■ SHIFT AND SELECT MECHANISM

- On the C53 and C54 manual transaxles, an excellent shift feel has been achieved through the adoption of the mass damper on the shift & select shaft, and sliding ball bearing.
- A shift guide plate is provided on the shift & select shaft. The movement distance of the shift & select shaft in the select direction after completing the shifting is regulated by the shift guide plate and shift guide pin. This clarifies the position of the shift knob and enables accurate shift operations.
