ENHANCEMENT OF PRODUCT APPEAL

■WIPER ARM & BLADE

Smooth and smartly designed wiper arms and blades are used to highlight the body design.

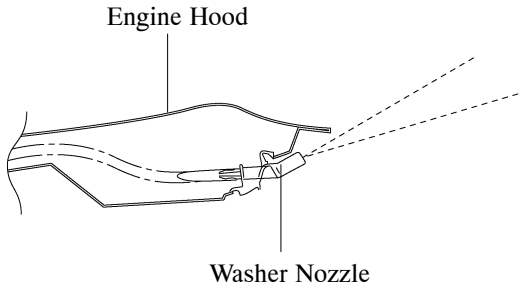

- The jointless flat blades help maintain even pressure along the blade at low temperatures and in snowy and icy conditions.
- The wiper blades use two types of rubber: EPDM (Ethylene Propylene Diene Monomer) rubber and natural rubber.
- EPDM rubber provides high durability and natural rubber achieves excellent wiper performance.

■WASHER NOZZLE

The washer nozzles are located under the engine hood to ensure good appearance. Spray type nozzles are used. These nozzles can spray windshield washer fluid in a wide range and excellent cleaning performance is achieved.

Service Tip

Spray type washer nozzles cannot be adjusted because of their structure. Do not attempt to adjust the nozzles as it could damage them.

If adjustment is necessary, adjust the nozzles by replacing them with those selected from three part numbers with different spray angles. For details, see the 2007 TOYOTA TUNDRA Repair Manual (Pub. No. RM04E2U).
