

2014 ACCESSORIES AND EQUIPMENT

Body - Interior & Exterior - Cherokee

WARNING

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.
- During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- avoid prolonged skin contact with petroleum or alcohol based

cleaning solvents.

- do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
- always have a fire extinguisher ready for use when welding.
- disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.
- do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
- do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
- do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use **ONLY** the recommended splicing kit and procedure. For applicable and available

MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet:
(<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then

that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold

straightening" method. No heat may be used during the straightening process.

- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

DIAGNOSIS AND TESTING

GENERAL WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate information for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Serious or fatal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations, refer to **HOISTING, STANDARD PROCEDURE** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all

doors and windows, start engine, and set heater control to high blower in HEAT position. If engine cannot be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

TRACING POWDER LEAK TEST METHOD

Tracing powder can be used to help aid in pinpointing the area of the leak. It is available through many aftermarket automotive suppliers. Apply the tracing powder along weatherstrips, body seams and other areas where the water leak is suspected of coming from. Perform a water leak test in the in the suspected area. Refer to **WATER LEAK TESTS**. When the water passes over the tracing powder the leak should be pinpointed by the displacement of the tracing powder. Follow the tracing powder's manufacturer restrictions, guidelines and directions.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate information for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSR's) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the table for materials and usage. Refer to **BUZZ, SQUEAKS AND RATTLES**.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to 225° F)
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway	-40° to 200° C (-40° to 390° F)

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Body - Interior & Exterior - Cherokee

		bars.	
KRYTOX® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34° to 205° C (-30° to 400° F)
KRYTOX® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34° to 205° C (-30° to 400° F)

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
 - a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

RIGID PLASTICS:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

SEMI-RIGID PLASTICS:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

FLEXIBLE PLASTICS:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

REPAIR PROCEDURE:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

ADHESION PROMOTER/SURFACE MODIFIER:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	Acrylonitrile Styrene Acrylite	Lurans	Consoles, Grilles
ABS	Acrylonitrile Butadiene Styrene	Terluran	"A" Pillars, Consoles, Grilles
ABS/PC	ABS/PC Alloy	Pulse, Proloy, Bayblend	Doors, Instrument Panels
ABS/PVC	ABS/PV Alloy	Proloy, Pulse, Lustran,	Door Panels, Grilles, Trim

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Body - Interior & Exterior - Cherokee

		Cyclovin	
BMC	Bulk Molding Compound	BMC	Fender Extensions
EMA	Ehtylene Methyl Acrylate/Ionomer	Surlyn, EMA, Ionomer	Bumper Guards, Pads
METTON	Metton	Metton	Grilles, Kick Panels, Running Boards
MPPO	Modified Polyphenylene Oxide	MPPO	Spoiler Assembly
PA	Polyamid	Zytel, Vydyne, PA, Minlon	Fenders, Quarter Panels
PET	Thermoplastic Polyester	Rynite	Trim
PBT/PPO	PBT/PPO Alloy	Germax	Claddings
PBTP	Polybutylene Therephthalate	PBT, PBTP, Pocan, Valox	Wheel Covers, Fenders, Grilles
PBTP/EEBC	Polybutylene Therephthalate/EEBC Alloy	Bexloy, "M", PBTP/EEBC	Fascias, Rocker Panel, Moldings
PC	Polycarbonate	Lexan, Merlon, Calibre, Makrolon PC	Tail Light Lenses, I/P Trim, Valance Panels
PC/ABS	PC/ABS Alloy	Germax, Bay Blends, Pulse	Doors, Instrument Panels
PPO	Polyphenylene Oxide	Azdel, Hostalen, Marlex, Prfax, Noryl, GTX, PPO	Interior Trim, Door Panels, Splash Shields, Steering Column Shroud
PPO/PA	Polyphenylene/Polyamid	PPO/PA, GTX 910	Fenders, Quarter Panels
PR/FV	Fiberglass Reinforced Plastic	Fiberglass, FV, PR/FV	Body Panels
PS	Polystyrene	Lustrex, Styron, PS	Door Panels, Dash Panels
RTM	Resin Transfer Molding Compound	RTM	Body Panels
SMC	Sheet Molded Compound	SMC	Body Panels
TMC	Transfer Molding Compound	TMC	Grilles
UP	Unsaturated Polyester (Thermosetting)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	Grille Opening Panel, Liftgates, Flareside Fenders, Fender Extensions
EEBC	Ether/Ester Blocked Co-Polymer	EEBC	Bumpers
EEBC/PBTP	EEBC/Polybutylene Terephthalate	EEBC, PBTP, BEXLOY	Bumper, Rocker Panels
EMPP	Ethylene Modified Polypropylene	EMPP	Bumper Covers
EPDM	Ethylene/Propopylene Diene Monomer	EPDM, Nordel, Vistalon	Bumpers
EPM	Ethylene/Propopylene Co-Polymer	EPM	Fenders
MPU	Foam Polyurethane	MPU	Spoilers
PE	Polyethylene	Alathon, Dylan, Lupolen, Marlex	-

PP	Polypropylene (Blends)	Noryl, Azdel, Marlox, Dylon, Pravex	Inner Fender, Spoilers, Kick Panels, A-Pillars, Door Panels, B-Pillars, Quarter Panels, Sport Bar Trim, Liftgate Trim, Decklid Trim Scuff Plates, Kick Panels, Consoles
PP/EPDM	PP/EPDM Alloy	PP/EPDM	Spoilers, Grilles
PUR	Polyurethane	Colonels, PUR, PU	Fascias, Bumpers
PUR/PC	PUR/PC Alloy	Texin	Bumpers
PVC	Polyvinyl Chloride	Apex, Geon, Vinylite	Body Moldings, Wire Insulation, Steering Wheels
RIM	Reaction Injected Molded Polyurethane	RIM, Bayflex	Front Fascias, Modular Windows
RRIM	Reinforced Reaction Injected Molded	PUR, RRIM	Fascias, Body Panels, Body Trims
TPE	Thermo Polyethylene	TPE, Hytrel, Bexloy-V	Fascias, Bumpers, Claddings
TPO	Thermopolyolefin	Polytrope, Renflex, Santoprene, Visaflex, ETA, Apex, TPO, Shields, Claddings	Bumpers, End Caps, Telcar, Rubber, Strips, Sight, Interior B-Pillar
TPP	Thermo-Polypropylene	TPP	Bumpers
TPU	Thermopolyurethane, Polyester	TPU, Hytrel, Texin, Estane	Bumpers, Body Side, Moldings, Fenders, Fascias

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a

suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.
14. Apply a coat of adhesive to the exposed ends of the support squares.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Body - Interior & Exterior - Cherokee

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.
17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.
18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.
20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: **Do not add more lubricant.**

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE**ENGINE OIL**

- Door Hinges - Hinge Pin and Pivot Contact Areas
- Hood Hinges - Pivot Points
- Liftgate Hinges

MOPAR® SPRAY WHITE LUBE OR EQUIVALENT

- Door Check Straps
- Liftgate Latches
- Liftgate Prop Pivots
- Ash Receiver
- Fuel Filler Door Remote Control Latch Mechanism
- Parking Brake Mechanism
- Sliding Seat Tracks
- Liftgate Latch

MOPAR® MULTIPURPOSE GREASE OR EQUIVALENT

- All Other Hood Mechanisms

MOPAR® LOCK CYLINDER LUBRICANT OR EQUIVALENT

- Door Lock Cylinders
 - Liftgate Lock Cylinder

HINGE, LIFTGATE

REMOVAL

REMOVAL

Fig. 1: Nuts, Header, Bolts & Hinges
Courtesy of CHRYSLER GROUP, LLC

1. Remove the spoiler (1). Refer to **SPOILER, REMOVAL**.

NOTE: It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

2. Open and support the liftgate with a suitable prop or block.
3. If the liftgate is being replaced, remove the liftgate support struts (2) at the liftgate. Refer to **PROP ASSEMBLY, POWER, REMOVAL**.
4. Remove the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
5. Lower the rear of the headliner to gain access to the hinge fasteners.
6. Remove the bolts (1) that secure the hinge to the liftgate.
7. Remove the hinges (2) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 2: Nuts, Header, Bolts & Hinges
Courtesy of CHRYSLER GROUP, LLC

1. It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

NOTE: Use a suitable body sealer on the hinge to body mating surfaces prior to installation.

2. Position the liftgate hinge (2) to the upper liftgate opening header (4) on the vehicle.
3. Carefully pull the upper edge of the side panels downward from the header far enough to install and tighten the nut (3) to 63 N.m (46 ft. lbs.).
4. Position the liftgate to the liftgate half of the hinge (1) on the vehicle.
5. Install and tighten the two fasteners (1) that secure the hinge to the liftgate.
6. Tighten the fasteners to 28 N.m (21 ft. lbs.).
7. Install the support struts. Refer to **PROP ASSEMBLY, POWER, INSTALLATION**.
8. Install the spoiler to the liftgate. Refer to **SPOILER, INSTALLATION**.
9. Check the liftgate for proper alignment and operation. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
10. Install the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

LATCH, LIFTGATE

REMOVAL

REMOVAL

Fig. 3: Identifying Liftgate, Hatch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the trim panel from the lift gate. Refer to **PANEL, TRIM, REMOVAL**.
2. Remove the three bolts (3) from the lift gate latch (2).
3. Disconnect the electrical connectors.
4. Remove the lift gate latch (2) from the lift gate (1).

INSTALLATION

INSTALLATION

Fig. 4: Identifying Liftgate, Hatch & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Install the latch (2) to the lift gate (1).
2. Install the three bolts (3) to the lift gate latch (2) and tighten the bolts to 9 N.m (80 in. lbs.).
3. Connect the electrical connectors.
4. Install the liftgate trim panel. Refer to **PANEL, TRIM, INSTALLATION**.

LIFTGATE

ADJUSTMENTS

ADJUSTMENTS

IN/OUT

Fig. 5: Nuts, Header, Bolts & Hinges
Courtesy of CHRYSLER GROUP, LLC

NOTE: The position of the lift gate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use a body sealer on the hinge to body mating surface.

1. Remove the upper quarter trim panels and lower the rear of the headliner to access the hinge fasteners. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
2. For the upper lift gate adjustments, loosen the six hinge to header fasteners (2 and 3) and adjust to specifications. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
3. Tighten the hinge bolts to 28 N.m (21 ft. lbs.).

Fig. 6: Identifying Striker & Screws

Courtesy of CHRYSLER GROUP, LLC

4. For the lower lift gate adjustments, remove liftgate scuff trim. Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION**.
5. Loosen the striker screws (2) and adjust to specifications. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
6. Tighten the striker screws to 28 N.m (21 ft. lbs.).
7. Position the upper rear headliner trim and seat fully.
8. Position liftgate scuff plate trim and seat fully.
9. Install the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

UP/DOWN AND LEFT/RIGHT

Fig. 7: Nuts, Header, Bolts & Hinges

Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper quarter trim panels and lower the rear of the headliner to access the hinge fasteners. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
2. Remove liftgate scuff trim. Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.
3. Loosen the hinge to liftgate bolts (1).

Fig. 8: Identifying Striker & Screws

Courtesy of CHRYSLER GROUP, LLC

4. Loosen the striker screws (1).
5. Adjust the liftgate up/down position and tighten the hinge bolts to 28 N.m (21 ft. lbs.). Refer to **GAP AND FLUSH, SPECIFICATIONS**.
6. Confirm the lower liftgate in/out position and tighten the striker screws to 28 N.m (21 ft. lbs.).
7. Install liftgate scuff plate trim. Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION**.
8. Install the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

REMOVAL

REMOVAL

Fig. 9: Nuts, Header, Bolts & Hinges
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper quarter trim panels and lower the rear of the headliner to access the hinge fasteners. Refer to **PANEL, QUARTER TRIM, REMOVAL**.

WARNING: Do not disconnect the support rod cylinders with the liftgate closed. The support rod pistons are operated by high pressure gas. This pressure could cause damage and/or personal injury if they are removed while the pistons are compressed.

WARNING: Failure to follow these instructions may result in possible serious or fatal injury.

2. Open and support the liftgate.
3. Remove the support struts (2) from the liftgate (1). Refer to **PROP ASSEMBLY, POWER, REMOVAL**.
4. Disconnect the wire harnesses.
5. Using a grease pencil or equivalent, mark the hinge location.
6. Remove the liftgate to body fasteners (3) and remove liftgate from vehicle.

INSTALLATION

INSTALLATION

Fig. 10: Nuts, Header, Bolts & Hinges
Courtesy of CHRYSLER GROUP, LLC

NOTE: With assistance, support the lift gate while the hinges are being installed.

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Position the liftgate onto the vehicle.
2. Install the four hinge to liftgate bolts (1) and tighten the to 28 N.m (21 ft. lbs.).
3. Install two hinge to header nuts (3) and tighten to 63 N.m (46 in. lbs.).

Fig. 11: Liftgate & Support Struts
Courtesy of CHRYSLER GROUP, LLC

4. Install the support struts (2). Refer to **PROP ASSEMBLY, POWER, INSTALLATION**.
5. Connect wiring harnesses and washer hose.
6. Check and adjust the liftgate if necessary. Refer to **LIFTGATE, ADJUSTMENTS**.
7. Install the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

PANEL, TRIM**REMOVAL****REMOVAL**

Fig. 12: Identifying Liftgate & Upper Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the upper trim panel (2) using a trim stick or another suitable wide flat-bladed tool, carefully pry the trim panel away from the inside of the liftgate (1) to release the fasteners that secure the panel to the liftgate.

**Fig. 13: Identifying Liftgate & Side Trim Panel**

Courtesy of CHRYSLER GROUP, LLC

3. Remove the side trim panels (1) using a trim stick or another suitable wide flat-bladed tool, carefully pry the trim panel away from the inside of the liftgate (2) to release the fasteners that secure the panel to the liftgate.

**Fig. 14: Identifying Pull Cups**

Courtesy of CHRYSLER GROUP, LLC

4. using a trim stick or another suitable wide flat-bladed tool, remove the pull cups (1)

Fig. 15: Identifying Liftgate & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Carefully release the retaining clips and separate the trim panel (2) completely from the liftgate (1).
6. Disconnect the trim panel lighting connectors.
7. Remove the liftgate lower trim panel from the vehicle.

INSTALLATION

INSTALLATION

Fig. 16: Identifying Liftgate & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the trim panel (2) back onto the liftgate (1) and Using hand pressure, press firmly and evenly on the trim panel over each of the retaining clip locations until the clips are seated fully in the holes on the inside of the liftgate.

Fig. 17: Identifying Pull Cups
Courtesy of CHRYSLER GROUP, LLC

2. Install the pull cups (1).
3. Secure the trim panel (2) to the inside of the liftgate.

Fig. 18: Identifying Liftgate & Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Position the trim panel (1) back onto the liftgate (2) and Using hand pressure, press firmly and evenly on

the upper trim panel over each of the fastener locations until the fasteners are fully seated in the holes on the inside of the liftgate.

Fig. 19: Identifying Liftgate & Upper Trim Panel
Courtesy of CHRYSLER GROUP, LLC

5. Position the top liftgate trim (2) onto the liftgate and seat the upper retaining clips fully.

PROP ASSEMBLY, POWER

REMOVAL

REMOVAL

Fig. 20: Mount, Liftgate Strut & Liftgate

Courtesy of CHRYSLER GROUP, LLC

1. Open and support the liftgate with a suitable prop or block.
2. Locate the mount (2) for the liftgate strut (3) on the liftgate (1).

80F70306

Fig. 21: Removing Support Cylinder
Courtesy of CHRYSLER GROUP, LLC

3. Using a small flat bladed tool (3), or equivalent, release the retaining clips (2) while pulling the ball socket (1) away from the ball stud (4).

2718172

Fig. 22: Rubber Grommet & Liftgate Strut
Courtesy of CHRYSLER GROUP, LLC

4. Remove the rubber grommet (1) to gain access to the liftgate strut (3) connector.

Fig. 23: Connector & Strut
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the connector (2).
6. Remove the strut (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 24: Connector & Strut
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the liftgate with a suitable prop or block.
2. Locate the ball mount (3) for mounting the strut (1) onto the vehicle.
3. Install the liftgate strut onto the vehicle by pressing into place until clip is seated fully.
4. Route the wiring harness through the access hole on body and connect the connectors (2).

Fig. 25: Rubber Grommet & Liftgate Strut
Courtesy of CHRYSLER GROUP, LLC

5. Install the rubber grommet (1) into the access hole.

Fig. 26: Mount, Liftgate Strut & Liftgate
Courtesy of CHRYSLER GROUP, LLC

6. Locate the mount (2) on the liftgate, to mount the strut.

7. Install the strut (3) onto the liftgate (1) by applying moderate hand pressure until clip is seated fully.
8. Test strut for proper operation.

SPOILER**REMOVAL****REMOVAL**

2313006590

Fig. 27: Identifying Liftgate, Trim & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove liftgate trim as necessary. Refer to **PANEL, TRIM, REMOVAL**.
2. Remove the bolts at each outboard lower attachment (1).
3. Remove the six nuts (3).

Fig. 28: Identifying Liftgate & Spoiler
Courtesy of CHRYSLER GROUP, LLC

4. Lower the liftgate.
5. Separate the spoiler from the liftgate (2) and pivot the spoiler (1) towards the front of the vehicle.
6. Disconnect the washer hose from the washer nozzle. Disconnect the wiring connector from the CHMSL. Remove wiring clips (2 total).
7. Remove spoiler from vehicle.

INSTALLATION

INSTALLATION

NOTE: When the spoiler is removed for repair or replacement, the gaskets at the spoiler attachment locations should be replaced.

NOTE: The following components are serviceable on the rear spoiler

- CHMSL
- Washer Nozzle
- Spoiler center support bracket
- W-attaching clip and seals
- Seal kit for attaching locations
- Mounting Studs
- Mounting Nuts

Fig. 29: Identifying Liftgate & Spoiler
Courtesy of CHRYSLER GROUP, LLC

1. Lift spoiler (1) into place and pivot towards the front of the vehicle.
2. Connect the washer hose to the washer nozzle. Connect the wiring connector to the CHMSL. Install wiring clips (2 total).
3. Lower spoiler into position.

Fig. 30: Identifying Liftgate, Trim & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolts (1) and tighten 6 N.m (53 in. lbs.).
5. Install the six nuts (3) and tighten 6 N.m (53 in. lbs.). Start in the center and work your way out to the ends when tightening the nuts.

6. Install the liftgate trim panels. Refer to **PANEL, TRIM, INSTALLATION**.

STRIKER, LATCH

ADJUSTMENTS

ADJUSTMENTS

Fig. 31: Identifying Striker & Screws

Courtesy of CHRYSLER GROUP, LLC

1. Remove liftgate scuff trim. Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.
2. Using a grease pencil or equivalent, mark the position of the striker (1) to aid in adjustment.
3. Loosen the striker bolts (2).
4. Change the striker position to adjust the lower liftgate gap and flush measurement. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
5. Tighten the bolts to 28 N.m (21 ft. lbs.).

REMOVAL

REMOVAL

Fig. 32: Scuff Plate Trim Panel

Courtesy of CHRYSLER GROUP, LLC

1. Remove the scuff plate trim panel (2) from the inside of the liftgate opening lower panel. Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.

Fig. 33: Liftgate Latch Striker & Two Fasteners

Courtesy of CHRYSLER GROUP, LLC

2. Mark the latch striker (2) location on the inside of the liftgate opening with a grease pencil to aid reinstallation.
3. Remove the two fasteners (1) that secure the latch striker to the inside of the liftgate opening lower panel.
4. Remove the latch striker from the vehicle.

INSTALLATION

INSTALLATION

Fig. 34: Liftgate Latch Striker & Two Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the liftgate latch striker (2) to the inside of the liftgate opening lower panel and align using the marks made during removal.
2. Install and tighten the two screws (1) that secure the latch striker to the liftgate opening lower panel. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper liftgate latch operation.

Fig. 35: Scuff Plate Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the scuff plate (2). Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION**.

5. Check and adjust the striker if necessary. Refer to **STRIKER, LATCH, ADJUSTMENTS**.

DOOR - FRONT

APPLIQUE

REMOVAL

REMOVAL

Fig. 36: Removing Door Glass From Door
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door glass (2) from the door (1). Refer to **GLASS, DOOR, REMOVAL**.
2. Remove the outside mirror. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.

Fig. 37: Identifying Door Glass Run, Door Applique & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear portion of the door glass run.
4. Remove the three door applique fasteners (2).
5. Remove the door applique (1).

INSTALLATION

INSTALLATION

Fig. 38: Door Glass Run, Applique & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Position the door applique.
2. Install the three door applique (2) fasteners (3) and tighten securely.
3. Insert the rear portion of the door glass run (1) and verify it is seated fully.

**Fig. 39: Installing Door Glass Into Door**

Courtesy of CHRYSLER GROUP, LLC

4. Install the door glass (2) into the door (1). Refer to **GLASS, DOOR, INSTALLATION**.

DOOR

ADJUSTMENTS

ADJUSTMENTS

NOTE: It is recommended that you adjust the rear door before adjusting the front door. Refer to **DOOR, REAR, ADJUSTMENTS**.

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges and striker.

FORE/AFT

Fig. 40: Identifying Front Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the body fasteners (1) one hinge at a time and moving the door to the correct position.

1. Support the front door with a suitable lifting device.
2. Loosen the bolts (1) that secure the front door hinges (2) to the A-pillar.
3. Adjust the front door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS.**
4. Tighten the upper bolt of the upper hinge to the A-pillar to 43 N.m (32 ft. lbs.).
5. Tighten the upper bolt of the lower hinge to 43 N.m (32 ft. lbs.).
6. Tighten the remaining hinge bolts to 43 N.m (32 ft. lbs.).

UP/DOWN

Fig. 41: Two Bolts & Striker

Courtesy of CHRYSLER GROUP, LLC

NOTE: Up/down door adjustment is done by loosening either the hinge to the body fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the front door with a suitable lifting device.
2. Loosen the two bolts (2) that secure the striker (1) to the B-pillar.

Fig. 42: Identifying Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

3. If necessary, loosen the bolts (2) that secure the door hinges (1) to the front door.

Fig. 43: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, loosen the bolts (1) that secure the front door hinges (2) to the A-pillar.

Fig. 44: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Adjust the front door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS.**
6. Tighten the bolts (2) that secure the door hinges (1) to the front door to 43 N.m (32 ft. lbs.).

Fig. 45: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the bolts (1) that secure the door hinges (2) to the A-pillar to 43 N.m (32 ft. lbs.) using the following sequence.
 1. Tighten the upper bolt on the upper hinge.
 2. Tighten the lower bolt on the lower hinge.
 3. Tighten the remaining hinge bolts to 43 N.m (32 ft. lbs.).

Fig. 46: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the protrusion (3) is orientated towards the interior of the

vehicle.

- 8.
9. Tighten the two bolts (2) that secure the striker (1) to the B-pillar to 30 N.m (22 ft. lbs.).

IN/OUT

Fig. 47: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the front door with a suitable lifting device.
2. Loosen the two bolts (2) that secure the striker (1) to the B-pillar.

Fig. 48: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the bolts (2) that secure the door hinges (1) to the front door.
4. Adjust the front door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS.**
5. Tighten the bolts (2) that secure the door hinges (1) to the front door to 43 N.m (32 ft. lbs.).

Fig. 49: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the protrusion (3) is orientated towards the interior of the vehicle.

6. Tighten the two bolts (2) that secure the striker (1) to the B-pillar to 30 N.m (22 ft. lbs.).

REMOVAL

REMOVAL

Fig. 50: Identifying Door Check Strap & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners (2) and (4), replace with new, readily available through Mopar parts.

NOTE: Driver side door shown, passenger side similar.

1. Open and support the door on a suitable lifting device.
2. Disconnect and isolate the negative battery cable.
3. Remove the fastener securing the door check strap (1).
4. Remove the fastener (2) securing the upper door hinges half to the A-pillar hinge half.
5. Remove the fastener (4) securing the lower door hinge half to the A-pillar half.
6. With the use a suitable lifting device, remove the door from the vehicle.
7. Disconnect the front door harness wire connector (3) from the body harness.

INSTALLATION

INSTALLATION

Fig. 51: Identifying Door Check Strap & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners (2) and (4), replace with new readily available through Mopar parts.

NOTE: Driver side door shown, passenger side similar.

1. With the use of a suitable lifting device, position the door near the vehicle.
2. Position the door upper hinge half and lower hinge half onto the A-pillar upper hinge half and lower hinge half.
3. Lower and remove the support from the door.
4. Install the new fasteners (2, 4) securing the door hinge halves to the A-pillar hinge halves. Tighten the fasteners to 24 N.m (18 ft. lbs.).
5. Align the door's check strap and install the fastener (1) securing the check strap to the A-pillar. Tighten the fastener to 30 N.m (22 ft. lbs.).
6. Connect the front door harness wire connector (3) to the body harness.
7. Verify door fit and operation. Adjust the door for flushness and parallel gaps as necessary. Refer to **DOOR, ADJUSTMENTS**.
8. Connect the negative battery cable.
9. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

GLASS, DOOR

REMOVAL

REMOVAL

Fig. 52: Identifying Inner Door Belt Weatherstrip, Door Glass & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.

Fig. 53: Front Door Glass & Inner Door Belt Weatherstrip
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick or equivalent, pry upward to remove the inner door belt weatherstrip (2) to allow the door glass (1) clearance.

Fig. 54: Identifying Window Motor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the window motor (2) wiring connector.
5. Remove the three window motor (2) fasteners.
6. Remove the window motor (2) from the carrier plate.

Fig. 55: Identifying Access Plugs & Glass Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Open the access plugs (2) to expose the glass fasteners (3).
8. Lower the glass by hand until the glass fasteners (3) line up in the access holes.
9. Remove the glass fasteners (1).

Fig. 56: Removing Door Glass From Door
Courtesy of CHRYSLER GROUP, LLC

10. Lift up on the rear portion of the glass (2) to tilt.
11. Remove the glass (2) from the door (1).

INSTALLATION

INSTALLATION

Fig. 57: Installing Door Glass Into Door
Courtesy of CHRYSLER GROUP, LLC

1. Insert the front of the door glass (2) into the door (1).

2. Rotate the rear of the door glass into the door until fully seated into the front and rear run channels.

Fig. 58: Identifying Access Plugs & Glass Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Align the door glass mounts to the window regulator within the access holes (1).
4. Apply a medium grade threadlocker adhesive to the glass fastener threads per manufacture recommendations.
5. Install the glass fasteners and tighten to 13 N.m (10 ft. lbs.).
6. Close the access plugs. (2)

Fig. 59: Identifying Window Motor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Align the window motor (2) onto the carrier plate.
8. Install the window motor (2) fasteners (1) and tighten securely.
9. Connect the window motor (2) wiring connector.

231068500

11. Install the door trim panel (1). Refer to **PANEL, DOOR TRIM, INSTALLATION**.
12. Connect the negative battery cable.
13. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

HANDLE, EXTERIOR

REMOVAL

REMOVAL

231068506

Fig. 62: Torx Bit, Fastener, Slide Plate & Outside Door Handle Bracket

Courtesy of CHRYSLER GROUP, LLC

NOTE: Passenger side doors not equipped with a lock cylinder. Refer to **HANDLE, EXTERIOR, REMOVAL**.

1. With a small flat bladed tool, remove the outside handle access plug from inner door jamb.
2. Using a T-20 torx bit (1), turn the fastener (2) counter clockwise to move the slide plate (3) rearward in the outside door handle bracket (4).

Fig. 63: Identifying Exterior Door Handle, Door Handle Cap & Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

3. Lift the exterior door handle (3) outward.
4. Continue holding the exterior handle out and remove the door handle cap and lock cylinder (2).

Fig. 64: Sliding Exterior Door Handle Out Of Door
Courtesy of CHRYSLER GROUP, LLC

5. Slide the exterior door handle (1) rearward and rotate out of the door.
6. If so equipped, disconnect the wiring connector.

INSTALLATION

INSTALLATION

Fig. 65: Sliding Exterior Door Handle Out Of Door
Courtesy of CHRYSLER GROUP, LLC

NOTE: Passenger side doors not equipped with a lock cylinder.

1. If equipped, connect the harness connector to the exterior door handle (1). Refer to **HANDLE, EXTERIOR, INSTALLATION**.
2. Rotate the front of the exterior handle (4) into the door until it is flush with the door.
3. Slide the exterior door handle (1) forward until seated fully.

Fig. 66: Identifying Exterior Door Handle, Door Handle Cap & Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

4. Lift the exterior door handle (3) to the open position.
5. While holding the exterior handle (3) in the open position, insert the door handle cap (2).

231068506

Fig. 67: Torx Bit, Fastener, Slide Plate & Outside Door Handle Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Using a T-20 torx bit (1), turn the fastener (2) clockwise to move the slide plate (3) forward into the outside door handle bracket (4).
7. Tighten the fastener (2) to 2 N.m (18 in. lbs.).

HANDLE, INTERIOR

REMOVAL

REMOVAL

231068496

Fig. 68: Inside Release Handle & Cables

Courtesy of CHRYSLER GROUP, LLC

1. Remove rear door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. With the use of a flat bladed tool or equivalent, remove the lock cable from the inside release handle housing (2).
3. Place the lock button in the unlocked position and remove the lock cable (3) barrel end.
4. With the use of pliers or equivalent, depress the tabs on the handle cable (3) and remove from the inside release handle housing (2).
5. Place the pull handle in the open position and remove the handle cable (3) barrel end.
6. Remove the inside handle from the vehicle.

INSTALLATION

INSTALLATION

231068496

Fig. 69: Inside Release Handle & Cables

Courtesy of CHRYSLER GROUP, LLC

1. Place the pull handle in the open position and install the handle cable (3) barrel end.
2. Insert the handle cable (3) into the inside release handle housing (2) and seat tabs fully.
3. Place the lock button in the unlocked position and install the lock cable (3) barrel end.
4. Insert the lock cable (3) into the inside release handle housing (2).
5. Install the rear door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

HINGE, DOOR

REMOVAL

REMOVAL

Fig. 70: Identifying Door Check Strap & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners (2) and (4), replace with new readily available through Mopar parts.

NOTE: Driver side door shown, passenger side similar.

Remove the door-

1. Disconnect and isolate the negative battery cable.
2. Open and support door on a suitable lifting device.
3. Disconnect wire connector (3).
4. Remove check strap fastener (1) from the body side.
5. Remove fasteners (2) and (4) and discard.
6. Remove the door from the vehicle.
7. Transfer the door to a bench.

Fig. 71: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

Body side hinge half-

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Mark position of the hinge half (2) and/or lower hinge on the upper A-pillar and lower A-pillar with a grease pencil or other suitable device to ease installation.
2. Remove bolts (1) attaching hinge to door the upper A-pillar and/or lower A-pillar frame and remove the hinge.

Fig. 72: Identifying Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

Door side hinge half-

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Mark position of upper hinge (1) and/or lower hinge on the upper door and/or lower door with a grease pencil or other suitable device to ease installation.
2. Remove bolt (2) attaching hinge to the upper door and/or the lower door and remove the hinge.

INSTALLATION

INSTALLATION

Fig. 73: Identifying Front Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners, replace with new readily available through Mopar parts.

NOTE: If necessary, paint new door hinge prior to installation.

NOTE: Left upper shown, all other hinges on this model typical

Body side hinge half-

NOTE: A suitable body sealant should be used when moving or replacing hinges.

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Align the upper hinge and/or the lower hinge to the upper A-pillar and/or the lower A-pillar to the marks previously made.
2. Install bolts (2) attaching the hinge (1) to the upper A-pillar and/or lower A-pillar frame and tighten to 43 N.m (32 ft. lbs.).

Fig. 74: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

Door side hinge half-

NOTE: A suitable body sealant should be used when moving or replacing hinges.

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Align the upper hinge and/or the lower hinge to the upper door and lower door to the marks previously made.
2. Install bolt (2) attaching the hinge to the door and tighten to 43 N.m (32 ft. lbs.).

Install the door-

2310004417

Fig. 75: Identifying Door Check Strap & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the door. Refer to **DOOR, INSTALLATION**.

LATCH, DOOR

REMOVAL

REMOVAL

2310004380

Fig. 76: Identifying Latch Door Components
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

2. Remove the carrier plate. Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 77: Identifying Tab, Latch & Presenter Bracket
Courtesy of CHRYSLER GROUP, LLC

3. With the use of a flat bladed tool or equivalent, gently pry up on tab (1) and slide the latch (3) off of the presenter bracket (2).

Fig. 78: Identifying Lock Cables, Latch Assembly, Electrical Connector & Cover Tabs
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (2).
5. Release the latch cover tabs (3) and remove the latch cover.

Fig. 79: Identifying Handle/Lock Cables & Latch Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect handle and lock cables (1) and remove the latch assembly (2).

INSTALLATION

INSTALLATION

Fig. 80: Identifying Handle/Lock Cables & Latch Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Connect the handle and lock cables (1).

Fig. 81: Identifying Lock Cables, Latch Assembly, Electrical Connector & Cover Tabs
Courtesy of CHRYSLER GROUP, LLC

2. Connect the electrical connector (2) and install the latch cover.
3. Seat the latch cover retaining tabs (3) fully.

Fig. 82: Identifying Tab, Latch & Presenter Bracket
Courtesy of CHRYSLER GROUP, LLC

4. Install the latch (3) onto the presenter bracket (2) and seat the clip (1) fully.

Fig. 83: Identifying Latch Door Components
Courtesy of CHRYSLER GROUP, LLC

5. Install the carrier plate. Refer to **PLATE, CARRIER, INSTALLATION**.
6. Connect the negative battery cable.
7. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE**.

MOLDING, OUTER BELT

REMOVAL

REMOVAL

Fig. 84: Identifying Inner Door Belt Weatherstrip, Door Glass & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.

Fig. 85: Removing Door Glass From Door
Courtesy of CHRYSLER GROUP, LLC

2. Remove the door glass (1) from the door (2). Refer to **GLASS, DOOR, REMOVAL**.
3. Remove the outside mirror. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.

Fig. 86: Door Glass Run, Applique & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the rear portion of the door glass run (1).
5. Remove the three door applique (2) fasteners (3).
6. Remove the door applique (2).

231168795

Fig. 87: Belt Molding, Notch & Door Edge
Courtesy of CHRYSLER GROUP, LLC

7. Locate the notch (1) on the belt molding (1) inner edge B-pillar end.
8. Insert a small flat bladed tool or equivalent, into the notch (2) of the inner side of the belt molding (1).
9. Pry inboard to clear the tab on the door.
10. Continue to hold the notch inboard and using trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry up on outer belt molding, lifting the belt molding (1) upward approximately 25 mm (1 in.), it will be tight as it is raised over the door edge (3)
11. Lift the belt molding (1) upward 25 mm (1 in.).
12. Locate the notch (1) on the belt molding inner edge outside mirror end.
13. Insert a small flat bladed tool or equivalent, into the notch (2) of the inner side of the belt molding (1).
14. Pry inboard to clear the tab on the door.

2310004386

Fig. 88: Identifying Belt Molding
Courtesy of CHRYSLER GROUP, LLC

15. Using trim stick or equivalent, gently pry up on outer belt molding
16. Remove the belt molding (1) from the door (2).

INSTALLATION

INSTALLATION

231068501

Fig. 89: Door Glass Run, Applique & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Position the door applique.
2. Install the three door applique (2) fasteners (3) and tighten securely.
3. Insert the rear portion of the door glass run (1) and verify it is seated fully.

Fig. 90: Installing Door Glass Into Door
Courtesy of CHRYSLER GROUP, LLC

4. Install the door glass (2) into the door (1). Refer to **GLASS, DOOR, INSTALLATION**.

231168795

Fig. 91: Belt Molding, Notch & Door Edge
Courtesy of CHRYSLER GROUP, LLC

5. Align the tab (4) on the inner edge of belt molding (1) to the indentations on the door.
6. With firm hand pressure push down until belt molding (1) has seated fully onto the door (3) and the notches on the ends (2).

2310004420

Fig. 92: Identifying Inner Door Belt Weatherstrip, Door Glass & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the outside mirror. Refer to **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and

MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION.

8. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION.**

PANEL, DOOR TRIM**REMOVAL****REMOVAL**

Fig. 93: Identifying Window Switch, Liner & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using (special tool #C-4755, Trim Stick) or equivalent, remove and disconnect the window switch (2) from the door.
3. Using a trim stick or equivalent, remove the liner (4) from the door trim pull handle.
4. Remove the fastener (3) securing the door trim panel to the carrier plate.

Fig. 94: Identifying Bezel & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Using a trim stick or equivalent, pull out on the interior door handle and remove the bezel (2) located in the cavity.
6. Remove the fastener (1) and the fastener securing the door trim panel to the carrier plate.

Fig. 95: Identifying Inner Door Belt Weatherstrip, Door Glass & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Using a trim stick or equivalent, pry the door trim panel away, starting along the lower edge and working around the perimeter to disengage the retaining clips (3).
8. Lift the door trim panel up and out. **Position the door trim panel slightly away, do not remove.**

2310004419

Fig. 96: Identifying Interior Handle, Notch & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

9. Pull the interior handle (1) out fully from the notch (2) to detach from the trim panel (3).
10. Disconnect electrical connectors and remove the door trim panel (3).

INSTALLATION

INSTALLATION

2310004419

Fig. 97: Identifying Interior Handle, Notch & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the door trim panel (3) near the door.

2. Connect any electrical connectors as necessary except for the window switch. Feed the window switch harness through the cavity in the door trim panel.
3. Raise the trim panel and position the backside of the upper trim edge to be engaged with inner belt molding.
4. Feed the interior door handle (1) and the tab (2) through the back of the door trim panel and clip into place.

Fig. 98: Identifying Inner Door Belt Weatherstrip, Door Glass & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Align the door trim panel retaining clips (3) to the door.
6. Once aligned, engage the upper trim edge with the inner belt molding (1).
7. Hand tap the door trim panel to secure the retaining clips.

Fig. 99: Identifying Bezel & Fastener
Courtesy of CHRYSLER GROUP, LLC

8. Install the fasteners (1) into the interior door handle pocket, securing the door trim panel to the carrier plate. Tighten the fasteners securely.
9. Install the interior door handle (2) bezel.

Fig. 100: Identifying Window Switch, Liner & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Connect the electrical connector (2) and install the window switch (1) to the door.
11. Install the fastener (3) securing the door trim panel to the carrier plate. Tighten the fastener securely.
12. Install the liner (4) into the door trim pull handle cavity.
13. Connect the negative battery cable.

PLATE, CARRIER

REMOVAL

REMOVAL

Fig. 101: Identifying Wire Harness & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Remove the fasteners (2) and separate the wire harness (1) from the carrier plate.
4. Disconnect the door glass from the window regulator and secure in the full up position using tape or other suitable tool. Refer to **GLASS, DOOR, REMOVAL**.

Fig. 102: Identifying Exterior Door Handle & Fastener
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the exterior door handle. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL**.
6. Remove the fastener (3) located beneath the exterior door handle.

Fig. 103: Identifying Inner Door & Door Latch Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Remove the door latch fasteners (1) from the inner door (2).

Fig. 104: Identifying Latch Door Components
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the exterior mirror wiring connector.
9. Separate the wire harness from the carrier plate as necessary to gain enough slack in the harness to remove the carrier plate from the door.
10. Remove the carrier plate fasteners (1).
11. Remove the carrier plate from the door (1).
12. Disconnect and release the remaining harness connectors.

INSTALLATION

INSTALLATION

Fig. 105: Identifying Latch Door Components
 Courtesy of CHRYSLER GROUP, LLC

1. Move the carrier plate into the door opening until position allows for routing of the rear door wiring harness.
2. Route and fasten the wiring harness guides into the carrier plate and the latch presenter.
3. Insert latch inside and the outer handle bracket into the inner sheet metal.
4. Move carrier plate into opening until position of module aligns with surrounding sheet metal.
5. Install carrier plate fasteners (1) and tighten to 8 N.m (71 in. lbs.).
6. Connect wire harness to mirror connector.

Fig. 106: Identifying Inner Door & Door Latch Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the door latch fasteners (1) into the inner door (2).
8. Tighten the latch fasteners to 8 N.m (71 in. lbs.).

2310004379

Fig. 107: Identifying Exterior Door Handle & Fastener
Courtesy of CHRYSLER GROUP, LLC

9. Align the outer door handle bracket (1).
10. Install the outer door handle bracket fastener (3) and tighten securely.
11. Install the exterior door handle. Refer to **HANDLE, EXTERIOR, INSTALLATION** and **HANDLE, INTERIOR, INSTALLATION**.

2310008578

Fig. 108: Identifying Access Plugs & Glass Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Release glass and lower into position onto regulator.
13. Align the door glass mounts (1) to the window regulator within the access holes (3).
14. Apply a medium grade threadlocker adhesive to the glass fastener threads per manufacture recommendations.
15. Install the glass fasteners and tighten to 13 N.m (10 ft. lbs.).

Fig. 109: Identifying Window Motor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

16. Align the window motor (2) onto the carrier plate.
17. Install the window motor fasteners (1) and tighten to and tighten securely.
18. Connect the window motor (2) wiring connector.
19. Close the access plugs.

Fig. 110: Identifying Wire Harness & Fasteners

Courtesy of CHRYSLER GROUP, LLC

20. Position the harness (1) back into place and install the screws (2).
21. Install trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.
22. Connect the battery.
23. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

REGULATOR, WINDOW

REMOVAL

REMOVAL

Fig. 111: Identifying Carrier Plate, Window Regulator & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Remove the carrier plate (1). Refer to **PLATE, CARRIER, REMOVAL**.
2. Remove fasteners (2) from the window regulator (3).
3. Remove window regulator (3) from the carrier plate (1).

INSTALLATION

INSTALLATION

Fig. 112: Identifying Carrier Plate, Window Regulator & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Align the window regulator (3) onto the carrier plate (1).
2. Insert the window regulator drive mechanism tabs into the carrier plate until clips engage fully.
3. Install the four window regulator fasteners (2) and tighten securely.
4. Install the carrier plate. Refer to **PLATE, CARRIER, INSTALLATION**.
5. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

STRIKER, DOOR LATCH

REMOVAL

REMOVAL

Fig. 113: Door Latch Striker & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right hand shown, left hand typical.

1. Using a grease pencil or equivalent, mark the location of the door latch striker (1) on the B-pillar.
2. Remove the two bolts (2) that secure the striker to the B-pillar and remove the striker.
3. Be sure to check for any shims between door latch striker and B-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

INSTALLATION

INSTALLATION

Fig. 114: Two Bolts & Striker

Courtesy of CHRYSLER GROUP, LLC

NOTE: The striker needs to be properly orientated to the B-pillar. The striker loop (3) must be installed to the inboard side of the B-pillar.

1. Position the door latch striker (1) onto the B-pillar and loosely install the two bolts (2).
2. Align the door latch striker to the B-pillar using the reference marks made during the removal procedure and tighten the bolts to 30 N.m (22 ft. lbs.).

DOORS - REAR

APPLIQUE

REMOVAL

REMOVAL

231168781

Fig. 115: Door Glass Weatherstrip, C-Pillar Applique & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Lower window fully.
2. Remove the door trim panel. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Partially remove the rear portion of the door glass weatherstrip (2).
4. Remove the three C-pillar applique (1) fasteners (3).
5. Remove the C-pillar applique (1) from the vehicle.

231168784

Fig. 116: Door Glass Weatherstrip, B-Pillar Applique & Fasteners
Courtesy of CHRYSLER GROUP, LLC

B-Pillar Applique-

1. Lower window fully.
2. Remove the door trim panel. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Partially remove the front portion of the door glass weatherstrip (1).
4. Remove the three B-pillar applique (2) fasteners (3).

231168785

Fig. 117: B-Pillar Applique & Weatherstrip
Courtesy of CHRYSLER GROUP, LLC

5. Untuck the front edge of the weatherstrip (2) from the applique (1) and the door edge.
6. Remove the B-pillar applique (1) from the vehicle.

INSTALLATION

INSTALLATION

231168781

Fig. 118: Door Glass Weatherstrip, C-Pillar Applique & Fasteners
Courtesy of CHRYSLER GROUP, LLC

C-Pillar Applique-

1. Install the three C-pillar applique (1) fasteners (3) and tighten securely.
2. Insert the rear portion of the door glass weatherstrip (2) into the glass run channel and verify it is seated fully.
3. Install the door trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.
4. Raise the door glass fully.

231168785

Fig. 119: B-Pillar Applique & Weatherstrip
Courtesy of CHRYSLER GROUP, LLC

B-Pillar Applique-

1. Align the B-pillar applique (1) onto the door frame.
2. Insert the front edge of the weatherstrip (2) onto the applique (1) and the door edge.

231168784

Fig. 120: Door Glass Weatherstrip, B-Pillar Applique & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Install the three B-pillar applique (2) fasteners (3) and tighten securely.
4. Insert the front portion of the door glass weatherstrip (1) into the glass run channel) and verify it is seated fully.
5. Install the door trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.
6. Raise the door glass fully.

DOOR, REAR

ADJUSTMENTS

ADJUSTMENTS

NOTE: Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

Fig. 121: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the body fasteners (1) one hinge at a time and moving the door to the correct position.

1. Support the rear door with a suitable lifting device.
2. Loosen the bolts (1) that secure the front door hinges (2) to the B-pillar.
3. Adjust the rear door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Tighten the upper bolt of the upper hinge to the B-pillar to 43 N.m (32 ft. lbs.).
5. Tighten the upper bolt of the lower hinge to 43 N.m (32 ft. lbs.).
6. Tighten the remaining hinge bolts to 43 N.m (32 ft. lbs.).

UP/DOWN

Fig. 122: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Up/down door adjustment is done by loosening either the hinge to the body fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the rear door with a suitable lifting device.
2. Loosen the two bolts (2) that secure the striker (1) to the C-pillar.

Fig. 123: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, loosen the bolts (2) that secure the door hinges (1) to the rear door.

Fig. 124: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, loosen the bolts (1) that secure the front door hinges (2) to the B-pillar.

Fig. 125: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Adjust the rear door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
6. Tighten the bolts (2) that secure the door hinges (1) to the rear door to 43 N.m (32 ft. lbs.).

Fig. 126: Identifying Front Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the bolts (1) that secure the door hinges (2) to the B-pillar to 43 N.m (32 ft. lbs.) using the following sequence.
 1. Tighten the upper bolt on the upper hinge.
 2. Tighten the lower bolt on the lower hinge.

3. Tighten the remaining hinge bolts to 43 N.m (32 ft. lbs.).

Fig. 127: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the protrusion (3) is orientated towards the interior of the vehicle.

- 8.
9. Tighten the two bolts (2) that secure the striker (1) to the C-pillar to 30 N.m (22 ft. lbs.).

IN/OUT

Fig. 128: Two Bolts & Striker

Courtesy of CHRYSLER GROUP, LLC

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the rear door with a suitable lifting device.
2. Loosen the two bolts (2) that secure the striker (1) to the C-pillar.

**Fig. 129: Identifying Door Hinges & Bolts**

Courtesy of CHRYSLER GROUP, LLC

3. Loosen the bolts (2) that secure the door hinges (1) to the rear door.
4. Adjust the rear door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
5. Tighten the bolts (2) that secure the door hinges (1) to the front door to 43 N.m (32 ft. lbs.).

Fig. 130: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the protrusion (3) is orientated towards the interior of the vehicle.

6. Tighten the two bolts (2) that secure the striker (1) to the C-pillar to 30 N.m (22 ft. lbs.).

REMOVAL

REMOVAL

Fig. 131: Identifying Rear Door Wiring Harness Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners, replace with new readily available through Mopar parts.

NOTE: Passenger side door shown, drivers side similar.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the rear door wiring harness connector from the body harness (3) located on the B-pillar.
3. With the rear door open, remove the fastener (1) securing the door check strap.
4. On the upper door hinge, remove the fastener (2) that secures the door half hinge to body side half hinge and discard.
5. Repeat on the lower hinge.
6. With the use of a suitable lifting device, remove the door from the vehicle.

INSTALLATION

INSTALLATION

Fig. 132: Identifying Rear Door Wiring Harness Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners, replace with new readily available through Mopar parts.

NOTE: Passenger side door shown, drivers side similar.

1. With the use of a suitable lifting device, position the door to the vehicle.
2. Align the door side hinge halves to the B-pillar hinge halves.

3. Insert the door upper half hinge body side upper half hinge and at the same time the lower hinges.
4. Install new fasteners (2, 4) to both the upper and lower hinges and tighten 24 N.m (18 ft. lbs.).
5. With the rear door (2) open, install the fastener (1) securing the door check strap and tighten 30 N.m (22 ft. lbs.).
6. Connect the rear door wiring harness connector (3) to the body harness located on the B-pillar (1).
7. Connect the negative battery cable.
8. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

GLASS, DOOR

REMOVAL

REMOVAL

Fig. 133: Identifying Rear Door Trim & C-Pillar Applique
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the trim panel. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Remove the C-pillar applique (4). Refer to **APPLIQUE, REMOVAL**.

231168782

Fig. 134: Window Motor, Fasteners & Harness
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the window motor (1) wiring harness (3).
5. Remove the three fasteners (2) from the window motor (1).
6. Remove the window motor (1) from the carrier plate.

2311010658

Fig. 135: Identifying Access Plugs, Carrier Plate & Fasteners

1. Lower glass (1) down into the opening at top of door (2).

Fig. 138: Identifying Access Plugs, Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Position the glass (1) by hand until the glass fasteners lines up in the access hole (2)
3. Apply a medium grade threadlocker adhesive to the glass fastener threads per manufacture recommendations.
4. Install the glass fastener and tighten to 13 N.m (10 ft. lbs.).
5. Close the access plug on the carrier plate (3).

Fig. 139: Window Motor, Fasteners & Harness
Courtesy of CHRYSLER GROUP, LLC

6. Align the window motor (1) onto the carrier plate.
7. Install the three fasteners (2) to the window motor (1) and tighten securely.
8. Connect the window motor (3) wiring harness.

2311005399

Fig. 140: Identifying Rear Door Trim & C-Pillar Applique
Courtesy of CHRYSLER GROUP, LLC

9. Install the C-pillar applique (4). Refer to **APPLIQUE, INSTALLATION**.
10. Install the trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.
11. Connect the negative battery cable.
12. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE**.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

231068508

Fig. 141: Disengaging Slide Plate

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left hand shown, right side typical.

1. With a small flat bladed tool, remove the outside handle access plug from inner door jamb.
2. Using a right angled pick (2) or equivalent, hook the slide plate (1) and pull rearward to disengage.

3329280

Fig. 142: Door Handle Cap

Courtesy of CHRYSLER GROUP, LLC

3. Lift the exterior door handle to the open position.

4. Continue holding the exterior handle in the open position and remove the door handle cap (1).

231068510

Fig. 143: Removing Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

5. Slide the exterior door handle (1) rearward and rotate out of the door.
6. Remove the handle from the vehicle.

INSTALLATION

INSTALLATION

231068511

Fig. 144: Installing Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left hand shown, right side typical.

1. Rotate the front of the exterior handle (1) into the door until it is flush with the door.
2. Slide the exterior door handle (1) forward until seated fully.

3329280

Fig. 145: Door Handle Cap
Courtesy of CHRYSLER GROUP, LLC

3. Lift the exterior door handle to the open position.
4. While holding the exterior handle in the open position, insert the door handle cap (1).

230970368

Fig. 146: Engaging Slide Plate
Courtesy of CHRYSLER GROUP, LLC

5. Using a right angled pick (2) or equivalent, push the slide plate (1) forward to engage.
6. Insert the outside handle access plug from inner door jamb.

HANDLE, INTERIOR

REMOVAL

REMOVAL

231068496

Fig. 147: Inside Release Handle & Cables
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear door trim panel. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
2. With the use of a flat bladed tool or equivalent, remove the lock cable from the inside release handle housing (2).
3. Place the lock button in the unlocked position and remove the lock cable (3) barrel end.
4. With the use of pliers or equivalent, depress the tabs on the handle cable (3) and remove from the inside release handle housing (2).
5. Place the pull handle in the open position and remove the handle cable (3) barrel end.
6. Remove the inside handle from the vehicle.

INSTALLATION

INSTALLATION

231068496

Fig. 148: Inside Release Handle & Cables
 Courtesy of CHRYSLER GROUP, LLC

1. Place the pull handle in the open position and install the handle cable (3) barrel end.
2. Insert the handle cable (3) into the inside release handle housing (2) and seat tabs fully.
3. Place the lock button in the unlocked position and install the lock cable (3) barrel end.
4. Insert the lock cable (3) into the inside release handle housing (2).
5. Install the rear door trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.

HINGE, DOOR

REMOVAL

REMOVAL

Fig. 149: Identifying Rear Door Wiring Harness Connector & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners (2, 4), replace with new readily available through Mopar parts.

NOTE: Left upper shown, all other hinges on this model typical

Remove the door-

1. Remove the door. Refer to **DOOR, REAR, REMOVAL**.
2. Transfer the door to a bench.

Fig. 150: Identifying Front Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

Body side hinge half-**NOTE: Upper and lower hinge halves are serviced exactly the same**

1. Mark position of the body side half hinge (2) with a grease pencil or other suitable device to ease installation.
2. Remove the bolts (1) attaching the body side half hinge (2) to the body side.
3. Remove the body side half hinge (2) from the vehicle.

**Fig. 151: Identifying Door Hinges & Bolts**

Courtesy of CHRYSLER GROUP, LLC

Door side hinge half-**NOTE: Upper and lower hinge halves are serviced exactly the same**

1. Mark position of the door side half hinge (1) with a grease pencil or other suitable device to ease installation.
2. Remove the bolt attaching the door side half hinge (1) to the body side.
3. Remove the door side half hinge (1) from the vehicle.

INSTALLATION**INSTALLATION**

Fig. 152: Identifying Front Door Hinges & Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the door half hinge to body side half hinge fasteners, replace with new readily available through Mopar parts. If necessary, paint new door hinge prior to installation.

NOTE: If necessary, paint new door hinge prior to installation.

NOTE: Left upper shown, all other hinges on this model typical

Body side hinge half-

NOTE: A suitable body sealant should be used when moving or replacing hinges.

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Align the upper hinge and/or the lower hinge to the upper B-pillar and/or the lower B-pillar to the marks previously made.
2. Install bolts (2) attaching the hinge (1) to the upper B-pillar and/or lower B-pillar frame and tighten to 43 N.m (32 ft. lbs.).

Fig. 153: Identifying Door Hinges & Bolts
Courtesy of CHRYSLER GROUP, LLC

Door side hinge half-

NOTE: A suitable body sealant should be used when moving or replacing hinges.

NOTE: Upper and lower hinge halves are serviced exactly the same

1. Align the upper hinge and/or the lower hinge to the upper door and lower door to the marks previously made.
2. Install bolt (2) attaching the hinge to the door and tighten to 43 N.m (32 ft. lbs.).

Install the door -

Fig. 154: Identifying Rear Door Wiring Harness Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the door. Refer to **DOOR, REAR, INSTALLATION**.

LATCH, DOOR

REMOVAL

REMOVAL

Fig. 155: Identifying Rear Door Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

2. Remove the rear door carrier plate (2). Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 156: Identifying Latch, Pry Tab & Electrical Connector
 Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1).
4. With the use of a small flat bladed tool or equivalent, gently pry tab (3) and slide the latch (2) off of the presenter bracket.

Fig. 157: Identifying Lock Cables, Latch Assembly, Electrical Connector & Cover Tabs
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door latch shown, rear door latch similar.

5. Disconnect the electrical connector (2).
6. Release the latch cover tabs (3) and remove the latch cover.

Fig. 158: Identifying Handle/Lock Cables & Latch Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door latch shown, rear door latch similar.

7. Disconnect handle and lock cables (1) and remove the latch assembly (2).

INSTALLATION

INSTALLATION

1. Connect the handle and lock cables (1).

NOTE: Front door latch shown, rear door latch similar.

2311010997

Fig. 161: Identifying Latch, Pry Tab & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Install the cover and seat the latch cover retaining tabs (3) fully.
3. Install the latch (2) onto the presenter bracket and seat the clip (3) fully.
4. Connect the electrical connector (1).

2311005402

Fig. 162: Identifying Rear Door Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the rear door carrier plate (2). Refer to **PLATE, CARRIER, INSTALLATION**.
6. Connect the negative battery cable.
7. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE**.

MOLDING, REAR DOOR

REMOVAL

REMOVAL

2311005399

Fig. 163: Identifying Rear Door Trim & C-Pillar Applique
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the B-pillar (2) and C-pillar rear door appliques (4). Refer to **APPLIQUE, REMOVAL**.

231168795

Fig. 164: Belt Molding, Notch & Door Edge
Courtesy of CHRYSLER GROUP, LLC

2. Locate the notch (2) on the belt molding (1) inner edge on the B-pillar end.
3. Insert a small flat bladed tool or equivalent, into the notch (2) of the inner side of the belt molding (1).
4. Pry inboard to clear the tab on the door sheet metal.
5. Continue to hold the notch (2) inboard and lift the belt molding (1), it will be tight as it is raised over the door edge (3).
6. Using trim stick (special tool #C-4755, Trim Stick) or equivalent, gently pry up on outer belt molding, lifting the belt molding (1) upward approximately 25 mm (1 in.).
7. Locate the notch (1) on the belt molding inner edge of the C-pillar end.
8. Insert a small flat bladed tool or equivalent, into the notch (2) of the inner side of the belt molding (1).
9. Pry inboard to clear the tab on the door sheet metal.
10. Using a trim stick or equivalent, gently pry up on outer belt molding.
11. Remove the belt molding from the door.

INSTALLATION

INSTALLATION

231168795

Fig. 165: Belt Molding, Notch & Door Edge
Courtesy of CHRYSLER GROUP, LLC

1. Align the tab (4) on the inner edge of belt molding (1) to the indentations on the door sheet metal edge.
2. With firm hand pressure push down until belt molding (1) has seated fully onto the door (3) and the

notches on the ends (2).

2311005399

Fig. 166: Identifying Rear Door Trim & C-Pillar Applique
Courtesy of CHRYSLER GROUP, LLC

3. Install the rear door B-pillar (2) and C-pillar appliques (4). Refer to **APPLIQUE, INSTALLATION**.

PANEL, REAR DOOR TRIM

REMOVAL

REMOVAL

2311010665

Fig. 167: Identifying Bezel & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Pull out on the interior door handle (1) and using a (special tool #C-4755, Trim Stick) or equivalent, remove the bezel (2) located in the cavity.
3. Remove the fastener (1) and fastener (3) securing the door trim panel to the carrier plate.

Fig. 168: Identifying Window Switch, Electrical Connector, Liner & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or equivalent, remove the window switch (1) from the door and disconnect the electrical connector (2).
5. Using a trim stick or equivalent, remove the liner (4) from the door trim pull handle.
6. Remove the fastener (3) securing the door trim panel to the carrier plate.

Fig. 169: Identifying Door Trim Panel & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

7. Using a trim stick or equivalent, pry the door trim panel away from the door (1), starting on the bottom edge and working around the perimeter, to release the retaining clips (2).

Fig. 170: Identifying Interior Handle, Notch & Trim Panel
Courtesy of CHRYSLER GROUP, LLC

8. Lift the door trim panel (1) up and out.

Position the door trim panel slightly away, do not remove.

9. Pull the interior handle (2) out fully from the notch (3) to detach from the trim panel (1).

10. Remove the door trim panel from the vehicle.

INSTALLATION

INSTALLATION

Fig. 171: Identifying Interior Handle, Notch & Trim Panel
 Courtesy of CHRYSLER GROUP, LLC

1. Position the door trim panel (3) near the door.
2. Feed the interior door handle (1) into the notch on the back of the door trim panel (3) and clip into place (2).

Fig. 172: Identifying Door Trim Panel & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

3. Feed the window switch harness through the cavity in the door trim panel.
4. Align the door trim panel retaining clips (2) to the door (1).
5. Once aligned, engage the upper trim edge with the inner belt molding.
6. Hand tap the door trim panel to seat the retaining clips fully.

Fig. 173: Identifying Window Switch, Electrical Connector, Liner & Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Install the fastener (3) securing the door trim panel to the carrier plate. Tighten the fastener securely.
8. Install the liner (4) into the door trim pull handle pocket.
9. Connect the window switch wiring connector (2) and install the switch (1) into the door trim panel.

Fig. 174: Identifying Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install fastener (1) and fastener (3) securing the door trim panel to the carrier plate.
11. Tighten fasteners securely.
12. Install the interior door handle (2) bezel.
13. Connect the negative battery cable.

PLATE, CARRIER

REMOVAL

REMOVAL

2311005400

Fig. 175: Identifying Wire Harness & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the door trim panel. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Remove the fasteners (1) and separate the wire harness (2) from the carrier plate.
4. Disconnect the door glass from the window regulator and secure in the full up position using tape or other suitable tool. Refer to **GLASS, DOOR, REMOVAL**.

2310004379

Fig. 176: Identifying Exterior Door Handle & Fastener
Courtesy of CHRYSLER GROUP, LLC

NOTE: Front door shown, rear door similar.

5. Remove the exterior door handle. Refer to **HANDLE, EXTERIOR, REMOVAL**.
6. Remove the fastener (3) located beneath the exterior door handle.

Fig. 177: Identifying Latch & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

7. Remove the latch fasteners (3), located on the inner face of the door and the fastener (2) located on the inner door surface.

Fig. 178: Identifying Rear Door Carrier Plate & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

8. Separate the wire harness from the carrier plate as necessary to gain enough slack in the harness to remove the carrier plate from the door.
9. Remove the carrier plate fasteners (1).
10. Remove the carrier plate from the door (1).
11. Disconnect the latch wiring connector (3).
12. Disconnect and release the remaining harness connectors.

13. Remove the carrier (1) plate from the vehicle.

INSTALLATION**INSTALLATION**

Fig. 179: Identifying Rear Door Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Move the carrier plate into the door opening until position allows for routing of the rear door wiring harness.
2. Route and fasten the wiring harness guides into the carrier plate (1) and the latch presenter.
3. Insert latch inside and the outer handle bracket into the inner sheet metal.
4. Move carrier plate into opening until position of module aligns with surrounding sheet metal.
5. Install the carrier plate fasteners (1) tighten to and 8 N.m (71 in. lbs.).

Fig. 180: Identifying Latch & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the latch fasteners (3), located on the inner face of the door and the fastener (2) located on the inner door surface.
7. Tighten the fasteners (2) to 8 N.m (71 in. lbs.).

Fig. 181: Identifying Exterior Door Handle & Fastener
Courtesy of CHRYSLER GROUP, LLC

8. Install the outside handle bracket fastener (3) and tighten securely.
9. Install the exterior handle. Refer to **HANDLE, EXTERIOR, INSTALLATION**.

Fig. 182: Identifying Access Plugs, Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Release glass and lower into position onto regulator.
11. Apply a medium grade threadlocker adhesive to the glass fastener threads per manufacture recommendations.
12. Install the glass to regulator fastener (2) and tighten to 13 N.m (10 ft. lbs.).
13. Close the access plug on the carrier plate (3).

Fig. 183: Window Motor, Fasteners & Harness
Courtesy of CHRYSLER GROUP, LLC

14. Align the window motor (1) onto the carrier plate.
15. Install the three fasteners (2) to the window motor (1) and tighten securely.
16. Connect the window motor (3) wiring connector.

2311005400

Fig. 184: Identifying Wire Harness & Fasteners
Courtesy of CHRYSLER GROUP, LLC

17. Position the harness (2) back into place and install the screws (1).
18. Install trim panel. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.
19. Connect the battery.
20. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE** .

REGULATOR, WINDOW

REMOVAL

REMOVAL

Fig. 185: Identifying Rear Door Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove carrier plate (2) from rear door. Refer to **PLATE, CARRIER, REMOVAL**.

Fig. 186: Carrier Plate, Window Regulator & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Remove two window regulator fasteners (2) and remove from the rear of the carrier plate (1).

INSTALLATION

INSTALLATION

231168791

Fig. 187: Carrier Plate, Window Regulator & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position regulator (3) on carrier plate (1) and install the two fasteners (2) and tighten securely.

2311005402

Fig. 188: Identifying Rear Door Carrier Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the carrier plate in door panel. Refer to **PLATE, CARRIER, INSTALLATION**.
3. Perform the Clear/Relearn procedure. Refer to **STANDARD PROCEDURE**.

STRIKER, DOOR LATCH

REMOVAL

REMOVAL

Fig. 189: Door Latch Striker & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right hand shown, left hand typical.

NOTE: The front and rear door latch strikers are mounted and adjusted the exact same way.

1. Using a china marker or equivalent, mark the outline of the door latch striker (1) on the C-pillar.
2. Remove the bolts (2) attaching the door latch striker to C-pillar.
3. Remove the door latch striker (1) from vehicle.

NOTE: Be sure to check for any shims between door latch striker and C-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

INSTALLATION

INSTALLATION

Fig. 190: Two Bolts & Striker
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right hand shown, left hand typical.

NOTE: Front door striker shown, rear door striker similar.

NOTE: The front and rear door latch strikers are mounted and adjusted the exact same way.

NOTE: Be sure to check for any shims between door latch striker and C-pillar. If any shims are found, they must be reinstalled with the new door latch striker to maintain proper door operation.

NOTE: The striker needs to be properly orientated to the C-pillar. The striker loop (3) must be installed to the inboard side of the C-pillar.

1. Position door latch striker (1) and any shims on vehicle.
2. Loosely install the bolts (2) attaching latch striker to C-pillar.
3. Using the reference marks made during removal, align the latch striker to marks on C-pillar and tighten bolts to 30 N.m (22 ft. lbs.).
4. Verify door fit and operation. Adjust door latch striker as necessary.

EXTERIOR

COVER, COWL PANEL

REMOVAL**REMOVAL**

231374219

Fig. 191: Cowl Mocket**Courtesy of CHRYSLER GROUP, LLC****COWL PANEL COVER**

1. Release hood latch and open hood.
2. Remove the fender to cowl mocket (1) by pulling up at the end of the fender to cowl mocket (1) to cowl panel joint and then pulling the fender to cowl mocket (1) out of the fender.
3. Remove the driver's side wiper cover by pulling up on the cover.
4. Remove windshield wiper arms. Refer to **ARM, WIPER, REMOVAL** .

Fig. 192: Identifying Cowl Panel & Push Pins
Courtesy of CHRYSLER GROUP, LLC

5. With the use of (special tool #C-4755, Trim Stick) or equivalent, remove the push pins (1) attaching cowl panel (2) to the cowl plenum extension.

Fig. 193: Cowl Panel & Cowl Cover
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when removing the cowl screen from the retainer on the windshield. If the retainer on the windshield is broken/damaged the windshield will require replacement.

6. Starting at the driver's side pull up on the back edge of the cowl panel (1) and work cross car to release

the tab from the backside of the cowl panel (1) from the groove in the lower windshield channel (2).

7. Remove cowl cover (1) from vehicle.

Fig. 194: Installing Cowl Panel

Courtesy of CHRYSLER GROUP, LLC

COWL PLENUM PANEL

1. Remove the screws (2) and remove the panel (1).

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

COWL PANEL COVER

CAUTION: Use care when removing the cowl screen from the retainer on the windshield. If the retainer on the windshield is broken/damaged the windshield will require replacement.

1. Position cowl panel cover (2) to vehicle.
2. Starting in the center of the back edge of the cowl panel (1) and working out to the edges, align the tab on the backside of the cowl panel (1) into the groove in the lower windshield channel (2).

Fig. 197: Identifying Cowl Panel & Push Pins
Courtesy of CHRYSLER GROUP, LLC

3. Using hand pressure fully insert cowl panel tab (1) into windshield insert (2).
4. Install push pins (1) attaching cowl cover to cowl.
5. Install windshield wiper arms. Refer to **ARM, WIPER, INSTALLATION** .
6. Align the clips on the driver's side wiper cover and engage clips with hand pressure.

Fig. 198: Cowl Mocket
Courtesy of CHRYSLER GROUP, LLC

7. Align the clips on the right and left fender to cowl mocket (1) and engage with hand pressure.
8. Install the clips attaching cowl plenum under hood to cowl bulb seal to cowl panel.

DOOR, FUEL FILL**REMOVAL****REMOVAL**

230970366

Fig. 199: Removing Fuel Fill Door**Courtesy of CHRYSLER GROUP, LLC**

1. Open the fuel fill door (2).
2. Insert a pick or equivalent to lift the fuel door retaining tab (3).
3. Slide the gas door (2) outward to release from fuel filler housing (1).
4. Remove fuel fill door.

INSTALLATION**INSTALLATION**

231368279

Fig. 200: Installing Fuel Fill Door
Courtesy of CHRYSLER GROUP, LLC

1. Align fuel door (2) onto the fuel filler housing (1).
2. Slide fuel fill door (2) inward until retaining tab (3) is engaged fully.
3. Close the fuel door (2).

FENDER, FRONT

REMOVAL

REMOVAL

2313008602

Fig. 201: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
3. Remove the eight fasteners (2) from the upper fascia closeout panel (1).
4. Remove the upper fascia closeout panel (1) from the vehicle.

Fig. 202: Front Fascia Support Bracket
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the fasteners from the front fascia support bracket (2).
6. Position the bracket to allow access to the front fender fastener.

Fig. 203: Identifying Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Accessing from within the wheelhouse, remove the fascia to fender fastener (1).
8. Carefully pull out on the upper and lower fascia sides to disengage the fascia retaining tabs.

231374219

Fig. 204: Cowl Mocket
Courtesy of CHRYSLER GROUP, LLC

9. Remove the fender to cowl mocket by pulling up at the end of the fender to cowl mocket at the cowl panel joint and then pulling the fender to cowl mocket out of the fender.

2313006657

NOTE: Each grille insert (3) is unique to it's spot on the hood and is numbered accordingly (2). Make sure the correct grille inserts are installed in the original position.

2. Install the nuts (1).

GRILLE, ACTIVE SHUTTER

DESCRIPTION

DESCRIPTION

This vehicle features an Active Grille Shutter (AGS) system. The AGS is located behind the front lower portion of the grill and in front of the radiator.

Fig. 225: Active Grille Shutter Components
 Courtesy of CHRYSLER GROUP, LLC

The AGS system consist of an electric motor, shutter vanes, linkage, and seals that are located behind the front grille. The AGS components include:

1. Frame
2. Right Side Actuator Housing
3. Vanes
4. Linkage
5. Actuator
6. Left Side Actuator Housing

Aerodynamics plays an important role in regards to fuel efficiency. Aerodynamic drag increases as vehicle speed increases. With the vehicle traveling at highway speeds, engine power requirements increase in order to overcome wind drag across the front of the vehicle. Reducing the wind drag coefficient across the front of the vehicle is directly proportional to an improvement in fuel efficiency.

OPERATION

OPERATION

The AGS system is controlled by the powertrain control module (PCM) over a dedicated network LIN bus. When the ambient air and engine coolant temperatures are below a specified threshold, airflow across the radiator is not required. When airflow across the radiator is not required and vehicle speeds reach a calibrated threshold, the PCM will command the shutter vanes to close.

Closing the grille shutter vanes creates an improved drag coefficient across the front of the vehicle. If additional cooling is required due to increasing engine coolant temperatures, the PCM commands the grille shutter vanes to open. In cold climates, the active grille shutter system may be used to improve engine coolant warm-up times further increasing fuel economy.

To aid with diagnosis, the grille shutter vanes can be commanded to the open or closed positions with a scan tool. The active grille shutters perform an initialization each time the vehicle is started. The initialization can be used as a quick way to validate the operation of the AGS. To perform the AGS validation, start the engine and observe the grille shutters, the shutters will cycle to the fully open position and then to the fully closed positions to initialize and learn the hard stops on the grille shutter frame for that key cycle.

If the AGS smart module detects the grille shutters are jammed, it will attempt to free them by cycling the shutters from the open to close positions 3 times. If this condition is detected when the ambient air temperature is greater than 4.4° C (40° F) the MIL will illuminate and a diagnostic trouble code (DTC) will set. If the ambient air temperature is below 4.4° C (40° F) and a jammed condition is detected, the smart module will assume the shutters are frozen and will not illuminate the MIL or set a DTC.

The active grille shutter assembly contains an integral smart module, the module receives a command position signal from the PCM to properly position the shutter vanes. The AGS module reports the position to the PCM on the LIN bus. The AGS module four-pin connector also contains a battery voltage, ignition voltage, and a ground circuit.

REMOVAL

REMOVAL

Fig. 226: Identifying Active Grille Shutter Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

NOTE: When replacing the active grill shutter assembly or active grill shutter actuator with a service part it will be necessary to perform a counter reset with a scan tool. Follow the scan tool prompts as located under PCM/Misc. Functions/Active Grill Shutter Replace.

1. Remove the front fascia and place on a workbench. Refer to **FASCIA, FRONT, REMOVAL**.
2. Accessing from the rear of the fascia, remove the fasteners (1) securing the active grille shutter to the fascia.
3. Remove the active grille shutter from the fascia.

DISASSEMBLY

DISASSEMBLY

2313006647

Fig. 227: Identifying Flat Bladed Tool, Active Grill Shutter Frame & Vane Outer End
Courtesy of CHRYSLER GROUP, LLC

NOTE: When replacing the active grill shutter assembly or active grill shutter actuator with a service part it will be necessary to perform a counter reset with a scan tool. Follow the scan tool prompts as located under PCM/Misc. Functions/Active Grill Shutter Replace.

1. Place an appropriate sized flat bladed tool (1), or equivalent between the active grill shutter frame (2) and the vane (3) outer end.
2. Gently pry until the vane (3) tab is released from the frame (2).

231368337

Fig. 228: Identifying Frame, Linkage & Vane
Courtesy of CHRYSLER GROUP, LLC

3. Upper and lower vanes will need to be unclipped from the linkage (2), center vanes sit in the slot guides.
4. Move vane outward (3) to release it from the frame (1).

231300648

Fig. 229: Identifying Frame & Linkage
Courtesy of CHRYSLER GROUP, LLC

5. Remove the linkage (2).
6. Disconnect the wiring connector for the active grill shutter actuator.

2313006650

Fig. 230: Identifying Active Grill Shutter Actuator & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Remove the two fasteners (1).
8. Remove the active grill shutter actuator (2) from the active grill shutter frame.

ASSEMBLY**ASSEMBLY**

2313006650

Fig. 231: Identifying Active Grill Shutter Actuator & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Place the active grill shutter actuator (2) into the active grill shutter frame.
2. Install the two actuator fasteners (1) and tighten securely.

231368338

Fig. 232: Linkage, Actuator Arm And Frame
Courtesy of CHRYSLER GROUP, LLC

3. Rotate the linkage (1) onto the frame (3).
4. Align the actuator arm (2) to the center notch on the linkage (1).

231368337

Fig. 233: Identifying Frame, Linkage & Vane
Courtesy of CHRYSLER GROUP, LLC

5. The vane (3) has two inner tabs, guide one into the appropriate hole in center of the frame (1).
6. Guide the second inner tab into the appropriate slot on the linkage (2). The linkage (2) will clip onto the vane tab on the upper and lower shutters, center shutters will sit in the center piece slots.

2313006647

Fig. 234: Identifying Flat Bladed Tool, Active Grill Shutter Frame & Vane Outer End
 Courtesy of CHRYSLER GROUP, LLC

7. Place an appropriate sized flat bladed tool (1) or equivalent, between the active grill shutter frame (2) and the vane (3) outer end.
8. Gently pry until the vane (3) tab can be inserted into the appropriate hole in the frame (2).
9. Repeat until all vanes have been placed.
10. When replacing the active grill shutter assembly or active grill shutter actuator with a service part it will be necessary to perform a counter reset with a scan tool. Follow the scan tool prompts as located under PCM/Misc. Functions/Active Grill Shutter Replace.

INSTALLATION

INSTALLATION

2313006655

Fig. 235: Identifying Active Grill Shutter Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Align and position the active grille shutter to the fascia.
2. Accessing from the rear of the fascia, install the fasteners (1) securing the active grille shutter (1) to the fascia. Tighten the fastener securely.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.
4. When replacing the active grill shutter assembly or active grill shutter actuator with a service part it will be necessary to perform a counter reset with a scan tool. Follow the scan tool prompts as located under PCM/Misc. Functions/Active Grill Shutter Replace.

MIRROR, OUTSIDE REARVIEW

REMOVAL

REMOVAL

Fig. 236: Identifying Upper Door Trim & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a (special tool #C-4755, Trim Stick), remove the upper door trim. Refer to **PANEL, DOOR TRIM, REMOVAL**.

Fig. 237: Identifying Exterior Mirror, Wire Harness & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, disconnect the power mirror accessory wire harness (2).
4. Remove the fasteners (1) securing the exterior mirror (3).
5. If equipped with power mirror accessory features, detach the wire harness grommet located in the mirror flag area.
6. Remove the exterior mirror (3) from vehicle, feed the wire harness (2) and the grommet through the hole in the mirror flag area.

INSTALLATION

INSTALLATION

Fig. 238: Identifying Exterior Mirror, Wire Harness & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the exterior mirror (3) near the vehicle.
2. If equipped with power mirror accessory features, feed the wire harness (2) through the hole in the mirror flag and seat the grommet. **Do not pull on the wire harness to seat the grommet.**
3. Align and position the exterior mirror (3) into the mirror flag area of the door.
4. Install the fasteners (1) securing the exterior mirror to the door. Tighten the fasteners securely.

Fig. 239: Identifying Upper Door Trim & Fasteners

5. Align, position and install the upper trim panel (1). Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MIRROR, OUTSIDE REARVIEW, GLASS

REMOVAL

REMOVAL

GLASS

3833105

Fig. 240: Mirror Glass

Courtesy of CHRYSLER GROUP, LLC

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. Push mirror glass case (2) into full down position
2. Disconnect and isolate the negative battery cable.
3. Place thumbs behind mirror glass case (2) and push out from the mirror assembly (1). This will disengage the mirror glass case's snap attachment feature.

3833147

Fig. 241: Mirror Glass & Electrical Harnesses

Courtesy of CHRYSLER GROUP, LLC

4. If equipped, disconnect any accessory electrical harnesses (2, 3 & 4) from the mirror glass (1).

MIRROR CAP

3833105

Fig. 242: Mirror Glass

Courtesy of CHRYSLER GROUP, LLC

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. Disconnect and isolate the negative battery cable.
2. Remove the exterior mirror from the vehicle. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.
3. Push mirror glass case (2) into full down position
4. Place thumbs behind mirror glass case (2) and push out from the mirror assembly (1). This will disengage the mirror glass case's snap attachment feature.

Fig. 243: Mirror Glass & Electrical Harnesses
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, disconnect any accessory electrical harnesses (2, 3 & 4) from the mirror glass (1).
6. Remove the mirror glass (1).

Fig. 244: Puddle Lamp & Connectors
Courtesy of CHRYSLER GROUP, LLC

7. If equipped, remove and disconnect the puddle lamp. Refer to **LAMP, MIRROR, REMOVAL** .

Fig. 245: Mirror Housing, Fasteners & Retaining Tabs
 Courtesy of CHRYSLER GROUP, LLC

8. Remove the fasteners (2) securing the mirror housing bezel (1).
9. Using needle nose pliers, two flat head screwdrivers or equivalent, disengage the retaining tabs (3) located in the upper inboard corner.

Fig. 246: Mirror Cap/Mirror Assembly & Bezel
 Courtesy of CHRYSLER GROUP, LLC

10. Separate the mirror housing bezel (2) from the mirror cap/mirror assembly (1).
11. If equipped with turn signal, separate the mirror housing bezel (2) from the mirror cap/mirror assembly (1).

3828797

Fig. 247: Turn Signal Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

12. If equipped with turn signal, disengage the turn signal retaining tabs (3, 4 & 5) and separate the mirror housing bezel from the mirror cap/mirror assembly. Refer to **LAMP, MIRROR, REMOVAL**.

INSTALLATION

INSTALLATION

GLASS

3833147

Fig. 248: Mirror Glass & Electrical Harnesses
Courtesy of CHRYSLER GROUP, LLC

WARNING: Always wear eye and hand protection when servicing the mirror

assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. If equipped, connect any accessory electrical harnesses (2, 3 & 4) to the mirror glass (1).

3833105

Fig. 249: Mirror Glass

Courtesy of CHRYSLER GROUP, LLC

2. Align and position the mirror glass (1) to the mirror motor.
3. Push the glass (1) forward until the glass case snaps are fully seated on motor.

NOTE: An audible snap is normal.

4. Connect the negative battery cable.

MIRROR CAP

Fig. 250: Turn Signal Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

WARNING: Always wear eye and hand protection when servicing the mirror assembly. Failure to observe these warnings may result in personal injury from broken glass.

1. If equipped with turn signal, position and engage the turn signal retaining tabs (3, 4 & 5) to the mirror cap/mirror assembly. Refer to **LAMP, MIRROR, INSTALLATION** .

Fig. 251: Mirror Cap/Mirror Assembly & Bezel
Courtesy of CHRYSLER GROUP, LLC

2. Align and position the mirror housing bezel (2) to the mirror cap/mirror assembly (1). Push the mirror housing bezel into the mirror cap to engage the retaining tabs.

NOTE: An audible snap is normal.

Fig. 252: Mirror Housing, Fasteners & Retaining Tabs

3. Install the fasteners (2) securing the mirror housing bezel (1). Tighten the fasteners securely.

Fig. 253: Puddle Lamp & Connectors
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, connect and install the puddle lamp. Refer to **LAMP, MIRROR, INSTALLATION** .

Fig. 254: Mirror Glass & Electrical Harnesses
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, connect any accessory electrical harnesses (2, 3 & 4) to the mirror glass (1).

Fig. 255: Mirror Glass
Courtesy of CHRYSLER GROUP, LLC

6. Align and position the mirror glass (1) to the mirror motor.
7. Push the glass (1) forward until the glass case snaps are fully seated on motor.

NOTE: An audible snap is normal.

8. Connect the negative battery cable.

MOLDING, FRONT WHEEL OPENING

REMOVAL

REMOVAL - FRONT FASCIA

Fig. 256: Identifying Front Wheelhouse Splash Shield, Flare Molding & Clip Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
2. Release the clip fasteners and remove the flare molding (2).

REMOVAL - FRONT FENDER

Fig. 257: Identifying Wheel Flare, Fender & Protective Cover
Courtesy of CHRYSLER GROUP, LLC

1. If the wheel flare is to be reused
 - a. Remove two sided tape residue from the flare.
 - b. Clean back of the flare with Mopar® Super Kleen solvent, or equivalent.
 - c. Wipe dry with lint free cloth.
 - d. Apply new two sided adhesive tape to back of flare.
2. Clean the painted surface with Mopar® Super Kleen solvent, or equivalent. Wipe surface dry with lint free cloth.
3. Remove the protective cover (1) from the tape on back of the wheel flare (2).
4. Align the spring retainers on the wheel flare (2) to the appropriate slots on the fender (1) and with the use of hand pressure seat the clips fully.
5. Using a roller tool or equivalent, roll along the wheel flare where the two sided tape is applied with enough force to guarantee adhesion.

INSTALLATION

INSTALLATION - FRONT FASCIA

1. If the wheel flare is to be reused
 - a. Remove two sided tape residue from the flare.
 - b. Clean back of the flare with Mopar® Super Kleen solvent, or equivalent.
 - c. Wipe dry with lint free cloth.
 - d. Apply new two sided adhesive tape to back of flare.
2. Clean the painted surface with Mopar® Super Kleen solvent, or equivalent. Wipe surface dry with lint free cloth.
3. Remove the protective cover (1) from the tape on back of the wheel flare (2).

Fig. 260: Identifying Wheel Flare, Fender & Protective Cover
Courtesy of CHRYSLER GROUP, LLC

4. Align the spring retainers on the wheel flare (2) to the appropriate slots on the fender (1) and with the use of hand pressure seat the clips fully.
5. Using a roller tool or equivalent, roll along the wheel flare where the two sided tape is applied with enough force to guarantee adhesion.

MOLDING, REAR WHEEL OPENING

REMOVAL

REMOVAL

REMOVAL - REAR DOOR

Fig. 261: Identifying Molding & Wheel Flares
Courtesy of CHRYSLER GROUP, LLC

The wheel flares are set with two sided adhesive tape and plastic spring clips. The temperature in the work area and the vehicle should be at least 21° C (70° F) to avoid damaging the flare.

1. Use a plastic putty knife (1) or equivalent, along the edges of the flare (2) to cut the two sided tape.

NOTE: A small socket or pliers should be used to help release the spring retainers from the back side.

2. Use trim tool (special tool #C-4829A, Remover, Trim), or equivalent to release the spring retainers.
3. Remove the flare.
4. Remove adhesive tape residue from painted surface of vehicle. Use a 3M Scotch-Brite™ Molding Adhesive and Stripe Removal Discs, or equivalent, to clean adhesive residue from painted surfaces. The adhesive removal discs are available from automotive paint suppliers. Refer to instructions supplied with the discs for proper usage.

REMOVAL - QUARTER PANEL

Fig. 262: Identifying Quarter Panel & Flares

 - b. Clean back of the flare with Mopar® Super Kleen solvent, or equivalent.
 - c. Wipe dry with lint free cloth.
 - d. Apply new two sided adhesive tape to back of flare.
2. Clean the painted surface with Mopar® Super Kleen solvent, or equivalent. Wipe surface dry with lint free cloth.
3. Remove the protective cover (1) from the tape on back of the wheel flare (2).

2913006319

Fig. 267: Identifying Quarter Panel & Flares

Courtesy of CHRYSLER GROUP, LLC

4. Align the spring retainers on the wheel flare (1) to the appropriate slots on the quarter panel and with the use of hand pressure seat the clips fully.
5. Using a roller tool or equivalent, roll along the wheel flare where the two sided tape is applied with enough force to guarantee adhesion.

INSTALLATION - REAR FASCIA

Fig. 268: Identifying Flare & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Align the spring retainers on the wheel flare (2) to the appropriate slots on the fascia (1) and with the use of hand pressure seat the clips fully.
2. Install the wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.

PANEL, CLOSURE, RADIATOR

REMOVAL

REMOVAL

2313005310

Fig. 269: Identifying Radiator, Closure, Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable.
2. Remove the bolts securing the hood latch assembly and position the latch aside.
3. Remove the radiator assembly. Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .
4. Remove the charge air cooler, if equipped. Refer to **REMOVAL** .
5. Remove both headlamp assemblies. Refer to **UNIT, FRONT LAMP, REMOVAL** .
6. Remove the washer bottle. Refer to **RESERVOIR, WINDSHIELD WASHER, REMOVAL** .
7. Remove the coolant bottle. Refer to **BOTTLE, PRESSURIZED COOLANT, REMOVAL** .
8. Release the clips to remove the headlamp harness and position the harness aside.
9. Remove the wheel house splash shields. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** and **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL**.
10. Remove the shotgun bracket bolt (2) from both sides.
11. Remove the three bolts (1) on both side securing the radiator closure panel (2) to the fenders and upper body.
12. Remove the lower two lower bolts (1) on both sides that secure the closure panel (2) to the front of the vehicle body.
13. Carefully remove the closure making sure the paint on the front edge of the fenders is protected from damage.

INSTALLATION

INSTALLATION

2313005310

Fig. 270: Identifying Radiator, Closure, Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Carefully position the closure assembly up onto the front end sheet metal mounting and avoid damaging the front edges of the fenders.
2. Loosely install the two lower bolts on both sides but do not tighten at this time.
3. Install the three upper bolts on both sides, and tighten to 16 N.m (12 ft. lbs.).
4. Tighten the four lower bolts to 26 N.m (19 ft. lbs.).
5. Install the shotgun bracket bolts from inside the wheel wells and tighten to 16 N.m (12 ft. lbs.).
6. Position wheel liners and install the push-pin type retainers as needed. Install the front bumper beam assembly. Refer to **REINFORCEMENT, BUMPER, FRONT, INSTALLATION**.
7. Route the headlamp harness and secure as needed.
8. Position the coolant bottle, install the three bolts and secure. Tighten the bolts to 10 N.m (89 in. lbs.).
9. Install both the left and right headlamp assemblies. Refer to **UNIT, FRONT LAMP, INSTALLATION**.
10. Position the washer bottle, install the three fasteners and secure. Tighten the bolts to 7 N.m (60 in. lbs.).
11. Position the radiator back and install. Refer to **RADIATOR, ENGINE COOLING, INSTALLATION**.
12. Install the charge air cooler, if equipped. Refer to **INSTALLATION**.
13. Install the hood latch assembly and tighten the bolts to 9 N.m (80 in lbs).
14. Install the grille. Refer to **GRILLE, INSTALLATION**.
15. Connect the negative battery cable.

PANEL, PLENUM

REMOVAL**REMOVAL****Fig. 271: Cowl Panel & Push Pins****Courtesy of CHRYSLER GROUP, LLC**

1. Release hood latch and open hood.
2. Remove the clips attaching the cowl bulb seal to the cowl panel.
3. Remove the cowl panel end caps by pulling up at the end cap to cowl panel joint and then pulling the end cap out of the fender.
4. Remove the driver's side wiper cover by pulling up on the cover.
5. Remove windshield wiper arms. Refer to **ARM, WIPER, REMOVAL** .
6. With the use of (special tool #C-4755, Trim Stick) or equivalent, remove the seven push pins (1) attaching cowl panel (2) to the cowl plenum extension.

231368283

Fig. 272: Cowl Panel & Cowl Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: It will be necessary to use care when removing the cowl screen from the retainer on the windshield. If the retainer on the windshield is broken/damaged the windshield will require replacement.

7. Starting at the driver's side pull up on the back edge of the cowl panel (1) and work cross car to release the tab from the backside of the cowl panel (1) from the groove in the lower windshield channel (2).
8. Remove cowl cover (1) from vehicle.

Fig. 273: Hood, Plenum Panel & Fasteners

NOTE: Right side shown, left side typical.

1. Align the plenum panel to the vehicle.

231370995

Fig. 277: Plenum Panel, Alignment Block & Fastener
Courtesy of CHRYSLER GROUP, LLC

2. Insert the plenum panel alignment blocks (2) into the appropriate holes in the cowl plenum lower panel on the right and left sides.
3. Install fasteners (3) on the right and left sides of the plenum panel.
4. Tighten the fasteners (3) securely.

231370994

Fig. 278: Hood, Plenum Panel & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Shown with hood (1) closed to show fasteners (3) locations. Access the fasteners (3) with the hood (1) open.

5. Install the three fasteners (3) into the plenum panel (2).
6. Tighten the fasteners (3) securely.

231368283

Fig. 279: Cowl Panel & Cowl Cover

Courtesy of CHRYSLER GROUP, LLC

7. Position cowl panel cover (2) to vehicle.
8. Starting in the center of the back edge of the cowl panel (1) and working out to the edges, align the tab on the backside of the cowl panel (1) into the groove in the lower windshield channel (2).

Fig. 280: Cowl Panel & Push Pins
Courtesy of CHRYSLER GROUP, LLC

9. Using hand pressure fully insert cowl panel tab (1) into windshield insert (2).
10. Install push pins (1) attaching cowl cover to cowl.
11. Install windshield wiper arms. Refer to **ARM, WIPER, INSTALLATION** .
12. Align the clips on the driver's side wiper cover and engage clips with hand pressure.
13. Align the clips on the right and left cowl panel end caps and engage with hand pressure.
14. Install the clips attaching cowl plenum under hood to cowl bulb seal to cowl panel.

NAMEPLATE

REAR NAMEPLATES

1 - LIMITED, SPORT, LONGITUDE, NORTH, TRAIL HAWK
2 - JEEP
3 - 4x4, ECO DIESEL

1. Remove carrier from adhesive tape on back of emblem.
2. Position emblem properly on body.
3. Press emblem firmly to body with palm of hand.
4. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

RACK, LUGGAGE

STANDARD PROCEDURE

RIVET NUT PROCEDURE

CAUTION: Failure to follow these recommendations could result in damage to the vehicle

Rivet nuts are used on the roof to mount the roof rack. Rivet nuts are used for parts installations, when access to the back mounting area is limited or boxed in. It is important to achieve a full seat on the first attempt due to the lack of accessibility on the back side of the rivet nut. Poor seating of the rivet nut will result in part failure, loose parts and possible water leaks.

The use of a commercially available threaded insert tool will be necessary. There are several styles and types readily available. Examples of multi fit choices are the Matco® 203F and the Snap On® HP650M, or you may select one with equivalent capabilities. If a multi fit option is not chosen, it must be capable of a thread size of **M6 X 1.00** . Follow the tool manufacturer recommended directions for proper installation.

REMOVAL

REMOVAL

2313012444

Fig. 285: Identifying Fastener Covers & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: If any of the four tabs are broken during removal, the cover must be replaced.

1. Using a small flat bladed tool or equivalent, remove the two fastener covers (1).
2. Remove the two fasteners (2) at the front and rear of the rail.

Fig. 286: Removing Roof Rack Rail
Courtesy of CHRYSLER GROUP, LLC

3. Slide the roof rack rail (1) forward and remove.

INSTALLATION

INSTALLATION

Fig. 287: Identifying Roof Rack Rail & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Place roof rack rail (1) just forward of the rivnut fasteners (2) and slide rearward until fully engaged.

Fig. 288: Identifying Fastener Covers & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the four fasteners (2) and tighten to 6 N.m (53 in. lbs.)
3. Install the fastener covers (1) and seat fully.

NOTE: Make sure the two retention clips snap fully below the rail. Cover should be flush to the top of the rail.

SHIELD, SPLASH, FRONT WHEELHOUSE

REMOVAL

REMOVAL

Fig. 289: Identifying Front Wheelhouse Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheel from the side of the vehicle being serviced. Refer to **REMOVAL** .
3. Remove the five push pins (3) from the rear area of the splash shield (2).

Fig. 290: Identifying Inner Wheel Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the push pin fasteners (2) from the front of the splash shield (1).
5. Remove the fasteners (3) securing the splash shield (1) to the fascia.
6. Release the outboard edge of the splash shield (1) from the fender flange.

7. Remove the splash shield (1) from the vehicle.

INSTALLATION**INSTALLATION**

Fig. 291: Identifying Front Wheelhouse Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the front wheelhouse splash shield (2) into the front fender well.
2. Install the five push pins (3) into the rear area of the splash shield.

Fig. 292: Identifying Inner Wheel Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Install the push pin fasteners (2) into the front of the splash shield (1).
4. Install the fasteners (3) securing the shield to the fascia and tighten securely.
5. Install the front wheel to the side of the vehicle being serviced. Refer to **INSTALLATION**.
6. Lower the vehicle.

SHIELD, SPLASH, REAR WHEELHOUSE

REMOVAL

REMOVAL

Fig. 293: Identifying Rear Wheelhouse Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the wheel from the side of the vehicle being serviced. Refer to **REMOVAL**.
3. Remove the push pins (3) from the splash shield (2).
4. Remove the fasteners (1) securing the splash shield (2) to the fascia and wheelhouse.
5. Release the outboard edge of the splash shield (2) from the body side flange.
6. Remove the splash shield (2) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 294: Identifying Rear Wheelhouse Splash Shield & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Position the rear wheelhouse splash shield (2) into the rear body side opening.
2. Install the fasteners (1) securing the shield to the fascia and wheelhouse.
3. Tighten the fasteners securely
4. Install the push pin fasteners (3) into the splash shield (1).
5. Install the front wheel to the side of the vehicle being serviced. Refer to **INSTALLATION** .
6. Lower the vehicle.

HOUSING, FUEL FILL

REMOVAL

REMOVAL

130569171

Fig. 295: Splash Shield, Push Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the fuel filler door.
2. Disconnect and isolate the negative battery cable.
3. Remove right rear wheel. Refer to **REMOVAL** .
4. Remove right rear wheelhouse splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL**.

231370985

Fig. 296: Cable Grommet & Actuator Wiring Connector

5. From within the wheelhouse, disconnect actuator wiring connector (1).

082370948

Fig. 297: Lock Tabs & Fuel Door Actuator
Courtesy of CHRYSLER GROUP, LLC

6. With the use of a small flat bladed tool or equivalent, gently pry the two tabs (1) on the outside of the actuator (2) to release the top portion from the fuel filler housing.
7. Move the top of the actuator (1) forward.
8. Lift up slightly to release the bottom of the actuator from the fuel filler housing.

082370949

Fig. 298: Actuator**Courtesy of CHRYSLER GROUP, LLC**

9. Rotate and angle the actuator (1) so that it will fit through the hole in the fuel filler housing.

231370988

Fig. 299: Gas Cap, Fuel Door & Gas Cap Tether
Courtesy of CHRYSLER GROUP, LLC

10. Remove fuel fill door (2). Refer to **DOOR, FUEL FILL, REMOVAL**.
11. With the use of a (special tool #C-4829A, Remover, Trim) remove the gas cap tether (3) from the fuel filler housing.

231370987

Fig. 300: Fuel Filler Housing & Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

12. On the back of the fuel filler housing, use hand pressure to release the rear lower mounting tab (2) and the

rear upper mounting tab located above and move the rear lower portion of the fuel filler housing (1) slightly outward.

13. Press in the rear upper tab to release on the fuel filler housing.

231370989

Fig. 301: Fuel Filler Housing
Courtesy of CHRYSLER GROUP, LLC

14. With the rear portion of the fuel filler housing (1) released from the vehicle, press the upper and lower front tabs on the back of the fuel filler housing.
15. Move the rear portion of the fuel filler out further to get the seal over the fuel filler tube.
16. Remove the fuel filler housing from the vehicle.

INSTALLATION

INSTALLATION

231370989

Fig. 302: Fuel Filler Housing**Courtesy of CHRYSLER GROUP, LLC**

1. Position the front portion of the fuel filler housing (1) behind the quarter panel.
2. Insert fuel filler tube through center seal of the fuel filler housing (1).
3. Push inward to seat the four mounting tabs located on the back of the fuel filler housing.
4. Verify the four tabs have seated fully.

082370949

Fig. 303: Actuator

Courtesy of CHRYSLER GROUP, LLC

5. Angle the fuel door latch actuator (1) so that it fits through the hole in the fuel filler housing and slide the actuator into the fuel filler housing pocket.

082370948

Fig. 304: Lock Tabs & Fuel Door Actuator

Courtesy of CHRYSLER GROUP, LLC

6. Insert the bottom of the fuel door latch actuator (2) into the notch on the bottom of the fuel filler housing.
7. Push the upper portion of the actuator back to engage the two upper tabs (1).

231370988

Fig. 305: Gas Cap, Fuel Door & Gas Cap Tether
Courtesy of CHRYSLER GROUP, LLC

8. Install the gas cap (1).
9. Align the gas cap tether retaining clip (3) into the appropriate hole in the fuel filler housing and insert fully.
10. Install the fuel filler door (2). Refer to **DOOR, FUEL FILL, INSTALLATION**.

231370985

Fig. 306: Cable Grommet & Actuator Wiring Connector
 Courtesy of CHRYSLER GROUP, LLC

11. From within the wheelhouse, connect the wiring connector to the actuator (1).
12. Inspect to be certain the manual release cable grommet (2) is seated properly.
13. If not seated properly, insert into wheel house fully.

130569171

Fig. 307: Splash Shield, Push Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Install the rear wheelhouse splash shield (1). Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.
15. Install the wheel. Refer to **INSTALLATION**.
16. Connect the battery negative cable.

HOOD

CABLE, HOOD RELEASE

REMOVAL

REMOVAL

Fig. 308: Upper Close Out Panel Cover Components

1. Remove the push pins and remove the radiator closeout panel.

Fig. 309: Removing Hood Release Handle
Courtesy of CHRYSLER GROUP, LLC

2. Remove the hood release handle by pushing up on the release (1) to disengage and then pulling rearward on the handle.

2314004730

Fig. 310: Identifying Hood Latch Cable & Retaining Clips/Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Disengage the cable (2) from the hood latch (3).

2314004731

Fig. 311: Identifying Grommet & Cable
Courtesy of CHRYSLER GROUP, LLC

4. Release retaining clips/tabs attaching the hood release cable (1) to the left inner frame rail.

Fig. 312: Hood Release Cable Inside Vehicle
Courtesy of CHRYSLER GROUP, LLC

5. Disengage rubber grommet at lower dash panel.
6. From the vehicle interior pull the cable assembly (1) rearward.
7. Remove the hood release cable (1) from vehicle.

INSTALLATION

INSTALLATION

Fig. 313: Hood Release Cable Inside Vehicle
Courtesy of CHRYSLER GROUP, LLC

1. Route the hood release cable (1) through the hole located in the lower dash panel.
2. Engage the rubber grommet into the lower dash panel.

2314004731

Fig. 314: Identifying Grommet & Cable
Courtesy of CHRYSLER GROUP, LLC

3. Route the hood latch cable (1) along the inner frame rail.
4. Engage the hood release cable retaining clips/tabs along the inner frame rail.

2314004730

Fig. 315: Identifying Hood Latch Cable & Retaining Clips/Tabs
Courtesy of CHRYSLER GROUP, LLC

5. Route the hood latch cable under the headlamp, along the side of the front end module and across the upper radiator support towards the hood latch.

6. Engage the cable (2) to the hood latch (3).

2314004729

Fig. 316: Identifying Steering Column Opening Cover/Knee Blocker Trim
Courtesy of CHRYSLER GROUP, LLC

7. Install the hood release handle (2) to the steering column opening cover/knee blocker trim (1) by aligning, pushing in to engage and then pushing upward on the handle.

2313008602

Fig. 317: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

8. Install the radiator closeout panel (1) and install the push pin fasteners.

HINGE, HOOD

REMOVAL

REMOVAL

Fig. 318: Hood Hinge & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Support the hood on the side that requires hinge replacement and disconnect the support cylinder from the upper hinge. Refer to **PROP, GAS, REMOVAL**.
2. Mark the hinge (1) attachment locations at the hood with a grease pencil or other suitable device to aid installation.
3. Remove the cowl cover. Refer to **COVER, COWL PANEL, REMOVAL**.
4. Remove the bolts (2) attaching the hood to the hinge (1).

Fig. 319: Hood Hinge & Bolts At Load Beam

Courtesy of CHRYSLER GROUP, LLC

5. Mark the hinge (2) attachment locations at the load beam inner with a grease pencil or other suitable device to aid installation.
6. Remove the bolts (1) attaching the hood hinge (2) to the load beam inner and remove the hinge from vehicle.

INSTALLATION**INSTALLATION**

Fig. 320: Hood Hinge & Bolts At Load Beam
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, paint the new hinge (2) before installation.
2. Using the reference marks made in removal, align and position the hood hinge (2) on the vehicle.
3. Install the bolts (2) to attach hood hinge to load beam inner. Tighten the bolts to 9 N.m (7 ft. lbs.) torque.

Fig. 321: Hood Hinge & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Align the hood with the reference marks made during removal.
5. Install the bolts (2, 3) to attach the hood to the hinge.
6. Align all marks and secure bolts.
7. Tighten the bolts to 21 N.m (16 ft. lbs.) torque.
8. Install the support cylinder back onto the hinge. Refer to **PROP, GAS, INSTALLATION**.
9. If necessary, adjust the hood hinge positions and the hood adjuster bumpers to achieve proper spacing and operation. Refer to **GAP AND FLUSH, SPECIFICATIONS**. Shims can be added or removed under hood hinge to achieve proper hood height.
10. Install cowl cover. Refer to **COVER, COWL PANEL, INSTALLATION**.
11. Verify hood latch operation. Adjust as necessary.

HOOD

REMOVAL

REMOVAL

Fig. 322: Hood Hinge & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right hand shown, left hand similar.

1. Open the hood.
2. Mark the outline of the hinges (1) on the inside of hood to aid installation.
3. Disconnect the windshield washer hose from hood.
4. Disconnect the under hood lamp wire connector to the engine compartment wire harness if equipped.
5. Remove the top bolts (3) attaching the hood to the hinge (1) and loosen the bottom bolts (2) until they can be removed by hand.
6. With assistance from a helper at the opposite side of the vehicle to support the hood, remove the bottom bolts (2) attaching the hood to hinge.
7. Remove the hood from the vehicle.
8. Transfer parts as necessary.

INSTALLATION

INSTALLATION

Fig. 323: Hood Hinge & Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.

NOTE: Right hand shown, left hand similar.

1. With assistance from a helper, place the hood in position on vehicle.
2. Align the hood with the reference mark made during removal.
3. Install the bottom bolts (2) securing the hood to the hinge. Tighten the bolts finger tight.
4. Install the top bolts (3) securing the hood to the hinge. Tighten the bolts finger tight.
5. Position bolts at outline marks and tighten bolts (2, 3) to 21 N.m (16 ft. lbs.).
6. Connect under hood lamp wire connector to engine compartment wire harness, if equipped.
7. Route and connect windshield washer hose to hood.
8. Verify proper hood latch operation and alignment.
9. If necessary, adjust the hood hinge positions and the hood adjuster bumpers to achieve proper spacing and operation. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

LATCH, HOOD

REMOVAL

REMOVAL

Fig. 324: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

1. Remove the push pins and remove the radiator closeout panel.

Fig. 325: Identifying Hood Latch & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. If equipped, disconnect the hood ajar switch harness (1).
3. Mark an outline of the hood latch on radiator support crossmember with a grease pencil or other suitable device to aid installation.
4. Remove the fasteners (2) attaching the hood latch to the upper radiator support crossmember.

2314010411

Fig. 326: Identifying Hood Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

5. Position the hood latch away from the from vehicle.
6. Disconnect the release cable (1) from the latch.
7. Remove the latch.

INSTALLATION

INSTALLATION

2314010411

Fig. 327: Identifying Hood Latch Release Cable
Courtesy of CHRYSLER GROUP, LLC

1. Connect the release cable (1) into the hood latch.

Fig. 328: Identifying Hood Latch & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Position the latch on radiator support crossmember and loosely install the fasteners (2).
3. Using the reference marks made during removal, align the hood latch.
4. Tighten the fasteners to 9 N.m (80 in. lbs.).
5. If equipped, connect the electrical connector (1).
6. Close the hood to verify operation. Adjust as necessary.

Fig. 329: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

7. Install the radiator closeout panel (1) and install the push pin fasteners.

LATCH, SAFETY

REMOVAL

REMOVAL

Fig. 330: Identifying Safety Latch, Handle & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood squeeze the tabs (3) together and separate the handle (2) from the hood.

Fig. 331: Identifying Safety Latch, Nuts & Cable
Courtesy of CHRYSLER GROUP, LLC

2. Remove the nuts (3) and remove the safety latch (1).

3. Disconnect the cable (2).

INSTALLATION

INSTALLATION

Fig. 332: Identifying Safety Latch, Nuts & Cable
Courtesy of CHRYSLER GROUP, LLC

1. Connect the release cable (2).
2. Install the safety latch (1) and install the nuts (3)

Fig. 333: Identifying Safety Latch, Handle & Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Position the handle assembly (2) onto the hood and seat the clips (3) fully.

PROP, GAS

REMOVAL

REMOVAL

80170308

Fig. 334: Support Cylinder-Ball Socket-Typical
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use a support to hold the hood while working on removing the hood strut.

1. Open and support the hood.

CAUTION: Do not pull on the hood support cylinders at the middle of the support cylinder during removal. Failure to follow this caution can result in damage to the hood support cylinders.

2. Using a small flat bladed tool, or equivalent (3), release the retaining clip (2) at each end of the support cylinder while carefully pulling the ball socket (1) away from the ball stud (4).

Fig. 335: Support Cylinder Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

- 1 - RETAINING CLIP
- 2 - BALL SOCKET
- 3 - BALL STUD

NOTE: Lift the clips (1) only enough to release the ball studs (3).

Fig. 336: Identifying Hood Support Cylinder & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the hood support cylinder (2) from the hood ball stud (1) and the ball stud on the strut tower (4).

INSTALLATION

INSTALLATION

Fig. 337: Identifying Hood Support Cylinder & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the upper ball stud (1) onto the hood and the lower ball stud (4) onto the strut tower. Install the ball studs securely.

CAUTION: Do not push on the hood support cylinders at the middle of the support cylinder during installation. Failure to follow this caution can result in damage to the hood support cylinders.

NOTE: Install the hood support cylinders with the cylinder end connected to the hood as shown.

NOTE: If required, only release each retaining clip enough to install the ball socket onto the ball stud.

2. Install the hood support cylinder (2) over the upper (1) and lower ball studs (4) and fully engage the retaining clips.

STRIKER, HOOD

REMOVAL

REMOVAL

Fig. 338: Identifying Hood, Striker & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Using a china marker or equivalent, mark the outline of the striker (1) to assist with installation.
3. Remove the fasteners (3) securing the striker (2) to the hood.
4. Remove the striker (2) from the hood.

INSTALLATION**INSTALLATION**

Fig. 339: Identifying Hood, Striker & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Using reference marks made previously, align the striker (2) with holes in hood.
2. Install the fasteners (3) securing the striker (2). Tighten the fasteners to 21 N.m (16 ft. lbs.)
3. Verify fit of the hood striker (1) and operation of the latch. Adjust as necessary.

INSTRUMENT PANEL

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use **ONLY** the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or

combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

BEZEL, INSTRUMENT CLUSTER

REMOVAL

REMOVAL

Fig. 340: Identifying Steering Column Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.

NOTE: Passenger side end cap shown (2), driver side similar.

4. Install the end cap (2) and seat the retaining clips fully.

GLOVE BOX, INSTRUMENT PANEL

REMOVAL

REMOVAL

Fig. 360: Identifying Glove Box Doors & Support Arms
Courtesy of CHRYSLER GROUP, LLC

1. Open the glove box door and release the support arms (2) by pressing down and pulling out of the box assembly.
2. Release the damper arm (1) and remove the door.

Fig. 361: Identifying Front Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the front fasteners (1) and remove the rear fastener from under the IP and at the front of the box.

Fig. 362: Identifying Box
Courtesy of CHRYSLER GROUP, LLC

4. Release the side retaining clips and remove the box (1) from the instrument panel.

INSTALLATION

INSTALLATION

Fig. 363: Identifying Box
Courtesy of CHRYSLER GROUP, LLC

1. Position the glove box assembly (1) back into the instrument panel and seat the retaining clips fully.

Fig. 364: Identifying Front Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the screws (1) at the front of the box and install the screw at the front of the box from under the instrument panel.

Fig. 365: Identifying Glove Box Doors & Support Arms
Courtesy of CHRYSLER GROUP, LLC

3. Install the glove box door (3) hinges onto the instrument panel and connect the damper arm (1).
4. Insert the support arms (2) into the box slots and check door for operation.

GRILLE, DEFROSTER

REMOVAL

REMOVAL

2315008558

Fig. 366: Identifying Speaker Covers

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

1. Disconnect and isolate the negative battery cable.
2. Remove the a-pillar trim (3). Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.

Fig. 371: Identifying Instrument Panel & End Cap
Courtesy of CHRYSLER GROUP, LLC

3. Using a (special tool #C-4755, Trim Stick) or equivalent, remove the end caps (2) from the instrument panel (1). Refer to **CAP, INSTRUMENT PANEL END, REMOVAL**.

Fig. 372: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or equivalent, release the push pin fasteners (1) and the retaining tabs (2) and remove closeout panel (3) located between the A-pillar trim and the front scuff plate.

Fig. 373: Removing Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

5. Using a trim stick or equivalent, disengage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.
6. Remove the front door sill scuff panel (1).

Fig. 374: Dash Side & Connector
Courtesy of CHRYSLER GROUP, LLC

7. Unclip the harness and connector (2) from the dash side (1) on both sides of the vehicle.

8. Disconnect the a-pillar wiring connectors.
9. Repeat on the opposite side of the vehicle.

2315008558

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

1. Position the dash pad (1) into the vehicle.

2. Connect sun sensor and center stack wiring retainers into the dash pad (1).
3. Position the dash pad onto the dash carrier fully.

Fig. 395: Identifying HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. From under the instrument panel install the fasteners (1) securing the duct work to the HVAC housing and tighten securely.

Fig. 396: Identifying Trim Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the fasteners (1) in the cluster opening and the fasteners (2) at the center opening.

Fig. 397: Identifying Trim Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the fasteners (1).
7. Install the trim panel (2) and trim fasteners (3).

Fig. 398: Identifying Trim Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Install the fasteners (1).

2315010025

Fig. 399: Identifying Lower Instrument Panel Surround Panel
Courtesy of CHRYSLER GROUP, LLC

9. Position the lower surround panel (1) back into place and seat the retaining clips fully.

2315011603

Fig. 400: Identifying Lower Surround Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install the lower surround panel fasteners (1).

Fig. 401: Identifying Lower Surround Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Install the lower surround panel fasteners (1).

Fig. 402: Identifying Harness
Courtesy of CHRYSLER GROUP, LLC

12. Position the harness (1), if equipped, back and secure fully.

Fig. 403: Identifying Upper Storage Bin & Instrument Panel Top Cover
Courtesy of CHRYSLER GROUP, LLC

13. Position the storage bin (1) back into place onto the instrument panel top cover (2) and seat fully.

Fig. 404: Identifying Center Speaker Cover & Screws
Courtesy of CHRYSLER GROUP, LLC

14. Install the fasteners (2).
15. Install the speaker, if equipped.
16. Install center speaker cover (1) and seat fully.

1020006267

Fig. 405: Removing/Installing Passenger AirBag (PAB)
Courtesy of CHRYSLER GROUP, LLC

17. Reach through and above the glove box opening (4) of the instrument panel to reconnect the instrument panel wire harness connector to the PAB pigtail wire harness connector (1). Be certain that the connector is fully engaged and locked.
18. Still reaching through the glove box opening, install and tighten the two screws (5) that secure the PAB (2) lower mounting bracket to the instrument panel structural support (3). Tighten the screws to 9 N.m (80 in. lbs.).

2315008644

Fig. 406: Identifying Radio Support Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Install the radio support bracket (1) and install the bolts (2).

2315009466

Fig. 407: Identifying Center Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

20. Install the radio module. Refer to **RADIO, INSTALLATION** .
21. Connect the electrical connectors and install the center bezel (2).
22. Seat the clips (1) fully.
23. Install the fasteners (3).

2315008554

Fig. 408: Identifying HVAC Control Head & Clips
Courtesy of CHRYSLER GROUP, LLC

24. Connect the HVAC control head electrical connectors and install the control head (2).
25. Seat the four control head fastener clips (1) fully.

231568798

Fig. 409: Dash Wiring Harnesses & Coaxial Connector
Courtesy of CHRYSLER GROUP, LLC

26. Located under the passenger side of dash, connect the body to dash wiring harnesses (1).
27. Connect the coaxial connectors (2), if so equipped.

231669158

Fig. 410: Hush Panel & Push Pin Fasteners
Courtesy of CHRYSLER GROUP, LLC

28. Install the silencer panel (1) and install the push pin fasteners (2).

2315008592

Fig. 411: Identifying Defroster Grille & Sun Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

29. Install the defroster grille (1). Refer to **GRILLE, DEFROSTER, INSTALLATION**.
30. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.
31. Install the steering column. Refer to **COLUMN, INSTALLATION**.

32. Install the instrument cluster. Refer to **INSTALLATION** .
33. Install the glove box assembly. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

231568798

Fig. 412: Dash Wiring Harnesses & Coaxial Connector
Courtesy of CHRYSLER GROUP, LLC

34. Located under the passenger side of dash, connect the body to dash wiring harnesses (1).
35. Connect the coaxial connectors (2), if so equipped.

Fig. 413: Dash Side & Connector
Courtesy of CHRYSLER GROUP, LLC

36. Connect the a-pillar wiring connectors.
37. Fasten the harness and connector (2) into the dash side (1) on both sides of the vehicle.

Fig. 414: Installing Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

38. Position the front door sill scuff panel (1).

39. Hand tap to engage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.

Fig. 415: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

40. Position the closeout trim panel (3) located between the A-pillar trim and the front scuff plate.
41. Seat the retaining clips (1 and 2) fully.

Fig. 416: Identifying Instrument Panel & End Cap
Courtesy of CHRYSLER GROUP, LLC

42. Install the end caps (1). Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION**.

2316010415

Fig. 417: Identifying A-Pillar Trim, Tab & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

43. Install the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
44. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

PANEL, INSTRUMENT

REMOVAL

REMOVAL

241070008

Fig. 418: Refrigerant Lines, Heater Core Hoses & Fastener
 Courtesy of CHRYSLER GROUP, LLC

1. Partially drain the cooling system. Refer to **STANDARD PROCEDURE** .
2. Evacuate the air conditioning system. Refer to **STANDARD PROCEDURE** .
3. Disconnect the heater core hoses (2) and (3) to the HVAC housing. Refer to **CORE, HEATER, REMOVAL** .
4. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.
5. Remove fastener (4) and disconnect the air conditioning refrigerant lines (1) and (5) from the HVAC housing (2).
6. Install plugs in, or tape over the opened refrigerant lines fitting.
7. Remove the front doors (1). Refer to **DOOR, REMOVAL**.
8. Remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.
9. Remove the shifter assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .

2315008634

Fig. 419: Identifying HVAC Floor Ducts, Bracket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Remove the bracket (2) and remove the HVAC floor ducts (1). Refer to **DUCT, FLOOR DISTRIBUTION, REMOVAL** .

2315008554

Fig. 420: Identifying HVAC Control Head & Clips
Courtesy of CHRYSLER GROUP, LLC

11. Using a (special tool #C-4755, Trim Stick) or equivalent, separate the four clips (1) and remove the HVAC control head (2).
12. Disconnect the control head electrical connector.

Fig. 421: Identifying Center Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Remove the center bezel (2). Refer to **BEZEL, INSTRUMENT PANEL, CENTER, REMOVAL**.

Fig. 422: Identifying Radio Support Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Remove the bolts and remove the radio support bracket.

Fig. 423: Identifying Instrument Panel & End Cap
Courtesy of CHRYSLER GROUP, LLC

15. Using a trim stick or equivalent, remove the end caps (2) from the instrument panel (1). Refer to **CAP, INSTRUMENT PANEL END, REMOVAL**.

Fig. 424: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

16. Using a trim stick or equivalent, release the push pin fasteners (1) and the retaining tabs (2) and remove closeout panel (3) located between the A-pillar trim and the front scuff plate.

Fig. 425: Removing Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

17. Using a trim stick or equivalent, disengage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.
18. Remove the front door sill scuff panel (1).

Fig. 426: Identifying Speaker Covers
Courtesy of CHRYSLER GROUP, LLC

19. Using a trim stick or equivalent, remove the speaker covers (1).

Fig. 427: Identifying Defroster Grille & Sun Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

20. Remove defroster grill. Refer to **GRILLE, DEFROSTER, REMOVAL**.

Fig. 428: Dash Side & Connector
Courtesy of CHRYSLER GROUP, LLC

21. Remove the a-pillar trim. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
22. Unclip the harness and connector (2) from the dash side (1).
23. Disconnect the A-pillar wiring connector (1).

24. Remove lower dash silencer panels. Refer to **PANEL, SILENCER, LOWER, REMOVAL**.

231568800

Fig. 429: Steering Column, Gap Hider & Fasteners
Courtesy of CHRYSLER GROUP, LLC

25. Remove steering column opening closeout. Refer to **PANEL, SILENCER, LOWER, REMOVAL**.
26. Remove the steering column gap hider (2) fasteners (3).
27. Remove the steering column (1). Refer to **COLUMN, REMOVAL** .

231568802

Fig. 430: Floor Pan Bracket Fasteners, Ground Wiring, Drain Tube & Clamp
Courtesy of CHRYSLER GROUP, LLC

28. Remove the lower instrument panel to floor pan bracket fasteners (1).
29. Unfasten the ground wiring to the floor (3).
30. Repeat on the opposite side.
31. With the use of pliers or equivalent disconnect the air conditioning drain tube clamp (4).
32. Remove the drain tube from the floor valve.
33. Remove the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL**.

231568798

Fig. 431: Dash Wiring Harnesses & Coaxial Connector
Courtesy of CHRYSLER GROUP, LLC

34. From under the passenger side of dash, disconnect the body to dash wiring harnesses (1).
35. Disconnect the coaxial connectors (2), if so equipped.

Fig. 432: Identifying Tape On Instrument Panel & Outside Of Windshield
Courtesy of CHRYSLER GROUP, LLC

36. Place tape along the top of the instrument panel (1) and onto the outside of the windshield (3) as indicated and mark with felt tip pen or equivalent (2), to aid during the installation.

Fig. 433: Identifying Tape On Door Sill Flanges
Courtesy of CHRYSLER GROUP, LLC

37. Place tape along the door sill flanges (1) as indicated and mark with felt tip pen or equivalent (2), to aid during the installation.

Fig. 434: Identifying Pocket Ruler & Distance Measurements
Courtesy of CHRYSLER GROUP, LLC

38. Using a pocket ruler (4) or equivalent, measure and record the distance (3) from the door sill flanges (1) to the instrument panel support beam (2) on both sides of the instrument panel to aid installation.

Fig. 435: Identifying Lower Plenum Fasteners
Courtesy of CHRYSLER GROUP, LLC

39. Remove the wiper arms. Refer to **ARM, WIPER, REMOVAL** .
40. Remove the cowl vent panel. Refer to **COVER, COWL PANEL, REMOVAL**.
41. Remove the wiper linkage. Refer to **LINKAGE, WIPER ARM, REMOVAL** .
42. Remove the dash carrier to the lower plenum fasteners (1).

231568797

Fig. 436: Hinge Pillar Fastener

Courtesy of CHRYSLER GROUP, LLC

NOTE: Use a 9 mm deep well socket with a full cut to remove the dash carrier side bolts (1). The carrier bolts design will not allow a partial cut socket to access.

Fig. 437: Identifying Dash Carrier Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Removal of the dash will require the use of three people. One on each end and one in the middle.

43. Place assistant at the center of the dash to help support and assist with removal.
44. With the use of a small flat bladed tool or equivalent, remove the fastener covers located on the hinge pillar (1) of both sides of the vehicle.
45. Remove the four dash carrier bolts (2), two on each side.
46. Remove the dash from vehicle.

INSTALLATION

INSTALLATION

2315008648

Fig. 438: Identifying Mounting Bushings
Courtesy of CHRYSLER GROUP, LLC

NOTE: Installation of the dash will require the use of three people. One on each end and one in the middle.

1. Verify that the six mounting bushings (1) are fully retracted and rotate freely.

Fig. 439: Identifying Tape On Instrument Panel & Outside Of Windshield
Courtesy of CHRYSLER GROUP, LLC

2. Place the instrument panel into the vehicle
3. Line up the marks on the tape made during removal to aid installation.

231568797

Fig. 440: Hinge Pillar Fastener
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use a 9 mm deep well socket with a full cut to install the dash carrier hinge pillar fasteners. The carrier bolts design will not allow a partial cut socket to access.

2315008645

Fig. 441: Identifying Round Bladed Tool & Upper Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Place round bladed tools (3) or equivalent, into the lower dash mounting holes located in the hinge pillar on both sides of the vehicle.
5. Start the upper fastener (1) on both sides of the vehicle.

2315008643

Fig. 442: Identifying HVAC Housing Seal
Courtesy of CHRYSLER GROUP, LLC

6. Have the center person push the dash forward to load the HVAC housing seal (1) against the vehicle steel dash panel. Continue to load the seal until the four dash carrier hinge pillar fasteners and dash carrier to lower plenum fastener has been installed and torqued to specifications.

2315008649

Fig. 443: Identifying Upper Dash Carrier To Hinge Pillar Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Verify that proper alignment is still being maintained. Adjust as necessary.
8. Install the upper dash carrier to hinge pillar fasteners (1) and tighten to 27 N.m (20 ft lbs).
9. Remove the alignment punch or equivalent, from both sides.

NOTE: It will be necessary to wait at least five minutes and recheck the torque on the side support bolts.

10. Install the lower dash carrier hinge pillar fasteners (1) and tighten to 27 N.m (20 ft lbs).

Fig. 444: Identifying Pocket Ruler & Distance Measurements
Courtesy of CHRYSLER GROUP, LLC

11. Using a pocket ruler (4) or equivalent, verify that the side to side instrument panel measurements (3) are the same as during removal.
12. If necessary, loosen the instrument panel side fasteners and repeat steps 6 through 10 until correct instrument panel positioning is maintained.

NOTE: If the instrument panel position is incorrect it may interfere with proper door operation.

2315006593

Fig. 445: Identifying Lower Plenum Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Install the instrument panel to plenum fasteners (1) and tighten to 20 N.m (15 ft lbs).
14. The center assistant may now stop loading the dash forward.
15. Install the access plug covers into the dash carrier to hinge pillar fastener holes.
16. Install the wiper linkage. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .
17. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION**.
18. Install the wiper arms. Refer to **ARM, WIPER, INSTALLATION** .

231568798

Fig. 446: Dash Wiring Harnesses & Coaxial Connector

Courtesy of CHRYSLER GROUP, LLC

19. From under the passenger side of the dash, connect the body to dash wiring harnesses (1).
20. Connect the coaxial connectors (2), if equipped.
21. Install the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.

231568802

Fig. 447: Floor Pan Bracket Fasteners, Ground Wiring, Drain Tube & Clamp
 Courtesy of CHRYSLER GROUP, LLC

22. Insert the air conditioning drain tube onto the floor valve.
23. With the use of pliers or equivalent, connect the air conditioning drain tube clamp (4).
24. Fasten the ground wiring (3) to the floor, and tighten securely.
25. Install the instrument panel to floor bracket fasteners (1) and tighten securely.

231568800

Fig. 448: Steering Column, Gap Hider & Fasteners
Courtesy of CHRYSLER GROUP, LLC

26. Install the steering column (1). Refer to **COLUMN, INSTALLATION** .
27. Install the steering column gap hider (3) fasteners (2), and tighten securely.
28. Install the steering column opening closeout.
29. Install the lower dash silencer panels. Refer to **PANEL, SILENCER, LOWER, INSTALLATION**.

Fig. 449: Dash Side & Connector
Courtesy of CHRYSLER GROUP, LLC

30. Connect the a-pillar wiring connectors (2) on both sides of the vehicle.
31. Clip the wiring connectors (1) to the side of the dash panel (1).

Fig. 450: Identifying Defroster Grille & Sun Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

32. Install the a-pillar trim. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
33. Install the defroster grill, and seat fully. Refer to **GRILLE, DEFROSTER, INSTALLATION**.

2316008558

Fig. 451: Identifying Speaker Covers
Courtesy of CHRYSLER GROUP, LLC

34. Position the speaker covers (1) back into place and seat fully.

2316008561

Fig. 452: Installing Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

35. Position the front door sill scuff panel (1).
36. Hand tap to engage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.

Fig. 453: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

37. Position the closeout trim panel (3) located between the A-pillar trim and the front scuff plate.
38. Seat the retaining clips (1 and 2) fully.

Fig. 454: Identifying Instrument Panel & End Cap
Courtesy of CHRYSLER GROUP, LLC

39. Install the end caps (1). Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION**.

Fig. 455: Identifying Radio Support Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

40. Install the radio support bracket (1) and install the fasteners (2).

Fig. 456: Identifying Center Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

41. Install the center bezel (2) and seat the clips (1) fully.
42. Install the center bezel fasteners (3).

10. Position the shifter bezel (1) back in place and seat fully.
11. Connect the negative battery cable.

CONSOLE, OVERHEAD, FRONT

DESCRIPTION

DESCRIPTION

Fig. 492: Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a power sunroof have a power sunroof switch (3) integral to the overhead console (1) located in the headliner just forward of the sunroof opening. The switch buttons are centered between the two map/reading lamps (4), forward of the sunglasses storage bin (5) and, if equipped, rearward of the universal transmitter (Homelink®) push buttons (2). This switch has three momentary push buttons clearly identified by either text or icons indicating their functions. The three functions are from front-to-back: AUTO (CLOSE), VENT and AUTO (OPEN). The switch push buttons also have instrument panel dimmer controlled Light Emitting Diode (LED) units that provide back lighting for visibility at night.

The power sunroof switch is connected to the vehicle electrical system through the printed circuit board of the overhead console, which is connected to a dedicated take out and connector of the overhead wire harness. If the switch is ineffective or damaged, the entire overhead console must be replaced.

REMOVAL**REMOVAL**

Fig. 493: Identifying Overhead Console, Clips & Wiring Connector
Courtesy of CHRYSLER GROUP, LLC

1. Place a trim stick or equivalent, between the headliner and the overhead console (1) front center.
2. Pry gently until the retaining clips are released.
3. Disconnect the overhead console (1) wiring connector (2).
4. Remove the overhead console (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 494: Identifying Overhead Console, Clips & Wiring Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the overhead console (3) wiring connector (2).
2. Align the rear tabs of the overhead console (1) into the retaining bracket.
3. Align the overhead console (1) retaining clips and apply hand pressure to insert fully.
4. Connect the negative battery cable.

HANDLE, GRAB**REMOVAL****REMOVAL**

3806913

NOTE: **Rear grab handle shown, front grab handle similar.**

1. Position the grab handle (2).
2. Install the fastener (3) securing the grab handle (2). Tighten the fastener securely. Repeat on the other side of the grab handle (2).
3. Install the grab handle fastener cover (1). Repeat on the other side of the grab handle (2).

HEADLINER**REMOVAL****REMOVAL**

Fig. 497: Headliner Wire Harness & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.

NOTE: Please use clean gloves or ensure hands are clean before removing the headliner.

1. Disconnect and isolate the negative battery cable.
2. Support the headliner with a clean and suitable prop.
3. Remove the right and left end caps from the instrument panel. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL**.
4. Disconnect the headliner wire harness (2) from the vehicle harness (1) on both sides.

Fig. 498: Identifying Overhead Console, Clips & Wiring Connector
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, remove the overhead console (3). Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.
6. Remove both sided visors and visor supports. Refer to **SUPPORT, VISOR, REMOVAL** and **VISOR, REMOVAL**.

NOTE: View shown from exterior of the vehicle.

1. Place the rearview mirror over the aluminum button in the upper center of the windshield.
2. Accessing through the vehicle interior, twist the mirror assembly (2) counter clockwise to install the mirror on the aluminum button attached to the windshield.

NOTE: Mirror must be fully seated or wedged onto the button before rotating.

TELEMATICS MIRROR

Fig. 542: Mirror Electrical Connector (Telematics)
Courtesy of CHRYSLER GROUP, LLC

1. Place the rearview mirror over the aluminum button in the upper center of the windshield.
2. Twist the mirror base onto the button in a counter clockwise direction to attach the mirror.

NOTE: Mirror must be fully seated or wedged onto the button before rotating.

NOTE: Mirror must be rotated in a counter clockwise direction to prevent the mirror from touching the rain sensor.

3. Position the rain sensor wire harness back into place and secure accordingly.
4. Connect the electrical connector (1) and install the trim cover.

NOTE: Rain sensor connection should be verified prior to install the mirror trim covers.

5. Install the mirror trim and harness trim covers
6. Connect the negative battery cable.

REAR VIEW MIRROR BUTTON

NOTE: The rear view mirror button is permanently bonded to the inside of the windshield glass. If the button should become separated from the glass, it may be re-bonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar® in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror button on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror button installation can be used as a guide.
2. Clean the button contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with rubbing alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support button with fine grit-sandpaper. Wipe the button surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the button according to the following instructions:
 - Crush the accelerant vial to saturate the felt applicator.
 - Remove the paper sleeve.
 - Apply accelerant to the bonding surface of the button.
 - Allow the accelerant to dry for five minutes.
 - Do not touch the button bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the button contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the button contact area of the glass after the accelerant has been applied.
6. Install the button according to the following instructions:
 - Apply one drop of adhesive at the center of the button contact area on the inside of the windshield glass.
 - Apply an even coat of adhesive to the bonding surface of the button.
 - Align the button with the marked position on the windshield glass.
 - Press and hold the button in place for at least one minute.

NOTE: **Verify that the mirror button is correctly aligned, because the adhesive will cure rapidly.**

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

PANEL, A-PILLAR TRIM

REMOVAL

REMOVAL

Fig. 543: Identifying Instrument Panel & End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Apply protective tape to lower a-pillar trim and to defroster grill, to prevent scaring of either surfaces.
2. Remove instrument panel end cap by using a (special tool #C-4755, Trim Stick) or equivalent, to disengage clips holding end cover (1) to instrument panel.

Fig. 544: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick or equivalent, release the push pin fasteners (1) and the retaining tabs (2) and remove closeout panel (3) located between the A-pillar trim and the front scuff plate.

231669161

Fig. 545: Disengaging Tether Clip From Housing
 Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or equivalent, starting at the bottom and working up, pry the A-pillar trim pane retaining clips out from the vehicle A-pillar (1). **Do not remove the A-pillar trim.**
5. Using a screwdriver (2) or equivalent, press downward disengaging tether clip and slide from housing (3).

231669164

Fig. 546: A-Pillar Trim & Headliner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Be careful not to crease the headliner.

- 6.
7. Lower the top of the A-pillar trim (2) to release the headliner (1) from the pocket of the A-pillar trim.

Fig. 547: Identifying A-Pillar Trim, Tab & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Remove the A-pillar trim (3) from vehicle.

INSTALLATION

INSTALLATION

2316010415

Fig. 548: Identifying A-Pillar Trim, Tab & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the A-pillar trim near the A-pillar.

231669164

Fig. 549: A-Pillar Trim & Headliner
Courtesy of CHRYSLER GROUP, LLC

2. Position the top of the A-pillar trim (2) behind the headliner (1).
3. Insert the lower portion of the A-pillar trim (2) into the dash pocket.

231669162

Fig. 550: A-Pillar Trim Tether
Courtesy of CHRYSLER GROUP, LLC

4. Slide the A-pillar trim tether (2) into the tether pocket (3), and clip into place.
5. Verify the A-pillar trim tether (2) is clipped in fully.

231669164

Fig. 551: A-Pillar Trim & Headliner

Courtesy of CHRYSLER GROUP, LLC

6. Move the top of the A-pillar trim (2) down just far enough to insert the headliner (1) into the A-pillar trim (2) pocket.
7. It may be necessary to use a (special tool #C-4755, Trim Stick) or equivalent, to inset the headliner into the A-pillar trim channel.

231669162

Fig. 552: A-Pillar Trim Tether**Courtesy of CHRYSLER GROUP, LLC**

8. Locate the four way locator pin (1) on the A-pillar trim.

231669163

Fig. 553: Alignment Hole & A-Pillar
Courtesy of CHRYSLER GROUP, LLC

9. Verify, if so equipped, all drain tubes, wiring and tethers are routed properly and clipped fully.
10. Align the A-pillar four way locator pin to the alignment hole (1) on the A-pillar (2).
11. Guide the locator pin into the locator hole (1).
12. Firmly seat the lower portion of the A-pillar trim into position and hand tap to engage the retaining clips.

2316010416

Fig. 554: Identifying Closeout Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Position the closeout trim panel (3) located between the A-pillar trim and the front scuff plate.
14. Seat the retaining clips (1 and 2) fully.

15. Position end cover (2) over retaining slots and firmly snap into place.

PANEL, B-PILLAR TRIM

REMOVAL

REMOVAL

UPPER

2316010007

Fig. 556: Identifying B-Pillar Trim, Upper B-Pillar Trim & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Release the front seat belt anchor. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
3. Using (special tool #C-4755, Trim Stick), pry the lower portion of the B-pillar trim (1) to disengage the retaining clips and route seat belt through B-pillar trim.
4. Remove the upper B-pillar trim (1).

LOWER

2316010007

Fig. 557: Identifying B-Pillar Trim, Upper B-Pillar Trim & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove sill trim panel, Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.
3. Remove the upper B-pillar trim (1).

2316010008

Fig. 558: Identifying Lower B-Pillar Trim & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Using (special tool #C-4755, Trim Stick), pry the upper portion of the lower B-pillar trim (1) to disengage the retaining clips.
5. Using trim stick, pry up on the lower portion of the B-pillar trim (1) and remove from the vehicle.

INSTALLATION

INSTALLATION

UPPER

2316010007

Fig. 559: Identifying B-Pillar Trim, Upper B-Pillar Trim & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper portion of the upper B-pillar trim (1) into the retaining clips located in the bodyside.
2. Route the seat belt through B-pillar trim.
3. Position the lower portion of the upper B-pillar trim (1) and hand tap to engage the retaining clips.
4. Install the seat belt buckle anchor. Refer to **BUCKLE, SEAT BELT, INSTALLATION**.
5. Connect the negative battery cable.

LOWER

Fig. 560: Identifying Lower B-Pillar Trim & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Align and position the lower B-pillar trim (1), hand tap to engage the retaining clips.

Fig. 561: Identifying B-Pillar Trim, Upper B-Pillar Trim & Fasteners

Courtesy of CHRYSLER GROUP, LLC

2. Install the upper B-pillar trim (1).
3. Install the sill/scuff trim panel. Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION**.
4. Connect the negative battery cable.

PANEL, QUARTER TRIM

REMOVAL

REMOVAL

2316010012

Fig. 562: Identifying Quarter Trim Panel & Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

UPPER

1. Separate the seat belt anchor (2). Refer to **BUCKLE, SEAT BELT, REMOVAL**.
2. Position the door seal aside.
3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining fasteners (3) that secure the quarter trim panel to the quarter panel.
4. Pull the quarter trim panel away from the quarter panel.
5. If equipped, disconnect the power outlet wire harness connector (1).
6. Remove the quarter trim panel (1).

LOWER

1. Remove the load floor. Refer to **LOAD FLOOR, CARGO, REMOVAL**.
2. Remove the upper quarter trim. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
3. Remove the rear door scuff plate. Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.
4. Position the door seal (1) aside.

Fig. 563: Identifying Quarter Trim Panel, Electrical Connectors & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the screws (3).
6. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining fasteners that secure the quarter trim panel to the quarter panel.
7. Pull the quarter trim panel away from the quarter panel.
8. If equipped, disconnect the electrical connectors (2).
9. Remove the quarter trim panel (1).

2316010014

Fig. 564: Identifying Quarter Trim Panel, Electrical Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Remove the screws (3).
11. Using a trim stick or equivalent, disengage the retaining fasteners that secure the quarter trim panel to the quarter panel.
12. Pull the quarter trim panel away from the quarter panel.
13. If equipped, disconnect the electrical connectors (1).
14. Remove the quarter trim panel (2).

INSTALLATION

INSTALLATION

2316010012

Fig. 565: Identifying Quarter Trim Panel & Seat Belt Anchor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side similar.

UPPER

1. Position the seat belt (2) through the trim (1).
2. Position the trim back in place and seat the retaining clips fully.
3. Install the seat belt anchor. Refer to **BUCKLE, SEAT BELT, INSTALLATION**.

LOWER

2316010014

Fig. 566: Identifying Quarter Trim Panel, Electrical Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side similar.

1. Position the quarter trim panel (2) back into the vehicle.
2. Position the front locating pin into the body and seat the push pin near the location pin fully.
3. Seat the clip at the top of the trim panel into the C-pillar first.
4. For the right side, seat the three front push pins.
5. For the left side, seat the two front push pins.
6. Seat the push pin at the rear of the quarter glass.
7. For the right side, connect the power outlet electrical connector (1).
8. For the left side, connect the flash light electrical connector and the power liftgate switch, if equipped.
9. Position the rear locating pin into the body and seat the remaining push pins.
10. Install the screw (3).
11. Position the door weatherstrip (1) back and seat fully.
12. Install the rear door scuff plate. Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION**.
13. Install the upper quarter trim. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
14. Install the load floor. Refer to **LOAD FLOOR, CARGO, INSTALLATION**.

PLATE, SCUFF, DOOR SILL

REMOVAL

REMOVAL

Fig. 567: Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #C-4755, Trim Stick), disengage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.
2. Remove the front door sill scuff panel (1).

Fig. 568: Rear Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

3. Using (special tool #C-4755, Trim Stick), disengage the retaining clips securing the door sill scuff panel (1) to the door sill, lower B-pillar and lower C-pillar.
4. Remove the rear door sill scuff panel (1).

INSTALLATION

INSTALLATION

Fig. 569: Front Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door sill scuff panel (1).
2. Hand tap to engage the retaining clips securing the front door sill scuff panel (1) to the door sill and lower B-pillar.

Fig. 570: Rear Door Sill Scuff Panel
Courtesy of CHRYSLER GROUP, LLC

3. Position the rear door sill scuff panel (1).
4. Hand tap to engage the retaining clips securing the front door sill scuff panel (1) to the door sill, lower B-pillar and lower C-pillar.

SUPPORT, VISOR

REMOVAL

REMOVAL

3806219

Fig. 571: Sun Visor Support & Cover
 Courtesy of CHRYSLER GROUP, LLC

1. Disengage the sun visor from the sun visor support (1).
2. Using a small pick/pry too, remove the cover (1) from the sun visor support (2).
3. Remove the screw that secures the support (2) to the roof panel and remove the support from the headliner.

INSTALLATION

INSTALLATION

3806219

Fig. 572: Sun Visor Support & Cover

Courtesy of CHRYSLER GROUP, LLC

1. Position the sun visor support (2) on the headliner and install the screw that secures the support to the roof panel. Tighten the screw securely.
2. Install the cover (1) to the sun visor support (2).
3. Engage the sun visor to sun visor support (2).

VISOR

REMOVAL

REMOVAL

Fig. 573: Sun Visor Base Bracket Cover & Fastener

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disengage the sun visor from the sun visor support.
3. Open the sun visor base bracket cover (1). If necessary, use a small pick/pry tool to open the cover.
4. Remove the fastener (2) that secures the sun visor bracket to the roof panel.

3805374

Fig. 574: Visor & Base Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Simultaneously pull the visor (2) down and forward to disengage the base bracket (1) hook feature.
6. Position the visor (2) away from the headliner.
7. If equipped, disconnect the illuminated vanity mirror wire harness connector.
8. Remove the visor (2) from the vehicle.

INSTALLATION

INSTALLATION

3805374

Fig. 575: Visor & Base Bracket
Courtesy of CHRYSLER GROUP, LLC

1. If equipped, connect the illuminated vanity mirror wire harness connector.
2. Position the sun visor (2) on the headliner and seat the sun visor bracket (1) into the cavity by pushing up and rearward.

3805224

Fig. 576: Sun Visor Base Bracket Cover & Fastener
 Courtesy of CHRYSLER GROUP, LLC

3. Install the fastener (2) that secures the sun visor to the roof panel. Tighten the fastener securely.
4. Close the sun visor base bracket cover (1).
5. Engage the sun visor to the sun visor support.
6. Connect the negative battery cable.

PAINT

SPECIFICATIONS

SPECIFICATIONS

NOTE: Because of late model changes to the available paint colors for each vehicle the current color codes can be found on the Vehicle Certification Label. Refer to VEHICLE CERTIFICATION LABEL, DESCRIPTION .

SEATS, FRONT

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners.

Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

BIN, UNDER SEAT STORAGE

REMOVAL

REMOVAL - PASSENGER STORAGE BIN

Fig. 577: Storage Bin, Seat Track Assembly, Storage Bin Support & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Remove the seat cushion and cover. Refer to **COVER, SEAT CUSHION, REMOVAL** and **COVER, SEAT CUSHION, REMOVAL**.
2. Remove the bolts (4) and remove the storage bin support (3).
3. Remove the storage bin (1) from the seat track assembly (2).

INSTALLATION

INSTALLATION - PASSENGER STORAGE BIN

Fig. 578: Storage Bin, Seat Track Assembly, Storage Bin Support & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the storage bin (1) onto the seat track assembly (2).
2. Install the storage bin support (3) and install the bolts (4).
3. Tighten the bolts to (5.5 N.m 49 in. lbs.).
4. Install the seat cushion and cover. Refer to **COVER, SEAT CUSHION, INSTALLATION** and **COVER, SEAT CUSHION, INSTALLATION**.

COVER, SEAT CUSHION

REMOVAL

REMOVAL

PASSENGER SIDE WITH STORAGE

3. Position the lower lumbar assembly (1) into the keyhole slots (2).

Fig. 627: Securing Lower Lumbar Anchors Fully Into Seat Back Assembly
 Courtesy of CHRYSLER GROUP, LLC

4. Secure the lower lumbar anchors (2) fully into the seat back assembly (1).

Fig. 628: Hog Rings & Hook And Loop Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Install the seat back cushion assembly onto the seat frame and connect the heated seat pad wiring connector, if equipped.
6. Position the seat cover assembly onto the cushion and install new hog rings (1).
7. Connect the hook and loop fasteners (2) along both sides and the center of the front of the seat cover and cushion.

Fig. 629: Seat Air Bag, Cushion Pocket & Connector
Courtesy of CHRYSLER GROUP, LLC

8. Position the seat air bag (1) into the seat cover pocket (2).
9. Connect the squib wiring electrical connector (3).
10. Install the seat air bag (1) onto the frame and into the cushion pocket (2).

Fig. 630: Seat Air Bag Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Located on the inside of the seat back frame, install the two fasteners (1) and tighten to (10 N.m 89 in. lbs.).

231968319

Fig. 631: Wire Guides & Connectors

Courtesy of CHRYSLER GROUP, LLC

12. Connect the electrical connectors (1) and connect the two wire guides (2) to the seat back frame.

815bd820

Fig. 632: Headrest Sleeve Install

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical front seat back and head restraint sleeves shown.

13. Position the seat back cover and cushion (1) onto the seat back frame.
14. Install the headrest sleeves (2) by pushing down on the sleeve.

231968333

Fig. 633: Lower Zip Strips
Courtesy of CHRYSLER GROUP, LLC

15. Secure the lower zip strips (1), fully.

231968332

Fig. 634: Rear Zippers
Courtesy of CHRYSLER GROUP, LLC

16. Close the side zippers (1) fully and tuck the zipper up into the seat back cover.
17. Install the seat back. Refer to **SEAT BACK, FRONT, INSTALLATION**.

INSTALLATION

INSTALLATION

231968330

Fig. 635: Seat Back Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Position the seat back assembly back onto the seat track assembly and install the bolts (1).
2. Tighten the bolts (1) to (50 N.m 37 ft. lbs.)
3. Connect the electrical connectors to the seat back accessories, if equipped.

231969528

Fig. 636: Recliner Link & Clip

Courtesy of CHRYSLER GROUP, LLC

4. Connect the recliner link (1) and secure the clip (2) fully, if equipped.
5. Install the side shields. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION**.
6. Install the seat. Refer to **SEAT, INSTALLATION**.

SEAT**REMOVAL****REMOVAL**

8. Install the adjustment handles (2, 6), if equipped. Refer to **HANDLE, FRONT RECLINER, INSTALLATION**.

SEATS, REAR

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use **ONLY** the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these

instructions may result in possible serious or fatal injury.

SEAT, REAR

REMOVAL

REMOVAL

Fig. 649: Identifying Rear Seat, Electrical Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Fold the rear seat backs down and remove the rear nuts (3).
2. Disconnect the electrical connectors (4) and (2).

Fig. 650: Identifying Rear Seat, Electrical Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Fold the seat backs up.

4. Open the fasteners covers (2).
5. Remove the bolts (1).
6. Disconnect the electrical connectors, if equipped, and remove the seat assembly.

INSTALLATION**INSTALLATION**

2319004714

Fig. 651: Identifying Rear Seat, Electrical Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat assembly (3) back into the vehicle.
2. Install the bolts (1) and tighten to 85 N.m (63 ft. lbs.).
3. Install the trim covers (2) and seat fully.

2319004715

Fig. 652: Identifying Rear Seat, Electrical Connectors & Fasteners

Fig. 672: Pivoting Armrest Assembly Out Of Support Bracket
Courtesy of CHRYSLER GROUP, LLC

13. Pivot the armrest assembly (1) out of the support bracket and off of the pivot and detent pins (2) and remove the armrest.

Fig. 673: Seat Back Cushion And Cover Assembly
Courtesy of CHRYSLER GROUP, LLC

14. Remove the seat cushion cover and cushion (1) from the seat back frame assembly.

INSTALLATION

INSTALLATION

Fig. 674: Rear Seat Back
Courtesy of CHRYSLER GROUP, LLC

1. Carefully install the seat back cover to the foam, installing the hog rings.
2. Engage the J-hook at the bottom of the seat back cover.

3. Install the seat back to the frame.
4. Install the fastener to the side of the appropriate seat back.
5. Install the seat back to the vehicle. Refer to **SEATS, REAR** .

INSTALLATION - BENCH SEAT

Fig. 675: Seat Back Cushion And Cover Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat back cushion and cover assembly (1) onto the seat back assembly.

Fig. 676: Headrest Sleeve Install
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical front seat back and headrest sleeves shown, rear seat headrest sleeves typical.

2. Install the headrest sleeves (2) by pushing down on the sleeve.

231968333

Fig. 677: Lower Zip Strips
Courtesy of CHRYSLER GROUP, LLC

3. Secure the lower zip strips (1), fully.

231968328

Fig. 678: Seat Back Cover
Courtesy of CHRYSLER GROUP, LLC

4. Close the side zippers (1) fully and tuck the zipper up into the seat back cover.

Fig. 679: Seat Back Mounting Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the rear seat back mounting bracket (2) onto the seat back assembly and install the bolts (1).
6. Tighten the bolts to (25 N.m 18 ft. lbs.).
7. Install the rear seat back assembly back into the vehicle. Refer to **SEATS, REAR**.

INSTALLATION - SPLIT SEAT

Fig. 680: Seat Back Cushion And Cover Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: 40% seat back service is similar to the 60% seat back unless otherwise noted.

1. Position the seat back cushion and cover assembly (1) onto the seat back assembly.

Fig. 681: Headrest Sleeve Install
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical front seat back and headrest sleeves shown, rear seat headrest sleeves typical.

2. Install the headrest sleeves (2) by pushing down on the sleeve.

Fig. 682: Seat Back Cover
Courtesy of CHRYSLER GROUP, LLC

3. Close the side zippers (1) fully and tuck the zipper up into the seat back cover.

231969871

Fig. 683: Pass Through Door Trim Ring
Courtesy of CHRYSLER GROUP, LLC

4. Position the pass through trim ring (1) onto the seat back and seat fully.

231969958

Fig. 684: Detent Slotted Guide
Courtesy of CHRYSLER GROUP, LLC

5. Locate the detent slotted guide (1) in the 60% seat back assembly.

231969866

Fig. 685: Positioning Armrest Assembly Back Into Place
Courtesy of CHRYSLER GROUP, LLC

6. Position the armrest assembly (1) back into place with the pivot pins (2) inserted into the detent slotted guide from the previous step and pivot the armrest down into the support bracket.

231969866

Fig. 686: Arm Rest Pivot Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Install the armrest pivot bolt (1) and tighten to (25 N.m 18 ft. lbs.).

Fig. 687: Installing Pass Through Trim
Courtesy of CHRYSLER GROUP, LLC

8. Open the pass through lid/armrest (2) and install the trim panel (1).
9. Seat the trim panel (1), fully.

Fig. 688: Installing 60% Seat Back Assembly Into Support Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Install the 60% seat back assembly (1) pivot pin (3) into the support bracket (2) and pivot down into the support bracket fully.

Fig. 689: Lower Cover, Retaining Clip & Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

11. Verify that the retaining clip (3) is installed fully onto the 40% seat back pivot (1).

Fig. 690: Installing 40% Seat Back Assembly Into Support Bracket
Courtesy of CHRYSLER GROUP, LLC

12. Install the 40% seat back assembly (1) onto the pivot pin (2) and onto the support bracket fully.

Fig. 691: Seat Back Support Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Install the seat back pivot bolts (1) and tighten to (25 N.m 18 ft. lbs.)

Fig. 692: Lower Zip Strips
Courtesy of CHRYSLER GROUP, LLC

14. Secure the lower zip strips (1), fully.
15. Install the rear seat back assembly back into the vehicle. Refer to **SEATS, REAR**.

COVER, SEAT CUSHION

REMOVAL**REMOVAL**

231968324

Fig. 693: Hog Rings & Hooks

Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat cushion. Refer to **COVER, SEAT CUSHION** .
2. Remove the hog rings (1) and separate the fabric from the hooks (2).

231968325

Fig. 694: J-Straps

Courtesy of CHRYSLER GROUP, LLC

3. Release the remaining j-strap (1) and separate the cushion and cover from the seat cushion frame.

231968326

Fig. 695: Cover, Cushion & Hog Rings
Courtesy of CHRYSLER GROUP, LLC

4. Position aside the cover (1) and expose the hogs (3).
5. Remove the hog rings (3) and separate the cover (1) from the cushion (2).

INSTALLATION

INSTALLATION

231968326

Fig. 696: Cover, Cushion & Hog Rings

Courtesy of CHRYSLER GROUP, LLC

1. Position the cover (1) onto the cushion (2) and install new hog rings (3).
2. Install the cover (1) over the cushion (2) and secure the hook and loop fasteners fully.

231968325

Fig. 697: J-Straps

Courtesy of CHRYSLER GROUP, LLC

3. Fasten the j-straps (1) around the perimeter of the seat frame.

231968324

Fig. 698: Hog Rings & Hooks

Courtesy of CHRYSLER GROUP, LLC

4. Fasten the cover over the hooks (2) and install new hog rings (1).
5. Install the seat cushion assembly. Refer to **INSTALLATION** .

HEADREST**REMOVAL****REMOVAL****Fig. 699: Head Restraint & Guides****Courtesy of CHRYSLER GROUP, LLC**

1. Raise the head restraint (1) slightly.
2. At the same time, press both buttons on the head restraint guides (2) and pull upward to release the head restraint (1).
3. Remove the head restraint (1) from the seat back.

INSTALLATION**INSTALLATION**

Fig. 700: Head Restraint & Guides

Courtesy of CHRYSLER GROUP, LLC

1. Place the head restraint (1) in position.
2. Push the head restraint (1) down into the lock position.
3. Raise the head restraint (1) to ensure it locks at the last stop.

STATIONARY GLASS

WARNING

WARNING

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- Chrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufacturer's warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.
- Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.

- Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.
- Skin contact with urethane adhesive should be avoided. Personal injury may result.
- Always wear eye and hand protection when working with glass.

Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

GLASS, LIFTGATE

REMOVAL

REMOVAL

Fig. 701: Identifying Liftgate Glass, Rear Wiper Arm, Heated Backlite Electrical Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING**.
2. Remove liftgate trim panels. Refer to **PANEL, TRIM, REMOVAL**.
3. Remove the spoiler. Refer to **SPOILER, REMOVAL**.
4. Remove rear window wiper arm (4), if equipped. Refer to **ARM, WIPER, REMOVAL**.

5. Disconnect the heated backlite electrical connectors (1), if equipped.

Fig. 702: Adhesive Separation
Courtesy of CHRYSLER GROUP, LLC

- | |
|--|
| 1 - T-HANDLE
2 - WINDSHIELD ADHESIVE
3 - COUNTER SUPPORT
4 - CUTTING WIRE |
|--|

NOTE: Windshield removal shown, backlite similar.

6. Using a windshield cut-out wire or other suitable tool, separate the adhesive.
7. Carefully remove backlite.

INSTALLATION

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing backlite to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The backlite fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height,

should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers should be replaced with new parts. Replace any missing or damaged spacers around the perimeter of the liftgate opening.

GLASS PREPARATION - INSTALLING A PREVIOUSLY INSTALLED BACKLITE

Fig. 703: Glass Adhesive Preparation
Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| 1 - WINDSHIELD
2 - SCRAPER
3 - OLD ADHESIVE |
|---|

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING.**
2. Level old bead of backlite adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

Fig. 704: Identifying Liftgate Glass, Rear Wiper Arm, Heated Backlite Electrical Connector & Fasteners

Courtesy of CHRYSLER GROUP, LLC

3. Position the backlite glass over the wiper shaft (5) and onto the liftgate.
4. Position backlite in center of liftgate opening and resting on the guide pins (2)

Fig. 705: Applying Adhesive Tape To Windshield

- 2 - WINDSHIELD SEAL

NOTE: Typical primer installation shown.

6. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
7. Apply primer to gluing surface at backlite seal.

8129ec29

Fig. 711: Applying Primer
Courtesy of CHRYSLER GROUP, LLC

8. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (2).
9. Allow primer to air dry for at least 10 minutes.
10. Using a flash light, verify that glass primer is without damage.

LIFTGATE OPENING PREPARATION

8111a74d

Fig. 712: Smoothing Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

- 1 - OLD ADHESIVE
- 2 - SCRAPER
- 3 - WINDSHIELD OPENING

NOTE: Windshield opening shown, liftgate opening similar.

1. Clean and vacuum liftgate opening.
2. Level old bead of liftgate opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

Fig. 713: Applying Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

- 1 - PRIMER
- 2 - WINDSHIELD OPENING

NOTE: Windshield opening shown, liftgate opening similar.

3. Clean and dry area of liftgate opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
5. Allow primer to air dry for at least 10 minutes.

BACKLITE INSTALLATION

Fig. 714: Applying Windshield Adhesive
 Courtesy of CHRYSLER GROUP, LLC

- 1 - ADHESIVE BEAD
- 2 - WINDSHIELD SEAL

1. Apply bead of adhesive (1) with a triangular nozzle directly to the backlite seal starting at bottom in center of the backlite.

CAUTION: Always apply bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying adhesive.

Fig. 715: Identifying Adhesive Bead Dimensions
 Courtesy of CHRYSLER GROUP, LLC

- 1 - ADHESIVE WIDTH 9.5 mm (0.375 in)
- 2 - ADHESIVE HEIGHT 12.7 mm (0.50 in)

2. Bead dimensions should be approximately 9.5 mm wide (1) by 12.7 mm in height (2).

Fig. 716: Identifying Windshield Adhesive Overlap
Courtesy of CHRYSLER GROUP, LLC

1 - ADHESIVE BEAD
2 - WINDSHIELD SEAL

3. Allow end of adhesive bead (1) to run out parallel to the start of the bead and smooth ends flush.

Fig. 717: Identifying Liftgate Glass, Rear Wiper Arm, Heated Backlite Electrical Connector & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the backlite glass over the wiper shaft (5) and onto the liftgate.
5. Position backlite in center of liftgate opening and resting on the guide pins (2).
6. Use the tape as a guide to aid installation of the backlite into the center of the cutout.
7. Carefully lay down the backlite and press on.

CAUTION: It is no longer possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing backlite to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

8. Install the rear wiper arm, if equipped. Refer to ARM, WIPER, INSTALLATION.
9. Install the liftgate trim panels. Refer to PANEL, TRIM, INSTALLATION.
10. Install the spoiler. Refer to SPOILER, INSTALLATION.

GLASS, QUARTER

REMOVAL

REMOVAL

2320012107

Fig. 718: Identifying Quarter Glass
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to STATIONARY GLASS, WARNING.
2. Remove the upper quarter trim from the side of the vehicle being serviced. Refer to PANEL, QUARTER TRIM, REMOVAL.
3. Reposition the headliner on the side of the vehicle being serviced as necessary.

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the fixed glass/windshield.

4. Using a razor knife, cut the urethane adhesive that secures the quarter glass (1) to window fence (2).
5. Carefully push the quarter window glass (1) from the opening.

INSTALLATION

INSTALLATION

Fig. 719: Identifying Quarter Glass
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not operate the vehicle within 24 hours of quarter glass installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the quarter glass may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the quarter glass. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

NOTE: To prevent corrosion, do not damage paint on the quarter glass fence when removing original urethane.

NOTE: The quarter glass fence should be cleaned of most of its old urethane adhesive.

A small amount of old urethane, approximately 1 mm (.04 in.) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

1. Using a razor knife, level the original bead of urethane on the fence to a thickness of approximately 1 mm (0.04 in.).
2. If the quarter glass (1) is being reused, remove as much of the original urethane as possible from the glass surface using a razor knife.

WARNING: Do not use solvent based glass cleaners to clean the quarter glass before applying glass prep and primer or poor glass adhesion may result.

3. Clean the inside of the quarter glass (1) with an ammonia based glass cleaner and a lint-free cloth.
4. Apply glass prep adhesion promoter 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
5. Apply glass primer 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
6. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the quarter glass.
7. Re-prime any area that is not fully and evenly primed.
8. Clean the quarter glass fence with an ammonia based glass cleaner and a lint-free cloth.
9. Apply pinch weld primer 15 mm (0.75 in.) wide around the quarter glass fence. Allow at least three minutes drying time.
10. Using a flashlight, verify that the primer is completely and evenly installed along the quarter glass fence.
11. Re-prime any area that is not fully and evenly primed.

CAUTION: Always apply the bead of adhesive to the quarter glass. Always install the quarter glass within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

12. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass starting at the bottom center of the quarter glass.
13. Run the end of the adhesive bead on the quarter glass parallel to the start of the bead and smooth the ends flush.
14. Place the quarter glass (1) into the window opening (2) and insert mounting studs through the holes in the window fence.
15. Position the headliner as necessary.
16. Install the quarter trim. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

WINDSHIELD**REMOVAL****REMOVAL****Fig. 720: Adhesive Separation**

Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Disconnect and isolate the negative battery cable.
3. Remove the rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL**.
4. Remove the exterior cowl panel. Refer to **COVER, COWL PANEL, REMOVAL**.

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

5. Remove the molding from the top of the windshield.
6. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.

Fig. 721: Identifying Windshield & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Using appropriate tools, carefully remove the windshield (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 722: Removing Old Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door

glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the windshield (1) is being reused, remove as much of the original urethane (3) as possible from the glass surface using a razor knife (2).

Fig. 723: Leveling Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

NOTE: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

NOTE: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.04 in.) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove any damaged adhesive backed spacers.

Fig. 724: Identifying Windshield & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Install new adhesive backed spacers (2) along the windshield fence as required.
4. Install a new rubber seal along the top of the windshield (1).
5. Using an assistant, position the windshield into the windshield opening and against the windshield fence and spacers (2).
6. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
7. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
8. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

Fig. 725: Applying Primer To Gluing Surface Of Windshield Seal
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
13. Re-prime any area that is not fully and evenly primed.

Fig. 726: Applying Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

14. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
17. Re-prime any area that is not fully and evenly primed.

Fig. 727: Applying Windshield Adhesive
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

18. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.

Fig. 728: Windshield Adhesive Overlap
Courtesy of CHRYSLER GROUP, LLC

19. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.

Fig. 729: Identifying Windshield & Harness Connector
 Courtesy of CHRYSLER GROUP, LLC

20. Using an assistant, position the windshield (1) over the windshield opening.
21. Using the grease pencil marks or tape as reference points, align the windshield to the windshield opening.
22. Carefully lower the windshield into the windshield opening. Guide the windshield and the rubber seal at the top the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

23. Push the windshield inward until the windshield comes into contact with the spacers (2) located on the windshield fence.
24. Install the cowl grill. Refer to COVER, COWL PANEL, INSTALLATION.
25. Install the rear view mirror onto the windshield. Refer to MIRROR, REARVIEW, INSTALLATION.
26. Connect the negative battery cable.

SUNROOF, DUAL PANE

DESCRIPTION

DESCRIPTION

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The front sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the fixed rear glass panel when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes an electric rolling sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The electric rolling sunshade

PARTS LIST

7 - MOTOR SCREWS 4 N.m (35 in. lbs.)	15 - DRAIN TROUGH
8 - TENSION BAR	

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in the "RUN" or "ACCESSORY" position. If the sunroof is moving when the key is turned to the START position (crank engine), all motions will stop. The sunroof will also stop a requested motion if the key is turned "OFF".

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the front sunroof glass panel up into the vent position (Rear of the front sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. Refer to **SWITCH, SUNROOF, OPERATION** for additional information.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "close" end of the rocker switch moves the sunroof glass panel to the full closed position. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur. This secondary EFL override may be necessary when known debris (ice blockage for example) is preventing the glass panel from closing.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - SUNROOF**

For sunroof electrical system diagnosis and testing procedures, refer to **DIAGNOSIS AND TESTING** .

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to **ADJUSTMENTS** and **ADJUSTMENTS** .

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

NOTE: **Care must be taken not to fold or kink the headliner upon removal.**

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. Refer to **HEADLINER, REMOVAL**.
2. Repair as necessary.

HIGH OPERATIONAL NOISE

If a scratching noise is observed as the sunroof glass is cycled from open to closed and closed to open this could be caused by dust and debris accumulation in the guide tracks. To correct this issue, refer to **SUNROOF, DUAL PANE, STANDARD PROCEDURE**.

STANDARD PROCEDURE**STANDARD PROCEDURE - NEW INITIALIZE AND TEACH**

The following steps are necessary initialize and teach a module that has never been initialized (newly reflashed).

1. Press and hold the glass close switch until the glass moves to the full vent up position and then bounces back to vent up.
2. The shade will then move to flush, bounces back and stop at the halfway position.
3. Once both the shade and glass have stopped, release the glass close switch and press it again within five seconds.

4. The shade moves to full open, and the glass will move to full open.
5. The glass will move to full flush.
6. The shade will move to flush. Hold the switch until the glass and shade have completed their movements.
7. Release the glass close switch. Glass and shade are now initialized and taught.

STANDARD PROCEDURE - RE-INITIALIZE AND RE-TEACH

The following steps are necessary initialize and teach a module that has been previously initialized and taught.

1. With the glass at flush, press and hold the glass close switch for 10 seconds.
2. Continue to press and hold the glass close switch until the glass moves to full vent up and bounces back to vent up.
3. The shade will then move to flush, bounce back, and stops at the halfway position.
4. Once both the shade and glass have stopped, release the glass close switch and press it again within 5 seconds.
5. The shade moves to full open, and the glass will move to full open.
6. The glass will move to flush.
7. The shade will move to flush. Hold the switch until the glass and shade have completed their movements.
8. Release the glass close switch. Glass and shade are now initialized and taught.

STANDARD PROCEDURE - CLEAN AND RE-GREASE SUNROOF GUIDE TRACKS

2321032783

Fig. 731: Identifying Wind Deflector
Courtesy of CHRYSLER GROUP, LLC

1. Open glass fully to expose the guide tracks.
2. Hold down the wind deflector (1).

Fig. 732: Identifying Channels
Courtesy of CHRYSLER GROUP, LLC

3. Wipe out the channels (1) and remove any accumulated dust and debris.

Fig. 733: Applying Mopar Grease To Tracks
Courtesy of CHRYSLER GROUP, LLC

4. Using Mopar Grease P/N 68079674AA with a small brush (1), apply grease (2) to the tracks as shown.
5. Cycle the glass open and close to verify high operating noise no longer exists. Repeat process if necessary.

REMOVAL

REMOVAL

2823363

Fig. 734: Four Drain Tubes

Courtesy of CHRYSLER GROUP, LLC

NOTE: For exploded view and call outs, refer to SUNROOF, DUAL PANE, DESCRIPTION.

1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.
3. Lower the headliner in the vehicle enough to gain access to the sunroof assembly. Refer to HEADLINER, REMOVAL.
4. Disconnect the four drain tubes (1) from sunroof housing.
5. Disconnect the sunroof wire harness electrical connector.

2321004720

Fig. 735: Identifying Sunroof Assembly, Roof Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Loosen the 14 bolts (3) attaching sunroof assembly.
7. With the help of an assistant, support the sunroof and remove the 17 bolts attaching sunroof assembly (2) to roof panel.
8. Remove the sunroof assembly (2) from vehicle.

INSTALLATION

INSTALLATION

Fig. 736: Identifying Sunroof Assembly, Roof Panel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: After installation the sunroof motors will need to be initialized.

1. Verify that glass panel is fully closed.
2. Locate the alignment holes along the sides of the module assembly and position the holes so that they line up with the holes located in sunroof frame (1).
3. Raise sunroof module assembly (2) and guide it carefully into position.
4. While supporting the sunroof assembly Install the 17 bolts (2).

2321010042

Fig. 737: Identifying Sunroof Assembly Frame Alignment Holes
Courtesy of CHRYSLER GROUP, LLC

5. Tighten the bolts to 9 N.m (80 in. lbs.) using the sequence shown.

2823363

Fig. 738: Four Drain Tubes
Courtesy of CHRYSLER GROUP, LLC

6. Connect the electrical connector.
7. Connect the drain tubes (1) to the sunroof.
8. Connect the battery negative cable.

9. Test sunroof operation, adjust if necessary. Refer to **ADJUSTMENTS** and **ADJUSTMENTS**.
10. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
11. Initialize sunroof motor. Refer to **SUNROOF, DUAL PANE, STANDARD PROCEDURE**.

COVER, SUNROOF MECHANISM

REMOVAL

REMOVAL

2321010035

Fig. 739: Identifying Sunroof Mechanism Cover & Mounting Flanges
Courtesy of CHRYSLER GROUP, LLC

1. Move the front glass into the full closed position.
2. Open the sunshade into the full open position.

CAUTION: Separate the mechanism covers by pulling on the metal flanges only. Pulling on the cover membrane may result in tearing of the membrane.

3. Separate the mechanism cover (1) from the tabs on the glass panel and frame assembly by pulling on the mounting flanges (2) only.

INSTALLATION

INSTALLATION

2321010035

Fig. 740: Identifying Sunroof Mechanism Cover & Mounting Flanges
 Courtesy of CHRYSLER GROUP, LLC

1. With the sunroof in the open position, snap the mechanism cover (1) into the lower guide channel and the glass panel and seat the flanges (2) fully.

DEFLECTOR, WIND

REMOVAL

REMOVAL

2321010043

Fig. 741: Identifying Wind Deflector Cloth & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Move the front glass into the full open position.
2. Lower the headliner as necessary to catch any debris that falls while removing the wind deflector rivets (3). Refer to **HEADLINER, REMOVAL**.
3. Separate the front of the wind deflector cloth from the clips (1) in the frame assembly.
4. Remove the rivet (3) securing the wind deflector assembly to the side rails.

Fig. 742: Identifying Rear Deflector Bases & Slide Rail Assembly
 Courtesy of CHRYSLER GROUP, LLC

5. Slide the rear deflector bases (2) rearward and remove from the side rail assembly (1).
6. Remove the wind deflector.

INSTALLATION

INSTALLATION

Fig. 743: Identifying Deflector Swing Arm Bases & Slots Of Side Rails
Courtesy of CHRYSLER GROUP, LLC

1. Remove all debris created during removal from the hole in the sunroof frame.
2. Position the deflector swing arm bases (2) into the slots of the side rails (1) and slide forward.

Fig. 744: Identifying Front Tabs & Swing Arm Bases
Courtesy of CHRYSLER GROUP, LLC

3. Make sure the front tabs (1) of the swing arm bases (2) are positioned above the rail.

Fig. 745: Identifying Lift Springs & Slots
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the lift springs (1) are correctly positioned into the slots (2) on the side rails and the swing arms.

Fig. 746: Identifying Wind Deflector Cloth & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install new rivets (3).
6. Starting at the center notch, seat the front of the fabric into the front clips (1) fully.
7. Install the headliner. Refer to **HEADLINER, INSTALLATION**.

GLASS, SUNROOF, FRONT**ADJUSTMENTS****ADJUSTMENTS**

2798479

GLASS ADJUSTMENT SEQUENCE

1 - SET THE FRONT GLASS PANEL FRONT GAP TO 3 mm (0.12 in.)

2 - SET THE FRONT OF THE FRONT GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)

3 - SET THE REAR OF THE FRONT GLASS PANEL FLUSH WITH THE ROOF

4 - SET THE FRONT OF THE REAR GLASS PANEL GAP TO 3.5 mm TO 4 mm (0.14 in. to 0.16 in)

5 - SET THE REAR OF THE REAR GLASS PANEL OVER FLUSH 0 mm TO 2.5 mm (0.0 in. to 0.10 in)

6 - SET THE FRONT OF THE REAR GLASS PANEL FLUSH TO UNDER FLUSH 2.5 mm (0.10 in.)

1. Initialize sunroof motor. Refer to **SUNROOF, DUAL PANE, STANDARD PROCEDURE**.
2. Open the sunshade fully.
3. Verify the sunroof glass panel is in the fully closed position.
4. Separate the mechanism covers from the tabs on the glass panel.
5. Loosen the attaching screws on each side of the rear glass panel enough to permit adjustment of the glass gap and flush.
6. Loosen the attaching screws on each side of the front glass panel enough to permit adjustment of the glass gap and flush.

NOTE: Use shims to maintain gap during the flush adjustments.

7. Adjust the front edge of the front glass gap to 3 mm (0.12 in.).
8. Adjust the front surface of the front sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the roof.
9. Tighten the front glass panel attaching screws to 4.5 N.m (40 in. lbs.).
10. Adjust the rear surface of the front sunroof glass panel flush with the top surface of the roof.
11. Tighten the remaining front glass panel attaching screws to 4.5 N.m (40 in. lbs.).

NOTE: Use shims to maintain gap during the flush adjustments.

12. Adjust the front edge of the rear glass gap 3.5 mm (0.12 in.) minimum to 4.0 mm (35.5 in.) maximum.
13. Adjust the rear surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) above the top surface of the roof.
14. Tighten the rear screws of the rear glass panel to 4.5 N.m (40 in. lbs.).
15. Adjust the front surface of the rear sunroof glass panel 0.00 mm to 2.5 mm (0.00 in. to 0.10 in.) below the top surface of the front glass panel.
16. Tighten the remaining rear glass panel attaching screws to 4.5 N.m (40 in. lbs.).
17. Check for proper fit. If not OK, repeat glass panel adjustment.
18. Position the mechanism covers over the glass tabs between the locating features and seat fully.
19. Verify sunroof operation and alignment.

REMOVAL

REMOVAL

2321010035

Fig. 748: Identifying Sunroof Mechanism Cover & Mounting Flanges
 Courtesy of CHRYSLER GROUP, LLC

1. Open the sunshade fully.

2. Open the front glass to the vent position and remove the mechanism covers (1). Refer to **COVER, SUNROOF MECHANISM, REMOVAL**.

2820484

Fig. 749: Six Glass Panel Screws
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the six glass panel screws (1).

2321010187

SUNSHADE, SUNROOF

REMOVAL

REMOVAL

2321010035

Fig. 759: Identifying Sunroof Mechanism Cover & Mounting Flanges
 Courtesy of CHRYSLER GROUP, LLC

1. Open the sunshade fully.
2. Open the front glass into the vent position.

CAUTION: Separate the mechanism covers by pulling on the metal flanges only. Pulling on the cover membrane may result in tearing of the membrane.

3. Separate the mechanism cover (1) from the tabs on the glass panel by pulling on the mounting flanges (2) only.
4. Close the front glass fully.

2820484

Fig. 760: Six Glass Panel Screws

Courtesy of CHRYSLER GROUP, LLC

5. Remove the six glass panel screws (1).

2321010187

Fig. 761: Identifying Glass Panel & Guide Mechanisms

Courtesy of CHRYSLER GROUP, LLC

6. Lift off the glass panel (1) from the guide mechanisms (2) and remove from vehicle.

2321012149

Fig. 762: Identifying Rear Glass & Fasteners

Courtesy of CHRYSLER GROUP, LLC

7. Remove the rear glass fasteners (2) and carefully slide the rear glass (1) panel forward to gain access to the sunshade.

Fig. 763: Releasing Tension Bar Using Small Flat Bladed Tool
Courtesy of CHRYSLER GROUP, LLC

8. Using a small flat bladed tool or equivalent, release the tension bar (1) then slide off the clip (2) and remove.

Fig. 764: Removing Shade From Overmolds Using Large Flat Bladed Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: The sunshade retraction spring force is significant. Firmly hold onto the sunshade while releasing the shade from the overmolds in the following steps.

9. Insert a large flat bladed tool (1) into the slot on the overmold brackets.
10. Twist the tool (1) and release the sunshade beam (2) by rotating the tool down and back.
11. Repeat on each side.
12. Allow the spring to retract remaining fabric into the roll.

Fig. 765: Removing Sunshade Assembly From Frame Assembly
Courtesy of CHRYSLER GROUP, LLC

13. Twist the sunshade axle (2) and release the sunshade assembly (1) from the frame assembly and position toward the rear of the bracket.

Fig. 766: Removing Support Pin (2) From Support Bracket

Courtesy of CHRYSLER GROUP, LLC

14. Separate the support pin (2) from the support bracket (1) and position behind the bracket.

Fig. 767: Lifting Axle From Frame Bracket & Removing Sunshade Out Of Sunroof Opening
Courtesy of CHRYSLER GROUP, LLC

15. Lift the axle (2) up and over the frame bracket then remove the sunshade (1) out of the sunroof opening.

INSTALLATION

INSTALLATION

3. Install the mechanism covers (1). Refer to COVER, SUNROOF MECHANISM, INSTALLATION.

TUBE, SUNROOF DRAIN

REMOVAL

REMOVAL

FRONT

2321004717

Fig. 790: Identifying Sunroof, Support Clips, Tube & Floor Grommet
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
2. Remove the instrument panel speakers as necessary. Refer to **SPEAKER, REMOVAL**.
3. Lower the headliner as necessary to gain access to the drain tube. Refer to **HEADLINER, REMOVAL**.
4. Separate the drain tube from the support clips (1).
5. Disconnect the drain tube from the floor grommet (4).
6. Disconnect the tube from the sunroof (2) and pull the tube (3) up through the instrument panel.

REAR

2921004718

Fig. 791: Identifying Drain Tube, Support Clips & Floor Grommet
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
2. Remove the rear grab handles. Refer to **HANDLE, GRAB, REMOVAL**.
3. Remove the quarter trim panel. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
4. Lower the headliner as necessary to gain access to the drain tube. Refer to **HEADLINER, REMOVAL**.
5. Separate the drain tube support clips (2).
6. Disconnect the drain tube from the floor grommet (3).

2321004719

Fig. 792: Identifying Sunroof, Tube & Clips
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the tube (4) from the sunroof (1) and remove the tube (3).

INSTALLATION

INSTALLATION

FRONT

2321004717

Fig. 793: Identifying Sunroof, Support Clips, Tube & Floor Grommet
Courtesy of CHRYSLER GROUP, LLC

1. Install the front tube (3) and seat into the support fasteners (1) fully.
2. Position the lower portion through the grommet (4) in the body.

3. Connect the new drain tube to the sunroof housing (2) and test drainage.
4. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
5. Install the instrument panel speaker. Refer to **SPEAKER, INSTALLATION**.
6. Install the A-pillar trim. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.

REAR

2321004718

Fig. 794: Identifying Drain Tube, Support Clips & Floor Grommet
Courtesy of CHRYSLER GROUP, LLC

1. Install the rear tube and seat the push pin fasteners (2) fully.
2. Position the lower portion (3) through the grommet in the body.

2321004719

Fig. 795: Identifying Sunroof, Tube & Clips
Courtesy of CHRYSLER GROUP, LLC

3. Connect the new drain tube (4) to the sunroof housing (1) and test drainage.
4. Install the headliner. Refer to **HEADLINER, INSTALLATION**.
5. Install the quarter trim panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
6. Install the grab handles. Refer to **HANDLE, GRAB, INSTALLATION**.
7. Install the upper B-pillar trim. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.

2014 ACCESSORIES AND EQUIPMENT**Chime/Buzzer/Driver Assist - Service Information - Cherokee****DESCRIPTION****BLIND SPOT MONITOR SYSTEM**

The Blind Spot Monitor (BSM) system is an available factory-installed electronic driving aid. This system provides both blind spot and Rear Cross Path (RCP) monitoring features. While the vehicle is being driven, this system alerts the vehicle operator when it detects other highway licensable vehicles that enter the targeted blind spot and cross path alert zones. These zones lie immediately to the right and behind as well as immediately to the left and behind the vehicle. Due to the surrounding rear vehicle structure or other adjacent stationary obstacles outside of the vehicle, these zones might be more difficult for the vehicle operator to easily monitor.

When the BSM system detects another vehicle within one of the target zones, the system is capable of illuminating an amber triangle icon located in each outside rear view mirror glass, as well as reducing audio system volume and sounding chime tones through the audio system speakers to provide the vehicle operator with both visual and audible alerts. However, it should be noted that this BSM system is intended to supplement and not to replace safe vehicle operating habits, including proper adjustment and use of the standard equipment inside and outside rear view mirrors.

The BSM system includes the following major components, which are described in further detail elsewhere within this service information:

- **Blind Spot Displays** - Vehicles equipped with the BSM system have an amber Light Emitting Diode (LED) unit mounted on the back of each outside rear view mirror glass case behind the translucent outline of a triangle in the mirror glass. The BSM system illuminates the appropriate triangle icon in amber each time a vehicle is detected in one of the blind spot or rear cross path alert zones.
- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RADAR sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus with its respective Driver Door Module (DDM) or Passenger Door Module (PDM), which is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right or left outboard end of the rear bumper fascia, just behind each rear wheel opening.
- **Door Modules**
 - An electronic Driver Door Module (DDM) and Passenger Door Module (PDM) receives electronic messages over the Controller Area Network (CAN) data bus from its respective Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) to control a hard wired output to the BSM display in its respective outside rear view mirror. The door modules are concealed behind the front door trim panels on each front door inside panel.
- **Electronic Vehicle Information Center** - In vehicles equipped with the optional BSM system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the

Instrument Panel Cluster/IPC) may display textual warnings and error messages related to the current operating status of the BSM system.

- **Radio Receiver Module** - The virtual buttons in the touch screen of the optional premium Radio Receiver Module (RRM) (also known as the radio or the head unit) provide an interface that allows the vehicle operator to enable, disable and modify certain BSM system settings using the customer programmable features option.

Hard wired circuitry connects the BSM system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The BSM system components cannot be adjusted or repaired. If any of the BSM system components becomes damaged or ineffective, that component must be replaced.

CHIME WARNING SYSTEM

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based IC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the IC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The IC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **beep** or **chime** tone.
- **Slow Rate Repetitive Chime Tones** - Repeated **chime** tones that are issued at a rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime Tones** - Repeated **chime** tones that are issued at a rate of about 180 chimes per minute.

Hard wired circuitry connects the IC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the IC through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The IC chime warning system circuits and components cannot be adjusted or repaired. If the IC circuitry, the on-board transducer or the relay are damaged or ineffective, the IC assembly must be replaced.

FORWARD COLLISION WARNING PLUS

The Forward Collision Warning Plus (FCW+) system is an enhancement to the current vehicles equipped with Adaptive Cruise Control (ACC) and a Forward Facing Camera (FFC). This system uses the FFC for enhanced sensitivity to objects in front of the vehicle. The system utilizes radar and video input to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn/assist the driver in avoiding the incident. The system communicates with other components on the vehicle to apply the brakes and/or to alert the driver through visual and audible warnings. The FCW Plus function operates regardless of whether ACC with stop and go is active or not. The system operates down to 0 mph and provides audible closing/proximity warnings as well as brake pedal vibration.

Forward Collision Warning options and Active Braking settings can be changed. When the vehicle is equipped with a Uconnect® 8.4/8.4A system screen, the Safety and Driving Assistance soft key needs to be selected to access the options menu. When the vehicle is equipped with the Uconnect® 5.0 system, pressing the "+ MORE" hard-key located on the lower right side of the Uconnect® system will bring you to the "Settings" soft key.

The system also monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If no driver's steering input is received for 3-5 seconds, the system alert the driver with audio and visual warning. If the steering wheel continues to receive no torque input from the driver, the FCW+, ACC+ and LDW+ will deactivate. Once the vehicle has achieved road speeds of 60 km/h (37 mph) and below 160 km/h (100 mph), sense the drivers steering input and the FFC can clearly detect the lines in the road, the system will enable again. The system will also disable when the drivers seatbelt is unbuckled while the vehicle is travelling at speeds of 10 mph or greater.

The following is a list of FCW+ operations:

- Utilizes Radar and Video sensors to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn / assist the driver in avoiding / mitigating the incident;
- The driver has the ability to adjust the sensitivity and turn brake support on or off in the radio;
- Prefill: Prepares the brakes for emergency braking;
- Audible & Visual Warnings;
- Brake Jerk: Short deceleration to alert driver;
- CMS (Collision Mitigation System) Up to 1.5 sec of braking to give driver additional reaction time;

- ABA (Advanced Brake Assist) If the driver is not braking enough, ABA will increase the braking to avoid / mitigate the accident. **NOTE: it is important to note the system will use "mitigated" braking to avoid accidents, but will not completely stop the vehicle in all scenarios if an impact is imminent - its purpose is to "warn and assist".**

LANE DEPARTURE WARNING (LDW+)

Haptic Lane Departure Warning Plus (LDW+) - This system is an available option offered on vehicles equipped with Electronic Power Steering (EPS) and the Forward Facing camera (FFC). The system can be turned on or off with a single hard button the Auxiliary Switch Bank Module (ASBM). The LED on the button will inform the driver of the system status when the driver is not on the Drive Assist screen. The system operates when enabled above 60 km/h (37 mph) and below 160 km/h (100 mph).

The LDW+ system issues a warning alert to the driver in case of an unintended lane departure (i.e the driver did not use turn signals beforehand to confirm a planned lane change). The LDW system uses the Forward Facing Camera (FFC) to detect lane markings and measure vehicle position within those lane boundaries. The warning can be audible, visual or haptic feedback to the driver, for example through a vibration in the steering wheel that feels like a virtual "rumble strip" induced by the electronic powered steering (EPS) system. If the driver continues to unintentionally drift out of the lane, the system provides a visual warning to prompt the driver to adjust the vehicle's trajectory to remain within the lane boundaries. When only a single lane marking is detected and the driver unintentionally drifts across the lane marking (again, no turn signal), the LDW system provides a visual warning through the instrument cluster to prompt the driver to remain within the lane. When only a single lane marking is detected, as haptic warning will not be provided. The driver may manually override the haptic warning by applying torque into the steering wheel at any time. The use of the turn signal suppresses the warning.

No Hands Recognition Strategy - When operating conditions have been met, the LDW system will employ a "No Hands Recognition Strategy". The system monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If the hands are not detected, this will cause an audible warning to the driver consisting of left front and right front chimes as well as displaying a visual warning message. The strategy will cancel LDW+ activation if the driver does not return their hands to the wheel.

The driver can configure the torque feedback amount and warning zone start point through personalization settings in the radio. Three settings for each are provided.

The LDW system will indicate the current lane drift condition through the Electronic Vehicle Information Center (EVIC). When the LDW system is ON, the lane lines are gray when the lane boundaries have not been detected and the LDW indicator is solid white.

Changing LDW+ Status:

1. Press the "Controls" soft-key located on the bottom of the Uconnect® system screen.
2. Press the "Settings" soft-key.
3. Press the "Safety and Driving Assistance" soft-key.

Personalization Settings:

- The LDW+ system can be enabled/disabled via an ON/OFF defeat switch with indicator (indicator ON when system is OFF). The indicator will remain ON when a fault is detected in the LDW+ system.
- The LDW+ system retains the last system state (enabled or disabled) from the last ignition cycle when the ignition is changed to the ON/RUN position.
- The LDW+ system has a lane warning sensitivity setting to adjust earliest to latest haptic feedback warning levels (e.g. early, medium, late) located within the personalization settings.
- The LDW+ system retains the last lane warning sensitivity setting from the last ignition cycle when the ignition is changed to the ON/RUN position.
- The LDW+ system has a torque intensity setting to adjust the torque level (e.g. low, medium, high) of the haptic warning located within the personalization settings.
- The LDW+ lane sensitivity and torque intensity settings will not be locked out during driving.

EVIC Lane Detection Display -

3.5 EVIC Screen - Left Lane Departure - Only Left Lane Detected (Right Side Similar) :

- When the LDW system is ON, the LDW indicator is solid white when only the left lane marking has been detected and the system is ready to provide visual warnings in the EVIC if an unintentional lane departure occurs.
- When the LDW system senses that the lane has been approached and is in a lane cross situation, the left thick lane line flashes from gray to flashing white, the left thin line remains solid and the LDW indicator changes from solid white to a flashing yellow.

Left Lane Departure - Both Lanes Detected:

- When the LDW system is ON, the lane lines turn from gray to white to indicate that the lane markings have been detected. The LDW indicator is solid green when both lane marking have been detected and the system is "armed" to provide visual warnings in the EVIC and a torque warning in the steering wheel if an unintentional lane departure occurs.
- When the LDW system sense a lane cross situation, the left thick lane line turns solid white, the right thin line remains solid white. The LDW indicator changes from solid green to solid yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary. For example, if approaching the left side of the lane, the steering wheel will torque to the right side.
- When the LDW system senses the lane has been approached and is in a lane cross situation, the left thick lane line flashes from white to gray, the right thin line remains solid white and the LDW indicator changes from solid yellow to flashing yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary. For example, if approaching the left side of the lane, the steering wheel will torque to the right side.

7.0 EVIC Screen - Left Lane Departure - Only Left Lane Detected (Right Side Similar)

- When the LDW system is on, the lane lines are gray when the lane boundaries have not been detected and the LDW indicator is solid white.

- When the LDW system is ON, the LDW indicator is solid white when only the left lane marking has been

detected and the system is ready to provide visual warning in the EVIC if an unintentional lane departure occurs.

- When the LDW system senses the lane has been approached and is in a lane cross situation, the left lane line flashes think yellow and the right lane line remains grey.

Left Lane Departure - Both Lanes Detected:

- When the LDW system is ON, the lane lines turn from gray to white to indicate that the lane marking have been detected. The LDW indicator is solid green when both lane markings have been detected and the system is "armed" to provide visual warning in the EVIC and a torque warning in the steering wheel if an unintentional lane departure occurs.
- When the LDW system sense a lane cross situation, the left lane line changes to think yellow and the right lane line. The LDW indicator changes from solid green to solid yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary.
- When the LDW system senses the lane has been approached and is in a lane cross situation, the left lane line flashes yellow and the right lane line remains white. The LDW indicator changes from solid yellow to flashing yellow. At this time, torque is applied to the steering wheel in the opposite direction of the lane boundary.

PARK ASSIST SYSTEM

A park assist system is an optional factory-installed electronic parking aid. There are also three distinct versions of the park assist system. The three versions can be readily identified by noting the quantity of ultrasonic sensors installed and the sensor location in the rear or the front and rear bumper fascias. Additional details of each of these versions and their components can be found elsewhere in this service information.

- **Rear Park Assist** - The Rear Park Assist (RPA) alerts the vehicle operator to obstacles located in the path immediately behind the vehicle. This system has four radar sensors, all installed in the rear bumper fascia.
- **Front and Rear Park Assist** - The Front and Rear Park Assist (FRPA) alerts the vehicle operator to obstacles located in the path immediately in front of the vehicle as well as those behind. This system has ten radar sensors, four installed in the rear bumper fascia and six installed in the front bumper fascia. In vehicles equipped with an automatic transmission, the FRPA can also provide an additional autonomous braking alert (also known as stop and release) feature when the automatic transmission gear selector is in Reverse (R) and certain obstacles are detected at the rear of the vehicle. The autonomous braking feature is not available in vehicles equipped with a manual transmission.
- **Parallel and Perpendicular Park Assist** - The Parallel and Perpendicular Park Assist (PPPA) includes all of the features of the FRPA, but adds semiautomatic parallel and perpendicular parking assistance features. This system has twelve radar sensors, six installed in the rear bumper fascia and six installed in the front bumper fascia.

Hard wired circuitry connects the RPA, FRPA or PPPA components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RPA, FRPA or PPPA components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the

appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The RPA, FRPA and PPPA system components cannot be adjusted or repaired. If any of these components is damaged or ineffective, that component must be replaced.

REAR PARK ASSIST

A Rear Park Assist (RPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the path immediately behind the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The RPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Instrument Cluster** - In vehicles equipped with the optional RPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location and relative distance of obstacles within the rear path of the vehicle. The EVIC also displays textual warnings and error messages along with issuing audible alerts related to the current operating status of the RPA system.
- **Park Assist Module** - Vehicles equipped with the RPA system include a 4 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional RPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the RPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the RPA system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. Only the sensor membrane is visible on the outer surface of the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surface of the rear bumper fascia.
- **Radio Receiver Module** - In vehicles equipped with the RPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the rear path of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the

RRM provides an interface that allows the vehicle operator to manually disable or enable the RPA system using the customer programmable features option.

FRONT AND REAR PARK ASSIST

A Front and Rear Park Assist (FRPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the paths immediately behind and ahead of the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The FRPA is also capable of providing an autonomous brake warning (also known as brake and release) feature. When enabled, this feature will alert the vehicle operator when the automatic transmission gear selector is in the Reverse (**R**) position and an object is detected in the rear path of the vehicle by aggressively applying and releasing the brakes. Following an autonomous brake warning application, an icon representing the rear of the vehicle with three red arcs and the text **BRAKE!** will appear in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). This brake warning feature is not available in vehicles equipped with a manual transmission.

The FRPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - The Antilock Brake Module (ABM) controls the application of the vehicle brakes to implement the autonomous brake warning feature when it receives the appropriate electronic message input over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).
- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Antilock Brake Module (ABM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM).
- **Instrument Cluster** - In vehicles equipped with the optional FRPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location of obstacles within the front or rear paths of the vehicle. The EVIC also displays textual warnings and error messages along with issuing audible alerts related to the current operating status of the FRPA system.
- **Park Assist Module** - Vehicles equipped with the FRPA system include a 10 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional FRPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the FRPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the FRPA system have ten ultrasonic park assist sensors. Four are concealed behind the rear bumper fascia and six are concealed behind the front bumper fascia.

Only the sensor membrane is visible on the outer surface of the bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surfaces of the front and rear bumper fascias.

- **Radio Receiver Module** - In vehicles equipped with the FRPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the front and rear paths of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the front or rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the RRM provides an interface that allows the vehicle operator to manually disable or enable the FRPA system using the customer programmable features option.

PARALLEL AND PERPENDICULAR PARK ASSIST

A Parallel and Perpendicular Park Assist (PPPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the paths immediately behind and ahead of the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The PPPA is also capable of providing an autonomous brake warning (also known as brake and release) feature. When enabled, this feature will alert the vehicle operator when the automatic transmission gear selector is in the Reverse (**R**) position and an object is detected in the rear path of the vehicle by aggressively applying and releasing the brakes. Following an autonomous brake warning application, an icon representing the rear of the vehicle with three red arcs and the text **BRAKE!** will appear in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). This brake warning feature is not available in vehicles equipped with a manual transmission.

Finally, the PPPA provides a semiautomatic parallel and perpendicular park assist feature. When enabled, this feature will identify a suitable parking spot and help to steer the vehicle into a selected parallel or perpendicular parking spot accordingly.

The PPPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - The Antilock Brake Module (ABM) controls the application of the vehicle brakes to implement the autonomous brake warning feature when it receives the appropriate electronic message input over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).
- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Antilock Brake Module (ABM), the Electronic Power Steering (EPS) module, the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM).
- **Electronic Power Steering Module** - The Electronic Power Steering (EPS) module controls the vehicle steering in order to maneuver the vehicle into a selected parallel or perpendicular parking space based upon electronic message inputs received over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).

- **Instrument Cluster** - In vehicles equipped with the optional PPPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location of obstacles within the front or rear paths of the vehicle. The EVIC displays graphics and text to support the parallel and perpendicular parking features, textual warnings and error messages along with issuing audible alerts related to the current operating status of the PPPA system.
- **Parallel And Perpendicular Park Assist On Switch** - The Parallel and Perpendicular Park Assist (PPPA) features of the optional PPPA system can be selected and toggled using a PPPA On switch. The PPPA On switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the PPPA features On and toggle between the parallel and the perpendicular park assist features.
- **Park Assist Module** - Vehicles equipped with the PPPA system include a 12 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional PPPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the FRPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the PPPA system have twelve ultrasonic park assist sensors. Six are concealed behind the rear bumper fascia and six are concealed behind the front bumper fascia. Only the sensor membrane is visible on the outer surface of the bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surfaces of the front and rear bumper fascias.
- **Radio Receiver Module** - In vehicles equipped with the PPPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the front and rear paths of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the front or rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the RRM provides an interface that allows the vehicle operator to manually disable or enable the PPPA system using the customer programmable features option.

OPERATION

BLIND SPOT MONITOR SYSTEM

The primary components of the Blind Spot Monitor (BSM) system are the micro-controller based Electronic Control Units (ECU) integral to each of the two Radio Detection And Ranging (RADAR) sensors, one behind each outboard side of the rear bumper fascia. Each ECU operates on battery current received from a fuse in the interior Power Distribution Center (PDC) whenever the status of the ignition switch is On, and the ECU has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. Each of these ECU communicate with each other as well as with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus network.

The BSM system ECU continually monitor all of the BSM system circuits and components for readiness, and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ECU also communicate with a diagnostic scan tool over the CAN data bus. When a BSM system ECU stores a DTC, it sends an electronic request message to the Electronic Vehicle Information Center (EVIC) in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and a **SERVICE BLIND SPOT SYSTEM** or **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** textual message is displayed by the EVIC to alert the vehicle operator.

The BSM system ECU also monitor electronic messages received over the CAN data bus from the Radio Receiver Module (RRM) (also known as the radio or the head unit) indicating the customer programmable features settings for the BSM system. The BSM system ECU receive and analyze data inputs directly from the radar sensors, calculate and provide the proper hard wired outputs to illuminate the visual alert displays in their respective right or left outside rear view mirrors, as well as calculate and communicate the proper audible alert output requests to the RRM over the CAN data bus.

The BSM radar sensors allow the BSM system ECU to locate and identify nearby objects of interest meeting the criteria established by algorithms within the system software. The BSM displays provide the vehicle operator with a visual alert indicating that an object of interest has been detected within one of the vehicle detection zones. The BSM audible alerts are then issued by the RRM through the appropriate audio system speakers based upon electronic **audible alert request** messages received from the BSM system ECU. The BSM system ECU also send electronic **radio mute request** messages over the CAN data bus to the RRM whenever an audible alert is requested. This message activates the radio mute function while the audible alert is being sounded, then resumes normal radio function when the alert is completed.

The hard wired circuits between components related to the BSM system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM system or the electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the BSM system or the ECU and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) mode is active only when the manual transmission gear selector is in a position other than Reverse (**R**) or the automatic transmission gear selector is in a position other than Reverse (**R**) or Park (**P**). The BSM mode is intended to provide a visual alert to the driver when a target vehicle (object of interest) is located in the lane adjacent to and just behind either outside rear view mirror (the detection zone), in the blind spot area where vision of target vehicles may be inhibited by the rear structure of the host vehicle. If a turn signal is activated in the host vehicle in the same direction as that in which the target vehicle is located, an audible alert tone will also be generated. The audible alerts of the BSM mode are not active unless the turn signal is activated.

The width of the BSM mode detection zone covers one traffic lane over on each side of the host vehicle, approximately 4.0 meters (13 feet). The length of the BSM mode detection zone starts at the outside rear view mirror and extends approximately 4.5 meters (15 feet) rearward from the rear edge of the rear fascia. The BSM mode visual alerts are activated immediately if an object of interest is within the detection zone and meets the warning criteria. However, the BSM system will not activate these alerts if:

- The object of interest (target vehicle) comes from the rear of the detection zone and passes the host vehicle at a speed greater than 50 kilometers-per-hour (31 miles-per-hour).
- The object of interest (target vehicle) enters the detection zone from the front and remains in the zone for less than 1.5 seconds.
- The object of interest (target vehicle) passes through the detection zone with a relative speed greater than 20 kilometers-per-hour (12 miles-per-hour).
- The object of interest (target vehicle) passes the host vehicle from the opposite direction.

The BSM mode audible alert may be deactivated if the operator prefers using the customer programmable features settings within the RRM. The BSM mode can be configured for visual and audible alerts, visual alerts only or for the entire BSM system (including Rear Cross Path/RCP mode) to be turned Off.

REAR CROSS PATH MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) system provides a feature called Rear Cross Path (RCP) mode. The RCP mode is active only when the transmission gear selector (manual or automatic) is in the Reverse (**R**) position. The RCP mode is intended to aid the driver when backing out of parking spaces where vision of vehicles crossing laterally through the rear path of the host vehicle may be blocked. The host vehicle must proceed slowly and cautiously out of the parking space until the rear end of the vehicle is exposed. The BSM radar sensors will then have a clear view of the crossing traffic and, if an oncoming vehicle (object of interest) is detected, will generate visual and audible alerts to the operator of the host vehicle.

The BSM system monitors the rear detection zones on both sides of the vehicle for objects that are moving toward the side of the vehicle with speeds of from 1 to 3 kilometers-per-hour (1 to 2 miles-per-hour) up to 35 kilometers-per-hour (22 miles-per-hour), such as typically encountered in parking lot situations. In vehicles equipped with the BSM option, the RCP mode is enabled from the factory as a default. The RCP mode can be manually disabled and enabled by the vehicle operator using the customer programmable features option of the RRM.

The RCP mode normally uses the same BSM system customer programmable features settings. However, the RCP mode will always include the audible alert feature, even if it was disabled for the BSM mode using the RRM customer programmable features settings. The audible alert can not be deactivated for the RCP mode. The RCP mode visual alert is illuminated only in the display located on the same side of the vehicle where the object of interest is detected. Likewise, the RCP mode repeating short audible alert is issued only through the audio system speakers located on the same side of the vehicle where the object of interest is detected.

STANDBY MODE

The Blind Spot Monitor (BSM) system remains in standby mode as long as the park brake is applied in a _____

vehicle with a manual transmission, or while the automatic transmission gear selector lever is in the Park (P) position. In the standby mode the system receives vehicle information, responds to changes in customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and can perform limited self-diagnostics indicating hard system fault conditions.

CHIME WARNING SYSTEM

The chime warning system operates on battery current received from the Body Control Module (BCM) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch status. The chime warning system also monitors the ignition switch status so that some chime features are functional only when the status of the ignition switch is On, while other features are functional regardless of the ignition switch status.

In nearly every instance the chime warning system simply provides an audible output to support a visual indication provided by a gauge or an indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), or a textual message displayed by the Electronic Vehicle Information Center (EVIC). Outputs of the system include the following:

- **Battery Voltage Low Warning** - The IC transducer will generate one short chime when the **BATTERY VOLTAGE LOW** textual message is displayed in the EVIC. This warning indicates that the monitored electrical system voltage is low. This chime will only occur once during any ignition cycle.
- **Blind Spot Detection Temporarily Unavailable Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION TEMPORARILY UNAVAILABLE** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically disabled temporarily.
- **Blind Spot Detection Unavailable - Astronomy Zone Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION UNAVAILABLE - ASTRONOMY ZONE** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically turned Off.
- **Blind Spot Detection Unavailable - Wipe Off Rear Bumper Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION UNAVAILABLE - WIPE OFF REAR BUMPER** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically disabled due to an accumulation of road film, snow or ice on the rear bumper fascia that must be removed. This chime will occur each time the BSM system features would normally be employed.
- **Blind Spot System Off Warning** - The IC transducer will generate one short chime when the **BLIND SPOT SYSTEM OFF** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been manually turned Off by the vehicle operator.
- **Brake Fluid Low Warning** - The IC transducer will generate one short chime when the **BRAKE FLUID LOW** textual message is displayed in the EVIC. This warning indicates that the fluid level in the brake master cylinder is low. This chime will only occur once during any ignition cycle.
- **Check Fuel Cap Warning** - The IC transducer will generate one short chime when the **CHECK FUEL CAP** textual message is displayed in the EVIC. This warning indicates that the fuel cap is loose or not installed while the engine is running.
- **Door Open Warning** - The IC transducer will generate repetitive chimes at a slow rate when a **DOOR**

OPEN or **DOORS OPEN** textual message is displayed in the EVIC. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.

- **Driver Seat Belt Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **DRIVER SEATBELT UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that the driver side front seat belt is unbuckled while the vehicle is moving.
- **Engine Temperature Too Hot Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **ENGINE TEMPERATURE TOO HOT** textual message is displayed in the EVIC. This warning indicates that the monitored engine coolant temperature is too hot. This chime will only recur during an ignition cycle if the engine coolant temperature cycles below the temperature threshold and back to above that threshold once again.
- **Front Seat Belts Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **FRONT SEAT BELTS UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that both the driver side and passenger side front seat belts are unbuckled while the vehicle is moving.
- **Fuel Low Warning** - The IC transducer will generate one short chime when the **FUEL LOW** textual message is displayed in the EVIC. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.
- **Headlight Out Warning** - The IC transducer will generate one short chime when the **HEADLIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a low beam headlight circuit. This chime will only occur once during any ignition cycle.
- **High Beam Headlight Out Warning** - The IC transducer will generate one short chime when the **HIGH BEAM HEADLIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a high beam headlight circuit. This chime will only occur once during any ignition cycle.
- **Ignition Or Accessory On, Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **IGNITION OR ACCESSORY ON, LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the status of the ignition switch, an accessory system and the exterior lighting is On with the driver side front door open. The chimes will continue to sound until the status of the ignition switch, all accessory systems and the exterior lighting system is Off, or until the driver side front door is closed, whichever occurs first.
- **Inflate Tire Warning** - The IC transducer will generate one short chime when the **INFLATE TIRE TO XX Kpa (PSI)** textual message is displayed in the EVIC. This warning indicates that the Tire Pressure Monitor (TPM) system has detected a tire with a low inflation pressure. This chime will only occur once during any ignition cycle.
- **Key Fob Has Left Vehicle Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY FOB HAS LEFT VEHICLE** textual message is displayed in the EVIC. This warning indicates that the optional Keyless Go (KG) system will not operate until a valid key fob is detected within the vehicle.
- **Key Fob Not Detected Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY FOB NOT DETECTED** textual message is displayed in the EVIC. This warning indicates that the optional Keyless Go (KG) system will not operate until a valid key fob is detected within the vehicle.
- **Key In Ignition And Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY IN IGNITION AND LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the key is in the ignition switch and the exterior lighting system is turned On. The

chimes will continue to sound until the key is removed from the ignition switch or the exterior lighting system is turned Off, whichever occurs first.

- **Key In Ignition Warning** - The IC transducer will generate repetitive chimes at a fast rate when the **KEY IN IGNITION** textual message is displayed in the EVIC. This warning indicates that the key is in the ignition switch with the driver side front door open. The chimes will continue to sound until the key is removed from the ignition switch or the driver side front door is closed, whichever occurs first.
- **Left Turn Signal Light Out Warning** - The IC transducer will generate one short chime when the **LEFT TURN SIGNAL LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a left turn signal light circuit. This chime will only occur once during any ignition cycle.
- **Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the exterior lighting is turned On while the status of the ignition switch is Off. The chimes will continue to sound until the exterior lighting is turned Off or the ignition switch transitions to a status other than Off, whichever occurs first.
- **Oil Change Due Warning** - The IC transducer will generate one short chime when the **OIL CHANGE DUE** textual message is displayed in the EVIC. This warning indicates that the monitored engine oil change interval has been surpassed. This chime will only occur once during any ignition cycle.
- **Oil Pressure Low Warning** - The IC transducer will generate one short chime when the **OIL PRESSURE LOW** textual message is displayed in the EVIC. This warning indicates that the monitored engine oil pressure is low.
- **Park Assist Sensor Fail Warning** - The IC transducer will generate one short chime when the **PARK ASSIST SENSOR FAIL** textual message is displayed in the EVIC. This warning indicates that a sensor of the optional park assist system has failed.
- **Park Assist System Disabled Warning** - The IC transducer will generate one short chime when the **PARK ASSIST SYSTEM DISABLED** textual message is displayed in the EVIC. This warning indicates that the optional park assist system has been automatically disabled due to a fault in a monitored circuit or component of the system. This chime will occur each time the park assist system features would normally be employed.
- **Park Assist Unavailable - Wipe Off Sensors Warning** - The IC transducer will generate one short chime when the **PARK ASSIST UNAVAILABLE - WIPE OFF SENSORS** textual message is displayed in the EVIC. This warning indicates that the optional park assist system has been automatically disabled due to an accumulation of road film, snow or ice on the sensor membrane that must be removed. This chime will occur each time the park assist system features would normally be employed.
- **Parking Brake Engaged Warning** - The IC transducer will generate one short chime when the **PARKING BRAKE ENGAGED** textual message is displayed in the EVIC. This warning indicates that the parking brake is engaged while the vehicle is moving. This chime will only occur once during any ignition cycle.
- **Parking Light Out Warning** - The IC transducer will generate one short chime when the **PARKING LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a parking light circuit. This chime will only occur once during any ignition cycle.
- **Passenger Seat Belt Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **PASSENGER SEATBELT UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that the passenger side front seat belt is unbuckled while the vehicle is moving.

- **Plate Light Out Warning** - The IC transducer will generate one short chime when the **PLATE LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a license plate light circuit. This chime will only occur once during any ignition cycle.
- **Rain Sensor Failure Warning** - The IC transducer will generate one short chime each time the **RAIN SENSOR FAILURE** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in the rain sensor in vehicles equipped with the optional automatic windshield wiper system. This chime will only occur once during any ignition cycle.
- **Reverse Light Out Warning** - The IC transducer will generate one short chime when the **REVERSE LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a reverse (or backup) light circuit. This chime will only occur once during any ignition cycle.
- **Right Turn Signal Light Out Warning** - The IC transducer will generate one short chime when the **RIGHT TURN SIGNAL LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a right turn signal light circuit. This chime will only occur once during any ignition cycle.
- **Service Airbag System Warning** - The IC transducer will generate one short chime each time the **SERVICE AIRBAG SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Supplemental Restraint System (SRS). This chime will only occur once during any ignition cycle.
- **Service Airbag Warning Light** - The IC transducer will generate one short chime each time the **SERVICE AIRBAG WARNING LIGHT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in the airbag indicator circuit of the Supplemental Restraint System (SRS). This chime will only occur once during any ignition cycle.
- **Service Antilock Brake System Warning** - The IC transducer will generate one short chime each time the **SERVICE ANTILOCK BRAKE SYSTEM WARNING** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Antilock Brake System (ABS). This chime will only occur once during any ignition cycle.
- **Service Blind Spot System Warning** - The IC transducer will generate one short chime each time the **SERVICE BLIND SPOT SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional Blind Spot Monitor (BSM) system. This chime will only occur once during any ignition cycle.
- **Service Electronic Braking System Warning** - The IC transducer will generate one short chime each time the **SERVICE ELECTRONIC BRAKING SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the electronic braking system. This chime will only occur once during any ignition cycle.
- **Service Electronic Throttle Control Warning** - The IC transducer will generate one short chime each time the **SERVICE ELECTRONIC THROTTLE CONTROL** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Electronic Throttle Control (ETC) system. This chime will only occur once during any ignition cycle.
- **Service Keyless System Warning** - The IC transducer will generate one short chime when the

SERVICE KEYLESS SYSTEM textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional Passive Entry Keyless Go (PEKG) system.

- **Service Park Assist System Warning** - The IC transducer will generate one short chime when the **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional park assist system. This chime will only occur once during any ignition cycle.
- **Service Power Steering Warning** - The IC transducer will generate one short chime when the **SERVICE POWER STEERING** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the electric power steering system. This chime will only occur once during any ignition cycle.
- **Service Tire Pressure System Warning** - The IC transducer will generate one short chime each time the **SERVICE TIRE PRESSURE SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Tire Pressure Monitor (TPM) system. This chime will only occur once during any ignition cycle.
- **Traction Control Off Warning** - The IC transducer will generate one short chime when the **TRACTION CONTROL OFF** textual message is displayed in the EVIC. This warning indicates that the Electronic Stability Control (ESC) has been manually turned Off by the vehicle operator.
- **Trunk Open Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **TRUNK OPEN** textual message is displayed in the EVIC. This warning indicates that the trunk (deck lid) is not closed or completely latched while the vehicle is moving.
- **Turn Signal Indication** - The IC relay will generate repetitive clicks at a slow rate whenever a turn signal is active. The clicks will occur at a fast rate when a turn signal bulb outage is detected.
- **Turn Signal On Reminder** - The IC transducer will generate repetitive chimes at a slow rate when the **TURN SIGNAL ON** textual message is displayed in the EVIC. This reminder indicates that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle moving. The hazard warning flashers will not activate this chime feature.
- **Vehicle Not In Park Warning** - The IC transducer will generate one short chime when the **VEHICLE NOT IN PARK** textual message is displayed in the EVIC. This warning indicates that the PARK position of the transmission is not engaged.
- **Washer Fluid Low Warning** - The IC transducer will generate one short chime when the **WASHER FLUID LOW** textual message is displayed in the EVIC. This warning indicates that the fluid level in the windshield washer reservoir is low. This chime will only occur once during any ignition cycle.

The IC provides chime service for all available features in the chime warning system, except for the audible warning function provided by the Radio Receiver Module (RRM) for the optional park assist system. The IC relies upon its internal programming, numerous hard wired inputs and electronic message inputs received from other electronic modules over the Controller Area Network (CAN) data bus to provide the chime warning system features. The programming of the IC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls and communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

FORWARD COLLISION WARNING PLUS

The Forward Collision Warning Plus (FCW+) system is only active when the status of the ignition switch is ON and the PRNDL is in D (Drive). The system can be manually disabled and enabled by the vehicle operator using hard button on the Auxiliary Switch Bank Module (ASBM). The default status of FCW+ is "On". The system state is kept in memory from one key cycle to the next. If the system is turned OFF, it will remain OFF when the vehicle is restarted. The minimum speed for FCW+ activation is 5 mph (10 km/h).

Components that make up the FCW+ system are the Forward Facing Camera (FFC), Powertrain Control Module (PCM), ASBM and the Adaptive Cruise Control Plus (ACC+) radar sensor/module. The radar module is the component that is responsible for the FCW+, Lane Departure Warning Plus (LDW+) and ACC+ decision making. The radar sensor receives data from the FFC and performs a data fusion with its own sensor data. At this point, the radar determines if a FCW+, LDW+ or ACC+ event needs to occur.

Since there are multiple modules involved in the operation of the FCW+ system, all faults or diagnostic trouble codes should be checked during diagnosis. The system utilizes the radar sensor in front of the vehicle, so any alignment or configuration issues may cause the system to be inoperative. If the ACC radar detects incorrect or compromised information from the FFC, the ACC+/FCW+ will function in a limited capacity. If the data consistency continue to occur from the FFC, a fault code will set.

NOTE: **The FCW+ does not stop the vehicles automatically, but alerts and assists the driver to help avoid or mitigate a collision. If the driver does not respond to any of the audible, visual, and haptic warnings, the impact may not be avoided**

The FCW+ system uses fusion of the sensor data from the ACC radar and the FFC to detect a probable frontal or forward collision. The following actions will be performed when qualified:

- **Pre Fill -**

The pre-fill process prepares the brakes for emergency braking by engaging the pump and applying a small amount of pressure to the brakes. This allows for immediate braking. Sufficient pressure applied between the brake pads and the discs means that driver intervention has a more immediate impact.

- **Audible and Visual Warnings** - Audible sounds within the cabin of the vehicle and visual warnings shown within the EVIC are activated when necessary to notify the driver.
- **Brake Jerk** - A short deceleration is performed to alert the driver.
- **Collision Mitigation System (CMS)** - CMS assists braking operation by automatically applying an

appropriate amount of braking force to help avoid or minimize the chances of hitting a vehicle. CMS allows up to 1.5 seconds of braking to give the driver additional reaction time. When CMS activates its automatic brake, it also turns the brake lights on.

- **Advanced Brake Assist (ABA)** - Once the driver presses the brake pedal, advanced brake assist (ABA) will engage. If the driver is not applying enough force, ABA will increase the braking force required to avoid or mitigate the accident. If the driver does not react to any of the previous warnings, the collision cannot be avoided.

The hard wired circuits between components related to the FCW+ system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the FCW+ system or the electronic controls and communication between modules and other devices that are provided some features of the FCW+ system. The most reliable, efficient and accurate means to diagnose the system or the electronic controls and communication related to the FCW+ system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

LANE DEPARTURE WARNING (LDW+)

The purpose of the Lane Departure Warning (LDW+) system is to provide a warning alert to the driver in case of an unintended lane departure (i.e the driver did not use turn signals beforehand to confirm a planned lane change).

The LDW+ system will be enabled and ready to provide feedback when the following conditions are met:

- System voltage is in a normal operating range.
- The vehicle ignition is in the ON/RUN state & driver has enabled the system & reverse gear is NOT engaged.
- No LDW+ system faults are present.
- Roads with positive or negative inclination transition (change in road grade) of up to 5%
- Left and Right lane boundaries are both detected simultaneously. (HAPTIC only)
- Vehicle speed is above 37 mph (60 km/h) and below 100 mph (180 km/h)
- No intervention of the safety systems ABS, ESP and DAS Safety Requests, e.g. ABA, ACC takeover request, FCW, etc. Note: After the intervention of a safety system has ended, the LDW+ system can only provide haptic feedback warnings again after a calibratable period has been allowed to elapse.

The LDW+ system will retain the last system state (enabled or disabled) and the last lane warning sensitivity selected in the radio from the last ignition cycle when the ignition is changed to the On/Run position.

The system can be overridden by the driver using a variety of methods, including turn signals, driver steering torque, steering torque rate, and acceleration and deceleration rate. The LDW+ system can also be turned on or off with a single hard button on the switch bank. The LED on the button will inform the driver of the system status when the driver is not on the driver assist screen in the EVIC. The feature will automatically disable when a safety system engages (such as traction control).

The main component of the LDW+ system is the forward facing camera. The camera mounts near the rear view mirror and communicates on the CAN-C bus. The camera also has a dedicated private CAN B bus that connects directly to the radar sensor and that is used for forward collision warning and adaptive cruise control. The camera has the ability to detect alignment faults and is adjusted similar to the smart beam camera.

Another important factor in system operation is road condition. The forward facing camera has the ability to detect the contrast of the surface of the pavement and the white or yellow lines. Roads that are not marked or that have extremely worn markings may not be detected by the camera which will disable the system. While monitoring the EVIC display for driver assist systems, a customer can tell if the system is enabled by the solid lines on the display. This is also important for diagnosing an intermittent or inoperative concern.

The system also monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If no driver's steering input is received, the system will deactivate until all enabling conditions are met. These Include:

- Drivers steering input.
- The FFC can clearly detect the lines in the road.
- There are no Diagnostic Trouble Codes (DTC) present in the steering or LDW+ system.
- Vehicle speed is above 37 mph (60 km/h) and below 100 mph (180 km/h).

COMPONENT RESPONSIBILITY - BODY CONTROL MODULE (BCM)

- Acquisition on the CAN-C bus of the LDW+ system enabled/disabled status from the Forward Facing Camera (FFC) to control the Auxiliary Switch Bank Module (ASBM) LED indication.

- Acquisition on the CAN-C bus of the chime request from the FFC to inform the driver to place his/her hands on the steering wheel.
- Acquisition on the CAN-C bus of the current LDW+ system sensitivity setting from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system torque intensity setting from the FFC.
- Acquisition on the LIN bus of the LDW+ system enable/disable switch (pressed/not pressed) status from the ASBM.
- Gates the ASBM on/off signal command on LIN to a signal on CAN-C.
- Gates the current ASBM status signal on CAN-C to the BCM concerning an ASBM control signal on the LIN bus.
- Transmission on the CAN-B bus of the chime request to the Radio to inform the driver to place his/her hands on the steering wheel (audible alert).
- Transmission on the CAN-B bus of the LDW+ system current sensitivity setting to the Radio.
- Transmission on the CAN-B bus of the LDW+ system current torque intensity setting to the Radio.
- Transmission on the CAN-C bus of the brake pedal status to the FFC.
- Transmission on the CAN-C bus of the (left/right) turn signal lamp status to the FFC.
- Transmission on the CAN-C bus of the wiper status (parked/not parked) to the FFC.
- Transmission on the CAN-C bus of the LDW+ system enable/disable request to the FFC (gated from LIN).
- Transmission on the CAN-C bus of the LDW+ system sensitivity setting request (gated from CAN-B) to the FFC.
- Transmission on the CAN-C bus of the LDW+ system torque intensity setting request (gated from CAN-B) to the FFC.
- Transmission on the LIN bus of the LDW+ system enable/disable switch indicator control status to the ASBM (gated from CAN-C).

COMPONENT RESPONSIBILITY - ELECTRONIC POWER STEERING (EPS)

- Apply directional torque to the steering wheel based on lane position of vehicle during an unintentional lane departure.
- Manage the Torque Overlay Interface (TOI).
- Acquisition on the CAN-C bus of the torque overlay interface activation request from the FFC.
- Acquisition on the CAN-C bus of the FFC system status from the FFC.
- Acquisition on the CAN-C bus of the FFC drive style status from the FFC.
- Transmission on the CAN-C bus of the steering angle and steering angle rate to the FFC.
- Transmission on the CAN-C bus of the FFC Torque Overlay Interface activation status to the FFC.
- Transmission on the CAN-C bus of the FFC Torque Overlay Interface fault status to the FFC.
- Transmission on the CAN-C bus of the DST Torque Overlay Interface activation status to the FFC.
- Transmission on the CAN-C bus of the EPS temporary deactivation status to the FFC.
- Transmission on the CAN-C bus of the steering column torque to the FFC.
- Transmission on the CAN-C bus of the steering column torque validity to the FFC.

- Transmission on the CAN-C bus of the EPS motor torque to the FFC.
- Transmission on the CAN-C bus of the EPS motor torque validity to the FFC.

COMPONENT RESPONSIBILITY - FORWARD FACING CAMERA (FFC)

- Monitor the road scenario.
- Process the video image.
- Quantify the geometry of the lane boundaries in front of the vehicle.
- Calculate the torque request to control the vehicle response based on lane position of vehicle.
- Evaluate the "Hands Off" condition. When the driver's hands are not detected on the steering wheel, the system provides an audible warning consisting of left front and right front chimes to inform the driver to place his/her hands on the steering wheel.
- Acquisition on the CAN-C bus of the EPS motor torque from the EPS.
- Acquisition on the CAN-C bus of the FFC Torque Overlay Interface activation status from the EPS.
- Acquisition on the CAN-C bus of the FFC Torque Overlay Interface fault status from the EPS.
- Acquisition on the CAN-C bus of the effective torque applied on the steering wheel from the EPS.
- Acquisition on the CAN-C bus of the brake pedal status from the BCM.
- Acquisition on the CAN-C bus of the (left/right) turn signal request status from the SCCM.
- Acquisition on the CAN-C bus of the (left/right) turn signal lamp status from the BCM.
- Acquisition on the CAN-C bus of the wiper status (parked/not parked) from the BCM.
- Acquisition on the CAN-C bus of the LDW+ system enable/disable request from the BCM.
- Acquisition on the CAN-C bus of the customer-selected LDW+ system sensitivity setting from the BCM.
- Acquisition on the CAN-C bus of the customer-selected LDW+ system torque intensity setting from the BCM.
- Acquisition on the CAN-C bus of the ABS status from the BSM.
- Acquisition on the CAN-C bus of the ESC status from the BSM.
- Acquisition on the CAN-C bus of the DAS request active status from the BSM.
- Acquisition on the CAN-C bus of the vehicle speed from the BSM.
- Acquisition on the CAN-C bus of the yaw rate offset from the BSM.
- Acquisition on the CAN-C bus of the lateral acceleration offset from the BSM.
- Acquisition on the CAN-C bus of the longitudinal acceleration offset from the BSM.
- Acquisition on the CAN-C bus of the ACC takeover request from the DASM.
- Acquisition on the CAN-C bus of the Forward Collision Warning system status from the DASM.
- Acquisition on the CAN-C bus of the engine start/stop status from the ECM.
- Acquisition on the CAN-C bus of the gas pedal position from the ECM.
- Acquisition on the CAN-C bus of the reverse gear status from the ECM.
- Acquisition on the CAN-C bus of the steering angle from the EPS.
- Acquisition on the CAN-C bus of the steering angle rate from the EPS.
- Acquisition on the CAN-C bus of the DST Torque Overlay Interface activation status from the EPS.

- Acquisition on the CAN-C bus of the EPS temporary deactivation status from the EPS.
- Acquisition on the CAN-C bus of the yaw rate from the ORC.
- Acquisition on the CAN-C bus of the lateral acceleration from the ORC.
- Acquisition on the CAN-C bus of the longitudinal acceleration from the ORC.
- Transmission on the CAN-C bus of the torque request to the EPS.
- Transmission on the CAN-C bus of the LDW+ system enabled/disabled status to the BCM.
- Transmission on the CAN-C bus of the chime request to the BCM (gateway) to inform the driver to place his/her hands on the steering wheel.
- Transmission on the CAN-C bus of the current LDW+ system sensitivity and torque intensity settings to the BCM and IPC.
- Transmission on the CAN-C bus of the LDW+ lane boundary detection status to the IPC.
- Transmission on the CAN-C bus of the LDW+ warning status to the IPC.
- Transmission on the CAN-C bus of the LDW+ ISO telltale status to the IPC.
- Transmission on the CAN-C bus of the LDW+ display popup status to the IPC.
- Transmission on the CAN-C bus of the LDW+ fault status to the IPC.

COMPONENT RESPONSIBILITY - INSTRUMENT PANEL CLUSTER (IPC)

- Display LDW+ system state, configuration (sensitivity setting, torque intensity setting), lane boundary detection, warning and fault status.
- Acquisition on the CAN-C bus of the LDW+ lane boundary detection status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ warning status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ fault status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ ISO telltale status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ display popup status from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system sensitivity setting from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system torque intensity setting from the FFC.

COMPONENT RESPONSIBILITY - AUXILIARY SWITCH BANK MODULE (ASBM)

- Display LDW+ system defeat switch state (LED illuminated = LDW+ System is OFF, i.e. "defeated").
- Transmission on the LIN bus of the LDW+ system enable/disable switch (pressed/not pressed) status to the BCM.
- Acquisition on the LIN bus of the LDW+ system enable/disable switch indicator control status from the BCM.

CAMERA -

The camera is able to detect lane markings of any color (especially yellow and white which common colors for lane markings). The camera is able to detect and quantify the following information regarding the lane boundaries:

- The lateral distance from the center of the vehicle to the left lane boundary.
- The lateral distance from the center of the vehicle to the right lane boundary.
- The heading angle of the vehicle with respect to the center axis of the lane.
- A measurement of the radius of curvature of the road ahead of the vehicle.
- The type of lane boundary, i.e. double line, solid line, dashed line, road edge.
- The camera shall be capable of detecting if the camera lens is occluded and the windshield needs to be cleaned. During this condition, an indication is provided to clean the windshield.
- The camera is capable of self-monitoring and diagnosis to determine whether it is operating properly.
- The effective horizontal field of view of the camera is at a minimum of 36 degrees.
- The effective vertical field of view of the camera is at a minimum of 20 degrees.

IMAGE ACQUISITION -

These functional requirements address a vision-based approach for measurement of vehicle lateral position relative to lane boundaries in the lane of travel.

- In the daytime, the camera shall be able to detect lane markings where lighting and environmental conditions provide good visibility in excess of 30 meters.
- At night, the camera shall be able to detect lane markings with lighting conditions provided by standard, production low beam headlamps, with or without additional sources of road illumination, and where environmental conditions provide good visibility in excess of 30 meters.
- The camera shall be capable of compensating for sudden changes in lighting conditions such as during tunnel entry/exit.
- The LDW+ system shall not have degraded performance from changes of the camera pitch angle due to vehicle dynamics (e.g. during hard braking or acceleration) or under maximum rated vehicle loading conditions, i.e. gross vehicle weight rating (GVWR).
-

The hard wired circuits between components related to the LDW+ system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LDW+ system or the electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the LDW+ system and related communication operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

Details for the three versions of the park assist system available for this vehicle (Rear Park Assist/RPA, Front and Rear Park Assist/FRPA, or Parallel and Perpendicular Park Assist/PPPA) can be found under dedicated, separate headings within this service information.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR PARK ASSIST

The Rear Park Assist (RPA) system is active only when the status of the ignition switch is On, the transmission gear selector lever is in the Reverse (**R**) position and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The system can be manually disabled and enabled by the vehicle operator using the park assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual RPA alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the RPA alerts to become distracting due to the proximity of large trees or boulders and the extreme rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, and whenever the gear selector lever is in the Reverse (**R**) position. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the gear selector lever is in the Reverse (**R**) position.

The micro-controller based, 4 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the RPA system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Four ultrasonic park assist sensors in the rear bumper fascia allow the RPA system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 2 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear

corners of the vehicle.

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the rear of the vehicle designated for arc alerts: Center, Left and Right. The Center region consists of six zones, while the Right and Left regions consist of two zones. The zones range from furthest to nearest from the rear of the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the RPA audible warnings are being generated.

When the PAM monitors a problem in any of the RPA system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the rear fascia, the EVIC will display a **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the gear selector lever is in the Reverse (**R**) position.

FRONT AND REAR PARK ASSIST

The Front and Rear Park Assist (FRPA) system is active only when the status of the ignition switch is On, the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position, the manual transmission gear selector lever is in the Reverse **R** or is not in Reverse and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The system can be manually disabled and enabled by the vehicle operator using the park assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual FRPA alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the FRPA alerts to become distracting due to the proximity of large trees or boulders and the extreme front and rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions, or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in

Reverse positions. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour), or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour).

The micro-controller based, 10 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the FRPA system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM) (also known as the radio or the head unit), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Six ultrasonic park assist sensors in the front bumper fascia and four sensors in the rear bumper fascia allow the FRPA system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the front of the vehicle is about 1.2 meters (47 inches), or from the rear of the vehicle is about 2 meters (80 inches). The detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both front and rear corners of the vehicle.

In vehicles with an automatic transmission, the FRPA has an available autonomous brake warning feature (also known as brake and release). When the transmission gear selector position is Reverse (**R**), an object is detected at the rear of the vehicle at a vehicle velocity based distance value and the ultrasonic sensors are capable of detecting an object the PAM sends an electronic **brake and release** message to the Antilock Brake Module (ABM) over the CAN data bus network. The autonomous brake warning is aggressively performed by the ABM to reduce vehicle speed and pre-fill the brake hydraulic system in an effort to warn and to give the vehicle operator more time to react to a detected object at the rear of the vehicle.

The autonomous brake warning feature is an alert function, not a comfort function; therefore, the brake application will be sharp and sudden to disturb, rather than smooth and discrete. This feature is enabled from the factory as a default, but can be manually disabled or enabled by the vehicle operator using the customer programmable features settings menu of the RRM.

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the front or rear of the vehicle designated for arc alerts: Center, Left and Right. The Front Center region consists of five zones, the Rear Center region consist of six zones, while the Right and Left regions at the front and rear both consist of two zones. The zones range from furthest to nearest from the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the FRPA audible warnings are being generated.

When the PAM monitors a problem in any of the FRPA system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the front or rear fascia, the EVIC will display a **WIPE OFF FRONT PARK ASSIST SENSORS** or **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position or the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions.

PARALLEL AND PERPENDICULAR PARK ASSIST

The Parallel and Perpendicular Park Assist (PPPA) system is active only when the status of the ignition switch is On, the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position, the manual transmission gear selector lever is in the Reverse **R** or is not in Reverse and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The front and rear park assist features of this system can be manually disabled and enabled by the vehicle operator using the Park Assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual park assist alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the park assist alerts to become distracting due to the proximity of large trees or boulders and the extreme front and rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions, or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour), or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour).

The micro-controller based, 12 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the park assist system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Six ultrasonic park assist sensors in the front bumper fascia and six sensors in the rear bumper fascia allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the front of the vehicle is about 1.2 meters (47 inches), or from the rear of the vehicle is about 2 meters (80 inches). The detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both front and rear corners of the vehicle. In the PPPA system, the four sensors on the outboard right and left ends of the front and rear fascias have increased range over the other eight sensors and are not interchangeable.

In vehicles with an automatic transmission, the PPPA has an available autonomous brake warning feature (also known as brake and release). When the transmission gear selector position is Reverse (**R**), an object is detected at the rear of the vehicle at a vehicle velocity based distance value and the ultrasonic sensors are capable of detecting an object the PAM sends an electronic **brake and release** message to the Antilock Brake Module (ABM) over the CAN data bus network. The autonomous brake warning is aggressively performed by the ABM to reduce vehicle speed and pre-fill the brake hydraulic system in an effort to warn and to give the vehicle operator more time to react to a detected object at the rear of the vehicle.

The autonomous brake warning feature is an alert function, not a comfort function; therefore, the brake application will be sharp and sudden to disturb, rather than smooth and discrete. This feature is enabled from the factory as a default, but can be manually disabled or enabled by the vehicle operator using the customer programmable features settings menu of the Radio Receiver Module (RRM) (also known as the radio or the head unit).

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the front or rear of the vehicle designated for arc alerts: Center, Left and Right. The Front Center region consists of five zones, the Rear Center region consist of six zones, while the Right and Left regions at the front and rear both consist of two zones. The zones range from furthest to nearest from the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the park assist audible warnings are being generated.

The semiautomatic parallel and perpendicular parking feature is designed to assist the vehicle operator, not to substitute for the vehicle operator. The vehicle operator must stay in full control of the acceleration and braking of the vehicle. The driver initiates the parallel and perpendicular parking feature by using the Parallel And Perpendicular Park Assist On push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM).

Once the parallel and perpendicular park feature is turned On, a Active Park Sense Search screen pops up in the EVIC display unit. The initial search screen to pop up will be for the parallel parking feature, but text at the bottom of the EVIC display advises, **Press OK for Perpendicular Park**. The vehicle operator can then press the **OK** push button in the EVIC switch pod on the left horizontal spoke of the steering wheel to toggle back and forth between the parallel parking space and perpendicular parking space search screens. From this point through completion of the selected parking maneuver, the system will automatically coach the vehicle operator through the location of an appropriate parking space and the parking maneuver using both graphical representations and text that pops up within the EVIC display unit.

During parallel and perpendicular parking maneuvers the PPPA system assists the vehicle operator by measuring and identifying an appropriate parking space while driving slowly past the potential space. Then the system calculates the appropriate trajectory and controls the steering wheel to steer the vehicle into the selected space. Depending upon the parking maneuver selected, the PPPA system is capable of steering a vehicle into a parallel or a perpendicular parking space on either the driver side or the passenger side of the vehicle. The PAM controls the measuring and maneuvering of the vehicle by monitoring the ultrasonic sensor inputs and sending the appropriate electronic messages to the Electronic Power Steering (EPS) module over the CAN data bus.

When the PAM monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the front or rear fascia, the EVIC will display a **WIPE OFF FRONT PARK ASSIST SENSORS** or **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position or the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLIND SPOT MONITOR SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The following textual messages related to the Blind Spot Monitor (BSM) system may appear within the Electronic Vehicle Information Center (EVIC) display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC):

- **BLIND SPOT SYSTEM OFF** - This message to the vehicle operator when the ignition switch first transitions to the On status indicates that the BSM system has been turned Off using the customer programmable features function of the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **SERVICE BLIND SPOT SYSTEM** - This message to the vehicle operator while the ignition switch status is On indicates that the BSM system is unavailable due to a monitored system fault or faults.
- **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** - This message to the vehicle operator while the ignition switch status is On indicates that the BSM system is temporarily unavailable as a result of one of the following:
 1. **Sensor Blockage** - The amber BSM visual icon in both outside rear view mirrors will be illuminated as long as blockage exists or until the ignition switch status transitions to Off, whichever occurs first.
 2. **Monitored System Fault** - The BSM system has detected a monitored system fault condition and has stored a Diagnostic Trouble Code (DTC). The amber BSM visual icon will be illuminated in both outside rear view mirrors for as long as the condition exists or until the ignition switch status transitions to Off, whichever occurs first.

NOTE: If the **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** message is received for a minimum of 5 minutes, please verify that the outboard area at each end of the rear fascia behind the rear wheel openings where the radar sensors are located is not blocked by snow, ice or road debris. If the area is blocked, remove the blockage and verify that the message is no longer present in the EVIC display.

NOTE: If the vehicle has experienced any trauma in the outboard area at each end of the rear fascia behind the rear wheel openings where the sensors are located, even if the fascia is not damaged, the radar sensor may have become misaligned. A misaligned radar sensor will result in the BSM system not operating properly.

The hard wired circuits between components related to the BSM system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM system or the electronic controls and communication between modules and other devices that provide some features of the system. The most reliable, efficient and accurate means to diagnose the BSM system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING - CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls and communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING - FORWARD COLLISION WARNING

The hard wired circuits between components related to the Forward Collision Warning (FCW+) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the FCW+ system or the electronic controls and communication between modules and other devices that provide some features of the FCW+ system. The most reliable, efficient and accurate means to diagnose the FCW+ system or the electronic controls and communication related to FCW+ system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING - LANE DEPARTURE WARNING SYSTEM

The hard wired circuits between components related to the Lane Departure Warning (LDW+) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LDW+ system or the electronic controls and communication between modules and other devices that provide some features of the

LDW+ system. The most reliable, efficient and accurate means to diagnose the LDW+ system or the electronic controls and communication related to LDW+ system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING - PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

If a **SERVICE PARK ASSIST SYSTEM** graphic and textual message appears in the Electronic Vehicle Information Center (EVIC) display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), be certain to confirm the following:

- Be certain that the rear bumper fascia (with Rear Park Assist/RPA) is, or the front and rear bumper fascias (with Front and Rear Park Assist/FRPA or with Parallel and Perpendicular Park Assist/PPPA) are free of dirt and debris to keep the system operating properly.
- The presence of jackhammers, large trucks and other sources of vibration in the vicinity of the vehicle could also impact the performance of the system.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING**.

DISPLAY, BLIND SPOT

DESCRIPTION

DESCRIPTION

0809004962

Fig. 2: Outside Rear View Mirror & Translucent Triangle Icon
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Blind Spot Monitor (BSM) system have a display that appears in both the right and left outside rear view mirrors (1). The display consists of a translucent triangle icon (2) in the mirror glass that is illuminated by an amber Light Emitting Diode (LED) unit mounted behind the icon on the mirror glass case. When illuminated, only the amber colored triangle is visible on the outer surface of the mirror glass. The LED unit for the display is connected to the vehicle electrical system along with the other wiring for the power mirror through a dedicated take out and connector of the door wire harness.

The BSM displays are each integral to the outside rear view mirror glass and case unit. The displays cannot be adjusted or repaired. If a BSM display is ineffective or damaged, the entire mirror glass and case unit must be replaced. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.

OPERATION

OPERATION

The Blind Spot Monitor (BSM) displays provide the vehicle operator with a visual alert that a target vehicle (object of interest) has been detected by the BSM system within one of the BSM or Rear Cross Path (RCP) detection zones. The BSM display is also illuminated momentarily as a bulb test each time the ignition switch status transitions to On as a part of the BSM system self tests. If a BSM display remains illuminated with the park brake applied or with the automatic transmission gear selector lever in the Park (P) position, it indicates that the BSM system has registered a system fault and may require service.

Each BSM display is completely controlled by a hard wired output of the Driver Door Module (DDM) or Passenger Door Module (PDM) on the same side of the vehicle as the display. The DDM and PDM receive electronic messages over the Controller Area Network (CAN) data bus from the Blind Spot Module (BSM) integral to the Radio Detection And Ranging (RADAR) smart sensor (also known as Left Blind Spot Sensor/LBSS or Right Blind Spot Sensor) for the same side of the vehicle. The display units are grounded at all times through a takeout and evelet terminal of the body wire harness that is secured to the body sheet metal.

The hard wired circuits between the BSM displays and the DDM or PDM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM displays or the electronic controls and communication between other modules and devices that provide some features of the BSM displays. The most reliable, efficient and accurate means to diagnose the BSM displays or the electronic controls and communication related to BSM display operation requires the use of a diagnostic scan tool.

DISPLAY, PARK ASSIST

DESCRIPTION

DESCRIPTION

The park assist graphics share the Electronic Vehicle Information Center (EVIC) display, which is an electronic display unit located near the center of, and soldered onto the printed circuit board of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). Refer to **CENTER, ELECTRONIC VEHICLE**

INFORMATION, DESCRIPTION . The park assist display along with the EVIC electronic display unit receive battery current and ground from, and are completely controlled by the IC circuit board.

The park assist graphics are only displayed when the system is active, sound and display mode is enabled, and an object or obstacle is detected within a detection area. The IC then displays the park assist graphic along with the appropriate object detection alert bar and arc sections within the EVIC display to indicate the approximate relative distance and location of the object or obstacle.

The EVIC electronic display unit is serviced only as a complete unit with the IC. The display unit cannot be adjusted or repaired. If ineffective or damaged, the entire IC unit must be replaced.

OPERATION

OPERATION

The park assist display in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) provides the vehicle operator with visual feedback by illuminating a vehicle graphic and object detection bar and arc sections in zones at the rear (with Rear Park Assist/RPA) or front and rear (with Front and Rear Park Assist/FRPA or with Parallel and Perpendicular Park Assist/PPPA) of the icon indicating the approximate relative location and distance of an object or obstacle from the vehicle. The fewer bar and arc sections illuminated, the nearer the object. In addition, the nearest bar sections can change from solid illumination to flashing on and off or from amber to red in color as the object or obstacle becomes nearer.

The IC will display the park assist graphics in the EVIC electronic display unit whenever an object is within the detection area and an electronic request message is received from the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) over the Controller Area Network (CAN) data bus.

Conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls and communication between modules and other devices that provide some features of the park assist display. The most reliable, efficient and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE, BLIND SPOT

DESCRIPTION

DESCRIPTION

The optional Blind Spot Monitor (BSM) system used in this vehicle has two control modules. One control module is dedicated to each side of the vehicle. A Blind Spot Module (BSM) is integral to the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) for the same side of the vehicle. Refer to **SENSOR, BLIND SPOT, DESCRIPTION**.

MODULE, PARK ASSIST

DESCRIPTION

DESCRIPTION

3767779

Fig. 3: Park Assist Module, Connector Receptacles & Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

The Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) (1) is secured with two nuts to weld studs through two mounting tabs (3) integral to the module housing on the left quarter inner panel just behind the left rear wheel house. The module is concealed behind the quarter inner trim within the cargo area of the vehicle. Concealed within the molded plastic PAM housing is a micro-controller and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry.

There are three unique versions of the PAM used that are similar in appearance, but are not interchangeable. The PAM version depends upon the version of the park assist system in the vehicle. The Rear Park Assist (RPA) uses a 4 channel PAM, the Front and Rear Park Assist (FRPA) system uses a 10 channel PAM, and the Parallel and Perpendicular Park Assist (PPPA) uses a 12 channel PAM.

Two or three connector receptacles (2) containing terminal pins are integral to the downward-facing side of the housing. The module is connected to the vehicle electrical system through dedicated take outs and connectors of the body wire harness. The number of connector receptacles and body harness take outs also depends upon which of the three available versions of the park assist system is installed in the vehicle.

The PAM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced with a new unit. The PAM software is flash programmable.

OPERATION

OPERATION

The micro-controller within the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) contains the park assist system logic circuits. The PAM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for park assist system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The PAM provides source current to the park assist sensors located on the bumper fascia or fascias. The PAM then monitors return inputs from each of the sensors on dedicated hard wired data communication circuits. These sensor inputs allow the PAM to determine when an obstacle is in the path of the vehicle, to calculate the relative location of an obstacle and to determine whether the distance to that obstacle is increasing or decreasing.

Pre-programmed decision algorithms and calibrations allow the PAM micro-controller to determine the appropriate park assist system outputs based upon the inputs received from the park assist sensors and electronic messages received from other modules in the vehicle over the CAN data bus. When the programmed conditions are met, the PAM sends electronic messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM) (also known as the radio or the head unit) over the CAN data bus to obtain the proper park assist system visual and audible outputs.

In vehicles equipped with an automatic transmission and the optional Front and Rear Park Assist (FRPA) or the Parallel and Perpendicular Park Assist (PPPA), the PAM also communicates with the Antilock Brake Module (ABM) using electronic messaging over the CAN data bus to provide the autonomous brake (also known as

brake and release) warning feature. In vehicles equipped with the optional PPPA, the PAM also communicates with the Electronic Power Steering (EPS) module using electronic messaging over the CAN data bus to provide the semiautomatic parallel and perpendicular parking features.

While the system is active, the PAM micro-controller continuously monitors all of the park assist system electrical circuits and components to determine the system readiness. If a monitored system fault is detected, the PAM sets a Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the IC to control the display of the appropriate park assist system graphics and textual messages in the Electronic Vehicle Information Center (EVIC) display within the IC and the generation of the appropriate audible warnings by the IC.

The PAM receives battery current on a fused ignition output (run) circuit through the Power Distribution Center/PDC). The PAM has a path to ground at all times through a ground circuit and take out of the body wire harness that is secured to the body sheet metal. These connections allow the PAM to be operational whenever the status of the ignition switch is On.

The hard wired circuits between components related to the PAM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PAM or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the PAM or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PARK ASSIST MODULE

The hard wired circuits between components related to the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) may be diagnosed using conventional diagnostic tools and procedures. Fig. 5: Left Quarter Inner Panel, Connectors & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) (3) onto the weld studs on the left quarter inner panel (1) just behind the left rear wheel house.
2. Install and tighten the two nuts (2) that secure the PAM to the weld studs. Tighten the nuts securely.
3. Reconnect the body wire harness connectors (4) to the PAM connector receptacles.
4. Reinstall the trim onto the left quarter inner panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
5. Reconnect the negative cable to the battery.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

SENSOR, BLIND SPOT

DESCRIPTION

DESCRIPTION

Fig. 6: Blind Spot Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Blind Spot Monitor (BSM) system have two primary components. These components are the two Radio Detection And Ranging (RADAR) blind spot sensors (1) (also known as the Left or Right Blind Spot Sensors/LBSS or RBSS). In this vehicle, each sensor also includes an internal micro-controller and control circuitry that monitors and controls both the sensor and the blind spot display for the same side of the vehicle. This explains why the sensors are sometimes referred to as smart sensors.

Each sensor with control circuitry is contained and protected within a molded plastic case that includes an integral connector receptacle (2) at one end. The sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the rear bumper fascia wire harness. The two sensors are concealed behind the outboard ends of the rear bumper fascia. Each sensor is snapped into a dedicated molded plastic mounting bracket that is permanently affixed to the inside surface of the fascia just behind the left and right rear wheel openings.

The blind spot sensors and control circuitry cannot be adjusted or repaired. If a sensor is damaged or ineffective, it must be replaced with a new unit. The sensor module software is flash capable. The mounting bracket for each sensor is serviced only as a unit with the rear bumper fascia.

OPERATION

OPERATION

The Blind Spot Monitor (BSM) Radio Detection And Ranging (RADAR) smart sensors (also known as the Left Blind Spot Sensor/LBSS and Right Blind Spot Sensor/RBSS) are each controlled by their on-board micro-controller and control circuitry. When the micro-controller recognizes that the appropriate conditions exist, it will energize the sensor to generate 25 Gigahertz radar pulses through the blind spot zone on that side of the vehicle. The sensor receives and filters the radar signals being returned from any objects detected within the zone, then transmits the appropriate data identifying the position and speed of identified objects to the micro-controller.

The micro-controller analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the micro-controller sends electronic request messages over the Controller Area Network (CAN) data bus to its respective Driver Door Module (DDM) or Passenger Door Module (PDM). The DDM or PDM then controls its respective left or right BSM display directly through a hard wired output. The micro-controller of the LBSS or RBSS also sends electronic messages to the Radio Receiver Module (RRM) (also known as the radio or head unit) to mute any current output through the sound system speakers and to generate chime tones as an audible alert.

Each of the two BSM smart sensors is independent and communicates on the CAN data bus. The sensor performs a bulb test by requesting illumination of the triangle icon in its respective right or left blind spot display for a few seconds each time the status of the ignition switch transitions to On. Each sensor micro-controller also continually monitors the BSM system and the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between of the smart sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the smart sensors or the electronic controls and communication between other modules and devices that provide some features of the BSM system. The most reliable, efficient and accurate means to diagnose the smart sensors or the electronic controls and communication related to LBSS or RBSS operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLIND SPOT SENSOR

The hard wired circuits between the Blind Spot Monitor (BSM) smart sensors (also known as the Left Blind Spot Sensor/LBSS and the Right Blind Spot Sensor/RBSS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the smart sensors or the electronic controls and communication between modules and other devices that provide some features of the BSM system. The most reliable, efficient and accurate means to diagnose the smart sensors or the electronic controls and communication related to LBSS or RBSS operation requires the use of a diagnostic scan tool.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative cable from the battery.
2. Reach up behind the outboard end of the rear bumper fascia to access and disconnect the rear bumper fascia wire harness connector (4) from the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) (3) connector receptacle.
3. Disengage the latch tabs (2) of the BSM sensor mounting bracket and pull the LBSS or RBSS out of the bracket.

INSTALLATION

INSTALLATION

Fig. 8: Blind Spot Sensor, Latch Tabs & Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Reach up behind the outboard end of the rear bumper fascia to position the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) (3) to the mounting bracket on the inside surface of the fascia (1).
2. Using hand pressure, press the LBSS or RBSS firmly and evenly into the mounting bracket until the latch tabs (2) are fully engaged.
3. Reconnect the rear bumper fascia wire harness connector (4) to the LBSS or RBSS sensor connector receptacle.
4. Reconnect the negative cable to the battery.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

SENSOR, PARK ASSIST**DESCRIPTION****DESCRIPTION**

Fig. 9: Park Assist Sensor

Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the park assist system have up to twelve park assist sensors (3). Vehicles with Rear Park Assist (RPA) have four sensors installed in the rear bumper fascia. Vehicles with Front and Rear Park Assist (FRPA) have four sensors in the rear bumper fascia plus six sensors in the front bumper fascia. Each of these sensors is a Generation 5.0 sensor and is identical in construction and is interchangeable.

Vehicles with Parallel and Perpendicular Park Assist (PPPA) have six sensors in the rear fascia and six sensors in the front fascia. However, the sensors in each right and left outward-facing end of the front and rear fascias has a unique Generation 5.1 sensor, while the forward and rearward-facing sensors are still the Generation 5.0 type. The Generation 5.1 sensors offer increased range required to support the parallel and perpendicular parking features of the PPPA system. The only physical difference between the two sensor types besides the part number is the offset location of the indexing feature (2) on the sensor body. This offset indexing feature is designed to match up with an indexing notch in the sensor bracket to prevent installation of a sensor in an incorrect location.

Only the membrane (4) of each sensor is visible through a hole in the outer vertical surface of the fascia. The remainder of each sensor including the sensor mounting bracket, the sensor spacer (also known as the O-ring or decoupling ring) and the sensor wiring connection is concealed behind the fascia. A sensor wire harness behind the fascia connects the sensors to the vehicle electrical system.

The electronic circuitry and a communication chip for each sensor is enclosed and protected within the molded black plastic sensor housing. The housing includes an integral connector receptacle (5) and two integral latch tabs (1). The sensor membrane extends from the surface of the sensor housing, and is finished to match the outer surface of the fascia.

0809004709

Fig. 10: Park Assist Sensors Numbering System
Courtesy of CHRYSLER GROUP, LLC

The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front fascia. Regardless of whether the vehicle is equipped with RPA, FRPA or PPPA the left front sensor location is always considered the number 1 sensor. The numbering continues in a clockwise direction around the vehicle to the left rear sensor, which is always considered the number 12 sensor.

A resilient O-ring spacer (also known as a decoupling ring) around the circumference of the sensor membrane isolates the membrane from the openings in the fascia. Each sensor is snapped into its own dedicated molded

plastic mounting bracket. Each sensor mounting bracket is heat-staked to the back side of the bumper fascia.

The park assist sensors cannot be adjusted or repaired. If a sensor is ineffective or damaged it must be replaced with a new unit. The sensor spacers are available for individual service replacement. The sensor mounting brackets are serviced only as a unit with the bumper fascia.

OPERATION

OPERATION

The park assist sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module). The sensors transmit and receive ultrasonic signals. The sensors each receive battery current and ground in parallel from the PAM, but are each connected to individual dedicated serial bus communication circuits to the module.

Each sensor membrane is oscillated, then quieted by the PAM in a pulsing fashion. While the sensor membrane oscillates, it emits an ultrasonic signal. This signal will bounce or echo off of objects within the field of vision for that sensor. While quieted, each membrane receives the echoes of the ultrasonic signals it and the other sensors have transmitted. The sensors then communicate this echo pulse data over the serial bus lines back to the PAM. The micro-controller within the PAM uses the intervals between the ultrasonic transmission and reception data from the sensors to calculate the distance to any obstacles identified by the ultrasonic echoes.

The hard wired circuits between components related to the park assist sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist sensors or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist sensors or the electronic controls and communication related to park assist sensor operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING**.

SWITCH, PARK ASSIST

DESCRIPTION

DESCRIPTION

0809005080

Fig. 17: Park Assist Switch
Courtesy of CHRYSLER GROUP, LLC

The park assist Off switch (5) and the Parallel and Perpendicular Park Assist (PPPA) On switch (6) are integral to the instrument panel switch pod (1) (also known as the Accessory Switch Bank Module/ASBM), which is secured to the instrument panel center bezel just below the heater and air conditioner controls. Refer to **POD, SWITCH, DESCRIPTION**.

The park assist Off switch push button is clearly identified with a white International Control and Display Symbol graphic for **Parking Aid** and the text **OFF**. The PPPA On switch push button is clearly identified with white International Control and Display Symbol graphics for **Parking** and **Electric Power Steering** along with the text **ON**.

An amber Light Emitting Diode (LED) unit is illuminated behind a small clear plastic jewel-like lens in the park assist Off push button to give a visual indication whenever the park assist system has been manually disabled or if a system fault is monitored. Another amber LED unit is illuminated in the PPPA On push button whenever that system has been enabled. Both switches are only functional while the status of the ignition switch is On. The switch buttons also have panel lamps dimmer controlled illumination for night visibility.

All of the circuitry and components of the park assist Off switch and the PPPA On switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The park assist Off switch and the PPPA On switch cannot be adjusted or repaired and, if either switch is ineffective or damaged, the entire instrument panel switch pod unit must be replaced with a new unit.

OPERATION

OPERATION

The status of the park assist Off switch and the Parallel and Perpendicular Park Assist (PPPA) On switch is continually monitored by the circuitry within the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). The switch pod receives battery voltage at all times on a fused battery feed circuit and has a path to ground at all times through the instrument panel wire harness. The inputs to and outputs from the switch pod consist of electronic message communication with the Body Control Module (BCM) over the single wire Local Interface Network (LIN) data bus.

Each time the park assist Off switch or PPPA On switch push button is depressed the switch pod circuitry sends an electronic **switch status** message input to the BCM over the LIN data bus. The BCM then relays an electronic **switch request** message to the Park Assist Module (PAM) over the Controller Area Network (CAN) data bus. The PAM responds to each **switch request** message by toggling the status of the appropriate park assist system feature from enabled to disabled, or from disabled to enabled, then sends an electronic **system status** message back to the BCM over the CAN data bus as confirmation.

The BCM responds to the system status message by sending a message to the switch pod over the LIN data bus to control the park assist Off switch or PPPA On switch Light Emitting Diode (LED) units so that they are illuminated only when appropriate while the status of the ignition switch is On, and are extinguished when the status of the ignition switch is anything except On. If the park assist system is disabled due to a monitored fault or failure, a press of the park assist Off push button will result in the LED flashing on and off for about 5

seconds, then lighting solid.

The hard wired circuits between components related to the park assist Off switch and the PPPA On switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist Off switch, the PPPA On switch or the electronic controls and communication related to park assist switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BUMPERS

FASCIA, FRONT

REMOVAL

REMOVAL

Fig. 1: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Remove the push pin fasteners and remove the radiator closeout panel (1).

Fig. 2: Identifying Fender & Fascia Bracket Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the fender (1) and fascia bracket fasteners (2).

Fig. 3: Identifying Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the negative battery cable.
5. Raise and support the vehicle.
6. Remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**.
7. Remove the front wheel flare. Refer to **MOLDING, FRONT WHEEL OPENING, REMOVAL**.
8. Accessing from the wheelhouse, remove the fender to fascia fastener (1). Repeat for the opposite side.

1303004723

Fig. 4: Identifying Upper Fascia Closeout Panel, Radiator Support & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

9. Remove the lower fasteners (4).
10. Remove the eight push pin fasteners (2) from the upper fascia closeout panel (1).
11. Remove the upper fascia closeout panel (1) from the vehicle.
12. Remove the two fascia to upper radiator support push pins (1) located above the headlamp. Repeat on the opposite side.
13. Remove the fascia to upper radiator fasteners (2, 3, 6).
14. Carefully pull out on the upper and lower fascia sides (4, 5) to disengage the fascia retaining tabs. Repeat on the opposite side.
15. Remove the fascia from the vehicle.
16. Accessing from under the vehicle, disconnect the active grille shutter wire harness.
17. If equipped, disconnect the fog lamps.

Fig. 5: Identifying Upper Fascia Closeout Panel, Upper & Lower Fascia Sides & Fasteners
Courtesy of CHRYSLER GROUP, LLC

INSTALLATION

INSTALLATION

Fig. 6: Identifying Upper Fascia Closeout Panel, Upper & Lower Fascia Sides & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the fascia to the vehicle.
2. Align and hand tap the fascia sides (4, 5) to engage the fascia retaining tabs. Repeat on the opposite side.
3. Install the fascia to upper radiator fasteners (2, 3, 6). Tighten the fasteners securely.
4. Install the four fascia to upper radiator support push pins (1).

Fig. 7: Identifying Fender & Fascia Bracket Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the fascia bracket fasteners (1) and (2).

Fig. 8: Upper Close Out Panel Cover Components

Courtesy of CHRYSLER GROUP, LLC

6. Position the upper radiator closeout panel (1) back into place and install the push pin fasteners.

Fig. 9: Identifying Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Raise the vehicle.
8. Install the fender to fascia fastener (1). Tighten the fastener securely. Repeat for the opposite side.
9. If equipped, connect the fog lamps.
10. Accessing from under the vehicle, connect the active grille shutter wire harness.
11. Position the fascia lower closeout panel (1), install the thirteen fasteners (2) securing the fascia lower close out panel. Tighten the fasteners securely.
12. Install the front splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
13. Lower the vehicle.
14. Connect the negative battery cable.
15. Close the hood.

FASCIA, REAR

REMOVAL

REMOVAL

1309004725

Fig. 10: Identifying Rear Fascia Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect the negative battery cable.
3. Raise and support the vehicle.
4. Remove the wheelhouse splash shields. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL**.
5. Remove the push pin retainer (3) that secures the underside of the rear fascia assembly.

Fig. 11: Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

6. Accessing from the wheelhouse, remove the fender to fascia fastener (1). Repeat for the opposite side.

Fig. 12: Identifying Rear Fascia Assembly, Fender To Fascia Fastener & Push Pin Retainers
Courtesy of CHRYSLER GROUP, LLC

7. Remove the quarter panel wheel opening flare molding. Refer to **MOLDING, REAR WHEEL OPENING, REMOVAL**.
8. Remove the bolts (3).
9. Pull out on the fascia (4) at the wheel house opening (2) to disengage the fascia from the retaining bracket. Repeat on the opposite side.
10. With the help of an assistant, pull rearward to disengage the fascia (1) from the rear retaining bracket. **Do not completely remove at this time.**
11. Disconnect the vehicle wiring harness (2).
12. Remove the fascia (1) from vehicle.

INSTALLATION

INSTALLATION

1309004726

Fig. 13: Identifying Rear Fascia Assembly, Fender To Fascia Fastener & Push Pin Retainers
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the fascia (4) to the vehicle.
2. Connect the vehicle wiring harness.
3. With the help of an assistant and using firm pressure, align and push forward to engage the fascia to the rear retaining bracket.

4. Align the fascia (4) with the retaining brackets at the tail lamp (1) and wheelhouse openings (2). Using firm pressure push in to engage. Repeat on the opposite side.

Fig. 14: Fender To Fascia Fastener

Courtesy of CHRYSLER GROUP, LLC

5. Accessing from the wheelhouse, install the fastener (1) that secures the rear fascia assembly to the rear quarter. Tighten the fastener securely. Repeat for opposite side.

1303004725

Fig. 15: Identifying Rear Fascia Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the fasteners (3) that secures the rear fascia assembly to the underbody.
7. Install the wheelhouse splash shields. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.
8. Connect the negative battery cable.

REINFORCEMENT, BUMPER, FRONT

REMOVAL

REMOVAL

UPPER REINFORCEMENT

3772539

Fig. 16: Upper Bumper Reinforcement & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove front fascia. Refer to **FASCIA, FRONT, REMOVAL**.
2. Remove the fasteners (2) securing the upper bumper reinforcement (1) to the frame/front end module. Repeat on the opposite side and remove the upper bumper reinforcement (1).

LOWER REINFORCEMENT

3772580

Fig. 17: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove front fascia. Refer to **FASCIA, FRONT, REMOVAL**.

2. Remove the fasteners (2) securing the lower bumper reinforcement (1) to the frame/front end module.
Remove the lower bumper reinforcement (2).
3. If necessary, repeat steps for the opposite side.

INSTALLATION**INSTALLATION**

2311036493

Fig. 18: Identifying Front Bumper Reinforcement, Bolts & Adaptive Cruise Control Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the front bumper reinforcement (2) and install the bolts (1). Tighten the front bumper reinforcement bolts to the proper. Refer to **SPECIFICATIONS**.
2. Install the adaptive cruise control module (3). Refer to **MODULE, ADAPTIVE CRUISE CONTROL, INSTALLATION**.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

UPPER REINFORCEMENT

3772539

Fig. 19: Upper Bumper Reinforcement & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper bumper reinforcement (1) to the frame/front end module.
2. Install the fasteners securing the upper bumper reinforcement (1) to the frame/front end module. Tighten the fasteners to 45 N.m (33 ft. lbs.). Repeat on the opposite side.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

LOWER REINFORCEMENT

3772580

Fig. 20: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower bumper reinforcement (1) to the frame/front end module.
2. Install the fasteners (2) securing the lower bumper reinforcement (1) to the frame/front end module. Tighten the fasteners to 45 N.m (33 ft. lbs.).
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.
4. If necessary, repeat steps for opposite side.

REINFORCEMENT, BUMPER, REAR**REMOVAL****REMOVAL****STANDARD BUMPER**

Fig. 21: Identifying Rear Bumper Reinforcement & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear fascia. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove nuts (1) attaching rear bumper reinforcement (3) to frame rail.
3. Remove bumper reinforcement (3) from vehicle.

TRAILHAWK BUMPER

NOTE: Trailer hitch shown, bumper beam similar.

Fig. 22: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear fascia. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove the bolts (3, 4) and remove the hitch (1).

INSTALLATION

INSTALLATION

STANDARD BUMPER

Fig. 23: Identifying Rear Bumper Reinforcement & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position rear bumper reinforcement (3) on vehicle.

2. Install nuts (1) attaching the bumper reinforcement to frame rail.
3. Tighten nuts (2) to 28 N.m (21 ft lbs).
4. Install rear fascia. Refer to **FASCIA, REAR, INSTALLATION**.

TRAILHAWK BUMPER

NOTE: Trailer hitch shown, bumper beam similar.

Fig. 24: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the bumper beam (1) into the frame openings (2).
2. Install the bolts (3, 4) and tighten to 165 N.m (122 ft lbs)
3. Install the rear fascia. Refer to **FASCIA, REAR, INSTALLATION**.

FRAME

WARNING

WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.

- do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
- always have a fire extinguisher ready for use when welding.
- disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.
- do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
- do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
- do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use **ONLY** the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at

the following address on the Internet:
(<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or

disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

USE OF HEAT DURING REPAIR

WARNING: Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the

straightening process.

- During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

SPECIFICATIONS

FRAME DIMENSIONS

NOTE: Frame dimensions are listed in metric scale millimeter (mm). All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

CROSSMEMBER, FRONT SUSPENSION

REMOVAL

REMOVAL

Fig. 27: Floor Carpet, Intermediate Shaft, Coupling Bolt & Steering Gear Pinion Shaft
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to **FRONT, WARNING** .

1. Disconnect battery negative cable.
2. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This keeps the clockspring in the proper orientation.
3. Remove pinch bolt (3) and separate intermediate shaft (2) from steering gear shaft.

Fig. 28: Identifying Stabilizer Bar Link, Nuts & Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
5. Remove the wheel mounting bolts, then the tire and wheel assembly.
6. If equipped, remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**.
7. At each end of the stabilizer bar, while holding the stabilizer bar link stud stationary, remove the nut (3) securing the link (2) to the stabilizer bar and position aside.

Fig. 29: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: Discard the ball joint retaining nut. Use a NEW nut when installing the ball joint.

8. Remove the ball joint to control arm retaining nut (4).
9. Remove the outer tie rod retaining nut (7) and separate the outer tie rod end (7) from the knuckle

020568629

Fig. 30: Opening Between Control Arm Front Mounting Bolt & Front Fascia Support Beam & Pry Bar

Courtesy of CHRYSLER GROUP, LLC

NOTE: Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.

10. Insert a pry bar (2) in the opening (1) between the control arm front mounting bolt and the front fascia support beam.
11. Separate the lower control arm from the knuckle by prying down with the pry bar (2).
12. Remove the lower load beam. Refer to **LOAD BEAM, LOWER, REMOVAL**.

191069435

Fig. 31: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the downstream oxygen sensor harness connector.
14. Remove the exhaust extension pipe.
15. Disconnect the harness connectors (2) at the steering gear control module (1).

191069436

Fig. 32: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the steering gear connector (1) from the body harness connector at the bottom of the dash panel.
17. Separate the steering gear harness from the crossmember by removing the tie strap (2) from the crossmember.
18. Remove the rear engine mount.

NOTE: Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

- 19.
20. Mark the position of the cross member with a grease pencil or equivalent.

020568633

Fig. 33: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

21. Support the crossmember with a transmission jack, or equivalent.
22. Remove the upper mounting bolt (1) from each side of the crossmember.

020568626

Fig. 34: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Remove the four rear mounting bolts (1, 3) that secure the crossmember (2) to the vehicle
24. Slowly lower the crossmember with the jack and remove from the vehicle.

INSTALLATION

INSTALLATION

020568626

Fig. 35: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Slowly raise the crossmember (2) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal.
2. Install four mounting bolts (1, 3) and tighten to 189 N.m (139 ft lbs).

020568633

Fig. 36: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the upper mounting bolt (1) on each side of the crossmember and tighten to 120 N.m (86 ft lbs).

191069436

Fig. 37: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

4. Connect the steering harness connector (1) to the body harness connector at the bottom of the dash panel.
5. Install the tie strap (2) to the crossmember.

191069435

Fig. 38: Steering Gear Control Module & Harness Connectors
 Courtesy of CHRYSLER GROUP, LLC

6. Connect the harness connectors (2) at the steering gear module (1).
7. Install the rear engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 3.2L.
8. Install the exhaust extension pipe.
9. Connect the downstream oxygen sensor harness connector.
10. Install the lower load beams (1). Refer to **LOAD BEAM, LOWER, INSTALLATION**.

Fig. 39: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

11. Insert the lower ball joint into the control arm, install a **NEW** nut (4) and tighten to 25 N.m Plus 175° (18 ft lbs Plus 175°).
12. Install the outer tie rod end (8) into the knuckle and install a **NEW** retaining nut (7) and tighten to 25 N.m Plus 80° (18 ft lbs Plus 80°).

1715005814

Fig. 40: Identifying Stabilizer Bar Link, Nuts & Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

13. Install the stabilizer link stud into the stabilizer bar and install the nut.
14. Hold the stabilizer link stud stationary and tighten the nut to 63 N.m (46 ft lbs).

Fig. 41: Floor Carpet, Intermediate Shaft, Coupling Bolt & Steering Gear Pinion Shaft
 Courtesy of CHRYSLER GROUP, LLC

15. If equipped, install the engine belly pan. Refer to **BELLY PAN, INSTALLATION**.
16. Install the tire and wheel assembly. Refer to **INSTALLATION**.
17. Lower the vehicle.
18. Install the intermediate shaft (2) to the steering gear pinion shaft (4).
19. Install a **NEW** pinch bolt (3) and tighten to specification. Refer to **COLUMN, SPECIFICATIONS**.
20. Remove the steering wheel holder.
21. Connect the battery negative cable.
22. Check and adjust wheel alignment as necessary. Refer to **FRONT SUSPENSION & WHEEL ALIGNMENT**.

CROSSMEMBER, REAR SUSPENSION

REMOVAL

REMOVAL

ALL WHEEL DRIVE

Fig. 42: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .
3. Remove the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, REMOVAL** .
4. Remove the rear driveline module. Refer to **REMOVAL** .
5. Remove the remaining knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .
6. Separate the vent tube from the crossmember.

Fig. 43: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Remove the ride height sensor (1), if equipped.

Fig. 44: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

8. Separate the wire harness (1) from the crossmember.

Fig. 45: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the rear crossmember mounting bolts (2, 3) and remove the rear crossmember (4) from the vehicle (1).
10. If necessary, remove the spring links. Refer to **LINK, CAMBER, REMOVAL** , **LINK, TOE,**

REMOVAL and LINK, SPRING, REMOVAL .

11. If necessary, remove the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** and **ISOLATOR, REAR CROSSMEMBER, FRAME, REMOVAL**.

FRONT WHEEL DRIVE

Fig. 46: Identifying Rear Suspension Crossmember (All Wheel Drive)

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove both rear knuckles. Refer to **KNUCKLE, REAR, REMOVAL** .
3. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .
4. Remove the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, REMOVAL** .
5. Separate the vent tube from the crossmember.

Fig. 47: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the ride height sensor, if equipped.

Fig. 48: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

7. Separate the wire harness from the crossmember.

Fig. 49: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the rear crossmember mounting bolts (2, 3) and remove the rear crossmember (4) from the vehicle.
9. If necessary, remove the spring links. Refer to **LINK, CAMBER, REMOVAL** , **LINK, TOE, REMOVAL** and **LINK, SPRING, REMOVAL** .
10. If necessary, remove the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** and **ISOLATOR, REAR CROSSMEMBER, FRAME, REMOVAL**.

INSTALLATION

INSTALLATION

ALL WHEEL DRIVE

Fig. 50: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, INSTALLATION** and **ISOLATOR, REAR CROSSMEMBER, FRAME, INSTALLATION**.
2. If necessary, install the spring links. Refer to **LINK, CAMBER, INSTALLATION** , **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION** .
3. Install the rear crossmember (2) to the body and install the mounting bolts (1, 3) and tighten to 150 N.m (111 ft. lbs.).
4. Install the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, INSTALLATION** .

Fig. 51: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness (1) to the crossmember.

Fig. 52: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vent tube (1) to the crossmember.

Fig. 53: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Install the ride height sensor (1), if equipped.
8. Install the rear driveline module. Refer to **INSTALLATION** .

9. Install the knuckles as necessary. Refer to **KNUCKLE, REAR, INSTALLATION** .
10. Install the exhaust to the vehicle. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
11. Lower the vehicle and tighten the following fasteners with the vehicle at normal ride height:
 - Lower transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
 - Upper transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
 - Upper transversal link to lower control arm: 80 N.m (59 ft. lbs.) Plus 45°.
12. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** then tighten the lower transversal link to lower control arm bolt to 130 N.m (96 ft. lbs.).

FRONT WHEEL DRIVE

Fig. 54: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, INSTALLATION** and **ISOLATOR, REAR CROSSMEMBER, FRAME, INSTALLATION**.
2. If necessary, install the spring links. Refer to **LINK, CAMBER, INSTALLATION** , **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION** .
3. Install the rear crossmember (2) to the body and install the mounting bolts (1, 3) and tighten to 150 N.m (111 ft. lbs.).
4. Install the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, INSTALLATION** .

Fig. 55: Identifying Wire Harness From Crossmember

NOTE: **Right side shown, left side typical.**

1. Position the underbody shield (1) to the vehicle.
2. Install the two retaining nuts (3) that secure the underbody shield (1) to the vehicle underbody (2). Tighten to 4 N.m (35 in. lbs.).
3. Install the two push pin fasteners (4) that secure the underbody shield (1).
4. Install the seven fasteners that secure the underbody shield (1) to the vehicle underbody (2). Tighten to 5 N.m (44 in. lbs.).
5. Lower the vehicle.

2014 ACCESSORIES AND EQUIPMENT

Heated Glass - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken when cleaning or removing foreign materials, decals or stickers from the rear glass. Normal glass cleaning solvents or hot water used with soft toweling is recommended.

The rear window defogger system consists of two vertical bus bars and a series of grid lines fired onto the inside surface of the rear window.

The front windshield wiper defogger system (if equipped) consists of three horizontal grid lines fired onto the inside surface of the front windshield.

The defrost for each system is turned on or off by a push-buttons. The soft switch is located in the Uconnect touch screen menu. The hard switch is located on the center of the instrument panel center bezel. (Refer to **DESCRIPTION**)

Circuit protection is provided by fuses located in the power distribution center (PDC). The heater mirrors, rear defrost and front windshield wiper de-icer each have a separate fuse.

OPERATION

OPERATION

The defogger system can be controlled by a momentary switch located in the A/C-heater control. An amber indicator will illuminate whenever either switch is pushed to the ON position.

The defogger system can also be controlled by momentary soft switches located in the U-Connect® touch screen. The front or rear defrost switch will illuminate when selected for use.

When the rear window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a request signal over the CAN Bus to the Power Distribution Center (PDC) to energize the internal high side driver. When energized, the high side driver provides battery current to the rear window defogger grid lines and to the heated side view mirrors. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

The front window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a signal over the CAN bus to a relay grid located inside the PDC. That relay is actuated by a low-side driver in the BCM.

The Wiper Deicer system is automatically activated when the outside ambient temperature is less than 40 degrees F (5C) and either the rear defrost system or full front defrost system is active. The wiper blade Deicer will be able to unfreeze both wiper blades from the windshield in 8 minutes or less at minus 10 degrees F (-23C) if the vehicle is stationary.

The defogger and Deicer system will automatically turn off after an initial programmed time interval of about ten minutes, as long as the ignition switch is in RUN. After the initial time interval has expired, if either switch is pressed to ON again during the same ignition cycle, the defogger system will automatically turn off after about five minutes.

Repair of the defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.

The defogger control system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACK LIGHT (EBL) SYSTEM

NOTE: Illumination of the rear window defogger indicator lamp in the instrument cluster does not necessarily mean that electrical current is reaching the rear window glass heating grid.

NOTE: Refer to **SYSTEM WIRING DIAGRAMS** for circuit descriptions and diagrams.

Operation of the EBL system can be confirmed by the following:

Fig. 1: Rear Window Glass Grid Test
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical heated rear window glass shown.

1. Use a scan tool and check for Diagnostic Trouble Codes (DTCs) related to the Body Control Module (BCM) and the lower accessory switchbank. If no DTCs are found, go to Step 2. If any DTCs are found, repair as required.
2. Turn the ignition to RUN and press the rear window defogger switch to on. Rear window defogger operation can be checked by feeling the surfaces of the rear window glass. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass should be detected within three to four minutes of operation.
3. If a temperature difference is not detected, use a 12 volt Direct Current (DC) voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
 - Confirm the ignition is in RUN.
 - Confirm the rear window defogger switch is on.
 - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the heating grid and the EBL relay in the Power Distribution Center (PDC).
 - Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.
 - Confirm the EBL relay in the PDC is operational. Refer to **SYSTEM WIRING DIAGRAMS**.
4. If broken defogger grid lines or bus bars are suspected, use a 12 volt DC voltmeter and contact terminal A with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.
5. If the EBL system operation has been verified but the rear window defogger indicator in the instrument cluster does not illuminate, replace the switch bank.

GRID, DEFOGGER

STANDARD PROCEDURE

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

**Fig. 2: Grid Line Repair - Typical**

Courtesy of CHRYSLER GROUP, LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH, DEFOGGER

DESCRIPTION

DESCRIPTION

0812002401

Fig. 3: Rear Window Defogger Switch
 Courtesy of CHRYSLER GROUP, LLC

The momentary push-button switch for the rear window defogger (EBL) system can be located in the A/C-heater control in the center of the instrument panel.

0812002402

Fig. 4: Heated Mirror System Switches
 Courtesy of CHRYSLER GROUP, LLC

There is an option for the switches to be located within the U-Connect touch screen. An amber indicator will illuminate to indicate when the EBL system is turned on for either switch.

OPERATION

OPERATION

An amber indicator will illuminate when either window defogger switch is activated. When activated, the switch sends a request signal to the Body Control Module (BCM) to energize the internal EBL high side driver to provide battery current to the appropriate window defogger grid lines and to the heated side view mirrors, when equipped.

NOTE: **The defroger system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the defrost system will last 5 minutes.**

The defogger/deicer system will automatically turn off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the window defogger switch is pressed to ON again during the same ignition cycle, the defogger/deicer system will automatically turn off after about 5 minutes. The defogger/deicer system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the window defogger switch a second time.

The window defogger switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The window defogger switch and indicator cannot be adjusted or repaired. The switch bank (hard switch) or the radio (soft switch) must be replaced if diagnostics lead to switch replacement.

2014 ACCESSORIES AND EQUIPMENT**Heated Mirrors - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

Fig. 1: Heated Outside Rear View Mirrors & Window Defogger
Courtesy of CHRYSLER GROUP, LLC

Electrically heated outside rear view mirrors (1) are optional on some models. Vehicles with this option can be visually identified by the International Standards Organization (ISO) icon for rear window defogger (2), which appears on the corner of the outside rear view mirror glass.

The heated mirror system operates in concert with the rear window defogger system, also known as the Electric Back Light (EBL). The EBL system is controlled by the rear window defogger switch, located in the A/C heater control or a soft switch located in the U-Connect touch screen menu. An amber indicator lamp in the control will illuminate to indicate when the heated mirror system is on. Refer to **SWITCH, DEFOGGER, DESCRIPTION**.

The heated mirror system will automatically turn off after a programmed time interval of about ten minutes as long as the ignition is in RUN. After the initial time interval has expired, if the rear window defogger system is turned on again during the same ignition cycle, the heated mirror system will automatically turn off after about five minutes. The heated mirror system will also turn off if the ignition is set to any position other than RUN, or by manually pressing the rear window defogger switch a second time.

Circuit protection is provided by a fuse located in the Power Distribution Center (PDC).

OPERATION

OPERATION

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on. Refer to **OPERATION** . When the heated mirror system is activated, an electric heater grid located behind the glass of each outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to **DIAGNOSIS AND TESTING** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror assembly must be replaced if the heating grid is found inoperative or damaged. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

2014 ACCESSORIES AND EQUIPMENT**Heated Seats - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

Vehicles with the optional heated seat system can be visually identified by the two heated seat switches located in the Radio Receiver Module (RRM), in the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO).

The heated seat system includes the following major components:

- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each front heated seat. Both switches are integral to the Radio Receiver Module (RRM). Refer to **SWITCH, HEATED SEAT, DESCRIPTION**.
- **Comfort Seat and Wheel Module** - One Comfort Seat and Wheel Module (CSWM) is used per vehicle. The CSWM is mounted under the driver seat and contains the control logic and software for the front heated seat system. Refer to **MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION**.
- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements for each seat, one on the seat back cushion and the other on the seat bottom cushion. The heated seat elements are hard-wired to the CSWM. Refer to **PAD, HEATER, DESCRIPTION**.

OPERATION**OPERATION**

The Comfort Seat and Wheel Module (CSWM) directly provides power to the seat heating elements in the seat cushions and backs for seat heating. Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position and the engine is running. The module responds to heated seat thermistor sensor feedback from each heating element and ignition switch status inputs by controlling the electrical output to the front seat heating elements. The heated seat system will turn off automatically whenever the ignition switch is turned to any position except On.

Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off. When the switch is pressed, the CSWM energizes an integral solid-state relay, which supplies battery current to the heating elements. If high-level heating is initially selected, the heated seat control system will automatically switch to a lower level temperature after 50 minutes of continuous operation at the desired temperature level. Operation in the low-level setting automatically turns to off after 45 minutes.

The driver seat heat system and passenger seat heat system each consist of a cushion element connected in parallel with a back element. Both systems have a seat cushion with a thermistor sensor that provides feedback to the CSWM. Both systems seat cushion and seat back have a thermostat that will request the heated seat to turn off if the temperature reaches or exceeds 135 °F (+/- 9 ° F). The CSWM will also turn off the heated seat

elements if an open or short in the heating element circuit is detected.

Auto On Feature

The Auto On feature is a customer configurable feature that when enabled will activate the driver heated seat and heated steering wheel on engine start based on ambient temperature. If Auto On feature is enabled, and the ambient temperature is at or below 40° F the CSWM will activate the driver heated seat and heated steering wheel feature at the high level during engine start. This feature also works with Remote Start.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE: Vehicles equipped with the heated seat option utilize a voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an intermittent fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. Wiggle the heated seat wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the fuse in the Power Distribution Center (PDC) and for power at the CSWM. Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Comfort Seat and Wheel Module (CSWM) and/or the Radio Receiver Module (RRM). If any DTCs are found, repair as necessary (Refer to **DTC INDEX**).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be supplying sufficient energy to operate the heated seat system.

PAD, HEATER

DESCRIPTION

DESCRIPTION

Fig. 1: Removing/Installing Heated Seat Element
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional heated seat system have two heated seats. One heating element (1) is used for each seat bottom cushion and another heating element is used for each seat back cushion.

All of the heated seat elements consist of multiple heating circuits operating in parallel throughout the carbon fiber element and a wire lead and connector (2). The heated seat elements are captured between the seat cover and the seat cushion (3). If a malfunction occurs in one or more of the individual circuits, the remaining operational circuits will continue to provide heat.

OPERATION**OPERATION**

Battery current is directed to the heated seat elements by the Comfort Seat and Wheel Module (CSWM). The CSWM will energize the heated seat elements when a heated seat switch is pressed on.

As electrical current passes through each heated seat element, the resistance of the wire used in the element disperse some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the seat bottom and seat back covers, warming the seat covers and its occupant.

The heated seat elements cannot be repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

- NOTE:** For complete circuit diagrams, **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.
- NOTE:** The wire harness connectors for the heating elements are located under the seat.
- NOTE:** When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position.
1. Locate and disconnect the seat heating element electrical connectors as necessary.
 2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance table . If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL**.

HEATED SEAT ELEMENT RESISTANCE

Element Location	Acceptable Resistance Value
Driver Seat Bottom Cushion	7.8 - 9.6 ohms
Passenger Seat Bottom Cushion	8.4 - 10.4 ohms
Driver and Passenger Seat Back Cushion	8.5 - 10.6 ohms

REMOVAL**REMOVAL**

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Seat bottom cushion shown in illustrations, seat back cushion similar.

Fig. 2: Removing/Installing Heated Seat Element
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat bottom or seat back cushion and place it on a workbench (Refer to **SEATS, FRONT** or **SEATS, REAR**).
3. Remove the seat bottom or seat back cover from the cushion (1) (Refer to **SEATS, FRONT** or **SEATS, REAR**).
4. Make note of the installed location of the heated seat element on the cushion (3) being serviced.
5. Remove the heated seat element from the foam cushion by peeling the element away from the cushion. Be careful not to remove excessive foam from the cushion.

INSTALLATION

INSTALLATION

CAUTION: During heated seat element replacement, be careful not to fold or crease the new heating element. Folds or creases will cause premature heated seat element failure.

NOTE: Front seat bottom cushion shown, rear seat and seat back cushions similar.

80c91c12

Fig. 3: Identifying Replacement Heating Element And Factory Installed Heating Element
 Courtesy of CHRYSLER GROUP, LLC

1. Peel off the adhesive backing from the replacement heated seat element (2).
2. Position the heated seat element to the foam cushion directly where the original heater element was located. There will be adhesive marks on the cushion outlining the factory installed location (1).
3. Firmly press the heated seat element onto the foam cushion. Make sure the adhesive is fully adhered to the cushion.
4. Install the cover onto the seat bottom or seat back cushion (1) (Refer to **SEATS, FRONT** or **SEATS, REAR**).

NOTE: Make certain the heated seat element and airbag wire harnesses are correctly routed. Any excess wire should be securely placed between the rear of the seat bottom cushion and the rear seat cover flap.

5. Install the seat bottom or seat back cushion (Refer to **SEATS, FRONT** or **SEATS, REAR**).
6. Install the seat. Refer to **SEAT, INSTALLATION SEAT, REAR, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Verify proper heated seat system operation.

SWITCH, HEATED SEAT

DESCRIPTION

DESCRIPTION

0804005802

Fig. 4: View of Vented Seats U-Connect Touch Screen
 Courtesy of CHRYSLER GROUP, LLC

The switches (1) for the optional front heated seat system are located in the U-Connect Touch™ screen module, at the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO). When the heated seat switches are pressed on, each heated seat switch illuminates either HI or LO, and an International Standards Organization (ISO) symbol appears at the top of the U-Connect Touch™ screen module.

OPERATION

OPERATION

When either of the hard or soft front heated seat switches are pressed with the engine running, a signal is sent to the Comfort Seat and Wheel Module (CSWM) over the Controller Area Network (CAN) data bus, signaling the module to energize the heating elements for the selected seat. Indicator lamps illuminate for each heated seat switch and indicate the level of heat in use (HI or LO). Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The CSWM energizes the integral solid-state relays that supply battery current to the heating elements. During high-temperature level operation, the HI indicator illuminates on the U-Connect Touch™ screen. After 50 minutes of high-temperature level heating, the CSWM automatically lowers the heat level to low. At that time, the LO indicator illuminates on the U-Connect Touch™ screen. Operation on the low-temperature level setting will automatically turn off after 45 minutes.

The individual front heated seat switches located in the U-Connect Touch™ screen module cannot be adjusted or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire U-Connect Touch™ screen module must be replaced. Refer to **RADIO, REMOVAL**.

Heated/Cooled Accessories - Service Information - Cherokee

DESCRIPTION

HEATED STEERING WHEEL

Fig. 1: View of Vented Seats U-Connect Touch Screen
 Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel system is designed to enhance the thermal comfort of the driver by heating the steering wheel, when desired. The steering wheel heating element is made of copper wire and is sandwiched between the leather and the substrate material of the steering wheel. A vehicle with a heated steering wheel can easily be identified by the heated steering wheel switch (3) located in the U-Connect Touch™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol appears in the top corner of the U-Connect Touch™ screen module.

The heated steering wheel system consists of the following major components

- **Heated Steering Wheel Switch** - Refer to **SWITCH, HEATED STEERING WHEEL, DESCRIPTION**.
- **Comfort Seat and Wheel Module** - Refer to **MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION**.
- **Heated Steering Wheel** - Refer to **OPERATION**.

VENTED SEATS

0804005802

Fig. 2: View of Vented Seats U-Connect Touch Screen
 Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. A vehicle with vented seats can be identified by the vented seat switches (2) located in the Radio Receiver Modules (RRM) U-Connect touch screen.

Each vented seat switch illuminates when the vented seat system is on.

The vented seat system consist of the following major components (there are two different available seat modules, the HSM and the CSWM) :

- **Vented Seat Pads** - Refer to [**PAD, VENTED SEAT, DESCRIPTION**](#) for more information.
- **Vented Seat Switches** - Refer to [**SWITCH, VENTED SEAT, DESCRIPTION**](#) for more information.
- **Vented Seat Motors** - Refer to [**MOTOR, VENTED SEAT, DESCRIPTION**](#) for more information.
- **Custom Seat and Wheel Module** - Refer to [**MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION**](#) .

OPERATION

HEATED STEERING WHEEL

Operation of the steering wheel heating element is controlled by the Comfort Seat and Wheel Module (CSWM). The Steering Column Control Module is the interface between the heated steering wheel and the vehicle. The CSWM provides power to the heated steering wheel heating elements in the steering wheel. A temperature sensor is integrated into the steering wheel heating element that sends the temperature of the steering wheel to the steering wheel switch. The steering wheel switch sends this information over the LIN bus to the SCCM. The SCCM then sends this information over the CAN C bus to the Body Control Module (BCM). The BCM sends

this information to the CSWM over the CAN I bus. The normal heating cycle of the steering wheel will last up to 50 minutes on high setting, unless the switch is pressed again. The heated steering wheel system will automatically shut off if the heating element reaches a temperature greater than 46° C (115° F), or if a fault is detected. If for any reason a fault in the heated steering wheel system becomes present, a Diagnostic Trouble Code (DTC) will set.

Auto On Feature

The Auto On feature is a customer configurable feature that when enabled will activate the driver heated seat and heated steering wheel on engine start based on ambient temperature. If Auto On feature is enabled, and the ambient temperature is at or below 40° F the CSWM will activate the driver heated seat and heated steering wheel feature at the high level during engine start. This feature also works with Remote Start.

The heated steering wheel system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The steering wheel heating element is not serviced separately from the steering wheel and if inoperative or damaged, the entire steering wheel assembly must be replaced. Refer to **WHEEL, STEERING, REMOVAL** .

VENTED SEATS

The Vented Seat assembly is located internally to the front seats and are intended to enhance the thermal comfort of the seat occupant by ventilating seat to occupant interface. Occupant comfort is achieved by pulling air from the seat surface to the back and underside under side of the seat.

The vented seats are controlled by the heated seat module (HSM also know as the Comfort Seat Wheel Module or CSWM) which provides variable analog voltages driving the 12V vented seat motors in the seats. The vented seats have 2 selectable speeds with a hidden intermediate speed for the fans. For seat venting, each press of the vented seat switch will cause the vented seat to change venting modes. From OFF to HI, from HI to LO and from LO to OFF. The HSM shall turn on the vented seats only with the engine running. Both vented seats operate separately from each other, and will not operate at the same time as the heated seats. To review vented seat switch information, refer to **SWITCH, VENTED SEAT, DESCRIPTION**.

DIAGNOSIS AND TESTING

HEATED STEERING WHEEL

NOTE: Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. Also wiggle the heated steering wheel wire harness and electrical connectors

while testing continuity.

NOTE: For complete circuit diagrams, see **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

NOTE: The Auto On feature is designed to function at an ambient temperature of 40° F or below. Make sure this option is enabled the customer programmable interface prior to diagnosis of an inoperative Auto On feature concern.

Before testing any individual components in the heated steering wheel system, check the following:

- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Comfort Seat and Wheel module (CSWM), U-Connect Touch TM screen module and the Radio Receiver Module (RRM). If any DTCs are found, repair as necessary.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be supplying sufficient energy to operate the heated steering wheel system.
- If there are no DTCs and the heated steering wheel system functions properly, but the heated steering wheel indicator does not illuminate, the entire U-Connect Touch TM screen module (Integrated Center Stack) must be replaced (Refer to **RADIO**).

VENTILATED SEATS

NOTE: Vehicles equipped with the ventilated seat option utilize a low voltage cut-off feature. This feature turns off power to the ventilated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the ventilated seat system appears inoperative.

NOTE: If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around within the seat while testing continuity. Also wiggle the ventilated seat wire harness and electrical connectors while testing continuity.

NOTE: For complete circuit diagrams, see **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Before testing any individual components in the ventilated seat system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM) and the U-Connect Touch™ screen module. If any DTCs are found, repair as necessary (Refer to **DTC INDEX**).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be supplying sufficient energy to operate the front vented seat system.
- If there are no DTCs and the front vented seat system functions properly, but a vented seat indicator does not illuminate, the entire U-Connect Touch™ screen module must be replaced (Refer to **RADIO**).

SWITCH, HEATED STEERING WHEEL

DESCRIPTION

DESCRIPTION

Fig. 3: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The switch (3) for the optional heated steering wheel is located in the U-Connect Touch™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol appears at the top of the U-Connect Touch™ screen module.

OPERATION

OPERATION

The heated steering wheel switch allows the driver to turn on and off the heated steering wheel. The heated

steering wheel will remain off until the driver presses the switch. Once the switch is pressed, the switch will illuminate and an International Standards Organization (ISO) symbol appears in to top corner of the U-Connect Touch™ screen module, indicating that the heating element in the steering wheel is operating. Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel off.

The heated steering wheel switch also functions as a visual indicator for a fault with the heated steering wheel system. When the heated steering wheel switch is pressed and a fault is present in the heated steering wheel system, the switch will illuminate for two seconds and then immediately turn off.

The heated steering wheel switch is diagnosed using a scan tool.

The heated steering wheel switch located in the U-Connect Touch™ screen module cannot be adjusted or repaired. If a heated steering wheel switch or indicator lamp is inoperative or damaged, the entire U-Connect Touch™ screen module must be replaced (Refer to **RADIO**).

SWITCH, VENTED SEAT

DESCRIPTION

DESCRIPTION

Fig. 4: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. A vehicle with vented seats can be identified by the vented seat switches (2) located in the Radio Receiver Modules (RRM) U-Connect touch screen. Each vented seat switch illuminates when the vented seat system is on.

OPERATION

OPERATION

The two vented seat switches are momentary push button type switches that are used to operate the front vented seats. When a vented seat switch is pressed, Light Emitting Diode(s) (LEDs) on the face of that switch will illuminate to indicate the desired mode for that particular vented seat, and a request signal is sent over the Controller Area Network (CAN) bus to the Heated Seat Module (HSM). The HSM provides variable analog voltages that drive the two 12 volt vented seat motors in the seat. There are three settings for each vented seat; off, hi and lo. The vented seat system always starts in the off setting, where none of the LEDs on the switches are illuminated. Pressing a switch once will change the setting for that particular seat from off to hi, and will illuminate both LEDs on the switch. Pressing the same vented seat switch again will change the setting from hi to lo, and only one LED on that switch will illuminate. Pressing the switch once again will change the setting from lo to off again. If for any reason a fault in the vented seat system becomes present, a Diagnostic Trouble Code (DTC) will set and a LED in the vented seat switch will illuminate for two seconds and then go out.

The vented seat switches are diagnosed using a scan tool.

PAD, VENTED SEAT

DESCRIPTION

DESCRIPTION

NOTE: Seat cushion shown, seat back cushion similar.

Fig. 5: Vented Seat Pad, 12 Volt Motor & Heated Seat Pad
 Courtesy of CHRYSLER GROUP, LLC

When equipped, each seat bottom and seat back cushion have there own vented seat pad (1) and 12 volt motor (3). The vented seat pad and the heated seat pad (2) are a one piece assembly. The vented and heated pad

assemblies are located between each front seat cushion and cover and are attached to each cushion, by an adhesive.

OPERATION

OPERATION

The vented seat pads provide a path for the air to be pulled away from the seat bottom and seat back surfaces for seat ventilation.

The vented seat pads cannot be repaired and must be replaced if found damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Front seat bottom cushion shown, front seat back cushion similar.

2820663

Fig. 6: Front Passenger Seat Bottom Cushion, Occupant Detection Sensor (ODS) & Heater Element
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate front seat and place it on a workbench. Refer to **SEAT, REMOVAL**.
3. Remove the vented seat motor from the seat cushion being serviced. Refer to **MOTOR, VENTED SEAT, REMOVAL**.
4. Remove the seat bottom or seat back cover from the cushion (1) (Refer to **SEATS, FRONT**).

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).

5. When servicing the front passenger vented and heated seat pad assembly (2), be sure to replace the Occupant Detection Sensor (ODS) (3). Refer to **SENSOR, OCCUPANT DETECTION, DESCRIPTION**.

Fig. 7: Heated Seat Pad Assembly & Cushion
Courtesy of CHRYSLER GROUP, LLC

NOTE: When servicing the seat back vented and heated pad assembly, carefully guide the vented pad through the opening in the seat back cushion while removing the pad assembly.

6. Remove the vented and heated seat pad assembly (1) by slowly peeling the pad away from the cushion (2). Be careful not to remove excessive foam from the cushion.

INSTALLATION

INSTALLATION

CAUTION: During vented and heated seat pad replacement, be careful not to fold or

crease the new seat pad. Folds or creases will cause premature failure.

NOTE: Front seat bottom cushion shown, front seat back cushion similar.

Fig. 8: Heated Seat Pad Assembly & Cushion
Courtesy of CHRYSLER GROUP, LLC

1. Peel off the adhesive backing from the replacement vented and heated seat pad assembly (1).

NOTE: When servicing the seat back vented and heated pad assembly, carefully guide the vented pad through the opening in the seat back cushion while installing the pad assembly.

2. Position the seat pad to the foam cushion directly where the original seat pad was located. There will be adhesive marks on the cushion outlining the factory installed location.
3. Firmly press the vented and heated pad assembly onto the foam cushion. Make sure the adhesive is fully adhered to the cushion.

2820663

Fig. 9: Front Passenger Seat Bottom Cushion, Occupant Detection Sensor (ODS) & Heater Element
Courtesy of CHRYSLER GROUP, LLC

4. When servicing the front passenger bottom vented and heated seat pad assembly (2), install a new Occupant Detection Sensor (ODS) (3). Refer to **SENSOR, OCCUPANT DETECTION, INSTALLATION** .
5. Install the seat bottom or seat back cover onto the cushion (1) (Refer to **SEATS, FRONT**).
6. Install the vented seat motor and cushion. Refer to **MOTOR, VENTED SEAT, INSTALLATION**.
7. Install the seat. Refer to **SEAT, INSTALLATION** .

NOTE: Make certain the vented and heated seat wire harnesses and ODS harness (when equipped) are correctly routed. Any excess wire for the heated seat element and ODS should be securely placed between the rear of the foam cushion and the rear seat cover flap.

8. Reconnect the negative battery cable.
9. Verify proper vented and heated seat system operation.

MOTOR, VENTED SEAT

DESCRIPTION

DESCRIPTION

2841423

Fig. 10: Vented Seat Motor, Integral Fan Blade, Wire Lead And Connector, Metal Mounting Bracket & Plastic Tabs

Courtesy of CHRYSLER GROUP, LLC

when equipped, each front seat has two vented seat motors (1). One motor is mounted to the seat back frame and the second motor is mounted to the seat bottom pan. Each vented seat motor is attached to a vented pad.

Each vented seat motor consists of a 12 volt motor with a wire lead and connector (4), an integral fan blade (2), a metal mounting bracket (3) and four plastic tabs (5) that secure the motor to the vented pad. The vented seat motors can be seen once the cushions and covers have been removed.

OPERATION

OPERATION

The vented seat motors will only operate with the engine running and will not operate at the same time as the heated seats. The vented seat motors are controlled by the Heated Seat Module (HSM). The HSM provides the vented seat motors with variable analog voltages giving the motors two selectable speeds. These speeds are selected by the driver and/or front passenger by pressing the vented seat switches. Switching the vented seats on while the heated seats are already operating will disable the heating of the seat and start the venting of the seat. Both front vented seats work independently from each other, so that the driver and front passenger can choose there own settings for individual comfort preferences.

The vented seat system is diagnosed using a scan tool. Comfort Seat and Wheel Module. Refer to **DIAGNOSIS AND TESTING** .

The vented seat motors cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: LHD passenger seat shown in illustrations, RHD and driver seat similar.

SEAT BOTTOM CUSHION MOTOR

2841920

Fig. 11: Heated Seat Pad Electrical Connectors, Seat Cushion Pan & Heated Seat Pad Electrical Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat and place it on a workbench. Refer to **SEAT, REMOVAL**.
3. Disconnect the heated seat pad electrical connectors (2 and 4) located on the seat cushion pan (3).
4. Disengage the heated seat pad electrical connector (1) from the seat cushion pan.

Fig. 12: Two Nuts, Two Push Pin Retainers & Seat Cushion Pan

5. When servicing the passenger seat, remove the comfort seat and wheel module with bracket. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL**.
6. Remove the two nuts (1) and disengage the two push pin retainers (2) that secure the vented seat motor to the seat cushion pan (4).
7. Disconnect the vented seat motor electrical connector (3).

Fig. 13: Trim Stick, Vented Seat Motor & Vented Seat Duct
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with seat cover removed. It is not necessary to completely remove the seat bottom cushion cover from the seat bottom cushion to service the vented seat motor.

8. Remove the seat bottom cushion cover from the seat cushion pan (Refer to **SEATS, FRONT**).

NOTE: On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to disconnect the wire harness connector for the ODS prior to removing the front passenger seat cover and cushion. Refer to **SENSOR, OCCUPANT DETECTION, REMOVAL** .

9. Remove the seat bottom cushion (3) and cover from the seat cushion pan and place on a workbench (Refer to **SEATS, FRONT**).
10. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (4), carefully disengage the four retaining clips that secure the vented seat motor (3) to the vented seat duct (2) and remove the motor.
11. If required, carefully disengage the retaining tab (5) and remove the vented seat duct from the vented seat pad (1).

SEAT BACK CUSHION MOTOR

Fig. 14: Four Nuts, Vented Seat Motor & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat and place it on a workbench. Refer to **SEAT, REMOVAL** .
3. Remove the seat back cover from the seat back frame (Refer to **SEATS, FRONT**).
4. Remove the four nuts (1) that secure the vented seat motor (3) to the seat back frame (2).

7. Disconnect the air bag electrical connector (1) and seat back heated pad electrical connector (3) located on the seat cushion pan (2).

Fig. 17: Trim Stick, Vented Seat Motor & Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the seat back cushion cover from the seat back cushion to replace the seat back vented seat motor. Keep the seat cushion and cover together as an assembly while performing this procedure.

8. Remove the seat back cover and cushion (3) as an assembly and place on a workbench (Refer to **SEATS, FRONT**).
9. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (4), carefully disengage the four retaining clips that secure the vented seat motor (2) to the vented seat pad (1) and remove the motor.

INSTALLATION

INSTALLATION

NOTE: LHD passenger seat shown in illustrations, RHD and driver seat similar.

SEAT BOTTOM CUSHION MOTOR

Fig. 18: Vented Seat Duct, Vented Seat Pad, Vented Seat Motor & Retaining Tab
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with seat cover removed from cushion.

1. If removed, install the vented seat duct (2) onto the vented seat pad (1). Be sure the retaining tab (4) is fully engaged.
2. Position the vented seat motor (3) to the vented seat duct and carefully engage the four retaining clips that secure the vented seat motor (3) to the duct. Be sure the retaining clips are fully engaged.

NOTE: On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to reconnect the wire harness connector for the ODS once the front passenger seat bottom cushion and cover are installed. Refer to SENSOR, OCCUPANT DETECTION, INSTALLATION .

3. Install the seat bottom cushion (Refer to SEATS, FRONT).

Fig. 19: Two Nuts, Two Push Pin Retainers & Seat Cushion Pan
Courtesy of CHRYSLER GROUP, LLC

4. Position the vented seat motor to the seat cushion pan (4), install the two nuts (1) and engage the two push pin retainers (2). Tighten the nuts securely.
5. Connect the vented seat motor electrical connector (3).
6. Install the seat bottom cushion cover (Refer to **SEATS, FRONT**).
7. When servicing the passenger seat, install the Comfort Seat and Wheel Module with bracket. Refer to **MODULE, COMFORT SEAT AND WHEEL, INSTALLATION** .

Fig. 20: Heated Seat Pad Electrical Connectors, Seat Cushion Pan & Heated Seat Pad Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

8. Engage the heated seat pad electrical connector (1) to the seat cushion pan (3).

9. Connect the heated seat pad electrical connectors (2 and 4).

NOTE: On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to reconnect the wire harness connector for the ODS once the front passenger seat bottom cushion and cover are installed. Refer to SENSOR, OCCUPANT DETECTION, INSTALLATION .

10. Install the seat. Refer to SEAT, INSTALLATION .
11. Reconnect the negative battery cable.
12. Verify proper vented seat system operation.

SEAT BACK CUSHION MOTOR

Fig. 21: Vented Seat Motor & Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

1. Position the vented seat motor (2) to the vented seat pad (1) and carefully engage the four retaining clips that secure the motor to the pad. Be sure the retaining clips are fully engaged.

Fig. 22: Vented Seat Motor Electrical Harness Retainer, Connector & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

2. Position the seat back cushion and cover onto the seat back frame (2).
3. Engage the vented seat motor electrical harness retainer (1) and the connector (4) to the seat back frame.
4. Connect the vented seat motor electrical connector (3).

Fig. 23: Four Nuts, Vented Seat Motor & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

5. Position the vented seat motor (3) to the seat back frame (2) and install the four nuts (1). Tighten the nuts securely.
6. Install the seat back cushion cover onto the seat back frame (Refer to **SEATS, FRONT**).

Fig. 24: Air Bag Electrical Connector, Seat Back Heated Pad Electrical Connector & Seat Cushion Pan

Courtesy of CHRYSLER GROUP, LLC

7. Connect the air bag electrical connector (1) and seat back heated pad electrical connector (3) at the seat cushion pan (2).
8. Install the seat. Refer to **SEAT, INSTALLATION** .
9. Reconnect the negative battery cable.
10. Verify proper vented seat system operation.

2014 ACCESSORIES AND EQUIPMENT**Horn System - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

An electrically-operated horn system is standard factory-installed equipment in this vehicle. Depressing the Driver AirBag (DAB) trim cover in the center of the steering wheel actuates the horn switch contacts, which provides the vehicle operator with a convenient, audible signaling device that can be used to alert pedestrians or the operators of other vehicles in near proximity.

The Body Control Module (BCM) serves as the controller for the horn system, which also allows the BCM to utilize the horn system when providing audible outputs to support other vehicle features such as the horn chirp verification of the Remote Keyless Entry (RKE) and Remote Start systems, as well as the pulsing horn deterrent feature of the optional Vehicle Theft Alarm (VTA) and RKE Panic mode.

The horn system includes the following major components, which are described in further detail elsewhere in this service information:

- **Horn Relay** - The horn relay is soldered onto the Printed Circuit Board (PCB) located within the Body Control Module (BCM) and is not serviceable. The BCM is concealed within the instrument panel behind a fuse access panel outboard of the steering column.
- **Horns** - The standard dual-note horns are located on a bracket secured to the Front End Module (FEM) carrier near the center of the upper radiator cross member, just behind the radiator grille panel. The appearance shield covering the FEM carrier, the cross member and the outboard sides of the cooling module must be removed to gain access to the horns for service.
- **Horn Switch Plate** - The floating horn switch plate is secured to the back of the DAB housing within the steering wheel hub cavity and also serves as the mounting bracket between the DAB and the steering wheel.

Certain functions and features of the horn system rely upon resources shared with other electronic modules in the vehicle over the Local Interface Network (LIN) data bus and the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect horn system operation are:

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. The BCM is both a LIN bus master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION**.

The BCM and the RFHM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION**.

Hard wired circuitry connects the various horn system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The horn system components operate on battery current received through non-switched fused B(+) circuits so that the system will remain operational, regardless of the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM). The Body Control Module (BCM) controls the output of battery current to the horns through a horn relay soldered to a Printed Circuit Board (PCB) located within the BCM. The BCM controls the relay based upon internal programming, hard wired inputs from the horn switch as well as electronic message inputs received from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) over the Controller Area Network (CAN) data bus.

The vehicle operator can control typical horn system signaling through the horn switch contacts on the horn switch plate on the back of the Driver AirBag (DAB) within the hub cavity of the steering wheel. When the DAB trim cover in the center of the steering wheel is depressed, the horn switch contacts close, providing a hard wired analog input to the BCM.

In addition, the RFHM sends electronic **horn request** messages to the BCM over the CAN data bus in response to inputs received from the Remote Keyless Entry (RKE) transmitter in vehicles without the optional Passive Entry Keyless Go (PEKG) system, or received from the FOB with Integrated Key (FOBIK) transmitter in vehicles with the PEKG system. Lastly, as the Vehicle Theft Security System (VTSS) controller, the BCM can activate the horn system based upon programming and both hard wired and electronic message inputs from the various VTSS components.

The horns can be activated by the BCM to support each of the following features:

- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Lock** request audible verification.
- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Panic** mode audible alert.
- **Remote Start System** - Remote Start System **Start** request audible verification.
- **Vehicle Theft Alarm** - Vehicle Theft Alarm (VTA) audible alarm.

The RKE system **Lock** request audible verification is a customer programmable feature, which allows the feature to be enabled or disabled to suit individual preferences. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION**.

The hard wired circuits between components related to the horn system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes

wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the horn system or the electronic controls and communication between modules and other devices that provide some features of the horn system. The most reliable, efficient and accurate means to diagnose the horn system or the electronic controls and communication related to horn system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

NOTE: A continuously sounding horn is immediately resolved by disconnecting the wiring at the horns.

HORN SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
HORNS SOUND CONTINUOUSLY	1. Ineffective horn feed circuit.	1. Test and repair shorted horn feed circuit if required.
	2. Ineffective horn switch return circuit.	2. Test and repair shorted horn switch return circuit if required.
	3. Ineffective horn relay.	3. Test and replace the horn relay, which is integral to the Body Control Module (BCM), if required.
	4. Ineffective horn switch.	4. Test and replace the shorted horn switch, which is integral to the Driver AirBag (DAB), if required.
	5. Ineffective Body Control Module (BCM) inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HORNS SOUND INTERMITTENTLY AS THE STEERING WHEEL IS ROTATED	1. Ineffective horn switch return circuit.	1. Test and repair intermittently shorted horn switch return circuit if required.
	2. Ineffective horn switch.	2. Test and replace the intermittently open or shorted horn switch, which is integral to the Driver AirBag (DAB), if required.

2014 Jeep Cherokee Trailhawk**2014 ACCESSORIES AND EQUIPMENT Horn System - Service Information - Cherokee**

HORNS DO NOT SOUND	1. Ineffective horn ground circuit.	1. Test and repair open horn ground circuit if required.
	2. Ineffective horn feed circuit.	2. Test and repair open horn feed circuit if required.
	3. Ineffective horn relay.	3. Test and replace the horn relay, which is integral to the Body Control Module (BCM), if required.
	4. Ineffective horns.	4. Test and replace open horns if required.
	5. Ineffective horn switch feed circuit.	5. Test and repair open horn switch feed circuit if required.
	6. Ineffective horn switch return circuit.	6. Test and repair open horn switch return circuit if required.
	7. Ineffective horn switch.	7. Test and replace the open horn switch, which is integral to the Driver AirBag (DAB), if required.
	8. Ineffective BCM inputs or outputs.	8. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

Horn Mounting Bracket Screw	6	-	53

HORN**DESCRIPTION****DESCRIPTION**

0814005391

Fig. 1: Horns, Connector & Bracket**Courtesy of CHRYSLER GROUP, LLC**

Dual electromagnetic diaphragm-type horns are standard equipment on this vehicle. A low note (3) and a high note (2) trumpet-style horn are each secured to a mounting bracket (4). The horn and mounting bracket unit is then secured by a single screw to the Front End Module (FEM) carrier atop the upper radiator cross member. The mounting bracket fastening provision is concealed beneath an appearance shield. Internally the two horns are identical in construction and the external horn trumpets are symmetrically opposite.

A short jumper harness connects the horns to each other electrically so they can both be connected through a single connection (1) integral to the left horn. A dedicated take out and connector of the FEM wire harness connects the horns to the vehicle electrical system.

The two horns and the mounting bracket are factory-tuned as a unit and, therefore, are serviced only as a unit. These horns cannot be adjusted or repaired. If either horn or the mounting bracket is ineffective or damaged, the entire unit must be replaced.

OPERATION

OPERATION

Each horn has a path to ground at all times through its wire harness connection to an eyelet terminal secured to the body sheet metal. The horns are completely controlled by a fused B(+) output received through a relay soldered onto the Printed Circuit Board (PCB) within the Body Control Module (BCM).

Within the two halves of the horn housing are a flexible diaphragm, a plunger, an electromagnetic coil and a set of contact points. The diaphragm is secured in suspension around its perimeter by the mating surfaces of the

horn housing. The plunger is secured to the center of the diaphragm and extends into the center of the electromagnetic coil. The contact points control the current flow through the windings of the electromagnetic coil.

When the horn is energized, electrical current flows through the closed contact points to the electromagnetic coil. The resulting electromagnetic field draws the plunger and diaphragm toward it until that movement mechanically opens the contact points. When the contact points open, the electromagnetic field collapses allowing the plunger and diaphragm to return to their relaxed positions and closing the contact points again. This cycle continues repeating at a very rapid rate producing the vibration and movement of air that creates the sound that is directed through the horn trumpet outlet.

The horns as well as the hard wired input circuits for the horns may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORNS

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect the Front End Module (FEM) wire harness connectors from the pigtail connector on the horn and mounting bracket unit. Check for continuity between the horn ground circuit in the FEM wire harness connector for the horns and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.
2. Check for battery voltage at the horn circuit in the FEM wire harness connector for the horns. There should be zero volts. If OK, go to Step 3. If not OK, repair the shorted horn circuit between the horns and the Body Control Module (BCM) as required.
3. Depress the horn switch. There should now be battery voltage at the horn circuit of the FEM wire harness connector for the horns. If OK, replace the ineffective horn and mounting bracket unit. If not OK, use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis of the Body Control Module (BCM) inputs and outputs.

REMOVAL

REMOVAL

0814005392

Fig. 2: Carrier, Screw, Connector & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the appearance shield from over the Front End Module (FEM) carrier (1) on the upper radiator cross member.
3. Disconnect the FEM wire harness connector (3) from the pigtail wire connector for the horns.
4. Remove the screw (2) that secures the horn mounting bracket (4) to the top surface of the FEM carrier.
5. Remove both horns and the mounting bracket from the vehicle as a unit.

INSTALLATION

INSTALLATION

0814005392

Fig. 3: Carrier, Screw, Connector & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the horns and the mounting bracket (4) to the Front End Module (FEM) carrier (1) atop the upper radiator cross member as a unit.
2. Install and tighten the screw (2) that secures the horn mounting bracket to the top surface of the FEM carrier. Tighten the screw to 6 N.m (53 in. lbs.).
3. Reconnect the FEM wire harness connector (3) to the pigtail wire connector for the horns.
4. Reinstall the appearance shield onto the FEM carrier.
5. Reconnect the negative cable to the battery.

RELAY, HORN

DESCRIPTION

DESCRIPTION

The horn relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The horn relay for this vehicle is soldered in place on the Printed Circuit Board (PCB) internal to the Body Control Module (BCM), which is located within the instrument panel outboard of the steering column.

The horn relay cannot be repaired or adjusted and, if ineffective or damaged, the entire BCM unit must be replaced.

OPERATION

OPERATION

The horn relay within the Body Control Module (BCM) switches battery current to the horns when the BCM energizes the electromagnetic coil of the relay. When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. The closed relay contacts supply fused battery current from the BCM to energize the horns.

When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position, which de-energizes the horns. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired output of the horn relay within the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN RELAY

The hard wired output of the horn relay in the Body Control Module (BCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The horn relay used in this vehicle is soldered onto a Printed Circuit Board (PCB) internal to the Body Control Module located in the instrument panel outboard of the steering column. The horn relay is integral to and serviced only as a unit with the BCM. Refer to **MODULE, BODY CONTROL, REMOVAL** .

INSTALLATION

INSTALLATION

The horn relay used in this vehicle is soldered onto a Printed Circuit Board (PCB) internal to the Body Control Module (BCM) located in the instrument panel outboard of the steering column. The horn relay is integral to

and serviced only as a unit with the BCM. Refer to **MODULE, BODY CONTROL, INSTALLATION**.

SWITCH, HORN

DESCRIPTION

DESCRIPTION

Fig. 4: Horn Switch Plate, Mounting Plate, Horn Switch Contacts & Connector
Courtesy of CHRYSLER GROUP, LLC

The horn switch for this vehicle consists of four individual sets of normally open contacts wired in parallel so that all four sets of contacts operate as one switch. The horn switch contacts (3) are secured to, but insulated from a stamped metal floating horn switch plate (1) that also serves as the mounting plate for the Driver AirBag (DAB) (2). The horn switch plate is over-molded with integral plastic insulators for the horn contacts and routing clips for the contact wiring.

The horn switch plate is secured to but isolated from the DAB housing with four sleeved screws and insulating washers. Each sleeved screw passes through a small coiled spring retained by an interference fit within an isolator on the switch plate. A dedicated take out and connector of the steering wheel wire harness connects the horn switch plate to the vehicle electrical system through a connector (4) on the upper edge of the switch plate. A mounting spring on each outboard side of the horn switch plate is secured within the hub of the steering wheel under a hook formation in the steering wheel hub armature adjacent to each horizontal steering wheel spoke.

The components that make up the horn switch plate cannot be adjusted or repaired. If damaged or ineffective, the entire DAB and horn switch plate must be replaced as a unit.

OPERATION

OPERATION

The floating horn switch plate allows the vehicle operator to actuate the horns by depressing anywhere on the upper surface of the Driver AirBag (DAB) trim cover in the center of the steering wheel. The four sets of horn switch contacts are wired in parallel so they perform as a single switch. One contact from each pair is connected to a path to ground at all times through the steering wheel wire harness and the clockspring.

When the DAB trim cover is depressed, the DAB housing compresses the coil springs isolating the floating horn switch plate causing at least one of the four sets of electrically conductive horn switch contacts to close. When the DAB trim cover is released, the coil springs on the switch plate return the DAB to its at rest position and open the horn switch contacts, which opens the horn switch circuit. The closed horn switch contacts provide a ground signal to the Body Control Module (BCM), which will energize the control coil of the horn relay located within the BCM. The horn relay in the BCM then controls the output to the horns accordingly.

The hard wired circuits between components related to the horn switch plate may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the horn switch pigtail wire harness connector.
3. With the horn switch contacts released, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should be no continuity. If OK, go to Step 4. If not OK, replace the ineffective horn switch plate and DAB as a unit.
4. With each of the horn switch contacts compressed one at a time, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should now be continuity. If OK, go to Step 5. If not OK, replace the ineffective horn switch plate and DAB as a unit.

5. Check the steering wheel wire harness for shorts or opens between the horn switch connector and the clockspring. If OK, go to Step 6. If not OK, repair or replace the steering wheel wire harness as required.
6. Check the clockspring ground circuit between the clockspring and the ground source for continuity. If OK, go to Step 7. If not OK, repair or replace the clockspring or the open ground circuit as required.
7. Check the horn switch output circuit between the clockspring and the horn switch output circuit at the Body Control Module (BCM) for shorts or opens. Repair or replace the clockspring or the shorted or open circuit as required.

REMOVAL**REMOVAL**

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, REMOVAL** .

INSTALLATION**INSTALLATION**

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, INSTALLATION** .

2014 ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Exterior - Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is centered on the liftgate spoiler just above the flip-up glass opening at the rear of the vehicle.
- **Daytime Running Lamps** - The Daytime Running Lamps (DRL) are located in the combination Park/Turn lamp assembly. The DRLs on this vehicle are LED. There is a LED module located on the back of the lamp assembly.
- **Front Fog Cornering Lamps** - Vehicles equipped with this option have a separate fog lamp unit mounted near each outboard end of the front fascia, below each front lamp unit.
- **Front Lamp Units** - A halogen front lamp unit is standard equipment on vehicles manufactured for domestic markets. A High Intensity Discharge (HID) front lamp unit is optional equipment in vehicles manufactured for export markets and optional for domestic market vehicles. The front lamp units are mounted to the front fascia on either side of the mid grille opening.
- **License Plate Lamps** - Two standard equipment rear license plate lamp units are mounted to the underside of the light bar and handle unit, just above the license plate tub formation on the outer liftgate panel.
- **Outside Mirror Signal Lamps** - Vehicles equipped with this option have a signal lamp unit integral to the lower forward facing surface of each outside rear view mirror. These signal lamps are serviced only as a unit with the outside rear view mirror assembly.
- **Rear Lamp Unit** - Full 48-element LED illumination on either side of the vehicle - 24-LED elements are position on either side of the tailgate-to-rear aperture split line. The rear lamp unit combines a three-shot lens that integrates clear, red, and black surround surfacing. Direction signals and braking lamps illuminate on the outside array of the lamp, running lamps illuminate on the full array inside and outside.
- **Rear Fog Lamps** - In certain export markets where they are required, two rectangular fog lamps with red lenses and reflectors are located in the rear bumper fascia, one just inboard and below each rear lamp unit. In domestic market vehicles, a red reflector is installed in the rear fascia in place of a rear fog lamp.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Automatic headlamps are optional equipment on this vehicle. The headlamp switch includes an **A** (Automatic) position and an automatic headlamp sensor senses ambient light levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel. When the **A** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate.
- **Automatic High Beam Control** - Vehicles equipped with the optional automatic high beam control system include a unique digital light-sensing imager camera inside the vehicle on the windshield next to the rear view mirror. The conditions that need to be met for Automatic High Beam Control (AHBC) are:
 1. The headlamp switch needs to be set to AUTO.
 2. Customer preference in the radio options needs to be enable.
 3. The stalk moved to the back/high beam position.
 4. Appropriate light conditions.
- **Backup Lamps** - In domestic market vehicles, the backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each inner and outer rear lamp unit. In export market vehicles, backup lamps are found in only the two inner rear lamp units.

- **Brake Lamps** - The brake (or stop) lamps are LED and are integral to each outer rear lamp unit, and the red lens and multiple Light-Emitting Diode (LED) units of the CHMSL. On vehicles equipped with combined rear lighting, the turn signal and stop lamp use the same LED elements. When combined rear lighting is present, turn signals are allowed to interrupt stop lamp actuation to allow turn signal actuation.
- **Daytime Running Lamps** - Domestic market vehicles with HID front lamp units and DRL illuminate a dedicated DRL bulb in the combination park/turn lamp unit, while export market vehicles illuminate a combination DRL/position lamp bulb in each front lamp unit.
- **Exterior Lamp Fail-Safe Operation** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Body Control Module (BCM) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from the headlamp switch, or when there is no communication over the Controller Area Network (CAN) data bus.
- **Exterior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all exterior lamps that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Cornering Lamps** - The optional front fog lamps include the bulb, reflector and lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamp Delay** - The low or high beam headlamps remain illuminated for 90 seconds after the ignition switch has been turned to the OFF position. If the vehicle is equipped with the optional Electronic Vehicle Information Center (EVIC), the delay interval is customer-programmable for 0, 30, 60 or 90 seconds.
- **Headlamps** - Two headlamp systems are available on this vehicle for domestic markets. The standard halogen headlamp system includes two single filament halogen bulbs in each front lamp unit, one low beam and one high beam. The optional HID headlamp system includes a single HID lighting element/igniter unit for low or high beam headlamps. An electric motor and mechanism internal to the HID lamp unit closes a shutter for low beams and opens the shutter for high beams. The HID front lamp units each include an electronic ballast module, while an Automatic Headlamp Leveling Module (AHLM) that serves both front lamp units levelling motor. Both headlamp systems also include an adjustable reflector and clear lens integral to each front lamp unit.
- **Headlamp Leveling** - On all vehicles equipped with optional HID headlamps, an Automatic Headlamp Leveling Module (AHLM) controls a headlamp leveling actuator motor attached to each front lamp unit to automatically perform headlamp adjustments using inputs from front and rear axle sensors to monitor changes in the vehicle suspension height. On vehicles equipped with manual headlamp levelling, the BCM directly drives both of the headlamp motors.
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park Lamps** - The front park lamps include either the bulbs, the reflectors and the clear lenses of the park lamp compartment in both front combination lamp units. On vehicles not equipped with repeater lamp units, the front lamps also include the front side marker lamp bulbs and reflectors. On vehicles equipped with repeater lamp units, only the side marker reflectors are retained in the front lamp units. The rear park lamps include a clear bulb, a reflector and a red lens integral to each inner and outer rear lamp unit as well as the clear bulbs and lenses of the two license plate lamp units.

- **Rear Fog Lamps** - Rear fog lamps are available only in certain export markets where they are required equipment. The rear fog lamps include a clear bulb and a red lens and reflector that are integral to each rear fog lamp unit located below the outer tail lamps in the rear fascia. On domestic market vehicles, only the red reflector is retained in the rear fascia.
- **Turn Signal Lamps** - The front turn signal lamps include an amber bulb, a reflector, and a clear lens that are integral to each front combination lamp unit. On vehicles equipped with the optional outside mirror signal lamps, there are several amber LED units integral to each mirror signal lamp unit that are also activated by the turn signal circuits for the same side of the vehicle. Depending upon market requirements, the rear turn signal lamps include either a clear bulb and a red lens or an amber lens and a reflector that are integral to each outer rear lamp unit. On vehicles equipped with combined rear lighting, the turn signal and stop lamps use the same bulb filament. When combined rear lighting is preset, turn signals are allowed to interrupt stop lamp actuation to allow turn signal actuation.

Other components of the exterior lighting system for this vehicle include:

- **Automatic Headlamp Leveling Module** - Vehicles equipped with HID headlamps have an AHLM located in the passenger cabin underneath the glove box. The AHLM monitors the vehicle ride height through the front and rear axle sensors, then provides inputs to the headlamp leveling motor on each front lamp unit as appropriate.
- **Axle Sensors** - Vehicles equipped with HID headlamps have an axle sensor for both the front and the rear axles, which monitor the suspension height of the vehicle.
- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this vehicle.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the steering column support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Daytime Running Lamp Relays** - All vehicles equipped with optional HID headlamps have two DRL relays located in the Power Distribution Center (PDC).
- **Electronic Ballast Module** - Vehicles equipped with the HID headlamps have an electronic ballast module secured to the underside of each front lamp unit. Each module controls the HID lighting element/igniter within the front lamp unit to which it is mounted.
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel.
- **Headlamp Leveling Motor** - A headlamp leveling actuator motor is attached to each front lamp unit housing of vehicles manufactured with HID headlamps.
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below the left instrument panel vent outboard of the steering column. The headlamp switch includes a rotary knob to turn the park lamps and headlamps ON or OFF and is pushed inward for selecting the optional front fog lamps on vehicles so equipped. The headlamp switch also features a vertical thumbwheel for selecting the panel lamps dimming level, a PARADE mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned ON, and for interior lighting control.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the

steering column opening, directly in front of the driver. Refer to **DESCRIPTION**.

- **Multi-Function Switch** - The multi-function switch is integral to the Steering Column Control Module (SCCM) located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the SCM is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).
- **Park Brake Switch** - A park brake switch is located on the park brake lever mechanism on the cowl side inner panel (Left-Hand Drive/LHD) or the right side of the floor panel transmission tunnel (Right-Hand Drive/RHD) to the left of the steering column.
- **Steering Control Module** - The Steering Control Module (SCM) is located within and integral to the Steering Column Control Module (SCCM) located on the top of the steering column, just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION**.
- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Trailer Tow Wiring** - Domestic market vehicles with a factory-installed trailer towing package have a trailer tow wire harness with a combination 4-way and heavy duty 7-way trailer tow connector installed in the rear bumper fascia near the trailer hitch receiver. This package also includes an electric trailer brake wiring provision that terminates at a connector located on top of the large body harness connection bracket under the instrument panel to the left of the steering column. An electric trailer brake pigtail harness and an instruction card are available through MOPAR® to ease installation of most aftermarket electric trailer brake controllers.
- **Trailer Tow Relays** - Domestic market vehicles with a factory-installed trailer towing package have two trailer tow relays installed in the TIPM in the engine compartment. One relay is for the trailer right turn and brake lamps, and the other is for the trailer left turn and brake lamps.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting

system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMP

The two optional automatic headlamp systems can include the headlamp switch, the Body Control Module (BCM), the heater and air conditioner control head (also known as the Electronic Climate Control/ECC). The auto headlamp system has two available sensors that give the BCM feedback for lamp control. The light rain sensor and the twilight sensor on the top of the instrument panel are the two available sensors.

If the vehicle is not equipped with a light rain sensor, the twilight sensor provides the ambient light level input to the A/C - heater control whenever the ignition switch status is ON. The A/C - heater control responds to this input by sending the appropriate electronic **light level** messages to the BCM over the Controller Area Network (CAN) data bus. When the **AUTO** (Automatic) position is selected with the headlamp switch, the BCM receives a hard wired multiplex input from the headlamp switch. The BCM also receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) indicating the engine is running. **The twilight sensor is only used for auto headlamp operation when the vehicle is not equipped with an optional light rain sensor.**

If the vehicle is equipped with a light rain sensor, then this rain sensor is what is read by the BCM.

The BCM responds to either input condition by automatically controlling a Pulse-Width Modulated (PWM) voltage output to the selected headlamp bulb filaments through the right and left low or high beam driver circuits to illuminate the headlamps. The BCM also remembers which beams (low or high) were selected when the headlamps were last turned OFF, and energizes those beams and lamps again the next time it turns the headlamps ON.

AUTOMATIC HIGH BEAM CONTROL

The optional auto high beam system (**if equipped with the Forward Facing Camera (FFC)**) includes the digital imager Forward Facing (FFC), the BCM, the radio, the IC and the headlamp switch. First, the **Auto High Beams** option must be enabled using the customer programmable features function of the radio. Then the **AUTO** (Automatic) position must be selected using the rotary knob of the headlamp switch, the headlamp beam selector switch must be in the high beam position and the appropriate lighting conditions must be present. Finally, the vehicle speed must be greater than 32 kilometers-per-hour (20 miles-per-hour).

Once all of these prerequisites have been met, the HaLF module (otherwise known as the Forward Facing Camera or FFC) automatically sends the appropriate electronic **headlamp beam select switch status** messages to the BCM over the CAN C data bus. The BCM follows the command from the HaLF and turns on or off the high beams appropriately. The BCM also sends a message to the cluster for "Enabled" and "Disabled" display messages. These messages should not display unless under optimal lighting conditions (night, dusk, etc.).

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the

body wire harness that is secured to the body sheet metal within the passenger compartment. On vehicles with a manual transmission, the backup lamp switch provides a hard wired input to the PCM through a backup lamp switch signal circuit, and the PCM sends the appropriate electronic **reverse gear status** messages to the BCM over the CAN data bus. The BCM then controls a battery feed to the backup lamps on the backup lamp feed circuit as required whenever the ignition switch status is ON.

On vehicles with an automatic transmission, the PCM continually monitors electronic an hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the appropriate electronic **gear selector status** messages received from the Gear Shift Module (GSM) over the CAN data bus, then relays the appropriate electronic **reverse gear status** messages to the BCM over the CAN data bus.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal within the passenger compartment. The brake lamp switch is continually monitored by the BCM. When the normally open circuit of the brake lamp switch is closed by the brake pedal arm, the BCM responds to the brake lamp switch input by providing a control output that energizes or de-energizes the brake lamps.

Some models can be equipped with combined rear lighting. This option allows the brake lamp and the turn signal lamp to use the same single bulb filament. The turn signal operation will take precedence when commanded on.

DAYTIME RUNNING LAMPS

Vehicles equipped with this option or manufactured for sale in Canada illuminate the LED bulbs of both front combination turn/park lamp units when the engine is running, the parking brake is released and the exterior lamps are turned OFF. The BCM must be programmed appropriately for this feature to be enabled. Once enabled, anytime the BCM receives electronic messages over the CAN data bus from the PCM indicating the engine is running, a hard wired multiplex input from the headlamp switch indicating the status of the headlamp switch is OFF and a hard wired input from the park brake switch indicating that the parking brake is released, the BCM provides an output to the proper bulb filaments through the right and left front turn signal feed circuits to produce illumination at the proper intensity.

FRONT FOG AND CORNERING LAMPS

Vehicles equipped with optional front fog lamps include a front fog lamp switch integral to the headlamp switch on the instrument panel. The front fog lamps have a path to ground at all times through their connection to the Front End Module (FEM) wire harness and a takeout with an eyelet terminal that is secured to the body sheet metal.

When the BCM input from the headlamp switch assembly indicates the fog lamps are selected, it controls front fog lamp operation by providing a battery voltage output to the fog lamps through the right and left front fog lamp control circuits. The BCM also sends the appropriate electronic **front fog lamp status** messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to illuminate or extinguish the front fog lamp indicator.

Fog Lamp Dropout with High Beam Activation - If the front fog lamps are active and the vehicle's high beams turn ON, then the front fog lamp outputs shall turn OFF and the IPC indicator will also turn off and remain off until the high beams are turned OFF. If vehicle high beams are active and the front fog lamp command is operated, the IPC indicator will remain OFF. The BCM will keep track of a fog lamp request and honor the request when the high beams are turned OFF.

The BCM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes when the status of the ignition switch is LOCK, if there is a charging system failure or if the electrical system voltage falls below about 11.75 volts for more than about 30 seconds.

Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

FRONT FOG CORNERING LAMPS

The Cornering lights function is derived from two different inputs. Steering angle or the activation of the turn signal lamps. Both of those items can induce lamp cornering activation. In the event that both are creating an active request at the same time, the steering angle will be given priority to the expense of the one based on the turn signal lights. In the case of the steering angle sensor, the lamps will activate at the "10 and 2" positions when turning. When neither angle is breached, both of the front fog lamps remain on uninterrupted.

HAZARD WARNING LAMPS

The hazard warning system includes the IC, the BCM and the hazard latching switch in the switch pod bank in the center area of the instrument panel. The hazard switch provides a hard wired input to the BCM. When the BCM receives an input from the hazard switch, it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the front and rear, right and left turn signal control circuits.

The BCM also sends the appropriate electronic **hazard switch status** messages to the IC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical hazard warning flasher.

HEADLAMPS

The headlamp system includes the IC, the Steering Control Module (SCM), the BCM, the headlamp switch and the multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the FEM wire harness. The FEM harness has takeouts with eyelet terminals that are secured to the front end sheet metal within the engine compartment. The BCM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The BCM monitors a hard wired multiplex input to determine the status of the headlamp switch. The BCM also monitors electronic **headlamp beam select switch status** messages received from the SCM over the CAN data bus. The BCM responds to these inputs by providing a pulse width modulated voltage output to the headlamp bulbs through high side drivers on the right and left headlamp feed circuits to illuminate the headlamps, and controls the high and low beam shutter operation through high side drivers on the right and left high beam feed

circuits. The BCM also sends the appropriate electronic **headlamp beam status** messages to the IC to control the illumination of the high beam indicator.

The BCM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The BCM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes when the ignition switch status is LOCK. The SCM and the BCM each provide a fail-safe feature for the headlamps, which will cause the BCM to turn the low beam headlamps ON automatically if there is no input available from the headlamp switch or the multi-function switch. The BCM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected when the ignition switch status is ON.

Each headlamp includes an integral reflector adjustment screw to be used for static aiming of the headlamps.

HEADLAMP LEVELING

On vehicles with the HID headlamps, an automatic leveling system is used that includes front and rear axle sensors and an Automatic Headlamp Leveling Module (AHLM) located under the dash on the passenger side compartment. A headlamp leveling motor located on the back of each HID lamp unit is mechanically connected through an integral pushrod to the adjustable headlamp reflector.

The automatic headlamp leveling system automatically adjusts the headlamp beam reflectors to compensate for changes in vehicle suspension height regardless of whether caused by the loading of the vehicle suspension or vehicle pitch changes caused by acceleration and deceleration. The actuator motors are automatically adjusted by the AHLM, which reads the front and the rear axle sensors to determine the suspension height changes. The circuitry of the AHLM provides a voltage signal to the electronic circuitry of both leveling actuator motors and the electronic circuitry of these stepper motors responds to the voltage inputs received from the AHLM to move the headlamp reflectors to the selected position.

The headlamp leveling motors have a path to ground at all times. The automatic headlamp leveling components operate on battery current received only when the exterior lighting and the ignition switch are turned ON.

MANUAL HEADLAMP LEVELING

In certain markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique front headlamp units each connected to a headlamp leveling actuator motor, and a roller-actuated headlamp leveling switch integral to the headlamp switch pod on the instrument panel. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension. The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp mounting collar.

Each time the headlamp leveling switch is depressed the circuitry of the switch pod provides an electronic **select status up** or **select status down** message input to the BCM over the a data bus. The BCM provides a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the BCM. The BCM also sends the appropriate electronic messages back to the switch to control the illumination of the **1** , **2** , or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch

button. BCM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

HEADLAMP TIME DELAY

The headlamp delay feature includes the headlamp switch and the BCM. In vehicles with the optional EVIC, this feature is customer programmable using the EVIC switch pod and the EVIC electronic display unit to select delay intervals of 0 seconds (disabled), 30 seconds, 60 seconds and 90 seconds. If the headlamp switch remains in the headlamp **AUTO** (Automatic) position until after the ignition switch status transitions to OFF, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp time delay interval. The default delay interval is 90 seconds, but can be reprogrammed by the customer using the EVIC switch pod.

PARK LAMPS

The park lamps system includes the headlamp switch on the instrument panel and the BCM. The front park lamps each have a path to ground at all times through their connection to the FEM wire harness. The FEM wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear park/tail lamps and license plate lamp bulb each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is also secured to the body sheet metal.

The BCM monitors a hard wired multiplex input from the headlamp switch. The BCM responds to this input by controlling a battery voltage output to the appropriate lamps and bulbs through high side drivers on the front and rear, right and left lamp driver and control circuits. The BCM also sends the appropriate electronic **park lamps status** messages to the IC to control the illumination and lighting level of the panel lamps.

The BCM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes while the ignition switch status is LOCK. The BCM also provides a fail-safe feature for the park lamps, which will turn the park lamps and low beam headlamps ON automatically if there is no input available from the headlamp switch after the ignition switch status transitions to ON. The BCM also provides a fail-safe feature for the park lamps that will turn the park lamps and low beam headlamps ON automatically whenever a loss of CAN bus communication is detected after the ignition switch status transitions to ON.

TURN SIGNAL LAMPS

The left or right direction signals are activated using the left stalk switch input to the SCCM. These commands are codified using a resistive divider, into the analogical command that is read by the SCCM and then sent to the BCM over CAN-C.

The turn signal lamps system includes the multi-function switch on the steering column, the SCM, the IC and the BCM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the combination park/turn lamp and dash wire harness. The combination park/turn lamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear turn signal lamps are LED elements within the rear outer tail lamp housing.

The SCM monitors a hard wired multiplex input from the multi-function switch to determine the status of the

turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the BCM over the CAN data bus. The BCM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate front and rear, right or left turn signal control circuits. The BCM also sends the appropriate electronic messages to the IC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical turn signal flasher.

The BCM also provides a Turn Signal ON warning that will send a **turn signal ON warning** request message to the IC over the CAN bus that causes the IC to generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

SNA Definition - Signal Not Acquired. If the SCCM detects an issue (stuck switch, etc) and sets an active fault, the SCCM shall broadcast the SNA state to the BCM. BCM will default to an idle state and keep all turn signal outputs OFF until a valid request is received.

Combined Rear Lighting - Some models will be equipped with combined rear lighting. The stop lamp and the turn signal lamp share the same single bulb filament. When the turn signal is activated, the SCCM recognizes the signal switch request. The SCCM sends this message over the CAN C bus to the BCM for processing. The BCM then actuates the single bulb filament for signal operation only until the stalk is reset back to the neutral position.

Combined Front Park/Turn - When the turn signal function is active, the BCM will apply the normal voltage to the turn signal output. When both the park and the turn functions (or hazards) are active, the BCM will switch between park intensity and turn intensity for the duration of the front left turn or right turn (or hazard) event.

Lane Change Function - If either of the turn signals are actuated for a time equal to or less than 500 ms, the BCM will activate the requested turn signal light and will blink for three blinks. At the same time the signals are switched ON, the BCM will also activate the internal signal corresponding with the selected side. The internal signal will show ON for the entire period of the turn signal even and will not show to be blinking. The internal signal is synchronous with the signal activation and will turn OFF at the end of the event. After 3 blink cycles, the BCM switches OFF the turn signals, the CAN-B signals, and the internal signals corresponding to the selected side.

Turn Signal Alert Feature - When either the left or right turn signal are activated, the IPC (Cluster) will record the distance travelled using odometer information by way of the CAN-B signal. When one mile (1.6 km) has been traveled, the cluster will assume that the operator has unintentionally left the turn signals activated and two alerts will occur: A slow audible chime will emit from the cluster or an icon and textual message will display on the cluster.

CONTROL MODULE RESPONSIBILITY

- BCM - Turn signal lights request from the SCCM, received from the turn signal multi-function switch.

- BCM - Turn signal lights powering (left and right sides)
- BCM - Turn signal light status transmittal over CAN-B.
- BCM - Combined lighting turn/stop and park/turn lamp management.
- IPC - Obtain turn signal lamp status from CAN-B
- IPC - Turn signal lights signalling management.
- IPC - Turn signal lights fail signalling management.
- SCCM - Turn signal output acquisition from the multi-function switch
- SCCM - Turn signal activation request to BCM over CAN-C

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXTERIOR LIGHTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMPS

NOTE: Be certain that the headlamps can be turned ON and OFF manually before attempting to diagnose and repair the Automatic Headlamps. If not, diagnose and repair those problems before attempting to repair the Automatic Headlamps.

NOTE: The Automatic Headlamp switch is integral to the headlamp switch itself, which communicates with the Body Control Module (BCM) over via data bus. Before performing any of the following tests, determine whether the other functions of the headlamp are operational. If the other functions are ineffective, diagnose and repair that problem before attempting to repair the Automatic Headlamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
AUTO HEADLAMPS INEFFECTIVE	1. Feature not enabled.	1. Enable Auto Low or Auto Low/High using the customer programmable features function of the Electronic Vehicle Information Center (EVIC).
	2. Ineffective headlamp switch.	2. Test and replace switch if required.
	2. Incorrect BCM configuration.	2. Use a diagnostic scan tool to check and configure BCM if required.
	3. Ineffective circuits between sun load sensor and air conditioner - heater control (except with automatic wipers).	3. Test and repair sun sensor and sun sensor return circuits if required.
	4. Ineffective sun load sensor (except with automatic wipers). If vehicle is export, then LRSM is 100% in control of light identification and not the Sun Sensor.	4. Test and replace sun load sensor if required. Connect the scan tool and monitor the sensor voltage while covering and uncovering the sensor. A covered sensor voltage should read approximately 4.6V and an uncovered sensor should read approximately 2.3V.
	5. Ineffective Light Rain Sensor Module (LRSM) (with automatic wipers).	5. Use a diagnostic scan tool to test and replace the LRSM if required. Refer to the appropriate diagnostic information.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

AUTO HIGH BEAM HEADLAMP

Please make sure the beauty cover is installed in position while testing the (Forward Facing Camera) FFC and Auto High Beams. Loss of cover creates interference with the imager of the camera.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Lamps/Lighting - Exterior - Service Information - Cherokee

CONDITION	POSSIBLE CAUSES	CORRECTION
AUTO HIGH BEAM CONTROL SYSTEM IS INOPERATIVE.	1. Feature is not enabled.	1. Enable Auto Low/High using the customer programmable features function located within the radio.
	2. Automatic headlamps are not turned ON .	2. Turn automatic headlamps ON using the control knob of the headlamp switch.
	3. Headlamp high beams are not selected.	3. Turn high beam headlamps ON using the stalk.
	4. Vehicle speed is below 34 kilometers-per-hour (18 miles-per-hour).	4. Increase vehicle speed. This system not designed to operate at speeds below 34 kilometers-per-hour (18 miles-per-hour).
	5. Incorrect (Body Control Module) BCM configuration.	5. Use a diagnostic scan tool to check and correct the BCM configuration settings if required. Refer to the appropriate diagnostic information.
	6. FFC is inoperative on the bus or a loss of CAN C bus communication.	6. Using the WiTech, confirm the FFC is off-line and to test the CAN C bus system.
	7. Ineffective ground circuit to the FFC.	7. Test and repair open ground circuit to the forward facing camera as required.
	8. Ineffective feed circuit to the FFC.	8. Test and repair open fused run relay output circuit to the forward facing camera if required.
	9. Forward Facing Camera imager lens dirty or obstructed.	9. Clean imager lens and windshield or remove obstructions from the windshield glass if required.
	10. FFC bussed outputs to the BCM.	10. Use a diagnostic scan tool confirm the FFC operation.
	11. FFC is in a limited function mode.	11. Use a diagnostic scan tool and check for DTCs relative to FFC reliant components.

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open backup lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open backup lamp feed circuit if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Lamps/Lighting - Exterior - Service Information - Cherokee

BACKUP LAMP DOES NOT EXTINGUISH	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or TRS (automatic transmission) if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	1. Ineffective feed circuit.	1. Test and repair shorted backup lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: The brake lamps and the Center High Mounted Stop Lamp (CHMSL) are illuminated by several Light-Emitting Diode (LED) units that are soldered to the electronic circuit board within the lamp housing. The CHMSL is hard wired to the output of the brake lamp switch, while the brake lamps are powered by high side drivers within the BCM based upon an input from the brake lamp switch. If the brake lamps and all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the CHMSL LED units operate and others do not, the CHMSL assembly must be replaced with a new unit.

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective ground circuit.	1. Test and repair open brake lamp ground circuit if required.
	2. Ineffective fuse.	2. Test and replace the fuse in the BCM if required.
	3. Ineffective feed circuit.	3. Test and repair open brake lamp switch output circuit or stop lamp output circuit if required.
	4. Ineffective switch.	4. Test and replace brake lamp switch if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted brake lamp switch output circuit or stop lamp output

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Lamps/Lighting - Exterior - Service Information - Cherokee

		circuit if required.
	2. Improperly adjusted switch.	2. Adjust the brake lamp switch if required.
	3. Ineffective switch.	3. Test and replace brake lamp switch if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the turn signals operate. If the turn signals are also ineffective, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect BCM programming. 2. Automatic transmission in PARK position. 3. Parking brake applied. 4. Engine not running. 5. Ineffective LED Module 6. Ineffective BCM inputs or outputs.	1. Use a diagnostic scan tool to check and configure BCM if required. 2. Place the transmission gear selector lever in any position except PARK. 3. Release the parking brake. 4. Start the engine. 5. Confirm power and ground at the LED module prior to replacement. 6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

NOTE: The front fog lamp switch is integral to the left multi-function switch/Steering Control Module (SCM), which communicates with the Body Control Module (BCM). The BCM communicates or broadcasts to the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the CAN-B. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Fog Lamps.

If the BCM receives a short or open circuit from the fog lamp switch, the BCM will set a DTC for each present faulted condition. If the BCM received an open or short circuit while the front fog lamps are ON then the BCM will retain the last state of the fog lamp switch until the next engine cycle. After the next ignition cycle if the headlamp switch is still faulted, the BCM will not activate the front fog lamps.

If the front fog lamp switch is active for 20 second or more, the BCM shall activate the front fog lamps and will

2014 Jeep Cherokee Trailhawk**2014 ACCESSORIES AND EQUIPMENT Lamps/Lighting - Exterior - Service Information - Cherokee**

set a front fog stick switch fault DTC. If the front fog lamp switch remains faulted, the BCM will continue to drive the front fog lamps in a normal manner until the switch is repaired or replaced. If the front fog switch is no longer stuck, the BCM will clear the related fault DTC.

If the BCM received a front fog command and the PROXI is not correct or set for the vehicle being equipped with fog lamps, the BCM will set a misbuild fault. Run PROXI configuration first.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: The hazard switch is integral to the instrument panel switch bank, which provides a hard wired output to the BCM. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the hazard warning lamps system.

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective instrument panel switch bank.	1. Test and replace instrument panel switch bank if required.
	2. Ineffective BCM inputs or	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the

	outputs.	appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective instrument panel switch bank. 2. Ineffective BCM inputs or outputs.	1. Test and replace instrument panel switch bank if required. 2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the BCM. Diagnose and repair those problems before attempting to repair the Headlamps. In addition, the BCM will store a Diagnostic Trouble Code (DTC) for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.

2014 Jeep Cherokee Trailhawk

HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING - AUTOMATIC

NOTE: Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. If the park lamps are ineffective or operate improperly, diagnose and repair that problem before attempting to repair the automatic headlamp leveling function.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open headlamp adjust signal circuit if required.
	4. Ineffective motor.	4. Test and replace headlamp leveling motor (front lamp unit) if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective motor ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective motor feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open or shorted leveling motor signal circuit if required.
	4. Ineffective Automatic Headlamp Leveling Module (AHLM) (also known as the High Intensity Discharge Transducer/HIDT) inputs or outputs.	4. Use a diagnostic scan tool to test the AHLM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors (front lamp units) if required.

HEADLAMP LEVELING - MANUAL

NOTE: Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. If the park lamps are ineffective or operate improperly, or if the other instrument panel switch pod functions are ineffective, diagnose and repair those problems before attempting to repair the manual headlamp leveling function.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open headlamp leveling motor signal circuit if required.
	4. Ineffective motor.	4. Test and replace headlamp leveling motor if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective switch inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further switch diagnosis.
	2. Ineffective motor ground circuit.	2. Test and repair open leveling motor ground circuit if required.
	3. Ineffective motor feed circuit.	3. Test and repair open leveling motor feed circuit if required.
	4. Ineffective signal circuit.	4. Test and repair open or shorted headlamp leveling motor signal circuit if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors if required.

PARK LAMPS

NOTE: As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the BCM. Diagnose and repair those problems before attempting to repair the Park Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Lamps/Lighting - Exterior - Service Information - Cherokee

	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

Turn Lamp Fault Environment - Diagnoses is performed for the front and rear turns signal lamps by the BCM. If Combined Front Park/Turn is present on the vehicle, the BCM will only perform diagnostics when the turn signal is placed into an active state. If a left or right turn signal is requested and a faulted condition is present for either the front or rear turn signals at the time of the activation, the frequency of the CAN-B signals will show doubled corresponding to the side of the fault. If the left or right side has a faulted condition, the cluster will send an internal signal to display to the driver the faulted condition. However, the BCM output frequency to the lamps will not be changed during this faulted state. Even if the CAN-B frequency is doubled, the output from the BCM to the lamps will still be driven at a normal operating frequency.

It is required that, during the same ignition cycle, if a turn signal lamp or bulb is replaced, the system will recover with no intervention by the technician. Starting the vehicle and disconnecting a turn signal bulb or LED will result in an open fault. Replacing the bulb or LED lamp assembly causes the fault to change from active to stored. Normal signalling behavior will return. This process applies to any of the six exterior lighting turn signal displays in use for this vehicle.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP	1. Ineffective or missing	1. Test and replace turn signal bulb if

DOES NOT ILLUMINATE	bulb.	required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS DO NOT FLASH	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open bulb ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (clockspring) if required.
	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (left multi-function switch) if required.

STANDARD PROCEDURE**STANDARD PROCEDURE - LAMP ALIGNMENT****VEHICLE PREPARATION FOR LAMP ALIGNMENT**

1. Check for and correct any burnt out bulbs.
2. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify the proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.

7. Verify the correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

Fig. 1: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER GROUP, LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.

6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen from the horizontal line to 50 millimeters (2 inches) below the horizontal line for domestic market vehicles, or to 125 millimeters (5 inches) below the horizontal line for export market vehicles. No horizontal (right/left) adjustment is required for this headlamp beam pattern in domestic market vehicles. Export market vehicles have a second horizontal (right/left) adjustment screw provided. The high beam pattern will be correct when the low beams are properly aimed.

Fig. 2: Headlamp Vertical Adjustment Screw
Courtesy of CHRYSLER GROUP, LLC

1. Turn the headlamps ON and select the LOW beams for vehicles in all markets.
2. On all vehicles except those with headlamp leveling, use a screwdriver to rotate the headlamp vertical adjustment screw (2) on the back of the front lamp unit just inboard of the fender and forward of the upper radiator crossmember (1) to adjust the beam height as required.

3. For export markets only, use a screwdriver to rotate the headlamp horizontal adjustment screw on each headlamp to adjust the beam right or left as required.

FOG LAMP ALIGNMENT

NOTE: A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp for domestic market vehicles.

Fig. 3: Vertical Adjustment Screw, Front Fog Lamp & Front Fascia
Courtesy of CHRYSLER GROUP, LLC

1. Turn the fog lamps ON.
2. Insert a screwdriver through the clearance hole in the underside of the front fascia (3) closure panel below each fog lamp (2) to rotate the vertical adjustment screw (1) on each lamp to adjust the beam height as required.

BALLAST, HIGH INTENSITY DISCHARGE (HID)

DESCRIPTION

DESCRIPTION

Fig. 4: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional High Intensity Discharge (HID) headlamps have an electronic ballast module (1) mounted to the inboard side of each upper lamp unit. The electronic circuitry of the module is contained within a die cast aluminum module housing, which is secured by four screws through integral mounting tabs to the molded plastic front lamp unit housing.

The sealed connector receptacle of the module is integral located on the side of the housing. The connector receptacle contains terminal pins that connect the module to the vehicle electrical system, to the high tension HID cable and to the front lamp unit through dedicated take outs and connectors of the front lamp unit wire harness.

The electronic ballast module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The electronic ballast module operates on battery current and ground received directly from the Body Control Module (BCM). Each module controls operation of the High Intensity Discharge (HID) igniter and lighting element for the front lamp unit on which it is installed. The BCM monitors a hard wired input from the headlamp switch to determine the proper control outputs to the electronic ballast module, which then provides a controlled voltage to operate the HID lamp igniter as appropriate.

The BCM also monitors electronic message inputs received from the Steering Control Module (SCM) over the Controller Area Network (CAN) Interior High Speed (IHS) data bus based upon multi-function switch inputs and, if the vehicle is so equipped, from the SmartBeam® (also known as the Automatic High Beam Module/AHBM) and the Light Rain Sensor Module (LRSM) (also known as the Rain Sensor Module/RSM, Light Sensor Module/LSM or Rain/Light Sensor Module/RLSM) to determine the proper lighting outputs to provide to the ballast module.

When a proper 12 volt Direct Current (DC) control output is received from the BCM, the HID electronic ballast module activates the HID igniter integral to the lighting element through a high-tension cable to provide a high voltage (up to about 800 volts Alternating Current/AC) surge. The igniter further steps up this AC voltage to up to about 25, 000 volts, which creates a light arc between the lighting element electrodes. Once the igniter and electronic ballast module detect a suitably stable light arc, they switch over to a power-limiting mode to sustain the light arc, which requires only about 85 volts to sustain proper lighting element output.

The hard wired electronic ballast module circuits may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic ballast module or the electronic controls and communication that provide some features of the HID lamp system. Proper diagnosis of the electronic ballast module, the BCM, the SCM, the SmartBeam®, the LRSM, the CAN data bus and the electronic communication related to electronic ballast module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 5: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

1. Disconnect and isolate the battery negative cable.
2. Remove the upper lamp unit from the vehicle. Refer to **UNIT, FRONT LAMP, REMOVAL**.
3. Remove the screws (2) that secure the electronic ballast module (1) to the inboard side of the front lamp unit housing.
4. Pull the ballast module away from the front lamp unit far enough to access and disconnect the wire harness connections within the front lamp unit.
5. Remove the electronic ballast module from the lamp.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

Fig. 6: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the electronic ballast module (1) to the inboard side of the front lamp unit housing.
2. Reconnect the wire harness connections within the front lamp unit to the module connector receptacles.
3. Install and tighten the screws (2) that secure the module to the housing. Tighten the screws securely.
4. Reinstall the front lamp unit into the vehicle. Refer to **UNIT, FRONT LAMP, INSTALLATION**.

5. Reconnect the battery negative cable.

CAM, TURN SIGNAL CANCEL

DESCRIPTION

DESCRIPTION

The turn signal cancel cam is concealed within the clockspring case on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the rotating electrical components on the steering wheel and the instrument panel wire harness on the steering column. The multi-function switch and the housing of the clockspring are secured to the steering column and remain stationary. The rotor of the clockspring, including the turn signal cancel cam lobes, rotate with the steering wheel.

The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If ineffective or damaged, the entire clockspring unit must be replaced. Refer to **CLOCKSPRING, REMOVAL** .

OPERATION

OPERATION

When the multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small opening on the left side of the Steering Column Control Module (SCCM) mounting housing toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the latched multi-function switch control stalk to the neutral or OFF position.

LAMP, CENTER HIGH MOUNTED STOP

REMOVAL

REMOVAL

0811008913

Fig. 7: Center High Mounted Stop Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear spoiler from the vehicle. Refer to **SPOILER, REMOVAL**.
3. Working from the back of the rear spoiler, remove the support bracket (2), the washer nozzle hose from the nozzle and the washer nozzle itself (3).
4. Disconnect the electrical connection (4) from the back of the CHMSL assembly.
5. Remove five screws (5) that secure the CHMSL to the spoiler assembly.
6. Remove the CHMSL assembly from the spoiler.

INSTALLATION

INSTALLATION

0811008913

Fig. 8: Center High Mounted Stop Lamp
 Courtesy of CHRYSLER GROUP, LLC

1. Position the Center High Mounted Stop Lamp (CHMSL) into the rear spoiler for installation.
2. Secure the CHMSL to the rear spoiler using the provided fasteners (1). Secure the center bolts first and then the outer bolts last.
3. Connect the body electrical connector to the receptacle (4) on the back of the CHMSL.
4. Install the bracket (2) to the CHMSL.
5. Install the washer nozzle (3) to the CHMSL.
6. Route the washer fluid tube and seat into position on the CHMSL.
7. Install the rear spoiler to the vehicle. Refer to **SPOILER, INSTALLATION**.
8. Connect the negative battery cable to the proper negative battery terminal.

LAMP, FOG

REMOVAL

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Raise the vehicle until the wheel well access cover for the fog lamps can be reached comfortably.
3. Twist the top rotational button until the top of the cover releases. Rotate the cover 180° allowing full access to the back of the fog lamp and bulb assembly.

4. Disconnect the harness from the back of the fog lamp assembly.
5. Remove the four fasteners securing the lamp to the lower front fascia.
6. Pull the fog lamp through the access hole.
7. Depress on the two points of the bulb socket to release and remove from the fog lamp assembly.
8. Remove the bulb from the bulb socket.

LAMP

1. Disconnect and isolate the battery negative cable.
2. Raise the vehicle until the wheel well access cover for the fog lamps can be reached comfortably.
3. Twist the top rotational button until the top of the cover releases. Rotate the cover 180° allowing full access to the back of the fog lamp and bulb assembly.
4. Disconnect the harness from the back of the fog lamp assembly.
5. Remove the four fasteners securing the lamp to the lower front fascia.
6. Pull the fog lamp through the access hole.

INSTALLATION**BULB**

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

0817010626

Fig. 9: Fog Lamp, Bulb & Socket

Courtesy of CHRYSLER GROUP, LLC

1. Secure the replacement bulb into the bulb socket (3).
2. Insert the bulb and socket into the back of the fog lamp assembly.
3. Connect the wiring harness connector to the back of the fog lamp socket.
4. Close the access cover in the wheel well area.
5. Connect the negative battery cable to the battery negative post.

LAMP

1. Insert the fog lamp through the access panel in the wheel well.
2. Line up the lamp with the screw holes and secure the lamp using all four fasteners.
3. Attach the harness connector to the back of the lamp assembly.
4. Turn the access cover until the cover is lined up and the button can be turned to secure the cover to the wheel well.
5. Lower the vehicle to access and connect the negative battery cable to the negative battery post.

LAMP, LICENSE PLATE**REMOVAL****BULB**

3113244

Fig. 10: Bulb & Socket

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate lamp from the rear fascia.

3. Pull the base of the bulb (2) straight out of the socket (1).

LAMP

Courtesy of CHRYSLER GROUP, LLC

5. Pull the puddle lamp (3) away from the mirror shell (1) far enough to access and disconnect the two mirror wire harness connectors (2) from the two terminals of the puddle lamp.
6. Remove the puddle lamp from the mirror.

SIGNAL LAMP

3811773

Fig. 18: Outside Rear View Mirror & Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have two Light Emitting Diode (LED) units that illuminate an optic light pipe through a clear lens on the lower, forward and outboard facing surfaces of the mirror shell. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

3828768

Fig. 19: Mirror Housing, Fasteners & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the mirror glass and case unit from the outside rear view mirror. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.
3. Remove the puddle lamp from the outside rear view mirror. Refer to **LAMP, MIRROR, REMOVAL**.
4. Remove the three screws (2) that secure the mirror bezel and housing unit (1) to both the mirror shell and the mirror arm.
5. Insert two flat-bladed screwdrivers into the two holes (3) in the upper inboard corner of the mirror housing and push the screwdriver handles away from each other to pry the two latch features of the housing toward each other far enough to disengage the housing latch features from the mirror shell.
6. Remove the mirror bezel and housing unit from the mirror shell and the mirror arm.

3828786

Fig. 20: Mirror Shell, Mirror Arm & Tab

7. Disengage the tab (3) that secures the inboard end of the mirror shell (1) to the notch in the inboard end of the mirror arm (2).

Fig. 21: Turn Signal Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

8. From within the outboard end of the mirror shell, carefully pry the mounting tab (3) of the signal lamp (4) housing away from the face of the mounting pocket formation (1) integral to the interior of the mirror shell until it disengages from the locating rib (6) with a light audible snap.
9. Slide the mirror shell mounting pocket formation off of the outboard end of the mirror arm (2).
10. From outside of the mirror shell, press the inboard end of the signal lamp lens into the interior of the shell.
11. Press the outboard end of the signal lamp inboard far enough to disengage the two lamp mounting tabs (5) from the lamp mounting tab receptacle loops integral to the outboard end of the mirror shell interior.
12. Set the mirror shell aside.

Fig. 22: Signal Lamp Housing, Harness Connector, Mirror Arm & Connector Receptacle
 Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the mirror wire harness connector (2) from the connector receptacle (4) integral to the signal lamp housing (1).
14. Remove the signal lamp from the mirror arm (3).

INSTALLATION

PUDDLE LAMP

Fig. 23: Puddle Lamp & Connectors
 Courtesy of CHRYSLER GROUP, LLC

1. Position the puddle lamp (3) near the lamp opening on the underside of the mirror shell (1).

2. Reconnect the two mirror wire harness connectors (2) to the two terminals of the puddle lamp. Be certain to connect small connector to the small lamp terminal and the large connector to the large lamp terminal.

3828739

Fig. 24: Mirror Shell, Puddle Lamp & Latch
Courtesy of CHRYSLER GROUP, LLC

3. Engage the hook features on the inboard side of the puddle lamp (2) into the inboard side of the lamp opening in the mirror shell (1).
4. Using hand pressure, push the outboard side of the lamp up into the opening in the mirror shell until the latch feature (3) snaps into place.
5. Reconnect the battery negative cable.

SIGNAL LAMP

3811773

Fig. 25: Outside Rear View Mirror & Signal Lamp

Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have two Light Emitting Diode (LED) units that illuminate an optic light pipe through a clear lens on the lower, forward and outboard facing surfaces of the mirror shell. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

Fig. 26: Signal Lamp Housing, Harness Connector, Mirror Arm & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the signal lamp (1) to the forward facing surface of the mirror arm (3).
2. Reconnect the mirror wire harness connector (2) to the connector receptacle (4) integral to the signal lamp housing. Be certain the connector is fully engaged and latched.

Fig. 27: Turn Signal Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Engage the two signal lamp mounting tabs (5) into the lamp mounting tab receptacle loops integral to the outboard end of the mirror shell interior.
4. From within the interior of the mirror shell, press the inboard end of the signal lamp lens (4) into engagement with the mounting hole of the shell.
5. Slide the mounting pocket formation (1) integral to the interior of the mirror shell over the outboard end of the mirror arm (2).
6. From within the outboard end of the mirror shell, press the mounting tab (3) of the signal lamp into position against the locating rib (6) on the face of the mounting pocket until it engages with a light audible snap.

Fig. 28: Mirror Shell, Mirror Arm & Tab
Courtesy of CHRYSLER GROUP, LLC

7. Engage the tab (3) that secures the inboard end of the mirror shell (1) to the notch in the inboard end of the mirror arm (2).

Fig. 29: Mirror Housing, Fasteners & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

8. Position the mirror bezel and housing unit (1) over the mirror arm and the mirror shell. Be certain that the mirror wire harness is not pinched between the bezel and the shell, and that the wiring for the puddle lamp is routed through the mounting hole in the underside of the shell.
9. With the bezel aligned with the shell, squeeze the two together until the latch features (3) of the housing engage the receptacle of the shell with a light audible snap.
10. Install and tighten the three screws (2) that secure the mirror bezel and housing unit to both the mirror shell and the mirror arm. Tighten the screws securely.
11. Reinstall the puddle lamp into the outside rear view mirror. Refer to **LAMP, MIRROR, INSTALLATION**.
12. Reinstall the mirror glass and case unit into the outside rear view mirror. Refer to **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION**.
13. Reconnect the battery negative cable.

LAMP, PARK AND TURN SIGNAL

DESCRIPTION

DESCRIPTION

0817008758

Fig. 30: Park And Turn Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a combination Park and Turn signal lamp assembly. The combination lamp includes the following components:

- **Daytime Running Lamp (1):** Domestic market vehicles with HID front lamp units and DRL illuminate a dedicated DRL LED bar in the combination lamp unit. This bar is made up of ten LED points of light.
- **Turn signal lamp (2):**

The front turn signal indicator integral to the combination lamp uses a single amber bulb.

- **Park lamps (3):** The front park indicator integral to the combination lamp assembly uses a single amber colored bulb.
- **Side marker lamp (3):** The side marker indicator integral to the combination lamp uses a single clear bulb.
- **LED Module:** The LED module is secured to the back of the combination lamp by four fasteners.

REMOVAL

LAMP

0823006551

Fig. 31: Front Park/Turn Signal Lamp Housing
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
3. Disconnect the wire harness connector from the connector receptacles (3) on the back of the front park/turn signal lamp housing.
4. Remove the fasteners (1) that secure the lamp housing in place.
5. Pull out on the lamp until the alignment pin (2) has been released.

PARK/TURN LAMP BEZEL REMOVAL

0817009115

Fig. 32: Park/Turn Lamp Assembly

Courtesy of CHRYSLER GROUP, LLC

1. Remove the park/turn lamp assembly. This will involve front fascia removal. Refer to **LAMP, PARK AND TURN SIGNAL, REMOVAL**.
2. Flip the lamp assembly over to access the three fasteners (1) securing the bezel to the bottom of the lamp assembly.
3. Remove the bezel from the lamp assembly.

INSTALLATION**INSTALLATION**

0823006551

Fig. 33: Front Park/Turn Signal Lamp Housing
 Courtesy of CHRYSLER GROUP, LLC

1. Position the lamp assembly to the vehicle for installation and insert the alignment pin (2) into position.
2. Install the fasteners (1) that secure the lamp in place.
3. Connect the wire harness connectors to the connector receptacles (3) on the back of the front park/turn signal lamp housing.
4. Install the front fascia to the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
5. Connect the negative battery cable to the negative battery terminal.

PARK/TURN LAMP BEZEL REMOVAL

0817009115

Fig. 34: Park/Turn Lamp Assembly

Courtesy of CHRYSLER GROUP, LLC

1. Position the bezel to the bottom of the lamp assembly for installation.
2. Secure the bezel to the lamp assembly by inserting and tightening the three fasteners (1).
3. Install the front lamp assembly. Refer to **LAMP, PARK AND TURN SIGNAL, INSTALLATION**.

MOTOR, HEADLAMP LEVELING

DESCRIPTION

DESCRIPTION

Fig. 35: Headlamp Leveling Motor, Integral Molded Connector Receptacle & Ball Formation
Courtesy of CHRYSLER GROUP, LLC

The headlamp leveling motor (1) is located on the rear lower surface of each front lamp unit on vehicles equipped with High Intensity Discharge (HID) headlamps and the automatic headlamp leveling system. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting flange (3) to a keyed flange on the back of the front lamp unit housing. A rubber seal around the circumference of the mounting flange seals the motor to the lamp housing.

The outside of the motor housing features an integral molded connector receptacle (4) facing rearward on its lower surface, and a plastic pushrod with a ball formation (2) on its free end extends from the motor mounting flange. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The headlamp leveling motor is serviced as a unit with the front lamp unit. The motor cannot be repaired and, if ineffective or damaged, the entire front lamp unit must be replaced.

OPERATION

OPERATION

The controller board and logic circuitry of the headlamp leveling motor controls motor operation based upon a voltage signal input received from the Body Control Module (BCM). On vehicles with High Intensity Discharge (HID) lighting and the automatic headlamp leveling system, the BCM uses electronic messages received over the Controller Area Network (CAN) data bus from the Automatic Headlamp Leveling Module (AHLM) (also known as the High Intensity Discharge Transducer/HIDT) to determine the correct voltage signal to provide the leveling motor.

The headlamp leveling motors have a path to ground at all times. The motors operate on battery voltage received through the headlamp low beam feed circuits so that the system will only operate when the headlamp

low beams are turned ON. When the motor is energized it will extend or retract the motor pushrod through an integral screw-drive transmission. The ball on the end of the pushrod is snapped into a socket clip on the back of the reflector within the front lamp unit housing, which will cause the reflector to move as the pushrod is extended or retracted, changing the angle at which the light is projected from the headlamp.

The hard wired circuits for the headlamp leveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling motors or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling motor or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

LAMP, TAIL STOP TURN

REMOVAL

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp.

OUTER LAMP

2758572

Fig. 36: Outer Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: In vehicles manufactured for domestic markets, the outer rear lamp unit (1) contains a bulb (2) for tail/stop/rear side marker/turn signal functions and a second bulb (3) behind a clear lens for an auxiliary backup lamp function. In vehicles manufactured for export markets, the tail/stop/rear side marker functions are performed by one bulb (2) and a separate turn signal bulb (3) behind an amber lens is used in place of the auxiliary backup bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the outer rear lamp unit (1) from the end of the quarter panel. Refer to **LAMP, TAIL STOP TURN, REMOVAL**.
3. Firmly grasp the appropriate bulb socket (2 or 3) on the back of the rear lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

INNER LAMP

Fig. 37: Inner Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate to access and remove the inside trim panel from the lower liftgate. Refer to **PANEL, TRIM, REMOVAL**.
3. Firmly grasp the appropriate bulb socket (2 or 3) on the back of the lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out of the lamp.
5. Pull the base of the bulb straight out of the socket.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the decklid or liftgate (depending on application) adjacent to the outer lamp.

OUTER

2760132

Fig. 38: Outer Rear Tail Lamp Housing, Grommets, Push-Pins & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate and remove the plastic push-pin fastener that secures the bracket on the bottom of the inboard side of the outer rear tail lamp housing (2) to the upper flange of the rear fascia.
3. Open the liftgate to access and remove the two plastic push-pin fasteners (1) that secure the inboard side of the lamp to the side jamb of the liftgate opening.
4. Pull the outboard side of the lamp rearward far enough to disengage the two ball studs on the back of the lamp housing from the plastic grommets (3) in the lamp opening of the body sheet metal (4).
5. Pull the lamp away from the vehicle far enough to access and disconnect the two body wire harness connectors (5) from the two bulb socket connector receptacles on the back of the lamp housing.
6. Remove the lamp from the vehicle.

INNER

2760172

Fig. 39: Inner Rear Tail Lamp Unit, Acorn Nuts & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate (2) to access and remove the inside trim panel from the lower liftgate. Refer to **PANEL, TRIM, REMOVAL**.
3. Disconnect the two liftgate wire harness connectors (3) from the bulb socket connector receptacles on the back of the inner rear tail lamp unit (4).
4. Remove the four acorn nuts (1) that secure the four studs on the back of the lamp housing to the lamp opening of the liftgate.
5. Remove the lamp from the vehicle.

INSTALLATION

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp.

OUTER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 40: Outer Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: In vehicles manufactured for domestic markets, the outer rear lamp unit (1) contains a bulb (2) for tail/stop/rear side marker/turn signal functions and a second bulb (3) behind a clear lens for an auxiliary backup lamp function. In vehicles manufactured for export markets, the tail/stop/rear side marker functions are performed by one bulb (2) and a separate turn signal bulb (3) behind an amber lens is used in place of the auxiliary backup bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate bulb socket (2 or 3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the outer rear lamp unit housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the outer rear lamp unit. Refer to **LAMP, TAIL STOP TURN, INSTALLATION**.
7. Reconnect the battery negative cable.

INNER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 41: Inner Rear Lamp Unit & Bulbs
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate bulb socket (2 or 3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the inner rear lamp unit housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the inside trim panel to the lower liftgate. Refer to **PANEL, TRIM, INSTALLATION**.
7. Reconnect the battery negative cable.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the decklid or liftgate (depending on application) adjacent to the outer lamp.

OUTER

Fig. 42: Outer Rear Tail Lamp Housing, Grommets, Push-Pins & Connectors
 Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the two plastic grommets (3) are in good condition and properly installed in the outboard side of the lamp opening of the body sheet metal (4).
2. Position the outer rear lamp unit (2) to the lamp opening of the body sheet metal.
3. Reconnect the two body wire harness connectors (5) to the two bulb socket connector receptacles on the back of the lamp housing.
4. Align the two ball studs on the back of the lamp housing with the plastic grommets in the lamp opening of the body sheet metal.
5. Using hand pressure, push firmly and evenly on the outboard top and bottom of the lamp until both ball studs snap into the grommets.
6. Reinstall the upper plastic push-pin fastener (1) followed by the lower fastener that secures the inboard side of the outer rear lamp unit to the side jamb of the liftgate opening.
7. Reinstall the plastic push-pin fastener that secures the bracket on the bottom of the inboard side of the outer rear tail lamp housing to the upper flange of the rear fascia.
8. Reconnect the battery negative cable.

INNER

Fig. 43: Inner Rear Tail Lamp Unit, Acorn Nuts & Connectors
 Courtesy of CHRYSLER GROUP, LLC

1. Position the inner rear lamp unit (4) to the lamp opening of the liftgate (2).
2. Install and tighten the four acorn nuts (1) that secure the four studs on the back of the lamp housing to the lamp opening of the liftgate in the following sequence: upper outboard, upper inboard, lower outboard then lower inboard. Tighten the nuts securely.
3. Reconnect the two liftgate wire harness connectors (3) to the bulb socket connector receptacles on the back of the lamp housing.
4. Reinstall the inside trim panel to the lower liftgate. Refer to **PANEL, TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.

SWITCH, BACKUP LAMP

DESCRIPTION

DESCRIPTION

Fig. 44: Backup Lamp Switch

Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a manual transmission (2) have a normally open, spring-loaded plunger type backup lamp switch (1). Vehicles with an optional electronic automatic transmission have a Gear Shift Module (GSM) that is used to perform several functions, including that of the backup lamp switch. The GSM is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

The backup lamp switch is located in a threaded hole in the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness. When installed, only the switch connector and the hex formation are visible on the outside of the transmission housing.

The backup lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the entire switch unit must be replaced.

OPERATION

OPERATION

The backup lamp switch controls a path to ground for the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) on the reverse switch signal circuit. The PCM reads this input through an internal pull-up, then sends an electronic **reverse switch status** message to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus network. The BCM controls an output through a high side driver that regulates the flow of battery current to the backup lamp bulbs as appropriate on the backup lamp feed circuit.

The backup lamp switch plunger is mechanically actuated by the gearshift mechanism within the transmission,

which will depress the switch plunger and close the switch contacts whenever the REVERSE gear has been selected. The switch has a path to ground at all times through a take out and eyelet terminal of the engine wire harness that is secured to the body sheet metal.

The backup lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the backup lamp switch input. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to backup lamp switch operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BACKUP LAMP SWITCH

1. Disconnect and isolate the battery negative cable.
2. Locate and disconnect the engine wire harness connector from the backup lamp switch connector receptacle.
3. Check for continuity between the two terminal pins in the backup lamp switch connector receptacle.
 - a. With the gear selector lever in the REVERSE position, there should be continuity.
 - b. With the gear selector lever in any position other than REVERSE, there should be no continuity.
4. If the switch fails either of these two continuity tests, replace the ineffective backup lamp switch.

SWITCH, HAZARD WARNING

DESCRIPTION

DESCRIPTION

0809005080

Fig. 45: Switch Pod

Courtesy of CHRYSLER GROUP, LLC

The hazard warning flasher switch (4) is located in the switch pod (1) below the radio screen. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard warning flasher switch button.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and the icon on the switch button may illuminate at an increased intensity while the turn signals and turn signal indicators are flashing. The switch button latches to a position flush with the other push buttons in the switch pod when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within the molded plastic control head or switch bank housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the switch pod will need be replaced. Refer to **POD, SWITCH, DESCRIPTION**.

OPERATION

OPERATION

The hazard switch has a path to ground at all times through the instrument panel wire harness. Whenever the hazard switch is in its latched and lowered position, the switch bank circuitry provides a hard wired ground signal output to the Body Control Module (BCM) and the hazard warning system is selected. When the BCM receives a hazard switch input, it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left, front and rear turn signal feed circuits.

The BCM also sends the appropriate electronic messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hard wired circuits for the hazard switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HAZARD WARNING SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hazard switch as well as the hard wired inputs and outputs of the heater or air conditioner and heater control head or the Integrated Center Stack (ICS) switch bank may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

1. Remove the control head or switch bank from the instrument panel as a unit, but do not disconnect it from the instrument panel wire harness.
2. Using a multi-meter, test the continuity between the ground terminal and the hazard switch sense terminal of the control head or switch bank. There should be continuity when the hazard switch push button is in its latched (lowered) position, and no continuity when the push button is in its unlatched (flush) position.
3. If the switch fails either of the continuity tests, replace the ineffective control head or switch bank as required.

SWITCH, HEADLAMP

DESCRIPTION

DESCRIPTION

Fig. 46: Headlamp Switch

Courtesy of CHRYSLER GROUP, LLC

The headlamp switch (1) is located on the instrument panel, molded into the steering column opening cover to the left of the steering column. Several different switches are used, depending upon optional equipment requirements. The standard switch features a three-position rotary knob for exterior lighting control. An optional switch has a fourth position added to the rotary knob for automatic headlamps and a momentary PUSH function added to the rotary knob for front fog lamp control.

Each of these switches is constructed of molded plastic. On vehicles with optional fog lamps the rotary knob also has the International Control and Display Symbol icon for **Front Fog Light** applied to it. The switch face plate is also labeled with graphics and icons to clearly identify the many functions of the rotary knob.

The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A panel dimmer controlled Light Emitting Diode (LED) unit soldered to the circuit board within the switch provides back lighting for visibility at night, but is not serviceable.

The headlamp switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The headlamp switch uses a single resistor multiplexed output to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a headlamp switch MUX return circuit. The BCM then reads the switch outputs using an internal pull up on the headlamp/fog lamp switch signal circuit to control the exterior lighting functions.

The switch illumination circuit receives a path to ground at all times through an instrument panel ground circuit.

The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the interior lighting thumbwheel switch in the dimmer module. Refer to **SWITCH, DIMMER, OPERATION**.

The headlamp switch operates as follows:

- **Front Fog Lamps Control** - For vehicles so equipped, the rotary knob on the headlamp switch is depressed to activate or deactivate the optional front fog lamps. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM reads and responds to this input by energizing or de-energizing the right and left front and rear fog lamp control circuits through internal High Side Drivers (HSD) and by sending an electronic confirmation message to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus, which controls the front fog lamp indicator as appropriate.
- **Exterior Lighting Control** - The rotary knob on the headlamp switch is rotated to a detent position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM responds by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal HSDs and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **AUTO** (Automatic) position is selected, the BCM monitors an electronic **ambient light level** message received over the Local Interface Network (LIN) data bus from the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Rain Sensor Module/RSM or the Light Sensor Module/LSM) from the turn to the exterior lighting ON and OFF automatically while the ignition switch status is ON. If vehicle is not equipped with a RLSM,/LSM/RSM but is equipped with auto head lamps, the BCM also monitors for an electronic **ambient light level** message received over the CAN data bus from the air conditioner - heater control module based upon a hard wired input from the sun sensor

The headlamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

2986787

Fig. 47: Terminals Of The Switch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the headlamp switch from the instrument panel. Refer to **SWITCH, HEADLAMP, REMOVAL**.
2. Disconnect the instrument panel wire harness connector from the back of the headlamp switch.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Headlamp Switch Tests table.

HEADLAMP SWITCH TESTS TABLE

HEADLAMP SWITCH TESTS	
SWITCH POSITION (PINS)	*RESISTANCE RANGE (OHMS)
AUTO (3 and 6)	4028.0 - 4452.0
OFF (3 and 6)	1938.0 - 2142.0
PARK (3 and 6)	1073.5 - 1186.5
HEADLAMP (3 and 6)	627.0 - 693.0
FOG LAMP - AUTO (3 and 6)	347.2 - 383.8
FOG LAMP - OFF (3 and 6)	317.7 - 351.1
FOG LAMP - PARK (3 and 6)	280.6 - 310.1
FOG LAMP - HEADLAMP (3 and 6)	236.6 - 261.5
	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 4 TO PLUS (+), CONNECT PIN

SWITCH ILLUMINATION (4 and 5)

5 TO MINUS (-) - LEDs SHOULD BARELY GLOW

*All resistance values are plus or minus 5%.

4. If the switch fails any of the tests, replace the ineffective headlamp switch as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 48: Headlamp Switch Harness Receptacle & Push Down Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the drivers side lower steering column cover panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.
3. With the panel loosened, disconnect the wiring connector from the headlamp switch harness receptacle (2).

4. Remove the panel to access the two push down tabs (1). Press down on both tabs to and press the switch outward from the panel.
5. Remove the headlamp switch.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 49: Headlamp Switch Harness Receptacle & Push Down Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Align the headlamp switch to the mounting location in the instrument panel steering column opening cover.
2. Using hand pressure, push the switch through in order to seat the switch to the housing. Make sure both pawl retainers (1) have cleared the opening and are retaining the switch to the cover.
3. Connect the wiring harness to the headlamp switch harness receptacle (2).
4. Install the lower steering column cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.

5. Reconnect the battery negative cable.

SWITCH, MULTIFUNCTION

DESCRIPTION

DESCRIPTION

Fig. 50: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the front wiper and washer systems, the turn signals and for headlamp beam selection. The only visible components of the switch are the control stalk (2) and the control knob (1) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connections and the turn signal cancel actuator are concealed within the Steering Column Control Module (SCCM) mounting housing beneath the shrouds.

The multi-function switch controls as well as the SCCM mounting housing are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. The multi-function switch is integral to the SCCM mounting housing.

The SCCM mounting housing is located near the top of the steering column below the steering wheel. In addition to the integral multi-function switch the SCCM mounting housing incorporates the Steering Control Module (SCM) and has integral features to support the mounting of the clockspring. All of the multi-function switch inputs and outputs are directly connected to the SCM. The SCM is an electronic microcontroller that serves as a Local Interface Network (LIN) master node and also as a gateway to the Controller Area Network

(CAN) data bus.

The SCCM mounting housing also features an integral interconnect connector receptacle. This interconnect connects all of the inputs and outputs of the SCM to the vehicle electrical system through several terminal pins of the clockspring interconnect connector and the pass through circuits of the clockspring. The clockspring is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following exterior lighting functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary WASH position for washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides detent switching for two continuous wipe switch positions, low (LO) speed or high (HI) speed and an intermittent wipe mode with four delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system. The control knob also has a momentary pulse wipe (MIST) feature switch position.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp HIGH or LOW beams.
- **Headlamp Optical Horn** - The multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides both momentary non-detent (lane change) switching and detent switching with automatic cancellation for both the left and right turn signal.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM mounting housing, SCM and multi-function switch unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL**. The clockspring is available for separate service replacement.

OPERATION

OPERATION

The multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) and other electronic modules in the vehicle.

If the SCM detects no inputs from the multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals the other electronic modules to implement a fail-safe or default mode of operation. For the exterior lighting system, the multi-function switch

fail-safe mode automatically selects LOW beams when the headlamps are turned ON. For the wiper system, the multi-function switch fail-safe mode will maintain the last selected wiper system mode of operation for the remainder of the current ignition cycle, after which the wiper system will default to OFF.

The hard wired inputs and outputs of the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the multi-function switch or the electronic controls and communication between other modules and devices that provide some features of the lighting or wiper and washer systems. The most reliable, efficient and accurate means to diagnose the multi-function switch or the electronic controls and communication related to right multi-function switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the multi-function switch is operated to control the functions and features it provides:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary WASH position to activate the washer pump/motor in the FRONT WASH mode. The washer pump/motor will continue to operate for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the two continuous wiper detent positions (LO or HI), to one of four intermittent delay or sensitivity wiper detent positions, or to the OFF position to select the FRONT WIPER mode. The SCM reads the resistor multiplexed input from the multi-function switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The control knob on the end of the multi-function switch control stalk is rotated to the momentary MIST position to activate the wiper MIST mode. The wiper motor will continue to operate, one complete cycle at a time, for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp HIGH beams will remain illuminated for as long as the control stalk is held in this momentary position and the LOW beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Turn Signal Control** - The turn signals are requested when the multi-function switch control stalk is moved downward (LEFT signal) or upward (RIGHT signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary

position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends from the multi-function switch through the Steering Column Control Module (SCCM) mounting housing toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the LEFT turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **turn signal switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

REMOVAL

REMOVAL

The multi-function switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and multi-function switch unit. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

INSTALLATION

INSTALLATION

The multi-function switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and multi-function switch unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . The clockspring is available for separate service replacement.

SWITCH, STOP LAMP

DESCRIPTION

DESCRIPTION

Fig. 51: Stop Lamp Switch, Mounting Collar, Switch Plunger & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The brake (or stop) lamp switch (1) is a two-circuit, spring-loaded plunger actuated switch that is secured to the brake pedal support bracket under the instrument panel on the driver side of the vehicle. The molded plastic switch housing has an integral connector receptacle (4) containing four terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The switch plunger (3) extends through a mounting collar (2) on one end of the switch housing. The plunger has a telescoping self-adjustment feature that is activated as the switch is being installed by the brake pedal in its normal at-rest position.

This brake lamp switch cannot be repaired. If the switch is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

The brake (or stop) lamp switch controls two independent circuits. These circuits are described as follows:

- **Normally Closed** - The normally closed circuit provides a hard wired output to the Body Control Module (BCM) indicating the position of the brake pedal, depressed or released. The BCM responds by relaying electronic **brake switch status** messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.
- **Normally Open** - The normally open circuit provides hard wired outputs to the BCM, the Powertrain Control Module (PCM) and the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) whenever the brake pedal is depressed. The BCM responds to the normally open input by providing a control output that energizes or de-energizes the brake lamps. The RFHM responds to the normally open input by providing a control output that energizes or de-energizes the Brake Transmission Shift Interlock (BTSI) solenoid.

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the switch can only be tested while installed and, while in the installed position, the switch terminals are inaccessible to test meter probes. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to brake lamp switch operation requires the use of a diagnostic scan tool to read the switch status through the BCM. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STOP LAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

3828400

Fig. 52: Stop Lamp Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the switch can only be tested while installed and, while in the installed position, the switch terminals are inaccessible to test meter probes. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to brake lamp switch operation requires the use of a diagnostic scan tool to read the switch status through the BCM and the PCM.

1. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) in the BCM and PCM. If no DTCs are found, go to Step 2. If any DTCs are found, refer to **DTC INDEX** to locate the DTC and repair as needed.
2. Monitor the Brake Lamp Switch operation by using the diagnostic scan tool to verify that both switch states in the BCM changes while actuating the brake pedal. If actuation is detected in the BCM, move to the PCM to confirm actuation is detected.

0617003990

Fig. 53: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

3. If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.
 - 1 - Defective brake switch due to the switch tab being sheared off.
 - 2 - Defective brake switch due to the switch tab being offset.
 - 3 - Normal operational brake lamp switch to be used for installation.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Never remove or install the brake lamp switch while the brake pedal arm is disassembled from the brake booster push rod.

CAUTION: Do not depress, lift or move the brake pedal during brake lamp switch removal to avoid switch damage. Do not depress, lift or move the brake pedal during brake lamp switch installation to avoid improper switch adjustment.

081769096

Fig. 54: Stop Lamp Switch & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the brake lamp switch (1) on the brake pedal support bracket (2) on the dash panel under the instrument panel.
3. Disconnect the body wire harness connector from the brake lamp switch.

NOTE: If a click noise is heard during switch removal, the switch may have internal damage and should be replaced.

4. Press the brake lamp switch against the bracket while rotating the switch housing clockwise about 45 degrees to align the tabs on the switch locking collar with the keyed hole in the brake pedal support

bracket.

5. Pull the switch straight away from the keyed hole to remove it from the bracket.
6. Remove the switch from the vehicle.

Fig. 55: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

7. If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.
 - 1 - Defective brake switch due to the switch tab being sheared off.
 - 2 - Defective brake switch due to the switch tab being offset.
 - 3 - Normal operational brake lamp switch to be used for installation.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Never remove or install the brake lamp switch while the brake pedal arm is disassembled from the brake booster push rod.

CAUTION: Do not depress, lift or move the brake pedal during brake lamp switch removal to avoid switch damage. Do not depress, lift or move the brake pedal during brake lamp switch installation to avoid improper switch adjustment.

NOTE: Be certain that the brake pedal bracket is not bent or damaged before installing or reinstalling a brake lamp switch. Inspect the brake switch tab location making sure its in the proper location indicating that the switch is not defective.

Fig. 56: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

NOTE: If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.

- 1 - Defective brake switch due to the switch tab being sheared off.
- 2 - Defective brake switch due to the switch tab being offset.
- 3 - Normal operational brake lamp switch to be used for installation.

081769096

Fig. 57: Stop Lamp Switch & Brake Pedal Support Bracket
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the brake pedal bracket is not bent before installing or reinstalling a brake lamp switch.

1. Position the brake lamp switch (1) near the brake pedal support bracket (2) on the dash panel under the instrument panel.
2. Align the tabs on the brake lamp switch locking collar with the keyed hole in the brake pedal support bracket.
3. Holding the brake lamp switch perpendicular to the support bracket, insert the tabs on the brake lamp switch locking collar through the keyed hole in the support bracket until the switch housing is firmly seated against the bracket.
4. Rotate the switch housing counterclockwise about 45 degrees to engage the tabs on the locking collar with the support bracket.
5. Reconnect the body wire harness connector to the connector receptacle on the switch.
6. Reconnect the battery negative cable.

UNIT, FRONT LAMP

STANDARD PROCEDURE

STANDARD PROCEDURE - LAMP LENS DEFOGGING

Some customers may report that on occasion, vehicle exterior lamp assemblies are fogged with a light layer of

condensation on the inside of the lenses. This may be reported after the lamps have been turned on and brought up to operating temperature, turned off, and then rapidly cooled by cold water (such as rain, or the water from a car wash). Lens fogging can also occur under certain atmospheric conditions after a vehicle has been parked outside overnight (i.e., a warm humid day followed by clear cool night). This will usually clear as atmospheric conditions change to allow the condensation to change back into a vapor. Turning the lamps on will usually accelerate this process.

A lamp that exhibits condensation/fogging should be evaluated in a service bay environment by first drying all water from the outside surface of the lens and operating the lamp for 20 minutes. If the condensation/fogging has begun to clear from the lamp lens after 20 minutes with the lamps operating, this indicates the lamp sealing has not been breached, and the lamp does not need to be replaced.

If the condensation/fogging has not begun to clear after 20 minutes with the lamps operating, or the lamp has large amounts of water droplets visible on most internal surfaces, this indicates a problem with the lamp sealing that has allowed water to enter the lamp. In this instance, the customer is also likely to report that moisture in the lamp is always present and never disappears. A lamp that exhibits internal moisture permanently should be replaced.

REMOVAL

BULB - HEADLAMP

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

0823006553

Fig. 58: Headlamp Bulb Base & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. For passenger side bulb assembly, position the air cleaner box out of the way. Refer to **AIR CLEANER, REMOVAL** for 2.0L Diesel, **AIR CLEANER, REMOVAL** for 2.4L or **AIR CLEANER, REMOVAL** for 3.2L.
3. Firmly grasp the headlamp bulb access cover on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.
5. Firmly grasp the headlamp bulb base (1) on the back of the reflector within the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the bulb and base straight out from the keyed opening in the reflector.

NOTE: Take care to prevent the front lamp unit wire harness and connector from falling back into the lamp housing after disconnecting it from the bulb.

7. Disconnect the front lamp unit wire harness connector (2) from the bulb connector receptacle.
8. Remove the bulb from the back of the front lamp unit.

LAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

Fig. 59: Front End Module (FEM)

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the fascia from the Front End Module (FEM) (1). Refer to **FASCIA, FRONT, REMOVAL**.
3. Remove the 4 screws (1) that secures the lower front lamp unit to the vehicle.
4. Pull the lamp away from the front of the vehicle far enough to access and disconnect the wire harness connection (2) from the back of the lamp housing.
5. Remove the front lamp unit from the vehicle.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart

pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

Fig. 60: HID Igniter & High Tension Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL**.
3. Remove the front headlamp assembly. Refer to **UNIT, FRONT LAMP, REMOVAL**.
4. Firmly grasp the headlamp bulb access cover on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Remove the access cover from the lamp housing.

NOTE: Take care to prevent the high tension cable from falling back into the lamp housing after disconnecting it from the HID igniter (2).

6. Disconnect the high tension cable (1) from the HID igniter connector receptacle on the back of the reflector within the front lamp unit housing.
7. Firmly grasp the igniter (2) and rotate it counterclockwise about 30 degrees to unlock it.
8. Pull the HID igniter and lighting element straight out from the keyed opening in the reflector.
9. Remove the igniter and lighting element from the back of the front lamp unit.

INSTALLATION

BULB - HEADLAMP

0823006553

Fig. 61: Headlamp Bulb Base & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Position the headlamp bulb close enough to the back of the front lamp unit housing to access and reconnect the lamp wire harness connector (1) to the headlamp bulb connector receptacle.
2. Insert the headlamp bulb into the reflector opening until firmly seated.
3. Rotate the base clockwise about 30 degrees to lock it into place.
4. Position the headlamp bulb access cover onto the outboard back of the front lamp unit housing and rotate it clockwise about 30 degrees to lock it into place.
5. Install the air cleaner assembly (for passenger bulb installations). Refer to **AIR CLEANER, INSTALLATION** for 2.0L Diesel, **AIR CLEANER, INSTALLATION** for 2.4L or **AIR CLEANER, INSTALLATION** for 3.2L.
6. Reconnect the battery negative cable.

LAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. 1. Align and insert the High Intensity Discharge (HID) igniter and lighting element unit (2) straight into the opening in the front lamp unit reflector as a unit.
2. Press the igniter firmly and evenly toward the reflector until the base is firmly seated.
3. Rotate the igniter clockwise about 30 degrees to lock it into place.
4. Reconnect the high tension cable connector (1) to the connector receptacle integral to the lower edge of the igniter housing.
5. Position the headlamp bulb access cover onto the outboard back of the front lamp unit (2) housing and rotate it clockwise about 30 degrees to lock it into place.
6. Reconnect the battery negative cable.

2014 ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Interior - Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the BULB APPLICATION TABLE . In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The interior lighting system for this vehicle includes lighting on the dome/courtesy lamp circuit and the non-dimming panel lamps circuit. The lamps on the dome/courtesy circuit include:

- **Cargo Lamp** - An available cargo lamp is located in the left quarter inside panel just forward of the trunk side trim panel at the back of the vehicle and is controlled by the courtesy lamp circuit.
- **Dome/Reading Lamps** - Standard front seat driver side and passenger side dome/reading lamps are located in a mounting bracket on the headliner above the instrument panel near the upper windshield header and are controlled by both the courtesy lamp circuit and by independent push button switches adjacent to each lamp.
- **Vanity Lamps** - An optional single intensity, incandescent vanity lamp is located on each side of a covered mirror on both the right and left sun visors, and is controlled by an integral vanity mirror cover-actuated switch.
- **Glove Box Lamp** - A standard glove box lamp with a single LED unit and an integral switch is located in the glove box housing of the instrument panel and illuminates whenever the glove box is opened.
- **Courtesy Lamps** - Standard incandescent courtesy lamps are located under the right and left ends of the instrument panel, and are controlled by the courtesy lamp circuit.
- **Front Door Map Pocket Lamps** - Front door trim panel map pockets on some models include an LED lamp unit to assist visibility at night. These lamps are controlled by the panel lamps dimmer circuit and illuminate whenever the exterior lighting is turned ON.

- **Center Dome Lamps** - The standard incandescent rear dome/reading lamps are controlled by both the courtesy lamp circuit and independent lens-actuated switches.

Most controls on the instrument panel and elsewhere in the interior of the vehicle are illuminated by Light-Emitting Diode (LED) units on a non-dimming panel lamps circuit for night visibility. These LED units are soldered to internal circuit boards and are not serviceable.

Other components of the interior lighting system for this vehicle include:

- **Body Control Module** - The Body Control Module (BCM) is located under the instrument panel to the left of the steering column in the passenger compartment of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each door.
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch mechanism of the liftgate.
- **Instrument Panel Cluster** - The Instrument Panel Cluster (IPC) is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION**.
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below and outboard of the steering column. The headlamp switch includes a thumbwheel for selecting the panel lamps dimming level and for interior lighting control. A PARADE position of the thumbwheel illuminates all display units at full brightness for visibility when driving in daylight with the exterior lighting turned ON. There are also detent positions to turn ON all interior courtesy lighting, and a DEFEAT position that overrides door ajar switch control of interior lighting. Refer to **SWITCH, HEADLAMP, DESCRIPTION**.

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The lamps of the interior lighting system can be divided into two general classifications based upon the circuit that controls their operation: The courtesy lamp circuit, or the non-dimming panel lamps circuit. The following are paragraphs that briefly describe the operation of each of these interior lighting circuits.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness

connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

COURTESY LAMP CIRCUIT

The courtesy lamp circuit includes the dome/reading lamps located on the headliner near the center of the windshield opening upper header and the cargo (or trunk) lamp located on the rear edge of the left quarter inner trim near the left trunk trim panel at the rear of the vehicle. The lamps in the courtesy lamp circuit are provided with battery voltage and ground by the Body Control Module (BCM) using internal low side drivers through two ground circuits based upon hard wired inputs from the ignition switch and the door ajar switches. Power for the Trunk Lighting Function is sourced via a dedicated high side relay. The BCM also uses electronic message inputs received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus to control these outputs.

When a door or trunk ajar switch input to the BCM transitions to closed, the BCM will illuminate the courtesy lamps and keep them active for up to about 3 minutes. After all of the ajar switch inputs to the BCM transition to open, the BCM will keep the courtesy lamps illuminated for about 10 seconds. The BCM also provides courtesy lamp operation based upon certain inputs received from the Remote Keyless Entry (RKE) transmitter to provide an Illuminated Entry feature and in response to certain electronic message inputs received from the Occupant Restraint Controller (ORC) or the Powertrain Control Module (PCM) over the CAN data bus.

For those lamps in the courtesy lamp circuit with independent switching such as the dome/reading lamps, the BCM provides a second feed to the switches using another internal low side driver through a separate load shed circuit. The BCM provides a battery saver (load shedding) feature for these lamps, which will automatically turn the lamps OFF if they are left ON for more than about fifteen minutes with the ignition switch in the OFF position.

READING LAMP CIRCUIT

For those lamps on the courtesy lamp circuit with independent switching such as the map or reading lamps, the EMIC also provides a battery voltage output to those switches through a separate reading lamp circuit. The EMIC provides a battery saver (load shedding) feature for the reading lamp circuit as well as the courtesy lamp circuit, which will automatically turn these lamps OFF if they are left ON for more than about 10 minutes after the electronic **ignition switch status** message transitions to OFF. If any reading lamp input is received subsequent to a 10 minute load shed and prior to a new ignition cycle, the reading lamps will turn OFF after 90 seconds.

PANEL LAMPS DIMMER CIRCUIT

The panel lamps dimmer circuit actually includes several circuits. These circuits control the back lighting illumination and dimming level of the headlamp switch, the dimmer module, the automatic transmission gear selector bezel lamp, the front door map pocket lamps, as well as the center floor console cup holder and forward

storage compartment lamps. All lamps in the panel lamps dimmer circuits are provided a path to ground at all times through a hard wired ground circuit. These lamps are illuminated by a 12-volt Pulse Width Modulated (PWM) output of the BCM through several panel lamps dimmer circuits.

This shared PWM output synchronizes the selected illumination intensity level of all the lamps in the panel lamps dimmer circuits. The BCM uses hard wired resistor multiplexed inputs from the rotary exterior lighting control knob of the headlamp switch to determine when the exterior lighting is turned ON and from the thumbwheel of the dimmer module to determine the dimming level selection. Then the BCM provides the appropriate PWM outputs through the panel lamps dimmer circuits as well as electronic **dimming level** messages over the CAN data bus to other electronic modules in the vehicle.

The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and the Integrated Center Stack (ICS) use the electronic **dimming level** messages to control the illumination intensity of their own back lighting, controls and display units. In addition, when the interior lighting thumbwheel of the dimmer module is moved to the PARADE (or funeral) mode detent position, all of the electronic display units are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lighting turned ON. The PARADE mode has no effect on the illumination intensity of incandescent panel lamps.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTERIOR LIGHTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

WARNING: On vehicles equipped with the high voltage system, disconnecting the 12-volt battery negative cable alone will not power down the 12-volt system. You must perform the 12-volt Power Down procedure before proceeding.

Failure to follow these instructions may result in possible serious or fatal injury.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

COURTESY LAMP CIRCUIT

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace the courtesy lamp bulb if required.

LAMP, READING

REMOVAL

BULB - OVERHEAD CONSOLE

Fig. 1: Dome/Reading Lamp Socket

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console (1) from the headliner.
3. Grasp the dome/reading lamp socket (3) firmly and push it to one side far enough to unsnap the socket latch features from the lamp housing (4).
4. Pull the socket and bulb (2) out of the lamp housing.
5. Pull the base of the bulb straight out of the lamp socket.

INSTALLATION

BULB - OVERHEAD CONSOLE

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 2: Dome/Reading Lamp Socket
Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the bulb (2) with the overhead console dome/reading lamp socket (3).
2. Push the bulb straight into the socket until the base is fully seated.
3. Align the socket and bulb with the keyed opening in the lamp housing (4).
4. Insert the bulb and socket straight into the housing until the socket latch features are both fully engaged.
5. Reinstall the overhead console (1) to the headliner.
6. Reconnect the battery negative cable.

LAMP, VANITY

DESCRIPTION

DESCRIPTION

If the overhead visor is equipped with illumination, the lamp and bulb are not serviced. Replacement of the visor is necessary if the bulb is found to be burned out. Refer to **VISOR, REMOVAL**.

SWITCH, DIMMER

DESCRIPTION**DESCRIPTION**

This vehicle has a panel dimmer switch (also known as the dimmer module) (1) that is located within the headlamp switch housing on the instrument panel steering column opening cover. The standard dimmer module features a single thumbwheel for panel lamps dimming and interior lighting control. There is also an optional switch with a second thumbwheel. The second thumbwheel is used for ambient (also known as halo) lighting control in vehicles with the ambient lighting option.

The dimmer module is constructed of molded plastic. The thumbwheel is molded plastic and knurled around its circumference to ease operator control. The headlamp switch face plate is labeled with graphics and International Control and Display Symbol icons to clearly identify the functions of the thumbwheel or optional thumbwheels.

The headlamp switch housing is snapped into place within the mounting hole of the steering column opening and held in place by two tension push down to release springs built into the headlamp switch housing itself. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the module to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. Panel dimmer controlled Light Emitting Diode (LED) units soldered to the circuit board within the module provide back lighting for visibility at night, but are not serviceable.

The switch cannot be repaired and, if ineffective or damaged, it must be replaced. Refer to **SWITCH, HEADLAMP, REMOVAL**.

OPERATION**OPERATION**

The panel dimmer switch (also known as the dimmer module) uses a single resistor multiplexed output for each switch thumbwheel to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a multifunction switch MUX return circuit. It then provides outputs to the BCM on a panel lamps dimmer signal circuit to control panel dimmer and interior lighting functions, or on a dimmer environmental lighting circuit to control ambient (halo) lighting functions.

The dimmer module illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the dimmer module.

The dimmer module operates as follows:

- **Ambient (Halo) Lighting Control** - On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the ambient DEFEAT or one of the six ambient dimmer detent positions to control the ambient (halo) lighting level. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the dimmer environmental lighting circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the liftgate courtesy feeds

driver circuit.

- **Interior Lighting Control** - The left thumbwheel on the dimmer module is rotated to the dome DEFEAT, dome ON, PARADE mode, or one of the six panel dimmer detent positions to control the interior courtesy/dome and panel lamps. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the panel lamps dimmer signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the courtesy lamps, panel lamps and reading lamps driver circuits, and by sending appropriate electronic **dimming level** messages to other electronic modules over the CAN data bus.

The dimmer module as well as the hard wired inputs and outputs of the module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

SWITCH, DOOR AJAR

DESCRIPTION

DOOR

This vehicle has four door ajar switches, one for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type micro switch units that are actuated by the mechanisms internal to the door latch. An integral connector receptacle on each door latch connects the door ajar switch and the power lock motor to the vehicle electrical system through its respective door wire harness.

The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced. Refer to **LATCH, DOOR, REMOVAL** or **LATCH, DOOR, REMOVAL**.

LIFTGATE

A liftgate ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the liftgate latch unit. The switch is a momentary leaf contact-type micro switch unit that is actuated by the liftgate latch mechanism. An integral connector receptacle on the liftgate latch connects the liftgate ajar switch to the vehicle electrical system through the liftgate wire harness.

The liftgate ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the liftgate latch unit must be replaced. Refer to **LATCH, LIFTGATE, REMOVAL**.

OPERATION

DOOR

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit. The door ajar switches are hard wired in series between a body ground and the Body Control Module (BCM). The BCM reads the hard wired door ajar switch inputs through internal pull-ups, then uses these inputs to control many electronic functions and features of the vehicle. The BCM also sends electronic **door ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The door ajar switches as well as the hard wired inputs and outputs of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

LIFTGATE

The liftgate ajar switch is actuated by the liftgate latch mechanism. When the liftgate is closed and properly latched, the liftgate ajar switch is an open circuit. When the liftgate is open or only partially latched, the liftgate ajar switch is a closed circuit. The liftgate ajar switch is hard wired in series between a body ground and the Body Control Module (BCM) on vehicles without the power liftgate option, or the Power LiftGate Module (PLGM) on vehicles with the power liftgate option. The BCM or the PLGM reads the hard wired liftgate ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The BCM or the PLGM also sends electronic **liftgate ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The liftgate ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

LAMP, DOME

REMOVAL

LAMP - CENTER

1. Disconnect and isolate the battery negative cable.
2. To remove and replace a bulb, use a trim stick to pop loose the lens covering the defective bulb. Remove bulb and replace.
3. To remove the entire dome lamp assembly, Insert a trim stick between the lamp housing and the headliner to pry the dome lamp assembly loose.
4. Disconnect the harness from the back of the dome lamp.

INSTALLATION

LAMP - CENTER

1. Position the dome lamp to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. Set the lamp into the opening in the headliner.
4. Gently and evenly press the lens lamp into the mounting hole until the bezel of the lamp housing is snapped flush with the headliner.
5. Reconnect the battery negative cable.

LAMP, CARGO

REMOVAL

BULB

3347239

Fig. 3: Lamp Hood, Bulb, Lamp Lens & Lamp Socket
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the cargo lamp from the vehicle. Refer to **LAMP, CARGO, REMOVAL**.
3. Disengage the end of the lamp lens (3) with the latch feature from the retention pin on each side of the lamp hood (1).
4. Pivot the lens up from over the hood.
5. Unfold the lamp hood from the lamp socket (4) far enough to access the bulb (2).
6. Pull the base of the bulb straight out of the socket.

LAMP

3347175

Fig. 4: Trunk Side Trim Panel, Left Quarter Trim Panel & Cargo Lamp

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the cargo lamp (3) in the rear edge of the left quarter trim panel (2) near the trunk side trim panel (1).
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the notched lower end of the cargo lamp lens to disengage the lower end of the lamp housing from the mounting hole in the quarter trim panel.
4. Pull the upper end of the lamp housing out of the mounting hole far enough to access and disconnect the body wire harness connector from the lamp connector receptacle.
5. Remove the cargo lamp from the vehicle.

INSTALLATION**BULB**

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

3347239

Fig. 5: Lamp Hood, Bulb, Lamp Lens & Lamp Socket

Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the bulb (2) with the cargo lamp socket (4).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Fold the lamp hood (1) back over the bulb until it is parallel to the lamp socket and connector.
4. Pivot the lens down over the hood.
5. Press the end of the lamp lens with the latch feature down firmly and evenly over the hood until the lens

snaps into place over the retention pin on each side of the hood.

6. Install the cargo lamp into the vehicle. Refer to **LAMP, CARGO, INSTALLATION**.
7. Reconnect the battery negative cable.

LAMP

Fig. 6: Trunk Side Trim Panel, Left Quarter Trim Panel & Cargo Lamp
 Courtesy of CHRYSLER GROUP, LLC

1. Position the cargo lamp (3) close enough to the mounting hole in the rear edge of the left quarter trim panel (2) near the trunk side trim panel (1) to access and reconnect the body wire harness connector to the lamp connector receptacle.
2. Engage the wiring and connector on the upper end of the lamp housing into the upper end of the mounting hole.
3. Using hand pressure, press the notched lower end of the cargo lamp lens firmly and evenly into the mounting hole against the spring pressure of the latch feature until the latch snaps into place.
4. Reconnect the battery negative cable.

2014 ACCESSORIES AND EQUIPMENT**Message Center - Service Information - Cherokee****CENTER, ELECTRONIC VEHICLE INFORMATION****DESCRIPTION****DESCRIPTION****0409004648**

Fig. 1: Electronic Vehicle Information Center (EVIC) Driver-Interactive Display
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the middle of the instrument cluster between the speedometer and tachometer. This system conveniently allows the driver to select a variety of useful information by pressing the switches mounted on the steering wheel. The EVIC displays information related to the following:

- Audio mode display
- Compass display
- Fuel saver indicator, Economizer (ECO) display
- Navigation system screens - If Equipped
- Outside temperature display
- Park Assist System - If Equipped
- Personal Settings (customer programmable features)
- System Status

- Tire Pressure Monitor System - If Equipped
- Trip computer functions
- U-Connect™ hands-free communication system displays - If Equipped
- Vehicle information warning message displays

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster
- Steering Wheel Switches
- Ambient Temperature Sensor
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced. Refer to **REMOVAL** . If the EVIC function buttons are inoperative and require replacement, refer to **SWITCH, EVIC CONTROL, REMOVAL** for the appropriate procedure.

OPERATION

EVIC SWITCHES

Fig. 2: EVIC Function Buttons

Courtesy of CHRYSLER GROUP, LLC

The EVIC function buttons are used to operate the different functions of the EVIC system. Pressing and releasing the **Arrow** buttons allows the driver to scroll through and select the Compass/Temperature, Trip Computer, Personal Settings or System Status functions. The **OK** button allows the selection of setting or resetting of the function currently displayed at that time.

EVIC DISPLAY MODES

SYSTEM STATUS

Displays warnings and user interaction messages. Initial warnings will be displayed accompanied by a series of audible beeps. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the menu buttons.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn signal on
- Perform service
- Key not programmed - damaged key
- Key not programmed - invalid key
- Key not programmed - exceeded key program limit
- Programming active - new key programmed
- Service security key

TRIP COMPUTER

Press and release the **MENU** buttons until one of the following Trip Functions displays in the EVIC:

- Average Fuel Economy
- Distance To Empty
- Elapsed Time
- Display Units of Measure in

Press the **STEP** button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information:

- **Average Fuel Economy** Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.
- **Distance To Empty (DTE)** Shows the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the **RESET** button. When the DTE value is less than 30 miles (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the "LOW FUEL" text and a new DTE value will display.
- **Elapsed Time** Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.
- **Display Units of Measure in:** To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

To Reset The Display Reset will only occur while a reset function is being displayed. Press and release the **RESET** button once to clear the reset function being displayed. To reset all reset functions, press and release the **RESET** button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will display during this 3 second window).

HANDS FREE TELEPHONE - IF EQUIPPED

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
- UConnect Active
- Caller ID phone number display

NAVIGATION - IF EQUIPPED

Navigation Display Control Press and release the MENU button until Navigation displays in the EVIC. When the Navigation System is On, the steering wheel buttons can be used to select the Map or Menu display on the Navigation Unit. When the Menu display is active, the STEP button can be used to scroll through the list, the RESET button can be used to select an item, and the AUDIO MODE button can be used to return to the

previous menu. When the Map display is active, pressing the RESET button will change the Navigation Unit Display to the Menu.

Turn-By-Turn Directions The EVIC displays turn-by-turn directions to a programmed destination when Turn-By-Turn Navigation is enabled through Personal Settings. When enabled, the EVIC displays the name of the approaching road at the top of the screen, followed by an arrow to indicate the direction to turn the vehicle, and a count down to indicate the distance to the turn.

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the **MENU** button until Personal Settings is displayed in the EVIC. Pressing and releasing the **STEP** button will scroll through the following personal settings choices:

- **Language** When in this display you may select one of five languages for all display nomenclature, including the trip functions and the navigation system (if equipped). Press the **RESET** button while in this display to select English, Espanol, or Francais. Then, as you continue, the information will display in the selected language.

NOTE: **The EVIC will not change the UConnect™ language selection.**

- **Lock Doors Automatically at 15 mph (24 km/h)** When ON is selected, all doors will lock automatically when the vehicle reaches a speed of 15 mph (24 km/h). To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Unlock Doors Automatically on Exit** When ON is selected, all doors will unlock when the vehicle is stopped and the transmission is in the P (Park) or N (Neutral) position and the driver's door is opened. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Remote Key Unlock** When DRIVER DOOR 1ST PRESS is selected, only the driver's door will unlock on the first press of the remote keyless entry unlock button. When Driver Door 1st Press is selected, you must press of the remote keyless entry unlock button twice to unlock the passenger's doors. When ALL DOORS 1ST PRESS is selected, all of the doors will unlock on the first press of the remote keyless entry unlock button. To make your selection, press and release the **RESET** button until "Driver Door 1st Press" or "All Doors 1st Press" appears.
- **Sound Horn with Remote Key Lock** When ON is selected, a short horn sound will occur when the remote keyless entry "Lock" button is pressed. This feature may be selected with or without the flash lights on lock/unlock feature. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Flash Lights with Remote Key Lock** When ON is selected, the front and rear turn signals will flash when the doors are locked or unlocked with the remote keyless entry transmitter. This feature may be selected with or without the sound horn on lock feature selected. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Turning Headlights Off** When this feature is selected, the driver can choose to have the headlights remain on for 0, 30, 60, or 90 seconds when exiting the vehicle. To make your selection, press and release the **RESET** button until "0," "30," "60," or "90" appears.
- **Turn Headlights On with Remote Key Unlock** When this feature is selected, the headlights will

activate and remain on for up to 90 seconds when the doors are unlocked with the remote keyless entry transmitter. To make your selection, press and release the **RESET** button until "OFF," "30 sec.," "60 sec.," or "90 sec." appears.

- **Headlights On with Wipers (Available with Auto Headlights Only)** When this feature is selected and the headlight switch is in the AUTO position, the headlights will activate approximately 10 seconds after the wipers are turned on. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Power Off to Accessories Until Exit** When this feature is selected, the power window switches, radio, hands-free system (if equipped), DVD video system (if equipped), power sunroof (if equipped), and power outlets will remain active for up to 10 minutes after the ignition switch is turned off. Opening a vehicle door will cancel this feature. To make your selection, press and release the **RESET** button until "Off," "45 sec.," "5 min.," or "10 min." appears.
- **Confirmation of Voice Commands - If Equipped** When ON is selected, all voice commands from the UConnect™ system are confirmed. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Display Units of Measure in** The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

COMPASS/TEMPERATURE

Compass heading and outside temperature are displayed on the EVIC display screen. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and one of 15 compass variance settings can be programmed. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit).

For additional information regarding the compass, refer to Personal Settings (Customer Programmable Features) in this article .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster functions and the Body Control Module (BCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 3: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the front fascia.

OPERATION**OPERATION**

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the A/C-heater control, Powertrain Control Module (PCM) and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool. Refer to the appropriate Diagnostic Information .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL**.

REMOVAL**REMOVAL**

Fig. 4: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (3) from the ambient air temperature sensor (2).
3. Remove the push pin (1) that secures the ambient air temperature sensor and remove the sensor.

INSTALLATION

INSTALLATION

1. Install the push pin (2) that secures the ambient air temperature sensor to the vehicle.
2. Connect the wire harness connector (3) to the ambient air temperature sensor (2).
3. Connect the negative battery cable.

SWITCH, EVIC CONTROL

DESCRIPTION

DESCRIPTION

Fig. 6: EVIC Function Buttons
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) control switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to eight push buttons. Five of the push buttons are used on all vehicles equipped with the EVIC. Three additional push buttons are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the EVIC control switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The EVIC control switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) control switch pod is a resistor multiplexed unit that receives source current from and provides hard wired inputs to the Local Interface Network (LIN) slave node circuitry of the LIN module or integral to the cruise control switch pod in the right spoke of the steering wheel spoke bezel. The LIN slave node circuitry communicates the switch states of the EVIC control switch pod, the remote radio switches, the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the LIN master node integral to the Steering Column Module (SCM) integral to the Steering Column Control Module (SCCM) mounting housing located on the top of the steering column below the clockspring. The SCM is also a gateway to the Controller Area Network (CAN) data bus.

The EVIC control switch pod contains four push buttons whose functions are:

- **Down Arrow** - Pressing and releasing the Down Arrow push button allows the operator to scroll downward through the various EVIC main menus and sub menus.
- **Left Arrow** - Pressing and releasing the Left Arrow push button returns you to the previous sub menu or main menu.
- **Right Arrow** - Pressing and releasing the Right Arrow (Select) push button allows the operator to navigate, select and reset items or settings in the currently displayed EVIC main menu or sub menu. Pressing and holding the Right Arrow (Select) push button for two seconds provides a global reset of all of those EVIC features that can be reset, whether currently displayed or not.
- **Up Arrow** - Pressing and releasing the Up Arrow push button allows the operator to scroll upward through the various EVIC main menus and sub menus.

For vehicles equipped with the Uconnect® Hands-Free Communication System, the EVIC control switch pod contains two additional switch push buttons whose functions are:

- **VR (Voice Recognition)** - This switch button activates the Uconnect® Voice Command system.
- **Phone** - This switch push button activates the Uconnect® Hands-Free Phone system.

The LIN slave node circuitry of the LIN module or the cruise control switch pod provides current for all of the switches and sensors on the rotating steering wheel as well as for the Light Emitting Diode (LED) back lighting of both the cruise control and the EVIC control switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the CAN data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the EVIC control switch pod as well as the hard wired circuits between the switch pod and the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM or the electronic controls and communication between modules and other devices that provide some features of the EVIC system. The most reliable, efficient, and accurate means to diagnose the EVIC control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and

communication related to EVIC system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .

0806007482

Fig. 7: Steering Wheel Front Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

3. From the back of the steering wheel front bezel (2), remove the two screws (1) that secure the EVIC switch pod to the bezel.
4. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 8: Steering Wheel Front Bezel & Screws

Courtesy of CHRYSLER GROUP, LLC

1. Position the Electronic Vehicle Information center (EVIC) switch pod to the back of the steering wheel front bezel (2).
2. Install and tighten the two screws (1) that secure the switch to the bezel. Tighten the screws securely.
3. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
4. Connect the negative battery cable.

2014 ACCESSORIES AND EQUIPMENT**Navigation/Telecommunication - Service Information - Cherokee****DESCRIPTION****HANDS FREE PHONE**

A Uconnect™ Hands Free Phone system is factory-installed optional equipment. This system allows hands free use of compatible mobile phones for sending and receiving phone calls and text messages as well as for streaming audio from those devices through the audio system in the vehicle. The Hands Free Phone system includes the following major components, which are described in further detail elsewhere in this service information:

- **Bluetooth™ Antenna** - A Bluetooth™ antenna is internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Bluetooth™ Phone** - A customer-supplied and paired Bluetooth™ phone is a required component of the hands free phone system.
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Hands Free Phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION**.
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the phone system in this vehicle. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION**.

The RRM also contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION**.

The Uconnect™ Hands Free Phone system components cannot be adjusted or repaired. If any Hands Free Phone system component is damaged or ineffective, that component must be replaced. The Hands Free Phone

system software is flash programmable through the Universal Serial Bus (USB) port.

NAVIGATION

A factory-installed satellite navigation system based upon the Global Positioning System (GPS) is an available option on this vehicle. Depending upon the optional touchscreen Radio Receiver Module (RRM) (also known as the radio or the head unit) selected for the vehicle, there are some variations in navigation system features available. Each system provides the vehicle operator with both visual and audible guidance to a chosen destination. An available premium navigation system includes such features as one-shot Voice Recognition (VR) destination entry, three dimensional city models and landmarks, digital terrain modeling, SiriusXM™ Travel Link and SiriusXM™ Traffic.

A color touchscreen electronic display provides a graphical interface for programming, searching for and selecting destinations. In vehicles also equipped with a Uconnect™ Hands-Free telecommunication option, the available navigation systems are also equipped with Advanced Speech Recognition (ASR) input capability allowing hands-free operation. Each system provides visual guidance through dynamic maps with a turn-by-turn feature that can be enabled or disabled by the vehicle operator, while voice prompts through the audio system of the vehicle provide the vehicle operator with audible alerts and directions coordinated with the visual displays. The system also displays and logs valuable trip information such as speed, posted speed limit, distance and Estimated Time of Arrival (ETA).

The premium navigation system is activated when the vehicle is shipped from the factory, while another available system is shipped from the factory as Navigation Ready. The Navigation Ready system allows the customer to choose whether to have the dealer activate the embedded navigation module after the vehicle has been delivered.

The navigation system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Combination Antenna** - The navigation module acquires GPS position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION**.
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is an electronic display within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). When Turn-By-Turn navigation is enabled through the EVIC Personal Settings menu, the EVIC displays turn-by-turn directions to the chosen destination supplemental to the navigation display within the RRM touchscreen unit. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION**.
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Uconnect™ Hands-Free Phone

system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .

- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands-Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION** .
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) contains the central components of the navigation system. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a navigation module is internal and integral to each RRM that is equipped with navigation capability. The navigation module contains all of the navigation system hardware and software. Hardware includes the GPS receiver, an electronic gyroscope, a microcontroller and flash memory for system software and map data storage. Refer to **RADIO, DESCRIPTION** .

The IC and the RRM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network - Interior High Speed (CAN - IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The navigation system components cannot be adjusted or repaired. If any of the navigation system components is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The navigation system software as well as the map data is flash programmable through the Universal Serial Bus (USB) port.

UCONNECT ACCESS

A Uconnect™ Access system is factory-installed optional equipment. The Uconnect™ Access system uses an embedded cellular connection and available subscription service packages to enable several mobile connectivity features. Vehicles equipped with the Uconnect™ Access system can be readily identified by two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** labels.

To fully enable the Uconnect™ Access system, a Uconnect™ Access account must first be established by following the steps described in the Uconnect™ Access registration process at **www.MoparOwnerConnect.com** . Next, one of two optional subscription service packages must be selected. The two packages are:

- **Uconnect™ Access Assist Package** - This package provides one touch 9-1-1 calling and roadside assistance calling features.
- **Uconnect™ Access Advantage Package** - This package also includes the one touch 9-1-1 calling and roadside assistance calling features found in the Assist Package. In addition, this package provides features such as Bing™ hands-free search and voice-to-text hands-free text message dictation, both through the user's compatible, paired and enabled Bluetooth™ phone. Another feature of this package is remote vehicle services like remote **Lock** , **Unlock** and **Start** . The remote vehicle services can be activated through the user's compatible smart phone after the **Uconnect™ Access Mobile** smart phone app is installed on the smart phone. Download and installation of the **Uconnect™ Access Mobile** smart phone app can be done during the Uconnect™ Access registration process at **www.MoparOwnerConnect.com** or from the user's smart phone App storefront. The user can also activate the remote vehicle services feature from the Uconnect™ Access web portal.

NOTE: **A free trial period of the Uconnect™ Access Assist or Advantage subscription**

packages may be offered after successful completion of the Uconnect™ Access registration process.

The Uconnect™ Store Front is accessible from the appropriate Radio Receiver Module (RRM) (also known as the radio or the head unit) touch screen menu once the Uconnect™ Access registration process has been successfully completed. In the future, additional Uconnect™ Access compatible applications (also known as RRM apps) will be made available for purchase and download from the Uconnect™ Store Front.

The Uconnect™ Access system includes the following major components, which are described in further detail elsewhere in this service information:

- **Access Switches** - In vehicles equipped with Uconnect™ Access, the inside rear view mirror also contains two integral push button switches and a Light Emitting Diode (LED) indicator located on the rearward-facing housing just below the center of the mirror glass for activation of the **ASSIST** and **9-1-1** features.
- **Bluetooth™ Antennas** - Bluetooth™ antennas are internal and integral to the RRM.
- **Bluetooth™ Phone** - A customer-supplied and paired Bluetooth™ smart phone is a required component of the Uconnect™ Access system to enable remote services.
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Combination Antenna** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) sends and receives cellular data through a roof-mounted combination antenna that also receives satellite audio and Global Positioning System (GPS) navigation signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION**.
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Voice Recognition (VR) switch button and the Phone switch button of the hands-free phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION**.
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the hands-free phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is a key component of the Uconnect™ Access remote vehicle services feature. The RFHM is located on the left rear quarter inner panel in the cargo area within the passenger compartment and concealed behind the quarter trim panel. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the Uconnect™ Access system in this vehicle. The RRM includes a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most

commonly used for the market destination. Refer to **RADIO, DESCRIPTION**.

- **Uconnect™ Access Registration And Applications** - Uconnect™ Access registration must be completed before individual RRM apps or Uconnect™ Access subscription packages can be purchased from the Uconnect™ Store Front. The Uconnect™ Access Mobile smart phone app must also be installed on the user's compatible smart phone for the remote vehicle services features to operate. Many additional Uconnect™ Access apps are under development for later release.

The RRM contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. In vehicles equipped with Uconnect™ Access, the RRM also uses electronic message communication with other electronic modules in the vehicle over the CAN-C data bus. Refer to **COMMUNICATION, DESCRIPTION**.

The Uconnect™ Access system components cannot be adjusted or repaired. If any Uconnect™ Access system component is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The Uconnect™ Access system software is flash programmable through the Universal Serial Bus (USB) port.

WI-FI HOT SPOT

Vehicles equipped with the Uconnect™ Access system can become a Wi-Fi hot spot with payment of a daily, weekly or monthly subscription option. This system allows the use of the vehicle as a Wi-Fi hot spot for connecting consumer Wi-Fi devices to the Internet through a Wi-Fi antenna and an embedded cellular connection that are internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit), and the external cellular combination antenna.

The Wi-Fi Hot Spot system includes the following major components, which are described in further detail elsewhere in this service information:

- **Wi-Fi Antenna** - The Wireless Local Area Network (WLAN) (also known as Wi-Fi) antenna is internal and integral to the RRM.
- **Wi-Fi Device** - A customer-supplied Wi-Fi capable device is a required component of the Wi-Fi Hot Spot system.
- **Combination Antenna** - The RRM sends and receives cellular data through a roof-mounted combination antenna that also receives satellite audio and Global Positioning System (GPS) navigation signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the telecommunication system in this vehicle. The RRM includes a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION**.

The Uconnect™ Access Wi-Fi Hot Spot system components cannot be adjusted or repaired. If any Wi-Fi Hot Spot system component is damaged or ineffective, that component must be replaced. The external combination

antenna can be repaired separately from the RRM. The Wi-Fi Hot Spot system software is flash programmable through the Universal Serial Bus (USB) port.

OPERATION

HANDS FREE PHONE

The Uconnect™ Hands Free Phone system relies upon Bluetooth™ technology to enable wireless connectivity between Bluetooth™ compatible, paired and turned On mobile devices and the on-board entertainment system components. This system also relies upon Advanced Speech Recognition (ASR) software to enable Voice Commands to control the mobile device as well as the components and features of some other on-board systems.

The system will recognize up to ten Bluetooth™ compatible devices, each of which is identified within the system by the name acquired from the device during the pairing process. The Hands Free Phone system will communicate with a paired device that is anywhere within the vehicle. However, covering the paired device with a metal object may block the signal.

The Hands Free Phone system is operated in one of two ways: actively or passively. Active operation begins with the vehicle operator depressing a push button in the Electronic Vehicle Information Center (EVIC) switch pod on the face of the left horizontal spoke of the steering wheel. The Uconnect™ Voice Recognition (**VR**) (also known as Voice Command) button is depressed for hands free Voice Command access to available features other than the phone, or the Uconnect™ Phone (**Phone** is identified by a phone handset icon) button is depressed for hands free phone access.

The **VR** or **Phone** button press provides a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the EVIC switch pod. The LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM is also a gateway to the CAN - Interior High Speed (CAN-IHS) data bus and relays the message over CAN-IHS data bus to the Radio Receiver Module (RRM) (also known as the radio or the head unit).

When the RRM receives the electronic **switch press** message, the RRM suppresses any current audio output and issues an audible **beep** to indicate that the VR hardware is prepared to receive a Voice Command. Part of the Uconnect™ Hands Free Phone system hardware includes the VR stereo microphones integral to the top surface of the inside rear view mirror. The microphones provide a hard wired input of Voice Commands to the VR engine within the RRM, and the ASR software converts that input into an electronic instruction message broadcast over the CAN-IHS data bus to invoke the appropriate system response. If no appropriate Voice Command is received within a few seconds following the audible **beep**, the system will provide an audible verbal output listing a menu of the available Voice Command options.

Passive operation begins when an incoming cellular call is received. If the Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ system (see the Uconnect™ web site), passive operation will also begin when an SMS text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM display to accept the call, or the soft button that will appear in the RRM display to accept the message.

The Bluetooth™ transceiver connects the voices of the two phone parties using outputs through the audio system speakers and inputs through the Uconnect™ hands free microphones. In the case of a text message, the Bluetooth™ transceiver sends the message to the VR hardware and the ASR software converts the message from text to voice and plays it through the audio system speakers.

If the RRM has the optional 213 millimeter (8.4 inch) electronic touchscreen display, the text message can then be replied to by depressing the Uconnect™ **VR** button and giving an **SMS** Voice Command to select from several predetermined short text phrase responses. If the RRM has the 127 millimeter (5 inch) display, it can receive and display SMS text messages, but it is not equipped to reply to text messages.

The Hands Free Phone system operates on battery current received through a fused B(+) circuit, but also monitors the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) status through electronic messages received over the CAN-IHS data bus. If a call is in progress when the status of the ignition switch transitions to Off, the system will continue to operate until the call has been completed.

The RRM receives electronic message inputs over the CAN-IHS data bus related to the Hands Free Phone system. The RRM is also connected to the CAN-C data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the Bluetooth™ transceiver circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit.

The hard wired circuits between components related to the RRM and the Hands Free Phone system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Hands Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Hands Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NAVIGATION

The optional navigation system is active whenever the Radio Receiver Module (RRM) (also known as the radio or the head unit) electronic display is powered On. In vehicles equipped with a navigation system that allows activation after the vehicle has been delivered, all post delivery activations must be performed by the dealer.

If a navigation system menu or map isn't being actively displayed, the system is still operating in the background. The menu, map or route that was active when the RRM electronic display was powered Off along with all other user-relevant information is saved in nonvolatile memory by the navigation module for display again the next time the RRM electronic display is powered On and the navigation system is selected.

Once a destination is selected, the navigation system uses information from stored map data to quickly calculate a route. As the vehicle is driven along that route, the vehicle operator is guided with visual displays and voice prompts. Any variances from that route will cause the navigation system to automatically recalculate and

deliver a revised route to the chosen destination.

When Turn-By-Turn Navigation is enabled through the Personal Settings menu of the Electronic Vehicle Information Center (EVIC), the EVIC supplements the RRM display with a more focused turn-by-turn display which includes: the name of the approaching crossroad, an arrow indicating the upcoming turn direction and a countdown to indicate the distance to that turn.

All vehicles have their original map and Points-Of-Interest (POI) data stored in nonvolatile flash memory integral to the navigation module integral and internal to the RRM. Updated map and POI data as well as updated navigation software for these vehicles can be uploaded to the system using Universal Serial Bus (USB) media. The originally installed data is based upon the market for which the vehicle was manufactured. Navigation software updates are also uploaded to the system using USB media.

The Global Positioning System (GPS) receiver of the navigation module is capable of acquiring and tracking GPS signal inputs through the roof-mounted combination antenna from numerous satellites simultaneously to calculate and display the position and direction of the vehicle. However, when access to satellite signals is blocked by bridges, tunnels or other obstacles, the navigation module relies upon Dead Reckoning (DR) to aid in calculating vehicle position and direction. The navigation module uses pulse signals from the wheel speed sensors, a Reverse gear indicator input and an internal electronic gyroscope sensor to provide DR vehicle position and direction calculations to supplement GPS satellite signals.

User input mechanisms for the navigation system include the RRM touchscreen and the Uconnect™ Hands-Free Voice Recognition (VR) (also known as Voice Command) verbal commands. The VR function uses Advanced Speech Recognition (ASR) software. Master control of the VR function is handled by the VR engine internal and integral to the RRM. The VR recognizes and responds to certain global commands, while other commands are specific to the RRM or the navigation system.

For safety reasons some input, editing and setting features of the navigation system are restricted when the vehicle is in motion or when a hands-free phone call is active. This includes many features that require touchscreen inputs. However, many of those same features disabled for touchscreen inputs remain enabled for Uconnect™ Hands-Free VR inputs.

The navigation module receives electronic message inputs within the RRM over the Controller Area Network - Interior High Speed (CAN-IHS) data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the navigation module and the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the navigation system antenna circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The external combination antenna may be diagnosed separately from the RRM.

The hard wired circuits between components related to the RRM and the navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the

navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

UCONNECT ACCESS

The two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** labels in vehicles equipped with the optional Uconnect™ Access system provide active control of the one-touch 9-1-1 calling and roadside assistance calling features. The **ASSIST** button behavior is dependent upon the Uconnect™ Assist or Advantage subscription status. If either subscription is active, pressing the **ASSIST** allows the user to contact the Chrysler Customer Care Center, the Uconnect™ Customer Care Center for Uconnect™ Access related issues or the Roadside Assistance Call Center. If both subscriptions are inactive, only the Chrysler Customer Care Center or the Roadside Assistance Call Center may be contacted. The **9-1-1** button is enabled with or without a subscription. These switches provide a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the inside rear view mirror.

The LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM relays the message over the Controller Area Network - Interior High Speed (CAN-IHS) data bus, where it is retrieved by the Radio Receiver Module (RRM) (also known as the radio or the head unit). There is also an **ASSIST** soft button available in a menu of the RRM that provides a direct input to the Uconnect™ Access system.

The Light Emitting Diode (LED) indicator between the push buttons provides an indication of the status of the Uconnect™ Access embedded cellular device. Any fault indication is accompanied by a pop up screen in the RRM (also known as the radio or the head unit) electronic display. The following indications are provided whenever the status of the ignition switch is On or Accessory:

- **Solid Green** - No active call.
- **Flashing Green** - A call is active.
- **Solid Red** - A CAN, embedded cellular device or cellular antenna fault has been detected.
- **Off** - No power supply to the rear view mirror.

If a Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ Access system (see the Uconnect™ web site for a phone compatibility list), a Uconnect™ Advantage subscription provides an enhanced SMS text message free form dictation feature to compose a response when a text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM display to accept the message and dictate a response.

If the vehicle has had the optional Uconnect™ Mobile application (also known as app) downloaded, installed and enabled on their smart phone the Uconnect™ Advantage subscription can provide remote door locking and unlocking, remote starting and remote horn and lights features. In the Uconnect™ Access system the Mobile app on the smart phone calls the RRM in the vehicle, the RRM communicates through electronic messages over the Controller Area Network - C (CAN-C) data bus with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the RFHM communicates over the CAN-C bus with the Body Control Module

(BCM) (also known as the Common Body Controller/CBC) to achieve the requested remote features. While the RRM uses electronic message communication over the CAN-C data bus and the CAN - Interior High Speed (CAN-IHS) data bus, the RRM is not a CAN gateway.

The Uconnect™ Advantage subscription also enables hands-free mobile Bing™ local search and navigation capabilities.

The hard wired circuits between components related to the RRM and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Access system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Access system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WI-FI HOT SPOT

Vehicles equipped with the optional Uconnect™ Access system are capable of becoming Wi-Fi hot spots with the Wi-Fi Hot Spot system. The Radio Receiver Module (RRM) (also known as the radio or the head unit) includes both an integral internal Wireless Local Area Network (WLAN) (also known as Wi-Fi) antenna and an embedded cellular connection. Along with a paid daily, weekly or monthly subscription service these features allow the vehicle to become a Wireless Access Point (WAP) for access to the Internet through Wi-Fi capable and enabled devices.

An Application Settings menu of the RRM allows the adjustment of the WAP password and security settings. The external combination antenna can be diagnosed and repaired separately from the RRM.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HANDS-FREE PHONE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Hands-Free Phone system may be diagnosed using conventional

diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Hands-Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Hands-Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
PHONE NOT AVAILABLE	1. Bluetooth phone not paired to the RRM. 2. Bluetooth phone not present or turned Off. 3. Bluetooth phone has low battery. 4. The boot procedure for the RRM, the phone or both did not complete successfully. 5. A phone freeze has occurred.	1. Be certain that the phone is Bluetooth compatible and is paired to the RRM. 2. Be certain that the paired phone is present, turned On and that the Bluetooth option is enabled in the phone. 3. At low battery levels, some phones will turn Off Bluetooth functionality. Be certain that the phone battery is charged to an adequate level. 4. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure. 5. Power cycle the phone. Refer to the operator's manual for the phone.
	1. The phone is not Bluetooth enabled. 2. The phone does not support the Bluetooth Hands-Free Profile. 3. Incorrect discovered Bluetooth device selected in phone. 4. The PIN of the phone is not the same as the PIN	1. The Bluetooth transceiver requires that the cellular phone be Bluetooth enabled. The phone must be upgraded to one that is Bluetooth enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect 2. The Bluetooth transceiver requires that the cellular phone support the Hands-Free Profile. The phone must be upgraded to one that supports the Hands-Free Profile. A list of suggested phones is available at: http://www.chrysler.com/uconnect 3. Be certain to select Uconnect in the discovered Bluetooth™ devices in the phone for pairing. 4. The PIN assigned by the RRM during pairing

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Navigation/Telecommunication - Service Information - Cherokee

PHONE PAIRING FAILED	assigned by the RRM during pairing. 5. Phone pairing is locked (password protected). 6. The RRM has reached the maximum number of allowed devices paired. 7. The phone has reached the maximum number of allowed devices paired. 8. The boot procedure for the RRM, the phone or both did not complete successfully. 9. A phone freeze has occurred.	must match the PIN of the phone. 5. To unlock phone pairing in the phone, be certain that password protection is turned Off. 6. Remove one of the previously paired devices from the paired list of the RRM. 7. Remove one of the previously paired devices from the paired list of the phone, or delete the pairing history from the phone. Refer to the operator's manual for the phone. 8. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure. 9. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
PHONE WILL NOT RECONNECT AFTER PAIRING	1. Bluetooth settings in phone are incorrect. 2. Phone pairing is locked (password protected). 3. The boot procedure for the RRM, the phone or both did not complete successfully. 4. A phone freeze has occurred.	1. Bluetooth settings in phone should be set to auto-connect or select Uconnect™ as a trusted device in phone. 2. To unlock phone pairing in the phone, be certain that password protection is turned Off. 3. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure. 4. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
	1. User is not waiting for the beep tone acknowledgement before issuing Voice Commands. 2. User is not issuing Voice Commands in a smooth and consistent speaking voice. 3. User is not using proper Voice Command syntax. 4. High noise levels within the passenger	1. Be certain the user knows to wait for the acknowledgement beep tone prior to issuing Voice Commands. 2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance. 3. User must speak using proper Voice Command syntax. 4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the

POOR VOICE RECOGNITION	compartment. 5. Passengers are talking while the user is attempting to issue a Voice Command. 6. Foreign objects interfering with microphone input. 7. The inside rear view mirror is not properly attached to the mount. 8. The incorrect Uconnect switch button is being depressed. 9. Microphone failure.	windows closed and the blower fan set to Low or Off. 5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments. 6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception. 7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed. 8. Phone features are accessed using the Uconnect Phone button on the steering wheel or the Phone soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect VR button or soft key. 9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
PHONE BOOK DOES NOT DOWNLOAD	1. Phone does not support the Phone Book Access Profile (PBAP). 2. Phone book transfer not enabled in phone during pairing. 3. Missing contacts from downloaded phone book.	1. The Uconnect system requires that the cellular phone support the PBAP profile. To enable the Uconnect phone book download feature, the phone must be upgraded to one that is PBAP enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect 2. Be certain that phone book transfer is accepted or enabled in the phone during pairing to enable the Uconnect phone book download feature. 3. Only contacts with a phone number are downloaded from phone and the number of contacts downloaded is limited to 1000.
	1. User is not waiting for the beep tone acknowledgement before issuing Voice Commands. 2. User is not issuing Voice Commands in a smooth and consistent speaking voice. 3. User is not using proper	1. Be certain the user knows to wait for the acknowledgement beep tone prior to issuing Voice Commands. 2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance. 3. User must speak using proper Voice Command

PHONE BOOK NAMES NOT RECOGNIZED CONSISTENTLY	Voice Command syntax. 4. Phone book names too short. 5. Name not spoken by user as it appears in the phone book. 6. Multiple similar sounding names in the phone book. 7. Phone book download not yet completed. 8. High noise levels within the passenger compartment. 9. Passengers are talking while the user is attempting to issue a Voice Command. 10. Foreign objects interfering with microphone input. 11. The inside rear view mirror is not properly attached to the mount. 12. The incorrect Uconnect switch button is being depressed. 13. Microphone failure.	syntax (i.e.: say Call - then name, or say Dial - then number). 4. For increased performance, it is recommended to use both first and last names for phone book entries. Example: Daniel Johnson as opposed to Dan . 5. Speak the full contact name as it appears in the phone book. Do not use nicknames. 6. For increased performance it is recommended that the user do not enter similar sounding names in the phone book. 7. Depending upon the size of the contact list on the phone, the download may not have had time to complete. If the Phone Book button on the RRM phone screen appears grayed out, the contact list download is still in progress. Wait until download completes. 8. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off. 9. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments. 10. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception. 11. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed. 12. Phone features are accessed using the Uconnect Phone button on the steering wheel or the Phone soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect VR button or soft key. 13. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
	1. High noise levels within the passenger	1. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the

POOR PHONE AUDIO QUALITY	compartment. 2. Passengers are talking while the user is attempting to issue a Voice Command. 3. Foreign objects interfering with microphone input. 4. The inside rear view mirror is not properly attached to the mount. 5. Microphone failure.	windows closed and the blower fan set to Low or Off. 2. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments. 3. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception. 4. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed. 5. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
NO PHONE AUDIO	1. The settings in the phone cause the phone audio to be routed to a handset.	1. Route the phone audio to the hands-free device.
CALL LOG INOPERATIVE OR INACCURATE	1. Call log not supported by phone. 2. The phone is not providing accurate call log data.	1. The Uconnect system requires that the cellular phone support the call log feature. To enable the Uconnect call log feature, the phone must be upgraded to one that is call log enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect 2. Refer to the operator's manual for the phone.
AUDIO OUTPUT TOO LOW	1. Volume setting on the Bluetooth device set too low. 2. Volume setting on the RRM set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume. 2. Set the volume of the RRM to the desired level during an active Uconnect Hands-Free Phone call session.

DIAGNOSIS AND TESTING - NAVIGATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper

precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - UCONNECT ACCESS

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate diagnostic information.

NOTE: Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.

UCONNECT ACCESS DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
	1. User is not waiting for the beep tone	1. Be certain the user knows to wait for the acknowledgement beep tone prior to issuing

POOR VOICE RECOGNITION	acknowledgement before issuing Voice Commands. 2. User is not issuing Voice Commands in a smooth and consistent speaking voice. 3. User is not using proper Voice Command syntax. 4. High noise levels within the passenger compartment. 5. Passengers are talking while the user is attempting to issue a Voice Command. 6. Foreign objects interfering with microphone input. 7. The inside rear view mirror is not properly attached to the mount. 8. The incorrect Uconnect switch button is being depressed. 9. Microphone failure.	Voice Commands. 2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance. 3. User must speak using proper Voice Command syntax. 4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off. 5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments. 6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception. 7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed. 8. Phone features are accessed using the Uconnect Phone button on the steering wheel or the Phone soft key in the RRM (also known as the radio or head unit) display. Other Uconnect Voice Command features are accessed using the Uconnect VR button or soft key. 9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
TEXT MESSAGING INOPERATIVE	1. The Bluetooth Message Access Profile (MAP) is not supported by the phone. 2. The Connect-To-Your-Messages setting has not	1. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: http://www.chrysler.com/uconnect 2. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Navigation/Telecommunication - Service Information - Cherokee

	been accepted on the phone.	the phone.
ENHANCED VOICE-TO-TEXT (DICTATED) MESSAGING RESPONSE FEATURE INOPERATIVE	1. Uconnect registration incomplete. 2. Uconnect Access Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 3. The Bluetooth Message Access Profile (MAP) is not supported by the phone. 4. The Connect-To-Your-Messages setting has not been accepted on the phone.	1. Select the Apps soft key in the RRM (also known as the radio or head unit) display, then select the Uconnect Registration App soft key from the Apps list. For further assistance press the ASSIST button on the inside rear view mirror to contact Uconnect Customer Care. 2. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 3. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: http://www.chrysler.com/uconnect 4. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for the phone.
UNABLE TO DOWNLOAD APPLICATIONS FROM UCONNECT STORE FRONT	1. Uconnect registration incomplete. 2. Cellular antenna issue.	1. Select the Apps soft key in the RRM (also known as the radio or head unit) display, then select the Uconnect Registration App soft key from the Apps list. For further assistance press the ASSIST button on the inside rear view mirror to contact Uconnect Customer Care. 2. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna.
	1. Uconnect registration incomplete. 2. Uconnect Access Mobile application (app) not downloaded or not fully installed to smart	1. Select the Apps soft key in the RRM (also known as the radio or head unit) display, then select the Uconnect Registration App soft key from the Apps list. For further assistance press the ASSIST button on the inside rear view mirror to contact Uconnect Customer Care. 2. Download the Uconnect Access Mobile app to the user's smart phone from www.MoparOwnerConnect.com . Allow sufficient time for the Uconnect Access Mobile application (app) download to smart phone to complete. Download times will vary widely with

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Navigation/Telecommunication - Service Information - Cherokee

REMOTE SERVICES INOPERATIVE	phone. 3. Uconnect Access Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 4. Cellular antenna issue. 5. Radio Frequency Hub Module (RFHM) issue.	the throughput performance of the user's smart phone and the accessibility of the user's cellular network services. 3. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 4. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. 5. Further diagnosis of the RFHM requires the use of a diagnostic scan tool and the appropriate diagnostic procedures.
AUDIO OUTPUT TOO LOW	1. Volume setting on Bluetooth device set too low. 2. Volume setting on the RRM (also known as the radio or head unit) set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume. 2. Set the volume of the RRM (also known as the radio or head unit) to the desired level during an active Uconnect Access feature session.
UCONNECT ACCESS INOPERATIVE - NO GREEN OR RED LED INDICATOR	1. Status of ignition switch is Off. 2. Inside rear view mirror wiring not connected. 3. Ineffective ground circuit. 4. Ineffective feed circuit.	1. Ignition switch status must be On or Accessory during Uconnect Access operation. 2. Be certain the wire harness for the inside rear view mirror is connected and fully engaged. 3. Test and repair the open inside rear view mirror ground circuit if required. 4. Test and repair the open inside rear view mirror feed circuit if required.
UCONNECT ACCESS INOPERATIVE - GREEN LED INDICATOR	1. Uconnect registration incomplete. 2. Uconnect Access Assist or Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 3. Uconnect Access application (app) corrupt or improperly installed.	1. Select the Apps soft key in the RRM (also known as the radio or head unit) display, then select the Uconnect Registration App soft key from the Apps list. For further assistance press the ASSIST button on the inside rear view mirror to contact Uconnect Customer Care. 2. Many Uconnect Access features are only available with the Uconnect Access Assist or Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 3. Perform the Uconnect Access System Reinstall Applications Standard Procedure. Refer to STANDARD PROCEDURE.
	1. Loss of Controller Area	1. Further diagnosis of CAN-IHS or CAN-C

UCONNECT ACCESS INOPERATIVE - RED LED INDICATOR	Network (CAN) - Interior High Speed (IHS) or CAN-C communication.	communication requires the use of a diagnostic scan tool and the appropriate diagnostic procedures.
	2. Cellular antenna issue.	2. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna.
	3. Ineffective embedded cellular device.	3. Test and replace the RRM (also known as the radio or head unit) if required.

DIAGNOSIS AND TESTING - WI-FI HOT SPOT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Wi-Fi Hot Spot system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Wi-Fi Hot Spot system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Wi-Fi Hot Spot system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.

WI-FI HOT SPOT DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
	1. Uconnect registration incomplete.	1. Select the Apps soft key in the RRM display, then select the Uconnect Registration App soft key from the Apps list. For further assistance press the ASSIST button on the inside rear view mirror to contact Uconnect Customer Care.
	2. Uconnect Wi-Fi	2. This feature is only available with the

WI-FI HOT SPOT INOPERATIVE	subscription service is inactive, expired or not installed in the RRM. 3. Wi-Fi capability is not enabled in user's Bluetooth device. 4. Selected Wireless Access Point (WAP) is incorrect. 5. Wireless Access Point (WAP) password or security settings incorrect. 6. Cellular antenna issue.	Uconnect Wi-Fi subscription service. Be certain that the subscription service account is active and installed in the RRM. 3. Confirm Wi-Fi setting in user's Bluetooth device is enabled. Refer to the user's manual for that device. 4. Confirm that correct WAP is selected in user's Bluetooth device. Refer to the user's manual for that device. 5. Use the Application Settings menu of the RRM to confirm or adjust the WAP password and security settings. 6. Refer to the Audio And Video System service information for further diagnosis of the cellular antenna.
-------------------------------	---	---

STANDARD PROCEDURE

NAVIGATION SYSTEM - ACTIVATION

In vehicles equipped with the optional Navigation Ready version of the Radio Receiver Module (RRM) (also known as the radio or the head unit), if the customer chooses to have the navigation system activated, the vehicle must be returned to the dealer for system activation. The dealer activates the navigation system as follows:

NOTE: Once a Radio Receiver Module (RRM) (also known as the radio or the head unit) with the Navigation Ready feature has had the Navigation feature activated, any factory replacement RRM for the same vehicle will be provided with the Navigation system already activated.

1. Place the RRM into Dealer Mode using a simultaneous 3 button press of the driver side Temperature Up, driver side Temperature Down and Front Defrost push buttons.
2. The Dealer Mode screen will appear in the RRM display showing the System Information menu. Select the **VP3 Navigation Activation** menu item.
3. A Navigation Activation screen appears advising that an Activation Code needs to be purchased and referencing Technical Service Bulletin (TSB) 08-031-12. A 16 digit alpha numeric Request Code appears just below the displayed text.
4. With the Request Code and the Vehicle Identification Number (VIN), log onto the DealerConnect web site (<https://dealerconnect.chrysler.com/>). Locate the Navigation Activation link on the web site, enter the Request Code and VIN as appropriate. The web site will respond with an alpha numeric Activation Code.

NOTE: During the initial launch of this product, the dealer will be provided with a Navigation Activation phone number (Nokia Location And Content Call Center) to use in order to obtain an Activation Code rather than the

DealerConnect link mentioned in Step 4.

5. With the Activation Code, go back to the RRM and press the **OK** button on the Navigation Activation screen. A Data Entry screen will appear. Enter the Activation Code, then press the **OK** button on the Data Entry screen.
6. The navigation system has now been activated using the hardware and software that was installed in the RRM at the time that it was manufactured. If the customer wishes to update the factory installed map and Points-Of-Interest (POI) software, it may be purchased at the customer's expense and downloaded from the Navteq Maps web site (www.navigation.com). See Navigation System - Restore Or Update. Refer to **STANDARD PROCEDURE**.

NAVIGATION SYSTEM - RESTORE OR UPDATE

Navigation System map and Point-Of-Interest (POI) data updates may become available occasionally through the Navteq Maps web site (www.navigation.com). The updated information as well as some additional feature applications can be downloaded and copied to Universal Serial Bus (USB) media for transfer and installation to the navigation module within the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the vehicle. These are fee-based applications and updates, which are made at the option and expense of the customer.

However, a new RRM is equipped with only a standard base version of the map and POI data. Before an original RRM is replaced by the dealer with a new unit, the version of the map and POI data on the original RRM must be noted. If the version of the map and POI data found on the new RRM is not equal to or newer than the version that was found on the replaced RRM, updated data will have to be downloaded and installed to the new RRM at the expense of the dealer.

UCONNECT ACCESS SYSTEM - REINSTALL APPLICATIONS

NOTE: The following procedure may assist the dealer technician in diagnosis by reloading the applications for which the vehicle owner or operator has valid subscriptions. This is primarily used to troubleshoot any application provisioning or data corruption issues. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen on the Apps orb of the Radio Receiver Module (RRM).

The Reinstall Applications procedure can only be initiated from the touchscreen of the Radio Receiver Module (RRM) (also known as the radio or the head unit).

During this procedure, the subscribed applications are removed from the RRM and reinstalled based upon data found on the cloud server. The applications reinstalled onto the RRM will be based upon valid subscriptions and is referred to as Digital Rights.

1. Navigate through the **Apps > Uconnect Store > My Apps > Settings** on the RRM touchscreen.
2. Select **Reinstall Apps**.
3. Press the **Continue** soft key to initiate the Reinstall Applications procedure, or press the **Help** soft key for

more information.

4. When the **Apps** reinstalled. **Radio will restart shortly**. screen appears, press the **OK** soft key.
5. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.** After the radio reset occurs, the apps will begin to be reinstalled. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen on the Apps orb of the RRM.

NOTE: One or two ignition cycles (including bus time-outs) may speed the reloading process following the radio reset.

UCONNECT ACCESS SYSTEM - REMOVE ACCOUNTS

NOTE: The following procedure is provided to the dealer technician as **INFORMATION ONLY**. This procedure is intended for use by the vehicle owner or operator. This procedure is used when selling the vehicle or cancelling the Uconnect Access account. Removing the account will disassociate the Vehicle Identification Number (VIN) from the account and remove Uconnect Access features from the vehicle. The Uconnect Access features can be reinstated by repeating the registration process through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and following the directions associated with registering for Uconnect Access.

The Remove Accounts procedure can be initiated by one of three methods:

- Through the touchscreen of the RRM.
- Through the Uconnect™ Call Center (**ASSIST** button on inside rear view mirror) or under **Uconnect™ Apps** selection of the RRM display.
- Through the Uconnect™ Owners information accessed through the Mopar Owner Connect web site (www.moparownerconnect.com).

The following describes the Remove Accounts procedure accomplished through the RRM touchscreen:

1. Navigate through **Apps > Uconnect Store > My Apps > Settings** on the RRM touchscreen.
2. Select **Remove Uconnect Account**.
3. Press the **Continue** soft key after each of the two **Warning** screens, or press the **Cancel** soft key to abort the procedure.
4. When the **Authentication** screen is reached, enter the 4 digit **Uconnect Access ID**.
5. Press the **Continue** soft key to continue the Remove Accounts procedure, the **Help** soft key for additional information or the **Cancel** soft key to abort the Remove Accounts procedure.
6. When the **This vehicle has been removed from your account**. screen appears, press the **OK** soft key. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.**
7. After the radio reset occurs, Uconnect Access applications will no longer be available and the **Uconnect**

Registration screen will appear each time the **Apps** soft key is selected until a new valid registration has been successfully completed.

ANTENNA, NAVIGATION

DESCRIPTION

DESCRIPTION

The navigation antenna is integrated into a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .

OPERATION

OPERATION

The navigation module acquires Global Positioning System (GPS) position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NAVIGATION ANTENNA

Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

The navigation antenna is serviced as a unit with the combination antenna located on the roof panel. Refer to **ANTENNA, SATELLITE, AUDIO, REMOVAL** .

INSTALLATION

INSTALLATION

The navigation antenna is serviced as a unit with the combination antenna located on the roof panel. Refer to **ANTENNA, SATELLITE, AUDIO, INSTALLATION** .

MICROPHONE

DESCRIPTION

DESCRIPTION

081973477

Fig. 1: Inside Rear View Mirror Housing
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional hands-free system have two stereo microphones (2) mounted in the top surface of the inside rear view mirror housing (1), one to each side of center. The two microphones are individually powered by and provide hard wired inputs to the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the instrument panel whenever the Voice Recognition (VR) feature of the hands-free system is active. These two microphones are connected to the vehicle electrical system through a connector receptacle integral to the forward-facing surface of the inside rear view mirror housing by a dedicated take out and connector of the overhead wire harness.

In vehicles equipped with the optional Uconnect™ Access system, the inside rear view mirror system also houses both a **9-1-1** push button (3) and a **Assist** push button (5).

The microphones cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a unit with the inside rear view mirror assembly.

OPERATION

OPERATION

When the hands-free Voice Recognition (VR) control circuitry integral and internal to the Radio Receiver Module (RRM) (also known as the radio or the head unit) detects the appropriate inputs or requests, it energizes the circuitry of the two stereo microphones within the inside rear view mirror housing. The microphones remain active until they are deactivated by the hands-free VR control circuitry, or until the status of the ignition switch (also known as the Keyless Ignition Node/KIN or Ignition Node Module/IGNM) transitions to Off, whichever occurs first.

The inputs from the microphones is processed, filtered and redirected by the VR control circuitry and logic as appropriate. Those inputs can be redirected to the Advanced Speech Recognition (ASR) engine or to the audio send circuitry of the Bluetooth™ transceiver. Each of these electronic modules is also integral and internal to the RRM.

The status of the Uconnect™ Access **Assist** and **9-1-1** push buttons is relayed by the Local Interface Network (LIN) slave node integral to the inside rear view mirror over the LIN data bus to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which is a LIN master node. The BCM is also a Controller Area Network (CAN) data bus gateway and relays the push button status information to the RRM over the CAN - Interior High Speed (CAN-IHS) data bus.

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the RRM controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MICROPHONE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the Radio Receiver Module (RRM) (also known as the radio or the head unit) controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL**.

INSTALLATION

INSTALLATION

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, INSTALLATION** .

2014 ACCESSORIES AND EQUIPMENT

Power Liftgate - Service Information - Cherokee

WARNING

WARNING

WARNING: There is a small area located on each side of the liftgate from about the belt line down to the sill which is not protected by the power liftgate system pinch sensors. Extreme caution must be taken to prevent body extremities or other objects from entering this area once the liftgate reaches the secondary latch contact position, which is about 13 millimeters (1/2 inch) before the liftgate is fully closed. Failure to observe this warning may result in serious or fatal injury.

WARNING: Never attempt to enter, exit or reach through the liftgate opening with the power liftgate in motion. You could cause damage to the power liftgate system or components, and serious or fatal injuries may result.

CAUTION: Never attempt to operate the power liftgate system while the Power Drive Unit (PDU) or a gas-charged hydraulic strut or prop is removed or disconnected. Damage to the power liftgate system or components may result.

DESCRIPTION

DESCRIPTION

A power operated liftgate system is an available option on this vehicle. The power liftgate system includes the following major components, which are described in further detail elsewhere in this service information:

- **Chime** - An electronic power liftgate chime tone generator is located on the inside of the left inner D-pillar just below the belt line, where it is concealed behind the interior D-pillar trim.
- **D-Pillar Switch** - A power liftgate D-pillar switch (also known as the rear zone switch) is located in a bezel near the back of the left quarter inside trim panel near the D-pillar.
- **Exterior Latch Handle Switch** - A power liftgate exterior latch handle switch (also known as the outside handle switch) is integral to the unique power liftgate exterior latch handle.
- **Latch** - A unique, electrically actuated power liftgate latch and latch cinching mechanism is installed in place of the latch used on vehicles without the power liftgate system option.
- **Overhead Console Switch** - A power liftgate overhead console switch (also known as the front zone switch) is located between the two front reading lamp switches in the overhead console.
- **Pinch Sensors** - A power liftgate pinch sensor is located on each side shut face of the liftgate and extends from about the belt line to just below the liftgate opening header. The right side pinch sensor includes an

integral thermistor.

- **Power Drive Unit** - An electrically operated Power Drive Unit (PDU) is installed on the left side of the liftgate between the liftgate and the liftgate opening trough. It is secured to the same ball studs that are used for the conventional gas-charged hydraulic strut or prop that the PDU replaces.
- **Power Liftgate Module** - The Power LiftGate Module (PLGM) (also known as the Power Liftgate/PLG control module) is concealed behind the liftgate sill scuff plate and trim, on the inside of the back rear cargo area. The PLGM is secured by two integral mounting tabs and an integral latch tab to slots in the sheet metal. Refer to **MODULE, POWER LIFTGATE CONTROL, DESCRIPTION**.
- **Thermistor** - A thermistor is internal and integral to the right side pinch sensor.

Hard wired circuitry connects the power liftgate system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power liftgate components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The components and features of the power liftgate system are designed to provide the vehicle operator with convenient and safe access to the cargo area of the vehicle. The power liftgate components convert electrical energy produced by the electrical system of the vehicle into the mechanical action necessary to latch, unlatch, raise and lower the liftgate with the simple touch of a button or the slight pull of the exterior liftgate latch handle.

Battery voltage is supplied to the Power LiftGate Module (PLGM) through a fused B(+) fuse in the Power Distribution Center (PDC) so the PLGM can operate regardless of the ignition switch status. The PLGM monitors many hard wired switch and sensor inputs from the liftgate latch and cinch mechanisms, the Power Drive Unit (PDU), the D-pillar power liftgate switch, the exterior latch handle power liftgate switch, the overhead console power liftgate switch, both pinch sensors and the thermistor in the right pinch sensor.

The PLGM also monitors many electronic message inputs received over the Controller Area Network (CAN) data bus network. Electronic message inputs include: ignition switch status, Transmission Range Sensor (TRS) status, vehicle speed, Remote Keyless Entry (RKE) commands, vehicle theft alarm status, power lock system status and (if equipped) liftgate flip-up glass ajar switch status. In response to those many inputs, the PLGM logic allows it to properly control numerous hard wired outputs that operate the power liftgate latch and cinch mechanisms and the PDU that opens and closes the liftgate as well as the chime tone generator that provides audible indications of the power liftgate status. The PLGM will also place electronic messages on the CAN data bus indicating the liftgate status and many of the hard wired sensor inputs it receives for use by other electronic modules in the vehicle.

Operation of the power liftgate requires the transmission be in the Park or Neutral positions, the vehicle speed

not be greater than zero and that the liftgate flip-up glass is closed. When the vehicle is also unlocked, the power liftgate can be opened by lifting the exterior liftgate latch handle. If the vehicle is locked, a single press of the overhead console power liftgate button or two presses within five seconds of the RKE Liftgate button on the FOB with Integrated Key (FOBIK) will unlock and open the liftgate. The fully open liftgate can be closed automatically by depressing the D-Pillar switch or the overhead console switch one time or by depressing the RKE Liftgate button on the FOBIK twice within five seconds. The fully open liftgate can also be closed manually by pulling it down in the same manner as a non-power liftgate.

The PLGM also confirms safety requirements are met before supplying power to the PDU to begin any power cycle. The PLGM software detects obstructions through inputs from the two pinch sensors as well as by monitoring the resistance to travel of the PDU. When a sufficient obstruction is detected, the PLGM will reverse the direction of the liftgate. Also, an exterior liftgate handle pull during an automatic **Close** cycle will reverse the power liftgate operation to **Open**, while an exterior liftgate handle pull during an automatic **Open** cycle will cancel the cycle and put the power liftgate into full manual operation. In addition to the Electronic Vehicle Information Center (EVIC) customer programmable audible power liftgate chime alerts, when a customer programmable feature is set to **Flash Lamps With Lock**, two flashes of the exterior signal lamps will occur at the beginning of each power liftgate **Open** or **Close** cycle.

The PLGM continually monitors all of the power liftgate system circuits and components, and will store a Diagnostic Trouble Code (DTC) for any problem it detects. The PLGM uses an adaptive memory which allows it to relearn and adapt to changes in the system that might occur due to component wear or ambient conditions. If a power liftgate system component is replaced or a liftgate adjustment is made, the PLGM is required to relearn the effort and time required to open or close the liftgate. This learn cycle can be initiated with a diagnostic scan tool. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE**.

The hard wired circuits and components of the power liftgate system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls or communication between other modules and devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LIFTGATE SYSTEM

NOTE: **Before any testing of the power liftgate system is attempted, the battery should be fully-charged.**

The latch, the sensors, the switches and the hard wired circuits between components related to the power liftgate system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to power liftgate system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are quick reference diagnostic tables to help when diagnosing and testing the power liftgate system.

SYMPTOM DRIVEN POWER LIFTGATE SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
LIFTGATE WILL NOT INITIATE POWER OPEN/POWER CLOSE WITH EITHER FOB/K OR OVERHEAD CONSOLE SWITCH	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	3. Binding or sticking of components.	3. Establish location of binding or sticking components. Repair or replace if required.
	4. Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective Power LiftGate Module (PLGM).	5. Test the PLGM using a diagnostic scan tool. Replace if required.
	6. Ineffective power liftgate latch assembly.	6. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	7. Ineffective liftgate Power Drive Unit (PDU).	7. Use a diagnostic scan tool to cycle the PDU. Replace if required.
FOBIK DOES NOT OPERATE POWER LIFTGATE, BUT OVERHEAD CONSOLE SWITCH DOES	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	3. Key in ignition.	3. FOB with Integrated Key (FOBIK) buttons do not function while key is in ignition by design. Remove key from ignition and retry.
	4. Ineffective FOBIK.	4. Reprogram FOBIK and retry. Replace if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	5. Ineffective Keyless Ignition Node (KIN).	5. Test the KIN using a diagnostic scan tool. Replace if required.
	6. Wiring problems (system or vehicle).	6. Refer to the appropriate wiring information. Repair if required.
	7 Ineffective Controller Area Network (CAN) data bus.	7. Test the CAN data bus using a diagnostic scan tool. Repair if required.
	8. Ineffective PLGM.	8. Test the PLGM using a diagnostic scan tool. Replace if required.
OVERHEAD CONSOLE SWITCH DOES NOT OPERATE POWER LIFTGATE - BUT FOB/K DOES	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	3. Ineffective power liftgate overhead console switch.	3. Test the overhead console switch. Replace if required.
	4. Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective PLGM.	5. Test the PLGM using a diagnostic scan tool. Replace if required.
LATCH WILL NOT RELEASE WITH EXTERIOR HANDLE, POWER-OPEN CYCLE MAY OR MAY NOT INITIATE	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	3. Ineffective power liftgate exterior handle switch.	3. Test the exterior handle switch. Replace if required.
	4. Ineffective power liftgate latch assembly.	4. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Binding or sticking of components.	6. Establish location of binding or sticking components. Repair or replace if required.
		7. Test the PLGM using a diagnostic scan

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	7. Ineffective PLGM.	tool. Replace if required.
LIFTGATE REVERSES DIRECTION DURING POWER OPEN - POWER CLOSE CYCLE	1. FOB/K button being hit more than the two times, or overhead console switch being hit more than once.	1. By design, the liftgate will reverse direction if the FOB/K button is depressed more than twice or the overhead console switch button is depressed more than once.
	2. Power Liftgate System Inhibitors preventing operation.	2. Check Inhibit Monitors using a diagnostic scan tool. Refer to <u>POWER LIFTGATE SYSTEM INHIBIT MONITORS</u> . Repair if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to <u>POWER LIFTGATE INPUT - OUTPUT TABLE</u> . Repair if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Ineffective liftgate PDU.	6. Use a diagnostic scan tool to cycle the PDU. Replace if required.
	7. Ineffective PLGM.	7. Test the PLGM using a diagnostic scan tool. Replace if required.
LATCH WILL NOT POWER-CINCH TO PRIMARY POSITION DURING MANUAL OR POWER OPERATION	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to <u>POWER LIFTGATE SYSTEM INHIBIT MONITORS</u> . Repair if required.
	2. Pinch sensor activated or opened shorted circuit.	2. Check pinch sensor status using a diagnostic scan tool. Repair or replace if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to <u>POWER LIFTGATE INPUT - OUTPUT TABLE</u> . Repair if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Liftgate weather seal force too high.	5. Inspect weather seals for damage, improper installation, foreign matter or other possible obstructions. Repair if required.
	6. Wiring problems (system or vehicle).	6. Refer to the appropriate wiring information. Repair if required.
	7. Ineffective power liftgate latch assembly.	7. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
		8. Test the PLGM using a diagnostic scan

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	8. Ineffective PLGM.	tool. Replace if required.
LIFTGATE SAGS AFTER COMPLETION OF POWER OPEN CYCLE OR MANUAL OPENING	1. Loose or damaged PDU or strut mounts.	1. Check for loose or broken PDU (left side) or strut (right side) ball stud attachments. Repair or replace if required.
	2. Ineffective liftgate gas-charged strut (prop rod).	2. Check gas-charged strut (prop rod) on right side of liftgate. Replace if required.
HIGH OPENING EFFORT - LIFTGATE OPENS VERY SLOWLY DURING MANUAL OR POWER OPERATION	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	2. Loose or damaged PDU or strut mounts.	2. Check for loose or broken PDU (left side) or strut (right side) ball stud attachments. Repair or replace if required.
	3. Ineffective liftgate gas-charged strut (prop rod).	3. Check gas-charged strut (prop rod) on right side of liftgate. Replace if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Vehicle located on too steep of a grade for power liftgate operation.	6. Operate liftgate manually.
	7. Ineffective liftgate PDU.	7. Use a diagnostic scan tool to cycle the PDU. Replace if required.
LIFTGATE CONTINUES TO POWER-CLOSE AFTER REACHING FULL-CLOSED POSITION	1. Power Liftgate Input/Output status incorrect.	1. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	2. Wiring problems (system or vehicle).	2. Refer to the appropriate wiring information. Repair if required.
	3. Binding or sticking of components.	3. Establish location of binding or sticking components. Repair or replace if required.
	4. Ineffective power liftgate latch assembly.	4. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	5. Ineffective PLGM.	5. Test the PLGM using a diagnostic scan tool. Replace if required.
LIFTGATE CONTINUES TO POWER-OPEN AFTER REACHING FULL-OPEN POSITION - MAY PULSE SEVERAL TIMES	1. Power Liftgate Input/Output status incorrect.	1. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	2. Wiring problems (system or vehicle).	2. Refer to the appropriate wiring information. Repair if required.
	3. Ineffective full open switch (liftgate PDU).	3. Use a diagnostic scan tool to check the switch status and cycle the PDU. Replace if required.
	4. Ineffective PLGM.	4. Test the PLGM using a diagnostic scan tool. Replace if required.
SQUEAKS, NOISES AND RATTLES	1. Foreign material within liftgate panel.	1. Remove foreign material from within liftgate if required.
	2. Worn or loose liftgate components.	2. Inspect and tighten or replace loose liftgate components if required.
LIFTGATE UNLATCHES OR INITIATES POWER OPEN OR POWER CLOSE CYCLE UNEXPECTEDLY	1. Inadvertent power liftgate activation.	1. Use a diagnostic scan tool to read and record PLGM activation history.
	2. Power Liftgate System Inhibitors preventing operation.	2. Check Inhibit Monitors using a diagnostic scan tool. Refer to POWER LIFTGATE SYSTEM INHIBIT MONITORS . Repair if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to POWER LIFTGATE INPUT - OUTPUT TABLE . Repair if required.
	4. Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective power liftgate overhead console switch.	5. Test the overhead console switch. Replace if required.
	6. Ineffective FOB/K.	6. Reprogram FOB/K and retry. Replace if required.
	7. Ineffective power liftgate latch assembly.	7. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	8. Ineffective PLGM.	8. Test the PLGM using a diagnostic scan tool. Replace if required.

POWER LIFTGATE SYSTEM CONTROL PARAMETERS

The power liftgate system is designed with a number of control parameters, which are conditions that must be fulfilled to allow operation. These control parameters are listed below:

- The Power LiftGate Module (PLGM) will inhibit operation of the power liftgate in extreme ambient temperatures. These temperatures are at or below about -30° C (-22° F) and at or above about 65° C (149° F). The pinch sensor/thermistor assembly on the right side of the liftgate monitors the ambient temperature.

- The transmission must be in the **Park (P)** or **Neutral (N)** positions for the power liftgate system to operate.
- The vehicle speed input must be zero (0) for the power liftgate system to operate.
- The electrical system voltage must be within minimum and maximum specifications for the power liftgate system to operate. A low-voltage cut off is built into the power liftgate system to prevent the battery from discharging to the point where the vehicle cannot be operated.
- If the ignition switch is in the **Start** position, the power liftgate system will not initiate a power cycle.
- If the ignition switch is moved to the **Start** position during a power cycle, the power liftgate will pause.
- If the vehicle is locked, the exterior liftgate handle will not release the latch. The FOB with Integrated Key (FOBIK) and the overhead console switch will work for power open or close cycles.
- If the vehicle theft alarm is armed, the overhead console switch will not open the liftgate; however, the FOBIK will.
- If a liftgate pinch sensor is activated during a power close, the liftgate will reverse direction. If a pinch sensor is already active, the power liftgate system will not initiate a power close. A pinch activation during latch cinch will stop the cinch operation.
- If something sufficiently impedes liftgate travel, the power liftgate will detect an obstacle and reverse direction, traveling to full open or full closed.
- If multiple obstacles are detected during the same power open or close cycle, the liftgate will abort that power cycle and go into full manual operation.
- The power liftgate components are protected by the power liftgate system fuse. If the fuse is ineffective, the power liftgate system will not function.
- Some Diagnostic Trouble Codes (DTC) stored in the PLGM may cause the power liftgate system not to operate. Always use a diagnostic scan tool to check and clear DTCs from the PLGM before and after servicing any power liftgate system components.

POWER LIFTGATE INPUT - OUTPUT TABLE

POWER LIFTGATE INPUT - OUTPUT TABLE

INPUT	NORMAL READINGS			
	FULLY CLOSED AND LATCHED	FULLY OPEN	BETWEEN FULLY OPEN AND CLOSED	DESCRIPTION
PRIMARY RATCHET - AJAR SWITCH CLOSED	FALSE	TRUE	TRUE	Primary/Ajar switch, internal to the liftgate latch. Open when latch is in primary. Closed when latch is out of primary.
SECONDARY RATCHET SWITCH CLOSED	FALSE	TRUE	TRUE	Internal to the liftgate latch. Indicates when the latch is in secondary position. Open when in secondary position. Closed when out of secondary

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

				position.
SECTOR GEAR SWITCH CLOSED	FALSE	FALSE	FALSE	Internal to the liftgate latch. Essentially a park switch for the latch. When latch is running a cinch or release, this switch is Closed . After cinch or release is complete, the Power LiftGate Module (PLGM) will reverse direction of the latch until the switch is Open .
FULL OPEN SWITCH CLOSED	FALSE	TRUE	FALSE	Internal to the Power Drive Unit (PDU). Indicates when the liftgate is a few degrees from full open. Closed when full open. Open when not full open.
POSITION SENSOR NUMBER 1 AND NUMBER 2 CLOSED	FALSE OR TRUE	FALSE OR TRUE	FALSE OR TRUE	When in motion, these signals will toggle between Open and Closed . The two signals together tell the PLGM the speed and distance of liftgate travel. These inputs are also used by the PLGM to sense obstacles encountered by the liftgate.
POSITION SENSOR PULSE COUNTS	100	1600 TO 1800	100 TO 1600	This is a counter derived from the pulses coming from Position Sensors number 1 and 2. This count represents total travel of the liftgate (to mechanical end of travel).
GATE FULL OPEN SWITCH POSITION COUNTS	ABOUT 1600	ABOUT 1600	ABOUT 1600	This is a counter derived from the pulses coming from Position Sensors number 1 and 2. This count represents the position of the full open switch in the PDU.
INPUT	NORMAL (NOT PRESSED)	PRESSED	DESCRIPTION	
LEFT PINCH SENSOR	About 4.1 Volts (10 Kilohms)	Less than 1 Volt	Pinch sensor reads 10 kilohms when not pinched. When pinched, shorts out the 10 kilohm resistor and should read from 0 to about 200 ohms.	
			Right pinch sensor has a 10 kilohm at room	

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

RIGHT PINCH SENSOR	About 1.7 Volts at 21° C (70° F)	Less than 1 Volt	temperature thermistor in place of the resistor. When not pinched, resistance is proportional to the ambient temperature. When pinched, shorts out the thermistor and should read from 0 to about 200 ohms.
EXTERIOR HANDLE SWITCH	5 Volts (Normally Open)	About 3.4 Volts (4.7 Kilohms)	Located in the liftgate latch. Open circuit when not active. 4.7 kilohms to ground when handle is activated.
OVERHEAD CONSOLE SWITCH	About 4.7 Volts	About 3.4 Volts	When not pressed, should read about 810 kilohms. When pressed, should read about 4.7 kilohms.
D-PILLAR (REAR ZONE) SWITCH	About 4.7 Volts	About 3.4 Volts	When not pressed, should read about 810 kilohms. When pressed, should read about 4.7 kilohms.
OUTPUT	DESCRIPTION	DIAGNOSE	
HALL EFFECT POWER	Provides +5 Volts to the Hall sensors in the PDU	As long as the PLGM is awake it should read approximately +5 volts.	
LATCH MOTOR	Provides +/- 12 Volts to latch motor for cinch and release	Actuate with diagnostic scan tool. Should see positive voltage on the cinch wiring connector terminal for cinch direction. Should see positive voltage on the release wiring connector terminal for release direction. Refer to the appropriate wiring information for specific harness and connector pinout information.	
DRIVE MOTOR	Provides +/- 12 Volts to PDU for power Open or Close	Actuate with diagnostic scan tool. Should see positive voltage on the open wiring connector terminal for open direction. Should see positive voltage on the close wiring connector terminal for close direction. Refer to the appropriate wiring information for specific harness and connector pinout information.	
CHIME	Provides signal to output sound	Actuate with diagnostic scan tool. While monitoring with a digital multimeter some activity should be present, but not much voltage.	

POWER LIFTGATE SYSTEM INHIBIT MONITORS

The following is a list of inhibit monitors that may be observed using an appropriate diagnostic scan tool.

INHIBIT MONITOR	POSSIBLE CAUSES	CORRECTION
\$80 OPEN INHIBIT - VOLTAGE TOO LOW	1. Low or dead battery.	1. Test and charge battery. Replace if required.
	2. Ineffective power or ground circuits to the Power LiftGate Module (PLGM).	2. Check the power and ground circuits for the PLGM. Repair if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$82 CLOSE INHIBIT - VOLTAGE TOO LOW	3. Inaccurate voltage reading from the PLGM.	3. Compare the PLGM battery reading using a diagnostic scan tool with a voltmeter reading at the PLGM wiring connections. If a voltage difference of 0.5 Volt or greater is obtained, replace the PLGM.
\$81 OPEN INHIBIT - VOLTAGE TOO HIGH	1. Charging system over voltage.	1. Test the charging system. Repair if required.
\$83 CLOSE INHIBIT - VOLTAGE TOO HIGH	2. Inaccurate voltage reading from the PLGM.	2. Compare the PLGM battery reading using a diagnostic scan tool with a voltmeter reading at the PLGM wiring connections. If a voltage difference of 0.5 Volt or greater is obtained, replace the PLGM.
\$84 OPEN INHIBIT - TEMPERATURE TOO LOW	1. Temperature was below - 30° C (-22° F) when the operation was attempted.	1. Inform customer of power liftgate system temperature operating range.
	2. Open or high resistance to right pinch sensor thermistor through signal or ground circuit.	2. Check the signal and ground circuits between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor or thermistor.	3. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Test the resistance of the right pinch sensor and thermistor compared to specification. Replace if required.
	4. Inaccurate temperature reading from the PLGM.	4. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Compare the PLGM temperature reading using a diagnostic scan tool with the temperature indicated by the resistance specification of the right pinch sensor and thermistor. If the right pinch sensor and thermistor are within range of specification and the temperature difference at the PLGM is greater than 4.5° C (8° F), replace the PLGM.
\$86 CLOSE INHIBIT - TEMPERATURE TOO LOW		
\$85 OPEN INHIBIT - TEMPERATURE TOO HIGH	1. Temperature was above 65° C (149° F) when the operation was attempted.	1. Inform customer of power liftgate system temperature operating range.
	2. Shorted or partially shorted right pinch sensor thermistor through signal or ground circuit.	2. Check the signal and ground circuits between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor or thermistor.	3. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Test the resistance of the right pinch sensor and thermistor compared to

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$87 CLOSE INHIBIT - TEMPERATURE TOO HIGH		specification. Replace if required.
	4. Inaccurate temperature reading from the PLGM.	4. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Compare the PLGM temperature reading using a diagnostic scan tool with the temperature indicated by the resistance specification of the right pinch sensor and thermistor. If the right pinch sensor and thermistor are within range of specification and the temperature difference at the PLGM is greater than 4.5° C (8° F), replace the PLGM.
\$88 CLOSE INHIBIT - LEFT PINCH SENSOR ACTIVE	1. Left pinch sensor was activated prior to activation of power close cycle.	1. Check for obstructions causing pinch sensor activation. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
\$89 CLOSE INHIBIT - RIGHT PINCH SENSOR ACTIVE	1. Right pinch sensor was activated prior to activation of power close cycle.	1. Check for obstructions causing pinch sensor activation. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

		okay, replace the PLGM.
\$8A OPEN INHIBIT - NOT IN PARK OR NEUTRAL	1. Operator attempted power open cycle when vehicle was not in Park or Neutral.	1. Inform customer of power liftgate system operating restrictions.
	2. Operator attempted manual latch release with exterior handle when vehicle was not in Park or Neutral.	2. Inform customer of power liftgate system operating restrictions.
	3. Ignition switch status problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	4. Transmission Range Sensor (TRS) problem.	4. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
	5. Overhead console power liftgate switch problem.	5. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	6. FOB with Integrated Key (FOBIK) or Keyless Ignition Node (KIN) (also known as Wireless Control Module/WCM) problem.	6. Verify proper operation of the FOBIK and the Remote Keyless Entry (RKE) system. Repair or replace if required.
	7. Exterior liftgate latch handle switch problem.	7. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
\$8B CLOSE INHIBIT -	1. Operator attempted power close cycle when vehicle was not in Park or Neutral.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. TRS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

NOT IN PARK OR NEUTRAL		PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
\$8C OPEN INHIBIT - NON-ZERO VEHICLE SPEED	1. Operator attempted power open cycle when vehicle is in Neutral and rolling.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Vehicle Speed Sensor (VSS) problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
	6. Exterior liftgate latch handle switch problem.	6. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	1. Operator attempted power close cycle when vehicle is in Neutral and rolling.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$8D CLOSE INHIBIT - NON-ZERO VEHICLE SPEED		if required.
	3. VSS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
\$8E OPEN INHIBIT - IGNITION IN START POSITION	1. Operator attempted power open cycle with the ignition switch in the Start position.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Overhead console power liftgate switch problem.	3. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	4. FOBIK or KIN problem.	4. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
\$8F CLOSE INHIBIT - IGNITION IN START POSITION	1. Operator attempted power close cycle with the ignition switch in the Start position.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Overhead console power liftgate switch problem.	3. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	4. FOBIK or KIN problem.	4. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
\$90 OPEN INHIBIT - IN-PLANT MODE	1. Power open cycle will not function because the PLGM is in the in-plant mode.	1. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE . If learn cycle does not correct the problem, replace the PLGM if required.
\$91 CLOSE INHIBIT - IN-PLANT MODE	1. Power close cycle will not function because the PLGM is in the in-plant mode.	1. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE . If learn cycle does not correct the problem, replace the PLGM if required.
\$92 OPEN INHIBIT - GEAR/SPEED MISMATCH	1. Power open cycle will not function because of a conflict between the TRS and VSS inputs.	1. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Verify the vehicle speed and the PRNDL status read correctly. If not okay, repair or replace the TRS or VSS if required. NOTE: This inhibitor could also have been operator induced by placing the transmission in Park when the vehicle is still rolling and immediately attempting a power open cycle command.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
\$93 CLOSE INHIBIT - GEAR/SPEED MISMATCH	1. Power close cycle will not function because of a conflict between the TRS and VSS inputs.	1. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Verify the vehicle speed and the PRNDL status read correctly. If not okay, repair or replace the TRS or VSS if required. NOTE: This inhibitor could also have been operator induced by placing the transmission in Park when the vehicle is still rolling and immediately attempting a power close cycle command.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	1. Operator induced by	

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$94 OPEN INHIBIT - NOT FULLY OPEN OR FULLY CLOSED	placing the liftgate latch in the primary or secondary latch position while the liftgate was open.	1. Inform customer of proper power liftgate and latch operation.
	2. Conflict between power liftgate latch switches and PDU full open switch inputs to the PLGM.	2. Use a diagnostic scan tool to observe the liftgate latch full open, primary, secondary, sector and pawl switch readings with the liftgate in the fully open position. Verify that the full open, primary, secondary and pawl switch readings are all Closed and the sector switch reading is Open . Then, with the liftgate in the fully closed position, verify that the full open, primary, secondary and pawl switch readings are all Open and the sector switch reading is Closed . Repair if required.
	3. PDU full open switch problem.	3. Use a diagnostic scan tool to verify proper operation of the full open switch during a power liftgate cycle. Repeat during a manual liftgate cycle. In each case the switch reading should be Closed with the liftgate a few degrees below fully opened and Open in all other positions. Repair if required.
\$95 LATCH RELEASE INHIBIT - LOCK ENGAGED	1. Vehicle was locked when the operator attempted to release the power liftgate latch using the exterior latch handle.	1. Inform customer of proper power liftgate and latch operation.
	2. Invalid lock status received by the PLGM.	2. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Cycle the power door locks using the FOB/K, the interior lock switches and the automatic (or rolling) lock feature. Verify that the lock status reads correctly. Repair if required.
\$96 LATCH CINCH ABORTED - LEFT PINCH SENSOR ACTIVE	1. Left pinch sensor was activated when power liftgate latch was cinching.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

		than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
\$97 LATCH CINCH ABORTED - RIGHT PINCH SENSOR ACTIVE	1. Right pinch sensor was activated when power liftgate latch was cinching.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
\$98 OPEN CANCELLED - HANDLE ACTIVE	1. Operator induced by grabbing the exterior handle while a power open cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$99 OPEN CANCELLED - RKE ACTIVE	1. A power open cycle was cancelled during the first two seconds (while chiming) by an RKE signal.	1. Inform customer of power liftgate system operating restrictions. FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. FOBIK or KIN problem.	2. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
\$9A OPEN CANCELLED - OVERHEAD/IP ACTIVE	1. A power open cycle was cancelled during the first two seconds (while chiming) by an overhead console power liftgate switch signal.	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
\$9B CLOSE CANCELLED - HANDLE ACTIVE	1. Operator induced by grabbing the exterior handle while a power close cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
\$9C CLOSE CANCELLED - RKE ACTIVE	1. A power close cycle was cancelled during the first two seconds (while chiming) by an RKE signal.	1. Inform customer of power liftgate system operating restrictions. FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. FOBIK or KIN problem.	2. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
	1. A power close cycle was cancelled during the first two	1. Inform customer of power liftgate system

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

\$9D CLOSE CANCELLED - OVERHEAD/IP ACTIVE	seconds (while chiming) by an overhead console power liftgate switch signal.	operating restrictions. The overhead console power liftgate switch may have been double pressed.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
\$9E CLOSE CANCELLED - LEFT PINCH SENSOR DETECTED	1. A power close cycle was cancelled during the first two seconds (while chiming) by a left pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
\$9F CLOSE CANCELLED - RIGHT PINCH SENSOR DETECTED	1. A power close cycle was cancelled during the first two seconds (while chiming) by a right pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
		4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	4. Ineffective PLGM.	approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
\$A0 OPEN REVERSAL - GEAR OR SPEED STATE CHANGE	1. Operator shifted vehicle out of Park or Neutral while a power open cycle was in progress.	1. Inform customer of power liftgate system operating restrictions.
	2. VSS problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	3. TRS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
\$A1 OPEN REVERSAL - USER INPUT	1. Operator activated either a FOB/K button or the overhead console power liftgate switch while a power open or power close cycle was in progress	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed or the FOB/K buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	3. FOB/K or KIN problem.	3. Verify proper operation of the FOB/K and the RKE system. Repair or replace if required.
\$A2 CLOSE REVERSAL - USER INPUT	1. Operator activated either a FOB/K button or the overhead console power liftgate switch while a power open or power close cycle was in progress.	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed or the FOB/K buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if

2014 Jeep Cherokee Trailhawk

		required.
	3. FOBIK or KIN problem.	3. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
SA3 CLOSE REVERSAL - LEFT PINCH SENSOR DETECTED	1. A power close cycle reversed direction due to a left pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
SA4 CLOSE REVERSAL - RIGHT PINCH SENSOR DETECTED	1. A power close cycle reversed direction due to a right pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
	1. A power close cycle

\$A5 CLOSE REVERSAL - HANDLE ACTIVE	reversed direction due to the operator grabbing the exterior handle while the cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
\$A6 OPEN ABORTED - HANDLE ACTIVE	1. A power open cycle was aborted due to the operator grabbing the exterior handle while the cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
\$A7 OPEN OBSTACLE	1. A power open cycle reversed direction due to an obstacle detected while the cycle was taking place.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Binding or sticking of components.	2. Use a diagnostic scan tool to determine the Gate Position indicated in the Inhibit Monitor record. Move the liftgate manually to that location and note the components involved in the obstruction or binding. Repair or replace the components if required.
		3. Use a diagnostic scan tool to perform the

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Liftgate - Service Information - Cherokee

	3. The PLGM is not properly calibrated.	PLGM learn cycle. Refer to MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE . If learn cycle does not correct the problem, replace the PLGM if required.
\$A8 CLOSE OBSTACLE	1. A power close cycle reversed direction due to an obstacle detected while the cycle was taking place.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Binding or sticking of components.	2. Use a diagnostic scan tool to determine the Gate Position indicated in the Inhibit Monitor record. Move the liftgate manually to that location and note the components involved in the obstruction or binding. Repair or replace the components if required.
	3. The PLGM is not properly calibrated.	3. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE . If learn cycle does not correct the problem, replace the PLGM if required.
\$A8 LATCH IS NOT NEAR SECONDARY STATE	1. Operator induced by placing the liftgate latch in the primary or secondary latch position while the liftgate was open.	1. Inform customer of proper power liftgate and latch operation.
	2. Wiring problem.	Use a diagnostic scan tool to observe and verify that the position sensor 1 and 2 in the PDU toggle between Open and Closed . If readings are inaccurate, diagnose the wiring for possible opens or shorts to ground or voltage. Refer to the appropriate wiring information. Repair if required.
	3. PDU position sensor problem.	3. Manually open the liftgate to the fully open position. Bring the liftgate down to just before the latch contacts the striker. Using a diagnostic scan tool observe the Gate Position counts. If the count is greater than 20, replace the ineffective PDU.
	4. PLGM problem.	Use a diagnostic scan tool to observe the position sensor 1 and 2 status. Disconnect the PDU electrical connector. Apply opens and grounds to the position sensor signal circuits. Verify that the PLGM reads the correct Open and Closed status. If not okay, replace the PLGM if required.

Use a diagnostic scan tool to observe and verify that electronic messages from the Body Control Module (BCM) over the CAN data bus indicate the proper status of the liftgate flip-up glass. If not okay, repair or replace flip-up glass ajar switch if required.

STANDARD PROCEDURE

STANDARD PROCEDURE - LIFTGATE OPERATION

The liftgate must open and close freely and smoothly in order for the power liftgate system to function properly. The power liftgate system is designed to compensate for some minor changes in opening and closing effort caused by moderate changes in temperature or vehicle attitude. However, if there are extreme deficiencies in the alignment of the liftgate to the liftgate opening causing mechanical interference, or if there is extreme binding in a liftgate hinge or liftgate prop rod, appropriate adjustments or mechanical repairs may be required.

Manually operate the liftgate of another vehicle of the same model that is known to be in good condition for a comparison of liftgate opening and closing effort. Liftgate adjustment procedures and specifications are the same for vehicles with or without the optional power liftgate system. Refer to **LIFTGATE, ADJUSTMENTS**.

CHIME

DESCRIPTION

DESCRIPTION

2778201

Fig. 1: Power Liftgate, Chime, Retainer & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power operated liftgate have a power liftgate chime (1). The chime is concealed behind the left quarter inner trim panel. The chime is contained within small cylindrically-shaped molded plastic housing that is secured to the left inner D-pillar sheet metal by an integral molded plastic retainer (2).

The chime has a pigtail wire and connector (3) that connects it to the vehicle electrical system through a

dedicated take out and connector of the body wire harness.

The chime cannot be adjusted or repaired and, if damaged or ineffective, the entire chime unit must be replaced.

OPERATION

OPERATION

The power liftgate chime can produce either single or repetitive, audible chime tones as an alert heard at the rear of the vehicle at the start of any power liftgate opening or closing cycle. The chime is completely controlled by and receives both a path to ground and current through hard wired circuits from the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module). The PLGM outputs a Pulse Width Modulated (PWM) signal to drive the chime. When activated in the repetitive mode the chime is pulsed ON and OFF in 0.5 second intervals.

If the power liftgate chime is enabled through the Electronic Vehicle Information Center (EVIC) customer programmable features, there are four chime tones generated at the beginning of a power **Close** cycle. There are also four chime tones generated in response to a power **Open** cycle from all operator inputs except the exterior liftgate handle switch, which is associated with three chime tones only. Any reversal during a power cycle operation will result in two chime tones being generated.

The power liftgate chime as well as the hard wired circuits to the chime unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

REMOVAL

REMOVAL

Fig. 2: Sill, D-Pillar, Power Liftgate, Chime & Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the scuff plate from the liftgate opening sill (2). Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL**.
3. Move the quarter trim panel away from the lower left inner D-pillar (1) far enough to access the power liftgate chime (3). Refer to **PANEL, QUARTER TRIM, REMOVAL**.
4. Disconnect the body wire harness connector (4) from the chime pigtail wire connector.
5. Disengage the retainer integral to the chime pigtail wire connector from the body sheet metal.
6. Disengage the retainer integral to the chime housing from the body sheet metal.
7. Remove the chime from the vehicle.

INSTALLATION**INSTALLATION****Fig. 3: Sill, D-Pillar, Power Liftgate, Chime & Harness Connector****Courtesy of CHRYSLER GROUP, LLC**

1. Position the power liftgate chime (3) to the left inner D-pillar (1) in the vehicle.
2. Engage the retainer integral to the chime housing into the hole in the inner D-pillar.
3. Reconnect the chime pigtail wire connector to the body wire harness connector (4) for the chime.
4. Engage the retainer integral to the chime pigtail wire connector with the hole in the inner D-pillar.
5. Reinstall the quarter trim panel to the lower left inner D-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
6. Reinstall the scuff plate onto the liftgate opening sill (2). Refer to **PLATE, SCUFF, DOOR SILL,**

INSTALLATION .

7. Reconnect the battery negative cable.

DRIVE UNIT, POWER**DESCRIPTION****DESCRIPTION**

2774920

Fig. 4: Socket-Type Pivot End & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power liftgate system, are equipped with a single Power Drive Unit (PDU) mounted in place of the standard equipment gas-charged lift strut on the left side of the liftgate. The PDU is equipped with a socket-type pivot end (3) with spring clip retainer at both the top and bottom and is mounted using the same ball studs at the top of the left liftgate opening side trough and near the belt line of the left liftgate shut face as are used for securing a conventional gas-charged lift strut.

The PDU appears similar in construction to a conventional gas-charged lift strut, but has both upper and lower cylinders or tubes that are noticeably larger in diameter than the cylinder and rod found on most conventional gas-charged lift struts. This larger diameter accommodates a small, but powerful reversible electric motor, a small planetary gear set transmission, a full-open switch, a screw-type drive unit and two Hall effect sensors. There are also two coil-type springs within the PDU; one long spring with large diameter coils, and one short spring with smaller diameter coils.

The PDU has a pigtail wire harness and connector (2) that exits the top of the larger upper cylinder. The pigtail harness is equipped with a large rubber grommet where the harness passes through the sheet metal of the left liftgate opening side trough. The PDU wiring is connected to the vehicle electrical system through a dedicated

takeout and connector of the body wire harness near the top of the inner D-pillar.

The PDU cannot be adjusted or repaired and, if damaged or inoperative, it must be replaced with a new unit.

OPERATION

OPERATION

The motor, transmission and screw-drive portions of the power liftgate Power Drive Unit (PDU) provide the power and torque required to open or close the liftgate under most conditions. The Hall effect sensors provide the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) with both a speed signal and a direction signal. These Hall effect inputs allow the PLGM to monitor and respond appropriately to any irregularities in liftgate travel and or operation. The full-open switch is used to let the PLGM know when the liftgate is approaching the full open position.

The long, large diameter coil spring within the PDU is strong enough to assist in opening and, in combination with the gas-charged lift cylinder on the right side of the liftgate, will support the liftgate in any open position. The short, small-diameter spring provides an initial lift-off that moves the liftgate latch away from the latch striker after the power liftgate latch is initially released.

The hard wired input and output circuits of the PDU may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls that provide many features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the PDU or the electronic controls related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of liftgate support.

2775112

6. Insert a small flat-bladed tool (3) into the notch on the outer face of the ball socket end (1) on the lower end of the PDU and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the liftgate.
7. Release the retaining clip to its installed position.
8. Repeat Step 6 and Step 7 for the ball socket on the upper end of the PDU at the left liftgate opening trough.
9. Remove the PDU from the vehicle as a unit.

INSTALLATION

INSTALLATION

Fig. 8: Grommet & PDU

Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the ball studs (1) on the liftgate trough and the liftgate are both in good condition and properly tightened. Tighten the ball studs to 30 N.m (22 ft. lbs.).
2. Position the ball socket on the upper end of the power liftgate Power Drive Unit (PDU) (2) to the ball stud on the left liftgate opening trough.
3. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
4. Repeat Step 2 and Step 3 for the ball socket on the lower end of the PDU at the ball stud on the liftgate (4).
5. Inspect to be certain that the retaining clip on each of the PDU ball socket ends is fully seated.
6. Insert the PDU pigtail wire and connector through the clearance hole in the upper left liftgate opening trough and seat the grommet (3).

2775112

Fig. 9: Pigtail Wire Connector & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Reconnect the PDU pigtail wire connector (1) to the body wire harness connector (2) on the inside of the trim panel.
8. Install the trim onto the inside of the left quarter trim pillar/panel (3). Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
9. Remove the service support prop from the liftgate.
10. Reconnect the battery negative cable.
11. Perform the Power Liftgate Learn/Relearn Cycle standard procedure. Refer to **STANDARD PROCEDURE**.

LATCH, LIFTGATE

DESCRIPTION

DESCRIPTION

Fig. 10: Latch Assembly, Actuator Motor & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power liftgate are equipped with a unique latch assembly (3) that performs the same function as a manual liftgate latch, but includes a Direct Current (DC) electric cinch and release actuator motor (1). This latch also includes three integral switches: a sector switch, a secondary ratchet switch and a primary ratchet switch. The primary ratchet switch also provides the liftgate ajar signal from the power liftgate latch.

Only the lower latch housing is visible on the lower center of the liftgate shut face, where the latch is secured with three screws. The remainder of the latch mechanism extends upward into the interior of the liftgate shell, where it is concealed between the liftgate outer panel and the lower liftgate trim panel. An integral pigtail wire harness and connector (2) connects the latch to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The power liftgate latch cannot be repaired. If the latch mechanism, the actuator motor or any one of the three latch switches is damaged or ineffective, the entire power liftgate latch unit must be replaced.

OPERATION

OPERATION

The power cinching liftgate latch actuator motor (cinch/release motor) provides the torque required to close the liftgate from the secondary to the primary closed and latched position. The actuator also releases the liftgate from the primary closed and latched position to the fully unlatched and movable position. The actuator motor includes a small drive gear that meshes with the internal gear mechanism of the latch assembly to drive the latch and perform the power cinch and release functions.

The latch actuator is controlled by the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG

control module), which controls the cinch and release functions and limits actuator current draw to protect the assembly. The PLGM also monitors the latch and latch pawl positions through hard wired inputs from the sector, primary ratchet and secondary ratchet switches integral to the latch. If the power liftgate pinch sensors are damaged or ineffective, the PLGM will disable the cinching function of the latch.

Following every cinch or release sequence, the power liftgate latch will return to a **home** or neutral position. If for any reason the latch is unable to return to the **home** position, the PLGM will sense this through the integral latch switch inputs and prevent the latch from releasing. If this condition exists, activation of the power liftgate using the front or rear switches, the exterior handle, Passive Entry or the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) will result in a short, audible beep tone being issued from the power liftgate chime. This indicates that the Power Liftgate Latch Homing standard procedure must be performed. Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE**.

The hard wired input and output circuits of the power liftgate latch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls that provide some features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the power liftgate latch or the electronic controls related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

POWER LIFTGATE LATCH HOMING

Following every power liftgate cinch or release sequence, the latch returns to a **home** or neutral position. If for any reason the latch is unable to return to the **home** position, the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) will sense this through hard wired inputs from the sector, primary ratchet and secondary ratchet switches integral to the latch and prevent the latch from releasing. If this condition exists, activation of the power liftgate using the front or rear switches, or the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) will result in a short, audible beep tone being issued from the power liftgate chime. This indicates that it is necessary to perform a latch homing routine. Latch homing in many cases can be initiated by pulling on the exterior liftgate handle. If unsuccessful, then a diagnostic scan tool must be used to run a routine that allows the latch to be returned to the **home** position as follows:

1. Connect a diagnostic scan tool to the Data Link Connector (DLC).
2. Follow the programming steps outlined in the diagnostic scan tool for **Latch Home Position Test** under the **PLGM/Power LiftGate Module** menu item.
3. If the **Latch Home Position Test** is unsuccessful, disconnect the battery for 60 seconds. Reconnect the battery, then lift the outside liftgate handle and hold it for at least 20 seconds to actuate the handle switch.
4. If the liftgate latch still does not release, use the diagnostic scan tool to select **Actuators** and **Latch Motor Release Direction**. This will drive the latch motor for longer than actuating the outside handle switch.
5. If driving the latch motor using the **Latch Motor Release Direction** works to release the latch, perform the **Latch Home Position Test** again before returning the vehicle to the owner. If driving the latch motor using the **Latch Motor Release Direction** does not work to release the latch, use the Power Liftgate Latch Manual Override standard procedure to open the liftgate and continue the diagnosis as required.

Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE.**

POWER LIFTGATE LATCH MANUAL OVERRIDE

Fig. 11: View Of Power Liftgate Latch Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the power liftgate latch (1) latch release function becomes inoperative, it may be released manually by operating the manual latch release lever (3). If the power liftgate latch cinch release function becomes inoperative, it may be overridden by pushing downward on the manual cinch override lever (2).

1. Remove the access cover from the center of the lower liftgate trim panel.
2. Reach around to the rearward face of the latch assembly to access and manually actuate the appropriate release lever for the current latch condition.

REMOVAL

REMOVAL

Fig. 12: Liftgate, Screws & Liftgate Latch, Connector, Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate (2). Refer to **PANEL, TRIM, REMOVAL**.
4. Remove the three screws (5) that secure the power liftgate latch (1) to the lower shut face of the liftgate.
5. Disconnect the connector (4) of the liftgate wire harness (3) from the pigtail wire connector of the latch.
6. Remove the latch from the inside of the liftgate.

INSTALLATION

INSTALLATION

Fig. 13: Liftgate, Screws & Liftgate Latch, Connector, Wire Harness

Courtesy of CHRYSLER GROUP, LLC

1. Position the power liftgate latch (1) into the inside of the liftgate (2).
2. Reconnect the connector (4) of the liftgate wire harness (3) to the pigtail wire connector of the latch.
3. Loosely install the screw (5) into the right rear mounting hole that secures the latch to the lower shut face of the liftgate.
4. Install and tighten the two screws into the front mounting holes that secure the latch to the liftgate. Tighten the screws to 12 N.m (106 in. lbs.).
5. Tighten the left rear latch mounting screw to 12 N.m (106 in. lbs.).
6. Reinstall the lower trim panel onto the inside of the liftgate. Refer to **PANEL, TRIM, INSTALLATION**.
7. Reconnect the battery negative cable.
8. Perform the Power Liftgate Learn/Relearn Cycle standard procedure. Refer to **STANDARD PROCEDURE**.

SENSOR, PINCH

DESCRIPTION

DESCRIPTION

Fig. 14: Two Pinch Sensors, Five Plastic Clips, Wire And Connector & Grommet
 Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power operated liftgate system use two pinch sensors (1) (also known as anti-pinch sensors). One sensor is located on each side jamb of the liftgate, extending from the belt line to just below the liftgate header. Externally, these pinch sensors appear very similar to a synthetic rubber weather strip.

that is secured by five plastic clips (2) to the side jamb of the liftgate. However, internally each pinch sensor has two electrically conductive membranes (also known as tape switches), a diagnostic resistor and a plastic carrier. The right side pinch sensor also contains a thermistor.

Each pinch sensor has a short pigtail wire and connector (4) that exits through a grommet (3) on the lower end of the inboard side of each unit and passes through a dedicated hole in the side jamb of the liftgate near the belt line into the interior of the liftgate. Concealed within the liftgate each sensor is connected to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

A pinch sensor cannot be adjusted or repaired. If damaged or ineffective, the entire sensor unit must be replaced.

OPERATION

OPERATION

The two pinch sensors (also known as anti-pinch sensors) are tactile sensors that are able to react to the slightest pressure. They are used to provide additional protection against vehicle damage or personal injury caused by obstructions between the liftgate and the liftgate opening of the vehicle. The interior of each sensor contains two electrically conductive polymer material membranes that will close a circuit when the sensor is contacted.

During a **close** cycle of the power liftgate, if either of the two pinch sensors come in contact with an obstacle, the pinch sensor circuit is closed. The closed sensor circuit provides a sense input to the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) indicating there is an obstruction in the path of the closing liftgate. The PLGM will then stop the liftgate **close** cycle immediately and return the liftgate to the full open position.

The thermistor integral to the right pinch sensor provides a temperature sense input that allows the PLGM to monitor and compensate for extreme temperature conditions and provide proper power liftgate operation. This temperature sense input is only provided when the pinch sensor is an open circuit because, when the sensor is a closed circuit, the thermistor is shorted. As the outside temperature increases, the resistance reading decreases. As temperature decreases, the resistance reading increases.

The pinch sensors are wired in series with the PLGM, so if either pinch sensor becomes a closed or shorted circuit the module will act as though both sensors are closed circuits. Each sensor also contains a diagnostic resistor, which allows the PLGM to diagnose a problem in the pinch sensor circuits and store a Diagnostic Trouble Code (DTC) for any problem it detects.

The hard wired input and output circuits of the power liftgate pinch sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication that provide some features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the power liftgate pinch sensors or the electronic controls and communication related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PINCH SENSOR**SENSOR**

WARNING: To avoid serious or fatal injury during testing of pinch sensor operation, use extreme caution to keep away from the closing liftgate.

To verify power liftgate system pinch sensor operation:

1. Remove the liftgate trim panel to access and disconnect the inoperable pinch sensor's electrical connector. Using an ohmmeter, check for continuity on the two wires leading from the pinch sensor. While depressing either pinch sensor, continuity should be less than 400 ohms. While NOT depressing the left pinch sensor, continuity should be 10, 000 ohms $\pm$ 500 ohms. While NOT depressing the right pinch sensor, continuity will vary with ambient temperature (see table below), but should always be greater than 4000 ohms. If the measured pinch sensor meets the stated continuity, then it is OK at this time. If the measured continuity is outside of the stated ranges, replace the pinch sensor.
2. Remove the lower trim from the inside of the liftgate to access and disconnect the pinch sensor pigtail wire connectors from the liftgate wire harness. Using an ohmmeter, check the resistance between the two pins of each pinch sensor pigtail wire connector. When the sensor is depressed (contacts are closed), the resistance should be 300 ohms maximum. When the pinch sensor is released (contacts are open) the resistance should be 10, 000 ohms minimum. If not OK, replace the ineffective pinch sensor.

THERMISTOR

The thermistor portion of the right pinch sensor provides a temperature sense input to the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module). The temperature input is only provided when the pinch sensor is in a non-pinched (contacts are open) condition. When the pinch sensor contacts are closed (sensor is pinched) this input is unavailable because the thermistor is shorted. Remove the lower trim from the inside of the liftgate to access and disconnect the right pinch sensor pigtail wire connector from the liftgate wire harness. Refer to the **Right Pinch Sensor Thermistor Resistance** table and check between the two terminals of the sensor connector for the proper thermistor resistance at the listed temperatures. If the sensor fails this test, replace the right pinch sensor unit.

RIGHT PINCH SENSOR THERMISTOR RESISTANCE TABLE

RIGHT PINCH SENSOR THERMISTOR RESISTANCE	
TEMPERATURE	RESISTANCE
0°C (32°F)	29330 - 35990 Ohms
25°C (77°F)	9120 - 10880 Ohms
40°C (104°F)	4900 - 5750 Ohms

REMOVAL**REMOVAL**

Fig. 15: Liftgate, Pigtail Wire Connector, Harness Connector & Pinch Sensor
 Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate (2).
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim from the liftgate inner panel. Refer to **PANEL, TRIM, REMOVAL**.
4. Reach through the access hole in the liftgate inner panel to access and disconnect the pinch sensor pigtail wire connector (4) from the liftgate wire harness connector (3).
5. Disengage the five plastic retainers of the pinch sensor (1) from the liftgate shut face.
6. Disengage the pigtail wire grommet on the lower end of the pinch sensor from the clearance hole in the liftgate shut face.
7. While guiding the pigtail wire out through the clearance hole, remove the pinch sensor from the liftgate.

INSTALLATION

INSTALLATION

Fig. 16: Liftgate, Pigtail Wire Connector, Harness Connector & Pinch Sensor
 Courtesy of CHRYSLER GROUP, LLC

1. While guiding the pinch sensor pigtail wire and connector (4) through the clearance hole in the liftgate (2) shut face, position the sensor to the liftgate.
2. Engage the pigtail wire grommet on the lower end of the pinch sensor into the clearance hole in the liftgate shut face.
3. Engage the five plastic retainers of the pinch sensor (1) to the holes in the liftgate shut face.
4. Reach through the access hole in the liftgate inner panel to access and reconnect the pinch sensor pigtail wire connector to the liftgate wire harness connector (3).
5. Reinstall the lower trim onto the liftgate inner panel. Refer to **PANEL, TRIM, INSTALLATION**.
6. Reconnect the battery negative cable.

SWITCH, D-PILLAR

DESCRIPTION

DESCRIPTION

Fig. 17: Power Liftgate Switch, Push Button, Snap Features & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The rear power liftgate switch (1) (also known as the D-pillar switch) is located on the left quarter trim panel, in a mounting hole bezel located between the left rear inner wheel housing and the D-pillar. This switch has a single momentary push button (2) and is used to provide a **Close** request to the Power LiftGate Module (PLGM).

The switch is constructed of molded plastic and the push button has a smooth, concave face with an International Control and Display Symbol icon for **Liftgate Release** or **Liftgate Open** applied to it. The switch housing is secured within the receptacle on the back of the switch mounting bezel by two snap features (4) integral to each side of the switch housing. The top of the switch housing has an integral spline (3) that ensures proper switch orientation when it engages a keyway integral to the switch bezel receptacle.

The bottom of the switch housing has an integral connector receptacle (5) containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The rear power liftgate switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The rear power liftgate switch (also known as the D-pillar switch) is a momentary, push button actuated, resistor multiplexed switch. The switch receives source voltage from the Power LiftGate Module (PLGM) through an internal pull up on a power liftgate logic return circuit. The switch then provides a multiplexed output to the PLGM on a liftgate switch rear signal circuit. The output to the PLGM indicates whether the switch push button is depressed or released.

When the switch push button is depressed, it provides a **Close** request to the PLGM. If the push button is depressed a second time, while the PLGM is in the process of closing the liftgate, the PLGM will automatically

reverse the liftgate to the full open position. This switch will NOT open the liftgate if it is already closed.

The rear power liftgate switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to rear power liftgate switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 18: Power Liftgate Switch, Bezel & Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the edges of the rear power liftgate switch (2) bezel (3) away from the left quarter trim panel (1) far enough to disengage the two integral latch features of the bezel from the quarter trim panel bezel opening.
3. Pull the switch and bezel unit away from the quarter trim panel far enough to access and disconnect the body wire harness connector from the connector receptacle on the bottom of the switch.

Fig. 19: Bezel, Switch & Two Snap Features
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the sides of the switch receptacle on the back of the bezel (1) away from the switch (2) far enough to release the two snap features (3) on each side of the switch housing.
5. Remove the rear power liftgate switch from the receptacle on the back of the switch bezel.

INSTALLATION

INSTALLATION

Fig. 20: Bezel, Switch & Two Snap Features
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear power liftgate switch (2) to the receptacle on the back of the switch bezel (1) being

certain to align the spline on the top of the switch housing with the keyway at the top of the receptacle.

2. Using hand pressure, press the switch firmly and evenly into the receptacle until the two snap features (3) on each side of the switch housing snap into place and the switch is fully engaged in the receptacle.

Fig. 21: Power Liftgate Switch, Bezel & Quarter Trim Panel
 Courtesy of CHRYSLER GROUP, LLC

3. Position the switch (2) and switch bezel (3) unit close enough to the bezel opening in the left quarter trim panel (1) to access and connect the body wire harness connector to the connector receptacle on the bottom of the switch housing.
4. Align the switch bezel to the quarter trim panel bezel opening and, using hand pressure, press the bezel firmly and evenly into the opening until the two latch features integral to the back of the bezel are fully engaged.
5. Reconnect the battery negative cable.

SWITCH, EXTERIOR HANDLE

DESCRIPTION

DESCRIPTION

Fig. 22: Power Liftgate Exterior Handle Switch, Latch Handle Assembly & Wire
Courtesy of CHRYSLER GROUP, LLC

The power liftgate exterior handle switch (2) is integral to a unique liftgate exterior latch handle assembly (3). Externally the latch handle and the handle bezel or housing appear identical to the latch handle used without a power liftgate option. However, within the liftgate the power liftgate handle includes the dedicated exterior handle switch and it has no mechanical cables or linkage connecting it to the liftgate latch. The exterior handle switch is mechanically actuated by the exterior latch handle, and is used to provide an **Open** request to the Power LiftGate Module (PLGM).

The exterior handle switch is a micro switch. The switch housing is constructed of molded plastic and includes a short pigtail wire (1) and connector. The switch housing is secured to one of the pivot stanchions on the back of the handle bezel or housing. The switch pigtail wire and connector connect the switch to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The power liftgate exterior handle switch cannot be repaired or adjusted. If the switch is ineffective or damaged, the entire liftgate exterior latch handle unit must be replaced.

OPERATION

OPERATION

The power liftgate exterior handle switch is a momentary, plunger actuated, resistor multiplexed micro switch. The switch receives source voltage from the Power LiftGate Module (PLGM) through an internal pull up on a power liftgate logic return circuit. The switch then provides a multiplexed output to the PLGM on a liftgate switch MUX input 2 circuit. The output to the PLGM indicates whether the switch plunger is depressed or extended. When the switch plunger is extended, it provides an **Open** request to the PLGM.

An exterior handle switch input to the PLGM will begin a power **Open** cycle of the liftgate if the liftgate is fully

closed when it occurs, will cancel a power **Open** cycle and put the power liftgate in manual operating mode if the liftgate is already in a power **Open** cycle when it occurs, will reverse the liftgate to open if it occurs during a power **Close** cycle, or may be used to home the latch as described in the Power Liftgate Latch Homing standard procedure. Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE**.

The power liftgate exterior handle switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to power liftgate exterior handle switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 23: Liftgate, Exterior Handle, Two Nuts & Wire Connector
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the power liftgate latch from the liftgate (1) inner panel. Refer to **LATCH, LIFTGATE, REMOVAL**.
4. Disconnect the power liftgate exterior handle (3) switch pigtail wire connector (4) from the liftgate wire harness connector.
5. Remove the two nuts (2) that secure the two studs on the back of the handle housing to the inside of the liftgate outer panel.
6. From the outside of the liftgate, remove the power liftgate exterior handle and switch through the liftgate outer panel latch handle pocket as a unit.

INSTALLATION

INSTALLATION

Fig. 24: Liftgate, Exterior Handle, Two Nuts & Wire Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the power liftgate exterior handle (3) and switch into the liftgate outer panel (1) latch handle pocket as a unit. Be certain not to pinch the exterior handle switch pigtail wire (4) between the handle housing and the liftgate outer panel.
2. Install and tighten the two nuts (2) that secure the two studs on the back of the handle housing to the inside of the liftgate outer panel. Tighten the nuts securely.
3. Reconnect the power liftgate exterior handle switch pigtail wire connector to the liftgate wire harness connector.
4. Reinstall the power liftgate latch onto the liftgate. Refer to **LATCH, LIFTGATE, INSTALLATION**.
5. Reconnect the battery negative cable.

SWITCH, OVERHEAD CONSOLE

DESCRIPTION

DESCRIPTION

2815126

Fig. 25: Front Power Liftgate Switch
Courtesy of CHRYSLER GROUP, LLC

The front power liftgate switch (2) (also known as the overhead console switch) is located in the forward switch pod of the overhead console (1), between the two reading lamp switches. This switch has a single momentary push button and is used to provide a toggling **Open** or **Close** request to the Power LiftGate Module (PLGM).

The switch is constructed of molded plastic and the push button has a smooth face with an International Control and Display Symbol icon for **Liftgate Release** or **Liftgate Open** applied to it. The switch button has instrument panel dimmer controlled Light Emitting Diode (LED) back lighting for night visibility.

The front power liftgate switch is integral to the overhead console switch pod assembly on the printed circuit board for the overhead console. The switch cannot be repaired or adjusted and, if ineffective or damaged, the entire overhead console unit must be replaced. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.

OPERATION

OPERATION

The front power liftgate switch (also known as the overhead console switch) is a momentary, push button actuated, resistor multiplexed switch. The switch has a path to ground at all times through an eyelet terminal secured by a screw to the body sheet metal within the passenger compartment. The switch provides a multiplexed output to the PLGM on a liftgate switch front signal circuit. The PLGM reads the switch output through an internal pull up. The output to the PLGM indicates whether the switch push button is depressed or released.

When the switch push button is depressed, it provides an **Open** or a **Close** request to the PLGM. The PLGM interprets the request based upon the present status of the liftgate. If the monitored status of the liftgate is not closed, the front switch input is interpreted as a **Close** request. If the status of the liftgate is not opened, the front switch input is interpreted as an **Open** request. If the switch button is depressed a second time, while the PLGM is in the process of opening or closing the liftgate, the PLGM will automatically reverse the liftgate to the full open position.

The front power liftgate switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to front power liftgate switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

2014 ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

A power operated door lock system is available factory-installed equipment on this vehicle. The power lock system allows all of the doors to be locked or unlocked electrically. Locking or unlocking the vehicle using the power lock system can be accomplished by up to three different methods:

- **Power Lock System** - Operating a power lock system switch on either front door inside trim panel will lock or unlock the latches of all four doors. Operating the power liftgate switch on the front overhead console will unlatch and open the liftgate. Operating a fuel door release switch on the driver side front door trim panel will unlatch the fuel filler door in the right quarter outside panel.
- **Remote Keyless Entry System** - Depressing the **Lock** or **Unlock** button of the optional Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) can also be used to lock or unlock the latches of the doors. Depressing the **Liftgate Release** button of the RKE transmitter two times will unlatch the liftgate. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Passive Entry System** - On vehicles with the optional Passive Entry Keyless Go (PEKG) system, contacting the capacitive **Unlock** switch on the inside of either exterior front door Smart handle pull or depressing the tactile **Lock** button of either front door Smart handle while a valid FOBIK is identified in that same zone can be used to lock or unlock the doors. Also depressing the tactile electronic liftgate handle while a valid FOBIK is identified in that same zone can be used to unlatch the deck lid. The specific locks operated varies depending upon the Customer Programmable settings chosen by the vehicle operator.

Additional details of each of these subsystems and their components can be found in the subheadings and paragraphs that follow.

PASSIVE ENTRY SYSTEM

A Passive Entry Keyless Go (PEKG) system is available factory-installed equipment for this vehicle. The PEKG system allows the vehicle to be unlocked without the use of a mechanical key, as long as an authorized FOB with Integrated Key (FOBIK) is in the possession of the individual or in close proximity to the aperture of the vehicle that is to be unlocked. All other features and Customer Programmable feature settings of the power lock system and the Remote Keyless Entry (RKE) system function the same as they would on vehicles without the PEKG system option.

The PE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Liftgate Latch Release Switch** - A tactile liftgate release switch is located where you normally would find a mechanical latch mechanism.

- **Door Handle Switches** - Each PE door outside handle (also known as a Smart handle) is equipped with three switches and an Integrated Circuit (IC). A tactile **Lock** switch is located on the outer horizontal surface of each door handle pull, a capacitive **Unlock** switch membrane is located on the inner vertical surface of the handle pull, while a Hall effect switch and an IC are concealed within the handle pull unit.
- **Low Frequency Antennas** - The PE system includes four Low Frequency (LF) antennas, one mounted beneath the front of the center floor console, one on each rear door hardware module carrier concealed behind the inside trim panel, one in front of the left rear seat floor and one concealed behind the rear fascia at the rear of the vehicle.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the Passive Entry Keyless Go (PEKG) system control module and RF receiver located in the rear cargo area headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

Hard wired circuitry connects many of the PE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the PE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

POWER LOCK SYSTEM

The power lock system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) includes the EVIC switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS) located in the center stack area of the instrument panel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Fuel Door Release Switch** - A switch in the map pocket on the driver side front door inside trim panel will unlatch the fuel filler door in the right outside quarter panel.
- **Power Lock Motors** - A reversible electric power lock motor is integral to the latch of each front and rear door and the liftgate.
- **Power Lock Switches** - A power lock switch is integral to the switch module located on the forward end of the arm rest of each front door inside trim panel.

These components and their controls are combined to provide the following power lock system central locking and unlocking features:

- **Automatic Door Locking** - Automatic door locking (also known as rolling door locks) automatically locks any unlocked door when the vehicle speed exceeds about 25.7 kilometers per hour (15 miles per hour). This is a Customer Programmable feature.

- **Automatic Door Unlocking** - Automatic door unlocking (also known as automatic unlock doors on exit) automatically unlocks the doors after they were automatically locked when the vehicle speed exceeded about 25.7 kilometers per hour (15 miles per hour), the vehicle speed has returned to zero, the transmission shift lever is in the **Neutral** or **Park** positions and the driver side front door is opened. This is a Customer Programmable feature.
- **Customer Programmable Features** - The vehicle operator interfaces with the BCM, which is the power lock system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the power lock system Customer Programmable Features through the EVIC display.
- **Door Lock Inhibit** - Prevents locking the doors using a power door lock switch or the **Lock** button of the Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) if the key is in the ignition and the driver side front door is open.
- **Enhanced Accident Response System** - In the event of a vehicle impact that causes airbag deployment but leaves vehicle electrical power intact, the Enhanced Accident Response System (EARS) automatically turns OFF the supply of fuel to the engine, turns ON the interior courtesy lamps, turns ON the hazard warning flashers and unlocks the doors after the vehicle speed has returned to zero. This helps emergency responders in their efforts to render the appropriate assistance. The courtesy lamps and hazard flashers remain ON as long as the battery has power or until the key is removed from the ignition.
- **Illuminated Entry** - Automatic illumination of the interior courtesy lamps when the vehicle is unlocked using the power lock system.

Hard wired circuitry connects the power lock system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power lock system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system is available factory-installed equipment on this vehicle. The RKE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is a digital display integral to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). The EVIC includes the EVIC switch pod in the right horizontal spoke of the steering wheel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the RKE system control module and RF receiver located up in the rear cargo headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION**.
- **Remote Keyless Entry System Transmitter** - The RKE system transmitter (also known as the FOB with Integrated Key/FOBIK) is the battery powered, wireless and portable Radio Frequency (RF) user controller for all of the features of the RKE system.

These components and their controls are combined to provide the following RKE system features:

- **Customer Programmable Features** - The vehicle operator interfaces with the RFHM, which is the RKE system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the RKE system Customer Programmable Features through the EVIC display.
- **Flash Lights With Lock And Unlock** - This is a Customer Programmable feature of the RKE system. The first option has the park lamps flash as an optical verification that the RKE system has received a valid **Lock** or **Unlock** request from the FOBIC. The second option disables the optical verification feature.
- **Panic Feature** - In certain markets the FOBIC may also be equipped with a red **Panic** button. Depressing the **Panic** button of the FOBIC while within transmitter range will sound the vehicle signal horn and flash the exterior lighting of the vehicle for about three minutes or until the **Panic** button is depressed a second time, whichever occurs first. Attaining a vehicle speed of about 25.7 kilometers per hour (15 miles per hour) will also cancel the Panic event.
- **Programming Additional Transmitters** - Two RKE transmitters are shipped with the vehicle from the factory, but the RKE system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE system controller memory, even if the battery is disconnected. If a FOBIC is ineffective, lost or an additional FOBIC is desired, new transmitter vehicle access codes can be programmed into the system using a diagnostic scan tool.
- **Remote Liftgate Unlatching** - Depressing the **Liftgate Release** button of the FOBIC twice within 5 seconds while within transmitter range will unlatch and open the liftgate of the vehicle.
- **Remote Engine Start** - On vehicles equipped with the optional Remote Starting System, depressing the **Remote Start** button of the FOBIC twice while within transmitter range will lock all of the vehicle doors and start the engine of the vehicle.
- **Remote Locking** - Depressing the **Lock** button of the FOBIC while within transmitter range will lock all of the vehicle doors.
- **Remote Unlocking** - Depressing the **Unlock** button of the FOBIC while within transmitter range will unlock the vehicle and activate the Illuminated Entry System. The specific locks operated and the number of FOBIC button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Remote Unlock Sequence** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option allows only the driver side front door to unlock when the FOBIC **Unlock** button is depressed one time, and the remaining doors unlock when the button is depressed a second time within 5 seconds of the first press. The second option allows all doors to unlock upon a single press of the FOBIC **Unlock** button.
- **Sound Horn On Lock** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option has the signal horn of the vehicle sound a short chirp as an audible verification that the RKE system received a valid **Lock** request from the FOBIC. The second option disables the audible verification feature.
- **Vehicle Theft Alarm Arming** - If the vehicle is equipped with the optional Vehicle Theft Alarm (VTA), depressing the **Lock** button of the FOBIC while within transmitter range will arm the VTA in addition to activating the remote locking feature.
- **Vehicle Theft Alarm Disarming** - If the vehicle is equipped with the optional Vehicle Theft Alarm (VTA), depressing the **Unlock** button of the FOBIC while within transmitter range will disarm the VTA in addition to activating the remote unlocking feature.

Hard wired circuitry connects many of the RKE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RKE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

PASSIVE ENTRY SYSTEM

In the Passive Entry Keyless Go (PEKG) system the doors are unlocked passively; however, they must still be locked actively after exiting the vehicle using the tactile **Lock** button on either front door Smart handle. When the system senses a hand approaching the capacitive switch in the door Smart handle pull or detects a button press of the liftgate release switch, it sends out challenge messages through the Low Frequency (LF) antennas to authenticate the presence and location of a valid FOB with Integrated Key (FOBIK).

The FOBIK responds by sending a Very High Frequency (VHF) message back to the receiver within the Radio Frequency Hub Module (RFHM) (also known as the RF Hub). If the RFHM determines the FOBIK is valid and that it is located outside the vehicle in the same zone or vicinity as the door handle or liftgate switch being activated, it sends an electronic **Unlock Request** message over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) to automatically unlock and allow entry to that aperture.

The PEKG system circuits and FOBIK inputs are continually monitored by the microprocessor and software contained within the RFHM. When the RFHM monitors a problem in any of the PEKG system circuits or FOBIK inputs, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the PEKG system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PEKG system or the electronic controls or communication between other modules and devices that provide features of the PEKG system. The most reliable, efficient, and accurate means to diagnose the PEKG system or the electronic controls and communication related to PEKG system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

POWER LOCK SYSTEM

The power lock system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the status of the ignition switch. The BCM is the primary power lock system controller. On vehicles equipped with a Drivers Door Module (DDM), the power lock switches are hard wired direct to the DDM. The DDM then sends the switch status via

CAN to the BCM. For those vehicles equipped with a Smart Motor instead of the DDM, the power door lock switches are hardwired directly to the BCM. The BCM, DDM and PDM all communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

When the BCM receives an input from a door module or from a switch on a Smart motor system, it responds to these request messages by providing the appropriate outputs to each of the power lock motors to lock or unlock each of the door latches. The BCM also monitors a hard wired input from the power liftgate module and electronic message inputs indicating automatic transmission gear selector position and vehicle speed. The BCM uses all of these inputs and internal programming to determine whether or not to provide the output necessary to operate the liftgate latch release motor.

The BCM also stores the power lock system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). The BCM uses these settings and internal programming along with hard wired and electronic message inputs to determine the proper outputs needed to produce each of the appropriate power lock system features.

The power lock system circuits are continually monitored and controlled by the microprocessor and software contained within the BCM. When the BCM monitors a problem in any of the power lock system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the power lock system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock system or the electronic controls and communication related to power lock system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the ignition switch position. The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the primary RKE system controller as well as the Radio Frequency (RF) RKE receiver. The RFHM validates the vehicle access code of each RKE transmitter (also known as FOB with Integrated Key/FOBIK) from which it receives RF signal inputs. It ignores requests from any transmitter for which it has no stored vehicle access code.

The RFHM communicates and shares resources with the BCM and many other electronic modules in the vehicle over the CAN data bus. The RFHM also stores the RKE system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). When the RFHM receives an input from a valid transmitter source, it uses these settings and internal programming to send the appropriate electronic request messages to the BCM and other electronic modules over the CAN data bus to invoke the proper RKE system features and responses.

The RKE system circuits and transmitter inputs are continually monitored by the microprocessor and software

contained within the RFHM. When the RFHM monitors a problem in any of the RKE system circuits or transmitters, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the RKE system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RKE system or the electronic controls or communication between other modules and devices that provide features of the RKE system. The most reliable, efficient, and accurate means to diagnose the RKE system or the electronic controls and communication related to RKE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCK SYSTEMS

PASSIVE ENTRY SYSTEM

As a preliminary diagnosis for the Passive Entry Keyless Go (PEKG) system, first check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that this Customer Programmable feature is enabled. Next, confirm that the power lock system and the RKE system operate satisfactorily. If the power lock system or the RKE system fails to operate correctly, repair that problem before attempting to diagnose the PEKG system.

The most reliable, efficient, and accurate means to diagnose the PEKG system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is sending the proper Radio Frequency (RF) signals to and receiving the proper RF signals from the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its PEKG system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

POWER LOCK SYSTEM

Following are tests that may help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Controller Area Network (CAN) data bus and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the power lock motors are receiving

the proper hard wired outputs from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) for them to perform their power lock system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the **Lock** and **Unlock** functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter (also known as the FOB with Integrated Key/FOBIK). Then, proceed as follows:

1. If the entire power lock system fails to function with either the power lock switches or the FOBIK, check the fused B(+) fuse for the power lock system.
2. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the RKE system.
3. If the power lock system functions with the FOBIK, but not with one or both power lock switches, proceed to diagnosis of the door lock switches.
4. If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to diagnosis of the power lock motor.

REMOTE KEYLESS ENTRY SYSTEM

Following are tests that may help to diagnose the Remote Keyless Entry (RKE) system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the RKE system, the Controller Area Network (CAN) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the RKE system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the RKE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is being sent the proper Radio Frequency (RF) signals by the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its RKE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the RKE system, first confirm that the power lock system operates satisfactorily. If the power lock system fails to operate correctly, repair that problem before attempting to diagnose the RKE system. If the problem being diagnosed involves only one or more Customer Programmable features, check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that these programmable features are enabled. If the features are enabled and still fail to operate, the RFHM and the CAN

data bus must be tested. Next, note the RKE system operation while you perform both the **Lock** and **Unlock** functions with the FOBIK. Then, proceed as follows:

1. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the FOBIK.
2. If the FOBIK checks okay, proceed to diagnosis of the RFHM or the CAN data bus. The use of a diagnostic scan tool and the appropriate diagnostic information are required.

ACTUATOR, FUEL DOOR

DESCRIPTION

DESCRIPTION

082371064

Fig. 1: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

An electronically actuated fuel door release mechanism is standard equipment in this vehicle. A striker on the fuel door is engaged by a latch and actuator mechanism (2) integral to the fuel filler housing located behind the fuel door opening of the outer quarter panel. The actuator mechanism is operated by an electronic solenoid that is also integral to the fuel filler housing. A short wire harness connected to the solenoid passes through a rubber grommet and a hole in the body sheet metal into the trunk compartment along with a mechanical emergency release cable (1). The solenoid is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness located on the right side of the trunk.

OPERATION

OPERATION

The fuel filler door actuator solenoid is energized by fused battery feed received from the fuel filler door switch located within the map pocket of the driver side front door inside trim panel whenever the momentary switch button is depressed. The solenoid is connected to a path to ground at all times through a take out of the body wire harness that is secured to the body sheet metal. These connections allow the solenoid to operate regardless of the ignition switch status.

If the vehicle electrical system, the fuel filler release solenoid, the switch or the release solenoid electrical circuits are damaged or ineffective, pulling the mechanical emergency release cable located within the trunk compartment will manually release the fuel filler door.

REMOVAL**REMOVAL**

Fuel Door Actuator Removal.

082370948

Fig. 2: Lock Tabs & Fuel Door Actuator
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the fuel door using the push button switch within the map pocket of the drivers door panel. If unable to actuate the fuel door with the switch then open the trunk and pull the mechanical emergency release cable to release the fuel door manually. The mechanical emergency release cable is located on the right side within the trunk compartment.
3. Once the fuel door is open you can access the fuel door actuator (2). There are two lock tabs (1) holding

the actuator in place. Use a screw driver or like object to pop the fuel door actuator out from underneath the tabs.

082371064

Fig. 3: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

4. Once the fuel door actuator is free of the tabs, remove the rubber grommet and maneuver the actuator through the opening that the actuator is fed through so that you are feeding the actuator back into the trunk.
5. Disconnect the fuel door actuator harness from the solenoid assembly.
6. Disconnect the mechanical emergency fuel door release cable from the interior wall of the trunk and pull the actuator and cable out from the trunk, fully removing the actuator and cable from the vehicle.

INSTALLATION

INSTALLATION

Fuel Door Actuator Installation.

082371064

Fig. 4: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

1. The fuel door actuator is routed through the passenger side interior of the trunk through the opening in the body sheet metal that allows the actuator to pass through and reside within filler housing. Feed the actuator through this opening while maneuvering the actuator.

082370948

Fig. 5: Lock Tabs & Fuel Door Actuator

Courtesy of CHRYSLER GROUP, LLC

2. Once the actuator is inserted through the hole and into the housing area, position the actuator so that the lock tabs on the housing will mesh with the tabs on the actuator. Snap/secure the actuator into place.
3. Connect the fuel door actuator harness connector to the solenoid assembly.
4. Connect the mechanical emergency release cable into position on the passenger side of the trunk compartment.
5. Reconnect the battery negative cable and test for proper fuel door actuation.

ANTENNA, PASSIVE ENTRY**DESCRIPTION****DESCRIPTION**

3072245

Fig. 6: Integral Connector Receptacle, Ferrite Antenna Units & Flanges
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) and Keyless Go (KG) systems have several Low Frequency (LF), ferrite antenna units (2) located within the vehicle. Each ferrite PE antenna unit is contained within a molded black plastic housing with an integral connector receptacle (3) molded into one end. The connector receptacle contains terminal pins that connect the antenna to the vehicle electrical system through a twisted pair of conductors and a connector that are part of the adjacent wire harness.

Each antenna housing also includes an integral mounting flange or flanges (1) which can be used to mount the unit with screws. However, in some applications the antenna mounting flanges are snapped into a spring steel adapter or retainer, which allows the antenna unit to be securely clipped in place over a body flange rather than being secured with screws. This vehicle platform uses five PE antenna units. One is secured to the underside of the center floor console, one is secured to each rear door hardware module carrier concealed behind the inside door trim panels, one is secured in front of the rear seat to the floor and one is concealed behind the rear fascia

to the bracket.

The antennas are each connected to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) on dedicated and sequentially numbered circuits. The left rear door antenna is connected through the antenna 1 circuits, the right rear door antenna is connected through the antenna 2 circuits, the trunk antenna is connected through the antenna 3 circuits, the center floor console is connected through the antenna 4 circuits and the rear fascia bracket antenna is connected through the antenna 5 circuits.

PASSIVE ENTRY LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	Antenna And Circuit Number
Left Rear Door	1
Right Rear Door	2
Center Floor Console	3
Left Rear Floor	4
Rear Fascia Bracket	5

An LF antenna unit cannot be adjusted or repaired. If ineffective or damaged, it must be replaced with a new unit. For applications where it is used, the antenna unit adapter or retainer may be serviced only as a unit with the LF antenna.

OPERATION

OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 0.7 meters (2.5 feet) horizontally in all directions around the outside of the vehicle. The RFHM uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RFHM communication with the FOBIK is on 125 kilohertz using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RFHM. One connection is the LF antenna output circuit, while the other connection is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RFHM microprocessor continuously monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the LF antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the LF antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

CENTER FLOOR CONSOLE

082370505

Fig. 7: Low Frequency (LF) Antenna**Courtesy of CHRYSLER GROUP, LLC**

1. Disconnect and isolate the battery negative cable.
2. Remove the center floor console from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. Disconnect the wire harness connector from the connector receptacle for the Low Frequency (LF) antenna (1) beneath the front of the console.
4. Remove the two screws that secure the antenna to the bracket beneath the front of the console.
5. Remove the antenna from the console.

REAR DOOR

**Fig. 8: Antenna, Connector & Screws**

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, REMOVAL**.
3. Disconnect the door wire harness connector (3) from the Low Frequency (LF) antenna connector receptacle.
4. Remove the two screws that secure the antenna (2) to the inside of the rear door hardware module carrier.
5. Remove the antenna (1) from the carrier.

REAR FASCIA BRACKET

Fig. 9: Low Frequency Antenna & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to **FASCIA, REAR, REMOVAL** .
3. Disconnect the wire harness connector (1) from the connector receptacle for the Low Frequency (LF) antenna (2) located in a pocket near the center of the rear fascia bracket.
4. Unsnap the antenna from the retainer integral to the rear fascia bracket.
5. Remove the LF antenna from the vehicle.

TRUNK

0823006560

Fig. 10: LF Antenna, Connector & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Fold and move forward the drivers side second row set. Next to the left side of the right side seat track (3) is a cover cut into the carpet. Fold this cover up to expose the LF antenna (1).
3. Disconnect the body wire harness connector from the Low Frequency (LF) antenna connector receptacle (2).
4. Remove the fasteners that secure the antenna in position.
5. Remove the LF antenna.

INSTALLATION

CENTER FLOOR CONSOLE

082370505

Fig. 11: Low Frequency (LF) Antenna**Courtesy of CHRYSLER GROUP, LLC**

1. Position the Low Frequency (LF) antenna (1) to the bracket beneath the front of the center floor console.
2. Install and tighten the two screws that secure the antenna to the bracket beneath the front of the console. Tighten the screws securely.
3. Reconnect the wire harness connector to the antenna connector receptacle.
4. Reinstall the console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Reconnect the battery negative cable.

REAR DOOR

Fig. 12: Antenna, Connector & Screws

Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (1) to the rear door hardware module carrier.
2. Install and tighten the two screws (2) that secure the antenna to the carrier. Tighten the screws securely.
3. Reconnect the door wire harness connector (3) to the antenna connector receptacle.
4. Reinstall the trim panel onto the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION**.
5. Reconnect the battery negative cable.

REAR FASCIA BRACKET

Fig. 13: Low Frequency Antenna & Connector

Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (2) in the pocket near the center of the rear fascia bracket.
2. Reconnect the wire harness connector (1) to the connector receptacle for the antenna.
3. Align the antenna with the retainers integral to the rear fascia bracket, then slide it downward until it snaps into place.
4. Reinstall the rear fascia onto the vehicle. Refer to **FASCIA, REAR, INSTALLATION** .
5. Reconnect the battery negative cable.

FORWARD CARGO FLOOR

0823006560

Fig. 14: LF Antenna, Connector & Cover

Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (1) into position in the opening on the floor behind the drivers second row seat, to the left of the right side seat track (3).
2. Install the fasteners that secure the antenna to the floor.
3. Reconnect the body wire harness connector to the antenna connector receptacle (2).
4. Reconnect the battery negative cable.

MOTOR, DOOR LOCK**DESCRIPTION**

DESCRIPTION

Power operated door locking and liftgate latching mechanisms are available equipment in this vehicle. The lock mechanisms of each door and the liftgate latch of vehicles with the power lock system are actuated by a reversible electric motor integral to each latch unit. A connector receptacle integral to each latch connects the power lock motor and the integral door or liftgate ajar micro switch to the vehicle electrical system through a dedicated take out and connector of the door or body wire harness.

The power lock motors cannot be adjusted or repaired and, if ineffective or damaged, the entire door or liftgate latch unit must be replaced.

OPERATION**OPERATION**

The power lock motors are controlled by outputs received from the Body Control Module (BCM). The BCM acts upon programming, hard wired inputs from the driver or passenger door lock switches as well as electronic **lock** or **unlock** command message inputs received over the Controller Area Network (CAN) data bus from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) based upon inputs from the Remote Keyless Entry (RKE) or FOB with Integrated Key (FOBIK) transmitters.

A positive and negative battery connection to the two lock motor terminals will cause the motor to move in one direction, locking or unlocking the latch. Reversing the current will cause the motor to move in the opposite direction.

The power lock motors and the hard wired circuits between the motors and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide some features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock motors or the electronic controls and communication related to power lock motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - POWER LOCK MOTOR**

Remember, the Body Control Module (BCM) circuitry controls the outputs to the power lock motors. If both the power lock motors and the circuits between the motors and the BCM test okay, the use of a diagnostic scan tool is required for further power lock system diagnosis. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the power lock motor for correct operation while moving a power lock switch to both the **Lock** and **Unlock** positions.

2. Disconnect the door or body wire harness connector from the inoperative power lock motor.
3. Apply 12 volts to the lock and unlock driver circuit cavities of the power lock motor connector to check its operation in one direction.
4. Reverse the connection polarity to check the motor operation in the opposite direction.
5. If motor operation is okay in both directions, check both the lock and unlock circuits between the lock motor and the BCM and repair if required. If motor operation is not okay in both directions, replace the latch unit containing the ineffective power lock motor.

SWITCH, DOOR HANDLE

DESCRIPTION

DESCRIPTION

Fig. 15: Front Door Handle Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have unique outside front door handles that incorporate three switches and a logic circuit. These unique PE door handles are sometimes referred to as smart handles. The handle itself is very similar in appearance to those used in conventional non-PE applications, consisting primarily of a grip (4) and a base (1).

The PE door handles can be readily identified by a tactile, resistive membrane lock switch (5) located on the outward facing vertical surface at the rearward end of the handle grip, and by a capacitive sensor or switch membrane patch on the inside surface (2) of the grip. A third, Hall-effect type switch as well as an Integrated Circuit (IC) chip are concealed within the grip near the handle base.

The mechanical functions and mounting provisions of the PE handle are identical to those of a conventional outside door handle. However, an integral connector receptacle (3) is located at the forward end of the handle grip where it is concealed within the door interior. The PE handle is connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The individual switches of the PE outside front door handles cannot be adjusted or repaired. If any one of the switches, the IC or any of the mechanical handle components is damaged or ineffective, the entire handle unit must be replaced. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL**.

OPERATION

OPERATION

The three switches of each Passive Entry (PE) outside front door handles are each powered by and provide a direct input to the Integrated Circuit (IC) of that door handle. The IC of each PE outside front door handle receives power from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) on a signal circuit, and a clean ground from the RFHM on a return circuit. The PE handle IC and the RFHM communicate with each other by modulating the current in the signal circuit.

Each PE outside front door handle has three switches. The inputs from those three switches and the handle logic circuit allow each handle to send the RFHM up to four different signals: Unlock Request, Hall, Lock Request and Error. The RFHM determines the system response based upon the inputs it receives from each handle as well as the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The tactile, mechanical, resistive membrane lock switch allows the user to actively lock the vehicle. The capacitive switch senses a hand approaching the handle grip to passively unlock the vehicle. The Hall-effect switch senses handle grip movement. An adaptation algorithm in the logic circuit of each handle can modify the sensitivity of the capacitive switches as well as system responses to the Hall-effect switch inputs to compensate for sensed repeated or continuous actuations such as might be caused by the switch membrane being wetted, but restores normal sensitivity about one minute after the repeated or continuous actuation input ceases.

The hard wired inputs and outputs of the PE outside front door handle may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, FUEL DOOR

DESCRIPTION

DESCRIPTION

Fig. 16: Switch, Latch Features, Receptacle & Alignment Spline
Courtesy of CHRYSLER GROUP, LLC

The fuel door release switch (1) is mounted in the map pocket of the driver side front door inside trim panel. Only the switch button is visible on the outer surface of the trim panel. The black plastic switch button has a white International Control and Display Symbol icon applied to it, which clearly identifies its function. A Light Emitting Diode (LED) unit within the switch illuminates the icon on the switch button for improved visibility.

The black, molded plastic switch housing encloses the switch button mechanism and the switch circuitry including the switch contacts. A connector receptacle (3) is integral to the back of the switch housing, while integral latch features (2) and an alignment spline (4) on the sides of the housing are used to secure and locate the switch within a mounting receptacle integral to a reinforcement on the back side of the door trim panel. The fuel door release switch is connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The fuel door release switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

OPERATION

The fuel door release switch is a normally open, momentary switch that is connected to fused battery feed at all times. When the switch button is depressed, it provides a battery feed signal to the fuel door release actuator solenoid on the fuel filler housing through a fuel door control circuit.

The hard wired circuit between the fuel door release switch and the fuel door release actuator solenoid may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

REMOVAL

REMOVAL

Fig. 17: Latch Tabs & Release Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Working from the back side of the door trim panel, disengage the latch tabs (1 and 3) that secure the fuel door release switch (2) to the receptacle integral to the trim panel reinforcement.
4. Remove the switch from the door trim panel.

INSTALLATION

INSTALLATION

Fig. 18: Latch Tabs & Release Switch

Courtesy of CHRYSLER GROUP, LLC

1. Align the fuel door release switch (2) with the receptacle integral to the reinforcement on the back side of the driver side front door trim panel.
2. Using hand pressure, push the switch into the receptacle until each of the switch latch tabs (1 and 3) are fully engaged.
3. Reinstall the trim panel onto the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, INSTALLATION**.
4. Reconnect the battery negative cable.

SWITCH, LOCK**DESCRIPTION****DESCRIPTION**

Fig. 19: Driver Side & Passenger Side Front Door Power Switch Module & Bezel Unit
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Separate modules are used for the driver side (1) and the passenger side (2) front doors. In addition, there are three versions of each module to accommodate power window and power mirror options. Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

The Driver Door Switch Assembly contains window lift switches for front windows (driver and passenger) including auto-down or an auto-down and auto-up (also known as one-touch down or up and express down or up) features for both front door windows, window lift switches for rear windows (as equipped), window lockout switch (as equipped), power mirror switch with mirror select (as equipped), and a power fold button (as

equipped - LIN & Hybrid only). The passenger side power door switch module may combine power lock switches with a passenger side front door power window switch with the auto-down or the auto down and auto-up features. Each power switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the module housing. A connector receptacle (4) integral to each module housing connects the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harnesses.

Each front door power switch module may include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system is standard equipment in each front door power switch module in vehicles equipped with the optional power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system is standard equipment in each front door power switch module in vehicles equipped with the optional power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - In vehicles equipped with the power outside rear view mirror option, two latching mirror selector switch buttons choose the power mirror to be adjusted, **R** (right) or **L** (left).
- **Power Mirror Control Switch (Driver Side Switch Only)** - In vehicles equipped with the power outside rear view mirror option, after a power mirror is selected, pressing down on one of the four arrowheads on the circular, concave momentary mirror control switch pad will move the selected mirror in that direction for as long as the pad is held down or until the limit of the mirror travel is reached.
- **Power Window Lockout Switch (Driver Side Switch Only)** - In vehicles equipped with the power window option, a latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger door power window switch is extinguished.
- **Power Window Switches** - In vehicles equipped with the power window option, a single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each front and rear passenger door window. The driver side switch module contains four of these power window switches, one switch dedicated to each door window. In vehicles with the base power window system, all power window switches are of a high current design and the switch tabs for the driver and passenger side front door power windows have an intermediate detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. In vehicles equipped with the premium power window system, the front door power window switches are a low current design and a time based (less than 800 milliseconds) activation in the up or down direction on either front door power window switch activates the **Auto-Down** or **Auto-Up** (also known as express up and down, or one-touch up and down) feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door power switch module must be replaced as a unit.

OPERATION

OPERATION

The Main function of the this switch assembly is to control the opening or closing of the Power windows and power locks based on the manual input given. The Driver Door Switch Assemblies are classified as high current, low current (LIN) or "hybrid." High current Door Switch Assemblies directly control windows and mirrors through high current switched contacts within the switch assembly. Low current (LIN) Door Switch Assemblies control windows and mirrors via messages sent over the LIN bus to a module which directly controls the windows and mirrors. Hybrid Door Switch Assemblies control front windows and mirrors via LIN messages, while controlling rear windows through high current switched contacts. In all cases, Door Locks are controlled by an RMUX signal to the module which directly controls the door lock solenoids.

The front door power switch module provides resistor multiplexed outputs to the Body Control Module (BCM) indicating the power lock switch selection, and the BCM operates the lock motors accordingly. On vehicles with the power outside rear view mirror option, the driver side front door power switch module also provides hard wired analog outputs directly from the power mirror selector and control switches to the power mirrors.

On vehicles with a base power window system option, the driver side front door power switch module provides high current hard wired analog outputs directly to the driver side front power window motor, or to the front and rear passenger door power window motors through the power window switch for that door. In the base power window system, an integrated circuit within each front door power switch module monitors inputs from the auto-down detent of the front door power window switches to invoke that feature.

On vehicles with a premium power window system option, the driver and passenger side front door power switch modules provide low current hard wired outputs to the driver or passenger side front r window motors, while the rear passenger power window motors still rely upon high current hard wired outputs from the switches. In the premium power window system, the BCM monitors the front door power window switches to invoke the auto-down and auto-up features through the smart power window motors.

The hard wired inputs and outputs of the driver and passenger side front door power switch modules may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls of the power switch modules or in the diagnosis of the other modules and electronic controls that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER FRONT DOOR SWITCH MODULES

2851221

Fig. 20: Driver Front Door Switch Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

2851230

Fig. 21: Passenger Front Door Switch Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the power switch module and bezel unit from the front door trim panel. Refer to **SWITCH, LOCK, REMOVAL**.
2. Disconnect the door wire harness connector from the power switch module.
3. Using an ohmmeter, test the resistance between the terminals of the front door power lock or power window switch as shown in the Power Lock or Power Window Switch Tests chart .

NOTE: The switches in the driver front door switch module not listed in the Switch Test Tables provide inputs to the Driver Door Module (DDM) over a Local Interface Network (LIN) data bus and cannot be resistance tested.

The use of a diagnostic scan tool and the appropriate diagnostic information is required for further testing of those switches.

POWER LOCK SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	RESISTANCE RANGE (OHMS)
LOCK (4 and 8)	326 - 341
UNLOCK (4 and 8)	99 - 103
NEUTRAL (4 and 8)	>1 megohm

POWER WINDOW SWITCH TESTS - DRIVER DOOR	
SWITCH POSITION (PINS)	RESISTANCE (OHMS)
MASTER LEFT REAR WINDOW	
UP SWITCH - NEUTRAL (2 and 5)	>1 megohm
UP SWITCH - UP (2 and 5)	<2
DOWN SWITCH - NEUTRAL (2 and 7)	>1 megohm
DOWN SWITCH - DOWN (2 and 7)	<2
MASTER RIGHT REAR WINDOW	
UP SWITCH - NEUTRAL (2 and 12)	>1 megohm
UP SWITCH - UP (2 and 12)	<2
DOWN SWITCH - NEUTRAL (2 and 14)	>1 megohm
DOWN SWITCH - DOWN (2 and 14)	<2

POWER WINDOW SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	RESISTANCE RANGE (OHMS)
UP (4 and 8)	990 - 1022
AUTO UP (4 and 8)	329 - 349
DOWN (4 and 8)	2970 - 3042
AUTO DOWN (4 and 8)	0 - 12
NEUTRAL (4 and 8)	>1 megohm

- If a switch fails any of the tests, replace the ineffective front door power switch module and bezel unit as required.

REMOVAL

REMOVAL

Fig. 22: Front Door Switch Module & Door Wire Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using (special tool #C-4755, Trim Stick), pry the bezel of the front door switch module (1) up and away from the front door trim panel arm rest far enough to disengage the four spring steel retainers of the switch from the arm rest opening.
3. Pull the switch module away from the mounting hole of the arm rest far enough to access and disconnect the door wire harness connector (2) from the switch connector receptacle.
4. Remove the switch module from the vehicle.

INSTALLATION

INSTALLATION

Fig. 23: Front Door Switch Module & Door Wire Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module (1) close enough to the mounting hole in the arm rest of the front door trim panel to access and reconnect the front door wire harness connector (2) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.
3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Reconnect the battery negative cable.

TRANSMITTER, INTEGRATED KEY FOB

DESCRIPTION

DESCRIPTION

3823026

Fig. 24: FOBIK Transmitter - Without Passive Entry Keyless Go System
Courtesy of CHRYSLER GROUP, LLC

3068587

Fig. 25: FOBIK Transmitter - With Passive Entry Keyless Go System
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the power lock system may also have the optional Remote Keyless Entry (RKE) or the optional Passive Entry Keyless Go (PEKG) system. These vehicles are each shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. Although either type of transmitter can be programmed for compatibility with the power lock, Vehicle Theft Alarm (VTA) and remote start system features of the other, the FOBIK for vehicles without the PEKG system will not operate the passive entry system features, and neither FOBIK is compatible with the ignition switch design of the other.

The transmitter circuitry of both FOBIK types is contained and protected within a molded black plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case has a key ring and houses a mechanically coded, metal emergency key (5) that is released by sliding a latch button on the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include either a hard red plastic button with the white text **PANIC**, or a touch pad section on the FOBIK with the red text **PANIC** applied to it. Not counting the **PANIC** button or touch pad (4), the available switches include:

- **Unlock (1)** - Standard Equipment.
- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Trunk (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system, the VTA system and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System** - Refer to **DESCRIPTION**.
- **Passive Entry System** - Refer to **DESCRIPTION**.
- **Sentry Key® Theft Deterrent System** - Refer to **DESCRIPTION**.
- **Vehicle Theft Security System (VTSS)** - Refer to **DESCRIPTION**.

Other than battery replacement, the FOBIK cannot be adjusted or repaired. Once a FOBIK has been programmed to a vehicle, it cannot be reprogrammed for use on any other vehicle. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

OPERATION

OPERATION

The FOB with Integrated Key (FOBIK) incorporates many useful functions into a single, compact unit. The transducer on the internal circuit board of the FOBIK uses low frequency Radio Frequency (RF) communication to ensure vehicle security through an electronic validation or handshake process that is performed with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) each time the engine is started.

When any one of the Remote Keyless Entry (RKE) buttons of the FOBIK is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RFHM. If the RFHM determines that the RF signal was generated by a FOBIK that is valid for the vehicle, the RFHM relays

electronic request messages to the appropriate electronic modules in the vehicle over the Controller Area Network (CAN) data bus to invoke the functions or features associated with the request.

The integrated mechanical emergency key of the FOBIK provides emergency access to the vehicle in case the battery in the vehicle or the transmitter becomes discharged. The emergency key can also be retained to keep any locked on-board vehicle storage compartments such as the glove box secured, for example: While the vehicle is being attended to by a parking valet.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Diagnosis of a FOBIK transmitter requires the use of a Radio Frequency Detector such as special tool (special tool #9001, RF Detector). Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FOBIK TRANSMITTER

114508

Fig. 26: Radio Frequency Detector #9001
Courtesy of CHRYSLER GROUP, LLC

Use a Radio Frequency Detector such as special tool (special tool #9001, RF Detector) to confirm that the Remote Keyless Entry (RKE) transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for the transmitters of vehicles manufactured for Asian markets, and 30.5 centimeters (12 inches) for all others.

1. Position the transmitter the appropriate distance from the special tool.

2. Depress any transmitter button, then test each button individually. The special tool will issue an audible beep tone if a satisfactory radio signal strength that lights five or more Signal Strength Light Emitting Diode (LED) units is detected.
3. Repeat Step 2 three times. If the transmitter fails any of the signal strength tests, use a diagnostic scan tool and the appropriate diagnostic information to complete further diagnosis.

STANDARD PROCEDURE

STANDARD PROCEDURE - FOB/K TRANSMITTER BATTERY REPLACEMENT

WITHOUT PASSIVE ENTRY KEYLESS GO SYSTEM

Fig. 27: Case, Notch, Emergency Key & Storage Slot
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the back of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

Fig. 28: Back Half Of FOBIK Case, Front Half Of FOBIK Case & Battery
 Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (1).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER, INTEGRATED KEY FOB, SPECIFICATIONS**.
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (2) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

WITH PASSIVE ENTRY KEYLESS GO SYSTEM

3068797

Fig. 29: Emergency Key, Storage Slot & Integrated Key (FOBIK) Case
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the front of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

3068870

Fig. 30: FOBIK Case & Battery

Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (2).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER, INTEGRATED KEY FOB, SPECIFICATIONS**.
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (1) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

STANDARD PROCEDURE - FOBIK TRANSMITTER PROGRAMMING

FOB with Integrated Key (FOBIK) transmitter programming may require the use of the Personal Identification Number (PIN) for the vehicle, a diagnostic scan tool and the appropriate diagnostic information. Also be certain that the FOBIK and any replaced electronic modules are programmed in the proper sequence. Refer to **STANDARD PROCEDURE**.

SPECIFICATIONS**SPECIFICATIONS - FOBIK TRANSMITTER****BATTERY**

The FOB with Integrated Key (FOBIK) transmitter is powered by a single 3-volt lithium and manganese dioxide button cell battery, which can be removed and replaced without special tools. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE**. The international standard battery type designation is: **CR2032**. This battery type is available at many local retail stores. Typical battery life is approximately three years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal FOBIK Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal FOBIK transmitter operation range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal FOBIK transmitter operation range is increased to up to 91 meters (300 feet). Please note that the actual FOBIK transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any FOBIK transmission is attempted.

SWITCH, LIFTGATE RELEASE

DESCRIPTION

DESCRIPTION

2810385

Fig. 31: Liftgate Handle And Light Bar Unit, PE Liftgate Lock And Unlock Switch And Push Button
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have a unique liftgate handle and light bar unit (1) that incorporates a PE liftgate lock and unlock switch (3) and push button (4). This tactile switch is secured to the back of the right side of the handle and light bar unit by three latch features integral to the back of the handle housing. The switch button extends through a clearance hole in the handle housing so that it can be accessed on the outer surface of the handle to the right side of center.

The switch is soldered to the handle and light bar unit wire harness secured to the back of the handle housing that connects the switch along with the liftgate flip-up glass latch release switch, the two license plate lamps and, if the vehicle is so equipped, the rear view camera to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The PE liftgate lock and unlock switch cannot be adjusted or repaired. If the switch is damaged or ineffective, the entire liftgate handle and light bar unit wire harness must be replaced.

OPERATION

OPERATION

The Passive Entry (PE) liftgate lock and unlock switch is a normally open switch that is hard wired to the Remote Frequency Hub (RFHUB) through a signal circuit and a return circuit. The RFHUB continually monitors the condition of the PE liftgate lock and unlock switch and circuits, and will store a Diagnostic Trouble Code (DTC) for any fault that is detected in these circuits.

When the switch button is depressed, it provides a signal to the RFHUB. The RFHUB determines the system response based upon the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK). If the authentication process is successful, the RFHUB sends an electronic **lock request** or **unlock request** message to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus, and the BCM energizes the liftgate lock and unlock relay accordingly.

The hard wired circuits between the PE liftgate lock and unlock switch and the RFHUB may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide some features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to liftgate lock and unlock switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

2014 ACCESSORIES AND EQUIPMENT**Power Mirrors - Service Information - Cherokee****DESCRIPTION****AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR SYSTEM**

The automatic dimming inside rear view mirror is available factory-installed equipment on this vehicle. This mirror is also known as the ElectroChromic Mirror Module (ECMM). This mirror system uses an ElectroChromic (EC) material and will automatically adjust the reflectance of the mirror glass to reduce glare from the headlamps of following vehicles during dark or night time driving conditions. Reducing glare will improve driver comfort and vision under these driving conditions. The components of the automatic dimming inside rear view mirror system are completely self-contained within the inside rear view mirror. Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION**.

Certain functions and features of the EC mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect EC mirror operation are:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Powertrain Control Module** - The Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is located beneath the hood in the engine compartment of the vehicle. The PCM controls many of the powertrain electrical system components. The PCM communicates on the CAN data bus. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION**.
- **Transmission Control Module** - On vehicles with an automatic transmission, the Transmission Control Module (TCM) (also known as the Engine Control Module/ECM) is located beneath the hood in the engine compartment of the vehicle. The TCM controls many of the automatic transmission electrical system components. The TCM communicates on the CAN data bus. Refer to **MODULE, TRANSMISSION CONTROL, OPERATION**.

These components and their controls are combined to provide the following EC mirror system feature:

- **Dimming Disabled In Reverse** - The automatic dimming feature of the EC mirrors is disabled anytime the Reverse position of the transmission is selected.

POWER OPERATED OUTSIDE REAR VIEW MIRROR SYSTEM

The power operated outside rear view mirror system is available factory-installed equipment on this vehicle. This system allows the driver to adjust both the driver and passenger side outside rear view mirrors electrically from the driver seat by operating switches on the arm rest of the driver side front door inside trim panel. These switches allow the vehicle operator a convenient means of adjusting the mirrors to optimize peripheral vision to include the areas at the sides and rear corners of the vehicle, those blind spot areas that are generally blocked

from the view of the vehicle operator by the vehicle structure.

The power operated outside rear view mirror system includes the following major components, which are described in further detail elsewhere in this service information:

- **Power Mirror** - Vehicles equipped with the power operated outside rear mirror system have a power operated mirror secured to the mirror flag area at the front of each front door glass opening. Refer to **MIRROR, OUTSIDE REARVIEW, DESCRIPTION**.
- **Power Mirror Switch** - Vehicles equipped with the power operated outside rear view mirror system have a power mirror selector switch, a power mirror control switch, and a power folding mirror switch integral to the power switch module located near the front of the arm rest on the driver side front door interior trim panel. Refer to **SWITCH, LOCK, DESCRIPTION**.

Certain functions and features of the power operated outside rear view mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect power operated outside rear view mirror operation are:

- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RADAR sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus and is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right and left outboard ends of the rear bumper fascia, just behind the rear wheel openings.
- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the RKE system control module and RF receiver located in the rear cargo area headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION**.

These components and their controls are combined to provide the following power operated outside rear view mirror system features:

- **Blind Spot Monitor Display** - In vehicles also equipped with the optional Blind Spot Monitor (BSM) system, an amber Light Emitting Diode (LED) unit behind a small, triangular translucent icon in each outside rear view mirror glass is illuminated each time the right or left blind spot sensor detects an object of interest in one of the monitored vehicle blind spots. Refer to **DISPLAY, BLIND SPOT, DESCRIPTION**.
- **Heated Mirrors** - The heated mirror option includes an electric heating grid behind the mirror glass in each outside rear view mirror, which can clear the mirror glass of ice, snow, or fog. Refer to **DESCRIPTION**.
- **Puddle Lamps** - In vehicles equipped with this option, white Light Emitting Diode (LED) units behind a small round lens on the underside of each outside rear view mirror illuminate the ground outside each front door when a door is opened. Refer to **DESCRIPTION**.

- **Signal Lamps** - In vehicles equipped with this option, two amber Light Emitting Diode (LED) units illuminate a light pipe behind a clear lens that wraps around the lower outward and forward-facing surfaces of each mirror shell in concert with the turn signals. Refer to **DESCRIPTION**.

OPERATION

OPERATION

AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR SYSTEM

The ElectroChromic Mirror Module (ECMM) of the automatic dimming inside rear view mirror system receives battery current on a fused ignition output (run) circuit from a fuse in the Junction Block (JB) (also known as the interior Power Distribution Center/PDC). The ECMM has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These connections allow the automatic dimming inside rear view mirror system to operate. When the automatic dimming mirror system is on, a green power indicator within the mirror housing is illuminated by an integral Light-Emitting Diode (LED) unit.

POWER OPERATED OUTSIDE REAR VIEW MIRRORS

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. First, a mirror selector switch button is depressed in the driver door power switch module to determine whether the mirror adjuster switch will have control over the right or left mirror. If the vehicle is equipped with the high current door power switch module configuration, hard wired ground and battery current outputs to each power mirror motor determine whether the horizontal or the vertical motor will be operated and the polarity of those outputs control the direction in which the motor will move the drive unit and mirror glass.

Power mirror and mirror switch functionality is the same with the low current configuration; however, the driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

The power mirror switch is diagnosed using a scan tool, refer to **DIAGNOSIS AND TESTING** for the appropriate information.

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

INSIDE MIRROR - An automatic dimming inside rear view mirror is an available factory-installed option on this vehicle. This mirror features a thin layer of ElectroChromic (EC) material sandwiched between two pieces

of conductive glass to make up the face of the mirror. The EC material explains how this mirror also became known as the ElectroChromic Mirror Module (ECMM). The ECMM will automatically change the reflectance of the inside rear view mirror glass to reduce the glare of headlamps approaching the vehicle from the rear while driving during dark or night time conditions. The ability to turn this option ON or OFF will be found in the U-Connect touch screen as a soft button select switch.

The ECMM is a completely self-contained unit that replaces the standard equipment prismatic inside rear view mirror. Besides the mirror glass, the ECMM includes two photocell sensors, the electronic mirror control circuitry and the hardware necessary to communicate as a Local Interface Network (LIN) slave node on the LIN data bus.

Hard wired circuitry connects the ECMM to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the ECMM through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The ECMM cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire ECMM unit must be replaced.

OUTSIDE MIRROR - The automatic dimming driver side outside rear view mirror is able to automatically change its reflectance. The automatic dimming outside rear view mirror replaces the standard equipment outside rear view mirror. The two layers of conductive mirror glass with a thin layer of electrochromic material between them is contained within the outside rear view mirror glass case. However, this mirror relies upon the photocells and mirror control circuitry of the automatic dimming inside rear view mirror to control its reflectance.

The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors. The mirror is connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness. The automatic dimming circuitry of the outside rear view mirror receives current through auto day/night mirror feed (+) and return (-) circuits from the inside rear view mirror, and will only operate when the ignition switch is in the ON or START positions.

The automatic dimming outside rear view mirror sensitivity cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire outside rear view mirror unit must be replaced. For service procedures, refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** , **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** , **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .

OPERATION

OPERATION

Both the inside and outside automatic dimming mirrors receive battery current through a fused ignition switch output (run/start) circuit and fuse in the Body Control Module (BCM), and will only operate when the ignition

switch is in the ON or START positions.

INSIDE

The soft switch located in the U-Connect touch screen provides the vehicle operator with a manual control of whether the automatic dimming feature is operational. If the dimming is turned to the off position, the mirror will always turn back ON by default at the onset of a new ignition ON cycle. The automatic dimming mirror circuitry also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the REVERSE position.

The ambient photocell sensor of the mirror faces forward, to detect the outside light levels through the windshield glass. A second headlamp photocell sensor is located in the upper right quadrant of the mirror face, to detect the light level received at the rear window side of the mirror. When the mirror control circuitry detects that the difference between the two sensed light levels has become too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror) the mirror begins to darken. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror.

On vehicles equipped with an optional driver side automatic dimming outside rear view mirror, the signal to control the dimming of that mirror is generated by the automatic dimming inside rear view mirror circuitry. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

The BCM determines the ignition status and the gear status. Once determined, the BCM sends an enable/disable signal over the LIN bus to the electrochromic mirror. The electrochromic mirror reads the internal message for the sensor value and determines the ratio between forward/backward light intensity, along with the enable signal coming from the BCM, to determine the reflecting mode to be used.

OUTSIDE

The driver side automatic dimming outside mirror is operated by the same controls and circuitry as the automatic inside rear view mirror. When the automatic inside rear view mirror is switched ON or OFF, the automatic dimming outside mirror is likewise switched ON or OFF. Just as in the automatic inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the automatic dimming outside mirror. However, the signal to control the dimming of the outside mirror is generated by the automatic dimming inside rear view mirror control circuitry based upon the inputs from the two photocell sensors integral to the inside mirror. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

1. With the status of the ignition switch Of, disconnect and isolate the battery negative cable. Unplug the wire harness connector from the ElectroChromic Mirror Module (ECMM). Reconnect the battery negative cable, then transition the status of the ignition switch to On. Check for battery voltage at the fused ignition output (run) circuit cavity of the wire harness connector for the ECMM. If OK, go to step

2. If not OK, repair the open circuit as required.
2. Transition the status of the ignition switch to Off. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the wire harness connector for the ECMM and a good ground. There should be continuity. If OK, go to step 3. If not OK, repair the open circuit to ground as required.
3. Reconnect the wire harness connector for the ECMM. Reconnect the battery negative cable. Cover the forward facing ambient photocell sensor to keep out any ambient light. Transition the status of the ignition switch to On. Place the transmission gear selector lever in the Neutral position.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

4. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. Turn the light Off. The mirror glass should return to normal reflectance. If OK, go to step 5. If not OK, replace the ineffective ECMM unit.
5. Use a diagnostic scan tool and the appropriate diagnostic procedure to perform further ECMM diagnosis.

MIRROR, OUTSIDE REARVIEW

DESCRIPTION

DESCRIPTION

3825390

Fig. 1: Signal Lamps & Puddle Lamps
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional power operated outside rear view mirror system are equipped with a power mirror head unit located on the outside of each front door. Each power mirror has a molded plastic housing and bezel that faces rearward and a molded plastic decorative cover or shell that faces forward. The shell may also

include openings to accommodate Light Emitting Diode (LED) signal lamps (1) and puddle lamps (2) on vehicles equipped with those optional features.

The housing and shell are secured to a molded plastic arm with an integral, hollow pivot pin that is secured to the mirror mounting bracket. This pivot pin features a spring-loaded detent mechanism that allows the mirror to be manually folded toward the door glass for additional clearance during vehicle shipping or storage. The mirror mounting bracket has three threaded studs that are used to secure the mirror assembly to the flag area at the front of each front door glass opening.

3825398

Fig. 2: Blind Spot Monitor (BSM) LED Indicator Lamp Unit
Courtesy of CHRYSLER GROUP, LLC

The open rearward-facing side of the housing and bezel unit serves as a seat within which the mirror glass is exposed to the view of the vehicle operator. The mirror glass is mounted within a molded plastic case. In vehicles with the heated mirror option, a glass heating grid locked within a plastic membrane is sandwiched between the back of the mirror glass and the case. A Blind Spot Monitor (BSM) LED indicator lamp unit (1) is also integral to the case in vehicles with that option.

The mirror glass case snaps onto a swivel assembly integral to the mirror articulation mechanism on the arm within the mirror housing. The mirror articulation mechanism includes two small Direct Current (DC) electric motors with gear drives and clutch units that connect them to the swivel assembly. A mirror wire harness is connected to each of the electrical elements within the mirror housing and is routed through the hollow pivot pin and the mounting bracket to the interior of the front door, where it connects the mirror to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The power operated outside rear view mirror housing and bezel, mounting bracket, arm and articulation mechanism cannot be adjusted or repaired. If damaged or ineffective, the entire mirror unit must be replaced. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**. The puddle lamp and the signal lamp are available for separate service replacement. Refer to **LAMP, MIRROR, REMOVAL**. The mirror shell as well as a mirror glass and case unit with an integral heating grid and BSM indicator lamp are available for separate service replacement. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL**.

REMOVAL .**OPERATION****OPERATION**

Each power mirror articulation mechanism is driven by two individual Direct Current (DC) reversible electric motors. Each motor also features Positive Temperature Coefficient (PTC) protection. One motor in each mirror controls horizontal (left and right) movement, while the second motor controls vertical (up and down) movement. The power mirror selector switch setting determines which mirror is to receive the output from the power mirror control switch.

The power mirror control switch determines which motor will be energized and the direction in which the motor will be driven. When battery current and ground are output from the control switch to the two motor terminals, the motor rotates in one direction. When the switch output polarity to the motor connections is reversed, the motor rotates in the opposite direction. The mirror articulation mechanism also incorporates clutches that protect the mechanism by disengaging the drive whenever the travel limits of the articulation swivel have been reached.

The power mirrors as well as the hard wired input circuits for the mirrors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - POWER OUTSIDE REAR VIEW MIRROR**

The following tests will confirm whether the power mirror horizontal and vertical motors and articulation mechanisms are functional in either a driver or passenger outside rear view mirror. If the mirror motors and mechanisms pass the following tests, but a mirror fails to operate using the power mirror switch integral to the power lock and power window switch pod on the driver side front door, be certain to test the switch and the wiring between the switch and the mirror before considering component replacement.

Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** and refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the door to which the ineffective power mirror is secured. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect the door wire harness connector from the connector for the mirror to be tested.
4. Reconnect the battery negative cable.
5. Connect a jumper wire to a good body ground.
6. Connect a second jumper wire to a source of fused 12-volt battery current.
7. See the Power Mirror Motor Test table below for the correct jumper wire connections to the power mirror wire harness connector.

Fig. 3: Passenger Front Door Switch Module Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

POWER MIRROR MOTOR TEST TABLE

POWER MIRROR MOTOR TEST			
MIRROR CONNECTOR PINS		MIRROR REACTION	
12 VOLTS	GROUND	RIGHT MIRROR	LEFT MIRROR
Pin 1	Pin 2	-	Up
Pin 6	Pin 2	-	Left
Pin 2	Pin 1	-	Down
Pin 2	Pin 6	-	Right
Pin 7	Pin 2	Up	-
Pin 4	Pin 2	Left	-
Pin 2	Pin 7	Down	-
Pin 2	Pin 4	Right	-

NOTE: If either the horizontal or the vertical power mirror motor and articulation mechanism do not respond as indicated in the table, replace the ineffective power mirror assembly. If both power mirror motors and mechanisms respond as indicated in the table, test the power mirror switch. If the switch tests okay, test and repair the wiring between the power mirror switch and the power mirror for a short or open circuit as required.

SWITCH, MIRROR

DESCRIPTION

DESCRIPTION

2607275

Fig. 4: Driver Front Door Power Switch Module
Courtesy of CHRYSLER GROUP, LLC

The power mirror switch includes the mirror selector switch (2) and the mirror control switch (3), which are both integral to the driver side front door power switch module (1) located near the forward end of the arm rest on the driver side front door inside trim panel. The mirror selector switch includes two momentary push buttons marked **R** (Right) and **L** (Left). The mirror control switch includes a momentary selector disc marked with four directional arrow heads.

There are two unique versions of the driver side front door power switch module. One version is for use in vehicles equipped with the base power window system and is a high current design. The other version is for use in vehicles equipped with the premium power window system and is a low current design. Either version will operate the power mirror system correctly, but an incorrect version will not be compatible with the front door power window system components.

The power mirror switch is serviced only as a unit with the driver side front door power switch module (1). If any part of this switch module is ineffective or damaged, the entire module must be replaced with a new unit. Refer to **SWITCH, LOCK, REMOVAL**.

OPERATION

OPERATION

The power mirror switch circuitry within the driver side front door power switch module is connected to battery current through a non-switched fused B(+) circuit received from a fused B(+) fuse in the underhood Power Distribution Center (PDC). The power mirror switch circuitry also has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These connections allow the power mirror switch to remain operational regardless of the status of the ignition switch.

A latching push button power mirror selector switch has three positions, **L** (left), **R** (right) and **N** (neutral). After the right or left mirror is selected, one of the four directional arrows on the momentary power mirror control switch disc is depressed to move the selected mirror up, down, right or left. The power mirror control

switch directs the appropriate battery current and ground feeds to the proper horizontal or vertical motor within the mirror articulating mechanism of the selected power mirror.

The power mirror switches as well as the hard wired input and output circuits of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** .

2014 ACCESSORIES AND EQUIPMENT**Power Seats - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

2979749

Fig. 1: Seat Position Switch & Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

A driver side six-way power seat is available on this vehicle. The power seat system allows the driver to electrically adjust the seating position using the power seat switch (1) located on the outboard seat cushion side shield. This graphic also shows the available lumbar option if equipped (2).

The six-way power seat can be adjusted forward, rearward, front up and front down. This power seat system may also be equipped with heated seats.

Fig. 2: Reversible Motor, Up/Down Seat Motor & Forward/Rearward Seat Motor
 Courtesy of CHRYSLER GROUP, LLC

The power seat adjuster assembly is made up of an upper and a lower power seat adjuster. The upper power seat adjuster contains one reversible motor (1) that is connected to a gearbox that tilts the front of the seat cushion up and down. The lower power seat adjusted contains two reversible motors connected to gearboxes. One motor (2) tilts the rear of the seat up and down and the other motor (3) moves the seat assembly forward and rearward. When the rear and front tilt motors are activated together, the height of the driver seat raises and lowers. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damage the motors.

The power seat motors cannot be adjusted or repaired and if inoperative or damaged, the entire power seat adjuster assembly must be replaced.

0825008028

Fig. 3: Heated & Vented Seat System (HVS Equipped) Lumbar System & Heated Only Or Non Heated Or Non Vented Seat (non-HVS) Lumbar System
Courtesy of CHRYSLER GROUP, LLC

There are two possible lumbar systems available for this vehicle.

- **HEATED AND VENTED SEAT SYSTEM (HVS equipped) LUMBAR SYSTEM (1)**
- **HEATED ONLY OR NON HEATED OR NON VENTED SEAT (non-HVS) LUMBAR SYSTEM (2).**

OPERATION

OPERATION

The power seat system receives battery current through a fuse in the Power Distribution Center (PDC) and remains operational, regardless of ignition position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the gearbox and linkage is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

The power seat motors, gearboxes and linkage cannot be adjusted or repaired and if inoperative or damaged, the entire power seat adjuster and seat cushion pan, or the power reclining seat back must be replaced as an assembly.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SYSTEM

NOTE: For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Operate the power seat switches and power lumbar support switch. Move the seat, seat back and power lumbar support in all directions. The seat and lumbar support should move in each of the selected directions. If any of the power seat and/or lumbar support motors fail to operate in more than one direction, proceed as follows:

1. Inspect the power seat and power lumbar pneumatic motor to ensure the electrical connectors are fully connected to the motor. If OK, go to Step 2. If not OK, reconnect the electrical connector(s).
2. Check the power seat fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, replace the fuse.
3. Remove the power seat switch and/or power lumbar switch from the seat cushion side panel. Check for

battery voltage at the fused B(+) circuit cavity of the switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

4. Check for continuity between the ground circuit cavity of the power seat switch and/or power lumbar switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open circuit to ground as required.
5. Test the power seat switch and/or power lumbar switch. Refer to **SWITCH, SEAT, DIAGNOSIS AND TESTING** and **SWITCH, LUMBAR CONTROL, DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the switch and the motor(s) (refer to **SYSTEM WIRING DIAGRAMS**). If the circuits check OK, replace the inoperative power seat track or the seat back assembly (Refer to **SEATS, FRONT** or **SEATS, REAR**). If the circuits are not OK, repair the wire harness as required.

SWITCH, MEMORY

DESCRIPTION

DESCRIPTION

Fig. 4: Memory Switch & Driver Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

When equipped, the memory seat switch (2) is located on the driver door trim panel (1). The driver seating position can be automatically adjusted for two different driver preference settings using the memory seat switch. The memory seat system is able to store and recall all driver power seat positions (fore/aft, up/down, tilt and recline), driver side power rear view mirror position and the power adjustable steering column position, when equipped. The memory system is also able to store and recall up to twenty radio station presets for two drivers (ten AM and ten FM). The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

OPERATION

OPERATION

When one of the two driver memory seat switches is pressed, a resistance signal is sent to the Memory Seat Module (MSM) over the Controller Area Network (CAN) data bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat motors.

The MSM receives the memory seat switch set and selection inputs through the CAN bus circuit, along with input signals from the hall effect sensors in the driver side mirror and power adjustable steering column (when equipped), and hardwired input signals from the hall effect sensors mounted in each of the driver power seat motors. The programmed software in the module allow it to know where the driver seat, driver side mirror and power adjustable steering column (when equipped) are located in their designed travel, by the pulse count generated from each hall effect sensor. This way, when a memory switch is pressed, the MSM powers the driver seat, driver side mirror and power adjustable steering column (when equipped), until each correct preset location is achieved. The MSM will prevent seat memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the driver seat belt is latched. These inputs are monitored by the MSM over the CAN bus.

- A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "set" button.
- A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

The memory seat switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The memory seat switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

REMOVAL**REMOVAL**

NOTE: **Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.**

3067628

Fig. 5: Memory Seat Switch & Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the driver door handle and place it on a workbench. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Using an appropriate flat bladed tool, gently disengage the four retaining tabs (2 and 4) that secure the memory seat switch (1) to the back of the driver door handle bezel (3).
4. Remove the memory seat switch from the driver door handle bezel.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.

Fig. 6: Memory Seat Switch & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Install the memory seat switch (1) into the driver door handle bezel (3). Push the switch firmly into the bezel until the retaining tabs (2 and 4) are fully engaged.
2. Install the driver door handle and bezel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.
3. Reconnect the negative battery cable.
4. Using a scan tool, perform the Power Seat System Verification test. Refer to **STANDARD PROCEDURE**.
5. Verify proper memory seat system operation.

MOTOR, SEAT

REMOVAL

REMOVAL- SEAT HEIGHT ADJUSTMENT MOTOR

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Use caution when removing the height adjust motor and gearbox assembly (2) if the motor is inoperative, and the power seat is not in the full up position. The seat adjuster assembly is under load from the height adjust assist spring and may cause the motor to rotate under pressure

when the fasteners are removed. The seat adjuster assembly also may spring upward when the motor is removed. If the height adjust motor is operative, move the power seat to the full up position prior to disconnecting the battery.

Fig. 7: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inoperative front seat. Refer to **SEAT, REMOVAL**.
3. Disconnect the height adjust motor electrical connector.
4. Remove the height adjust motor gearbox spindle (1) retaining screw (4).
5. Remove the motor retaining screws (3).
6. Remove the height adjust motor and gearbox assembly (2) from the seat track.

REMOVAL- SEAT FORWARD/AFT MOTOR

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

81cff6b2

Fig. 8: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inoperative front seat. Refer to **SEAT, REMOVAL** .
3. Remove the flex drive cable cover (2).
 - a. Using a small flat bladed tool, release the mounting strap (1) that secures the flex drive cable cover (2) to the fore/aft motor (5).
 - b. Pivot the cover away from the cable and pull it away from the seat frame (4) to disengage the cover slot from the mounting tab (3).

81cff6d2

Fig. 9: Flex Drive Cable
Courtesy of CHRYSLER GROUP, LLC

4. Remove the flex drive cable.

- a. Carefully bend the flex drive cable at the center and pull the motor end (3) away from the fore/aft motor (1) to disengage.
- b. Pull the cable out of the screw drive assembly (2) and remove from seat track.

81c1f6eb

Fig. 10: Seat Frame Assembly
 Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fore aft motor electrical connector.
6. Remove the fore/aft motor to mounting bracket retaining screws (1).
7. Remove the fore/aft motor (3).
8. Remove the short flex drive cable (2) from the seat frame assembly (4).

INSTALLATION

INSTALLATION - SEAT FORWARD/AFT MOTOR

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: Seat track side to side timing may be off if the fore aft motor was completely inoperative prior to removal. In the event the track timing is in question, proceed to for track timing procedure. If track timing is not in question proceed to.

1. Using the square drive end of the old flex drive cable and a variable speed drill motor, drive the seat track screw drive assemblies reward until they reach the rear stops.
 - a. Clamp one end of the old cable into the drill motor chuck.
 - b. Put the other cable end into the seat track screw drive cable slot and slowly drive the seat track assembly reward until it reaches the rear stops. Take care not to bind the cable when the drive reaches the stop.
 - c. Repeat this procedure for the other seat track.

81cfff6eb

Fig. 11: Removing/Installing Short Flex Drive Cable & Fore/Aft Motor
 Courtesy of CHRYSLER GROUP, LLC

2. Install the short flex drive cable (2) into the seat frame assembly (4). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.
3. Install the fore/aft motor (3) ensuring the square cable end is properly aligned and fully inserted into the square drive slot of the motor.
4. Install the motor retaining screws (1). Tighten the screws to 5 N.m (45 in. lbs.).

Fig. 12: Flex Drive Cable
Courtesy of CHRYSLER GROUP, LLC

5. Install the flex drive cable.
 - a. Install the flex drive cable into the seat frame assembly (2). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.
 - b. Install the flex drive cable into the fore/aft motor (1). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the motor assembly (3).

Fig. 13: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER GROUP, LLC

6. Position the flex drive cable cover (2) onto the seat track assembly (4). Ensure the cover slots are properly aligned and fully inserted onto the mounting tabs (3).
7. Pivot the cable cover towards the cable and onto the fore/aft motor (5).

8. Secure the cover to the motor with the retaining strap (1).
9. Connect the fore/aft motor electrical connector.
10. Install the power seat. Refer to **SEAT, INSTALLATION** .
11. Verify proper power seat operation.

INSTALLATION

Fig. 14: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Screw the height adjust motor gearbox spindle (1) in or out as necessary until the motor retaining screws (3) and spindle screw (4) holes are aligned and all fasteners can be installed.
2. Position the height adjust motor and gearbox assembly (2) onto the seat track.
3. Install the motor retaining screws (3). Tighten the screws to 12 N.m (106 in. lbs.).
4. Install the height adjust motor gearbox spindle (1) retaining screw (4). Tighten the screw to 17 N.m (150 in. lbs.).
5. Connect the motor electrical connector.
6. Install the seat. Refer to **SEAT, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Verify proper power seat operation.

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

082574994

Fig. 15: Seat Position Switch & Power Seat Recliner Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: Driver power seat switch shown.

The standard driver power seat and available power front passenger seats can be adjusted using the power seat switch located on the outboard seat cushion side shield.

The power seat adjuster switch assembly is used for adjusting the front seats (both driver and passenger) position, it could have one or two knobs depending on the different versions (4-way, 6-way, 8-way).

Both the high current and low current versions of the power seat adjuster switch assemblies is to provide a means to electrically adjust the position of the front driver and passenger seats, high current switch feeds the Seat motors directly whilst low current is used in vehicles with Memory Recall feature so the signal travel to an ECU which controls the motors.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track adjuster motor. The selected adjuster motor operates to move the seat through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12 volt battery feed and ground path to the power seat adjuster motors.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The

power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The individual switches in the power seat switch cannot be adjusted or repaired. If a switch is damaged or inoperative, the entire power seat switch must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

8132c253

Fig. 16: Power Seat Switch Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch. If not OK, replace the faulty power seat switch. If switch tests OK, refer to **DIAGNOSIS AND TESTING**.

POWER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or

service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

2980599

Fig. 17: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when servicing the power seat switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL**.
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the power seat switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the power seat switch and remove the switch.

INSTALLATION

INSTALLATION

2980599

Fig. 18: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power seat switch (1). Make sure the connector is fully engaged to the switch.
2. Position the power seat switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION**.
4. Connect the negative battery cable.
5. Verify proper power seat operation.

SWITCH, LUMBAR CONTROL

DESCRIPTION

DESCRIPTION

2733809

Fig. 19: Power Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The Power Lumbar Switch which is located at the side bottom of both driver and front passenger seat. It is used to provide a means to electrically adjust the position of the front driver and passenger seats to make it more comfortable. It is able to adjust the Seat Back Rest Lumbar support forward and Rearward. It is also able to adjust the Lumbar Support position upward and downward. It's a high current switch driving the seat motors directly from battery feed.

There are two available lumbar systems available for this model. Vehicles with Heated and Vented Seats (HVS) receive a motor and cable driver lumbar system. Vehicle with heated seat or no heating or cooled accessories will receive a non-HVS system which involves a pneumatic pump and bladder.

OPERATION

OPERATION

HEATED ONLY OR NON HEATED OR NON VENTED SEAT (non-HVS) LUMBAR SYSTEM - When a power lumbar support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar pneumatic pump. The pneumatic pump operates the lumbar support bladder in the selected direction until the switch is released, or until the fill limit of the bladder is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the pneumatic pump motor to run in the opposite direction.

The power lumbar support switch should not be held applied in any direction after the bladder has reached its travel limit. The power lumbar support pneumatic motor contains a self-resetting circuit breaker to protect from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The power lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

HEATED AND VENTED SEAT SYSTEM (HVS equipped) LUMBAR SYSTEM - When a power lumbar

support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar support adjuster. The selected lumbar support adjuster motor operates the lumbar support adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the selected power lumbar support adjuster motor to run in the opposite direction.

No power lumbar support switch should be held applied in any direction after the adjuster has reached its travel limit. The power lumbar support adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The power lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LUMBAR SWITCH

NOTE: For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

2834249

Fig. 20: Power Lumbar Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power lumbar support switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power lumbar support switch using the following table. If not OK, replace the inoperative power lumbar support switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the power lumbar

support adjuster motor(s) as required.

LUMBAR SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	1-2, 1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
UP	1-2, 1-3, 1-4, 2-3, 2-4, 3-4, 5-6
DOWN	1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
IN	1-2, 1-4, 1-5, 2-6, 3-4, 3-5, 4-5
OUT	2-4, 2-5, 3-6, 4-5

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

2980511

Fig. 21: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when

servicing the power lumbar control switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL** .
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the lumbar control switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the lumbar control switch and remove the switch.

INSTALLATION

INSTALLATION

2980511

Fig. 22: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power lumbar control switch (1). Make sure the connector is fully engaged to the switch.
2. Position the lumbar control switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION** .
4. Connect the negative battery cable.
5. Verify proper power lumbar support operation.

2014 ACCESSORIES AND EQUIPMENT**Power Top/Sunroof - Service Information - Cherokee****DESCRIPTION****DUAL PANE SUNROOF**

The optional dual pane (also known as the CommandView®) sunroof has one movable deep tinted glass pane over the front row seating and one fixed deep tinted glass pane over the second row seating. This unit also features a power operated sunshade that extends over both the front and rear glass panes when closed. If one of the switch push buttons for the movable pane is actuated while the sunshade is extended over the front glass opening, the system will automatically retract the sunshade to behind the front glass opening before moving the sunroof glass pane. Therefore, the sunshade can never cover the movable glass pane opening unless the pane is in the fully closed position.

The dual pane power sunroof system allows the sliding glass sunroof panel to be opened, closed or placed in a ventilation position electrically by actuating one of three switch push buttons located in the overhead console. The electronic controls integral to the sunroof motor and module unit provide an express (also known as one-touch) feature to simplify sunroof opening and closing while driving. The electronics also provide an Excess Force Limitation (EFL) feature, which detects obstacles trapped between the glass and the opening in the vehicle roof panel during closing.

A second two push button switch in the overhead console provides separate express features for opening and closing the sunshade. The power operated sunshade electronics also provide an EFL feature, which detects obstacles trapped between the sunshade and the opening in the vehicle roof panel during closing.

The sliding sunroof glass panel tilts upward at the rear for the ventilation position, or slides downward and rearward beneath the fixed glass panel for the open position. The sliding glass panel seals flush with the roof in the closed position to eliminate wind noise, and an integrated mesh wind deflector reduces wind buffeting at low speeds with the sunroof open.

The major components of the dual pane power sunroof system include:

- **Fixed Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Frame and Mechanism** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Motor And Electronic Module Units** - The dual pane power sunroof and power sunshade motor and electronic module units are secured to each side of center on the front frame member of the sunroof, between the outer roof panel and the headliner.
- **Power Sunshade** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Sliding Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Switches** - The dual pane power sunroof and power sunshade switches are integral to the overhead console centered in the headliner between the windshield upper header and the front of the sunroof opening.
- **Wind Deflector** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

Hard wired circuitry connects the dual pane power sunroof system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the dual pane power sunroof system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

DUAL PANE SUNROOF AND SUNSHADE

The dual pane power sunroof sliding glass panel and power sunshade motors both receive battery feed through a fused B(+) circuit from the Power Distribution Center (PDC). However, the on-board electronic module of each sunroof or sunshade motor monitors an input on a fused ignition (run - accessory) circuit and is configured to only allow the power sunroof and the power sunshade to be operated with the switches in the overhead console when the ignition switch is in the ON or ACCESSORY positions, or using the accessory delay feature for a timed interval after the ignition is turned to the OFF position as long as neither front door has been opened.

The electric motor and electronic module unit of the sunroof or sunshade moves the sliding glass panel or the sunshade through the use of mechanical drive cables as well as mechanical linkages and guides. Refer to **SUNROOF, DUAL PANE, DESCRIPTION** for additional information on these components..

The on-board electronic modules integral to the power sunroof and sunshade motors provide both express (also known as one-touch) and manual opening and closing for their respective motors based upon module programming and the inputs received from the sunroof and sunshade switches integral to the overhead console. The electronic modules store and recall a sliding glass panel or a power sunshade hard stop position, then counts the direction and number of motor rotations from that hard stop to enable the express open and close features. These hard stops must be learned by a service replacement motor and electronic module unit during an initialization procedure.

In addition, the electronic modules are programmed to move only one motor at a time. The two motors communicate switch input information as well as sunroof and sunshade position information with each other through a serial bus circuit, but do not communicate with any other electronic modules in the vehicle. The electronic modules are programmed to move the sunshade out of the way into a safe mid-open position automatically before allowing the sliding glass panel to move. Likewise, if the sunshade switch is depressed to close the sunshade while the sliding glass panel is in an open position, the electronic modules are programmed to automatically close the glass panel before closing the sunshade.

The electronic modules also provide an obstacle detection (also known as Excess Force Limitation/EFL) feature for both the sliding glass panel and the sunshade. The modules each monitor motor closing load through motor speed. When an obstacle is detected due to a significant decrease in motor speed, the module will stop the motor closing motion while limiting the forces applied to the obstacle, then reverse the motor direction to allow the obstacle to be removed.

The electronic modules provide a thermal protection feature to protect the motors from abuse or overheating. If

the motor is cycled enough to cause overheating, the software will allow one final closing cycle before it stops responding to further switch inputs. Once a motor has cooled sufficiently, normal operation will be automatically restored. However, the ignition switch must remain in the ON or ACCESSORY positions so that the module remains awake long enough to monitor the cool down of the motor.

The power sunroof and sunshade circuits and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the on-board electronic modules or the power sunroof and power sunshade motors. If there are no issues with the power sunroof and sunshade mechanisms and the power sunroof or power sunshade switches and circuitry test okay, but the motor and express or EFL features are still ineffective following the initialization procedure, the motor and electronic module unit must be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRIVE MOTOR TEACH PROCEDURE

REPLACEMENT DRIVE MOTOR

1. Operate the sunroof manually and continuously through one full Vent and Slide cycle.
2. After completion of complete cycle, release sunroof switch. Sunroof will now operate normally.
3. Verify sunroof express function operation.

ORIGINAL DRIVE MOTOR

1. Press and hold sunroof Vent switch until the sunroof glass vents and stops.
2. Release sunroof switch.
3. Press and hold sunroof Vent switch once again for at least 15 seconds. After 15 seconds of pressing the Vent switch, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Operate the sunroof manually and continuously through one full Vent and Slide cycle.
6. After completion of complete cycle, release sunroof switch. Sunroof will now operate normally.
7. Verify sunroof express function operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SUNROOF SYSTEM

The hard wired circuits between components related to the operation of the single pane power sunroof system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module

integral to the power sunroof motor. If the power sunroof switches, motors and circuitry test okay, but the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module unit must be replaced.

NOTE: If there is no sliding sunroof panel movement when the power sunroof switch **OPEN** or **CLOSE** push button is depressed, but there is movement when the **VENT** push button is depressed, the sunroof module requires calibration. Complete the **Single Pane Sunroof Motor And Module Initialization** procedure prior to performing any further sunroof diagnosis. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

CONDITION	POSSIBLE CAUSES	CORRECTION
POWER SUNROOF COMPLETELY INOPERATIVE	1. Ineffective ground circuit.	1. Test and repair the open sunroof motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open sunroof motor feed circuit if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
AUDIBLE WHINE WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective sunroof motor and module unit.	2. Replace the sunroof motor and module unit if required.
AUDIBLE CLICKING OR RATCHETING WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to <u>ADJUSTMENTS</u> or <u>ADJUSTMENTS</u> .
	2. Damaged or worn drive cable.	2. Replace the broken or worn drive cable if required.
	3. Damaged or worn motor drive gear.	3. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND OPENS BUT DOES NOT CLOSE	1. Damaged or disengaged trough guide.	1. Replace or reinstall trough guide if required.
	2. Binding drive cable.	2. Replace the binding drive cable if required.
	3. Ineffective CLOSE circuit.	3. Repair the sunroof CLOSE circuit between the switch and the motor if required.
	4. Ineffective sunroof switch.	4. Test and replace the sunroof switch (overhead console assembly) if required.
	5. Ineffective sunroof motor and module unit.	5. Replace the sunroof motor and module unit if required.
	1. Binding drive cable.	1. Replace the binding drive cable if required.

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Power Top/Sunroof - Service Information - Cherokee

POWER SUNROOF VENTS AND CLOSES BUT DOES NOT OPEN	2. Ineffective OPEN circuit.	2. Repair the sunroof OPEN circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF DOES NOT VENT	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective VENT circuit.	2. Repair the sunroof VENT circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF GLASS MOVEMENT INCONSISTENT - NOT SMOOTH AND UNIFORM	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to <u>ADJUSTMENTS</u> or <u>ADJUSTMENTS</u> .

MOTOR, SUNROOF

DESCRIPTION

DESCRIPTION

2850106

Fig. 1: Single Pane Sunroof Motor
Courtesy of CHRYSLER GROUP, LLC

2850134

Fig. 2: Dual Pane Sunroof Or Sunshade Motor
Courtesy of CHRYSLER GROUP, LLC

The motor and electronic module units for both the single pane sunroof and the dual pane sunroof or sunshade are quite similar, but are not interchangeable. However, the dual pane sunroof and sunshade motor and module units are interchangeable and configure themselves to either sunroof or sunshade operation through a configuration pin in the sunshade connector of the sunroof wire harness. Each sunroof motor (5) is a reversible, 12-volt Direct Current (DC), permanent magnet motor with internal thermal protection.

The single panel sunroof has a single motor and electronic module unit secured by three screws near the center of the underside of the front sunroof frame member where it is concealed above the headliner. The dual pane sunroof has two motor and electronic modules, each secured by three screws to the underside of the front sunroof frame member and concealed above the headliner. The motor to the left of center operates the sliding

glass mechanism, while the motor to the right of center operates the power sunshade mechanism.

Each motor is connected mechanically to the sunroof or sunshade drive gear (4) through a right angle drive, gear reduction transmission (3). Each motor also is connected electrically to an on-board electronic control unit (2) that has an integral connector receptacle (1) that connects the unit to the vehicle electrical system through a dedicated take out and connector of the sunroof wire harness.

The sunroof motor or sunshade motor and electronic module units cannot be repaired. If ineffective or damaged, the entire motor and module unit must be replaced.

OPERATION

OPERATION

The single pane and dual pane power sunroof and power sunshade motors are each completely controlled by the circuitry of their respective on-board electronic module. The module receives battery current on a fused B(+) circuit from the Power Distribution Center (PDC) and has a path to ground at all times through a take out and eyelet terminal connector secured by a ground screw to the body sheet metal. These connections allow the module to function regardless of the ignition switch position.

However, the modules both monitor an input on a fused ignition switch output (run - accessory) circuit, and provide a source current to the sunroof and sunshade switches in the overhead console only when the ignition switch is in the ON or ACCESSORY positions, or while the accessory delay feature is active. The modules then monitor a separate input circuit for each switch position, which it uses to determine the proper outputs to the power sunroof or power sunshade motor. A positive and negative battery connection to the two motor brushes will cause the power sunroof or sunshade motor to rotate in one direction. Reversing the current through these same two brushes will cause the motor to rotate in the opposite direction.

The hard wired circuits of the power sunroof and power sunshade motors as well as those between the electronic modules and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof and power sunshade motors. If the power sunroof or power sunshade switches and the hard wired circuitry test okay, but the motor or the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module must be replaced as a unit.

STANDARD PROCEDURE

DUAL PANE SUNROOF OR SUNSHADE OVERRIDE POSITION CALIBRATION

SLIDING GLASS

The sliding glass panel motor stalls when the glass reaches the fully vented position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the fully closed and fully open positions of the glass are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully vented motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the power sunshade is open at least beyond the back of the sliding glass panel opening.
4. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel is in the fully vented position or until the motor will not drive the glass any further towards the fully vented position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the VENT push button of the sunroof switch for about ten seconds. At the end of ten seconds, the motor will try to drive the sliding glass panel to the fully vented position. Once motor stall is detected the electronic module will write that stall position to memory as the new glass position.
9. Verify sliding glass panel motor operation by cycling the glass to fully opened, fully closed, fully vented, then fully closed again.

SUNSHADE

The sunshade motor stalls when the shade reaches the fully closed position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the mid-opened and fully opened positions of the shade are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully closed motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the sliding glass panel is in the fully closed position.
4. Depress and hold the CLOSE push button of the sunshade switch until the shade is in the fully closed position or until the motor will not drive the shade any further towards the fully closed position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the CLOSE push button of the sunshade switch for about ten seconds. At the end of ten seconds, the motor will try to drive the shade to the fully closed position. Once motor stall is detected, the electronic module will write that stall position to memory as the new shade position.
9. Verify sunshade motor operation by cycling the shade to mid-opened, fully opened, then fully closed again.

DUAL PANE SUNROOF OR SUNSHADE OBSTACLE DETECTION UPDATE

The obstacle detection function (also known as Excessive Force Limitation/EFL) updates the sunroof sliding glass panel and sunshade closing profiles after each successful CLOSE event as long as temperature and voltage are within a normal range. Being certain that these parameters are within range and cycling the sliding glass panel and sunshade will update the obstacle detection settings in the electronic module software.

- Be certain electrical system voltage is at or above 12.5 volts.
- Be certain vehicle is in an area that is near room temperature - 20 to 25° C (68 to 77° F).
- Be certain the key is in the ignition switch and the switch is in the ON position.
- Be certain there are no physical binds or blockages to sliding glass panel or sunshade travel.

SLIDING GLASS

1. Be certain the power sunshade is in the fully open position.
2. Depress the VENT push button of the sunroof switch so that the sliding glass panel travels to the fully vented position.
3. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
4. Depress the OPEN push button of the sunroof switch so that the sliding glass panel travels to the fully opened position.
5. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
6. Repeat Steps 2 through 5 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Be certain the sunroof sliding glass is in the fully closed position.
2. Depress the OPEN push button of the sunshade switch so that the shade travels to the mid-open position.
3. Depress the OPEN push button of the sunshade switch again so that the shade travels to the fully opened position.
4. Depress the CLOSE push button of the sunshade switch so that the shade travels to the fully closed position.
5. Repeat Steps 2 through 4 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF MOTOR AND MODULE INITIALIZATION**SINGLE PANE SUNROOF****INITIALIZATION**

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: **Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.**

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sunroof sliding glass panel moves to the fully closed hard stop and then back to the tilt (VENT) position.
2. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push button again within 5 seconds.
3. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
4. Initialization is complete. Release the sunroof switch push button.

REINITIALIZATION

The following procedure causes a previously calibrated and properly operating electronic motor module to relearn and update motor stall position and obstacle detection.

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sliding glass panel is fully closed.
2. Continue to hold the CLOSE push button of the sunroof switch. It will take at least 10 seconds for the initialization process to begin.
3. The sunroof sliding glass panel will move to the hard stop and then back to the tilt (VENT) position.
4. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push button again within 5 seconds.
5. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
6. Initialization is complete. Release the sunroof switch push button.

DUAL PANE SUNROOF

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.

SUNROOF

1. Turn the ignition switch to the ON position.

2. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel has moved to the fully vented position.
3. Be certain that the sunshade has opened to at least beyond the back of the sliding glass panel opening before finishing the sunroof motor and module initialization.
4. Depress the VENT push button of the sunroof switch and release. The sliding glass panel should travel to the fully vented position.
5. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel past the fully closed position, then reverse direction back to fully closed to set the sunroof seal.
6. Depress the OPEN push button of the sunroof switch and release. The sliding glass panel should travel to the fully opened position.
7. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel to the fully closed position.
8. Repeat Steps 4 through 7 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Turn the ignition switch to the ON position.
2. Depress and hold the CLOSE push button of the sunroof switch until the sliding sunshade panel has moved to the fully closed position.
3. Be certain that the sunroof sliding glass panel is in the fully closed position before finishing the sunshade motor and module initialization.
4. Depress the OPEN push button of the sunshade switch and release. The sunshade panel should travel to the mid-open position at least beyond the back of the sliding glass panel opening.
5. Depress the OPEN push button of the sunshade switch again and release. The sunshade panel should travel to the fully opened position.
6. Depress the CLOSE push button of the sunshade switch and release. The sunshade panel should travel to the fully closed position.
7. Repeat Steps 4 through 6 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF OR SUNSHADE OBSTACLE DETECTION REVERSAL OVERRIDE**SINGLE PANE**

There are two methods for overriding the obstacle detection feature if the single pane sunroof sliding glass is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof switch during the close. The sunroof will be in override mode during the close.

OVERRIDE - METHOD 2

Once the sunroof encounters and reverses on an obstacle during express (one touch) closing three consecutive times, the sunroof will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof obstacle detection override mode is exited by reaching the close position. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

DUAL PANE

There are two methods for overriding the obstacle detection feature if the dual pane sunroof sliding glass panel or sunshade is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof or sunshade switch during the initial close, during the reversal and for 2 seconds after the reversal stops. If the CLOSE push button is released at any time between the initial close and the end of the 2 seconds after the reversal stops, the sunroof or sunshade will not enter override mode. Once the CLOSE push button has been held through these events, the sunroof or sunshade will be in primary override mode. All CLOSE push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in primary override mode.

OVERRIDE - METHOD 2

Once the sunroof or sunshade encounters and reverses on an obstacle during closing three consecutive times with no other sunroof or sunshade push button switches being depressed, the fourth time the CLOSE push button is depressed, the sunroof or sunshade will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof or sunshade obstacle detection override mode is exited by either reaching the close position or by depressing any sunroof or sunshade switch push button except CLOSE to remove the obstacle. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

REMOVAL

REMOVAL

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage

to the vehicle, to the sunroof or in serious or fatal injuries.

2842625

Fig. 3: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Lower the headliner (1) from the inner roof panel. Refer to **HEADLINER, REMOVAL**.
3. Remove the three screws (2) that secure the motor and module to the sunroof frame.
4. Lower the motor and module unit far enough to access and disconnect the sunroof wire harness connector from the motor and module connector receptacle (3).
5. Remove the sunroof motor and module unit from the vehicle.

INSTALLATION

INSTALLATION

WARNING: Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.

WARNING: The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries.

Fig. 4: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
 Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof motor and module unit (4) close enough to the sunroof frame to access and reconnect the sunroof wire harness connector to the motor and module connector receptacle (3).
2. Position the motor and module through the headliner bracket opening and onto the sunroof frame.
3. Install and tighten the three screws (2) that secure the motor and module to the sunroof frame. Tighten the screws to 4 N.m (35 in. lbs.).
4. Reinstall the headliner (1) to the inner roof panel. Refer to **HEADLINER, INSTALLATION** .
5. Reconnect the battery negative cable.
6. Perform the Sunroof Motor And Module Initialization standard procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

Fig. 5: Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a power sunroof have a power sunroof switch (3) integral to the overhead console (1) located in the headliner just forward of the sunroof opening. The switch buttons are centered between the two map/reading lamps (4), forward of the sunglasses storage bin (5) and, if equipped, rearward of the universal transmitter (Homelink®) push buttons (2). This switch has three momentary push buttons clearly identified by either text or icons indicating their functions. The three functions are from front-to-back: AUTO (CLOSE), VENT and AUTO (OPEN). The switch push buttons also have instrument panel dimmer controlled Light Emitting Diode (LED) units that provide back lighting for visibility at night.

The power sunroof switch is connected to the vehicle electrical system through the printed circuit board of the overhead console, which is connected to a dedicated take out and connector of the overhead wire harness. If the switch is ineffective or damaged, the entire overhead console must be replaced.

OPERATION

OPERATION

The power sunroof switch is hard wired to the electronic module integral to the power sunroof motor. The electronic module provides the switch with a source current whenever the status of the ignition switch is ON or ACCESSORY. When one of the switch push buttons is depressed, it sends a signal back to the electronic module and the electronic module controls the motor to move the sunroof panel to the appropriate position.

A short duration (less than 800 milliseconds) press of the switch push button is interpreted by the electronic module as an AUTO (also known as express or one touch) command, where the motor will automatically move the glass panel to the fully open, fully closed or the ventilation position. A long duration (greater than 800 milliseconds) press of the push button is interpreted by the electronic module as a manual command, where the motor moves only as long as the push button is held in the depressed position. During an AUTO event, any new switch input will immediately stop the event in progress which, as in the manual mode, allows the customer to stop the sliding glass panel at any desired location.

The power sunroof switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SUNROOF SWITCH

3764602

Fig. 6: Overhead Console Wire Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.
3. Disconnect the overhead wire harness connector from the overhead console connector receptacle.
4. Using a multimeter, test the continuity between the terminals of the overhead console connector receptacle while actuating the power sunroof switch as shown in the Sunroof Switch Tests chart.

SUNROOF SWITCH TESTS	
SWITCH POSITION	CONTINUITY BETWEEN PINS
NO BUTTONS PRESSED (OFF)	NO CONTINUITY BETWEEN PINS 7, 8 or 9 and PIN 10
AUTO (OPEN)	7 and 10
AUTO (CLOSE)	9 and 10
VENT	8 and 10

5. If the switch fails any of the tests, replace the overhead console and the switch as a unit.

REMOVAL

REMOVAL

The power sunroof switch is serviced only as a unit with the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .

INSTALLATION

INSTALLATION

The power sunroof switch is serviced only as a unit with the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION** .

2014 ACCESSORIES AND EQUIPMENT**Power Windows - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed only when the ignition switch is in the RUN or ACCESSORY position. The power window system will also operate when in power accessory delay

Vehicles equipped with Express Up Windows are equipped with a door module. Refer to **OPERATION** for further information.

Vehicle equipped with One Touch Down (OTD) employ a Smart Window Motor. Refer to **OPERATION** for further information.

For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to **BODY - INTERIOR & EXTERIOR** .

OPERATION**OPERATION**

Power Window Switch - The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows. The power window switch for the driver side front door window has a second detent position beyond the normal Down position, that provides an automatic one-touch window down feature. Some vehicles may be equipped with an express closing feature (front windows only). During an express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverses travel to avoid pinching an occupant fingers. Modules in the doors are programmed to compare the position of the glass to the amount of current being used to drive up the glass. The system also includes various features to manage the perceived forces on the glass as it travels up. If the express closing calibration is lost, the system will self-calibrate itself after the windows are moved up and down two cycles. The power window switches control the battery and ground feeds to the power window motors. All passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted. Please review the power window switch service information for further operation detail. Refer to **SWITCH, POWER WINDOW, DESCRIPTION**.

Door Control Modules (DCM) - The (Driver Door Module (DDM) and Passenger Door Module (PDM)) opens or closes the windows when a actuation input signal from the window switch is received. This is only

powered when the ignition switch is in the RUN or ACCESSORY position. Power is supplied to the modules through the Power Distribution Center (PDC). For further DCM/DDM/PDM operation, refer to **MODULE, DOOR, DESCRIPTION** .

Power Window Motor - A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction. Each individual motor is grounded through the master switch. In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads. The power window motor and gearbox assembly cannot be adjusted or repaired. If damaged or ineffective, the entire unit must be replaced. Refer to **MOTOR, WINDOW REGULATOR, REMOVAL**.

EXPRESS UP/DOWN WINDOW FEATURE

Express operation is time-driven. If the window button is pressed for more than 50 milliseconds but less than 800 milliseconds, the window motor activates express operation. The smart motors will ignore any switch input lasting longer than 15 seconds. Vehicles may be equipped with either express down or express up and down.

EXPRESS AUTO-UP FEATURE WITH ANTI-PINCH PROTECTION

AUTO-Up Feature With Anti-Pinch Protection - If Equipped Lift the window switch to the second detent, release, and the window will go up automatically. To stop the window from going all the way up during the AUTO-up operation, push down on the switch briefly. To close the window part way, lift the window switch to the first detent and release it when you want the window to stop.

Anti-Pinch Functionality - The Anti-Pinch strategy is only active after the system has been initialized. This function will work during manual and express window functions. If the window runs into any obstacle during auto-closure, it will reverse direction and then go back down. Remove the obstacle and use the window switch again to close the window. Any impact due to rough road conditions may trigger the auto-reverse function unexpectedly during auto-closure. If this happens, pull the switch lightly to the first detent and hold to close the window manually.

EXPRESS DOWN WINDOW FEATURE

This feature allows the driver or front passenger to lower the door glass to its full-down position without holding the switch while the glass is in motion. To activate the Express-down feature depress the window switch to its second detent and release, the door glass will lower automatically. This feature may also be controlled and allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the Remote Keyless Entry (RKE) transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOWS

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

ALL WINDOWS INOPERATIVE

1. Check the circuit breaker. If OK, go to Step 2. If not OK, replace the inoperative circuit breaker.
2. Disconnect and isolate the battery negative cable. Remove the window/lock switch from the driver side front door trim panel. Unplug the wire harness connector.
3. Check for continuity between the ground circuit cavity of the door module wire harness connector and a good ground. If OK, go to Step 4. If not OK, repair the circuit to ground as required.
4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the window/lock switch wire harness connector. If OK, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . If not OK, repair the circuit as required.

ONE WINDOW INOPERATIVE

The window glass must be free to slide up and down for the power window motor to function properly. If the glass is not free to move up and down, the motor will overload and trip the integral circuit breaker. To determine if the glass is free, disconnect the regulator from the glass. Then slide the window up and down by hand.

There is an alternate method to check if the glass is free. Position the glass between the up and down stops. Then, shake the glass in the door. Check that the glass can be moved slightly from side to side, front to rear, and up and down. Then check that the glass is not bound tight in the tracks. If the glass is free, proceed with the diagnosis that follows. If the glass is not free, determine the cause of the condition.

If the only inoperative window is in the driver or passenger side front door and the preceding checks have not identified a problem. Refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If the problem being diagnosed involves only the Auto-down feature for the driver side front door window, but all of the power windows are operational, replace the driver's side window/lock switch. For diagnosis of the window/lock switch, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . For a rear power window problem, proceed with the following:

1. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the power window switch unit on the door with the inoperative power window. Check for continuity between the ground circuit cavity of the power window switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open circuit to the power window and door lock master switch as required.
2. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity in the body half of the power window switch unit wire harness connector. If OK, go to Step 3. If not OK, repair the open circuit to the power window and door lock master switch as required.
3. Test the power window switch continuity. Refer to **SWITCH, POWER WINDOW, DIAGNOSIS AND TESTING**. If OK, go to Step 4. If not OK, replace the power window switch.
4. Check the continuity in each circuit between the inoperative power window switch wire harness connector cavities and the corresponding power window motor wire harness connector cavities. If OK, refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If not OK, repair the open circuit(s) as required.

NOTE: All passenger door power window switches receive their battery and ground feed for operating the passenger door power window motors through the driver side power window and lock master switch and wire harness connector.

STANDARD PROCEDURE

DOOR MODULE LEARN PROCEDURES

- NOTE:**
- This procedure must be performed anytime the power window system has been serviced in either front door or when there is a possible concern with a door module calibration.
 - The battery must be fully charged or the vehicle running before proceeding with the learn procedure.
 - All doors must be completely closed before proceeding.
 - It is suggested to sit inside the vehicle in the drivers seat and close the door.

Express-up / Express-down possible concerns.

- Glass will not lower all the way down flush to the belt-line.
- Glass will not raise fully; wind noise / water leak.
- Glass will not raise automatically (Express-up) after lifting the switch to the second detent and releasing.

To relearn the door module memory after module replacement, perform the following procedure:

1. Check and repair any door module Diagnostic Trouble Code (DTC) (s) unrelated to missing calibration before proceeding.
2. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
3. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
4. Code should now be stored. Clear code and test window operations.

To relearn the door module memory after window/regulator replacement, perform the following procedure:

1. Using the scan tool, go to the network topology screen.
2. Click on the Diagnostic Procedures tab at the lower portion of the screen.
3. Run ECU Reset for DDM/PDM.
4. DDM/PDM calibration missing DTC will now set.

5. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
6. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
7. DTC will now be stored. Clear code and test window operations.

MOTOR, WINDOW REGULATOR

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed only when the ignition switch is in the RUN or ACCESSORY position. The power window system will also operate when in power accessory delay

Vehicles equipped with Express Up Windows are equipped with a door module. Refer to **OPERATION** for further information.

Vehicle equipped with One Touch Down (OTD) employ a Smart Window Motor. Refer to **OPERATION** for further information.

For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to **BODY - INTERIOR & EXTERIOR** .

OPERATION

POWER WINDOW MOTOR - STANDARD

A positive and negative battery connection to the two motor terminals will cause the power window motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction.

Because the Drivers Door Module (DDM) drives the window, it can sense when the top and bottom travel has been reached and stop driving the window regardless of the window switch position (no hall pulses within 50 ms). The DDM considers the Hall Effect faulted if no pulses are sensed when the window is driven up and down. When this condition is detected, the DDM will activate the motor until the switch is released or a stuck fault is set (10 seconds). In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads.

The driver side motor is controlled directly by the DDM. The passenger side motor receives current through a

window up relay and a window down relay. The up and down window relays are controlled by the DDM.

There is also a fuse in the Power Distribution Center (PDC) to protect the passenger window circuits and a fuse in the PDC to protect the drivers window circuits.

POWER WINDOW MOTOR - SMART

Vehicles equipped with the One Touch Down (OTD) option use a "smart" window motor assembly. The smart window motors contain the electronics required to provide express up or down operation without the use of separate door modules.

The smart window motor will enter sleep mode after 20 seconds if ALL of the following conditions are true:

- No motor movement (stall condition previously detected)
- No switch input is active or the stuck switch condition has not been detected
- No stuck relay condition has been detected
- Window thermal protection is not in severe or activated mode

The smart window motor wakes up based on the following inputs:

- Any switch input becomes active
- Hardware reset
- Voltage is detected in any output from the relay to the motor terminals

The smart window motor does not communicate with the other modules on the vehicle. The rear windows on vehicles equipped with one-touch power front windows operate in the same manner used for the standard power window system. The one touch feature is not available for the rear windows.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW SMART MOTOR

When a window motor is installed, it must be initialized to program the up and down stops. The initialization procedure is to manually drive the window motor to both the top and bottom of the window travel. Initialization is performed by holding the switch for two seconds after the window reaches the full up position.

Diagnosing a motor concern requires the technician to diagnose by the process of elimination. If a window motor is inoperative, verify that all switch signals to the motor are correct. Verify power and ground at the window motor. If the switch signals, power and ground are okay and there are no obstructions, attempt to initialize the motor prior to replacement.

DIAGNOSIS AND TESTING - WINDOW MOTOR

1. Remove door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Connect positive (+) lead from a test battery to either of the two motor terminals.

3. Connect negative (-) lead from test battery to remaining motor terminal.
4. The motor should now rotate in one direction to either move window up or down.
 - a. If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.
 - b. Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.
 - c. Reverse battery leads in Step 2 and Step 3 and window should now move. If window does not move, replace motor.
5. If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.
6. If window does not move, check to make sure that it is free.
7. It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.
8. To determine if the glass is free, disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

REMOVAL

REMOVAL

Fig. 1: Interior Trim panel

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the door interior trim panel (2). Refer to **PANEL, DOOR TRIM, REMOVAL** or **PANEL, REAR DOOR TRIM, REMOVAL** for the appropriate procedure.

Fig. 2: Power Window Motor Electrical Connector, Three Fasteners, Power Window Motor And Gear Assembly

Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the power window motor electrical connector (3).
4. Remove the three fasteners (2) that secure the power window motor and gear assembly (1) to the carrier plate and remove the motor and gear assembly.

INSTALLATION

INSTALLATION

Fig. 3: Power Window Motor Electrical Connector, Three Fasteners, Power Window Motor And Gear Assembly

Courtesy of CHRYSLER GROUP, LLC

NOTE: The power window motor may need to be actuated momentarily to line up the gear in the drive assembly with the regulator.

1. Connect the power window motor electrical connector to the motor electrical connector receptacle (3).
2. Position the power window motor and gear assembly (2) on the carrier plate (1) aligning the drive gear with the regulator.
3. If necessary, temporarily connect the window switch assembly and battery to actuate the motor.
4. Install and tighten the three fasteners (4) that secure the power window motor and gear assembly to the carrier plate.

Fig. 4: Interior Trim panel
Courtesy of CHRYSLER GROUP, LLC

5. Reinstall the door interior trim panel (2). Refer to **PANEL, DOOR TRIM, INSTALLATION** or **PANEL, REAR DOOR TRIM, INSTALLATION** for the appropriate procedure.
6. Connect the negative battery cable.

SWITCH, POWER WINDOW

DESCRIPTION

DESCRIPTION

2824067

Fig. 5: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
 Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Two different modules are used: a driver side module (1), and a passenger side module (2). Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

Each switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the switch module housing. The passenger side switch module includes a small cubby bin. A connector receptacle (4) integral to the switch module housing connect the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harness.

The front door power switch modules include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - Three mirror selector switch buttons choose the power mirror to be adjusted, **R** (right), **L** (left) or a power fold position (both mirrors).
- **Power Mirror Direction Control Switch (Driver Side Switch Only)** - After a power mirror is selected, pressing down on one of the arrows on the momentary mirror direction switch will move the selected mirror in that direction for as long as it is held down until the limit of the mirror travel is reached.
- **Power Window Lockout Switch (Driver Side Switch Only)** - A latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger

door power window switch is extinguished.

- **Power Window Switches** - A single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each passenger door window while the driver side switch module contains four of these power window switches, one switch dedicated to each door window. The switch tab for the driver side front door power window has a second detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. A second detent in the up direction on both front door power window switches activates the **Express-Up** feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door switch module must be replaced as a unit.

There are 3 available driver door switch assemblies :

- 1-touch up and down driver window control
- 1-touch down only driver window control
- 1-touch down only driver window control and manual door locks and mirrors

There are 3 available passenger door switch assemblies:

- 1-touch up and down passenger window control
- Manual passenger window control
- Manual passenger window control and manual door locks.

OPERATION

OPERATION

WITH SMART MOTOR

2824067

Fig. 6: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver smart motor indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door smart motor or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the smart motor. **The smart window motor does not communicate with other modules on the vehicle**. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

The hard-wired circuits between the passenger side front door power switch module and the passenger side smart motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The most reliable, efficient, and accurate means to diagnose the power switch module or the

electronic controls and communication related to power lock or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WITH DOOR MODULE

2824067

Fig. 7: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver door module indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door module or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the door module or in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic

controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOW SWITCHES

The master window switch has an Auto-Down feature. Actuation of the master switch to the second down position will move the drivers side window completely down. The electronic switch will automatically disconnect the motor approximately one second after the window bottoms out. Failure of the electronic switch to detect stall current, will cause the switch to disconnect after approximately 13 seconds. The auto down function can be canceled by any movement of that switch.

FRONT DOOR - DRIVER SIDE

Any diagnosis of the power window system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service Information .

The diagnosis found here applies to the passenger power window switches. If the problem being diagnosed is an inoperative power window switch illumination lamp, but the power window switch operates as designed, replace the faulty door power window switch.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS**.

1. Disconnect and isolate the battery negative cable.
2. Remove the power window switch from the door trim panel. Refer to **SWITCH, POWER WINDOW, REMOVAL**.
3. Check the door power window switch continuity as shown in the power window switch test table below.

Fig. 13: Rear Power Window Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

The following test procedure applies to the rear door power window switches on all vehicles equipped with power windows, with or without power locks.

1. Remove the power window switch from the rear door trim panel. Refer to **SWITCH, POWER WINDOW, REMOVAL**.
2. Using an ohmmeter, test the continuity between the terminals of the rear door power window switch as shown in the Rear Door Power Window Switch Tests table.

REAR DOOR POWER WINDOW SWITCH TESTS TABLE

REAR DOOR POWER WINDOW SWITCH TESTS	
SWITCH POSITION	CONTINUITY BETWEEN (PINS)
NEUTRAL	1 and 4, 3 and 6
UP	2 and 4, 3 and 5
DOWN	2 and 3, 4 and 5
SWITCH ILLUMINATION	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 2 TO PLUS (+), CONNECT PIN 5 TO MINUS (-) - LEDs SHOULD BARELY GLOW

3. If a switch fails any of the tests, replace the ineffective rear door power window switch as required.

REMOVAL

REMOVAL

FRONT DOOR

Fig. 14: Power Window Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect switch wire connector.
4. Remove switch assembly (1).

REAR DOOR

1. Disconnect and isolate the negative battery cable.
2. Remove the interior handle. Refer to **HANDLE, EXTERIOR, REMOVAL** .
3. Disconnect the electrical connector.
4. Remove the switch from the handle.

INSTALLATION

INSTALLATION

FRONT DOOR

**Fig. 15: Power Window Switch**

Courtesy of CHRYSLER GROUP, LLC

1. Install the switch (1) by snapping into place.
2. Connect switch wire connector.
3. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Connect the negative battery cable.

REAR DOOR

1. Install the switch to the handle.
2. Connect the electrical connector.
3. Install the interior door handle. Refer to **HANDLE, EXTERIOR, INSTALLATION** .
4. Connect the negative battery cable.

2014 ACCESSORIES AND EQUIPMENT**Speed Control - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

Two electronic speed control systems are available factory-installed equipment on this vehicle: a conventional system and an adaptive system. Additional details of these two systems and their components can be found under the subheadings and paragraphs that follow.

ADAPTIVE SPEED CONTROL STOP AND GO**Quick Overview:**

- Utilizes Radar and camera sensors to identify vehicles in forward path and maintains a selectable distance between the vehicle and the one in front of it;
- ACC with stop and go has full functionality between 0 and 100 mph;
- After ACC with stop and go brings the vehicle to a stop, the driver must indicate the intention to resume by either pressing the resume button or tapping the accelerator pedal;
- Driver can select one of four following distances depending on driver preference.

Functional Overview - The optional **ACC Plus (ACC +)** system (also known as ACC Stop and Go) has functionality beyond that of Normal Cruise Control and Adaptive Cruise Control. This system has the functionality of the cruise control system of maintaining a driver defined Set Speed without the driver needing to press the throttle. This system also has the functionality of the regular ACC system of increasing and decreasing the vehicle speed based on target vehicles moving slower than the ACC Set Speed. Beyond the functionality of the regular ACC system, this system offers a larger operational speed range, which constitutes of speeds from 0 mph to a configurable upper bound. If a target vehicle comes to a standstill, the ACC+ system will also bring the ACC+ host vehicle to a stop, and will keep the vehicle at a standstill for an undetermined period of time by first applying the brakes, and after the brakes time-out, cancelling the ACC+ system and applying the Electronic Park Brake (EPB). The ACC with stop and go system will also incorporate Forward Collision Warning-Plus (FCW). With grade braking, the transmission will automatically downshift to maintain selected vehicle speed and distance, preventing overheating of brakes.

The ACC sensor, the FFC, the ABM, the EMIC, the EVIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ACC module to provide inputs to the ABM, the EVIC and the PCM. This is also used by the ABM to provide inputs to the PCM, by the SCM to relay the status of the speed control switches to the PCM and by the PCM for control of the indicators in the EMIC and the indications in the EVIC. Refer to **COMMUNICATION, DESCRIPTION**.

The ACC with stop and go system used also incorporates grade braking and Forward Collision Warning-Plus (FCW). With grade braking, the transmission will automatically downshift to maintain selected vehicle speed and distance, preventing overheating of brakes.

The optional equipment ACC+ system includes the following major components, which are described in further detail elsewhere in this service information:

- **Adaptive Speed Control Module** - An adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket secured near the center of the underside of the front bumper support member of the Front End Module (FEM) behind the front fascia. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, DESCRIPTION**.
- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) is located on the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION**.
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION**.
- **ElectroMechanical Instrument Cluster** - A CRUISE indicator is located in the fixed segment display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION**.
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is located in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and provides an interface to the vehicle operator for setting the adaptive speed control customer preferences as well as a display of the adaptive speed control and Forward Collision Warning (FCW) system status messages. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION**.
- **Forward Facing Camera** - The Forward Facing Camera (FFC) is located inside the Combined Rear View Mirror Module (CRVMM) housing assembly. The FFC provides input for data fusion purposes allowing the ACC sensor radar data to be redundancy checked. Refer to **MODULE, FORWARD FACING CAMERA, DESCRIPTION**.
- **Powertrain Control Module** - The Powertrain Control Module (PCM) located in the right front corner of the engine compartment contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION**.
- **Speed Control Switches** - A speed control switch pod containing six momentary switch push buttons is located in the right horizontal spoke of the steering wheel. Refer to **SWITCH, SPEED CONTROL, DESCRIPTION**.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION**.
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION**.

Hard wired circuitry connects the adaptive electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered

splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

CONVENTIONAL SPEED CONTROL

The standard equipment conventional electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) is located on the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION**.
- **Brake Lamp Sensor** - The brake (also known as stop) lamp sensor is located on the brake pedal support bracket under the driver side of the instrument panel. (Refer to **SWITCH, STOP LAMP**).
- **ElectroMechanical Instrument Cluster** - A CRUISE indicator is located in the fixed segment display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION**.
- **Powertrain Control Module** - The Powertrain Control Module (PCM) in the right front corner of the engine compartment contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION**.
- **Speed Control Switches** - A speed control switch pod containing four momentary switch push buttons is located in the right horizontal spoke of the steering wheel. Refer to **SWITCH, SPEED CONTROL, DESCRIPTION**.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION**.
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION**.

The ABM, the EMIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the SCM to relay the status of the speed control switches to the PCM, and by the PCM for control of the CRUISE indicator in the EMIC. Refer to **COMMUNICATION, DESCRIPTION**.

Hard wired circuitry connects the conventional electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

ADAPTIVE SPEED CONTROL

The vehicle operator controls all adaptive speed control system (ACC) features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) and to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or as the radar sensor or module) over the Controller Area Network (CAN) data bus. The PCM and ACC sensor microprocessors continually monitor these inputs as well as electronic **wheel speed** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module), electronic **gear selector** message inputs from the Transmission Control Module TCM, video data from the Forward Facing Camera (FFC) and numerous hard wired inputs including the brake (or stop) lamp switch, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

Using the MODE push button of the speed control switch pod on the face of the right horizontal spoke of the steering wheel, the vehicle operator can choose between adaptive speed control and conventional speed control modes of operation. As the name implies, when in the conventional speed control mode the speed control system is used and functions exactly like a conventional speed control system. When in the adaptive speed control mode, the vehicle operator can use the DISTANCE push button of the speed control switch pod to select from one of three distance settings for the adaptive cruise system to maintain. These settings equate to the time in seconds separating the vehicle from a preceding vehicle. The FFC and the ACC sensor share a private bus allowing data fusion to occur within the ACC sensor. The ACC sensor then uses this information to send electronic message outputs to the ABM, the TCM and the PCM to maintain the selected separation distance. The available distance settings are:

- 1 - 1.0 second
- 2 - 1.5 seconds
- 3 - 2.0 seconds

If the ECM/PCM detects a fault on one of the following systems, it will disable the cruise control system. The ECM/PCM will store an appropriate DTC.

- Engine Speed Sensor
- Sensor or actuators of the electric throttle (only for gasoline engines)
- Accelerator Pedal Potentiometer (APP Sensor)
- Brake Pedal Position
- Clutch Switch rationality
- Engine Load sensor (only for gasoline engines)

- Ignition Coils (only for gasoline engines)
- Fuel Injectors
- High pressure system components (only for GDI and Diesel engines)
- Turbo sensors or actuators.

The PCM and ACC sensor microprocessors continuously monitor all of the speed control system electrical circuits to determine the system readiness and accuracy. If the PCM or ACC sensor detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM and ACC components use On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM and the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM, the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control system. The most reliable, efficient, and accurate means to diagnose the PCM, the ACC sensor or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONVENTIONAL SPEED CONTROL

The vehicle operator controls all conventional speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input via LIN, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) C data bus. The PCM software continually monitors these inputs as well as electronic **vehicle distance** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) and numerous hard wired inputs including the brake (or stop) lamp switch, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

The PCM microprocessor continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

If the ECM/PCM detects a fault on one of the following systems, it will disable the cruise control system. The

ECM/PCM will store an appropriate DTC.

- Engine Speed Sensor
- Sensor or actuators of the electric throttle (only for gasoline engines)
- Accelerator Pedal Potentiometer (APP Sensor)
- Brake Pedal Position
- Clutch Switch rationality
- Engine Load sensor (only for gasoline engines)
- Ignition Coils (only for gasoline engines)
- Fuel Injectors
- High pressure system components (only for GDI and Diesel engines)
- Turbo sensors or actuators.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the conventional speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

0811003272

Fig. 1: Speed Control Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod (1) is located in the right spoke of the steering wheel spoke bezel. Two different switches are used. One switch has five buttons and is used on vehicles not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system. The other switch has eight buttons and is used on vehicles equipped with the ACC system option. These switches are the primary control used by the vehicle operator to manage the particular speed control system installed in the vehicle. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The speed control switch pod is a resistor multiplexed unit that provides LIN bussed inputs to the Steering Control Module (SCM) microprocessor integral to the Steering Column Control Module (SCCM). The speed control switch pod also contains the circuitry of a Local Interface Network (LIN) slave node, which provides source current for and communicates the switch or sensor states of the Electronic Vehicle Information Center (EVIC) switches, the remote radio switches, the paddle shifter switches (if equipped), the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the SCM, which is the LIN master node.

The speed control switch pod for vehicles equipped with a conventional electronic speed control system and not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system contains four switch push buttons whose functions are:

- **On/Off** - This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Resume / +** - This switch button restores the vehicle to a previously stored set speed or accelerates the vehicle from an already attained set speed.
- **Cancel** - This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.
- **Set / -** - This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.

The optional adaptive speed control switch pod for vehicles equipped with the ACC system option contains the same four switch push buttons as the conventional speed control switch pod, then adds two buttons whose functions are:

- **Mode** - This switch button toggles the speed control system between adaptive (ACC) or conventional (non-ACC) modes of operation.
- **Distance Buttons** - These switch buttons select the separation or following distance (in seconds) that the ACC system maintains between this vehicle and any preceding vehicle.

The SCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the speed control switch pod as well as the hard wired circuits between the switch pod and the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM, the SCCM or the electronic controls and communication between modules and other

devices that provide some features of the speed control system. The most reliable, efficient, and accurate means to diagnose the speed control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

2827003

Fig. 2: Speed Control Switch Harness Connector Terminal Identification

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following test confirms only correct speed control switch functions. It does not test or confirm any of the Local Interface Network (LIN) slave node inputs, outputs or functions. LIN slave node testing requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the speed control switch pod from the steering wheel. Refer to **SWITCH, SPEED CONTROL, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the back of the speed control switch pod.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Speed Control

Switch Tests table.

SPEED CONTROL SWITCH TESTS TABLE

SPEED CONTROL SWITCH TESTS	
SWITCH POSITION	PINS (*RESISTANCE - OHMS)
NO PUSH BUTTONS DEPRESSED	13 and 14 (20708) 14 and 15 (20591)
ON / OFF	13 and 14 (464) 14 and 15 (133)
CANCEL	13 and 14 (896) 14 and 15 (457)
DISTANCE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (1515) 14 and 15 (899)
MODE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (2468) 14 and 15 (1518)
SET / - (DECEL)	13 and 14 (4088) 14 and 15 (2471)
RESUME / + (ACCEL)	13 and 14 (7408) 14 and 15 (4091)
*All resistance values are plus or minus 5%.	

- If the switch fails any of the tests, replace the ineffective speed control switch pod as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

- Disconnect and isolate the battery negative cable.
- Remove the remote radio switch. Refer to **SWITCH, REMOTE RADIO, REMOVAL**.

0806007483

Fig. 3: Steering Wheel Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

3. From the back of the steering wheel front bezel (2), remove the two screws (1) that secure the speed control switch pod to the bezel.
4. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

0806007483

Fig. 4: Steering Wheel Bezel & Screws

Courtesy of CHRYSLER GROUP, LLC

1. Position the Speed Control switch pod to the back of the steering wheel front bezel (2).
2. Install and tighten the two screws (1) that secure the switch to the bezel. Tighten the screws securely.
3. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
4. Connect the negative battery cable.

2014 ACCESSORIES AND EQUIPMENT**Vehicle Theft Security - Service Information - Cherokee****DESCRIPTION****VEHICLE THEFT SECURITY SYSTEM**

The Vehicle Theft Security System (VTSS) is available factory-installed equipment for this vehicle. The VTSS includes various standard and optional features that provide protection against unauthorized vehicle access, operation and intrusion. The VTSS is comprised of two primary subsystems: The Sentry Key Immobilizer System (SKIS) and the Vehicle Theft Alarm (VTA). Additional details of each of these subsystems and their components can be found elsewhere within this service information.

Except for the Sentry Key transponders which rely upon Radio Frequency (RF) communication, hard wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the SKIS or VTA components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is factory-installed standard equipment on this model. The SKIS provides passive vehicle protection, immobilizing the vehicle by preventing the engine from operating unless a valid electronically encoded key or FOB with Integrated Key (FOBIK) is detected. In vehicles not equipped with the Passive Entry Keyless Go (PEKG) system, a valid encoded key or FOBIK must be present within the IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) for the engine to continue to operate. In vehicles equipped with the optional PEKG system, the FOBIK must only be present somewhere within the passenger compartment of the vehicle for the engine to continue to operate.

The SKIS used in combination with the export premium version of the Vehicle Theft Alarm (VTA) adds a steering shaft lock feature that provides passive protection by preventing the vehicle from being steered unless a valid encoded key or FOBIK is present within the IGNM (without PEKG), or a valid FOBIK is present somewhere within the passenger compartment of the vehicle (with PEKG). The export premium version of the VTA is only available in vehicles manufactured for sale in certain markets where it is required equipment.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Ignition Node Module** - The IGnition Node Module (IGNM) (also known as the Keyless Ignition

Node/KIN) is located in the instrument panel just inboard of the steering column. Refer to **MODULE, IGNITION NODE, DESCRIPTION** .

- **Instrument Cluster** - The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is located in the instrument panel, above the steering column and directly in front of the vehicle operator. Refer to **DESCRIPTION** .
- **Low Frequency Antenna** - Vehicles equipped with the optional Passive Entry Keyless Go (PEKG) system have several low frequency antenna units strategically placed within the vehicle. Refer to **ANTENNA, PASSIVE ENTRY, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is located on the inboard side of the battery tray in the left front corner of the engine compartment. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Sentry Key Transponder** - A Sentry Key transponder microchip is located within each key or FOB with Integrated Key (FOBIK). Refer to **KEY, TRANSPONDER, DESCRIPTION** .
- **Shaft Lock Module** - A shaft lock module (also known as the Electronic Steering Column Lock/ESCL module) is located on the steering column below the instrument panel in the passenger compartment of vehicles built for sale in certain export markets where it is required equipment and equipped with the export premium version of the VTA. Refer to **MODULE, SHAFT LOCK, DESCRIPTION** .

VEHICLE THEFT ALARM

The Vehicle Theft Alarm (VTA) is factory-installed optional equipment in this vehicle. The VTA is available in different configurations and versions. One configuration is designed for vehicles manufactured for sale in domestic markets; while, another configuration is designed for vehicles manufactured for sale in export markets. In addition, the VTA for export markets is available in two versions: base and premium.

Each of these systems provide perimeter vehicle protection by monitoring the vehicle doors, the liftgate and the status of the ignition (also known as the Ignition Node Module/IGNM or Keyless Ignition Node/KIN). In vehicles manufactured for some markets the VTA also monitors the hood. If unauthorized vehicle access, intrusion or tampering is detected with any of these systems, the vehicle horn is pulsed as an audible deterrent and certain exterior lamps are flashed as a visual deterrent.

The export premium version of the VTA system is only available in vehicles manufactured for sale in certain markets where it is required equipment. The export premium version of the VTA provides the same perimeter protection features as the base version, but adds interior vehicle intrusion and vehicle anti-tilt protection. The export premium VTA also replaces the pulsing horn feature of the base version with an alarm siren module providing the audible deterrent, while retaining the flashing exterior lamps as the visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Alarm Siren Module** - An alarm siren module is located on the engine compartment side of the Front End Module (FEM) carrier between the right front lamp unit housing and the cooling module. The alarm siren is used only in vehicles built for sale in certain export markets where it is required equipment. Refer

to **SIREN, DESCRIPTION**.

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. The BCM is both a LIN bus master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door. Refer to **LATCH, LIFTGATE, REMOVAL**.
- **Hood Ajar Switch** - A hood ajar switch is integral to the hood latch assembly of vehicles manufactured for certain export markets. Refer to **SWITCH, HOOD AJAR, DESCRIPTION**.
- **Ignition Node Module** - The IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) is located in the instrument panel just inboard of the upper steering column opening. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION**.
- **Instrument Cluster** - The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is located in the instrument panel above the steering column and directly in front of the driver. Refer to **DESCRIPTION**.
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch for the liftgate in the vehicle. Refer to **LATCH, LIFTGATE, REMOVAL**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION**.
- **Ultrasonic And Anti-tilt Module** - In vehicles equipped with the premium VTA, an Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM) is located on and concealed above the overhead console trim cover on the headliner near the center of the upper windshield opening. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, DESCRIPTION**.

OPERATION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is comprised of two primary subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). Additional operational details on each of these two subsystems of the VTSS can be found elsewhere within this service information.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine whenever an attempt is made to operate the vehicle using anything other than a key or FOB with Integrated Key (FOBIK) equipped with a valid Sentry Key transponder microchip. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention.

The microcontroller-based Radio Frequency Hub Module (RFHM) (also known as the RF Hub) uses Radio Frequency (RF) communication to challenge and obtain confirmation that the key or FOBIK being used is a valid key or FOBIK for operating the vehicle. The microcontroller-based RFHM hardware and software also uses electronic messages to communicate with the IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) over a private serial bus and with other electronic modules in the vehicle over the

Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each RFHM will recognize a maximum of eight Sentry Keys or FOBIK units. If the customer would like additional Sentry Keys or FOBIK units other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional Sentry Keys or FOBIK units must be programmed to the RFHM in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool. Refer to **STANDARD PROCEDURE**.

In vehicles equipped with an export premium version of the Vehicle Theft Alarm (VTA), the Body Control Module (BCM) controls an electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL) on the steering column that locks the steering shaft from rotation unless the BCM receives a electronic **valid key** message from the RFHM. The BCM also communicates with the electronic shaft lock module over the CAN data bus to monitor and control the shaft lock function.

The BCM performs a self-test of the SKIS and the shaft lock module each time the ignition status transitions to On, and will store fault information in the form of a Diagnostic Trouble Code (DTC) for any system or component malfunction that is detected. If a fault is detected, the BCM will illuminate the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) or the IC will display a textual **SHAFT LOCK ERROR** message in the Electronic Vehicle Information Center (EVIC) display as appropriate.

The hard wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

VEHICLE THEFT ALARM

The base version of the Vehicle Theft Alarm (VTA) is designed to provide either active or passive perimeter protection of the vehicle by monitoring the vehicle doors, the ignition and the liftgate. In vehicles built for certain markets where it is required equipment, the perimeter protection also includes monitoring of the hood. If the VTA system detects any attempt to compromise a monitored vehicle system or feature, the vehicle horn is pulsed as an audible deterrent and certain exterior lamps are flashed as a visual deterrent.

The Body Control Module (BCM) includes the logic and control circuits for the base versions of the VTA. Each of the ajar switches provides hard wired inputs to the BCM, while the BCM provides control outputs to the vehicle horns and lighting systems. The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) monitors the status of the Ignition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) through a private serial bus and relays this information to the BCM as electronic messages transmitted over the Controller Area Network (CAN) data bus.

The premium version of the VTA includes an Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM). The UAM provides interior intrusion protection as well as vehicle tow-away and tire theft protection. The UAM includes the logic and control circuits for these features of the VTA and is also a slave node communicating over the Local Interface Network (LIN) data bus. The UAM is armed and disarmed by electronic messages received over the LIN data bus from the BCM, which is a LIN master node. While armed, the UAM uses external ultrasonic transmit and receive transducers to monitor the vehicle interior for movement as well as internal accelerometers to monitor vehicle pitch and roll. When an exception is detected, the UAM relays this information to the BCM over the LIN bus, and the BCM invokes the VTA audible and visual alerts. In vehicles with an ITM, the horn output function of the BCM is replaced by an output of the alarm siren module that is controlled by the BCM over the LIN data bus.

The hard wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls and communication between modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the Vehicle Theft Alarm (VTA) operating modes.

- **Enabling** - The Body Control Module (BCM) and the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) must have the Vehicle Theft Alarm (VTA) function electronically enabled in order for the VTA to perform as designed. The BCM stores and compares vehicle configuration data with other Electronic Control Units (ECU) in the vehicle, including the RFHM. This process is referred to as PROgramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a Diagnostic Trouble Code (DTC). A configuration mismatch will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.
- **Arming** - Passive arming of the VTA occurs when the vehicle is exited with the key or FOB with Integrated Key (FOBIK) removed from the ignition, the headlamps are turned Off and the doors are locked while they are open using the power lock switch. Active arming occurs when the Lock button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors and the liftgate must be closed and the status of the ignition must be Off when the RKE transmitter Lock button is depressed. The power lock switch will not function if a key or FOBIK is in the ignition with the driver side front door open.

Pre-arming of the VTA is initiated when the vehicle is locked using a power door lock switch or when the RKE transmitter Lock button is depressed. Pre-arming will not occur if the key or FOBIK is in the ignition with the driver side front door open. When the VTA is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTA will remain in pre-armed mode

for up to 16 seconds after all doors and the liftgate have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition status transitions to On, if a door or the liftgate is unlocked or opened by any means, or if the RKE Panic button (if equipped) is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the security indicator will illuminate solid and the engine compartment will not be protected unless the hood is closed when the VTA arming sequence first begins. Also, if the status of the hood ajar switch changes from open to closed during the 16 second arming process, the security indicator will switch from solid to flashing. Once the arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

- **Disarming** - Passive disarming of the Vehicle Theft Alarm (VTA) occurs by inserting a valid Sentry Key Immobilizer System (SKIS) key or FOB with Integrated Key (FOBIK) into the ignition or when the ignition status transitions to On. Active disarming of the VTA for all markets occurs when the vehicle is unlocked by depressing the Unlock button of the Remote Keyless Entry (RKE) transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the Panic button (if equipped) on the RKE transmitter will **not** disarm the VTA.
- **Alarm** - The Vehicle Theft Alarm (VTA) alarm output provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing On and Off of the exterior lamps, while the audible output will be either a pulsing of the horn or, if the vehicle is so equipped, the siren. For vehicles with the base version of the VTA, the inputs that will trigger the alarm include a change in the status of the ignition, the door ajar switches, the liftgate ajar switch and, in vehicles built for certain markets where they are required, the hood ajar switch. In vehicles with the premium version of the VTA, the inputs that will trigger the alarm also include any movement detected within the vehicle passenger compartment, or a change in the vehicle pitch or roll of greater than about 0.5 degrees.
- **Power-Up Mode** - When the armed Vehicle Theft Alarm (VTA) senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the armed alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system.

If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

- **Tamper Alert** - The Vehicle Theft Alarm (VTA) tamper alert feature will pulse the horn three times upon VTA disarming if the alarm was triggered and has since timed out, or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended. This feature is disabled in vehicles manufactured for certain export

markets where it is required.

- **Anti-tilt And Intrusion Alarm Disabling** - The anti-tilt and intrusion alarm is an exclusive feature of the premium version of the Vehicle Theft Alarm (VTA). When this version of the VTA is armed, the Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM) uses ultrasonic transmit and receive transducers to monitor the interior of the vehicle for movement and low gravity accelerometers to monitor vehicle pitch and roll. If interior motion or change in vehicle attitude are detected, the UAM sends an electronic message to the Body Control Module (BCM) over the Local Interface Network (LIN) data bus to invoke the audible and visual alarm features.

The anti-tilt and intrusion alarm features of the premium VTA can be disabled by depressing the Lock button on the Remote Keyless Entry (RKE) transmitter 3 times within 15 seconds during VTA pre-arming, while the security indicator is still flashing rapidly. The VTA provides a single short siren chirp as an audible confirmation that the anti-tilt and intrusion alarm features disable request has been received. The default for the UAM features is enabled; therefore, the disable procedure must be repeated each time the VTA is disarmed, then armed again to prevent the system from monitoring interior movement and vehicle pitch and roll.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). The recommended procedures for diagnosis and testing of each of these two VTSS subsystems can be found elsewhere within this service information.

DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hard wired circuits between modules and components related to the Sentry Key Immobilizer System (SKIS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between other modules and devices that provide features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and

communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED). 2. Ineffective security indicator circuit. 3. Ineffective ground circuit. 4. Ineffective battery feed circuit. 5. Ineffective ignition feed circuit.	1. Use a diagnostic scan tool to perform the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) actuator test. Refer to the appropriate diagnostic information. 2. Check the security indicator circuit between the Body Control Module (BCM) and the IC for an open or short. Repair the circuit, if required. 3. Test and repair the open ground circuit at the connector for the IC, if required. 4. Test and repair the open battery feed circuit at the connector for the IC, if required. 5. Test and repair the open ignition feed circuit at the connector for the IC, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid key or FOB with Integrated Key (FOBIK) in the ignition. 2. Key-related fault.	1. Replace the invalid key or FOBIK with a known valid key or FOBIK. 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected. 2. SKIS system ineffective.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis. 2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

DIAGNOSIS AND TESTING - VEHICLE THEFT ALARM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in

accidental airbag deployment.

The hard wired circuits between modules and components related to the Vehicle Theft Alarm (VTA) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA or the electronic controls and communication between other modules and devices that provide features of the VTA. The most reliable, efficient and accurate means to diagnose the VTA or the electronic controls and communication related to VTA operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE**SENTRY KEY IMMOBILIZER SYSTEM INITIALIZATION**

The Sentry Key Immobilizer System (SKIS) must be initialized following the service replacement of a Body Control Module (BCM), a Radio Frequency Hub Module (RFHM) (also known as the RF Hub), a Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) or a electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL). SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have security access and a temporary authorization PIN code. The PIN code **MUST** be used to enter the Secured Access Mode. Refer to **STANDARD PROCEDURE** . This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

NOTE: If the Body Control Module (BCM) is replaced in a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to the new BCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the RFHM.

NOTE: If the electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL) is replaced in a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Body Control Module (BCM) to the new electronic shaft lock module using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the BCM.

NOTE: If the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is replaced in a vehicle equipped with the Sentry Key Immobilizer

System (SKIS), the unique Secret Key data must be transferred from the Body Control Module (BCM) to the new PCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the BCM.

SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Keys or FOB with Integrated Key (FOBIK) units included with the vehicle are pre-programmed to work with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) when the vehicle is shipped from the factory. The RFHM can be programmed to recognize up to a total of eight Sentry Key or FOBIK transponder units. When programming a blank transponder, the Sentry Key mechanical key must first be cut to match the ignition lock cylinder (if equipped) or the FOBIK mechanical key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once the mechanical key has been cut, the RFHM must be programmed to recognize it as a valid key transponder. To program the RFHM to recognize a new or additional valid key transponder, the Secured Access Method must be used. The details of this programming method can be found under **FOBIK Programming** elsewhere in this service information using the link that follows. Refer to **STANDARD PROCEDURE**. This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

DESCRIPTION

DESCRIPTION

083168754

Fig. 1: Transponder Keys**Courtesy of CHRYSLER GROUP, LLC**

Three unique variations of a transponder key are available for this vehicle. They are:

- **Sentry Key Immobilizer System Transponder Key** - The Sentry Key Immobilizer System (SKIS) transponder key (1) is used in combination with an IGnition Node Module (IGNM) (also known as the Wireless Ignition Node/WIN) featuring a rotary-type ignition switch. This transponder key is used only for vehicles that are not equipped with the optional Remote Keyless Entry (RKE) system.
- **Remote Keyless Entry System Transponder Key** - The Remote Keyless Entry (RKE) system transponder key (2) is also known as a FOB with Integrated Key (FOBIK). Like the SKIS transponder key, the RKE FOBIK transponder key is used in combination with an IGnition Node Module (IGNM) (also known as the Wireless Ignition Node/WIN) featuring a rotary-type ignition switch. This transponder key is used for vehicles that are equipped with the RKE system, but not with the optional Passive Entry Keyless Go (PEKG) system.
- **Passive Entry Keyless Go System Transponder Key** - The Passive Entry Keyless Go (PEKG) system transponder key (3) is also known as a FOB with Integrated Key (FOBIK). However, unlike the SKIS transponder key and RKE FOBIK transponder key, the PEKG transponder key is used in combination with an IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) featuring a push button-type ignition switch. This transponder key is used only for vehicles that are equipped with the PEKG system.

Regardless of the type of transponder key used for this vehicle, in addition to having to be cut to match the mechanical coding of the lock cylinders and programmed for operation of the RKE system, each ignition key has a transponder microchip included that carries a unique transponder identification code. This identification code that is permanently programmed into it by the manufacturer must be programmed into the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to be recognized by the SKIS as a valid key.

The Sentry Key transponder key cannot be adjusted or repaired. If ineffective or damaged, the entire transponder key or FOB/IK and RKE transmitter unit must be replaced.

OPERATION

OPERATION

When the status of the ignition switch transitions to On the Ignition Node Module (IGNM) sends an electronic **ignition switch status** message over a private serial bus to the Radio Frequency Hub Module (RFHM) (also known as the RF-Hub). In vehicles not equipped with the Passive Entry Keyless Go (PEKG) system, the IGNM uses an internal antenna to communicate with the Sentry Key transponder based upon inputs received from the RFHM through the private serial bus. In vehicles that are equipped with the PEKG system, the RFHM relies upon several Low Frequency (LF) antenna units to challenge the Sentry Key transponders using a LF signal, then monitors responses from the Sentry Key transponders received as Very High Frequency (VHF) signals.

The RFHM determines whether a valid key is present based upon the response from the transponder. If a valid key is detected, that fact is communicated by the RFHM to the Body Control Module (BCM), and by the BCM to the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the BCM receives an electronic **invalid key** message or no message, or if the PCM receives an electronic **invalid key** message or no message over the CAN data bus, the engine will be disabled. The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator On and Off.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the RFHM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the RFHM, the RFHM stores the transponder identification code from the Sentry Key and the Sentry Key learns the Secret Key code from the RFHM. Once the Sentry Key learns the Secret Key code of the RFHM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle. Refer to **STANDARD PROCEDURE**.

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch status transitions to On, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

Common communication problems:

- Two transponder keys too close to each other.
- Another transponder device (i.e.: Speed Pass) too close to the Sentry Key transponder.

A security indicator illuminated solid (not flashing) in the IC indicates that there is a system failure.

- Loss of PCM/CAN data bus communication.
- Failed antenna circuit.

NOTE: After a RFHM is replaced with a new unit, the Sentry Key transponders need to be programmed to the new RFHM. Follow the instructions found in the diagnostic scan tool for the Replace RFHM Routine . The Sentry Key transponders and the Remote Keyless Entry (RKE) transmitters (if equipped) will both be programmed during this operation. There is no need to program the RKE transmitter again once the Sentry Key transponder key has been programmed to the new RFHM. This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

MODULE, SENTRY KEY IMMOBILIZER (SKIM)

DESCRIPTION

DESCRIPTION

0831002982

Fig. 2: Sentry Key Immobilizer Module (SKIM)
Courtesy of CHRYSLER GROUP, LLC

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REmote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and either the Keyless Ignition Node (KIN) in vehicles equipped with the push button ignition Keyless Go (KG) system or the IGnition Node Module (IGNM) in vehicles equipped with a rotary ignition key or FOB with Integrated Key (FOBIK).

The RFHM is the primary component of the Sentry Key Immobilizer System (SKIS). It is also the receiver for the Remote Keyless Entry (RKE) system, the Passive Entry (PE) system, the remote start system and the Tire Pressure Monitor (TPM) system on vehicles so equipped. The RFHM is located on the inner roof panel reinforcement near the liftgate opening within the passenger compartment, where it is concealed above the headliner trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

The KIN includes the integral ignition push button. The IGNM includes the ignition rotary FOBIK switch or key cylinder switch. The KIN or the IGNM is located in the instrument panel, just to the right of the steering column. The remainder of the KIN or IGNM including its mounting provisions and electrical connections are concealed within the instrument panel. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** or **MODULE, IGNITION NODE, DESCRIPTION** .

OPERATION

OPERATION

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REMote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the IGnition Node Module/IGNM or the Keyless Ignition Node (KIN) in this vehicle. The RFHM contains a Radio Frequency (RF) transceiver and a microcontroller.

In vehicles with a rotary ignition switch the RFHM controls Low Frequency (LF) signaling with the Sentry Key transponder integral to the mechanical key or FOB with Integrated Key (FOBIK) through a tuned antenna internal to the IGNM. The IGNM transmits the received LF signal and the selected ignition switch status back to the RFHM. In vehicles with the push button Keyless Go (KG) system, the RFHM transmits LF signals to, and receives LF signals from the Sentry Key transponder integral to the FOBIK through a tuned antenna internal to the RFHM housing, while the KIN allows the vehicle operator to select and monitor the status of the ignition switch and also transmits the selected ignition switch status back to the RFHM.

The RFHM also serves as the Remote Keyless Entry (RKE) RF receiver and, if the vehicle is so equipped, the receiver for the remote start system and for the Tire Pressure Monitoring (TPM) system. Refer to **DESCRIPTION** , **OPERATION** and **TIRE PRESSURE MONITORING, DESCRIPTION** . The RFHM communicates over the Controller Area Network (CAN) data bus with the Body Control Module (BCM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) or the diagnostic scan tool. It also communicates over a dedicated Local Interface Network (LIN) data bus circuit with the IGNM or the KIN.

The RFHM and the PCM both use software that includes a rolling code algorithm strategy, which helps to reduce the possibility of unauthorized Sentry Key Immobilizer System (SKIS) disarming. The rolling code algorithm ensures security by preventing an override of the SKIS through the unauthorized substitution of the RFHM or the PCM. However, the use of this strategy also means that replacement of either the RFHM or the PCM units will require a system initialization procedure to restore system operation.

The RFHM retains in memory the ID numbers of any Sentry Key or FOBIK transponder that is programmed into it. A maximum of eight Sentry Key transponders can be programmed into the RFHM. For added system security, each RFHM is programmed with a unique Secret Key code. This code is stored in memory, sent over

the CAN data bus to the PCM, and is encoded to the transponder of every Sentry Key that is programmed into the RFHM. Therefore, the Secret Key code is a common element that is found in every component of the SKIS.

Another security code called a PIN is used to gain access to the RFHM Secured Access Mode. The Secured Access Mode is required during service to perform the SKIS initialization and Sentry Key transponder programming procedures. The RFHM also stores the Vehicle Identification Number (VIN) in its memory, which it learns through a CAN data bus message from the PCM during SKIS initialization.

In the event that a RFHM replacement is required, the Secret Key code can be transferred to the new RFHM from the PCM using the diagnostic scan tool and the SKIS initialization procedure. Proper completion of the SKIS initialization will allow the existing Sentry Key transponder units to be programmed into the new RFHM so that new Sentry Key units will not be required. In the event that the original Secret Key code cannot be recovered, RFHM replacement will also require new Sentry Key units. The diagnostic scan tool will alert the technician during the SKIS initialization procedure if new Sentry Key units are required. Refer to **STANDARD PROCEDURE** .

When the status of the ignition switch transitions to On, the RFHM transmits a LF signal to excite the transponder in the FOBK. The RFHM then waits for a LF signal response from the transponder. If the response received identifies the key or FOBK as valid, the RFHM sends an electronic **valid key** message to the PCM over the CAN data bus. If the response received identifies the key or FOBK as invalid or if no response is received from the key or FOBK transponder, the RFHM sends an **invalid key** message to the PCM. The PCM will enable or disable engine operation based upon the status of the RFHM messages. It is important to note that the default condition in the PCM is an **invalid key** ; therefore, if no message is received from the RFHM by the PCM, the engine will be disabled and the vehicle immobilized after two seconds of running.

The RFHM also sends electronic **security indicator** request messages to the IC over the CAN data bus to tell the IC how to operate the security indicator. The **security indicator** request message from the RFHM tells the IC to turn the indicator On for about three seconds each time the status of the ignition switch transitions to On as a bulb test. After completion of the bulb test, the RFHM sends **security indicator** request messages to the IC to turn the indicator Off, turn the indicator On or to flash the indicator On and Off. If the security indicator flashes or stays On solid after the bulb test, it signifies a SKIS fault. If the RFHM detects a system malfunction or the SKIS has become ineffective, the security indicator will stay On solid. If the RFHM detects an invalid key or FOBK, or if a key or FOBK transponder-related fault exists, the security indicator will flash.

The SKIS performs a self-test each time the status of the ignition switch transitions to On, and will store fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a system malfunction is detected. The hard wired circuits of the RFHM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RFHM or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the RFHM or the electronic controls and communication related to RFHM operation requires the use of a diagnostic scan tool.

MODULE, SHAFT LOCK

DESCRIPTION

DESCRIPTION

0831005390

Fig. 3: Shaft Lock Module, Locking Bolt, Mounting Bracket & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

A shaft lock module (1) (also known as the Electronic Steering Column Lock/ESCL or the Elektronische Lenkungs Verriegelung/ELV) is part of the premium version of the Sentry Key Immobilizer System (SKIS) in the Vehicle Theft Security System (VTSS). The premium version of the SKIS is only available in vehicles built for certain markets, where the additional features offered by this system are required. The module is located near the upper end of the steering column housing below the instrument panel in the passenger compartment.

The shaft lock module includes a die cast aluminum cover that conceals and protects the electronic circuitry of the module, which includes a single integral connector receptacle (4). The electronics of the module are connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The bi-directional electric motor that actuates the locking bolt (3) is also contained within a die cast metal housing. That housing includes an integral saddle type mounting bracket (2) that is clamped securely to the steering column housing by two tamper resistant screws.

The mounting provisions for the shaft lock module are designed to resist unauthorized tampering. The module cannot be removed from the steering column while the steering column is installed in the vehicle. The shaft lock module cannot be adjusted or repaired and, if ineffective or damaged it must be replaced.

OPERATION**OPERATION**

The electronic shaft lock module (also known as the Electronic Steering Column Lock/ESCL or the

Elektronische Lenkungs Verriegelung/ELV) is designed to work in conjunction with the Body Control Module (BCM) to control a locking bolt that engages a machined slot in the steering shaft to prevent shaft rotation whenever a valid key is not present in the Ignition Node Module (IGNM) (without Keyless Go/KG), or when the status of the Keyless Ignition Node/KIN transitions to Off (with KG). The shaft lock module can only be unlocked if the presence of a valid FOB with Integrated Key (FOBIK) unit is detected within the IGNM (without KG), or when the status of the KIN (with KG) transitions from Off to any other status.

The electronic circuitry within the shaft lock module contains all of the logic circuits and components to monitor and control the operation of the shaft locking bolt. The module uses the Controller Area Network (CAN) data bus for bi-directional communication with the BCM. If the module detects a problem with the positioning or operation of the locking bolt, it sends an error message to the BCM. The BCM then sets and stores a Diagnostic Trouble Code (DTC) and sends an electronic error message over the CAN data bus to other electronic modules in the vehicle.

The shaft lock module continuously monitors inputs from the BCM and the Antilock Brake System module (ABS) (also known as the Antilock Brake Module/ABM or the Brake System Module/BSM), then energizes the electric motor to move the locking bolt to the locked or unlocked position based upon those inputs. If the BCM receives an input from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) indicating that an invalid FOBIK has been detected, the locking bolt remains in the locked position.

When the RFHM indicates that a valid FOBIK has been detected within the IGNM (without KG), or within the vehicle when the status of the KIN (with KG) transitions from Off to any other status, the BCM has the shaft lock module operate a motor to move the locking bolt to the unlocked position. However, to prevent inadvertent column locking due to a failure while the vehicle is being operated, the module cannot move the locking bolt from the unlocked position to the locked position while a vehicle speed input indicates that the vehicle is still moving.

The hard wired circuits of the shaft lock module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the shaft lock module or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the shaft lock module or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

0831010576

Fig. 4: Steering Column Housing, Tamper Resistant Screws & Shaft Lock Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the steering column from the vehicle. Refer to **COLUMN, REMOVAL**.
3. Remove and discard the two tamper resistant screws (2) that secure the shaft lock module (3) to the steering column housing (1). One of three methods is suggested:
 - Cut a straight slot in the top of each screw to enable removal with a screw driver.
 - Use a drift punch and a hammer to rotate each screw counterclockwise far enough to grasp and complete removal using locking pliers.
 - Use an appropriate drill bit to bore a hole in the center of each screw, then use an appropriate screw extractor to complete screw removal.
4. Remove the shaft lock module from the steering column.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

0831010576

Fig. 5: Steering Column Housing, Tamper Resistant Screws & Shaft Lock Module
Courtesy of CHRYSLER GROUP, LLC

1. Carefully inspect the shaft lock module (also known as the Electronic Steering Column Lock/ESCL or the Elektronische Lenkungs Verriegelung/ELV) interface area of the module, the steering shaft and the steering column housing for damage or debris. Remove debris or replace damaged components that could hinder proper shaft lock module operation as required.
2. Position the shaft lock module (3) onto the steering column housing (1).
3. Install and tighten two new tamper resistant screws (2) to secure the shaft lock module to the steering column housing. Tighten the screws until the heads shear off.
4. Reinstall the steering column into the vehicle. Refer to **COLUMN, INSTALLATION** .
5. Reconnect the negative cable to the battery.

MODULE, ULTRASONIC AND ANTI-TILT

DESCRIPTION

DESCRIPTION

0831005635

Fig. 6: UAM Housing, Transducer & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) is part of the premium version of the Vehicle Theft Alarm (VTA) available only in Right-Hand Drive (RHD) vehicles manufactured for certain export markets where it is required equipment. The UAM is concealed above the overhead console trim cover at the front center of the headliner. Only the rearward-facing transmit and receive ultrasonic transducer membranes are visible within small grilled openings on the outboard rear corners of the overhead console trim cover within the passenger compartment of the vehicle.

The molded black plastic UAM housing (1) and both transducers (3) are fit into mounts and fittings integral to and concealed on the inside surface of the overhead console trim cover. Each of the transducers is hard wired to the UAM housing. The overhead console trim cover is secured by snap clips that pass through the console opening in the headliner into the overhead console mounting bracket above the headliner substrate. A connector receptacle (2) integral to the right end of the UAM housing contains terminal pins that are connected to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness.

Concealed within the center of the UAM housing is the electronic circuitry of the module. The UAM housing is sealed to enclose and protect the internal components of the module including a microcontroller, anti-tilt sensors and electronic communication circuitry. The UAM is also a Local Interface Network (LIN) slave node and communicates over the LIN data bus with the Body Control Module (BCM), which is a LIN master node.

The UAM and the two ultrasonic transducers cannot be adjusted or repaired. If ineffective or damaged, the entire UAM and both transducers must be replaced as a unit.

OPERATION

OPERATION

The Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) controls all of the added features of the premium version of the Vehicle Theft Alarm (VTA). The UAM adds personal property theft protection by detecting movement within the interior of the vehicle and provides tire-theft and tow-away protection by monitoring the pitch and roll of the vehicle. The microcontroller within the UAM contains both motion detection and anti-tilt logic and is also a Local Interface Network (LIN) slave node that communicates over the LIN data bus with the Body Control Module (BCM), which is a LIN master node.

The UAM receives battery voltage on a fused B+ circuit through a fuse in the Power Distribution Center (PDC) and is grounded at all times through a take out and connector of the body wire harness that is secured to the body sheet metal at a remote ground point. These connections allow the UAM to remain operational, regardless of the status of the ignition switch. The UAM receives an electronic **arm request** message from the BCM over the LIN data bus whenever the VTA is armed. However, the UAM features may be disarmed by the customer by pressing and releasing the Lock button of the Remote Keyless Entry (RKE) transmitter three additional times during the 16 second pre-arm period of the VTA, while the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is still flashing rapidly.

While the VTA is armed, the UAM generates ultra high frequency sound bursts into the vehicle interior through an ultrasonic transmit transducer and monitors the return signal input through an ultrasonic receive transducer. The UAM logic uses an algorithm to detect movement in the vehicle interior through modulation of the ultrasonic echo that occurs due to the Doppler effect. The UAM also monitors internal low gravity (also known as low G) accelerometers to detect changes in vehicle pitch and roll. If interior movement or changes in vehicle pitch and roll are detected, the UAM sends electronic **alarm request** messages to the BCM over the LIN data bus, and the BCM invokes the VTA visual and audible alerts. Vehicle operators must be made aware that items in the vehicle that could move or sway due to environmental conditions or external vibrations may cause nuisance or phantom alarms.

The hard wired circuits of the UAM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the UAM or the electronic controls and communication between modules and other devices that provide some features of the VTA. The most reliable, efficient and accurate means to diagnose the UAM or the electronic controls and communication related to VTA operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ULTRASONIC AND ANTITILT MODULE

The hard wired circuits between the Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) and the Body Control Module (BCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the UAM or the electronic controls and communication between other modules and devices that provide some features of the Vehicle Theft Alarm (VTA) system. The most reliable, efficient and accurate means to diagnose the UAM or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

0831005636

Fig. 7: Console Trim Cover, Transducer & UAM
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.
3. Working from above the overhead console trim cover (1) rotate each of the two Ultrasonic and Anti-tilt Module (UAM) transducers (3) counterclockwise about 30 degrees to disengage them from the rearward-facing receptacles on each side of the console trim cover inside surface.
4. Unlatch the UAM (2) from the mounting provisions integral to the inside surface of the console trim cover.
5. Remove the UAM and both transducers from the overhead console as a unit.

INSTALLATION

INSTALLATION

0831005636

Fig. 8: Console Trim Cover, Transducer & UAM
 Courtesy of CHRYSLER GROUP, LLC

1. Position the Ultrasonic and Anti-tilt Module (UAM) (2) and both transducers (3) to the inside surface of the overhead console trim cover (1).
2. Latch the UAM into the mounting provisions integral to the inside surface of the console trim cover.
3. Carefully insert and rotate each of the two UAM transducers about 30 degrees clockwise into the rearward-facing receptacles on each side of the console trim cover inside surface.
4. Reinstall the overhead console onto the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION**.
5. Reconnect the negative cable to the battery.

SIREN

DESCRIPTION

DESCRIPTION

0831005296

Fig. 9: Siren Housing & Integral Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

An alarm siren module is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. This unit is designed to provide the audible alert requirements for the premium VTA.

The alarm siren module consists of microcontroller based electronic control circuitry, the piezoelectric siren and a nickel metal hydride backup battery. All of the alarm module components are protected and sealed within a molded plastic housing (1). An integral connector receptacle (2) is integral to a stanchion that extends from the bottom of the housing and connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The back of the alarm siren module housing includes a threaded stud that is used to secure the unit to the vehicle. The siren is located on the engine compartment side of the Front End Module (FEM) carrier, below the upper radiator cross member between the right side of the cooling module and the right front lamp unit housing.

The alarm siren module cannot be repaired or adjusted and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The microcontroller within the alarm siren module provides the siren unit features and functions based upon internal programming and electronic **arm** and **disarm** messages received from the Body Control Module (BCM) over a Local Interface Network (LIN) data bus connection. The BCM monitors inputs from the

Intrusion Transceiver Module (ITM) to control the output to the alarm siren module. The siren module receives battery voltage on a fused B(+) circuit through a fuse in the BCM and receives a path to ground through a ground circuit in the Front End Module (FEM) wire harness. These connections allow the siren to remain operational, regardless of the status of the ignition switch.

When the premium version of the Vehicle Theft Alarm (VTA) is armed, the siren module continuously monitors electronic message inputs from the BCM to sound its internal siren. While armed, the siren also enters its auto-detect mode. While in the auto-detect mode, if the siren module detects that its power supply or communication circuits are being tampered with or have been sabotaged, it will sound an audible alarm and continue to operate through an on-board backup battery. If the siren module is in its disarmed mode when its power supply or communication circuits are interrupted, the siren will not sound.

The alarm siren module will also notify the BCM when the backup battery requires charging, and the BCM will send electronic messages that will allow the backup battery to be recharged through the battery voltage and ground circuits to the alarm siren module only while the status of the ignition switch is On and the engine is running. This prevents the potential discharge of the main battery while the vehicle is not being operated.

The alarm siren module will self-detect problems with its internal and external power supply and communication circuits, then send electronic messages indicating the problem to the BCM upon receiving an **arm** or **disarm** request message. The BCM will store a Diagnostic Trouble Code (DTC) for any detected alarm siren module fault. The DTC can then be retrieved with a diagnostic scan tool through the 16-way Data Link Connector (DLC) located under the driver side lower edge of the instrument panel over the Controller Area Network (CAN) data bus.

The hard wired inputs and outputs for the alarm siren module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the alarm siren module or the electronic controls and communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the alarm siren module or the electronic controls and communication related to alarm siren module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

0831005389

Fig. 10: Upper Radiator Cross Member, FEM Carrier, Alarm Siren Module & Connector
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the engine air cleaner housing from the right side of the engine compartment. Refer to **BODY, AIR CLEANER, REMOVAL** for 2.0L Diesel, **BODY, AIR CLEANER, REMOVAL** for 2.4L or **BODY, AIR CLEANER, REMOVAL** for 3.2L.
3. Locate the alarm siren module (3) on the engine compartment side of the Front End Module (FEM) carrier (2), below the upper radiator cross member (1) between the right side of the cooling module and the back of the right front lamp unit housing.
4. Disconnect the FEM wire harness connector (4) from the connector receptacle for the siren.
5. Remove the appearance shield from the upper radiator cross member.
6. From the front of the FEM carrier, remove the nut that secures the siren to the FEM carrier located between the right side of the cooling module and the right front lamp unit housing.
7. Remove the siren from the engine compartment side of the FEM carrier.

INSTALLATION

INSTALLATION

0831005389

Fig. 11: Upper Radiator Cross Member, FEM Carrier, Alarm Siren Module & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the alarm siren module has been replaced with a new unit, a diagnostic scan tool **MUST** be used to initialize and configure the new unit in the Body Control Module (BCM) before the Vehicle Theft Security System (VTSS) can operate as designed. Follow the programming steps outlined in the diagnostic scan tool for **INITIALIZE SIREN** under **MISCELLANEOUS FUNCTIONS** for the **BODY CONTROL MODULE/BCM** menu item as appropriate.

1. Position the alarm siren module (3) to the engine compartment side of the Front End Module (FEM) carrier (2), below the upper radiator cross member (1) between the right side of the cooling module and the back of the right front lamp unit housing.
2. From the front of the FEM carrier, install and tighten the nut that secures the siren to the FEM carrier located between the right side of the cooling module and the right front lamp unit housing. Tighten the nut to 6 N.m (53 in. lbs.).
3. Reinstall the appearance shield onto the upper radiator cross member.
4. Reconnect the FEM wire harness connector (4) to the connector receptacle of the siren.
5. Reinstall the engine air cleaner housing into the right side of the engine compartment. Refer to **BODY, AIR CLEANER, INSTALLATION** for 2.0L Diesel, **BODY, AIR CLEANER, INSTALLATION** for 2.4L or **BODY, AIR CLEANER, INSTALLATION** for 3.2L.
6. Reconnect the negative cable to the battery.

SWITCH, HOOD AJAR

DESCRIPTION**LATCH MOUNTED SWITCH**

2097165

Fig. 12: Hood Latch Mounted Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

There are two types of hood ajar switches used on this vehicle. This information covers the hood latch mounted hood ajar switch (1) that is standard equipment on all vehicles. A stand alone switch is also used on some vehicles in addition to the latch mounted switch, but is discussed elsewhere in this service information.

The latch mounted hood ajar switch is integrated into the hood latch assembly and is a normally open, single pole, spring-loaded plunger actuated switch. The input of this switch may be used for the Vehicle Theft Alarm (VTA) system as well as for the optional remote start system. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The latch mounted hood ajar switch can not be adjusted or repaired. If damaged or ineffective this switch type must be replaced as a unit with the hood latch assembly.

STAND ALONE SWITCH

Fig. 13: Hood Ajar Switch

Courtesy of CHRYSLER GROUP, LLC

There are two types of hood ajar switches used on this vehicle. This information covers the stand alone hood ajar switch (1) that is optional equipment on some vehicles. A latch mounted hood ajar switch is standard on most vehicles, but is discussed elsewhere in this service information.

The stand alone switch has a molded plastic switch body (5) with an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in the switch mounting bracket. The mounting bracket is secured to the left front fender load beam. The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The input of this switch is used exclusively for the start-stop system, which is optional equipment with certain optional engines.

Once a stand alone hood ajar switch is installed it cannot be readjusted or repaired. If the switch is damaged, ineffective or requires readjustment, it must be replaced with a new unit. The stand alone hood ajar switch bracket is available for separate service replacement.

OPERATION

LATCH MOUNTED SWITCH

The hood latch mounted hood ajar switch is actuated by the hood latch mechanism and the hood latch striker. When the hood is closed and properly latched, the latch mounted hood ajar switch is an open circuit. When the hood is open or only partially latched, the hood ajar switch is a closed circuit. The switch has two 500 ohm diagnostic resistors connected in parallel to the switch contacts located between the two switch terminals. The hood ajar switch is hard wired in series between a return circuit and a signal circuit of the Body Control Module (BCM).

The BCM reads the hard wired hood ajar switch input through an internal pull-up resistor, then uses this input to control other electronic functions and features of the vehicle. Some of these features may include the remote start system and the Vehicle Theft Alarm (VTA). The BCM may also send electronic **hood ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The latch mounted hood ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

STAND ALONE SWITCH

The plunger of the optional stand alone hood ajar switch is actuated by the underside of the hood panel inner reinforcement as the hood panel is closed. When the hood is closed and properly latched, the hood ajar switch is an open circuit. When the hood is open or only partially latched, the hood ajar switch is a closed circuit. The switch has a 1 kilohm diagnostic resistor connected in parallel to the switch contacts located between the two switch terminals. The stand alone hood ajar switch is hard wired in series between a return circuit and a signal circuit of the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM).

The PCM reads the hard wired hood ajar switch input through an internal pull-up resistor, then uses this input to control certain features of the start-stop system. The PCM may also send electronic **hood ajar switch status** messages to other electronic modules in the vehicle over the CAN data bus.

The stand alone hood ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LATCH MOUNTED HOOD AJAR SWITCH

1. Disconnect and isolate the negative cable from the battery.
2. Disconnect the wire harness connector from the hood ajar switch.
3. Check for continuity between the two terminals of the hood ajar switch. There should be continuity with the hood latch open, and only the continuity of the two 500 ohm diagnostic resistors with the hood latch closed. If OK, use a diagnostic scan tool and the appropriate diagnostic procedure to complete testing of the Body Control Module (BCM) as well as the circuits between the BCM and the hood ajar switch. If not OK, replace the ineffective hood ajar switch.

DIAGNOSIS AND TESTING - STAND ALONE HOOD AJAR SWITCH

1. Disconnect and isolate the negative cable from the battery.
2. Disconnect the wire harness connector from the hood ajar switch.
3. Check for continuity between the two terminals of the hood ajar switch. There should be continuity with the switch plunger extended, and only the continuity of the 1 kilohm diagnostic resistor with the switch plunger depressed. If OK, use a diagnostic scan tool and the appropriate diagnostic procedure to complete testing of the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) as well as the circuits between the PCM and the hood ajar switch. If not OK, replace the ineffective hood ajar switch.

REMOVAL

STAND ALONE SWITCH BRACKET

0831005684

Fig. 14: Mounting Bracket, Hood Ajar Switch, Screws & Load Beam
Courtesy of CHRYSLER GROUP, LLC

1. Remove the stand alone hood ajar switch (2) from the mounting bracket (1). Refer to **SWITCH, HOOD AJAR, REMOVAL**.
2. Remove the screw (3) that secures the mounting bracket to the left front fender load beam (4).
3. Remove the mounting bracket from the left front fender load beam.

LATCH MOUNTED SWITCH

The latch mounted hood ajar switch used in this vehicle is integral to and serviced only as a unit with the hood latch. Refer to **LATCH, HOOD, REMOVAL**.

STAND ALONE SWITCH

0831005683

Fig. 15: Mounting Bracket, Load Beam, Latch Tabs & Switch
Courtesy of CHRYSLER GROUP, LLC

1. Unlatch and open the hood.
2. Disconnect and isolate the negative cable from the battery.
3. Working from the top of the mounting bracket (3) on the left front fender load beam (1), squeeze the two stand alone hood ajar switch latch tabs (4) together far enough to pull the switch (2) upward.
4. Pull the switch up through the hole in the mounting bracket far enough to access and disconnect the wire harness connector from the switch connector receptacle.
5. Remove the stand alone hood ajar switch from the vehicle.

INSTALLATION

STAND ALONE SWITCH BRACKET

0831005684

Fig. 16: Mounting Bracket, Hood Ajar Switch, Screws & Load Beam
Courtesy of CHRYSLER GROUP, LLC

1. Position the stand alone hood ajar switch mounting bracket (1) onto the left front fender load beam (4).
2. Install and tighten the screw (3) that secures the mounting bracket to the left front fender load beam. Tighten the screw to 5.5 N.m (4 ft. lbs.).
3. Reinstall the stand alone hood ajar switch (2) into the mounting bracket. Refer to **SWITCH, HOOD AJAR, INSTALLATION**.

LATCH MOUNTED SWITCH

The latch mounted hood ajar switch used in this vehicle is integral to and serviced only as a unit with the hood latch. Refer to **LATCH, HOOD, INSTALLATION** .

STAND ALONE SWITCH

0831005683

Fig. 17: Mounting Bracket, Load Beam, Latch Tabs & Switch
Courtesy of CHRYSLER GROUP, LLC

1. Position the stand alone hood ajar switch (2) near the mounting bracket (3) on the left front fender load beam (1).
2. Route the wire harness connector for the switch through the mounting hole in the mounting bracket from beneath and reconnect it to the switch connector receptacle.
3. From the top of the mounting bracket, align and insert the switch through the mounting hole and press it downward until the two integral switch latch tabs (4) snap into place.
4. Reconnect the negative cable to the battery.
5. Close and latch the hood.

2014 ACCESSORIES AND EQUIPMENT**Wiper System & Washer System - Service Information - Cherokee****DESCRIPTION****FRONT**

An electrically operated intermittent front wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Front Washer Nozzle** - Two fluidic front washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the front washer system consists of rubber hoses, hard plastic tubing and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the left front fender load beam. From the dash panel the washer plumbing is routed along the left hood hinge to the hood, then across the underside of the hood panel to the washer nozzles.
- **Front Wiper Arms And Blades** - The two front wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two front wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the front wiper system is not in operation. The left and right wiper arms and wiper blades are unique and are not interchangeable.
- **Front Wiper Module** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the cowl plenum beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the wiper drive link, the wiper connector link and the two wiper pivots.
- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield. This single reversible washer pump/motor provides washer fluid to either the front or the rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir** - The washer reservoir is secured to the left outboard end of the Front End Module (FEM) where it is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from the left front corner of the engine compartment.

Certain functions and features of the front wiper and washer systems rely upon resources shared with other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect front wiper and washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Light Rain Sensor Module** - A Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) is used on vehicles equipped with the optional automatic wiper feature. The LRSM is located on a bracket bonded to the inside surface of the windshield glass, near the inside rear view mirror mount.
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) mounting housing along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION**.

The BCM and the SCM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. In addition the BCM and the RLSCM communicate with each other using the Local Interface Network data bus. Refer to **COMMUNICATION, DESCRIPTION**.

Hard wired circuitry connects the front wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the front wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

HEADLAMP

An electrically operated headlamp washer system is standard factory-installed equipment on this vehicle when it is manufactured for certain markets with High Intensity Discharge (HID) headlamps. The headlamp washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Headlamp Washer Nozzle** - A headlamp washer nozzle is secured to the front fascia beneath each front lamp unit.
- **Headlamp Washer Pump/Motor** - The electric headlamp washer pump/motor unit is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield. This high pressure pump is located above and rearward of the reversible front and rear washer pump/motor unit on the reservoir.

- **Headlamp Washer Plumbing** - The plumbing for the headlamp washer system consists of large diameter rubber hoses and molded plastic fittings. The plumbing is routed to the washer nozzles on the front fascia from the washer reservoir. The connections at the headlamp washer pump and the two headlamp washer nozzles feature unique quick-connect fittings.
- **Headlamp Washer Relay** - The headlamp washer relay is soldered onto the Printed Circuit Board (PCB) located within the Power Distribution Center (PDC) and is not serviceable. The PDC is located within the engine compartment near the battery.
- **Washer Reservoir** - A unique washer reservoir is used on vehicles with the optional headlamp washer system, which has dedicated provisions for the headlamp washer pump and plumbing. This reservoir is mounted in the same location and using the same mounting hardware as is used for vehicles without the headlamp washers. The reservoir is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, are accessed from the left front corner of the engine compartment.

Certain functions and features of the headlamp washer system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect headlamp washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the headlamp washer system.
- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .

The BCM and the SCM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the headlamp washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the headlamp washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

REAR

An electrically operated rear wiper and washer system is standard factory equipment on this vehicle. The rear wiper and washer system includes the following major components which are described in further detail elsewhere in this service information:

- **Rear Washer Nozzle** - The rear washer nozzle and the integrated rear washer system check valve are located in the spoiler on the outer liftgate panel above the center of the liftgate glass opening.
- **Rear Washer Plumbing** - The plumbing for the rear washer system consists of rubber hoses, hard plastic tubing and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the left front fender load beam. The plumbing is then routed through the dash into the passenger compartment, up the inner A-pillar to the headliner, above the headliner to the upper liftgate opening header, then through the upper liftgate opening header and the upper liftgate to the rear washer nozzle in the spoiler on the upper liftgate.
- **Rear Wiper Arm and Blade** - The single rear wiper arm and blade assembly is secured by a nut directly to the rear wiper motor output shaft which extends through a rubber grommet inserted through a hole in the liftgate glass and is parked near the base of the liftgate glass when the rear wiper system is not in operation.
- **Rear Wiper Motor** - The rear wiper motor includes the motor and three rubber-isolated wiper motor mounts. The wiper motor output shaft is the only visible component of the rear wiper motor. The remainder of the motor is concealed by the inner liftgate trim panel on the inside of the liftgate beneath the liftgate glass opening.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard surface of the washer reservoir, ahead of the left front fender wheel house. This single reversible washer pump/motor provides washer fluid to either the front or the rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir** - The washer reservoir is secured to the left outboard end of the Front End Module (FEM) where it is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from the left front corner of the engine compartment.

Certain functions and features of the rear wiper and washer systems rely upon resources shared with other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect rear wiper and washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION**.
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) mounting housing along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the front and rear wiper and washer systems.

- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION**.

Hard wired circuitry connects the rear wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the rear wiper and washer system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

FRONT

0833005928

Fig. 1: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The front wiper and washer system is designed to provide the vehicle operator with a convenient, safe and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced and stored by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be

wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control knob (2) and control sleeve (3) on the control stalk (1) of the right multifunction switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Delay (except with the optional automatic wiper system), Automatic (with the optional automatic wiper system only), Low or High front wiper system operating modes. In the Delay mode, the control knob also allows the vehicle operator to select from one of four intermittent wipe Delay intervals. In the Automatic mode, the control knob allows the vehicle operator to select from one of four automatic wiper sensitivity levels.

Pulling the control stalk rearward actuates the momentary front washer system switch, which selects the Wash and Wipe-After-Wash modes depending upon when and how long the switch is held closed. Raising the control stalk upward actuates another momentary switch and selects the Mist mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the control stalk is released.

The right multifunction switch provides hard wired digital inputs to the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) mounting housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Front wiper and washer system operation is completely controlled by the SCM and BCM logic circuits, and that logic will only allow these systems to operate when the status of the ignition is Accessory or On. The BCM uses intelligent, high current, self-protected high side switches to control integrated wiper relays that control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The right multifunction switch circuitry receives battery current and a clean ground output from the SCM, then provides digital inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the front wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the front wiper and washer system operating modes.

- **Continuous Wipe Mode** - When the Low position of the control knob on the control stalk of the right multifunction switch is selected the SCM sends an electronic **wiper switch low** status message to the

BCM over the CAN data bus. The BCM then directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the High position of the control knob is selected the SCM sends an electronic **wiper switch high** status message to the BCM. The BCM then directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the Off position of the right multifunction switch control knob is selected, the SCM sends an electronic **wiper switch off** status message to the BCM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected.

If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the BCM. The BCM then de-energizes the wiper motor and the wiper motor ceases to operate.

If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is an open circuit and the BCM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the BCM is again closed to ground.

- **Intermittent Wipe Mode** - The following applies to vehicles not equipped with the optional automatic wiper system, or to vehicles equipped with the automatic wiper system that have had that feature disabled using the customer programmable features function.

When the control knob on the control stalk of the right multifunction switch is moved to one of the four Delay interval positions the SCM sends an electronic **wiper switch delay interval** status message to the BCM. Then the BCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

The BCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the BCM to determine the proper intervals at which to energize and de-energize the wiper motor low speed brush to operate the wiper motor intermittently for one low speed cycle at a time.

The BCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature, the BCM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

- **Automatic Wipe Mode** - If the vehicle is equipped with the optional automatic wiper system and it is enabled, when the control knob on the control stalk of the right multifunction switch is moved to one of the four sensitivity positions, the SCM sends an electronic **wiper switch sensitivity** message to the BCM over the CAN data bus. The BCM, which is also a Local Interface Network (LIN) data bus master node,

relays the **wiper switch sensitivity** message to the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM), which is a LIN slave node over the LIN data bus.

The LRSM monitors an area within the wipe pattern of the windshield glass for the accumulation of moisture. Based upon internal programming and the selected sensitivity level, when sufficient moisture has accumulated the LRSM sends the appropriate electronic **wipe command** messages back to the BCM over the LIN data bus. Then the BCM operates the wiper system accordingly.

As the sensitivity level is set higher, the LRSM is more sensitive to moisture accumulation and will send **wipe commands** more frequently. The third (middle) sensitivity position of the control knob is designed to provide optimal wiper performance for most typical driving requirements. The BCM logic is also programmed to provide an immediate wipe cycle each time the control knob on the control stalk of the multifunction switch is moved from the Off position to one of the four sensitivity positions, and another immediate wipe cycle each time the control knob is moved from a lower sensitivity position to a higher sensitivity position.

Also, if a vehicle is equipped with automatic wipers but the feature has been disabled using the customer programmable features function, when any sensitivity position is selected with the right multifunction switch control knob the system will respond in the same manner as in the intermittent wipe mode. The automatic wiper system has features designed to protect the mechanical components of the wiper system, and will not allow automatic wiper operation under the following conditions:

- **Low Ambient Temperature** - When the ambient temperature is below 0° C (32° F), the automatic wipers will not operate during a new ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the current ignition cycle began, or until a vehicle speed input is detected.
- **Transmission In Neutral** - When the transmission gear selector is placed in the Neutral N position while the ignition status is On, the automatic wipers will not operate during the current ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment that Neutral N was selected, until the vehicle speed is greater than 8 kilometers-per-hour (5 miles-per-hour) or until the transmission gear selector is moved out of the Neutral N position, whichever occurs first.
- **Mist Wipe Mode** - When the control stalk of the right multifunction switch is lifted upward to the momentary Mist position, the SCM sends an electronic **wiper mist mode** status message to the BCM. The BCM then energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The BCM can operate the wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.
- **Headlamps On With Wipers Mode** - The circuitry of the BCM provides an automatic Headlamps On With Wipers mode for vehicles equipped with the optional automatic headlamps. This is a customer programmable feature that can be enabled or disabled through the Electronic Vehicle Information Center (EVIC). If this feature is enabled, when the headlamp switch is in the Auto position, the headlamps will turn On automatically whenever the windshield wipers are turned On; and, if the headlamps were turned On automatically when the wipers were turned On, they will also turn Off automatically when the wipers are turned Off.

If this feature is enabled in vehicles equipped with the optional automatic wiper feature, when the automatic wiper mode is selected the headlamps will turn On automatically only after the wipers complete three automatic wipe cycles within about 30 seconds, and they will turn Off automatically after 3 minutes elapse without any automatic wipe cycles unless ambient light conditions dictate otherwise.

- **Wash Mode** - When the control stalk of the right multifunction switch is pulled rearward to the momentary Wash position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 20 seconds) and to be de-energized when the control stalk is released.

When the control stalk is pulled to the momentary Wash position while the wiper system is operating in one of the Delay interval (or sensitivity level with automatic wipers) positions, the washer pump/motor operation is the same. However, the BCM logic also overrides the selected delay interval or sensitivity level and operates the wiper motor in a continuous low speed mode for as long as the control stalk is held in the momentary Wash position, then reverts to the selected delay interval or sensitivity level several wipe cycles after the control stalk is released. If the Wash switch is held closed for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds, then cycled back to the Wash position.

- **Wipe-After-Wash Mode** - When the control stalk of the right multifunction switch is pulled rearward to the momentary Wash position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to operate the washer pump/motor and energizes the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 20 seconds). When the control stalk is released, the BCM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

If the control stalk is pulled rearward for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the stalk is released for about 2 seconds and then cycled back to the Wash position; however, the wipers will continue to operate for as long as the switch is held closed. The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to count the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the Wipe-After-Wash mode cycle.

HEADLAMP

The headlamp washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining High Intensity Discharge (HID) headlamp lighting performance. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the lenses of the two front lamp units, removing excess accumulations of snow, ice, bugs, mud, or other minor debris from the front lamps that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates the headlamp washer system function using the control stalk of the right multifunction switch that extends from the right side of the steering column, just below the steering wheel. While the HID headlamp low beams are turned On, pulling the control stalk rearward towards the steering wheel beyond the actuation point for more than about 100 milliseconds (0.10 second) activates the front washer pump/motor. During any ignition cycle, the first time the front washer pump/motor is activated and; thereafter, each eleventh time the front washer pump/motor is activated, the headlamp washer pump/motor cycle is also activated.

Each time the headlamp washers are employed, the headlamp washer pump/motor is activated using a two shot strategy. The initial shot wets the lenses of the HID headlamps. The lenses are then allowed to soak for a short interval before a second shot is dispensed to rinse the lenses. Each shot results in several high pressure streams of washer fluid being dispensed upon the headlamp lenses by the headlamp washer nozzles.

Headlamp washer system operation is completely controlled by the Body Control Module (BCM) logic circuits based upon programming and electronic **wash command** message inputs received from the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the BCM over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

The BCM will only allow this system to operate when the status of the ignition is On and the headlamp low beams are turned On. When the appropriate inputs are monitored and the appropriate programming requirements have been met, the BCM provides the appropriate output to the headlamp washer relay integral to the Printed Circuit Board (PCB) within the Power Distribution Center (PDC). The BCM uses a Low Side Driver (LSD) to energize or de-energize the headlamp washer relay which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer system or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR

0833005928

Fig. 2: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The rear wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the liftgate glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blade to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the liftgate glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all rear wiper and washer system functions with the control sleeve (3) and the control stalk (1) of the right (wiper) multifunction switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control sleeve to a detent position selects the Off or Delay (Intermittent) rear wiper system operating modes. Pushing the control stalk to a momentary forward position actuates the rear washer system switch, which selects the rear wash mode and dispenses washer fluid in the wipe pattern on the liftgate glass for as long as the switch is held closed.

The right multifunction switch provides hard wired digital inputs to the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) mounting housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Rear wiper and washer system operation is completely controlled by the SCM and BCM logic circuits, and that logic will only allow these systems to operate when the status of the ignition is Accessory or On. The BCM uses

a High Side Driver (HSD) to control rear wiper system operation by energizing or de-energizing the rear wiper motor. The right multifunction switch circuitry receives battery current and a clean ground output from the SCM, then provides digital inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the rear wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper and washer system or the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the rear wiper and washer system operating modes.

- **Intermittent Wipe Mode** - When the right (wiper) multifunction switch control sleeve is moved to the Delay (Intermittent) position, the SCM sends an electronic **rear wiper switch on** status message to the BCM over the CAN data bus. The BCM responds by energizing a High Side Driver (HSD) that directs battery current to the rear wiper motor. If the front wiper system is inactive, the BCM will cycle the rear wiper at a fixed intermittent speed. If the front wiper system is active, the BCM cycles the rear wiper in a synchronous manner, at one-half the speed of the front wipers. If Reverse (R) has been selected with the transmission gear selector, the BCM operates the rear wiper in a continuous manner.

When the Off position of the right multifunction switch control sleeve is selected, the SCM sends an electronic **rear wiper switch off** status message to the BCM over the CAN data bus. The event that occurs depends upon the position of the wiper blade on the liftgate glass at the moment that the control sleeve Off position is selected.

If the rear wiper blade is in the down position on the glass when the Off position is selected, the park switch that is integral to the rear wiper motor is an open circuit, which provides a hard wired park switch sense input to the BCM. The internal BCM circuitry pulls the park switch sense input to ground when the switch is open so that the microcontroller sees a ground when the wiper blade is parked. The BCM then de-energizes the rear wiper motor and the wiper motor ceases to operate.

If the rear wiper blade is not in the down position on the liftgate glass at the moment the Off position is selected, the park switch is closed to fused ignition output and the BCM continues running the wiper motor at low speed until the rear wiper blade is in the down position on the liftgate glass and the park switch input to the BCM is again pulled to ground.

- **Wash Mode** - When the control stalk of the right (wiper) multifunction switch is pushed forward to the momentary rear Wash position, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 20 seconds) and to be de-energized when the control stalk is released.

When the control stalk is pushed forward to the momentary Wash position while the rear wiper system is operating the washer pump/motor operation is the same. However, the BCM logic also overrides the selected wiper operating mode and operates the wiper motor in a continuous low speed mode for as long as the control stalk is held in the momentary Wash position, then reverts to the selected operating mode several wipe cycles after the control stalk is released. If the Wash switch is held closed for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds, then cycled back to the Wash position.

- **Wipe-After-Wash Mode** - When the control stalk of the right (wiper) multifunction switch is pushed forward to the momentary rear Wash position for more than about one-half second while the rear wiper system is not operating, the BCM directs battery current and ground to the washer pump/motor and energizes the rear wiper motor in a continuous mode for as long as the switch is held closed. When the control stalk is released, the BCM de-energizes the washer pump/motor immediately, but allows the rear wiper motor to operate for about three additional wipe cycles. An additional wipe cycle is performed about six seconds later before the BCM de-energizes the rear wiper motor and parks the wiper blade near the base of the liftgate glass.

The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to monitor the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the Wipe-After-Wash mode cycle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FRONT WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

If the front wiper motor operates, but the wipers do not move on the windshield, replace the ineffective front wiper motor or wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift or do not clear the glass, clean and inspect the front wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired front wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front wiper and washer system or the electronic controls and communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The front wiper and washer switches are integral to the right multifunction switch in the Steering Column Control Module (SCCM) mounting housing. The right multifunction switch communicates with the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. The SCM communicates with the Body Control Module (BCM) over the Controller Area Network (CAN) data bus. The BCM controls front wiper motor operation through wiper relays that are integral to the Printed Circuit Board (PCB) within the BCM.

Before performing any of the following tests, determine whether the other functions of the right multifunction switch are operational. If other right multifunction switch functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.

FRONT WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor as required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	3. Ineffective wiper motor park switch.	3. Test and replace wiper motor if required.
	1. Ineffective wiper motor.	1. Check amperage draw with linkage

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Wiper System & Washer System - Service Information - Cherokee

WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS		disconnected from wiper motor output shaft. Correct draw should be about 2 amperes on Low speed, or 3 amperes on High speed. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected, replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.
AUTOMATIC WIPERS ONLY ARE INOPERATIVE	1. Automatic wipers (Rain Sensing) feature has been disabled.	1. Be certain that the automatic wipers (Rain Sensing) feature is enabled in the Customer Programmable Features Settings menu.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuits.	2. Test and repair washer pump feed circuits between BCM and washer pump if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

DIAGNOSING FALSE WIPES (AUTOMATIC WIPER ONLY)

False wipes are unnecessary wipes that occur when the control knob of the right multifunction switch is in one of the four automatic wiper sensitivity positions and no rain or moisture is apparent within the wipe pattern on the windshield glass. Because this system is designed to operate whenever it detects moisture, if the switch is in one of the automatic wiper sensitivity positions any road spray, bug splatters or mist from passing cars or trucks may occasionally cause the wipers to cycle. These are normal characteristics of this system and are not false wipes.

False wipes generally are the result of foreign material or flaws that interfere with the system optics. The optics for this system allow the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) to precisely transmit several

InfraRed (IR) light beams and monitor the intensity of these beams reflected from the outer surface of the windshield glass to determine the presence of moisture. The sensitivity of this system is such that anything that distorts the focus or intensity of the IR light beams or impacts the ability of the photo diodes within the LRSM to see and accurately measure these light beams can result in the LRSM logic misinterpreting the resulting input data as moisture on the windshield. The optics for this system include the lenses of the LRSM, the adhesive silicone gelatin (SilGel) layer that bonds the LRSM to the inside of the windshield and the windshield glass.

The following procedure should only be used if false wipe occurrences are frequent and persistent. Perform diagnosis of the wiper system, the right multifunction switch, the Steering Control Module (SCM) and the LRSM using a diagnostic scan tool and the appropriate diagnostic procedures before performing the following:

NOTE: **The Light Rain Sensor Module (LRSM) mounting bracket is serviced as a unit with the windshield glass. If either the bracket or the glass is ineffective or damaged, the entire LRSM bracket and windshield glass unit must be replaced. Also, if the LRSM is removed from the mounting bracket for any reason, the integrity of the adhesive silicone gelatin (SilGel) layer of the LRSM will be compromised and the silicone gelatin pad must be replaced with a new unit.**

1. Carefully inspect the outer surface of the windshield glass for physical damage, including scratches, cracks or chips in the vicinity of the LRSM mounting bracket. **Scratches, cracks or chips in the windshield glass outside the area of the LRSM mounting bracket lenses will not cause false wipes.** If OK, go to Step 2. If not OK, replace the damaged windshield.
2. From the outside of the windshield glass, carefully inspect the adhesive layer between the windshield glass and the LRSM bracket for any large voids (air pockets). If an adhesive void greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin pad. If OK, go to Step 3.
3. Lightly pull the LRSM away from the windshield bracket to confirm that both sides of the spring steel LRSM mounting band are fully engaged with the mounting bracket on the inside of the windshield glass. If OK, go to Step 4. If not OK, install the LRSM mounting band onto the bracket as required.
4. Remove the LRSM from the mounting bracket. Carefully inspect the LRSM mounting bracket for any physical damage and inspect the windshield glass area within the LRSM mounting bracket for contamination. If OK, go to Step 5. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. If damaged, replace the damaged LRSM bracket and windshield as a unit.
5. Carefully replace the LRSM with a new unit. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

DIAGNOSIS AND TESTING - HEADLAMP WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Before attempting to diagnose the headlamp washer system, confirm whether the front washer system operates satisfactorily. If the front washer system is ineffective or operates improperly, diagnose and repair that problem before attempting to repair the headlamp washer system. If the front washer system operates satisfactorily and the headlamp washer pump/motor unit operates, but both headlamp washer nozzles do not dispense washer fluid on the front lamp unit lenses, inspect the headlamp washer plumbing for pinched or leaking hoses and fittings. If the headlamp washer pump/motor unit does not operate, check the headlamp washer system fuse.

The hard wired headlamp washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer system or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - REAR WIPER AND WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

If the rear wiper motor operates, but the wiper motor output shaft does not move, replace the ineffective rear wiper motor. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wiper operates, but chatters, lifts, or does not clear the glass, clean and inspect the rear wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired rear wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper and washer system or the

electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: The rear wiper and washer switches are integral to the right multifunction switch in the Steering Column Control Module (SCCM). The right multifunction switch communicates with the Steering Control Module (SCM), which is also integral to the SCCM. The SCM communicates with the Body Control Module (BCM) over the Controller Area Network (CAN) data bus. The BCM controls rear wiper motor operation through the rear wiper relay that is integral to the Printed Circuit Board (PCB) within the BCM.

Before performing any of the following tests, determine whether the other functions of the right multifunction switch are operational. If other right multifunction switch functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Wiper and Washer System.

REAR WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair motor feed circuit between BCM and rear wiper motor if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor if required.
WIPER DOES NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and rear wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	3. Ineffective wiper motor park switch.	3. Test and replace rear wiper motor if required.
	1. Ineffective wiper motor.	1. Check amperage draw with wiper arm disconnected from rear wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:

2014 Jeep Cherokee Trailhawk

2014 ACCESSORIES AND EQUIPMENT Wiper System & Washer System - Service Information - Cherokee

WIPER MOTOR OPERATES SLOWLY	2. Amperage draw too low.	2. Test and repair shorted rear wiper motor signal and fused ignition switch output (run - accessory) circuits if required.
	3. Amperage draw too high.	3. With wiper arm disconnected from wiper motor output shaft check for binding between output shaft and motor output shaft housing. If binding is detected, lubricate if required. If no binding is detected, replace the wiper motor if required.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuit.	2. Test and repair washer pump feed circuit between BCM and washer pump if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

CLEANING

FRONT WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber

seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted front washer nozzles cannot be back-flushed due to the integral check valve mechanism. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

FRONT WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

REAR WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegee of the wiper blade.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet filter

screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the rear washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged or restricted rear washer nozzle cannot be back-flushed due to the integral check valve mechanism. If the rear washer nozzle obstruction cannot be cleared, replace the rear washer nozzle.

REAR WIPER SYSTEM

CAUTION: Protect the rubber squeegee of the wiper blade from any petroleum-based cleaners, solvents or contaminants. These products can rapidly deteriorate the rubber squeegee.

The squeegee of a wiper blade exposed to the elements for a long time tends to lose its wiping effectiveness. Periodic cleaning of the squeegee is suggested to remove any deposits of salt or road film. The wiper blade, arm, and liftgate glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blade continues to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

INSPECTION

FRONT WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

FRONT WIPER SYSTEM

Fig. 3: Wiper Blades And Wiper Arms
Courtesy of CHRYSLER GROUP, LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4) or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements on both arms are taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between

the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing or beading, replace the wiper blade.

REAR WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

REAR WIPER SYSTEM

Fig. 4: Inspecting Wiper Blades
Courtesy of CHRYSLER GROUP, LLC

The rear wiper blade and wiper arm should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blade for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arm for damage (6). If the wiper arm and blade are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If the wiper blade or arm is damaged, replace it with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has insufficient spring tension to maintain contact between the squeegee and the glass.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

ARM, WIPER

DESCRIPTION

FRONT

3220910

Fig. 5: Stamped Steel Channel, Aluminum Pivot End & Stamped Steel Strap

Courtesy of CHRYSLER GROUP, LLC

The front wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms have a somewhat sculpted appearance that actually has a functional purpose. The sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

These wiper arms feature an over-center hinge design that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast aluminum pivot end (2) with a large, internally tapered mounting hole at one end. A molded black plastic cap snaps over the pivot end to conceal the wiper arm retaining nut and the mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (1) hinges on and is secured with a hinge pin to the blade end of the wiper arm pivot end. One end of a rigid stamped steel strap (3), is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook to cradle the pivot block of the front wiper blade. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

Concealed within the stamped steel channel is a long tension spring which is engaged with a formed wire link hooked over a metal dowel pin that passes through the underside of the pivot end. The opposite end of the spring is hooked over another metal dowel pin that passes through the underside of the steel channel.

The driver and passenger side wiper arms are unique and are not interchangeable. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

REAR

Fig. 6: Rear Wiper Arm

Courtesy of CHRYSLER GROUP, LLC

The rear wiper arm is the rigid member located between the rear wiper motor output shaft that protrudes through the liftgate glass above the center of the liftgate glass opening and the wiper blade on the outside of the glass. The wiper arm is constructed of molded black plastic. A hinged pivot end is also molded plastic.

A molded black plastic nut cover (2) with two pivot pins on the back end and snap features on the end nearest the wiper blade fits over the wiper arm retaining nut to conceal the nut and mounting hole following wiper arm installation. The wiper arm hinge and tension spring are concealed on the underside of the wide end of the arm (1), while an integral latch feature (3) concealed on the underside of the narrow end of the wiper arm accepts the pivot pin of the matching molded plastic wiper blade unit.

The rear wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

FRONT

The front wiper arms are designed to mechanically transmit the motion from the wiper pivots to the front wiper blades. The front wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nut locks the front wiper arm to the threaded stud of the wiper pivot shaft. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the front wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REAR

The rear wiper arm is designed to mechanically transmit the motion from the rear wiper motor output shaft to the rear wiper blade. The wiper arm must be properly indexed to the motor output shaft in order to maintain the proper wiper blade travel on the glass. The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection.

A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the plastic cover snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The latch formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot pin to the wiper arm.

REMOVAL

FRONT

0833005727

Fig. 7: Front Wiper Arm, Pivot Shaft, Nuts & Caps
Courtesy of CHRYSLER GROUP, LLC

1. Carefully pry the plastic nut cap (1) off of the pivot end of the wiper arm (4).
2. Remove the nut (2) that secures the wiper arm to the wiper pivot shaft (3).
3. Lift the front wiper arm to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
4. Use a slight rocking action to disengage the front wiper arm pivot end from the pivot shaft and remove the wiper arm.

CAUTION: The use of a battery terminal puller when removing the front wiper arm is NOT recommended except as a last resort, as this may damage the front wiper arm.

Fig. 8: Disengaging Wiper Arm From Pivot Shaft

Courtesy of CHRYSLER GROUP, LLC

5. If the rocking action failed to free the wiper arm from the pivot shaft, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the pivot shaft (2).
6. Remove the wiper arm pivot end from the pivot shaft.

REAR

0833005793

Fig. 9: Wiper Arm, Pivot Cover & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Unsnap and swing the molded plastic pivot cover (1) off of the pivot end of the wiper arm (2).
2. Remove the nut (3) that secures the wiper arm to the rear wiper motor output shaft.

CAUTION: The use of a battery terminal puller when removing the rear wiper arm is NOT recommended as this may damage the rear wiper arm.

3. Use a slight rocking action to disengage the rear wiper arm pivot end from the output shaft and remove the wiper arm.

INSTALLATION**FRONT**

0833005727

Fig. 10: Front Wiper Arm, Pivot Shaft, Nuts & Caps
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the wiper motor is in the park position before attempting to install the front wiper arms. Transition the status of the ignition switch to On and move the right multifunction switch control knob to its front wiper Off position. If the wiper pivots move, wait until they stop moving, then transition the ignition switch status back to Off. The front wiper motor is now in its park position.

1. The front wiper arms must be indexed to the pivot shafts with the front wiper motor in the park position to be properly installed. Position the wiper arm pivot end onto the wiper pivot shaft so that the lower edge of the wiper blade is aligned with the wiper alignment marks located near or within the lower margin of the windshield.
2. Once the wiper blade is aligned, lift the wiper arm away from the windshield slightly to relieve the spring tension on the pivot end and push the pivot end of the wiper arm (4) down firmly and evenly over the pivot shaft (3).
3. Install and tighten the nut (2) that secures the wiper arm to the pivot shaft. Tighten the nut to 20 N.m (15 ft. lbs.).
4. Wet the windshield glass, then operate the front wipers. Turn the wiper switch to the Off position, then check for the correct wiper arm alignment position and readjust as required.
5. Reinstall the plastic cap (1) onto the wiper arm pivot end.

REAR

0833005793

Fig. 11: Wiper Arm, Pivot Cover & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the rear wiper motor is in the park position before attempting to install the rear wiper arm. Transition the status of the ignition switch to On and move the rear wiper switch to its Off position. If the wiper motor output shaft moves, wait until it stops moving, then transition the status of the ignition switch back to Off. The wiper motor is now in its park position.

1. The rear wiper arm (2) must be indexed to the rear wiper motor output shaft with the motor in the park position to be properly installed. Position the wiper arm pivot end onto the output shaft so that the tip of the wiper blade is horizontal and parallel with the sine wave rear window defogger grid line at the bottom of the liftgate glass.
2. With the rear wiper arm properly indexed, push the tapered mounting hole on the pivot end of the wiper arm down over the output shaft.
3. Install and tighten the nut (3) that secures the rear wiper arm to the output shaft. Tighten the nut to 9 N.m (80 in. lbs.).
4. Fold and snap the molded plastic pivot cover (1) over the nut on the pivot end of the rear wiper arm.
5. Wet the liftgate glass and operate the rear wiper. Turn the rear wiper switch to the Off position, then check for correct wiper arm position and readjust as required.

BLADE, WIPER

DESCRIPTION

FRONT

Fig. 12: Blade Covers, Integral Latch & Pivot Block
Courtesy of CHRYSLER GROUP, LLC

Each front wiper blade is secured by an integral latch (2) and an integral pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. These wiper blades have a somewhat sculpted appearance that actually has a functional purpose. The sculpted appearance is due to molded plastic blade covers (1) securely fastened over the bridges and links of the wiper blade. This sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

The wiper blade consists of the following components:

- **Blade Covers** - The molded plastic blade covers shield the wiper superstructure and elements to reduce wind buffeting.
- **Element (4)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.
- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

The passenger side wiper blades are 45.00 centimeters (17.71 inches) long. The driver side wiper blades are 65.00 centimeters (25.59 inches) long. They have non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If ineffective, worn or damaged the entire wiper blade unit must be replaced.

REAR

Fig. 13: Rear Wiper Blade Is Secured By An Integral Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

The rear wiper blade is secured by an integral pivot pin (2) to a receptacle at the tip of the rear wiper arm, and rests near the base of the liftgate glass when the wiper is not in operation. The rear wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes a molded black plastic bridge and plastic links with claw formations that grip the wiper blade element. Also included in this unit is the pivot pin that secures the superstructure to the wiper arm.
- **Element (3)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The rear wiper blade is 35 centimeters (13.78 inches) long with a non-replaceable element (squeegee). The wiper blade superstructure cannot be adjusted or repaired. If ineffective, worn or damaged the entire wiper blade unit must be replaced.

OPERATION

FRONT

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the

glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet be resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REAR

The rear wiper blade is moved back and forth across the liftgate glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 14: Tab, Wiper Arm & Element
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (3) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, lift or gently pry the latch release tab (1) located just in front of the pivot block at the tip of the arm upward until it stands perpendicular to the wiper arm.
3. Rotate the lower end of the blade slightly downward (toward the wiper element and away from the wiper arm), then slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation on the end of the arm.
4. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure between the latch and the pivot block.
5. Gently lower the tip of the wiper arm onto the glass.

REAR

3. To remove the wiper blade (3) from the wiper arm (1), grasp the end of the blade nearest to the motor output shaft, then over-rotate it out from under the arm and past its stop far enough to unsnap the blade pivot pin (2) from the receptacle (4) on the end of the arm.
4. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 17: Tab, Wiper Arm & Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade and element unit (3) near the hook formation on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure between the latch (1) and the pivot block far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until it is fully engaged.
5. Rotate the latch release tab down into the blade until it snaps into its locked position. Latch engagement will be accompanied by an audible click.
6. Gently lower the wiper blade and element onto the glass.

REAR

0833005794

Courtesy of CHRYSLER GROUP, LLC

1. Lift the rear wiper arm pivot cap (1) upward to allow the rear wiper arm to be raised off of the glass.

NOTE: **The rear wiper arm cannot be raised to its over-center hinge position unless the pivot cover is raised first.**

2. Lift the rear wiper arm (2) to its over-center hinge position and off of the liftgate glass.

0833005795

Fig. 19: Wiper Blade, Wiper Arm, Pivot Pin & Receptacle
Courtesy of CHRYSLER GROUP, LLC

3. Position the rear wiper blade (3) with the pivot pin (2) aligned with the opening of the receptacle (4) on the tip of the wiper arm (1).
4. Using hand pressure, press the wiper blade pivot pin firmly and evenly into the wiper arm receptacle until it snaps into place.
5. Lower the wiper blade onto the glass and snap the pivot cover back into place.

CHECK VALVE, WASHER

DESCRIPTION

DESCRIPTION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for the washer system are integral to their respective front and rear washer nozzles. Refer to **NOZZLE, WASHER, DESCRIPTION**.

OPERATION

OPERATION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for the washer system are integral to their respective front and rear washer nozzles. Refer to **NOZZLE, WASHER, OPERATION**.

HOSES AND TUBES, WASHER

DESCRIPTION

FRONT

0833005485

Fig. 20: Front Washer Plumbing, Rear Washer Plumbing, Hood Plumbing & Body Plumbing
Courtesy of CHRYSLER GROUP, LLC

The reservoir front washer plumbing (4) consists of small diameter rubber hose or hard plastic tubing that is routed along with the reservoir rear washer plumbing (1) from the washer reservoir located on the left outboard Front End Module (FEM) hydroform ahead of the left front wheel housing. The plumbing is attached to its respective front or rear barbed outlet nipple of the washer pump/motor unit near the bottom of the reservoir, then routed through dedicated troughs integral to the reservoir to the left front fender load beam.

Plastic push-in type retainers secure the plumbing to the underside and the outboard side of the load beam. The front and rear plumbing are then connected by molded plastic quick-connect fittings above the left front wheel house. The front plumbing is connected to the hood plumbing (2). The rear plumbing is connected to the body plumbing (3), which is routed through a grommet and a hole in the dash panel into the passenger compartment.

0833005488

Fig. 21: Hood Plumbing, Hood Panel & Front Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

The hood plumbing (3) is routed from the load beam to the left hood hinge lower bracket, then to the left hood hinge upper bracket to the hood panel (1) and the inner hood reinforcement. The plumbing is then connected by molded rubber fittings to the barbed nipple of each front washer nozzle (2). The hood plumbing is also secured by plastic push-in type retainers to the load beam, the hood hinge and the inner hood reinforcement.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

HEADLAMP

The headlamp washer system plumbing consists of a large diameter high pressure rubber supply line that is routed from the outlet nipple of the headlamp washer pump/motor unit on the washer reservoir to one barbed nipple of a wye fitting behind the center of the front fascia. The other two barbed nipples of the wye fitting are connected to two short lengths of supply line that each terminate at a headlamp washer nozzle behind the fascia and below the two front lamp units. The supply line connections at the nozzles and at the headlamp washer pump are secured using molded plastic quick-connect fittings.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic washer plumbing fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

REAR

0833005486

Fig. 22: Rear Washer Plumbing
Courtesy of CHRYSLER GROUP, LLC

The reservoir rear washer plumbing consists of a small diameter rubber hose or hard plastic tubing that is routed along with the reservoir front washer plumbing from the washer reservoir under the left front fender ahead of the left front wheel house to the outboard side of the left front fender load beam. The plumbing is attached to its respective front or rear barbed outlet nipple of the washer pump/motor unit near the bottom of the reservoir. The plumbing is then secured by plastic push-in type retainers to the load beam.

The reservoir rear washer plumbing is connected by a molded plastic quick-connect fitting to the body rear washer plumbing above the left front wheel house. The body rear washer plumbing then passes from the engine compartment through a hole with a rubber grommet in the dash panel near the belt line to the left cowl side area within the passenger compartment.

The body rear washer plumbing (5) is routed up the inner left A-pillar (6), where it is connected by a molded plastic quick-connect fitting to the headliner rear washer plumbing (3). The plumbing is secured by plastic push-in type retainers (2) to the inner A-pillar. The headliner rear washer hose is secured to the headliner (1) substrate and routed along with the antenna wiring (4) toward the back of the vehicle.

0833005487

Fig. 23: Headliner, Rear Washer Plumbing & Upper Liftgate Opening Header
 Courtesy of CHRYSLER GROUP, LLC

Above the headliner (3) at the back of the vehicle the headliner rear washer plumbing (4) is connected to the liftgate rear washer plumbing (1) by another molded plastic quick-connect fitting. The liftgate rear washer plumbing is routed along with the liftgate wire harness through a clearance hole in the upper liftgate opening header (2) and rubber grommets in the upper liftgate opening trough and the liftgate inner and outer panels to the rear spoiler. The hose is secured to routing clips integral to the Center High Mounted Stop Lamp (CHMSL) housing within the spoiler to the barbed quick-connect nipple of the rear washer nozzle within the liftgate spoiler.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. Portions of the rear washer plumbing is integral to the headliner. The molded plastic washer hose fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

OPERATION

FRONT

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the front washer system plumbing and fittings to the two front washer nozzles. Whenever routing the washer plumbing or a wire harness containing washer plumbing, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the plumbing must be avoided.

HEADLAMP

Washer fluid in the washer reservoir is pressurized and fed by the headlamp washer pump/motor unit through

the headlamp washer system plumbing and fittings to the two telescopic headlamp washer nozzles. Whenever routing the washer plumbing, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the plumbing must be avoided.

REAR

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the rear washer system plumbing and fittings to the rear washer nozzle. Whenever routing the washer plumbing or a wire harness containing washer plumbing, it must be routed away from hot, sharp or moving parts; and, any sharp bends that might pinch the plumbing must be avoided.

STANDARD PROCEDURE

DISCONNECTING HIGH PRESSURE WASHER PLUMBING QUICK-CONNECT FITTINGS

0833006523

Fig. 24: Disconnecting High Pressure Washer Plumbing Quick-Connect Fittings
 Courtesy of CHRYSLER GROUP, LLC

Molded plastic quick-connect fittings join sections of the high pressure headlamp washer plumbing. To disconnect this fitting:

1. Push the molded plastic female half of the quick-connect fitting toward the male half quick-connect nipple of the headlamp washer pump, headlamp washer nozzle or other plumbing fitting.
2. While still pushing the two halves of the connector toward each other, squeeze or pinch the ribbed retainers on each side of the female half of the quick-connect between your thumb and forefinger.
3. Finally, pull the female half of the quick-connect fitting straight back from the male half quick-connect nipple to disconnect.

NOTE: When reconnecting the quick-connect fitting, align the female half of the fitting to the male half of the fitting. Do not attempt to reconnect using an angled approach. Push the two halves together until an audible click is heard.

DISCONNECTING LOW PRESSURE WASHER PLUMBING QUICK-CONNECT FITTINGS

3318084

Fig. 25: Molded Plastic Quick-Connect & Washer Hose Tubes
Courtesy of CHRYSLER GROUP, LLC

Molded plastic quick-connect fittings join sections of the low pressure front and rear washer plumbing. To disconnect this fitting:

1. Squeeze the two solid sides (not the open sides) of the female half of the quick-connect fitting at the outer edge.
2. While still squeezing the female half of the fitting, pull the two sections of the washer plumbing away from each other.

DISCONNECTING REAR WASHER NOZZLE QUICK-CONNECT FITTING

3805103

Fig. 27: Wiper Arm Linkage Components
 Courtesy of CHRYSLER GROUP, LLC

The wiper linkage module is secured within the cowl plenum panel beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the wiper linkage module.

The wiper linkage module consists of the following major components:

- **Bracket** - The wiper linkage module bracket (2) consists of two tubular members that extend from opposite sides of a die cast center section that serves as the wiper motor mount. Each tubular member has a die cast pivot bracket formation secured at the outboard end where the wiper pivots are secured. The wiper linkage module bracket is secured within the cowl plenum by two screws through two rubber insulators (1).
- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.
- **Linkage** - A stamped steel drive link (5) connects the wiper motor crank arm to the left wiper pivot lever arm. A stamped steel connector link (4) connects the left wiper pivot lever arm to the right wiper pivot lever arm. Each link has a plastic socket-type bushing on each end. The bushing on the pivot end of each link is snap-fit over a ball stud on the crank arm or the pivot lever arm.
- **Motor** - The wiper motor (3) is secured by a bracket integral to the motor transmission housing with two screws and nuts near the center of the wiper linkage module bracket. A knob-like rubber insulator (6) on a stud integral to the motor transmission housing is engaged in a slot in a stamped bracket on the cowl plenum panel. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch and an internal automatic resetting circuit breaker. An integral connector receptacle connects the motor to the vehicle electrical system.
- **Pivots** - The two front wiper pivots (7) are secured to the ends of the wiper module bracket. The lever arm that extends from the lower end of the left pivot shaft has two ball studs that are engaged with the bushings of the drive and connector links. The lever arm of the right pivot shaft has a single ball stud that

is engaged with the bushing of the connector link. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip.

The wiper motor and crank arm unit is available for separate service replacement. Any other component of the wiper linkage module cannot be adjusted or repaired. If any component of the module other than the motor is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The wiper linkage module operation is controlled by the battery current inputs received by the wiper motor through the Body Control Module (BCM). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper motor or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the wiper motor, the BCM or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to

DIAGNOSIS AND TESTING

REMOVAL

REMOVAL

0833005796

Fig. 28: Front Wiper Module, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove both front wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Remove the cowl plenum cover/grille panel from over the front wiper module.
4. Disconnect the wire harness (2) connector from the connector receptacle for the front wiper motor.
5. Remove the two screws that secure the ends of the front wiper module (1) bracket to the stamped brackets (3 and 5) within the cowl plenum.
6. Pull the front wiper module inboard far enough to disengage the knob-like rubber isolator from the slotted bracket (4) on the rearward wall of the cowl plenum.
7. Remove the front wiper module from the cowl plenum as a unit.

INSTALLATION

INSTALLATION

0833005796

Fig. 29: Front Wiper Module, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.

1. Position the wiper linkage module (1) to the cowl as a unit.
2. Position the knob-like rubber isolator to the slotted bracket (4) on the rear wall of the cowl plenum panel and pull the module outboard far enough to seat the isolator into the bracket.
3. Starting on the outboard side, install and tighten the two screws that secure the wiper linkage module to the stamped brackets (3 and 5) within the cowl plenum. Tighten the screws to 5.5 N.m (49 in. lbs.).
4. Reconnect the wire harness connector (2) to the connector receptacle for the wiper motor. Be certain that the connector is fully engaged and locked.
5. Reinstall the cowl plenum cover/grille panel over the wiper linkage module. Refer to COVER, COWL PANEL, INSTALLATION.
6. Reinstall both wiper arms onto the wiper pivots. Refer to ARM, WIPER, INSTALLATION.
7. Reconnect the negative cable to the battery.

MODULE, LIGHT RAIN SENSOR

DESCRIPTION

DESCRIPTION

3805559

Fig. 30: Light Rain Sensor Module Components

Courtesy of CHRYSLER GROUP, LLC

The Light Rain Sensor Module (LRSM) (1) is the primary component of the automatic wiper system. The LRSM is also capable of performing an ambient light sensor function; therefore, it is alternately referred to as the Rain Light Sensor Module (RLSM), the Light Sensor Module (LSM) or the Rain Sensor Module (RSM). The LRSM is located on the inside of the windshield glass just below and to the right of the inside rear view mirror mounting button. The LRSM is concealed from view within the vehicle interior by a molded plastic inside rear view mirror bracket trim cover that fits over the top of the LRSM housing and the LRSM mounting bracket, but the LRSM is visible through the windshield glass from the exterior of the vehicle.

The molded black plastic LRSM housing has an integral connector receptacle (2) with three terminal pins. These terminal pins connect the LRSM to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness that extends from above the headliner. The windshield side of the housing is filled with a clear, silicone gelatin (also known as SilGel) adhesive membrane pad (3), which serves as an optical coupler between the sensor and the inside of the windshield glass. A spring steel retaining strap or clip extends forward on each side of the housing to latch the LRSM to a molded black plastic mounting bracket, which is permanently bonded to the inside of the windshield glass.

Concealed and protected within the LRSM housing is the electronic circuitry of the module, which includes an InfraRed (IR) diode and photocell based light and rain sensors, control electronics and Local Interface Network (LIN) data bus communication management hardware. The LRSM is a LIN slave node and communicates over a single LIN bus circuit with the Body Control Module (BCM). The BCM is a LIN master node and a gateway to the Controller Area Network (CAN) data bus. The BCM controls the exchange of electronic messages back and forth between the LRSM and other electronic modules in the vehicle, as well as with a diagnostic scan tool connected to the Data Link Connector (DLC).

The LRSM cannot be adjusted or repaired. If ineffective or damaged, the entire module must be replaced. The silicone gelatin adhesive membrane pad is available for separate service replacement. The LRSM mounting bracket is serviced only as a unit with the windshield glass.

OPERATION

OPERATION

The Light Rain Sensor Module (LRSM) (1) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) senses moisture and ambient light levels on the outside of the windshield glass and sends electronic messages to the Body Control Module (BCM) over the Local Interface Network (LIN) data bus to give an indication of the monitored conditions. The BCM relays messages back and forth between the LRSM and other electronic modules in the vehicle.

For the rain sensor function, InfraRed (IR) diodes within the LRSM generate infrared light beams that are aimed by the optics of the sensor through the windshield glass, while an IR photo diode monitors the infrared light reflected back from the windshield glass. When sufficient moisture accumulates within the wipe pattern on the windshield glass, less of the infrared light is reflected back and the sensor detects a change in the monitored infrared light intensity. For the light sensor function, an IR photo diode within the sensor monitors the intensity of the ambient infrared light received through the windshield glass and the sensor optics.

The internal programming of the LRSM sends the appropriate electronic **wipe command** messages to the BCM over the LIN data bus. The BCM then responds by activating or deactivating the wiper system. Similarly, the LRSM provides electronic **ambient light level** messages to the BCM, and the BCM relays these messages to other electronic modules in the vehicle.

The Steering Control Module (SCM) sends electronic **wiper switch status** and **automatic wipe sensitivity level** messages over the Controller Area Network (CAN) data bus to the BCM based upon the driver-selected settings of the control knob on the control stalk of the right multifunction switch. The higher the selected wipe sensitivity setting the more sensitive the LRSM is to the accumulated moisture on the windshield glass, and the more frequently the LRSM will send **wipe commands** to the BCM to operate the wiper system. The BCM also monitors electronic **automatic display brightness level** messages based upon the driver-selected settings of the Electronic Vehicle Information Center (EVIC) as well as electronic messages from other electronic modules in the vehicle received over the CAN data bus, then relays the messages to the LRSM over the LIN bus.

The LRSM operates on battery current received through a fused ignition output (run/accessory) circuit. The LRSM has a path to ground at all times through a take out of the body wire harness with an eyelet terminal that is secured to the body sheet metal. Therefore, the LRSM is operational only when the ignition switch status is On or Accessory.

If the BCM receives an electronic status message from the LRSM indicating a sensor failure condition, a **Rain Sensor Failure** message should be displayed by the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). It is important to note that the default operation of the automatic wiper system is continuous wipe On, while the default operation for automatic lighting is On. Therefore, if no command message is received by the BCM from the LRSM for more than about five seconds when the Automatic wipe mode is selected, the wipers will default to Low Speed or High Speed continuous wipe operation. Likewise, if no command message is received by the BCM from the LRSM when the Automatic lighting mode is selected, the exterior lighting will default to On. The BCM must be properly configured for the automatic wipers and automatic lighting options in order for these systems to function.

The hard wired circuits of the LRSM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LRSM or the electronic controls and communication between other modules

and devices that provide some features of the automatic wiper and automatic lighting systems. The most reliable, efficient and accurate means to diagnose the LRSM or the electronic controls and communication related to LRSM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

PROTECTIVE CAP REMOVAL

3806254

Fig. 31: Protective Cap, Adhesive Membrane, LRSM & Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Light Rain Sensor Module (LRSM) (3) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane (2) that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. The service replacement LRSM is shipped with a clear plastic protective cap (1) installed and secured to the outer circumference of the LRSM by two latch features (4). This protective cap should not be removed until immediately before the LRSM is to be installed using the following procedure.

Fig. 32: Tabs, Protective Cap & LRS
 Courtesy of CHRYSLER GROUP, LLC

1. Firmly grasp the LRS (3) by the outer circumference from the side opposite the SilGel membrane pad.
2. Firmly grasp the protective shipping cap (2) of the LRS by the two latch release tabs (1) between your thumb and index finger from the SilGel membrane pad side of the module.
3. Firmly pinch the two latch release tabs together between your thumb and index finger far enough to release the two latch features of the protective cap from the outer circumference of the LRS.
4. Pull the protective cap off of the LRS.
5. Install the LRS into the mounting bracket bonded onto the windshield as instructed in the Installation procedure. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

SILICONE GELATIN PAD REPLACEMENT

0833003672

Fig. 33: LRSM & Adhesive Membrane
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Light Rain Sensor Module (LRSM) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the replacement silicone gelatin (SilGel) adhesive membrane pad onto the Light Rain Sensor Module (LRSM), it is necessary to minimize air pockets trapped between the SilGel membrane and the LRSM. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

1. Carefully peel away the old silicone gelatin adhesive membrane pad (2) from the windshield (optics) side of the Light Rain Sensor Module (LRSM) (1).
2. Thoroughly clean the windshield (optics) side of the LRSM using isopropyl alcohol and a clean, lint-free cloth.

3. Using care not to contaminate, touch or damage the replacement pad, peel off the yellow protective foil.

0833003673

Fig. 34: Protective Film & Replacement Pad
Courtesy of CHRYSLER GROUP, LLC

4. Looking through the transparent protective film (1), align and center the replacement pad (2) over the windshield (optics) side of the LRSM. Then use a slow, smooth and deliberate motion to roll the pad onto the windshield (optics) side of the LRSM.
5. With the transparent protective film still in place, use a thumb and a firm wiping motion to press the entire surface pad against the windshield (optics) side of the LRSM.
6. To avoid contamination or damage of the replacement pad, do not remove the transparent protective film until just before reinstalling the LRSM onto the windshield. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

REMOVAL

REMOVAL

Fig. 35: LRS, Harness Connector, Mount Bracket & Retaining Strap
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the inside rear view mirror from the mounting button (3) on the inside of the windshield glass (2). Refer to **MIRROR, REARVIEW, REMOVAL**.
3. Disconnect the wire harness connector (1) from the connector receptacle for the Light Rain Sensor Module (LRS) (6).
4. Insert the tip of a small screwdriver into the rectangular cutout on one side of the spring steel retaining strap (5) on the LRS and carefully pry the end of the strap closest to the glass away from the groove in the mounting bracket (4) on the windshield. Now rotate the loose side of the strap away from the glass far enough to disengage the other side of the strap from the mounting bracket groove.
5. Firmly grasp the connector receptacle of the LRS to pull the module away from the windshield glass and the mounting bracket.
6. If the LRS will be reinstalled, the silicone gelatin (also known as SilGel) adhesive membrane pad MUST be removed, discarded and replaced with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

CAUTION: The Light Rain Sensor Module (LRS) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRS should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry

inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the Light Rain Sensor Module (LRSM) it is necessary to minimize air pockets trapped between the SilGel membrane and the windshield glass. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

CAUTION: To avoid excessive air pockets, do not try to install the spring steel retaining strap until AFTER the Light Rain Sensor Module (LRSM) has been successfully positioned to the glass within the mounting bracket bonded to the windshield.

Fig. 36: LRSM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. If a new Light Rain Sensor Module (LRSM) is being installed, remove the protective shipping cap from the LRSM as described in: Standard Procedure - Protective Cap Removal. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**. If an existing LRSM is being reused, the silicone gelatin (also known as SilGel) adhesive membrane pad **MUST** be removed, discarded and replaced with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.
2. Grasp the LRSM (2) by the connector receptacle between your thumb and middle finger. Place your index finger on the back of the LRSM at the point opposite the connector receptacle.
3. Align the LRSM with the mounting bracket (1) bonded onto the inside of the windshield glass near the inside rear view mirror mounting button.
4. Slowly insert the LRSM into the mounting bracket at a slight angle so that the edge of the module nearest

the tip of your index finger makes the initial contact with the windshield glass.

5. Using a slow, deliberate motion and light pressure, draw your index finger across the back of the LRSM toward the connector receptacle until the silicone gelatin adhesive membrane pad is in full contact with the windshield glass.

Fig. 37: LRSM, Harness Connector, Mount Bracket & Retaining Strap
Courtesy of CHRYSLER GROUP, LLC

6. Engage one side of the spring steel retaining strap (5) into the groove on one side of the LRSM mounting bracket (4) on the inside of the windshield glass (2).
7. Depress the opposite side of the retaining strap over the LRSM firmly and evenly until it fully engages the groove of the mounting bracket with an audible click.
8. Looking through the windshield from outside the vehicle, inspect the silicone gelatin adhesive membrane pad for air pockets. If air pockets are observed, let the vehicle stand for about four hours at room temperature to allow the air pockets to dissipate. If an adhesive void (air pocket) greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin adhesive membrane pad with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.
9. Reconnect the wire harness connector (1) to the LRSM connector receptacle (6).
10. Reinstall the inside rear view mirror to the mounting button (3) on the inside of the windshield glass. Refer to **MIRROR, REARVIEW, INSTALLATION**.
11. Reconnect the negative cable to the battery.

NOZZLE, WASHER

DESCRIPTION

FRONT

3807822

Fig. 38: Washer Nozzle Components
Courtesy of CHRYSLER GROUP, LLC

The fluidic front washer nozzles (1) are constructed of molded plastic and include an integral check valve. Each nozzle has two integral latches (3) that secure it in a dedicated hole in the hood panel near the base of the windshield. A resilient rubber gasket (2) seals the nozzle to the outer hood panel. The domed upper surface of the washer nozzle is visible on the outside of the hood panel and the nozzle orifices are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. The barbed washer plumbing fittings (4) for the nozzles extend below the hood panel and are accessible from the engine compartment when the hood is opened.

A front washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

HEADLAMP

0833005537

Fig. 39: On-Road Nozzle & Off-Road Nozzle
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional headlamp washer system have two static headlamp washer nozzles mounted in the front bumper fascia, one beneath each front lamp unit. Two unique versions of the nozzle are used and they are not interchangeable. The on-road version of the nozzle (1) used in vehicles that are not equipped with the optional off-road front bumper fascia can be identified by a more rounded bezel appearance and a straight quick-connect inlet nipple. The off-road version of the nozzle (2) used in vehicles that are equipped with the optional off-road front bumper fascia can be identified by a more elongated bezel appearance and a right angle quick-connect inlet nipple.

The fixed body of both molded plastic nozzles have a fixed integral mounting clip on the rearward side just below the bezel, and a movable integral mounting clip on the opposite side. Both also have an integral index tab that engages a notch in the front bumper fascia mounting hole. A large diameter high pressure washer fluid supply line from the dedicated headlamp washer pump/motor unit is connected to the inlet nipple on the nozzle body using a molded plastic quick-connect fitting.

The headlamp washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, the nozzle must be replaced with a new unit.

REAR

0833008962

Fig. 40: Fluidic Rear Washer Nozzle
 Courtesy of CHRYSLER GROUP, LLC

The fluidic rear washer nozzle (4) is constructed of molded plastic and includes an integral check valve. The rear washer nozzle is secured by two integral latch features (3) within a mounting hole near the Center High-Mounted Stop Lamp (CHMSL) in the lower surface of the rear spoiler above the liftgate glass opening on the outer liftgate panel.

The outer surface of the washer nozzle is visible on the lower exterior surface of the spoiler, and a rubber gasket seals the nozzle bezel or flange (2) to the spoiler mounting hole. The nozzle orifice (1) is oriented downward towards the liftgate glass. The barbed washer plumbing quick-connect nipple fitting (5) is concealed between the spoiler and the liftgate outer panel.

The rear washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

FRONT

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single supply line, which is attached to a barbed nipple on each washer nozzle below the hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply lines back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until

washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being drawn into the washer system by a siphoning action through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning out through the washer nozzles after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

HEADLAMP

Each time the headlamp washer pump/motor unit is activated, pressure builds within the high pressure supply lines to each headlamp washer nozzle. As the hydraulic pressure is delivered to the nozzle, the nozzle sprays several high pressure streams against the lens of the front lamp unit.

REAR

The rear washer nozzle is designed to dispense washer fluid into the wiper pattern area on the outside of the liftgate glass. Pressurized washer fluid is fed to the nozzle from the washer reservoir by the washer pump/motor through a single supply line, which is attached to a barbed nipple on the back of the nozzle. A fluidic matrix within the nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in the nozzle prevents washer fluid from draining out of the washer supply hose back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzle because the washer pump would have to refill the washer plumbing from the reservoir to the nozzle. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzle after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well within the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

FRONT

0833005488

Fig. 41: Hood Plumbing, Hood Panel & Front Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. From the underside of the hood (1), remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement as necessary to access the washer nozzle (2) plumbing connections.
2. From the underside of the hood, disconnect the washer plumbing (3) fitting from the barbed nipple of the washer nozzle.
3. From the underside of the hood, release the integral latch features of the washer nozzle and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the washer nozzle from the top of the hood panel.

HEADLAMP

0833005538

Fig. 42: Headlamp Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle cover or the front fascia during the following procedure.

NOTE: There are two headlamp washer nozzle configurations available for this vehicle: one for vehicles not equipped with an off-road package, and another for vehicles equipped with an off-road package (shown here). However, the removal and installation procedures for these two nozzle configurations is identical.

1. Remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL**.
2. From the back side of the front fascia (1), disconnect the high pressure hose quick-connect fitting from the quick-connect nipple of the headlamp washer nozzle.

Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.

3. From the back side of the front fascia, compress the movable mounting clip (2) of the headlamp washer nozzle (3) tightly against the body of the nozzle.
4. With the movable mounting clip fully compressed, tip the body of the nozzle forward far enough to raise the end of the movable clip through the mounting hole of the front fascia.
5. Disengage the fixed mounting clip (4) of the nozzle and pull it upward through the mounting hole of the front fascia.
6. Remove the headlamp washer nozzle from the front fascia.

REAR

0833008963

Fig. 43: Rear Washer Nozzle

Courtesy of CHRYSLER GROUP, LLC

1. Remove the liftgate spoiler from the top of the liftgate outer panel. Refer to **SPOILER, REMOVAL**.
2. From the interior of the spoiler (1), disengage the rear washer hose from the routing clips on the back of the Center High Mounted Stop Lamp (CHMSL) housing (5).
3. Disconnect the quick-connect fitting (2) of the washer hose from the quick-connect nipple of the rear washer nozzle (4). Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
4. From the interior of the spoiler, release the latch features (3) of the rear washer nozzle and push the nozzle out through the mounting hole to the outside of the spoiler.
5. Remove the rear washer nozzle from the liftgate spoiler.

INSTALLATION

FRONT

0833005488

Fig. 44: Hood Plumbing, Hood Panel & Front Washer Nozzle
 Courtesy of CHRYSLER GROUP, LLC

1. Position the washer nozzle (2) to the mounting hole on the outside of the hood panel (1).
2. Align the anti-rotation tabs of the nozzle with the anti-rotation notches in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral latch features lock into place on the underside of the hood.
4. From the underside of the hood, reconnect the washer plumbing (3) fitting to the barbed nipple of the nozzle.
5. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement.

HEADLAMP

0833005538

Fig. 45: Headlamp Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle cover or the front fascia during the following procedure.

1. Insert the quick-connect nipple and body of the headlamp washer nozzle (3) into the mounting hole of the front fascia (1).
2. Engage the fixed mounting clip (4) on the nozzle body through the mounting hole.

Tilt the nozzle body rearward far enough to engage the movable mounting clip (2) through the mounting hole and until the nozzle bezel is flush with the surface of the front fascia.

3. From the back side of the front fascia (1), reconnect the high pressure hose quick-connect fitting to the quick-connect nipple of the headlamp washer nozzle.
4. Reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .

REAR

0833008963

Fig. 46: Rear Washer Nozzle

Courtesy of CHRYSLER GROUP, LLC

1. Position the rear washer nozzle (4) to the mounting hole in the liftgate spoiler (1). Be certain that the rubber gasket is in position on the back of the nozzle bezel or flange.
2. Using hand pressure, push firmly and evenly on the nozzle bezel or flange until both integral latch features (3) are fully engaged on the inside of the spoiler mounting hole.
3. Reconnect the washer supply line quick-connect fitting (2) to the quick-connect barbed nipple on the back of the nozzle.
4. Engage the washer hose into the routing clips on the back of the Center High Mounted Stop Lamp (CHMSL) housing (5).
5. Reinstall the spoiler onto the liftgate outer panel. Refer to **SPOILER, INSTALLATION** .

MOTOR, WIPER

DESCRIPTION

FRONT

The front wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, DESCRIPTION**.

REAR

Fig. 47: Rear Wiper Motor, Motor Output Shaft, Integral Connector Receptacle & Rubber Isolators
Courtesy of CHRYSLER GROUP, LLC

The rear wiper motor is concealed behind the lower liftgate inside trim panel on the liftgate inner panel just below the liftgate glass near the center. The threaded and tapered end of the motor output shaft (1) that extends through the liftgate glass to drive the rear wiper arm and blade is the only visible component of the rear wiper motor. A rubber grommet is engaged within the output shaft clearance hole of the liftgate glass and seals the output shaft housing where it passes through the glass. An integral connector receptacle (4) connects the rear wiper motor to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness. The rear wiper motor consists of the following major components:

- **Bracket (2)** - The rear wiper motor bracket consists of a Stamped metal mounting plate for the wiper motor that is secured with screws to the wiper motor transmission housing. The bracket is secured with screws through three rubber isolators (5) to three mounting points that are integral to the liftgate inner panel.
- **Motor (3)** - The single-speed permanent magnet rear wiper motor is secured to the rear wiper motor bracket. The wiper motor includes an integral transmission, the motor output shaft, a park switch and an integral connector receptacle. An automatic resetting circuit breaker and an internal clutch mechanism protect the motor from overloads.

The rear wiper motor cannot be adjusted or repaired. If any component of the motor is ineffective or damaged, the entire rear wiper motor unit must be replaced. The motor output shaft grommet, the mounting hardware and the liftgate glass are available for individual service replacement.

OPERATION

FRONT

The front wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, OPERATION**.

REAR

The rear wiper motor operation is controlled by the Body Control Module (BCM), which uses relays soldered onto the BCM Printed Circuit Board (PCB) to control rear wiper system operation for energizing or de-energizing the rear wiper motor. The BCM uses internal programming, hard wired inputs received from the right (wiper) multifunction switch and the rear wiper motor park switch as well as electronic messages received over the Controller Area Network (CAN) data bus to provide the rear wiper and washer system operating modes.

The rear wiper motor park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes and opens a voltage signal for the rear wiper motor electronic control logic circuitry of the BCM. The park switch is normally an open circuit when the rear wiper blade is in the parked position, and is connected to fused ignition output when the rear wiper blade is anywhere except parked.

This park switch input allows the electronic logic circuits of the BCM to control all of the electronic features of rear wiper motor operation and to keep the motor energized long enough to complete its current wipe cycle and park the wiper blade at the base of the glass after the status of the rear wiper system or the ignition switch transitions to Off. The internal BCM circuitry pulls the park switch sense input to ground when the switch is open so that the microcontroller sees a ground when the wiper blade is parked.

The rear wiper motor is grounded at all times through a take out with an eyelet terminal connector in the body wire harness that is secured to a ground location in the passenger compartment. The automatic resetting circuit breaker protects the motor from overloads. The rear wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the liftgate glass.

The hard wired inputs and outputs of the rear wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper motor or the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper motor or the electronic controls and communication related to rear wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL**FRONT**

0833005471

Fig. 48: Front Wiper Linkage Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module **MUST** be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit **MUST** be replaced.

1. Disconnect and isolate the negative cable from the battery.
2. Remove the front wiper linkage module from the cowl plenum and place it on a suitable work surface. Refer to **LINKAGE, WIPER ARM, REMOVAL**.
3. Disengage the socket bushing (1) of the wiper drive link (2) from the ball stud on the wiper motor crank arm (6) using two large screwdrivers, one on each side of the ball stud. Pry firmly and evenly between the crank arm and the metal portion of the drive link until the socket unsnaps from the ball.
4. Remove the two screws (5) that secure the motor bracket (3) to the module bracket (4).
5. Remove the wiper motor and crank arm as a unit from the module bracket.

REAR

2918916

Fig. 49: Liftgate Glass, Rear Wiper Arm & Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. From the outside of the liftgate glass (4), remove the rear wiper arm (2) from the rear wiper motor output shaft (5). Refer to **ARM, WIPER, REMOVAL**.

0833005470

Fig. 50: Rear Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

3. From the inside of the liftgate, remove the trim from the liftgate inner panel (1). Refer to **PANEL, TRIM, REMOVAL**.
4. Disconnect the liftgate wire harness connector (4) from the rear wiper motor (2) connector receptacle.
5. Remove the three screws (3) that secure the motor mounting bracket to the liftgate inner panel.

6. Carefully slide the rear wiper motor output shaft and housing out of the grommet installed in the clearance hole of the liftgate glass.
7. From the outside of the liftgate, remove the output shaft grommet from the clearance hole in the liftgate glass and discard.

INSTALLATION

FRONT

0833005471

Fig. 51: Front Wiper Linkage Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module **MUST** be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit **MUST** be replaced.

1. Position the front wiper motor unit to the front wiper module bracket (4).

2. Install and tighten the two screws (5) into the two nuts that secure the motor bracket (3) to the module bracket. Tighten the screws to 7.5 N.m (66 in. lbs.).
3. Position the socket bushing (1) of the wiper drive link (2) over the ball stud on the crank arm (6).
4. Place a short 19 millimeter or 3/4 inch socket over the domed cap side of the socket bushing as an installation tool. Use large channel-lock pliers to firmly and evenly apply enough pressure to the underside of the crank arm and the top of the socket installation tool to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushing.**

NOTE: Be certain to transition the ignition switch to the On status, then turn the front wiper switch On and Off again to cycle the wiper motor and linkage to their natural park position before reinstalling the front wiper arms onto the wiper pivots.

5. Reinstall the front wiper linkage module into the vehicle. Refer to **LINKAGE, WIPER ARM, INSTALLATION**.
6. Reconnect the negative cable to the battery.

REAR

2918916

Fig. 52: Liftgate Glass, Rear Wiper Arm & Output Shaft
 Courtesy of CHRYSLER GROUP, LLC

1. From the outside of the liftgate, install a new rubber grommet (3) into the rear wiper motor output shaft clearance hole of the liftgate glass (4). Always use a new grommet in the glass.

0833005470

Fig. 53: Rear Wiper Motor

Courtesy of CHRYSLER GROUP, LLC

2. From the inside of the liftgate, position the rear wiper motor (2) output shaft and housing through the grommet in the liftgate glass clearance hole.
3. Position the rear wiper motor mounting bracket to the liftgate inner panel.
4. Install and tighten the three screws (3) that secure the motor mounting bracket to the liftgate inner panel. Tighten the screws securely.
5. Reconnect the liftgate wire harness connector (4) to the rear wiper motor connector receptacle.
6. Reinstall the trim onto the liftgate inner panel. Refer to **PANEL, TRIM, INSTALLATION**.
7. From the outside of the liftgate, reinstall the rear wiper arm onto the motor output shaft. Refer to **ARM, WIPER, INSTALLATION**.
8. Reconnect the negative cable to the battery.

PUMP, WINDSHIELD WASHER

DESCRIPTION

FRONT AND REAR

Fig. 54: Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit is located on the top of a sump area on the outboard side of the washer reservoir, which is located between the left front fender and the left front fender load beam ahead of the left front wheel house splash shield. A small permanently lubricated and sealed reversible electric motor (3) is coupled to the rotor-type washer pump (4). The use of an integral valve body (7) allows the washer pump/motor unit to provide washer fluid to either the front or the rear washer systems, depending upon the direction of the pump impeller rotation.

An inlet nipple (6) on the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir sump. The filter screen prevents most debris from entering the pump housing. When the pump is installed in the reservoir the front barbed outlet nipple (5) on the pump valve body housing connects the unit to the front washer plumbing, and the rear barbed outlet nipple (8) connects the unit to the rear washer plumbing. The letters **F** and **R** molded into the valve body housing adjacent to each nipple provide further clarification of the nipple assignments.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap fit between the snap post (2) at the top of the pump motor housing and a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (1) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced. The rubber grommet seal/filter screen is available for separate service replacement.

HEADLAMP

Fig. 55: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

The headlamp washer pump/motor unit (1) of vehicles so equipped is located on the top of a sump area just above and rearward of the reversible front and rear washer pump on the outboard side of the washer reservoir, between the left front fender and left front fender load beam ahead of the left front wheel house splash shield. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump.

An inlet nipple (4) on the bottom of the pump housing (3) passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir. When the pump is installed in the reservoir the quick connect outlet nipple (5) on the pump housing points toward the left side of the vehicle and connects the unit to the headlamp washer plumbing.

The headlamp washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by a light snap fit into a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (2) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The headlamp washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire headlamp washer pump/motor unit must be replaced. The rubber grommet seal/filter screen is available for separate service replacement.

OPERATION

FRONT AND REAR

Fig. 56: Washer Pump/Motor Operation
 Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit features a small Direct Current (DC) reversible electric motor. The direction of the motor is controlled by hard wired outputs from the Body Control Module (BCM). When battery current and ground are applied to the two pump motor terminals, the motor rotates in one direction. When the polarity of these connections is reversed, the motor rotates in the opposite direction. When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through one of the two pump outlet nipples, and into the front or rear washer plumbing.

The BCM controls the hard wired outputs to the pump motor based upon electronic **washer switch** status messages received over the Controller Area Network (CAN) data bus from the Steering Control Module (SCM). The SCM monitors analog and digital inputs from the front and rear washer switch circuitry contained within the right multifunction switch to determine the proper electronic messages to send. Whenever the low washer fluid indicator is illuminated, the BCM is programmed to suppress all rear washer requests in order to give priority to the need for forward visibility.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. An integral valve body is located in a housing on the outlet port side (2) of the pump housing. A diaphragm (4) in this valve body controls which washer system plumbing receives the washer fluid being pressurized by the pump.

When the pump impeller (1) rotates in the counterclockwise direction (viewed from the bottom), the biased diaphragm is sealing off the rear washer system outlet and nipple so the pressurized washer fluid is pushed out through the pump front outlet port and the front washer outlet nipple (5). When the pump impeller rotates in the clockwise direction (viewed from the bottom), pressurized washer fluid is pushed out through the pump rear outlet port and moves the diaphragm to open the rear washer outlet nipple and seal off the front washer outlet nipple, then the pressurized washer fluid is pushed out through the rear washer outlet nipple (3).

The washer pump/motor unit and the hard wired motor control circuits from the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer pump/motor unit or the electronic controls and communication between other modules and devices that provide some features of the front and rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP

Headlamp washer pump/motor unit operation is completely controlled by the Body Control Module (BCM) logic circuits based upon electronic **headlamp switch** and **washer switch** status messages received from the Steering Control Module (SCM) over the Controller Area Network (CAN) data bus. The SCM monitors hard wired analog and digital inputs from the headlamp switch circuitry of the left multifunction switch and from the front washer switch circuitry of the right multifunction switch to determine the proper status messages to send.

The headlamp washer relay control coil operates on ground received from the BCM, and the BCM will only allow the relay to function while the engine is running. In addition, the BCM will only allow the headlamp washers to operate when the headlamps are turned On. The BCM uses both a Low Side Driver (LSD) to energize or de-energize the headlamp washer relay in the Power Distribution Center (PDC) which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer pump/motor unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer pump/motor or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer pump/motor unit or the electronic controls and communication related to headlamp washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT AND REAR

0833005535

Fig. 57: Washer Pump/Motor Unit

Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Raise and support the vehicle.
4. Remove the plastic push-in fasteners that secure the forward end of the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the left front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer pump/motor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform.
6. Disconnect the FEM wire harness connector (2) for the washer pump motor from the motor connector receptacle.

NOTE: **To aid in reinstallation, note the installed position of the front and rear washer plumbing fittings (4) prior to disconnecting them from the washer pump.**

7. Disconnect the front and rear washer plumbing fittings from the barbed outlet nipples of the washer pump and allow the washer fluid to drain into a clean container for reuse.
8. Pull lightly outward on the top of the washer pump/motor housing away from the washer reservoir to disengage the snap post on the top of the motor from the receptacle in the reservoir.
9. Using hand pressure, firmly grasp and pull the washer pump upward far enough to disengage the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage the reservoir.
10. Remove the washer pump/motor unit from the washer reservoir.
11. Remove the rubber grommet seal from the washer pump mounting hole in the reservoir and discard.

HEADLAMP

0833005536

Fig. 58: Headlamp Washer Pump/Motor Unit
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The headlamp washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.

1. Disconnect and isolate the negative cable from the battery.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Turn the steering wheel to move the front wheels to the full left position.
4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
6. Pull the forward end of the left front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the headlamp washer pump/motor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform. The headlamp washer pump is above and behind the reversible front and rear washer pump/motor unit (5).
7. Disconnect the FEM wire harness connector (2) for the headlamp washer pump motor from the motor connector receptacle.
8. Disconnect the high pressure headlamp washer supply line quick connect fitting from the headlamp washer pump outlet quick connect nipple. Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
9. Pull lightly outward on the top of the headlamp washer pump/motor housing away from the washer reservoir to unsnap it from the molded receptacle in the reservoir.
10. Using hand pressure, firmly grasp and pull the headlamp washer pump upward far enough to disengage

the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage the reservoir.

11. Remove the rubber grommet seal/filter screen from the pump mounting hole in the washer reservoir and discard.

INSTALLATION

FRONT AND REAR

0833005535

Fig. 59: Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber grommet seal/filter screen with clean washer fluid and install it into the washer pump mounting hole in the washer reservoir (1). Always use a new rubber grommet seal/filter screen on the reservoir.
2. Position the inlet nipple on the base of the pump housing of the washer pump/motor unit (3) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the top of washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the snap post on the top of the motor housing with the snap post receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of motor housing until the post snaps into the receptacle.

NOTE: Be certain to reconnect the front and rear washer plumbing fitting to the proper outlet nipples of the washer pump. Failure to properly connect the

fittings will cause the front and rear washer systems to operate incorrectly.

6. Reconnect the front and rear washer plumbing fittings (4) to the barbed outlet nipples of the washer pump.
7. Reconnect the Front End Module (FEM) wire harness connector (2) for the washer pump/motor unit to the connector receptacle on the top of the motor.
8. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
9. Lower the vehicle.
10. Reconnect the negative cable to the battery.
11. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

HEADLAMP

0833005536

Fig. 60: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal/filter screen into the headlamp washer pump/motor unit mounting hole in the washer reservoir (1). Always use a new rubber grommet seal on the reservoir.
2. Position the inlet nipple of the headlamp washer pump/motor unit (3) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the headlamp washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the

reservoir.

4. Using hand pressure, press the top of the headlamp washer pump/motor housing firmly inward far enough to engage the snap fit between the motor housing and the molded motor receptacle in the reservoir.
5. Reconnect the Front End Module (FEM) wire harness connector (2) to the connector receptacle on the top of the pump motor.
6. Reconnect the headlamp washer high pressure supply line quick connect fitting to the headlamp washer pump outlet quick connect nipple. Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
7. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
8. Lower the vehicle.
9. Refill the washer reservoir with the washer fluid drained during removal.
10. Reconnect the negative cable to the battery.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

0833005656

Fig. 61: Windshield Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

A single washer fluid reservoir (1) is used for both the front and rear washer systems. The molded plastic

washer fluid reservoir is mounted on the left outboard side of the Front End Module (FEM) hydroform between the left front fender and the left front fender load beam, ahead of the left front wheel, where it is concealed by the left front wheel house splash shield. The only visible component of the washer reservoir is the filler neck and cap unit (2), which extends upward into the engine compartment just behind the upper radiator cross member. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** molded into it snaps over the open end of the filler neck. The cap hinges on and is secured to the reservoir filler neck by an integral retainer ring and bail strap.

There are separate, dedicated holes on the outboard side of the reservoir provided for the reversible front and rear washer pump/motor unit (5) and the washer fluid level switch (4). The inboard side of the washer reservoir has integral mounting tabs that are secured to weld studs on the FEM hydroform by two nuts. A mounting tab near the top of the filler neck is secured by a screw to the upper radiator cross member. A mounting tab at the upper rear corner of the reservoir is secured to the battery tray after the FEM is secured to the vehicle. The left front fender wheel house splash shield must be removed to access the washer reservoir for service.

A unique reservoir is used for vehicles manufactured for export markets with the optional High Intensity Discharge (HID) headlamps and the headlamp washer system. This reservoir has a dedicated sump and mounting receptacle for the headlamp washer pump (3) on the outboard side of the reservoir, above and rearward of the reversible front and rear washer pump. The location and mounting provisions for this reservoir are the same as those for vehicles without the headlamp washer system.

The washer reservoir cannot be repaired and, if ineffective or damaged, it must be replaced. The washer reservoir, rubber grommet seals for the washer pump/motor units and the washer fluid level switch as well as the filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the front and rear washer systems. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir.

The reversible front and rear washer pump/motor unit is located in a sump area near the bottom on the outboard side of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The front and rear washer pump/motor unit is mounted in the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the front and rear washer systems will no longer operate.

On vehicles equipped with the headlamp washer system the reservoir features a second sump located rearward of and above the front and rear washer pump sump. This allows the front and rear washer systems to remain operational after the washer fluid level falls below the pump inlet for the headlamp washer pump.

REMOVAL

REMOVAL

Fig. 62: Upper Radiator Support, Filler Neck & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Remove the screw (3) that secures the washer reservoir filler neck (2) to the upper radiator support (1).

0833005703

Fig. 63: Washer Fluid Level Switch, Pump/Motor & Headlamp Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.
6. Pull the forward end of the front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer reservoir (4) for service.
7. Disconnect the Front End Module (FEM) wire harness connectors from the washer fluid level switch (6), the washer pump/motor (7) and, if equipped, the headlamp washer pump/motor (5).

NOTE: **To aid in reinstallation, note the installed position of the washer hoses prior to disconnecting them from the washer pump.**

8. Disconnect the front and rear washer hoses from the barbed outlet nipples of the washer pump and allow the washer fluid to drain into a clean container for reuse.
9. If the vehicle is so equipped, disconnect the headlamp washer supply hose quick-connect fitting from the headlamp washer pump/motor.
10. Remove the screw (3) that secures the mounting tab on the upper rear corner of the washer reservoir to the battery tray (2).
11. Remove the two nuts (8) that secure the forward mounting tabs of the washer reservoir to the weld studs on the outboard side of the FEM hydroform (1).
12. Lower the washer reservoir from the vehicle, rotating it as necessary for clearance.

INSTALLATION

INSTALLATION

0833005703

Fig. 64: Washer Fluid Level Switch, Pump/Motor & Headlamp Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer reservoir (4) into the left front fender wheel house from underneath the vehicle.
2. Raise the washer reservoir into position, rotating it as necessary for clearance.
3. Engage the two mounting tabs at the front of the washer reservoir over the weld studs on the outboard side of the Front End Module (FEM) hydroform (1).
4. Install and tighten the two nuts (8) that secure the washer reservoir to the weld studs on the FEM hydroform. Tighten the nuts to 7 N.m (60 in. lbs.).
5. Install and tighten the screw (3) that secures the mounting tab on the upper rear corner of the washer reservoir to the battery tray (2). Tighten the screw to 7 N.m (60 in. lbs.).

NOTE: Be certain to reconnect the front and rear washer hoses to the proper outlet nipples of the washer pump. Failure to properly connect the hoses will cause the front and rear washer systems to operate incorrectly.

6. Reconnect the front and rear washer hoses to the barbed outlet nipples of the washer pump (7).
7. If the vehicle is so equipped, reconnect the headlamp washer supply hose quick-connect fitting to the outlet nipple of the headlamp washer pump (5).
8. Reconnect the FEM wire harness connectors to the washer fluid level switch (6), the washer pump/motor and, if equipped, the headlamp washer pump/motor.
9. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
10. Lower the vehicle.

Fig. 65: Upper Radiator Support, Filler Neck & Screw
Courtesy of CHRYSLER GROUP, LLC

11. Install and tighten the screw (3) that secures the washer reservoir filler neck (2) mounting tab to the upper radiator cross member (1). Tighten the screw to 7 N.m (60 in. lbs.).
12. Refill the washer reservoir with the washer fluid drained during removal.
13. Reconnect the negative cable to the battery.

SWITCH, MULTIFUNCTION, RIGHT

DESCRIPTION

DESCRIPTION

1012006656

Fig. 66: Steering Column Control Module (SCCM) & Clockspring
Courtesy of CHRYSLER GROUP, LLC

The right (wiper) multifunction switch (3) is integral to the Steering Column Control Module (SCCM) (2), which includes both the left (1) and right multifunction switches, the microcontroller based Steering Control Module (SCM) and serves as the carrier for the clockspring (4). The right multifunction switch is located on the right side of the steering column, just below the steering wheel. This switch is the primary control for the front and rear wiper and washer systems.

0833005928

Fig. 67: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The only visible components of the switch are the control stalk (1), control knob (2) and control sleeve (3) that extend through the steering column shrouds on the right side of the column. The remainder of the switch including its mounting provisions and electrical connections are concealed within the SCCM beneath the steering column shrouds. The switch controls are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions.

The right (wiper) multifunction switch provides the vehicle operator with a control interface for the following wiper and washer system functions:

- **Continuous Front Wipers** - The right multifunction switch control knob provides detent switching for two continuous front wipe modes, low speed or high speed.
- **Intermittent Front Wipers** - The right multifunction switch control knob provides detent switching for the intermittent front wipe mode with four minor detent delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system.
- **Front Wiper Mist Mode** - The right multifunction switch control stalk includes momentary switching of the front wiper motor low speed circuit to provide a mist mode features (sometimes referred to as pulse wipe), which allows the vehicle operator to momentarily operate the front wipers for one or more complete cycles.
- **Front Washer Mode** - The right multifunction switch control stalk provides momentary switching for control of the front washer system operation.
- **Intermittent Rear Wipe Mode** - The right multifunction switch control sleeve provides detent switching for a single fixed interval intermittent rear wiper mode.

- **Rear Washer Mode** - The right multifunction switch control stalk provides momentary switching for control of rear washer system operation.

The right multifunction switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM mounting housing, SCM and multifunction switches unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL**. The clockspring is available for separate service replacement.

OPERATION

OPERATION

The right (wiper) multifunction switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) and other electronic modules in the vehicle.

If the SCM detects no inputs from the right multifunction switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals the other electronic modules to implement a fail-safe or default mode of operation for the front and rear wiper systems. The fail-safe mode will maintain the last selected front and rear wiper system operation for the remainder of the current ignition cycle, after which both wiper systems will default to Off.

The hard wired inputs and outputs of the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the right multifunction switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the right multifunction switch or the electronic controls and communication related to right multifunction switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the right multifunction switch is operated to control the many front and rear wiper and washer system functions and features it provides:

- **Front Washer Control** - The right multifunction switch control stalk is pulled rearward towards the steering wheel to a momentary WASH position to activate the washer pump/motor in the front washer mode. The washer pump/motor will continue to operate for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multifunction switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the right multifunction switch control stalk is rotated to one of the two continuous wiper detent positions (LO or HI), to one of four intermittent delay or sensitivity wiper detent positions, or to the OFF position to select the front wiper mode. The SCM reads the resistor multiplexed input from the right multifunction switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic modules in the vehicle.

- **Front Wiper Mist Mode** - The right multifunction switch control stalk is lifted upward to a momentary MIST position to activate the front wiper MIST mode. The front wiper motor will continue to operate, one complete cycle at a time, for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multifunction switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Rear Washer Control** - The right multifunction switch control pushed forward away from the steering wheel to the momentary WASH positions to activate the washer pump/motor in the rear washer mode. The washer pump/motor will continue to operate in the rear washer mode for as long as the control stalk is held in this position. The SCM reads the input from the right multifunction switch and sends an electronic **rear washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Rear Wiper Control** - The rear wiper mode is selected when the right multifunction switch control sleeve is rotated to the fixed interval intermittent rear wipe detent ON position detent position. The SCM reads the input from the right multifunction switch and sends an electronic **rear wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RIGHT MULTIFUNCTION SWITCH

The hard wired inputs and outputs of the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the right multifunction switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the right multifunction switch or the electronic controls and communication related to right multifunction switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The right multifunction switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and both multifunction switches. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

INSTALLATION

INSTALLATION

The right multifunction switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and both multifunction switches. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . The clockspring is available for separate service replacement.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION

0833005657

Fig. 68: Washer Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

The washer fluid level switch is a single pole, single throw reed-type switch mounted just above the sump area near the bottom of the washer reservoir. Only the molded plastic switch mounting flange (1) and the integral connector receptacle (5) are visible when the switch is installed in the reservoir. A short barbed nipple formation extends from the inner surface of the switch mounting flange and is pressed through a rubber grommet seal (4) installed in the mounting hole of the reservoir.

A molded plastic float (3) hangs under a molded plastic beam (2) that extends axially from the switch mounting flange. A small permanent magnet is secured within a receptacle on the bottom of the float, and the reed switch is concealed within the beam.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, it must be replaced. The grommet seal should be replaced with a new unit each time the switch is removed from the washer reservoir.

OPERATION

OPERATION

The washer fluid level switch uses a float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float moves, the proximity of this magnet to a stationary reed switch within the beam formation of the switch changes. When the fluid level in the washer reservoir is at or above the

float level, the float rises and the influence of the float magnetic field is applied to the reed switch causing the normally open reed switch contacts to close. When the fluid level in the washer reservoir falls below the level of the float, the float falls and the influence of the float magnetic field is removed from the reed switch, causing the contacts of the normally open reed switch to open.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness. The switch is connected in series between the washer fluid switch sense and return circuits of the Body Control Module (BCM). When the switch opens, the BCM senses the input on the washer fluid switch return circuit. The BCM is programmed to respond to this input by sending an electronic message to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus requesting illumination of the low washer fluid indicator and the sounding of an audible chime tone warning.

The washer fluid level switch and the hard wired circuits between the switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer systems. The most reliable, efficient and accurate means to diagnose the washer fluid level switch or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 69: Washer Fluid Level Sensor Unit & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.**

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Raise and support the vehicle.
4. Remove the plastic push-in fasteners that secure the forward end of the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the left front wheel house splash shield away from the inner fender panel and front fascia far enough to access the washer fluid level sensor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform.
6. Disconnect the FEM wire harness connector (2) for the washer fluid level sensor from the sensor connector receptacle.
7. Disconnect one of the reservoir washer plumbing fittings from the barbed outlet nipple of the washer pump (4) and allow the washer fluid to drain into a clean container for reuse.
8. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level sensor out of the rubber grommet seal on the reservoir just above the sump. Care must be taken not to damage the reservoir.
9. Remove the washer fluid level sensor from the washer reservoir.
10. Remove the rubber grommet seal from the washer fluid level sensor mounting hole in the washer reservoir and discard.

INSTALLATION

INSTALLATION

0833005484

Fig. 70: Washer Fluid Level Sensor Unit & Connector
 Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber grommet seal with clean washer fluid and install it into the washer fluid level sensor mounting hole in the washer reservoir (1). Always use a new rubber grommet seal on the reservoir.
2. Insert the float of the washer fluid level sensor (3) through the rubber grommet seal and into the washer reservoir. The flat of the index tab on the washer fluid level switch mounting flange should be pointed downward.
3. Using hand pressure, press firmly and evenly on the washer fluid level sensor mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the mounting hole of the washer reservoir.
4. Reconnect the Front End Module (FEM) wire harness connector (2) for the washer fluid level sensor to the sensor connector receptacle.
5. Reconnect the reservoir washer plumbing fitting to the barbed outlet nipple of the washer pump (4).
6. Reinstall the plastic push-in fasteners that secure the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
7. Lower the vehicle.
8. Reconnect the negative cable to the battery.
9. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.

2014 AUTOMATIC TRANSMISSION

948TE - Service Information - Cherokee

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for the 8HP transmission. This fluid is **NOT** compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see **FLUIDS, LUBRICANTS AND GENUINE PARTS** in the owner's manual.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Power Transfer Unit performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

AIR TESTING

The 948TE transmission can be air tested to evaluate the condition of the seals and clutch apply circuits within the transmission. An adaptor plate in place of the valve body is required to perform this test. A rubber tipped air chuck connected to a 413 kPa (60 PSI) regulated shop air hose will provide adequate air pressure and volume to properly test the sealing components within the transmission.

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 1: Installing Air Test Adaptor Plate
Courtesy of CHRYSLER GROUP, LLC

3. Place the (special tool #10507, Plate, Air Pressure Test) (1) in position on the transmission housing.

Fig. 2: Air Test Adaptor Plate Installed
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolts (2) to hold the air test adaptor plate (1) to the transmission housing.

NOTE: Do not exceed 60 psi air pressure. Air Pressure greater than 413 kPa (60 psi) may create a false positive result. Lip seals that are marginal may seal under higher pressure.

Fig. 3: Applying Air Pressure At Adaptor Plate
Courtesy of CHRYSLER GROUP, LLC

5. Using a rubber tip blow chuck (2) on a 413 kPa (60 psi) **regulated** shop air hose, pressurize each of the clutch apply circuits marked on the adaptor plate (1).
6. Each circuit should thump when the clutch or dog applies and hold until the air chuck is released.
 - If a clutch or dog does not apply and air escapes past a damaged seal, the transmission will need to be replaced or overhauled as necessary.
 - If the transmission passes the air test, the valve body or solenoid valve will be the likely cause of the transmission shifting problem. If the valve body or solenoid valves are defective, they will need to be replaced as necessary.
7. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
8. Road test the vehicle to verify the repair.

PRELIMINARY DIAGNOSIS

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how the transmission upshifts, downshifts, and engages.
3. Check fluid level and condition. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Position the vehicle on a hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Check for cracked, leaking cooler lines.

2014 Jeep Cherokee Trailhawk**2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee**

4. Check the fluid level and condition. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
5. With the transmission in the park position, attempt to rotate halfshafts to make sure the transmission output shaft is intact.
6. Check the power transfer unit (PTU) (if equipped).
7. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
 - a. On AWD vehicle, if propeller shaft turns but wheels do not, problem is with the differential or halfshafts.
 - b. If the propeller shaft does not turn and the transmission is noisy, stop the engine. Remove the oil pan, and check for debris. If the pan is clear, remove the transmission and check for damaged driveplate, torque converter, oil pump, or input shaft.
8. Check the transmission control module (TCM), wiring, valve body, and solenoids (Utilize fault codes to diagnose if available).

ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been verified.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

EMERGENCY RUNNING FUNCTION - LIMP IN MODE

In the event of a complete transmission electrical failure (loss of power to the transmission control module (TCM), the transmission enters default limp-in mode. When the TCM loses power, all solenoids are de-energized. Maximum pressure locks the transmission in fourth gear, and a diagnostic trouble code (DTC) is stored in memory. If the vehicle is in a forward gear range when the fault occurs, the transmission defaults to fourth gear.

The limp-in function remains active until the DTC is repaired or a stored DTC is erased with an appropriate scan tool.

FLUID LEAK DETECTION

The following procedure is for detecting transmission fluid leaks from the area between the transmission and the Power Transfer Unit (PTU). When transmission fluid is leaking from the weep hole in the area of the PTU, the seals around the differential output shaft and the differential side gear is most likely faulty. The large seals around the differential output shaft and side gear is serviceable without removing the transmission. The following procedure is recommended to determine which seal is leaking.

1. Disconnect the transmission vent tube from the adaptor nipple.
2. Adapt a compressed shop air coupling and a length neoprene hose onto the vent nipple.
3. Attach a 48 kPa (7 psi) regulated shop air source to the air coupling on the vent nipple.
4. Raise the vehicle on a suitable hoist.
5. Remove the PTU from the vehicle

Refer to **REMOVAL** .

6. Apply a soapy solution to the seals inside and around the differential output shaft.
7. Observe over several minutes to see if air bubbles form in the leak area.

Test Results

- If bubbles are emanating from the inner differential side gear seal, remove the adapter sleeve and replace the inner seal.
- If bubbles are emanating from the outer output shaft seal, remove the adapter sleeve replace the seal.
- If bubbles are emanating from the transmission housing casting, replace the porous component.

STANDARD PROCEDURES

BEARING TURNING TORQUE MEASUREMENT

To determine proper select shim thickness for the differential and transfer gear bearings, the turning torque must be measured. If just the differential or transfer gear bearings are being replaced it is not necessary to measure the bearing turning torque. The original factory installed shims will be sufficient to properly preload the bearings when the transmission is assembled. If the differential, transfer gear, or transmission housing castings are replaced the differential and transfer gear bearing turning torque will need to be reestablished.

Verify that the bearings and races are **NEW** and properly installed on/in clean components with the factory installed select shims behind the bearing races. Lightly lubricate the bearings with transmission fluid.

210171838

Fig. 4: Special Tool #C-4995A
Courtesy of CHRYSLER GROUP, LLC

Tool (special tool #C-4995A, Tool, Differential Bearing Torque) must be modified to be compatible with the following operation. Two 3/8-24 nuts (1) must be added to keep the center shaft from rotating in the cone and sleeve.

1. Remove the nylok™ nut and expander cone from the center shaft.
2. Remove the sleeve from the center shaft.
3. Install a nut on the center shaft and tighten it against the existing nut. Install the sleeve.
4. Install the 2nd nut inside the sleeve just far enough to install the cone and nut.
5. Install the cone and nut tight enough to keep the center shaft from rotating inside the cone and sleeve.

MEASUREMENT PROCEDURE

1. Position the differential on a clean work surface.

210171737

Fig. 5: Differential Pinion Gears & Lock Tool
Courtesy of CHRYSLER GROUP, LLC

2. On 4WD transmissions tool 10425 is not required, there is no differential. on FWD and AWD transmissions, install the lock tool (special tool #10425, Tool, Pinion and Side Gear Locking) (2) between the differential (1) pinion gears next to the link pin to prevent the differential from rotating.
3. Position the transmission and bell housing on a suitable clean work bench.
4. Install new bearing races with the original select shims.
5. Install the differential with new bearings lightly lubricated with transmission fluid in the transmission housing.
6. Install the bell housing.
7. Install the bolts to hold the bell housing to the transmission housing. Tighten bolts to 50% on the specified torque value

Refer to **SPECIFICATIONS**.

8. Insert modified tool (special tool #C-4995A, Tool, Differential Bearing Torque) into the differential until the sleeve (C-4995-1) enters the halfshaft spline in the differential side gear.
9. Tighten the nut until the sleeve expands tightly in the side gear.
10. Tighten the jamb nut to prevent the center shaft from rotating in the sleeve.
11. Using a suitable wrench, rotate the differential 20 rotations clockwise and 20 rotations counterclockwise.

210171756

Fig. 6: Torque Wrench & Differential
Courtesy of CHRYSLER GROUP, LLC

12. Using a torque wrench (1), measure the turning resistance of the differential (2) after the initial break away. It should measure between 1.7 to 2.8 N.m (15 and 25 in lbs)
13. Adjust the turning torque by adding to or subtracting from the thickness of the select shims behind the differential bearing races.
14. After achieving proper differential turning torque, separate the bell housing from the transmission housing.
15. Install the transfer gear with new bearings into the transmission housing.
16. Install the bell housing.
17. Install the bolts to hold the bell housing to the transmission housing. Tighten bolts to 50% on the specified torque value

Refer to **SPECIFICATIONS**.

NOTE: **The turning torque of the differential and the transfer gear will be higher than the differential alone. The ring gear is driving a smaller gear on the transfer shaft.**

18. Using a suitable wrench, rotate the differential 20 rotations clockwise and 20 rotations counterclockwise.

210171756

Fig. 7: Torque Wrench & Differential
Courtesy of CHRYSLER GROUP, LLC

19. Using a torque wrench (1), measure the turning resistance of the differential (2) after the initial break away. It should measure between 3.4 to 6.8 N.m (35 and 60 in lbs)
20. Adjust the turning torque by adding to or subtracting from the thickness of the select shims behind the transfer shaft bearing races.
21. Remove tool C-4995 from the differential.
22. Separate the bell housing from the transmission housing.
23. Remove the differential (1) and transfer gear (2).

210171737

Fig. 8: Differential Pinion Gears & Lock Tool
Courtesy of CHRYSLER GROUP, LLC

24. On FWD and AWD transmissions, remove lock tool 10425 (2) from the differential (1).
25. Prepare transmission components for final assembly.

INPUT SHAFT END PLAY MEASUREMENT

Before disassembling the 948TE transmission measure the end play of the input shaft. This will aid in the assembly process when selecting a select shim.

1. Place the transaxle on a suitable clean work surface.
2. Remove the torque converter.
3. Use tools (special tool #8266B, End Play Socket Set) and (special tool #C-3339A, Set, Dial Indicator) attached to the input shaft, to measure the input shaft end play.

Fig. 9: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

4. Attach the dial indicator to the handle 8266-8.
5. Attach the handle to the spline adapter 8266-6.
6. Attach the spline adapter to the input shaft.
7. Position the dial indicator plunger on the bellhousing rim.
8. Pull outward on the handle and zero the dial indicator face.

Fig. 10: Input Shaft End Play Measurement
Courtesy of CHRYSLER GROUP, LLC

2014 Jeep Cherokee Trailhawk

2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee

9. Push inward on the handle and read the dial indicator.
10. Record the measurement as a reference number for selecting the proper thickness select spacer when assembling the transmission.

CLUTCH SPECIFICATIONS

The B, C, D and E clutch clearance must be measured and properly set during the assembly process of the 948TE transmission. The recommended measurement procedures can be found in the appropriate CLUTCH - ADJUSTMENTS procedure.

CLUTCH COMPOSITION

A - Clutch	Dog Clutch
B - Clutch	5 Discs
C - Clutch	4 Discs
D - Clutch	4 Discs
E - Clutch	5 Discs
F - Clutch	Dog Clutch

CLUTCH CLEARANCE

B-clutch = 1.28 - 1.77 (0.050 - 0.070 in)	C-clutch = 0.76 - 1.15 (0.030 - 0.045 in)
D-clutch = 1.01 - 1.50 (0.040 - 0.059 in)	E-clutch = 1.28 - 1.77 (0.050 - 0.070 in)

REMOVAL

FWD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the battery. Refer to **BATTERY, REMOVAL**.
3. Remove Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL**.
4. Remove the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL**.
5. Hoist the vehicle.
6. Remove the front wheels. Refer to **REMOVAL**.

7. Remove the left and right half shafts. Refer to **REMOVAL** . If accessible, install suitable cap-plugs in the axle seals to prevent leakage.
8. Remove the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
9. Remove the front fascia lower outboard rivets to the right front splash shield for lower load beam bolt access.
10. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
11. Lower the vehicle until the brake rotors are 100 mm (4 in.) above the ground.
12. Release the lock lever on the wire connector on the front of the battery tray.
13. Separate the wire connector from the main engine harness.
14. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
15. Disconnect the vacuum line from the vacuum pump. Refer to **PUMP, VACUUM, REMOVAL** .
16. Disconnect the wire connector from the vacuum pump
17. Remove the nuts holding the vacuum pump to the mount bracket.
18. Separate the vacuum pump from the mount bracket.

Fig. 16: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

19. Release the lock on the TCM connector (1).
20. Separate the wire connector (1) from the TCM.

Fig. 17: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

21. Remove the bolt (1) holding the ground cable to the top of the transmission.
22. Separate the ground cable (1) from the transmission.

Fig. 18: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

23. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.

Fig. 19: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

24. Release the locks holding the shift cable housing (2) to the mount bracket (1) on the transmission.
25. Separate the shift cable (2) from the mount bracket (2).

Fig. 20: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

26. Rotate the lock lever (2) counterclockwise on the transmission solenoid connector.
27. Separate the transmission solenoid connector (2) from the transmission.
28. Position a floor jack under the transmission.

29. Raise the jack enough to relieve tension on the upper transmission mount.

Fig. 21: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Remove the bolts (1) holding the upper transmission mount to the adaptor block (4).

Fig. 22: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

31. Place a wooden block (1) between the transmission end cover and the frame rail load beam.
32. Lower the floor jack until the wood block supports the transmission.

Fig. 23: Transmission End Cover Ground Cable
Courtesy of CHRYSLER GROUP, LLC

33. Remove the bolt (1) holding the ground cable to the transmission end cover.
34. Separate the ground cable (1) from the transmission.

Fig. 24: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

35. Remove the bolts (3) and hidden bolts (2) holding the transmission mount adaptor block (4) to the transmission.
36. Separate the transmission mount adaptor block (4) from the vehicle.

Fig. 25: Wire Harness Bracket & Bellhousing Bolt
Courtesy of CHRYSLER GROUP, LLC

37. Remove the upper bolt (1) holding the wire harness bracket and transmission bellhousing to the engine block

081569490

Fig. 26: Upper Starter Bolt
Courtesy of CHRYSLER GROUP, LLC

38. If equipped with a 2.4L engine, loosen and back out the upper starter bolt (1).

NOTE: The bolt will not be able to be removed due to lack of clearance.

Fig. 27: Upper Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

39. Remove upper bolts (1) holding the transmission bellhousing to the engine block located behind the main engine wire harness.
40. Raise the vehicle and place safety stands under the rear frame rails behind the rear axle to stabilize the vehicles center of gravity. Refer to the WARNING at beginning of this procedure (see **FWD**).
41. Place a suitable drain pan under the transmission to collect fluid that may leak from the differential seals and cooler lines.

Fig. 28: Transmission Cooler Lines

Courtesy of CHRYSLER GROUP, LLC

42. Disengage the quick couplings holding the cooler lines to the transmission.
43. Separate the cooler lines from the transmission. If accessible, install suitable cap-plugs in the male and female ends of the cooler lines to prevent leakage.

Fig. 29: Removing/Installing Starter

Courtesy of CHRYSLER GROUP, LLC

NOTE: After the bolts holding the starter motor to the bellhousing are removed the starter motor will remain the place.

44. If equipped with a 2.4L Remove the bolt (3) holding the starter (4) to the transmission bellhousing.

Fig. 30: Starter Bolts (3.2L)

Courtesy of CHRYSLER GROUP, LLC

45. If equipped with a 3.2L engine, remove the starter bolts (1).

Fig. 31: Transmission Bellhousing Bolts Above The Differential Housing

Courtesy of CHRYSLER GROUP, LLC

46. Remove the bolt (1) holding the transmission bellhousing to the engine block from above the differential housing.
47. Remove the front exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

Fig. 32: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

48. Remove the access door in the splash shield on the bellhousing.

NOTE: The crankshaft can be rotated using a wrench to turn the balancer pulley end bolt.

Fig. 33: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

49. Through the access door opening, remove the bolts (1) holding the flexplate to the torque converter. Rotate the crankshaft to bring each set of bolts into view through the access door.

Fig. 34: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

50. Using a wooden block (3) to protect the engine oil pan, position a high stand (2) under the engine oil pan to support the engine.
51. Position a suitable transmission jack (1) under the transmission in a stable condition.
52. Secure the transmission to the lift plate of the transmission jack to avoid dropping the transmission during removal.

Fig. 35: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

53. Lift the transmission jack and high stand until the wooden block (1) can be removed from between the

transmission end cover and the frame rail load beam.

Fig. 36: Rear Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

54. Remove the through bolt (1) holding the rear transmission mount to the suspension cradle.
55. Remove the through bolt (2) holding the rear transmission mount to the adapter block on the transmission bellhousing.
56. Push the rear transmission mount rearward into the bracket on the suspension cradle and out of the way.

Fig. 37: Load Beam Bolts
Courtesy of CHRYSLER GROUP, LLC

57. Remove the bolts (2) holding the rear end of the load beam (1) to the suspension cradle.
58. Remove the bolts (3) holding the front of the load beam (1) to the radiator support panel.
59. Separate load beam (1) from the vehicle.

Fig. 38: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

60. Remove the bolts (2) holding the engine block and oil pan to the bellhousing next to the differential housing.

Fig. 39: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

61. Remove the bolts (1) holding the engine block and oil pan to the bellhousing from behind the exhaust maniverter.
62. Remove the bolt (1) holding the engine oil pan and exhaust bracket to the bellhousing.
63. Using a suitable prying tool, pry the bell housing away from the engine block
64. While guiding the transmission past obstacles, lower the transmission downward and away from the vehicle.

AWD/4WD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the battery. Refer to **BATTERY, REMOVAL** .
3. Remove the Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
4. Remove the Power Distribution Center (PDC). Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .
5. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
6. If equipped with a 2.4L, remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
7. If equipped with a 3.2L, disconnect the vacuum line from the vacuum pump. Refer to **PUMP, VACUUM, REMOVAL** .
8. For 3.2L disconnect the wire connector from the vacuum pump.
9. For 3.2L remove the nuts holding the vacuum pump to the mount bracket.
10. For 3.2L separate the vacuum pump from the mount bracket.

Fig. 40: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

11. Release the lock on the Transmission Control Module (TCM) connector (1).
12. Separate the wire connector (1) from the TCM.

Fig. 41: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

13. Remove the bolt (1) holding the ground cable to the top of the transmission.
14. Separate the ground cable (1) from the transmission.

Fig. 42: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.

Fig. 43: View Of Shift Cable Housing & Mount Bracket

43. If equipped with a 3.2L, remove the starter bolts (1).
44. Remove the bolt (1) holding the transmission bellhousing to the engine block from above the differential housing.

Fig. 55: Bellhousing Access Door

Courtesy of CHRYSLER GROUP, LLC

45. Remove the access door in the splash shield on the bellhousing.

NOTE: The crankshaft can be rotated using a wrench to turn the balancer pulley end bolt.

Fig. 56: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

46. Through the access door opening, remove the bolts (1) holding the flexplate to the torque converter. Rotate the crankshaft to bring each set of bolts into view through the access door.

Fig. 57: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

47. Position a suitable transmission jack (1) under the transmission in a stable condition.

48. Secure the transmission to the lift plate of the transmission jack to avoid dropping the transmission during removal.
49. Remove the bolts (2) holding the engine block and oil pan to the bellhousing next to the differential housing.

Fig. 58: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

50. Remove the bolts (1) holding the engine block and oil pan to the bellhousing from behind the catalytic converter.
51. Remove the bolt (1) holding the engine oil pan and exhaust bracket to the bellhousing.
52. Using a suitable prying tool, pry the bell housing away from the engine block.
53. While guiding the transmission past obstacles, lower the transmission downward and away from the vehicle.

DISASSEMBLY

DISASSEMBLY

The 948TE automatic transmission can be overhauled if the vehicle is beyond it's warranty coverage. Verify that the vehicle is no longer covered by warranty before proceeding with this procedure. A clean work area is necessary to assure a properly functioning transmission after the overhaul procedures are completed. Special tools have been developed and are required to disassemble this transmission. Acquire all of the special tools before starting this procedure.

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings,

as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Before disassembling the transmission, wash the transmission with a suitable solvent and a siphon pressure washer to remove oily grime and loose dirt. Place the transmission on a clean work surface with ample fluid drainage or absorbency.

Fig. 59: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

1. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 60: Valve Body Cover Pan Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Remove the valve body cover pan bolts (1).
3. Remove the valve body cover pan from the transmission.

Fig. 61: Valve Body Bolts

4. Remove the valve body bolts (1).
5. Using a suitable prying tool, pry the valve body away from the adapter tubes.

Fig. 62: Fluid Pressure Transducer Wire Harness Connector

Courtesy of CHRYSLER GROUP, LLC

6. Turn the valve body over to gain access to wire harness connectors.
7. Release the lock (2) on the fluid pressure transducer wire connector and separate the wire connector (2) from the fluid pressure transducer (1).

Fig. 63: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
9. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
10. Separate the valve body from the transmission.

NOTE: **If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.**

65. Place the tool (special tool #10504, Compressor, Spring) (1) over the C-clutch bellville spring at the bottom of the transmission housing.

Fig. 114: C-Clutch Bellville Spring & Special Tools
Courtesy of CHRYSLER GROUP, LLC

66. Place tool (special tool #8228, Installer, Bearing) (3) over the input shaft support (tool 8901 with 10428 legs can also be used), compress the bellville spring to gain access to the stepped snap-ring (1).

Fig. 115: Removing/Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

67. Using a suitable screw driver, remove the snap-ring (1) holding the C-clutch bellville spring in the transmission housing.

Fig. 116: C-Clutch Bellville Spring & C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

68. Separate the C-clutch bellville spring (1) from the C-clutch piston (2).

Fig. 117: Removing/Installing C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

69. Using a suitable pliers (2), remove the C-clutch piston (1) from the transmission housing.

Fig. 118: C-Clutch Piston & Seals
Courtesy of CHRYSLER GROUP, LLC

70. If overhaul is being performed, remove inner (1) and outer (2) seals from the C-clutch piston.

Fig. 119: Removing/Installing Inner Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

71. Using a suitable hook tool, remove the inner seal-rings (1) from the input shaft support.

Fig. 120: Removing/Installing Outer Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

72. Using a suitable hook tool, remove the outer seal-rings (1) from the input shaft support.

Fig. 121: Removing/Installing Split Roller Bearing
Courtesy of CHRYSLER GROUP, LLC

73. Using a suitable hook tool, remove the split roller bearing (1) from the input shaft support.

ASSEMBLY

ASSEMBLY

The work area, counter surfaces and tools must be thoroughly cleaned before attempting to assemble the 948TE transmission. All of the sub assemblies should be disassembled, cleaned, and assembled with new sealing components where applicable. The transmission housing should be clean and oil free before beginning this procedure. The B, C, D, and E-clutches should be properly measured and adjusted prior to assembling the transmission. If the transmission was contaminated with metallic material, all of the thrust bearings and roller bearing should be replaced. The bearing in the output gear support assembly is not serviceable. The output gear support assembly should be replaced if metal debris is present.

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

1. Place the transmission housing on a clean work surface with the open interior upward.
2. Place wooden blocks under the transmission to stabilize it for assembly.

Fig. 122: Removing/Installing Split Roller Bearing
Courtesy of CHRYSLER GROUP, LLC

3. Install the split roller bearing (1) in position on the input shaft support.

Fig. 123: Removing/Installing Outer Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

4. Install the outer seal-rings (1) in the lands in the input shaft support.

Fig. 124: Removing/Installing Inner Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

5. Install the inner seal-rings (1) in the lands in the input shaft support.

Fig. 125: Installing Inner Seal On C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

6. Install the inner seal (2) on the C-clutch piston (1).

Fig. 126: Installing Outer Seal On C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

7. Install the outer seal (2) on the C-clutch piston (1).

Fig. 127: Removing/Installing C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

8. Install the C-clutch piston (1) in the transmission housing.

Fig. 128: Using Feeler Gauge To Turn Lip On Seal
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, use a thin feeler gauge to turn the lip on the seal into the retainer as the piston is pushed downward.

Fig. 129: C-Clutch Bellville Spring & C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

10. Place the C-clutch bellville spring (1) in position on the C-clutch piston (2).

Fig. 130: C-Clutch Bellville Spring & Special Tool
Courtesy of CHRYSLER GROUP, LLC

11. Place the tool (special tool #10504, Compressor, Spring) (1) over the C-clutch bellville spring (3) at the bottom of the transmission housing.

Fig. 131: C-Clutch Bellville Spring & Special Tools
Courtesy of CHRYSLER GROUP, LLC

12. Place tool (special tool #8228, Installer, Bearing) (3) over the input shaft support (tool 8901 with 10428 legs can also be used), compress the bellville spring to gain access to the snap-ring (1) groove.

Fig. 132: Removing/Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

13. Install the snap-ring (1), stepped side down, to hold the C-clutch bellville spring in the transmission housing.
14. Remove the transmission housing from the arbor press and position it on a clean work bench. Position wood blocks under transmission to stabilize it for assembly.

Fig. 133: Exploded View Of C-Clutch Wave Plate, Steel Plates, & Friction Discs
 Courtesy of CHRYSLER GROUP, LLC

15. Install the C-clutch wave plate (5), one steel plate (2), then install the friction discs (1) alternately separated with steel plates (2) into the transmission housing on top of the C-clutch piston.

Fig. 134: C-Clutch Reaction Plate
 Courtesy of CHRYSLER GROUP, LLC

16. Install the C-clutch reaction plate (1) with raised bosses upward on top of the C-clutch disc and plate

pack.

Fig. 135: Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

17. Install the snap-ring (1) in the groove (2) in the transmission housing.

NOTE: Perform C-clutch measurements to verify that the correct selective plate is installed.

Fig. 136: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform D-clutch measurements to verify that the correct select plate (2) is installed.

18. Install the correct thickness selective plate (2).
19. Starting with a friction plate (1), alternately install the friction (1) and steel plates (3) in to the case.

Fig. 137: Removing/Installing Input Shaft Rear Support Selective Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

20. Install the input shaft rear support selective thrust washer.

Fig. 138: Thrust Bearing & Input Shaft Rear Support
Courtesy of CHRYSLER GROUP, LLC

21. Install the thrust bearing (1) onto the input shaft rear support.

Fig. 139: D And C-Clutch Hubs & Input Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

22. Use a suitable screw driver to align the gaps in the friction discs in to D (1) and C (2) -clutch to prepare for installing the annulus gear 2, D and C-clutch hubs and input shaft assembly (1).

NOTE: Before Final assembly of the annulus gear 2, D and C-clutch hub and input shaft, measure the B-clutch to verify that proper select plate was installed

and air test the dog-A clutch and input shaft to verify proper sealing. The input shaft dog-A clutch hub are not serviceable and must be replaced if leaking.

Fig. 140: Thrust Bearing & C-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

23. Place the thrust bearing (1) in position on the C-clutch hub/B-clutch retainer (2).

Fig. 141: Annulus Gear 2, D-Clutch Hub & C-Clutch Hub/B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

24. Place the Annulus gear 2, D-clutch hub (1) in position on the C-clutch hub/B-clutch retainer (2).

Fig. 142: Annulus Gear 2, D And C-Clutch Hub (3) & Sun Gear 1
Courtesy of CHRYSLER GROUP, LLC

25. Insert the sun gear 1 (1) into annulus gear 2 (2), D and C-clutch hub/B-clutch retainer (3).

Fig. 143: Annulus Gear 2, D And C-Clutch Hub/B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

26. Turn the annulus gear 2, D and C-clutch hub/B-clutch retainer over and place it on tool (special tool #9611, Plug, Differential End) (2) to hold the sun gear in position.

Fig. 144: Remove/Install Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

27. Using a suitable snap-ring pliers (1), install the snap-ring (2) to hold the sun gear 1 to the annulus gear 2, D and C-clutch hub/B-clutch retainer.

Fig. 145: Remove/Install Input Shaft Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW seal-rings (1) in the lands (2) on the input shaft (3).
29. Insert the input shaft into the B-clutch hub.

Fig. 146: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

30. Using a suitable snap-ring pliers (3), install the snap-ring (2) to hold the input shaft to the B-clutch (1) hub.

Fig. 147: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

31. Place the thrust bearing on the B-clutch hub.
32. Install the annulus gear 2, D and C-clutch hub on the input shaft, B-clutch assembly.

Fig. 148: Annulus Gear 2, D & C-Clutch Hub And Input Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

33. Install the annulus gear 2, D and C-clutch hub, input shaft and B-clutch assembly (1) into the transmission housing.

NOTE: While not allowing the input shaft to slip inward, wriggle the annulus gear 2, D and C-clutch hubs and input shaft assembly (1) until they engage the D and C-clutch discs. A solid audible clunk will be heard if installed correctly. If the input shaft slips inward the B-clutch will come out of its retainer impeding proper installation.

Fig. 149: Removing/Installing Bellville Spring

Courtesy of CHRYSLER GROUP, LLC

34. Place the D-clutch piston bellville spring (1) in position on the transmission housing (2).

Fig. 150: D-Clutch Piston Retainer & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

35. Install NEW O-ring seal (2) in the D-clutch piston retainer (1).

Fig. 151: D-Clutch Piston & Outer Lip Seal Ring
Courtesy of CHRYSLER GROUP, LLC

36. Install NEW outer lip seal ring (2) in the D-clutch piston (1).

Fig. 152: D-Clutch Piston & Inner Lip Seal Ring
Courtesy of CHRYSLER GROUP, LLC

37. Install NEW inner lip seal ring (1) in the D-clutch piston (2).

Fig. 153: D-Clutch Piston & Retainer
Courtesy of CHRYSLER GROUP, LLC

38. Install the D-clutch piston (2) in the retainer (1).

Fig. 154: D-Clutch Piston Retainer
Courtesy of CHRYSLER GROUP, LLC

39. Place the D-clutch piston (2) and retainer (1) assembly in the transmission housing over the D-clutch bellville spring. The fingers on the D-clutch piston (2) rest against the D-clutch select plate.
40. Position the transmission housing on a suitable arbor pressure using wooden blocks for support.

Fig. 155: Gaining Access To Snap Ring-Ring & Groove
Courtesy of CHRYSLER GROUP, LLC

41. Using Tool (special tool #8901A, Pressing Tool) (with the pressure scale removed) (1) and legs (special tool #10428, Adapter, Pressing Tool), Compress the bellville spring to gain access to the snap ring-ring groove (4) in the transmission housing.

42. Install the snap-ring to hold the D-clutch piston retainer (2) into the transmission housing (4).
43. Remove the transmission housing from the arbor press and place the transmission housing on the clean work surface. Use wood blocks to stabilize the transmission.

Fig. 156: Carrier Gear, Annulus Gear & D-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

44. Insert the carrier gear 1 and 2 (1) annulus gear 2, D-clutch hub and input shaft assembly onto the annulus gear 2, D and C-clutch hub and input shaft assembly.

Fig. 157: Carrier Gear 1&2 & O-Ring Seal

53. Install a NEW thrust spacer (1) on the underside of the gear 4 planetary pinion carrier (2).

Fig. 166: Thrust Spacer & Topside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

54. Install a NEW thrust spacer (1) on the topside of the gear 4 planetary pinion carrier (2).

Fig. 167: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

55. Install the gear 4 planetary pinion carrier (1) into the annulus gear 4.

Fig. 168: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

56. Install the sun gear 3 and 4 and Dog Clutch-F (1) into the gear 4 planetary pinion carrier.

Fig. 169: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

57. Install the roller type thrust bearing (1) onto the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 170: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: If new transfer gear (1) or transmission housing are being replaced measurements must be performed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.

58. If necessary, replace the bearings and races on the transfer gear (1).
59. Install the transfer gear (1) into the transmission housing.

Fig. 171: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

60. Install the output gear support (1) into the gear 4 planetary pinion carrier (2).

Fig. 172: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

61. Install the E-clutch hub and shaft (1) into the output gear support (2).

Fig. 173: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

62. Install the thrust bearing (1) on the E-clutch (2) hub.

Fig. 174: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing the E-clutch, use a suitable screwdriver to align the grooves in the friction.

63. Install the E-clutch onto the E-clutch hub and shaft (2).

Fig. 175: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

64. Wriggle the E-clutch (1) until all of the friction discs are fully engaged on the E-clutch hub and shaft.

NOTE: When the E-clutch (1) is fully seated the gap (2) will be very small between the E-clutch retainer and the output gear support.

Fig. 176: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: If new differential (1) or transmission housing are being replaced measurements must be performed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.

65. If necessary, replace the bearings and races on the differential (1).
66. Install the differential assembly (1) into the transmission housing.

2101006419

Fig. 177: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

67. Place a NEW gasket (1) in position on the sealing surface of the transmission housing (2).

2101006417

Fig. 178: Port Seal
Courtesy of CHRYSLER GROUP, LLC

68. Install a NEW seal (1) in the port in the transmission housing.

2101006419

Fig. 179: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

69. Install the gasket (1) on the sealing surface of the transmission housing (2).
70. If necessary, replace the output seal and the impeller hub seal.

2101006416

Fig. 180: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

71. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

Fig. 181: Checking Guide Pin Alignment
Courtesy of CHRYSLER GROUP, LLC

72. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 182: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

73. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing.
74. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
75. Install several bolts to hold the bell housing to the transmission housing. Tighten the bolts hand tight.

76. Position the transmission on the bench with the bellhousing facing outward.

Fig. 183: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

77. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 184: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

78. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 185: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

79. Install NEW O-rings on both ends of the fluid transfer tubes.
80. Install the fluid adapter tubes (1) from the transmission.

Fig. 186: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

81. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 187: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

82. Install the speed sensor screw (1) to hold the speed sensor to the transmission housing.

Fig. 188: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

83. Place the Transmission Range Sensor (TRS) (1) in position on the transmission with the wire harness connected.

Fig. 189: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

84. Install the TRS screw (1) to hold the TRS to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 190: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

85. Place the valve body (1) in position on the transmission.
86. Place the wire harness connector (2) in position on the solenoids.
87. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 191: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

88. Install the screws to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 192: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

89. Insert the wire harness connector into the fluid pressure transducer connector
90. Press connector together until the lock engages.

Fig. 193: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

91. Turn the valve body (1) over and align the valve body (1) with the fluid transfer tubes.

Fig. 194: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

92. Guide the manual lever cam (2) into the slot (3) on the manual valve.
93. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 195: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

94. Install the valve body bolts (1) to hold the valve body to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 196: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

95. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.

Fig. 197: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

96. Place the valve body cover pan (1) in position on the transmission.
97. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 198: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

98. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
99. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 199: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

100. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 200: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

101. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
102. Install the valve body cover pan bolts (1) to hold the valve body cover pan to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
103. Install the transmission in the vehicle Refer to **INSTALLATION**.

104. Road test the vehicle to verify the repair.

INSTALLATION

FWD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

NOTE: If equipped with a 2.4L, be sure that the upper starter bolt is inserted into the proper hole in the transmission prior to mating transmission to block.

Fig. 201: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

1. While guiding the transmission past obstacles, jack (1) the transmission upward until the engine and the transmission are in line.
2. Push the bell housing against the engine block until the guide pins engage.

Fig. 202: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the bolt (1) to hold the engine oil pan and exhaust bracket to the bellhousing. Refer to **SPECIFICATIONS**.
4. Install the bolts (1) to hold the engine block and oil pan to the bellhousing in position on behind the exhaust maniverter. Refer to **SPECIFICATIONS**.

Fig. 203: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the bolts (2) to hold the engine block and oil pan to the bellhousing next to the differential housing. Refer to **SPECIFICATIONS**.

Fig. 204: Load Beam Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Shown in illustration with fascia removed for clarity.

6. Place the load beam (1) in position on the vehicle.
7. Install the bolts (3) to hold the front of the load beam (1) to the radiator support panel.
8. Install the bolts (2) to hold the rear end of the load beam (1) to the suspension cradle.

Fig. 205: Rear Transmission Mount

Courtesy of CHRYSLER GROUP, LLC

9. Push the rear transmission mount forward until the bolt holes line up.
10. Install the through bolt (2) to hold the rear transmission mount to the adapter block on the transmission bellhousing. Refer to **SPECIFICATIONS**.
11. Install the through bolt (1) to hold the rear transmission mount to the suspension cradle. Refer to **SPECIFICATIONS**.

Fig. 206: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

12. Place a wooden block (1) between the load beam and the transmission end cover.

Fig. 207: Wooden Block Used To Protect Engine Oil Pan

Courtesy of CHRYSLER GROUP, LLC

13. Remove the safety chain holding the transmission to the transmission jack lift plate.
14. Lower the high stand (2) and the transmission jack (1) until the transmission rests on the wooden block.
15. Remove the high stand (2) and transmission jack (1) from under the vehicle.

Fig. 208: Torque Converter Bolts

Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Failure to follow this caution may result in transmission damage.

16. Through the access door opening, Install **new** bolts (1) to hold the flexplate to the torque converter, Rotate the crankshaft to bring each set of bolts into view through the access door. Refer to **SPECIFICATIONS**.

Fig. 209: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

17. Install the access door in the splash shield on the bellhousing.
18. Install the front exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION**.

Fig. 210: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

19. Install the bolt (1) to hold the transmission bellhousing to the engine block above the differential housing. Refer to **SPECIFICATIONS**.

Fig. 211: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

20. If equipped with a 2.4L, install the bolt (3) to hold the starter (4) to the transmission bellhousing. Refer to **SPECIFICATIONS** .

Fig. 212: Starter Bolts (3.2L)
Courtesy of CHRYSLER GROUP, LLC

21. If equipped with a 3.2L, install the starter bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 213: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

22. Guide the cooler lines in position on the transmission.
23. Engage the quick couplings to hold the cooler lines to the transmission.
24. Install the left and right half shafts. Refer to **INSTALLATION**.
25. Remove the safety stands under the rear frame rails behind the rear axle and lower the vehicle.

Fig. 214: Upper Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

26. Install upper bolts (1) to hold the transmission bellhousing to the engine block located behind the main

engine wire harness. Refer to **SPECIFICATIONS**.

081569490

Fig. 215: Upper Starter Bolt

Courtesy of CHRYSLER GROUP, LLC

27. If equipped with a 2.4L, tighten the upper starter bolt (1). Refer to **SPECIFICATIONS** .

Fig. 216: Wire Harness Bracket & Bellhousing Bolt

Courtesy of CHRYSLER GROUP, LLC

28. Install the upper bolt (1) to hold the wire harness bracket and transmission bellhousing to the engine block. Refer to **SPECIFICATIONS**.

Fig. 217: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Place the transmission mount adaptor block (4) in position on the transmission.
30. Install the bolts (3) and hidden bolts (2) to hold the transmission mount adaptor block (4) to the transmission. Refer to **SPECIFICATIONS**.

Fig. 218: Transmission End Cover Ground Cable
Courtesy of CHRYSLER GROUP, LLC

31. Place the ground cable (1) in position on the transmission.
32. Install the bolt (1) to hold the ground cable to the transmission end cover. Refer to **SPECIFICATIONS**.
33. Position a floor jack under the transmission.
34. Raise the transmission until the wood block is free to be removed.

Fig. 219: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

35. Remove the wooden block (1) from between the transmission end cover and the frame rail load beam.

Fig. 220: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

36. Install the bolts (1) to hold the upper transmission mount to the adaptor block (4). Refer to **SPECIFICATIONS**.
37. Lower and remove the floor jack.

Fig. 221: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

38. Engage the transmission solenoid connector (2) into transmission connector.
39. Rotate the lock lever (2) clockwise on the transmission solenoid connector.

Fig. 222: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

40. Place the shift cable (2) in position on the mount bracket (2).
41. Press the shift cable housing (2) into the mount bracket (1) on the transmission.

Fig. 223: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

42. Snap the shift cable end (2) in position on the manual lever on the transmission.

Fig. 224: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

43. Place the ground cable (1) in position on the transmission.

44. Install the bolt (1) to hold the ground cable to the top of the transmission. Refer to **SPECIFICATIONS**.

Fig. 225: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

45. Engage the wire connector (1) into the TCM connector.
46. Close the lock on the TCM connector (1).
47. Place the vacuum pump in position on the mount bracket. Refer to **PUMP, VACUUM, INSTALLATION** .
48. Install the nuts to hold the vacuum pump to the mount bracket.
49. Connect the wire connector onto the vacuum pump.
50. Connect the vacuum line onto the vacuum pump.
51. Install the battery tray. Refer to **TRAY, BATTERY, INSTALLATION** .
52. Install the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
53. Engage the wire connector into the main engine harness on the front of the battery tray.
54. Engage the lock lever on the wire connector.
55. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
56. Raise the vehicle.
57. Fill the transmission to the proper level with the specified fluid.
58. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
59. Install new rivets at the lower outboard front fascia to right front splash shield.
60. Install the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
61. Install the front wheels. Refer to **INSTALLATION** .

62. Lower the vehicle.
63. Install the battery. Refer to **BATTERY, INSTALLATION**.
64. If transmission is replaced, program the Vehicle Identification Number (VIN) into the Transmission Control Module (TCM).

NOTE: **Note; only perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair. Do not perform this procedure if the repair did not require the valve body and/or TCM to be replaced. Do not perform this procedure if the transmission is being replaced.**

65. If valve body or the TCM was replaced, perform Valve Body Solenoid Learn procedure.
66. If transmission is replaced or internal repairs were made, perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE**.
67. Road test the vehicle to verify the repair.

AWD / 4WD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

NOTE: **If equipped with a 2.4L, be sure that the upper starter bolt is inserted into the proper hole in the transmission prior to mating transmission to block.**

1. While guiding the transmission past obstacles, jack (1) the transmission upward until the engine and the transmission are in line.
2. Push the bell housing against the engine block until the guide pins engage.

Fig. 226: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the bolt (1) to hold the engine oil pan and exhaust bracket to the bellhousing. Refer to **SPECIFICATIONS**.
4. Install the bolts (1) to hold the engine block and oil pan to the bellhousing in position on behind the exhaust maniverter. Refer to **SPECIFICATIONS**.
5. Install the bolts to hold the engine block and oil pan to the bellhousing next to the differential housing. Refer to **SPECIFICATIONS**.

Fig. 227: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Failure to follow this caution may result in transmission damage.

6. Through the access door opening, Install **new** bolts (1) to hold the flexplate to the torque converter, Rotate the crankshaft to bring each set of bolts into view through the access door. Refer to **SPECIFICATIONS**.

Fig. 228: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

7. Install the access door in the splash shield on the bellhousing.

Fig. 229: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

8. Install the bolt (1) to hold the transmission bellhousing to the engine block above the differential housing. Refer to **SPECIFICATIONS**.

Fig. 230: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

9. If equipped with a 2.4L, install the bolt (3) to hold the starter (4) to the transmission bellhousing. Refer to **SPECIFICATIONS**.

Fig. 231: Starter Bolts (3.2L)
Courtesy of CHRYSLER GROUP, LLC

10. If equipped with a 3.2L, install the starter bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
11. Install the power transfer unit (PTU). Refer to **INSTALLATION**.

Fig. 232: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

12. Insert a wood block (1) between the load beam and the transmission.

Fig. 233: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

13. Remove the safety chain holding the transmission to the transmission jack lift plate.

14. Lower the high stand (2) and the transmission jack (1) until the transmission rests on the wooden block.
15. Remove the high stand (2) and transmission jack (1) from under the vehicle.

Fig. 234: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

16. Guide the cooler lines in position on the transmission.
17. Engage the quick couplings to hold the cooler lines to the transmission.
18. Install the left and right half shafts. Refer to **INSTALLATION**.
19. Remove the safety stands under the rear frame rails behind the rear axle and lower the vehicle.

Fig. 235: Upper Bellhousing Bolts

Courtesy of CHRYSLER GROUP, LLC

20. Install upper bolts (1) to hold the transmission bellhousing to the engine block located behind the main engine wire harness. Refer to **SPECIFICATIONS**.

081569490

Fig. 236: Upper Starter Bolt

Courtesy of CHRYSLER GROUP, LLC

21. If equipped with a 2.4L, tighten the upper starter bolt. Refer to **SPECIFICATIONS**.

Fig. 237: Wire Harness Bracket & Bellhousing Bolt

Courtesy of CHRYSLER GROUP, LLC

22. Install the upper bolt (1) to hold the wire harness bracket and transmission bellhousing to the engine block. Refer to **SPECIFICATIONS**.

**Fig. 238: Upper Transmission Mount Bolts**

Courtesy of CHRYSLER GROUP, LLC

23. Place the transmission mount adaptor block (4) in position on the transmission.
24. Install the bolts (3) and hidden bolts (2) to hold the transmission mount adaptor block (4) to the transmission. Refer to **SPECIFICATIONS**.
25. Place the ground cable (1) in position on the transmission.
26. Install the bolt (1) to hold the ground cable to the transmission end cover. Refer to **SPECIFICATIONS**.
27. Position a floor jack under the transmission.
28. Raise the transmission until the wood block is free to be removed.

Fig. 239: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

29. Remove the wooden block (1) from between the transmission end cover and the frame rail load beam.

Fig. 240: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Install the bolts (1) to hold the upper transmission mount to the adaptor block (4). Refer to **SPECIFICATIONS**.
31. Lower and remove the floor jack.

Fig. 241: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

32. Engage the transmission solenoid connector (2) into transmission connector.
33. Rotate the lock lever (2) clockwise on the transmission solenoid connector.

Fig. 242: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

34. Place the shift cable (2) in position on the mount bracket (2).
35. Press the shift cable housing (2) into the mount bracket (1) on the transmission.

Fig. 243: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

36. Snap the shift cable end (2) in position on the manual lever on the transmission.

Fig. 244: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

37. Place the ground cable (1) in position on the transmission.
38. Install the bolt (1) to hold the ground cable to the top of the transmission. Refer to **SPECIFICATIONS**.

Fig. 245: Identifying Wire Connector Lock To TCM
 Courtesy of CHRYSLER GROUP, LLC

39. Engage the wire connector (1) into the TCM connector.
40. Close the lock on the TCM connector (1).
41. If equipped with a 3.2L, place the vacuum pump in position on the mount bracket. Refer to **PUMP, VACUUM, INSTALLATION** .
42. For 3.2L install the nuts to hold the vacuum pump to the mount bracket.
43. For 3.2L connect the wire connector onto the vacuum pump.
44. For 3.2L connect the vacuum line onto the vacuum pump.
45. If equipped with a 2.4L, install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
46. Install the battery tray Refer to **TRAY, BATTERY, INSTALLATION** .
47. Install the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
48. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
49. Engage the connectors on the PCM.
50. Raise the vehicle.
51. Fill the transmission to the proper level with the specified fluid.
52. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
53. Install new rivets at the lower outboard front fascia to wheel well liners.
54. Install the front wheels. Refer to **INSTALLATION** .
55. Lower the vehicle.
56. Install the battery. Refer to **BATTERY, INSTALLATION** .
57. If transmission is replaced, program the Vehicle Identification Number (VIN) into the Transmission

Control Module (TCM).

NOTE: Note; only perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair. Do not perform this procedure if the repair did not require the valve body and/or TCM to be replaced. Do not perform this procedure if the transmission is being replaced.

58. If valve body or the TCM was replaced, perform Valve Body Solenoid Learn procedure.
59. If transmission is replaced or internal repairs were made, perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE**.
60. Road test the vehicle to verify the repair.

(Originally Shipped In Kit Number(s)
9202, 9202A-CAN, 9202-CAN, 9202CC.)

2014 Jeep Cherokee Trailhawk

2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee

C-3972-A - Installer, Seal
(Originally Shipped In Kit Number(s)
9975.)

C-4171 - Driver Handle, Universal
(Originally Shipped In Kit Number(s)
9202, 9202A-CAN, 9202CC, 9299,
9299CC, 9299CC, 9300A-CAN.)

2014 Jeep Cherokee Trailhawk

2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee

C-4310 - Installer, Bearing
(Originally Shipped In Kit Number(s) C-4306.)

2014 Jeep Cherokee Trailhawk

2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee

C-4995A - Tool, Differential Bearing Torque

MD998805 - Installer, Seal
(Originally Shipped In Kit Number(s)
9926.)

8901A - Pressing Tool
(Originally Shipped In Kit Number(s)
8901A.)

CABLE, SHIFT

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT

1. Park the vehicle on level ground and set the parking brake.

2316004759

Fig. 246: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

2. Using (special tool #C-4755, Trim Stick) or equivalent, remove the front trim (3) covering the console fasteners.

2316004757

Fig. 247: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

3. Detach shifter bezel (1) from console bezel using (special tool #C-4755, Trim Stick) or equivalent, pry up on bezel (1).

NOTE: Do not remove the shifter bezel, as it will fit through the opening in the console bezel when it is removed.

4. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shift Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

2316004761

Fig. 248: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Using (special tool #C-4755, Trim Stick) or equivalent, separate the console bezel (1) and disconnect the electrical connectors (2).
6. Place the gearshift lever in Park (P) and remove ignition key.

2102039040

Fig. 249: Shifter Cable End & Adjustment Screw
Courtesy of CHRYSLER GROUP, LLC

7. Loosen the cable adjustment screw (3) at the shifter end of the cable.

8. Pull the gearshift lever fully forward to the park detent position.
9. Release the park brake, then rock the vehicle to assure it is in park. Reset the park brake.
10. Tighten the cable adjustment screw to proper specification, refer to **SPECIFICATIONS**.
11. Verify adjustment by using the verification procedure.
12. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shifter Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

2316004761

Fig. 250: Shifter Bezel, Console Bezel & Electrical Connectors
 Courtesy of CHRYSLER GROUP, LLC

13. Insert the shifter bezel through the console bezel (1).
14. Connect the console bezel electrical connectors (2).
15. Install the console bezel (1) to the console.

2316004757

Fig. 251: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

16. Install the shifter bezel (1) to the console bezel.

2316004759

Fig. 252: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

17. Install the console front trim (3).

VERIFICATION

1. Place gearshift lever in Park (P).
2. Attempt to move vehicle by rocking back and forth on level ground. If vehicle does not move, attempt to start engine. If engine starts, the park position is correct.
3. Set parking brake.
4. Turn key to on/run and depress brake pedal. Place gearshift lever in Neutral (N).
5. Attempt to start engine. If engine starts in both Neutral (N) or Park (P), gearshift cable is adjusted properly. No adjustment is required.
6. If engine does not start in either Park (P) or Neutral (N), perform adjustment procedure.

REMOVAL

REMOVAL

1. Set the parking brake.
2. Disconnect and isolate the negative battery cable.

2316004759

Fig. 253: Console Trim Pieces
 Courtesy of CHRYSLER GROUP, LLC

3. Using (special tool #C-4755, Trim Stick) or equivalent, remove the front trim (3) covering the console fasteners.

2316004757

Fig. 254: Shifter Bezel & Console Bezel
 Courtesy of CHRYSLER GROUP, LLC

4. Detach shifter bezel (1) from console bezel using (special tool #C-4755, Trim Stick) or equivalent, pry up on bezel (1).

NOTE: Do not remove the shifter bezel, as it will fit through the opening in the console bezel when it is removed.

5. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shift Interlock (BITSI)

Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

2316004761

Fig. 255: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Using (special tool #C-4755, Trim Stick) or equivalent, separate the console bezel (1) and disconnect the electrical connectors (2).
7. Remove the console bezel.
8. Place shifter in Park position.

2102039040

Fig. 256: Shifter Cable End & Adjustment Screw

Courtesy of CHRYSLER GROUP, LLC

9. Disconnect shifter cable (1) from the shifter (2).

Fig. 257: Shifter Cable & Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Release the lock (3) holding the shifter cable (4) to the shifter bracket (1).
11. Separate the shifter cable (4) from the shifter bracket (1).
12. Remove the Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL**.
13. Remove the PCM bracket from the battery tray.

Fig. 258: Shifter Cable End & Manual Lever At Transmission
Courtesy of CHRYSLER GROUP, LLC

14. Separate the shifter cable end (1) from the manual lever (2) on the transmission.

Fig. 259: Shifter Cable & Shift Cable Bracket On Transmission
Courtesy of CHRYSLER GROUP, LLC

15. Release the lock (2) holding the shifter cable (1) to the shift cable bracket (3) on the transmission.
16. Separate the shifter cable (1) from the shift cable bracket (3).
17. Raise and support the vehicle on a hoist. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 260: Exhaust Heat Shield Nuts
Courtesy of CHRYSLER GROUP, LLC

18. Remove the exhaust heat shield (1) nuts (2) and lower heat shield to gain access to the shifter cable and grommet.

Fig. 261: Shifter Cable Support Bracket & Shifter Cable Grommet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Exhaust and heat shield removed for clarity.

19. Detach the shifter cable from the support bracket (1).

20. Detach the shifter cable grommet (2) from the floor pan.

Fig. 262: Shifter Cable Clip
Courtesy of CHRYSLER GROUP, LLC

21. Detach the shifter cable from the clip (1) attached to the steering gear.

Fig. 263: Shifter Cable & Floor Pan Access Hole
Courtesy of CHRYSLER GROUP, LLC

22. Pull the shifter cable (1) through the floor pan.
23. Disconnect front sway bar links from the sway bar.

Fig. 264: Shifter Cable
Courtesy of CHRYSLER GROUP, LLC

24. Rotate the sway bar (1) for shifter cable (2) clearance.
25. Remove the shifter cable from the vehicle.

INSTALLATION

INSTALLATION

Fig. 265: Shifter Cable
Courtesy of CHRYSLER GROUP, LLC

NOTE: Exhaust and heat shield are removed for clarity.

Fig. 266: Shifter Cable & Floor Pan Access Hole
Courtesy of CHRYSLER GROUP, LLC

1. Position the shifter cable (2) into the vehicle.
2. Push the shifter cable (1) up through the floor pan.

Fig. 267: Shifter Cable Clip
Courtesy of CHRYSLER GROUP, LLC

3. Attach the shifter cable to the clip (1) attached to the steering gear.

Fig. 268: Shifter Cable Support Bracket & Shifter Cable Grommet
Courtesy of CHRYSLER GROUP, LLC

4. Attach the shifter cable grommet (2) to the floor pan.
5. Attach the shifter cable to the support bracket (1).

Fig. 269: Exhaust Heat Shield Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Position the heat shield (1) in place and install the heat shield nuts (2).
7. Attach the front sway bar links to the sway bar and tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS** .

8. Lower the vehicle.

Fig. 270: Shifter Cable & Shift Cable Bracket On Transmission
Courtesy of CHRYSLER GROUP, LLC

9. Attach the shifter cable (1) in the shifter cable bracket (3) on the transmission.

Fig. 271: Shifter Cable End & Manual Lever At Transmission
Courtesy of CHRYSLER GROUP, LLC

10. Attach the shifter cable end (1) to the manual lever (2).

NOTE: Make sure the transmission is in Park by rotating the manual lever to its forward most position.

11. Install the Powertrain Control Module (PCM) bracket to the battery tray.
12. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .

Fig. 272: Shifter Cable & Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

13. Attach the shifter cable (4) to the shifter bracket (1).

Fig. 273: Shifter Cable End & Adjustment Screw

Courtesy of CHRYSLER GROUP, LLC

14. With shifter in the Park position, attach the shifter cable end (1) to the shifter (2).
15. If necessary, adjust the shifter cable. Refer to **CABLE, SHIFT, ADJUSTMENTS**.
16. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shifter Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

2316004761

Fig. 274: Shifter Bezel, Console Bezel & Electrical Connectors
 Courtesy of CHRYSLER GROUP, LLC

17. Insert the shifter bezel through the console bezel (1).
18. Connect the console bezel electrical connectors (2).
19. Install the console bezel (1) to the console.

2316004757

Fig. 275: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

20. Install the shifter bezel (1) to the console bezel.

2316004759

Fig. 276: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

21. Install the console front trim (3).
22. Connect the negative battery cable.

BEARINGS, DIFFERENTIAL

REMOVAL

DIFFERENTIAL BEARING

1. Remove the transmission from the vehicle. Refer to **INSTALLATION**.
2. Position the transmission on a suitable, clean work surface.
3. Drain the fluid from the transmission.

Fig. 277: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (1) from around the perimeter of the transmission, (1) holding the bellhousing to the transmission housing.

Fig. 278: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (1) holding the bellhousing to the output gear support.
6. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
7. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the

transmission housing.

Fig. 279: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

8. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).
9. Remove the bellhousing from the transmission.

Fig. 280: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Remove the differential unit from the transmission

11. Clean the differential unit with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 281: Removing Differential Side Bearings (Differential is Assembled)
Courtesy of CHRYSLER GROUP, LLC

If the Differential is Assembled remove bearings using following tools and procedure.

1. Using tools (special tool #9738, Blocks, Adapter) (2), and (special tool #8513A, Insert, Crankshaft) (3), along with (special tool #C-293-PA, Puller, Press) (1) remove the side bearings.

If the Differential is Disassembled remove the bearings using following tools and procedure.

Fig. 282: Removing Differential Side Bearings (Differential is Disassembled)
 Courtesy of CHRYSLER GROUP, LLC

1. Using tools (special tool #C-293-37, Block Set, Puller) (2), and (special tool #9678, Press Plug) (3), along with (special tool #C-293-PA, Puller, Press) (1) remove the side bearing (4).

BEARING RACE

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Position the transmission on a suitable, clean work surface.
3. Drain the fluid from the transmission.

Fig. 283: Bellhousing To Transmission Housing Bolts

Courtesy of CHRYSLER GROUP, LLC

4. From around the perimeter of the transmission, remove the bolts (1) holding the bellhousing to the transmission housing.

Fig. 284: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (1) holding the bellhousing to the output gear support.
6. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
7. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the transmission housing.

Fig. 285: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

8. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).
9. Remove the bellhousing from the transmission.

Fig. 286: Remove Bearing Race From Bellhousing
Courtesy of CHRYSLER GROUP, LLC

10. Using tool (special tool #9664, Remover, Bearing Cup) (2), (special tool #C-637, Slide Hammer, Universal) (1) and a suitable vise-grip pliers (3) to hold the expansion screw in position, remove the bearing race (4) from the bellhousing.

Fig. 287: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

11. Remove the differential unit (1) from the transmission.

Fig. 288: Removing Bearing Race From The Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

12. Using tool (special tool #9664, Remover, Bearing Cup) (2), (special tool #C-637, Slide Hammer, Universal) (1) and a suitable vise-grip pliers (3) to hold the expansion screw in position, remove the bearing race (4) from the transmission housing.

INSTALLATION

DIFFERENTIAL BEARING

1. Clean the differential unit with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 289: Installing Differential Side Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable hammer (1) tool (special tool #6888, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal)

install the side bearings.
3. If necessary, assemble the differential unit.

Fig. 290: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Install the differential unit (1) in the transmission.

Fig. 291: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

5. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).
6. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.

Fig. 292: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 293: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
9. Install the transmission in the vehicle. Refer to **INSTALLATION**.
10. Fill the transmission with the specified type and quantity fluid. Refer to **FLUID AND FILTER**.

STANDARD PROCEDURE.

11. Road test the vehicle to verify the repair.

BEARING RACE

If only the bearing are being replaced the bearing preload does not require selecting a new select shim. If the transmission housing, bellhousing or differential is replaced the proper thickness select shim will have to be determined. Refer to **STANDARD PROCEDURES.**

1. Wipe the bearing bores clean with a clean lint free cloth.
2. Inspect the bearing bores to damage or cracks in the casting.

Fig. 294: Install Bearing Bore Shim
Courtesy of CHRYSLER GROUP, LLC

3. Install the original shim in the bearing bore of the transmission housing.

Fig. 295: Bearing Race
Courtesy of CHRYSLER GROUP, LLC

4. Place the NEW bearing race in the bearing bore of the transmission housing.

Fig. 296: Installing Bearing Race
Courtesy of CHRYSLER GROUP, LLC

5. Using tool (special tool #C-4310, Installer, Bearing) (2) and (special tool #C-4171, Driver Handle, Universal) (1) install the bearing race in the transmission housing.

Fig. 297: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Install the differential unit in the transmission housing.
7. Place the NEW bearing race in the bearing bore of the bellhousing.
8. Using tool (special tool #C-4310, Installer, Bearing) and (special tool #C-4171, Driver Handle, Universal) install the bearing race in the bellhousing.

Fig. 298: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

9. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

10. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.

Fig. 299: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 300: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper

specifications. Refer to **SPECIFICATIONS**.

13. Install the transmission in the vehicle. Refer to **INSTALLATION**.
14. Fill the transmission with the specified type and quantity fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
15. Road test the vehicle to verify the repair.

BEARINGS, TRANSFER GEAR

REMOVAL

TRANSFER GEAR INNER BEARING

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Before disassembling the transmission, wash the transmission with a suitable solvent and a siphon pressure washer to remove oily grime and loose dirt. Place the transmission on a clean work surface with ample fluid drainage or absorbency.

Fig. 301: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

1. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 302: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts holding the valve body cover pan to the transmission housing.
3. Remove the valve body cover pan from the transmission.

Fig. 303: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts holding the valve body to the transmission housing.
5. Using a suitable prying tool, pry the valve body away from the adapter tubes.
6. Turn the valve body over to gain access to wire harness connectors.

Fig. 304: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Release the lock (2) on the fluid pressure transducer wire connector.
8. Separate the wire connector from the fluid pressure transducer (1).

Fig. 305: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
10. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
11. Separate the valve body from the transmission.

NOTE: If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.

Fig. 306: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

12. Remove the screw (1) holding the TRS to the transmission housing.

Fig. 307: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

13. Separate the TRS (1) from the transmission with the wire harness connected.

Fig. 308: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

14. Remove the screw (1) holding the speed sensors to the transmission housing.

Fig. 309: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

15. Separate the speed sensor (1) from the transmission with the wire harness connected.

Fig. 310: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

16. Using suitable pliers, remove the fluid adapter tubes (1) from the transmission.

Fig. 311: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

17. From around the perimeter of the transmission, remove the bolts (1) holding the bellhousing to the transmission housing.

Fig. 312: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Remove the bolts (1) holding the bellhousing to the output gear support.
19. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
20. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the transmission housing.

Fig. 313: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

21. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).

Fig. 314: Port Seal

Courtesy of CHRYSLER GROUP, LLC

22. Remove the seal (1) from the port in the transmission housing.

2101006419

Fig. 315: Sealing Surface Of Transmission Housing

Courtesy of CHRYSLER GROUP, LLC

23. Separate the gasket (1) from the sealing surface of the transmission housing (2).

Fig. 316: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

24. Remove the differential assembly (1) from the transmission housing.

Fig. 317: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

25. Separate the E-clutch from the E-clutch hub and shaft (2).

Fig. 318: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

26. Separate the thrust bearing (1) from the E-clutch (2) hub.

Fig. 319: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

27. Separate the E-clutch hub and shaft (1) from the output gear support (2).

Fig. 320: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

28. Separate the output gear support (1) from the gear 4 planetary pinion carrier (2).

Fig. 321: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

29. Remove the transfer gear from the transmission housing (1).

Fig. 322: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

30. Separate the roller type thrust bearing (1) from the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 323: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

31. Separate the sun gear 3 and 4 and Dog Clutch-F (1) from the gear 4 planetary pinion carrier.

Fig. 324: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

32. Separate the gear 4 planetary pinion carrier (1) from the annulus gear 4.

Fig. 325: Annulus Gear 4
Courtesy of CHRYSLER GROUP, LLC

33. Separate the annulus gear 4 from the annulus gear 3 (2).

Fig. 326: Removing Transfer Gear Bearing Cone
Courtesy of CHRYSLER GROUP, LLC

34. Using Puller Press (special tool #C-293-PA, Puller, Press) (1), Adapter Blocks (special tool #9738, Blocks, Adapter) (3) and a suitable socket as a plug (2), remove the transfer gear bearing cone from the transmission housing.

TRANSFER GEAR INNER RACE

1. Clean the transfer gear with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 327: Removing Bearing Race From Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

2. Clamp the transfer gear (1) in a suitable bench vise with protective jaws.

NOTE: It may be necessary to clamp vise grips (3) on the seal remover to keep the expander screw in place.

3. Using tool (special tool #C-637, Slide Hammer, Universal) (4) and (special tool #7794-A, Remover, Seal) (2) with the jaws expanded out under the inner edge on the bearing race.
4. Knock outward with the slide hammer (4) until the bearing race comes out of the transfer gear (1).

TRANSFER GEAR OUTER BEARING

Fig. 328: Removing Transfer Gear Outer Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Clamp tool (special tool #C-293-PA, Puller, Press) (1) in a suitable vise with the ram blot head upward.
2. Using tool (special tool #C-293-40, Block Set, Puller) (2) with the transfer gear bearing inserted under the puller press and engage the blocks evenly spaced around the bearing.
3. Insert tool (special tool #8513A, Insert, Crankshaft) (3) between the press ram and the transfer gear (5) and hand tighten the press (1) ram down to the Insert
4. While holding the transfer gear, use a suitable wrench to tighten the press (1) ram until the bearing (4) comes off the transfer gear.

TRANSFER GEAR OUTER RACE

1. Disassemble the transmission. Refer to **DISASSEMBLY**.
2. Position the bellhousing on a stable, clean work surface.

Fig. 329: Removing Transfer Gear Outer Bearing Race From Bellhousing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #C-637, Slide Hammer, Universal) (1) and (special tool #9664, Remover, Bearing Cup) (2) with the tool fingers inserted in the channels behind the transfer gear outer bearing race (3), remove the transfer gear outer bearing race (3) from the bellhousing bore.

INSTALLATION

TRANSFER GEAR INNER BEARING

The work area, counter surfaces and tools must be thoroughly cleaned before attempting to assemble the 948TE transmission. All of the sub assemblies should be disassembled, cleaned, and assembled with new sealing components where applicable. The transmission housing should be clean and oil free before beginning this procedure. If the transmission was contaminated with metallic material, all of the thrust bearings and roller bearings should be replaced. The bearing in the output gear support assembly is not serviceable. The output gear support assembly should be replaced if metal debris is present.

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Fig. 330: Installing Transfer Gear Bearing Cone Onto Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

1. Using Bearing Installer (special tool #6888, Installer, Seal) (2), and handle (special tool #C-4171, Driver Handle, Universal) (3) install the transfer gear bearing cone (1) onto the transmission housing.

Fig. 331: Annulus Gear 4
Courtesy of CHRYSLER GROUP, LLC

2. Install the annulus gear 4 into the annulus gear 3 (2).

Fig. 332: Thrust Spacer & Underside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

3. Install a NEW thrust spacer (1) on the underside of the gear 4 planetary pinion carrier (2).

Fig. 333: Thrust Spacer & Topside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

4. Install a NEW thrust spacer (1) on the topside of the gear 4 planetary pinion carrier (2).

Fig. 334: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

5. Install the gear 4 planetary pinion carrier (1) into the annulus gear 4.

Fig. 335: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

6. Install the sun gear 3 and 4 and Dog Clutch-F (1) into the gear 4 planetary pinion carrier.

Fig. 336: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

7. Install the roller type thrust bearing (1) onto the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 337: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: If new transfer gear (1) or transmission housing are being replaced measurements must be preformed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.

8. If necessary, replace the bearings and races on the transfer gear (1).
9. Install the transfer gear (1) into the transmission housing.

Fig. 338: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

10. Install the output gear support (1) into the gear 4 planetary pinion carrier (2).

Fig. 339: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

11. Install the E-clutch hub and shaft (1) into the output gear support (2)

Fig. 340: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

12. Install the thrust bearing (1) on the E-clutch (2) hub.

Fig. 341: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing the E-clutch, use a suitable screwdriver to align the grooves in the friction.

13. Install the E-clutch onto the E-clutch hub and shaft (2).

Fig. 342: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

14. Wriggle the E-clutch (1) until all of the friction discs are fully engaged on the E-clutch hub and shaft.

NOTE: When the E-clutch (1) is fully seated the gap (2) will be very small between the E-clutch retainer and the output gear support.

Fig. 343: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: If new differential (1) or transmission housing are being replaced

measurements must be preformed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.

15. If necessary, replace the bearings and races on the differential (1).
16. Install the differential assembly (1) into the transmission housing.

2101006419

Fig. 344: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

17. Place a NEW gasket (1) in position on the sealing surface of the transmission housing (2).

Fig. 345: Port Seal

Courtesy of CHRYSLER GROUP, LLC

18. Install a NEW seal (1) in the port in the transmission housing.
19. If necessary, replace the output seal and the impeller hub seal.

**Fig. 346: Removing/Installing Bellhousing At Transmission Housing**

Courtesy of CHRYSLER GROUP, LLC

20. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

**Fig. 347: Checking Guide Pin Alignment**

Courtesy of CHRYSLER GROUP, LLC

21. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 348: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

22. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing
23. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
24. Install several bolts to hold the bell housing to the transmission housing. Tighten the bolts hand tight.
25. Position the transmission on the bench with the bellhousing facing outward.

Fig. 349: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

26. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support. Refer to **SPECIFICATIONS**.

Fig. 350: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the bolts (1) to hold the bellhousing to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 351: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW O-rings on both ends of the fluid transfer tubes.
29. Install the fluid adapter tubes (1) from the transmission.

Fig. 352: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

30. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 353: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

31. Install the screw (1) to hold the speed sensors to the transmission housing.

Fig. 354: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

32. Place the TRS (1) in position on the transmission with the wire harness connected.

Fig. 355: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

33. Install the screw (1) to hold the TRS to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 356: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

34. Place the valve body (1) in position on the transmission.
35. Place the wire harness connector (2) in position on the solenoids.
36. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 357: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

37. Install the screws to hold the wire harness connector to the valve body and solenoids. Refer to **SPECIFICATIONS**.

Fig. 358: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

38. Insert the wire harness connector into the fluid pressure transducer connector
39. Press connector together until the lock engages.

Fig. 359: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

40. Turn the valve body (1) over and align the valve body (1) with the fluid transfer adapters.

Fig. 360: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

41. Guide the manual lever cam (2) into the slot (3) on the manual valve.
42. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 361: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

43. Install the bolts (1) to hold the valve body to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 362: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

44. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.

Fig. 363: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

45. Place the valve body cover pan (1) in position on the transmission.
46. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 364: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

47. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
48. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 365: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

49. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 366: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

50. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
51. Install the bolts (1) to hold the valve body cover pan to the transmission housing. Refer to **SPECIFICATIONS**.
52. Install the transmission in the vehicle.

53. Road test the vehicle to verify the repair.

TRANSFER GEAR INNER RACE

1. Using a clean lint free cloth, wipe the transfer gear bore clean. Inspect the bore for burrs or other damage. Use crocus cloth the dress down burrs.
2. Place the transfer gear on the stable, clean work surface.

Fig. 367: Installing Bearing Race Into Transfer Gear Until
Courtesy of CHRYSLER GROUP, LLC

3. Place the NEW bearing race in the transfer gear bore.
4. Using a suitable hammer (1) and tool (special tool #9588, Installer, Bearing Cup)with (special tool #C-4171, Driver Handle, Universal), drive the bearing race into the transfer gear until it butts against the bottom surface.
5. Install the transfer gear in the transaxle.

TRANSFER GEAR OUTER BEARING

Clean the transfer gear with suitable solvent and blow it dry with 344 kPa (50psi) regulated shop air.

1. Place the transfer gear on a stable, clean work surface.

Fig. 368: Installing Transfer Gear Bearing Onto Transfer Gear
 Courtesy of CHRYSLER GROUP, LLC

2. Place the NEW transfer gear bearing (3) on the transfer gear (4).
3. Using a suitable hammer (1) and tool (special tool #6052, Installer, Bearing/Seal) (2), drive the transfer gear bearing (3) onto the transfer gear (4).
4. Assemble the transaxle and install it in the vehicle. Refer to **ASSEMBLY**. Refer to **INSTALLATION**.
5. Properly fill the transaxle with specified type and quantity fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
6. Road test the vehicle to verify the repair.

TRANSFER GEAR OUTER RACE

Clean the bearing bore with a lint free cloth and inspect for damage to the bellhousing casting. If the bellhousing is damaged the transmission will require replacement.

1. Place the NEW transfer gear outer bearing race in position in the bellhousing bore.

Fig. 369: Installing Transfer Gear Outer Bearing Race Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

2. Using and suitable hammer and tool (special tool #10036, Installer, Bearing Cup) (1) with (special tool #C-4171, Driver Handle, Universal) (2), drive the transfer gear outer bearing race (3) into the bellhousing bore until it seats down to the bottom stop.
3. Assemble the transmission and install the transmission in the vehicle. Refer to **ASSEMBLY**. Refer to **INSTALLATION**.
4. Fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
5. Road test the vehicle to verify the repair.

BELLHOUSING

REMOVAL

REMOVAL

The following procedure is performed with the transmission drained and removed from the vehicle.

1. Place the transmission on a suitable, clean work surface.
2. Remove the torque converter.
3. Using a dial indicator, measure the input shaft end-play.

Fig. 370: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 371: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the valve body cover pan bolts (1).
6. Remove the valve body cover pan from the transmission.

Fig. 372: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the valve body bolts (1).
8. Using a suitable prying tool, pry the valve body away from the adapter tubes.

Fig. 373: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. Turn the valve body over to gain access to wire harness connectors.
10. Release the lock (2) on the fluid pressure transducer wire connector and separate the wire connector (2) from the fluid pressure transducer (1).

Fig. 374: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

11. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
12. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
13. Separate the valve body from the transmission.

Fig. 375: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

14. Remove the Transmission Range Sensor (TRS) screw (1).

Fig. 376: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

15. Separate the TRS (1) from the transmission with the wire harness connected.

Fig. 377: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

16. Remove the speed sensor screw (1).

Fig. 378: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

17. Separate the speed sensor (1) from the from the transmission with the wiring harness connected.

Fig. 379: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

18. Using suitable pliers, remove the fluid adapter tubes (1) from the transmission.

Fig. 380: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

19. From around the perimeter of the transmission, remove the bellhousing bolts (1) holding the bellhousing to the transmission housing.

Fig. 381: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Remove the bellhousing bolts (1) holding the bellhousing to the output gear support.
21. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
22. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the

transmission housing.

Fig. 382: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

23. Lift the bellhousing (1) upward and separate the bellhousing from the transmission housing (2).

INSTALLATION

INSTALLATION

Fig. 383: Port Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a NEW crossover port seal (1) in the transmission housing.

2101006419

Fig. 384: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

2. Place a NEW gasket (1) on the clean sealing surface of the transmission housing (2).
3. If necessary, replace the output seal and the impeller hub seal.

2101006416

Fig. 385: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

4. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

Fig. 386: Checking Guide Pin Alignment
Courtesy of CHRYSLER GROUP, LLC

5. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 387: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing.
7. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
8. Install several bolts to hold the bellhousing to the transmission housing. Tighten hand tight.

9. Position the transmission on the bench with the bellhousing facing outward.

Fig. 388: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the output gear support bellhousing bolts (1) to hold the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 389: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bellhousing bolts (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 390: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

12. Install NEW O-rings on both ends of the fluid transfer tubes.
13. Install the fluid adapter tubes (1) from the transmission.

Fig. 391: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

14. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 392: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

15. Install the speed sensor screw (1) to hold the speed sensor to the transmission housing.

Fig. 393: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

16. Place the Transmission Range Sensor (TRS) (1) in position on the transmission with the wire harness connected.

Fig. 394: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

17. Install the TRS screw (1) to hold the TRS to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 395: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

18. Place the valve body (1) in position on the transmission.
19. Place the wire harness connector (2) in position on the solenoids.
20. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 396: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

21. Install the screws (1) to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 397: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

22. Insert the fluid pressure transducer connector (2) into the fluid pressure transducer (1).
23. Press connector together until the lock engages.

Fig. 398: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

24. Turn the valve body (1) over and align the valve body (1) with the fluid transfer tubes.

Fig. 399: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

25. Guide the manual lever cam (2) into the slot (3) on the manual valve.
26. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 400: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the valve body bolts (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 401: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.

Fig. 402: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

29. Place the valve body cover pan (1) in position on the transmission.
30. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 403: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

31. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
32. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 404: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

33. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 405: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

34. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
35. Install the valve body cover pan bolts (1) to hold the valve body cover pan to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
36. Install the torque converter.

37. Install the transmission in the vehicle. Refer to **INSTALLATION**.

CLUTCH, B

ADJUSTMENTS

B-CLUTCH MEASUREMENT

After the B-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate has been installed.

Fig. 406: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

1. Position the B-clutch on a arbor press with the reaction plate (4) facing upward.

Fig. 407: Compressing B-Clutch
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10429, Gauge, Force) (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool) (3), compress the B-clutch (4) to collapse wave plate to 68 kgf (150 lb. force) (1).
3. Using as suitable feeler gauge, measure the gap between the B-clutch hub and the reaction plate. Refer to **SPECIFICATIONS**.
4. If the measurement is not within specification, replace the reaction plate with the correct plate.

DISASSEMBLY

B-CLUTCH DISASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

NOTE: Clean the B-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the B-clutch components on a clean work surface in preparation for assembly.

Fig. 408: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

1. Remove the thrust bearing from B-clutch hub.

Fig. 409: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Remove the snap-ring holding the B-clutch hub to the input shaft Dog A-clutch.
3. Remove the input shaft from the B-clutch (1).

Fig. 410: Compressing B-Clutch Piston To Gain Access To Snap-Ring
 Courtesy of CHRYSLER GROUP, LLC

4. Place the B-clutch with piston up on a suitable arbor press.
5. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool), compress the B-clutch (2) piston to gain access to the snap-ring.

Fig. 411: Snap-Ring, B-Clutch Piston & B-Clutch Hub
 Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable snap-ring pliers (3), remove the snap-ring (2) holding the B-clutch piston in the B-clutch (1) hub.
7. Remove the B-clutch from the arbor press.

Fig. 412: B-Clutch Piston & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

8. Remove the B-clutch piston (1) from the B-clutch (2).

Fig. 413: B-Clutch & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

9. Remove the B-clutch (2) From the B-clutch hub (1).

Fig. 414: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

10. Separate the friction discs (2) from the steel plates (1).

Fig. 415: Belleville Spring & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

11. Remove the belleville spring (2) from the B-clutch hub.

Fig. 416: Removing O-Ring Seals From B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

12. Using a suitable hook tool (3) remove the O-ring seals (2) from the B-clutch hub (1).

Fig. 417: Remove/Install Balance Piston At B-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

13. Remove the balance piston (1) from the B-clutch piston (2).

Fig. 418: Removing B-Clutch Balance Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable hook tool, remove the O-ring (2) from the balance piston (1).

Fig. 419: Removing B-Clutch Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable hook tool, remove the O-ring seal from the B-clutch piston.

ASSEMBLY

B-CLUTCH ASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Clean the B-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the B-clutch components on a clean work surface in preparation for assembly.

Fig. 420: Installing B-Clutch Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Install the O-ring seal (2) on the B-clutch piston.

Fig. 421: Installing B-Clutch Balance Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install the O-ring seal (1) on the B-clutch balance piston (2).

Fig. 422: Remove/Install Balance Piston At B-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install the balance piston (1) in the B-clutch piston (2).

Fig. 423: B-Clutch Hub & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

4. Install New O-ring seals (2) in the B-clutch hub (1).

Fig. 424: Belleville Spring & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

5. Install the belleville spring (2) in the B-clutch hub (1).

Fig. 425: Reaction Plate & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

6. Install the reaction plate (1) on the B-clutch hub (2).

Fig. 426: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

7. In alternating sequence, Install the B-clutch friction plates (2) and steel plates (1) On the B-clutch hub.

Fig. 427: B-Clutch & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

8. Install the wave spring plate (1) on the B-clutch hub.

Fig. 428: B-Clutch Piston & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

9. Install the piston (1) the B-clutch (2).

Fig. 429: Compressing B-Clutch Piston To Gain Access To Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

10. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool), compress the B-clutch (2) piston to gain access to the snap-ring.

Fig. 430: Snap-Ring, B-Clutch Piston & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

11. Compress the B-clutch belleville spring and piston until the snap-ring groove is exposed.
12. Using a suitable snap-ring pliers (3), install the snap-ring (2) in the B-clutch (1) hub.

NOTE: Before installing the input shaft/Dog A-clutch, measure the B-clutch to determine if the proper select reaction plate was installed. Air test the dog A-clutch with shop air regulated to 344 kPa (50 psi), it fails the air test replace the input shaft.

Fig. 431: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

13. Insert the input shaft/dog A-clutch into the B-clutch hub.
14. Using a suitable snap-ring pliers, install the snap-ring to hold the input shaft in the B-clutch hub.

Fig. 432: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

15. Install the thrust bearing on the B-clutch hub.

CLUTCH, C

ADJUSTMENTS

C-CLUTCH MEASUREMENT

After the C-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate (3) has been installed.

Fig. 433: Exploded View Of C-Clutch Wave Plate, Steel Plates, & Friction Discs
Courtesy of CHRYSLER GROUP, LLC

1. Position the transaxle housing on a suitable arbor press.

Fig. 434: Compressing C-Clutch To Collapse Wave Plate
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10429, Gauge, Force) (2), (special tool #8901A, Pressing Tool) (with pressure scale removed) (3) and legs (special tool #10428, Adapter, Pressing Tool), compress the C-clutch (4) to collapse wave plate (5, See **Fig. 433**) to 68 kgf (150 lb. force).

Fig. 435: Measuring Gap Between C-Clutch Snap-Ring & Reaction Plate
Courtesy of CHRYSLER GROUP, LLC

3. Using as suitable feeler gauge (1), measure the gap between the C-clutch snap-ring (2) and the reaction plate (2). Refer to **SPECIFICATIONS**.
4. If measurement does not match the specifications, replace the select reaction plate.

CLUTCH, D

ADJUSTMENTS

D-CLUTCH MEASUREMENT

After the D-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate has been installed.

Fig. 436: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

1. Install the D-clutch snap-ring (5) in the groove in the transaxle housing.

Fig. 437: Measuring Distance From The Bottom Of D-Clutch Snap-Ring To D-Clutch Shoulder
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable caliper (1), measure the distance from the bottom of the D-clutch snap-ring (2) to the D-clutch shoulder (3) in the transaxle housing. Record this number.

Fig. 438: Measuring Thickness Of D-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Place the D-clutch piston retainer/piston, belleville spring, and clutch stack on a suitable arbor press.
4. Using tool (special tool #10429, Gauge, Force) (1) and (special tool #8901A, Pressing Tool) (2) (with pressure scale and legs removed), compress the D-clutch (5) to 22.5 kgf (50 lb. force) (1).
5. Using a suitable caliper (1), measure the thickness from the snap-ring step in the D-clutch piston retainer

to the underside of the D-clutch reaction plate. Record this number.

6. Subtract the amount of step 5 from the amount of step 2. The difference is the amount of free-play in the D-clutch. Refer to **SPECIFICATIONS**.

Fig. 439: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

7. If the remainder from step 6 does not match the specifications, replace the select reaction plate (2).

CLUTCH, E

ADJUSTMENTS

E-CLUTCH MEASUREMENT

After the E-clutch is cleaned and assembled the end play must be measured to verify that the correct select snap-ring has been installed.

1. Use a dial indicator and a magnetic base attached to the E-clutch retainer with the stylist tip resting on the reaction plate.

Fig. 440: Pressing Downward On Reaction Plate
Courtesy of CHRYSLER GROUP, LLC

2. Press downward on the reaction plate (1) and zero the dial indicator face (2).

Fig. 441: Prying Center Friction Discs Upward
Courtesy of CHRYSLER GROUP, LLC

3. Using two suitable screw drivers (2), pry the center friction discs (3) upward while reading the dial indicator (1).

Fig. 442: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

4. The reading should be within specification. Refer to **SPECIFICATIONS**. If not, install the correct select snap-ring (4).

DISASSEMBLY

E-CLUTCH DISASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

NOTE: Clean the E-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. If the E-clutch failed an air test and air is bypassing the piston seals, the piston will require replacement. The seals are integral to the piston.

Fig. 443: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Using a suitable screw driver, remove the snap-ring (2) holding the E-clutch thrust place in the E-clutch retainer (1).

Fig. 444: Thrust Plate & E-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Remove the thrust plate (1) from the E-clutch retainer (2).

Fig. 445: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

3. Remove the E-clutch friction plates (1) and steel plates (2) from the E-clutch retainer.

Fig. 446: E-Clutch Retainer & Arbor Press
Courtesy of CHRYSLER GROUP, LLC

4. Place the E-clutch retainer (3) on a suitable arbor press (4).
5. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool

#10428, Adapter, Pressing Tool) (2), compress the E-clutch spring retainer to gain access to the snap-ring.

Fig. 447: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable snap-ring pliers (4), remove the snap-ring (3) holding the spring retainer to the E-clutch (2).
7. Remove the tools 8904 and 10428 (1) from the arbor press.

Fig. 448: Belleville Spring Retainer & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

8. Remove the belleville spring retainer (1) from the E-clutch (2).

Fig. 449: Belleville Spring & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

9. Remove the belleville spring (1) from the E-clutch (1).

Fig. 450: E-Clutch Retainer & Piston
Courtesy of CHRYSLER GROUP, LLC

10. Remove the piston (1) from the E-clutch retainer (2).

ASSEMBLY

E-CLUTCH ASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

NOTE: Clean the E-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the E-clutch components on a clean work surface in preparation for assembly. If the seals are damaged in any way clutch piston, retainer and belleville spring retainer will require replacement.

Fig. 451: E-Clutch Retainer & Piston
Courtesy of CHRYSLER GROUP, LLC

1. Install the piston (1) into the E-clutch retainer (2).

Fig. 452: Belleville Spring & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

2. Install the belleville spring (1) into the E-clutch (1).

Fig. 453: Belleville Spring Retainer & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Install the belleville spring retainer (1) from the E-clutch (2).

Fig. 454: E-Clutch Retainer & Arbor Press
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool) (2), compress the E-clutch spring retainer to until snap-ring groove is exposed.

Fig. 455: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable snap-ring pliers (4), remove the snap-ring (3) holding the spring retainer to the E-clutch (2).
6. Remove the tools 8904 and 10428 (1) from the arbor press.

7. Place the E-clutch retainer on a suitable clean work surface.

Fig. 456: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

8. In alternating sequence, Install the E-clutch friction plates (1) and steel plates (2) into the E-clutch retainer.

Fig. 457: Thrust Plate & E-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

9. With stepped side up, install the thrust plate (1) into the E-clutch retainer (2).

Fig. 458: Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

10. Install the snap-ring (2) to hold the E-clutch thrust place in the E-clutch retainer (1).

CLUTCH, F DOG

DISASSEMBLY

DOG F-CLUTCH DISASSEMBLY

The Dog F-clutch is located in the output gear support.

1. Clamp the output gear support assembly in a suitable bench vise.

Fig. 459: Locking Plate
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable screw driver, pry the staking in the locking plate outward to allow to stake nut to rotate.

Fig. 460: Removing/Installing Stake Nut
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #2012900210, Wrench, Spanner), remove the stake nut holding the output gear and bearing to the output gear support hub.

Fig. 461: Removing/Installing Lock Plate
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lock plate from the output gear support.

Fig. 462: Removing/Installing Output Gear
Courtesy of CHRYSLER GROUP, LLC

5. Remove the output gear from the output gear support.

NOTE: The double roller bearing in the output gear cannot be removed. If the bearing is damaged, replace the output gear as well.

Fig. 463: Removing Dog F-Clutch Thrust Plate
Courtesy of CHRYSLER GROUP, LLC

6. Using tool (special tool #C-637, Slide Hammer, Universal) (1) and (special tool #7794-A, Remover, Seal) (1), remove the dog F-clutch thrust plate (3) from the output gear support hub.

Fig. 464: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable screw driver, remove the snap-ring holding the dog F-clutch plug and piston in the output gear support hub.

Fig. 465: Removing Dog F-Clutch From Output Gear Support Hub
Courtesy of CHRYSLER GROUP, LLC

8. Using tool (special tool #C-637, Slide Hammer, Universal) (1) and (special tool #7794-A, Remover, Seal) (2), remove the dog F-clutch (3) from the output gear support hub (4).
9. Remove the dog F-clutch plug from the dog F-clutch piston.

Fig. 466: Dog F-Clutch Plug & Inside O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

10. Remove the O-ring seal from the inside of the dog F-clutch plug.

Fig. 467: Dog F-Clutch Piston & Inside O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

11. Remove the outer O-ring seal from the dog F-clutch piston.

Fig. 468: Dog F-Clutch Piston & Inner O-Ring Seal

12. Remove the inner O-ring seal from the dog F-clutch piston.

Fig. 469: Output Gear Support Hub & Upper O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

13. Remove the upper O-ring seal from the land inside the output gear support hub.

ASSEMBLY

DOG F-CLUTCH ASSEMBLY

Clean the dog F-clutch components with solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Inspect the dog F-clutch components for damage or excessive wear. If dog F-clutch components are damaged the entire output gear support assembly will require replacement. Only the O-ring seals can be replaced. Apply assembly lubricant to the O-ring seals to aid installation.

Fig. 470: Installing A New Upper O-Ring Seal To Inside Land Of Output Gear Support Hub
Courtesy of CHRYSLER GROUP, LLC

1. Install a new upper O-ring seal (1) into the land inside the output gear support (2) hub.

Fig. 471: Installing New Inner O-Ring Seal Into The Dog F-Clutch Piston

9. Install the snap-ring (1) to hold the dog F-clutch plug and piston in the output gear support hub (2).

Fig. 479: Placing Dog F-Clutch Thrust Plate In Position On Output Gear Support Hub
Courtesy of CHRYSLER GROUP, LLC

10. Place the dog F-clutch thrust plate (1) in position on the output gear support (2) hub.

Fig. 480: Installing Dog F-Clutch Thrust Plate Into Output Gear Support Hub
Courtesy of CHRYSLER GROUP, LLC

11. Using tools (special tool #8148, Cup) (2) and (special tool #C-4171, Driver Handle, Universal) (1), install the dog F-clutch thrust plate into the output gear support (3) hub.

Fig. 481: Removing/Installing Output Gear
Courtesy of CHRYSLER GROUP, LLC

12. Install the output gear (1) onto the output gear support (2).

Fig. 482: Removing/Installing Lock Plate
Courtesy of CHRYSLER GROUP, LLC

13. Align the tab (3) on the lock plate (1) with the notch (4) on the output gear support hub and install the lock plate (3) onto the output gear (2) support.

Fig. 483: Removing/Installing Stake Nut
Courtesy of CHRYSLER GROUP, LLC

14. Using tool (special tool #2012900210, Wrench, Spanner), install the stake nut (2) to hold the output gear and bearing to the output gear support hub. Refer to **SPECIFICATIONS**.

Fig. 484: Locking Plate

Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable punch, stake (1) the locking plate inward to lock the stake nut in position.
16. Install the output gear support in the transaxle.

DIFFERENTIAL AND RING GEAR

DISASSEMBLY

2WD

NOTE: The differential unit can be placed on tool (special tool #6888, Installer, Seal) as a stable holding fixture.

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place the transmission on a suitable clean work surface.
3. Position a suitable drain pan under the transmission drain plug.
4. Remove the drain plug and allow the fluid to drain into the drain pan.
5. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 485: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Separate the differential unit (1) from the transmission.

Fig. 486: View Of Ring Gear To Differential Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the ring gear (1) to the differential unit.

Fig. 487: View Of Ring Gear & Differential Unit
Courtesy of CHRYSLER GROUP, LLC

8. Separate the ring gear (1) from the differential unit (2).

Fig. 488: View Of Upper Half Housing & Lower Differential Housing

Courtesy of CHRYSLER GROUP, LLC

12. Slide the pinion shaft (4) outward and remove the conical thrust washer (1) from behind the pinion gear (2).

Fig. 492: Removing/Installing Pinion Gear 1
Courtesy of CHRYSLER GROUP, LLC

13. Slide the pinion shaft (2) outward and remove the pinion gear 1 (1).

Fig. 493: Removing/Installing Pinion Shaft & Pinion Gear 2
Courtesy of CHRYSLER GROUP, LLC

14. Slide the pinion shaft (2) outward and remove the pinion gear 2 (1).

Fig. 494: Removing/Installing Pinion Shaft & Conical Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

15. Slide the pinion shaft (2) outward and remove the conical thrust washer (1) from behind the pinion gear 2.
16. Remove the pinion shaft (2) from the differential housing.

Fig. 495: Removing/Installing Differential Side Gear & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

17. Remove the differential side gear (1) and thrust washer (2) from the differential housing (3).

4WD

NOTE: There are no differential gears in the carrier housing of the 948TE Four Wheel Drive version transmission. The 2 speed PTU is equipped with a differential for the front wheels.

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place the transmission on a suitable clean work surface.
3. Position a suitable drain pan under the transmission drain plug.
4. Remove the drain plug and allow the fluid to drain into the drain pan.

2101009395

Fig. 496: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

5. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), remove the differential adapter sleeve.
6. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Courtesy of CHRYSLER GROUP, LLC

16. Install the differential adapter sleeve (1).
17. Install the transmission in the vehicle. Refer to **INSTALLATION**.
18. Road test the vehicle to verify the repair.

FLUID AND FILTER

STANDARD PROCEDURE

FLUID LEVEL CHECK

2.4L

NOTE: It is not necessary to check the fluid level in the 948TE automatic transmission unless there are shifting issues and/or has evidence of a transmission fluid leak.

NOTE: Special Tool (special tool #10323A, Dipstick) Fluid level Indicator and a Scan-tool are required to accurately measure the fluid level (4) in the 948TE automatic transmission.

Checking the fluid level in the 948TE automatic transmission is to measure the distance from the upper lip of the fluid level check port, located on top of the transmission housing above the differential, down to the surface of the fluid. Tool 10323A fluid level indicator is marked in 5 mm increments with the base of the handle at 140 mm and the lower tip at "0". The engine must be running at idle with the transmission in park and the vehicle in a level position.

1. Connect a Scan Tool to the Diagnostic Connector under the instrument panel on the driver's side of the vehicle.
2. Navigate to a screen to display transmission fluid temperature.
3. Start the engine and allow it to run at idle with the transmission in Park.
4. Verify that the fluid temperature is above 50 °C.

NOTE: **Vehicle must be level for accurate transmission fluid level readings.**

5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the left front tire and wheel assembly.
7. Turn the steering wheel to the full left position.

Fig. 563: Fluid Level Check Port
Courtesy of CHRYSLER GROUP, LLC

8. Remove the plug from the fluid level check port.

Fig. 564: Checking Trans Fluid Level Using Dipstick Special Tool
Courtesy of CHRYSLER GROUP, LLC

9. Insert tool (special tool #10323A, Dipstick) (1) into the fluid level check port and allow the handle of the tool to rest on the flat surface of the transmission housing (2) around the check port.
10. Remove the tool from the check port, keeping the handle above the tip so the level reading remains accurate.
11. Note the increment on the shaft of the tool where the fluid left a witness mark.

2101004346

Fig. 565: Fluid Level & Temperature Chart
Courtesy of CHRYSLER GROUP, LLC

12. Based on the temperature of the fluid and the measurement on the tool, refer to the graph or the table to determine the proper level.
13. Install the plug into the fluid level check port. Tighten to specification.
14. Install the left front tire and wheel assembly. Refer to **INSTALLATION**.

FLUID LEVEL TABLE

TEMP in °C	MIN LEVEL (mm)	NOMINAL LEVEL (mm)	MAX LEVEL (mm)
50°	21 mm	26 mm	31.5 mm
55°	23 mm	27.5 mm	33 mm
60°	25 mm	30 mm	34 mm
65°	27 mm	31 mm	35.5 mm
70°	28.5 mm	33 mm	36.5 mm
75°	30 mm	35 mm	38 mm
80°	31.5 mm	36 mm	39 mm
85°	32.5 mm	37 mm	40 mm
90°	34 mm	38 mm	41.5 mm

FLUID LEVEL CHECK

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
 then type "A00641450.vid1" into the "Search Channel" box.

NOTE: It is not necessary to check the fluid level in the 948TE automatic transmission unless there are shifting issues and/or has evidence of a transmission fluid leak.

NOTE: Special Tool (special tool #10323A, Dipstick) Fluid level Indicator and a Scan-tool are required to accurately measure the fluid level (4) in the 948TE automatic transmission.

Checking the fluid level in the 948TE automatic transmission is to measure the distance from the upper lip of the fluid level check port, located on top of the transmission housing above the differential, down to the surface of the fluid. Tool 10323A fluid level indicator is marked in 5 mm increments with the base of the handle at 140 mm and the lower tip at "0". The engine must be running at idle with the transmission in park and the vehicle in a level position.

1. Connect a Scan Tool to the Diagnostic Connector under the instrument panel on the driver's side of the vehicle.
2. Navigate to a screen to display transmission fluid temperature.
3. Start the engine and allow it to run at idle with the transmission in Park.

4. Verify that the fluid temperature is above 50 °C.
5. Remove the engine cover.

85°	32.5 mm	37 mm	40 mm
90°	34 mm	38 mm	41.5 mm

FLUID AND FILTER SERVICE

The 948TE automatic transmission is a sealed for life design and does not require periodic service. The only time the transmission fluid needs to be checked is when abnormal shifts frequently occur or evidence of a transmission fluid leak is present. The fluid filter is mounted internally and requires that the transmission be removed from the vehicle and disassembled to replace the filter. The fluid filter has a plastic body filled with polyester filter fleece.

NOTE: The fluid used in the 948TE automatic transmission is not compatible with other types of transmission fluid, use only Shell® L12108 Automatic Transmission Fluid or Mopar® equivalent after repairs have been completed. Refer to Star Parts for the part number.

Use of improper fluid will cause premature failure, poor shift quality and possible leaks.

REMOVAL

REMOVAL

NOTE: The fluid filter does not require periodic replacement. It should only be replaced in conjunction with a major failure that caused excessive fluid contamination or during an overhaul.

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 569: Fluid Tube

Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the intermediate support plate and bellhousing.

Fig. 570: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (2) holding the oil filter (1) to the intermediate support plate.

Fig. 571: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the intermediate support plate (2).

INSTALLATION

INSTALLATION

1. Clean the intermediate support plate in preparation for the NEW filter.

Fig. 572: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

2. Verify that the O-ring (3) is in good condition. Replace the O-ring (3) if damage is present.
3. Insert the oil filter neck (3) into the oil pump orifice and align the bolt hole with the bore in the intermediate support plate (2).

Fig. 573: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolt (2) to hold the oil filter (1) to the intermediate support plate and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
5. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
6. Install the transmission in the vehicle. Refer to **INSTALLATION**.
7. Road test the vehicle to verify the repair.

MANUAL LEVER AND PARK ROD

REMOVAL

PARK DETENT AND MANUAL SHAFT

The transmission does not require removal to complete the following procedure.

1. Remove the valve body from the transmission. Refer to **VALVE BODY, REMOVAL**.

Fig. 574: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.
3. Remove the nut holding the manual shift lever to the manual shaft.
4. Pry the manual shift lever upward and off the manual shaft.

Fig. 575: Prying Spring Over Top Of Detent
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable screw driver (3), pry the spring (1) to the inside and off of the detent (2).

Fig. 576: Removing/Installing Detent Hub Roll Pin
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable hammer (3) and pin-punch (2), drive the roll-pin out of the detent hub (1).

Fig. 577: Removing/Installing Manual Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable pliers (3), pull the manual shaft (2) out of the detent hub (1) and transmission housing.

Fig. 578: Park Rod, Park Rod Guide And Detent
Courtesy of CHRYSLER GROUP, LLC

8. Separate the detent (2) and park rod (1) from the transmission.

INSTALLATION

PARK DETENT AND MANUAL SHAFT

Fig. 579: Park Rod, Park Rod Guide And Detent
Courtesy of CHRYSLER GROUP, LLC

1. Insert the and park rod (1) into the Park rod guide and the detent (2) into the transmission.

Fig. 580: Removing/Installing Manual Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Insert the manual shaft (2) into the detent hub (1) and transmission housing and align the holes in the detent hub and the manual shaft.

Fig. 581: Detent Hub Roll-Pin
Courtesy of CHRYSLER GROUP, LLC

3. Insert the tapered end of the roll-pin into the hole in the detent hub.

Fig. 582: Removing/Installing Detent Hub Roll Pin
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable hammer (3) and pin-punch (2), drive the roll-pin into of the detent hub (1) until the head is flush.

Fig. 583: Prying Spring Over Top Of Detent
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable screw driver (3), pry the spring (1) over the top of the detent (2).
6. Place the manual lever in position on the manual shift lever.
7. Install the nut to hold the manual shift lever to the manual shaft to the manual shaft. Refer to **SPECIFICATIONS**.
8. Snap the shift cable end onto the ball link on the manual shift lever.
9. Install the valve body into the transmission. Refer to **VALVE BODY, INSTALLATION**.

NEEDLE BEARING, OIL PUMP SPROCKET

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 584: Fluid Tube

Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the bellhousing.

Fig. 585: Oil Filter, Intermediate Support Plate & Fastener

Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (1) holding the oil filter (2) to the bellhousing.

Fig. 586: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the bellhousing (2).

Fig. 587: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the reaction shaft (1) to the intermediate support plate (4).

Fig. 588: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

8. Separate the reaction shaft (2) from the intermediate support plate (1).

Fig. 589: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (3) holding the intermediate support plate and oil pump (1) to the bellhousing.

Fig. 590: Removing/Installing Intermediate Support Plate And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Separate the intermediate support plate and oil pump (1) from the bellhousing (3).
11. Using a suitable screw driver, remove the input shaft seal from the bellhousing.

Fig. 591: View Of Snap-Ring Holding Oil Pump Sprocket Needle Bearing In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

12. Using a suitable screw driver (2), remove the snap-ring (1) holding the oil pump sprocket needle bearing (3) in the bellhousing.

Fig. 592: Removing Oil Pump Sprocket Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

13. Using a suitable punch tool, remove the oil pump sprocket needle bearing by tapping outward while alternating between the three notches in the bellhousing bore flange.

INSTALLATION

INSTALLATION

1. Clean the oil pump sprocket needle bearing and input shaft seal bore.

Fig. 593: Installing Oil Pump Sprocket Needle Bearing Into Bellhousing

Courtesy of CHRYSLER GROUP, LLC

2. Place the oil pump sprocket needle bearing (1) in position into the bore in the center of the bellhousing.

Fig. 594: Seating Oil Pump Sprocket Needle Bearing Against Flange
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #10503, Installer, Bearing) (3) and (special tool #C-4171, Driver Handle, Universal), install the oil pump sprocket needle bearing (2) in the bellhousing (1) bore until the bearing butts against the flange.

Fig. 595: View Of Snap-Ring Holding Oil Pump Sprocket Needle Bearing In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

4. Install the snap-ring (1) to hold the oil pump sprocket needle bearing (3) in the bellhousing.
5. Apply assembly lube on the lip of the NEW seal.
6. Place the seal on tool (special tool #9677, Installer, Seal), with the tension spring away from the tool, and insert the seal into the bore in the bellhousing.

Fig. 596: Installing Seal Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable hammer, drive the seal into the bore in the center of the bellhousing until the tool seats against the bellhousing.

Fig. 597: Removing/Installing Intermediate Support Plate And Oil Pump

Courtesy of CHRYSLER GROUP, LLC

8. Place the intermediate support plate and oil pump (1) in position on the bellhousing (3) while guiding the oil pump sprocket into oil pump sprocket needle bearing.

Fig. 598: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 599: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

10. Place the reaction shaft (2) in position on the intermediate support plate (1).

Fig. 600: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 601: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

12. Place the oil filter (1) in position on the bellhousing (2) and insert feed tube into the oil pump.

Fig. 602: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

13. Install the bolt (1) to hold the oil filter (2) to the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 603: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

14. Install the fluid tube (1) in the bellhousing.
15. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
16. Install the transmission in the vehicle. Refer to **INSTALLATION**.

17. Road test the vehicle to verify the repair.

PARKING SPRAG AND GUIDE

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Position the transmission on the clean, stable work surface.
3. Remove the bellhousing from the transmission housing. Refer to **BELLHOUSING, REMOVAL**.

Fig. 604: Removing/Installing Park Pawl
Courtesy of CHRYSLER GROUP, LLC

4. Compress and release the park pawl (2) return spring (3).
5. Pull the reaction pin (1) outward and separate the reaction pin (1) from the park pawl (2).
6. Separate the park pawl (2) from the park rod guide.

Fig. 605: Removing/Installing Park Rod Guide Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolt (2) holding the park rod guide (1) to the transmission housing.

Fig. 606: Removing/Installing Park Rod Guide
Courtesy of CHRYSLER GROUP, LLC

8. Separate the park rod guide (1) from the transmission.

INSTALLATION

PARK ROD GUIDE AND PAWL

NOTE: If the park pawl is damaged the transfer gear may also be damaged. Replace the transfer gear if damage is present. If the transfer gear is replaced the proper thickness bearing preload select shim will have to be established.

Fig. 607: Removing/Installing Park Rod Guide
Courtesy of CHRYSLER GROUP, LLC

1. Place the park rod guide (1) in position on the transmission.

Fig. 608: Removing/Installing Park Rod Guide Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Install the bolt (2) to hold the park rod guide (1) to the transmission housing and tighten to the proper

specifications. Refer to **SPECIFICATIONS**.

Fig. 609: Removing/Installing Park Pawl
Courtesy of CHRYSLER GROUP, LLC

3. Place the park pawl (2) in position in park rod guide.
4. Insert the reaction pin (1) through the park pawl (2) and into the transmission housing.
5. Slide the park pawl return spring (3) over the reaction pin (1) and insert the tail of the spring into the notch in the transmission housing.
6. Wind the park pawl return spring (3) counterclockwise and hook the bent end of the spring over the park pawl (2).
7. Install the bellhousing into the transmission housing. Refer to **BELLHOUSING, INSTALLATION**.
8. Install the torque converter.
9. Install the transmission into the vehicle. Refer to **INSTALLATION**.
10. Road test the vehicle to verify the repair.

PUMP, FLUID

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 610: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the intermediate support plate and bellhousing.

Fig. 611: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (2) holding the oil filter (1) to the intermediate support plate.

Fig. 612: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the intermediate support plate (2).

Fig. 613: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the reaction shaft (1) to the intermediate support plate (4).

Fig. 614: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

8. Separate the reaction shaft (2) from the intermediate support plate (1).

Fig. 615: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (3) holding the intermediate support plate and oil pump (1) to the bellhousing.

Fig. 616: Removing/Installing Intermediate Support Plate And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Separate the intermediate support plate and oil pump (1) from the bellhousing (3).
11. Turn the intermediate support plate and oil pump (1) outside up on the work surface.

Fig. 617: View Of Oil Pump Drive Sprocket & Drive Chain
Courtesy of CHRYSLER GROUP, LLC

12. Separate the oil pump drive sprocket (1) from the drive chain (2).

Fig. 618: View Of Oil Pump Drive Chain & Oil Pump Driven Sprocket
Courtesy of CHRYSLER GROUP, LLC

13. Separate the oil pump drive chain (3) from the oil pump driven sprocket (2).

Fig. 619: Compressing Snap-Ring At Oil Pump
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable pliers (1), compress the snap-ring holding the oil pump (2) into the intermediate support plate (3).
15. While holding compression on the snap-ring (1), pry the oil pump out of the bore in the intermediate support plate (3).

Fig. 620: Removing/Installing Oil Pump At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

16. Separate the oil pump (1) from the intermediate support plate (2).

INSTALLATION

INSTALLATION

1. Clean the intermediate support plate and oil pump with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air.
2. Inspect the intermediate support plate and oil pump for apparent damage or wear. If the intermediate support plate is damaged, the transmission will require replacement. If the oil pump is damaged, replace the oil pump.

Fig. 621: Removing/Installing Oil Pump At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

3. Insert the oil pump (1) into the intermediate support plate (2). Align the tabs on the pump with the notches on the intermediate support plate.

Fig. 622: Compressing Snap-Ring At Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable pliers (1), compress the snap-ring to hold the oil pump (2) into the intermediate support plate (3).
5. While holding compression on the snap-ring (1), tap the oil pump into the bore in the intermediate support plate (3) until it seats.

Fig. 623: View Of Oil Pump Drive Chain & Oil Pump Driven Sprocket
Courtesy of CHRYSLER GROUP, LLC

6. install the oil pump drive chain (3) onto the oil pump driven sprocket (2).

Fig. 624: View Of Oil Pump Drive Sprocket & Drive Chain
Courtesy of CHRYSLER GROUP, LLC

7. Install the oil pump drive sprocket (1) onto the drive chain (2).
8. While holding the chain on the drive sprocket, turn the intermediate support plate and oil pump (1) inside up on the work surface.

Fig. 625: Removing/Installing Intermediate Support Plate And Oil Pump
 Courtesy of CHRYSLER GROUP, LLC

9. Place the intermediate support plate and oil pump (1) in position on the bellhousing (3).
10. Insert the oil pump drive sprocket into the oil pump sprocket needle bearing.

Fig. 626: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
 Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (3) to hold the intermediate support plate and oil pump (1) to the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 627: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

12. Place the reaction shaft (2) into the intermediate support plate (1).

Fig. 628: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

13. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 629: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

14. Insert the oil filter neck (3) into the oil pump orifice and align the bolt hole with the bore in the intermediate support plate (2).

Fig. 630: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

15. Install the bolt (2) to hold the oil filter (1) to the intermediate support plate and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 631: Fluid Tube

Courtesy of CHRYSLER GROUP, LLC

16. Replace the O-ring seals (2) on the fluid tube (1).
17. Install the fluid tube (1) into the bellhousing and intermediate support plate.
18. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
19. Install the transmission in the vehicle. Refer to **INSTALLATION**.
20. Road test the vehicle to verify the repair.

SENSOR, FLUID PRESSURE

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Turn the valve body over to gain access to the pressure sensor.

Fig. 632: Fluid Pressure Sensor Wire Connector
Courtesy of CHRYSLER GROUP, LLC

4. Release the lock on the pressure sensor wire connector.
5. Pull the wire connector from the pressure sensor.

Fig. 633: Loosening/Tightening Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable wrench, loosen the pressure sensor.

Fig. 634: Removing/Installing Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Remove the pressure sensor from the valve body.

INSTALLATION

INSTALLATION

1. Remove the old O-ring from the pressure sensor if the old pressure sensor is reused.

Fig. 635: Fluid Pressure Sensor & O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install a NEW O-ring (2) on the pressure sensor (1).

Fig. 636: Removing/Installing Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Thread the pressure sensor (1) into the valve body.

Fig. 637: Loosening/Tightening Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable wrench, tighten the pressure sensor (1).

Fig. 638: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Push the pressure sensor wire connector (2) into the pressure sensor (1).
6. The lock on the pressure sensor wire connector will click when fully engaged.
7. Turn the valve body over into position on transmission.
8. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
9. Road test the vehicle to verify the repair.

SEAL, AXLE

REMOVAL

FWD BOTH SIDES - AWD AND 4WD LEFT SIDE

1. Remove the halfshaft from the vehicle. Refer to **REMOVAL** .

Fig. 639: Punching Hole In Differential Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Keep the punch tool in the center of the seal to avoid damage to the transmission housing.

2. Using a suitable punch tool and hammer, punch a hole in the metal armature inside the seal.

Fig. 640: Slide Hammer & Differential Seal
Courtesy of CHRYSLER GROUP, LLC

3. Use a suitable Slide Hammer Dent Puller (2), to remove the seal (1).

4. Thread the sheet metal screw of the dent puller into the punched hole in the seal.
5. Tap outward on the slide hammer until the seal comes out of the seal bore.

RIGHT SIDE - 4WD

NOTE: The 948TE automatic transmission configured for Four Wheel Drive (4WD) utilizes an adapter sleeve to couple the Power Transfer Unit (PTU) to the differential. Lip seals are used to seal the inner and outer surfaces of the adapter sleeve.

1. Remove the Power Transfer Unit (PTU). Refer to **REMOVAL** .

2101009395

Fig. 641: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), Remove the adapter sleeve from the transmission.

Fig. 642: Removing Seal From Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the seal from the transmission.

Fig. 643: View of Adapter Sleeve Seal Tension Spring
Courtesy of CHRYSLER GROUP, LLC

4. Position the adapter sleeve on the work surface with the seal tension spring down.

Fig. 644: Removing Seal From Inside Of Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

5. Insert tool (special tool #9611, Plug, Differential End) (2) into the outer end of the adapter sleeve (3).
6. Using a suitable hammer (1), drive the seal from the inside of the adapter sleeve (3).

RIGHT SIDE - AWD

Fig. 645: All Wheel Drive (AWD) Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: The 948TE automatic transmission configured for All Wheel Drive (AWD) utilizes an adapter sleeve (1) to couple the Power Transfer Unit (PTU) to the differential.

Lip seals are used to seal the inner and outer surfaces of the adapter sleeve.

1. Remove the PTU from the vehicle. Refer to **REMOVAL** .

2101009395

Fig. 646: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), Remove the adapter sleeve from the transmission.

2101009385

Fig. 647: Removing Seal From Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the seal from the transmission.

Fig. 648: View of Adapter Sleeve Seal Tension Spring
Courtesy of CHRYSLER GROUP, LLC

4. Position the adapter sleeve on the work surface with the seal tension spring down.

Fig. 649: PTU Side Of Adapter Sleeve And Special Tool
Courtesy of CHRYSLER GROUP, LLC

5. Insert tool (special tool #9676, Adapter Plug) (1) into the outer, PTU side of the adapter sleeve (2).

Fig. 650: Removing Seal From Inside Of Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable hammer (1), drive the seal from the inside of the adapter sleeve (3).

INSTALLATION

FWD BOTH SIDES - AWD AND 4WD LEFT SIDE

NOTE: Clean the seal bore in the transmission housing with a clean lint-free cloth.

1. Apply assembly lube on the lip of the NEW seal to avoid damage after installation.

Fig. 651: Inserting Seal Into Transmission Bore

Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10506, Installer, Oil Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (1) with the seal (3) positioned on the installer, insert the seal in the transmission bore around the output shaft.

Fig. 652: Installing Seal Into Transmission

Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable hammer, drive the seal into the transmission until it is seated.
4. Install the Left Hand (LH) halfshaft. Refer to **INSTALLATION**.
5. Verify that the transmission fluid is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

RIGHT SIDE - 4WD

NOTE: Clean the adapter sleeve with suitable solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

1. Apply assembly lube on the inner seal lip to avoid damaging the seal after installation.
2. Place the adapter sleeve on a suitable work surface with the transmission side up.

Fig. 653: Inserting Lip Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Insert the **NEW** lip seal (1) into the adapter sleeve (2), (AWD Shown in illustration) with the tension spring up.

Fig. 654: Installing Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #9611, Plug, Differential End) (2) and a hammer (1), install the seal in the adapter sleeve (3).

Fig. 655: Inserting Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

5. Apply assembly lube on the outer seal (1) lip to avoid damaging the seal after installation.
6. Insert the **NEW** lip seal (1) into the transmission (2).

Fig. 656: Installing Outer Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using tool (special tool #C-3972-A, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal) (2) and a hammer (1), Install the outer lip seal in the transmission.
8. Install the Power Transfer Unit (PTU) into the vehicle. Refer to **INSTALLATION** .

9. Verify that the transmission fluid level is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

RIGHT SIDE - AWD

NOTE: Clean the adapter sleeve with suitable solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

1. Apply assembly lube on the inner seal lip to avoid damaging the seal after installation.
2. Place the adapter sleeve on a suitable work surface with the transmission side up.

Fig. 657: Inserting Lip Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Insert the NEW lip seal (1) into the adapter sleeve (2) with the tension spring up.

Fig. 658: Installing Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #8840, Installer, Oil Slinger) (2) and a hammer (1), install the seal in the adapter sleeve (3).

Fig. 659: Inserting Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

5. Apply assembly lube on the outer seal (1) lip to avoid damaging the seal after installation.
6. Insert the NEW lip seal (1) into the transmission (2).

Fig. 660: Installing Outer Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using tool (special tool #C-3972-A, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal) (2) and a hammer (1), Install the outer lip seal in the transmission.
8. Install the Power Transfer Unit (PTU) into the vehicle. Refer to **INSTALLATION**.
9. Verify that the transmission fluid level is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

SEAL, INPUT SHAFT

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle, Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the torque converter from the transmission.
4. Using a suitable punch tool, pierce a 3 mm (0.125 in.) hole in the center of the seals front surface through the metal armature.

Fig. 661: Removing Seal From Center Of Bellhousing
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable dent puller (2) threaded into the hole in the seal (1), remove the seal (1) from the bore in the center of the bellhousing.

INSTALLATION

INSTALLATION

1. Clean the seal bore in the center of the bellhousing.
2. Apply assembly lube on the lip of the NEW seal.
3. Place the seal on tool (special tool #9677, Installer, Seal), with the tension spring away from the tool, and insert the seal into the bore in the bellhousing.

Fig. 662: Installing Seal Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable hammer, drive the seal into the bore in the center of the bellhousing until the tool seats against the bellhousing.
5. Install the torque converter.
6. Install the transmission in the vehicle. Refer to **INSTALLATION**.
7. Fill the transmission to the proper level. Refer to **STANDARD PROCEDURES**.
8. Road test the vehicle to verify the repair.

SENSORS, SPEED

REMOVAL

REMOVAL

The speed sensors can be replaced with the transmission in the vehicle.

1. Position the vehicle on a suitable hoist with the transmission in neutral.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 663: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw (1) holding the speed sensors to the transmission housing.

Fig. 664: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Separate the speed sensor (1) from the transmission.
5. Release the lock on the wire connector.
6. Separate the wire connector from the speed sensor.

INSTALLATION

INSTALLATION

1. Insert the wire connector into the speed sensor.
2. Engage the lock on the wire connector.

Fig. 665: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Insert the speed sensor (1) into the transmission housing.

Fig. 666: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the screw (1) to hold the speed sensors to the transmission housing.
5. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
6. Road test the vehicle to verify repair.

SENSOR, TRANSAXLE RANGE

REMOVAL

REMOVAL

The Transmission Range Sensor (TRS) can be replaced with the transmission in the vehicle

1. Position the vehicle on a suitable hoist with the transmission in neutral.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 667: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw (1) holding the TRS to the transmission housing.

Fig. 668: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Separate the TRS (1) from the transmission.
5. Release the lock on the wire connector.
6. Separate the wire connector from the TRS.

INSTALLATION

INSTALLATION

1. Insert the wire connector into the Transmission Range Sensor (TRS).
2. Engage the lock on the wire connector.

Fig. 669: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Insert the TRS (1) into the transmission housing.

Fig. 670: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the screw (1) to hold the TRS to the transmission housing.
5. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
6. Road test the vehicle to verify repair.

SHAFT, REACTION

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.
