WIRELESS DOOR LOCK CONTROL SYSTEM

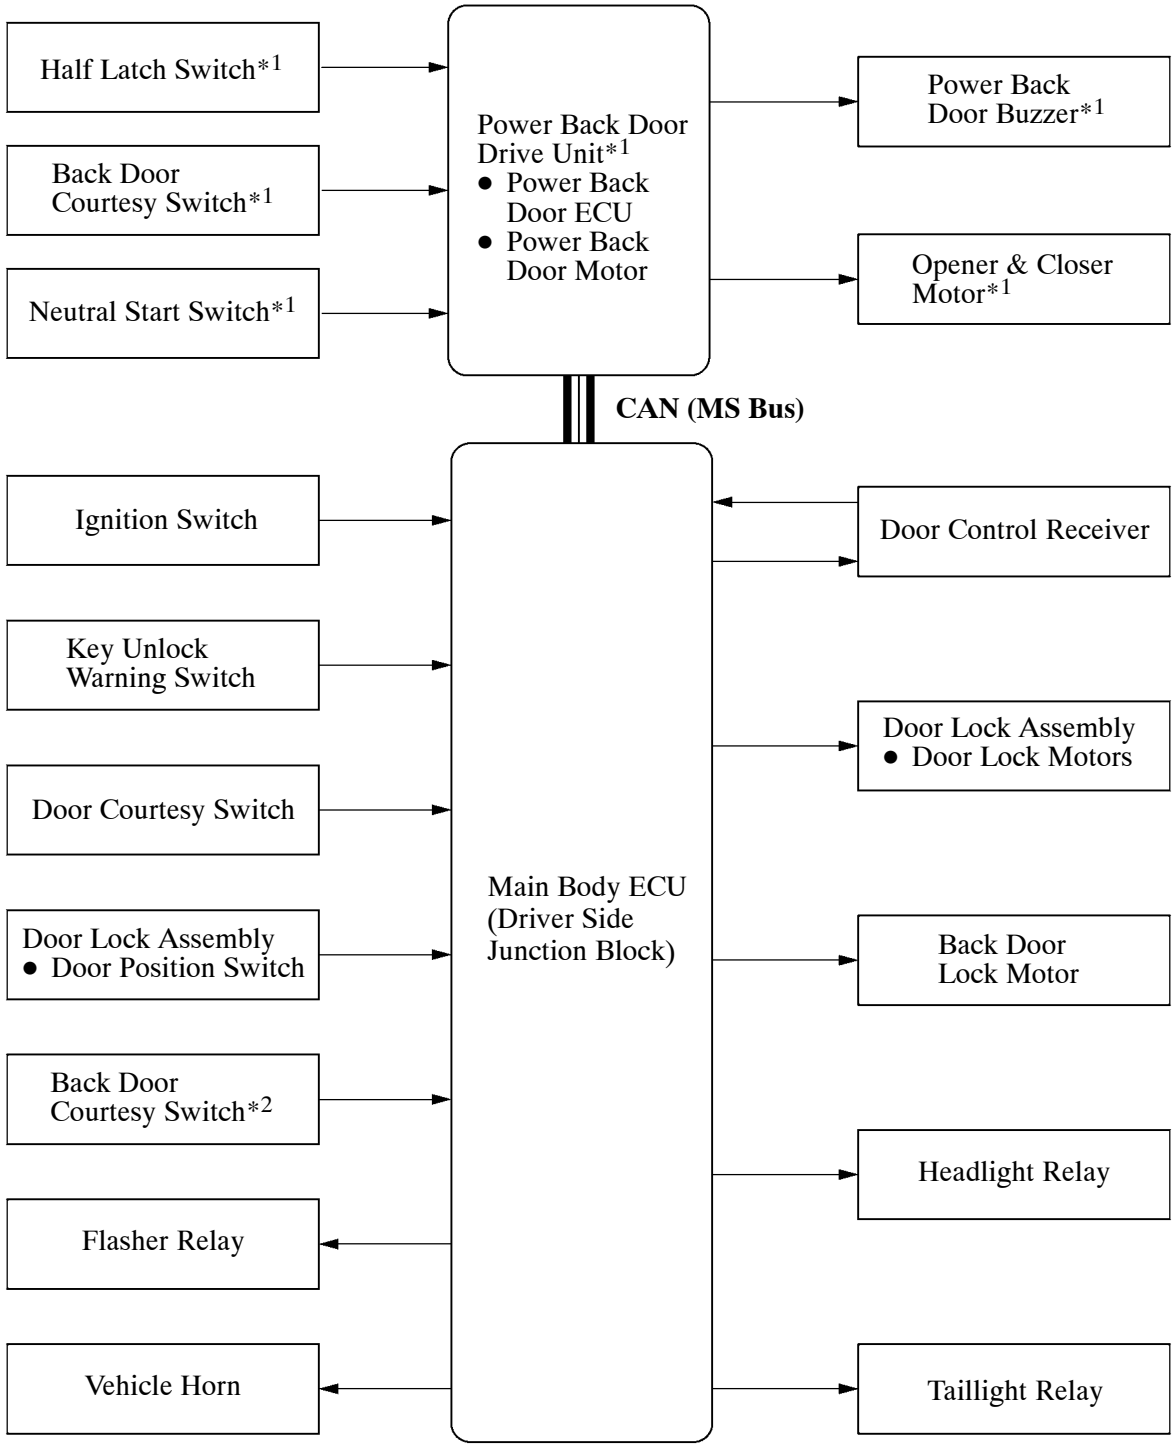

■ DESCRIPTION

The wireless door lock control system is provided as standard equipment on all models.
This system is a convenient system for locking and unlocking all doors at a distance. This system has the following features:

- In this system, the door control receiver performs the code identification process and sends the lock or unlock signal to the main body ECU, then the main body ECU effects the door lock control.
- A key-integrated, 4-button (lock, unlock, panic and power back door*) type transmitter is used.
- To inform the user that the locking or unlocking of the doors has been completed through the operation of the transmitter, an answer back operation, which flashes the hazard lights and sounds the wireless door lock buzzer, has been provided.
- A panic alarm operation is provided that activates alarms when the panic button on the transmitter is pressed and held for approximately 0.8 seconds.
