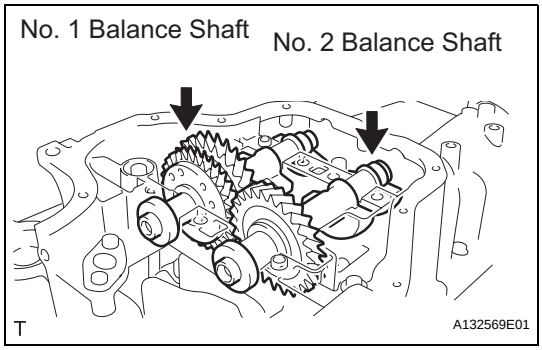
(j) Apply a light coat of engine oil on the threads and under the heads of the bolts.

(k) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 21.6 N*m (220 kgf*cm, 16 ft.*lbf)

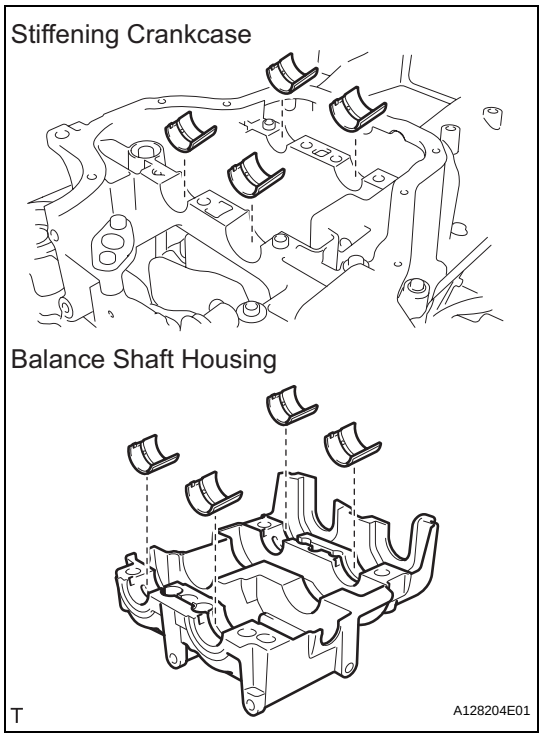
(l) Mark the front of the bolts with paint.
(m) Retighten the bolts 90° as shown in the illustration.
(n) Check that the paint mark is now at a 90° angle to the front.
(o) Remove the balance shaft housing from the crankcase.
(p) Measure the Plastigage at its widest point.

Standard oil clearance:
0.004 to 0.049 mm (0.0002 to 0.0019 in.)
Maximum oil clearance:
0.049 mm (0.0019 in.)
NOTICE:
Remove the Plastigage completely after the measurement.
If the oil clearance is greater than the maximum, replace the bearing. If necessary, replace the balance shaft.
HINT:
If replacing a bearing, select a new one with the same number.

Standard balance shaft housing journal bore diameter

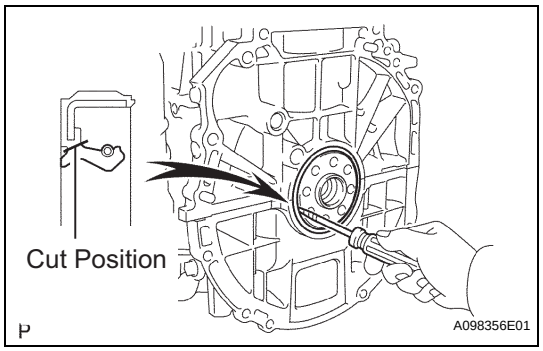


Item	Specified Condition
Mark 1	26.000 to 26.006 mm (1.0236 to 1.0239 in.)
Mark 2	26.007 to 26.012 mm (1.0239 to 1.0214 in.)
Mark 3	26.013 to 26.018 mm (1.0241 to 1.0243 in.)



Standard balance shaft journal diameter:
22.985 to 23.000 mm (0.9049 to 0.9055 in.)

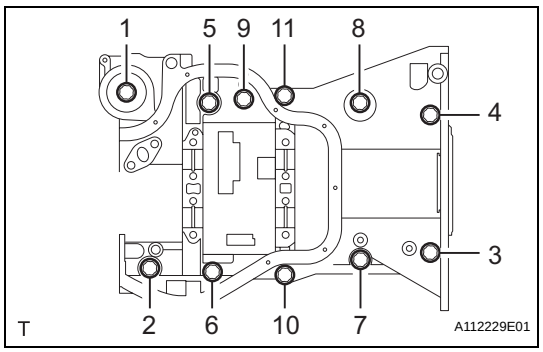
Standard bearing center wall thickness



Item	Specified Condition
Mark 1	1.486 to 1.489 mm (0.05850 to 0.05862 in.)
Mark 2	1.490 to 1.492 mm (0.05866 to 0.05874 in.)
Mark 3	1.493 to 1.495 mm (0.0585 to 0.0586 in.)

53. REMOVE BALANCE SHAFT

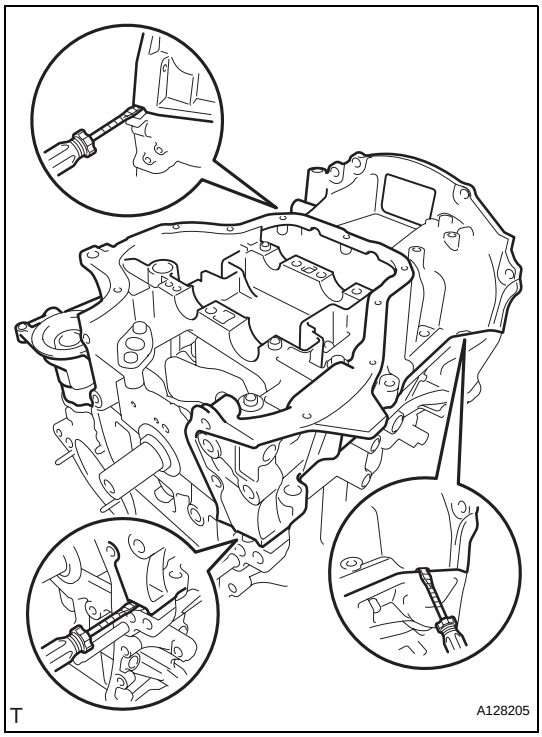
54. REMOVE NO. 1 BALANCE SHAFT BEARING



55. REMOVE ENGINE REAR OIL SEAL

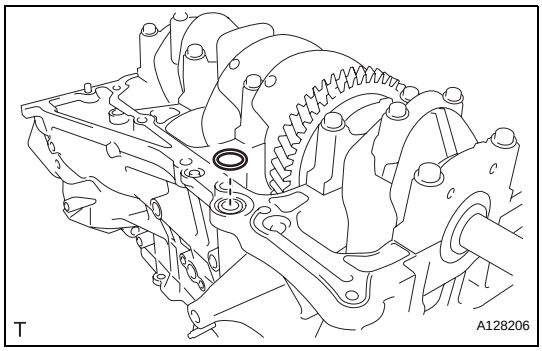
(a) Using a knife, cut off the lip of the oil seal.

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

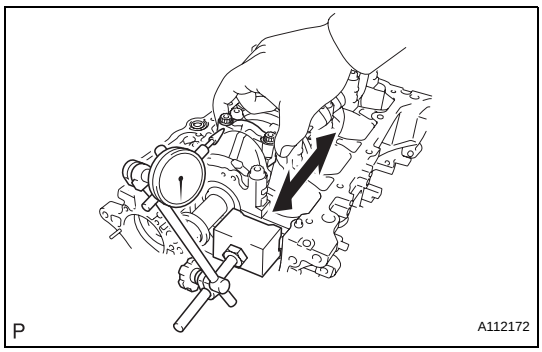


NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

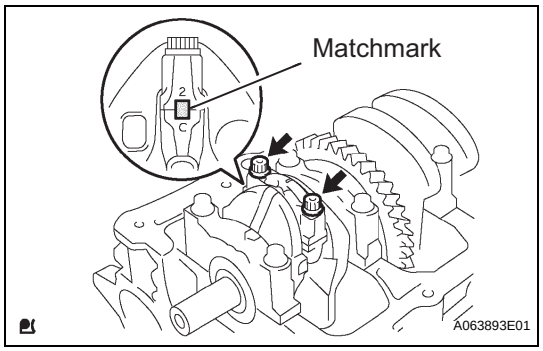


56. REMOVE STIFFENING CRANKCASE ASSEMBLY

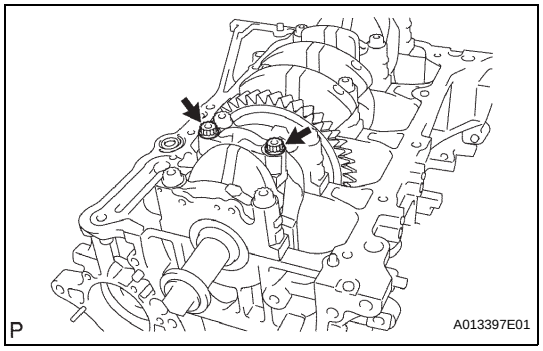


(a) Using several steps, uniformly loosen and remove the 11 bolts in the sequence shown in the illustration.

(b) Remove the crankcase by prying the portions between the crankcase and cylinder block.
NOTICE:
Be careful not to damage the contact surfaces of the crankcase and cylinder bock.



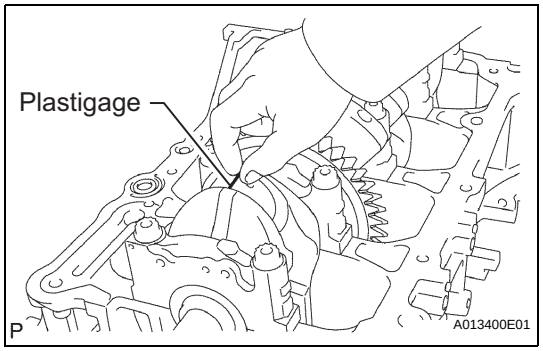
(c) Remove the O-ring from the cylinder block.



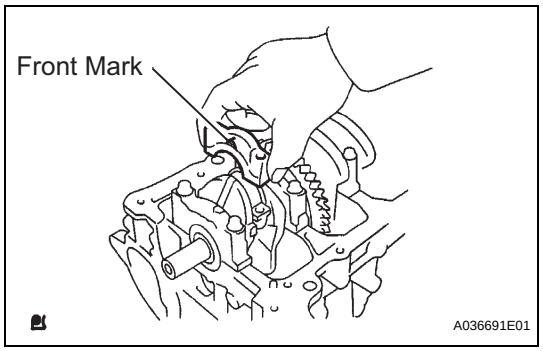
57. INSPECT CONNECTING ROD THRUST CLEARANCE

(a) Using a dial indicator, measure the thrust clearance while moving the connecting rod back and forth.
Standard thrust clearance:
0.160 to 0.362 mm (0.0063 to 0.0143 in.)
Maximum thrust clearance:
0.362 mm (0.0143 in.)
If the thrust clearance is greater than the maximum, replace the connecting rod. If necessary, replace the crankshaft.

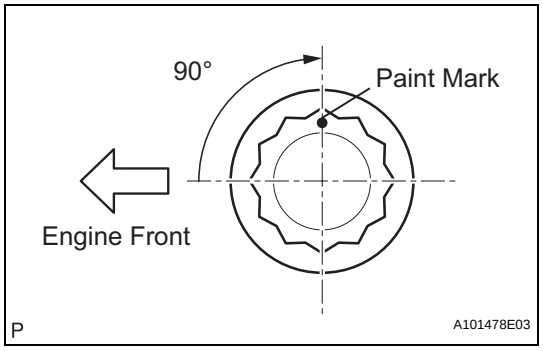
58. INSPECT CONNECTING ROD OIL CLEARANCE
NOTICE:
Do not turn the crankshaft during the measurement.



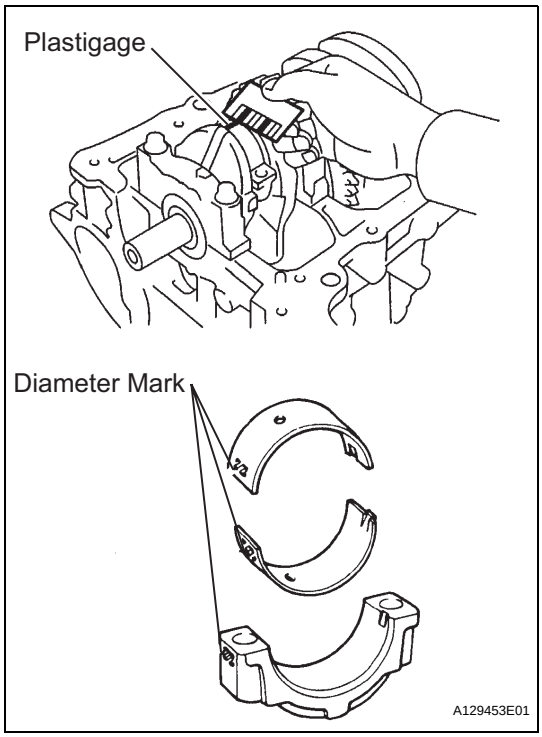
(a) Using marking paint, write the matched cylinder number on each connecting rod and cap.
HINT:
The matchmarks in the connecting rods and caps are for ensuring correct reassembly.



(b) Using a 12 mm socket wrench, remove the 2 bolts and connecting rod cap.
(c) Clean the crank pin and bearing.
(d) Check the crank pin and bearing for pitting and scratches.



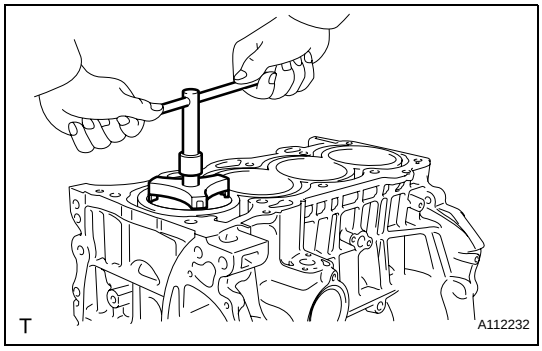
EM



(e) Lay a strip of Plastigage on the crank pin.

(f) Check that the front mark of the connecting rod cap is facing in the correct direction.
(g) Apply a light coat of engine oil to the threads and under the heads of the connecting rod bolts.
(h) Using a 12 mm socket wrench, tighten the bolts in several passes to the specified torque.
Torque: 24.5 N*m (250 kgf*cm, 18 ft.*lbf)

(i) Mark the front of the connecting rod bolts with paint.
(j) Retighten the cap bolts 90° as shown in the illustration.
(k) Check that the crankshaft turns smoothly.
(l) Using a 12 mm socket wrench, remove the 2 bolts and connecting rod cap.

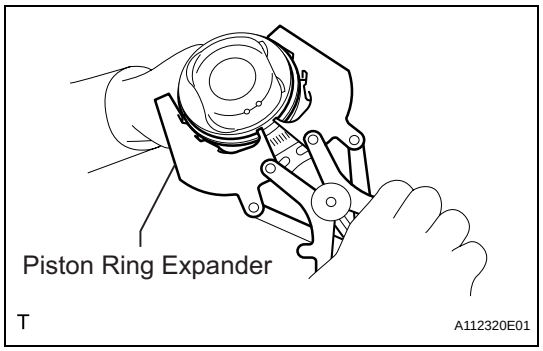


(m) Measure the Plastigage at its widest point.
Standard oil clearance:
0.024 to 0.048 mm (0.0009 to 0.0019 in.)
Maximum oil clearance:
0.08 mm (0.0032 in.)
NOTICE:
Remove the Plastigage completely after the measurement.
If the oil clearance is greater than the maximum, replace the connecting rod bearing. If necessary, grind or replace the crankshaft.
HINT:
If replacing a bearing, select a new one with the same number as marked on the connecting rod. There are 3 sizes of standard bearings, marked "1", "2" and "3" accordingly.
Standard connecting rod large end bore diameter

Mark	Specified Condition
Mark 1	51.000 to 51.007 mm (2.0079 to 2.0082 in.)
Mark 2	51.008 to 51.013 mm (2.0082 to 2.0084 in.)
Mark 3	51.014 to 51.020 mm (2.0084 to 2.0087 in.)

Standard connecting rod bearing thickness

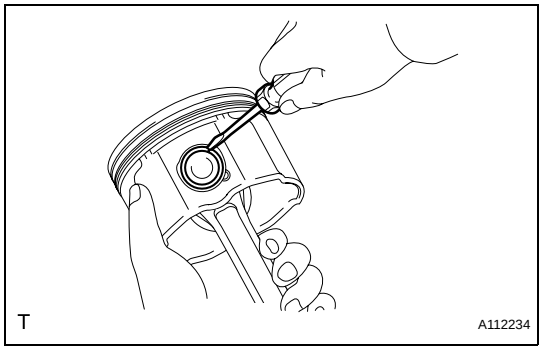
Mark	Specified Condition
Mark 1	1.485 to 1.488 mm (0.0585 to 0.0586 in.)
Mark 2	1.489 to 1.491 mm (0.0586 to 0.0587 in.)
Mark 3	1.492 to 1.494 mm (0.0587 to 0.0588 in.)



Standard crankshaft pin diameter:
47.990 to 48.000 (1.8894 to 1.8898 in.)

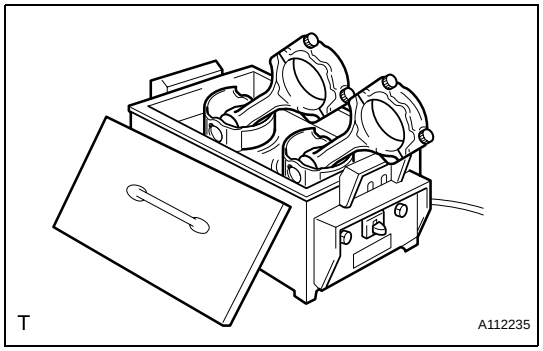
59. REMOVE PISTON WITH CONNECTING ROD

(a) Using a ridge reamer, remove all the carbon from the top of the cylinder.
(b) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.
HINT:
- Keep the bearing, connecting rod and cap together.
- Arrange the piston and connecting rod assemblies in the correct order.



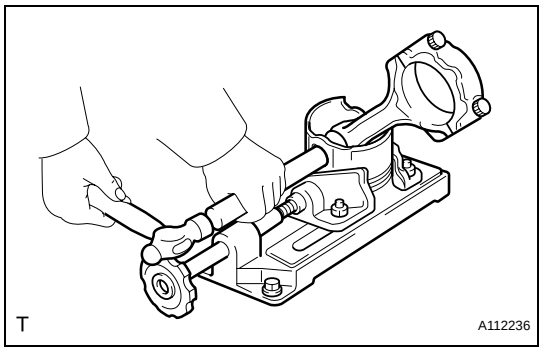
60. REMOVE CONNECTING ROD BEARING

61. REMOVE PISTON RING SET



(a) Using a piston ring expander, remove the 2 compression rings.

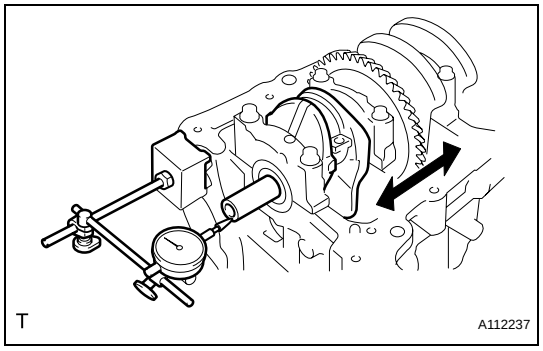
(b) Remove the oil ring and expander by hand.



62. REMOVE PISTON PIN HOLE SNAP RING

(a) Using a small screwdriver, pry out the 2 snap rings.

63. REMOVE PISTON



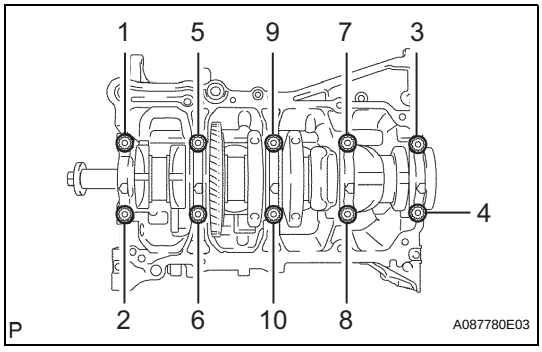
(a) Gradually heat the piston up to 80 to 90°C (176 to 194°F).

(b) Using a plastic-faced hammer and brass bar, lightly tap out the piston pin, then remove the connecting rod.

HINT:

- The piston and pin are a matched set.
- Arrange the piston, pin, ring, connecting rod and bearings in the correct order.

64. INSPECT CRANKSHAFT THRUST CLEARANCE

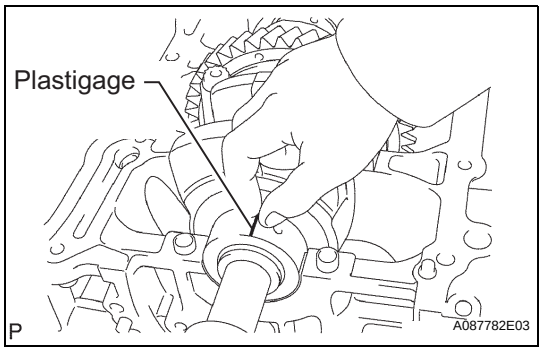


(a) Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

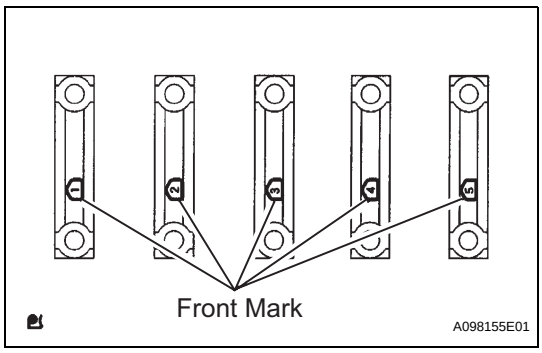
Standard thrust clearance:
0.04 to 0.24 mm (0.0016 to 0.0095 in.)
Maximum thrust clearance:
0.30 mm (0.012 in.)

If the thrust clearance is greater than the maximum, replace the thrust washers as a set.

HINT:
The thrust washer thickness is 1.93 to 1.98 mm (0.0760 to 0.0780 in.).



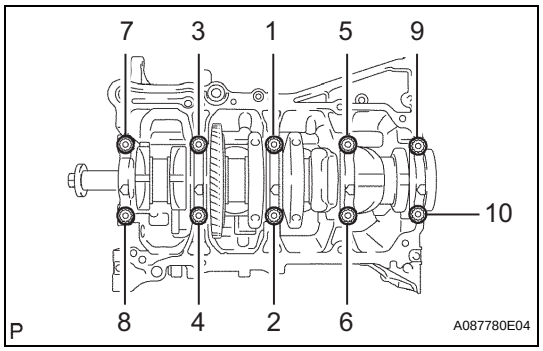
65. INSPECT CRANKSHAFT OIL CLEARANCE
NOTICE:
Do not turn the crankshaft during the measurement.



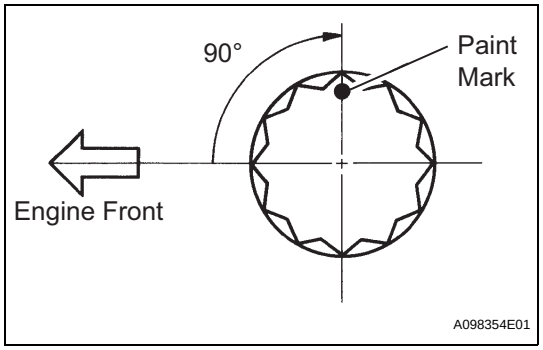
(a) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.
(b) Remove the 5 bearing caps from the cylinder block.
HINT:
- Keep the No. 2 crankshaft bearings and crankshaft bearing caps together.
- Arrange the bearing caps in correct order.

(c) Remove the crankshaft.
HINT:
Keep the crankshaft bearings and crankshaft thrust washer uppers together with the cylinder block.
(d) Clean each main journal and bearing.
(e) Check each main journal and bearing for pitting and scratches.
- If the journal or bearing is damaged, replace the bearings.
- If necessary, replace the crankshaft.

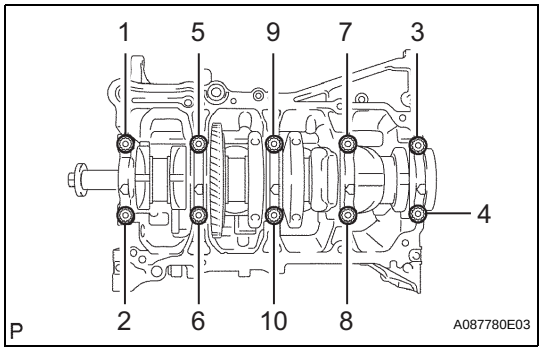
(f) Place the crankshaft onto the cylinder block.



(g) Lay a strip of Plastigage across each journal.

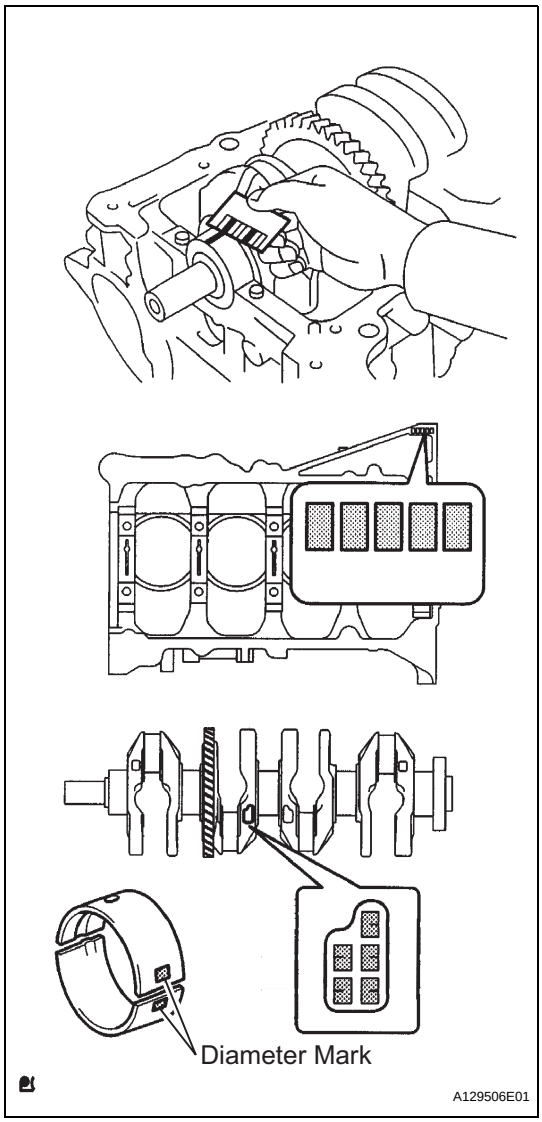


(h) Examine the front marks and numbers, and install the bearing caps onto the cylinder block in the order shown in the illustration.
(i) Apply a light coat of engine oil to the threads and under the heads of the crankshaft bearing cap set bolts.



EM

(j) Using several steps, uniformly install and tighten the 10 bearing cap bolts in the sequence shown in the illustration.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)



(k) Mark the front of the bearing cap bolts with paint.
(l) Retighten the 10 bearing cap bolts by 90°.
(m) Check that the paint marks are at a 90° angle to the front.

(n) Remove the crankshaft bearing caps.

EM

(o) Measure the Plastigage at its widest point.

Standard oil clearance:
0.008 to 0.024 mm (0.0003 to 0.0010 in.)
Maximum oil clearance:
0.050 mm (0.0020 in.)
NOTICE:
Remove the Plastigage completely after the measurement.

If the oil clearance is greater than the maximum, replace the crankshaft bearing. If necessary, replace the crankshaft.

HINT:

If replacing a bearing, select a new one with the same number. If the number of the bearing cannot be determined, calculate the correct bearing number by adding together the numbers imprinted on the cylinder block and crankshaft. Then select a new bearing with the calculated number. There are 4 sizes of standard bearings, marked "1", "2", "3" and "4" accordingly.

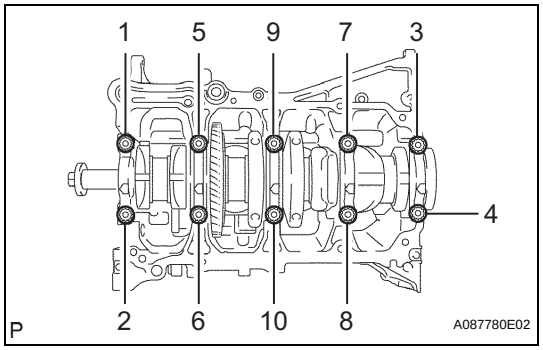
Cylinder block + Crankshaft	0 to 2	3 to 5	6 to 8	9 to 11
Use bearing	"1"	"2"	"3"	"4"

EXAMPLE

- Imprinted number on the cylinder block is 3.
- Imprinted number on the crankshaft is 4.
  3 + 4 = 7
  Select the bearing marked "3".

Standard cylinder block journal bore diameter

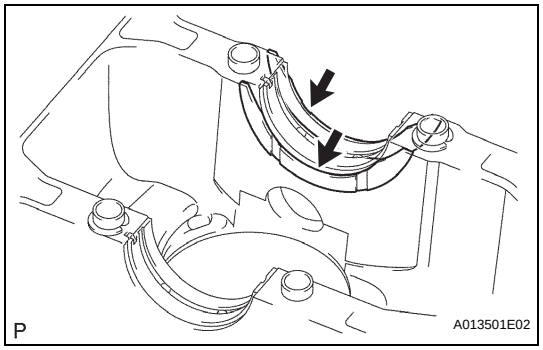
Mark	Specified Condition
0	59.000 to 59.002 mm (2.3228 to 2.3229 in.)
1	59.003 to 59.004 mm (2.3230 to 2.3230 in.)
2	59.005 to 59.006 mm (2.3230 to 2.3231 in.)
3	59.007 to 59.009 mm (2.3231 to 2.3232 in.)
4	59.010 to 59.011 mm (2.3232 to 2.3233 in.)
5	59.012 to 59.013 mm (2.3233 to 2.3234 in.)
6	59.014 to 59.016 mm (2.3234 to 2.3235 in.)



Standard crankshaft journal diameter

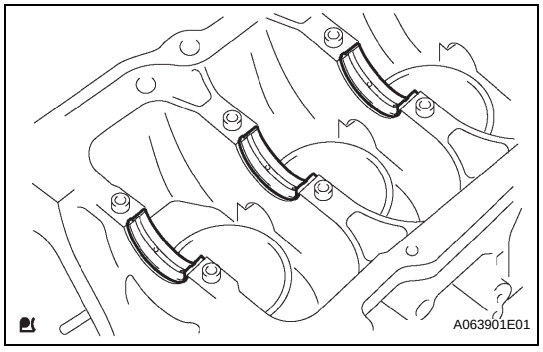
Mark	Specified Condition
0	54.999 to 55.000 mm (2.1653 to 2.1654 in.)
1	54.997 to 54.998 mm (2.1652 to 2.1653 in.)
2	54.995 to 54.996 mm (2.1652 to 2.1652 in.)
3	54.993 to 54.994 mm (2.1651 to 2.1651 in.)

Mark	Specified Condition
4	54.991 to 54.992 mm (2.1650 to 2.1650 in.)
5	54.988 to 54.990 mm (2.1649 to 2.1650 in.)



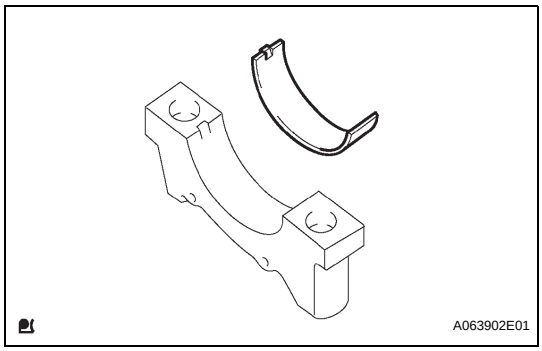
Standard bearing center wall thickness

Mark	Specified Condition
1	1.993 to 1.996 mm (0.0785 to 0.0786 in.)
2	1.997 to 1.999 mm (0.0786 to 0.0787 in.)
3	2.000 to 2.002 mm (0.0787 to 0.0788 in.)
4	2.003 to 2.005 mm (0.0789 to 0.0789 in.)



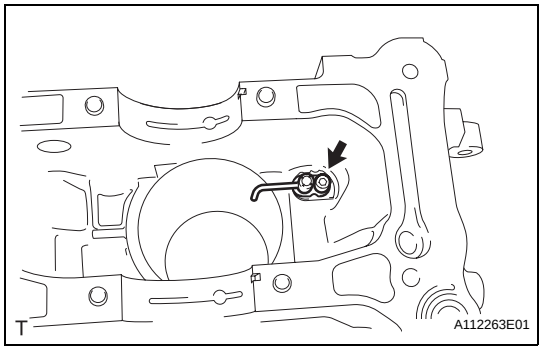
66. REMOVE CRANKSHAFT

(a) Using several steps, uniformly loosen and remove the 10 bearing cap bolts in the sequence shown in the illustration.
(b) Remove the 5 bearing caps from the cylinder block.
(c) Remove the crankshaft from the cylinder block.



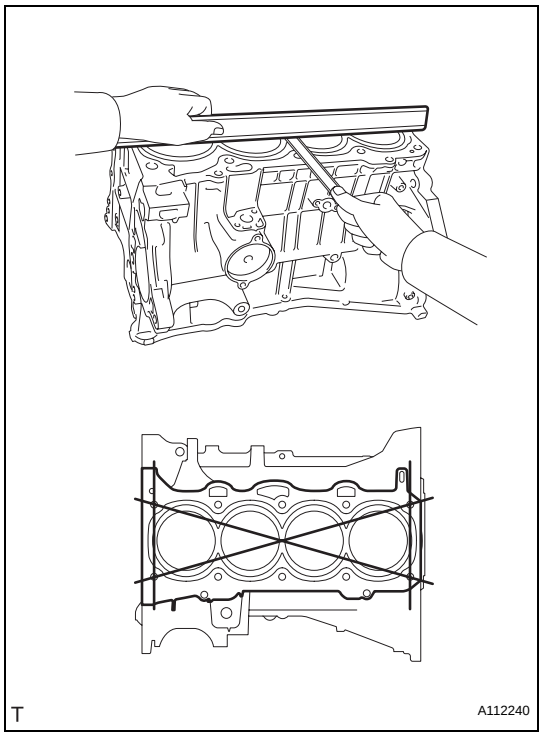
67. REMOVE CRANKSHAFT THRUST WASHER UPPER

68. REMOVE CRANKSHAFT BEARING



HINT:
Arrange the bearings in the correct order.

69. REMOVE NO. 2 CRANKSHAFT BEARING



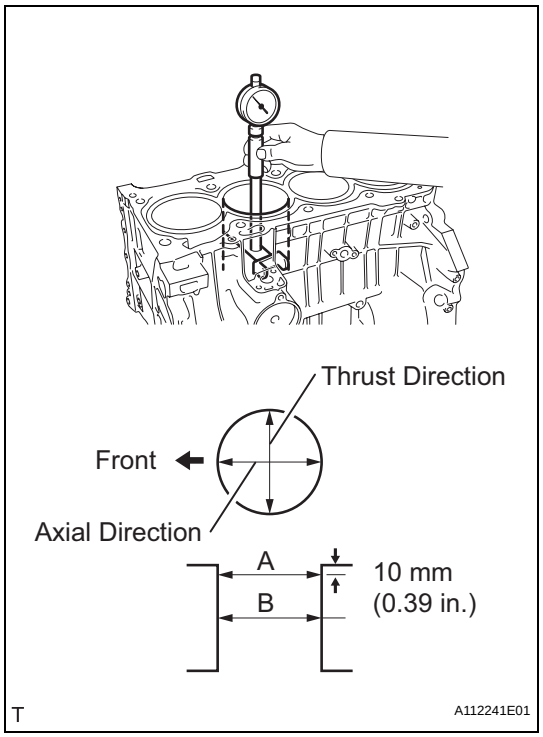
HINT:

Arrange the bearings in the correct order.

70. REMOVE NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Remove the 4 bolts and 4 oil nozzles.

INSPECTION



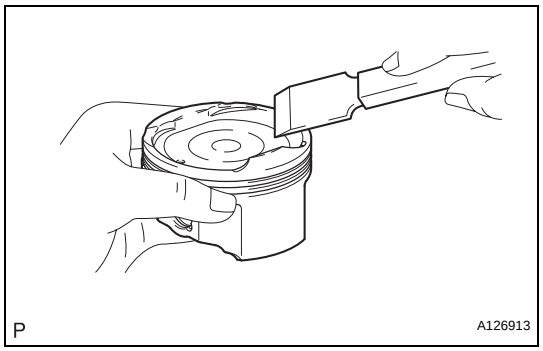
1. INSPECT CYLINDER BLOCK FOR WARPAGE

(a) Using a precision straightedge and feeler gauge, measure the warpage of the surface that is in contact with the cylinder head gasket.

Maximum warpage:

0.05 mm (0.0020 in.)

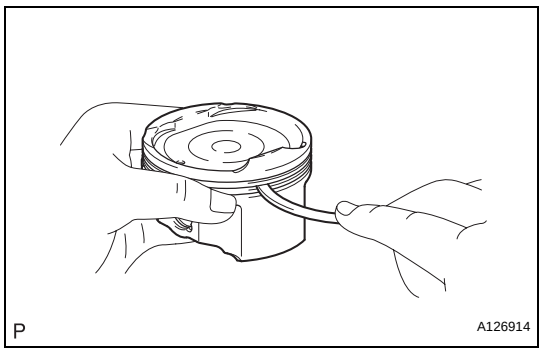
If the warpage is greater than the maximum, replace the cylinder block.



2. INSPECT CYLINDER BORE

(a) Using a cylinder gauge, measure the cylinder bore diameter at positions A and B in the thrust and axial directions.

Standard diameter:
88.500 to 88.513 mm (3.4843 to 3.4847 in.)
Maximum diameter:
88.633 mm (3.4894 in.)



If the average diameter of the 4 positions is greater than the maximum, replace the cylinder block.

EM

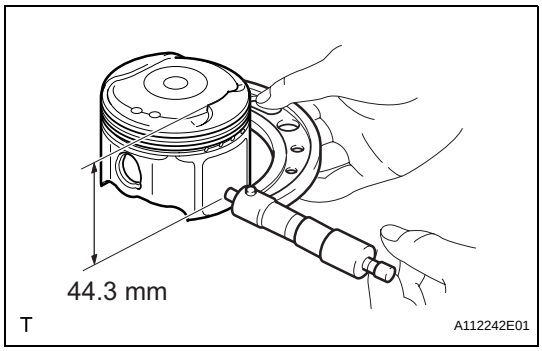
3. INSPECT PISTON

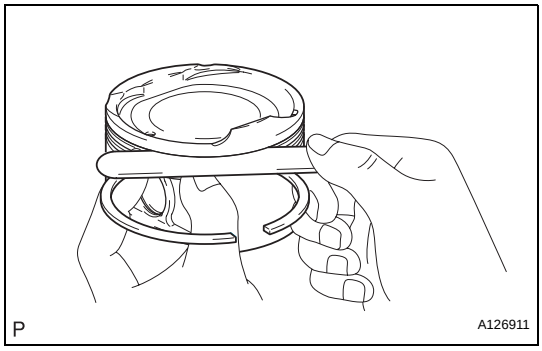
(a) Using a gasket scraper, remove the carbon from the piston top.



(b) Using a groove cleaning tool or a broken ring, clean the piston ring grooves.

(c) Using a brush and solvent, thoroughly clean the piston.

NOTICE:
Do not use a wire brush.



(d) Using a micrometer, measure the piston diameter at right angles to the piston pin hole, and at the piston 44.3 mm (1.7587 in.) from the piston head.
Standard piston diameter:
88.477 to 88.487 mm (3.5125 to 3.5129 in.)
If the diameter is not as specified, replace the piston.

4. INSPECT PISTON OIL CLEARANCE

(a) Subtract the piston diameter measurement from the cylinder bore diameter measurement.
Standard oil clearance:
0.021 to 0.044 mm (0.0008 to 0.0017 in.)
Maximum oil clearance:
0.10 mm (0.0039 in.)
If the oil clearance is greater than the maximum, replace all the pistons. If necessary, replace the cylinder block.

EM

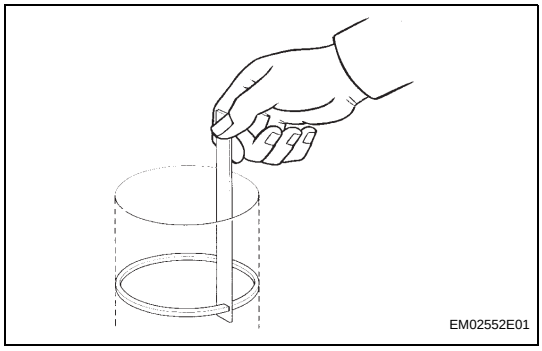
5. INSPECT RING GROOVE CLEARANCE

(a) Using a feeler gauge, measure the clearance between the new piston ring and wall of the ring groove.
Standard ring groove clearance



Item	Specified Condition
No. 1 ring	0.020 to 0.070 mm (0.0008 to 0.0028 in.)
No. 2 ring	0.020 to 0.060 mm (0.0008 to 0.0024 in.)
Oil ring	0.020 to 0.070 mm (0.0008 to 0.0028 in.)

If the groove clearance is not as specified, replace the piston.

6. INSPECT PISTON RING END GAP

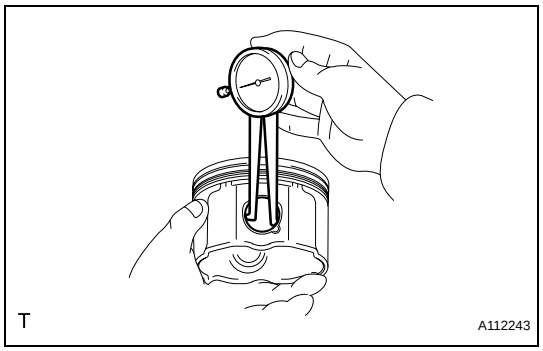
(a) Using a piston, push the piston ring a little beyond the bottom of the ring travel, 110 mm (4.33 in.) from the top of the cylinder block.

(b) Using a feeler gauge, measure the end gap.
Standard end gap

Item	Specified Condition
No. 1 ring	0.24 to 0.31 mm (0.0094 to 0.0122 in.)
No. 2 ring	0.33 to 0.43 mm (0.0130 to 0.0169 in.)
Oil ring	0.10 to 0.30 mm (0.0040 to 0.0119 in.)

Maximum end gap

Item	Specified Condition
No. 1 ring	0.89 mm (0.0350 in.)



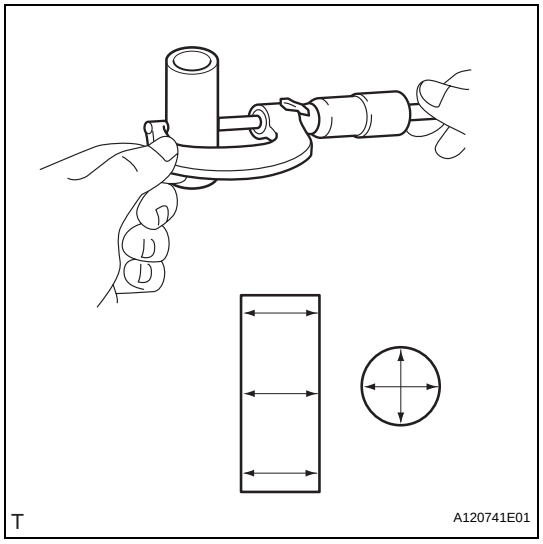
Item	Specified Condition
No. 2 ring	1.37 mm (0.0539 in.)
Oil ring	0.73 mm (0.0287 in.)

If the end gap is greater than the maximum, replace the piston ring. If the end gap is greater than the maximum, even with a new piston ring, replace the cylinder block.

7. INSPECT PISTON PIN OIL CLEARANCE

(a) Using a caliper gauge, measure the piston pin bore diameter.

Standard piston pin bore diameter:
22.001 to 22.010 mm (0.8662 to 0.8665 in.)

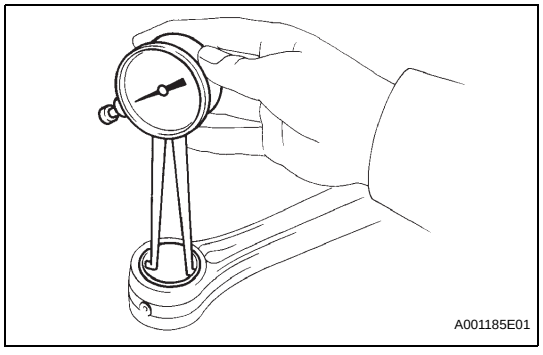


Item	Specified Condition
A	22.001 to 22.004 mm (0.8662 to 0.8663 in.)
B	22.005 to 22.007 mm (0.8663 to 0.8664 in.)
C	22.008 to 22.010 mm (0.8665 to 0.8665 in.)

If the diameter is not as specified, replace the piston.

(b) Using a micrometer, measure the piston pin diameter.

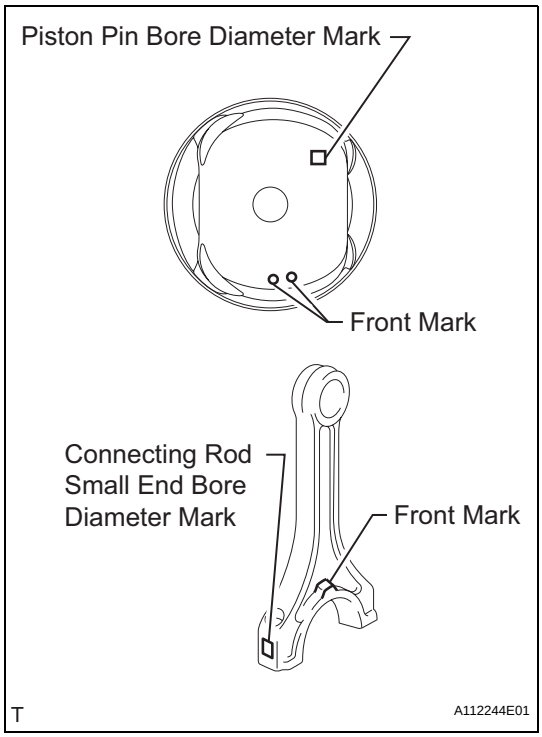
Standard piston pin diameter:
21.997 to 22.006 mm (0.8660 to 0.8664 in.)



Item	Specified Condition
A	21.997 to 22.000 mm (0.8660 to 0.8661 in.)
B	22.001 to 22.003 mm (0.8662 to 0.8663 in.)
C	22.004 to 22.006 mm (0.8663 to 0.8664 in.)

If the diameter is not as specified, replace the piston pin.

(c) Using a caliper gauge, measure the connecting rod small end bore diameter.



Standard connecting rod small end bore diameter:
22.005 to 22.014 mm (0.8663 to 0.8667 in.)

Item	Specified Condition
A	22.005 to 22.008 mm (0.8663 to 0.8665 in.)
B	22.009 to 22.011 mm (0.8665 to 0.8666 in.)
C	22.012 to 22.014 mm (0.8666 to 0.8667 in.)

If the diameter is not as specified, replace the connecting rod.

EM

(d) Subtract the piston pin diameter measurement from the piston pin bore diameter measurement.
Standard oil clearance:
0.001 to 0.007 mm (0.00004 to 0.0003 in.)
Maximum oil clearance:
0.013 mm (0.0005 in.)
If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the piston and piston pin as a set.

(e) Subtract the piston pin diameter measurement from the connecting rod small end bore diameter measurement.
Standard oil clearance:
0.005 to 0.011 mm (0.0002 to 0.0004 in.)
Maximum oil clearance:
0.017 mm (0.0007 in.)
If the oil clearance is greater than the maximum, replace the connecting rod. If necessary, replace the connecting rod and piston pin as a set.

EM

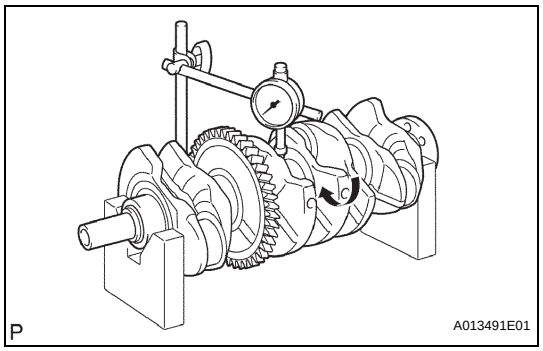
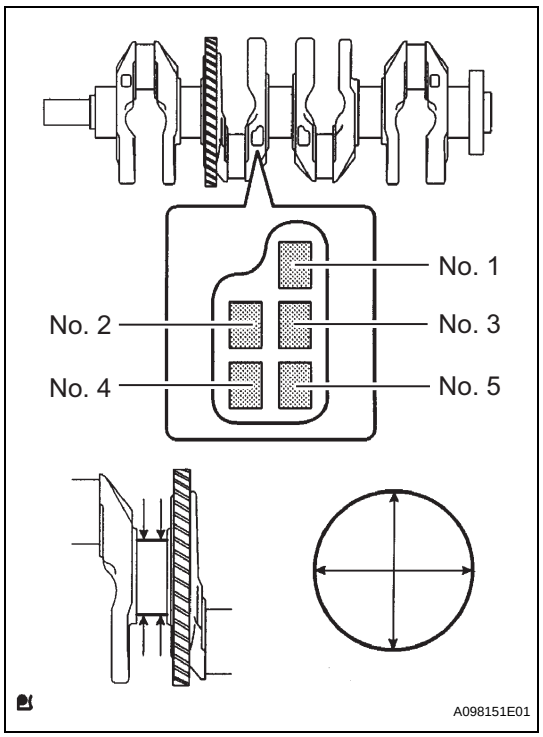
8. INSPECT CONNECTING ROD SUB-ASSEMBLY

(a) Using a connecting rod aligner and feeler gauge, check the connecting rod alignment.

(1) Check for misalignment.
Maximum misalignment:
0.05 mm (0.0020 in.) per 100 mm (3.94 in.)
If the misalignment is greater than the maximum, replace the connecting rod.



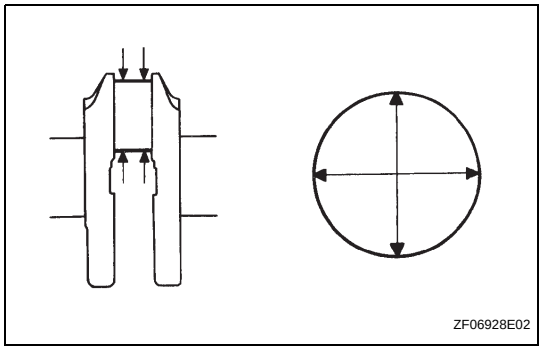
(2) Check for twist.
Maximum twist:
0.15 mm (0.0059 in.) per 100 mm (3.94 in.)
If the twist is greater than the maximum, replace the connecting rod.



9. INSPECT CONNECTING ROD BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolt.
Standard diameter:
7.2 to 7.3 mm (0.283 to 0.287 in.)
Maximum diameter:
7.0 mm (0.276 in.)
If the diameter is less than the minimum, replace the connecting rod bolt.

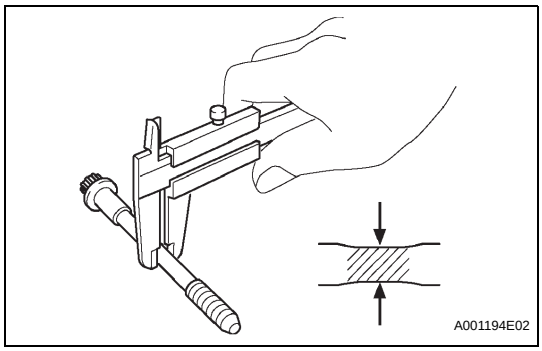
10. INSPECT CRANKSHAFT



(a) Using a dial indicator and V-blocks, measure the circle runout as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.

(b) Using a micrometer, measure the diameter of each main journal.
Standard diameter:
54.988 to 55.000 mm (2.1830 to 2.1654 in.)
If the diameter is not as specified, check the crankshaft oil clearance.

(c) Check each main journal for taper and distortion as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.
Standard diameter (Reference)



Mark	Specified Condition
0	54.999 to 55.000 mm (2.1653 to 2.1654 in.)
1	54.997 to 54.998 mm (2.1652 to 2.1653 in.)
2	54.995 to 54.996 mm (2.1652 to 2.1652 in.)
3	54.993 to 54.994 mm (2.1651 to 2.1651 in.)
4	54.991 to 54.992 mm (2.1650 to 2.1650 in.)
5	54.998 to 54.990 mm (2.1649 to 2.1650 in.)

(d) Using a micrometer, measure the diameter of each crank pin.
Standard diameter:
47.990 to 48.000 mm (1.8894 to 1.8898 in.)
If the diameter is not as specified, check the connecting rod oil clearance.

(e) Inspect each crank pin for taper and distortion as shown in the illustration.
Maximum taper and distortion:
0.003 mm (0.0001 in.)
If the taper and distortion are greater than the maximum, replace the crankshaft.

EM

11. INSPECT CRANKSHAFT BEARING CAP SET BOLT

(a) Using a vernier caliper, measure the tension portion diameter of the bolts.

Standard diameter:

7.5 to 7.6 mm (0.295 to 0.299 in.)

Minimum diameter:

7.5 mm (0.295 in.)

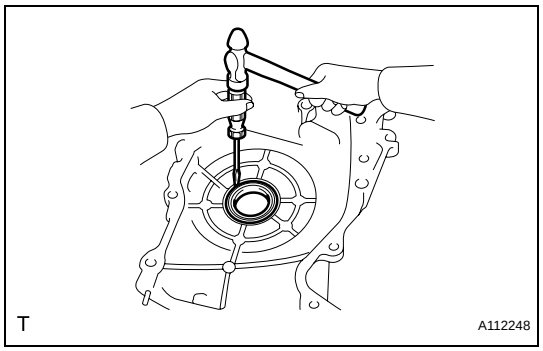
If the diameter is less than the minimum, replace the bolt.

REPLACEMENT

1. REPLACE TIMING CHAIN COVER OIL SEAL

HINT:

There are 2 methods to replace the oil seal.



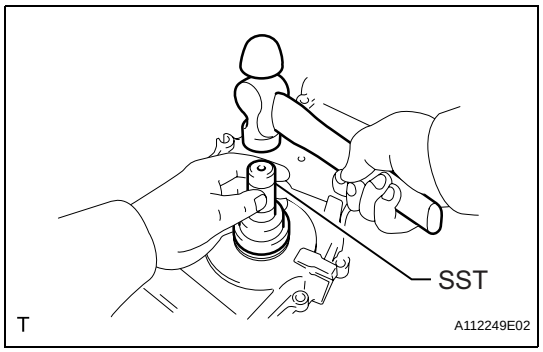
(a) If the timing chain cover is removed from the cylinder block:

(1) Using a screwdriver and hammer, tap out the oil seal.

(2) Apply multi-purpose grease to the lip of a new oil seal.

NOTICE:

Keep the lip free of foreign objects.



(3) Using SST and a hammer, tap in the new oil seal until its surface is flush with the timing chain cover edge.

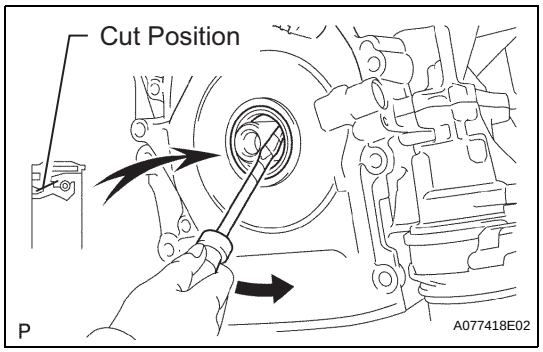
SST 09223-22010

NOTICE:

Do not tap the oil seal at an angle.

(b) If the timing chain cover oil seal is installed to the cylinder block:

(1) Remove the fan and generator V belt (see page EM-6).



(2) Remove the crankshaft pulley (see page EM-25).

(3) Using a knife, cut off the lip of the oil seal.

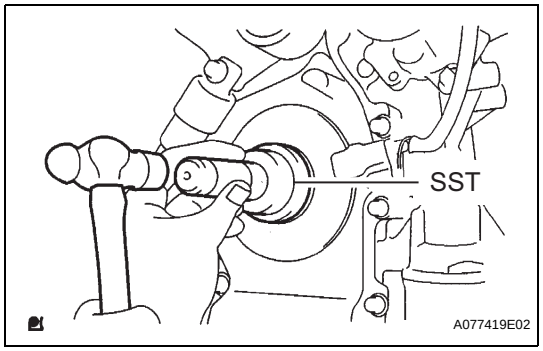
(4) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

NOTICE:

After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

(5) Apply multi-purpose grease to the lip of a new oil seal.

NOTICE:

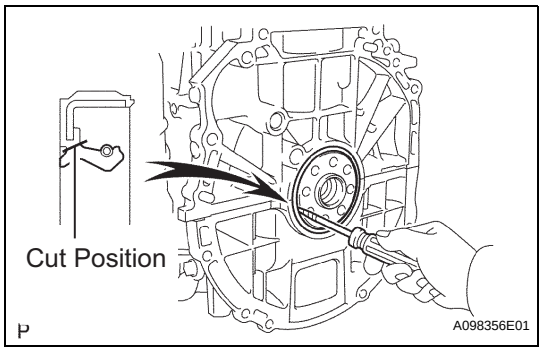


Keep the lip free of foreign objects.

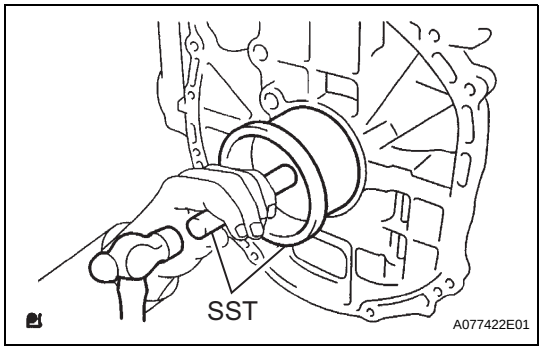
(6) Using SST and a hammer, tap in the new oil seal until its surface is flush with the timing chain cover edge.

SST 09223-22010

NOTICE:



Do not tap the oil seal at an angle.



(7) Install the crankshaft pulley (see page EM-38).

(8) Install the fan and generator V belt (see page EM-7).

EM

2. REPLACE ENGINE REAR OIL SEAL

(a) Using a knife, cut off the lip of the oil seal.

(b) Using a screwdriver with its tip wrapped with tape, pry out the oil seal.

NOTICE:
After removing, check the crankshaft for damage. If damaged, smooth the surface with 400-grit sandpaper.

(c) Apply multi-purpose grease to the lip of a new oil seal.

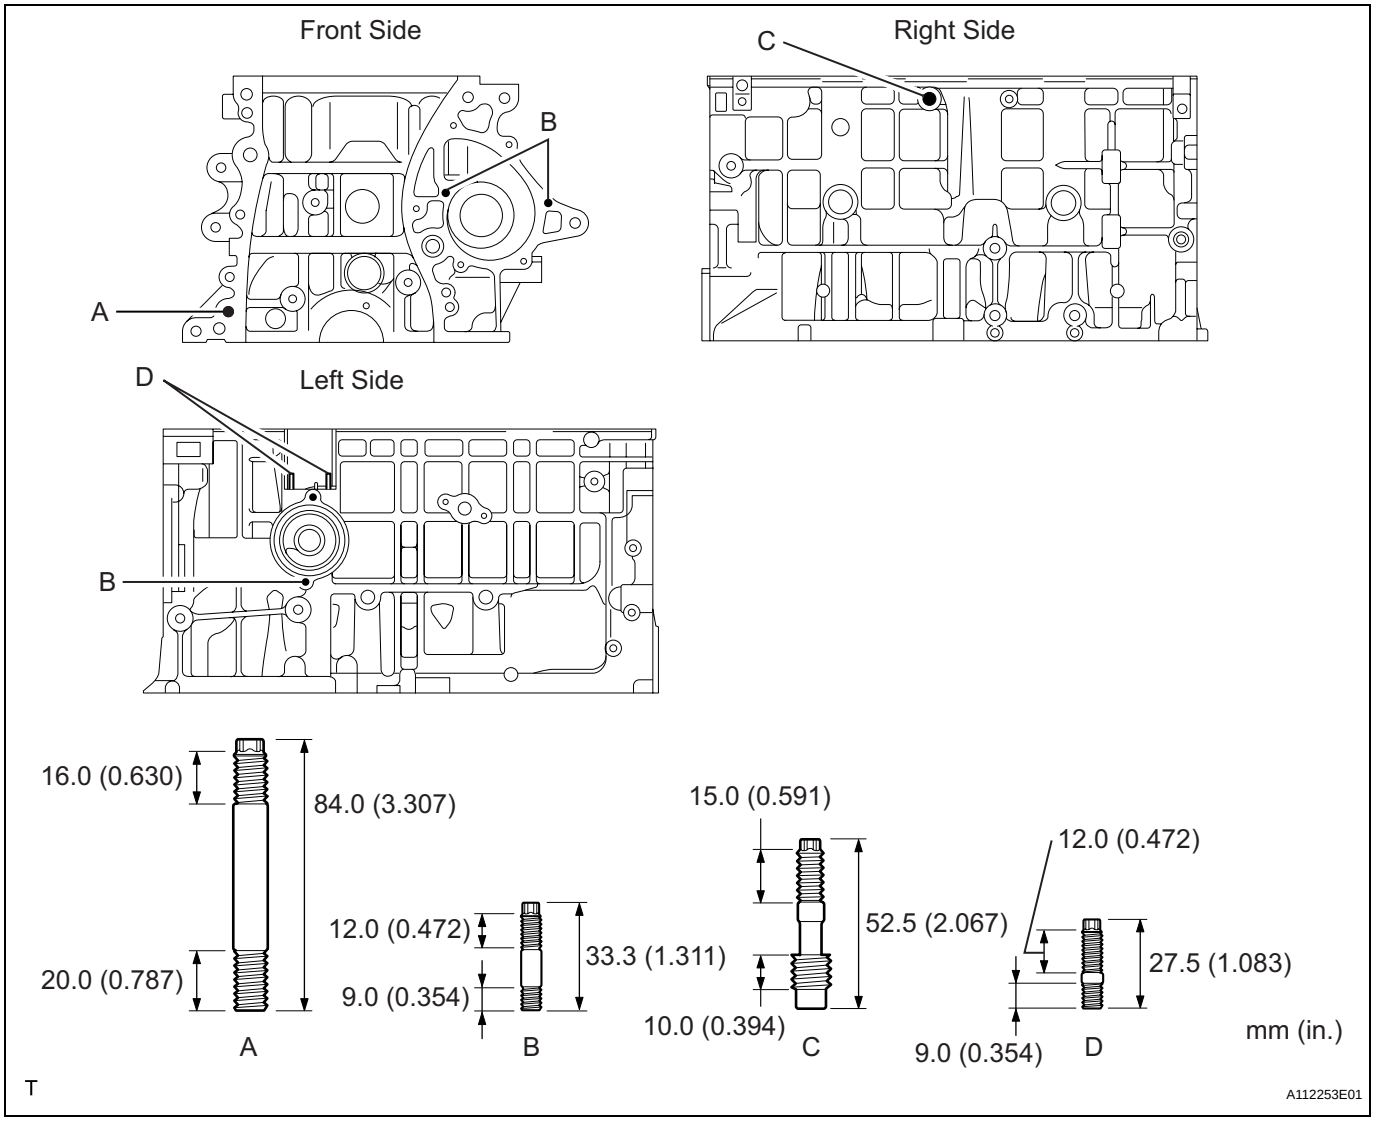
NOTICE:
Keep the lip free of foreign objects.

(d) Using SST and a hammer, tap in the new oil seal until its surface is flush with the rear oil seal retainer edge.

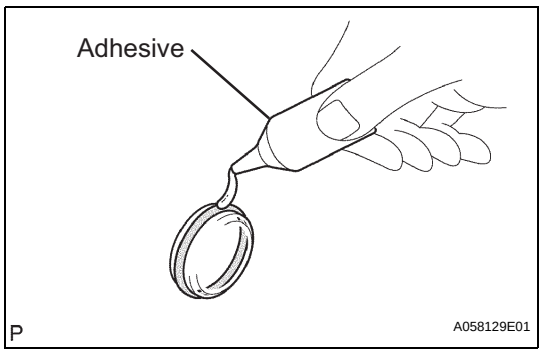
SST 09223-15030, 09950-70010 (09951-07100)

NOTICE:
- **Wipe any extra grease off the crankshaft.**
- **Do not tap the oil seal at an angle.**

3. REPLACE STUD BOLT (for Cylinder Block)



NOTICE:
If the stud bolt is deformed or the threads are damaged, replace it.



(a) Remove the 8 stud bolts.

(b) Install the 8 stud bolts into the cylinder block.

Torque

Item	Specified Condition
A	5.0 N*m (51 kgf*cm, 44 in.*lbf)
B	21.5 N*m (219 kgf*cm, 16 ft.*lbf)
C	5.0 N*m (51 kgf*cm, 44 in.*lbf)
D	5.0 N*m (51 kgf*cm, 44 in.*lbf)

4. REPLACE TIGHT PLUG (for Cylinder Block)

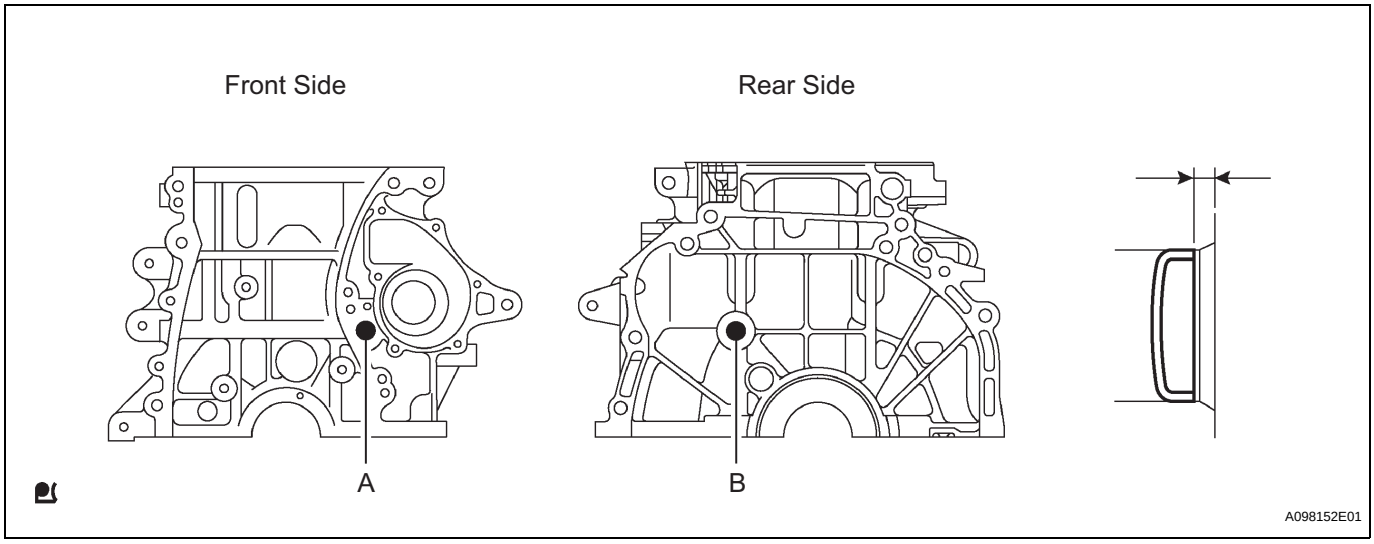
NOTICE:

If water leaks from the tight plug or the plug corrodes, replace it.

(a) Remove the 2 tight plugs from the engine front and rear side.

(b) Apply adhesive around new tight plugs.

Adhesive:



Toyota Genuine Adhesive 1342, Three Bond 1342 or Equivalent

(c) Using SST, install the 2 tight plugs.

SST 09950-60010 (09951-00200), 09950-70010 (09951-07100)

Standard depth

Item	Specified Condition
A	1.7 to 2.7 mm (0.067 to 0.106 in.)
B	2.2 to 3.2 mm (0.087 to 0.126 in.)

EM

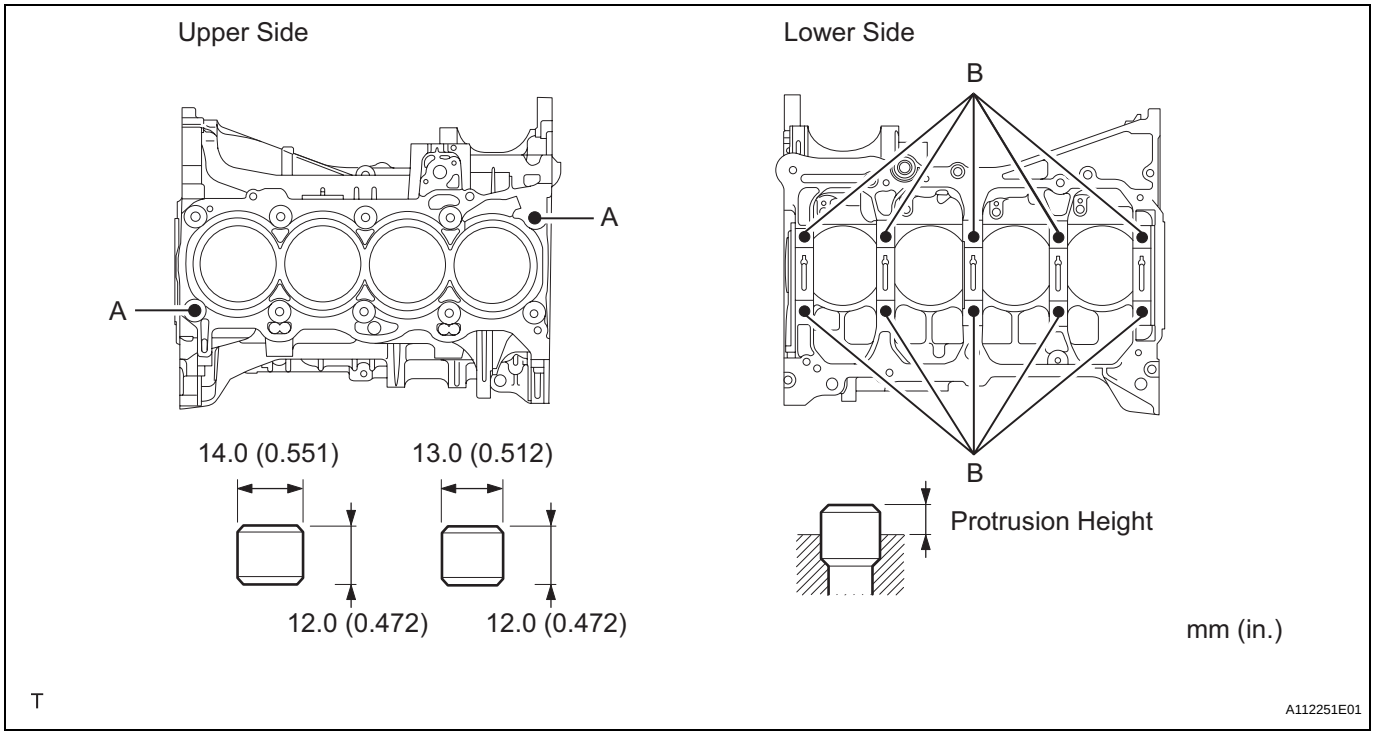
5. REPLACE RING PIN (for Cylinder Block)

NOTICE:



It is not necessary to remove with head pin unless it is being replaced.

(a) Remove the 12 ring pins.

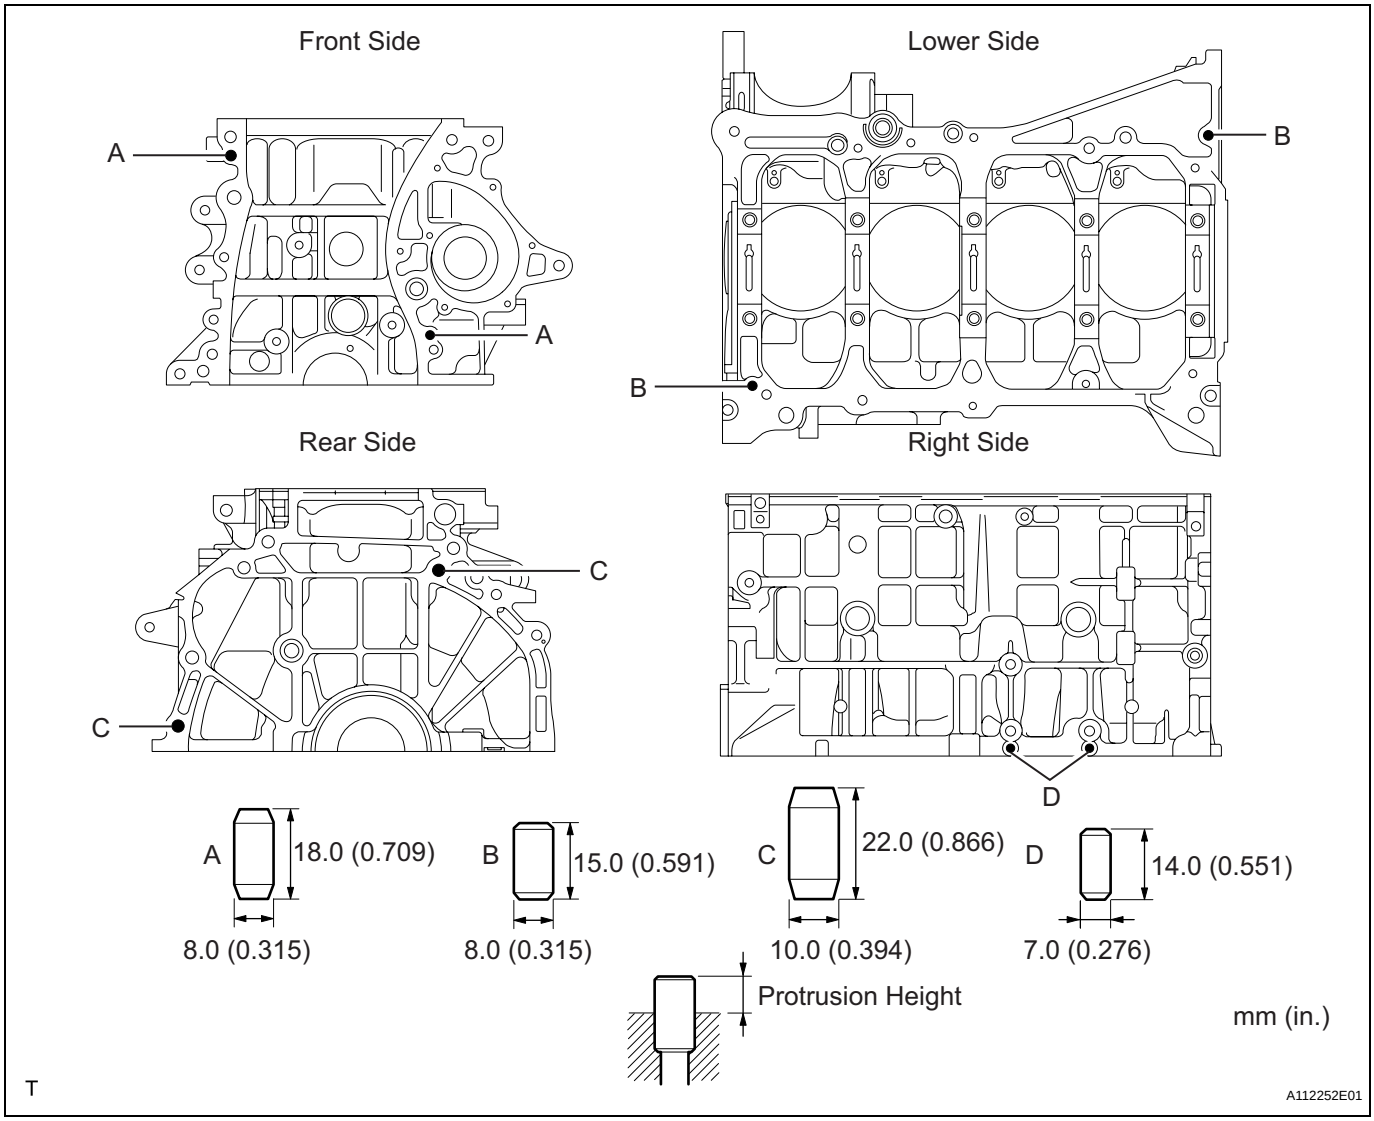
(b) Using a plastic-faced hammer, install 12 new ring pins.

Standard protrusion height

Item	Specified Condition
A	6.0 mm (0.236 in.)
B	5.0 mm (0.197 in.)

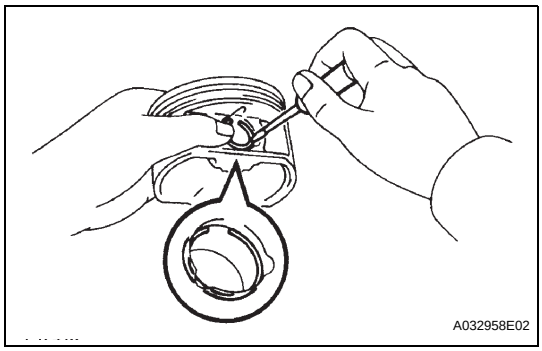
6. REPLACE STRAIGHT PIN (for Cylinder Block)

NOTICE:



It is not necessary to remove with straight pin unless it is being replaced.

(a) Remove the 8 straight pins.



(b) Using a plastic-faced hammer, install 8 new straight pins.

Standard protrusion height

Item	Specified Condition
A	8.0 mm (0.315 in.)
B	7.5 mm (0.295 in.)
C	12.0 mm (0.472 in.)
D	5.0 mm (0.197 in.)

EM

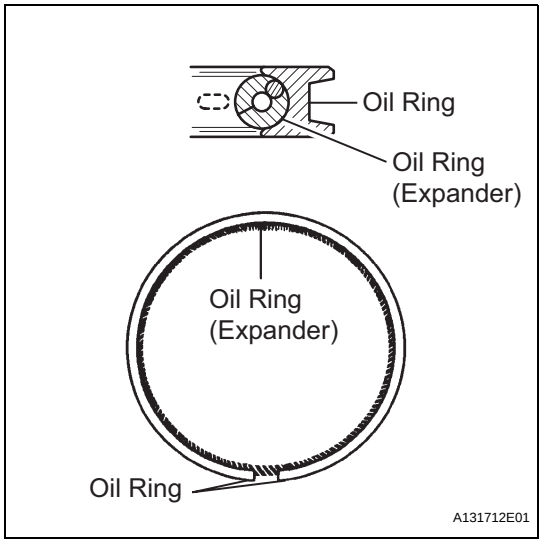
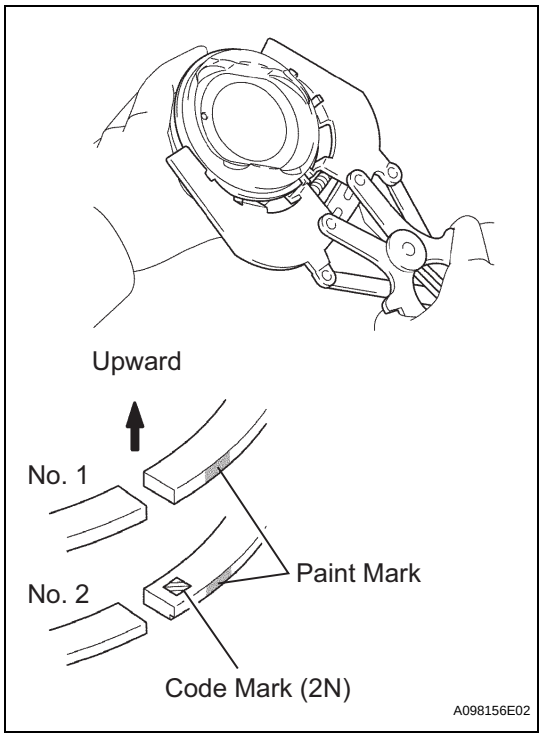
REASSEMBLY



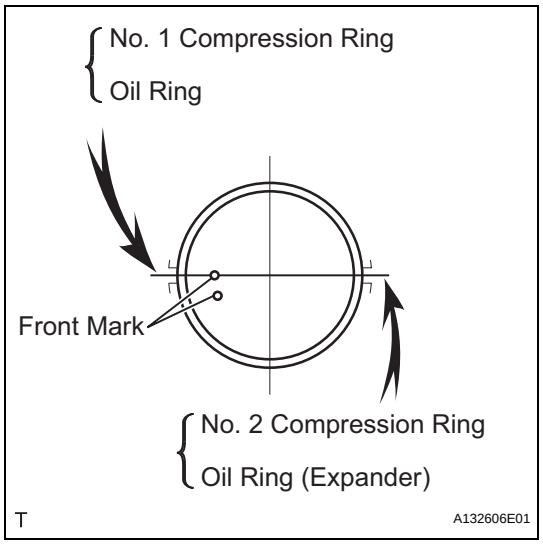
1. INSTALL PISTON

(a) Using a small screwdriver, install a new snap ring onto one end of the piston pin hole.
HINT:
Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

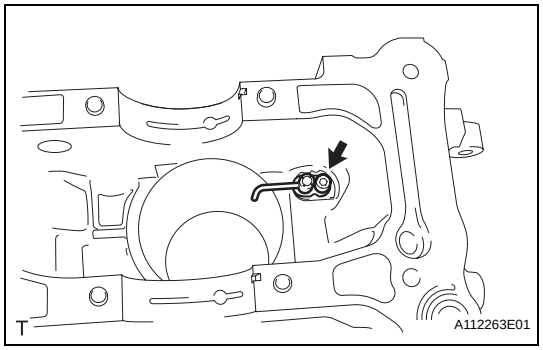
(b) Gradually heat the piston up to 80 to 90°C (176 to 194°F).



(c) Align the front marks of the piston and connecting rod, then push in the piston pin with your thumb until the pin comes into contact with the snap pin hole.
HINT:
Make sure that the end gap of the snap ring is not aligned with the pin hole cutout portion of the piston.

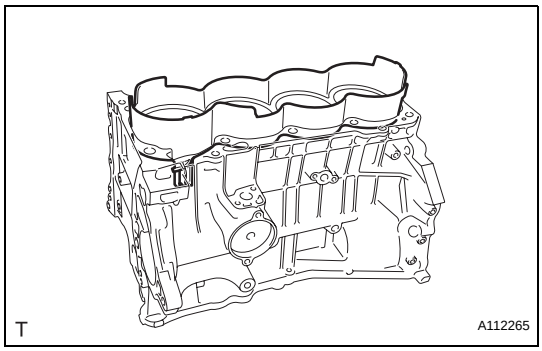


2. INSTALL PISTON RING SET

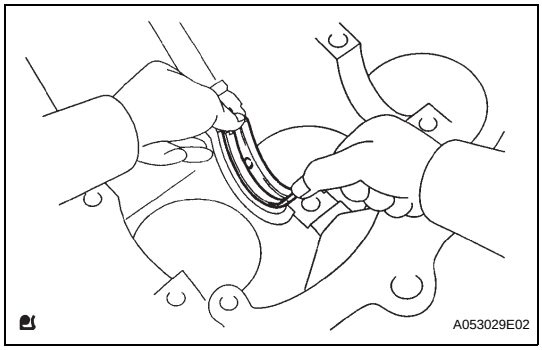


(a) Install the expander and oil ring by hand.

(b) Using a piston ring expander, install the 2 compression rings with the paint mark as shown in the illustration.
NOTICE:
Install the No. 2 compression ring with the code mark (2N) facing upward.



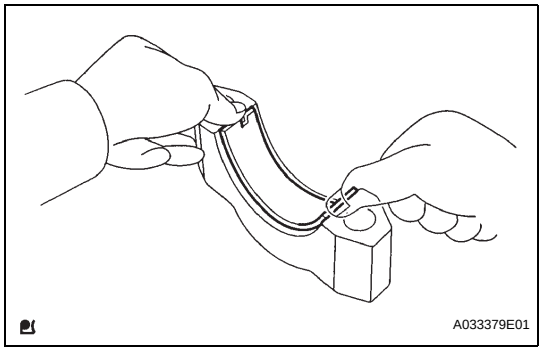
(c) Position the piston rings so that the ring ends are as shown in the illustration.



3. INSTALL NO. 1 OIL NOZZLE SUB-ASSEMBLY

(a) Install the 4 oil nozzles with the 4 bolts.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

4. INSTALL CYLINDER BLOCK WATER JACKET SPACER

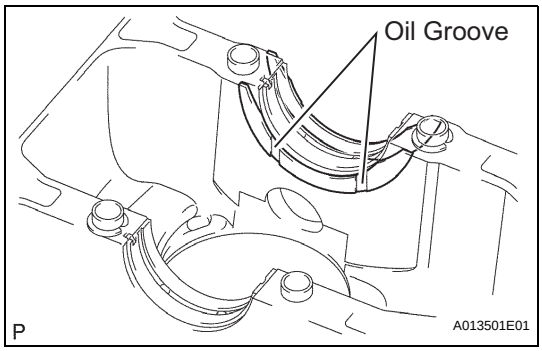


5. INSTALL CRANKSHAFT BEARING

(a) Install the upper bearing with an oil groove onto the cylinder block.

NOTICE:

Do not apply engine oil to the contact surfaces of the cylinder block and crankshaft bearing.



6. INSTALL NO. 2 CRANKSHAFT BEARING

(a) Install the lower bearing onto the bearing cap.

NOTICE:

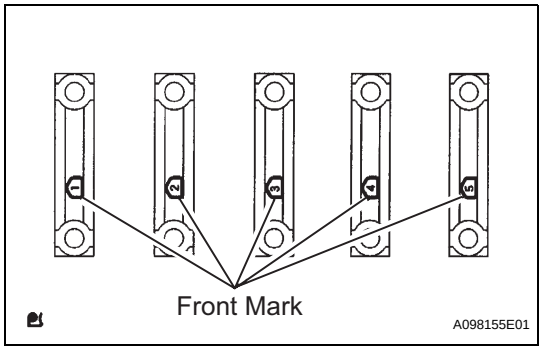
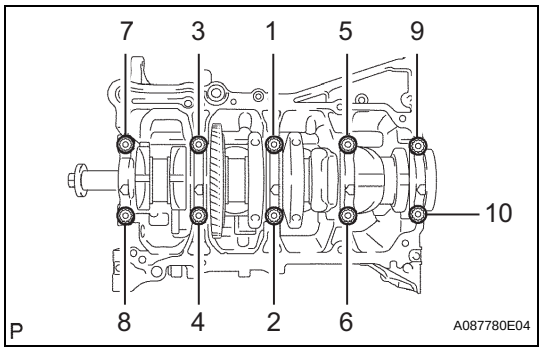
Do not apply engine oil to the contact surfaces of the cylinder block and crankshaft bearing cap..



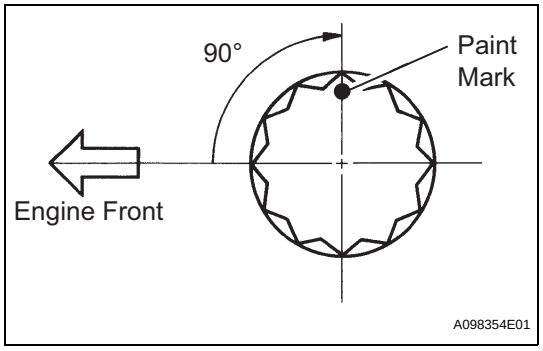
7. INSTALL CRANKSHAFT THRUST WASHER UPPER

(a) Install the 2 thrust washers onto the No. 3 journal position of the cylinder block with the oil groove facing outward.



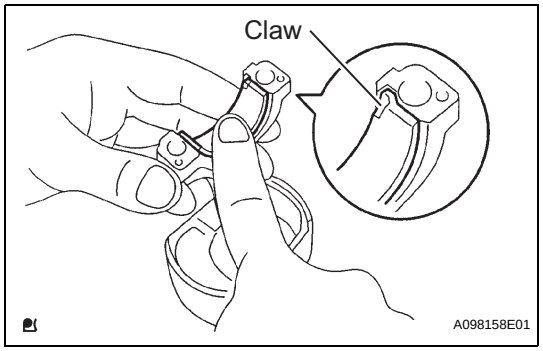
8. INSTALL CRANKSHAFT

(a) Apply engine oil to the upper bearing, and install the crankshaft onto the cylinder block.



(b) Examine the front marks and numbers, and install the bearing caps onto the cylinder block in the order shown in the illustration.

(c) Apply a light coat of engine oil to the threads and under the heads of the bearing cap bolts.



(d) Using several steps, uniformly install and tighten the 10 bearing cap bolts in the sequence shown in the illustration.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)

(e) Mark the front of the bearing cap bolts with paint.
(f) Retighten the 10 bearing cap bolts by 90° in the same sequence.
(g) Check that the paint marks are now at a 90° angle to the front.
(h) Check that the crankshaft turns smoothly.

EM

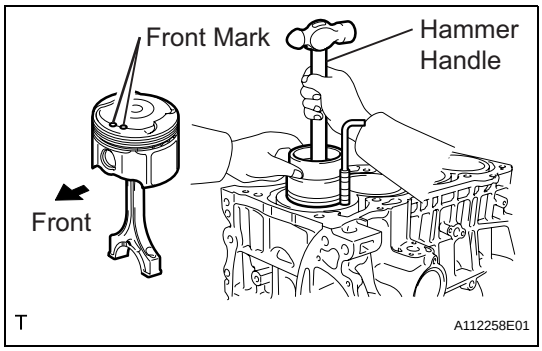
9. INSTALL CONNECTING ROD BEARING



(a) Align the bearing claw with the oil groove of the connecting rod or connecting rod cap.
NOTICE:
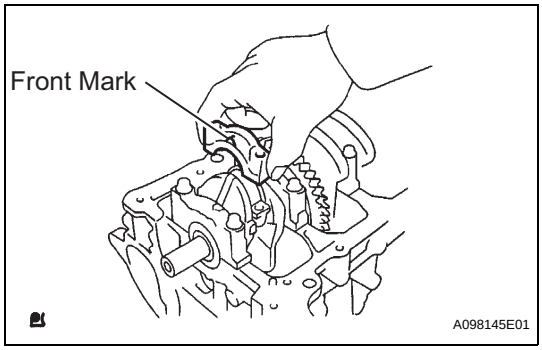
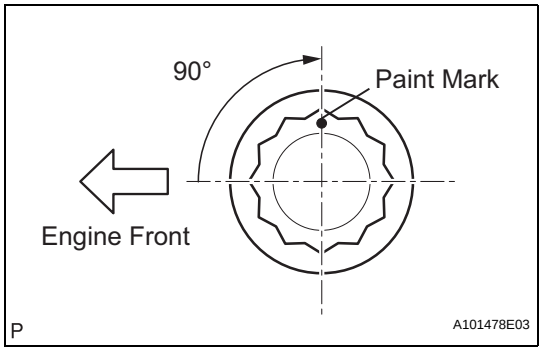
- **Do not apply engine oil to the contact surfaces of the connecting rod cap and bearing.**
- **Do not apply engine oil to the contact surfaces of the connecting rod and bearing.**

10. INSTALL PISTON WITH CONNECTING ROD



(a) Apply engine oil to the cylinder walls, pistons, and surfaces of connecting rod bearings.

(b) Check the position of the piston ring ends.



(c) Using a hammer handle and piston ring compressor, press a piston and connecting rod into each cylinder with the front mark of the piston facing forward.

(d) Check that the front mark of the connecting rod cap is facing in the correct direction.
NOTICE:
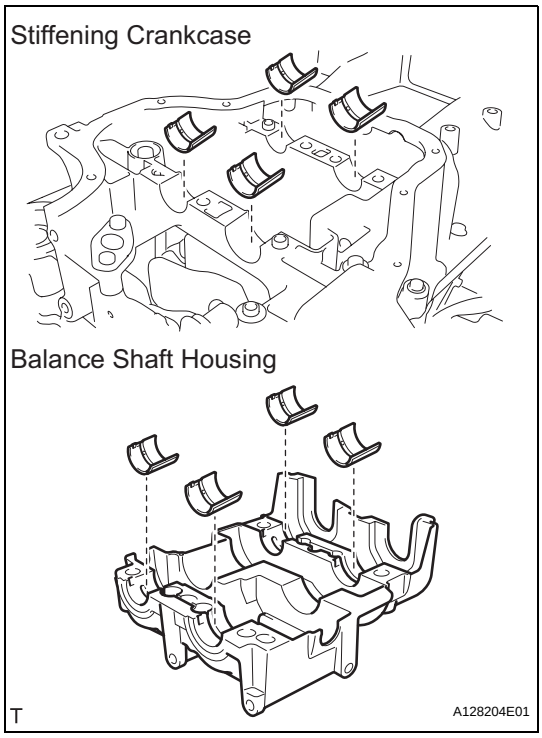
Match the numbered connecting rod cap with the connecting rod.

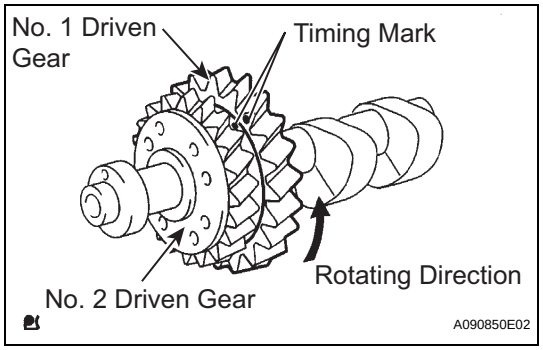
(e) Apply a light coat of engine oil to the threads and under the heads of the connecting rod bolts.



(f) Using a 12 mm socket wrench, tighten the bolts in several passes to the specified torque.
Torque: 24.5 N*m (250 kgf*cm, 18 ft.*lbf)

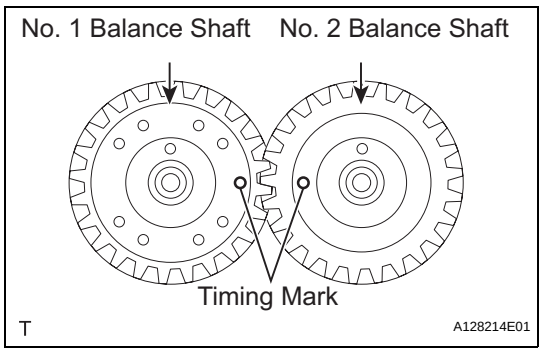
(g) Mark the front of the connecting rod bolts with paint.

(h) Retighten the cap bolts 90° as shown in the illustration.



(i) Check that the crankshaft turns smoothly.

11. INSTALL NO. 1 BALANCE SHAFT BEARING



(a) Align the bearing claw with the claw groove, and push in the 8 bearings.
NOTICE:
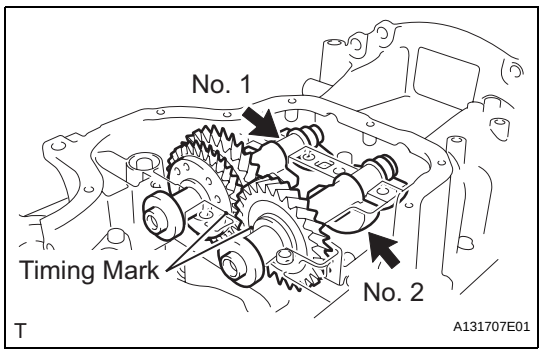
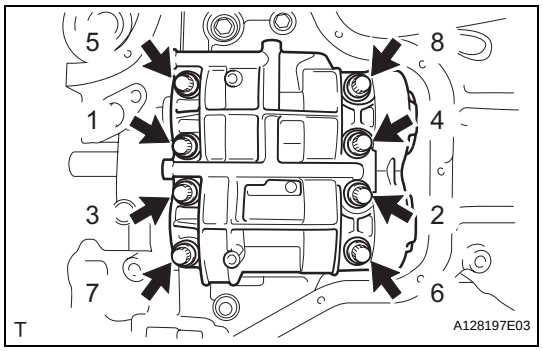
- **Do not apply engine oil to the contact surfaces of the balance shaft bearing and balance shaft housing.**
- **Do not apply engine oil to the contact surfaces of the balance shaft bearing and stiffening crankcase.**

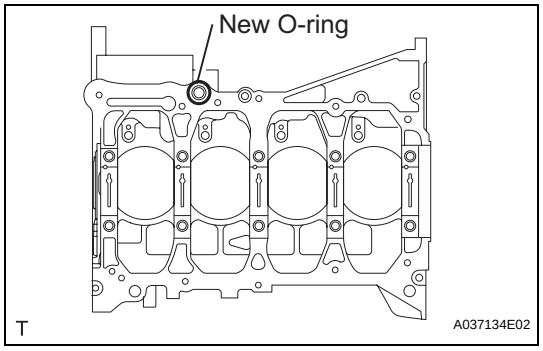
(b) Apply light coat of engine oil to the bearings.



12. INSTALL BALANCE SHAFT



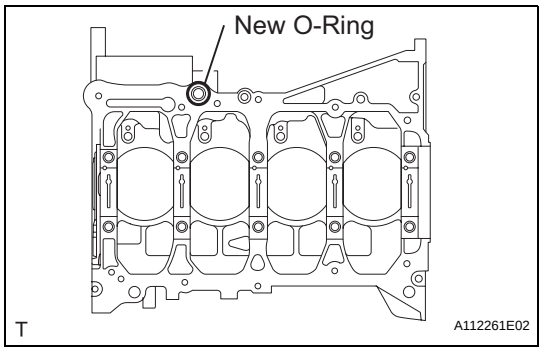
(a) Rotate the No. 1 driven gear of the No. 1 balance shaft in the rotating direction until it hits the stopper.



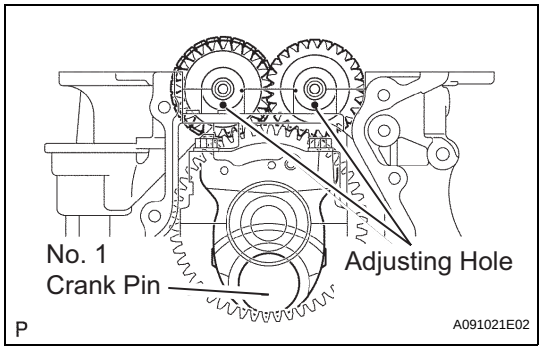
(b) Confirm that the timing marks on the No. 1 and No. 2 driven gears are aligned.

(c) Align the timing marks of the No. 1 and No. 2 balance shafts as shown in the illustration.
(d) Place the No. 1 and No. 2 balance shafts onto the crankcase.
(e) Apply a light coat of engine oil to the threads and under the heads of the bolts.

(f) Using several steps, uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 21.6 N*m (220 kgf*cm, 16 ft.*lbf)
(g) Mark the front of the bolts with paint.
(h) Retighten the bolts 90° as shown in the illustration.



(i) Check that the paint mark is now at a 90° angle to the front.



13. INSTALL STIFFENING CRANKCASE ASSEMBLY

(a) Remove any old packing material and be careful not to drop any oil on the contact surfaces of the cylinder block and crankcase.

EM

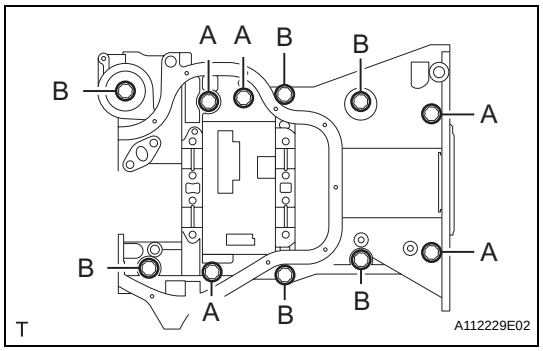
(b) Place a new O-ring on the cylinder block as shown in the illustration.

(c) With the No. 1 crank pin of the crankshaft placed at the 6 o'clock position, install the No. 1 and No. 2 balance shafts and align the adjusting holes as shown in the illustration.



(d) Apply a continuous bead of seal packing (Diameter 2.5 to 3.0 mm (0.098 to 0.118 in.)) as shown in the illustration.

Seal packing:

Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

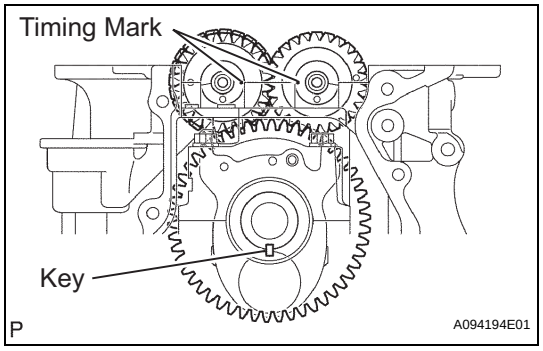
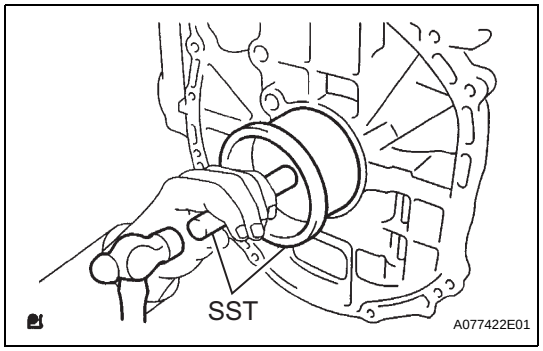
- **Remove any oil from the contact surface.**
- **Install the crankcase within 3 minutes of applying seal packing.**
- **Do not add engine oil for at least 2 hours after installing the crankcase.**

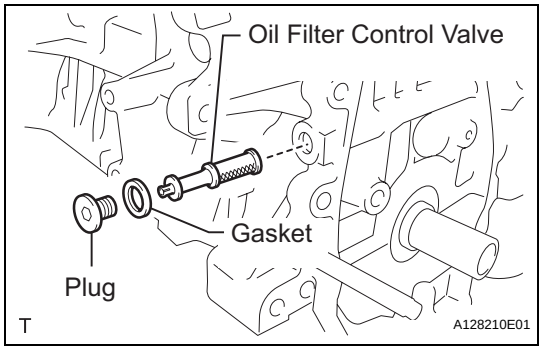


(e) Temporarily install the crankcase with the 11 bolts.
Standard bolt length

Item	Specified Condition
For bolt A (12 mm head)	112 mm (4.41 in.)
For bolt B (12 mm head)	35 mm (1.38 in.)



(f) Uniformly tighten the bolts.
Torque: 24 N*m (245 kgf*cm, 18 ft.*lbf)



(g) Confirm that the timing marks of the balance shafts are aligned when the key groove is placed at the 6 o'clock position, as shown in the illustration.

14. INSTALL ENGINE REAR OIL SEAL

(a) Apply multi-purpose grease to the lip of a new oil seal.
NOTICE:
Keep the lip free of foreign object.

(b) Using SST and hammer, tap in the new oil seal until its surface is flush with the rear oil seal retainer edge.
SST 09223-15030, 09950-70010 (09951-07100)
NOTICE:
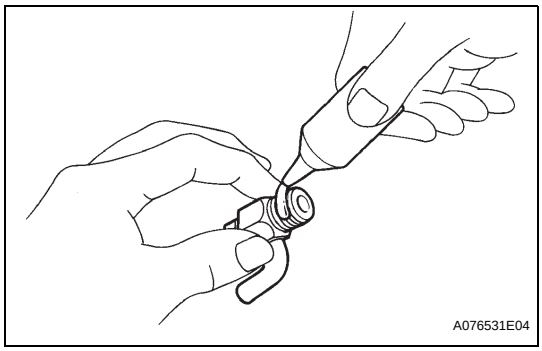
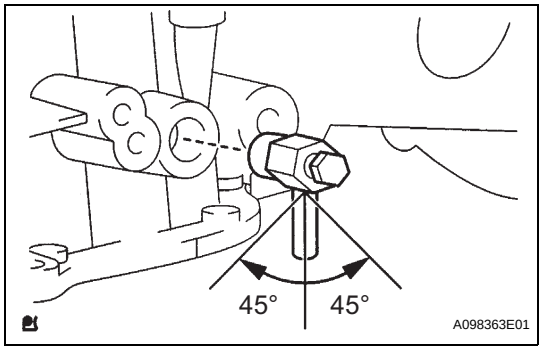
- **Wipe any extra grease off the crankshaft.**
- **Do not tap the oil seal at an angle.**



15. INSTALL OIL CONTROL VALVE FILTER



(a) Check that there are no foreign objects on the mesh part of the oil control valve filter.

(b) Using a 6 mm socket hexagon wrench, install a new gasket and the oil control valve filter with the plug.
Torque: 30 N*m (306 kgf*cm, 22 ft.*lbf)

EM

16. **INSTALL CYLINDER BLOCK WATER DRAIN COCK SUB-ASSEMBLY**
    (a) Apply adhesive to 2 or 3 threads of the drain cock.
    Adhesive:
    Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

    (b) After tightening the drain cock to the specified torque, turn the drain cock clockwise as shown in the illustration.
    Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)
    NOTICE:
    - **Install the drain cock within 3 minutes of applying adhesive.**
    - **Do not add coolant for at least an hour after installing the drain cock.**
    - **Do not turn the drain cock by more than 1 revolution (360°) after tightening the drain cock to the specified torque.**
    - **Do not loosen the drain cock after setting it correctly.**

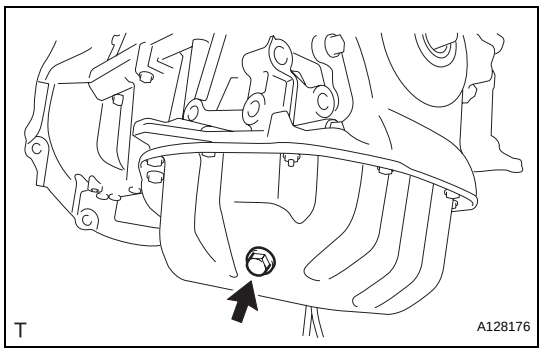
17. **INSTALL CYLINDER HEAD GASKET (See page EM-82)**

18. **INSTALL CYLINDER HEAD SUB-ASSEMBLY (See page EM-82)**

19. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
    (a) Apply a light coat of engine oil to a new O-ring, then install it onto the camshaft timing oil control valve.

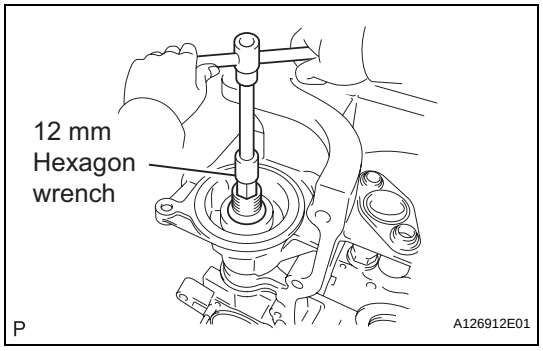
    (b) Install the camshaft timing oil control valve with the bolt.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

20. **INSTALL CAMSHAFT TIMING GEAR ASSEMBLY (See page EM-83)**



21. **INSTALL NO. 2 CAMSHAFT TIMING SPROCKET (See page EM-84)**

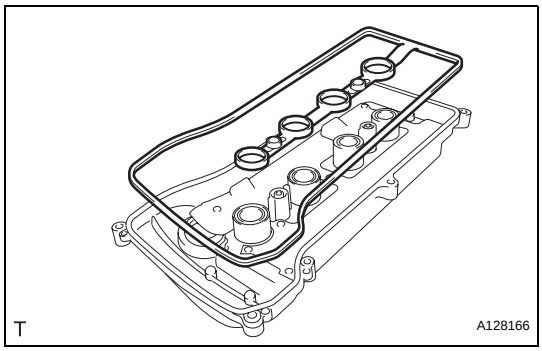
22. **INSTALL NO. 2 CAMSHAFT BEARING (See page EM-81)**



23. **INSTALL NO. 1 CAMSHAFT BEARING (See page EM-81)**

24. **INSTALL CAMSHAFT (See page EM-84)**
25. **INSTALL OIL PUMP ASSEMBLY (See page LU-15)**
26. **INSTALL OIL PUMP DRIVE GEAR**
27. **INSTALL NO. 2 CHAIN SUB-ASSEMBLY (See page EM-32)**
28. **INSTALL CRANKSHAFT TIMING SPROCKET**
29. **INSTALL NO. 1 CHAIN VIBRATION DAMPER (See page EM-33)**
30. **INSTALL CHAIN SUB-ASSEMBLY (See page EM-33)**
31. **INSTALL CHAIN TENSIONER SLIPPER (See page EM-34)**
32. **INSTALL TIMING CHAIN GUIDE (See page EM-34)**
33. **INSTALL NO. 1 CRANKSHAFT POSITION SENSOR PLATE (See page EM-35)**
34. **REPLACE TIMING CHAIN COVER OIL SEAL (See page EM-144)**
35. **INSTALL TIMING CHAIN COVER SUB-ASSEMBLY (See page EM-35)**
36. **INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-37)**
37. **INSTALL CRANKSHAFT PULLEY (See page EM-38)**
38. **INSTALL OIL PAN SUB-ASSEMBLY (See page EM-39)**

39. **INSTALL OIL PAN DRAIN PLUG**
    (a) Place a new gasket on the oil pan drain plug, then install it onto the oil pan.
    Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)
40. **INSTALL WATER PUMP ASSEMBLY (See page CO-12)**
41. **INSTALL WATER PUMP PULLEY (See page CO-13)**
42. **INSTALL CRANKSHAFT POSITION SENSOR (See page ES-402)**



43. **INSTALL OIL FILTER UNION**
    (a) Using a 12 mm hexagon wrench, install the oil filter union.
    Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf)
44. **INSTALL OIL FILTER SUB-ASSEMBLY (See page LU-4)**
45. **SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page EM-25)**
46. **CHECK VALVE CLEARANCE (See page EM-8)**
47. **ADJUST VALVE CLEARANCE (See page EM-8)**
48. **INSTALL CAMSHAFT (See page EM-13)**

EM

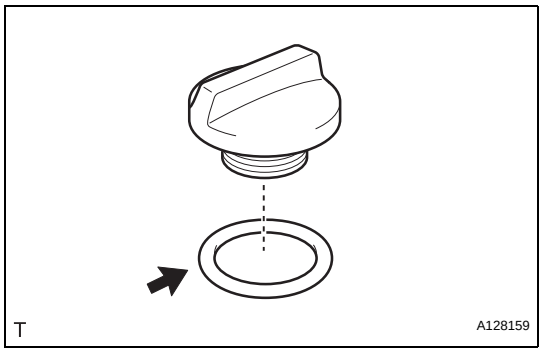
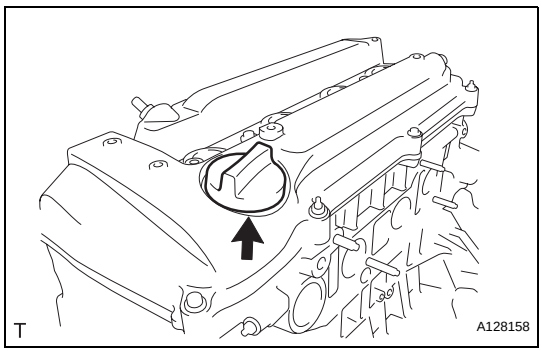
49. INSTALL NO. 2 CAMSHAFT (See page EM-14)



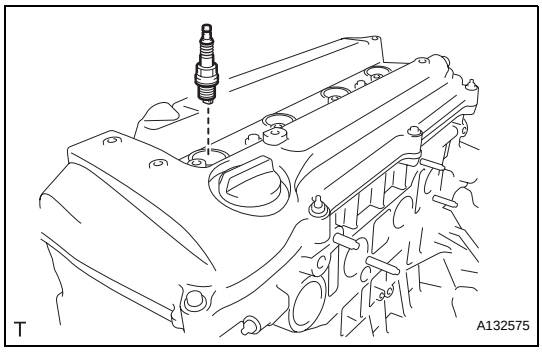
50. INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY (See page EM-37)

51. INSTALL CYLINDER HEAD COVER GASKET



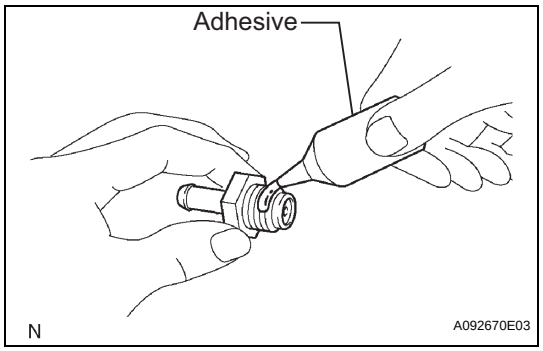
(a) Install the gasket onto the cylinder head cover.

52. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-40)

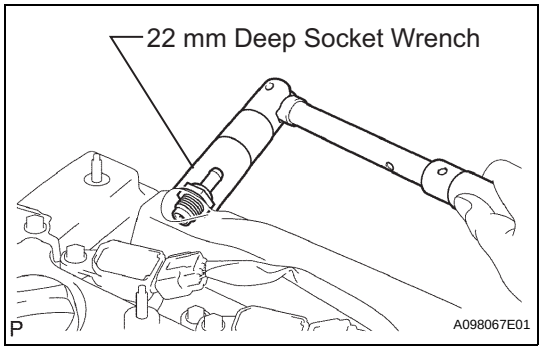


53. INSTALL OIL FILLER CAP SUB-ASSEMBLY

(a) Install the gasket to the cap.

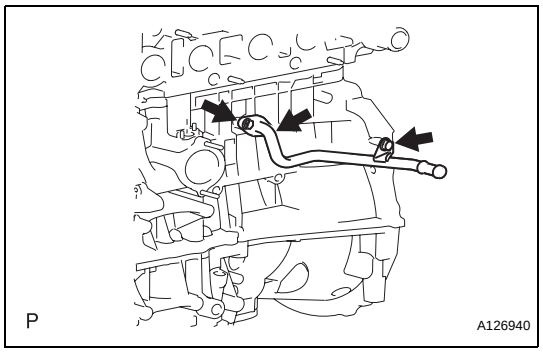


(b) Install the oil filler cap.
Torque: 3.0 N*m (31 kgf*cm, 26 in.*lbf)



54. INSTALL SPARK PLUG
Torque: 25 N*m (254 kgf*cm, 18 ft.*lbf)

55. INSTALL IGNITION COIL ASSEMBLY (See page IG-9)

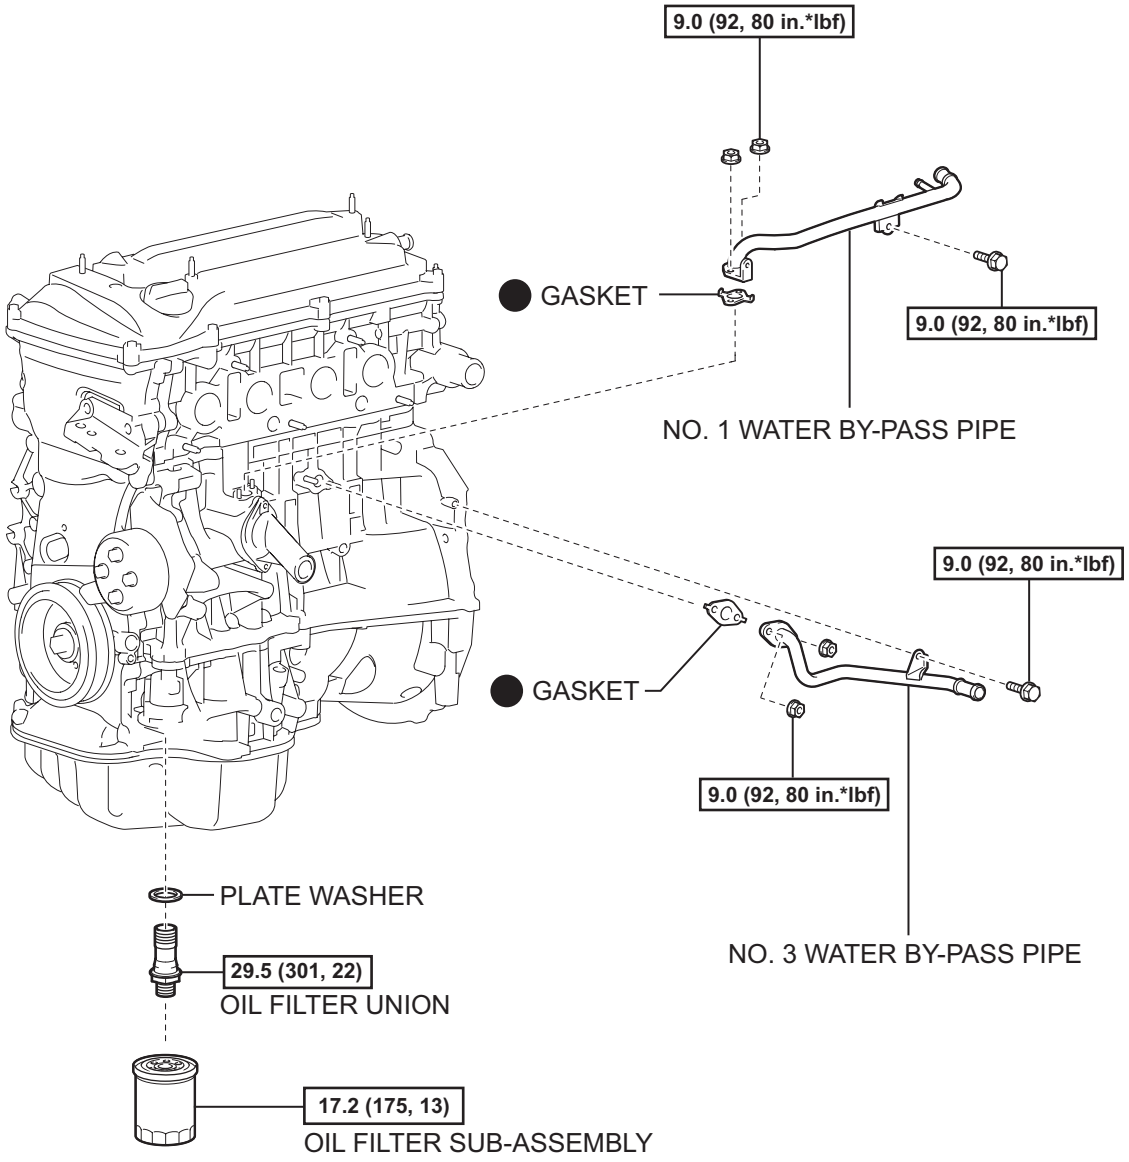


56. **INSTALL VENTILATION VALVE SUB-ASSEMBLY**
    (a) Apply adhesive to the threads of the ventilation valve.
    Adhesive:
    Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

    (b) Using a 22 mm deep socket wrench, install the ventilation valve.
    Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

57. **INSTALL OIL DIPSTICK GUIDE (See page EM-86)**
58. **INSTALL OIL DIPSTICK**
59. **INSTALL CAMSHAFT POSITION SENSOR (See page EM-81)**
60. **INSTALL ENGINE COOLANT TEMPERATURE SENSOR (See page EM-82)**
61. **INSTALL OIL PRESSURE SWITCH ASSEMBLY (See page EM-82)**
62. **INSTALL RADIO SETTING CONDENSER (See page EM-82)**
63. **INSTALL KNOCK SENSOR (See page ES-420)**
64. **INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (See page ES-396)**
65. **INSTALL V-RIBBED BELT TENSIONER ASSEMBLY (See page EM-38)**

66. **INSTALL NO. 3 WATER BY-PASS PIPE**
    (a) Install a new gasket and pipe with the bolt and 2 nuts.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)



67. **INSTALL NO. 1 WATER BY-PASS PIPE**
    (a) Install a new gasket and the pipe with the bolt and 2 nuts.
    Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
68. **INSTALL THERMOSTAT (See page CO-15)**
69. **INSTALL WATER INLET (See page CO-16)**
70. **INSTALL EXHAUST MANIFOLD CONVERTER SUB-ASSEMBLY (See page EM-85)**

EM

71. **INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (See page EM-86)**
72. **INSTALL NO. 2 MANIFOLD STAY (See page EM-86)**
73. **INSTALL MANIFOLD STAY (See page EM-86)**
74. **INSTALL IDLER PULLEY (See page EM-41)**

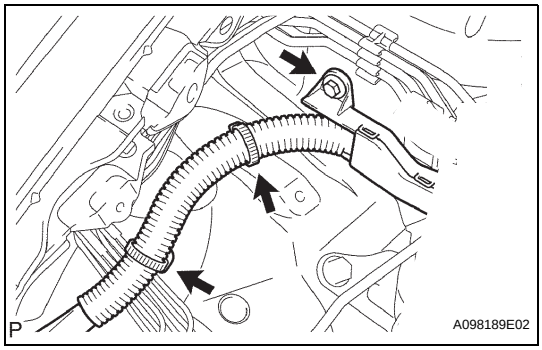
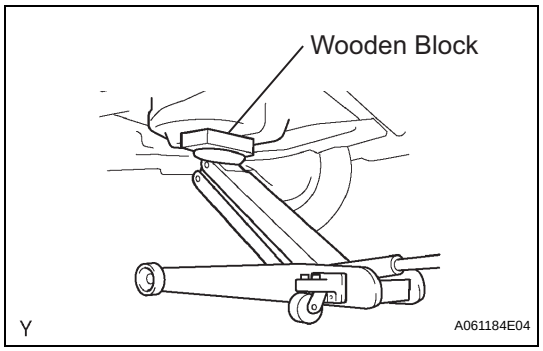
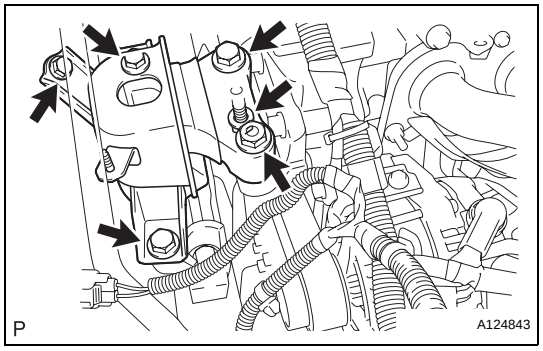
REMOVAL



1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE RADIATOR SUPPORT OPENING COVER**
3. **REMOVE FRONT WHEEL RH**
4. **REMOVE NO. 1 ENGINE UNDER COVER**
5. **REMOVE FRONT FENDER APRON RH**
6. **REMOVE NO. 1 ENGINE COVER**
   (a) Remove the 2 nuts and cover.



7. **DRAIN ENGINE OIL (See page LU-4)**
8. **REMOVE FRONT EXHAUST PIPE (See page EX-3)**
9. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-6)**
10. **REMOVE FAN AND GENERATOR V BELT (See page EM-6)**
11. **REMOVE GENERATOR ASSEMBLY (See page CH-9)**
12. **REMOVE RADIATOR RESERVOIR**
    (a) Remove the 2 bolts and radiator reservoir.



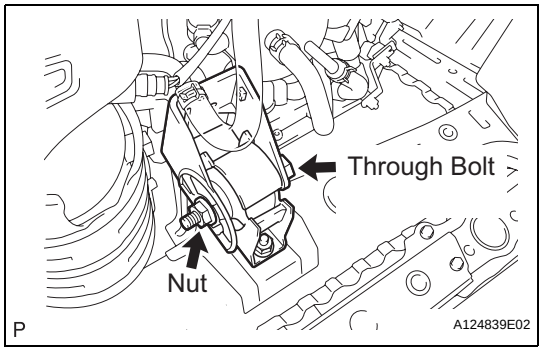
13. **REMOVE ENGINE MOUNTING INSULATOR RH**
    (a) Remove the bolt of the wire harness protector.
    (b) Disconnect the 2 clamps of the engine wire.

(c) Place a transmission jack underneath the engine, then put a wooden block on the jack.

(d) Remove the 4 bolts, 2 nuts and engine mounting insulator RH.

NOTICE:

Do not apply excessive force to the return tube when removing the engine mounting insulator RH.

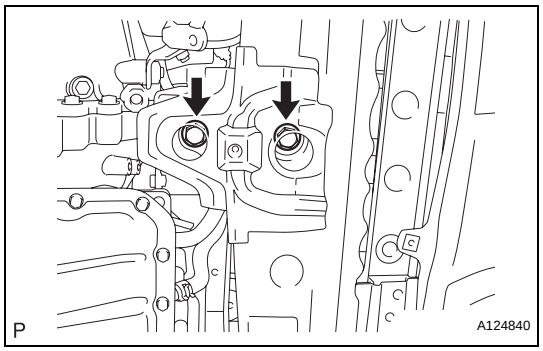


HINT:

Keep clearance by lowering the engine using the transmission jack when removing the engine mounting insulator FR.

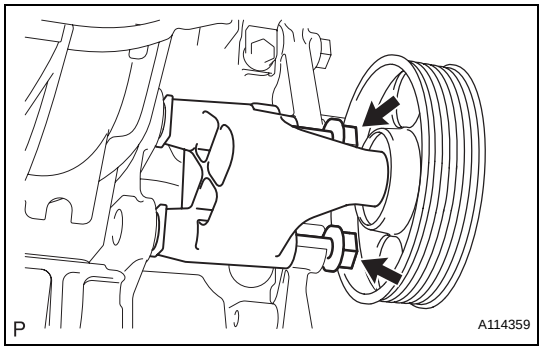
EM

14. REMOVE ENGINE MOUNTING INSULATOR FR



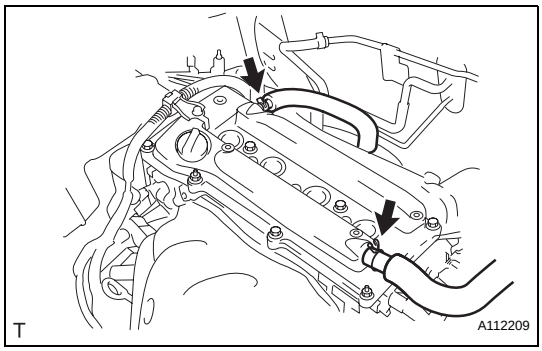
(a) Remove the through bolt and nut.

(b) Remove the 2 bolts and engine mounting insulator FR.



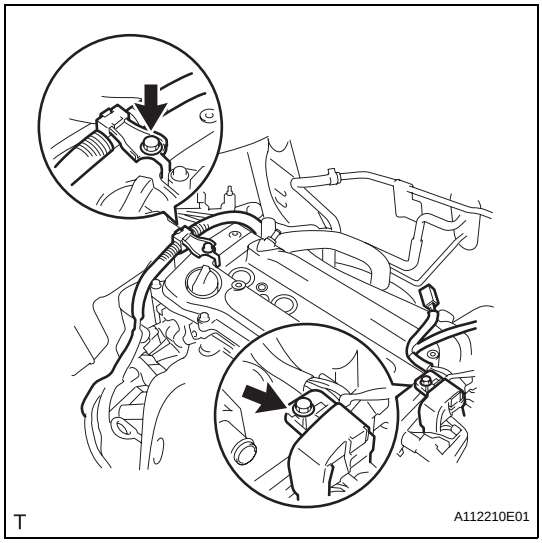
HINT:

Keep clearance by lowering the engine using the transmission jack when removing the engine mounting insulator FR.



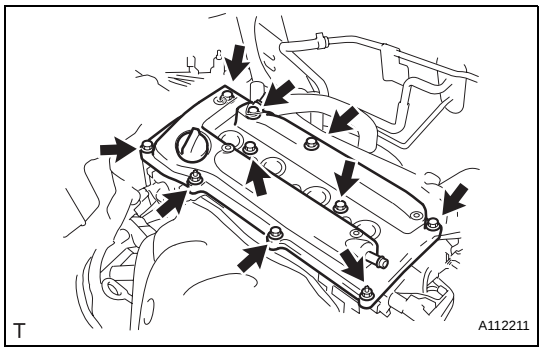
15. REMOVE IDLER PULLEY

(a) Loosen the 2 bolts and remove the idler pulley with the 2 bolts.

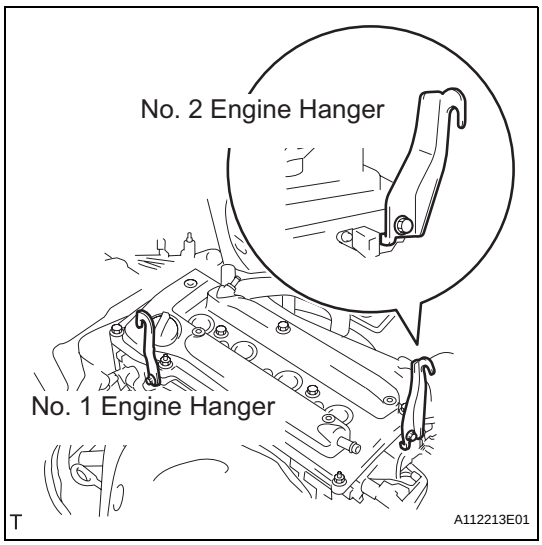


16. REMOVE IGNITION COIL ASSEMBLY (See page IG-9)

17. REMOVE SPARK PLUG (See page EM-8)



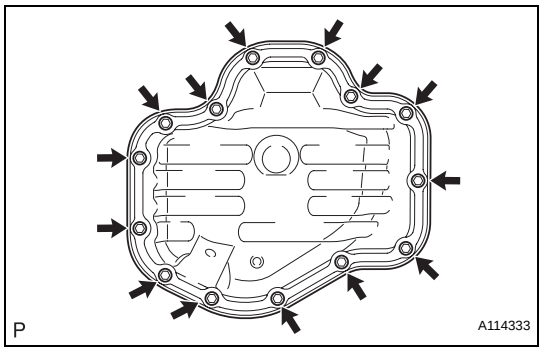
18. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY



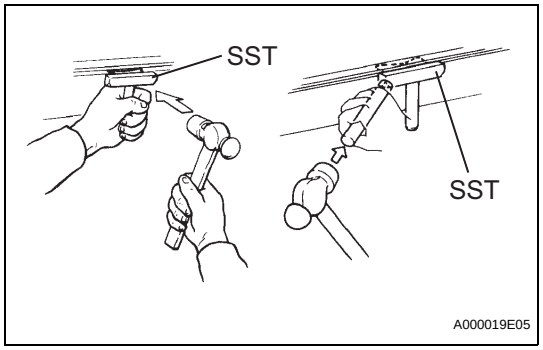
(a) Disconnect the 2 ventilation hoses form the cylinder head cover.

(b) Remove the 2 bolts and disconnect the 2 engine wires.

(c) Remove the 8 bolts, 2 nuts and cylinder head cover.



19. REMOVE OIL PAN SUB-ASSEMBLY

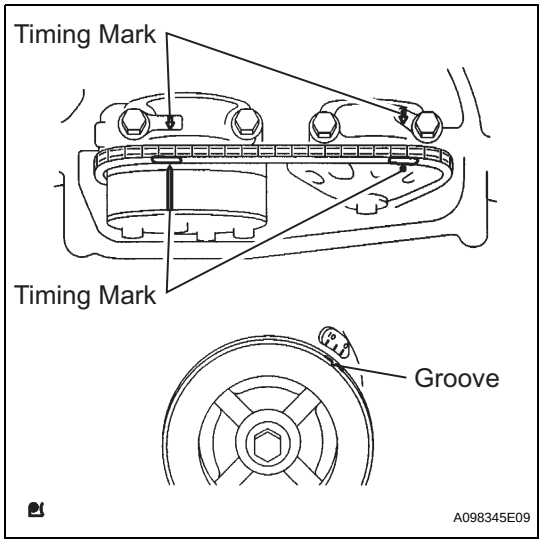


(a) Install the No. 1 and No. 2 engine hangers with the bolts.
Torque: 38 N*m (387 kgf*cm, 28 ft.*lbf)
Part No.

Item	Part No.
No. 1 engine hanger	12281-28010
No. 2 engine hanger	12282-28010
Bolt	91512-61020

(b) Attach the sling device to the engine hangers and chain block.

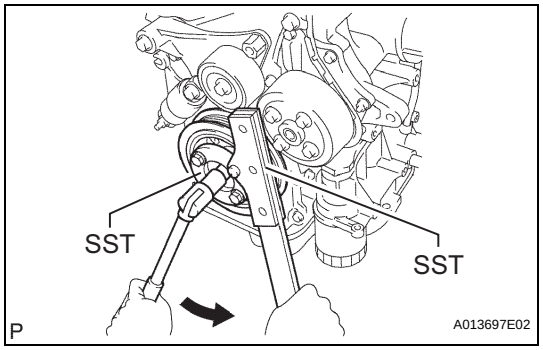
(c) Remove the 12 bolts and 2 nuts.



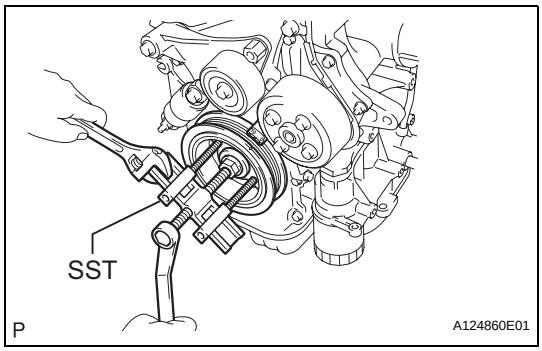
(d) Insert the blade of SST between the crankcase, chain cover and oil pan, then cut off the applied sealer and remove the oil pan.
SST 09032-00100
NOTICE:
Be careful not to damage the contact surface of the crankcase, chain cover and oil pan.

EM

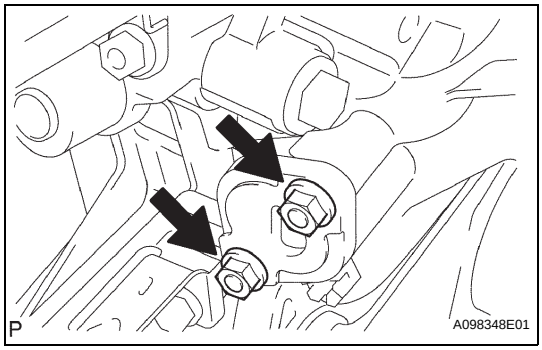
20. SET NO. 1 CYLINDER TO TDC/COMPRESSION



(a) Turn the crankshaft pulley until its groove and the timing mark "0" of the timing chain cover are aligned.

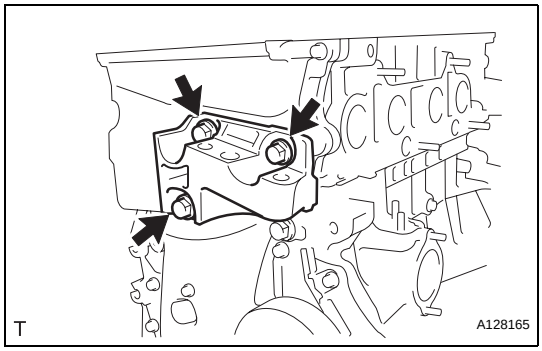


(b) Check that each timing mark of the camshaft timing gear and sprocket is aligned with each timing mark located on the No. 1 and No. 2 bearing caps as shown in the illustration.
If not, turn the crankshaft by 1 revolution (360°) to align the timing marks as above.



21. REMOVE CRANKSHAFT PULLEY

(a) Using SST, fix the pulley in place and loosen the pulley bolt.
SST 09213-54015 (91651-60855), 09330-00021

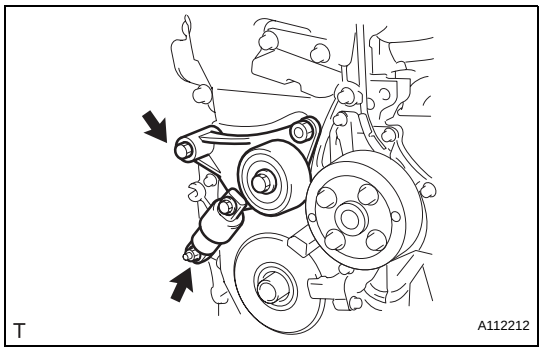


(b) Remove the crankshaft pulley.
HINT:
If necessary, remove the pulley and pulley bolt using SST.
SST 09950-50013 (09951-05010, 09952-05010, 09953-05020, 09954-05021), 09950-40011 (09957-04010)

22. REMOVE NO. 1 CHAIN TENSIONER ASSEMBLY

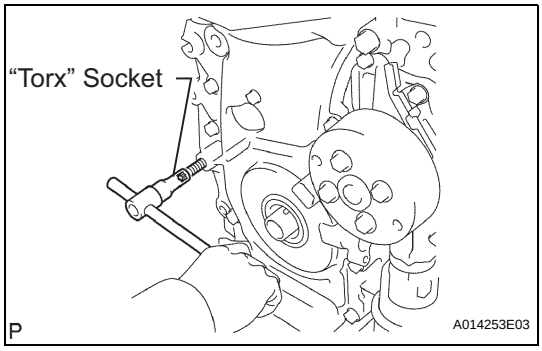
(a) Remove the 2 nuts, chain tensioner and gasket.
NOTICE:
Do not turn the crankshaft without the chain tensioner.

EM



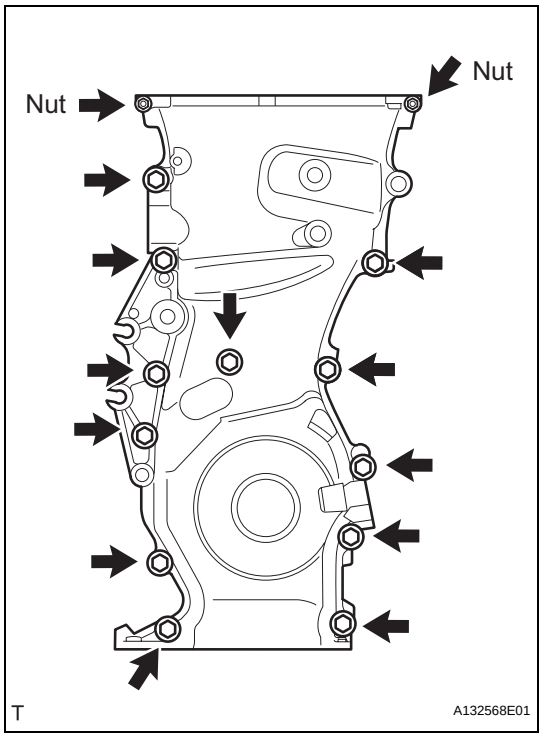
23. REMOVE ENGINE MOUNTING BRACKET RH

(a) Remove the 3 bolts and engine mounting bracket RH.



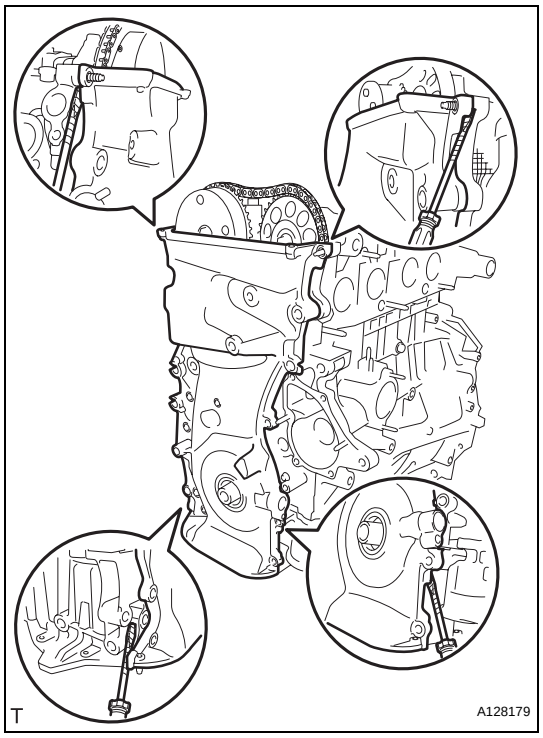
24. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY

(a) Lift the engine upward using the transmission jack.
NOTICE:
Do not lift the engine more than necessary.

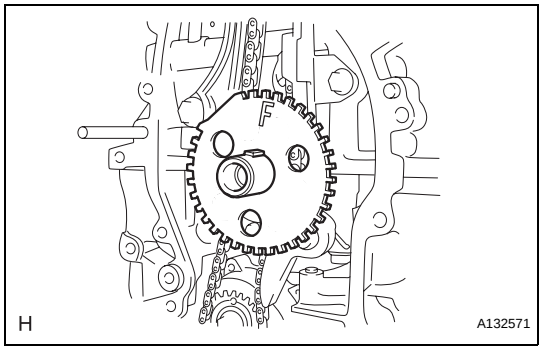


(b) Remove the bolt, nut and V-ribbed belt tensioner.

25. REMOVE CRANKSHAFT POSITION SENSOR (See page ES-402)

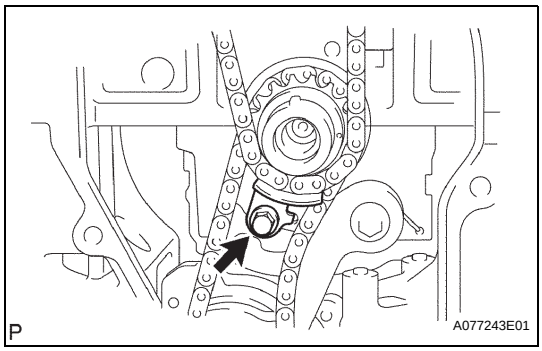


26. REMOVE TIMING CHAIN COVER SUB-ASSEMBLY

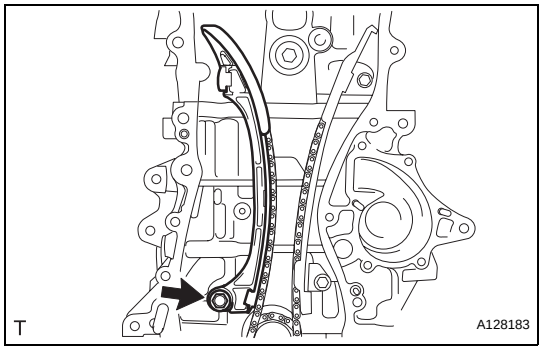


(a) Using an E10 "torx" socket, remove the stud bolt for the V-ribbed belt tensioner.

(b) Remove the 12 bolts and 2 nuts.

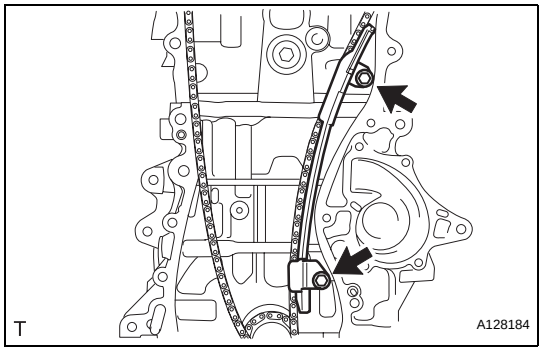


(c) Remove the timing chain cover by prying the portions between the timing chain cover, cylinder head and cylinder block with a screwdriver.
NOTICE:
Be careful not to damage the contact surfaces of the timing chain cover, cylinder head and cylinder block.



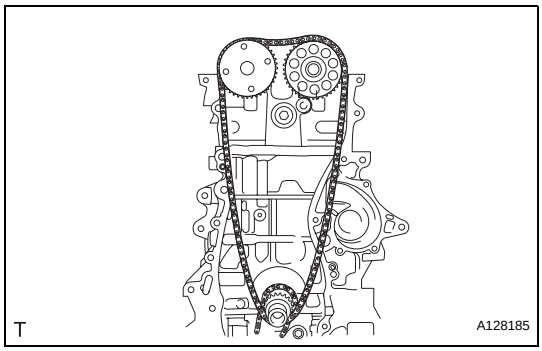
27. REMOVE NO. 1 CRANKSHAFT POSITION SENSOR PLATE

EM



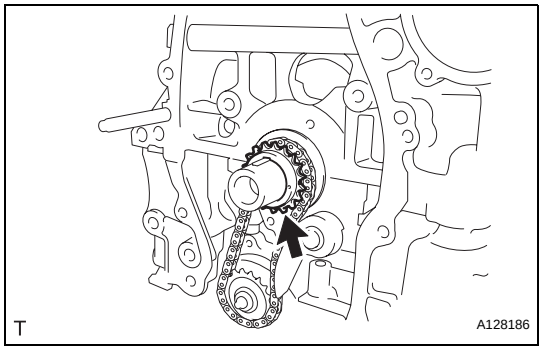
28. REMOVE TIMING CHAIN GUIDE

(a) Remove the bolt and timing chain guide.

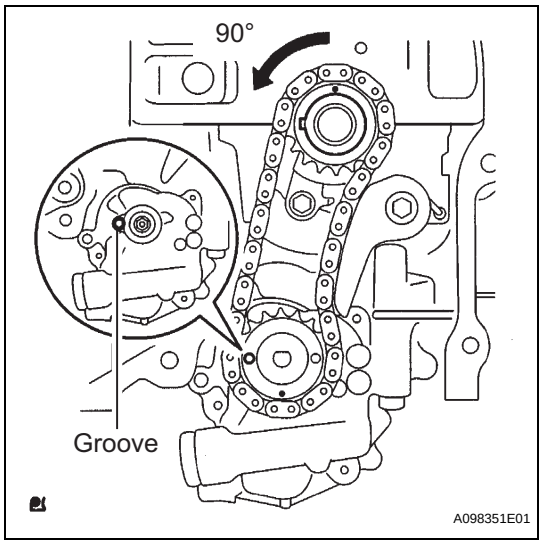


29. REMOVE CHAIN TENSIONER SLIPPER

(a) Remove the bolt and chain tensioner slipper.

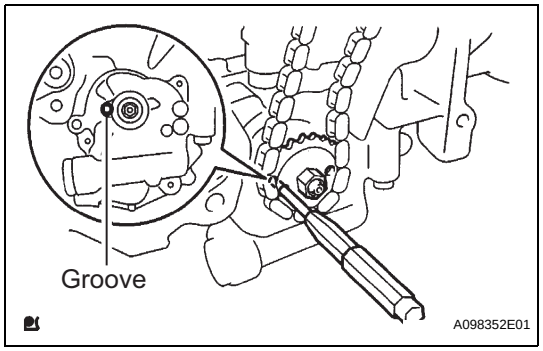


30. REMOVE NO. 1 CHAIN VIBRATION DAMPER

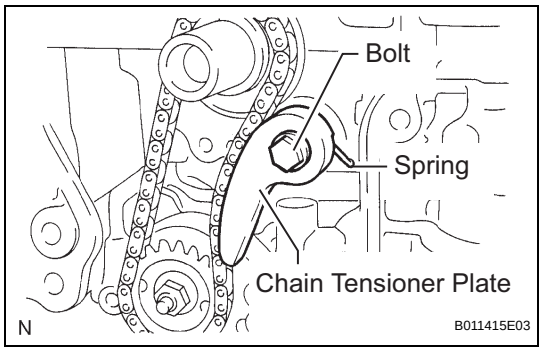


(a) Remove the 2 bolts and chain vibration damper.

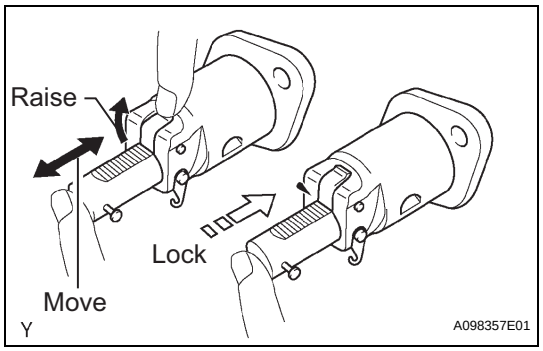
31. REMOVE CHAIN SUB-ASSEMBLY



32. REMOVE CRANKSHAFT TIMING SPROCKET

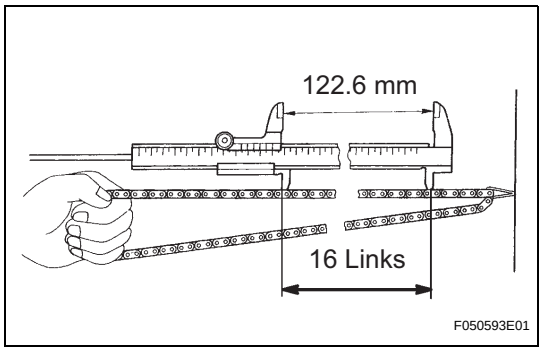


33. REMOVE NO. 2 CHAIN SUB-ASSEMBLY



(a) Turn the crankshaft by 90° counterclockwise to align the adjusting hole of the oil pump drive shaft sprocket with the groove of the oil pump.

(b) Insert a 4 mm diameter bar into the adjusting hole of the oil pump drive shaft sprocket to lock the gear in position, and then remove the nut.



(c) Remove the bolt, chain tensioner plate and spring.
(d) Remove the oil pump drive sprocket, oil pump drive shaft sprocket and No. 2 chain.

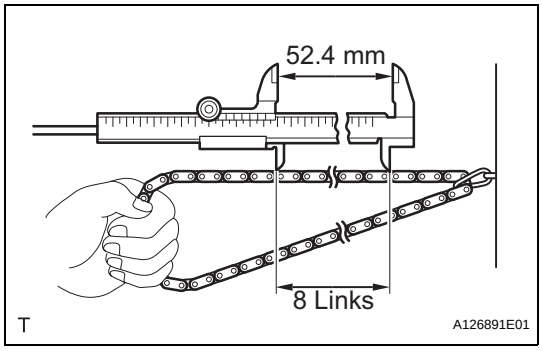
INSPECTION

1. INSPECT NO. 1 CHAIN TENSIONER

(a) Check that the plunger moves smoothly when the ratchet pawl is raised with your finger.
(b) Release the ratchet pawl, then check that the plunger is locked in place by the ratchet pawl and does not move when pushed with your finger.

2. INSPECT CHAIN SUB-ASSEMBLY

(a) Using a vernier caliper, measure the length of the 16 links with the chain fully stretched.



Maximum chain elongation:

122.6 mm (4.827 in.)

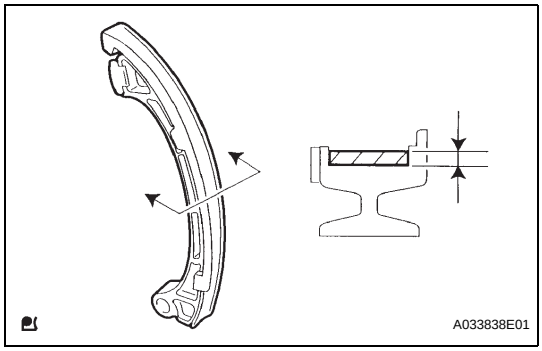
If the chain elongation is greater than the maximum, replace the chain sub-assembly.

HINT:

Take the measurements at 3 or more places selected at random.

3. INSPECT NO. 2 CHAIN SUB-ASSEMBLY

(a) Using a vernier caliper, measure the length of the 8 links with the chain fully stretched.



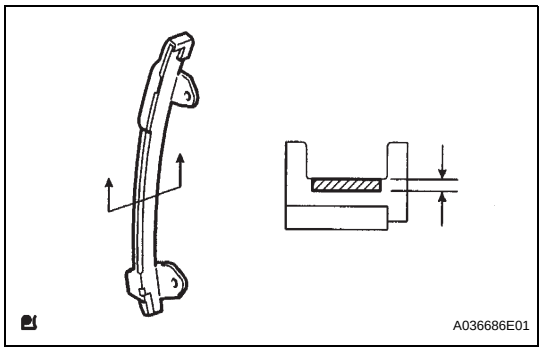
Maximum chain elongation:

52.4 mm (2.063 in.)

If the chain elongation is greater than the maximum, replace the No. 2 chain sub-assembly.

HINT:

Take the measurements at 3 or more places selected at random.



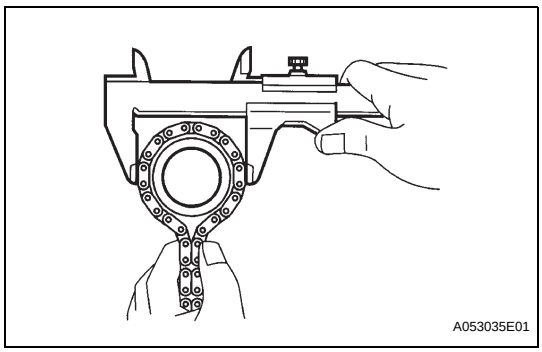
4. INSPECT CHAIN TENSIONER SLIPPER

(a) Using a vernier caliper, measure the tensioner slipper wear.

Maximum wear:

1.0 mm (0.039 in.)

If the wear is greater than the maximum, replace the chain tensioner slipper.



5. INSPECT NO. 1 CHAIN VIBRATION DAMPER

(a) Using a vernier caliper, measure the vibration damper wear.

Maximum wear:

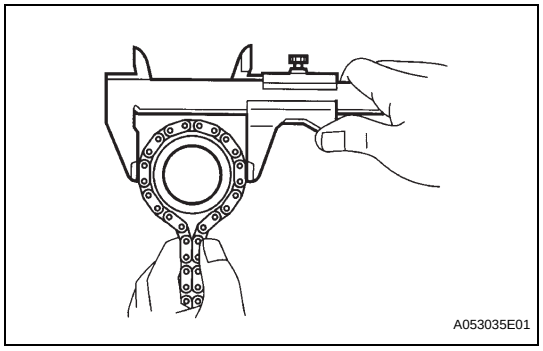
1.0 mm (0.039 in.)

If the wear is greater than the maximum, replace the No. 1 chain vibration damper.

6. INSPECT CRANKSHAFT TIMING SPROCKET

(a) Wrap the chain around the timing sprocket.

(b) Using a vernier caliper, measure the timing gear diameter with the chain.



Minimum gear diameter (with chain):

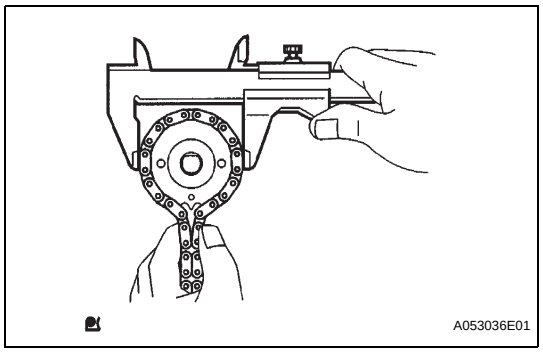
51.6 mm (2.031 in.)

NOTICE:

The vernier caliper must be in contact with the chain rollers when measuring.

If the gear diameter is less than the minimum, replace the chain sub-assembly and crankshaft timing sprocket.

7. INSPECT OIL PUMP DRIVE SPROCKET



(a) Wrap the chain around the drive sprocket.

(b) Using a vernier caliper, measure the drive gear diameter with the chain.

Minimum gear diameter (with chain):
48.2 mm (1.898 in.)

NOTICE:
The vernier caliper must be in contact with the chain rollers when measuring.

If the gear diameter is less than the minimum, replace the No. 2 chain sub-assembly and oil pump drive sprocket.

8. INSPECT OIL PUMP DRIVE SHAFT SPROCKET

(a) Wrap the chain around the drive shaft sprocket.

(b) Using a vernier caliper, measure the drive shaft gear diameter with the chain.

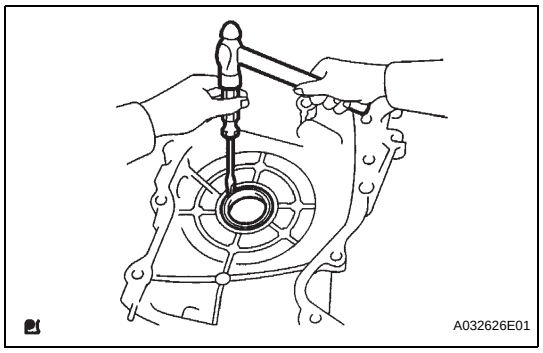
Minimum gear diameter (with chain):
48.2 mm (1.898 in.)

NOTICE:
The vernier caliper must be in contact with the chain rollers when measuring.

If the gear diameter is less than the minimum, replace the No. 2 chain sub-assembly and oil pump drive shaft sprocket.

EM

REPLACEMENT

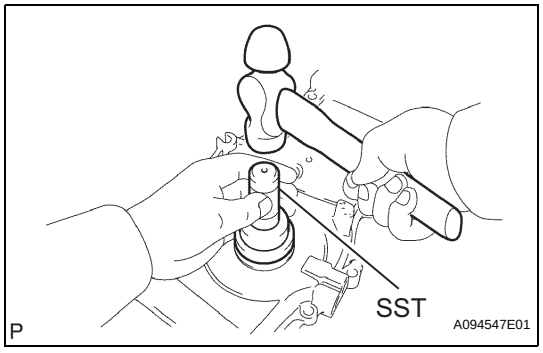


1. REPLACE TIMING CHAIN COVER OIL SEAL

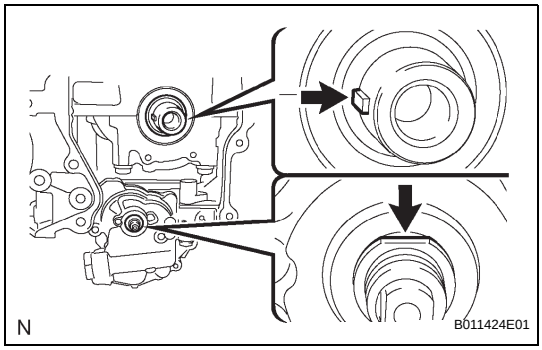
(a) Using a screwdriver and hammer, tap out the oil seal.

(b) Place the oil seal retainer on wooden blocks.

(c) Apply multi-purpose grease to the lip of a new oil seal.



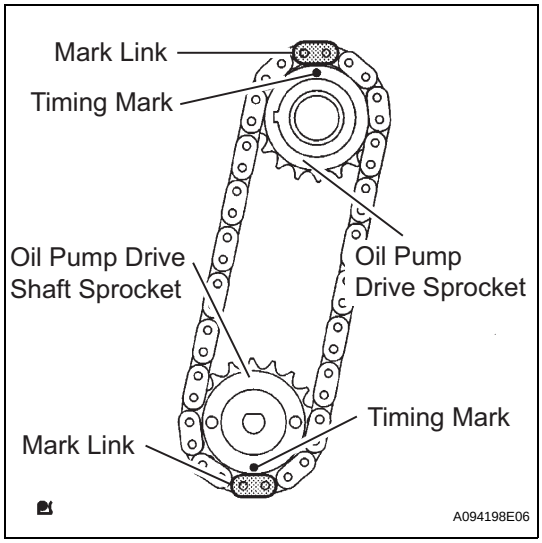
NOTICE:
Keep the lip free of foreign objects.

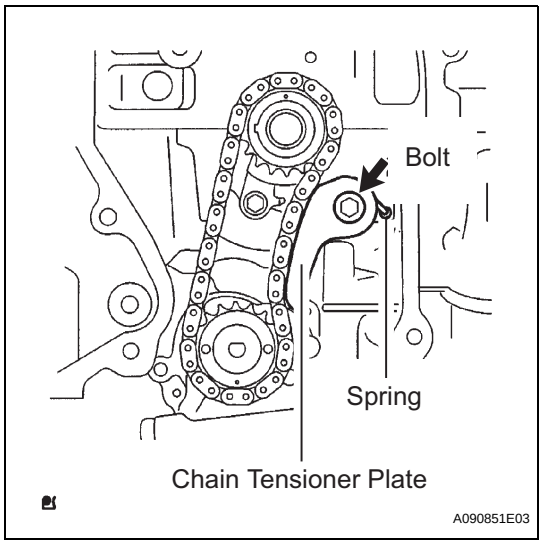


(d) Using SST and a hammer, tap in a new oil seal until its surface is flush with the timing gear case edge.

SST 09223-22010

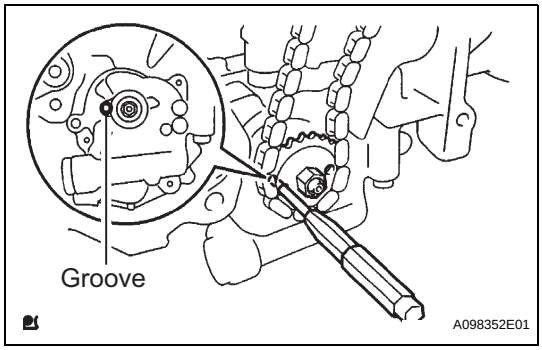
NOTICE:
Do not tap the oil seal at an angle.



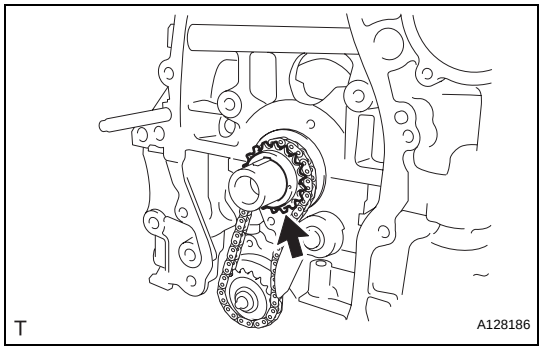


INSTALLATION

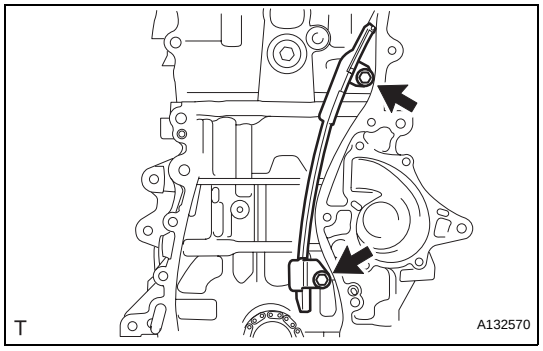
1. INSTALL NO. 2 CHAIN SUB-ASSEMBLY



(a) Set the crankshaft key in the left horizontal position.
(b) Turn the cutout of the drive shaft so that it faces upward.

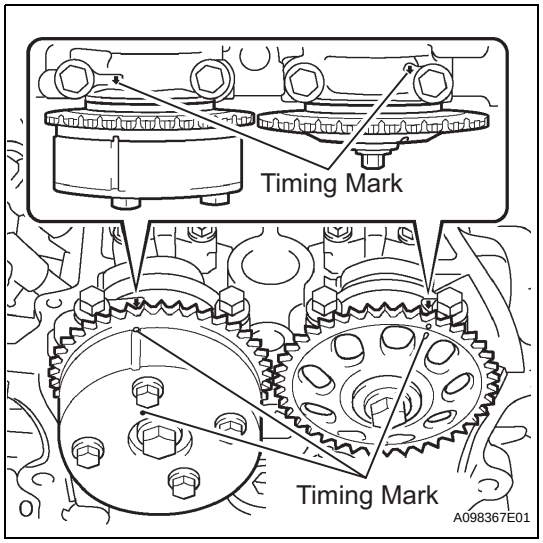


(c) Align the yellow mark links with the timing marks of each gear as shown in the illustration.
(d) Install the sprockets onto the crankshaft and oil pump shaft with the chain wrapped on the gears.
(e) Temporarily tighten the oil pump drive shaft sprocket with the nut.

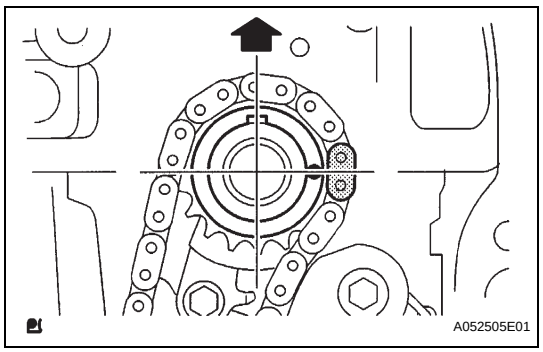


(f) Insert the damper spring into the adjusting hole, and then install the chain tensioner plate with the bolt.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)

(g) Align the adjusting hole of the oil pump drive shaft sprocket with the groove of the oil pump.
(h) Insert a 4 mm diameter bar into the adjusting hole of the oil pump drive shaft gear to lock the gear in position, and then tighten the nut.
Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf)

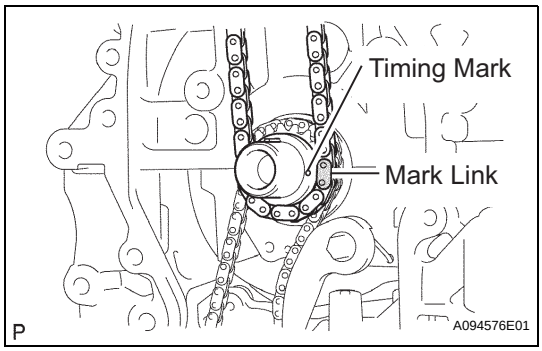


2. INSTALL CRANKSHAFT TIMING SPROCKET

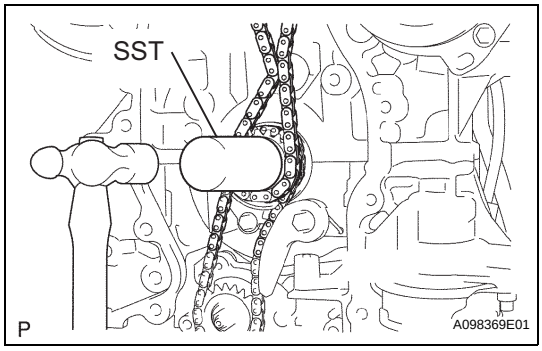


3. INSTALL NO. 1 CHAIN VIBRATION DAMPER

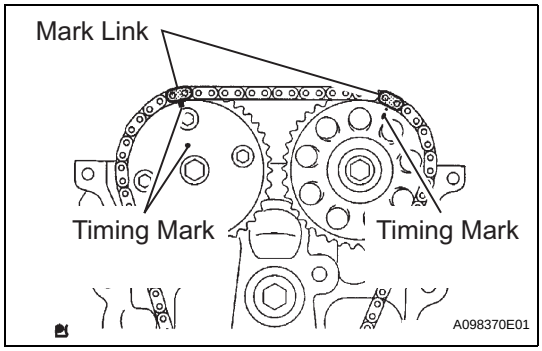
(a) Install the chain vibration damper with the 2 bolts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)



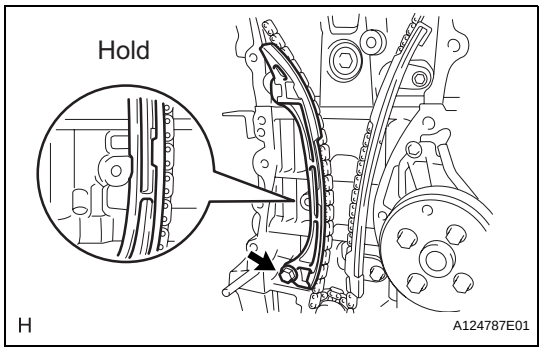
4. INSTALL CHAIN SUB-ASSEMBLY



(a) Set the No. 1 cylinder to TDC/compression.
(1) Turn the camshafts with a wrench (using the hexagonal lobe) to align the timing marks of the camshaft timing gear with each timing mark located on the No. 1 and No. 2 bearing caps as shown in the illustration.

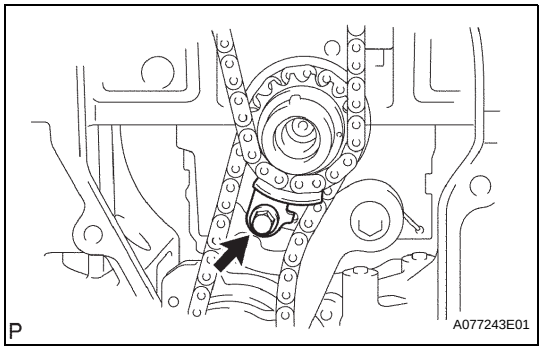


(2) Using the crankshaft pulley bolt, turn the crankshaft to position the key on the crankshaft upward.

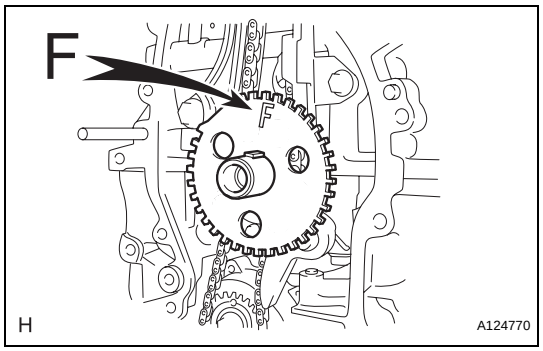


(b) Install the chain onto the crankshaft timing sprocket with the gold or orange mark link aligned with the timing mark on the crankshaft.

(c) Using SST and a hammer, tap in the crankshaft timing sprocket.
SST 09309-37010



(d) Align the gold or yellow links with each timing mark located on the camshaft timing gear and sprocket, then install the chain.

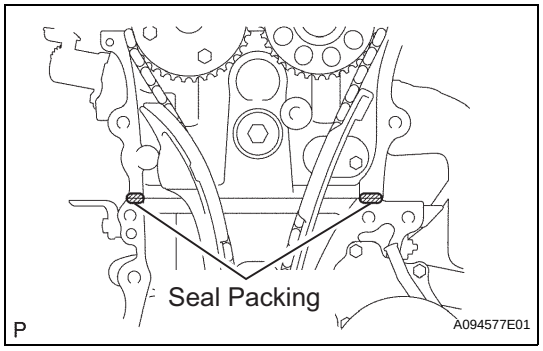


5. INSTALL CHAIN TENSIONER SLIPPER

(a) Install the chain tensioner slipper with the bolt.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

6. INSTALL TIMING CHAIN GUIDE

(a) Install the timing chain guide with the bolt.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)



7. INSTALL NO. 1 CRANKSHAFT POSITION SENSOR PLATE

(a) Install the sensor plate with the "F" mark facing forward.

8. INSTALL TIMING CHAIN COVER SUB-ASSEMBLY

(a) Remove any old packing material and be careful not to drop any oil on the contact surfaces of the timing chain cover, cylinder head and cylinder block.

(b) Apply seal packing (Diameter 4.0 to 4.5 mm (0.157 to 0.177 in.)) as shown in the illustration.

Seal packing:

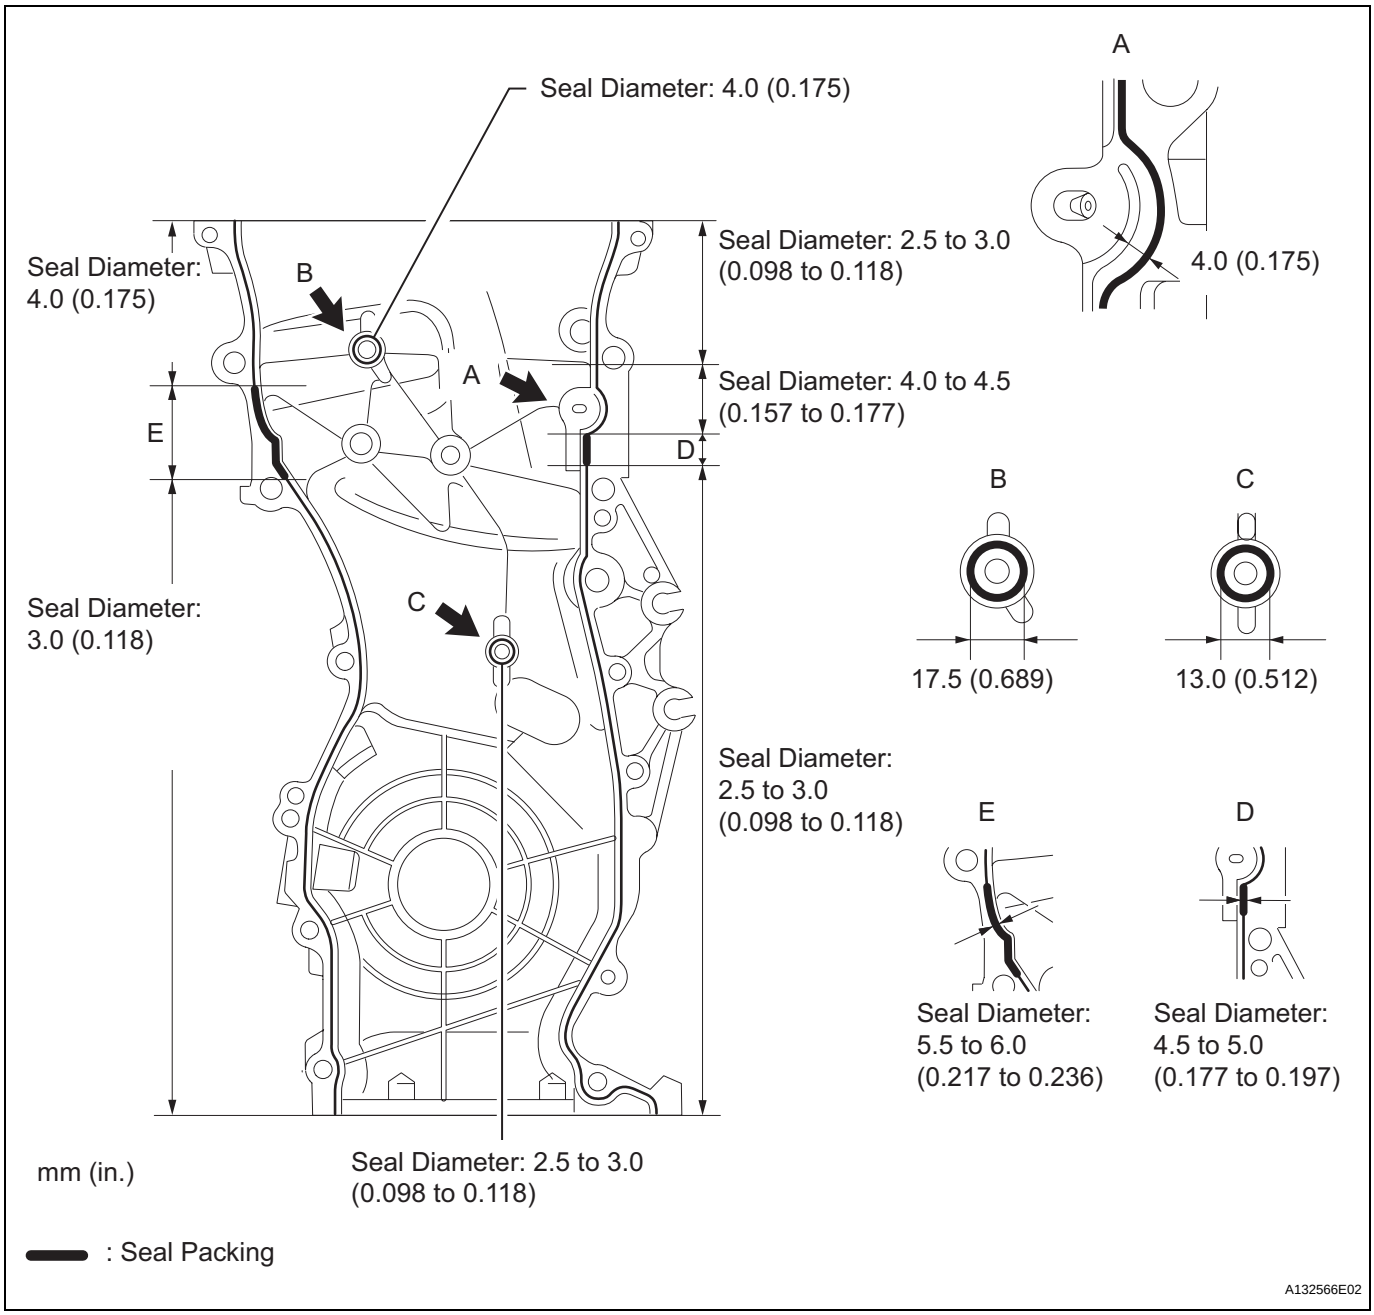
Toyota Genuine Seal Packing Block, Three Bond 1207B or Equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the chain cover within 3 minutes of applying seal packing.**
- **Do not add engine oil for at least 2 hours after installing the chain cover.**

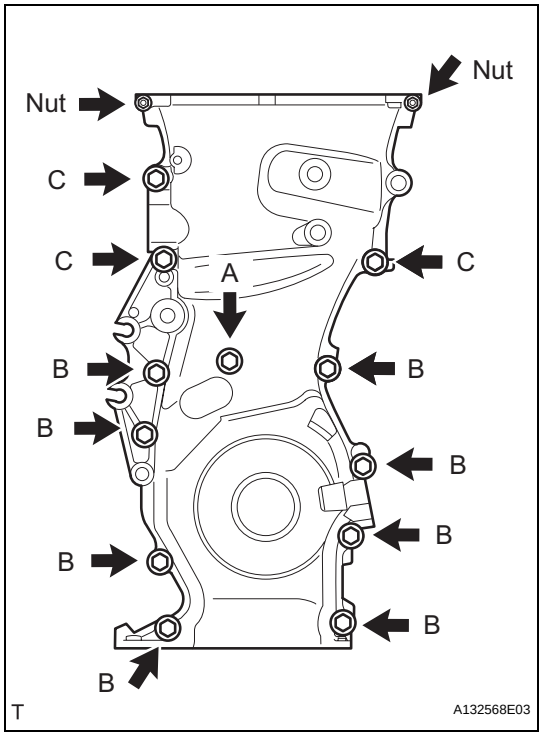
(c) Apply a continuous bead of seal packing as shown in the illustration.

Seal packing:



Toyota Genuine Seal Packing Block, Three Bond 1207B or Equivalent

NOTICE:

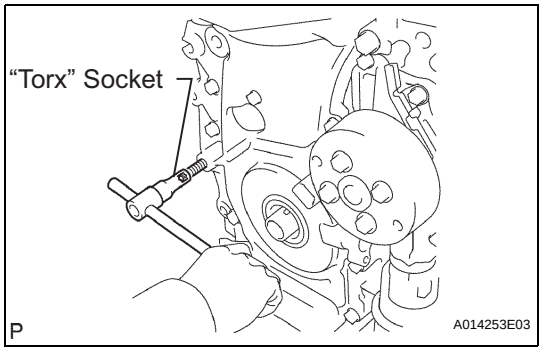


- **Remove any oil from the contact surface.**
- **Install the chain cover within 3 minutes of applying seal packing.**

EM

- **Do not add engine oil for at least 2 hours after installing the chain cover.**

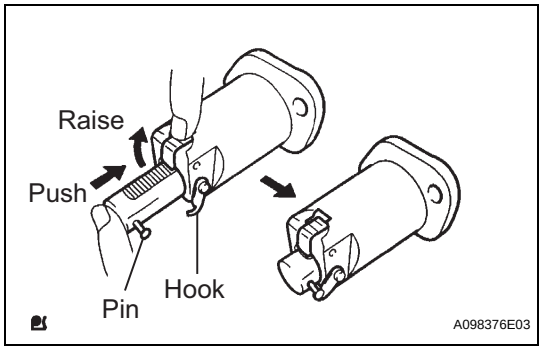
EM



(d) Install the timing chain cover with the 12 bolts and 2 nuts.

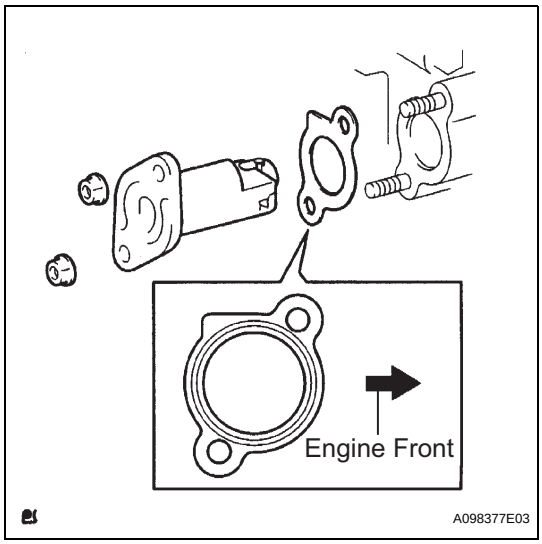
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf) for bolt A
25 N*m (255 kgf*cm, 18 ft.*lbf) for bolt B
55 N*m (561 kgf*cm, 41 ft.*lbf) for bolt C
11 N*m (112 kgf*cm, 8 ft.*lbf) for nut

HINT:
Bolt length:



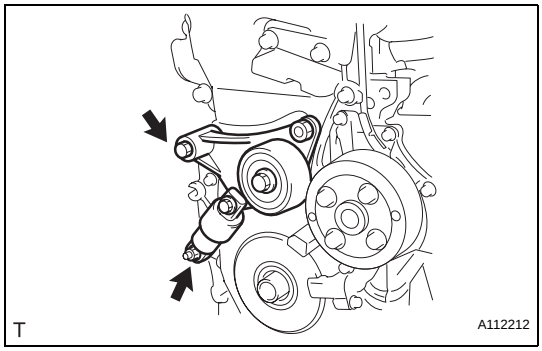
Bolt A	30 mm (1.18 in.) length for 10 mm head
Bolt B	30 mm (1.18 in.) length for 12 mm head
Bolt C	40 mm (1.57 in.) length for 14 mm head

EM

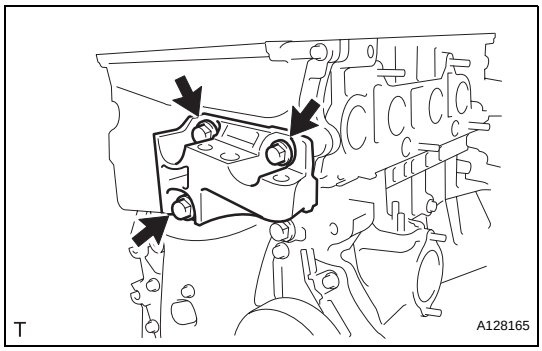


(e) Using an E10 "torx" socket, install the stud bolt for the V-ribbed belt tensioner.

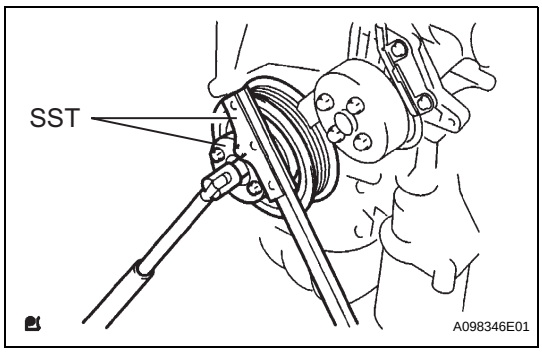
Torque: 21.5 N*m (219 kgf*cm, 16 ft.*lbf)



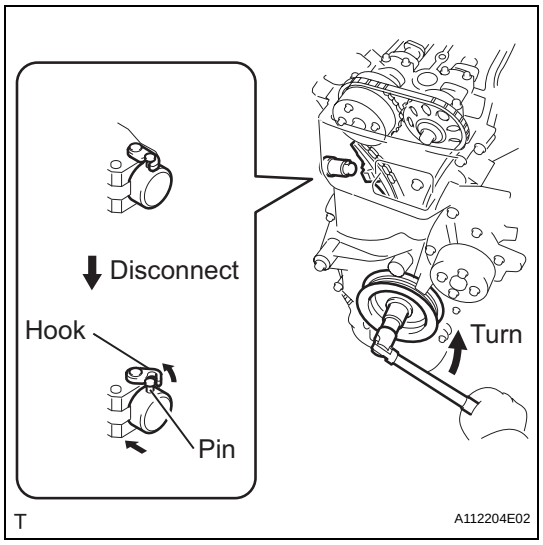
9. INSTALL NO. 1 CHAIN TENSIONER ASSEMBLY



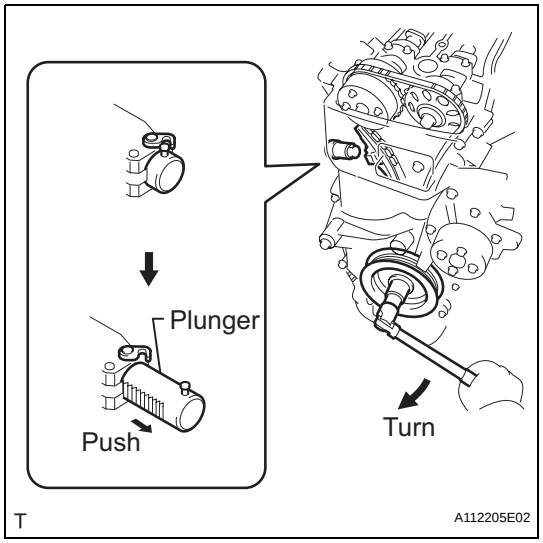
(a) Release the ratchet pawl, then fully push in the plunger and hook the hook to the pin so that the plunger is in the position shown in the illustration.



(b) Install a new gasket and the chain tensioner with the 2 nuts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
NOTICE:
When installing the chain tensioner, set the hook again if the hook releases the plunger.



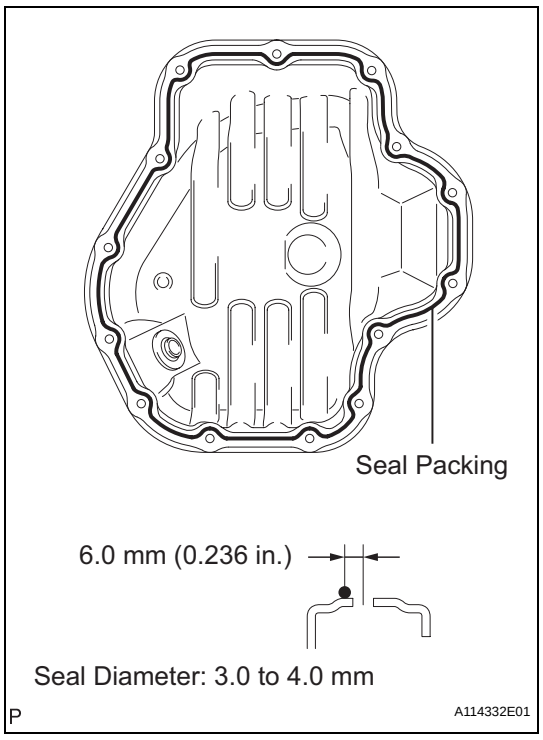
10. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY
(a) Install the V-ribbed belt tensioner with the bolt and nut.
Torque: 59.5 N*m (607 kgf*cm, 44 ft.*lbf)
NOTICE:
Do not lift the engine more than necessary.



11. INSTALL ENGINE MOUNTING BRACKET RH
(a) Install the engine mounting bracket RH with the 3 bolts.
Torque: 55 N*m (561 kgf*cm, 41 ft.*lbf)

12. INSTALL CRANKSHAFT PULLEY
(a) Using SST, fix the pulley in place and tighten the bolt.
SST 09213-54015 (91651-60855), 09330-00021
Torque: 180 N*m (1,835 kgf*cm, 133 ft.*lbf)

(b) Turn the crankshaft counterclockwise, then disconnect the plunger knock pin from the hook.

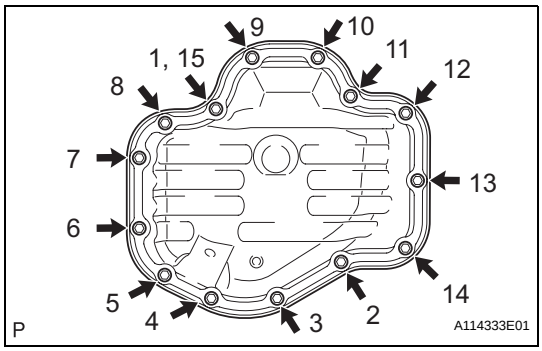


(c) Turn the crankshaft clockwise, then check that the plunger is extended.

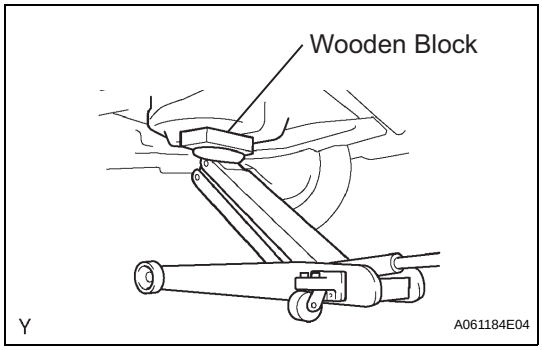
EM

13. INSTALL OIL PAN SUB-ASSEMBLY

(a) Remove any old packing material and be careful not to drop any oil on the contact surfaces of the cylinder block and oil pan.



(b) Apply a continuous bead of seal packing (Diameter 3.0 to 4.0 mm (0.118 to 0.157 in.)) as shown in the illustration.

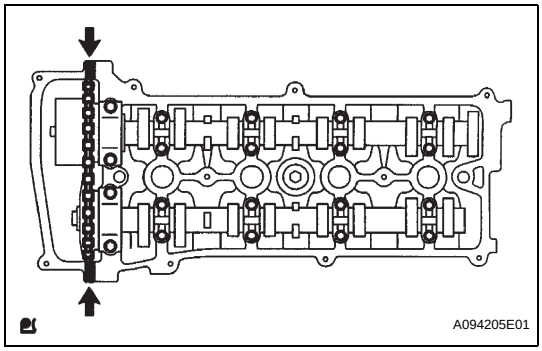


Seal packing:
Toyota Genuine Seal Packing Block, Three Bond 1207B or Equivalent

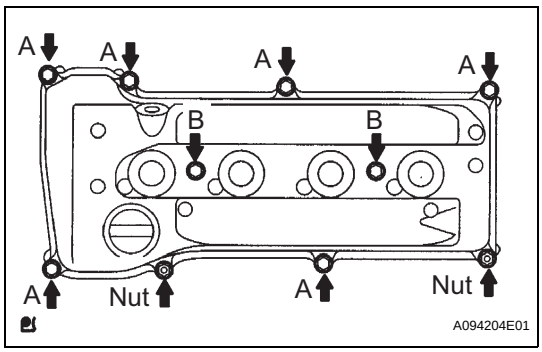
NOTICE:
- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes of applying seal packing.**
- **Do not add engine oil for at least 2 hours after installing the oil pan.**

(c) Install the oil pan to the cylinder block.

(d) Uniformly tighten the 12 bolts and 2 nuts in the sequence shown in the illustration.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)

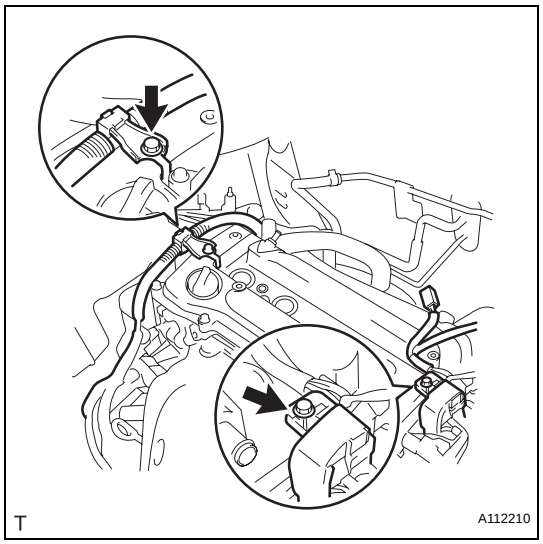


(e) Place a transmission jack underneath the engine, then put a wooden block on the jack.
(f) Remove the chain block and sling device.
(g) Remove the No. 1 and No. 2 engine hangers.

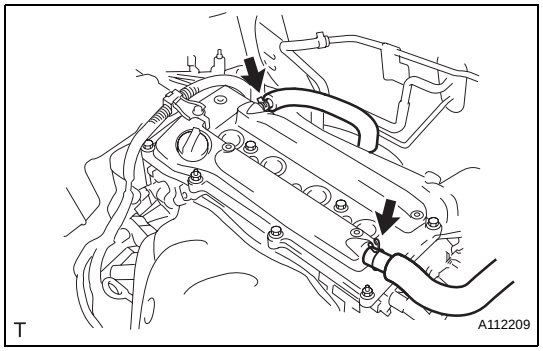


14. INSTALL CRANKSHAFT POSITION SENSOR (See page ES-402)

15. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY

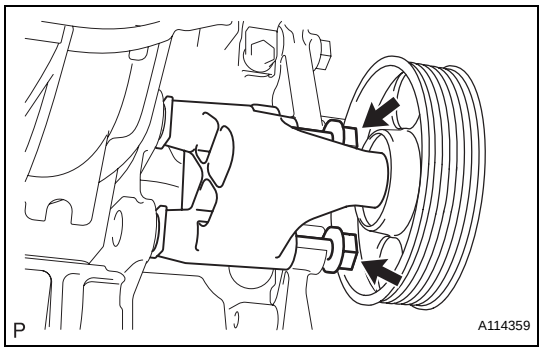


(a) Remove any old packing material from the contact surface.



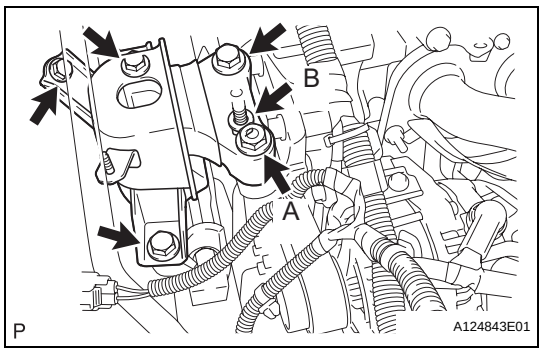
(b) Apply seal packing to the 2 locations shown in the illustration.
Seal packing:
Toyota Genuine Seal Packing Block, Three Bond 1207B or Equivalent
NOTICE:
- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes of applying seal packing.**
- **Do not add engine oil for at least 2 hours after installing the oil pan.**

(c) Install the cylinder head cover with the 8 bolts and 2 nuts.
Torque: 11 N*m (112 kgf*cm, 8 ft.*lbf) for bolt A
14 N*m (143 kgf*cm, 10 ft.*lbf) for bolt B
11 N*m (112 kgf*cm, 8 ft.*lbf) for nut



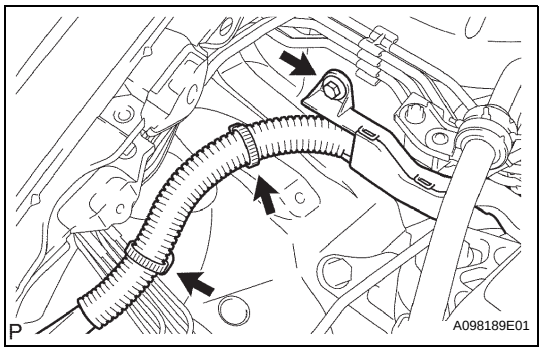
(d) Install the 2 engine wires with the 2 bolts.
Torque: 8.4 N*m (86 kgf*cm, 74 in.*lbf)

(e) Connect the 2 ventilation hoses to the cylinder head cover.



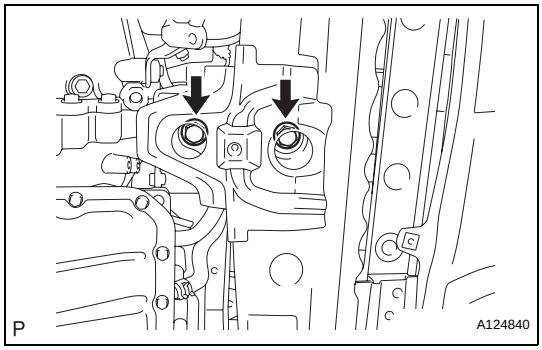
16. INSTALL SPARK PLUG (See page EM-16)

17. INSTALL IGNITION COIL ASSEMBLY (See page IG-9)



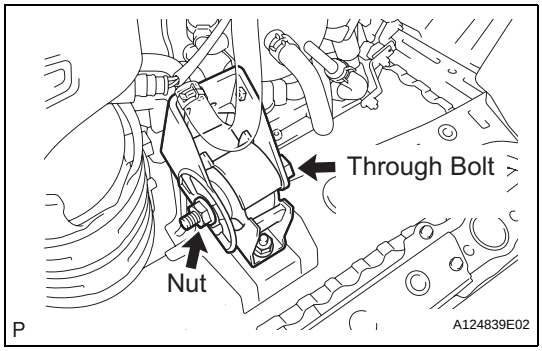
18. INSTALL IDLER PULLEY

(a) Install the idler pulley with the 2 bolts.
Torque: 60 N*m (612 kgf*cm, 44 ft.*lbf)

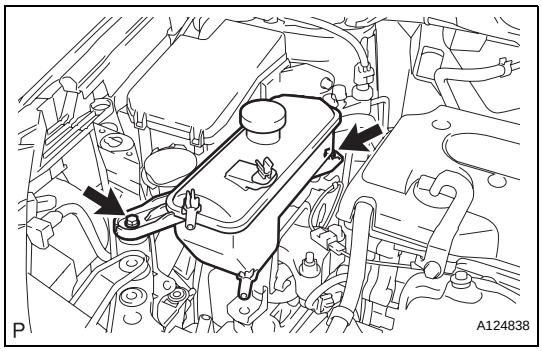


19. INSTALL ENGINE MOUNTING INSULATOR RH

(a) Install the engine mounting insulator RH with the 4 bolts and 2 nuts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf) for bolt
95 N*m (969 kgf*cm, 70 ft.*lbf) for nut A
52 N*m (530 kgf*cm, 38 ft.*lbf) for nut B



(b) Connect the 2 clamps of the engine wire.
(c) Install the wire harness protector with the bolt.



20. INSTALL ENGINE MOUNTING INSULATOR FR

(a) Install the engine mounting insulator FR with the 2 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

(b) Install the through bolt and nut.
Torque: 145 N*m (1,479 kgf*cm, 107 ft.*lbf)
HINT:
Install the bolt which is used to secure the front engine mounting bracket FR.

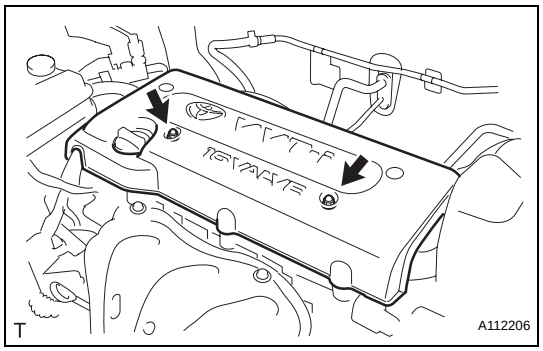
21. INSTALL RADIATOR RESERVOIR

(a) Install the radiator reservoir with the 2 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

22. INSTALL GENERATOR ASSEMBLY (See page CH-15)

23. INSTALL FAN AND GENERATOR V BELT (See page EM-7)

24. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)



25. INSTALL FRONT EXHAUST PIPE (See page EX-4)

26. ADD ENGINE OIL (See page LU-4)

27. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

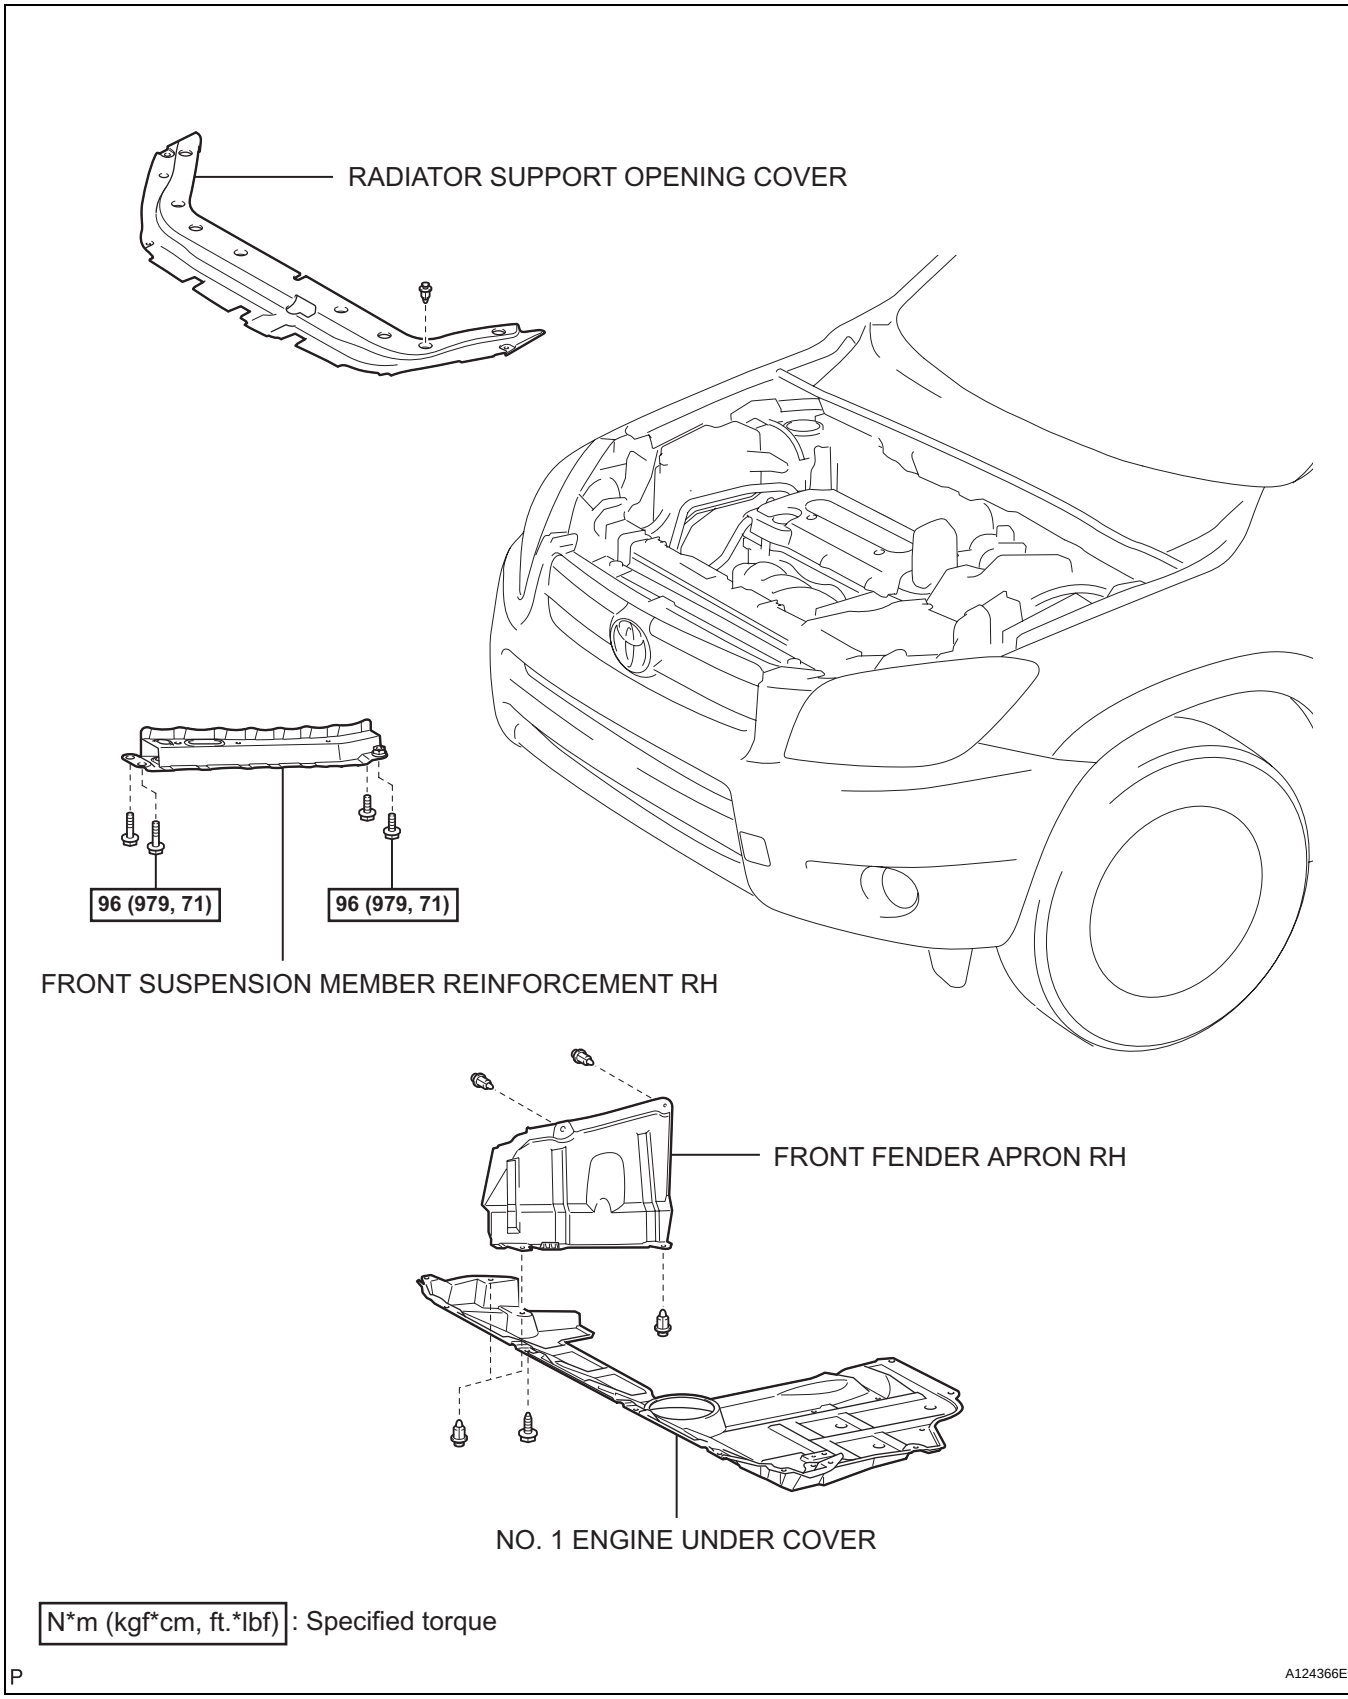
28. CHECK FOR ENGINE OIL LEAKS

29. CHECK FOR EXHAUST GAS LEAKS

30. INSTALL NO. 1 ENGINE COVER

(a) Install the engine cover with the 2 nuts.
Torque: 7.0 N*m (71 kgf*cm, 62 in.*lbf)

31. INSTALL FRONT FENDER APRON RH



32. INSTALL NO. 1 ENGINE UNDER COVER

33. INSTALL FRONT WHEEL RH

34. INSTALL RADIATOR SUPPORT OPENING COVER

TIMING CHAIN

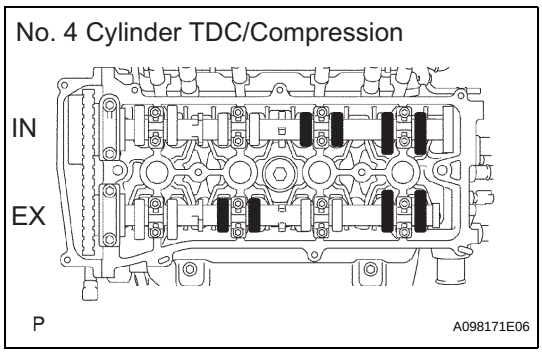
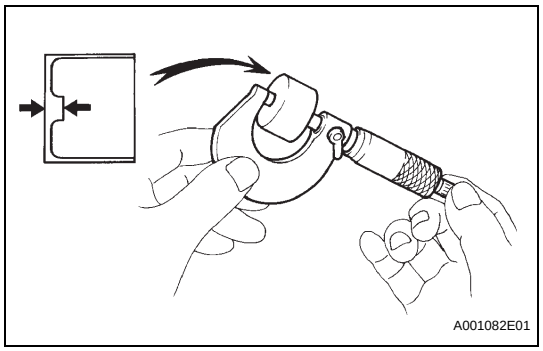
VALVE CLEARANCE



ADJUSTMENT

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE FRONT WHEEL RH**
3. **REMOVE NO. 1 ENGINE UNDER COVER**
4. **REMOVE FRONT FENDER APRON RH**
5. **REMOVE NO. 1 ENGINE COVER (See page EM-22)**
6. **REMOVE IGNITION COIL ASSEMBLY (See page IG-9)**
7. **REMOVE SPARK PLUG**
   (a) Remove the 4 spark plugs.
8. **REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-24)**
9. **SET NO. 1 CYLINDER TO TDC/COMPRESSION (See page EM-25)**
10. **CHECK VALVE CLEARANCE**
    (a) Check only the valves indicated.
    (1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.
    Standard valve clearance (cold)



Item	Standard Condition
Intake	0.19 to 0.29 mm (0.0075 to 0.0114 in.)
Exhaust	0.38 to 0.48 mm (0.0150 to 0.0189 in.)

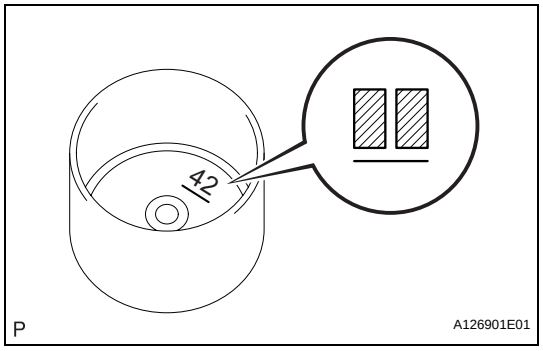
    (2) Record any out-of-specification valve clearance measurements. They will be used later to determine the required replacement valve clearance lifters.
    (b) Turn the crankshaft 1 revolution (360°) and set the No. 4 cylinder to the TDC/compression.
    (c) Check only the valves indicated.
    (1) Using a feeler gauge, measure the clearance between the valve lifter and camshaft.
    Standard valve clearance (cold)

Item	Standard Condition
Intake	0.19 to 0.29 mm (0.0075 to 0.0114 in.)
Exhaust	0.38 to 0.48 mm (0.0150 to 0.0189 in.)

    (2) Record any out-of-specification valve clearance measurements. They will be used later to determine the required replacement valve lifters.
11. **ADJUST VALVE CLEARANCE**
    (a) Remove the No. 2 camshaft (see page EM-60).

(b) Remove the camshaft (see page EM-61).
(c) Remove the valve lifters.
(d) Using a micrometer, measure the thickness of the removed valve lifters.
(e) Calculate the thickness of a new lifter so that the valve clearance comes within the specified values.

New lifter thickness



Item	Specification
Intake	**A = B + (C - 0.24 mm (0.0095 in.))**
Exhaust	**A = B + (C - 0.43 mm (0.0169 in.))**

A	New lifter thickness
B	Used lifter thickness
C	Measured valve clearance

CALCULATION EXAMPLE (Intake):

1. Measured intake valve clearance = 0.40 mm (0.0158 in.)
   (Measured - Specification = Excess clearance)
   (a) 0.40 mm (0.0158 in.) - 0.24 mm (0.0095 in.) = 0.16 mm (0.0063 in.)
2. Measured used lifter thickness = 5.250 mm (0.2067 in.)
3. New lifter thickness = 5.410 mm (0.2130 in.)
   (Excess clearance + Used lifter thickness = Ideal new lifter)
   (a) 0.16 mm (0.0063 in.) + 5.250 mm (0.2067 in.) = 5.410 mm (0.2130 in.)
4. Closest new lifter = 5.420 mm (0.2134 in.)
   – Select No. 42 lifter

(f) Select a new lifter with a thickness as close as possible to the calculated values.
HINT:
- Lifters are available in 35 sizes in increments of 0.020 mm (0.0008 in.), from 5.060 to 5.740 mm (0.1992 to 0.2260 in.).
- The identification number inside the valve lifters shows the value to 2 decimal places. (The illustration shows 5.420 mm (0.2134 in.)

Standard intake valve clearance (cold):
0.19 to 0.29 mm (0.0075 to 0.0114 in.)

EXAMPLE:

The 5.250 mm (0.2067 in.) lifter is installed, and the measured clearance is 0.400 mm (0.0157 in.).

Replace the 5.250 mm (0.2067 in.) lifter with a new No. 42 lifter.

(h) Valve lifter selection chart (exhaust).

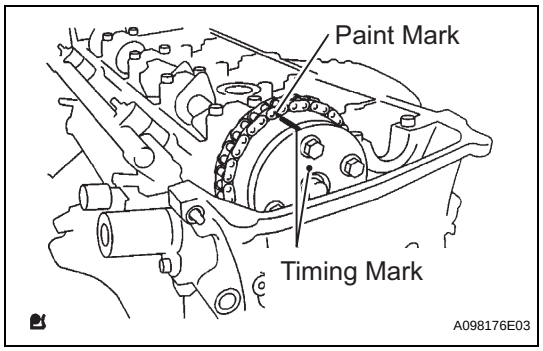
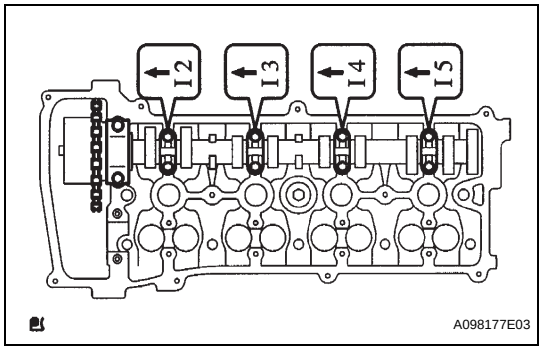
Standard exhaust valve clearance (cold):
0.38 to 0.48 mm (0.0150 to 0.0189 in.)



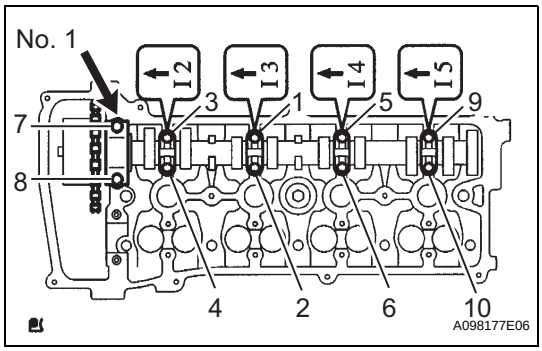
EXAMPLE:
The 5.340 mm (0.2102 in.) lifter is installed, and the measured clearance is 0.430 mm (0.0169 in.).
Replace the 5.340 mm (0.2102 in.) lifter with a new No. 42 lifter.

(i) Install the selected valve lifter.



12. INSTALL CAMSHAFT

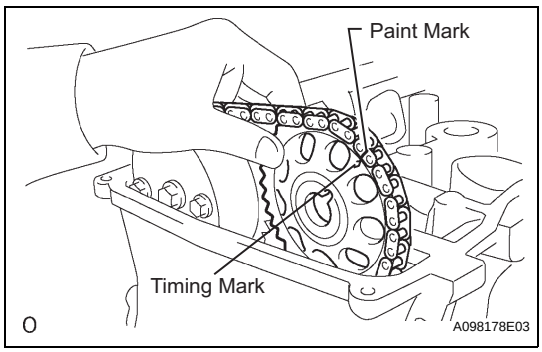
(a) Apply a light coat of engine oil to the journal portion of the camshaft.



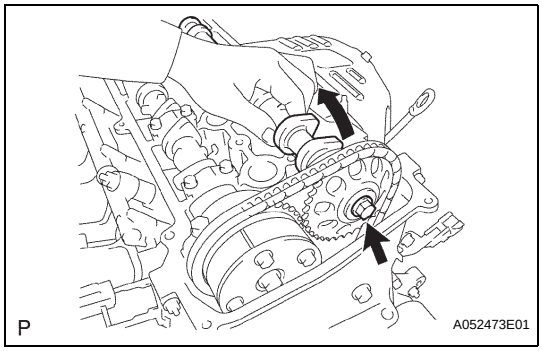
(b) Install the timing chain onto the camshaft timing gear with the paint mark aligned with the timing mark in the camshaft timing gear as shown in the illustration.

(c) Examine the front marks and numbers, and check that the order is as shown in the illustration. Then install the bearing caps into the cylinder head.

(d) Apply a light coat of engine oil on the threads and under the heads of the bearing cap bolts.

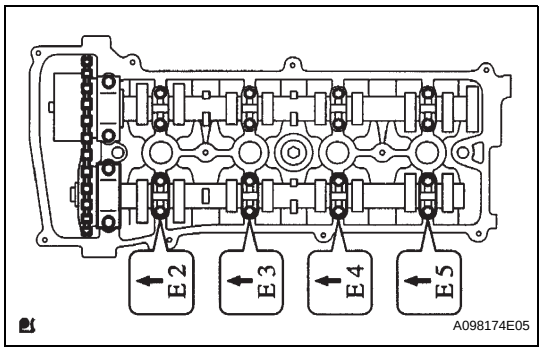


(e) Using several steps, uniformly tighten the 10 bearing cap bolts in the sequence shown in the illustration.



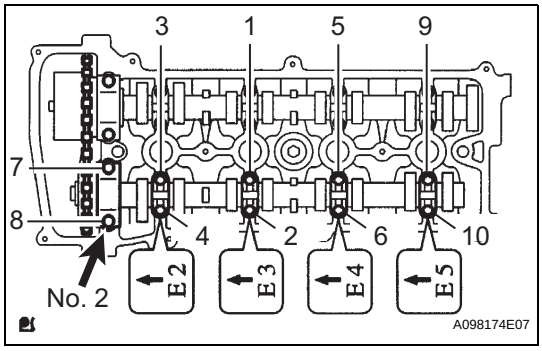
Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf) for No. 1 bearing cap
9.0 N*m (92 kgf*cm, 80 in.*lbf) for No. 3 bearing cap

13. INSTALL NO. 2 CAMSHAFT

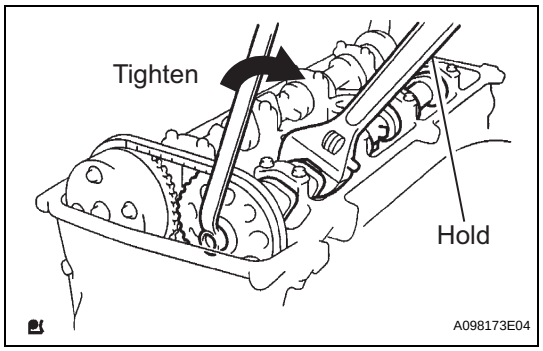


(a) Apply a light coat of engine oil to the journal portion of the No. 2 camshaft.

(b) Put the No. 2 camshaft on the cylinder head with the paint mark of the chain aligned with the timing mark on the camshaft timing sprocket.

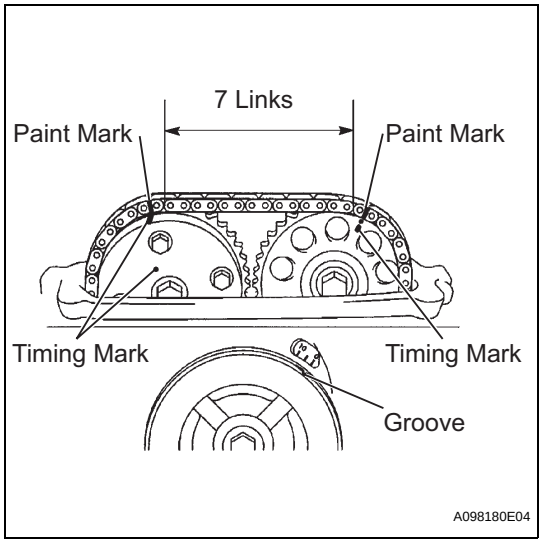


(c) While holding the No. 2 camshaft by hand, temporarily tighten the camshaft timing sprocket set bolt.



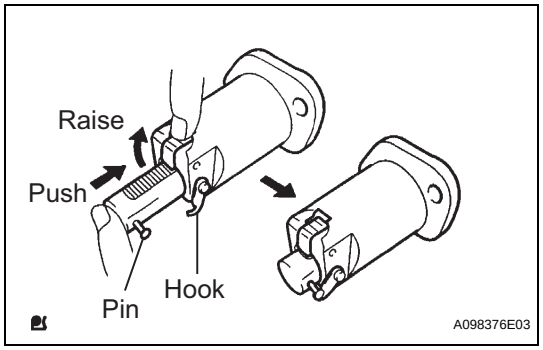
(d) Examine the front marks and numbers, and check that the order is as shown in the illustration. Then install the bearing caps onto the cylinder head.

(e) Apply a light coat of engine oil to the threads and under the heads of the bearing cap bolts.

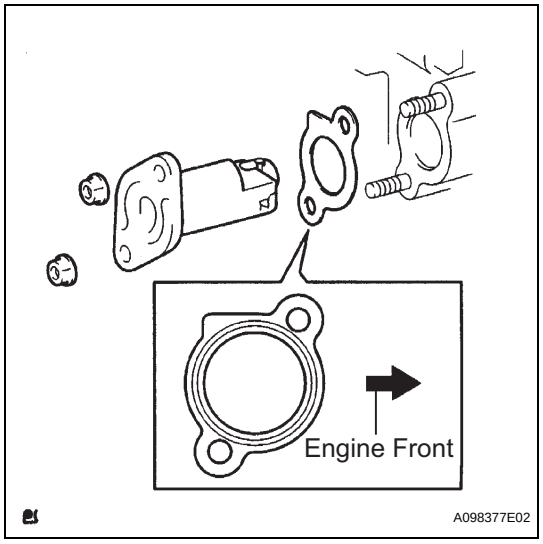


(f) Using several steps, uniformly tighten the 10 bearing cap bolts in the sequence shown in the illustration.

Torque: 29.5 N*m (301 kgf*cm, 22 ft.*lbf) for No. 2 bearing cap
9.0 N*m (92 kgf*cm, 80 in.*lbf) for No. 3 bearing cap

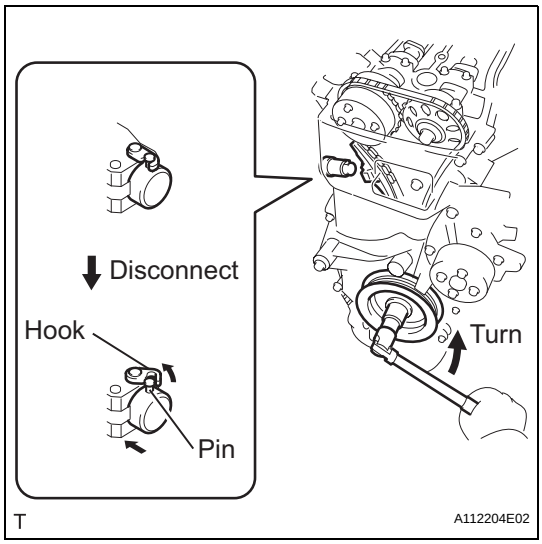


(g) While holding the camshaft with a wrench, tighten the camshaft timing sprocket set bolt.
Torque: 54 N*m (551 kgf*cm, 40 ft.*lbf)
NOTICE:
Be careful not to damage the valve lifter.

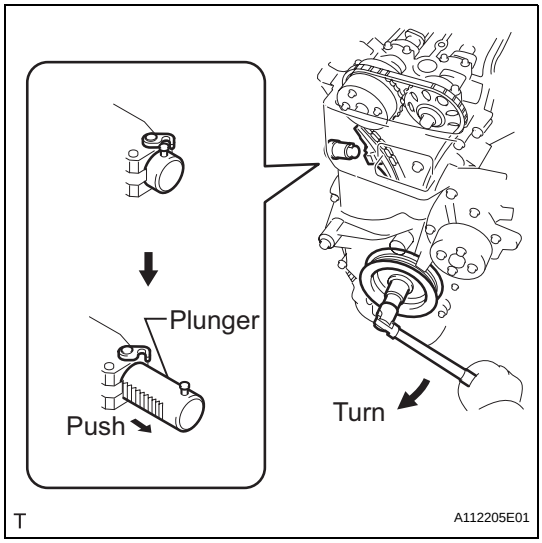


(h) Check that the paint marks on the chain are aligned with the timing marks on the camshaft timing gear and camshaft timing sprocket. Also, check that the crankshaft pulley groove is aligned with the timing mark "0" of the timing chain cover.

EM

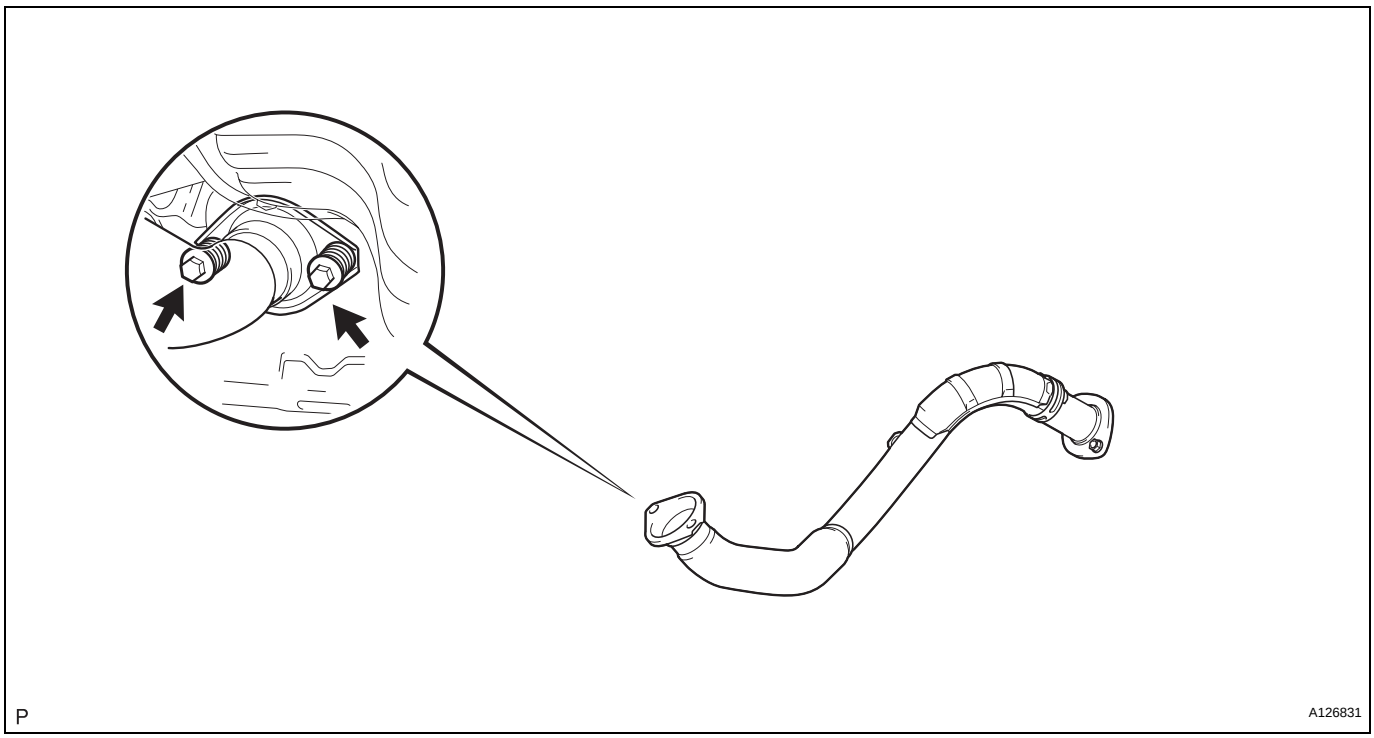


14. INSTALL NO. 1 CHAIN TENSIONER



(a) Release the ratchet pawl, then fully push in the plunger and hook the hook to the pin so that the plunger is in the position shown in the illustration.

(b) Install a new gasket and the chain tensioner with the 2 nuts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
NOTICE:
When installing the chain tensioner, set the hook again if the hook releases the plunger.



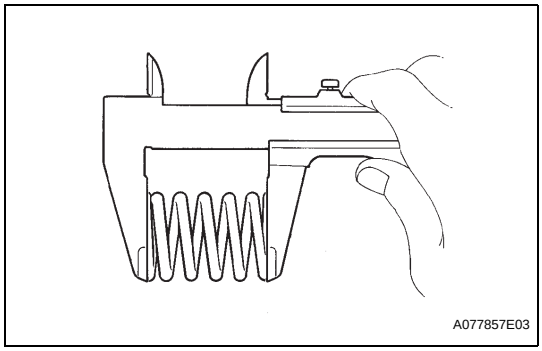
(c) Turn the crankshaft counterclockwise, then disconnect the plunger knock pin from the hook.

(d) Turn the crankshaft clockwise, then check that the plunger is extended.

15. **INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY (See page EM-40)**
16. **INSTALL SPARK PLUG**
    (a) Install the 4 spark plugs.
    Torque: 25 N*m (255 kgf*cm, 18 ft.*lbf)
17. **INSTALL IGNITION COIL ASSEMBLY (See page IG-9)**
18. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
19. **CHECK FOR ENGINE OIL LEAKS**
20. **INSTALL NO. 1 ENGINE COVER (See page EM-43)**
21. **INSTALL FRONT FENDER APRON RH**
22. **INSTALL NO. 1 ENGINE UNDER COVER**
23. **INSTALL FRONT WHEEL RH**

(b) Remove the gasket from the exhaust manifold.

INSTALLATION

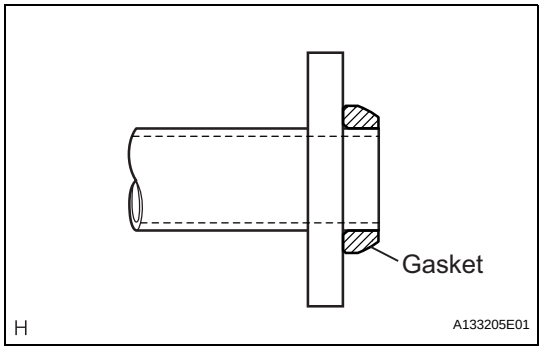


1. INSTALL FRONT EXHAUST PIPE ASSEMBLY

(a) Using a vernier caliper, measure the free length of the compression spring.

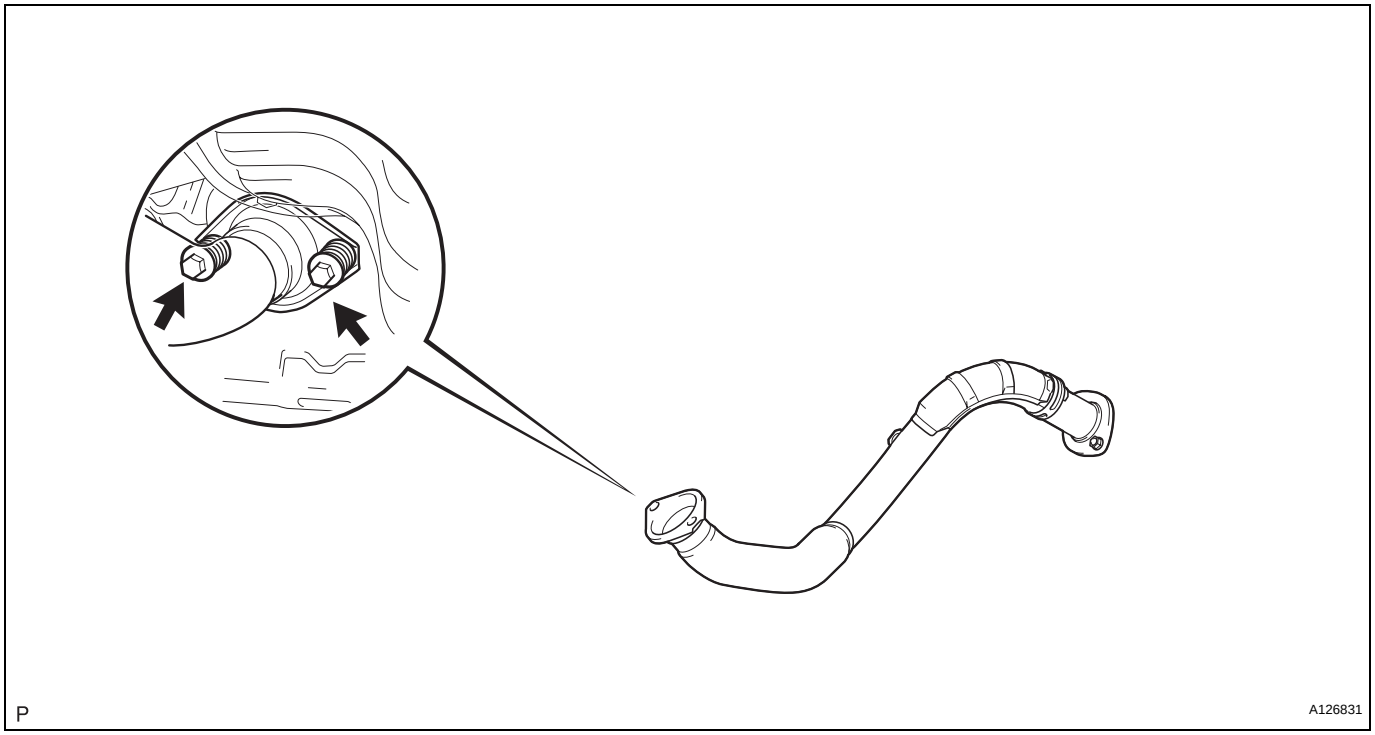
Minimum length:

41.5 mm (1.634 in.)

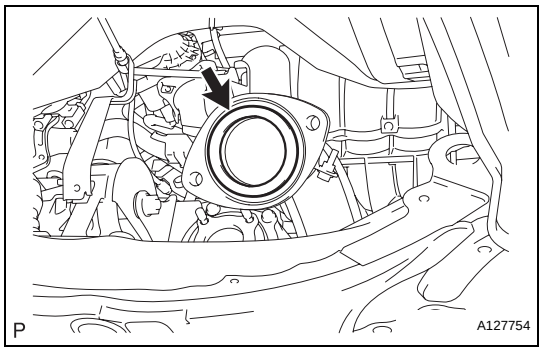


If the length is less than the minimum, replace the compression spring.

(b) Install a new gasket by hand so that its surface is flush with the exhaust manifold.



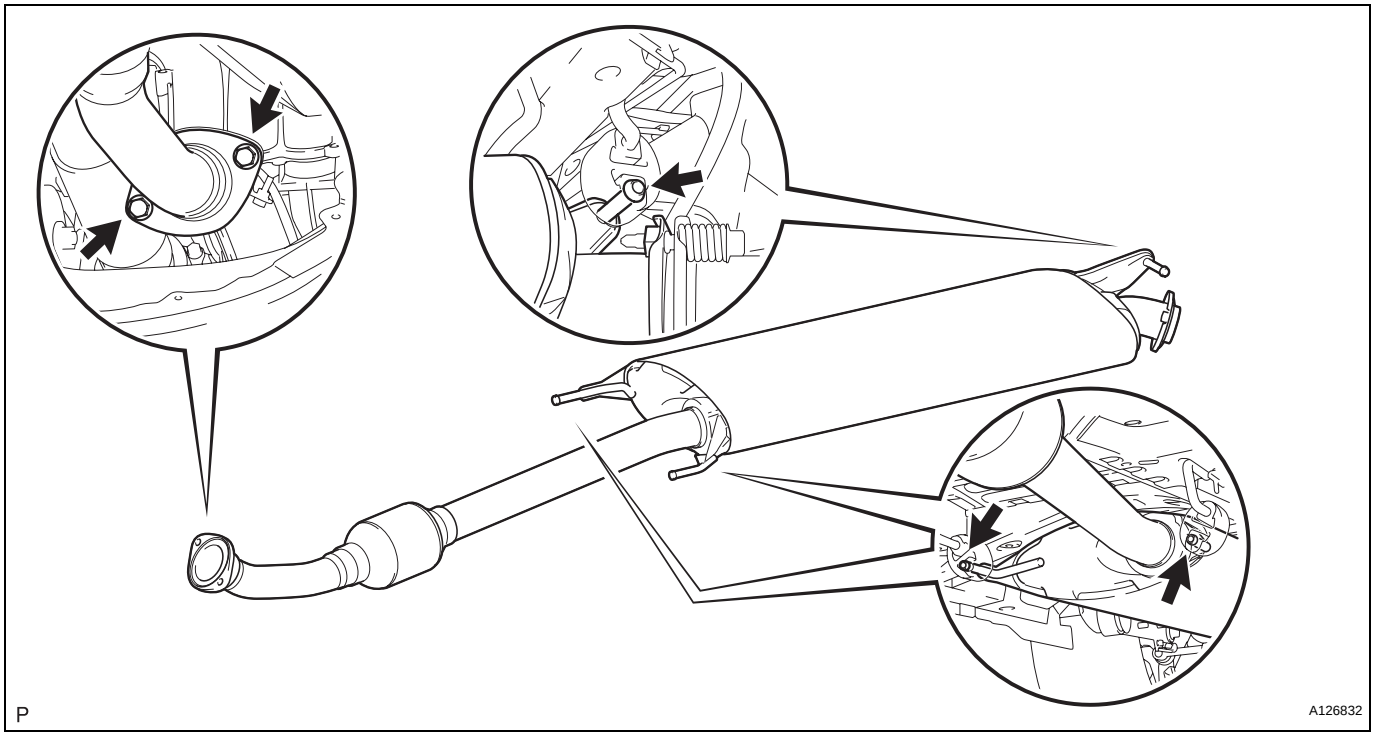
NOTICE:



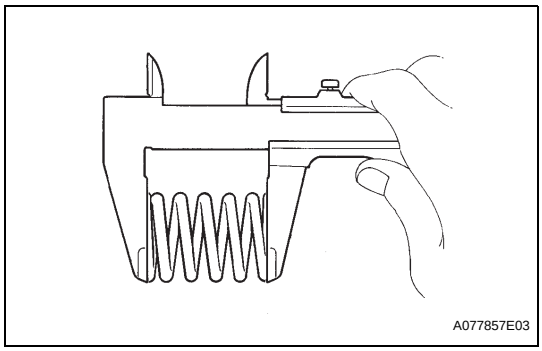
- **Make sure the gasket is facing the correct direction.**
- **Do not reuse the removed gasket.**
- **Do not push in the gasket while installing the front exhaust pipe.**

(c) Install the front exhaust pipe with the 2 compression springs and 2 bolts.

Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)



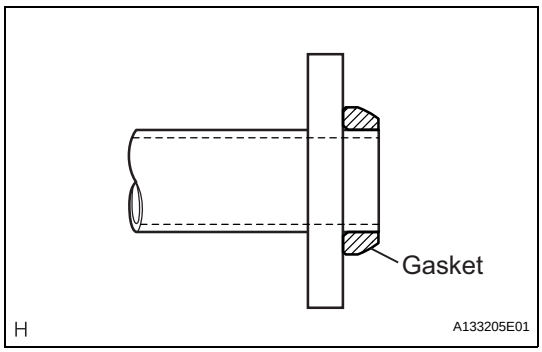
2. INSTALL CENTER EXHAUST PIPE ASSEMBLY



(a) Install a new gasket onto the front exhaust pipe.

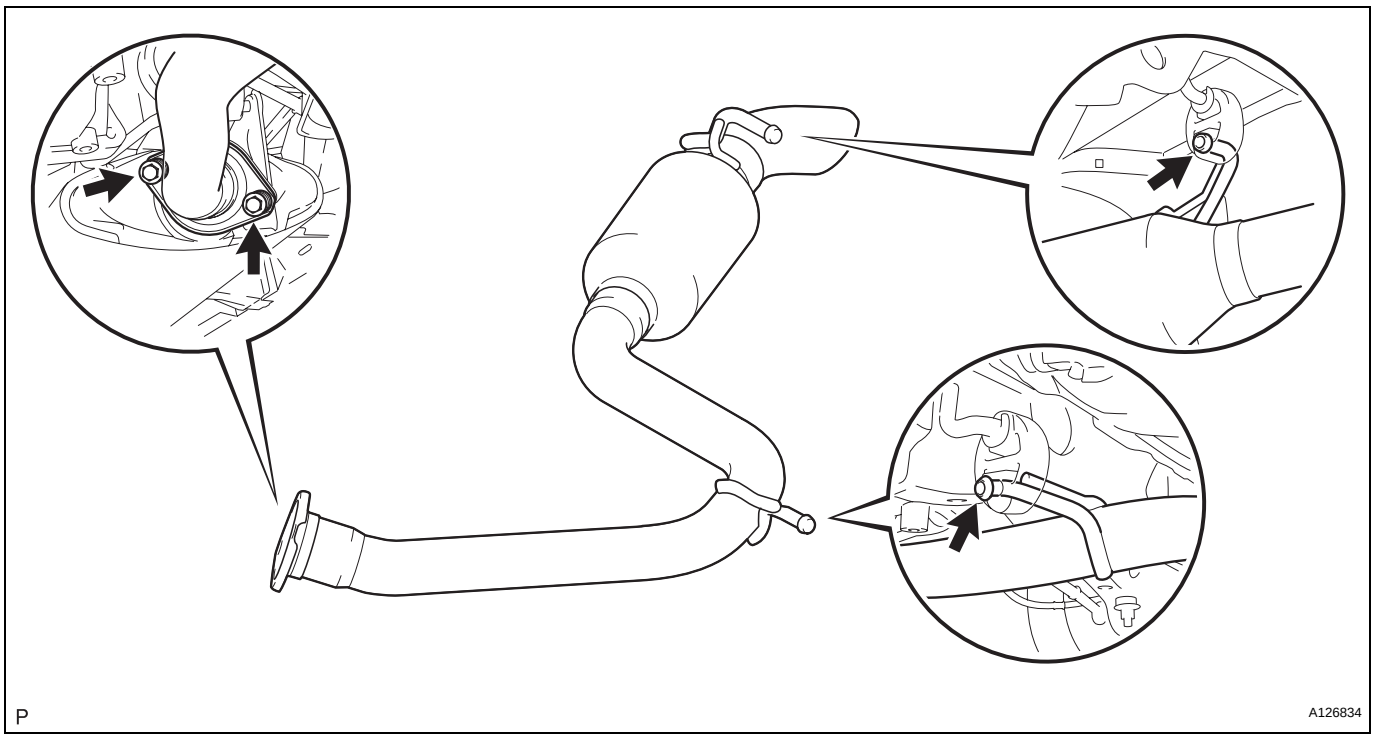
(b) Connect the 3 exhaust pipe supports, and install the center exhaust pipe.

(c) Install the 2 bolts.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)



EX

3. INSTALL TAILPIPE ASSEMBLY

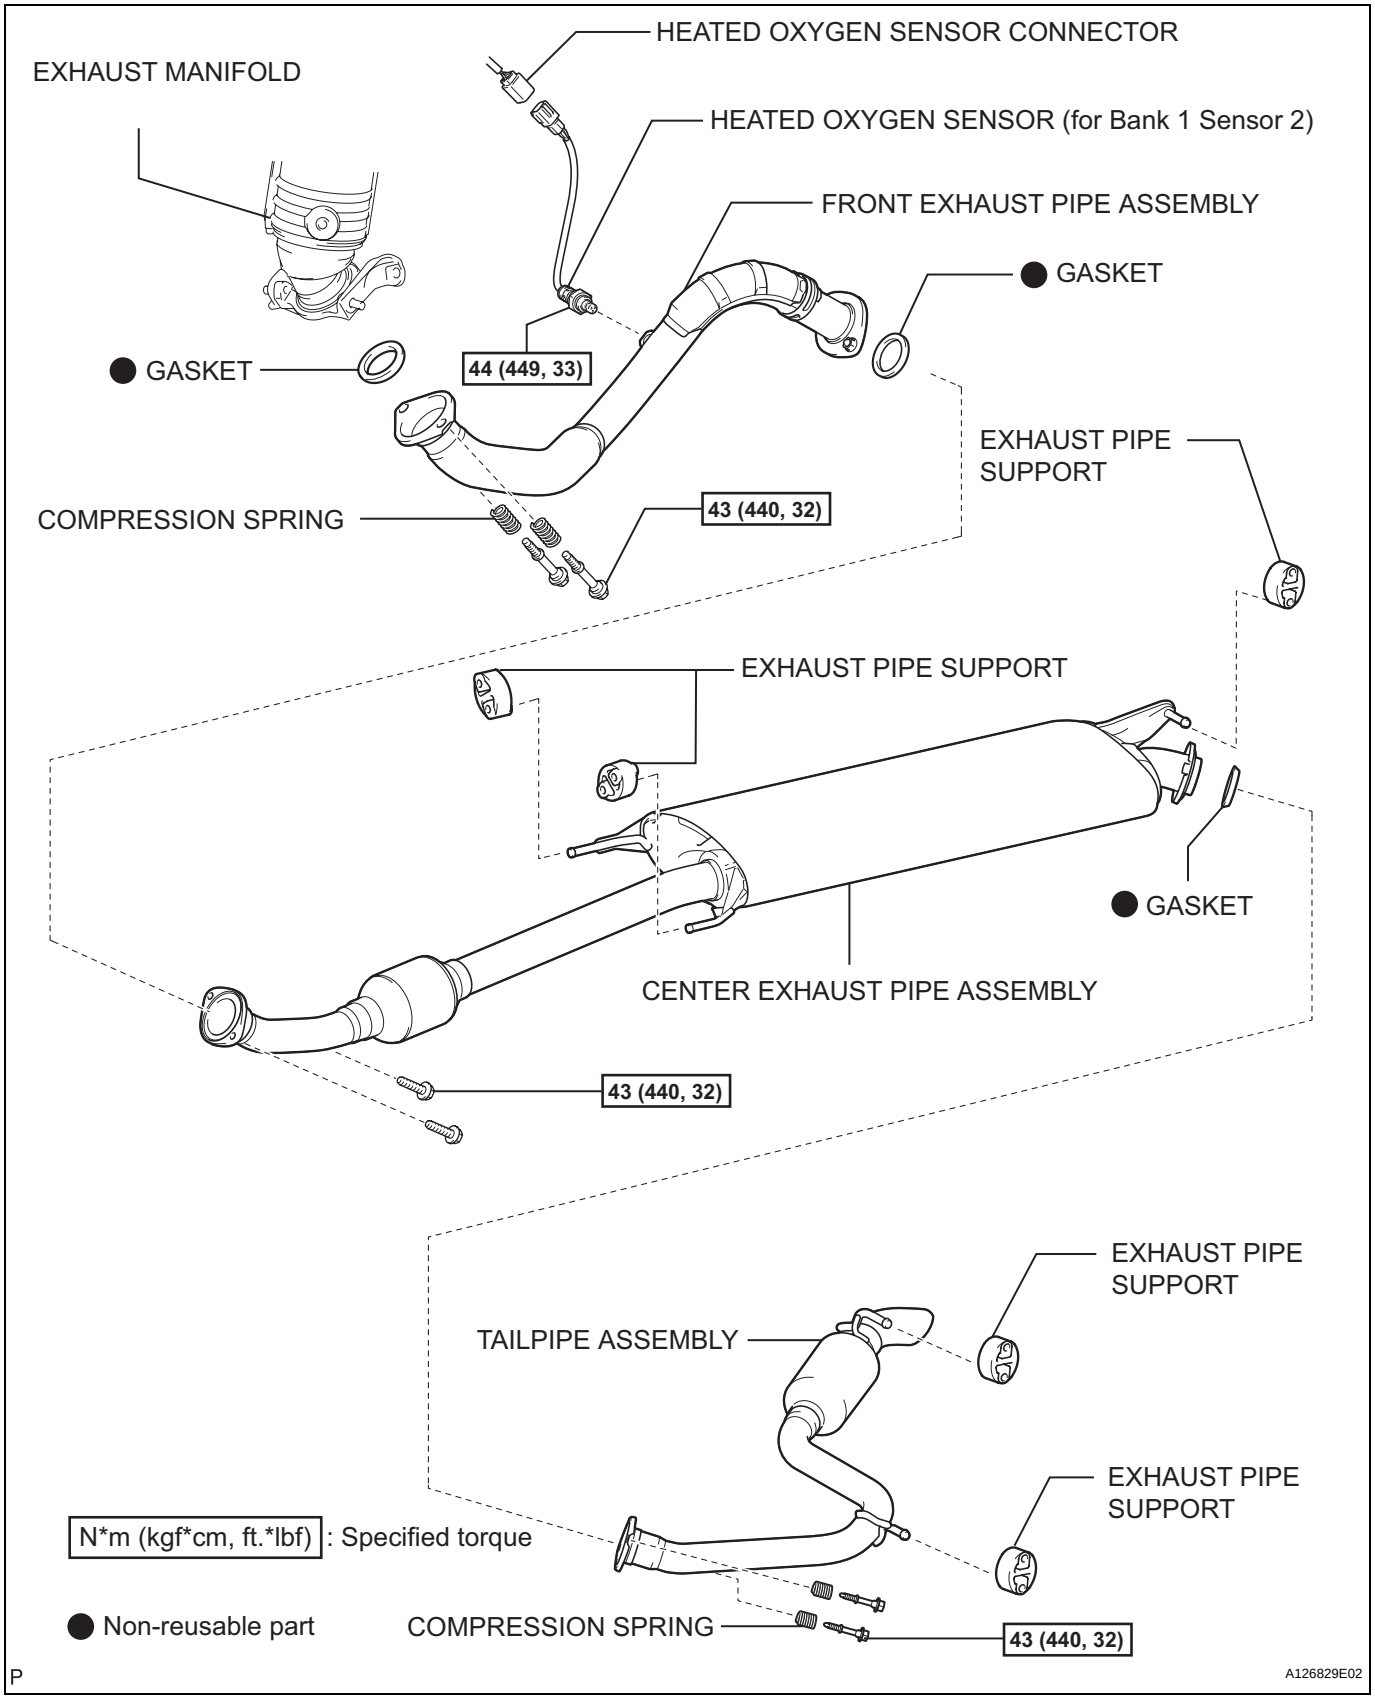


(a) Using a vernier caliper, measure the free length of the compression spring.
Minimum length:
38.5 mm (1.516 in.)
If the length is less than the minimum, replace the compression spring.

(b) Install a new gasket by hand so that its surface is flush with the center exhaust pipe.
NOTICE:
- **Make sure the gasket is facing the correct direction.**
- **Do not reuse the removed gasket.**
- **Do not push in the gasket while installing the tailpipe.**

(c) Connect the 2 exhaust pipe supports, and install the tailpipe.

(d) Install the 2 compression springs and 2 bolts.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

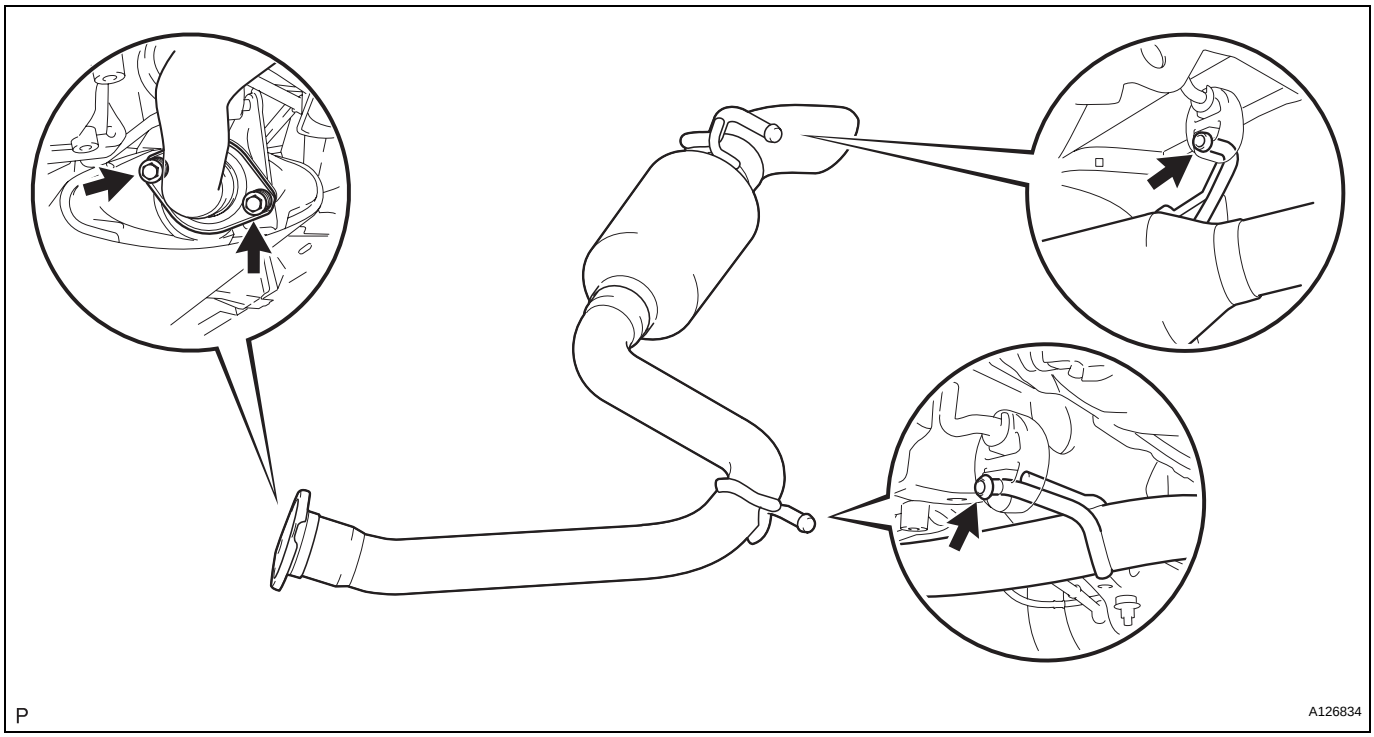


4. INSTALL HEATED OXYGEN SENSOR (for Bank 1 Sensor 2) (See page EC-24)

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

6. CHECK FOR EXHAUST GAS LEAKS
If gas is leaking, tighten the areas necessary to stop the leak. Replace damaged parts as necessary.

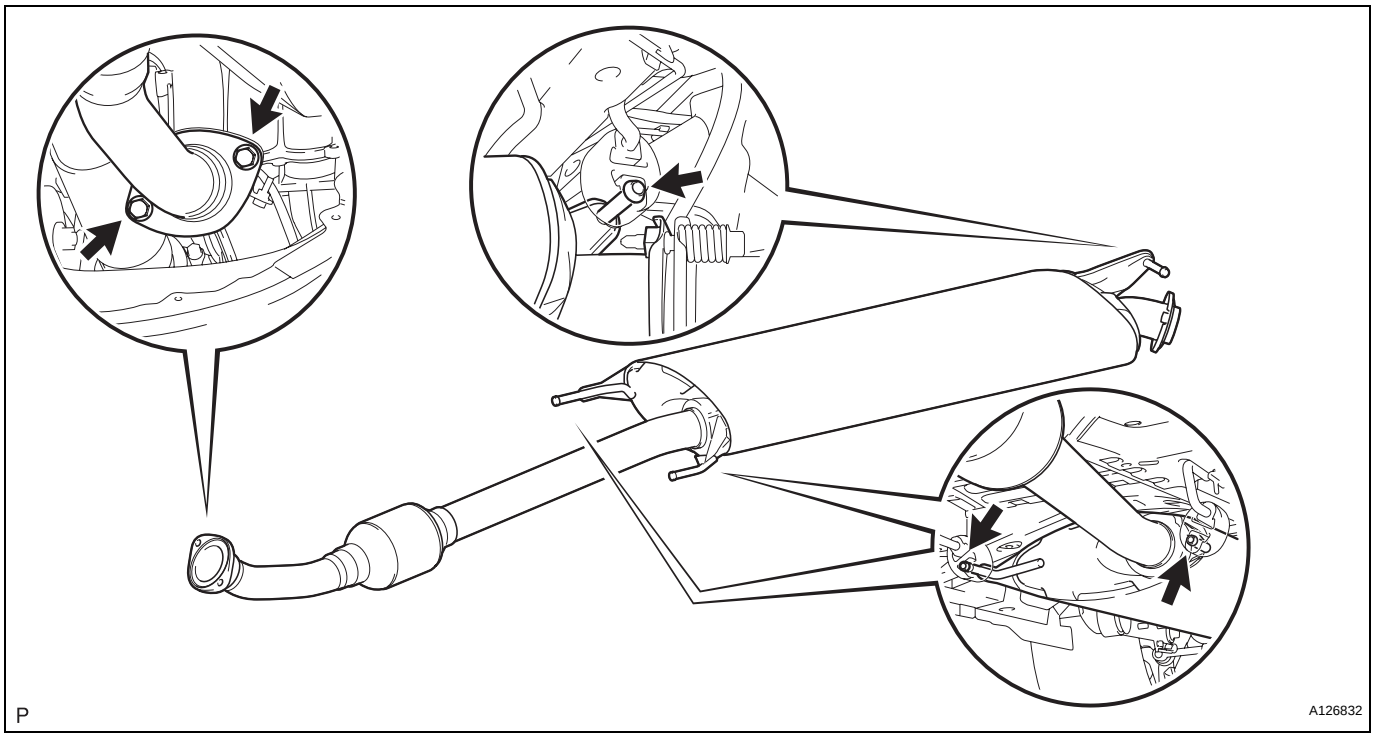
EXHAUST PIPE



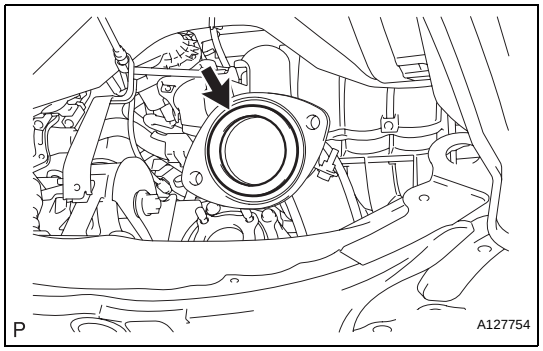
COMPONENTS

EX

REMOVAL



1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE HEATED OXYGEN SENSOR (for Bank 1 Sensor 2) (See page EC-24)**
3. **REMOVE TAILPIPE ASSEMBLY**
   (a) Remove the 2 bolts and 2 compression springs.
   (b) Disconnect the 2 exhaust pipe supports, and remove the tailpipe.
   (c) Remove the gasket from the center exhaust pipe.



4. **REMOVE CENTER EXHAUST PIPE ASSEMBLY**
   (a) Remove the 2 bolts.

EX

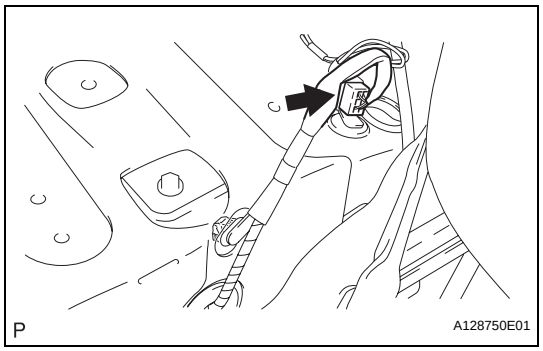
(b) Disconnect the 3 exhaust pipe supports, and remove the center exhaust pipe.

(c) Remove the gasket from the front exhaust pipe.

5. REMOVE FRONT EXHAUST PIPE ASSEMBLY

(a) Remove the 2 bolts, 2 compression springs and front exhaust pipe.

EX



REMOVAL

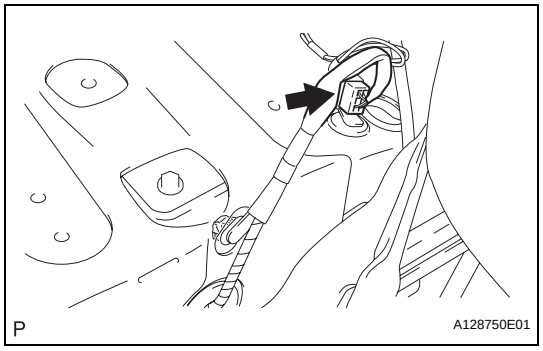
1. DISCHARGE FUEL SYSTEM PRESSURE

CAUTION:

- **DISCHARGE FUEL SYSTEM PRESSURE procedures must be performed before disconnecting any part of the fuel system.**
- **After performing the DISCHARGE FUEL SYSTEM PRESSURE procedures, pressure will remain in the fuel line. When disconnecting the fuel line, place a cloth or equivalent over fittings to reduce the risk of fuel spray.**

(a) Remove the console box (see page IR-83).

(b) Disconnect the connector.



(c) Start the engine. After the engine has stopped, turn the ignition switch off.

HINT:

DTC P0171 (system too lean) may be set.

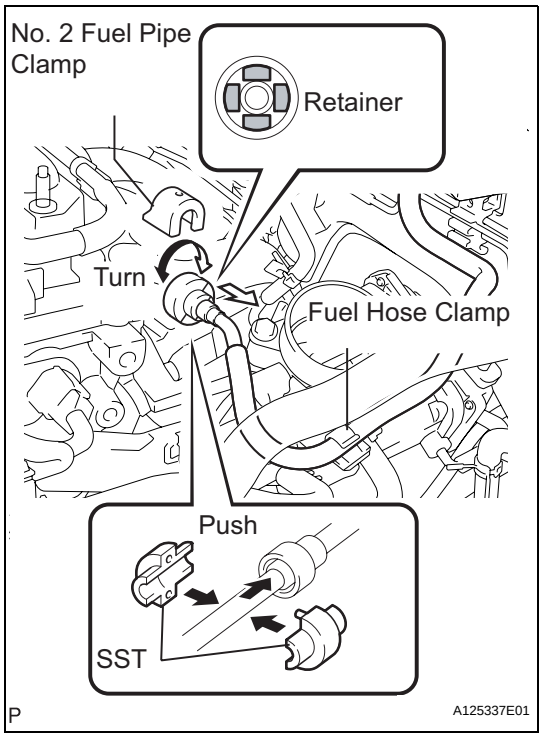
(d) Check that the engine does not start.

(e) Remove the fuel tank cap, and let the air out of the fuel tank.

(f) Connect the connector.

(g) Install the console box (see page IR-90).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL



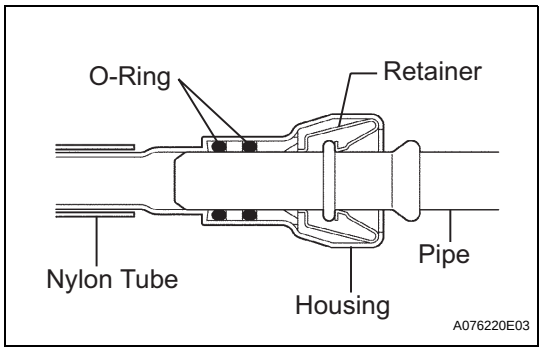
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

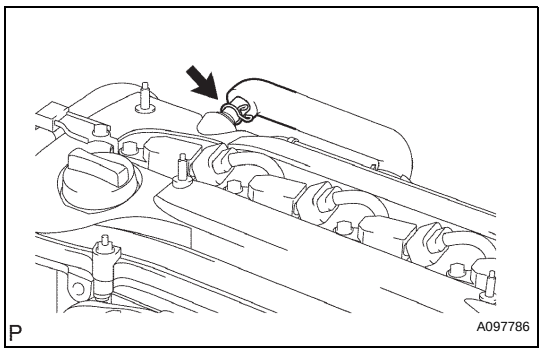
3. REMOVE NO. 1 ENGINE COVER (See page ES-410)

4. REMOVE AIR CLEANER CAP SUB-ASSEMBLY (See page ES-411)

FU



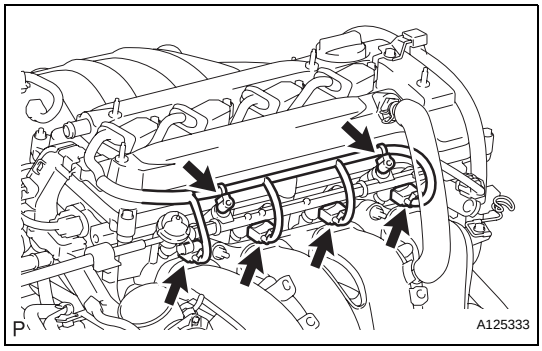
5. DISCONNECT FUEL MAIN TUBE



NOTICE:

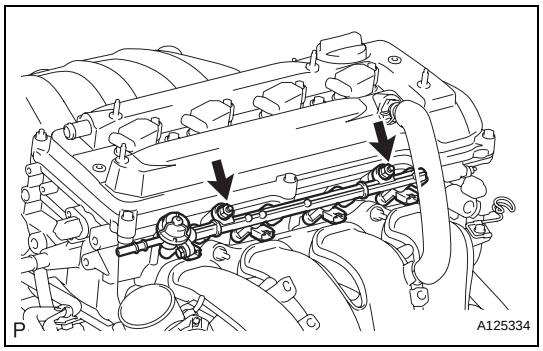
Do not forcibly bend and twist the fuel main tube.

(a) Remove the fuel tube from the fuel hose clamp.
(b) Remove the fuel pipe clamp.
(c) Wipe off any dirt on the fuel tube connector.
(d) Hold the fuel tube connector, and then install SST.
SST 09268-21010
(e) Turn SST to align the retainer inside the fuel tube connector with the chamfered part of SST.
(f) Insert SST into the fuel tube and hold it. Then push the fuel tube connector toward SST side.
(g) Mount the retainer of the fuel tube connector onto the chamfered part of SST.

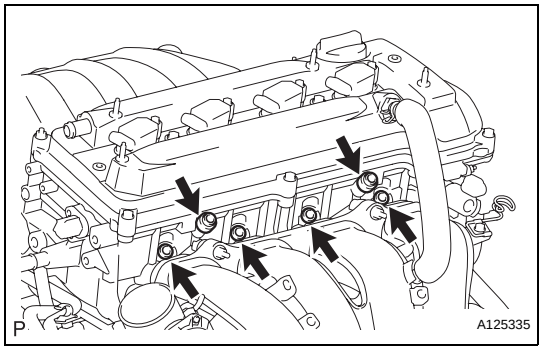


(h) Slide SST and fuel tube connector together towards the fuel tube until they make a "click" sound, and then disconnect the fuel tube.
(i) Drain the fuel remaining inside the fuel tube.
(j) Cover the fuel tube and fuel pipe with a plastic bag to protect the disconnected part.

6. DISCONNECT NO. 2 VENTILATION HOSE

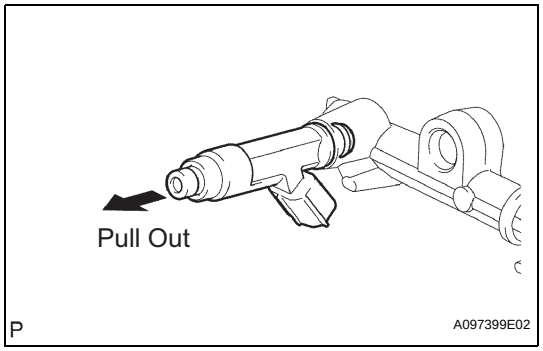


(a) Disconnect the No. 2 ventilation hose from the ventilation valve.



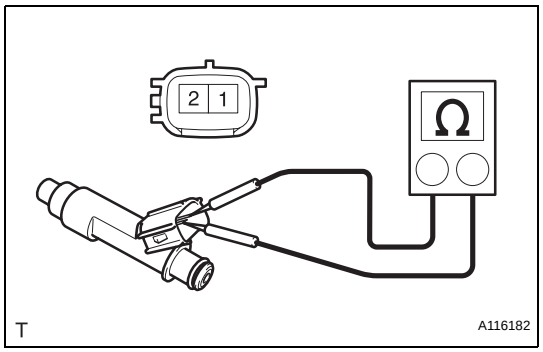
7. REMOVE FUEL DELIVERY PIPE SUB-ASSEMBLY

(a) Remove the 2 wire harness clamps.
(b) Disconnect the 4 fuel injector connectors.

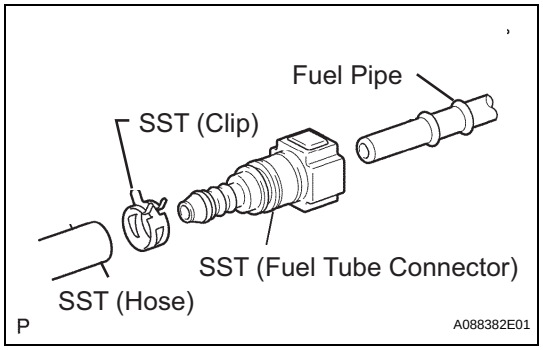


FU

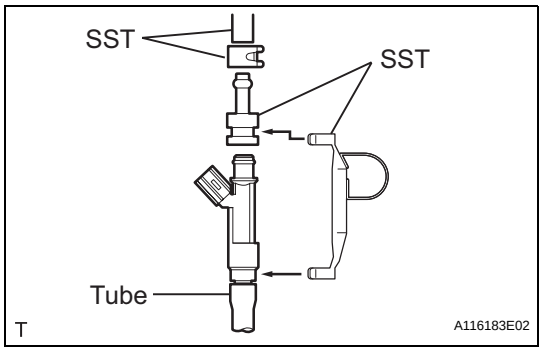
(c) Remove the 2 bolts, then remove the fuel delivery pipe together with the 4 fuel injectors.
NOTICE:
Be careful not to drop the fuel injectors when removing the fuel delivery pipe.



(d) Remove the 2 delivery pipe spacers from the cylinder head.
(e) Remove the 4 insulators from the cylinder head.



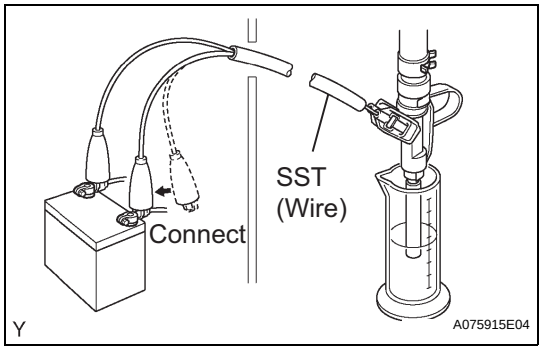
8. REMOVE FUEL INJECTOR ASSEMBLY
(a) Pull the 4 fuel injectors out of the fuel delivery pipe.

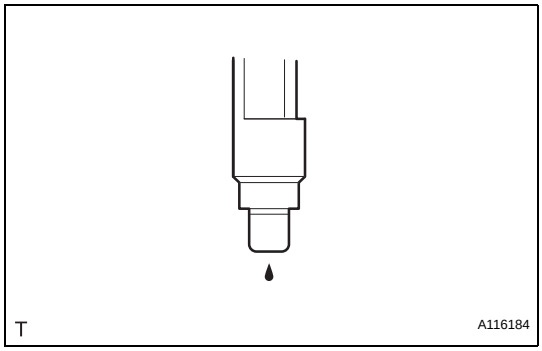


INSPECTION

1. INSPECT FUEL INJECTOR ASSEMBLY
(a) Measure the resistance between the injector terminals.
Standard resistance:
11.6 to 12.4 Ω at 20°C (68°F)
If the result is not as specified, replace the injector.
(b) Inspect the injector injection.
CAUTION:
Keep the injector away from sparks during the test.

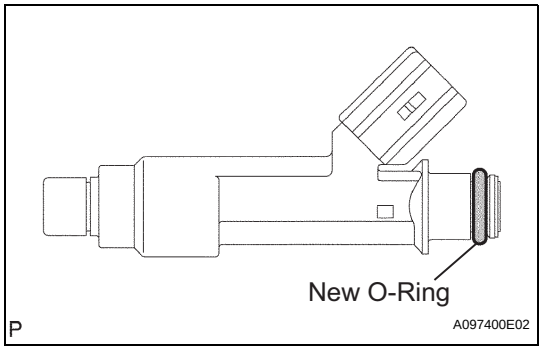
(1) Connect SST (fuel tube connector) to SST (hose), then connect them to the fuel pipe (vehicle side).
SST 09268-31011 (09268-41500, 90467-13001, 95336-08070)
(2) Install the O-ring to the fuel injector.





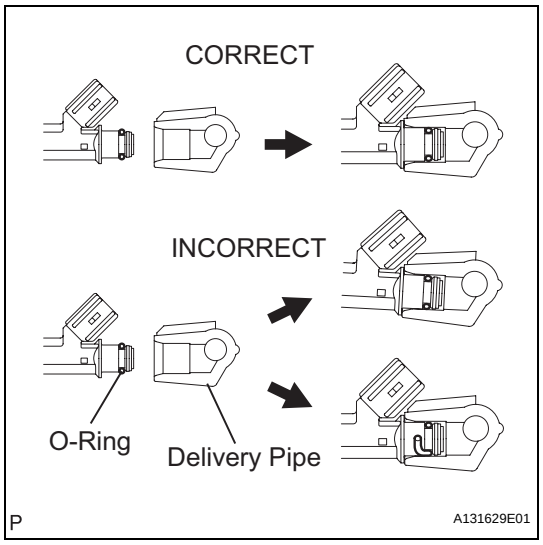
(3) Connect SST (adapter and hose) to the injector, and hold the injector and union with SST (clamp).
SST 09268-31011 (09268-41110, 09268-41130, 09268-41310)

(4) Put the injector into the graduated cylinder.
CAUTION:
Install a suitable vinyl tube onto the injector to contain gasoline spray.

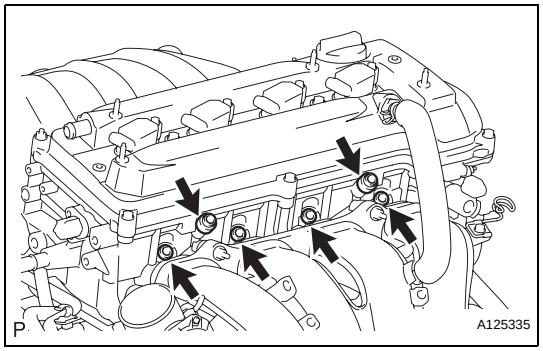


(5) Operate the fuel pump.

(6) Connect SST (wire) to the injector and the battery for 15 seconds, and measure the injection volume with the graduated cylinder. Test each injector 2 or 3 times.
SST 09842-30080
Standard injection volume:
76 to 92 cm^3 (4.6 to 5.6 cu in.) per 15 seconds
Standard difference between each injector:
16 cm^3 (1.0 cu in.) or less



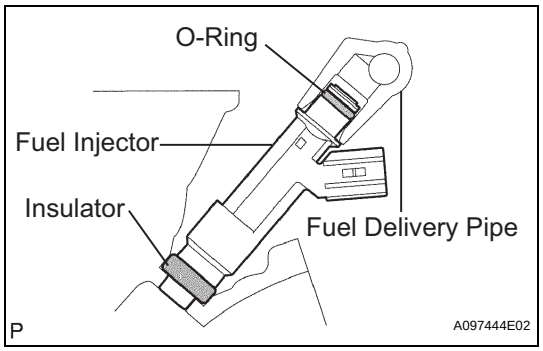
(c) Inspect the fuel leakage.
(1) Disconnect the SST (wire) tester probes from the battery and check the fuel leakage from the injector.
Standard fuel drop:
1 drop or less per 12 minutes
(2) Turn the ignition switch OFF.
(3) Disconnect the cable from the negative (-) battery terminal.
(4) Remove SST.
SST 09842-30080
(5) Disconnect the intelligent tester from the DLC3.
(6) Reconnect the fuel inlet hose (rear fuel pipe) to the fuel main tube.



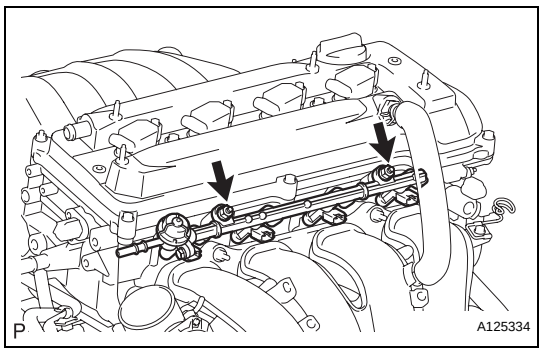
INSTALLATION

1. INSTALL FUEL INJECTOR ASSEMBLY

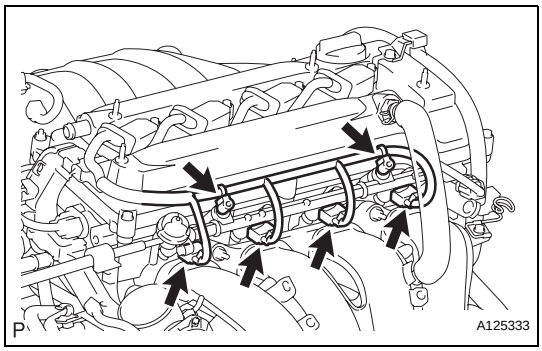
(a) Apply a light coat of gasoline or spindle oil to new O-rings, then install one onto each fuel injector.



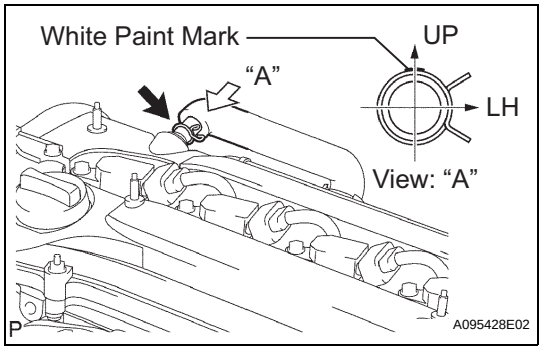
(b) Apply a light coat of gasoline or spindle oil to the part of the fuel delivery pipe which comes into contact with the O-ring of the fuel injector.
(c) Apply a light coat of gasoline or spindle oil to the O-ring again, then install the right and left fuel injectors onto the fuel delivery pipe.
NOTICE:
Make sure that the O-ring is not cracked or jammed when installing.
(d) Check that the fuel injector rotates smoothly. If the fuel injector does not rotate, replace the O-ring.



2. INSTALL FUEL DELIVERY PIPE SUB-ASSEMBLY
(a) Install 4 new insulators into the cylinder head.
(b) Install the 2 delivery pipe spacers onto the cylinder head.



FU



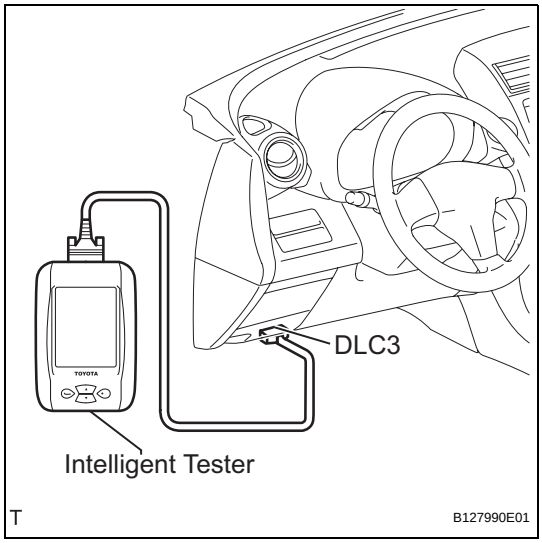
(c) Install the fuel delivery pipe together with the 4 fuel injectors, then temporarily tighten the 2 bolts.
NOTICE:
Be careful not to drop the fuel injectors when installing the fuel delivery pipe.
(d) Check that the fuel injector rotates smoothly.
If the fuel injector does not rotate, replace the O-ring.

(e) Tighten the 2 bolts to the specified torque.
Torque: 20 N*m (205 kgf*cm, 15 ft.*lbf)

(f) Connect the 4 fuel injector connectors.
(g) Install the 2 wire harness clamps.

3. CONNECT NO. 2 VENTILATION HOSE

(a) Connect the ventilation hose to the ventilation valve.
NOTICE:
Make sure that the paint mark and hose clamp are at the correct angle when installing the hose.



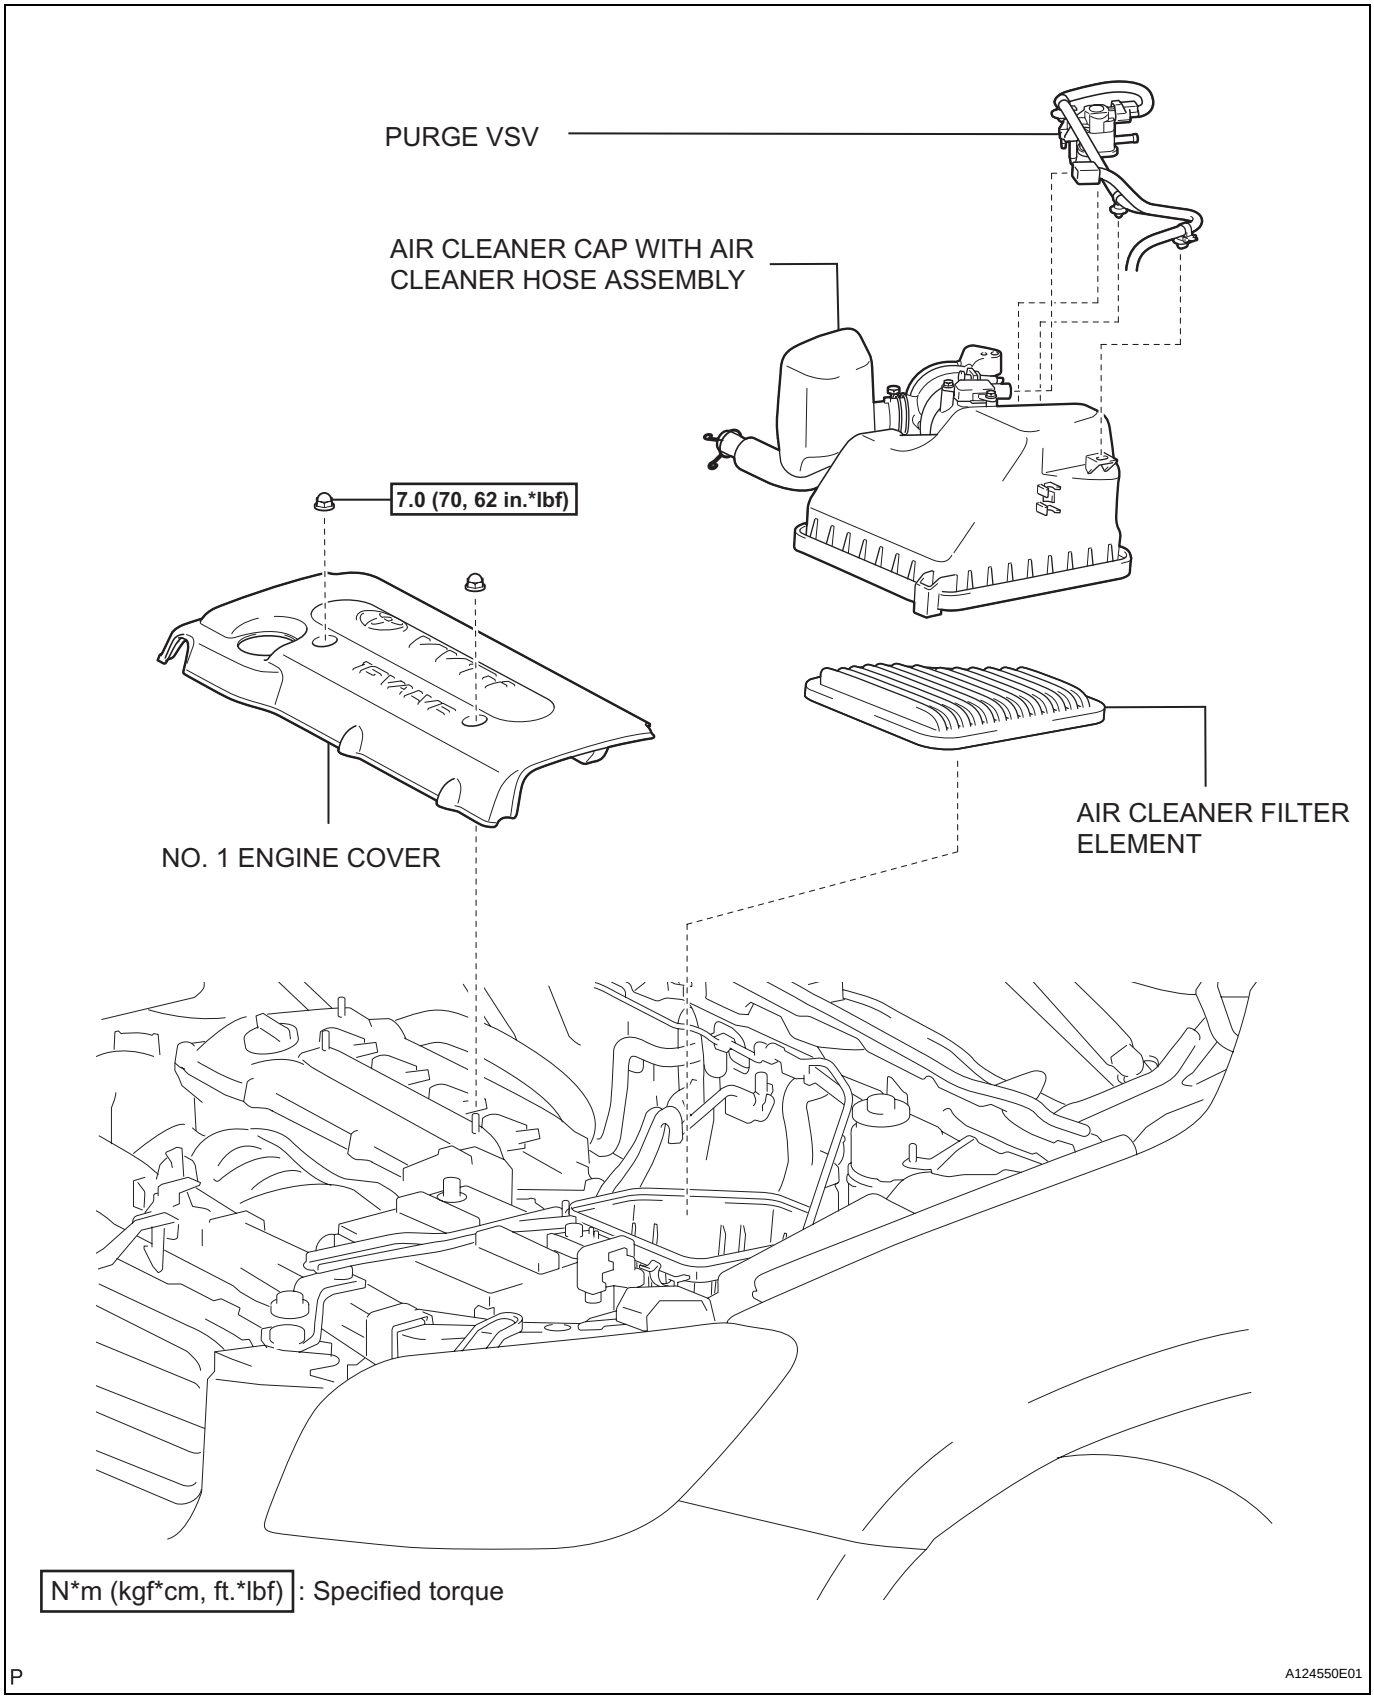
4. CONNECT FUEL MAIN TUBE

(a) Connect the fuel main tube.
(b) Push the fuel tube connector until it makes a "click" sound.
(c) Install the fuel pipe clamp.
(d) Install the fuel tube to the fuel hose clamp.

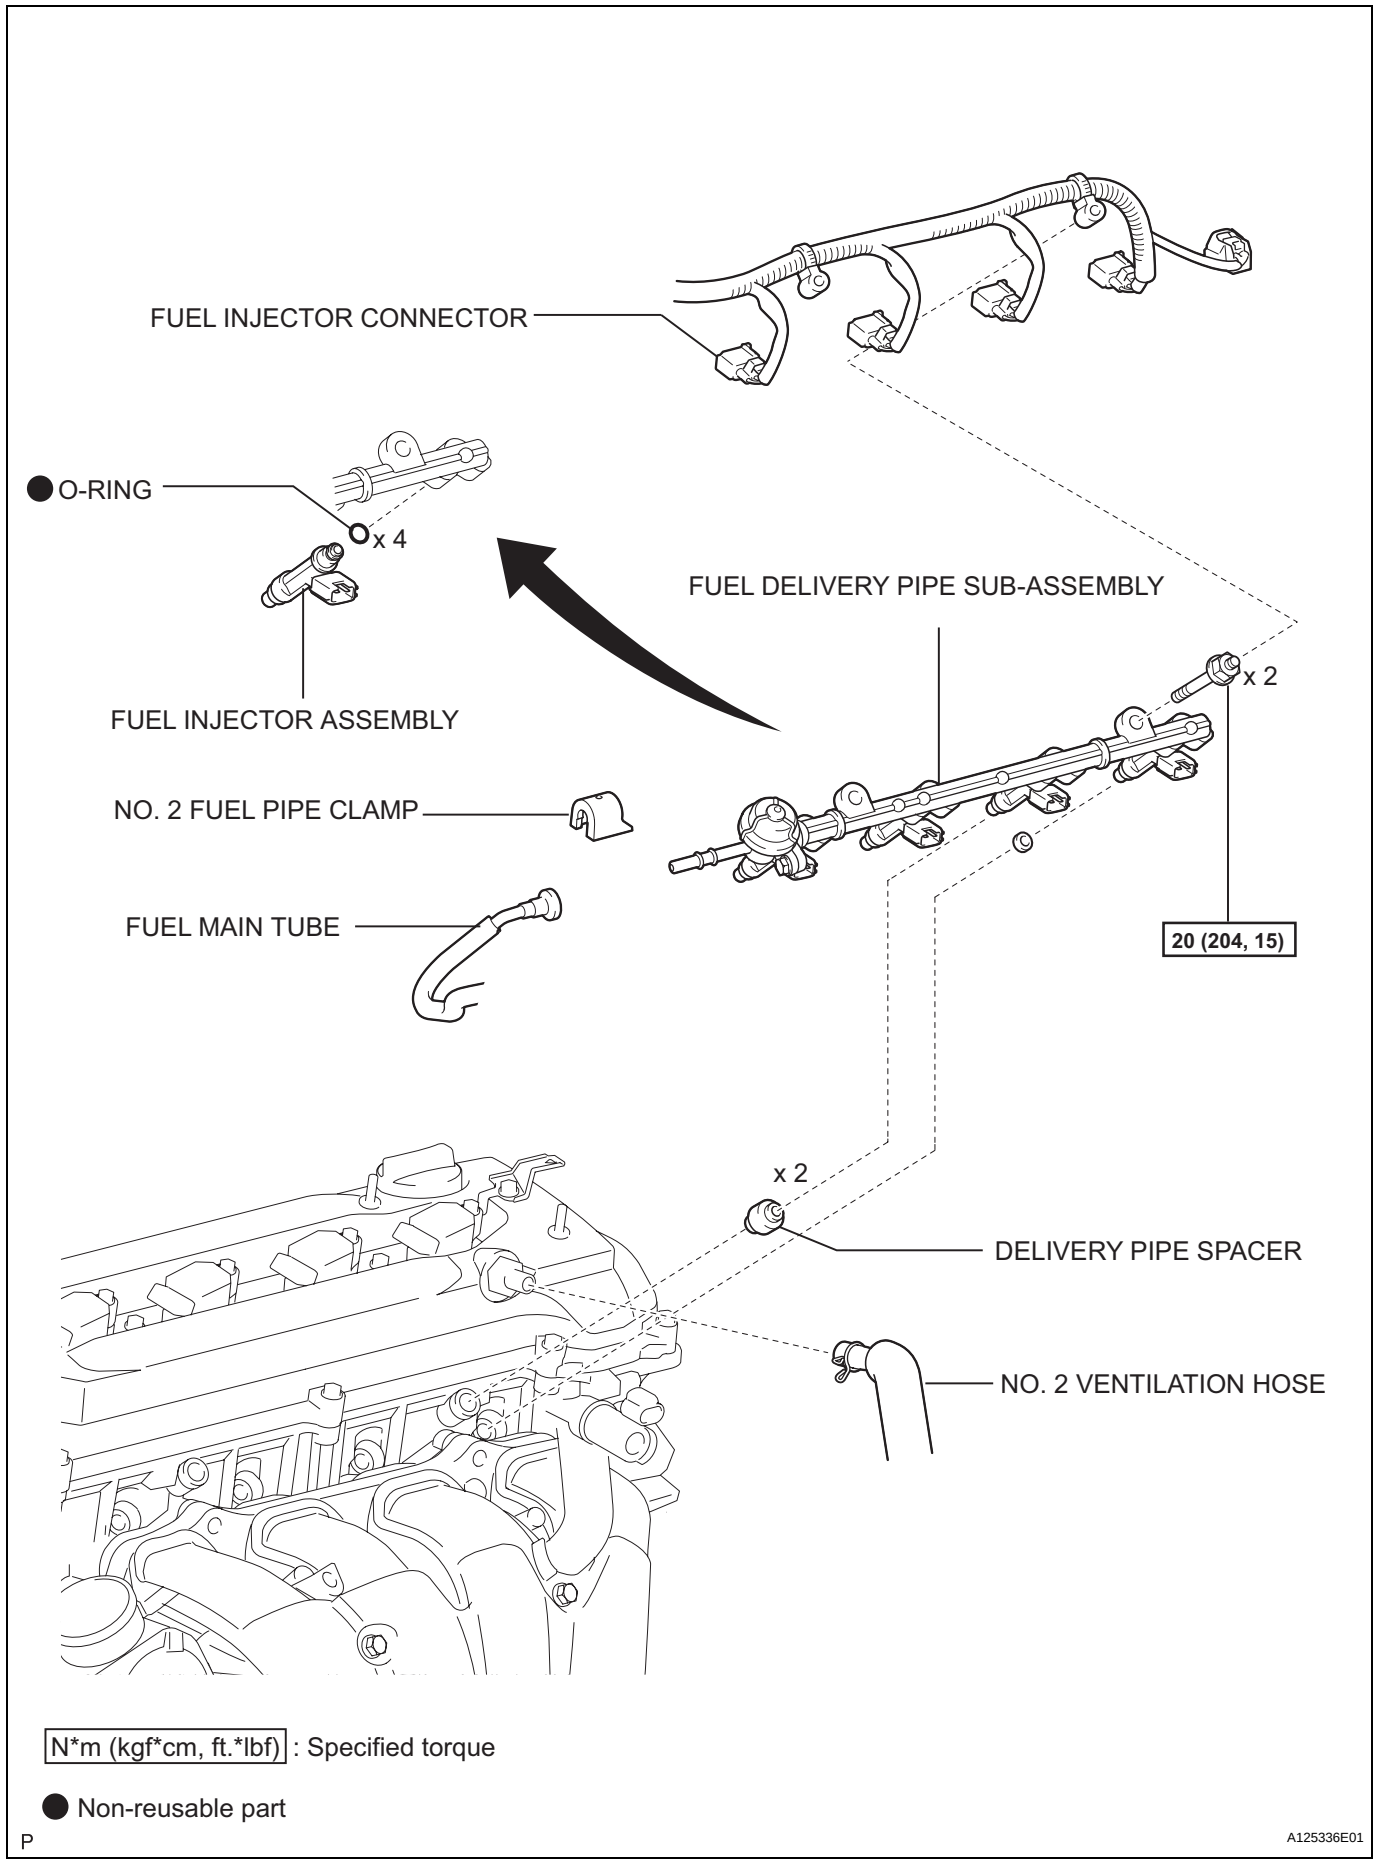
5. INSTALL AIR CLEANER CAP SUB-ASSEMBLY (See page ES-413)

6. INSTALL NO. 1 ENGINE COVER (See page ES-414)

7. CONNECT CABLE TO BATTERY NEGATIVE TERMINAL



8. CHECK FOR FUEL LEAKAGE



(a) Make sure that there are no fuel leaks after performing maintenance on the fuel system.
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON, and push the intelligent tester main switch ON.
NOTICE:
Do not start the engine.
(3) Select the Active Test mode on the intelligent tester.
HINT:
Refer to the intelligent tester operator's manual for further details.
(4) Check that there are no leaks from the fuel system.
(5) Turn the ignition switch OFF.
(6) Disconnect the intelligent tester from the DLC3.

FUEL INJECTOR

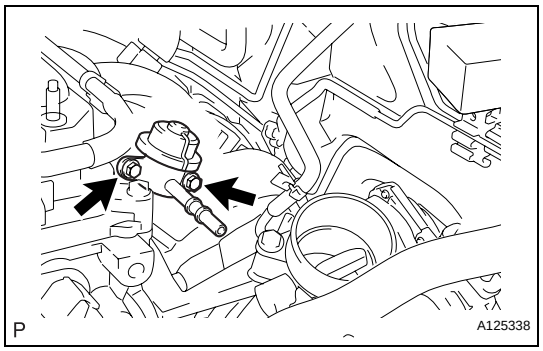
REMOVAL

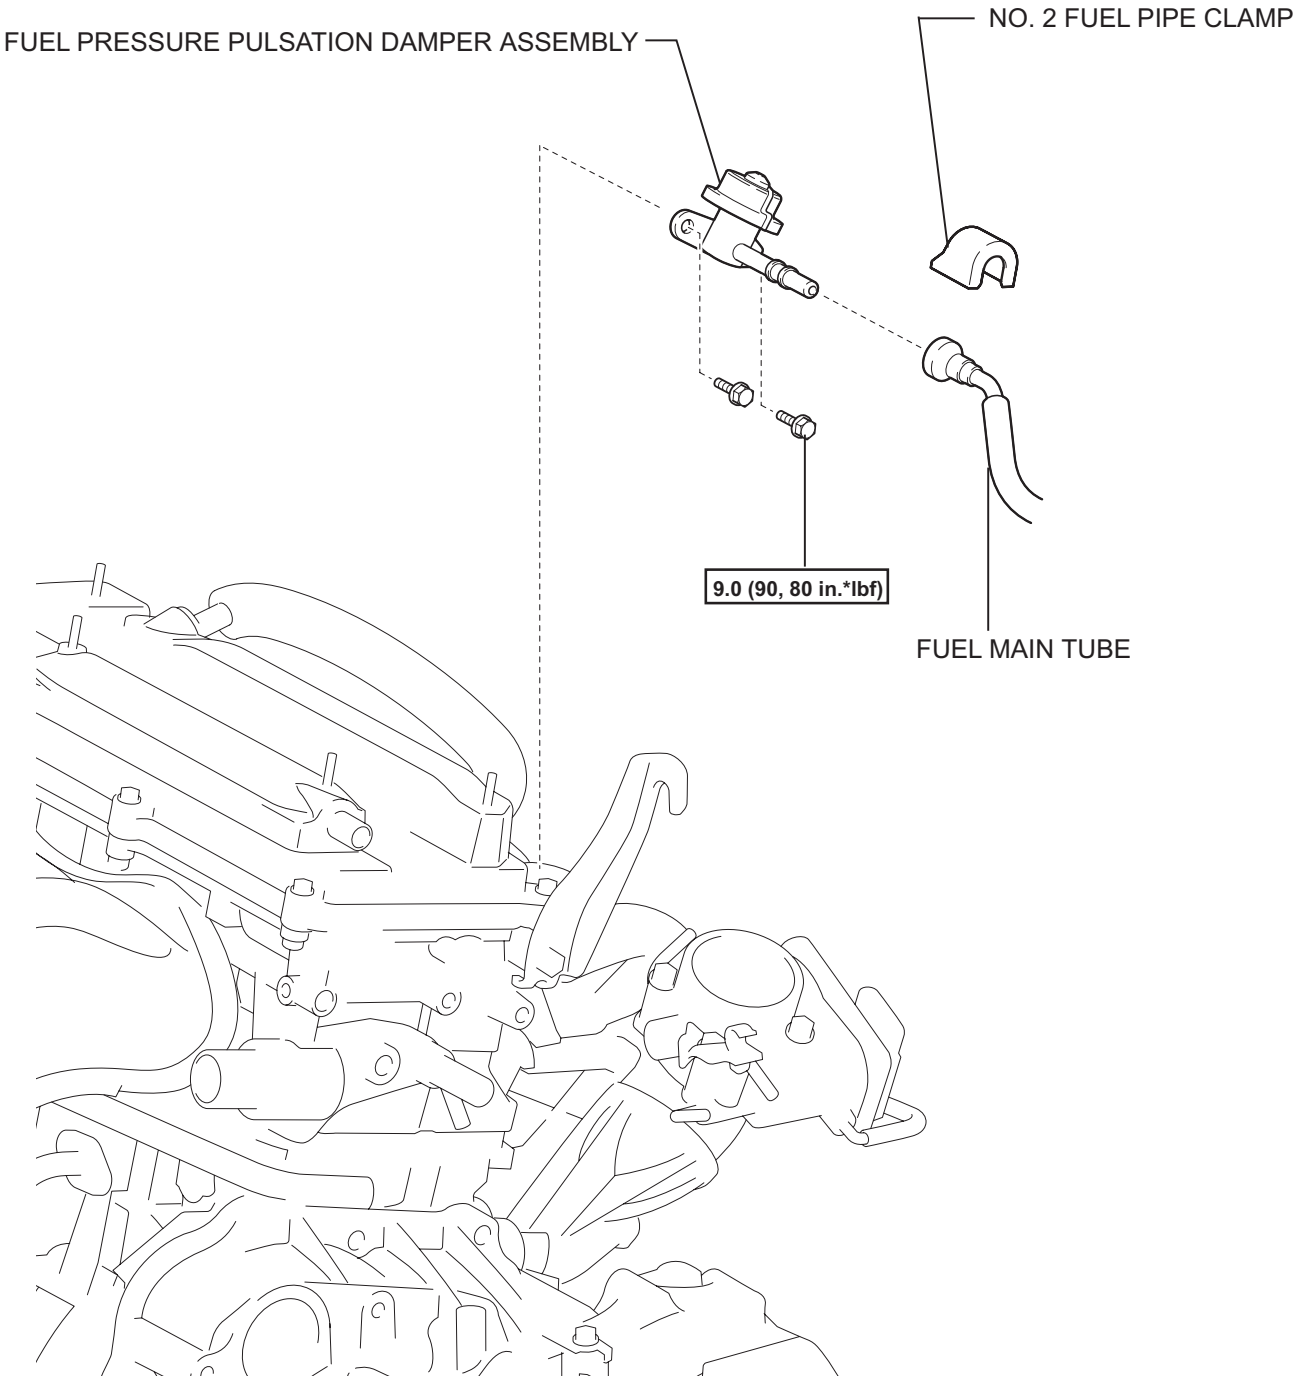
1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
3. **REMOVE NO. 1 ENGINE COVER (See page ES-410)**
4. **REMOVE AIR CLEANER CAP SUB-ASSEMBLY (See page ES-411)**
5. **DISCONNECT FUEL MAIN TUBE (See page FU-10)**
6. **REMOVE FUEL PRESSURE PULSATION DAMPER ASSEMBLY**
   (a) Remove the 2 bolts and fuel pressure pulsation damper.



INSTALLATION

1. **INSTALL FUEL PRESSURE PULSATION DAMPER ASSEMBLY**
   (a) Apply a light coat of gasoline or spindle oil to the O-ring of the fuel pressure pulsation damper.

   (b) Install the fuel pressure pulsation damper with the 2 bolts.
   Torque: 9.0 N*m (90 kgf*cm, 80 in.*lbf)
   NOTICE:
   Make sure that the O-ring is not cracked or jammed when installing.



2. **INSTALL FUEL MAIN TUBE (See page FU-14)**
3. **INSTALL AIR CLEANER CAP SUB-ASSEMBLY (See page ES-413)**
4. **INSTALL NO. 1 ENGINE COVER (See page ES-414)**
5. **CONNECT CABLE TO BATTERY NEGATIVE TERMINAL**
6. **CHECK FOR FUEL LEAKS (See page FU-14)**

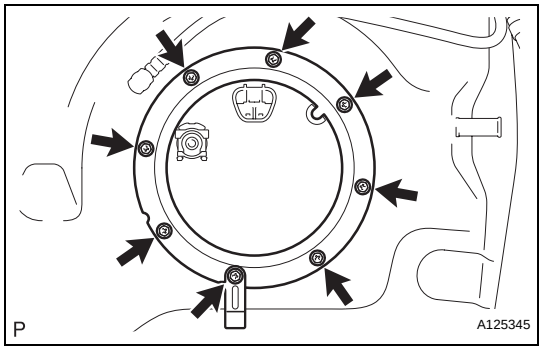
REMOVAL

1. REMOVE FUEL TANK ASSEMBLY

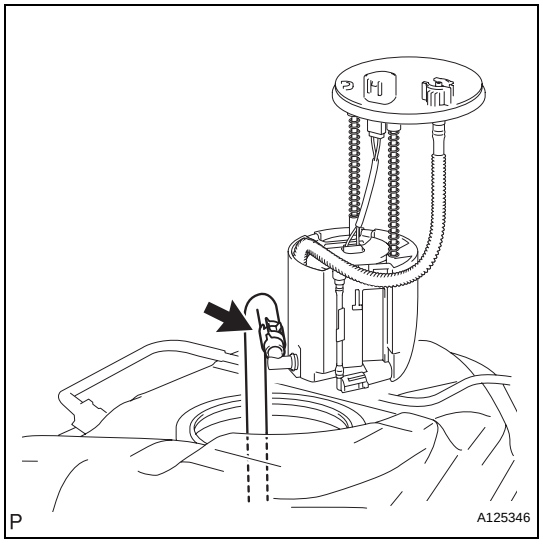
(a) Remove the fuel tank (see page FU-39).



2. REMOVE FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Remove the joint clip and fuel tank main tube.

CAUTION:

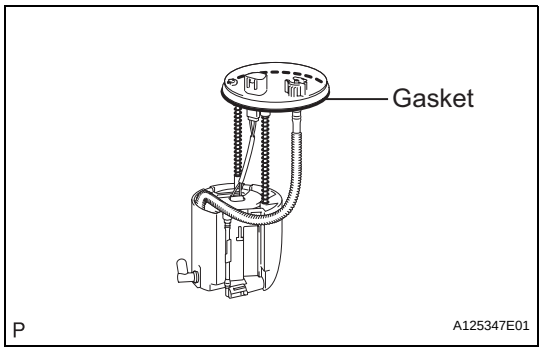


- **Before removing the tube joint clip, check for foreign matter around the clip. Clean if necessary.**
- **Keep the O-ring free of foreign matter, as it becomes contaminated easily.**
- **Do not use any tools in this procedure.**
- **Do not forcefully bend or twist the tube.**
- **Put the tube in a plastic bag to prevent damage and contamination.**
- **If the fuel suction plate and tube are stuck together, pinch the tube and turn it carefully to disconnect it.**
- **Be careful not to damage the clip. If the clip is damaged, replace it.**

FU

3. REMOVE FUEL TANK VENT TUBE SET PLATE

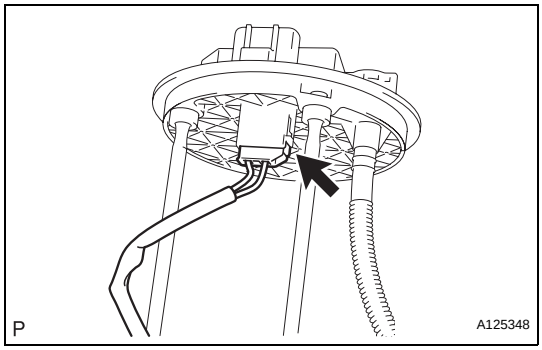
(a) Remove the 8 bolts and set plate.



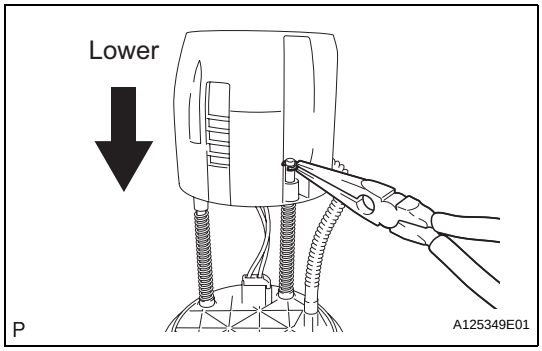
4. REMOVE FUEL SUCTION WITH PUMP ASSEMBLY

(a) Disconnect the fuel hose and remove the fuel pump from the fuel tank.

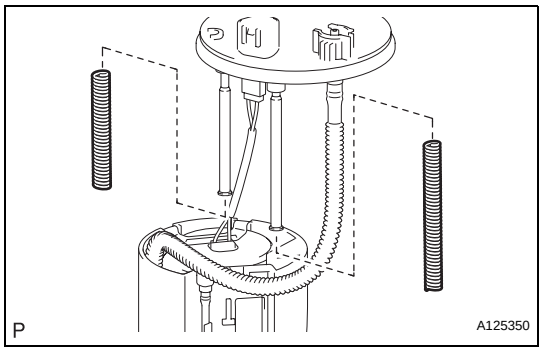
NOTICE:



Do not damage the fuel pump.

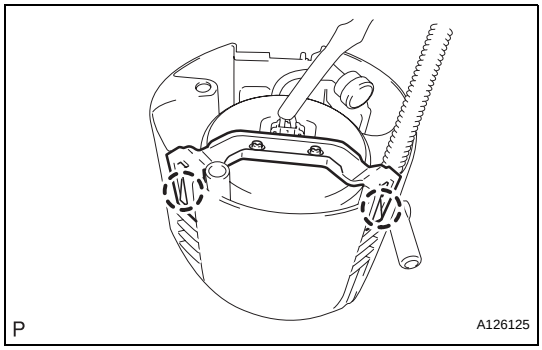


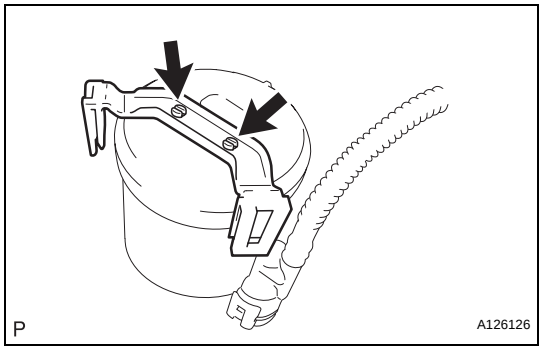
(b) Remove the gasket from the fuel pump.



5. REMOVE FUEL SUB-TANK ASSEMBLY

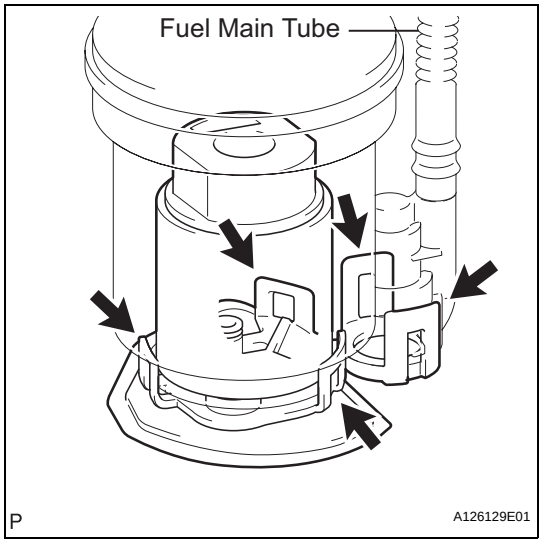
(a) Disconnect the wire harness.



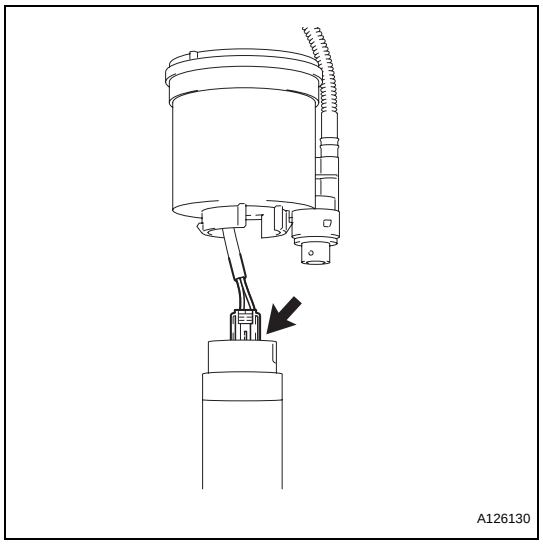


(b) Using needle nose pliers, remove the E-ring.
HINT:
Slightly lower the sub-tank to remove the E-ring.

(c) Remove the 2 springs from the 2 shaft.

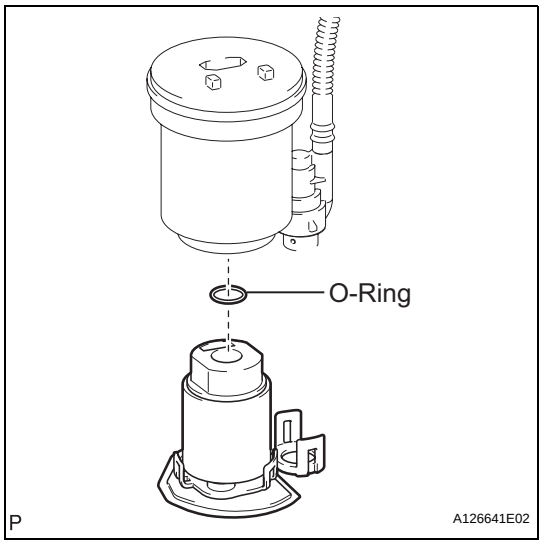


(d) Detach the 2 claws and remove the sub-tank.



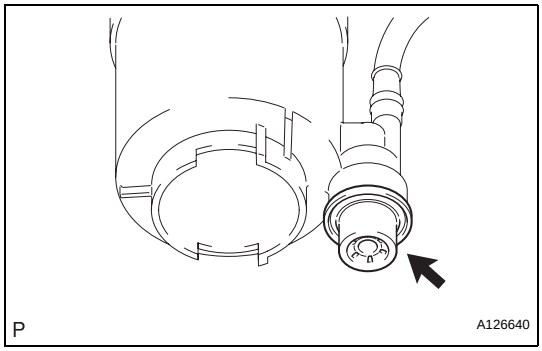
6. REMOVE BRACKET

(a) Using a screwdriver, detach the 2 claws and remove the bracket.
HINT:
Tape the screwdriver tip before use.



7. REMOVE FUEL PUMP ASSEMBLY

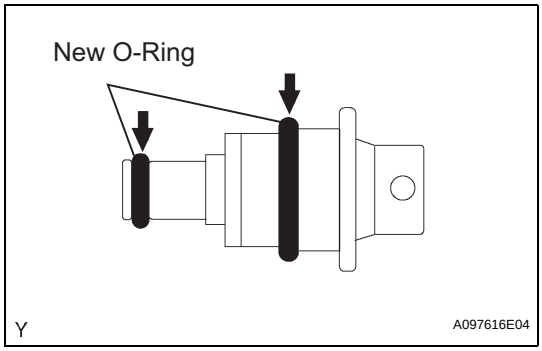
(a) Detach the 5 claws on the filter and remove the fuel pump from the fuel filter.
HINT:
When removing the claw, do not disconnect the fuel main tube.



(b) Disconnect the fuel pump connector.

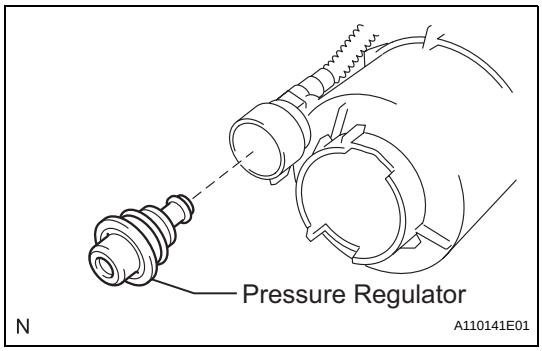
FU

(c) Remove the O-ring from the fuel filter.



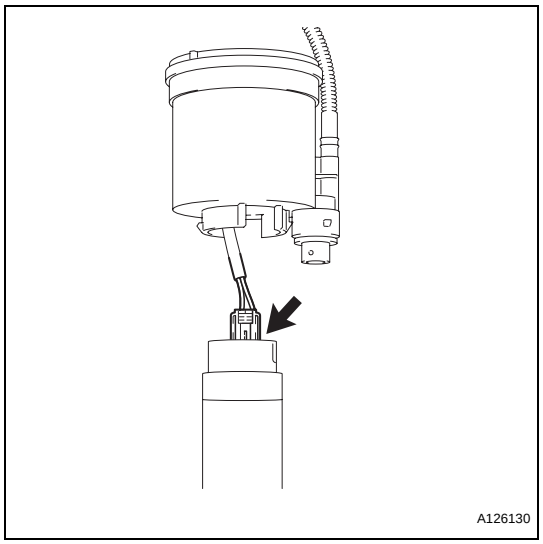
8. REMOVE FUEL PRESSURE REGULATOR ASSEMBLY

(a) Remove the fuel pressure regulator from the fuel filter.



(b) Remove the 2 O-rings.

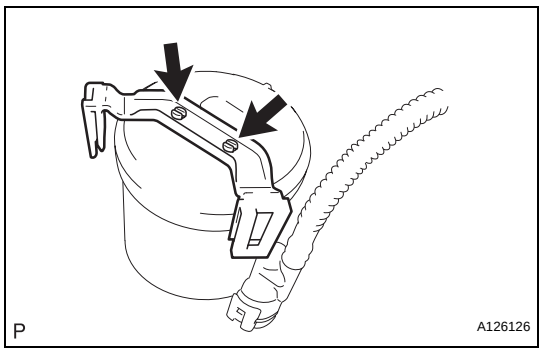
INSTALLATION



1. INSTALL FUEL PRESSURE REGULATOR ASSEMBLY

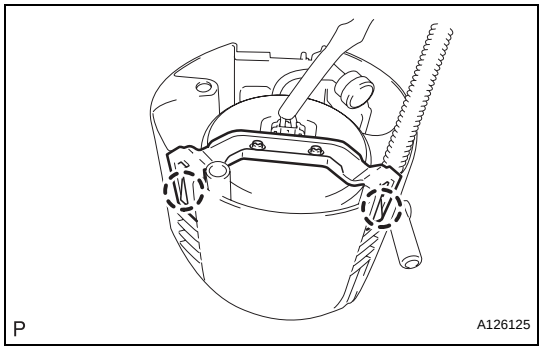
(a) Apply a light coat of gasoline to 2 new O-rings, and install them onto the fuel pressure regulator.

(b) Install the fuel pressure regulator to the fuel filter.



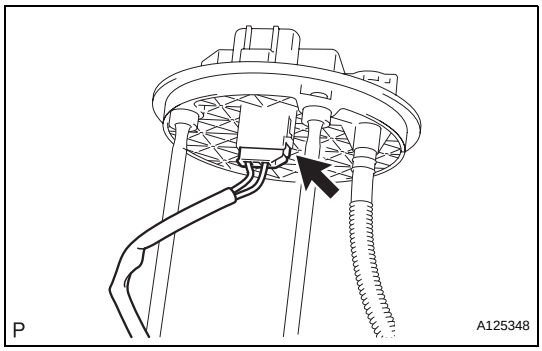
2. INSTALL FUEL PUMP ASSEMBLY

(a) Connect the pump harness connector.



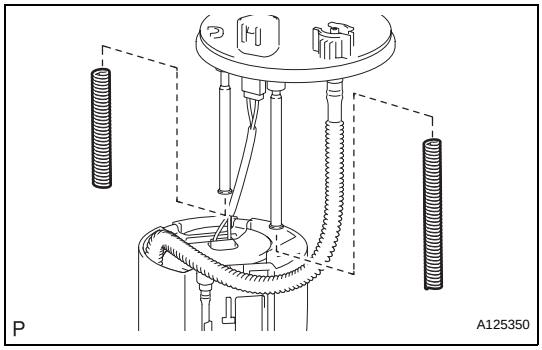
(b) Apply gasoline to a new O-ring and install the O-ring to the fuel filter.

(c) Attach the 5 claws to the claw holes and install the fuel pump.

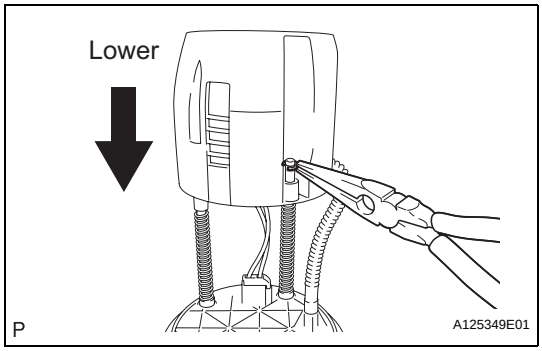


3. INSTALL BRACKET

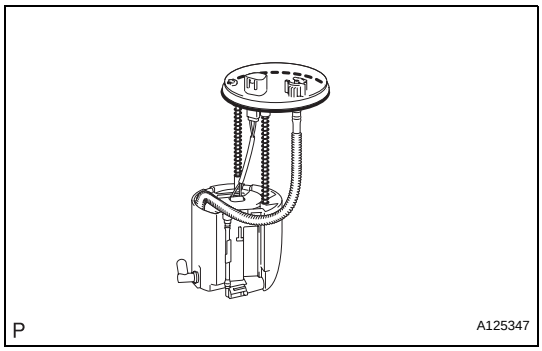
(a) Attach the 2 claws to the claw holes and install the bracket.



4. INSTALL FUEL SUB-TANK ASSEMBLY

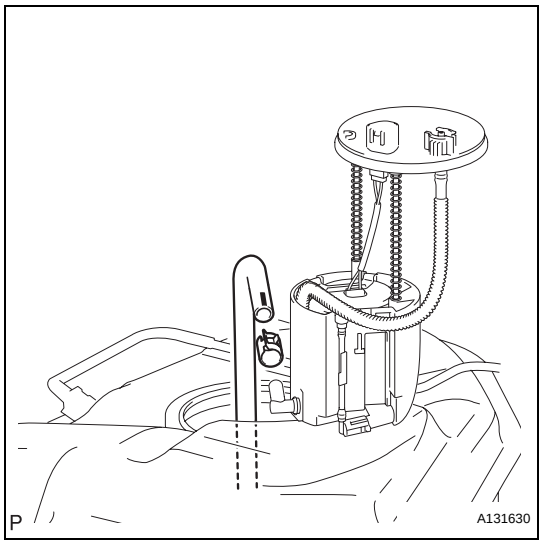


(a) Attach the 2 claws to the claw holes and install the fuel sub-tank.

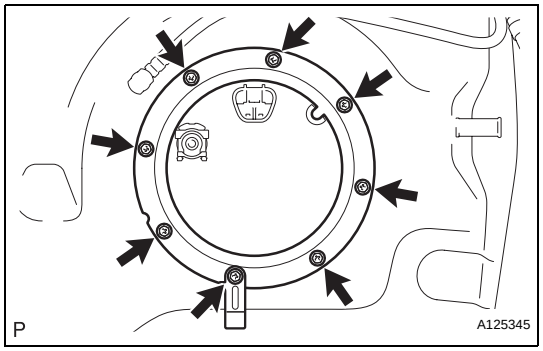


(b) Connect the wire harness.

(c) Install the spring to the fuel suction plate shaft and install it to the sub-tank.

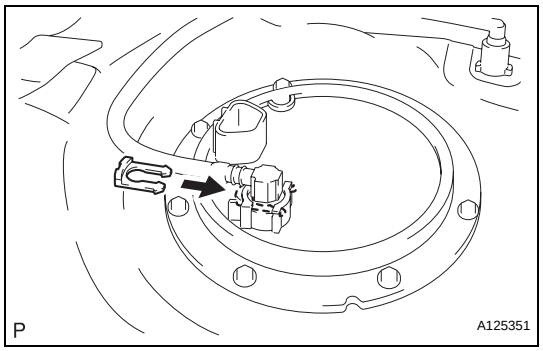


(d) Using needle-nose pliers, install a new E-ring.
HINT:
Slightly lower the sub-tank to install the E-ring.



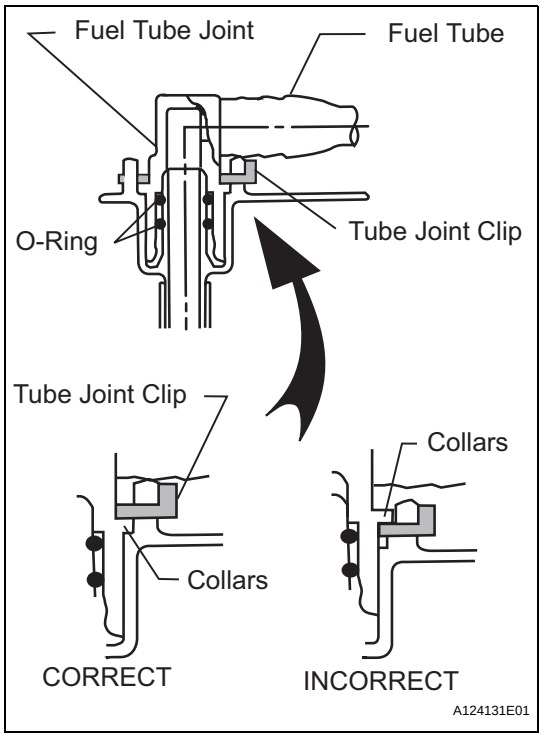
5. INSTALL FUEL SUCTION WITH PUMP ASSEMBLY

(a) Install a new gasket onto the fuel pump.



(b) Connect the fuel hose and install the fuel pump into the fuel tank.
NOTICE:
Do not damage the fuel pump filter.

6. INSTALL FUEL TANK VENT TUBE SET PLATE



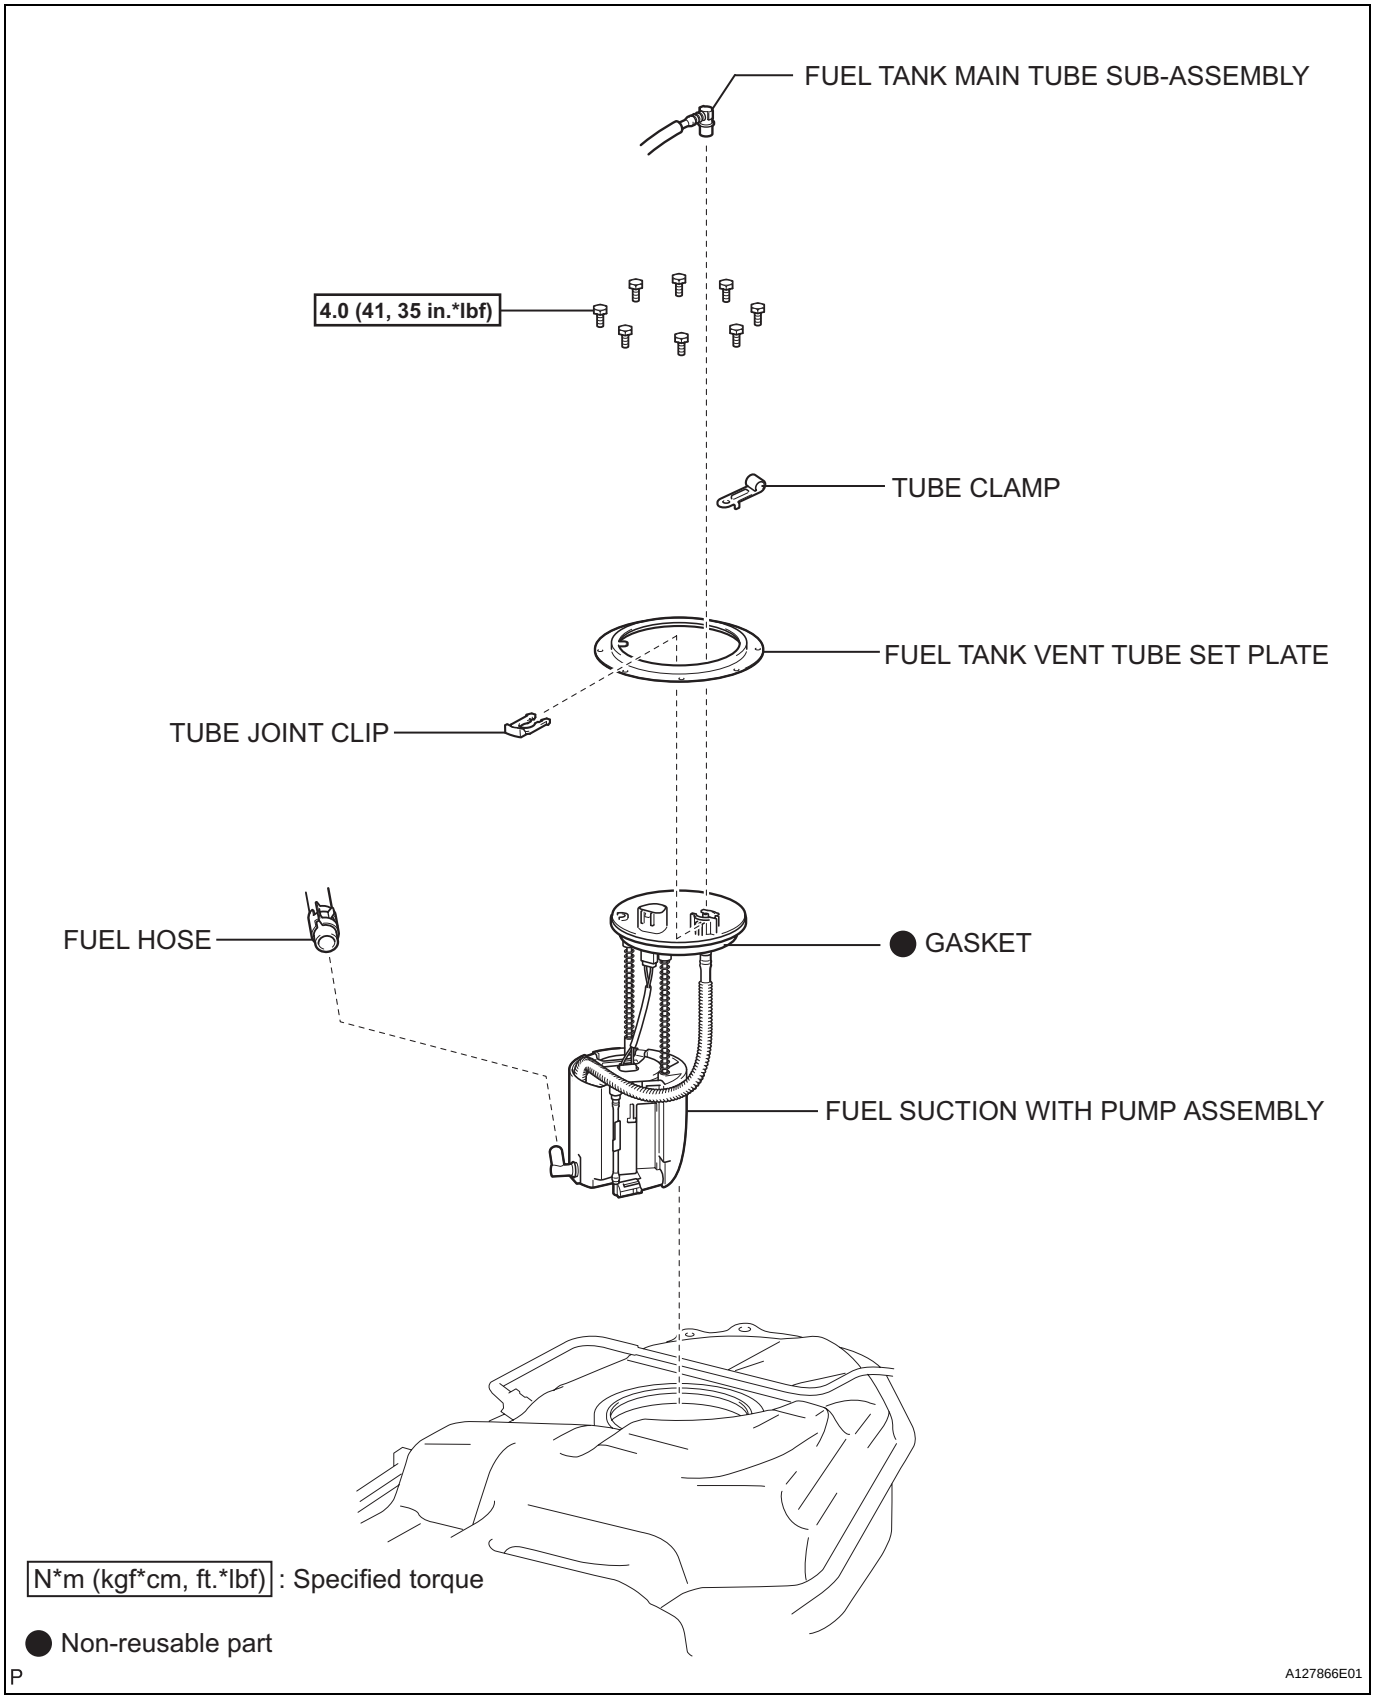
(a) Install the set plate with the 8 bolts.
Torque: 4.0 N*m (41 kgf*cm, 35 in.*lbf)

7. INSTALL FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Install the fuel tube with the joint clips.

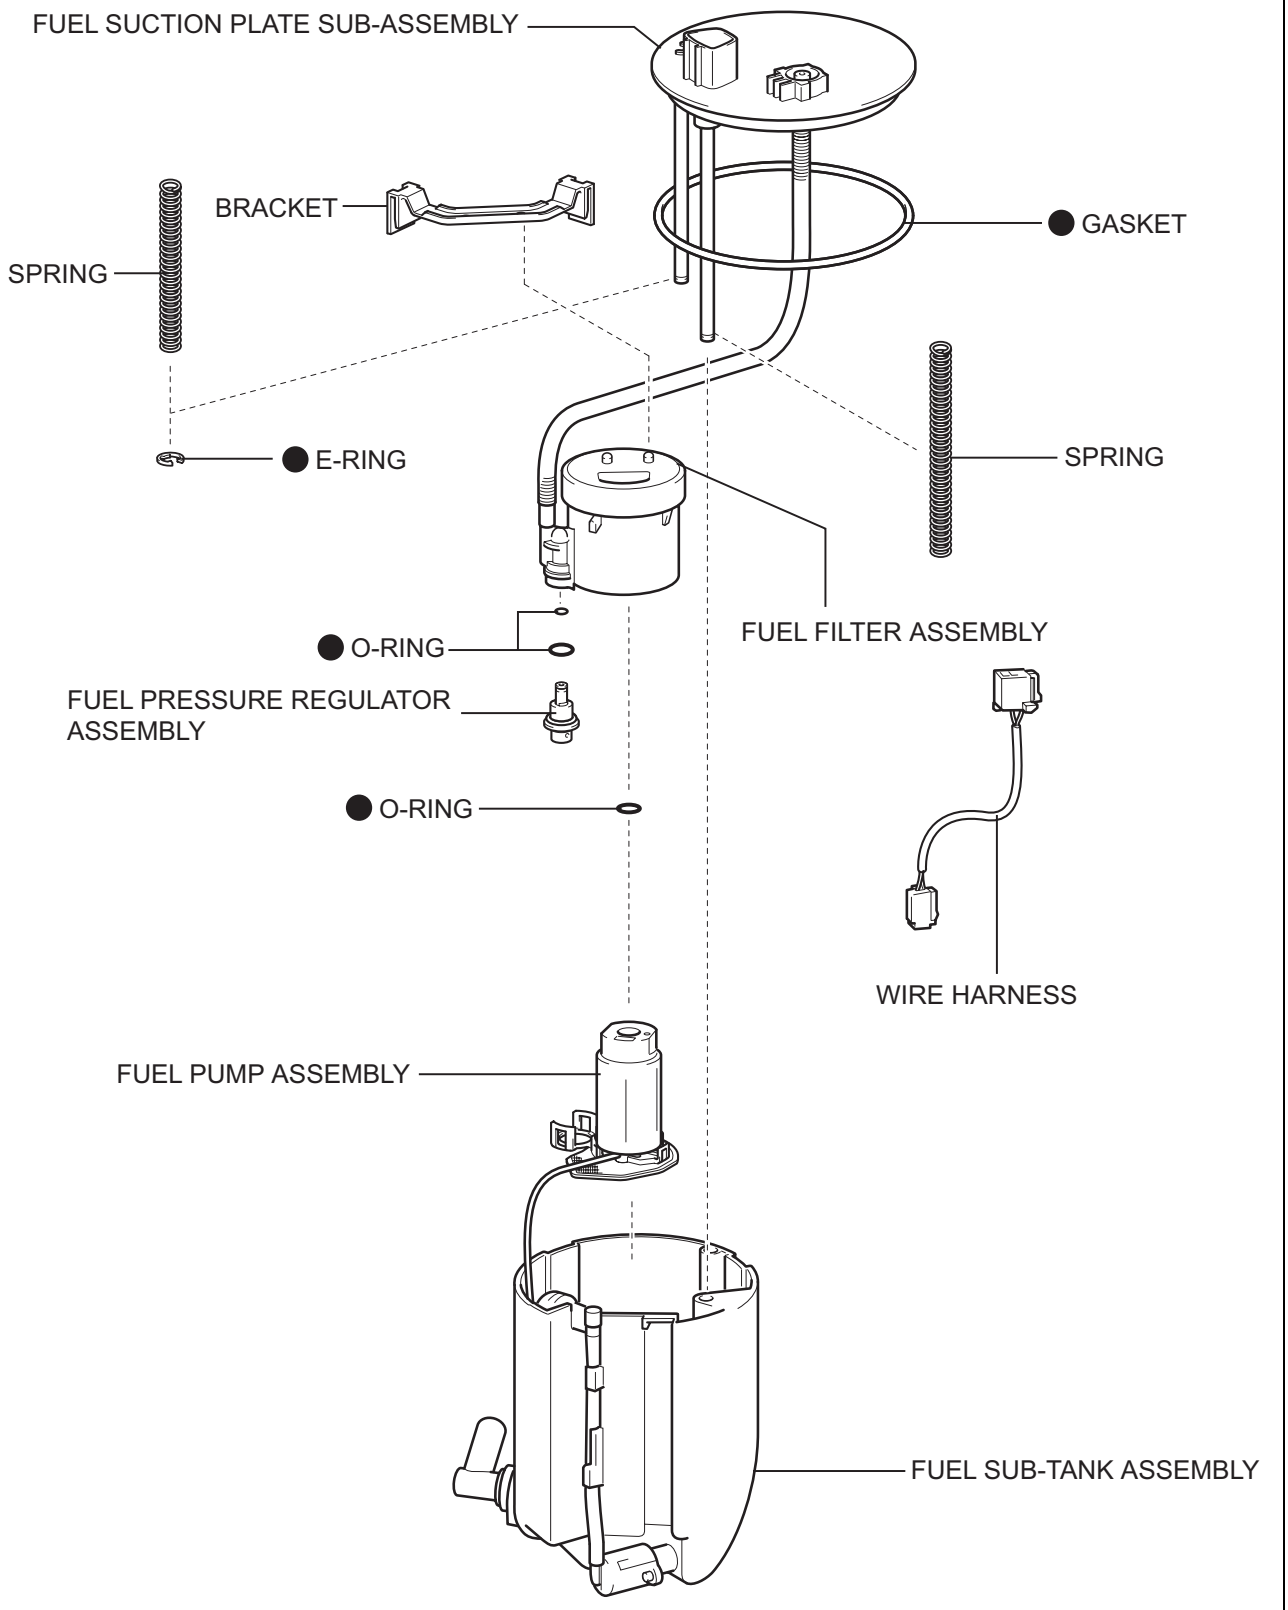
FU

CAUTION:



- **Check that there are no scratches or foreign objects on the connecting parts.**
- **Check that the fuel tube joint is inserted securely.**
- **Check that the fuel tube joint clip is on the collars of the fuel tube joint.**
- **After installing the tube joint clip, check that the fuel tube joint has not been pulled off.**
- **Be careful not to damage the clip. If the clip is damaged, replace it.**

8. INSTALL FUEL TANK ASSEMBLY



(a) Install the fuel tank (see page FU-44).

FU

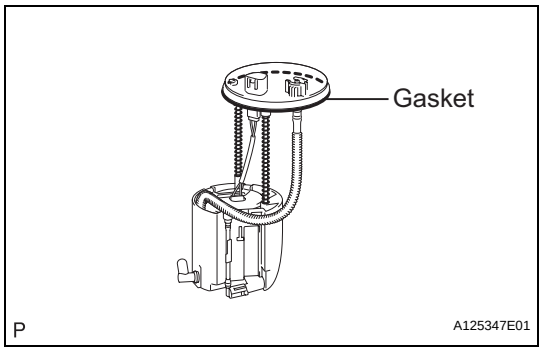
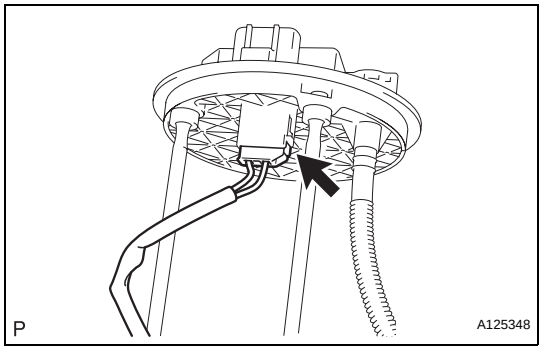
3. REMOVE FUEL TANK VENT TUBE SET PLATE

(a) Remove the 8 bolts and set plate.



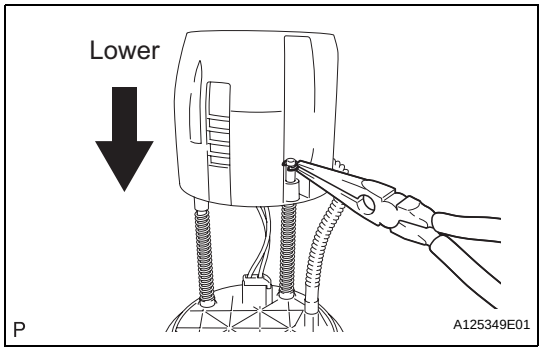
4. REMOVE FUEL SUCTION WITH PUMP ASSEMBLY



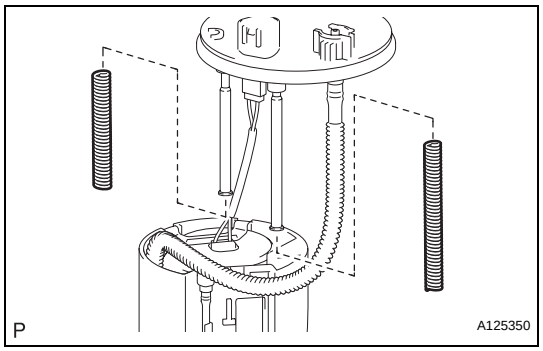
(a) Disconnect the fuel hose and remove the fuel pump from the fuel tank.

NOTICE:

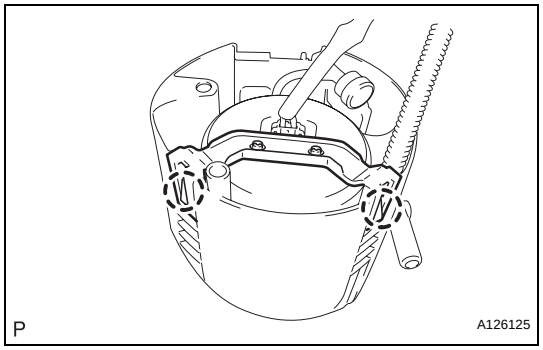
Do not damage the fuel pump.



(b) Remove the gasket from the fuel pump.

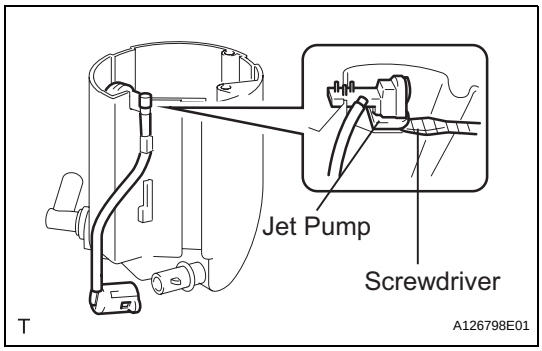


5. REMOVE FUEL SUB-TANK ASSEMBLY

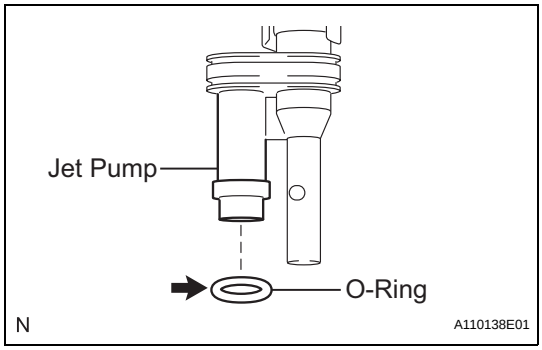


(a) Disconnect the wire harness.

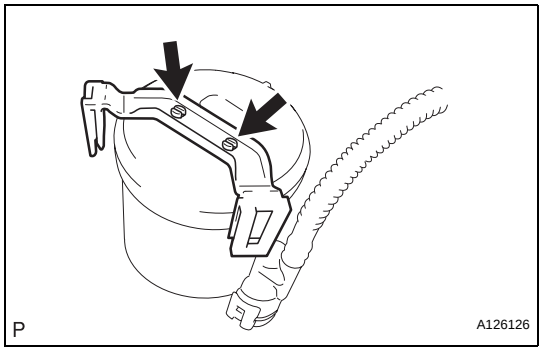
(b) Using needle nose pliers, remove the E-ring.
HINT:
Slightly lower the sub-tank to remove the E-ring.



(c) Remove the 2 springs from the 2 shaft.

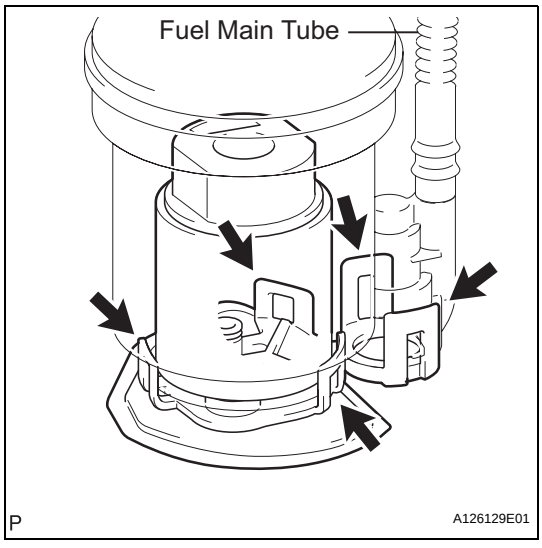


(d) Detach the 2 claws and remove the sub-tank.

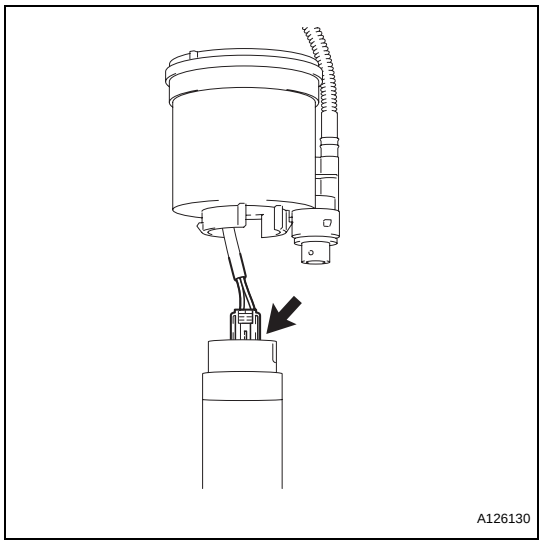


FU

(e) Disengage the claw of the jet pump nozzle.
(f) Using a screwdriver with the tip taped, remove the jet pump.

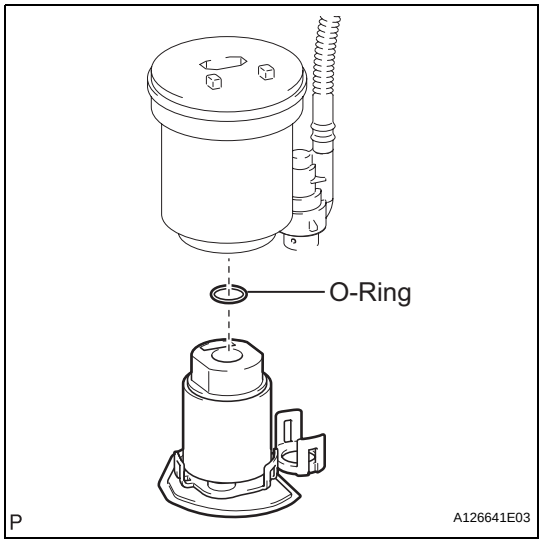


(g) Remove the O-ring from the jet pump.

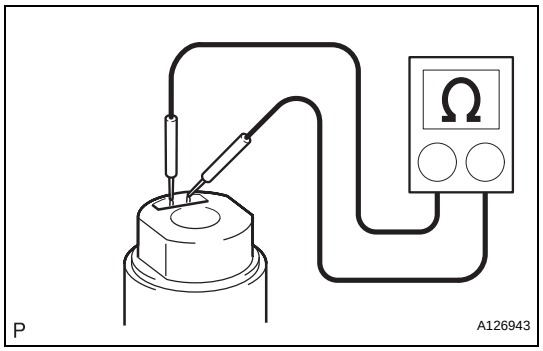


6. REMOVE BRACKET

(a) Using a screwdriver, detach the 2 claws and remove the bracket.
HINT:
Tape the screwdriver tip before use.



7. REMOVE FUEL PUMP ASSEMBLY



(a) Detach the 5 claws on the filter and remove the fuel pump from the fuel filter.
HINT:
When removing the claw, do not disconnect the fuel main tube.

(b) Disconnect the fuel pump connector.

(c) Remove the O-ring from the fuel filter.

INSPECTION

1. INSPECT FUEL PUMP

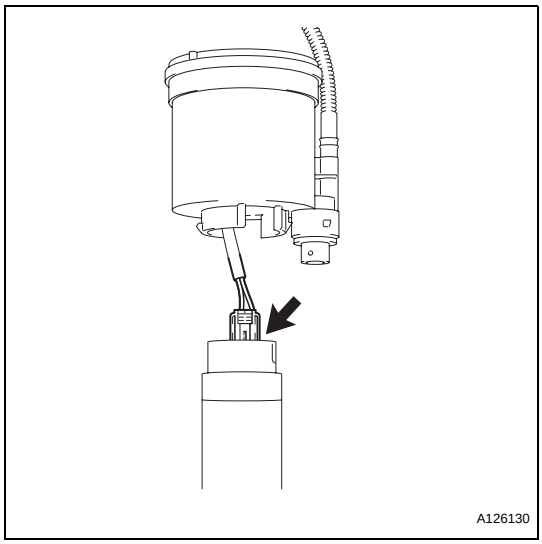
(a) Check the fuel pump resistance.

(1) Measure the resistance between terminals 1 and 2.

Standard resistance:

0.2 to 3.0 Ω at 20°C (68°F)

If the result is not as specified, replace the fuel pump.

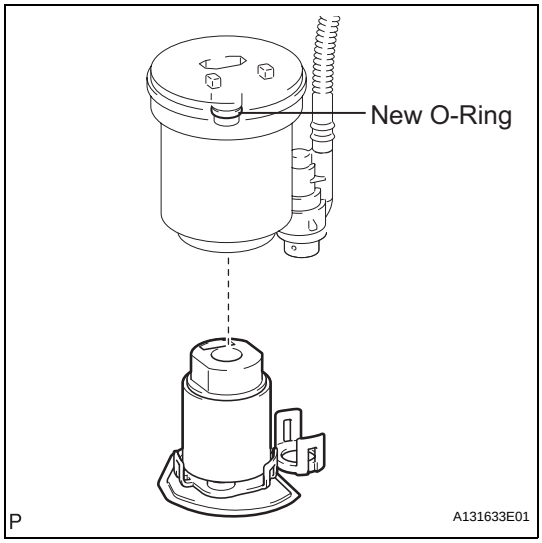


(b) Check fuel pump operation.

(1) Apply battery voltage to terminals 1 and 2. Check that the pump operates.

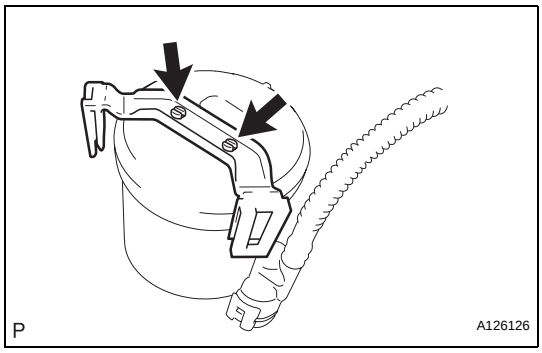
NOTICE:

- **These tests must be completed within 10 seconds to prevent the coil from burning out.**
- **Keep the fuel pump as far away from the battery as possible.**
- **Always the voltage on and off on the battery side, not the fuel pump side.**



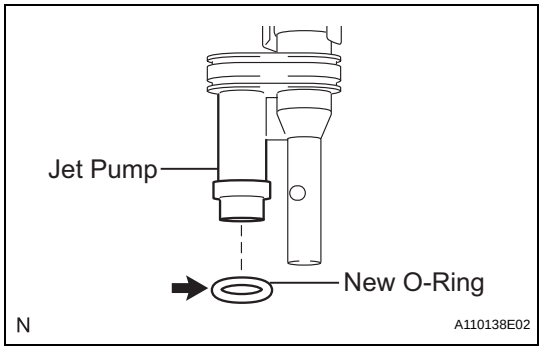
If the pump does not operate, replace the fuel pump.

INSTALLATION



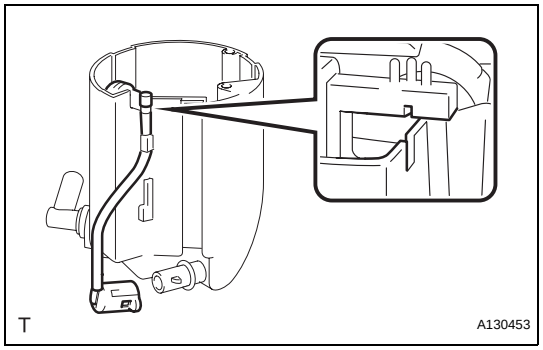
1. INSTALL FUEL PUMP ASSEMBLY

(a) Connect the pump harness connector.



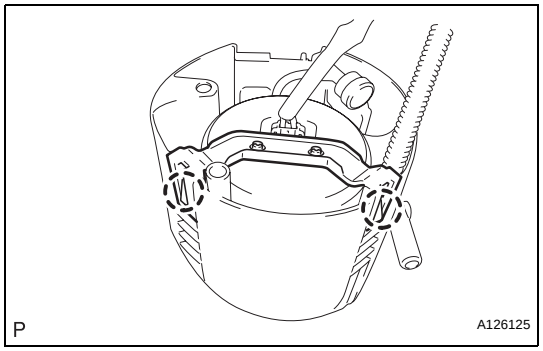
(b) Apply gasoline to a new O-ring and install the O-ring to the fuel filter.

(c) Attach the 5 claws to the claw holes and install the fuel pump.



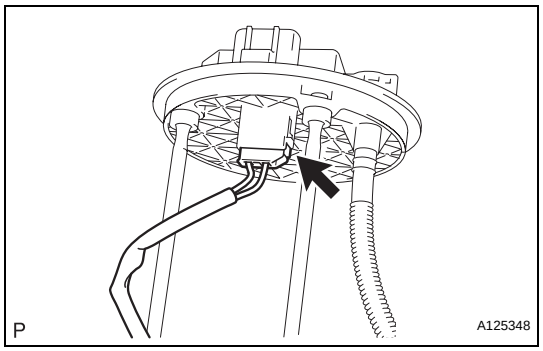
2. INSTALL BRACKET

(a) Attach the 2 claws to the claw holes and install the bracket.

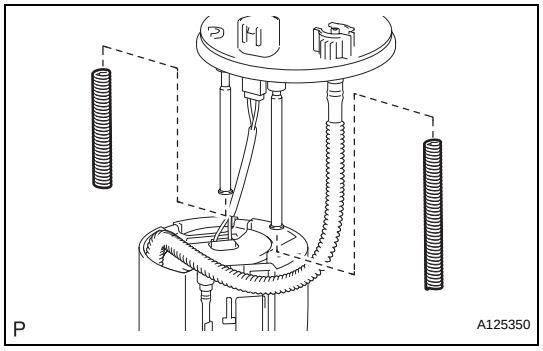


3. INSTALL FUEL SUB-TANK ASSEMBLY

(a) Apply gasoline to a new O-ring and install it to the jet pump.

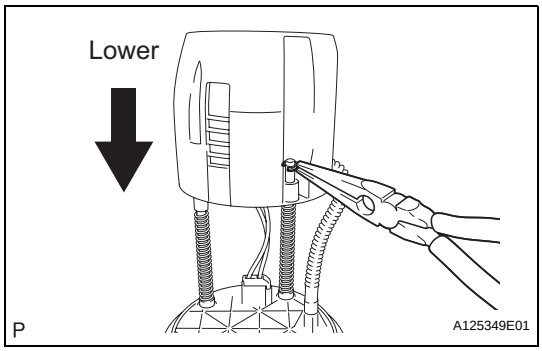


(b) Install the jet pump while aligning it to the installation position of the sub-tank.

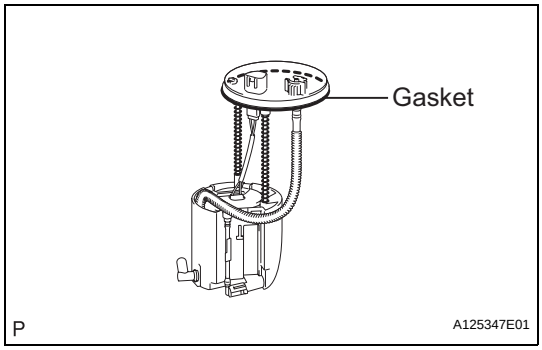


(c) Install the jet pump nozzle.

(d) Attach the 2 claws to the claw holes and install the fuel sub-tank.

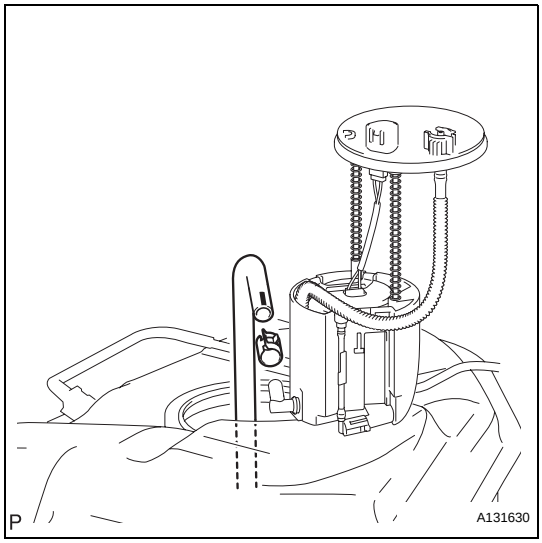


(e) Connect the wire harness.

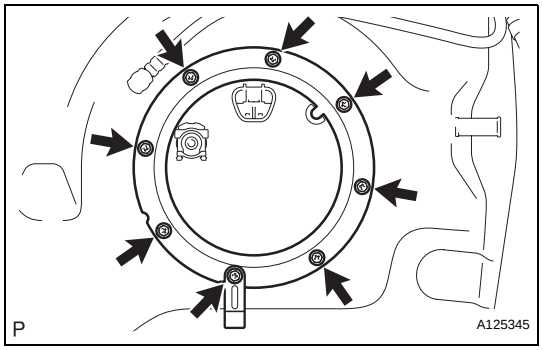


(f) Install the spring to the fuel suction plate shaft and install them to the sub-tank.

FU

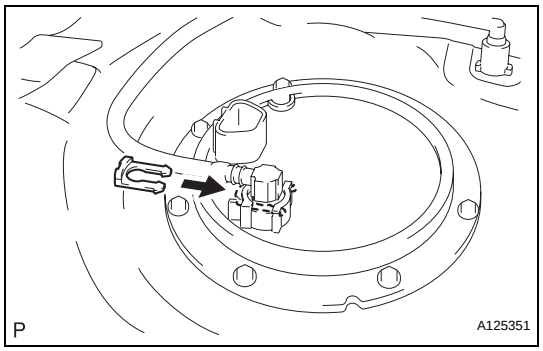


(g) Using needle-nose pliers, install a new E-ring.
HINT:
Slightly lower the sub-tank to install the E-ring.



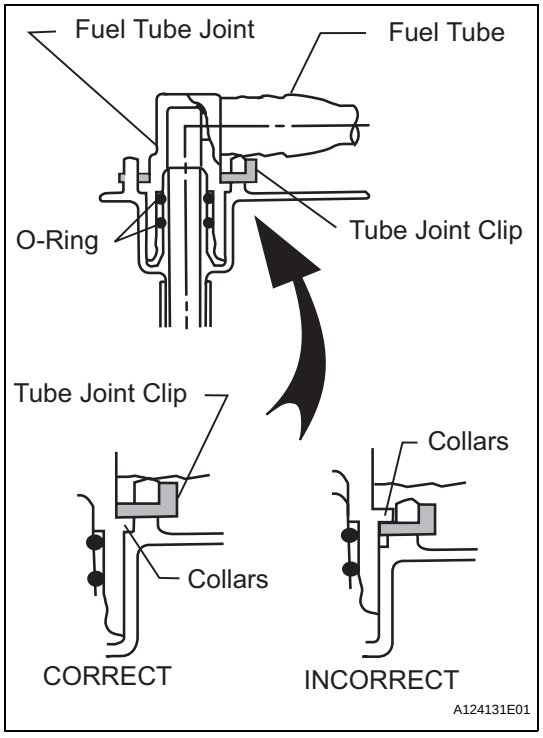
4. INSTALL FUEL SUCTION WITH PUMP ASSEMBLY

(a) Install a new gasket onto the fuel pump.



(b) Connect the fuel hose and install the fuel pump into the fuel tank.
NOTICE:
Do not damage the fuel pump filter.

5. INSTALL FUEL TANK VENT TUBE SET PLATE



(a) Install the set plate with the 8 bolts.
Torque: 4.0 N*m (41 kgf*cm, 35 in.*lbf)

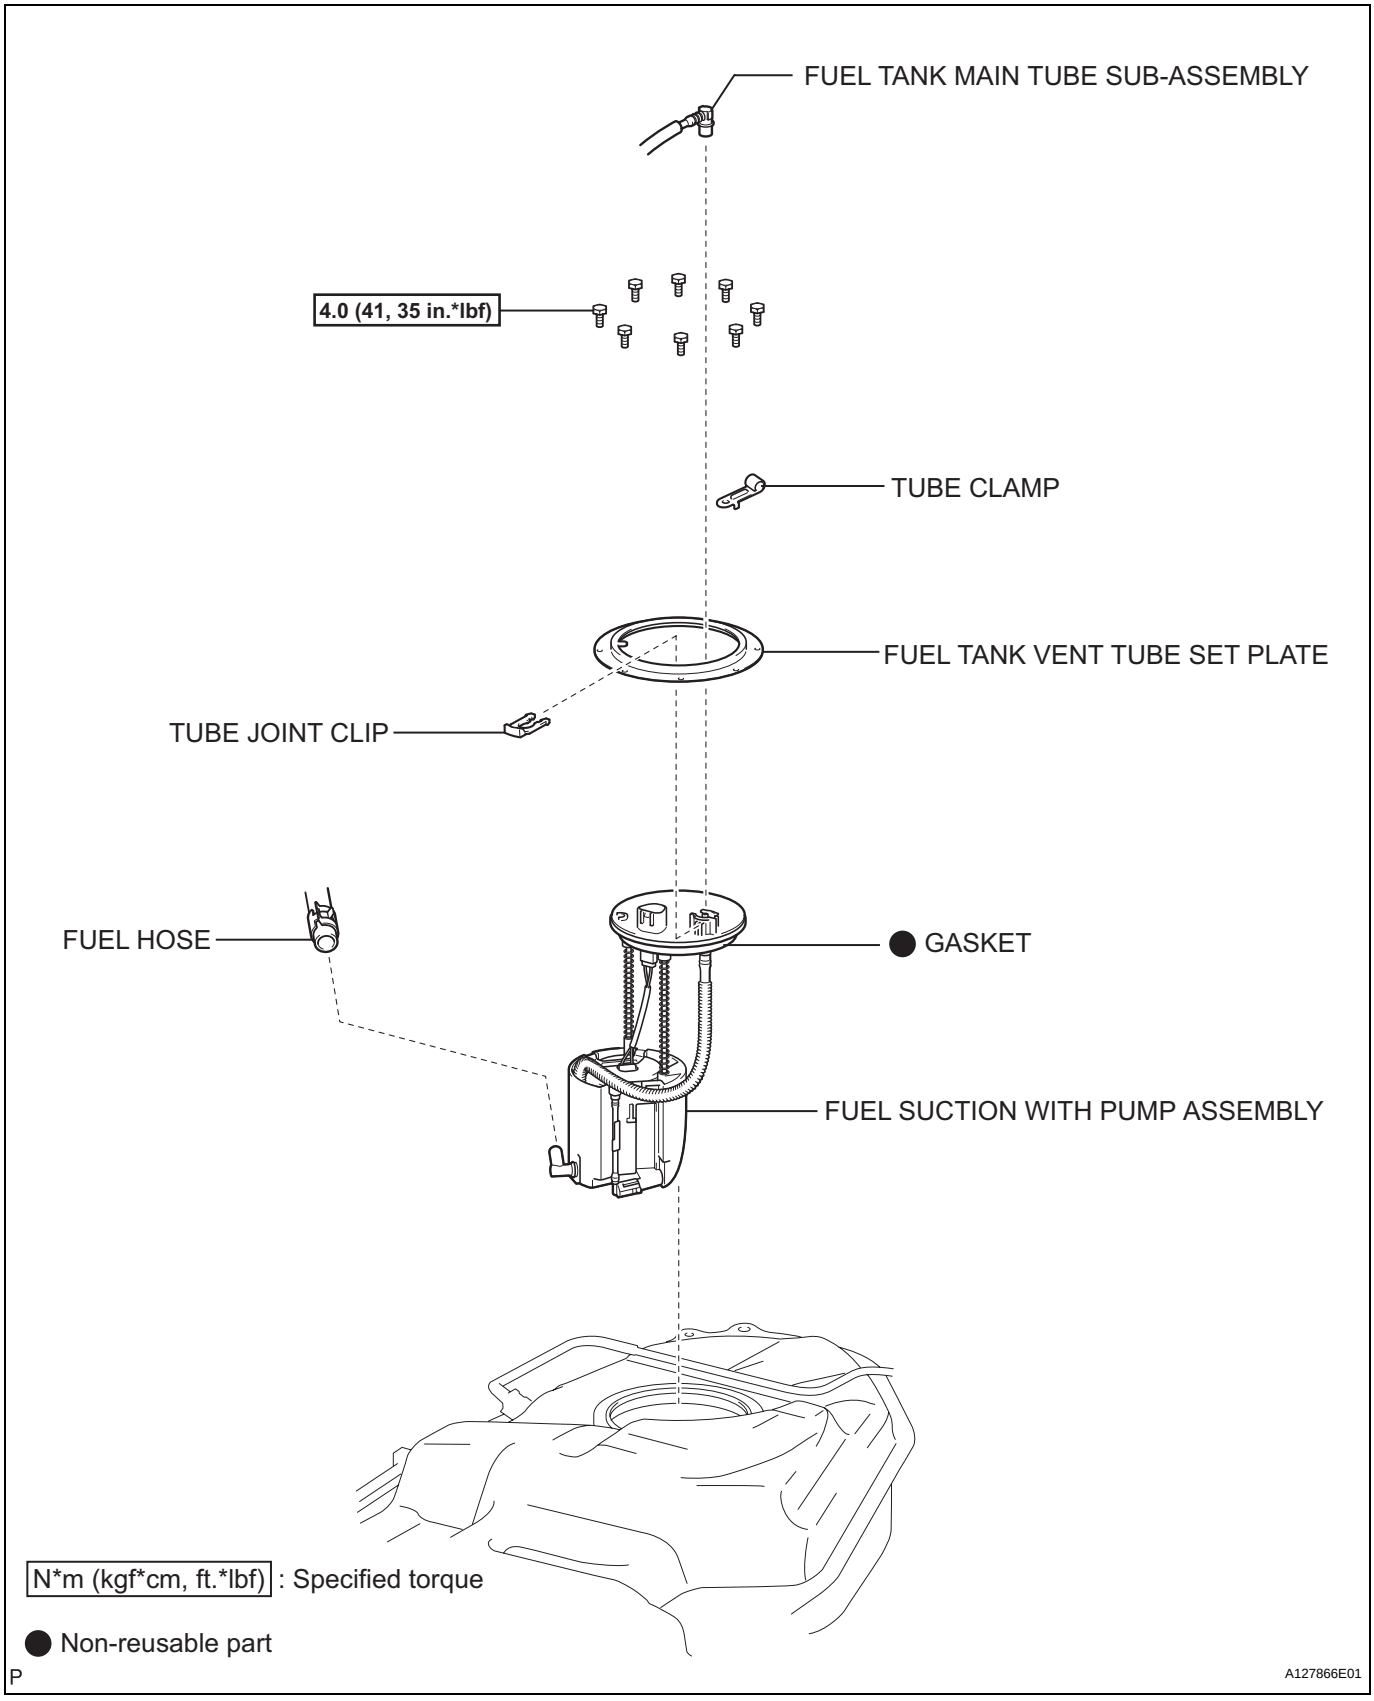
FU

6. INSTALL FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Install the fuel tube with the joint clips.

CAUTION:

- **Check that there are no scratches or foreign objects on the connecting parts.**
- **Check that the fuel tube joint is inserted securely.**
- **Check that the fuel tube joint clip is on the collars of the fuel tube joint.**
- **After installing the tube joint clip, check that the fuel tube joint has not been pulled off.**
- **Be careful not to damage the clip. If the clip is damaged, replace it.**



7. INSTALL FUEL TANK ASSEMBLY

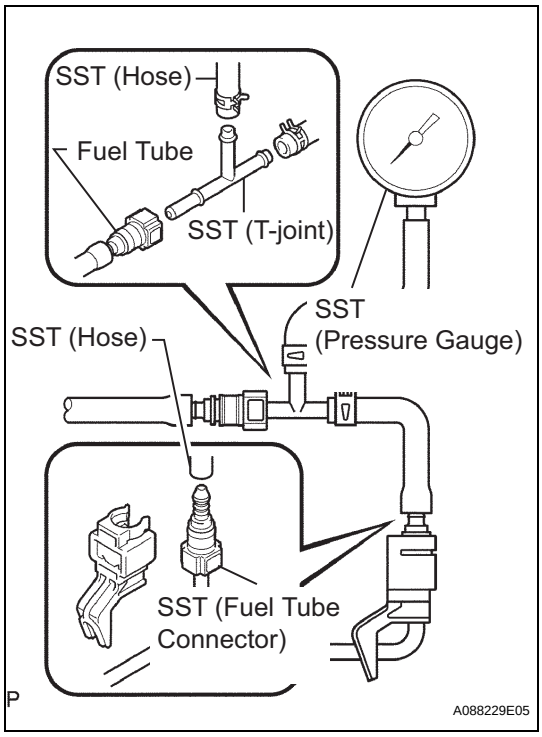
SYSTEM DIAGRAM

FU



ON-VEHICLE INSPECTION

1. CHECK FUEL PUMP OPERATION

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON. Do not start the engine.
(c) Select the following tester menus: DIAGNOSIS, ENHANCED OBD II, ACTIVE TEST and FUEL PUMP/SPD. Operate the fuel pump.
(d) Touch the fuel hose in the engine compartment to check the fuel flow, and you will be able to hear the sound of the fuel pump.
(e) Stop the fuel pump.
If there is no fuel flow, the fuel pump may not operate. Check the fuel pump circuit (see page FU-33).

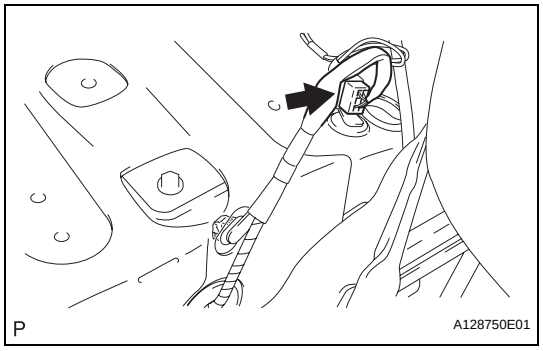
2. CHECK FUEL PRESSURE

(a) Check that the battery positive voltage is above 12 V.
(b) Discharge the fuel system pressure (see page FU-9).
(c) Disconnect the cable from the negative (-) battery terminal.
(d) Disconnect the fuel main tube (see page FU-10).
(e) Install SST (pressure gauge) as shown in the illustration.
SST 09268-31011 (95336-08070, 90467-13001, 09268-41500), 09268-45014 (09268-41200, 09268-41220, 09268-41250)
(f) Wipe off any gasoline.
(g) Reconnect the cable to the negative (-) battery terminal.
(h) Start the engine.
(i) Measure the fuel pressure at idle.
Fuel pressure:
304 to 343 kPa (3.1 to 3.5 kgf/cm^2, 44 to 50 psi)
If the pressure is not as specified, check the fuel pump and injectors.
(j) After checking the fuel pressure, disconnect the cable from the negative (-) battery terminal and carefully remove SST and the fuel tube connector to prevent fuel from spilling.
(k) Reconnect the fuel main tube (see page FU-14).
(l) Check for fuel leaks (see page FU-14).

FUEL SYSTEM

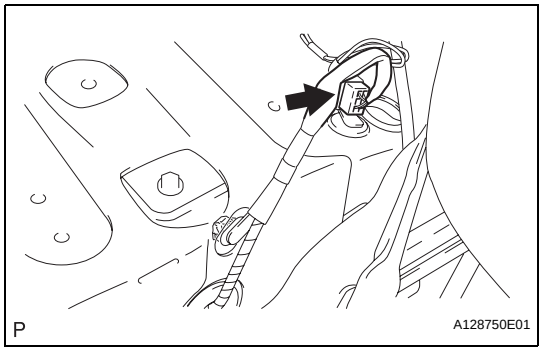
PRECAUTION

1. BEFORE WORKING ON FUEL SYSTEM



(a) Do not work near an open flame.
(b) Keep gasoline away from rubber and leather parts.
(c) Discharge the fuel pressure before disconnecting the fuel line to prevent gasoline from spilling out. Refer to the following procedure.

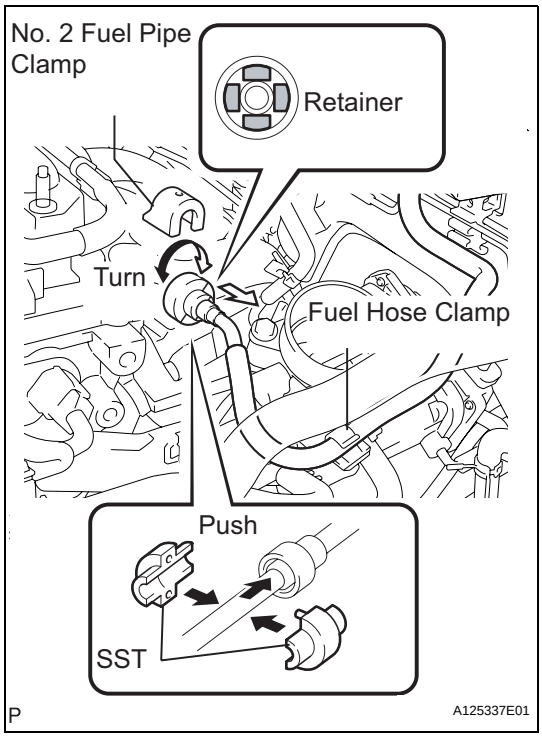
2. DISCHARGE FUEL PRESSURE



CAUTION:

- **DISCHARGE FUEL SYSTEM PRESSURE procedures must be performed before disconnecting any part of the fuel system.**
- **After performing the DISCHARGE FUEL SYSTEM PRESSURE procedures, pressure will remain in the fuel line. When disconnecting the fuel line, place a cloth or equivalent over fittings to reduce the risk of fuel spray.**

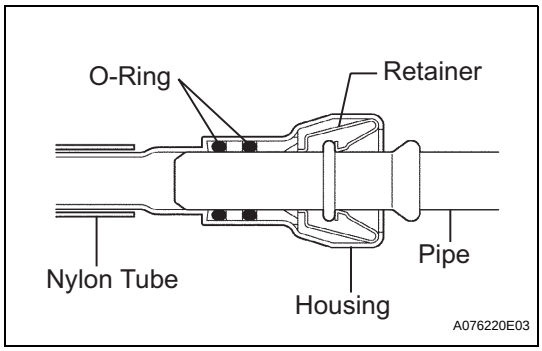
(a) Remove the console box (see page IR-83).



(b) Disconnect the connector.
(c) Start the engine. After the engine has stopped, turn the ignition switch off.
HINT:
DTC P0171 (system too lean) may be set.
(d) Check that the engine does not start.
(e) Remove the fuel tank cap, and let the air out of the fuel tank.

(f) Connect the connector.
(g) Install the console box (see page IR-90).

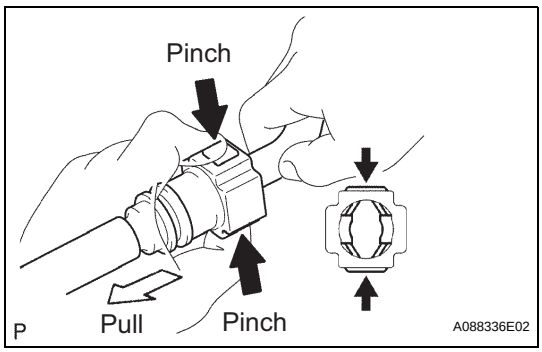
FU



3. DISCONNECT FUEL MAIN TUBE

NOTICE:

Do not forcibly bend and twist the fuel main tube.



(a) Remove the fuel tube from the fuel hose clamp.
(b) Remove the fuel pipe clamp.
(c) Wipe off dirt on the fuel tube connector.
(d) Hold the fuel tube connector, and then install SST.
SST 09268-21010
(e) Turn SST to align the retainer inside the fuel tube connector with the chamfered part of SST.
(f) Insert SST into the fuel tube and hold it. Then push the fuel tube connector toward SST side.
(g) Mount the retainer of the fuel tube connector onto the chamfered part of SST.

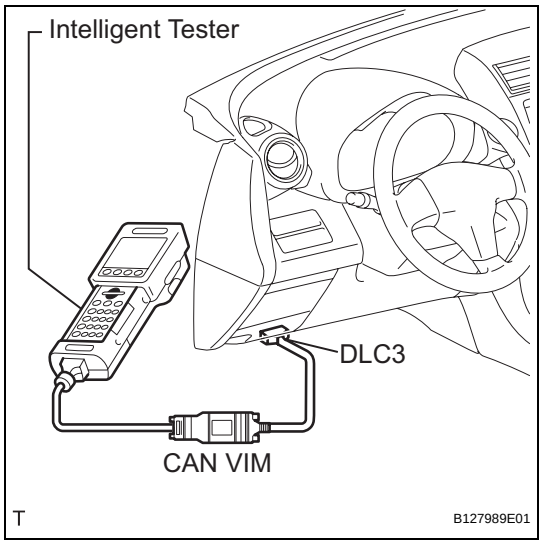
(h) Slide SST and fuel tube connector together towards the fuel tube until they make a click sound, and then disconnect the fuel tube.
(i) Drain the fuel remaining inside the fuel tube.
(j) Cover the fuel tube and fuel pipe with a plastic bag to protect the disconnected part.

4. CONNECT FUEL MAIN TUBE

(a) Connect the fuel main tube.
(b) Push the fuel tube connector until it makes a "click" sound.
(c) Install the fuel pipe clamp.
(d) Install the fuel tube to the fuel hose clamp.

5. DISCONNECT FUEL TUBE CONNECTOR

(a) Wipe off any dirt on the fuel tube connector.
(b) Pinch the fuel tube connector, and then disconnect the fuel tube. Do not use any tools.
(c) Drain the fuel remaining inside the fuel tube.
(d) Cover the fuel tube and fuel pipe with a plastic bag to protect the disconnected part.



6. CONNECT FUEL TUBE CONNECTOR

(a) Connect the fuel tube connector to the fuel pipe.
(b) Push the fuel connector until it makes a click sound.

HINT:

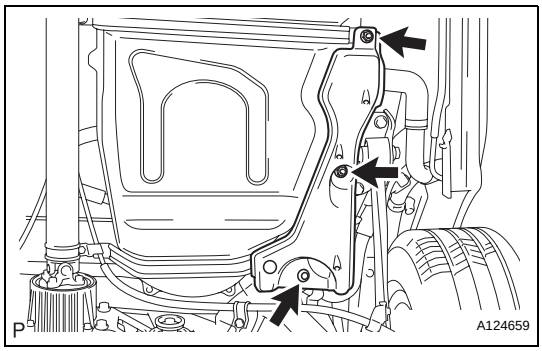
If it is difficult to connect the fuel tube connector, apply a small amount of new engine oil on the tip of the pipe.

FU

7. CHECK FOR FUEL LEAKS

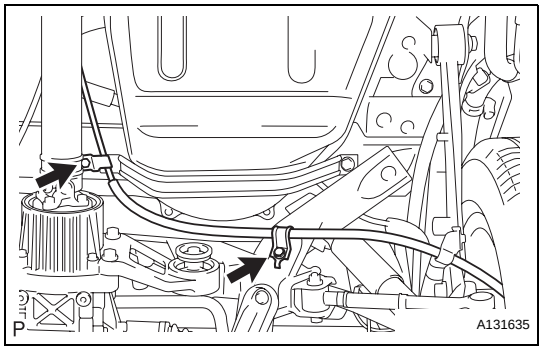
(a) Make sure that there are no fuel leaks after performing maintenance on the fuel system.
  (1) Connect the intelligent tester to the DLC3.
  (2) Turn the ignition switch ON, and push the intelligent tester main switch ON.
  NOTICE:
  Do not start the engine.
  (3) Select the Active Test mode on the intelligent tester.
  HINT:
  Refer to the intelligent tester operator's manual for further details.
  (4) Check that there are no leaks from the fuel system.
  (5) Turn the ignition switch OFF.
  (6) Disconnect the intelligent tester from the DLC3.

REMOVAL

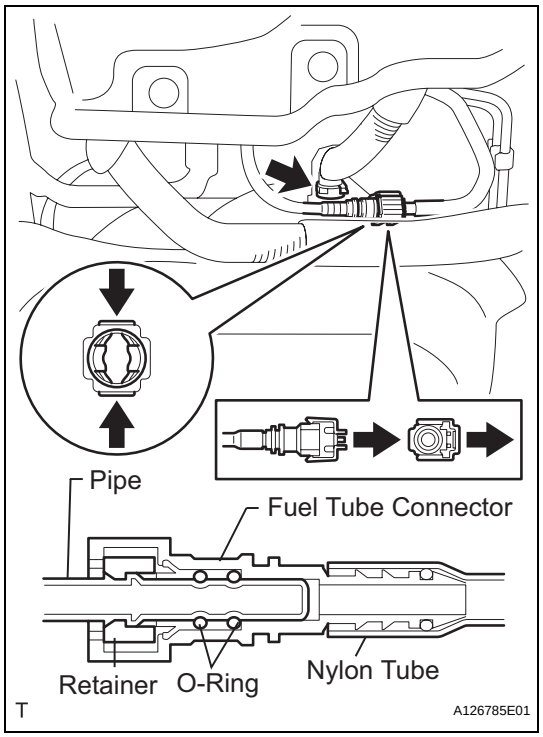


1. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-9)**

2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.



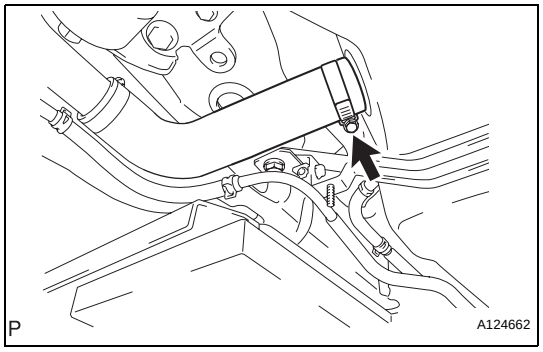
3. **REMOVE FUEL TANK CAP**



4. **REMOVE FRONT FLOOR COVER**
   (a) Remove the nut, bolt, 3 clips and floor cover.

5. **REMOVE NO. 1 FLOOR UNDER COVER**
   (a) Remove the 2 nuts, clip and floor under cover.

6. **DISCONNECT NO. 2 PARKING BRAKE CABLE ASSEMBLY**
   (a) Remove the 2 bolts and disconnect the parking brake cable.

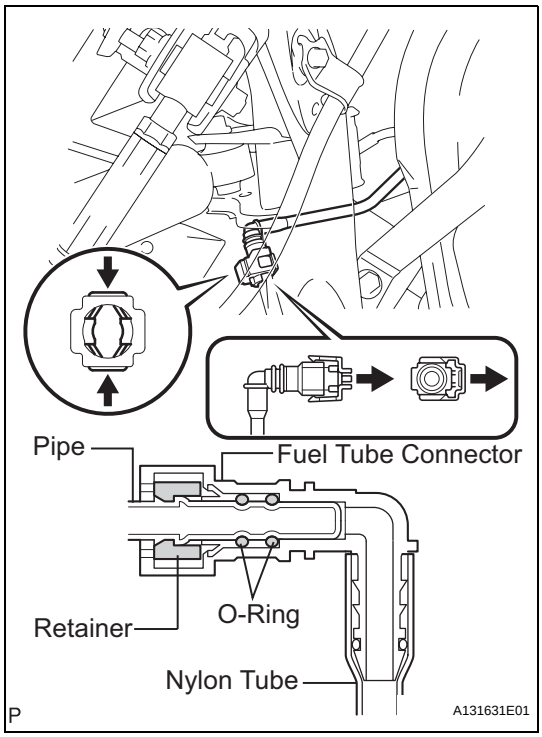


7. DISCONNECT FUEL TANK MAIN TUBE SUB-ASSEMBLY

(a) Pinch and pull the main tube connector to disconnect the connector from the pipe.

NOTICE:

- **Check for foreign matter in the pipe and around the connector. Clean if necessary. Foreign matter may damage the O-ring or cause leaks in the seal between the pipe and connector.**
- **Do not use any tools to separate the pipe and connector.**
- **Do not forcefully bend or twist the nylon tube.**
- **Check for foreign matter on the pipe seal surface. Clean if necessary.**
- **Put the pipe and connector ends in plastic bags to prevent damage and foreign matter contamination.**
- **If the pipe and connector are stuck together, pinch the connector between your fingers and turn it carefully to disconnect it.**



(b) Disconnect the EVAP hose from the tank.

8. DISCONNECT FUEL TANK TO FILLER PIPE HOSE

(a) Disconnect the filler pipe hose from the fuel tank.

FU

9. DISCONNECT FUEL TANK BREATHER HOSE

(a) Disconnect the breather hose from the fuel tank.

NOTICE:

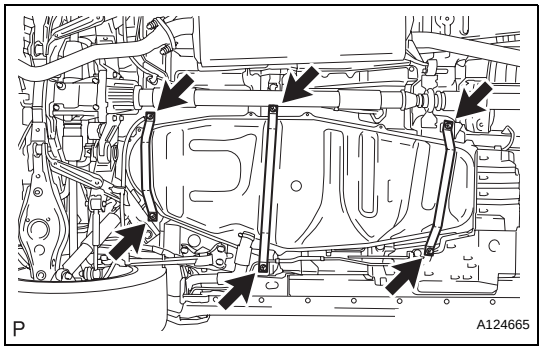
- **Check for foreign matter in the pipe and around the connector. Clean if necessary. Foreign matter may damage the O-ring or cause leaks in the seal between the pipe and connector.**
- **Do not use any tools to separate the pipe and connector.**
- **Do not forcefully bend or twist the nylon tube.**
- **Check for foreign matter on the pipe seal surface. Clean if necessary.**
- **Put the pipe and connector ends in plastic bags to prevent damage and foreign matter contamination.**
- **If the pipe and connector are stuck together, pinch the connector between your fingers and turn it carefully to disconnect it.**

10. REMOVE FUEL TANK FILLER PIPE

(a) Remove the 3 bolts and filler pipe protector.

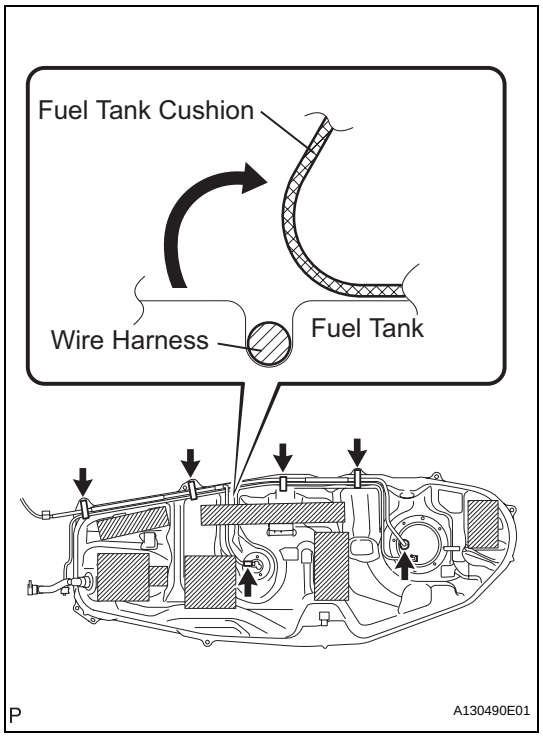
(b) Remove the 2 bolts and filler pipe.

11. REMOVE FUEL TANK ASSEMBLY



(a) Set a mission jack underneath the fuel tank.

(b) Remove the 6 bolts and 3 fuel tank bands.



(c) Slightly lower the mission jack.

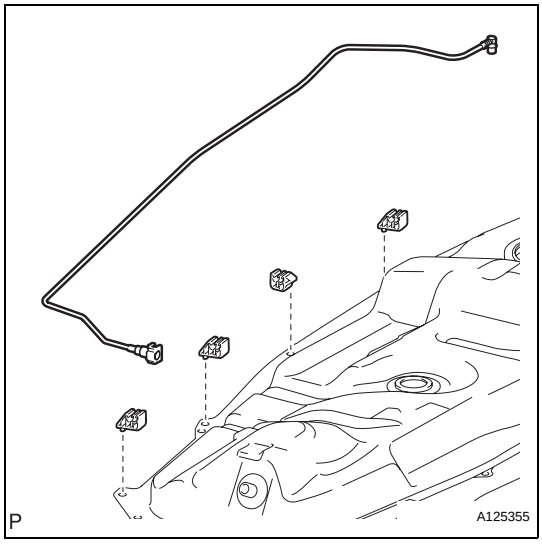
NOTICE:

Be careful not to cut the wirings.

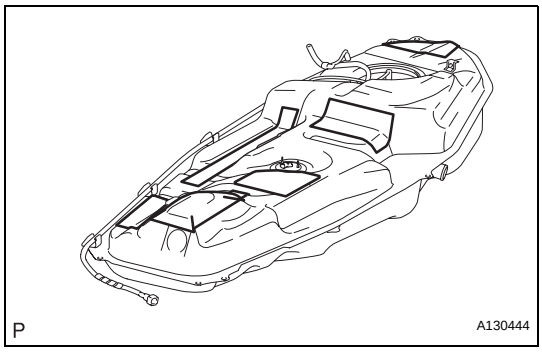
FU

(d) Fold back approximately half of each cushion rubber so that the wire harness can be detached from the fuel tank in the step below.

(e) Disconnect the fuel pump connector and sender gauge connector.

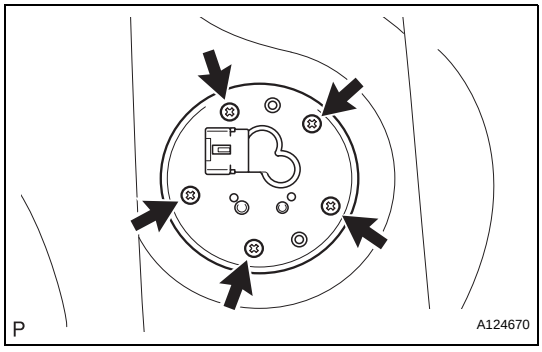


NOTICE:



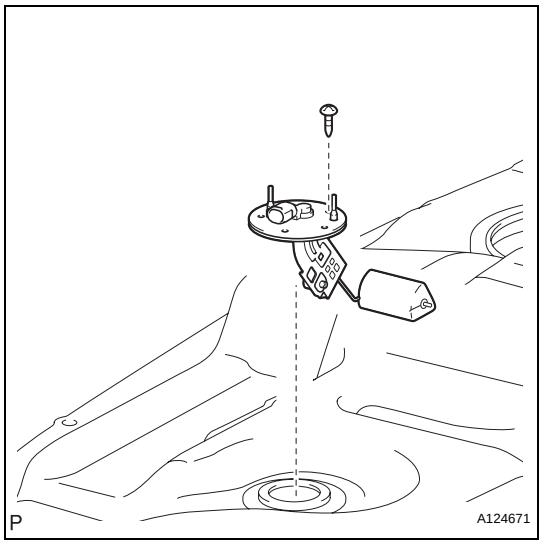
- **Before this procedure, check the connector for dirt, mud or other contamination.**
- **Do not use any tools in this procedure.**

(f) Detach the wire harness from the 4 clamps and remove the fuel tank.

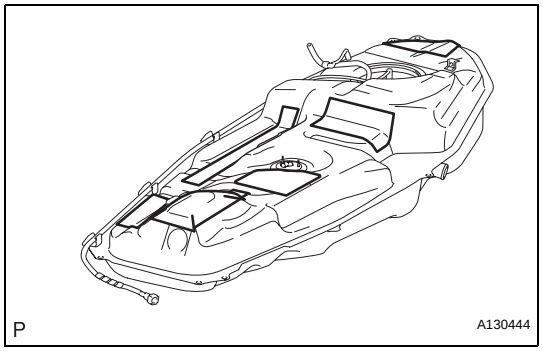


DISASSEMBLY

1. **REMOVE FUEL TANK MAIN TUBE SUB-ASSEMBLY (See page FU-30)**
2. **REMOVE FUEL TANK VENT TUBE SET PLATE (See page FU-30)**
3. **REMOVE FUEL SUCTION WITH PUMP ASSEMBLY (See page FU-30)**
4. **REMOVE FUEL TANK MAIN TUBE SUB-ASSEMBLY**
   (a) Remove the tube from the fuel tube clamps.
5. **REMOVE NO. 1 FUEL TUBE CLAMP**
   (a) Remove the 4 tube clamps from the fuel tank.

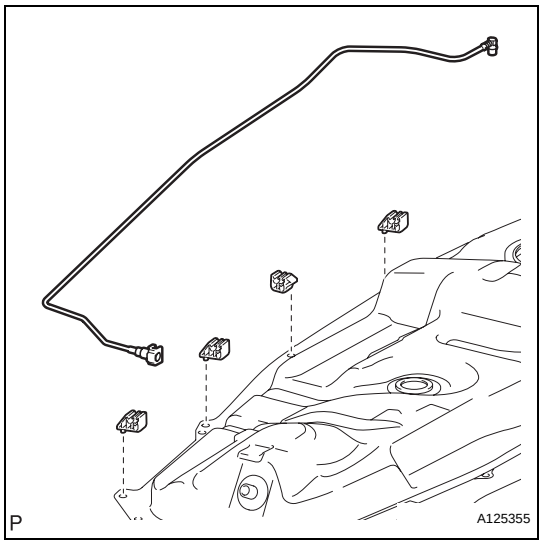


6. **REMOVE NO. 1 FUEL TANK CUSHION**
   (a) Remove the 7 fuel tank cushions from the fuel tank.



7. **REMOVE FUEL SENDER GAUGE ASSEMBLY**
   (a) Remove the 5 screws and sender gauge.

REASSEMBLY



1. INSTALL FUEL SENDER GAUGE ASSEMBLY

(a) Install the sender gauge with the 5 bolts.
Torque: 1.5 N*m (15 kgf*cm, 13 in.*lbf)

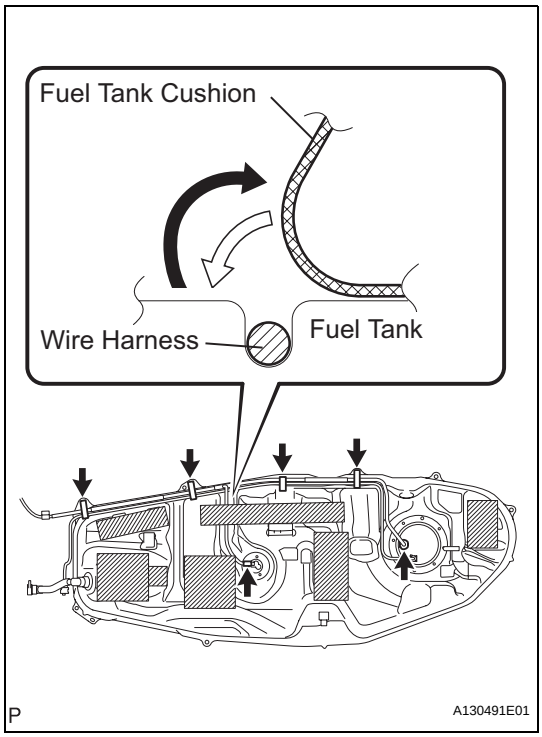
2. INSTALL NO. 1 FUEL TANK CUSHION

(a) Install 7 new fuel tank cushions onto the fuel tank as shown in the illustration.

3. INSTALL NO. 1 FUEL TUBE CLAMP

(a) Install the 4 tube clamps to the fuel tank.

4. INSTALL FUEL TANK MAIN TUBE SUB-ASSEMBLY

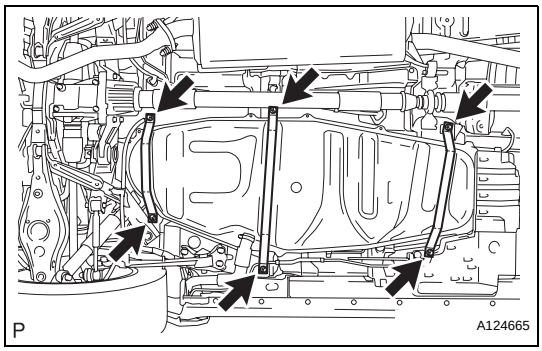


(a) Install the tube with the 4 clips.

5. INSTALL FUEL SUCTION WITH PUMP ASSEMBLY (See page FU-36)

6. INSTALL FUEL TANK VENT TUBE SET PLATE (See page FU-36)

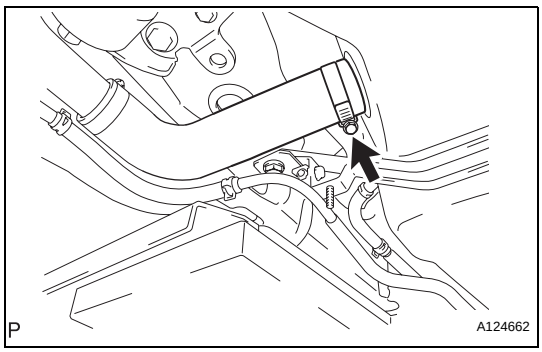
7. INSTALL FUEL TANK MAIN TUBE SUB-ASSEMBLY (See page FU-37)



FU

INSTALLATION

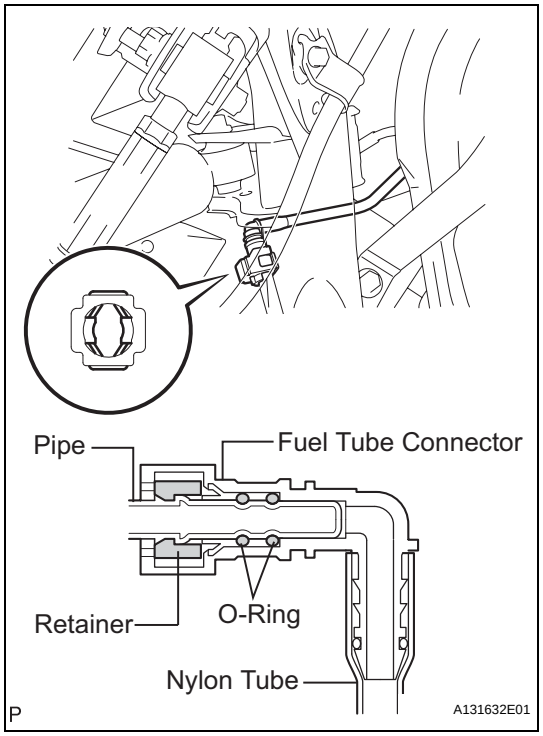
1. INSTALL FUEL TANK ASSEMBLY



(a) Set the fuel tank on a mission jack.
(b) Lift up the mission jack.
(c) Fold back the 2 cushion rubbers.
(d) Connect the fuel pump connector and sender gauge connector to the fuel tank.
NOTICE:
Be careful not to cut the wirings.
(e) Attach the wire harness to the 4 clamps.

(f) Install the 3 fuel tank bands with the 6 bolts.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)

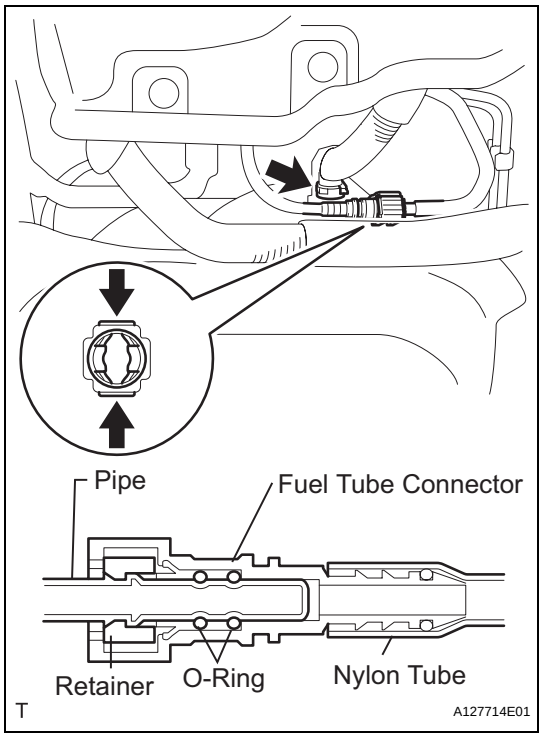
2. INSTALL FUEL TANK FILLER PIPE



(a) Install the filler pipe with the 2 bolts.
Torque: 23.5 N*m (240 kgf*cm, 17 ft.*lbf)
(b) Install the filler pipe protector with the 3 bolts.

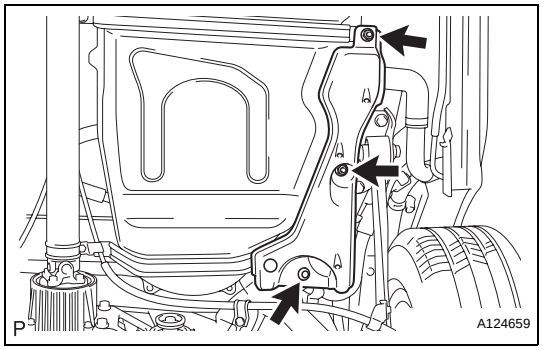
3. CONNECT FUEL TANK TO FILLER PIPE HOSE

(a) Connect the filler pipe hose to the fuel tank.



FU

4. CONNECT FUEL TANK BREATHER HOSE

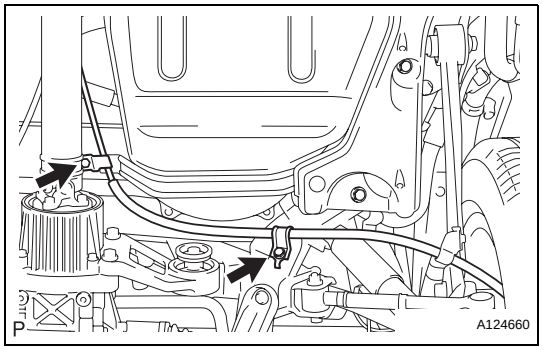


(a) Connect the fuel tank breather hose to the fuel tank.
NOTICE:
- **Before installing the tube connector to the pipe, check the connector for damage and foreign matter.**
- **Check that the connector and pipe is securely connected by trying to pull them apart.**

5. CONNECT FUEL TANK MAIN TUBE SUB-ASSEMBLY
NOTICE:
Before installing the tube connector to the pipe, check the connector for damage and foreign matter.

(a) Connect the main tube connector to the pipe. Push the 2 parts together firmly until a "click" sound is heard.
NOTICE:
Check that the connector and pipe are securely connected by trying to pull them apart.

(b) Connect the EVAP hose to the fuel tank.

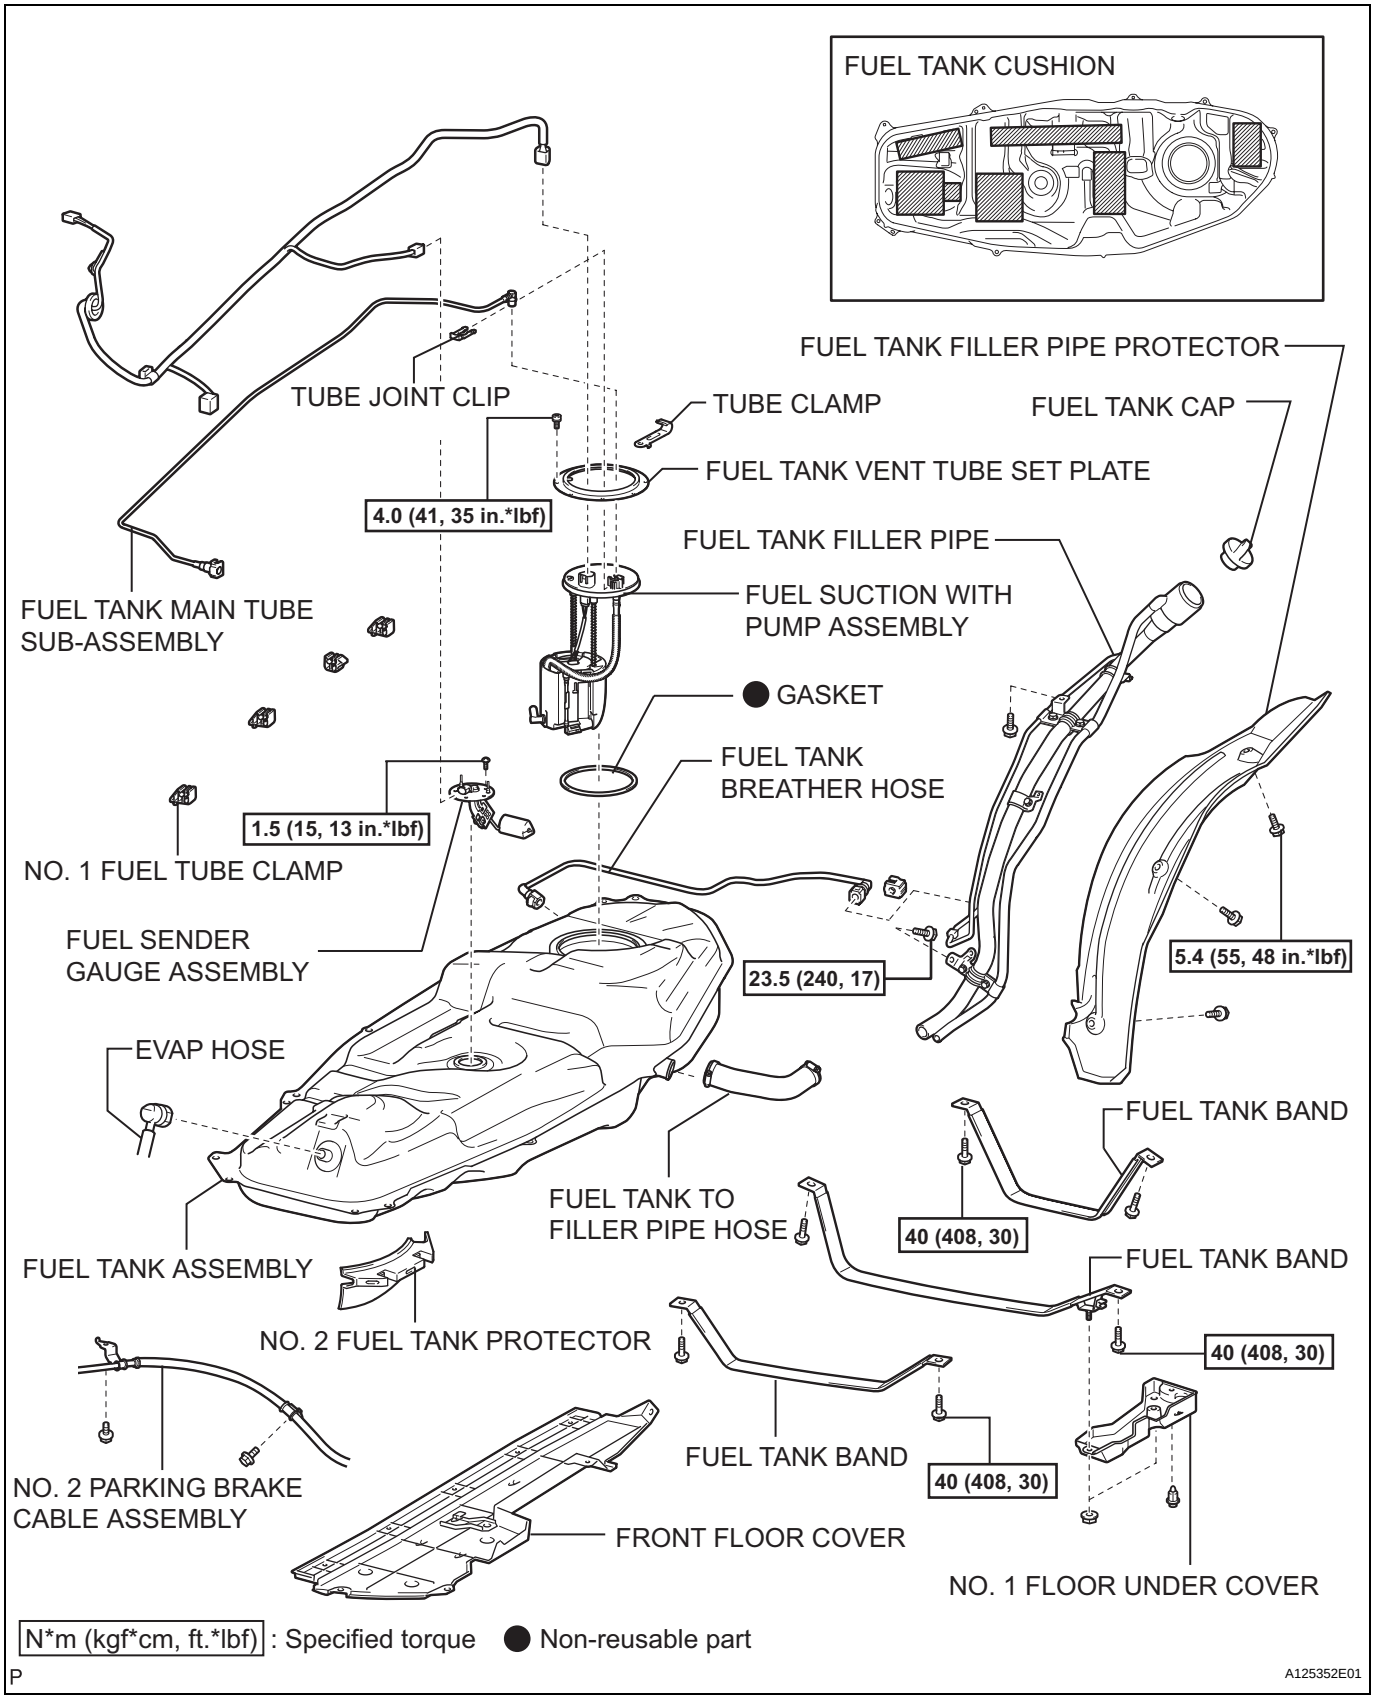


6. INSTALL NO. 1 FLOOR UNDER COVER

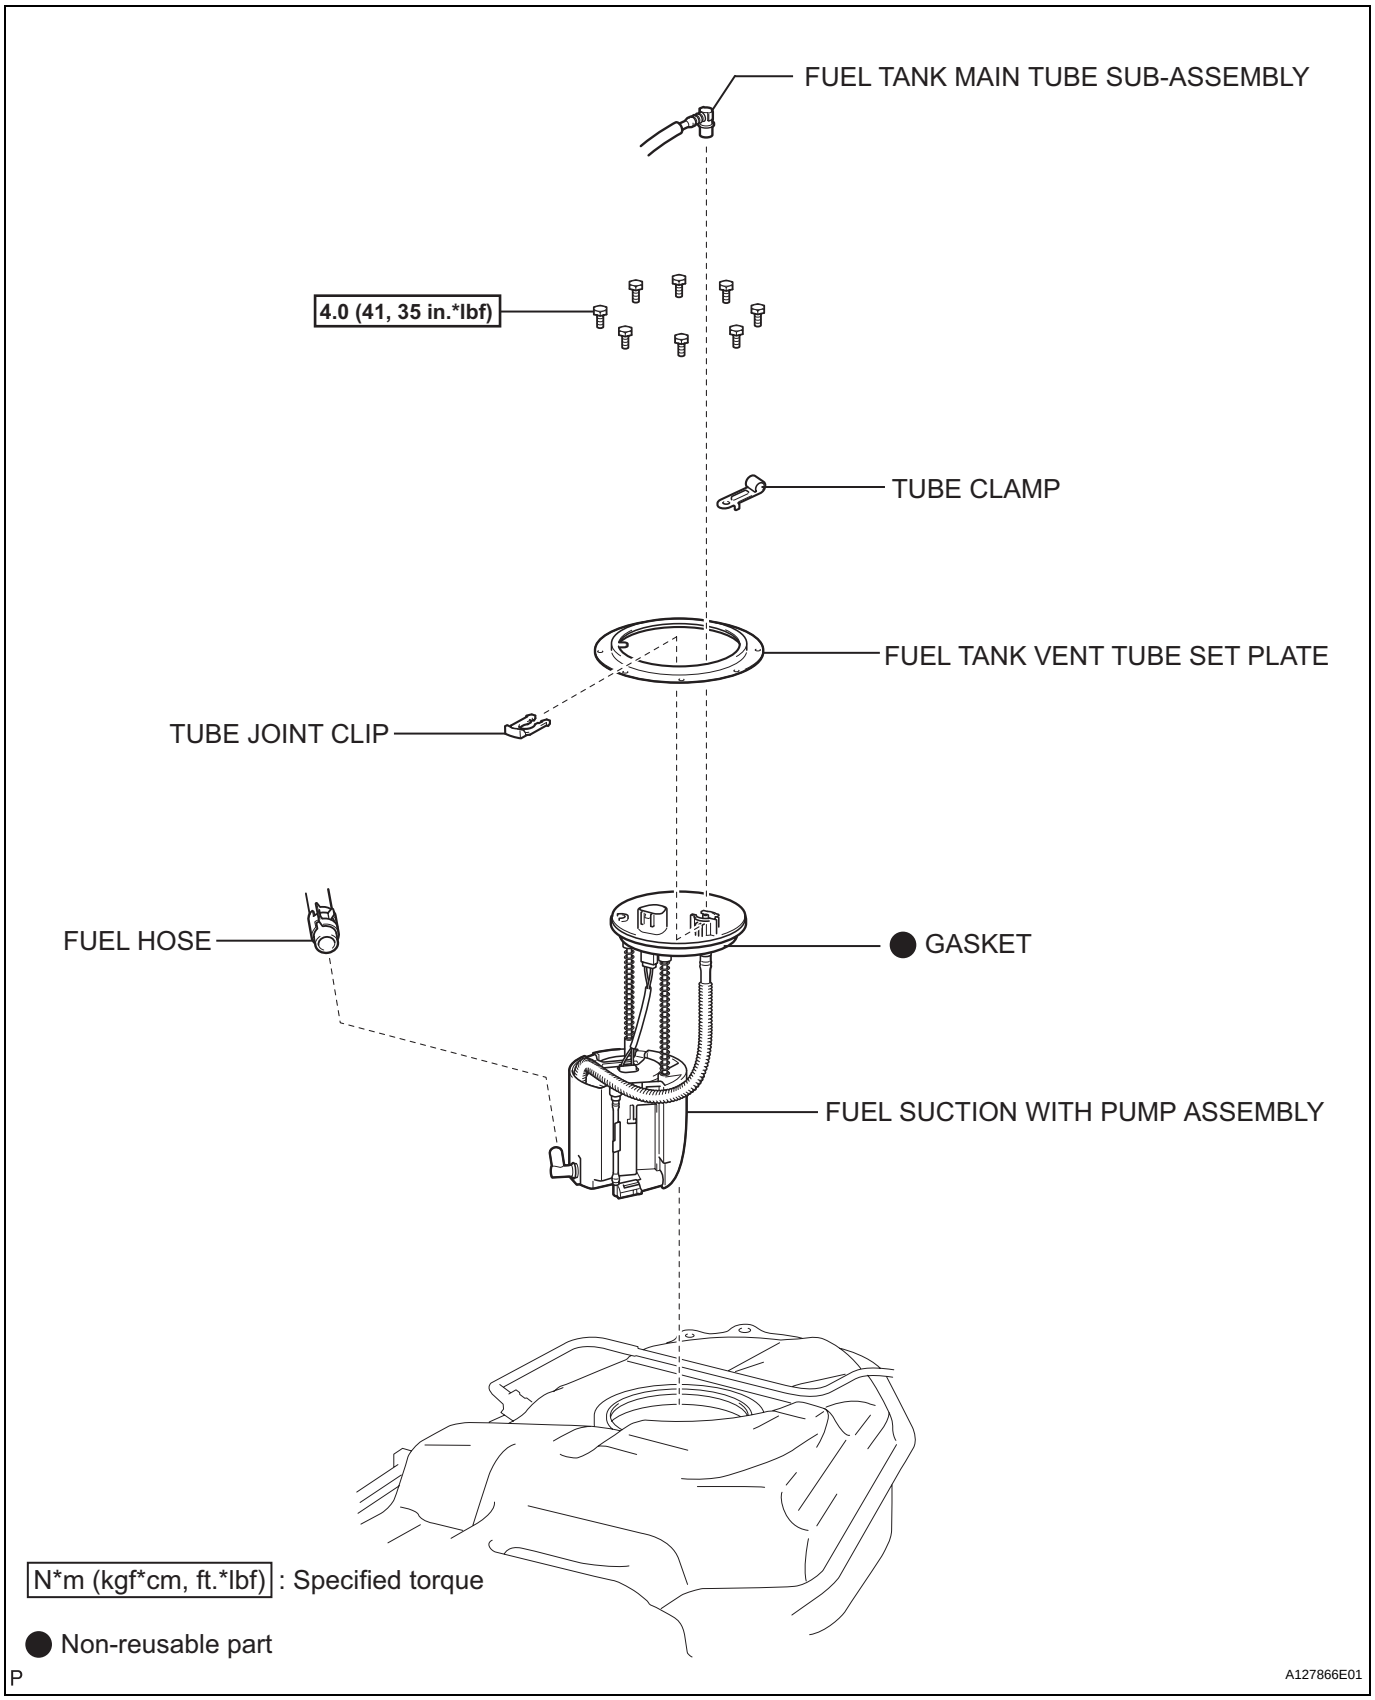
(a) Install the floor cover with the clip and 2 nuts.

7. INSTALL FRONT FLOOR COVER

(a) Install the floor under cover with the 3 clips, bolt and nut.



FU



8. **INSTALL NO. 2 PARKING BRAKE CABLE ASSEMBLY**
   (a) Install the parking brake cable with the 2 bolts.
9. **INSTALL FUEL TANK CAP**
10. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
11. **CHECK FOR FUEL LEAKS (See page FU-14)**

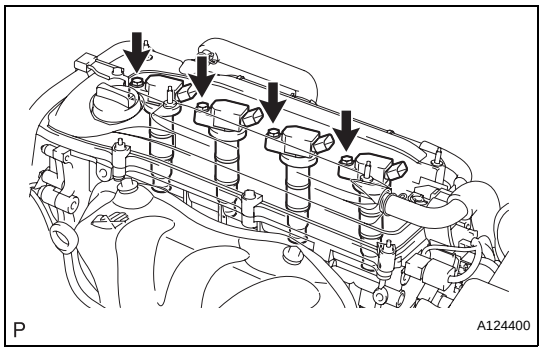
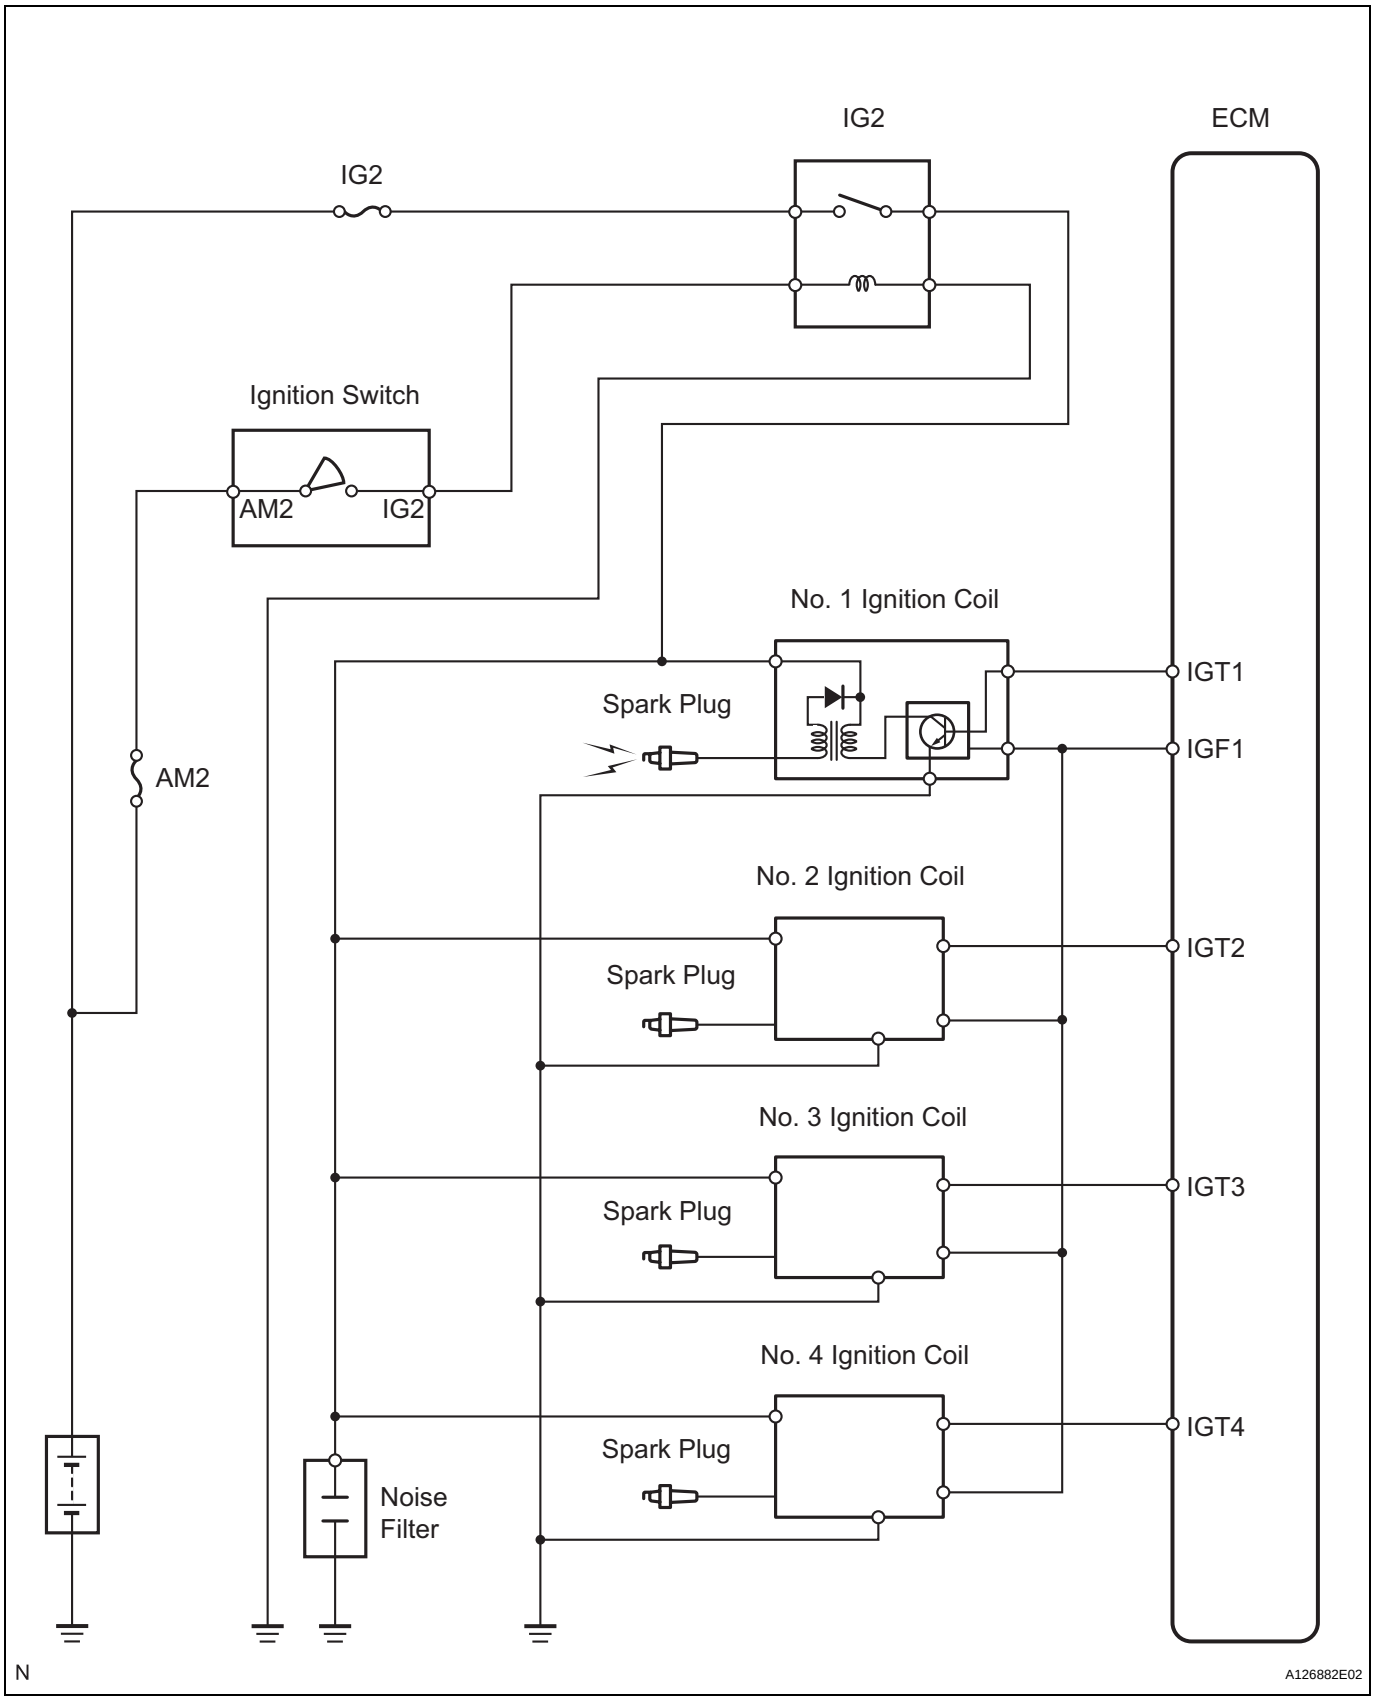
IGNITION COIL

COMPONENTS

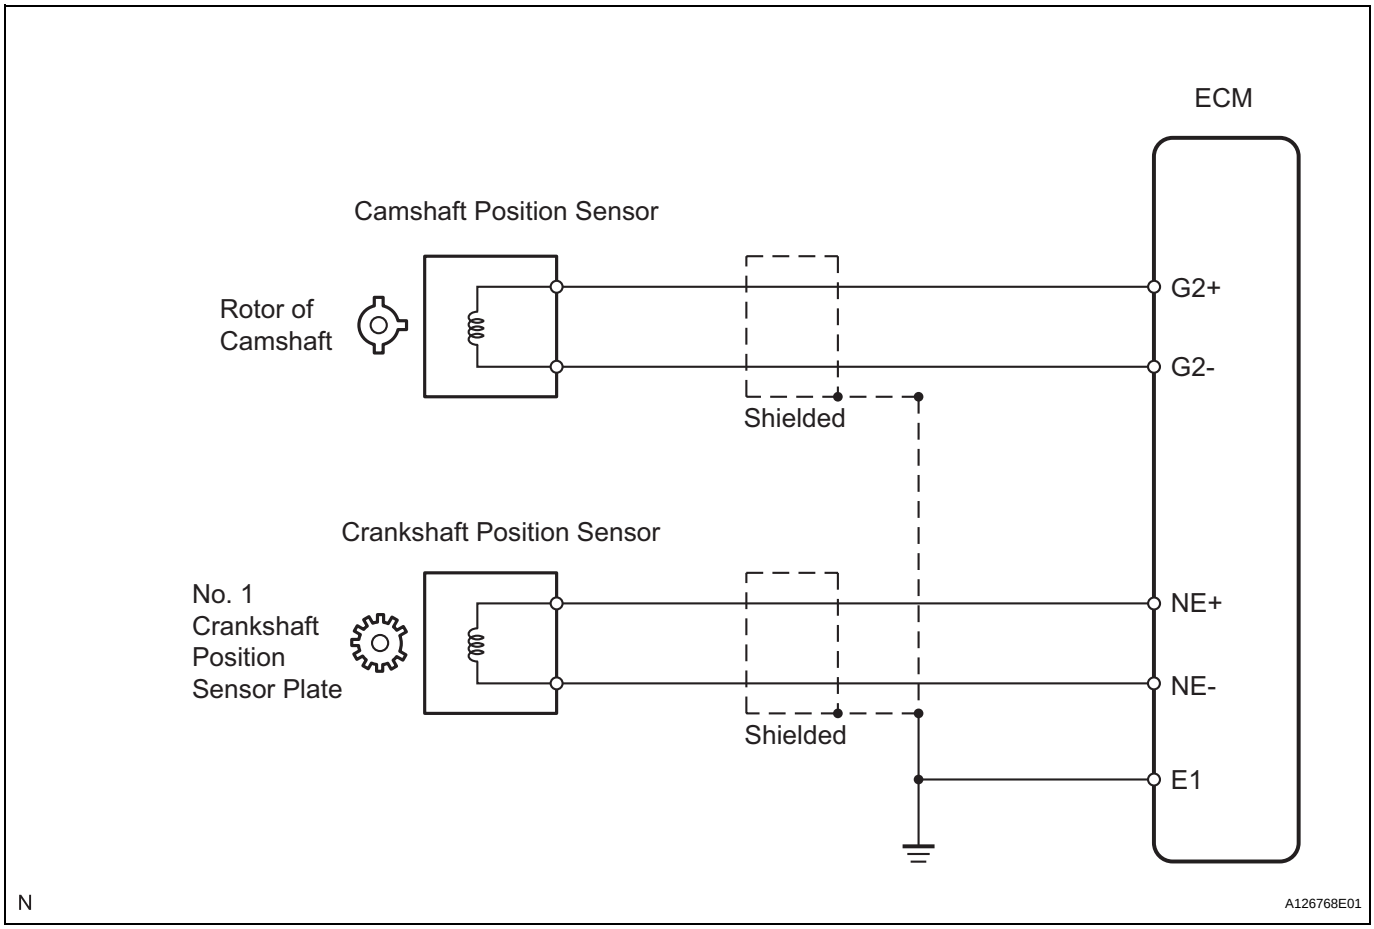


REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE NO. 1 ENGINE COVER (See page ES-410)**
3. **REMOVE IGNITION COIL ASSEMBLY**
   (a) Disconnect the 4 ignition coil connectors.
   (b) Remove the 4 bolts and 4 ignition coils.



INSTALLATION



1. **INSTALL IGNITION COIL ASSEMBLY**
   (a) Install the 4 ignition coils with the 4 bolts.
   Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
   (b) Connect the 4 ignition coil connectors.
2. **INSTALL NO. 1 ENGINE COVER (See page ES-414)**
3. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

ON-VEHICLE INSPECTION

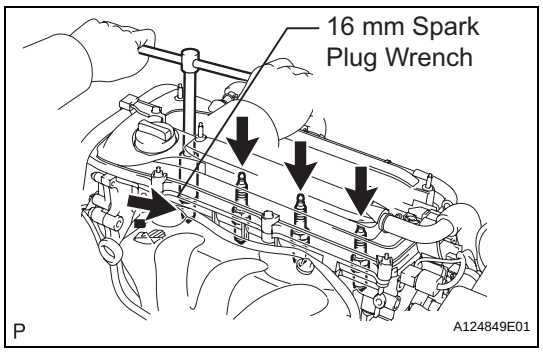
1. CHECK IGNITION COIL ASSEMBLY AND PERFORM SPARK TEST

NOTICE:

In this section, the terms "cold" and "hot" refer to the temperature of the coils. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

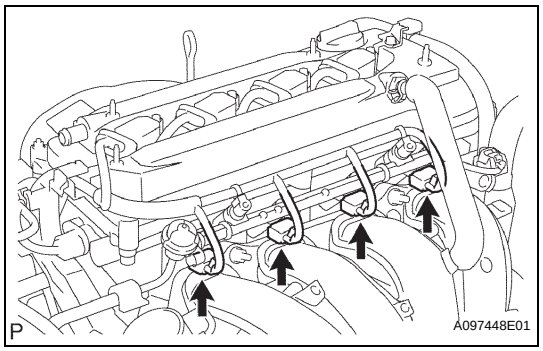
(a) Check the DTCs.

NOTICE:



If a DTC is present, perform troubleshooting in accordance with the procedure for that DTC.

(b) Check that sparks occur.



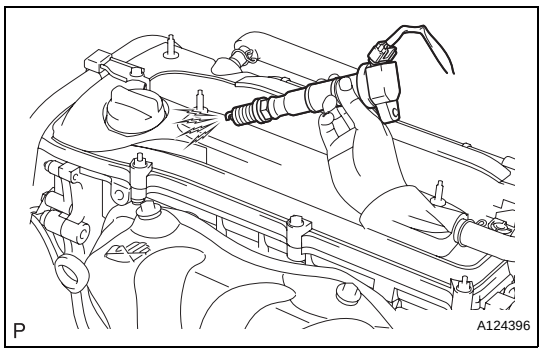
(1) Remove the No. 1 engine cover.

(2) Remove the bolt and ignition coil.

(3) Using a 16 mm spark plug wrench, remove the spark plug.

(4) Disconnect the 4 fuel injector connectors.

(5) Install the spark plug into the ignition coil, and then connect the ignition coil connectors.



(6) Ground the spark plug.

(7) Check that sparks occur at the spark plug while the engine is being cranked.

NOTICE:

- **Be sure to ground the spark plugs when checking them.**
- **If the ignition coil has been struck or dropped, replace it.**
- **Do not crank the engine for more than 2 seconds.**

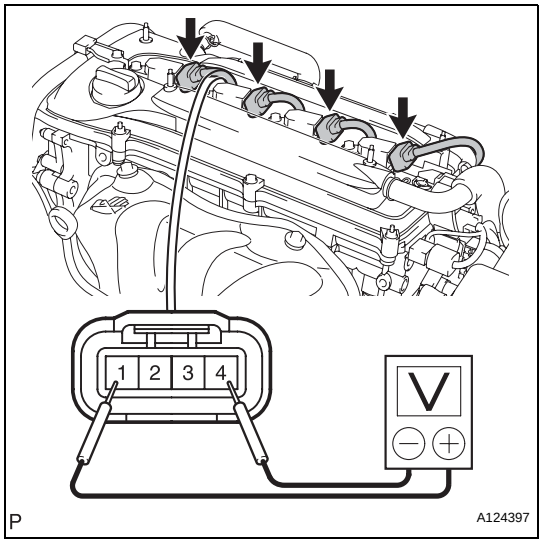
If sparks do not occur, Perform the spark test.

(8) Using a 16 mm plug wrench, install the spark plug.

Torque: 25 N*m (254 kgf*cm, 18 ft.*lbf)

IG

(9) Install the ignition coil with the bolt.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
(10) Connect the 4 fuel injector connectors.
(11) Install the No. 1 engine cover.



(c) Spark test flow chart.

(1) Check that the ignition coil connector is securely connected.
Result

Result	Proceed to
NG	Connect securely
OK	Go to next step

(2) Perform the spark test on each ignition coil.
1. Replace the ignition coil with a normal one.
2. Perform the spark test again.
Result

Result	Proceed to
OK	Replace ignition coil
NG	Go to next step

(3) Check the power supply to the ignition coil.
1. Disconnect the ignition coil connector.
2. Turn the ignition switch ON.
3. Measure the voltage of the wire harness side connector.
Standard voltage

Tester Connection	Specified Condition
1 (+B) - 4 (GND)	9 to 14 V

Result

Result	Proceed to
NG	Check wire harness and connector
OK	Go to next step

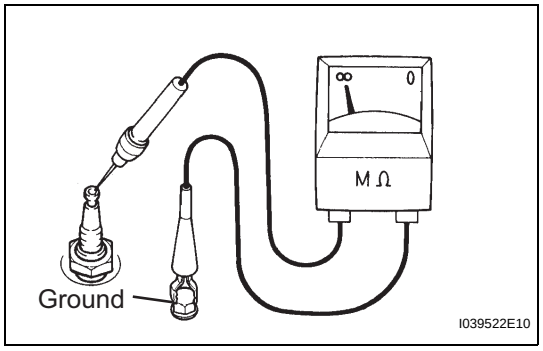
(4) Check the resistance of the camshaft position sensor.
Standard resistance

Temperature Condition	Specified Condition
Cold	835 to 1,400 Ω
Hot	1,060 to 1,645 Ω

Result

Result	Proceed to
NG	Replace camshaft position sensor
OK	Go to next step

(5) Check the resistance of the crankshaft position sensor.
Standard resistance

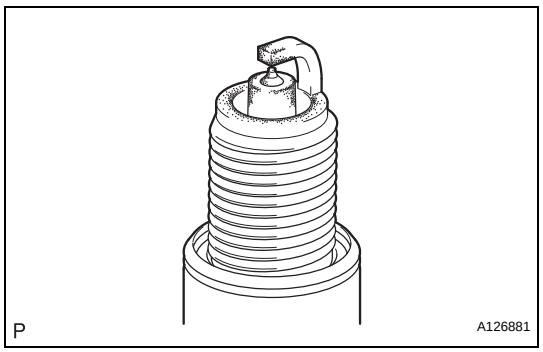


Temperature Condition	Specified Condition
Cold	985 to 1,600 Ω
Hot	1,265 to 1,890 Ω

Result

Result	Proceed to
NG	Replace crankshaft position sensor
OK	Go to next step

(6) Check the IGT signal from the ECM.
Result



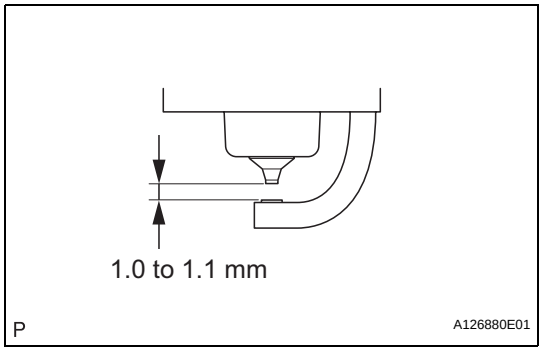
Result	Proceed to
NG	Check ECM (see page ES-183)
OK	Repair wiring between ignition coil and ECM

2. CHECK SPARK PLUG

(a) Check the electrode.

(1) Using a megohmmeter, measure the insulation resistance.
Standard insulation resistance:
10 MΩ or more
HINT:
- If a megohmmeter is not available, perform the following simple inspection instead.
- If the result is 10 MΩ or less, clean the plug and measure the resistance again.

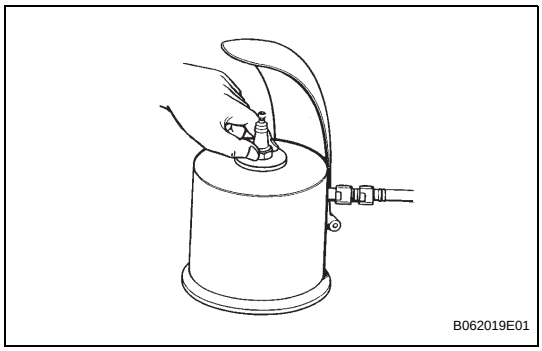
(b) Alternative inspection method:



(1) Quickly accelerate the engine to 4,000 rpm 5 times.

(2) Remove the spark plug.

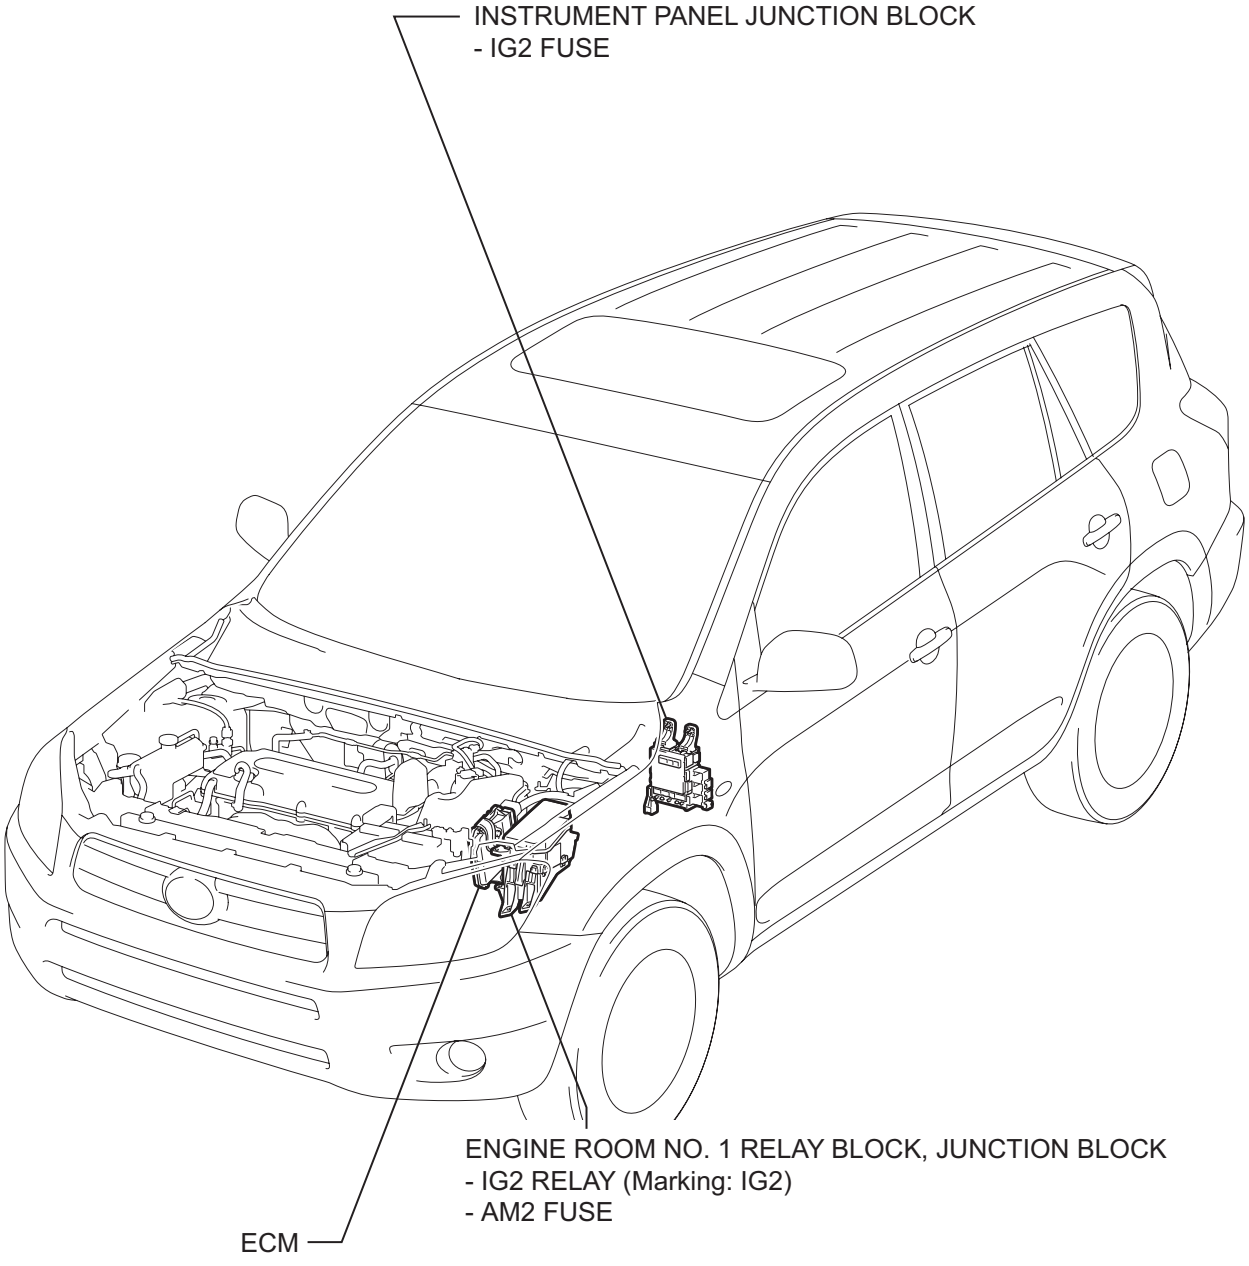
(3) Visually check the spark plug.
If the electrode is dry, the spark plug is functioning properly. If the electrode is damp, proceed to the next step.



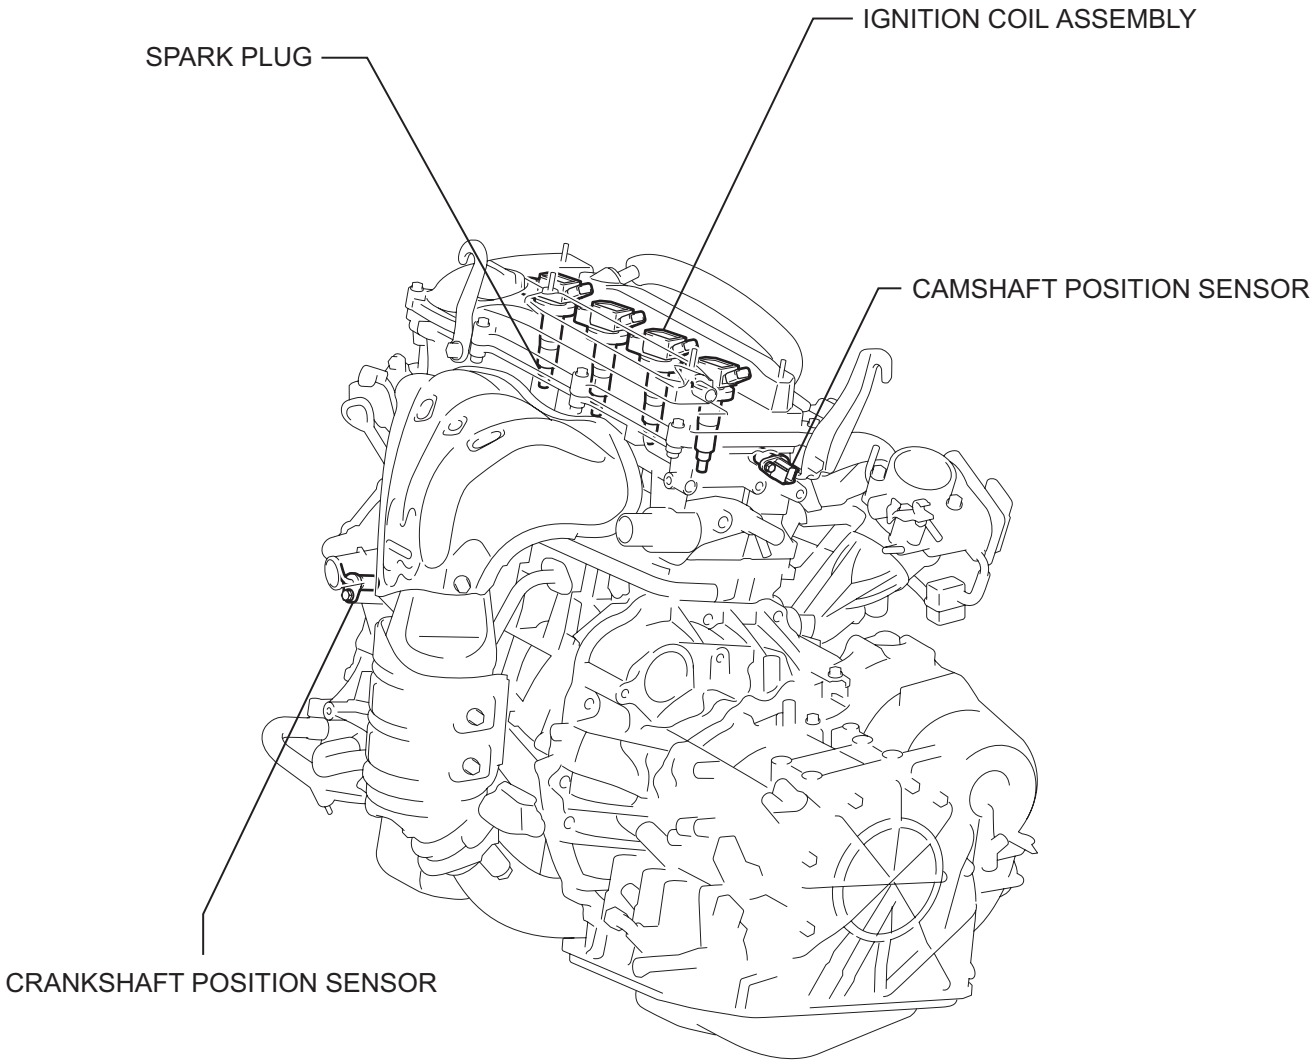
(c) Check the spark plug for any damage on its threads and insulator.
If there is damage, replace the spark plug.
Recommended spark plug

Manufacturer	Spark plug type
DENSO	SK20R11
NGK	IFR6A11

(d) Check the spark plug electrode gap.
Maximum electrode gap for used spark plug:
1.3 mm (0.051 in.)
If the gap is greater than the maximum, replace the spark plug.
Electrode gap for new spark plug:
1.0 to 1.1 mm (0.039 to 0.043 in.)



IG



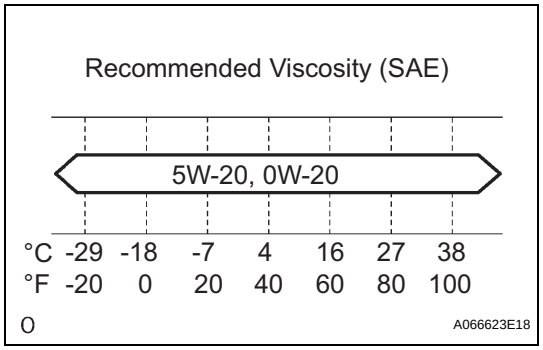
(e) Clean the spark plugs.
If the electrode has traces of wet carbon, clean the electrode with a spark plug cleaner and then dry it.
Standard air pressure:
588 kPa (6 kgf*cm^2, 85 psi)
Standard duration:
20 seconds or less
HINT:
Only use the spark plug cleaner when the electrode is free of oil. If the electrode has traces of oil, use gasoline to clean off the oil before using the spark plug cleaner.

IGNITION SYSTEM

PARTS LOCATION

P

A124848E03



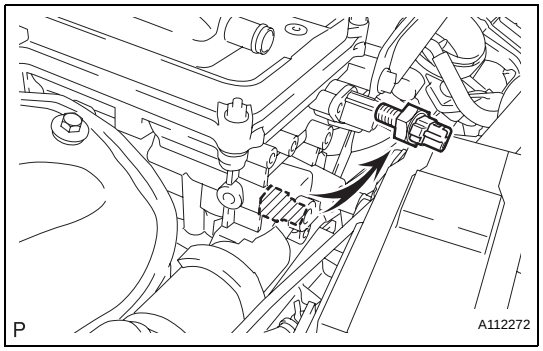
LUBRICATION SYSTEM

ON-VEHICLE INSPECTION

1. CHECK ENGINE OIL LEVEL

(a) Warm up the engine, stop the engine and wait for 5 minutes.

(b) Check that the engine oil level is between the L and F marks of the oil dipstick.
If low, check for leakage and add oil up to the F mark.
NOTICE:
Do not add engine oil above the F mark.

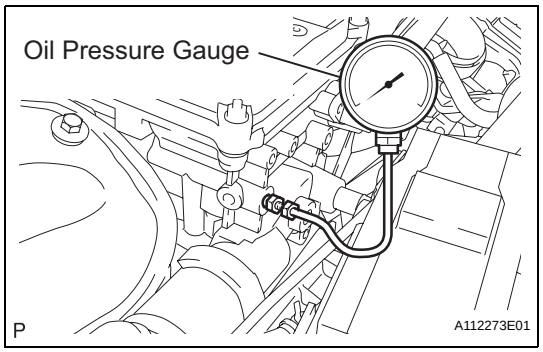


2. CHECK ENGINE OIL QUALITY

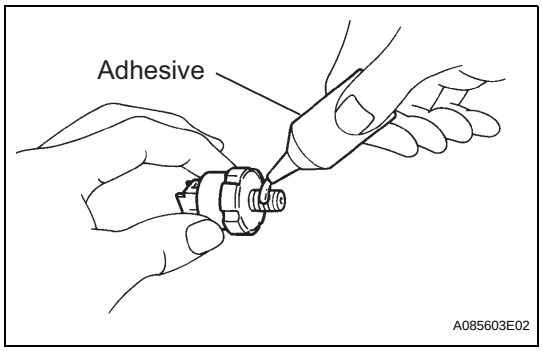
(a) Check the oil for deterioration, water intrusion, discoloration or thinning.
If the quality is visibly poor, replace the oil.
Oil grade:
Use API grade SL "Energy-Conserving" or ILSAC multigrade engine oil. SAE 5W-20 and SAE 0W-20 engine oil may be used. However, SAE0W-20 is the best choice for good fuel economy and good starting in cold weather.

3. CHECK OIL PRESSURE

(a) Disconnect the oil pressure switch connector.



(b) Using a 24 mm deep socket wrench, remove the oil pressure switch.



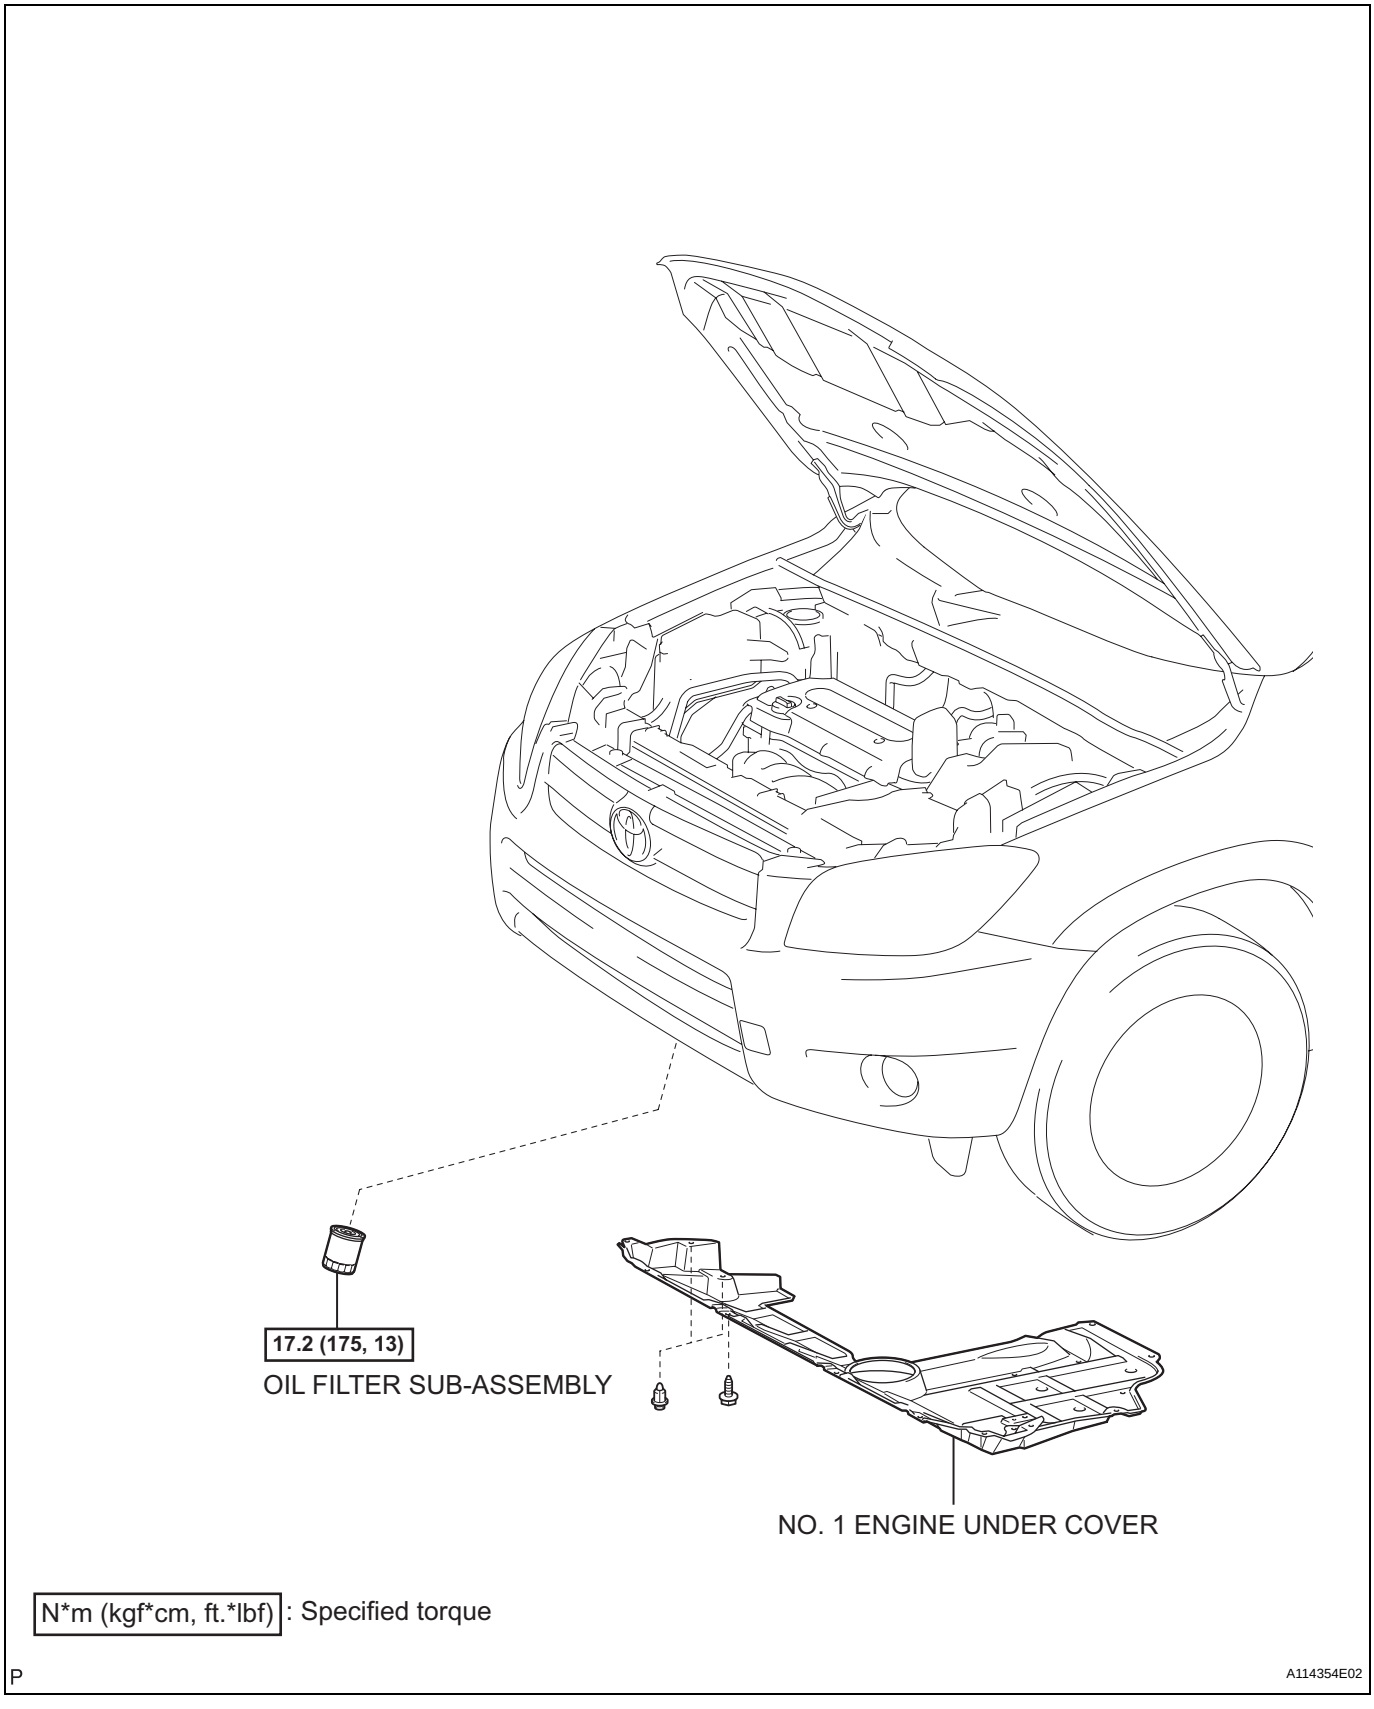
(c) Install the oil pressure gauge.

(d) Warm up the engine.

(e) Measure the oil pressure.
Standard oil pressure

Condition	Specified Condition
Idle	29 kPa (0.3 kgf/cm^2, 4.3 psi) or more
3,000 rpm	160 to 539 kPa (1.6 to 5.5 kgf/cm^2, 23 to 78 psi)

(f) Apply adhesive to 2 or 3 threads of the oil pressure switch.
Adhesive:
TOYOTA Genuine Adhesive 1344, Three Bond 1344 or Equivalent



(g) Using a 24 mm deep socket wrench, install the oil pressure switch.
Torque: 15 N*m (153 kgf*cm, 11 ft.*lbf)
NOTICE:
Do not start the engine within 1 hour of installation.

(h) Connect the oil pressure switch connector.

(i) Check for engine oil leakage.

OIL FILTER

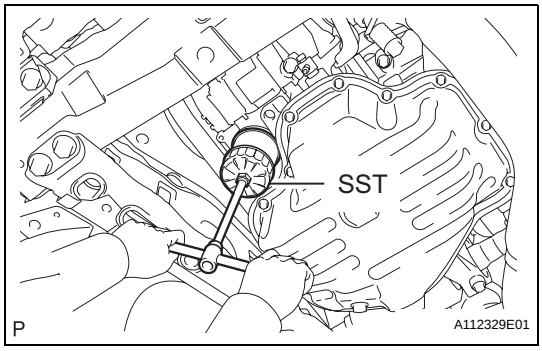
COMPONENTS

REPLACEMENT

CAUTION:

- **Prolonged and repeated contact with engine oil will cause the loss of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Precautions should be taken when replacing engine oil to minimize the risk of your skin making contact with used engine oil. Wear protective clothing and gloves. Wash your skin thoroughly with soap and water, or use a waterless hand cleaner to remove any used engine oil. Do not use gasoline, thinners or solvents.**
- **For environmental protection, used oil and used oil filters must be disposed of at designated disposal sites.**

1. REMOVE NO. 1 ENGINE UNDER COVER



2. DRAIN ENGINE OIL

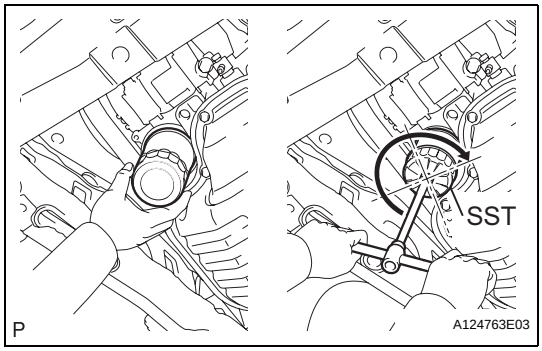
(a) Remove the oil filler cap.

(b) Remove the oil drain plug and drain the oil into a container.

3. REMOVE OIL FILTER SUB-ASSEMBLY

(a) Using SST, remove the oil filter.
SST 09228-06501

4. INSTALL OIL FILTER SUB-ASSEMBLY



(a) Check and clean the oil filter installation surface.

(b) Apply clean engine oil to the gasket of a new oil filter.

(c) Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts the seat.

(d) Using SST, tighten the oil filter.
SST 09228-06501

(1) Depending on the work space available, choose from the following.
1. If enough space is available, use a torque wrench to tighten the oil filter.
Torque: 17.2 N*m (175 kgf*cm, 13 ft.*lbf)
2. If enough space is not available to use a torque wrench, tighten the oil filter a 3/4 turn by hand or use a common wrench.

5. ADD ENGINE OIL

(a) Clean and install the oil drain plug with a new gasket.
Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf)

LU

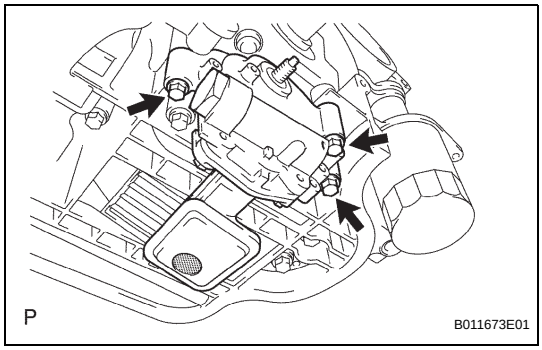
(b) Add new oil.
Standard capacity

Item	Standard Condition
Drain and refill with oil filter change	4.3 liters (4.5 US qts, 3.8 Imp. qts)
Drain and refill without oil filter change	4.1 liters (4.3 US qts, 3.6 Imp. qts)
Dry fill	5.0 liters (5.3 US qts, 4.4 Imp. qts)

(c) Install the oil filler cap.

6. CHECK FOR ENGINE OIL LEAKS

7. INSTALL NO. 1 ENGINE UNDER COVER

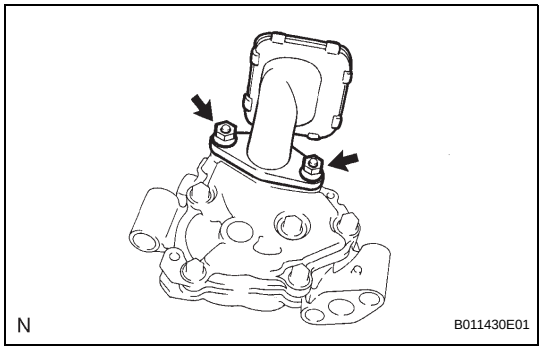


REMOVAL

1. REMOVE CHAIN SUB-ASSEMBLY

(a) Remove the chain (see page EM-22).

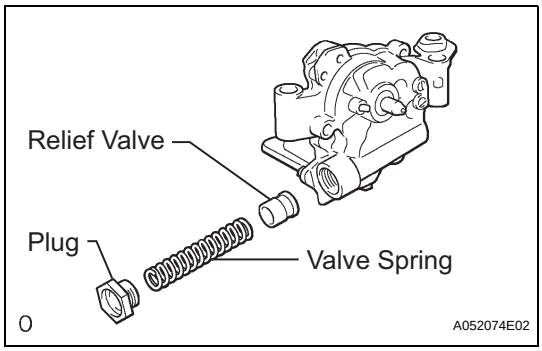
2. REMOVE OIL PUMP ASSEMBLY



(a) Remove the 3 bolts, oil pump and gasket.

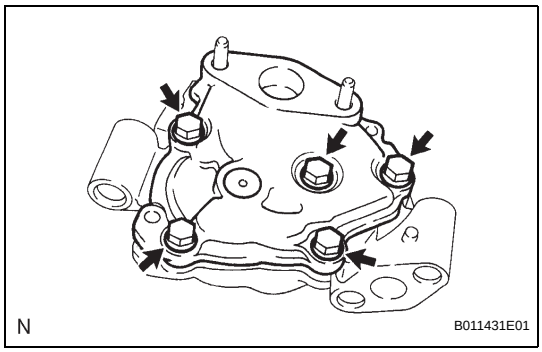
DISASSEMBLY

1. REMOVE OIL PUMP STRAINER



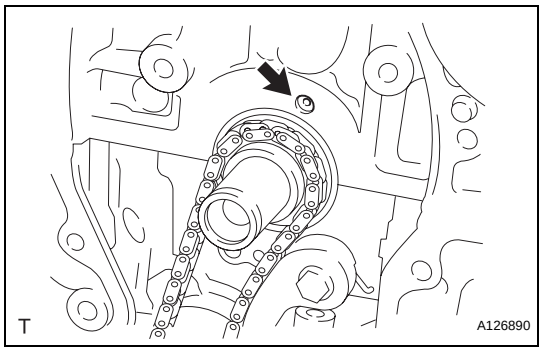
(a) Remove the 2 nuts, oil pump strainer and gasket.

2. REMOVE OIL PUMP RELIEF VALVE



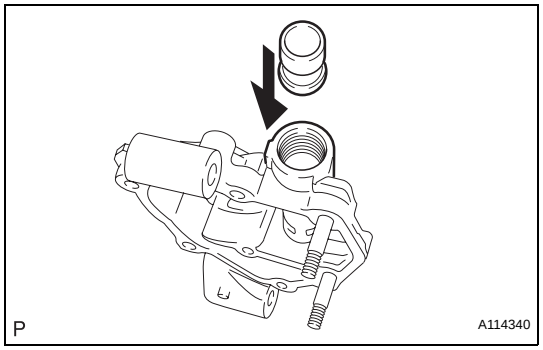
(a) Using a 27 mm socket wrench, remove the plug.

(b) Remove the valve spring and relief valve.



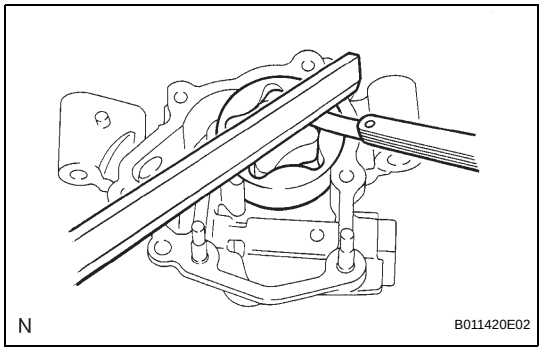
3. REMOVE OIL PUMP COVER

(a) Remove the 5 bolts and oil pump cover.



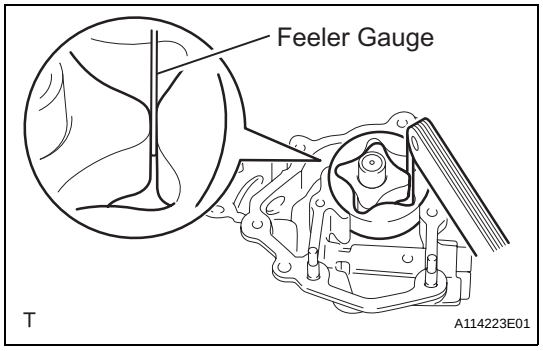
LU

INSPECTION



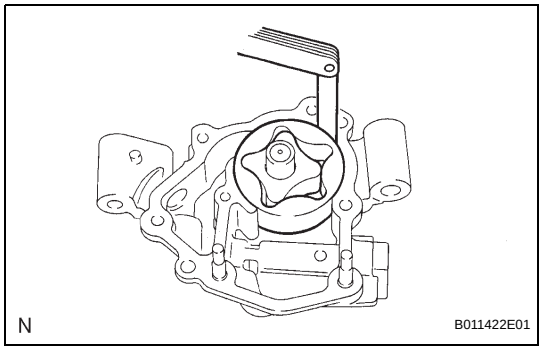
1. INSPECT OIL JET

(a) Check the oil jet for damage or clogging.
If necessary, repair the cylinder block.

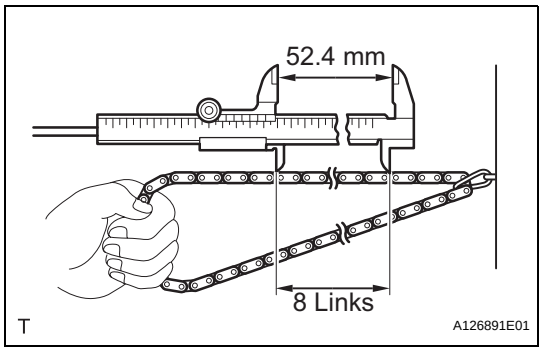


2. INSPECT OIL PUMP RELIEF VALVE

(a) Check the relief valve.
(1) Coat the valve with engine oil, and then check that the valve falls smoothly into the valve hole by its own weight.
If it does not, replace the relief valve. If necessary, replace the oil pump assembly.



3. INSPECT OIL PUMP ROTOR



(a) Check the side clearance.
(1) Using a feeler gauge and precision straightedge, measure the clearance between the rotors and precision straightedge.
Standard clearance:
0.030 to 0.085 mm (0.0012 to 0.0033 in.)
Maximum clearance:
0.16 mm (0.0063 in.)
If the side clearance is greater than the maximum, replace the oil pump assembly.

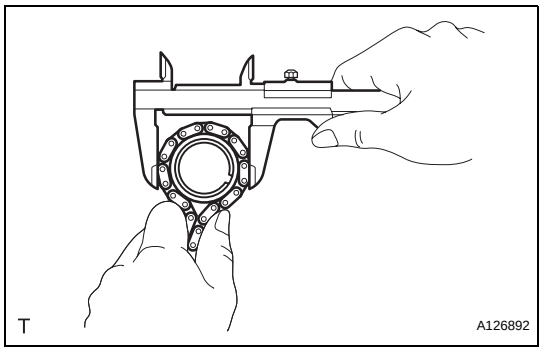
(b) Check the tip clearance.
(1) Using a feeler gauge, measure the clearance between the drive and driven rotor tips.
Standard clearance:
0.080 to 0.160 mm (0.0031 to 0.0063 in.)
Maximum clearance:
0.35 mm (0.0138 in.)
If the tip clearance is greater than the maximum, replace the oil pump assembly.

(c) Check the body clearance.
(1) Using a feeler gauge, measure the clearance between the driven rotor and pump body.
Standard clearance:
0.100 to 0.170 mm (0.0039 to 0.0067 in.)
Maximum clearance:
0.325 mm (0.01128 in.)
If the body clearance is greater than the maximum, replace the oil pump assembly.

4. INSPECT OIL PUMP DRIVE CHAIN AND 2 OIL PUMP SPROCKETS

(a) Using vernier calipers, measure the length of the 8 links with the chain fully stretched.

Maximum chain elongation:



52.4 mm (2.063 in.)

If the elongation is greater than the maximum, replace the chain.

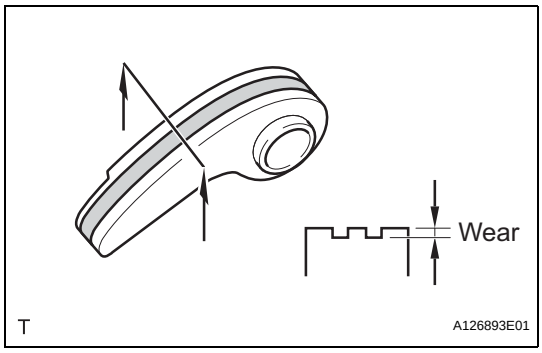
HINT:

Make the measurements at 3 or more places selected at random.

(b) Wrap the chain around the oil pump sprocket.

(c) Using vernier calipers, measure the sprocket diameter with the chain.

NOTICE:



Vernier calipers must contact the chain rollers when measuring.

Minimum sprocket diameter (with chain):

Crankshaft 48.2 mm (1.898 in.)

Oil pump drive shaft 48.2 mm (1.898 in.)

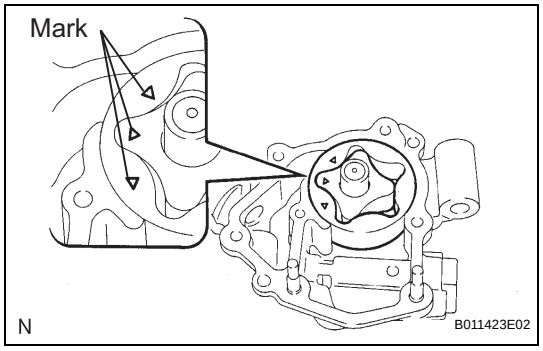
If the diameter is less than the minimum, replace the chain and sprockets.

5. INSPECT CHAIN TENSIONER PLATE

(a) Measure the chain tensioner plate wear.

Maximum wear:

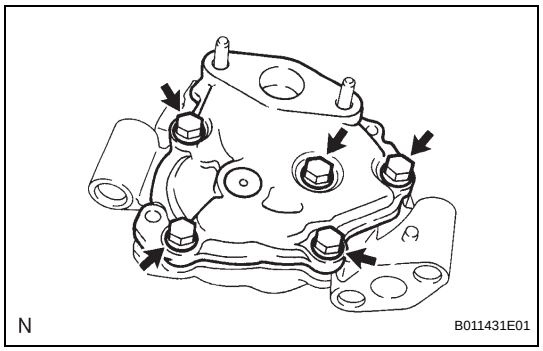
0.5 mm (0.020 in.)



If the wear is greater than the maximum, replace the chain tensioner plate.

REASSEMBLY

1. INSTALL OIL PUMP ROTOR

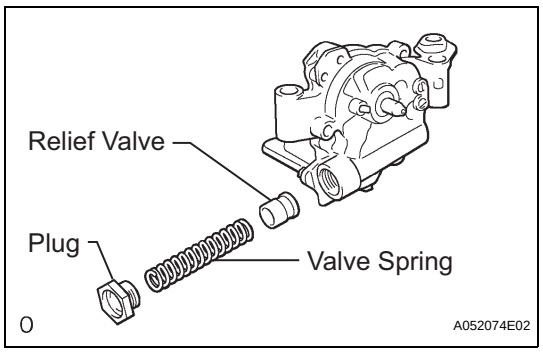


(a) Coat the drive rotor and driven rotor with engine oil.

(b) Place the drive and driven rotors into the oil pump with the marks facing the pump cover side.

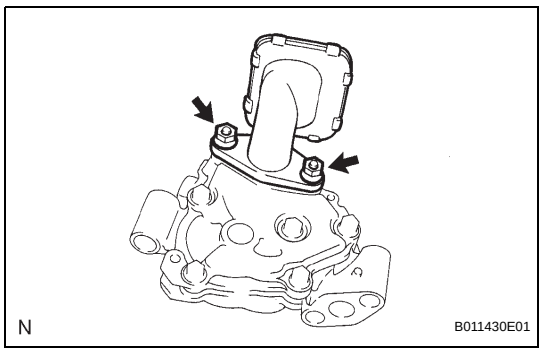
2. INSTALL OIL PUMP COVER

(a) Install the oil pump cover with the 5 bolts.
Torque: 8.8 N*m (90 kgf*cm, 78 in.*lbf)

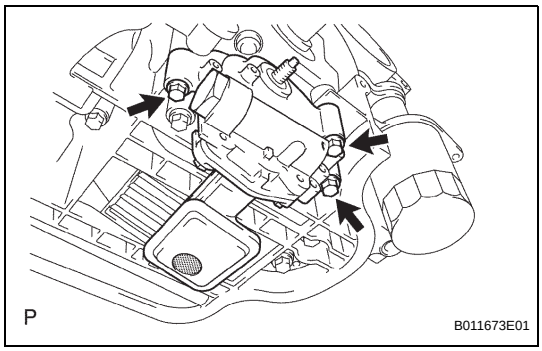


3. INSTALL OIL PUMP RELIEF VALVE

(a) Coat the relief valve with engine oil.



(b) Insert the relief valve and spring into the pump body hole.



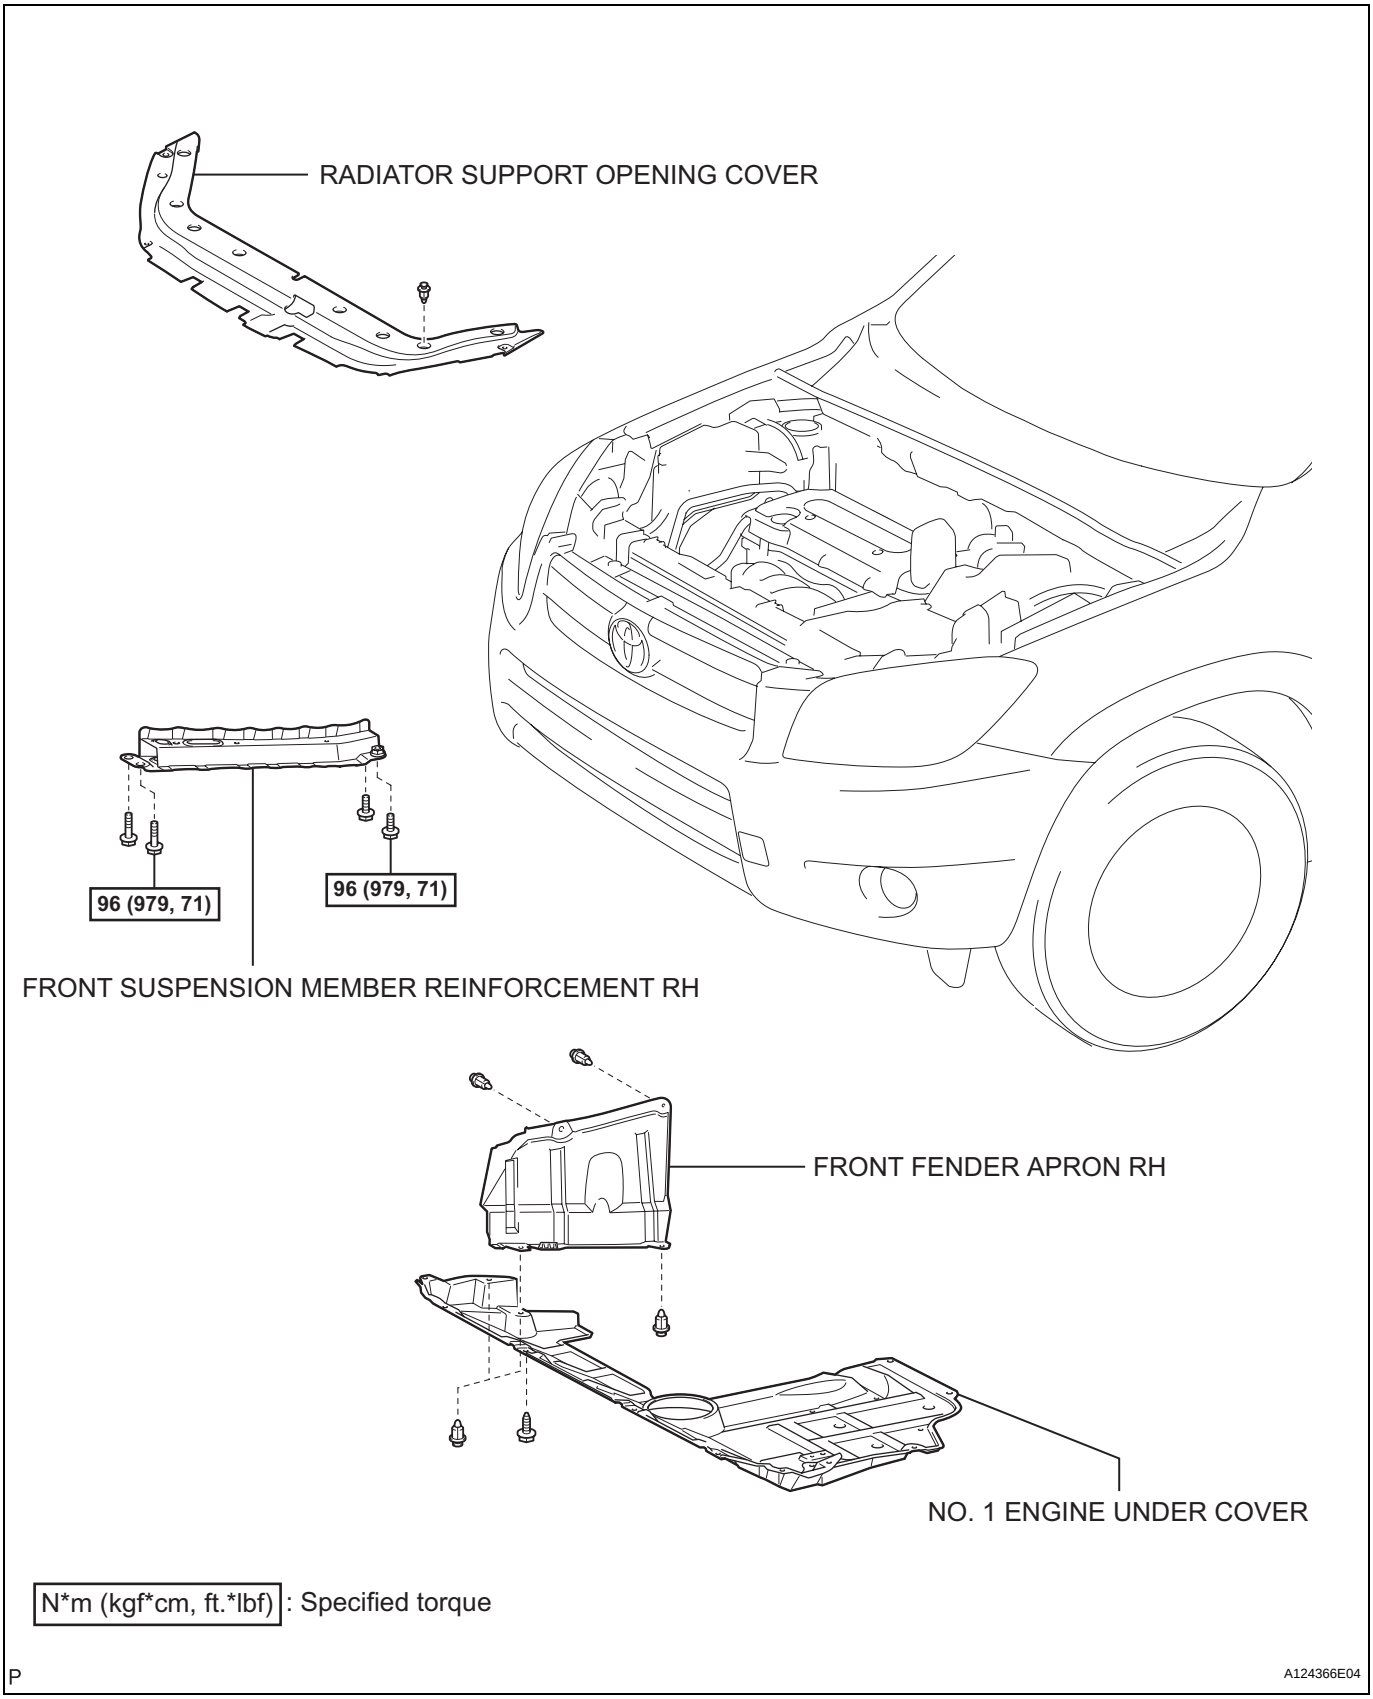
(c) Using a 27 mm socket wrench, install the plug.
Torque: 49 N*m (500 kgf*cm, 36 ft.*lbf)

4. INSTALL OIL PUMP STRAINER

(a) Install a new gasket and the oil strainer with the 2 nuts.
Torque: 8.8 N*m (90 kgf*cm, 78 in.*lbf)

INSTALLATION

1. INSTALL OIL PUMP ASSEMBLY



(a) Install a new gasket and the oil pump with the 3 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

2. INSTALL CHAIN SUB-ASSEMBLY

(a) Install the chain (see page EM-32).

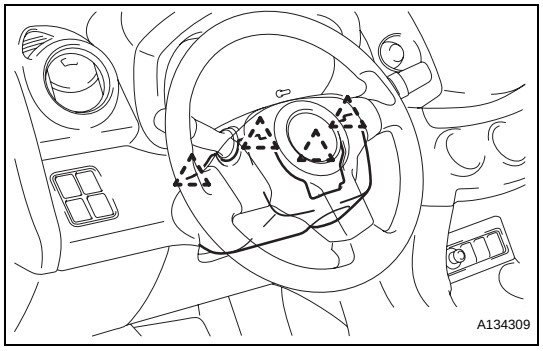
If the result is not as specified, replace the switch assembly.

INSTALLATION

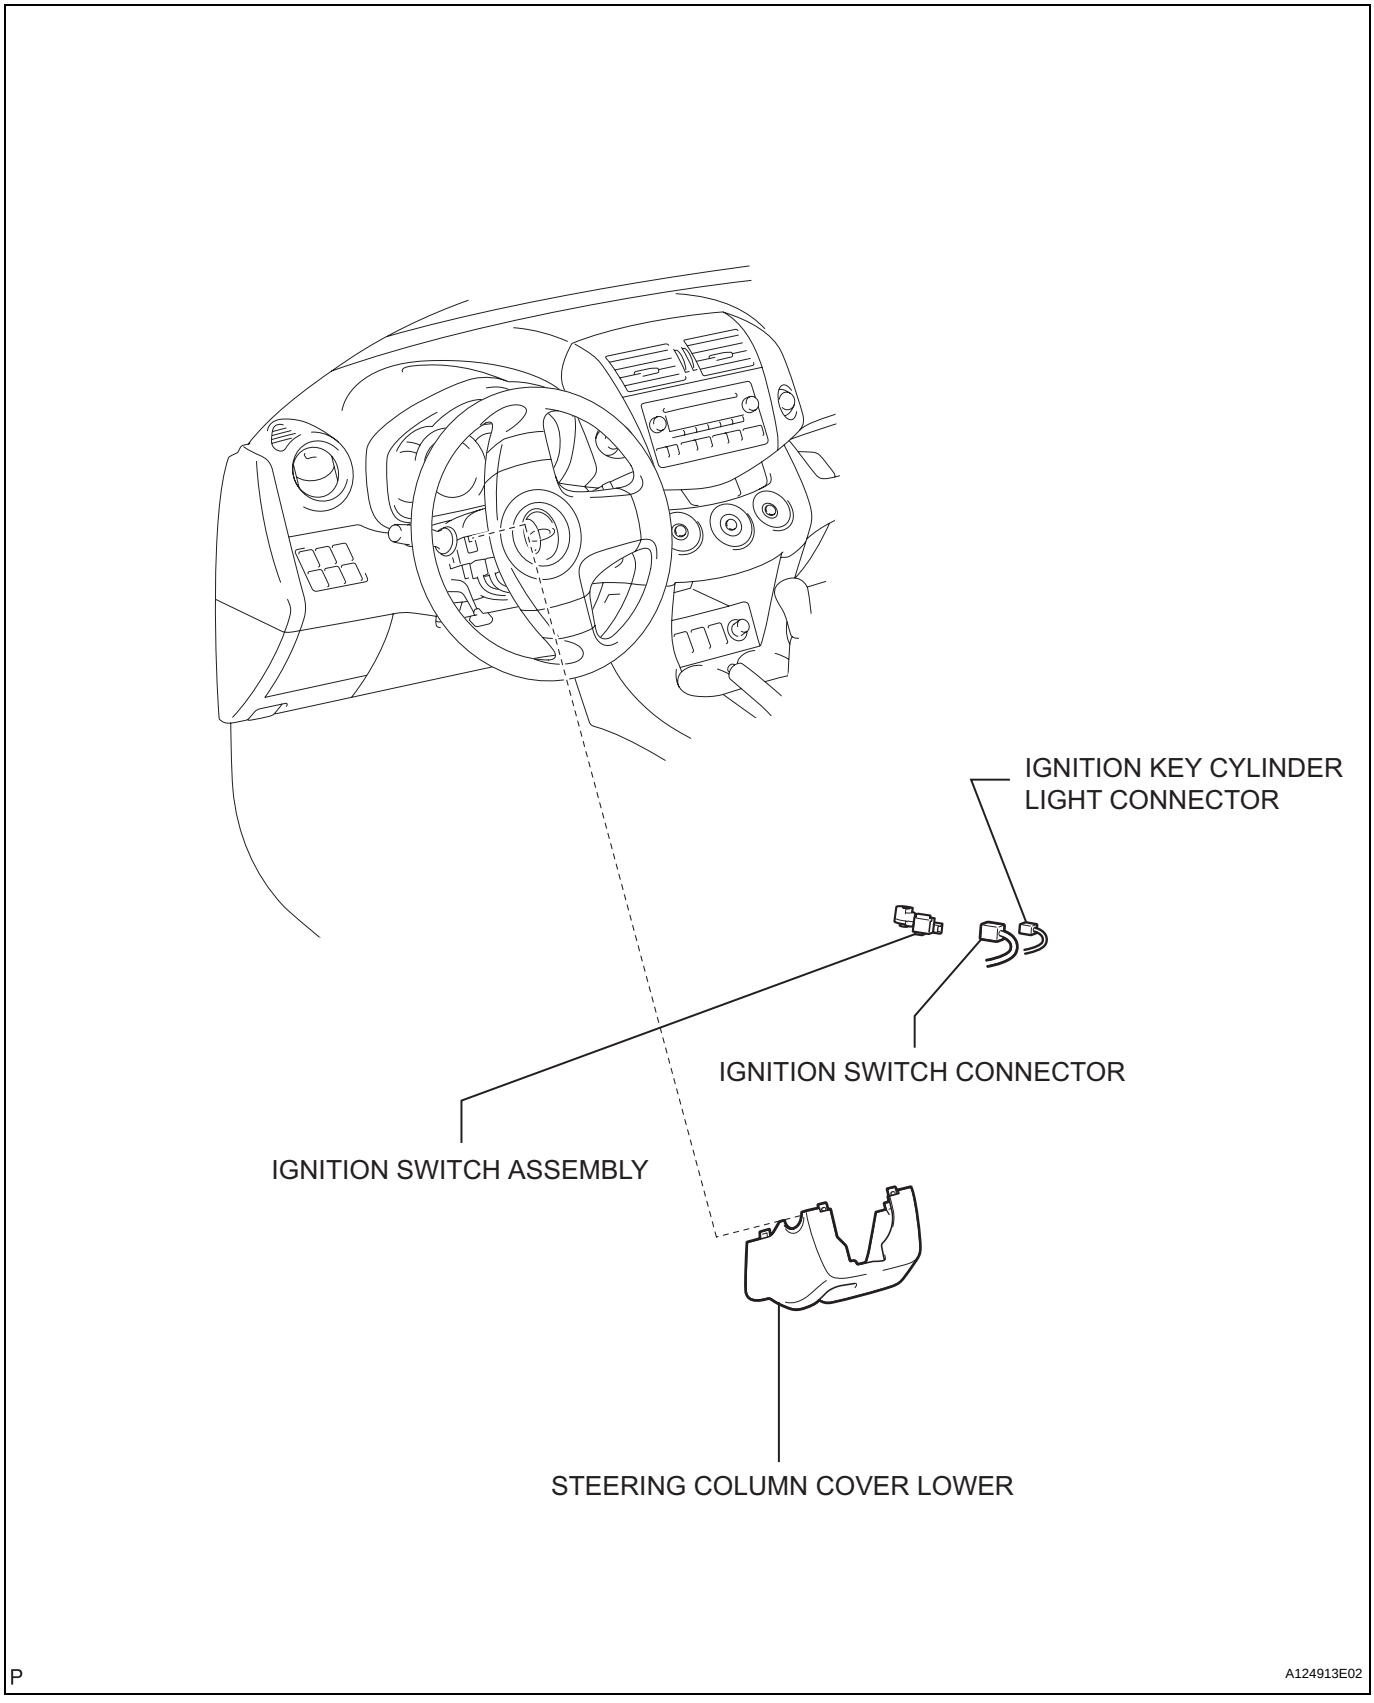


1. INSTALL IGNITION SWITCH ASSEMBLY

(a) Install the ignition switch with the 2 screws.

(b) Install the ignition key cylinder light connector.

(c) Install the ignition switch connector.

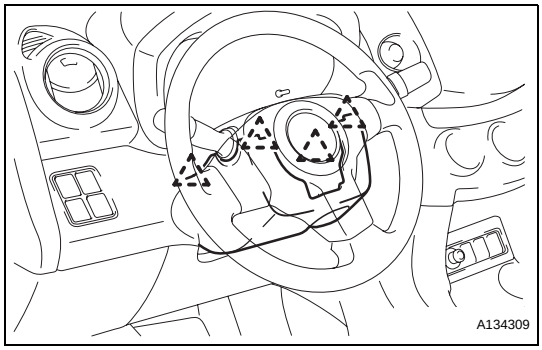


2. INSTALL STEERING COLUMN COVER LOWER

(a) Attach the 4 claws to install the steering column lower cover.

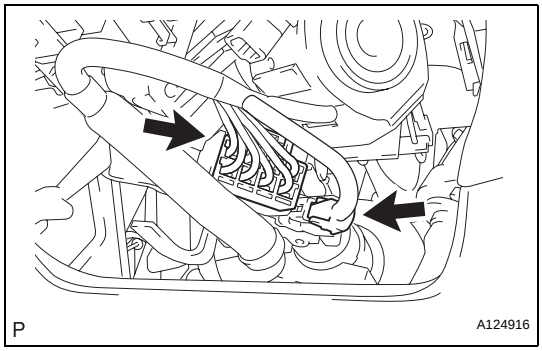
3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

IGNITION SWITCH



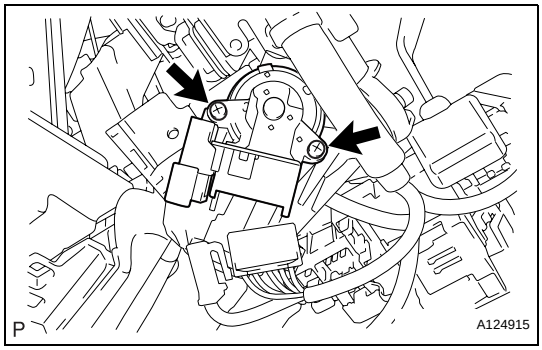
COMPONENTS

REMOVAL



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

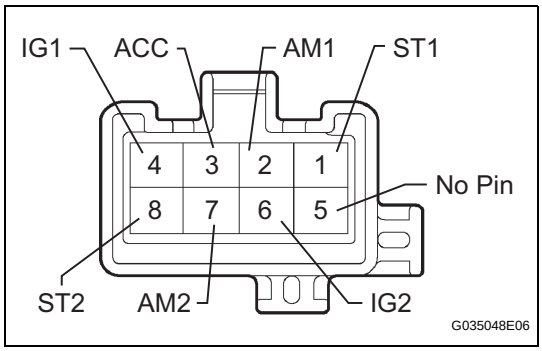


2. REMOVE STEERING COLUMN COVER LOWER

(a) Detach the 4 claws, release the tilt lever and remove the steering column cover lower.

3. REMOVE IGNITION SWITCH ASSEMBLY

(a) Disconnect the ignition switch connector.
(b) Disconnect the ignition key cylinder light connector.

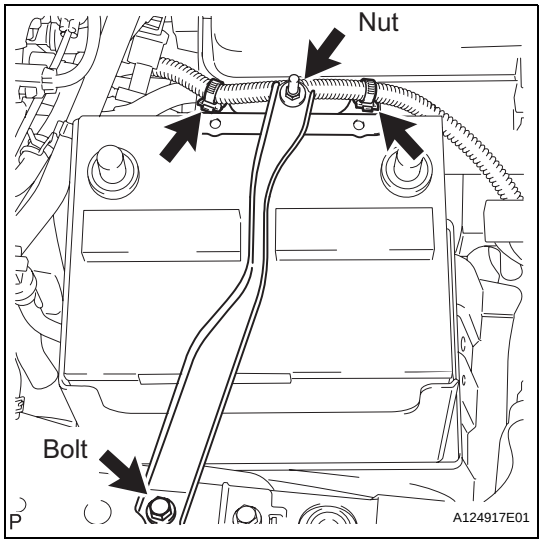


(c) Remove the 2 screws and ignition switch.

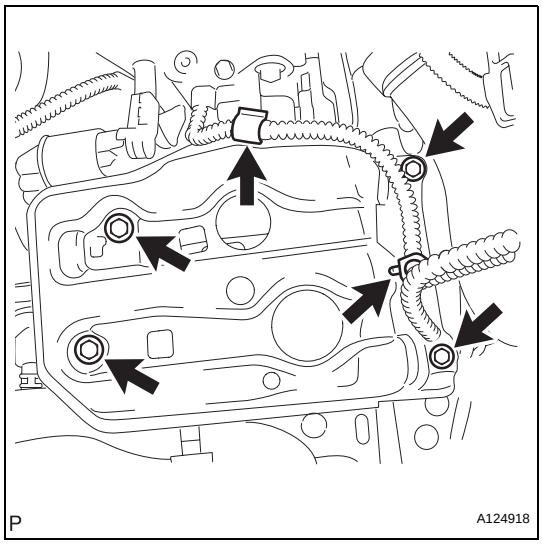
INSPECTION

1. INSPECT IGNITION SWITCH ASSEMBLY

(a) Measure the resistance of the switch.
Standard resistance

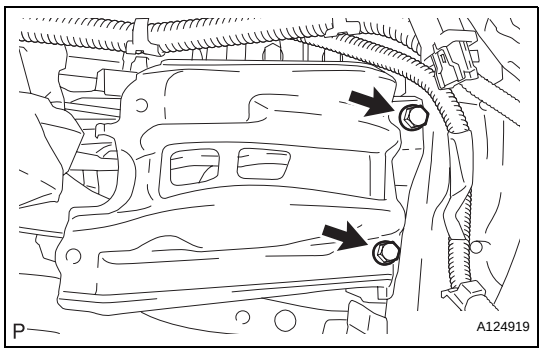


Tester Connection	Switch Condition	Specified Condition
-	LOCK	10 kΩ or higher
2 (AM1) - 3 (ACC)	ACC	Below 1 Ω
2 (AM1) - 3 (ACC) 2 (AM1) - 4 (IG1) 6 (IG2) - 7 (AM2)	ON	Below 1 Ω
1 (ST1) - 2 (AM1) 1 (ST1) - 4 (IG1) 6 (IG2) - 7 (AM2) 6 (IG2) - 8 (ST2)	START	Below 1 Ω

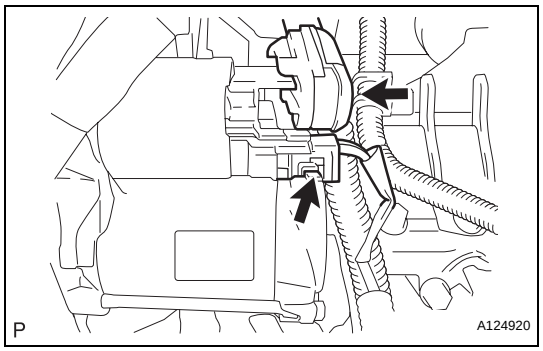


ST

REMOVAL

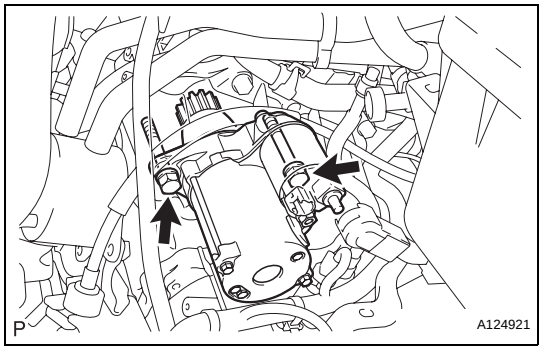


1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **DISCONNECT CABLE FROM POSITIVE BATTERY TERMINAL**
3. **REMOVE BATTERY CLAMP**
   (a) Remove the bolt and loosen the nut.
   (b) Detach the 2 wire harness clamps.
   (c) Detach the hook of the battery clamp from the battery bracket front, and then remove the battery clamp.
4. **REMOVE BATTERY INSULATOR**
5. **REMOVE BATTERY**



6. **REMOVE FRONT BATTERY BRACKET**
   (a) Detach the 2 wire harness clamps.
   (b) Remove the 4 bolts and bracket front.

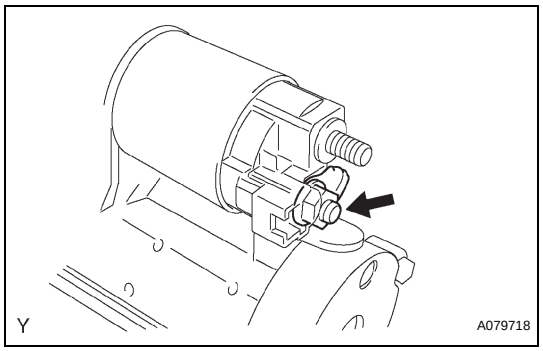
7. **REMOVE BATTERY BRACKET REINFORCEMENT**
   (a) Remove the 2 bolts and reinforcement bracket.



8. REMOVE STARTER ASSEMBLY

(a) Disconnect the starter connector.

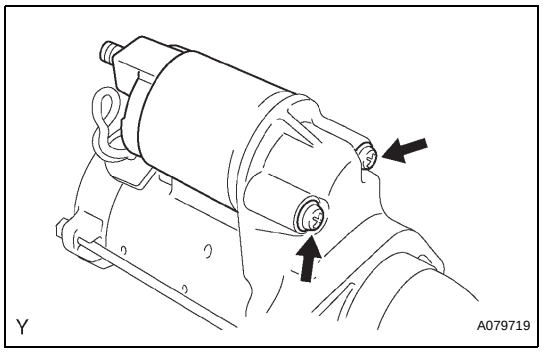
(b) Open the terminal cap, remove the nut and disconnect the starter wire.



(c) Remove the 2 bolts and starter.

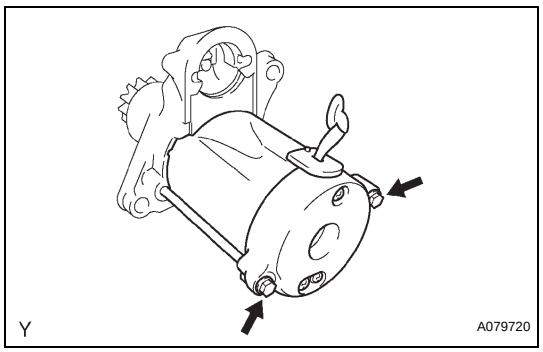
DISASSEMBLY

1. REMOVE MAGNETIC SWITCH ASSEMBLY



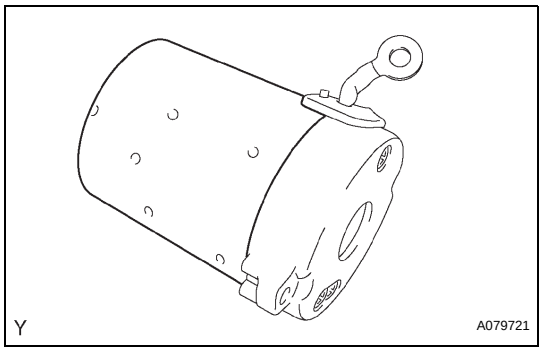
(a) Remove the nut and disconnect the lead wire from the magnetic switch.

(b) Remove the 2 screws holding the magnetic switch to the starter drive housing.

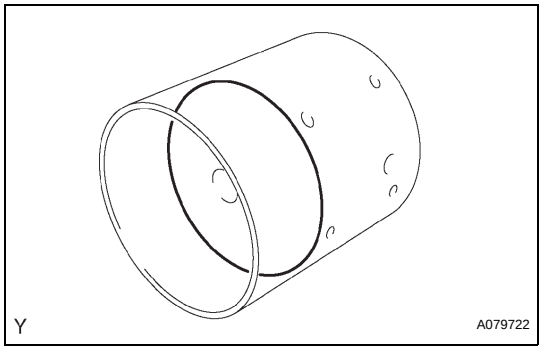


(c) Remove the magnetic switch.

(d) Remove the return spring and plunger from the starter drive housing.

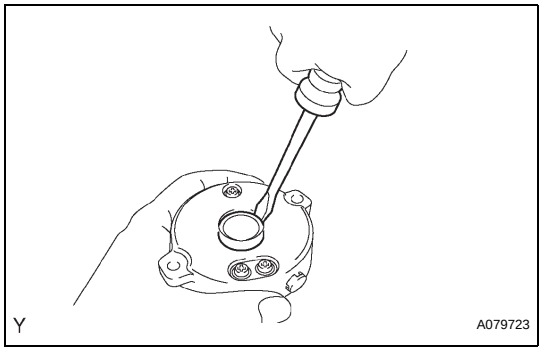


2. REMOVE STARTER YOKE ASSEMBLY

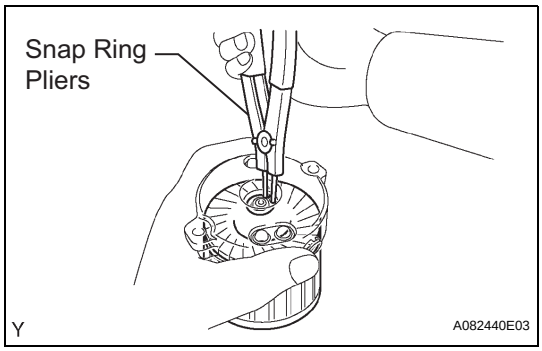


(a) Remove the 2 through-bolts, and pull out the starter yoke together with the commutator end frame.

ST



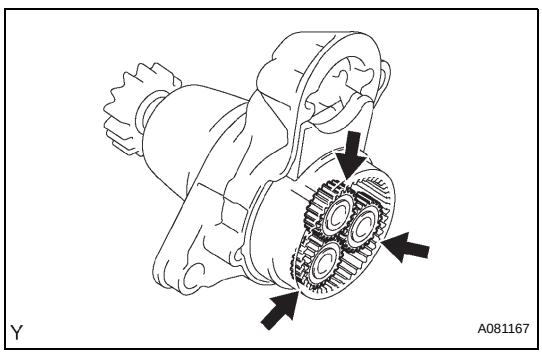
(b) Remove the starter yoke from the commutator end frame.



3. REMOVE STARTER ARMATURE PLATE

(a) Remove the armature plate from the starter yoke.

4. REMOVE STARTER COMMUTATOR END FRAME COVER



(a) Using a screwdriver, pry out the commutator end frame cover.

5. REMOVE STARTER ARMATURE ASSEMBLY

(a) Using snap ring pliers, remove the snap ring and plate washer.

(b) Remove the armature from the commutator end frame.

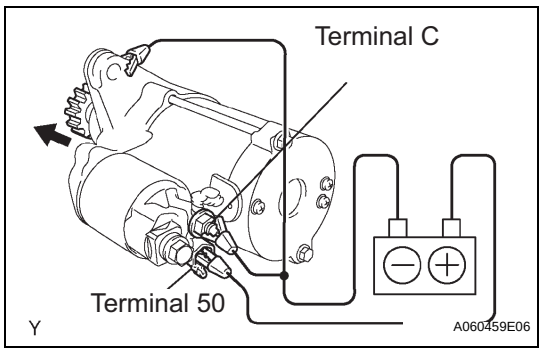
6. REMOVE PLANETARY GEAR

(a) Remove the 3 planetary gears from the starter drive housing.

ST

INSPECTION

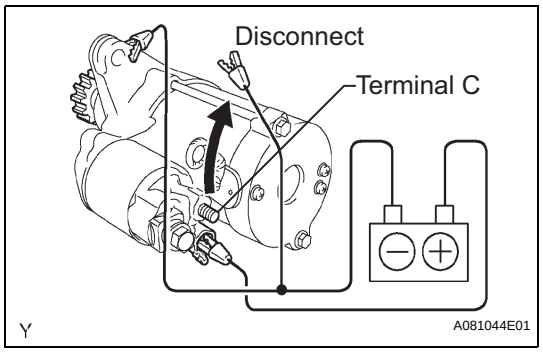
1. INSPECT STARTER ASSEMBLY



NOTICE:

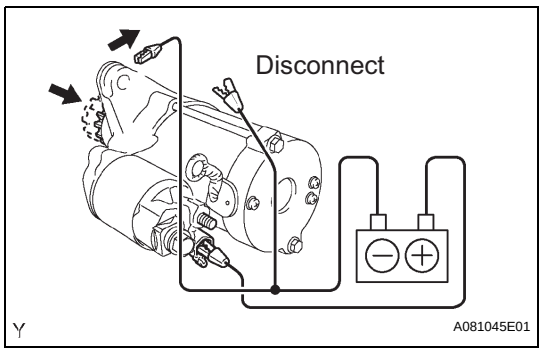
These tests must be performed within 3 to 5 seconds to avoid burning out the coil.

(a) Perform the pull-in test.



(1) Disconnect the lead wire from terminal C.

(2) Connect the battery to the magnetic switch as shown in the illustration. Check that the clutch pinion gear extends.
If the clutch pinion gear does not move, replace the magnetic switch.

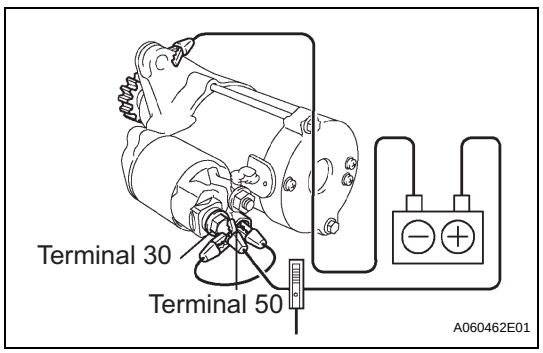


(b) Perform the hold-in test.

(1) Maintain the battery connections of the pull-in test above, but disconnect the negative (-) lead from terminal C. Check that the pinion gear remains extended.
If the clutch pinion gear returns inward, replace the magnetic switch.

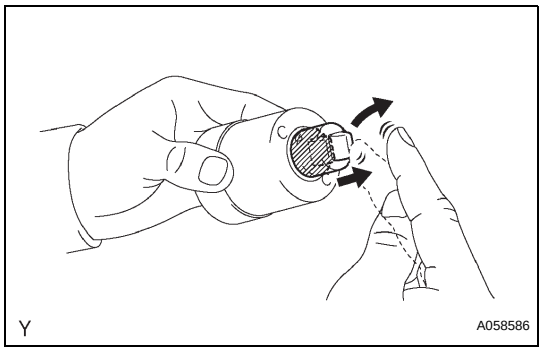
(c) Check the clutch pinion gear return.

(1) Disconnect the negative (-) lead from the switch body. Check that the clutch pinion gear returns.
If the clutch pinion gear does not return, replace the magnetic switch.



(d) Perform the no-load performance test.

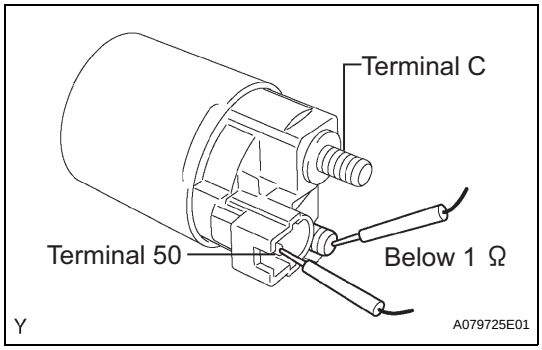
(1) Connect the lead wire to terminal C. Make sure that the lead is not grounded.



(2) Clamp the starter in a vise.

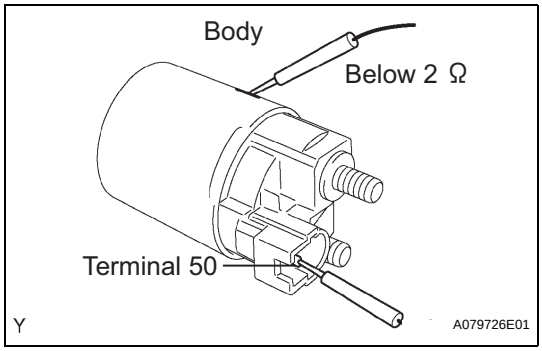
(3) Connect the battery and an ammeter to the starter as shown in the illustration.

(4) Check that the starter rotates smoothly and steadily while the pinion gear is moving out. Then measure the current.
Standard current:
90 A or less at 11.5 V
If result is not as specified, replace the starter assembly.



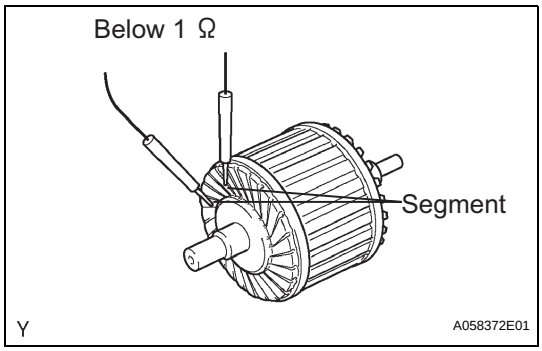
ST

2. INSPECT MAGNETIC SWITCH ASSEMBLY



(a) Check the plunger.

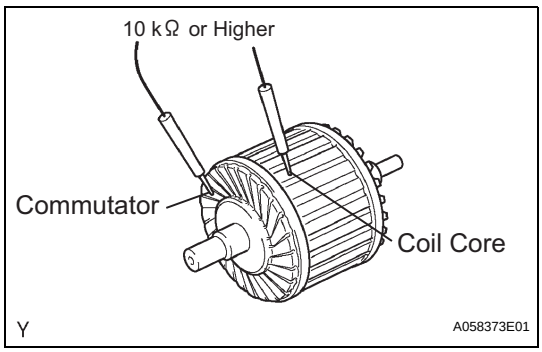
(1) Push in the plunger and check that it returns quickly to its original position.
If necessary, replace the magnetic switch assembly.



(b) Check if the pull-in coil has an open circuit.

(1) Measure the resistance between terminals 50 and C.
Standard resistance:
Below 1 Ω
If the result is not as specified, replace the magnetic switch assembly.

(c) Check if the hold-in coil has an open circuit.

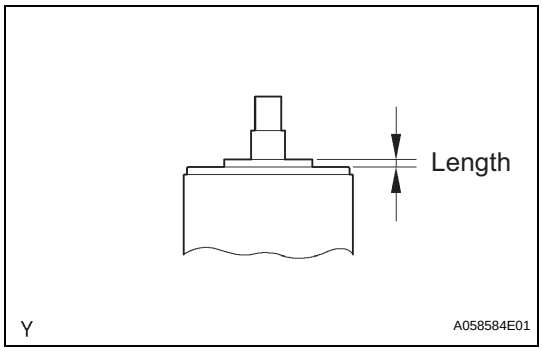


(1) Measure the resistance between terminal 50 and the switch body.
Standard resistance:
Below 2 Ω
If the result is not as specified, replace the magnetic switch assembly.

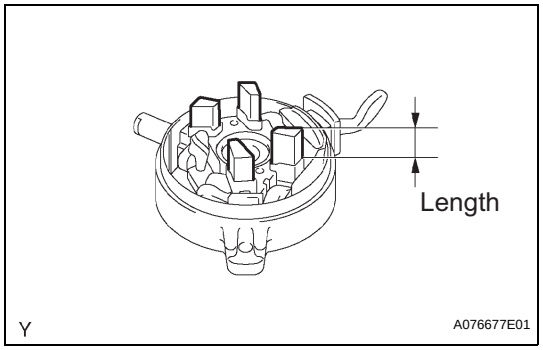
3. INSPECT STARTER ARMATURE ASSEMBLY

(a) Check if the commutator has an open circuit.

(1) Measure the resistance between the segments of the commutator.
Standard resistance:
Below 1 Ω
If the result is not as specified, replace the armature assembly.



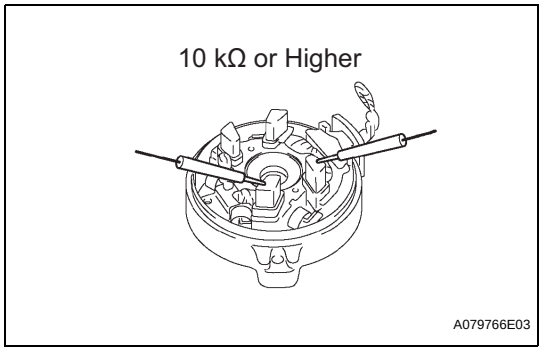
(b) Check if the commutator is grounded.



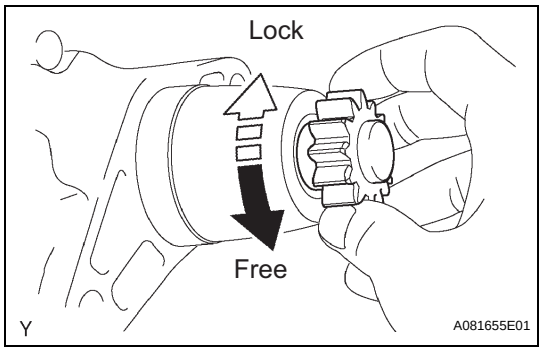
(1) Measure the resistance between the commutator and armature coil core.
Standard resistance:
10 kΩ or higher
If the result is not as specified, replace the armature assembly.

(c) Check the commutator for contamination and burns on its surface.
If the surface is dirty or burnt, correct it with sandpaper (No. 400) or a lathe.

ST



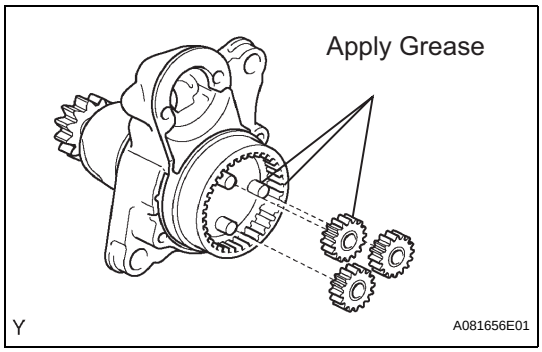
(d) Using a vernier caliper, measure the commutator's length.
Standard length:
3.1 to 3.8 mm (0.122 to 0.150 in.)
If the length is greater than the maximum, replace the starter armature assembly.



4. INSPECT STARTER COMMUTATOR END FRAME ASSEMBLY

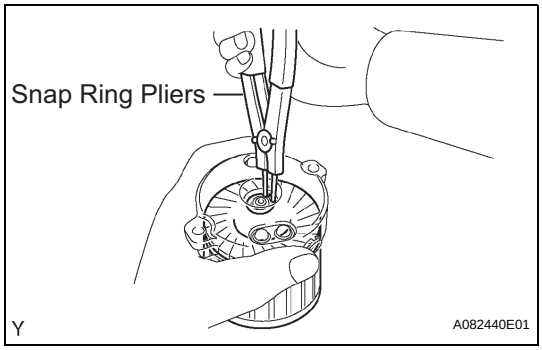
(a) Using a vernier caliper, measure the brush length.
Standard length:
4.0 to 9.0 mm (0.158 to 0.359 in.)
If the length is less than the minimum, replace the end frame assembly.

(b) Check the brush insulation.
(1) Measure the resistance between the positive (+) and negative (-) brush.
Standard resistance:
10 kΩ or higher
If the result is not as specified, repair or replace the end frame assembly.



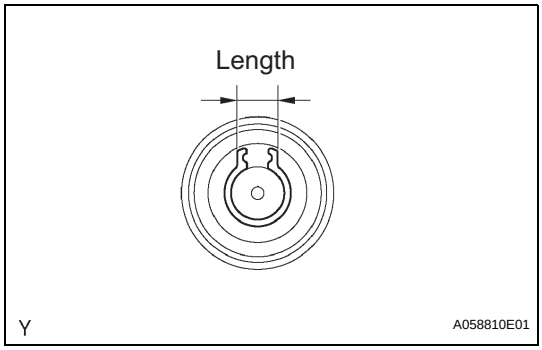
5. INSPECT STARTER CLUTCH

(a) Check the starter clutch.
(1) Rotate the clutch pinion gear counterclockwise and check that it turns freely. Try to rotate the clutch pinion gear clockwise and check that it locks.
If necessary, replace the starter drive housing assembly.



REASSEMBLY

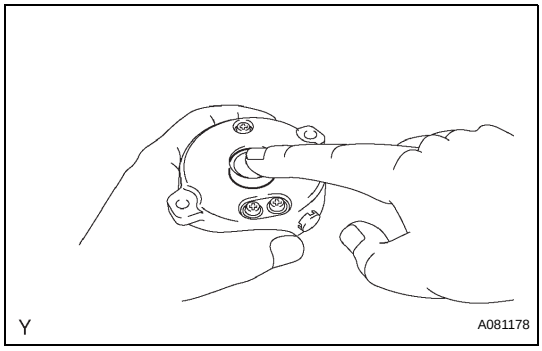
HINT:
Use high-temperature grease to lubricate the bearings, gears, return spring and steel ball when assembling the starter.



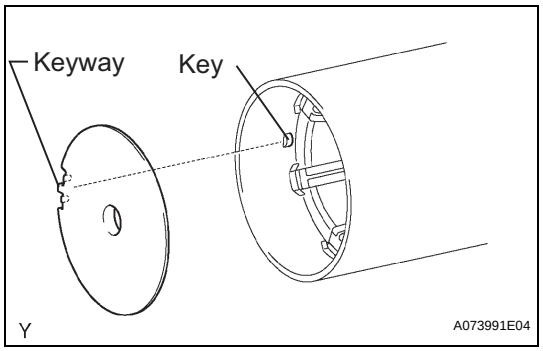
1. INSTALL PLANETARY GEAR

(a) Apply grease to the planetary gears and pin parts of the planetary shaft.
(b) Install the 3 planetary gears.

2. INSTALL STARTER ARMATURE ASSEMBLY



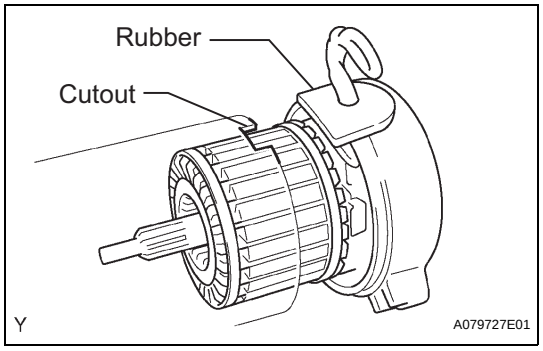
(a) Apply grease to the plate washer and the armature shaft.
(b) Install the starter armature to the starter commutator end frame.
(c) Using snap ring pliers, install the plate washer and a new snap ring.



(d) Using a vernier caliper, measure length of the snap ring.
Maximum length:
5.0 mm (0.197 in.)
If the length is greater than the maximum, replace it with a new snap ring.

3. INSTALL STARTER COMMUTATOR END FRAME COVER

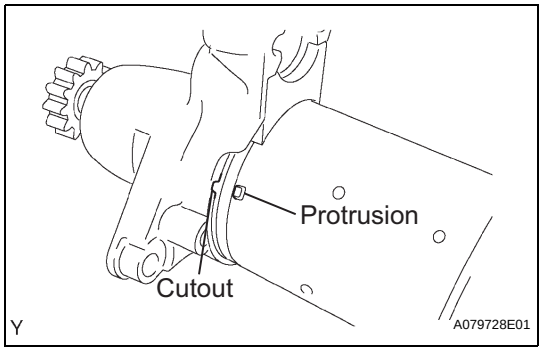
(a) Install the end frame cover to the commutator end frame.



ST

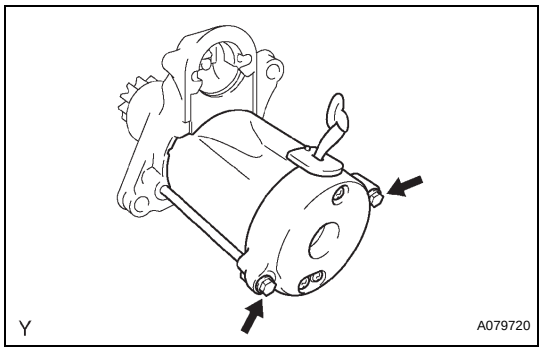
4. INSTALL STARTER ARMATURE PLATE

(a) Insert the armature plate to the starter yoke.



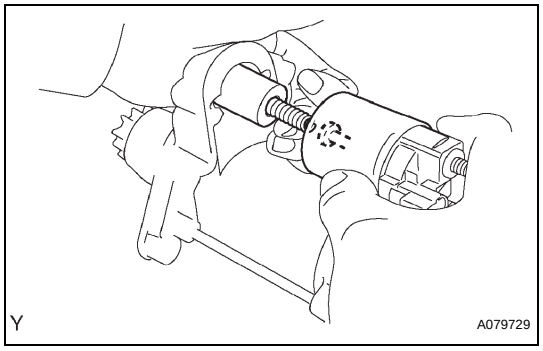
(b) Align the keyway of the starter plate with the key inside the starter yoke, and install the starter plate.

5. INSTALL STARTER COMMUTATOR END FRAME ASSEMBLY



(a) Align the rubber of the end frame with the cutout of the starter yoke.

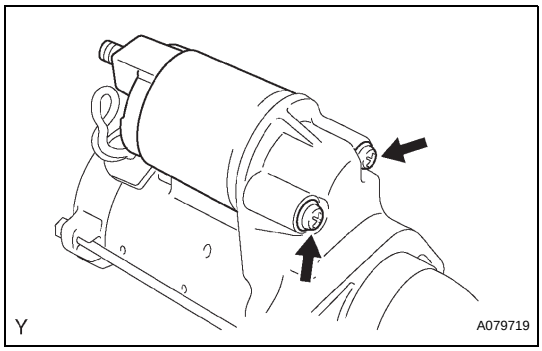
(b) Install the end frame to the starter yoke.



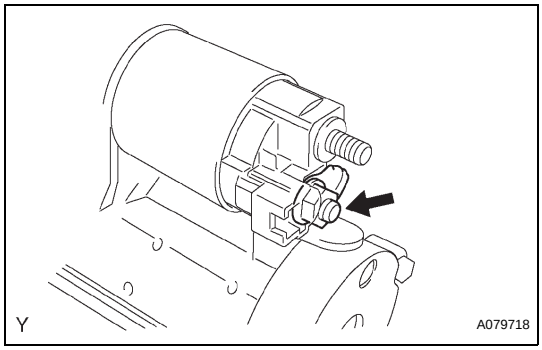
6. INSTALL STARTER YOKE ASSEMBLY

(a) Align the protrusion of the starter yoke with the cutout of the starter drive housing.

(b) Install the starter yoke with the 2 through-bolts.
Torque: 5.9 N*m (60 kgf*cm, 52 in.*lbf)



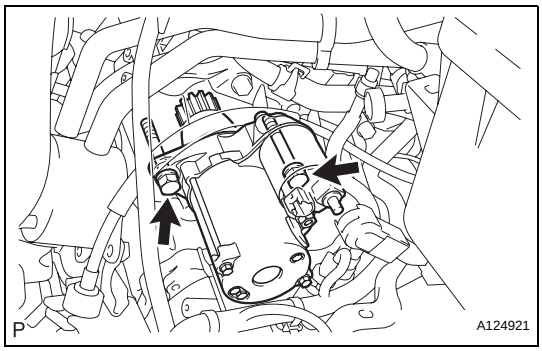
7. INSTALL MAGNETIC SWITCH ASSEMBLY



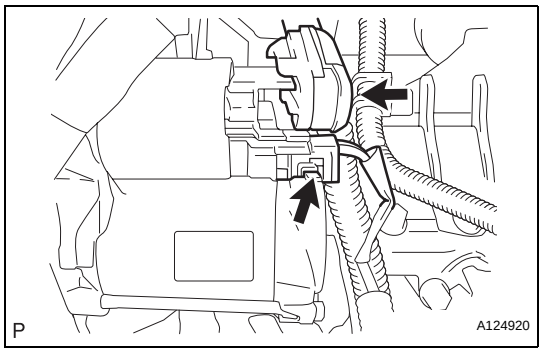
(a) Apply grease to the plunger and the hook.

(b) Hang the plunger hook of the magnetic switch to the drive lever.

(c) Install the plunger and return spring.

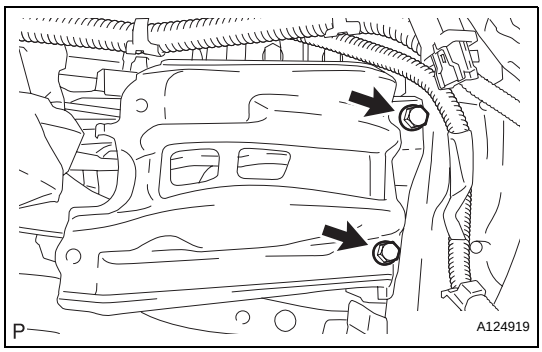


(d) Install the magnetic switch with the 2 screws.
Torque: 7.5 N*m (76 kgf*cm, 66 in.*lbf)



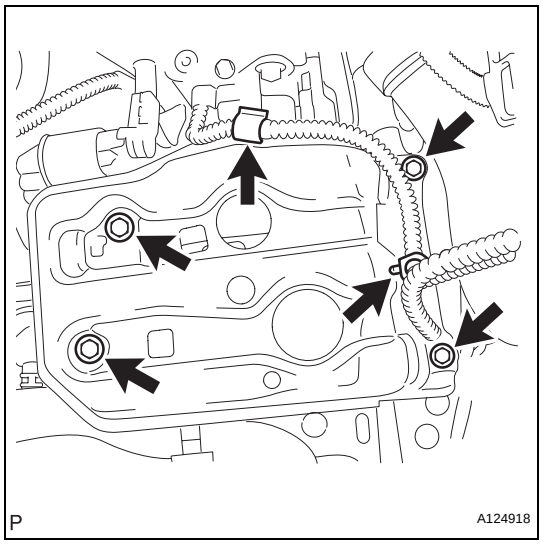
(e) Connect the lead wire to the magnetic switch with the nut.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)

INSTALLATION



1. INSTALL STARTER ASSEMBLY

(a) Install the starter with the 2 bolts.
Torque: 37 N*m (377 kgf*cm, 27 ft.*lbf)

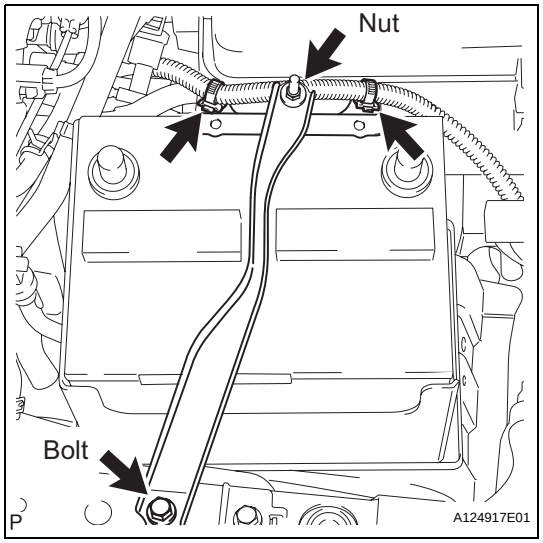


(b) Connect the starter connector.
(c) Install the terminal nut and cover the nut with the cap.
Torque: 9.8 N*m (100 kgf*cm, 7 ft.*lbf)

2. INSTALL BATTERY BRACKET REINFORCEMENT

(a) Install the bracket reinforcement.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

ST



3. INSTALL FRONT BATTERY BRACKET

(a) Install the bracket front with the 4 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

(b) Attach the 2 wire harness clamps.

4. INSTALL BATTERY

5. INSTALL BATTERY INSULATOR

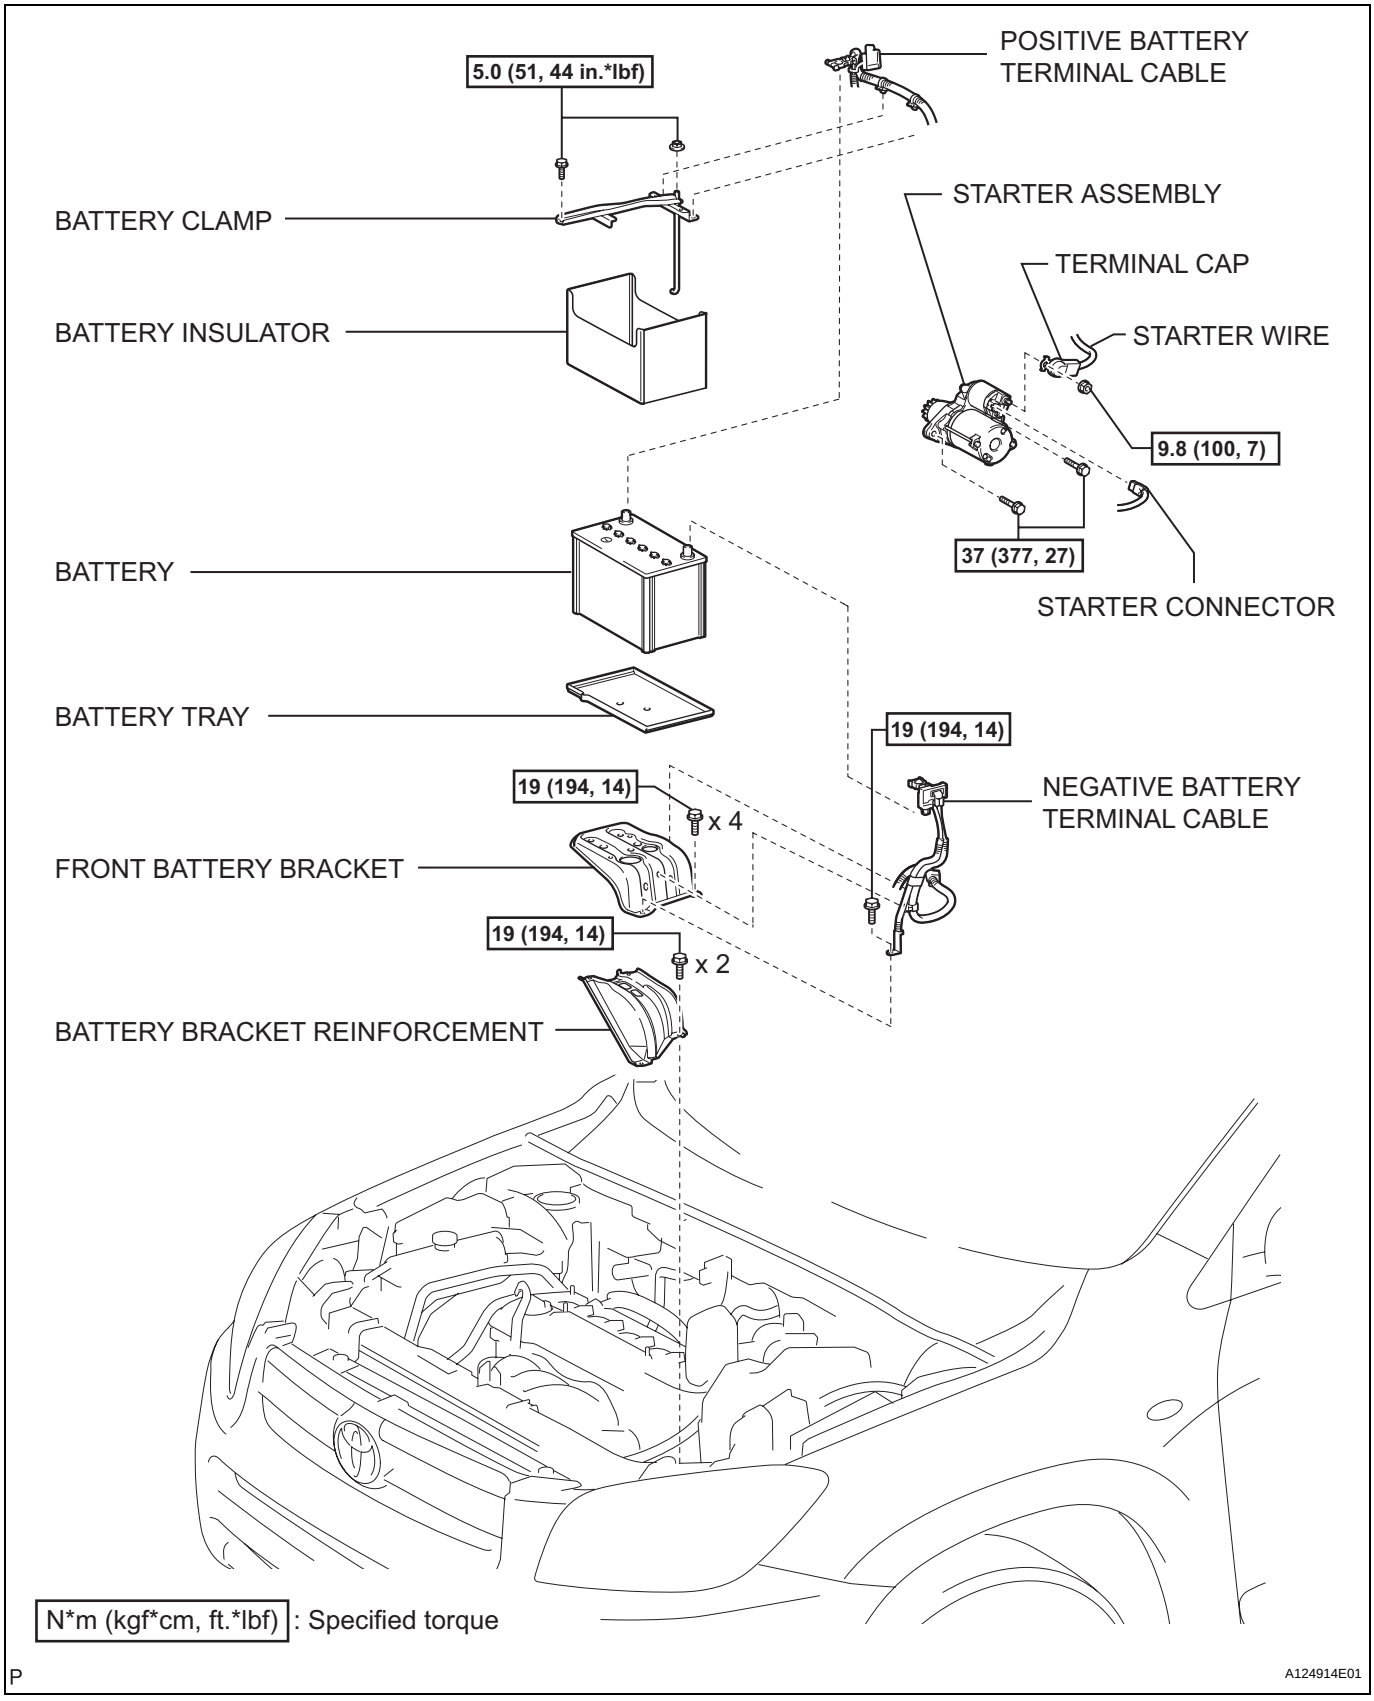
6. INSTALL BATTERY CLAMP

(a) Attach the hook of the battery clamp to the battery bracket front.

(b) Temporarily tighten the nut and install the bolt.

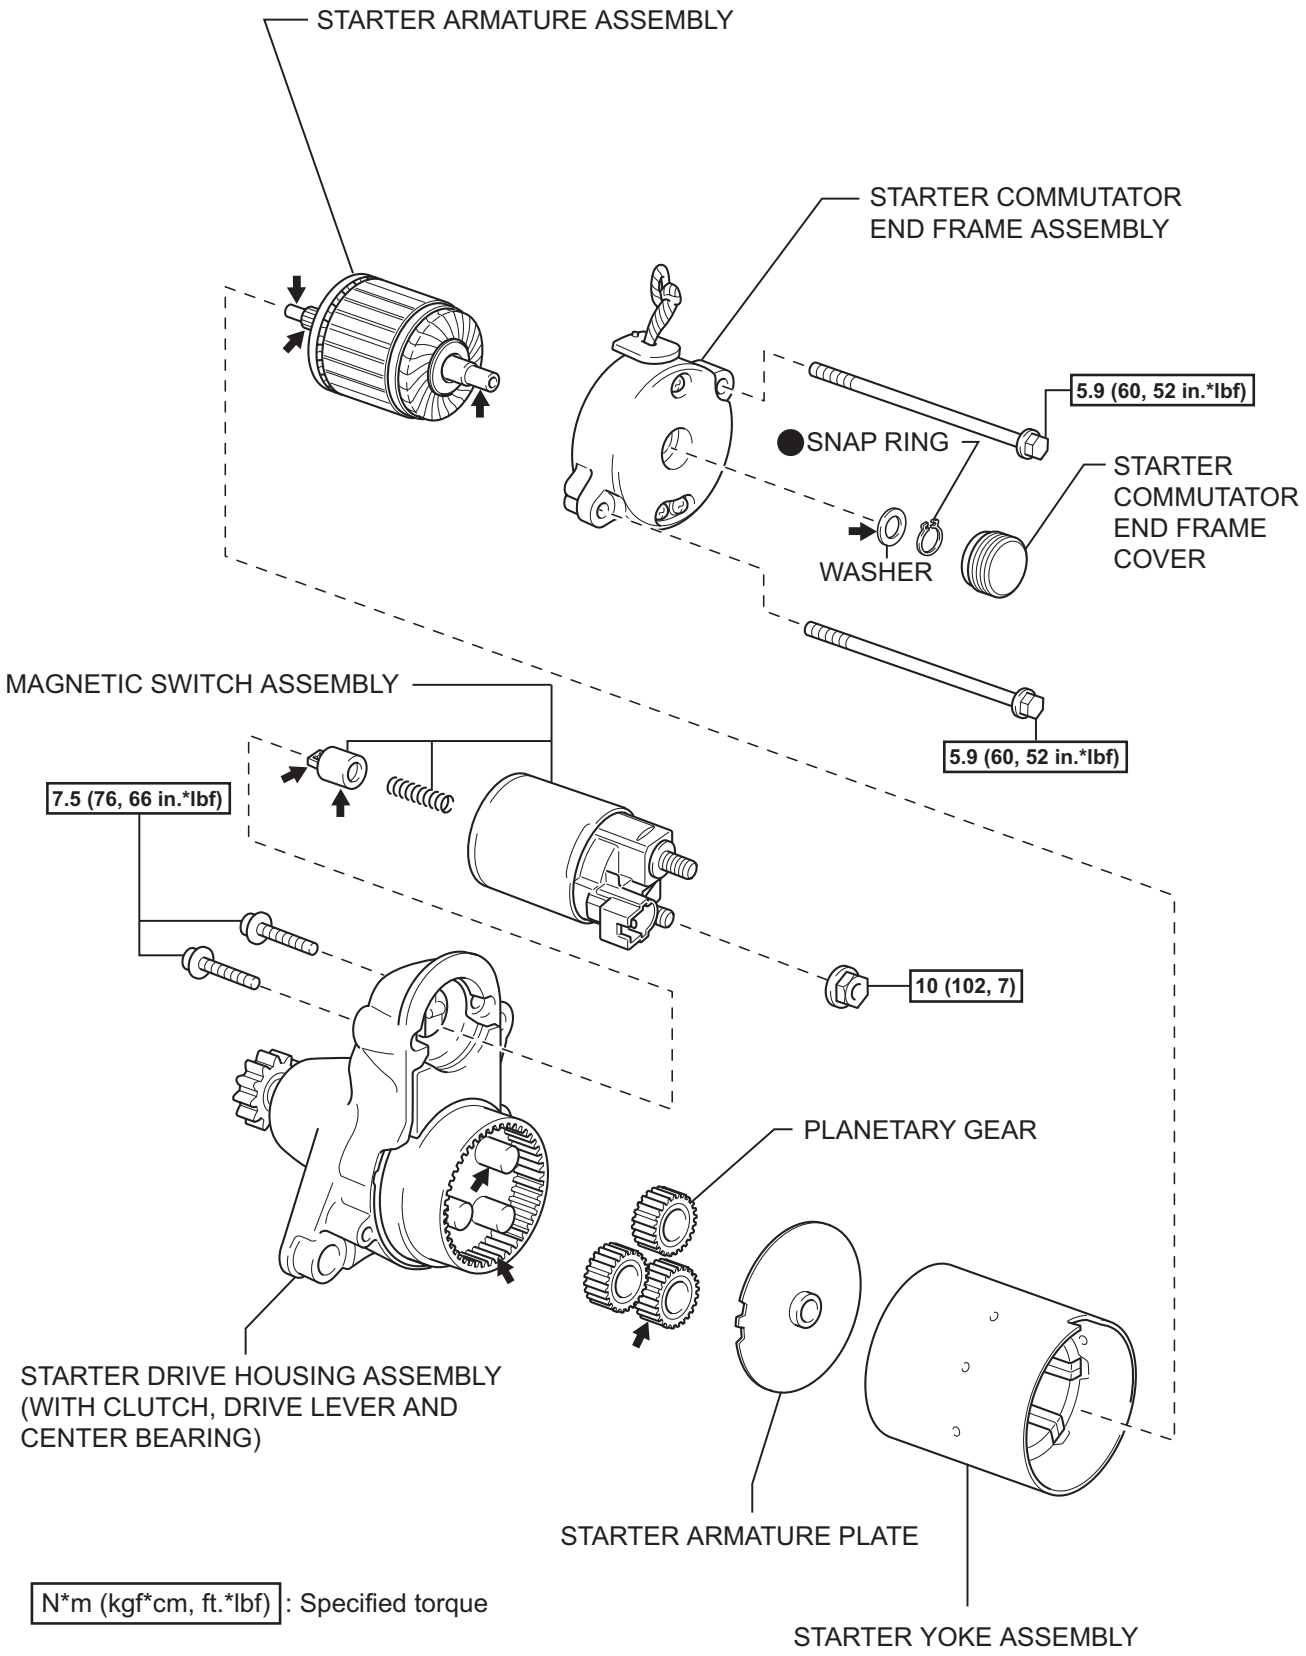
(c) Adjust the battery clamp's position.

(d) Fully tighten the nut and bolt.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)



(e) Attach the 2 wire harness clamps.

7. CONNECT CABLE TO POSITIVE BATTERY TERMINAL



8. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

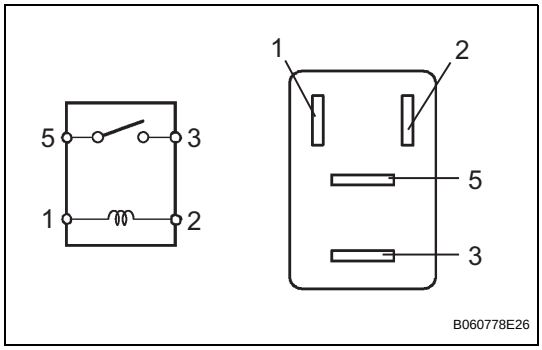
STARTER RELAY



ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE STARTER RELAY

(a) Remove the starter relay from the No. 7 relay block.

3. INSPECT STARTER RELAY

(a) Measure the resistance of the relay.

Standard resistance

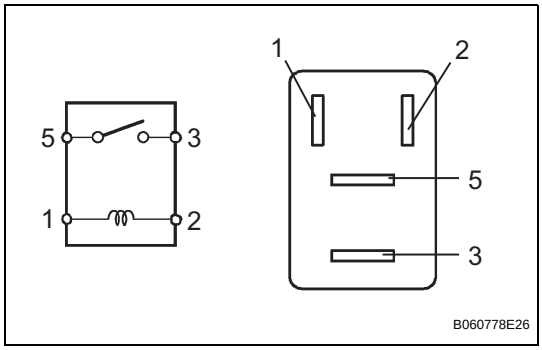
Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the resistance is not as specified, replace the relay.

4. INSTALL STARTER RELAY

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

STARTER RELAY



ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE STARTER RELAY

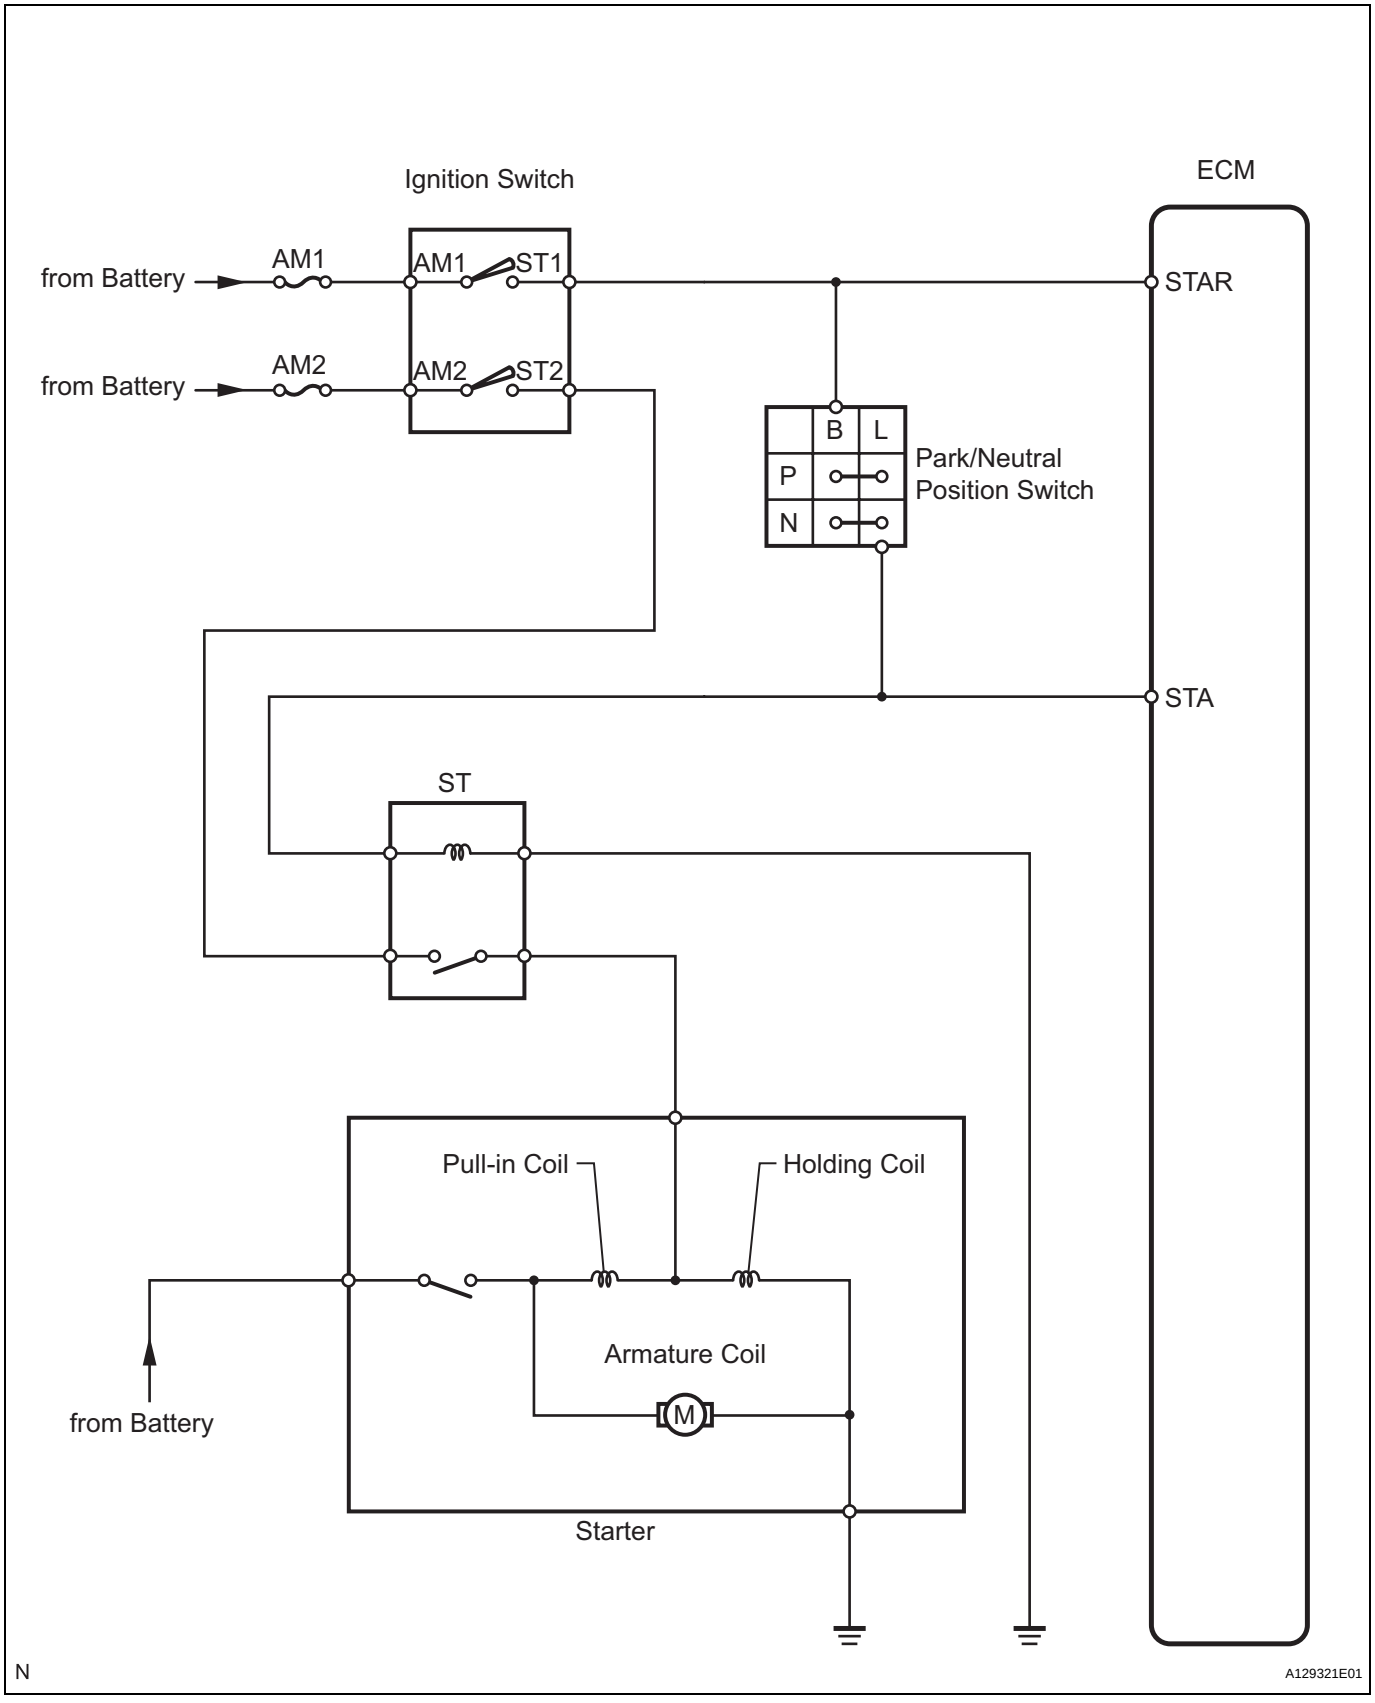
(a) Remove the starter relay from the No. 7 relay block.

3. INSPECT STARTER RELAY

(a) Measure the resistance of the relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

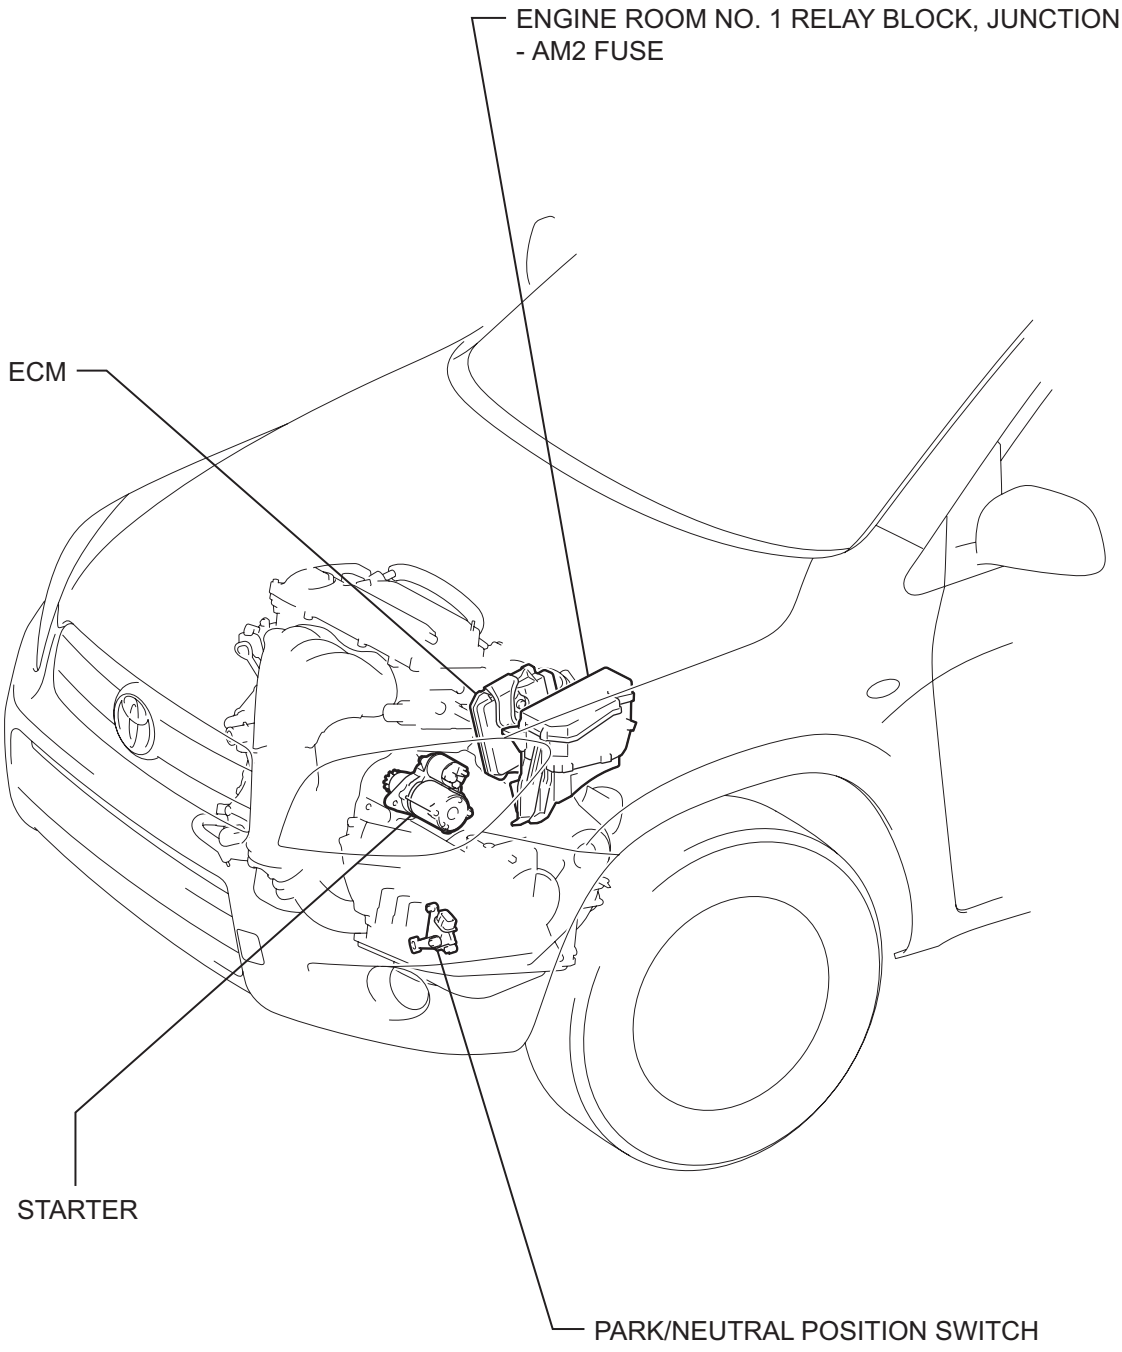


If the resistance is not as specified, replace the relay.

4. INSTALL STARTER RELAY

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

SYSTEM DIAGRAM



The starting system rotates the starter motor according to the signals from the ignition switch and PNP switch.

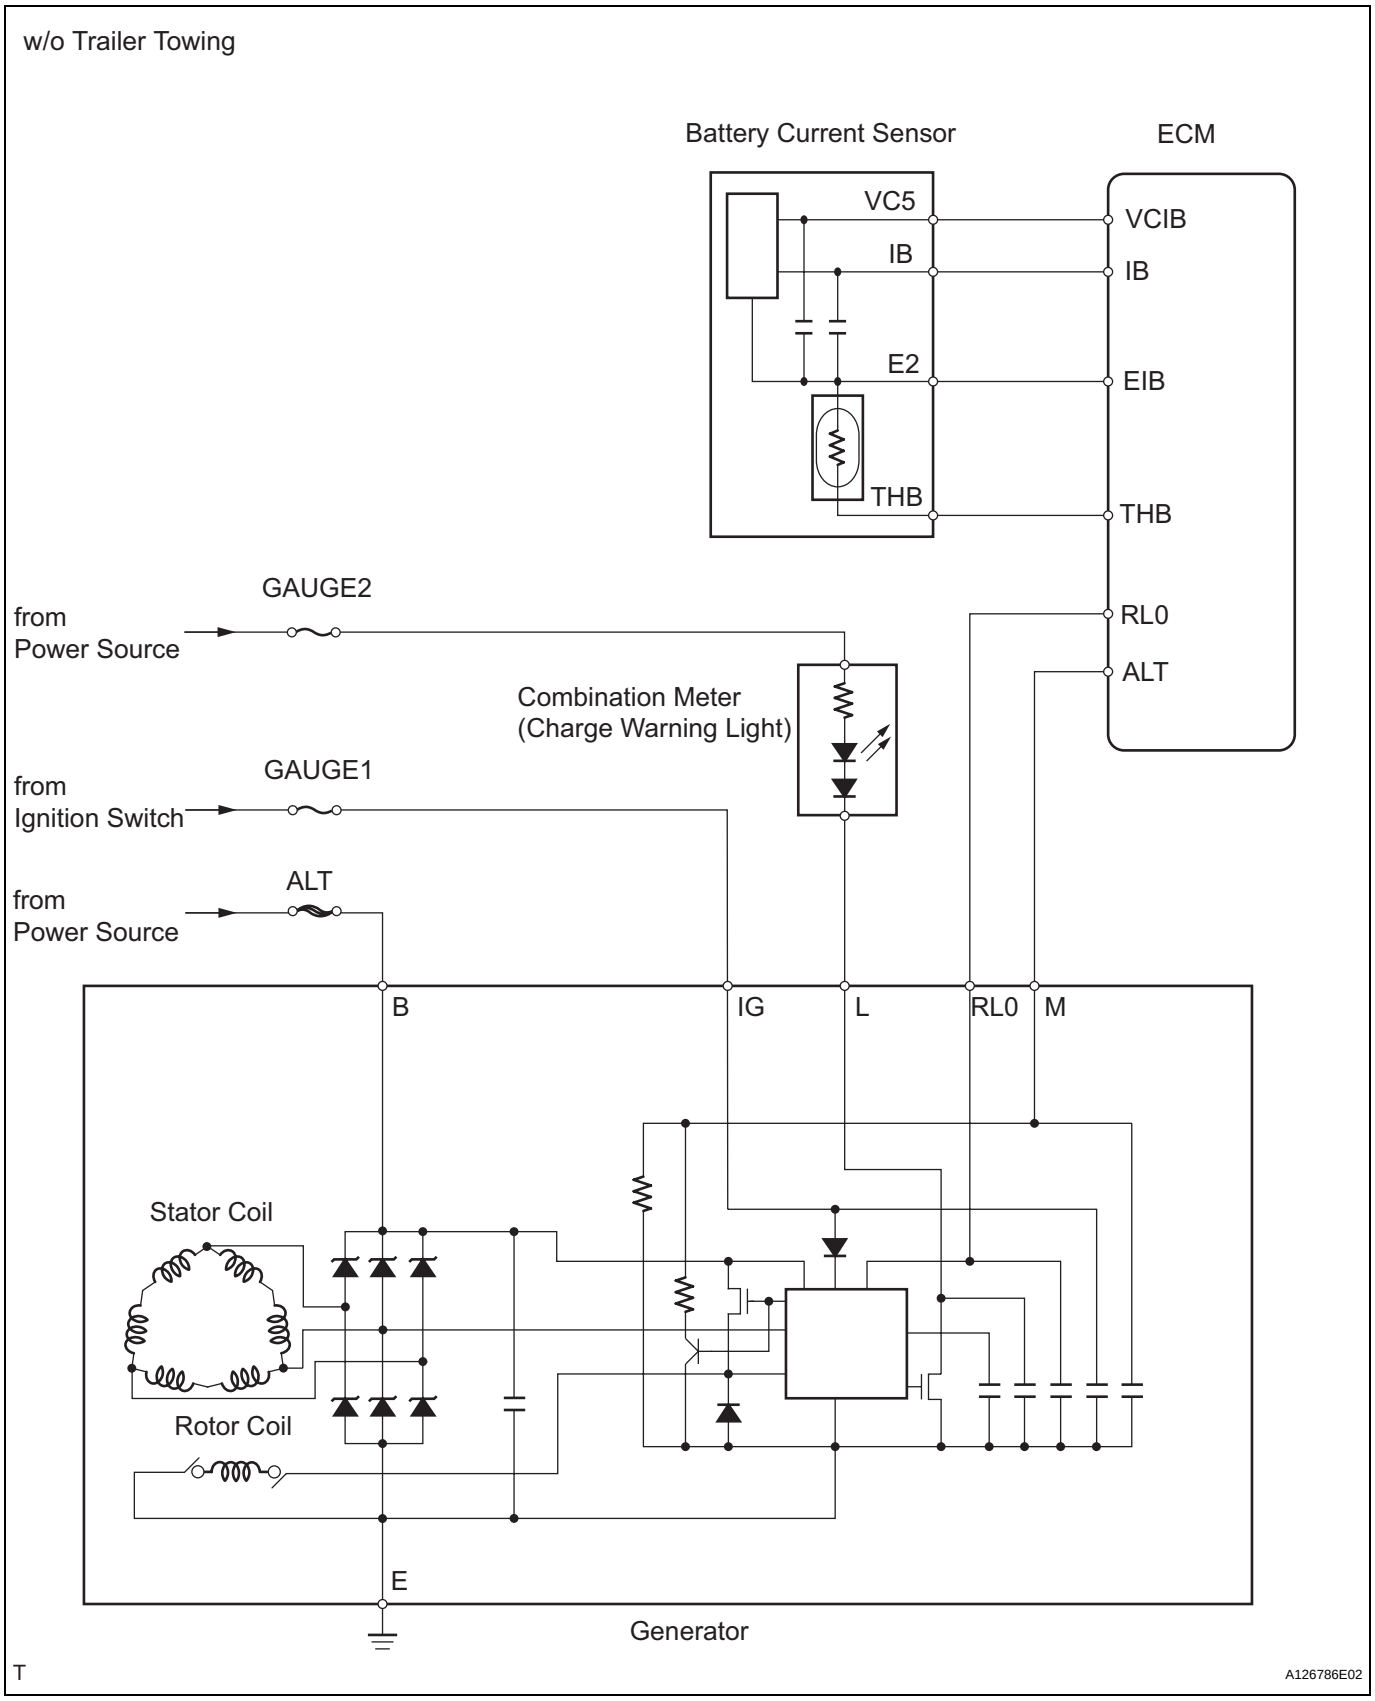
BATTERY CURRENT SENSOR

ON-VEHICLE INSPECTION

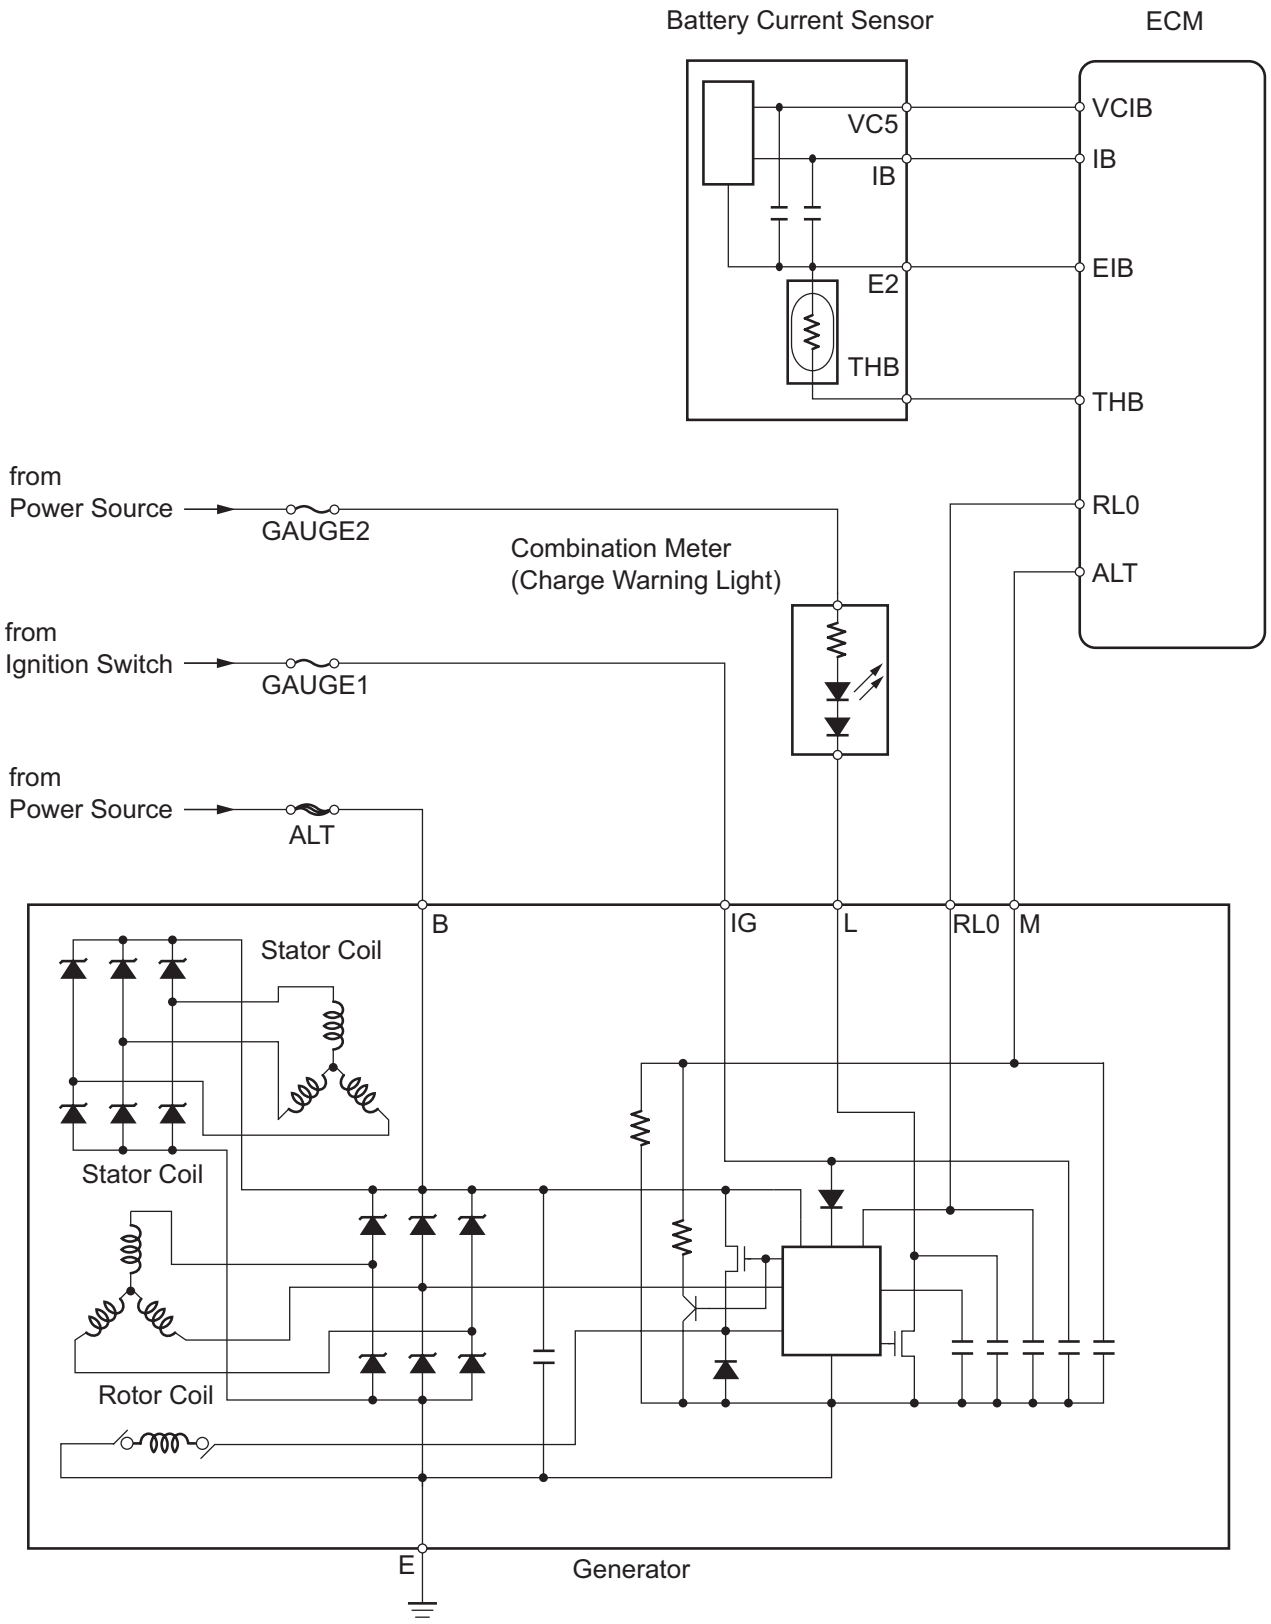
1. INSPECT BATTERY CURRENT SENSOR ASSEMBLY



(a) Measure the resistance of the sensor.

Standard resistance

Tester Connection	Condition	Specified Condition
2 (VC5) - 4 (E2)	Always	3 to 10 kΩ
2 (VC5) - 3 (IB)	Always	Below 0.5 kΩ
3 (IB) - 4 (E2)	Always	3 to 10 kΩ
1 (THB) - 4 (E2)	20 to 30°C (68 to 86°F)	1.5 to 2.5 kΩ



HINT:
Tester connection 1 (THB) - 4 (E2):
As the temperature increases, the resistance decreases (see graph).
If the result is not as specified, replace the sensor assembly.

SYSTEM DIAGRAM

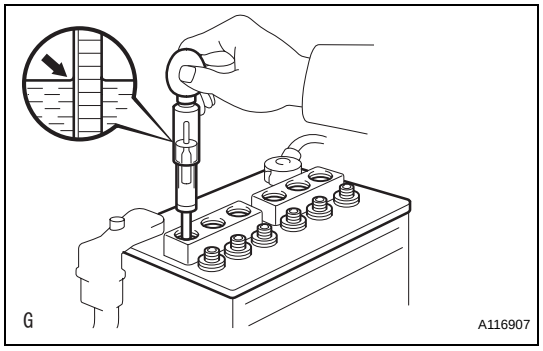
ON-VEHICLE INSPECTION

1. CHECK BATTERY CONDITION

NOTICE:

If the battery is weak or if the engine is difficult to start, perform the following procedures.

(a) Check the battery for damage and deformation. If severe damage, deformation or leakage is found, replace the battery.



(b) Check the electrolyte quantity of each cell.

(1) For maintenance-free batteries:

- If the electrolyte quantity is below the lower line, replace the battery.
- If the electrolyte quantity is above the lower line, check the battery voltage when cranking the engine. If the voltage is less than 9.6 V, recharge or replace the battery.

HINT:

Before checking the battery voltage, turn off all the electrical systems (headlights, blower motor, rear defogger, etc.).

(2) For non-maintenance-free batteries:

If the electrolyte quantity is below the lower line, add distilled water to each cell. Then, recharge the battery and check the electrolyte's specific gravity.

Standard specific gravity:

1.25 to 1.29 at 20°C (68°F)

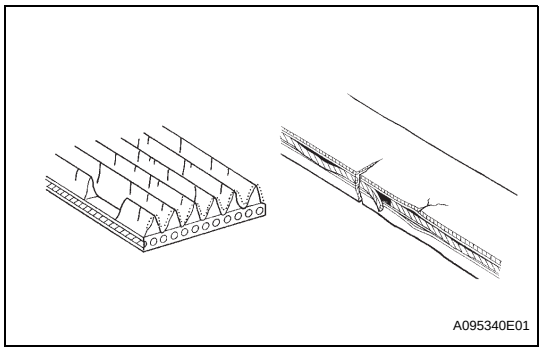
If the electrolyte quantity is above the lower line, check the battery voltage when cranking the engine. If the voltage is less than 9.6 V, recharge or replace the battery.

HINT:

Before checking the battery voltage, turn off all the electrical systems (headlights, blower motor, rear defogger, etc.).

2. INSPECT BATTERY TERMINAL AND FUSE

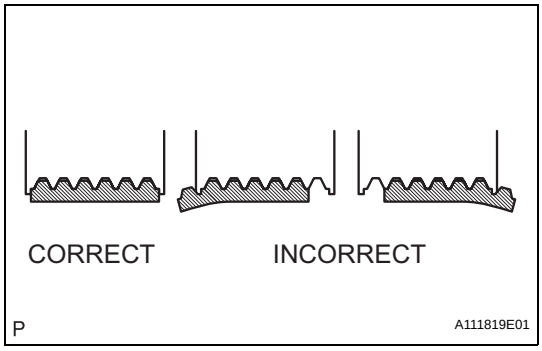
(a) Visually check the battery terminals.



(1) Check that the battery terminals are not loose or corroded.

(b) Measure the resistance of the H-fuses and fuses.

Standard resistance:



Below 1 Ω

If the results are not as specified, replace the fuses as necessary.

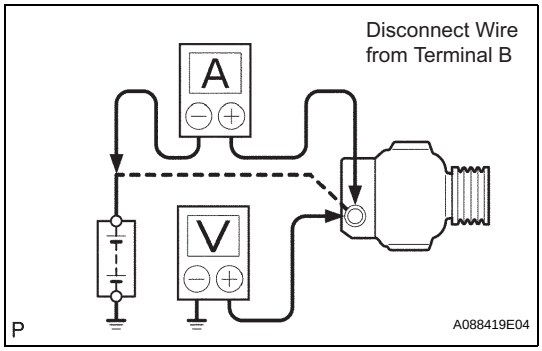
A095340E01

3. INSPECT V-RIBBED BELT

(a) Visually check the belt for excessive wear, frayed cords, etc.
If any defects are found, replace the V-ribbed belt.
HINT:
Cracks on the rib side of the belt are considered acceptable. If the belt has chunks missing from the ribs, it should be replaced.

(b) Check that the belt fits properly in the ribbed grooves.
HINT:
Confirm by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

4. INSPECT GENERATOR WIRING



(a) Visually check the generator wiring.
(1) Check that the wiring is in good condition.

5. CHECK FOR ABNORMAL NOISES

(a) Listen for abnormal noises from the generator.
(1) Check that no abnormal noises are heard from the generator while the engine is running.

6. INSPECT CHARGE WARNING LIGHT CIRCUIT

(a) Turn the ignition switch ON. Check that the charge warning light comes on.
(b) Start the engine and check that the light goes off.
If the light does not operate as specified, troubleshoot the charge warning light circuit.

7. INSPECT CHARGING CIRCUIT WITHOUT LOAD

(a) Connect a voltmeter and ammeter to the charging circuit as follows.
(1) Disconnect the wire from terminal B of the generator, then connect it to the negative (-) lead of the ammeter.
(2) Connect the positive (+) lead of the ammeter to terminal B of the generator.
(3) Connect the positive (+) lead of the voltmeter to terminal B of the generator.
(4) Ground the negative (-) lead of the voltmeter.
(b) Check the charging circuit.
(1) Keep the engine speed at 2,000 rpm and check the reading on the ammeter and voltmeter.
Standard amperage:
10 A or less
Standard voltage:
12.1 to 15.4 V
If the result is not as specified, replace the generator.
HINT:
If the battery is not fully charged, the ammeter reading will sometimes be more than the standard amperage.

8. INSPECT CHARGING CIRCUIT WITH LOAD

(a) With the engine running at 2,000 rpm, turn the high beam headlights ON and turn the heater blower switch to the "HI" position.

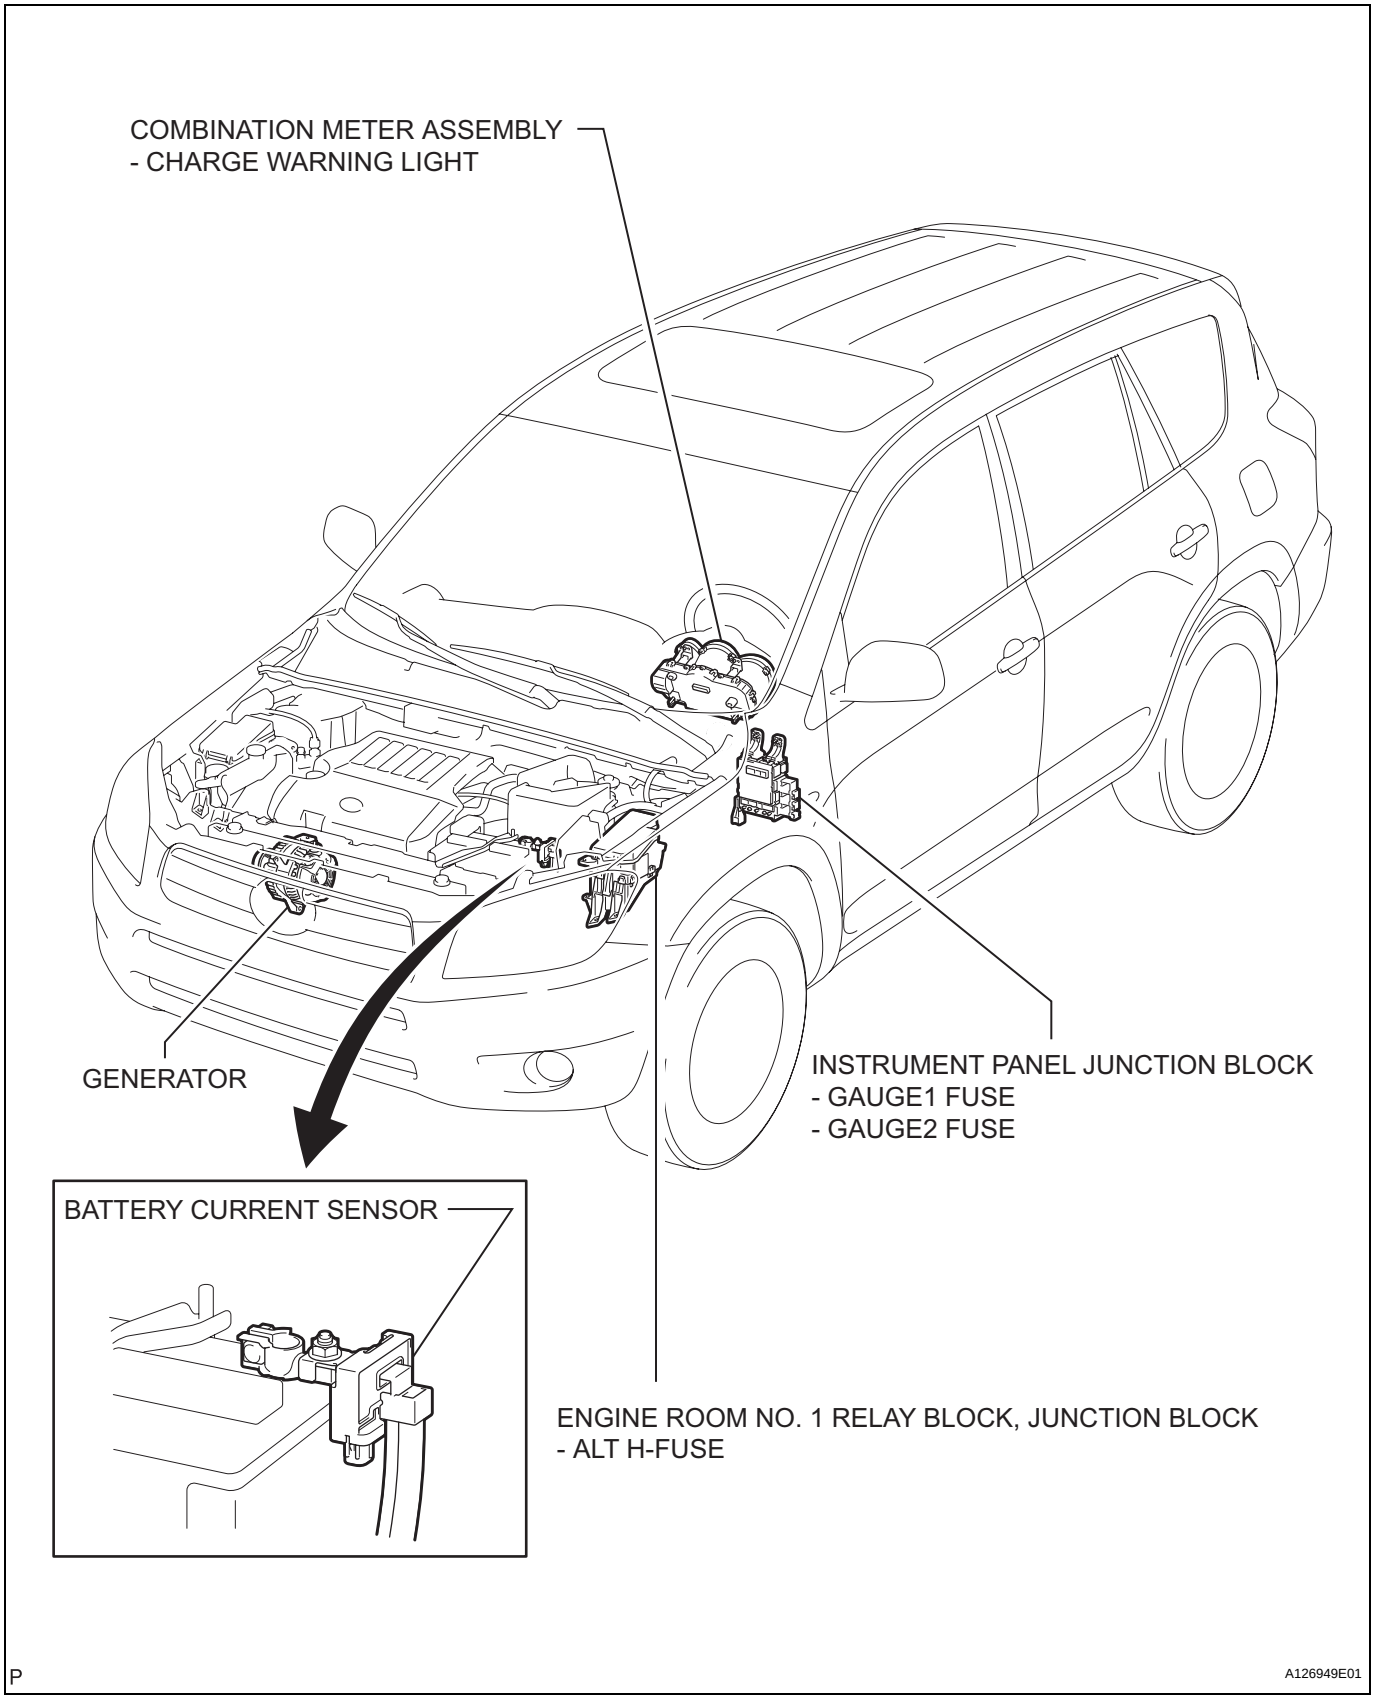
(b) Check the reading on the ammeter.

Standard amperage:

30 A or more

If the ammeter reading is less than the standard amperage, repair the generator.

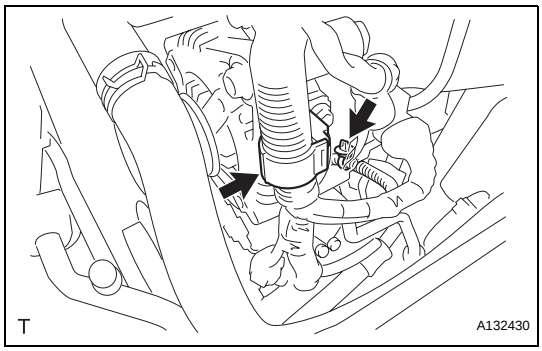
HINT:



If the battery is fully charged, the indication will sometimes be less than the standard amperage. If this is the case, add more electrical load (operate the wipers, rear window defogger, etc.) and check the reading on the ammeter again.

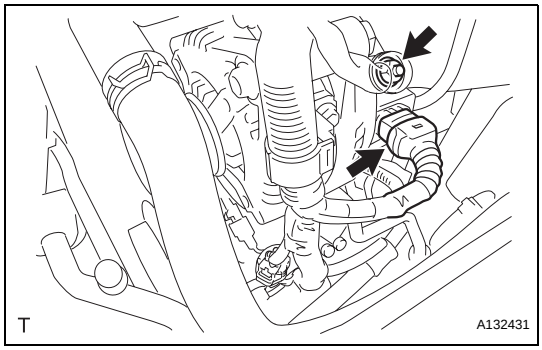
CHARGING SYSTEM

PRECAUTION

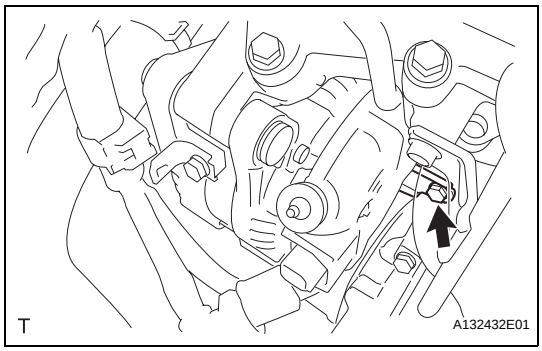


1. **Check that the battery cables are connected to the correct terminals.**
2. **Disconnect the battery cables if a quick charge is given to the battery.**
3. **Do not perform tests with a high voltage insulation resistance tester.**
4. **Never disconnect the battery while the engine is running.**
5. **Check that the charging cable is tightly connected onto terminal B of the generator and the fuse box.**
6. **Do not check whether the generator generates current or not while terminal F is connected to the other terminals.**

PARTS LOCATION



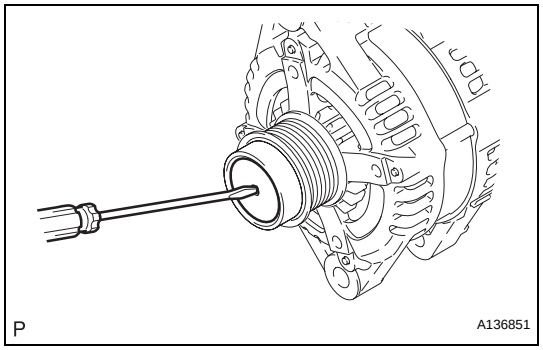
REMOVAL



1. **REMOVE RADIATOR ASSEMBLY**
   (a) Remove the radiator (see page CO-36).
2. **REMOVE FRONT WHEEL RH**
3. **REMOVE ENGINE UNDER COVER REAR RH (See page EM-21)**
4. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)**
5. **REMOVE RADIATOR RESERVOIR TANK (See page CO-19)**
6. **REMOVE FAN AND GENERATOR V BELT (See page EM-8)**
7. **REMOVE GENERATOR ASSEMBLY**
   (a) Disconnect the 2 wire harness clamps.

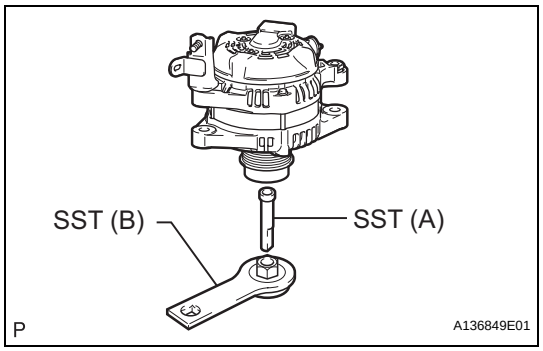
   (b) Remove the terminal cap.
   (c) Remove the nut and disconnect the generator wire from terminal B.
   (d) Disconnect the generator connector from the generator.

   (e) Remove the bolt from the cylinder block.



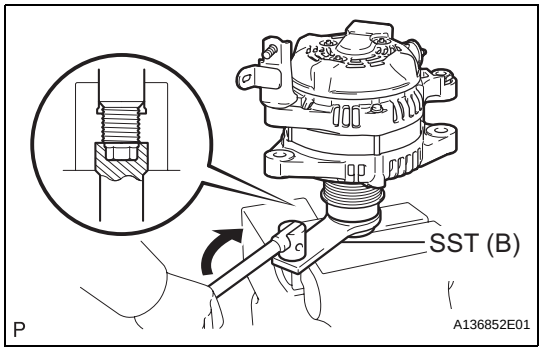
(f) Remove the 2 bolts and generator.

DISASSEMBLY



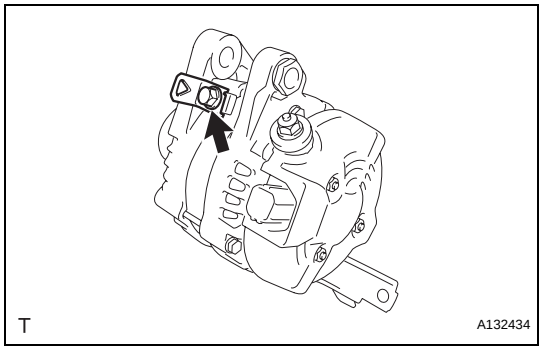
1. REMOVE GENERATOR PULLEY WITH CLUTCH

(a) Using a screwdriver, puncture the center of the cap and pry it off the pulley.
NOTICE:
Do not reuse the cap.

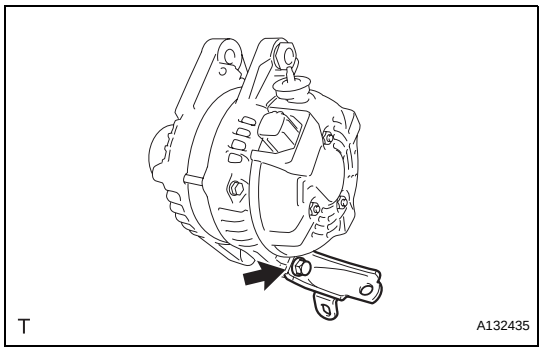


(b) Install SST to the pulley as shown in the illustration.
SST 09820-63020

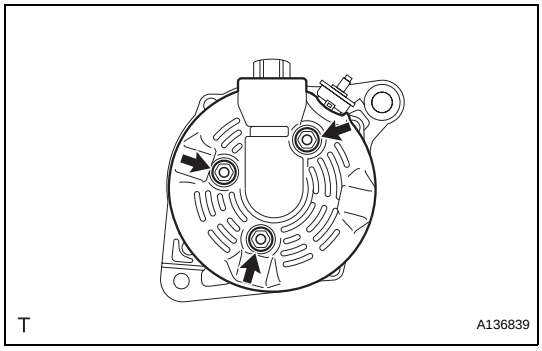
(c) Mount SST (A) in a vise.



(d) Turn SST (B) clockwise to loosen the pulley.

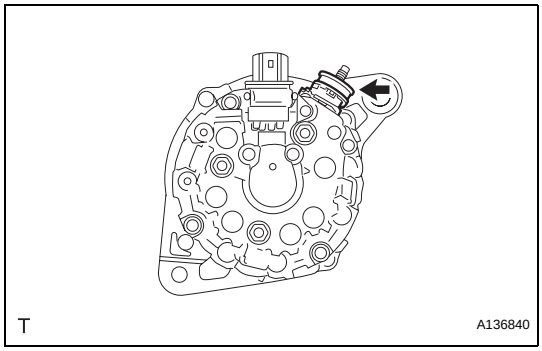


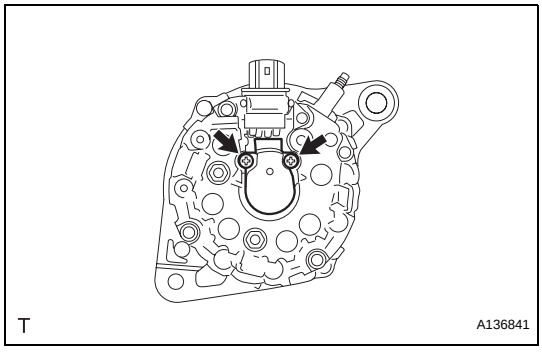
(e) Remove the pulley.



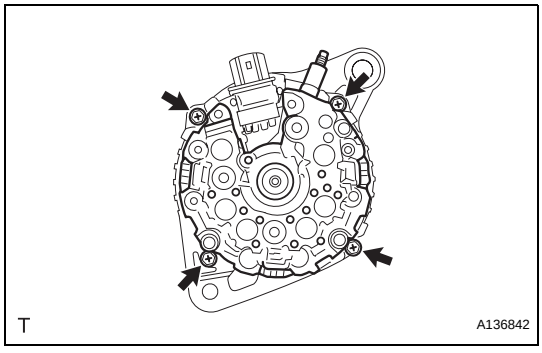
2. REMOVE GENERATOR BRUSH HOLDER ASSEMBLY

(a) Remove the bolt and wire harness clamp stay.



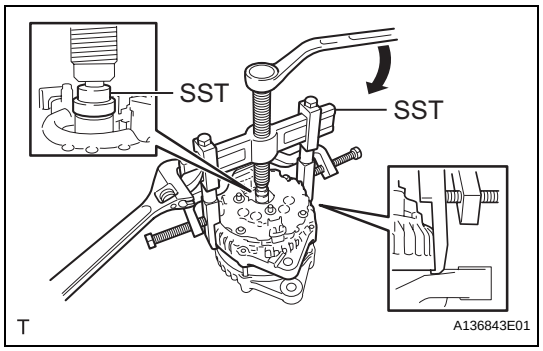


(b) Remove the bolt and bracket.



(c) Remove the 3 nuts and generator rear end cover.

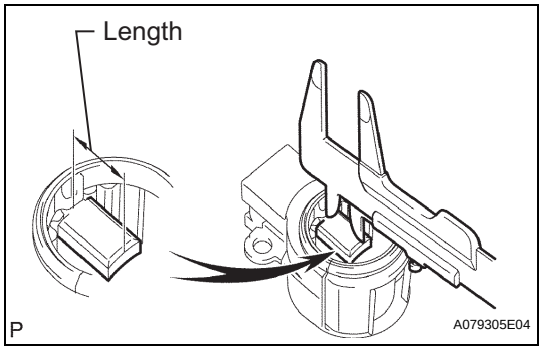
(d) Remove the terminal insulator.



(e) Remove the 2 screws and generator brush holder.

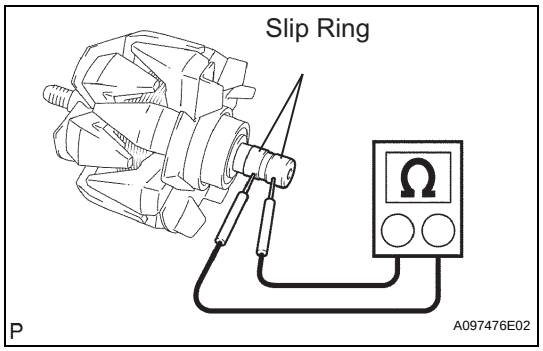
3. REMOVE GENERATOR ROTOR ASSEMBLY

(a) Remove the 4 bolts.



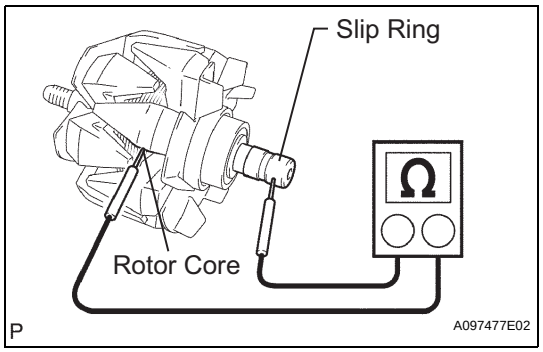
(b) Using SST, remove the generator rectifier end frame.
SST 09950-40011 (09951-04020, 09952-04010, 09953-04020, 09954-04010, 09955-04071, 09957-04010, 09958-04011)
(c) Remove the washer.
(d) Remove the generator rotor.

INSPECTION

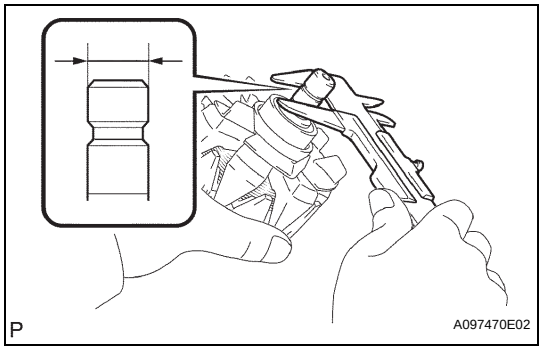


1. INSPECT GENERATOR BRUSH HOLDER ASSEMBLY

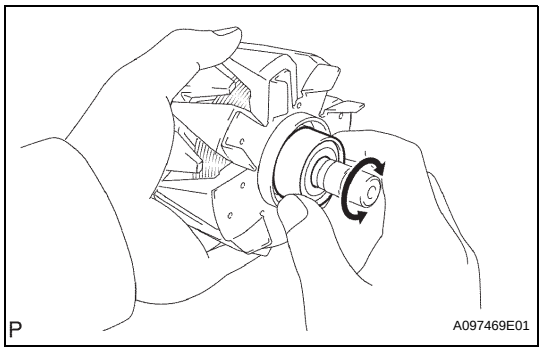
(a) Using a vernier caliper, measure the brush length.
Standard length:
9.5 to 11.5 mm (0.374 to 0.453 in.)
Minimum length:
4.5 mm (0.177 in.)
If the brush length is less than the minimum, replace the generator brush holder assembly.



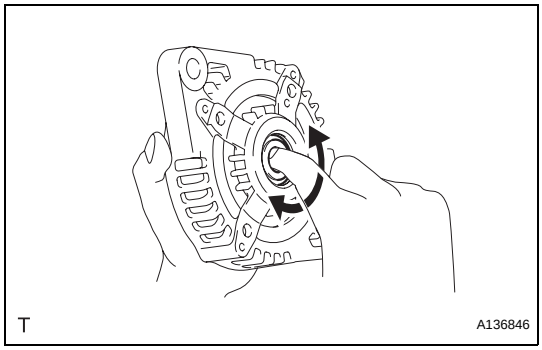
2. INSPECT GENERATOR ROTOR ASSEMBLY



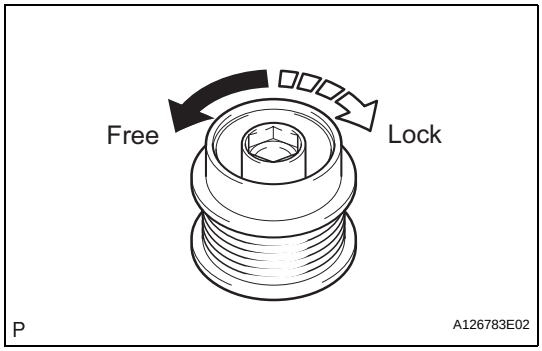
(a) Check the resistance.
(1) Measure the resistance between the slip rings.
Standard resistance:
2.3 to 2.7 Ω at 20°C (68°F)
If the result is not as specified, replace the generator rotor assembly.



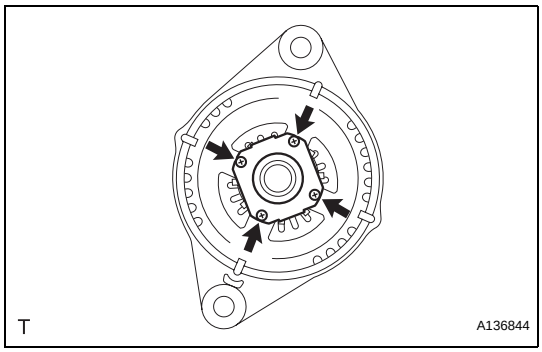
(2) Measure the resistance between the slip ring and rotor core.
Standard resistance:
1 MΩ or higher
If the result is not as specified, replace the generator rotor assembly.



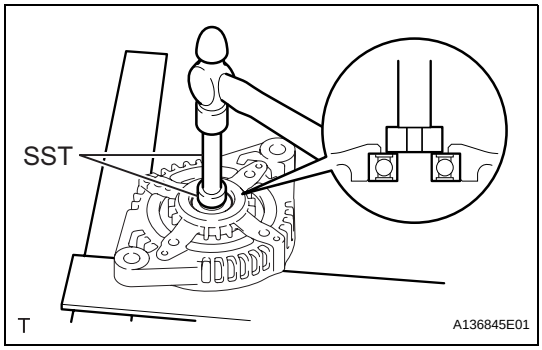
(b) Check the slip ring diameter.
(1) Using a vernier caliper, measure the slip ring diameter.
Standard diameter:
14.2 to 14.4 mm (0.559 to 0.567 in.)
Minimum diameter:
14 mm (0.551 in.)
If the diameter is less than the minimum, replace the generator rotor assembly.



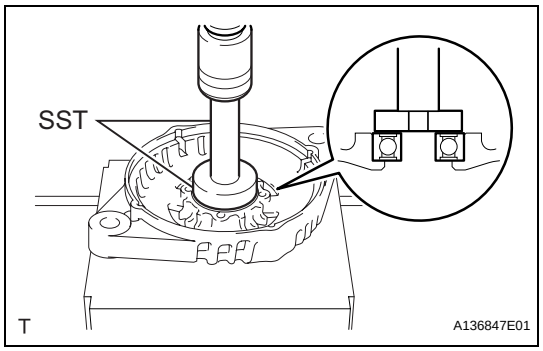
(c) Check the appearance.
(1) Check that the bearing is not rough or worn.
OK:
The bearing rotates smoothly.
If the result is not as specified, replace the generator rotor assembly.



3. INSPECT GENERATOR DRIVE END FRAME BEARING
(a) Check that the bearing is not rough or worn.
OK:
The bearing rotates smoothly.
If the bearing does not rotate smoothly, replace the bearing.

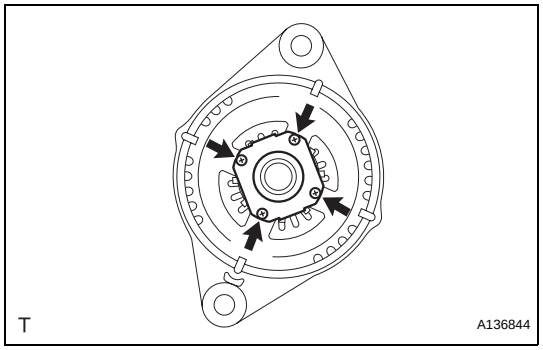


4. INSPECT GENERATOR PULLEY WITH CLUTCH
(a) Hold the center of the pulley, and confirm that the outer ring turns counterclockwise and does not turn clockwise.
If the result is not as specified, replace the generator pulley with clutch.



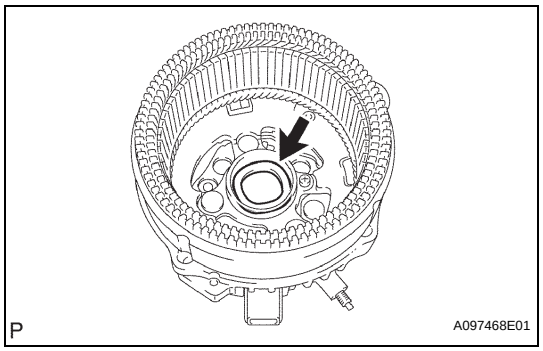
REPLACEMENT

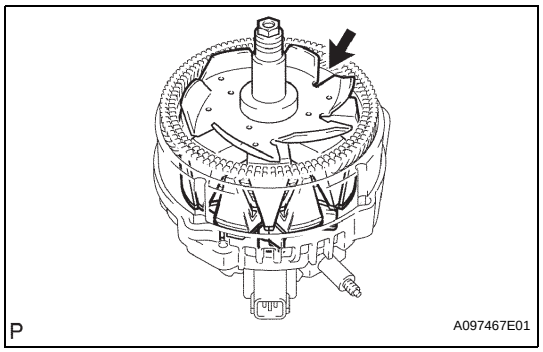
1. REPLACE GENERATOR DRIVE END FRAME BEARING
(a) Remove the 4 screws and bearing retainer.



(b) Using SST and a hammer, tap out the bearing.
SST 09950-60010 (09951-00250), 09950-70010 (09951-07100)

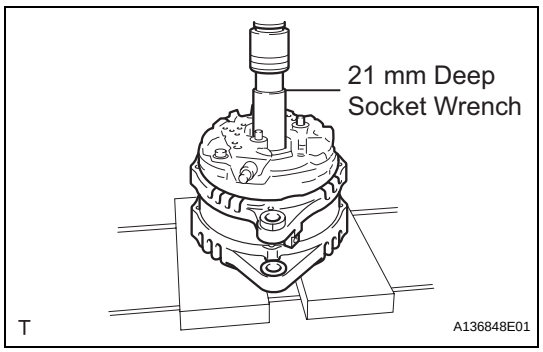
(c) Using SST and a press, press in a new bearing.
SST 09950-60010 (09951-00250), 09950-70010 (09951-07100)





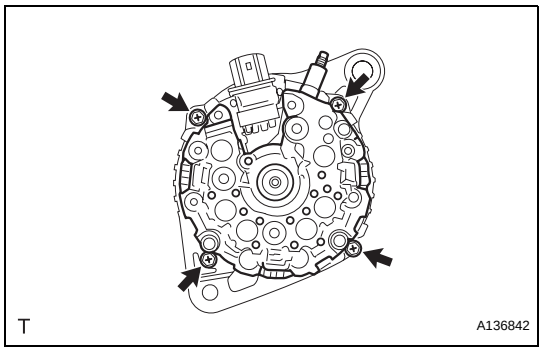
(d) Install the bearing retainer with the 4 screws.
Torque: 2.3 N*m (23 kgf*cm, 20 in.*lbf)

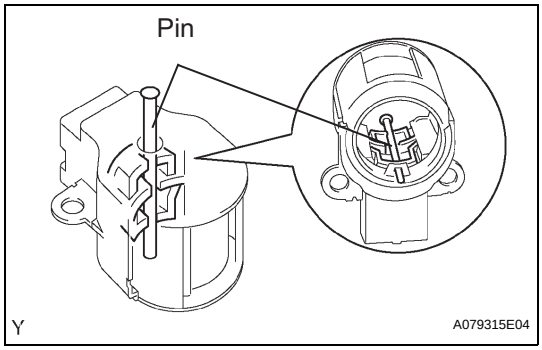
REASSEMBLY



1. INSTALL GENERATOR ROTOR ASSEMBLY

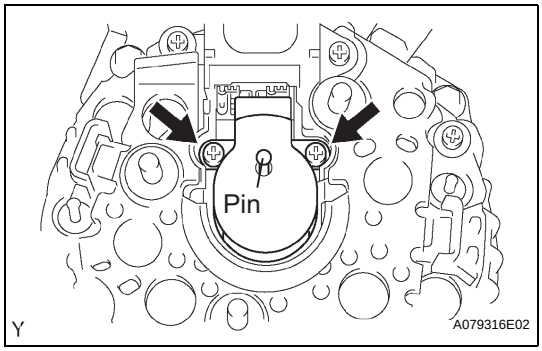
(a) Install the washer onto the generator rectifier end frame.



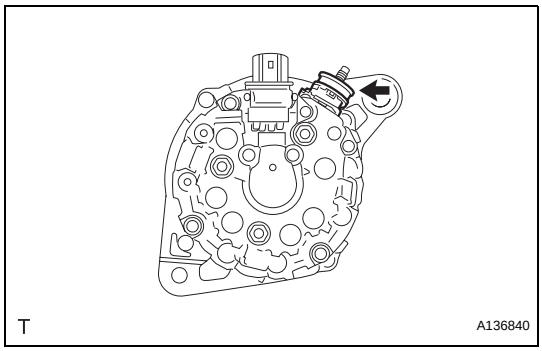


(b) Install the generator rotor onto the generator rectifier end frame.

(c) Using a 21 mm deep socket wrench and press, slowly push the generator drive end frame onto the generator rectifier frame.

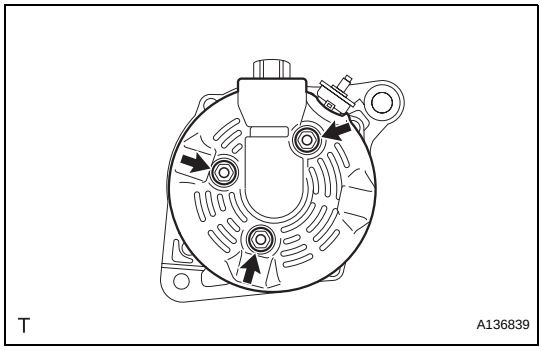


(d) Install the 4 bolts.
Torque: 5.8 N*m (59 kgf*cm, 51 in.*lbf)

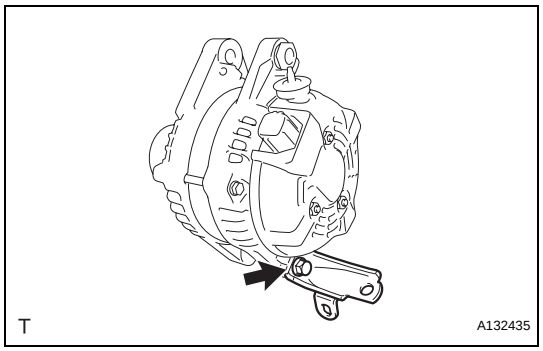


2. INSTALL GENERATOR BRUSH HOLDER ASSEMBLY

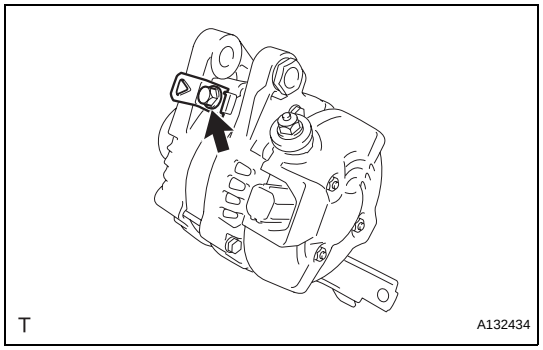
(a) While pushing the 2 brushes into the generator brush holder, insert a ϕ 1.0 mm (0.039 in.) pin into the generator brush holder.



(b) Install the generator brush holder with the 2 screws.
Torque: 1.8 N*m (18 kgf*cm, 16 in.*lbf)

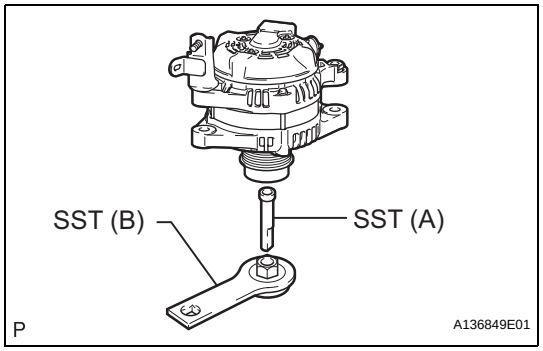


(c) Pull the pin out of the generator brush holder.

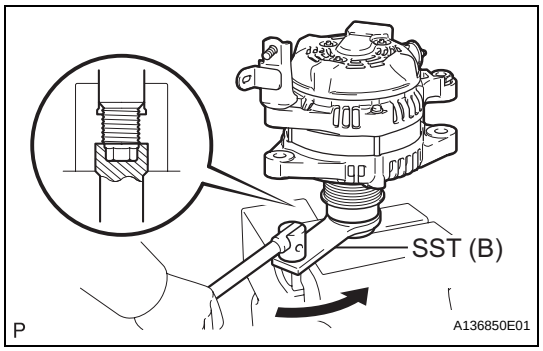


(d) Install the terminal insulator onto the generator rectifier end frame.

(e) Install the generator rear end cover with the 3 nuts.
Torque: 4.6 N*m (47 kgf*cm, 41 in.*lbf)



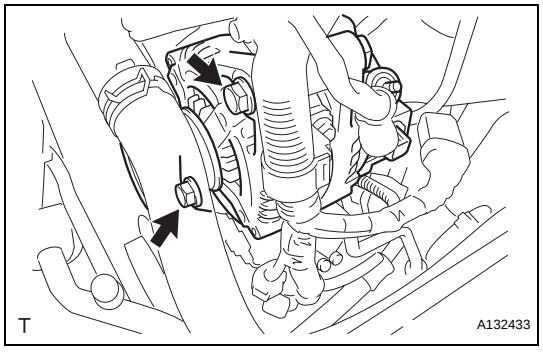
(f) Install the bracket with the bolt.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)



(g) Install the wire harness clamp stay.
Torque: 8.4 N*m (86 kgf*cm, 74 in.*lbf)

3. INSTALL GENERATOR PULLEY WITH CLUTCH

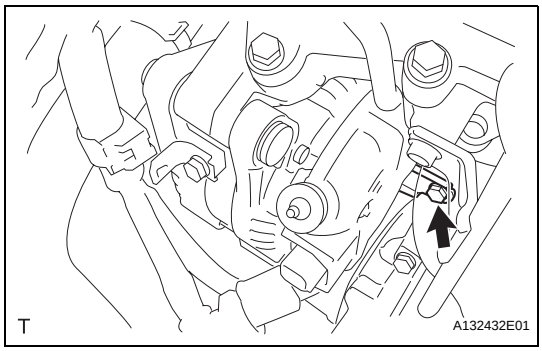
(a) Install the pulley by hand.



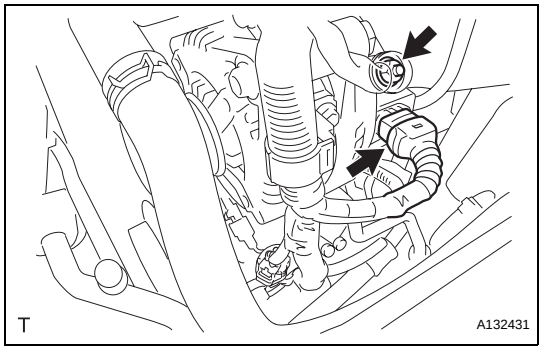
(b) Install SST to the pulley as shown in the illustration.
SST 09820-63020

(c) Turn SST (B) counterclockwise to tighten the pulley.
Torque: 111 N*m (1125 kgf*cm, 81 ft.*lbf)

(d) Install a new cap to the pulley.

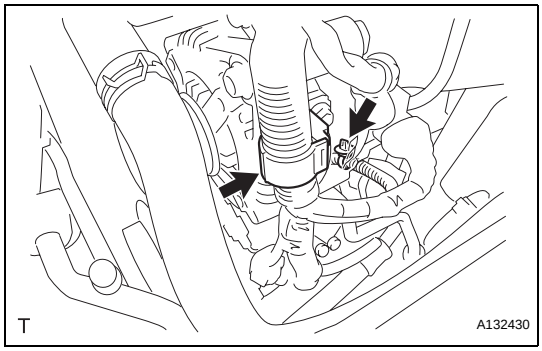


(e) Check that the generator pulley rotates smoothly.



INSTALLATION

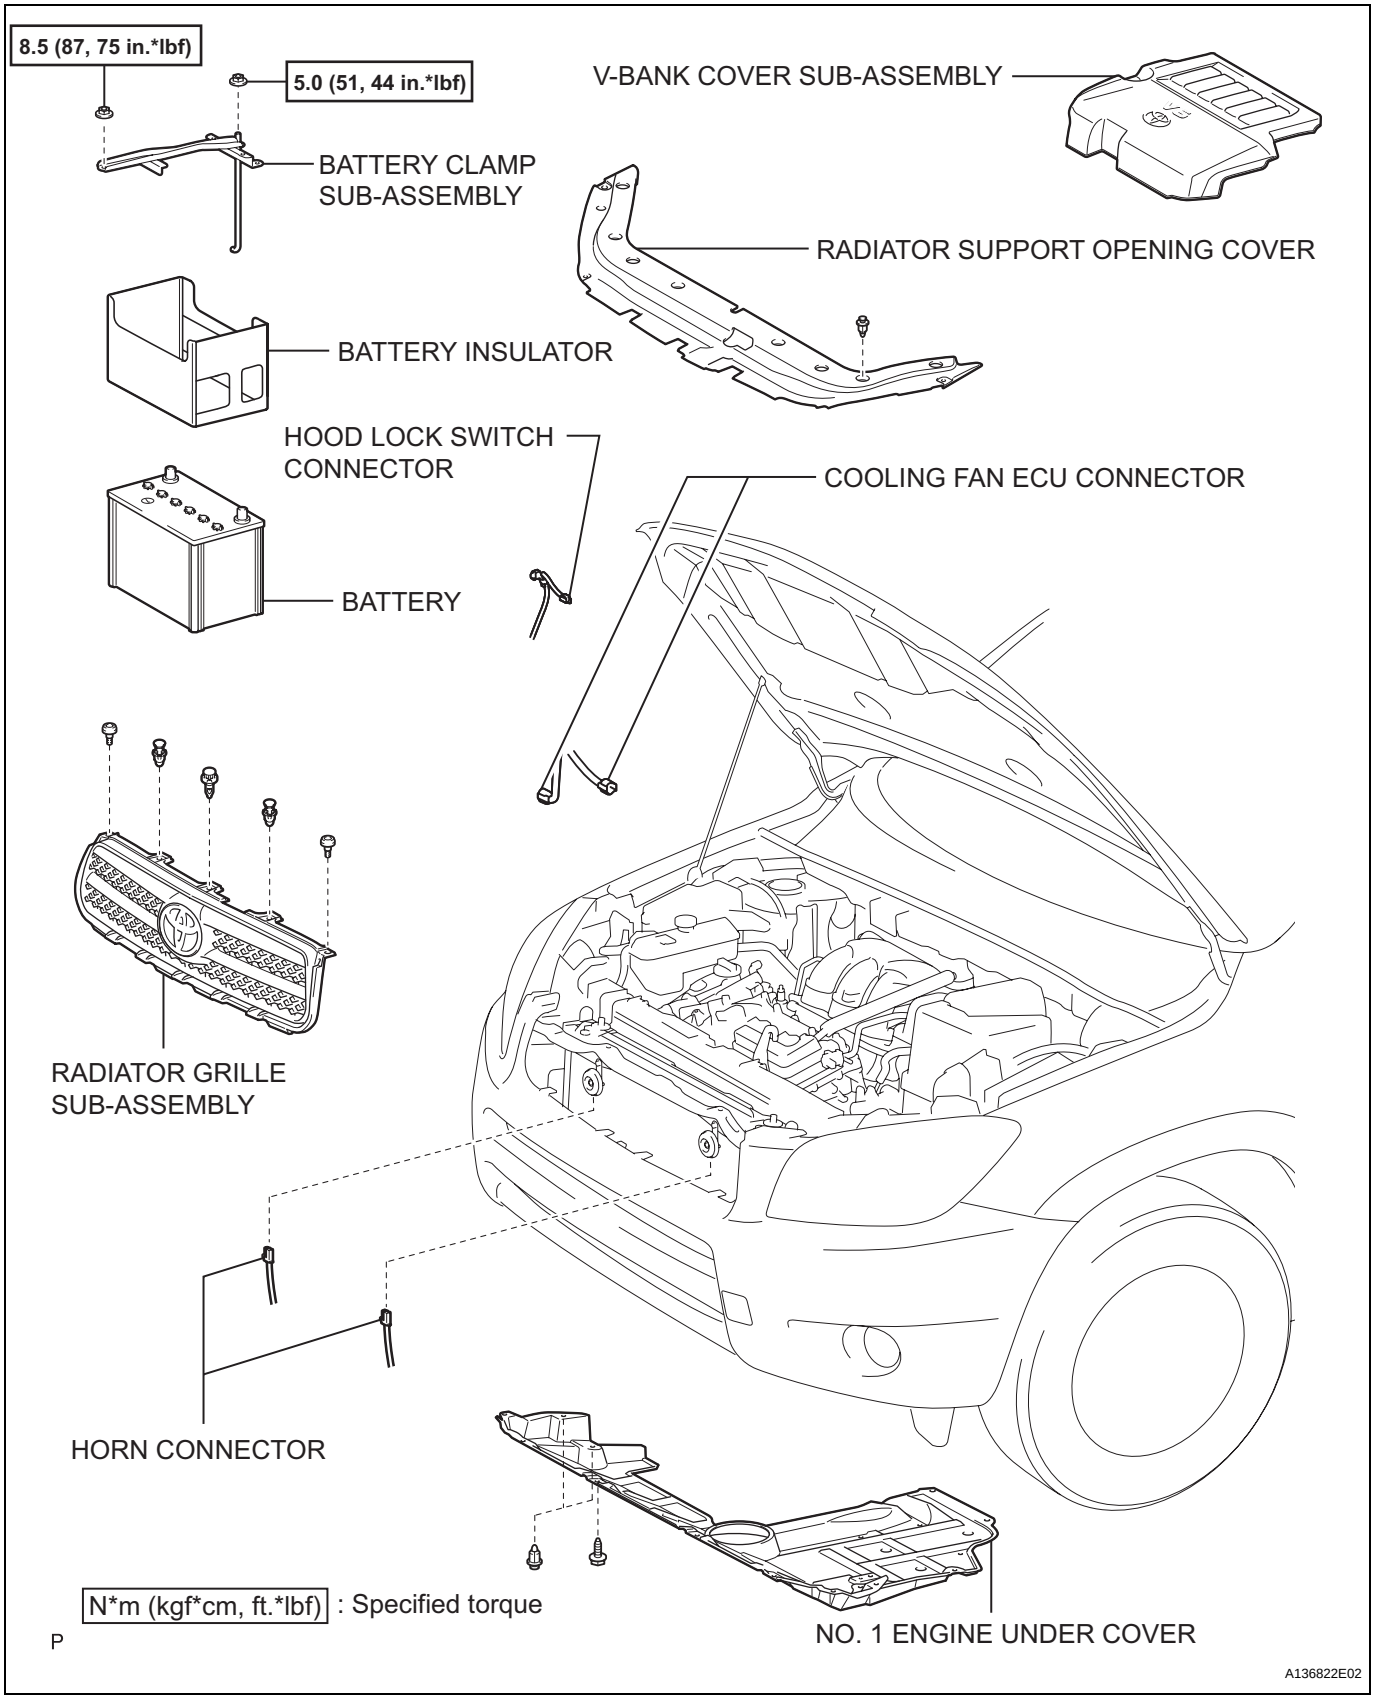
1. INSTALL GENERATOR ASSEMBLY



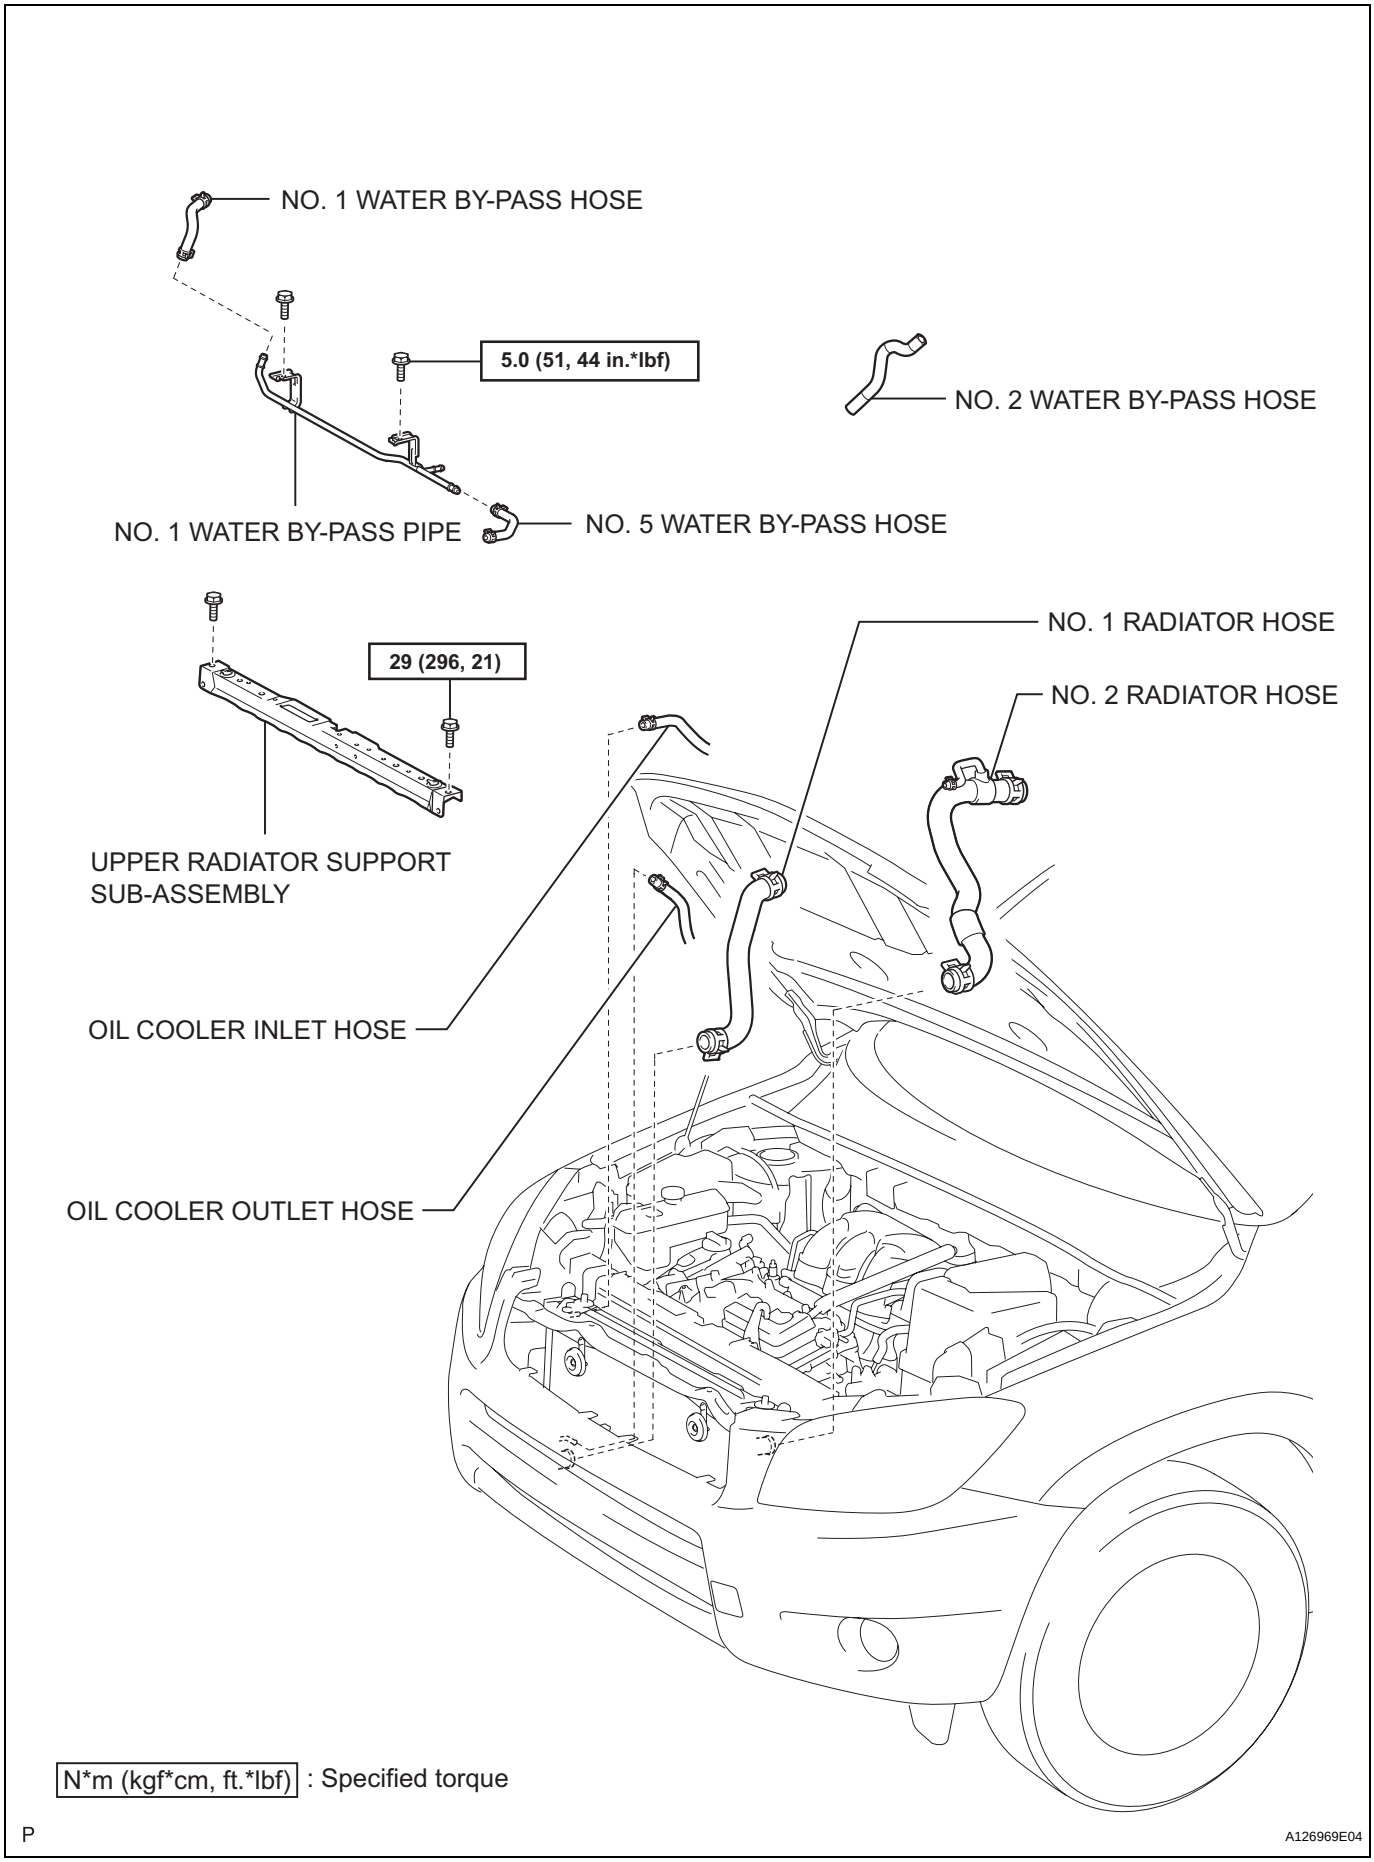
(a) Install the generator with the 2 bolts.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

(b) Install the bolt to the cylinder block.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)

(c) Connect the generator connector to the generator.
(d) Connect the generator wire with the nut.
Torque: 9.8 N*m (100 kgf*cm, 88 in.*lbf)
(e) Install the terminal cap.



(f) Connect the 2 wire harness clamps.



2. **INSTALL FAN AND GENERATOR V BELT (See page EM-8)**
3. **INSTALL RADIATOR RESERVOIR TANK (See page CO-21)**
4. **INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-9)**
5. **INSTALL ENGINE UNDER COVER REAR RH (See page EM-41)**
6. **INSTALL FRONT WHEEL RH**
7. **INSTALL RADIATOR ASSEMBLY**
   (a) Install the radiator (see page CO-40).

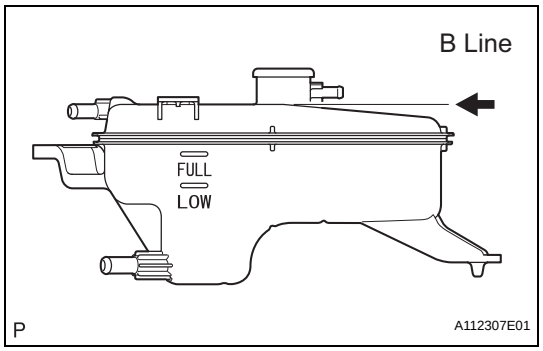
COOLANT



REPLACEMENT

1. **REMOVE NO. 1 ENGINE UNDER COVER (See page EM-21)**

2. **DRAIN ENGINE COOLANT**
   (a) Loosen the radiator drain cock plug.
   HINT:
   Collect the coolant in a container and dispose of it according to the regulations in your area.
   (b) Remove the radiator reservoir cap.
   CAUTION:
   Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.
   (c) Loosen the 2 cylinder block drain cock plugs.

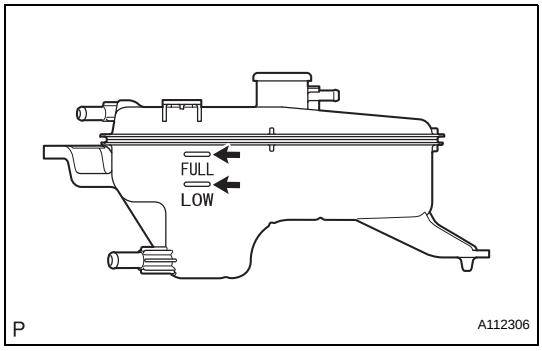
3. **ADD ENGINE COOLANT**
   (a) Tighten the radiator drain cock plug by hand.
   (b) Tighten the 2 cylinder block drain cock plugs.
   Torque: 12.7 N*m (130 kgf*cm, 10 ft.*lbf)
   (c) Add TOYOTA Super Long Life Coolant (SLLC) to the radiator reservoir filler opening.

(d) Continue adding TOYOTA SLLC until it is filled to the B line at the base of the reservoir's filler neck.
Standard capacity

Item	Specified Condition
STD (A/T)	**8.9 liters (9.4 US qts, 7.8 Imp. qts)**
TWG (A/T)	**9.3 liters (9.8 US qts, 8.2 Imp. qts)**

HINT:
TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).
NOTICE:
Never use water as a substitute for engine coolant.

(e) Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the level of the coolant. If the coolant level drops below the B line, add TOYOTA SLLC to the B line.
(f) Install the radiator reservoir cap.
(g) Start the engine and warm it up until the cooling fan operates. While the cooling fan operates, circulate the coolant for several minutes.
(1) Set the air conditioning as follows while warming up the engine.

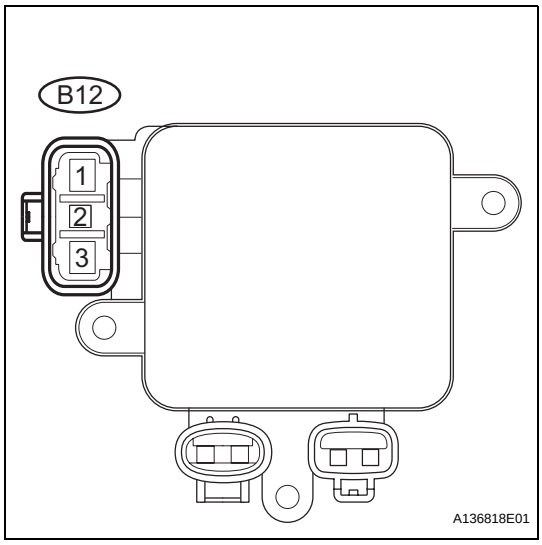


Item	Specified Condition
Manual Air Conditioning System	Fan speed: Any setting except OFF
	Temperature: Toward WARM Air conditioning switch: OFF
Automatic Air Conditioning System	Temperature: Toward MAX Air conditioning switch: OFF

(2) Maintain the engine speed at 2,000 to 2,500 rpm and warm up the engine until the cooling fan operates.
NOTICE:
- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the B line.**

- **Run the engine at 2,000 rpm until the coolant level has stabilized.**

(h) Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.
CAUTION:
When pressing the radiator hoses:
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan.**



(i) Stop the engine and wait until the coolant cools down to ambient temperature.

(j) Check that the coolant level is between the FULL and LOW line.
If the coolant level is below the LOW line, repeat all of the procedures above.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and LOW line.

4. CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-1)

5. INSTALL NO. 1 ENGINE UNDER COVER (See page EM-41)

COOLING FAN ECU

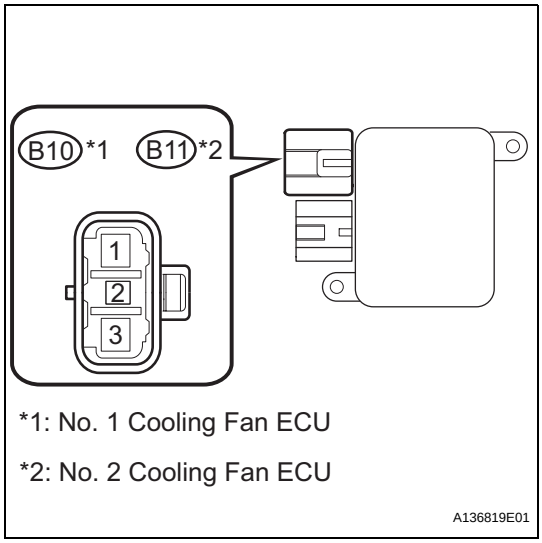
ON-VEHICLE INSPECTION

1. CHECK COOLING FAN ECU (w/o Trailer Towing System)

(a) Disconnect the B12 ECU connector.

(b) Measure the voltage and resistance of the wire harness side connector.

Standard voltage



Tester Connection	Condition	Specified Condition
B12-3 (+B) - Body ground	Ignition switch ON	9 to 14 V

Standard resistance

Tester Connection	Condition	Specified Condition
B12-1 (E1) - Body ground	Always	Below 1 Ω

If the result is not as specified, inspect the power source system (fusible link, fuse, wire harness and relay).

(c) Connect the B12 ECU connector.

2. CHECK COOLING FAN ECU (w/ Trailer Towing System)

(a) Disconnect the B10 and B11 ECU connector.

(b) Measure the voltage and resistance of the wire harness side connector.

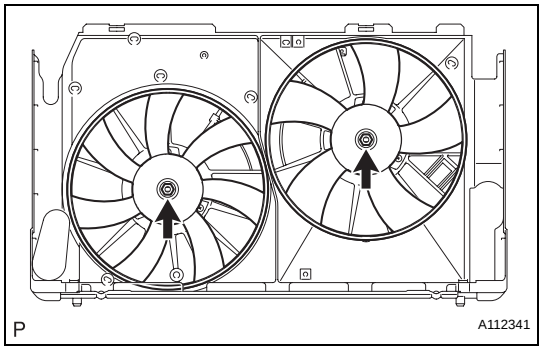
Standard voltage

Tester Connection	Condition	Specified Condition
B10-1 (+B1) - Body ground	Ignition switch ON	9 to 14 V
B11-1 (+B2) - Body ground	Ignition switch ON	9 to 14 V

Standard resistance

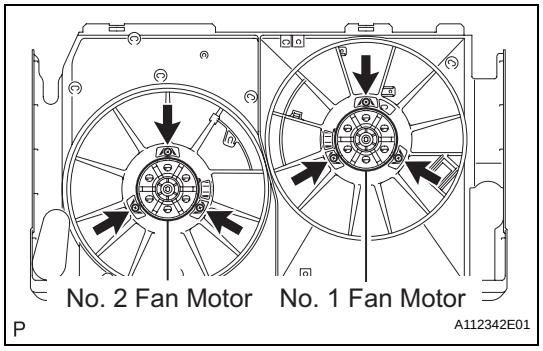
Tester Connection	Condition	Specified Condition
B10-3 (E1) - Body ground	Always	Below 1 Ω
B11-3 (E2) - Body ground	Always	Below 1 Ω

If the result is not as specified, inspect the power source system (fusible link, fuse, wire harness and relay).



(c) Connect the B10 and B11 ECU connector.

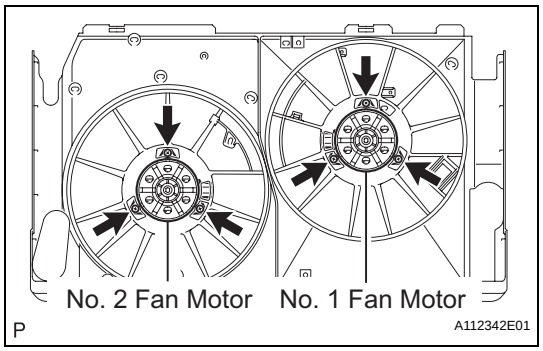
CO



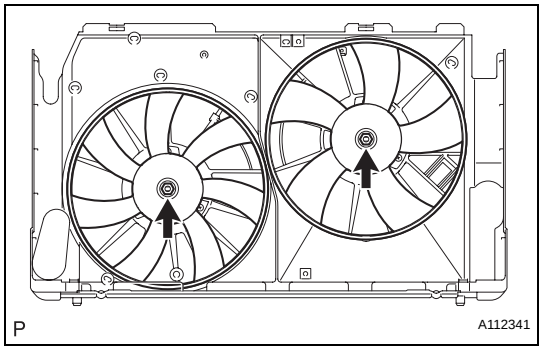
REMOVAL

1. **REMOVE RADIATOR ASSEMBLY**
   (a) Remove the radiator (see page CO-36).

DISASSEMBLY



1. **REMOVE FAN**
   (a) Remove the 2 nuts and 2 fans.



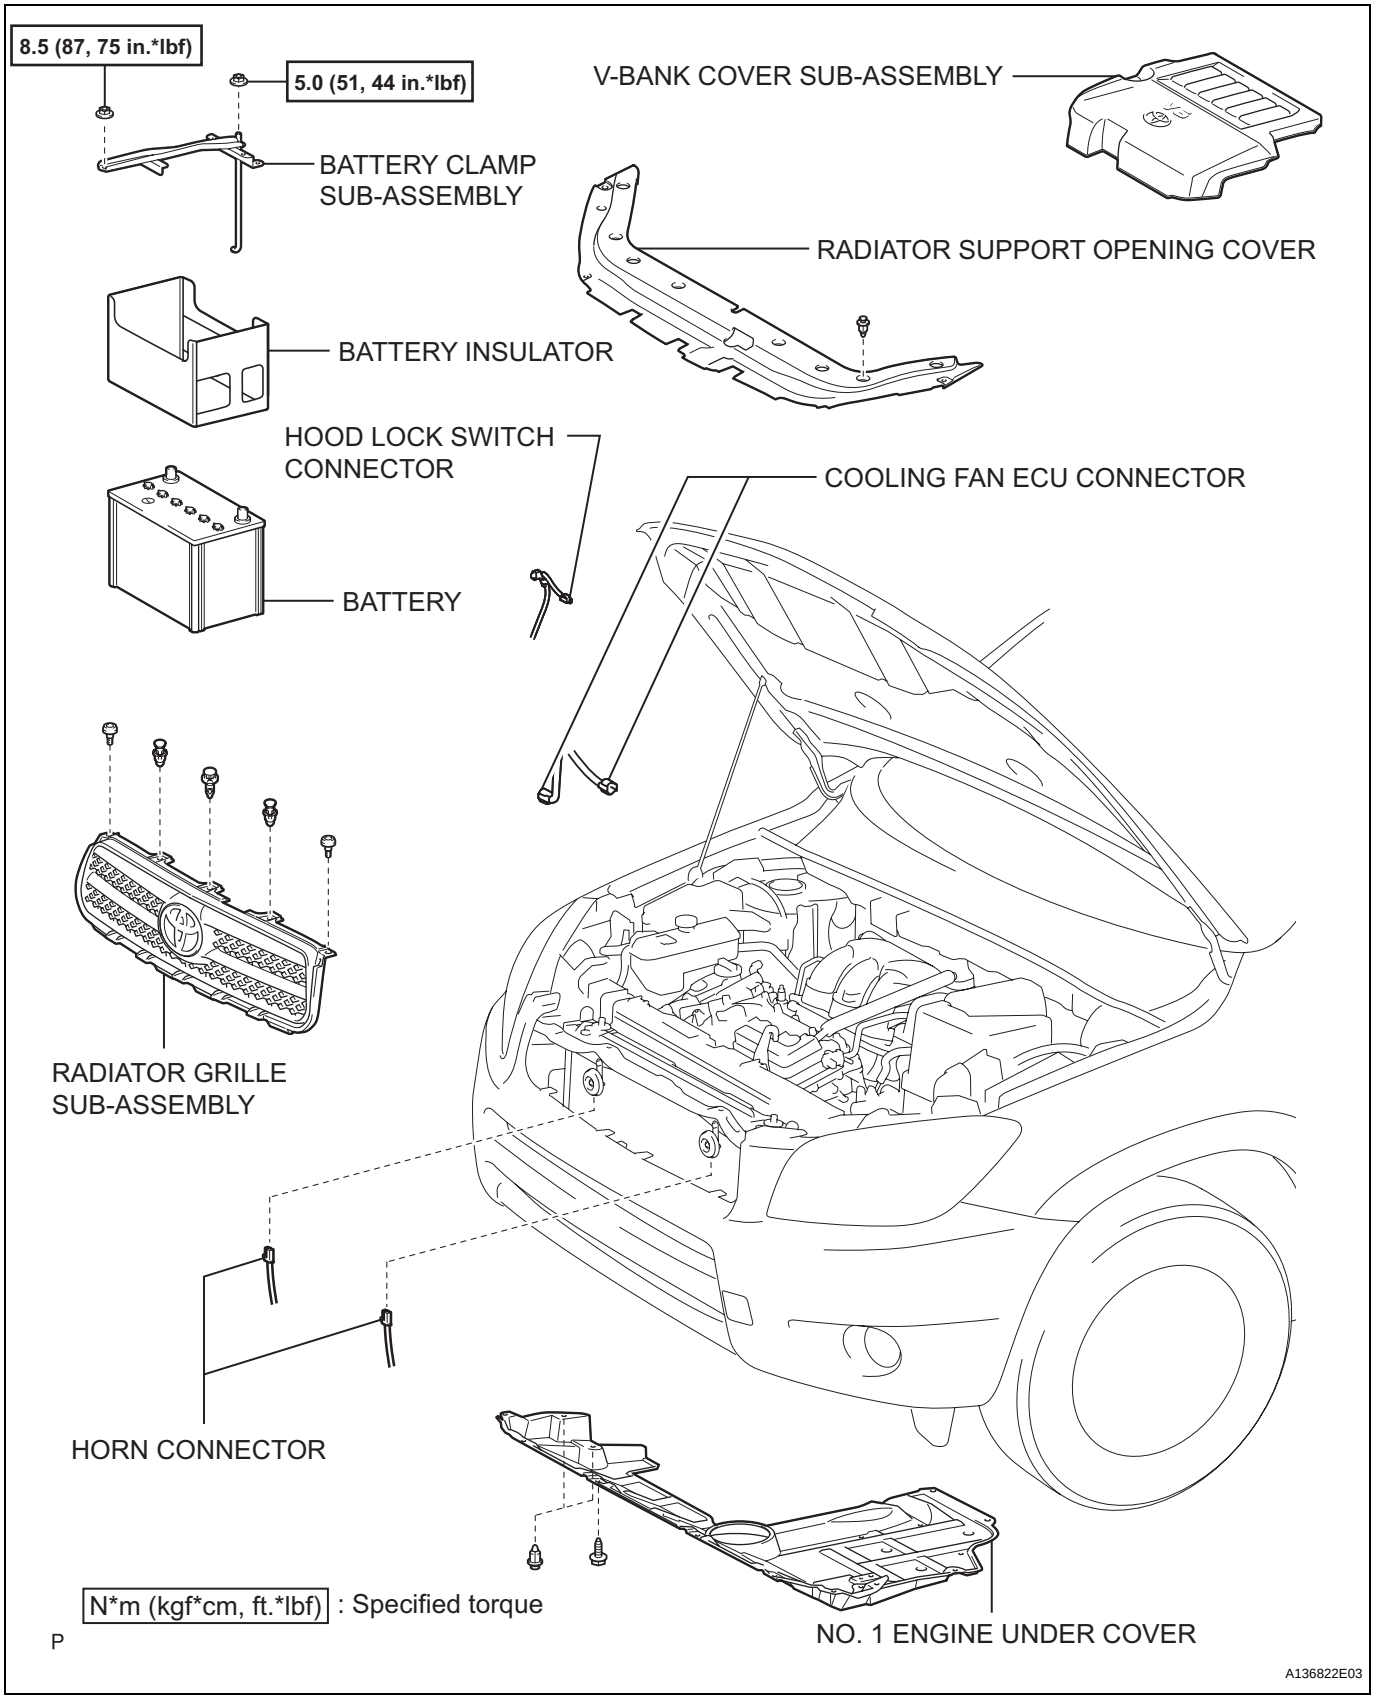
2. **REMOVE NO. 1 COOLING FAN MOTOR**
   (a) Remove the 3 screws and fan motor.
3. **REMOVE NO. 2 COOLING FAN MOTOR**
   (a) Remove the 3 screws and fan motor.

REASSEMBLY

1. **INSTALL NO. 2 COOLING FAN MOTOR**
   (a) Install the fan motor with the 3 screws.
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)
2. **INSTALL NO. 1 COOLING FAN MOTOR**
   (a) Install the fan motor with the 3 screws.
   Torque: 3.9 N*m (40 kgf*cm, 35 in.*lbf)

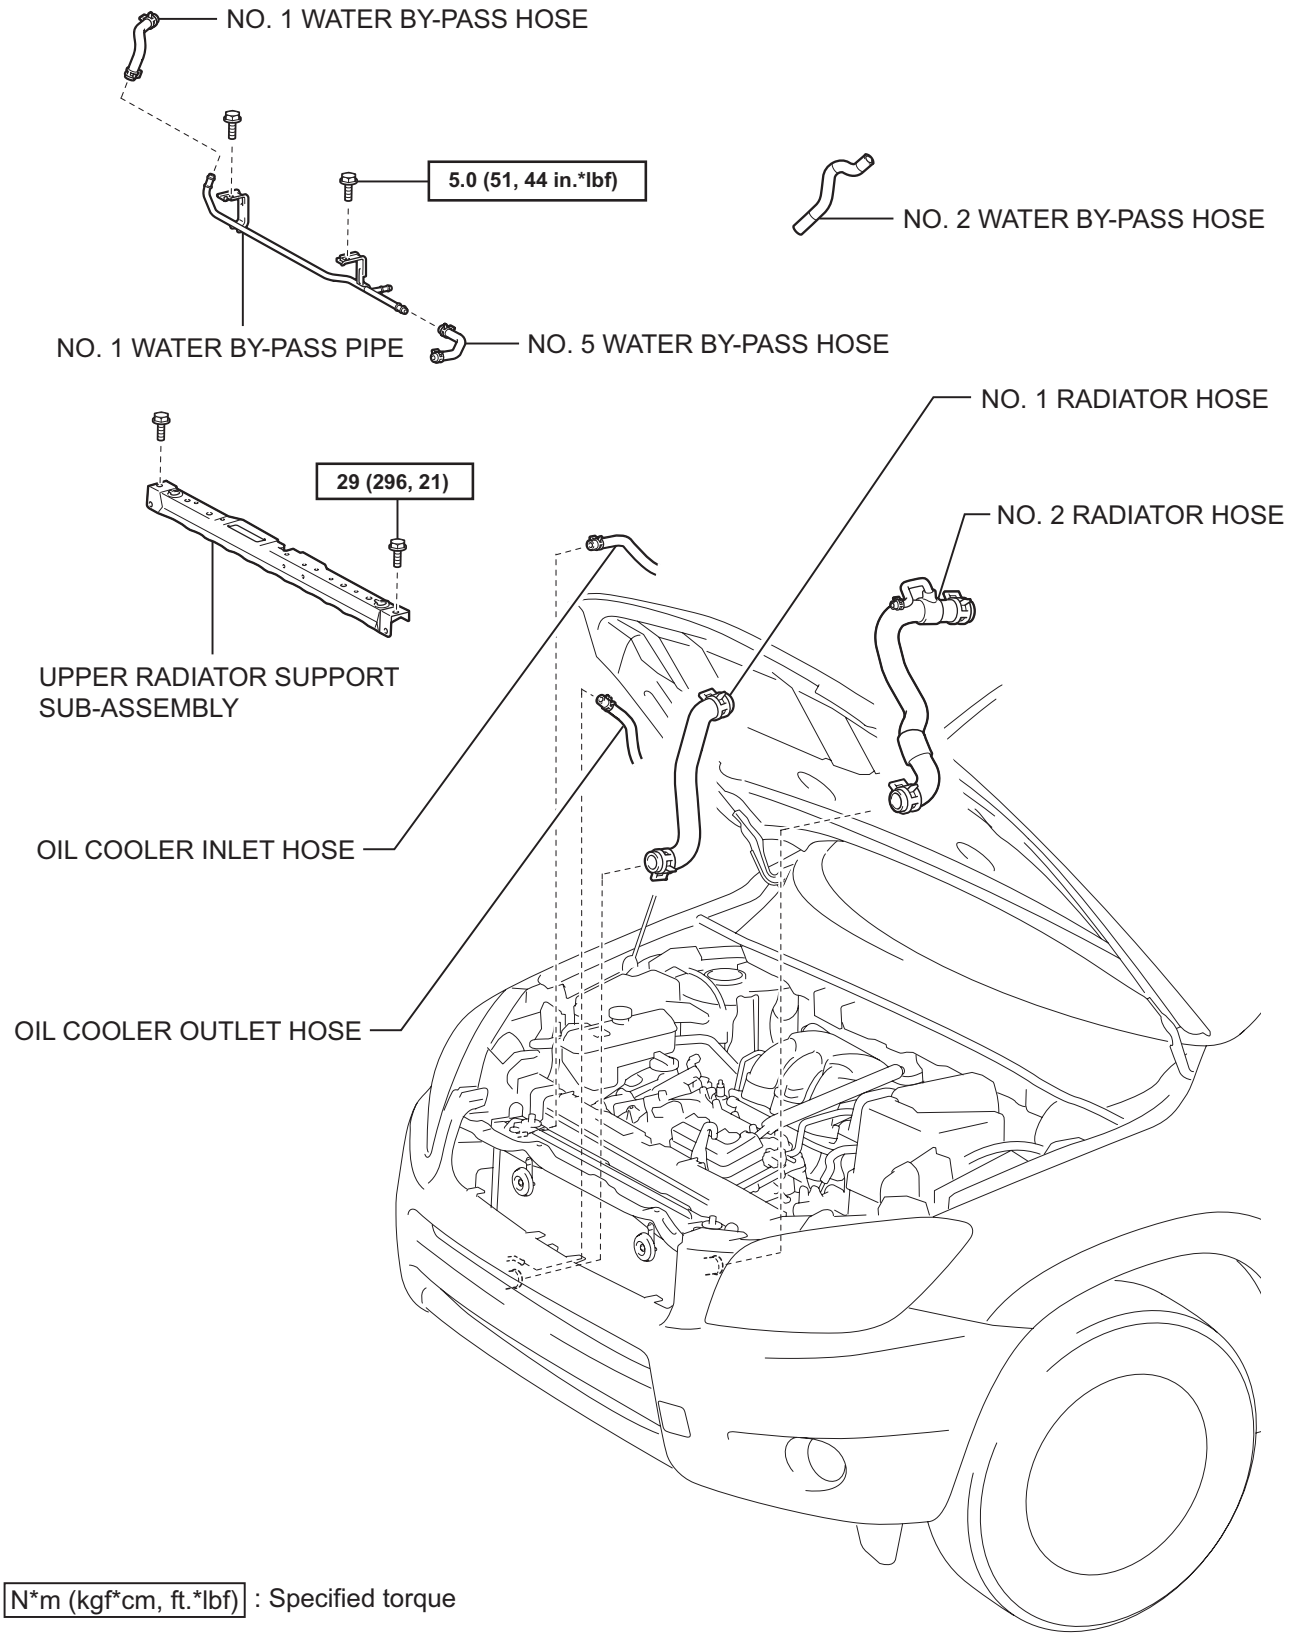
3. **INSTALL FAN**
   (a) Install the 2 fans with the 2 nuts.
   Torque: 6.3 N*m (64 kgf*cm, 55 in.*lbf)
   (b) Check the fan motor operation.

CO



INSTALLATION

1. INSTALL RADIATOR ASSEMBLY



(a) Install the radiator (see page CO-40).

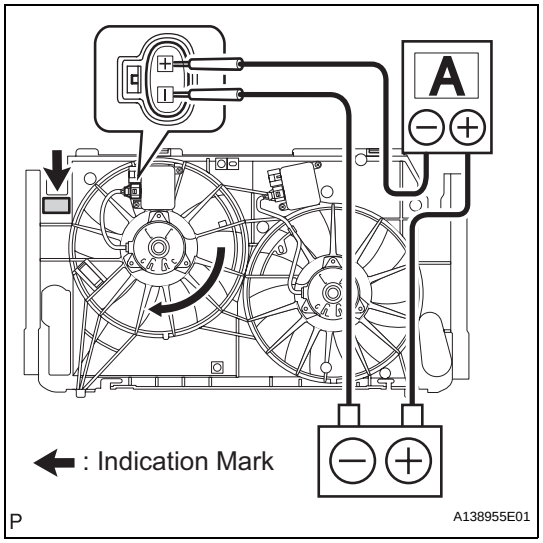
ON-VEHICLE INSPECTION

1. INSPECT NO. 1 COOLING FAN MOTOR (w/o Trailer Towing System)



(a) Disconnect the No. 1 fan connector.
(b) Connect the battery and an ammeter to the No. 1 fan motor connector.
(c) Check that the No. 1 fan rotates smoothly, and then check the reading on the ammeter.

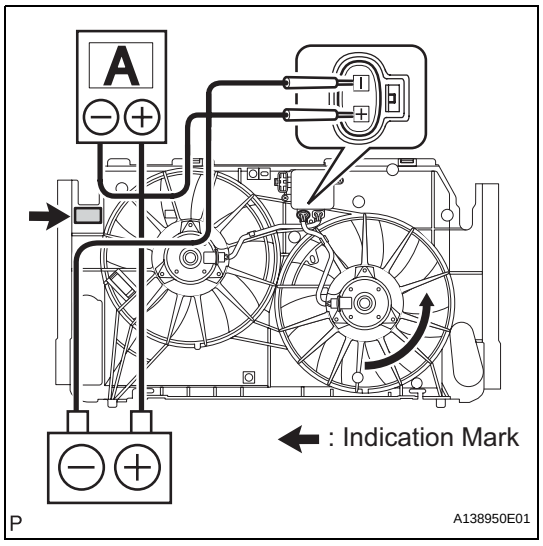
Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
E	160 W	at 20°C (68°F)	11.8 to 14.8 A

HINT:
Refer to the illustration for the indication mark location.
If the result is not as specified, replace the No. 1 cooling fan motor.

(d) Reconnect the No. 1 fan motor connector.

2. INSPECT NO. 1 COOLING FAN MOTOR (w/ Trailer Towing System)



(a) Disconnect the No. 1 fan connector.
(b) Connect the battery and an ammeter to the No. 1 fan motor connector.
(c) Check that the No. 1 fan rotates smoothly, and then check the reading on the ammeter.

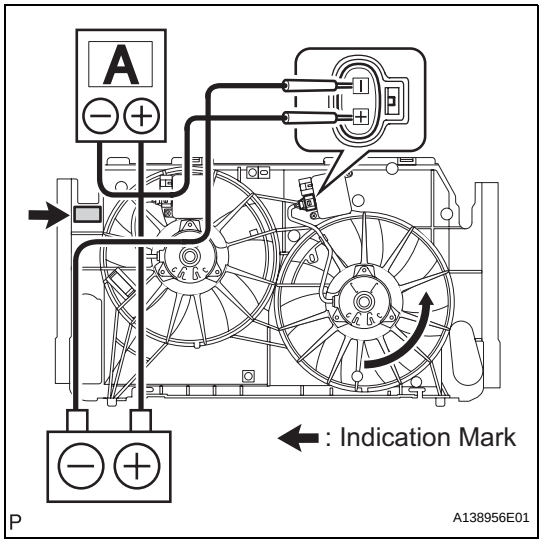
Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
H	240 W	at 20°C (68°F)	18.0 to 22.0 A

HINT:
Refer to the illustration for the indication mark location.
If the result is not as specified, replace the No. 1 cooling fan motor.

(d) Reconnect the No. 1 fan motor connector.

3. INSPECT NO. 2 COOLING FAN MOTOR (w/o Trailer Towing System)



(a) Disconnect the No. 2 fan connector.
(b) Connect the battery and an ammeter to the No. 2 fan motor connector.
(c) Check that the No. 2 fan rotates smoothly, and then check the reading on the ammeter.

Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
E	160 W	at 20°C (68°F)	11.8 to 14.8 A

HINT:
Refer to the illustration for the indication mark location.
If the result is not as specified, replace the No. 2 cooling fan motor.

CO

(d) Reconnect the No. 2 fan motor connector.

4. INSPECT NO. 2 COOLING FAN MOTOR (w/ Trailer Towing System)

(a) Disconnect the No. 2 fan connector.

(b) Connect the battery and an ammeter to the No. 2 fan motor connector.

(c) Check that the No. 2 fan rotates smoothly, and then check the reading on the ammeter.

Standard amperage

Indication Mark	Motor Type	Condition	Specified Condition
H	240 W	at 20°C (68°F)	18.0 to 22.0 A

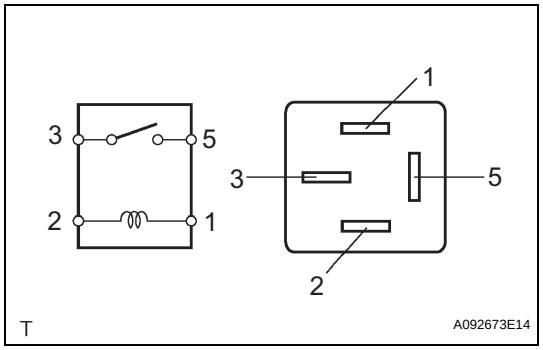
HINT:

Refer to the illustration for the indication mark location.

If the result is not as specified, replace the No. 2 cooling fan motor.

(d) Reconnect the No. 2 fan motor connector.

COOLING FAN RELAY



ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

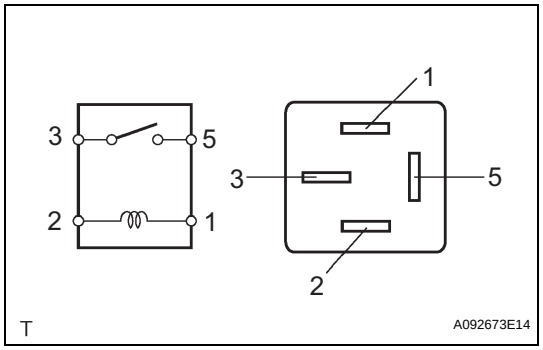
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE ENGINE ROOM NO. 2 RELAY BLOCK COVER

3. INSPECT NO. 1 FAN RELAY (Marking: FAN NO. 1)

(a) Remove the relay from the engine room No. 2 relay block.



(b) Measure the resistance of the relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 Ω or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

(c) Install the relay.

4. INSPECT NO. 2 FAN RELAY (Marking: FAN NO. 2)

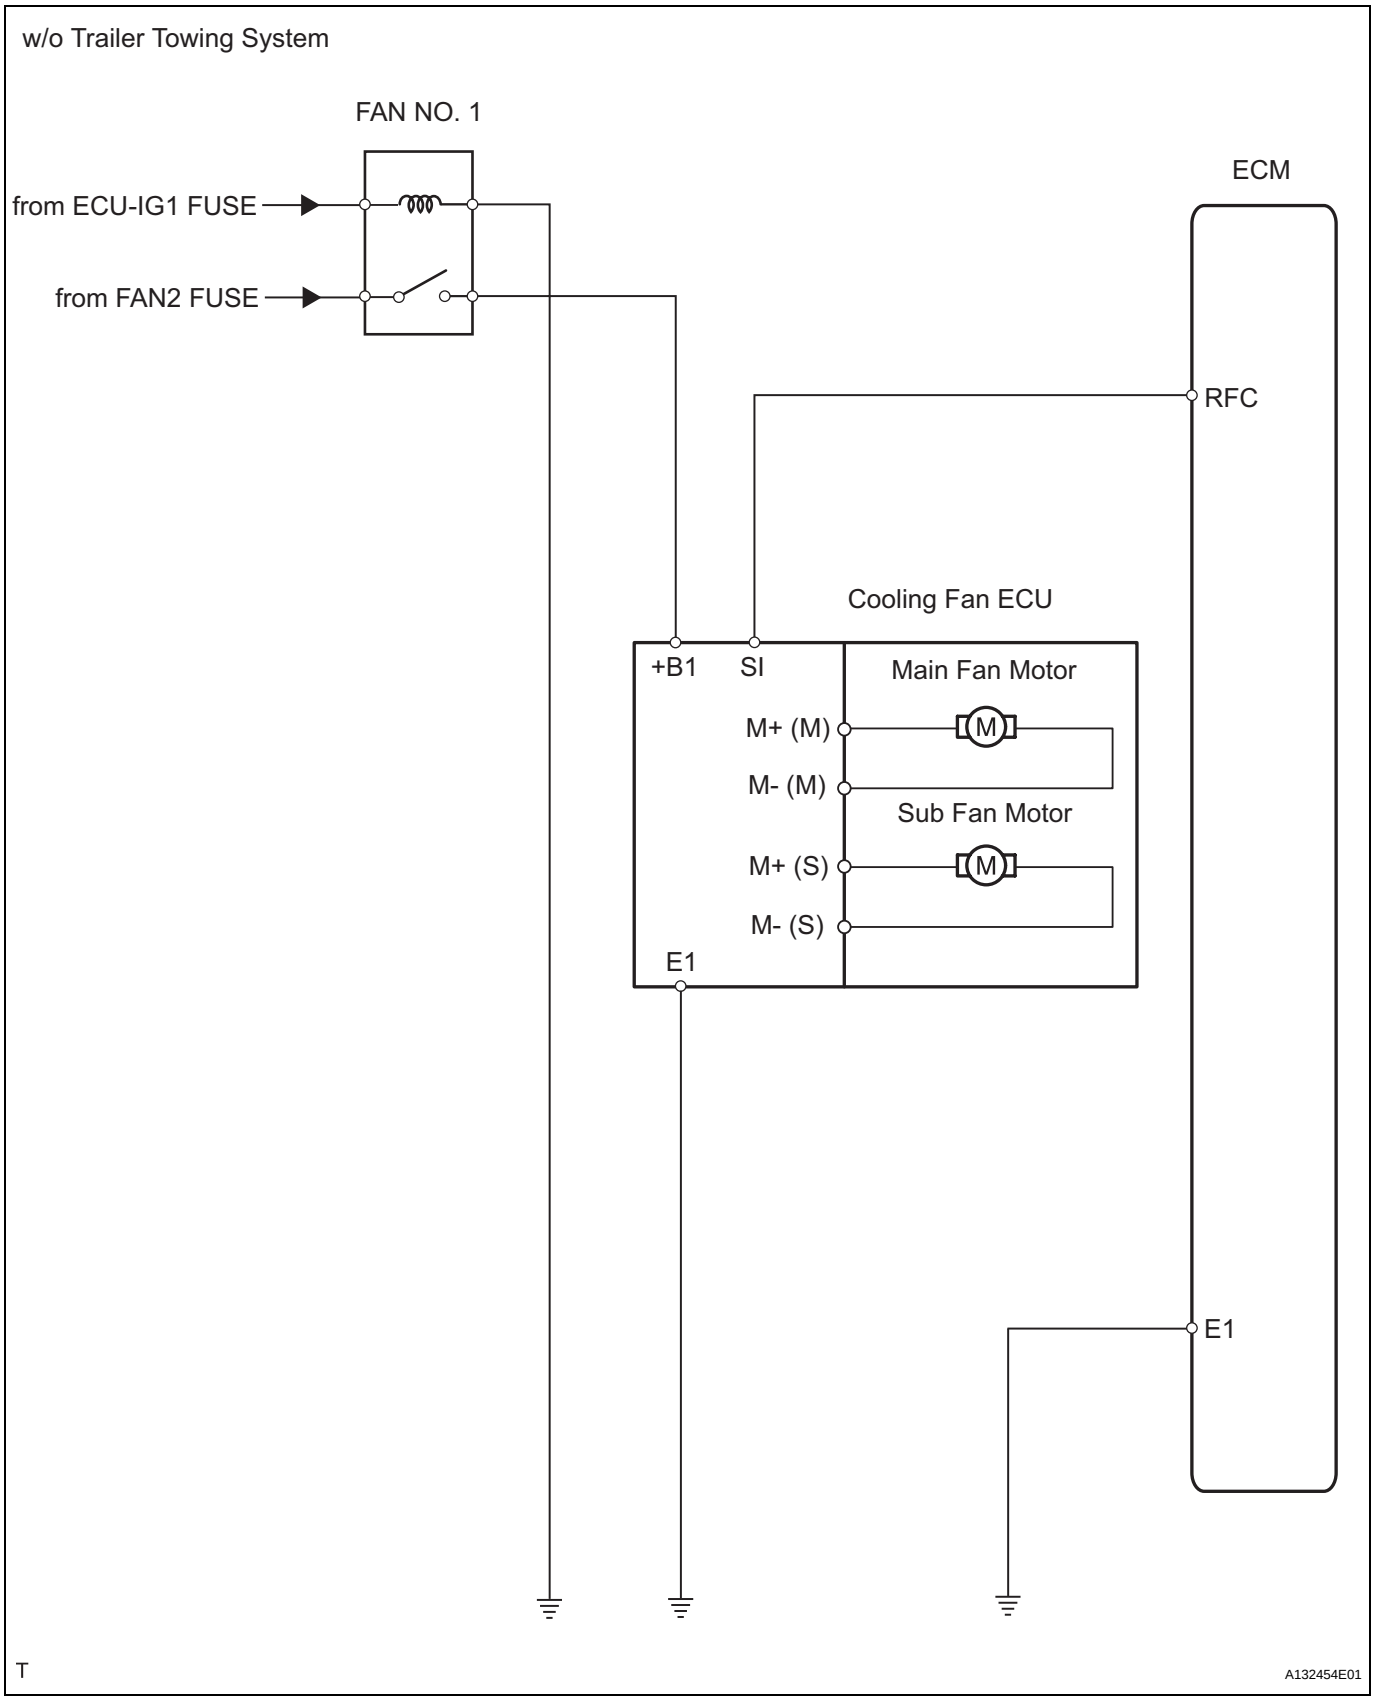
(a) Remove the relay from the engine room No. 2 relay block.

(b) Measure the resistance of the relay.

Standard resistance

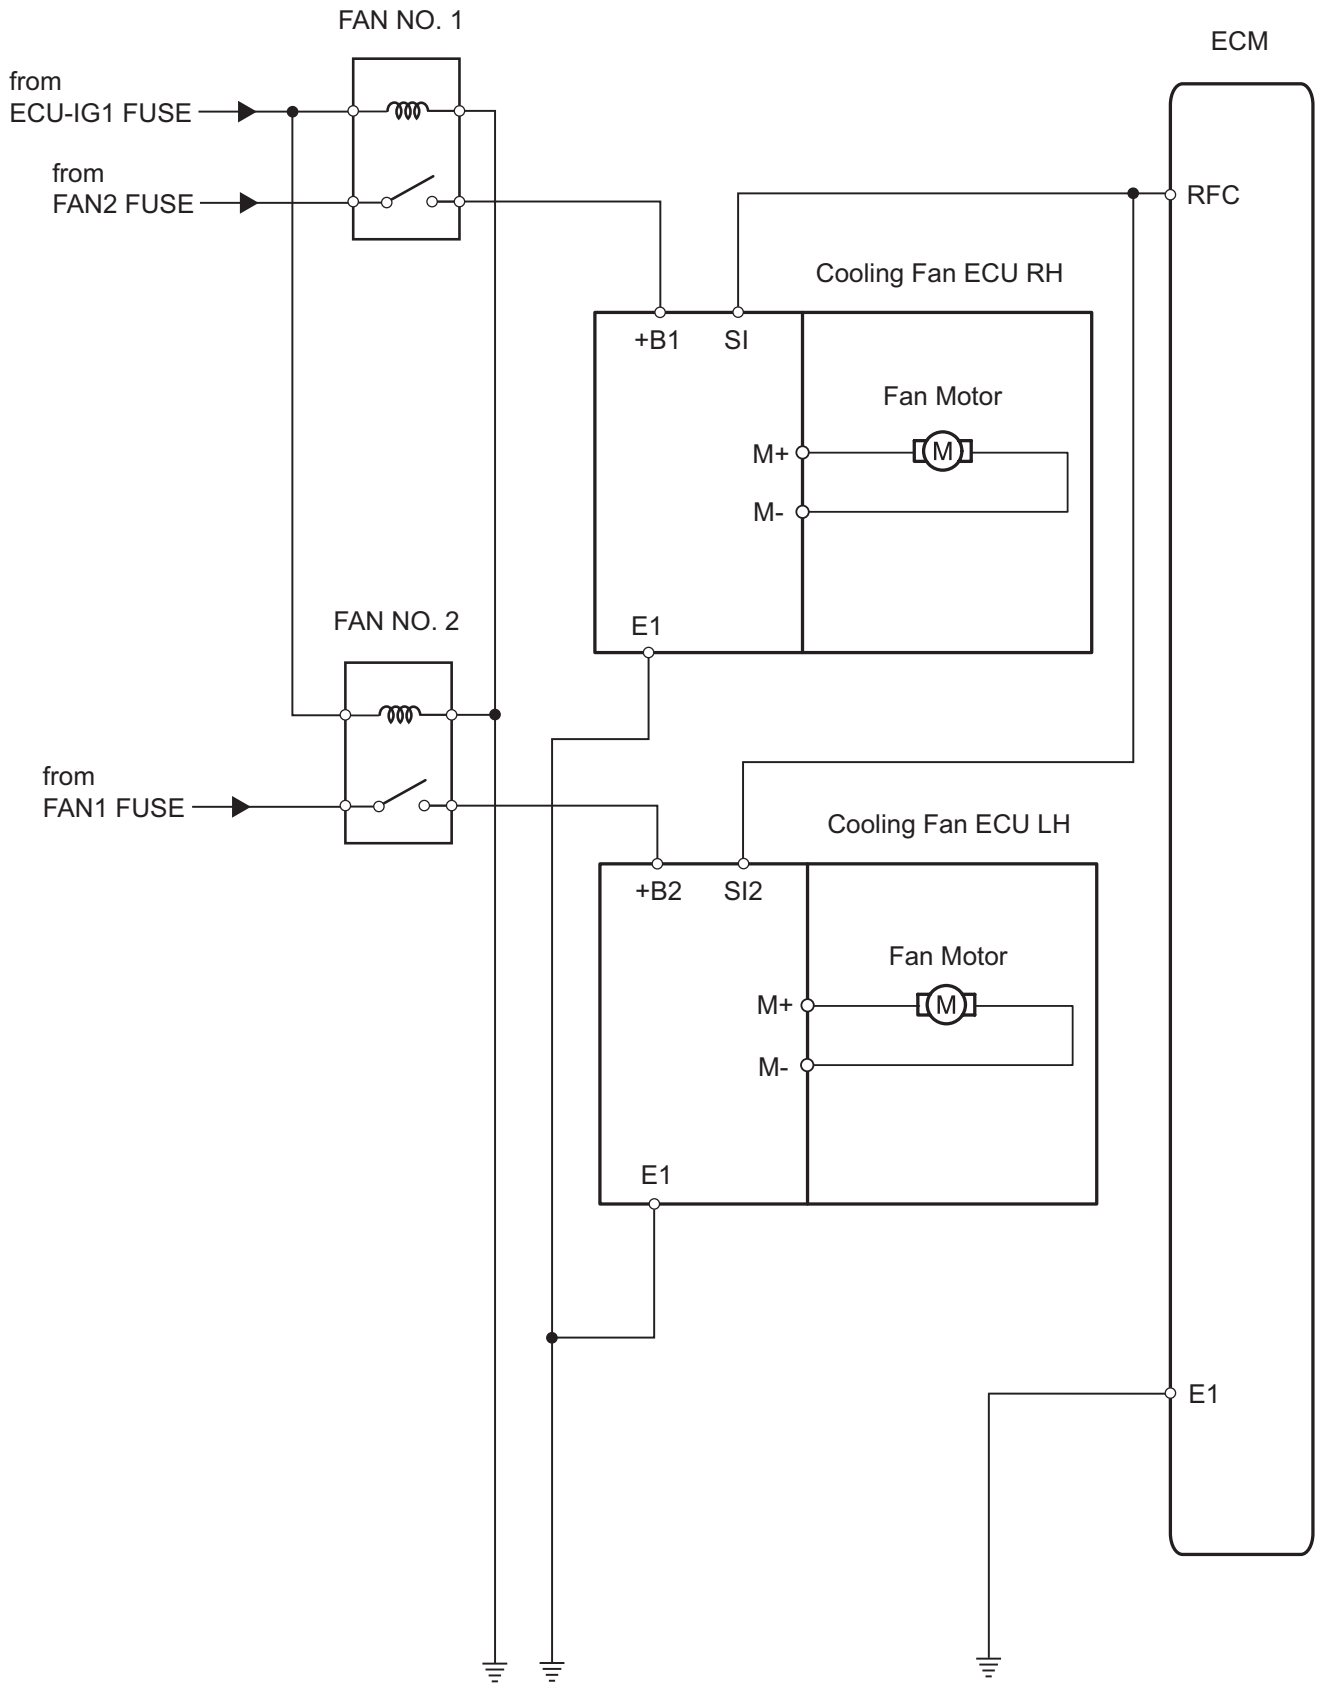
Tester Connection	Specified Condition
3 - 5	10 Ω or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.



(c) Install the relay.

5. INSTALL ENGINE ROOM NO. 2 RELAY BLOCK COVER



6. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

CO

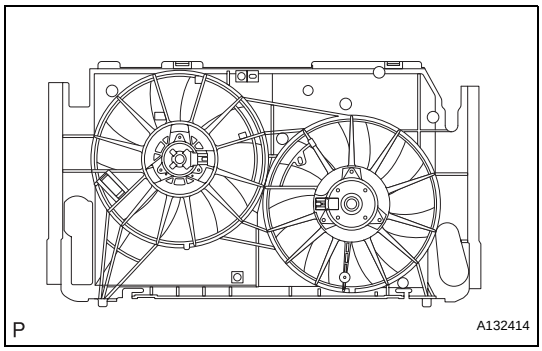
SYSTEM DIAGRAM

w/ Trailer Towing System

T

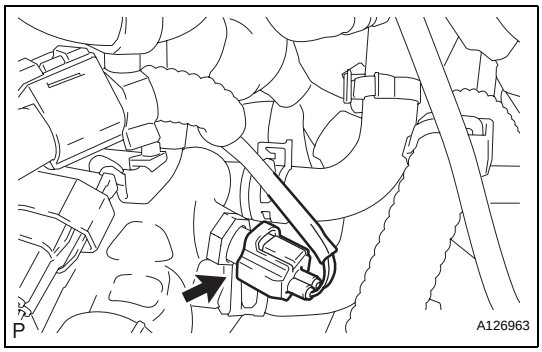
A132455E01

CO



ON-VEHICLE INSPECTION

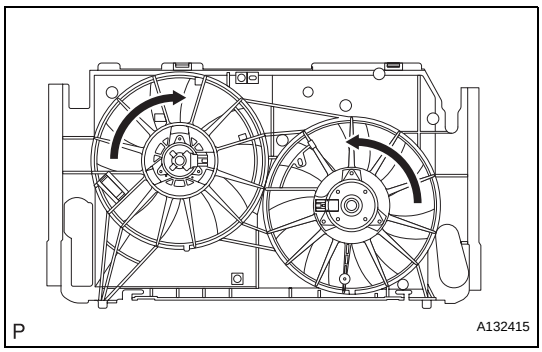
HINT:
It is normal for the cooling fan to sometimes rotate when the ignition switch is turned from ACC to ON.



1. CHECK COOLING FAN OPERATION AT LOW TEMPERATURES (Below 94°C (201°F))

(a) Turn the ignition switch ON with the A/C switch OFF.

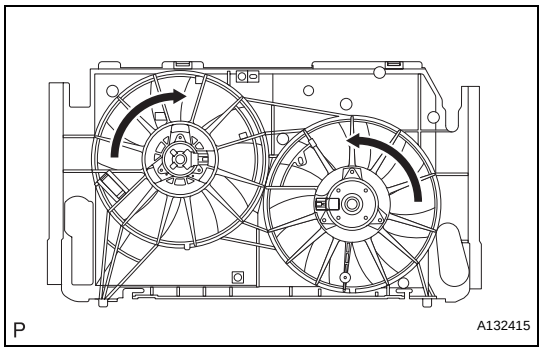
(b) Check that the cooling fan stops.
If it does not, check the cooling fan relays and engine coolant temperature sensor, and then check for disconnection of the connector or wire breaks between the cooling fan relay and engine coolant temperature sensor.



(c) Disconnect the engine coolant temperature sensor connector.

(d) Check that the cooling fan rotates.
If it does not, check the fuses, cooling fan relays, ECM and cooling fan, and then check for an open circuit between the cooling fan relay and engine coolant temperature sensor.

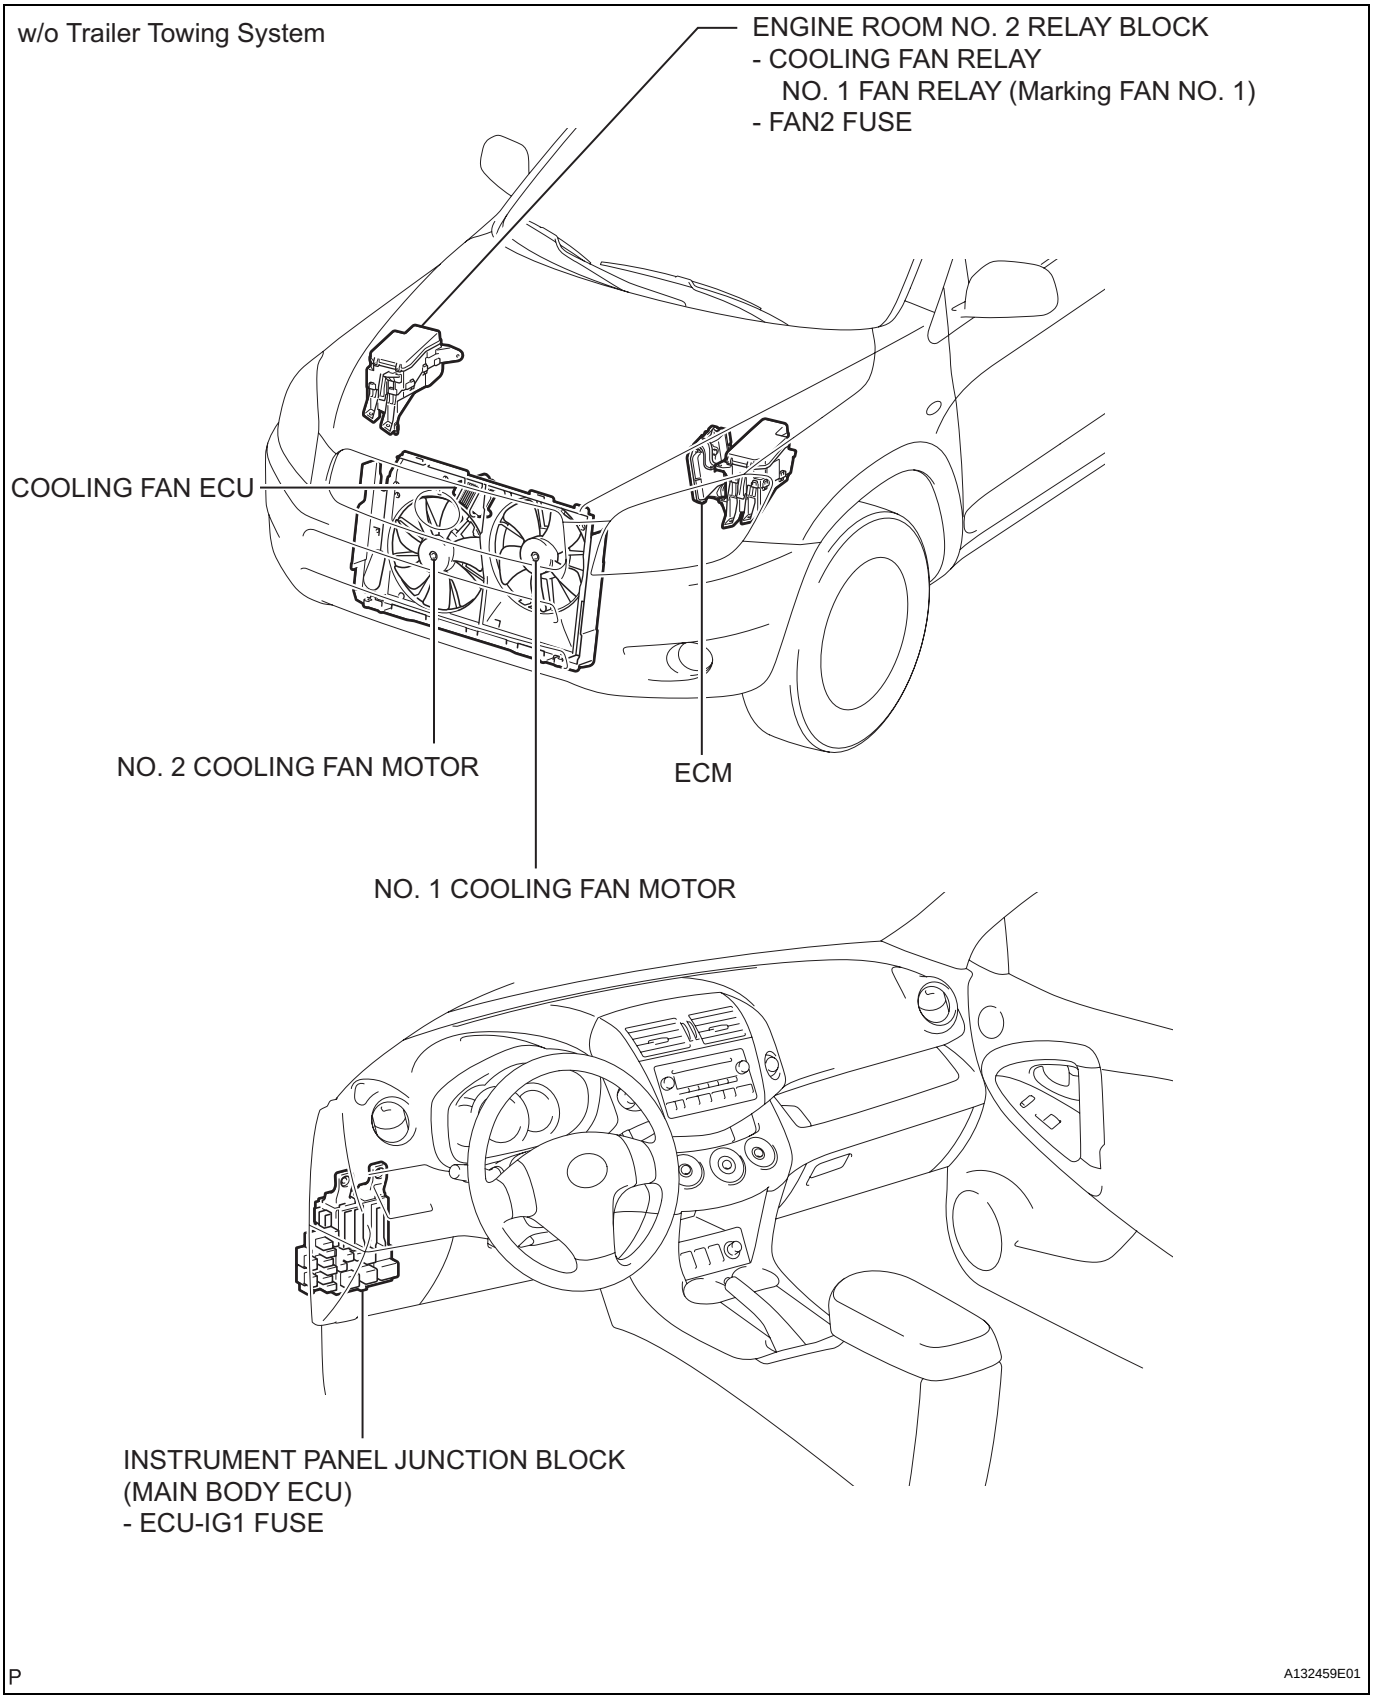
(e) Reconnect the engine coolant temperature sensor connector.



2. CHECK COOLING FAN OPERATION AT HIGH TEMPERATURES (Above 96°C (205°F))

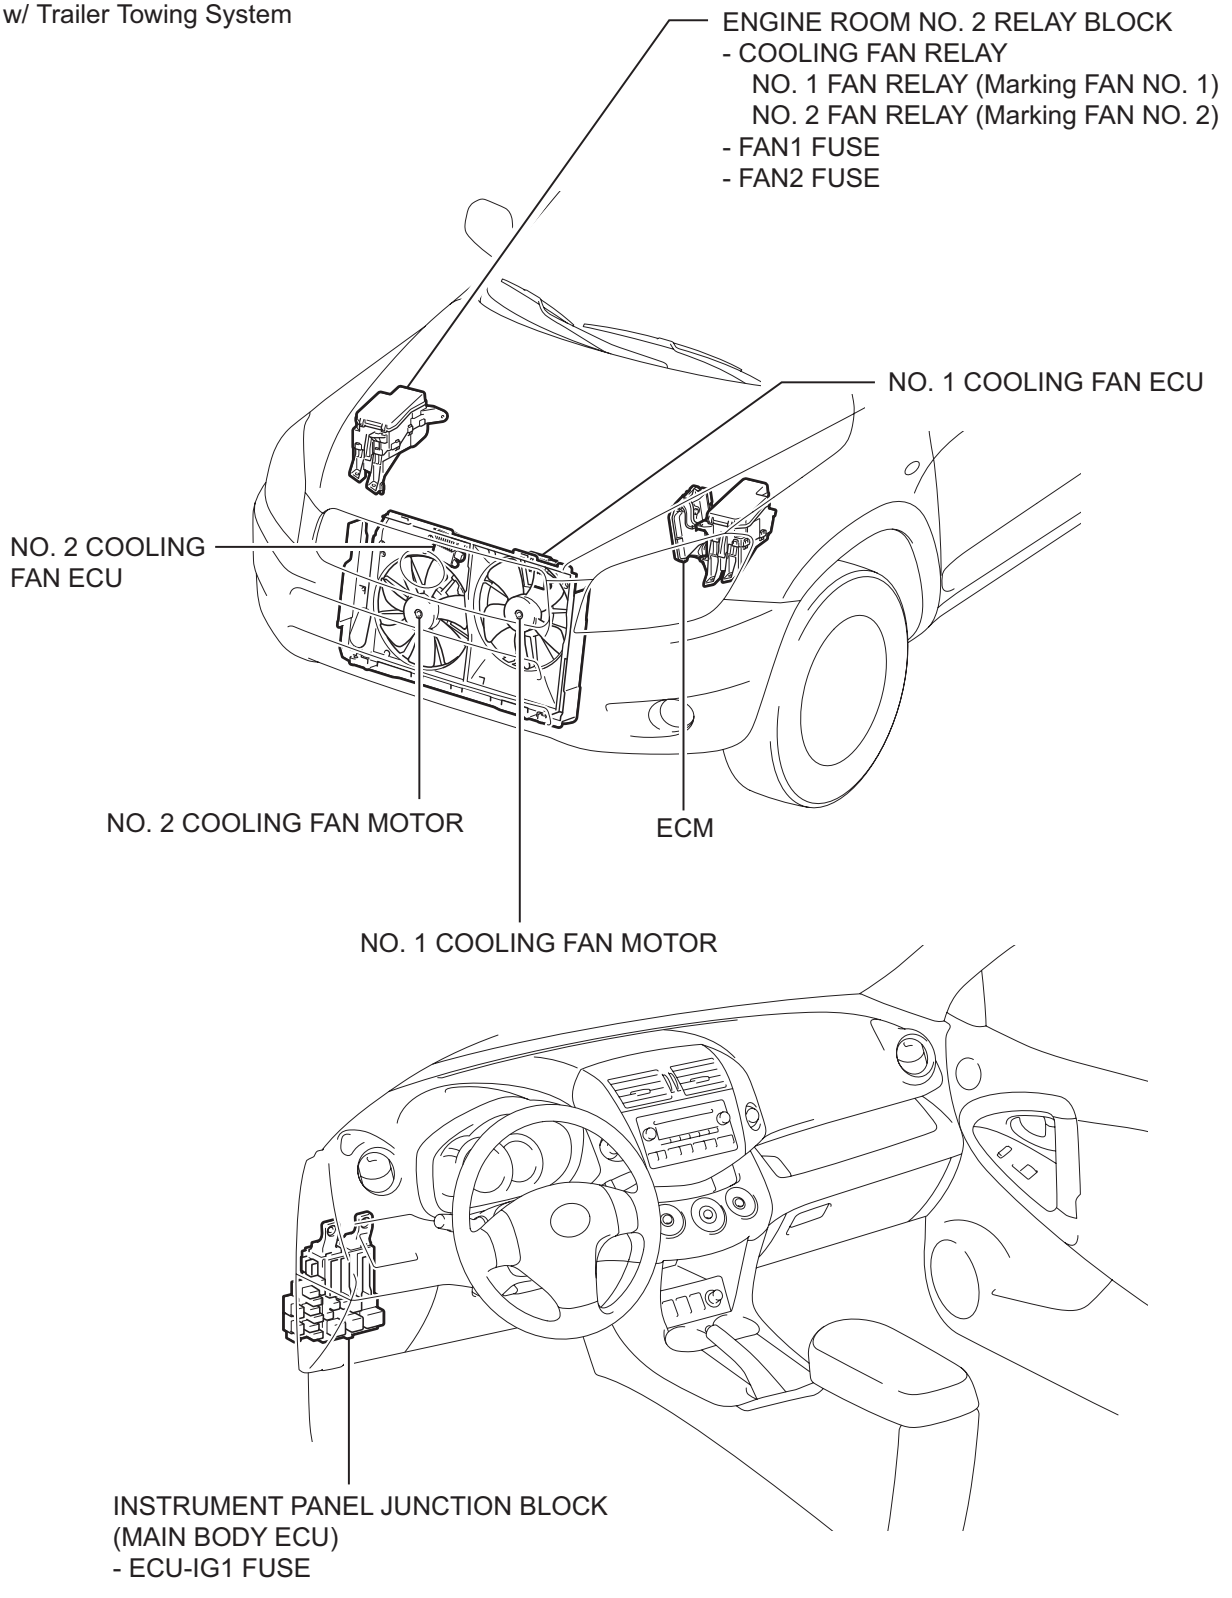
(a) Start the engine, and then raise the coolant temperature to above 96°C (205°F).
HINT:
Coolant temperature is the value detected by the engine coolant temperature sensor on the cylinder head.

(b) Check that the A/C switch is OFF.



CO

(c) Check that the cooling fan rotates.
If it does not, check the engine coolant temperature sensor, cooling fan, harness or connector.



COOLING FAN SYSTEM

PARTS LOCATION

CO

w/ Trailer Towing System

P

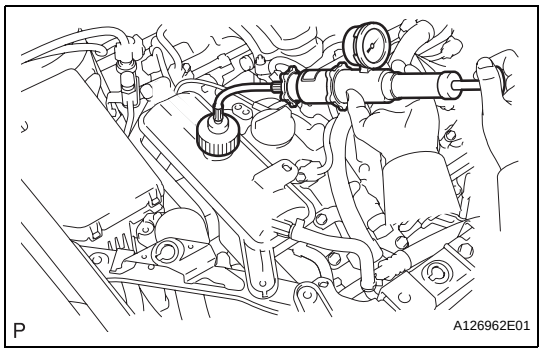
CO



COOLING SYSTEM

ON-VEHICLE INSPECTION

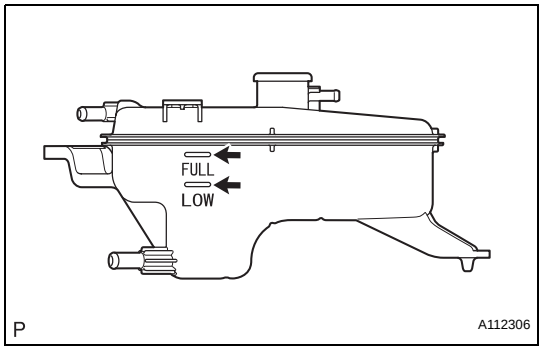
1. CHECK COOLING SYSTEM FOR LEAKS

(a) Remove the radiator reservoir cap.

CAUTION:
Do not remove the radiator reservoir cap while the engine and radiator are still hot.
Pressurized, hot engine coolant and steam may be released and cause serious burns.

(b) Fill the radiator with coolant, and then attach a radiator cap tester.

(c) Warm up the engine.



(d) Pump the radiator cap tester to 118 kPa (1.2 kgf/cm^2, 17.1 psi), and then check that the pressure does not drop.

If the pressure drops, check the hoses, radiator and water pump for leakage.

If there are no signs of external coolant leaks, check the heater core, cylinder block and head.

(e) Reinstall the radiator cap.

2. CHECK ENGINE COOLANT LEVEL OF RESERVOIR

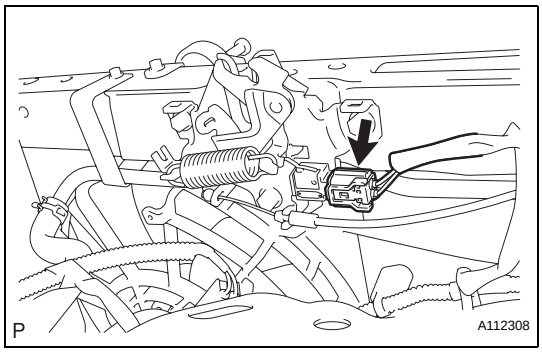
(a) The engine coolant should be between the LOW and FULL lines when the engine is cold.

If the coolant level is below the LOW line, check for leakage and add TOYOTA Super Long Life Coolant (SLLC) or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, and non-borate coolant with long-life hybrid organic acid technology up to the FULL line.

3. CHECK ENGINE COOLANT QUALITY

(a) Remove the radiator reservoir cap.

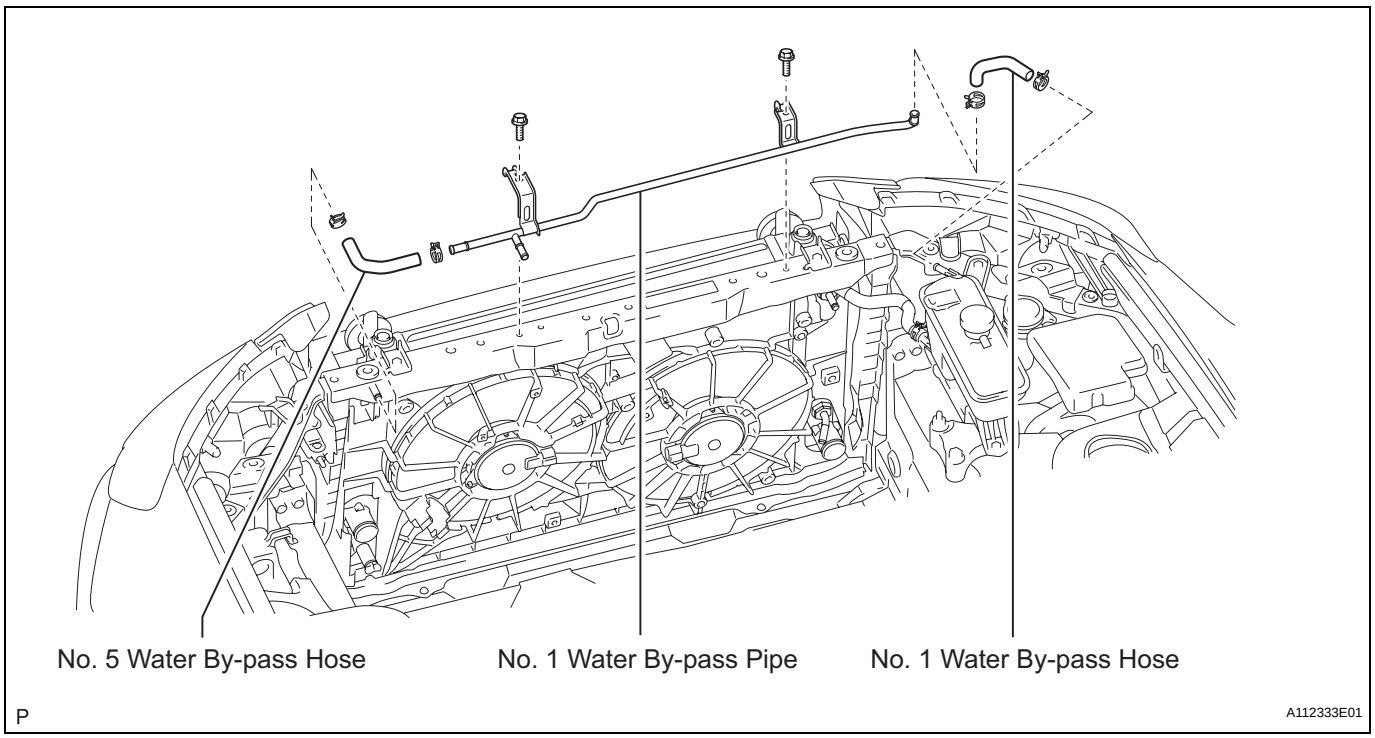
CAUTION:
Do not remove the radiator reservoir cap while the engine and radiator are still hot.
Pressurized, hot engine coolant and steam may be released and cause serious burns.



(b) Check for any excessive deposits of rust or scale around the radiator reservoir cap and radiator filler hole. The coolant should be free of oil.

If excessively dirty, replace the coolant.

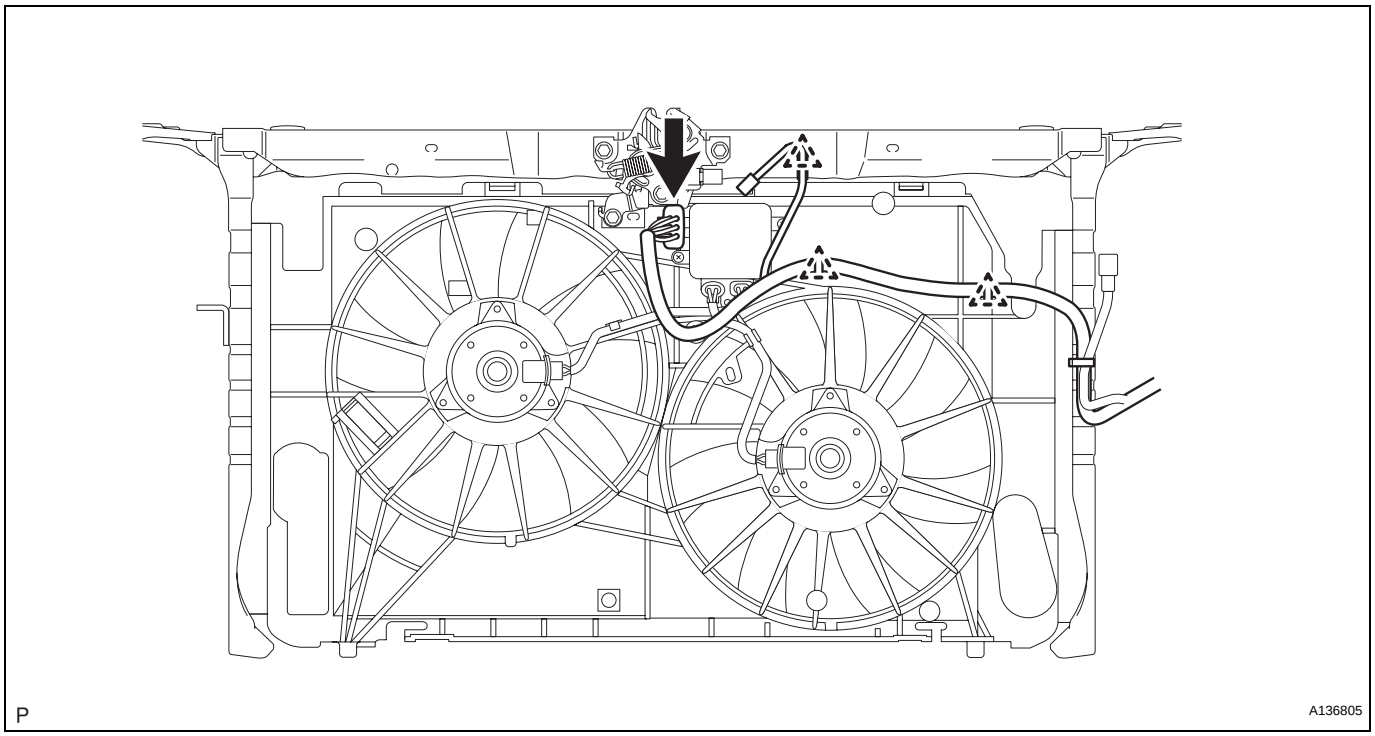
(c) Install the radiator reservoir cap.



REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag activation.
2. **REMOVE BATTERY CLAMP SUB-ASSEMBLY (See page ST-6)**
3. **REMOVE BATTERY INSULATOR**
4. **REMOVE BATTERY**
5. **REMOVE NO. 1 ENGINE UNDER COVER (See page EM-21)**
6. **DRAIN ENGINE COOLANT (See page CO-8)**
7. **REMOVE V-BANK COVER SUB-ASSEMBLY (See page EM-21)**
8. **REMOVE RADIATOR SUPPORT OPENING COVER (See page EM-22)**
9. **REMOVE RADIATOR GRILLE SUB-ASSEMBLY (See page ET-6)**
10. **DISCONNECT HOOD LOCK SWITCH CONNECTOR**

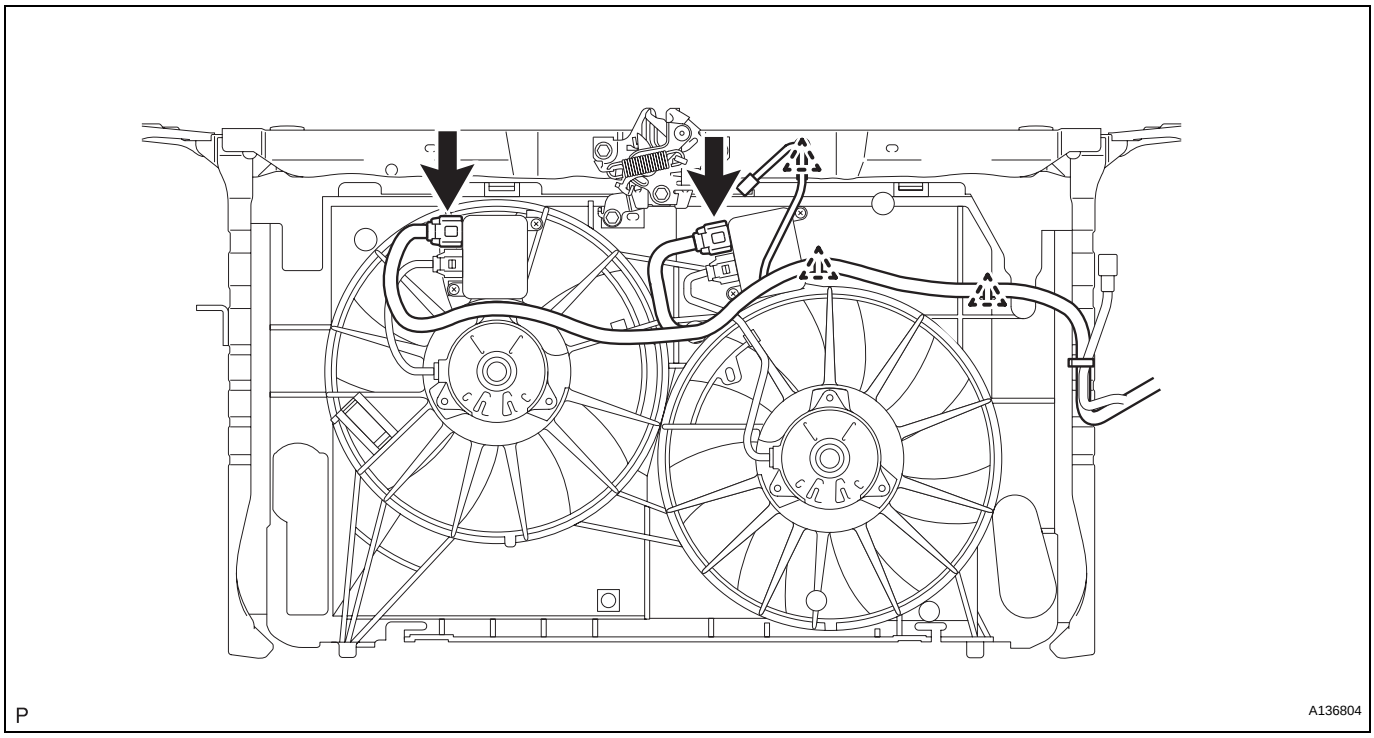
11. **DISCONNECT NO. 1 WATER BY-PASS HOSE**
    (a) Disconnect the hose from the radiator reservoir.
12. **DISCONNECT NO. 5 WATER BY-PASS HOSE**
    (a) Disconnect the hose from the radiator.
13. **REMOVE NO. 1 WATER BY-PASS PIPE**
    (a) Disconnect the pipe from the No. 1 radiator hose.



(b) Remove the 2 bolts and pipe.

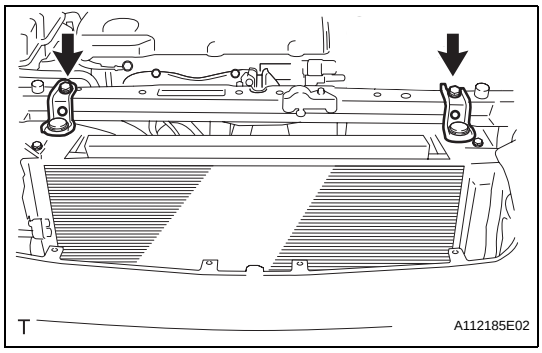
14. DISCONNECT COOLING FAN ECU HARNESS (w/o Trailer Towing System)

(a) Disconnect the fan ECU connector.



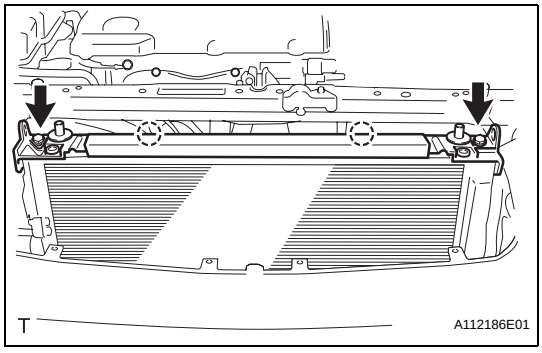
(b) Detach the 3 harness clamps from the fan shroud and upper radiator support.

15. DISCONNECT COOLING FAN ECU HARNESS (w/ Trailer Towing System)



(a) Disconnect the 2 fan ECU connectors.

(b) Detach the 3 harness clamps from the fan shroud and upper radiator support.

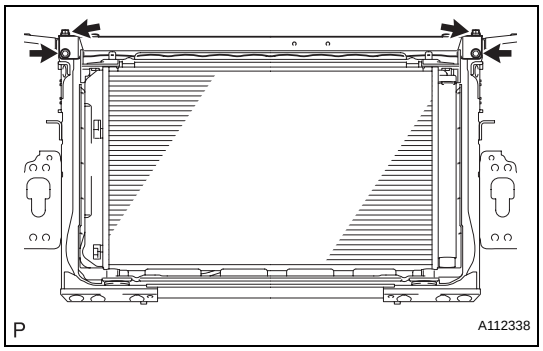


16. DISCONNECT HORN CONNECTOR

(a) Disconnect the 2 horn connectors.

17. REMOVE UPPER RADIATOR SUPPORT BRACKET

(a) Remove the 2 bolts and 2 upper radiator support brackets.



18. REMOVE NO. 2 FAN SHROUD

(a) Remove the 2 bolts.

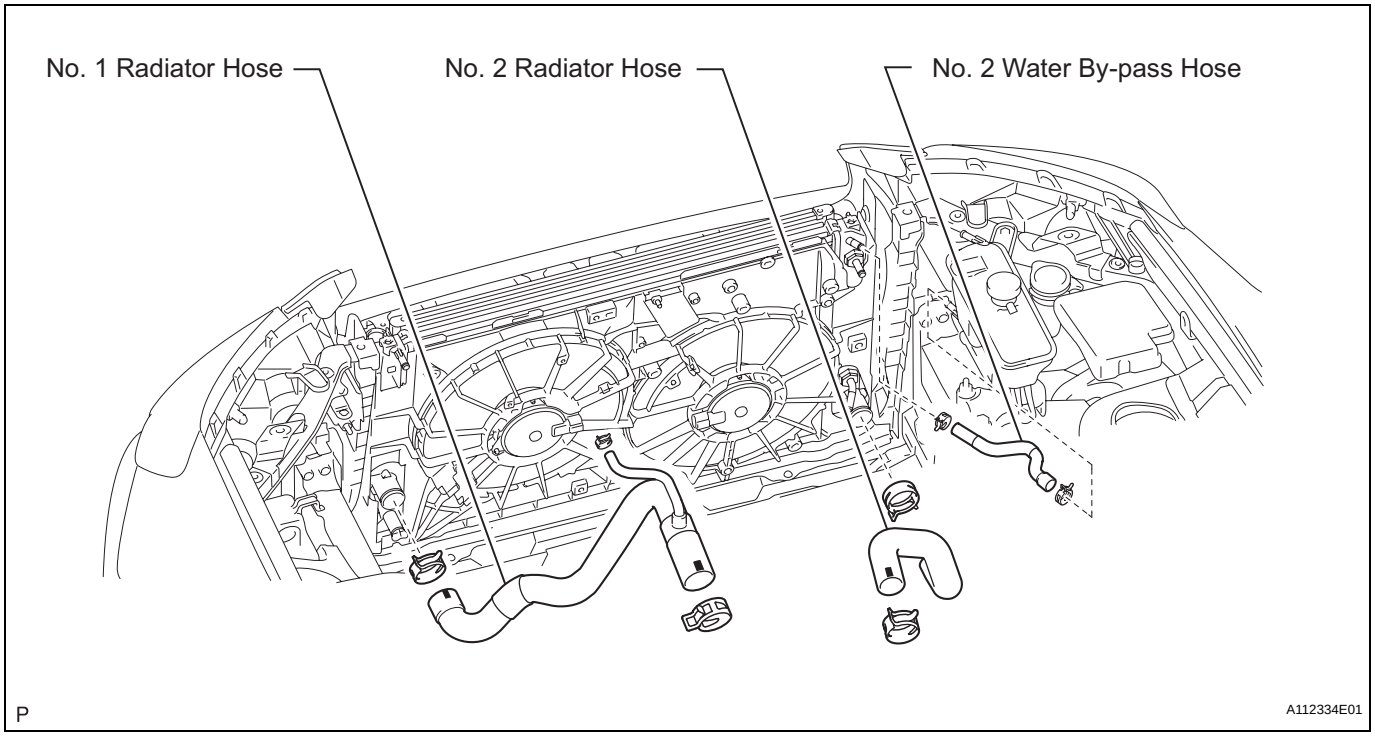
(b) Detach the 2 claws and No. 2 shroud.

CO

19. REMOVE UPPER RADIATOR SUPPORT SUB-ASSEMBLY

(a) Remove the 4 bolts and upper radiator support with hood lock.

20. DISCONNECT OIL COOLER INLET HOSE



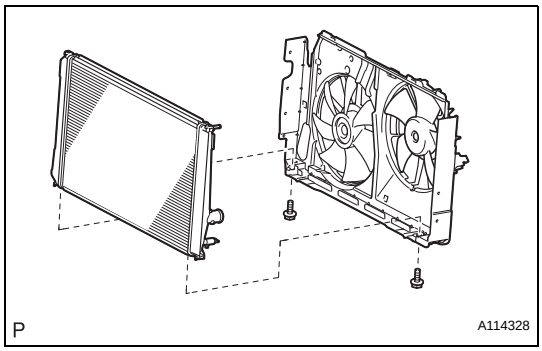
21. DISCONNECT OIL COOLER OUTLET HOSE

22. DISCONNECT NO. 1 RADIATOR HOSE

23. DISCONNECT NO. 2 RADIATOR HOSE

24. DISCONNECT NO. 2 WATER BY-PASS HOSE

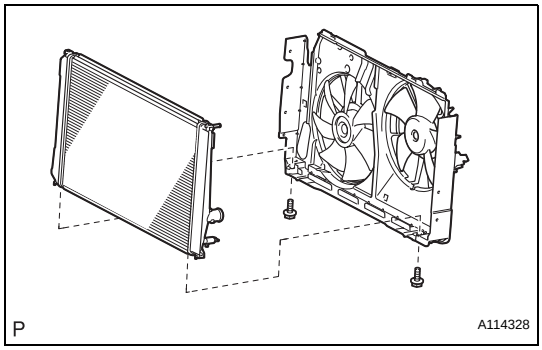
(a) Disconnect the by-pass hose from the radiator reservoir and radiator.



25. REMOVE RADIATOR ASSEMBLY

(a) Detach the cooler condenser from the radiator.
HINT:
After detaching the condenser, make sure that all 4 fan shroud cushions are present.

(b) Remove the radiator with the 2 radiator support lower cushions.
HINT:
After detaching the radiator, make sure that all 2 radiator support lowers are present.

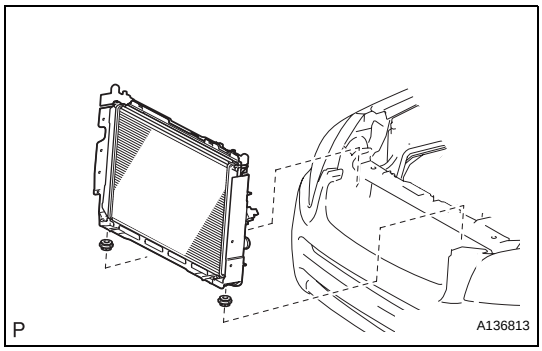


CO

26. REMOVE FAN SHROUD WITH COOLING FAN

(a) Remove the 2 bolts and fan shroud with cooling fan from the radiator.

INSTALLATION

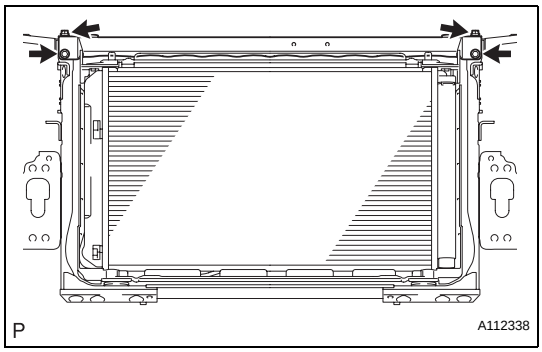


1. INSTALL FAN SHROUD WITH COOLING FAN

(a) Install the fan shroud with cooling fan to the radiator with the 2 bolts.
Torque: 10.5 N*m (107 kgf*cm, 8 ft.*lbf)

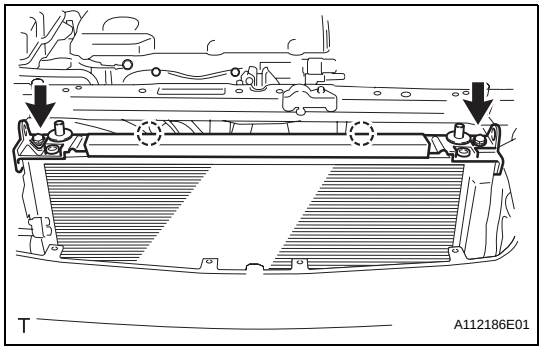
2. INSTALL RADIATOR ASSEMBLY

(a) Install the 4 fan shroud cushions to the cooler condenser.



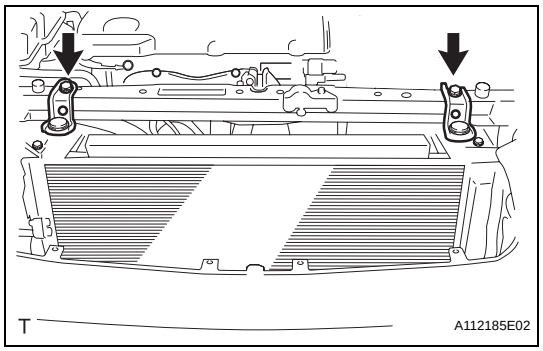
(b) Set the cooler condenser into the fan shroud.

(c) Install the 2 radiator support lower cushions to the fan shroud.



(d) Install the radiator with cooler condenser and fan shroud to the radiator support lowers.

CO



3. INSTALL UPPER RADIATOR SUPPORT SUB-ASSEMBLY

(a) Install the upper radiator support with the 4 bolts.
Torque: 29 N*m (296 kgf*cm, 21 ft.*lbf)

4. INSTALL NO. 2 FAN SHROUD

(a) Attach the 2 claws to install the No. 2 fan shroud, and install the 2 bolts.
Torque: 10.5 N*m (107 kgf*cm, 8 ft.*lbf)

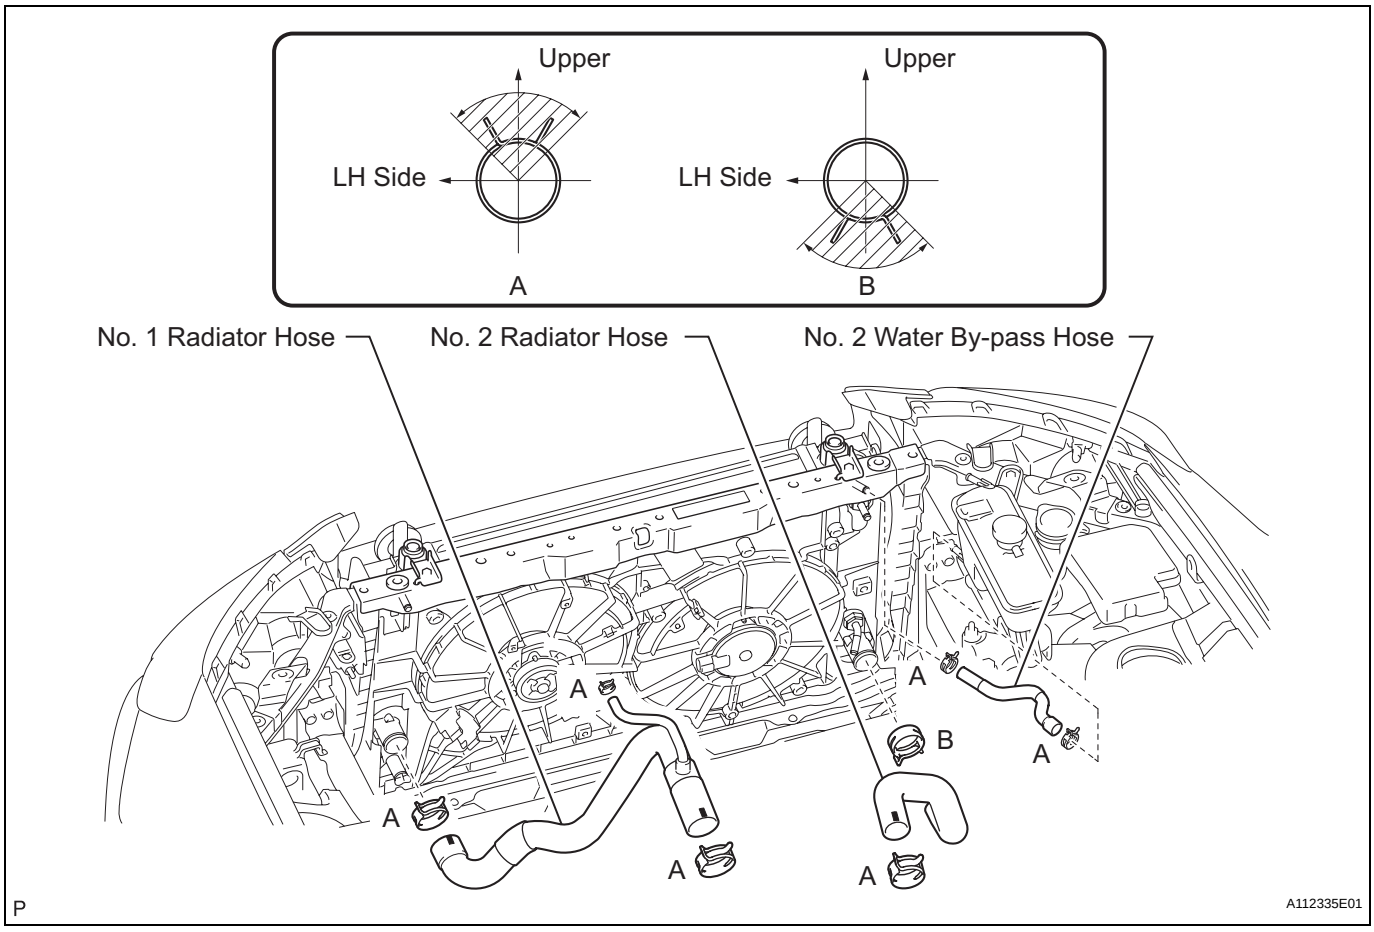
5. INSTALL UPPER RADIATOR SUPPORT BRACKET

(a) Install the brackets with the 2 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

6. CONNECT HORN CONNECTOR

(a) Connect the 2 horn connectors.

7. CONNECT NO. 2 WATER BY-PASS HOSE



(a) Connect the by-pass hose to the radiator and radiator reservoir.
HINT:
The direction of the hose clamp is indicated in the illustration.

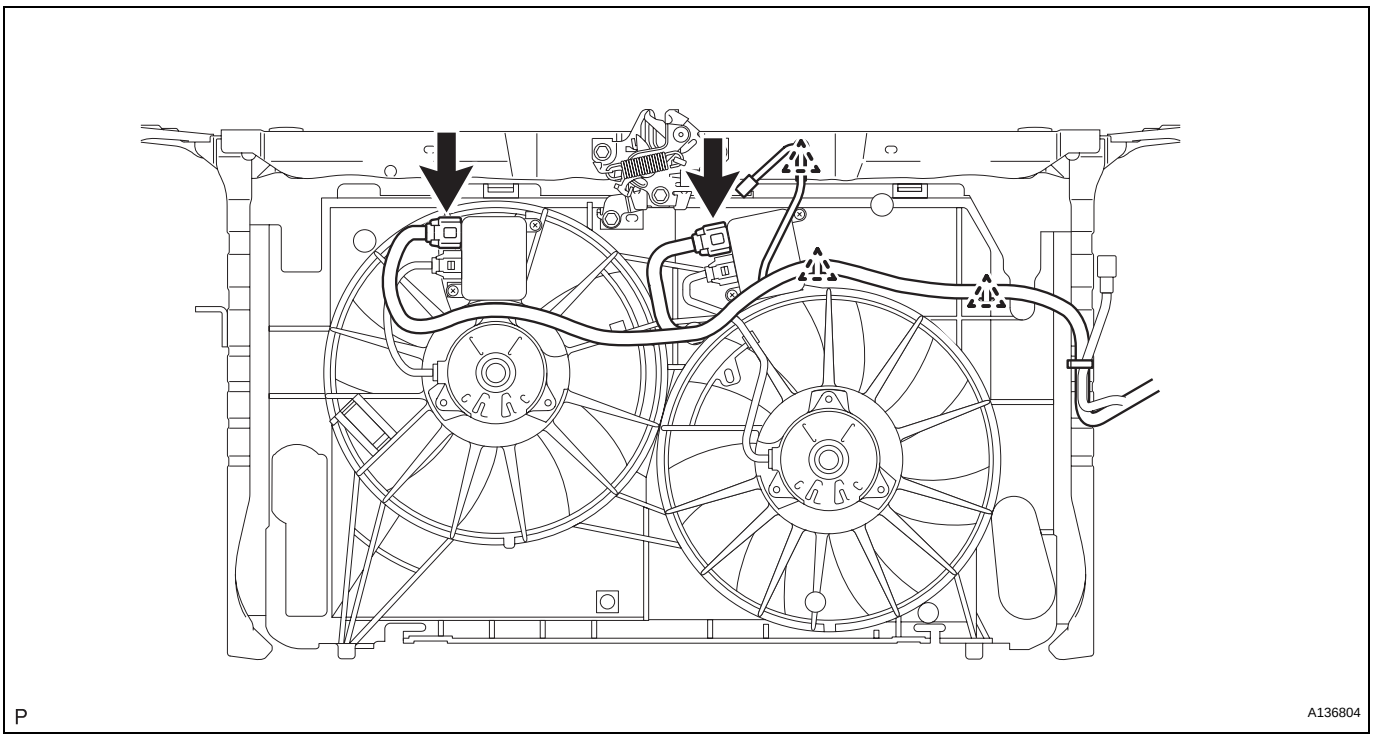
8. CONNECT NO. 2 RADIATOR HOSE

HINT:
The direction of the hose clamp is indicated in the illustration.

9. CONNECT NO. 1 RADIATOR HOSE

HINT:
The direction of the hose clamp is indicated in the illustration.

10. CONNECT OIL COOLER OUTLET HOSE

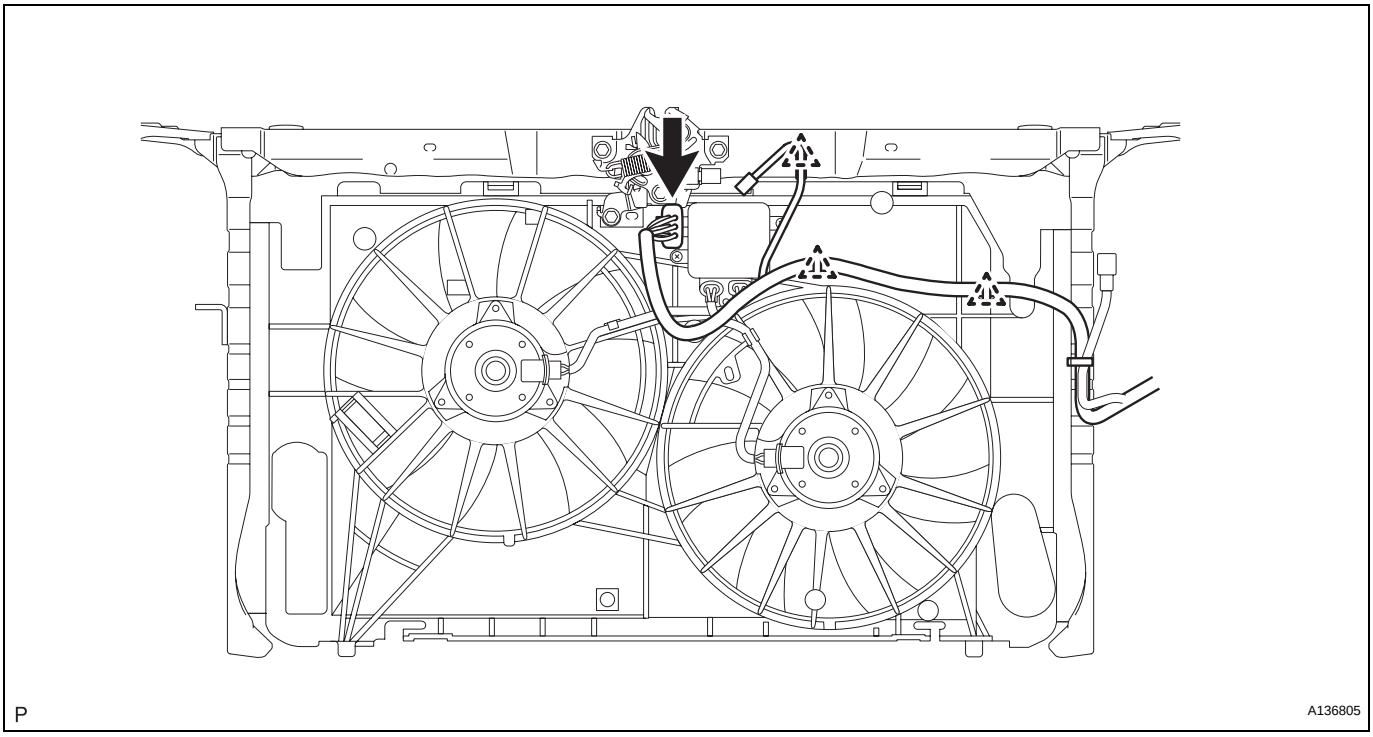


11. CONNECT OIL COOLER INLET HOSE

12. CONNECT COOLING FAN ECU HARNESS (w/ Trailer Towing System)

(a) Attach the harness with the 3 clamps.

CO

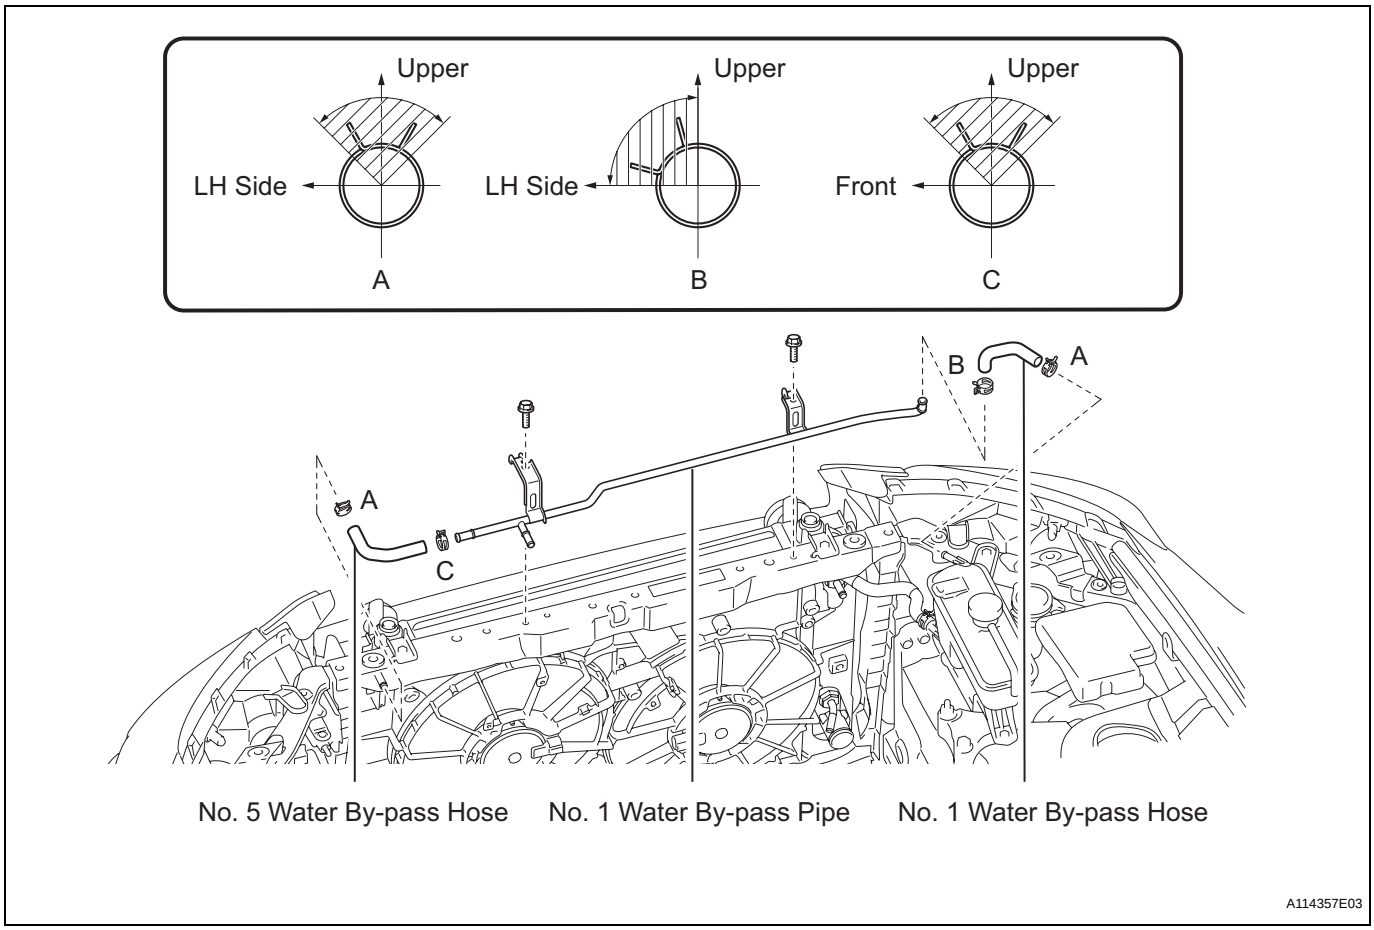


(b) Connect the 2 fan ECU connectors.

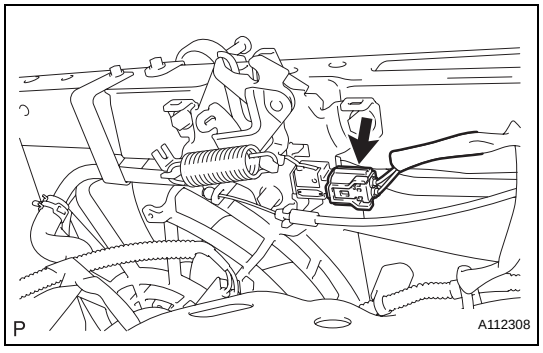
13. CONNECT COOLING FAN ECU HARNESS (w/o Trailer Towing System)

(a) Attach the harness with the 3 clamps.

(b) Connect the fan ECU connector.



14. INSTALL NO. 1 WATER BY-PASS PIPE



(a) Install the by-pass pipe with the 2 bolts to the upper radiator support.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

(b) Connect the No. 1 radiator hose to the pipe.

15. **CONNECT NO. 5 WATER BY-PASS HOSE**
    (a) Connect the by-pass hose to the radiator.

16. **CONNECT NO. 1 WATER BY-PASS HOSE**
    (a) Connect the by-pass hose to the radiator reservoir.

17. **CONNECT HOOD LOCK SWITCH CONNECTOR**

18. **INSTALL RADIATOR GRILLE SUB-ASSEMBLY (See page ET-10)**

19. **INSTALL BATTERY**

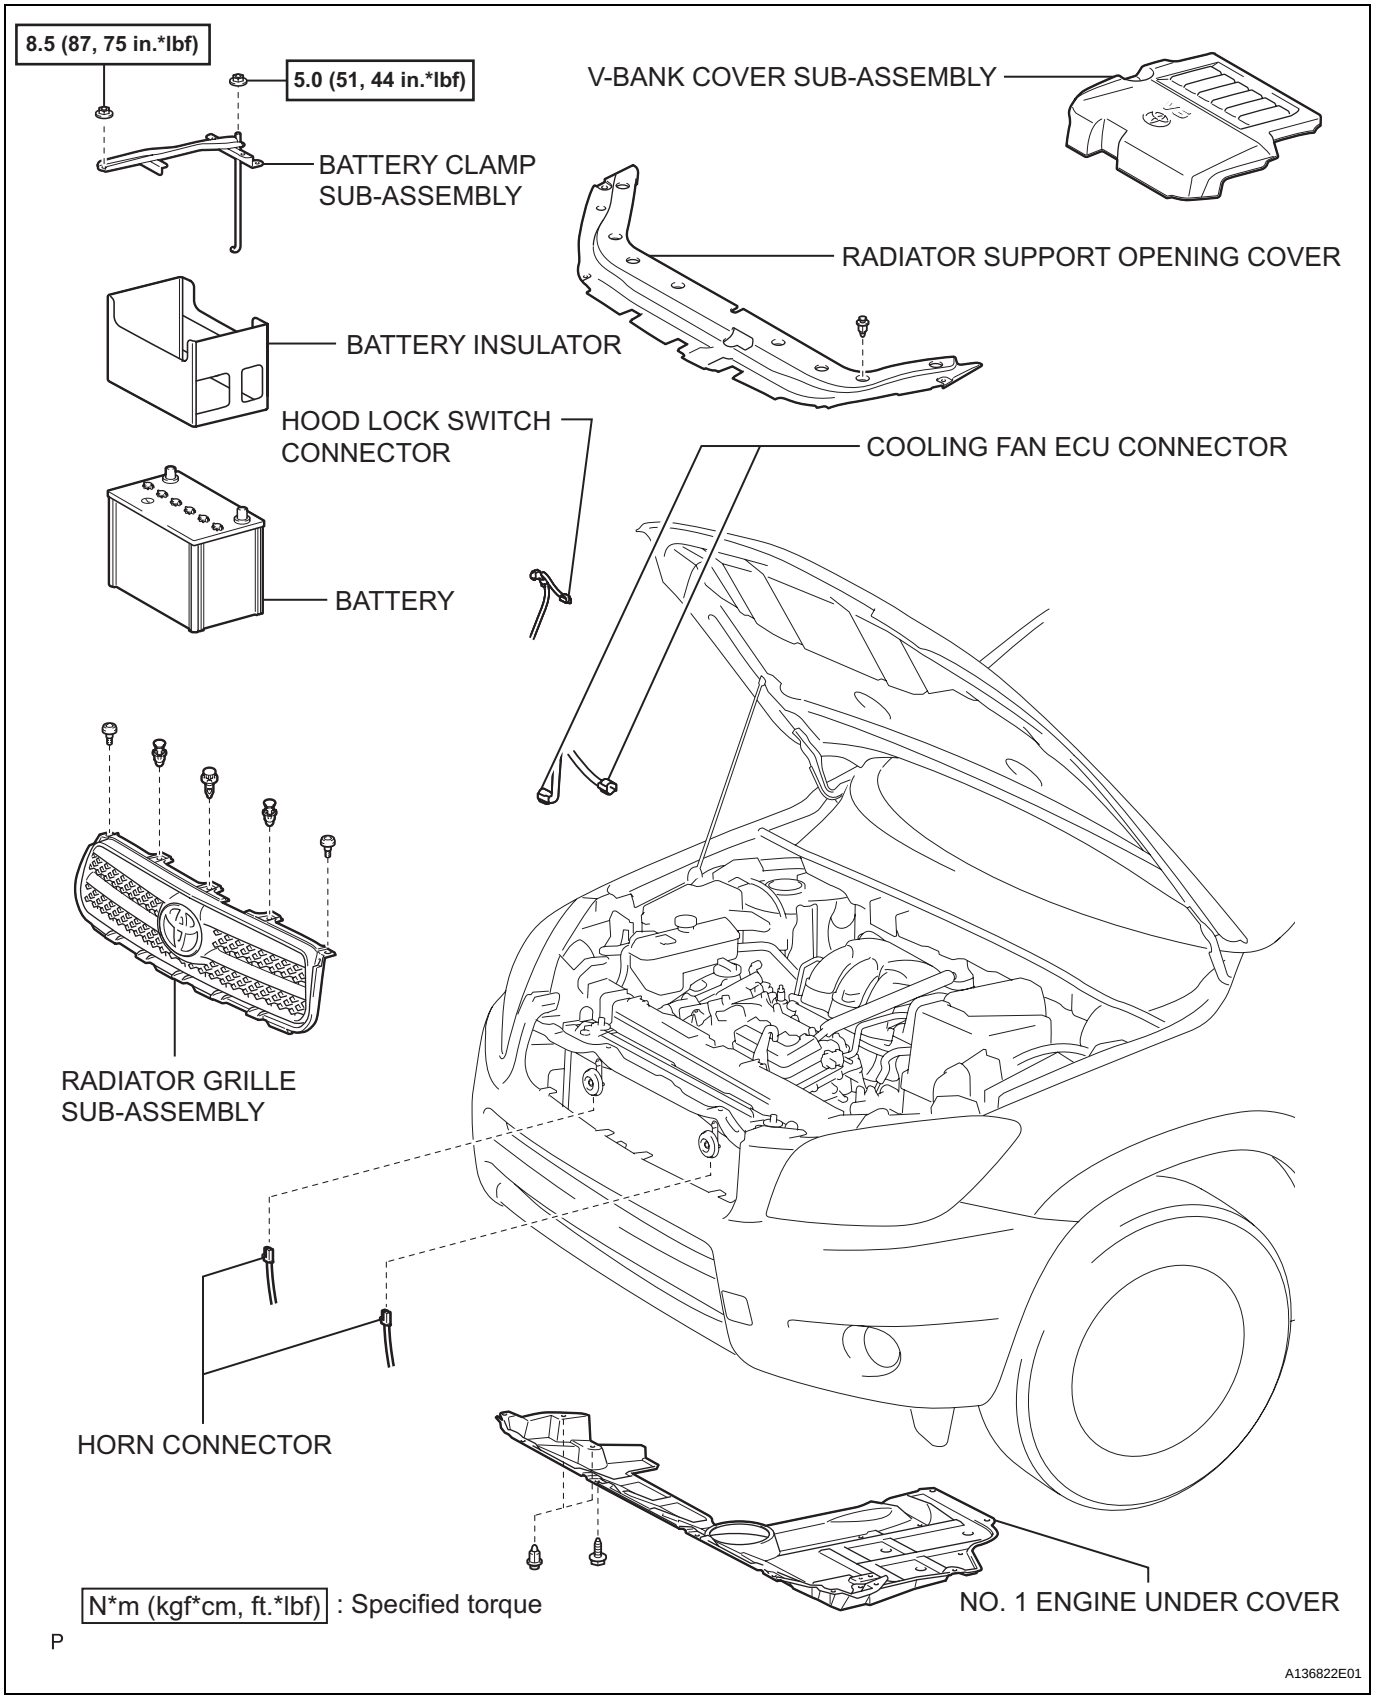
20. **INSTALL BATTERY INSULATOR**

21. **INSTALL BATTERY CLAMP SUB-ASSEMBLY (See page ST-15)**

22. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

23. **INSTALL RADIATOR SUPPORT OPENING COVER (See page EM-42)**

24. **INSTALL V-BANK COVER SUB-ASSEMBLY (See page EM-42)**



25. **ADD ENGINE COOLANT (See page CO-8)**

26. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**

27. **INSTALL NO. 1 ENGINE UNDER COVER (See page EM-41)**

ON-VEHICLE INSPECTION

1. CHECK RADIATOR RESERVOIR CAP SUB-ASSEMBLY

(a) Measure the valve opening pressure.

(1) If there are water stains or foreign matter on O-ring 1, clean it with water and finger scouring.

(2) Check that O-ring 1 is not deformed, cracked or swollen.

(3) Apply engine coolant to O-ring 1 and rubber packing 2 before using a radiator cap tester.

(4) When using the cap tester, tilt it more than 30°.

(5) Pump the cap tester several times, and check the maximum pressure*.

Pump speed:

1 pump per second

*: Even if the cap cannot maintain the maximum pressure, it is not a defect.

Judgment criterion

Item	Specified Condition
Standard value (for brand-new cap)	93.3 to 122.7 kPa (0.95 to 1.25 kgf/cm^2, 13.5 to 17.8 psi)
Minimum standard value (after using cap)	78.5 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator reservoir cap sub-assembly.

ON-VEHICLE CLEANING

1. INSPECT RADIATOR ASSEMBLY

(a) Check that the radiator and condenser are not blocked with leaves, dirt, or insects. Clean the hose connections.

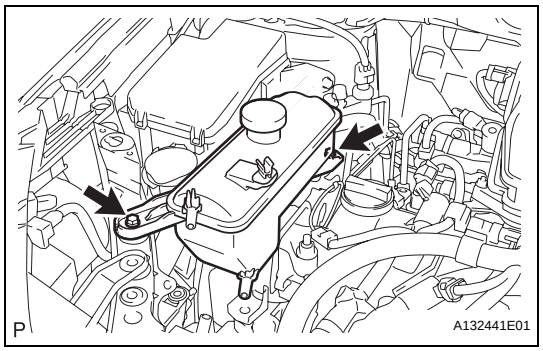
If the fins are blocked, wash them with water or a steam cleaner.

NOTICE:

- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**
- **Keep the following injection distance.**

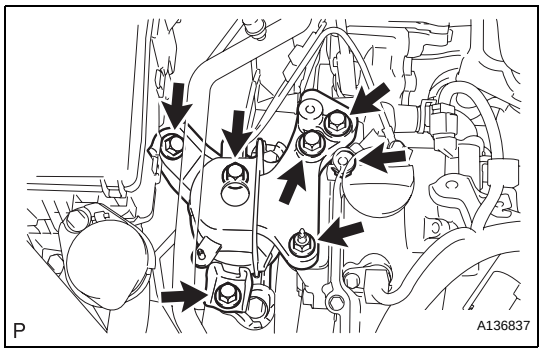
Standard injection distance

Injection Pressure	Specified Condition
2,942 to 4,903 kPa (30 to 50 kgf/cm^2, 427 to 711 psi)	300 mm (11.81 in.)
4,903 to 7,845 kPa (50 to 80 kgf/cm^2, 711 to 1,138 psi)	500 mm (19.69 in.)



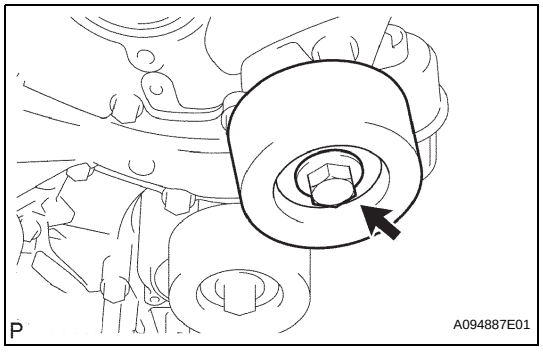
- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electronic components.**

(b) Dry the fins with compressed air.



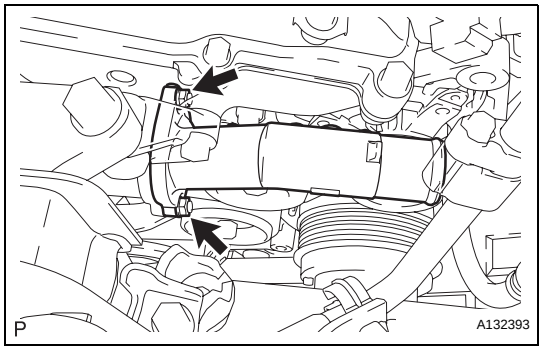
CO

REMOVAL



1. **REMOVE FRONT WHEEL RH**
2. **REMOVE NO. 1 ENGINE UNDER COVER (See page EM-21)**
3. **REMOVE ENGINE UNDER COVER REAR RH (See page EM-21)**
4. **REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-7)**
5. **DRAIN ENGINE COOLANT (See page CO-8)**
6. **REMOVE V-BANK COVER SUB-ASSEMBLY (See page EM-21)**
7. **REMOVE RADIATOR SUPPORT OPENING COVER (See page EM-22)**
8. **REMOVE RADIATOR RESERVOIR TANK**
   (a) Remove the 2 bolts and radiator reservoir.

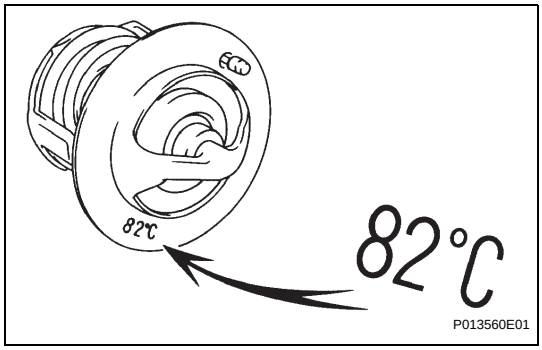
9. **REMOVE FAN AND GENERATOR V BELT (See page EM-8)**
10. **REMOVE ENGINE MOUNTING INSULATOR RH**
    (a) Remove the 5 bolts, 2 nuts and engine mounting insulator RH.



11. **REMOVE FRONT NO. 1 ENGINE MOUNTING BRACKET LH (See page CO-12)**
12. **REMOVE NO. 2 IDLER PULLEY SUB-ASSEMBLY**
    (a) Remove the bolt, No. 2 idler pulley cover plate and No. 2 idler pulley.

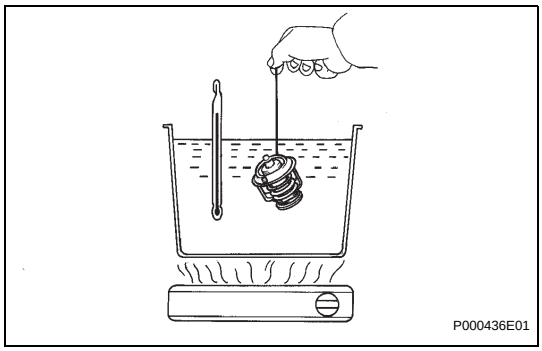
13. **DISCONNECT NO. 2 RADIATOR HOSE**

CO



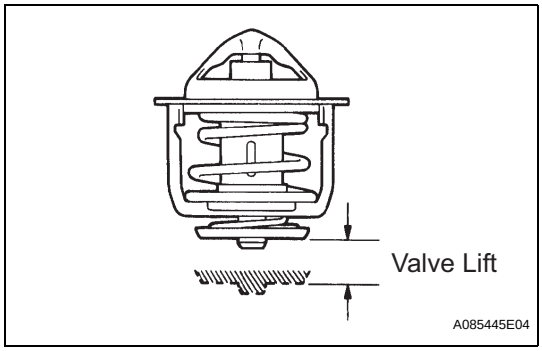
14. REMOVE WATER INLET

(a) Remove the 2 nuts and remove the water inlet from the water inlet housing.



15. REMOVE THERMOSTAT

INSPECTION



1. INSPECT THERMOSTAT

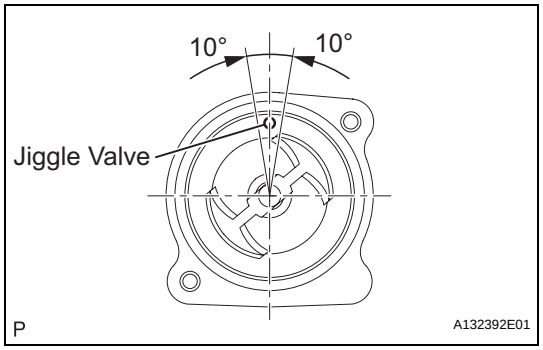
HINT:
The valve opening temperature is inscribed on the thermostat.

(a) Immerse the thermostat in water, and then gradually heat the water.

(b) Check the valve opening temperature of the thermostat.
Standard valve opening temperature:
80 to 84°C (176 to 183°F)
If the valve opening temperature is not as specified, replace the thermostat.

(c) Check the valve lift.
Standard valve lift:
10 mm (0.39 in.) or more at 95°C (203°F)
If the valve lift is not as specified, replace the thermostat.

(d) Check that the valve is fully closed when the thermostat is at low temperatures (below 77°C (171°F)).
If not fully closed, replace the thermostat.

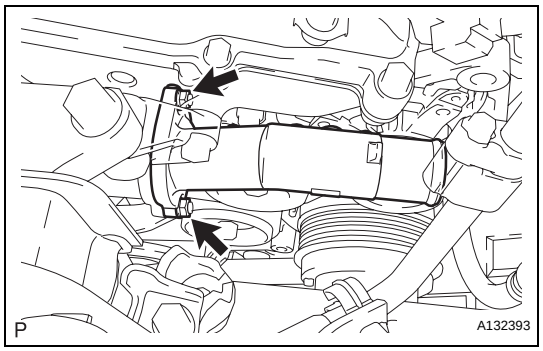


CO

INSTALLATION

1. INSTALL THERMOSTAT

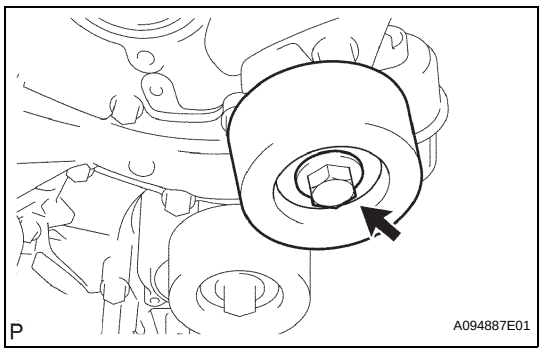
(a) Install a new gasket to the thermostat.



(b) Install the thermostat with the jiggle valve facing upward.
HINT:
The jiggle valve can be set to within 10° of either side of the upward position.

2. INSTALL WATER INLET

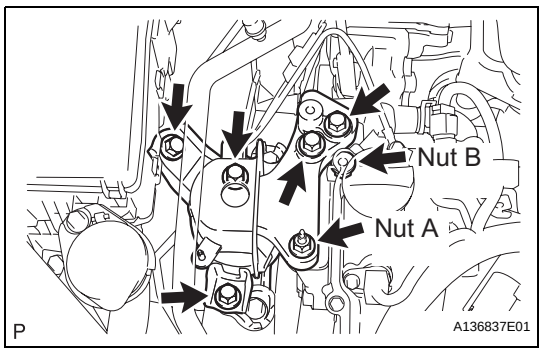
(a) Install the water inlet with the 2 nuts.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)



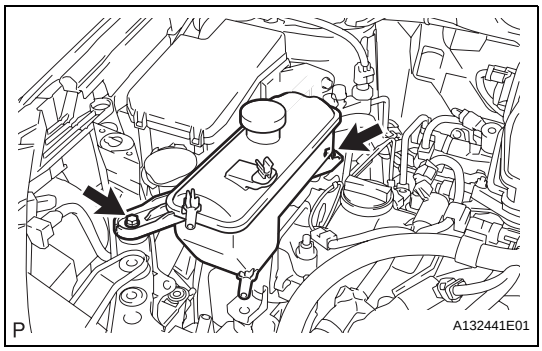
3. CONNECT NO. 2 RADIATOR HOSE

4. INSTALL NO. 2 IDLER PULLEY SUB-ASSEMBLY

(a) Install the No. 2 idler pulley cover plate and No. 2 idler pulley with the bolt.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)



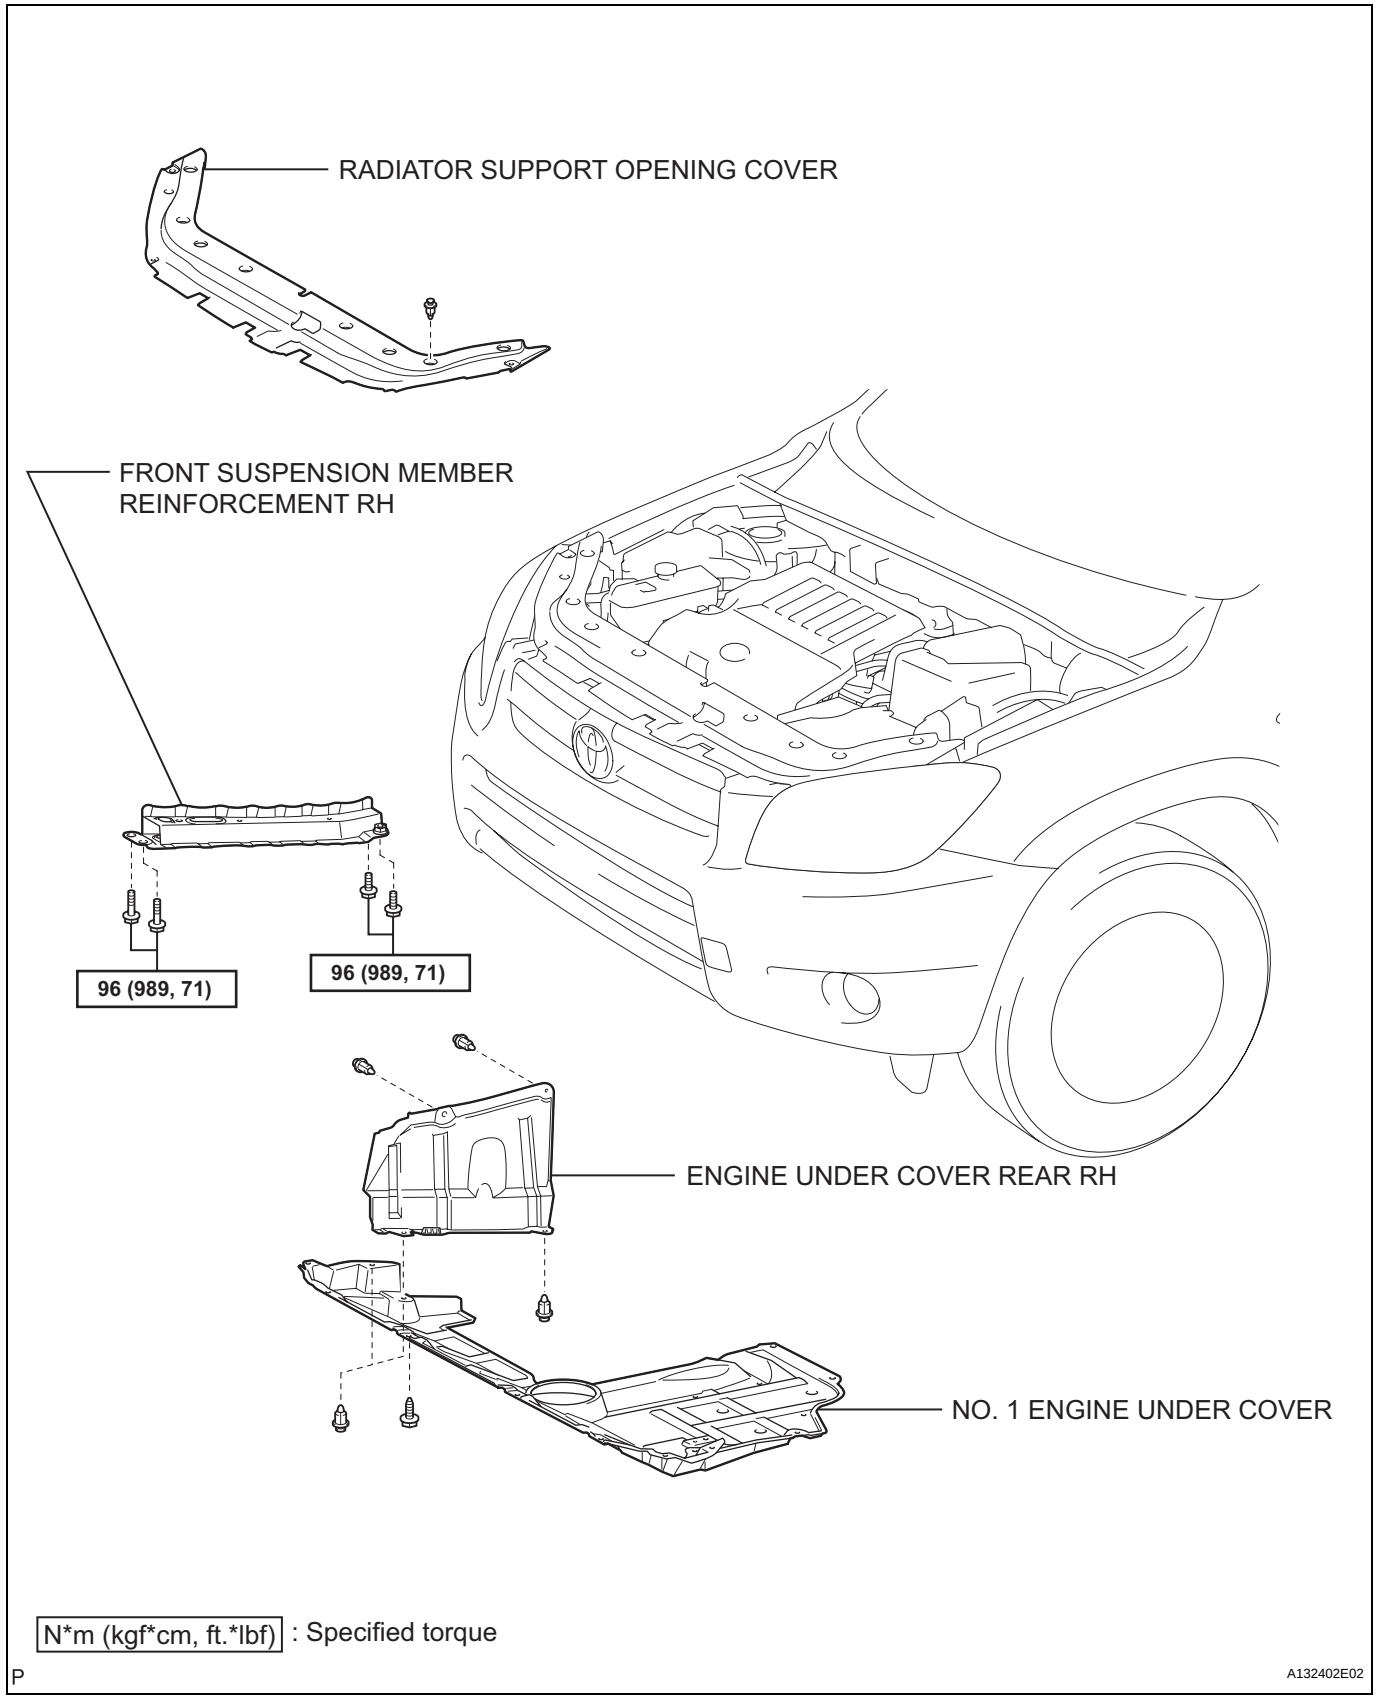
5. INSTALL FRONT NO. 1 ENGINE MOUNTING BRACKET LH (See page CO-15)



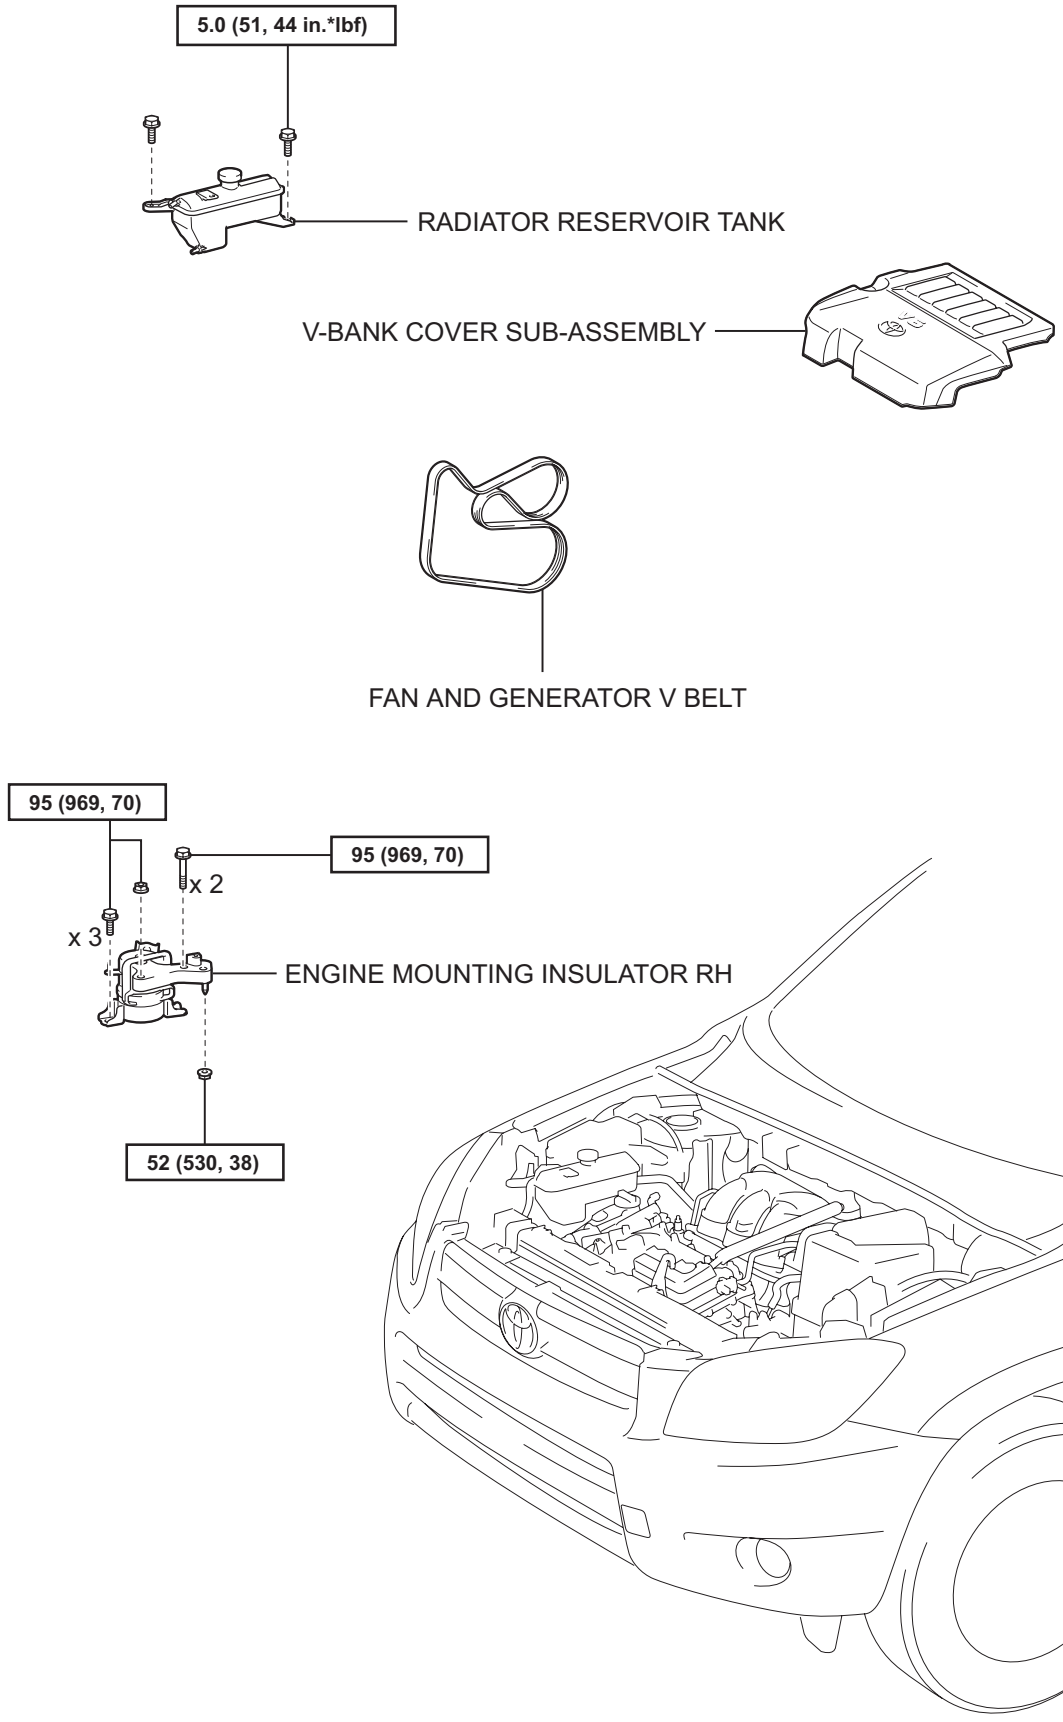
6. INSTALL ENGINE MOUNTING INSULATOR RH

(a) Install the engine mounting insulator RH with the 2 nuts and 5 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf) for bolt
95 N*m (969 kgf*cm, 70 ft.*lbf) for nut A
52 N*m (530 kgf*cm, 38 ft.*lbf) for nut B

7. INSTALL FAN AND GENERATOR V BELT (See page EM-8)



CO



8. **INSTALL RADIATOR RESERVOIR TANK**
   (a) Install the radiator reservoir with the 2 bolts.
   Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
9. **INSTALL RADIATOR SUPPORT OPENING COVER (See page EM-42)**
10. **INSTALL V-BANK COVER SUB-ASSEMBLY (See page EM-42)**
11. **ADD ENGINE COOLANT (See page CO-8)**
12. **CHECK FOR ENGINE COOLANT LEAKAGE (See page CO-1)**
13. **INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH (See page EM-9)**
14. **INSTALL ENGINE UNDER COVER REAR RH (See page EM-41)**
15. **INSTALL NO. 1 ENGINE UNDER COVER (See page EM-41)**
16. **INSTALL FRONT WHEEL RH**

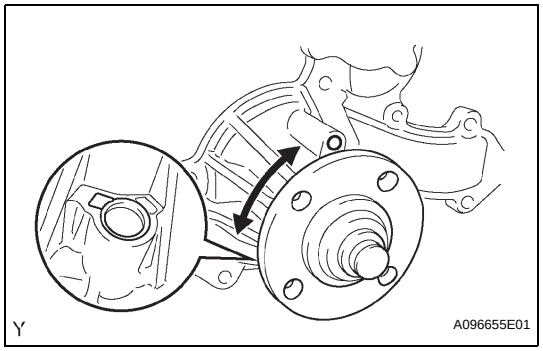
6. REMOVE NO. 2 IDLER PULLEY SUB-ASSEMBLY

(a) Remove the bolt, No. 2 idler pulley cover plate and No. 2 idler pulley.

7. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY

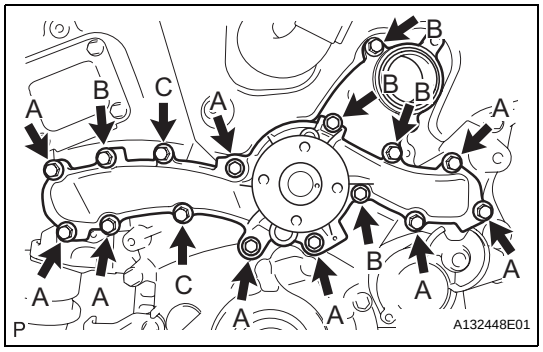


(a) Remove the 5 bolts and V-ribbed belt tensioner assembly.

8. REMOVE WATER PUMP ASSEMBLY

(a) Remove the 16 bolts, water pump and water pump gasket.

INSPECTION



1. INSPECT WATER PUMP ASSEMBLY

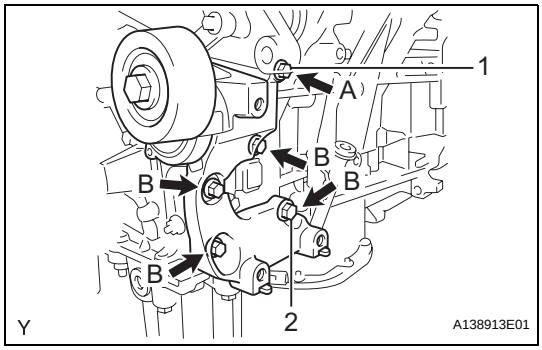
(a) Visually check the drain hole for coolant leakage. If leakage is found, replace the water pump assembly.

(b) Turn the pulley, and then check that the water pump bearing moves smoothly without making a clicking noise.

If it does not move smoothly, replace the water pump assembly.

INSTALLATION

1. INSTALL WATER PUMP ASSEMBLY



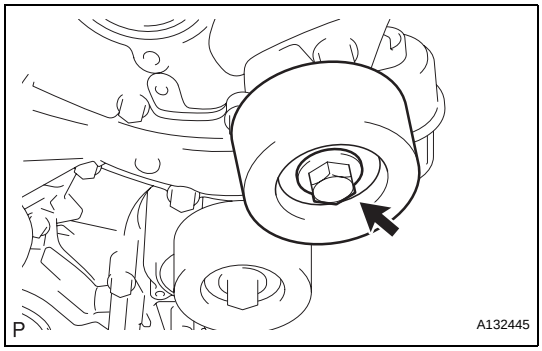
(a) Install a new water pump gasket and the water pump with the 16 bolts.

Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf) for bolt A
9.1 N*m (93 kgf*cm, 81 in.*lbf) for bolt B and C

CO

NOTICE:

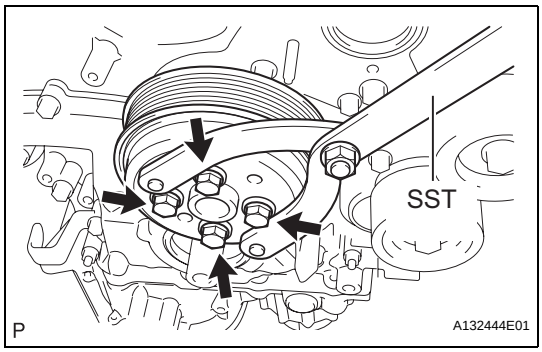
- **Be sure to replace the 2 C bolts with new ones or reuse them after applying adhesive.**
  Adhesive:
  Toyota Genuine Adhesive 1344, Three Bond 1344 or Equivalent
- **Make sure that there is no oil on the threads of the A bolts.**



2. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY

(a) Temporarily install the V-ribbed belt tensioner with the 5 bolts.
HINT:
Each bolt length is as follows:
A: 70 mm (2.76 in.)
B: 30 mm (1.30 in.)

(b) Install the V-ribbed belt tensioner by tightening the bolt 1 and bolt 2 in the order shown in the illustration.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

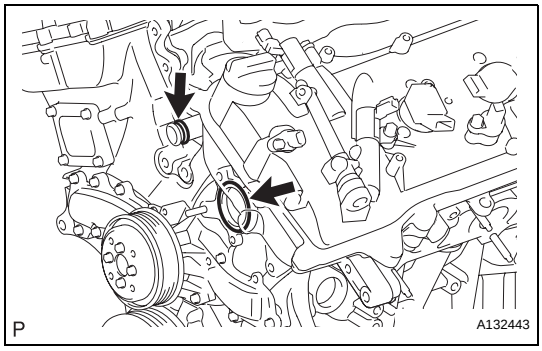


(c) Tighten the other bolts.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

3. INSTALL NO. 2 IDLER PULLEY SUB-ASSEMBLY

(a) Install the No. 2 idler pulley cover plate and No. 2 idler pulley with the bolt.
Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

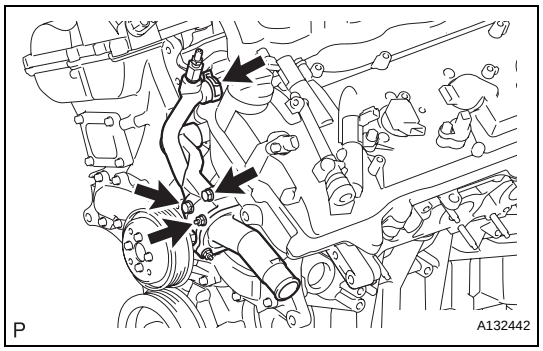
CO



4. INSTALL WATER PUMP PULLEY

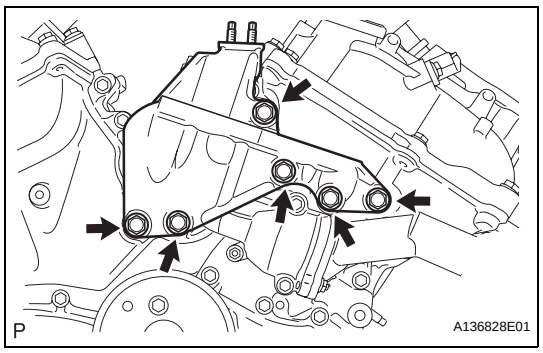
(a) Temporarily install the water pump pulley with the 4 bolts.

(b) Using SST, hold the water pump pulley.
SST 09960-10010 (09962-01000, 09963-00700)



(c) Tighten the 4 bolts.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)

5. INSTALL CRANKSHAFT PULLEY (See page EM-126)



6. INSTALL WATER INLET HOUSING

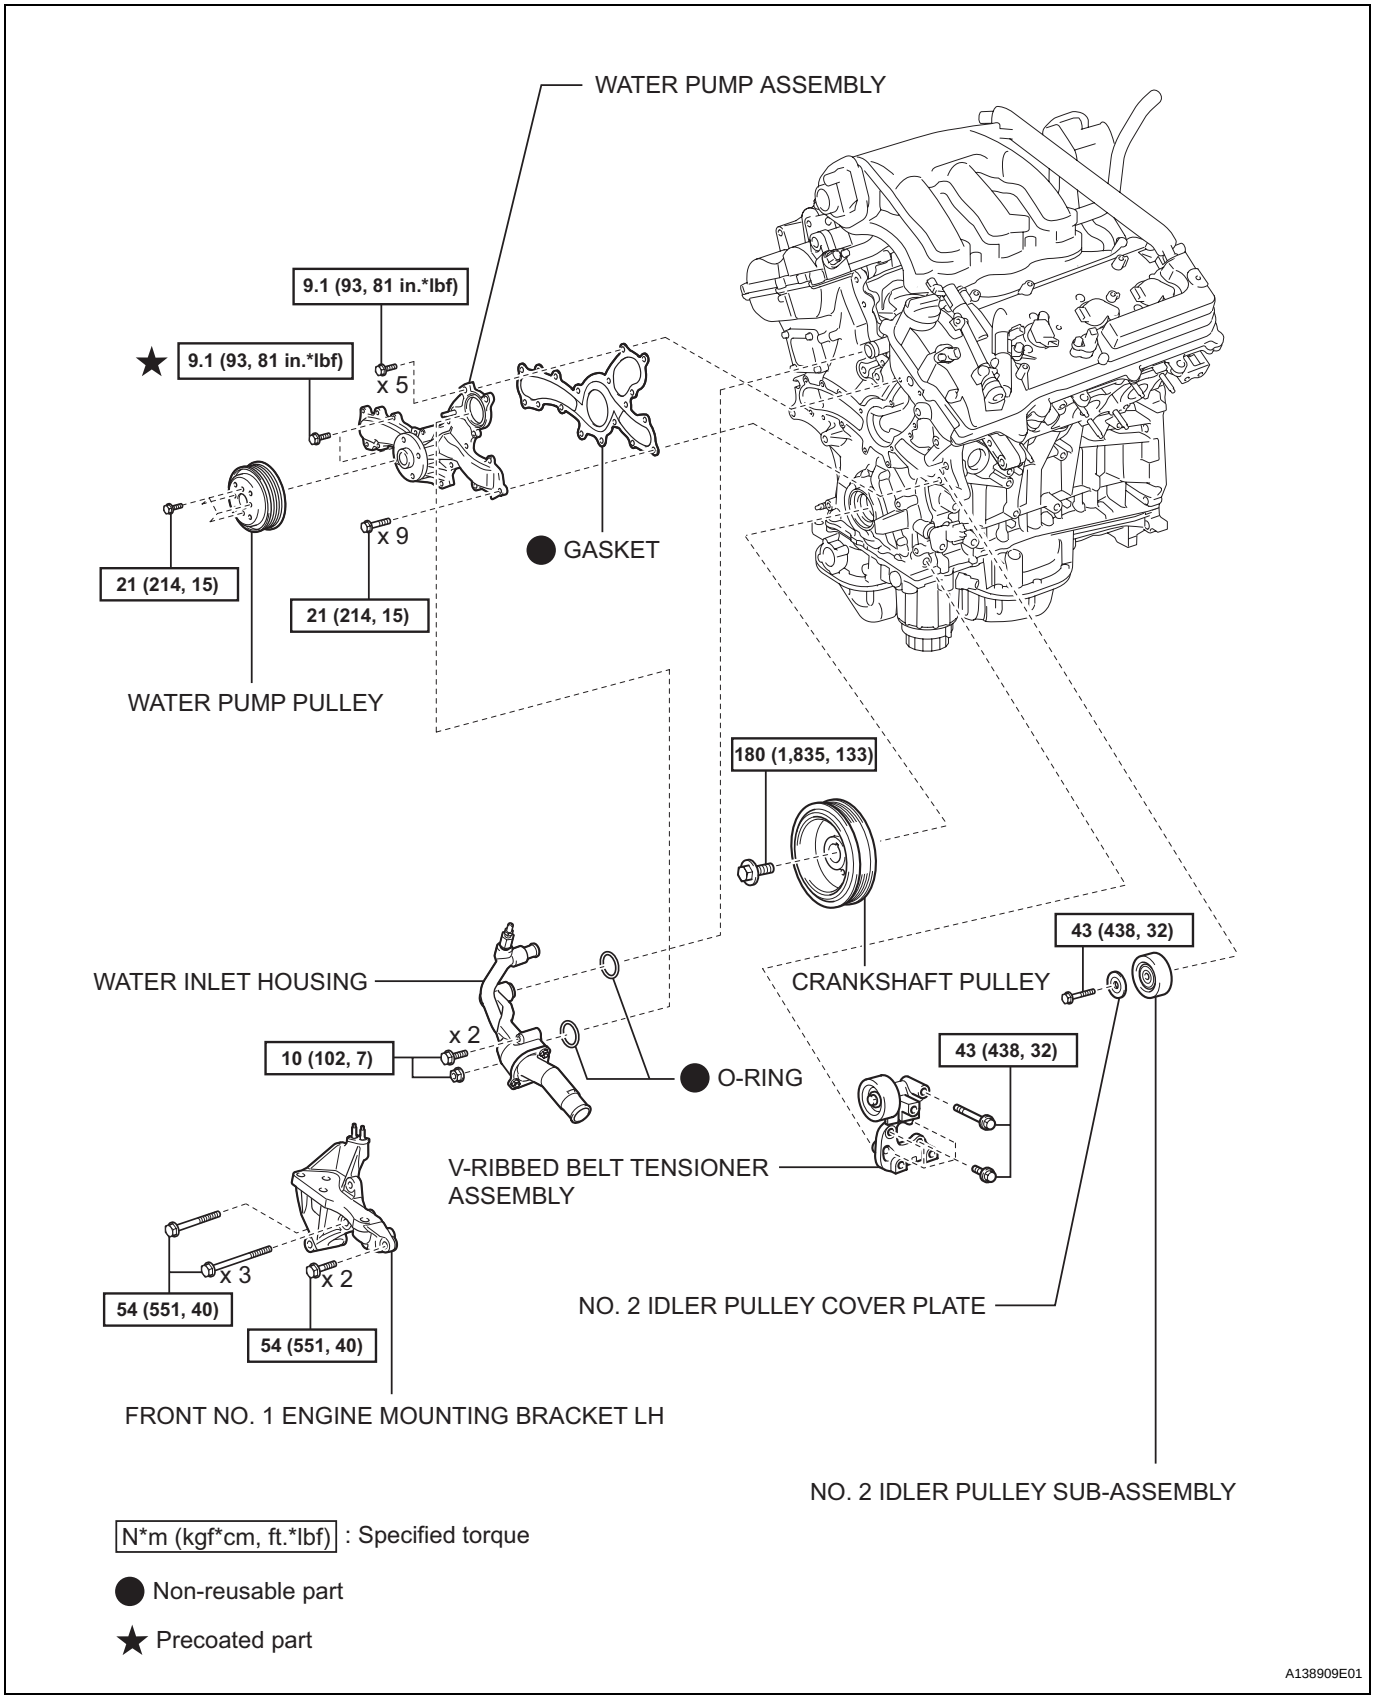
(a) Install a new water inlet housing No. 1 gasket and water outlet pipe O-ring.

(b) Install the water inlet with the 2 bolts and nut.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)
NOTICE:
Be careful not to allow the O-ring to get caught between the parts.

(c) Connect the water hose.

7. INSTALL FRONT NO. 1 ENGINE MOUNTING BRACKET LH

(a) Install the front No. 1 engine mounting bracket LH with the 6 bolts.
Torque: 54 N*m (551 kgf*cm, 40 ft.*lbf)
NOTICE:
- **Install the water inlet and mounting bracket within 15 minutes after installing the chain cover.**
- **Do not start the engine for at least 2 hours after installation.**



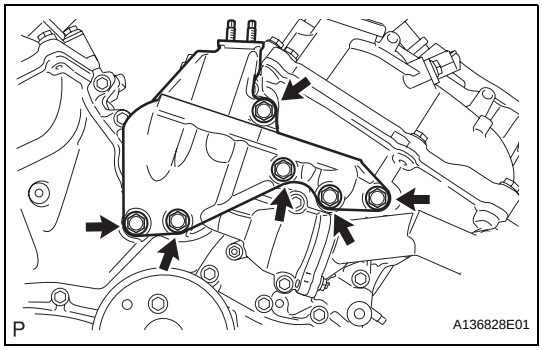
8. INSTALL ENGINE ASSEMBLY

(a) Install the engine (see page EM-31).

CO

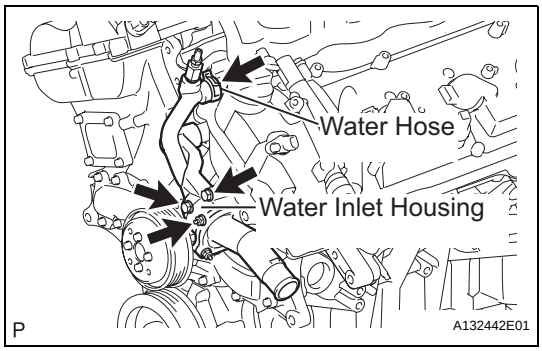
WATER PUMP

COMPONENTS



CO

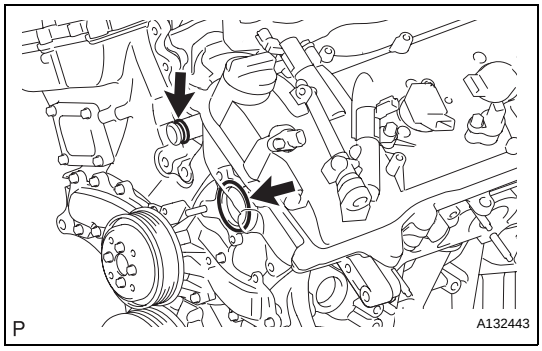
REMOVAL



1. REMOVE ENGINE ASSEMBLY

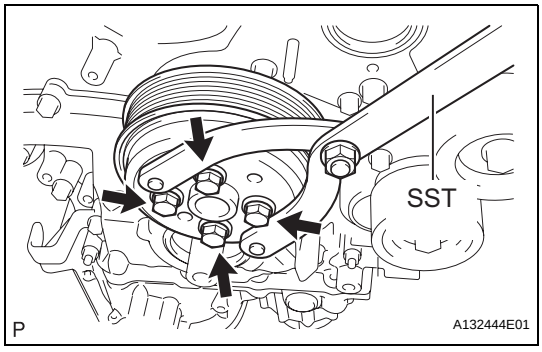
(a) Remove the engine (see page EM-21).

2. REMOVE FRONT NO. 1 ENGINE MOUNTING BRACKET LH



(a) Remove the 6 bolts and mounting bracket.

3. REMOVE WATER INLET HOUSING

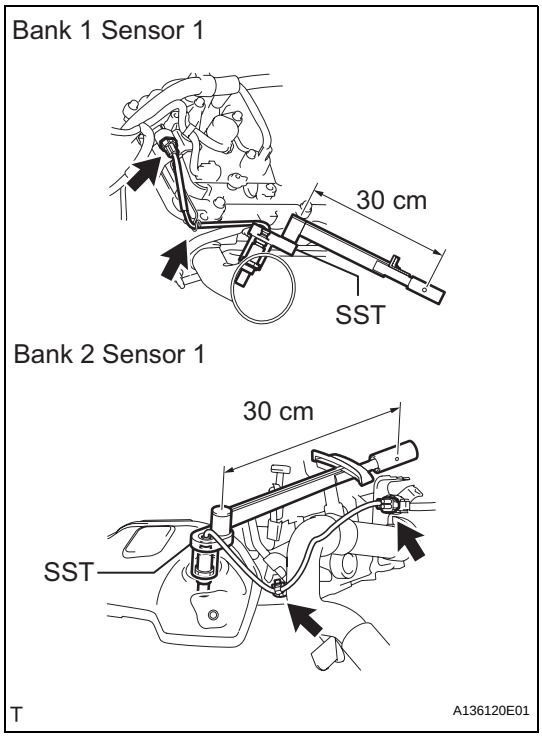


(a) Disconnect the water hose.

(b) Remove the 2 bolts, nut and water inlet housing.

(c) Remove the water inlet housing No. 1 gasket and water outlet pipe O-ring.

4. REMOVE CRANKSHAFT PULLEY (See page EM-54)



5. REMOVE WATER PUMP PULLEY

(a) Using SST, hold the water pump pulley.
SST 09960-10010 (09962-01000, 09963-00700)

(b) Remove the 4 bolts and water pump pulley.

CO

INSTALLATION

1. INSTALL AIR FUEL RATIO SENSOR (for Sensor 1)

(a) Using SST, install the sensor to the exhaust manifold.

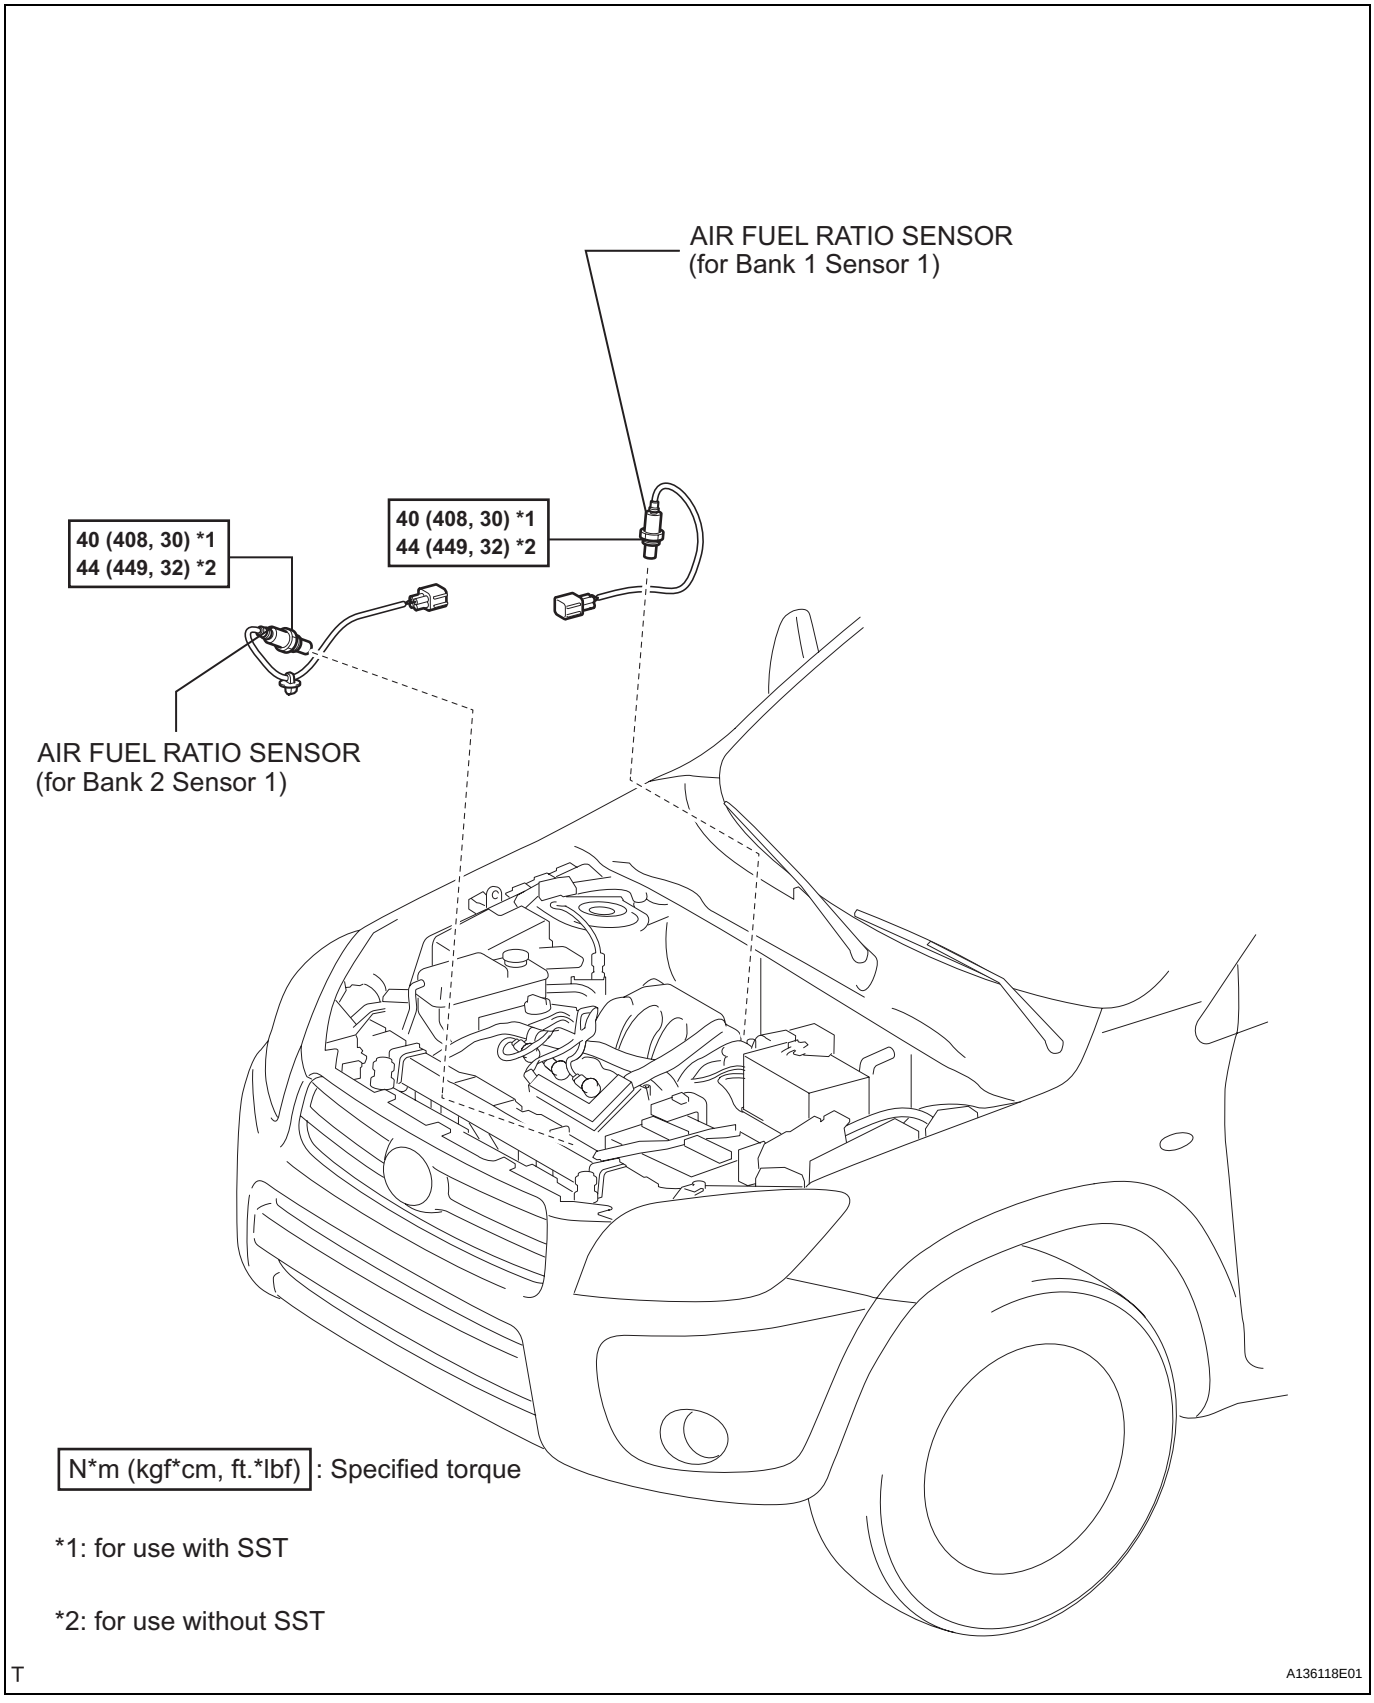
SST 09224-00010

Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf) for use with SST
44 N*m (449 kgf*cm, 32 ft.*lbf) for use without SST

HINT:

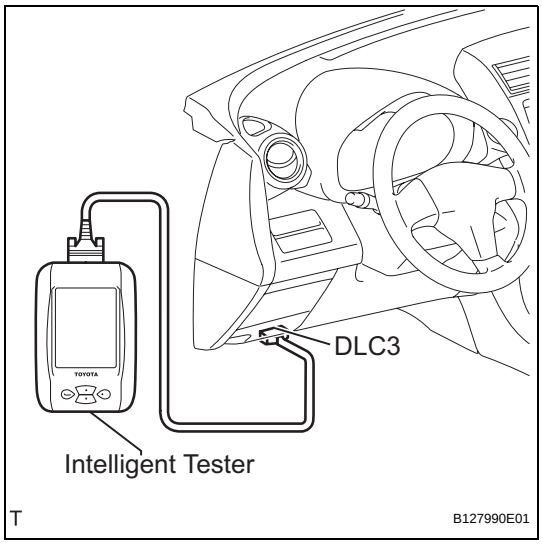
- Use a torque wrench with a fulcrum length of 30 cm (11.81 in.).
- Make sure SST and a wrench are connected in a straight line.

(b) Connect the sensor connector.



2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

3. CHECK FOR EXHAUST GAS LEAKS



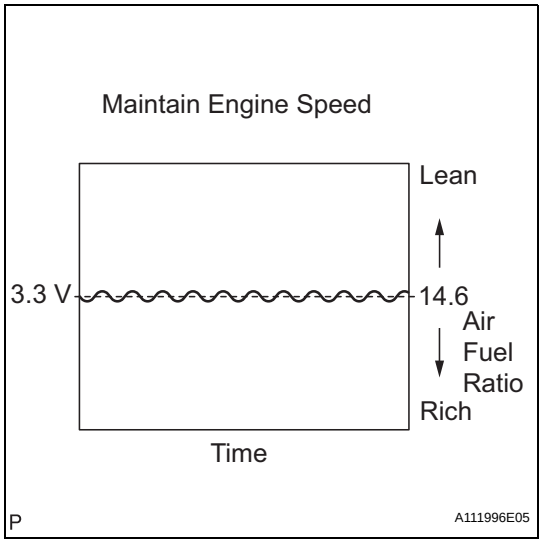
EC

AIR FUEL RATIO SENSOR

COMPONENTS

EC

ON-VEHICLE INSPECTION



1. CHECK AIR FUEL RATIO COMPENSATION SYSTEM

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.

(c) Select the following menu items: Data List / A/FS B1 S1, A/FS B2 S1, O2S B1 S2 and O2S B2 S2.

(d) Warm up the A/F sensor with the engine speed at 2,500 rpm for approximately 2 minutes.

(e) Maintain the engine speed at 2,500 rpm and confirm that the display of "A/FS B1 S1" and "A/FS B2 S1" is as shown in the illustration.

HINT:

- The illustration may slightly differ from the display on the intelligent tester.
- Only the intelligent tester displays the waveform of the A/F sensor.

(f) Confirm that the display of "O2S B1 S2" and "O2S B2 S2" changes between 0 to 1 V with the engine speed at 2,500 rpm.

OK:

The voltage output oscillates more than 8 times in 10 seconds.

NOTICE:

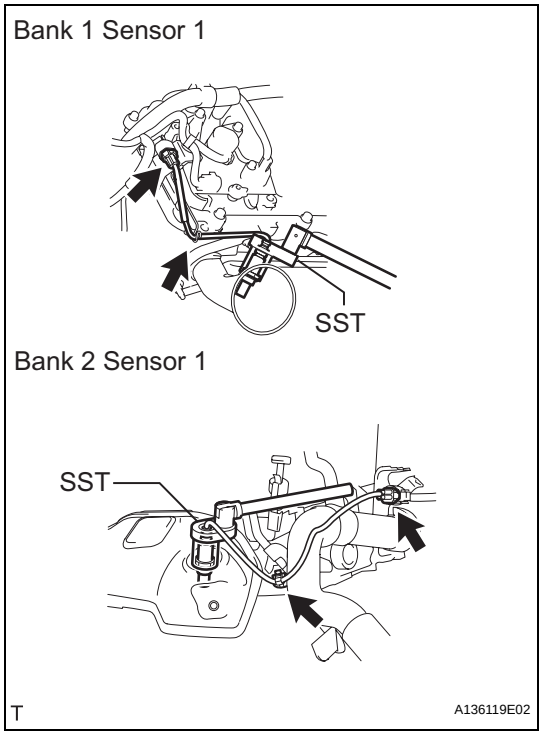
- **Perform the check immediately after warming the engine up.**
- **If the voltage variation could not be verified, warm up the A/F sensor again. If it could not be verified even after warming up the sensor again, check for DTCs (see page ES-334).**

EC

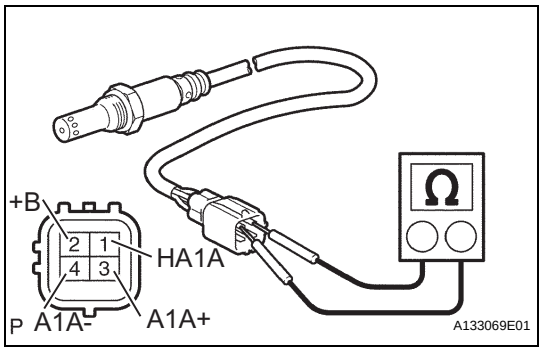
REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.



2. REMOVE AIR FUEL RATIO SENSOR (for Sensor 1)

(a) Disconnect the sensor connector.

(b) Using SST, remove the sensor from the exhaust manifold.

SST 09224-00010

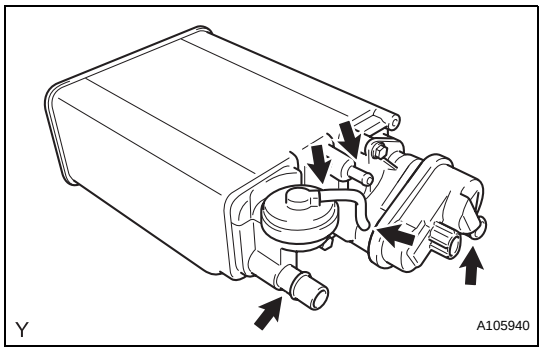
INSPECTION

1. INSPECT AIR FUEL RATIO SENSOR (for Sensor 1)

(a) Measure the resistance of the sensor.

Standard resistance

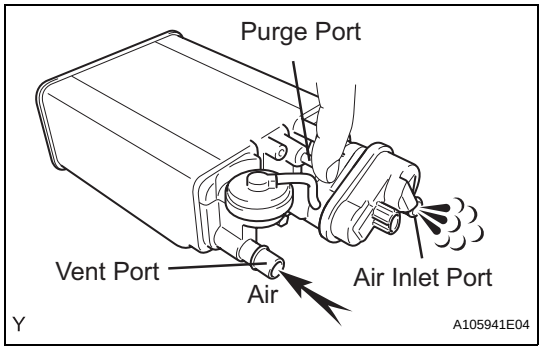
Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	-	10 kΩ or higher



If the resistance is not as specified, replace the sensor.

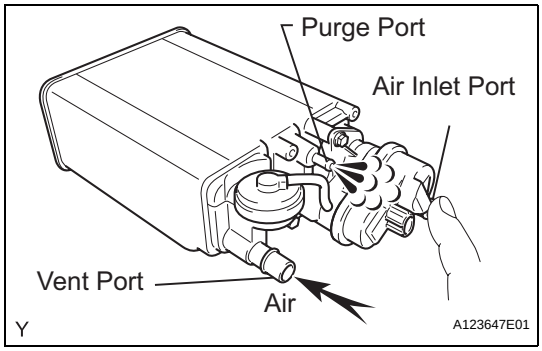
EC

INSPECTION

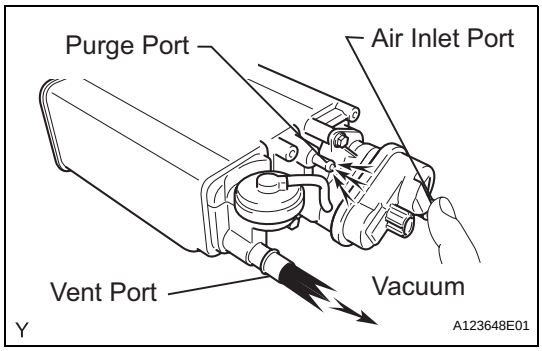


1. INSPECT CANISTER

(a) Visually check the canister for cracks or damage.
If cracks or damage is found, replace the canister.

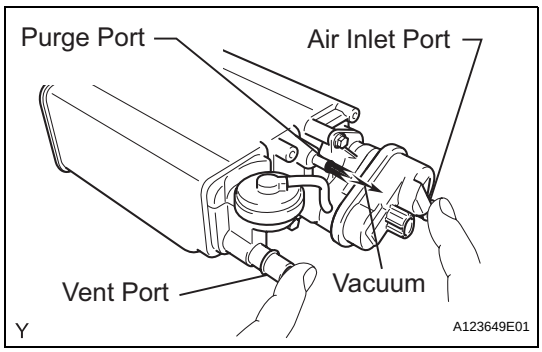


(b) Check the canister operation.

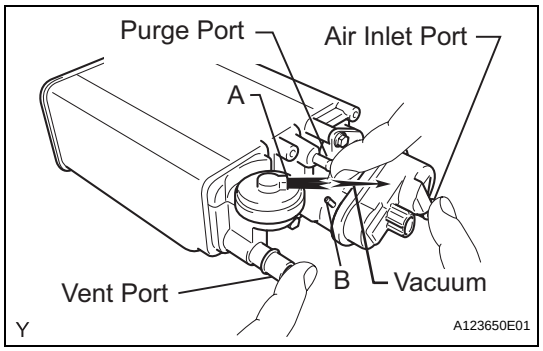


(1) While holding the purge port closed, blow air 0.39 kPa (4.0 kgf/cm^2, 3 mmHg) into the vent port, and check that air flows from the air inlet port.
If the result is not as specified, replace the canister.

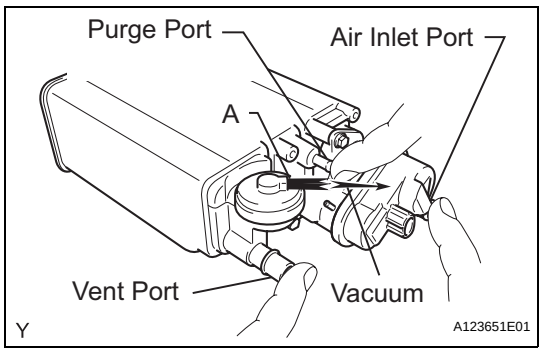
(2) While holding the air inlet port closed, blow air 0.39 kPa (4.0 kgf/cm^2, 3 mmHg) into the vent port, and check that air flows from the purge port.
If the result is not as specified, replace the canister.



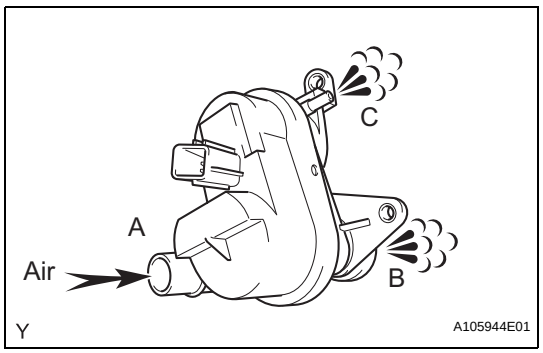
(3) While holding the air inlet port closed, apply vacuum 3.43 kPa (35.0 kgf/cm^2, 25.7 mmHg) to the vent port, and check that air is sucked into the purge port.
If the result is not as specified, replace the canister.



(c) Check the airtightness.

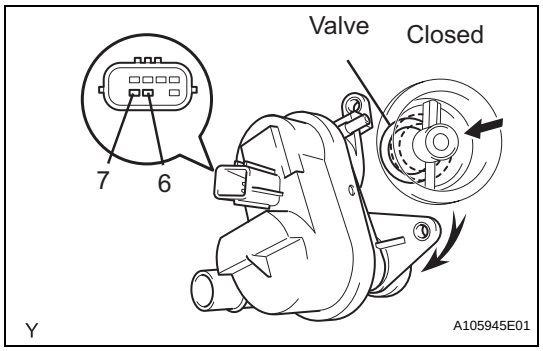


(1) While holding the vent and air inlet ports closed, apply vacuum 3.43 kPa (35.0 kgf/cm^2, 25.7 mmHg) to the purge port, and check that the vacuum is maintained for 1 minute.
If the result is not as specified, replace the canister.

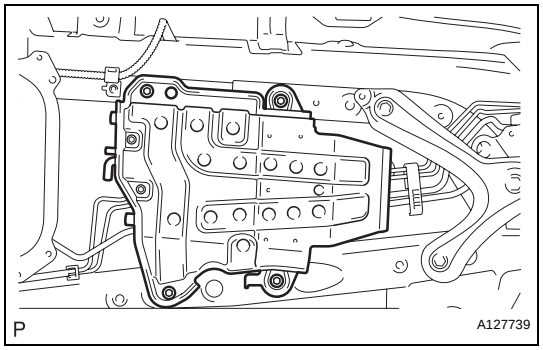


EC

(d) Check the diaphragm.
(1) Remove the air hose between ports A and B.
(2) While holding the vent, purge and air inlet ports closed, apply vacuum 1.42 kPa (14.5 kgf/cm^2, 10.6 mmHg) to port A, and check that air is not sucked into port B.

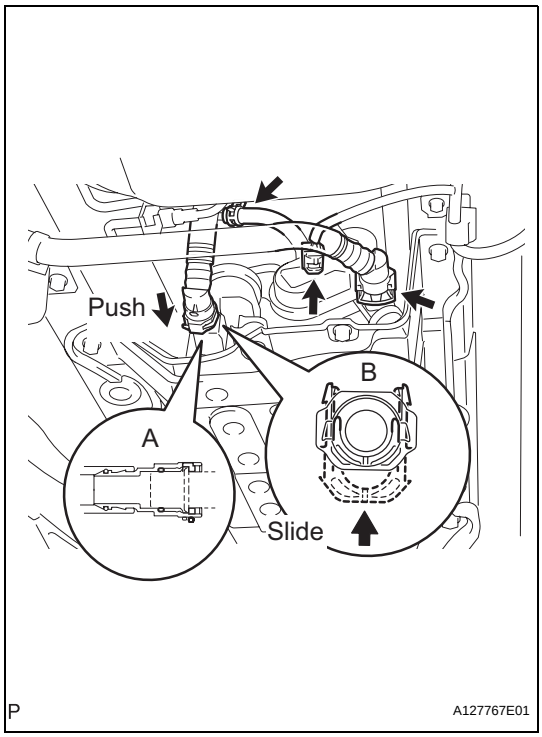


(3) While holding the vent, purge and air inlet ports closed, apply vacuum 1.42 kPa (14.5 kgf/cm^2, 10.6 mmHg) to port A, and measure how long it takes for the vacuum to drop.
Vacuum drop time:
10 seconds or more
If the result is not as specified, replace the canister.



(e) Check the leak detection pump.
(1) Check that air flows from port A to port B and C.
If the result is not as specified, replace the canister.

EC



(2) Connect the positive (+) lead of the battery to terminal 7 and the negative (-) lead to terminal 6.
(3) Check that the valve closes.
If the result is not as specified, replace the canister.
(4) Install the canister pump module.

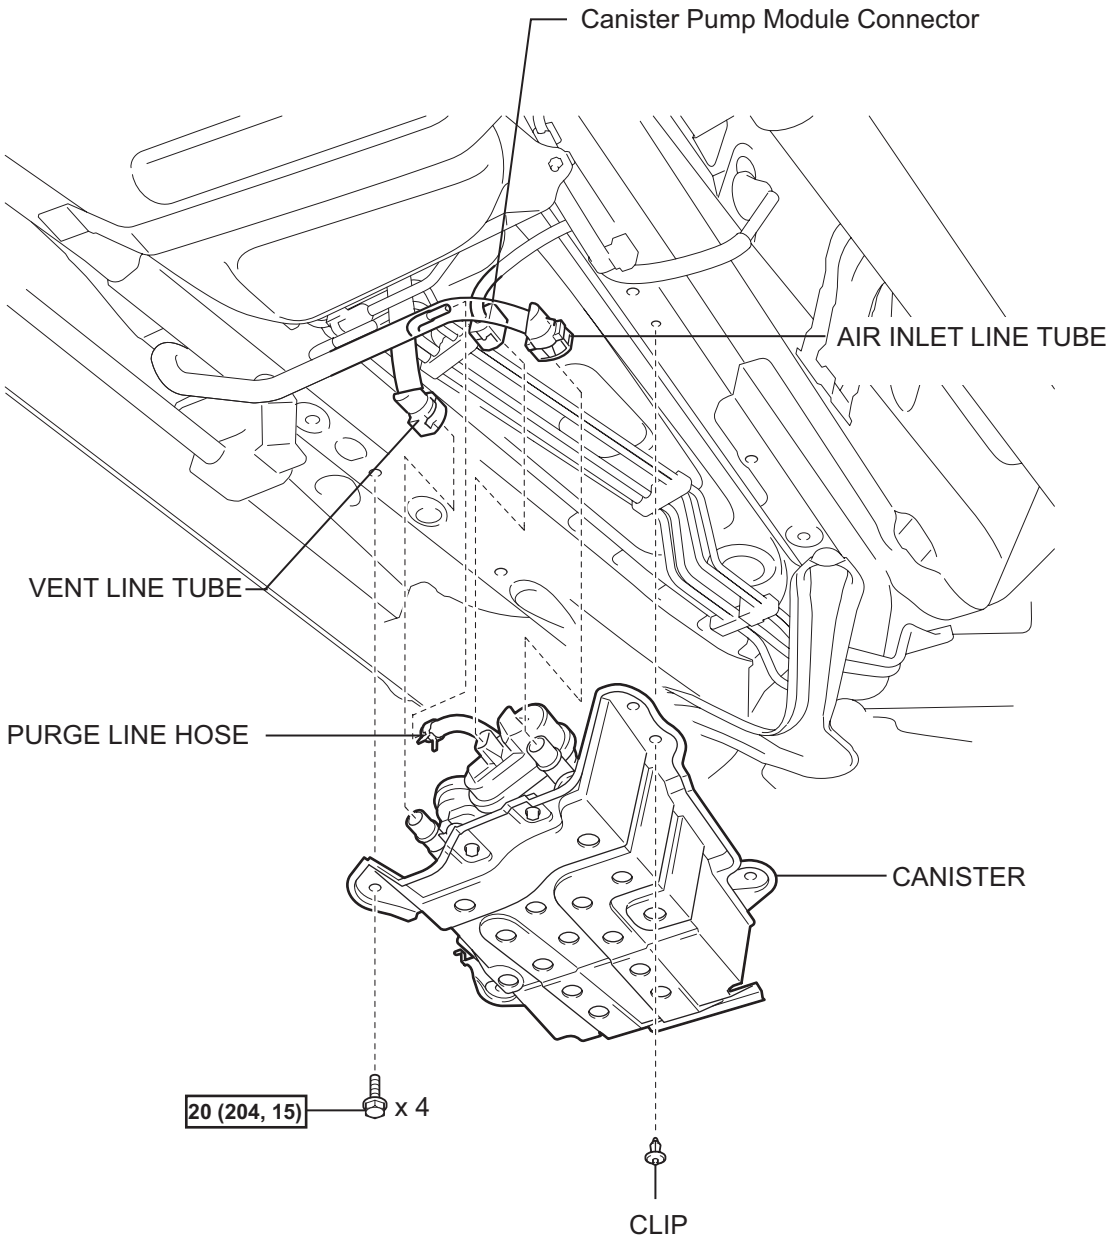
INSTALLATION

1. INSTALL CANISTER

(a) Install the canister with the 4 bolts and clip.
Torque: 20 N*m (204 kgf*cm, 15 ft.*lbf)
(b) Connect the air inlet line tube to the canister (leak detection pump).

(c) Install the vent line tube.
  (1) Connect the pipe to the fuel tube connector, as shown in A in the illustration. Then push up the retainer to lock the claws, as shown in B in the illustration.
  NOTICE:
  - **Check that there are no scratches or foreign objects around the connected part of the fuel tube connector and pipe before performing this work.**
  - **After connecting the fuel tank vent line tube, check that the fuel tank vent line tube is securely connected by pulling the fuel tube connector and pipe.**

(d) Connect the purge line hose.
  HINT:
  Install the hose to the canister, and then attach the retainer.



(e) Connect the connector to the canister (leak detection pump).

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

EC

CANISTER

COMPONENTS

N*m (kgf*cm, ft.*lbf) : Specified torque

P

A127737E01

REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

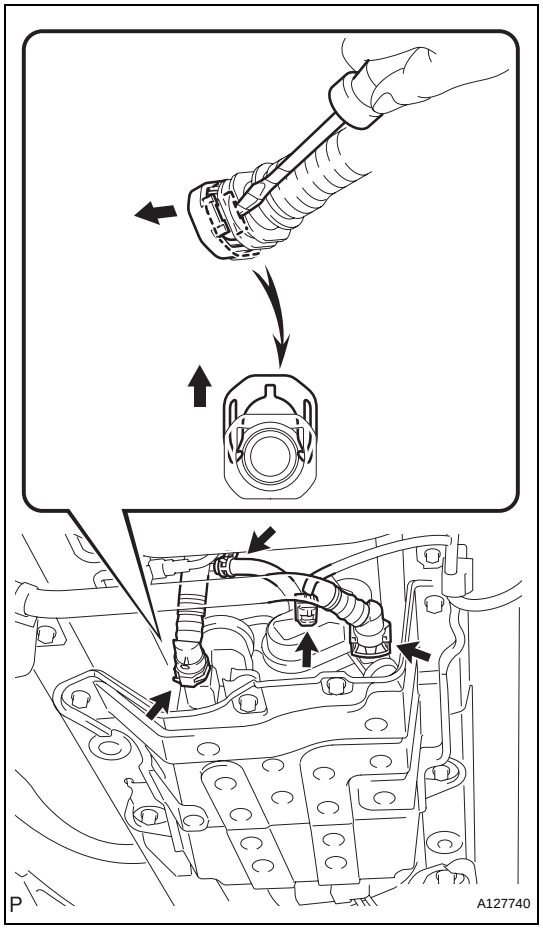
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE CANISTER

NOTICE:

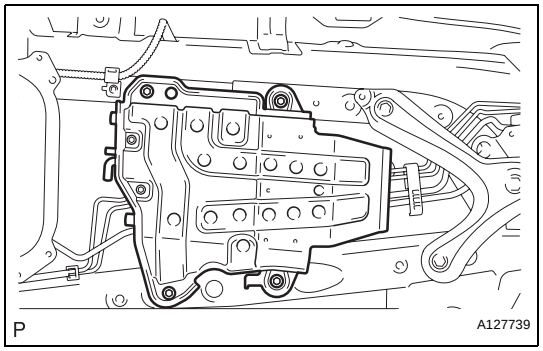
Remove any dirt or foreign objects before performing this work.

(a) Disconnect the 2 tubes, hose and connector.



(1) Using a screwdriver, pry up the retainer.
HINT:
Do not remove the retainer.

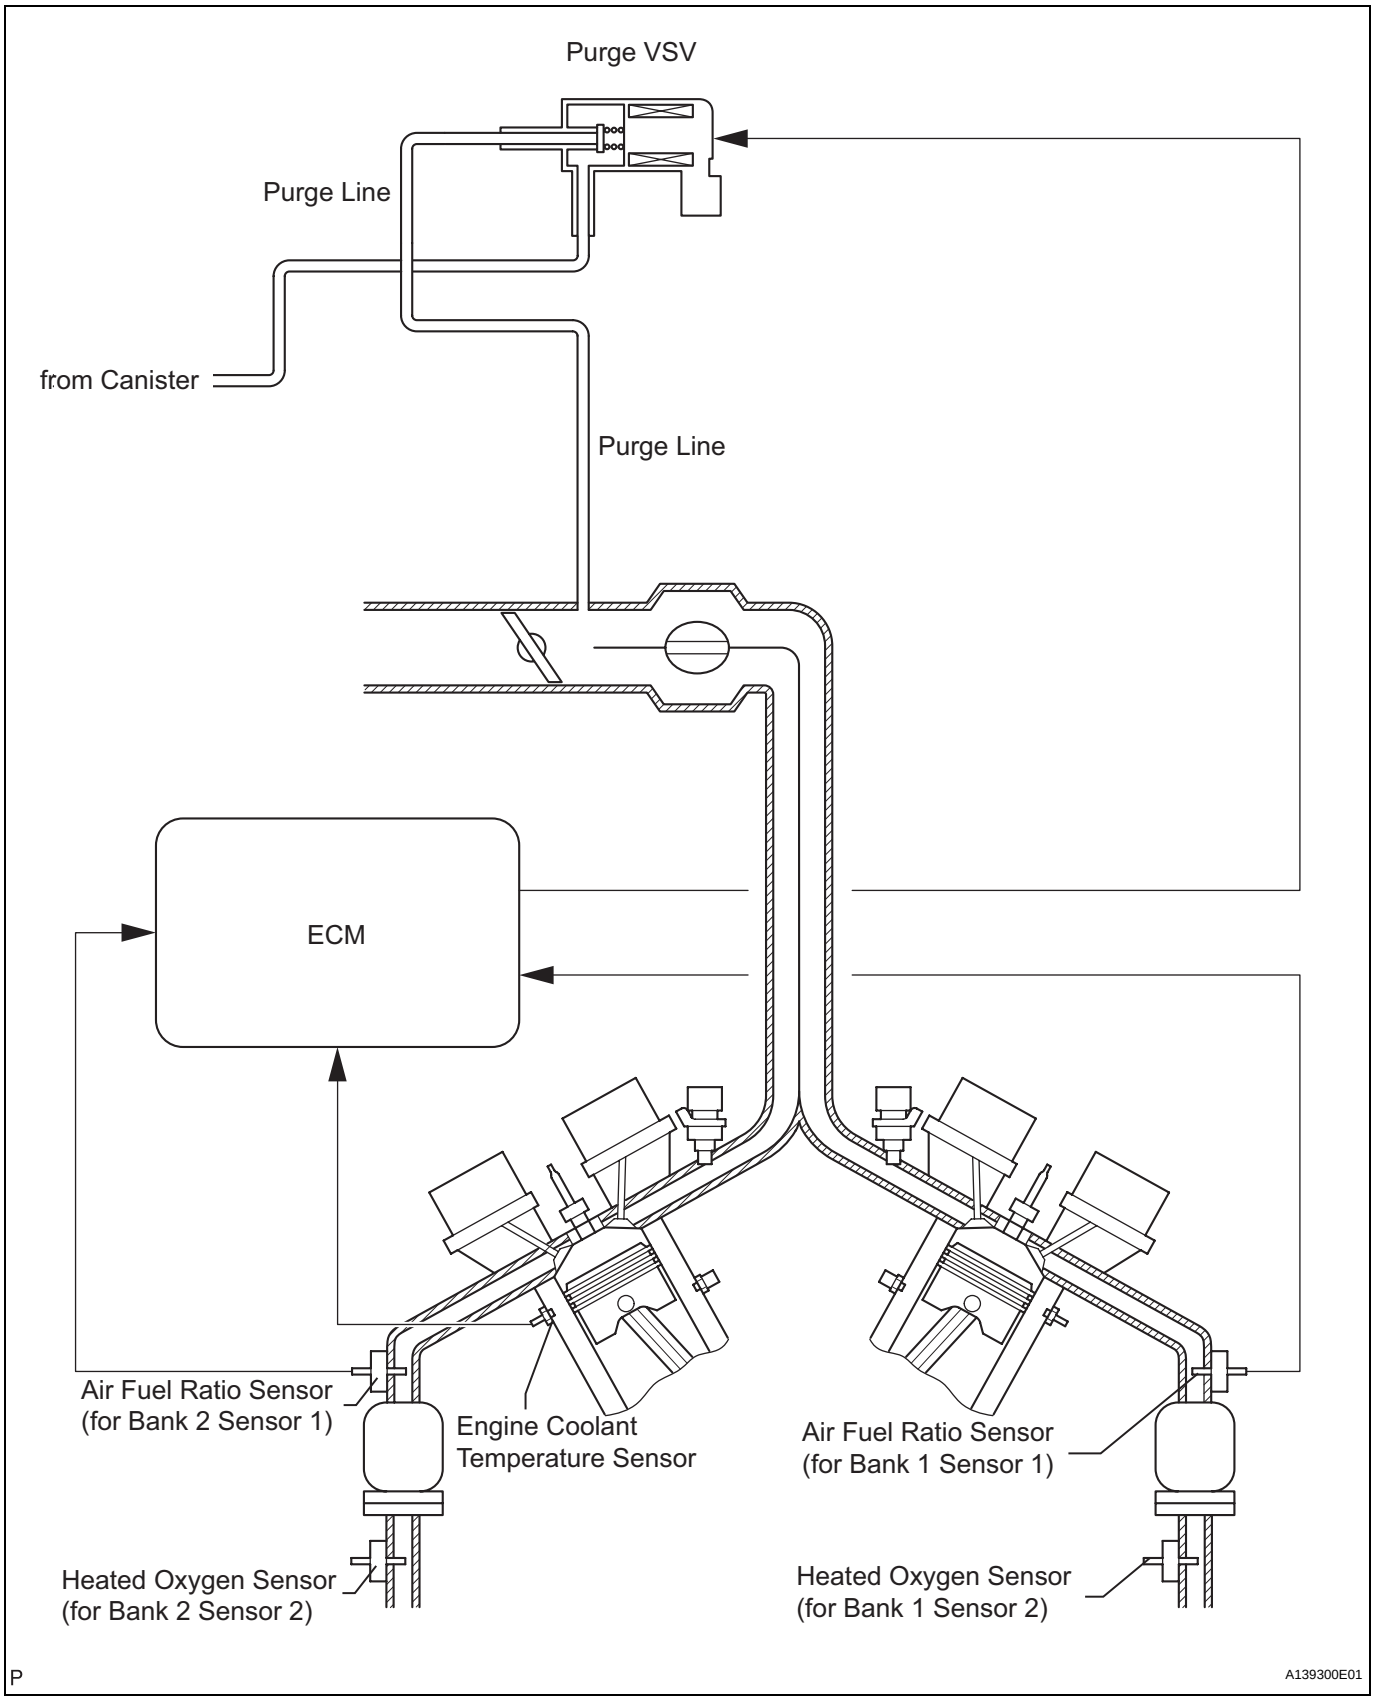
(2) Disconnect the purge line hose.



(3) Disconnect the air inlet line tube from the canister.

(4) Disconnect the vent line tube from the canister (leak detection pump).

(5) Disconnect the connector from the canister (leak detection pump).



(b) Remove the 4 bolts, clip and canister.

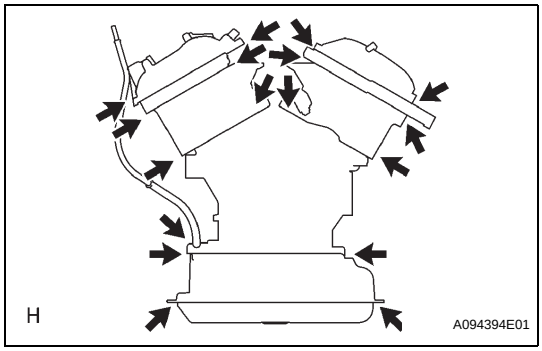
ON-VEHICLE INSPECTION

1. CHECK FUEL CUT RPM

(a) Increase the engine speed to at least 3,500 rpm.

(b) Use a sound scope to check for injector operating noise.



(c) Check that the operating sounds stop momentarily and then resume when the throttle lever is released.

HINT:

Measure with the A/C OFF.

Fuel return rpm:

1,400 rpm

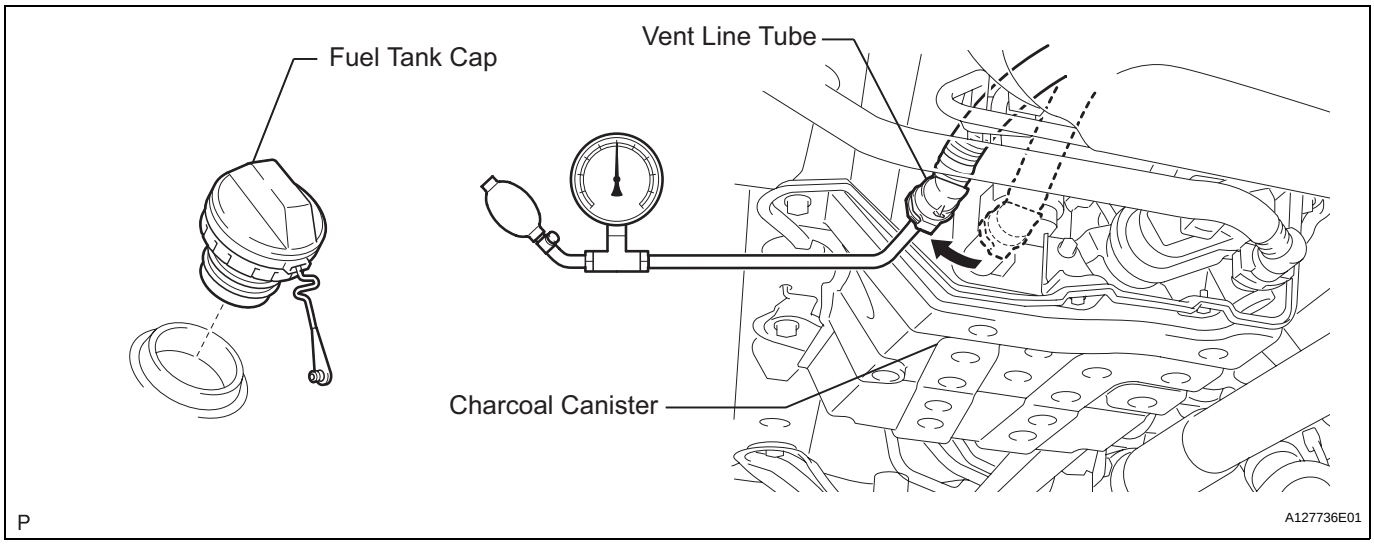
2. CHECK FOR LEAKS

(a) Visually check that the hoses, connections and gaskets have no cracks, leaks or damage.

NOTICE:

- **Detachment or other problems with the engine oil dipstick, filler cap, PCV hose and other components may cause the engine to run improperly.**
- **Disconnection, looseness or cracks in the parts of the air induction system between the throttle body and cylinder head will allow air suction and cause an engine failure or engine malfunctions.**

If the result is not as specified, replace parts as necessary.



3. CHECK LINE AND CONNECTORS

(a) Visually check for loose connections, sharp bends or damage.

4. CHECK FUEL TANK ASSEMBLY

(a) Visually check for deformation, cracks or fuel leakage.

5. CHECK FUEL TANK AND VENT LINE

(a) Disconnect the vent line tube from the canister.

(b) Connect a pressure gauge to the vent line tube.

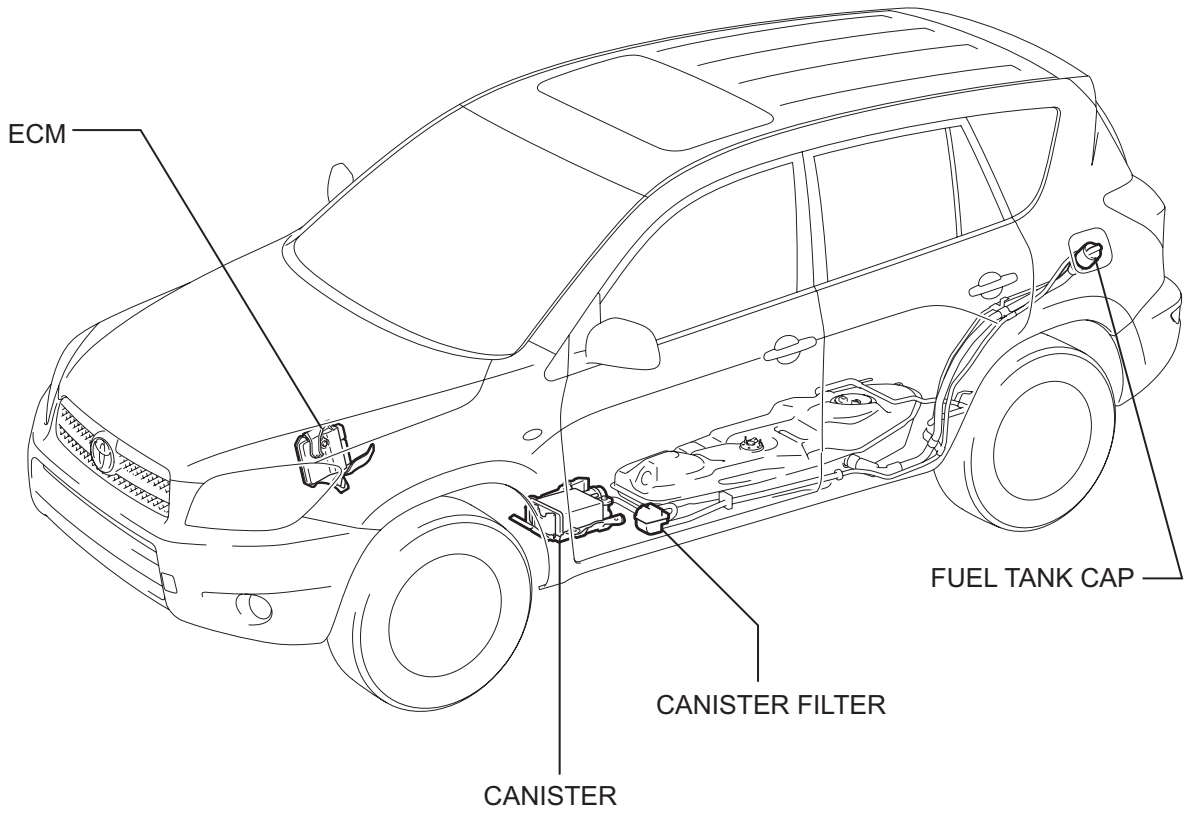
(c) Apply 4 kPa (41 kgf/cm^2, 30 mmHg) of pressure to the vent line of the fuel tank.
HINT:
Perform this inspection with the fuel tank less than 90% full. When the fuel tank is full, the fuel cutoff valve closes and pressure is released through the 1.5 mm orifice. As a result, when the fuel tank cap is removed, the pressure does not decrease smoothly.

(d) Check that the fuel tank pressure is maintained for some time, and does not decrease immediately.
HINT:
If the pressure decreases immediately, one of the following may be the cause:
- The fuel tank cap is not completely tightened.
- The fuel tank cap is damaged.
- Air is leaking from the vent line.
- The fuel tank is damaged.

(e) When the fuel tank cap is removed, check that pressure is released smoothly.
HINT:
If the pressure does not drop, replace the fuel tank assembly.

(f) Reconnect the vent line tube to the canister.

6. CHECK AIR INLET LINE



(a) Disconnect the air inlet line hose from the charcoal canister.

(b) Check that air flows freely into the air inlet line.
HINT:
If air does not flow freely into the air inlet line, repair or replace it.

(c) Reconnect the air inlet line hose to the charcoal canister.

FUEL TANK CAP

INSPECTION

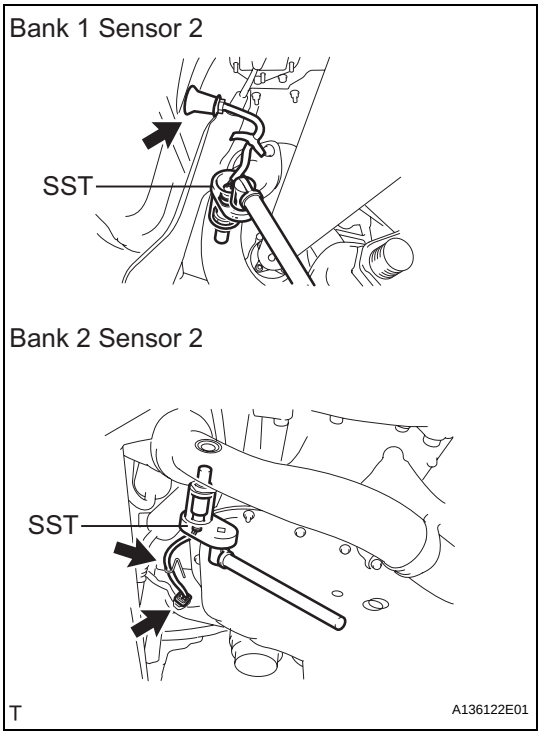
1. INSPECT FUEL TANK CAP ASSEMBLY

(a) Visually check that the cap and gasket are not deformed or damaged.
If the result is not as specified, replace the cap assembly or gasket.

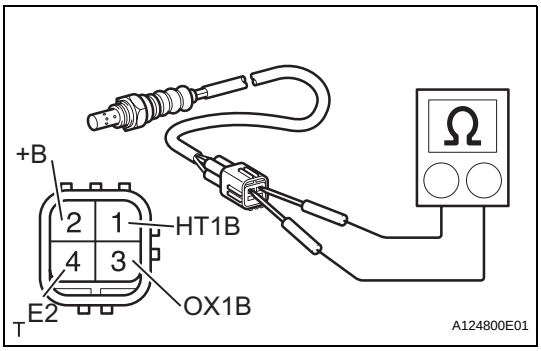
REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

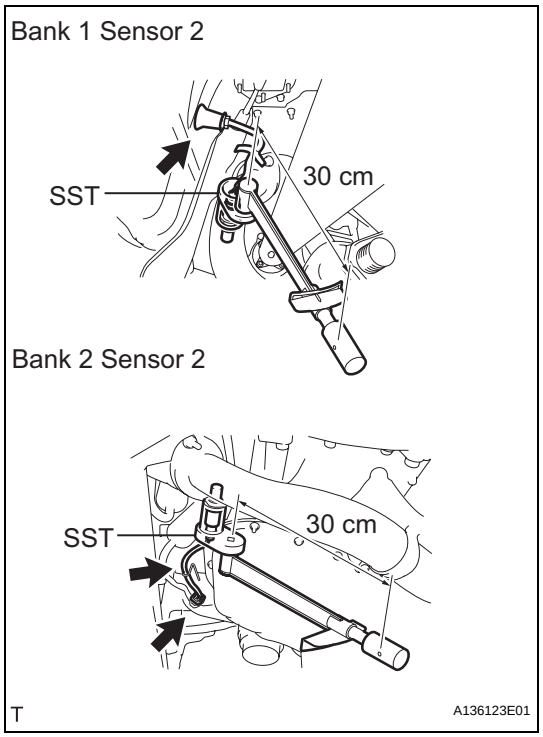


2. REMOVE HEATED OXYGEN SENSOR (for Sensor 2)

(a) Bank 1 Sensor 2:
Remove the rear console box (see page IP-16).

(b) Disconnect the sensor connector.

(c) Using SST, remove the sensor from the exhaust pipe.
SST 09224-00010



INSPECTION

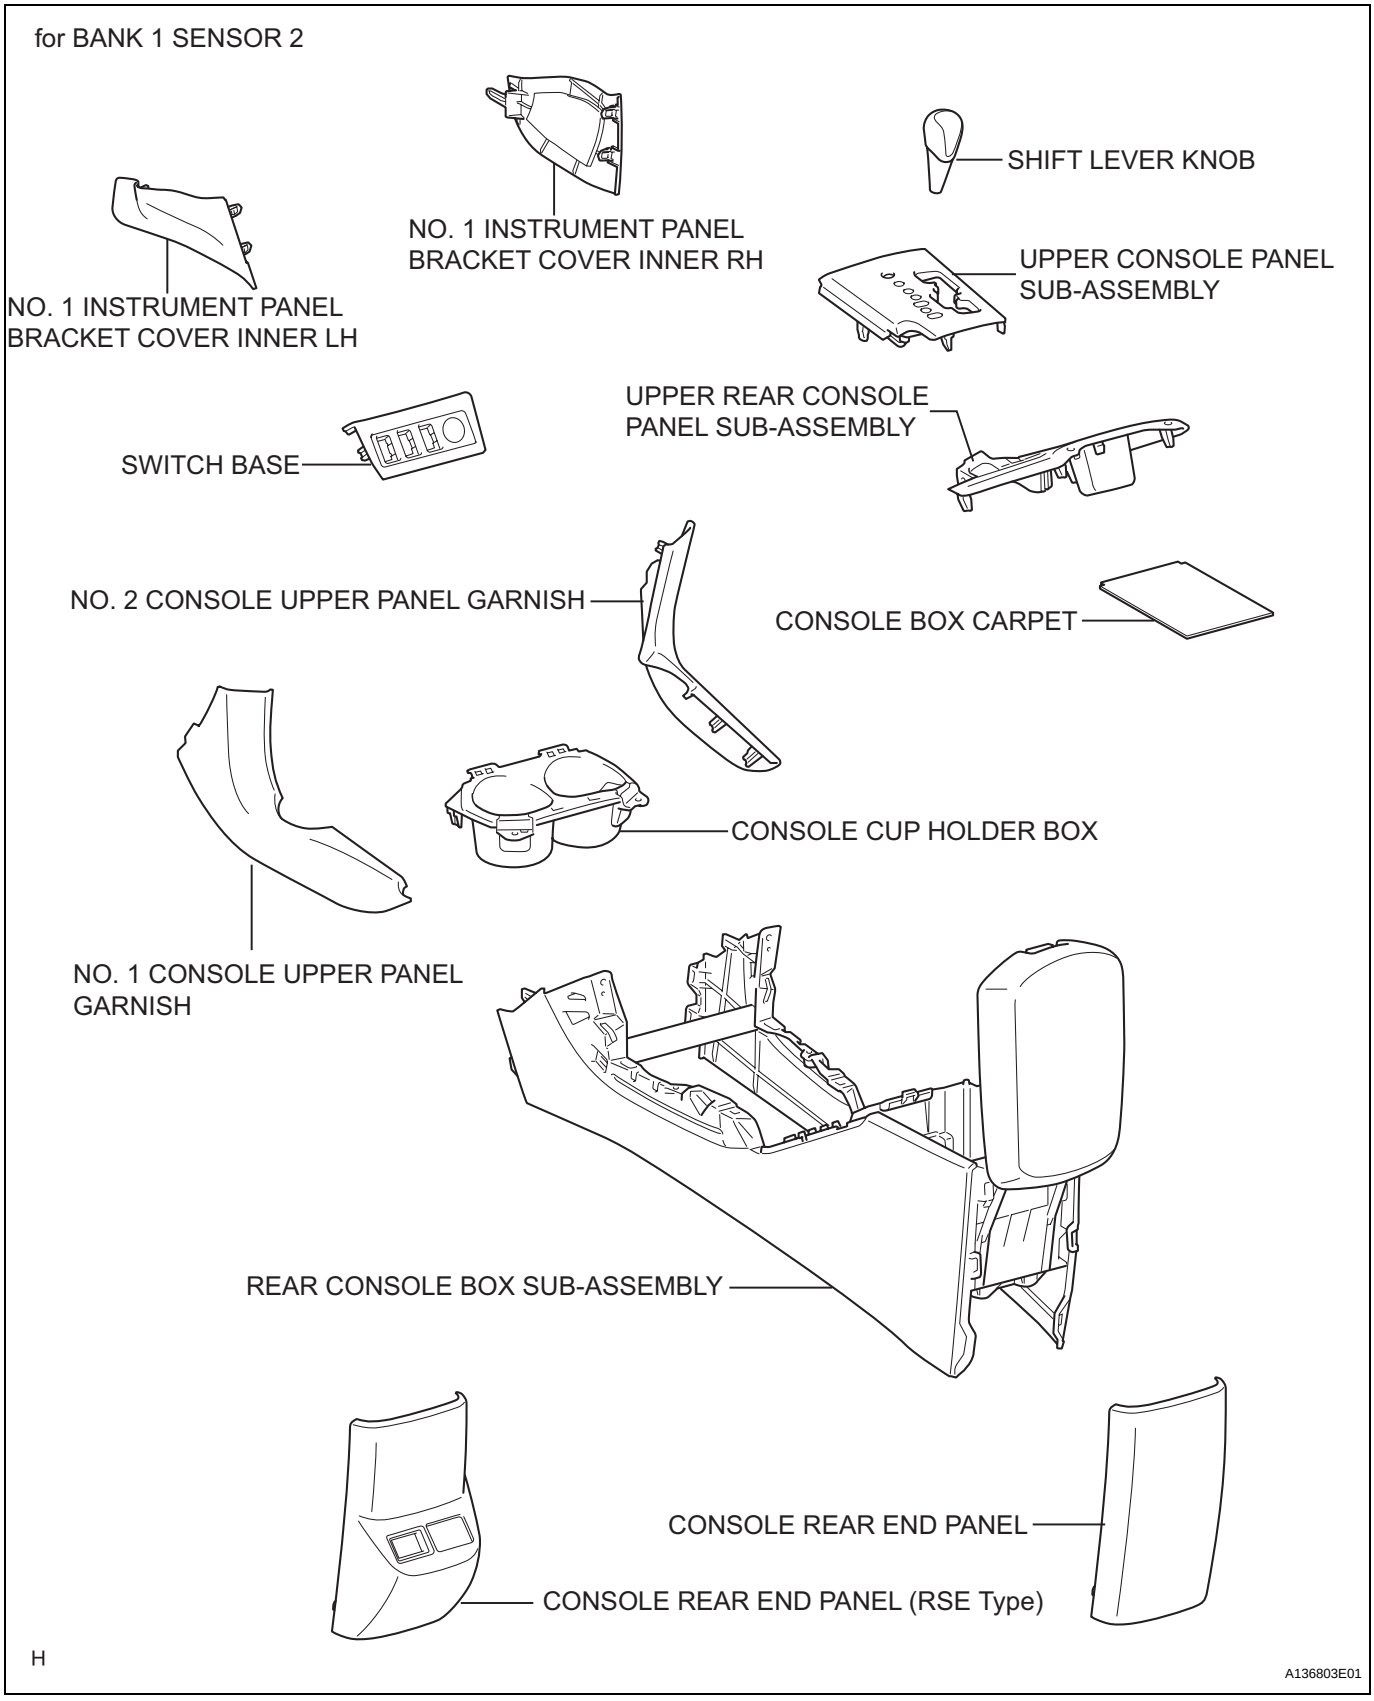
1. INSPECT HEATED OXYGEN SENSOR (for Sensor 2)

(a) Measure the resistance of the sensor.
Standard resistance

Tester Connection	Specified Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	-	10 kΩ or higher

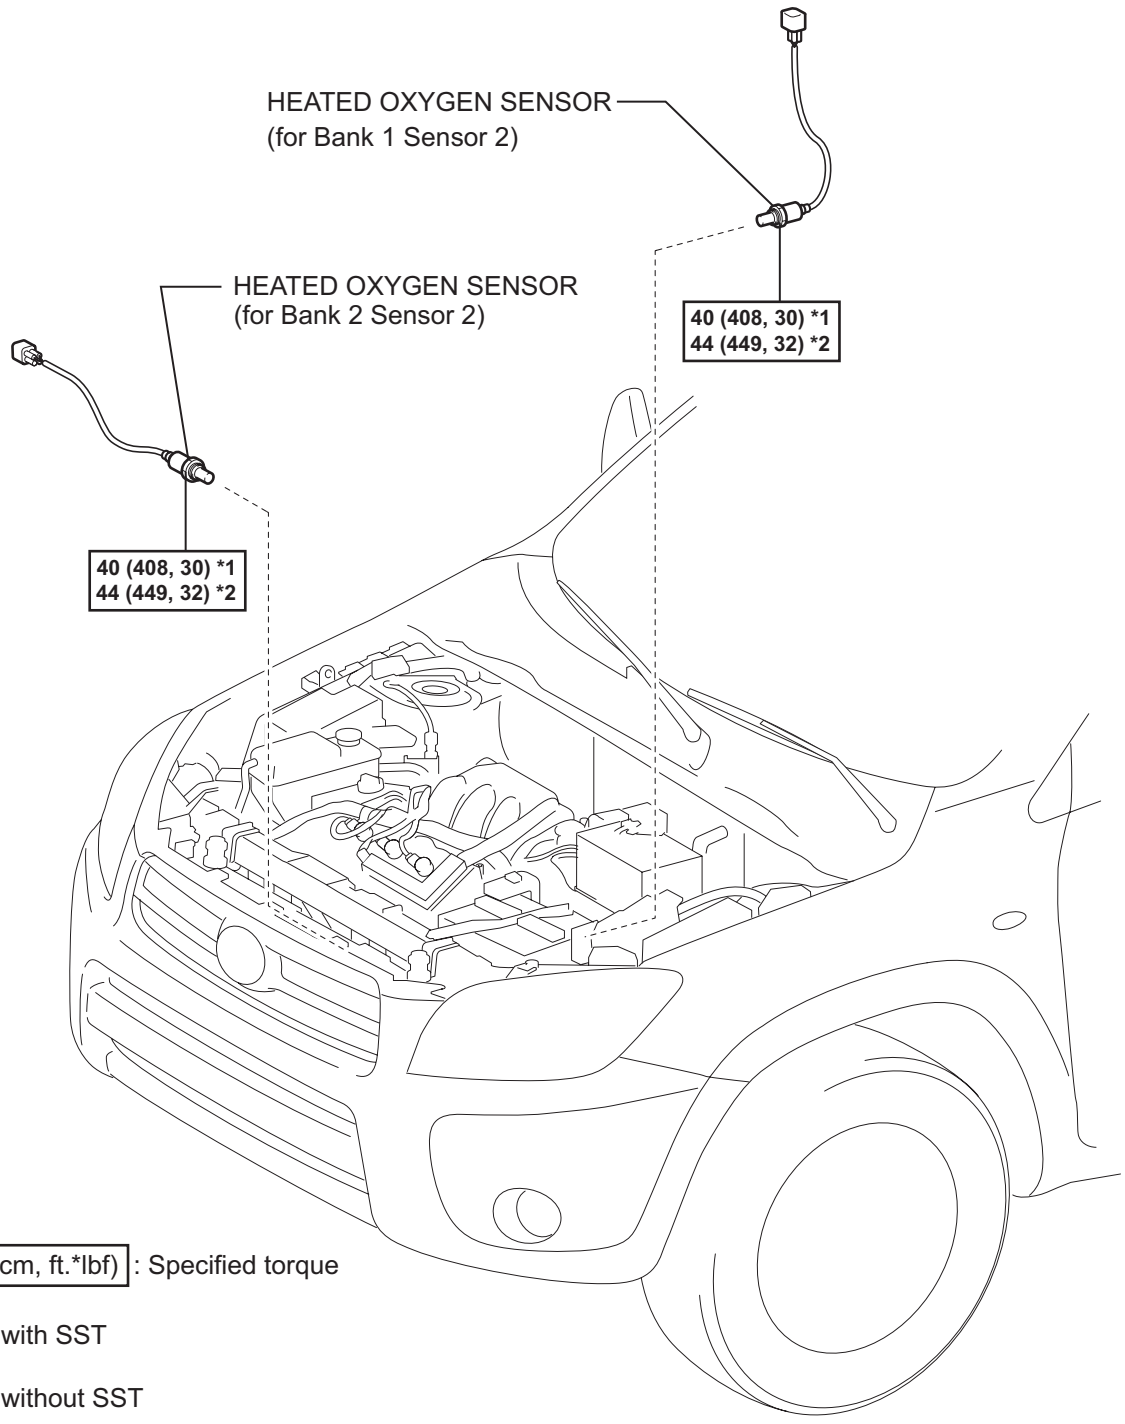
If the resistance is not as specified, replace the sensor.

INSTALLATION



1. **INSTALL HEATED OXYGEN SENSOR (for Sensor 2)**
   (a) Using SST, install the sensor to the exhaust pipe.
   SST 09224-00010
   Torque: 40 N*m (408 kgf*cm, 30 ft.*lbf) for use with SST
   44 N*m (449 kgf*cm, 32 ft.*lbf) for use without SST
   HINT:
   - Use a torque wrench with a fulcrum length of 30 cm (11.81 in.).
   - Make sure SST and a wrench are connected in a straight line.

   (b) Connect the sensor connector.
   (c) Bank 1 Sensor 2:
   Install the rear console box (see page IP-23).
2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
3. **CHECK FOR EXHAUST GAS LEAKS**



EC

EC

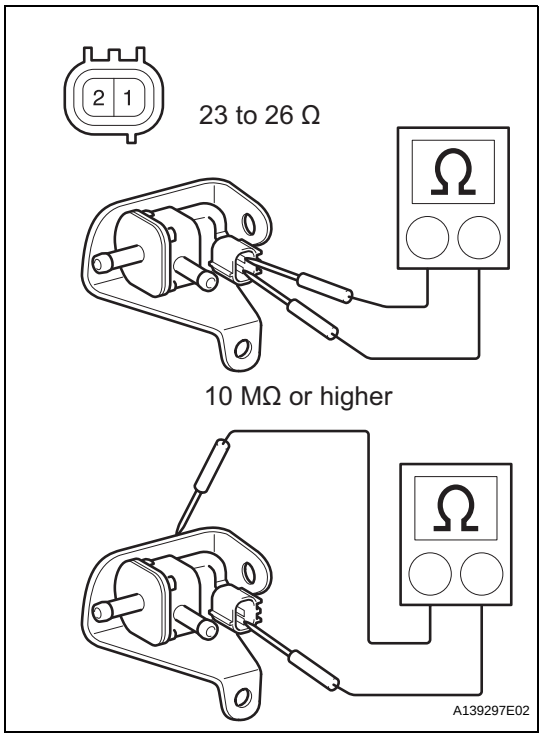
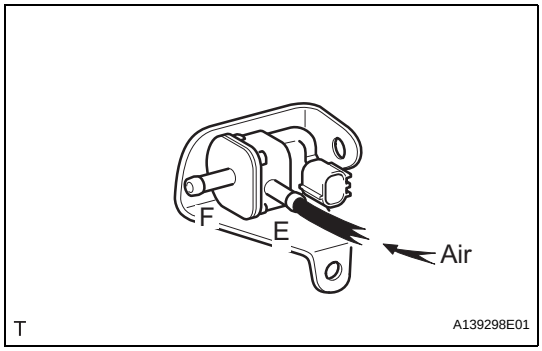
REMOVAL

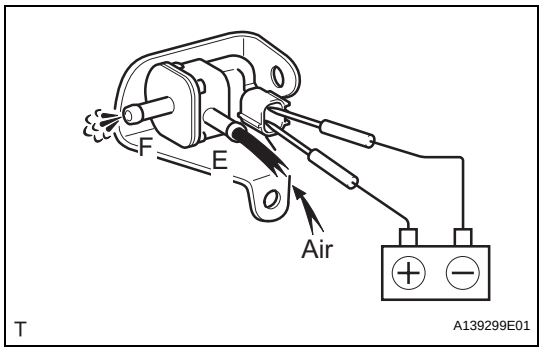
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE V-BANK COVER SUB-ASSEMBLY (See page EM-21)**
3. **REMOVE PURGE VSV**
   (a) Disconnect the purge VSV connector.
   (b) Disconnect the wire harness clamp.
   (c) Disconnect the 2 purge line hoses from the purge VSV.
   (d) Remove the bolt and purge VSV.



INSPECTION

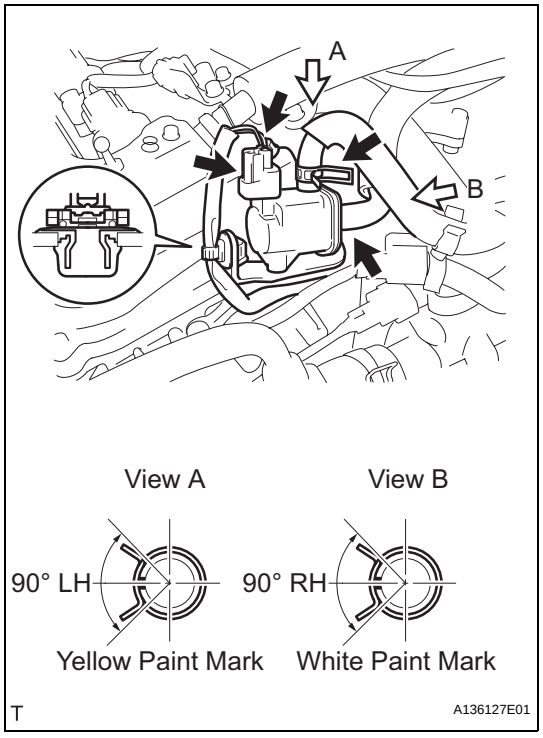


1. **INSPECT PURGE VSV**
   (a) Measure the resistance of the purge VSV.
   Standard resistance



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	23 to 26 Ω
1 - Body ground 2 - Body ground	-	10 MΩ or higher

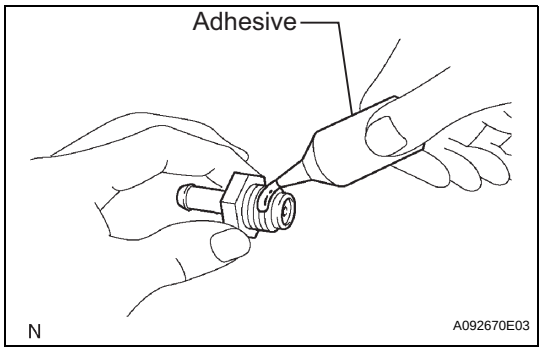
If the result is not as specified, replace the purge VSV.



(b) Check the operation of the purge VSV.
   (1) Check that air does not flow from port E to port F.

(2) Apply battery voltage across the terminals.
(3) Check that air flows from port E to port F.
If the result is not as specified, replace the purge VSV.

INSTALLATION



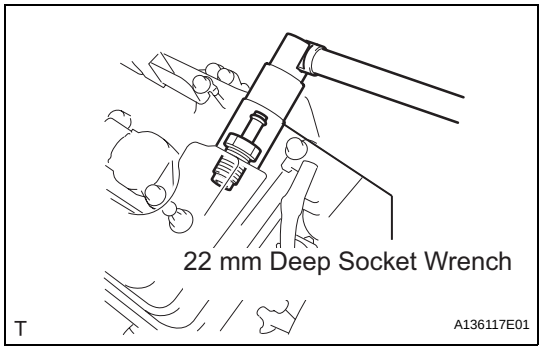
1. INSTALL PURGE VSV

(a) Install the purge VSV with the bolt.
Torque: 10 N*m (102 kgf*cm, 7 in.*lbf)
(b) Connect the 2 purge line hoses to the purge VSV.
(c) Connect the wire harness clamp.
(d) Connect the purge VSV connector.

2. INSTALL V-BANK COVER SUB-ASSEMBLY (See page EM-42)

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

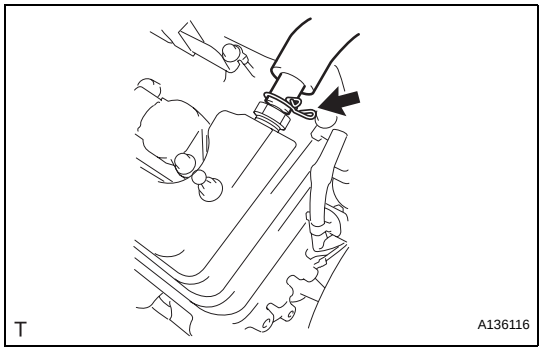
EC



INSTALLATION

1. INSTALL VENTILATION VALVE SUB-ASSEMBLY

(a) Apply adhesive to 2 or 3 threads of the ventilation valve.



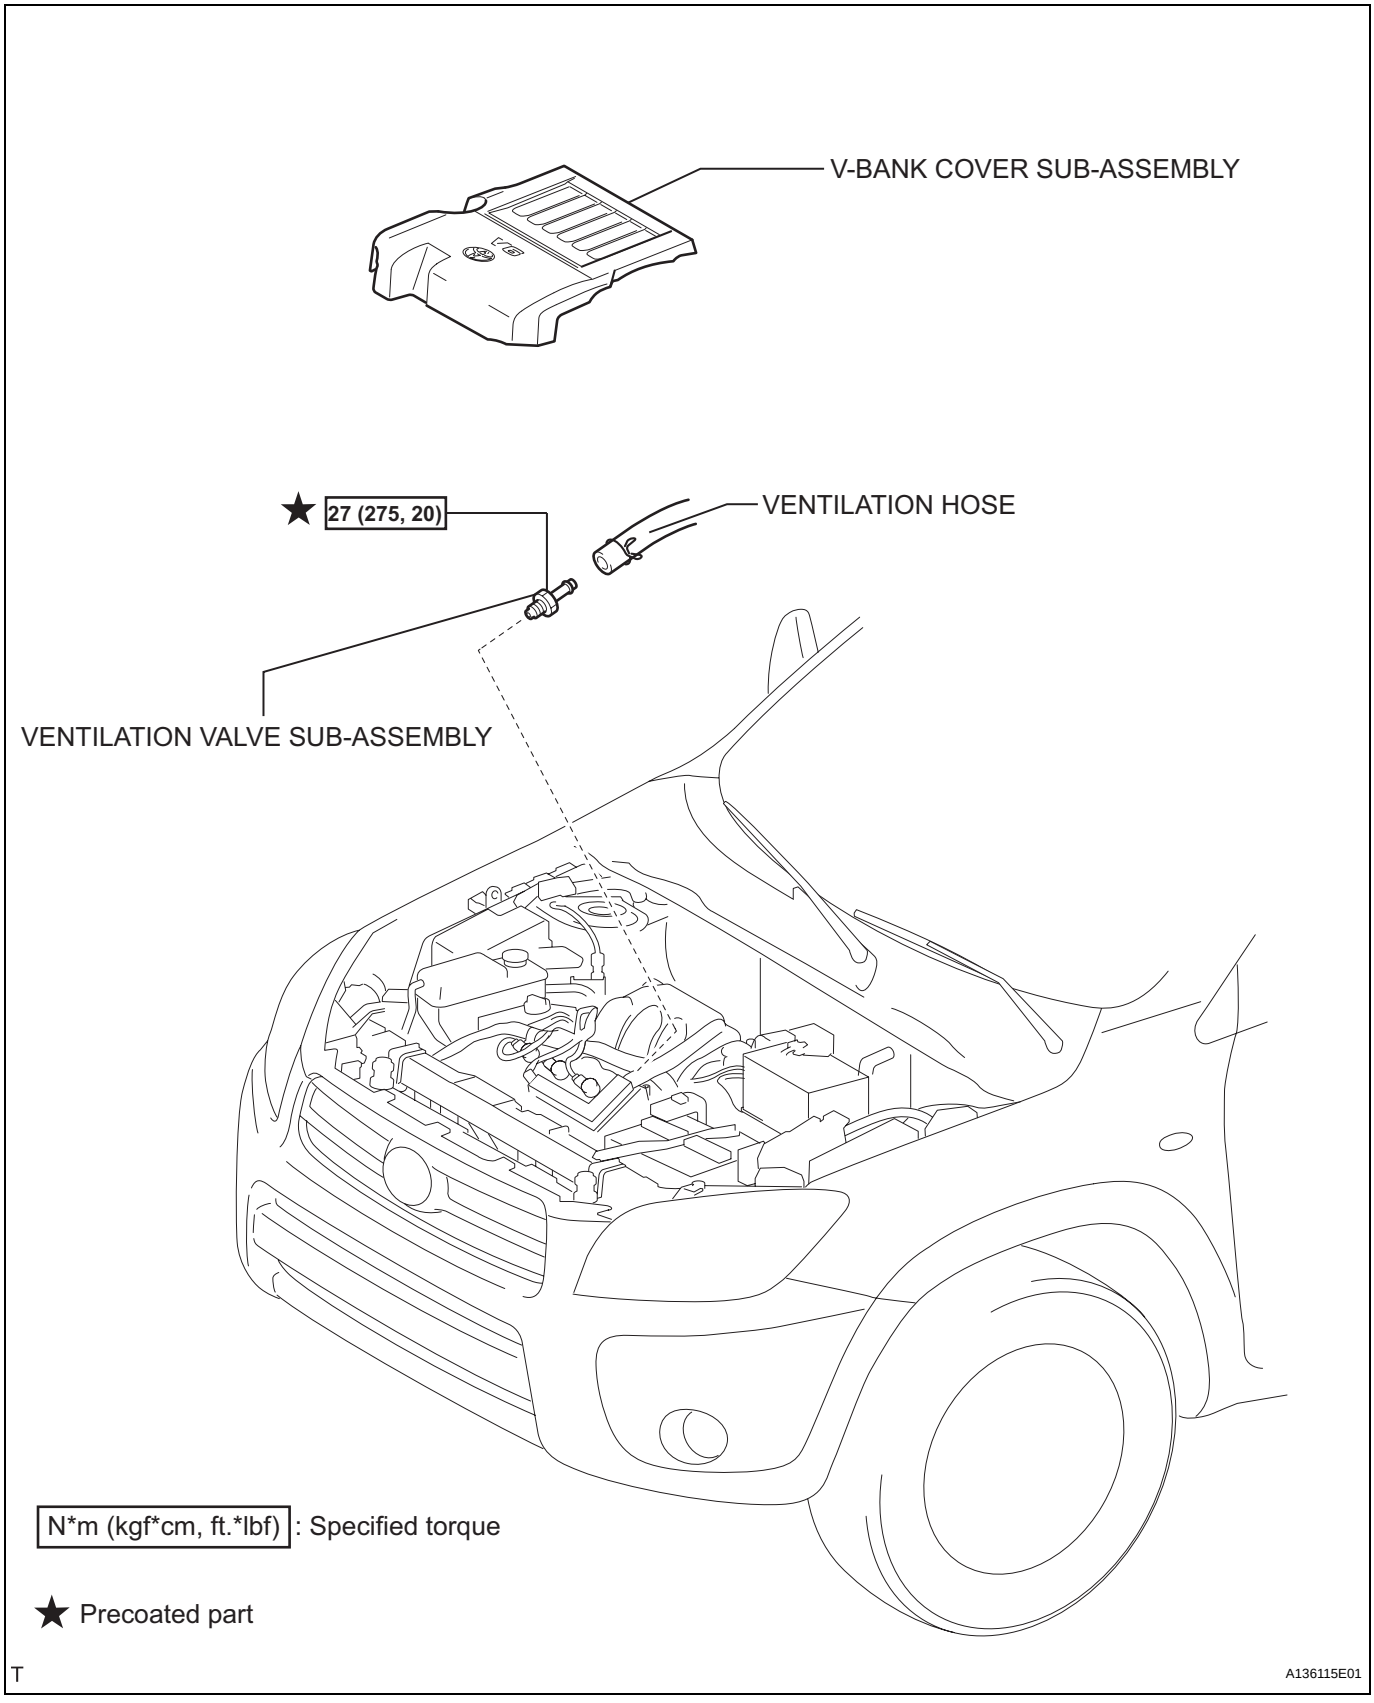
Adhesive:

Toyota genuine adhesive 1324, three bond 1324 or equivalent

(b) Using a 22 mm deep socket wrench, install the ventilation valve.

Torque: 27 N*m (275 kgf*cm, 20 ft.*lbf)

(c) Connect the ventilation hose.



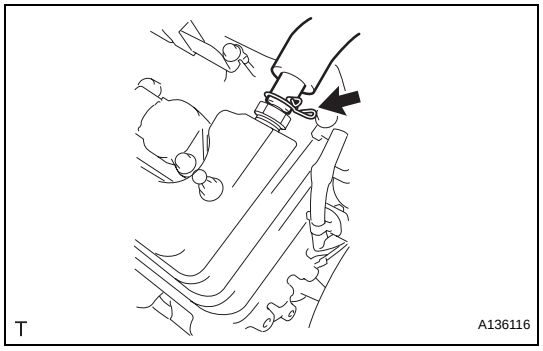
2. INSTALL V-BANK COVER SUB-ASSEMBLY (See page EM-43)

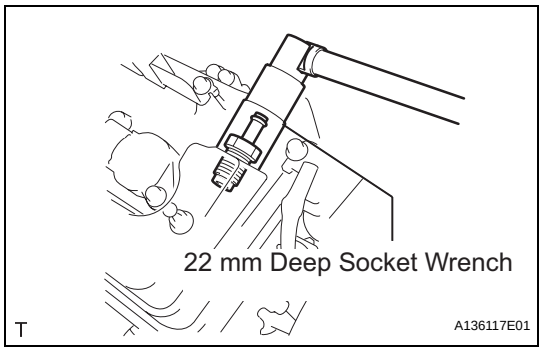
3. CHECK FOR ENGINE OIL LEAKS

EC

VENTILATION VALVE

COMPONENTS





EC

REMOVAL

1. **REMOVE V-BANK COVER SUB-ASSEMBLY (See page EM-21)**

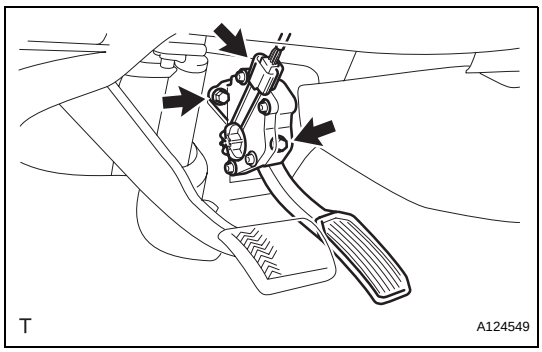
2. **REMOVE VENTILATION VALVE SUB-ASSEMBLY**
   (a) Disconnect the ventilation hose from the ventilation valve.

   (b) Using a 22 mm deep socket wrench, remove the ventilation valve.

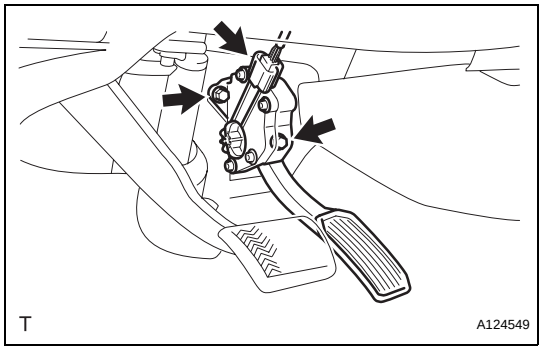
INSPECTION

1. **INSPECT VENTILATION VALVE SUB-ASSEMBLY**
   (a) Install a clean hose to the ventilation valve.
   (b) Check the ventilation valve operation.
      (1) Blow air into the cylinder head side, and check that air passes through easily.
      CAUTION:
      Do not suck air through the valve.
      Petroleum substances inside the valve are hazardous to your health.

      (2) Blow air into the intake manifold side, and check that air passes through with difficulty.
      If the result is not as specified, replace the ventilation valve sub-assembly.
   (c) Remove the clean hose from the ventilation valve.



EC

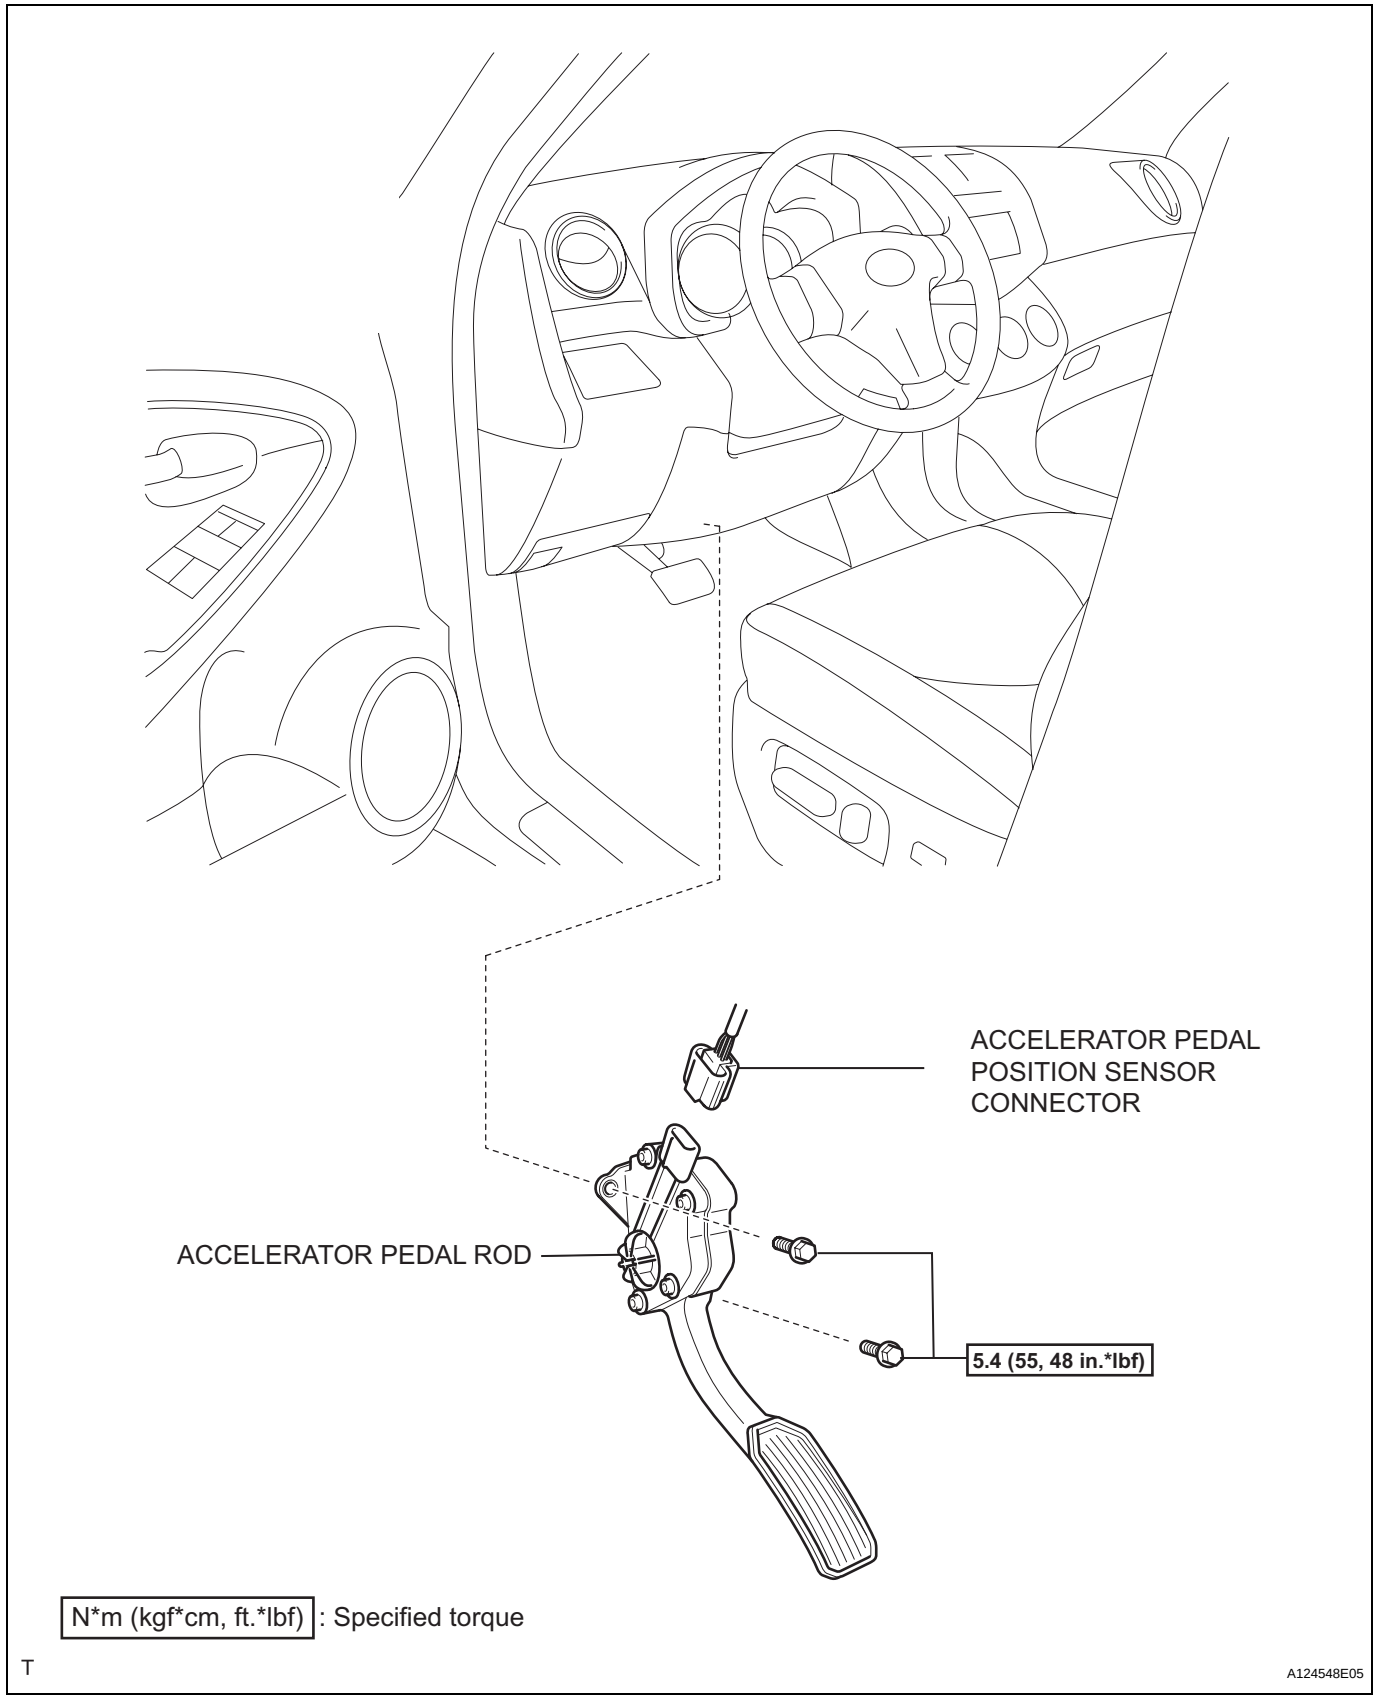


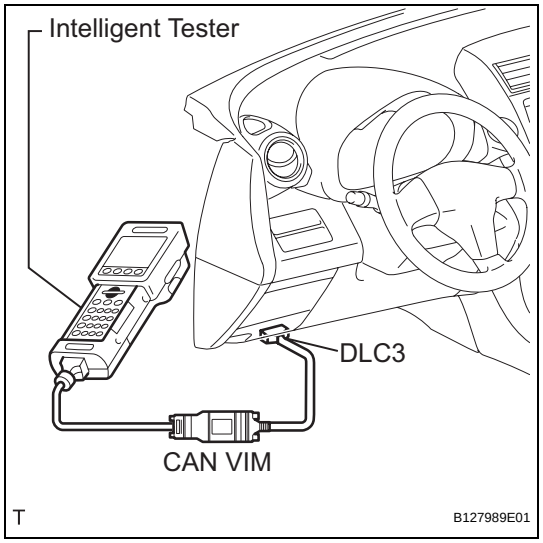
REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. **REMOVE ACCELERATOR PEDAL ROD**
   (a) Disconnect the accelerator pedal position sensor connector.
   (b) Remove the 2 bolts and accelerator pedal rod.

INSTALLATION





1. **INSTALL ACCELERATOR PEDAL ROD**
   (a) Install the accelerator pedal rod with the 2 bolts.
   Torque: 5.4 N*m (55 kgf*cm, 48 in.*lbf)
   (b) Connect the accelerator pedal position sensor connector.

2. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

ACCELERATOR PEDAL ROD

COMPONENTS

ON-VEHICLE INSPECTION

1. CHECK ACCELERATOR PEDAL ROD

(a) Check the voltage.

(1) Connect the intelligent tester to the DLC3.

(2) Turn the ignition switch ON.

(3) Turn the intelligent tester ON.

(4) Select the menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ALL / ACCEL POS #1, ACCEL POS #2.

(5) Operate the accelerator pedal, and then check that the ACCEL POS #1 and ACCEL POS #2 values are within the specifications.

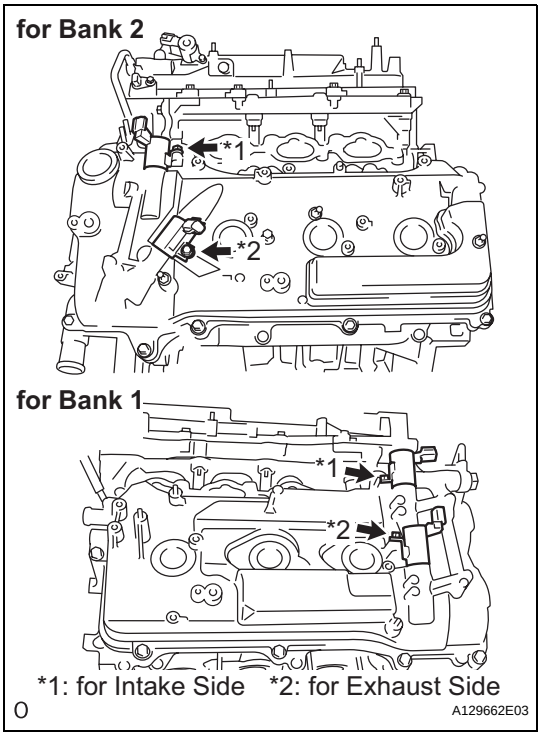
Standard voltage:

ACCEL POS #1

Accelerator Pedal Condition	Specified Condition
Released	0.5 to 1.1 V
Depressed	2.5 to 4.5 V

ACCEL POS #2

Accelerator Pedal Condition	Specified Condition
Released	1.2 to 2.0 V
Depressed	3.4 to 5.0 V



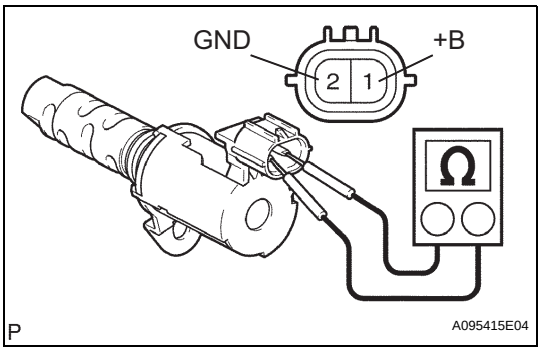
If the result is not as specified, check the accelerator pedal rod, wire harness or ECM.

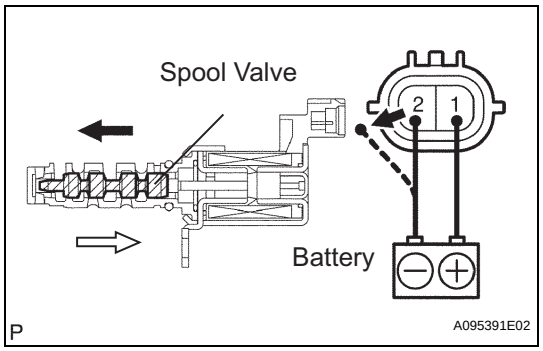
ES

ES

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE ENGINE ASSEMBLY**
   (a) Remove the engine (see page EM-21).
3. **REMOVE INTAKE AIR SURGE TANK ASSEMBLY (See page EM-27)**
4. **REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Disconnect the 4 oil control valve connectors.
   (b) Remove the 4 bolts and 4 oil control valves.
   (c) Remove the O-ring from each oil control valve.



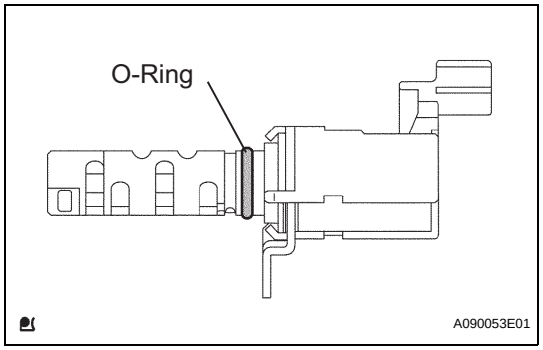


INSPECTION

1. **INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**
   (a) Measure the resistance of the oil control valve.
   Standard resistance

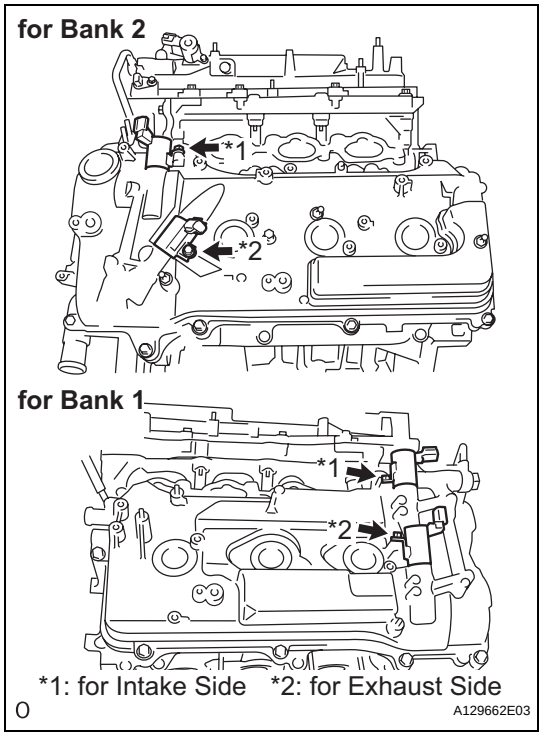
Tester Connection	Specified Condition
1 (+B) - 2 (GND)	6.9 to 7.9 Ω at 20°C (68°F)

If the result is not as specified, replace the oil control valve assembly.



(b) Check the operation.
(1) Connect the battery's positive (+) lead to terminal 1 and negative (-) lead to terminal 2, and check the movement of the valve.
OK

Condition	Specified Condition
Battery positive (+) voltage is applied	Valve moves in black arrow direction shown in illustration
Battery positive (+) voltage is cut off	Valve moves in white arrow direction shown in illustration



NOTICE:
Check that the spool valve is not stuck.
HINT:
The spool valve may not return if foreign objects are caught in it. This may cause subtle pressure leaks to the advance side, and a DTC may be set.

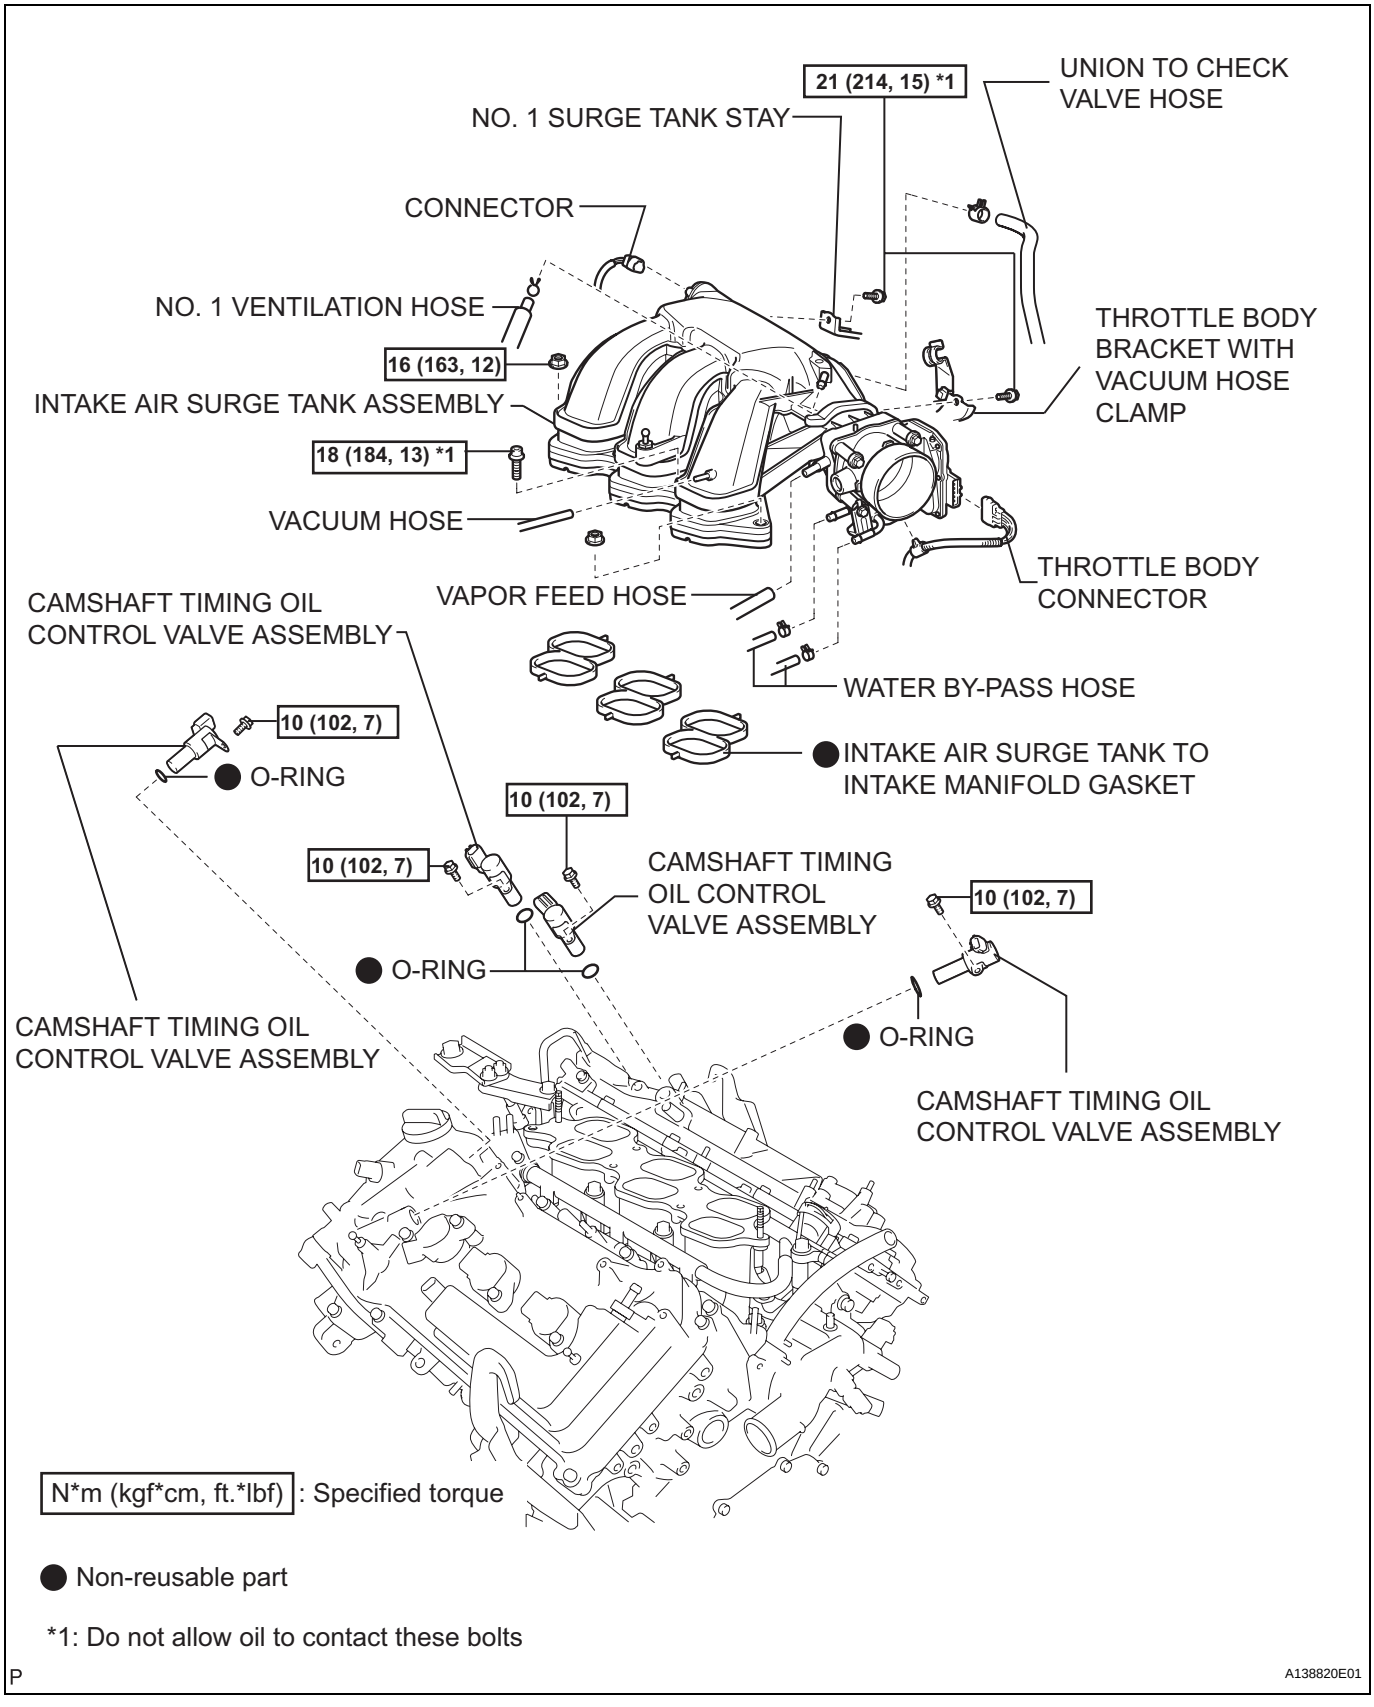
ES

INSTALLATION

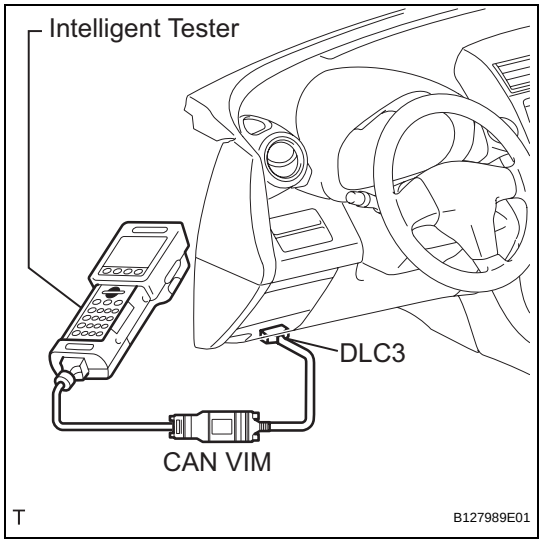
1. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY
(a) Apply a light coat of engine oil to new 4 O-rings of the oil control valves.
(b) Install the O-rings to the 4 oil control valves.

(c) Install the 4 oil control valves with the 4 bolts.
Torque: 9.0 N*m (92 kgf*cm, 80 in.*lbf)
NOTICE:
Make sure that the O-ring is not cracked or jammed.
(d) Connect the 4 oil control valve connectors.

2. INSTALL INTAKE AIR SURGE TANK ASSEMBLY (See page EM-34)



3. INSTALL ENGINE ASSEMBLY
(a) Install the engine (see page EM-31).



4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

5. CHECK FOR ENGINE OIL LEAKS
(a) Start the engine, and check that there are no oil leaks.

CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

COMPONENTS

ON-VEHICLE INSPECTION

1. CHECK CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

(a) Check the operation.

(1) Connect the intelligent tester to the DLC3.

(2) Turn the ignition switch ON.

(3) Turn the intelligent tester main switch ON.

(4) Start and warm up the engine.

(5) Select the menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.

(6) Operate the oil control valve using the intelligent tester, and then check the engine speed.

Standard condition

Condition	Specified Condition
Oil control valve is OFF	Normal engine speed
Oil control valve is ON	Rough idling or engine stalls

If the operation is not as specified, check the oil control valve, wire harness and ECM.

ES

CIRCUIT OPENING RELAY

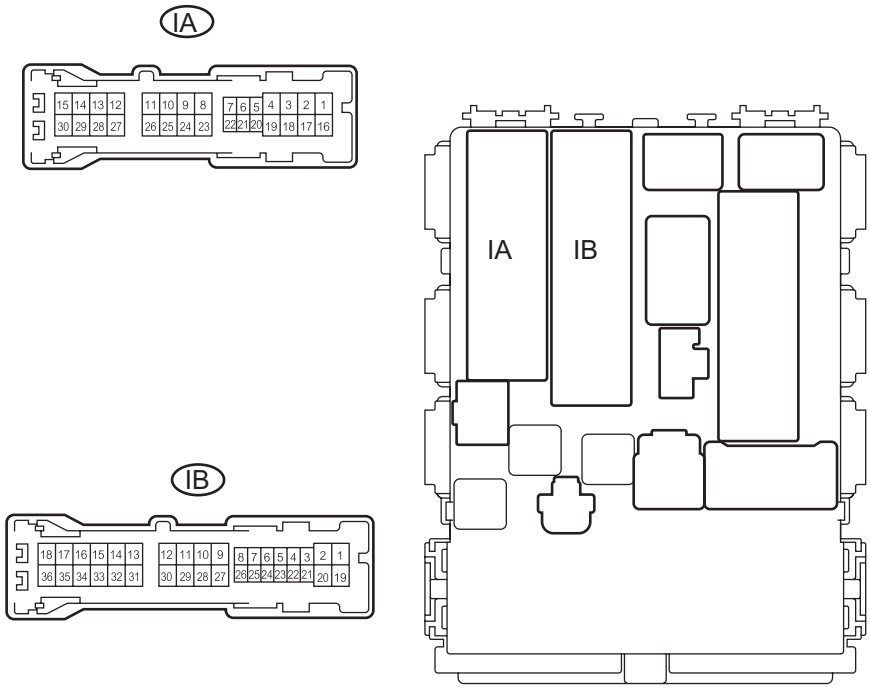
ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. INSPECT INSTRUMENT PANEL JUNCTION BLOCK



NOTICE:

The circuit opening (C/OPN) relay is built into the instrument panel junction block.

(a) Measure the resistance between the terminals.

ES

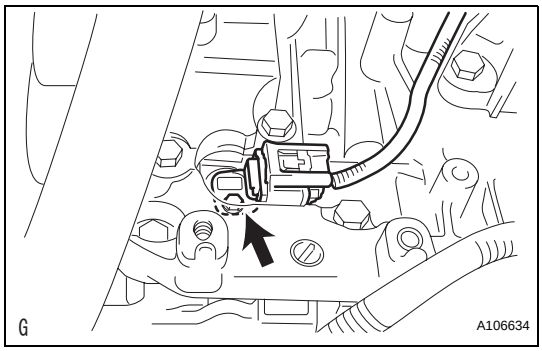
Instrument Panel Junction Block (Front View)

H

E114510E25

Standard resistance

Tester Connection	Specified Condition
1B-11 - 1A-8	10 kΩ or higher
1B-11 - 1A-8	Below 1 Ω (when battery voltage is applied to terminals 1E-5 and 1D-1)



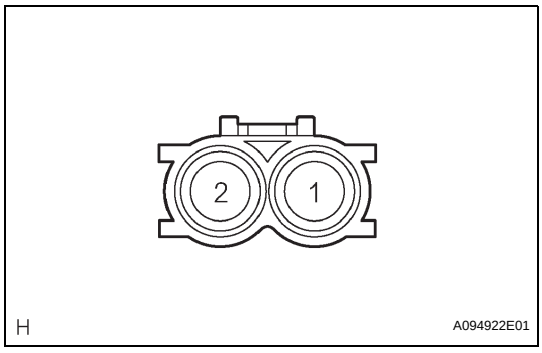
If the result is not as specified, replace the instrument panel junction block.

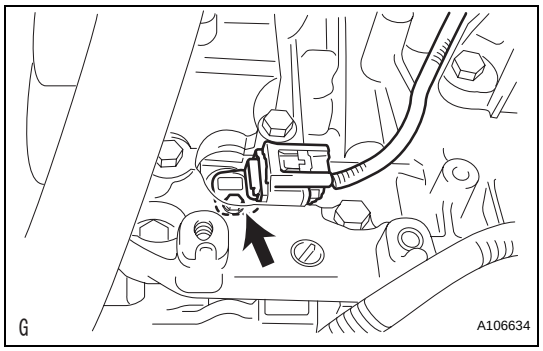
3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ES

REMOVAL

1. **DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM (See page AC-172)**
2. **DRAIN ENGINE COOLANT (See page CO-8)**
3. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
4. **REMOVE RADIATOR ASSEMBLY**
   (a) Remove the radiator assembly (see page CO-36).
5. **REMOVE FAN AND GENERATOR V BELT (See page EM-8)**
6. **DISCONNECT COMPRESSOR WITH PULLEY ASSEMBLY (See page AC-220)**
7. **REMOVE CRANKSHAFT POSITION SENSOR**
   (a) Disconnect the sensor connector.
   (b) Remove the bolt and sensor.



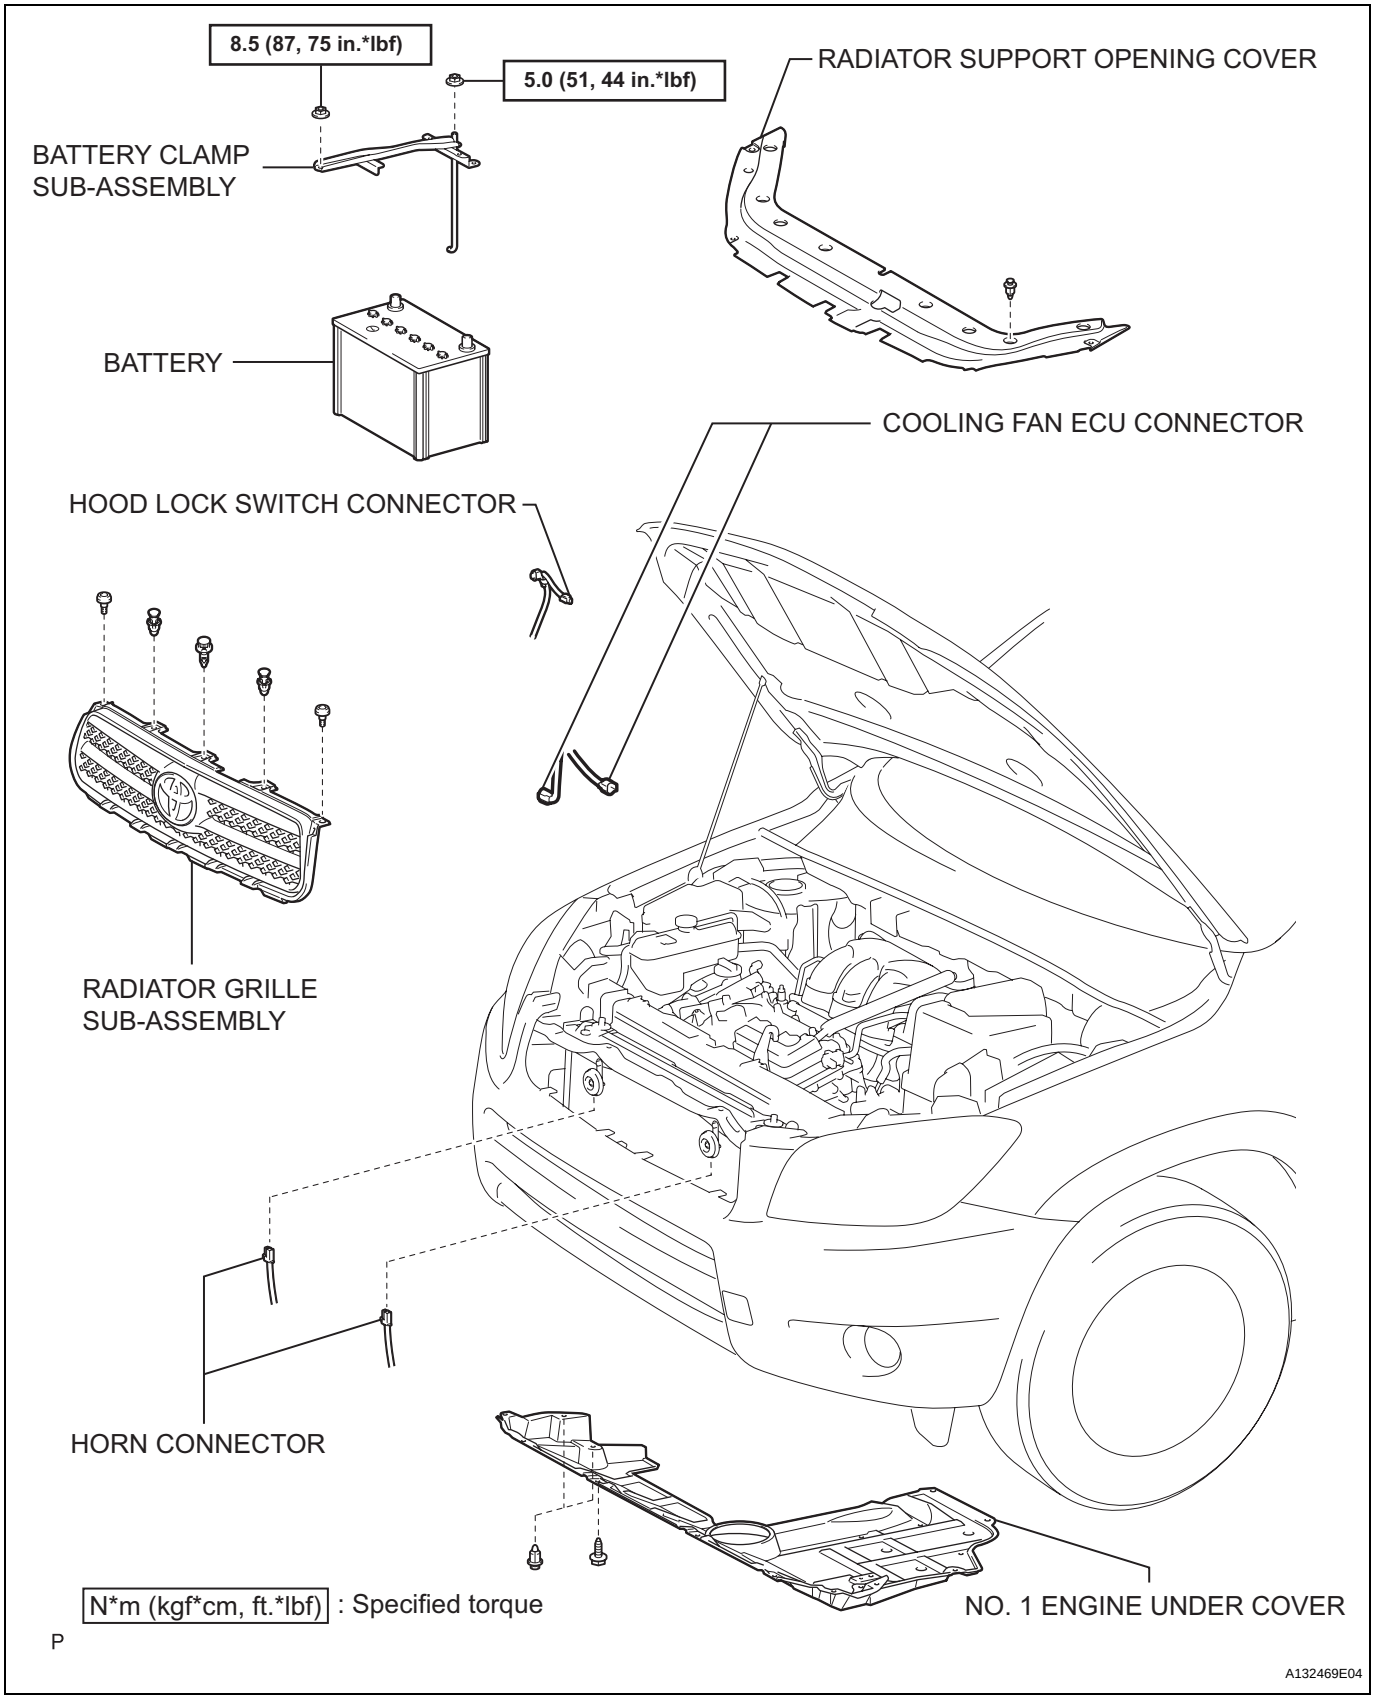


INSPECTION

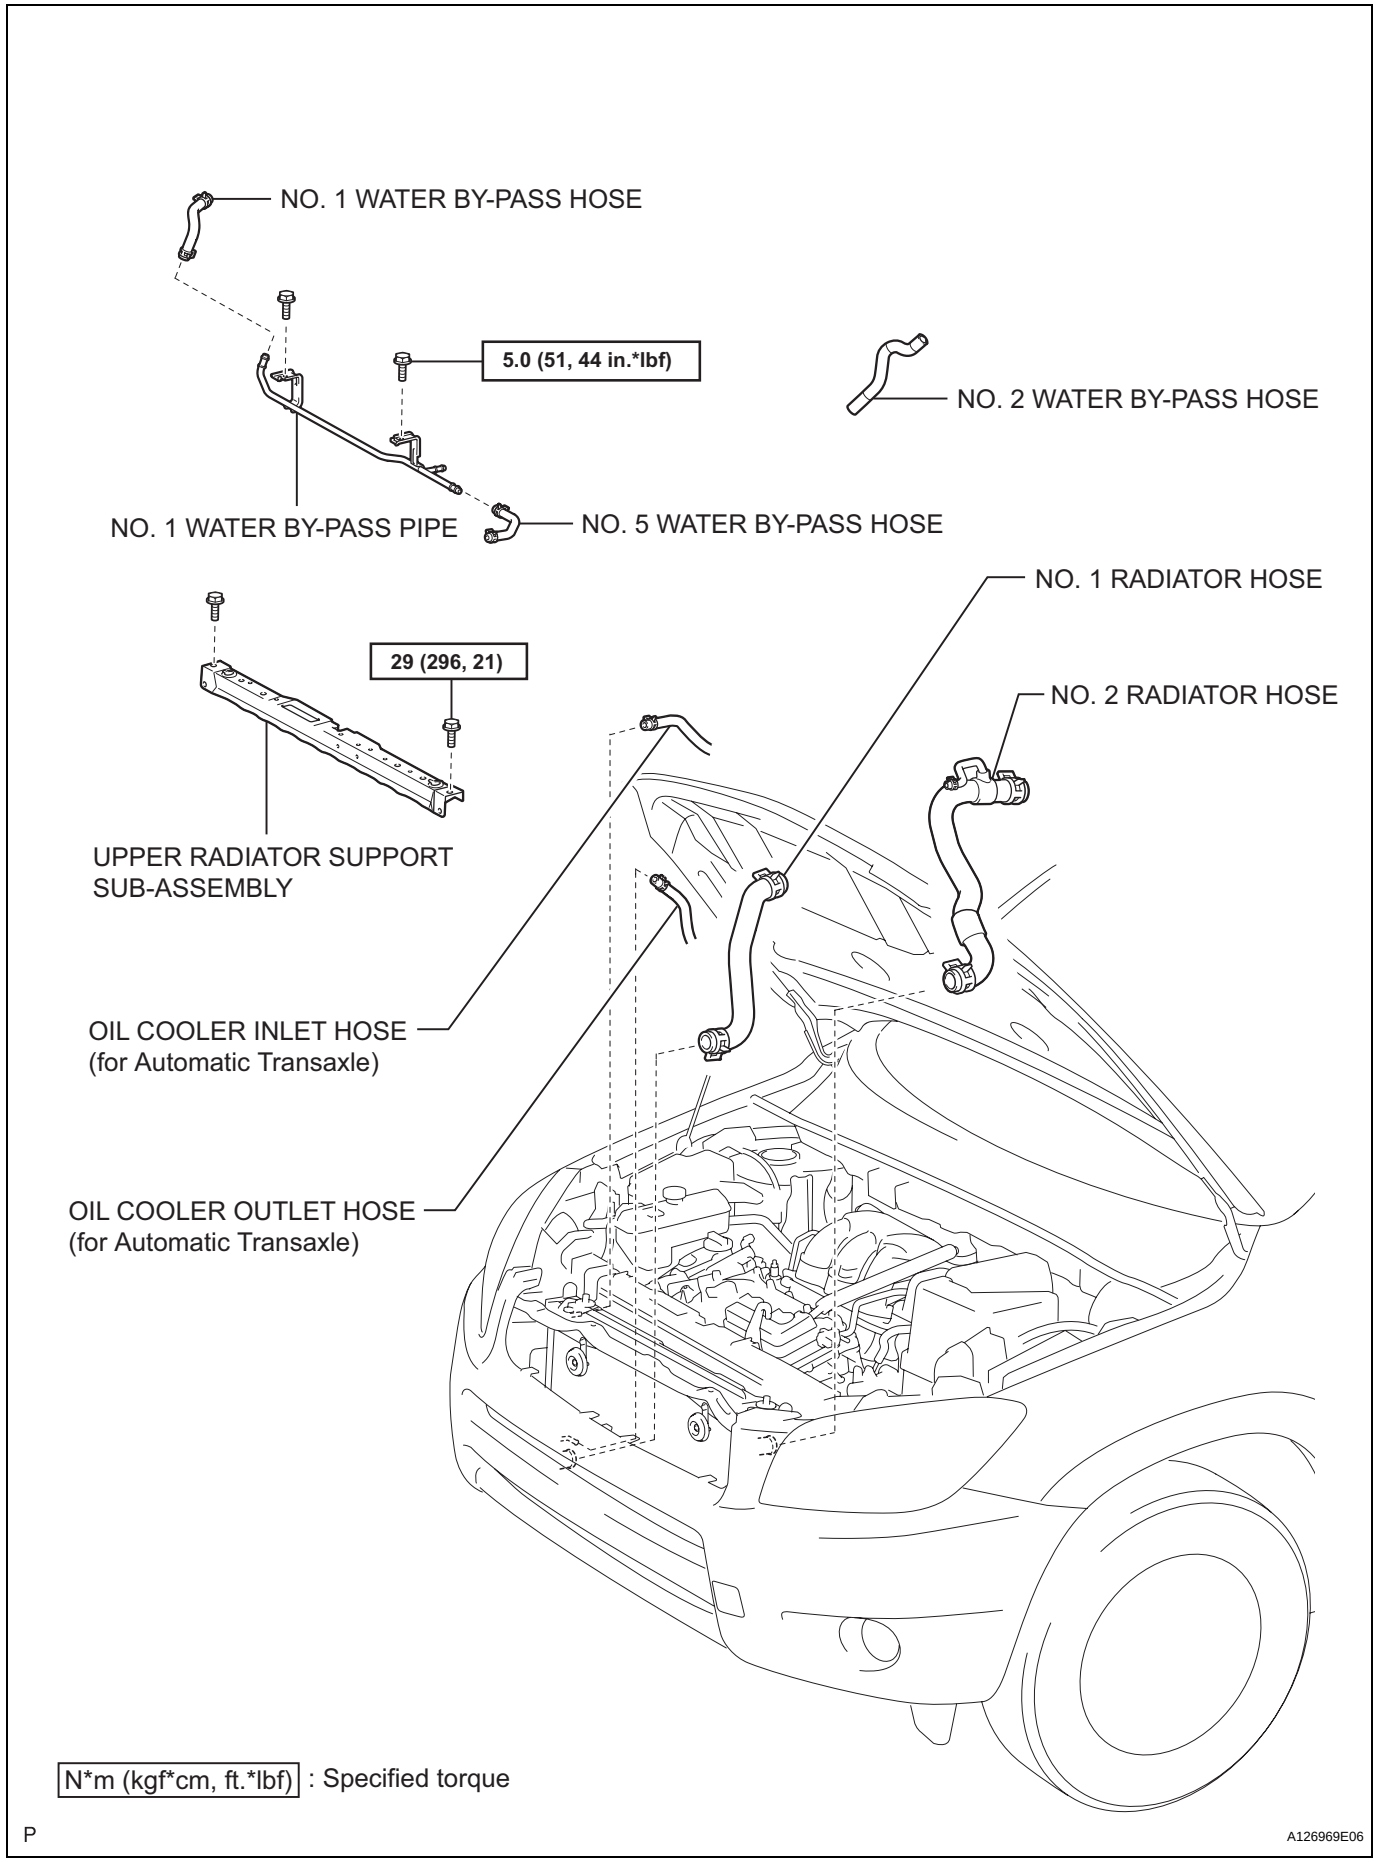
1. **INSPECT CRANKSHAFT POSITION SENSOR**
   (a) Measure the resistance between the terminals.
   Standard resistance

Temperature	Specified Condition
Cold	1,630 to 2,740 Ω
Hot	2,065 to 3,225 Ω

NOTICE:
In the table above, the terms "Cold" and "Hot" refer to the temperature of the coils. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).
If the resistance is not as specified, replace the sensor.



INSTALLATION



1. **INSTALL CRANKSHAFT POSITION SENSOR**
   (a) Apply a coat of engine oil to an O-ring of the sensor.
   (b) Install the sensor with the bolt.
   Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)
   (c) Connect the sensor connector.
2. **INSTALL COMPRESSOR WITH PULLEY ASSEMBLY (See page AC-221)**
3. **INSTALL FAN AND GENERATOR V BELT (See page EM-8)**
4. **INSTALL RADIATOR ASSEMBLY**
   (a) Install the radiator assembly (see page CO-40).
5. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
6. **CHARGE REFRIGERANT (See page AC-172)**
7. **ADD ENGINE COOLANT (See page CO-8)**
8. **CHECK FOR LEAKAGE OF REFRIGERANT (See page AC-173)**
9. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**

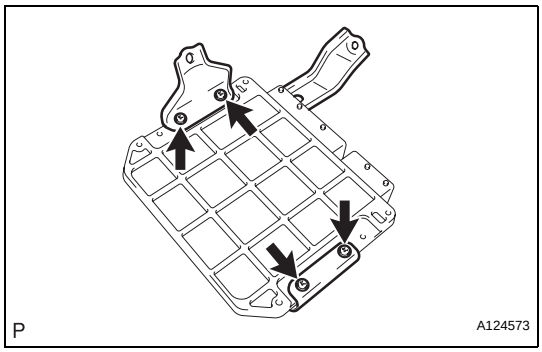
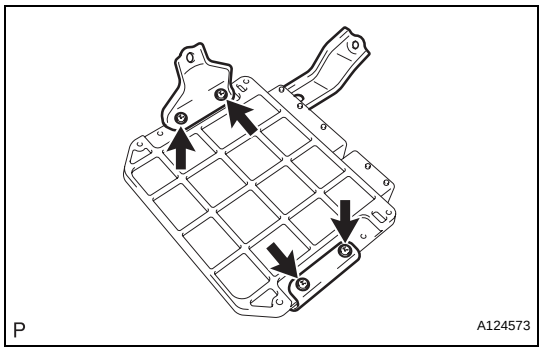
REMOVAL

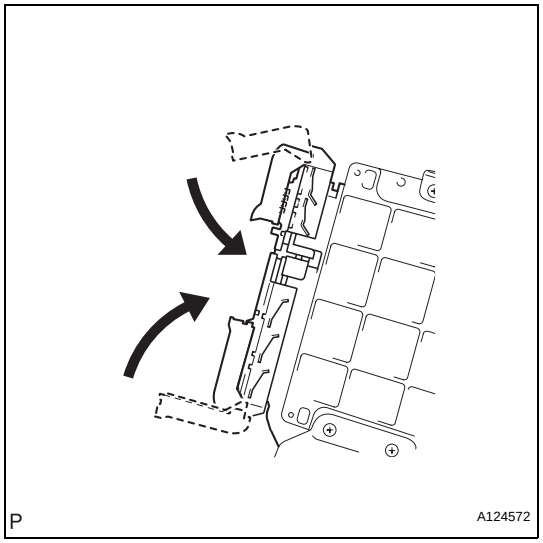
1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE AIR CLEANER CAP (See page EM-23)**
3. **REMOVE AIR CLEANER CASE (See page EM-23)**
4. **REMOVE ECM**
   (a) Remove the 3 bolts of the ECM bracket.



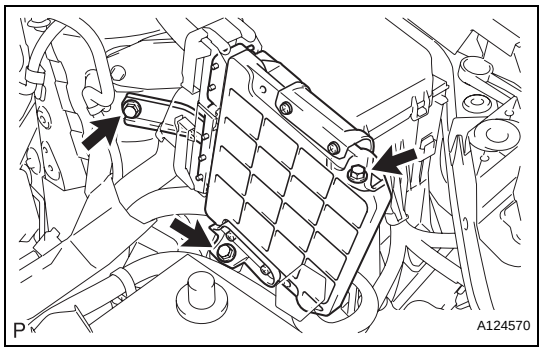


(b) Disconnect the 2 ECM connectors.
NOTICE:
After disconnecting the connector, make sure that dirt, water and other foreign matter does not contact the connecting part of the connector.
(1) Raise the 2 levers while pushing the locks on the 2 levers, and disconnect the 2 ECM connectors.

(c) Remove the ECM with bracket.



(d) Remove the 4 screws and 2 ECM brackets.



INSTALLATION

1. **INSTALL ECM**
   (a) Install the 2 brackets to the ECM with the 4 screws.
   Torque: 3.0 N*m (30 kgf*cm, 27 in.*lbf)

   (b) Connect the 2 ECM connectors.
   NOTICE:
   When connecting the connector, make sure that dirt, water and other foreign matter does not become stuck between the connector and other part.
      (1) Connect the 2 ECM connectors and lower the 2 levers.
      NOTICE:
      Make sure that the 2 levers are securely lowered.

   (c) Install the ECM with the 3 bolts.
   Torque: 6.5 N*m (66 kgf*cm, 57 in.*lbf)

2. **INSTALL AIR CLEANER CASE (See page EM-39)**
3. **INSTALL AIR CLEANER CAP (See page EM-39)**
4. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**
5. **PERFORM REGISTRATION**
   (a) When replacing the ECM, the Vehicle Identification Number (VIN) must be input into the replacement the new ECM (see page ES-14).
   (b) When replacing the ECM, perform the vehicle stability control system recognition in the ECM (see page CC-12).
6. **RESET MEMORY**
   (a) 2WD:
   When replacing the ECM, perform the RESET MEMORY procedure (A/T initialization) (see page AX-20).
   (b) 4WD:
   When replacing the ECM, perform the RESET MEMORY procedure (A/T initialization) (see page AX-20).

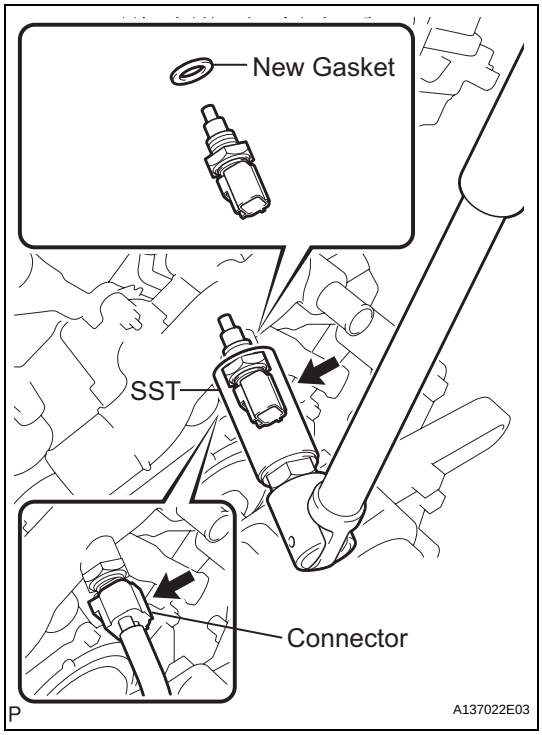
INSPECTION

1. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

(a) Measure the resistance of the sensor.



Standard resistance

Tester Connection	Condition	Specified Condition
1 (E2) - 2 (THW)	20°C (68°F)	2.32 to 2.59 kΩ
1 (E2) - 2 (THW)	80°C (176°F)	0.310 to 0.326 kΩ

NOTICE:
If checking the sensor in water, be careful not to allow water to contact the terminals. After checking, wipe the water off the sensor.

If the result is not as specified, replace the sensor.

INSTALLATION

1. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

(a) Install a new gasket onto the sensor.

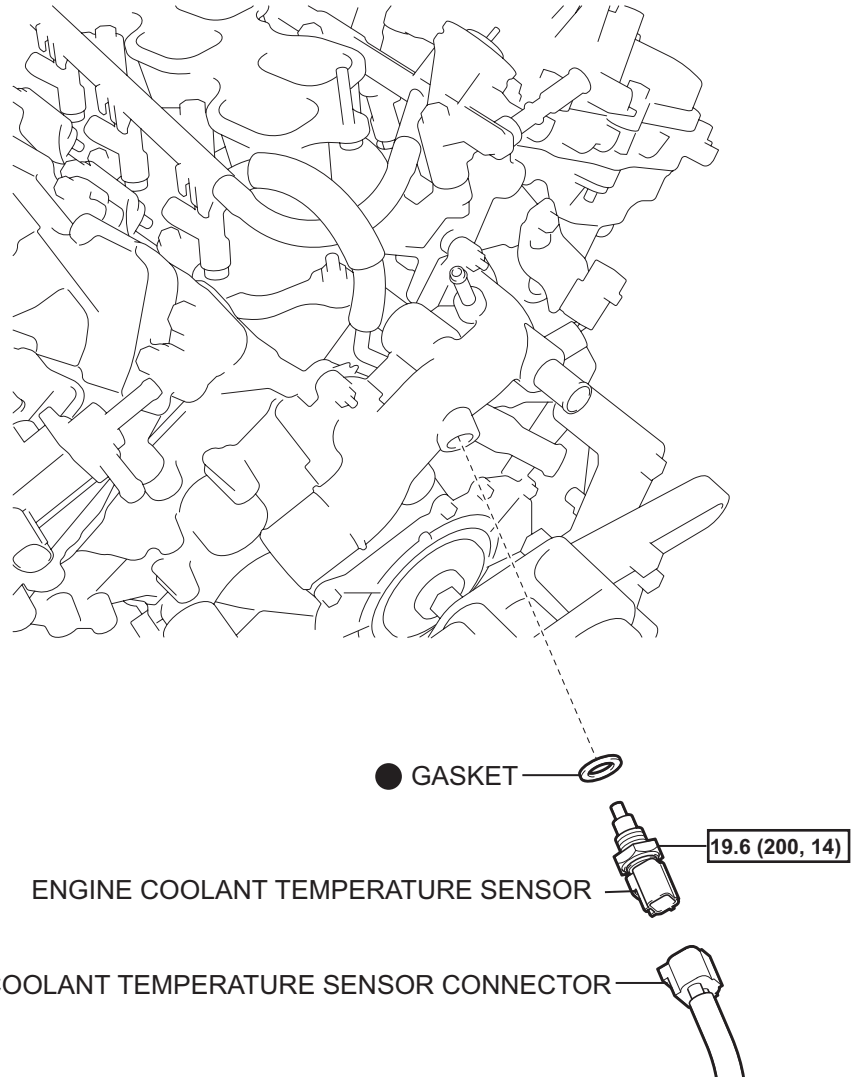
(b) Using SST, install the sensor.

SST 09817-33190

Torque: 19.6 N*m (200 kgf*cm, 14 ft.*lbf)

(c) Connect the sensor connector.

2. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



3. ADD ENGINE COOLANT (See page CO-8)

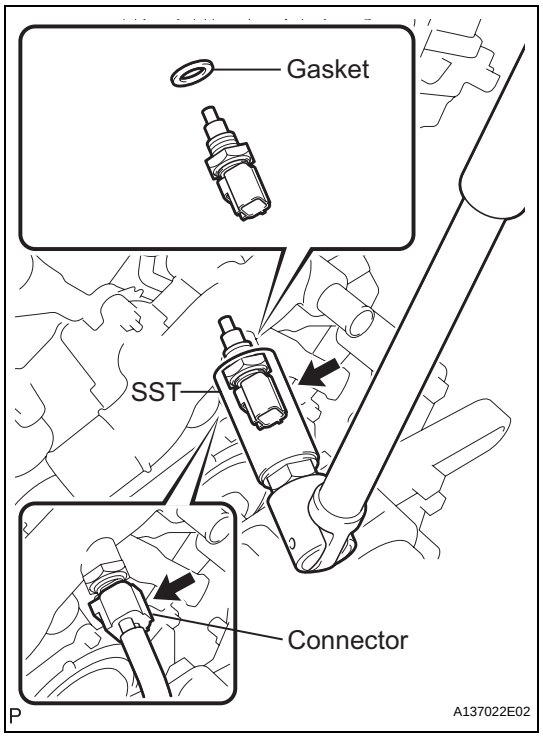
4. CHECK FOR COOLANT LEAKS (See page CO-1)

ENGINE COOLANT TEMPERATURE SENSOR

COMPONENTS

ES

N*m (kgf*cm, ft.*lbf) : Specified torque



● Non-reusable part

P

A137021E01

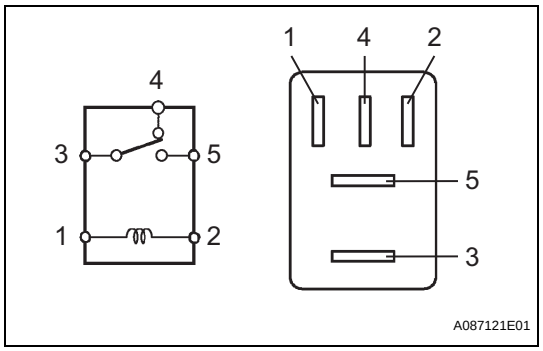
REMOVAL

1. **DRAIN ENGINE COOLANT (See page CO-8)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE ENGINE COOLANT TEMPERATURE SENSOR**
   (a) Disconnect the sensor connector.
   (b) Using SST, remove the sensor and gasket.
   SST 09817-33190

ES

FUEL PUMP RELAY

ON-VEHICLE INSPECTION



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE FUEL PUMP RELAY

(a) Remove the fuel pump relay from the engine room No. 1 relay block.

3. INSPECT RELAY

(a) Measure the resistance of the fuel pump relay.

Standard resistance

Tester Connection	Specified Condition
3 - 4	Below 1 Ω
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)
3 - 5	10 kΩ or more
3 - 4	10 kΩ or more (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

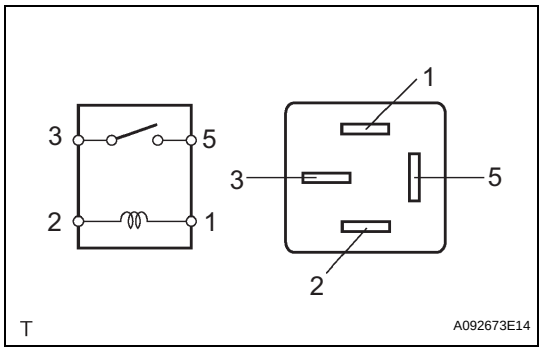
4. INSTALL FUEL PUMP RELAY

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ES

IG1 RELAY

ON-VEHICLE INSPECTION



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE IG1 RELAY

(a) Remove the IG1 relay from the instrument panel junction block.

3. INSPECT IG1 RELAY

(a) Measure the resistance of the IG1 relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

4. INSTALL IG1 RELAY

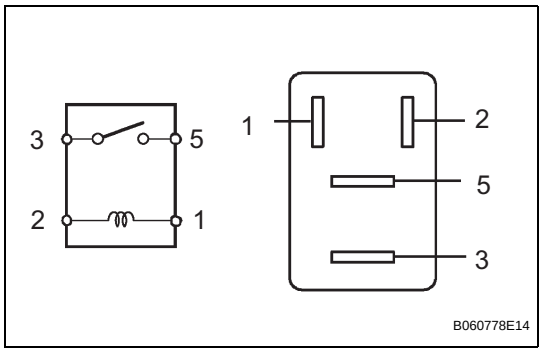
5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ES

IG2 RELAY

ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL



CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE IG2 RELAY

(a) Remove the engine room No. 1 relay block cover.

(b) Remove the IG2 relay from the engine room No. 1 relay block.

3. INSPECT IG2 RELAY

(a) Measure the resistance of the IG2 relay.

Standard resistance

Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

If the result is not as specified, replace the relay.

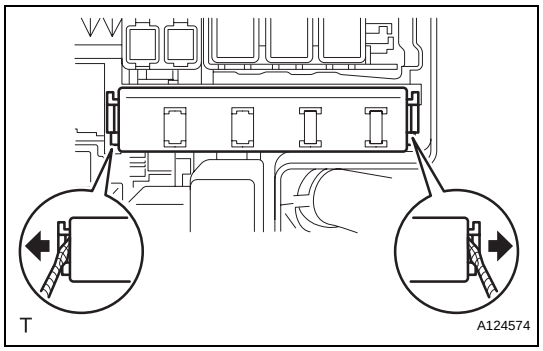
4. INSTALL IG2 RELAY

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

INTEGRATION RELAY

ON-VEHICLE INSPECTION

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL



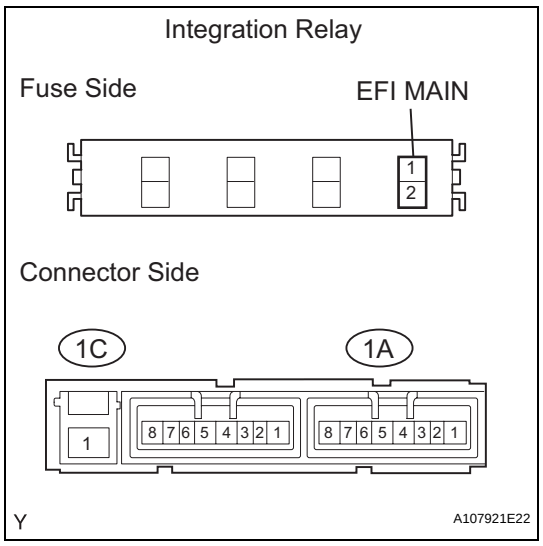
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. INSPECT INTEGRATION RELAY

NOTICE:

- **The EFI relay is built into the integration relay (unit A: EFI MAIN).**
- **Some relays are built into the integration relay. The integration relay cannot be disassembled. If there is a malfunction in the circuit of the integration relay, replace the integration relay.**



(a) Using a screwdriver, detach the 2 claws and disconnect the integration relay from the engine room No. 1 junction block.

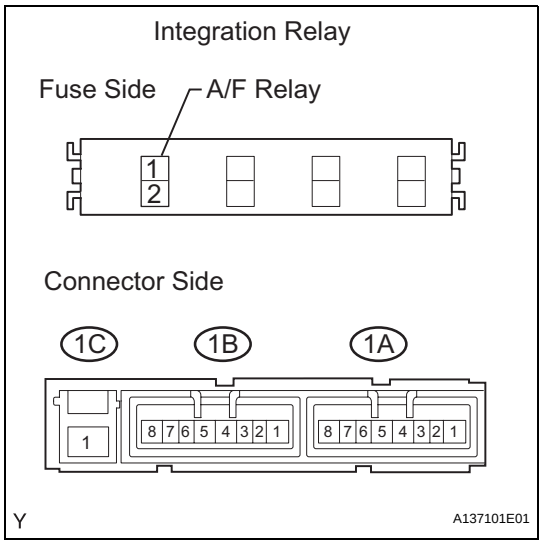
HINT:

Tape the screwdriver tip before use.

(b) Disconnect the 3 connectors from the integration relay.

(c) Inspect the EFI MAIN relay.

(1) Check the resistance of the EFI MAIN fuse.



If the result is not as specified, replace the EFI MAIN fuse.

(2) Measure the resistance of the integration relay.

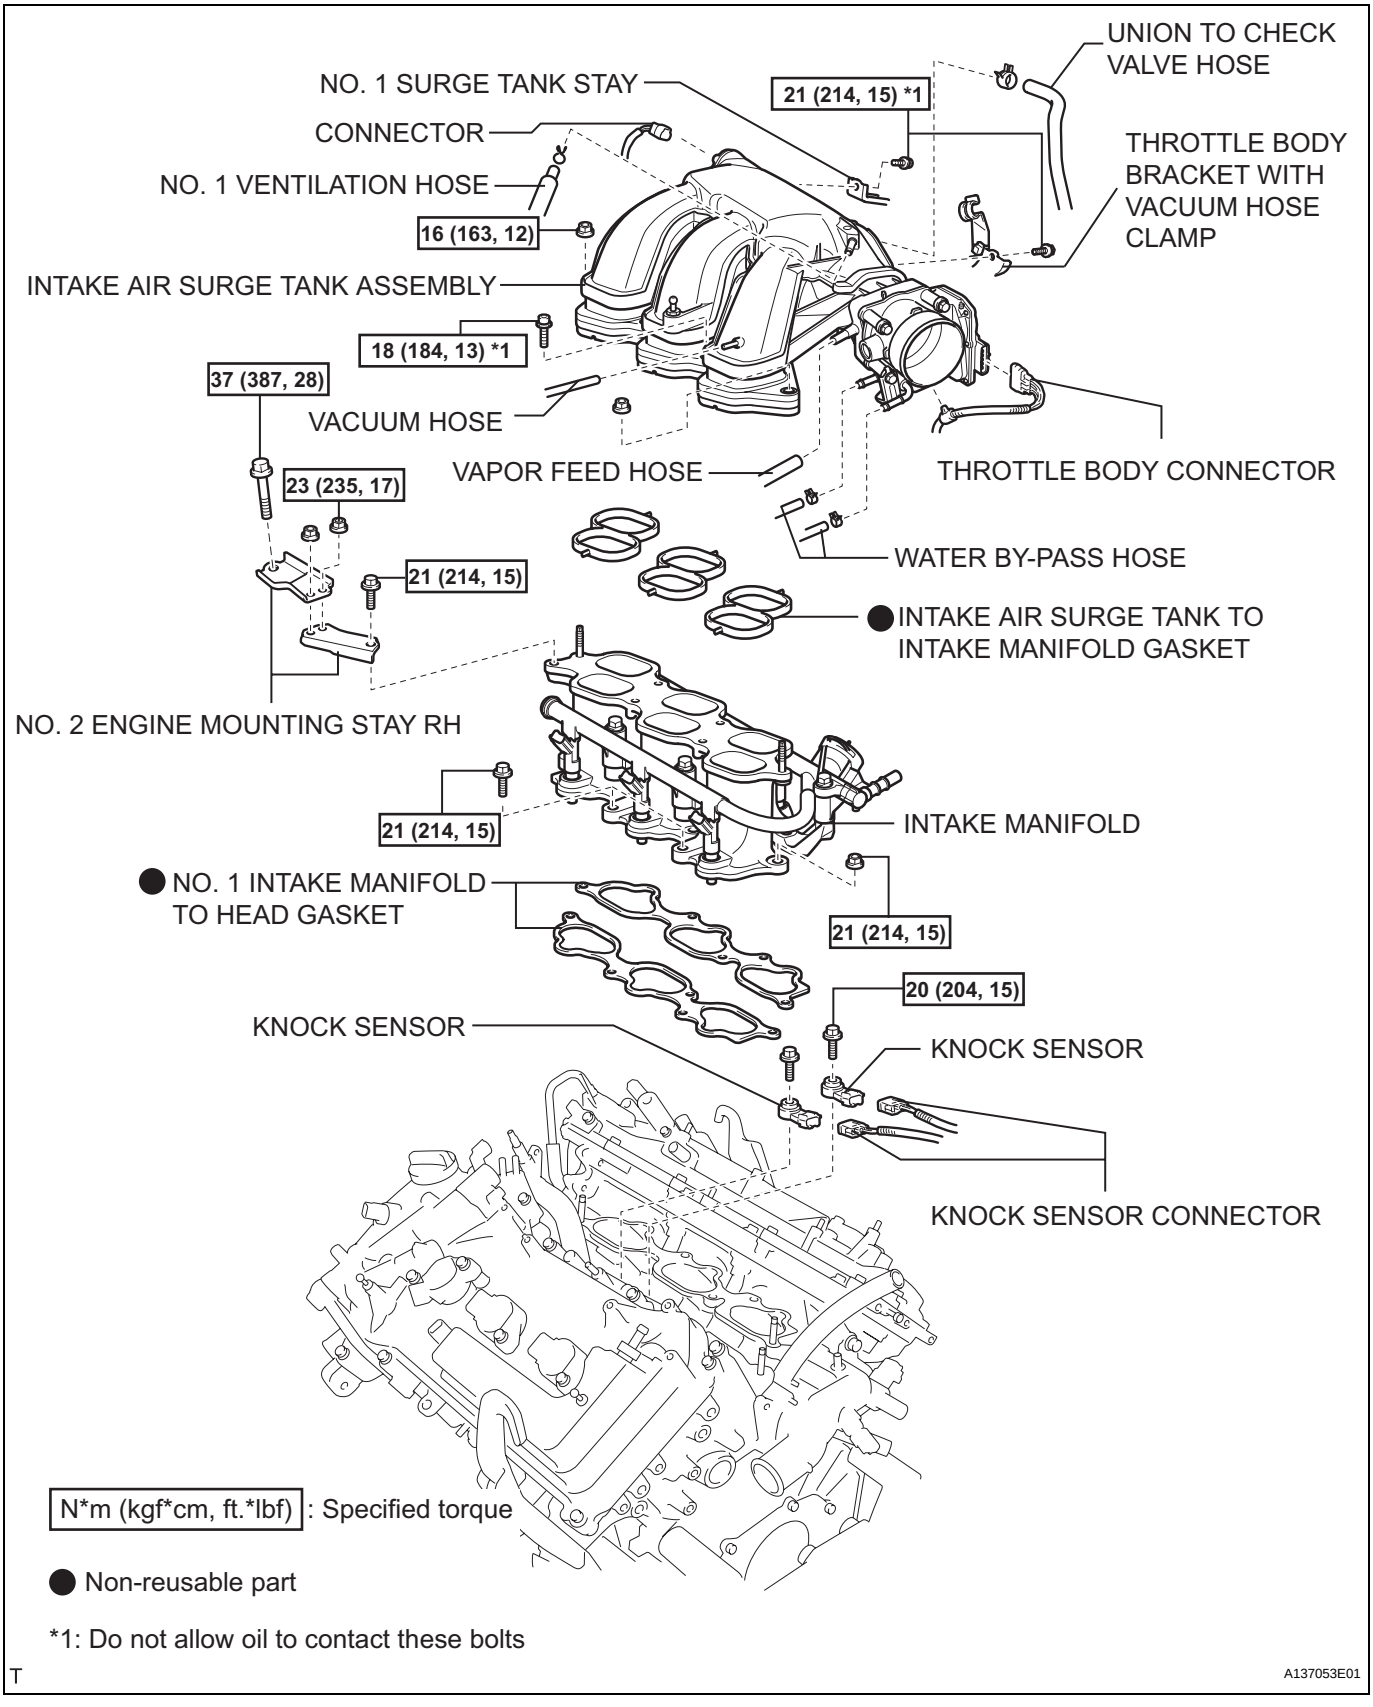
Standard resistance

Tester Connection	Specified Condition
1A-4 - 1C-1	10 kΩ or higher
1A-4 - 1A-1	
1A-4 - 1C-1	Below 1 Ω (when battery voltage is applied to terminals 1A-3 and 1A-2)
1A-4 - 1A-1	

If the result is not as specified, replace the integration relay.

(d) Inspect the A/F relay.
(1) Check the resistance of the A/F fuse.
If the result is not as specified, replace the A/F fuse.
(2) Measure the resistance of the integration relay.
Standard resistance

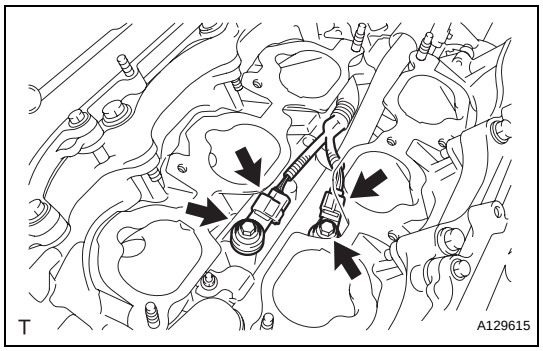
Tester Connection	Specified Condition
1B-8 - 1C-1	10 kΩ or higher
1B-8 - 1B-5	
1B-8 - 1C-1	Below 1 Ω (when battery voltage is applied to terminals 1B-6 and 1B-7)
1B-8 - 1B-5	



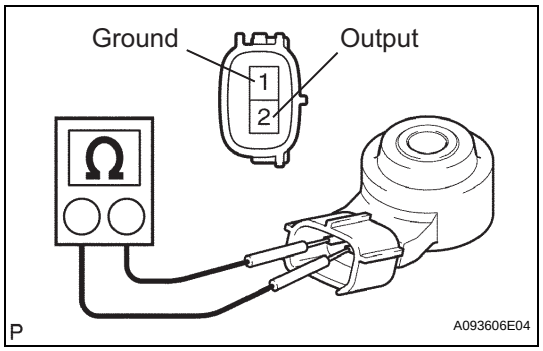
If the result is not as specified, replace the integration relay.

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

ES



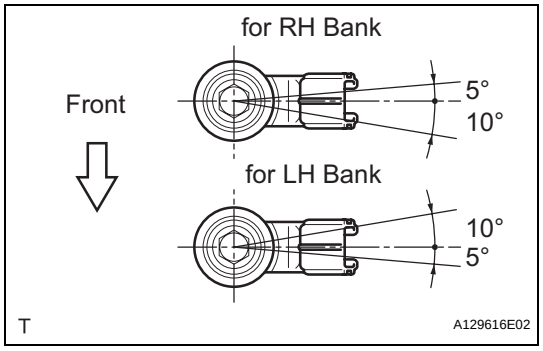
KNOCK SENSOR



COMPONENTS

REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
2. **REMOVE ENGINE ASSEMBLY**
   (a) Remove the engine (see page EM-21).
3. **REMOVE INTAKE AIR SURGE TANK ASSEMBLY (See page EM-27)**
4. **REMOVE INTAKE MANIFOLD (See page EM-28)**
5. **REMOVE KNOCK SENSOR**
   (a) Disconnect the 2 sensor connectors.
   (b) Remove the 2 bolts and 2 sensors.



INSPECTION

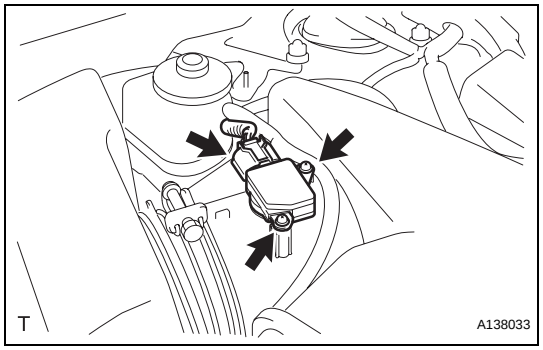
1. **INSPECT KNOCK SENSOR**
   (a) Measure the resistance of the sensor.
   Standard resistance

Tester Connection	Condition	Specified Condition
1 (Ground) - 2 (Output)	20°C (68°F)	120 to 280 kΩ

If the result is not as specified, replace the knock sensor.

INSTALLATION

1. **INSTALL KNOCK SENSOR**
   (a) Install the 2 sensors with the 2 bolts as shown in the illustration.
   Torque: 20 N*m (205 kgf*cm, 15 ft.*lbf)
   NOTICE:
   Make sure that the knock sensor is in the correct position.
   (b) Connect the 2 sensor connectors.
2. **INSTALL INTAKE MANIFOLD (See page EM-33)**
3. **INSTALL INTAKE AIR SURGE TANK ASSEMBLY (See page EM-34)**
4. **INSTALL ENGINE ASSEMBLY**
   (a) Install the engine (see page EM-31).
5. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

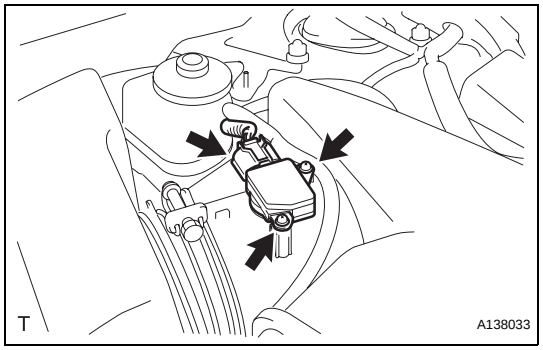


6. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**
7. **CHECK FOR FUEL LEAKS**
8. **CHECK FOR ENGINE OIL LEAKS (See page LU-6)**

REMOVAL

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

2. REMOVE MASS AIR FLOW METER

(a) Disconnect the mass air flow meter connector.

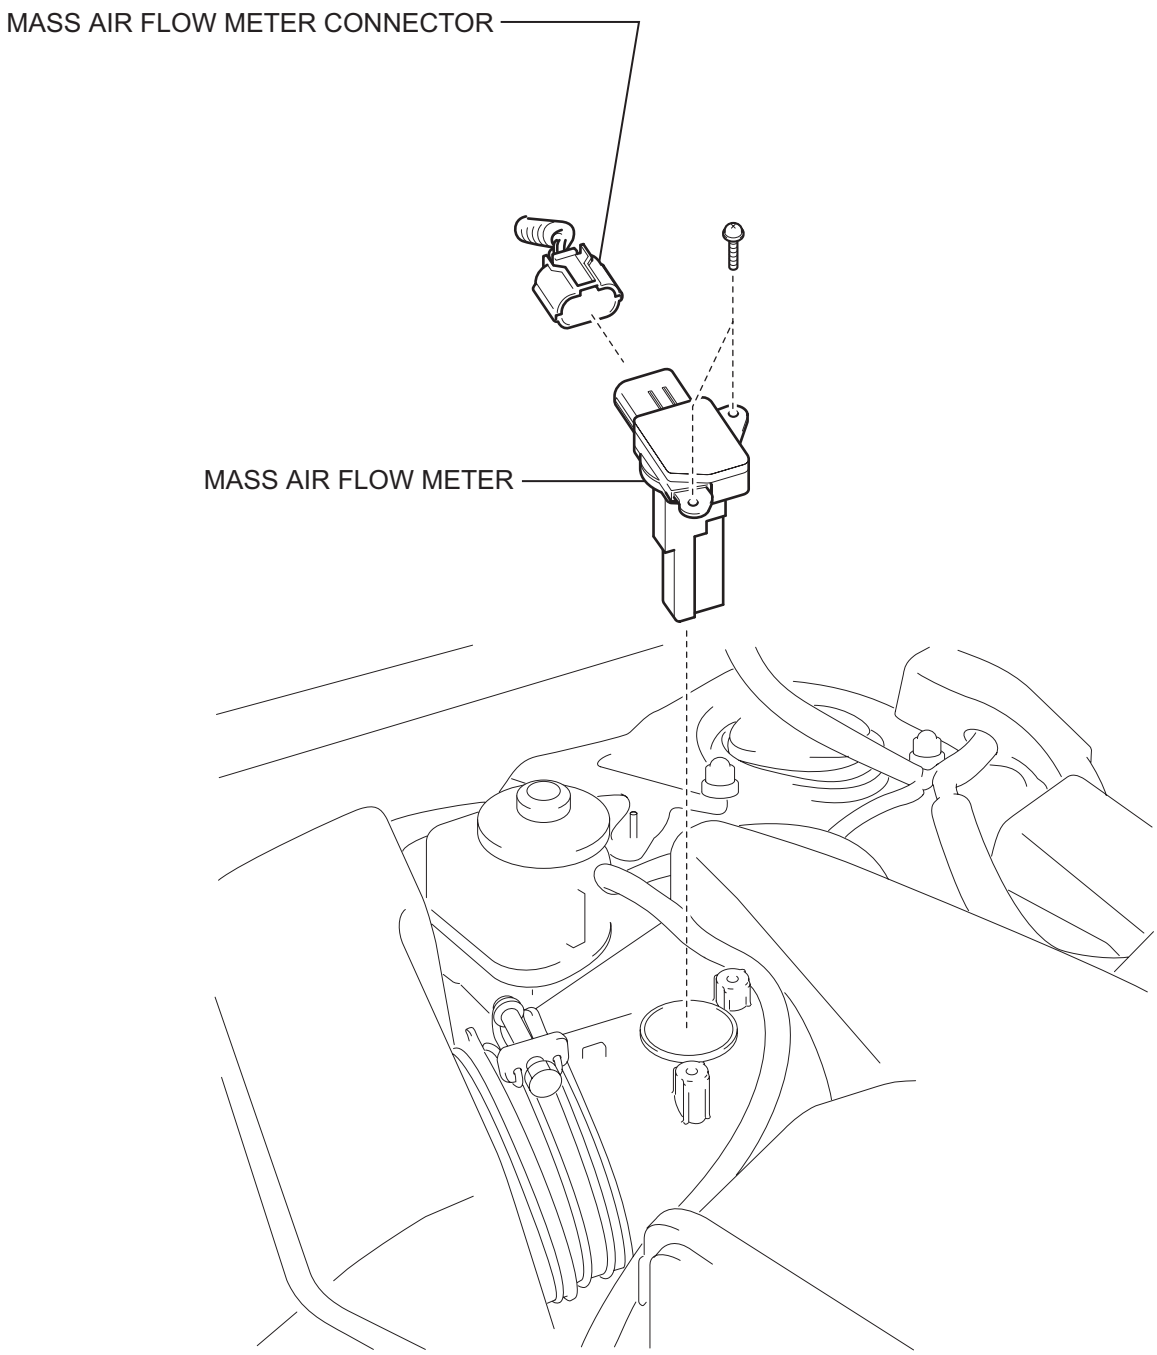
(b) Remove the 2 screws and mass air flow meter.

INSTALLATION

1. INSTALL MASS AIR FLOW METER

(a) Install the mass air flow meter with the 2 screws.

NOTICE:



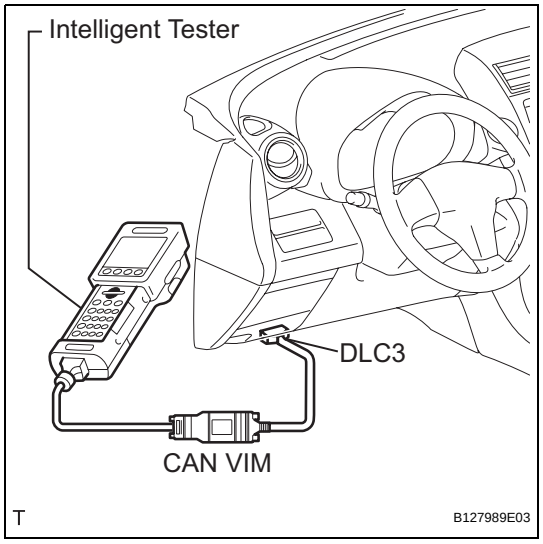
Make sure that the O-ring is not cracked or jammed when installing it.

(b) Connect the mass air flow meter connector.

2. CONNECT CABLE TO BATTERY NEGATIVE TERMINAL

MASS AIR FLOW METER

COMPONENTS

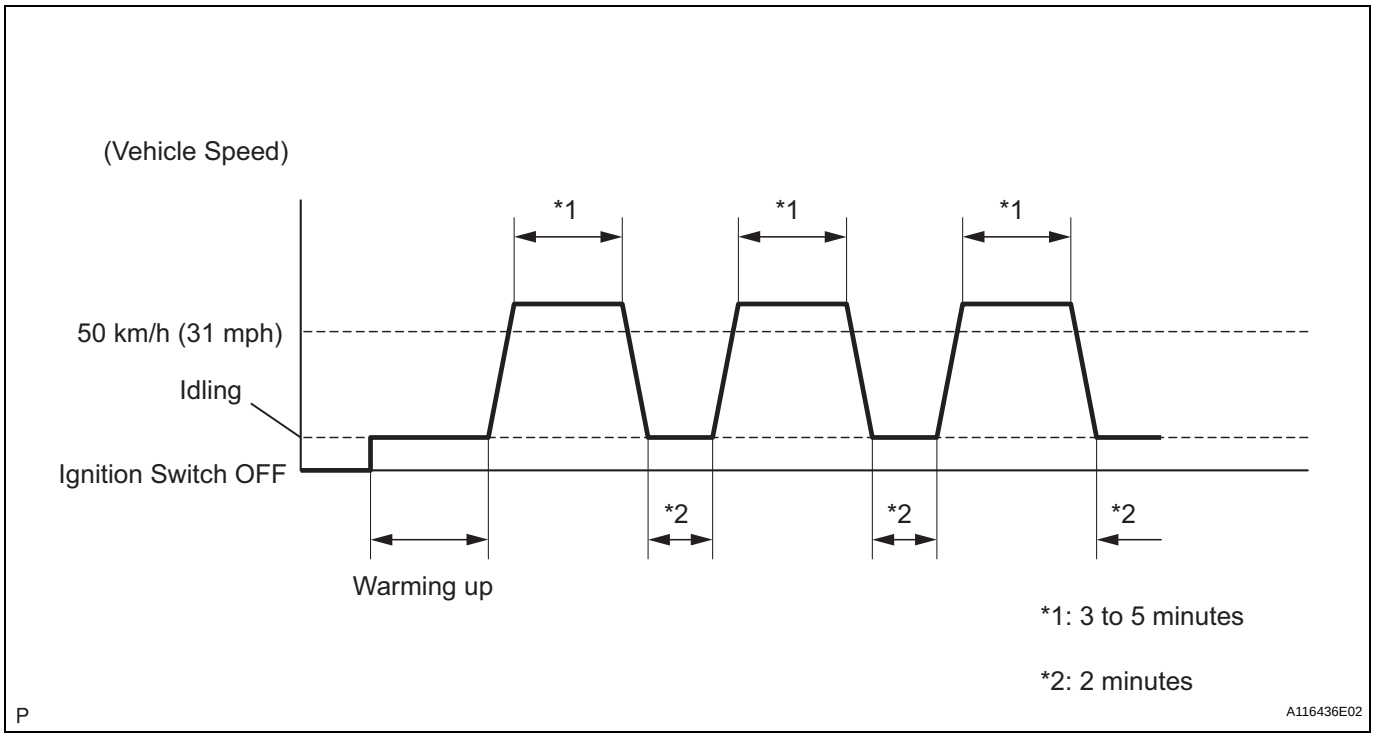


T

A138035E01

ON-VEHICLE INSPECTION

NOTICE:



- **Perform the MAF meter inspection according to the procedures below.**
- **Only replace the MAF meter when both the LONG FT#1 value and MAF value in the DATA LIST (with the engine stopped) are not within the normal operating range.**

1. INSPECT MASS AIR FLOW METER

(a) Perform confirmation driving pattern.

(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear the DTCs (see page ES-39).
(5) Start the engine and warm it up with all accessory switches OFF until the engine coolant temperature is 75°C (167°F) or more.
(6) Drive the vehicle at 50 km/h (31 mph) or more for 3 to 5 minutes*1.
(7) Allow the engine to idle for 2 minutes*2.
(8) Perform steps *1 and *2 at least 3 times.

(b) Read the value using the intelligent tester (LONG FT#1).

(1) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / LONG FT#1.
(2) Read the values displayed on the tester.
Standard value:
Within -15 to +15%

If the result is not within the specified range, perform the inspection below.

(c) Read the value using the intelligent tester (MAF).

NOTICE:

- **Turn off the engine.**
- **Perform the inspection with the vehicle indoors and on a level surface.**
- **Perform the inspection of the MAF meter while it is installed to the air cleaner case (installed to the vehicle).**
- **During the test, do not use the exhaust air duct to perform suction on the exhaust pipe.**

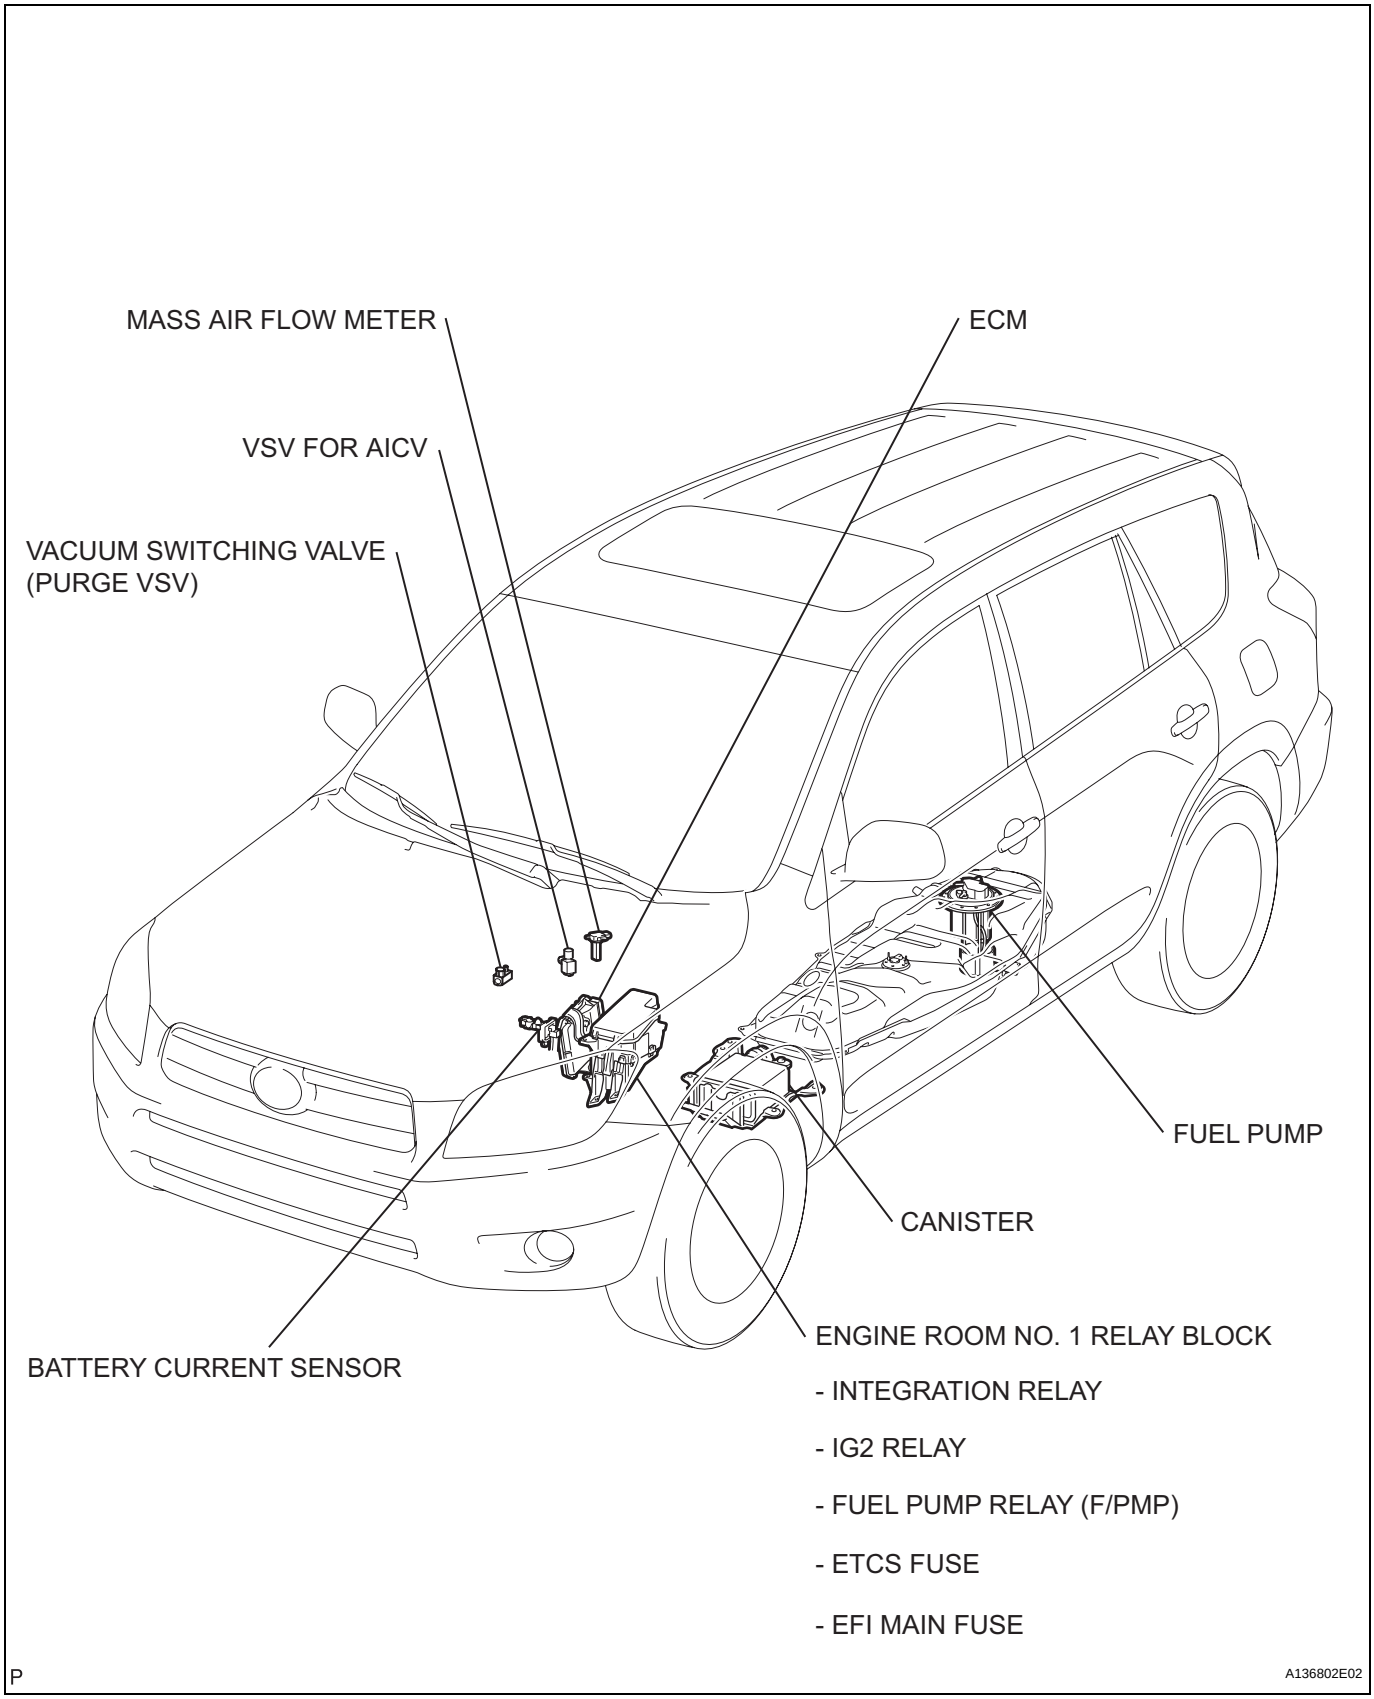
(1) Turn the ignition switch to ACC.

(2) Turn the ignition switch ON (do not run the engine).

(3) Turn the tester ON.

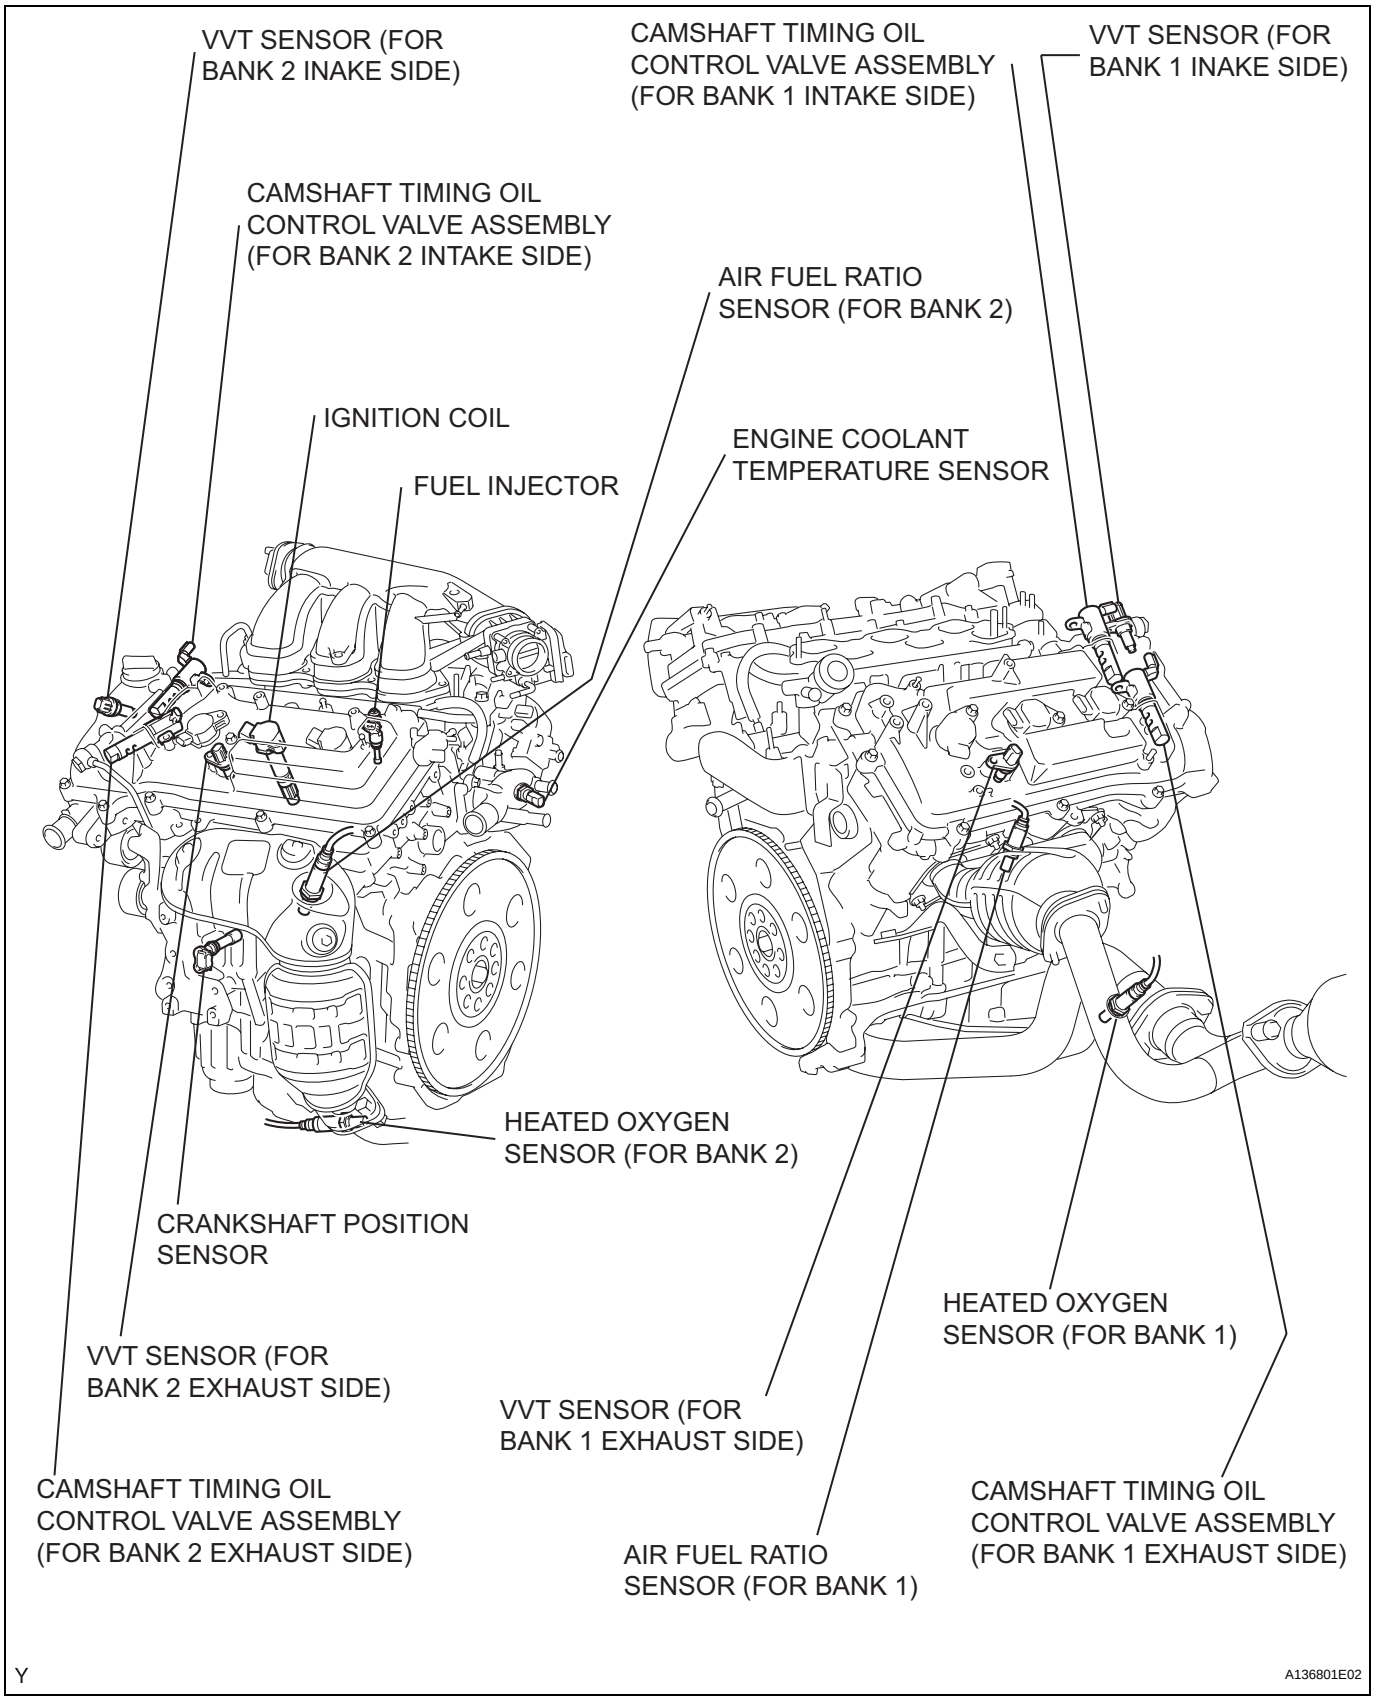
(4) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.

(5) Wait 30 seconds, and read the values on the intelligent tester.



Standard condition:

Less than 0.55 g/sec.



- If the result is not as specified, replace the MAF meter.
- If the result is within the specified range, inspect the cause of the extremely rich or lean air-fuel ratio (see page ES-176).

HOW TO PROCEED WITH TROUBLESHOOTING

HINT:
*: Use the intelligent tester.

1	VEHICLE BROUGHT TO WORKSHOP

NEXT

2	CUSTOMER PROBLEM ANALYSIS

NEXT

3	CONNECT INTELLIGENT TESTER TO DLC3*

HINT:
If the display indicates a communication fault in the tester, inspect the DLC3.

NEXT

4	CHECK DTC AND FREEZE FRAME DATA*

HINT:
Record or print DTCs and freeze frame data, if necessary.

NEXT

5	CLEAR DTC AND FREEZE FRAME DATA*

NEXT

6	CONDUCT VISUAL INSPECTION

NEXT

7	SET CHECK MODE DIAGNOSIS*

NEXT

8	CONFIRM PROBLEM SYMPTOMS

HINT:
If the engine does not start, first perform the "CHECK DTC" procedures and "CONDUCT BASIC INSPECTION" procedures below.

Result	Proceed to
Malfunction does not occur	A
Malfunction occurs	B

B → GO TO STEP 10

A

9	SIMULATE SYMPTOMS

NEXT

10	CHECK DTC*

Result	Proceed to
Malfunction code	A
No code	B

B → GO TO STEP 12

A

11	REFER TO DTC CHART

NEXT

GO TO STEP 14

12	CONDUCT BASIC INSPECTION

Result	Proceed to
Malfunctioning parts not confirmed	A
Malfunctioning parts confirmed	B

B → GO TO STEP 17

A

13	REFER TO PROBLEM SYMPTOMS TABLE

Result	Proceed to
Malfunctioning circuit confirmed	A
Malfunctioning parts confirmed	B

B → GO TO STEP 17

A

14	CHECK ECM POWER SOURCE CIRCUIT

NEXT

15	CONDUCT CIRCUIT INSPECTION

Result	Proceed to
Malfunction not confirmed	A
Malfunction confirmed	B

B → GO TO STEP 18

A

16	CHECK FOR INTERMITTENT PROBLEMS

NEXT

GO TO STEP 18

17	CONDUCT PARTS INSPECTION

NEXT

18	IDENTIFY PROBLEM

NEXT

19	ADJUST AND/OR REPAIR

NEXT

20	CONDUCT CONFIRMATION TEST

NEXT

END

CHECK FOR INTERMITTENT PROBLEMS

HINT:
Inspect the vehicle's ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. Clear the DTCs (see page ES-39).
2. Switch the ECM from normal mode to check mode using the intelligent tester (see page ES-42).
3. Perform a simulation test.
4. Check and wiggle the harness(es), connector(s) and terminal(s).

BASIC INSPECTION

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when performing engine troubleshooting.

ES

1 CHECK BATTERY VOLTAGE

NOTICE:
Conduct this check with the engine stopped and ignition switch OFF.

Result	Proceed to
11 V or more	OK
Below 11 V	NG

NG → **CHARGE OR REPLACE BATTERY**

OK

2 CHECK WHETHER ENGINE WILL CRANK

NG → **PROCEED TO PROBLEM SYMPTOMS TABLE**

OK

3 CHECK WHETHER ENGINE STARTS

NG → **GO TO STEP 6**

OK

4 CHECK AIR FILTER

(a) Visually check that the air filter is not excessively contaminated with dirt or oil.

NG → **REPLACE AIR FILTER**

OK

5 CHECK IDLING SPEED

NG → **TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP**

OK

6	CHECK FUEL PRESSURE

NG → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7	CHECK FOR SPARK

NG → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

REGISTRATION

NOTICE:
The Vehicle Identification Number (VIN) must be input into the replacement ECM.
HINT:
The VIN is a 17-digit alphanumeric number. The intelligent tester is required to register the VIN.

1. DESCRIPTION

This registration section consists of 3 parts: Input Instructions, Read VIN and Write VIN.

(a) Input Instructions: Explains the general VIN input instructions when using the intelligent tester.

(b) Read VIN: Explains the VIN reading process in a flowchart. This process allows the VIN stored in the ECM to be read in order to confirm that the two VINs, provided with the vehicle and stored in the vehicle's ECM, are the same.

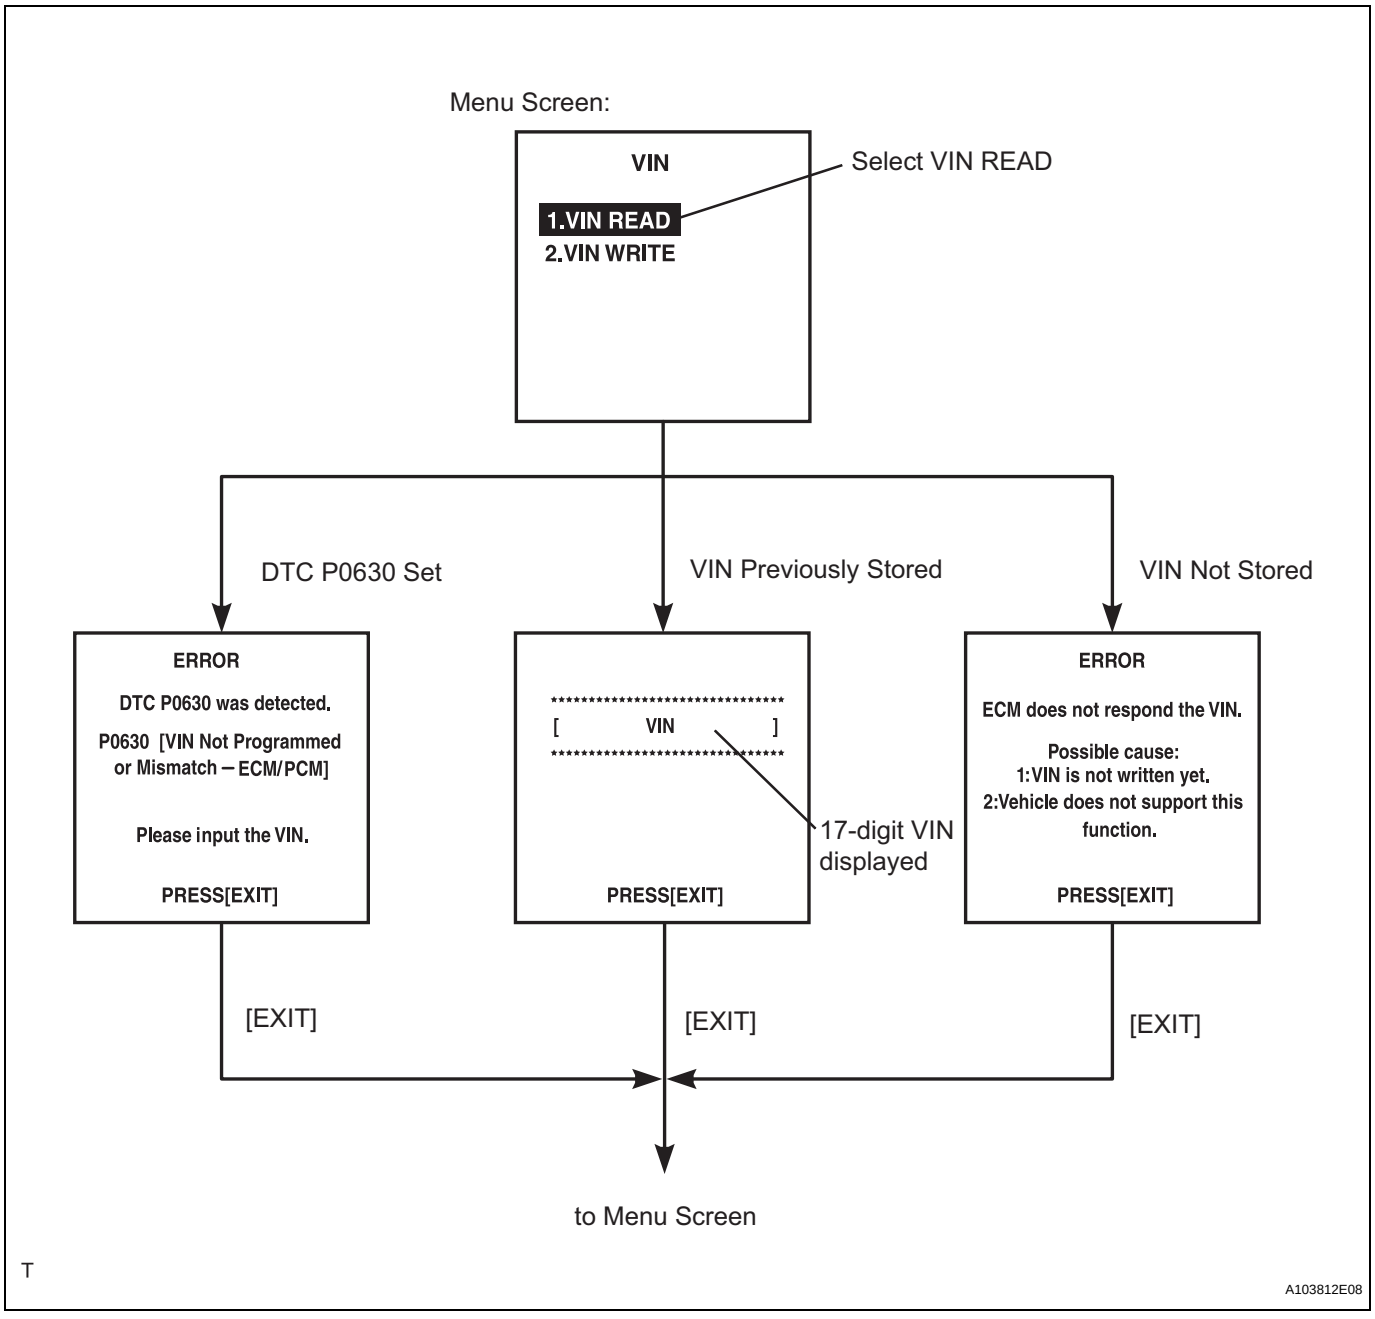
(c) Write VIN: Explains the VIN writing process in a flowchart. This process allows the VIN to be input into the ECM. If the ECM is changed, or the vehicle VIN and ECM VIN do not match, the VIN can be registered or overwritten in the ECM by following this procedure.

2. INPUT INSTRUCTIONS

(a) Intelligent Tester
The arrow buttons (UP, DOWN, RIGHT and LEFT) and numerical buttons (0 to 9) are used to input the VIN.

(b) Cursor Operation
To move the cursor around the tester screen, press the RIGHT and LEFT buttons.

(c) Alphabetical Character Input
(1) Press the UP and DOWN buttons to select the desired alphabetical character.
(2) After selection, the cursor should move.

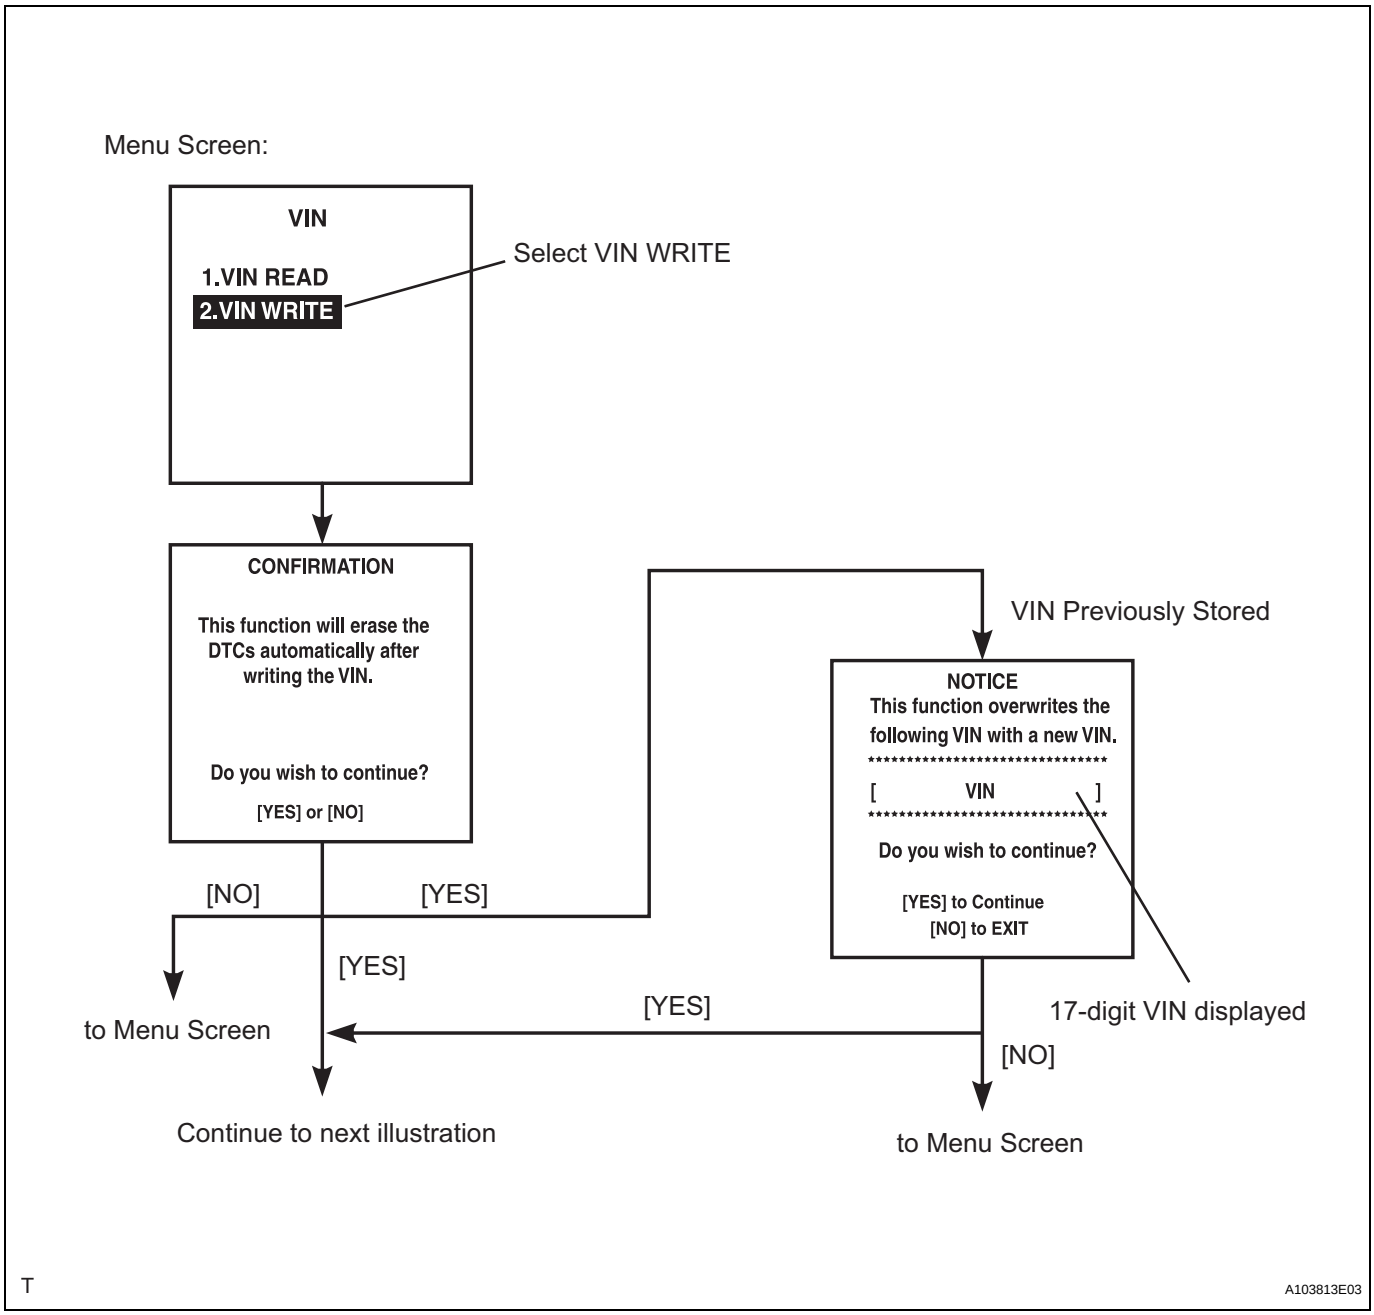


(d) Numeric Character Input
(1) Press the numerical button corresponding to the number that you want to input.
(2) After input, the cursor should move.
HINT:
Numerical characters can also be selected by using the UP and DOWN buttons.

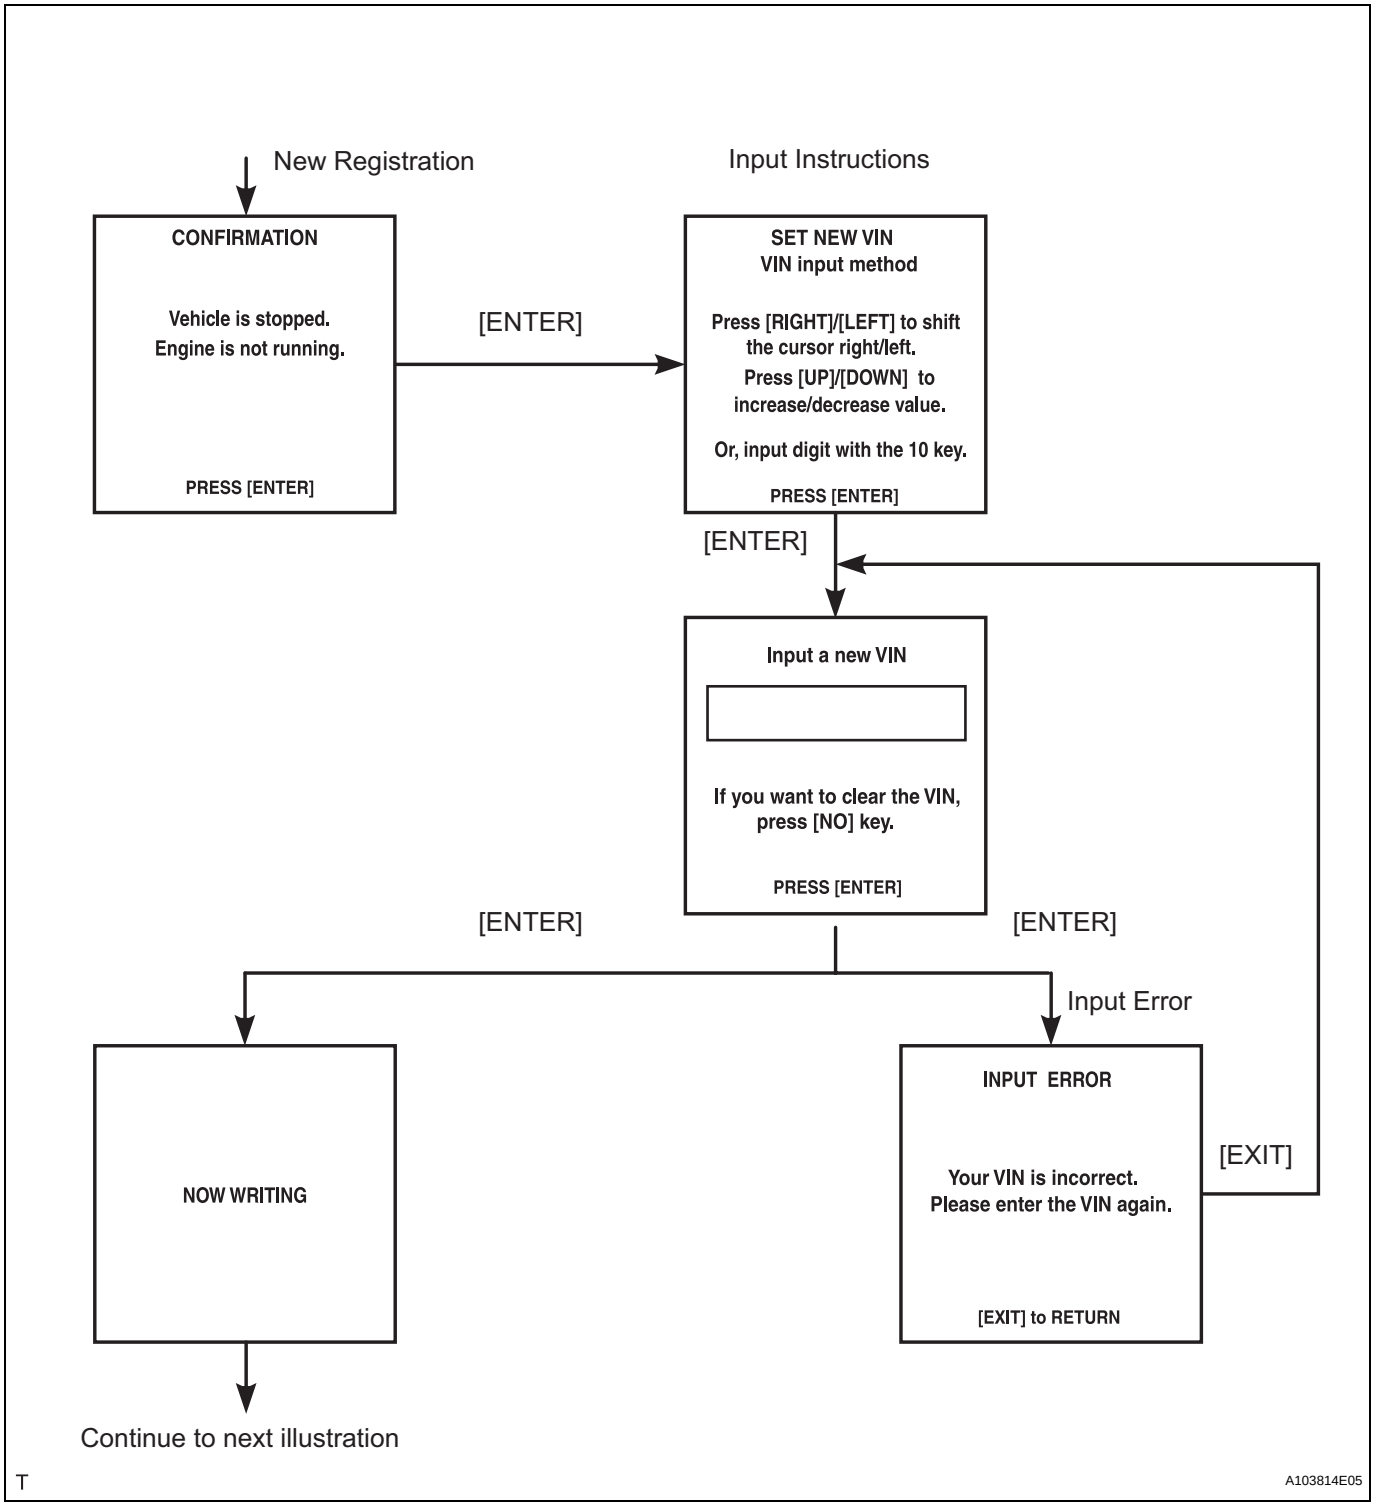
(e) Correction
(1) When correcting the input character(s), put the cursor onto the character using the RIGHT and LEFT buttons.
(2) Select or input the correct character using the UP/DOWN buttons, or the numerical buttons.

(f) Finishing Input Operation
(1) Make sure that the input VIN matches the vehicle VIN after input.
(2) Press the ENTER button on the tester.

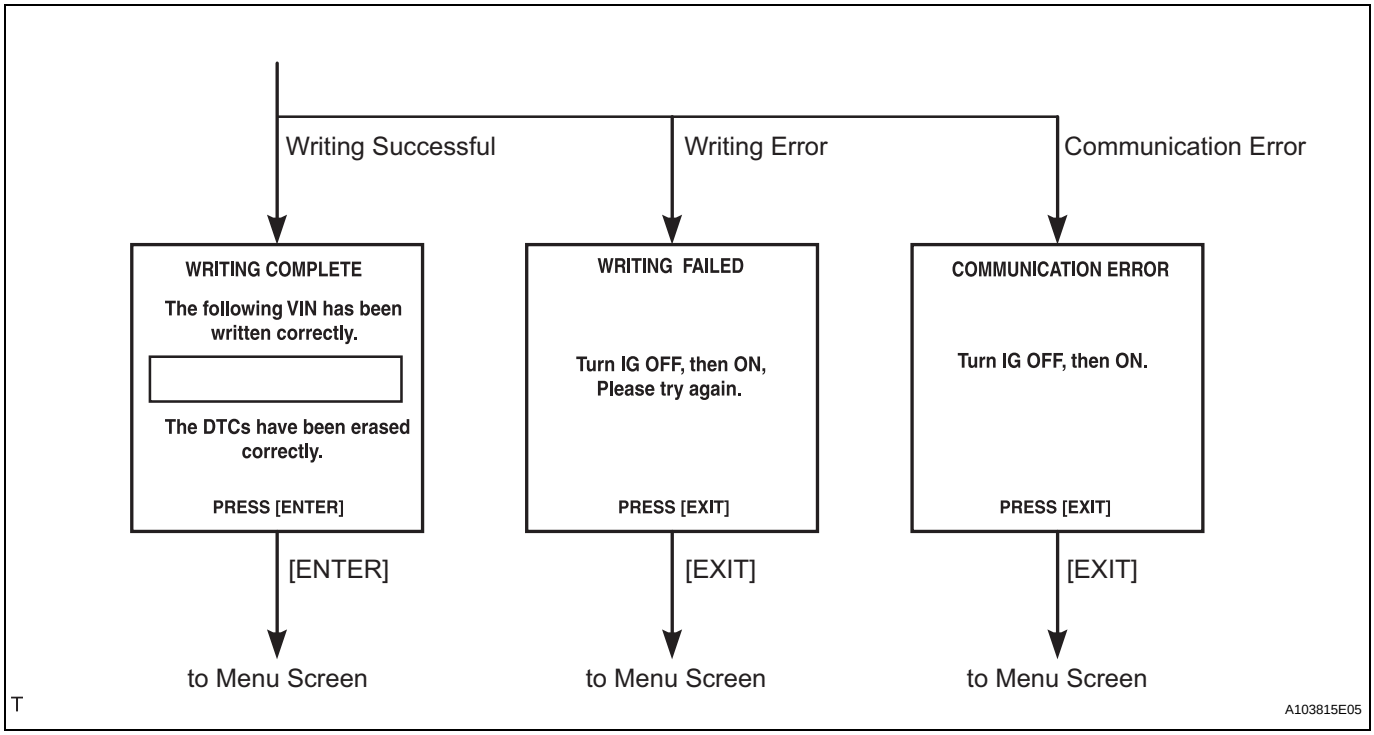
3. READ VIN



(a) Confirm the vehicle VIN.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / VIN.



4. WRITE VIN



(a) Confirm the vehicle VIN.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.

(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / VIN.

CHECKING MONITOR STATUS

The purpose of the monitor result (mode 06) is to allow access to the results of on-board diagnostic monitoring tests of specific components/systems that are not continuously monitored. Examples are catalysts, evaporative emissions (EVAP) and thermostats.

The monitor result allows the OBD II scan tool to display the monitor status, test value, minimum test limit and maximum test limit. These data are displayed after the vehicle has been driven to run the monitor.

When the test value is not between the minimum and maximum test limits, the ECM (PCM) interprets this as a malfunction. If the test value is on the borderline of the test limits, the component is likely to malfunction in the near future.

Perform the following procedures to view the monitor status. Although these procedures refer to the Lexus/Toyota diagnostic tester, the monitor status can be checked using a generic OBD II scan tool. Refer to your scan tool operator's manual for specific procedural information.

1. PERFORM MONITOR DRIVE PATTERN

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch and the tester ON.

(c) Clear the DTCs (see page ES-39).

(d) Run the vehicle in accordance with the applicable drive pattern described in READINESS MONITOR DRIVE PATTERN (see page ES-22). Do not turn the ignition switch OFF.

NOTE:

The test results will be lost if the ignition switch is turned OFF.

2. ACCESS MONITOR RESULT

(a) Select the following items from the intelligent tester menus: DIAGNOSIS, ENHANCED OBD II, MONITOR INFO and MONITOR RESULT. The monitor status appears after the component name.

- INCMP: The component has not been monitored yet.
- PASS: The component is functioning normally.
- FAIL: The component is malfunctioning.

(b) Confirm that the component is either PASS or FAIL.

(c) Select the component and press ENTER. The accuracy test value appears if the monitor status is either PASS or FAIL.

3. CHECK COMPONENT STATUS

(a) Compare the test value with the minimum test limit (MIN LIMIT) and maximum test limit (MAX LIMIT).

(b) If the test value is between the minimum and maximum test limits, the component is functioning normally. If not, the component is malfunctioning. The test value is usually not near the test limits. If the test value is on the borderline of the test limits, the component is likely to malfunction in the near future.
HINT:
The monitor result might on rare occasions be PASS even if the malfunction indicator lamp (MIL) is illuminated. This indicates the system malfunctioned on a previous driving cycle. This might be caused by an intermittent problem.

4. MONITOR RESULT INFORMATION

If you use a generic scan tool, multiply the test value by the scaling value listed below.

A/F Sensor (Bank 1 Sensor 1)

Monitor ID	Test ID	Scaling	Unit	Description
$01	$8E	Multiply by 0.001	V	A/F sensor deterioration level
$01	$91	Multiply by 0.004	mA	A/F sensor current

A/F Sensor (Bank 2 Sensor 1)

Monitor ID	Test ID	Scaling	Unit	Description
$05	$8E	Multiply by 0.001	V	A/F sensor deterioration level
$05	$91	Multiply by 0.004	mA	A/F sensor current

HO2 Sensor (Bank 1 Sensor 2)

Monitor ID	Test ID	Scaling	Unit	Description
$02	$07	Multiply by 0.001	V	Minimum sensor voltage
$02	$08	Multiply by 0.001	V	Maximum sensor voltage
$02	$8F	Multiply by 0.0003	g	Maximum oxygen storage capacity

HO2 Sensor (Bank 2 Sensor 2)

Monitor ID	Test ID	Scaling	Unit	Description
$06	$07	Multiply by 0.001	V	Minimum sensor voltage
$06	$08	Multiply by 0.001	V	Maximum sensor voltage
$06	$8F	Multiply by 0.0003	g	Maximum oxygen storage capacity

Catalyst (Bank 1)

Monitor ID	Test ID	Scaling	Unit	Description
$21	$A9	Multiply by 0.0003	No dimension	Oxygen storage capacity of catalyst

Catalyst (Bank 2)

Monitor ID	Test ID	Scaling	Unit	Description
$22	$A9	Multiply by 0.0003	No dimension	Oxygen storage capacity of catalyst

EVAP

Monitor ID	Test ID	Scaling	Unit	Description
$3D	$C9	Multiply by 0.001	kPa	Test value for small leak (P0456)
$3D	$CA	Multiply by 0.001	kPa	Test value for gross leak (P0455)
$3D	$CB	Multiply by 0.001	kPa	Test value for leak detection pump stuck OFF (P2401)
$3D	$CD	Multiply by 0.001	kPa	Test value for leak detection pump stuck ON (P2402)
$3D	$CE	Multiply by 0.001	kPa	Test value for vent valve stuck OFF (P2420)
$3D	$CF	Multiply by 0.001	kPa	Test value for vent valve stuck ON (P2419)
$3D	$D0	Multiply by 0.001	kPa	Test value for reference orifice low flow (P043E)

Monitor ID	Test ID	Scaling	Unit	Description
$3D	$D1	Multiply by 0.001	kPa	Test value for reference orifice high flow (P043F)
$3D	$D4	Multiply by 0.001	kPa	Test value for purge VSV stuck closed (P0441)
$3D	$D5	Multiply by 0.001	kPa	Test value for purge VSV stuck open (P0441)
$3D	$D7	Multiply by 0.001	kPa	Test value for purge flow insufficient (P0441)

Rear Oxygen Sensor Heater

Monitor ID	Test ID	Scaling	Unit	Description
$42	$91	Multiply by 0.001	Ohm	Oxygen sensor heater resistance bank 1 sensor 2
$46	$91	Multiply by 0.001	Ohm	Oxygen sensor heater resistance bank 2 sensor 2

Misfire

Monitor ID	Test ID	Scaling	Unit	Description
$A1	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for all cylinders: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A1	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - all cylinders
$A2	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 1: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total
$A2	$0C	Multiply by 1	Time	Ignition switch ON: Total misfire counts for last driving cycle Engine running: Total misfire counts for current driving cycle Misfire counts for last or current driving cycle - cylinder 1
$A3	$0B	Multiply by 1	Time	Exponential Weighted Moving Average (EWMA) misfire for cylinder 2: EWMA = Total misfire counts for last driving cycle * 0.1 + Last EWMA * 0.9 Misfire counts for last 10 driving cycles - Total

READINESS MONITOR DRIVE PATTERN

1. PURPOSE OF READINESS TESTS

- The On-Board Diagnostic (OBD II) system is designed to monitor the performance of emission related components, and indicate any detected abnormalities with DTC (Diagnostic Trouble Codes). Since various components need to be monitored during different driving conditions, the OBD II system is designed to run separate monitoring programs called Readiness Monitors.
- The intelligent tester's software must be version 9.0 or newer to view the Readiness Monitor Status. To view the status, select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
- When the Readiness Monitor status reads COMPL (complete), the necessary conditions have been met for running the performance tests for that Readiness Monitor.
- A generic OBD II scan tool can also be used to view the Readiness Monitor status.

HINT:

Many state Inspection and Maintenance (I/M) programs require a vehicle's Readiness Monitor status to show COMPL before beginning emission tests.

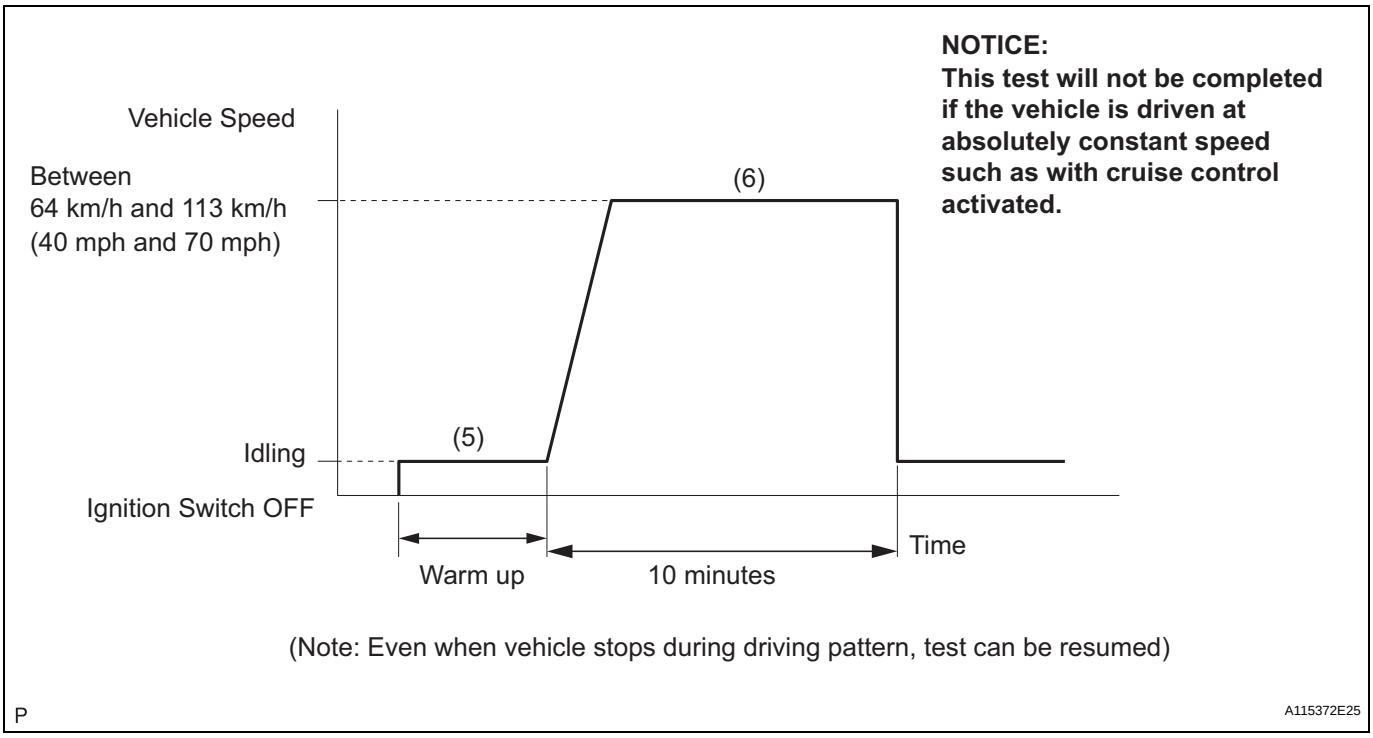
The Readiness Monitor will be reset to INCMPL (incomplete) if:

- The ECM has lost battery power or blown a fuse.
- DTCs have been cleared.
- The conditions for running the Readiness Monitor have not been met.

If the Readiness Monitor status shows INCMPL, follow the appropriate Readiness Monitor Drive Pattern to change the status to COMPL.

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.



NOTICE:

These drive patterns represent the fastest method of satisfying all conditions necessary to achieve complete status for each specific Readiness Monitor.

In the event of a drive pattern being interrupted (possibly due to factors such as traffic conditions), the drive pattern can be resumed. In most cases, the Readiness Monitor will still achieve complete status upon completion of the drive pattern.

To ensure completion of the Readiness Monitors, avoid sudden changes in vehicle load and speed (driving up and down hills and/or sudden acceleration).

2. CATALYST MONITOR (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

(a) Preconditions
The monitor will not run unless:
- The MIL is OFF.

(b) Drive Pattern
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (if set) (see page ES-39).
(5) Start the engine and warm it up.
(6) Drive the vehicle at between 40 mph and 70 mph (64 km/h and 113 km/h) for at least 10 minutes.

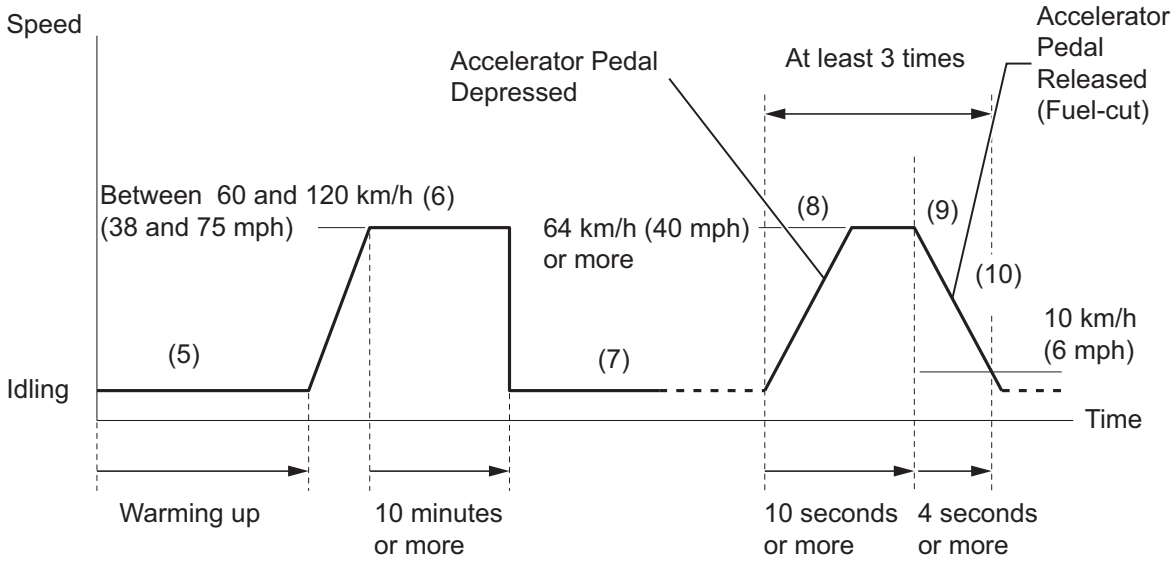
(c) Monitor Status
Check the Readiness Monitor status displayed on the tester.
If the status does not switch to COMPL (complete), extend the driving time.

3. EVAP SYSTEM MONITOR (KEY OFF TYPE)

(a) Preconditions
The monitor will not run unless:
– The fuel tank is less than 90% full.
– The altitude is less than 8,000 ft. (2,450 m).
– The vehicle is stationary.
– The engine coolant temperature is between 4.4°C and 35°C (40°F and 95°F).
– The intake air temperature is between 4.4°C and 35°C (40°F and 95°F).
– Vehicle was driven in a city area (or on freeway) for 10 minutes or more.

(b) Monitor Conditions
(1) Turn the ignition switch OFF and wait for 6 hours.
HINT:
Do not start the engine until checking Readiness Monitor status. If the engine is started, the step described above must be repeated.

(c) Monitor Status
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Check the Readiness Monitor status displayed on the tester.



If the status does not switch to COMPL (complete), restart the engine, make sure that the preconditions have been met, and then perform the Monitor Conditions again.

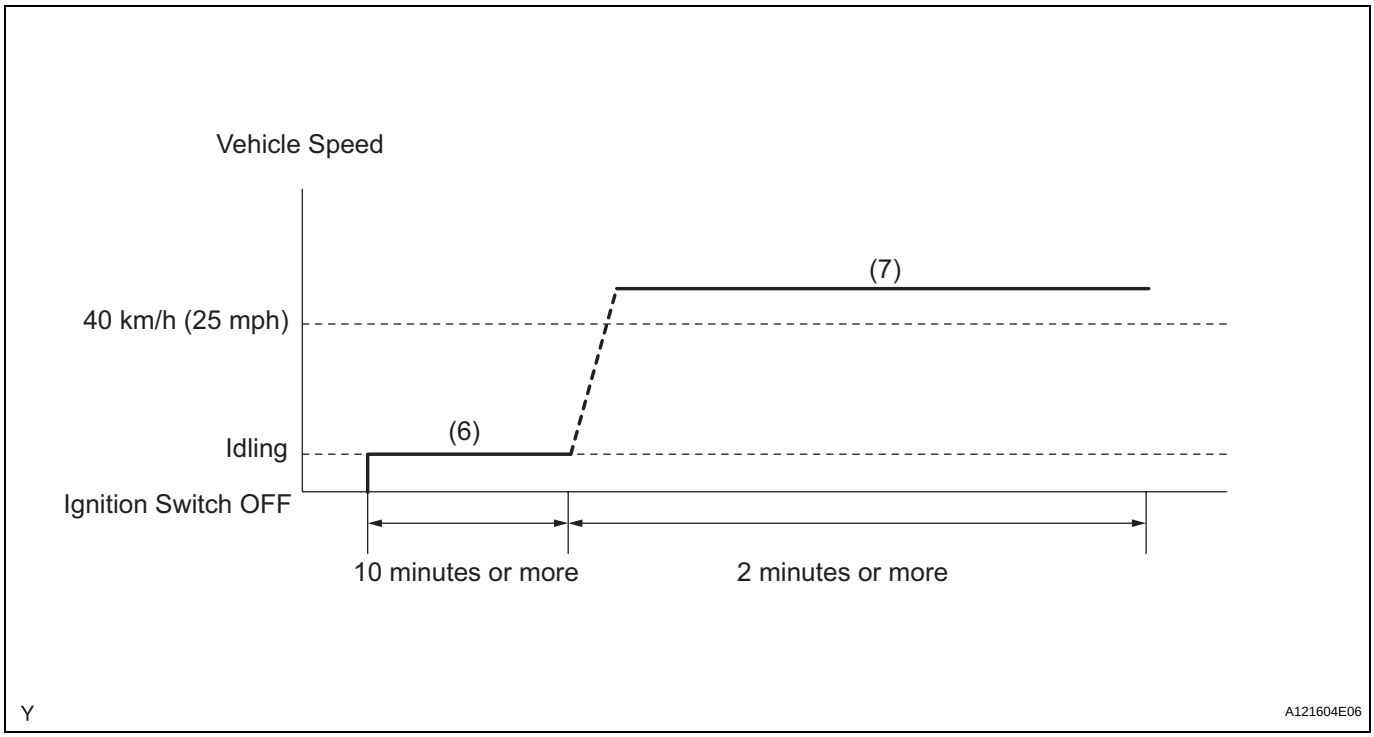
ES

4. AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSOR MONITORS (ACTIVE AIR-FUEL RATIO CONTROL TYPE)

Monitor Drive Pattern

ECT: 75°C (167°F) or more

P A115374E08



(a) Preconditions
The monitor will not run unless:
– 2 minutes or more have elapsed since the engine was started.
– The Engine Coolant Temperature (ECT) is 75°C (167°F) or more.
– Cumulative driving time at a vehicle speed of 48 km/h (30 mph) or more exceeds 6 minutes.

– Air-fuel ratio feedback control is performed.

(b) Drive Pattern for front A/F sensor and HO2 sensor
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (see page ES-39).
(5) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(6) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(7) Change the transmission to 2nd gear.
(8) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(9) Soon after performing step (8) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal in order to execute fuel-cut control.
(10) Allow the vehicle to decelerate until the vehicle speed declines to less than 10 km/h (6 mph).
(11) Repeat steps from (8) through (10) above at least 3 times in one driving cycle.

(c) Monitor Status
(1) Check the Readiness Monitor status displayed on the tester.
(2) If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and then perform steps from (5) through (11) in the Drive Pattern above.

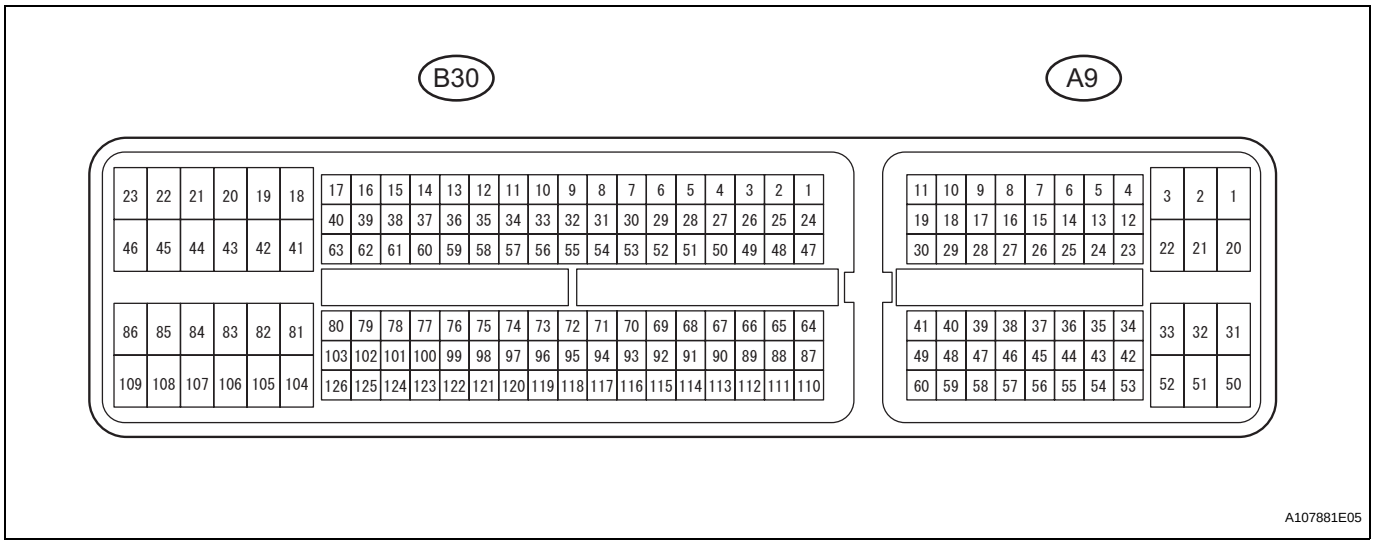
5. AIR-FUEL RATIO (A/F) AND HEATED OXYGEN (HO2) SENSOR HEATER MONITORS (FRONT A/F AND REAR HO2 SENSOR TYPE)

(a) Preconditions
The monitor will not run unless:
– The MIL is OFF.

(b) Drive Pattern
(1) Connect the intelligent tester to the DLC3.
(2) Turn the ignition switch ON.
(3) Turn the tester ON.
(4) Clear DTCs (if set) (see page ES-39).
(5) Start the engine.
(6) Allow the engine to idle for 10 minutes or more.
(7) Drive the vehicle at 40 km/h (25 mph) or more for at least 2 minutes.

(c) Monitor Status
(1) Check the Readiness Monitor status displayed on the tester.
If the status does not switch to COMPL (complete), make sure that the preconditions have been met, and repeat steps from (5) to (7) described in the Drive Pattern above.

PROBLEM SYMPTOMS TABLE



HINT:
Use the table below to help determine the cause of the problem symptom. The potential causes of the symptoms are listed in order of probability in the "Suspected area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

Symptom	Suspected area	See page
Engine does not crank (Does not start)	1. Battery	CH-5
	2. Starter	ST-8
	3. Starter relay	ST-16
	4. Park/neutral position switch	AX-132
	5. Immobiliser system	EI-3
No initial combustion (Does not start)	1. ECM power source circuit	ES-402
	2. Crankshaft position sensor	ES-448
	3. VVT sensor	ES-214
	4. Ignition system	IG-5
	5. Fuel pump control circuit	ES-414
	6. ECM	ES-470
	7. VC output circuit	ES-408
Engine cranks normally but difficult to start	1. Fuel pump control circuit	ES-414
	2. Compression	EM-3
Difficult to start with cold engine	1. Ignition system	IG-5
	2. Spark plug	IG-7
	3. Fuel pump control circuit	ES-414
	4. Injector	FU-15
Difficult to start with warm engine	1. Injector	FU-15
	2. Ignition system	IG-5
	3. Spark plug	IG-7
	4. Fuel pump control circuit	ES-414
High engine idle speed	1. Electronic throttle control system	ES-311
	2. A/C signal circuit	-
	3. ECM power source circuit	ES-402
	4. Acoustic Control Induction System (ACIS)	ES-423
Low engine idle speed (Poor idling)	1. Electronic throttle control system	ES-311
	2. A/C signal circuit	-
	3. Fuel pump control circuit	ES-414
	4. Air induction system	IT-5
	5. Acoustic Control Induction System (ACIS)	ES-423
	6. PCV hose	-

Symptom	Suspected area	See page
Rough idling	1. Compression	EM-3
	2. Spark plug	IG-7
	3. Injector	FU-15
	4. Ignition system	IG-5
	5. Fuel pump control circuit	ES-414
	6. Electronic throttle control system	ES-311
	7. Air induction system	IT-5
	8. Acoustic Control Induction System (ACIS)	ES-423
	9. PCV hose	-
	10. Mass air flow meter	ES-435
Idle hunting	1. Electronic throttle control system	ES-311
	2. Air induction system	IT-5
	3. ECM power source circuit	ES-402
	4. Acoustic Control Induction System (ACIS)	ES-423
Hesitation/Poor acceleration	1. Fuel pump control circuit	ES-414
	2. Spark plug	IG-7
	3. Ignition system	IG-5
	4. Injector	FU-15
	5. Mass air flow meter	ES-435
	6. Electronic throttle control system	ES-311
	7. Air induction system	IT-5
	8. Compression	EM-3
	9. Air Intake Control System (AICS)	ES-426
Surging (Poor driveability)	1. Spark plug	IG-7
	2. Fuel pump control circuit	ES-414
	3. Ignition system	IG-5
	4. Injector	FU-15
	5. Mass air flow meter	ES-435
	6. Variable valve timing system	ES-439
	7. Compression	EM-3
Engine stalls soon after starting	1. Fuel pump control circuit	ES-414
	2. Spark plug	IG-7
	3. Ignition system	IG-5
	4. Injector	FU-15
	5. Variable valve timing system	ES-439
	6. Electronic throttle control system	ES-311
	7. Air induction system	IT-5
	8. PCV hose	-
	9. Compression	EM-3
Engine stalls only during A/C operation	1. A/C signal circuit	-
	2. ECM	ES-470
Unable/difficult to refuel	1. Refueling valve (canister)	-

TERMINALS OF ECM

1. CHECK ECM

A107881E05

(a) Measure the voltage of the ECM connector.
HINT:
The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column. The illustration above can be used as a reference to identify the ECM terminal locations.

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
BATT (A9-20) - E1 (B30-81)	W - BR	Battery (for measuring battery voltage and for ECM memory)	Always	9 to 14 V
+BM (A9-3) - E1 (B30-81)	LG - BR	Power source of throttle actuator	Always	9 to 14 V
IGSW (A9-28) - E1 (B30-81)	B - BR	Ignition switch	Ignition switch ON	9 to 14 V
+B (A9-2) - E1 (B30-81)	B - BR	Power source of ECM	Ignition switch ON	9 to 14 V
+B2 (A9-1) - E1 (B30-81)	B - BR	Power source of ECM	Ignition switch ON	9 to 14 V
OC1+ (B30-58) - OC1- (B30-57)	W - B	Camshaft timing oil control valve (OCV)	Ignition switch ON	Pulse generation (see waveform 1)
OC2+ (B30-52) - OC2- (B30-51)	BR - B	Camshaft timing oil control valve (OCV) (Intake side (bank 2))	Ignition switch ON	Pulse generation (see waveform 1)
OE1+ (B30-56) - OE1- (B30-55)	R - LG	Camshaft timing oil control valve (OCV) (Exhaust side (bank 1))	Ignition switch ON	Pulse generation (see waveform 1)
OE2+ (B30-50) - OE2- (B30-49)	W - B	Camshaft timing oil control valve (OCV) (Exhaust side (bank 2))	Ignition switch ON	Pulse generation (see waveform 1)
MREL (A9-44) - E1 (B30-81)	O - BR	EFI relay	Ignition switch ON	9 to 14 V
VG (B30-72) - E2G (B30-73)	GR - L-G	Mass air flow meter	Idling, Shift lever position P or N, A/C switch OFF	0.5 to 3.0 V
THA (B30-71) - ETHA (B30-74)	P - G-R	Intake air temperature sensor	Idling, Intake air temperature 20°C (68°F)	0.5 to 3.4 V

ES

Symbol (Terminal No.)	Wiring Color	Terminal Description	Condition	Specified Condition
THW (B30-79) - ETHW (B30-78)	L - BR	Engine coolant temperature sensor	Idling, Engine coolant temperature 80°C (176°F)	0.2 to 1.0 V
VCTA (B30-96) - ETA (B30-97)	B - W	Power source of throttle position sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
VTA1 (B30-98) - ETA (B30-97)	Y - W	Throttle position sensor (for engine control)	Ignition switch ON, Throttle valve fully closed	0.5 to 1.1 V
			Ignition switch ON, Throttle valve fully open	3.3 to 4.9 V
VTA2 (B30-99) - ETA (B30-97)	GR - W	Throttle position sensor (for sensor malfunction detection)	Ignition switch ON, Throttle valve fully closed	2.1 to 3.1 V
			Ignition switch ON, Throttle valve fully open	4.6 to 5.0 V
VPA (A9-55) - EPA (A9-59)	W - Y	Accelerator pedal position sensor (for engine control)	Ignition switch ON, Accelerator pedal released	0.5 to 1.1 V
			Ignition switch ON, Accelerator pedal fully depressed	2.6 to 4.5 V
VPA2 (A9-56) - EPA2 (A9-60)	R - O	Accelerator pedal position sensor (for sensor malfunctioning detection)	Ignition switch ON, Accelerator pedal released	1.2 to 2.0 V
			Ignition switch ON, Accelerator pedal fully depressed	3.4 to 5.0 V
VCPA (A9-57) - EPA (A9-59)	B - Y	Power source of accelerator pedal position sensor (for VPA)	Ignition switch ON	4.5 to 5.5 V
VCP2 (A9-58) - EPA2 (A9-60)	L - O	Power source of accelerator pedal position sensor (for VPA2)	Ignition switch ON	4.5 to 5.5 V

The wavelength becomes shorter as the engine rpm increases.

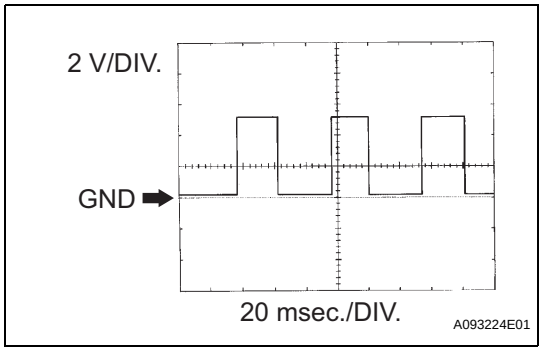
ES

(g) WAVEFORM 6
Igniter IGT signal (from ECM to igniter) and Igniter IGF signal (from igniter to ECM)

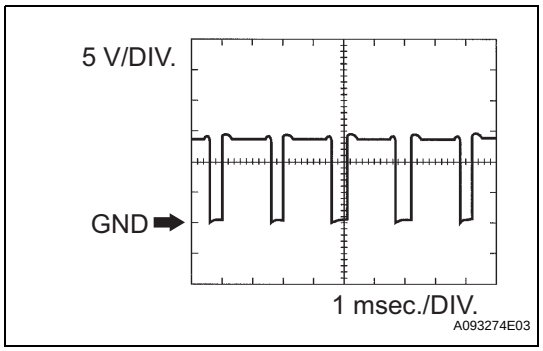
Symbol (Terminal No.)	Between IGT (1 to 6) and E1 Between IGF1 and E1
Tester Range	2 V/DIV., 20 msec./DIV.
Condition	Idling



HINT:
The wavelength becomes shorter as the engine rpm increases.

(h) WAVEFORM 7
Purge VSV

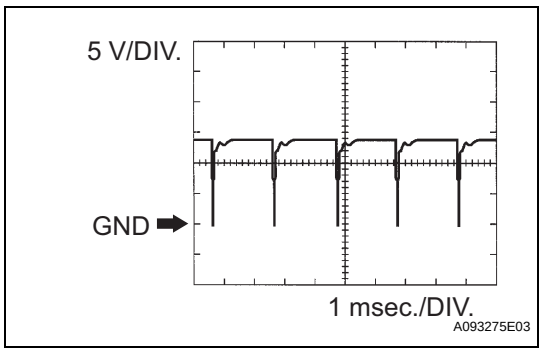
Symbol (Terminal No.)	Between PRG and E1
Tester Range	5 V/DIV., 50 msec./DIV.
Condition	Idling



HINT:
If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

(i) WAVEFORM 8
Vehicle speed signal

Symbol (Terminal No.)	Between SPD and E1
Tester Range	2 V/DIV., 20 msec./DIV.
Condition	Driving at 20 km/h (12 mph)

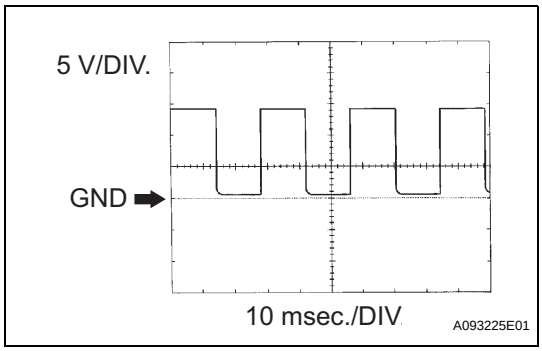


HINT:
The wavelength becomes shorter as the vehicle speed increases.

(j) WAVEFORM 9
Throttle actuator positive terminal

Symbol (Terminal No.)	Between M+ and ME01
Tester Range	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine

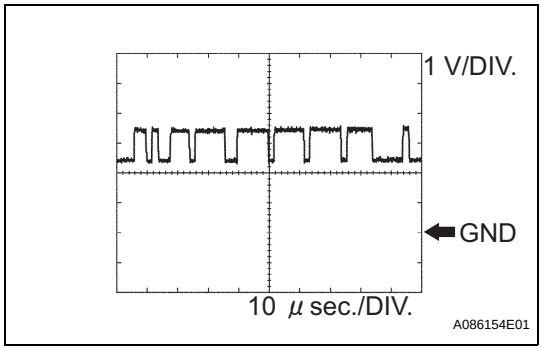
HINT:
The duty ratio varies depending on the throttle actuator operation.



(k) WAVEFORM 10
Throttle actuator negative terminal

Symbol (Terminal No.)	Between M- and ME01
Tester Range	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine

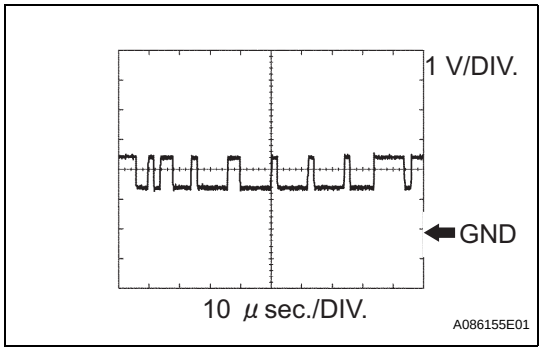
HINT:
The duty ratio varies depending on the throttle actuator operation.



ES

(l) WAVEFORM 11
Engine speed signal

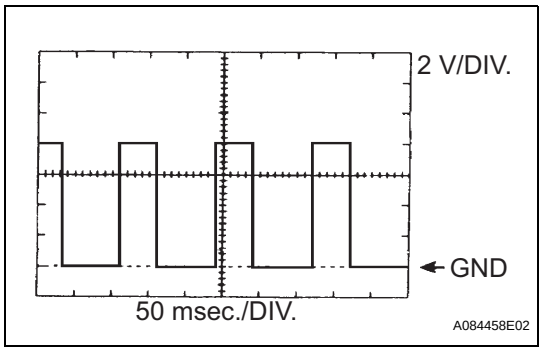
Symbol (Terminal No.)	Between TACH and E1
Tester Range	5 V/DIV., 10 msec./DIV.
Condition	Idling



HINT:
The wavelength becomes shorter as the engine rpm increases.

(m) WAVEFORM 12
CAN communication signal

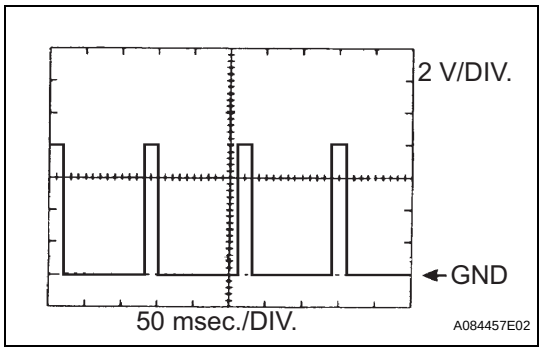
Symbol (Terminal No.)	Between CANH and E1
Tester Range	1 V/DIV., 10 μsec./DIV.
Condition	Engine stops and ignition switch ON



HINT:
The waveform varies depending on the CAN communication signal.

(n) WAVEFORM 13
CAN communication signal

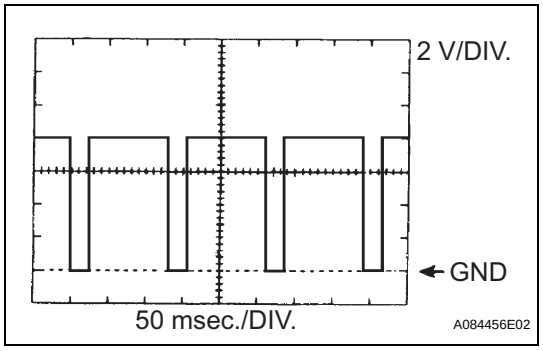
Symbol (Terminal No.)	Between CANL and E1
Tester Range	1 V/DIV., 10 μsec./DIV.
Condition	Engine stops and ignition switch ON



HINT:
The waveform varies depending on the CAN communication signal.

(o) WAVEFORM 14
Generator

Symbol (Terminal No.)	Between RLO and E1
Tester Range	2 V/DIV., 50 msec./DIV.
Condition	After engine warmed up, during charging control, vehicle driven at constant speed



HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

(p) WAVEFORM 15
Generator

Symbol (Terminal No.)	Between RLO and E1
Tester Range	2 V/DIV., 50 msec./DIV.
Condition	After engine warmed up, during charging control, vehicle accelerated

HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

(q) WAVEFORM 16
Generator

Symbol (Terminal No.)	Between RLO and E1
Tester Range	2 V/DIV., 50 msec./DIV.
Condition	After engine warmed up, during charging control, vehicle decelerated

HINT:
A constant value is not output, as the duty ratio varies depending on the electrical load and battery condition.

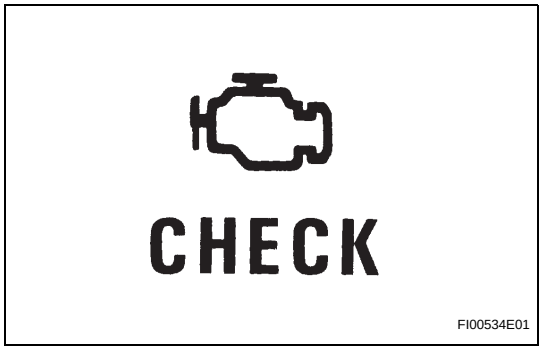
ES

DIAGNOSIS SYSTEM

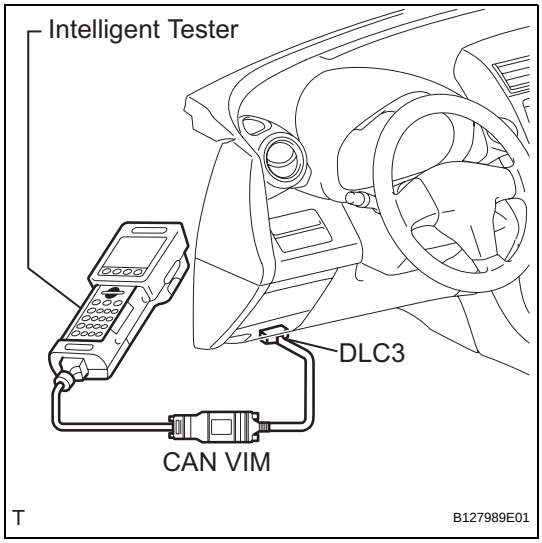
1. DESCRIPTION

When troubleshooting OBD II (On-Board Diagnostics) vehicles, the intelligent tester (complying with SAE J1987) must be connected to the DLC3 (Data Link Connector 3) of the vehicle. Various data in the vehicle's ECM (Engine Control Module) can be then read.

OBD II regulations require that the vehicle's on-board computer illuminate the MIL (Malfunction Indicator Lamp) on the instrument panel when the computer detects a malfunction in:



(a) The emission control system components.
(b) The powertrain control components (which affect vehicle emissions).
(c) The computer itself.



In addition, if the applicable DTCs (Diagnostic Trouble Codes) prescribed by SAE J2012 are not recorded on 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

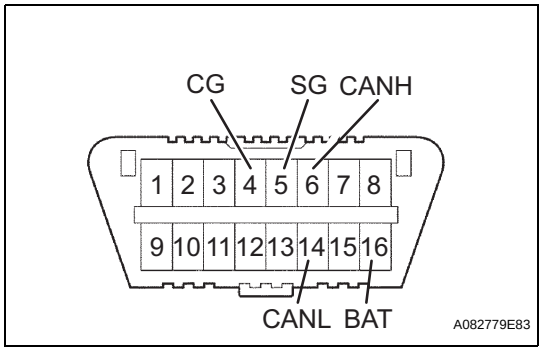
To check DTCs, connect the intelligent tester to the DLC3. The tester displays DTCs, freeze frame data, and a variety of the engine data. The DTCs and freeze frame data can be erased with the tester (see page ES-39).

In order to enhance OBD function on vehicles and develop the Off-Board diagnosis system, CAN (Controller Area Network) communication is introduced in this system. It minimizes the gap between technician skills and vehicle technology. CAN is a network, which uses a pair of data transmission lines, spanning multiple computers and sensors. It allows high speed communication between the systems and simplifies the wire harness connection.

Since this system is equipped with the CAN communication, connecting the CAN VIM (Vehicle Interface Module) to the intelligent tester is necessary to display any information from the ECM. (Also the communication between the intelligent tester and the ECM uses CAN communication signals.) When confirming the DTCs and any data of the ECM, connect the CAN VIM between the DLC3 and the intelligent tester.

2. NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the system's ability to detect malfunctions, including intermittent problems (intelligent tester only) (see page ES-42).



3. 2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent drive cycle, the MIL is illuminated (2nd trip).

4. FREEZE FRAME DATA

Freeze frame data records the engine conditions (fuel system, calculated engine load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

5. DLC3 (Data Link Connector 3)

Symbol (Terminal No.)	Terminal Description	Condition	Specified Condition
SIL (7) - SG (5)	Bus "+" line	During transmission	Pulse generation
CG (4) - Body ground	Chassis ground	Always	Below 1 Ω
SG (5) - Body ground	Signal ground	Always	Below 1 Ω
BAT (16) - Body ground	Battery positive	Always	9 to 14 V
CANH (6) - CANL (14)	CAN bus line	Ignition switch OFF*	54 to 69 Ω
CANH (6) - Battery positive	HIGH-level CAN bus line	Ignition switch OFF*	6 kΩ or higher
CANH (6) - CG (4)	HIGH-level CAN bus line	Ignition switch OFF*	200 Ω or higher
CANL (14) - Battery positive	LOW-level CAN bus line	Ignition switch OFF*	6 kΩ or higher
CANL (14) - CG (4)	LOW-level CAN bus line	Ignition switch OFF*	200 Ω or higher

NOTICE:

***: Before measuring the resistance, leave the vehicle as is for at least 1 minute and do not operate the ignition switch, any other switches or the doors.**

If the result is not as specified, the DLC3 may have a malfunction. Repair or replace the harness and connector.

HINT:

The DLC3 is the interface prepared for reading various data from the vehicle's ECM. After connecting the cable of the intelligent tester to the CAN VIM, turn the ignition switch ON and turn the tester ON. If a communication failure message is displayed on the tester screen (on the tester: UNABLE TO CONNECT TO VEHICLE), a problem exists in either the vehicle or tester. In order to identify the location of the problem, connect the tester to another vehicle.

If communication is normal: Inspect the DLC3 on the original vehicle.
If communication is still not possible: The problem is probably in the tester itself. Consult the Service Department listed in the instruction manual.

6. BATTERY VOLTAGE

Standard battery voltage:

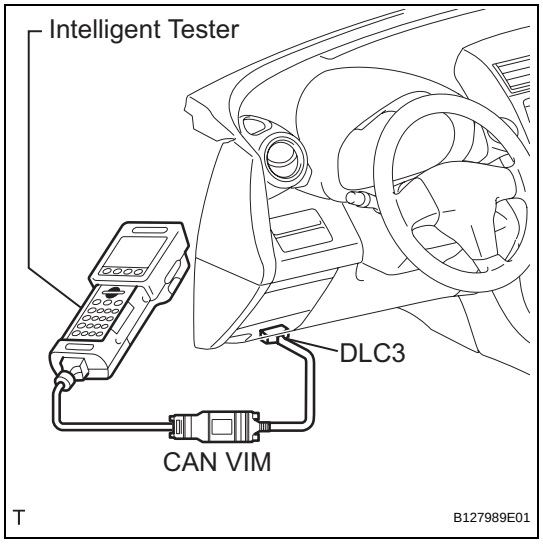
11 to 14 V

If the voltage is below 11 V, replace or recharge the battery before proceeding.

7. MIL (Malfunction Indicator Lamp)

(a) The MIL is illuminated when the ignition switch is first turned ON (the engine is not running).

(b) The MIL should turn OFF when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.
HINT:
If the MIL is not illuminated when the ignition switch is first turned ON, check the MIL circuit (see page ES-430).



8. ALL READINESS

For the vehicle, using the intelligent tester allows readiness codes corresponding to all DTCs to be read. When diagnosis (normal or malfunctioning) has been complete, readiness codes are set. Select the following menu items on the intelligent tester: ENHANCED OBD II / MONITOR STATUS.

DTC CHECK / CLEAR

NOTICE:
When the diagnosis system is changed from normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are erased. Before changing modes, always check and make a note of any DTCs and freeze frame data.
HINT:

- DTCs which are stored in the ECM can be displayed on the intelligent tester. The intelligent tester can display current and pending DTCs.
- Some DTCs are not set if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.

1. CHECK DTC (Using intelligent tester)
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES or PENDING CODES.
(e) Check the DTC(s) and freeze frame data, and then write them down.
(f) Check the details of the DTC(s) (see page ES-56).

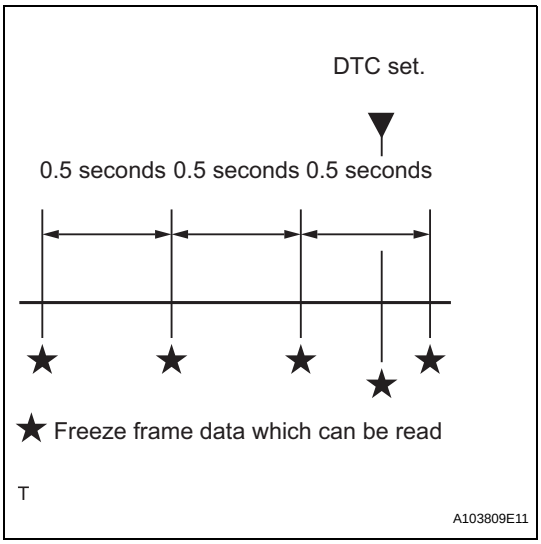
2. CLEAR DTC (Using intelligent tester)
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CLEAR CODES.
(e) Press the YES button.

3. CLEAR DTC (Without using intelligent tester)
(a) Perform either of the following operations.
(1) Disconnect the cable from the negative (-) battery terminal for more than 1 minute.
(2) Remove the EFI and ETCS fuses from the engine room relay block (located inside the engine compartment) for more than 1 minute.

FREEZE FRAME DATA

1. DESCRIPTION

Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.



HINT:

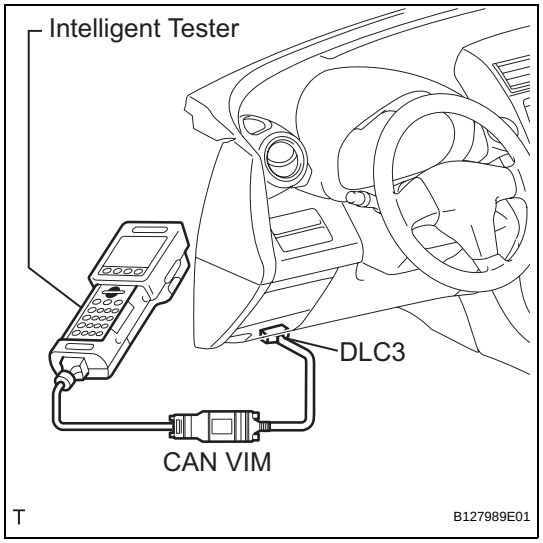
If it is impossible to duplicate the problem even though a DTC is detected, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

– 3 data sets before the DTC was set.
– 1 data set when the DTC was set.
– 1 data set after the DTC was set.

These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

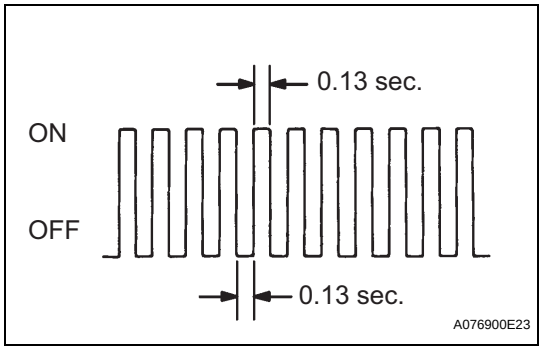
2. LIST OF FREEZE FRAME DATA



LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder	-
IGN ADVANCE	Ignition advance	-
CALC LOAD	Calculated load	Calculated load by ECM
VEHICLE LOAD	Vehicle load	-
MAF	Mass air flow volume	If approximately 0.0 g/sec.: • Mass air flow meter power source circuit open or short • VG circuit open or short If 160.0 g/sec. or more: • E2G circuit open
ENGINE SPD	Engine speed	-
VEHICLE SPD	Vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature	If -40°C (-40°F), sensor circuit open If 140°C (284°F) or more, sensor circuit shorted
INTAKE AIR	Intake air temperature	If -40°C (-40°F), sensor circuit open If 140°C (284°F) or more, sensor circuit shorted
AIR-FUEL RATIO	Ratio compared to stoichiometric level	-
PURGE DENSITY	Learning value of purge density	-
EVAP PURGE FLOW	Ratio of evaporative purge flow to intake air volume	-
EVAP PURGE VSV	EVAP purge VSV duty ratio	-
KNOCK CRRT VAL	Correction learning value of knocking	-

LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
KNOCK FB VAL	Feedback value of knocking	-
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No.1	-
ACCEL POS #2	Absolute APP No. 2	-
THROTTLE POS	Throttle sensor positioning	-
THROTTLE POS	Throttle position	-
THROTTLE POS #2	Throttle sensor positioning #2	-
THROTTLE MOT	Throttle motor	-
O2S B1 S2 O2S B2 S2	Heated oxygen sensor output	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
AFS B1 S1 AFS B2 S1	A/F sensor output	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
TOTAL FT #1 TOTAL FT #2	Total fuel trim	-
SHORT FT #1 SHORT FT #2	Short-term fuel trim	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1 LONG FT #2	Long-term fuel trim	Overall fuel compensation carried out in long-term to compensate a continual deviation of short-term fuel trim from central valve
O2FT B1 S2 O2FT B2 S2	Fuel trim at heated oxygen sensor	-
AF FT B1 S1 AF FT B2 S1	Fuel trim at A/F sensor	-
AFS B1 S1 AFS B2 S1	A/F sensor current	-
CAT TEMP B1S1 CAT TEMP B2S1	Estimated catalyst temperature (sensor 1)	-
CAT TEMP B1S2 CAT TEMP B2S2	Estimated catalyst temperature (sensor 2)	-
S O2S B1S2 S O2S B2S2	Sub heated oxygen sensor impedance (sensor 2)	-
INI COOL TEMP	Engine coolant temperature at engine start	-
INI INTAKE TEMP	Intake air temperature at engine start	-
INJ VOL	Injection volume	-
STARTER SIG	Starter switch (STSW) signal	-
PS SW	Power steering signal	-
PS SIGNAL	Power steering signal (history)	Signal status usually ON until ignition switch turned OFF
CTP SW	Closed throttle position switch	-
A/C SIGNAL	A/C signal	-
PNP SW (NSW)	Park/Neutral Position (PNP) switch signal	-
ELECT LOAD SIG	Electrical load signal	-
STOP LIGHT SW	Stop light switch	-
BATTERY VOLTAGE	Battery voltage	-
ATM PRESSURE	Atmosphere pressure	-
FUEL PMP SP CTL	Fuel pump speed control status	-
ACIS VSV	VSV for Acoustic Control Induction System (ACIS)	-
EVAP (Purge) VSV	EVAP Purge VSV	-
FUEL PUMP/SPD	Fuel pump/speed status	-

LABEL (Intelligent Tester Display)	Measurement Item	Diagnostic Note
VVT CTRL B1 VVT CTRL B2	VVT control status	-
VACUUM PUMP	Key-off EVAP system leak detection pump status	(see page ES-369)
EVAP VENT VAL	Key-off EVAP system vent valve status	-
FAN MOTOR	Electric fan motor	-
AICV VSV	VSV for Air Intake Control System (AICS)	-
TC/TE1	TC and CG (TE1) terminals of DLC3	-
FC IDL	Fuel cut idle	ON: when throttle valve fully closed and engine speed over 3,500 rpm
FC TAU	Fuel cut during very light load	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
IGNITION	Ignition counter	-
CYL #1	Cylinder #1 misfire	Only displayed during idling
CYL #2	Cylinder #2 misfire	Only displayed during idling
CYL #3	Cylinder #3 misfire	Only displayed during idling
CYL #4	Cylinder #4 misfire	Only displayed during idling
CYL #5	Cylinder #5 misfire	Only displayed during idling
CYL #6	Cylinder #6 misfire	Only displayed during idling
CYL ALL	All cylinders misfire	Only displayed during idling
MISFIRE RPM	Engine speed when misfire occurred	-
MISFIRE LOAD	Engine load when misfire occurred	-
MISFIRE MARGIN	Margin to detect engine misfire	-
ENG RUN TIME	Accumulated engine running time	-
TIME DTC CLEAR	Cumulative time after DTC cleared	-
DIST DTC CLEAR	Accumulated distance from DTC cleared	-
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared	-



CHECK MODE PROCEDURE

HINT:
Intelligent tester only:
Compared to normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected by normal mode.
NOTICE:
All the stored DTCs and freeze frame data are erased if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the ignition switch is turned from ON to ACC or OFF while in check mode. Before changing modes, always check and make a note of any DTCs and freeze frame data.

1. CHECK MODE PROCEDURE (Using intelligent tester)

(a) Check and ensure the following conditions:
  (1) Battery positive voltage 11 V or more.
  (2) Throttle valve fully closed.
  (3) Transmission in the P or N position.
  (4) A/C switch OFF.
(b) Turn the ignition switch OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / CHECK MODE.
(g) Switch the ECM from normal mode to check mode.

(h) Make sure the MIL flashes as shown in the illustration.
(i) Start the engine.
(j) Make sure the MIL turns off.
(k) Simulate the conditions of the malfunction described by the customer.
(l) Check DTCs and freeze frame data using the tester.

FAIL-SAFE CHART

If any of the following DTCs are set, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTC	Component	Fail-Safe Operation	Fail-Safe Deactivation Condition
P0031, P0032, P0051 and P0052	Air-Fuel Ratio (A/F) Sensor Heater	ECM turns off A/F sensor heater.	Ignition switch OFF
P0037, P0038, P0057 and P0058	Heated Oxygen (HO2) Sensor Heater	ECM turns off HO2 sensor heater.	Ignition switch OFF
P0100, P0102 and P0103	Mass Air Flow (MAF) Meter	ECM calculates ignition timing according to engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Intake Air Temperature (IAT) Sensor	ECM estimates IAT to be 20°C (68°F).	Pass condition detected
P0115, P0117 and P0118	Engine Coolant Temperature (ECT) Sensor	ECM estimates ECT to be 80°C (176°F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0604, P0606, P0607, P0657, P2102, P2103, P2111, P2112, P2118, P2119 and P2135	Electronic Throttle Control System (ETCS)	ECM cuts off throttle actuator current and throttle valve returned to 6° throttle position by return spring. ECM then adjusts engine output by controlling fuel injection (intermittent fuel-cut) and ignition timing in accordance with accelerator pedal opening angle to allow vehicle to continue at minimal speed*.	Pass condition detected and then ignition switch turned OFF
P0327, P0328, P0332 and P0333	Knock Sensor	ECM sets ignition timing to maximum retard.	Ignition switch OFF
P0351 to P0356	Igniter	ECM cuts fuel.	Pass condition detected
P1550, P1551, P1552 and P1602	Generator	Alternator command is fixed.	Pass condition detected
P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138	Accelerator Pedal Position (APP) Sensor	APP sensor has 2 sensor circuits: Main and Sub. If either circuit malfunctions, ECM controls engine using other circuit. If both circuits malfunction, ECM regards accelerator pedal as being released. As a result, throttle valve closed and engine idles.	Pass condition detected and then ignition switch turned OFF

HINT:

*: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.

DATA LIST / ACTIVE TEST

1. DATA LIST

HINT:

By reading the DATA LIST displayed on the intelligent tester, values can be checked, including those of the switches, sensors, and actuators, without removing any parts. Reading the DATA LIST as the first step of troubleshooting is one method of shortening diagnostic time.

NOTICE:

In the table below, the values listed under Normal Condition are for reference only. Do not depend solely on these values when determining whether or not a part is faulty.

(a) Warm up the engine.
(b) Turn the ignition switch OFF.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
(g) Check the values by referring to the table below.

ECM:

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
INJECTOR	Injection period of No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	1.2 to 2.4 ms: Idling	-
IGN ADVANCE	Ignition timing advance for No. 1 cylinder: Min.: -64 deg, Max.: 63.5 deg	BTDC 7 to 24 deg: Idling	-
CALC LOAD	Load calculated by ECM: Min.: 0%, Max.: 100%	• 10 to 20%: Idling • 10 to 20%: Running without load at 2,500 rpm	Load value
VEHICLE LOAD	Vehicle load: Min.: 0%, Max.: 25,700%	Actual vehicle load	Load percentage in terms of maximum intake air flow amount
MAF	Air flow rate from MAF meter: Min.: 0 g/sec., Max.: 655.35 g/sec.	2 to 5 g/sec.: Idling 8 to 19 g/sec.: Running without load at 2,500 rpm	If value approximately 0.0 g/sec.: • Mass air flow meter power source circuit open • VG circuit open or short If value 160.0 g/sec. or more: • E2G circuit open
ENGINE SPD	Engine speed: Min.: 0 rpm, Max.: 16,383.75 rpm	600 to 700 rpm: Idling	-
VEHICLE SPD	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Speed indicated on speedometer
COOLANT TEMP	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If -40°C (-40°F): sensor circuit open • If 140°C (284°F) or more: sensor circuit shorted
INTAKE AIR	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If -40°C (-40°F): sensor circuit open • If 140°C (284°F) or more: sensor circuit shorted
AIR-FUEL RATIO	Ratio compared to stoichiometric level: Min.: 0, Max.: 1.999	0.8 to 1.2: Idling	-
PURGE DENSITY	Learning value of purge density: Min.: -50, Max.: 350	-40 to 0: Idling	Service data

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
EVAP PURGE FLOW	Ratio of evaporative purge flow to intake air volume: Min.: 0%, Max.: 102.4%	0 to 8%: Idling	-
EVAP PURGE VSV	EVAP (PURGE) VSV control duty: Min.: 0%, Max.: 100%	0 to 100%: Idling	Order signal from ECM
VAPOR PRES PUMP	Vapor pressure: Min.: 33.853 kPa, Max.: 125.596 kPa	0 kPa: Fuel tank cap removed	EVAP system pressure monitored by canister pressure sensor
VAPOR PRES CALC	Vapor pressure (calculated): Min.: -5.632 kPa, Max.: 715.264 kPa	0 kPa: Fuel tank cap removed	EVAP system pressure monitored by canister pressure sensor
KNOCK CRRT VAL	Correction learning value of knocking: Min: -64°CA, Max.: 1,984°CA	0 to 22°CA: Driving at 70 km/h (44 mph)	Service data
KNOCK FB VAL	Feedback value of knocking: Min: -64°CA, Max.: 1,984°CA	-22 to 0°CA: Driving at 70 km/h (44 mph)	Service data
CLUTCH	Clutch current: Min.: 0 A, Max.: 2.49 A	-	-
ACCEL POS #1	Absolute Accelerator Pedal Position (APP) No. 1: Min.: 0%, Max.: 100%	10 to 22%: Accelerator pedal released 54 to 86%: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #2	Absolute APP No. 2: Min.: 0%, Max.: 100%	12 to 42%: Accelerator pedal released 66 to 98%: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
ACCEL POS #1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Accelerator pedal released 2.6 to 4.5 V: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL POS #2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: Accelerator pedal released 3.4 to 5.0 V: Accelerator pedal fully depressed	Read value with ignition switch ON (Do not start engine)
ACCEL IDL POS	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL LEARN VAL	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	-
ACCEL SSR #1 AD	Accelerator fully closed value No. 1 (AD): Min.: 0 V, Max.: 4.98 V	-	ETCS service data
ACCEL LRN VAL#1	Accelerator fully closed learning value No. 1: Min.: 0 deg, Max.: 124.512 deg	-	ETCS service data
ACCEL LRN VAL#2	Accelerator fully closed learning value No. 2: Min.: 0 deg, Max.: 124.512 deg	-	ETCS service data
FAIL #1	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
FAIL #2	Whether or not fail safe function executed: ON or OFF	ON: ETCS has failed	-
ST1	Starter signal: ON or OFF	ON: Cranking	-

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
SYS GUARD JUDGE	System guard: ON or OFF	-	ETCS service data
OPN MALFUNCTION	Open side malfunction: ON or OFF	-	ETCS service data
THROTTLE POS	Absolute throttle position sensor: Min.: 0%, Max.: 100%	• 10 to 24%: Throttle fully closed • 64 to 96%: Throttle fully open	• Calculated value based on VTA1 • Read value with ignition switch ON (Do not start engine)
THROTTL IDL POS	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	-
THRTL REQ POS	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
THROTTLE POS	Throttle position: Min.: 0%, Max.: 100%	0 to 18%: Idling	Calculated value based on VTA1
THROTTLE POS #2	Absolute throttle position sensor No. 2: Min.: 0%, Max.: 100%	-	Calculated value based on VTA2
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
THROTTLE POS #2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
THROTTLE POS #1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully open	-
THROTTLE POS #2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.0 V: Throttle fully open	Read value with ignition switch ON (Do not start engine)
THRTL COMND VAL	Throttle position command value: Min.: 0 V, Max.: 4.9804 V	0.5 to 4.8 V	Read value with ignition switch ON (Do not start engine)
THROTTLE SSR #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.9804 V	0.6 to 0.9 V	ETCS service data
THROTTLE SSR #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.9804 V	2.2 to 2.6 V	ETCS service data
THRTL SSR #1 AD	Throttle position sensor No. 1 output voltage (AD): Min.: 0 V, Max.: 4.9804 V	0.6 to 0.9 V	ETCS service data
THROTTLE MOT	Whether or not throttle actuator control permitted: ON or OFF	ON: Idling	Read value with ignition switch ON (Do not start engine)
THROTTLE MOT	Throttle actuator current: Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	-
THROTTLE MOT	Throttle actuator: Min.: 0%, Max.: 100%	0.5 to 40%: Idling	-
THROTTLE MOT	Throttle actuator current: Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
THROTL OPN DUTY	Throttle actuator opening duty ratio: Min.: 0%, Max.: 100%	0 to 40%: Idling	• When accelerator pedal depressed, duty ratio increased • Read value with ignition switch ON (Do not start engine)

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
THROTL CLS DUTY	Throttle actuator closed duty ratio: Min.: 0%, Max.: 100%	0 to 40%: Idling	• When accelerator pedal released quickly, duty ratio increased • Read value with ignition switch ON (Do not start engine)
THRTL MOT (OPN)	Throttle actuator duty ratio (open): Min.: 0%, Max.: 100%	-	ETCS service data
THRTL MOT (CLS)	Throttle actuator duty ratio (closed): Min.: 0%, Max.: 100%	-	ETCS service data
O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2: Min.: 0 V Max.: 1.275 V	0.1 to 0.9 V: Driving at 70 km/h (44 mph)	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
O2S B2 S2	Heated oxygen sensor output voltage for bank 2 sensor 2: Min.: 0 V Max.: 1.275 V	0.1 to 0.9 V: Driving at 70 km/h (44 mph)	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
AFS B1 S1	A/F sensor output voltage for bank 1 sensor 1: Min.: 0 V Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
AFS B2 S1	A/F sensor output voltage for bank 2 sensor 1: Min.: 0 V Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing INJ VOL or A/F CONTROL function of ACTIVE TEST enables technician to check output voltage of sensor
TOTAL FT #1	Total fuel trim of bank 1 Average value for fuel system system of bank 1: Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
TOTAL FT #2	Total fuel trim of bank 2 Average value for fuel system system of bank 2: Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
SHORT FT #1	Short-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-20 to 20%	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
SHORT FT #2	Short-term fuel trim of bank 2: Min.: -100%, Max.: 99.2%	-20 to 20%	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio
LONG FT #1	Long-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-20 to 20%	Overall fuel compensation carried out in long-term to compensate for continual deviation of short-term fuel trim from central value
LONG FT #2	Long-term fuel trim of bank 2: Min.: -100%, Max.: 99.2%	-20 to 20%	Overall fuel compensation carried out in long-term to compensate for continual deviation of short-term fuel trim from central value
FUEL SYS #1	Fuel system status (Bank 1): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using A/F sensor as feedback for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but A/F sensor, which used for fuel control malfunctioning

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
FUEL SYS #2	Fuel system status (Bank 2): OL or CL or OL DRIVE or OL FAULT or CL FAULT	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied conditions to go closed loop • CL (Closed Loop): Using A/F sensor as feedback for fuel control • OL DRIVE: Open loop due to driving conditions (fuel enrichment) • OL FAULT: Open loop due to detected system fault • CL FAULT: Closed loop but A/F sensor, which used for fuel control malfunctioning
O2FT B1 S2	Short-term fuel trim associated with bank 1 sensor 2: Min.: -100%, Max.: 99.2%	-20 to 20%	Same as SHORT FT #1
O2FT B2 S2	Short-term fuel trim associated with bank 2 sensor 2: Min.: -100%, Max.: 99.2%	-20 to 20%	Same as SHORT FT #2
AF FT B1 S1	Short-term fuel trim associated with bank 1 sensor 1: Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) =Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = Rich	-
AF FT B2 S1	Short-term fuel trim associated with bank 2 sensor 1: Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) =Lean • Stoichiometric air-fuel ratio=1 • Value greater than 1 (1.001 to 1.999) = Rich	-
AFS B1 S1	A/F sensor current: Min.: -128 mA, Max.: 127.99 mA	-	-
AFS B2 S1	A/F sensor current: Min.: -128 mA, Max.: 127.99 mA	-	-
CAT TEMP B1S1	Estimated catalyst temperature (bank 1 sensor 1): Min.: -40°C, Max.: 6,513.5°C	-	-
CAT TEMP B1S2	Estimated catalyst temperature (bank 1 sensor 2): Min.: -40°C, Max.: 6,513.5°C	-	-
CAT TEMP B2S1	Estimated catalyst temperature (bank 2 sensor 1): Min.: -40°C, Max.: 6,513.5°C	-	-
CAT TEMP B2S2	Estimated catalyst temperature (bank 2 sensor 2): Min.: -40°C, Max.: 6,513.5°C	-	-
S O2S B1S2	Sub heated oxygen sensor impedance (bank 1 sensor2): Min.: 0 Ω, Max.: 21247.68 Ω	-	-
S O2S B2S2	Sub heated oxygen sensor impedance (bank 2 sensor2): Min.: 0 Ω, Max.: 21247.68 Ω	-	-
INI COOL TEMP	Engine coolant temperature at engine start: Min.: -40°C, Max.: 120°C	Close to ambient air temperature	-
INI INTAKE TEMP	Intake air temperature at engine start: Min.: -40°C, Max.: 120°C	Close to ambient air temperature	-
INJ VOL	Injection volume (cylinder 1): Min.: 0 ml, Max.: 2.048 ml	Max.: 0.5 ml	Quantity of fuel injected over 10 injections

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
STARTER SIG	Starter signal: ON or OFF	ON: Cranking	-
PS SW	Power steering signal: ON or OFF	ON: Power steering operation	-
PS SIGNAL	Power steering signal (history): ON or OFF	ON: When steering wheel first turned after battery terminals connected	Signal status usually ON until battery terminals disconnected
CTP SW	Closed throttle position switch: ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	-
A/C SIGNAL	A/C signal: ON or OFF	ON: A/C ON	-
PNP SW [NSW]	PNP switch status: ON or OFF	ON: P or N position	-
ELECT LOAD SIG	Electrical load signal: ON or OFF	ON: Headlights or defogger turned ON	-
STOP LIGHT SW	Stop light switch: ON or OFF	ON: Brake pedal depressed	-
+BM	Whether or not electric throttle control system power input: ON or OFF	ON: Idling	-
+BM VOLTAGE	+BM voltage: Min.: 0, Max.: 19.922	10 to 15 V: Idling	ETCS service data
BATTERY VOLTAGE	Battery voltage: Min.: 0 V, Max.: 65.535 V	9 to 14 V: Idling	-
ACTUATOR POWER	Actuator power supply: ON or OFF	ON: Idling	ETCS service data
ATM PRESSURE	Atmospheric pressure: Min.: 0 kPa, Max.: 255 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
BATTERY CURRENT	Battery current: Min.: -100 A, Max.: 100 A	-	-
BATTERY TEMP	Battery temperature: Min.: -45 °C, Max.: 156.4 °C	-	-
ALT OUTPUT DUTY	Generator output duty ratio: Min.: 0%, Max.: 100%	-	During charge control
ALT V NORMAL	Request output voltage: Min.: 0 V, Max.: 20 V	9 to 14 V	Not during alternator forced activation
ALT V ACT TST	Request output voltage: Min.: 0 V, Max.: 20 V	-	During alternator forced activation
FUEL PMP SP CTL	Fuel pump speed control status: ON or OFF	Idling: ON	Active Test support data
ACIS VSV	VSV for Acoustic Control Induction System Status: ON or OFF	-	ON: Open OFF: Closed
EVAP (Purge) VSV	Purge VSV status: ON or OFF	-	Active Test support data
FUEL PUMP / SPD	Fuel pump status: ON or OFF	-	Active Test support data
VVT CTRL B1	VVT control (bank 1) status: ON or OFF	-	Active Test support data
VVT CTRL B2	VVT control (bank 2) status: ON or OFF	-	Active Test support data
VACUUM PUMP	Key-off EVAP system leak detection pump status: ON or OFF	-	Active Test support data
EVAP VENT VAL	Key-off EVAP system vent valve status: ON or OFF	-	Active Test support data
FAN MOTOR	Electric fan motor: ON or OFF	ON: Electric fan motor operating	Active Test support data

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
AICV VSV	VSV for Air Intake Control System Status: ON or OFF	-	-
TC/TE1	TC and CG (TE1) terminal of DLC3: ON or OFF	-	Active Test support data
VVTL AIM ANGL#1	VVT aim angle bank 1 Intake side): Min.: 0%, Max.: 100%	-	Target angle during intrusive operation
VVT CHNG ANGL#1	VVT change angle (bank 1 Intake side): Min.: 0°FR, Max.: 60°FR	0 to 5°FR: Idling	Displacement angle during intrusive operation
VVT OCV DUTY B1	VVT OCV operation duty (bank 1 Intake side): Min.: 0%, Max.: 100%	0 to 100%	Requested duty value for intrusive operation
VVT EX HOLD B1	VVT exhaust hold duty ratio learning value (bank 1 Exhaust side): Min.: 0%, Max.: 100%	10 to 50%: Idling	Requested duty value for intrusive operation
VVT EX CHG ANG1	VVT change angle (bank 1 Exhaust side): Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	Displacement angle during intrusive operation
VVT EX OCV D B1	VVT OCV operation duty (bank 1 Exhaust side): Min.: 0%, Max.: 100%	0 to 100%	Requested duty value for intrusive operation
VVTL AIM ANGL #2	VVT aim angle (bank 2 Intake side): Min.: 0%, Max.: 100%	-	Target angle during intrusive operation
VVT CHNG ANGL #2	VVT change angle (bank 2 Intake side): Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	Displacement angle during intrusive operation
VVT OCV DUTY B2	VVT OCV operation duty (bank 2 Intake side): Min.: 0%, Max.: 100%	0 to 100%	Requested duty value for intrusive operation
VVT EX HOLD B2	VVT exhaust hold duty ratio learning value (bank 2 Exhaust side): Min.: 0%, Max.: 100%	10 to 50%: Idling	Requested duty value for intrusive operation
VVT EX CHG ANG2	VVT change angle (bank 2 Exhaust side): Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	Displacement angle during intrusive operation
VVT EX OCV D B2	VVT exhaust operation duty (bank 2 Exhaust side): Min.: 0%, Max.: 100%	0 to 100%	Requested duty value for intrusive operation
FC IDL	Fuel cut idle: ON or OFF	ON: Fuel cut operation	FC IDL = "ON" when throttle valve fully closed and engine speed over 2,800 rpm
FC TAU	Fuel cut TAU (Fuel cut during very light load): ON or OFF	ON: Fuel cut operating	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete
IGNITION	Ignition counter: Min.: 0, Max.: 800	0 to 800	-
CYL #1	Misfire ratio of cylinder 1: Min.: 0, Max.: 255	0	This item displayed only during idling
CYL #2	Misfire ratio of cylinder 2: Min.: 0, Max.: 255	0	This item displayed only during idling
CYL #3	Misfire ratio of cylinder 3: Min.: 0, Max.: 255	0	This item displayed only during idling
CYL #4	Misfire ratio of cylinder 4: Min.: 0, Max.: 255	0	This item displayed only during idling

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
CYL #5	Misfire ratio of cylinder 5: Min.: 0, Max.: 255	0	This item displayed only during idling
CYL #6	Misfire ratio of cylinder 6: Min.: 0, Max.: 255	0	This item displayed only during idling
CYL ALL	All cylinders misfire rate: Min.: 0, Max.: 255	0 to 35	-
MISFIRE RPM	Engine RPM for first misfire range: Min.: 0 rpm, Max.: 6,375 rpm	0 rpm: Misfire 0	-
MISFIRE LOAD	Engine load for first misfire range: Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
MISFIRE MARGIN	Misfire monitoring: Min.: -100%, Max.: 99.22%	-100 to 99.22%	Misfire detecting margin
#CODES	#Codes: Min.: 0, Max.: 255	-	Number of detected DTCs
CHECK MODE	Check mode: ON or OFF	ON: Check mode ON	(see page ES-42)
SPD TEST	Check mode result for vehicle speed sensor: COMPL or INCMPL	-	-
MISFIRE TEST	Check mode result for misfire monitor: COMPL or INCMPL	-	-
OXS1 TEST	Check mode result for HO2 sensor (bank 1): COMPL or INCMPL	-	-
OXS2 TEST	Check mode result for HO2 sensor (bank 2): COMPL or INCMPL	-	-
A/F SSR TEST B1	Check mode result for air-fuel ratio sensor (bank 1): COMPL or INCMPL	-	-
A/F SSR TEST B2	Check mode result for air-fuel ratio sensor (bank 2): COMPL or INCMPL	-	-
MIL	MIL status: ON or OFF	ON: MIL ON	-
MIL ON RUN DIST	MIL ON run distance: Min.: 0 km, Max.: 65,535 km	Distance driven after DTC detected	-
MIL ON RUN TIME	Running time from MIL ON: Min.: 0 minutes, Max.: 65,535 minutes	Running time after MIL ON	-
ENG RUN TIME	Engine run time: Min.: 0 seconds, Max.: 65,535 seconds	Time after engine start	-
TIME DTC CLEAR	Time after DTC cleared: Min.: 0 minutes, Max.: 65,535 minutes	Time after DTCs erased	-
DIST DTC CLEAR	Distance after DTC cleared: Min.: 0 km, Max.: 65,535 km	Distance driven after DTCs erased	-
WU CYC DTC CLEAR	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	-	Number of warm-up cycles after DTC cleared
OBD CERT	OBD requirement	OBD2	-
#CARB CODES	Number of emission related DTCs	-	-
COMP MON	Comprehensive component monitor: NOT AVL or AVAIL	-	-
FUEL MON	Fuel system monitor: NOT AVL or AVAIL	-	-

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
MISFIRE MON	Misfire monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) HTR	O2S (A/FS) heater monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) HTR	O2S (A/FS) heater monitor: COMPL or INCMPL	-	-
O2S (A/FS) MON	O2S (A/FS) monitor: NOT AVL or AVAIL	-	-
O2S (A/FS) MON	O2S (A/FS) monitor: COMPL or INCMPL	-	-
EVAP MON	EVAP monitor: NOT AVL or AVAIL	-	-
EVAP MON	EVAP monitor: COMPL or INCMPL	-	-
CAT MON	Catalyst monitor: NOT AVL or AVAIL	-	-
CAT MON	Catalyst monitor: COMPL or INCMPL	-	-
CCM ENA	Comprehensive component monitor: UNABLE or ENABLE	-	-
CCM CMPL	Comprehensive component monitor: COMPL or INCMPL	-	-
FUEL ENA	Fuel system monitor: UNABLE or ENABLE	-	-
FUEL CMPL	Fuel system monitor: COMPL or INCMPL	-	-
MISFIRE ENA	Misfire monitor: UNABLE or ENABLE	-	-
MISFIRE CMPL	Misfire monitor: COMPL or INCMPL	-	-
EGR ENA	EGR monitor: UNABLE or ENABLE	-	-
EGR CMPL	EGR monitor: COMPL or INCMPL	-	-
HTR ENA	O2S (A/FS) heater monitor: UNABLE or ENABLE	-	-
HTR CMPL	O2S (A/FS) heater monitor: COMPL or INCMPL	-	-
O2S (A/FS) ENA	O2S (A/FS) monitor: UNABLE or ENABLE	-	-
O2S (A/FS) CMPL	O2S (A/FS) monitor: COMPL or INCMPL	-	-
ACRF ENA	A/C monitor: UNABLE or ENABLE	-	-
ACRF CMPL	A/C monitor: COMPL or INCMPL	-	-
AIR ENA	2nd Air monitor: UNABLE or ENABLE	-	-
AIR CMPL	2nd Air monitor: COMPL or INCMPL	-	-
EVAP ENA	EVAP monitor: UNABLE or ENABLE	-	-
EVAP CMPL	EVAP monitor: COMPL or INCMPL	-	-
HCAT ENA	Heated catalyst monitor: UNABLE or ENABLE	-	-

Tester Display	Measurement Item/Range	Normal Condition*	Diagnostic Note
HCAT CMPL	Heated catalyst monitor: COMPL or INCMPL	-	-
CAT ENA	Catalyst monitor: UNABLE or ENABLE	-	-
CAT CMPL	Catalyst monitor: COMPL or INCMPL	-	-
MODEL CODE	Model code information	-	Identifying model code: GSA3#
ENGINE TYPE	Engine type information	-	Identifying engine type: 2GRFE
CYLINDER NUMBER	Cylinder number: Min.: 0, Max.: 255	-	Identifying cylinder number: 6
TRANSMISSION	Transmission type information	-	Identifying transmission type: 5AT
DESTINATION	Destination information	-	Identifying destination: A (America)
MODEL YEAR	Model year: Min.: 1900, Max.: 2155	-	Identifying model year: 200#
SYSTEM	Engine system information	-	Identifying engine system: GASLIN (gasoline engine)

ES

HINT:

*: If no idling conditions are specified, the transmission gear selector lever should be in the N or P position, and the A/C switch and all accessory switches should be OFF.

2. ACTIVE TEST

HINT:

Performing the ACTIVE TEST enables components including the relays, VSV (Vacuum Switching Valve) and actuators, to be operated without removing any parts. The ACTIVE TEST can be performed with the intelligent tester. Performing the ACTIVE TEST as the first step of troubleshooting is one method of shortening diagnostic time.

The DATA LIST can be displayed during the ACTIVE TEST.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST.
(e) Perform the ACTIVE TEST by referring to the table below.

ECM:

Tester Display	Test Part	Control Range	Diagnostic Note
INJ VOL	Change injection volume	-12.5 to 24.8%	• All injectors tested at same time • Perform test at less than 3,000 rpm • Injection volume can be changed in 0.2% graduations within control range

Tester Display	Test Part	Control Range	Diagnostic Note
A/F CONTROL	Change injection volume	Decrease by 12.5% or increase by 24.8%	• Perform test at less than 3,000 rpm • A/F CONTROL enables checking and graphing of A/F (Air-Fuel Ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs • To conduct test, select following menu items: ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2; then press YES and ENTER followed by F4.
FUEL PMP SP CTL	Fuel pump speed control	ON (low speed) / OFF (high speed)	Test possible when following conditions met: • Ignition switch ON • Engine is stopped
INTAKE CTL VSV1	Activate the VSV for Acoustic Control Induction System (ACIS)	ON/OFF	-
EVAP VSV (ALONE)	Activate purge VSV control	ON/OFF	-
VVT CTRL B1	Turn on and off OCV (Oil Control Valve) for VVT (Bank 1)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV OFF • Test possible while vehicle stopped and engine idling
VVT CTRL B2	Turn on and off OCV (Oil Control Valve) for VVT (Bank 2)	ON/OFF	• Engine stalls or idles roughly when OCV turned ON • Normal engine running or idling when OCV OFF • Test possible while vehicle stopped and engine idling
FUEL PUMP / SPD	Activate fuel pump (C/OPN Relay)	ON/OFF	Test possible when engine stopped
TC/TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 connected • OFF: TC and TE1 disconnected
FC IDL PROHBT	Prohibit idling fuel cut control	ON/OFF	-
COOLING FAN	Control electric cooling fan	ON/OFF	-
ETCS OPEN SLOW	Control the ETCS (throttle actuator)	ON: Throttle valve opens slowly	Test possible when following conditions met: • Engine stopped • Shift position in P • Fully depressing accelerator pedal (APP: 59° or more)
ETCS CLOSE SLOW	Control the ETCS (throttle actuator)	ON: Throttle valve closes slowly	
ETCS OPEN FAST	Control the ETCS (throttle actuator)	ON: Throttle valve opens fast	
ETCS CLOSE FAST	Control the ETCS (throttle actuator)	ON: Throttle valve closes fast	
VVT B1	Control the VVT (bank 1 Intake Side)	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100% : Maximum retard	-
VVT B2	Control the VVT (bank 2 Intake Side)	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100% : Maximum retard	-
VVT EX B1	Control the VVT (bank 1 Exhaust Side)	-128 to 127% This valve added to present OCV control duty 100%: Maximum retard -100%: Maximum advance	-

Tester Display	Test Part	Control Range	Diagnostic Note
VVT EX B2	Control the VVT (bank 2 Exhaust Side)	-128 to 127% This valve added to present OCV control duty 100%: Maximum retard -100%: Maximum advance	-
VACUUM PUMP	Activate the leak detection pump	ON/OFF	-
VENT VALVE	Activate the vent valve	ON/OFF	-
AICV VSV	Activate the VSV for Air Intake Control System (AICS)	ON/OFF	-
ALT VOL	Request output voltage of generator regulator during forced activation	12.5 to 14.8 V	Engine running
FUEL CUT #1	Cylinder #1 injector fuel cut	ON/OFF	Test possible during vehicle stopping and engine idling ON: Injector fuel cut and ignition stop
FUEL CUT #2	Cylinder #2 injector fuel cut	ON/OFF	
FUEL CUT #3	Cylinder #3 injector fuel cut	ON/OFF	
FUEL CUT #4	Cylinder #4 injector fuel cut	ON/OFF	
FUEL CUT #5	Cylinder #5 injector fuel cut	ON/OFF	
FUEL CUT #6	Cylinder #6 injector fuel cut	ON/OFF	

ES

3. SYSTEM CHECK

HINT:

Performing a SYSTEM CHECK enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are set, and can detect potential malfunctions in the system. The SYSTEM CHECK can be performed with the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK.
(e) Perform the SYSTEM CHECK by referring to the table below.

ECM:

Tester Display	Test Part	Control Range	Diagnostic Note
EVAP SYS CHECK (AUTO OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor automatically	-	• If no DTCs in PENDING CODE after performing this test, system functioning normally • 35°C (95°F) or less • Refer to EVAP system
EVAP SYS CHECK (MANUAL OPERATION)	Perform 5 steps in order to operate EVAP key-off monitor manually	-	• Used to detect malfunctioning parts • 35°C (95°F) or less • Refer to EVAP system

DIAGNOSTIC TROUBLE CODE CHART

HINT:
Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.
If any DTCs are displayed during a check mode DTC check, check the trouble area for the DTCs listed in the table below.
For details of each DTC, refer to the "See page" below.

SFI system

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	1. Open or short in Oil Control Valve (OCV) circuit for intake camshaft (bank 1) 2. OCV for intake camshaft (bank 1) 3. ECM	Comes on	DTC stored	ES-74
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	1. Valve timing 2. OCV for intake camshaft (bank 1) 3. OCV filter (bank 1) 4. Intake camshaft (bank 1) timing gear assembly 5. ECM	Comes on	DTC stored	ES-78
P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)	Same as DTC P0011	Comes on	DTC stored	ES-78
P0013	Camshaft Position "B" Actuator Circuit / Open (Bank 1)	1. Open or short in OCV for exhaust camshaft (bank 1) circuit 2. OCV for exhaust camshaft (bank 1) 3. ECM	Comes on	DTC stored	ES-86
P0014	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 1)	1. Valve timing 2. OCV for exhaust camshaft (bank 1) 3. OCV filter (bank 1) 4. Exhaust camshaft 5. ECM	Comes on	DTC stored	ES-90
P0015	Camshaft Position "B" - Timing Over-Retarded (Bank 1)	1. Valve timing 2. OCV for exhaust camshaft (bank 1) 3. OCV filter (bank 1) 4. Exhaust camshaft 5. ECM	Comes on	DTC stored	ES-90
P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)	1. Mechanical system (Timing chain has jumped tooth or chain stretched) 2. ECM	Comes on	DTC stored	ES-98
P0017	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B)	1. Mechanical system (Timing chain has jumped tooth or chain stretched) 2. ECM	Comes on	DTC stored	ES-98
P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)	1. Mechanical system (Timing chain has jumped tooth or chain stretched) 2. ECM	Comes on	DTC stored	ES-98

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0019	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)	1. Mechanical system (Timing chain has jumped tooth or chain stretched) 2. ECM	Comes on	DTC stored	ES-98
P0020	Camshaft Position "A" Actuator Circuit (Bank 2)	1. Open or short in OCV circuit for intake camshaft (bank 2) 2. OCV for intake camshaft (bank 2) 3. ECM	Comes on	DTC stored	ES-74
P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)	1. Valve timing 2. Oil Control Valve (OCV) for intake camshaft (bank 2) 3. OCV filter (bank 2) 4. Intake camshaft (bank 2) timing gear assembly 5. ECM	Comes on	DTC stored	ES-78
P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)	1. Valve timing 2. OCV for intake camshaft (bank 2) 3. OCV filter (bank 2) 4. Intake camshaft (bank 2) timing gear assembly 5. ECM	Comes on	DTC stored	ES-78
P0023	Camshaft Position "B" Actuator Circuit / Open (Bank 2)	1. Open or short in OCV for exhaust camshaft (bank 2) circuit 2. OCV for exhaust camshaft (bank 2) 3. ECM	Comes on	DTC stored	ES-86
P0024	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)	1. Valve timing 2. OCV for exhaust camshaft (bank 2) 3. OCV filter (bank 2) 4. Exhaust camshaft timing gear assembly 5. ECM	Comes on	DTC stored	ES-90
P0025	Camshaft Position "B" - Timing Over-Retarded (Bank 2)	1. Valve timing 2. OCV for exhaust camshaft (bank 2) 3. OCV filter (bank 2) 4. Exhaust camshaft timing gear assembly 5. ECM	Comes on	DTC stored	ES-90
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	1. Open in Air-Fuel Ratio (A/F) sensor heater circuit 2. A/F sensor heater (bank 1 sensor 1) 3. Integration relay 4. ECM	Comes on	DTC stored	ES-101
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	1. Short in A/F sensor heater circuit 2. A/F sensor heater (bank 1 sensor 1) 3. Integration relay 4. ECM	Comes on	DTC stored	ES-101

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	1. Open in Heated Oxygen (HO2) sensor heater circuit 2. HO2 sensor heater (bank 1 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	1. Short in HO2 sensor heater circuit 2. HO2 sensor heater (bank 1 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)	1. Open in A/F sensor heater (bank 2 sensor 1) circuit 2. A/F sensor heater (bank 2 sensor 1) 3. Integration relay 4. ECM	Comes on	DTC stored	ES-101
P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)	1. Short in A/F sensor heater circuit (bank 2 sensor 1) circuit 2. A/F sensor heater (bank 2 sensor 1) 3. Integration relay 4. ECM	Comes on	DTC stored	ES-101
P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)	1. Open in Heated Oxygen (HO2) sensor heater circuit 2. HO2 sensor heater (bank 2 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)	1. Short in HO2 sensor heater circuit 2. HO2 sensor heater (bank 2 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0100	Mass or Volume Air Flow Circuit	1. Open or short in Mass Air Flow (MAF) meter circuit 2. MAF meter 3. ECM	Comes on	DTC stored	ES-115
P0101	Mass Air Flow Circuit Range / Performance Problem	1. MAF meter 2. Air induction system 3. PCV hose connections	Comes on	DTC stored	ES-122
P0102	Mass or Volume Air Flow Circuit Low Input	1. Open or short in MAF meter circuit 2. MAF meter 3. ECM	Comes on	DTC stored	ES-115
P0103	Mass or Volume Air Flow Circuit High Input	1. Open or short in MAF meter circuit 2. MAF meter 3. ECM	Comes on	DTC stored	ES-115

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0110	Intake Air Temperature Circuit Malfunction	1. Open or short in Intake Air Temperature (IAT) sensor circuit 2. IAT sensor (built into MAF meter) 3. ECM	Comes on	DTC stored	ES-125
P0111	Intake Air Temperature Sensor Gradient Too High	Mass air flow meter	Comes on	DTC stored	ES-131
P0112	Intake Air Temperature Circuit Low Input	1. Short in IAT sensor circuit 2. IAT sensor (built into MAF meter) 3. ECM	Comes on	DTC stored	ES-125
P0113	Intake Air Temperature Circuit High Input	1. Open in IAT sensor circuit 2. IAT sensor (built into MAF meter) 3. ECM	Comes on	DTC stored	ES-125
P0115	Engine Coolant Temperature Circuit Malfunction	1. Open or short in Engine Coolant Temperature (ECT) sensor circuit 2. ECT sensor 3. ECM	Comes on	DTC stored	ES-134
P0116	Engine Coolant Temperature Circuit Range / Performance Problem	1. Thermostat 2. ECT sensor	Comes on	DTC stored	ES-140
P0117	Engine Coolant Temperature Circuit Low Input	1. Short in ECT sensor circuit 2. ECT sensor 3. ECM	Comes on	DTC stored	ES-134
P0118	Engine Coolant Temperature Circuit High Input	1. Open in ECT sensor circuit 2. ECT sensor 3. ECM	Comes on	DTC stored	ES-134
P0120	Throttle / Pedal Position Sensor / Switch "A" Circuit Malfunction	1. Throttle Position (TP) sensor (built into throttle body) 2. ECM	Comes on	DTC stored	ES-143
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	TP sensor (built into throttle body)	Comes on	DTC stored	ES-150
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	1. TP sensor (built into throttle body) 2. Short in VTA1 circuit 3. Open in VC circuit 4. ECM	Comes on	DTC stored	ES-143
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	1. TP sensor (built into throttle body) 2. Open in VTA1 circuit 3. Open in E2 circuit 4. Short between VC and VTA1 circuits 5. ECM	Comes on	DTC stored	ES-143

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control	1. Cooling system 2. ECT sensor 3. Thermostat	Comes on	DTC stored	ES-152
P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)	1. Thermostat 2. Cooling system 3. ECT sensor 4. ECM	Comes on	DTC stored	ES-155
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	1. Open or short in HO2 sensor (bank 1 sensor 2) circuit 2. HO2 sensor (bank 1 sensor 2) 3. HO2 sensor heater (bank 1 sensor 2) 4. Air-Fuel Ratio (A/F) sensor (bank 1 sensor 1) 5. Integration relay (EFI MAIN relay) 6. Gas leakage from exhaust system	Comes on	DTC stored	ES-158
P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	1. Open in HO2 sensor (bank 1 sensor 2) circuit 2. HO2 sensor (bank 1 sensor 2) 3. HO2 sensor heater (bank 1 sensor 2) 4. Integration relay (EFI MAIN relay) 5. Gas leakage from exhaust system	Comes on	DTC stored	ES-158
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	1. Short in HO2 sensor (bank 1 sensor 2) circuit 2. HO2 sensor (bank 1 sensor 2) 3. ECM internal circuit malfunction	Comes on	DTC stored	ES-158
P0141	Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)	1. Open or short in HO2 sensor heater circuit 2. HO2 sensor heater (bank 1 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)	1. Open or short in HO2 sensor (bank 2 sensor 2) circuit 2. HO2 sensor (bank 2 sensor 2) 3. HO2 sensor heater (bank 2 sensor 2) 4. Air-Fuel Ratio (A/F) sensor (bank 2 sensor 1) 5. Integration relay (EFI MAIN relay) 6. Gas leakage from exhaust system	Comes on	DTC stored	ES-158

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)	1. Open in HO2 sensor (bank 2 sensor 2) circuit 2. HO2 sensor (bank 2 sensor 2) 3. HO2 sensor heater (bank 2 sensor 2) 4. integration relay (EFI MAIN relay) 5. Gas leakage from exhaust system	Comes on	DTC stored	ES-158
P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)	1. Short in HO2 sensor (bank 2 sensor 2) circuit 2. HO2 sensor (bank 2 sensor 2) 3. ECM internal circuit malfunction	Comes on	DTC stored	ES-158
P0161	Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)	1. Open or short in HO2 sensor heater circuit 2. HO2 sensor heater (bank 2 sensor 2) 3. Integration relay (EFI MAIN relay) 4. ECM	Comes on	DTC stored	ES-107
P0171	System Too Lean (Bank 1)	1. Air induction system 2. Injector blockage 3. MAF meter 4. ECT sensor 5. Fuel pressure 6. Gas leakage from exhaust system 7. Open or short in A/F sensor (bank 1 sensor 1) circuit 8. A/F sensor (bank 1 sensor 1) 9. A/F sensor heater (bank 1 sensor 1) 10. Integration relay 11. A/F sensor heater and integration relay circuits 12. PCV valve and hose 13. PCV hose connections 14. ECM	Comes on	DTC stored	ES-176

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0172	System Too Rich (Bank 1)	1. Injector leakage or blockage 2. MAF meter 3. ECT sensor 4. Ignition system 5. Fuel pressure 6. Gas leakage from exhaust system 7. Open or short in A/F sensor (bank 1 sensor 1) circuit 8. A/F sensor (bank 1 sensor 1) 9. A/F sensor heater (bank 1 sensor 1) 10. Integration relay 11. A/F sensor heater and integration relay circuits 12. ECM	Comes on	DTC stored	ES-176
P0174	System Too Lean (Bank 2)	1. Air induction system 2. Injector blockage 3. Mass Air Flow (MAF) meter 4. Engine Coolant Temperature (ECT) sensor 5. Fuel pressure 6. Gas leakage from exhaust system 7. Open or short in A/F sensor (bank 2 sensor 1) circuit 8. A/F sensor (bank 2 sensor 1) 9. A/F sensor heater (bank 2 sensor 1) 10. Integration relay 11. A/F sensor heater and integration relay circuits 12. PCV valve and hose 13. PCV hose connections 14. ECM	Comes on	DTC stored	ES-176
P0175	System Too Rich (Bank 2)	1. Injector leakage or blockage 2. MAF meter 3. ECT sensor 4. Ignition system 5. Fuel pressure 6. Gas leakage from exhaust system 7. Open or short in A/F sensor (bank 2 sensor 1) circuit 8. A/F sensor (bank 2 sensor 1) 9. A/F sensor heater (bank 2 sensor 1) 10. Integration relay 11. A/F sensor heater and integration relay circuits 12. ECM	Comes on	DTC stored	ES-176

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0220	Throttle / Pedal Position Sensor / Switch "B" Circuit	1. TP sensor (built into throttle body) 2. ECM	Comes on	DTC stored	ES-143
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	1. TP sensor (built into throttle body) 2. Short in VTA2 circuit 3. Open in VC circuit 4. ECM	Comes on	DTC stored	ES-143
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	1. TP sensor (built into throttle body) 2. Open in VTA2 circuit 3. Open in E2 circuit 4. Short between VC and VTA2 circuits 5. ECM	Comes on	DTC stored	ES-143
P0230	Fuel Pump Primary Circuit	1. Open or short in F/PMP relay circuit 2. F/PMP relay 3. ECM	-	DTC stored	ES-185
P0300	Random / Multiple Cylinder Misfire Detected	1. Open or short in engine wire harness 2. Connector connection 3. Vacuum hose connection 4. Ignition system 5. Injector 6. Fuel pressure 7. MAF meter 8. ECT sensor 9. Compression pressure 10. Valve clearance 11. Valve timing 12. PCV valve and hose 13. PCV hose connections 14. Air induction system 15. ECM	Comes on/Blinks*1	DTC stored	ES-189
P0301	Cylinder 1 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0302	Cylinder 2 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0303	Cylinder 3 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0304	Cylinder 4 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0305	Cylinder 5 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0306	Cylinder 6 Misfire Detected	Same as DTC P0300	Comes on/Blinks*1	DTC stored	ES-189
P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)	1. Short in knock sensor circuit (bank 1) 2. Knock sensor (bank 1) 3. ECM	Comes on	DTC stored	ES-201

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)	1. Open in knock sensor circuit (bank 1) 2. Knock sensor (bank 1) 3. ECM	Comes on	DTC stored	ES-201
P0332	Knock Sensor 2 Circuit Low Input (Bank 2)	1. Short in knock sensor circuit (bank 2) 2. Knock sensor (bank 2) 3. ECM	Comes on	DTC stored	ES-201
P0333	Knock Sensor 2 Circuit High Input (Bank 2)	1. Open in knock sensor circuit (bank 2) 2. Knock sensor (bank 2) 3. ECM	Comes on	DTC stored	ES-201
P0335	Crankshaft Position Sensor "A" Circuit	1. Open or short in Crankshaft Position (CKP) sensor circuit 2. CKP sensor 3. CKP sensor plate 4. ECM	Comes on	DTC stored	ES-207
P0339	Crankshaft Position Sensor "A" Circuit Intermittent	Same as DTC P0335	-	DTC stored	ES-207
P0340	Camshaft Position Sensor Circuit Malfunction	1. Open or short in VVT sensor circuit for intake camshaft 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214
P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)	1. Open or short in VVT sensor circuit for intake camshaft 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214
P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)	1. Open or short in VVT sensor for intake camshaft circuit 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0345	Camshaft Position Sensor "A" Circuit (Bank 2)	1. Open or short in VVT sensor for intake camshaft circuit 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214
P0347	Camshaft Position Sensor "A" Circuit Low Input (Bank 2)	1. Open or short in VVT sensor for intake camshaft circuit 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214
P0348	Camshaft Position Sensor "A" Circuit High Input (Bank 2)	1. Open or short in VVT sensor for intake camshaft circuit 2. VVT sensor for intake camshaft 3. Camshaft timing gear for intake camshaft 4. Jumped tooth of timing chain for intake camshaft 5. ECM	Comes on	DTC stored	ES-214
P0351	Ignition Coil "A" Primary / Secondary Circuit	1. Ignition system 2. Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil with igniter and ECM 3. No. 1 to No. 6 ignition coils with igniters 4. ECM	Comes on	DTC stored	ES-220
P0352	Ignition Coil "B" Primary / Secondary Circuit	Same as DTC P0351	Comes on	DTC stored	ES-220
P0353	Ignition Coil "C" Primary / Secondary Circuit	Same as DTC P0351	Comes on	DTC stored	ES-220
P0354	Ignition Coil "D" Primary / Secondary Circuit	Same as DTC P0351	Comes on	DTC stored	ES-220
P0355	Ignition Coil "E" Primary / Secondary Circuit	Same as DTC P0351	Comes on	DTC stored	ES-220
P0356	Ignition Coil "F" Primary / Secondary Circuit	Same as DTC P0351	Comes on	DTC stored	ES-220

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0365	Camshaft Position Sensor "B" Circuit (Bank 1)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229
P0367	Camshaft Position Sensor "B" Circuit Low Input (Bank 1)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229
P0368	Camshaft Position Sensor "B" Circuit High Input (Bank 1)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229
P0390	Camshaft Position Sensor "B" Circuit (Bank 2)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229
P0392	Camshaft Position Sensor "B" Circuit Low Input (Bank 2)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229
P0393	Camshaft Position Sensor "B" Circuit High Input (Bank 2)	1. Open or short in VVT sensor for exhaust camshaft circuit 2. VVT sensor for exhaust camshaft 3. Exhaust camshaft 4. Jumped tooth of timing chain 5. ECM	Comes on	DTC stored	ES-229

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0420	Catalyst System Efficiency Below Threshold (Bank 1)	1. Front exhaust pipe (with Three-Way Catalytic Converter) 2. Gas leakage from exhaust system 3. A/F sensor (bank 1 sensor 1) 4. HO2 sensor (bank 1 sensor 2)	Comes on	DTC stored	ES-234
P0430	Catalyst System Efficiency Below Threshold (Bank 2)	1. Front exhaust pipe (with TWC) 2. Gas leakage from exhaust system 3. A/F sensor (bank 2 sensor 1) 4. HO2 sensor (bank 2 sensor 2)	Comes on	DTC stored	ES-234
P043E	Evaporative Emission System Reference Orifice Clog Up	1. Canister pump module 2. Connector / wire harness (between canister pump module and ECM) 3. Leakage from EVAP system 4. ECM	Comes on	DTC stored	ES-241
P043F	Evaporative Emission System Reference Orifice High Flow	1. Canister pump module 2. Connector / wire harness (between canister pump module and ECM) 3. Leakage from EVAP system 4. ECM	Comes on	DTC stored	ES-241
P0441	Evaporative Emission Control System Incorrect Purge Flow	1. Purge VSV 2. Connector/wire harness (Purge VSV - ECM) 3. Canister pump module 4. Leakage from EVAP system 5. Leakage from EVAP line (Purge VSV - Intake manifold) 6. ECM	Comes on	DTC stored	ES-245
P0450	Evaporative Emission Control System Pressure Sensor / Switch	1. Canister pump module 2. EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) 3. ECM	Comes on	DTC stored	ES-252

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P0451	Evaporative Emission Control System Pressure Sensor Range / Performance	1. Canister pump module 2. Connector/wire harness (Canister pump module - ECM) 3. EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) 4. ECM	Comes on	DTC stored	ES-252
P0452	Evaporative Emission Control System Pressure Sensor / Switch Low Input	Same as DTC P0451	Comes on	DTC stored	ES-252
P0453	Evaporative Emission Control System Pressure Sensor / Switch High Input	Same as DTC P0451	Comes on	DTC stored	ES-252
P0455	Evaporative Emission Control System Leak Detected (Gross Leak)	1. Fuel tank cap (loose) 2. Leakage from EVAP line (Canister - Fuel tank) 3. Leakage from EVAP line (Purge VSV - Canister) 4. Canister pump module 5. Leakage from fuel tank 6. Leakage from canister	Comes on	DTC stored	ES-262
P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)	Same as DTC P0455	Comes on	DTC stored	ES-262
P0500	Vehicle Speed Sensor "A"	1. Open or short in speed signal circuit 2. Vehicle speed sensor 3. Combination meter 4. ECM 5. Skid control ECU	Comes on	DTC stored	ES-266
P0504	Brake Switch "A" / "B" Correlation	1. Short in stop light switch signal circuit 2. STOP fuse 3. IGN fuse 4. Stop light switch 5. ECM	-	DTC stored	ES-271
P0505	Idle Control System Malfunction	1. ETCS (Electronic Throttle Control System) 2. Air induction system 3. PCV hose connections 4. ECM	Comes on	DTC stored	ES-275

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P050A	Cold Start Idle Air Control System Performance	1. Throttle body assembly 2. MAF meter 3. Air induction system 4. PCV hose connections 5. VVT system 6. Air cleaner filter element 7. ECM	Comes on	DTC stored	ES-279
P050B	Cold Start Ignition Timing Performance	Same as DTC P050A	Comes on	DTC stored	ES-279
P0516	Battery Temperature Sensor Circuit Low	1. Battery current sensor 2. Short in battery current sensor circuit 3. ECM	-	DTC stored	ES-285
P0517	Battery Temperature Sensor Circuit High	1. Battery current sensor 2. Open in battery current sensor circuit 3. ECM	-	DTC stored	ES-285
P0560	System Voltage	1. Open in back up power source circuit 2. Battery 3. Battery terminals 4. EFI MAIN fuse 5. ECM	Comes on	DTC stored	ES-287
P0604	Internal Control Module Random Access Memory (RAM) Error	ECM	Comes on	DTC stored	ES-291
P0606	ECM / PCM Processor	ECM	Comes on/-*2	DTC stored	ES-291
P0607	Control Module Performance	ECM	Comes on	DTC stored	ES-291
P0617	Starter Relay Circuit High	1. Park/Neutral Position (PNP) switch 2. ST relay circuit 3. Ignition switch 4. ECM	Comes on	DTC stored	ES-293
P0630	VIN not Programmed or Mismatch - ECM / PCM	ECM	Comes on	DTC stored	ES-298
P0657	Actuator Supply Voltage Circuit / Open	ECM	Comes on	DTC stored	ES-291
P0724	Brake Switch "B" Circuit High	1. Short in stop light switch circuit 2. Stop light switch 3. ECM	Comes on	DTC stored	ES-300
P1550	Battery Current Sensor Circuit	1. Open or short in battery current sensor circuit 2. Battery current sensor 3. ECM	-	DTC stored	ES-303
P1551	Battery Current Sensor Circuit Low	1. Short in battery current sensor circuit 2. Battery current sensor 3. ECM	-	DTC stored	ES-303

DTC No.	Detection Item	Trouble Area	MIL	Memory	See page
P1552	Battery Current Sensor Circuit High	1. Open in battery current sensor circuit 2. Battery current sensor 3. ECM	-	DTC stored	ES-303
P1602	Deterioration of Battery	1. Battery 2. ECM back-up power source circuit	-	DTC stored	ES-306
P2102	Throttle Actuator Control Motor Circuit Low	1. Open in throttle actuator circuit 2. Throttle actuator 3. ECM	Comes on	DTC stored	ES-307
P2103	Throttle Actuator Control Motor Circuit High	1. Short in throttle actuator circuit 2. Throttle actuator 3. Throttle valve 4. Throttle body assembly 5. ECM	Comes on	DTC stored	ES-307
P2111	Throttle Actuator Control System - Stuck Open	1. Throttle actuator 2. Throttle body assembly 3. Throttle valve	Comes on	DTC stored	ES-311
P2112	Throttle Actuator Control System - Stuck Closed	Same as DTC P2111	Comes on	DTC stored	ES-311
P2118	Throttle Actuator Control Motor Current Range / Performance	1. Open in ETCS power source circuit 2. Battery 3. Battery terminals 4. ETCS fuse 5. ECM	Comes on	DTC stored	ES-314
P2119	Throttle Actuator Control Throttle Body Range / Performance	1. ETCS 2. ECM	Comes on	DTC stored	ES-321
P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit	1. Accelerator Pedal Position (APP) sensor 2. ECM	Comes on	DTC stored	ES-324
P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance	1. APP sensor 2. ECM	Comes on	DTC stored	ES-331
P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input	1. APP sensor 2. Open in VCP1 circuit 3. Open or ground short in VPA circuit 4. ECM	Comes on	DTC stored	ES-324
P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input	1. APP sensor 2. Open in EPA circuit 3. ECM	Comes on	DTC stored	ES-324
P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit	1. APP sensor 2. ECM	Comes on	DTC stored	ES-324
P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input	1. APP sensor 2. Open in VCP2 circuit 3. Open or ground short in VPA2 circuit 4. ECM	Comes on	DTC stored	ES-324

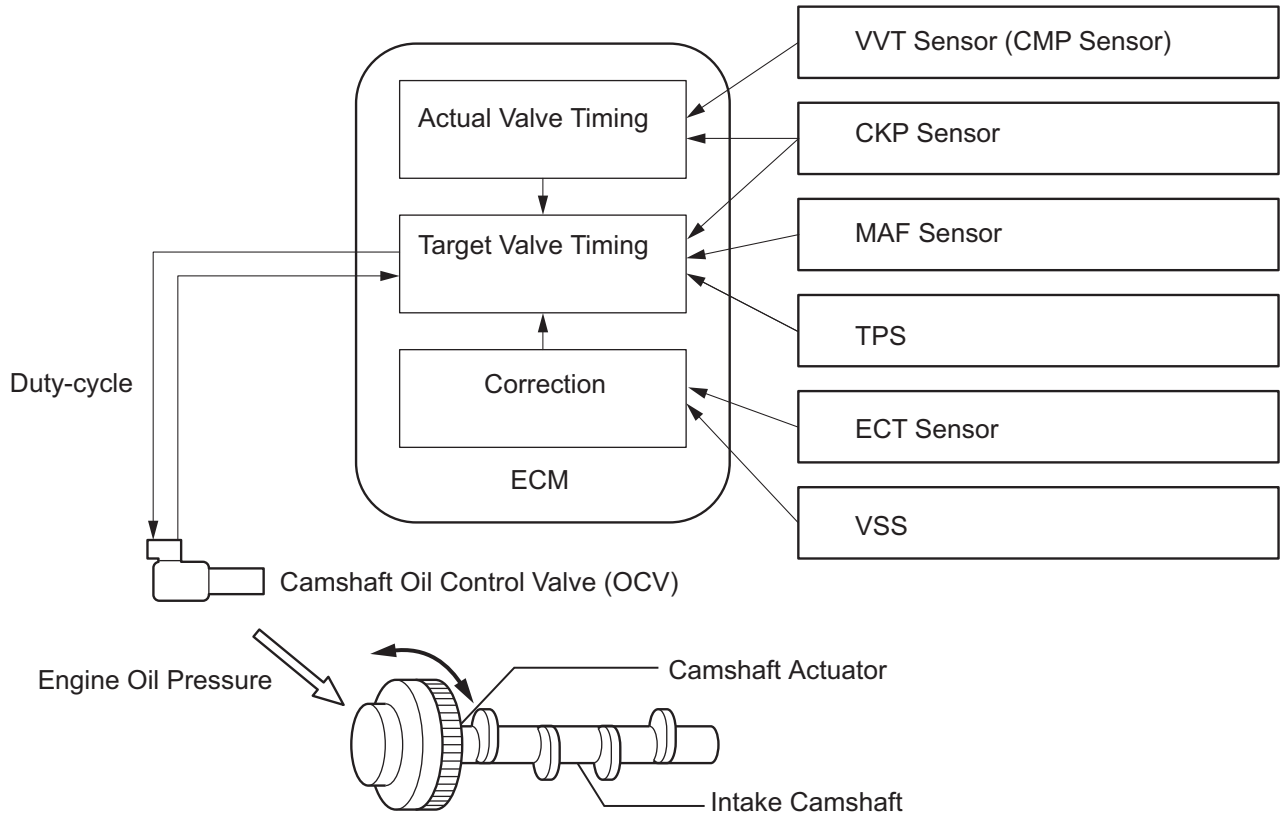
DTC	P0010	Camshaft Position "A" Actuator Circuit (Bank 1)



DTC	P0020	Camshaft Position "A" Actuator Circuit (Bank 2)

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV's duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and set the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies the 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

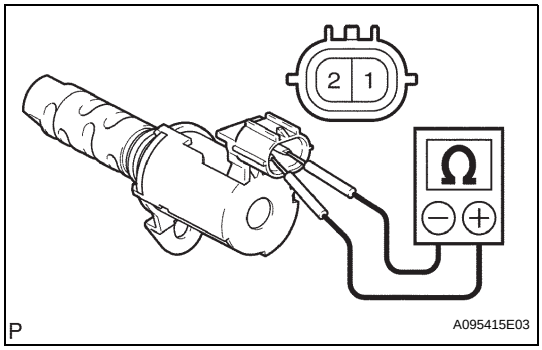
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK DTC

(a) Clear DTC after recording the freeze frame data and DTC.
(b) Turn the ignition switch OFF.
(c) Allow the engine to idle and check DTC.
(d) Check that P0010 or P0020 is present.



OK:

P0010 or P0020 is present.

OK	CHECK FOR INTERMITTENT PROBLEMS

DTC	P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)
DTC	P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)
DTC	P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)
DTC	P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)

DESCRIPTION

The VVT system includes the ECM, Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0011 P0021	Valve timing is not adjusted in valve timing advance range (1 trip detection logic)	• Valve timing • OCV for intake camshaft • OCV filter • Intake camshaft timing gear assembly • ECM
P0012 P0022	Valve timing is not adjusted in valve timing retard range (2 trip detection logic)	• Valve timing • OCV for intake camshaft • OCV filter • Intake camshaft timing gear assembly • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and sets a DTC.

Example:

A DTC is set when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 and P0021 (Advanced Cam Timing) is subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) is subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:
– The engine is warm (the engine coolant temperature is 75°C [167°F] or more).
– The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
– The engine has idled for 3 minutes.

MONITOR STRATEGY

Related DTCs	P0011: Advanced camshaft timing (bank 1) P0012: Retarded camshaft timing (bank 1) P0021: Advanced camshaft timing (bank 2) P0022: Retarded camshaft timing (bank 2)
Required Sensors/Components (Main)	VVT OCV and VVT Actuator
Required Sensors/Components (Related)	Crankshaft position sensor, Camshaft position sensor and Engine coolant temperature sensor
Frequency of Operation	Once per driving cycle
Duration	Within 10 seconds
MIL Operation	Advanced camshaft timing: Immediate Retarded camshaft timing: 2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0125 (Insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0356 (Igniter)
Battery voltage	11 V or more
Engine RPM	500 to 4,000 rpm
ECT	75°C (167°F) to 100°C (212°F)

TYPICAL MALFUNCTION THRESHOLDS

Advanced camshaft timing:

Valve timing	No change at advanced valve timing

Retard camshaft timing:

Valve timing	No change at retarded valve timing

If the difference between the target and actual camshaft timings is greater than the specified value, the ECM operates the VVT actuator.
Then, the ECM monitors the camshaft timing change for 5 seconds.

WIRING DIAGRAM

Refer to DTC P0010 (see page ES-76).

INSPECTION PROCEDURE

HINT:
DTC P0011, P0012, P0021 or P0022 may be set when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain set even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.
HINT:

Abnormal bank	Advanced timing over (Valve timing is out of specified range)	Retarded timing over (Valve timing is out of specified range)
Bank 1	P0011	P0021
Bank 2	P0012	P0022

- If DTC P0011 or P0012 is displayed, check the right bank VVT system for intake camshaft circuit (bank 1).
- Bank 1 refers to the bank that includes No. 1 cylinder.
- If DTC P0021 or P0022 is displayed, check the left bank VVT system for intake camshaft circuit (bank 2).
- Bank 2 refers to the bank that does not include No. 1 cylinder.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0011, P0012, P0021 or P0022	A
P0011, P0012, P0021 or P0022 and other DTCs	B

HINT:
If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

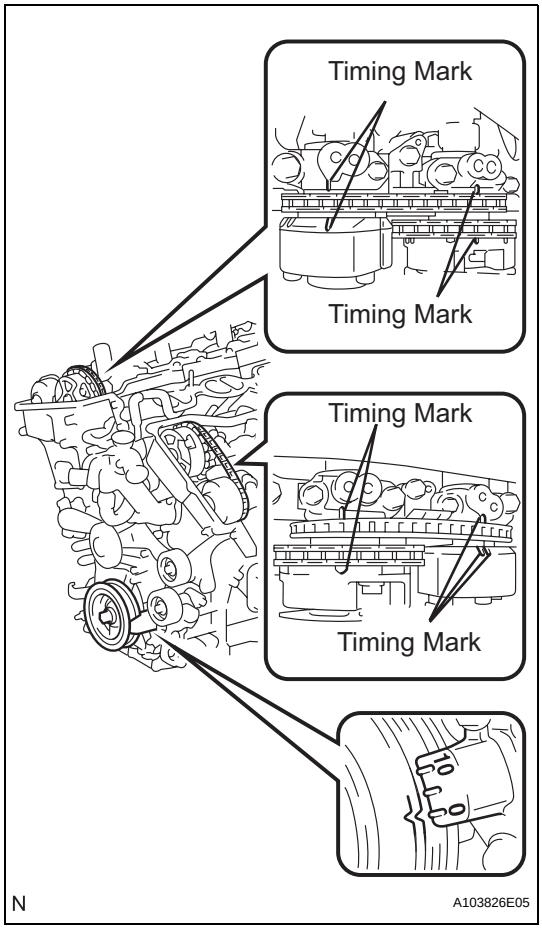
OK

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → **Go to step 4**

OK ↓

3	CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)



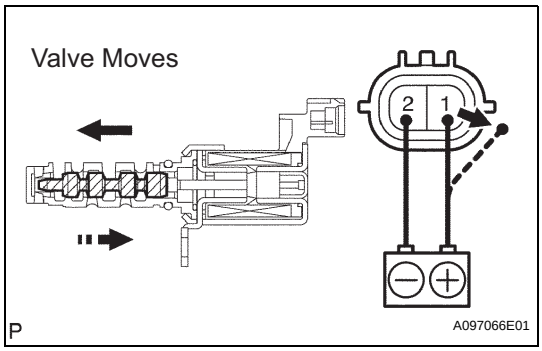
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester.
(f) Drive the vehicle for more than 10 minutes.
(g) Read DTCs using the tester.
OK:
No DTC output.

NG → **Go to step 4**

OK ↓

END

4	CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

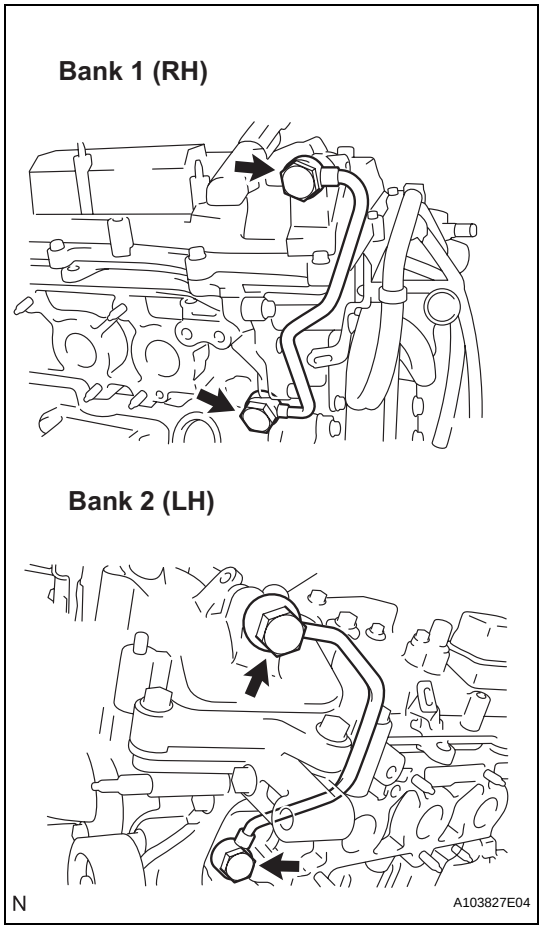


(a) Remove the cylinder head cover.
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" on the timing chain cover.
(c) Check that the timing marks on the camshaft timing sprocket and camshaft timing gear are facing upward as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.
OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.
(d) Reinstall the cylinder head cover.

NG → **ADJUST VALVE TIMING**

OK

5	INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV)



(a) Remove the OCV.
(b) Measure the resistance between the terminals of the OCV.
Standard resistance:
6.9 to 7.9 Ω at 20°C (68°F)
(c) Apply the positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.
OK:
Valve moves quickly.
(d) Reinstall the OCV.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

6	INSPECT OIL CONTROL VALVE FILTER AND PIPE

(a) Remove the oil pipe No. 1 or No. 2.
(b) Remove the OCV filter.
(c) Check that the filter is not clogged.
OK:
Filter is not clogged.
(d) Reinstall the OCV filter.
(e) Reinstall the oil pipe No. 1 or No. 2.

NG → **CLEAN OIL CONTROL VALVE FILTER AND PIPE**

OK

7	REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Start the engine and warm it up.
(e) Switch the ECM from normal mode to check mode using the tester.
(f) Drive the vehicle for more than 10 minutes.
(g) Read output DTCs using the tester.
Standard:
No DTC output.

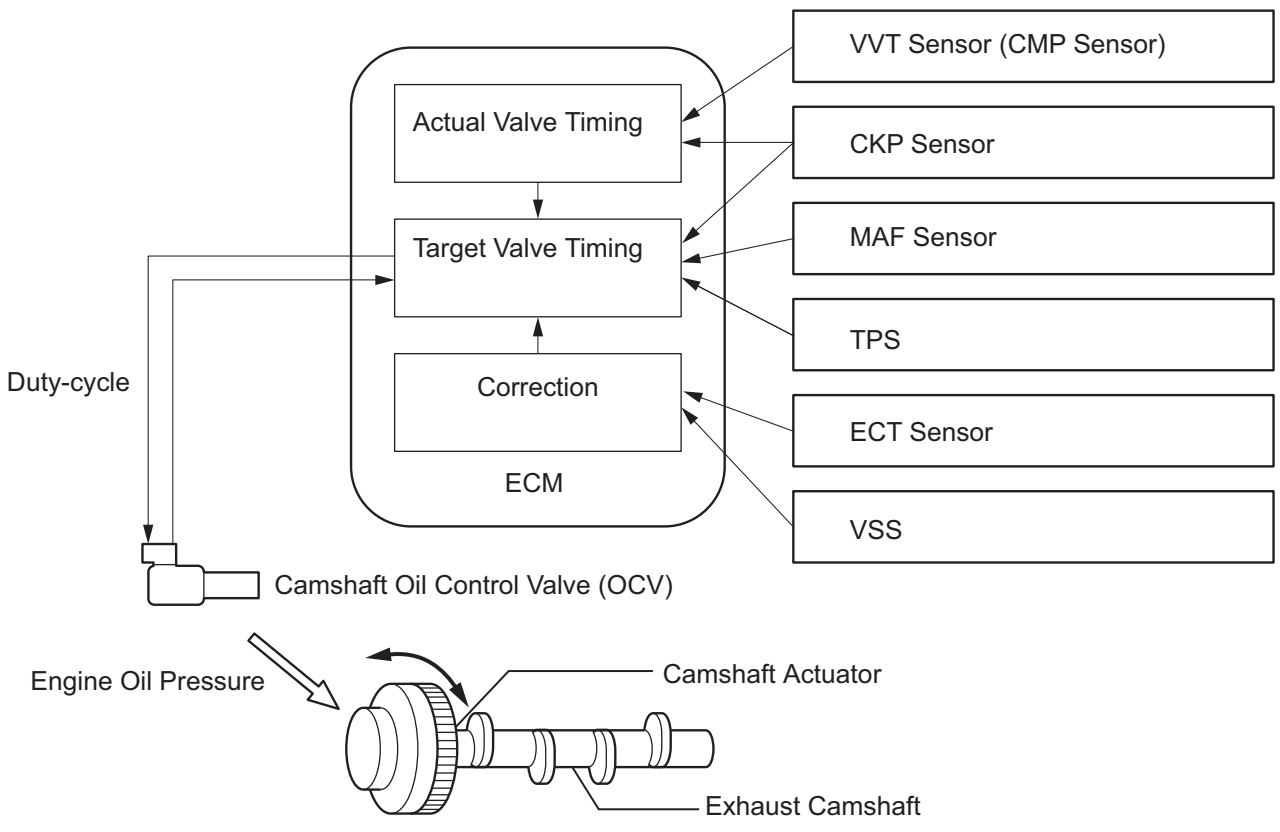
ES

HINT:
DTC P0011, P0012, P0021 or P0022 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay registered even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

OK → **SYSTEM OK**

NG

REPLACE ECM



DTC	P0013	Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC	P0023	Camshaft Position "B" Actuator Circuit / Open (Bank 2)

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV's duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and set the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies the 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

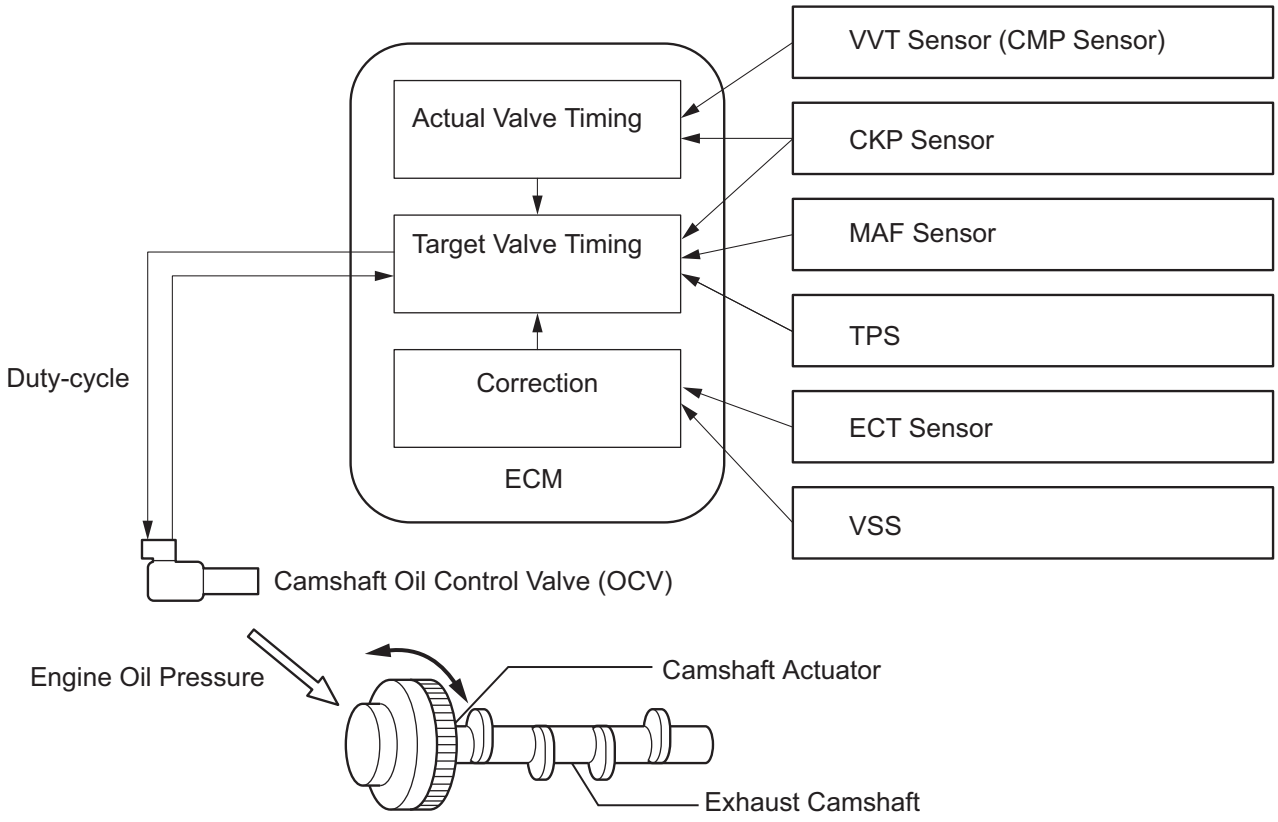
DTC	P0014	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 1)
DTC	P0015	Camshaft Position "B" - Timing Over-Retarded (Bank 1)
DTC	P0024	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)
DTC	P0025	Camshaft Position "B" - Timing Over-Retarded (Bank 2)



DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is present, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

VVT System

Y

A130637E02

DTC No.	DTC Detection Condition	Trouble Area
P0014 P0024	Advanced cam timing: With warm engine and engine speed of between 500 rpm and 4,000 rpm, all conditions (a), (b) and (c) are met (2 trip detection logic): (a) Difference between target and actual exhaust valve timing more than 5°CA (Crankshaft Angle) for 4.5 seconds (b) Current exhaust valve timing fixed (timing changes less than 5°CA in 5 seconds) (c) Variations in VVT controller timing more than 19°CA of maximum delayed timing (advanced)	• Valve timing • Oil control valve (OCV) for exhaust camshaft • OCV filter • Exhaust camshaft • ECM
P0015 P0025	Retarded cam timing: With warm engine and engine speed of between 500 rpm and 4,000 rpm, all conditions (a), (b) and (c) are met (1 trip detection logic): (a) Difference between target and actual exhaust valve timing more than 5°CA (Crankshaft Angle) for 4.5 seconds (b) Current exhaust valve timing fixed (timing changes less than 5°CA in 5 seconds) (c) Variations in VVT controller timing more than 19°CA or less of maximum delayed timing (retarded)	• Valve timing • OCV for exhaust camshaft • OCV filter • Exhaust camshaft • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and sets a DTC.
   Example:
   A DTC is set when the following conditions A, B and C are met:
   A The difference between the target and actual exhaust valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   B It takes 5 seconds or more to change the valve timing by 5°CA (Procedure "B").
   C After above procedures "A" and "B" are met, the OCV is forcibly activated 63 times or more.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 1 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 2 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   (a) The engine is warm (the engine coolant temperature is 75°C [167°F] or more).
   (b) The vehicle has been driven at more than 40 mph (64 km/h) for 3 minutes.
   (c) The engine has idled for 3 minutes.

Required sensors / components (Main)	VVT OCV and VVT Actuator
Required sensors / components (Related)	Crankshaft position sensor, Camshaft position sensor and Engine coolant temperature sensor
Frequency of operation	Once per driving cycle
Duration	Within 10 seconds
MIL operation	Advanced camshaft timing (bank 1): Immediate Advanced camshaft timing (bank 2): Immediate Retarded camshaft timing (bank 1): 2 driving cycles Retarded camshaft timing (bank 2): 2 driving cycles
Sequence of operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs are not present	P0100 - P0103 (MAF sensor) P0115 - P0118 (ECT sensor) P0125 (insufficient ECT for closed loop) P0335 (CKP sensor) P0340 (VVT sensor) P0351 - P0356 (igniter)
Battery voltage	11 V or more
Engine RPM	500 to 4,000 rpm
Engine coolant temperature	75 to 100°C (167 to 212°F)

TYPICAL MALFUNCTION THRESHOLDS

Advanced camshaft timing:

Valve timing	No change

Valve timing	Advanced position

Retarded camshaft timing:

Valve timing	No change
Valve timing	Retarded position

WIRING DIAGRAM

Refer to DTC P0013 (see page ES-88).

INSPECTION PROCEDURE

HINT:

Abnormal bank	Advanced timing over (Valve timing is out of specified range)	Retarded timing over (Valve timing is out of specified range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- If DTC P0014 or P0015 is displayed, check the bank 1 VVT system for exhaust camshaft circuit.
- Bank 1 refers to the bank that includes cylinder No. 1.
- If DTC P0024 or P0025 is displayed, check the bank 2 VVT system for exhaust camshaft circuit.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Read freeze frame data using the intelligent tester. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction (See page ES-40).

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:
If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	**PERFORM ACTIVE TEST BY INTELLIGENT TESTER (OPERATE OCV)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the tester ON.
(c) Warm up the engine.

(d) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1 or VVT CTRL B2.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK

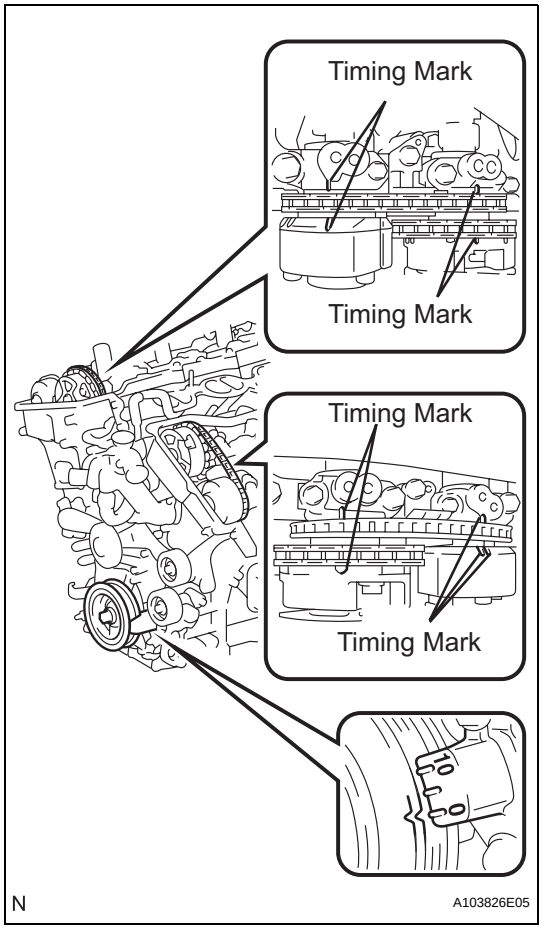
Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → **Go to step 4**

OK

ES

3 CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)



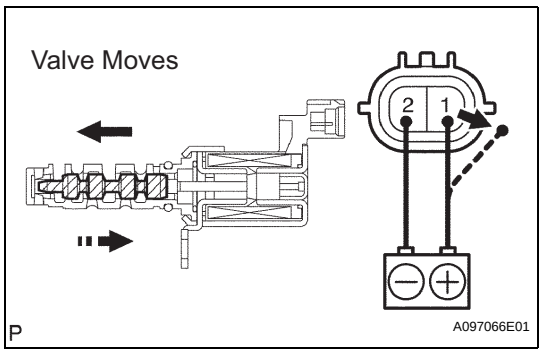
(a) Connect the intelligent tester to the DLC3.
(b) Turn the tester ON.
(c) Clear DTCs (See page ES-39).
(d) Warm up the engine.
(e) Switch the ECM from normal mode to check mode using the tester (See page ES-42).
(f) Drive the vehicle for more than 10 minutes.
(g) Read DTCs using the tester.
OK:
No DTC output.

NG → **Go to step 4**

OK

END

4	CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

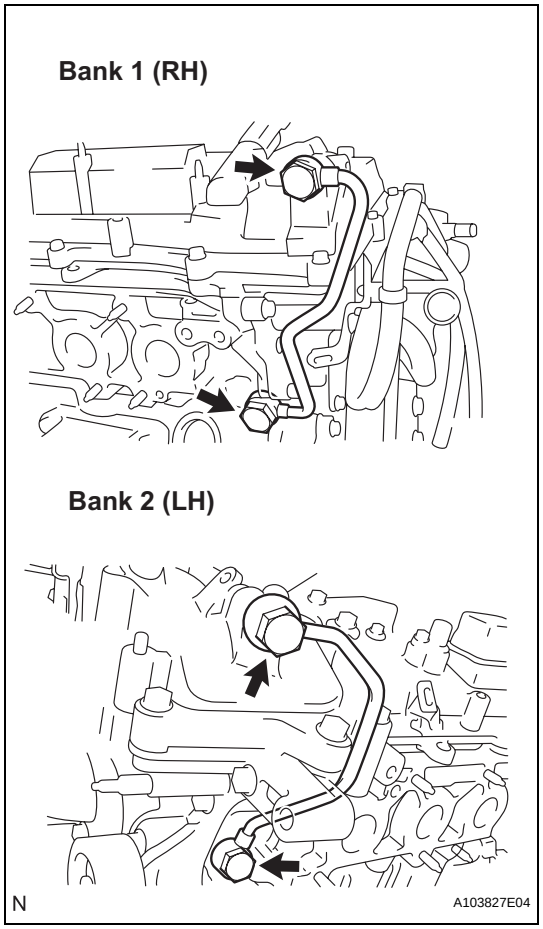


(a) Remove the cylinder head cover RH and LH.
(b) Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.
(c) Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.
OK:
Timing marks on crankshaft timing gears are aligned as shown in the illustration.
(d) Reinstall the cylinder head cover.

NG → **ADJUST VALVE TIMING**

OK

5	INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



(a) Remove the OCV.
(b) Measure the resistance between the terminals of the OCV.
Standard resistance:
6.9 to 7.9 Ω at 20°C (68°F)
(c) Apply the positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.
OK:
Valve moves quickly.
(d) Reinstall the OCV.

NG → **REPLACE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY**

OK

6	INSPECT OIL CONTROL VALVE FILTER AND PIPE

(a) Remove the oil pipe No. 1 or No. 2.
(b) Remove the oil control valve filter.
(c) Check that the filter and pipe are not clogged.
OK:
Filter is not clogged.
(d) Reinstall the oil control valve filter.
(e) Reinstall the oil pipe No. 1 or No. 2.

NG → **CLEAN OIL CONTROL VALVE FILTER AND PIPE**

OK

7	REPLACE EXHAUST CAMSHAFT

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the tester ON.
(c) Clear DTCs.
(d) Warm up the engine.
(e) Switch the ECM from normal mode to check mode using the intelligent tester (see page ES-42).
(f) Drive the vehicle for more than 10 minutes or more.
(g) Read output DTCs using the intelligent tester.
OK:
No DTC output.

ES

HINT:
DTC P0014, P0015, P0024 or P0025 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay registered even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

OK → **SYSTEM IS OK**

NG

REPLACE ECM

DTC	P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC	P0017	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B)

DTC	P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

DTC	P0019	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)

ES

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the gaps between the camshaft and crankshaft.

DTC No.	DTC Detection Condition	Trouble Area
P0016	Deviation in crankshaft position sensor signal and VVT sensor 1 (for intake camshaft bank 1) signal (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM
P0017	Deviation in crankshaft position sensor signal and VVT sensor 1 (for exhaust camshaft bank 1) signal (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM
P0018	Deviation in crankshaft position sensor signal and VVT sensor 2 (for intake camshaft bank 2) signal (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM
P0019	Deviation in crankshaft position sensor signal and VVT sensor 2 (for exhaust camshaft bank 2) signal (2 trip detection logic)	• Mechanical system (Timing chain has jumped tooth or chain stretched) • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and sets the DTC P0016 (bank 1) or P0018 (bank 2).

To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and sets the DTC P0017 (bank 1) or P0019 (bank 2).

MONITOR STRATEGY

Related DTCs	P0016: Camshaft timing misalignment at idling (bank 1 intake side) P0017: Camshaft timing misalignment at idling (bank 1 exhaust side) P0018: Camshaft timing misalignment at idling (bank 2 intake side) P0019: Camshaft timing misalignment at idling (bank 2 exhaust side)
Required Sensors/Components	VVT actuator
Required Sensors/Components	Camshaft position sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle

Duration	Within 1 minute
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0011 (VVT system 1 - advanced) P0012 (VVT system 1 - retarded) P0021 (VVT system 2 - advanced) P0022 (VVT system 2 - retarded) P0115 - P0118 (ECT sensor)
VVT feedback mode	Executing
VVT	Maximum advanced or retarded position
Engine RPM	500 to 1,000 rpm

ES

TYPICAL MALFUNCTION THRESHOLDS

Intake side:

One of following conditions met	-
VVT learning value when camshaft maximum retarded	Less than 18.5°CA
VVT learning value when camshaft maximum retarded	More than 43.5°CA

Exhaust side:

One of following conditions met	-
VVT learning value when camshaft maximum retarded	Less than 77°CA
VVT learning value when camshaft maximum retarded	More than 102°CA

WIRING DIAGRAM

Refer to DTC P0335 (see page ES-207).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN) (See page ES-90)**

NG → **Go to step 3**

OK

2	**REPLACE ECM**

NEXT → **Go to step 4**

3	ADJUST VALVE TIMING

NEXT

4	CHECK WHETHER DTC OUTPUT RECURS

NOTICE:
After replacing the ECM or adjusting intake valve timing, confirm that the DTC output does not recur.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Switch the ECM from normal mode to check mode using the tester (see page ES-42).
(f) Start the engine and warm it up.
(g) Allow the engine to idle for 1 minute or more, and then drive the vehicle for 1 minute or more.
(h) Confirm that no DTC is set, using the tester.
OK:
No DTC output

END

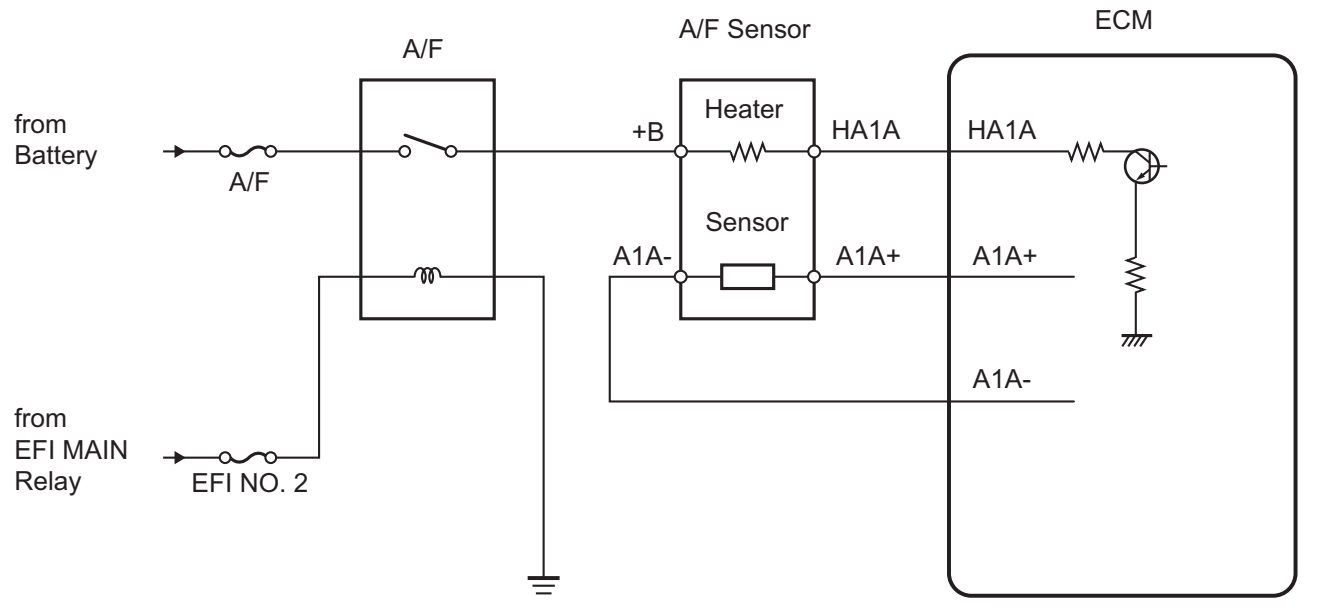
DTC	P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC	P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC	P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC	P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

ES



DESCRIPTION

Refer to DTC P2195 (see page ES-334).

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.
- When one of these DTCs is set, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the B+ side of the circuit.

Reference (System Diagram of Bank 1 Sensor 1):

DTC No.	DTC Detection Condition	Trouble Area
P0031 P0051	Air-Fuel Ratio (A/F) sensor heater current less than 0.8 A (1 trip detection logic)	• Open in A/F sensor heater circuit • A/F sensor heater (sensor 1) • Integration relay • ECM

DTC No.	DTC Detection Condition	Trouble Area
P0032 P0052	Air-Fuel Ratio (A/F) sensor heater current fail (1 trip detection logic)	• Short in A/F sensor heater circuit • A/F sensor heater (sensor 1) • Integration relay • ECM

HINT:
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.

The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate air-fuel ratio properly.

When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and sets a DTC.

Example:

The ECM sets DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is less than 0.8 A, DTC P0031 or P0051 is set.

MONITOR STRATEGY

Related DTCs	P0031: A/F sensor heater (bank 1) open/short (Low electrical current) P0032: A/F sensor heater (bank 1) open/short (High electrical current) P0051: A/F sensor heater (bank 2) open/short (Low electrical current) P0052: A/F sensor heater (bank 2) open/short (High electrical current)
Required Sensors/Components (Main)	A/F sensor heater
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	10 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P0031 and P0051:

Battery voltage	10.5 V or more
A/F sensor heater duty-cycle ratio	50% or more
Time after engine start	10 seconds or more

P0032 and P0052:

Time after engine start	10 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0031 and P0051:

A/F sensor heater current	Less than 0.8 A

P0032 and P0052:

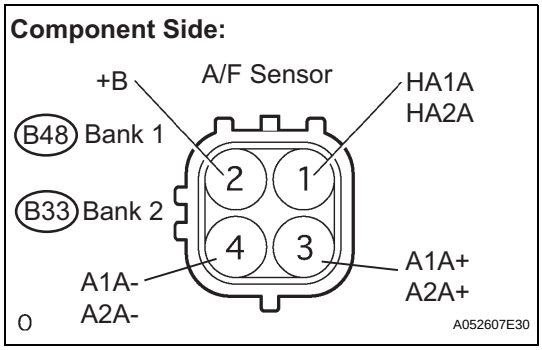
Hybrid IC high current limiter port	Fail

COMPONENT OPERATING RANGE

A/F sensor heater current	0.9 to 9.9 A

ES

WIRING DIAGRAM



Refer to DTC P2195 (see page ES-339).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)

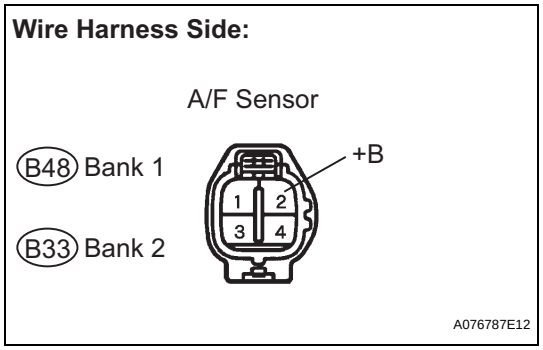
(a) Disconnect the B33 or B48 A/F sensor connector.

(b) Measure the resistance of the A/F sensor connector.

Standard resistance
Bank 1

Tester Connection	Specified Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4(A1A-)	-	10 kΩ or higher

Standard resistance
Bank 2



Tester Connection	Specified Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	-	10 kΩ or higher

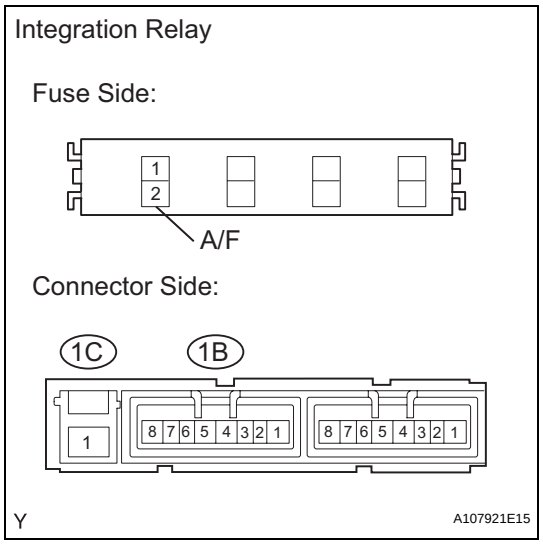
(c) Reconnect the A/F sensor connector.

NG → **REPLACE AIR-FUEL RATIO SENSOR**

OK

2 CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

(a) Disconnect the B33 or B48 A/F sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the B33 or B48 A/F sensor connector and body ground.
Standard voltage



Tester Connection	Specified Condition
B33-2 (+B) - Body ground	9 to 14 V
B48-2 (+B) - Body ground	9 to 14 V

(d) Reconnect the A/F sensor connector.

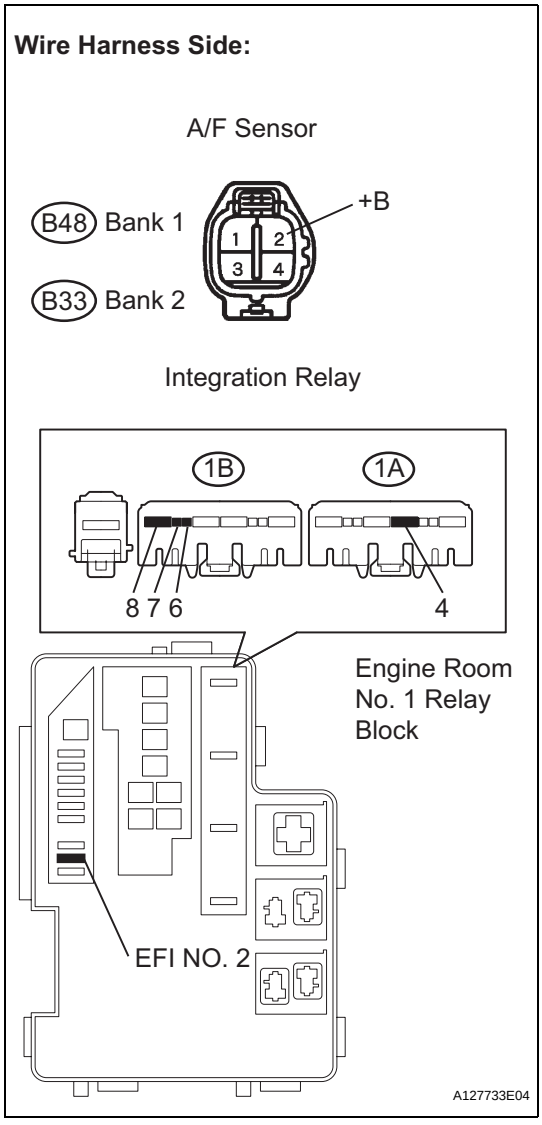
OK → **Go to step 5**

NG

3 INSPECT INTEGRATION RELAY (A/F RELAY)

(a) Remove the integration relay from the engine room No. 1 relay block.
(b) Inspect the A/F fuse.
(1) Remove the A/F fuse from the integration relay.
(2) Measure the A/F fuse resistance.
Standard resistance:
Below 1 Ω
(3) Reinstall the A/F fuse.
(c) Inspect the A/F relay.
(1) Measure the A/F relay resistance.
Standard resistance

Tester Connection	Specified Condition
1C-1 - 1B-8	10 kΩ or higher
	Below 1 Ω (Apply battery voltage between terminals 1B-6 and 1B-7)



(d) Reinstall the integration relay.

NG → **REPLACE INTEGRATION RELAY**

OK

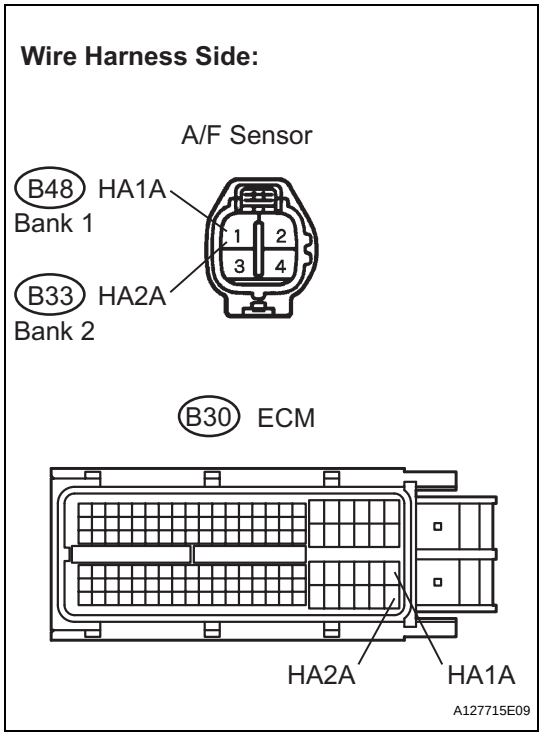
ES

4	CHECK WIRE HARNESS (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

(a) Check the EFI NO. 2 fuse.
(b) Disconnect the B33 or B48 A/F sensor connector.
(c) Remove the integration relay from the engine room No. 1 relay block.
(d) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
B48-2 (+B) - 1B-8	Below 1 Ω
B33-2 (+B) - 1B-8	Below 1 Ω
1A-4 - 1B-6	Below 1 Ω
1B-7 - Body ground	Below 1 Ω
B48-2 (+B) or 1B-8 - Body ground	10 kΩ or higher
B33-2 (+B) or 1B-8 - Body ground	10 kΩ or higher
1A-4 or 1B-6 - Body ground	10 kΩ or higher



(e) Reconnect the A/F sensor connector.
(f) Reinstall the integration relay.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

CHECK ECM POWER SOURCE CIRCUIT

5 CHECK WIRE HARNESS (A/F SENSOR - ECM)

(a) Disconnect the B33 or B48 A/F sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
B48-1 (HA1A) - B30-86 (HA1A)	Below 1 Ω
B33-1 (HA2A) - B30-109 (HA2A)	Below 1 Ω
B48-1 (HA1A) or B30-86 (HA1A) - Body ground	10 kΩ or higher
B33-1 (HA2A) or B30-109 (HA2A) - Body ground	10 kΩ or higher

(d) Reconnect the A/F sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

6 CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Start the engine.
(f) Allow the engine to idle for 1 minute or more.
(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(h) Read DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P0031, P0032, P0051 or P0052	B

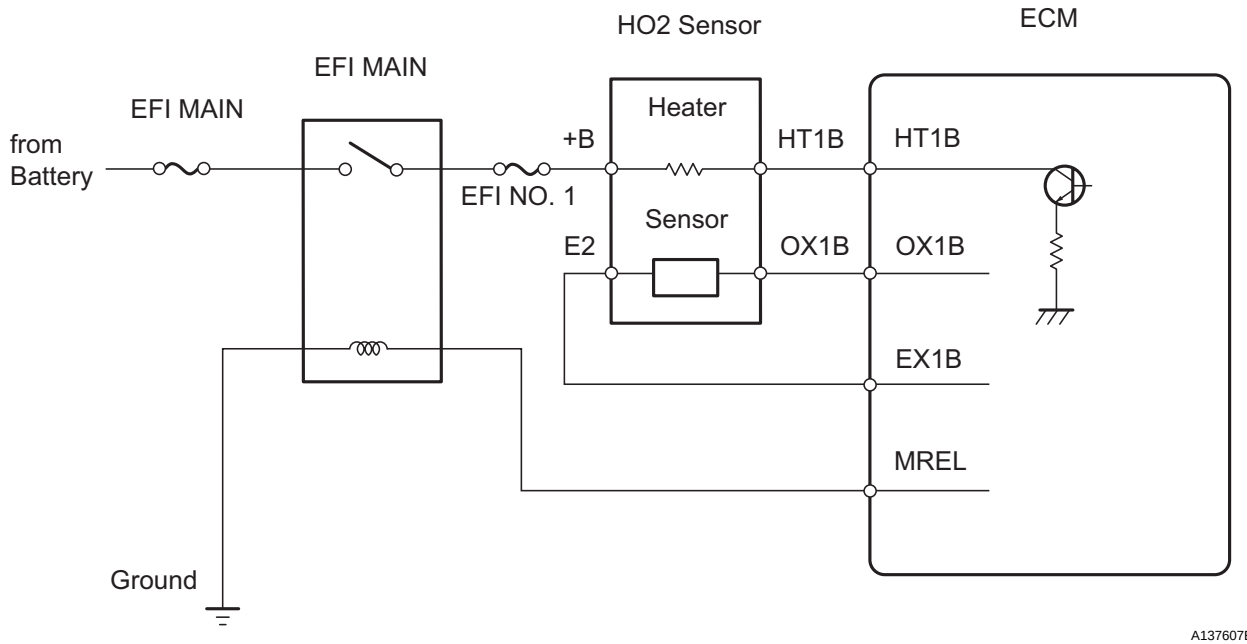
B → **REPLACE ECM**

A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)
DTC	P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)
DTC	P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)
DTC	P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)
DTC	P0141	Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)
DTC	P0161	Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)

ES



DESCRIPTION

Refer to DTC P0136 (see page ES-158).

HINT:

- When any of these DTCs are set, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned OFF.
- The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the B+ side of the circuit.

Reference (System Diagram of Bank 1 Sensor 2):

DTC No.	DTC Detection Condition	Trouble Area
P0037 P0057	Heated Oxygen (HO2) sensor heater current less than 0.3 A (1 trip detection logic)	• Open in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM
P0038 P0058	Heated Oxygen (HO2) sensor heater current more than 2 A (1 trip detection logic)	• Short in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM
P0141 P0161	Cumulative heater resistance correction value exceeds threshold (2 trip detection logic)	• Open or short in HO2 sensor heater circuit • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • ECM

HINT:
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that does not include cylinder No. 1.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

ES

MONITOR DESCRIPTION

The sensing position of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is above the threshold value, the ECM determines that there is a short circuit in the heater.

The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and sets a DTC.

If a malfunction is detected, the ECM cuts off the current applied to the heater.

Example:

The ECM sets DTC P0038 or P0058 when the current in the HO2 sensor heater is more than 2 A. Conversely, when the heater current is less than 0.3 A, DTC P0037 or P0057 is set.

Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater.

If the resistance is above the threshold value, the ECM determines that there is a malfunction in the HO2 sensor heater and set DTC P0141 or P0161.

MONITOR STRATEGY

Related DTCs	P0037: Heated oxygen sensor heater (bank 1) range check (Low electrical current) P0038: Heated oxygen sensor heater (bank 1) range check (High electrical current) P0057: Heated oxygen sensor heater (bank 2) range check (Low electrical current) P0058: Heated oxygen sensor heater (bank 2) range check (High electrical current) P0141: Heated oxygen sensor heater performance (bank 1) P0161: Heated oxygen sensor heater performance (bank 2)
Required Sensors/Components (Main)	Heated oxygen sensor heater
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous: P0037, P0038, P0057 and P0058 Once per driving cycle: P0141 and P0161

Duration	2 second: P0037, P0038, P0057 and P0058 10 seconds: P0141 and P0161
MIL Operation	Immediate: P0037, P0038, P0057 and P0058 2 driving cycles: P0141 and P0161
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

P0037 and P0057:

Battery voltage	10.5 to 20 V

P0038 and P0058:

Battery voltage	10.5 to 20 V

P0141 or P0161 (Heater performance monitor check):

All of following conditions met:	-
Battery voltage	10.5 V or more
Fuel cut	OFF
Time after fuel cut ON to OFF	30 seconds or more
Accumulated heater ON time	100 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P0037 and P0057:

Heater current	Less than 0.3 A

P0038 and P0058:

Heater current	More than 2 A

P0141 or P0161 (Heater performance monitor check):

Accumulated heater resistance	Varies with sensor element temperature (Example: More than 23 Ω)

COMPONENT OPERATING RANGE

Heated Oxygen (HO2) sensor heater current	0.4 to 1 A (when engine idles, HO2 sensor warmed up and battery voltage 11 to 14 V)

WIRING DIAGRAM

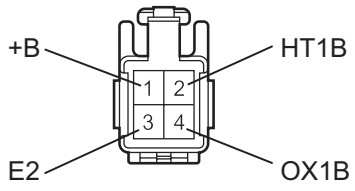
Refer to DTC P0136 (see page ES-165).

CONFIRMATION DRIVING PATTERN

These DTCs are detected when the engine idles for 110 seconds or more.

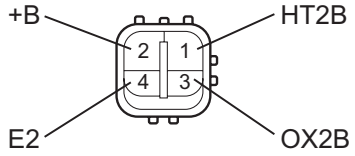
INSPECTION PROCEDURE

HINT:



Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1 INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

Component Side:

HO2 Sensor (bank 1)

HO2 Sensor (bank 2)

A136185E01

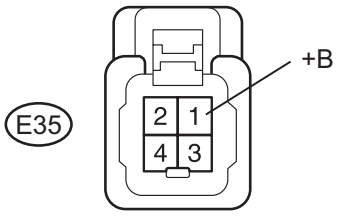
(a) Disconnect the B19 or E35 Heated Oxygen (HO2) sensor connector.
(b) Measure the resistance of the HO2 sensor connector.
Standard resistance
Bank 1

Tester Connection	Specified Condition
2 (HT1B) - 1 (+B)	11 to 16 Ω at 20°C (68°F)
2 (HT1B) - 3 (E2)	10 kΩ or higher

Standard resistance
Bank 2

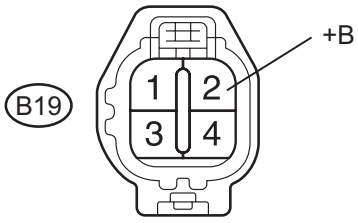
Tester Connection	Specified Condition
1 (HT2B) - 2 (+B)	11 to 16 Ω at 20°C (68°F)
1 (HT2B) - 4 (E2)	10 kΩ or higher

(c) Reconnect the HO2 sensor connector.



NG → **REPLACE HEATED OXYGEN SENSOR**

OK



2 CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

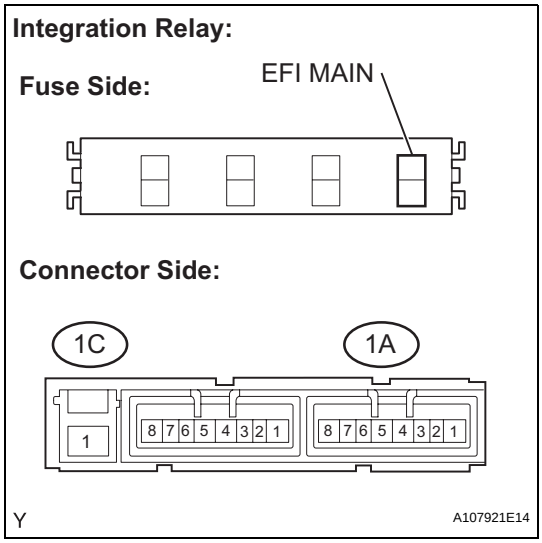
Wire Harness Side:

HO2 Sensor (Bank 1)

HO2 Sensor (Bank 2)

A136186E01

(a) Disconnect the B19 or E35 HO2 sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the B19 or E35 HO2 sensor connector and body ground.
Standard voltage



Tester Connection	Specified Condition
E35-1 (+B) - Body ground	9 to 14 V
B19-2 (+B) - Body ground	9 to 14 V

(d) Reconnect the HO2 sensor connector.

OK → **Go to step 5**

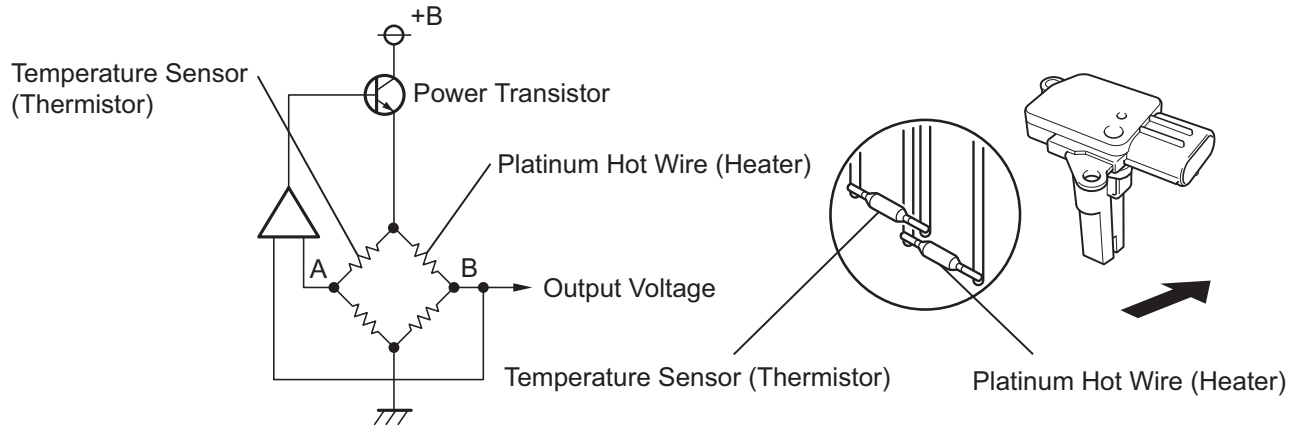
CHECK FOR INTERMITTENT PROBLEMS



DTC	P0100	Mass or Volume Air Flow Circuit

DTC	P0102	Mass or Volume Air Flow Circuit Low Input

DTC	P0103	Mass or Volume Air Flow Circuit High Input

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the temperature sensor create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.
HINT:
When any of these DTCs are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine RPM and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P0100	MAF meter voltage less than 0.2 V, or more than 4.9 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM
P0102	MAF meter voltage less than 0.2 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM
P0103	MAF meter voltage more than 4.9 V for 3 seconds (1 trip detection logic)	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:
When any of these DTCs are set, check the air-flow rate by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF.

Mass Air Flow Rate (g/sec.)	Malfunction
Approximately 0.0	• Open in Mass Air Flow (MAF) meter power source circuit • Open or short in VG circuit
271.0 or more	• Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and sets a DTC.
Example:
When the sensor output voltage remains less than 0.2 V, or more than 4.9 V, for more than 3 seconds, the ECM sets a DTC.
If the malfunction is not repaired successfully, a DTC is set 3 seconds after the engine is next started.

DTC	P0101	Mass Air Flow Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0100 (see page ES-115).

DTC No.	DTC Detection Condition	Trouble Area
P0101	Conditions (a), (b), (c), (d) and (e) continue for more than 10 seconds (2 trip detection logic): (a) Engine running (b) Engine coolant temperature 70°C (158°F) or higher (c) Throttle Position (TP) sensor voltage 0.24 V or more (d) Average engine load value ratio less than 0.81, or more than 1.15 (varies with estimated engine load) Average engine load value ratio = Average engine load based on MAF meter output / Average engine load estimated from driving conditions (e) Average air-fuel ratio less than -20%, or more than 20%	• Mass Air Flow (MAF) meter • Air induction system • PCV hose connections

ES

MONITOR DESCRIPTION

The MAF meter is a sensor that measures the amount of air flowing through the throttle valve. The ECM uses this information to determine the fuel injection time and to provide an appropriate air-fuel ratio. Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air. By applying a specific electrical current to the wire, the ECM heats it to a specific temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components of the MAF meter. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The ECM monitors the average engine load value ratio to check the MAF meter for malfunctions. The average engine load value ratio is obtained by comparing the average engine load calculated from the MAF meter output to the average engine load estimated from the driving conditions, such as the engine speed and the throttle opening angle. If the average engine load value ratio is below the threshold value, the ECM determines that the intake air volume is low, and if the average engine load value ratio is above the threshold value, the ECM determines that the intake air volume is high.
If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0101: Mass air flow meter rationality
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Crankshaft Position (CKP) sensor, Engine Coolant Temperature (ECT) sensor and Throttle Position (TP) sensor

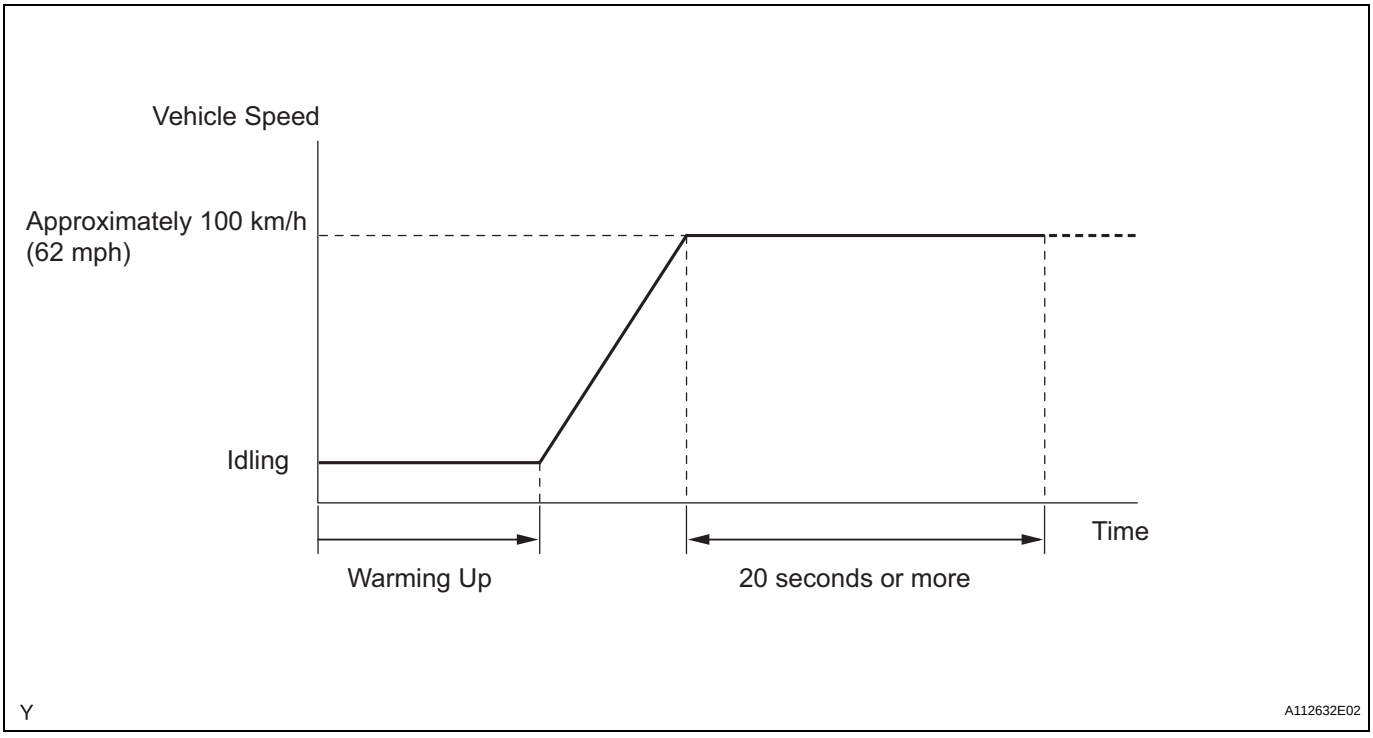
EVAP vent valve	OK

TYPICAL MALFUNCTION THRESHOLDS

Both of following conditions 1 and 2 met	-
1. Averaged engine load value ratio	Less than 0.81, or more than 1.15 (varies with estimated engine load)
2. Averaged air-fuel ratio	Less than -20%, or more than 20%



ES

WIRING DIAGRAM

Refer to DTC P0100 (see page ES-117).

CONFIRMATION DRIVING PATTERN

HINT:
Performing this confirmation pattern will activate the mass air flow performance monitor.

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON.
3. Turn the tester ON.
4. Clear DTCs (see page ES-39).
5. Start the engine, and warm it up until the engine coolant temperature reaches 70°C (158°F) or higher.
6. Drive the vehicle at approximately 100 km/h (62 mph) for 20 seconds or more.
7. On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0101)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0101	A
P0101 and other DTCs	B

HINT:
If any DTCs other than P0101 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

A

2 CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

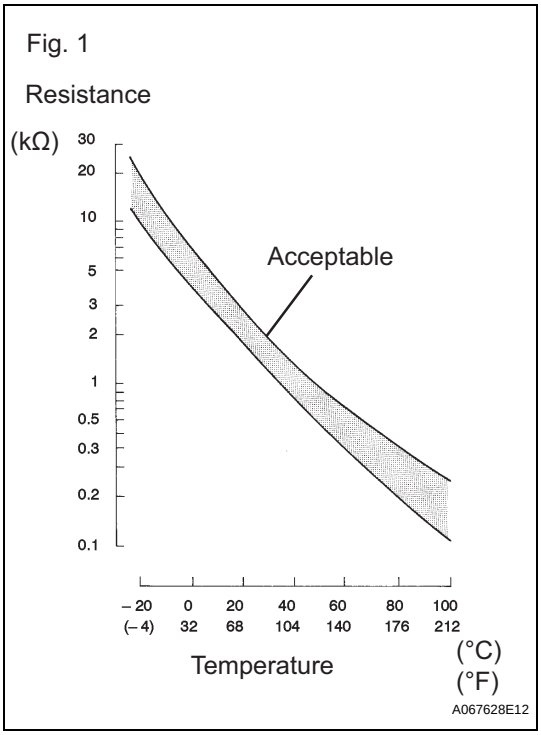
3 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

REPLACE MASS AIR FLOW METER



DTC	P0110	Intake Air Temperature Circuit Malfunction

DTC	P0112	Intake Air Temperature Circuit Low Input

DTC	P0113	Intake Air Temperature Circuit High Input

DESCRIPTION

Fig. 1

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).

The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.

Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 are set, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P0110	Open or short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0112	Short in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	Open in IAT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:
When any of these DTCs are set, check the IAT by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / INTAKE AIR.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and sets a DTC.
Example:
If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and sets DTC P0113. Conversely, if the output voltage is less than 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0112.
If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0110: IAT sensor range check (Fluctuating) P0112: IAT sensor range check (Low voltage) P0113: IAT sensor range check (High voltage)
Required Sensors/Components (Main)	IAT sensor
Required Sensors/Components (Related)	-

Wire Harness Side:

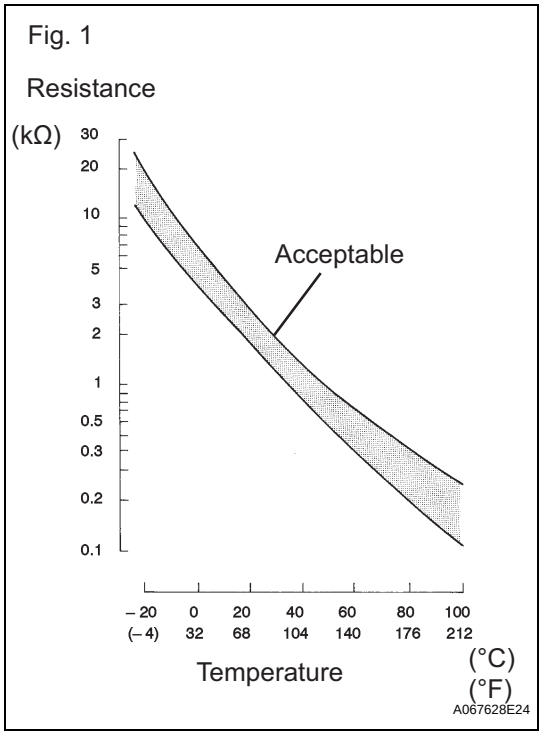
(a) Disconnect the B1 MAF meter connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
B1-1 (THA) or B30-71 (THA) - Body ground	10 kΩ or higher

(d) Reconnect the MAF meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**



OK

REPLACE ECM

ES

DTC	P0111	Intake Air Temperature Sensor Gradient Too High

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

DTC No.	DTC Detection Condition	Trouble Area
P0111	When either condition below is met: 1. The intake air temperature rise is large, from the previous trip warm-up to the following trip (2 trip detection logic). 2. When the change in the intake air temperature after engine start is less than the threshold value.	Mass air flow meter assembly

MONITOR DESCRIPTION

The ECM performs OBD II monitoring based on the values from the intake air temperature sensor. If there is no change of the sensor value within the normal range, the ECM will not be able to perform OBD II monitoring or will misdiagnose that there is a malfunction in the sensor. The ECM detects the stuck intake air temperature sensor value by performing monitoring after the ignition switch is turned OFF or the engine is started (short soak or long soak).

MONITOR STRATEGY

Related DTCs	P0111: Intake air temperature sensor rationality (After engine stop) P0111: Intake air temperature sensor rationality (After cold engine start)

A → **GO TO DTC CHART**

DTC	P0115	Engine Coolant Temperature Circuit Malfunction

DTC	P0117	Engine Coolant Temperature Circuit Low Input

DTC	P0118	Engine Coolant Temperature Circuit High Input

DESCRIPTION

A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.

The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are set, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC No.	DTC Detection Condition	Trouble Area
P0115	Open or short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open or short in ECT sensor circuit • ECT sensor • ECM
P0117	Short in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Short in ECT sensor • ECT sensor • ECM
P0118	Open in ECT sensor circuit for 0.5 seconds (1 trip detection logic)	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:

When any of these DTCs are set, check the ECT by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and sets a DTC.

Example:

If the sensor output voltage is more than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and sets DTC P0118. Conversely, if the voltage output is less than 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and sets DTC P0117.

If the malfunction is not repaired successfully, a DTC is set 0.5 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0115: ECT sensor range check (Fluctuating) P0117: ECT sensor range check (Low voltage) P0118: ECT sensor range check (High voltage)

Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

ES

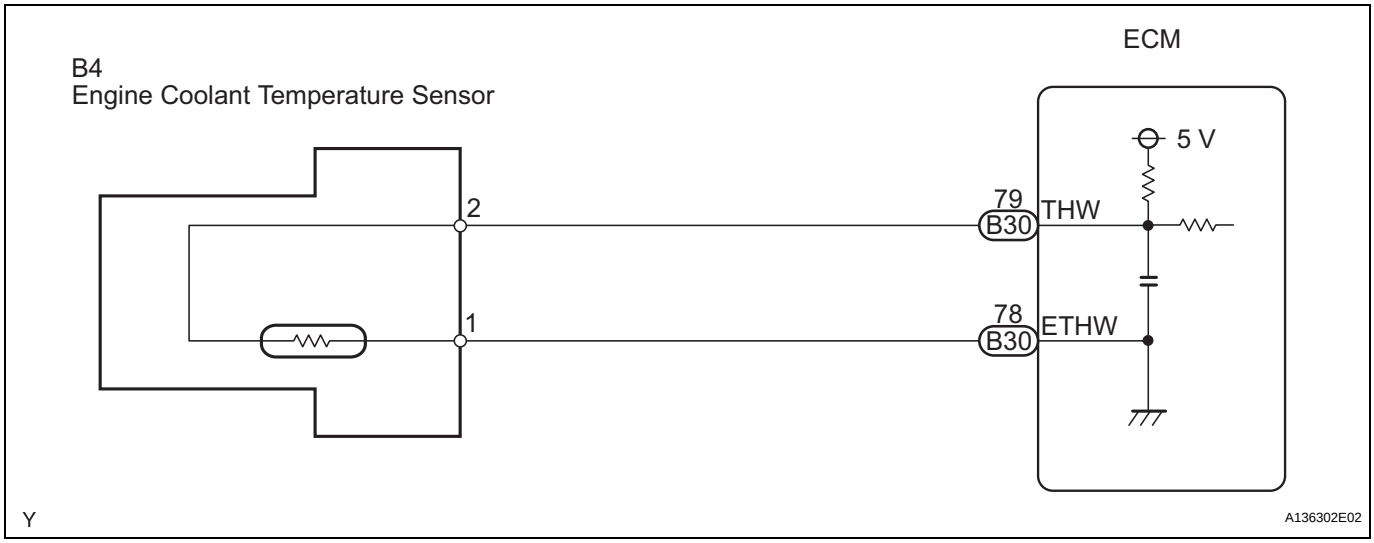
TYPICAL MALFUNCTION THRESHOLDS

P0115:

ECT sensor voltage	Less than 0.14 V, or more than 4.91 V

P0117:

ECT sensor voltage [ECT]	Less than 0.14 V [More than 140°C (284°F)]



P0118:

ECT sensor voltage [ECT]	More than 4.91 V [Less than -40°C (-40°F)]

COMPONENT OPERATING RANGE

ECT sensor voltage [ECT]	0.14 to 4.91 V [-40°C to 140°C (-40°F to 284°F)]

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ OUTPUT DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the intelligent tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0115	A
P0117	B
P0118	C

B → **Go to step 5**

C → **Go to step 3**

A

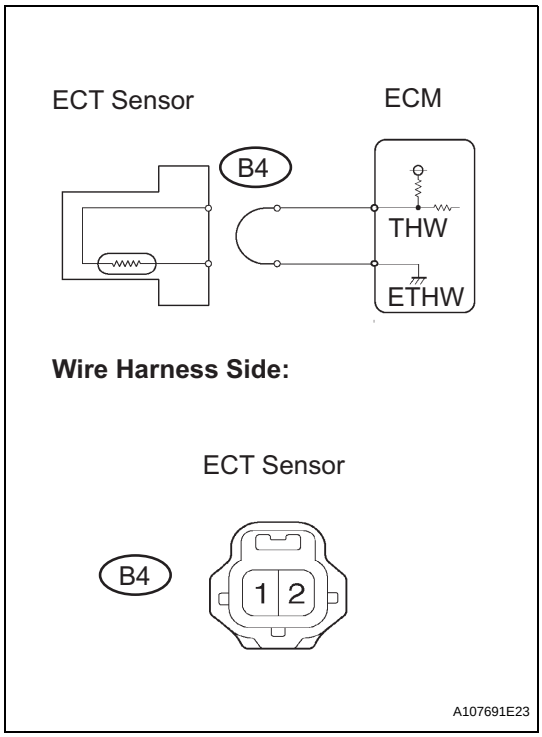
2	READ VALUE USING INTELLIGENT TESTER (ENGINE COOLANT TEMPERATURE)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(e) Read the value displayed on the tester.

Standard value:
Between 80°C and 100°C (167°F and 212°F) with warm engine.

Result

Temperature Displayed	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
Between 80°C and 100°C (176°F and 212°F)	C



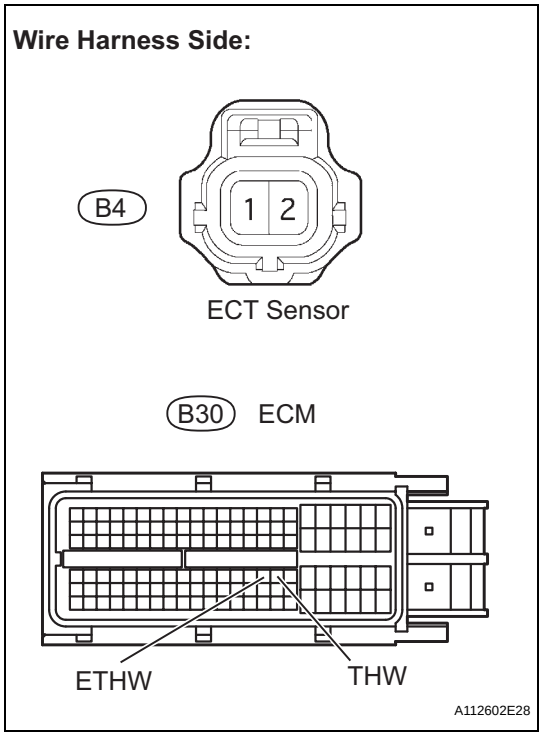
HINT:
- If there is an open circuit, the intelligent tester indicates -40°C (-40°F).
- If there is a short circuit, the intelligent tester indicates 140°C (284°F) or higher.

B → **Go to step 5**

C → CHECK FOR INTERMITTENT PROBLEMS

A

3	READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)



(a) Disconnect the B4 Engine Coolant Temperature (ECT) sensor connector.
(b) Connect terminals 1 and 2 of the ECT sensor connector on the wire harness side.
(c) Connect the intelligent tester to the DLC3.
(d) Turn the ignition switch ON.
(e) Turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(g) Read the value displayed on the tester.
Standard value:
140°C (284°F) or higher.
(h) Reconnect the ECT sensor connector.

OK → **CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

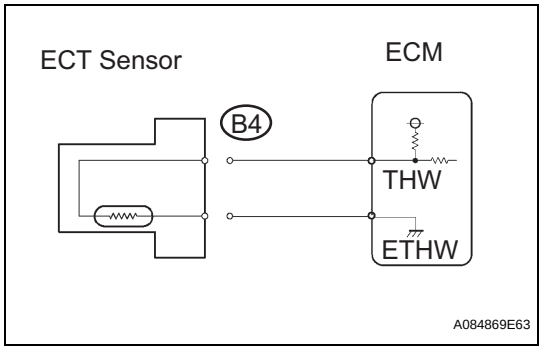
NG

ES

4	CHECK WIRE HARNESS (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

(a) Disconnect the B4 ECT sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance

Tester Connection	Specified Condition
B4-2 - B30-79 (THW)	Below 1 Ω
B4-1 - B30-78 (ETHW)	Below 1 Ω



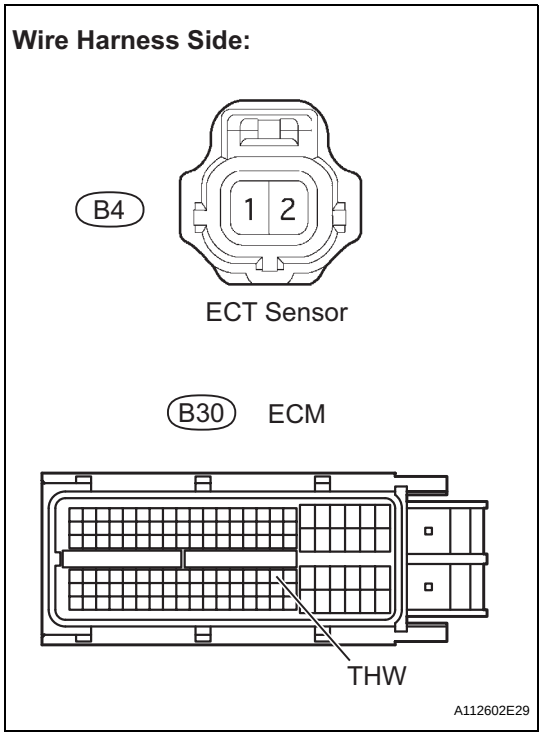
(d) Reconnect the ECT sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

GOOD CONNECTION TO ECM. IF OK, REPLACE ECM

5	READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)



(a) Disconnect the B4 ECT sensor connector.
(b) Connect the intelligent tester to the DLC3.
(c) Turn the ignition switch ON.
(d) Turn the tester ON.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(f) Read the value displayed on the tester.
Standard value:
-40°C (-40°F)
(g) Reconnect the ECT sensor connector.

OK → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

NG

ES

6	CHECK WIRE HARNESS (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

(a) Disconnect the B4 ECT sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
B4-2 or B30-79 (THW) - Body ground	10 kΩ or higher

(d) Reconnect the ECT sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

ES

DTC	P0116	Engine Coolant Temperature Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0115 (see page ES-134).

DTC No.	DTC Detection Condition	Trouble Area
P0116	When either of following conditions met (2 trip detection logic): • When cold engine started and engine warmed up, Engine Coolant Temperature (ECT) sensor value does not change. • After warmed up engine started, ECT sensor value does not change when engine stopped and then next cold engine start performed.	• Thermostat • ECT sensor

ES

MONITOR DESCRIPTION

Engine coolant temperature (ECT) sensor cold start monitor

When a cold engine start is performed and then the engine is warmed up, if the ECT sensor value does not change, it is determined that a malfunction has occurred. If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

ECT sensor soak monitor

After a warmed up engine is started, if the ECT sensor value does not change when the engine is stopped and then the next cold engine start is performed, it is determined that a malfunction has occurred. If this is detected in 2 consecutive driving cycles, the MIL is illuminated and a DTC is set.

MONITOR STRATEGY

Related DTCs	P0116: Engine coolant temperature (ECT) sensor cold start monitor P0116: ECT sensor soak monitor
Required Sensors/Components (Main)	ECT sensor
Required Sensors/Components (Related)	None
Frequency of Operation	Once per driving cycle
Duration	5 hours or more
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0100 to P0103: Mass Air Flow (MAF) meter P0110 to P0113: Intake Air Temperature (IAT) sensor
Battery voltage	10.5 V or more
Time after engine start	1 second or more
ECT at engine start	Less than 60°C (140°F)
IAT sensor circuit	OK
Soak time	5 hours or more
Accumulated MAF	1,176 g or more
Engine	Running
Fuel cut	OFF
Difference between ECT at engine start and IAT	Less than 40°C (72°F)

ECT Sensor soak monitor:

Monitor runs whenever following DTCs not present	P0100 to P0103: MAF meter
Battery voltage	10.5 V or more

Engine	Running
Soak time	5 hours or more
Either (a) or (b) condition met	-
(a) ECT	60°C (140°F) or more
(b) Accumulated MAF	2,029 g or more

TYPICAL MALFUNCTION THRESHOLDS

ECT Sensor cold start monitor:

ECT sensor value change	Less than 5°C (9°F)

ECT Sensor soak monitor:

Difference between current ECT sensor value and previous ECT sensor value when engine stopped	Less than 5°C (9°F)

ES

COMPONENT OPERATING RANGE

ECT	ECT sensor value changes in accordance with actual ECT

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0117, P0118 or P0125 are set simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED II / DTC INFO / CURRENT CODES.
(e) Read the DTC.

Result

Display (DTC Output)	Proceed to
P0116	A
P0116 and other DTCs	B

B → GO TO DTC CHART

A

2	INSPECT THERMOSTAT

(a) Remove the thermostat (see page CO-15).
(b) Measure the valve opening temperature of the thermostat.
Standard value:
80°C to 84°C (176°F to 183°F)

HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

(c) Reinstall the thermostat (see page CO-15).

NG → **REPLACE THERMOSTAT**

OK

REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input
DTC	P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input
DTC	P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.

The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.

As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

Note:

The throttle valve opening angle detected by the sensor terminal VTA1 is expressed as a percentage.

Between 10% and 22%: Throttle valve fully closed

Between 66% and 98%: Throttle valve fully open

Approximately 19%: Fail-safe angle (6°)

A122493E05

DTC No.	DTC Detection Condition	Trouble Area
P0120	Output voltage of VTA1 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• Throttle Position (TP) sensor (built into throttle body) • ECM
P0122	Output voltage of VTA1 0.2 V or less for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	Output voltage of VTA1 4.535 V or more for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	Output voltage of VTA2 quickly fluctuates beyond lower and upper malfunction thresholds for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • ECM

DTC No.	DTC Detection Condition	Trouble Area
P0222	Output voltage of VTA2 1.75 V or less for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	Output voltage of VTA2 4.8 V or more, and VTA1 between 0.2 V and 2.02 V for 2 seconds when accelerator pedal depressed (1 trip detection logic)	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) met (1 trip detection logic): (a) Difference between output voltages of VTA1 and VTA2 0.02 V or less for 0.5 seconds or more (b) Output voltage of VTA1 0.2 V or less, and VTA2 1.75 V or less, for 0.4 seconds or more	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

ES

HINT:

- When any of these DTCs are set, check the throttle valve opening angle by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1 AND THROTTLE POS #2.
- THROTTLE POS #1 denotes the VTA1 signal, and THROTTLE POS #2 denotes the VTA2 signal.

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
THROTTLE POS #1	**0.5 to 1.1 V**	**3.3 to 4.9 V**
THROTTLE POS #2	**2.1 to 3.1 V**	**4.6 to 5.0 V**

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.

- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and sets a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and sets a DTC.

If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

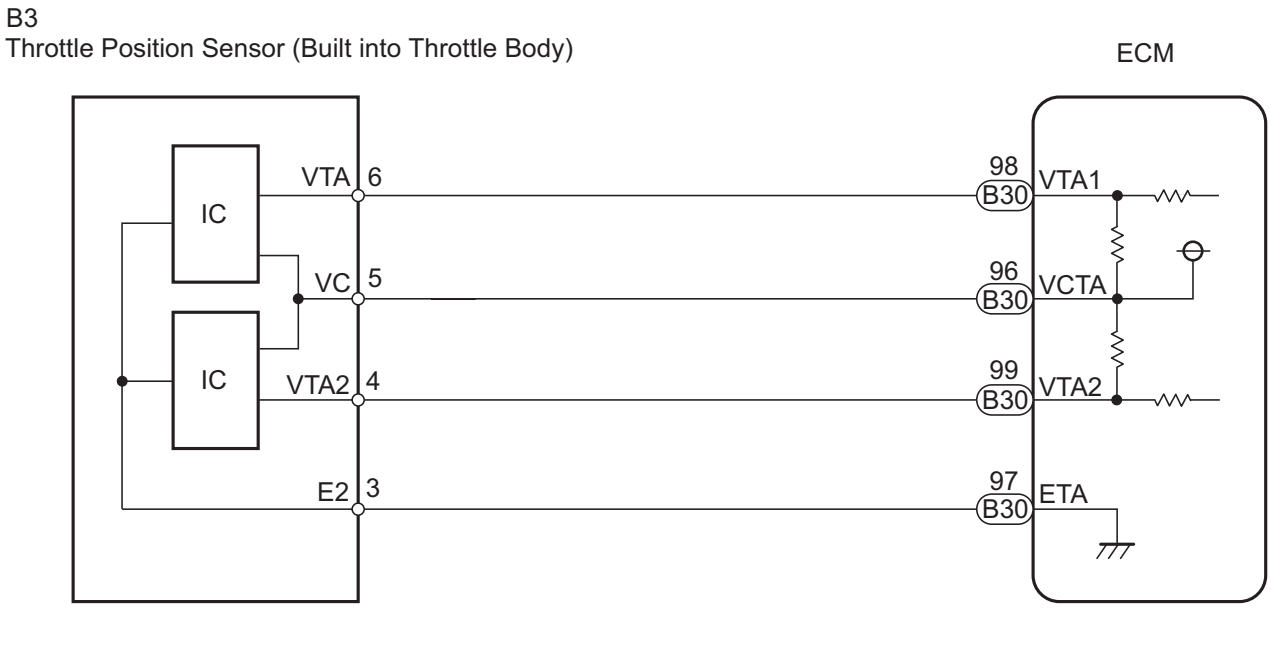
Difference between VTA1 and VTA2 voltages	0.02 V or less

P2135 Case 2:

VTA1 voltage	0.2 V or less
VTA2 voltage	1.75 V or less



COMPONENT OPERATING RANGE

VTA1 voltage	0.69 to 4.05 V
VTA2 voltage	2.25 to 4.8 V

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- These DTCs relate to the Throttle Position (TP) sensor.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (THROTTLE POS #1 AND THROTTLE POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1 and THROTTLE POS #2.
(d) Check the values displayed on the tester.

Result

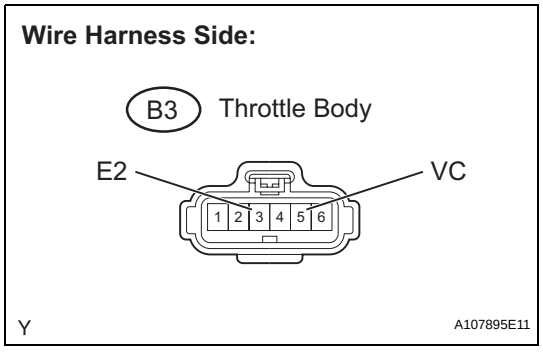
2 CHECK WIRE HARNESS (THROTTLE POSITION SENSOR - ECM)

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

Standard resistance



Tester Connection	Specified Condition
B3-5 (VC) - B30-96 (VCTA)	Below 1 Ω
B3-6 (VTA) - B30-98 (VTA1)	Below 1 Ω
B3-4 (VTA2) - B30-99 (VTA2)	Below 1 Ω
B3-3 (E2) - B30-97 (ETA)	Below 1 Ω
B3-5 (VC) or B30-96 (VCTA) - Body ground	10 kΩ or higher
B3-6 (VTA) or B30-98 (VTA1) - Body ground	10 kΩ or higher
B3-4 (VTA2) or B30-99 (VTA2) - Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → REPAIR OR REPLACE HARNESS AND CONNECTOR

OK

3 INSPECT ECM (VC VOLTAGE)

(a) Disconnect the B3 throttle body connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the throttle body connector.

Standard voltage

Tester Connection	Specified Condition
B3-5 (VC) - B3-3 (E2)	4.5 to 5.5 V

(d) Reconnect the throttle body connector.

NG → REPLACE ECM

OK

4	REPLACE THROTTLE BODY ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (THROTTLE POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds or more.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

B → SYSTEM OK

A

REPLACE ECM

DTC	P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

DESCRIPTION

Refer to DTC P0120 (see page ES-143).

DTC No.	DTC Detection Condition	Trouble Area
P0121	Difference between VTA1 and VTA2 voltages less than 0.8 V, or more than 1.6 V for 2 seconds (1 trip detection logic)	TP sensor (built into throttle body)

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1. The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0121: TP sensor rationality
Required Sensors/Components (Main)	TP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 2 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0120 - P0223, P2135 (TP sensor)
Either of following conditions A or B set	-
A. Ignition switch	ON
B. Electric throttle motor power	ON

TYPICAL MALFUNCTION THRESHOLDS

Difference in voltage between VTA1 and VTA2 TP sensor 1 - [TP sensor 2 x 0.8 (corrected by learning value)]	Less than 0.8 V, or more than 1.6 V

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

INSPECTION PROCEDURE

HINT:

- This DTC relates to the Throttle Position (TP) sensor.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0121)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

REPLACE THROTTLE BODY ASSEMBLY

DTC	P0125	Insufficient Coolant Temperature for Closed Loop Fuel Control

DESCRIPTION

Refer to DTC P0115 (see page ES-134).

DTC No.	DTC Detection Condition	Trouble Area
P0125	Engine Coolant Temperature (ECT) does not reach closed-loop enabling temperature for 20 minutes (this period varies with engine start ECT) (2 trip detection logic)	• ECT sensor • Cooling system • Thermostat

MONITOR DESCRIPTION

The resistance of the ECT sensor varies in proportion to the actual ECT. The ECT supplies a constant voltage to the sensor and monitors the signal output voltage of the sensor. The signal voltage output varies according to the changing resistance of the sensor. After the engine is started, the ECT is monitored through this signal. If the ECT sensor indicates that the engine is not yet warm enough for closed-loop fuel control, despite a specified period of time having elapsed since the engine was started, the ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.
Example:
The ECT is 0°C (32°F) at engine start. After about 1 minute running time, the ECT sensor still indicates that the engine is not warm enough to begin closed-loop fuel (air-fuel ratio feedback) control. The ECM interprets this as a malfunction in the sensor or cooling system and sets the DTC.

ES

MONITOR STRATEGY

Related DTCs	P0125: Insufficient engine coolant temperature for closed-loop fuel control
Required Sensors/Components (Main)	Thermostat, cooling system
Required Sensors/Components (Related)	Engine coolant temperature sensor and mass air flow meter
Frequency of Operation	Once per driving cycle
Duration	54.5 seconds or more: Engine coolant temperature at engine start -3.34°C (26°F) or more 93 seconds or more: Engine coolant temperature at engine start -4.45° to -3.34°C (24° to 26°F) 20 minutes or more: Engine coolant temperature at engine start less than -4.45°C (24°F)
MIL Operation	2 driving cycles
Sequence of Operation	None

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor)
Thermostat failure	Not detected

TYPICAL MALFUNCTION THRESHOLDS

Time until actual engine coolant temperature reaches closed-loop fuel control enabling temperature	54.5 seconds or more: Engine coolant temperature at engine start -3.34°C (26°F) or more 93 seconds or more: Engine coolant temperature at engine start -4.45° to -3.34°C (24° to 26°F) 20 minutes or more: Engine coolant temperature at engine start less than -4.45°C (24°F)

WIRING DIAGRAM

Refer to DTC P0115 (see page ES-135).

INSPECTION PROCEDURE

HINT:

- If any of DTCs P0115, P0116, P0117 or P0118 are set simultaneously with DTC P0125, the Engine Coolant Temperature (ECT) sensor may have an open or a short circuit. Troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0125)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0125	A
P0125 and other DTCs	B

HINT:
If any DTCs other than P0125 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	INSPECT THERMOSTAT

(a) Remove the thermostat (see page CO-15).
(b) Check the valve opening temperature of the thermostat.
Standard value:
80 to 84°C (176 to 183°F)
HINT:
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.
(c) Reinstall the thermostat (see page CO-15).

NG → REPLACE THERMOSTAT

OK

3	CHECK COOLING SYSTEM

(a) Check for defects in the cooling system that might cause the system to be too cold, such as abnormal radiator fan operation or any modifications.

NG → **REPAIR OR REPLACE COOLING SYSTEM**

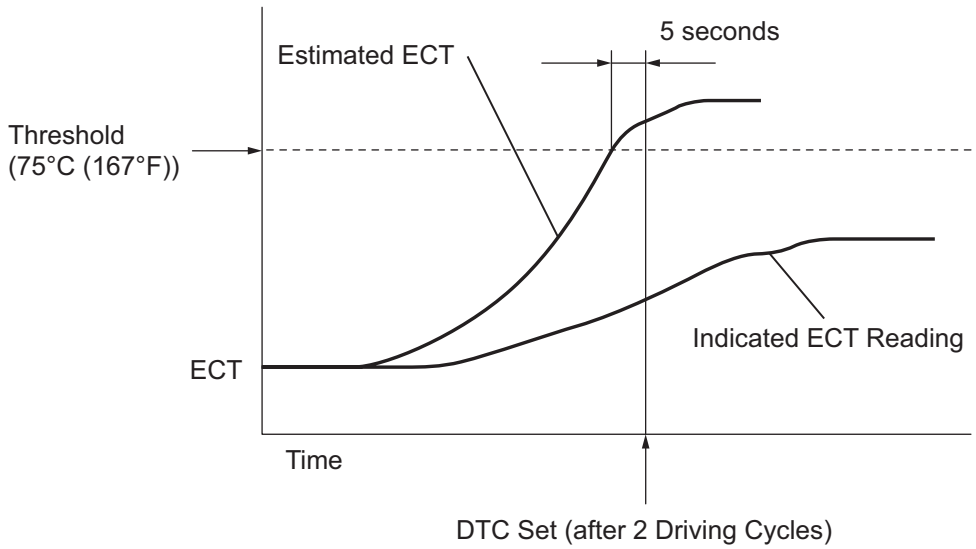
REPLACE ENGINE COOLANT TEMPERATURE SENSOR

DTC	P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature)



DESCRIPTION

This DTC is set when the Engine Coolant Temperature (ECT) does not reach 75°C (167°F) despite sufficient engine warm-up time having elapsed.

DTC No.	DTC Detection Condition	Trouble Area
P0128	Conditions (a), (b) and (c) met for 5 seconds (2 trip detection logic): (a) Cold start (b) Engine warmed up (c) ECT less than 75°C (167°F)	• Thermostat • Cooling system • ECT sensor • ECM

ES

MONITOR DESCRIPTION

Y

A121605E02

The ECM estimates the ECT based on the starting temperature, engine loads, and engine speeds. The ECM then compares the estimated temperature with the actual ECT. When the estimated ECT reaches 75°C (167°F), the ECM checks the actual ECT. If the actual ECT is less than 75°C (167°F), the ECM interprets this as a malfunction in the thermostat or the engine cooling system and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0128: Coolant Thermostat

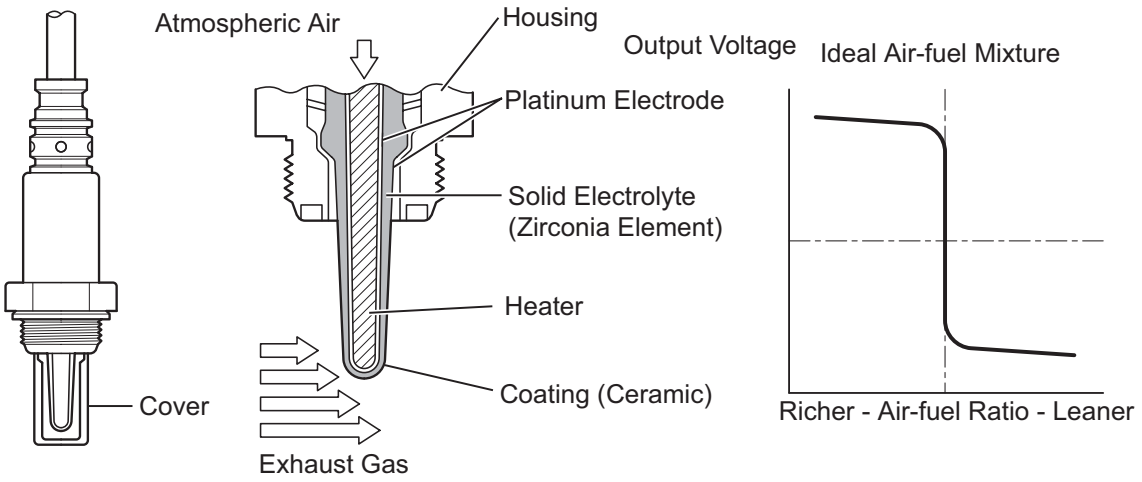
DTC	P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)
DTC	P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)
DTC	P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)
DTC	P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)
DTC	P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)
DTC	P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. less than 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. more than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

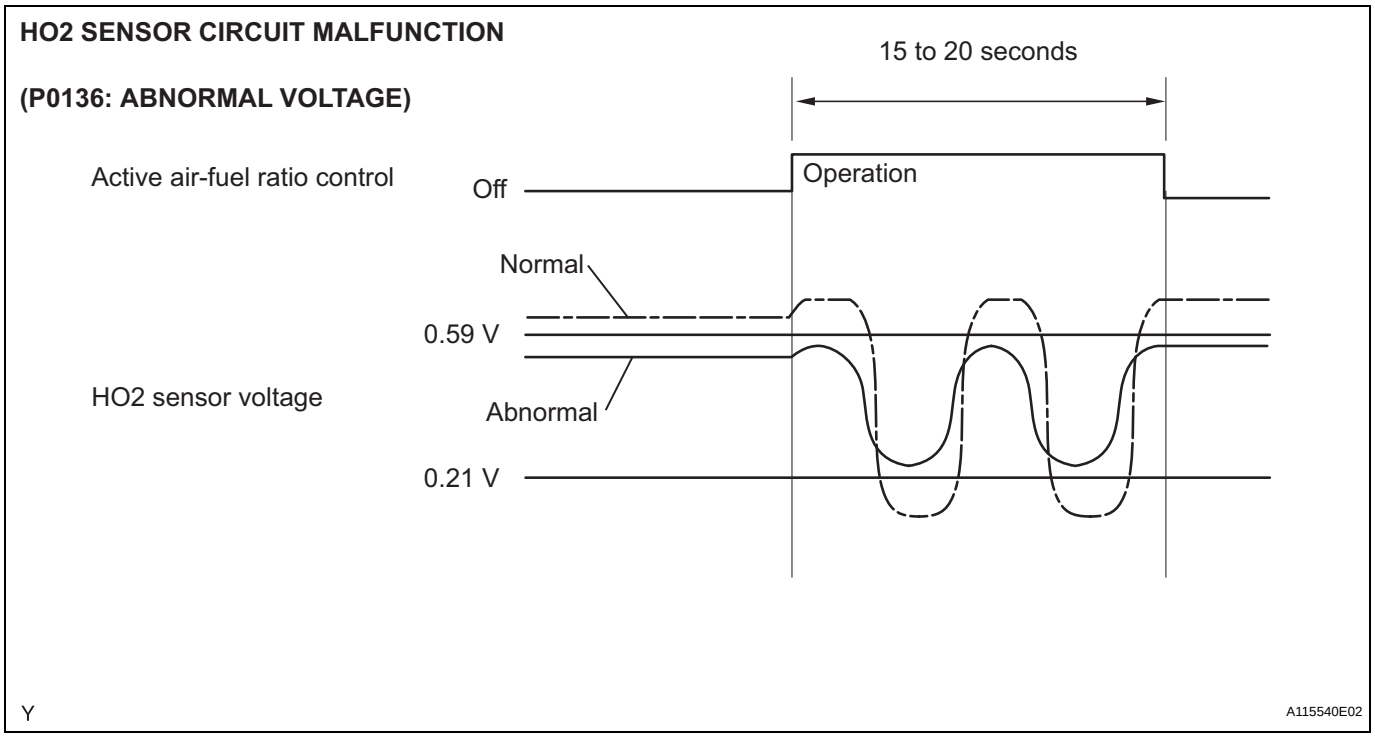
P

A115539E07

DTC No.	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) Heated Oxygen (HO2) sensor voltage does not decrease to less than 0.59 V (b) HO2 sensor voltage does not increase to more than 0.21 V • Low impedance: Sensor impedance less than 5 Ω for more than 30 seconds when ECM presumes sensor to be warmed up and operating normally (2 trip detection logic)	• Open or short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor heater (sensor 2) • Air-fuel Ratio (A/F) sensor (sensor 1) • Integration relay (EFI MAIN relay) • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) HO2 sensor voltage output less than 0.21 V (b) Target air-fuel ratio rich • High impedance: Sensor impedance 15 kΩ or more for more than 90 seconds when ECM presumes sensor to be warmed up and operating normally (2 trip detection logic)	• Open in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • HO2 sensor heater (sensor 2) • Integration relay (EFI MAIN relay) • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, following conditions (a) and (b) met for certain period of time (2 trip detection logic): (a) HO2 sensor voltage output more than 0.59 V (b) Target air-fuel ratio lean • Extremely high voltage (short): HO2 sensor voltage output exceeds 1.2 V for more than 10 seconds (2 trip detection logic)	• Short in HO2 sensor (sensor 2) circuit • HO2 sensor (sensor 2) • ECM internal circuit malfunction

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control



The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, one of the following DTCs is set: DTC P0136 or P0156 (abnormal voltage output), P0137 or P0157 (open circuit) and P0138 or P0158 (short circuit).

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

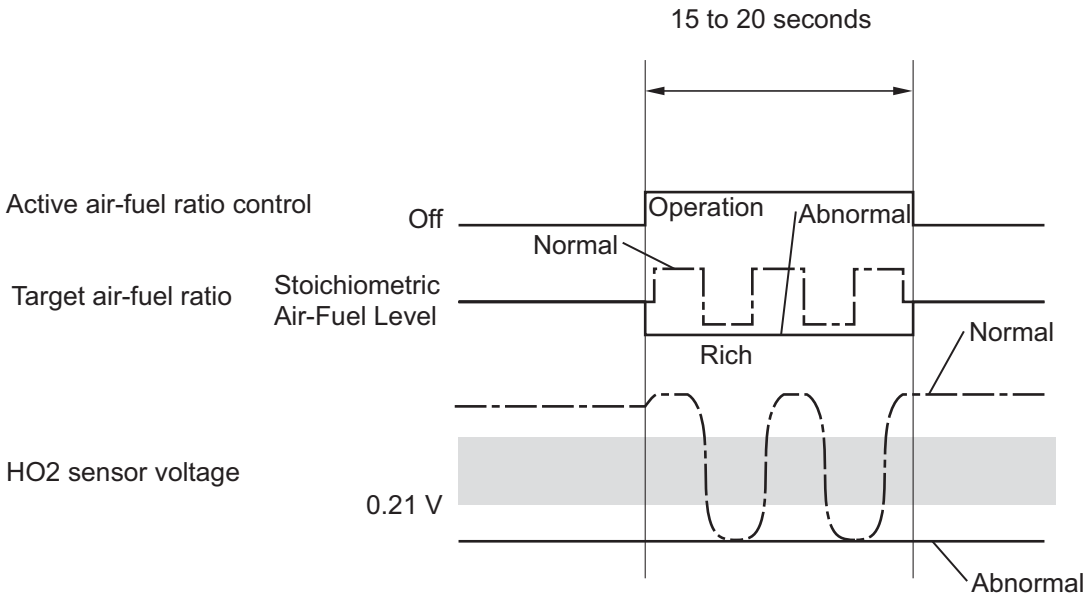
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to less than 0.21 V and does not increase to more than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and sets DTC P0136 or P0156.

ES

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

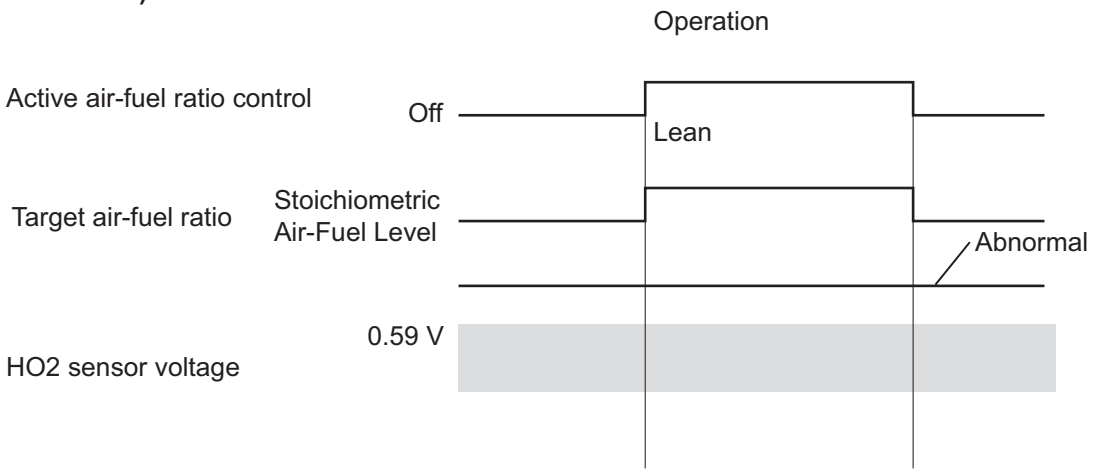
While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and sets DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or more (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and sets DTC P0138 or P0158.



HINT:

DTC P0138 or P0158 is also set if the HO2 sensor voltage output is more than 1.2 V for 10 seconds or more.

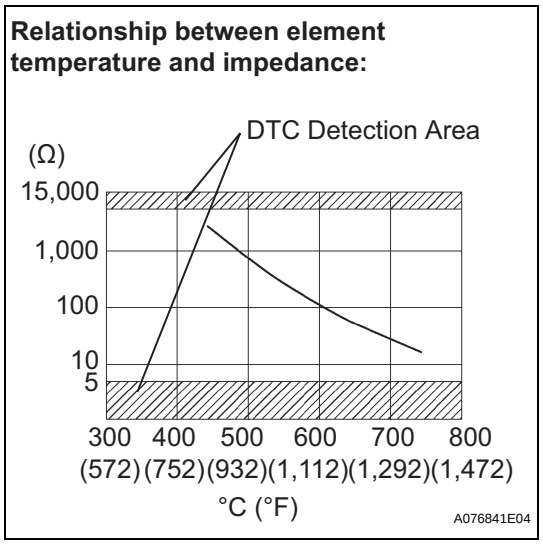
*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (see page ES-234).



HO2 SENSOR CIRCUIT LOW VOLTAGE

(P0137 and P0157: OPEN)

HO2 SENSOR CIRCUIT HIGH VOLTAGE



(P0138 and P0158: SHORT)

Y

A115541E06

High or Low Impedance of Heated Oxygen (HO2) Sensor (DTC P0136 and P0156 or P0137 and P157)

During normal air-fuel ratio feedback control, there are small variations in the exhaust gas oxygen concentration. In order to continuously monitor the slight variations in the HO2 sensor signal while the engine is running, the impedance* of the sensor is measured by the ECM. The ECM determines that there is a malfunction in the sensor when the measured impedance deviates from the standard range.
*: The effective resistance in an alternating current electrical circuit.
HINT:

- The impedance cannot be measured using an ohmmeter.
- DTC P0136 and P0156 indicate the deterioration of the HO2 sensor. The ECM sets this DTC by calculating the impedance of the sensor when the typical enabling conditions are satisfied (2 driving cycles).
- DTC P0137 and P0157 indicate an open or short circuit in the HO2 sensor (2 driving cycles). The ECM sets this DTC when the impedance of the sensor exceeds the threshold 15 kΩ.

ES

Heated Oxygen Sensor Output Voltage (Abnormal Voltage Output, High Voltage and Low Voltage):

Active air-fuel ratio control	Executing
Active air-fuel ratio control begins when all of following conditions met:	-
Battery voltage	11 V or more
Engine coolant temperature	75°C (167°F) or more
Idling	OFF
Engine RPM	Less than 3,200 rpm
A/F sensor status	Activated
Fuel system status	Closed loop
Fuel cut	OFF
Engine load	10 to 70%
Shift position	4th

Heated Oxygen Sensor Impedance (Low):

Battery voltage	11 V or more
Estimated rear HO2 sensor temperature	Less than 700°C (1,292°F)
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Impedance (High):

Battery voltage	11 V or more
Estimated rear HO2 sensor temperature	450°C (842°F) or more
ECM monitor	Completed
DTC P0606	Not set

Heated Oxygen Sensor Output Voltage (Extremely High):

Battery voltage	11 V or more
Time after engine start	2 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Heated Oxygen Sensor Output Voltage (Abnormal Voltage Output):

Either of following conditions met:	1 or 2
1. All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	0.21 to 0.59 V

(c) OSC (Oxygen Storage Capacity of Catalyst)	2 g or more
2. All of following conditions (d), (e) and (f) met	-
(d) Commanded air-fuel ratio	14.9 or more
(e) Rear HO2 sensor voltage	0.21 to 0.59 V
(f) OSC	2 g or more

Heated Oxygen Sensor Output Voltage (Low):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.3 or less
(b) Rear HO2 sensor voltage	Less than 0.21 V
(c) OSC	2 g or more

Heated Oxygen Sensor Output Voltage (High):

All of following conditions (a), (b) and (c) met	-
(a) Commanded air-fuel ratio	14.9 or more
(b) Rear HO2 sensor voltage	More than 0.59 V
(c) OSC	2 g or more

Heated Oxygen Sensor Impedance (Low):

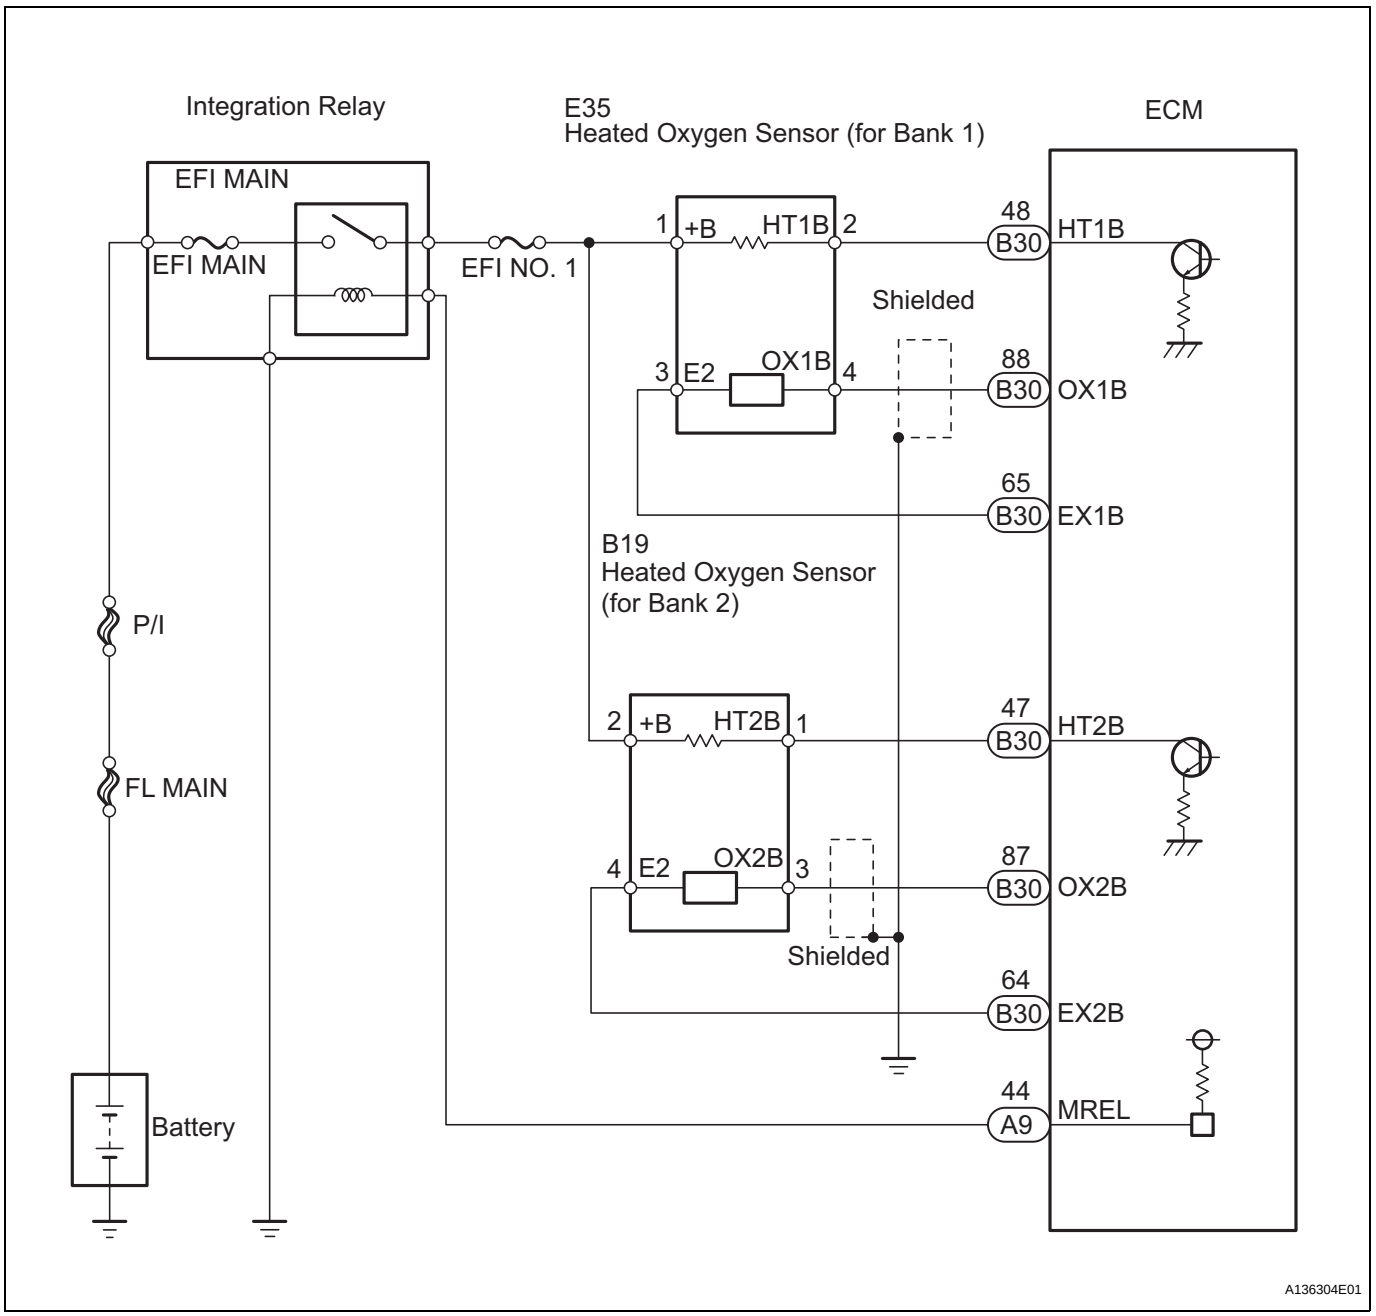
Duration of following condition met	30 seconds or more
Heated oxygen sensor impedance	Less than 5 Ω

Heated Oxygen Sensor Impedance (High):

Duration of following condition met	90 seconds or more
Heated oxygen sensor impedance	15 kΩ or more

Heated Oxygen Sensor Output Voltage (Extremely High):

Duration of following condition met	10 seconds or more
Heated oxygen sensor voltage	1.2 V or more

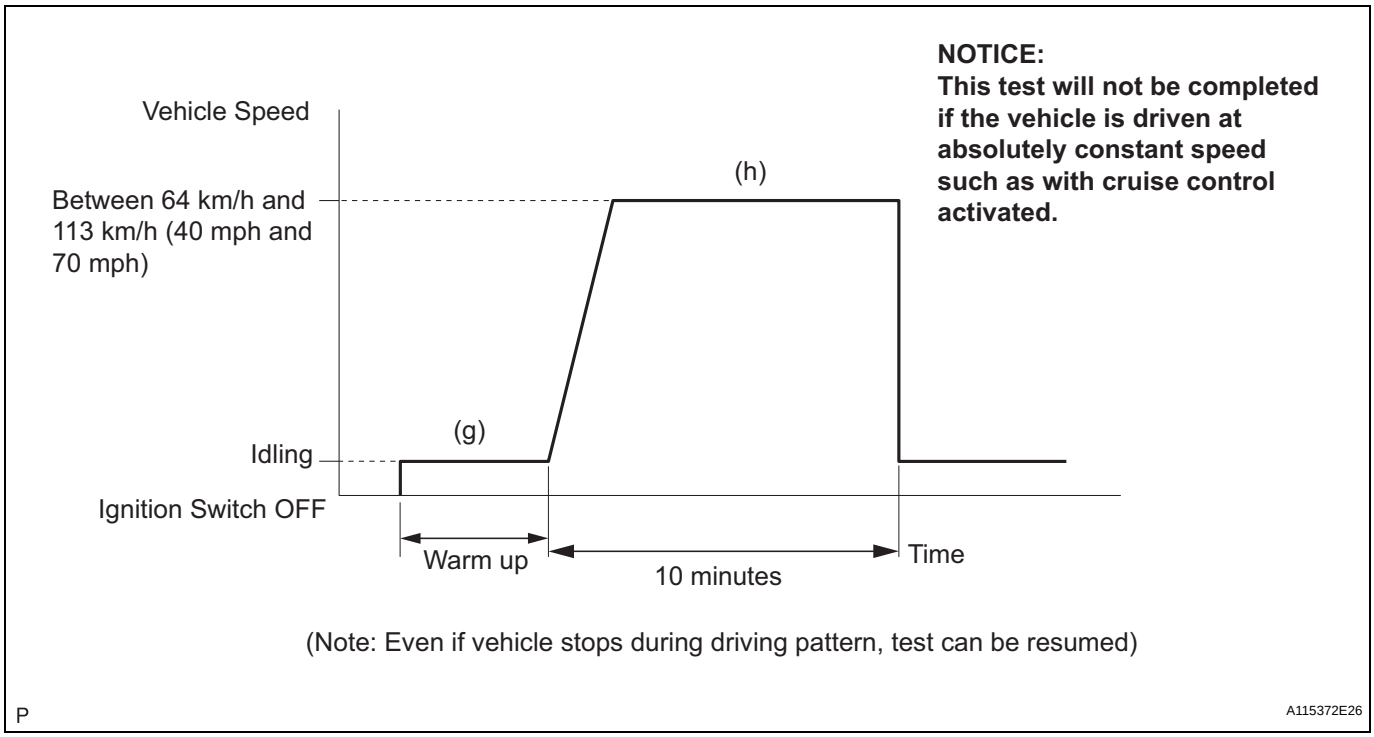


COMPONENT OPERATING RANGE

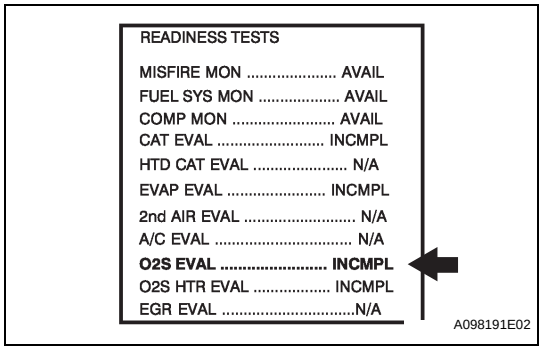
Duration of following condition met	30 seconds or more
Heated oxygen sensor voltage	Varies between 0.1 and 0.9 V

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).



WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.
- Performing this confirmation pattern will activate the Heated Oxygen (HO2) sensor monitor. (The catalyst monitor is performed simultaneously.) This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-39).
(e) Select the following menu items: DIAGNOSIS / CARB OBD II / READINESS TESTS.
(f) Check that O2S EVAL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as the O2S EVAL monitor operates.
(j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES. Then check if any DTCs (any pending DTCs) are set.
HINT:
If O2S EVAL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

INSPECTION PROCEDURE

HINT:
Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.
HINT:
Intelligent tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

ES

HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
AFS B2 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B1 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4
O2S B2 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
3	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

ES

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2; then press the YES button and then the ENTER button followed by the F4 button.
HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0138 will be set.
- If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0158 will be set.

1	READ OUTPUT DTC

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC output)	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

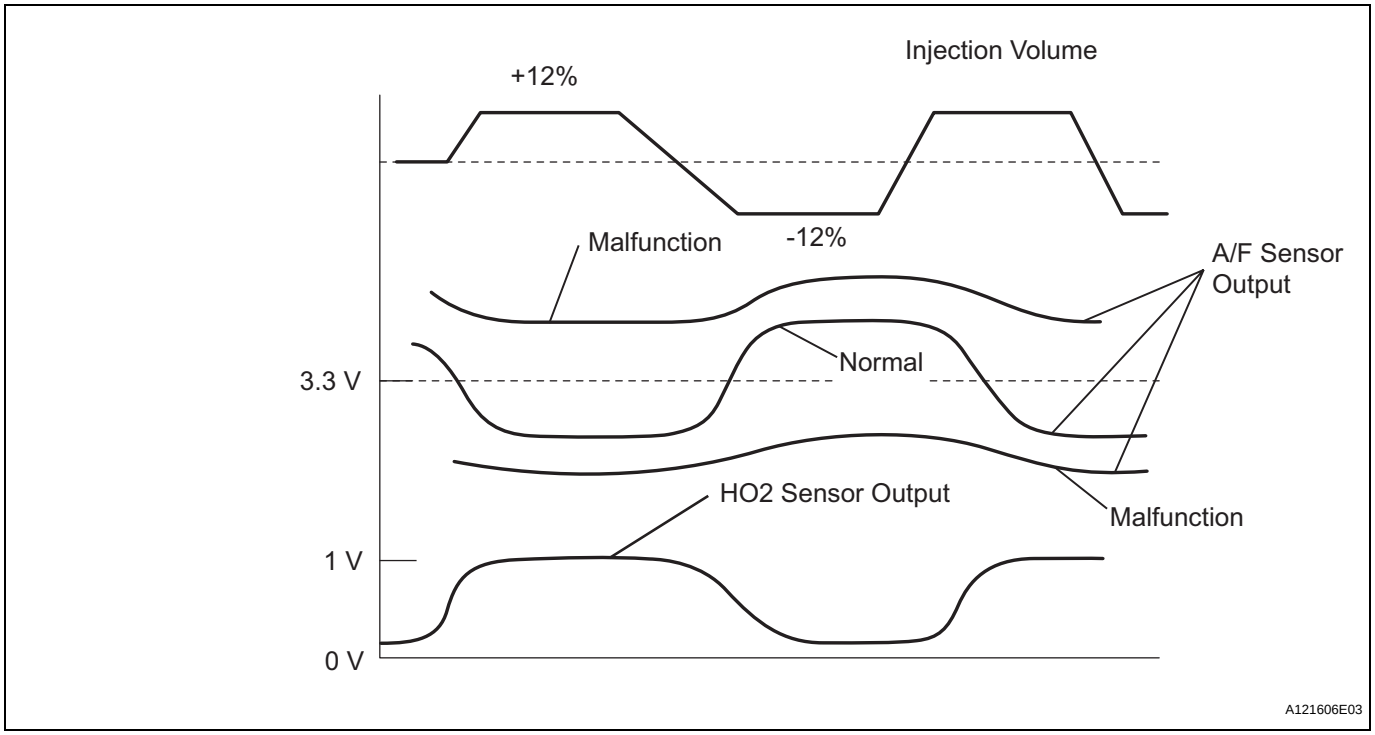
12	CHECK WHETHER DTC OUTPUT RECURS (DTC P0136 OR P0156)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(b) Read DTCs.



Result

Display (DTC Output)	Proceed to
P0136 or P0156	A
No output	B

B → REPAIR COMPLETE

A

13	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INJ VOL.

(e) Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.
- The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.

Result

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between more and less than 3.3 V	OK
	Remains at more than 3.3 V	NG
	Remains at less than 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or more than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → **REPLACE AIR-FUEL RATIO SENSOR**

OK ↓

CHECK AND REPAIR EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

14 CHECK FOR EXHAUST GAS LEAK

OK:

No gas leakage.

16 INSPECT INTEGRATION RELAY (EFI MAIN RELAY) (See page ES-118)

NG → **REPLACE INTEGRATION RELAY**

OK

17	CHECK WIRE HARNESS (HEATED OXYGEN SENSOR - ECM)

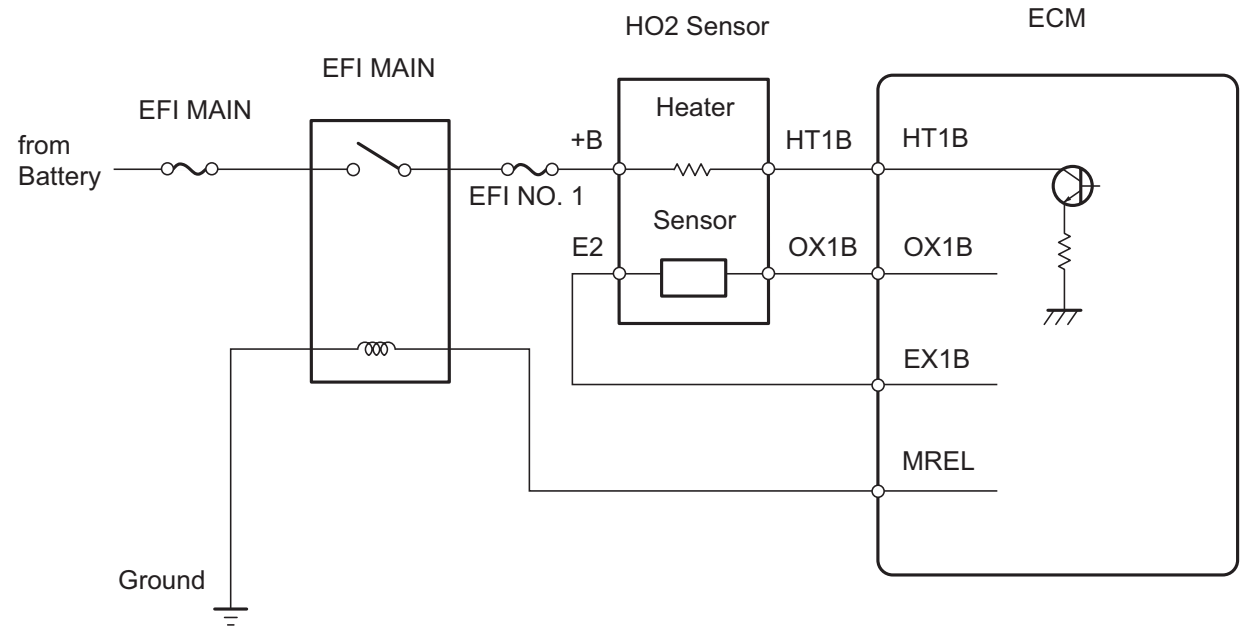
Wire Harness Side:

(a) Disconnect the B19 or E35 HO2 sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the +B terminal of the HO2 sensor connector and body ground.

Standard voltage

Tester Connection	Specified Condition
E35-1 (+B) - Body ground	9 to 14 V
B19-2 (+B) - Body ground	9 to 14 V

(d) Turn the ignition switch OFF.
(e) Disconnect the B30 ECM connector.
(f) Measure the resistance.



Standard resistance

Tester Connection	Specified Condition
E35-2 (HT1B) - B30-48 (HT1B)	Below 1 Ω
E35-4 (OX1B) - B30-88 (OX1B)	Below 1 Ω
E35-3 (E2) - B30-65 (EX1B)	Below 1 Ω
B19-1 (HT2B) - B30-47 (HT2B)	Below 1 Ω
B19-3 (OX2B) - B30-87 (OX2B)	Below 1 Ω
B19-4 (E2) - B30-64 (EX2B)	Below 1 Ω
E35-2 (HT1B) or B30-48 (HT1B) - Body ground	10 kΩ or higher
E35-4 (OX1B) or B30-88 (OX1B) - Body ground	10 kΩ or higher
E35-3 (E2) or B30-65 (EX1B) - Body ground	10 kΩ or higher
B19-1 (HT2B) or B30-47 (HT2B) - Body ground	10 kΩ or higher
B19-3 (OX2B) or B30-87 (OX2B) - Body ground	10 kΩ or higher
B19-4 (E2) or B30-64 (EX2B) - Body ground	10 kΩ or higher

(g) Reconnect the HO2 sensor connector.
(h) Reconnect the ECM connector.

DTC	P0171	System Too Lean (Bank 1)

DTC	P0172	System Too Rich (Bank 1)

DTC	P0174	System Too Lean (Bank 2)

DTC	P0175	System Too Rich (Bank 2)

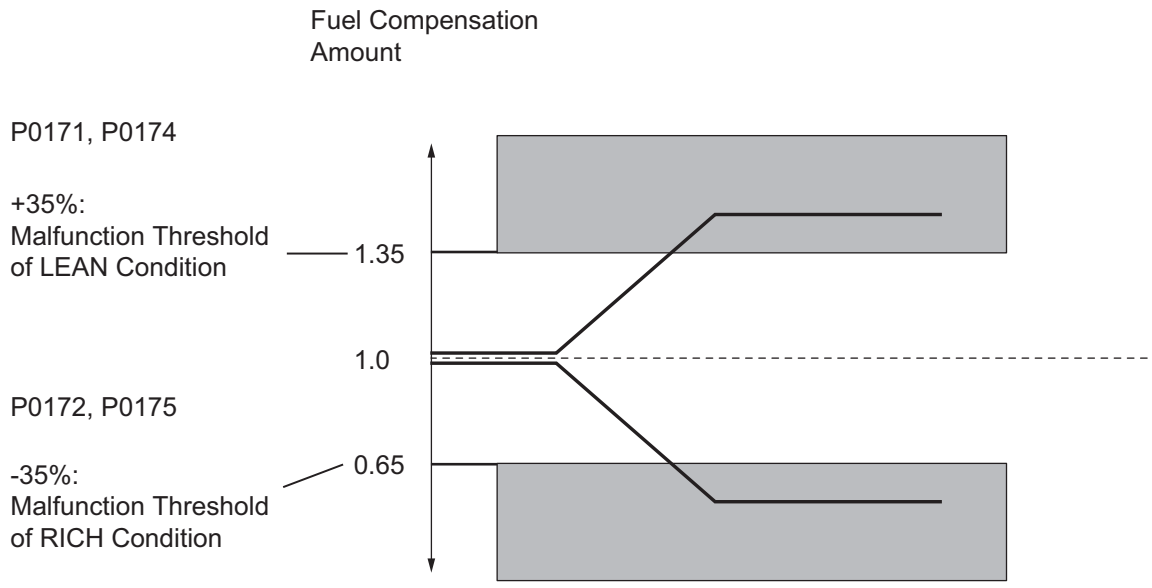
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.

The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.

Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel term to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.

ES



DTC No.	DTC Detection Condition	Trouble Area
P0171 P0174	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to lean side (2 trip detection logic)	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With warm engine and stable air-fuel ratio feedback, fuel trim considerably in error to rich side (2 trip detection logic)	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:

- When DTC P0171 or P0174 is set, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is set, the actual air-fuel ratio is on the rich side.
- If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be set. The MIL is then illuminated.
- When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and sets a DTC.
Example:
The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

TYPICAL MALFUNCTION THRESHOLDS

Purge-cut	Executing
Either of following conditions 1 or 2 met	-
1. Average of short-term fuel trim and long-term fuel trim	35% or more (varies with ECT)
2. Average of short-term fuel trim and long-term fuel trim	-35% or less (varies with ECT)

WIRING DIAGRAM

Refer to DTC P2195 (see page ES-339).

INSPECTION PROCEDURE

HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

1	**CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175	A

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:
If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of A/F and HO2 sensors (AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2) displayed on the tester.

Result:

The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25% = Rich output:
Less than 3.0 V
-12.5% = Lean output:
More than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
3	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		Extremely rich or lean actual air-fuel ratio • Injector leakage or blockage • Gas leakage from exhaust system • Fuel pressure • MAF meter • ECT sensor • Air induction system • PCV hose connections
	Output Voltage Almost no reaction	 NG	Output Voltage Almost no reaction	 NG	

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1S1 and O2S B1S2 or AFS B2S1 and O2S B2S2; then press the YES button and then the ENTER button followed by the F4 button.

3 READ VALUE USING INTELLIGENT TESTER (MAF)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / MAF and COOLANT TEMP.
(d) Allow the engine to idle until the COOLANT TEMP reaches 75°C (167°F) or more.
(e) Read the MAF with the engine in an idling condition and at an engine speed of 2,500 rpm.
Standard:
MAF while engine idling: Between 1 g/sec. and 3 g/sec. (shift position: N; A/C: OFF).
MAF at engine speed of 2,500 rpm: Between 2 g/sec. and 6 g/sec. (shift position: N; A/C: OFF).

NG → REPLACE MASS AIR FLOW METER

OK

4	READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / COOLANT TEMP.
(d) Read the COOLANT TEMP twice, when the engine is both cold and warmed up.
Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 75°C and 100°C (167°F and 212°F).

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR**

OK

5	CHECK PCV HOSE CONNECTIONS

(a) Check for PCV hose connections.
OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

6	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

7	CHECK FOR SPARKS AND IGNITION (See page ES-204)

NG → **REPAIR OR REPLACE IGNITION SYSTEM**

OK

8	CHECK FOR EXHAUST GAS LEAK

(a) Check for exhaust gas leakage.

OK:
No gas leakage.

NG → **REPAIR OR REPLACE EXHAUST SYSTEM**

OK

9	CHECK FUEL PRESSURE

(a) Check the fuel pressure (see page FU-6).
Standard pressure:
304 to 343 kPa (3.1 to 3.5 kgf/cm^2, 44.1 to 49.7 psi)

NG → **REPAIR OR REPLACE FUEL SYSTEM**

OK

ES

10	INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

(a) Check the injection volume (see page FU-11).
Standard injection volume:
45 to 58 cm^3 (2.9 to 3.5 cu. in.) per 15 seconds

NG → **REPLACE FUEL INJECTOR**

OK

11	INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE) (See page ES-110)

NG → **REPLACE AIR-FUEL RATIO SENSOR**

OK

12	INSPECT INTEGRATION RELAY (A/F RELAY) (See page ES-111)

NG → **REPLACE INTEGRATION RELAY**

OK

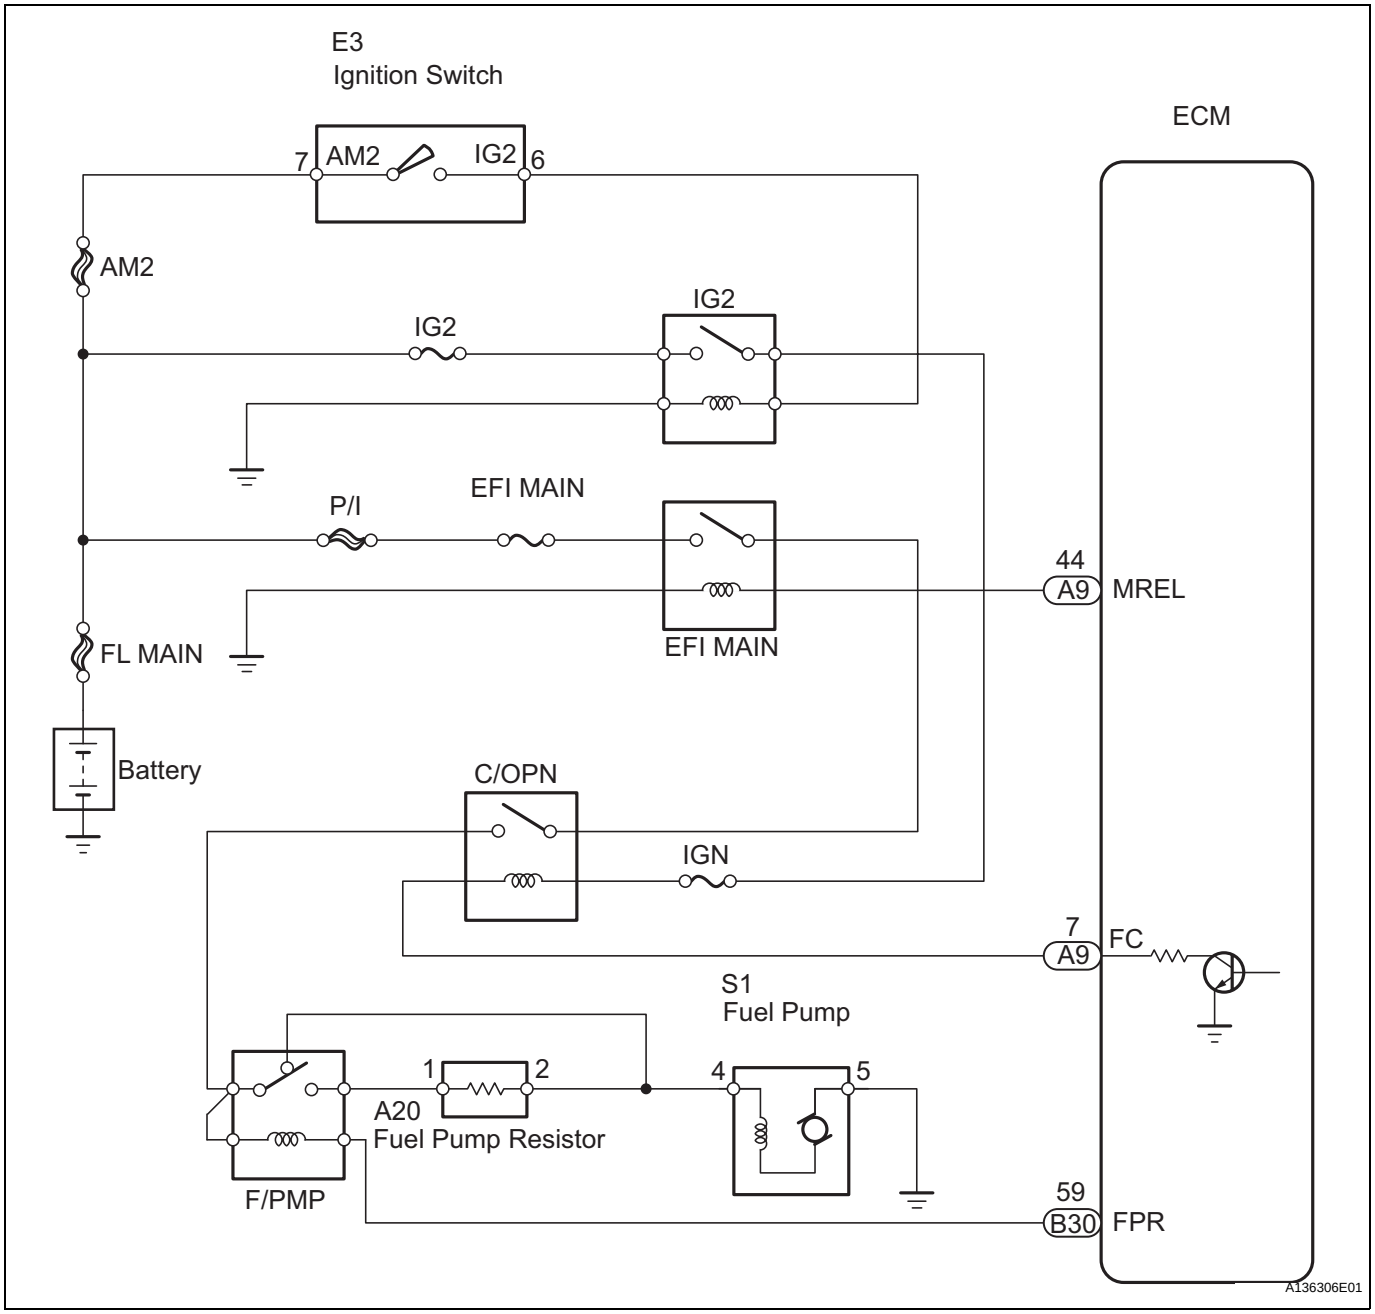
No output	A
P0171, P0172, P0174 or P0175	B

B → Go to step 3

A → END



DTC	P0230	Fuel Pump Primary Circuit

DESCRIPTION

- This DTC is designed to detect a malfunction in the fuel pump (F/PMP) relay circuit. When the system is normal, the battery voltage is applied to FPR terminal of the ECM while the F/PMP relay is turned OFF. If the battery voltage is not applied to the FPR terminal while the F/PMP relay is OFF, the ECM interprets this as a malfunction. The ECM then illuminates the MIL and sets a DTC.
- The F/PMP relay switches the fuel pump speed according to the engine conditions. The fuel pump operates when the ECM receives the starter-operating signal (STA) and crankshaft-rotating signal (NE). The F/PMP relay is turned ON while the engine is idling or operating at low load. This causes current to flow through the fuel pump resistor to the fuel pump. The fuel pump then operates at low speed. The F/PMP relay is turned OFF while the engine is cranking or operating at high load. The fuel pump then operates at normal speed.

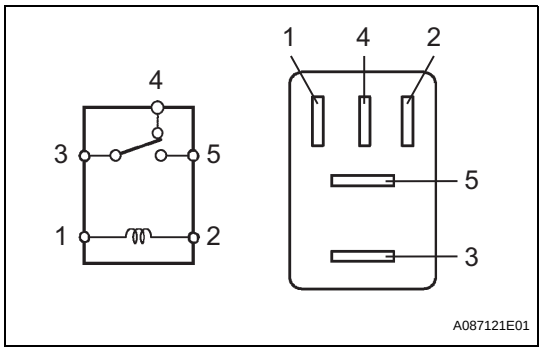
DTC No.	DTC Detection Condition	Trouble Area
P0230	Open or short in F/PMP relay circuit (1 trip detection logic)	• Open or short in F/PMP relay circuit • F/PMP relay • ECM

WIRING DIAGRAM

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the problem symptoms table (see page ES-27).

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST BY INTELLIGENT TESTER



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the intelligent tester ON.
(c) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP SP CTL.
(d) Check the operation of the relay while operating it using the intelligent tester.

OK:
Operating noise can be heard from the relay.

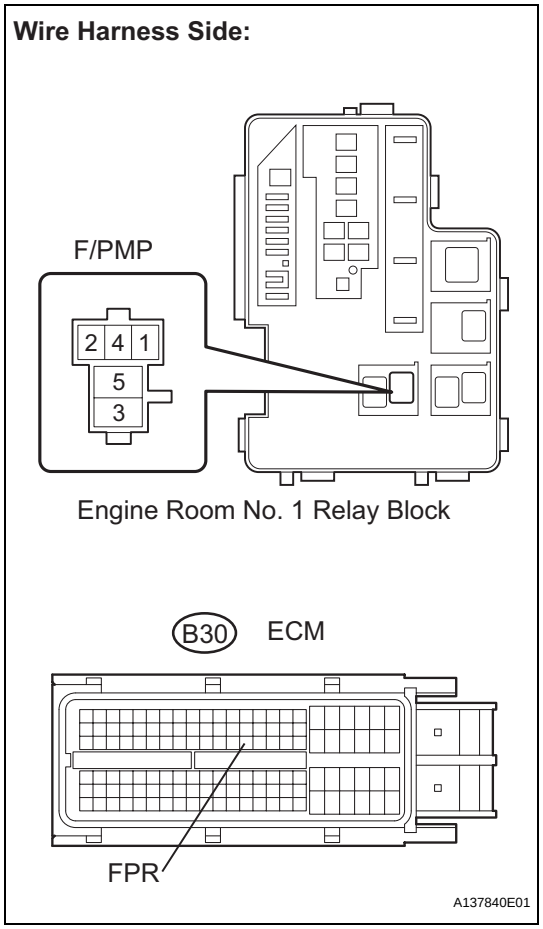
OK → **CHECK INTERMITTENT PROBLEMS**

NG

2	INSPECT FUEL PUMP RELAY (Marking: F/PMP)

(a) Remove the F/PMP relay from the engine room No. 1 relay block.
(b) Measure the resistance according to the value(s) in the table below.

Standard resistance



Tester Connection	Specified Condition
3 - 4	Below 1 Ω
3 - 5	10 kΩ or more
3 - 4	10 kΩ or more (when battery voltage is applied to terminals 1 and 2)
3 - 5	Below 1 Ω (when battery voltage is applied to terminals 1 and 2)

NG → **REPLACE FUEL PUMP RELAY (Marking: F/PMP)**

OK

ES

3	CHECK WIRE HARNESS (F/PMP RELAY - ECM)

(a) Remove the F/PMP relay from the engine room No. 1 relay block.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard resistance

Tester Connection	Specified Condition
F/PMP relay terminal 1- B30-59 (FPR)	Below 1 Ω
F/PMP relay terminal 1 or B30-59 (FPR) - Body Ground	10 kΩ or higher

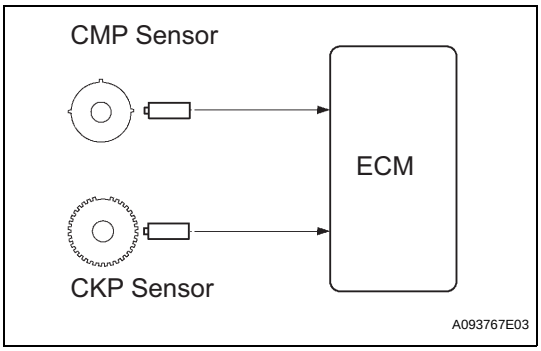
DTC	P0300	Random / Multiple Cylinder Misfire Detected

DTC	P0301	Cylinder 1 Misfire Detected

DTC	P0302	Cylinder 2 Misfire Detected

DTC	P0303	Cylinder 3 Misfire Detected



DTC	P0304	Cylinder 4 Misfire Detected

DTC	P0305	Cylinder 5 Misfire Detected

ES

DTC	P0306	Cylinder 6 Misfire Detected

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire rate exceeds the threshold level, and could cause emission deterioration, the ECM illuminates the MIL and sets a DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders detected (2 trip detection logic)	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder detected (2 trip detection logic)	

When DTCs for misfiring cylinders are randomly set, but DTC P0300 is not set, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only set when several misfiring cylinders are detected at the same time.

MONITOR DESCRIPTION

The ECM illuminates the MIL and sets a DTC when either of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1,000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs once.
- After the first 1,000 crankshaft revolutions, an excessive misfiring rate (approximately 20 to 50 misfires per 1,000 crankshaft revolutions) occurs 4 times in sequential crankshaft revolutions.

The ECM flashes the MIL and sets a DTC when either of the following conditions, which could cause Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- In every 200 crankshaft revolutions at a high engine rpm, the threshold misfiring percentage is recorded once.
- In every 200 crankshaft revolutions at a normal engine rpm, the threshold misfiring percentage is recorded 3 times.

ES

MONITOR STRATEGY

Related DTCs	P0300: Multiple cylinder misfire P0301: Cylinder 1 misfire P0302: Cylinder 2 misfire P0303: Cylinder 3 misfire P0304: Cylinder 4 misfire P0305: Cylinder 5 misfire P0306: Cylinder 6 misfire
Required Sensors/Components (Main)	Crankshaft position sensor and Camshaft position sensor
Required Sensors/Components (Related)	Engine coolant temperature and intake air temperature sensors and Mass air flow meter
Frequency of Operation	Continuous
Duration	1,000 to 4,000 crankshaft revolutions: Emission related misfire 200 to 600 crankshaft revolutions: Catalyst damaged misfire
MIL Operation	2 driving cycles: Emission related misfire MIL flashes immediately: Catalyst damaged misfire
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Misfire:

Monitor runs whenever following DTCs not present	P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0327, P0328 (Knock sensor) P0335 (CKP sensor) P0340 (CMP sensor) P0500 (VSS)
Battery voltage	8 V or more
VVT system	Not operated by scan tool
Engine RPM	450 to 6,500 rpm
Either of following conditions (a) or (b) met	-
(a) ECT at engine start	More than -7°C (19°F)
(b) ECT	More than 20°C (68°F)
Fuel cut	OFF

Monitor period of emission-related-misfire:

First 1,000 revolutions after engine start, or Check Mode	Crankshaft 1,000 revolutions
Except above	Crankshaft 1,000 revolutions x 4

Monitor period of catalyst-damaged-misfire (MIL blinks):

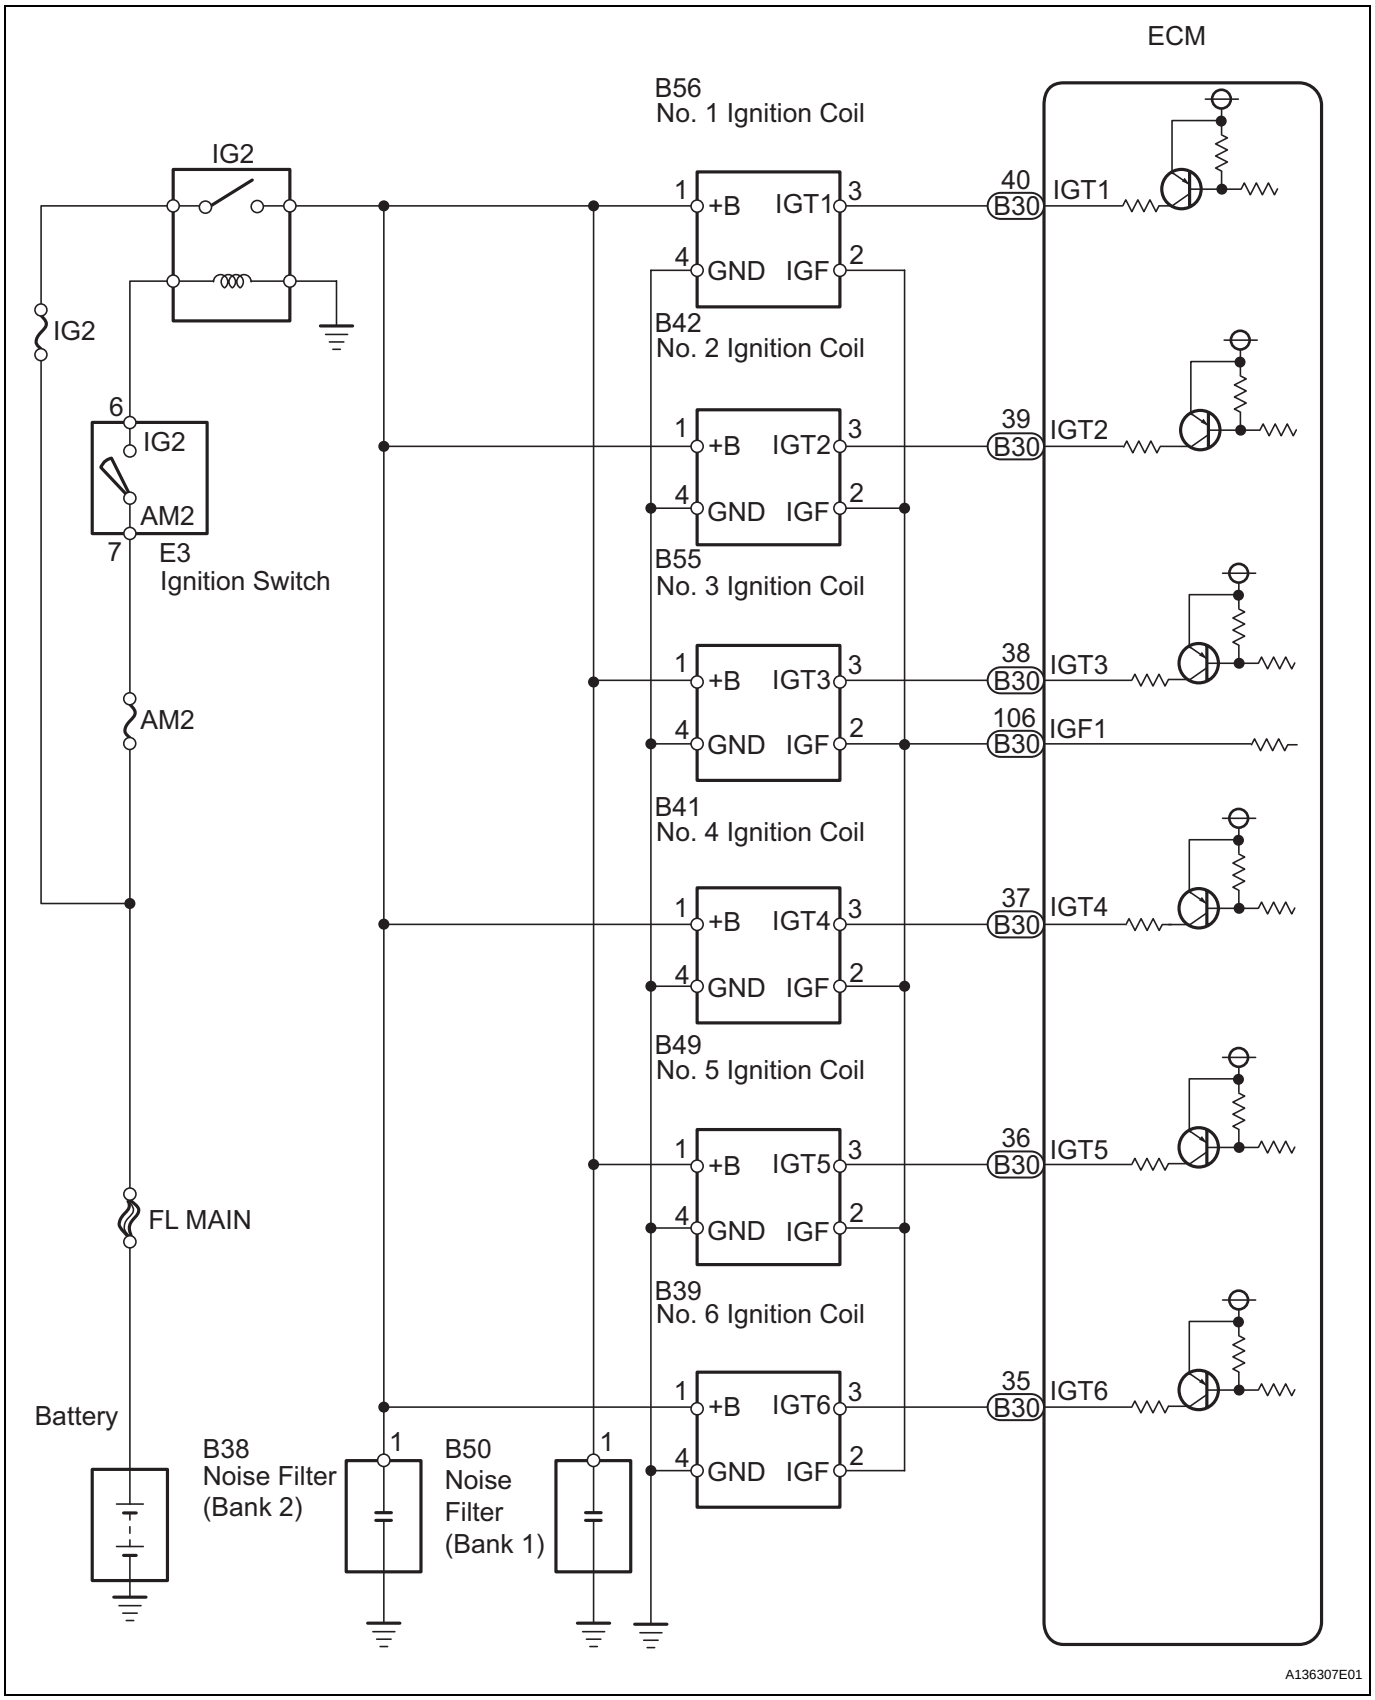
All of following conditions 1, 2 and 3 met	Crankshaft 200 revolutions x 3
1. Driving cycles	1st
2. Check mode	OFF
3. Engine RPM	Less than 2,600 rpm
Except above	Crankshaft 200 revolutions

TYPICAL MALFUNCTION THRESHOLDS

Monitor period of emission-related-misfire:

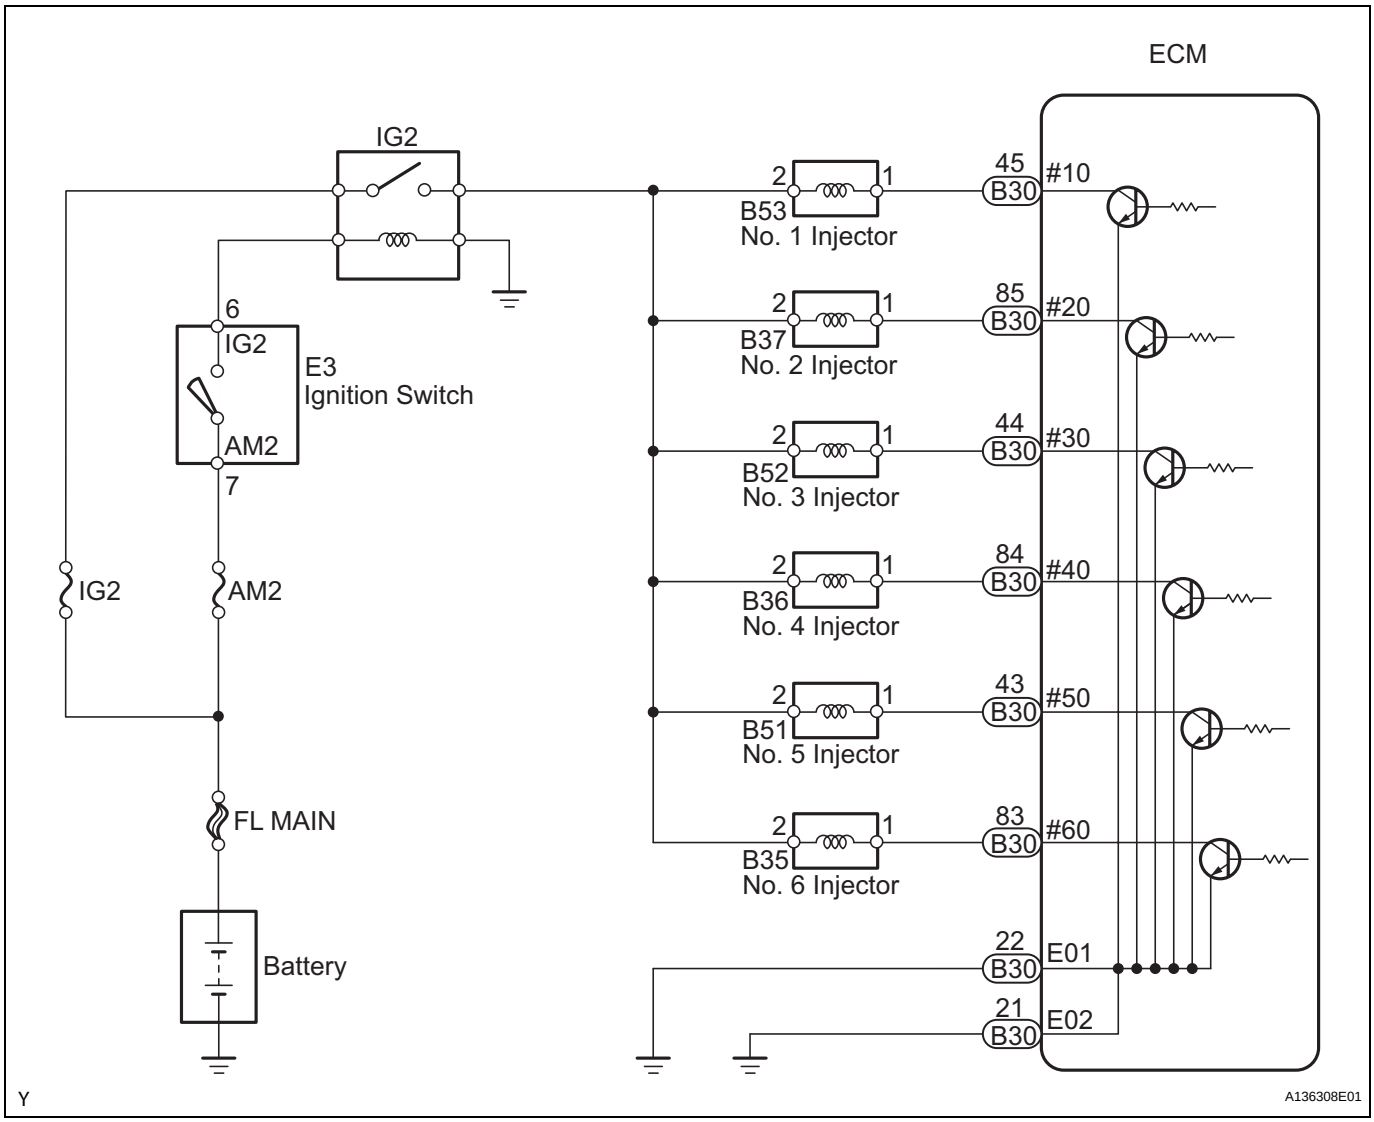
Misfire rate	1% or more

Monitor period of catalyst-damaged-misfire (MIL blinks):



Number of misfire per 200 revolutions	94 or more (varies with intake air amount and RPM)

MONITOR RESULT



Refer to CHECKING MONITOR STATUS (see page ES-19).

WIRING DIAGRAM

Wiring diagram of the ignition system.

Wiring diagram of the injector circuit.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON.
3. Turn the tester ON.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (see page ES-42).
6. Read the misfire counts of each cylinder (CYL #1 to #6) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine rpm and engine load, shown in MISFIRE RPM and MISFIRE LOAD in the DATA LIST.
   HINT:
   In order to store misfire DTCs, it is necessary to drive the vehicle for the period of time shown in the table below, with the MISFIRE RPM and MISFIRE LOAD in the DATA LIST.

Engine RPM	Duration
Idling	3.5 minutes or more
1,000	3 minutes or more
2,000	1.5 minutes or more
3,000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.
   HINT:
   Do not turn the ignition switch OFF until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be erased.
9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the ignition switch OFF and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.
- If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:
  (a) The fuel level is low.
  (b) Improper fuel is used.
  (c) The spark plugs are dirty.
  (d) The problem is complex due to multiple factors.
- After finishing repairs, check that no misfires occur in each cylinder (CYL #1, #2, #3, #4, #5 and #6).
- Be sure to confirm that no misfiring cylinder DTCs are set again by conducting the confirmation driving pattern, after the repairs.
- For 6 and 8 cylinder engines, the ECM intentionally does not set the specific misfiring cylinder DTCs at high engine RPM. If misfires only occur during high engine RPM driving, only DTC P0300 is set.
  In the event of DTC P0300 being present, perform the following operations:
  (a) Clear the DTC (see page ES-39).
  (b) Start the engine and conduct the confirmation driving pattern.
  (c) Read the misfiring rates of each cylinder or DTC(s) using the tester.
  (d) Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.
  (e) After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not set.
- When either SHORT FT #1 or LONG FT #1 in the freeze frame data is outside the range of +-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).
- When the COOLANT TEMP in the freeze frame data is less than 75°C (167°F), the misfires occurred only while warming up the engine.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:
If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

(a) Connect the intelligent tester the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / MISFIRE RPM and MISFIRE LOAD.
(d) Read and note the MISFIRE RPM and MISFIRE LOAD (engine load) values.
HINT:
The MISFIRE RPM and MISFIRE LOAD indicate the vehicle conditions under which the misfire occurred.

ES

NEXT

3 CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE**

OK

4 CHECK MISFIRE COUNT (CYL #1, #2, #3, #4, #5 AND #6)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / MISFIRE / CYL #1, #2, #3, #4, #5 and #6.
(f) Allow the engine to idle.
(g) Read each value for CYL #1 to #6 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Shift the gear selector lever to the D position.
(2) Check the CYL #1 to #6.
(3) If misfire counts are still not displayed, perform steps (h) and (i) and then check the misfire counts again.
(h) Drive the vehicle with the MISFIRE RPM and MISFIRE LOAD noted in the "READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)" procedures above.

(i) Read the CYL #1 to #6 or DTCs displayed on the tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- If it is difficult to reproduce misfires for each cylinder, check the DATA LIST item called MISFIRE MARGIN. Try to find vehicle driving conditions that lower the MISFIRE MARGIN value. Values above 30% are considered normal.
- If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.
- If the freeze frame data's record of the ENGINE RUN TIME is below 120 seconds, the misfire may be detected immediately after the engine is started.

ES

B → **Go to step 14**

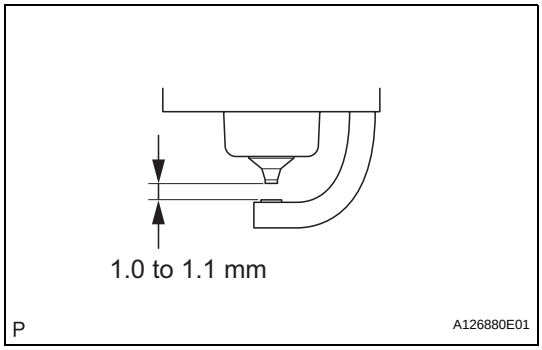
A

5 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT #1 TO #6)

(a) Allow the engine to idle.
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL CUT#1 (to #6).
(c) If a cylinder has a high misfire count, cut fuel to that cylinder. Compare the misfire count of the cylinder before fuel cut and after fuel cut.

Result

Misfire Count in Each Cylinder	Proceed to
Misfire count of cylinder before fuel cut and after fuel cut roughly same	A
Misfire count of cylinder before fuel cut lower than after fuel cut	B



NOTICE:
This ACTIVE TEST cannot be performed while the vehicle is being driven.

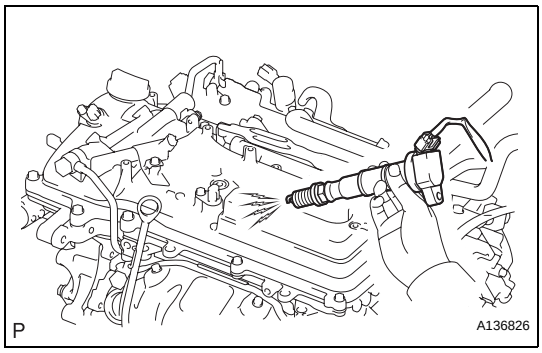
HINT:
If the misfire count of the cylinder before and after the fuel cut are roughly the same, the cylinder is misfiring.
If the misfire count of the cylinder before the fuel cut is lower than after the fuel cut, the cylinder misfires sometimes.

B → **Go to step 11**

A

6	CHECK SPARK PLUG

(a) Remove the ignition coil and the spark plug of the misfiring cylinder.
(b) Measure the spark plug electrode gap.
Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)
(c) Check the electrode for carbon deposits.
Recommended spark plug:



Manufacturer	Product
DENSO	FK20HR11

NOTICE:
If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → **REPLACE SPARK PLUG**

OK

7	CHECK FOR SPARKS AND IGNITION

(a) Disconnect the injector connectors to prevent the engine from starting.
(b) Remove the ignition coil from the cylinder head.
(c) Install the spark plug onto the ignition coil.
(d) Attach the spark plug assembly to the cylinder head.
(e) Crank the engine for less than 2 seconds and check the spark.
OK:
Sparks jump across electrode gap.
(f) Install the ignition coil.
(g) Reconnect the injector connectors.

NG → **Go to step 9**

OK

8	CHECK CYLINDER COMPRESSION PRESSURE OF MISFIRING CYLINDER

(a) Measure the cylinder compression pressure of the misfiring cylinder.

OK → **Go to step 10**

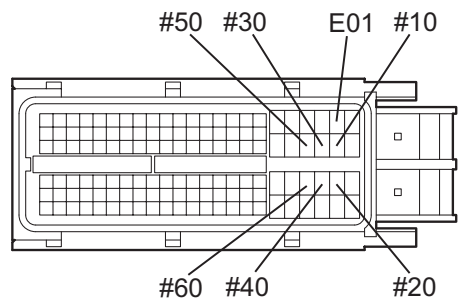
NG

CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

9	CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

(a) Change the installed spark plug to a spark plug that functions normally.
(b) Perform a spark test.
CAUTION:
Always disconnect all injector connectors.
NOTICE:
Do not crank the engine for more than 2 seconds.
(1) Install the spark plug to the ignition coil and connect the ignition coil connector.
(2) Disconnect the injector connector.
(3) Ground the spark plug.
(4) Check if sparks occur while the engine is being cranked.
OK:
Sparks jump across electrode gap.

ES



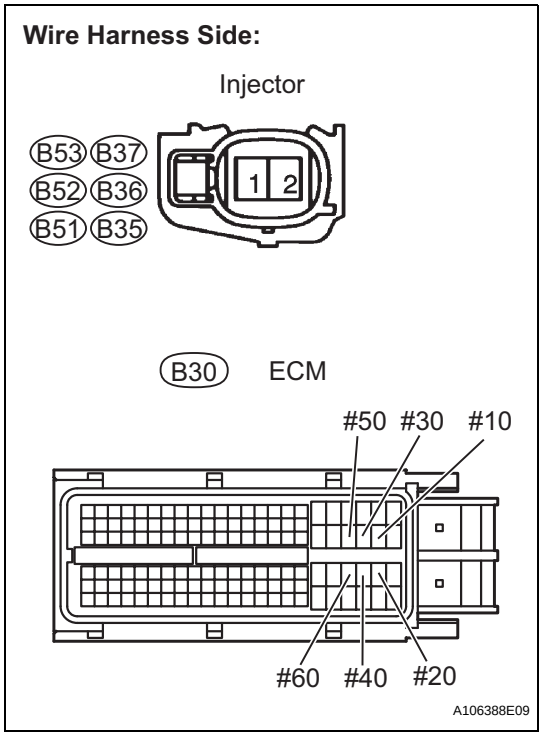
NG → **REPLACE IGNITION COIL ASSEMBLY THEN CONFIRM THAT THERE IS NO MISFIRE**

OK

REPLACE SPARK PLUG

10	INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND /OR #60 VOLTAGE)

Wire Harness Side:



(a) Disconnect the B30 ECM connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the ECM connector.
Standard voltage

Tester Connection	Specified Condition
B30-45 (#10) - B30-22 (E01)	9 to 14 V
B30-85 (#20) - B30-22 (E01)	9 to 14 V
B30-44 (#30) - B30-22 (E01)	9 to 14 V
B30-84 (#40) - B30-22 (E01)	9 to 14 V
B30-43 (#50) - B30-22 (E01)	9 to 14 V
B30-83 (#60) - B30-22 (E01)	9 to 14 V

OK → **Go to step 12**

NG

11	CHECK WIRE HARNESS (INJECTOR - ECM)

(a) Disconnect the injector connector (of the misfiring cylinder).
(b) Disconnect the B30 ECM connector.
(c) Turn the ignition switch ON.
(d) Measure the resistance and voltage between the injector and the ECM connector terminals.

Standard voltage

Cylinder	Tester Connection	Specified Condition
No. 1	B53-2 - Ground	9 to 14 V
No. 2	B37-2 - Ground	9 to 14 V
No. 3	B52-2 - Ground	9 to 14 V
No. 4	B36-2 - Ground	9 to 14 V
No. 5	B51-2 - Ground	9 to 14 V
No. 6	B35-2 - Ground	9 to 14 V

Standard resistance

Cylinder	Tester Connection	Specified Condition
No. 1	B53-1 - Ground	10 kΩ or higher
	B53-1 - B30-45 (#10)	Below 1 Ω
No. 2	B37-1 - Ground	10 kΩ or higher
	B37-1 - B30-85 (#20)	Below 1 Ω
No. 3	B52-1 - Ground	10 kΩ or higher
	B52-1 - B30-44 (#30)	Below 1 Ω
No. 4	B36-1 - Ground	10 kΩ or higher
	B36-1 - B30-84 (#40)	Below 1 Ω
No. 5	B51-1 - Ground	10 kΩ or higher
	B51-1 - B30-43 (#50)	Below 1 Ω
No. 6	B35-1 - Ground	10 kΩ or higher
	B35-1 - B30-83 (#60)	Below 1 Ω

(e) Reconnect the injector connector.
(f) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

12	CHECK FUEL INJECTOR OF MISFIRING CYLINDER

(a) Check the injector injection (whether fuel volume is high or low, and whether injection pattern is poor).

NG → **REPLACE FUEL INJECTOR ASSEMBLY**

OK

13	CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

NG → ADJUST VALVE CLEARANCE

OK

14	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

15	CHECK VALVE TIMING (See page ES-90)

NG → ADJUST VALVE TIMING

OK

16	CHECK FUEL PRESSURE

(a) Check the fuel pressure (see page FU-6).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

17	READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP) (See page ES-188)

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR

OK

18	READ VALUE USING INTELLIGENT TESTER (MAF) (See page ES-187)

NG → REPLACE MASS AIR FLOW METER

OK

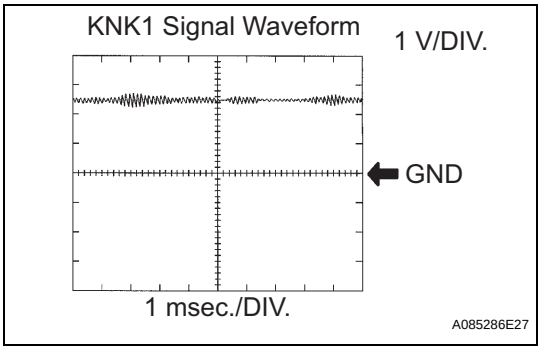
CHECK FOR INTERMITTENT PROBLEMS

DTC	P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)

DTC	P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)

DTC	P0332	Knock Sensor 2 Circuit Low Input (Bank 2)

DTC	P0333	Knock Sensor 2 Circuit High Input (Bank 2)



DESCRIPTION

ES

Flat type knock sensors (non-resonant type) have structures that can detect vibrations: between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed. The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC No.	DTC Detection Condition	Trouble Area
P0327 P0332	Output voltage of knock sensor less than 0.5 V (1 trip detection logic)	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	Output voltage of knock sensor more than 4.5 V (1 trip detection logic)	• Open in knock sensor circuit • Knock sensor • ECM

HINT:
When any of DTCs P0327, P0328, P0332 and P0333 are set, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned OFF.
Reference: Inspection using an oscilloscope

The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Keep engine speed at 4,000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and sets a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is set 5 seconds after the engine is next started.

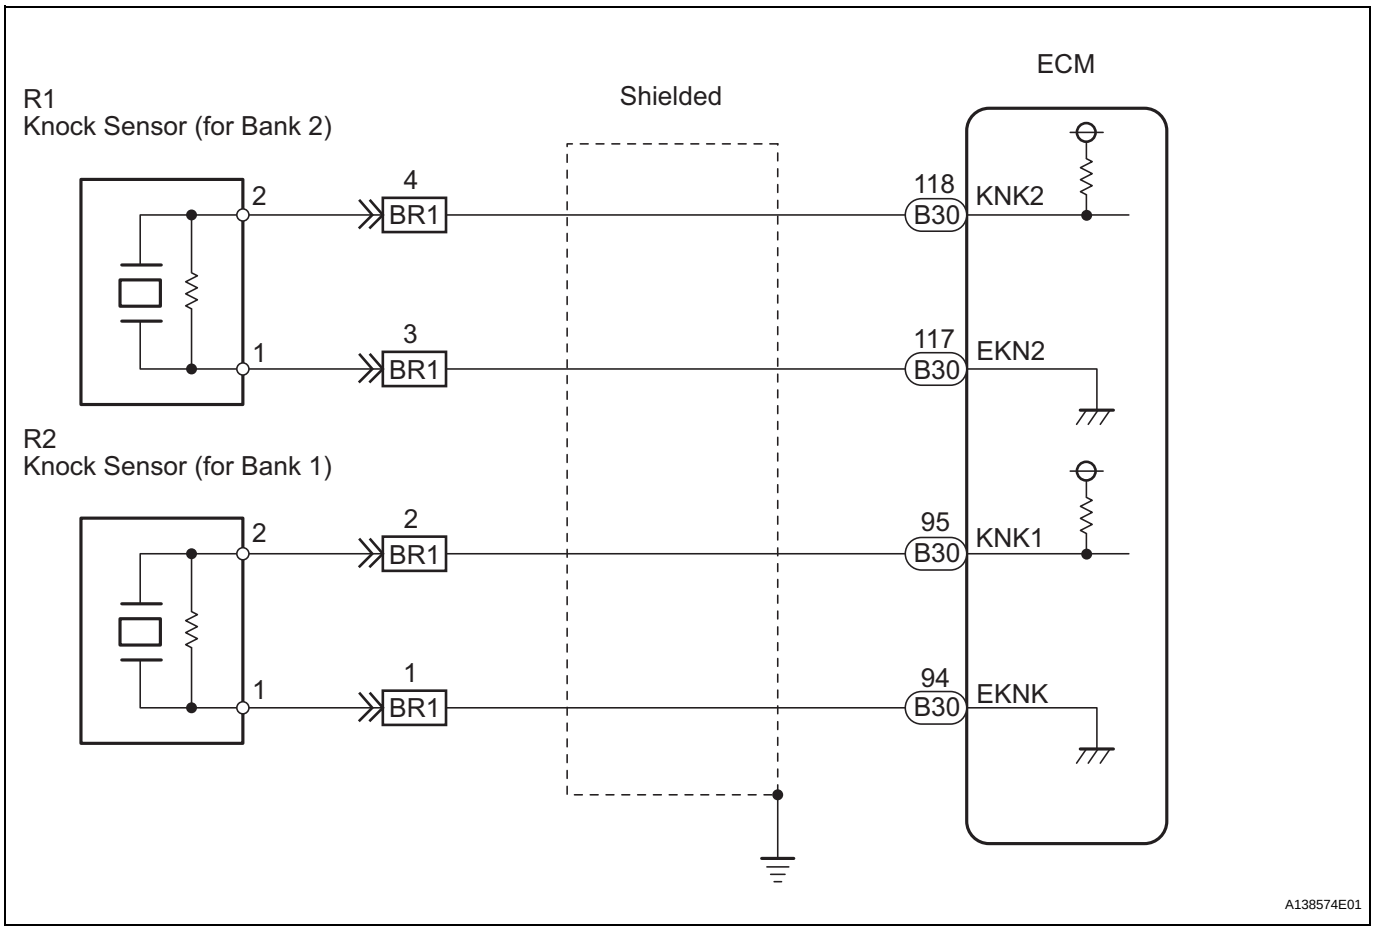
MONITOR STRATEGY

Related DTCs	P0327: Knock sensor (bank 1) range check (Low voltage) P0328: Knock sensor (bank 1) range check (High voltage) P0332: Knock sensor (bank 2) range check (Low voltage) P0333: Knock sensor (bank 2) range check (High voltage)
Required Sensors/Components (Main)	Knock sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Time after engine start	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS



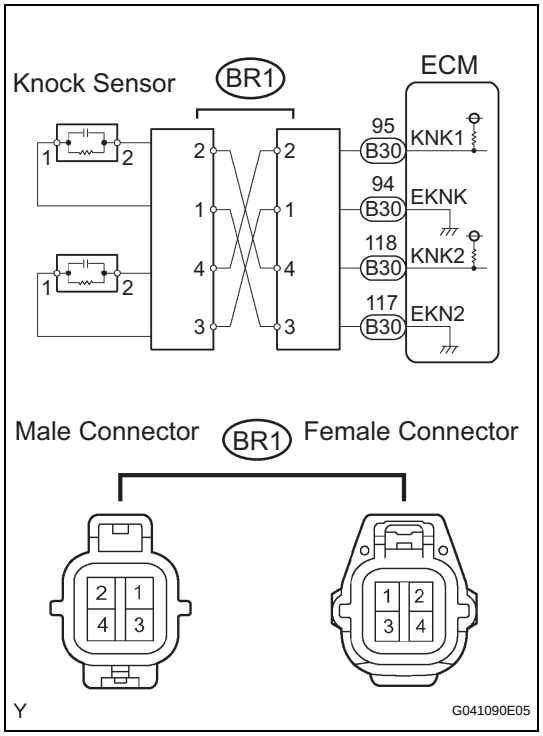
Knock Sensor Range Check (Low voltage) P0327 and P0332:

Knock sensor voltage	Less than 0.5 V

Knock Sensor Range Check (High voltage) P0328 and P0333:

Knock sensor voltage	More than 4.5 V

WIRING DIAGRAM



INSPECTION PROCEDURE

HINT:

- DTCs P0327 and P0328 are for the bank 1 knock sensor circuit.
- DTCs P0332 and P0333 are for the bank 2 knock sensor circuit.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ DTC OUTPUT (CHECK KNOCK SENSOR CIRCUIT)

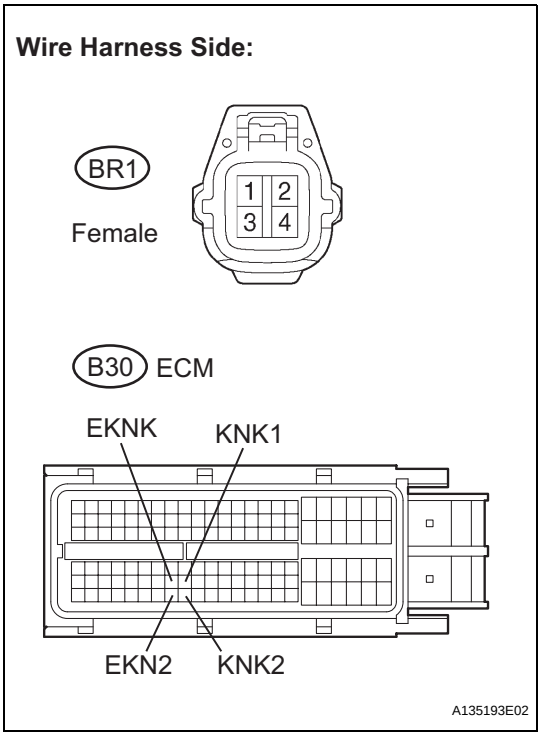
(a) Disconnect the BR1 connector.
(b) Using lead wires, connect the connectors as follows:

Male Connector - Female Connector
Terminal 2 - Terminal 4
Terminal 1 - Terminal 3
Terminal 4 - Terminal 2
Terminal 3 - Terminal 1

(c) Warm up the engine.
(d) Run the engine at 3,000 rpm for 10 seconds or more.
(e) Connect the intelligent tester to the DLC3.
(f) Turn the ignition switch ON and turn the intelligent tester ON.
(g) DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(h) Read DTCs.

Result

Display	Proceed to
DTCs are same as when vehicle brought in P0327, P0328 → P0327, P0328 or P0332, P0333 → P0332, P0333	**A**
DTCs are different from when vehicle brought in P0327, P0328 → P0332, P0333 or P0332, P0333 → P0327, P0328	**B**



(i) Reconnect the BR1 connector.

B → **Go to step 4**

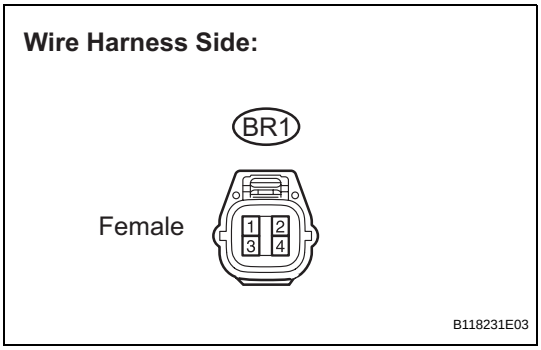
A

ES

2	CHECK WIRE HARNESS (CONNECTOR - ECM)

(a) Disconnect the BR1 connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard resistance



Tester Connection	Specified Condition
BR1 female connector 2 - B30-95 (KNK1)	Below 1 Ω
BR1 female connector 1 - B30-94 (EKNK)	Below 1 Ω
BR1 female connector 4 - B30-118 (KNK2)	Below 1 Ω
BR1 female connector 3 - B30-117 (EKN2)	Below 1 Ω
BR1 female connector 2 or B30-95 (KNK1) - Body ground	10 kΩ or higher
BR1 female connector 1 or B30-94 (EKNK) - Body ground	10 kΩ or higher
BR1 female connector 4 or B30-118 (KNK2) - Body ground	10 kΩ or higher
BR1 female connector 3 or B30-117 (EKN2) - Body ground	10 kΩ or higher

(d) Reconnect the BR1 connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

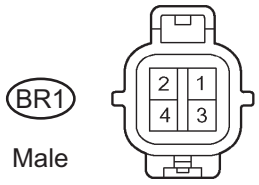
3	INSPECT ECM (VOLTAGE)

(a) Disconnect the BR1 connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage according to the value(s) in the table below.

Standard voltage

Tester Connection	Specified Condition
CV1 female connector 2 - 1	4.5 to 5.5 V
CV1 female connector 4 - 3	4.5 to 5.5 V

(d) Reconnect the BR1 connector.



NG → **REPLACE ECM**

OK

CHECK FOR INTERMITTENT PROBLEMS

4 INSPECT KNOCK SENSOR

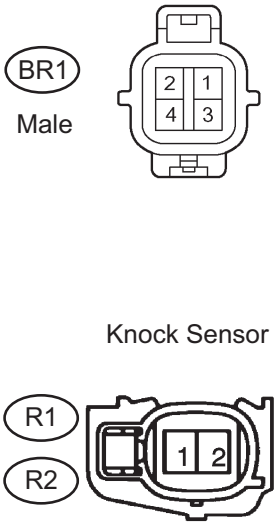
Wire Harness Side:

G042949E05

(a) Disconnect the BR1 connector.
(b) Measure the resistance according to the value(s) in the table below.

Standard resistance

Tester Connection	Condition	Specified Condition
BR1 male connector 1 - 2	20°C (68°F)	120 to 280 kΩ
BR1 male connector 3- 4	20°C (68°F)	120 to 280 kΩ



(c) Reconnect the BR1 connector.

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

5 CHECK WIRE HARNESS (CONNECTOR - KNOCK SENSOR)

Wire Harness Side:

A135025E02

HINT:
- If DTC P0327 or Po328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.

(a) Disconnect the BR1 connector.
(b) Disconnect the R1 and R2 knock sensor connectors.
(c) Measure the resistance according to the value(s) in the table below.

Standard resistance

Tester Connection	Specified Condition
BR1 male connector 2 - R2-2	Below 1 Ω
BR1 male connector 1 - R2-1	Below 1 Ω
BR1 male connector 4 - R1-2	Below 1 Ω
BR1 male connector 3 - R1-2	Below 1 Ω
BR1 male connector 2 or R2-2 - Body ground	10 kΩ or higher
BR1 male connector 1 or R2-1 - Body ground	10 kΩ or higher
BR1 male connector 4 or R1-2 - Body ground	10 kΩ or higher
BR1 male connector 3 or R1-2 - Body ground	10 kΩ or higher

(d) Reconnect the BR1 connector.
(e) Reconnect the knock sensor connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

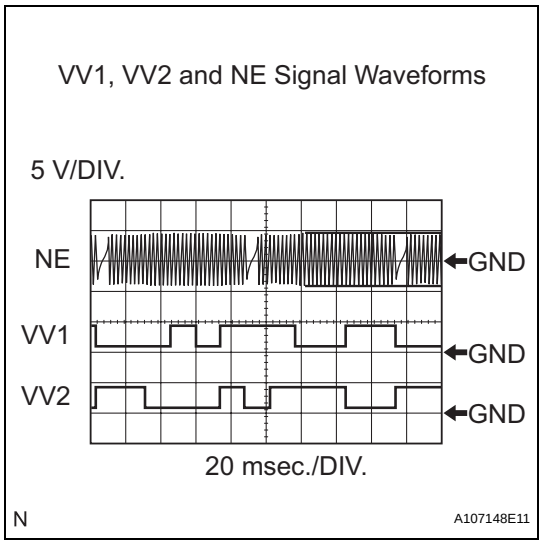
OK

REPLACE KNOCK SENSOR

ES

DTC	P0335	Crankshaft Position Sensor "A" Circuit

DTC	P0339	Crankshaft Position Sensor "A" Circuit Intermittent



DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes through the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per engine revolution. Based on these signals, the ECM calculates the crankshaft position and engine RPM. Using these calculations, the fuel injection time and ignition timing are controlled.

ES

DTC No.	DTC Detection Condition	Trouble Area
P0335	When either condition below is met: • No CKP sensor signal to ECM while cranking (1 trip detection logic) • No CKP sensor signal to ECM at engine speed of 600 rpm or more (1 trip detection logic)	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal to ECM for 0.05 seconds or more (1 trip detection logic): (a) Engine speed 1,000 rpm or more (b) Starter signal OFF (c) 3 seconds or more have elapsed since starter signal switched from ON to OFF	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

HINT:

- The correct waveform is as shown.
- VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.
- Grounding failure of the shielded wire may cause noise in waveforms.

Item	Content
Terminal	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Setting	5 V/DIV., 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is set 10 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P0335: CKP sensor range check or rationality
Required Sensors/Components (Main)	CKP sensor
Required Sensors/Components (Related)	CMP sensor
Frequency of Operation	Continuous
Duration	3 times
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None

Case 1:

Time after starter OFF to ON	0.3 seconds or more
Number of CMP sensor signal pulse	6 times
Battery voltage	7 V or more
CMP sensor circuit failure	Not detected
Ignition switch	ON

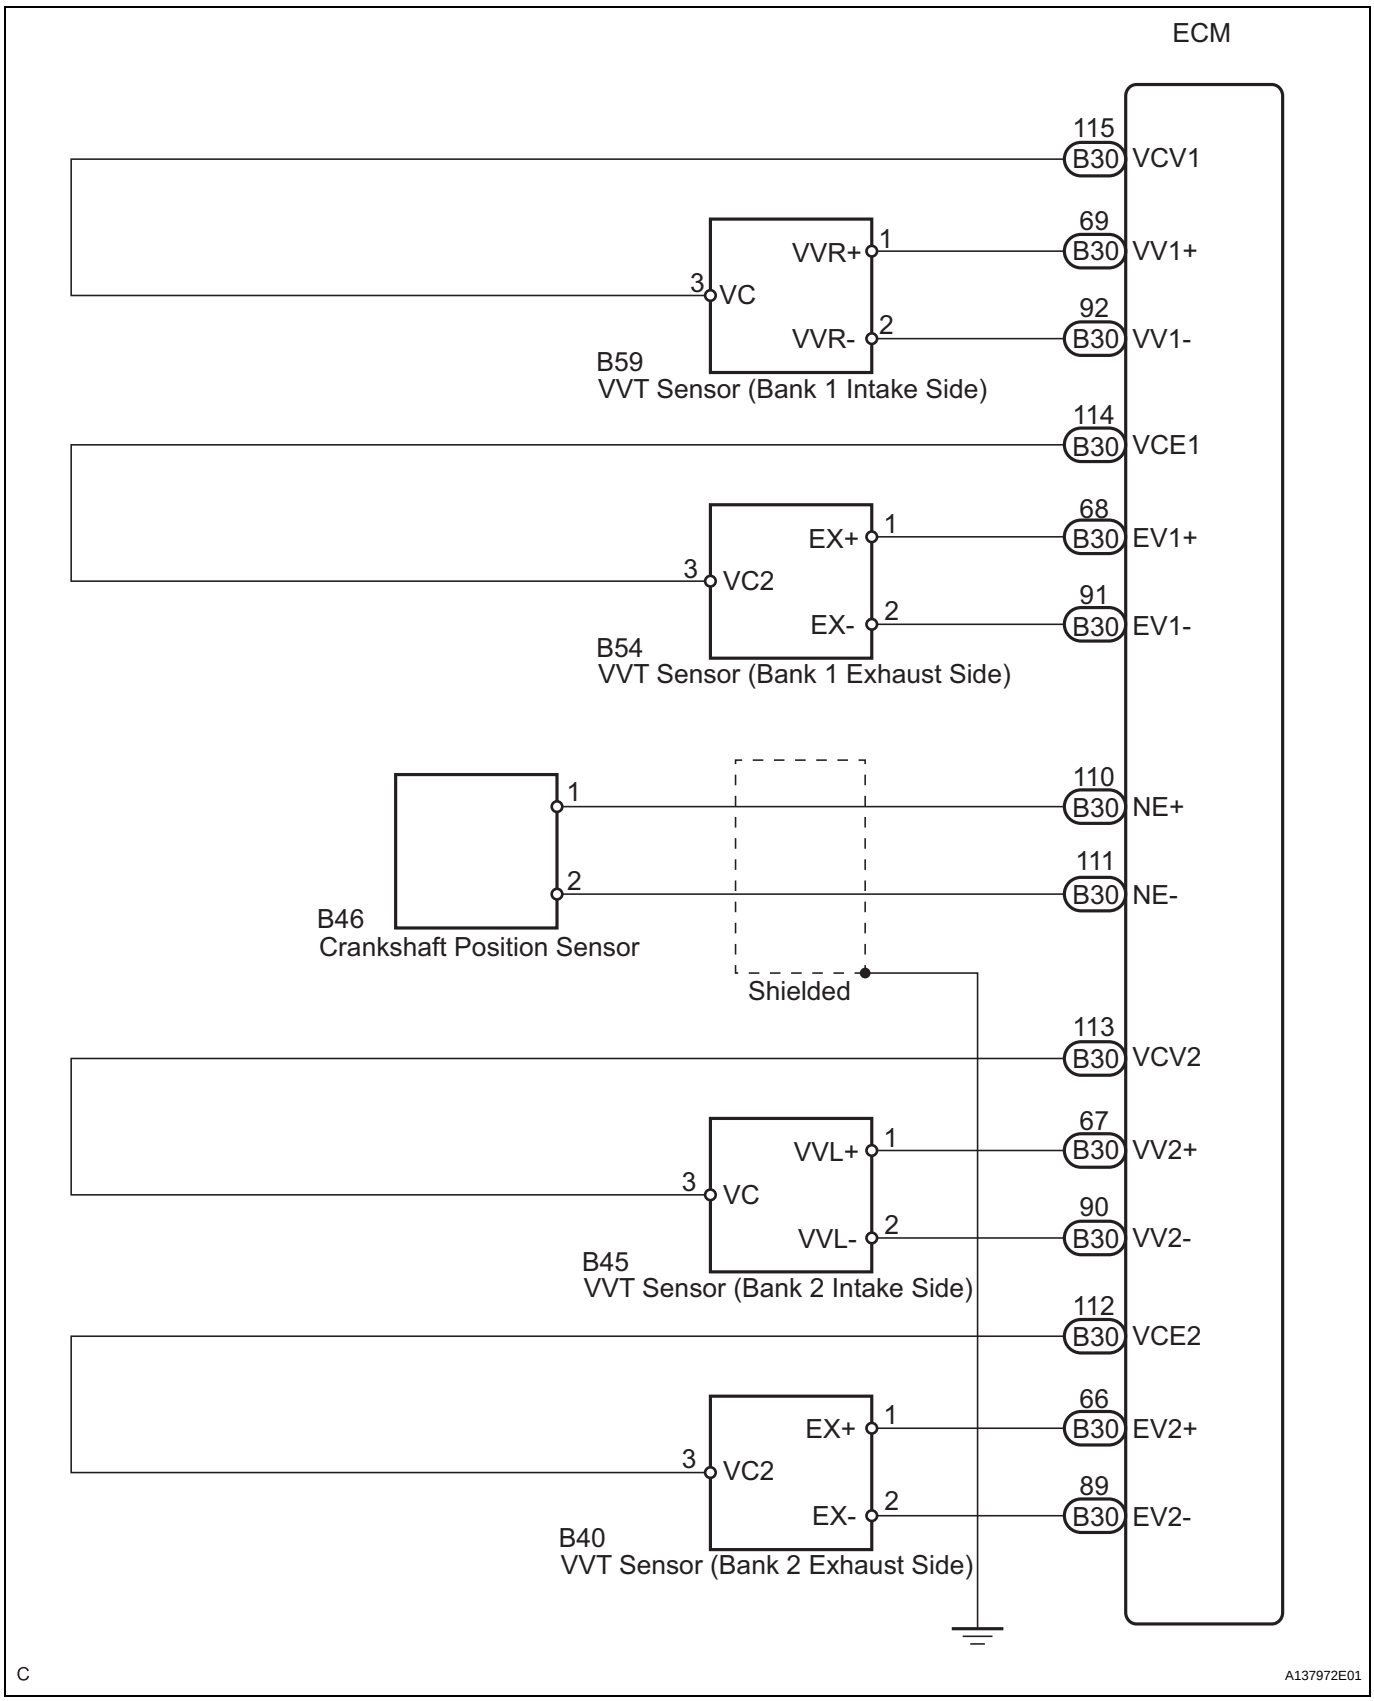
Case 2:

Starter	OFF
Engine speed	600 rpm or more
Time after starter from ON to OFF	3 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

Case 1:

Number of CKP sensor signal pulse	132 or less, and 174 or more



Case 2:

Engine speed signal	No signal

COMPONENT OPERATING RANGE

CKP sensor	• CKP sensor output voltage fluctuates while crankshaft revolving • 34 CKP sensor signals per crankshaft revolution

WIRING DIAGRAM

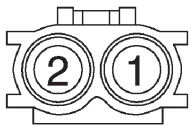
INSPECTION PROCEDURE

HINT:

- If no problem is found through this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.
- Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:
  (a) Connect the intelligent tester to the DLC3.
  (b) Start the engine.
  (c) Turn the tester ON.
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
  The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed if the CKP sensor output voltage is insufficient.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1	READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
(e) Start the engine.
(f) Read the values displayed on the tester while the engine is running.
Standard:
Correct values are displayed.
HINT:
- To check the engine speed change, display the graph on the tester.
- If the engine does not start, check the engine speed while cranking.
- If the engine speed indicated on the tester remains at zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.

OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

2 INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)

Component Side:

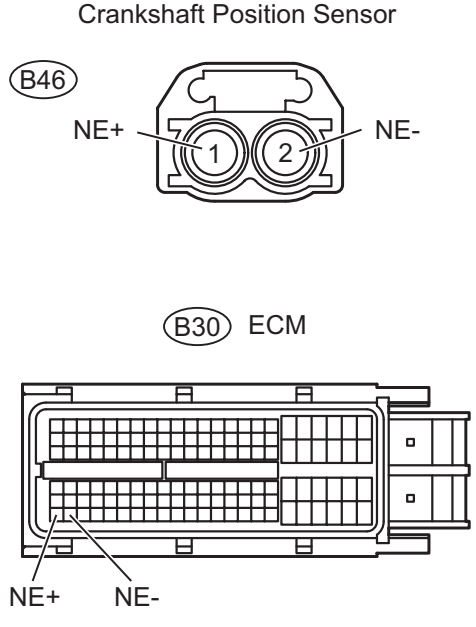
CKP Sensor

A078431E14

(a) Disconnect the B46 CKP sensor connector.
(b) Measure the resistance between terminals 1 and 2.
Standard resistance

Tester Connection	Condition	Specified Condition
1 - 2	Cold	985 to 1,600 Ω
1 - 2	Hot	1,265 to 1,890 Ω

HINT:
The terms "Cold" and "Hot" refer to the temperature of the sensor. Cold means approximately -10 to 50°C (14 to 122°F). Hot means approximately 50 to 100°C (122 to 212°F).



(c) Reconnect the CKP sensor connector.

NG → **REPLACE CRANKSHAFT POSITION SENSOR**

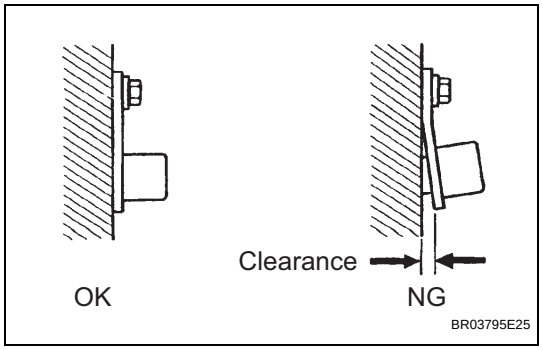
OK

3 CHECK WIRE HARNESS (CRANKSHAFT POSITION SENSOR - ECM)

Wire Harness Side:

A107850E03

(a) Disconnect the B46 CKP sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance



Tester Connection	Specified Condition
B46-1 (NE+) - B30-110 (NE+)	Below 1 Ω
B46-2 (NE-) - B30-111 (NE-)	Below 1 Ω
B46-1 (NE+) or B30-110 (NE+) - Body ground	10 kΩor higher
B46-2 (NE-) or B30-111 (NE-) - Body ground	10 kΩor higher

(d) Reconnect the ECM connector.
(e) Reconnect the CKP sensor connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

4	CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

(a) Check the CKP sensor installation.
OK:
Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

5	CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

(a) Check the teeth of the sensor plate.
OK:
Sensor plate does not have any cracks or deformation.

NG → **REPLACE CRANKSHAFT POSITION SENSOR PLATE**

OK

6	REPLACE CRANKSHAFT POSITION SENSOR

NEXT

7	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Start the engine.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P0335 or P0339	B

HINT:
If the engine does not start, replace the ECM.

B → **REPLACE ECM**

ES

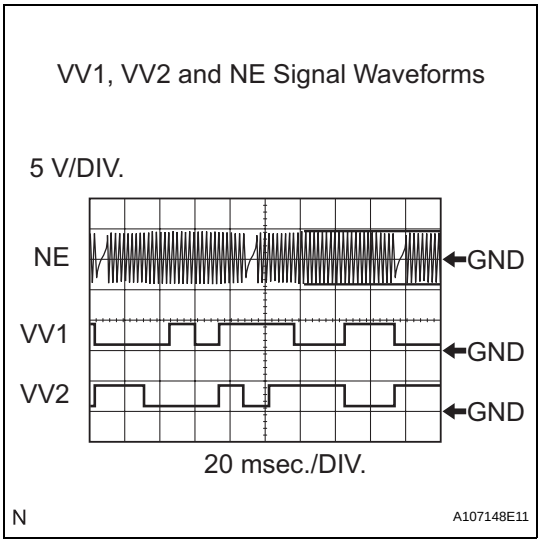
DESCRIPTION



The intake camshaft's Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).

The VVT camshaft drive gear has a sensor plate with 3 teeth on its outer circumference. When the gear rotates, changes occur in the air gaps between the sensor plate and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the gear rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each engine revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC No.	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • Input voltage to ECM remains less than 0.3 V, or more than 4.7 V for 4 seconds, when 2 or more seconds have elapsed after turning ignition switch ON (1 trip detection logic) • No VVT sensor signal to ECM during cranking (1 trip detection logic)	• Open or short in VVT sensor circuit for intake camshaft • VVT sensor for intake camshaft • Camshaft timing gear for intake camshaft • Jumped tooth of timing chain for intake camshaft • ECM
P0342 P0347	Output voltage of VVT sensor less than 0.3 V for 4 seconds (1 trip detection logic)	• Open or short in VVT sensor circuit for intake camshaft • VVT sensor for intake camshaft • Camshaft timing gear for intake camshaft • Jumped tooth of timing chain for intake camshaft • ECM
P0343 P0348	Output voltage of VVT sensor more than 4.7 V for 4 seconds (1 trip detection logic)	• Open or short in VVT sensor for intake camshaft circuit • VVT sensor for intake camshaft • Camshaft timing gear for intake camshaft • Jumped tooth of timing chain for intake camshaft • ECM

Reference: Inspection using an oscilloscope

ES

HINT:
- The correct waveform is as shown.
- VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.

Item	Content
Terminal	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Setting	5 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

MONITOR STRATEGY

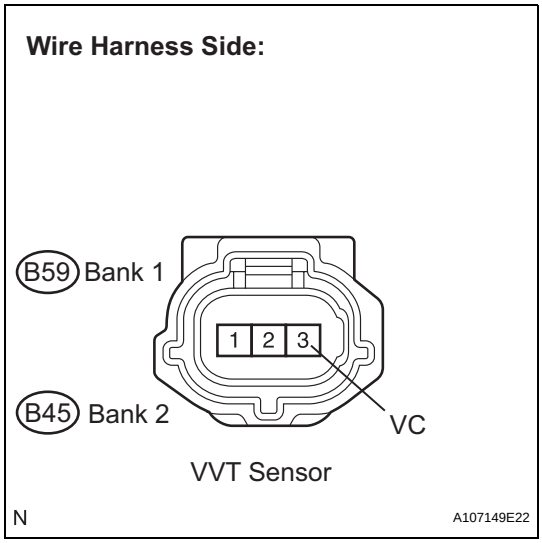
VVT sensor voltage	More than 4.7 V

COMPONENT OPERATING RANGE

VVT sensor voltage	0.3 to 4.7 V

WIRING DIAGRAM

Refer to DTC P0335 (See page ES-209).



INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction (See page ES-40).

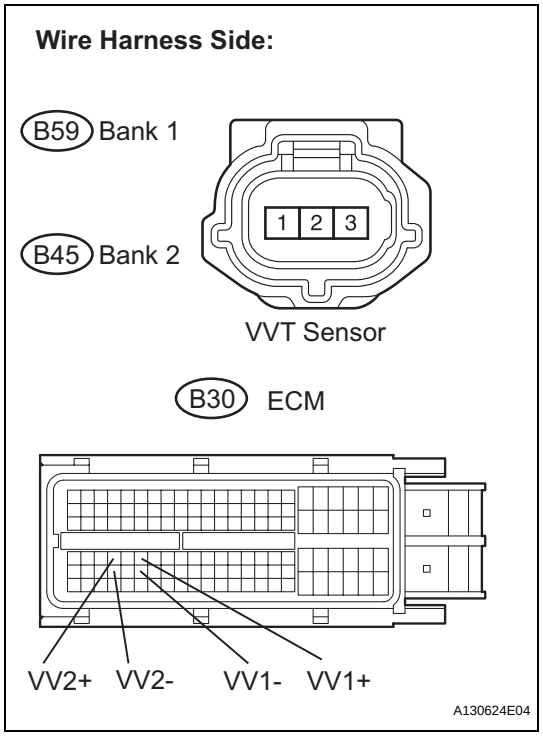
ES

1	CHECK WIRE HARNESS (SENSOR POWER SOURCE)

(a) Disconnect the B59 or B45 VVT sensor connector.

(b) Measure the voltage according to the value(s) in the table below.

Standard voltage



Tester Connection	Specified Condition
B59-3 (VC) - Body ground	4.5 to 5.0 V
B45-3 (VC) - Body ground	4.5 to 5.0 V

(c) Reconnect the VVT sensor connector.

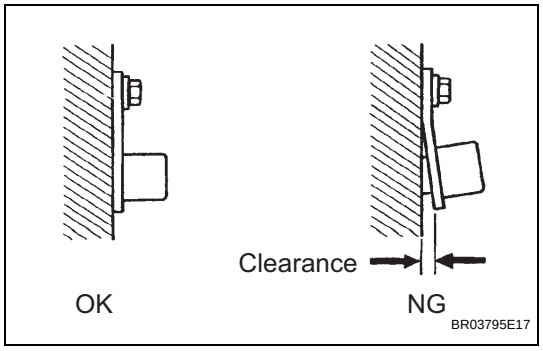
NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

2 CHECK WIRE HARNESS (VVT SENSOR FOR INTAKE CAMSHAFT - ECM)

(a) Disconnect the B59 or B45 VVT sensor connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance according to the value(s) in the table below.

Standard resistance



Tester Connection	Specified Condition
B59-1 (VVR+) - B30-69 (VV1+)	Below 1 Ω
B59-2 (VVR-) - B30-92 (VV1-)	Below 1 Ω
B45-1 (VVL+) - B30-67 (VV2+)	Below 1 Ω
B45-2 (VVL-) - B30-90 (VV2-)	Below 1 Ω
B59-1 (VVR+) or B30-69 (VV1+) - Body ground	10 kΩ or higher
B59-2 (VVR-) or B30-92 (VV1-) - Body ground	10 kΩ or higher
B45-1 (VVL+) or B30-67 (VV2+) - Body ground	10 kΩ or higher
B45-2 (VVL-) or B30-90 (VV2-) - Body ground	10 kΩ or higher

(d) Reconnect the VVT sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

3 CHECK SENSOR INSTALLATION (VVT SENSOR FOR INTAKE CAMSHAFT)

(a) Check the CKP sensor installation.

OK:

Sensor is installed correctly.

NG → **SECURELY REINSTALL SENSOR**

OK

4 CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF PLATE)

(a) Check the teeth of the signal plate.

OK:

Sensor plate teeth do not have any cracks or deformation.

NG → **REPLACE CAMSHAFT TIMING GEAR ASSEMBLY**

ES

OK

5	REPLACE VVT SENSOR

NEXT

6	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs.
(e) Start the engine.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(g) Read DTCs.

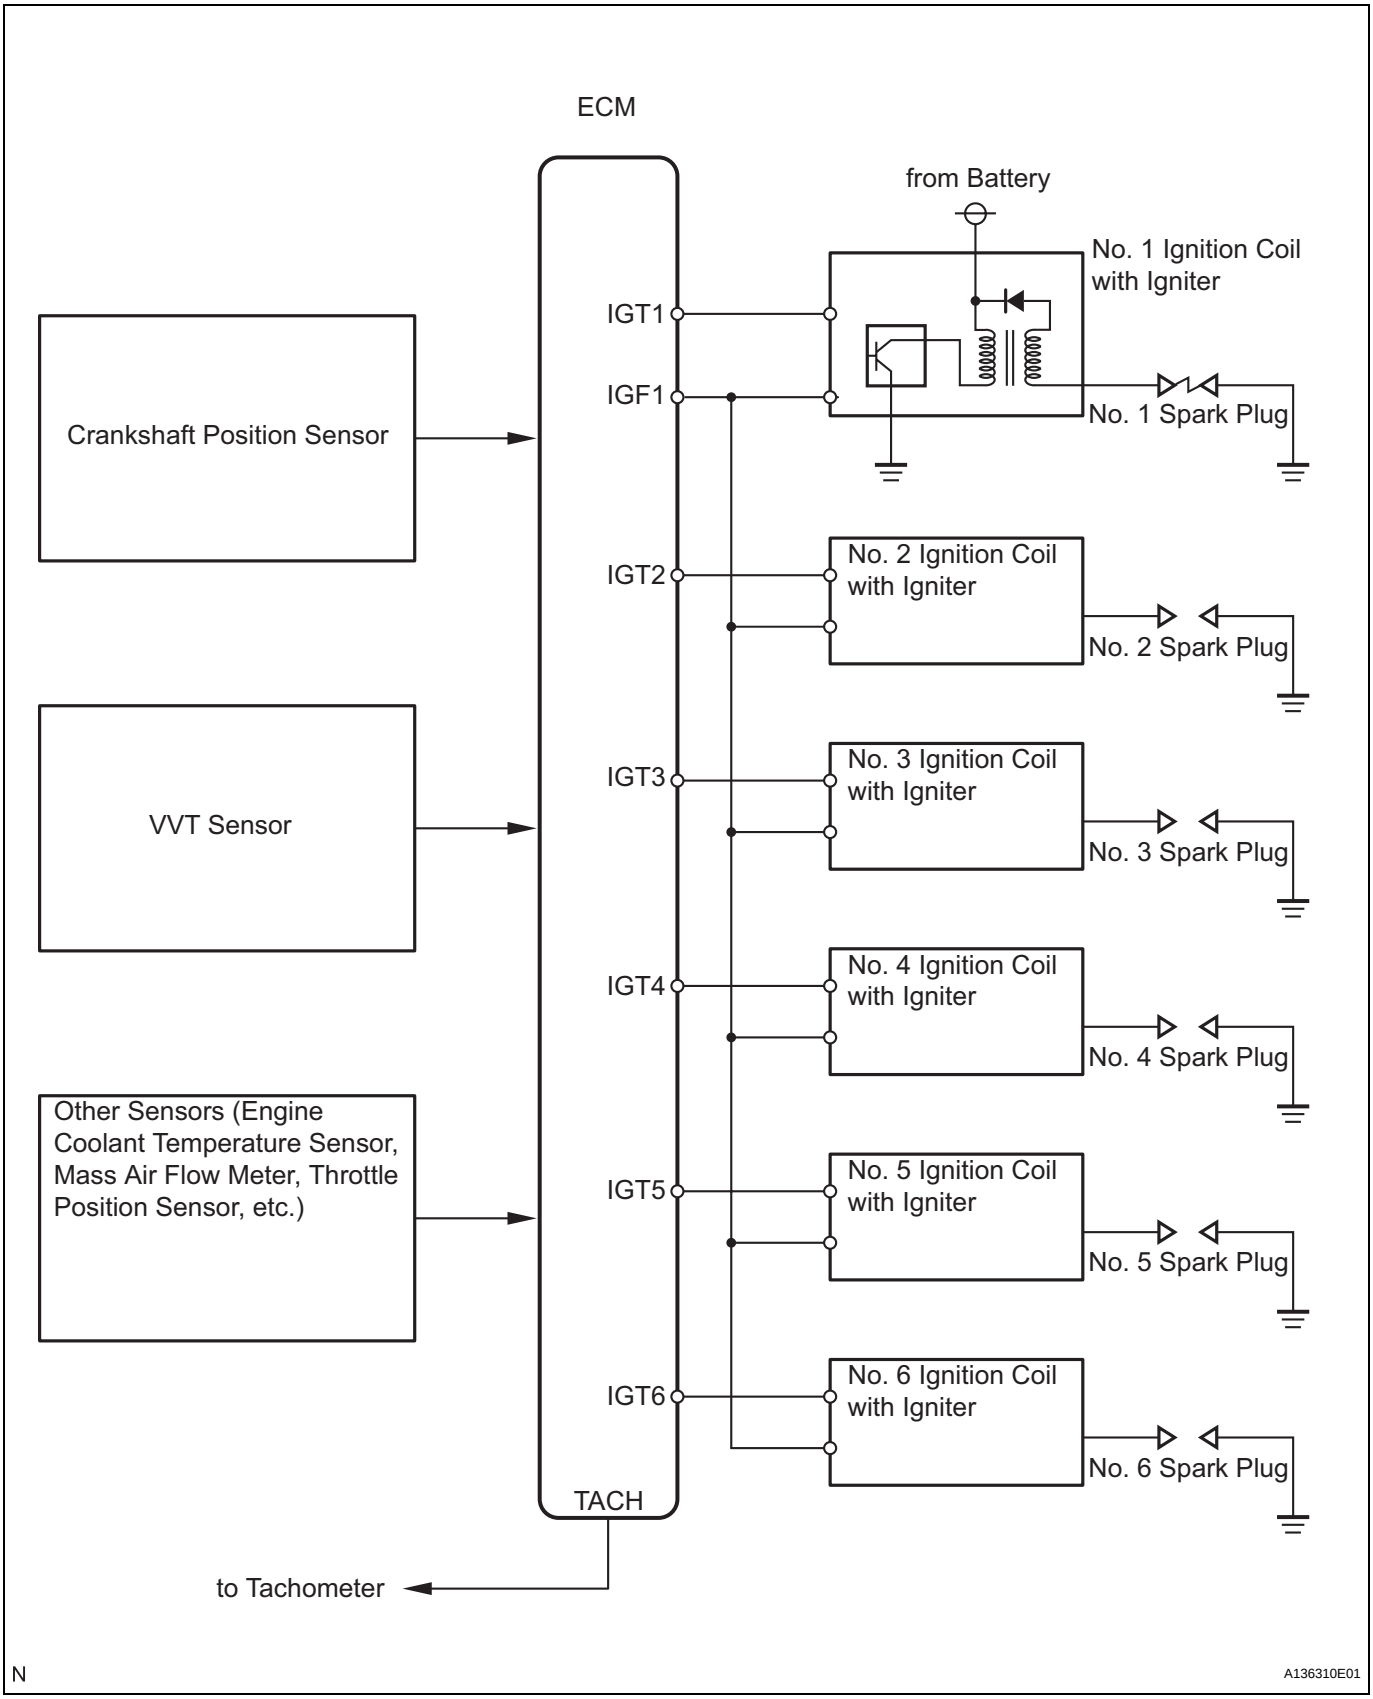
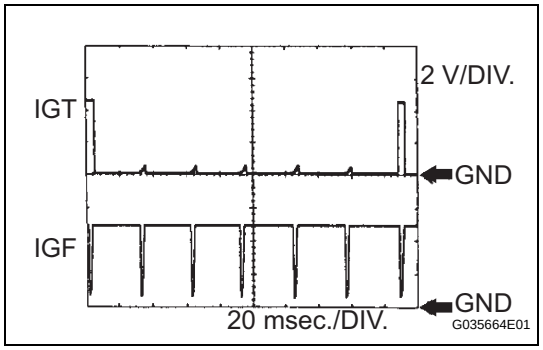
DESCRIPTION



HINT:

- These DTCs indicate malfunctions relating to the primary circuit.
- If DTC P0351 is set, check No. 1 ignition coil with igniter circuit.
- If DTC P0352 is set, check No. 2 ignition coil with igniter circuit.
- If DTC P0353 is set, check No. 3 ignition coil with igniter circuit.
- If DTC P0354 is set, check No. 4 ignition coil with igniter circuit.
- If DTC P0355 is set, check No. 5 ignition coil with igniter circuit.
- If DTC P0356 is set, check No. 6 ignition coil with igniter circuit.



A Direct Ignition System (DIS) is used on this vehicle.

The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.

The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM, for each cylinder ignition.

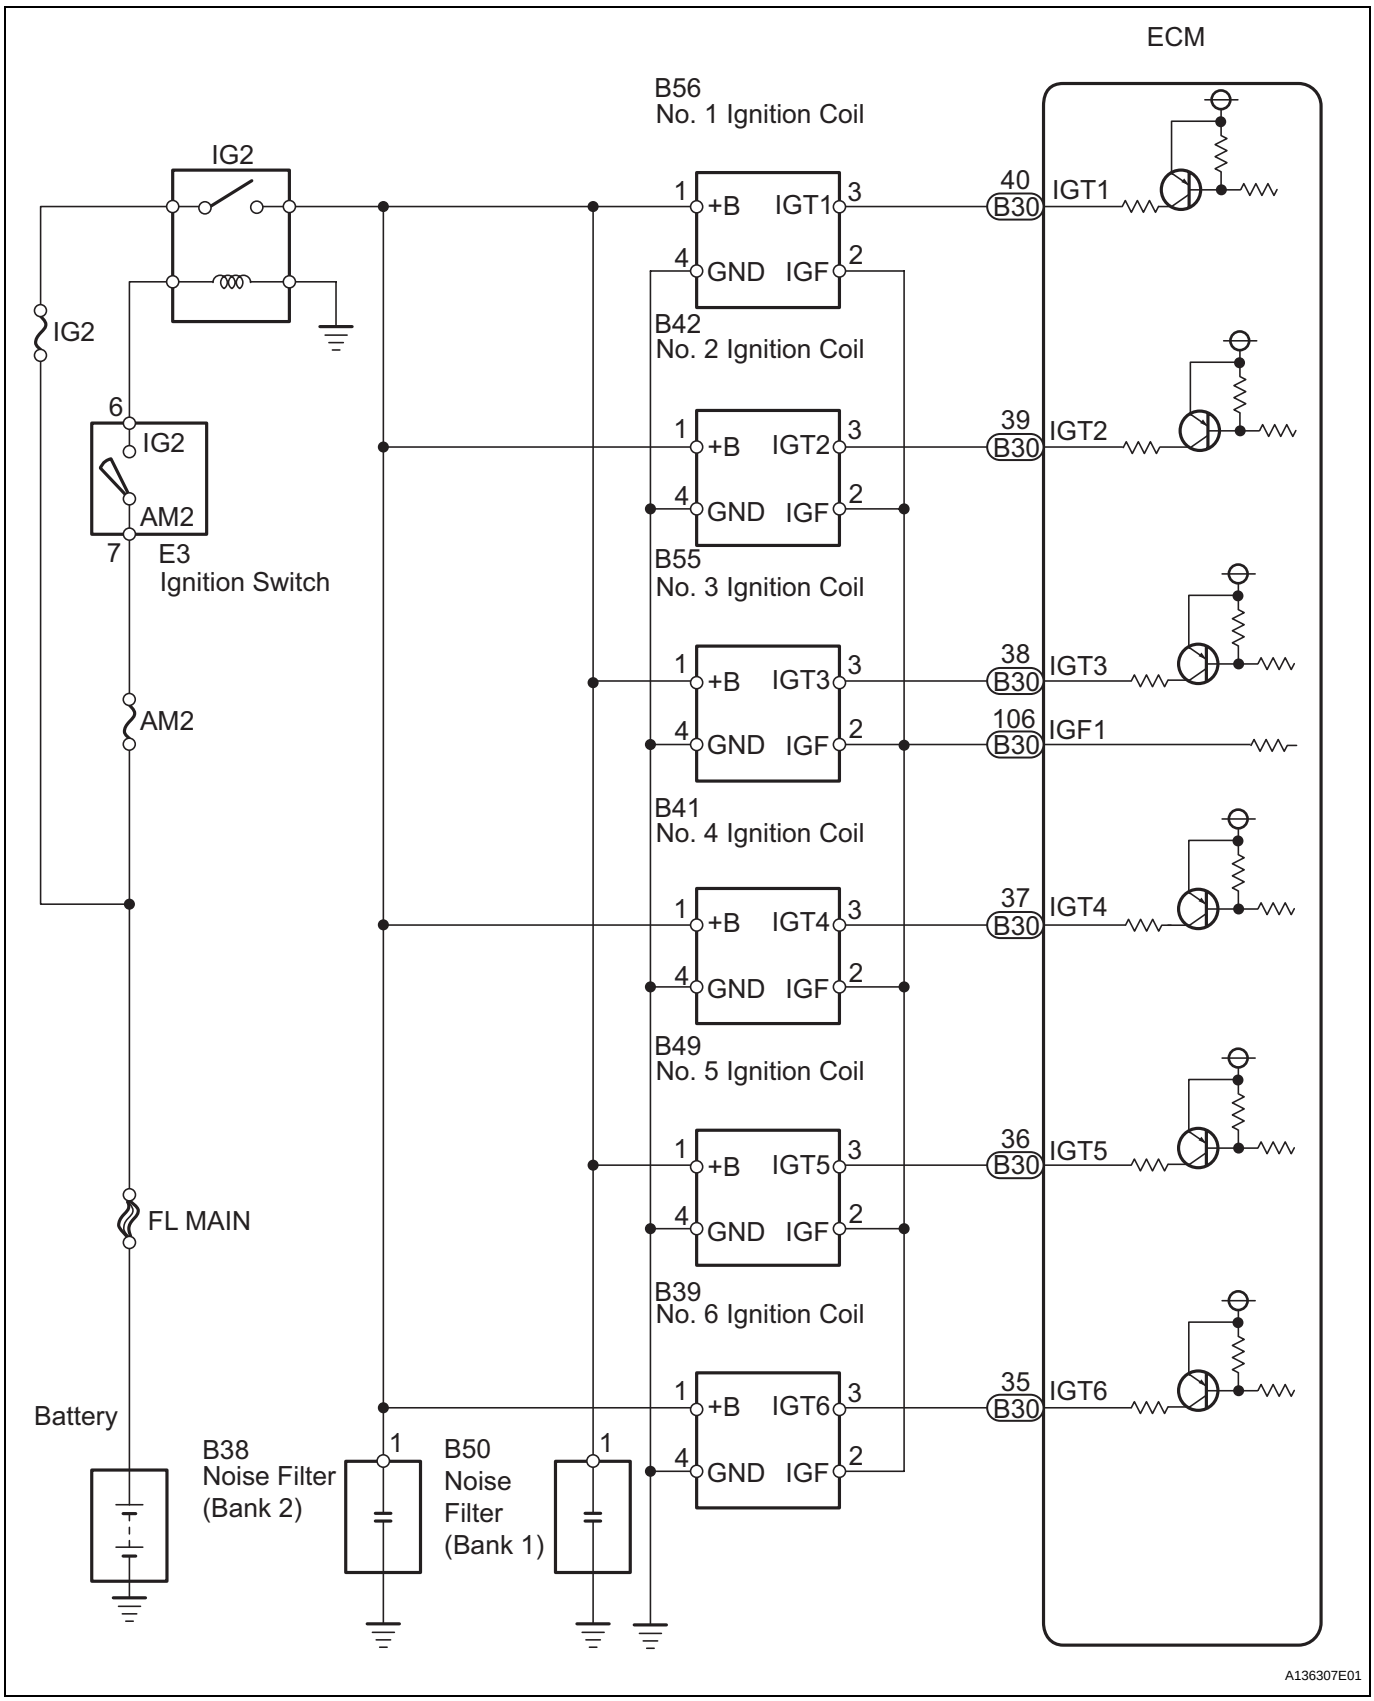
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions A or B met	-
A. Engine RPM	1,500 rpm or less
B. Starter	OFF
Either of following conditions C or D met	-
C. Both of following conditions (a) and (b) met	-
(a) Engine speed	500 rpm or less
(b) Battery voltage	6 V or more
D. All of following conditions (a), (b) and (c) met	-
(a) Engine speed	More than 500 rpm
(b) Battery voltage	10 V or more
(c) Number of sparks after CPU reset	5 sparks or more



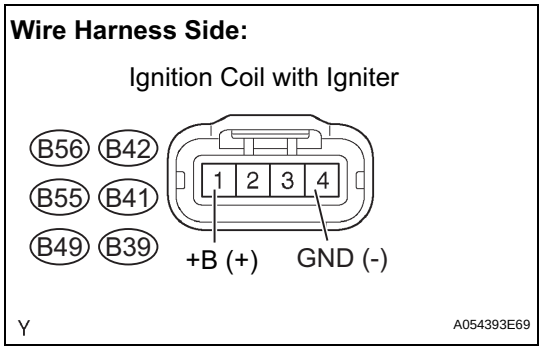
TYPICAL MALFUNCTION THRESHOLDS

IGF signal	ECM does not receive any IGF signal despite ECM sending IGT signal to igniter

COMPONENT OPERATING RANGE

IGF signal	Igniter transmits IGF signal when it receives IGT signal from ECM

WIRING DIAGRAM



INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

(a) Disconnect the ignition coil with igniter connector.

(b) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
B56-4 (GND) - Body ground	Below 1 Ω
B42-4 (GND) - Body ground	Below 1 Ω
B55-4 (GND) - Body ground	Below 1 Ω
B41-4 (GND) - Body ground	Below 1 Ω
B49-4 (GND) - Body ground	Below 1 Ω
B39-4 (GND) - Body ground	Below 1 Ω

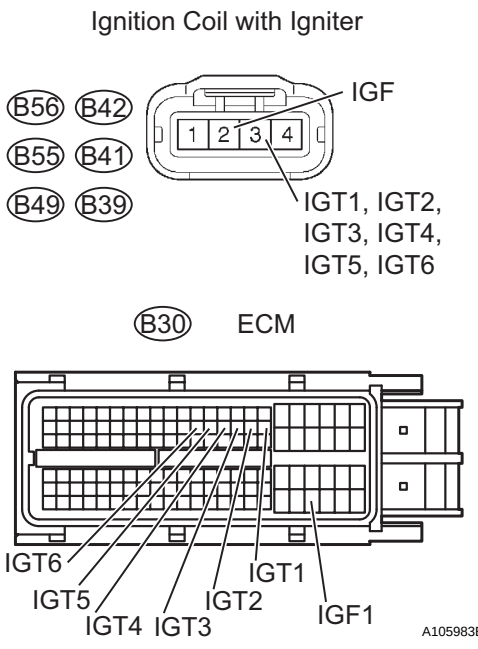
(c) Turn the ignition switch ON.

(d) Measure the voltage between the terminals of the wire harness side connector.

Standard voltage

Tester Connection	Specified Condition
B56-1 (+B) - B56-4 (GND)	9 to 14 V
B42-1 (+B) - B42-4 (GND)	9 to 14 V
B55-1 (+B) - B55-4 (GND)	9 to 14 V
B41-1 (+B) - B41-4 (GND)	9 to 14 V
B49-1 (+B) - B49-4 (GND)	9 to 14 V
B39-1 (+B) - B39-4 (GND)	9 to 14 V

(e) Reconnect the ignition coil with igniter connector.



NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

ES

2	CHECK WIRE HARNESS (IGNITION COIL ASSEMBLY - ECM)

Wire Harness Side:

(a) Disconnect the ignition coil with connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.

DTC	P0393	Camshaft Position Sensor "B" Circuit High Input (Bank 2)

DESCRIPTION

The exhaust camshaft's Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference.
When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • Input voltage to ECM remains less than 0.3 V, or more than 4.7 V for more than 4 seconds, when 2 or more seconds have elapsed after turning ignition switch ON (1 trip detection logic) • No VVT sensor signal to ECM during cranking (1 trip detection logic)	• Open or short in VVT sensor for exhaust camshaft circuit • VVT sensor for exhaust camshaft • Exhaust camshaft • Jumped tooth of timing chain • ECM

END

DTC	P0420	Catalyst System Efficiency Below Threshold (Bank 1)

DTC	P0430	Catalyst System Efficiency Below Threshold (Bank 2)

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.

The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.

In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control, rather than the conventional detecting method, which uses the locus ratio.

The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.

The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0420	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Front exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (bank 1 sensor 1) • Heated Oxygen (HO2) sensor (bank 1 sensor 2)
P0430	OSC value smaller than standard value under active air-fuel ratio control (2 trip detection logic)	• Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (bank 2 sensor 1) • Heated Oxygen (HO2) sensor (bank 2 sensor 2) • Exhaust manifold (TWC)

HINT:

- Bank 1 refers to the bank that includes No. 1 cylinder.
- Bank 2 refers to the bank that does not include No. 1 cylinder.
- Sensor 1 refers to the sensor closest to the engine assembly.
- Sensor 2 refers to the sensor farthest away from the engine assembly.

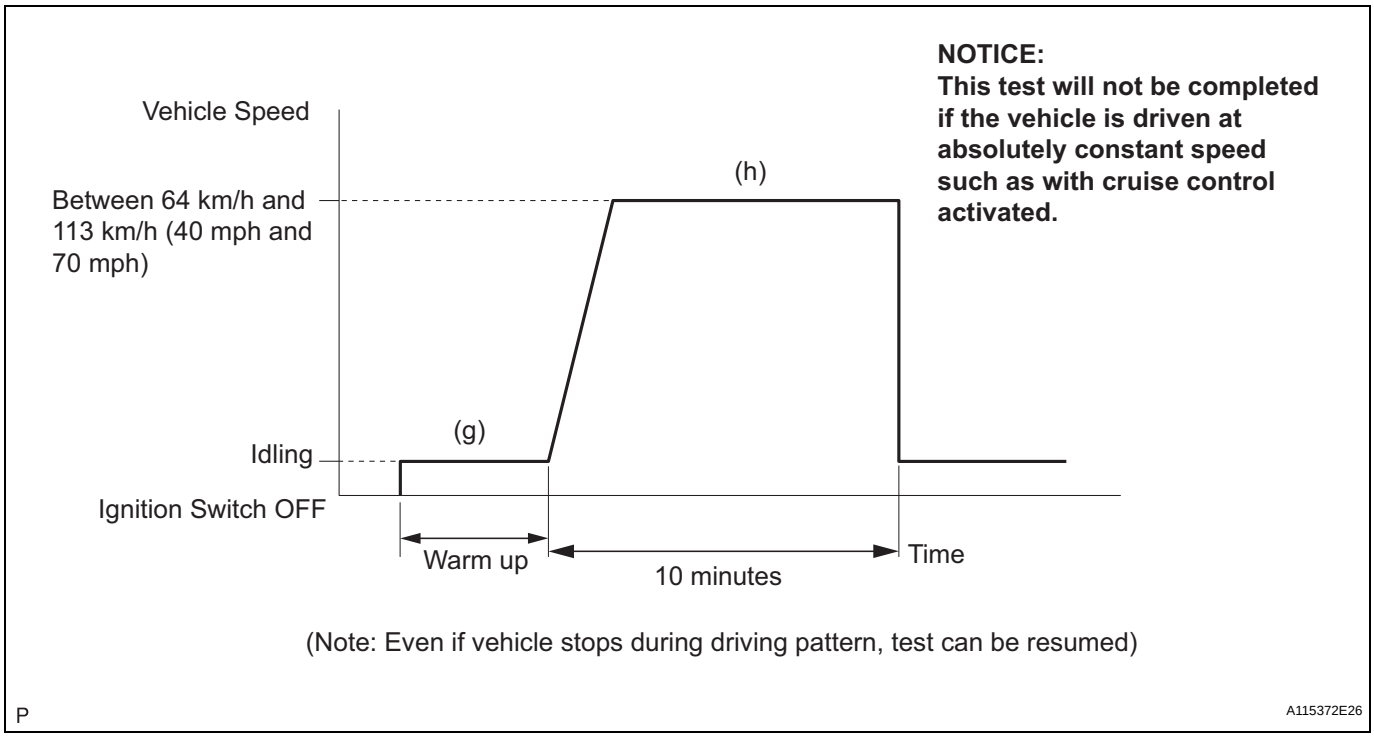
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

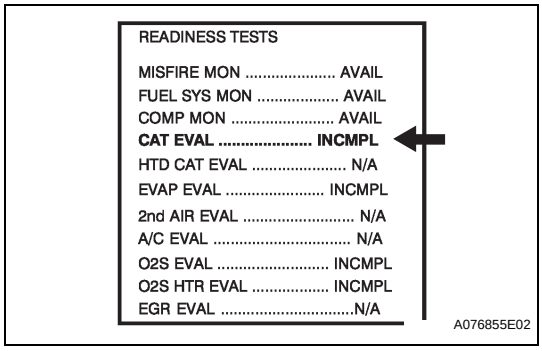
Monitor runs whenever following DTCs not present	P0011 (VVT System 1 - Advance) P0012 (VVT System 1 - Retard) P0021 (VVT System 2 - Advance) P0022 (VVT System 2 - Retard) P0031, P0032, P0051, P0052 (A/F Sensor heater - Sensor 1) P0037, P0038, P0057, P0058 (O2 Sensor heater - Sensor 2) P0100 - P0103 (MAF meter) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0136, P0156 (O2 Sensor - Sensor 2) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0351 - P0356 (Igniter) P0500 (VSS) P2196, P2198 (A/F Sensor - rationality) P2A00, P2A03 (A/F Sensor - slow response)
Battery voltage	11 V or more
Intake air temperature	-10°C (14°F) or more
Engine coolant temperature	75°C (167°F) or more
Atmospheric pressure	76 kPa (570 mmHg) or more
Idling	OFF
Engine RPM	Less than 3,200 rpm
A/F sensor status	Activated
Fuel system status	Closed loop
Engine load	10 to 70%
All of following conditions (a), (b) and (c) met	-
(a) Mass air flow rate	5 to 60 g/sec.
(b) Estimated front catalyst temperature	600 to 750°C (1,112 to 1,382°F)
(c) Estimated rear catalyst temperature	100 to 900°C (212 to 1,652°F)
EVAP system monitor	The monitor has not run yet or the vacuum introduction has been completed
A/F sensor monitor	Completed
Rear HO2 sensor heater monitor	Completed
Shift position	4th or higher

TYPICAL MALFUNCTION THRESHOLDS

Oxygen Storage Capacity (OSC) of Three-Way Catalytic Converter (TWC)	Less than 0.046 g



MONITOR RESULT

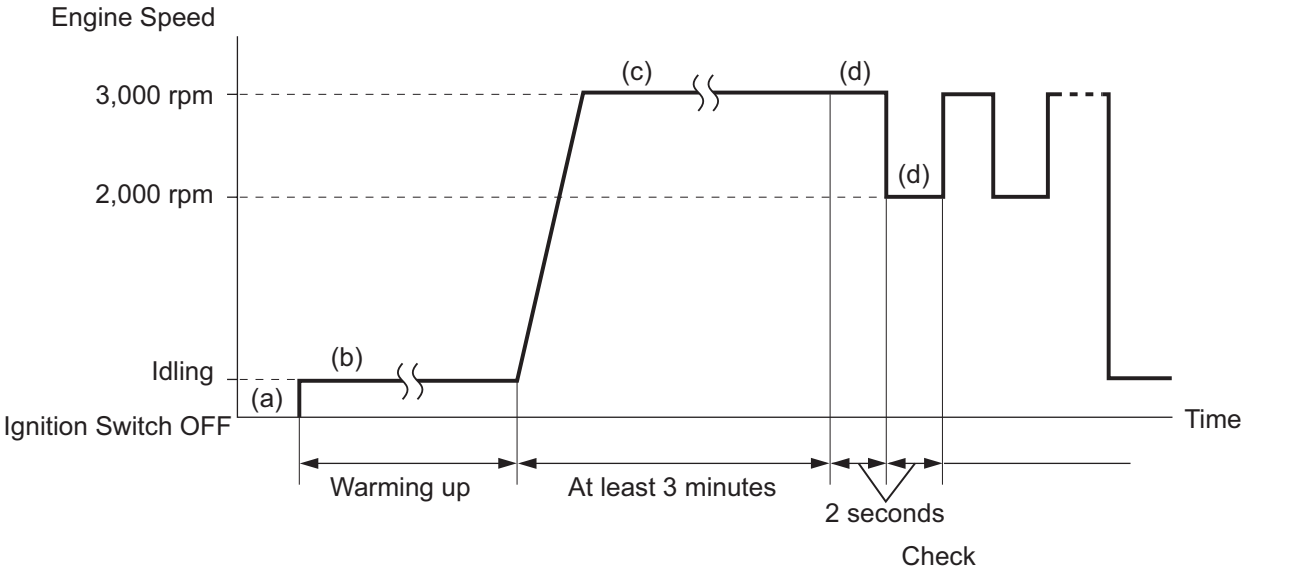


Refer to CHECKING MONITOR STATUS (see page ES-19).

CONFIRMATION DRIVING PATTERN

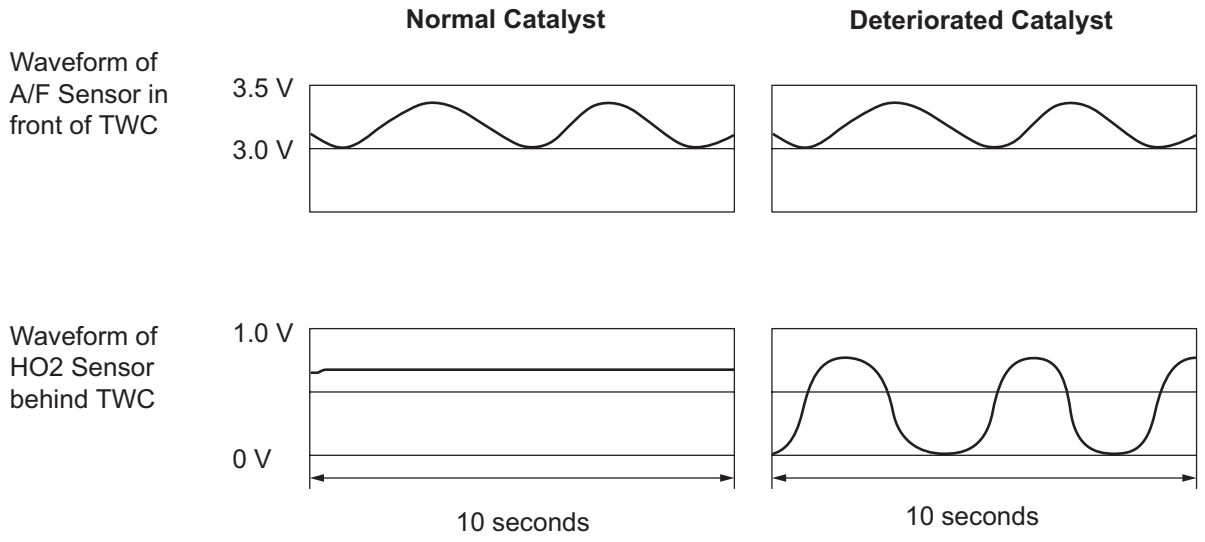
HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-39).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / CAT CMPL.
(f) Check that CAT CMPL is INCMPL (incomplete).
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to COMPL (complete) as CAT CMPL monitor operates.
(j) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES and check if any DTCs (any pending DTCs) are set.
HINT:
If CAT CMPL does not change to COMPL, and any pending DTCs fail to set, extend the driving time.

CONDITIONING FOR SENSOR TESTING



HINT:
Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched OFF, until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2,500 rpm and 3,000 rpm for at least 3 minutes.
(d) While running the engine at 3,000 rpm and 2,000 rpm alternating at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.
HINT:

- If either voltage output of the Air-Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.
- If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following A/F CONTROL using the intelligent tester.
- If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).

Voltage output when active air-fuel ratio control not performed:

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Read DTCs.

Result

Display (DTC Output)	Proceed to
P0420 or P0430	A
P0420 or P0430 and other DTCs	B

HINT:
If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.

(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:

A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Less than 3.0 V
-12.5% = Lean output:
More than 3.35 V

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• Catalyst • Exhaust gas leakage
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		Extremely rich or lean actual air-fuel ratio • Injector • Fuel pressure • Gas leakage from exhaust system
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2; then press the YES button and then the ENTER button followed by the F4 button.

DTC SUMMARY

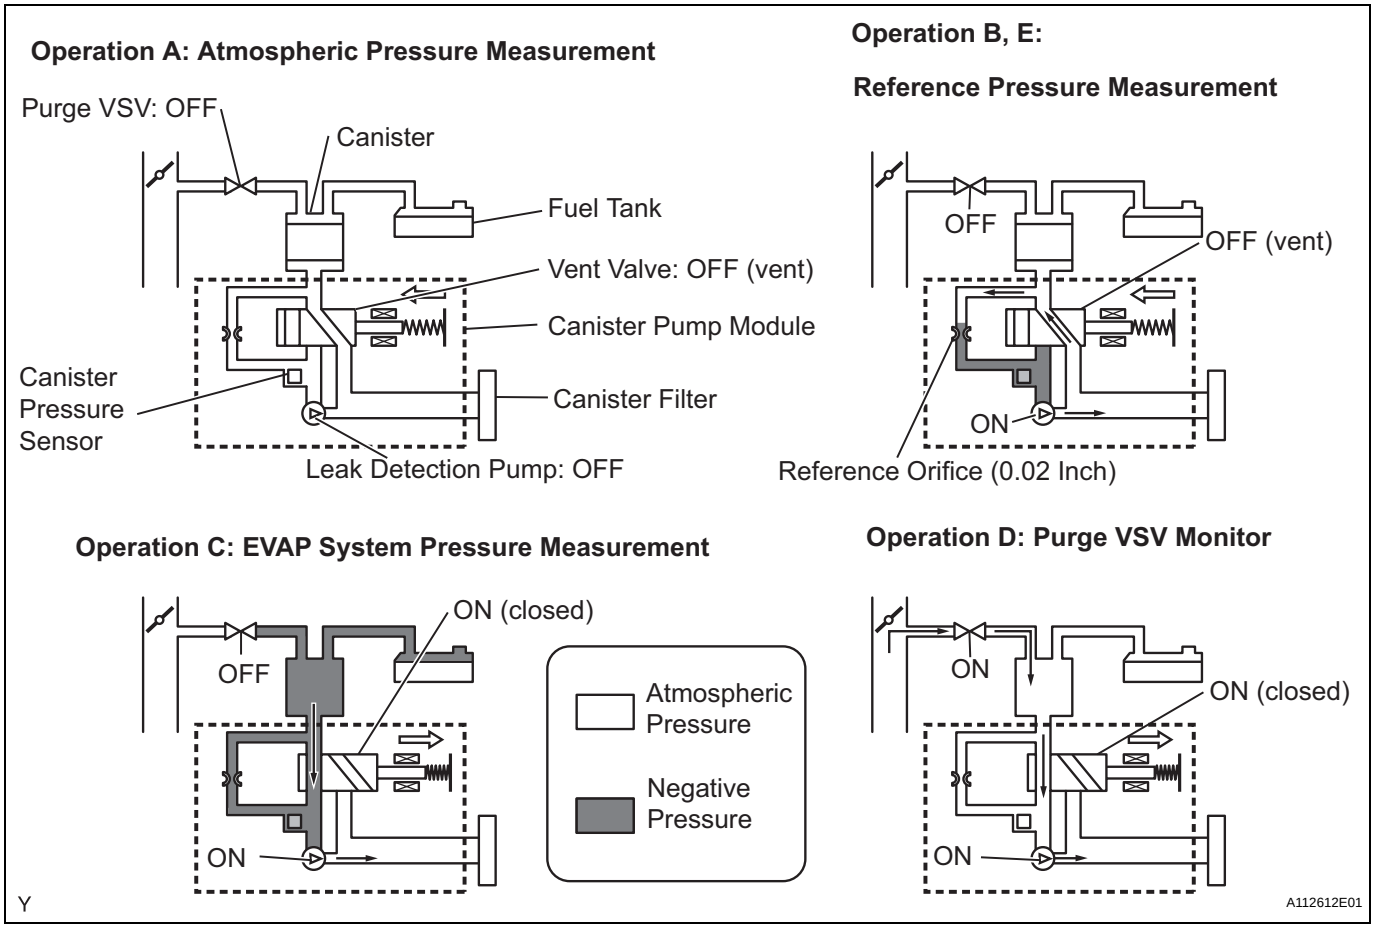
DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P043E	Reference orifice clogged	P043E, P043F, P2401, P2402 and P2419 present when one of following conditions met during key-off EVAP monitor: • Reference orifice clogged • Reference orifice high-flow • Leak detection pump OFF malfunction • Leak detection pump ON malfunction • Vent valve ON (close) malfunction	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	While ignition switch OFF	2 trip
P043F	Reference orifice high-flow				
P2401	Leak detection pump stuck OFF				
P2402	Leak detection pump stuck ON				
P2419	Vent valve stuck closed				

HINT:
The reference orifice is located inside the canister pump module.

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-371).

INSPECTION PROCEDURE

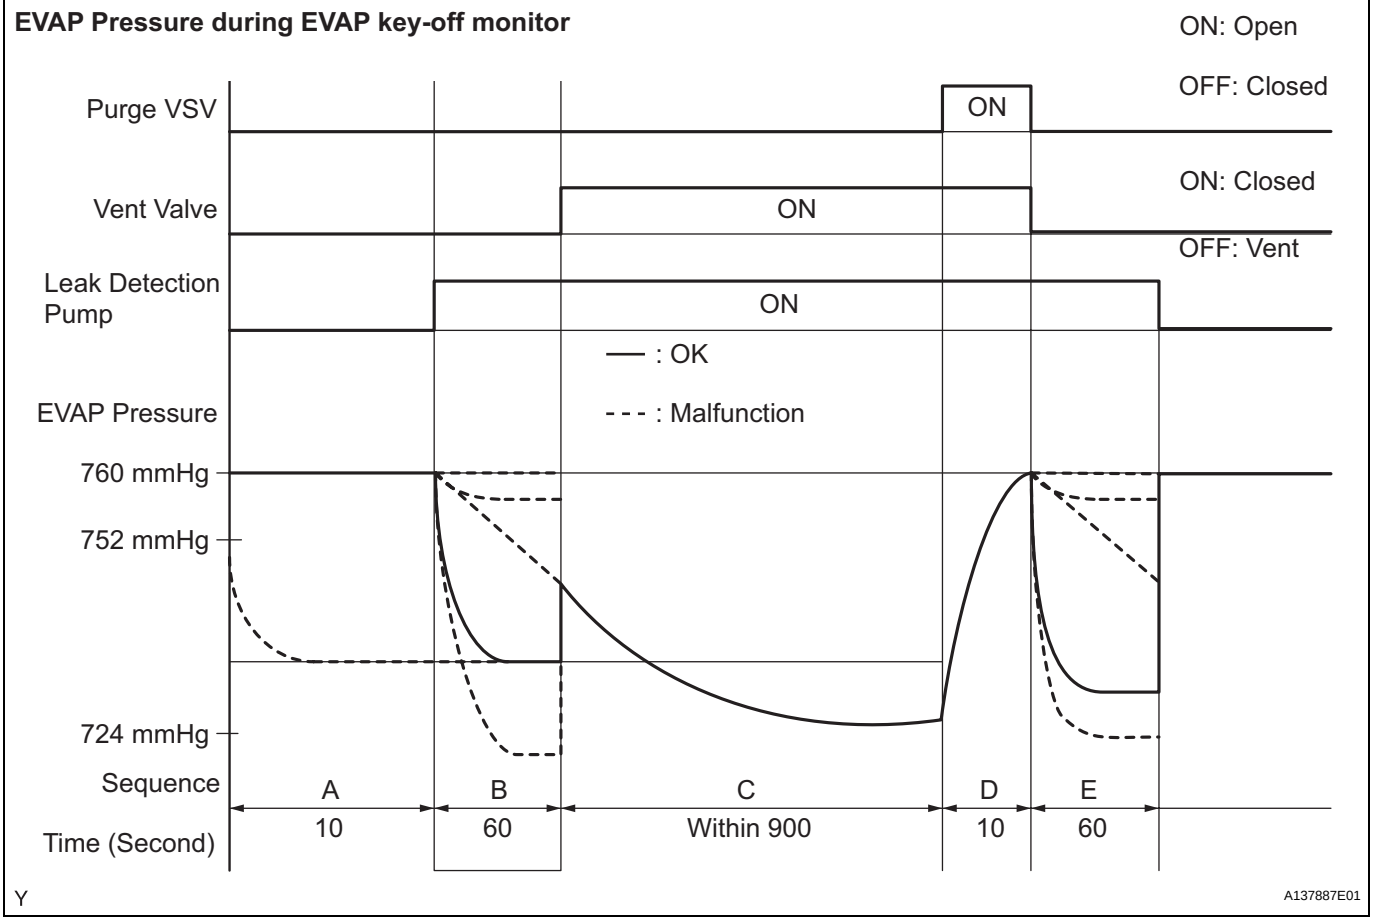


Refer to the EVAP System (see page ES-376).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
-	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-



*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

The leak detection pump creates negative pressure through the reference orifice. When the system is normal, the EVAP pressure is between 724 to 752 mmHg* and saturated within a minute. If not, the ECM interprets this as a malfunction. The ECM will illuminate the MIL and set DTC if this malfunction is detected in consecutive drive cycles.

*: Typical value.

EVAP Pressure during EVAP key-off monitor

ES

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed

ECT	4.4° to 35°C (40° to 95°F)
IAT	4.4° to 35°C (40° to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement started	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

TYPICAL MALFUNCTION THRESHOLDS

"Saturated" indicates that the EVAP pressure change is less than 0.286 kPa-g (2.14 mmHg-g) in 60 seconds.

One of following conditions met	-
EVAP pressure just after reference pressure measurement started	More than -1 kPa-g (-7.5 mmHg-g)
Reference pressure	Less than -4.85 kPa-g (-36.4 mmHg-g)
Reference pressure	-1.057 kPa-g (-7.93 mmHg-g) or more
Reference pressure	Not saturated within 60 seconds
Reference pressure difference between first and second	0.7 kPa-g (5.25 mmHg-g) or more

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).

DTC	P0441	Evaporative Emission Control System Incorrect Purge Flow

DTC SUMMARY

DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P0441	Purge VSV (Vacuum Switching Valve) stuck open	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than [second reference pressure x 0.2], ECM determines that purge VSV stuck open.	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
	Purge VSV stuck closed	After EVAP leak check performed, purge VSV turned ON (open), and atmospheric air introduced into EVAP system. Reference pressure measured at start and at end of check. If pressure does not return to near atmospheric pressure, ECM determines that purge VSV stuck closed.	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • ECM • Canister pump module • Leakage from EVAP system	While ignition switch OFF	2 trip
	Purge flow	While engine running, following conditions successively met: • Negative pressure not created in EVAP system when purge VSV turned ON (open) • EVAP system pressure change less than 0.5 kPa-g (3.75 mmHg-g) when vent valve turned ON (closed) • Atmospheric pressure change before and after purge flow monitor less than 0.1 kPa-g (0.75 mmHg-g)	• Purge VSV • Connector/wire harness (Purge VSV - ECM) • Leakage from EVAP line (Purge VSV - Intake manifold) • ECM	While engine running	2 trip

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-371).

INSPECTION PROCEDURE

Refer to the EVAP System (see page ES-376).

MONITOR DESCRIPTION

The two monitors, Key-Off and Purge Flow, are used to detect malfunctions relating to DTC P0441. The Key-Off monitor is initiated by the ECM internal timer, known as the soak timer, 5 hours* after the ignition switch is turned OFF. The purge flow monitor runs while the engine is running.

1. KEY-OFF MONITOR

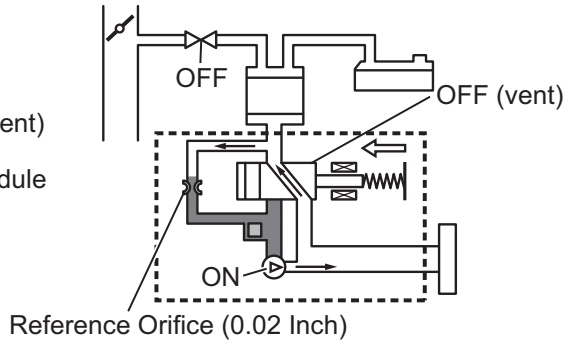
   5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.

   HINT:

   *: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

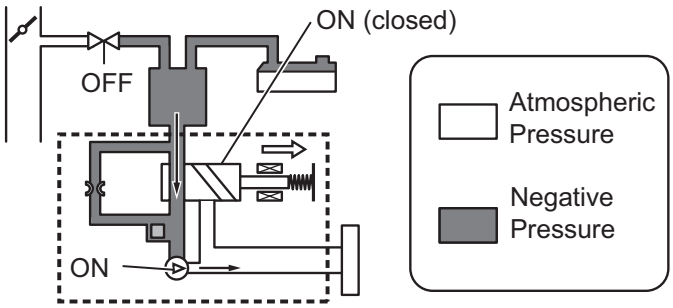
Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-

Sequence	Operation	Description	Duration
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
-	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

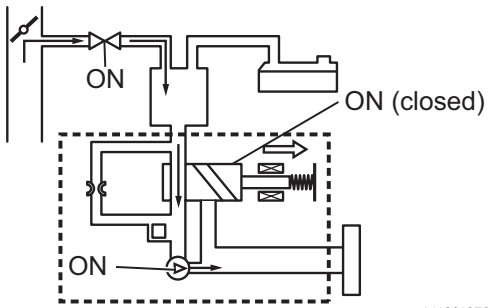


*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

Operation A: Atmospheric Pressure Measurement



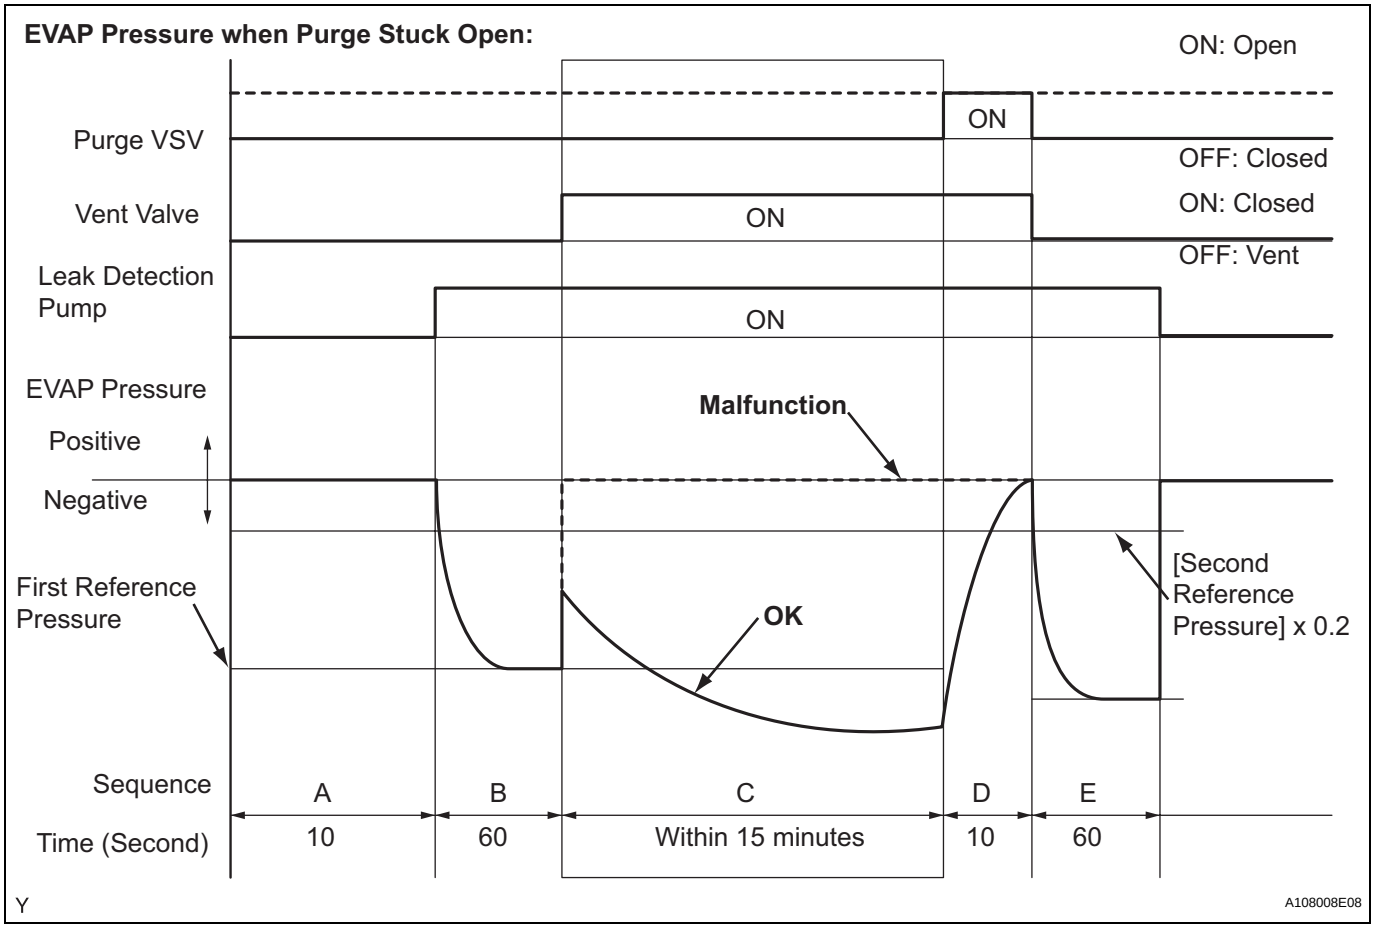
Operation B, E:



Reference Pressure Measurement

Operation C: EVAP System Pressure Measurement

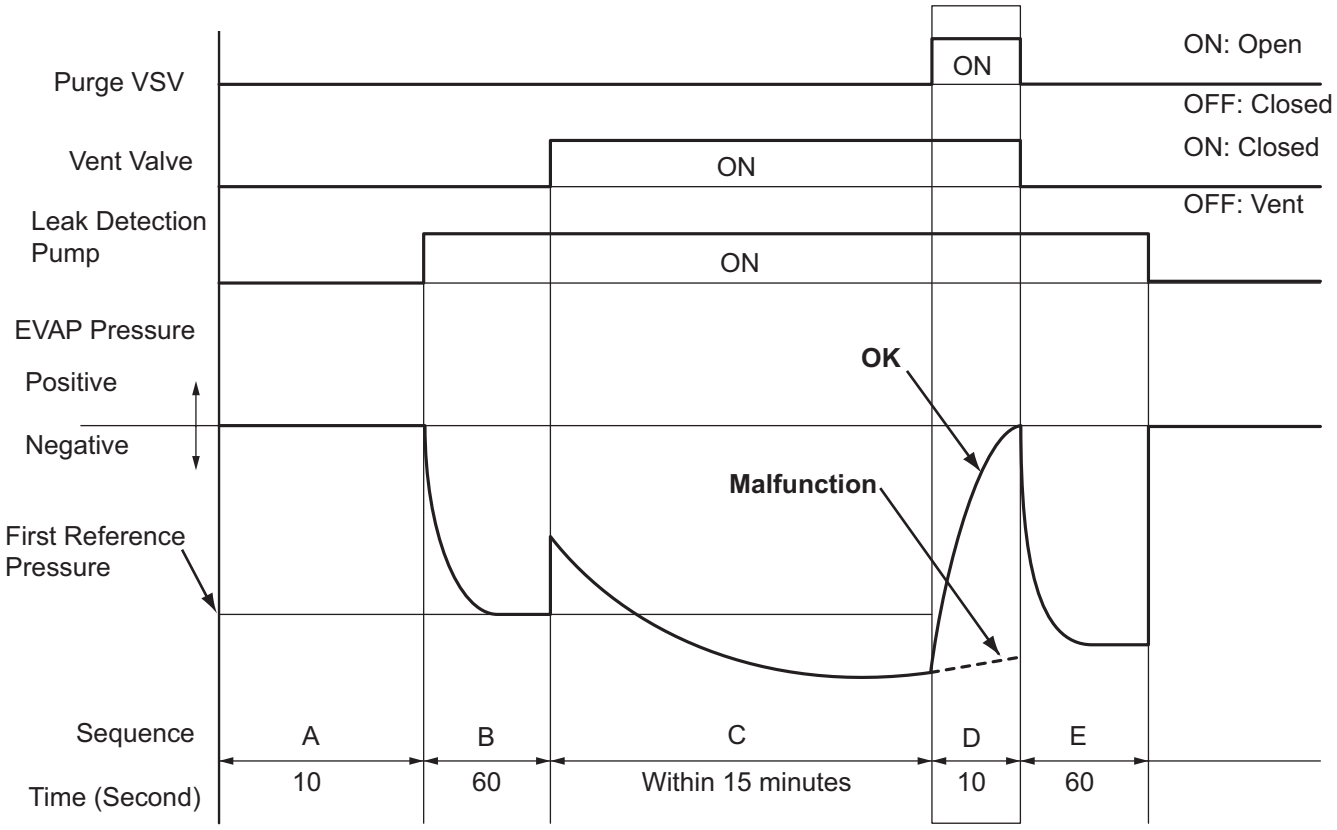
Operation D: Purge VSV Monitor



Y

A112612E01

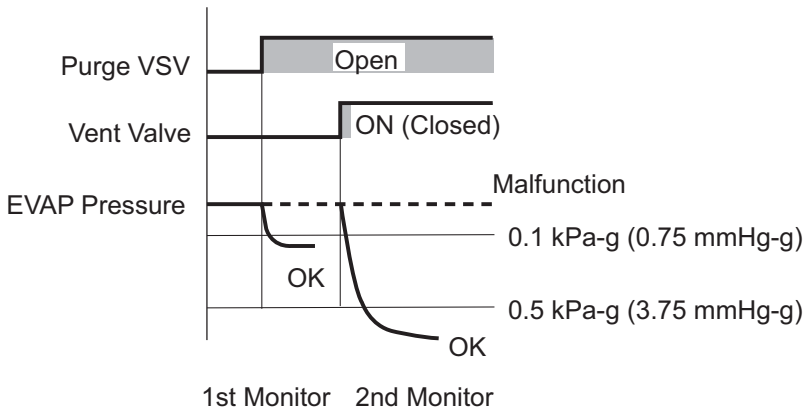
(a) Purge VSV stuck open



In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The EVAP system pressure is then measured by the ECM using the canister pressure sensor. If the stabilized system pressure is higher than [second reference pressure x 0.2], the ECM interprets this as the purge VSV (Vacuum Switching Valve) being stuck open. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).

(b) Purge VSV stuck closed

In operation D, the canister pressure sensor measures the EVAP system pressure. The pressure measurement for the purge VSV monitor is begun when the purge VSV is turned ON (open) after the EVAP leak check. When the measured pressure indicates an increase of 0.3 kPa-g (2.25 mmHg-g) or more, the purge VSV is functioning normally. If the pressure does not increase, the ECM interprets this as the purge VSV being stuck closed. The ECM illuminates the MIL and sets the DTC (2 trip detection logic).



EVAP Pressure when Purge VSV Stuck Closed:

Y A106059E08

2. PURGE FLOW MONITOR

EVAP Pressure During Purge Flow Monitor:

Y A112640E01

The purge flow monitor consists of the two step monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

- The 1st monitor
  While the engine is running and the purge VSV is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.
- The 2nd monitor
  The vent valve is turned ON (closed) and the EVAP pressure is then measured. If the variation in the pressure is less than 0.5 kPa-g (3.75 mmHg-g), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.

OBD II MONITOR SPECIFICATIONS

1. Key-off Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

Typical Enabling Conditions

EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4 to 35°C (40° to 95°F)
IAT	4.4 to 35°C (40° to 95°F)

2. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement started	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

Typical Malfunction Thresholds

Purge VSV stuck open:	-
EVAP pressure when vacuum introduction complete	Higher than reference pressure x 0.2

Purge VSV stuck closed:	-
EVAP pressure change after purge VSV ON (open)	Less than 0.3 kPa-g (2.25 mmHg-g)

OBD II MONITOR SPECIFICATIONS

1. Purge Flow Monitor

Monitor Strategy

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

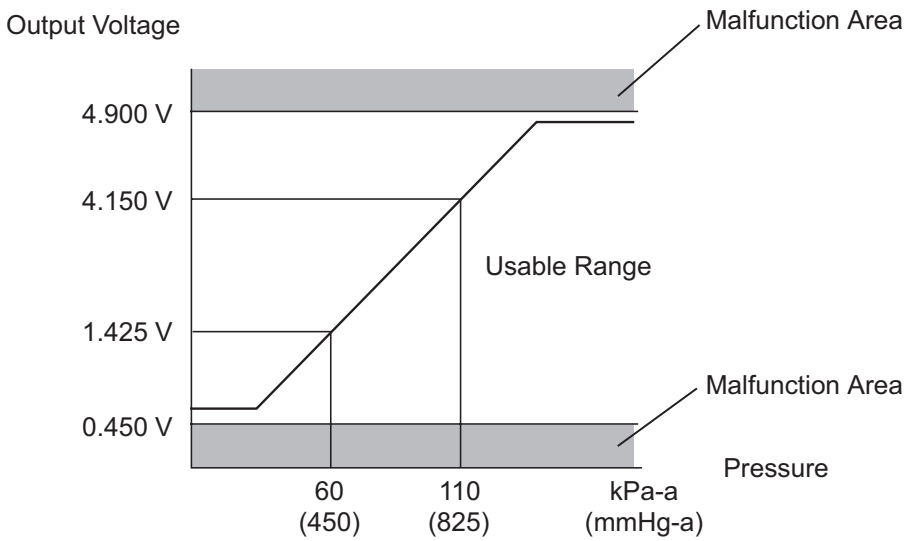
DTC SUMMARY

DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P0450	Canister pressure sensor voltage fluctuation abnormal	Sensor output voltage rapidly fluctuates beyond upper and lower malfunction thresholds for 0.5 seconds.	• Canister pump module • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition switch OFF) • Ignition switch ON	1 trip
P0451	Canister pressure sensor noise	Sensor output voltage fluctuates frequently within certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition switch OFF) • Engine running	2 trip
	Canister pressure sensor signal becomes fixed/flat	Sensor output voltage does not vary within certain time period.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• EVAP monitoring (ignition switch OFF)	2 trip
P0452	Canister pressure sensor low input	EVAP pressure less than 42.1 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• Ignition switch ON • EVAP monitoring (ignition switch OFF)	1 trip

DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P0453	Canister pressure sensor high input	EVAP pressure more than 123.8 kPa for 0.5 seconds.	• Canister pump module • Connector/wire harness (Canister pump module - ECM) • EVAP system hose (pipe from air inlet port to canister pump module, canister filter, fuel tank vent hose) • ECM	• Ignition switch ON • EVAP monitoring (ignition switch OFF)	1 trip

HINT:
The canister pressure sensor is built into the canister pump module.



ES

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-371).

MONITOR DESCRIPTION

Canister Pressure Sensor Specification:

HINT:

Standard atmospheric pressure is 101.3 kPa-a (760 mmHg-a)

A115543E05

1. DTC P0450: Canister pressure sensor abnormal fluctuation
   If the canister pressure sensor output [pressure] rapidly fluctuates between less than 42.1 kPa-a (315.9 mmHg-a) and more than 123.8 kPa-a (928.4 mmHg-a), the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP (Evaporative Emission) system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

2. DTC P0451: Canister pressure sensor noise or fixed/flat
   If the canister pressure sensor voltage output fluctuates rapidly for 10 seconds, the ECM stops the EVAP system monitor. The ECM interprets this as noise from the canister pressure sensor, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC.
   Alternatively, if the sensor voltage output does not change for 10 seconds, the ECM interprets this as the sensor being fixed/flat, and stops the monitor. The ECM then illuminates the MIL and sets the DTC. (Both the malfunctions are detected by 2 trip detection logic.)
3. DTC P0452: Canister pressure sensor voltage low
   If the canister pressure sensor output [pressure] is below 42.1 kPa-a (315.9 mmHg-a), the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).
4. DTC P0453: Canister pressure sensor voltage high
   If the canister pressure sensor output [pressure] is 123.8 kPa-a (928.4 mmHg-a) or more, the ECM interprets this as an open or short circuit malfunction in the canister pressure sensor or its circuit, and stops the EVAP system monitor. The ECM then illuminates the MIL and sets the DTC (1 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	Canister pump module
Frequency of Operation	Once per driving cycle: P0451 sensor fixed/flat Continuous: P0451 sensor noise, P0450, P0452 and P0453
Duration	0.5 seconds: P0450, P0452 and P0453 2 minutes: P0451
MIL Operation	Immediate: P0450, P0452 and P0453 2 driving cycles: P0451
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P0451 (Noise monitor):

Monitor runs whenever following DTCs not present	None
Atmospheric pressure (absolute pressure)	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Intake air temperature	4.4 to 35°C (40 to 95°F)
Canister pressure sensor malfunction (P0450, P0452, 0453)	Not detected
Either of following conditions met	A or B
A. Engine condition	Running
B. Time after key off	5 or 7 or 9.5 hours

P0451 (Fixed/flat monitor):

Monitor runs whenever following DTCs not present	None
Battery voltage	10.5 V or more
Intake air temperature	4.4 to 35°C (40 to 95°F)
Canister pressure sensor malfunction (P0450, P0452, 0453)	Not detected
Atmospheric pressure (absolute pressure)	70 to 110 kPa-a (525 to 825 mmHg-a)
Time after key off	5 or 7 or 9.5 hours

P0450, P0452 and P0453:

Monitor runs whenever following DTCs not present	None
Either of following conditions met	(a) or (b)
(a) Ignition switch	ON
(b) Soak timer	ON

TYPICAL MALFUNCTION THRESHOLDS

P0450: Canister pressure sensor chattering

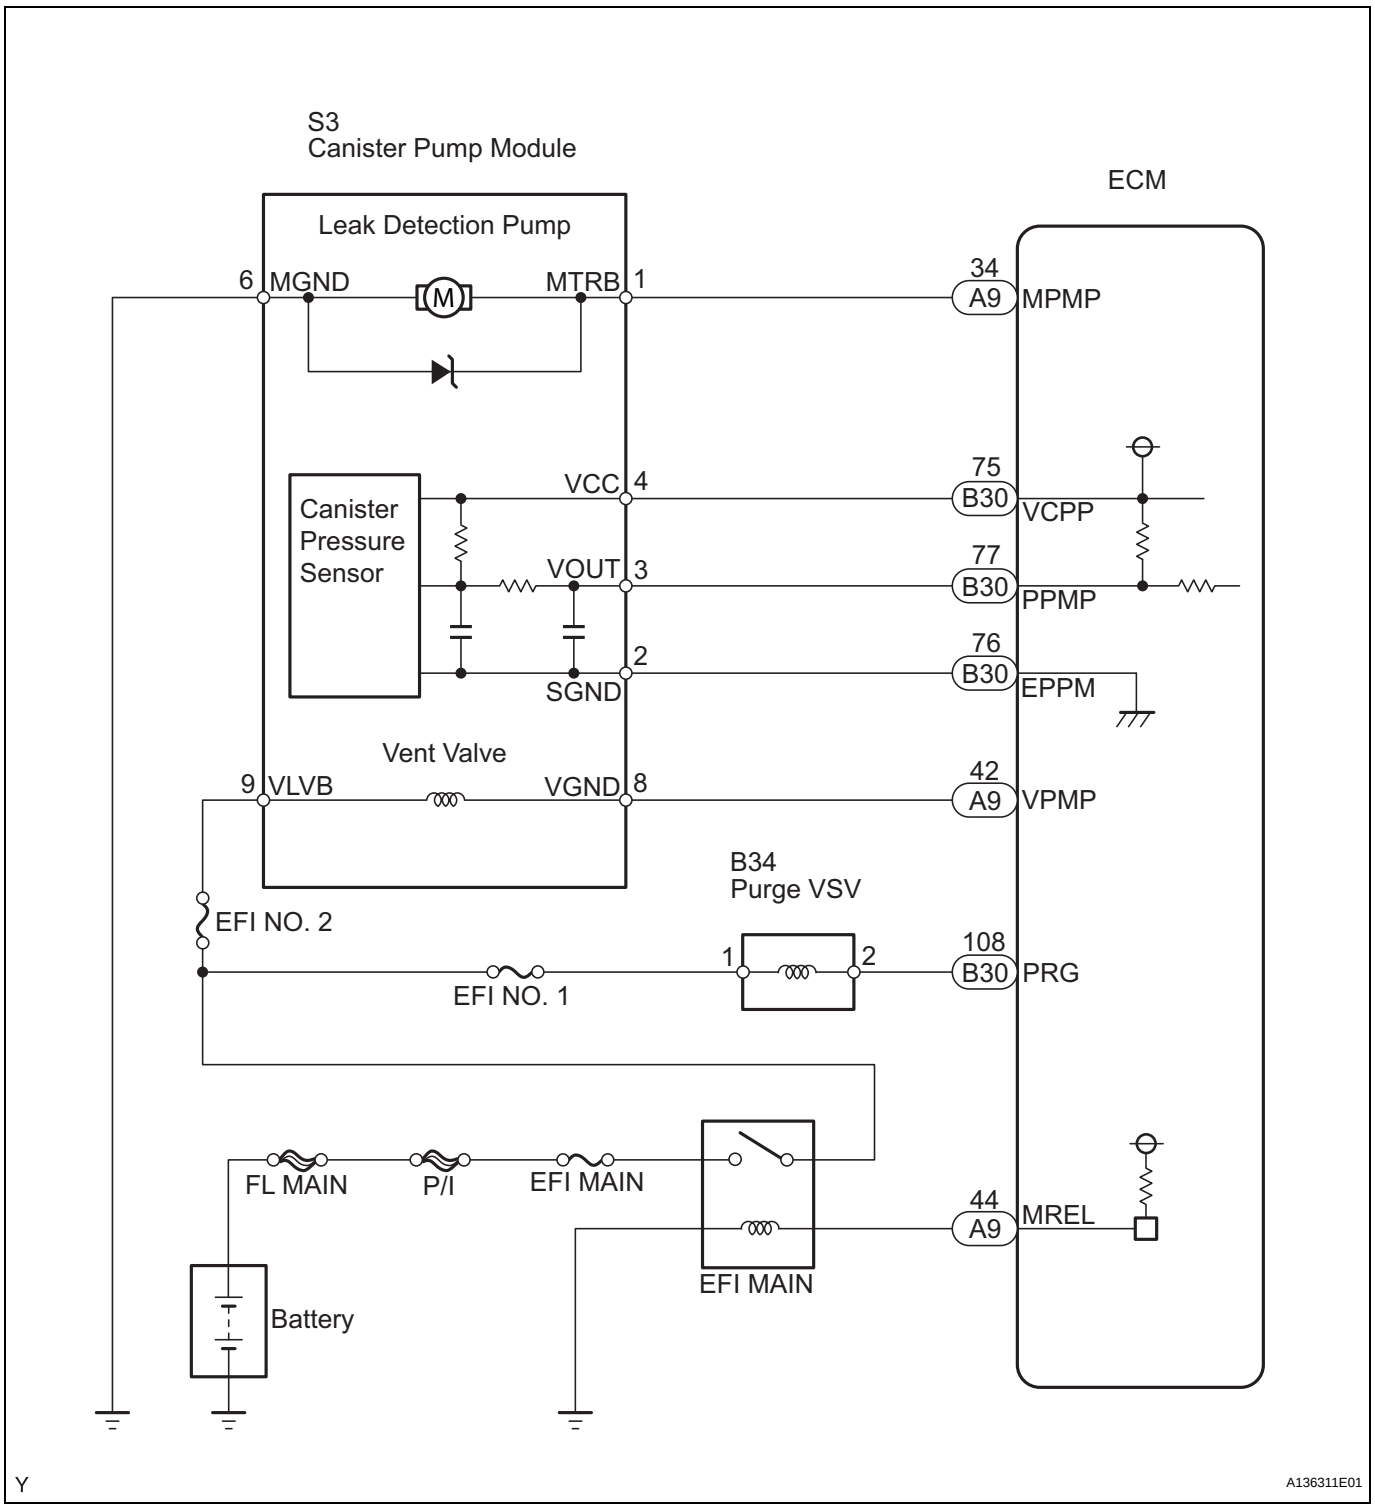
EVAP pressure	Less than 42.1 kPa-a (315.9 mmHg-a), or more than 123.8 kPa-a (928.4 mmHg-a)

P0451: Canister pressure sensor noise

Frequency that EVAP pressure change 0.3 kPa-g (2.25 mmHg-g) or more	10 times or more in 10 seconds

P0451: Canister pressure sensor fixed/flat

EVAP pressure change during reference pressure	Less than 0.65 kPa-g (4.87 mmHg-g)



P0452: Canister pressure sensor low voltage

EVAP pressure	Less than 42.1 kPa-a (315.9 mmHg-a)

P0453: Canister pressure sensor high voltage

EVAP pressure	More than 123.8 kPa-a (928.4 mmHg-a)

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

- **When a vehicle is brought into the workshop, leave it as it is. Do not change the vehicle condition. For example, do not tighten the fuel cap.**
- **Do not disassemble the canister pump module.**
- **The intelligent tester is required to conduct the following diagnostic troubleshooting procedure.**

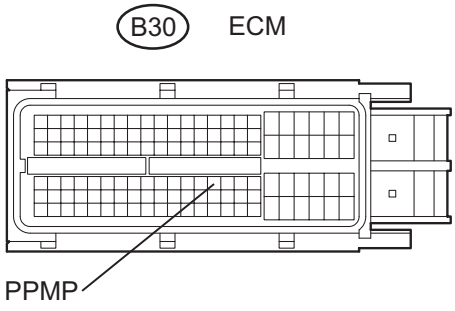
1	CONFIRM DTC AND EVAP PRESSURE

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON (do not start the engine).
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / EVAP / EVAP VAPOR PRESS.
(g) Read the EVAP (Evaporative Emission) pressure displayed on the tester.

ES

Result

Display (DTC Output)	Test Result	Suspected Trouble Area	Proceed to
P0451	-	Canister pressure sensor	C
P0452	Less than 45 kPa-a (430 mmHg-a)	• Wire harness/connector (ECM - Canister pressure sensor) • Canister pressure sensor • Short in ECM circuit	A
P0453	More than 120 kPa-a (900 mmHg-a)	• Wire harness/connector (ECM - Canister pressure sensor) • Canister pressure sensor • Open in ECM circuit	B



B → Go to step 4

C → GO TO EVAP SYSTEM

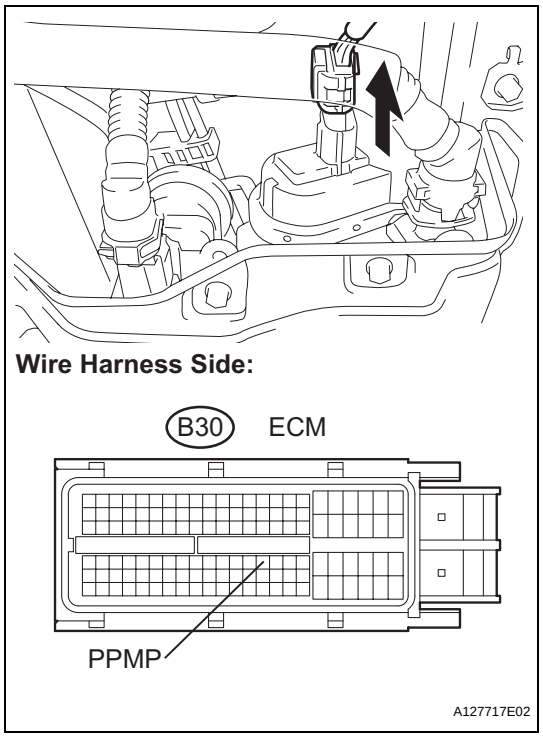
A

2	CHECK WIRE HARNESS (CANISTER PUMP MODULE - ECM)

Wire Harness Side:

(a) Turn the ignition switch OFF.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance between PPMP terminal of the ECM connector and the body ground.

Result



Test Result	Suspected Trouble Area	Proceed to
10 Ω or less	• Wire harness/connector (ECM - Canister pressure sensor) • Short in canister pressure sensor circuit	A
10 kΩ or more	• Wire harness/connector (ECM - Canister pressure sensor) • Short in ECM circuit	B

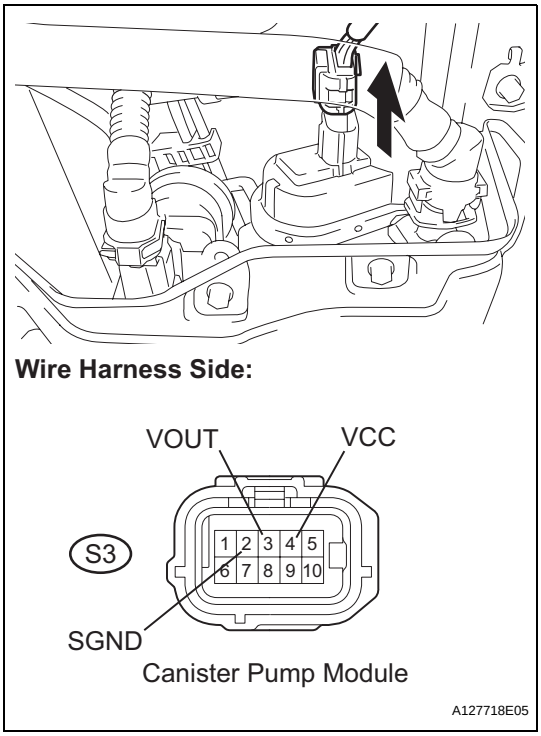
(d) Reconnect the ECM connector.

B	Go to step 7

A

3 CHECK WIRE HARNESS (CANISTER PUMP MODULE - ECM)

(a) Disconnect the S3 canister pump module connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance between PPMP terminal of the ECM connector and the body ground.



Result

Test Result	Suspected Trouble Area	Proceed to
10 kΩ or more	Short in canister pressure sensor circuit	A
10 Ω or less	Short in wire harness/connector (ECM - Canister pressure sensor)	B

(d) Reconnect the canister pump module connector.
(e) Reconnect the ECM connector.

A	Go to step 5
B	Go to step 6

4	CHECK WIRE HARNESS (CANISTER PUMP MODULE - ECM)

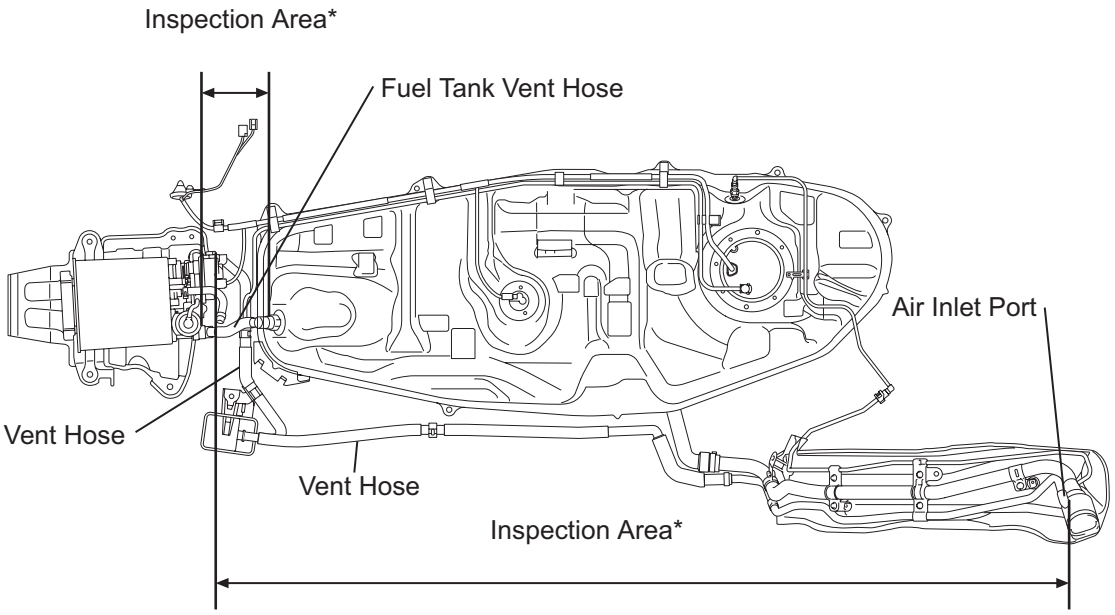
(a) Disconnect the S3 canister pump module connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage and resistance of the canister connector.

Standard

Tester Connection	Specified Condition
S3-4 (VCC) - Body ground	4.5 to 5.5 V
S3-3 (VOUT) - Body ground	4.5 to 5.5 V
S3-2 (SGND) - Body ground	100 Ω or less

Result

Test Result	Suspected Trouble Area	Proceed to
Voltage and resistance within standard ranges	Open in canister pressure sensor circuit	A
Voltage and resistance outside standard ranges	Open in wire harness/connector (ECM - Canister pressure sensor)	B



(d) Reconnect the canister pump module connector.

A	Go to step 5
B	Go to step 6

5	REPLACE CHARCOAL CANISTER ASSEMBLY

(a) Replace the canister assembly (see page EC-10).

NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel and other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.

*: Check for disconnection and/or cracks

P A127720E01

ES

NEXT → Go to step 8

6	REPAIR OR REPLACE HARNESS AND CONNECTOR

HINT:
If the exhaust tailpipe has been removed, go to the next step before reinstalling it.

NEXT → Go to step 8

7	REPLACE ECM

(a) Replace the ECM (see page ES-429).

NEXT → Go to step 8

8	CHECK WHETHER DTC OUTPUT RECURS (AFTER REPAIR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Wait for at least 60 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.

HINT:
If no pending DTCs are displayed on the tester, the repair has been successfully completed.

NEXT

COMPLETED

DTC	P0455	Evaporative Emission Control System Leak Detected (Gross Leak)

DTC	P0456	Evaporative Emission Control System Leak Detected (Very Small Leak)

DTC SUMMARY

DTCs	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P0455	EVAP gross leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than [second reference pressure x 0.2], ECM determines that EVAP system has large leak.	• Fuel tank cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip
P0456	EVAP small leak	Leak detection pump creates negative pressure (vacuum) in EVAP system and EVAP system pressure measured. Reference pressure measured at start and at end of leak check. If stabilized pressure higher than second reference pressure, ECM determines that EVAP system has small leak.	• Fuel tank cap (loose) • Leakage from EVAP line (Canister - Fuel tank) • Leakage from EVAP line (Purge VSV - Canister) • Canister pump module • Leakage from fuel tank • Leakage from canister	While ignition switch OFF	2 trip

DESCRIPTION

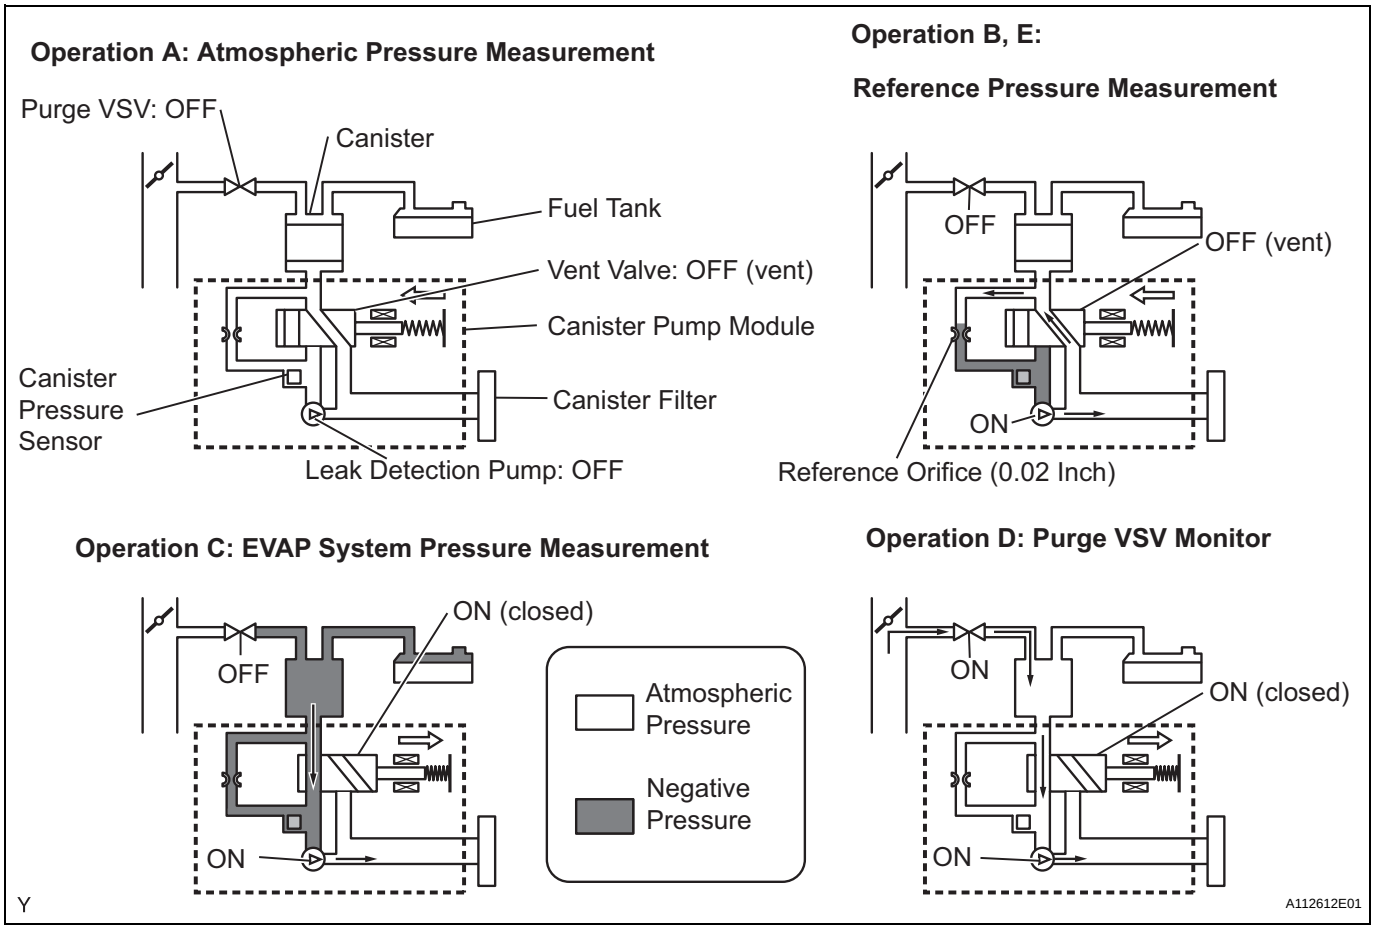
The description can be found in the EVAP (Evaporative Emission) System (see page ES-371).

INSPECTION PROCEDURE

Refer to the EVAP System (see page ES-376).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.



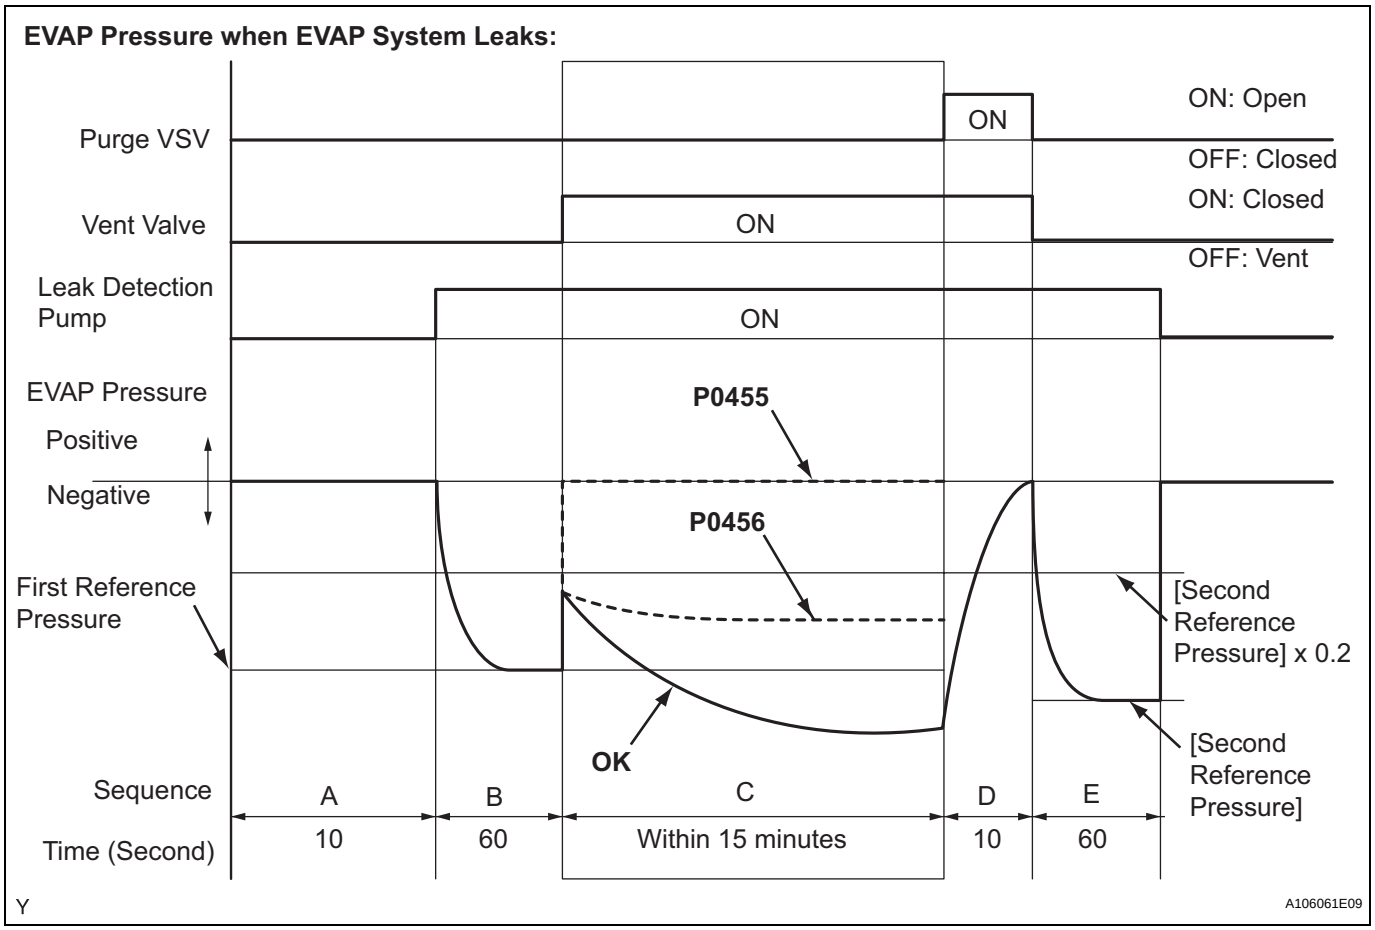
HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*

Sequence	Operation	Description	Duration
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
-	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-

*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.



(a) P0455: EVAP gross leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than [second reference pressure x 0.2] (near atmospheric pressure), the ECM determines that the EVAP system has a large leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

(b) P0456: EVAP very small leak

In operation C, the leak detection pump creates negative pressure (vacuum) in the EVAP system and the EVAP system pressure is measured. If the stabilized system pressure is higher than the second reference pressure, the ECM determines that the EVAP system has a small leakage, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 15 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool

Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed
ECT	4.4 to 35°C (40 to 95°F)
IAT	4.4 to 35°C (40 to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement started	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

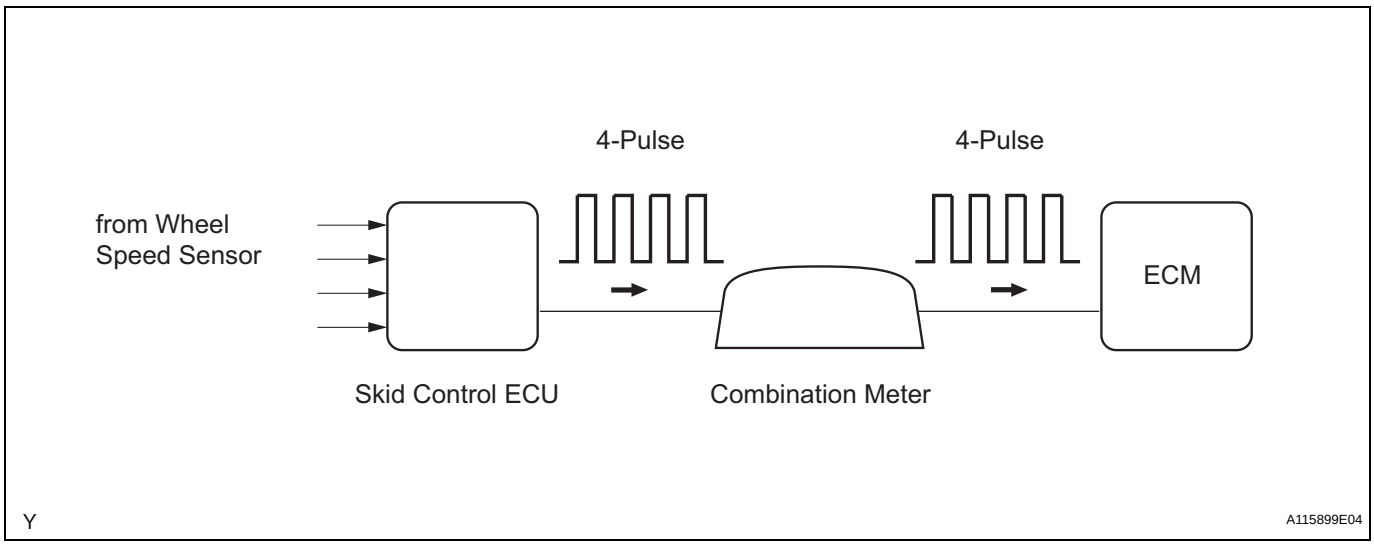
TYPICAL MALFUNCTION THRESHOLDS

P0455: EVAP gross leak

EVAP pressure when vacuum introduction complete	Higher than reference pressure x 0.2

P0456: EVAP small leak

EVAP pressure when vacuum introduction complete	Between reference pressure and reference pressure x 0.2



MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).

DTC	P0500	Vehicle Speed Sensor "A"

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC No.	DTC Detection Condition	Trouble Area
P0500	While vehicle being driven, no vehicle speed sensor signal transmitted to ECM (1 trip detection logic)	• Open or short in speed signal circuit • Vehicle speed sensor • Combination meter • ECM • Skid control ECU

MONITOR DESCRIPTION

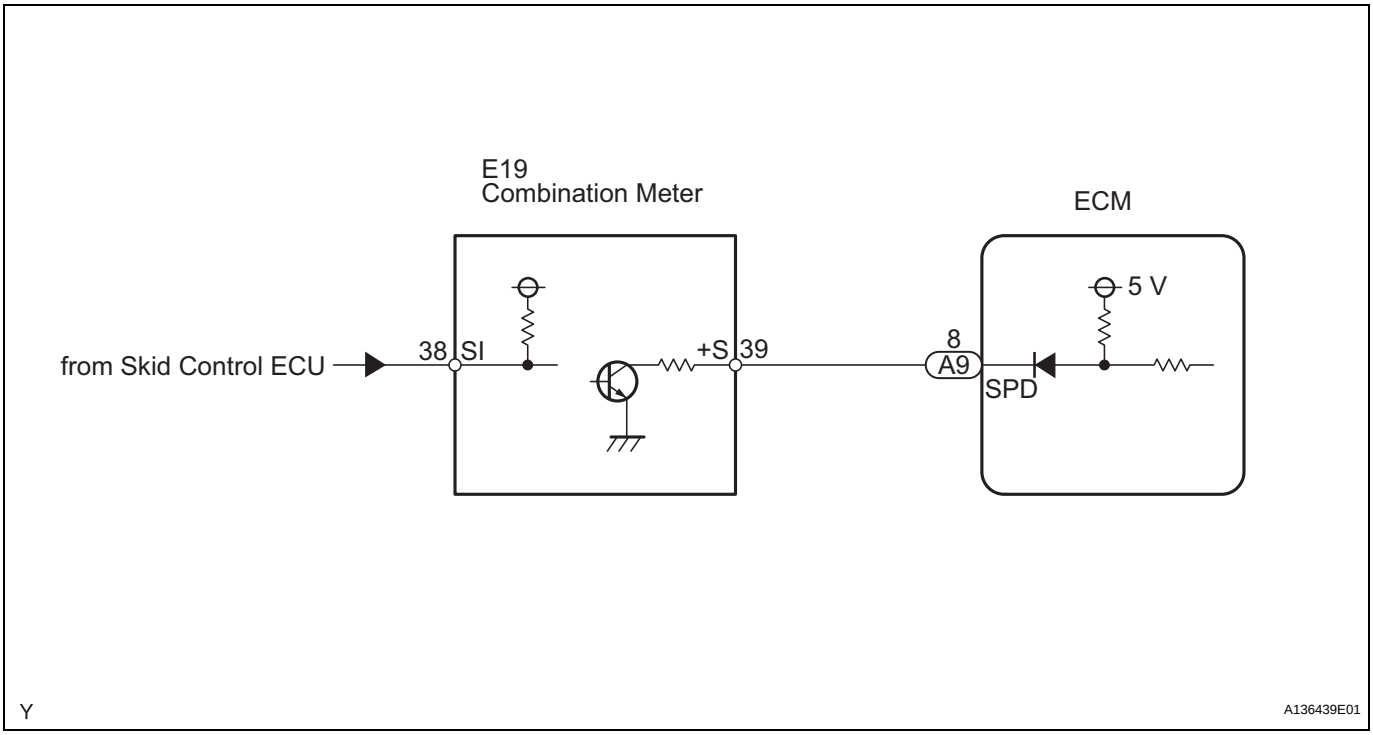
The ECM assumes that the vehicle is being driven, when the indicated engine speed is more than 2,300 rpm and 30 seconds have elapsed since the Park/Neutral Position (PNP) switch was turned OFF. If there is no speed signal from the combination meter, despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and sets the DTC.

MONITOR STRATEGY

Related DTCs	P0500: Vehicle speed sensor "A" pulse input error
Required Sensors/Components (Main)	Vehicle Speed Sensor (VSS), Combination meter and Skid control ECU
Required Sensors/Components (Related)	Park/Neutral Position (PNP) switch, Engine Coolant Temperature (ECT) sensor, Crankshaft Position (CKP) sensor, Throttle Position (TP) sensor and Mass Air Flow (MAF) meter
Frequency of Operation	Continuous
Duration	2 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0120 - P0223, P2135 (TP sensor)
Either of following conditions (a) or (b) met:	-



(a) Following conditions 1 and 2 met:	-
1. ECT and ECT sensor	20°C (68°F) or more, and sensor does not malfunction (P0115 or P0116)
2. Time after PNP switch turned OFF	10 seconds or more
(b) Following conditions 1 and 2 met:	-
1. ECT and ECT sensor	Less than 20°C (68°F), and sensor malfunction (P0115 or P0116)
2. Time after PNP switch turned OFF	30 seconds or more
Time after ignition switch turned ON	More than 0.5 seconds

TYPICAL MALFUNCTION THRESHOLDS

Vehicle speed sensor signal	No pulse input

ES

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**CHECK OPERATION OF SPEEDOMETER**

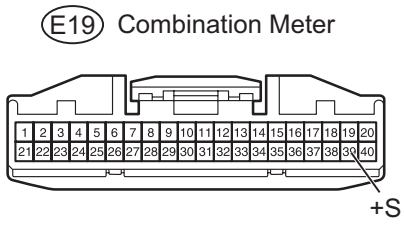
(a) Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.
HINT:
- The vehicle speed sensor is operating normally if the speedometer reading is normal.

- If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction (see page ME-41).

NG → **GO TO MALFUNCTION IN SPEEDOMETER**

OK

2 READ VALUE USING INTELLIGENT TESTER (VEHICLE SPD)



(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / VEHICLE SPD.
(e) Drive the vehicle.
(f) Read the value displayed on the tester.
OK:
Vehicle speeds displayed on tester and speedometer display are equal.

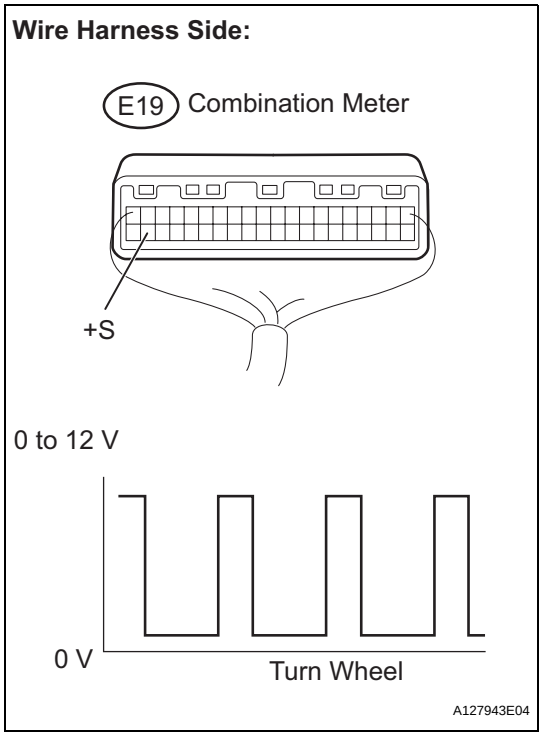
OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

3 CHECK COMBINATION METER ASSEMBLY (+S VOLTAGE)

Wire Harness Side:

(a) Disconnect the E19 combination meter connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminal of the combination meter and the body ground.
Standard voltage



Tester Connection	Specified Condition
E19-39 (+S) - Body ground	4.5 to 5.5 V

(d) Reconnect the combination meter connector.

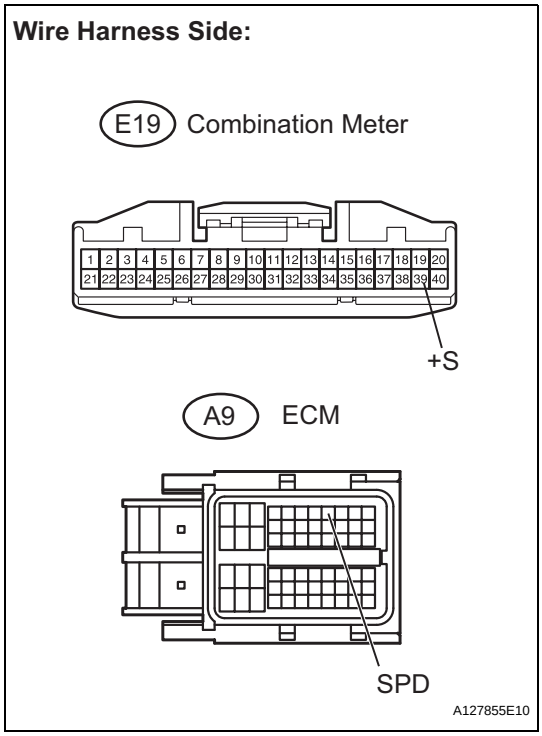
NG → **Go to step 5**

OK

4	CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL WAVEFORM)

(a) Shift the transmission gear selector lever to the neutral position.
(b) Jack up the vehicle.
(c) Turn the ignition switch ON.
(d) Check the voltage between the terminal of the combination meter and the body ground while the wheel is turned slowly.

Standard voltage



Tester Connection	Specified Condition
E19-39 (+S) - Body ground	Voltage generated intermittently

HINT:
The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

NG → **REPLACE COMBINATION METER ASSEMBLY**

OK

5	CHECK WIRE HARNESS (COMBINATION METER ASSEMBLY - ECM)

(a) Disconnect the E19 combination meter connector.
(b) Disconnect the A9 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
E19-39 (+S) - A9-8 (SPD)	Below 1 Ω
E19-39 (+S) or A9-8 (SPD) - Body ground	10 kΩ or higher

(d) Reconnect the combination meter connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

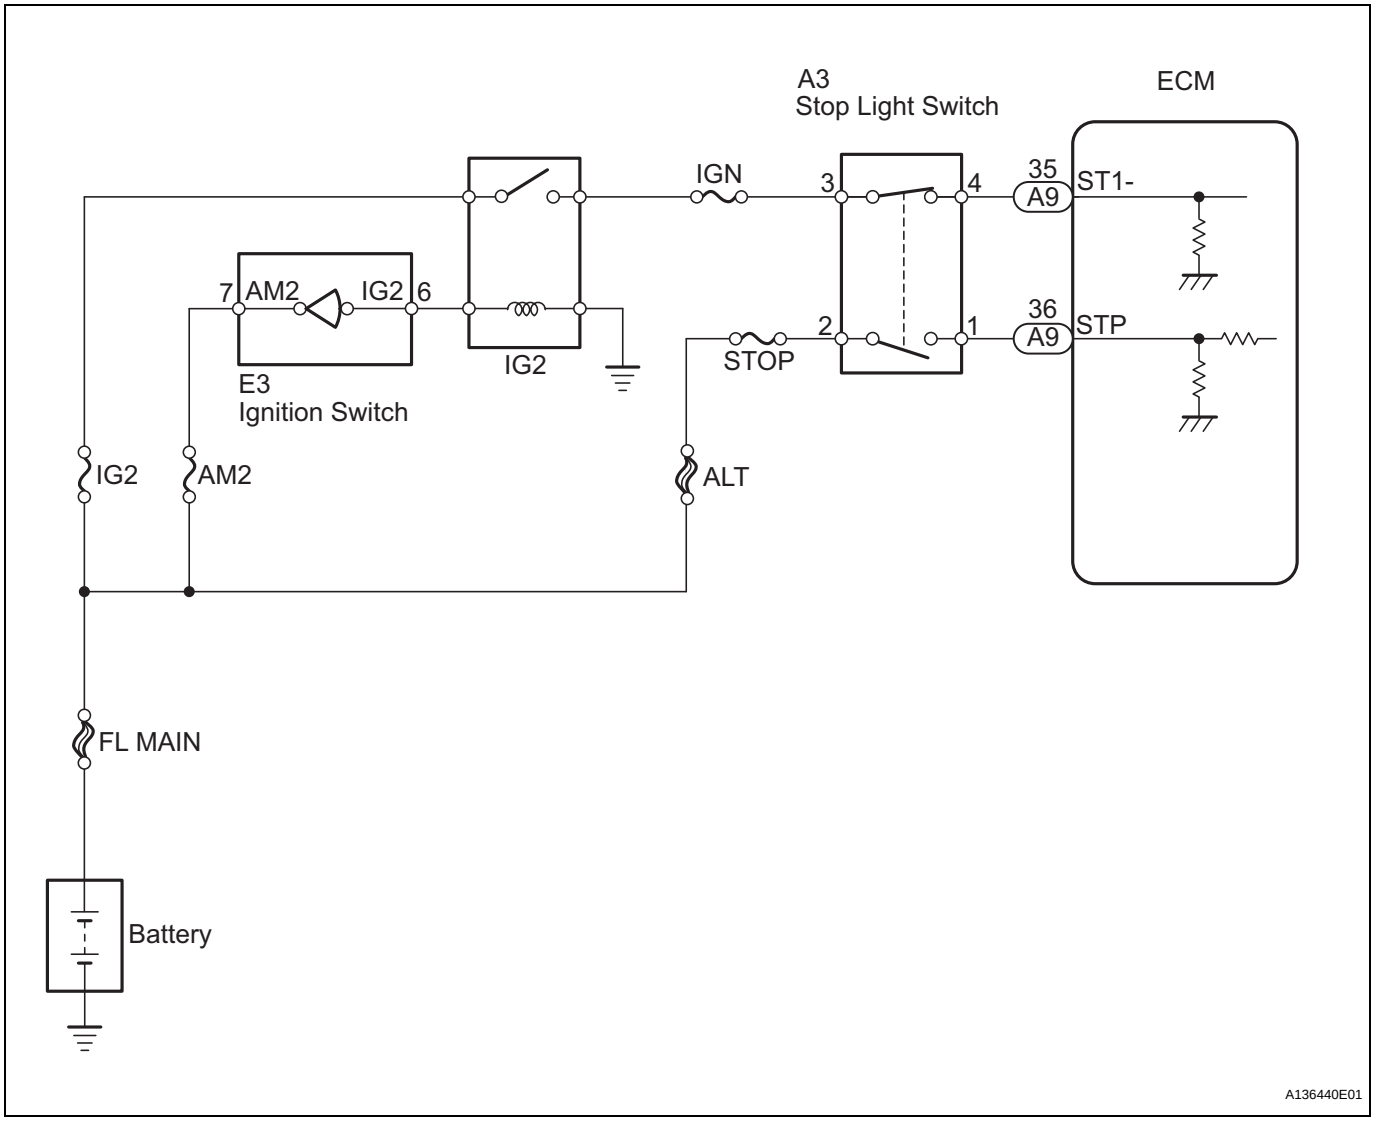
REPLACE ECM

DTC	P0504	Brake Switch "A" / "B" Correlation

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and sets the DTC.

HINT:



The normal conditions are as shown in the table below. The signals can be read using the intelligent tester.

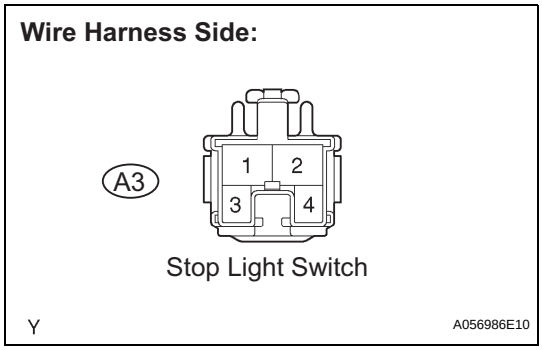
Signal	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

ES

DTC No.	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) Ignition switch ON (b) Brake pedal released (c) STP signal OFF when ST1- signal OFF	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

WIRING DIAGRAM

ES



INSPECTION PROCEDURE

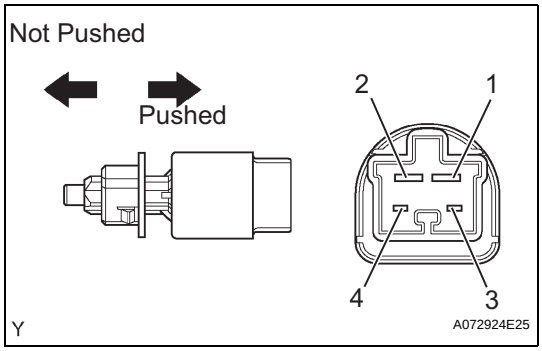
HINT:

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- STP signal conditions can be checked using the intelligent tester.
  (a) Connect the intelligent tester to the DLC3.
  (b) Turn the ignition switch ON.
  (c) Turn the tester ON.
  (d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STOP LIGHT SW.
  (e) Check the STP signal when the brake pedal is depressed and released.

Brake Pedal Operation	Specified Condition
Depressed	STP signal ON
Released	STP signal OFF

1	CHECK STOP LIGHT SWITCH ASSEMBLY (TERMINAL B VOLTAGE)

(a) Disconnect the A3 stop light switch connector.
(b) Measure the voltage between the terminals of the A3 stop light switch connector and body ground.
Standard voltage



Tester Connection	Condition	Specified Condition
A3-2 - Body ground	Always	9 to 14 V
A3-3 - Body ground	Ignition switch ON	9 to 14 V

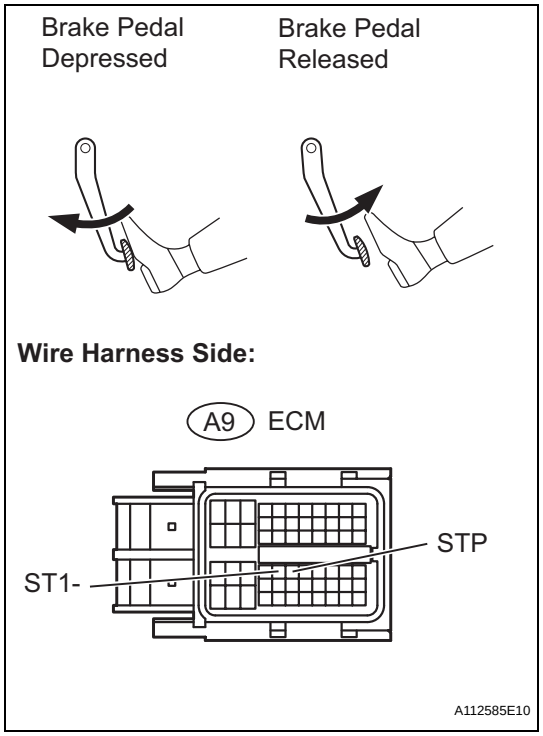
(c) Reconnect the stop light switch connector.

NG → **Go to step 4**

OK

2	INSPECT STOP LIGHT SWITCH ASSEMBLY

(a) Remove the stop light switch.
(b) Check the resistance.
Standard resistance



Tester Connection	Switch Position	Specified Condition
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

(c) Reinstall the stop light switch.

NG → **REPLACE STOP LIGHT SWITCH ASSEMBLY**

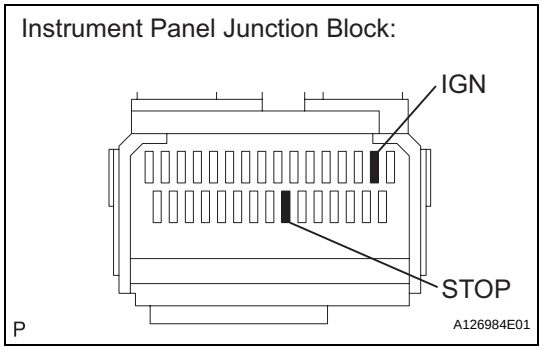
OK

3 CHECK ECM (STP AND ST1 - VOLTAGE)

(a) Disconnect the A9 ECM connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals ST1- and STP of the A9 ECM connector and body ground.
Standard voltage

Tester Connection	Brake Pedal Operation	Specified Condition
A9-35 (ST1-) - Body ground	Released	9 to 14 V
	Depressed	0 to 3 V
A9-36 (STP) - Body ground	Released	0 to 3 V
	Depressed	9 to 14 V

(d) Reconnect the ECM connector.



ES

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

4 INSPECT FUSE (STOP AND IGN FUSE)

(a) Remove the STOP and IGN fuses from the instrument panel junction block.
(b) Measure the resistance.
Standard resistance:
Below 1 Ω
(c) Reinstall the STOP and IGN fuses.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

REPAIR OR REPLACE HARNESS AND CONNECTOR

DTC	P0505	Idle Control System Malfunction

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

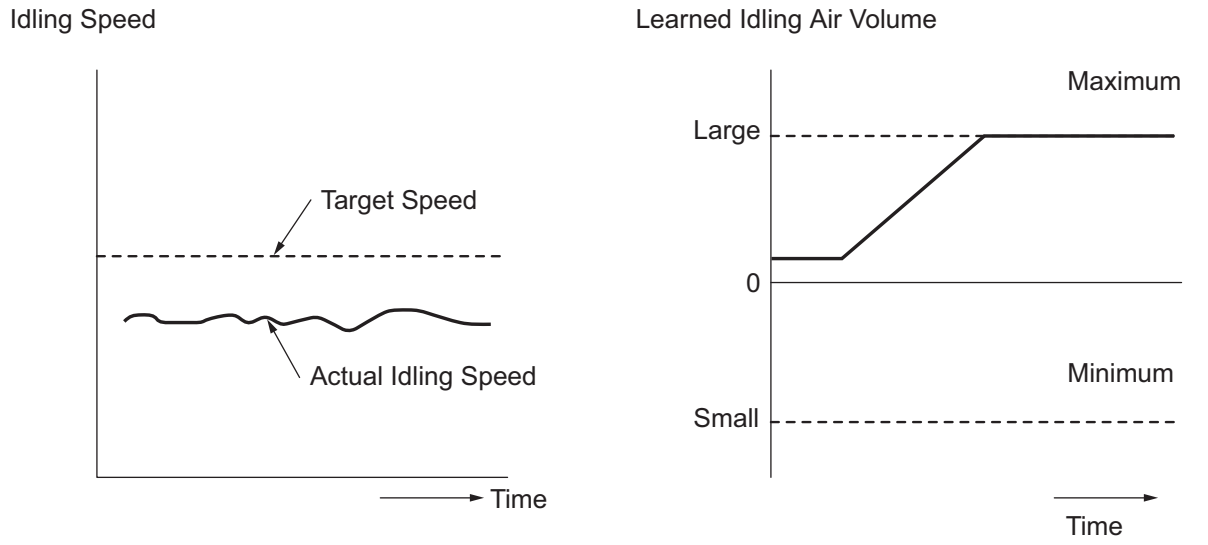
DTC No.	DTC Detection Condition	Trouble Area
P0505	Idling speed continues to vary greatly from target idling speed (2 trip detection logic)	• ETCS • Air induction system • PCV hose connections • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

- The learned idling air flow volume remains at the maximum or minimum volume 5 times or more during a drive cycle.
- After driving at 10 km/h (6.25 mph) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 200 rpm, 5 times or more during a drive cycle.



Example:

If the actual idling speed varies from the target idling speed by more than 200 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and sets the DTC.

HINT:

*: Threshold idling speed varies with engine load.

Example:

Y A121611E02

MONITOR STRATEGY

Related DTCs	P0505: ISC function
Required Sensors/Components (Main)	ETCS
Required Sensors/Components (Related)	Crankshaft position sensor, Engine coolant temperature sensor, and Vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Engine	Running

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions 1 or 2 met	-
1. Frequency that both of following conditions (a) and (b) set	5 times or more
(a) Engine rpm - Target engine rpm	Less than -100 rpm, or more than 150 rpm
(b) Vehicle condition	Stop after vehicle was driven at 10 km/h (6.25 mph) or more
2. Frequency that both of following conditions (c) and (d) set	Once
(c) Engine rpm - Target engine rpm	Less than -100 rpm, or more than 150 rpm
(d) IAC flow rate learning value	1.3 L/sec. or less, or 8.5 L/sec. or more

ES

INSPECTION PROCEDURE

HINT:

- The following conditions may also cause DTC P0505 to be set:
  (a) The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.
  (b) The accelerator pedal being not fully released.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

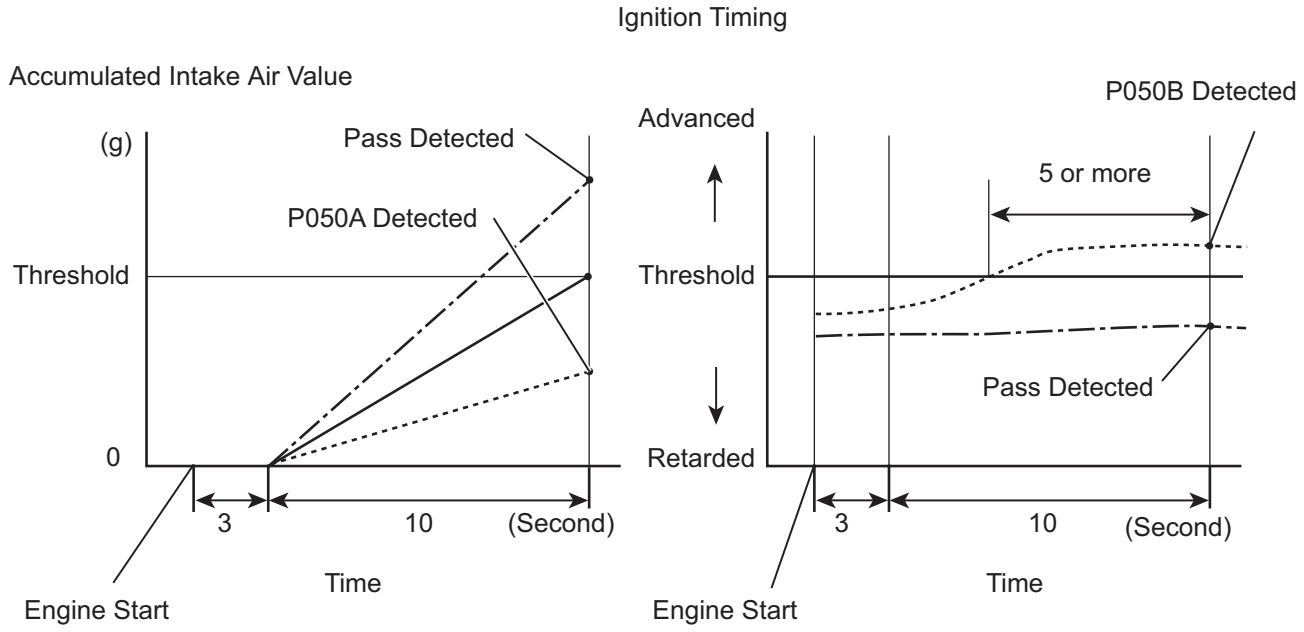
REPLACE ECM

DTC	P050A	Cold Start Idle Air Control System Performance

DTC	P050B	Cold Start Ignition Timing Performance



DESCRIPTION

The Electronic Throttle Control System (ETCS) controls the engine idling speed. The ETCS operates the throttle actuator to open and close the throttle valve, and adjusts the intake air amount to achieve the target idling speed.
In addition, the ECM retards the ignition timing and the ETCS increases the intake air amount to quickly increase the catalyst temperature at cold start to reduce emissions.

DTC No.	DTC Detection Condition	Trouble Area
P050A	Accumulated intake air amount during 10 seconds of idling after cold start is less than threshold (2 trip detection logic)	• Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • VVT system • Air cleaner filter element • ECM
P050B	Ignition timing retard value insufficient for 5 seconds or more during 10 seconds of P050A monitoring duration at cold start (2 trip detection logic)	• Throttle body assembly • Mass air flow meter • Air induction system • PCV hose connections • VVT system • Air cleaner filter element • ECM

ES

MONITOR DESCRIPTION

The ECM monitors the intake air amount during idling and the ignition timing.
When the Engine Coolant Temperature (ECT) is between -10°C and 50 °C (14°F and 122°F), the ECM calculates the idling intake air amount for 10 seconds, beginning 3 seconds after the engine starts.
When the accumulated value is below the threshold, the ECM interprets this as a malfunction in the Idle Speed Control (ISC) system at cold start.
The ECM also monitors the ignition timing at cold start, and judges it to be incorrect when it is advanced to the same value for a warm engine for 5 seconds or more of the 10 second monitoring period.
Example:
P050A is detected when all conditions below are met (2 trip detection logic).
1. The ECT is between -10°C and 50 °C (14°F and 122°F) when the engine starts.
2. The engine idles for 13 seconds after engine start.
3. The accumulated intake air amount is below the threshold.

The ECM sets the DTC and illuminates the MIL 13 seconds after the engine is next started.

NOTICE:

When the negative battery terminal is disconnected during inspection or repairs, the ISC learning values are cleared. The ISC learning must be performed by warming up the engine and idling for 5 minutes with the ECT at 75°C (167°F) or more because DTCs cannot be detected with the ISC learning values cleared.

ES

MONITOR STRATEGY

Related DTCs	P050A: Idle speed control problem at cold P050B: Idle ignition timing problem at cold
Required Sensors/Components (Main)	Mass air flow meter
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Throttle position sensor, Vehicle speed sensor
Frequency of Operation	Once per driving cycle
Duration	10 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

P050A:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10 to 50°C (14 to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 3 km/h (1.875 mph)
Time after shift position changed (A/T)	1 second or more
Atmospheric pressure	76 kPa (570 mmHg) or more

P050B:

Battery voltage	8 V or more
Time after engine start	3 seconds or more
Starter	OFF
ECT at engine start	-10°C (14°F) or more
ECT	-10 to 50°C (14 to 122°F)
Engine idling time	3 seconds or more
Fuel-cut	OFF
Vehicle speed	Less than 3 km/h (1.875 mph)

TYPICAL MALFUNCTION THRESHOLDS

P050A:

Accumulated air flow amount (A/T)	Varies with ECT (Example: Less than 20 g)

P050B:

Accumulated time when ignition timing retard is cut off	5 seconds or more

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

ES

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P050A AND/OR P050B)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read the DTCs.

Result

Display (DTC Output)	Proceed to
P050A and/or P050B	A
P050A and/or P050B and other DTCs	B

HINT:
If any DTCs other than P050A and P050B are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	READ VALUE USING INTELLIGENT TESTER (FUEL TRIM)

HINT:
Calculate the total fuel trim values to check the characteristic deviation of the mass air flow meter.
(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / SHORT FT #1 and LONG FT #1.
(e) Read the values displayed on the tester.
(f) Add together the SHORT FT #1 and LONG FT #1 values to obtain the total FUEL TRIM.
OK:
Total of SHORT FT #1 and LONG FT #1 values is between -20% and 20%.

OK → Go to step 12

NG

3	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VVT CTRL B1.
(e) Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 8

OK

4	CHECK PCV HOSE CONNECTIONS

OK:
PCV hose is connected correctly and is not damaged.

NG → Go to step 9

OK

5	CHECK AIR INDUCTION SYSTEM

(a) Check the air induction system for vacuum leakage.
OK:
No leakage from air induction system.

NG → Go to step 10

OK

6	CHECK AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

(a) Visually check that the air cleaner filter element is not excessively contaminated with dirt or oil.
OK:
Air cleaner filter element is not excessively contaminated with dirt or oil.

NG → Go to step 11

OK

7	REPLACE MASS AIR FLOW METER

NEXT → Go to step 15

8	CHECK AND REPAIR VVT SYSTEM

NEXT → Go to step 15

ES

9	REPAIR OR REPLACE PCV HOSE

NEXT → Go to step 15

10	REPAIR OR REPLACE AIR INDUCTION SYSTEM

NEXT → Go to step 15

11	REPLACE AIR CLEANER FILTER ELEMENT SUB-ASSEMBLY

NEXT → Go to step 15

12	CHECK THROTTLE VALVE

(a) Check for deposits around the throttle valve and throttle valve condition.

OK:

No deposits around throttle valve and throttle valve moves smoothly.

NG → Go to step 14

OK

13	REPLACE ECM

NEXT → Go to step 15

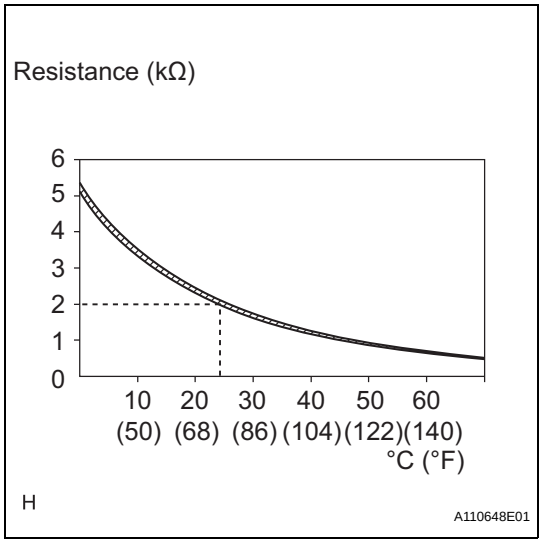
14	REPAIR OR REPLACE THROTTLE BODY ASSEMBLY

NEXT → Go to step 15

15	CHECK WHETHER DTC OUTPUT RECURS (DTC P050A AND/OR P050B)

NOTICE:
In this operation, the engine must be cold (the same level as the engine coolant temperature recorded in the freeze frame data).

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Switch the ECM from normal mode to check mode using the tester (see page ES-42).
(f) Start the engine and idle it for a minute.
OK:
Stable, fast idling.
(g) Read DTCs.
OK:
No DTC output.



NEXT

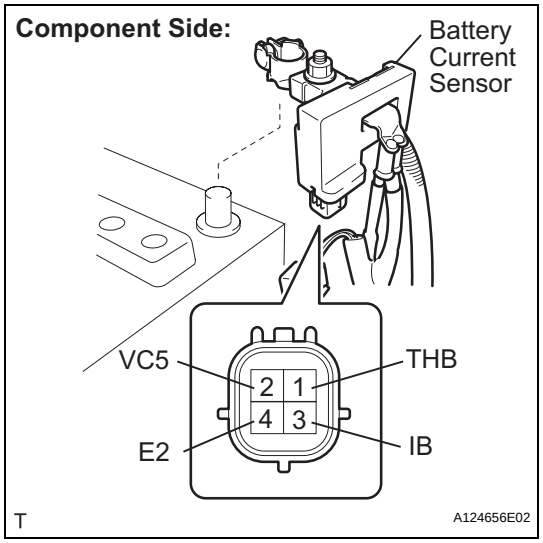
END

DTC	P0516	Battery Temperature Sensor Circuit Low

DTC	P0517	Battery Temperature Sensor Circuit High

DESCRIPTION

The battery temperature sensor installed on the battery current sensor detects battery temperature.
A thermistor is integrated into the battery temperature sensor, and the resistance in the battery temperature sensor changes according to the battery temperature.
The resistance of the thermistor in the battery temperature sensor decreases as the battery temperature increases. The resistance increases as the temperature decreases.
The battery temperature sensor is connected to the ECM. The ECM supplies 5 V from the THB terminal to the battery temperature sensor through resistor R.
The battery temperature sensor and resistor R are connected in series. This results in fluctuations in the voltage supplied from the THB terminal when the resistance changes according to the battery temperature.
The ECM determines the battery temperature according to fluctuations in voltage. When the battery temperature is high, the ECM determines to reduce the amount of current supplied from the generator in order to protect the battery.



DTC No.	DTC Detection Condition	Trouble Area
P0516	Battery temperature sensor output value is 0.2 V or less for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Battery current sensor • Short in battery temperature sensor circuit • ECM
P0517	Battery temperature sensor output value is 4.8 V or more for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Battery current sensor • Open in battery temperature sensor circuit • ECM

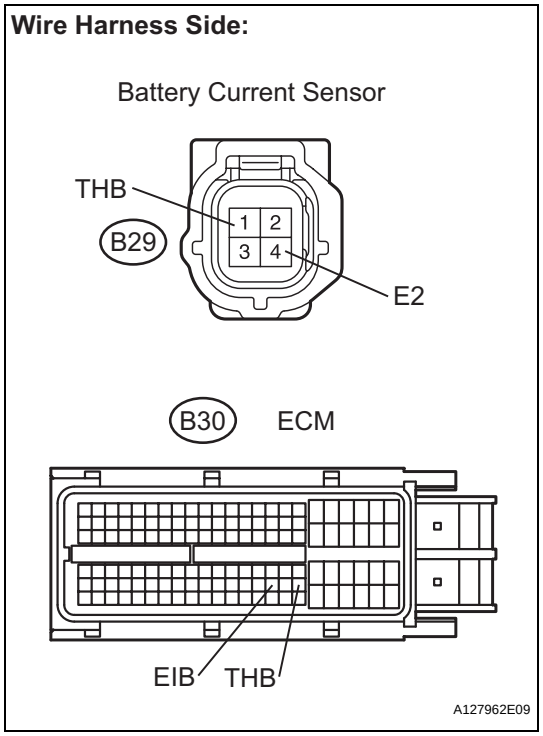
WIRING DIAGRAM

Refer to DTC P1550 (see page ES-304).

INSPECTION PROCEDURE

1 INSPECT BATTERY CURRENT SENSOR

(a) Disconnect the B29 battery current sensor connector.
(b) Measure the resistance.



Standard resistance

Tester Connection	Condition	Specified Condition
1 (THB) - 4 (E2)	24 to 26°C (75.2 to 78.8°F)	1.91 to 2.065 kΩ

NG → **REPLACE BATTERY CURRENT SENSOR**

OK

2 CHECK WIRE HARNESS (BATTERY CURRENT SENSOR - ECM)

(a) Disconnect the B29 battery current sensor connector.
(b) Disconnect the B30 ECM connectors.
(c) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
B29-1 (THB) - B30-103 (THB)	Below 1 Ω
B29-4 (E2) - B30-101 (EIB)	Below 1 Ω
B29-1 (THB) or B30-103 (THB) - Body ground	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

ES

DTC	P0560	System Voltage

DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is in the OFF position. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and sets the DTC.

DTC No.	DTC Detection Condition	Trouble Area
P0560	Open in ECM back up power source circuit (1 trip detection logic)	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

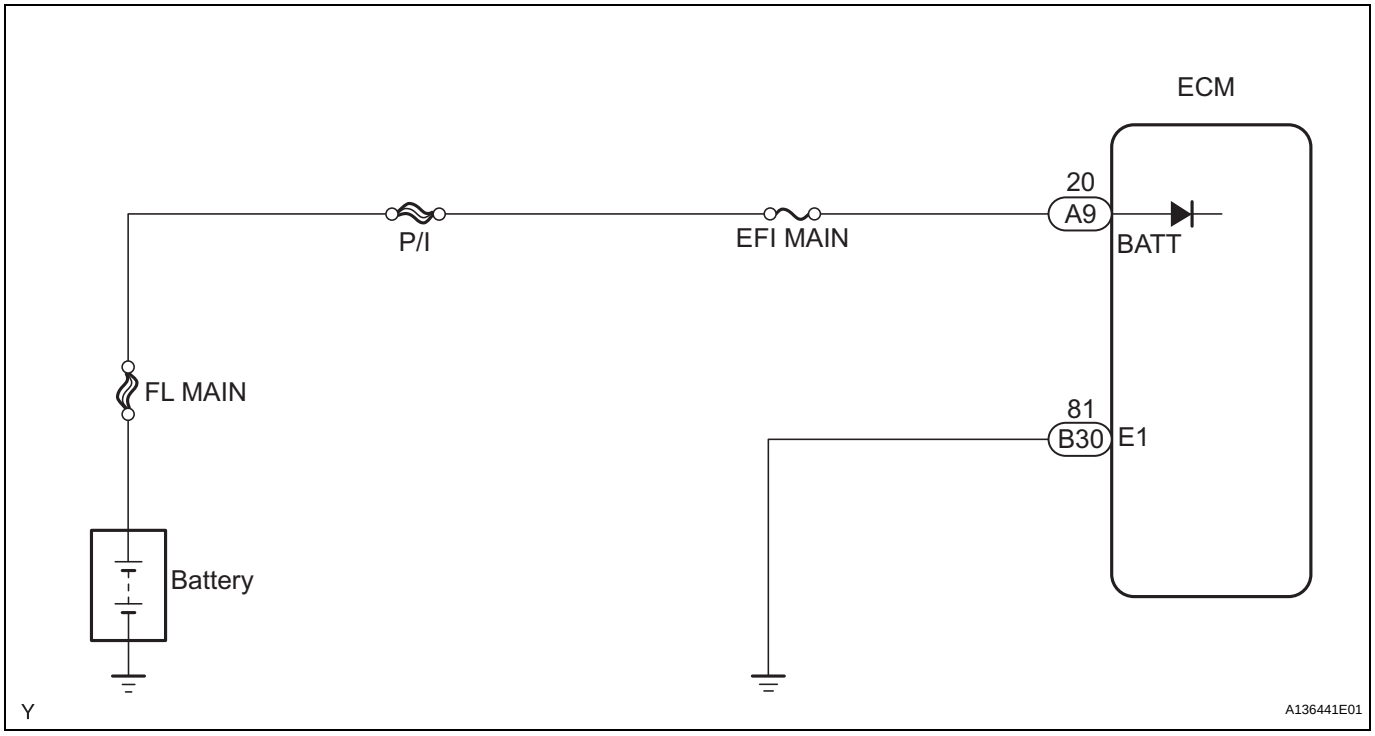
ES

HINT:

If DTC P0560 is set, the ECM does not store other DTCs or the data stored in the ECM are partly erased.

MONITOR STRATEGY

Related DTCs	P0560: ECM system voltage
Required Sensors/Components (Main)	ECM
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	3 seconds
MIL Operation	Immediate (MIL illuminated after next engine start)
Sequence of Operation	None



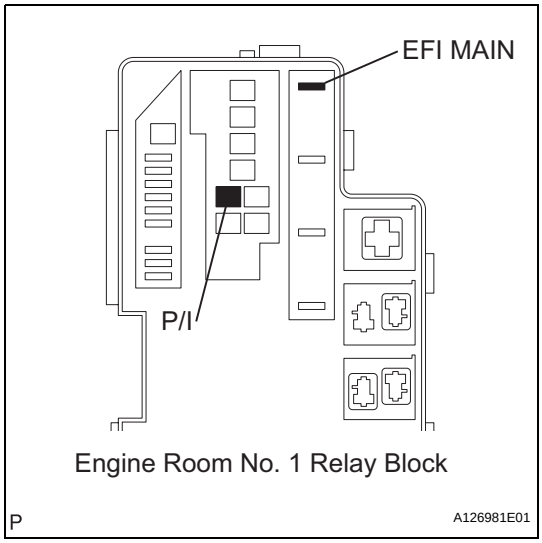
TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM power source	Less than 3.5 V

WIRING DIAGRAM



ES

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

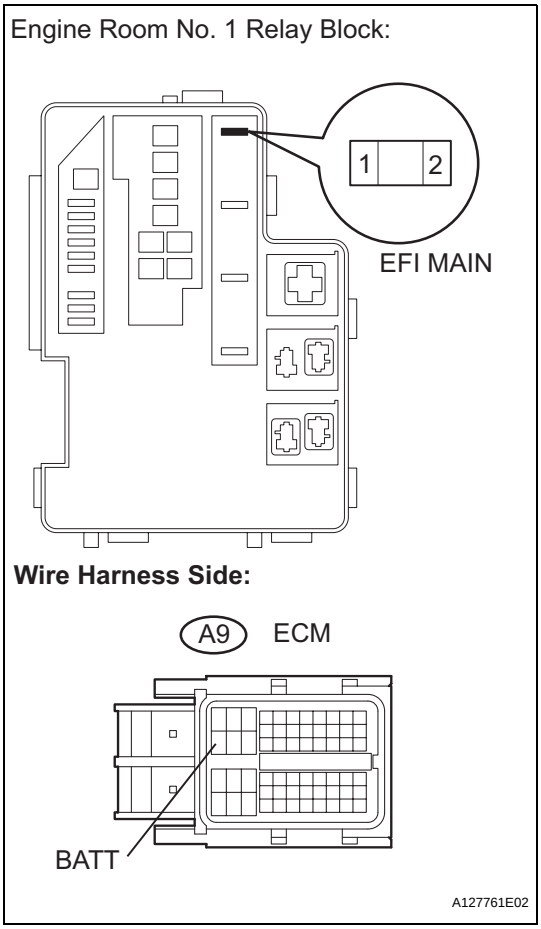
1	CHECK FUSE (EFI MAIN AND P/I)

Engine Room No. 1 Relay Block

(a) Remove the EFI MAIN fuse and P/I fuse from the engine room No. 1 relay block.

(b) Measure the resistance of the EFI MAIN fuse and P/I fuse.

Standard resistance:



Below 1 Ω

(c) Reinstall the EFI MAIN fuse and P/I fuse.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

2	CHECK WIRE HARNESS (ECM - EFI MAIN FUSE, EFI MAIN FUSE - BATTERY)

(a) Check the harness and the connector between the EFI MAIN fuse and ECM.
  (1) Remove the EFI MAIN fuse from the engine No. 1 room relay block.
  (2) Disconnect the A9 ECM connector.
  (3) Measure the resistance.
  Standard resistance

Tester Connection	Specified Condition
EFI MAIN fuse terminal 2 - A9-20 (BATT)	Below 1 Ω
EFI MAIN fuse terminal 2 or A9-20 (BATT) - Body ground	10 kΩ or higher

  (4) Reconnect the ECM connector.
  (5) Reinstall the EFI MAIN fuse.

(b) Check the harness and the connector between the EFI MAIN fuse and battery.
  (1) Remove the EFI MAIN fuse from the engine room No. 1 relay block.
  (2) Disconnect the positive battery terminal.
  (3) Measure the resistance.
  Standard resistance

Tester Connection	Specified Condition
Battery positive terminal - EFI MAIN fuse terminal 1	Below 1 Ω
Battery positive terminal or EFI MAIN fuse terminal 1- Body ground	10 kΩ or higher

  (4) Reconnect the positive battery terminal.
  (5) Reinstall the EFI MAIN fuse.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK ↓

3	INSPECT BATTERY

(a) Check that the battery is not depleted.
OK:
Battery is not depleted

NG → **REPLACE BATTERY**

OK ↓

4	CHECK BATTERY TERMINAL

(a) Check that the battery terminals are not loose or corroded.

OK:
Battery terminals are not loose or corroded

NG → **REPAIR OR REPLACE BATTERY TERMINAL**

OK ↓

5	CHECK WHETHER DTC OUTPUT RECURS

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Turn the ignition switch OFF and turn the tester OFF.
(e) Start the engine and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

REPLACE ECM

DTC	P0604	Internal Control Module Random Access Memory (RAM) Error

DTC	P0606	ECM / PCM Processor

DTC	P0607	Control Module Performance

DTC	P0657	Actuator Supply Voltage Circuit / Open

DESCRIPTION

ES

The ECM continuously monitors its own internal memory status, internal circuits, and output signals transmitted to the throttle actuator. This self-check ensures that the ECM is functioning properly. If any malfunction is detected, the ECM sets the appropriate DTC and illuminates the MIL.
The ECM memory status is diagnosed by internal mirroring of the main CPU and the sub CPU to detect Random Access Memory (RAM) errors. The two CPUs also perform continuous mutual monitoring. The ECM illuminates the MIL and sets a DTC if: 1) outputs from the two CPUs are different or deviate from the standards, 2) the signals sent to the throttle actuator deviate from the standards, 3) a malfunction is found in the throttle actuator supply voltage, and 4) any other ECM malfunction is found.

Duration	Within 60 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

TYPICAL MALFUNCTION THRESHOLDS

ECM RAM errors (P0604):

RAM mirror check	Fail

ECM CPU range check (P0606):

Either of following conditions met:	-
Difference between throttle valve position of main CPU and throttle valve position of sub CPU	0.3 V or more
Difference between accelerator pedal position of main CPU and accelerator pedal position of sub CPU	0.3 V or more

ECM CPU malfunction (P0607):

Either A or B met	-
A. All of following conditions (a), (b) and (c) met	-
(a) CPU reset	1 time or more
(b) Learned TP - learned APP	0.4 V or more
(c) Electronic throttle actuator	OFF
B. CPU reset	2 times or more

ETCS power supply (P0657):

ETCS power supply when ignition switch turned ON	7 V or more

INSPECTION PROCEDURE

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

REPLACE ECM

DTC	P0617	Starter Relay Circuit High

DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and sets the DTC.
This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.

DTC No.	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) met, positive (+B) battery voltage 10.5 V or more applied to ECM for 20 seconds (1 trip detection logic) (a) Vehicle speed 20 km/h (12.4 mph) or more (b) Engine speed 1,000 rpm or more (c) STA signal ON	• Park/Neutral Position (PNP) switch • Starter relay circuit • Ignition switch • ECM

ES

MONITOR STRATEGY

Related DTCs	P0617: Starter signal

Vehicle speed	20 km/h (12.43 mph) or more
Engine speed	1,000 rpm or more

TYPICAL MALFUNCTION THRESHOLDS

Starter signal	ON

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

HINT:

- The following troubleshooting flowchart is based on the premise that the engine is cranked normally. If the engine will not crank, proceed to the problem symptoms table (see page ES-27).
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

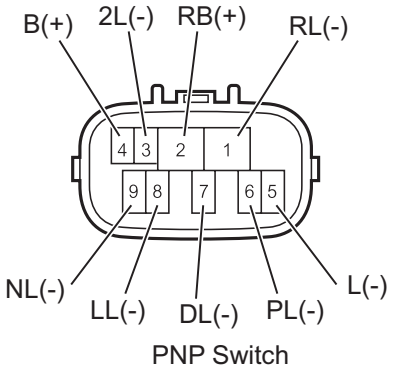
1	**READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.

(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.

OK

Ignition Switch Position	STARTER SIG
ON	OFF
START	ON



OK → **CHECK FOR INTERMITTENT PROBLEMS**

NG

ES

2 INSPECT PARK/NEUTRAL POSITION SWITCH ASSEMBLY

Component Side:

(a) Disconnect the B26 PNP switch connector.
(b) Measure the resistance when the transmission gear selector lever is moved to each position.

Standard resistance

Gear Selector Lever Position	Tester Connection	Specified Condition
P	2 (RB) - 6 (PL), 4 (B) - 5 (L)	Below 1 Ω
R	1 (RL) - 2 (RB)	Below 1 Ω
N	2 (RB) - 9 (NL), 4 (B) - 5 (L)	Below 1 Ω
D	2 (RB) - 7 (DL)	Below 1 Ω
2	2 (RB) - 3 (2L)	Below 1 Ω
L	2 (RB) - 8 (LL)	Below 1 Ω

(c) Reconnect the PNP switch connector.

OK → **Go to step 5**

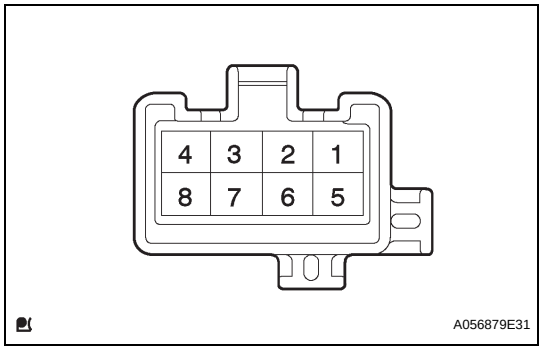
NG

3 REPLACE PARK/NEUTRAL POSITION SWITCH ASSEMBLY

NEXT

4 READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the value displayed on the tester when the ignition switch is turned to the ON and START positions.



OK

Ignition Switch Position	STARTER SIG
ON	OFF
START	ON

OK → SYSTEM OK

DTC	P0724	Brake Switch "B" Circuit High

DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling while driving in the lock-up condition when the brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

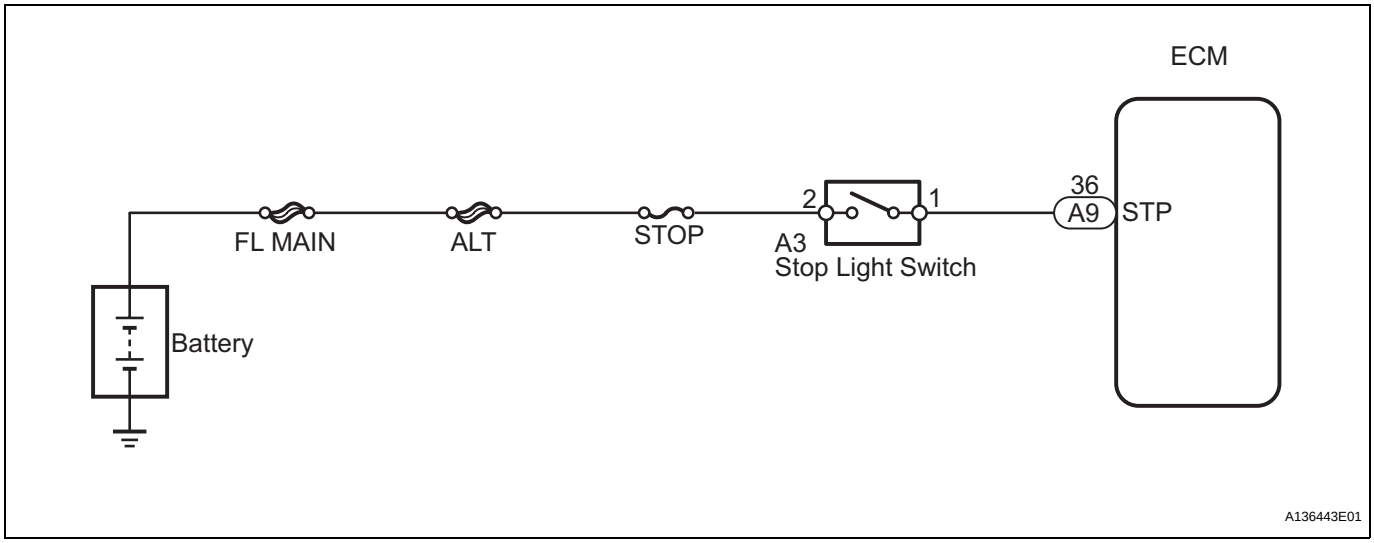
DTC No.	DTC Detection Condition	Trouble Area
P0724	Stop light switch remains ON even when vehicle is driven in GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) pattern 5 times (2 trip detection logic)	• Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains ON. When the stop light switch remains ON during GO and STOP driving, the ECM interprets this as a fault in the stop light switch. Then the MIL illuminates and the ECM stores the DTC. The vehicle must GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) 5 times for 2 driving cycles in order for the DTC to be output.

MONITOR STRATEGY

Related DTCs	P0724: Stop light switch/Range check/Rationality
Required sensors/Components	Stop light switch, Vehicle speed sensor
Frequency of operation	Continuous
Duration	GO and STOP 5 times
MIL operation	2 driving cycles
Sequence of operation	None



TYPICAL ENABLING CONDITIONS

The monitor will run whenever this DTC is not present.	None
Battery voltage	8 V or more
Starter	OFF
Ignition switch	ON
GO (Vehicle speed is 30 km/h (18.63 mph) or more)	Once
STOP (Vehicle speed is less than 3 km/h (1.86 mph))	Once

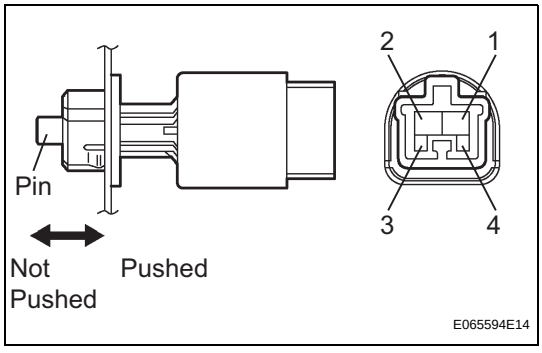
Brake switch	Stuck ON

WIRING DIAGRAM

ES



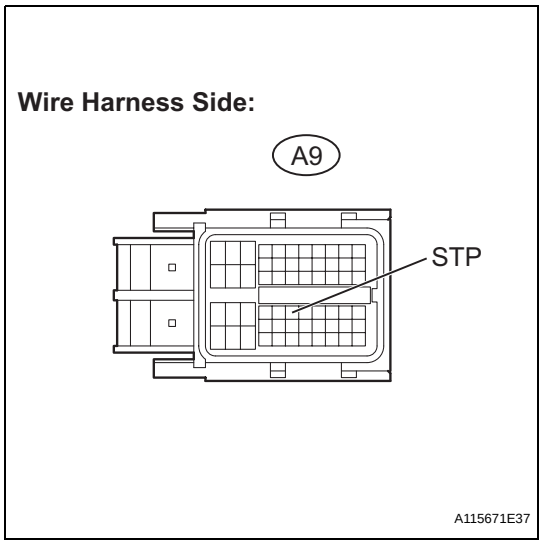
INSPECTION PROCEDURE

HINT:
Using the intelligent tester's DATA LIST allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the DATA LIST early in troubleshooting is one way to save time.
NOTICE:
In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

1. Warm up the engine.
2. Turn the ignition switch OFF.
3. Connect the intelligent tester to the CAN VIM. Then connect the CAN VIM to the DLC3.
4. Turn the ignition switch ON.
5. Turn the intelligent tester ON.
6. Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST.
7. Follow the instructions on the tester and read the DATA LIST.

Item	Measurement Item/ Range (Display)	Normal Condition	Diagnostic Note
STOP LIGHT SW	Stop light switch status/ ON or OFF	• Brake pedal is depressed: ON • Brake pedal is released: OFF	-

1	INSPECT STOP LIGHT SWITCH



(a) Remove the A3 stop light switch.
(b) Measure the resistance of the switch.
Standard resistance

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pin pushed (pedal released)	Below 1 Ω
1 - 2	Pin not pushed (pedal depressed)	10 kΩ or higher
3 - 4	Pin pushed (pedal released)	10 kΩ or higher
3 - 4	Pin not pushed (pedal depressed)	Below 1 Ω

NG → REPLACE STOP LIGHT SWITCH

OK

2 CHECK WIRE HARNESS (ECM - BATTERY)

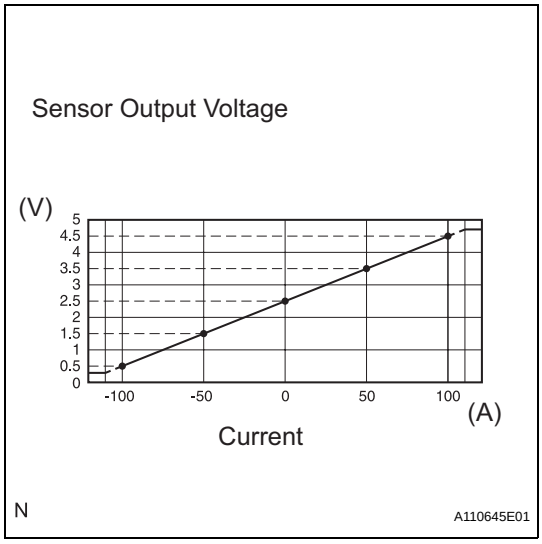
(a) Measure the voltage of the wire harness side connector.
Standard voltage

Tester Connection	Condition	Specified Condition
A9-36 (STP) - Body ground	Brake pedal is depressed	10 to 14 V
A9-36 (STP) - Body ground	Brake pedal is released	Below 1 V

NG → REPAIR OR REPLACE HARNESS AND CONNECTOR

OK

REPLACE ECM

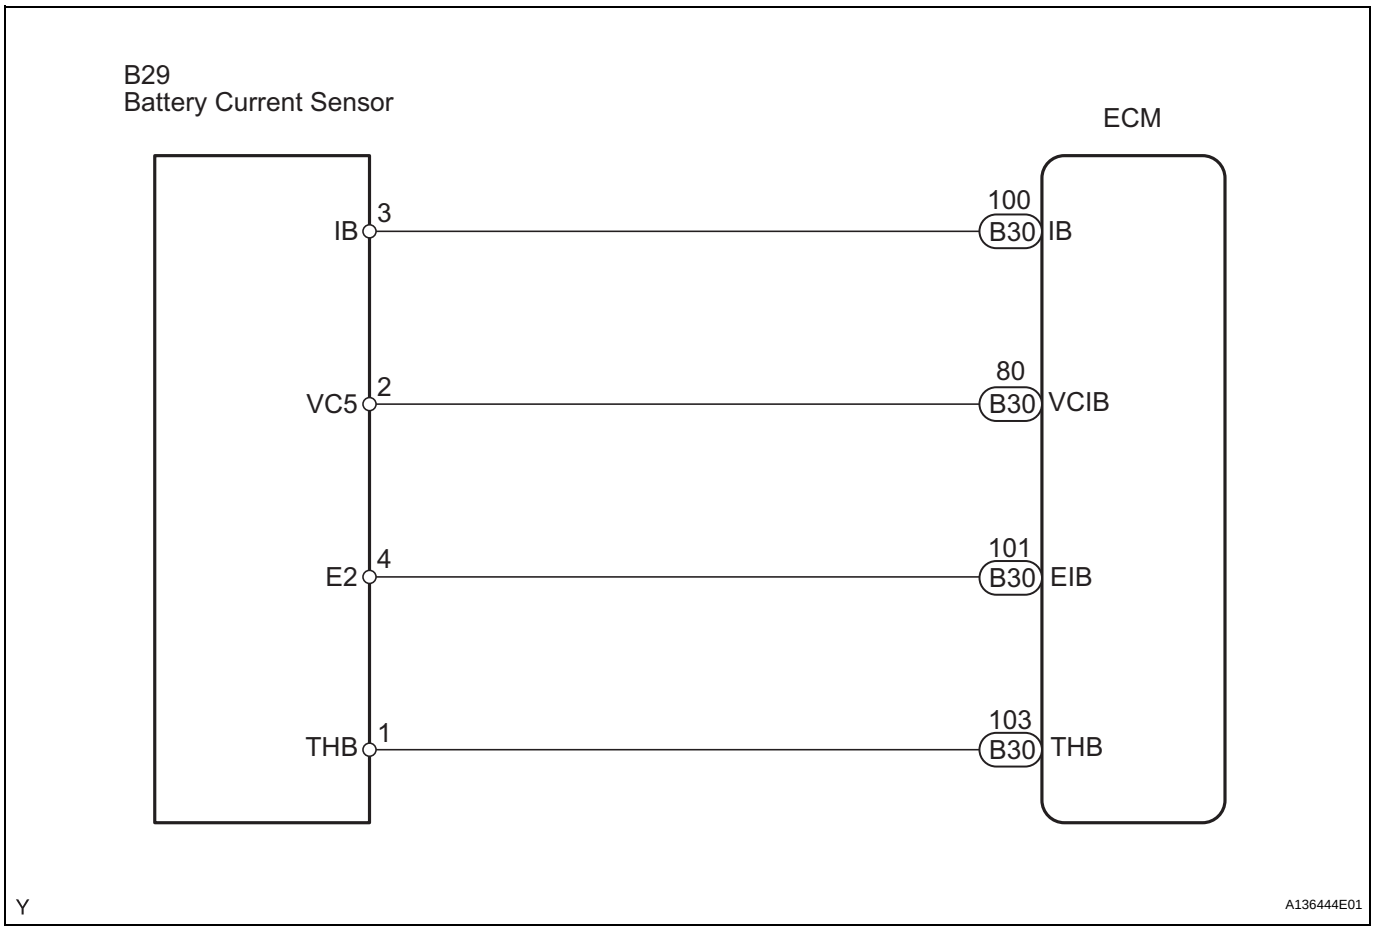


ES

DTC	P1550	Battery Current Sensor Circuit

DTC	P1551	Battery Current Sensor Circuit Low

DTC	P1552	Battery Current Sensor Circuit High

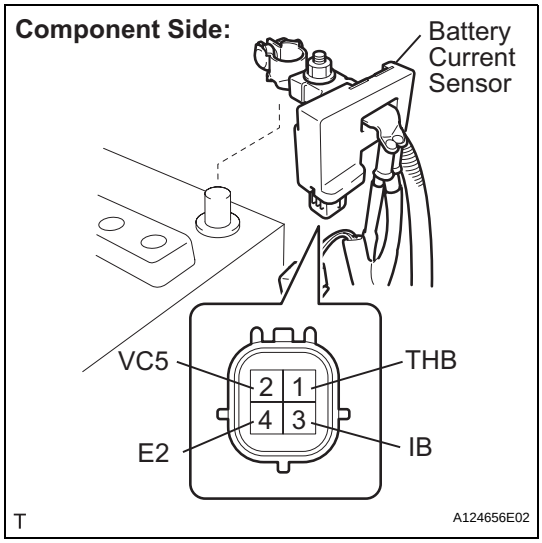


DESCRIPTION

The battery current sensor installed on the positive (+) battery terminal detects the amount of current supplied from the generator.
The battery current sensor changes current to voltage (at the positive (+) battery terminal) and sends it to the ECM. The ECM controls the voltage of the generator based on the signals from the battery current sensor.

DTC No.	DTC Detection Condition	Trouble Area
P1550	The following condition continues for 10 seconds or more with the ignition switch ON (1 trip detection logic): • Difference between the maximum and minimum current values of the battery current sensor is 1 A or less	• Open or short in battery current sensor circuit • Battery current sensor assembly • ECM
P1551	Battery current sensor output value is 0.2 V or less for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Short in battery current sensor circuit • Battery current sensor assembly • ECM
P1552	Battery current sensor output value is 4.8 V or more for 0.5 seconds or more with the ignition switch ON (1 trip detection logic)	• Open in battery current sensor circuit • Battery current sensor assembly • ECM

WIRING DIAGRAM



ES

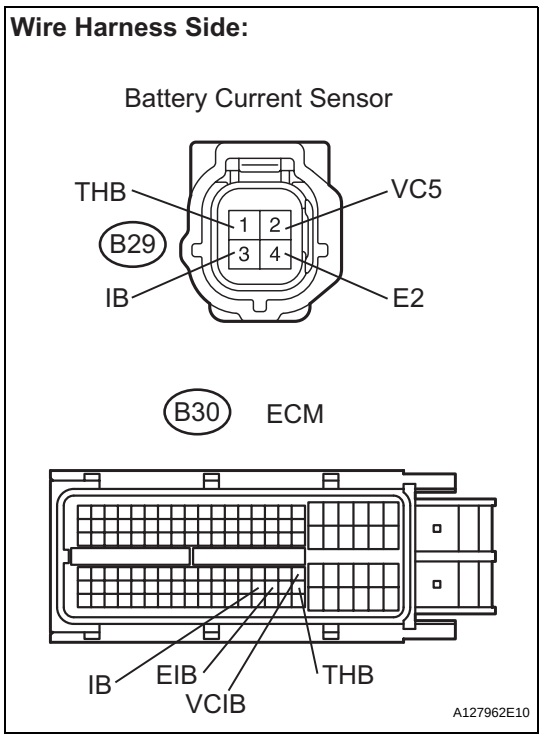
INSPECTION PROCEDURE

HINT:

- If DTCs related to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 INSPECT BATTERY CURRENT SENSOR ASSEMBLY

(a) Disconnect the B29 battery current sensor connector.
(b) Measure the resistance of the battery current sensor.
Standard resistance



Tester Connection	Specified Condition
2 (VC5) - 4 (E2)	3 to 10 kΩ
2 (VC5) - 3 (IB)	Below 0.5 kΩ
3 (IB) - 4 (E2)	3 to 10 kΩ

HINT:
The resistance differs according to the tester type.

NG → **REPLACE BATTERY CURRENT SENSOR ASSEMBLY**

OK

2 CHECK WIRE HARNESS (BATTERY CURRENT SENSOR - ECM)

(a) Disconnect the B29 battery current sensor connector.
(b) Disconnect the B30 ECM connectors.
(c) Measure the resistance of the wire harness side connectors.
Standard resistance

Tester Connection	Specified Condition
B29-3 (IB) - B30-100 (IB)	Below 1 Ω
B29-2 (VC5) - B30-80 (VCIB)	Below 1 Ω
B29-4 (E2) - B30-101 (EIB)	Below 1 Ω
B29-1 (THB) - B30-103 (THB)	Below 1 Ω
B29-3 (IB) or B30-100 (IB) - Body ground	10 kΩ or higher
B29-2 (VC5) or B30-80 (VCIB) - Body ground	10 kΩ or higher
B29-1 (THB) or B30-103 (THB) - Body ground	10 kΩ or higher

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

REPLACE ECM

ES

DTC	P1602	Deterioration of Battery

DESCRIPTION

The ECM determines the battery power according to the voltage of the BATT terminal while the engine is running (not cranking).

DTC No.	DTC Detection Condition	Trouble Area
P1602	Battery power is 0% (1 trip detection logic)	• Battery • ECM back-up power source circuit

INSPECTION PROCEDURE

1	INSPECT BATTERY

(a) Inspect the battery specific gravity.
  (1) Check the specific gravity of each cell.
    Standard gravity:
    1.25 to 1.29 at 20°C (68°F)

(b) Inspect the battery voltage.
  (1) After the vehicle is driven for 20 minutes, stop the engine.
  (2) Turn the ignition switch ON, and turn on the headlights, blower fan and defogger for 1 minute.
  (3) Turn the ignition switch OFF.
  (4) Measure the battery voltage.
    Standard voltage:
    9.6 V or more

NG → **REPLACE BATTERY**

OK

CHECK ECU POWER SOURCE CIRCUIT

DTC	P2102	Throttle Actuator Control Motor Circuit Low

DTC	P2103	Throttle Actuator Control Motor Circuit High

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) Throttle actuator duty ratio 80% or more (b) Throttle actuator current less than 0.5 A	• Open in throttle actuator circuit • Throttle actuator • ECM
P2103	Either of following conditions met (1 trip detection logic): • Hybrid IC diagnosis signal failure • Hybrid IC current limiter port failure	• Short in throttle actuator circuit • Throttle actuator • Throttle valve • Throttle body assembly • ECM

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and sets a DTC.
Example:
When the electrical current is less than 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and sets a DTC. If the malfunction is not repaired successfully, a DTC is set when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

MONITOR STRATEGY

Related DTCs	P2102: Throttle actuator current (low current) P2103: Throttle actuator current (high current)
Required Sensors/Components (Main)	Throttle actuator (throttle body)
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	2 seconds: P2102 0.1 seconds or 0.6 seconds: P2103
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None

P2102:

Throttle actuator	Activated
Duty-cycle ratio to open throttle actuator	80% or more

Throttle actuator power supply	8 V or more

P2103:

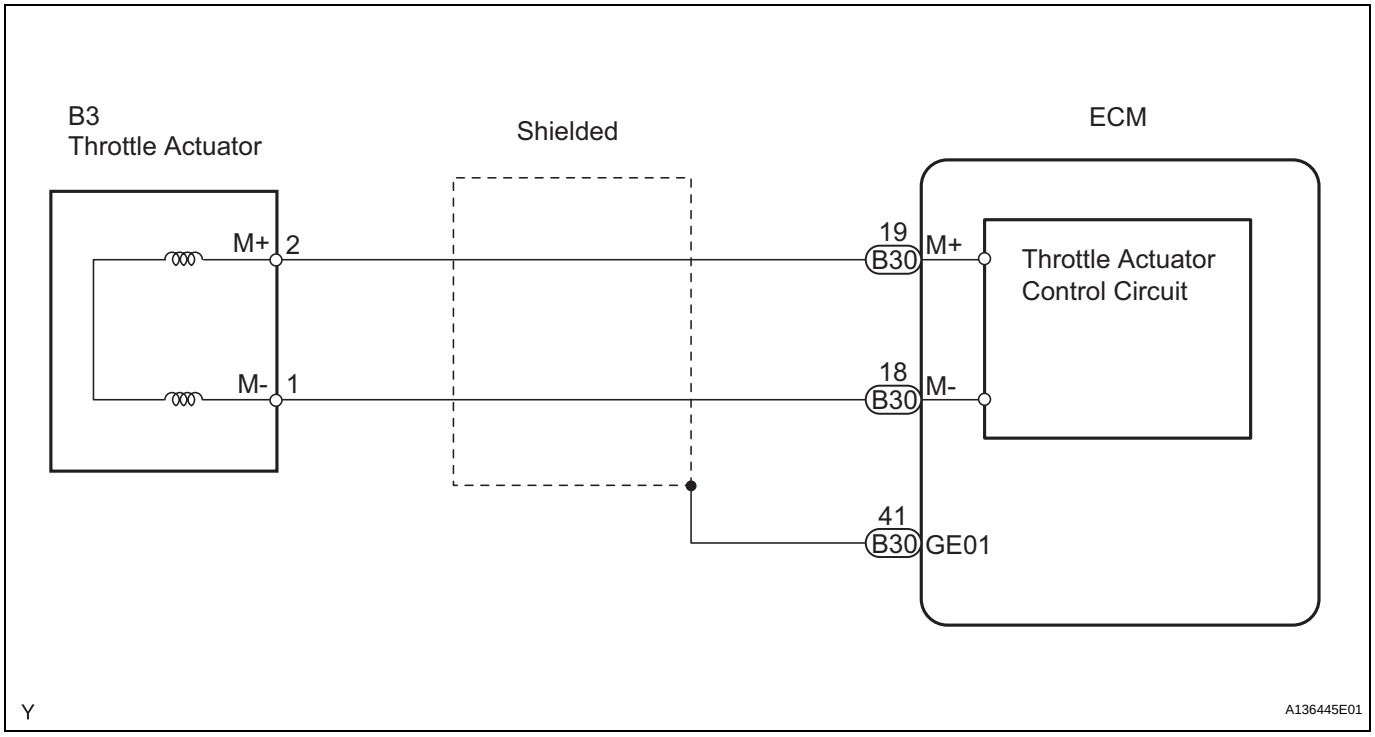
Throttle actuator	Activated
Throttle actuator power supply	8 V or more
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

P2102:

Throttle actuator current	Less than 0.5 A

P2103:



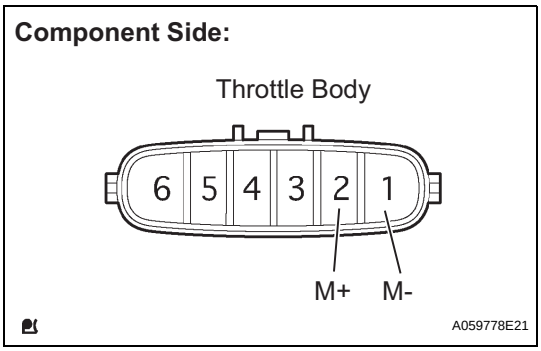
Either of the following condition is met	Condition 1 or 2
1. Hybrid IC diagnosis signal	Fail for 25 times
2. Hybrid IC current limiter port	Fail for 0.6 seconds

ES

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM



INSPECTION PROCEDURE

HINT:

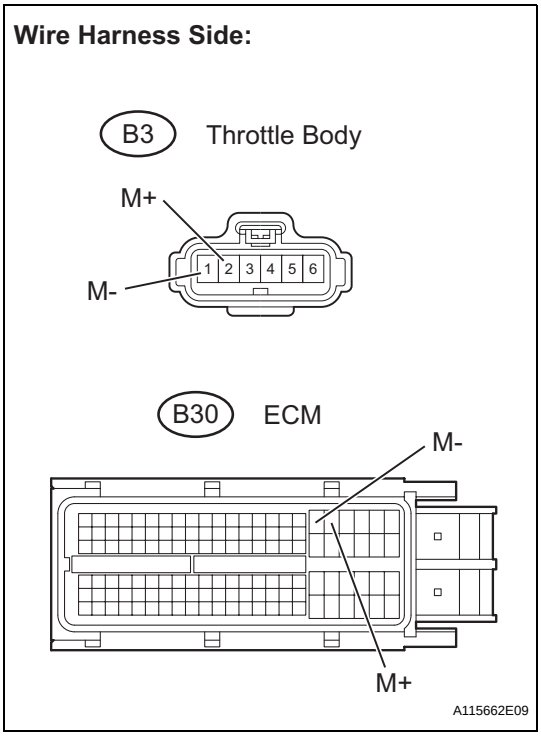
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- The throttle actuator current (THROTTLE MOT) and the throttle actuator duty ratio (THROTL OPN DUTY / THROTL CLS DUTY) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.

1 INSPECT THROTTLE BODY (RESISTANCE OF THROTTLE ACTUATOR)

Component Side:

(a) Disconnect the B3 throttle body connector.
(b) Measure the resistance of the throttle actuator.
Standard resistance

Tester Connection	Specified Condition
2 (M+) - 1 (M-)	0.3 to 100 Ω at 20°C (68°F)



(c) Reconnect the throttle body connector.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

2 CHECK WIRE HARNESS (THROTTLE ACTUATOR - ECM)

Wire Harness Side:

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the B30 ECM connector.
(c) Measure the resistance.
Standard resistance

Tester Connection	Specified Condition
B3-2 (M+) - B30-19 (M+)	Below 1 Ω
B3-1 (M-) - B30-18 (M-)	Below 1 Ω
B3-2 (M+) or B30-19 (M+) - Body ground	10 kΩ or higher
B3-1 (M-) or B30-18 (M-) - Body ground	10 kΩ or higher

(d) Reconnect the throttle body connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

3	INSPECT THROTTLE BODY ASSEMBLY

(a) Check for foreign objects between the throttle valve and the housing.
OK:
No foreign objects between throttle valve and housing.

NG → **REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY**

OK ↓

4	INSPECT THROTTLE VALVE

(a) Check if the throttle valve opens and closes smoothly.
OK:
Throttle valve opens and closes smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK ↓

REPLACE ECM

DTC	P2111	Throttle Actuator Control System - Stuck Open

DTC	P2112	Throttle Actuator Control System - Stuck Closed

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.
HINT:
This ETCS (Electronic Throttle Control System) does not use a throttle cable.

ES

DTC No.	DTC Detection Condition	Trouble Area
P2111	Throttle actuator does not close when signaled by ECM (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve
P2112	Throttle actuator does not open when signaled by ECM (1 trip detection logic)	• Throttle actuator • Throttle body assembly • Throttle valve

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and sets a DTC.
If the malfunction is not repaired successfully, a DTC is set when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2111: Throttle actuator stuck open P2112: Throttle actuator stuck closed
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

All:

Monitor runs whenever following DTCs not present	None
Throttle actuator	ON
Throttle actuator duty calculation	Executing
Throttle position sensor	Fail determined
Throttle actuator current-cut operation	Not executing
Throttle actuator power supply	4 V or higher
Throttle actuator	Fail determined

P2111 (Throttle actuator stuck open):

All of following conditions met	-
Throttle actuator current	2 A or more
Duty cycle to close throttle	80% or more

P2112 (Throttle actuator stuck closed):

All of following conditions met	-
Throttle actuator current	2 A or more
Duty cycle to open throttle	80% or more

TYPICAL MALFUNCTION THRESHOLDS

TP sensor voltage change	No change

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

Refer to DTC P2102 (see page ES-308).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P2111 or P2112	A
P2111 or P2112 and other DTCs	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

(a) Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.
OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

ES

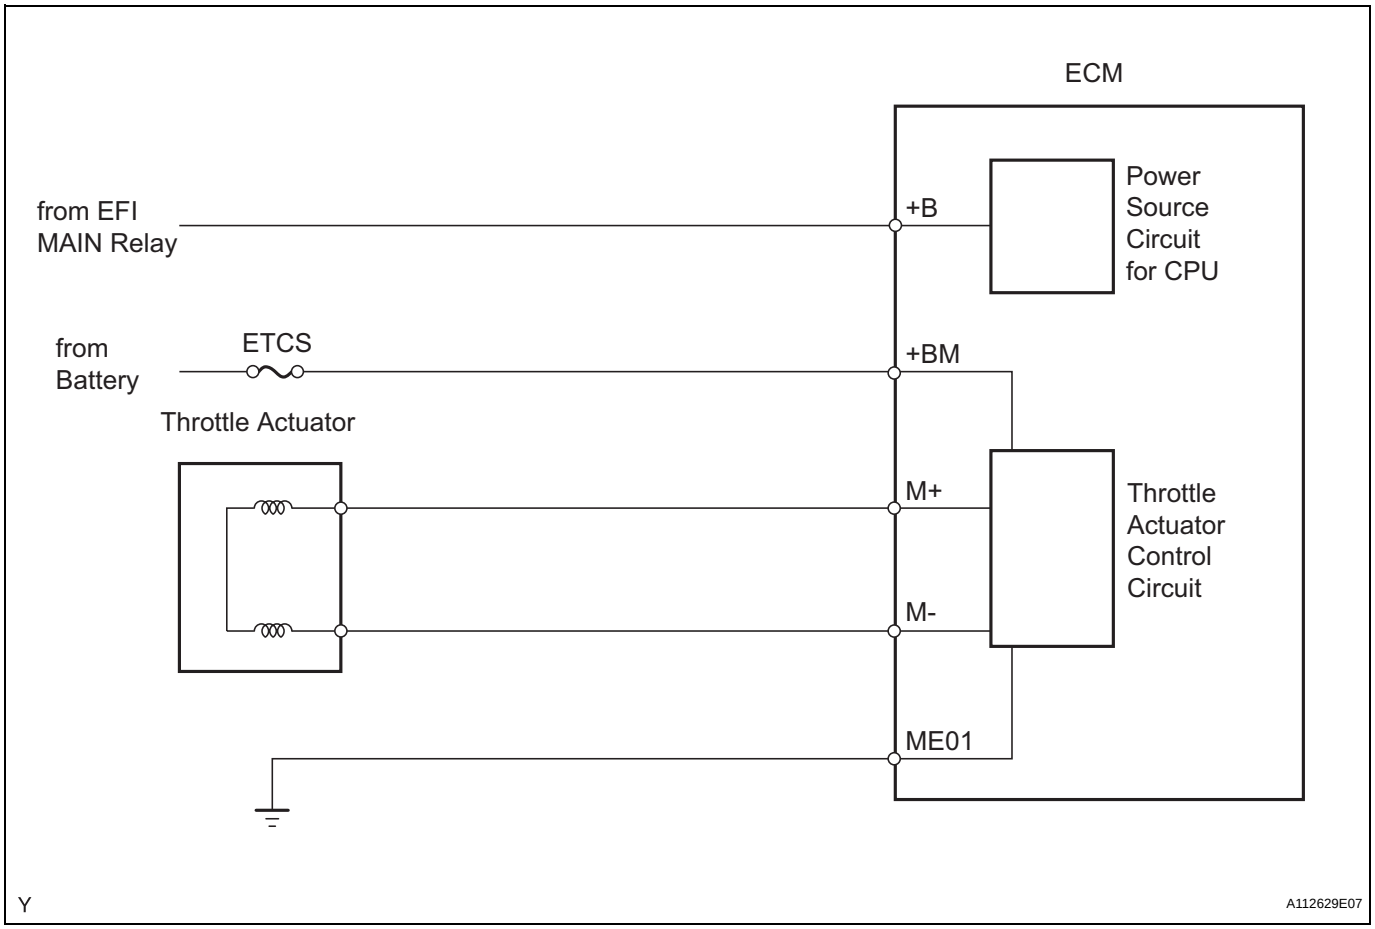
3	CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

Result

Display (DTC Output)	Proceed to
No DTC	A
P2111 or P2112	B

B → **REPLACE ECM**



A

CHECK FOR INTERMITTENT PROBLEMS

DTC	P2118	Throttle Actuator Control Motor Current Range / Performance

DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (less than 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the ignition switch OFF. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.
HINT:
The ETCS does not use a throttle cable.

DTC No.	DTC Detection Condition	Trouble Area
P2118	Open in ETCS power source (+BM) circuit (1 trip detection logic)	• Open in ETCS power source circuit • Battery • Battery terminals • ETCS fuse • ECM

MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set 5 seconds after the engine is next started.

MONITOR STRATEGY

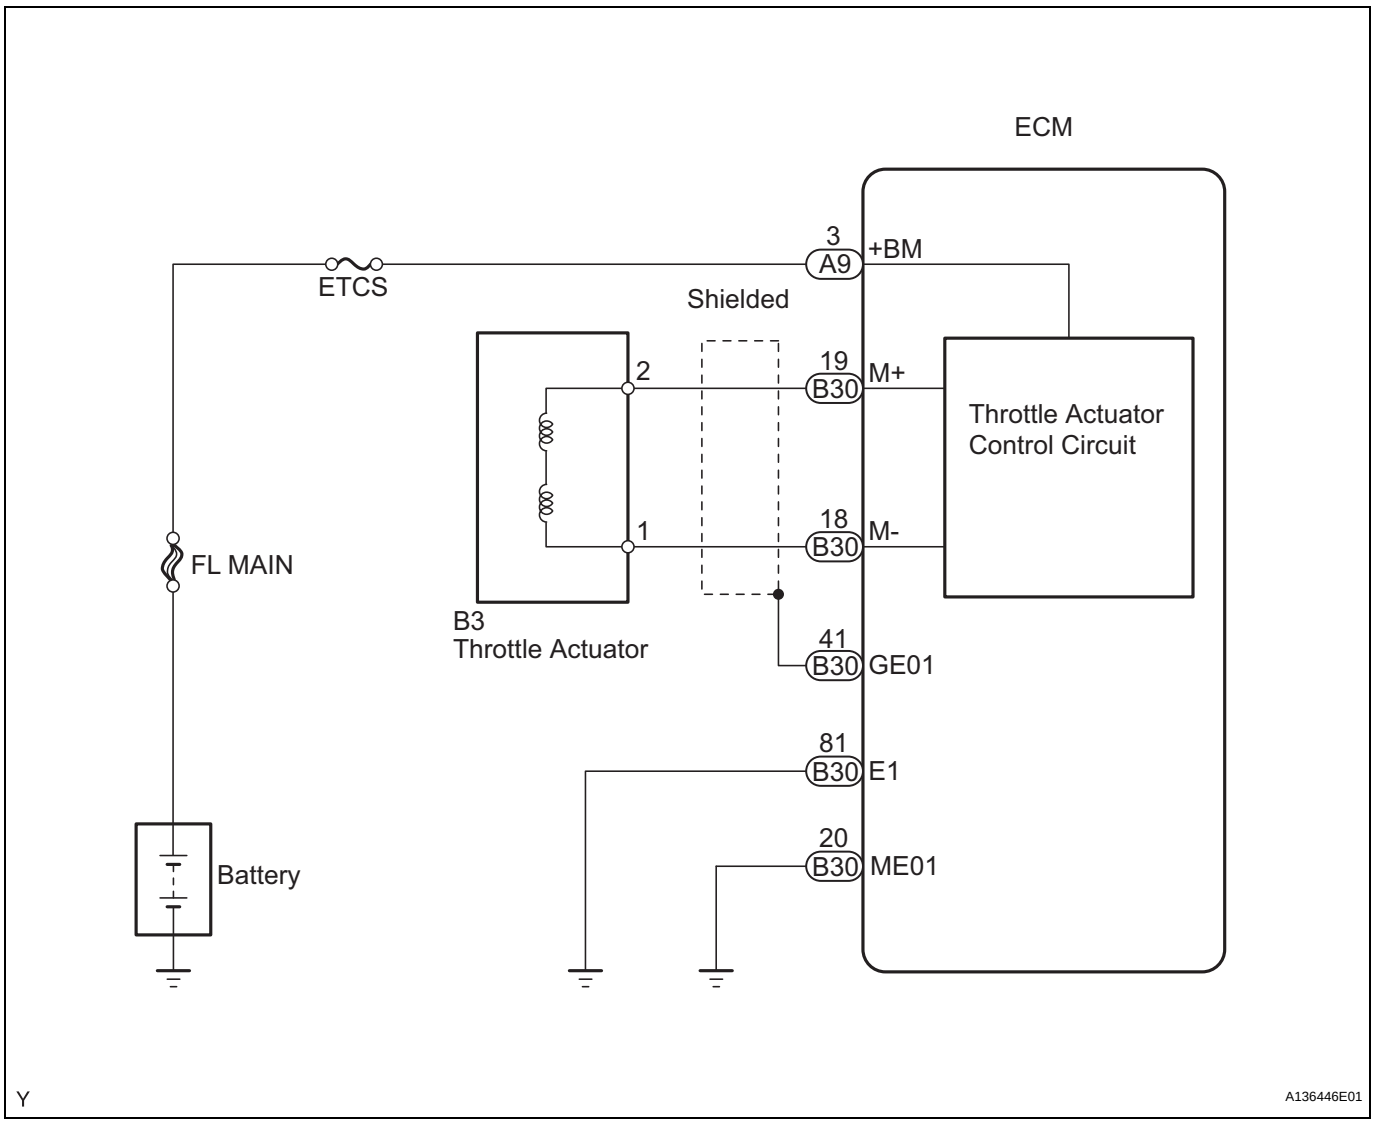
Related DTCs	P2118: Throttle actuator power supply
Required Sensors/Components (Main)	Throttle actuator, throttle valve, ETCS fuse
Required Sensors/Components (Related)	None
Frequency of Operation	Continuous
Duration	0.8 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Battery voltage	8 V or more
Electronic throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

Throttle actuator power supply voltage (+BM)	Less than 4 V



COMPONENT OPERATING RANGE

Throttle actuator power supply voltage (+BM)	9 to 14 V

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

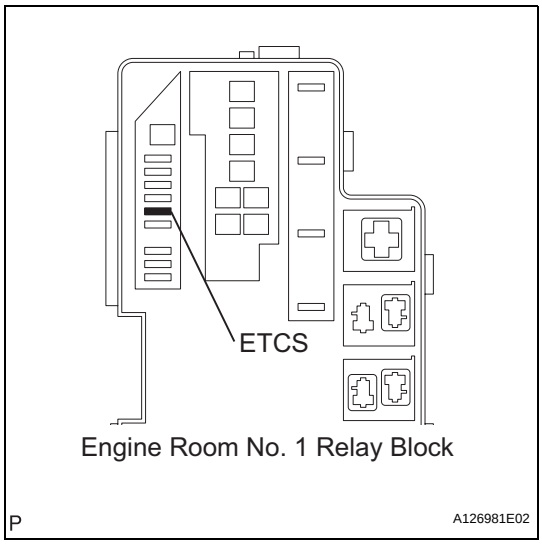
WIRING DIAGRAM

ES

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



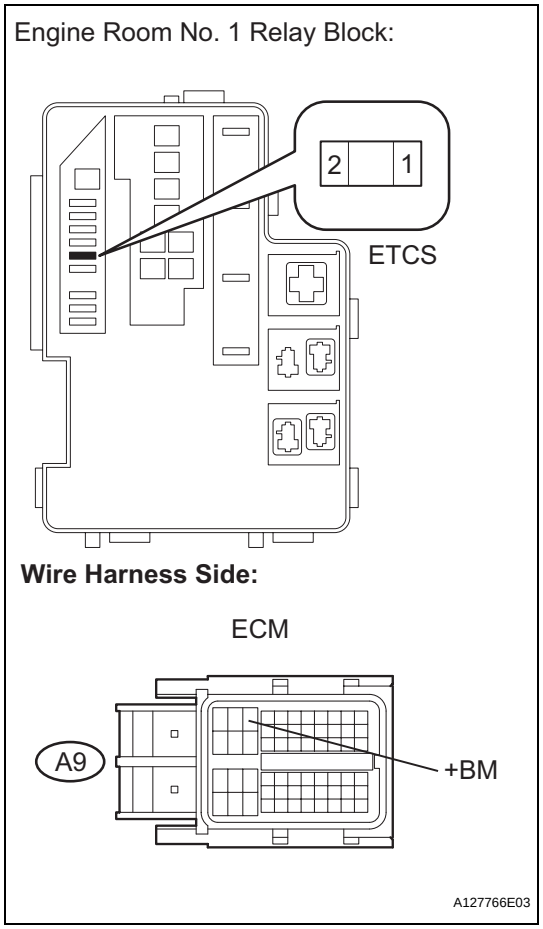
1	READ VALUE USING INTELLIGENT TESTER (+BM VOLTAGE)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / +BM VOLTAGE.
(e) Read the value displayed on the tester.
Standard voltage:
9 to 14 V

OK → Go to step 5

NG

2	CHECK FUSE (ETCS FUSE)



(a) Remove the ETCS fuse from the engine room No. 1 relay block.
(b) Measure the ETCS fuse resistance.
Standard resistance:
Below 1 Ω
(c) Reinstall the ETCS fuse.

NG → **CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

ES

3	CHECK WIRE HARNESS (ECM - ETCS FUSE, ETCS FUSE - BATTERY)

(a) Check the harness and connector between the ETCS fuse and ECM.
  (1) Remove the ETCS fuse from the engine room No. 1 relay block.
  (2) Disconnect the A9 ECM connector.
  (3) Measure the resistance.
  Standard resistance

Tester Connection	Specified Condition
ETCS fuse terminal 2 - A9-3 (+BM)	Below 1 Ω
ETCS fuse terminal 2 or A9-3 (+BM) - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the ECM connector.

(b) Check the harness and connector between the ETCS fuse and positive battery cable.
  (1) Remove the ETCS fuse from the engine room No. 1 relay block.
  (2) Disconnect the cable from the positive (+) battery terminal.
  (3) Check the resistance.
  Standard resistance

Tester Connection	Specified Condition
Positive battery cable - ETCS fuse terminal 1	Below 1 Ω
Positive battery cable or ETCS fuse terminal 1 - Body ground	10 kΩ or higher

  (4) Reinstall the ETCS fuse.
  (5) Reconnect the cable to the positive (+) battery terminal.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

ES

4	INSPECT ECM (+BM VOLTAGE)

(a) Disconnect the A9 and B30 ECM connectors.
(b) Measure the voltage between the terminals of the A9 and B30 ECM connectors.
Standard voltage

Tester Connection	Specified Condition
A9-3 (+BM) - B30-81 (E1)	9 to 14 V

(c) Reconnect the ECM connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR (TERMINAL E1 - BODY GROUND)**

OK

REPLACE ECM

5	INSPECT BATTERY

(a) Check that the battery is not depleted.
OK:
Battery is not depleted

NG → **REPLACE BATTERY**

OK

6	CHECK BATTERY TERMINAL

(a) Check that the battery terminals and ECM ground are not loose or corroded.
OK:
Battery terminals and ECM ground are not loose or corroded

NG → **REPAIR OR REPLACE BATTERY TERMINAL**

OK

CHECK FOR INTERMITTENT PROBLEMS

DTC	P2119	Throttle Actuator Control Throttle Body Range / Performance

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC No.	DTC Detection Condition	Trouble Area
P2119	Throttle valve opening angle continues to vary greatly from target opening angle (1 trip detection logic)	• ETCS • ECM

ES

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and sets the DTC.
If the malfunction is not repaired successfully, the DTC is set when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5,000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

MONITOR STRATEGY

Related DTCs	P2119: ETCS malfunction
Required Sensors/Components (Main)	Throttle actuator
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	Within 1 second
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Throttle actuator	ON
Throttle actuator duty calculation	Executing
Throttle position sensor	Fail determined
Throttle actuator current-cut operation	Not executing
Throttle actuator power supply	4 V or higher
Throttle actuator	Fail determined

TYPICAL MALFUNCTION THRESHOLDS

Either of following conditions A or B met	-
A. Difference between commanded closed throttle position and current closed throttle position	0.3 V or more for 1 second
B. Difference between commanded open throttle position and current open throttle position	0.3 V or more for 0.6 seconds

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, are set, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator off, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned OFF.

WIRING DIAGRAM

Refer to DTC P2102 (see page ES-308).

INSPECTION PROCEDURE

HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P2119	A
P2119 and other DTCs	B

HINT:
If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2	CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Allow the engine to idle for 15 seconds.
CAUTION:
Exercise extreme care and take precautions in steps (f) and (g) below. Failure to do so may result in the vehicle unexpectedly rolling away.
(f) Securely apply the parking brake and move the gear selector lever to the D position.

(g) While depressing the brake pedal securely, fully depress the accelerator pedal for 5 seconds.
(h) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(i) Read DTCs.
HINT:
The output voltage of the throttle position sensor can be checked during step (g) using the intelligent tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / THROTTLE POS #1.

OK:

No DTC output.

NG → **REPLACE THROTTLE BODY ASSEMBLY**

OK

CHECK FOR INTERMITTENT PROBLEMS

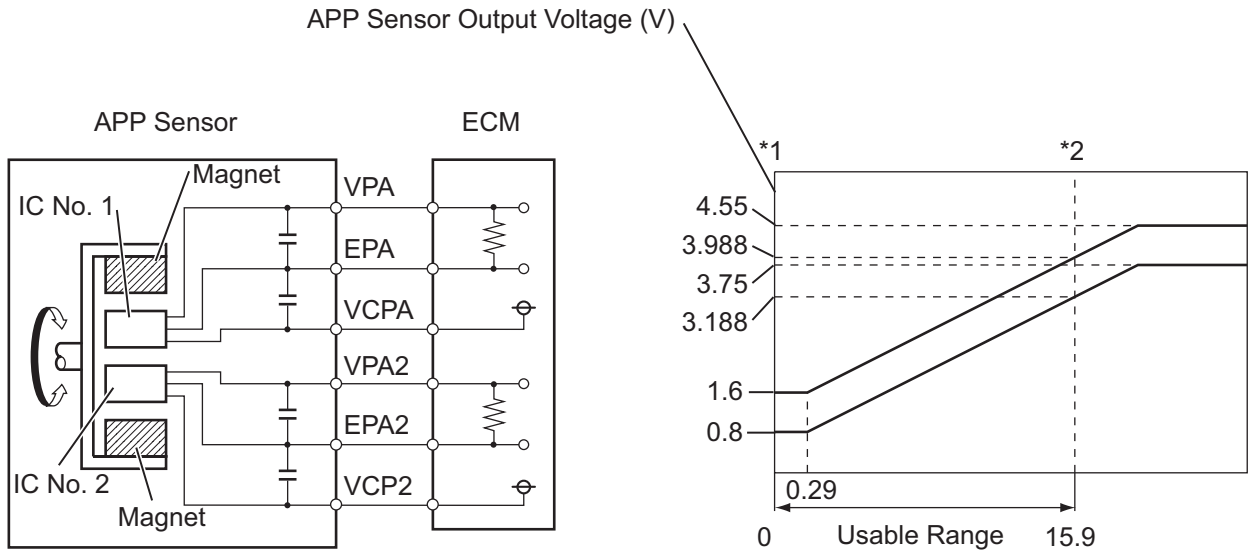
DTC	P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input
DTC	P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input
DTC	P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit
DTC	P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input
DTC	P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input
DTC	P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

Y

A112620E03

DTC No.	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2122	VPA 0.4 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA 4.8 V or more for 2.0 seconds or more (1 trip detection logic)	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic)	• APP sensor • ECM
P2127	VPA2 1.2 V or less for 0.5 seconds or more when accelerator pedal fully released (1 trip detection logic)	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 4.8 V or more (b) VPA between 0.4 V and 3.45 V	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) Difference between VPA and VPA2 0.02 V or less (b) VPA 0.4 V or less and VPA2 1.2 V or less	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:
When any of these DTCs are set, check the APP sensor voltage by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ACCEL POS #1 and ACCEL POS #2.

Trouble Area	ACCEL POS #1 When AP Released	ACCEL POS #2 When AP Released	ACCEL POS #1 When AP Depressed	ACCEL POS #2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:
- Accelerator pedal positions are expressed as voltages.
- AP stands for Accelerator Pedal.

ES

MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and sets a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is set.
If the malfunction is not repaired successfully, a DTC is set 2 seconds after the engine is next started.

MONITOR STRATEGY

Related DTCs	P2120: APP sensor 1 range check (fluctuating) P2122: APP sensor 1 range check (low voltage) P2123: APP sensor 1 range check (high voltage) P2125: APP sensor 2 range check (fluctuating) P2127: APP sensor 2 range check (low voltage) P2128: APP sensor 2 range check (high voltage) P2138: APP sensor range check (correlation)
Required Sensors/Components (Main)	APP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds: P2120, P2122, P2125 and P2127 2.0 seconds: P2123, P2128 and P2138
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met:	-
1. Ignition switch	ON
2. Throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

P2120:

Either of following conditions 1 or 2 met:	-
1. VPA voltage when VPA2 voltage 0.04 V or more	0.4 V or less
2. VPA voltage	4.8 V or more

P2122:

VPA voltage when VPA2 voltage 0.04 V or more	0.4 V or less

P2123:

VPA voltage	4.8 V or more

P2125:

Either of following conditions 1 or 2 met:	-
1. VPA2 voltage when VPA voltage 0.04 V or more	1.2 V or less
2. VPA2 voltage when VPA voltage 0.4 to 3.45 V	4.8 V or more

P2127:

VPA2 voltage when VPA voltage 0.04 V or more	1.2 V or less

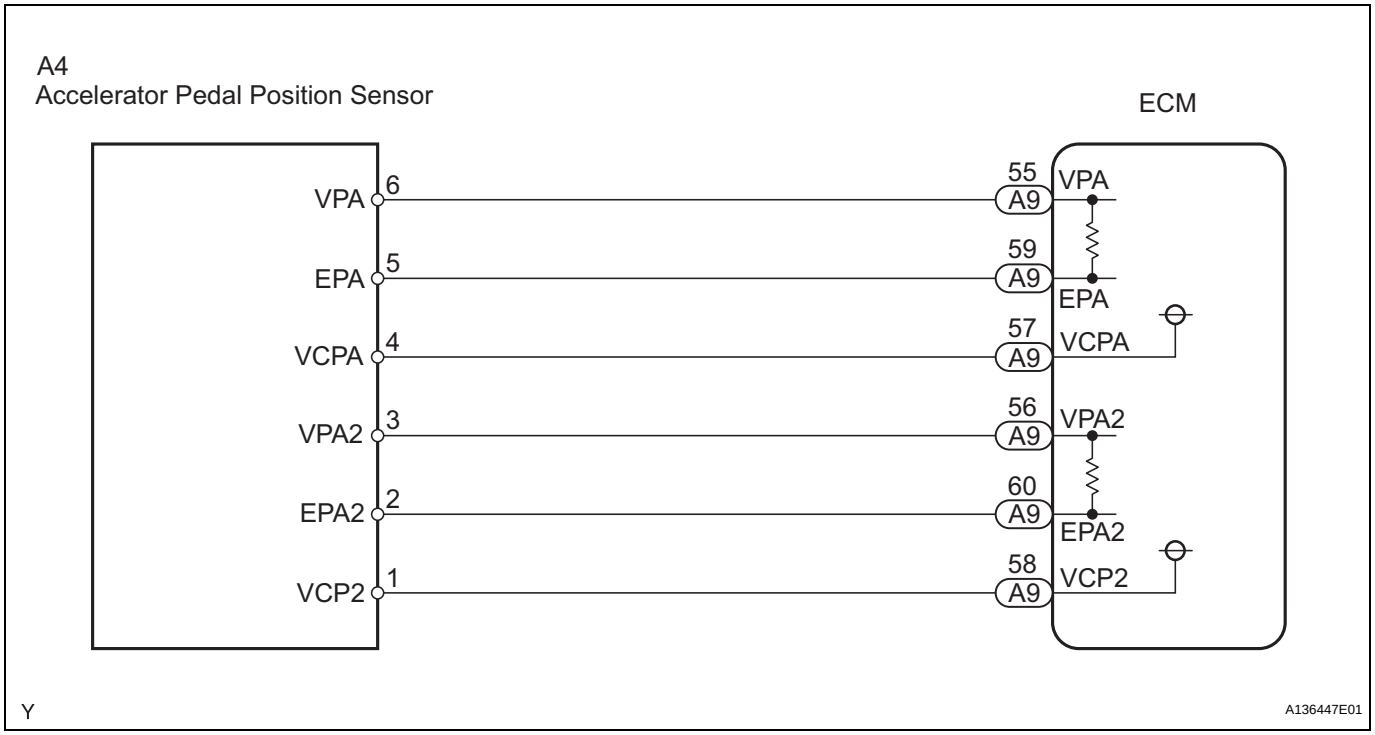
P2128:

VPA2 voltage when VPA voltage 0.4 to 3.45 V	4.8 V or more

ES

P2138:

Either of following conditions A or B met:	-
Condition A	-
Difference between VPA and VPA 2 voltages	0.02 V or less
Condition B	-
VPA voltage	0.4 V or less
VPA2 voltage	1.2 V or less



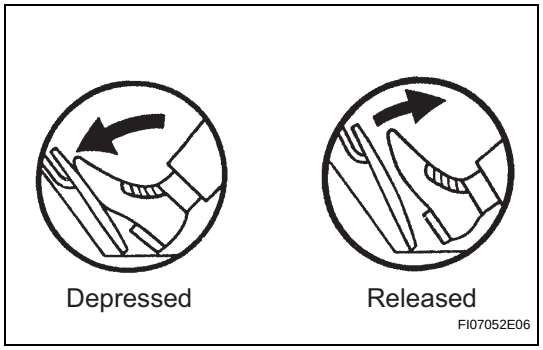
COMPONENT OPERATING RANGE

VPA voltage	0.5 to 4.7 V
VPA2 voltage	1.2 to 4.7 V
Difference between VPA and VPA2 voltages	More than 0.02 V

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are set, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned OFF.

WIRING DIAGRAM



INSPECTION PROCEDURE

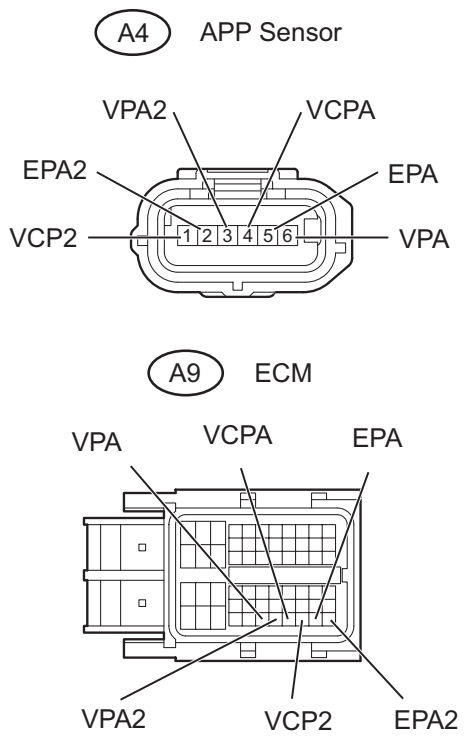
HINT:

- These DTCs relate to the Accelerator Pedal Position (APP) sensor.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	READ VALUE USING INTELLIGENT TESTER (ACCEL POS #1 AND ACCEL POS #2)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / ETCS / ACCEL POS #1 and ACCEL POS #2.
(d) Read the value displayed on the tester.

Standard voltage



Accelerator Pedal Operation	ACCEL POS #1	ACCEL POS #2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between ACCEL POS #1 and ACCEL POS #2 is greater than 0.02 V	Difference between ACCEL POS #1 and ACCEL POS #2 is greater than 0.02 V

OK → **Go to step 5**

NG

2 CHECK WIRE HARNESS (ACCELERATOR PEDAL POSITION SENSOR - ECM)

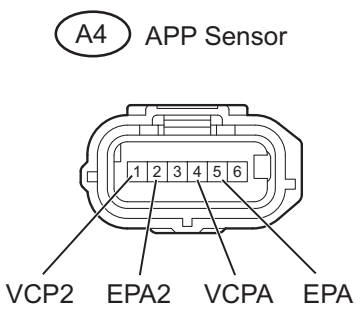
Wire Harness Side:

A115665E08

(a) Disconnect the A4 Accelerator Pedal Position (APP) sensor connector.
(b) Disconnect the A9 ECM connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
A4-6 (VPA) - A9-55 (VPA)	Below 1 Ω
A4-5 (EPA) - A9-59 (EPA)	Below 1 Ω
A4-4 (VCPA) - A9-57 (VCPA)	Below 1 Ω
A4-3 (VPA2) - A9-56 (VPA2)	Below 1 Ω
A4-2 (EPA2) - A9-60 (EPA2)	Below 1 Ω
A4-1 (VCP2) - A9-58 (VCP2)	Below 1 Ω
A4-6 (VPA) or A9-55 (VPA) - body ground	10 kΩ or higher
A4-5 (EPA) or A9-59 (EPA) - body ground	10 kΩ or higher
A4-4 (VCPA) or A9-57 (VCPA) - body ground	10 kΩ or higher
A4-3 (VPA2) or A9-56 (VPA2) - body ground	10 kΩ or higher
A4-2 (EPA2) or A9-60 (EPA2) - body ground	10 kΩ or higher
A4-1 (VCP2) or A9-58 (VCP2) - body ground	10 kΩ or higher



(d) Reconnect the APP sensor connector.
(e) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

3 CHECK ECM (VCPA AND VCP2 VOLTAGE)

Wire Harness Side:

A115666E10

(a) Disconnect the A4 APP sensor connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the A4 APP sensor connector.

Standard voltage

Tester Connection	Specified Condition
A4-4 (VCPA) - A4-5 (EPA)	4.5 to 5.5 V
A4-1 (VCP2) - A4-2 (EPA2)	4.5 to 5.5 V

(d) Reconnect the APP sensor connector.

NG → **REPLACE ECM**

OK

4	REPLACE ACCELERATOR PEDAL ASSEMBLY

NEXT

5	CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Start the engine.
(e) Allow the engine to idle for 15 seconds.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Read DTCs.

ES

Result

B → SYSTEM OK

A

REPLACE ECM

DTC	P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance

DESCRIPTION

HINT:

Refer to DTC P2120 (see page ES-324).

DTC No.	DTC Detection Condition	Trouble Area
P2121	Difference between VPA and VPA2 less than 0.4 V, or more than 1.2 V for 0.5 seconds (1 trip detection logic)	• Accelerator Pedal Position (APP) sensor • ECM

MONITOR DESCRIPTION

When the difference between the output voltages of VPA and VPA2 deviates from the standard, the ECM determines that the Accelerator Pedal Position (APP) sensor is malfunctioning. The ECM turns on the MIL and the DTC is set.

ES

MONITOR STRATEGY

Related DTCs	P2121: APP sensor rationality
Required Sensors/Components (Main)	APP sensor
Required Sensors/Components (Related)	-
Frequency of Operation	Continuous
Duration	0.5 seconds
MIL Operation	Immediate
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
Either of following conditions 1 or 2 met:	-
1. Ignition switch	ON
2. Throttle actuator power	ON

TYPICAL MALFUNCTION THRESHOLDS

Difference between VPA voltage (learned value) and VPA2 voltage (learned value)	Less than 0.4 V, or more than 1.2 V

FAIL-SAFE

The APP sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.

If a pass condition is detected and then the ignition switch is turned OFF, the fail-safe operation stops and the system returns to a normal condition.

WIRING DIAGRAM

Refer to DTC P2120 (see page ES-328).

INSPECTION PROCEDURE

HINT:

- This DTC relates to the Accelerator Pedal Position (APP) sensor.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1 **CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2121)**

(a) Connect the intelligent tester to the DLC3.

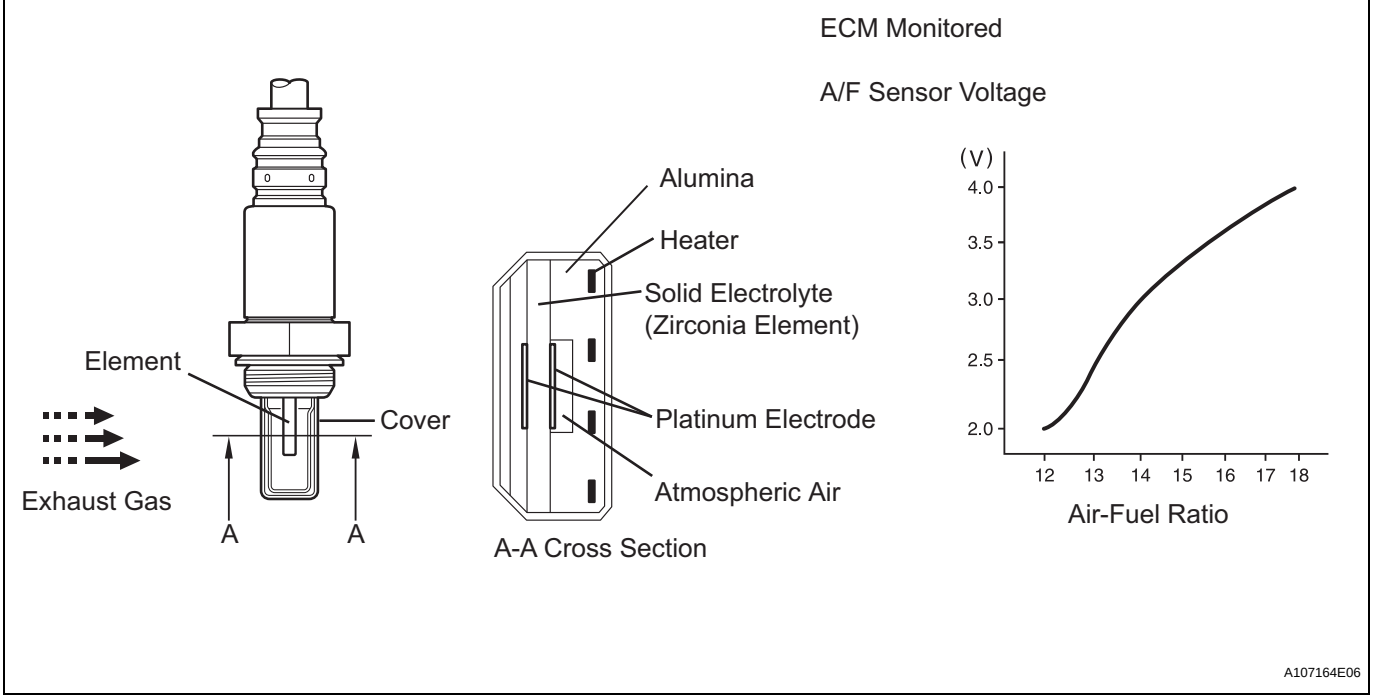
DTC	P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC	P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DTC	P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC	P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is of the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are narrower than the conventional type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC No.	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) A/F sensor voltage more than 3.8 V for 10 seconds (b) Heated Oxygen (HO2) sensor voltage 0.15 V or more	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While fuel-cut operation performed (during vehicle deceleration), A/F sensor current 3.6 mA or more for 3 seconds (2 trip detection logic)	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 10 seconds or more (2 trip detection logic): (a) A/F sensor voltage less than 2.8 V for 10 seconds (b) HO2 sensor voltage less than 0.6 V	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While fuel-cut operation performed (during vehicle deceleration), A/F sensor current less than 1.4 mA for 3 seconds (2 trip detection logic)	• A/F sensor • ECM

HINT:

- DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.
- DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.
- Bank 1 refers to the bank that includes No. 1 cylinder.
- Bank 2 refers to the bank that includes No. 2 cylinder.
- When either of these DTCs is set, check the A/F sensor output voltage by selecting the following menu items on the intelligent tester: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / AFS B1 S1 or AFS B2 S1.
- Short-term fuel trim values can also be read using the intelligent tester.

- The ECM regulates the voltages at the A1A+ and A1A- or A2A+ and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.
- If the A/F sensor is malfunctioning, the ECM sets the DTC P2195, P2196, P2197 or P2198.

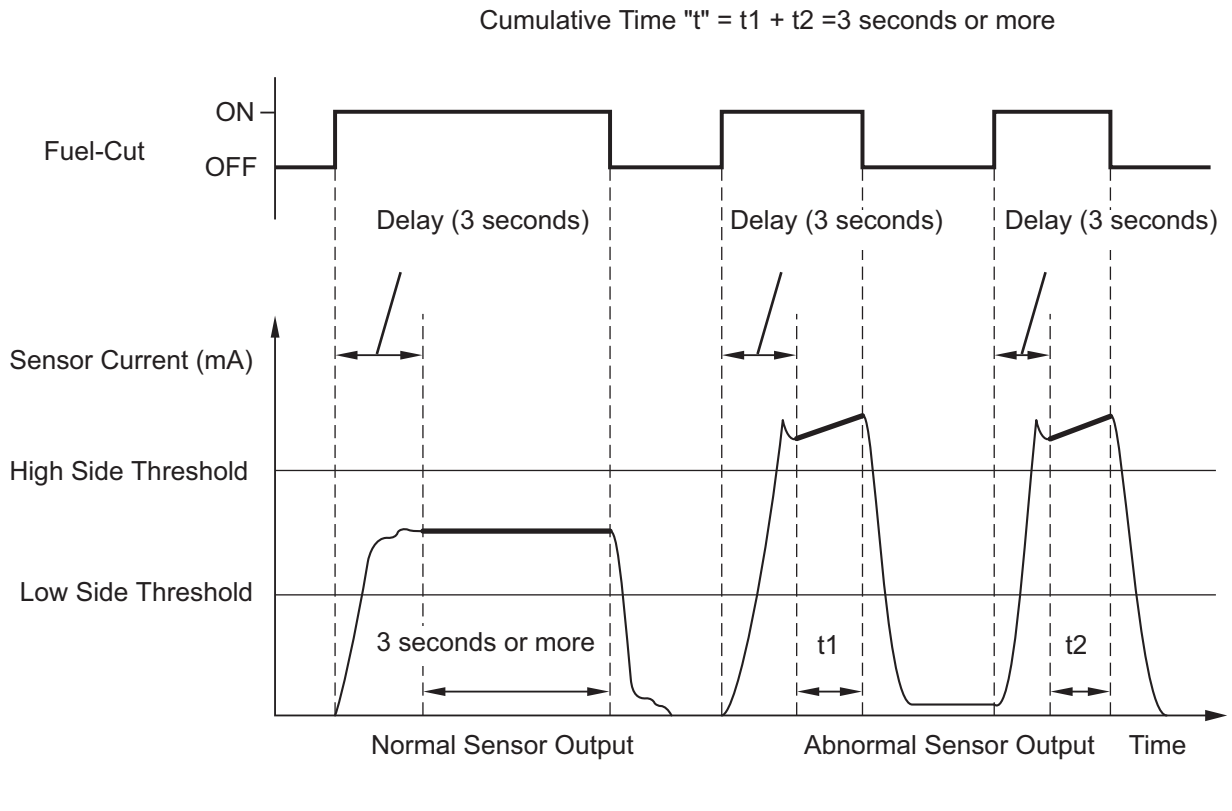
MONITOR DESCRIPTION

Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and sets a DTC.

Example:

If the A/F sensor output voltage is less than 2.8 V (very rich condition) for 10 seconds, despite the rear HO2 sensor output voltage being less than 0.6 V, the ECM sets DTC P2196 or P2198. Alternatively, if the A/F sensor output voltage is more than 3.8 V (very lean condition) for 10 seconds, despite the rear HO2 sensor output voltage being 0.15 V or more, DTC P2195 or P2197 is set.



ES

Sensor current detection monitor

A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or more for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and sets DTC P2195 or P2197 (high-side stuck). If the A/F sensor output is less than 1.0 mA for more than 3 seconds of cumulative time, the ECM sets DTC P2196 or P2198 (low-side stuck).

A/F Sensor Current Monitor:

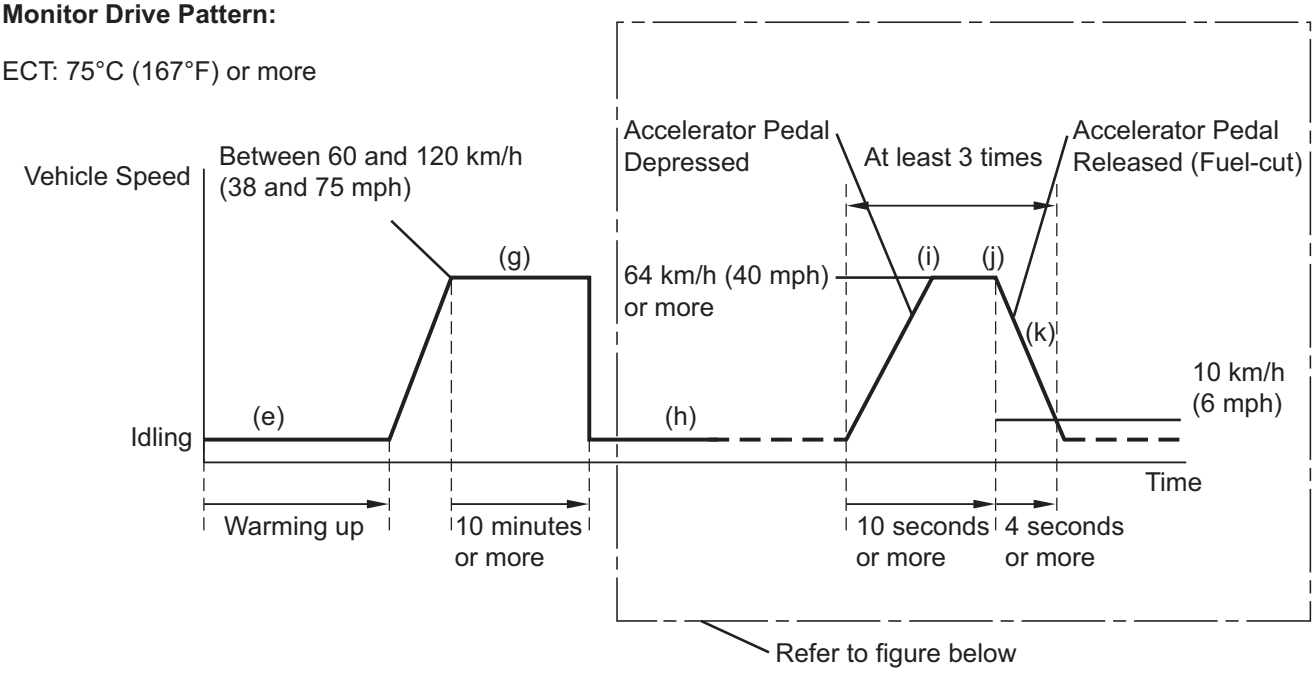
Sensor current detection monitor (Rich side malfunction P2196 and P2198):

A/F sensor current during fuel cut	Less than 1.4 mA

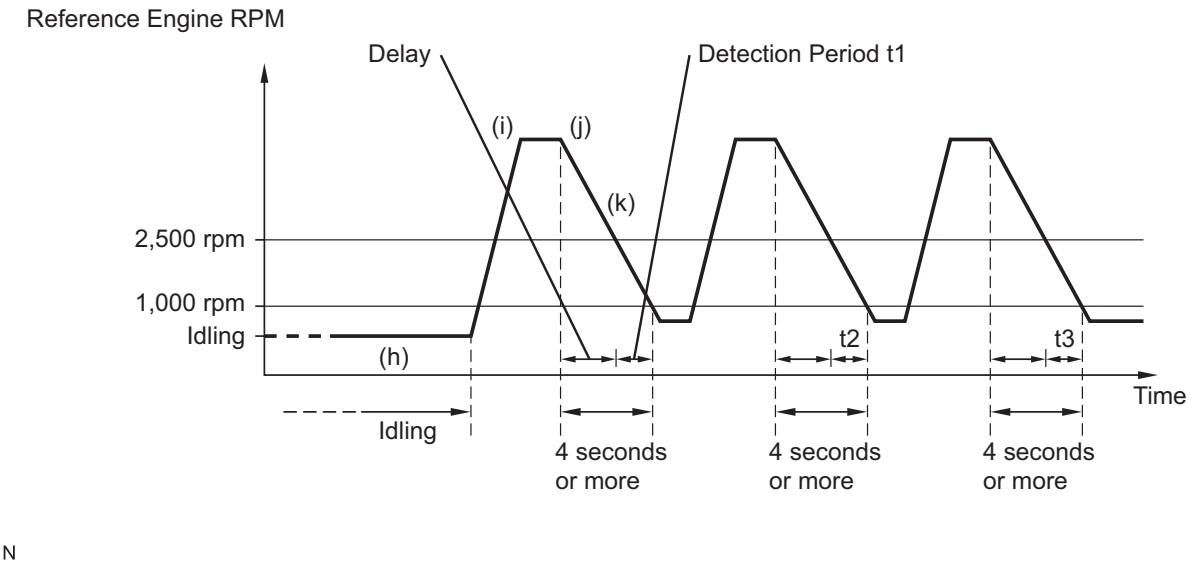
MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).



WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN



This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

Monitor Drive Pattern:

Driving Pattern Detail for (h) through (k):

Cumulative Detection Period "t" = t1 + t2 + t3 = 3 seconds or more

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) On the intelligent tester, select the following menu items to check the fuel-cut status: DIAGNOSIS / ENHANCED OBD II / DATA LIST / USER DATA / FC IDL.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.

(i) Drive the vehicle at proper vehicle speed to perform fuel-cut operation.
HINT:
Fuel-cut is performed when the following conditions are met:
- Accelerator pedal fully released.
- Engine speed is 2,500 rpm or more (fuel injection returns at 1,000 rpm).

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed declines to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
CAUTION:
Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

ES

INSPECTION PROCEDURE

HINT:
- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.
- DTC P2A00 may be set when the air-fuel ratio is stuck rich or lean.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.

HINT:
Intelligent tester only:
Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.
HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B1 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4
AFS B2 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B2 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor (sensor 2) output has a maximum output delay of approximately 20 seconds.

ES

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2; then press the YES button and then the ENTER button followed by the F4 button.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.

(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:
If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART**

ES

A

2 READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Clear DTCs (see page ES-39).
(d) Drive the vehicle in accordance with the driving pattern described in the CONFIRMATION DRIVING PATTERN.
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR STATUS.
(f) Check that the status of O2S MON is COMPL.
If the status is still INCMPL, drive the vehicle according to the driving pattern again.
HINT:
- AVAIL indicates that the component has not been monitored yet.
- COMPL indicates that the component is functioning normally.
- INCMPL indicates that the component is malfunctioning.

(g) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT / RANGE B1 S1; then press the ENTER button.
(h) Check the test value of the A/F sensor output current during fuel-cut.

Result

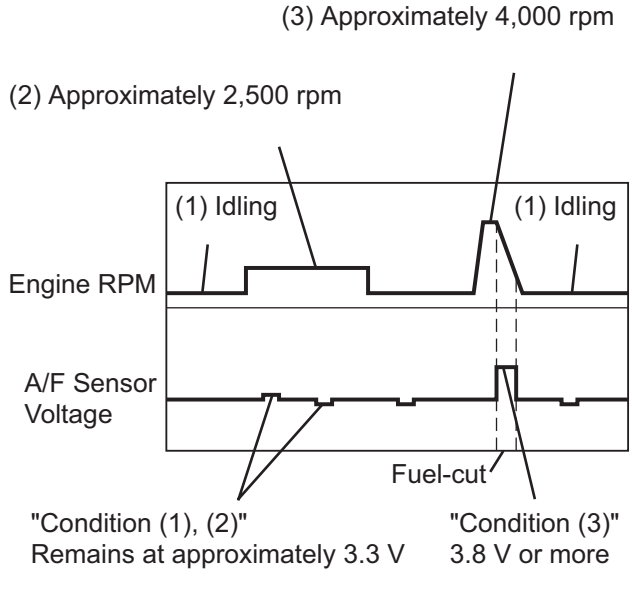
Test Value	Proceed to
Within normal range (1.0 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.0 mA, or 3.6 mA or more)	B

B → **Go to step 12**

A

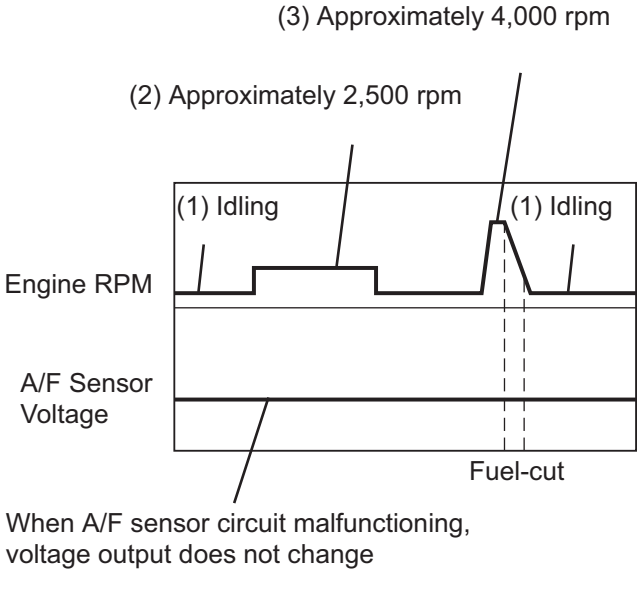
3	READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine.
(c) Turn the tester ON.
(d) Warm up the A/F sensor at an engine speed of 2,500 rpm for 90 seconds.
(e) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SNAPSHOT / MANUAL SNAPSHOT / USER DATA / AFS B1 S1 or AFS B2 S1 and ENGINE SPD.
(f) Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:
(1) While idling (check for at least 30 seconds).
(2) At an engine speed of approximately 2,500 rpm (without any sudden changes in engine speed).
(3) Raise the engine speed to 4,000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.



ES

Standard voltage



Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Remains at approximately 3.3 V	3.1 V to 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:
- For more information, see the diagrams below.

Normal Condition:

Malfunction Condition:

N

A107161E08

- If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)
- If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.
- The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.
- The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.
- When the vehicle is driven:
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.

DESCRIPTION

Refer to DTC P2195 (see page ES-334).

DTC No.	DTC Detection Condition	Trouble Area
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (2 trip detection logic): (a) AF+ voltage 0.5 V or less (b) (AF+) - (AF-) = 0.1 V or less • Case 2: A/F sensor admittance: Less than 0.022 1/Ω (2 trip detection logic)	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM
P2239 P2242	AF+ voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM
P2252 P2255	AF- voltage 0.5 V or less for 5.0 seconds or more (2 trip detection logic)	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

DTC No.	DTC Detection Condition	Trouble Area
P2253 P2256	AF- voltage more than 4.5 V for 5.0 seconds or more (2 trip detection logic)	• Open or short in A/F sensor (sensor 1) circuit • A/F sensor (sensor 1) • A/F sensor heater (sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:
- DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.
- DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that includes cylinder No. 2.

MONITOR DESCRIPTION

ES

The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

MONITOR STRATEGY

Related DTCs	P2238: A/F sensor (bank 1) open circuit between AF+ and AF- P2238: A/F sensor (bank 1) short circuit between AF+ and AF- P2238: A/F sensor (bank 1) short circuit between AF+ and GND P2239: A/F sensor (bank 1) short circuit between AF+ and +B P2252: A/F sensor (bank 1) short circuit between AF- and GND P2253: A/F sensor (bank 1) short circuit between AF- and +B P2241: A/F sensor (bank 2) open circuit between AF+ and AF- P2241: A/F sensor (bank 2) short circuit between AF+ and AF- P2241: A/F sensor (bank 2) short circuit between AF+ and GND P2242: A/F sensor (bank 2) short circuit between AF+ and +B P2255: A/F sensor (bank 2) short circuit between AF- and GND P2256: A/F sensor (bank 2) short circuit between AF- and +B
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	Engine Coolant Temperature (ECT) sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	10 seconds: A/F sensor open circuit between AF+ and AF- 5 seconds: Other
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0031, P0032, P0051, P0052 (A/F sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0455, P0456 (EVAP system) P0500 (VSS)

P2238 and P2241 (open circuit between AF+ and AF-):

AF+ terminal voltage	0.5 to 4.5 V
AF- terminal voltage	0.5 to 4.5 V
Difference between AF+ and AF- terminal voltages	0.1 to 0.8 V
ECT	5°C (41°F) or more (varies with ECT at engine start)

Engine	Running
Fuel-cut	OFF
Time after fuel-cut OFF	5 seconds or more
A/F sensor heater	ON
Battery voltage	10.5 V or more
Ignition switch	ON
Time after ignition switch is turned from OFF to ON	5 seconds or more

Other:

Battery voltage	10.5 V or more
Ignition switch	ON
Time after ignition switch is turned from OFF to ON	5 seconds or more

TYPICAL MALFUNCTION THRESHOLDS

P2238 and P2241 (Open circuit between AF+ and AF-):

A/F sensor admittance	Below 0.022 1/Ω

P2238 and P2241 (Short circuit between AF+ and GND):

AF+ terminal voltage	0.5 V or less

P2238 and P2241 (Short circuit between AF+ and AF-):

Difference between AF+ and AF- terminal voltages	0.1 V or less

P2239 and P2242 (Short circuit between AF+ and +B):

AF+ terminal voltage	More than 4.5 V

P2252 and P2255 (Short circuit between AF- and GND):

AF- terminal voltage	0.5 V or less

P2253 and P2256 (Short circuit between AF- and +B):

AF- terminal voltage	More than 4.5 V

WIRING DIAGRAM

Refer to DTC P2195 (see page ES-339).

INSPECTION PROCEDURE

HINT:

- Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.
- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.

HINT:

Intelligent tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.

(b) Start the engine and turn the tester ON.

(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.

(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.

(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- The A/F CONTROL operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B1 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4
AFS B2 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B2 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4

ES

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		
3	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output Voltage Almost no reaction		

Following the A/F CONTROL procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2; then press the YES button and then the ENTER button followed by the F4 button.
HINT:
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

DTC	P2420	Evaporative Emission System Switching Valve Control Circuit High

DTC SUMMARY

DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P2420	Vent valve stuck open (vent)	Following condition met during key-off EVAP monitor: • EVAP pressure change when vent valve closed (ON) less than 0.3 kPa-g (2.25 mmHg-g)	• Canister pump module (Reference orifice, leak detection pump, vent valve) • Connector/wire harness (Canister pump module - ECM) • ECM	While ignition switch OFF	2 trip

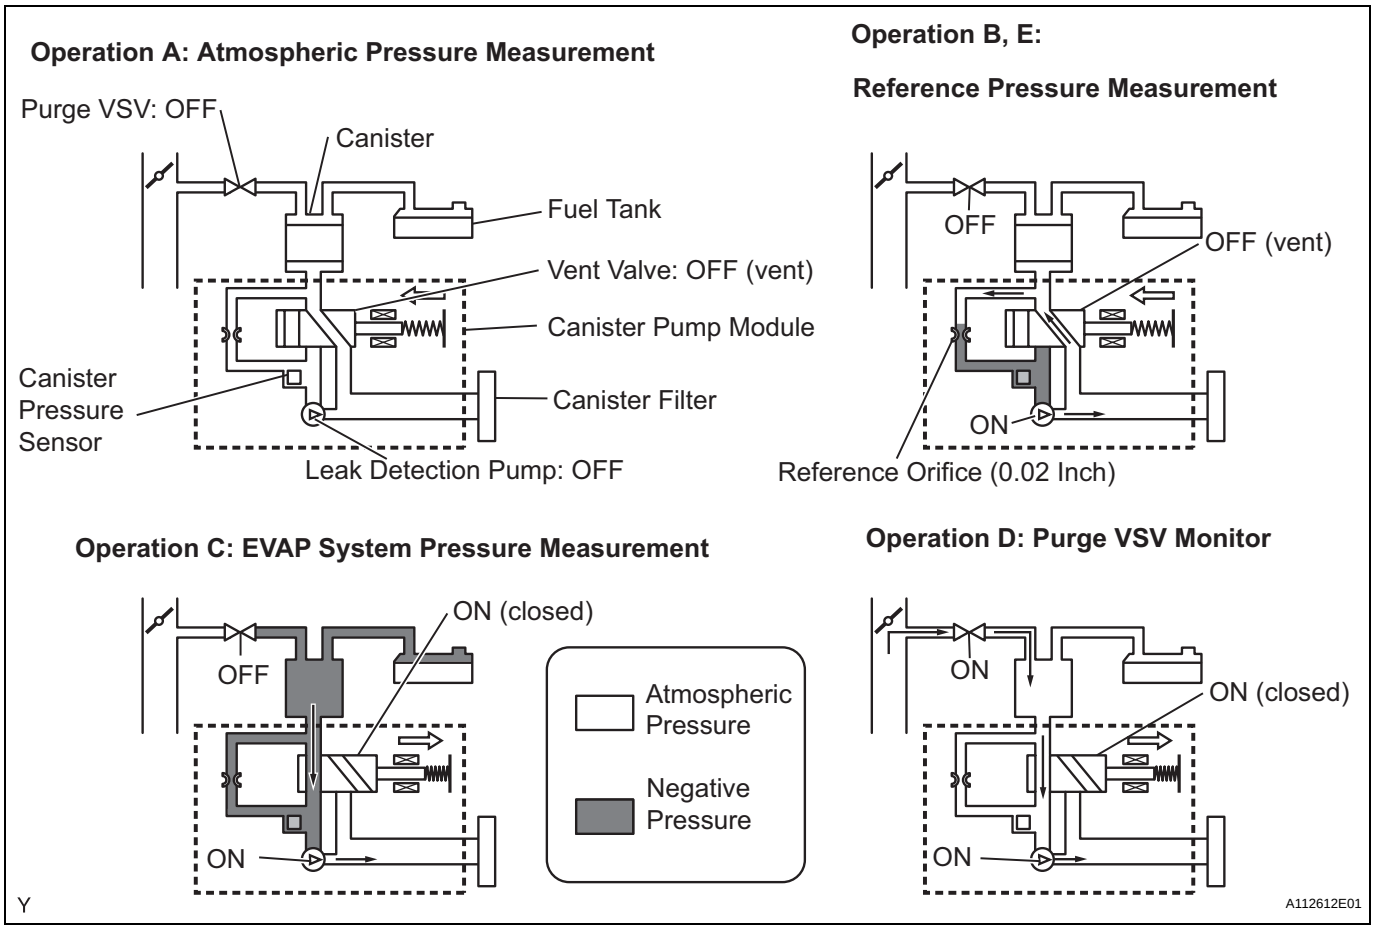
HINT:
The vent valve is built into the canister pump module.

ES

DESCRIPTION

The description can be found in the EVAP (Evaporative Emission) System (see page ES-371).

INSPECTION PROCEDURE

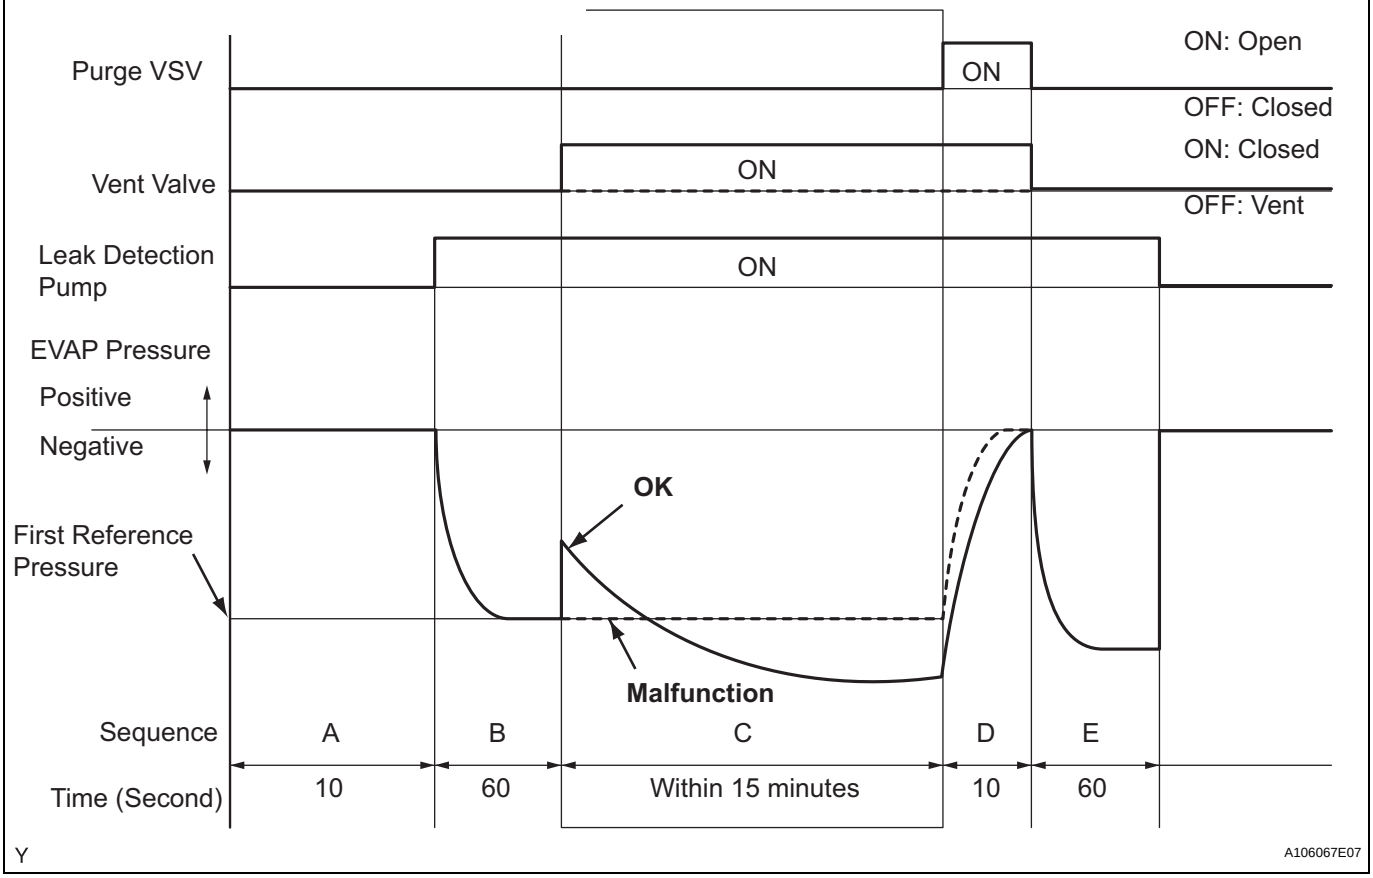


Refer to the EVAP System (see page ES-376).

MONITOR DESCRIPTION

5 hours* after the ignition switch is turned OFF, the leak detection pump creates negative pressure (vacuum) in the EVAP system. The ECM monitors for leaks and actuator malfunctions based on the EVAP pressure.
HINT:
*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

Sequence	Operation	Description	Duration
-	ECM activation	Activated by soak timer 5, 7 or 9.5 hours after ignition switch turned OFF.	-
A	Atmospheric pressure measurement	Vent valve turned OFF (vent) and EVAP system pressure measured by ECM in order to register atmospheric pressure. If pressure in EVAP system not between 76 kPa-a and 110 kPa-a (570 mmHg-a and 825 mmHg-a), ECM cancels EVAP system monitor.	10 seconds
B	First reference pressure measurement	In order to determine reference pressure, leak detection pump creates negative pressure (vacuum) through reference orifice and then ECM checks if leak detection pump and vent valve operate normally.	60 seconds
C	EVAP system pressure measurement	Vent valve turned ON (closed) to shut EVAP system. Negative pressure (vacuum) created in EVAP system, and EVAP system pressure then measured. Write down measured value as it will be used in leak check. If EVAP pressure does not stabilize within 15 minutes, ECM cancels EVAP system monitor.	15 minutes*
D	Purge VSV monitor	Purge VSV opened and then EVAP system pressure measured by ECM. Large increase indicates normality.	10 seconds
E	Second reference pressure measurement	After second reference pressure measurement, leak check performed by comparing first and second reference pressure. If stabilized system pressure higher than second reference pressure, ECM determines that EVAP system leaking.	60 seconds
-	Final check	Atmospheric pressure measured and then monitoring result recorded by ECM.	-



*: If only a small amount of fuel is in the fuel tank, it takes longer for the EVAP pressure to stabilize.

P2420: Vent valve stuck open (vent)

In operation C, the vent valve turns ON (closes) and the EVAP system pressure is then measured by the ECM, using the canister pressure sensor, to conduct an EVAP leak check. If the pressure does not increase when the vent valve is open, the ECM interprets this as the vent valve being stuck open. The ECM illuminates the MIL and sets the DTC.

EVAP Pressure when Vent Valve Stuck OFF:

MONITOR STRATEGY

Required Sensors/Components	Purge VSV and canister pump module
Frequency of Operation	Once per driving cycle
Duration	Within 2 minutes (varies with amount of fuel in tank)
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	None
EVAP key-off monitor runs when all of following conditions met	-
Atmospheric pressure	70 to 110 kPa-a (525 to 825 mmHg-a)
Battery voltage	10.5 V or more
Vehicle speed	Below 4 km/h (2.5 mph)
Ignition switch	OFF
Time after key off	5 or 7 or 9.5 hours
Canister pressure sensor malfunction (P0450, P0451, P0452 and P0453)	Not detected
Purge VSV	Not operated by scan tool
Vent valve	Not operated by scan tool
Leak detection pump	Not operated by scan tool
Both of following conditions met before key off	Conditions 1 and 2
1. Duration that vehicle driven	5 minutes or more
2. EVAP purge operation	Performed

ECT	4.4 to 35°C (40 to 95°F)
IAT	4.4 to 35°C (40 to 95°F)

1. Key-off monitor sequence 1 to 8

1. Atmospheric pressure measurement

Next sequence run if following condition set	-
Atmospheric pressure change	Less than 0.3 kPa-g (2.25 mmHg-g) in 1 second

2. First reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2 and 3
1. EVAP pressure just after reference pressure measurement started	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds

3. Vent valve stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after vent valve ON (closed)	0.3 kPa-g (2.25 mmHg-g) or more

4. Vacuum introduction

Next sequence run if following condition set	-
EVAP pressure	Saturated within 15 minutes

5. Purge VSV stuck closed check

Next sequence run if following condition set	-
EVAP pressure change after purge VSV ON (open)	0.3 kPa-g (2.25 mmHg-g) or more

6. Second reference pressure measurement

Next sequence run if all of following conditions set	Condition 1, 2, 3 and 4
1. EVAP pressure just after reference pressure	-1 kPa-g (-7.5 mmHg-g) or less
2. Reference pressure	-4.85 to -1.057 kPa-g (-36.4 to -7.93 mmHg-g)
3. Reference pressure	Saturated within 60 seconds
4. Reference pressure difference between first and second	Less than 0.7 kPa-g (5.25 mmHg-g)

7. Leak check

Next sequence run if following condition set	-
EVAP pressure when vacuum introduction complete	Second reference pressure or less

8. Atmospheric pressure measurement

EVAP monitor complete if following condition set	-
Atmospheric pressure difference between sequence 1 and 8	Within 0.3 kPa-g (2.25 mmHg-g)

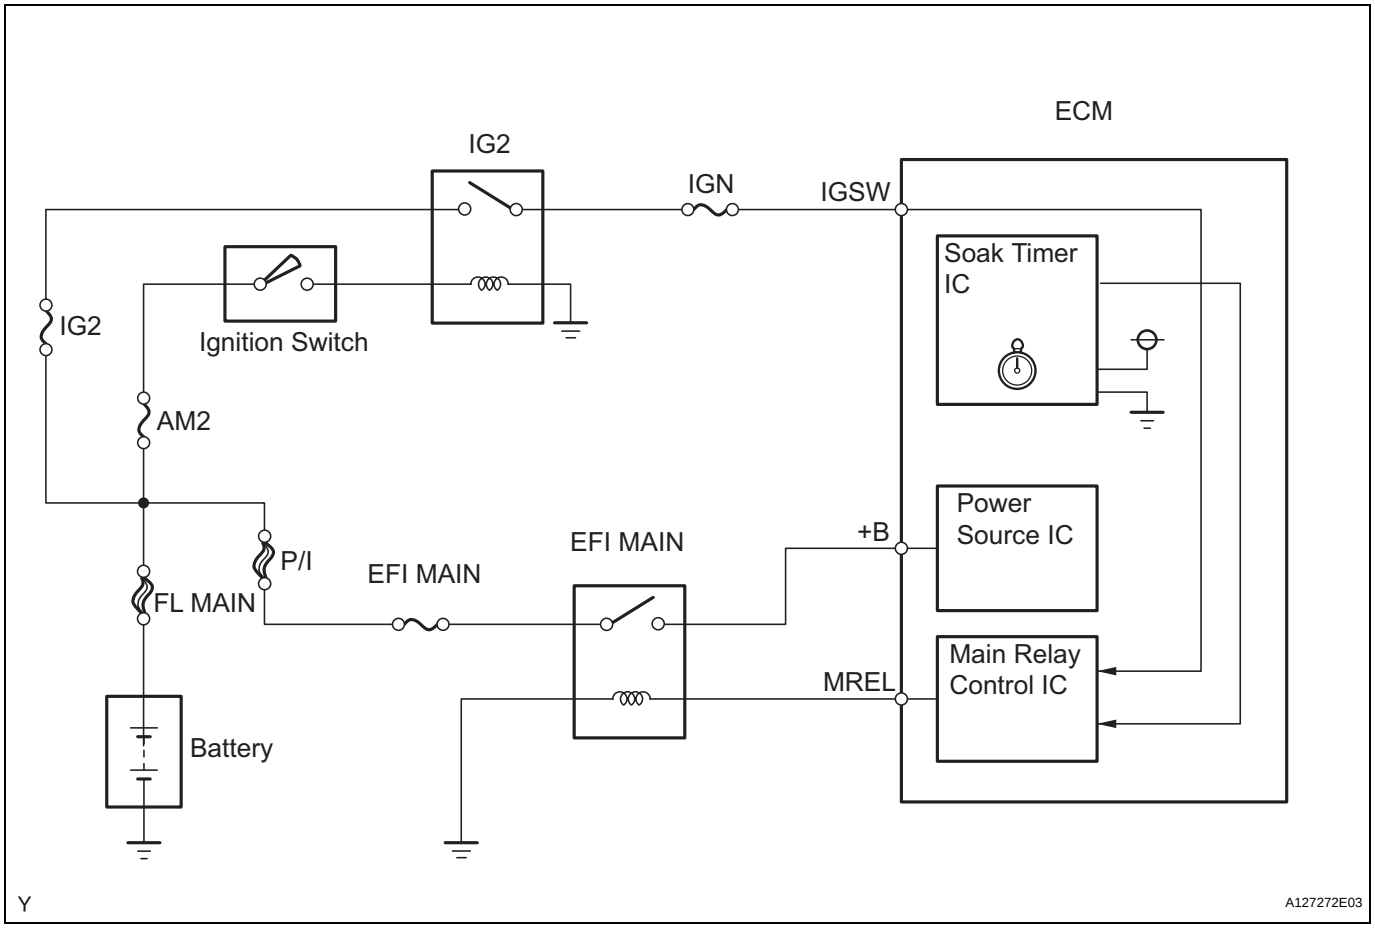
TYPICAL MALFUNCTION THRESHOLDS

EVAP pressure change after EVAP canister vent valve ON	Less than 0.3 kPa-g (2.25 mmHg-g)

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).

DTC	P2610	ECM / PCM Internal Engine Off Timer Performance



DTC SUMMARY

DTC	Monitoring Item	Malfunction Detection Condition	Trouble Area	Detection Timing	Detection Logic
P2610	Soak timer (built into ECM)	ECM internal malfunction	ECM	Engine running	2 trip

DESCRIPTION

To ensure the accuracy of the EVAP (Evaporative Emission) monitor values, the soak timer, which is built into the ECM, measures 5 hours (+-15 minutes) from when the ignition switch is turned OFF, before the monitor is run. This allows the fuel to cool down, which stabilizes the EVAP pressure. When 5 hours have elapsed, the ECM turns on.

ES

MONITOR DESCRIPTION

5 hours after the ignition switch is turned OFF, the soak timer activates the ECM to begin the EVAP system monitor. While the engine is running, the ECM monitors the synchronization of the soak timer and the CPU clock. If these two are not synchronized, the ECM interprets this as a malfunction, illuminates the MIL and sets the DTC (2 trip detection logic).

MONITOR STRATEGY

Required Sensors/Components	ECM
Frequency of Operation	Once per driving cycle

Duration	10 minutes
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTC not present	None
Ignition switch	ON
Engine	Running
Battery voltage	8 V or more
Starter	OFF

TYPICAL MALFUNCTION THRESHOLDS

ES

Soak timer measurement when ECM CPU clock counts 10 minutes	Less than 7 minutes, or more than 13 minutes

INSPECTION PROCEDURE

HINT:

- DTC P2610 is set if an internal ECM problem is detected. Diagnostic procedures are not required. ECM replacement is necessary.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**REPLACE ECM**

(a) Replace the ECM (see page ES-429).

NEXT

2	**CHECK WHETHER DTC OUTPUT RECURS**

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (see page ES-39).
(e) Start the engine and wait for 10 minutes or more.
(f) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(g) If no pending DTC is displayed, the repair has been successfully completed.

NEXT

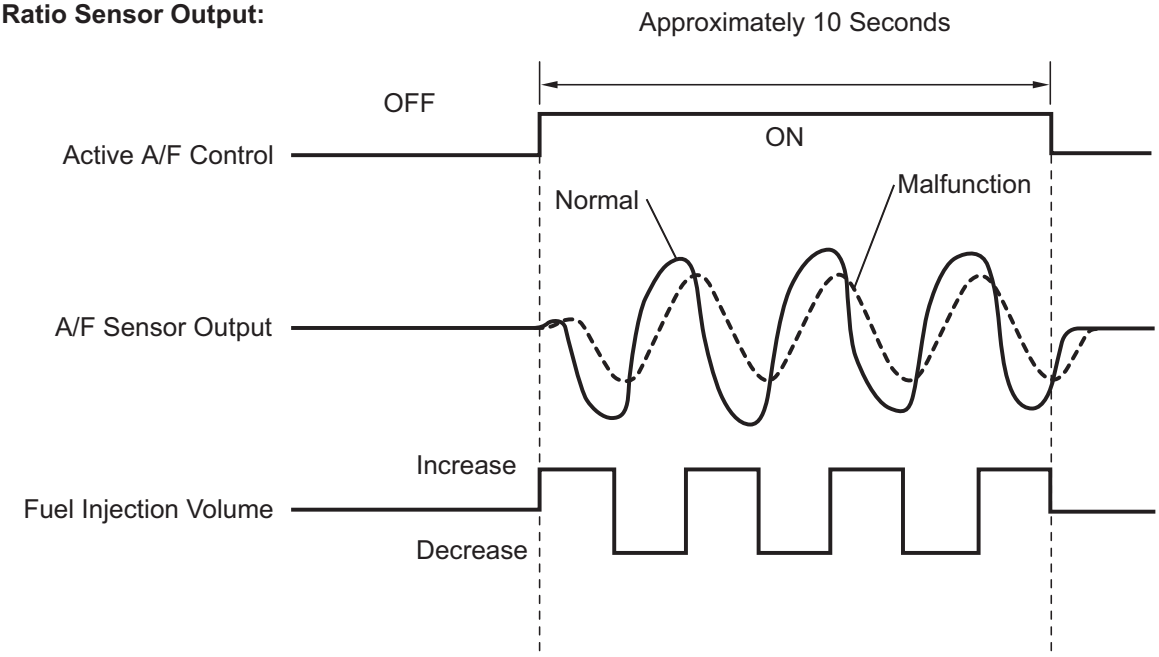
END

DTC	P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC	P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

DESCRIPTION

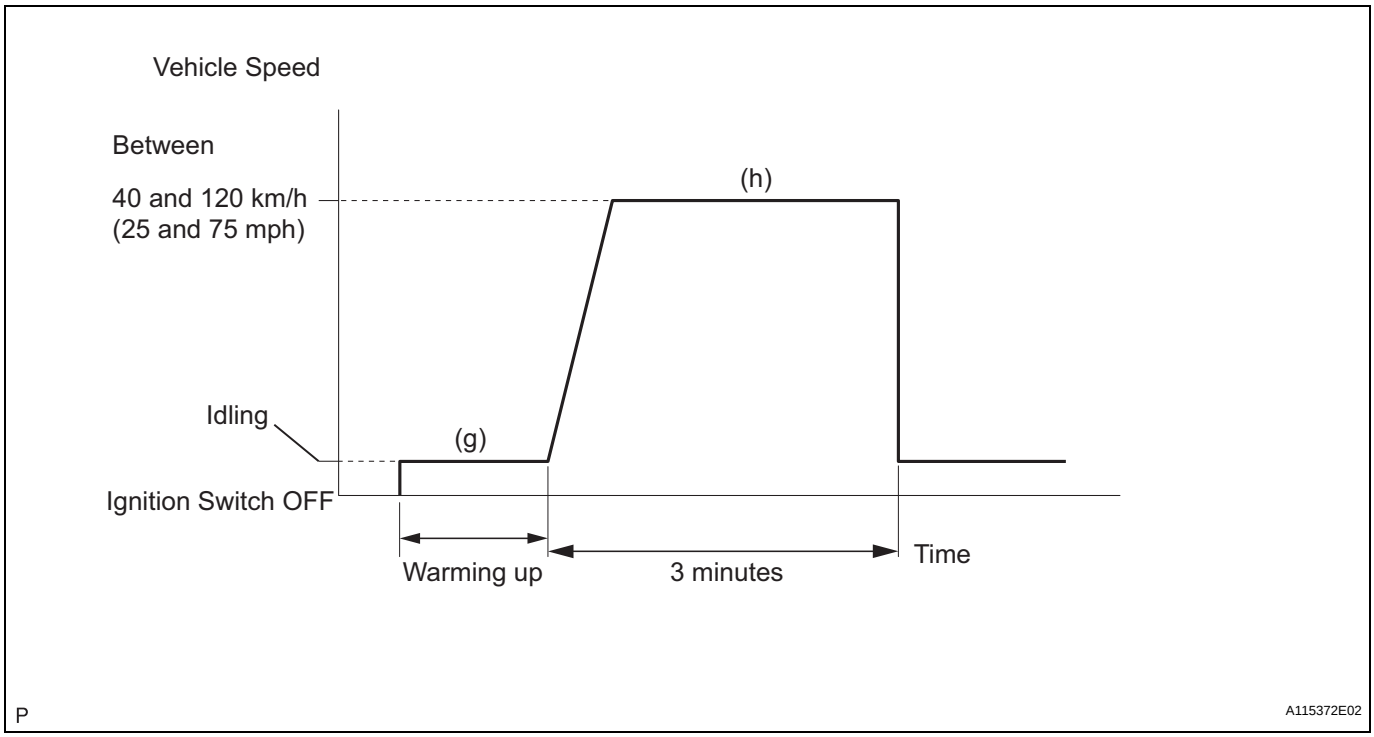
Refer to DTC P2195 (see page ES-334).



DTC No.	DTC Detection Condition	Trouble Area
P2A00	Calculated value of air-fuel ratio (A/F) sensor response rate deterioration level less than threshold (2 trip detection logic)	• Open or short in A/F sensor circuit (bank 1) • A/F sensor (bank 1) • ECM
P2A03	Calculated value of air-fuel ratio (A/F) sensor response rate deterioration level less than threshold (2 trip detection logic)	• Open or short in A/F sensor circuit (bank 2) • A/F sensor (bank 2) • ECM

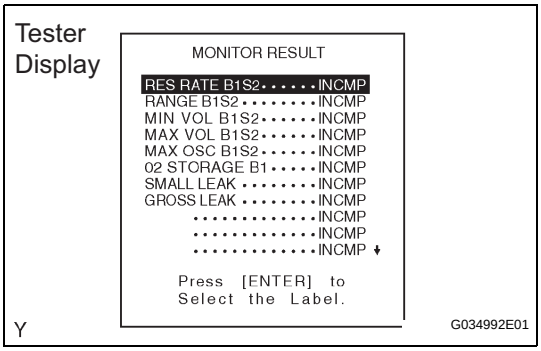
ES

MONITOR DESCRIPTION



After the engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F control is performed for approximately 10 seconds after the preconditions are met in order to measure the A/F sensor response rate. During active A/F control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F control and uses it to calculate the A/F sensor response rate deterioration level.
If the A/F sensor response rate deterioration level is less than the threshold, the ECM interprets this as a malfunction and sets the DTC.

Air-Fuel Ratio Sensor Output:



CONFIRMATION DRIVING PATTERN

HINT:
Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.

(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Clear DTCs (if set) (see page ES-39).
(e) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / MONITOR RESULT.
(f) Check that RES RATE B1S1 is INCOMP.
(g) Start the engine and warm it up.
(h) Drive the vehicle at a constant speed of between 40 km/h and 120 km/h (25 mph and 75 mph) for 3 minutes.
(i) Check the monitor result values on the intelligent tester by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR INFO / TEST RESULT.
(j) If the values indicated on the tester do not change, perform READINESS MONITOR DRIVE PATTERN for the A/F sensor and the heated oxygen sensor (see page ES-22).
HINT:
Completion of all A/F sensor monitors is required to change the value in TEST RESULT.
(k) Note the value of the Monitor Result.
(l) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(m) Check if any DTCs (any pending DTCs) are set.

MONITOR STRATEGY

Related DTCs	P2A00: Air-Fuel Ratio (A/F) sensor slow response (bank 1) P2A03: Air-Fuel Ratio (A/F) sensor slow response (bank 2)
Required Sensors/Components (Main)	A/F sensor
Required Sensors/Components (Related)	Vehicle speed sensor, Crankshaft position sensor
Frequency of Operation	Once per driving cycle
Duration	10 to 15 seconds
MIL Operation	2 driving cycles
Sequence of Operation	None

TYPICAL ENABLING CONDITIONS

Monitor runs whenever following DTCs not present	P0031, P0032, P0051, P0052 (A/F Sensor heater - Sensor 1) P0100 - P0103 (MAF meter) P0110 - P0113 (IAT sensor) P0115 - P0118 (ECT sensor) P0120 - P0223, P2135 (TP sensor) P0125 (Insufficient ECT for Closed Loop) P0171, P0172 (Fuel system) P0300 - P0306 (Misfire) P0335 (CKP sensor) P0340 (CMP sensor) P0455, P0456 (EVAP system) P0500 (VSS) P2196, P2198 (A/F Sensor - rationality)
Active A/F control	Performing
Active A/F control performed when following conditions met	-
Engine coolant temperature	75°C (167°F) or more
Battery voltage	11 V or more
Idle	OFF
Engine RPM	Less than 4,000 rpm
A/F sensor status	Activated
Fuel-cut	OFF
Engine load	10 to 70%
Shift position	2 or more
Catalyst monitor	Not yet
Intake air amount	2.5 to 15 g/sec.

TYPICAL MALFUNCTION THRESHOLDS

Response rate deterioration level	Less than 0.18 V

MONITOR RESULT

Refer to CHECKING MONITOR STATUS (see page ES-19).

WIRING DIAGRAM

Refer to DTC P2195 (see page ES-339).

INSPECTION PROCEDURE

HINT:
Intelligent tester only:

Malfunctioning areas can be identified by performing the A/F CONTROL function provided in the ACTIVE TEST. The A/F CONTROL function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.
The following instructions describe how to conduct the A/F CONTROL operation using the intelligent tester.
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester ON.
(c) Warm up the engine at an engine speed of 2,500 rpm for approximately 90 seconds.
(d) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL.
(e) Perform the A/F CONTROL operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

ES

HINT:
- The A/F CONTROL operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.
- The sensors react in accordance with increases and decreases in the fuel injection volume.

Standard

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B1 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4
AFS B2 S1 (A/F)	+25%	Rich	Less than 3.0
	-12.5%	Lean	More than 3.35
O2S B2 S2 (HO2)	+25%	Rich	More than 0.55
	-12.5%	Lean	Less than 0.4

NOTICE:
The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
1	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		-
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage More than 0.5 V Less than 0.4 V		
2	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• A/F sensor • A/F sensor heater • A/F sensor circuit
	Output Voltage Almost no reaction		Output Voltage More than 0.5 V Less than 0.4 V		

Case	A/F Sensor (Sensor 1) Output Voltage		HO2 Sensor (Sensor 2) Output Voltage		Main Suspected Trouble Area
3	Injection Volume +25% -12.5%		Injection Volume +25% -12.5%		• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
	Output Voltage More than 3.35 V Less than 3.0 V		Output Voltage Almost no reaction		
4	Injection volume +25% -12.5%		Injection Volume +25% -12.5%		• Injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely lean or rich)
	Output Voltage Almost no reaction		Output voltage Almost no reaction		

ES

Following the A/F CONTROL procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
To display the graph, select the following menu items on the tester: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / A/F CONTROL / USER DATA / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2; then press the YES button and then the ENTER button followed by the F4 button.
HINT:

- Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.
- DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.
- DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.
- Bank 1 refers to the bank that includes cylinder No. 1.
- Bank 2 refers to the bank that includes cylinder No. 2.
- DTC P2A00 or P2A03 may be set when the air-fuel ratio is stuck rich or lean.
- A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.
- A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON.
(c) Turn the tester ON.
(d) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(e) Read DTCs.

Result

Display (DTC Output)	Proceed to
P2A00 and/or P2A03	A
P2A00 and/or P2A03 and other DTCs	B

HINT:
If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2 INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE) (See page ES-110)

NG → REPLACE AIR-FUEL RATIO SENSOR

OK

ES

3 CHECK WIRE HARNESS (ECM - AIR-FUEL RATIO SENSOR) (See page ES-354)

NG → REPAIR OR REPLACE HARNESS AND CONNECTOR

OK

4 PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5 CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00 AND/OR P2A03)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(d) Read pending DTCs.

Result

Display (DTC Output)	Proceed to
P2A00 and/or P2A03	A
No output	B

B → CHECK FOR INTERMITTENT PROBLEMS

A

6 REPLACE AIR-FUEL RATIO SENSOR

NEXT

7	PERFORM CONFIRMATION DRIVING PATTERN

NEXT

8	CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00 AND/OR P2A03)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
(d) Read pending DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P2A00 and/or P2A03	B

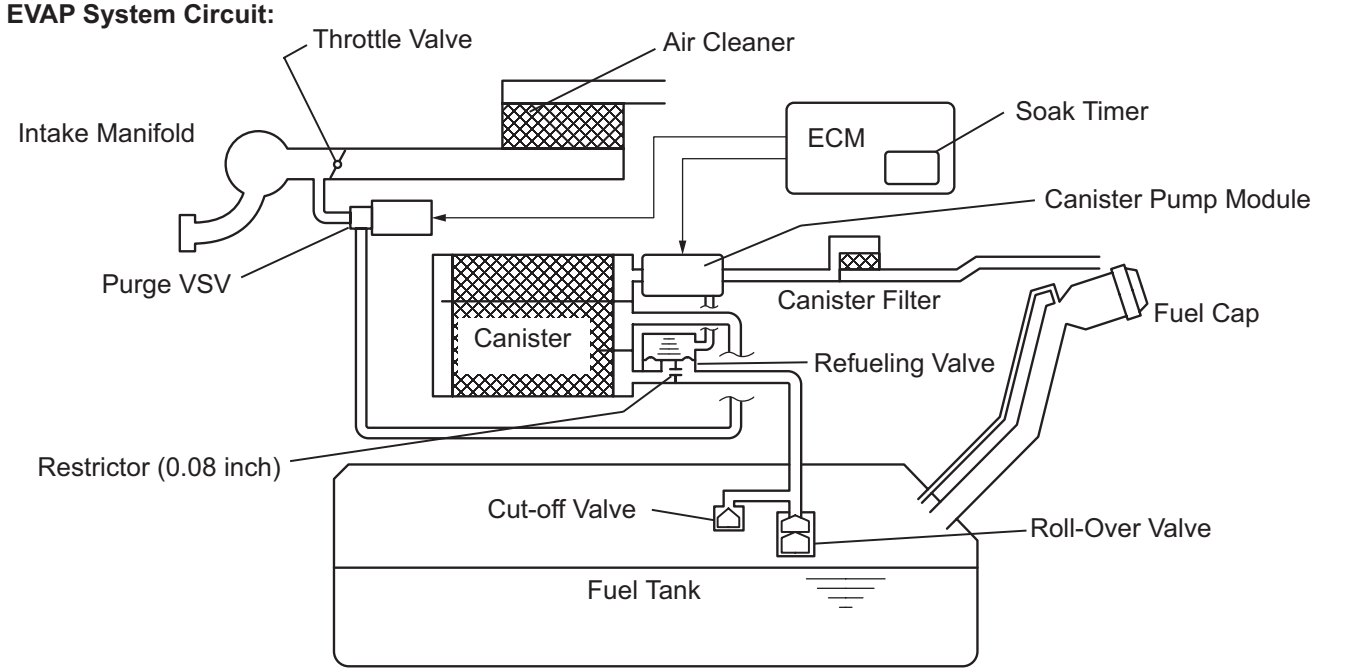
NOTICE:
If the reference pressure difference between the first and second checks is greater than the specification, all the DTCs relating to the reference pressure (P043E, P043F, P2401, P2402 and P2419) are stored.

ES

DESCRIPTION

Location of EVAP (Evaporative Emission) System:



NOTE:

The canister is located near the fuel tank, underneath the body.

A137888E02

EVAP System Circuit:

NOTICE:

In this vehicle's EVAP system, turning ON the vent valve does not seal off the EVAP system. To check for leaks in the EVAP system, disconnect the air inlet vent hose and apply pressure from the atmospheric side of the canister.

While the engine is running, if a predetermined condition (closed-loop, etc.) is met, the purge VSV is opened by the ECM and stored fuel vapors in the canister are purged into the intake manifold. The ECM changes the duty cycle ratio of the purge VSV to control purge flow volume.

The purge flow volume is also determined by the intake manifold pressure. Atmospheric pressure is allowed into the canister through the vent valve to ensure that the purge flow is maintained when the negative pressure (vacuum) is applied to the canister.

The following two monitors run to confirm the appropriate EVAP system operation.

1. Key-off monitor

This monitor checks for EVAP (Evaporative Emission) system leaks and canister pump module malfunctions. The monitor starts 5 hours* after the ignition switch is turned OFF. At least 5 hours are required for the fuel to cool down to stabilize the EVAP pressure, thus making the EVAP system monitor more accurate.

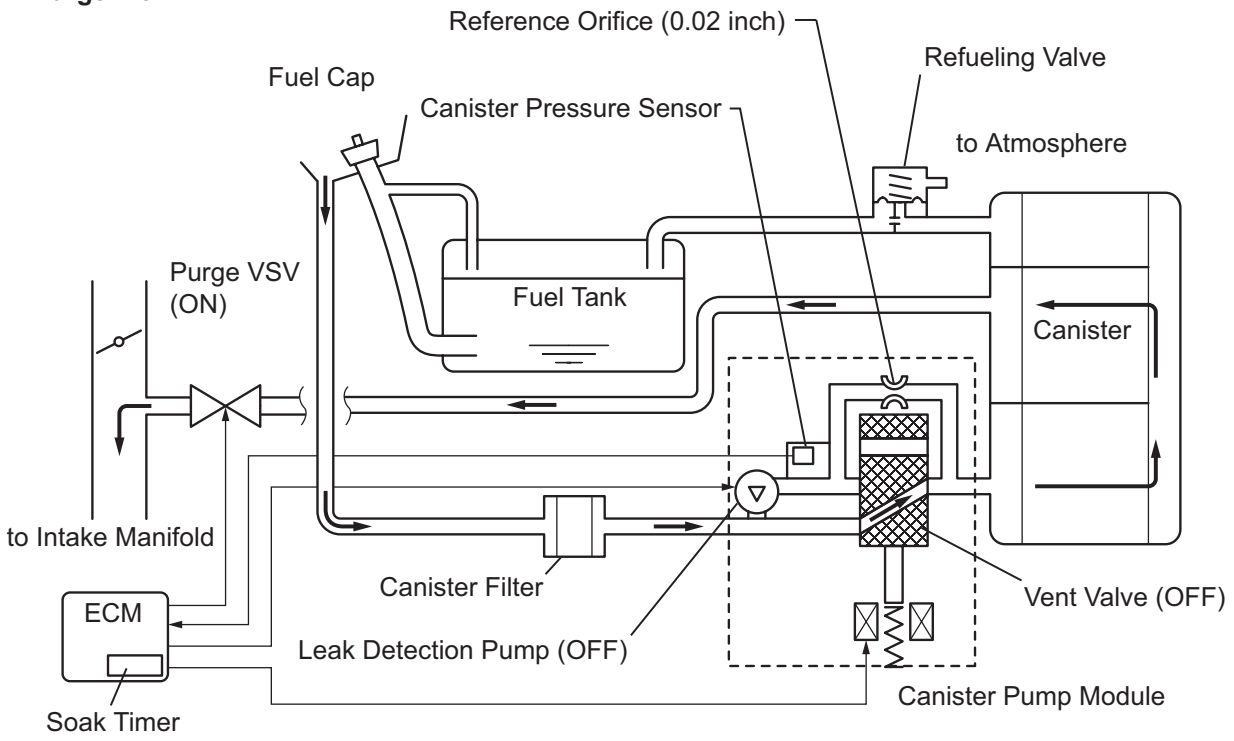
The leak detection pump creates negative pressure (vacuum) in the EVAP system and the pressure is measured. Finally, the ECM monitors for leaks from the EVAP system, and malfunctions in both the canister pump module and purge VSV, based on the EVAP pressure.

HINT:

*: If the engine coolant temperature is not below 35°C (95°F) 5 hours after the ignition switch is turned OFF, the monitor check starts 2 hours later. If it is still not below 35°C (95°F) 7 hours after the ignition switch is turned OFF, the monitor check starts 2.5 hours later.

2. Purge flow monitor

The purge flow monitor consists of 2 monitors. The 1st monitor is conducted every time and the 2nd monitor is activated if necessary.

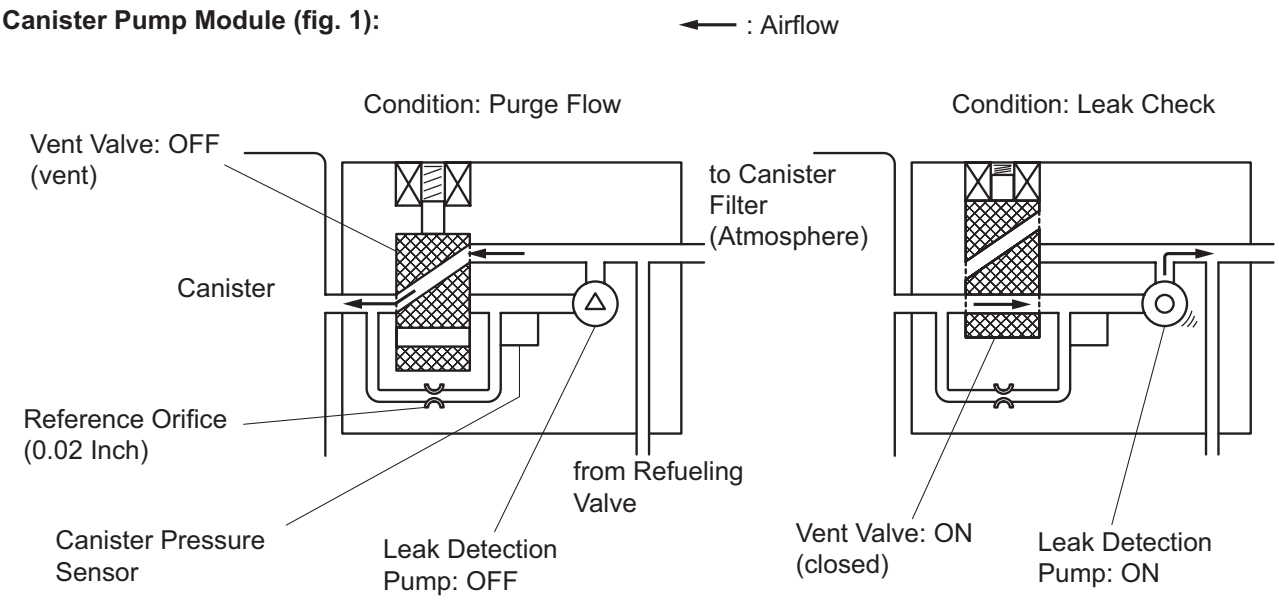


- The 1st monitor
  While the engine is running and the purge VSV (Vacuum Switching Valve) is ON (open), the ECM monitors the purge flow by measuring the EVAP pressure change. If negative pressure is not created, the ECM begins the 2nd monitor.

ES

- The 2nd monitor
  The vent valve is turned OFF (open) and the EVAP pressure is measured. If the variation in the pressure is less than 0.5 kPa-g (3.75 mmHg-g), the ECM interprets this as the purge VSV being stuck closed, and illuminates the MIL and sets DTC P0441 (2 trip detection logic).

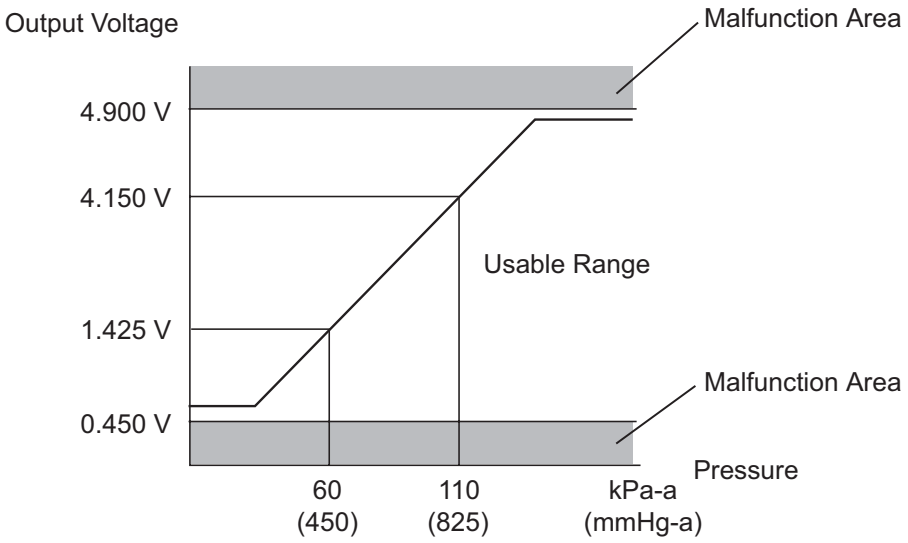
Atmospheric pressure check:
In order to ensure reliable malfunction detection, the variation between the atmospheric pressures, before and after conduction of the purge flow monitor, is measured by the ECM.



EVAP Purge Flow:

Component	Operation
Canister	Contains activated charcoal to absorb EVAP (Evaporative Emissions) generated in fuel tank.
Cut-off valve	Located in fuel tank. Valve floats and closes when fuel tank 100% full.
Purge VSV (Vacuum Switching Valve)	Opens or closes line between canister and intake manifold. ECM uses purge VSV to control EVAP purge flow. In order to discharge EVAP absorbed by canister to intake manifold, ECM opens purge VSV. EVAP discharge volume to intake manifold controlled by purge VSV duty cycle ratio (current-carrying time) (Open: ON; Closed: OFF).
Refueling valve	Controls EVAP pressure from fuel tank to canister. Valve consists of diaphragm, spring and restrictor (diameter: 0.08 inch). When fuel vapor and pressure inside fuel tank increase, valve opens. While EVAP purged, valve closes and restrictor prevents large amount of vacuum from affecting pressure in fuel tank. Valve opened while refueling.
Roll-over valve	Located in fuel tank. Valve closed by its own weight when vehicle overturns to prevent fuel from spilling out.
Soak timer	Built into ECM. To ensure accurate EVAP monitor, measures 5 hours (+-15 min) after ignition switch turned OFF. This allows fuel to cool down, stabilizing EVAP pressure. When approximately 5 hours elapsed, ECM activates (refer to fig. 3).
Canister pump module	Consists of (a) to (d) below. Canister pump module cannot be disassembled.
(a) Vent valve	Vents and closes EVAP system. When ECM turns valve ON, EVAP system closed. When ECM turns valve OFF, EVAP system vented. Negative pressure (vacuum) created in EVAP system to check for EVAP leaks by closing purge VSV, turning on vent valve (closed) and operating leak detection pump (refer to fig. 1).
(b) Canister pressure sensor	Indicates pressure as voltages. ECM supplies regulated 5 V to canister pressure sensor, and uses feedback from sensor to monitor EVAP system pressure (refer to fig. 2).

Component	Operation
(c) Leak detection pump	Creates negative pressure (vacuum) in EVAP system for leak check.
(d) Reference orifice	Has opening with 0.02 inch diameter. Vacuum produced through orifice by closing purge VSV, turning off vent valve and operating leak detection pump, to monitor reference pressure. Reference pressure indicates small leak of EVAP.

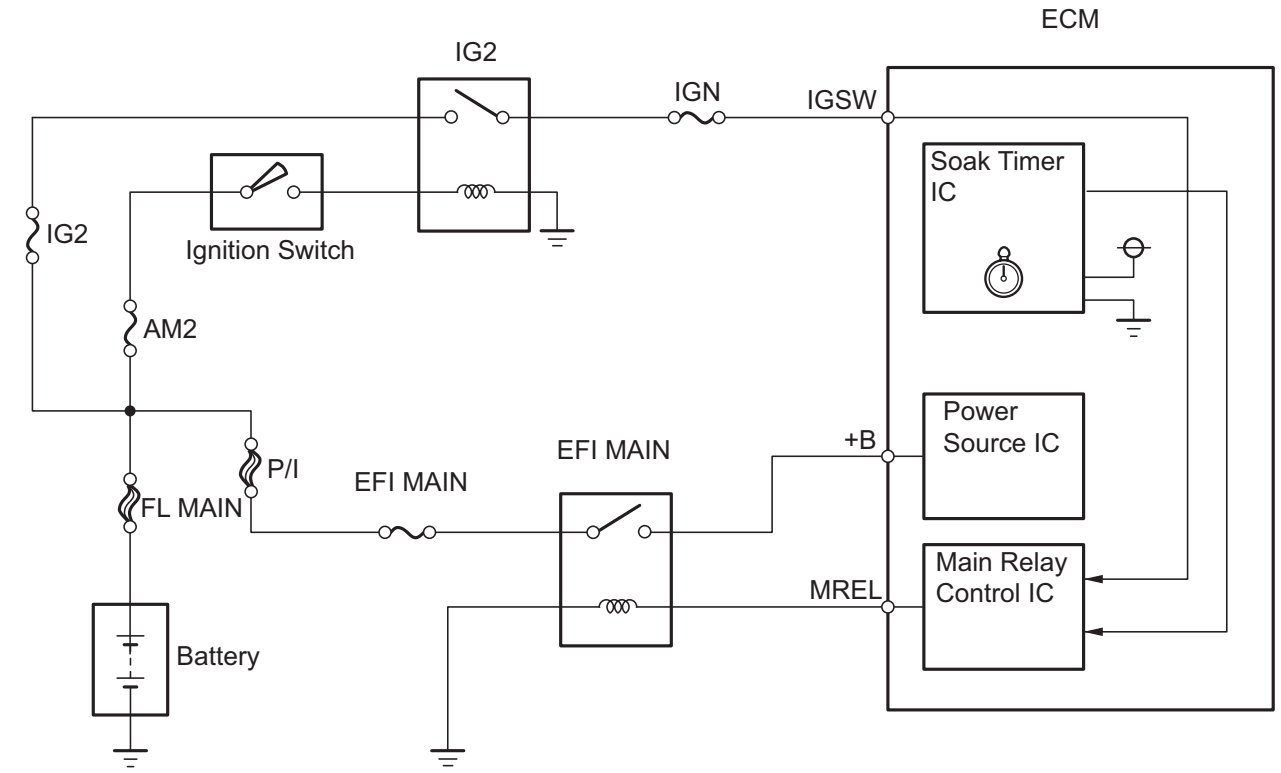


Canister Pump Module (fig. 1):

Y

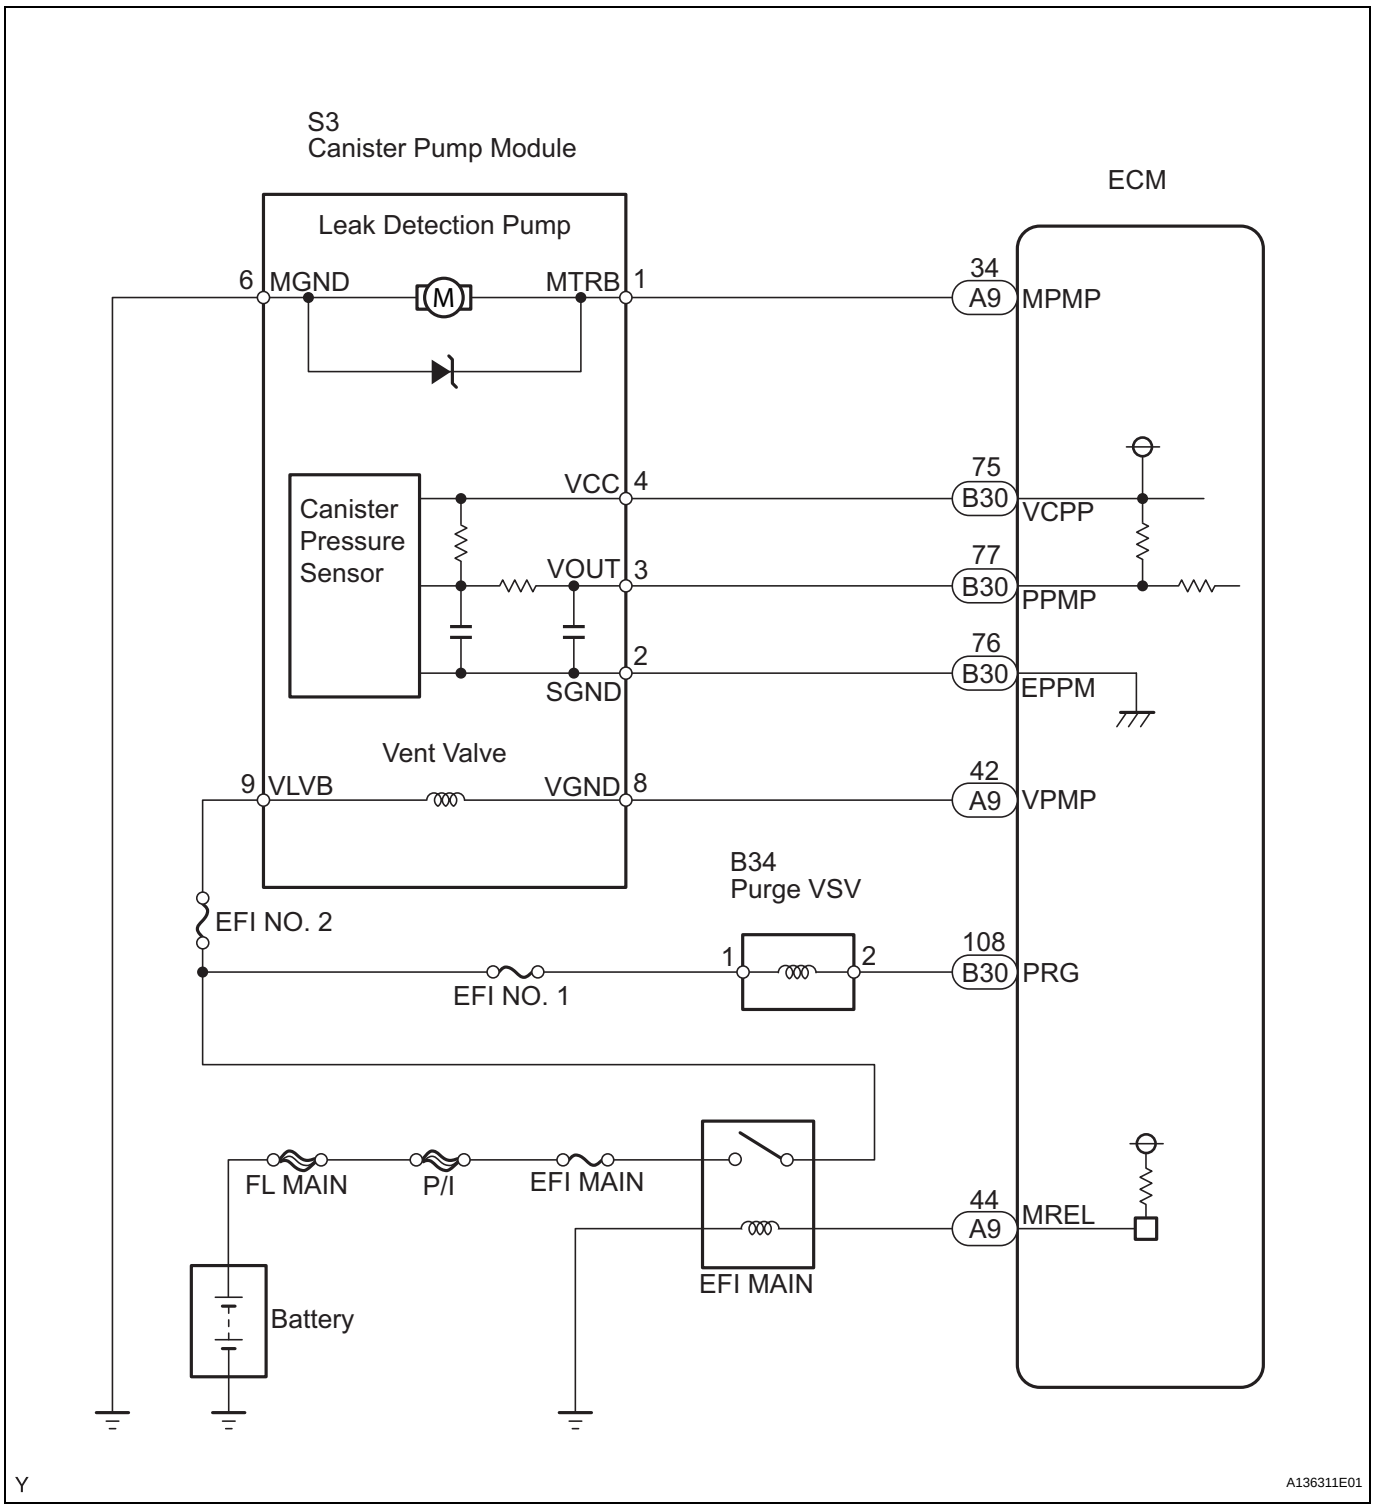
A115902E05

Canister Pressure Sensor Specification (fig. 2):



HINT:

Standard atmospheric pressure is 101.3 kPa-a (760 mmHg-a)



A115543E06

Soak Timer Circuit (fig. 3):

ES

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

The intelligent tester is required to conduct the following diagnostic troubleshooting procedure.

HINT:

- Using intelligent tester monitor results enables the EVAP (Evaporative Emission) system to be confirmed.

- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1	**CONFIRM DTC**

(a) Turn the ignition switch OFF and wait for 10 seconds.
(b) Turn the ignition switch ON.
(c) Turn the ignition switch OFF and wait for 10 seconds.
(d) Connect the intelligent tester to the DLC3.
(e) Turn the ignition switch ON and turn the tester ON.
(f) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(g) Confirm DTCs and freeze frame data.
If any EVAP system DTCs are set, the malfunctioning area can be determined using the table below.
NOTICE:
If the reference pressure difference between the first and second checks is greater than the specification, all the DTCs relating to the reference pressure (P043E, P043F, P2401, P2402 and P2419) are stored.

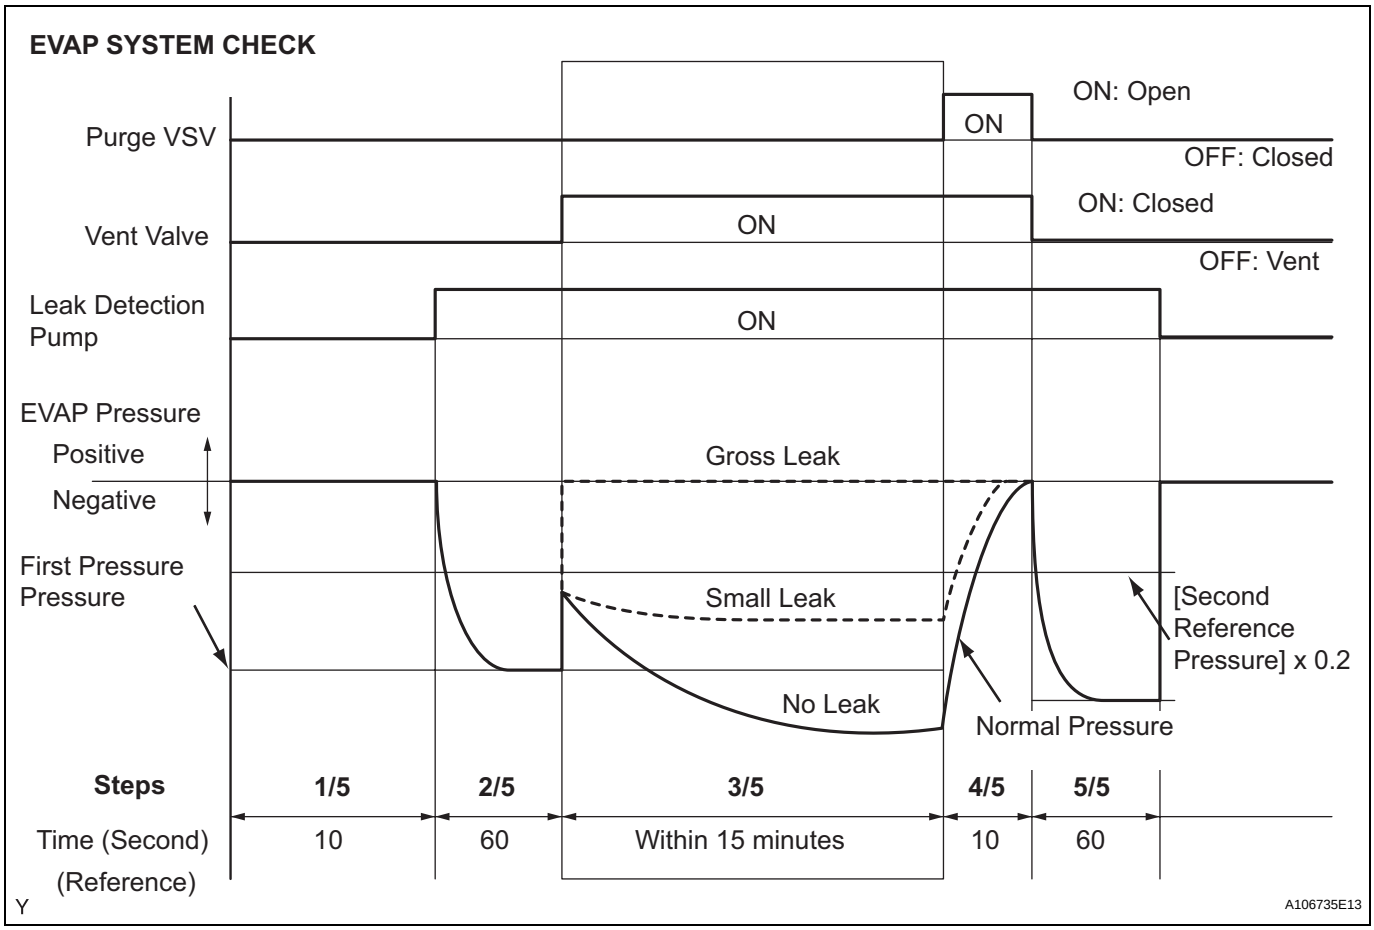
2	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of 5 steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine during this operation.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**



(a) Clear DTCs (see page ES-39).

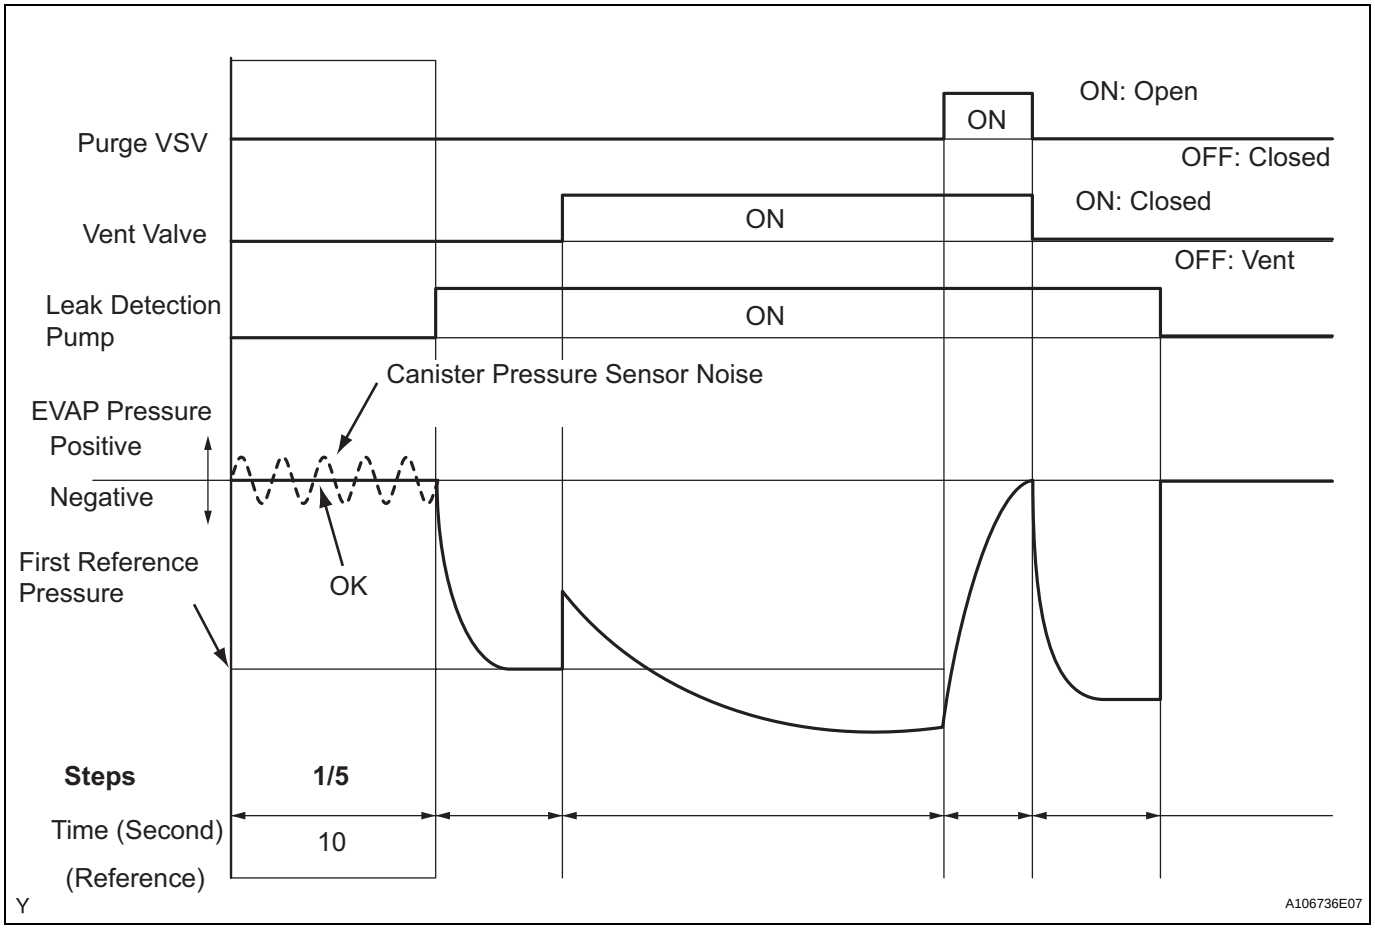
(b) On the tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.
(c) After the EVAP SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTCs are displayed, perform the MONITOR CONFIRMATION (see "Diagnostic Help" menu). After this confirmation, check for pending DTCs. If no DTCs are displayed, the EVAP system is normal.

NEXT

ES

3	PERFORM EVAP SYSTEM CHECK (MANUAL OPERATION)

NOTICE:



- **In the EVAP SYSTEM CHECK (MANUAL OPERATION), perform the series of 5 EVAP SYSTEM CHECK steps manually using the intelligent tester.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine during this operation.**

- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing the EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

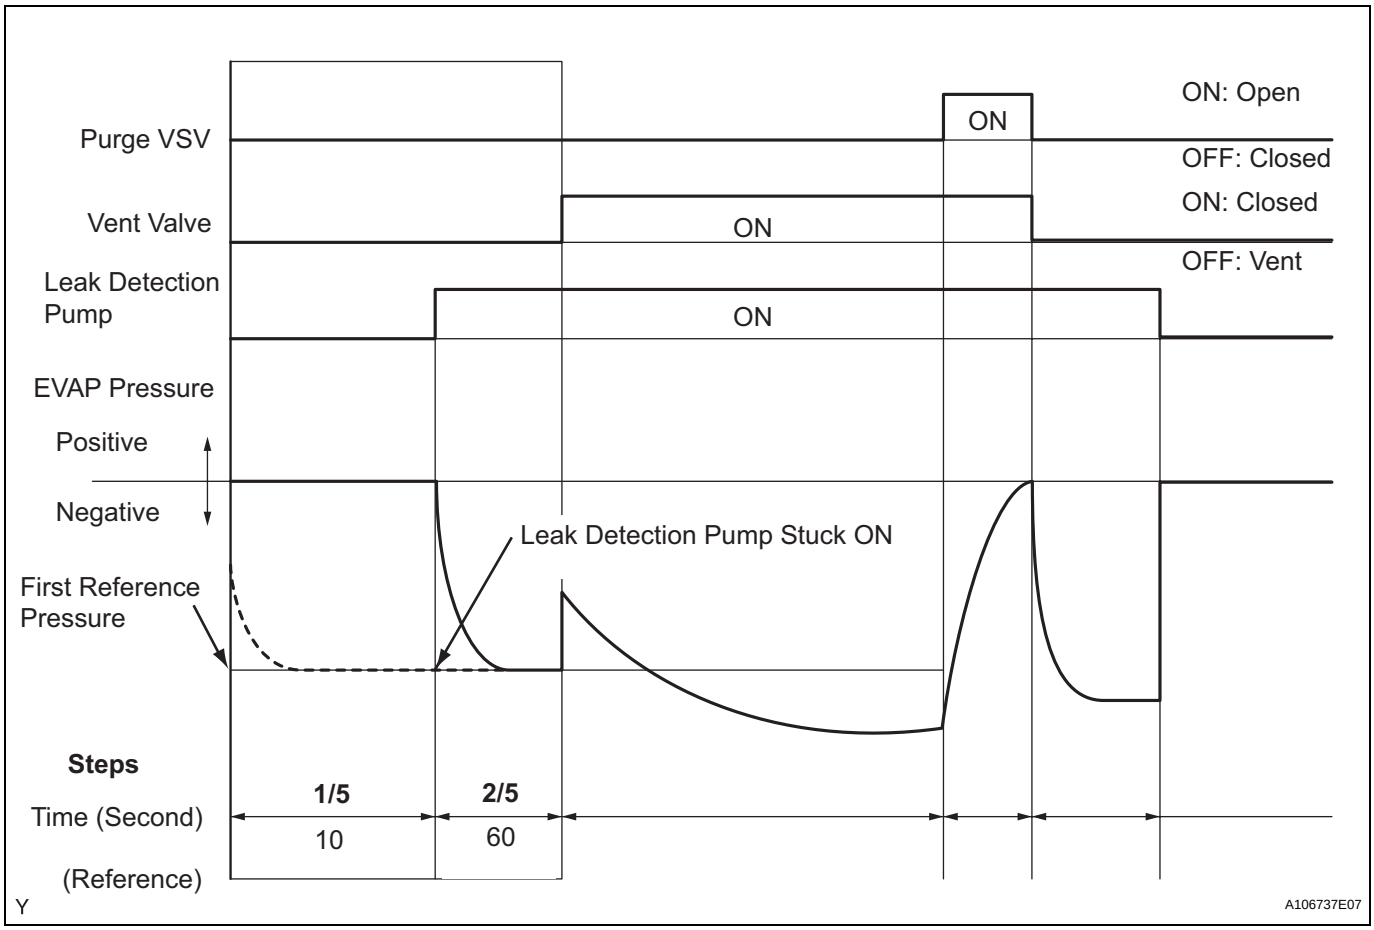
(a) Clear DTCs (See page ES-39).
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / MANUAL OPERATION.

NEXT

4	PERFORM EVAP SYSTEM CHECK (STEP 1/5)

(a) Check the EVAP pressure in step 1/5.

Result



DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	Virtually no variation in EVAP pressure	Not yet determined	A
P0451	EVAP pressure fluctuates by +-0.3 kPa-g (2.25 mmHg-g) or more	Canister pressure sensor noise	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

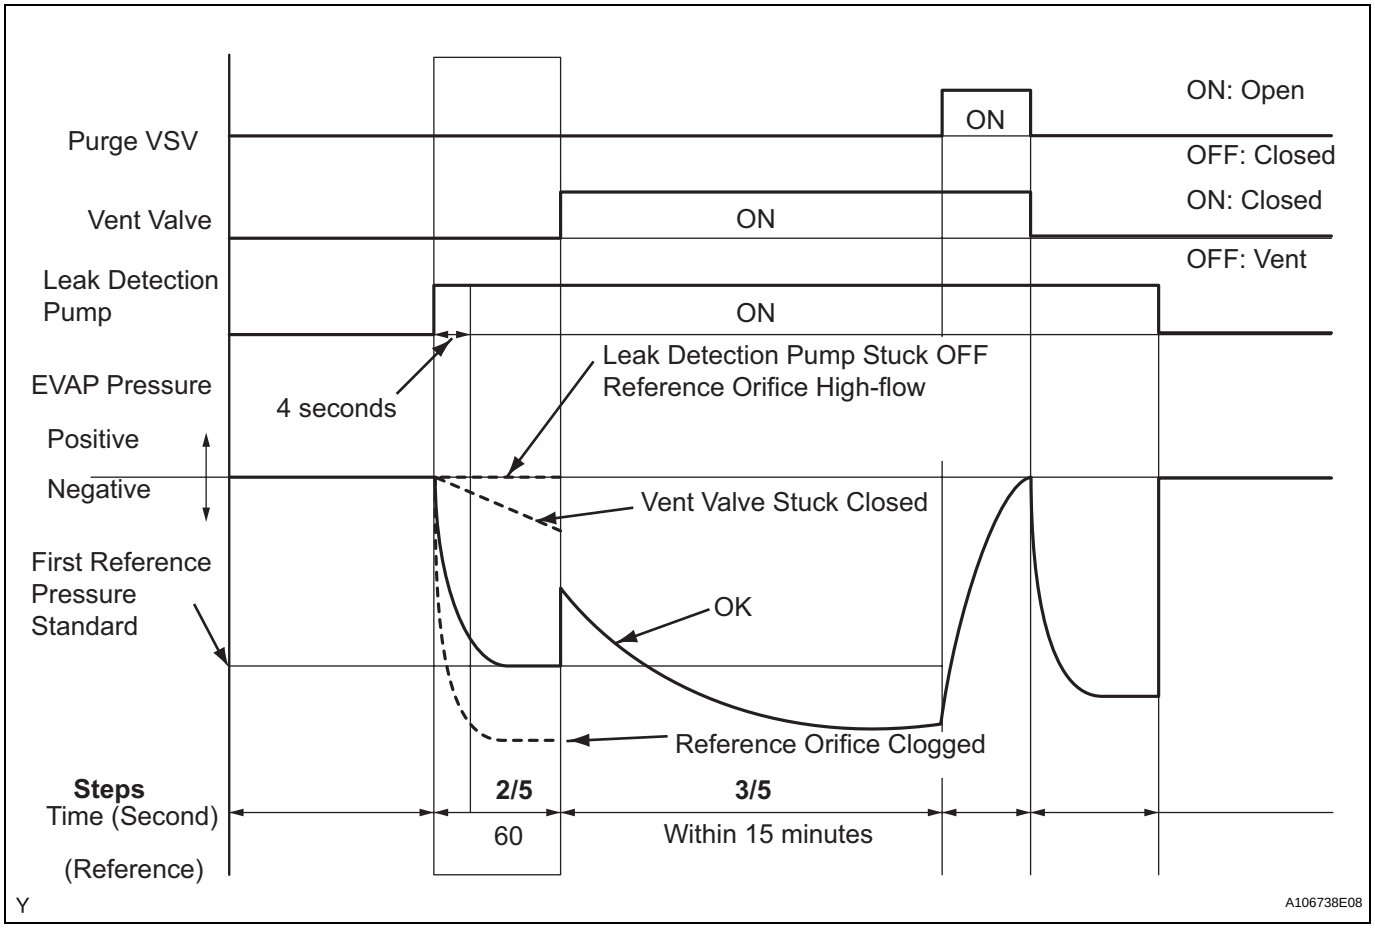
B	Go to step 29

A

5	PERFORM EVAP SYSTEM CHECK (STEP 1/5 TO 2/5)

(a) Check the EVAP pressure in steps 1/5 and 2/5.

Result



DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	Virtually no variation in EVAP pressure during step 1/5. Then decreases to reference pressure	Not yet determined	A
P2402	Small difference between EVAP pressures during steps 1/5 and 2/5	Leak detection pump stuck ON	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.
HINT:
The first reference pressure is the value determined in step 2/5.

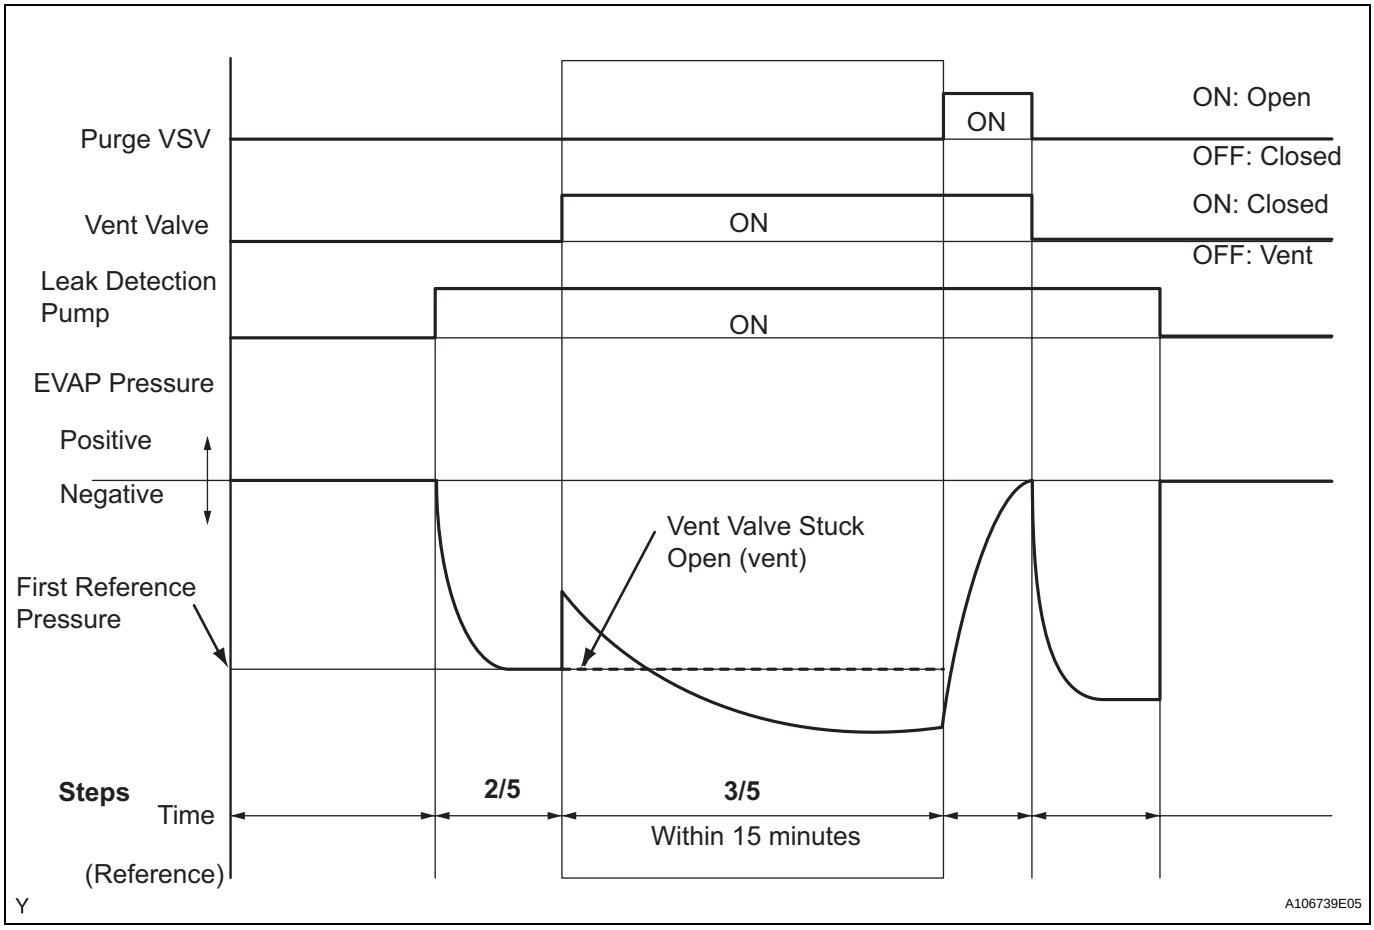
B → Go to step 22

A

6	PERFORM EVAP SYSTEM CHECK (STEP 2/5)

HINT:
Make a note of the pressures checked in steps (a) and (b) below.
(a) Check the EVAP pressure 4 seconds after the leak detection pump is activated*.
*: The leak detection pump begins to operate as step 1/5 finishes and step 2/5 starts.
(b) Check the EVAP pressure again when it has stabilized. This pressure is the reference pressure.

Result



DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure in step (b) between -4.85 kPa-g and -1.057 kPa-g (-36.4 mmHg-g and -7.93 mmHg-g)	Not yet determined	A
P043F and P2401	EVAP pressure in step (b) -1.057 kPa-g (-7.93 mmHg-g) or more	• Reference orifice high-flow • Leak detection pump stuck OFF	B
P043E	EVAP pressure in step (b) below -4.85 kPa-g (-36.4 mmHg-g)	Reference orifice clogged	C
P2419	EVAP pressure in step (a) more than -1.057 kPa-g (-7.93 mmHg-g)	Vent valve stuck closed	D

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

B	Go to step 11
C	Go to step 29
D	Go to step 20

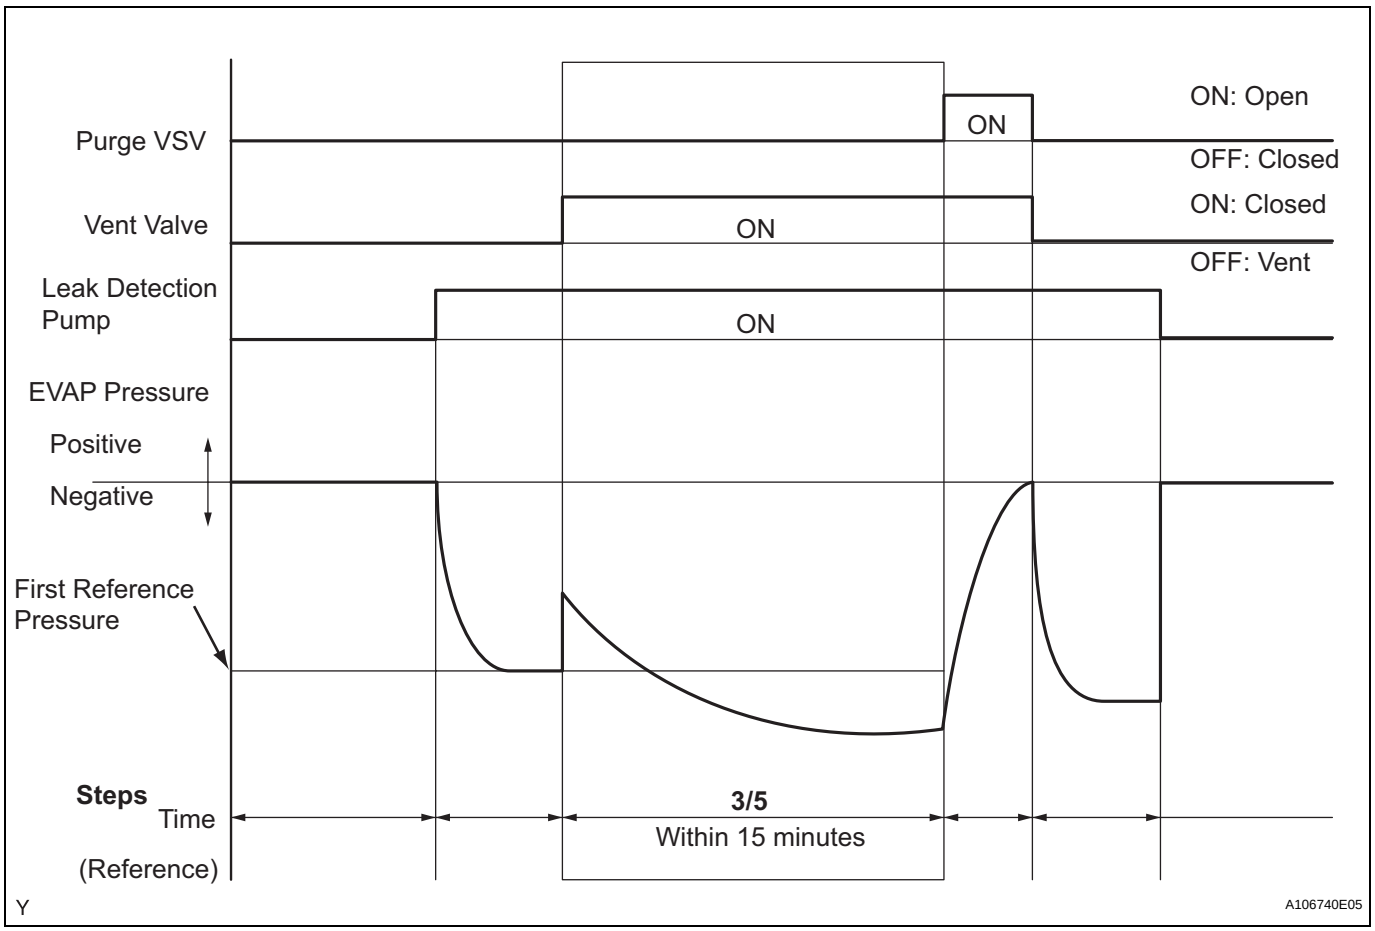
A

7	PERFORM EVAP SYSTEM CHECK (STEP 2/5 TO 3/5)

(a) Check the EVAP pressure increase in step 3/5.

Result

DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 2/5 to step 3/5	Not yet determined	A
P2420	No variation in EVAP pressure despite proceeding from step 2/5 to step 3/5	Vent valve stuck open (vent)	B
P0451	No variation in EVAP pressure during steps 1/5 through 3/5	Canister pressure sensor output value stuck	C



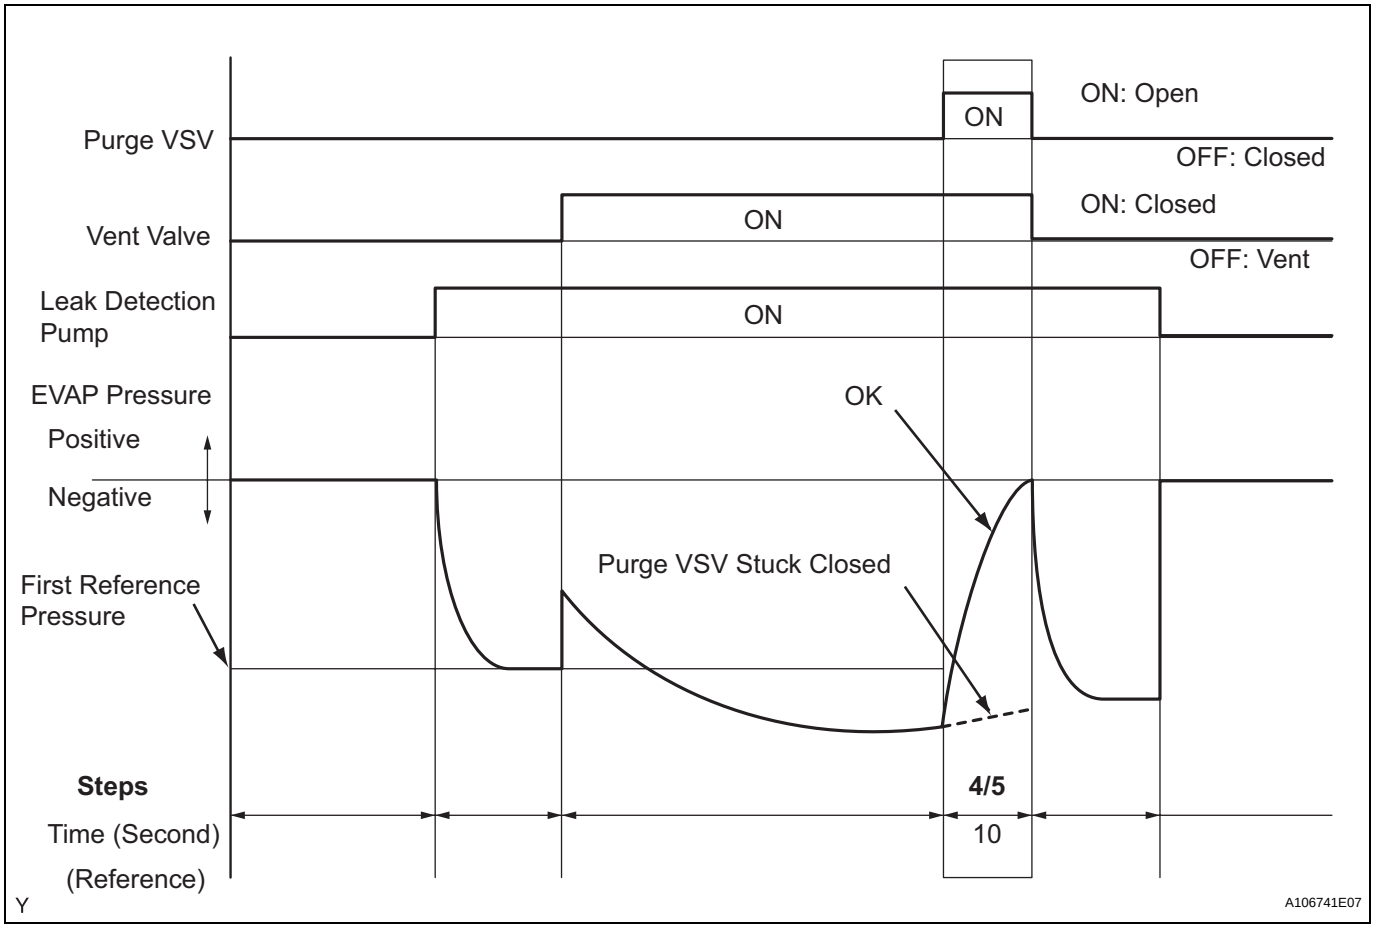
*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

B	Go to step 19

C	Go to step 29

A

8	PERFORM EVAP SYSTEM CHECK (STEP 3/5)



(a) Wait until the EVAP pressure change is less than 0.1 kPa-g (0.75 mmHg-g) for 30 seconds.
(b) Measure the EVAP pressure and record it.
HINT:
A few minutes are required for the EVAP pressure to become saturated. When there is little fuel in the fuel tank, it takes up to 15 minutes.

NEXT

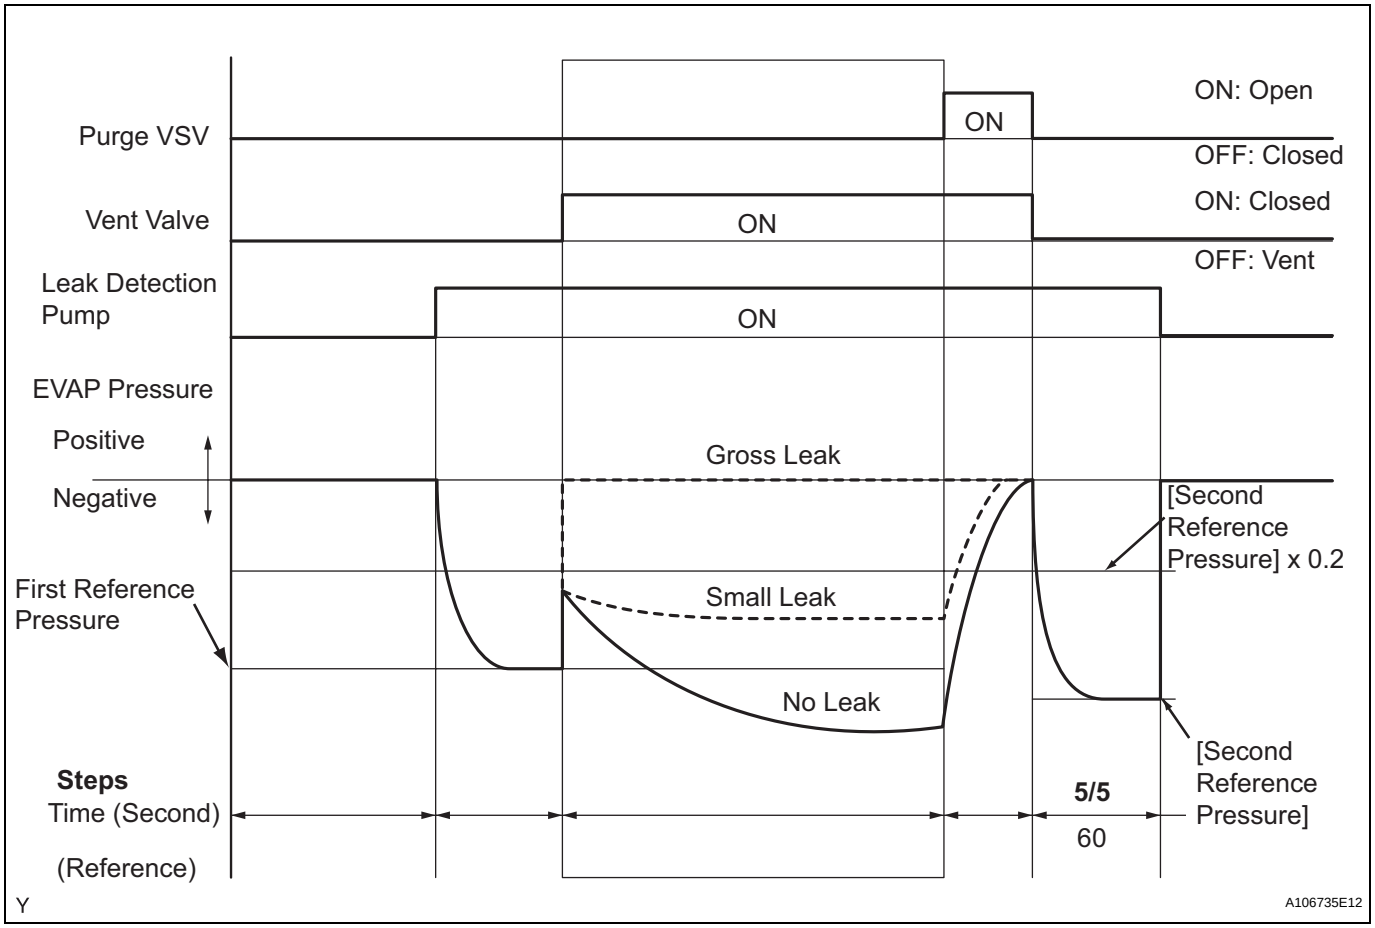
ES

9	PERFORM EVAP SYSTEM CHECK (STEP 4/5)

(a) Check the EVAP pressure in step 4/5.

Result

DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Not yet determined	A
P0441	EVAP pressure increases by 0.3 kPa-g (2.25 mmHg-g) or more within 10 seconds of proceeding from step 3/5 to step 4/5	Problems in EVAP hose between purge VSV and intake manifold	B
P0441	Variation in EVAP pressure less than 0.3 kPa-g (2.25 mmHg-g) for 10 seconds, after proceeding from step 3/5 to step 4/5	Purge VSV stuck closed	C



*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

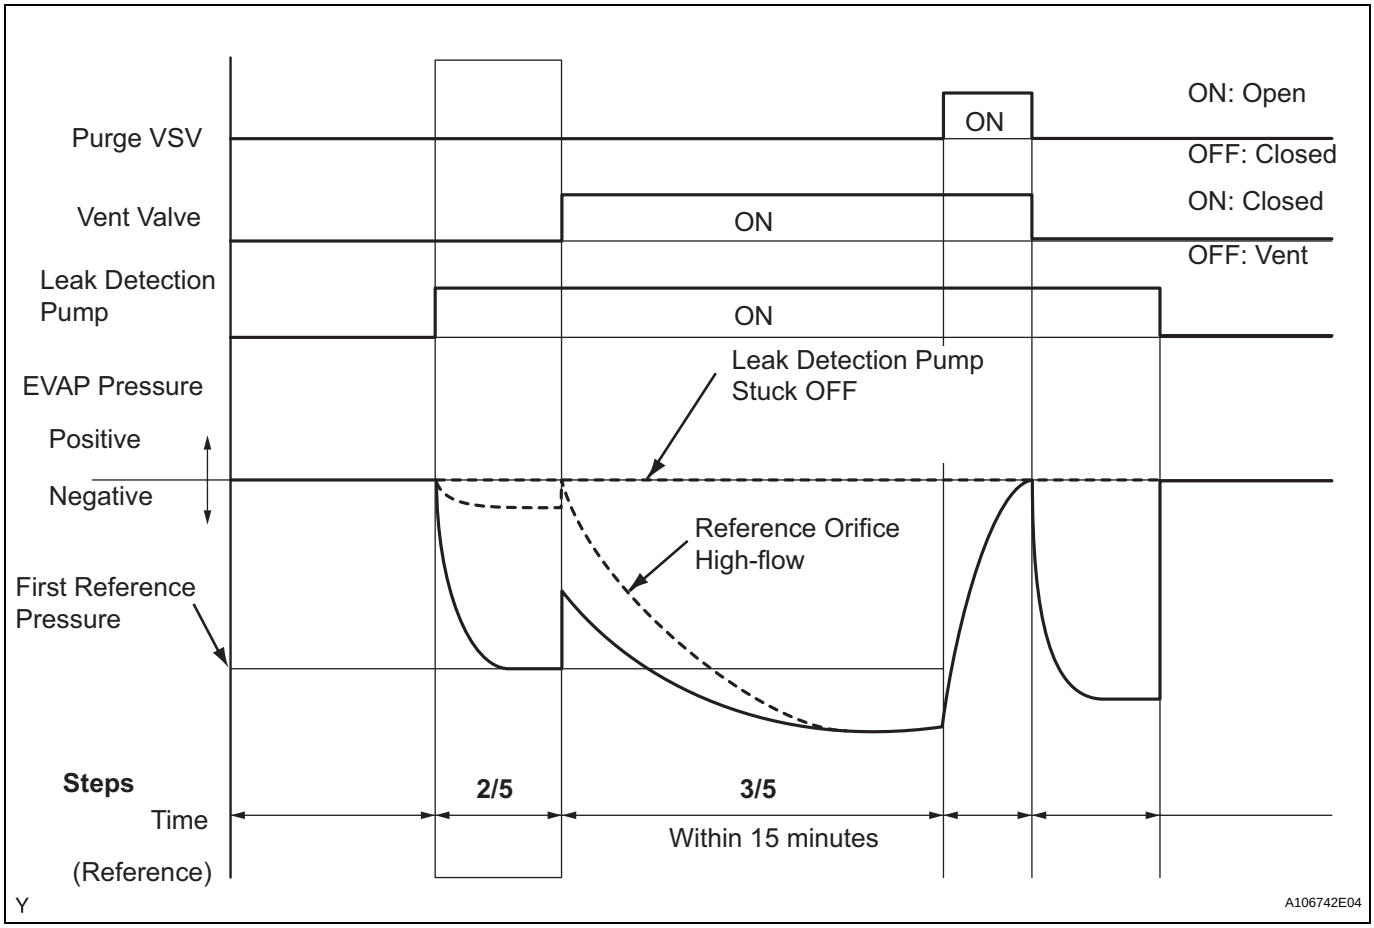
B → Go to step 15

C → Go to step 12

A

10	PERFORM EVAP SYSTEM CHECK (STEP 5/5)

(a) Check the EVAP pressure in step 5/5.
(b) Compare the EVAP pressure in step 3/5 and the second reference pressure (step 5/5).



Result

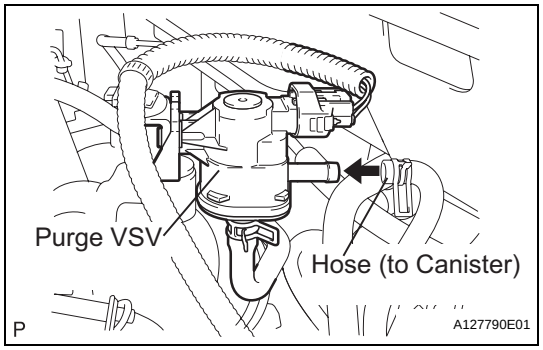
DTCs*	Test Result	Suspected Trouble Area	Proceed to
-	EVAP pressure (step 3/5) lower than second reference pressure (step 5/5)	Not yet determined (no leakage from EVAP system)	A
P0441 and P0455	EVAP pressure (step 3/5) higher than [second reference pressure (step 5/5) x 0.2]	• Purge VSV stuck open • EVAP gross leak	B
P0456	EVAP pressure (step 3/5) higher than second reference pressure (step 5/5)	EVAP small leak	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.

A	Go to step 35
B	Go to step 12

11	PERFORM EVAP SYSTEM CHECK (STEP 3/5)

(a) Check the EVAP pressure in step 3/5.



Result

DTCs*	Test Result	Suspected Trouble Area	Proceed to
P043F	EVAP pressure less than [reference pressure] measured at 2/5	Reference orifice high-flow	A
P2401	EVAP pressure almost same as [reference pressure] measured at 2/5	Leak detection pump stuck OFF	B

*: These DTCs are already present in the ECM when the vehicle arrives and are confirmed in the "CONFIRM DTC" procedures above.
HINT:
The first reference pressure is the value determined in step 2/5.

A	Go to step 29
B	Go to step 22

12 PERFORM ACTIVE TEST USING INTELLIGENT TESTER (PURGE VSV)

(a) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / EVAP VSV (ALONE).
(b) Disconnect the hose (connected to the canister) from the purge VSV.
(c) Start the engine.
(d) Using the tester, turn off the purge VSV (EVAP VSV: OFF).
(e) Use your finger to confirm that the purge VSV has no suction.
(f) Using the tester, turn on the purge VSV (EVAP VSV: ON).
(g) Use your finger to confirm that the purge VSV has suction.

ES

Result

Test Result	Suspected Trouble Area	Proceed to
No suction when purge VSV turned OFF, and suction applied when turned ON	Purge VSV normal	A
Suction applied when purge VSV turned OFF	Purge VSV stuck open	B
No suction when purge VSV turned ON	• Purge VSV stuck closed • Problems with EVAP hose between purge VSV and intake manifold	C

(h) Reconnect the hose.

B → Go to step 14

C → Go to step 15

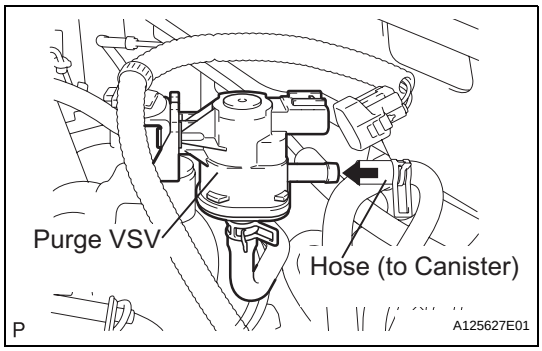
A

13 CHECK FUEL CAP ASSEMBLY

(a) Check that the fuel cap is correctly installed and confirm the fuel cap meets OEM specifications.
(b) Tighten the fuel cap until a few click sounds are heard.
HINT:
If an EVAP tester is available, check the fuel cap using the tester.
1. Remove the fuel cap and install it onto a fuel cap adapter.
2. Connect an EVAP tester pump hose to the adapter, and pressurize the cap to 3.2 to 3.7 kPa (24 to 28 mmHg) using an EVAP tester pump.
3. Seal the adapter and wait for 2 minutes.
4. Check the pressure. If the pressure is 2 kPa (15 mmHg) or more, the fuel cap is normal.

Result

Test Result	Suspected Trouble Area	Proceed to
Fuel cap correctly installed	-	A



Test Result	Suspected Trouble Area	Proceed to
Fuel cap loose	• Fuel cap improperly installed • Defective fuel cap • Fuel cap does not meet OEM specifications	B
Defective fuel cap	-	B
No fuel cap	-	C

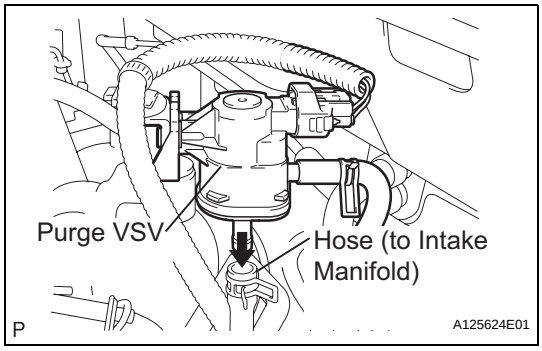
(c) Reinstall the fuel cap.

A	Go to step 28
B	Go to step 26
C	Go to step 27

ES

14 INSPECT PURGE VSV

(a) Turn the ignition switch OFF.
(b) Disconnect the B34 purge VSV connector.
(c) Disconnect the hose (connected to the canister) from the purge VSV.
(d) Start the engine.
(e) Use your finger to confirm that the purge VSV has no suction.



Result

Test Result	Suspected Trouble Area	Proceed to
No suction	ECM	A
Suction applied	Purge VSV	B

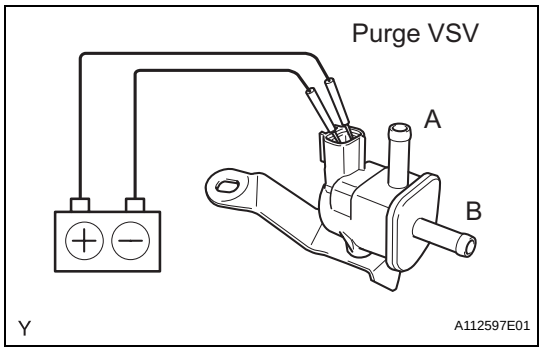
(f) Reconnect the purge VSV connector.
(g) Reconnect the hose.

A	Go to step 34
B	Go to step 30

15 CHECK EVAP HOSE (PURGE VSV - INTAKE MANIFOLD)

(a) Disconnect the hose (connected to the intake manifold) from the purge VSV.
(b) Start the engine.
(c) Use your finger to confirm that the hose has suction.

Result



Test Result	Suspected Trouble Area	Proceed to
Suction applied	EVAP hose between purge VSV and intake manifold normal	A
No suction	• Intake manifold port • EVAP hose between purge VSV and intake manifold	B

(d) Reconnect the hose.

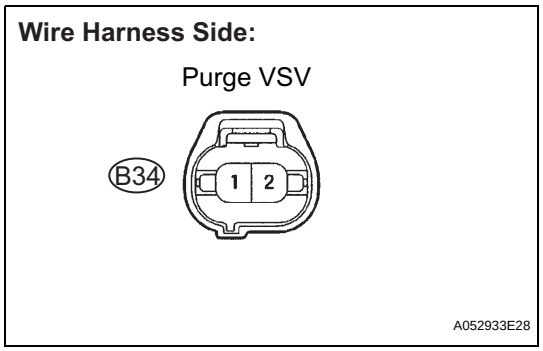
B → Go to step 25

A

16 INSPECT PURGE VSV

(a) Remove the purge VSV.
(b) Apply the battery voltage to the terminals of the purge VSV.
(c) Using an air gun, confirm that air flows from port A to port B.

Result



Test Result	Suspected Trouble Area	Proceed to
Air flows	-	A
No air flow	Purge VSV	B

(d) Install the purge VSV.

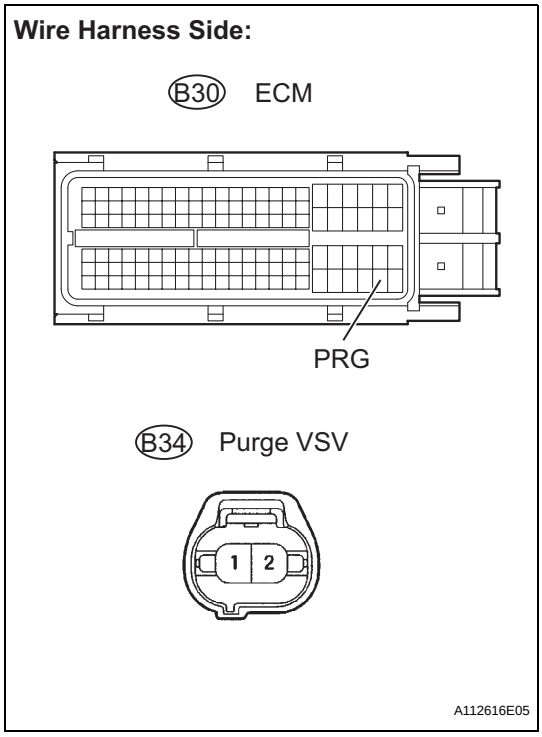
B → Go to step 30

A

17 CHECK WIRE HARNESS (POWER SOURCE OF PURGE VSV)

(a) Disconnect the B34 purge VSV connector.
(b) Turn the ignition switch ON.
(c) Measure the voltage between terminal 1 of the purge VSV connector and the body ground.

Result



Test Result	Suspected Trouble Area	Proceed to
9 to 14 V	Normal	A
Other than result above	Wire harness or connectors between purge VSV and ECM	B

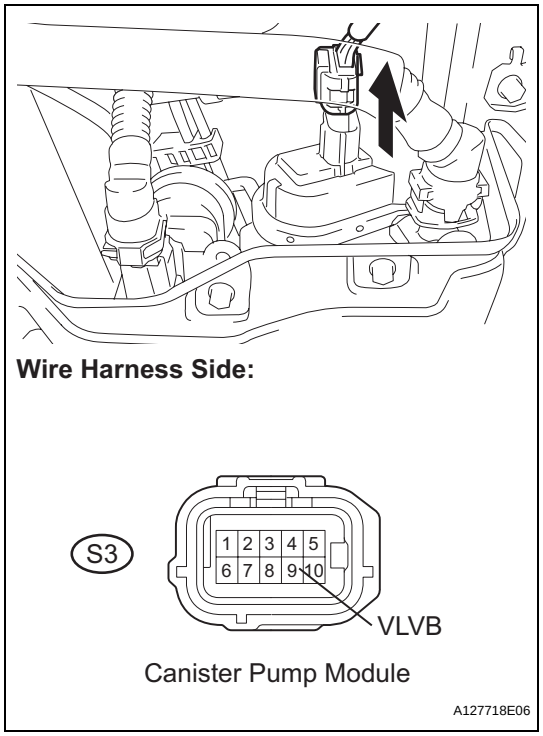
(d) Reconnect the purge VSV connector.

B	Go to step 31

A

18	CHECK WIRE HARNESS (PURGE VSV - ECM)

(a) Disconnect the B30 ECM connector and the B34 purge VSV connector.
(b) Measure the resistance.



Standard resistance

Tester Connection	Specified Condition
B30-108 (PRG) - B34-2 (Purge VSV)	Below 1 Ω
B30-108 (PRG) - Body ground	10 kΩ or higher
B34-2 (Purge VSV) - Body ground	10 kΩ or higher

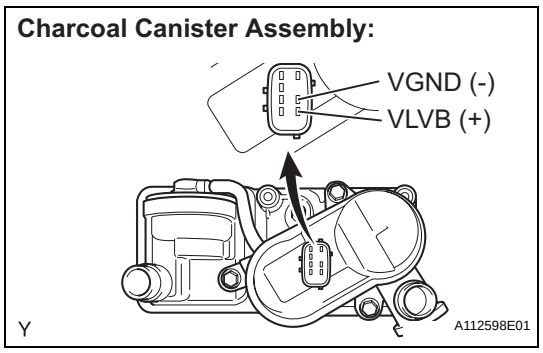
(c) Reconnect the purge VSV connector.
(d) Reconnect the ECM connector.

OK	Go to step 34
NG	Go to step 31

19 INSPECT CANISTER PUMP MODULE (POWER SOURCE FOR VENT VALVE)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Turn the ignition switch ON.
(d) Measure the voltage between VLVB terminal of the canister pump module connector and the body ground.

Result



Test Result	Suspected Trouble Area	Proceed to
9 to 14 V	1. Wire harness between vent valve and ECM 2. Vent valve 3. ECM	A
Below 3 V	Power source wire harness of vent valve	B

(e) Reconnect the canister pump module connector.

B → Go to step 31

A

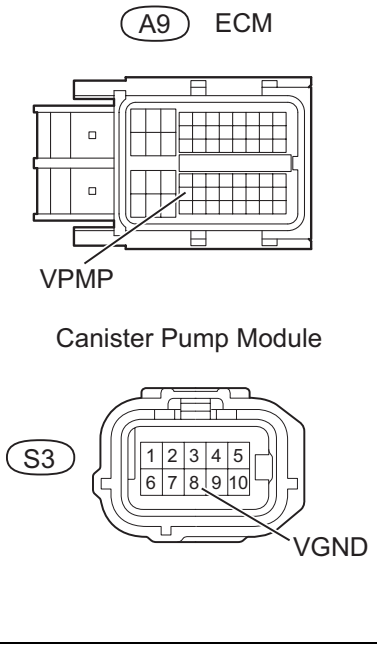
20 INSPECT CANISTER PUMP MODULE (VENT VALVE OPERATION)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Apply the battery voltage to VLVB and VGND terminals of the canister pump module.
(d) Touch the canister pump module to confirm the vent valve operation.

Result

Test Result	Suspected Trouble Area	Proceed to
Operating	1. Wire harness between vent valve and ECM 2. ECM	A

Test Result	Suspected Trouble Area	Proceed to
Not operating	Vent valve	B



(e) Reconnect the canister connector.

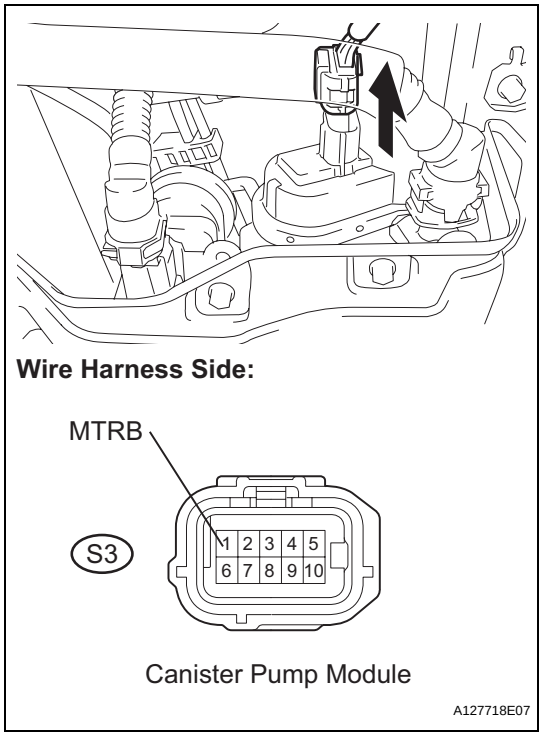
B	Go to step 29

A

21 CHECK WIRE HARNESS (ECM - CANISTER PUMP MODULE)

Wire Harness Side:

(a) Disconnect the A9 ECM connector.
(b) Disconnect the S3 canister pump module connector.
(c) Measure the resistance between VPMP terminal of the ECM connector and VGND terminal of the canister pump module connector.



Result

Test Result	Suspected Trouble Area	Proceed to
Below 1 Ω	ECM	A
10 kΩ or higher	Wire harness between ECM and canister pump module	B

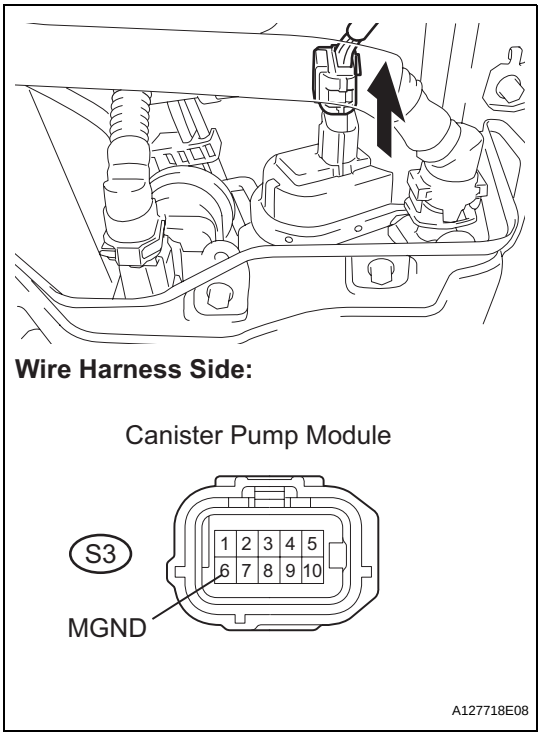
(d) Reconnect the ECM connector.
(e) Reconnect the canister pump module connector.

A	Go to step 34
B	Go to step 31

22	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (VACUUM PUMP (ALONE))

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Turn the ignition switch ON.
(d) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / VACUUM PUMP.
(e) Measure the voltage between MTRB terminal 1 of the canister pump module connector and the body ground when the leak detection pump is turned ON and OFF using the tester.

ES



Result

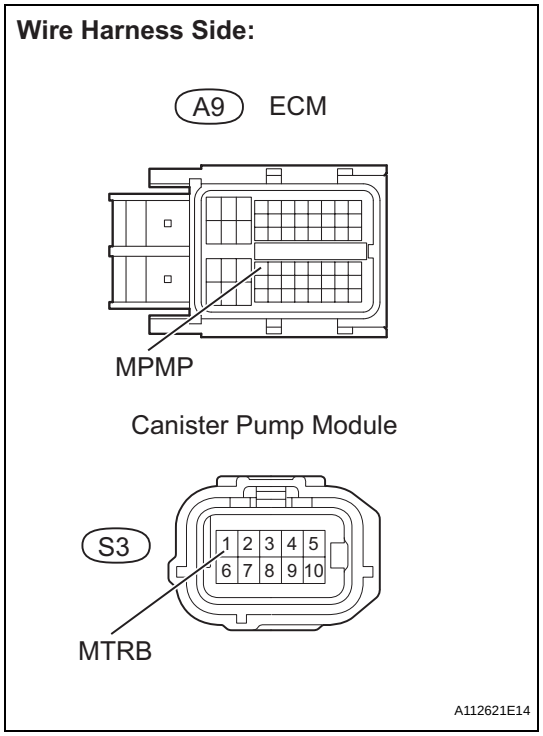
Test Result	Suspected Trouble Area	Proceed to
Below 3 V when OFF 9 to 14 V when ON	1. Wire harness between leak detection pump and body ground 2. Leak detection pump	A
Below 3 V when OFF and ON	1. Wire harness between leak detection pump and ECM 2. ECM	B

B → Go to step 24

A

23	CHECK WIRE HARNESS (CANISTER PUMP MODULE - BODY GROUND)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Check the resistance between MGND terminal of the canister pump module connector and the body ground.



Result

Test Result	Suspected Trouble Area	Proceed to
Below 1 Ω	Leak detection pump	A
10 kΩ or higher	Wire harness between canister pump module and body ground	B

(d) Reconnect the canister pump module connector.

A	Go to step 29
B	Go to step 31

24 CHECK WIRE HARNESS (ECM - CANISTER PUMP MODULE)

(a) Turn the ignition switch OFF.
(b) Disconnect the S3 canister pump module connector.
(c) Disconnect the A9 ECM connector.
(d) Measure the resistance between MPMP terminal of the ECM connector and MTRB terminal of the canister pump module connector.

Result

Test Result	Suspected Trouble Area	Proceed to
Below 1 Ω	ECM	A
10 kΩ or higher	Wire harness between ECM and canister pump module	B

(e) Reconnect the canister pump module connector.
(f) Reconnect the ECM connector.

A	Go to step 34
B	Go to step 31

25 INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Stop the engine.
(b) Disconnect the EVAP hose from the intake manifold.
(c) Start the engine.
(d) Use your finger to confirm that the port of the intake manifold has suction.

Result

Test Result	Suspected Trouble Area	Proceed to
Suction applied	EVAP hose between intake manifold and purge VSV	A
No suction	Intake manifold	B

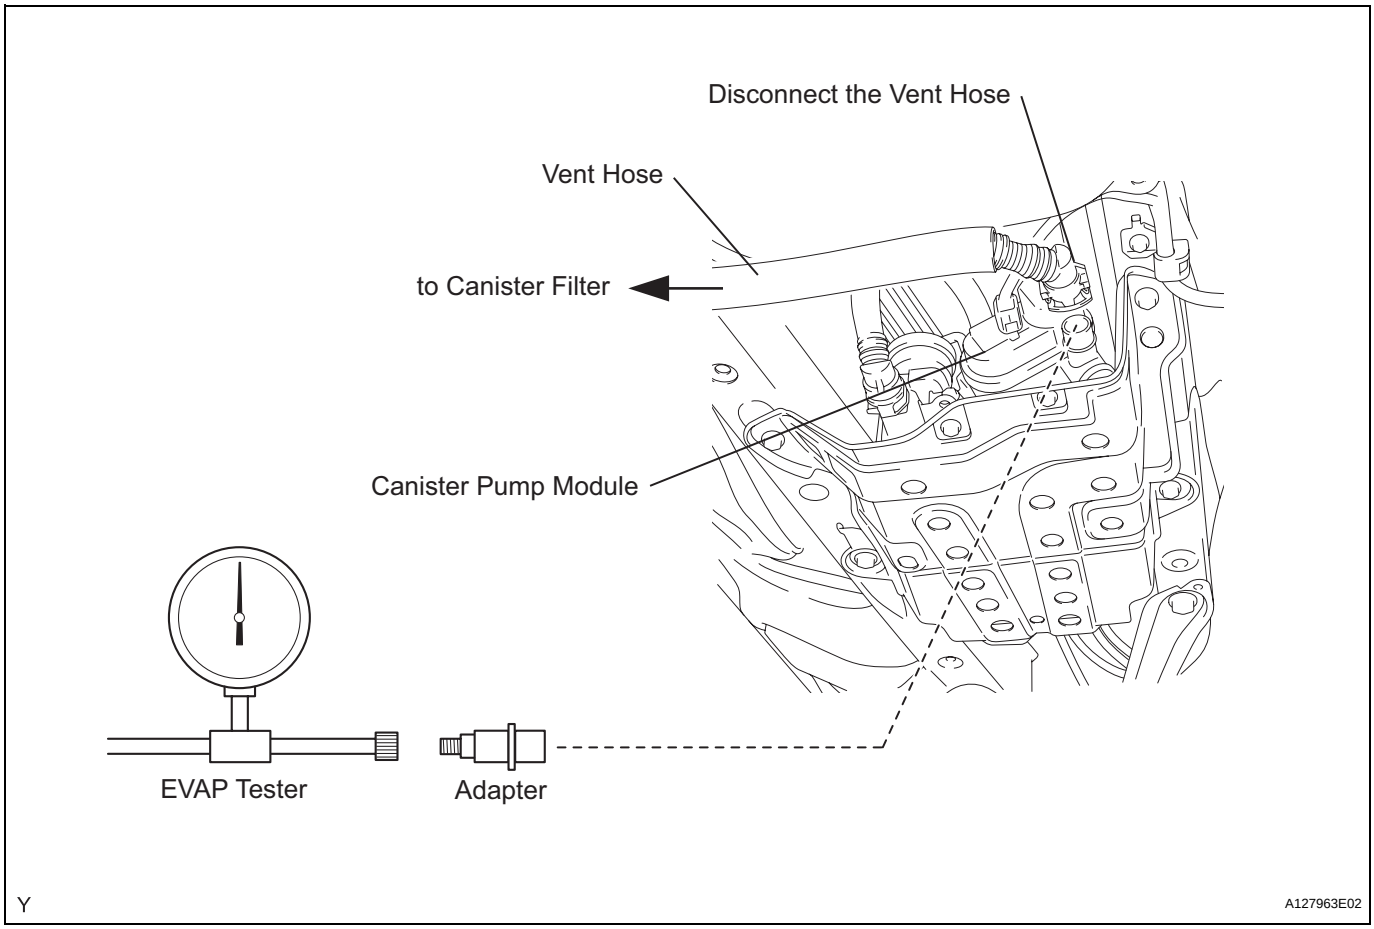
(e) Reconnect the EVAP hose.

A	Go to step 32
B	Go to step 33

26	CORRECTLY REINSTALL OR REPLACE FUEL CAP

HINT:
- When reinstalling the fuel cap, tighten it until a few click sounds are heard.
- When replacing the fuel cap, use a fuel cap that meets OEM specifications, and install it until a few click sounds are heard.

NEXT	Go to step 36



27	REPLACE FUEL CAP

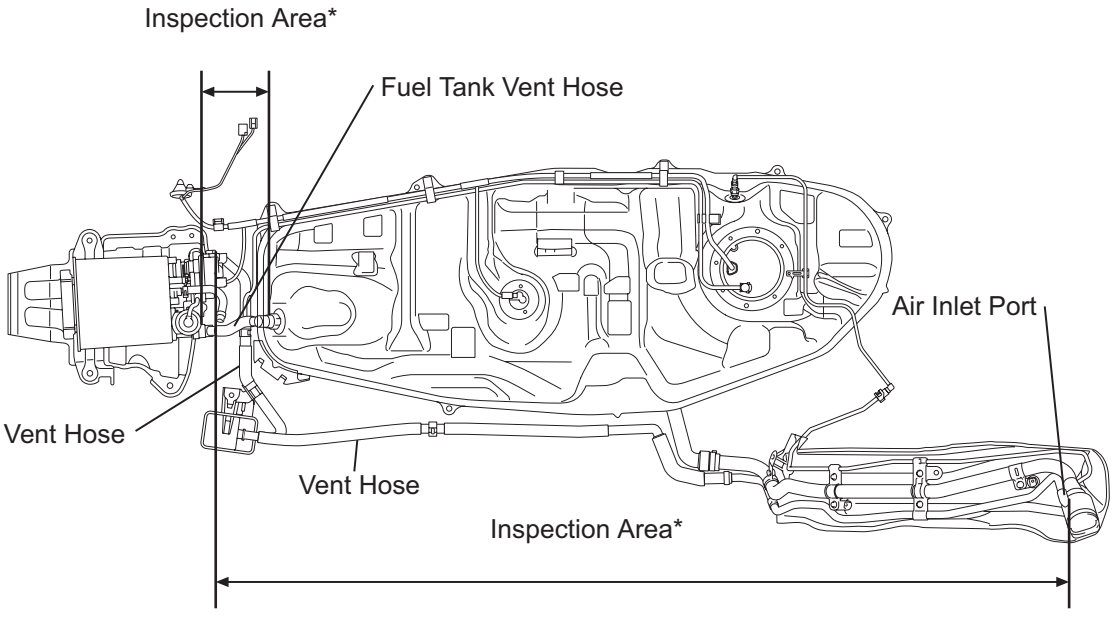
ES

HINT:
When installing the fuel cap, tighten it until a few click sounds are heard.

NEXT	Go to step 36

28	LOCATE EVAP LEAK PART

(a) Disconnect the vent hose.
(b) Connect the EVAP tester to the canister pump module with the adapter.



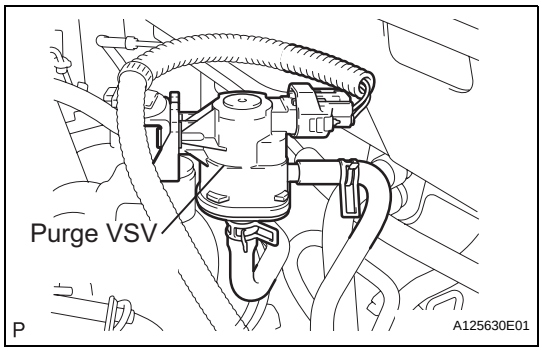
(c) Pressurize the EVAP system to 3.2 to 3.7 kPa (24 to 28 mmHg).
(d) Apply soapy water to the piping and connecting parts of the EVAP system.
(e) Look for areas where bubbles appear. This indicates the leak point.
(f) Repair or replace the leak point.
HINT:
Disconnect the hose between the canister and the fuel tank from the canister. Block the canister side and conduct an inspection. In this way, the fuel tank can be excluded as an area suspected of causing fuel leaks.

NEXT	Go to step 36

ES

29	REPLACE CHARCOAL CANISTER ASSEMBLY

(a) Replace the canister assembly (see page EC-10).
NOTICE:
When replacing the canister, check the canister pump module interior and related pipes for water, fuel and other liquids. If liquids are present, check for disconnections and/or cracks in the following: 1) the pipe from the air inlet port to the canister pump module; 2) the canister filter; and 3) the fuel tank vent hose.



*: Check for disconnection and/or cracks

P A127720E01

NEXT → Go to step 36

30 REPLACE PURGE VSV

(a) Disconnect the connector and the hoses from the purge VSV.
(b) Remove the purge VSV.
(c) Install a new purge VSV.
(d) Reconnect the connector and hoses.

NEXT → Go to step 36

ES

31 REPAIR OR REPLACE HARNESS AND CONNECTOR

NEXT → Go to step 36

32 REPLACE EVAP HOSE (INTAKE MANIFOLD - PURGE VSV)

NEXT → Go to step 36

33 INSPECT INTAKE MANIFOLD (EVAP PURGE PORT)

(a) Check that the EVAP purge port of the intake manifold is not clogged. If necessary, replace the intake manifold.

NEXT → Go to step 36

34 REPLACE ECM

(a) Replace the ECM (see page ES-429).

NEXT → Go to step 36

35 REPAIR OR REPLACE PARTS AND COMPONENTS INDICATED BY OUTPUT DTCS

(a) Repair the malfunctioning areas indicated by the DTCs that had been confirmed when the vehicle was brought in.

NEXT → Go to step 36

36	PERFORM EVAP SYSTEM CHECK (AUTO OPERATION)

NOTICE:

- **The EVAP SYSTEM CHECK (AUTO OPERATION) consists of 5 steps performed automatically by the intelligent tester. It takes a maximum of approximately 18 minutes.**
- **Do not perform the EVAP SYSTEM CHECK when the fuel tank is more than 90% full because the cut-off valve may be closed, making the fuel tank leak check unavailable.**
- **Do not run the engine in this step.**
- **When the temperature of the fuel is 35°C (95°F) or more, a large amount of vapor forms and any check results become inaccurate. When performing an EVAP SYSTEM CHECK, keep the temperature below 35°C (95°F).**

(a) Clear DTCs (see page ES-39).

(b) On the intelligent tester, select the following menu items: DIAGNOSIS / ENHANCED OBD II / SYSTEM CHECK / EVAP SYS CHECK / AUTO OPERATION.

(c) After the SYSTEM CHECK is completed, check for pending DTCs by selecting the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / PENDING CODES.
HINT:
If no pending DTCs are found, the repair has been successfully completed.

ES

NEXT

COMPLETED

CONFIRMATION DRIVING PATTERN

HINT:
After a repair, check Monitor Status by performing the Key-Off Monitor Confirmation and Purge Flow Monitor Confirmation described below.

1. KEY-OFF MONITOR CONFIRMATION

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway)
- The fuel tank is less than 90% full
- The altitude is less than 8,000 ft (2,400 m)
- The Engine Coolant Temperature (ECT) is between 4.4°C and 35°C (40°F and 95°F)
- The Intake Air Temperature (IAT) is between 4.4°C and 35°C (40°F and 95°F)
- The vehicle remains stationary (the vehicle speed is 0 km/h [0 mph])

(b) Monitor Conditions
1. Allow the engine to idle for at least 5 minutes.
2. Turn the ignition switch OFF and wait for 6 hours (8 or 10.5 hours).
HINT:
Do not start the engine until checking MONITOR STATUS. If the engine is started, the steps described above must be repeated.

(c) Monitor Status
1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch ON and turn the tester ON.
3. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
4. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

2. PURGE FLOW MONITOR CONFIRMATION (P0441)

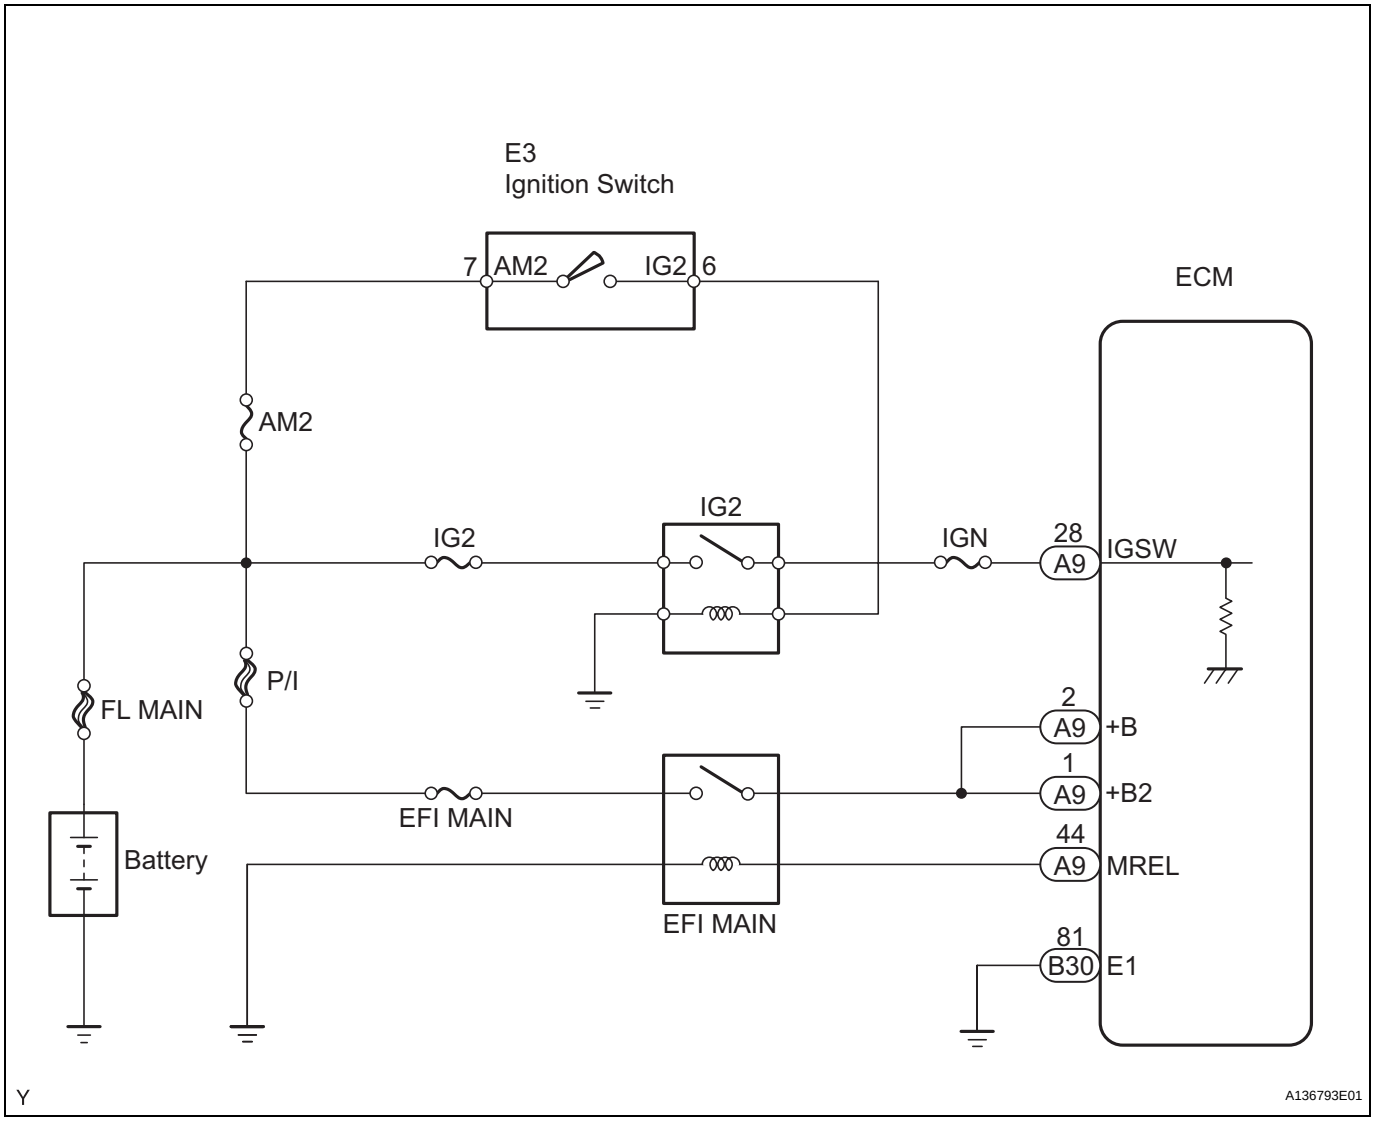
HINT:
Perform this monitor confirmation after the Key-Off Monitor Confirmation shows COMPL (complete).

(a) Preconditions
The monitor will not run unless:
- The vehicle has been driven for 10 minutes or more (in a city area or on a freeway)
- The ECT is between 4.4°C and 35°C (40°F and 95°F)
- The IAT is between 4.4°C and 35°C (40°F and 95°F)

(b) Monitor Conditions
1. Release the pressure from the fuel tank by removing and reinstalling the fuel cap.
2. Warm the engine up until the ECT reaches more than 75°C (167°F).
3. Increase the engine speed to 3,000 rpm once.
4. Allow the engine to idle and turn A/C ON for 1 minute.

(c) Monitor Status
1. Turn the ignition switch OFF (if ON or the engine is running).
2. Connect the intelligent tester to the DLC3.
3. Turn the ignition switch ON and turn the tester ON.
4. Select the following menu items: DIAGNOSIS / ENHANCED OBD II / MONITOR STATUS.
5. Check the Monitor Status displayed on the tester.
HINT:
If INCMP is displayed, the monitor is not complete. Make sure that the preconditions have been met, and perform the Monitor Conditions again.

MONITOR RESULT

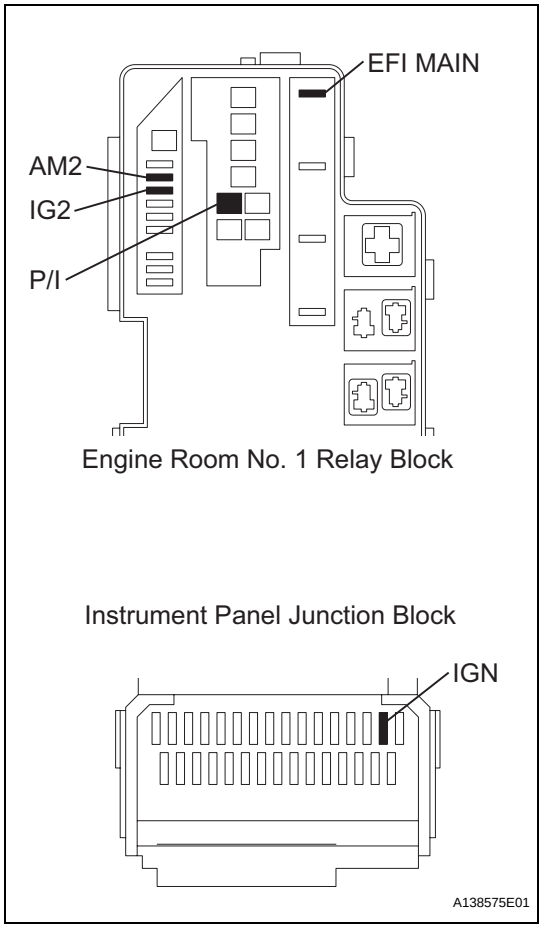


Refer to CHECKING MONITOR STATUS (See page ES-19).

ECM Power Source Circuit

DESCRIPTION

When the ignition switch is turned ON, the battery voltage is applied to the IGSW of the ECM. The output signal from the MREL terminal of the ECM causes a current to flow to the coil, closing the contacts of the integration relay (EFI MAIN relay) and supplying power to either terminal +B or +B2 of the ECM.

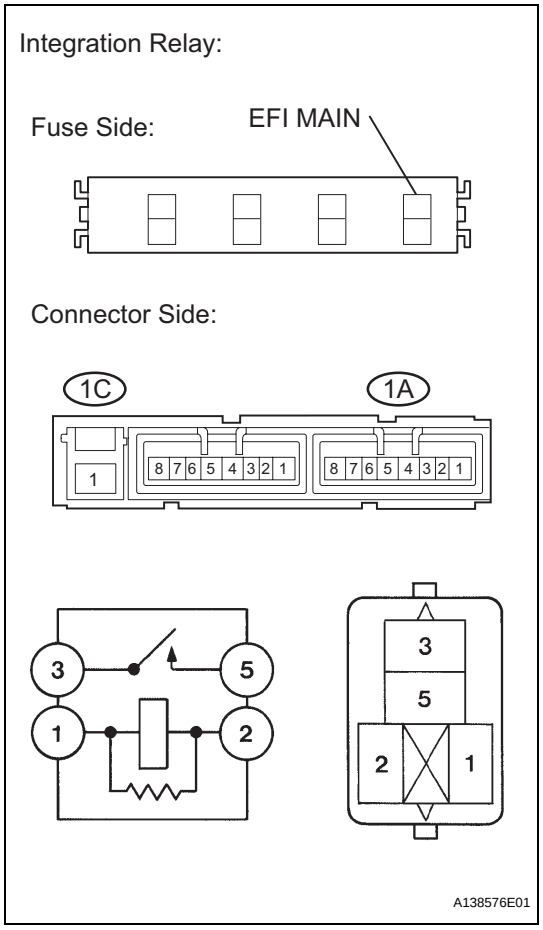


WIRING DIAGRAM

ES

INSPECTION PROCEDURE

1	INSPECT FUSES (P/I, AM2, IG2, EFI MAIN AND IGN)



(a) Remove the P/I fuse, AM2 fuse, IG2 fuse and EFI MAIN fuse from the engine room No. 1 relay block.
(b) Remove the IGN fuse from the instrument panel junction block.
(c) Measure the resistance of the fuses.
Standard resistance:
Below 1 Ω
(d) Reinstall the fuses.

NG → **CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE**

OK

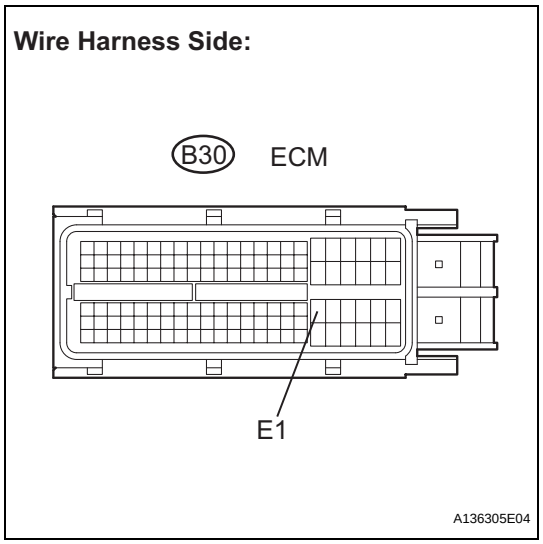
ES

2 INSPECT RELAY (IG2, EFI MAIN)

(a) Remove the integration relay and IG2 relay from the engine room No. 1 relay block.
(b) Measure the resistance between the terminals of the integration relay.
Standard resistance

Tester Connection	Specified Condition
1C-1 - 1A-4	10 kΩ or higher
	Below 1 Ω (When battery voltage is applied to terminals 1A-2 and 1A-3)

(c) Measure the resistance between the terminals of the IG2 relay.
Standard resistance



Tester Connection	Specified Condition
3 - 5	10 kΩ or higher
	Below 1 Ω (When battery voltage is applied to terminals 1 and 2)

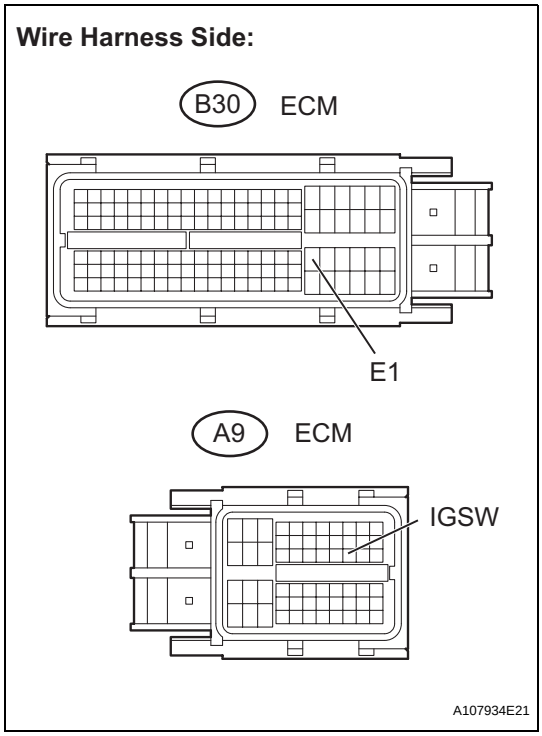
(d) Reinstall the relay.

NG → **REPLACE RELAY**

OK

3 CHECK WIRE HARNESS (ECM - BODY GROUND)

(a) Disconnect the B30 ECM connector.
(b) Measure the resistance.
Standard resistance



Tester Connection	Specified Condition
B30-81 (E1) - Body ground	Below 1 Ω

(c) Reconnect the ECM connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

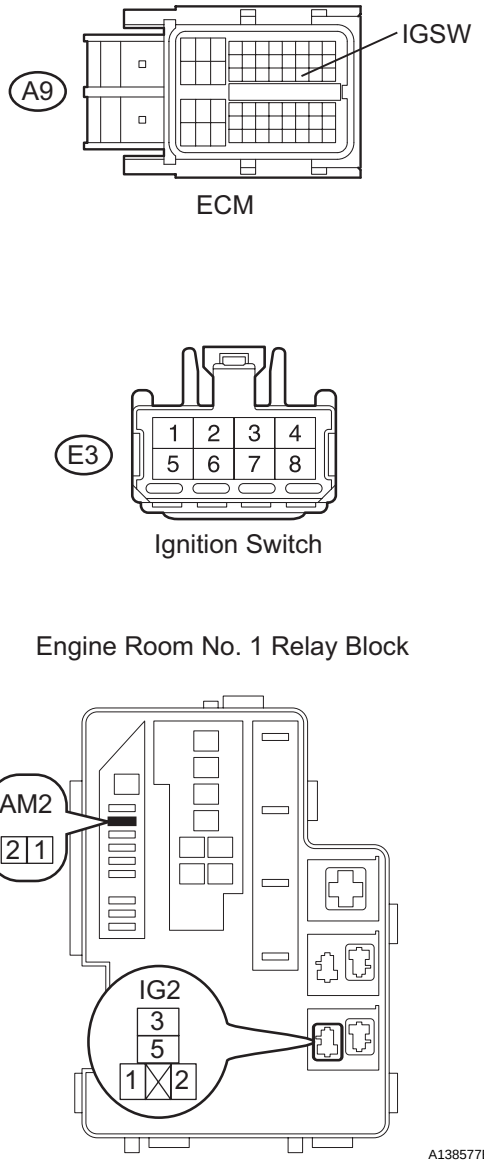
4	INSPECT ECM (IGSW VOLTAGE)

(a) Disconnect the B30 and A9 ECM connectors.
(b) Turn the ignition switch ON.
(c) Measure the voltage between the terminals of the B30 and A9 ECM connectors.

Standard voltage

Tester Connection	Specified Condition
A9-28 (IGSW) - B30-81 (E1)	9 to 14 V

(d) Reconnect the ECM connector.



OK → **REPLACE ECM**

NG

ES

5 CHECK WIRE HARNESS (RELAY BLOCK, ECM, IGNITION SWITCH, BATTERY)

Wire Harness Side:

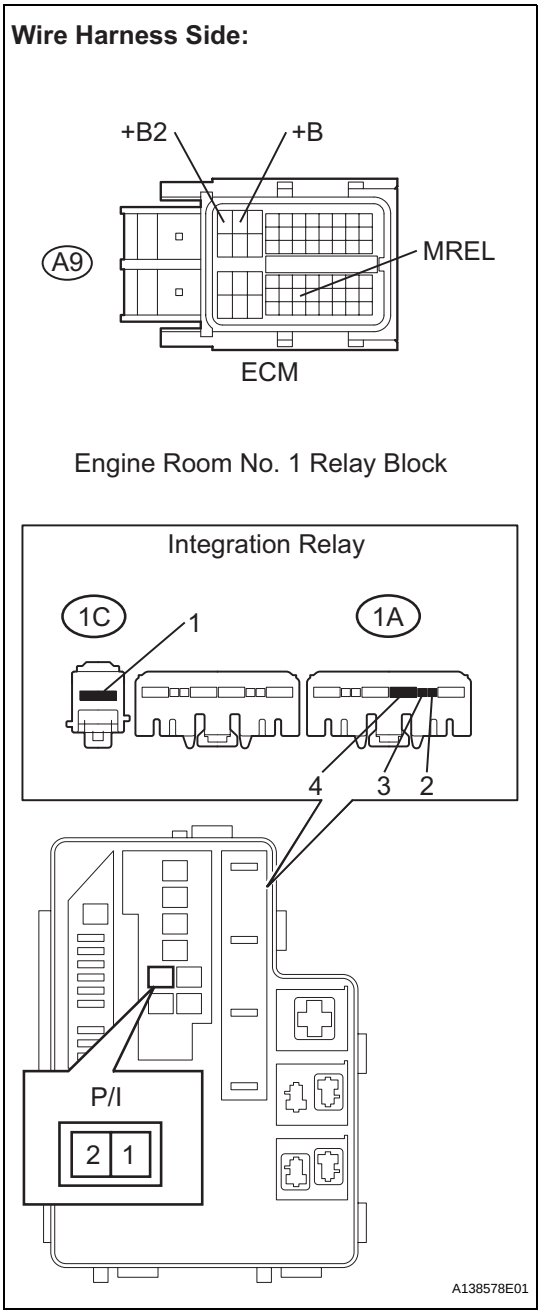
(a) Disconnect the A9 ECM connector.
(b) Disconnect the E3 ignition switch connector.
(c) Disconnect the cable from the battery positive terminal.
(d) Remove the AM2 fuse and IG2 relay.
(e) Measure the resistance between the terminals.

Standard resistance

Tester Connection	Specified Condition
A9-28 (IGSW) - IG2 relay terminal 5	Below 1 Ω
IG2 relay terminal 2 - Body ground	Below 1 Ω
Positive (+) battery cable - IG2 relay terminal 3	Below 1 Ω
Positive (+) battery cable - AM2 fuse terminal 1	Below 1 Ω
E3-7 (AM2) - AM2 fuse terminal 2	Below 1 Ω
E3-6 (IG2) - IG2 relay terminal 1	Below 1 Ω
A9-28 (IGSW) or IG2 relay terminal 5 - Body ground	10 kΩ or higher
Positive (+) battery cable or AM2 fuse terminal 1 - Body ground	10 kΩ or higher
Positive (+) battery cable or IG2 relay terminal 3 - Body ground	10 kΩ or higher
E3-7 (AM2) or AM2 fuse terminal 2 - Body ground	10 kΩ or higher
E3-6 (IG2) or IG2 relay terminal 1 - Body ground	10 kΩ or higher

(f) Reinstall the relay and fuse.
(g) Reconnect the connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**



OK

6 INSPECT IGNITION SWITCH (See page ES-303)

NG → **REPLACE IGNITION SWITCH**

OK

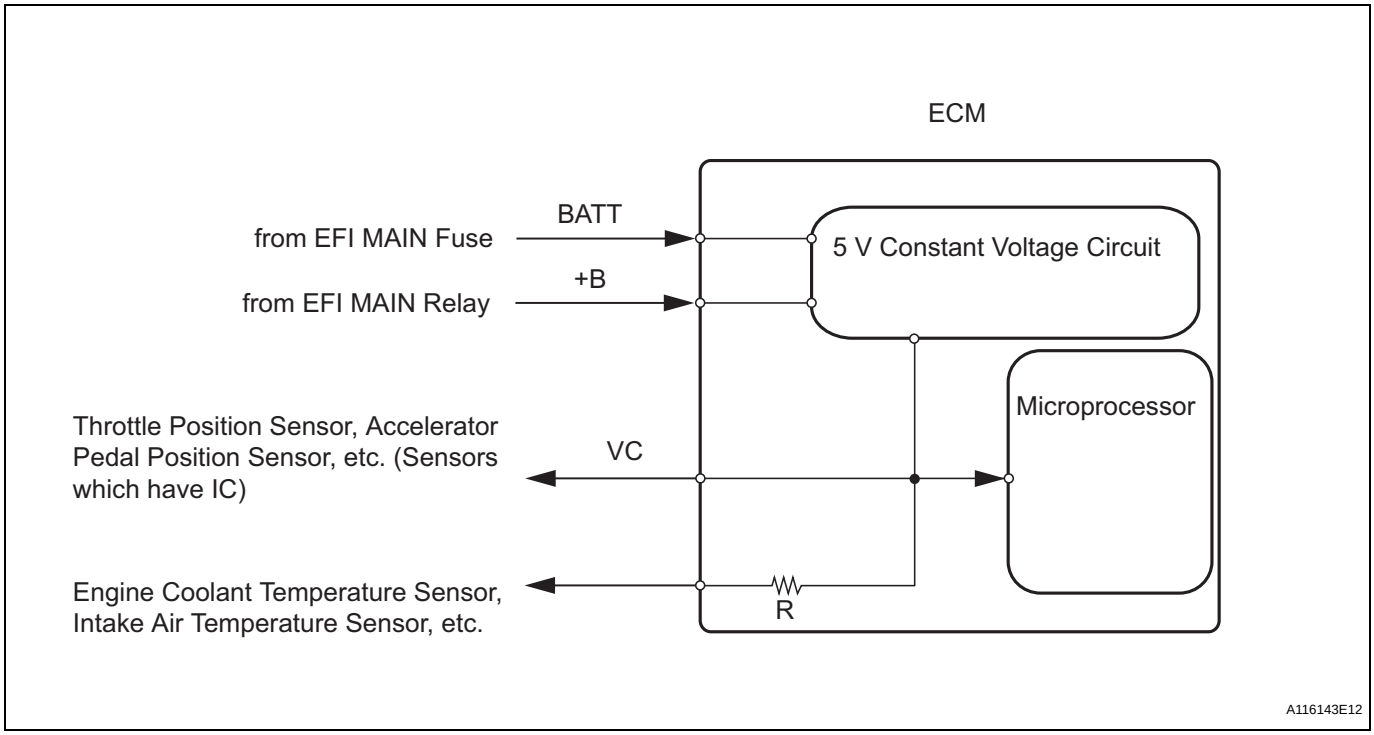
7	CHECK WIRE HARNESS (INTEGRATION RELAY - ECM, BATTERY AND BODY GROUND)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the cable from the battery positive terminal.
(c) Remove the integration relay from the engine room No. 1 relay block.
(d) Disconnect the integration relay connector.
(e) Remove the P/I fuse from the engine room No. 1 relay block.
(f) Measure the resistance between the terminals.
Standard resistance (Check for open)

Tester Connection	Specified Condition
A9-2 (+B) - 1A-4	Below 1 Ω
A9-1 (+B2) - 1A-4	Below 1 Ω
A9-44 (MREL) - 1A-2	Below 1 Ω
P/I fuse terminal 2 - 1C-1	Below 1 Ω
P/I fuse terminal 1 - Positive (+) battery cable	Below 1 Ω
1A-3 - Body ground	Below 1 Ω
A9-2 (+B) or 1A-4 - Body ground	10 kΩ or higher
A9-1 (+B2) or 1A-4 - Body ground	10 kΩ or higher
A9-44 (MREL) or 1A-2 - Body ground	10 kΩ or higher
P/I fuse terminal 2 or 1C-1 - Body ground	10 kΩ or higher
P/I fuse terminal 1 or Positive (+) battery cable - Body ground	10 kΩ or higher

(g) Reconnect the connectors.
(h) Reconnect the cable to the battery positive terminal.
(i) Reinstall the integration relay and P/I fuse.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**



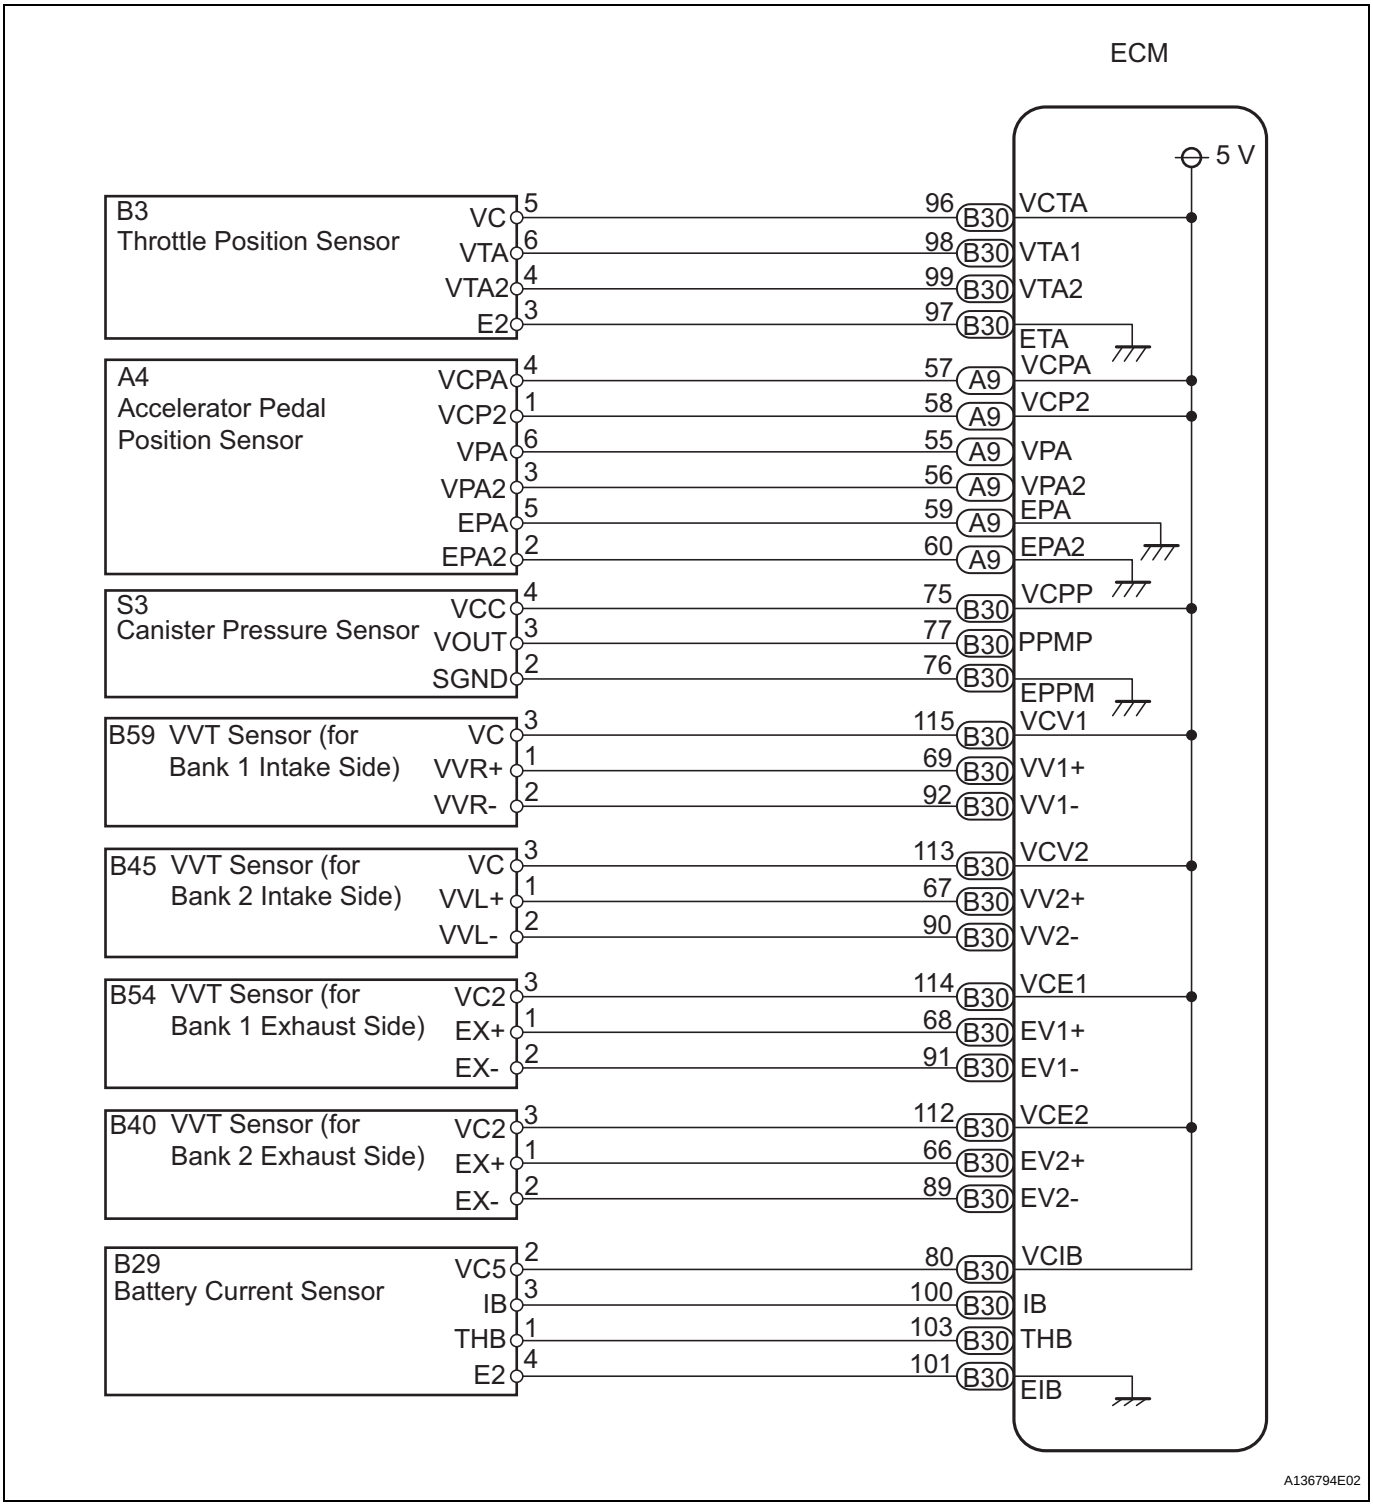
OK

REPAIR OR REPLACE ENGINE ROOM NO. 1 RELAY BLOCK

VC Output Circuit

DESCRIPTION

The ECM constantly generates 5 V power from the battery voltages supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied with power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the ignition switch is first turned ON. The MIL goes off when the engine is started.

WIRING DIAGRAM

INSPECTION PROCEDURE

1	**CHECK MIL**

(a) Check that the Malfunction Indicator Lamp (MIL) lights up when turning the ignition switch ON.

OK:

MIL lights up

OK → SYSTEM OK

NG

2 CHECK COMMUNICATION BETWEEN INTELLIGENT TESTER AND ECM

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and tester ON.
(c) Check the communication between the tester and ECM.

Result

Result	Proceed to
Communication is possible	A
Communication is not possible	B

A → GO TO MIL CIRCUIT

B

3 CHECK MIL (THROTTLE POSITION SENSOR)

(a) Disconnect the B3 throttle body connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the throttle body connector.

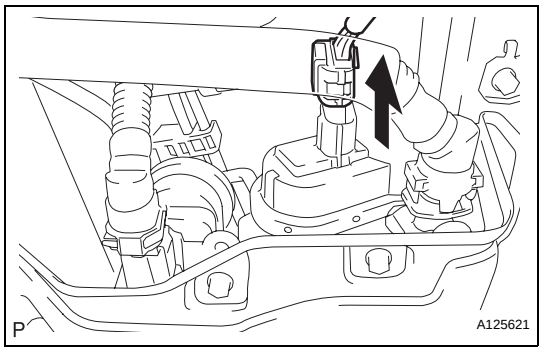
A → REPLACE THROTTLE BODY ASSEMBLY

B

4 CHECK MIL (ACCELERATOR PEDAL POSITION SENSOR)

(a) Disconnect the A4 accelerator pedal position sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result



Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the accelerator pedal position sensor connector.

A → REPLACE ACCELERATOR PEDAL POSITION SENSOR

B

5	CHECK MIL (CANISTER PUMP MODULE)

(a) Disconnect the S3 canister pump module connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

ES

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the canister pump module connector.

A → **REPLACE CHARCOAL CANISTER ASSEMBLY**

B

6	CHECK MIL (BATTERY CURRENT SENSOR)

(a) Disconnect the B29 battery current sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the battery current sensor connector.

A → **REPLACE BATTERY CURRENT SENSOR**

B

7	CHECK MIL (VVT SENSOR FOR BANK 1 INTAKE SIDE)

(a) Disconnect the B59 VVT sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the VVT sensor connector.

A → **REPLACE VVT SENSOR (FOR BANK 1 INTAKE SIDE)**

B

8	CHECK MIL (VVT SENSOR FOR BANK 2 INTAKE SIDE)

(a) Disconnect the B45 VVT sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the VVT sensor connector.

A → **REPLACE VVT SENSOR (FOR BANK 2 INTAKE SIDE)**

B

9	CHECK MIL (VVT SENSOR FOR BANK 1 EXHAUST SIDE)

(a) Disconnect the B54 VVT sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the VVT sensor connector.

A → **REPLACE VVT SENSOR (FOR BANK 1 EXHAUST SIDE)**

B

10	CHECK MIL (VVT SENSOR FOR BANK 2 EXHAUST SIDE)

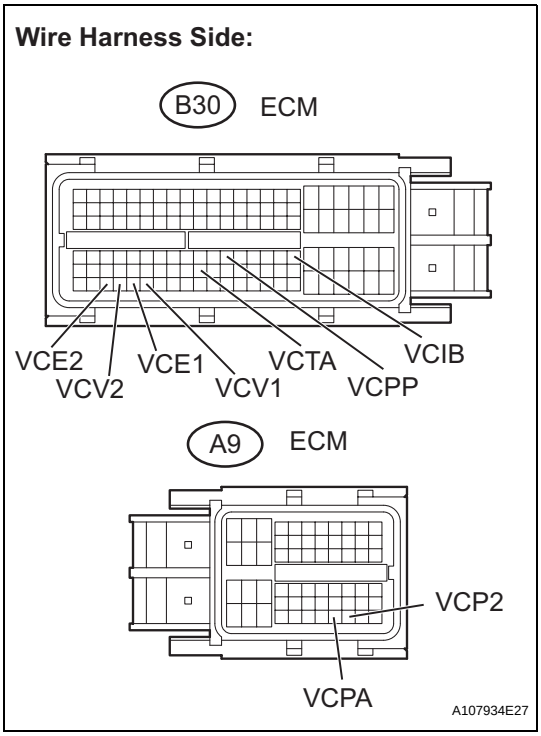
(a) Disconnect the B40 VVT sensor connector.
(b) Turn the ignition switch ON.
(c) Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

(d) Reconnect the VVT sensor connector.

A → REPLACE VVT SENSOR (FOR BANK 2 EXHAUST SIDE)



B

11	CHECK WIRE HARNESS

(a) Disconnect the B3 throttle body connector.
(b) Disconnect the A4 accelerator pedal position sensor connector.
(c) Disconnect the S3 canister pump module connector.
(d) Disconnect the B29 battery current sensor connector.
(e) Disconnect the B59 VVT sensor connector.
(f) Disconnect the B45 VVT sensor connector.
(g) Disconnect the B54 VVT sensor connector.
(h) Disconnect the B40 VVT sensor connector.
(i) Disconnect the A9 and B30 ECM connectors.
(j) Measure the resistance.

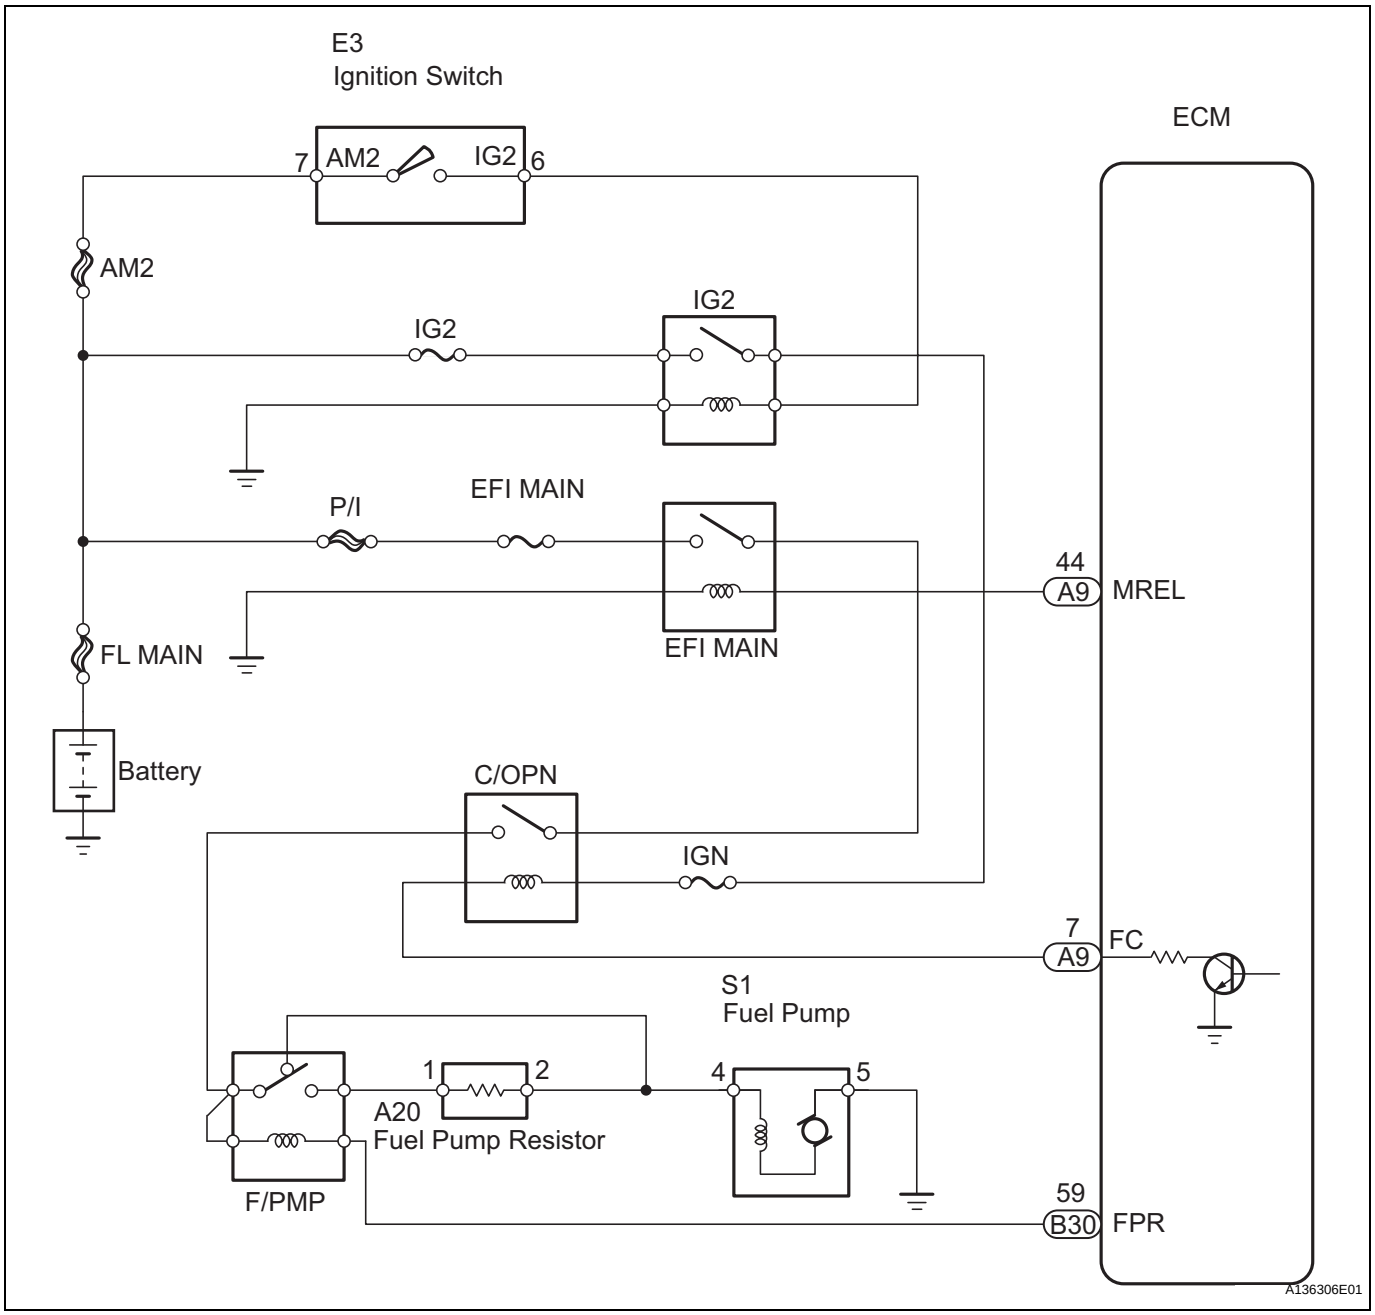
Standard resistance

Tester Connection	Specified Condition
B30-96 (VCTA) - Body ground	10 kΩ or higher
A9-57 (VCPA) - Body ground	10 kΩ or higher
A9-58 (VCP2) - Body ground	10 kΩ or higher
B30-75 (VCPP) - Body ground	10 kΩ or higher
B30-80 (VCIB) - Body ground	10 kΩ or higher
B30-115 (VCV1) - Body ground	10 kΩ or higher
B30-113 (VCV2) - Body ground	10 kΩ or higher
B30-114 (VCE1) - Body ground	10 kΩ or higher
B30-112 (VCE2) - Body ground	10 kΩ or higher

(k) Reconnect the throttle body connector.
(l) Reconnect the accelerator pedal position sensor connector.
(m) Reconnect the canister pump module connector.
(n) Reconnect the battery current sensor connector.
(o) Reconnect the VVT sensor connector.
(p) Reconnect the ECM connectors.

NG → REPAIR OR REPLACE HARNESS AND CONNECTOR

OK



REPLACE ECM

Fuel Pump Control Circuit

DESCRIPTION

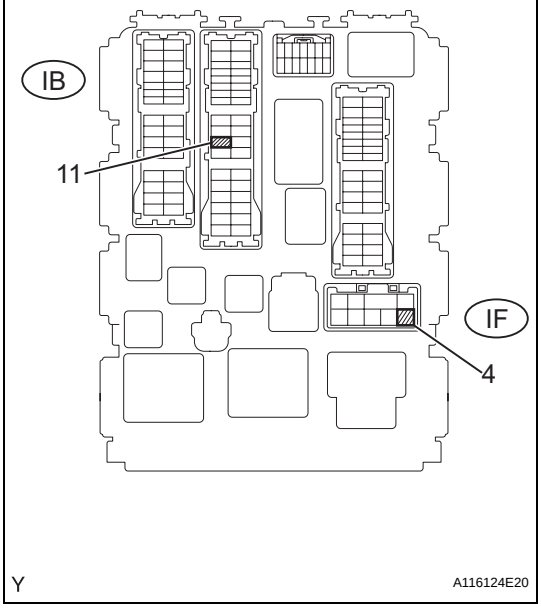
The F/PMP relay switches the fuel pump speed according to the engine conditions. The fuel pump operates when the ECM receives the starter-operating signal (STA) and crankshaft-rotating signal (NE). The F/PMP relay is turned ON while the engine is idling or operating at low load. This causes current to flow through the fuel pump resistor to the fuel pump. The fuel pump then operates at low speed. The F/PMP relay is turned OFF while the engine is cranking or operating at high load. The fuel pump then operates at normal speed.

WIRING DIAGRAM

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP/SPD)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PUMP / SPD.
(d) Check whether the fuel pump operating sound occurs when performing the Active Test on the tester.
OK:
Fuel pump operating sound occurs.



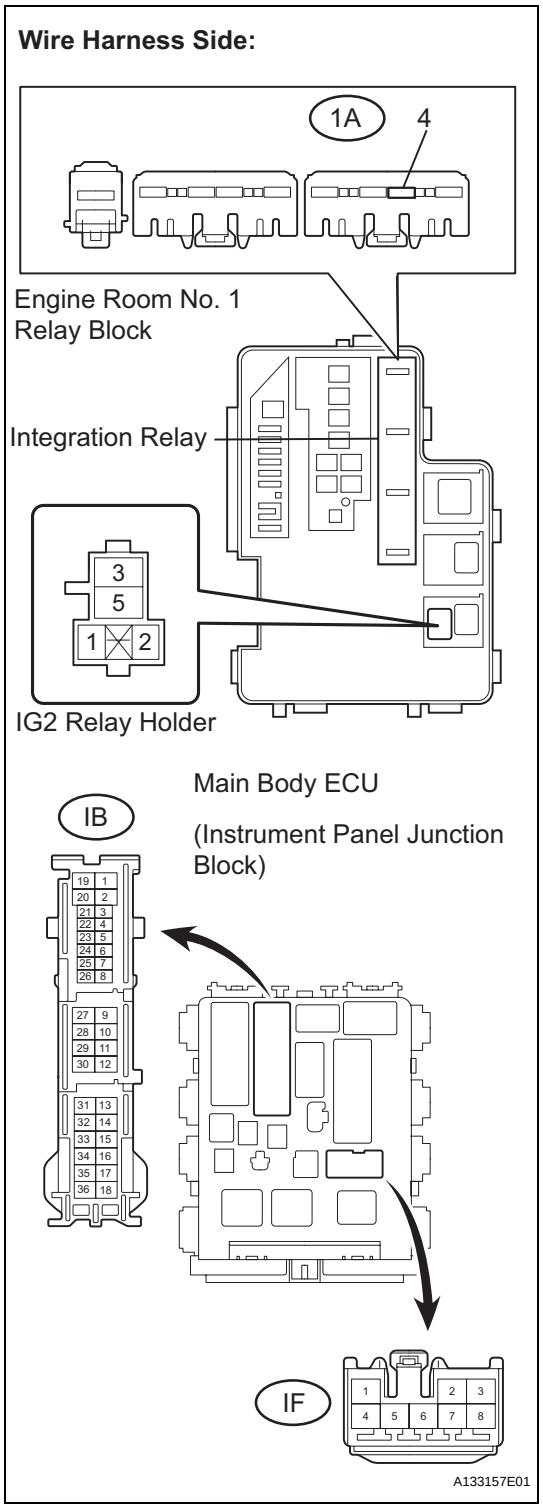
ES

OK → **Go to step 12**

NG

2	INSPECT INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY (C/OPN RELAY INPUT VOLTAGE)

Instrument Panel Junction Block:



(a) Measure the voltage between the terminal of the instrument panel junction block and the body ground when the ignition switch is turned ON and OFF.
Standard voltage

Tester Connection	Ignition Switch Condition	Specified Condition
IB-11 - Body ground	OFF	Below 1 V
IF-4 - Body ground		
IB-11 - Body ground	ON	9 to 14 V
IF-4 - Body ground		

OK → **Go to step 4**

NG

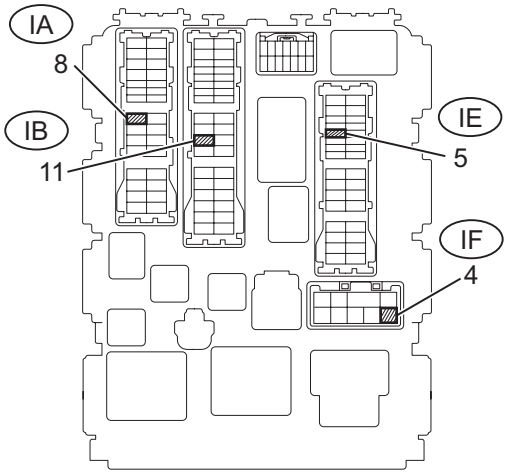
3	CHECK WIRE HARNESS (INSTRUMENT PANEL JUNCTION BLOCK - INTEGRATION RELAY AND IG2 RELAY)

(a) Remove the integration relay and IG2 relay from the engine room No. 1 relay block.
(b) Disconnect the instrument panel junction block connector.
(c) Measure the resistance.
Standard resistance

Tester Connection	Specified Condition
IG2 relay 5 - IF-4	Below 1 Ω
1A-4 - IB-11	Below 1 Ω
IF-4 - Body ground	10 kΩor higher
IB-11 - Body ground	10 kΩor higher

(d) Reinstall the integration relay and IG2 relay.
(e) Reconnect the instrument panel junction block connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**



ES

OK

GO TO ECM POWER SOURCE CIRCUIT

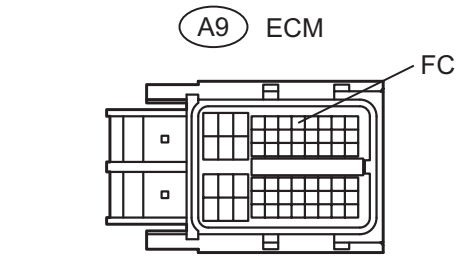
4	INSPECT INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY (C/OPN RELAY)

Instrument Panel Junction Block:

(a) Remove the instrument panel junction block.
(b) Measure the C/OPN relay resistance.
Standard resistance

Tester Connection	Specified Condition
IB-11 - IA-8	10 kΩ or higher
	Below 1 Ω (when battery voltage is applied to terminals IF-4 and IE-5)

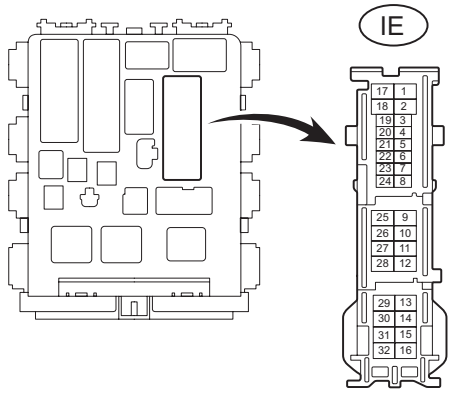
HINT:
Relay coil circuit between IF-4 and IE-5 is through IGN fuse.
(c) Reinstall the instrument panel junction block.



NG → **REPLACE INSTRUMENT PANEL JUNCTION BLOCK ASSEMBLY**

OK

ES



5	CHECK WIRE HARNESS (INSTRUMENT PANEL JUNCTION BLOCK - ECM)

Wire Harness Side:

Main Body ECU

(Instrument Panel Junction Block)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the IE connector from the instrument panel junction block.
(c) Measure the resistance.
Standard resistance

Tester Connection	Specified Condition
IE-5 - A9-7 (FC)	Below 1Ω
IE-5 or A9-7 (FC) - Body ground	10 kΩ or higher

(d) Reconnect the instrument panel junction block and the ECM connectors.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

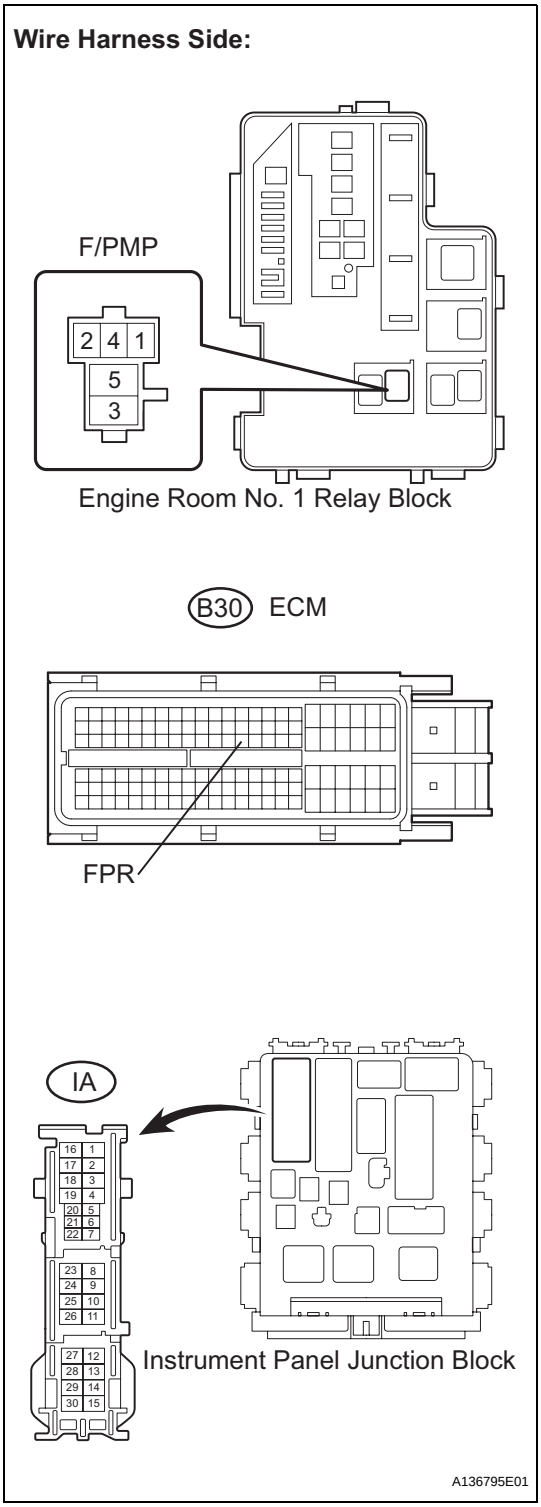
OK

6	PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PMP SP CTL)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / FUEL PMP SP CTL.
(d) Check the operation of the relay while operating it using the intelligent tester.
OK:
Operating noise can be heard from the relay.

OK → **Go to step 9**

NG



7	INSPECT F/PMP RELAY (See page ES-194)

NG → **REPLACE F/PMP RELAY**

ES

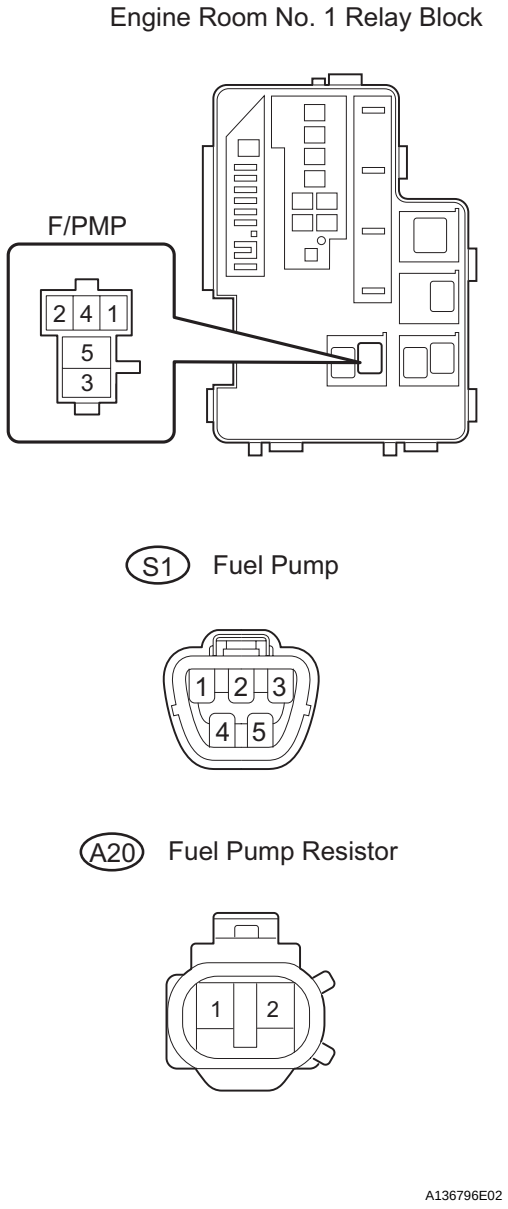
OK

8	CHECK WIRE HARNESS (F/PMP RELAY - ECM AND INSTRUMENT PANEL JUNCTION BLOCK)

(a) Remove the F/PMP relay from the engine room No. 1 relay block.
(b) Disconnect the B30 ECM connector.
(c) Disconnect the IA instrument panel junction block connector.
(d) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
F/PMP relay terminal 1 - B30-59 (FPR)	Below 1 Ω
F/PMP relay terminal 2 - IA-8	Below 1 Ω
F/PMP relay terminal 3 - IA-8	Below 1 Ω
F/PMP relay terminal 1 or B30-59 (FPR) - Body ground	10 kΩ or higher
F/PMP relay terminal 2 or IA-8 - Body ground	10 kΩ or higher
F/PMP relay terminal 3 or IA-8 - Body ground	10 kΩ or higher



(e) Reconnect the ECM connector
(f) Reconnect the instrument panel junction block connector.
(g) Reinstall the F/PMP relay.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

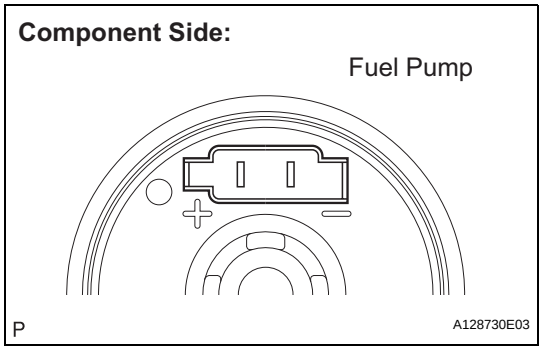
9	CHECK WIRE HARNESS (F/PMP - FUEL PUMP AND PUMP RESISTOR)

Wire Harness Side:

(a) Remove the F/PMP relay from the engine room No. 1 relay block.
(b) Disconnect the S1 fuel pump connector.
(c) Disconnect the A20 fuel pump resistor connector.
(d) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
F/PMP relay terminal 4 - S1-4	Below 1 Ω
F/PMP relay terminal 5 - A20-1	Below 1 Ω
A20-2 - S1-4	Below 1 Ω
S1-5 - Body ground	Below 1 Ω
F/PMP relay terminal 4 or S1-4 - Body ground	10 kΩ or higher
F/PMP relay terminal 5 or A20-1 - Body ground	10 kΩ or higher
A20-2 or S1-4 - Body ground	10 kΩ or higher



(e) Reconnect the fuel pump resistor connector.
(f) Reconnect the fuel pump connector.
(g) Reinstall the F/PMP relay.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

ES

10	INSPECT FUEL PUMP

(a) Inspect fuel pump resistance.
  (1) Measure the resistance between the terminals.
  Standard resistance:
  0.2 to 3.0 Ω at 20°C(68°F)

(b) Inspect fuel pump operation.
  (1) Apply the battery voltage to both the terminals. Check that the pump operates.
  NOTICE:
  - **These tests must be done quickly (within 10 seconds) to prevent the coil from burning out.**
  - **Keep the fuel pump as far away from the battery as possible.**
  - **Always turn the voltage on and off on the battery side, not the fuel pump side.**

NG → **REPLACE FUEL PUMP**

OK

11	INSPECT FUEL PUMP RESISTOR

(a) Measure the resistance of the fuel pump resistor.
Standard resistance:
0.30 to 0.34 Ω at 20°C (68°F)

NG → **REPLACE FUEL PUMP RESISTOR**

OK

REPLACE ECM

12	READ VALUE USING INTELLIGENT TESTER (STARTER SIG)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / STARTER SIG.
(d) Check the result when the ignition switch is turned ON and START.
OK

Ignition Switch Position	STARTER SIG
ON	OFF
START	ON

NG → **REPAIR OR REPLACE STARTING SYSTEM**

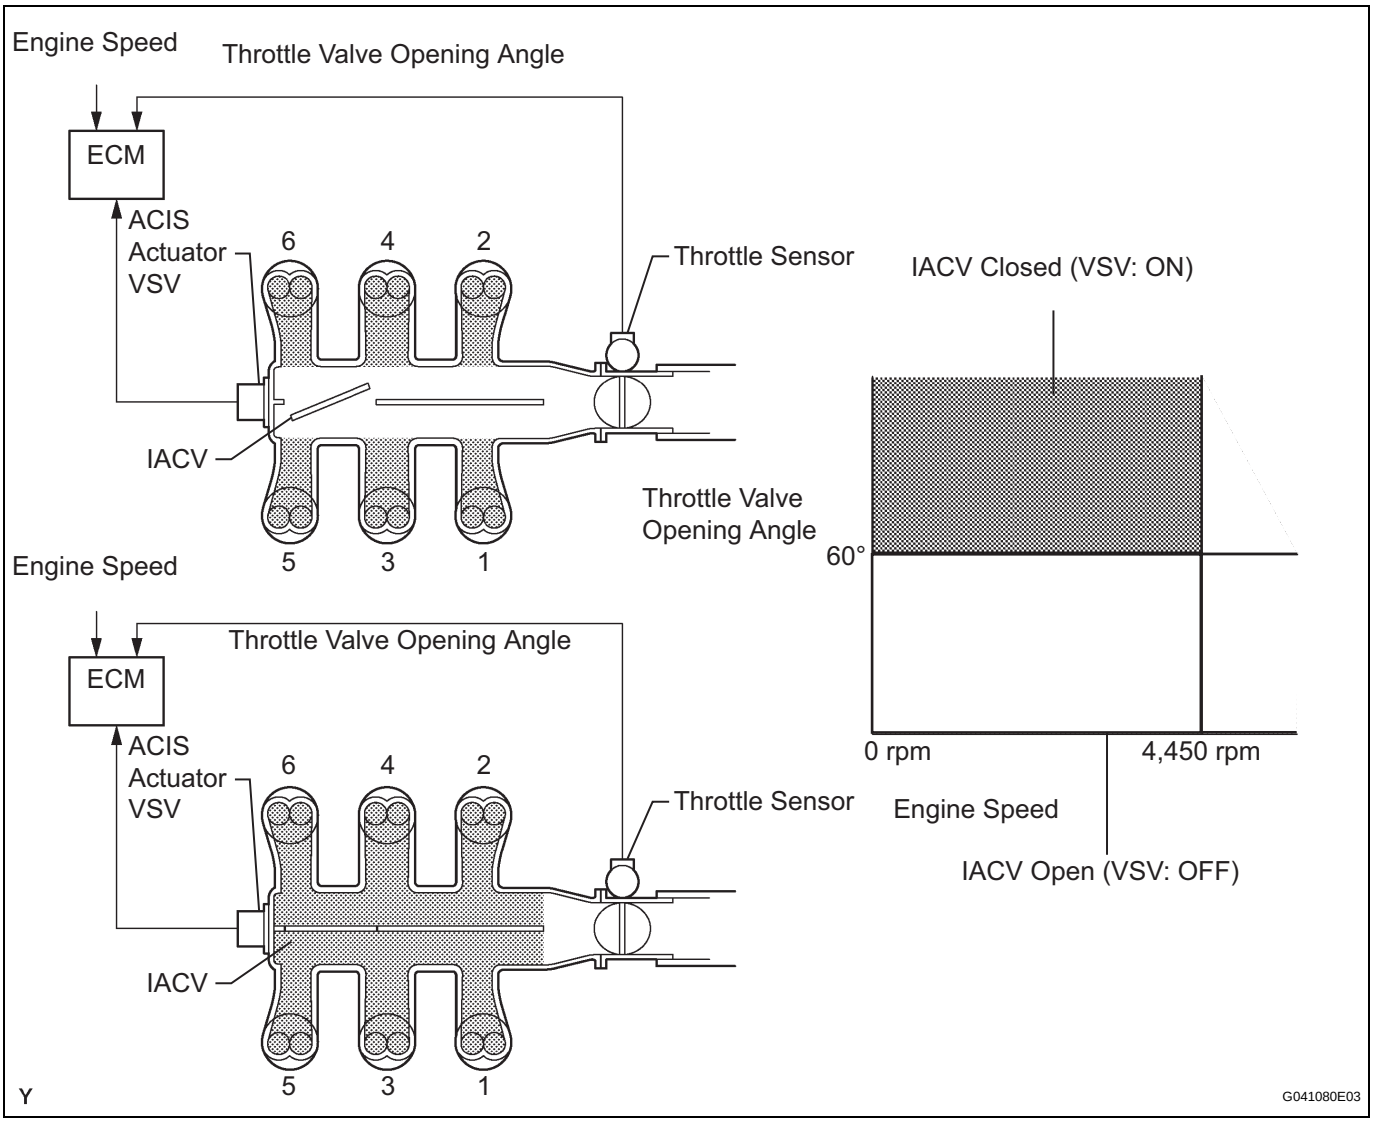
OK

13	READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DATA LIST / PRIMARY / ENGINE SPD.
(d) Read the values displayed on the tester while cranking.
Standard:
Values are displayed continuously.

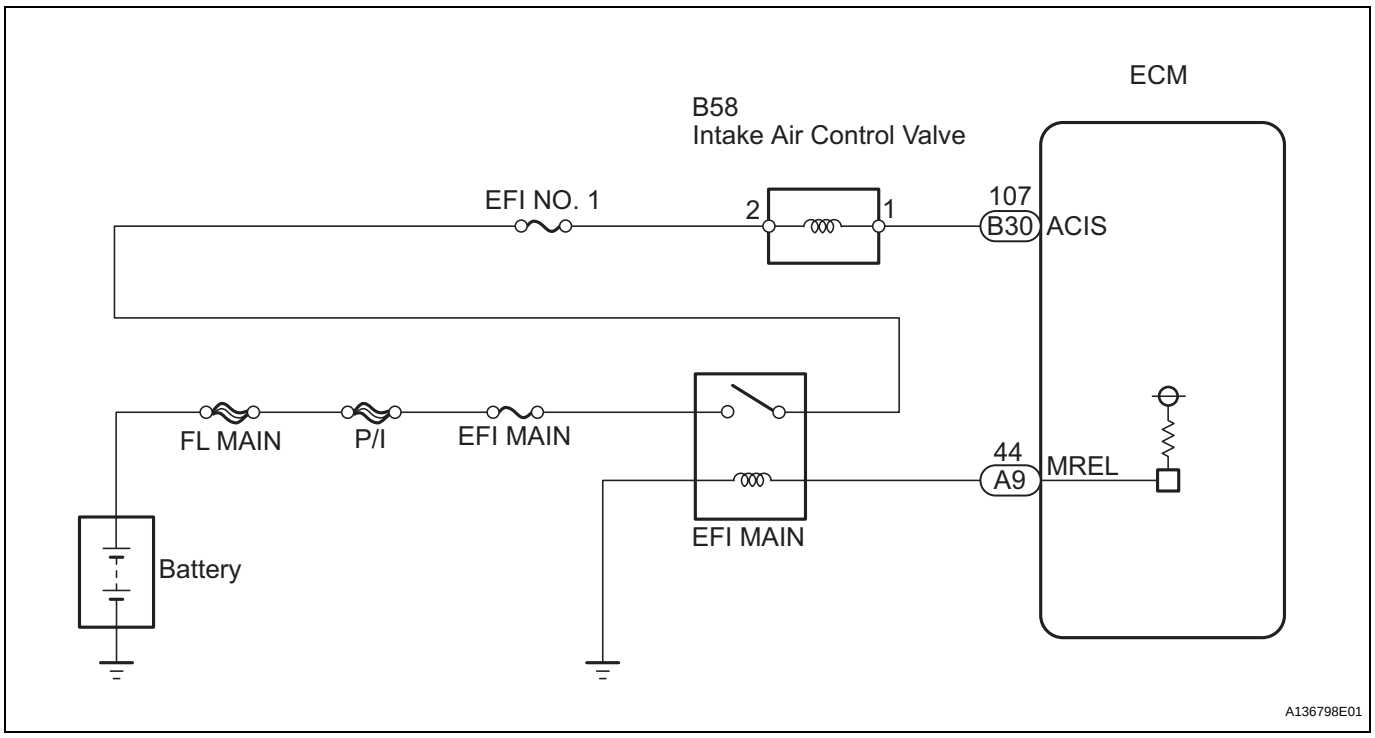
NG → **REPAIR OR REPLACE CRANKSHAFT POSITION SENSOR CIRCUIT**

ES



OK

REPLACE ECM



ACIS Control Circuit

DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to changes in the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).
When the engine speed is between 0 and 4,450 rpm and the throttle valve opening angle is 60° or more, the ECM supplies current to the VSV (ON status), to close the IACV. Under other conditions, the VSV is usually OFF and the IACV is open.

WIRING DIAGRAM

ES

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST BY INTELLIGENT TESTER (OPERATE VSV FOR ACIS)

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the intelligent tester on.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / INTAKE CTL VSV1. Operate the VSV for ACIS.
OK:
Operational noise can be heard.

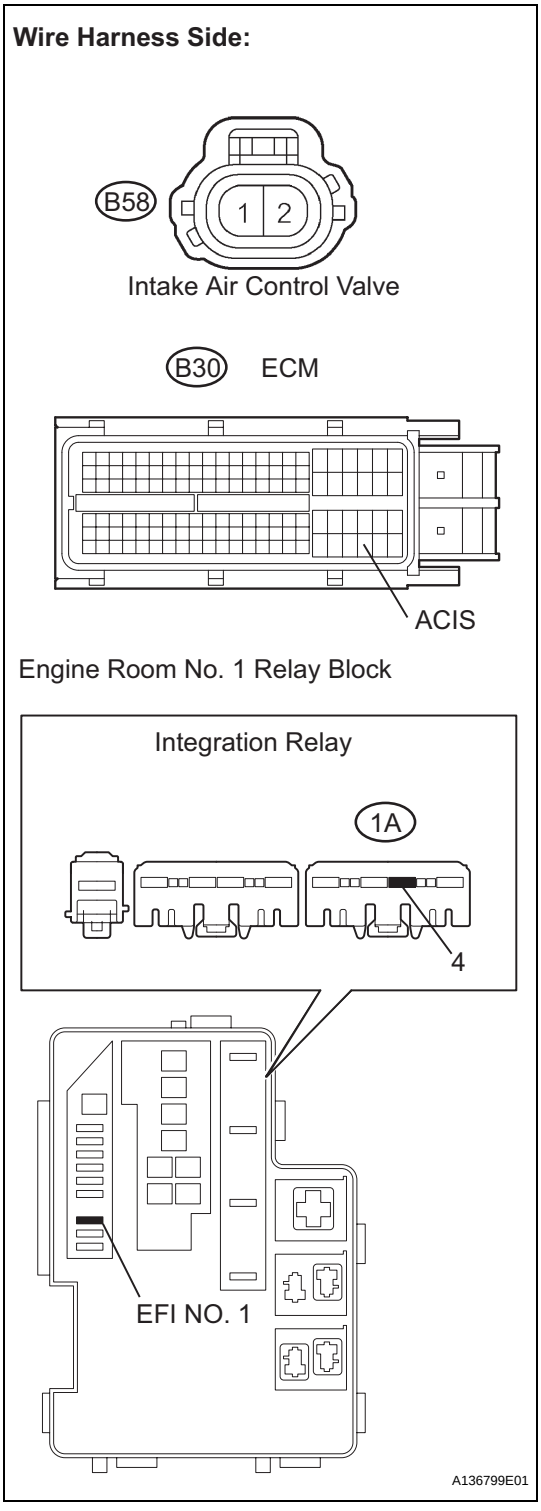
OK	PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE

NG

2	CHECK INTAKE AIR CONTROL VALVE (OPERATION)

Component Side:

Intake Air Control Valve



E121181E01

(a) Disconnect the B58 air intake valve connector.
(b) Apply battery voltage between the terminals of the air intake valve connector.
(c) Check the air intake valve operation.
OK:
Operational noise can be heard.

NG	REPLACE INTAKE AIR SURGE TANK

OK

3	CHECK WIRE HARNESS (INTAKE AIR CONTROL VALV - ECM, INTEGRATION RELAY)

(a) Remove the EFI NO. 1 fuse from the engine room No. 1 relay block.
(b) Check the EFI NO. 1 fuse.
(c) Reinstall the EFI NO. 1 fuse.
(d) Disconnect the B58 intake air control valve connector.
(e) Disconnect the B30 ECM connector.
(f) Remove the integration relay from the engine room No. 1 relay block.
(g) Disconnect the 1A integration relay connector.
(h) Measure the resistance of the wire harness side connectors.

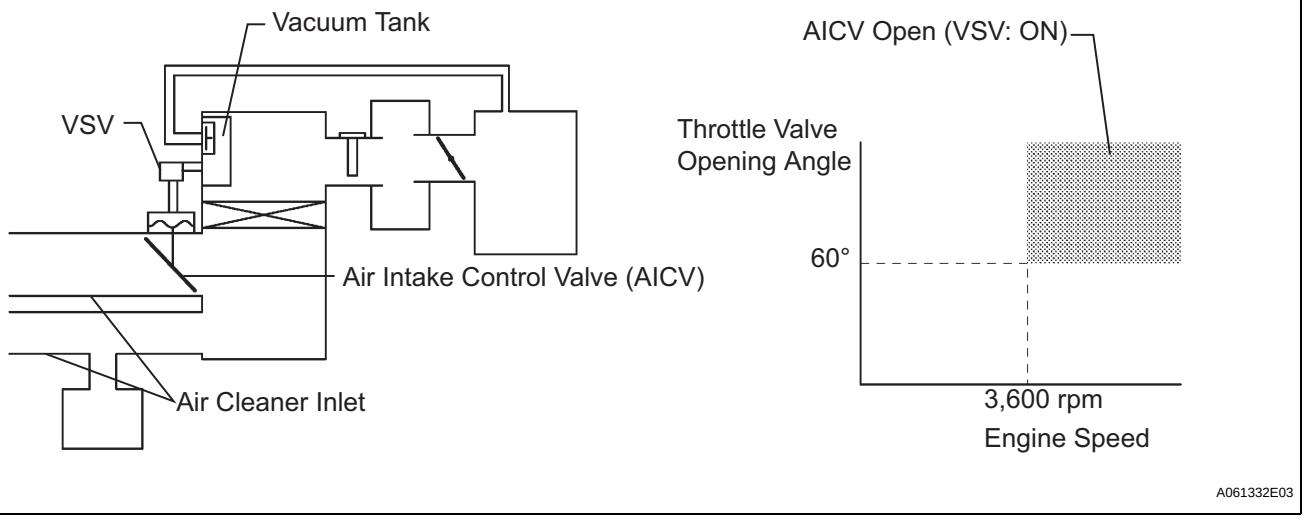
Standard resistance

Tester Connection	Specified Condition
B58-1 - B30-107 (ACIS)	Below 1 Ω
B58-2 - 1A-4	Below 1 Ω
B58-1 or B30-107 (ACIS) - Body ground	10 kΩ or higher
B58-2 or 1A-4 - Body ground	10 kΩ or higher

(i) Reconnect the intake air control valve connector.
(j) Reconnect the ECM connector.
(k) Reconnect the integration relay connector.
(l) Reinstall the integration relay.

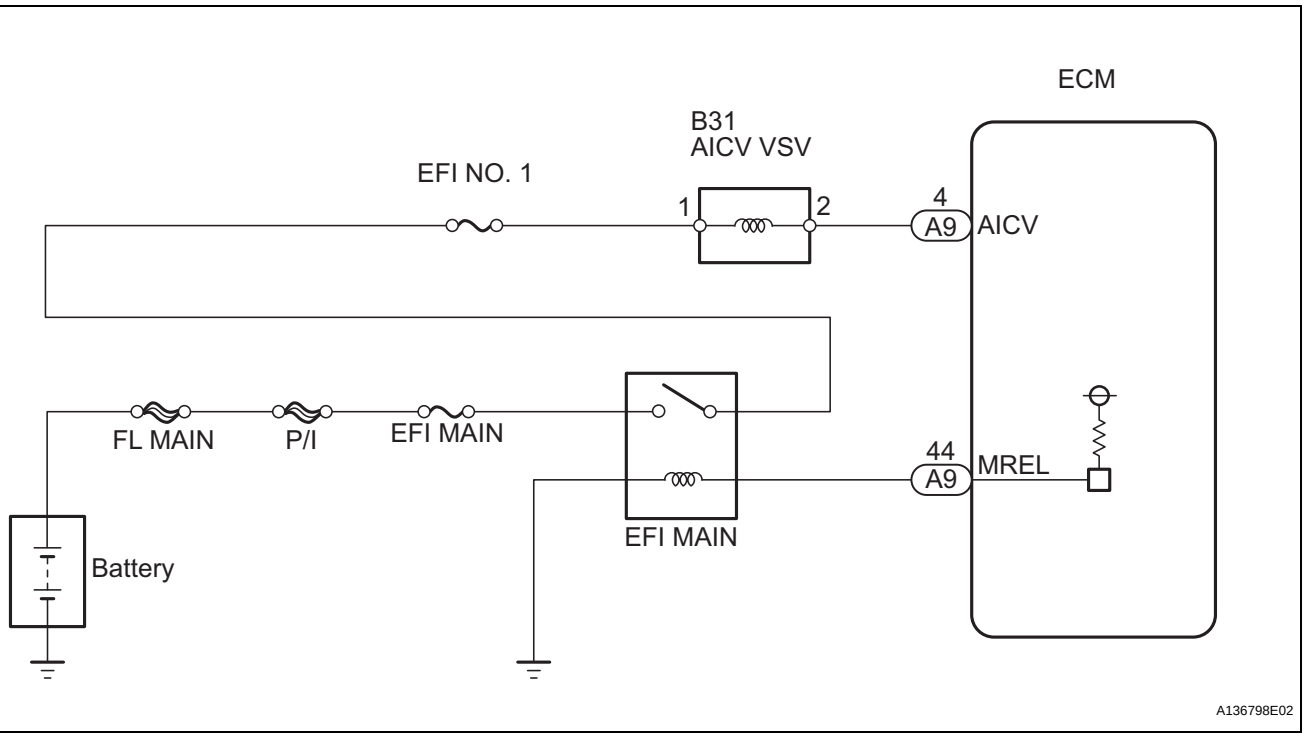
NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK



REPLACE ECM

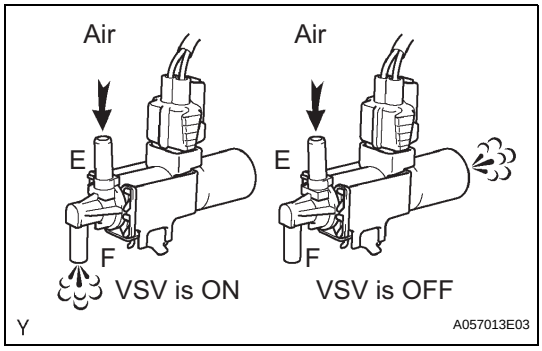
Air Intake Control Circuit



DESCRIPTION

The air cleaner is equipped with 2 inlets, one of which is opened or closed by the Air Intake Control Valve (AICV). This system reduces intake noise and increases engine power at low to high engine speeds range.

When the engine is operating in the low-to-mid speed range, this control operates the AICV to close one of the air cleaner inlets. When the engine speed is more than 3,600 rpm and the opening angle of the throttle valve is more than 60°, the ECM activates the VSV and opens the AICV.



WIRING DIAGRAM

INSPECTION PROCEDURE

1	PERFORM ACTIVE TEST BY INTELLIGENT TESTER (AICV VSV)

(a) Turn the ignition switch ON and turn the intelligent tester ON.
(b) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / ACTIVE TEST / AICV VSV.
(c) Check the operation of the VSV when the VSV is operated by the intelligent tester.

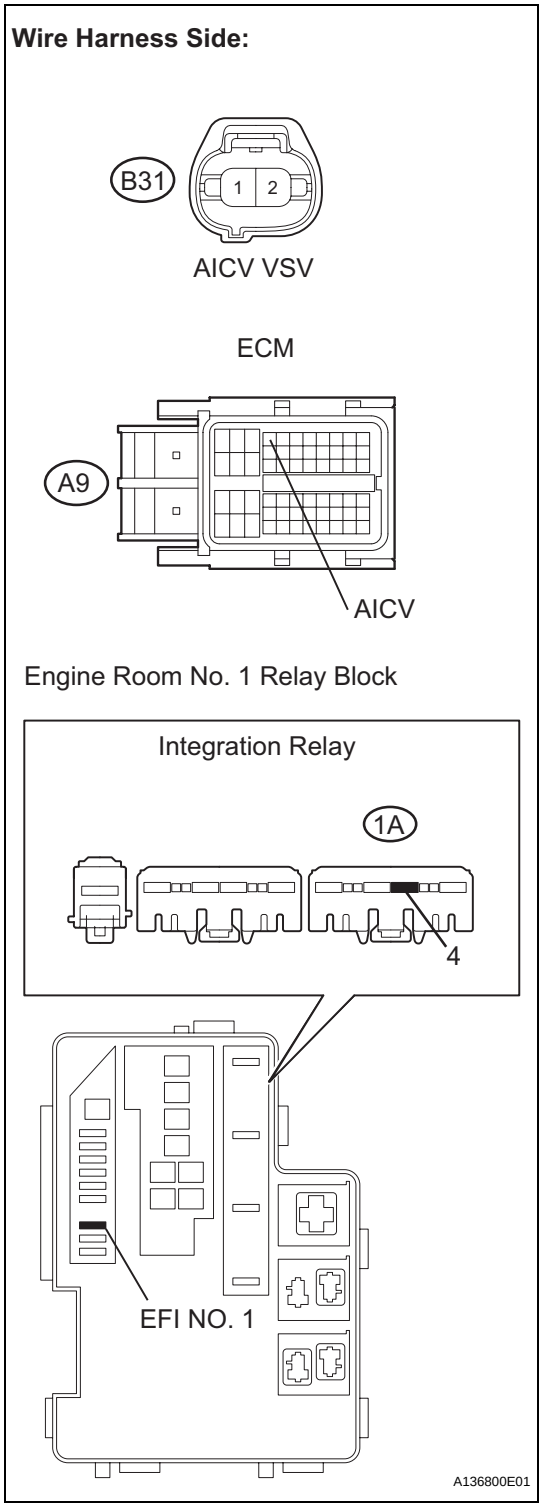
Standard

Tester Operation	Specified Condition
VSV is ON	Air from port E flows out through port F
VSV is OFF	Air from port E flows out through the air filter

OK → **Go to step 4**

NG

2	INSPECT AICV VSV



(a) Inspect the AICV VSV (See page IT-6).

NG → **REPLACE INTAKE AIR CONTROL VALVE ASSEMBLY**

OK

ES

3	CHECK WIRE HARNESS (AICV VSV - ECM AND INTEGRATION RELAY)

(a) Remove the EFI NO. 1 fuse from the engine room No. 1 relay block.
(b) Check the EFI NO. 1 fuse.
(c) Reinstall the EFI NO. 1 fuse.
(d) Disconnect the B31 AICV VSV connector.
(e) Disconnect the A9 ECM connector.
(f) Remove the integration relay from the engine room No. 1 relay block.
(g) Disconnect the 1A integration relay connector.
(h) Measure the resistance of the wire harness side connectors.

Standard resistance

Tester Connection	Specified Condition
B31-2 - A9-4	Below 1 Ω
B31-1 - 1A-4	Below 1 Ω
B31-2 or A9-4 - Body ground	Below 10 kΩ or higher
B31-1 or 1A-4 - Body ground	Below 10 kΩ or higher

(i) Reconnect the integration relay connector.
(j) Reinstall the integration relay.
(k) Reconnect the ECM connector.
(l) Reconnect the AICV VSV connector.

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

OK

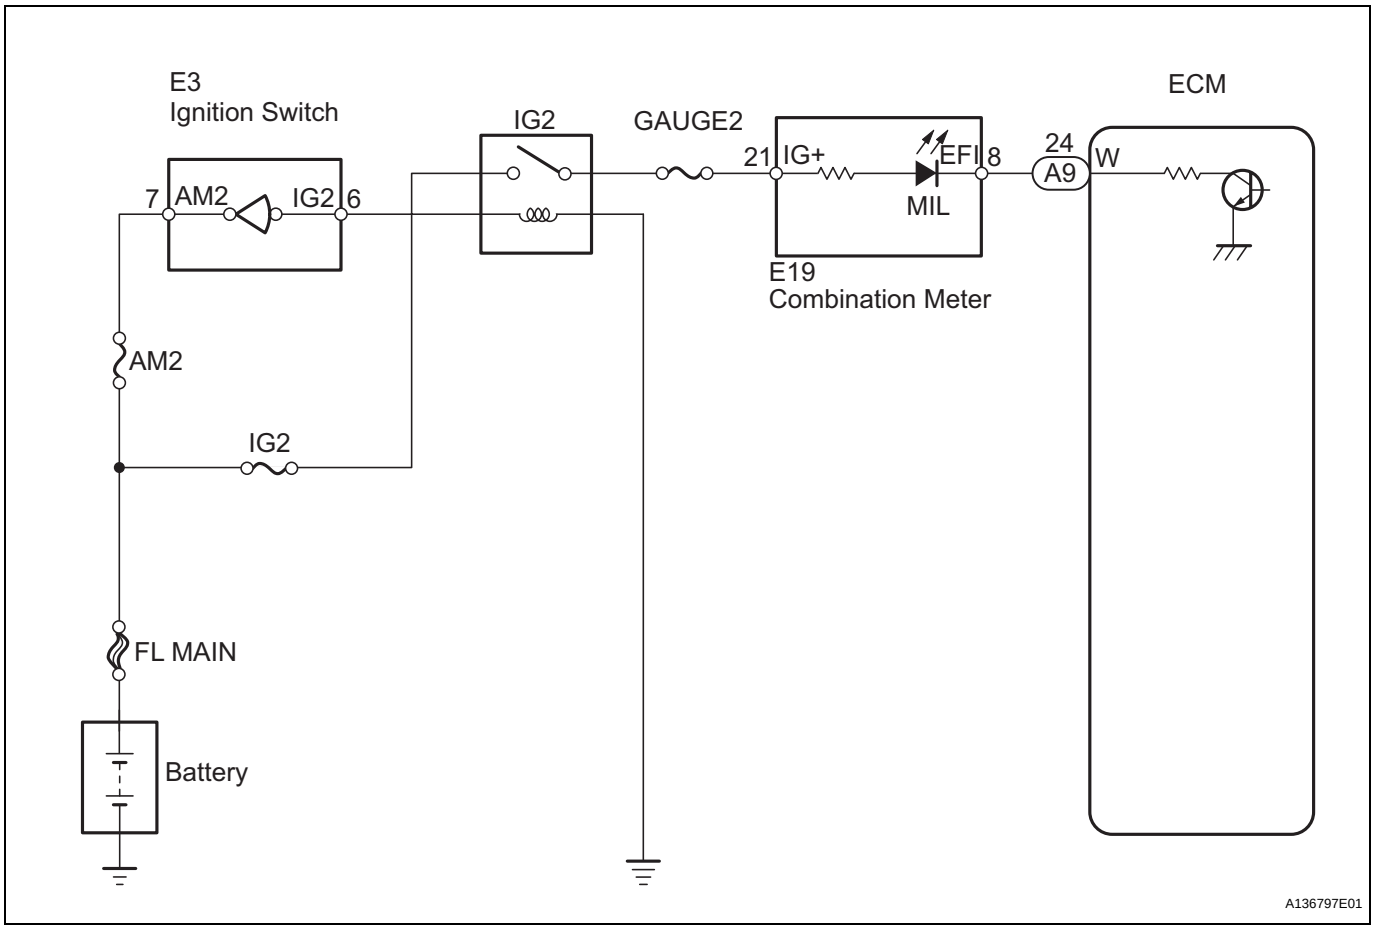
REPLACE ECM

ES

4	CHECK VACUUM PIPING (HOSE AND INTAKE MANIFOLD, VACUUM TANK)

NG → REPAIR OR REPLACE VACUUM LEAKAGE POINT

OK



REPAIR COMPLETED

MIL Circuit

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM. When the ignition switch is turned ON, power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the ignition switch is first turned ON, the MIL should be illuminated and should then turn off. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the intelligent tester.

WIRING DIAGRAM

INSPECTION PROCEDURE

1	CHECK THAT MIL IS ILLUMINATED

(a) Perform troubleshooting in accordance with the table below.

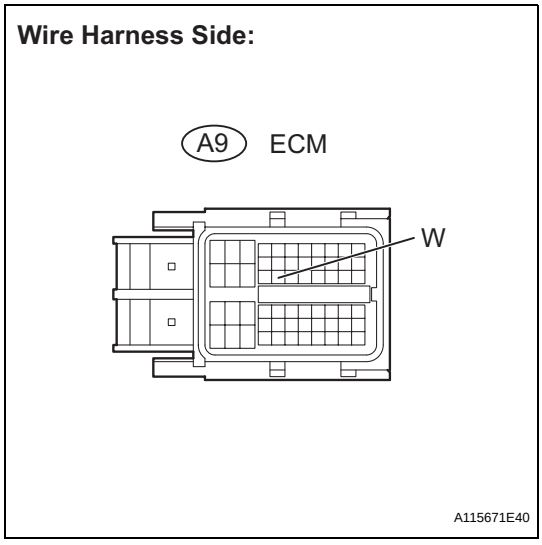
Condition	Proceed to
MIL remains ON	A
MIL does not illuminate	B

B	Go to step 5

A

2	CHECK WHETHER MIL TURNS OFF

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch ON and turn the tester ON.
(c) Select the following menu items: DIAGNOSIS / ENHANCED OBD II / DTC INFO / CURRENT CODES.
(d) Check if any DTCs have been stored. Note down any DTCs.
(e) Clear DTCs (see page ES-39).
(f) Check if the MIL goes off.
Standard:
MIL should go off.



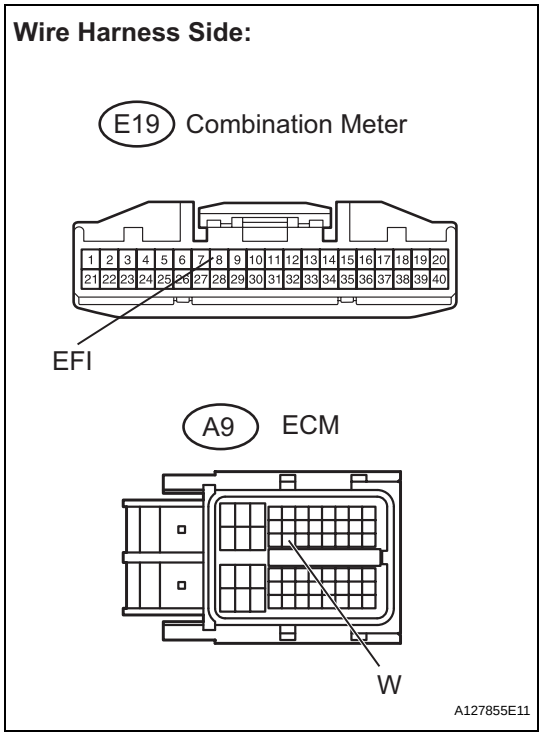
ES

OK → **REPAIR CIRCUITS INDICATED BY OUTPUT DTCS**

NG

3	CHECK WIRE HARNESS (CHECK FOR SHORT IN WIRE HARNESS)

Wire Harness Side:



(a) Disconnect the A9 ECM connector.
(b) Turn the ignition switch ON.
(c) Check that the MIL is not illuminated.
OK:
MIL is not illuminated.
(d) Reconnect the ECM connector.

OK → **REPLACE ECM**

NG

4	CHECK WIRE HARNESS (COMBINATION METER - ECM)

(a) Disconnect the A9 ECM connector.
(b) Disconnect the E19 combination meter connector.
(c) Measure the resistance.

Standard resistance

Tester Connection	Specified Condition
A9-24 (W) or E19-8 (EFI) - Body ground	10 kΩ or higher

(d) Reconnect the ECM connector.
(e) Reconnect the combination meter connector.

OK → **REPAIR OR REPLACE COMBINATION METER ASSEMBLY**

NG → **REPAIR OR REPLACE HARNESS AND CONNECTOR**

5	CHECK THAT MIL IS ILLUMINATED

(a) Check if the MIL is illuminated when the ignition switch is turned ON.

OK:

MIL should be illuminated.

OK → **SYSTEM OK**

NG

6	CHECK THAT ENGINE STARTS

(a) Turn the ignition switch ON.
(b) Start the engine.

Result	Proceed to
Engine starts	A
Engine does not start*	B

HINT:
*: The intelligent tester cannot communicate with the ECM.

ES

B → GO TO VC OUTPUT CIRCUIT

A

7	INSPECT COMBINATION METER ASSEMBLY (MIL CIRCUIT)

(a) Check the MIL circuit (see page ME-17).

NG → REPAIR OR REPLACE COMBINATION METER ASSEMBLY

OK

CHECK AND REPLACE HARNESS AND CONNECTOR (COMBINATION METER - ECM)

SFI SYSTEM

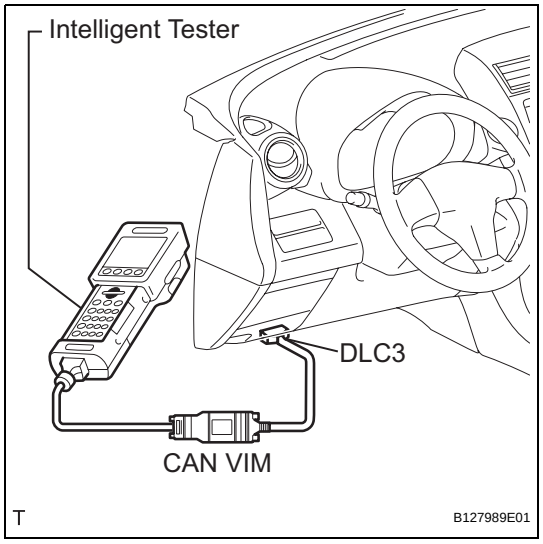
PRECAUTION

NOTICE:

- **Perform RESET MEMORY (AT initialization) when replacing the automatic transmission assembly, engine assembly or ECM (see page AX-20).**
- **Perform REGISTRATION (VIN registration) when replacing the ECM (see page ES-14).**

HINT:

Initialization cannot be completed by only removing the battery.



DEFINITION OF TERMS

Terms	Definition
Monitor Description	Description of what ECM monitors and how it detects malfunctions (monitoring purpose and details).
Related DTCs	Group of diagnostic trouble codes that are output by ECM based on same malfunction detection logic.
Typical Enabling Condition	Preconditions that allow ECM to detect malfunctions. With all preconditions satisfied, ECM sets DTC when monitored value(s) exceeds malfunction threshold(s).
Sequence of Operation	Order of monitor priority, applied if multiple sensors and components involved in single malfunction detection process. Each sensor and component monitored in turn, when previous detection operation completed.
Required Sensor/Components	Sensors and components used by ECM to detect each malfunction.
Frequency of Operation	Number of times ECM checks for each malfunction during each driving cycle. "Once per driving cycle" means ECM only performs checks for that malfunction once during single driving cycle. "Continuous" means ECM performs checks for that malfunction whenever enabling conditions met.
Duration	Minimum time for which ECM must detect continuous deviation in monitored value(s) in order to set DTC. Timing begins when Typical Enabling Conditions met.
Malfunction Thresholds	Value beyond which ECM determines malfunctions exist and sets DTCs.
MIL Operation	Timing of MIL illumination after malfunction detected. "Immediate" means ECM illuminates MIL as soon as malfunction detected. "2 driving cycle" means ECM illuminates MIL if same malfunction detected second time during next sequential driving cycle.

ON-VEHICLE INSPECTION

1. CHECK THROTTLE BODY

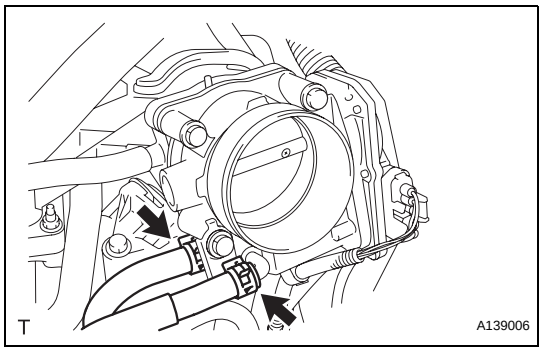
(a) Check the throttle control motor operating sounds.
  (1) Turn the ignition switch ON.
  (2) When pressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises emit from the motor. If friction noise exists, replace the throttle body.

(b) Check the throttle position sensor.
  (1) Connect the intelligent tester to the DLC3.
  (2) Turn the ignition switch ON.
  (3) Push the intelligent tester main switch ON.
  (4) Enter the following menus: DIAGNOSIS / ENHANCED OBD II / DATA LIST / THROTTLE POS.
  (5) Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of "THROTTLE POS" is within the specification.

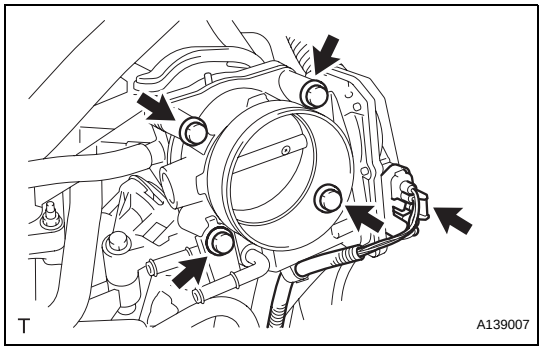
Standard throttle valve opening percentage:
60% or more

NOTICE:

When checking the standard throttle valve opening percentage, the shift lever should be in the N position.

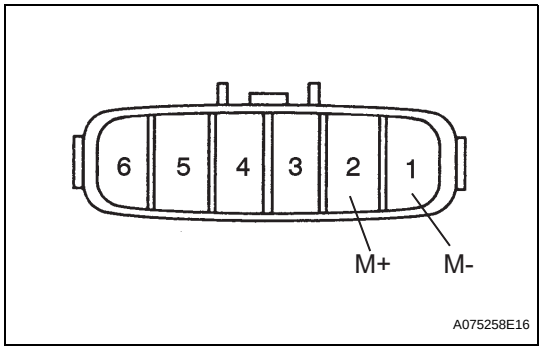


If the percentage is less than 60%, replace the throttle body.



ES

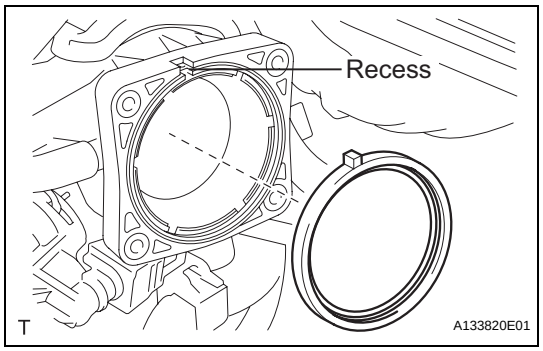
ES



REMOVAL

1. **DRAIN ENGINE COOLANT (See page CO-8)**
2. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
3. **REMOVE V-BANK COVER SUB-ASSEMBLY (See page EM-21)**
4. **REMOVE AIR CLEANER CAP SUB-ASSEMBLY (See page EM-23)**
5. **REMOVE THROTTLE BODY**
   (a) Disconnect the 2 water by-pass hoses from the throttle body.

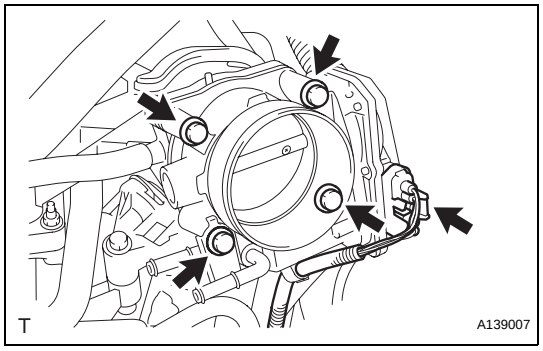
(b) Disconnect the control motor connector.
(c) Remove the 4 bolts and throttle body and wire harness clamp stay.
(d) Remove the gasket from the intake air surge tank.



INSPECTION

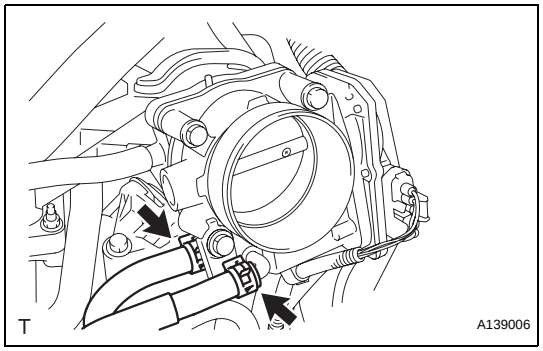
1. **INSPECT THROTTLE BODY**
   (a) Measure the resistance of the throttle control motor.
   Standard resistance

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	20°C (68°F)	0.3 to 100 Ω



If the result is not as specified, replace the throttle body.

INSTALLATION



1. INSTALL THROTTLE BODY

(a) Install a new gasket to the intake air surge tank.

(b) Install the throttle body and wire harness clamp stay to the intake air surge tank with the 4 bolts.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)

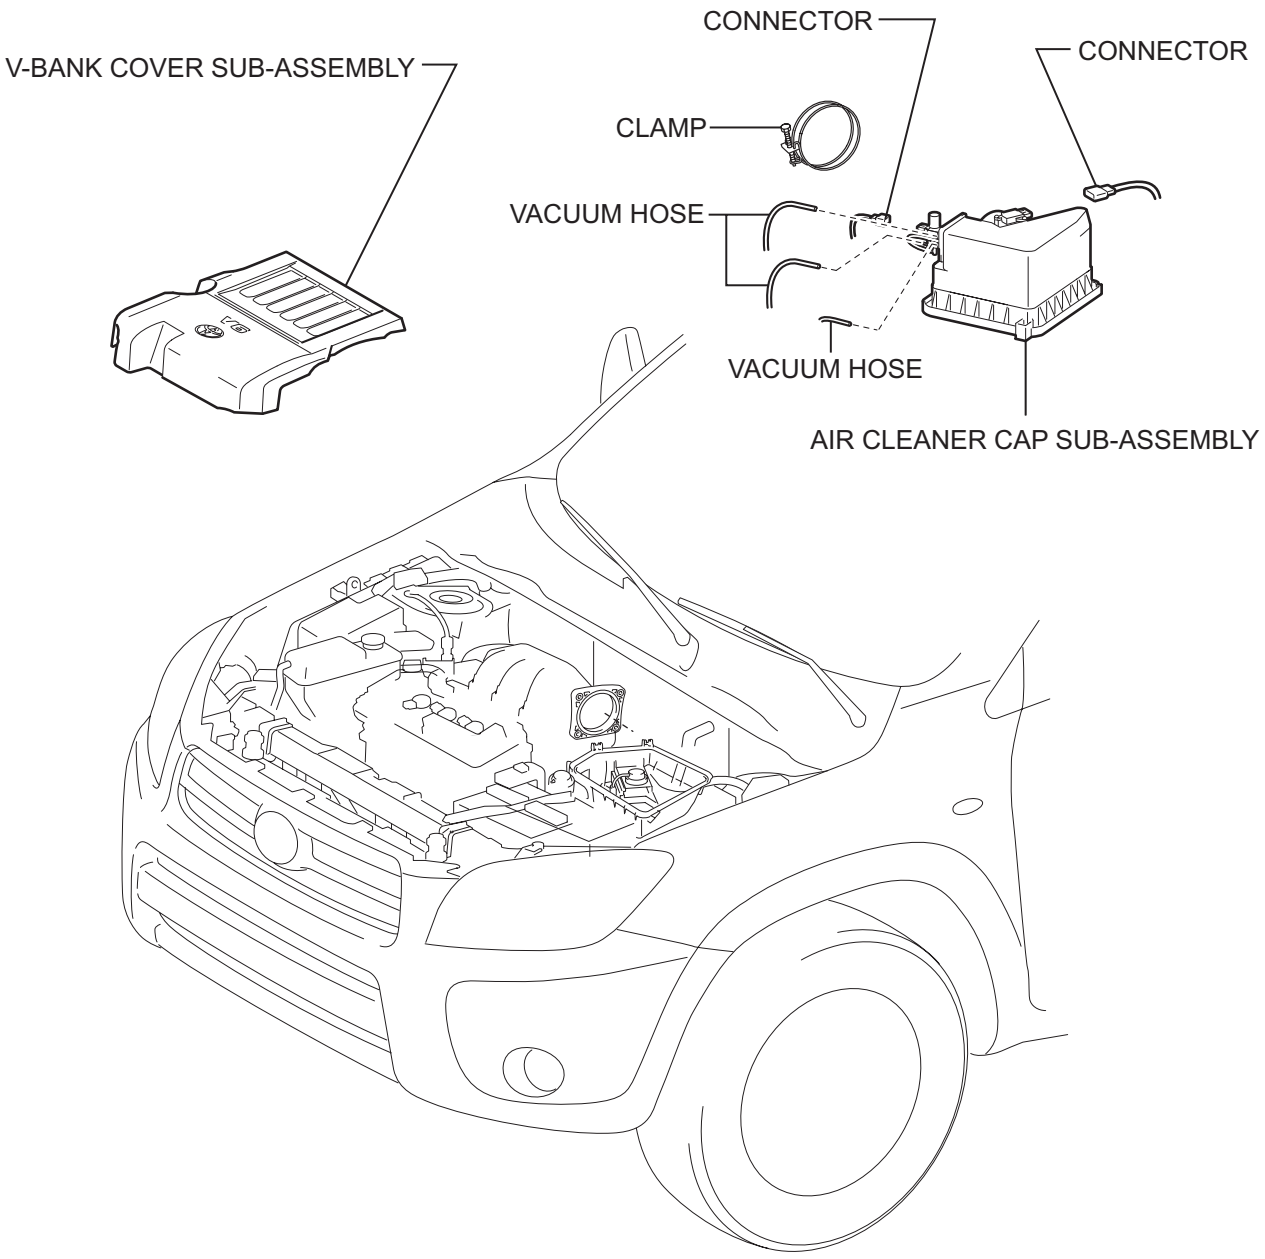
(c) Connect the control motor connector.

(d) Connect the 2 water by-pass hoses to the throttle body.

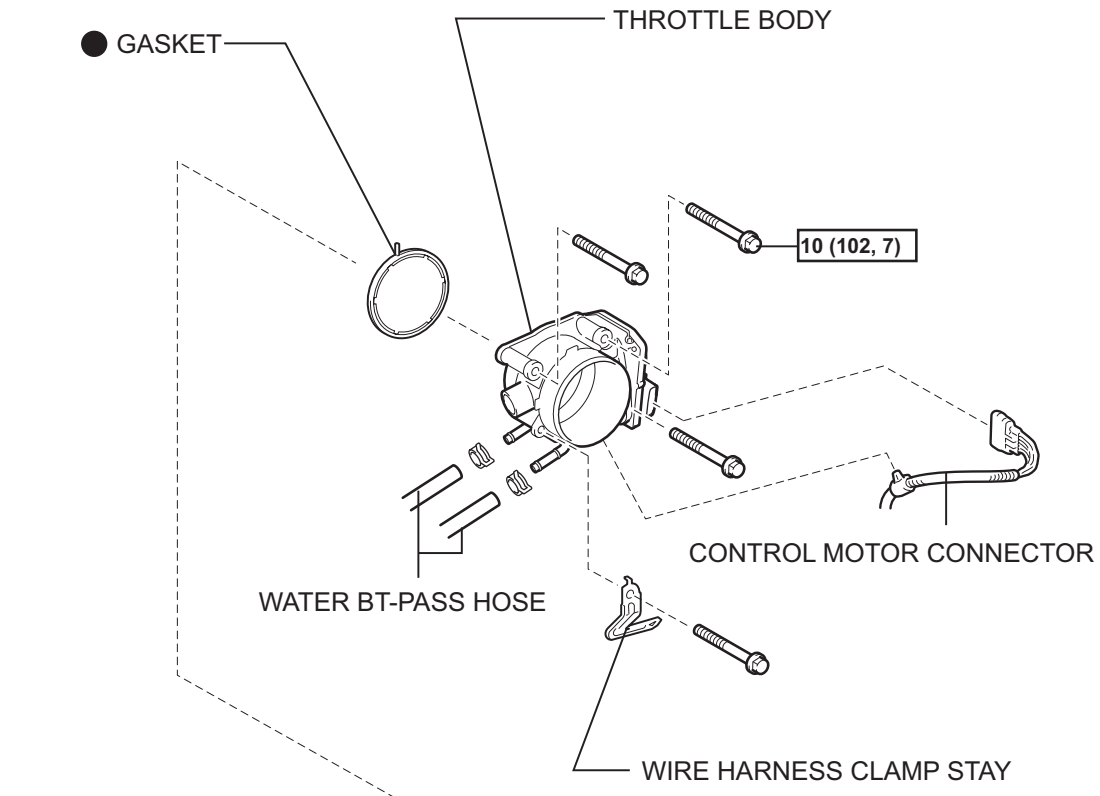
2. INSTALL AIR CLEANER CAP SUB-ASSEMBLY (See page EM-39)

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

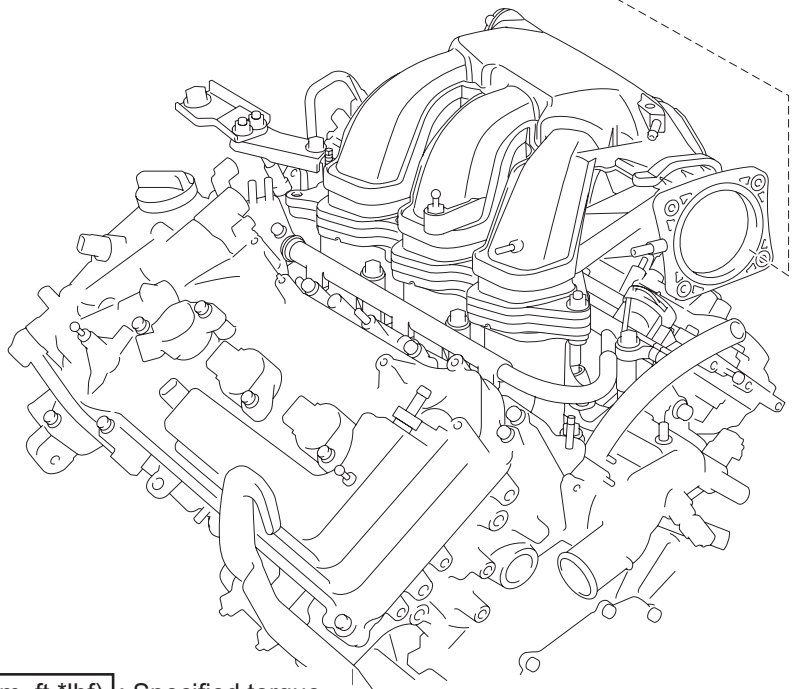
4. ADD ENGINE COOLANT (See page CO-8)



5. CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)



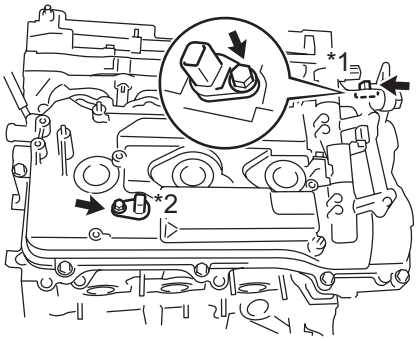
6. INSTALL V-BANK COVER SUB-ASSEMBLY (See page EM-41)



ES

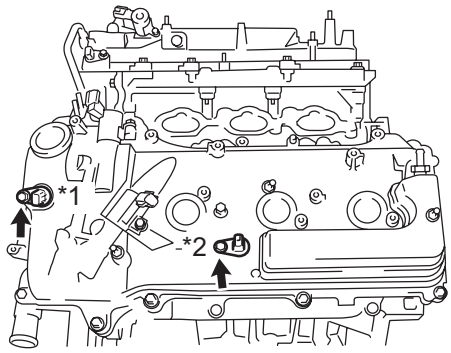
THROTTLE BODY

COMPONENTS



N*m (kgf*cm, ft.*lbf) : Specified torque

● Non-reusable part



P

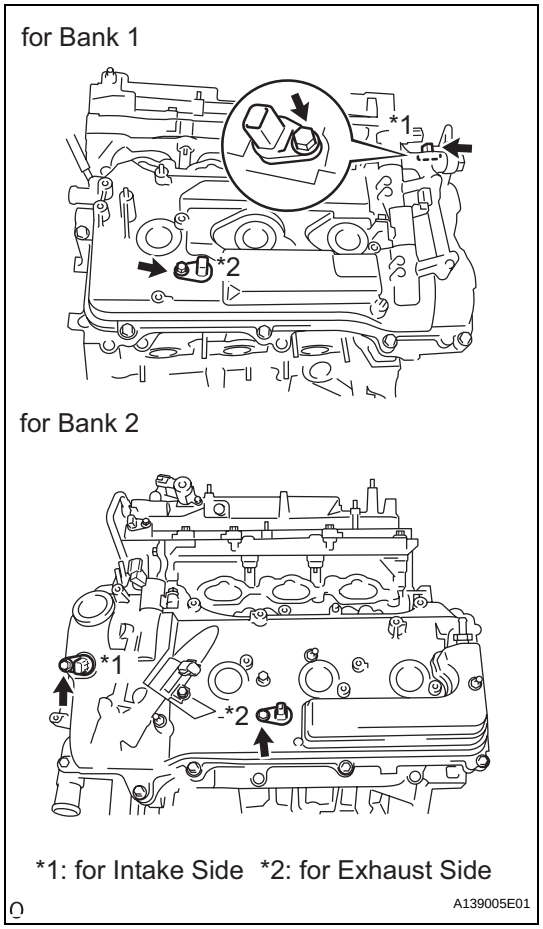
INSTALLATION

1. **INSTALL VVT SENSOR**
   (a) Install the 4 sensors with the 4 bolts.
   Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)
   (b) Connect the 4 sensor connectors.
2. **INSTALL INTAKE AIR SURGE TANK ASSEMBLY (See page EM-34)**
3. **INSTALL ENGINE ASSEMBLY**
   (a) Install the engine (see page EM-31).
4. **CONNECT CABLE TO NEGATIVE BATTERY TERMINAL**

VVT SENSOR

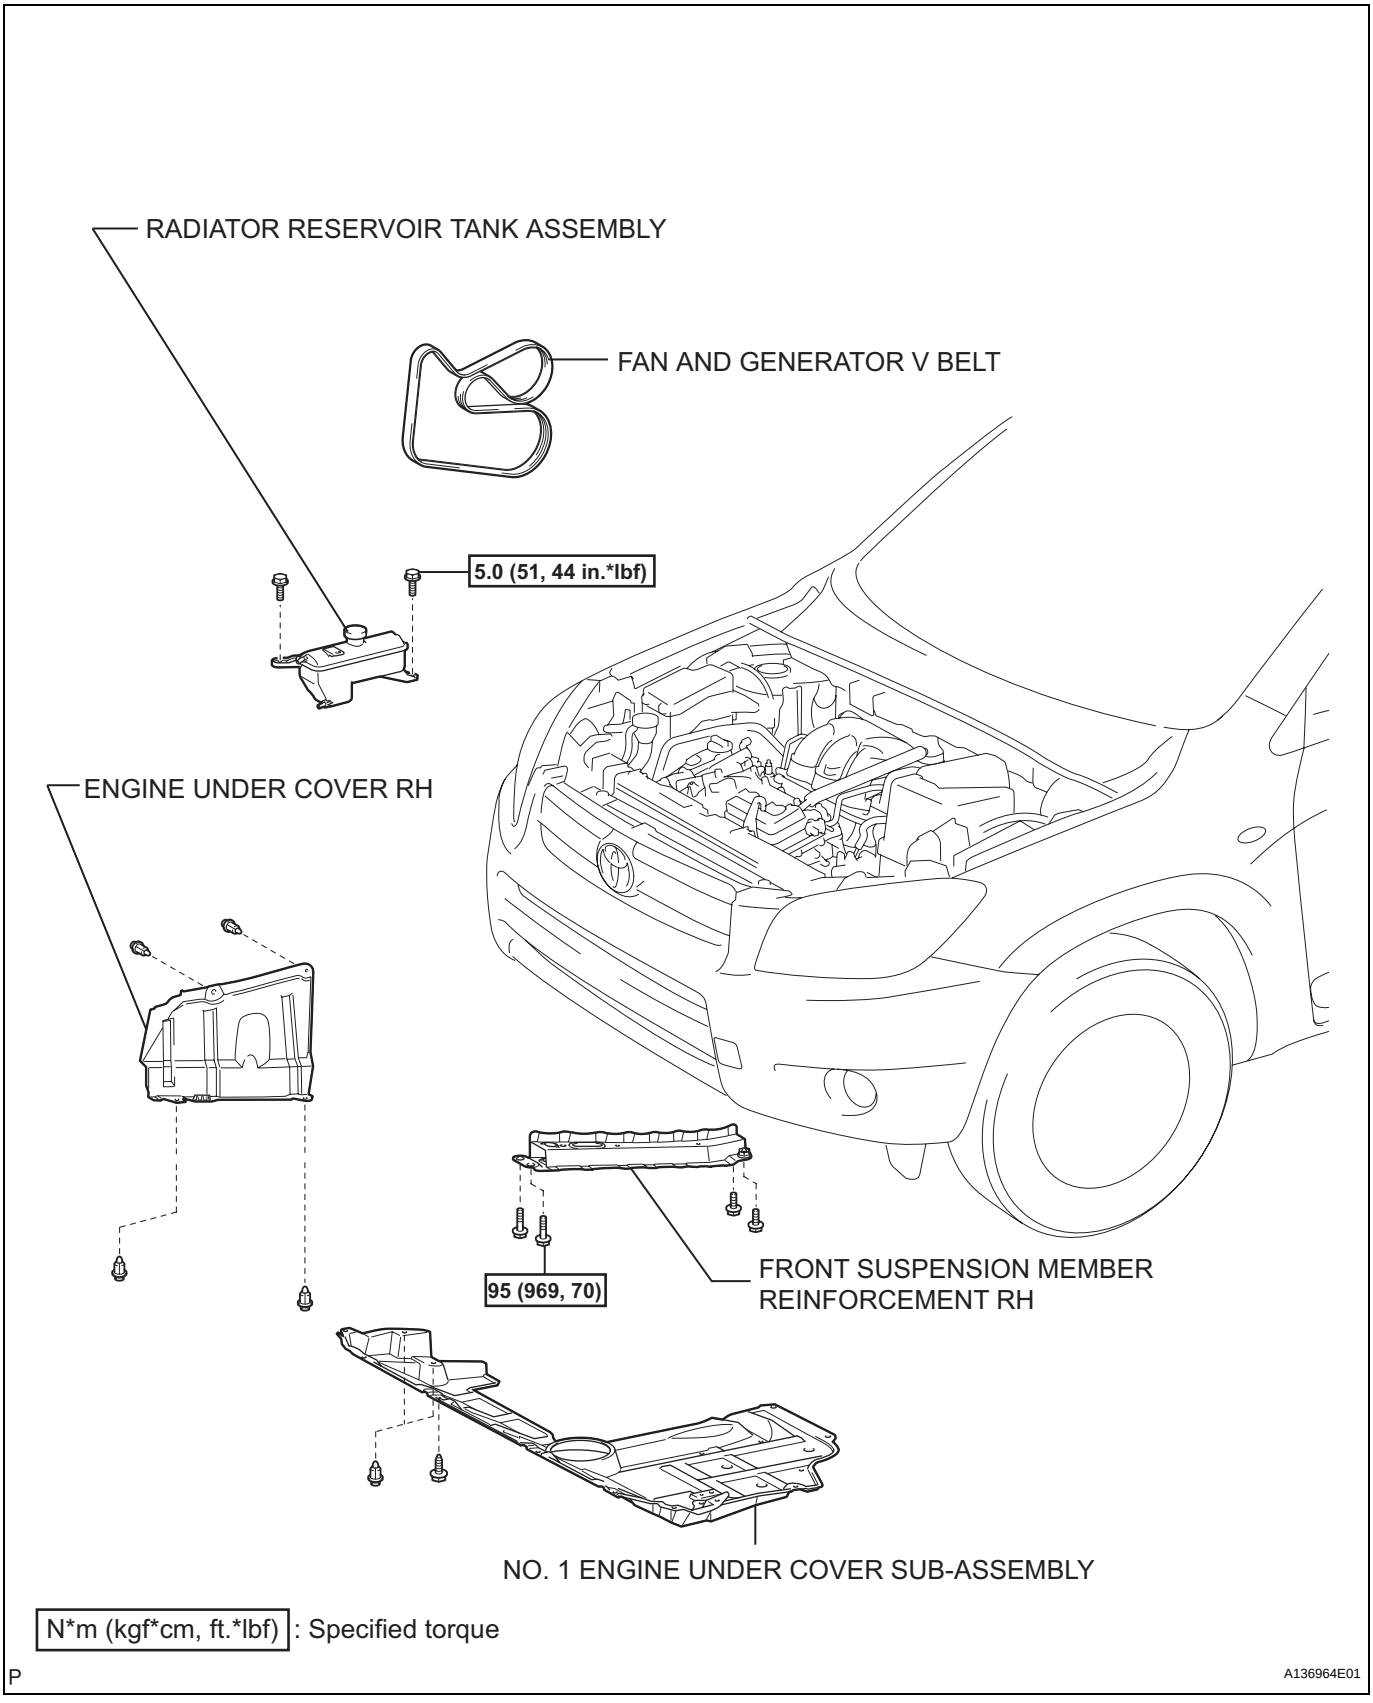
COMPONENTS



REMOVAL

1. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.

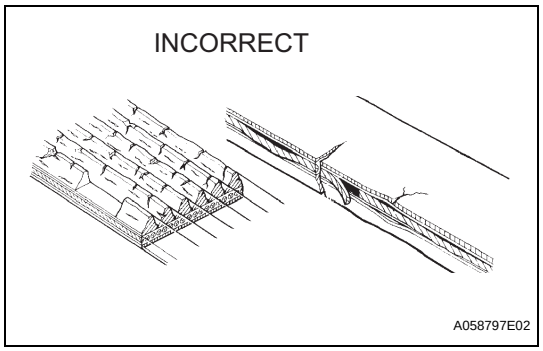
2. **REMOVE ENGINE ASSEMBLY**
   (a) Remove the engine (see page EM-21).



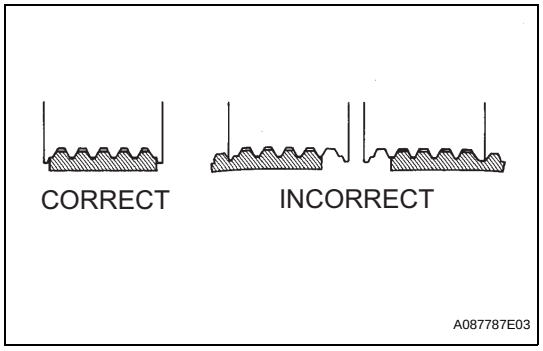
3. **REMOVE INTAKE AIR SURGE TANK ASSEMBLY (See page EM-27)**

4. **REMOVE VVT SENSOR**
   (a) Disconnect the 4 sensor connectors.
   (b) Remove the 4 bolts and 4 sensors.

DRIVE BELT



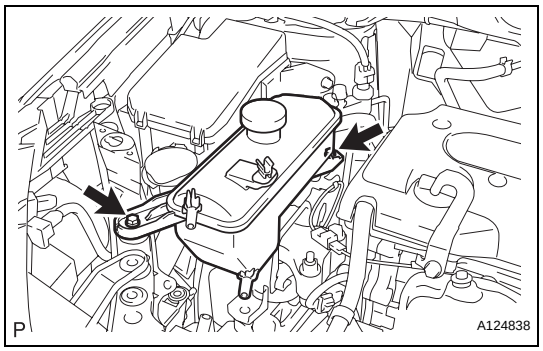
COMPONENTS



N*m (kgf*cm, ft.*lbf) : Specified torque

P

A136964E01



ON-VEHICLE INSPECTION

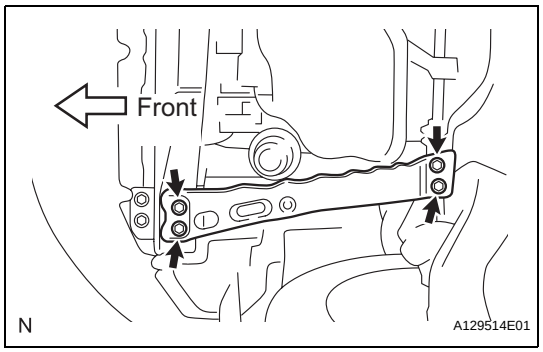
1. INSPECT FAN AND GENERATOR V BELT

(a) Visually check the drive belt for excessive wear, frayed cords, etc. If any defect is found, replace the drive belt.
HINT:
Cracks on the rib side of a drive belt are considered acceptable. If the drive belt has chunks missing from the ribs, it should be replaced.

(b) After installing the drive belt, check that it fits properly in the ribbed grooves. Check with your hand to confirm that the belt has not slipped out of the grooves on the bottom of the crank pulley.

EM

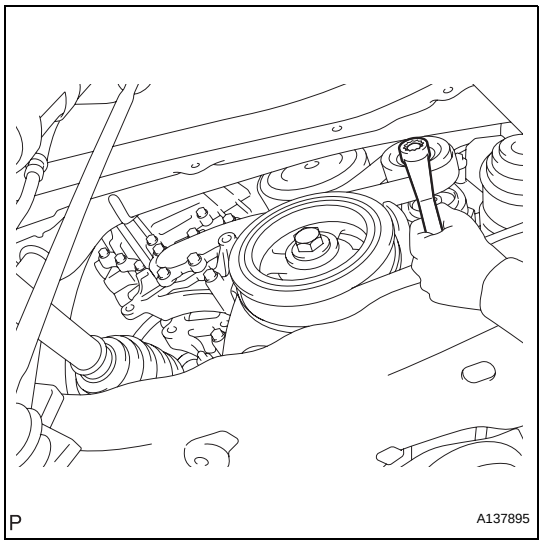
REMOVAL



1. DISCONNECT RADIATOR RESERVOIR TANK ASSEMBLY

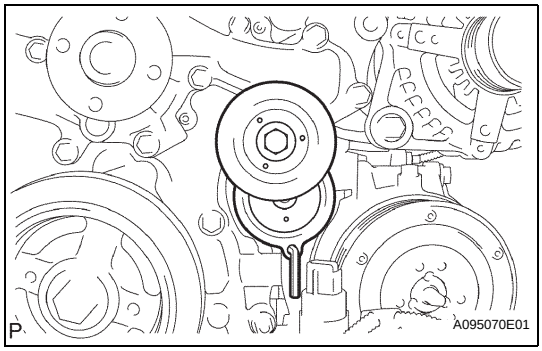
(a) Remove the 2 bolts and disconnect the reservoir tank.

2. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY (See page EM-21)



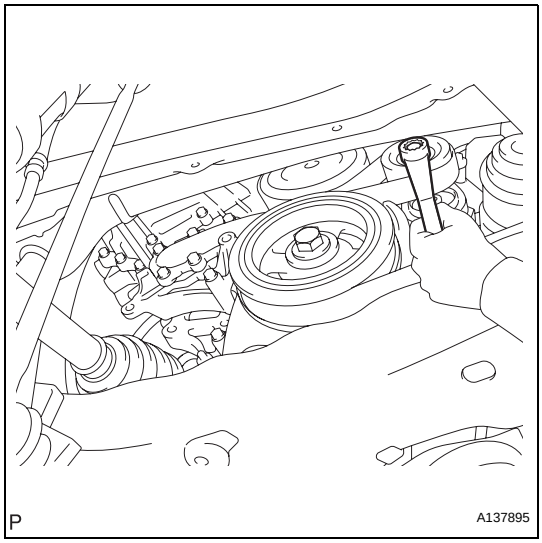
3. REMOVE ENGINE UNDER COVER RH

(a) Remove the 2 clips and engine under cover.



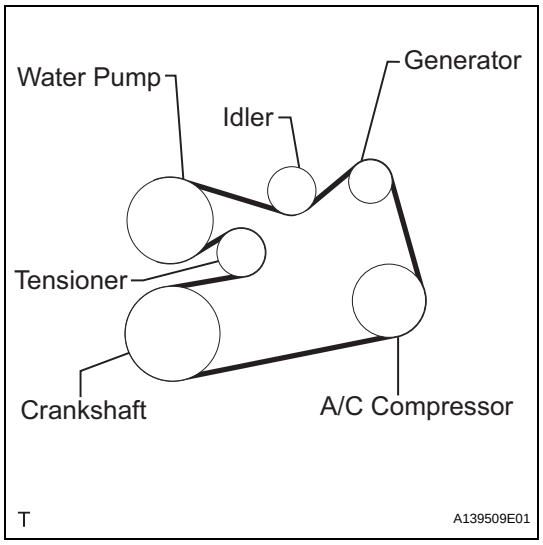
4. REMOVE FRONT SUSPENSION MEMBER REINFORCEMENT RH

(a) Remove the 4 bolts and reinforcement.



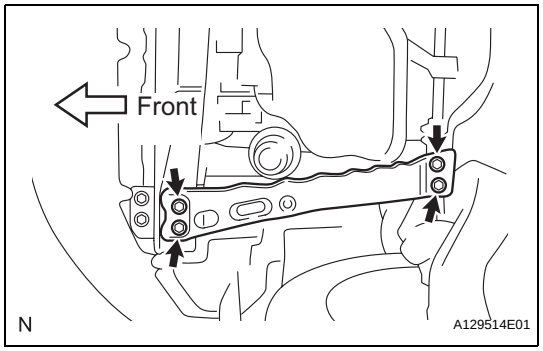
5. REMOVE FAN AND GENERATOR V BELT

(a) Rotate the tensioner pulley counterclockwise to loosen the belt tension. Then remove the V-ribbed belt.



(b) While turning the belt tensioner counterclockwise, align its holes, and then insert the 5 mm bi-hexagon wrench into the holes to fix the V-ribbed belt tensioner in place.

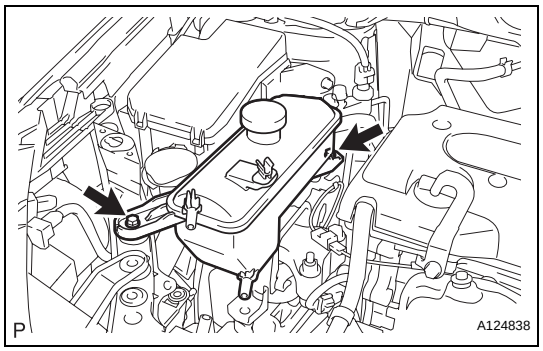
INSTALLATION



1. INSTALL FAN AND GENERATOR V BELT

(a) Rotate the tensioner pulley counterclockwise, and then install the V-ribbed belt.

(b) If it is difficult to install the V-ribbed belt, perform the following procedure.
  (1) Put the V-ribbed belt on everything except the tensioner pulley as shown in the illustration.
  (2) While releasing the belt tension by turning the belt tensioner counterclockwise, put the V-ribbed belt on the tensioner pulley.
  NOTICE:
  - **Put the backside of the V-ribbed belt on the tensioner pulley and idler pulley.**
  - **Check that the V-ribbed belt is properly set to each pulley.**



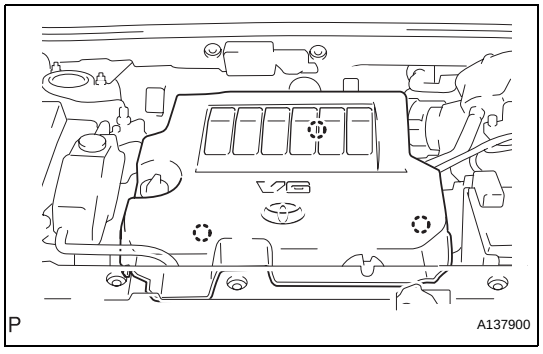
2. INSTALL FRONT SUSPENSION MEMBER REINFORCEMENT RH

(a) Install the reinforcement with the 4 bolts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

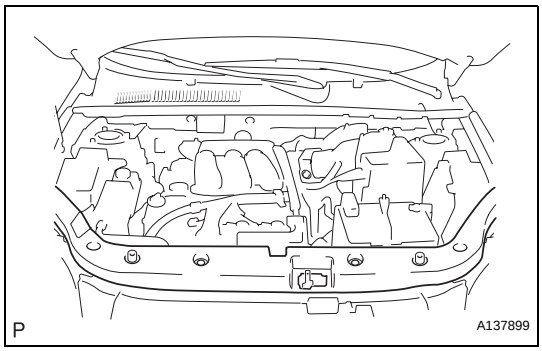
3. INSTALL ENGINE UNDER COVER RH

(a) Install the engine under cover with the 2 clips.

4. INSTALL NO. 1 ENGINE UNDER COVER (See page EM-41)



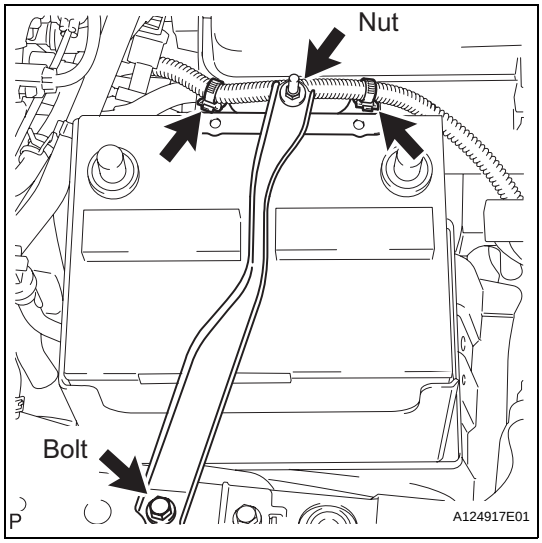
5. CONNECT RADIATOR RESERVOIR TANK ASSEMBLY



(a) Connect the reservoir tank with the 2 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)

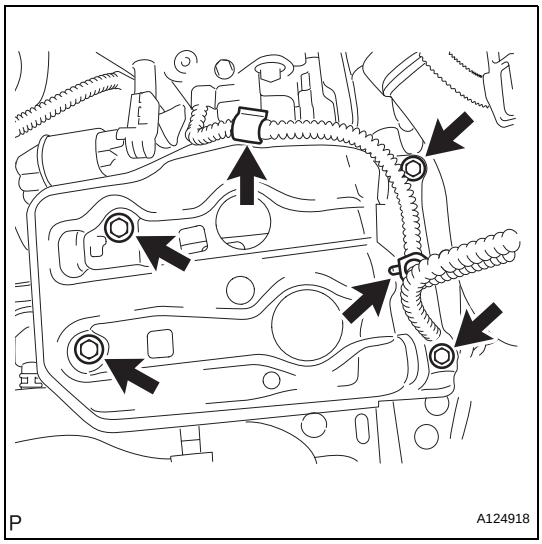
EM

REMOVAL



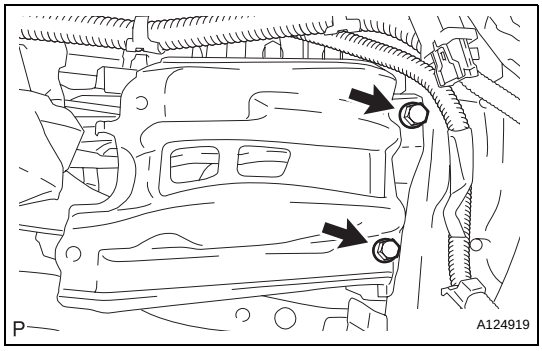
1. **DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM (See page AC-172)**
2. **DISCHARGE FUEL SYSTEM PRESSURE (See page FU-13)**
3. **DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL**
   CAUTION:
   Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to prevent airbag and seat belt pretensioner activation.
4. **REMOVE NO. 1 ENGINE UNDER COVER**
   (a) Remove the 4 bolts, 12 clips and under cover.
5. **REMOVE REAR ENGINE UNDER COVER RH**
   (a) Remove the 2 clips and under cover.
6. **REMOVE REAR ENGINE UNDER COVER LH**
   (a) Remove the 2 clips and under cover.
7. **REMOVE NO. 2 ENGINE UNDER COVER**
   (a) Remove the 2 clips and under cover.
8. **REMOVE FRONT FLOOR COVER (See page FU-34)**
9. **DRAIN ENGINE COOLANT (See page CO-8)**
10. **DRAIN ENGINE OIL (See page LU-4)**
11. **DRAIN AUTOMATIC TRANSAXLE FLUID**
    (a) 2WD:
    Drain automatic transaxle fluid (see page AX-172).
    (b) 4WD:
    Drain automatic transaxle fluid (see page AX-173)
12. **DRAIN TRANSFER OIL (for 4WD)**
13. **REMOVE HOOD SUB-ASSEMBLY (See page ED-4)**
14. **REMOVE V-BANK COVER SUB-ASSEMBLY**
    (a) Detach the 3 clips and remove the V-bank cover.

15. REMOVE RADIATOR SUPPORT OPENING COVER



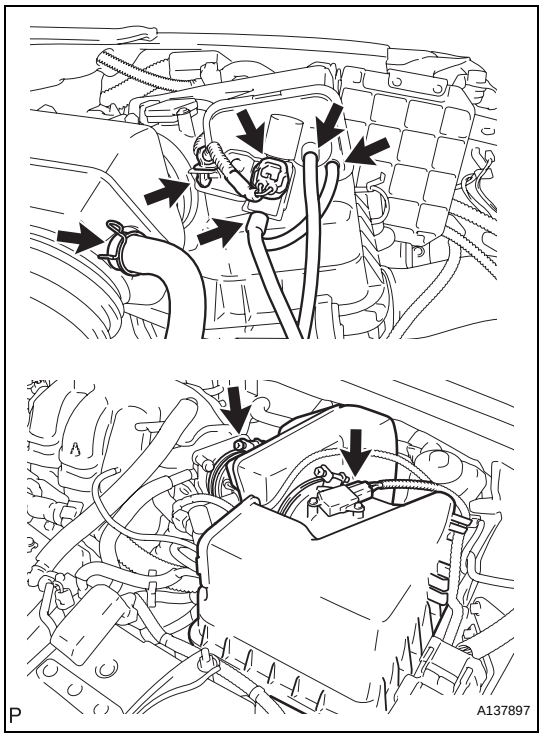
(a) Remove the 9 clips and cover.

16. REMOVE BATTERY CLAMP SUB-ASSEMBLY



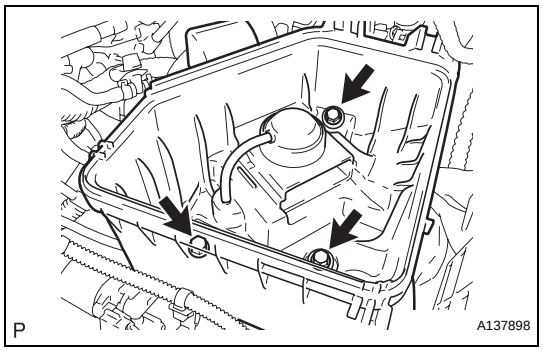
(a) Remove the bolt and loosen the nut.
(b) Detach the 2 wire harness clamps.
(c) Detach the hook of the battery clamp from the battery bracket front, and then remove the battery clamp.

17. REMOVE BATTERY



18. REMOVE FRONT BATTERY BRACKET

(a) Detach the 2 wire harness clamps.
(b) Remove the 4 bolts and front bracket.

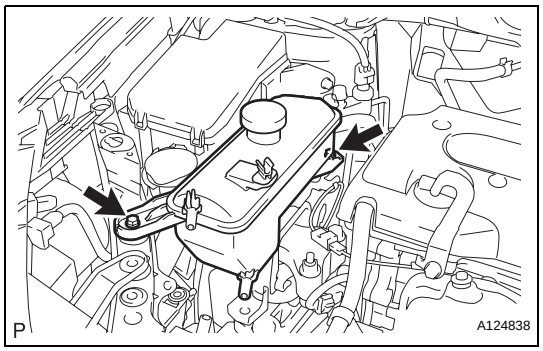


19. REMOVE BATTERY BRACKET REINFORCEMENT

(a) Remove the 2 bolts and bracket reinforcement.

20. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

(a) Disconnect the mass air flow meter connector.
(b) Disconnect the VSV (air intake control) connector.
(c) Disconnect the wire harness clamp and 3 vacuum hoses.
(d) Disconnect the No. 2 ventilation hose from the air cleaner hose.
(e) Loosen the No. 1 air cleaner hose clamp.
(f) Unfasten the 2 hook clamps, and then remove the air cleaner cap.
(g) Remove the air cleaner filter element from the air cleaner case.



21. REMOVE AIR CLEANER CASE

(a) Disconnect the harness clamp.
(b) Remove the 3 bolts and air cleaner case.

22. DISCONNECT HOSES AND CONNECTORS

(a) Remove the engine room junction block cover (upper).
(b) Remove the nut and disconnect the engine room junction block cover (side) with 3 connectors and wire.
(c) Remove the nut and disconnect the starter wire.
(d) Disconnect the fuel hoses.
(e) Disconnect the 2 heater hoses.
(f) Disconnect the 2 ECM connectors.

23. REMOVE ECM (See page ES-470)

24. REMOVE RADIATOR RESERVOIR TANK ASSEMBLY

(a) Remove the 2 bolts, 2 hoses and reservoir tank.

25. REMOVE DISCHARGE HOSE SUB-ASSEMBLY (See page AC-220)

26. DISCONNECT SUCTION HOSE SUB-ASSEMBLY (See page AC-220)

27. DISCONNECT RADIATOR HOSE INLET

28. DISCONNECT RADIATOR HOSE OUTLET

29. DISCONNECT OIL COOLER HOSE

30. DISCONNECT TRANSMISSION CONTROL CABLE ASSEMBLY

(a) 2WD:
Disconnect the control cable (see page AX-154).

EM

(b) 4WD:
Disconnect the control cable (see page AX-154).

31. REMOVE FRONT EXHAUST PIPE ASSEMBLY (See page EX-3)

32. REMOVE CENTER EXHAUST PIPE ASSEMBLY (See page EX-2)

33. REMOVE PROPELLER WITH CENTER BEARING SHAFT ASSEMBLY (See page PR-3)

34. REMOVE FRONT WHEELS

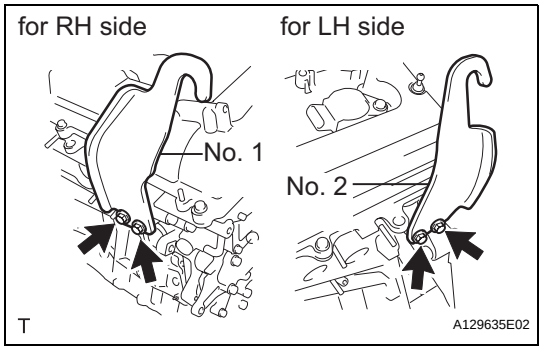
35. REMOVE FRONT AXLE HUB NUT LH
(a) Remove the hub nut (see page AH-8).

36. REMOVE FRONT AXLE HUB NUT RH
(a) Remove the hub nut (see page AH-8).

37. DISCONNECT FRONT STABILIZER LINK ASSEMBLY LH (See page SP-30)

38. DISCONNECT FRONT STABILIZER LINK ASSEMBLY RH (See page SP-30)

39. DISCONNECT STEERING INTERMEDIATE SHAFT (See page PS-44)



40. DISCONNECT TIE ROD END SUB-ASSEMBLY RH (See page PS-42)

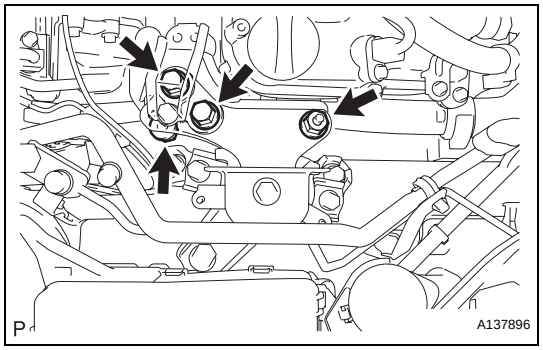
41. DISCONNECT TIE ROD END SUB-ASSEMBLY LH (See page PS-42)

42. REMOVE FRONT DRIVE SHAFT LH
(a) 2WD:
Remove the drive shaft (see page DS-10).
(b) 4WD:
Remove the drive shaft (see page DS-43).

43. REMOVE FRONT DRIVE SHAFT RH
(a) 2WD:
Remove the drive shaft (see page DS-10).
(b) 4WD:
Remove the drive shaft (see page DS-43).

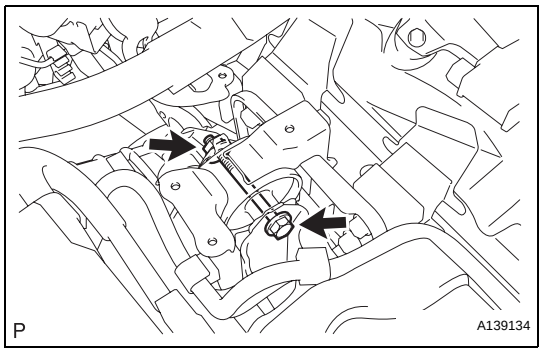
44. REMOVE ENGINE WITH TRANSAXLE
(a) Install the No. 1 and No. 2 engine hangers with the 4 bolts as shown in the illustration.
Torque: 33 N*m (337 kgf*cm, 24 ft.*lbf)

Part Name	Part No.
No. 1 engine hanger	12281-31120
No. 2 engine hanger	12282-31100
Bolt	91671-10825



HINT:
- Insert the claw of the hanger into hole of the cylinder head.
- Fit the fork part of the hanger onto the rib of the cylinder head.

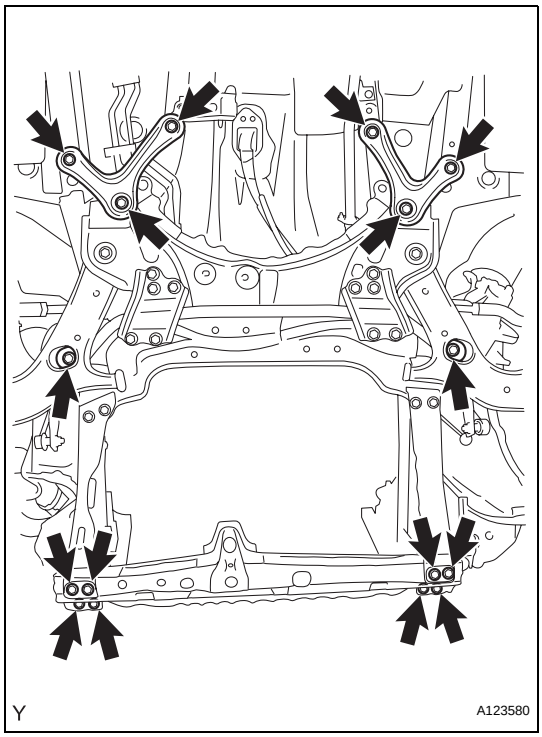
(b) Install an engine sling device to the engine and hold the engine with a chain block.
CAUTION:
Do not raise the engine more than necessary. If the engine is raised excessively, the vehicle may also be lifted up.



(c) Set an engine lifter underneath the engine.

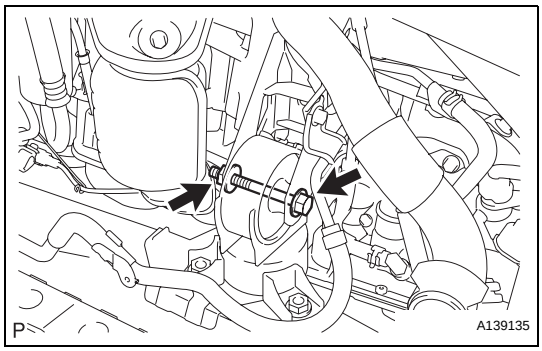
(d) Remove the column hole cover. Loosen the bolt holding the intermediate shaft, and slide the intermediate shaft.

(e) Put matchmarks on the intermediate shaft and pinion.

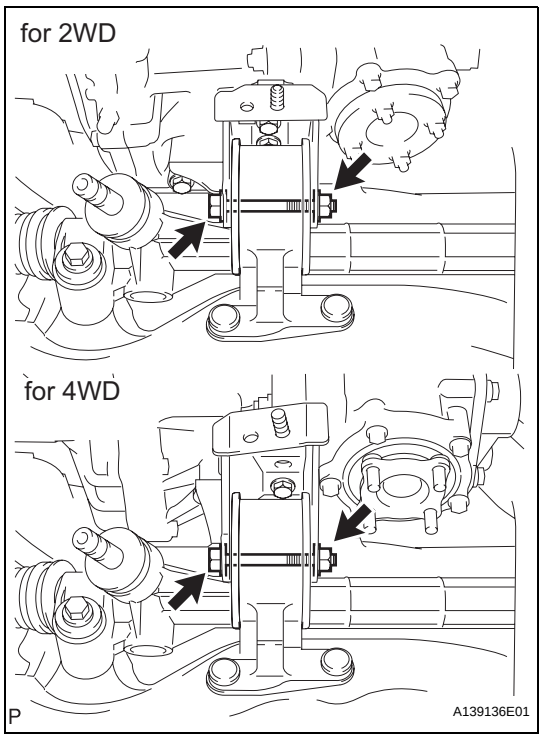


(f) Remove the 2 bolts and 2 nuts, and disconnect the engine mounting insulator RH.

(g) Remove the bolt and nut, and disconnect the engine mounting insulator LH.



EM

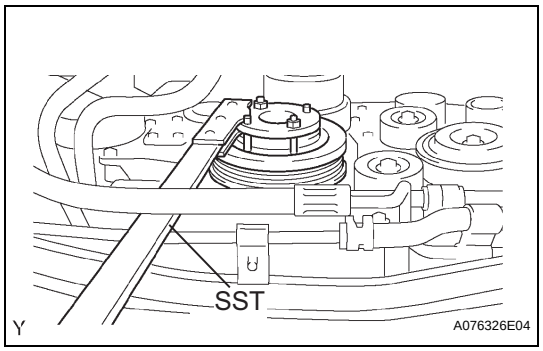


(h) Remove the 6 bolts and front suspension member brace rear RH and LH.
(i) Remove the 6 bolts, crossmember and suspension member.
(j) Using the chain block, slowly remove the engine from the vehicle and the intermediate shaft from the pinion. Then set the engine on the engine lifter.
NOTICE:
- **Make sure that the engine is clear of all wiring and hoses.**
- **While lowering the engine from the vehicle, do not allow it to contact the vehicle.**

HINT:
Place the engine on wooden blocks or an equivalent so that the engine is level.
(k) Remove the sling device from the engine.

45. REMOVE FRONT CROSSMEMBER SUB-ASSEMBLY
(a) Install a chain block.

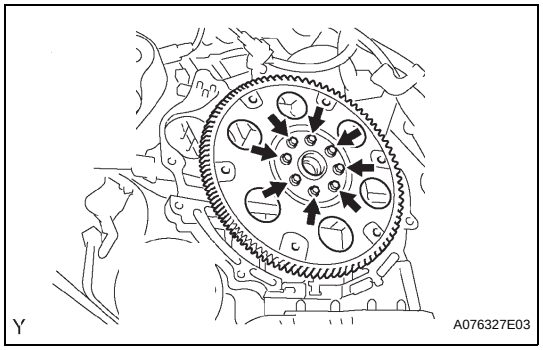
(b) Remove the bolt, nut and crossmember.



46. REMOVE FRONT SUSPENSION CROSSMEMBER SUB-ASSEMBLY
(a) Remove the bolt and suspension crossmember.

47. REMOVE ENGINE WIRE
(a) Remove the engine wire from the engine.

48. REMOVE STARTER ASSEMBLY (See page ST-6)

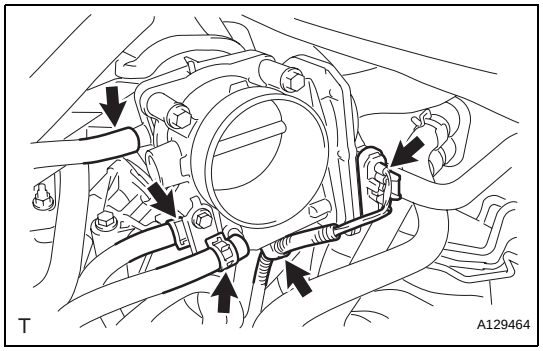


49. REMOVE TRANSFER ASSEMBLY (for 4WD) (See page TF-60)

50. REMOVE AUTOMATIC TRANSAXLE ASSEMBLY
(a) 2WD:
Remove the automatic transaxle (see page AX-172).
(b) 4WD:
Remove the automatic transaxle (see page AX-173).

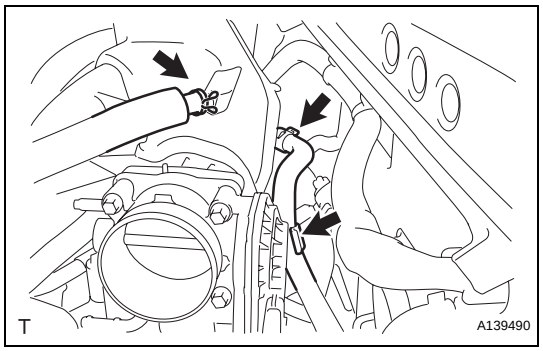
51. REMOVE DRIVE PLATE AND RING GEAR SUB-ASSEMBLY

(a) Using SST, hold the crankshaft.
SST 09213-70011, 09330-00021



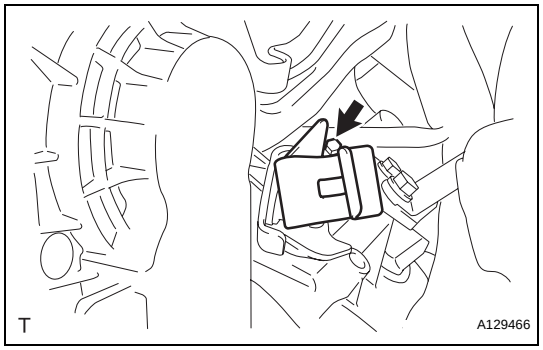
(b) Remove the 8 bolts, front spacer, drive plate and rear spacer.
NOTICE:
Do not reuse the bolts.

52. INSTALL ENGINE TO ENGINE STAND

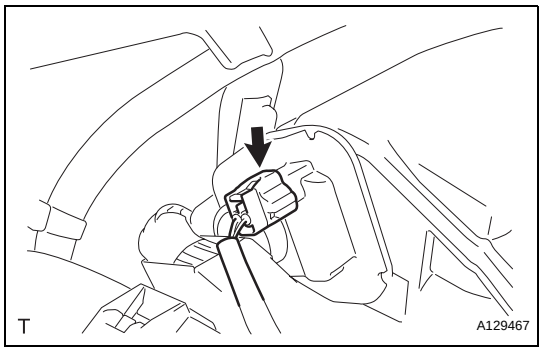


(a) Install the engine to an engine stand. Remove the sling device and chain block from the engine.

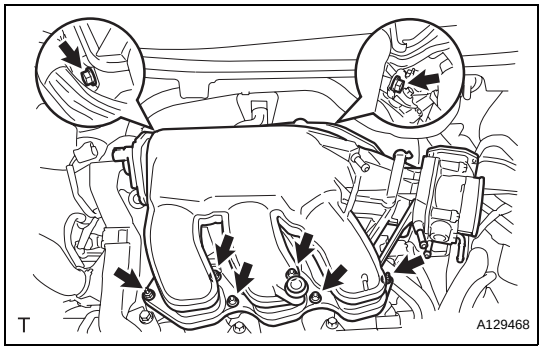
EM



53. REMOVE INTAKE AIR SURGE TANK ASSEMBLY



(a) Disconnect the 2 water by-pass hoses from the throttle body.
(b) Disconnect the vapor feed hose.
(c) Disconnect the throttle body connector and clamp.

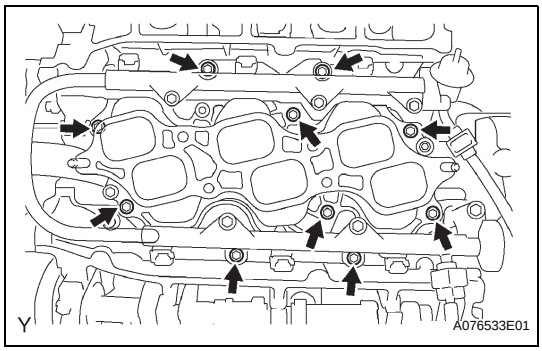


(d) Disconnect the No. 2 ventilation hose.
(e) Disconnect the union to check valve hose.

(f) Remove the bolt and vacuum hose clamp.

(g) Disconnect the connector.

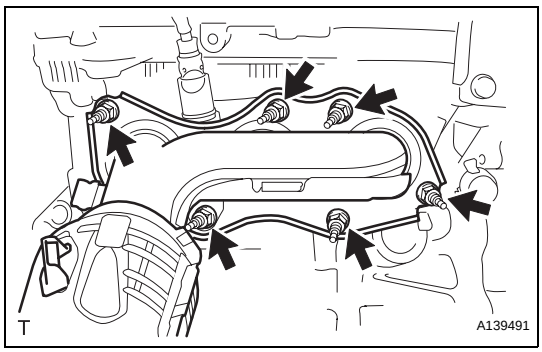
(h) Using a 5 mm socket hexagon wrench, remove the 4 bolts.
(i) Remove the 2 nuts, 2 bolts and surge tank.
(j) Remove the gasket from the surge tank.



54. REMOVE IGNITION COIL ASSEMBLY

(a) Remove the 6 bolts and 6 coils from the cylinder head.

55. REMOVE NO. 2 ENGINE MOUNTING STAY RH

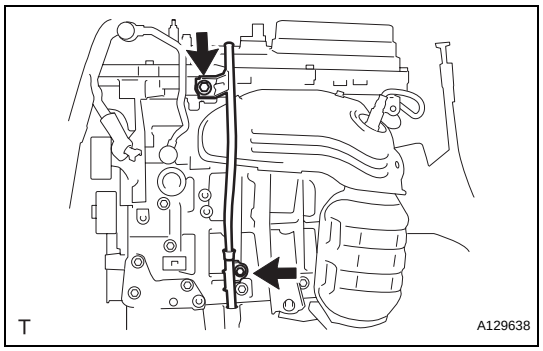


(a) Remove the bolt and mounting stay.

56. REMOVE FUEL INJECTOR ASSEMBLY (See page FU-14)

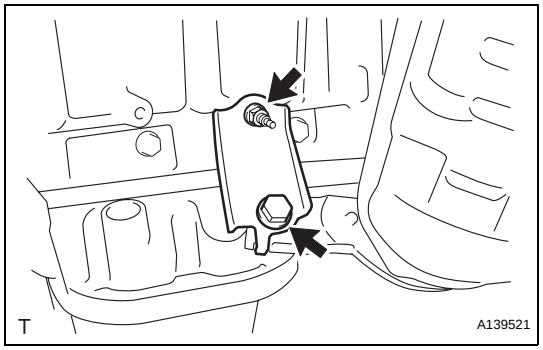
57. REMOVE INTAKE MANIFOLD

(a) Remove the 6 bolts, 4 nuts, intake manifold and 2 gaskets.



58. REMOVE EXHAUST MANIFOLD SUB-ASSEMBLY RH

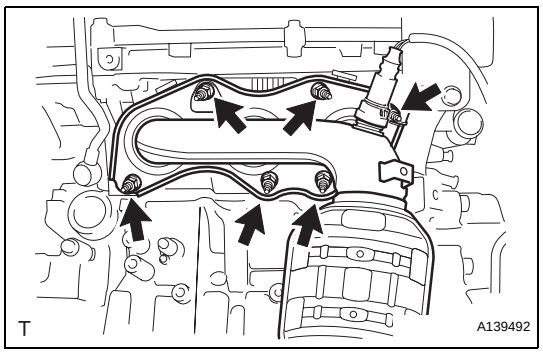
(a) Disconnect the air fuel ratio sensor connector clamp.
(b) Uniformly loosen and remove the 6 nuts.
(c) Remove the manifold and gasket.



59. REMOVE FAN AND GENERATOR V BELT (See page EM-8)

60. REMOVE COMPRESSOR WITH PULLEY ASSEMBLY (See page AC-220)

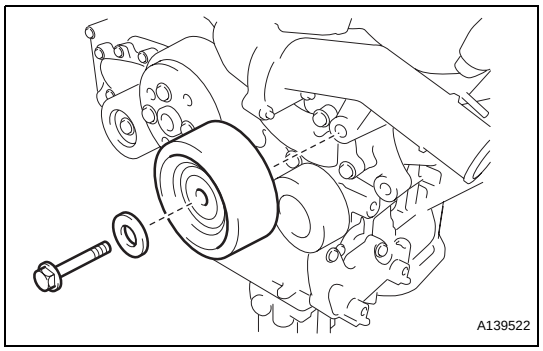
61. REMOVE GENERATOR ASSEMBLY (See page CH-12)



62. REMOVE OIL DIPSTICK GUIDE
(a) Remove the dipstick.
(b) Remove the 2 bolts, and the No. 1 and No. 2 guides.
(c) Remove the O-rings from the guide.

63. REMOVE NO. 2 MANIFOLD STAY
(a) Remove the bolt, nut and manifold stay.

64. REMOVE NO. 2 EXHAUST MANIFOLD HEAT INSULATOR
(a) Remove the 3 bolts and insulator.



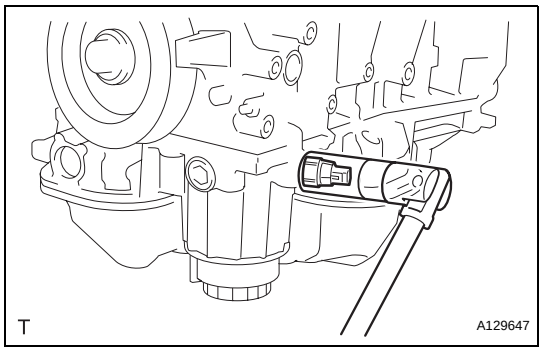
65. REMOVE EXHAUST MANIFOLD SUB-ASSEMBLY LH
(a) Uniformly loosen and remove the 6 nuts.
(b) Remove the manifold and gasket.

66. REMOVE ENGINE MOUNTING BRACKET RH
(a) Remove the 3 bolts and bracket.

67. REMOVE DRIVE SHAFT BEARING BRACKET
(a) Remove the 3 bolts and drive shaft bearing bracket.

68. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY
(a) Remove the 5 bolts and V-ribbed belt tensioner assembly.

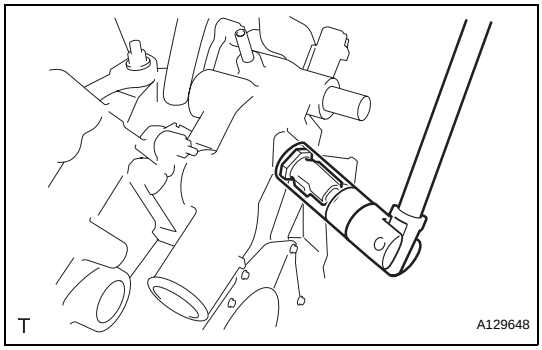
69. REMOVE NO. 2 TIMING GEAR COVER
(a) Remove the 2 bolts and gear cover.



70. REMOVE NO. 2 IDLER PULLEY SUB-ASSEMBLY
(a) Remove the bolt, plate and idler pulley.

71. REMOVE WATER PUMP PULLEY (See page CO-12)

72. REMOVE NO. 1 FRONT ENGINE MOUNTING BRACKET LH
(a) Remove the 6 bolts and bracket.



EM

73. REMOVE ENGINE OIL PRESSURE SWITCH ASSEMBLY

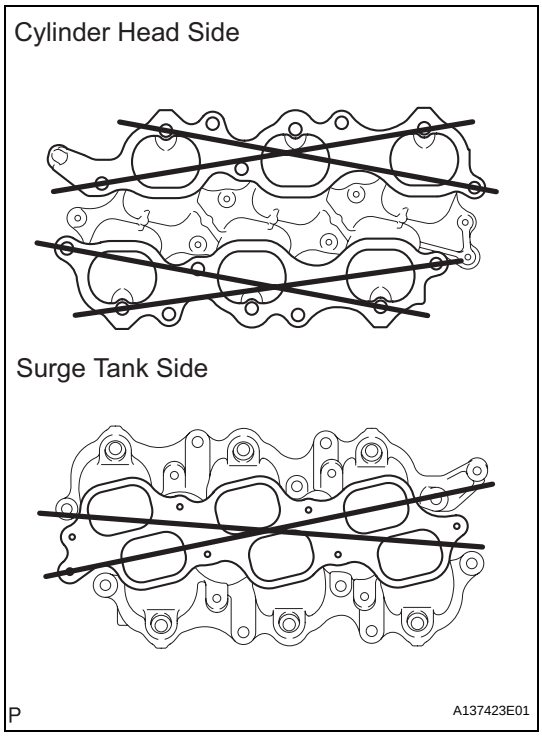
(a) Using a 24 mm deep socket wrench, remove the pressure switch.

74. REMOVE KNOCK SENSOR (See page ES-459)

75. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

(a) Using a 19 mm deep socket wrench, remove the sensor and gasket.

INSPECTION



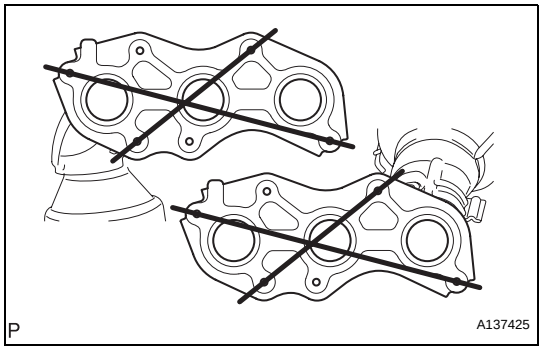
1. INSPECT INTAKE MANIFOLD

(a) Using a precision straightedge and feeler gauge, measure the warpage of the contact surface of the cylinder head and intake air surge tank.

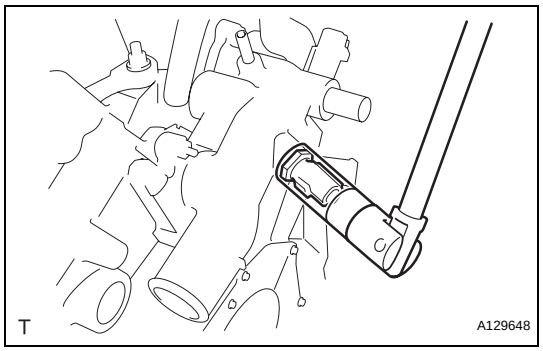
Maximum warpage

Item	Specified Condition
Intake manifold side	0.8 mm (0.031 in.)
Cylinder head side	0.2 mm (0.008 in.)

If the warpage is greater than the maximum, replace the manifold.



2. INSPECT EXHAUST MANIFOLD

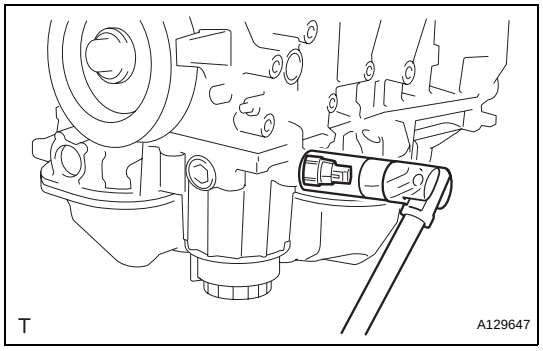


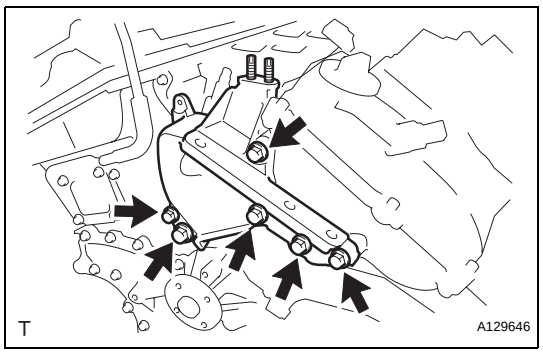
(a) Using a precision straightedge and feeler gauge, measure the surface contacting the cylinder head for warpage.

Maximum warpage:

0.70 mm (0.0028 in.)

If the warpage is greater than the maximum, replace the manifold.

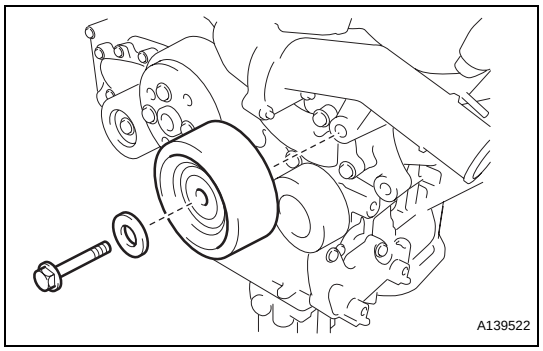




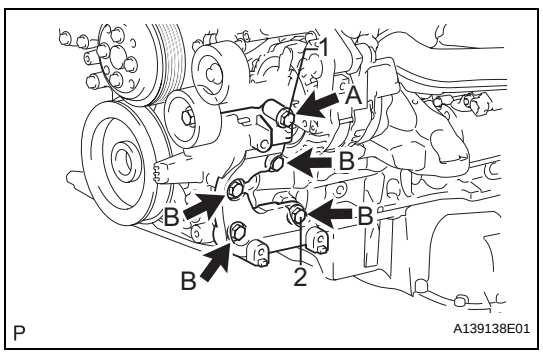
INSTALLATION

1. **INSTALL ENGINE COOLANT TEMPERATURE SENSOR**
   (a) Using a 19 mm deep socket wrench, install the sensor and a new gasket.
   Torque: 20 N*m (204 kgf*cm, 14 ft.*lbf)

2. **INSTALL KNOCK SENSOR (See page ES-459)**



3. **INSTALL ENGINE OIL PRESSURE SWITCH ASSEMBLY**
   (a) Clean the threads of the oil pressure switch. Apply adhesive to 2 or 3 threads of the oil pressure switch.
   Adhesive:
   Toyota Genuine Adhesive 1344, Three Bond 1344 or Equivalent
   (b) Using a 24 mm deep socket wrench, install the oil pressure switch.
   Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)

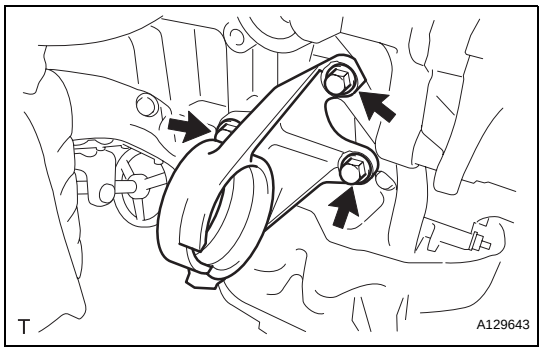


4. **INSTALL NO. 1 FRONT ENGINE MOUNTING BRACKET LH**
   (a) Install the mounting bracket with the 6 bolts.
   Torque: 54 N*m (551 kgf*cm, 40 ft.*lbf)

5. **INSTALL WATER PUMP PULLEY (See page CO-14)**

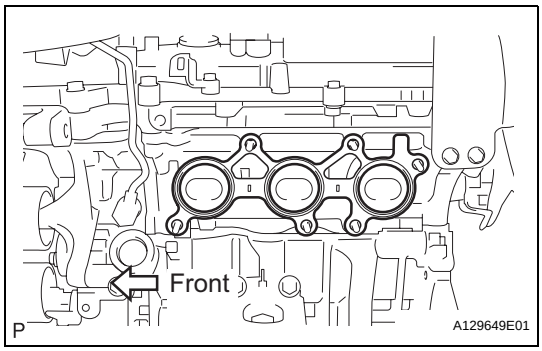
6. **INSTALL NO. 2 IDLER PULLEY SUB-ASSEMBLY**
   (a) Install the idler pulley and cover plate with the bolt.
   Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)

7. **INSTALL NO. 2 TIMING GEAR COVER**
   (a) Install the gear cover with the 2 bolts.
   Torque: 6.0 N*m (61 kgf*cm, 53 in.*lbf)



8. **INSTALL V-RIBBED BELT TENSIONER ASSEMBLY**
   (a) Temporarily install the V-ribbed belt tensioner with the 5 bolts.
   (b) Install the V-ribbed belt tensioner by tightening the bolt 1 and bolt 2 in the order shown in the illustration.
   Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)
   (c) Tighten the other bolts.
   Torque: 43 N*m (438 kgf*cm, 32 ft.*lbf)
   Each bolt length is as follows:

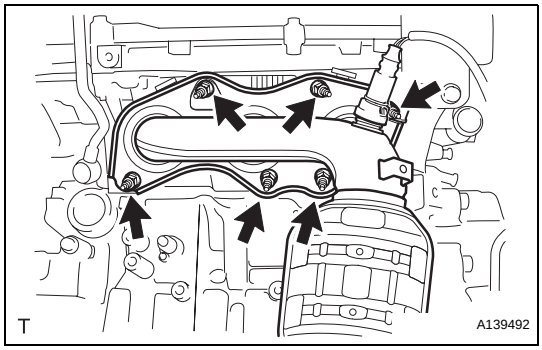
A	70 mm (2.76 in.)



EM

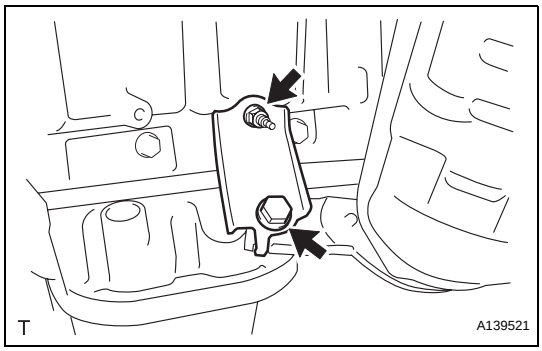
B	35 mm (1.37 in.)

9. INSTALL DRIVE SHAFT BEARING BRACKET



(a) Install the drive shaft bearing bracket with the 3 bolts.
Torque: 64 N*m (653 kgf*cm, 47 ft.*lbf)

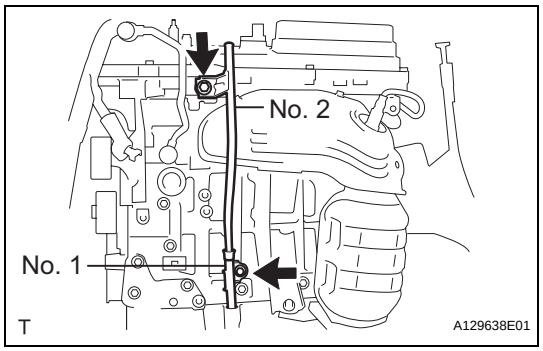
10. INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY LH



(a) Install a new gasket as shown in the illustration.

(b) Install the manifold with the 6 nuts.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)

11. INSTALL NO. 2 EXHAUST MANIFOLD HEAT INSULATOR

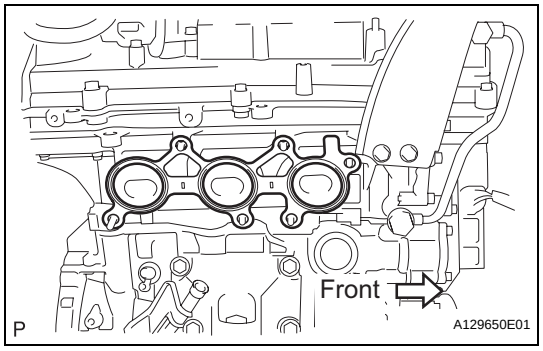


(a) Install the No. 2 heat insulator with the 3 bolts.
Torque: 8.5 N*m (87 kgf*cm, 75 in.*lbf)

12. INSTALL NO. 2 MANIFOLD STAY

(a) Install the No. 2 manifold stay with the bolt and nut.
Torque: 34 N*m (347 kgf*cm, 25 ft.*lbf)

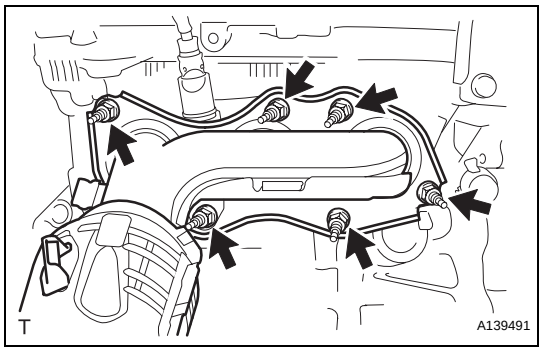
EM



13. INSTALL OIL DIPSTICK GUIDE

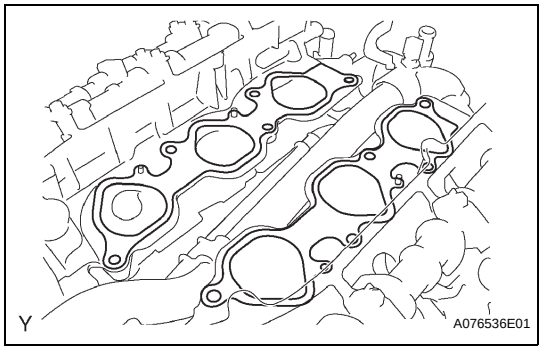
(a) Install 2 new O-rings to the guide.
(b) Apply a light coat of engine oil to the O-rings.
(c) Push in the guide end into the guide hole.
(d) Install the No. 1 guide with the bolt.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)
(e) Install the No. 2 guide with the bolt.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)
(f) Install the dipstick.

14. INSTALL GENERATOR ASSEMBLY (See page CH-19)



15. INSTALL COMPRESSOR WITH PULLEY ASSEMBLY (See page AC-221)

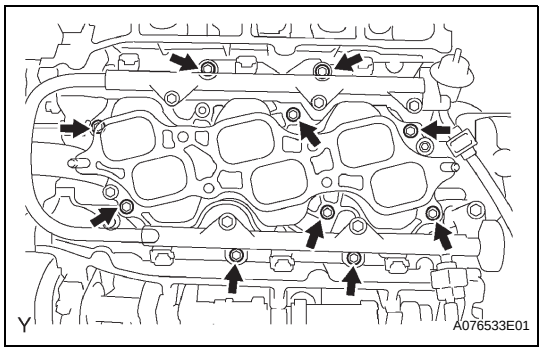
16. INSTALL FAN AND GENERATOR V BELT (See page EM-8)



17. INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY RH

(a) Install a new gasket as shown in the illustration.

(b) Install the manifold with the 6 nuts.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)

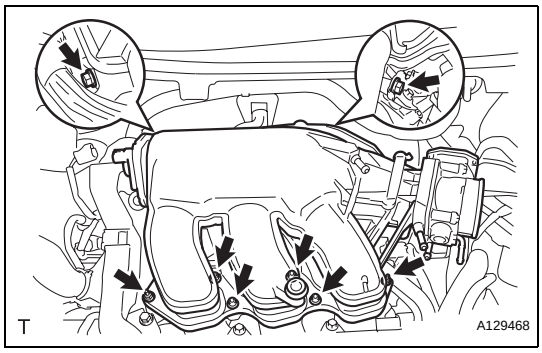


18. INSTALL INTAKE MANIFOLD

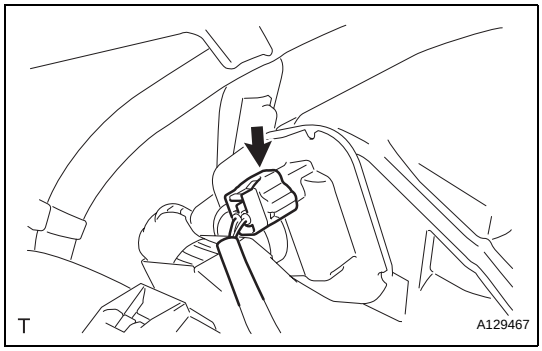
(a) Set a new gasket on each cylinder head.
NOTICE:
- **Align the port holes of the gasket and cylinder head.**
- **Be careful of the installation direction.**

(b) Set the intake manifold on the cylinder heads.

EM

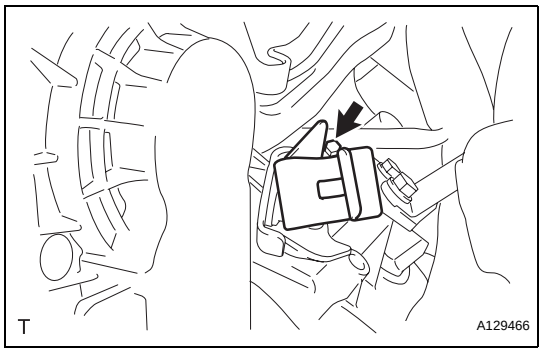


(c) Install and uniformly tighten the 6 bolts and 4 nuts in several passes.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)
(d) Connect the 6 fuel injector connectors.

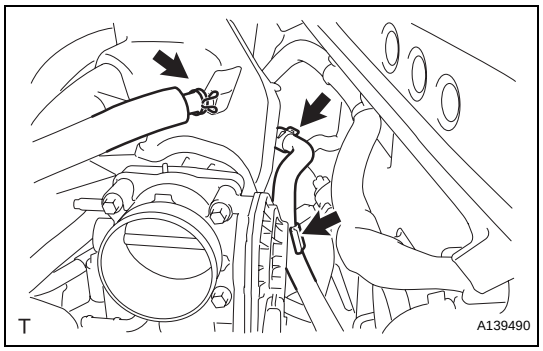


19. INSTALL FUEL INJECTOR ASSEMBLY (See page FU-16)

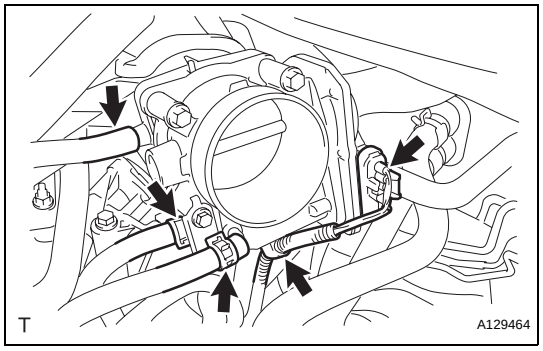
20. INSTALL NO. 2 ENGINE MOUNTING STAY RH
(a) Install the mounting stay with the bolt.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf)



21. INSTALL IGNITION COIL ASSEMBLY
(a) Install the 6 ignition coils with the 6 bolts to the cylinder head.
Torque: 10 N*m (102 kgf*cm, 7 ft.*lbf)



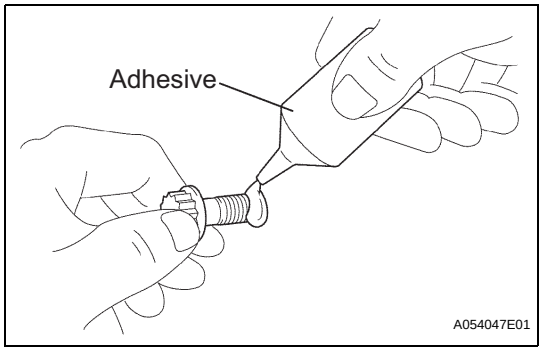
22. INSTALL INTAKE AIR SURGE TANK ASSEMBLY
NOTICE:
Make sure there is no oil on the bolts. If there is oil on the bolts, clean them before installing them.
(a) Install a new gasket to the surge tank.
(b) Using a 5 mm hexagon socket wrench, install the 4 bolts.
Torque: 18 N*m (184 kgf*cm, 13 ft.*lbf)
(c) Install the surge tank with the 2 nuts and 2 bolts.
Torque: 21 N*m (214 kgf*cm, 15 ft.*lbf) for bolt
16 N*m (163 kgf*cm, 12 ft.*lbf) for nut



(d) Connect the connector.

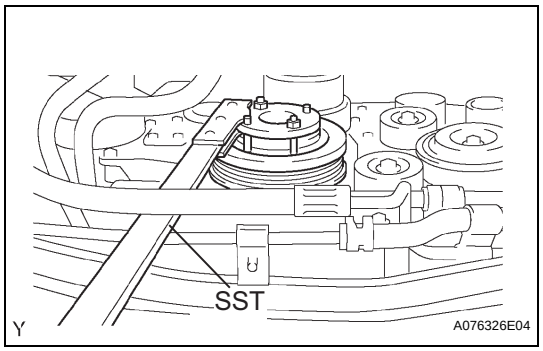
(e) Install the vacuum hose clamp with the bolt.
Torque: 5.4 N*m (55 kgf*cm, 48 in.*lbf)

(f) Connect the union to check valve hose.
(g) Connect the No. 2 ventilation hose.



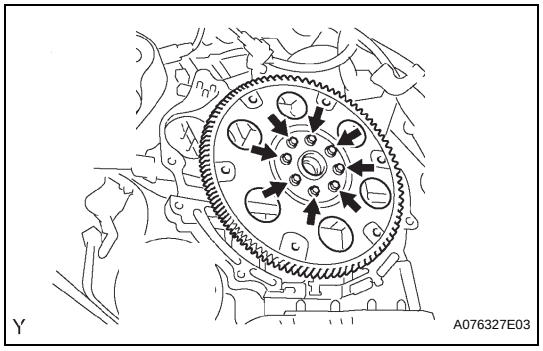
(h) Install the clamp and connect the throttle body connector.
(i) Connect the vapor feed hose.
(j) Connect the 2 water by-pass hoses to the throttle body.

23. REMOVE ENGINE FROM ENGINE STAND



(a) Install a sling device and chain block to the engine.
(b) Remove the engine from the engine stand.

EM



24. INSTALL DRIVE PLATE AND RING GEAR SUB-ASSEMBLY

(a) Clean the bolt and its hole.
(b) Apply adhesive to 2 or 3 threads of the bolt end.
Adhesive:
Toyota Genuine Adhesive 1324, Three Bond 1324 or Equivalent

(c) Using SST, hold the crankshaft.
SST 09213-70011, 09330-00021
(d) Install the flywheel, drive plate and drive plate spacer on the crankshaft.

(e) Uniformly install and tighten the 8 bolts in the sequence shown in the illustration.
Torque: 178 N*m (1,815 kgf*cm, 132 ft.*lbf)
NOTICE:
Do not start the engine for at least 1 hour after the installation.

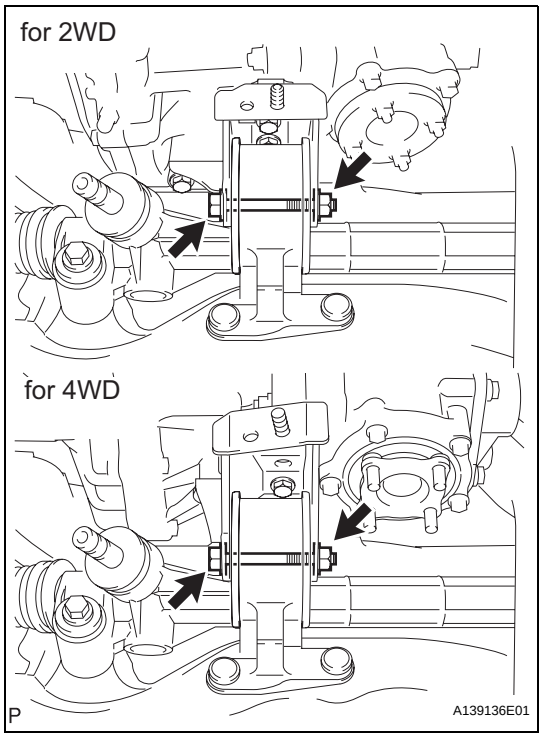
25. INSTALL AUTOMATIC TRANSAXLE ASSEMBLY

(a) 2WD:
Install the automatic transaxle (see page AX-174).

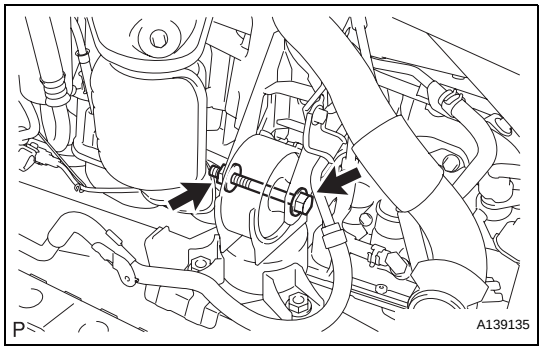
(b) 4WD:
Install the automatic transaxle (see page AX-175).

26. INSTALL TRANSFER ASSEMBLY (for 4WD) (See page TF-75)

27. INSTALL STARTER ASSEMBLY (See page ST-14)



28. INSTALL ENGINE WIRE



(a) Install the engine wire to the engine.

29. INSTALL FRONT SUSPENSION CROSSMEMBER SUB-ASSEMBLY

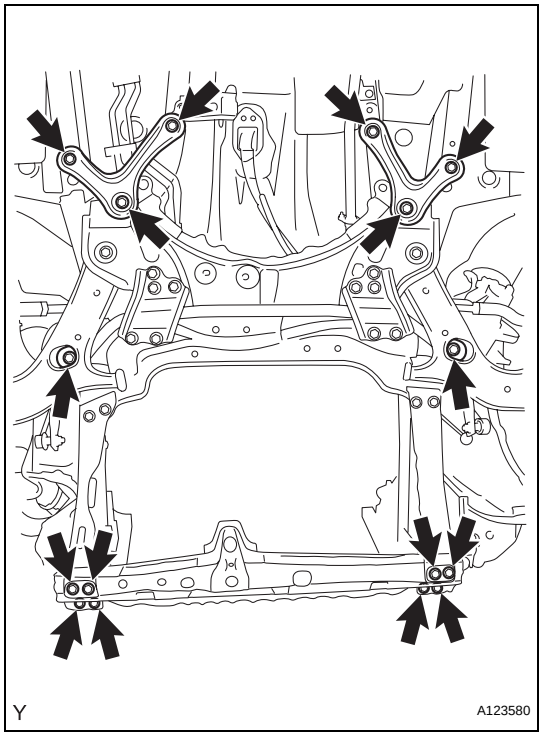
(a) Attach the engine together with the transaxle to the suspension crossmember and mounting.

(b) Install the bolt which secures the engine mounting bracket to the mounting insulator.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf)

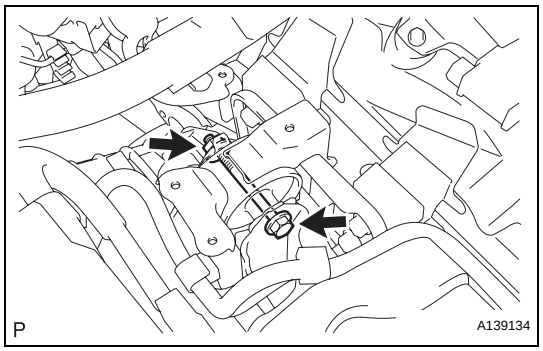
30. INSTALL FRONT CROSSMEMBER SUB-ASSEMBLY

(a) Install the bolt and nut which secures the engine mounting bracket to the mounting insulator.
Torque: 145 N*m (1,479 kgf*cm, 107 ft.*lbf)

31. INSTALL ENGINE WITH TRANSAXLE

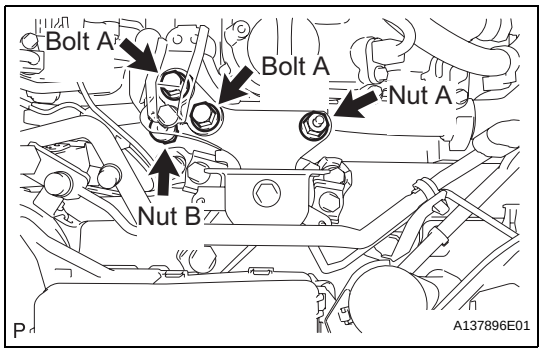


(a) Place the engine on an engine lifter.
HINT:
Place the engine on wooden blocks or an equivalent so that the engine is level.



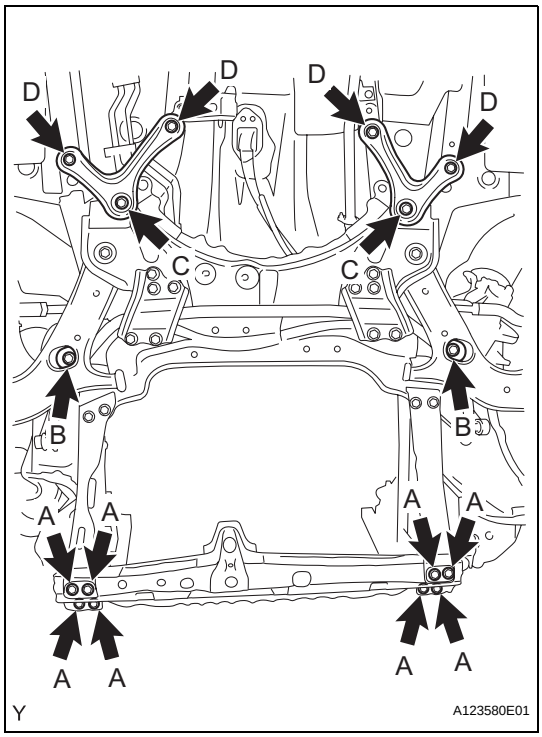
(b) Using the chain block, slowly install the engine to the vehicle and the intermediate shaft to the pinion.
CAUTION:
Do not raise the engine more than necessary. If the engine is raised excessively, the vehicle may also be lifted up.
NOTICE:
- **Make sure that the engine is clear of all wiring and hoses.**

- **While raising the engine into the vehicle, do not allow it to contact the vehicle.**
- **Align the matchmarks on the intermediate shaft and pinion.**



(c) Temporarily install the suspension member and crossmember with the 10 bolts.

(d) Temporarily install the member brace rear RH and LH with the 6 bolts.



(e) Install the engine mounting insulator LH with the bolt and nut.
Torque: 56 N*m (571 kgf*cm, 41 ft.*lbf)
NOTICE:
While holding the bolt in place, tighten the nut.

(f) Install the engine mounting insulator RH with the 2 bolts and 2 nuts.
Torque: 95 N*m (969 kgf*cm, 70 ft.*lbf) for bolt and nut A
52 N*m (530 kgf*cm, 38 ft.*lbf) for nut B

(g) Tighten the suspension member and crossmember's bolts.
Torque: 96 N*m (979 kgf*cm, 71 ft.*lbf) for bolt A
145 N*m (1,478 kgf*cm, 107 ft.*lbf) for bolt B

(h) Tighten the member brace rear's bolts.
Torque: 145 N*m (1,478 kgf*cm, 107 ft.*lbf) for bolt C
93 N*m (948 kgf*cm, 69 ft.*lbf) for bolt D

(i) Remove the sling device and chain block.

(j) Remove the 2 bolts and No. 1 and No. 2 engine hangers.

32. INSTALL FRONT DRIVE SHAFT LH

(a) 2WD:
Install the drive shaft (see page DS-33).

(b) 4WD:
Install the drive shaft (see page DS-66).

33. INSTALL FRONT DRIVE SHAFT RH

(a) 2WD:
Install the drive shaft (see page DS-33).

(b) 4WD:
Install the drive shaft (see page DS-66).

34. CONNECT TIE ROD END SUB-ASSEMBLY LH (See page PS-45)

35. CONNECT TIE ROD END SUB-ASSEMBLY RH (See page PS-45)

36. CONNECT STEERING INTERMEDIATE SHAFT (See page PS-44)

37. CONNECT FRONT STABILIZER LINK ASSEMBLY LH (See page SP-31)

38. CONNECT FRONT STABILIZER LINK ASSEMBLY RH (See page SP-31)

39. INSTALL FRONT AXLE HUB NUT LH

(a) Install the hub nut (see page AH-11).

40. INSTALL FRONT AXLE HUB NUT RH

(a) Install the hub nut (see page AH-11).

41. INSTALL FRONT WHEELS

42. INSTALL PROPELLER WITH CENTER BEARING SHAFT ASSEMBLY (See page PR-5)

43. INSTALL CENTER EXHAUST PIPE ASSEMBLY (See page EX-4)

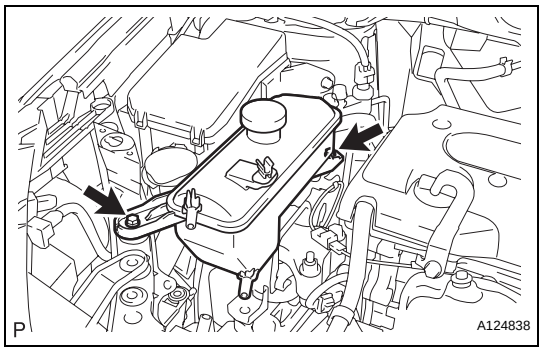
44. INSTALL FRONT EXHAUST PIPE ASSEMBLY (See page EX-4)

45. CONNECT TRANSMISSION CONTROL CABLE ASSEMBLY

(a) 2WD:
Connect the control cable (see page AX-154).

EM

(b) 4WD:
Connect the control cable (see page AX-154).

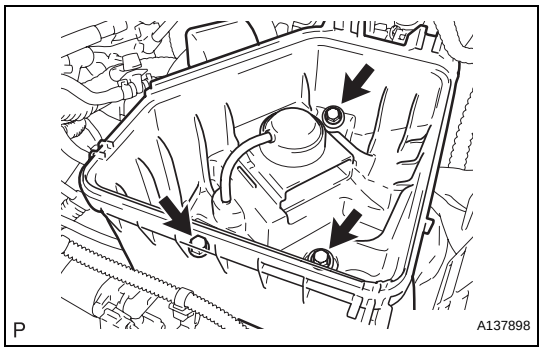


46. CONNECT RADIATOR HOSE INLET

47. CONNECT RADIATOR HOSE OUTLET

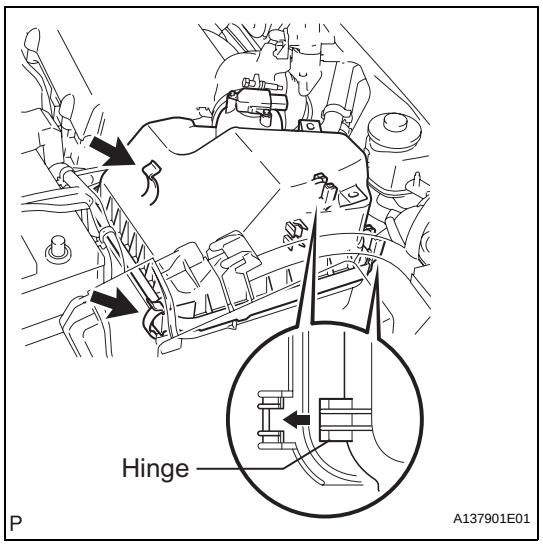
48. CONNECT OIL COOLER HOSE

49. CONNECT SUCTION HOSE SUB-ASSEMBLY (See page AC-221)



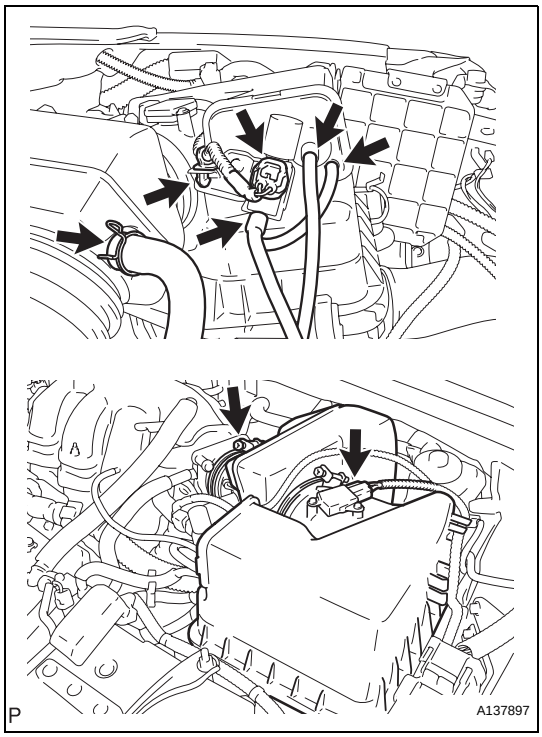
50. INSTALL DISCHARGE HOSE SUB-ASSEMBLY (See page AC-221)

51. INSTALL RADIATOR RESERVOIR TANK ASSEMBLY
(a) Install the reservoir tank with the 2 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
(b) Connect the 2 hoses



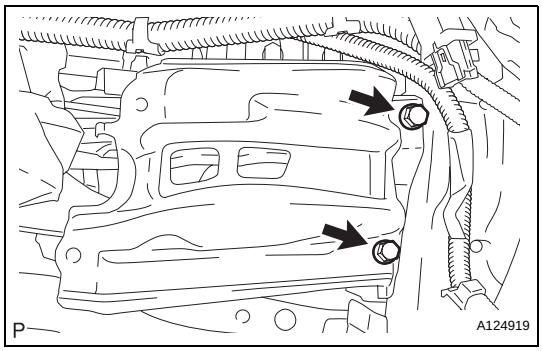
52. INSTALL ECM (See page ES-471)

53. CONNECT HOSES AND CONNECTORS
(a) Connect the 2 ECM connectors.
(b) Connect the 2 heater hoses.
(c) Connect the fuel hoses.
(d) Connect the starter wire with the nut.
Torque: 9.8 N*m (100 kgf*cm, 7 ft.*lbf)
(e) Connect the 3 connectors and wire with the nut.
Torque: 12 N*m (122 kgf*cm, 9 ft.*lbf)
(f) Install the engine room junction block cover (upper).

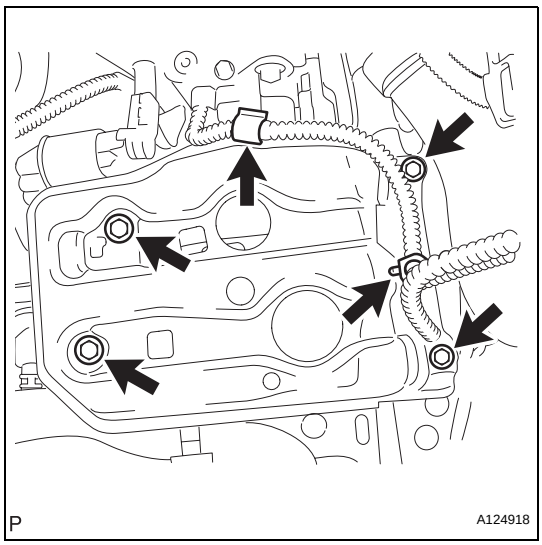


54. INSTALL AIR CLEANER CASE
(a) Install the air cleaner case with the 3 bolts.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
(b) Connect the harness clamp.

55. INSTALL AIR CLEANER CAP SUB-ASSEMBLY
(a) Install the air cleaner filter element onto the air cleaner case.



(b) Insert the hinge part of the air cleaner cap into the air cleaner case, then hang the 2 hook clamps.

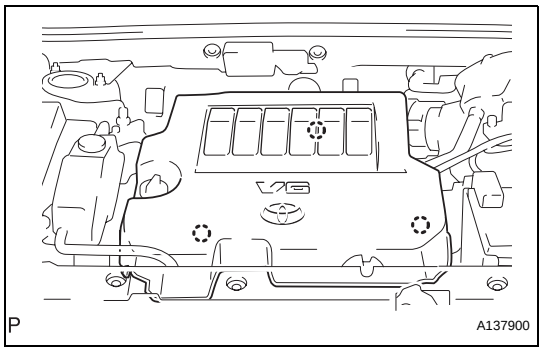


EM

(c) Tighten the No. 1 air cleaner hose clamp.
(d) Connect the No. 2 ventilation hose to the air cleaner hose.
(e) Connect the wire harness clamp and 3 vacuum hoses.
(f) Connect the VSV (intake air control) connector.
(g) Connect the mass air flow meter connector.

56. INSTALL BATTERY BRACKET REINFORCEMENT
(a) Install the bracket reinforcement with the 2 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)

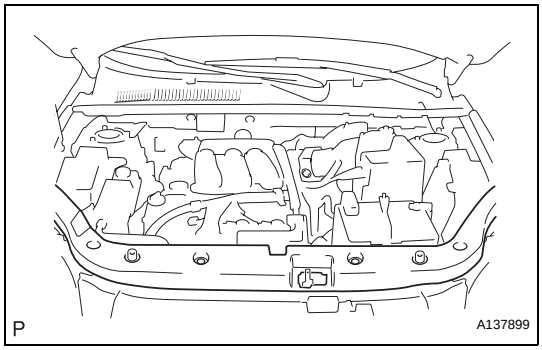
57. INSTALL FRONT BATTERY BRACKET
(a) Install the bracket front with the 4 bolts.
Torque: 19 N*m (194 kgf*cm, 14 ft.*lbf)
(b) Attach the 2 wire harness clamps.



58. INSTALL BATTERY

59. REMOVE BATTERY CLAMP SUB-ASSEMBLY
(a) Attach the hook of the battery clamp to the battery bracket front.
(b) Temporarily tighten the nut and install the bolt.
(c) Adjust the battery clamp's position.
(d) Fully tighten the nut and bolt.
Torque: 5.0 N*m (51 kgf*cm, 44 in.*lbf)
(e) Attach the 2 wire harness clamps.

60. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



61. INSTALL HOOD SUB-ASSEMBLY
(a) Install the hood (see page ED-7).
(b) Adjust the hood (see page ED-5).

62. **ADD AUTOMATIC TRANSAXLE FLUID**
    (a) 2WD:
    Add automatic transmission fluid (see page AX-177).
    (b) 4WD:
    Add automatic transmission fluid (see page AX-178).
63. **ADD TRANSFER OIL (for 4WD) (See page TF-45)**
64. **ADD ENGINE OIL (See page LU-6)**
65. **ADD ENGINE COOLANT (See page CO-8)**
66. **CHARGE REFRIGERANT (See page AC-172)**
67. **CHECK FOR LEAKAGE OF REFRIGERANT (See page AC-173)**
68. **CHECK FOR ENGINE OIL LEAKS (See page LU-6)**
69. **CHECK FOR ENGINE COOLANT LEAKS (See page CO-1)**
70. **CHECK FOR FUEL LEAKS**
71. **INSPECT EXHAUST GAS LEAKS**
72. **INSPECT SHIFT LEVER POSITION**
    (a) 2WD:
    Inspect the shift lever position (see page AX-159).
    (b) 4WD:
    Inspect the shift lever position (see page AX-158).
73. **ADJUST TRANSMISSION CONTROL CABLE**
    (a) 2WD:
    Adjust the shift lever position (see page AX-159).
    (b) 4WD:
    Adjust the shift lever position (see page AX-159).
74. **INSTALL FRONT FLOOR COVER (See page FU-39)**
75. **INSTALL NO. 2 ENGINE UNDER COVER**
    (a) Install the under cover with the 2 clips.
76. **INSTALL REAR ENGINE UNDER COVER LH**
    (a) Install the under cover with the 2 clips.
77. **INSTALL REAR ENGINE UNDER COVER RH**
    (a) Install the under cover with the 2 clips.
78. **INSTALL NO. 1 ENGINE UNDER COVER**
    (a) Install the under cover with the 4 bolts and 12 clips.

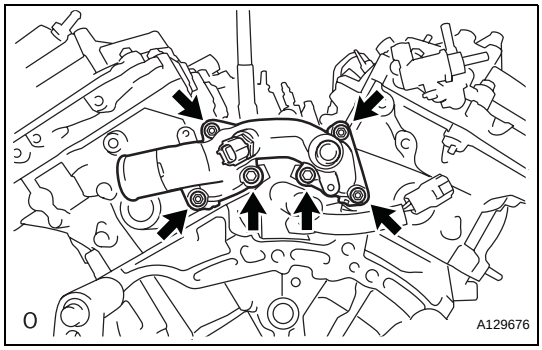
79. INSTALL V-BANK COVER SUB-ASSEMBLY

(a) Attach the 3 clips to install the engine cover.

80. INSTALL RADIATOR SUPPORT OPENING COVER

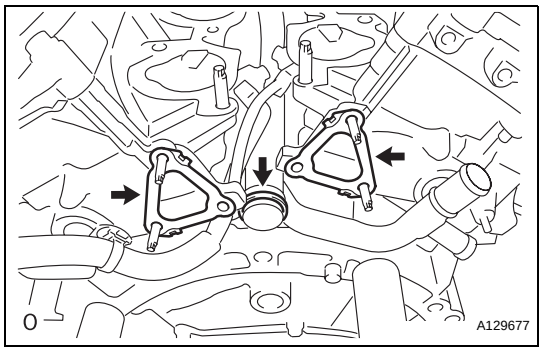
(a) Install the cover with the 9 clips.

81. ADJUST FRONT WHEEL ALIGNMENT



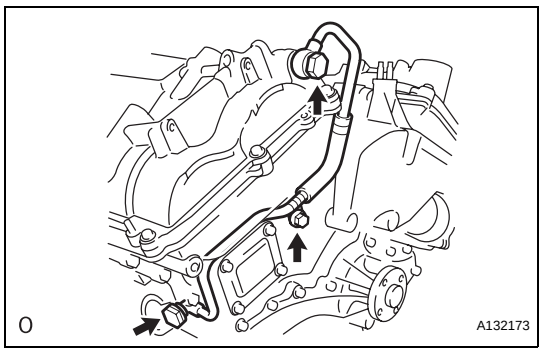
(a) Adjust the front wheel alignment (see page SP-3).

82. INSPECT IDLE SPEED (See page EM-2)



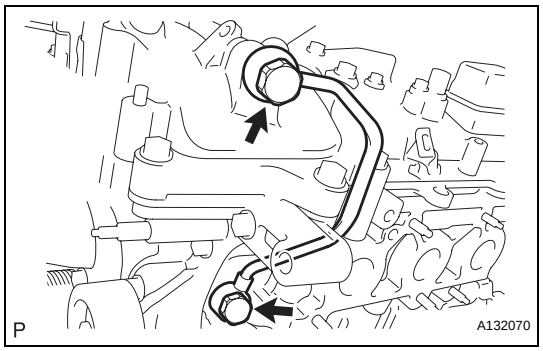
EM

DISASSEMBLY

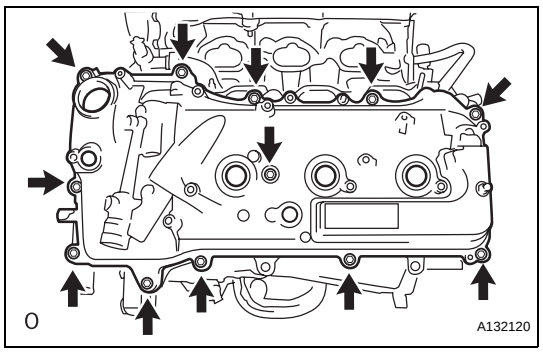


1. **REMOVE OIL FILLER CAP SUB-ASSEMBLY**
2. **REMOVE SPARK PLUG**
3. **REMOVE CAMSHAFT TIMING CONTROL VALVE ASSEMBLY (See page ES-440)**
4. **REMOVE VVT SENSOR (See page ES-443)**
5. **REMOVE WATER OUTLET**
   (a) Remove the 2 bolts, 4 nuts and water outlet.

   (b) Remove the 2 gaskets and O-ring.



6. **REMOVE OIL PIPE**
   (a) Remove the bolt, 2 union bolts and oil pipe.
   (b) Remove the oil control valve filter RH and gaskets.



7. **REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY (for Bank 1)**
   (a) Remove the 12 bolts, cylinder head cover and gasket.
   HINT:
   Make sure the removed parts are returned to the same places they were remove a from.
