6. Remove the seal rings (1) from the ring lands in the inner reaction shaft hub (2).

Fig. 674: Removing/Installing Seal Ring At Ring Land In Outer Reaction Shaft Hub
Courtesy of CHRYSLER GROUP, LLC

7. Remove the seal ring (1) from the ring land in the outer reaction shaft hub (2).

INSTALLATION

INSTALLATION

1. Clean the reaction shaft with suitable solvent and blow it dry using regulated 344 kPa (50 psi) shop air.
2. Inspect the reaction shaft for excess damage or ware. Replace the reaction shaft if damage is present.

Fig. 675: Removing/Installing Seal Ring At Ring Land In Outer Reaction Shaft Hub

Courtesy of CHRYSLER GROUP, LLC

3. Install a New seal ring (1) in the land of the outer reaction shaft hub (2).

Fig. 676: Removing/Installing Seal Rings At Ring Land In Inner Reaction Shaft Hub

4. Install New seal rings (1) in the lands of the inner reaction shaft hub (2).

Fig. 677: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

5. Place the reaction shaft (2) into the intermediate support plate (1).

Fig. 678: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

6. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4). Refer to **SPECIFICATIONS**.
7. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
8. Install the transmission in the vehicle. Refer to **INSTALLATION**.
9. Fill the transmission to the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

SHIFTER, FLOOR CONSOLE

REMOVAL

REMOVAL

1. Disconnect the battery negative cable.
2. Remove the center floor console

Refer to **CONSOLE, FLOOR, REMOVAL** .

210171835

Fig. 679: PRND Wire Connector & Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Release the wire connector lock and disconnect the PRND wire connector from the shifter assembly.

210171740

Fig. 680: Shifter Assembly & Gear Shift Cable End
Courtesy of CHRYSLER GROUP, LLC

4. Pry the gear shift cable end (2) from the pin under the shifter assembly (3).
5. Release the shift cable housing retainer and disengage the cable from the shifter assembly.

210171836

Fig. 681: Gear Shifter**Courtesy of CHRYSLER GROUP, LLC**

6. Remove the nuts holding the gear shifter to the floor.
7. Separate the gear shifter from the vehicle.

INSTALLATION

INSTALLATION

1. Place the gear shifter in position on the floor pan.

210171836

Fig. 682: Gear Shifter**Courtesy of CHRYSLER GROUP, LLC**

2. Install nuts to hold the gear shifter assembly (1) to the floor pan.
3. Insert the shift cable into the access hole on the front of the shifter and lock the retainer into the shifter.

210171740

Fig. 683: Shifter Assembly & Gear Shift Cable End

Courtesy of CHRYSLER GROUP, LLC

4. Push the gear shift cable end (2) onto the pin under the shifter assembly (3).

210171835

Fig. 684: PRND Wire Connector & Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Connect the PRND wire connector into the shifter assembly connector.
6. Install the center floor console

Refer to **CONSOLE, FLOOR, INSTALLATION** .

7. Connect the battery negative cable.

TUBE, OIL

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the left front wheel and tire. Refer to **REMOVAL** .

Fig. 685: Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil supply tube bolts (1, 3).
4. Remove the oil supply tube (1) from the transmission.

INSTALLATION

INSTALLATION

Fig. 686: O-Ring Seal Near Differential End For Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

1. Replace the O-ring seal (1) near the differential end for the oil supply tube.

Fig. 687: O-Ring Seal Near Transmission For Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

2. Replace the O-ring seal (1) near the end of the transmission for the oil supply tube.

Fig. 688: Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil supply tube (2) onto transmission.
4. Install the oil supply tube fasteners (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

5. Install the left front wheel and tire. Refer to **INSTALLATION**.
6. Fill the transaxle to the proper level with the correct fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL**.
4. Remove the drain plug and allow the fluid to drain from the transmission.
5. Install the drain plug.

Fig. 689: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the lock lever (2) counterclockwise on the transmission solenoid connector.
7. Disengage the wire connector from the socket on the transmission pan.

Fig. 690: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

8. Using a suitable pry tool, remove the clip (2) holding the wire connector socket (1) in the valve body cover.
9. Press the wire connector socket inside the valve body cover.

Fig. 691: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the bolts (1) holding the valve body cover to the transmission.
11. Remove the valve body cover from the transmission housing.

Fig. 692: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the larger (T45) bolts (1) holding the valve body to the transmission housing.
13. Using a suitable prying tool, separate the valve body from the fluid transfer adapter tubes.
14. Turn the valve body over to gain access to wire harness connectors.

Fig. 693: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

15. Release the lock (2) on the fluid pressure transducer wire connector.
16. Separate the wire connector from the fluid pressure transducer (1).

Fig. 694: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

17. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
18. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
19. Separate the valve body from the vehicle.

NOTE: **If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.**

DISASSEMBLY

DISASSEMBLY

Remove the valve body from the transmission and place the valve body on a clean oil absorbent work surface. Position wood blocks at each end of the valve body to provide a stable work fixture.

Fig. 695: View Of Valve Body & Solenoids
Courtesy of CHRYSLER GROUP, LLC

1. Remove the solenoids (2 - 5) from the valve body (1).

NOTE: Each type solenoid has a unique color end cover.

20. The support plates (3) and spring clip (6) are located in pockets (8) in the outer valve body (1).
21. Remove the support plate (3) holding the spring and converter pressure valve (2) in the bore in the outer valve body (1).
22. Remove the spring and converter pressure valve (2) from the bore in the outer valve body (1).
23. Remove the support plate (3) holding the plug (5), spring and system pressure valve (7) in the bore in the outer valve body (1).

24. Remove the plug (5), spring and system pressure valve (7) from the bore in the outer valve body (1).
25. Remove the spring clip (6) holding the plug (5), spring and lubrication valve (4) in the bore in the outer valve body (1).
26. Remove the plug (5), spring and lubrication valve (4) from the bore in the outer valve body (1).

Fig. 704: Inner Valve Body With The Valves Bores Facing Up
 Courtesy of CHRYSLER GROUP, LLC

27. Place the inner valve body on the clean work surface with the valves bores facing up.

NOTE: The spring clips holding (2) the plugs (1) in the inner valve are located in pockets (2) on the separator plate side of the inner valve body.

28. Press each of the valve plugs (1) downward and remove the spring clips (2) holding the valves in the bores in the inner valve body.

Fig. 705: Inner Valve Body Components
 Courtesy of CHRYSLER GROUP, LLC

29. Remove the plug (2), spring and boost valve (1) from the bore in the inner valve body (6).
30. Remove the plug (2), spring and solenoid limit valve (4) from the bore in the inner valve body (6).
31. Remove the plugs (2), springs and PCV valves (5) from the bores in the inner valve body (6).
32. Perform the cleaning and inspection procedures.

INSPECTION

VALVE BODY CLEANING AND INSPECTION

Clean the valve body components with a suitable clean solvent. The valve body components can be blown dry with compressed regulated 344 kPa (50 psi) shop air.

Inspect the valve components and bores for excessive scoring, porosity, warping or other damage that may cause the valves to bind or leak excessively. If damage is evident the complete valve body must be replaced.

ASSEMBLY

ASSEMBLY

Before assembling the valve body, thoroughly clean all of the components with a suitable solvent and blow them dry with 344 kPa (50 psi) **regulated** shop air. Clean the work surface and lay out a clean lint free cloth to avoid contaminating the clean valve body components. Lay the valve components out on the cloth in the order they will be installed in the valve body. The cloth will hold the valve components in place and keep them from rolling out of position. light lubricating oil can be applied to each component as the valve body is assembled.

Fig. 706: Inner Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the springs, PCV valves, and (5) plugs (2), from the bores in the inner valve body (6).
2. Install the solenoid limit valve (4), spring, and plug (2) into the bore in the inner valve body (6).
3. Install the boost valve (1), spring, and plug (2) into the bore in the inner valve body (6).

Fig. 707: Inner Valve Body With The Valves Bores Facing Up
Courtesy of CHRYSLER GROUP, LLC

4. Turn the inner valve body so the plugs (1) are facing upward
5. While pressing downward on the plugs (1), install the spring clips (2) to hold the plugs in the inner valve body.

Fig. 708: Outer Valve Body & Pressure Valve
 Courtesy of CHRYSLER GROUP, LLC

6. The support plates (3) and spring clip (6) are go into pockets (8) in the outer valve body (1).
7. Install the lubrication valve (4), spring, and plug (5) into the bore in the outer valve body (1).
8. Install the spring clip (6) to hold the plug (5), spring and lubrication valve (4) in the bore in the outer valve body (1).
9. Install the system pressure valve (7), spring, and plug (5) in the bore in the outer valve body (1).
10. Install the support plate (3) to hold the plug (5), spring and system pressure valve (7) into the bore in the outer valve body (1).
11. Install the converter pressure valve (2) and spring into the bore in the outer valve body (1).
12. Install the support plate (3) to hold the spring and converter pressure valve (2) in the bore in the outer valve body (1).

2101007414

Fig. 709: Outer Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

13. Position the outer valve body (11) on the work surface inside up to gain access to the valve retaining spring clips (12).
14. Install the MV park lock valve (9), spring, and plug into the bore in the outer valve body (11).
15. While pressing down on the plug to align the slot, install the spring clip (12) to hold the MV park lock valve and plug in the bore in the outer valve body (11).
16. Install the lubrication valves, springs (3), a plugs (5), into the bores in the outer valve body (11).
17. While pressing down on the plug to align the slot, install the spring clips (12) to hold the lubrication valve plugs in the bores in the outer valve body (11).
18. Install the parking lock valve (10) into the bore in the outer valve body (11).
19. Install the pressure regulator valves (6), sleeves (7), and bullets (8) into the bores in the outer valve body (11).
20. Install NEW O-rings (2) on the filter screen (1).
21. Install the filter screen (1) into the bore in the outer valve body (11).

Fig. 710: Inner Valve Body, Color Coded Check Valves & Check-Balls
Courtesy of CHRYSLER GROUP, LLC

22. Place the inner valve body on the work surface resting on wood blocks to elevate the center for clearance underneath.
23. Install the toggling, connected check-balls (2) into the inner valve body.
24. Install the color coded check valves (1) into the inner valve body.

Fig. 711: Inner Valve Body & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

25. With the smaller diameter end downward, install the guide pins (1) into the inner valve body.

Fig. 712: Separator Plate & Inner Valve Body
Courtesy of CHRYSLER GROUP, LLC

26. Place the separator plate (1) in position on of the inner valve body over the guide pins (2).

Fig. 713: Outer Valve Body & Separator Plate
Courtesy of CHRYSLER GROUP, LLC

27. Place the outer valve body (1) in position on the separator plate (2).

2101006815

Fig. 714: Valve Body & 2 Screws
Courtesy of CHRYSLER GROUP, LLC

28. Install two screws (1) to hold the outer valve body to the inner valve body and separator plate. Tighten the screws snug with a suitable torx-drive screw driver.

2101006817

Fig. 715: Valve Body & 12 Screws
Courtesy of CHRYSLER GROUP, LLC

29. Install the remaining screws (1) to hold the inner valve body to the outer valve body.
30. Install the pressure sensor in the valve body.

Fig. 716: View Of Valve Body & Solenoids
Courtesy of CHRYSLER GROUP, LLC

31. Install the solenoids (2 - 5) in the valve body (1).

NOTE: Each type solenoid has a unique color end cover.

- 2 = System Pressure Regulator Solenoid
- 3 = Pressure Regulator Solenoids
- 4 = Dog Clutch Solenoids
- 5 = Parking Lock Solenoid

32. Install the valve body in the transmission.
33. Finish assemble the vehicle.
34. Road test the vehicle to verify the repair.

INSTALLATION

INSTALLATION

NOTE: Before installing the valve body, replace the O-ring seals on the fluid transfer adapter tubes. Apply a light coating of assembly lube on the O-rings to ease valve body installation.

1. Clean the mating surfaces between the valve body and the transmission housing with a clean lint-free cloth.

Fig. 717: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

2. Place the valve body in position on the transmission.
3. Place the wire harness connector in position on the solenoids.
4. Press the connector inward to engage the terminals on the solenoids.
5. Install the bolts to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 718: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Insert the wire harness connector (2) into the fluid pressure transducer connector (1).
7. Press connector together until the lock engages.

Fig. 719: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

8. Turn the valve body (1) over and align the valve body (1) with the fluid transfer adapters.

Fig. 720: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

9. Guide the manual lever cam (2) into the slot (3) on the manual valve.

10. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 721: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) to hold the valve body to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 722: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

12. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.

Fig. 723: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

13. Place the valve body cover (1) in position on the transmission.
14. Insert the wire connector socket (3) into the opening on the inside of valve body cover (1) with the flat side (2) of the socket on the left.

Fig. 724: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

15. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover (1).
16. Install the clip (2) to hold the wire connector socket in the valve body cover.

Fig. 725: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

17. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover (2).

Fig. 726: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Place the valve body cover pan gasket against the sealing surface of the transmission housing.

19. Install the bolts (1) to hold the valve body cover to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 727: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

20. Engage the wire connector into the socket on the valve body cover.
21. Rotate the lock lever (1) clockwise onto the transmission solenoid connector.
22. Fill the transmission. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
23. Install the belly pan.
24. Connect the negative battery cable.
25. Perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair.
26. Perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE**.

VALVES, SOLENOID

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the valve body from the transmission. Refer to **VALVE BODY, REMOVAL**.
3. Place the valve body on a clean work surface supported on each end by wooden blocks with the outer half facing upward.

2101006810

Fig. 728: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws (1) holding the solenoid retainers to the outer valve body.

2101006811

Fig. 729: View Of Solenoid Valve Small Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Separate the small retainer (1) from the valve body.

2101006810

Fig. 730: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

6. Separate the large retainer (1) from the valve body.

2101006813

Fig. 731: Solenoid Valves & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

7. Turn the valve body over so the inner valve body (1) is on top.
8. Pull the solenoid valves (3) straight out of the outer valve body (2).

Fig. 732: Parking Lock Valve & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

9. Remove the parking lock valve (1) from the outer valve body (2).

INSTALLATION

INSTALLATION

Place the valve body on a clean work surface supported on each end by wooden blocks with the upper half facing upward.

Fig. 733: Parking Lock Valve & Outer Valve Body

Courtesy of CHRYSLER GROUP, LLC

1. Insert the parking lock valve into the bore in the outer valve body.

Fig. 734: Solenoid Valves & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

2. Insert the solenoids (3) straight into the outer valve body (2).

Fig. 735: Test Fitting Wire Connector
Courtesy of CHRYSLER GROUP, LLC

3. Test fit the wire connector (1) into the solenoid connectors (2) to assure alignment.

4. Remove the wire connector with care not to rotate the solenoids.

Fig. 736: Placing Large Retainer In Position On Valve Body
Courtesy of CHRYSLER GROUP, LLC

5. Turn the valve body over so the inner valve body (1) is on top.
6. Place the large retainer (1) in position on the valve body with the index tabs (3) on the retainer in the notches (2) on the center dog clutch solenoids.

Fig. 737: View Of Solenoid Valve Small Retainer
Courtesy of CHRYSLER GROUP, LLC

7. Place the small retainer (1) in position on the valve body.

Fig. 738: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

8. Install the screws (1) to hold the solenoid retainers to the outer valve body.
9. Install the valve body in the transmission.
10. Perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair.
11. Perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE** .

SHIFT, BRAKE INTERLOCK

DESCRIPTION

DESCRIPTION

The Brake Transmission Shift Interlock (BTSI) system prevents the driver from shifting out of Park unless the service brake pedal is actuated. The BTSI system is a "Power to Release" shift mechanism. The system is mechanically locked in Park until power is applied to the solenoid contained within the shifter. No brake interlock adjustment is required. In the event of a solenoid problem or power loss, the shifter cannot be moved from Park unless a manual override is actuated. A BTSI override mechanism is provided with this shifter to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

OPERATION

OPERATION

8111a2ba

Fig. 739: Ignition Key/Switch Positions
 Courtesy of CHRYSLER GROUP, LLC

- 1 - LOCK
- 2 - ACC
- 3 - ON
- 4 - START

The Brake Transmission Shifter/Ignition Interlock (BTISI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the ignition is in the ON position and the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTISI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear, except "PARK", and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.

2014 Jeep Cherokee Trailhawk

2014 AUTOMATIC TRANSMISSION 948TE - Service Information - Cherokee

5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

STANDARD PROCEDURE

BTSI OVERRIDE

If a malfunction occurs and the shift lever cannot be moved out of the PARK position, you can use the following procedure to temporarily move the shift lever.

1. Turn the engine OFF.
2. Apply the parking brake.

Fig. 740: Removing Shifter Bezel And Boot Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Using a screwdriver (2) or similar tool, carefully separate the shifter bezel and boot assembly (1) from the center console bezel.
4. Press and maintain firm pressure on the brake pedal.

Fig. 741: Holding The Override Release Lever Down
Courtesy of CHRYSLER GROUP, LLC

5. Insert a small screwdriver (1) or similar tool down into the shift lever override access hole (2) (at the right front corner of the shift lever assembly), and push and hold the override release lever down.
6. Move the shift lever to the NEUTRAL position
7. The vehicle may then be started in NEUTRAL.
8. Reinstall the shift lever boot.

2014 BRAKES

Antilock Brake System (ABS) - Service Information - Cherokee

CAUTION

CAUTION

The antilock brake system uses an electronic control module known as the Antilock Brake Module (ABM). This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the designated scan tool as described in this service information . Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The ABM 47-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this service information should be serviced.

CAUTION: If welding work is to be performed on the vehicle using an electric arc welder, the ABM connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle.

DESCRIPTION

ANTILOCK BRAKE SYSTEM

This vehicle uses an antilock brake system standard with Electronic Stability Control (ESC) and All-Speed Traction Control.

This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Hydraulic Control Unit (HCU) and Antilock Brake Module (ABM)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Steering Angle Sensor - Part of the Electronic Power Steering (EPS) Module, located in the EPS steering gear
- Dynamics Sensor Module - Includes Yaw rate, longitudinal, and lateral acceleration sensors. Located in the Occupant Restraint Controller (ORC) Module.

The ABS system is made up of the Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM). For additional information on these components, refer to **HYDRAULIC CONTROL UNIT (HCU), DESCRIPTION** and **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION**.

ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

All vehicles use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking when the brakes are applied in the partial braking range. For more information on electronic brake distribution, refer to

DESCRIPTION.**ELECTRONIC STABILITY CONTROL**

For information on the Electronic Stability Control, refer to **DESCRIPTION.**

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **DESCRIPTION.**

ELECTRONIC STABILITY CONTROL

Electronic Stability Control (ESC), which includes Hydraulic Brake Assist, Traction Control, and Electronic Roll Mitigation, is standard on all vehicles. ESC aids the driver in maintaining vehicle directional stability. ESC will do whatever can be done, within the limits of available traction, to keep the car on course.

ESC uses the ABS with Traction Control along with the following components to operate:

- Dynamics (ESC) Sensor
- Steering Angle Sensor (SAS)

The Dynamics Sensor is incorporated with the Occupant Restraint Controller (ORC) Module. The ORC is mounted under the center console, which is near the center of gravity of the car for effective sensing. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, DESCRIPTION**. The Steering Angle Sensor is located in the Electric Power Steering (EPS) gear. Refer to **SENSOR, STEERING WHEEL ANGLE, DESCRIPTION.**

HYDRAULIC BRAKE ASSIST

Brake Assist is programmed into the ESC system. Brake assist helps the driver overcome the tendency to not apply the brakes hard enough or quick enough to achieve the minimum stopping distance during a panic stop. During this situation, the ESC system instantly applies the maximum available pressure to the brakes and the vehicle stops as quickly as available traction will allow.

TRACTION CONTROL

The traction control system that is part of the Electronic Stability Control (ESC), is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

All-Speed Traction Control is effective up to 85 mph (137 km/h).

The traction control system may be turned off or on by depressing the ESC Off switch button, located near the middle of the dash.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the Integrated Control Unit (ICU).

OPERATION

ANTILOCK BRAKE SYSTEM

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 5-8 km/h (3-5 mph). If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the Wheel Speed Sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 5-6 km/h (3-4 mph).

There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph (5 km/h) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel speed sensor mounting bosses; and loose wheel speed sensor mounting screws.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ELECTRONIC STABILITY CONTROL

For information on the Electronic Stability Control, refer to **OPERATION**.

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **OPERATION**.

ELECTRONIC STABILITY CONTROL

To determine whether the car is responding properly to cornering commands, ESC uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESC operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESC system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

HYDRAULIC BRAKE ASSIST

Brake Assist is programmed into the ESC system. During a panic stop, a pressure sensor determines when the driver is doing so by measuring the brake pedal pressure application rate. A high rate of pedal pressure application causes the ESC system to apply maximum available pressure to the brakes and the vehicle stops as quickly as available traction will allow.

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **OPERATION**.

TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the ESC OFF switch button. The ESC OFF lamp illuminates immediately upon depressing the button. Pressing this button again or turning off and restarting the vehicle will enable the traction control system.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP, the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the Low Pressure Accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA is pumped back to the master cylinder by switching on the motor for ABS systems or by opening the ESVs for ESC systems. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSPECTION AND ROAD TEST

1. Visually inspect the ABS for damaged or disconnected components and connectors.
2. Verify the brake lamps are operational. If they are not, repair them prior to continuing.
3. Connect a scan tool to the Data Link Connector located under the instrument panel to the left of the steering column. If the scan tool does not power-up, check the power and ground supplies to the connector.
4. Turn the ignition key to the ON position.
5. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

If no problems are observed, it will be necessary to road test the vehicle.

Many ABS conditions judged to be a problem by the driver may be normal operating conditions. To become familiarized with the normal operating characteristics of this antilock brake system, refer to **OPERATION**.

WARNING: Conditions that result in turning on the red brake warning indicator lamp may indicate reduced braking ability.

Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on. If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle

Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

The following conditions will cause the red BRAKE lamp to illuminate:

- Low fluid in the brake reservoir
- Park Brake engaged
- Brake hydraulic problem
- ABS issue that will not allow the Brake Proportioning function

If the amber ABS warning indicator is on, road test the vehicle as described below. While only the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

6. Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning indicator lamp continues to stay on.
7. If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 25 km/h (15 mph) to complete the ABS Start-Up and Drive-Off Cycles. Refer to **OPERATION**. If at this time the amber ABS warning indicator lamp stays on, refer to the appropriate diagnostic information.
8. If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

STANDARD PROCEDURE

BLEEDING

PRESSURE BLEEDING

- NOTE:** **Pressure bleeding is the preferred method after ICU replacement.**
- NOTE:** **Follow pressure bleeder manufacturer instructions for use of pressure bleeding equipment.**
- NOTE:** **ABS pressure bleeding is done with the use of power pressure brake bleed equipment**
- NOTE:** **To bleed the brakes with a pressure bleeder, the aid of a helper will be required.**

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids.

1. Perform base brake bleeding. Refer to **STANDARD PROCEDURE** .
2. Install pressure bleeding equipment by following the pressure bleeder manufacturer instructions.
3. Connect scan tool to the Data Link Connector and navigate to the ABS menu to begin bleed process.
4. Starting at the LF wheel, following the scan tool on screen instructions, open the bleed screw and continue following scan tool process until cycle completes. Repeat this process for each remaining wheel going to RF, RR, LR.
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.
6. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

MANUAL BLEEDING

NOTE: **ABS manual bleeding is done without the use of power pressure brake bleed equipment.**

NOTE: **To bleed the brakes manually, the aid of a helper will be required. It is critical that during this process that the master cylinder brake fluid remains within operating range.**

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids.

1. Perform base brake bleeding. Refer to **STANDARD PROCEDURE** .
2. Connect scan tool to the Data Link Connector and navigate to the ABS menu to begin bleed process.
3. Starting at the LF wheel, following the scan tool prompts, open the bleed screw and begin stroking the brake pedal every two seconds while continuing to follow scan tool process until cycle is completed. Repeat this process for each remaining wheel going to RF, RR, LR.
4. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.
5. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

TORQUE

ELECTRICAL

SENSOR, DYNAMICS

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Occupant Restraint Controller
Courtesy of CHRYSLER GROUP, LLC

The Yaw Rate and Lateral Acceleration Sensors are referred to as the Dynamics Sensor and are housed within the Occupant Restraint Controller (ORC) (1). The sensors are used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The Occupant Restraint Controller (ORC) must be replaced when necessary. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

SENSOR, STEERING WHEEL ANGLE**DESCRIPTION****DESCRIPTION**

The steering angle sensor is an integral part of the Electric Power Steering (EPS) rack. If the steering angle sensor requires service, the EPS rack must be replaced. Refer to **GEAR, REMOVAL** .

SENSOR, WHEEL SPEED, FRONT**DESCRIPTION****DESCRIPTION**

1715005813

Fig. 2: Identifying Front Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

The antilock brake system uses two-wire wheel speed sensors, known as active wheel speed sensors. The sensors use an electronic principle known as magneto-resistive to help increase performance and durability. The sensors convert wheel speed into a small digital signal. A Wheel Speed Sensor (WSS) is used at each wheel. A magnetic pole encoder serves as the trigger mechanism for each sensor. At each wheel of the vehicle there is one wheel speed sensor and one encoder.

WSS air gaps are not adjustable.

3. Route wheel speed sensor cable and snap into clips and retainers.
4. Connect wheel speed sensor cable connector (1) to body wiring harness connector.
5. Lower the vehicle.

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)**DESCRIPTION****DESCRIPTION**

The Electronic Stability Control (ESC) switch is mounted in the switch bank assembly of the instrument panel.

The ESC Off switch turns the Electronic Stability Control off and back on. The system resets to ESC-on each time the ignition is cycled.

When the ESC Off switch is depressed and released, turning ESC off, it does not completely turn the system off. The ESC system reduces torque management to a lesser amount, but ESC function can still occur if the system perceives the need.

HYDRAULIC/MECHANICAL**HYDRAULIC CONTROL UNIT (HCU)****DESCRIPTION****DESCRIPTION**

The Hydraulic Control Unit (HCU) is mounted to the Antilock Brake Module (ABM) as part of the Integrated Control Unit (ICU). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to empty the accumulators during an ABS stop and supply build pressure to the brakes during a traction control or ESC event. If the HCU needs replacement it is removed as an assembly with the ABM and then disassembled. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.

VALVES AND SOLENOIDS

The valve block contains four inlet valves and four outlet solenoid valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring-loaded in the closed position during normal braking. The fluid is allowed to flow from the master cylinder to the wheel brakes.

During an ABS stop, these valves cycle to maintain the proper slip ratio for each wheel. The inlet valve closes preventing further pressure increase and the outlet valve opens to provide a path from the wheel brake to the HCU accumulators and pump/motor. This releases (decays) pressure from the wheel brake, thus releasing the wheel from excessive slippage. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply (build) pressure.

If the ABS includes the traction control feature, there are four other valves in the HCU. Two Traction Control (TC) (or ESC) valves, mounted in the HCU valve block, are normally in the open position and close only when the traction control is applied. There are also two normally closed shuttle valves which open during traction control and ESC events to provide a direct fluid path from the brake fluid reservoir to the inlet of the HCU pump.

These TC valves are used to isolate the rear (non-driving) wheels of the vehicle from the hydraulic pressure that the HCU pump/motor is sending to the front (driving) wheels when traction control is being applied. The rear brakes need to be isolated from the master cylinder when traction control is being applied so the rear wheels do not drag.

BRAKE FLUID ACCUMULATORS

There are two fluid accumulators in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Each hydraulic circuit uses a 3 cc accumulator.

The fluid accumulators temporarily store brake fluid that is removed from the wheel brakes during an ABS cycle. This stored fluid is used by the pump/motor to provide build pressure for the brake hydraulic system. When the antilock stop is complete, the accumulators are drained by the pump/motor.

There are two noise dampening chambers in the HCU on this vehicle equipped with traction control.

PUMP/MOTOR

There are two pump assemblies in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Both pumps are driven by a common electric motor. This DC-type motor is integral to the HCU and is controlled by the ABM.

Brake fluid is released to the accumulators when the outlet valve is opened during an antilock stop. The pump mechanism consists of two opposing pistons operated by an eccentric camshaft. In operation, these pistons are used to purge fluid from the accumulators back into the master cylinder circuits. When the antilock stop is complete, the pump/motor drains the accumulators.

The pump motor is also used to build pressure when the system goes into Electronic Stability Control (ESC) and traction control mode.

The ABM may turn on the pump/motor when an antilock stop is detected. The pump/motor continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor runs to drain the accumulators during the next drive-off.

The pump/motor is not a serviceable item; if it requires replacement, the HCU must be replaced.

INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

DESCRIPTION

Fig. 12: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

The Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU) (4).

The ICU (4) is located in the engine compartment, mounted to the left side body frame rail near the brake master cylinder.

The ABS with ESC and All-Speed Traction Control ICU consists of the following components: the ABM, solenoid valves, traction control solenoid valves, hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The ICU can be disassembled to service either the HCU or the ABM. The HCU and ABM (ICU) should be removed from the vehicle as an assembly . Refer to INTEGRATED CONTROL UNIT (ICU), REMOVAL.

For additional information on the ABS, refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

OPERATION

OPERATION

For information of the ICU, refer to these individual components of the ICU:

- ANTILOCK BRAKE MODULE (ABM). Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- HYDRAULIC CONTROL UNIT (HCU). Refer to **HYDRAULIC CONTROL UNIT (HCU), DESCRIPTION**.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING .

CAUTION: Before disassembling the ICU, the ICU must be thoroughly cleaned. This must be done to prevent dirt particles and debris from entering into vital areas of the ICU.

1. Install the brake pedal holding tool.
2. Disconnect and isolate battery negative cable from battery post.

Fig. 13: Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Power Distribution Center (PDC) (2). Refer to CENTER, POWER DISTRIBUTION (PDC), REMOVAL .

1722015732

Fig. 14: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (2) from the PDC mount (1), lift up and disconnect the wire harness retaining clips from the underside of the PDC mount and set the mount aside.

1722015729

Fig. 15: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the ABM connector (3) from the ICU (4).
6. Remove the brake lines (1, 5) at the ICU.
7. Loosen the two nuts (2) securing the ICU (4) to the bracket and remove the ICU.

8. If removing the brake booster, remove the ICU bracket mounting bolts and remove the bracket from the vehicle.

INSTALLATION**INSTALLATION**

1. If removed, place ICU bracket into position on body, then install mounting bolts and tighten to 25 N.m (18 ft. lbs.).

Fig. 16: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

2. Install ICU (4) to mounting bracket, then install retaining nuts (2) and tighten to 8 N.m (71 in. lbs.).
3. Install the brake lines (1, 5) to the ICU. Torque to specifications. Refer to **SPECIFICATIONS** .
4. Install the ABM connector (3) to the ICU (4).

1722015732

Fig. 17: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

5. Install the PDC mount, route the wire harness retaining clips under the mount and install and tighten the bolts (2).

1722015730

Fig. 18: Identifying Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

6. Install the PDC (2). Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION**.
7. Reconnect the negative battery cable.
8. Remove the brake pedal holding tool.

2014 Jeep Cherokee Trailhawk

2014 BRAKES Antilock Brake System (ABS) - Service Information - Cherokee

9. Install a scan tool to initialize the ABS module and perform the following:
 - a. Clear any faults.
 - b. Fill the master cylinder to the proper fill level and bleed the base and hydraulic system. Refer to **STANDARD PROCEDURE** .
10. Perform the Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

Base - Service Information - Cherokee

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

CAUTION: Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container. Do not use petroleum-based fluid because seal damage in the brake system will result.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

CAUTION: When handling the brake rotor and caliper, be careful to avoid damaging

the brake rotor and caliper, and scratching or nicking the brake shoe lining.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover the **RED BRAKE WARNING INDICATOR, BRAKE NOISE** and **OTHER BRAKE CONDITIONS**.

RED BRAKE WARNING INDICATOR

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING INDICATOR ON	1. Electric park brake is not released.	Refer to DIAGNOSIS AND TESTING
	2. Park brake warning switch.	Refer to DIAGNOSIS AND TESTING
	3. Brake fluid level low in reservoir.	3. Fill reservoir. Check entire system for leaks. Repair or replace as required.
	4. Brake fluid level switch.	4. Disconnect switch wiring connector. If lamp goes out, replace switch.
	5. Mechanical instrument cluster (MIC) problem.	5. Refer to appropriate diagnostic information.
	6. ABS EVBP malfunction.	6. Refer to the appropriate ABS diagnostic service information.

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC BRAKE CHIRP	1. Excessive brake rotor runout.	1. Diagnose and correct as necessary. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .
DISC BRAKE MOAN OR HOWL WHILE BRAKING IN REVERSE	1. Rear disc brake caliper guide pin bolts installed in incorrect locations.	1. Remove lower guide pin bolt and inspect for special sleeve on tip. If sleeve is present, remove upper and lower guide pin bolts and install special sleeved bolt in upper location and standard guide pin bolt in lower location. Refer to CALIPER, DISC BRAKE, FRONT, REMOVAL or CALIPER, DISC BRAKE, REAR, REMOVAL . Perform on both sides of vehicle as necessary.
DISC BRAKE RATTLE OR CLUNK	1. Broken or missing spring clips. 2. Caliper guide pin bolts loose. 3. Missing	1. Replace brake pads. 2. Tighten guide pin bolts. 3. Replace missing abutment shims.

2014 Jeep Cherokee Trailhawk

2014 BRAKES Base - Service Information - Cherokee

	abutment shims.	
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	1. Brake pad linings.	1. Replace brake pads.
SCRAPING (METAL-TO-METAL).	1. Foreign object interference with brakes. 2. Brake pads worn out.	1. Inspect brakes and remove foreign object. 2. Replace brake pads. Inspect rotors. Reface or replace as necessary.
SCRAPING OR WHIRRING	1. ABS wheel speed sensor hitting tone wheel.	1. Inspect, correct or replace faulty component(s).

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	1. Contaminated brake fluid.	1. Check for swollen seals. Replace all system components containing rubber.
	2. Binding caliper pins or bushings.	2. Replace pins and bushings
	3. Misadjusted brake lamp switch.	3. Replace brake lamp switch. Refer to <u>SWITCH, STOP LAMP, REMOVAL</u> .
	4. Master cylinder not fully returning.	4. Inspect master cylinder and replace as necessary.
	5. Binding brake pedal.	5. Replace brake pedal/bushings.
BRAKES DRAG (REAR ONLY)	1. Operator error.	1. Describe operation of electric park brake.
	2. Electric park brake does not release.	2. Refer to <u>DIAGNOSIS AND TESTING</u>
BRAKES GRAB	1. Contaminated brake pad.	1. Inspect and clean, or replace pads. Repair source of contamination.
	2. Improper power brake booster assist.	2. Refer to POWER BRAKE BOOSTER in this service information .
EXCESSIVE PEDAL EFFORT	1. Obstruction of brake pedal.	1. Inspect, remove or move

2014 Jeep Cherokee Trailhawk

2014 BRAKES Base - Service Information - Cherokee

		obstruction.
	2. Low power brake booster assist.	2. Refer to POWER BRAKE BOOSTER in this service information .
	3. Glazed brake linings.	3. Reface or replace brake rotors as necessary.
	4. Brake pad lining transfer to brake rotor.	4. Reface or replace brake rotors as necessary. Replace brake pads.
EXCESSIVE PEDAL EFFORT (HARD PEDAL - CAN'T SKID WHEELS)	1. Power brake booster runout (vacuum assist).	1. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to POWER BRAKE BOOSTER.
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
	2. Brake fluid low in reservoir	2. Fill reservoir. Check entire system for leaks; repair or replace as required.
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/SURGES DURING BRAKING	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines.	1. Bleed brakes.
	2. ABS EVBP not functioning.	2. Refer to the appropriate ABS diagnostic service information.
STOP LAMPS STAY ON	1. Brake lamp switch out of adjustment.	1. Replace brake lamp switch. Refer to SWITCH, STOP LAMP, REMOVAL .
	2. Brake pedal binding.	2. Inspect and replace as necessary.
	3. Power brake booster not allowing pedal to return completely.	3. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston.	1. Replace frozen piston or caliper. Bleed brakes.
	2. Contaminated brake pad lining (most likely front lining).	2. Inspect and clean, or replace pads. Repair source of contamination.
	3. Pinched brake lines.	3. Replace pinched line.
	4. Leaking piston seal.	4. Replace piston seal or brake caliper.
	5. Suspension problem.	5. Refer to the appropriate Suspension service information .

STANDARD PROCEDURE

STANDARD PROCEDURE - BASE BRAKE BLEEDING

CAUTION: Before removing the master cylinder cap, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder reservoir.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the hydraulic system.

- Left rear wheel
- Right front wheel
- Right rear wheel
- Left front wheel

MANUAL BLEEDING

NOTE: To bleed the brakes manually, the aid of a helper will be required.

Fig. 1: Bleeding Brakes

Courtesy of CHRYSLER GROUP, LLC

1. Attach, (special tool #8358-1, Bleed Tube) (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
2. Have a helper pump the brake pedal three or four times and hold it in the down position.
3. With the pedal in the down position, open the bleeder screw at least one full turn.
4. Once the brake pedal has dropped, close the bleeder screw. After the bleeder screw is closed, release the brake pedal.
5. Repeat the above steps until all trapped air is removed from that wheel circuit (usually four or five times).
6. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake system. Monitor the fluid level in the master cylinder reservoir to make sure it does not go dry.
7. Check and adjust brake fluid level to the FULL mark.
8. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
9. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

PRESSURE BLEEDING

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

1. Attach the pressure bleeding equipment to the Master Cylinder.

Fig. 2: Bleeding Brakes

Courtesy of CHRYSLER GROUP, LLC

2. Attach, (special tool #8358-1, Bleed Tube) (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
3. Open the bleeder screw at least one full turn or more to obtain a steady stream of brake fluid.
4. After approximately 120-240 ml (4-8 ounces) of fluid have been bled through the brake circuit and an air-

2014 Jeep Cherokee Trailhawk

2014 BRAKES Base - Service Information - Cherokee

free flow is maintained in the clear plastic hose and jar, close the bleeder screw.

5. Repeat this procedure at all the remaining bleeder screws.
6. Check and adjust brake fluid level to the FULL mark on the reservoir.
7. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
8. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

ELECTRICAL

PUMP, ELECTRIC VACUUM

DESCRIPTION

DESCRIPTION

Fig. 3: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only the 3.6L engine has an electric vacuum pump.

On the 3.6L engine there is an electric vacuum pump (1) located on the left side of the engine. The vacuum pump (1) has one electrical connector (3) on a pigtail connected to the mounting bracket. The mounting bracket is secured to the engine with two bolts (2).

Fig. 4: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
 Courtesy of CHRYSLER GROUP, LLC

The vacuum pump (2) mounts to the bracket with two rubber insulated studs (4) to reduce vibration. The vacuum hose has a quick-connect type end (1) with a locking tab at the vacuum pump (2).

OPERATION

OPERATION

The Electric Vacuum Pump (EVP) system is installed to provide supplemental vacuum to the brake booster when the engine vacuum supply is low. The vacuum pump is connected to the engine and the brake booster through a series of hoses and one-way flow check valves. A pressure sensor, mounted in the brake booster, provides information to the Antilock Brake System (ABS) module, then the vacuum level is sent over CAN to the Powertrain Control Module (PCM). The PCM modulates the EVP operation to maintain the brake booster vacuum within a given range. This system ensures that the customer experiences a consistent brake pedal feel under all driving conditions.

A two wire electrical connector is used to supply power and ground for the vacuum pump. Operating voltage is between 9V - 16V. Control of the vacuum pump is provided by the Powertrain Control Module (PCM) using a low side driver to a normally open relay (coil side). The relay coil side power is from a fuse in the under hood PDC. The switched power circuit to the vacuum pump relay is wired directly from the battery through an inline fuse holder located below the remote battery post connection on the RH side in the engine compartment. The relay is located on the LH shock tower in the engine compartment.

The PCM monitors the Manifold Absolute Pressure (MAP) sensor and when the signal indicates low engine vacuum the PCM will cycle the vacuum pump as necessary to add vacuum to the power brake booster. The vacuum hoses are connected between the vacuum pump, the engine manifold (for MAP sensor signal), and the

power brake booster vacuum sensor (on the brake booster). When the PCM cycles the vacuum pump on, the PCM monitors the MAP sensor and if the vacuum signal does not indicate a rising vacuum then DTCs will be set. Additionally, the Antilock Brake System (ABS) module monitors the vacuum at the brake booster vacuum sensor and DTCs will also set in the ABS module.

REMOVAL**REMOVAL**

Fig. 5: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine appearance cover.
2. Disconnect the electrical connector (3) and remove the harness connector from the back side of the mounting bracket.
3. Release the locking tab and disconnect the quick connect vacuum hose (1) from the vacuum pump (2).

Fig. 6: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the vacuum pump bracket bolts (2) and remove the vacuum pump assembly (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 7: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the vacuum pump assembly (1), ensuring that the two ground leads are in place while installing bracket mounting bolts (2).
2. Attach the harness connector to the bracket and connect the electrical connector (3).

Fig. 8: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

3. Connect the quick-connect vacuum hose (1) to the vacuum pump (2) and seat the locking tab.
4. Install the engine appearance cover.

SWITCH, BRAKE FLUID LEVEL

DESCRIPTION

DESCRIPTION

Fig. 9: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

The brake fluid level switch (2) is an internal part of the master cylinder brake fluid reservoir (1). The switch **cannot** be serviced separately from the brake master cylinder fluid reservoir (1). Refer to **RESERVOIR, BRAKE MASTER CYLINDER, REMOVAL**.

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION

Each disc brake assembly consists of the following major components:

- Caliper
- Caliper adapter bracket
- Pads
- Rotor
- Electric Park Brake (rear calipers)

REAR DISC CALIPER The rear brake caliper features an Electric Park Brake (EPB) which combines a electromechanical motor and gear unit (EPB actuator) with a conventional rear caliper. Refer to **PARKING BRAKE, DESCRIPTION**. The EPB actuator can be removed and serviced separately from the caliper.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

BOOSTER, POWER BRAKE

DESCRIPTION

DESCRIPTION

Fig. 10: Pedal And Booster Mounting - LHD
Courtesy of CHRYSLER GROUP, LLC

The power brake booster (3) is mounted to the engine side of the dash panel. The master cylinder is bolted to the front of the booster. A vacuum check valve is also mounted on the front of the booster. A vacuum line connects the check valve to engine source vacuum. The booster input rod extends through the dash panel and connects to the brake pedal.

This vehicle uses a single diaphragm, single rate vacuum power brake booster with 279 mm (11 in.) diaphragm.

The power brake booster can be identified by the tag attached to the body of the booster. This tag contains the following information:

- The production part number
- The date it was built, and
- The booster manufacturer.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.

5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows:
Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less than 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

REMOVAL**REMOVAL**

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

1. Disconnect and isolate the battery negative cable from its post on the battery.
2. Remove the Power Distribution Center (PDC) from the mounting location and position aside. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL**.
3. Remove the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.
4. Remove the ICU mounting bracket.
5. Remove the master cylinder and reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.
6. Disconnect the vacuum sensor and remove the vacuum hose from the booster.

Fig. 11: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.
8. Position the intermediate shaft (1) so that the pedal assembly can be accessed.
9. Remove the stop lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .

Fig. 12: Retainer & Clips
Courtesy of CHRYSLER GROUP, LLC

10. Disengage clips (1) on booster rod keeper assembly retainer (2). Position retainer (2) up to remove booster rod from pedal assembly.

0508007146

Fig. 13: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the four nuts (1) attaching the power brake booster to the dash panel.
12. Slide the power brake booster forward until its mounting studs clear the dash panel, then remove it through the engine compartment.

INSTALLATION

INSTALLATION

1. Install the power brake booster by sliding the push rod and studs through the dash panel and into mounting position. Insure vacuum check valve opening on front shell of booster is at approximately 9 o'clock.

0508007146

Fig. 14: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the four power brake booster mounting nuts (1) in following sequence: Top inboard, bottom outboard, top outboard, bottom inboard. Failure to do so may result in damage to the booster. Tighten to the proper specification

Refer to **TORQUE SPECIFICATIONS** .

NOTE: Make sure the cup that the booster push rod reacts against is still in place in the pedal before installing the new booster rod keeper.

NOTE: The brake pedal booster rod keeper (2) cannot be reused. Always install a new keeper if the brake pedal push rod was separated from the keeper.

Fig. 15: Retainer & Clips

Courtesy of CHRYSLER GROUP, LLC

3. Install the power brake booster push rod and retainer (2) into NEW booster rod keeper, ensuring that the clips (1) are engaged.
4. Install and adjust the stop lamp switch in the brake pedal bracket. Refer to **SWITCH, STOP LAMP, INSTALLATION** .

Fig. 16: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft

Courtesy of CHRYSLER GROUP, LLC

5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Install the intermediate shaft (1) onto the steering gear input shaft (2).

NOTE: **A new pinch bolt (3) must be installed every time the pinch bolt is removed.**

7. Install a **NEW** pinch bolt (3) and tighten to the proper specification. Refer to **COLUMN, SPECIFICATIONS** .
8. Connect the vacuum sensor and install the vacuum hose in the booster.
9. Install the master cylinder and reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.
10. Install the ICU mounting bracket and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
11. Install the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), INSTALLATION** .
12. Install the PDC. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
13. Connect the battery negative cable to its post on the battery.
14. Bleed the base brake system. Refer to **STANDARD PROCEDURE** .
15. Road test the vehicle to ensure proper operation of the brakes.

CALIPER, DISC BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: **Before proceeding, Refer to CAUTION and WARNING.**

1. Using a brake pedal holding tool, depress the brake pedal past its first 25 mm (1 inch) of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir when the lines are opened.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheel mounting bolts, then the tire and wheel assembly.

050868485

Fig. 17: Brake Line Connector & Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake line connector (2) from the junction on the inner fender.
5. Separate the clip (1) from the strut and remove the brake hose from the strut.

1715005815

Fig. 18: Identifying Brake Hose Connector And Pin Bolts

Courtesy of CHRYSLER GROUP, LLC

6. Remove the brake hose connector (1) from the brake caliper.
7. Remove the two brake caliper guide pin bolts (4).
8. Slide the disc brake caliper from the disc brake adapter bracket and remove.

DISASSEMBLY**DISASSEMBLY**

NOTE: Before disassembling the brake caliper, remove it from the vehicle. Refer to CALIPER, DISC BRAKE, FRONT, REMOVAL or CALIPER, DISC BRAKE, REAR, REMOVAL.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CALIPER, DISC BRAKE, FRONT, INSPECTION and CALIPER, DISC BRAKE, FRONT, CLEANING.

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Mount the caliper in a vise equipped with protective jaws.

80c4f337

Fig. 19: Identifying Wooden Block Placed In Brake Caliper

Courtesy of CHRYSLER GROUP, LLC

1 - WOOD BLOCK

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

2. Place a wooden block (1) in the caliper as shown in the illustration.
3. If necessary, apply low pressure compressed air to the caliper fluid inlet in short spurts to force the piston out.
4. Remove the piston from the caliper.
5. Remove the dust boot from the piston and discard it.

Fig. 20: Piston Seal Removal

Courtesy of CHRYSLER GROUP, LLC

1 - TRIM STICK

2 - SEAL

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

6. Using a soft tool such as a plastic trim stick (1), work the piston seal (2) out of its groove in caliper piston bore. Discard the used seal.
7. Clean the piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
8. Inspect both the piston and bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around piston boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

ASSEMBLY

ASSEMBLY

NOTE: Always have clean hands when assembling a brake caliper.

NOTE: Always use fresh, clean brake fluid when assembling a brake caliper.

Fig. 21: New Piston Seal Installation

Courtesy of CHRYSLER GROUP, LLC

- | |
|-----------------------------------|
| <p>1 - SEAL</p> <p>2 - GROOVE</p> |
|-----------------------------------|

NOTE: **Never use an old piston seal.**

1. Dip the NEW piston seal in clean brake fluid and install it in the groove (2) of the caliper bore. The seal (1) should be started at one area of the groove and gently worked around into the groove using only your clean fingers to seat it.

Fig. 22: Boot Installation

Courtesy of CHRYSLER GROUP, LLC

2. Coat the NEW piston with clean brake fluid.
3. Coat the NEW piston boot with clean brake fluid leaving a generous amount inside the boot.
4. Position the dust boot over the lower section of the piston.
5. Extend the dust boot below the bottom of the piston and guide the lip seal into the groove in the caliper

piston bore.

Fig. 23: Piston Installation

Courtesy of CHRYSLER GROUP, LLC

1 - PISTON GROOVE

CAUTION: Force applied to the piston (1) to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

6. Install the piston (1) into the bore, carefully pushing it past the piston seal using **hand pressure**. Push the piston in until it bottoms in the caliper bore and the dust boot lip seal falls into the groove near the top of the piston.
7. Install the caliper on the vehicle and bleed the brakes as necessary. Refer to **CALIPER, DISC BRAKE, FRONT, INSTALLATION** or **CALIPER, DISC BRAKE, REAR, INSTALLATION**.

INSTALLATION

INSTALLATION

1715005815

Fig. 24: Identifying Brake Hose Connector And Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.

1. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.
2. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.
3. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (4) and tighten to 43 N.m (32 ft. lbs.).
4. Install the brake hose (1) connector to the brake caliper and tighten to 18 N.m (159 in. lbs.).

050868485

Fig. 25: Brake Line Connector & Clip
Courtesy of CHRYSLER GROUP, LLC

5. Install brake hose fitting to brake line connector (2) and tighten to 18 N.m (159 in. lbs.).
6. Install brake hose to mounting location on strut (1) and secure with the clip.
7. Install the tire and wheel assembly. Refer to **INSTALLATION**.
8. Lower the vehicle.

81209e57

Fig. 26: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

9. Remove the brake pedal holding tool.

10. Bleed the caliper as necessary. Refer to **STANDARD PROCEDURE** .
11. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

CALIPER, DISC BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

The electronic park brake (EPB) actuator must be retracted prior to removing the brake caliper assembly. This can be done in two ways:

- A diagnostic scan tool (Service Mode position).
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Using a brake pedal holding tool, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.
2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the wheel mounting bolts, then the rear tire and wheel assembly.

1715005817

Fig. 27: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Remove the nut and brake line bracket (2) from the brake caliper.
6. Remove the brake line (3) from the flex hose (4).

1715005819

Fig. 28: Caliper Guide Pin Bolts

Courtesy of CHRYSLER GROUP, LLC

7. While holding guide pins from turning, remove caliper guide pin bolts (3).
8. Slide and remove the disc brake caliper from the disc brake adapter bracket.

INSTALLATION**INSTALLATION**

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the guide pin boots.

1715005819

Fig. 29: Caliper Guide Pin Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Install the disc brake caliper with outboard brake pad attached over the inboard brake pad and rotor, onto the brake caliper adapter bracket.
2. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (3) and tighten the guide pin bolts to 43N.m (32 ft. lbs.).

1715005817

Fig. 30: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Install brake line fitting (3) to the flex hose (4) and tighten to 18 N.m (159 in. lbs.).
4. Install the brake line bracket and nut (2) to the brake caliper.
5. Install the tire and wheel assembly. Refer to **INSTALLATION**.
6. Lower the vehicle.
7. Remove the brake pedal holding tool.

81209e57

Fig. 31: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

8. Bleed the caliper as necessary. Refer to **STANDARD PROCEDURE** .
9. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.
10. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
 - Exit the Service Mode with diagnostic scan tool.
 - While depressing the brake pedal, press the EPB switch.
11. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

FLUID

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts. Swelling indicates the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If the fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If the brake fluid is contaminated, drain and thoroughly flush the brake system. Replace all the rubber parts or components containing rubber coming into contact with the brake fluid including: the master cylinder and reservoir; caliper seals; ABS hydraulic control unit; and all hydraulic fluid hoses.

SPECIFICATIONS

SPECIFICATIONS

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

DESCRIPTION**DESCRIPTION**

All master cylinders are a two-outlet design and the brake tubes from these primary and secondary outlet ports lead directly to the Integrated Control Unit (ICU) before going to each wheel brake.

The master cylinder body is an anodized aluminum casting. It has a machined bore to accept the master cylinder pistons and also has threaded ports with seats for hydraulic brake tube connections.

The master cylinder has the brake fluid reservoir mounted on top of it which gravity feeds brake fluid to the master cylinder when it is required. On manual transmission model vehicles the brake fluid reservoir also feeds the clutch hydraulic circuit. The reservoir is made of see-through plastic and it houses the brake fluid level switch.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER**

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less than 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

Fig. 32: Bleeding Master Cylinder With ABS
 Courtesy of CHRYSLER GROUP, LLC

1. Clamp the master cylinder in a vise with soft-jaw caps.
2. Attach the special tools for bleeding the master cylinder in the following fashion:
 - a. Thread a Bleeder Tube (2) (special tool #8358-1, Bleed Tube), into the primary and secondary ports. Tighten bleeder tube nuts to 20 N.m (177 in. lbs.).
 - b. Flex each Bleeder Tube and place the open ends into the neck of the master cylinder reservoir. Position the open ends of the tubes into the reservoir so their outlets are below the surface of the brake fluid in the reservoir when filled.

NOTE: **Make sure the ends of the Bleeder Tubes stay below the surface of the brake fluid in the reservoir at all times during the bleeding procedure.**

3. Fill the brake fluid reservoir with fresh Mopar® Brake Fluid DOT 3 Motor Vehicle, or equivalent. Refer to **FLUID, SPECIFICATIONS**.
4. Using an appropriately sized wooden dowel as a pushrod, slowly press the pistons inward discharging brake fluid through the Bleeder Tubes, then release the pressure, allowing the pistons to return to the released position. Repeat this several times until all air bubbles are expelled from the master cylinder bore.

and Bleeder Tubes.

5. Remove the Bleeder Tubes from the master cylinder and plug the master cylinder outlet ports.
6. Install the fill cap on the reservoir.
7. Remove the master cylinder from the vise.
8. Install the master cylinder on the vehicle. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

REMOVAL

REMOVAL

CAUTION: The vacuum in the power brake booster must be pumped down before removing the master cylinder to prevent the booster from sucking in any contamination. This can be done by pumping the brake pedal while the engine is not running until a firm brake pedal is achieved.

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Remove the engine cover, if equipped.
3. Disconnect and isolate the battery negative cable from its post on the battery.

Fig. 33: Identifying Power Distribution Center (PDC)
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the PDC (2) from the vehicle. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL**.

1722015732

Fig. 34: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (2) from the PDC mounting bracket (1) and remove from the vehicle.
6. Siphon as much fluid as possible from master cylinder reservoir.

1722015729

Fig. 35: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

7. Remove the primary and secondary brake tubes (1) from the Integrated Control Unit (ICU) to the master cylinder.

Fig. 36: Removing/Installing Wire Harness From Brake Fluid Level Switch
 Courtesy of CHRYSLER GROUP, LLC

8. Disconnect wire harness (2) from brake fluid level switch on master cylinder reservoir.
9. Disconnect wire harness from brake vacuum check valve. Remove vacuum tube from power brake booster.
10. Remove master cylinder retaining nuts. Taking care not to lose o-ring seal between power brake booster and master cylinder, remove master cylinder from vehicle.

INSTALLATION

INSTALLATION

NOTE: The master cylinder must be bled before installing it on the vehicle.

1. Bench bleed the master cylinder. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.
2. Wipe the face of the power brake booster clean where the vacuum seal on the rear of the master cylinder comes in contact when it's installed. Do not get any cleaner or debris inside the booster.
3. Line up the master cylinder mounting holes with the mounting studs on the power brake booster. Ensure o-ring seal is located on rear of master cylinder before installing into the booster. Ensure the master cylinder piston push rod lines up with the booster push rod, then carefully slide the master cylinder into the power brake booster until it contacts the face of the booster.
4. Install two **NEW** master cylinder mounting nuts (1). Tighten each nut to 25 N.m (18 ft. lbs.).

Fig. 37: Removing/Installing Wire Harness From Brake Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wiring harness connector (2) to the brake fluid level switch.

Fig. 38: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

6. Connect the primary and secondary brake tubes (1) from the ICU to the master cylinder. Tighten the tube nuts to 25 N.m (18 ft. lbs.).
7. Connect the wiring harnesses to the brake vacuum sensor and connect the vacuum tube to the brake booster.

1722015732

Fig. 39: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

8. Install the PDC mount (1) and tighten the bolts (2).

1722015730

Fig. 40: Identifying Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

9. Install the PDC (2). Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION**.
10. Connect the negative (ground) cable on the battery.
11. Fill the master cylinder reservoir to the proper level.
12. Install the engine cover, if equipped.

13. Install a scan tool to initialize the ABS and perform the following:
 - a. Clear any faults.
 - b. Fill the master cylinder to the proper fill level and bleed the base hydraulic system. Refer to **STANDARD PROCEDURE** .
 - c. Check for leaks.
 - d. Perform the ABS Verification Test. Refer to **STANDARD PROCEDURE**
14. Road test the vehicle to ensure proper operation of the brakes.

PADS, BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005815

Fig. 41: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper guide pin bolts (4).
4. Remove the disc brake caliper from the disc brake adapter bracket and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

5. Remove the brake pads from the caliper adapter bracket.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

9205-315

Fig. 42: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.

2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL

3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures 1.5 mm (0.06 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: **It is important to inspect both front and rear brake pads during the same inspection.**

INSTALLATION

INSTALLATION

NOTE: **Make sure that the audible wear indicators (if equipped) are placed toward the top side nearest the bleeder screw when the inboard brake pads are installed on each side of the vehicle.**

1. Place the brake pads in the abutment shims clipped into the disc brake caliper adapter bracket. Place the pad with the wear indicator attached on the inboard side.
2. Completely retract the caliper piston back into the bore of the caliper.

1715005815

Fig. 43: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.

3. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.
4. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (4) and tighten to 43 N.m (32 ft. lbs.).
5. Install the tire and wheel assembly. Refer to **INSTALLATION**.
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

PADS, BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

The electronic parking brake actuator (EPB) must be retracted prior to removing the brake caliper assembly.

This can be done in two ways:

- A diagnostic scan tool (Service Mode position)
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the wheel mounting bolts, then the rear tire and wheel assembly.

1715005817

Fig. 44: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the nut and brake line bracket (2).

1715005819

Fig. 45: Caliper Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

5. While holding guide pins from turning, remove caliper guide pin bolts (3).
6. Slide and remove the disc brake caliper from the disc brake adapter bracket.

050868487

Fig. 46: Removing Brake Pads From The Caliper Adapter Bracket

Courtesy of CHRYSLER GROUP, LLC

7. Remove the brake pads from the caliper adapter bracket.

CLEANING**CLEANING**

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION**INSPECTION**

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

9205-315

Fig. 47: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.

2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL

3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures 1.5 mm (0.06 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

INSTALLATION

INSTALLATION

0508012591

Fig. 48: Identifying Lubricant Application Areas

Courtesy of CHRYSLER GROUP, LLC

1. Before installing the brake pads, apply WOLFRACOA[®]T C (1) or equivalent lubricant to the abutment clips as shown in the illustration.

NOTE: WOLFRACOA[®]T C or equivalent lubricant must be applied to prevent noise.

050868487

Fig. 49: Caliper Bracket Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the pads to the caliper adapter bracket making sure the wear indicators are on the bottom side opposite of the bleeder screw.

1715005819

Fig. 50: Caliper Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the guide pin boots.

3. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (3) and tighten the guide pin bolts to 43 N.m (32 ft. lbs.).

1715005817

Fig. 51: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Install the brake line bracket and nut (2).
5. Install the tire and wheel assembly Refer to **INSTALLATION**.
6. Lower the vehicle.
7. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.
8. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
 - Exit the Service Mode with diagnostic scan tool.
 - While depressing the brake pedal, press the EPB switch.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

PEDAL(S), BRAKE AND/OR ACCELERATOR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

1. Disconnect and isolate the battery negative cable from its post on the battery.

Fig. 52: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.
3. Position the intermediate shaft (1) so that the pedal assembly can be accessed.

050868753

Fig. 53: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the stop lamp switch (2). Refer to **SWITCH, STOP LAMP, REMOVAL** .
5. Disconnect accelerator pedal electrical connector (3).

050870013

Fig. 54: Retainer & Clips

Courtesy of CHRYSLER GROUP, LLC

6. Disengage clips (1) on booster rod keeper assembly retainer (2). Position retainer (2) up to remove booster rod from pedal assembly.
7. Disconnect the clutch safety switch electrical connector and disengage clutch rod from clutch pedal, if equipped. Refer to **PEDAL AND PAD, CLUTCH, REMOVAL** .

0508007146

Fig. 55: Remove/Install Power Brake Booster Nuts**Courtesy of CHRYSLER GROUP, LLC**

8. Remove the four nuts (1) attaching the brake pedal sled (and power brake booster) to the dash panel.

050868753

Fig. 56: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the remaining two nuts (1, 4) attaching the brake pedal sled to the dash panel.
10. Remove the brake pedal and bracket assembly from vehicle.

INSTALLATION

INSTALLATION

1. Carefully install the brake pedal and bracket assembly in the vehicle lining up the bracket with the power brake booster mounting studs and the studs on the dash panel.

0508007146

Fig. 57: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the four nuts (1) attaching the brake pedal (and power brake booster) to the dash panel. **Do not tighten the nuts at this time.**
3. Tighten the nuts in the following sequence: Top inboard, bottom outboard, top outboard, bottom inboard to the proper specifications. Refer to **SPECIFICATIONS** . Failure to do so may result in damage to the booster.

050868753

Fig. 58: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Install the two remaining nuts (1, 4) attaching the brake pedal sled to the dash panel and tighten to the proper specifications. Refer to **SPECIFICATIONS** .

050870013

Fig. 59: Retainer & Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: The brake pedal booster rod keeper (2) cannot be reused. Always install a new keeper if the brake pedal push rod was separated from the keeper.

5. Install the power brake booster push rod and retainer (2) into a NEW booster rod keeper, ensuring that the clips (1) are engaged.

NOTE: Make sure the cup that the booster push rod reacts against is still in place in the pedal before installing the new booster rod keeper.

Connect the clutch safety switch electrical connector and engage clutch rod to clutch pedal, if equipped. Refer to **PEDAL AND PAD, CLUTCH, INSTALLATION** .

050868753

Fig. 60: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Install and adjust the stop lamp switch (2) in the brake pedal bracket. Refer to **SWITCH, STOP LAMP, INSTALLATION** .
7. Connect accelerator pedal electrical connector (3).

Fig. 61: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new pinch bolt (3) must be installed every time the pinch bolt is removed.

8. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
9. Install the intermediate shaft (1) onto the steering gear pinion shaft (2).
10. Install a **NEW** pinch bolt (3) and tighten to specifications. Refer to **COLUMN, SPECIFICATIONS** .
11. If equipped, install the silencer pad below the instrument panel.
12. Connect the battery negative cable to its post on the battery.
13. Check the stop lamps to verify they are operating properly and not staying on when the pedal is in the released position.
14. Road test the vehicle to ensure proper operation of the brakes.

RESERVOIR, BRAKE MASTER CYLINDER

REMOVAL

REMOVAL

1. Remove the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.

Fig. 62: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

2. Thoroughly clean all surfaces of brake fluid reservoir (1) and master cylinder (3). Use only Mopar® Brake Parts Cleaner or equivalent.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

3. Using the appropriate tool, remove the roll pin (4) retaining the brake master cylinder reservoir (1) to the brake master cylinder (3).
4. Rock the brake fluid reservoir (1) side-to-side while pulling up to remove it from the seal grommets in master cylinder housing (3).

INSTALLATION

INSTALLATION

Fig. 63: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

1. Install **NEW** brake master cylinder reservoir (1) sealing grommets in brake master cylinder housing (3).
2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir (1) in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets or reservoir is not properly installed.
3. Using the appropriate tool, install the roll pin (4) retaining the brake master cylinder reservoir (1) to the brake master cylinder (3).
4. Install the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

ROTOR, BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be

refaced or replaced.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Fig. 64: Measuring Rotor Thickness
 Courtesy of CHRYSLER GROUP, LLC

Measure rotor thickness (1) at the center of the brake pad contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

On front rotors, Minimum thickness specifications are cast on the rotor's unmachined surface on the OD of the brake plate.

On rear rotors, Minimum thickness specifications are cast into the rotor's unmachined surface on the side of the hub mounting face. This area also shows the maximum thickness specifications for the hat section of the rotor.

ROTOR THICKNESS VARIATION**Fig. 65: Measuring Rotor Thickness****Courtesy of CHRYSLER GROUP, LLC**

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor.

1. If excessive rotor thickness variation is found, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly. Refer to **REMOVAL**.
3. Install wheel mounting (lug) bolts and spacers (washers) to secure rotor onto the hub assembly. Progressively tighten the (lug) bolts to specifications.
4. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) with Wheel (special tool #25-W, Roller Contact Point), or equivalent, to the knuckle. Position the dial indicator wheel to contact the rotor braking surface approximately 10 mm (0.39 in.) from the outer edge of the rotor.
5. Slowly rotate the brake rotor checking lateral runout, marking the low and high spots. Record these measurements.

6. Check and record the runout on the opposite side of the rotor in the same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. Refer to **SPECIFICATIONS**.
8. If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor and the one wheel stud closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.
9. Remove the rotor from the hub. Refer to **ROTOR, BRAKE, REMOVAL**.

NOTE: Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

10. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) to the knuckle. Position the dial indicator stem so it contacts the hub face near the outer diameter. Care must be taken to position the stem outside of the stud circle, but inside of the chamfer on the hub rim.
11. Slowly rotate the hub measuring runout. Hub runout should not exceed 0.040 mm (0.0016 inch). If runout exceeds this specification, the hub must be replaced. Refer to **HUB AND BEARING, REMOVAL** and **KNUCKLE, STEERING, REMOVAL**.
12. If hub runout does not exceed this specification, install the original rotor back on the hub, aligning the chalk mark on the rotor with a wheel mounting stud, two studs apart from the original stud.
13. Install wheel mounting (lug) bolts and spacers (washers) to secure rotor onto the hub assembly. Progressively tighten the (lug) bolts to specifications.
14. Mount the Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications.
15. If runout is still not within specifications, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Fig. 66: On-Car Brake Lathe
Courtesy of CHRYSLER GROUP, LLC

1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

NOTE: All brake rotors have markings for minimum allowable thickness cast on an unmachined surface of the rotor or stamped into the hat section. On this vehicle, the minimum thickness specification for the front brake rotor is located on the OD of the brake plate. The minimum thickness specification for the rear brake rotor is located on the side of the hub mounting face.

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE _____

MAINTAINED. Extreme care in the operation of rotor turning equipment is required.

REMOVAL

FRONT BRAKE ROTOR

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

1. Raise and support the vehicle, refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005815

Fig. 67: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper adapter bolts (2).

NOTE: The bolts are one time use and need to be discarded.

4. Remove the disc brake caliper and adapter as an assembly and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.
5. Remove the rotor retaining bolt and remove the rotor from the hub and bearing.

REAR BRAKE ROTOR

NOTE: Before proceeding, refer to **CAUTION** and **WARNING**.

The electronic parking brake actuator (EPB) must be retracted prior to removing the brake caliper assembly. This can be done in two ways:

- A diagnostic scan tool (Service Mode position)
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005817

Courtesy of CHRYSLER GROUP, LLC

6. Remove caliper from mounting bracket and support with a bungee cord or wire. Do not let it hang from the brake hose.
7. Remove caliper bracket mounting bolts (2) and remove caliper mounting bracket.

NOTE: **The bolts are one time use and need to be discarded.**

050870142

Fig. 71: Rotor & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove retaining bolt (1) and slide brake rotor (2) off the hub and bearing.

INSTALLATION

FRONT BRAKE ROTOR

NOTE: **Inspect disc brake pads before installation. Refer to INSPECTION .**

1. Clean the hub face to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor on the hub and bearing.
3. Install the brake rotor retaining bolt and tighten to 20 N.m (177 in. lbs.).

1715005815

Fig. 72: Identifying Brake Hose Connector And Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

4. Install the disc brake caliper and adapter bracket assembly over the brake rotor and knuckle.
5. Install **NEW** mounting bolts (2) securing the caliper adapter bracket to the knuckle and tighten to 175 N.m (129 ft. lbs.).
6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Lower the vehicle.
8. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
9. Check and adjust the brake fluid level in the reservoir as necessary.
10. Road test the vehicle and make several stops to seat the brake pads to the rotor.

REAR BRAKE ROTOR

050870142

Fig. 73: Rotor & Retaining Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads before installation. Refer to INSPECTION .**

1. Clean the hub face to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor (2) on the hub and bearing.
3. Install rotor retaining bolt (1) and tighten to 20 N.m (177 in. lbs.).

1715005821

Fig. 74: Installing Caliper Mounting Bracket And Two New Mounting Bolts

4. Install caliper mounting bracket and install two **NEW** mounting bolts (2) and tighten to 120 N.m (89 ft. lbs.).

0508012591

Fig. 75: Identifying Lubricant Application Areas
Courtesy of CHRYSLER GROUP, LLC

5. Before installing the brake pads, apply WOLFRACOA[®]T C (1) or equivalent lubricant to the abutment clips as shown in the illustration.

NOTE: **WOLFRACOA[®]T C or equivalent lubricant must be applied to prevent**

noise.

6. There is a small post on the lower backside of the inboard pad. Make sure that this post lines up with one of the slots on the piston to ensure the pad interfaces with the piston correctly.

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.

050868487

Fig. 76: Installing The Brake Pads To The Adapter Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Install the brake pads to the adapter bracket and install the caliper to the adapter bracket.
8. Install the disc brake caliper guide pin bolts (3). While holding the hex fitting on the caliper slides, tighten the guide pin bolts (1) to 43 N.m (32 ft. lbs.).

1715005817

Fig. 77: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

9. Install the brake line bracket and nut (2).
10. Install tire and wheel assembly. Refer to **INSTALLATION**.
11. Lower the vehicle.
12. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
13. Check and adjust the brake fluid level in the reservoir as necessary.
14. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
 - Exit the Service Mode with diagnostic scan tool.
 - While depressing the brake pedal, press the EPB switch.
15. Road test the vehicle and make several stops to seat the brake pads to the rotor.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

The electric park brakes consist of the following components:

- Electric park brake switch and indicator
- Electric park brake control module
- Two electromechanical motor gear units attached to conventional sliding calipers

- Communication to other modules allowing seamless operation of the electric parking brake

The electromechanical motor gear units attach directly to the rear brake calipers and provide clamp load through the caliper transferred to the brake rotor.

The motors are controlled by a bi-directional 12-volt feed and ground through the electric brake control module.

The module does not maintain voltage to the motors to keep the parking brake applied. Once engaged, the parking brake remains engaged even if the motors are disconnected.

For information on Service Mode and normal operating conditions. Refer to **MODULE, ELECTRIC PARK BRAKE, OPERATION**.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

SWITCH, ELECTRIC PARK BRAKE

DESCRIPTION

DESCRIPTION

Fig. 78: Identifying Electric Park Brake (EPB) Switch
Courtesy of CHRYSLER GROUP, LLC

All vehicles are equipped with a center-mounted, electric park brake (EPB) switch mounted between the front seats.

The EPB switch is a three-position switch that can be pulled up to apply or pressed down to release. The switch communicates with the EPB module through hard-wired circuits. The switch housing also includes an indicator to let the driver know when the parking brake is applied. If the vehicle is turned off, the indicator will extinguish after ten seconds.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

OPERATION

OPERATION

The EPB switch sends an on/off request signal to the EPB module to apply or release the EPB.

At any time, the EPB switch can be actuated. Depending on the speed of the vehicle when the EPB switch is actuated, the EPB module will output different commands to request the EPB to apply under the following conditions:

Static Apply (under 5 kph) - Retracts the EPB motors attached to the rear calipers to release the rear brakes.

Dynamic Apply (over 5 kph) - Actuates the hydraulic braking system.

0507012520

Fig. 79: Identifying Brake Warning And EPB Fault Lamp
Courtesy of CHRYSLER GROUP, LLC

There are two indicators in the instrument cluster to give feedback for the electric parking brake system. The

traditional red BRAKE warning lamp is illuminated when the EPB is applied. If there is a fault in the EPB system, an amber EPB fault lamp is illuminated.

NOTE: To remove the vehicle from Service Mode, press the EPB switch while also depressing the brake pedal.

For information on Service Mode and normal operating conditions. Refer to MODULE, ELECTRIC PARK BRAKE, OPERATION .

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

REMOVAL

REMOVAL

0508007143

Fig. 80: Identifying Electric Park Brake (EPB) Switch, Shift Bezel And Screws

Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

NOTE: If the EPB switch is removed while power is still applied to the vehicle, it will set a General Switch Fault (DTC) in the EPB module. The EPB switch is monitored by the EPB module to confirm it's availability at all times.

1. Disconnect negative (ground) cable from the battery and isolate it.
2. Remove the shift bezel (4). Refer to **BEZEL, SHIFTER, REMOVAL**.
3. Disconnect the electrical connector (1) from the EPB switch (3).
4. Remove the screws (2) from the EPB switch.

INSTALLATION

INSTALLATION

0508007143

Fig. 81: Identifying Electric Park Brake (EPB) Switch, Shift Bezel And Screws
Courtesy of CHRYSLER GROUP, LLC

1. Install the EPB switch (3) to the shift bezel (4).
2. Install the screws (2) securing the EPB switch (3) to the shift bezel (4).
3. Connect the electrical connector (1).
4. Install the shift bezel. Refer to **BEZEL, SHIFTER, INSTALLATION**.
5. Connect negative (ground) cable to the battery.

ACTUATOR, ELECTRIC PARK BRAKE

DESCRIPTION

DESCRIPTION

1715005819

Fig. 82: Identifying Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

The electromechanical motor gear units (1) attach directly to the conventional hydraulic rear brake calipers with two fasteners and provide clamp load through the caliper transferred to the brake rotor.

NOTE: If the electric park brake actuator is found to be defective or needs to be replaced, it can only be replaced as an assembly. There are no serviceable parts inside and is non-repairable.

OPERATION

OPERATION

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

The electric park brake (EPB) actuator is driven by the EPB module. It is a bi-directional motor that receives 12

volt power and ground through the EPB module to apply or release clamp load to the brake rotor. Once applied, it does not need voltage to maintain clamp load.

For information on Service Mode and normal operating conditions. Refer to **MODULE, ELECTRIC PARK BRAKE, OPERATION** .

REMOVAL

REMOVAL

NOTE: Release the electric park brake (EPB) before proceeding.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate battery negative cable from battery post.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

1715005817

Fig. 83: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect electrical connector (1) at the electric park brake actuator (EPB).

1710009336

Fig. 84: Identifying EPB Actuator
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two bolts (2) attaching the EPB actuator (1) from the brake caliper.

INSTALLATION

INSTALLATION

NOTE: Using an appropriate lubricant, lightly lubricate the O-ring on the body of the new EPB actuator before installing it.

1710009336

Fig. 85: Identifying EPB Actuator

Courtesy of CHRYSLER GROUP, LLC

1. Position the electric park brake (EPB) actuator (1) to the brake caliper and install the two bolts (2). Tighten the bolts to 12 N.m (106 in. lbs.).

1715005817

Fig. 86: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

2014 Jeep Cherokee Trailhawk

2014 BRAKES Base - Service Information - Cherokee

2. Connect the electrical connector (1) to the EPB actuator.
3. Lower the vehicle.
4. Connect negative (ground) cable to the battery.
5. Using the EPB switch, release the EPB, followed by an EPB apply and then another EPB release. Only in that order, even if the EPB is already in the released state. This will make sure the new actuator is working, recognized by the EPB module and there is correlation between the left and right sides.

2014 CLUTCH**Clutch System - Cherokee****DESCRIPTION****DESCRIPTION**

8114a710

Fig. 1: Clutch Hydraulic System - Typical
Courtesy of CHRYSLER GROUP, LLC

The typical clutch hydraulic system consists of a clutch master cylinder (2), slave cylinder (3), and an interconnecting hydraulic line. Clutch hydraulic fluid is supplied by the brake system via the brake master cylinder reservoir (1).

FLUID

CAUTION: Never use any type of petroleum-based fluid (engine oil, transmission oil, power steering fluid, etc.) in the clutch hydraulic system. Use of such fluids will result in master/slave cylinder seal damage, and cause a failure of the hydraulic clutch release system.

NOTE: Under normal operating conditions, the clutch hydraulic system does not require additional fluid for the life of the vehicle. Since the clutch shares the brake reservoir, the fluid level will be maintained whenever the brake system is checked.

The fluid required for use in the clutch hydraulic system is brake fluid conforming to DOT 3 specifications and J1703 standards. No other type of fluid is recommended or approved for use in the clutch hydraulic system. Use only MOPAR® brake fluid or equivalent from a tightly sealed container.

OPERATION

OPERATION

The clutch hydraulic system is responsible for engaging and disengaging the clutch. Depressing the clutch pedal develops hydraulic pressure in the clutch master cylinder. Hydraulic pressure is transmitted to the release bearing that is in contact with the pressure plate diaphragm spring. As hydraulic force is applied the bearing depresses the diaphragm spring inward on the fulcrums that pushes the pressure plate rearward releasing clamping force on the clutch disc.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH SYSTEM

Clutch problem diagnosis will generally require a road test to determine the type of fault. Component inspection will then determine the problem after road testing.

Drive the vehicle at normal speeds during road test. Shift the transaxle through all gear ranges and observe clutch action. If chatter, grab, slip, or improper release is experienced, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed. The transaxle or other driveline components may actually be at fault.

CLUTCH GRAB/CHATTER

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC FACING COVERED WITH OIL OR GREASE	Oil leak at engine rear main or transaxle input shaft seal.	Correct leak and replace modular clutch assembly.
	Too much grease applied to splines of disc and input shaft.	Apply lighter coating of grease to splines.
NO FAULT FOUND WITH CLUTCH COMPONENTS	Problem actually related to suspension or driveline component.	Further diagnosis required. Check engine/transmission mounts, suspension attaching parts and other driveline components as needed.
	Engine	Check EFI and

2014 Jeep Cherokee Trailhawk

2014 CLUTCH Clutch System - Cherokee

	related problems.	ignition systems.
PARTIAL ENGAGEMENT OF CLUTCH DISC	Clutch cover, spring, or release fingers bent, distorted (rough handling, improper assembly).	Replace clutch assembly.
	Clutch disc damaged or distorted.	Replace clutch assembly.
	Clutch Misalignment	Check clutch housing to engine dowels and dowel holes for damage. Correct as necessary.

CLUTCH SLIPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC FACING WORN OUT	Normal wear.	Replace clutch assembly.
	Driver frequently rides (slips) clutch, results in rapid wear, overheating.	Replace clutch assembly.
	Insufficient clutch cover diaphragm spring tension	Replace clutch assembly.
CLUTCH DISC FACING CONTAMINATED WITH OIL OR GREASE	Leak at rear main oil seal or transaxle input shaft seal	Replace leaking seals. Replace clutch assembly.
	Excessive amount of	Apply less grease to input

2014 Jeep Cherokee Trailhawk

2014 CLUTCH Clutch System - Cherokee

	grease applied to input shaft splines	shaft. Replace clutch assembly. -
	Road splash, water entering housing	Seal housing. Inspect clutch assembly.
	Concentric Slave Cylinder leaking hydraulic fluid	Replace Concentric Slave Cylinder (CSC)
CLUTCH IS RUNNING PARTIALLY DISENGAGED	Release bearing sticking or binding, does not return to normal running position.	Verify that bearing is actually binding. Then, replace bearing and transmission front bearing retainer if sleeve surface is damaged.
	Concentric Slave cylinder (CSC) binding	Replace Concentric Slave cylinder (CSC)
CLUTCH DISC FACINGS HAVE FRACTURED INTO SMALL PIECES	Driver performs a 5-1 downshift at vehicle speed in excess of 60 miles per hour	Alert driver to problem cause. Replace clutch assembly. Inspect slave cylinder and bearing for damage.
	Leak at rear main or transaxle input shaft seal	Replace seal. Replace clutch assembly. -
	Excessive heat from	Replace Clutch Assembly

2014 Jeep Cherokee Trailhawk**2014 CLUTCH Clutch System - Cherokee**

slippage

IMPROPER CLUTCH RELEASE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC BINDS ON INPUT SHAFT SPLINES	Clutch disc hub splines damaged during installation	Clean, smooth, and lubricate disc and shaft splines. Replace modular clutch assembly, or clutch disc, and/or input shaft if splines are severely damaged.
	Input shaft splines rough, damaged.	Clean input shaft splines. Then lube.
	Corrosion or rust formations on splines of input shaft and disc	Clean input shaft splines and disc splines, then lube
CLUTCH DISC RUSTED TO FLYWHEEL AND/OR PRESSURE PLATE	Occurs in vehicles stored or not driven for extended period of time. Also occurs after steam cleaning if vehicle is not used for extended period.	Replace clutch assembly.
CLUTCH WILL NOT DISENGAGE PROPERLY	Disc bent, distorted during transaxle	Replace clutch assembly.

2014 Jeep Cherokee Trailhawk**2014 CLUTCH Clutch System - Cherokee**

	installation	
	Clutch cover diaphragm spring damaged during transaxle installation	Replace clutch assembly.
	Air in clutch hydraulic system.	Bleed clutch hydraulic system to purge air.
	Clutch master cylinder or slave cylinder leaking	Check and replace master and/or slave cylinder

CLUTCH PEDAL NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH PEDAL SQUEAKS WHEN DEPRESSED TO FLOOR	Pedal bushings worn out or inadequate lubrication	Replace the Pedal assembly
	Push rod ball joint worn out	Lubricate or replace the push rod
	Clutch pedal return spring worn out	Replace the Pedal assembly

DIAGNOSIS AND TESTING - CLUTCH CHATTER COMPLAINTS

For all clutch chatter complaints, perform the following:

1. Check for loose, misaligned, or broken engine and transmission mounts. If present, they should be corrected at this time. Test vehicle for chatter. If chatter is gone, there is no need to go any further.
2. If chatter persists, check hydraulic clutch release system is functioning properly.
3. Check for loose connections in drivetrain. Correct any problems and determine if clutch chatter complaints have been satisfied. If not:

- a. Remove transaxle.
- b. Check to see if the release bearing is sticky or binding. Replace bearing, if needed.
- c. Check clutch assembly for contamination (dirt, oil). Replace clutch assembly, if required.
- d. Check to see if the clutch disc hub splines are damaged. Replace with new clutch assembly, if necessary.
- e. Check input shaft splines for damage. Replace, if necessary.
- f. Check for uneven wear on clutch fingers.
- g. Check for broken clutch cover diaphragm spring fingers. Replace with new clutch assembly, if necessary.

DIAGNOSIS AND TESTING - CLASH-INTO-REVERSE

Manual transaxles are equipped with a reverse synchronizer that reduces gear train spin down time after the clutch pedal is depressed. It prevents gear clash while shifting into reverse, when the vehicle is not moving.

1. Depress clutch pedal to floor and hold. After three seconds, shift to reverse. If clash is present, clutch has excessive spin time, and the reverse brake may not be functioning.
2. Remove transaxle.
3. Check the input shaft spline, clutch disc splines, and release bearing for dry rust. If present, clean rust off and apply a light coat of bearing grease to the input shaft splines. Apply grease on the input shaft splines only where the clutch disc slides. Verify that the clutch disc slides freely along the input shaft spline.
4. Check to see if the clutch disc hub splines are damaged, and replace with new clutch assembly if required.
5. Check the input shaft for damaged splines. Replace as necessary.
6. Check for broken clutch cover diaphragm spring fingers.
7. Install clutch assembly and transaxle.

STANDARD PROCEDURE

STANDARD PROCEDURE - BLEEDING CLUTCH HYDRAULIC CIRCUIT

MANUAL BLEEDING

NOTE: **A helper is required to perform this procedure.**

1. Verify fluid level in clutch/brake cylinder. Top off with DOT 3 brake fluid as necessary. Leave cap off.
2. Raise vehicle on a suitable hoist.
3. Remove the belly pan, if equipped.

210273640

Fig. 2: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

4. Remove the cap from the nipple (1) on top of the clutch slave cylinder union (4).

NOTE: Do not allow clutch/brake fluid reservoir to run dry while bleeding the clutch. If the reservoir runs dry during this procedure,

It must be refilled and the process must be repeated .

5. Have a helper depress and hold the clutch pedal to the floor.

NOTE: Verify the helper understands not release the clutch pedal from the floor until the technician closes the bleed port and signals the helper to cycle the clutch pedal to avoid inadvertently drawing air back into the system.

210273641

Fig. 3: Hydraulic Hose, Retainer Clip & Transparent Tubing
Courtesy of CHRYSLER GROUP, LLC

6. Connect a length of transparent tubing (1) to the bleeder nipple on the slave cylinder union. Insert the lower end of the transparent tube (1) into a clean container to catch the flow (4).
7. Press downward on the retainer clip (2) holding the hydraulic line to the slave cylinder union while pulling outward on the hydraulic hose (3) to open the bleeder flow (4). This allows the line to pop out about 1/8 in (3 mm) which opens the bleeder. Any air in the system will escape at this time.
8. Push the line (3) inward until the clip (2) snaps in place to stop the bleeder flow.
9. Repeat steps 5 through 8 at least fifteen times or until air bubbles are no longer visible in the transparent tube (1).
10. Slowly actuate the clutch pedal ten up/down cycles.
11. **Apply the brakes**

Start engine and verify clutch operation and pedal feel. If the clutch pedal feels fine and the transaxle can be easily shifted from neutral to any gear, the clutch is operating correctly. If pedal still feels spongy or clutch does not fully disengage, excessive air is still trapped within the system, most likely at the master cylinder.

12. Remove the transparent tube (1) from the nipple on the slave cylinder union.
13. Install the belly pan, if removed.
14. Lower the vehicle.
15. Top off brake master cylinder fluid level with DOT 3 brake fluid as necessary.

POWER BLEEDING CLUTCH HYDRAULIC CIRCUIT

1. Remove reservoir cap and connect bleeder cap to clutch/brake fluid reservoir.

NOTE: **Use Bleeder Cap/Modified reservoir cap adapter Snap-on #901-059 or equivalent.**

2. Connect power bleeding machine to bleeder cap.

NOTE: **Use Service Filling Machine/Brake power bleeder or equivalent.**

3. Service filling machine should be pressurized between 2.0 and 2.5 bar (29 - 36 PSI).
4. Raise vehicle on a suitable hoist.
5. Remove the belly pan, if equipped.

210273640

Fig. 4: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

6. Remove the dust cover from the nipple (1) on the hydraulic slave cylinder union (4).

210273641

Fig. 5: Hydraulic Hose, Retainer Clip & Transparent Tubing
Courtesy of CHRYSLER GROUP, LLC

7. Connect a length of transparent tubing (1) to the bleeder nipple. Insert the open end of the transparent tube (1) into a clean container to catch the fluid flow (4) during bleeding procedure.
8. Turn ON the power bleeding machine.

NOTE: While bleeding the system, do not allow the clutch fluid reservoir to completely to run dry. If this happens, refill the clutch fluid reservoir, and repeat the procedure.

9. Press downward on the retainer clip (2) holding the hydraulic line to the slave cylinder union while pulling outward on the hydraulic hose (3) to open the bleeder flow (4). This allows the line to pop out about 1/8 in (3 mm) which opens the bleeder. Any air in the system will escape at this time.
10. Allow fluid to flow (4) out of bleed port until no air bubbles are visible in the transparent tube (1).
11. Push the line (3) inward until the clip (2) snaps in place to stop the bleeder flow.
12. If necessary, lower the vehicle.
13. Slowly actuate the clutch pedal fifteen up/down cycles.
14. If necessary, hoist the vehicle.
15. Repeat steps 9 through 11 to verify air is NOT trapped in the system.
16. Turn OFF power bleeder machine.
17. If necessary, lower the vehicle.
18. **Apply brakes**

2014 Jeep Cherokee Trailhawk

2014 CLUTCH Clutch System - Cherokee

Start engine and verify clutch operation and pedal feel. If the clutch pedal feels fine and the transaxle can be easily shifted from neutral to any gear, the clutch is operating correctly. If pedal still feels spongy or clutch does not fully disengage, excessive air is still trapped in the system.

19. If clutch function is normal, disconnect bleeder machine and install reservoir cap.
20. If necessary, hoist the vehicle.
21. Remove the transparent tube (1) from the nipple on the slave cylinder union and install the dust cover.
22. Install the belly pan, if removed.
23. Lower the vehicle.

4. Connect the hydraulic connection at the case.
5. Install the transmission. Refer to **INSTALLATION**.
6. Bleed the hydraulic clutch system.

Refer to **STANDARD PROCEDURE**.

DISC, CLUTCH

REMOVAL

MANUAL

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

1. Remove the transaxle. Refer to **REMOVAL**.

Fig. 14: Flywheel Locking Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical installation of 10272 shown in illustration.

NOTE: It may be necessary to install an appropriate length 10 MM bolt, washer and nut in place of the supplied 12 MM fastener.

2. Install the (special tool #10272, Tool, Flywheel Locking).
3. Prior to removal, mark the position of the pressure plate to the flywheel with paint or scribe line for assembly reference.

Fig. 15: Pressure Plate-To-Flywheel Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Loosen pressure plate bolts (1) evenly, a few threads at a time and in a diagonal pattern to prevent warping the plate.
5. While holding the clutch and disc against the flywheel, remove the bolts (1) holding the pressure plate to the flywheel.
6. While securely holding the disc to the clutch plate, separate the clutch from the flywheel.

INSTALLATION

MANUAL

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

1. Inspect clutch release bearing and the Concentric Slave Cylinder (CSC) for excessive wear and replace if necessary.
2. Clean the surfaces of the flywheel and pressure plate to make certain that all oil, grease, and rust have been removed.

Fig. 16: Flywheel Locking Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical installation of 10272 shown in illustration.

3. Install the (special tool #10272, Tool, Flywheel Locking).

NOTE: It may be necessary to install an appropriate length 10 MM bolt, washer and nut in place of the supplied 12 MM fastener.

Fig. 17: Pressure Plate-To-Flywheel Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the clutch pressure plate to the flywheel and clutch disc. Finger tighten the pressure plate-to-flywheel bolts.

5. Use a suitable clutch alignment tool to position the clutch disc to the center of the flywheel.
6. Tighten pressure plate bolts (1) evenly and in rotation a few threads at a time. **The bolts must be tightened evenly and to specified torque to avoid distorting the pressure plate.**
7. Using a "star" torque pattern, tighten the pressure plate bolts (1). Refer to **SPECIFICATIONS**.
8. Remove the clutch alignment tool.
9. Apply light coat of Mopar® High Temperature Bearing Grease or equivalent to clutch disc hub and splines of transmission input shaft.

CAUTION: Do not over lubricate shaft splines. This will result in grease contamination of disc.

10. Install the transaxle.

FLYWHEEL

OPERATION

OPERATION

The flywheel serves to dampen the engine firing pulses. The heavy weight of the flywheel relative to the rotating mass of the engine components serves to stabilize the flow of power to the remainder of the drivetrain. The crankshaft has the tendency to attempt to speed up and slow down in response to the cylinder firing pulses. The flywheel dampens these impulses by absorbing energy when the crankshaft speeds and releasing the energy back into the system when the crankshaft slows down.

REMOVAL

MANUAL

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

Fig. 18: Removing/Installing Flywheel-To-Crankshaft Bolts And Flywheel Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove transmission.
2. Remove clutch pressure plate and disc.

Refer to **DISC, CLUTCH, REMOVAL**.

3. While holding the flywheel against the engine, remove the bolts (3) holding the flywheel to the crankshaft flange (1).
4. Separate the flywheel (2) from the engine.

INSTALLATION

MANUAL

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information. Whether the product contains asbestos or not, dust and dirt can accumulate on manual clutch parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

1. Place the flywheel (2) in position on the engine.
2. While holding the flywheel against the engine, install the bolts (3) to hold the flywheel to the crankshaft flange (1).

Fig. 19: Flywheel Locking Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical installation of 10272 shown in illustration.

3. Install (special tool #10272, Tool, Flywheel Locking).

NOTE: It may be necessary to install an appropriate length 10 MM bolt, washer and nut in place of the supplied 12 MM fastener.

Fig. 20: Removing/Installing Flywheel-To-Crankshaft Bolts And Flywheel Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Tighten the flywheel bolts to specification. Refer to **SPECIFICATIONS**.
5. Install clutch pressure plate and disc. Refer to **DISC, CLUTCH, REMOVAL**.

6. Install transmission.
7. Road test vehicle to verify repair.

PEDAL AND PAD, CLUTCH

REMOVAL

REMOVAL

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

NOTE: Before proceeding, refer to WARNING .

Refer to CAUTION .

NOTE: To remove brake/clutch/throttle pedal armature assembly from the vehicle, refer to PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL .

060868951

Fig. 21: Clevis Pin & E-Clip
Courtesy of CHRYSLER GROUP, LLC

1. Remove E-clip (3) holding the clevis pin (2) in the pedal armature.

060868950

Fig. 22: Clevis Pin, Armature, Clutch Pedal & Return Spring
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable pry bar, pry the clevis pin (1) from the left side of the armature (2) while holding the clutch pedal (4) in place.
3. As clevis (1) is pulled free of the armature (2) apply pressure to force the pedal inward to keep the return spring (5) from falling out of the assembly.
4. With one hand positioned under the return spring (5) to catch it, withdraw the clutch pedal (4) from the armature.

INSTALLATION

INSTALLATION

060868950

Fig. 23: Clevis Pin, Armature, Clutch Pedal & Return Spring
Courtesy of CHRYSLER GROUP, LLC

1. Position the return spring (5) over the pivot pin on the clutch pedal and into the notch on the plastic armature (2) while holding clutch pedal inward.
2. Align the clutch pedal (3) pivot bushings with the pass through holes in the armature (2).
3. Insert the clevis pin (1) into the left side of the armature (2) while holding the clutch pedal (3) in place. Align the head of the clevis with the inset on the armature and push the clevis all-the-way into the armature.

060868951

Fig. 24: Clevis Pin & E-Clip
Courtesy of CHRYSLER GROUP, LLC

4. Install the E-clip (3) to hold the clevis pin (2) in the pedal armature.

NOTE: To install brake/clutch/throttle pedal armature assembly in the vehicle, refer to PEDAL(S), BRAKE AND/OR ACCELERATOR, INSTALLATION .

SWITCH, CLUTCH STARTER INTERLOCK

DESCRIPTION

DESCRIPTION

The clutch pedal position switch is attached to the side of the brake/throttle/clutch pedal armature assembly. It is secured with an integral locking lever. A pin on the clutch pedal lever cycles the switch. A three pin electrical connector plugs into the switch.

OPERATION

OPERATION

The clutch pedal position switch is used to prevent starter motor engagement until the clutch pedal is fully depressed. An input from this switch is also used to either shut down or prevent operation of the speed control system when the clutch pedal is depressed. When the clutch pedal is depressed the switch contacts are closed and creates a complete circuit to allow the starter relay to energize the starter motor. When the clutch pedal is released, the switch contacts open and will not allow the starter relay to energize the starter motor.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH PEDAL POSITION SWITCH

The Clutch Pedal Position Switch consists of two open or closed style switches.

When the switch lever is at the rearward end of its swing (pedal released) the downstop or interlock switch is open and should not have continuity through the connector pins 1 and 2. The upstop switch is closed and should have continuity between pins 1 and 3.

When the switch lever is at the forward end of its swing (pedal depressed) the downstop or interlock switch is closed and should have continuity through the connector pins 1 and 2. The upstop switch is open and should not have continuity between pins 1 and 3.

061069620

Fig. 25: Clutch Pedal Position Switch Connector Terminal Identification

Courtesy of CHRYSLER GROUP, LLC

To test the switch, unplug the wire harness connector and connect a continuity tester or OHM meter to the pins in the switch connector (1).

CLUTCH PEDAL POSITION SWITCH TEST

SYMPTOM	TEST RESULT	REPAIR
Engine will not crank with clutch depressed.	1. No continuity is detected from pin 1 to pin 2 or continuity is detected from pin 1 to pin 3 with clutch pedal depressed.	1. Switch needs to be replaced. 2. Repair electrical fault in

2014 Jeep Cherokee Trailhawk

2014 CLUTCH Clutch System - Cherokee

	2. If switch tests OK with the clutch pedal depressed.	system.
Engine cranks with clutch released.	1. Continuity is detected from pin 1 to pin 2 or no continuity is detected from pin 1 to pin 2 with clutch pedal depressed. 2. If switch tests OK with the clutch pedal depressed.	1. Switch needs to be replaced. 2. Repair electrical fault in system.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable from its post on the battery.
2. If equipped, remove the knee blocker air bag to gain access to the brake/clutch/throttle pedal assembly.

Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .

060868953

Fig. 26: Pedal Arm Bracket & Lock-Levers
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect wire harness connector from clutch pedal position switch.
4. Disengage and rotate lock-lever (1) counterclockwise and pull the base of the lock-lever (3) outward.

3760133

Fig. 27: Locating Tab

Courtesy of CHRYSLER GROUP, LLC

5. Unhook retainer from slotted hole in pedal armature and separate the clutch pedal position switch from the clutch pedal arm.

INSTALLATION

INSTALLATION

3760133

Fig. 28: Locating Tab

Courtesy of CHRYSLER GROUP, LLC

1. Place the clutch pedal position switch onto the pin on the clutch pedal arm.
2. Hook (1) retainer on back of switch into the slotted hole in the clutch pedal armature.

060868953

Fig. 29: Pedal Arm Bracket & Lock-Levers
Courtesy of CHRYSLER GROUP, LLC

3. Insert the pin on the clutch pedal arm (2) into the switch lever and push the base of the lock-lever inward to engage the bracket (2).

2014 Jeep Cherokee Trailhawk
2014 CLUTCH Clutch System - Cherokee

4. Rotate lock-lever (3) clockwise until lever is seated.
5. Connect wire harness connector into clutch pedal position switch (1).
6. If equipped, install the knee blocker air bag.

Refer to **AIR BAG, KNEE BLOCKER, INSTALLATION** .

7. Connect the battery cable onto the negative post of the battery.

2014 DRIVELINE/AXLES

Front Half Shaft - Cherokee

DESCRIPTION

DESCRIPTION

This vehicle is equipped with an unequal length halfshaft system consisting of short left and long right halfshafts. The halfshafts consist of a fixed constant velocity (CV) joint at the outboard end connected by a solid shaft to a plunging CV joint on the inboard end. The inner (CV) joint has a splined connection into the transmission. The outer joint has a spline connection to the wheel hub and is retained with a steel lock nut.

All the halfshaft assemblies use the same type of inner and outer joints. The inner joint is a tripod joint that allows for the changes in halfshaft length through the jounce and rebound travel of the front suspension. The outer joint is a Rzeppa joint that allows articulation during front suspension travel and steering. Both tripod joints and Rzeppa joints are true constant velocity (CV) joint assemblies.

The inner tripod joints are designed with a retention feature that prevents the tripod rollers from coming out of the inner joint housing up to a specific load. If this feature is overcome and any of the rollers are pulled past the retention feature the joint will lock up and no longer function properly. The entire halfshaft assembly must be replaced if it locks up.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HALFSHAFT

VEHICLE INSPECTION

030369459

Fig. 1: C/V Joint, Tripod Joint, Halfshaft & Inner/Outer Boots
Courtesy of CHRYSLER GROUP, LLC

The general appearance of the Halfshafts should be clean and oil free around the CV (3) and tripod (1) boots (2). Grease on or around the boots is a sign of leakage and the boots or halfshaft should be replaced.

NOISE OR VIBRATION IN TURNS

Vibration associated with the CV joints in the halfshafts occur in the 3rd and 8th order. Use a vibration analyzer to determine the frequency of the vibration.

SYMPTOM	POSSIBLE CAUSE	REPAIR
Clicking noise while turning.	Lack of lube in CV joint boots.	Replace halfshaft
Chuckling or snap noise while turning.	Loose wheel or hub nut.	Tighten wheel or hub nut. Replace damaged components.
Loud knocking noise centering on inner CV tripod joints.	Damaged Differential side/pinion gears.	Remove halfshaft and rotate side gears by hand. Replaced damaged transaxle components.

Noise may also be caused by another component of the vehicle coming in contact with the half shaft, brake or wheel assemblies.

CLUNKING NOISE DURING ACCELERATION

SYMPTOM	POSSIBLE CAUSE	REPAIR
		1. Replace hub nut and

2014 Jeep Cherokee Trailhawk

2014 DRIVELINE/AXLES Front Half Shaft - Cherokee

Clunk/snap noise during launch or shifting into drive or reverse.	1. Loose hub nut. 2. Damaged hub splines.	properly tighten. 2. Replace hub bearing and halfshaft.
Clunking noise at low speed.	Severely worn or damaged tripod or CV joint.	Replace halfshaft.
Rattle/clunk over bumps. Grease slung around undercarriage.	Loss of lube in CV joint boots.	Replace halfshaft.

SHUDDER OR VIBRATION DURING ACCELERATION

SYMPTOM	POSSIBLE CAUSE	REPAIR
Shudder or vibration on acceleration.	1. Engine rotating beyond limits. 2. Worn or damaged half shaft inner tripod joint 3. Severely worn or damaged suspension or steering component. 4. Front end severely out of alignment.	1. Replaced damaged or worn engine/transaxle mounts. 2. Replace halfshaft. 3. Replace worn or damaged suspension or steering component. 4. Align front end. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE .

VIBRATION AT HIGHWAY SPEEDS

Vibration associated with the CV joints in the halfshafts occur in the 3rd and 8th order (3 or 8 events for each rotation). The inner tripod joint with three pivot axis has three events in each rotation of the halfshaft. This will produce a 3rd order vibration of the wheel rotation speed. The outer CV joint with 8 pivot axis balls has eight events in each rotation of the halfshaft. This will produce a 8th order vibration of the wheel rotation speed. An 8th order vibration will create a high pitch sound, like gear noise. Use a vibration analyzer to determine the frequency of the vibration before replacing components.

SYMPTOM	POSSIBLE CAUSE	REPAIR
Low frequency vibration, matching wheel speed. Wheel balance and runout is OK.	Foreign material (plastic bags, organic sinew and road debris) fouling the halfshaft.	Clean debris from around halfshaft.
High frequency vibration matching 3rd order wheel speed.	1. Faulty inner tripod joint. 2. Vehicle ride height is modified.	1. Replace halfshaft. 2. Return vehicle to proper ride height.
High pitch whine sound with possible high frequency vibration in the floor matching 8th order wheel speed.	1. Faulty outer CV joint. 2. Vehicle ride height is modified.	1. Replace halfshaft. 2. Return vehicle to proper ride height.

REMOVAL

WITHOUT INTERMEDIATE SHAFT

030369459

Fig. 2: C/V Joint, Tripod Joint, Halfshaft & Inner/Outer Boots

Courtesy of CHRYSLER GROUP, LLC

NOTE: Never handle the halfshaft assembly by the inner or outer boots (2). This can cause damage to the boot, which will allow contaminants to enter the C/V joint.

NOTE: The inner tripod joint (1) is designed with a retention feature that prevents the tripod rollers from coming out of the inner joint housing up to a specific load. If this feature is overcome and the rollers are pulled past the retention feature the joint will lock up and no longer function properly. The entire halfshaft assembly (4) must be replaced if this occurs.

030369423

Fig. 3: Hub Nut & Halfshaft
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle on a suitable hoist.
2. Remove the wheel and tire assembly from the vehicle. Refer to **REMOVAL**.
3. Using a suitable punch, lift the two staked areas in the hub nut to avoid damaging the halfshaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (1) from the halfshaft (2) and discard it.

The used hub nut is not reusable.

5. If equipped, remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**

Fig. 4: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower ball joint nut (4) to control arm.

NOTE: Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.

7. Pry the lower control arm (3) downward until ball joint stud clears the knuckle.

NOTE: The halfshaft may stick in the hub bearing during removal. A dead-blow or plastic hammer can be used to tap the halfshaft inward and out of the hub bearing.

8. Swing the steering knuckle (1) outward and off the halfshaft end.
9. Place a drain pan under the transaxle to catch fluid that may spill from differential seal when the halfshaft is removed.
10. Hold the halfshaft up and remove support stand.
11. Slip the halfshaft shaft from the differential seal.
12. Separate the halfshaft from the vehicle.

WITH INTERMEDIATE SHAFT

030369426

Fig. 5: C/V Joint, Tripod Joint, Halfshaft, Intermediate Shaft & Inner/Outer Boots

Courtesy of CHRYSLER GROUP, LLC

6. Remove bolts holding intermediate support bearing (6) to the engine bracket.
7. Separate the bearing bracket (6) from the engine support bracket and support the halfshaft on a suitable stand.

0205014774

Fig. 8: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

8. Remove the lower ball joint nut (4) to control arm.

NOTE: Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.

9. Pry the lower control arm (3) downward until ball joint stud clears the knuckle.

NOTE: The halfshaft may stick in the hub bearing during removal. A dead-blow or plastic hammer can be used to tap the halfshaft inward and out of the hub bearing.

10. Swing the steering knuckle (1) outward and off the halfshaft end.
11. Place a drain pan under the transaxle to catch fluid that may spill from differential seal when the halfshaft is removed.
12. Hold the halfshaft up and remove support stand.
13. Slip the halfshaft shaft from the differential seal.
14. Separate the halfshaft from the vehicle.

INSTALLATION

WITHOUT INTERMEDIATE SHAFT

Fig. 9: C/V Joint, Tripod Joint, Halfshaft & Inner/Outer Boots

Courtesy of CHRYSLER GROUP, LLC

NOTE: Never handle the halfshaft (4) assembly by the inner or outer boots (2). This can cause damage to the boot, which will allow contaminants to enter the C/V joint (3).

NOTE: The inner tripod joint (1) is designed with a retention feature that prevents the tripod rollers from coming out of the inner joint housing up to a specific load. If this feature is overcome and the rollers are pulled past the retention feature the joint will lock up and no longer function properly. The entire halfshaft assembly (3) must be replaced if this occurs.

1. Raise vehicle on a suitable hoist.
2. Position the halfshaft under the vehicle and over the lower control arm.

NOTE: Lightly apply a light grease to the splines prior to installation.

NOTE: When installing the right halfshaft on All Wheel Drive vehicles with a single speed Power Transfer Unit and manual transmission, use care when installing the halfshaft as the shaft must pass through multiple oil seals.

3. Slip the halfshaft shaft into the differential seal and lightly twist until intermediate shaft slides all the way into the differential.

NOTE: Attempt to remove tripod joint by hand to verify that the snap ring is fully engaged. If snap ring is fully engaged, tripod joint will not be removable from transmission by hand.

4. Swing the steering knuckle outward and engage the halfshaft end into the hub bearing spline.
5. Push the lower control arm downward until ball joint stud can enter the bottom of the knuckle.
6. Insert the ball joint stud into the control arm.

Fig. 10: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

7. Install a **NEW** lower ball joint to control arm nut (4) and tighten to 25 Nm Plus 175° (18 ft. lbs. Plus 175°). Refer to **FRONT, SPECIFICATIONS**.
8. Remove support stand from under the halfshaft.
9. If equipped, install the engine belly pan. Refer to **BELLY PAN, INSTALLATION**

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

10. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to 200 N.m (148 ft. lbs.)

3112889

Fig. 11: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools on staking tool while staking hub nut.

11. Using the staking tool (special tool #10287, Tool, Front Hub Staking), align the leading cutting edge of tool with the top left side channel on axle as shown in the illustration (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

Fig. 12: Special Tool #10287
Courtesy of CHRYSLER GROUP, LLC

NOTE: The hub nut must be staked so that it looks similar to **Fig. 11**. Both edges must be split and bent into the shape shown in the illustration (3). The staking must be in the opposite direction from the forward rotation of the wheel.

050768828

Fig. 13: Wheel Mounting Bolts

12. Install the wheel and tire assembly on the vehicle. Refer to **INSTALLATION** .
13. Lower the vehicle and road test to verify the repair.

WITH INTERMEDIATE SHAFT

030369426

Fig. 14: C/V Joint, Tripod Joint, Halfshaft, Intermediate Shaft & Inner/Outer Boots
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Never handle the halfshaft assembly by the inner or outer boots (2 and 4). This can cause damage to the boot, which will allow contaminants to enter the C/V joint.

NOTE: The inner tripod joint (1) is designed with a retention feature that prevents the tripod rollers from coming out of the inner joint housing up to a specific load. If this feature is overcome and the rollers are pulled past the retention feature the joint will lock up and no longer function properly. The entire halfshaft assembly (3) must be replaced if this occurs.

1. Raise vehicle on a suitable hoist.
2. Position the halfshaft under the vehicle and over the lower control arm.

NOTE: Lightly apply a light grease to the splines prior to installation.

3. Slip the halfshaft shaft into the differential seal and lightly twist until intermediate shaft slides all the way into the differential.
4. Hold the halfshaft up and place a support stand under the halfshaft to avoid damaging the halfshaft.
5. Swing the steering knuckle outward and engage the halfshaft end into the hub bearing spline.
6. Insert the ball joint stud into the control arm.

Fig. 15: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

7. Install a **NEW** nut (4) to lower ball joint stud to control arm and tighten to 25 Nm Plus 175° (18 ft. lbs. Plus 175°). Refer to **FRONT, SPECIFICATIONS**.

Fig. 16: C/V Joint, Tripod Joint, Halfshaft, Intermediate Shaft & Inner/Outer Boots
Courtesy of CHRYSLER GROUP, LLC

8. Position the intermediate bearing bracket (6) onto the engine support bracket and align the bolt holes.

9. Install bolts to hold intermediate support bearing (6) to the engine bracket. Refer to **SPECIFICATIONS**
10. Remove support stand from under the halfshaft.
11. If equipped, install the engine belly pan. Refer to **BELLY PAN, INSTALLATION** .

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

12. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to 200 N.m (148 ft. lbs.)

3112889

REMOVAL

REMOVAL

1. Remove halfshaft assembly from vehicle. Refer to **REMOVAL**.

030370922

Fig. 20: Removing Large Clamp
Courtesy of CHRYSLER GROUP, LLC

2. Remove the large clamp (2) retaining CV joint sealing boot (1) to CV joint housing and discard clamp.

030370915

Fig. 21: Removing Small Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Remove small clamp (2) holding CV joint boot (1) to interconnecting shaft and discard clamp.
4. Remove boot from CV joint housing and slide it down interconnecting shaft to expose the CV joint.
5. Wipe away grease to expose outer CV joint and interconnecting shaft.
6. Using a suitable vise with brass jaw insulators, secure the interconnecting shaft to prepare to remove the CV joint from the interconnecting shaft.

Fig. 22: Outer C/V Joint Removal From Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Using a dead-blow hammer (1), sharply strike the outer edge of the CV joint (2) to disengage the spider (3) from the circlip on interconnecting shaft.
8. Slide outer CV joint (2) off end of interconnecting shaft.
9. Remove the circlip from the end of the interconnecting shaft.
10. Slide the boot off interconnecting shaft.
11. Wipe excess lubricant from CV joint and inspect CV joint and interconnecting shaft for damage or excessive wear.

If the CV joint shows signs of excessive wear, the halfshaft assembly must be replaced.

INSTALLATION

INSTALLATION

1. Install a NEW circlip into the groove on the interconnecting shaft.

Fig. 23: Sealing Boot Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Position clamps in the grooves on the new CV joint boot (1).
3. Slide the new CV boot (1) onto the interconnecting shaft (4) until the boot seats is in the groove (3) on interconnecting shaft.

Fig. 24: Aligning CV Joint Hub
Courtesy of CHRYSLER GROUP, LLC

4. Align splines on interconnecting shaft with splines on CV joint hub (1) and push the CV joint onto interconnecting shaft.

030370923

Fig. 25: Installing CV Joint Hub
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Verify that the circlip compresses into the groove in the interconnecting shaft as the CV joint is installed on to the interconnecting shaft.

5. Using a brass hammer, drive the CV joint (1) onto the interconnecting shaft (3) until CV joint (1) is fully seated on the interconnecting shaft (3).

NOTE: Use **ONLY** the lubricant provided with the **NEW** boot during the assembly of the CV joint boot.

6. Apply 1/2 of the tube of lubricant, provided with the new boot, into the CV joint while articulating the joint in the housing. Apply the remaining amount inside the CV joint boot.
7. Position the small clamp (3) into CV joint boot recess (4).

Fig. 26: Sealing Boot Retaining Clamp Installed
 Courtesy of CHRYSLER GROUP, LLC

8. Using Special Tool (special tool #C-4975A, Installer, Axle Clamp), crimp (2) the small clamp (1) to hold the small end of the tripod boot (4) onto the interconnecting shaft (3).

Fig. 27: C-4975A - Installer, Axle Clamp
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Tighten tool until the jaws are closed and the clamp is fully crimped (2).

9. Seat the large end of the CV joint Boot onto the CV joint housing.
10. Inspect the CV joint boot to verify that it is not distorted or wrinkled in any way.

NOTE: It may be necessary to equalize the air inside boot to gain the proper shape.

11. An awl or trim stick can be inserted under the boot lip to equalize the air inside the boot.
12. Wrap new large "latching type boot clamp" around the CV joint boot large end and snap the ends of the clamp together in preparation for compressing the clamp.

Fig. 28: Clamping Tool Installed On Sealing Boot Clamp
Courtesy of CHRYSLER GROUP, LLC

13. Insert the prongs of Clamp Locking Tool (2) in the raised holes (1) on the clamp.

Fig. 29: Sealing Boot Clamp Correctly Installed
Courtesy of CHRYSLER GROUP, LLC

14. Squeeze tool together until the barbs (2) on underside of the clamp, lock into the windows in the topside of the clamp.
15. Install the halfshaft in the vehicle. Refer to **INSTALLATION** .

BOOT, DRIVE SHAFT, INNER

REMOVAL

REMOVAL

1. Remove the halfshaft from the vehicle. Refer to **REMOVAL**.

030370919

Fig. 30: Removing Large Boot Clamp
Courtesy of CHRYSLER GROUP, LLC

2. Remove large boot clamp (1) holding the inner tripod joint sealing boot (1) to tripod joint housing (2) and discard.

030370915

Fig. 31: Removing Small Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Remove small clamp (2) holding the inner tripod joint boot to interconnecting shaft and discard.
4. Push the boot down the interconnecting shaft to expose the tripod housing and tripod joint.
5. Slide the tripod joint housing off the spider assembly (2) and the interconnecting shaft.

Fig. 32: Spider Assembly Retaining Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

6. Remove snap-ring (3) holding the spider assembly to the interconnecting shaft.

Fig. 33: Spider Assembly Removal From Interconnecting Shaft
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not hit spider assembly bearings when removing spider assembly.

7. Slide the spider assembly (1) from interconnecting shaft (4). If spider assembly (1) will not come off interconnecting shaft by hand, it can be removed by tapping spider assembly with a brass drift (3).
8. Slide sealing boot off interconnecting shaft.
9. Thoroughly clean and inspect spider assembly, tripod joint housing, and interconnecting shaft for any signs of excessive wear.

If any parts show signs of excessive wear, the halfshaft assembly will require replacement. Component parts of these halfshaft assemblies are not serviceable.

INSTALLATION

INSTALLATION

NOTE: If the tripod joint bearings or housing is damaged due to loss of lubricant

1. Place new small clamp on Tripod boot.

Fig. 34: Sealing Boot Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Insert end of interconnecting shaft (4) into small end (2) of tripod boot (1).
3. Slide tripod boot up the interconnecting shaft (4) to gain access to the splined end of the interconnecting shaft.

Fig. 35: Spider Assembly Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Engage spline of interconnecting shaft (2) into the center on the tripod spider (1).

Fig. 36: Installing Spider Assembly On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Using a brass drift (4), tap tripod spider (2) onto the interconnecting shaft (3) until it seats and the snap-ring groove is exposed.

Fig. 37: Spider Assembly Retaining Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

6. Install the snap-ring (3) to hold the spider assembly to the interconnecting shaft.

NOTE: Use **ONLY** the lubricant provided with the **NEW** boot during the assembly of the tripod boot.

7. Apply 1/2 of the tube of lubricant, provided with the new boot, into tripod housing. Apply the remaining amount inside the tripod boot.

Fig. 38: Installing Tripod Housing On Spider Assembly
Courtesy of CHRYSLER GROUP, LLC

8. Engage the spider bearings (2) into the tripod housing (1).
9. Slide the spider into the tripod housing (1) until it seats.

Fig. 39: Sealing Boot Installation On Interconnecting Shaft
Courtesy of CHRYSLER GROUP, LLC

10. Slide boot (1) toward the tripod joint until the small end (2) seats in the recess (3) in the interconnecting shaft (4).
11. Insert tripod housing into the large end of the tripod boot.

Fig. 40: Sealing Boot Retaining Clamp Installed
Courtesy of CHRYSLER GROUP, LLC

12. Using Special Tool (special tool #C-4975A, Installer, Axle Clamp), crimp (2) the small clamp (1) to hold the small end of the tripod boot (4) onto the interconnecting shaft (3).

Fig. 41: C-4975A - Installer, Axle Clamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: Tighten tool until the jaws are closed and the clamp is fully crimped (2).

Fig. 42: Trim Stick Inserted For Venting Tripod Joint

Courtesy of CHRYSLER GROUP, LLC

13. Inspect the tripod boot to verify that it is not distorted or wrinkled in any way.

NOTE: It may be necessary to equalize the air inside boot to gain the proper shape.

14. An awl or trim stick (4) can be inserted under the boot lip to equalize the air inside the boot (1).
15. Center the clamp in the groove in the tripod joint boot.

030370916

Fig. 43: Locking Pliers & Lock Tabs

17. Squeeze the clamp (3) to engage the lock tabs to hold the tripod joint boot in position on the tripod joint housing (1).

2014 DRIVELINE/AXLES

Propeller Shaft - Cherokee

REMOVAL

REMOVAL

CAUTION: Propeller shaft removal is a two-person operation. Never allow propeller shaft to hang from the center bearing, or while only connected to power transfer unit (PTU) or rear driveline module flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the joint, boot, and/or center bearing from over-angulation. This may result in driveline vibrations.

1. Place transmission in neutral.
2. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE .

Fig. 1: Removing Bolts Holding Rear Propeller Shaft To Rear Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

3. Apply index marks on the rear pinion flange and the rear prop shaft.

NOTE: Be sure a helper is holding the propeller shaft in place.

4. Remove the bolts holding the rear propeller shaft to the rear pinion flange.

Fig. 2: Front Center Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the front center bearing mounting bolts (1).

Fig. 3: Rear Center Bearing Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the rear center bearing mounting bolts (1).

0306005213

Fig. 4: Sliding Propeller Shaft Off Power Transfer Unit
Courtesy of CHRYSLER GROUP, LLC

7. Slide the propeller shaft (1) off the Power Transfer Unit (PTU).

INSTALLATION

INSTALLATION

CAUTION: Propeller shaft removal is a two-person operation. Never allow propeller shaft to hang from the center bearing, or while only connected to power transfer unit (PTU) or rear driveline module flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the joint, boot, and/or center bearing from over-angulation. This may result in driveline vibrations.

NOTE: Lightly apply a light grease to the splines prior to installation.

0306005213

Fig. 5: Installing Propeller Shaft Into Power Transfer Unit
Courtesy of CHRYSLER GROUP, LLC

1. With the aid of a helper, install the propeller shaft (1) into the Power Transfer Unit (PTU).

NOTE: Attempt to remove propeller shaft joint by hand to verify that the snap ring is fully engaged. If snap ring is fully engaged, propeller shaft joint will not be removable from PTU by hand.

0306005215

Fig. 6: Rear Center Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Align the center bearing mounts in place.

3. Install the rear center bearing bolts (1) and torque to 23 N.m (17 ft. lbs.).

Fig. 7: Front Center Bearing Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the front center bearing bolts (1) and torque to 23 N.m (17 ft. lbs.).

Fig. 8: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

5. Align index marks on the propeller shaft to the pinion flange.
6. Replace propeller shaft bolts (1) and torque to 21 N.m (15 ft. lbs.).

2014 DRIVELINE/AXLES**Rear Driveline Module - Cherokee****OPERATION****OPERATION**

The primary benefits of All Wheel Drive are:

- Superior straight line acceleration, and cornering on all surfaces
- Better traction and handling under adverse conditions, resulting in improved hill climbing ability and safer driving.

ECU (Inside vehicle) uses throttle position, wheel speeds and steering angle (if equipped) to control clutch.

DIAGNOSIS AND TESTING**REAR DRIVELINE MODULE OPERATION**

Driveline module operation requires relatively straight-forward diagnosis. Refer to the following chart:

CONDITION	POSSIBLE CAUSES	CORRECTION
No AWD in forward or reverse directions, propeller shaft turning	1. Check Drivetrain Control Module for DTC's.	1. Review Drivetrain Control Module diagnostic service information
	2. Power Transfer Unit (PTU) failure	2. Replace the PTU assembly
No AWD in forward or reverse directions, propeller shaft not turning	1. Check Drivetrain Control Module for DTC's.	1. Review Drivetrain Control Module diagnostic service information
	2. Differential, Rear Axle component failure.	2. Diagnose and repair or replace as necessary.
Vibration at all speeds, continuous torque transfer	1. Mis-matched tires, worn tires on front axle.	1. Replace worn or incorrect (mis-matched) tires with same make and size

REAR DRIVELINE MODULE NOISE

Different sources can be the cause of noise that the rear driveline module assembly is suspected of making. Refer to the following causes for noise diagnosis.

DRIVELINE MODULE ASSEMBLY NOISE

The most important part of driveline module service is properly identifying the cause of failures and noise

complaints. The cause of most driveline module failures is relatively easy to identify. The cause of driveline module noise is more difficult to identify.

If vehicle noise becomes intolerable, an effort should be made to isolate the noise. Many noises that are reported as coming from the driveline module may actually originate at other sources. For example:

- Tires
- Road surfaces
- Wheel bearings
- Engine
- Transmission
- Exhaust
- Propeller shaft (vibration)
- Vehicle body (drumming)

Driveline module noises are normally divided into two categories: gear noise or bearing noise. A thorough and careful inspection should be completed to determine the actual source of the noise before replacing the driveline module. Other sources of noise from the rear driveline module are the pump, actuator, and low hydraulic fluid level.

The rubber mounting bushings help to dampen-out driveline module noise when properly installed. Inspect to confirm that no metal contact exists between the driveline module case and the body or suspension cradle. The complete isolation of noise to one area requires expertise and experience. Identifying certain types of vehicle noise baffles even the most capable technicians. Often such practices as:

- Increase tire inflation pressure to eliminate tire noise.
- Listen for noise at varying speeds with different driveline load conditions
- Swerving the vehicle from left to right to detect wheel bearing noise.

All driveline module assemblies produce noise to a certain extent. Slight carrier noise that is noticeable only at certain speeds or isolated situations should be considered normal. Carrier noise tends to peak at a variety of vehicle speeds. The pump and actuator may be audible in certain situations that may be normal. Noise is **NOT ALWAYS** an indication of a problem within the carrier or rear driveline module components.

TIRE NOISE

Tire noise is often mistaken for driveline module noise. Tires that are unbalanced, worn unevenly or are worn in a saw-tooth manner are usually noisy. They often produce a noise that appears to originate in the driveline module.

Tire noise changes with different road surfaces, but driveline module noise does not. Inflate all four tires with approximately 20 psi (138 kPa) more than the recommended inflation pressure (for test purposes only). This will alter noise caused by tires, but will not affect noise caused by the differential. Rear axle noise usually ceases when coasting at speeds less than 30 mph (48 km/h); however, tire noise continues, but at a lower frequency, as the speed is reduced.

After test has been completed lower tire pressure back to recommended pressure.

GEAR NOISE (DRIVE PINION AND RING GEAR)

Abnormal gear noise is rare and is usually caused by scoring on the ring gear and drive pinion. Scoring is the result of insufficient or incorrect lubricant in the carrier housing.

Abnormal gear noise can be easily recognized. It produces a cycling tone that will be very pronounced within a given speed range. The noise can occur during one or more of the following drive conditions:

- Drive
- Road load
- Float
- Coast

Abnormal gear noise usually tends to peak within a narrow vehicle speed range or ranges. It is usually more pronounced between 30 to 40 mph (48 to 64 km/h) and 50 to 60 mph (80 to 96 km/h). When objectionable gear noise occurs, note the driving conditions and the speed range.

BEARING NOISE (DRIVE PINION AND DIFFERENTIAL)

Defective bearings produce a rough growl that is constant in pitch and varies with the speed of vehicle. Being aware of this will enable a technician to separate bearing noise from gear noise.

Drive pinion bearing noise that results from defective or damaged bearings can usually be identified by its constant, rough sound. Drive pinion front bearing is usually more pronounced during a coast condition. Drive pinion rear bearing noise is more pronounced during a drive condition. The drive pinion bearings are rotating at a higher rate of speed than either the differential side bearings or the axle shaft bearing.

Differential side bearing noise will usually produce a constant, rough sound. The sound is much lower in frequency than the noise caused by drive pinion bearings.

Bearing noise can best be detected by road testing the vehicle on a smooth road (black top). However, it is easy to mistake tire noise for bearing noise. If a doubt exists, the tire treads should be examined for irregularities that often causes a noise that resembles bearing noise.

ENGINE AND TRANSMISSION NOISE

Sometimes noise that appears to be in the driveline module assembly is actually caused by the engine or the transmission. To identify the true source of the noise, note the approximate vehicle speed and/or RPM when the noise is most noticeable. Stop the vehicle next to a flat brick or cement wall (this will help reflect the sound). Place the transaxle in **NEUTRAL** . Accelerate the engine slowly up through the engine speed that matches the vehicle speed noted when the noise occurred. If the same noise is produced, it usually indicates that the noise is being caused by the engine or transaxle.

REMOVAL**REMOVAL**

CAUTION: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to

following these instructions will result in damage.

CAUTION: Propeller shaft installation is a two-person operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

1. Disconnect the battery negative cable.
2. Lift and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL**.

Fig. 1: Identifying Pressure Sensor And Pump Motor Electrical Connectors

4. Disconnect the pressure sensor electrical connector (1).
5. Disconnect the pump motor electrical connector (2).
6. Disconnect the vent hose.

Fig. 2: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

7. Apply alignment index marks to the rear propeller shaft and rear pinion flange.
8. Remove the bolts (1) holding the rear propeller shaft to the rear pinion flange.
9. Separate the rear propeller shaft from the rear pinion flange and secure the shaft to the side.

Fig. 3: Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

10. Using a suitable punch, remove the staking from the right side axle shaft nut (1).
11. Remove the right side axle shaft nut (1).

12. Remove the left rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL**

NOTE: Mark the axle shaft for location.

0306005204

Fig. 4: Identifying Rear Half Shaft
Courtesy of CHRYSLER GROUP, LLC

13. Remove the left axle shaft (1) from the Rear drive Module.

NOTE: It may be necessary to hold the stub shafts in place when removing the axle shaft.

NOTE: Tag the axle shaft shims for location.

Fig. 5: Identifying Axle Shaft And Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

14. Support the Rear Drive Module (1) with a suitable jack and secure it with chains.

Fig. 6: Rear Mount Bolt
Courtesy of CHRYSLER GROUP, LLC

15. Remove the rear mount bolt (1) from the Rear Drive Module.

NOTE: The rear sway bar (2) may need to be repositioned out of the way to remove RDM bolt (1).

Fig. 7: Front Mount Bolts

Courtesy of CHRYSLER GROUP, LLC

16. Remove the front mount bolts (1 and 2) from the Rear Drive Module.
17. Lower the Rear Drive Module with the right axle shaft (1) attached to the Rear Drive Module.

NOTE: The right side axle shaft may need to be tapped out with a suitable tool from the right hub.

18. If necessary remove the right axle shaft.

INSTALLATION

INSTALLATION

CAUTION: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instructions will result in damage.

CAUTION: Propeller shaft installation is a two-person operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller

shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

Fig. 8: Installing The Rear Drive Module (RDM) Mount Bracket And Torque Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the Rear Drive Module (RDM) mount bracket and torque bolts (1) to 60 N.m (44 ft. lbs.).

NOTE: Clean the splined mating surfaces and apply a light grease to the internal splines prior to installing halfshaft.

2. If removed, install the right axle shaft onto the RDM. Clean any residual excess grease from RDM output shaft.
3. Install the right axle shaft shim onto hub end of shaft.
4. Secure the RDM on a suitable jack and secure it with chains.
5. If service was performed to the RDM and hydraulic fluid needs to be added, refer to **FLUID, HYDRAULIC, STANDARD PROCEDURE**.
6. Raise the Rear Drive Module with the right axle shaft into position.

NOTE: There are locating pins on the RDM mount bracket. Make sure the RDM mount bracket is in the correct location.

Fig. 9: Identifying Axle Shaft And Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

7. Guide the right axle shaft (2) into the right side hub.
8. Connect the vent hose.

Fig. 10: Rear Mount Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Install rear mount bolt into RDM.

NOTE: Do not tighten at this time.

NOTE: The rear sway bar (2) may need to be repositioned to install the RDM bolt (1).

Fig. 11: Front Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the front mount bolts into the RDM.
11. Torque all RDM mount bolts to 130 N.m (96 ft.lbs.).

Fig. 12: Identifying Rear Axle Shaft
Courtesy of CHRYSLER GROUP, LLC

12. If service was performed the RDM and differential fluid needs to be added, refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

NOTE: **Clean the splined mating surfaces and apply a light grease to the internal splines prior to installing halfshaft.**

13. Install the left axle shaft onto the RDM. Clean any residual excess grease from RDM output shaft.
14. Install the axle shaft shim onto hub end of the shaft.
15. Install the left rear knuckle. Refer to **KNUCKLE, REAR, INSTALLATION** .

Fig. 13: Axle Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.**

16. Install a **new** right axle shaft nut (1) and torque to 200 N.m (148 ft. lbs.).

3112889

Fig. 14: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools while staking hub nut.

17. Using the staking tool (special tool #10287, Tool, Front Hub Staking), align the leading cutting edge of tool with the top left side channel on axle as shown in the illustration (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked so that it looks similar to **Fig. 14**. Both edges must be split and bent into the shape shown in the illustration (3). The staking must be in the opposite direction from the forward rotation of the wheel.

Fig. 15: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

18. Connect the rear prop shaft to the alignment mark and torque bolts (1) to 21 N.m (15 ft. lbs.).

Fig. 16: Identifying Pressure Sensor And Pump Motor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

19. Connect the pump motor electrical connector (2).
20. Connect the pressure sensor electrical connector (1).
21. Install the muffler. Refer to **MUFFLER, EXHAUST, INSTALLATION** .

CASE ASSEMBLY, DIFFERENTIAL

DESCRIPTION

DESCRIPTION

The differential gear system divides the torque between the axle shafts. It allows the axle shafts to rotate at different speeds when turning corners.

Each differential side gear is splined to an axle shaft. The pinion gears are mounted on a pinion mate shaft and are free to rotate on the shaft. The pinion gear is fitted in a bore in the differential case and is positioned at a right angle to the axle shafts.

OPERATION

OPERATION

Fig. 17: Differential Operation-Straight Ahead Driving
Courtesy of CHRYSLER GROUP, LLC

- 1 - IN STRAIGHT AHEAD DRIVING EACH WHEEL ROTATES AT 100% OF CASE SPEED
- 2 - PINION GEAR
- 3 - SIDE GEAR

4 - PINION GEARS ROTATE WITH CASE

In operation, power flow occurs as follows:

- The pinion gear (2) rotates the ring gear
- The ring gear (bolted to the differential case) rotates the case
- The differential pinion gears (mounted on the pinion mate shaft in the case) rotate the side gears
- The side gears (splined to the axle shafts) rotate the shafts

During straight-ahead driving, the differential pinion gears do not rotate on the pinion mate shaft. This occurs because input torque applied to the gears is divided and distributed equally between the two side gears. As a result, the pinion gears revolve with the pinion mate shaft but do not rotate around it.

Fig. 18: Differential Operation-On Turns
Courtesy of CHRYSLER GROUP, LLC

1 - PINION GEARS ROTATE ON PINION SHAFT

When turning corners, the outside wheel must travel a greater distance than the inside wheel to complete a turn. The difference must be compensated for to prevent the tires from scuffing and skidding through turns. To accomplish this, the differential allows the axle shafts to turn at unequal speeds. In this instance, the input torque applied to the pinion gears is not divided equally. The pinion gears now rotate around the pinion mate shaft in opposite directions. This allows the side gear and axle shaft attached to the outside wheel to rotate at a faster speed.

FLUID, DIFFERENTIAL

STANDARD PROCEDURE

STANDARD PROCEDURE-DIFFERENTIAL FLUID FILL

The differential is fluid is fill for life.

The fill plug (1) for the differential assembly is located on rear of the Rear Drive Module (RDM).

The correct fill level is to the bottom of the fill plug hole. Be sure the vehicle is on a level surface, or is hoisted in a level manner, in order to obtain the correct fill level.

Differential fluid must be equalized though out differential. It may take a couple of minutes for the fluid to equalize.

1. Raise and support the vehicle on a hoist. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 19: Differential Fill Plug

Courtesy of CHRYSLER GROUP, LLC

2. Position a drain pan under the differential fill plug (1).
3. Remove the differential fill plug (1).

NOTE: When filling the differential, it may take several minutes for the fluid to equalize, it is necessary to allow for fluid equalization to determine if the fluid level is correct when filling.

4. Using a suction gun or equivalent, fill the differential assembly to the bottom of the fill plug. If removed for service the fluid capacities are 89L (.94 Quarts) if single speed, 1.15 L (1.2 Quarts) if two speed standard, 1.23 L (1.3 Quarts) if two speed with locker of Mopar® specified MS-2395 fluid (70W-80). Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

CAUTION: RDM fluid contains a special modifier package for the wet clutch. Use of any other fluid not meeting the manufacturer specifications will cause damage to the RDM.

5. Install the fill plug (1) and torque to 35 N.m (26 ft. lbs.).

SEAL, INPUT FLANGE

REMOVAL

REMOVAL

NOTE: The pinion turning torque must be measured before the pinion flange is removed, for correct installation.

Fig. 20: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

1. Apply alignment index marks to the rear propeller shaft and rear pinion flange.
2. Remove the bolts (1) holding the rear propeller shaft to the rear pinion flange.
3. Separate the rear propeller shaft from the rear pinion flange and secure the shaft to the side.
4. Measure and record pinion turning torque.
5. Using suitable chisel, remove the staking from the pinion nut.
6. Remove the pinion nut.

030674758

Fig. 21: Removing The Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

7. Using (special tool #C-452, Puller, Companion Flange) (1), remove the pinion flange (2).

030674759

Fig. 22: Removing The Pinion Seal Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

8. Remove the pinion seal (3) using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (1).

9. Clean and inspect the sealing surface on the pinion flange, if damaged install a **NEW** pinion flange. If the pinion seal bore is damaged it will be necessary to replace the Differential, Rear Axle assembly.

INSTALLATION**INSTALLATION**

030674760

Fig. 23: Installing Pinion Seal Using Special Tool**Courtesy of CHRYSLER GROUP, LLC**

1. Install the pinion seal using (special tool #9987, Installer, Seal) (1).
2. Clean splines, apply Mopar® thread sealant meeting MS-CD95A or equivalent to the splines in the flange.

NOTE: For pinion flange installation 3-5 (in. lbs.) must be added to the original measured pinion turning torque.

030674751

Fig. 24: Installing Pinion Nut Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Place the pinion flange on the splines of the pinion.
4. Install a **NEW** pinion nut and tighten using (special tool #8979, Wrench, Pinion Flange) (1).

NOTE: **Do not over tighten pinion nut. The turning torque must be 3-5 (in lbs.) more than the turning torque before removal.**

5. Measure the pinion turning torque, adding 3-5 (in. lbs.) to pinion nut measurement that was measured before pinion flange removal.
6. Using a suitable chisel, stake the pinion nut on both sides of the nut.

Fig. 25: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

7. Connect the rear prop shaft with the alignment marks lined up.
8. Torque rear prop shaft bolts (1) to 21 N.m 15 (ft. lbs.).
9. Fill the differential, rear axle. Refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

SEAL, OUTPUT FLANGE

REMOVAL

ONE SPEED

1. Disconnect battery negative cable.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .

0306005204

Fig. 26: Identifying Rear Axle Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the axle shaft (1) from the Differential, Rear Axle.

NOTE: The output shaft may need to be held in place when removing the axle shaft.

NOTE: Tag the axle shaft shim for location.

030674756

Fig. 27: Removing Clip From Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove clip (2) from output shaft (1).

030674757

Fig. 28: Removing Output Shaft Using Special Tools
Courtesy of CHRYSLER GROUP, LLC

6. Using (special tool #8420B, Remover, Shaft) (2) and (special tool #C-637, Slide Hammer, Universal) (3) remove the output shaft (1).

030674754

Fig. 29: Removing The Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

7. Remove the output shaft seal (1) using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (3).
8. Clean and inspect the sealing surface on the output shaft, if damaged install a **NEW** output shaft. If the pinion seal bore is damaged it will be necessary to replace the Differential, Rear Axle assembly.

TWO SPEED - LEFT

1. Disconnect battery negative cable.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .

Fig. 30: Identifying Axle Half Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the axle shaft (1) from Rear Axle Differential.

NOTE: The output shaft may need to be held in place when removing the axle shaft.

NOTE: Tag the axle shaft shim for location.

030674756

Fig. 31: Removing Clip From Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove clip (2) from output shaft (1).

030674757

Fig. 32: Removing Output Shaft Using Special Tools
Courtesy of CHRYSLER GROUP, LLC

6. Using (special tool #8420B, Remover, Shaft) (2) and (special tool #C-637, Slide Hammer, Universal) (3) remove the output shaft (1).

030674754

Fig. 33: Removing The Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

7. Remove the output shaft seal (1) using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (3).
8. Clean and inspect the sealing surface on the output shaft, if damaged install a **NEW** output shaft. If the pinion seal bore is damaged it will be necessary to replace the Differential, Rear Axle assembly.

TWO SPEED - RIGHT

1. Disconnect battery negative cable.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .

0306005204

Fig. 34: Removing The Axle Shaft From Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

4. Remove the axle shaft (1) from Rear Axle Differential.

NOTE: Tag the axle shaft shim for location.

1722017968

Fig. 35: Removing The Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. If equipped with two speed with locker, carefully remove the dust deflector using a slide hammer. If equipped with a two speed non locking differential, using (special tool #9585, Remover, Bearing Cup) (2) and (special tool #C-637, Slide Hammer, Universal) (3) remove the output shaft (1).

030674754

Fig. 36: Removing The Output Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

6. If equipped with a two speed locking differential, pry the seal out with an appropriate screwdriver being careful not to damage the seal bore. If equipped with a two speed non locking differential, remove the output shaft seal (1) using (special tool #7794-A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal) (3).

NOTE: Left side shown in the illustration, right side similar.

7. Clean and inspect the sealing surface on the output shaft, if damaged install a **NEW** output shaft. If the pinion seal bore is damaged it will be necessary to replace the Differential, Rear Axle assembly.

INSTALLATION

ONE SPEED

Fig. 37: Installing The Output Seal Onto Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Install the output seal (1) onto (special tool #6952A, Installer, Seal) (2).

Fig. 38: Installing The Output Seal Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install the output seal using (special tool #6952A, Installer, Seal) (1).
3. Install the output shaft into the Rear Axle Differential.

030674756

Fig. 39: Installing Clip Onto Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Install a new circlip (2) onto output shaft (1).
5. Install the axle shaft shim on the hub end of the shaft.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to the seal upon installation.

0306005211

Fig. 40: Installing The Half Shaft Onto The Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lightly apply a light grease to the splines prior to installing halfshaft.

6. Install the axle shaft (2) onto the Rear Axle Differential (1).

NOTE: Be sure the axle shaft is installed fully into circlip.

7. Install the rear knuckle. Refer to **KNUCKLE, REAR, INSTALLATION** .
8. Fill the differential fluid. Refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

TWO SPEED - LEFT

Fig. 41: Installing The Output Seal Onto Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Install the output seal (1) onto (special tool #10117, Installer, Seal) (2).

030674755

Fig. 42: Installing The Output Seal Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install the output seal using (special tool #10117, Installer, Seal) (1).
3. Install the output shaft into the Differential, Rear Axle.

NOTE: Always use (special tool #9099, Seal Protector, Differential Output) when installing shaft into Rear Axle Differential. If Seal Protector is new, split at the seam before using.

030674756

Fig. 43: Installing A New Circlip Onto Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Install a new circlip (2) onto output shaft (1).

5. Install the axle shaft shim on the hub end of the shaft.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to the seal upon installation.

Fig. 44: Installing The Half Shaft Onto The Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lightly apply a light grease to the splines prior to installing halfshaft.

6. Install the axle shaft (2) onto the output shaft.

NOTE: Be sure the axle shaft is installed fully into circlip.

7. Install the rear knuckle. Refer to **KNUCKLE, REAR, INSTALLATION** .
8. Fill the differential fluid. Refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

TWO SPEED - RIGHT

0303026982

Fig. 45: Installing The Output Seal Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Install the output seal using (special tool #D-163, Installer, Seal) and (special tool #C-4171-2, Extension, Drive Handle).
2. If equipped with a two speed with locker, install dust deflector onto shaft. If equipped with a two speed non locking differential install the output shaft into the Rear Axle Differential.

NOTE: Always use (special tool #9099, Seal Protector, Differential Output) when installing shaft into the Differential, Rear Axle. If seal protector is new, split at the seam before using.

3. Install a new circlip to the output shaft.
4. Install the axle shaft shim on the hub end of the shaft.

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to the seal upon installation.

Fig. 46: Installing The Half Shaft Onto The Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lightly apply a light grease to the splines prior to installing halfshaft.

5. Install the axle shaft (2) onto the Rear Axle Differential, Rear Axle (1).

NOTE: Be sure the axle shaft is installed fully and circlip is seated onto output shaft.

6. Install the rear knuckle. Refer to **KNUCKLE, REAR, INSTALLATION** .
7. Fill the differential fluid. Refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

SENSOR, PRESSURE

REMOVAL

REMOVAL

Fig. 47: Removing The Pressure Sensor From The Rear Drive Module Housing
Courtesy of CHRYSLER GROUP, LLC

1. Place a drain pan under the (RDM) Rear Drive Module.
2. Disconnect the electrical connector from the pressure sensor.
3. Remove the pressure sensor (1) from the Rear Drive Module housing.
4. Allow fluid to drain from the housing.

INSTALLATION

INSTALLATION

Fig. 48: Replacing The Pressure Sensor With Pre-Applied Sealant To The Threads

Courtesy of CHRYSLER GROUP, LLC

1. Replace the pressure sensor (1) with pre-applied sealant to the threads.
2. Torque the pressure sensor (1) to 21 Nm (15 ft. lbs.).
3. Check and adjust the Rear Drive Module (RDM) hydraulic fluid level and bleed hydraulic system. Refer to **FLUID, HYDRAULIC, STANDARD PROCEDURE**.

CAUTION: Do not mix hydraulic fluid and the RDM lubricant. Use only recommended fluid to prevent damage to Rear Driveline Module components. Fluid must meet material specification MS-2155.

MOTOR, PUMP

REMOVAL

REMOVAL

NOTE: Some hydraulic fluid will be lost when removing the motor and pump assembly.

NOTE: The Rear Drive Module (RDM) must be topped off with proper hydraulic fluid if motor and pump assembly is being serviced. The hydraulic system then must be bled.

CAUTION: Do not mix hydraulic fluid and the RDM lubricant. Use only recommended fluid to prevent damage to Rear Driveline Module components. Fluid must meet material specification MS-2155.

1. With the scan tool park the RDM.
2. Position a drain under the RDM.

Fig. 49: Removing Three Fasteners From The RDM Motor And Pump Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Remove the three fasteners (1) from the RDM motor and pump assembly. **Do not remove the fasteners securing the motor to the pump (2) .**

Fig. 50: Removing The Motor And Pump Assembly From The RDM
Courtesy of CHRYSLER GROUP, LLC

4. Remove the motor and pump assembly (1) from the RDM.

CAUTION: Do not use motor housing as a lever or handle when removing pump and motor assembly, damage to the pump or motor may result.

INSTALLATION

INSTALLATION

1722017966

Fig. 51: Identifying Motor And Pump Assembly O-Rings
Courtesy of CHRYSLER GROUP, LLC

1. Park the Rear Drive Module motor and pump assembly using a scan tool.

NOTE: The motor and pump assembly O-rings must be replaced. The O-rings are of different size and must not be interchanged. the red O-ring (3) goes on first and is nearest the pump flange, followed by the blue O-ring (4) that sits nearest the outboard edge.

Fig. 52: Installing The Motor And Pump Assembly From The RDM
Courtesy of CHRYSLER GROUP, LLC

2. Install the motor and pump assembly (1) onto the Rear Drive Module.

Fig. 53: Installing Three Fasteners From The RDM Motor And Pump Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Install the three motor and pump assembly fasteners (1) and uniformly finger tighten until the motor and pump assembly are fully seated to housing. Torque to 12 N.m (106 in. lbs.).

Fig. 54: Identifying Pressure Sensor And Pump Motor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Connect the electrical connector (2).
5. Top off hydraulic fluid and bleed the hydraulic system. Refer to **FLUID, HYDRAULIC, STANDARD PROCEDURE**.

CAUTION: Do not mix hydraulic fluid and the RDM lubricant. Use only recommended fluid to prevent damage to Rear Driveline Module components. Fluid must meet material specification MS-2155.

FLUID, HYDRAULIC

STANDARD PROCEDURE

STANDARD PROCEDURE-HYDRAULIC FLUID FILL

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641401.vid1" into the "Search Channel" box.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .
3. Disengage the wire harness clips from the rear cross-member to gain length in the wire harness.

NOTE: The wire harness connectors must be left plugged in to the Rear Drive

Module (RDM), they will be needed in the filling process.

Fig. 55: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

4. Apply alignment index marks to the rear propeller shaft and the rear pinion flange.
5. Remove the bolts (1) holding the rear propeller shaft to the rear pinion flange.
6. Separate the rear propeller shaft from the rear pinion flange and secure the shaft to the side.

Fig. 56: Identifying Axle Shaft And Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable jack, support and secure the Rear Drive Module (RDM) (1).

NOTE: **The RDM must be
level
on the jack.**

Fig. 57: Rear Mount Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove the rear RDM mount bolt (1).

NOTE: **It may be necessary to position the rear sway bar (2) of the way to gain
clearance for rear mount bolt (1).**

Fig. 58: Front Mount Bolts

Courtesy of CHRYSLER GROUP, LLC

9. Remove the front RDM mount bolts (1 and 2).

NOTE: RDM must be level on jack when filling with fluid.

10. Lower the RDM evenly until there is approximately 4 in. of clearance between the body and the RDM hydraulic fluid cover.

NOTE: Make sure the wire harness and vent hose is not damaged.

11. Place a drain pan under the RDM.

0322006172

Fig. 59: Identifying Hydraulic Fluid Cover Bolts And Gaskets
Courtesy of CHRYSLER GROUP, LLC

12. Remove the hydraulic fluid cover (1) bolts (2).
13. Remove the hydraulic fluid cover (1) and gasket.

NOTE: Do not allow any debris to fall into hydraulic reservoir.

0322006171

Fig. 60: Identifying Reservoir And Fill Level Indicator
Courtesy of CHRYSLER GROUP, LLC

14. Fill the reservoir (2) with hydraulic fluid so that the fluid is level with the cast Fill Level Indicator (1). Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**

NOTE: Do not mix hydraulic fluid and the RDM lubricant. Use only recommended fluid to prevent damage to Rear Driveline Module components. Fluid must meet material specification MS-2155.

NOTE: A mirror may be required to see the fluid level.

15. Using the scan tool actuate the Rear Differential Bleed procedure in the Misc. Functions menu and follow the prompts.

Fig. 61: Identifying Diaphragm Gasket And Hydraulic Fluid Cover
Courtesy of CHRYSLER GROUP, LLC

16. Install a new diaphragm gasket (1) and install hydraulic fluid cover (2). Torque bolts to 6 N.m (53 in. lbs.).

NOTE: Be sure that the diaphragm gasket is properly orientated By ensuring the vent holes (3) align.

17. Raise the RDM in place and install the mounting bolts.
18. Torque the mounting bolts to 130 N.m (96 ft. lbs.).
19. Clip the wiring harness into the rear cross-member.

Fig. 62: Aligning Index Marks On Propeller Shaft To Pinion Flange
Courtesy of CHRYSLER GROUP, LLC

20. Align reference marks on propeller shaft and pinion flange. Tighten bolts to 21 N.m (15 ft. lbs.)
21. Install the muffler. Refer to **MUFFLER, EXHAUST, INSTALLATION** .

ACTUATOR, AXLE SHAFT

REMOVAL

REMOVAL

1. Using diagnostic scan tool, place Rear Axle Differential in the 4-HI position.
2. Remove the Rear Axle Differential assembly from the vehicle. Refer to **REMOVAL**.
3. Clean area around the actuator to prevent debris from entering housing.

0322008595

Fig. 63: Removing Actuator Retaining Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the actuator retaining fasteners and discard (1).

0322008596

Fig. 64: Removing The Actuator Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Remove the actuator assembly (1) up and off the housing (2).

INSTALLATION

INSTALLATION

1. Clean mating surfaces.
2. Install new gasket if necessary.

0322008596

Fig. 65: Positioning Actuator Onto Housing
Courtesy of CHRYSLER GROUP, LLC

3. Position actuator (1) onto housing (2), ensure the shift fork engages the sliding collar grooves.

NOTE: If replacing the actuator, check to make sure the two locating dowel pins are removed from the rear Axle Differential housing, the locating dowels come pre-installed in the actuator.

0322008595

Fig. 66: Installing New Actuator Retaining Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the actuator mounting screws.

4. Install new actuator retaining fasteners (1) and tighten. Refer to **SPECIFICATIONS**.
5. Install the Rear Axle Differential into vehicle. Refer to **INSTALLATION**.
6. Check and add fluid as necessary. Refer to **FLUID, DIFFERENTIAL, STANDARD PROCEDURE**.

2014 DRIVELINE/AXLES

Rear Half Shaft - Cherokee

REMOVAL

REMOVAL

CAUTION: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instructions will result in damage.

1. Disconnect battery negative cable.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .

Fig. 1: Identifying Rear Half Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Using appropriate tool, partially dislodge the half shaft from the differential. Install (special tool #9099, Seal Protector, Differential Output) to protect seal upon removal.

NOTE: The stub shaft may need to be held in place when removing the half shaft.

NOTE: Tag the half shaft shim for location.

5. Completely remove the half shaft from the differential. Make sure the seal protector engages seal.

INSTALLATION

INSTALLATION

CAUTION: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instructions will result in damage.

1. Install the half shaft shim on the hub end of the shaft.

NOTE: Lightly apply a light grease to the splines prior to installation.

NOTE: Use care when installing half shaft to axle assembly. The half shaft installation angle should be minimized to avoid damage to the seal upon installation.

2. Install new circlip(s) on half shaft(s).

Fig. 2: Installing The Half Shaft Onto The Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

3. Install the half shaft (2) onto the Rear Drive Module (1).

NOTE: **Attempt to remove tripod joint by hand to verify that the snap ring is fully engaged. If snap ring is fully engaged, tripod joint will not be removable from rear drive module by hand.**

4. Install the rear knuckle. Refer to **KNUCKLE, REAR, INSTALLATION** .
5. If necessary, fill the differential fluid.

2014 ELECTRICAL**Battery System - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle contains the following components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negative charged battery terminal posts to the vehicle electrical system.
- **Battery, Intelligent Sensor** - The Intelligent Battery Sensor (IBS) serves to record and process measured battery variable values (current, voltage, temperature) for the vehicle power net management system.
- **Battery Hold-down** - The battery hold-down hardware secures the battery in the battery tray.
- **Battery Thermal Guard** - The battery thermal guard insulates the battery to protect it from engine compartment temperature extremes.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery hold-down hardware.

For battery system maintenance schedules, refer to **MAINTENANCE SCHEDULES, DESCRIPTION**.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - BATTERY SYSTEM**

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this Service Information to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Battery System - Service Information - Cherokee

will store a DTC in electronic memory for any failure it detects. Refer to **DIAGNOSIS AND TESTING** for the proper charging system on-board diagnostic test procedures.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to BATTERY, STANDARD PROCEDURE for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is inoperative.	2. Determine if the charging system is performing to specifications. Refer to DIAGNOSIS AND TESTING . Repair the inoperative charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Midtronics GR8 battery tester. Refer to BATTERY, STANDARD PROCEDURE . Charge the battery as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to CABLES, BATTERY, DIAGNOSIS AND TESTING . Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to SPECIFICATIONS for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is inoperative.	6. Determine the battery cranking capacity using the Midtronics GR8 battery tester. Refer to BATTERY, STANDARD PROCEDURE . Replace the inoperative battery, as required.
	7. The starting system is inoperative.	7. Determine if the starting system is performing to specifications. Refer to DIAGNOSIS AND TESTING . Repair the inoperative starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to SPECIFICATIONS for the proper size and rating. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to CABLES, BATTERY, DIAGNOSIS AND TESTING . Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is	3. Refer to BATTERY, STANDARD PROCEDURE for the proper test

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Battery System - Service Information - Cherokee

	excessive.	procedures. Repair the inoperative electrical system, as required.
	4. The battery is inoperative.	4. Test the battery using the Midtronics GR8 battery tester. Refer to BATTERY, STANDARD PROCEDURE . Replace the inoperative battery, as required.
	5. The starting system is inoperative.	5. Determine if the starting system is performing to specifications. Refer to DIAGNOSIS AND TESTING . Repair the inoperative starting system, as required.
	6. The charging system is inoperative.	6. Determine if the charging system is performing to specifications. Refer to DIAGNOSIS AND TESTING . Repair the inoperative charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw systems in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is inoperative.	1. Test the battery using the Midtronics GR8 battery tester. Refer to BATTERY, STANDARD PROCEDURE . Replace the inoperative battery, as required.

GR8 ELECTRICAL SYSTEM TESTER

The Midtronics GR8 battery system tester is designed to help diagnose the cause of a defective battery. Refer to **BATTERY, STANDARD PROCEDURE** for directions on using the Midtronics GR8 battery tester.

STANDARD PROCEDURE

STANDARD PROCEDURE - SHIPPING MODE

When a new vehicle is delivered, the Body Control Module (BCM) is set to shipping mode. The BCM has a mode that takes the place of pulling the IOD fuse called "Shipping Mode". Shipping mode deactivates several vehicle accessories to prevent normal ignition OFF draw from depleting the battery over time. Removing the vehicle from shipping mode activates all vehicle systems.

You can enable/disable the vehicle from "Shipping Mode" by using the scan tool, go to BCM >> Misc. function >> Exit Shipping Mode.

SPECIFICATIONS

BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

NOTE: Vehicles equipped with a diesel engine utilize a unique battery. The specifications for this battery may differ from the standards shown here. Refer to the battery manufacturer for detailed specifications.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.
- **Load Test Amperage** - The Load Test Amperage rating specifies the current (in amperes) that a battery should be tested at with the battery load test equipment. This value should always be 50 percent of the CCA. For example: if the CCA for this battery is 700 amps, the Load Test Amperage is 50 percent of that or 350 amps.

CLEANING

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this Service Information and the owners manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

Fig. 1: Cleaning Battery Cable Terminal Clamps Using Terminal Cleaning Tool
Courtesy of CHRYSLER GROUP, LLC

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush (1) or a post and terminal cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery hold-down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

Fig. 2: Cleaning Outside Of Battery Case
Courtesy of CHRYSLER GROUP, LLC

3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to **SPECIFICATIONS** for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

Fig. 3: Cleaning Battery Terminal Post Using Terminal Cleaner
Courtesy of CHRYSLER GROUP, LLC

5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this Service Information and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold-down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case (if equipped). Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage (if equipped). Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to **STANDARD PROCEDURE** for detailed instructions.

BATTERY

DESCRIPTION

DESCRIPTION

Low-maintenance conventional batteries are used on this vehicle. These batteries have non-removable battery cell caps. Under normal service, the composition of this battery reduces gassing and water loss at normal charge rates.

Conventional batteries are made up of six individual cells that are connected in series. Each cell contains positive charged cell groups made of lead oxide, and negatively charged cell groups made of sponge lead. The cells are submerged in a sulfuric acid and water solution called electrolyte.

The battery performs the function of a chemical storage device for electrical energy generated by the alternator. It must be capable of supplying high current for starting and powering other electrical loads. The battery function is also to serve as a stabilizing component in the charging system by providing energy when the system demands exceed the output of the alternator.

OPERATION

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to STANDARD PROCEDURE for the proper battery charging procedures.

MIDTRONICS GR8 BATTERY TESTER

The Midtronics GR8 battery tester is designed to help diagnose the cause of an inoperative battery. Refer to BATTERY, STANDARD PROCEDURE for instructions on the use of the Midtronics GR8 battery tester.

STANDARD PROCEDURE

CONVENTIONAL BATTERY CHARGING

CAUTION: Vehicles equipped with a diesel engine utilize a unique spiral cell battery. This battery has a maximum charging voltage that must be used in order to restore the battery to its full potential, failure to use the spiral cell battery charging procedure could result in damage to the battery or personal injury. for the appropriate procedure.

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station) tester indicates

battery is OK.

- Open-circuit voltage of the battery is 12.65 volts or above.
- Battery passes Load Test multiple times.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and/or vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to an open-circuit voltage reading of 12.4 volts or greater, retest the battery with the Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station) tester indicates battery is OK or perform a load test to determine the battery cranking capacity.

Refer to **BATTERY, STANDARD PROCEDURE**.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service.

Refer to **CLEANING** for the proper battery system cleaning procedures. Refer to **INSPECTION** for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED CONVENTIONAL BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station).

NOTE: Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CONVENTIONAL BATTERY CHARGE RATE TABLE

Voltage	Minutes
16.0 volts maximum	up to 10 min.
14.0 to 15.9 volts	up to 20 min.
13.9 volts or less	up to 30 min.

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Battery System - Service Information - Cherokee

time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Conventional Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

CONVENTIONAL BATTERY CHARGING TIME TABLE

Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

GR8 BATTERY TESTER / CHARGER

Always use the Midtronics GR8 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

CAUTION: Never connect the GR8 to the remote battery posts. Connecting the GR8 to the remote battery posts will give a false test reading indicating that the battery is bad.

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. Refer to **CLEANING**. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. Connect the GR8 to directly to the battery posts.

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

3. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
4. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery

rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

5. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

NOTE: The **SERVICE CODE** is required on every warranty claim submitted for battery replacement.

QUICK REFERENCE GUIDE

Inspect the battery for damages and check the electrolyte level. Always use the necessary safety precautions when working with batteries to prevent severe injury or death. Follow all manufacturers' instructions and BCI (Battery Council International) safety recommendations, which include the following precautions:

MAIN MENU

The Main Menu is the starting point for all tools and utilities, which are depicted as icons. Some icons lead directly to the function they represent, while others are menu icons that lead to two or more options.

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.

- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to ten minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW TABLE

Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A
Instrument Cluster	No	0.44 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Turn off all electrical accessories.
4. Disconnect the battery negative cable.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

5. Connect a 10 amp fused jumper wire between the negative battery cable and the negative battery post.
6. Turn the ignition key ON and then OFF and wait 10 minutes for all systems to enter sleep mode.

NOTE: Do not break the connection between the 10 amp fused jumper wire and the battery. If the connection between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will

have to be repeated.

7. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter to the battery negative cable terminal clamp and the battery negative terminal post, but not on the jumper connection.
8. Remove the 10 amp jumper wire without breaking the digital multi-meter connection.
9. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post, but not the 10 amp jumper wire.
10. The high-amperage IOD reading on the multi-meter should be very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the BCM and PDC, one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete BCM and PDC, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.
11. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 10. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery, refer to the appropriate battery charging procedure.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity.

OPEN-CIRCUIT VOLTAGE TABLE

Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Battery System - Service Information - Cherokee

12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

CABLES, BATTERY

DESCRIPTION

DESCRIPTION

The standard battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The battery cables for Stop/Start applications are a higher durability cable capable of withstanding the increased cycling that stop/start vehicles will experience. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal made of stamped sheet metal that is die cast onto one end of the battery cable wire. A pinch-bolt and nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then soldered. The battery positive cable wires feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a smaller female battery terminal clamp.

The battery harness includes both the battery positive and negative cables to the remote battery connection and may include portions of the wiring circuits for other components on some vehicles. The starter harness includes both the battery positive and negative cables from the remote battery connection to the starter and engine ground location. The battery cables are part of the engine wiring harness. If the cables need to be serviced. The engine harness will need to be replaced as an assembly.

OPERATION

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Body Control Module (BCM), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp has one wire as an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a ground connection, typically on the engine cylinder block.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - BATTERY CABLES**

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to **STANDARD PROCEDURE** for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay can

be found in the Junction Block located in the left front engine compartment area. See the layout label affixed to the underside of the Junction Block cover for ASD relay identification and location.

Fig. 26: Connecting Voltmeter Leads To Battery Negative Terminal
 Courtesy of CHRYSLER GROUP, LLC

1. Connect the positive lead of the voltmeter (1) to the battery (2) negative terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

Fig. 27: Connecting Voltmeter Leads To Battery Positive Terminal
 Courtesy of CHRYSLER GROUP, LLC

2. Connect the positive lead of the voltmeter (1) to the battery (2) positive terminal post. Connect the negative lead of the voltmeter (1) to the battery (2) positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

Fig. 28: Connecting Voltmeter To Terminal Clamp And Stud
 Courtesy of CHRYSLER GROUP, LLC

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid B(+) terminal stud (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

Fig. 29: Connecting Voltmeter To Battery And Engine Block
 Courtesy of CHRYSLER GROUP, LLC

4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground on the engine block (3). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

TRAY, BATTERY

DESCRIPTION

DESCRIPTION

080770037

Fig. 30: Battery, Battery Tray And Related Components
 Courtesy of CHRYSLER GROUP, LLC

The battery (2) is placed and secured in a plastic molded battery tray (7). The battery tray is located in the left front side of the vehicle, just ahead of the left front wheel and tire assembly. The battery tray is secured to the left front frame rail.

REMOVAL

DIESEL

Fig. 31: Battery & Cables

17. Position the battery (2) onto the battery tray.
18. Install the battery hold down clamp. Tighten bolt to 6 N.m (53 in. lbs.).
19. Install the battery thermal cover.
20. Install the battery positive cable (1). Tighten bolt to 9 N.m (80 in. lbs.).
21. Install the negative battery cable (3). Tighten bolt to 9 N.m (80 in. lbs.).

MODULE, VOLTAGE STABILITY (VSM)

DESCRIPTION

DESCRIPTION

Fig. 60: Identifying Voltage Stability Module (VSM) & Body Control Module (BCM)
Courtesy of CHRYSLER GROUP, LLC

A Voltage Stability Module (VSM) (1) is an electronic module which converts a source of direct current (DC) from one voltage level to another. This model will use dual VSM setup located next to the BCM (2).

OPERATION

OPERATION

The Voltage Stability Module (VSM) supports the following items:

1. Exterior Lights
2. Radio
3. Display (Integrated center stack, various button and switch illuminations)
4. Instrument Cluster
5. HVAC electronic display and operation
6. Integrated Trailer Tow Module (ITBM)
7. Parktronics (PTS)

These components should work as designed and behave as if the engine is running during stop mode.

The AC compressor will not work during stop mode, but HVAC settings will be preserved. Under certain conditions, HVAC will force the engine to restart so that the blower will operate. The heated seats and windows will continue to run during a Stop event, however during period the vehicle restarts, heated seats will turn off temporarily to prevent draw on voltage. The windows will turn off temporarily during restart as well, due to anti-pinch algorithm. The indicator for the seats will remain on to the customer. Heated mirrors are unaffected.

The power outlets will experience a voltage dip during restart and depending what is currently plugged in, there will be different responses: resets, beeps, etc or in some cases no response noted. The 115V AC inverter will reset and may not immediately return to normal operation (depending on what is connected) and manually plugging out and back in of the device may be required.

All motors (e.g. windows, blowers, etc) running during stop will slow down but all should continue to operate normally after restart.

SENSOR, INTELLIGENT BATTERY (IBS)

DESCRIPTION

DESCRIPTION

3108689

Fig. 61: Intelligent Battery Sensor (IBS) Component Location
Courtesy of CHRYSLER GROUP, LLC

The Intelligent Battery Sensor (IBS) serves to record and process measured battery variable values (current, voltage, temperature) for the vehicle power net management system. The Intelligent Battery Sensor (IBS) will calculate the Battery 'state of charge', 'state of health', and 'state of function'.

The mechanical part of the IBS is comprised of the battery clamp for the negative terminal and a captured bolt to attach the ground cable to. The functional tasks include establishing the electrical contact between the body and the negative battery post, housing the electronic module (actual sensor element) and the provision of an adequate thermal contact between the sensor system temperature sensor and the negative battery post. The mechanical part of the IBS also protects the sensitive electronic components from external influences.

The IBS is mounted directly on the 12 VDC battery's negative post. The battery post clamp nut is a captive nut and the stud will break if the nut is removed.

OPERATION

OPERATION

The battery sensor measures, calculates and reports battery: voltage, current, temperature, state of charge and other parameters via a LIN (Local Interconnect Network) bus to a master control module (engine controller, body controller etc). The battery sensor is used to optimize vehicle performance (maintain battery charge, fuel economy etc) via the vehicles electrical system

The battery sensor is readable/diagnosable via a "scan tool" that can display all of the available parameters needed for vehicle servicing or trouble shooting.

Information the Intelligent Battery Sensor (IBS) send out on the CAN Bus is

- SOC = Battery State of Charge: Percentage the residual charge of the battery in respect to its nominal capacity. In few words represents how much the battery is charged.
- SOH = Battery State of Health: Send a percentage of the real capacity of the battery in respect to the nominal capacity of the battery. It's so called because during the functioning, the battery is subject to irreversible processes that reduce its capacity to be recharged and to give energy (battery ageing).
- SOF = Battery State of Function: The prediction of the minimum voltage that will be reached during a cranking phase

When the IBS is powered up for the first time or is powered after a power disconnection, it goes into a so called "recalibration" phase, where the IBS must recognize the type of battery and its characteristics and state. So in this phase the tolerances on the state functions (SOC, SOF, SOH) are greater than in normal working condition.

REMOVAL

REMOVAL

Fig. 62: Intelligent Battery Sensor (IBS) Component Location
Courtesy of CHRYSLER GROUP, LLC

1. Remove the components to access the battery. Refer to **BATTERY, REMOVAL**.

WARNING: Do not remove the captive nut, doing so will cause the stud to break.

2. Loosen the captive nut (1).
3. Disconnect the harness from the Intelligent Battery Sensor (IBS) (2).
4. Remove the IBS (3) from the negative battery post.
5. Remove the negative battery cable retainer to the IBS.
6. Remove the IBS.

INSTALLATION

INSTALLATION

Fig. 63: Intelligent Battery Sensor (IBS) Component Location
Courtesy of CHRYSLER GROUP, LLC

NOTE: Connecting the negative battery cable to the Intelligent Battery Sensor (IBS) must be done before installing on the battery post.

1. Place the IBS onto the negative battery post and push the IBS (3) down until properly seated on the cone of the post.
2. Fasten Ground terminal to M8 (max 20Nm +/-2Nm).

NOTE: M8 has much higher torque than the M6 clamp and can break IBS free if the M6 is tightened prior.

3. Secure the M6 pole clamp (max 6Nm +/- 1.5Nm).
4. Install amp 2 pin connector (Power & LIN) making sure there is no stress on the wires.
5. Install the components removed to access the battery. Refer to **BATTERY, INSTALLATION**.

2014 ELECTRICAL**Charging - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

The charging system consists of:

- Generator
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the **IGNITION SYSTEM - SERVICE INFORMATION** article for information)
- Battery (refer to the **BATTERY SYSTEM - SERVICE INFORMATION** article for information)
- Inlet Air Temperature (calculated battery temperature) (If equipped)
- Voltmeter (refer to the **INSTRUMENT CLUSTER - SERVICE INFORMATION** article for information if equipped)
- Wiring harness and connections (refer to the appropriate Wiring Information for information)
- Accessory drive belt (refer to the **ENGINE COOLING SYSTEM** article for more information)

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM**

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trips if the problem does not occur again.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running

- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test. Refer to **BATTERY, STANDARD PROCEDURE**.
- loose generator belt.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the scan tool. Refer to the appropriate ELECTRICAL DIAGNOSTICS article for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The scan tool must be used to erase a DTC.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in **DTC INDEX** for more DTC information. This will include a complete list of DTCs including DTCs for the charging system.

To perform a complete test of the charging system, refer to the appropriate ELECTRICAL DIAGNOSTICS article and the scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** article for procedures. Refer to **DIAGNOSIS AND TESTING**.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in the fuse block for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the **GENERATOR** Removal/Installation for torque specifications. Refer to **SPECIFICATIONS**.
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required.
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to **ENGINE COOLING SYSTEM** article for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Charging - Service Information - Cherokee

and tight. Repair as required.

2014 ELECTRICAL

Power Distribution - Cherokee

CENTER, POWER DISTRIBUTION (PDC)

DESCRIPTION

DESCRIPTION - POWER DISTRIBUTION CENTER

Fig. 1: Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Body Control Module (BCM)
- Power Distribution Center (PDC)
- Auxiliary PDC for vehicles equipped with a diesel engine
- Z Fuse Array attached to the PDC.
- 12 Volt Power Outlets
- Power Inverter Module
- NAFTA model 115 Volt Power Outlet.
- BUX model 220 Volt Power Outlet

The PDC also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers

- Blade-type fuses
- Cartridge fuses
- Fusible links
- Standard and Micro-Relays

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components. Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit diagrams.

For specific fuse location and types. Refer to **FUSE - RELAY LOCATIONS AND TYPES, SPECIFICATIONS** .

The PDC is serviced as part of the engine compartment body harness.

EXTERNALLY MOUNTED Z-CASE FUSE ARRAY

0822027501

Fig. 2: High Current Z-Case Fuse Assembly
Courtesy of CHRYSLER GROUP, LLC

A high-current Z-case fuse assembly (1) bolted to the outside of the Power Distribution Center (PDC) is used to direct battery power to high current devices. The assembly contains four fuses numbered F01, F03, F04, and F05. The connection at F02 is to attach the battery cable to the fuse array. The electric power steering (EPS) unit, generator, and PWM radiator fan controller receive battery power through the high-current fuses. The high-current fuses protect the wiring and devices from damage caused by unplanned over-current conditions. This component is serviced separate from the PDC.

Z Case Fuse Array	
F01	Electric Power Steering (EPS)

2014 Jeep Cherokee Trailhawk

2014 ELECTRICAL Power Distribution - Cherokee

F02	Battery Cable to Fuse Array
F03	Auxiliary PDC - Diesel Only
F04	Generator (180 or 160 amperes)
F05	Pulse-Width Modulated (PWM) Radiator Fan Controller.

OPERATION

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate accessories that the vehicle owner may choose to have installed in the aftermarket.

REMOVAL

REMOVAL - PDC ASSEMBLY

0822008650

Fig. 3: Identifying Power Distribution Center, Power Feed Connections & Bolts
Courtesy of CHRYSLER GROUP, LLC

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS**. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and

retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. **Disconnect and isolate the battery negative cable.**
2. Remove the PDC cover.
3. Disconnect the power feed connections from the PDC (3).
4. Loosen the three bolts (2) that secure top section of the PDC in place. These bolts are captured and cannot be completely removed.

0822008651

Fig. 4: Power Distribution Center, Power Feed Connections & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Release the plastic clips that secure the PDC to the tray.
6. The PDC top will now lift upward. Carefully lift and disconnect the three bulkhead connectors (2) from the PDC.
7. Remove the PDC from the vehicle.

REMOVAL - POWER DISTRIBUTION Z-CASE FUSE ARRAY

Fig. 5: Identifying Power Distribution Z-Case Fuse Array, Tabs & Nuts
Courtesy of CHRYSLER GROUP, LLC

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. **Disconnect and isolate the battery negative cable.**
2. Remove the cover from the Power Distribution Center (PDC).
3. Remove the nuts (2) from Z case fuse array and move the eyelet connectors off and away from the Z case fuse array.
4. Remove the nut (1) attaching the fuse array to the PDC.
5. Press on the tabs (3) on the side of the fuse array to separate the array from the PDC.
6. Lift the fuse array away from the PDC.

INSTALLATION

INSTALLATION - PDC ASSEMBLY

0822008651

Fig. 6: Power Distribution Center, Power Feed Connections & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper PDC component to the PDC base (3) in the engine compartment.
2. Connect the three bulkhead connectors (2) located in the base of the PDC to the upper PDC component.

0822008650

Fig. 7: Identifying Power Distribution Center, Power Feed Connections & Bolts

Courtesy of CHRYSLER GROUP, LLC

3. Tighten three bolts (2) through the upper PDC component top until secure. Be sure to not over tighten and crack the base or upper tray.
4. Connect all power feeds to their PDC posts.
5. Install the PDC enclosure cover onto the assembled PDC assembly.
6. Connect the negative battery cable to the negative battery post.

INSTALLATION

Fig. 8: Identifying Power Distribution Z-Case Fuse Array, Tabs & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the Z-case fuse array to the Power Distribution Center (PDC).
2. Press the Z-case down into position until the tabs (3) snap around the outer edges of the array indicating the array is firmly seated.
3. Install and tighten the nut (1) that secures the fuse array to the PDC case.
4. Connect all power feeds to their proper locations.
5. Secure the connectors to their posts using a nut (2).
6. Install the PDC cover into proper position on the assembled PDC assembly.
7. Connect the negative battery cable to the negative battery post.

OUTLET, POWER

DESCRIPTION

DESCRIPTION

This vehicle is equipped with 12 Volt (13 Amp) power outlets that can be used to power cellular phones, small electronics and other low powered electrical accessories. The power outlets are labeled with either a "key" or a "battery" symbol to indicate how the outlet is powered. Power outlets labeled with a "key" are powered when the ignition switch is in the ON or ACC position, while the outlets labeled with a "battery" are connected directly to the battery and powered at all times.

The outlets are located in the following locations:

- One outlet in the rear cargo area left quarter trim panel.
- One outlet in the instrument panel center stack under the heat/air conditioning controller.
- One outlet in the center console assembly.

OPERATION

12 VOLT POWER

The 12v power outlet consists of two major components: a knob and heating element unit, and a cigar lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Power Distribution Center (PDC) when the ignition is in the ON or ACC positions.

REMOVAL

12 VOLT POWER

1. Disconnect and isolate the battery negative cable.

Fig. 9: Inserting Power Outlet Remover
Courtesy of CHRYSLER GROUP, LLC

2. Look inside and note position of the retaining bosses (2).
3. Insert Remover, Power Outlet (special tool #10246, Remover, Power Outlet) (1) into the retaining bosses (2) of the power outlet.
4. Pull out the base through the mounting ring by gently rocking the tool.

Fig. 10: Power Outlet & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the harness (1) from the power outlet (2).
6. Set the base aside and remove the base mount ring.

INSTALLATION

12 VOLT POWER

2883346

Fig. 11: Power Outlet & Connector

Courtesy of CHRYSLER GROUP, LLC

1. Connect the wire connector (1) to the power outlet receptacle (2).
2. Install the power outlet mount into the panel.
3. Align the splines on the outside of the power outlet receptacle base connector receptacle with the grooves on the inside of the mount.
4. Press firmly on the power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.
5. Connect the battery negative cable.

OUTLET, POWER, 115 V**DESCRIPTION****DESCRIPTION**

NOTE: The 115-volt outlet is used in NAFTA models. A 220-volt is used in BUX models.

0811003271

Fig. 12: 115 Volt AC Outlet
Courtesy of CHRYSLER GROUP, LLC

The DC/AC Inverter is an electrical device that converts direct current (DC) to alternating current (AC). This can only be used to supply small appliances. The output voltage of the inverter can be a full sine wave or a modified sine wave. The 115-volt AC outlet is used in NAFTA models. A 220-volt is used in BUX models. The AC outlet (3) is mounted in the rear of the center floor console (2). The vehicle is able to supply AC power through the use of a inverter module. The inverter module is located under the right rear seat cushion. The inverter converts the 12 Volt DC from the vehicle battery system to a 115 Volt AC output for NAFTA vehicles. The BUX model converts the 12 Volt DC from the battery system to a 220 Volt AC output.

OPERATION

OPERATION

The AC power outlet switch receives 12 volts from the Integrated Power Module (IPM) and passes it as an enable signal to the inverter module. The inverter module also receives 12 volts via the IPM and inverts this to a 115 volt AC output (220 for BUX models). The IPM sends a signal over the switch sense circuit advising the cluster that the outlet is active. The enable signal received from the power outlet switch enables the inverter to convert the received voltage and pass it to the power outlet to power external devices.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INVERTER MODULE

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

115 VOLT POWER OUTLET DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POWER AT THE 115 VOLT POWER OUTLET. (220 VOLT POWER OUTLET FOR BUX MODEL)	1. Fuse inoperative.	1. Check Power Distribution Center (PDC) fuse. Replace fuse, if required.
	2. Power outlet connector damaged.	2. Check for loose or corroded power outlet connector. Repair, if required.
	3. Inverter module connector damaged.	3. Check for loose or corroded inverter module connector. Repair, if required.
	4. Wiring damaged.	4. Check for shorted or open wires. Repair wiring, if required.
	5. Inverter module ground damaged.	5. Check for continuity between the inverter module and a known good ground. There should be continuity. Repair ground, if required.
	6. Power outlet inoperative.	6. Replace the power outlet.
	7. Inverter module inoperative.	7. Replace the inverter module.
	8. Power outlet switch inoperative.	6. Replace the switch.

REMOVAL

REMOVAL

Fig. 13: Rear Center Console Bezel & Retainers
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick remove the rear center console bezel.
3. Remove the retainers securing the duct work to the rear center console panel.

Fig. 14: Electrical Connector & 115v Power Outlet
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) for the 115v power outlet (2).
5. Release the clips holding the 115v power outlet and push through the panel.

INSTALLATION

INSTALLATION

Fig. 15: Electrical Connector & 115v Power Outlet
Courtesy of CHRYSLER GROUP, LLC

1. Insert the 115v outlet into the panel.
2. Connect the electrical connector (1) to the 115v power outlet (2).

Fig. 16: Rear Center Console Bezel & Retainers

3. Install the duct to the trim panel.
4. Install the rear console trim panel.
5. Connect the negative battery cable.

MODULE, POWER INVERTER

DESCRIPTION

DESCRIPTION

0821006695

Fig. 17: Power Inverter Module

Courtesy of CHRYSLER GROUP, LLC

The DC-to-AC Inverter Module provides 115V AC/220 V AC power for customer use. Such Inverters are intended to power user loads that are not essential to vehicle control or safety (e.g. battery chargers for mobile phones or laptop computers, audio and entertainment equipment, etc.).

The power inverter module is located beneath the instrument panel inboard of the steering column where it is concealed behind the instrument panel steering column opening cover.

The inverter module is rated at 150 watts. It will momentarily supply 300 watts to account for surges as devices are plugged in. This is true of the NAFTA 110-volt inverter and the BUX 220-volt inverter.

OPERATION

OPERATION

The AC power outlet receives 12 volts from the Power distribution Center (PDC) and passes it as an enable signal to the inverter module. The inverter module also receives 12 volts via the PDC and inverts this to a 115 volt AC output (220 volt for BUX models). The enable signal received from the power outlet enables the inverter to convert the received voltage and pass it to the power outlet to power external devices.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INVERTER MODULE

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

115 VOLT POWER OUTLET DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO POWER AT THE 115 VOLT POWER OUTLET	1. Fuse inoperative.	1. Replace fuse, if required. Refer to <u>FUSE - RELAY LOCATIONS AND TYPES, SPECIFICATIONS</u> .
	2. Power outlet connector or pin loose or damaged.	2. Check for loose or corroded power outlet connector. Repair, if required.
	3. Inverter module connector or pin loose or damaged.	3. Check for loose or corroded inverter module connector. Repair, if required.
	4. Wiring damaged.	4. Check for shorted or open wires. Repair wiring, if required. This includes power, ground, and return sense from the IPM. Refer to wiring diagrams for complete wiring and check all relative circuits for loose pins and/or damaged wiring.
	5. Inverter module ground damaged.	5. Check for continuity between the inverter module and a known good ground. There should be continuity. Repair ground, if required.
	6. Power outlet inoperative.	6. Replace the power outlet.
	7. Inverter module inoperative.	7. Check relative wiring, pins and connections to the IPM before replacing the inverter module.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.

2. Unsnap the upper end of the floor duct from the outlet (2) on the left end of the heater and air conditioner distribution housing. Refer to **DUCT, FLOOR DISTRIBUTION, REMOVAL**.
3. Remove the electrical connector from the Power Inverter Module (PIM).
4. Remove the two fasteners holding the PIM bracket in position.
5. Remove the PIM from the vehicle.

INSTALLATION

REMOVAL

1. Position the PIM and bracket to the proper position and install using two fasteners.
2. Connect the electrical connector to the PIM once the PIM has been secured in position by fasteners.
3. Position the duct into position and snap/secure in place. Refer to **DUCT, FLOOR DISTRIBUTION, INSTALLATION**.
4. Connect the battery cable to the negative battery post.

MODULE, WIRELESS CHARGING PAD

DESCRIPTION

DESCRIPTION

0821008033

Fig. 18: Wireless Charging Pad Module
Courtesy of CHRYSLER GROUP, LLC

The wireless charging pad will charge a cell phone up to 5W through inductive charging. It follows the WPC (Wireless Power Consortium) Standard. The wireless charging pad is located within the top tray of the center

console.

This optional feature enables wireless charging of any cell phone that is Qi-wireless charging capable or has a Qi sleeve or backplate.

The wireless charging pad comes with a "phone retention feature" that holds that phone in place throughout up or down console movement and ensures efficient charge. The device must be aligned with the pad in order to charge correctly. An serviceable LED light will blink green to show the phone is charging and aligned correctly.

OPERATION

OPERATION

Wireless Charging Requirements - Wireless charging requires a transmitting coil (built into the charging pad tray) and a receiver coil which is integrated in the phone. The received coil gets aligned to the transmitting coil, and power is then transmitted.

Retention Feature - The retention feature is in place to hold the phone during vehicle and console movement. This also used to align the phone with the transmitting coil that is internal to the module. (Tolerance is +/- 10mm). This retention feature is designed to accommodate all WPC phones, larger and smallest, and all receiving coil replacement.

The Wireless Charging Module is capable of setting two Diagnostic Trouble Codes (DTC); Loss of communication and internal error faults. The module itself is not repairable and will need to be replaced if diagnostics lead to module failure.

Communication - The WCP communicates with the BCM over the LIN bus. The WCP outputs to the BCM if a device has been detected. If a valid device is detected, charging begins.

Timers - The WCP has a watch dog timer for two modes; the pad will automatically go into OFF mode after 5 minutes if no device is charging, and it will go into sleep mode 30 minutes after key off if a device has been left to charge with the ignition off. The WCP also has an idle mode where it will be continuously searching for a consumer device with the ignition ON.

Wireless Charging Pad Electrical Requirements

- Power to the Wireless Charging Pad (WCP) should be no greater than 10 watts.
- The WCP will transfer up to 5W to the receiver.
- The WCP has the capability to shut itself off if the system voltage drops below 12 volts with ignition off for a duration of 30 seconds.
- The WCP has an idle mode where it constantly searches for consumer devices with the ignition transitioned to the ON position.
- The nominal operating voltage of the WCP is 13.5v.

REMOVAL

REMOVAL

1. Remove the tray assembly from the center console.
2. Set the end stops to full out positions.

0821020289

Fig. 19: Prying Anti-Slip Mat
Courtesy of CHRYSLER GROUP, LLC

3. Using a flathead mini screwdriver gently pry one side of anti-slip mat.

0821020290

Fig. 20: Removing Anti Slip Mat

15. Push down the two pins on the other side of the mat into blind bosses to fully seat anti slip mat.
16. Reconnect the negative battery cable.

2014 ENGINE**2.0L Diesel - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

This engine is equipped with a high pressure electronic injection system from Bosch Common Rail ECD 16 C39 fast diesel engine, fully managed by an Powertrain Control Module (PCM). The engine respects the Euro 5 regulation and is equipped with the following emission components:

- Exhaust system with Diesel Oxidation Catalyst (DOC)/Diesel Particulate Filter (DPF).
- Exhaust Gas Recirculation System (EGR).
- Crankcase oil vapor recirculation system.

STANDARD PROCEDURE**DUST COVERS AND CAPS**

Fig. 1: Covers/Caps

Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

Fig. 2: Opening Cover

Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV MS-GF44B

Mopar® Engine RTV is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV MS-GF41B

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This

material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER MS-CD98D

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT MS-CD78D

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can with applicator.

MOPAR® THREEBOND ENGINE RTV SEALANT

MOPAR® THREEBOND ENGINE RTV SEALANT is a unique gasket material that is specially made to retain adhesion and sealing properties when used to seal components exposed to engine oil.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV MS-GF44B or ATF RTV MS-GF41B gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can with applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

ENGINE GASKET SURFACE PREPARATION

Fig. 3: Proper Tool Usage For Surface Preparation
 Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- High speed power tool with an abrasive pad or paper to clean the cylinder block and head (2).

NOTE: **Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover.
- High speed power tool with 3M Roloc™ Bristle Disc (white or yellow) (3).
- Plastic or wood scraper (4).

COMPRESSION TEST

1. Warm up engine to operating temperature (approximately 80 °C, 176 °F).
2. Shut off the engine.
3. Disable the low pressure fuel pump.
4. Remove the fuel injectors. Refer to **INJECTOR(S), FUEL, REMOVAL**.
5. Crank engine several times with the starter to eliminate combustion residues in the cylinders.

Fig. 4: Inserting Compression Test Adapter
Courtesy of CHRYSLER GROUP, LLC

6. Insert the (special tool #10497, Adapter, Compression Test) (1) into injector hole of cylinder to be tested. Install injector clamp, nut and securely tighten.
7. Test compression pressure by cranking engine with starter for at least 8 revolutions.

Cylinder compression Difference Between Cylinders	25 %
--	------

8. Carry out test procedure at the remaining cylinders in the same way.
9. Remove nut, injector clamp, and the (special tool #10497, Adapter, Compression Test) (1) from cylinder head.
10. Install the injectors. Refer to **INJECTOR(S), FUEL, INSTALLATION** .

REMOVAL

REMOVAL

CAUTION: When removing or disconnecting components, plug all inlet/outlet and fluid lines to prevent residual leakage and contamination.

Fig. 5: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative and positive battery cable.
2. Remove the engine cover (1).
3. Remove air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .

Fig. 6: Removing/Installing Starter

Courtesy of CHRYSLER GROUP, LLC

4. Raise the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove bolts (3) and the belly pan (2).
6. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
7. Drain the engine oil. Using a new sealing washer tighten drain plug to 20 N.m (177 in. lbs.)

8. Drain the transaxle fluid.

Fig. 7: Reverse Lamp Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. On MTX models, disconnect the reverse lamp sensor wire harness connector (2).
10. Lower the vehicle.

Fig. 8: Cable Connector & Release Tabs
Courtesy of CHRYSLER GROUP, LLC

11. On MTX models, pry up on the cable connector (1) to disengage from the lever.
12. On MTX models, disconnect the gear shift range cable at the bracket by squeezing the release tabs (2) while pulling upward.

Fig. 9: Gear Shift Selector Cable & Manual Lever
Courtesy of CHRYSLER GROUP, LLC

13. On MTX models, disconnect the gear shift selector cable (1) at the manual lever (2).

Fig. 10: Gear Shift Selector Cable & Bracket
Courtesy of CHRYSLER GROUP, LLC

14. On MTX models, disconnect the gear shift selector cable (1) at the bracket (2) by squeezing the release tabs while pulling upward.

Fig. 11: Hydraulic Supply Pipe & Concentric Slave Cylinder
Courtesy of CHRYSLER GROUP, LLC

15. On MTX models, disconnect the hydraulic supply pipe for the concentric slave cylinder.

Fig. 12: Brake Booster Hose & Retainer Clip
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the brake booster hose (1) at vacuum pump and retainer clip (2).

Fig. 13: Fuel Supply & Return Line Quick-Connect Fittings
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the fuel supply (2) line quick-connect fittings at fuel injection pump. Refer to **FITTING, QUICK CONNECT**.
18. Disconnect the fuel return line (1) near the fuel injection pump. Refer to **FITTING, QUICK CONNECT**.
19. Detach the fuel line routing clips.

Fig. 14: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

20. Disconnect the two glow plug harness connector (3).

Fig. 15: Powertrain Control Module (PCM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

21. Unlock and disconnect the two PCM harness connectors (1) at the PCM (2).

Fig. 16: Differential Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

22. Disconnect the differential pressure sensor wire harness connector (3).
23. Remove nut (1) and position aside the differential pressure sensor (2) from bracket.

Fig. 17: Right PDC Cover
Courtesy of CHRYSLER GROUP, LLC

24. Remove the right PDC cover (1).

Fig. 18: B+ Cable & Nut
Courtesy of CHRYSLER GROUP, LLC

25. Remove nut (1) and the B+ cable (2) from the right PDC.
26. Remove retainers and the right and left lower splash shield.
27. Remove the lower front closeout panel. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

28. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
29. Remove the right and left half shafts. Refer to **REMOVAL** .
30. Remove the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .
31. Remove the diesel particulate filter. Refer to **FILTER, DIESEL PARTICULATE, REMOVAL** .

Fig. 19: Lower CAC Hoses
Courtesy of CHRYSLER GROUP, LLC

32. Remove the right lower CAC hose (2).

Fig. 20: Right CAC Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

33. Remove bolts (2) and the right CAC tube (1) from turbocharger.

Fig. 21: Left Charge Air Cooler (CAC) & Hose
Courtesy of CHRYSLER GROUP, LLC

34. Remove the left side Charge Air Cooler (CAC) hose (1).

Fig. 22: CAC Air Tube & Nut
Courtesy of CHRYSLER GROUP, LLC

35. Remove the left CAC tube support bracket nut (1).

Fig. 23: EGR Air Flow Control Valve Inlet Tube, CAC Tube Wire Retainer & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

36. Release spring clip (2) and disconnect the left side CAC tube (3).

Fig. 24: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

37. Disconnect the two A/C compressor wire harness connector (1).

NOTE: The A/C compressor for 2.0L diesel models uses three bolts to secure the A/C compressor to the engine.

38. Support the A/C compressor (2) and remove the three bolts (3) that secure the compressor to the engine

and position aside.

39. Lower the vehicle.

Fig. 25: Thermostat Housing & Hoses
Courtesy of CHRYSLER GROUP, LLC

40. Using the (special tool #10288, Pliers, Hose Clamp) to release clamp (1) and remove the upper radiator hose at engine.

Fig. 26: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

41. Using the (special tool #10288, Pliers, Hose Clamp) to release clamp and remove the lower radiator hose

(1) at engine.

Fig. 27: Coolant Bottle & Lower Hose
Courtesy of CHRYSLER GROUP, LLC

42. Using the (special tool #10288, Pliers, Hose Clamp) to release clamp and remove the coolant hose from pressurized coolant bottle.

Fig. 28: Heater Hose
Courtesy of CHRYSLER GROUP, LLC

43. Disconnect the Heater Hose (1) at heater core.
44. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.

Fig. 29: B+ Cable Retainer
Courtesy of CHRYSLER GROUP, LLC

45. Remove nut (2) and the solenoid wire from starter.
46. Remove nut (1) and the B+ cable (4) from starter.

Fig. 30: Ground Cables & Nut
Courtesy of CHRYSLER GROUP, LLC

47. Remove nut (2) and the ground cables (1).

Fig. 31: B+ Retainer, Generator Field Connector & B+ Cable
Courtesy of CHRYSLER GROUP, LLC

48. Remove nut (2) and the B+ cable from generator.
49. Disconnect the generator field wire harness connector (1) from generator.
50. Remove the lower DPF mounting bracket.
51. Remove the rear mount assembly. Refer to **INSULATOR, ENGINE MOUNT, REAR, REMOVAL** .
52. Remove the coolant crossover tube.

Fig. 32: Battery Tray & Engine Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

53. Detach the engine wire harness retainer (1) from battery tray (2).

Fig. 33: Nut & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

54. Remove nut securing wire harness by battery.

Fig. 34: Engine Support Cradle, Cradle Posts, Safety Strap & Power Train Dolly
Courtesy of CHRYSLER GROUP, LLC

55. Assemble the Dolly (special tool #6135, Dolly, Power Train), Cradle (special tool #6710A, Cradle, Engine Support).
56. Lower vehicle and position Dolly (special tool #6135, Dolly, Power Train) (6), and Cradle (special tool #6710A, Cradle, Engine Support) (5) under engine.
57. Adjust the Cradle Posts (special tool #6848, Posts, Cradle) (1, 3, 4) to seat engine on Cradle Posts.

WARNING: Safety straps must be used to secure engine to the dolly fixture.

58. Install, tighten and lock safety strap (2) around engine and attach them to the cradle.
59. Lower vehicle so that only the weight of the engine and transaxle assembly is on dolly fixture.

Fig. 35: Left Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

60. Remove left mount to transaxle bolts (1).

Fig. 36: Right Transaxle Mount Bolts

Courtesy of CHRYSLER GROUP, LLC

61. Remove the right engine mount bracket bolt (2).
62. Remove the three engine mount bolts (3) and the mount bracket (1).

CAUTION: It may be necessary to adjust the engine and transmission assembly, with the dolly fixture attached, to successfully clear the engine compartment.

63. While watching for obstructions, slowly raise the vehicle until the engine and transmission assembly clear the engine compartment.
64. Separate engine and transmission.

INSTALLATION

INSTALLATION

1. On MTX models, install the transmission and tighten bolts to. Refer to **SPECIFICATIONS** .

Fig. 37: Engine Support Cradle, Cradle Posts, Safety Strap & Power Train Dolly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Safety straps must be used to secure engine to the dolly fixture.

NOTE: The fourth post is hidden behind the support strap.

2. Position the engine onto Cradle Post (special tool #6848, Posts, Cradle) (1, 3, 4), Engine Support (special tool #6710A, Cradle, Engine Support), and Dolly (special tool #6135, Dolly, Power Train) then install

safety strap (2) around engine, securing it to the Dolly (6).

3. Position the engine and transmission assemblies below vehicle engine compartment.

CAUTION: It may be necessary to adjust the engine and transmission assembly, with the dolly fixture attached, to successfully clear the engine compartment.

4. While watching for obstructions, slowly lower the vehicle until the engine and transaxle assembly clearly fit the engine compartment.

Fig. 38: Left Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install left mount to transaxle bolts (1). Tighten bolts 157 N.m (116 ft. lbs.).

Fig. 39: Right Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install right mount bracket (1) to frame rail retaining bolts and tighten to 90 N.m (66 ft. lbs.).

Fig. 40: Engine Support Cradle, Cradle Posts, Safety Strap & Power Train Dolly
Courtesy of CHRYSLER GROUP, LLC

7. Remove safety strap (2) and the Dolly (special tool #6135, Dolly, Power Train) (6).

Fig. 41: Nut & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

8. Install nut securing engine wire harness by battery.

Fig. 42: Battery Tray & Engine Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

9. Attach the engine wire harness retainer (1) to battery tray (2).
10. Install the coolant crossover tube.
11. Install the rear mount assembly. Refer to **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION**.

12. Install the lower DPF mounting bracket.

Fig. 43: B+ Retainer, Generator Field Connector & B+ Cable
Courtesy of CHRYSLER GROUP, LLC

13. Connect the generator field wire harness connector (1).
14. Install the B+ cable. Tighten nut (2) to 10 N.m (89 in. lbs.).

Fig. 44: Ground Cables & Nut
Courtesy of CHRYSLER GROUP, LLC

15. Install the ground cables (1). Tighten nut (2) to 20 N.m (177 in. lbs.).

**Fig. 45: B+ Cable Retainer**

Courtesy of CHRYSLER GROUP, LLC

16. Install the B+ cable (4) to starter. Tighten nut (1) to 10 N.m (89 in. lbs.).
17. Install the solenoid wire to starter and securely tighten nut (2).
18. Lower the vehicle.

**Fig. 46: Heater Hose**

Courtesy of CHRYSLER GROUP, LLC

19. Install the heater hoses (1) at heater core.
20. Connect the heater hose at intake manifold.

Fig. 47: Coolant Bottle & Lower Hose
Courtesy of CHRYSLER GROUP, LLC

21. Install the pressurized coolant reservoir hose (1). Using the (special tool #10288, Pliers, Hose Clamp) lock the clamp.

Fig. 48: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

22. Install the lower radiator hose (1) at engine. Using the (special tool #10288, Pliers, Hose Clamp) lock the clamp.

Fig. 49: Thermostat Housing & Hoses
Courtesy of CHRYSLER GROUP, LLC

23. Install the upper radiator (2) hose at engine. Using the (special tool #10288, Pliers, Hose Clamp) lock the clamp (1).
24. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 50: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The A/C compressor for 2.0L diesel models uses three bolts to secure the A/C compressor to the engine.

25. Install the A/C compressor (2). Tighten the three bolts (3) to 25 N.m (18 ft. lbs.).

26. Connect the two A/C compressor wire harness connector (1).

Fig. 51: O-Ring & EGR Air Flow Control Valve Inlet Tube
Courtesy of CHRYSLER GROUP, LLC

27. Install a new Inlet tube O-ring seal (2).

Fig. 52: EGR Air Flow Control Valve Inlet Tube, CAC Tube Wire Retainer & CAC Hose
Courtesy of CHRYSLER GROUP, LLC

28. Connect the left side Charge Air Cooler (CAC) tube (3) and install spring clip (2).

Fig. 53: CAC Air Tube & Nut
Courtesy of CHRYSLER GROUP, LLC

29. Install the left CAC tube support bracket nut (1). Tighten nut to 9 N.m (80 in. lbs.).

Fig. 54: Left Charge Air Cooler (CAC) & Hose
Courtesy of CHRYSLER GROUP, LLC

30. Install the right side CAC hose (3).

Fig. 55: CAC Tube & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

31. Install the CAC tube O-ring seal (1).

Fig. 56: Right CAC Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

32. Install the right CAC tube (1) to turbocharger flange. Tighten the bolts (2) to 10 N.m (89 in. lbs.).
33. Install the diesel particulate filter. Refer to **FILTER, DIESEL PARTICULATE, INSTALLATION** .
34. Install the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .
35. Install the right and left halfshafts. Refer to **INSTALLATION** .

36. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
37. Install the right and left lower splash shield and retainers.

Fig. 57: B+ Cable & Nut
Courtesy of CHRYSLER GROUP, LLC

38. Install the B+ cable (2) to the right PDC and securely tighten nut (1).

Fig. 58: Right PDC Cover
Courtesy of CHRYSLER GROUP, LLC

39. Install the right PDC cover (1).

Fig. 59: Differential Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

40. Install the differential pressure sensor (2) and securely tighten nut (1).
41. Connect the differential pressure sensor wire harness connector (3).

Fig. 60: Powertrain Control Module (PCM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

42. Connect and lock the two PCM harness connectors (1) at the PCM (2).

Fig. 61: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

43. Connect the two glow plug harness connector (3).

Fig. 62: Fuel Supply & Return Line Quick-Connect Fittings
Courtesy of CHRYSLER GROUP, LLC

44. Attach the fuel line routing clips.
45. Connect the fuel return line (1) near the fuel injection pump.
46. Connect the fuel supply (2) line quick-connect fitting at fuel injection pump.

Fig. 63: Brake Booster Hose & Retainer Clip
Courtesy of CHRYSLER GROUP, LLC

47. Connect the brake booster hose (1) at vacuum pump and retainer clip (2).

Fig. 64: Hydraulic Supply Pipe & Concentric Slave Cylinder
Courtesy of CHRYSLER GROUP, LLC

48. Connect the hydraulic supply pipe for the concentric slave cylinder.

Fig. 65: Gear Shift Selector Cable & Bracket
Courtesy of CHRYSLER GROUP, LLC

49. Connect the gear shift selector cable (1) to the bracket (2).

Fig. 66: Gear Shift Selector Cable & Manual Lever
Courtesy of CHRYSLER GROUP, LLC

50. Connect the gear shift selector cable (1) to the manual lever (2).

Fig. 67: Cable Connector & Release Tabs
Courtesy of CHRYSLER GROUP, LLC

51. Push the cable connector (1) to the lever.
52. Connect the gear shift range cable at the bracket.

Fig. 68: Reverse Lamp Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

53. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
54. Connect the reverse lamp wire harness connector (2).

Fig. 69: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

55. Install the belly pan (2) and securely tighten bolts (3).
56. Lower the vehicle.
57. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
58. Fill the transaxle with the recommended oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
59. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
60. Install a new oil filter and fill the engine with recommended oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

Fig. 70: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.0L Diesel - Service Information - Cherokee

61. Connect the negative and positive battery cable.
62. Start engine and check for leaks.
63. Install engine cover (1).

SPECIFICATIONS**SPECIFICATIONS - 2.0L DIESEL ENGINE****GENERAL**

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Type	In-Line OHV, DOHC	
Number of Cylinders	4	
Firing Order	1 - 3 - 4 - 2	
Compression Ratio	16.5:1	
Max. Variation Between Cylinders	25%	
Displacement	2.0 L	122 CID

CYLINDER BLOCK

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Material	Cast Iron	
Cylinder Liner Inner Diameter		
Grade A	83.000 - 83.010 mm	3.2677 - 3.2681 in.
Grade B	83.010 - 83.020 mm	3.2681 - 3.2684 in.
Grade C	83.020 - 83.030 mm	3.2684 - 3.2688 in.
Cylinder Liner Taper	< 0.005 mm	0.0002 in.
Cylinder Liner Out-of-Round	< 0.050 mm	0.002 in.
Cylinder Liner Inner Diameter Oversize	0.10 mm	0.0004 in.

CYLINDER HEAD

DESCRIPTION	SPECIFICATION	
	Metric	Standard
Engine Cylinder Head Lower Surface Flatness	< 0.1 mm	0.0039 in.
Cylinder Head Nominal Height	107 mm $\pm$ 0.05 mm	4.213 $\pm$ 0.002 mm

COVER, ENGINE

REMOVAL

REMOVAL

Fig. 71: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Remove engine cover (1) by lifting upwards.

INSTALLATION

INSTALLATION

Fig. 72: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Align engine cover (1) with mounting retainers.
2. Firmly press cover onto mounting studs.

CYLINDER HEAD**DESCRIPTION****DESCRIPTION**

The cylinder head is a one-piece design and is made from aluminum alloy and silicon.

Two, ductile cast iron, overhead camshafts in a camshaft housing; they are operated by a belt and gears.

The four valves per cylinder, parallel and vertical, are positioned in the valve guides and are controlled by rocker arms operated by camshaft cams and kept in contact with the valves through hydraulic tappets.

Valve guides are press-fitted in the cylinder head seats. A special reamer is used to produce the inner diameter after fitting.

Unlike cylinder heads with ante-chambers, the entire combustion process takes place in the combustion chamber on the piston.

The gasket between the cylinder head and crankcase is made of metal. No cylinder head tightening is required throughout the life of the engine.

REMOVAL**REMOVAL**

1. Disconnect the negative battery cable.
2. Remove air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .

Fig. 73: Rocker Arm, Retaining Clip & Lifter
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .

NOTE: **Number the position of each rocker arm and lifter as it is removed.**

4. Remove all the rocker arm (1) and lifters (3).
5. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
6. Remove the exhaust manifold. Refer to **MANIFOLD, EXHAUST, REMOVAL** .
7. Remove the EGR cooler manifold assembly. Refer to **COOLER, EGR, REMOVAL** .

9. Remove bolt (2) and the engine oil dipstick tube (1).

Fig. 76: Fuel Injection Pump Mounting Bracket & Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Remove bolt (1) and the fuel injection pump mounting bracket (2) from the cylinder head.
11. Remove power steering pump and support bracket.

Fig. 77: Cylinder Head Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove bolts (1) and the cylinder head assembly (2).

CLEANING

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block. Refer to ENGINE - STANDARD PROCEDURE . Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

INSPECTION

NOTE: Cylinder head cannot be resurfaced.

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers.

Fig. 78: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

- 1 - FEELER GAUGE
2 - STRAIGHT EDGE

1. Cylinder head must be flat within 0.1 mm (0.004 in.).

Fig. 79: Checking Wear on Valve Guide-Typical
Courtesy of CHRYSLER GROUP, LLC

- 1 - TOP
2 - MIDDLE
3 - BOTTOM
4 - CUT AWAY VIEW OF VALVE GUIDE MEASUREMENT LOCATIONS

2. Inspect camshaft bearing journals for scoring.
3. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
4. Using a small hole gauge and a micrometer, measure valve guides in 3 places top (1), middle (2), and bottom (3). Replace guides if they are not within specification. Refer to **SPECIFICATIONS - 2.0L DIESEL ENGINE**.
5. Check valve guide height.

6. Prior to installing cylinder head, the cylinder block should be checked for flatness.

INSTALLATION

INSTALLATION

Fig. 80: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

NOTE: If piston or connecting rods have been replaced, measure piston projection to ensure proper head gasket selection. Refer to **ENGINE BLOCK - STANDARD PROCEDURE**.

1. Clean the old gasket from the cylinder head and engine block. Refer to **ENGINE - STANDARD PROCEDURE**.
2. Check that the flatness of the cylinder head lower surface corresponds to the recommended values.

Cylinder Head	Value
Engine cylinder head lower surface flatness	0.1 mm (0.004 in.)
Cylinder head nominal height	107 +/- 0.05

NOTE: The locating dowel pins between the engine block and cylinder head are shorter (12.5 mm) than the dowel pins between the cylinder head and the camshaft housing. Take great care not to reverse them as this could impair engine operation.

3. If removed, install the engine block dowel pins.
4. Use a new gasket that is the same thickness as the one removed. If this is not the case, the thickness of the new cylinder head gasket must be determined by checking piston protrusion. Refer to **ENGINE BLOCK - STANDARD PROCEDURE**.

5. Position the first cylinder at TDC; rotate the crankshaft a further two teeth of the toothed drive pulley to lower the pistons, thereby preventing any resistance of the valves while fitting the cylinder head.

Fig. 81: Cylinder Head Gasket
Courtesy of CHRYSLER GROUP, LLC

6. Install the cylinder head assembly (1).

Fig. 82: Cylinder Head Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the cylinder head bolts more than four times because they undergo permanent lengthening whenever they are tightened. If the previous tightening torque is unknown, a replacement is necessary.

7. Install the cylinder head (2) onto the engine block and tighten the bolts (1) finger tight.

Fig. 83: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. Tighten the cylinder head bolts in the following order shown in illustration to:
 - a. Tighten bolts to 62 N.m (46 ft. lbs.).
 - b. Tighten bolts to 69 N.m (51 ft. lbs.).
 - c. Tighten bolts an additional 90° turn.
 - d. Tighten bolts an additional 90° turn.
 - e. Tighten bolts an additional 90° turn.

Fig. 84: Fuel Injection Pump Mounting Bracket & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Install the power steering pump support bracket. Tighten bolts to 30 N.m (22 ft. lbs.).
10. Install the fuel injection pump and mounting bracket (2) to the cylinder head. Tighten bolt (1) to 25 N.m (18 ft. lbs.).

Fig. 85: Engine Oil Dipstick Tube & Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Install the oil dipstick tube (1). Tighten bolt (2) to 9 N.m (80 in. lbs.).

Fig. 86: Upper Radiator Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

12. Install the upper radiator (2) hose at engine. Using the (special tool #10288, Pliers, Hose Clamp) lock the clamp (1).
13. Install the EGR cooler manifold. Refer to **COOLER, EGR, INSTALLATION** .

14. Install exhaust manifold. Refer to **MANIFOLD, EXHAUST, INSTALLATION** .
15. Install intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .

Fig. 87: Rocker Arm, Retaining Clip & Lifter
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Install the lifters and rocker arm into the original location as noted from removal.**

16. Install all the lifters (3) and rocker arms (1) back into their original location.
17. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
18. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
19. Install new oil filter and fill with oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
20. Install air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
21. Connect the negative battery cable.
22. Start engine and check for leaks.

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

Fig. 88: Camshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

The exhaust camshaft is controlled directly by the timing belt and transmits power to the inlet camshaft by means of a pair of straight toothed gears.

The exhaust camshaft also controls the vacuum unit fitted on the gears side.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .

Fig. 89: Vacuum Pump & Bolts

Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (1) and the vacuum pump (2).

Fig. 90: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolt (2) and the camshaft position sensor (3).

Fig. 91: Plugs & Camshaft Timing Tools
Courtesy of CHRYSLER GROUP, LLC

5. Remove plugs (1) and install the Camshaft Timing Tools (2) (special tool #20132, Tool, Timing Belt Locking) into the camshaft housing.

**Fig. 92: Camshaft Gear Bolts**

Courtesy of CHRYSLER GROUP, LLC

6. Remove the bolts (1) securing the camshaft gears.

**Fig. 93: Camshaft Timing Belt Sprocket & Bolt**

Courtesy of CHRYSLER GROUP, LLC

7. Using the Counter Torque Tool (3) (special tool #6847, Holder, Camshaft Sprocket) and Pins (2) (special tool #20127, Pins, Camshaft Pulley Remover/Installer) to hold camshaft sprocket (1) remove bolt (2) and the camshaft timing belt sprocket (1).

3476696

Fig. 94: Plugs & Camshaft Timing Tools
Courtesy of CHRYSLER GROUP, LLC

8. Remove the Camshaft Timing Tools (2) (special tool #20132, Tool, Timing Belt Locking).

3476819

Fig. 95: Camshaft Gears & Camshafts
Courtesy of CHRYSLER GROUP, LLC

9. Withdraw the camshafts (2) as far as necessary and remove the camshaft gears (1).

Fig. 96: Intake Camshaft, Plug, Exhaust Camshaft & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

10. Using a suitable drift, extract the intake camshaft (1) and plug (2).
11. Using a suitable drift, extract the exhaust camshaft (4) and the oil seal (3).

INSTALLATION

INSTALLATION

Fig. 97: Intake Camshaft, Plug, Exhaust Camshaft & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft bearings with clean engine oil.
2. Install the camshafts (1 and 4) in their housings.

Fig. 98: Camshaft Gears & Camshafts
Courtesy of CHRYSLER GROUP, LLC

3. Install the camshaft gears (1) in their housings and secure them without tightening the bolts.

Fig. 99: Plugs & Camshaft Timing Tools
Courtesy of CHRYSLER GROUP, LLC

NOTE: Check that the tools are correctly fitted in the housings in the camshafts.

4. Install the Camshaft Timing Shaft Tools (2) (special tool #20132, Tool, Timing Belt Locking) into the camshaft housing.

Fig. 100: Camshaft Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Tighten the camshaft gear bolts to 30 N.m (22 ft. lbs.) plus an additional 40° turn.

Fig. 101: Camshaft Oil Seal, Fitting Tool & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Using the Fitting Tool (2) (special tool #20131, Installer, Camshaft Oil Seal) position new camshaft seal (1) onto Fitting Tool (2) and install the camshaft oil seal (1) by drawing in the seal using the bolt (3).
7. Remove the Fitting Tool (2).

3476756

Fig. 102: Camshaft Timing Belt Sprocket & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Install the camshaft sprocket (1) and tighten bolt finger tight (2).
9. Using the Counter Torque Tool (3) (special tool #6847, Holder, Camshaft Sprocket) and Pins (2) (special tool #20127, Pins, Camshaft Pulley Remover/Installer) to hold camshaft sprocket (1) and tighten the bolt (4) to 30 N.m (22 ft. lbs.) plus an additional 40° turn.

3476696

Fig. 103: Plugs & Camshaft Timing Tools
Courtesy of CHRYSLER GROUP, LLC

10. Install the inlet side camshaft plug (1).
11. Place the exhaust side camshaft timing belt sprocket in its housing and secure it without tightening the bolt.
12. Remove the Camshaft Timing Shaft Tools (2) (special tool #20132, Tool, Timing Belt Locking).

Fig. 104: Camshaft Position Sensor, Connector & Bolt
 Courtesy of CHRYSLER GROUP, LLC

13. Install the camshaft position sensor (3). Tightening bolt (2) to 9 N.m (80 in. lbs.).

Fig. 105: Vacuum Pump & Bolts
 Courtesy of CHRYSLER GROUP, LLC

14. Using a new gasket, position driver gear on rear of pump and install vacuum pump (2). Tighten bolts (1) to 18 N.m (159 in. lbs.).
15. Using a new gasket, install the engine oil filler. Tighten the bolts to 8 N.m 71 in. lbs.).
16. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
17. Connect negative battery cable.

1. Using the Fitting Tool (2) (special tool #20131, Installer, Camshaft Oil Seal), position new camshaft seal (1) onto Fitting Tool (2) and install the camshaft oil seal (1) by drawing in the seal using the bolt (3).
2. Remove the Fitting Tool.
3. Install the camshaft timing belt sprocket. Refer to **BELT AND SPROCKETS, TIMING, INSTALLATION**.

Fig. 131: Engine Cover

4. Install the engine cover (1).

SPRING(S), VALVE

REMOVAL

REMOVAL

1. Disconnect negative battery cable.
2. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
3. Assemble the (special tool #MD998772A, Compressor, Valve Spring) to the (special tool #10224, Adapter, Valve Spring) and install onto cylinder head.

Fig. 132: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

4. Compress the valve spring (3) and remove the valve keepers (1).
5. Remove the valve upper shim (2).
6. Remove the valve spring (3).
7. Remove the lower shim (4) (exhaust valve only).
8. Repeat procedure for each cylinder as necessary.

INSTALLATION

INSTALLATION

Fig. 133: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect all valve springs and retainers for wear or damage. Replace as necessary.**

1. Install the lower shim (4) (exhaust valve only).
2. Install valve spring (3).
3. Install valve upper shim (2).
4. Assemble the (special tool #MD998772A, Compressor, Valve Spring) to the (special tool #10224, Adapter, Valve Spring) and install onto cylinder head.

NOTE: **Ensure that the valve keepers are seated properly.**

5. Compress valve spring (3) and install valve keepers (1).
6. Repeat procedure for each cylinder as necessary.
7. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
8. Connect negative battery cable.

VALVES, INTAKE AND EXHAUST

REMOVAL

REMOVAL

NOTE: **As a good practice, determine if the valve faces or valve seats require servicing. Measuring the valve height on a known good valve. If the replacement or refinished valve height is greater than the measurement of the known good valve height, machine enough material from the stem of the valves to give you the valve height of the good valve.**

NOTE: **Valves can not be ground, only lapping is permitted.**

1. Disconnect the negative battery cable.
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL** .
3. Assemble the (special tool #MD998772A, Compressor, Valve Spring) to the (special tool #10224, Adapter, Valve Spring) and install onto cylinder head.

Fig. 134: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Valves, springs and retainers must be kept in order of the cylinder they were removed.

4. Compress the valve spring (3) and remove the valve keepers (1).
5. Remove the valve upper shim (2).
6. Remove the valve spring (3).
7. Remove the lower shim (4) (exhaust valve only).

CAUTION: Suitably mark the valve and the position in the cylinder head before removal. Failure to do so will result in improperly seated valves and possible engine damage after reassembly.

8. Remove valve stem seal (5).
9. Repeat steps 3 through 7 for each valve as necessary.
10. Remove the valves and replace as necessary.

INSTALLATION

INSTALLATION

WARNING: Valves must be kept in their original positions in cylinder head. Failure to do so will result in engine damage.

NOTE: Inspect all valves, springs and retainers for wear or damage. Replace as necessary.

1. Install valves in their original position in the cylinder head.

3478789

Fig. 135: Valve Stem Seal & Fitting Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install the valve seal Fitting Tool (2) onto valve stem.
3. Install valve stem seal (1).
4. Remove the valve seal Fitting Tool (2) from the valve stem.

0916030703

Fig. 136: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower shim (4) (exhaust valve only).
6. Install the valve spring (3).
7. Install the valve upper shim (2).

8. Assemble the (special tool #MD998772A, Compressor, Valve Spring) to the (special tool #10224, Adapter, Valve Spring) and install onto cylinder head.

NOTE: Ensure that the valve keepers are seated properly.

9. Compress the valve spring (3) and install the valve keepers (1).
10. Repeat steps 3 through 10 for each valve as necessary.
11. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.
12. Connect the negative battery cable.

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

This engine is equipped with a high pressure electronic injection system from Bosch Common Rail ECD 16 C39 fast diesel engine, fully managed by an Powertrain Control Module (PCM). The engine respects the Euro 5 regulation and is equipped with the following emission components:

- Exhaust system with Diesel Oxidation Catalyst (DOC)/Diesel Particulate Filter (DPF).
- Exhaust Gas Recirculation System (EGR).
- Crankcase oil vapor recirculation system.

STANDARD PROCEDURE

BEARING SELECTION CHARTS

CRANKSHAFT BEARINGS

Crankshaft Main Journal Diameter	
Bearing Size	Specification
Main journal half-bearings - Grade A (Red) numerical code 1 (94 00)	1.832 - 1.836 mm (0.0721 - 0.0722 in.)
Main journal half-bearings - Grade B (Blue) numerical code 2 (88 94)	1.835 - 1.839 mm (0.0722 - 0.0724 in.)
Main journal half-bearings - Grade C (Yellow) numerical code 3 (82 88)	1.838 - 1.842 mm (0.0723 - 0.0725 in.)
Crankshaft Main Journal Diameter (Oversize)	
Main journal/crankpin half-bearings oversize - Grade A (brown)	0.127 mm (0.0049 in.)
Main journal/crankpin half-bearings oversize - Grade B (green)	0.127 mm (0.0049 in.)
Clearance between connecting rod bearings -	0.030 - 0.056 mm (0.0011 - 0.0022 in.)

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.0L Diesel - Service Information - Cherokee

crankpin bearings	
Main Journal Identification	
Main journal grade A (normal), RED paint mark, numerical code 1 (94 00)*	52.994 - 53.000 mm (2.0863 - 20.866 in.)
Main journal grade B (normal), BLUE paint mark, numerical code 2 (88 94)*	52.982 - 52.994 mm (2.0858 - 2.0863 in.)
Main journal grade C (normal), YELLOW paint mark, numerical code 3 (82 88)*	52.982 - 52.998 mm (2.0858 - 2.0865 in.)
Main journal grade D (0.127 mm undersize), BROWN paint mark, numerical code 6 (67 73)*	52.867- 52.873 mm (2.0813 - 2.0816 in.)
Main journal grade E (0.127 mm undersize), GREEN paint mark, numerical code 7 (61 67)*	52.861 - 52.867 mm (2.0811 - 2.0813 in.)
Main journal grade F (0.127 mm undersize), BLACK paint mark, numerical code 8 (55 61)*	52.855 - 52.861 mm (2.0808 in.)

NOTE: (*) Last two numbers (thousandth part) of the main journal dimensions.

NOTE: If using a crankshaft where the maximum undersize for the bearings is 0.127 mm through grindings, the grade should be selected by measuring the diameter of the bearing using the above as a reference.

NOTE: Having defined the grade and the color of each new or reground crankshaft bearing, it is necessary to select the bearing pair or thickness; these should be the same color as the corresponding journal; the pair of half-bearings required can be ordered from the Parts Dept. by quoting the order number.

NOTE: The above is designed to guarantee the optimum operational clearances for all pins.

NOTE: Lastly, we wish to point out that, in general, the clearance between the main journal and the half-bearing, produced through the selection method described above, should be min. 0.011 - max; 0.071 mm; this figure can be measured, as part of the final check, using the calibrated wire (Plastigage) following the instructions described below.

ROD BEARINGS

Connecting Rod Journal Diameter	
Bearing Size	Specification
Crankpin half-bearings - Grade A (red)	1.525 - 1.532 mm (0.0600 - 0.0603 in.)
Crankpin half-bearings - Grade B (blue)	1.532 - 1.536 mm (0.0603 - 0.0605 in.)
Crankpin half-bearings - Grade C (yellow)	1.535 - 1.539 mm (0.0604 - 0.0606 in.)
Connecting Rod Journal Diameter (Oversize)	
Main journal/crankpin half-bearings oversize - Grade	

A (brown)	0.127 mm (0.0049 in.)
Main journal/crankpin half-bearings oversize - Grade B (green)	0.127 mm (0.0049 in.)
Clearance between connecting rod bearings - crankpin bearings	0.030 - 0.056 mm (0.0011 - 0.0022 in.)
Main journal/crankpin half-bearing oversize	0.254 mm (0.0099 in.)

REPLACING ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug .

Fig. 137: Core Hole Plug Removal
Courtesy of CHRYSLER GROUP, LLC

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in

service immediately.

MEASURING CYLINDER BORES

Fig. 138: Measuring Cylinder Bores
Courtesy of CHRYSLER GROUP, LLC

- 1 - MEASURING POINT OF CYLINDER BORE
- 2 - MEASURING POINT OF CYLINDER BORE
- 3 - MEASURING POINT OF CYLINDER BORE
- 1a - UPPER REVERSAL POINT OF #1 PISTON RING
- 1b - BOTTOM DEAD CENTER OF PISTON
- 1c - BOTTOM REVERSAL POINT OF OIL SCRAPER RING
- 1A - LONGITUDINAL DIRECTION
- 1B - TRANSVERSE DIRECTION

NOTE: This must be done with engine completely disassembled.

1. Thoroughly clean all cylinder bores with appropriate cleaning solvent.
2. Measure each cylinder at the three measuring points shown in illustration.
3. Using the three measurement points, measure cylinder in the longitudinal and in the transverse direction.

PISTON PROTRUSION

NOTE: Any time a rod or piston is replaced, the piston protrusion must be checked.

Fig. 139: Zero Dial Indicator

Courtesy of CHRYSLER GROUP, LLC

1. Position scooter block (special tool #D-115-2A, Block, Scooter) (4) and a dial indicator flat on the cylinder block (3) head surface and zero the dial indicator.

Fig. 140: Piston Height

Courtesy of CHRYSLER GROUP, LLC

2. Slide Scooter block (special tool #D-115-2A, Block, Scooter) (4) so that the dial indicator (1) is now on the piston (2).
3. Read measurement and refer to the chart below for the correct head gasket:

HEAD GASKET SELECTION

Piston Protrusion	Head Gasket Identification

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.0L Diesel - Service Information - Cherokee

0.110 - 0.203 mm	0.035 - 0.039 in.	No Hole
0.231 - 0.330 mm	0.040 - 0.043 in.	One Hole
0.331 - 0.425 mm	0.044 - 0.047 in.	Two Hole

3479040

Fig. 141: Head Gasket Identification
Courtesy of CHRYSLER GROUP, LLC

4. Look up piston protrusion measurement in the table to find the correct head gasket. The head gasket is marked round holes (1).

COVER, ENGINE, FRONT

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.

NOTE: The crankshaft sprocket bolt is a left handed thread.

2. Remove the crankshaft sprocket. Refer to **BELT AND SPROCKETS, TIMING, REMOVAL**.

091174654

Fig. 142: Oil Pressure Regulator, Bolt & Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the oil pressure regulator wire harness connector (3).
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .

3477772

Fig. 143: Front Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove bolts (1) and the front cover (2).

INSTALLATION

INSTALLATION

Fig. 144: Front Cover, Gasket & Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket mating surfaces. Refer to **ENGINE - STANDARD PROCEDURE** .
2. Install the front cover gasket (1) and seal (3).

Fig. 145: Front Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil pan. Refer to **PAN, OIL, INSTALLATION** .
4. Install the front cover assembly (2). Tighten bolts (1) 9 N.m (80 in. lbs.).

091174654

Fig. 146: Oil Pressure Regulator, Bolt & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the oil pressure regulator wire harness connector (3).
6. If necessary, install a new front crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, FRONT, INSTALLATION**.

NOTE: The crankshaft sprocket bolt is a left handed thread.

7. Install the crankshaft sprocket. Refer to **BELT AND SPROCKETS, TIMING, INSTALLATION**.
8. Connect the negative battery cable.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

3372268

Fig. 147: Crankshaft Tone Wheel
Courtesy of CHRYSLER GROUP, LLC

- The crankshaft is made of cast iron and rests on five main bearings. Shaft axial clearance is governed by two half-rings housed in the rear main bearing.
- Eight counterweights accurately balance the crankshaft rotating masses.
- A set of ducts runs along the crankshaft to lubricate the main journals and crankpins.
- A tone wheel (1) is fitted at the rear of the crankshaft and is used for the RPM sensor.

STANDARD PROCEDURE

STANDARD PROCEDURE - MEASURE CRANKSHAFT AND BLOCK JOURNALS

NOTE: After bearing damage has occurred, remove all debris which is present in the main oil gallery, connecting rod bores, and in the crankshaft and oil galleries. Include removal of the inserting steel ball of the main oil gallery before cleaning.

1. Remove crankshaft. Refer to **CRANKSHAFT, REMOVAL**.
2. Clean all engine parts thoroughly.

CAUTION: After bearing damage has occurred, replace connecting rods which have suffered overheating because of bearing damage. The connecting rod must not have any cross scores and notches.

3. Inspect connecting rod. If damage is present, inspect crankshaft, replace as necessary.
4. Inspect crankcase.
5. Inspect standard size of crankshaft bearing shells.
6. Inspect crankshaft bearing cap.

7. Mount crankshaft radially.
8. Inspect crankshaft bearing play.

NOTE: Radial mounting of the main bearings of standard size crankshaft is possible by assigning the color-coded bearing shells.

9. Assign crankshaft bearing shells.
10. Mount crankshaft axially.
11. Inspect crankshaft bearing play.

ASSIGN CRANKSHAFT BEARING SHELLS

The oil pan rail of the cylinder block is marked with chisel punches indicating which bearing shells are used.

REMOVAL

REMOVAL

NOTE: The engine must be removed from the vehicle to service crankshaft.

Fig. 148: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the engine cover (1).
3. Remove the engine from the vehicle and place on an overhaul stand. Refer to **REMOVAL**.
4. Unscrew the drain plug from the engine oil pan and drain the engine oil. Tighten drain plug to 20 N.m (177 in. lbs.).

5. Remove the cylinder head assembly. Refer to **CYLINDER HEAD, REMOVAL** .
6. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .
7. Remove the catalytic converter DPF support.
8. Remove the wiring retaining bracket.

Fig. 149: Crankshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove the crankshaft position sensor.
10. Remove the engine oil cooler.
11. Remove the alternator.
12. Remove the front cover. Refer to **COVER, ENGINE, FRONT, REMOVAL**.

NOTE: Mark piston and rod location prior to removal with paint pen. Do not use a punch.

13. Rotate the crankshaft until connecting rod number one is at bottom dead center.
14. Remove piston and connecting rod assemblies. Refer to **ROD, PISTON AND CONNECTING, REMOVAL** .
15. Remove rear crankshaft oil seal cover. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL** .

NOTE: Crankshaft end play specification is 0.049 mm. If the value for the crankshaft end play does not correspond with the specification, when refitting, regrind the engine block seat and use suitable oversize thrust half-washers.

16. Check the amount of end play in the crankshaft using a dial indicator.

Fig. 150: Crankshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

17. Unbolt crankshaft bearing caps (10).
18. Remove the bearing caps (2).
19. Remove the lower main half-bearings (3).
20. Inspect crankshaft bearing caps and bolts for wear and stretching.
21. Remove crankshaft (4) from engine block.
22. Remove the upper main half-bearings (5).
23. Remove the thrust half-washers (6).
24. Undo the bolts (7) and remove the oil jets (8) from the engine block.
25. Remove the engine block from the overhaul stand, and place it on a workbench.
26. Drill and remove the water/oil sealing plugs from the engine block to allow for washing the ducts.
27. Wash the dismantled components.
28. Fit the water/oil sealing plugs in the engine block using suitable fitting tools.

INSTALLATION

INSTALLATION

Fig. 151: Crankshaft Assembly
 Courtesy of CHRYSLER GROUP, LLC

1. Replace the engine block on the overhaul stand using the mounting bracket.
2. Install the oil jets (8) in the engine block and securely tighten bolts (7).
3. Fit the main bearing caps into the block.
4. Torque the main bearing caps to specification. 25 N.m (18 ft. lbs), then an additional 100° turn.
5. Check that there are no deposits or blockages in the crankshaft lubrication ducts.
6. Measure the diameter of the main journals and compare them to the specifications. (Class A - 59.995 mm, Class B - 59.998 mm, Class C - 59.981 mm).

NOTE: **If the diameter of the main journals is not correct, stop reassembly and replace the engine assembly.**

7. Remove the main bearing caps (1).

Fig. 152: Crankshaft Bearing Identification & Size Identification
Courtesy of CHRYSLER GROUP, LLC

8. Locate the crankshaft journal letter class stamp on the toothed wheel at the rear of the crankshaft.

NOTE: In the case of the example, the numbers 11111N indicate that all five main bearings are Grade A (red) as indicated (1). Numerical code of main journal identification: the first number on the left refers to the first timing side bearing; the final "N" has no value.

NOTE: In the case of the example, the numbers 2222N indicate that all four connecting rod bearings as indicated (2). Numerical code of main journal identification: the first number on the left refers to the first timing side bearing; the final "N" has no value.

NOTE: In the case of the example, the number 94 (first on the left) (3) corresponds to the dimensions 52.994 for the first timing side bearing which identifies Grade A (red); the same method should be applied for other groups of two digits for the same reference 3 (97 -95 -95 -94).

9. Select the proper bearing sizes for the main bearings and connecting rod bearings. Refer to **ENGINE BLOCK - STANDARD PROCEDURE**.

Fig. 153: Crankshaft Assembly
 Courtesy of CHRYSLER GROUP, LLC

10. Install the upper bearing halves (5) into the engine block.
11. Lubricate the upper bearing halves with engine oil.
12. Install the upper thrust bearing (7) into the engine block.
13. Install the crankshaft (4) into the engine block.
14. Install the lower thrust bearing.
15. Install the lower main bearing halves into the main bearing caps.
16. Lubricate the lower bearing halves with engine oil
17. Install the main bearing caps into the block. Tighten bolts to 25 N.m (18 ft. lbs), then 100° additional turn.
18. Install the piston and connecting rod assemblies. Refer to **ROD, PISTON AND CONNECTING, INSTALLATION** .
19. Place the front engine cover in its seat complete with gasket and tighten the bolts to 9 N.m (80 in lbs.).
20. Place the front crank seal in its seat on the crankshaft oil seal front cover using the (special tool #20145, Installer, Crankshaft Front Oil Seal).
21. Install the crankshaft position sensor and tighten bolt to 9 N.m (80 in lbs.).
22. Place the timing belt tensioner mounting assembly in position and tighten the bolts to 25 N.m (18 ft. lbs.).
23. Install rear crankshaft oil seal and cover. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION** .
24. Apply silicone sealant to the entire perimeter of the engine oil pan assembly.
25. Position oil pan and install bolts. Tighten bolts to 25 N.m (18 ft. lbs.).
26. Install the two oil pan-to-rear oil seal carrier bolts and tighten bolts to 9 N.m (80 in. lbs.).
27. Install the crankshaft sprocket. Tighten bolt to 340 N.m (251 ft. lbs.).
28. Install cylinder head. Refer to **CYLINDER HEAD, INSTALLATION** .
29. Install the engine. Refer to **INSTALLATION** .

30. Fill crankcase with the correct engine oil, to the proper level.
31. Fill cooling system with the proper coolant, to the proper level. Refer to **STANDARD PROCEDURE** .
32. Connect negative battery cable.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothes.

33. Start engine and inspect for leaks.

Fig. 154: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

34. Install engine cover (1). Refer to **INSTALLATION** .

DAMPER, VIBRATION

REMOVAL

REMOVAL

1. Disconnect negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

Fig. 155: Vibration Damper & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (2) and the vibration damper (1).

INSTALLATION

INSTALLATION

Fig. 156: Vibration Damper & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the vibration damper (1). Tighten bolts (2) to 30 N.m (22 ft. lbs.).
2. Installed the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
3. Lower the vehicle.

4. Connect the negative battery cable.

PUMP, VACUUM**REMOVAL****REMOVAL****Fig. 157: Engine Cover**

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the engine cover (1).

**Fig. 158: Vacuum Pump & Vacuum Lines**

Courtesy of CHRYSLER GROUP, LLC

3. Remove the vacuum line (2) at vacuum pump (1).
4. Remove the thermostat housing. Refer to **THERMOSTAT, REMOVAL** .

Fig. 159: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Observe the position of drive gear on rear of pump upon removal.**

5. Remove bolts (1) and the vacuum pump (2).
6. Remove and discard gasket.

INSTALLATION

INSTALLATION

Fig. 160: Vacuum Pump & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket sealing surfaces.
2. Install new gasket (1) onto the vacuum pump (2).

Fig. 161: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Position driver gear on rear of pump and install vacuum pump (2) and securely tighten bolts.
4. Install the thermostat. Refer to **THERMOSTAT, INSTALLATION**.

Fig. 162: Vacuum Pump & Vacuum Lines
Courtesy of CHRYSLER GROUP, LLC

5. Install vacuum lines (2) onto the vacuum pump (1).

Fig. 163: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

6. Install the engine cover (1).
7. Connect the negative battery cable.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

Fig. 164: Piston & Connecting Rod Assembly
Courtesy of CHRYSLER GROUP, LLC

The pistons (3) are made of silicon aluminium alloy with self-heating inserts and are divided into three size categories.

An OMEGA-shaped combustion chamber in the piston crown improves combustion efficiency.

There is a channel inside the piston through which the oil, sent by the jet, flows, ensuring improved piston cooling.

The piston (3) is coupled to the pin by means of two copper alloy bushes.

The connecting rods (4) are made of hardened and tempered steel with a copper bush fitted for matching with the pin (2).

The floating pins are held in place by two expansion retaining rings (1) that are housed in the grooves in the piston hubs.

REMOVAL**REMOVAL**

1. Remove the engine from the vehicle. Refer to **REMOVAL** .
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL** .
3. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .

Fig. 165: Piston-Connecting Rods Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use a punch to mark connecting rods.

4. Mark connecting rods with paint marker.
5. Remove the bolts (1) and remove the connecting rod caps (2) complete with bearings (3).
6. Withdraw and remove the piston-connecting rods assemblies (6) with bearings (5).

PISTON RINGS

Fig. 166: Piston Rings - Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Using a suitable ring expander, remove the top and second piston rings.
2. Remove the upper oil ring side rail, lower oil ring side rail and then the oil expander from the piston.

3. Carefully clean carbon from the piston crowns, skirts and ring grooves.
4. Repeat this procedure for the remaining pistons and connecting rod assemblies.

PISTON PIN

Fig. 167: Piston & Connecting Rod Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Secure the connecting rod (4) in a soft jawed vice.
2. Remove the two snap rings (1) securing the piston pin (2).
3. Push the piston pin (2) out of the piston (3) and the connecting rod (4).
4. Remove the piston (3) from the connecting rod (4).
5. Measure the diameter of the piston pin in the center and on both ends. Refer to **SPECIFICATIONS - 2.0L DIESEL ENGINE**.
6. Repeat this procedure for the remaining pistons and connecting rod assemblies.

INSTALLATION

INSTALLATION

NOTE: The piston-connecting rod assemblies should be fitted in the cylinder block/crankcase so that the drain on the piston skirt is aligned with the oil jet on the crankcase.

1. Make sure the ring end gaps are properly staggered.
2. Lubricate the piston and rings with clean engine oil.
3. Compress piston rings with a ring compressor.

Fig. 168: Piston-Connecting Rods Assembly
 Courtesy of CHRYSLER GROUP, LLC

4. Install the upper rod bearing shell (5) into connecting rod (6) and oil bearing shell.

NOTE: The piston-connecting rod assemblies should be fitted in the cylinder block/crankcase so that the drain on the piston skirt is aligned with the oil jet on the crankcase.

5. Push piston into cylinder.

NOTE: Be careful when guiding rod into place not to nick the crankshaft journals.

NOTE: Fit the connecting rod caps so that the number stamped on each rod faces toward the same side as the number stamped on the big end (inlet side).

6. Install lower bearing shell (3) into connecting rod cap (2).
7. Lubricate lower bearing shell and position rod cap.
8. Install new rod bolts and tighten to 25 N.m (18 ft. lbs.) plus an additional 60° turn.
9. Install oil pan. Refer to **PAN, OIL, INSTALLATION**.
10. Install cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.
11. Install engine into vehicle. Refer to **INSTALLATION**.
12. Replace oil filter and fill with oil. Refer to **FILTER, ENGINE OIL, INSTALLATION**.
13. Fill cooling system. Refer to **STANDARD PROCEDURE**.
14. Start engine and check for leaks.

PISTON RINGS

Fig. 169: Piston Rings - Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

1. Install rings on the pistons using a suitable ring expander.

Fig. 170: Piston Ring Gap Location

| <p>1 - SECOND COMPRESSION RING GAP POSITION</p> <p>2 - OIL CONTROL RING GAP POSITION</p> <p>3 - TOP COMPRESSION RING GAP POSITION</p> |
|---|

2. Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows.
3. Top ring gap must be positioned at the No. 3 position (looking at the piston crown from above).
4. Second piston ring gap should be positioned at the No. 1 position.
5. Oil control ring gap should be positioned at the No. 2 position.

PISTON PIN

Fig. 171: Piston & Connecting Rod
Courtesy of CHRYSLER GROUP, LLC

1. Join the connecting rods to the pistons so that the number printed on connecting rod head (2) is facing notch (1) on the piston skirt for the oil jet housing.

Fig. 172: Piston & Connecting Rod Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Install the pins (2) into the piston (3) and rod (4) assembly and secure them using the retaining rings (1).

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

Fig. 173: Seal Remover Tool

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Remove the vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL** .
3. Using the (special tool #10498, Remover, Seal) (1), remove the front crankshaft seal.

INSTALLATION

INSTALLATION

Fig. 174: Crankshaft Sprocket Bolt & Oil Seal

Courtesy of CHRYSLER GROUP, LLC

1. Position the new front crankshaft oil seal onto (special tool #20145, Installer, Crankshaft Front Oil Seal) tool.
2. Using the (special tool #20145, Installer, Crankshaft Front Oil Seal), install the front crankshaft oil seal (2) using the crankshaft sprocket bolt (1) to draw the seal in place.
3. Remove bolt (1) and the (special tool #20145, Installer, Crankshaft Front Oil Seal).
4. Install the vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION** .
5. Connect the negative battery cable.

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. On MTX models, remove the flywheel. Refer to **FLYWHEEL, REMOVAL** .

Fig. 175: Rear Crankshaft Oil Seal Carrier & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the five rear crankshaft oil seal carrier bolts (1).
4. Remove the two oil pan-to-rear crankshaft oil seal carrier bolts (3).
5. Using a suitable pry bar, remove the rear crankshaft oil seal (2).

INSTALLATION

INSTALLATION

Fig. 176: Rear Crankshaft Oil Seal Carrier & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean any residues of sealant from the mating surface between the flywheel side oil seal cover and the crankcase oil pan.
2. Apply MS-GF-44B or equivalent RTV silicone sealant to the mating surface of the crankcase oil pan and the flywheel side oil seal cover. Refer to **ENGINE - STANDARD PROCEDURE** .
3. Install the rear crankshaft oil seal carrier (2). Tighten bolts (1, 3) to 9 N.m (80 in. lbs.).
4. On MTX models, install the flywheel. Refer to **FLYWHEEL, INSTALLATION** .
5. Connect the negative battery cable.

LUBRICATION

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

1. Disconnect and remove oil pressure switch. Refer to **SENSOR, OIL PRESSURE, REMOVAL** .
2. Install oil pressure gauge.
3. Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. Refer to **SPECIFICATIONS - 2.0L DIESEL ENGINE** .

CAUTION: *If pressure is ZERO at curb idle, DO NOT run engine at 4000 RPM.

4. If oil pressure is 0 at idle, shut off engine. Check for a failed oil pressure regulator, a clogged oil pickup screen or a damaged oil pickup tube gasket.

5. Remove the oil pressure regulator and inspect the regulator and wire harness. Refer to **REGULATOR, OIL PRESSURE, REMOVAL**.
6. Remove oil pan and inspect for debris and repair as necessary. Refer to **PAN, OIL, REMOVAL**.
7. After test is complete, remove test gauge and fitting.
8. Install oil pressure switch. Refer to **SENSOR, OIL PRESSURE, INSTALLATION**.

FILTER, ENGINE OIL

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the bellypan. Refer to **BELLY PAN, REMOVAL**.

Fig. 177: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

3. Remove oil filter housing cover (1).

3458264

Fig. 178: O-Ring Seals, Oil Filter Cartridge, O-Ring & Cover
Courtesy of CHRYSLER GROUP, LLC

4. Pull the oil filter cartridge (2) out of the filter housing cover (4) and discard.

INSTALLATION

INSTALLATION

3458264

Fig. 179: O-Ring Seals, Oil Filter Cartridge, O-Ring & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate and install new O-ring (3) onto cover (4).
2. position the oil filter cartridge (2) into cover and lubricate O-ring seals (1).

Fig. 180: Oil Filter Housing

Courtesy of CHRYSLER GROUP, LLC

3. Install oil filter housing cover. Tighten cover to 25 N.m (18 ft. lbs.).
4. Install the bellypan. Refer to **BELLY PAN, INSTALLATION** .
5. Lower the vehicle.

HOUSING, OIL FILTER

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle Refer to **HOISTING, STANDARD PROCEDURE** .
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

Fig. 181: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (3) and the belly pan (2).
5. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .
6. Remove the right front half shaft and intermediate shaft. Refer to **REMOVAL** .

Fig. 182: Oil Pressure Sensor 1/1 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect oil pressure sensor 1/1 wire harness connectors (2).

Fig. 183: Oil Pressure Sensor 1/2 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect oil pressure sensor 1/2 wire harness connectors (1).

Fig. 184: Oil Cooler Hoses & Drain Valve
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect both oil cooler hoses (1).
10. Open drain valve (2) to drain the oil filter housing and securely tighten drain valve.

Fig. 185: Engine Oil Cooler, Oil Filter Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove bolts (3) and the oil filter/cooler housing (1).

INSTALLATION

INSTALLATION

Fig. 186: Oil Filter Housing & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket sealing surfaces.
2. Install new O-ring seal (1) onto the oil filter housing (2).

Fig. 187: Engine Oil Cooler, Oil Filter Housing & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install oil filter/cooler housing (1). Tighten bolts (3) to 30 N.m (22 ft. lbs.).

Fig. 188: Oil Cooler Hoses & Drain Valve
Courtesy of CHRYSLER GROUP, LLC

4. Connect both oil cooler hoses (1).

Fig. 189: Oil Pressure Sensor 1/2 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Connect oil pressure sensor 1/2 wire harness connectors (1).

Fig. 190: Oil Pressure Sensor 1/1 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect oil pressure sensor 1/1 wire harness connectors (2).
7. Install the right front half shaft and intermediate shaft. Refer to **INSTALLATION** .
8. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

Fig. 191: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

9. Install the belly pan (2) and securely tighten bolts (3).
10. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
11. Lower the vehicle.
12. Connect the negative battery cable.

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Change engine oil at mileage and time intervals described in the Maintenance Schedule. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Remove oil fill cap.
4. Raise vehicle on hoist. Refer to **HOISTING, STANDARD PROCEDURE** .

5. Place a suitable oil collecting container under oil pan drain plug.

Fig. 192: Oil Pan Drain Plug
Courtesy of CHRYSLER GROUP, LLC

6. Remove oil pan drain plug (1) or and allow oil to drain into collecting container. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
7. Remove the oil filter. Refer to **FILTER, ENGINE OIL, REMOVAL** .
8. Install oil pan drain plug (1) and tighten to 25 N.m (18 ft. lbs.).
9. Install new oil filter. Refer to **FILTER, ENGINE OIL, INSTALLATION** .
10. Lower vehicle and fill crankcase with specified type and amount of engine oil . Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** and **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** .
11. Install oil fill cap.
12. Start engine and inspect for leaks.
13. Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. Replace oil filter with a Mopar® oil filter or the equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING under **STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE**.

PAN, OIL

REMOVAL

REMOVAL

Fig. 193: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Raise vehicle on hoist. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove bolts (3) and the belly pan (2).
4. Drain engine oil using a new sealing washer tighten drain plug to 25 N.m (18 ft. lbs.).
5. Remove fasteners and the oil dipstick.

Fig. 194: CCV Housing Lower Bolt & Starter
Courtesy of CHRYSLER GROUP, LLC

6. Remove the starter (2). Refer to **STARTER, REMOVAL**.

Fig. 195: Inner Fender Splash Shield
Courtesy of CHRYSLER GROUP, LLC

7. Remove retainers (2) and the right inner fender splash shield (1).
8. Remove the right halfshafts and intermediate shaft. Refer to **REMOVAL**.

Fig. 196: Crankshaft Position Sensor Harness Connector & CCV Tube Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the Crankshaft Position (CKP) Sensor wire harness connector (1).
10. Remove bolt (2) and the lower CCV tube.
11. Remove the rear mount (2). Refer to **INSULATOR, ENGINE MOUNT, REAR, REMOVAL**.
12. Remove the cowl panel cover. Refer to **COVER, COWL PANEL, REMOVAL**.

13. Support the engine using the (special tool #8534B, Fixture, Driveline Support).
14. On MTX models, remove the flywheel. Refer to **FLYWHEEL, REMOVAL** .

Fig. 197: Rear Crankshaft Oil Seal Carrier & Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the oil pan-to-front cover bolts.
16. Remove the two oil pan-to-rear oil seal carrier bolts (3).

Fig. 198: Oil Pan & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the oil pan bolts (2).
18. Remove oil pan by prying off with suitable pry bar.

Fig. 199: Oil Pump Intake Gasket
Courtesy of CHRYSLER GROUP, LLC

19. Remove the oil pump intake connector gasket.
20. Clean oil pan and engine block sealing surfaces.

INSTALLATION

INSTALLATION

Fig. 200: Oil Pump Intake Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Clean oil pan and all sealing surfaces. Refer to **ENGINE - STANDARD PROCEDURE** .
2. Install a new gasket (1) onto the oil pump intake.
3. Apply a 3 mm bead of Engine Sealant RTV MS-GF-44B or equivalent to oil pan. Refer to **ENGINE - STANDARD PROCEDURE** .

**Fig. 201: Oil Pan & Bolts**

Courtesy of CHRYSLER GROUP, LLC

4. Install the oil pan (1). Tighten bolts (2) to 25 N.m (18 ft. lbs.).

**Fig. 202: Rear Crankshaft Oil Seal Carrier & Bolts**

Courtesy of CHRYSLER GROUP, LLC

5. Install the two oil pan-to-rear oil seal carrier bolts (3) and tighten to 8 N.m (71 in. lbs.).
6. Install the oil pan-to-front cover bolts and tighten to 8 N.m (71 in. lbs.).
7. On MTX models, install the flywheel. Refer to **FLYWHEEL, INSTALLATION** .
8. Remove the (special tool #8534B, Fixture, Driveline Support).
9. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .
10. Install the rear mount (2). Refer to **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** .

Fig. 203: Crankshaft Position Sensor Harness Connector & CCV Tube Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Install the lower CCV tube. Tighten bolt (2) to 9 N.m 80 in. lbs.).
12. Connect the Crankshaft Position (CKP) Sensor wire harness connector (1).

Fig. 204: Inner Fender Splash Shield

Courtesy of CHRYSLER GROUP, LLC

13. Install the right intermediate shaft and halfshafts. Refer to **INSTALLATION** .
14. Position the right inner fender splash shield (1) and install retainers (2).

Fig. 205: CCV Housing Lower Bolt & Starter
Courtesy of CHRYSLER GROUP, LLC

15. Install the starter (2). Refer to **STARTER, INSTALLATION** .

Fig. 206: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

16. Install the oil dipstick tube and securely tighten fasteners.
17. Install the belly pan (2) and securely tighten bolts (3).

18. Lower the vehicle.
19. Fill the engine with recommended oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
20. Connect the negative battery cable.
21. Start engine and check for leaks.

REGULATOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

091174655

Fig. 207: Oil Pressure Regulator
Courtesy of CHRYSLER GROUP, LLC

The oil pressure regulator (2) regulates oil pressure at the variable rate oil pump and is located on the engine front cover. The PCM energize the Variable Oil Pump Solenoid to increase the oil pressure to the upper limit.

REMOVAL

REMOVAL

3371601

Fig. 208: Inner Fender Splash Shield
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the right front wheel and tire Refer to **REMOVAL** .
3. Remove fasteners (2) and the right inner fender splash shield (2).

091174654

Fig. 209: Oil Pressure Regulator, Bolt & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect oil pressure regulator wire harness connector (3).
5. Remove bolt (1) and oil pressure regulator (2).

INSTALLATION**INSTALLATION**

091174655

Fig. 210: Oil Pressure Regulator**Courtesy of CHRYSLER GROUP, LLC**

1. Replace the oil pressure regulator O-ring seal (1) and clean and inspect the inlet screen (3).

091174654

Fig. 211: Oil Pressure Regulator, Bolt & Connector
Courtesy of CHRYSLER GROUP, LLC

2. Install oil pressure regulator (3) and tighten bolt (1) to 25 N.m (18 ft. lbs.).
3. Connect oil pressure regulator wire harness connector (3).

3371601

Fig. 212: Inner Fender Splash Shield
Courtesy of CHRYSLER GROUP, LLC

4. Install the right inner fender splash shield (1) and fasteners (2).
5. Install the right front wheel and tire. Refer to **INSTALLATION**.

6. Connect the negative battery cable.

PICK-UP, OIL PUMP**REMOVAL****REMOVAL**

Fig. 213: Crankcase Oil Pickup Tube/Anti-Splash Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.
3. Remove bolts (1) and the crankcase oil pickup tube/anti-splash shield (2) from oil pan.

Fig. 214: Oil Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (1) and the oil pickup tube (2).

INSTALLATION

INSTALLATION

Fig. 215: Oil Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket mating surfaces.

2. Install the oil pickup tube (2) and securely tighten bolts (1).

Fig. 216: Crankcase Oil Pickup Tube/Anti-Splash Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the crankcase oil pickup tube/anti-splash shield (2) into oil pan and securely tighten bolts (1).
4. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
5. Connect the negative battery cable.

PUMP, ENGINE OIL

REMOVAL

REMOVAL

NOTE: The oil pump is part of the front engine cover and if diagnosis has lead you to replace the oil pump then the front engine cover needs to be replaced.

1. Disconnect the negative battery cable.
2. Remove the front engine cover. Refer to **COVER, ENGINE, FRONT, REMOVAL**.

INSTALLATION

INSTALLATION

1. Install the front engine cover. Refer to **COVER, ENGINE, FRONT, INSTALLATION**.
2. Connect the negative battery cable.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

There are two oil pressure switch is located on the backside of the engine attached to the oil cooler housing. The oil pressure switch is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil gallery). The switch is a single terminal device.

OPERATION

OPERATION

The Powertrain Control Module sends a pull up signal to both Oil Pressure Switches. The Oil Pressure Switches are normally closed (connected to ground) with no oil pressure. When oil pressure surpasses a certain threshold for each switch, the switch becomes open. The PCM interprets the Oil Pressure Switch inputs as follows in the chart below.

Oil Pressure Switch inputs to PCM		
Oil Pressure Switch 1	Oil Pressure Switch 2	PCM INTERPRETATION
Closed	Closed	Oil Pressure below 0.5 bar (7.25 psi)
Open	Closed	Oil pressure between 0.5 bar (7.25 psi) and 1.5 bar (21.75 psi)
Open	Open	Oil pressure above 1.5 bar (21.75 psi)
Closed	Open	switches implausible

REMOVAL

OIL PRESSURE SWITCH 1

0908009782

Fig. 217: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Engine Oil Cooler Hoses Removed for Clarity.

1. Disconnect the negative battery cable.
2. Remove bolts (3) and the belly pan (2).

Fig. 218: Oil Pressure Sensor 1/1 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect oil pressure sensor harness connector (2).
4. Remove oil pressure sensor (1).

OIL PRESSURE SWITCH 2

Fig. 219: Removing/Installing Starter

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Engine Oil Cooler Hoses Removed for Clarity.**

1. Disconnect the negative battery cable.
2. Remove bolts (3) and the belly pan (2).

Fig. 220: Oil Pressure Sensor 1/2 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect oil pressure sensor wire harness connector (1).
4. Remove the oil pressure sensor (2).

INSTALLATION

OIL PRESSURE SWITCH 1

Fig. 221: Oil Pressure Sensor 1/1 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

NOTE: Engine Oil Cooler Hoses Removed for Clarity.

1. Install oil pressure sensor (1) and tighten to 23 N.m (17 ft. lbs.).
2. Connect oil pressure sensor harness connector (2).

Fig. 222: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

3. Install the belly pan (2) and securely tighten bolts (3).
4. Connect the negative battery cable.

OIL PRESSURE SWITCH 2

Fig. 223: Oil Pressure Sensor 1/2 & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

NOTE: Engine Oil Cooler Hoses Removed for Clarity.

1. Install oil pressure sensor (2) and tighten to 23 N.m (17 in. lbs.).
2. Connect oil pressure sensor wire harness connector (1).

Fig. 224: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

3. Install the belly pan (2) and securely tighten bolt (3).

4. Connect the negative battery cable.

VALVE TIMING

BELT AND SPROCKETS, TIMING

REMOVAL

CAMSHAFT SPROCKET

1. Disconnect the negative battery cable.
2. Remove timing belt (1). Refer to **BELT, TIMING, REMOVAL**.
3. Assemble the (special tool #6847, Holder, Camshaft Sprocket) and (special tool #10494, Pins, Holding).

Fig. 225: Camshaft Sprocket Holder Tool, Camshaft Sprocket & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Using the Camshaft Sprocket Holder Tool 6847 and Pins 104294 (1) to hold camshaft sprocket, remove bolt (3) and the camshaft sprocket (2).

CRANKSHAFT SPROCKET

1. Disconnect the negative battery cable.
2. Remove the timing belt (1). Refer to **BELT, TIMING, REMOVAL**.
3. Remove the nuts and the flywheel lower guard.

Fig. 226: Camshaft Sprocket & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft sprocket bolt is a left handed thread.

4. Remove bolt (2) and the crankshaft sprocket (1).

INSTALLATION

CAMSHAFT SPROCKET

Fig. 227: Camshaft Timing Belt Sprocket & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the camshaft (1) sprocket and tighten bolt (2) finger tight.

Fig. 228: Camshaft Sprocket Holder Tool, Camshaft Sprocket & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Using the Camshaft Sprocket Holder Tool (special tool #6847, Holder, Camshaft Sprocket) and (special tool #10494, Pins, Holding) (1) to hold camshaft sprocket (2) and tighten the bolt (3) to 30 N.m (22 ft. lbs.) plus an additional 40° turn.
3. Install the timing belt (1). Refer to **BELT, TIMING, INSTALLATION**.
4. Connect the negative battery cable.

CRANKSHAFT SPROCKET

Fig. 229: Camshaft Sprocket & Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft sprocket bolt is a left handed thread.

1. Install the crankshaft sprocket (1). Tighten bolt (2) to 340 N.m (251 ft. lbs.).
2. Install the flywheel lower guard and securely tighten the nuts.
3. Install the timing belt (1). Refer to **BELT, TIMING, INSTALLATION**.
4. Connect the negative battery cable.

BELT, TIMING

REMOVAL

REMOVAL

Fig. 230: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Remove the vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.

Fig. 231: Upper Timing Cover Insulator
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper timing cover insulator (1).

Fig. 232: Upper Timing Cover Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the seven upper timing cover fasteners.
6. Remove the lower timing belt cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .

Fig. 233: Engine Block Front Cover Left Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft must be rotated, with small movements, to allow the locating dowel on the toothed timing drive belt pulley to be inserted in the opening in the tool.

7. Remove the left lower bolt (1) from the engine block front cover.

Fig. 234: Crankshaft Locking Tool & Sprocket
Courtesy of CHRYSLER GROUP, LLC

NOTE: The timing marks are located on the timing belt. Proper positioning of the timing marks is required before installation of a new belt can be performed.

8. Rotate engine to TDC and verify the timing marks on the belt are aligned to their respective gear. Insert the (special tool #10496, Tool, Crankshaft Timing Locking) (1) temporarily to check crankshaft timing.
9. Disconnect the fuel pressure sensor wire harness connector.

Fig. 235: Aligning Timing Marks On Belt & Sprocket Using Removal/Refitting Tool
Courtesy of CHRYSLER GROUP, LLC

10. Install the Removal/Refitting Tool (3) (special tool #20150, Remover/Installer, High Pressure Fuel Pump) to lock the pressure pump sprocket.

Fig. 236: Camshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

11. Remove the threaded plug from the camshaft housing.

NOTE: Check that the tool is correctly inserted in the housing in the inlet side camshaft, rotating the crankshaft until the pin for the tool can be heard engaging correctly in the housing in the camshaft.

12. Install the Camshaft Timing Tool (1) (special tool #20132, Tool, Timing Belt Locking), (intake side).
13. Remove the Crankshaft Timing Tool.

Fig. 237: Timing Belt & Tensioner Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

14. Loosen tensioner retaining nut (2).
15. Remove timing belt (1).

INSTALLATION

INSTALLATION

CAUTION: IT IS ESSENTIAL that the installation procedure is followed exactly. Failure to do so will result in severe engine damage.

NOTE: The timing marks are located on the timing belt. Proper positioning of the timing marks is required before installation of a new belt can be performed.

Fig. 238: Rotation Arrows, Timing Belt, Crankshaft Sprocket & Timing Mark On Belt
 Courtesy of CHRYSLER GROUP, LLC

1. Start the timing belt (2) around the crankshaft sprocket (3) with the rotation arrows (1) pointing clockwise.
2. Align the timing mark on the belt (4) with the mark on the crankshaft gear.
3. Wrap belt around water pump pulley and tensioner.

Fig. 239: Camshaft Sprocket, Timing Marks On Belt & Camshaft Drive Gears
 Courtesy of CHRYSLER GROUP, LLC

4. Position belt over camshaft sprocket (1) and align the timing marks on the belt (2) with the marks on the camshaft drive gears (3).

Fig. 240: Aligning Timing Marks On Belt & Sprocket Using Removal/Refitting Tool
Courtesy of CHRYSLER GROUP, LLC

5. Position belt over pressure pump sprocket and align the timing marks on the belt (1) with the marks on the pressure pump sprocket (2).

Fig. 241: Bolt, Tensioner Arrow, Mark & Tensioner Tab
Courtesy of CHRYSLER GROUP, LLC

6. Using a screwdriver, pry down on the tensioner tab (4) till the tensioner arrow (3) aligns with the mark (3).
7. Tighten tensioner nut to 28 N.m (21 ft. lbs.) plus an additional 40° turn.

Fig. 242: Camshaft Timing Tool
Courtesy of CHRYSLER GROUP, LLC

8. Remove the Camshaft Timing Tool 20132, (intake side).

Fig. 243: Aligning Timing Marks On Belt & Sprocket Using Removal/Refitting Tool
Courtesy of CHRYSLER GROUP, LLC

9. Remove the Removal/Refitting Tool (3)

Fig. 244: Crankshaft Locking Tool & Sprocket
Courtesy of CHRYSLER GROUP, LLC

10. Remove Crankshaft Locking Tool (1).
11. Rotate the crankshaft two full revolutions to allow for the timing belt to settle.
12. Loosen the timing belt tensioner and repeat step **5 and 6** .
13. Install the right lower screw for the engine block front cover and tighten to 9 N.m (80 in. lbs.).
14. Install the threaded plug from the camshaft housing and securely tighten.
15. Connect the fuel pressure sensor wire harness connector.
16. Install lower timing belt cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .

Fig. 245: Upper Timing Cover Fasteners
Courtesy of CHRYSLER GROUP, LLC

17. Install upper timing belt cover (2). Tighten the seven fasteners (1) securely.

Fig. 246: Upper Timing Cover Insulator
Courtesy of CHRYSLER GROUP, LLC

18. Install the upper timing cover insulator (1).
19. Install the vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION** .

Fig. 247: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

20. Install the engine cover (1).
21. Connect the negative battery cable.

COVER(S), ENGINE TIMING

REMOVAL

UPPER TIMING COVER

Fig. 248: Engine Cover

3. Connect Mass Air Flow (MAF) sensor connector (2).
4. Install the engine cover (1).
5. Connect the negative battery cable.

ENGINE MOUNTING

DESCRIPTION

DESCRIPTION

The engine mounting system consists of a three-point system utilizing two load-carrying mounts and one torque controlling mounts. The load-carrying mounts are located on each frame rail. The right and left mounts are hydro-elastic mounts. The one torque controlling mounts are attached to rear of the engine.

OPERATION

OPERATION

The three-point engine mounting system minimizes the transmission of structure-borne engine noise to the passenger compartment. The load-carrying right and left mounts dampen and isolate vertical motion and vibration. The rear mounts absorb torque reaction forces and torsional vibrations.

BRACKET, ENGINE MOUNT, LEFT

REMOVAL

REMOVAL

Fig. 304: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover (1).

Fig. 305: Left Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable jack. Support the transaxle.
3. Remove left mount to transaxle retaining bolts (1).

Fig. 306: Left Transaxle Mount Bracket & Bolts

2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
3. Using a suitable jack. Support the engine.
4. Remove the right engine mount bracket bolt (2).
5. Remove the three engine mount bolts (3) and mount bracket (1).
6. Remove bolts (4, 6) and the right engine mount (5).

INSTALLATION

INSTALLATION

Fig. 316: Right Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the right engine mount (5). Tighten bolts (3, 4) finger tight.
2. Install the right mount bracket (1) and tighten bolt (2) finger tight.
3. Install the right mount bolts (3) finger tight.
4. Tighten engine mount bolts to:
 - Tighten bolts (4) to 70 N.m (52 ft. lbs.).
 - Tighten bolt (6) to 65 N.m (48 ft. lbs.).
 - Tighten bolts (3) to 90 N.m (66 ft. lbs.).
 - Tighten bolt (2) to 25 N.m (18 ft. lbs.).
5. Remove the jack.
6. Install the bellypan. Refer to **BELLY PAN, INSTALLATION** .

Fig. 317: Coolant Bottle & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the coolant bottle (1). Tighten nuts and bolts (1) to 8 N.m (71 in. lbs.).

INSULATOR, ENGINE MOUNT, LEFT

REMOVAL

REMOVAL

1. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
2. Remove the PDC (1) assembly. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Position a jack under transaxle to support the transaxle.

Fig. 318: Left Transaxle Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the left mount bolts (1).

Fig. 319: Left Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove left mount to shock tower bolt (3).
7. Remove bolts (2) and the left mount (1).

INSTALLATION

INSTALLATION**Fig. 320: Left Mount Bolts**

Courtesy of CHRYSLER GROUP, LLC

1. Install the left mount (1) on frame rail. Tighten bolts (2) to 105 N.m (77 ft. lbs.).
2. Install left mount to shock tower bolt (3) and tighten to 64 N.m (47 ft. lbs.).

**Fig. 321: Left Transaxle Mount Bolts**

Courtesy of CHRYSLER GROUP, LLC

3. Install left mount bolts (1). Tighten bolt 157 N.m (116 ft. lbs.).
4. Remove the jack.

5. Install the belly pan Refer to **BELLY PAN, INSTALLATION** .
6. Install the PDC. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
7. Install the battery tray. Refer to **TRAY, BATTERY, INSTALLATION** .

INSULATOR, ENGINE MOUNT, REAR

REMOVAL

MTX

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
3. Remove the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

Fig. 322: Rear Mount Bracket & Bolts

2014 ENGINE**2.4L - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

The 2.4 Liter (146 cu. in.) Tigershark in-line four cylinder engine is a single over head camshaft with mechanical lash adjusters and four valves per cylinder design. This engine is NOT free-wheeling; meaning that the pistons will contact the valves in the event of a timing chain failure.

The cylinders are numbered from front of the engine to the rear. The firing order is 1-3-4-2.

Fig. 1: 2.4 Liter (146 Cu. In.) Engine
Courtesy of CHRYSLER GROUP, LLC

The cylinder head is designed with a variable valve actuator assembly (VVAA) that takes the place of a conventional intake camshaft assembly. The cylinder block and cylinder head are cast aluminum. The engine is mounted in the vehicle transversely.

DIAGNOSIS AND TESTING**ENGINE DIAGNOSIS - INTRODUCTION**

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions. Refer to **PERFORMANCE** and **ENGINE MECHANICAL DIAGNOSTIC TABLE** for possible causes and corrections of malfunctions. . Refer to **FUEL SYSTEM** article for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE** .
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE** .
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **CYLINDER HEAD GASKET - DIAGNOSIS AND TESTING** .
- Intake Manifold Leakage Diagnosis. Refer to **MANIFOLD, INTAKE, DIAGNOSIS AND TESTING** .

PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. Refer to DIAGNOSIS AND TESTING .
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. Check for codes. (Refer to DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. Refer to SPECIFICATIONS .
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.4L - Service Information - Cherokee

	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	5. Contamination in Oil Control Valve (OCV). ECK Only	5. Remove OCV and inspect for contamination. Replace OCV if contaminated. ECK Only
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. Install new parts, as necessary. Refer to DIAGNOSIS AND TESTING .
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.4L - Service Information - Cherokee

4. Contamination in fuel system.

4. Clean system and replace fuel filter.

ENGINE MECHANICAL DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. Refer to <u>OIL - STANDARD PROCEDURE</u> .
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. Inspect the valve guides for wear, cracks or looseness. If either condition exists, replace the cylinder head. Refer to <u>CYLINDER HEAD, REMOVAL</u> .
	8. Excessive runout of valve seats on valve faces.	8. Refer to <u>VALVES, INTAKE AND EXHAUST - STANDARD PROCEDURE</u> .
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Refer to <u>OIL - STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Refer to <u>OIL - STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of round.	6. Service or replace crankshaft.

7. Loose flywheel or torque converter.

7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: To perform a compression test on a MULTI-AIR equipped engine, the ignition **MUST** remain in the "key on" position. If the ignition is in the "off" position, the intake valves will not actuate and the result will be no compression.

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Be certain the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE** .

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
 - Leaks between adjacent cylinders or into water jacket.
 - Any causes for combustion/compression pressure loss.
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
 2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
 3. Remove the spark plugs.
 4. Remove the oil filler cap.
 5. Remove the air cleaner hose.
 6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
 7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

OIL CONSUMPTION TEST AND DIAGNOSIS

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: **Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.**

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the Owner's Manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: **Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.**

- Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.
- Verify that the engine has the correct oil level dipstick and dipstick tube installed.
- Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the positive crankcase ventilation (PCV) system. Make sure the system is not restricted and the

PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).

2. Perform a cylinder compression test and cylinder leak down test using the standard leak down gauge following manufacturers suggested best practices.

NOTE: **Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.**

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. Tapered and Out-of-Round Cylinders

The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. Distorted Cylinders

This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. Improper operation of "PCV" system

The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

If equipped with an engine driven vacuum pump, high oil consumption can be caused by unchecked airflow into the pump. This can be caused by anything that opens the vacuum pump intake port up to the atmosphere such as a faulty vacuum pump, hose fitting, hose and brake booster. If there is not a restriction (normally caused by the pump pulling vacuum on the brake booster), then the vacuum pump will pump a high volume of air. This high volume of air will pressurize the crankcase and cause excessive

oil burning and oil flow through the PCV system.

4. Worn Piston Ring Grooves

For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. Worn, Broken or Stuck Piston Rings

When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. Cracked or Broken Ring Lands

Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. Worn Valve Stems and Guides

When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. Bent or Misaligned Connecting Rods

Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. Fuel Dilution

If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

- Excess fuel can enter and mix with the oil via a leaking fuel injector
- Gasoline contaminated with diesel fuel
- Restricted air intake
- Excessive idling

10. Contaminated Cooling Systems

Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. Oil Viscosity

The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle Owner's Manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. Dirty Engine Oil

Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. Crankcase Overfull

Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. Excessively High Oil Pressure

A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. Aftermarket Performance Chips and Modification

Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. Lugging Engine

Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. Turbocharged Engines

There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge

air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. Restricted Air Intake

Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

19. Intake Manifold port seals

Engines that have a "V" configuration and a "wet valley" (3.3/3.8L) could draw oil into the intake ports due to improper sealing between the intake manifold ports and cylinder head. Causes may include improper torque of intake manifold bolts, corrosion (aluminum intake manifold) and or warped sealing surface.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings. Misaligned or damaged.	1. Replace as necessary.
	(a) Loose fasteners, broken or porous metal parts.	(a) Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear oil seal.	2. Replace rear crankshaft oil seal. Refer to <u>SEAL, CRANKSHAFT OIL, REAR, REMOVAL</u> .
	3. Crankshaft rear oil seal surface. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan. Refer to <u>PAN, OIL, REMOVAL</u> .
	5. Crankshaft front oil seal.	5. Replace front crankshaft oil seal. Refer to <u>SEAL, CRANKSHAFT OIL, FRONT, REMOVAL</u> .
OIL PRESSURE DROP	6. Crankshaft front oil seal surface. Scratched, nicked or grooved.	6. Polish or replace crankshaft.
	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure switch.	2. Replace switch (Refer to <u>SENSOR, OIL PRESSURE</u>).
	3. Low oil pressure.	3. Check main bearing clearance. Refer to <u>BEARING(S), CRANKSHAFT, MAIN - STANDARD PROCEDURE</u> . 3. Check rod bearing clearance.

2014 Jeep Cherokee Trailhawk

2014 ENGINE 2.4L - Service Information - Cherokee

		Refer to <u>BEARING(S), CONNECTING ROD - STANDARD PROCEDURE</u> .
	4. Clogged oil filter.	4. Replace oil filter. Refer to <u>FILTER, ENGINE OIL, REMOVAL</u> .
	5. Worn oil pump.	5. Replace oil pump. Refer to <u>PUMP, ENGINE OIL, REMOVAL</u> .
	6. Thin or diluted oil.	6. Change oil and filter. Refer to <u>OIL - STANDARD PROCEDURE</u> .
	7. Excessive bearing clearance.	7. Replace crankshaft bearings. Refer to <u>BEARING(S), CRANKSHAFT, MAIN - STANDARD PROCEDURE</u> . 7. Replace rod bearings. Refer to <u>BEARING(S), CONNECTING ROD - STANDARD PROCEDURE</u> .
	8. Oil pump relief valve stuck.	8. Replace oil pump. Refer to <u>PUMP, ENGINE OIL, REMOVAL</u> .
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	9. Oil pump pick-up tube loose, damaged or clogged.	9. Replace oil pump pick-up. .
	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings. Refer to <u>RING(S), PISTON - STANDARD PROCEDURE</u> .
	2. Carbon in oil ring slots.	2. Replace rings. Refer to <u>ROD, PISTON AND CONNECTING, REMOVAL</u> .
	3. Worn valve guides.	3. Replace cylinder heads. Refer to <u>CYLINDER HEAD, REMOVAL</u> .
	4. Leaking valve guide seals.	4. Replace valve guide seals. Refer to <u>SEAL(S), VALVE GUIDE, REMOVAL</u> .

STANDARD PROCEDURE**DUST COVERS AND CAPS**

**Fig. 2: Covers/Caps**

Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

**Fig. 3: Opening Cover**

Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

ENGINE GASKET SURFACE PREPARATION

Fig. 4: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 5: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc (3).

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All of the sealants mentioned below are not used on every engine, they are listed as general reference guide. See appropriate Service Information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers **must** free of grease or oil. Surfaces should be cleaned with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, the parts should be assembled in no more than 10 minutes.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is

specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces.

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Fig. 6: Plastigage Placed In Lower Shell-Typical

Courtesy of CHRYSLER GROUP, LLC

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.
3. Remove the bearing cap and compare the width of the flattened Plastigage with the scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications. Refer to **ENGINE SPECIFICATIONS** . Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

4. Install the proper crankshaft bearings to achieve the specified bearing clearances.

REMOVAL

REMOVAL

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

1. Release the fuel pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE**.

Fig. 7: Engine Cover & Pins
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1) from the ball studs (2).
3. Secure the steering wheel.

Fig. 8: Lower Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove the steering coupler bolt (3). Position the shaft out of the way.
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Drain the coolant.
7. Lower the vehicle.

Fig. 9: Battery Cover

Fig. 12: Battery Tray, PCM Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the PCM mount bracket bolts (2 & 4). Remove the bracket (3) from the battery tray (1).
13. Disconnect the heater core supply and return hoses at the fittings nearest the thermostat housing.
14. Remove the bolt securing the heater supply pipe at the left engine mount bracket.
15. Disconnect the heater hose at the thermostat outlet connector.
16. Separate the wire harness retainers at the transmission bell housing.
17. Loosen the upper starter bolt completely.

NOTE: **The upper bolt will not back out completely due to lack of clearance. Leave the bolt in the bell housing.**

18. Release the two harness retainers that are secured to the PDC bracket.
19. Remove the PDC. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL**.
20. Unlock and separate engine harness connectors at the front of the battery tray.
21. Release the connectors from the battery tray.

Fig. 13: Removing/Installing Inlet Assembly
Courtesy of CHRYSLER GROUP, LLC

22. Remove the fresh air hose from valve cover.
23. Remove the air cleaner inlet snorkel push pins (3). Remove the inlet assembly (1).

Fig. 14: Upper Close Out Panel Cover Components

24. Remove the radiator upper closeout panel push pins (2).
25. Remove the radiator upper closeout panel bolts (4).
26. Remove the radiator upper closeout panel bolts (3).

Fig. 15: Front Fascia Assembly
Courtesy of CHRYSLER GROUP, LLC

27. Remove the front fascia assembly (1). Refer to **FASCIA, FRONT, REMOVAL**.

28. Remove the radiator inlet hose clamp.
29. Remove the radiator outlet hose clamp.
30. Remove the oil cooler inlet and outlet hose clamps at the tubes.
31. Remove the serpentine belt.

0912009645

Fig. 16: Removing/Installing Generator
Courtesy of CHRYSLER GROUP, LLC

32. Open the 12 volt protective cover (3).
33. Remove the generator 12 volt connector nut (1).
34. Disconnect the generator fielding connector (4).
35. Reposition the harness (2) aside.
36. Remove the generator bolts.
37. Remove the generator (5).

Fig. 17: Air Conditioning Compressor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

38. Disconnect the air conditioning compressor electrical connectors (1).

Fig. 18: Air Conditioning Compressor & Bolts
Courtesy of CHRYSLER GROUP, LLC

39. Remove the air conditioning compressor bolts (1). Position the compressor (2) aside and secure with a strap.

NOTE: The is no need to separate the lines from the compressor.

090772118

Fig. 19: Resonator, Clamp & Connector
Courtesy of CHRYSLER GROUP, LLC

40. Loosen the snorkel to throttle body clamp (2).
41. Disconnect the IAT sensor (3).

090772119

Fig. 20: Resonator, Bolt & Clamp

42. Loosen the snorkel clamp (1).
43. Remove the air intake snorkel bolt (2) and remove the snorkel (3).

081569483

Fig. 21: Foam Insulator, Fuel Line & Purge Line
Courtesy of CHRYSLER GROUP, LLC

44. Disconnect the fuel line (1) and the purge line (2) quick connects.
45. Disconnect the MAP sensor connector.
46. Disconnect the oil temperature sensor connector.

090974919

Fig. 22: Hose Assembly & Hot Bottle Return Pipe Bolts
Courtesy of CHRYSLER GROUP, LLC

47. Remove the coolant reservoir return hose bolts (1). Disconnect both ends of the pipe. Remove the hose assembly (2).
48. Release the engine wire harness retainers.
49. Disconnect the transmission cooler hoses at the transmission fittings. Install plugs to limit the fluid loss.
50. Raise and support the vehicle.
51. Remove the forward skid plate fasteners (if equipped).
52. Remove the rearward skid plate fasteners (if equipped)
53. Remove both skid plates (if equipped)
54. Remove the front wheels.
55. Remove the left wheel well liner.
56. Remove the bolt holding the windshield washer reservoir to the battery tray.
57. Release the retainer from the harness at the bottom of the battery tray.
58. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
59. Raise and support the vehicle.
60. Remove the left and right axle shafts. Refer to **REMOVAL** .
61. Remove the left and right wheel well liners.
62. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
63. Remove the upper radiator hose.
64. Remove the lower radiator hose.
65. Remove the front tow hooks. Refer to **HOOK(S), TOW, FRONT, REMOVAL** .

66. Remove the radiator fan assembly. Refer to **FAN, COOLING, REMOVAL** .

020568625

Fig. 23: Crossmember To Fascia Support Beams Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

67. Remove the four bracket retaining bolts (1) from the cross member to fascia support beams bracket, then remove the bracket.

3772580

Fig. 24: Lower Bumper Reinforcements & Fasteners

70. Remove the rear engine mount to bracket through bolt (4) and nut (2).
71. Remove the rear engine mount to crossmember through bolt (1).
72. Reposition the engine forward to allow the mount to be removed from the pocket past the engine bracket (3).
73. Remove the front suspension crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL**.
74. Remove the exhaust cross-under pipe assembly. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL**.

210269678

Fig. 27: Transaxle & Ground Cable
Courtesy of CHRYSLER GROUP, LLC

75. Remove the bolt holding the ground cable (2) to transaxle and separate cable from transaxle (1).
76. Remove the bolt holding the ground strap to left frame rail.
77. Disconnect the shifter cables from the transmission. Refer to **CABLE, GEARSHIFT CONTROL, REMOVAL**.
78. Reposition the main wire harness away from the engine.

Fig. 28: Adapter, Engine Support Cradle, Power Train Dolly & Safety Straps
 Courtesy of CHRYSLER GROUP, LLC

79. Raise and position the vehicle height to allow Power Train Dolly (special tool #6135, Dolly, Power Train) (3) and Engine Support Cradle (special tool #6710A, Cradle, Engine Support) (2) to be installed under the engine/transaxle assembly.
80. Loosen the cradle engine mounts to allow movement for positioning onto the engine locating holes on the engine block and oil pan rail. Place Adapter (special tool #6848-3, Adapter) (1) on the front post and align to the oil pan mounting stud. Lower the vehicle and position cradle until the engine is resting on the posts. Tighten the post mounts to the cradle frame. Secure the engine/transaxle assembly to the dolly/cradle with safety straps (4).
81. Remove the left engine mount. Refer to **INSULATOR, ENGINE MOUNT, LEFT, REMOVAL** .
82. Remove the right engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT** .
83. Slowly raise the vehicle to allow the it to clear the powertrain assembly.

CAUTION: Make sure that all components are clear of obstructions while raising the vehicle off of the powertrain assembly.

84. On vehicles equipped with an automatic transaxle, remove torque converter bolts.

Fig. 29: Removing/Installing Bell-Housing
Courtesy of CHRYSLER GROUP, LLC

85. Affix a chain to the transmission mount bracket to be used as a lifting point.
86. Using an engine hoist, remove the slack from the lifting chain.
87. Remove the bell-housing bolts (2).
88. Separate engine (1) and transmission (2).

INSTALLATION

INSTALLATION

Fig. 30: Removing/Installing Bell-Housing
Courtesy of CHRYSLER GROUP, LLC

1. Push the bell housing against the engine block until the guide pins engage.
2. Install transmission bolts (2). Refer to **SPECIFICATIONS**.
3. On vehicles equipped with an automatic transaxle, install torque converter bolts.

Fig. 31: Flexplate-To-Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Through the access door opening, Install the bolts (1) to hold the flexplate to the torque converter. Refer to **SPECIFICATIONS**. Apply Mopar® Lock & Seal Adhesive or replace the bolts on the threads. Rotate the crankshaft to bring each set of bolts into view through the access door.

Fig. 32: Access Door In Splash Shield

Courtesy of CHRYSLER GROUP, LLC

5. Install the access door in the splash shield on the bellhousing.
6. Slowly lower the vehicle to allow it to clear the powertrain assembly.

CAUTION: Make sure that all components are clear of obstructions while raising the vehicle off of the powertrain assembly.

7. Install the left engine mount. Refer to INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION .
8. Install the right engine mount. Refer to INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION .
9. Remove the Power Train Dolly.
10. Connect the shifter cables from the transmission.

210269678

Fig. 33: Transaxle & Ground Cable
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolt holding the ground cable (2) to transaxle (1). Refer to SPECIFICATIONS .
12. Install the exhaust cross-under pipe assembly. Refer to PIPE, EXHAUST CROSSUNDER, INSTALLATION .
13. Install the front suspension crossmember. Refer to CROSSMEMBER, FRONT SUSPENSION, INSTALLATION .
14. Install the rear engine mount. Refer to INSULATOR, ENGINE MOUNT, REAR, INSTALLATION .

3140748

Fig. 34: Front Fascia Support Beams
 Courtesy of CHRYSLER GROUP, LLC

15. Install the front fascia support beams (1). Refer to **FRAME, SPECIFICATIONS** .

- 16.
17. Install the fasteners (2) securing the lower bumper reinforcement (1) and front fascia support beams to the frame/front end module. Refer to **FRAME, SPECIFICATIONS** .

18. Install the radiator fan assembly. Refer to **FAN, COOLING, INSTALLATION** .
- .
19. Install the front tow hooks. Refer to **HOOK(S), TOW, FRONT, INSTALLATION** .
20. Install the upper radiator hose.
21. Install the lower radiator hose.
22. Install the belly pan. Refer to **BELLY PAN** .
23. Install the left and right axle shafts. Refer to **INSTALLATION** .

Fig. 36: Windshield Washer Reservoir-To-Battery Tray Bolt
Courtesy of CHRYSLER GROUP, LLC

24. Install the bolt (2) holding the windshield washer reservoir to the battery tray.
25. Insert the harness retainer to the battery tray.
26. Install the left wheel well liner.
27. Install both skid plates (if equipped).
28. Install the forward skid plate fasteners (if equipped).
29. Install the rearward skid plate fasteners (if equipped).
30. Install the front wheels.
31. Install the engine wire harness retainers.
32. Connect the transmission cooler hoses at the transmission fittings.

090974919

Fig. 37: Hose Assembly & Hot Bottle Return Pipe Bolts

Courtesy of CHRYSLER GROUP, LLC

55. Install the radiator upper closeout panel push pins (2).
56. Install the radiator upper closeout panel bolts (4).
57. Install the radiator upper closeout panel bolts (3).

Fig. 47: Removing/Installing Inlet Assembly
Courtesy of CHRYSLER GROUP, LLC

58. Install the fresh air hose to the valve cover.
59. Install the air cleaner inlet assembly (1). Install the inlet snorkel push pins (3).
60. Install the inline connectors at the front of the battery tray.
61. Lock the engine harness connectors at the front of the battery tray.
62. Install the PDC. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION**.
- .
63. Install the two harness retainers that are secured to the PDC bracket.
64. Separate the wire harness retainers at the transmission bell housing.
65. Connect the heater core supply and return hoses at the fittings nearest the thermostat housing.

0909005842

Fig. 48: Battery Tray, PCM Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

66. Install the PCM bracket (3) to the battery tray (1). Install the PCM mount bracket bolts (2 & 4).
67. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION**.

0911005382

Fig. 49: Battery & Cables
Courtesy of CHRYSLER GROUP, LLC

68. Install the battery (2).
69. Connect the battery connectors (1 & 3).

Fig. 50: Battery Cover
Courtesy of CHRYSLER GROUP, LLC

70. Install the battery cover (1)
71. Fill the cooling system.

Fig. 51: Lower Coupling Bolt
Courtesy of CHRYSLER GROUP, LLC

72. Install the steering coupler bolt (3). Refer to **SPECIFICATIONS** .

Fig. 52: Engine Cover & Pins
Courtesy of CHRYSLER GROUP, LLC

73. Install the engine cover (1) to the ball studs (2).
74. Add engine oil and transmission fluid as necessary.
75. Start engine, check for leaks.
76. Bleed the cooling system. Refer to **STANDARD PROCEDURE** .

2. Install the hose to the resonator and tighten the clamp (1) to 4 N.m (35 in. lbs.).
3. Install the make up air hose.

RESONATOR, AIR CLEANER**REMOVAL****REMOVAL**

1. Remove the engine cover.

090772118

Fig. 61: Resonator, Clamp & Connector
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the electrical connector (2) from the Inlet Air Temperature (IAT) sensor.
3. Loosen the clamp (2) that secures the resonator (1) to the throttle body inlet.

090772119

Fig. 62: Resonator, Bolt & Clamp
Courtesy of CHRYSLER GROUP, LLC

4. Loosen the clamp (1) and remove the air inlet hose from the resonator (3).
5. Remove the bolt (2) that secures the resonator to the cylinder head cover.
6. Pull the resonator (3) up while tipping the top edge of the resonator slightly forward and remove from the vehicle.

INSTALLATION

INSTALLATION

090772119

Fig. 63: Resonator, Bolt & Clamp**Courtesy of CHRYSLER GROUP, LLC**

1. Position the resonator (3) between the forward edge of the cowl and the cylinder head cover. Align the openings with the throttle body intake and the airbox flex hose.
2. Install the bolt. Tighten the bolt to 9 N.m (81 in. lbs.).
3. Tighten the hose clamp (1).

090772118

Fig. 64: Resonator, Clamp & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Tighten the clamp (2) at the resonator outlet (1).
5. Connect the IAT connector (3).
6. Install the engine cover. Push downward to make sure all four rubber mounts are secure.

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

091072939

Fig. 65: Cylinder Head, Valves & Springs
Courtesy of CHRYSLER GROUP, LLC

The MultiAir, aluminum cylinder head (7) contains an exhaust camshaft and a variable valve actuator assembly (VVAA) with four valves per cylinder. The valves are arranged in two in-line banks. The exhaust valves (6) face toward the front of the vehicle. The intake valves face the dash panel (5). The valvetrain uses roller rocker arms with hydraulic lifters. The cylinder head incorporates pressed in powdered metal valve guides. The valve guides are not serviceable. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts. The valves contain a stem seal (4), spring (3), spring retainer (2) and three groove keepers (1).

Integral oil galleries provide lubrication passages to the VVAA, camshaft, and valve mechanisms.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant

- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between the cylinders located next to each other, follow the procedures in Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE** . An engine cylinder head gasket leaking between the cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

Fig. 66: Cooling System Pressure Tester - 7700-A
Courtesy of CHRYSLER GROUP, LLC

WARNING: WITH THE COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT THE PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester (special tool #7700-A, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Fig. 67: Bloc-Chek-Kit - C-3685-A
Courtesy of CHRYSLER GROUP, LLC

Combustion leaks into the cooling system can also be checked by using a (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform the test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding the cylinder head. Low speed running up to one hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
4. Low oil pressure.
5. The oil screen in cylinder head or the oil passage to the cylinder head is plugged with debris.
6. Air ingested into oil due to broken or cracked oil pump pick-up.
7. Worn valve guides.
8. Rocker arm ears contacting valve spring retainer.
9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
10. Oil leak or excessive cam bore wear in the cylinder head.
11. Faulty lash adjuster.
 - Check lash adjusters for "sponginess" while installed in the cylinder head and cam lobe at base circle. Depress part of rocker arm over the adjuster. Normal adjusters should feel firm when pressed quickly. When pressed very slowly, lash adjusters should collapse.
 - Remove suspected lash adjusters, and replace.
 - Before installation, make sure adjusters are full of oil. This can be verified by little plunger travel when lash adjuster is depressed quickly.

REMOVAL

REMOVAL

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .

2. Disconnect and isolate the battery negative cable.
3. Remove the engine cover.

090772119

Fig. 68: Resonator, Bolt & Clamp
Courtesy of CHRYSLER GROUP, LLC

4. Remove the resonator (3). Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
5. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

091071574

Fig. 69: Cylinder Head Cover Bolts

Courtesy of CHRYSLER GROUP, LLC

8. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .

3826577

Fig. 70: Exhaust Manifold Bolts

Courtesy of CHRYSLER GROUP, LLC

9. Remove the maniverter. Refer to **MANIFOLD, EXHAUST, REMOVAL**.

Fig. 71: Timing Cover Mark & Notch
Courtesy of CHRYSLER GROUP, LLC

10. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 72: Intake Manifold Lower Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Drain the coolant.
12. Remove the two nuts (1), the bolt (2) and the intake manifold lower bracket (3).
13. Remove the frame cover portion of the right splash shield. Refer to **SHIELD, SPLASH, FRONT**

WHEELHOUSE, REMOVAL .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

14. Rotate the crankshaft clockwise (as viewed from the front) to align the timing cover mark (1) with the damper notch (2) to place the number one cylinder piston at top-dead-center on the compression stroke.

Fig. 73: Timing Chain Cover Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

15. Remove the engine timing cover (1). Refer to **COVER(S), ENGINE TIMING, REMOVAL .**

091073256

Fig. 74: Timing Chain, Sprockets, Tensioner & Guides
Courtesy of CHRYSLER GROUP, LLC

16. Remove the tensioner (6) and timing chain (7). Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.
17. Remove the timing chain guides (3).

081569483

Fig. 75: Foam Insulator, Fuel Line & Purge Line
 Courtesy of CHRYSLER GROUP, LLC

18. Disconnect the vapor line (2) at the purge vapor solenoid end of the line.
19. Remove the NVH foam pad (3) prior to disconnecting the fuel line (1).

081569482

Fig. 76: Score Line
 Courtesy of CHRYSLER GROUP, LLC

20. To remove the foam pad, cut the pad along the score line (1). Make sure care is taken to not make contact with any other components while cutting the pad. **Do not cut beyond the line** . Remove the pad from the fuel rail once split.
21. Disconnect the fuel line from the fuel rail. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
22. Unplug the Electronic Throttle Control (ETC) connector.
23. Disconnect the VVAA solenoids.
24. Unplug the purge solenoid.

091466688

Fig. 77: MAP Sensor Connector & Fittings
Courtesy of CHRYSLER GROUP, LLC

25. Disconnect the three hoses from the intake manifold fittings (3).
26. Using a permanent ink or paint marker, identify the location and position on each camshaft bearing cap.

**CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS.
SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**

27. Loosen the camshaft bearing cap bolts and remove the camshaft bearing caps.
28. Remove the camshafts.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

29. Remove the rocker arm(s).

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

30. Remove the hydraulic lifter(s).

Fig. 78: Front Head Bolt Washers
Courtesy of CHRYSLER GROUP, LLC

NOTE: All of the cylinder head bolts have captured washers EXCEPT the front two (1).

31. Remove the cylinder head bolts and two uncaptured washers (1).
32. Remove the cylinder head from the engine block.

NOTE: There is a foam insulator that is sandwiched between the intake manifold and the engine block that may fall off when the cylinder head is removed. The foam pad must be reinstalled during assembly.

091469530

Fig. 79: Fuel Injectors & Rail
Courtesy of CHRYSLER GROUP, LLC

33. Disconnect the fuel injector electrical connectors (1). Remove the two bolts at the fuel rail (2).

091468958

Fig. 80: Intake Manifold Upper Support Bracket, Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

34. Remove the throttle body bracket bolts (3), loosen the nuts (2). Allow the throttle body bracket bolts to remain with the intake manifold.

091468686

Fig. 81: Intake Manifold Silencer Pad Screws
Courtesy of CHRYSLER GROUP, LLC

35. Remove the four screws that secure the intake manifold silencer to the manifold (1).

091468688

Fig. 82: MAP Sensor Connector & Fittings
Courtesy of CHRYSLER GROUP, LLC

36. Remove wiring harness retainer from the intake manifold eyelets (1)
37. Unplug the MAP sensor connector (2).

3826632

Fig. 83: Intake Manifold Retaining Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

38. Remove intake manifold retaining bolts (2) and nuts (1).
39. Remove the intake manifold from the cylinder head.

40. Inspect the cylinder head and cylinder head components. Refer to **CYLINDER HEAD - INSPECTION**.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.

CLEANING

CLEANING

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

1. Remove all gasket material from cylinder head and block. Refer to **ENGINE - STANDARD PROCEDURE**. Be careful not to gouge or scratch the aluminum head sealing surface.
2. Clean all engine oil passages.
3. Clean out the cylinder head bolt holes in the engine block.

INSPECTION

INSPECTION

Fig. 84: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical Cylinder Head shown in illustration.

1. Check for cylinder head warping with a straight edge (2) and feeler gauge (1).
2. Cylinder head must be flat within specification. Refer to **ENGINE SPECIFICATIONS**.
3. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
4. Inspect the following components and verify that they are within specification. Refer to **ENGINE SPECIFICATIONS**.
 - Springs
 - Valve Seats
 - Valve Guides
 - Valves

INSTALLATION

INSTALLATION

Fig. 85: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

1. Check the cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual

oil or coolant), and threads are not damaged.

NOTE: Prior to installing the cylinder head to the block, the intake manifold must be installed onto the cylinder head.

2. Replace the variable valve timing filter screen (3).
3. Clean all gasket surfaces.
4. Replace intake manifold gasket seals.
5. Position the foam pad over the coolant transfer tube.
6. **Apply 3-5 dabs of RTV to the foam pad where it makes contact with the coolant transfer tube prior to setting the foam pad in position. This will aid in holding the pad in the proper position while setting the head on the block.**

Fig. 86: Intake Manifold Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Position the intake manifold onto the cylinder head.
8. Install the three bolts and two nuts. Using the torque sequence pattern as a guide, tighten the bolts and nuts to 25 N.m (18 ft. lbs.).

091468958

Fig. 87: Intake Manifold Upper Support Bracket, Bolts & Nuts
 Courtesy of CHRYSLER GROUP, LLC

9. Install the manifold to head bracket (1). Tighten the nuts (2) and bolts to 9 N.m (81 in. lbs.)
10. Install the fuel rail assembly. Refer to **RAIL, FUEL, INSTALLATION** .

091468686

Fig. 88: Intake Manifold Silencer Pad Screws

Courtesy of CHRYSLER GROUP, LLC

11. Install the intake manifold silencer pad and screws. Tighten the screws to 2.5 N.m (22 in. lbs.).

NOTE: When using RTV, components should be assembled within 10 minutes and tighten to specification within 45 minutes.

Fig. 89: Engine Sealant RTV Location
Courtesy of CHRYSLER GROUP, LLC

12. Place two pea size dots of Mopar® engine sealant RTV or equivalent (1) on the cylinder block as shown in illustration.
13. Position the new cylinder head gasket on the engine block with the part number facing up. Ensure gasket is seated over the locating dowels in the block.
14. Route the knock sensor wiring harness between the coolant transfer tube and the engine block. Insert the harness retainer into the holder.
15. Position the cylinder head onto the engine block.

NOTE: Make sure the foam pad is not out of position. Inspect the positioning of the pad from below to make sure that no part of the pad is between the cylinder head and the engine block surface.

2200259

Fig. 90: Washers Must Be Installed With Bevel Edge Up Towards Bolt Head
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front two cylinder head bolts do not have captured washers. The washers must be installed with the bevel edge (1) up towards the bolt head.

81877ba8

Fig. 91: Front Head Bolt Washers
Courtesy of CHRYSLER GROUP, LLC

16. Install washers (1) for the front two cylinder head bolts with the beveled edge facing up.

Fig. 92: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: DOHC shown in illustration, SOHC same sequence.

NOTE: Before installing the cylinder head bolts, lubricate the threads with clean engine oil.

17. Install the ten cylinder head bolts finger tight.
18. Tighten the cylinder head bolts in the sequence shown in illustration, following this 4 step torque plus angle method. Tighten according to the following torque values:
 - Step 1: All to 30 N.m (22 ft. lbs.)
 - Step 2: All to 73 N.m (54 ft. lbs.)
 - Step 3: All again to 73 N.m (54 ft. lbs.)
 - Step 4: All an additional 90° Turn. **Do not use a torque wrench for this step.**
19. If the hydraulic lifters are being reused, reassemble them into their original locations.
20. Install the exhaust hydraulic lifters.

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

21. Install the exhaust rocker arms.
22. Oil all of the camshaft journals with clean engine oil.
23. Install the camshaft. Refer to CAMSHAFT, ENGINE, INSTALLATION .
24. Install the VVAA. Refer to ASSEMBLY, VARIABLE VALVE ACTUATION, INSTALLATION.
25. Install timing chain and tensioner. Refer to CHAIN AND SPROCKETS, TIMING, INSTALLATION .

26. Install timing chain cover, engine mount, pulleys and accessory drive belt. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .

091071574

Fig. 93: Cylinder Head Cover Bolts

30. Insert the foam insulator (3) over the fuel rail.
31. Connect fuel line (1).
32. Connect the purge vapor line (2). Remove wiring harness retainer from the intake manifold eyelets (1).
33. Connect the three hose connectors (3).
34. Connect the knock sensor connector.

081569485

Fig. 96: Intake Manifold Lower Bracket, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

35. Install the intake manifold lower bracket (3). Install the nuts (1) and bolt (2). Tighten to 9 N.m (81 in. lbs.)
36. Connect the VVAA solenoids.
37. Connect the MAP sensor connector (2).

081569483

Fig. 97: Foam Insulator, Fuel Line & Purge Line
Courtesy of CHRYSLER GROUP, LLC

38. Inspect quick connect fittings for damage, replace if necessary. Refer to **FITTING, QUICK CONNECT** .

3828269

Fig. 98: Air Cleaner Body, Clamp, Make Up Air Hose, Retainer & Bolt
Courtesy of CHRYSLER GROUP, LLC

39. Install the air cleaner body (1). Refer to **BODY, AIR CLEANER, INSTALLATION** .

Fig. 99: Engine Cover & Air Resonator Clamp
Courtesy of CHRYSLER GROUP, LLC

40. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE** .
41. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
42. Recharge the air conditioning system. Refer to **PLUMBING, STANDARD PROCEDURE** .
43. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** .
44. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
45. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .
46. The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. .

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

3178689

Fig. 100: Engine Camshaft**Courtesy of CHRYSLER GROUP, LLC**

The 2.4L engine uses a Single Over Head Camshaft (SOHC) to provide valve actuation but the camshaft is in the standard position of an exhaust camshaft in a Dual Over Head Camshaft (DOHC) engine. The camshaft has five bearing journal surfaces and three cam lobes per cylinder. The camshaft is built up on a hollow tube with cam lobes, bearing journals and end caps pressed into position. The front end cap includes the camshaft sprocket mounting. The middle (number three) bearing surface has thrust walls machined into it to control end play. The rear has a camshaft position sensor pick-up wheel and also drives the vacuum pump.

OPERATION**OPERATION**

The camshaft is driven by the crankshaft via a drive sprocket and a chain. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE**STANDARD PROCEDURE - CAMSHAFT END PLAY**

Fig. 101: Measuring Camshaft End Play
 Courtesy of CHRYSLER GROUP, LLC

STANDARD PROCEDURE - CAMSHAFT ENDPLAY

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **ENGINE SPECIFICATIONS** .

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the cylinder head cover . Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
3. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

091673425

Fig. 102: Vertical Center Line Of Camshaft, Dowel & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

5. Remove the frame cover portion of the right splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.

3825527

Fig. 103: Timing Cover Mark & Notch
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the crankshaft clockwise (as viewed from the front) to align the timing cover mark (1) with the damper notch (2) to place the number one cylinder piston at top-dead-center on the compression stroke.

091673425

Fig. 104: Vertical Center Line Of Camshaft, Dowel & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

7. Verify that the camshaft timing is correct as viewed above. The vertical center line of the camshaft (1) and the horizontal surface of the top of the cylinder head (3)

MUST be

90° from each other.

NOTE: The camshaft dowel (2) is slightly visible above the camshaft center bolt and should be at 12 o'clock when set.

8. Lower the vehicle and support the engine with a jack stand.

091073257

Fig. 105: Sprocket Mark & Painted Link
 Courtesy of CHRYSLER GROUP, LLC

9. Using a paint pen or equivalent, mark both camshaft sprockets and corresponding chain links (1 and 2) to aid in reassembly.

NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, number one exhaust camshaft bearing is marked "E1>".

**CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS.
 SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**

10. Remove the vacuum pump.
11. Remove the right engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, REMOVAL** .
12. Remove the timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
13. Using a permanent ink or paint marker, identify the location and position on each camshaft bearing cap.

091071570

Fig. 106: Special Tool, Spring Compressor & Indicators
 Courtesy of CHRYSLER GROUP, LLC

14. Using special tool 10259A (1), loosen the spring compressors (2) to fit over the valve and spring assemblies. Adjust the tool to align with the 2.4L indicators (3).
15. Install the (special tool #10259B, Compressor, MultiAir® Spring) spring compressor
16. Rotate the spring compressors counterclockwise until the springs are fully seated.

091073332

Fig. 107: Bearing Cap Bolts

Courtesy of CHRYSLER GROUP, LLC

17. **Slowly** remove the exhaust camshaft bearing cap bolts (1) one turn at a time. Remove the camshaft bearing caps.

Fig. 108: Chain Removal

Courtesy of CHRYSLER GROUP, LLC

18. Lift the timing chain (2) off of the sprocket (1).
19. Remove the camshaft.
20. Remove the sprocket from the camshaft.

INSPECTION

INSPECTION

Fig. 109: Inspecting Camshaft Wear Areas

Courtesy of CHRYSLER GROUP, LLC

1. Inspect the camshaft bearing journals (4) for damage and binding. If the journals are binding, check the camshaft bearing housing for damage. Also check the oil supply holes for clogging.
2. Check the surface of the cam lobes (5) for abnormal wear (1). Measure and compare the unworn area (3) to the worn area (2). Replace the camshaft if it is not within specification. Refer to **ENGINE SPECIFICATIONS** .

INSTALLATION**INSTALLATION**

NOTE: Camshaft bearing caps are marked during engine manufacturing. For example, the front camshaft bearing cap is marked 1, the rear cap is marked with a 5. The markings on the caps must be read while looking from the left bank of the engine (closest to the front of the vehicle).

NOTE: Following the installation of each camshaft bearing cap, visually verify that the camshaft has some endplay.

1. Lubricate camshaft journals with clean engine oil.
2. Apply a seam of Anaerobic Loctite® 518 Sealant on the camshaft housing in the contact area of the front and rear camshaft caps.

3078190

Fig. 110: Camshaft Bearing Cap Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

Torque Sequence

NOTE: VVAA removed for clarity

3. Install the camshaft and camshaft bearing caps. Tighten the twelve bolts in two steps following the sequence shown in illustration:
- Step 1: All to 5 N.m (44 in. lbs.).
 - Step 2: All to 10 N.m (89 in. lbs.).

091071570

Fig. 111: Special Tool, Spring Compressor & Indicators
Courtesy of CHRYSLER GROUP, LLC

4. Loosen the spring compressors (2), remove the tool (special tool #10259B, Compressor, MultiAir® Spring) (1).

3079876

Fig. 112: Camshaft Seal

Courtesy of CHRYSLER GROUP, LLC

5. If required, install a new camshaft seal (1). Refer to SEAL(S), CAMSHAFT, INSTALLATION .
6. Install the camshaft sprocket and timing chain. Refer to CHAIN AND SPROCKETS, TIMING, INSTALLATION .
7. Install the timing cover. Refer to COVER(S), ENGINE TIMING, INSTALLATION .
8. Install the cylinder head cover. Refer to COVER(S), CYLINDER HEAD, INSTALLATION .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

COVER(S), CYLINDER HEAD

DESCRIPTION

DESCRIPTION

3824889

Fig. 113: Cylinder Head Cover

Courtesy of CHRYSLER GROUP, LLC

The cylinder head cover is made of die cast aluminum. The cylinder head cover is sealed with press-in-place gaskets at the cylinder head and spark plug ports. RTV is used to seal the T-joint at the cylinder head cover, front timing cover and cylinder head. RTV is also used to seal the cylinder head cover to the rear camshaft bearing cap at the vacuum pump.

REMOVAL

REMOVAL

1. Remove the engine cover assembly.
2. Disconnect and isolate the battery negative cable.
3. Remove the make up air hose from the cylinder head cover fitting.
4. Remove the positive crankcase ventilation (PCV) hose.
5. Disconnect and remove the ignition coils. Refer to **COIL, IGNITION, REMOVAL** .

091071574

Fig. 114: Cylinder Head Cover Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Use compressed air to blow dirt and debris off of the cylinder head cover prior to removal.
7. Remove the push pins that secure the coil harness to the cover.

NOTE: If any of the push pins break off in the cover, use a pick to rotate the lodged portion counterclockwise to back the portion out of the hole.

8. Loosen twelve cylinder head cover mounting bolts and six stud bolts (1).
9. Remove the cylinder head cover from the cylinder head.

NOTE: With the help of an assistant, hold the coil harness up and spread open as the cover is removed through the area between the left and right harness runs.

3825223

Fig. 115: Cylinder Head Cover Gaskets
 Courtesy of CHRYSLER GROUP, LLC

10. Remove and discard the cylinder head cover gaskets (1 and 2).

091071569

Fig. 116: Sealant Application Areas
 Courtesy of CHRYSLER GROUP, LLC

11. Remove all residual sealant (1) from the cylinder head, timing chain cover, rear exhaust camshaft bearing cap and cylinder head cover mating surfaces. Refer to **ENGINE - STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

3825223

Fig. 117: Cylinder Head Cover Gaskets
Courtesy of CHRYSLER GROUP, LLC

1. Install new cylinder head cover gaskets (1 and 2).

091071569

Fig. 118: Sealant Application Areas
Courtesy of CHRYSLER GROUP, LLC

NOTE: When using RTV, the sealing surfaces must be clean and free from grease and oil.

NOTE: When using RTV, components should be assembled within 10 minutes and tighten to specification within 45 minutes.

2. Apply a 2 to 3 mm wide bead of Mopar® engine sealant RTV or equivalent to the cylinder head/front cover T-joint (1) and the rear exhaust camshaft bearing cap/cylinder head T-joint (1).

091071574

Fig. 119: Cylinder Head Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the cylinder head cover to the cylinder head with twelve bolts and six stud bolts (1). Tighten all eighteen fasteners to 10 N.m (90 in. lbs.).
4. Install the cylinder cover ground strap and nut. Tighten the nut to 10 N.m (90 in. lbs.)
5. Install and connect the ignition coils. Refer to **COIL, IGNITION, INSTALLATION**.
6. If removed, install the positive crankcase ventilation (PCV) valve and tighten to 4 N.m (37 in. lbs.).

NOTE: Make sure the O-ring is seated on the shoulder of the opening prior to reading the torque.

7. Connect the PCV hose to the PCV valve.
8. Connect the make up air hose.
9. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
10. Install the engine cover assembly.

LIFTER(S), HYDRAULIC

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LASH ADJUSTER (TAPPET) NOISE

Proper noise diagnosis is essential in locating the source of an NVH complaint. Locating a lash adjuster (tappet)

type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart for possible causes and correction of a lash adjuster (tappet) type noise:

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level-too high or too low. This may allow aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct the engine oil level.
2. Insufficient running time after rebuilding a cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in the lash adjuster (after 1 hour of run time).	3. See below: (a) Check lash adjusters for sponginess while installed in the cylinder head. Depress the lash adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If the lash adjuster(s) are still spongy, replace the lash adjuster(s). Refer to <u>LIFTER(S), HYDRAULIC, REMOVAL</u> .
4. Low oil pressure.	4. See below: (a) Check and correct the engine oil level. (b) Check the engine oil pressure. Refer to <u>LUBRICATION - DIAGNOSIS AND TESTING</u> . (c) Check for excessive main bearing clearance and correct. Refer to <u>BEARING(S), CRANKSHAFT, MAIN - STANDARD PROCEDURE</u> . (d) Check for a worn oil pump.
5. Oil passage to the cylinder head(s) plugged with debris.	5. Check cylinder head oil passages for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Measure valve stem-to-guide clearance. Refer to <u>VALVES, INTAKE AND EXHAUST - STANDARD PROCEDURE</u> .
7. Air ingested into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris ingestion.	8. Clean debris from engine and replace lash adjuster (s). Refer to <u>LIFTER(S), HYDRAULIC, REMOVAL</u> .

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.

091071574

Fig. 120: Cylinder Head Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the cylinder head cover assembly bolts (1) and remove the cover from the cylinder head.

091071570

Fig. 121: Special Tool, Spring Compressor & Indicators
Courtesy of CHRYSLER GROUP, LLC

3. Install special (1) tool to the cylinder head. With the spring compressors lined up in the 2.4L position of the bridge (3), rotate the screw jacks counterclockwise to compress the springs enough to allow slight

movement of the rockers.

4. Remove the camshaft(s). Refer to CAMSHAFT, ENGINE, REMOVAL .

NOTE: **If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.**

5. Remove the rocker arm(s). Refer to ROCKER ARM, VALVE, REMOVAL .

NOTE: **If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.**

6. Remove the hydraulic lifter(s).

INSTALLATION

INSTALLATION

1. Verify that the hydraulic lifters are at least partially full of oil. There should be little or no plunger travel when the hydraulic lifter is depressed.

NOTE: **If the hydraulic lifters are being reused, reassemble them into their original locations.**

2. Install the hydraulic lifter(s)

NOTE: **If the rocker arms are being reused, reassemble them into their original locations.**

3. Install the rocker arm(s). Refer to ROCKER ARM, VALVE, INSTALLATION .
4. Install the camshaft. Refer to CAMSHAFT, ENGINE, INSTALLATION .

091071570

Fig. 122: Special Tool, Spring Compressor & Indicators
Courtesy of CHRYSLER GROUP, LLC

5. Install the VVAA. Refer to **ASSEMBLY, VARIABLE VALVE ACTUATION, INSTALLATION**.
6. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
7. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).

ROCKER ARM, VALVE

DESCRIPTION

DESCRIPTION

3175529

Fig. 123: Valve Rocker Arm

Courtesy of CHRYSLER GROUP, LLC

The valve rocker arms are steel stampings with an integral roller bearing. A spring clip helps to hold the rocker arm in position on the ball socket when removing or installing the variable valve actuation assembly. The rocker arm ball socket also incorporates a 0.5 mm oil hole for roller and camshaft lubrication.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. If the exhaust rockers are to be serviced, remove the exhaust camshaft. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. If the intake rockers are to be serviced, remove the Variable Valve Actuator Assembly (VVAA). Refer to **ASSEMBLY, VARIABLE VALVE ACTUATION, REMOVAL**.
4. Remove the rocker arm(s).

INSPECTION

INSPECTION

3175529

Fig. 124: Valve Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

Inspect the valve rocker arm for wear or damage. Replace as necessary.

INSTALLATION

INSTALLATION

1. Lubricate the rocker arms with clean engine oil before installation.

NOTE: **If the rocker arms are being reused, reassemble them into their original locations.**

2. Install the rocker arm(s).
3. If the intake rockers were serviced, install the VVAA. Refer to ASSEMBLY, VARIABLE VALVE ACTUATION, INSTALLATION.
4. If the exhaust rockers were serviced, Install the camshaft and cylinder head cover. Refer to CAMSHAFT, ENGINE, INSTALLATION.
5. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).

SEAL(S), VALVE GUIDE**DESCRIPTION****DESCRIPTION**

Fig. 125: Valve Stem Oil Seal, Valve Spring & Valve Guide
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical valve configuration shown in illustration.**

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.

REMOVAL

REMOVAL

Fig. 126: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

1. Remove the valve spring(s) (2). Refer to **SPRING(S), VALVE, REMOVAL** .

Fig. 127: Valve Guide Seal & Valve Seal Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 2 cylinder exhaust valve guide seal shown in illustration, all other valve guide seals similar.

2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.

Fig. 128: Valve Spring Seat

Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 2 cylinder exhaust valve spring seat shown in illustration. Exhaust valve spring seats are marked with the letter "S" and have a thickness of 0.8 mm (0.031 in.). Intake valve spring seats are marked with the letter "A" and have a thickness of 3.2 mm (0.126 in.).

3. If required, remove the valve spring seat (1).
4. If required, remove the valve(s). Refer to VALVES, INTAKE AND EXHAUST, REMOVAL.

INSTALLATION

INSTALLATION

Fig. 129: Valve Spring Seat

Courtesy of CHRYSLER GROUP, LLC

NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to **ENGINE SPECIFICATIONS** .

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION** .

NOTE: Number 2 cylinder exhaust valve spring seat shown in illustration. Exhaust valve spring seats are marked with the letter "S" and have a thickness of 0.8 mm (0.031 in.). Intake valve spring seats are marked with the letter "A" and have a thickness of 3.2 mm (0.126 in.).

2. If removed, install the spring seat (1) over the valve guide.

Fig. 130: Driver, Garter Spring & Valve Guide Seal
Courtesy of CHRYSLER GROUP, LLC

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE: Make sure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 2 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 131: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original

locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Install the valve spring(s) (2). Refer to SPRING(S), VALVE, INSTALLATION .

SPRING(S), VALVE

DESCRIPTION

DESCRIPTION

3176201

Fig. 132: Valve Springs Assembly

Courtesy of CHRYSLER GROUP, LLC

The valve springs are a beehive design and made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. Valve guide seals are rubber overmolded on a steel support cylinder with a garter spring at the seal lip. The seals are not integrated with the valve spring seat. The steel valve spring retainers are designed for use with beehive springs and the valve spring retainer locks are a three bead Butt type design to promote valve rotation.

REMOVAL

ON VEHICLE

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

1. Remove the variable valve actuator assembly. Refer to ASSEMBLY, VARIABLE VALVE ACTUATION, REMOVAL.
2. Remove the exhaust camshaft. Refer to CAMSHAFT, ENGINE, REMOVAL .

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s). Refer to **ROCKER ARM, VALVE, REMOVAL** .
4. Install the (special tool #10224, Adapter, Valve Spring) (2) on the (special tool #MD998772A, Compressor, Valve Spring) (1).

Fig. 133: Valve Spring Compressor & Air Hose
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder exhaust valve spring compression shown in illustration, all other valves similar.

5. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
6. Install the (special tool #MD998772A, Compressor, Valve Spring) (1) onto the cylinder head.
7. Install a spark plug adapter attached to a regulated shop air supply (2). Pressurize the cylinder being serviced to 620.5 - 689 kPa (90 - 100 psi) to hold the valves in place.

Fig. 134: Compressing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder exhaust valve spring compression shown in illustration, all other valves similar.

CAUTION: Air pressure must be maintained as long as the valve springs are removed to prevent the valves from dropping into the cylinders.

8. Using the (special tool #10224, Adapter, Valve Spring) (2), compress valve spring (4) and remove valve retaining locks (3).

Fig. 135: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

9. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
10. If required, remove the valve guide seal. Refer to SEAL(S), VALVE GUIDE, REMOVAL.

OFF VEHICLE

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

3080080

Fig. 136: Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

1. Remove the variable valve actuator assembly. Refer to ASSEMBLY, VARIABLE VALVE ACTUATION, REMOVAL.
2. Install the (special tool #10224, Adapter, Valve Spring) (2) on the (special tool #MD998772A, Compressor, Valve Spring) (1).

Fig. 137: Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 intake valve spring compression shown in illustration, all other valves similar.

3. Install the (special tool #MD998772A, Compressor, Valve Spring) (1) onto the cylinder head.
4. Place a cushion of foam padding or a ball of rags in the dome area of the cylinder head to hold the valves in place during the retaining lock removal process.

Fig. 138: Compressing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder exhaust valve spring compression shown in illustration, all other valves similar.

5. Using the (special tool #10224, Adapter, Valve Spring) (2), compress valve spring (4) and remove valve retaining locks (3).

- NOTE:** The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if being reused. If they are being replaced, correctly identify the part numbers prior to installation.
- NOTE:** If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

6. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
7. If required, remove the valve guide seal. Refer to SEAL(S), VALVE GUIDE, REMOVAL .

INSPECTION

INSPECTION

**Fig. 140: Testing Valve Spring**

Courtesy of CHRYSLER GROUP, LLC

When valves have been removed for inspection, reconditioning or replacement, valve springs should be checked against specifications for free-length, spring force and spring installed height. Refer to **ENGINE SPECIFICATIONS**.

Spring force can be measured with a test fixture (2). Follow the tool manufactures instructions. Replace any springs that do not meet specifications.

**Fig. 141: Checking Valve Spring Installed Height**

Courtesy of CHRYSLER GROUP, LLC

Installed height of the valve spring must be checked with the valve assembled into the cylinder head. Refer to **SPRING(S), VALVE, INSTALLATION**.

If the valves or valve seats have been refinished, check the installed height of the valve springs (4). Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1). Refer to **ENGINE SPECIFICATIONS**.

INSTALLATION

ON VEHICLE

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

Fig. 142: Valve Guide Seal & Valve
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve guide seal (2) over the valve guide (3). Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Make sure that the garter spring (1) is intact around the top of the valve guide seal (2). Number 2 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

3807879

Fig. 143: Valve Spring & Retainer

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valves similar.

2. Install the valve spring (2) and valve spring retainer (1).

3807889

Fig. 144: Compressing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder exhaust valve spring compression shown in illustration, all other valves similar.

3. Using the (special tool #10224, Adapter, Valve Spring) (2) with the (special tool #MD998772A, Compressor, Valve Spring) (1), compress the valve spring (4) **only enough** to install the valve retaining locks (3).
4. Relieve the air pressure and remove the spark plug adapter.
5. Install the spark plug and tighten to 19 N.m (14 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION**.

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

6. Install the rocker arm(s). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
7. Install the camshaft. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
8. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).

OFF VEHICLE

NOTE: The intake and exhaust springs are NOT interchangeable. Make sure the springs are marked if reused. If they are being replaced, correctly identify the part numbers prior to installation.

Fig. 145: Valve Spring Component Measurements

8. If the valves or valve seats have been refinished, verify that the installed height of the valve springs (4) are within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1). Refer to **ENGINE SPECIFICATIONS**.
9. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.

VALVES, INTAKE AND EXHAUST

DESCRIPTION

DESCRIPTION

091072939

Fig. 152: Cylinder Head, Valves & Springs
 Courtesy of CHRYSLER GROUP, LLC

Each of the four combustion chambers contains four valves, two intake and two exhaust, for a total of 16 valves. The valves are made of heat resistant steel. They have nitrided stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING - INTAKE AND EXHAUST VALVES

809c3e96

Fig. 153: Valve Face & Seat
 Courtesy of CHRYSLER GROUP, LLC

- 1 - SEAT WIDTH
- 2 - FACE ANGLE
- 3 - SEAT ANGLE
- 4 - SEAT CONTACT AREA

The intake and exhaust valves have a 44.5 to 45 degree face angle (1). The valve seats (2) have a 45 to 45.5 degree face angle.

VALVES

Fig. 154: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

Inspect the remaining margin (5) after the valves are refaced. Refer to **ENGINE SPECIFICATIONS** .

VALVE SEATS

809c3e98

Fig. 155: Valve Face & Seat

Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| 1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA |
|---|

NOTE: When refacing the valve seats, it is important that the correct size valve guide pilot be used for the reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Refer to **ENGINE SPECIFICATIONS**.
2. Inspect the valve seat (3) with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat (3) **LIGHTLY** with Prussian blue then set the valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of the valve face (4), contact is satisfactory. If the blue is transferred to the top edge of the valve face, then lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, then raise the valve seat with a 65 degree stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

3. When the seat is properly positioned the width of the intake and exhaust seats should be within specification. Refer to **ENGINE SPECIFICATIONS**.

VALVE AND SPRING INSTALLED HEIGHT

Fig. 156: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **ENGINE SPECIFICATIONS**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

Fig. 157: Garter Spring, Valve Guide Seal & Spring Seat
Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (2) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION** .

NOTE: **Ensure that the garter spring (1) is intact around the top of the valve guide seal (2). Number 2 cylinder exhaust valve guide seal shown in illustration, all other valves similar.**

Fig. 158: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the valve springs are being reused, reassemble them into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valves similar.**

4. Install the valve spring (2) and valve spring retainer (1).

Fig. 159: Valve Spring Adapter, Valve Spring Compressor, Retaining Locks & Valve Springs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder exhaust valve spring compression shown in illustration, all other valves similar.

5. Compress valve springs (4) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (1) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (2). Install the retaining locks (3) and release the valve spring compression.

Fig. 160: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

6. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1). Refer to **ENGINE SPECIFICATIONS**.

REMOVAL

REMOVAL

Fig. 161: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head. Refer to CYLINDER HEAD, REMOVAL .

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 2 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

2. Remove the valve spring(s) (2). Refer to SPRING(S), VALVE, REMOVAL .

Fig. 162: Inspecting Valve Margin

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing the valves, remove any burrs from the valve stem retainer lock grooves (2) and stem tip (1) to prevent damage to the valve guides.

3. Remove the valve(s). Identify each valve to ensure installation in the original location.

Fig. 163: Garter Spring, Valve Guide Seal & Spring Seat
Courtesy of CHRYSLER GROUP, LLC

4. If required, remove the valve guide seal (2) and spring seat (3). Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

VALVES

Fig. 164: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect the retainer lock grooves for wear or damage (2).
3. Inspect the valve face (4) for wear and pitting.
4. Measure the valve stems (3) and margins (5) for wear. Refer to **ENGINE SPECIFICATIONS**.

VALVE GUIDES

Fig. 165: Measuring Valve Guide Wear
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical cylinder head shown in illustration.

1. Remove carbon and varnish deposits from inside of the valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install the valve (2) into the cylinder head so that it is 15 mm (0.590 inch.) off of the valve seat. A small piece of hose may be used to hold the valve in place.
4. Attach the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to the cylinder head and set it at a right angle to the valve stem being measured.
5. Move the valve to and from the indicator. Compare this reading to the specification. Refer to **ENGINE SPECIFICATIONS**.

NOTE: If stem-to-guide clearance exceeds specifications, you must measure the valve stem. If the valve stem is within specification or if the valve guide is loose in the cylinder head, replace the cylinder head.

INSTALLATION

INSTALLATION

Fig. 166: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **ENGINE SPECIFICATIONS**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

Fig. 167: Garter Spring, Valve Guide Seal & Spring Seat
Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (2) over the valve guide. Refer to SEAL(S), VALVE GUIDE, INSTALLATION .

NOTE: Make sure that the garter spring (1) is intact around the top of the valve guide seal (2). Number 2 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 168: Valve Spring & Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Install the valve spring(s) (2). Refer to SPRING(S), VALVE, INSTALLATION .

NOTE: Reassemble the valves springs into their original locations. If the valves or valve seats have been refinished, verify that the valve spring installed height is within specification. Refer to **ENGINE SPECIFICATIONS** . Number 2 cylinder exhaust valve spring shown in illustration, all other valves springs similar.

5. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION** .

PUMP, VACUUM

DESCRIPTION

DESCRIPTION

Fig. 169: Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

The vane-type vacuum pump is mounted to the rear of the cylinder head and is driven by the camshaft. The vacuum pump supplies vacuum to the brake booster.

REMOVAL

REMOVAL

1. Remove the engine cover. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
2. Remove the battery. Refer to **BATTERY, REMOVAL** .

NOTE: Oil may leak from the vacuum pump drive when the pump is removed. Place a shop towel under the pump to prevent oil leakage onto the engine or transmission assembly.

Fig. 170: Vacuum Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the vacuum line at the pump (1).
4. Remove the vacuum pump mounting bolts (2) and the vacuum pump.

Fig. 171: Vacuum Pump Gasket
Courtesy of CHRYSLER GROUP, LLC

5. Remove and discard the vacuum pump gasket (1). Note the location of the pump drive tab.

Fig. 172: Vacuum Fitting & Screw
Courtesy of CHRYSLER GROUP, LLC

6. If required, remove the screw (1) and the vacuum fitting (2).

Fig. 173: Vacuum Fitting O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

7. The vacuum fitting O-ring seal (1) can be reused if not damaged.

INSTALLATION

INSTALLATION

3345100

Fig. 174: Vacuum Fitting O-Ring Seal
 Courtesy of CHRYSLER GROUP, LLC

1. The vacuum fitting O-ring seal (1) can be reused if not damaged. If removed, lightly lubricate the O-ring seal (1) with clean engine oil and install on the vacuum fitting.

3345090

Fig. 175: Vacuum Fitting & Screw
 Courtesy of CHRYSLER GROUP, LLC

2. If removed, install the vacuum fitting (2) to the vacuum pump with the screw (1) tightened to 8 N.m (71 in. lbs.).
3. Clean the mating surfaces of the cylinder head and the vacuum pump. Install a new vacuum pump gasket.
4. Align the pump drive tab with the pump drive slot located on the cam shaft.
5. Install the vacuum pump mounting bolts. Tighten the bolts to 20 N.m (15 ft. lbs.).
6. Connect the vacuum supply line to the pump.

CAUTION: When servicing components near the vacuum pump, avoid contact with the plastic nipple that connects the vacuum pump to the brake booster hose. It is possible to crack the plastic nipple resulting in a brake booster vacuum leak.

7. Install the battery (4). Refer to **BATTERY, INSTALLATION**.
8. Install the engine cover. Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.
9. Run the engine a check the vacuum pump for proper operation.

ASSEMBLY, VARIABLE VALVE ACTUATION

DESCRIPTION

DESCRIPTION

091072144

Fig. 176: Intake Valve Tips

Courtesy of CHRYSLER GROUP, LLC

The primary component of variable valve actuation is the variable valve actuation module. The variable valve actuation module is bolted to the top of the camshaft bearing housing above the intake valves, next to the camshaft. The intake lobes on the camshaft operate hydraulic pumping elements instead of directly acting on the valves. The pumping elements provide high-pressure oil to open the intake valves. The relationship between the camshaft lobe and the intake valves is controlled by a solenoid operated hydraulic port. By varying the solenoid operation, the Powertrain Control Module (PCM) is able to control intake valve lift and duration. The actuators sit directly on top of the intake valve tips (circled).

OPERATION

OPERATION

Fig. 177: Solenoid Valve, Hydraulic Brake Pumping Element/Hydraulic Lash Adjusters, Upper Pumping Element & Oil Accumulator

Courtesy of CHRYSLER GROUP, LLC

Variable valve actuation controls the operation of the intake valves. By using a hydraulic link between the camshaft and the intake valves, the valve lift and timing can be adjusted infinitely.

The main components of variable valve actuation are the Powertrain Control Module (PCM) programming and the variable valve actuation module. The variable valve actuation module contains one set of the following components for each cylinder:

- Upper Pumping Element (3)
- Solenoid Valve (1)
- Hydraulic Brake Pumping Element/Hydraulic Lash Adjusters (2)
- Oil Accumulator (4)

3296116

Fig. 178: Variable Valve Actuation Assembly Operating Description
Courtesy of CHRYSLER GROUP, LLC

The upper pumping elements (1) in the variable valve actuator are filled with oil from the engine lubrication system. The upper pumping elements (1) are driven by the rocker arms through camshaft motion (9) to create high-pressure oil inside the oil chamber (2). As the camshaft continues to rotate and the camshaft lobe ramps down, a spring in the upper pumping element returns the piston and the rocker arm to their home positions.

The high-pressure oil in the oil chamber passageway is delivered to the solenoid valve (8) from the upper pumping element. The solenoid valve (8) is a normally open hydraulic control valve. Therefore, the high-pressure oil is vented from the oil chamber to the accumulator (7) unless the solenoid valve is powered. When the solenoid valve is supplied 12 volts, the valve closes and high pressure oil instead acts upon the hydraulic brake pumping elements (6) to operate the intake valves (5).

The hydraulic brake pumping element (6) is essentially a piston that is operated by the high-pressure oil to open the intake valves (5). It also functions as a brake to stop the movement of the pumping element and intake valves. The braking function is the result of vent holes around the perimeter of the element's cylinder. When the piston approaches full stroke, the lower perimeter vent holes bleed off oil. This stops the piston from moving any farther. When the pressure from the solenoid is taken away, the upper supply holes in the cylinder become bleed holes that allow the piston to return to the home position. The piston is pushed back to the home position by the force of the intake valve springs. As the piston approaches the home position, some of the bleed holes are covered and the speed of the piston is regulated as it approaches the final resting position. This also controls the valve speed as it seats in the cylinder head. The hydraulic brake pumping element also functions as a hydraulic lash adjuster (3) because the valve stem clearance is hydraulically taken up by the piston. This occurs because the hydraulic brake pumping element/hydraulic lash adjuster is always under some oil pressure from the engine oil lubrication system. This creates enough pressure to take up valve clearance.

The variable valve actuator features three areas that function together as an oil reservoir so that the actuator always has a ready supply of engine oil. The engine lubrication system provides oil to the lower reservoir area and keeps it full of oil. To flow from the lower reservoir to the upper reservoir, the oil must pass through very small holes. This helps to purge air from the lower reservoir and to maintain engine oil pressure in the lower reservoir. The third reservoir area, the oil accumulator (7), is filled by oil vented from the oil chamber by the solenoid valve (8). The oil accumulator is a spring loaded accumulator that absorbs the hydraulic shock that would otherwise be created when the solenoid valves are opened. This helps to increase the durability of the system, maintains higher pressure in the lower pressure side of the system and lowers the overall load on the engine oil pump.

Variable valve actuation provides five possible phases of operation. Each phase offers unique advantages compared to normal camshaft operation. The five phases are:

3250421

Fig. 179: Full Lift

Courtesy of CHRYSLER GROUP, LLC

- Full Lift. When variable valve actuation functions in the full lift phase, all of the camshaft lobe lift is transferred to the intake valves. The intake camshaft lobe is designed with a very aggressive lift and duration profile. This results in good power in the upper RPM ranges with high loads. This profile would rarely be used in everyday driving.

3250433

Fig. 180: Early Intake Valve Closing (EIVC)
Courtesy of CHRYSLER GROUP, LLC

- Early intake valve closing (EIVC). When variable valve actuation functions in the EIVC phase, the camshaft lobe lift is transferred to the intake valves at the beginning of the lift duration cycle. However, the hydraulic connection between the camshaft lobe and the valves is taken away before the lobe reaches full lift. The exact timing and lift can be infinitely varied to meet driver requirements. EIVC provides smooth engine performance and more torque at lower engine speeds.

3250447

Fig. 181: Late Intake Valve Opening (LIVO)
Courtesy of CHRYSLER GROUP, LLC

- Late intake valve opening (LIVO). When variable valve actuation functions in the LIVO phase, the camshaft lobe lift is NOT transferred to the intake valves at the beginning of the lift duration cycle. The hydraulic connection between the camshaft lobe and the valves is completed after the rocker arm has already begun riding the ramp of the camshaft lobe. When the hydraulic connection is completed, the

intake valves will begin to open. The valve lift timing can be varied infinitely within the full profile of the camshaft lobe. Therefore, as long as the hydraulic connection is completed before the camshaft lobe reaches its maximum lift, some valve lift will result. The lift profile will follow the camshaft lobe profile for the time that the hydraulic link is complete. Like EIVC, the exact timing and lift can be infinitely varied to meet driver requirements. LIVO provides lower emissions and a higher efficiency at lower loads or idle conditions.

3250458

Fig. 182: Multi-Lift**Courtesy of CHRYSLER GROUP, LLC**

- **Multi-Lift.** Multi-Lift is a combination of EIVC and LIVO because the hydraulic connection between the camshaft lobe and the intake valves is closed early and then re-opened later in the cycle. This creates a longer duration valve lift with a smaller amount of lift. The result is a higher velocity of air flow into the cylinder over a longer period of time. Multi-Lift may be used in mixed driving of acceleration and deceleration with moderate engine speeds.

3250466

Fig. 183: Closed

Courtesy of CHRYSLER GROUP, LLC

- Closed. The closed phase simply leaves the intake valves closed by not utilizing the camshaft lobe to lift the intake valves.

REMOVAL**REMOVAL**

091071574

Fig. 184: Cylinder Head Cover Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head cover bolts (1). Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Unlock and disconnect the four variable valve timing actuator electrical connectors.

091071569

Fig. 185: VVAA Block Removal Sequence (1 Of 2)
Courtesy of CHRYSLER GROUP, LLC

3. Remove four bolts from the VVAA block.

NOTE: The bolts need to be removed prior to the installation of the compressor tool due to the tool obstructs access to these bolts once the tool is installed.

NOTE: Be sure to follow the sequence shown in illustration above when removing the bolts.

091071570

Fig. 186: Special Tool, Spring Compressor & Indicators
Courtesy of CHRYSLER GROUP, LLC

4. Using special tool 10259A (1), loosen the spring compressors (2) to fit over the valve and spring assemblies. Adjust the tool to align with the 2.4L indicators (3).
5. Install the (special tool #10259B, Compressor, MultiAir® Spring) spring compressor.
6. Rotate the spring compressors counterclockwise until the springs are fully seated.

091071572

Fig. 187: VVAA Block Removal Sequence (2 Of 2)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not invert the variable valve actuation assembly when it is removed from the engine. Oil will drain from the assembly and excessive engine cranking will be required to refill the assembly and start the engine.

7. Remove the remaining five bolts from the VVAA.

NOTE: Be sure to follow the sequence shown in illustration above when removing the bolts.

8. Remove the variable valve timing actuation assembly, with the spring compressor attached, from the camshaft bearing housing.

090772120

Fig. 188: VVAA Assembly On Blocks Of Wood
Courtesy of CHRYSLER GROUP, LLC

9. Set the assembly (1) onto two blocks of wood (2) to store during repairs.

NOTE: Be sure to store the assembly in the upright position
AT ALL TIMES
to prevent oil related issues within the assembly.

NOTE: There are two locating pins/dowels that properly position the VVAA. Be careful that both dowels remain installed in cylinder head after removing

the VVAA. If a dowel comes loose,

locate the missing dowel and discard it

A new dowel will need to be used upon installation.

DO NOT REUSE A DOWEL THAT HAS BEEN REMOVED FROM THE CYLINDER HEAD.

10. Remove and discard the variable valve actuation assembly gasket.

Fig. 189: Rocker Arms

Courtesy of CHRYSLER GROUP, LLC

11. If required, remove the rocker arms. Refer to **ROCKER ARM, VALVE, REMOVAL** .

INSPECTION

INSPECTION

Fig. 190: Valve Rocker Arms, Oil Supply O-Ring & Oil Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

Because variable valve actuation is so closely monitored, the diagnostics of the system are strongly Diagnostic Trouble Code (DTC) driven. If the system does not perform according to design, many DTC's may be produced from a condition in the variable valve actuation system.

The variable valve actuation module includes very few serviceable components. The module has no internal components that are serviceable. The following components are serviceable:

- Valve rocker arms (1)
- Oil supply O-ring (2)
- Oil temperature sensor (3)

INSTALLATION

INSTALLATION

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;

<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641417.vid1" into the "Search Channel" box.

090772121

Fig. 191: Locating Pins

Courtesy of CHRYSLER GROUP, LLC

1. If the dowel/locating pins were removed, install two **NEW** variable valve actuation assembly locating pins (1).

3079561

Fig. 192: Rocker Arms

Courtesy of CHRYSLER GROUP, LLC

2. If removed, install the rocker arms (1). Refer to **ROCKER ARM, VALVE, INSTALLATION** .

091071570

Fig. 193: Special Tool, Spring Compressor & Indicators
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not invert the variable valve actuation assembly when it is removed from the engine. Oil will drain from the assembly and excessive engine cranking will be required to refill the assembly and start the engine.

3. Rotate the spring compressors (2) counterclockwise until fully seated.
4. Install a **new** gasket.

NOTE: To assist in the proper placement of the assembly, it is recommended to apply **NEW/CLEAN MS-272** white grease or similar like Vaseline® onto the tips of the plungers to hold them in the retracted position. This will help to locate the assembly correctly while preventing the plunger tips from interfering with the valve stem tips. Use just enough to hold the plungers retracted.

5. Set the VVAA into position onto the two dowels.

NOTE: It is very important that the plungers of the VVAA are centered over the valve stem tips. When properly aligned, the VVAA will set down onto the cylinder head evenly and will not have a tendency to wobble when set onto the head.

NOTE: The VVAA should sit relatively flush to cylinder head with no more than a 1 to 2 mm gap between the mating surfaces. An excessive gap indicates the VVAA is not seated properly.

6. Visually inspect the alignment of the VVAA plungers.

Fig. 194: Improperly Aligned VVAA
Courtesy of CHRYSLER GROUP, LLC

7. This is a visual indication of an IMPROPERLY aligned VVAA. The centerline of the plunger (1) and the centerline of the valve stem (2) are misaligned.

Fig. 195: Properly Aligned VVAA
Courtesy of CHRYSLER GROUP, LLC

8. This is a visual indication of a PROPERLY aligned VVAA. The centerline (1) of both the plunger and the valve stem are aligned.

091072145

Fig. 196: Six VVAA Retaining Bolts Hand Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

9. Install the six accessible bolts. Hand tighten the VVAA retaining bolts.

0910021157

Fig. 197: Variable Valve Actuation Assembly Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

10. Remove the spring compressor and tighten the ten bolts in three steps following the sequence shown in illustration:
 - Step 1: All to 10 N.m (89 in. lbs.).
 - Step 2: All to 22 N.m (16 ft. lbs.).
 - Step 3: All again to 22 N.m (16 ft. lbs.).
11. Connect and lock the four variable valve timing actuator electrical connectors.
12. Connect and lock the oil temperature sensor electrical connector.
13. Engage the oil temperature electrical connector to the bracket.

0910021156

Fig. 198: Cylinder Head Cover
Courtesy of CHRYSLER GROUP, LLC

14. Install the cylinder head cover. Refer to COVER(S), CYLINDER HEAD, INSTALLATION .

NOTE: If the VVAA is being replaced (new part), it is recommended that the VVAA be primed with NEW/CLEAN oil after installation. This will limit the amount of time it takes for the assembly to fill while cranking the engine. If the cylinder head cover is installed the service port can be accessed through the opening at the rear of the cover (1).

Fig. 199: Service Port & Bleed Port
Courtesy of CHRYSLER GROUP, LLC

15. Using an oil can with a **CLEAN** soft tip or similar tool like a **NEW** plastic syringe, force **CLEAN, UNUSED** oil into the service port (1). Continue to inject oil until oil flows continuously from the bleed port (2) or until a maximum of 200 mL has been injected.
16. The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. .

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

The die cast aluminum cylinder block is a two-piece assembly, consisting of the cylinder block and ladder frame. The block is an open deck design with cast in place cast iron cylinder liners. The cast iron cylinder liners are recessed below the aluminum deck surface. The ladder frame bolts to the cylinder block and does not incorporate the main bearing caps. This design offers a much stronger lower end and increased cylinder block and transaxle rigidity. The rear oil seal retainer is integral with the block and ladder frame. The ladder frame and block are serviced as an assembly.

Fig. 200: Serial Number Location
Courtesy of CHRYSLER GROUP, LLC

The engine serial number is located on the bottom of the ladder frame just behind the oil pan. The date can be seen with the oil pan in place.

STANDARD PROCEDURE

CYLINDER BORE DEGLAZING

Fig. 201: Cylinder Bore Crosshatch Pattern
Courtesy of CHRYSLER GROUP, LLC

Before deglazing, mask the crankcase area to keep abrasive materials from entering the engine lower end. Tape off any openings to prevent abrasive material from entering the coolant and oil circuits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

1. Select an appropriate size flexible ball hone.
2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. About 20-60 strokes, depending on the condition of the cylinder bore, will be sufficient to provide a satisfactory surface. Use a light **honing** oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

3. Deglazing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should intersect at 30° to 60° inclusive angle for proper seating of rings.
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle (1). The number of up and down strokes per minute can be regulated to get the desired 30° to 60° inclusive angle (2). Faster up and down strokes increase the crosshatch angle.
5. After deglazing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting. Upon completion, perform a visual inspection of the cylinder block passages to inspect for abrasive debris. If any debris is found, repeat the cleaning process.

NOTE: **Cylinder bore diameter should not increase more than 20 microns during deglazing process from original nominal bore diameter, if the maximum of 20 microns is exceeded, the cylinder block must be replaced. If deglazing the cylinder bore cannot remove the light scratches and scuffs the cylinder block should be replaced.**

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Fig. 202: Plastigage Placed In Lower Shell
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal shown in illustration.

Engine crankshaft and connecting rod bearing clearances can be determined by the use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove the oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Plastigage must not crumble in use. If brittle, obtain fresh stock.
3. Torque the bearing cap bolts of the bearing being checked to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

NOTE: **DO NOT rotate the crankshaft. Plastigage will smear, causing inaccurate results.**

Fig. 204: Checking Connecting Rod Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod journal shown in illustration.

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking. Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.

6. Install the proper bearings to achieve the specified bearing clearances.
7. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

INSPECTION

INSPECTION

2767936

Fig. 205: Main Bearing Inserts

Courtesy of CHRYSLER GROUP, LLC

1. Wipe the bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CRANKSHAFT, MAIN - STANDARD PROCEDURE** .
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage the engine block must be replaced.

Fig. 206: Measuring Cylinder Bore Diameter
 Courtesy of CHRYSLER GROUP, LLC

9. Use the Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
12. Determine taper by subtracting the smaller diameter from the larger diameter.
13. Rotate the Cylinder Indicator 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specification. Refer to **ENGINE SPECIFICATIONS**.
14. Determine out-of-roundness by comparing the difference between A and B at each of the three levels. Verify that the maximum out of round is within specification. Refer to **ENGINE SPECIFICATIONS**.
15. If cylinder bore taper and out-of-roundness are within specification, the cylinder bore can be honed. Refer to **ENGINE BLOCK - STANDARD PROCEDURE**. If the cylinder bore taper or out-of-round condition exceeds the maximum limits, the cylinder block must be replaced.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

BEARING(S), CONNECTING ROD

STANDARD PROCEDURE

STANDARD PROCEDURE - CONNECTING ROD - FITTING

Fig. 207: Bearing Selection

Courtesy of CHRYSLER GROUP, LLC

There are three different sizes of rod bearings available. Connecting rod bearing identification (4) can be found on the nose of the crankshaft (3). Use the table below for proper bearing selection:

CONNECTING ROD BEARING SELECTION

CRANKSHAFT PIN DIAMETER GRADE	DIMENSION	CONNECTING ROD BEARING CLASSIFICATION	CONNECTING ROD BEARING DIMENSION
1	48 mm	1 (Black)	1.5 mm
2	48 mm	2 (No Color)	1.5 mm
3	48 mm	3 (Green)	1.5 mm

Fig. 208: Connecting Rod Bearing Clearance - Typical
Courtesy of CHRYSLER GROUP, LLC

1. For measuring connecting rod bearing clearance procedure and use of Plastigage, refer to **ENGINE - STANDARD PROCEDURE** . For bearing clearance, refer to **ENGINE SPECIFICATIONS** .

NOTE: **The rod bolts should not be reused.**

2. Before installing the **NEW** rod bolts the threads and under the bolt head should be oiled with clean engine oil.
3. Install each bolt finger tight then alternately tighten each bolt to assemble the cap properly.
4. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

- Tighten the bolts to 20 N.m (15 ft. lbs.).
- Tighten the connecting rod bolts an additional 90°.

Fig. 209: Connecting Rod Side Clearance
Courtesy of CHRYSLER GROUP, LLC

5. Using a feeler gauge, check connecting rod side clearance. For clearance specifications, refer to **ENGINE SPECIFICATIONS** .

CONNECTING ROD BEARING REPLACEMENT

2769568

Fig. 210: Connecting Rod Bearing Shells & Bearing Size
 Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings (1) are serviced in-vehicle. They must be replaced one-at-a-time in order to prevent the pistons from contacting the valves. The connecting rod bearings are "select fit" to achieve proper oil clearances. Refer to **BEARING(S), CONNECTING ROD - STANDARD PROCEDURE** .

2778047

Fig. 211: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
3. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL** .
4. Remove the eight main bearing cap bolts in the sequence shown.

811318c8

Fig. 212: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

5. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

2778313

Fig. 213: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown.

CAUTION: Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD - STANDARD PROCEDURE**.
10. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
11. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

12. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

13. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
14. If required, check the connecting rod side clearance. Refer to **ROD, PISTON AND CONNECTING - STANDARD PROCEDURE**.
15. Repeat the previous steps for each connecting rod bearing being replaced.

Fig. 214: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

16. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 215: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

17. Install the eight main bearing cap bolts. Tighten the bolts in the sequence shown to 21 N.m (16 ft. lbs.) plus 90°.
18. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
19. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION**.
20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE**.
21. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).

22. Operate the engine until it reaches normal operating temperature.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

STANDARD PROCEDURE - CONNECTING ROD - FITTING

Fig. 216: Bearing Selection

Courtesy of CHRYSLER GROUP, LLC

There are three different sizes of rod bearings available. Connecting rod bearing identification (4) can be found on the nose of the crankshaft (3). Use the table below for proper bearing selection:

CONNECTING ROD BEARING SELECTION

CRANKSHAFT PIN DIAMETER GRADE	DIMENSION	CONNECTING ROD BEARING CLASSIFICATION	CONNECTING ROD BEARING DIMENSION
1	48 mm	1 (Black)	1.5 mm
2	48 mm	2 (No Color)	1.5 mm
3	48 mm	3 (Green)	1.5 mm

Fig. 217: Connecting Rod Bearing Clearance - Typical
Courtesy of CHRYSLER GROUP, LLC

1. For measuring connecting rod bearing clearance procedure and use of Plastigage, refer to **ENGINE - STANDARD PROCEDURE** . For bearing clearance, refer to **ENGINE SPECIFICATIONS** .

NOTE: **The rod bolts should not be reused.**

2. Before installing the **NEW** rod bolts the threads and under the bolt head should be oiled with clean engine oil.
3. Install each bolt finger tight then alternately tighten each bolt to assemble the cap properly.
4. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

- Tighten the bolts to 20 N.m (15 ft. lbs.).
- Tighten the connecting rod bolts an additional 90°.

NOTE: Typical V6 engine configuration shown.

CAUTION: Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD - STANDARD PROCEDURE**.
10. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
11. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

12. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

13. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
14. If required, check the connecting rod side clearance. Refer to **ROD, PISTON AND CONNECTING - STANDARD PROCEDURE**.
15. Repeat the previous steps for each connecting rod bearing being replaced.

Fig. 223: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

16. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 224: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

17. Install the eight main bearing cap bolts. Tighten the bolts in the sequence shown to 21 N.m (16 ft. lbs.) plus 90°.
18. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
19. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION**.
20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE**.
21. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
22. Operate the engine until it reaches normal operating temperature.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

3120702

Fig. 225: Crankshaft

Courtesy of CHRYSLER GROUP, LLC

The crankshaft is made from induction hardened forged steel. Eight counterweights at 180° balance the crankshaft rotary mass. The main journals are cross drilled for rod bearing lubrication. The crankshaft is supported by five select fit main bearings with the center bearing serving as the thrust washer location. Both the front and rear seals are a single piece design and are mounted to the oil pump and cylinder block.

STANDARD PROCEDURE

STANDARD PROCEDURE - MEASURING CRANKSHAFT END PLAY

Fig. 226: Checking Crankshaft End Play

Courtesy of CHRYSLER GROUP, LLC

- 1 - Crankshaft
- 2 - DIAL INDICATOR

1. Mount a dial indicator (2) to front of engine with the locating probe on nose of crankshaft (1).
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. for end play specification. Refer to **ENGINE SPECIFICATIONS** .

REMOVAL

REMOVAL

Fig. 227: Flex Plate

Courtesy of CHRYSLER GROUP, LLC

NOTE: Crankshaft can not be removed when engine is in vehicle.

1. Remove engine assembly from vehicle. Refer to **REMOVAL** .
2. Remove flex plate/flywheel (1).
3. Remove crankshaft rear oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL** .

Fig. 228: Oil Drain Plug & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

4. Install engine on suitable stand.
5. Drain engine oil (2).

Fig. 229: Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Remove oil filter (1).
7. Remove crankshaft vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.
8. Remove water pump pulley.

Fig. 230: Using Putty Knife To Loosen Seal Around Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

9. Remove the oil pan (2). Refer to **PAN, OIL, REMOVAL** .
10. Remove timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
11. Remove the timing chain. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .
12. Remove balance shaft module.

Fig. 231: Crankshaft Sprocket
 Courtesy of CHRYSLER GROUP, LLC

13. Remove the crankshaft sprocket (1).

140268955

Fig. 232: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

14. Remove crankshaft position sensor retaining bolt (1) and remove sensor (2).
15. Remove ladder frame. Refer to **FRAME, LADDER, REMOVAL**.

Fig. 233: Identify Connecting Rod To Cylinder-Typical
Courtesy of CHRYSLER GROUP, LLC

NOTE: If piston/connecting rod replacement is necessary, remove cylinder head.
Refer to **CYLINDER HEAD, REMOVAL** .

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods.
Damage to connecting rod could occur.

16. Using a permanent ink or paint marker, identify cylinder number on each connecting rod and cap.
17. Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

Fig. 234: Main Bearing Cap Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse connecting rod bolts.

18. Remove main bearing caps.

CAUTION: Use extreme care when handling crankshaft. Tone wheel damage can occur if crankshaft is mis-handled.

19. Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

INSPECTION

INSPECTION

Fig. 235: Measuring Crankshaft Journal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal measurements shown.

1. Clean the oil off the bearing journals.
2. Determine the maximum diameter of the journals with a micrometer. Measure at two locations 90° apart at each end of the journals.
3. Compare the measured rod journal diameter to the crankshaft connecting rod bearing journal diameter grade marking chart. Refer to **BEARING(S), CONNECTING ROD - STANDARD PROCEDURE** . Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal that will provide the proper oil clearance.
4. Compare the measured main bearing journal diameter to the crankshaft main bearing journal diameter grade marking chart. Refer to **BEARING(S), CRANKSHAFT, MAIN - STANDARD PROCEDURE** . Obtain the main bearing journal grade identification marks from the engine block and select the upper and lower main bearing sizes that will provide the proper oil clearance.
5. For connecting rod journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **ENGINE SPECIFICATIONS** .
6. For main bearing journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **ENGINE SPECIFICATIONS** .

INSTALLATION

INSTALLATION

Fig. 236: Bearing Identification
Courtesy of CHRYSLER GROUP, LLC

The crankshaft is supported in five main bearings. All upper bearing shells (2) in the crankcase have oil grooves and holes. All lower bearing shells (1) are smooth. Crankshaft end play is controlled by a two piece thrust bearing (3) on the number three main bearing journal.

1. Clean main bearing cap bolt holes with Mopar® brake parts cleaner or equivalent and blow out with compressed air.
2. Install the main bearing upper (2) shells with the lubrication groove and oil hole in the engine block.
3. Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

Fig. 237: Target Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the crankshaft is sent out for machine work, it must be balanced as an assembly with the target ring installed.

4. Clean crankshaft and target ring with Mopar® brake parts cleaner or equivalent and dry with compressed air to ensure that the crankshaft mating surface and target ring mounting holes are free from oil and lock patch debris.

NOTE: Always use **NEW** mounting screws whether installing original or new target ring.

5. Install **NEW** mounting screws finger tight starting with the #1 location. Make sure engagement occurs with the shoulder of the screws and mounting hole before starting all other screws.
6. Tighten all mounting screws to 13 N.m (110 in. lbs.) in the sequence shown.

Fig. 238: Installing Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Lightly apply trans gel to thrust bearings to hold bearings in block.

NOTE: The thrust bearings must be installed with the notches facing the crankshaft.

7. Install thrust bearings (2) in block (1).

CAUTION: Do not get oil on the ladder frame mating surface. It will affect the ability of the RTV to seal the ladder frame to cylinder block.

NOTE: Ensure main bearing cap bolt holes in the block are clean, dry (free of

residual oil or coolant), and threads are not damaged.

8. Oil the bearings and journals. Install crankshaft in engine block.

Fig. 239: Bearing Identification
Courtesy of CHRYSLER GROUP, LLC

9. Install lower main bearings (1) into main bearing cap. Make certain the bearing tabs are seated into the bearing cap slots.

NOTE: Main bearing caps are stamped 1 - 5 front to rear. Arrows on the caps must point towards the front of the engine.

10. Install main bearing caps to engine block.
11. Before installing the bolts the threads should be clean and dry.
12. Loosely install main bearing cap bolts.
13. To ensure correct thrust bearing alignment, perform the following steps:
 - Step 1: Rotate crankshaft until number 4 piston is at TDC.
 - Step 2: Move crankshaft rearward to limits of travel.
 - Step 3: Then, move crankshaft forward to limits of travel.
 - Step 4: Wedge an appropriate tool between the rear of the cylinder block and the rear crankshaft counterweight. This will hold the crankshaft in its furthest forward position.

CAUTION: There are different sets main bolts supplied with this engine. Each bolt set has a different torque value and engine damage could result if bolts are not torqued correctly. The bolts are not interchangeable.

94770

Fig. 240: Main Bolt Identification

Courtesy of CHRYSLER GROUP, LLC

14. If your bolt heads are marked with **b** (1) or **6** (2), go to step 15. If your bolt heads are marked with **M** (3) or any other marking, go to step 16.

81873e71

Fig. 241: Main Bearing Cap Removal/Installation Sequence

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before tightening bolts, you must identify the bolt head to obtain the correct torque value. Failure to identify the bolts correctly, could result in improperly tightened bolts which could result in engine damage.

15. Tighten bolts marked with **b** or **6** using the following three step method, in the sequence shown in illustration:
- Tighten all bolts to 15 N.m (11 ft. lbs.)

- Tighten all bolts to 27 N.m (20 ft. lbs.)
 - Tighten all bolts an additional 45°.
16. Tighten bolts marked with **M** using the following three step method, in the sequence shown in illustration:
 - Tighten all bolts to 15 N.m (11 ft. lbs.)
 - Tighten all bolts to 45 N.m (33 ft. lbs.)
 - Tighten all bolts an additional 45°.
 17. Remove wedge tool used to hold crankshaft.
 18. Check the crankshaft turning torque, it should not exceed 5.6 N.m (50 in. lbs.).
 19. Check crankshaft end play. Refer to **CRANKSHAFT - STANDARD PROCEDURE** .
 20. Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Tighten connecting rod bolts to 20 N.m + 90° (15 ft. lbs.) + 90°. Refer to **ROD, PISTON AND CONNECTING, INSTALLATION** .
 21. Install the ladder frame assembly. Refer to **FRAME, LADDER, INSTALLATION** .
 22. Install the balance shaft module. Refer to **PUMP, ENGINE OIL, INSTALLATION** .

140268955

Fig. 242: Crankshaft Position Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

23. Install crankshaft position sensor (2) and bolt (1). Tighten the bolt to 9 N.m (80 in. lbs.)
24. Install cylinder head if it was removed. Refer to **CYLINDER HEAD, INSTALLATION** .

Fig. 243: Crankshaft Sprocket
 Courtesy of CHRYSLER GROUP, LLC

25. Install front crankshaft sprocket (1).
26. Install the timing chain. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION** .
27. Install the timing chain front cover . Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .
28. Install the oil pan. Refer to **PAN, OIL, INSTALLATION** .
29. Install rear crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION** .
30. Install front crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, FRONT, INSTALLATION** .
31. Install crankshaft vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION** .
32. Install water pump pulley. Refer to **PUMP, WATER, INSTALLATION** .
33. Install crankshaft rear oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION** .
34. Install drive plate/flex plate using **new** bolts. Tighten bolts to 95 N.m (70 ft. lbs.).
35. Attach transaxle to engine. Tighten bellhousing bolts to 101 N.m (75 ft. lbs.).
36. Install the engine assembly into the vehicle. Refer to **INSTALLATION** .

**Fig. 244: Oil Filter**

Courtesy of CHRYSLER GROUP, LLC

37. Install new oil filter (1) and fill with oil.
38. Fill with coolant. Refer to **STANDARD PROCEDURE** .
39. Start engine and check for leaks.
40. Install engine cover.

DAMPER, VIBRATION

REMOVAL

REMOVAL

Fig. 245: Removing/Installing Crankshaft Damper Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Remove accessory drive belts. Refer to **BELT, SERPENTINE, REMOVAL** .
2. Install Damper holder (special tool #9707, Holder, Vibration Damper) (1).
3. Remove crankshaft damper bolt.
4. Pull damper off crankshaft.

INSTALLATION

INSTALLATION

Fig. 246: Removing/Installing Crankshaft Damper Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install crankshaft damper.
2. Apply clean engine oil crankshaft damper bolt threads and between bolt head and washer. Tighten bolt to 210 N.m (155 ft. lbs.).
3. Install accessory drive belts. Refer to **BELT, SERPENTINE, INSTALLATION** .

FLEX PLATE

REMOVAL

REMOVAL

Fig. 247: Flex Plate

Courtesy of CHRYSLER GROUP, LLC

1. Remove transmission.
2. Remove flex plate bolts (3) and discard.
3. Remove washer (2).
4. Remove flex plate (1).

INSTALLATION

INSTALLATION

Fig. 248: Flex Plate

Courtesy of CHRYSLER GROUP, LLC

1. Install flex plate (1).
2. Install washer (2).
3. Install **new** flex plate bolts (3) and tighten in a criss-cross pattern to 95 N.m (70 ft. lbs.).
4. Install transaxle.

FRAME, LADDER**REMOVAL****REMOVAL**

8187c841

Fig. 249: Pry Point 1**Courtesy of CHRYSLER GROUP, LLC**

1. Remove oil pan. Refer to **PAN, OIL, REMOVAL** .
2. Remove balance shaft assembly. Refer to **PUMP, ENGINE OIL, REMOVAL** .
3. Remove ladder frame retaining bolts.
4. Remove ladder frame using pry point cast in the rear of the block (1).

Fig. 250: Pry Point 2
Courtesy of CHRYSLER GROUP, LLC

5. To assist in removing the ladder frame another (1) pry point cast in the right side of the block.

INSTALLATION

INSTALLATION

Fig. 251: Sealing Ladder Frame
Courtesy of CHRYSLER GROUP, LLC

NOTE: When using RTV, the sealing surfaces must be clean and free from grease and oil.

NOTE: When using RTV, parts should be assembled in 10 minutes and tighten to final torque within 45 minutes.

1. Apply a 2 mm bead of Mopar® engine sealant RTV or equivalent as shown in illustration.

Fig. 252: Ladder Frame Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Install bolts and tighten as shown in illustration following a two step method.
 - First: All to 10 N.m (89 in. lbs.).
 - Second: All to 26 N.m (19 ft. lbs.).
3. Install balance shaft module. Refer to **PUMP, ENGINE OIL, INSTALLATION** .
4. Install oil pan. Refer to **PAN, OIL, INSTALLATION** .

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

Fig. 253: Measuring Piston Ring End Gap
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the cylinder bore clean.
2. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder to a position 12 mm (0.50 in.) from the bottom of the cylinder bore.
3. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.

Ring Position	Ring End Gap
No. 1 (top) Ring	0.25 - 0.40 mm (0.010 - 0.016 in.)
No. 2 (center) Ring	0.30 - 0.45 mm (0.012 - 0.018 in.)
Oil Control Ring (Steel Rail)	0.15 - 0.66 mm (0.006- 0.26 in.)

Fig. 254: Checking Piston Ring Grooves Clearances
Courtesy of CHRYSLER GROUP, LLC

4. Clean the piston ring grooves. Remove any nicks or burrs.
5. Measure the ring side clearance as shown in illustration. Make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.

Ring Position	Ring Side Clearance
No. 1 (top) Ring	0.025 - 0.033 mm (0.0010 - 0.0013 in.)
No. 2 (center) Ring	0.030 - 0.078 mm (0.0012 - 0.0031 in.)
Oil Control Ring (Steel Rails)	0.007 - 0.173 mm (.0003 - 0.0068 in.)

REMOVAL

REMOVAL

Fig. 255: Piston Ring Removal/Installation Sequence

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. Remove the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, REMOVAL**.

CAUTION: To avoid damage to the piston rings, they must be removed in the following order:

- No. 1 (upper) piston ring (1)
- No. 2 (intermediate) piston ring (2)
- Oil ring upper side rail (3)
- Oil ring lower side rail (4)
- Oil ring expander (5)

Fig. 256: Removing/Installing Upper & Intermediate Rings
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

2. Remove the No. 1 (upper) piston ring using a ring expander tool.
3. Remove the No. 2 (intermediate) piston ring using a ring expander tool.

Fig. 257: Removing/Installing Piston Ring Side Rail
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to remove the oil ring side rails.

4. Remove the oil ring upper side rail.
5. Remove the oil ring lower side rail.
6. Remove the oil ring expander (1).

INSTALLATION

INSTALLATION

Fig. 258: Piston Ring Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. If required, fit new rings to the piston. Refer to **RING(S), PISTON - STANDARD PROCEDURE** .

CAUTION: To avoid damage to the piston rings, they must be installed in the following order:

- Oil ring expander (5)
- Oil ring lower side rail (4)
- Oil ring upper side rail (3)
- No. 2 (intermediate) piston ring (2)
- No. 1 (upper) piston ring (1)

80ae8450

Fig. 259: Removing/Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to install the oil ring side rails.

2. Install the oil ring expander (1).
3. Install the oil ring lower side rail by placing one end between the piston ring groove and the oil ring expander. Hold this end firmly and press down the portion to be installed until the side rail is in position.
4. Install the oil ring upper side rail in the same manner as the lower side rail.

2791400

Fig. 260: Dot Marks On Piston Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: The No. 1 (upper) piston ring (1) and No. 2 (intermediate) piston ring (3) have a different cross section. Install the rings with manufacturers I.D.

mark (dot) (2) facing up, towards the top of the piston.

Fig. 261: Removing/Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

5. Install the No. 2 (intermediate) piston ring using a ring expander tool.
6. Install the No. 1 (upper) piston ring using a ring expander tool.
7. Rotate the rings around the piston, the rings must rotate in the grooves with out binding.

Fig. 262: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

8. Position the piston ring end gaps as follows:
 - Oil ring expander gap (5)
 - Oil ring lower side rail end gap (4)

- Oil ring upper side rail end gap (1)
 - No. 2 (intermediate) ring end gap (5)
 - No. 1 (upper) ring end gap (2)
9. Install the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, INSTALLATION** .

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

0911009495

Fig. 263: Piston & Connecting Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are a lightweight design with ultra low tension piston rings for improved fuel economy. The pistons are made of a high strength aluminum alloy and the piston skirt has a Moly® coating. The top piston ring land has an anodized coating for improved wear. The piston is connected to the rod using a full floating pin with two locking clips. The connecting rod is forged steel with a bolted cracked cap design. The connecting rod bolts are not reusable. Pistons are available in two different diameters with grade markings for each bore indicated on the side of the cylinder block. The upper compression ring is a 1.2 mm steel ring with a spray coating. The intermediate compression ring is 1.2 mm micro napier design. Both compression rings have a dot or a mark on the piston ring. The marked side of the ring must face the top of the piston. The 2 mm three piece oil control ring is very thin. These are chrome plated rings and have a stainless steel expander.

- 12 - Top Compressor Ring

STANDARD PROCEDURE

PISTON FITTING

Fig. 265: Engine Block Cylinder Bore Diameter Grade Markings
 Courtesy of CHRYSLER GROUP, LLC

The pistons are "select fit" to achieve proper oil clearance. Engine block cylinder bore diameter grade markings are stamped into the right side of the engine block. These marks are read from front to rear, corresponding with cylinder number 1, 2, 3, 4.

Engine block cylinder bore diameter grade markings correspond to specific cylinder bore diameters. The chart below identifies the three engine block grade markings and their associated cylinder bore diameters.

Engine Block Marking	Cylinder Bore Size mm (in.)	
	Metric	Standard
A	72.000 - 72.010 mm	2.8346 - 2.8350 in.
B	72.010 - 72.020 mm	2.8350 - 2.8354 in.
C	72.020 - 72.030 mm	2.8354 - 2.8358 in.

3110362

Fig. 266: Piston Size Mark

Courtesy of CHRYSLER GROUP, LLC

The piston is marked with the piston size (1) on the piston crown. The pistons are available in three different sizes in order to achieve the desired oil clearance. Select the piston size that corresponds to the engine block cylinder bore diameter grade markings for each cylinder.

Pistons are available in three sizes. The chart below identifies the three piston sizes.

Piston Marking	Piston Size mm (in.)	
	Metric	Standard
A	71.960 - 71.970 mm	2.8331 - 2.8835 in.
B	71.970 - 71.980 mm	2.8835 - 2.8339 in.
C	71.980 - 71.990 mm	2.8339 - 2.8342 in.

808ac2ao

Fig. 267: Coating Material On Piston

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

The coated pistons are serviced with the piston pin and connecting rod pre-assembled. The coating material (1 and 2) is applied to the piston after the final piston machining process. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

CONNECTING ROD SIDE CLEARANCE

DIAL INDICATOR

Fig. 268: Measuring Connecting Rod Side Clearance

Courtesy of CHRYSLER GROUP, LLC

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point on the engine. Locate the probe perpendicular to and resting against the connecting rod cap being checked.
2. Move the connecting rod all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the connecting rod forward to the limit of travel and read the dial indicator. Compare the measured side clearance to the specification. Refer to **ENGINE SPECIFICATIONS**.
5. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

FEELER GAUGE

Fig. 269: Connecting Rod Side Clearance
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical four cylinder engine shown in illustration.

1. Slide a snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Compare the measured side clearance to the specification. Refer to **ENGINE SPECIFICATIONS**.
2. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

REMOVAL

REMOVAL

Fig. 270: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

2. Remove the oil pans, engine timing cover and cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.
3. Remove the engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

811318c8

Fig. 271: Connecting Rod To Cylinder Identification

Courtesy of CHRYSLER GROUP, LLC

5. If necessary, remove the top ridge of the cylinder bores with a reliable ridge reamer before removing the pistons from the engine block. **Be sure to keep the tops of pistons covered during this operation.** Pistons and connecting rods must be removed from the top of the engine block. When removing piston and connecting rod assemblies from the engine, rotate the crankshaft CW so that each connecting rod is centered in the cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

Fig. 272: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Remove the piston and connecting rod (1) from cylinder bore.
10. Repeat the previous steps for each piston being removed.
11. Immediately after piston and connecting rod removal, reinstall the bearing cap (4) on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
12. If required, remove the piston rings. Refer to **RING(S), PISTON, REMOVAL**.
13. Repeat the previous steps for each piston being removed.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

3170166

Fig. 273: Inserts

Courtesy of CHRYSLER GROUP, LLC

1. Wipe the inserts (1) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CONNECTING ROD - STANDARD PROCEDURE**.

811318c8

Fig. 274: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

6. Inspect the connecting rod bearing bores for signs of scoring, nicks and burrs.

NOTE: Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment.

7. Replace misaligned, bent or twisted connecting rods.

NOTE: Connecting rods are serviced with the piston pre-assembled. The pistons are "select fit" to achieve proper oil clearance. Refer to ROD, PISTON AND CONNECTING - STANDARD PROCEDURE .

Fig. 275: Coating Material On Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

8. Inspect the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

NOTE: The coating material (1 and 2) is applied to the piston after the final piston machining process. This coating may affect the outside diameter measurement of a coated piston may not provide accurate results.

9. Check the piston for taper and out of round shape.

NOTE: Piston installation into the cylinder bore may require slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

NOTE: The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

INSTALLATION

INSTALLATION

3345100

Fig. 276: Vacuum Fitting O-Ring Seal
 Courtesy of CHRYSLER GROUP, LLC

1. The vacuum fitting O-ring seal (1) can be reused if not damaged. If removed, lightly lubricate the O-ring seal (1) with clean engine oil and install on the vacuum fitting.

3345090

Fig. 277: Vacuum Fitting & Screw
 Courtesy of CHRYSLER GROUP, LLC

2. If removed, install the vacuum fitting (2) to the vacuum pump with the screw (1) tightened to 8 N.m (71 in. lbs.).
3. Clean the mating surfaces of the cylinder head and the vacuum pump. Install a new vacuum pump gasket.
4. Align the pump drive tab with the pump drive slot located on the cam shaft.
5. Install the vacuum pump mounting bolts. Tighten the bolts to 20 N.m (15 ft. lbs.).
6. Connect the vacuum supply line to the pump.

CAUTION: When servicing components near the vacuum pump, avoid contact with the plastic nipple that connects the vacuum pump to the brake booster hose. It is possible to crack the plastic nipple resulting in a brake booster vacuum leak.

7. Install the battery (4). Refer to **BATTERY, INSTALLATION** .
8. Install the engine cover. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** .
9. Run the engine a check the vacuum pump for proper operation.

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

Fig. 278: Removing/Installing Crankshaft Damper
Courtesy of CHRYSLER GROUP, LLC

1. Remove accessory drive belt.
2. Install Damper Holder (special tool #9707, Holder, Vibration Damper) (1) and remove damper retaining bolt.
3. Pull damper off crankshaft.

Fig. 279: Removing Front Crankshaft Oil Seal By Prying Out With Screwdriver
 Courtesy of CHRYSLER GROUP, LLC

4. Remove front crankshaft oil seal (1) by prying out with a screw driver (2). Be careful not to damage the cover seal surface.

INSTALLATION

INSTALLATION

Fig. 280: Crankshaft Oil Seal & Seal Installer 9506
 Courtesy of CHRYSLER GROUP, LLC

1. Place seal (1) onto Front Crankshaft Seal Installer (special tool #9506, Installer, Oil Seal) (2) with seal spring towards the inside of engine.

Fig. 281: Installing New Seal By Using Seal Installer 9506 & Crankshaft Damper Bolt
 Courtesy of CHRYSLER GROUP, LLC

2. Install new seal (1) by using Front Crankshaft Seal Installer (special tool #9506, Installer, Oil Seal) (2) and crankshaft damper bolt (3).

Fig. 282: Pressing Seal Into Front Cover Until Seal Installer
 Courtesy of CHRYSLER GROUP, LLC

3. Press seal into front cover until Front Crankshaft Seal Installer (special tool #9506, Installer, Oil Seal) (1) seats against timing chain cover (3).
4. Remove Front Crankshaft Seal Installer (special tool #9506, Installer, Oil Seal) (1).

Fig. 283: Installing Damper Holder 9707
 Courtesy of CHRYSLER GROUP, LLC

5. Install crankshaft vibration damper.
6. Oil the bolt threads and between the bolt head and washer.
7. Install damper retaining bolt and Damper Holder (special tool #9707, Holder, Vibration Damper) (1). Tighten bolt to 210 N.m (155 ft. lbs.).

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

Fig. 284: Flex Plate

Courtesy of CHRYSLER GROUP, LLC

1. Remove transmission and flexplate (1). Refer to **FLEXPLATE, REMOVAL** .

**Fig. 285: Rear Crankshaft Oil Seal - Removal**

Courtesy of CHRYSLER GROUP, LLC

2. Insert a 3/16 flat bladed screwdriver (7) between the dust lip (8) and the metal case (4) of the crankshaft seal (1). Angle the screwdriver through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

3. Check to make sure the seals garter spring is not on the crankshaft.

INSTALLATION

INSTALLATION

Fig. 286: Rear Main Seal Installation
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), cleanup with 800 emery cloth to prevent seal damage during installation of new seal. If emery cloth is used, the crankshaft must be cleaned off Mopar® brake parts cleaner.

NOTE: When installing seal, lubricate Seal Guide (special tool #9509, Installer, Oil Seal) with clean engine oil.

1. Place Seal Guide (special tool #9509, Installer, Oil Seal) (3) on crankshaft.
2. Position seal (2) over guide tool. Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.
3. Drive the seal into the block using Seal Driver (special tool #9706, Installer, Crankshaft Rear Oil Seal) (1) and Driver Handle (special tool #C-4171, Driver Handle, Universal) (4) until Seal Driver (special tool #9706, Installer, Crankshaft Rear Oil Seal) bottoms out against the block.

Fig. 287: Flex Plate

Courtesy of CHRYSLER GROUP, LLC

4. Install the flexplate (1) and transmission. Refer to **FLEXPLATE, INSTALLATION** .

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, LEFT

REMOVAL

REMOVAL

1. Raise and support the vehicle
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
3. Lower the vehicle.
4. Remove the engine cover to prevent contact with the cowl.
5. Remove the battery and tray. Refer to **TRAY, BATTERY, REMOVAL** .
6. Support transaxle with a suitable jack.

Fig. 288: Removing/Installing Left Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

7. Remove the two mount to frame rail bolts (3).
8. Remove the three mount to transaxle bracket bolts (5).

Fig. 289: Strut Tower, Trans Mount & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Loosen, **but do not remove** the bolt (2) for the trans mount (3) to strut tower (1) attachment.
10. Remove the mount (4).

INSTALLATION

INSTALLATION

Fig. 290: Removing/Installing Left Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

1. Set the mount (4) into position between the engine block (6) and the frame rail (1).

Fig. 291: Strut Tower, Trans Mount & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Tighten the left mount to strut tower bolt (2) finger tight.

Fig. 292: Removing/Installing Left Engine Mount Insulator
 Courtesy of CHRYSLER GROUP, LLC

3. Install the left mount to frame rail bolts (3). Finger tighten the bolts.
4. Install the left mount to transmission bracket bolts (5). Finger tighten the bolts.
5. Tighten the left mount to strut tower bolt (2) to 64 N.m (47 ft. lbs.).
6. Tighten the left mount to transmission bracket bolts (5) to 157 N.m (115 ft. lbs.).
7. Tighten the left mount to frame rail bolts to 70 N.m (52 ft. lbs.).
8. Remove the jack.
9. Install the battery tray. Refer to **TRAY, BATTERY, INSTALLATION** .
10. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
11. Install the engine cover assembly.

INSULATOR, ENGINE MOUNT, REAR

REMOVAL

REMOVAL

1. Raise and support the vehicle.
2. If equipped, remove the front skid plate

Fig. 293: Rear Mount Bracket Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the mount to bracket through bolt nut (2).

Fig. 294: Rear Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the mount to through bolt (2).

Fig. 295: Removing/Installing Rear Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

5. Remove the mount to bracket through bolt and nut (4).
6. Reposition the engine forward to allow the mount to be removed from the pocket past the mount bracket (5).

NOTE: The exhaust system can remain intact. Carefully pry the engine forward enough to clear the bracket but not to overextend the exhaust hangers.

7. Remove rear mount (3).

INSTALLATION

INSTALLATION

Fig. 296: Rear Mount & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Position rear mount (3) into the crossmember pocket (4).
2. Install the through bolt (2) into the cradle portion of the mount.

10. Remove the exhaust manifold bolts (1).
11. Remove the manifold out the top of the vehicle.
12. Remove and discard manifold gasket.

INSTALLATION

INSTALLATION

1. Install a new exhaust manifold gasket. **DO NOT APPLY SEALER .**
2. Set the manifold into position. Install the manifold bolts.

Fig. 308: Exhaust Manifold Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Following the torque sequence, tighten the exhaust manifold bolts to 34 N.m (25 ft. lbs.).

Fig. 309: Exhaust Manifold Heat Shields
Courtesy of CHRYSLER GROUP, LLC

4. Install the four shields in the proper sequence. Tighten bolts to 12 N.m (105 in. lbs.).
5. Install a new manifold lower gasket.
6. Install flange nuts. Tighten nuts to 28 N.m (21 ft. lbs.)

7. Install exhaust pipe to manifold (1). Tighten fasteners to (250 in. lbs.).
8. Install the oxygen sensors. Tighten to 50 N.m (37 ft. lbs.).
9. Connect the oxygen sensor connectors.
10. Install belly pan.
11. Lower vehicle.
12. Connect oxygen sensor electrical connector (3).
13. Connect negative cable to battery.
14. Install the engine cover.

MANIFOLD, INTAKE

REMOVAL

REMOVAL

1. Remove the engine cover.
2. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
3. Disconnect the battery negative cable.
4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. **If equipped:** remove the skid plates

081569485

Fig. 310: Intake Manifold Lower Bracket, Nuts & Bolts

- 33.
34. Remove the intake manifold nuts (1).
35. Remove the intake manifold bolts (2).
36. Remove the intake manifold by lifting upward and out of the engine bay.

INSTALLATION

INSTALLATION

3826632

Fig. 324: Intake Manifold Retaining Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Clean all gasket surfaces.
2. Replace intake manifold gasket seals.
3. Position the foam pad over the coolant transfer tube.
4. Position the manifold onto the two studs.
5. Install intake manifold, tighten the fasteners (1 & 2) to 12 N.m (9 ft. lbs.).

091468686

Fig. 325: Intake Manifold Silencer Pad Screws
Courtesy of CHRYSLER GROUP, LLC

6. Install the intake manifold silencer cover and screws. Tighten the screws to 2.5 N.m (22 in. lbs.).

081569485

Fig. 326: Intake Manifold Lower Bracket, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

7. Install the intake manifold lower bracket (3). Install the two nuts (1) and one bolt (2). Tighten to 9 N.m (80 in. lbs.).
8. Connect fuel injector electrical connectors.
9. Inspect quick connect fittings for damage, replace if necessary. Refer to **FITTING, QUICK CONNECT**.
10. Connect the purge solenoid electrical connector.

081569483

Fig. 327: Foam Insulator, Fuel Line & Purge Line
Courtesy of CHRYSLER GROUP, LLC

11. Insert the foam insulator over the fuel rail (3).
12. Connect fuel line (1).
13. Connect the purge vapor line (2).

091468688

Fig. 328: MAP Sensor Connector & Fittings
Courtesy of CHRYSLER GROUP, LLC

14. Insert the harness retainers to the intake manifold eyelets (1).
15. Connect the three hose connectors (3).
16. Connect the MAP sensor connector (2).

091468957

Fig. 329: Throttle Body, Gasket & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install throttle body (3) onto the intake manifold.
18. Install the three throttle body screws (1) and one throttle body bolt (2). Tighten to 8 N.m (71 in. lbs.).

081569489

Fig. 330: Throttle Body Support Bracket, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

19. Install the throttle body upper support (2). Tighten the fasteners to 8 N.m (71 in. lbs.).

091468958

Fig. 331: Intake Manifold Upper Support Bracket, Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

20. Install the intake manifold upper bracket (1). Install bolts (3) and nuts (2). Tighten to 9 N.m (80 in. lbs.).
21. Connect the PCV valve hose.
22. With assistance, slide the engine rearward back into its proper position. **Make sure the mount is not against the frame while being moved.**

Fig. 332: Removing/Installing Right Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

23. Lower the floor jack once the mount is in proper alignment.
24. Install the 2 engine mount to frame rail bolts (2).
25. Install the right engine mount to strut tower bolt (4).
26. Tighten the mount to strut tower bolt to 65 N.m (48 ft. lbs.).
27. Tighten the mount to frame rail bolts to 105 N.m (77 ft. lbs.)

Fig. 333: Removing/Installing Airbox Bracket
Courtesy of CHRYSLER GROUP, LLC

28. Install the air cleaner bracket (1). Install the nuts (2).
29. Tighten the nuts to 8 N.m (71 in. lbs.).

090772119

Fig. 334: Resonator, Bolt & Clamp
Courtesy of CHRYSLER GROUP, LLC

30. Install the intake snorkel (3).
31. Install the snorkel fastener (2). Tighten to 8 N.m (71 in. lbs.).

090772118

Fig. 335: Resonator, Clamp & Connector
 Courtesy of CHRYSLER GROUP, LLC

32. Connect the IAT sensor (3).
33. Tighten the clamp (2) to 4 N.m (35 in. lbs.).
34. Install the engine cover.

0911009498

Fig. 336: Removing/Installing Air Cleaner Body

35. Install the air cleaner assembly (1). Refer to **BODY, AIR CLEANER, INSTALLATION**.

36. Connect negative cable to battery.

LUBRICATION

DESCRIPTION

DESCRIPTION

81867bc9

Fig. 337: Oil Flow Diagram

Courtesy of CHRYSLER GROUP, LLC

The lubrication system is a full-flow filtration, pressure feed type. The balance shaft module (BSM) is mounted below the ladder frame and chain driven by the crankshaft. The BSM consists of a non-serviceable pump, oil pressure relief valve, and a non-serviceable balance assembly.

Fig. 338: Oil Hole

Courtesy of CHRYSLER GROUP, LLC

NOTE: Not all blocks have the bolt on timing chain oil squirter. Engine blocks either have a bolt-on oil squirter or a 1.0 mm hole (1) drilled into the oil gallery passage. Engine blocks with the 1.0 mm hole no longer use an oil squirter even though the threaded mounting hole may still be present.

OPERATION

OPERATION

Engine oil is drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an internal oil passage at the #3 bearing location around the balance shaft module (BSM) mounting bolt. A vertical hole at the number one bulkhead routes pressurized oil through a filter screen and head gasket up to the cylinder head. The oil then divides into two passages; one to the variable valve actuator assembly (VVAA) and one to the exhaust camshaft. The passage to the camshaft feeds the hollow exhaust camshaft at the second cam journal. The rest of the cam journals are feed oil through the hollow camshaft. Oil returning to the pan from pressurized components supplies lubrication to the valve stems, cam lobes, and tappets. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or de-grease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by the manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair per Service Information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat the inspection.

If the oil leak source is not positively identified at this time, proceed with the **AIR LEAK DETECTION TEST METHOD**.

AIR LEAK DETECTION TEST METHOD

1. Disconnect the fresh air make-up hose from the oil filler neck. Cap or plug the make-up air hose nipple.
2. Remove the PCV hose from the PCV valve. Cap or plug the PCV valve nipple.
3. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

4. Gradually increase air pressure from 7 kPa (1 psi) to 17 kPa (2.5 psi) maximum while applying soapy water at the suspected leak source. Adjust the regulator to a suitable test pressure within this range that provides the best bubble generation which will pinpoint the leak source. If the oil leak is detected and identified, repair per Service Information procedures.
5. If the leakage occurs at the rear crankshaft oil seal area, follow the procedures for rear seal area leaks. Refer to **LUBRICATION - DIAGNOSIS AND TESTING**.
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and make-up air hoses.
7. Clean the oil off of the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

CHECKING ENGINE OIL PRESSURE

Fig. 339: Oil Temperature Sensor

Courtesy of CHRYSLER GROUP, LLC

NOTE: Anytime the oil temperature sensor is removed, it should be replaced with a new sensor.

1. Disconnect and remove oil temperature sensor (1).

Fig. 340: Oil Pressure Adapter 9879

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Threads in cylinder head are British Standard Pipe (BSP). Do not install a NPT threaded adapter, this could crack the cylinder block.

2. Install threaded adapter (special tool #9879. Adapter. Oil Pressure Test) (1).

3. Install oil pressure gauge (2).

Fig. 341: Oil PSI Gauge
Courtesy of CHRYSLER GROUP, LLC

4. Start engine and record reading on oil pressure gauge (1).

CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

5. If oil pressure is 0 at idle, shut off engine. Check for pressure relief valve stuck open or a clogged oil pick-up screen.
6. Remove oil pan and inspect for debris. Refer to **PAN, OIL, REMOVAL** .
7. Remove oil pressure relief valve. Refer to **VALVE, OIL PRESSURE RELIEF, REMOVAL**. and
8. Inspect oil pressure relief valve if damaged replace. Refer to **VALVE, OIL PRESSURE RELIEF, INSPECTION**.
9. If pressure relief valve is Ok, replace balance shaft module assembly. Refer to **PUMP, ENGINE OIL, REMOVAL** .

**Fig. 342: Oil Pressure Adapter 9879**

Courtesy of CHRYSLER GROUP, LLC

10. After test is complete, remove oil pressure gauge (2) and adapter (special tool #9879, Adapter, Oil Pressure Test) (1).

**Fig. 343: Oil Temperature Sensor**

Courtesy of CHRYSLER GROUP, LLC

11. Install a new oil pressure temperature sensor (1) and connect electrical connector.

CHECKING VVT OIL PRESSURE

This test can be used to help diagnose VVT faults.

Fig. 344: Oil Sender

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and remove oil pressure sensor (1).

Fig. 345: Oil Pressure Gauge

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Threads in block are 1/8"-28 British Standard Pipe (BSP). Do not install a National Pipe Thread (NPT) threaded adapter, this could crack the cylinder block.

2. Install an 1/8-28 BSP male to 1/8-27 female threaded adapter (2).
3. Install oil pressure gauge (1).
4. Start engine and record oil pressure.

CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

5. If oil pressure is 0 at idle, shut off engine. Check for pressure relief valve stuck open or a clogged oil pick-up screen.
6. Remove oil pan and inspect for debris. Refer to **PAN, OIL, REMOVAL** .
7. Remove oil pressure relief valve and inspect, if damaged replace pressure relief valve. Refer to **VALVE, OIL PRESSURE RELIEF, REMOVAL**.
8. If pressure relief valve is Ok, replace balance shaft module assembly. Refer to **PUMP, ENGINE OIL, REMOVAL** .

Fig. 346: Oil Pressure Gauge
Courtesy of CHRYSLER GROUP, LLC

9. After test is complete, remove test gauge (1) and fitting (2).

**Fig. 347: Oil Sender**

Courtesy of CHRYSLER GROUP, LLC

10. Install oil pressure sensor and electrical connector.

COOLER, OIL

DESCRIPTION

DESCRIPTION

An engine oil cooler is used on some engine packages. The cooler is a coolant-to-oil type and mounted between the oil filter and oil filter adapter.

REMOVAL

REMOVAL

NOTE: The oil cooler can not be cleaned out. In the event that the engine requires rebuilding or replacement, the oil cooler should be replaced.

Fig. 348: Identifying Oil Cooler

Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle on hoist.
2. Drain cooling system. Refer to **STANDARD PROCEDURE**.
3. Disconnect oil cooler coolant hoses.
4. Remove oil filter (3).

Fig. 349: Oil Cooler Mounting

Courtesy of CHRYSLER GROUP, LLC

5. Remove oil cooler connector bolt (2).

6. Remove oil cooler (1).

INSTALLATION

INSTALLATION

Fig. 350: Oil Cooler Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Replace oil cooler seal (1).
2. Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab.
3. Install oil cooler connector bolt (2). Tighten connector bolt to 49 N.m (36 ft. lbs.).

Fig. 351: Identifying Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

4. Install oil filter (3).
5. Connect oil cooler coolant hose.
6. Lower vehicle.
7. Fill cooling system. Refer to **STANDARD PROCEDURE** .

FILTER, ENGINE OIL

REMOVAL

REMOVAL

Fig. 352: Oil Filter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When servicing the oil filter, avoid deforming the filter can by installing the remove/install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using a suitable filter wrench, turn oil filter (1) counterclockwise to remove.

INSTALLATION

INSTALLATION

**Fig. 353: Oil Filter**

Courtesy of CHRYSLER GROUP, LLC

1. Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.
2. Lubricate new oil filter gasket.
3. Screw oil filter (1) on until the gasket contacts base. Tighten to 14 N.m (124 in. lbs.).

OIL

STANDARD PROCEDURE

ENGINE OIL LEVEL CHECK

81884c72

Fig. 354: Oil Level Indicator

Courtesy of CHRYSLER GROUP, LLC

NOTE: The engine must be **HOT** when checking oil level.

The best time to check engine oil level is after the engine is at operating temperature. Allow the engine to be shut off for at least 5 minutes before checking oil level.

818220bb

Fig. 355: Dip Stick

Courtesy of CHRYSLER GROUP, LLC

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick (1), and observe oil level. Add oil only when the level is at or below the SAFE mark. If the oil level is in the safe (2) range, do not add oil.

CAUTION: Do not operate engine if the oil level is above the MAX mark on the dipstick. Excessive oil volume can cause oil aeration which can lead to engine failure due to loss of oil pressure or increase in oil temperature.

ENGINE OIL AND FILTER CHANGE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

CAUTION: On export vehicles, refer to the Owner's Manual for the correct grade of oil.

Change engine oil at mileage and time intervals described in the Maintenance Schedule. Refer to

MAINTENANCE SCHEDULES, DESCRIPTION .

Fig. 356: Oil Drain Plug & Oil Pan

Courtesy of CHRYSLER GROUP, LLC

1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Remove oil fill cap.
4. Raise vehicle on hoist.
5. Place a suitable oil collecting container under oil pan drain plug (2).
6. Remove oil pan drain plug (2) or and allow oil to drain into collecting container. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

Fig. 357: Oil Filter

Courtesy of CHRYSLER GROUP, LLC

7. Remove oil filter (1). Refer to **FILTER, ENGINE OIL, REMOVAL** .

Fig. 358: Oil Drain Plug & Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

8. Install oil pan drain plug (2) and tighten drain plug to 40 N.m (30 ft. lbs.).

Fig. 359: Oil Filter
 Courtesy of CHRYSLER GROUP, LLC

9. Install new oil filter (1). Refer to **FILTER, ENGINE OIL, INSTALLATION** .
10. Lower vehicle and fill crankcase with specified type and amount of engine oil . Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** and **CAPACITIES AND**

RECOMMENDED FLUIDS, DESCRIPTION .

11. Install oil fill cap.
12. Start engine and inspect for leaks.
13. Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. Replace oil filter with a Mopar® or the equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to WARNING under **ENGINE OIL AND FILTER CHANGE .**

PAN, OIL**REMOVAL****REMOVAL**

Fig. 360: Oil Drain Plug & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle on hoist.
2. Remove oil drain plug (2) and drain the engine oil.
3. Remove accessory drive belt splash shield.

Fig. 361: Locating A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

4. Remove lower A/C compressor mounting bolt (if equipped).
5. Remove A/C mounting bracket (2).

Fig. 362: Using Putty Knife To Loosen Seal Around Oil Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use pry points in block to remove oil pan.

6. Remove oil pan retaining bolts.
7. Using a putty knife (1), loosen seal around oil pan (2).
8. Remove oil pan (2).

INSTALLATION

INSTALLATION

81834789

Fig. 363: Sealer Location

Courtesy of CHRYSLER GROUP, LLC

NOTE: Oil pan sealing surfaces must be free of grease or oil.

NOTE: Parts must be assembled within 10 minutes of applying RTV.

1. Apply Mopar® Engine RTV GEN II at the front cover to engine block parting lines (1).

81834782

Fig. 364: Sealing Oil Pan

Courtesy of CHRYSLER GROUP, LLC

2. Apply a 2 mm bead of Mopar® Engine RTV GEN II around the oil pan as shown in illustration.
3. Position oil pan and install bolts. Tighten bolts to 12 N.m (105 in. lbs.).

NOTE: The 2 long bolts must be tightened to 22 N.m (195 in. lbs.).

Fig. 365: Oil Drain Plug & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

4. Install oil drain plug (2).
5. Lower vehicle and fill engine crankcase with proper oil to correct level.
6. Start engine and check for leaks.

PLUG, OIL

DESCRIPTION

DESCRIPTION

1505534

Fig. 366: Tapered Plugs**Courtesy of CHRYSLER GROUP, LLC**

The engine block has three tapered plugs sealing the high pressure oil gallery. These threaded plugs do not have a torque specification but instead are installed to a specific depth. Do not attempt to further tighten these plugs, damage to the engine block could result. Whenever these plugs are removed they must be replaced. Service plugs have a lock patch and do not require the application of additional sealant.

REMOVAL**REMOVAL**

81c81fdc

Fig. 367: Gallery Plug

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Excessive use of brake parts cleaner to clean threads in block could cause #5 main bearing failure.

NOTE: Rear plug shown in illustration, other plugs are similar.

1. Remove the plug (2) from the engine block.
2. Use Mopar® Brake Parts Cleaner (or equivalent) sparingly to clean the block.

INSTALLATION

INSTALLATION

81c81fdc

Fig. 368: Gallery Plug

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Excessive use of brake parts cleaner to clean threads in block could cause #5 main bearing failure.

NOTE: Rear plug shown in illustration, other plugs are similar.

1. Use Mopar® Brake Parts Cleaner (or equivalent) sparingly to clean the block.
2. Install the plug (2) flush with the block boss face (1). The plug (2) is correctly installed when it is flush or protruding no more than 1 mm from the block boss face (1).

PUMP, ENGINE OIL

DESCRIPTION

DESCRIPTION

**Fig. 369: Balance Shaft Module & End Caps**

Courtesy of CHRYSLER GROUP, LLC

The oil pump is integral to the balance shaft module (BSM) (2). The oil pump cannot be disassembled for inspection. The pressure relief valve is serviceable and can be removed and inspected. The BSM can be identified by the plastic end caps (1).

REMOVAL

REMOVAL

	A multimedia supplement to the instructions contained in this article is
--	--

available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641417.vid2" into the "Search Channel" box.

When removing and installing the Balance Shaft/Oil Pump assembly in the vehicle, it is not necessary to align the plated links on the drive chain as long as the reference marks are created during the procedure.

1. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .

Fig. 370: Aligning Balance Shaft/Oil Pump Drive Gear And Housing Indicator
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the engine clockwise until the balance shaft/oil pump drive gear and the housing indicator are aligned.

NOTE: IT IS VERY IMPORTANT THAT THE CRANKSHAFT STAYS STATIONARY DURING THE FOLLOWING STEPS. DO NOT MOVE THE CRANKSHAFT UNTIL THE INSTALLATION PROCEDURE IS COMPLETED.

3. Clean the balance shaft/oil pump assembly drive gear with Mopar® brake cleaner or similar.

NOTE: Make sure the gear is clear of any oil to allow for marking.

Fig. 371: Oil Pump Chain And Sprocket To Module Body Marks
Courtesy of CHRYSLER GROUP, LLC

4. If the balance shaft/oil pump assembly is being reused, mark the oil pump chain and the sprocket (1) to the module body (2) for reassembly.
5. Install one air-conditioning compressor bracket bolt into the left forward corner thread boss.

NOTE: The bolt will provide a sturdy point to secure a tie strap to hold the tensioner in the compressed position.

Fig. 372: Positioning Plastic Tie Strap
Courtesy of CHRYSLER GROUP, LLC

6. Position a plastic tie strap (3) around the chain, tensioner (4) and bolt (2) that was previously installed.
7. Push the chain, guide and tensioner (1) to the compressed position.
8. Tighten the tie strap to hold the components together.

NOTE: **The tighter the strap, the more room for removal and installation.**

9. Remove the balance shaft/oil pump assembly mounting bolts.
10. Remove assembly from the engine by tilting the rear of the balance shaft/oil pump assembly downward while lifting the drive gear out of the chain links.

INSPECTION

INSPECTION

1. Remove timing chain cover . Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
2. Remove oil pan. Refer to **PAN, OIL, REMOVAL** .

8188d7c0

Fig. 373: Measuring Distance Between Tensioner Body & Guide Shoe
Courtesy of CHRYSLER GROUP, LLC

3. Measure the distance between the tensioner body and the guide shoe as shown in illustration.
4. If the distance is 10.1 mm (0.397 in.) or greater, replace the chain.

INSTALLATION

INSTALLATION

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641417.vid3" into the "Search Channel" box.

CAUTION: There are two different Balance Shaft Module (BSM) to engine block bolts used. 180 mm bolts with a lock-patch on the threads or 185 mm bolts without lock-patch. Do not reuse the 180 mm bolts. Always discard 180 mm bolts after removing. Failure to replace these bolts can result in engine damage. The 185 mm bolts are reusable. Install the same length bolts that were removed and use either four new 180 mm bolts or four 185 mm bolts.

Fig. 374: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

1. The 185 mm (7.283 in.) length bolts must be checked for stretching. Check the bolts with a straight edge for necking (2). If the bolts are necked down, they must be replaced.
2. Clean the balance shaft/oil pump assembly mounting holes with Mopar® brake parts cleaner.
3. Align the marks on the balance shaft/oil pump assembly and drive sprocket.

Fig. 375: Aligning Balance Shaft/Oil Pump Drive Gear And Housing Indicator
Courtesy of CHRYSLER GROUP, LLC

4. With the rear of the balance shaft/oil pump assembly on a slight downward angle, position the gear into the chain links. Make sure the paint marks are aligned.
5. Pivot balance shaft/oil pump assembly upwards and position on ladder frame.

81873851

Fig. 376: BSM Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Start balance shaft/oil pump assembly mounting bolts by hand.

NOTE: Use a three step procedure when tightening balance shaft/oil pump assembly mounting bolts. For new 180 mm bolts, go to step 7. For 185 mm

bolts, go to step 8.

7. Tighten new 180 mm balance shaft/oil pump assembly mounting bolts as follows:
 - a. Tighten to 15 N.m (11 ft. lbs.) in the sequence shown in illustration.
 - b. Tighten to 33 N.m (24 ft. lbs.) in the sequence shown in illustration.
 - c. Rotate bolts an additional 90° in the sequence shown in illustration.
8. Tighten 185 mm balance shaft/oil pump assembly mounting bolts as follows:
 1. Tighten to 15 N.m (11 ft. lbs.) in the sequence shown in illustration.
 2. Tighten to 29 N.m (22 ft. lbs.) in the sequence shown in illustration.
 3. Rotate bolts an additional 90° in the sequence shown in illustration.

Fig. 377: Oil Pump Chain And Sprocket To Module Body Marks
Courtesy of CHRYSLER GROUP, LLC

9. Double check the alignment marks to ensure the gear (1) and balance shaft/oil pump assembly indicator (2) is aligned.

0916014881

Fig. 378: Positioning Plastic Tie Strap
Courtesy of CHRYSLER GROUP, LLC

10. Remove the tie strap (3).
11. Remove the bracket bolt (2).
12. Inspect that the tensioner (1) has fully extended and applied pressure to the guide and chain (4).
13. Install the oil pan. Refer to **PAN, OIL, INSTALLATION** .
14. Fill engine with oil.
15. Start engine and check for leaks.

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

3156302

Fig. 379: Oil Temperature Sensor**Courtesy of CHRYSLER GROUP, LLC**

The oil temperature sensor is a two wire sensor located on the variable valve actuation assembly at the cylinder head. The sensor probe is mounted to the variable valve actuation assembly through an access hole. A compression washer seals the oil temperature sensor to the variable valve actuation assembly.

REMOVAL**REMOVAL**

1. Disconnect the battery negative cable.

090772122

Fig. 380: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1).

090772119

Fig. 381: Resonator, Bolt & Clamp

Courtesy of CHRYSLER GROUP, LLC

Loosen the intake clamp (1), remove the resonator bolt (2) and resonator (3).

3. Remove the engine cover (1).
4. Remove the wiring harness fastener from the intake manifold.
5. Disconnect oil temperature sensor electrical connector.

091071568

Fig. 382: Oil Temperature Sensor Location
Courtesy of CHRYSLER GROUP, LLC

6. Remove sensor (1).

INSTALLATION

INSTALLATION

1. If re-using the oil temperature sensor, coat the threads with Mopar® thread sealant.

091071568

Fig. 383: Oil Temperature Sensor Location
Courtesy of CHRYSLER GROUP, LLC

2. Install oil temperature sensor (1). Tighten to 18 N.m (160 in. lbs.).

090772119

Fig. 384: Resonator, Bolt & Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Install the resonator (3), bolt (2) and clamp (1). Tighten the bolt to 5 N.m (81 in. lbs.). Tighten the clamp.
4. Connect electrical connector.

090772122

Fig. 385: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the engine cover (1).

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

The oil pressure sensor is located on the right front side of the engine block. The oil pressure sensor is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil galley). The sensor is a three terminal device.

OPERATION

OPERATION

The oil pressure sending unit returns a voltage signal back to the PCM relating oil pressure. Ground for the sensor is supplied by the PCM.

REMOVAL

REMOVAL

NOTE: The oil pressure sensor is screwed into the cylinder block below the water pump.

1. Raise and support the vehicle.
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .

091370511

Fig. 386: Oil Temperature Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disengage the sensor harness at the block (5).
4. Unlock the connector (3).
5. Disconnect oil temperature sensor electrical connector (4).
6. Unscrew the sensor (2) from the cylinder block.
7. Remove sensor.

INSTALLATION

INSTALLATION

091370511

Fig. 387: Oil Temperature Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Screw the sensor (2) into the block.
2. Tighten the sensor to 48 N.m (35 ft. lbs.).
3. Install the connector (4).
4. Lock the connector (3).
5. Engage the harness retainer (5) into the block.
6. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

VALVE, OIL PRESSURE RELIEF

REMOVAL

REMOVAL

Fig. 388: Oil Pressure Relief Valve

Courtesy of CHRYSLER GROUP, LLC

1. Remove oil pan. Refer to **PAN, OIL, REMOVAL**.
2. Remove pressure regulating valve cap (2).
3. Remove pressure regulating valve spring (3) and valve (4).

INSPECTION

INSPECTION

Fig. 389: Oil Pressure Relief Valve

Courtesy of CHRYSLER GROUP, LLC

NOTE: Pressure regulating valve (4) can be serviced separately from the oil pump

assembly.

1. Inspect pressure relief valve (4) scoring, gouging, or debris. Replace as needed.
2. Inspect the pressure relief valve bore in the pump for scoring, gouging, or debris.
3. If pump bore is damaged, replace balance shaft module.

INSTALLATION**INSTALLATION**

Fig. 390: Oil Pressure Relief Valve
Courtesy of CHRYSLER GROUP, LLC

1. Lightly coat pressure regulating valve with clean engine oil and install valve (4).
2. Install spring (3) and cap (2).
3. Tighten cap to 44 N.m (32 lbs. ft.).

VALVE TIMING**STANDARD PROCEDURE****STANDARD PROCEDURE - VALVE TIMING VERIFICATION**

CAUTION: Painted or colored chain links are used during initial engine assembly and can not be relied upon for valve timing verification. Only use top-dead-center marks, cylinder head cover mounting surface and camshaft sprocket marks to verify valve timing or engine damage may result.

Fig. 391: Timing Cover Mark & Notch
Courtesy of CHRYSLER GROUP, LLC

Correct timing is critical for the NON free-wheeling designed engine. Engine timing can be verified by using the following procedures:

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Rotate the crankshaft clockwise (as viewed from the front) to align the timing cover mark (1) with the damper notch (2) to place the number one cylinder piston at top-dead-center on the compression stroke.

Fig. 392: Vertical Center Line Of Camshaft, Dowel & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

4. While maintaining this alignment, verify that the **dowel window** (2) on the camshaft sprocket point toward 12 o'clock.
5. Using a straightedge tool (1), place the tool vertically at the center of the cam gear. Using the top edge of the cylinder head (3) as a reference point, the angle between the straightedge and the cylinder head needs to be 90°.
6. If the engine timing is not correct, proceed to Timing Chain and Sprockets for service procedures. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .

CHAIN AND SPROCKETS, TIMING

REMOVAL

TIMING CHAIN

1. Remove the timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
2. Verify that the number one cylinder piston is still set to top-dead-center on the compression stroke.

NOTE: If the timing chain plated links can no longer be seen, the timing chain links corresponding to the timing marks must be marked prior to removal if the chain is to be reused.

0911003131

Fig. 393: Chain Link & Crankshaft Timing Mark
Courtesy of CHRYSLER GROUP, LLC

3. Mark chain link (2) corresponding to crankshaft timing mark (1).

091673425

Fig. 394: Vertical Center Line Of Camshaft, Dowel & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

4. While maintaining this alignment, verify that the camshaft dowel (2) is at the 12 o'clock position. The dowel center line (1) will be 90° from the horizontal surface line at the top of the cylinder head (3).
5. Mark the chain links corresponding to camshaft and crankshaft timing marks.

091073256

Fig. 395: Timing Chain, Sprockets, Tensioner & Guides
Courtesy of CHRYSLER GROUP, LLC

6. Remove timing chain tensioner (6). Refer to **TENSIONER, ENGINE TIMING, REMOVAL**.
7. Rotate the tensioner guide (3) away from the chain.
8. Remove timing chain (7).

CAMSHAFT SPROCKET

1. Set the timing at TDC. Refer to **VALVE TIMING - STANDARD PROCEDURE**.

091073258

Fig. 396: Wrench Flats

Courtesy of CHRYSLER GROUP, LLC

2. Remove the timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
3. Hold the camshaft stationary by the wrench flats (1).

091673427

Fig. 397: Camshaft Center Bolt & Sprocket

Courtesy of CHRYSLER GROUP, LLC

4. Remove the camshaft center bolt (1) from the sprocket (2).
5. Once the sprocket is clear of the alignment dowel, lower the sprocket to allow chain to slacken, then remove the chain from the sprocket.
6. Remove the sprocket from the engine.

CRANKSHAFT SPROCKET

Fig. 398: BSM Timing Chain Marks

Courtesy of CHRYSLER GROUP, LLC

1. Remove the timing chain. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .
2. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .
3. Remove the oil pump drive chain tensioner (3).
4. Remove the oil pump drive chain.

81872985

Fig. 399: Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

5. Remove the crankshaft sprocket (1).

INSPECTION

INSPECTION

81866f7b

Fig. 400: Measuring Distance From Tensioner Body To Edge Of Chain Guide
Courtesy of CHRYSLER GROUP, LLC

Inspect timing chain for stretching prior to removal.

1. Rotate engine while watching timing chain tensioner plunger. When the plunger reaches its maximum travel stop rotating engine.

2. Measure the distance from the tensioner body and the edge of the chain guide as shown in illustration.
3. If the distance is greater than 20.5 mm (0.81 in.) inspect guide shoes for excessive wear.
4. If guides are okay, replace timing chain.

INSTALLATION**TIMING CHAIN**

0911003131

Fig. 401: Chain Link & Crankshaft Timing Mark
Courtesy of CHRYSLER GROUP, LLC

1. Align the timing chain onto the crank sprocket mark (1) using the painted link (2) as a guide.

091073257

Fig. 402: Sprocket Mark & Painted Link
Courtesy of CHRYSLER GROUP, LLC

2. Align the timing chain onto the camshaft sprocket mark (2) using the painted link (1) as a guide.

3825668

Fig. 403: Piston, Ratchet Arm & Drill Bit
Courtesy of CHRYSLER GROUP, LLC

3. Reset the cam chain tensioner. Refer to **VALVE TIMING - STANDARD PROCEDURE** .

Fig. 404: Timing Chain, Sprockets, Tensioner & Guides
Courtesy of CHRYSLER GROUP, LLC

NOTE: Keep the slack in the timing chain on the tensioner side.

4. Install timing chain tensioner (6) and tighten bolts to 12 N.m (105 in. lbs.).
5. Remove the pin (1/8 in. drill bit) from the timing chain tensioner.
6. Verify that the valve timing is correct. Refer to **VALVE TIMING - STANDARD PROCEDURE**.
7. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
8. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE**.
9. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
10. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.
11. Install the engine cover.
12. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

CAMSHAFT SPROCKET(S)

NOTE: Do not use an impact wrench to tighten the camshaft sprocket bolt. Damage to the camshaft dowel pin and camshaft may occur.

091673427

Fig. 405: Camshaft Center Bolt & Sprocket
Courtesy of CHRYSLER GROUP, LLC

1. Install the chain onto the sprocket (2), insert the bolt (1).

091073258

Fig. 406: Wrench Flats

Courtesy of CHRYSLER GROUP, LLC

2. Using a wrench to hold the camshaft flats (1) tighten the sprocket bolt to 10 N.m + 65° (88 in. lbs. + 65°).
3. Verify correct timing. Refer to **VALVE TIMING - STANDARD PROCEDURE** .
4. Install the timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .
5. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
6. Install engine cover.

CRANKSHAFT SPROCKET

81872985

Fig. 407: Crankshaft Sprocket

Courtesy of CHRYSLER GROUP, LLC

1. Install the crankshaft sprocket (1) onto the crankshaft.

**Fig. 408: BSM Timing Chain Marks**

Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pump drive chain. Verify that the oil pump is correctly timed (1, 2, 5, 6).

**Fig. 409: Pushing Tensioner Piston Back Into Tensioner Body**

Courtesy of CHRYSLER GROUP, LLC

3. Reset the oil pump drive chain tensioner by pushing the plunger inward and installing (special tool #9703,

Pin, Tensioner).

Fig. 410: BSM Timing Chain Marks
Courtesy of CHRYSLER GROUP, LLC

4. Install the oil pump drive chain tensioner (3) and remove (special tool #9703, Pin, Tensioner) (4).
5. Install the timing chain and timing chain cover. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION** .
6. Install the oil pan. Refer to **PAN, OIL, INSTALLATION** .
7. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE** .
8. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
9. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .

2. Disconnect and isolate the battery negative cable.
3. Remove the resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
4. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
5. Remove the coolant recovery bottle. Refer to **BOTTLE, PRESSURIZED COOLANT, REMOVAL** .

3825205

Fig. 411: Identifying Six Stud Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .

3825527

Fig. 412: Timing Cover Mark & Notch
 Courtesy of CHRYSLER GROUP, LLC

7. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
8. Remove the frame cover portion of the right splash shield. Refer to **SHIELD, SPLASH, FRONT** .

WHEELHOUSE, REMOVAL .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

9. Rotate the crankshaft clockwise (as viewed from the front) to align the timing cover mark (1) with the damper notch (2) to place the number one cylinder piston at top-dead-center on the compression stroke.

Fig. 413: Accessory Drive Components & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

10. Remove the accessory drive belt (1). Refer to **BELT, SERPENTINE, REMOVAL** .
11. Remove the accessory drive belt idler pulley (3).
12. Remove the accessory drive belt tensioner (2).
13. Remove the crankshaft damper (4). Refer to **DAMPER, VIBRATION, REMOVAL** .
14. Remove three bolts (6) and the water pump pulley (5) from the water pump.

Fig. 414: A/C Compressor & Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil pan will need to be removed and immediately reinstalled. This procedure is necessary because the oil pan sealant must be broken to allow the timing cover to be removed without damage to the oil pan. The reason the pan is to be reinstalled is to allow for a support surface when the timing cover is removed.

15. Remove the oil pan. Refer to **PAN, OIL, REMOVAL** .
16. Temporarily reinstall the oil pan.
17. Install the oil pan bolts finger tight. **Do not install** the four oil pan to timing cover bolts (1) at this time.
18. Lower the vehicle.
19. Support the engine with a suitable jack.
20. Remove the right engine mount insulator. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, REMOVAL** .
21. Remove one M8 studbolt (1), six M6 bolts (2), two M8 bolts (3) and five M10 bolts (4).

Fig. 415: Timing Chain Cover Pry Points
Courtesy of CHRYSLER GROUP, LLC

22. Remove the engine timing cover using pry points (1, 2 and 3).

Fig. 416: Timing Chain Cover Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

23. Remove the engine timing cover (1) out through the bottom of the vehicle.

INSTALLATION

INSTALLATION

Fig. 417: Applying Engine Sealant RTV (Or Equivalent) At Cylinder Head To Block Parting Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: When using RTV, the sealing surfaces must be clean and free from grease and oil.

NOTE: When using RTV, parts should be assembled in 10 minutes and tighten to final torque within 45 minutes.

1. Install a new crankshaft seal if necessary.
2. Clean all sealing surfaces. Refer to **ENGINE - STANDARD PROCEDURE**.
3. Apply Mopar® engine sealant RTV (or equivalent) as shown in illustration at the cylinder head to block parting line (1 and 2).

Fig. 418: Applying Engine Sealant RTV (Or Equivalent) At Ladder Frame To Block Parting Line
Courtesy of CHRYSLER GROUP, LLC

4. Apply Mopar® engine sealant RTV (or equivalent) as shown in illustration at the ladder frame to block parting line (1 and 2).

Fig. 419: Engine Block And Cylinder Head To Timing Cover Sealant Application Points
Courtesy of CHRYSLER GROUP, LLC

5. Apply 2 mm bead of Mopar® MS-GF-46 (or equivalent) to the engine block and cylinder head to timing cover mating surfaces as shown in illustration. Be sure to apply a bead at the two center bolt lands that are

between the timing chain.

Fig. 420: Timing Chain Cover Removal/Installation
Courtesy of CHRYSLER GROUP, LLC

6. Install timing chain cover (1) upwards from under the vehicle.
7. Install the timing chain cover retaining bolts. Tighten six M6 bolts (2) to 9 N.m (80 in. lbs.), two M8 bolts (3) and one studbolt (1) to 26 N.m (19 ft. lbs.) and five M10 bolts (4) to 65 N.m (48 ft. lbs.).
8. Install the right engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION**.
9. Install the coolant reservoir bottle. Tighten bolt to 9 N.m (80 in. lbs.).

Fig. 421: Accessory Drive Components & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

10. Install the water pump pulley (5) and tighten three bolts (6) to 9 N.m (80 in. lbs.).
11. Install the crankshaft damper (4). Refer to **DAMPER, VIBRATION, INSTALLATION** .
12. Install the accessory drive belt tensioner (2).
13. Install the accessory drive belt idler pulley (3). Tighten bolt to 25 N.m (18 ft. lbs.).
14. Install the accessory drive belt (1). Refer to **BELT, SERPENTINE, INSTALLATION** .
15. Reseal the oil pan. Refer to **PAN, OIL, INSTALLATION** .
16. Install the right lower splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .

091071574

Fig. 422: Cylinder Head Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install the cylinder head cover and ignition coils . Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
18. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .

Fig. 423: Engine Cover & Air Resonator Clamp
Courtesy of CHRYSLER GROUP, LLC

19. Install the engine cover (1).
20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE**.
21. Install the resonator (1). Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.
22. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
23. Run the engine until it reaches normal operating temperature. Check cooling system for possible leaks and correct fluid level. Refer to **STANDARD PROCEDURE**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

TENSIONER, ENGINE TIMING

REMOVAL

REMOVAL

1. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

Fig. 426: Timing Chain, Sprockets, Tensioner & Guides
Courtesy of CHRYSLER GROUP, LLC

NOTE: Keep the slack in the timing chain on the tensioner side.

2. Install timing chain tensioner (6) and tighten bolts to 12 N.m (105 in. lbs.).
3. Remove the pin (1/8 in. drill bit) from the timing chain tensioner.
4. Verify that the valve timing is correct. Refer to **VALVE TIMING - STANDARD PROCEDURE** .
5. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .
6. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE** .
7. Connect the battery negative cable and tighten nut to 5 N.m (45 in. lbs.).
8. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** .
9. Install the engine cover.
10. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

2014 ENGINE**3.2L - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

CAUTION: If the engine has experienced a catastrophic failure, **THE INTAKE MANIFOLD MUST BE REPLACED!**

Fig. 1: 3.2 Liter (195.3 CID) Flexible Fuel V-6 Engine
Courtesy of CHRYSLER GROUP, LLC

NOTE: RWD engine configuration shown in illustration, FWD similar.

The 3.2 liter (195.3 CID) flexible fuel V-6 engine features Variable Valve Timing (VVT), Dual Overhead Camshafts (DOHC) and a high-pressure die-cast aluminum cylinder block with steel liners in a 60° configuration. The 3.2 liter engine has a chain driven variable discharge oil pump with a two-stage pressure regulator for improved fuel economy. The exhaust manifolds are integrated into the cylinder heads for reduced weight. The cylinders are numbered from front to rear. The right bank is numbered 1, 3, 5 and the left bank is numbered 2, 4, 6. The firing order is 1-2-3-4-5-6. The engine serial number is located on the left side of the cylinder block at the transmission flange.

DIAGNOSIS AND TESTING**ENGINE DIAGNOSIS - INTRODUCTION**

This Service Information can be helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions are classified as Performance (e.g., engine idles rough and stalls) or Mechanical (e.g., a strange noise).

Refer to **ENGINE PERFORMANCE DIAGNOSTIC TABLE** and **ENGINE MECHANICAL DIAGNOSTIC TABLE** for possible causes and corrections of malfunctions. Refer to **FUEL SYSTEM** article for the fuel system diagnosis.

Additional diagnosis and testing procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE** .
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE** .
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **CYLINDER HEAD, DIAGNOSIS AND TESTING** .
- Intake Manifold Leakage Diagnosis. Refer to **MANIFOLD, INTAKE, DIAGNOSIS AND TESTING** .

ENGINE PERFORMANCE DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary. Refer to <u>BATTERY, DIAGNOSIS AND TESTING</u> .
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Refer to <u>CLEANING</u> .
	3. Faulty engine starting system.	3. Diagnose engine starting system. Refer to <u>DIAGNOSIS AND TESTING</u> .
	4. Faulty coil or control unit.	4. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	5. Incorrect spark plug gap.	5. Correct as necessary.
	6. Incorrect cam timing.	6. Verify cam timing. Refer to <u>VALVE TIMING - STANDARD PROCEDURE</u> .
	7. Dirt or water in fuel system.	7. Clean fuel system.
	8. Faulty fuel pump or wiring.	8. Repair or replace as necessary.
	9. Faulty Camshaft Position (CMP) sensor.	9. Replace sensor. Refer to <u>SENSOR, CAMSHAFT POSITION, REMOVAL</u> .

2014 Jeep Cherokee Trailhawk

2014 ENGINE 3.2L - Service Information - Cherokee

	10. Faulty Crankshaft Position (CKP) sensor.	10. Replace sensor. Refer to <u>SENSOR, CRANKSHAFT POSITION, REMOVAL</u> .
ENGINE STALLS OR ROUGH IDLE	1. Vacuum leak.	1. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
	2. Faulty Crankshaft Position (CKP) sensor.	2. Replace sensor. Refer to <u>SENSOR, CRANKSHAFT POSITION, REMOVAL</u> .
	3. Faulty ignition coil.	3. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	4. Incorrect cam timing.	4. Verify cam timing. Refer to <u>VALVE TIMING - STANDARD PROCEDURE</u> .
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .
	2. Dirt or water in fuel system.	2. Clean fuel system.
	3. Faulty fuel pump.	3. Replace fuel pump. Refer to <u>MODULE, FUEL PUMP, REMOVAL</u> .
	4. Leaking cylinder head gasket.	4. Replace cylinder head gasket. Refer to <u>CYLINDER HEAD, REMOVAL</u> .
	5. Low compression.	5. Determine the cause and repair as necessary. Refer to <u>ENGINE, DIAGNOSIS AND TESTING</u> .
	6. Burned, warped or pitted valves.	6. Replace as necessary. Refer to <u>VALVES, INTAKE AND EXHAUST, REMOVAL</u> .
	7. Plugged or restricted exhaust system.	7. Inspect and replace as necessary.
	8. Faulty ignition coil.	8. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	9. Incorrect cam timing.	9. Verify cam timing. Refer to <u>VALVE TIMING - STANDARD PROCEDURE</u> .
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .
	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replace as necessary. Refer to <u>VALVES, INTAKE AND EXHAUST, REMOVAL</u> .
	4. Faulty ignition coil.	4. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .

2014 Jeep Cherokee Trailhawk

2014 ENGINE 3.2L - Service Information - Cherokee

ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .
	4. Faulty ignition coil.	2. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	3. Dirt or water in fuel system.	3. Clean fuel system.

ENGINE MECHANICAL DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. Refer to <u>OIL, STANDARD PROCEDURE</u> .
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. Inspect the valve guides for wear, cracks or looseness. If either condition exists, replace the cylinder head. Refer to <u>CYLINDER HEAD, REMOVAL</u> .
	8. Excessive runout of valve seats on valve faces.	8. Refer to <u>VALVES, INTAKE AND EXHAUST, STANDARD PROCEDURE</u> .
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Refer to <u>OIL, STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Refer to <u>OIL, STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.

2014 Jeep Cherokee Trailhawk

2014 ENGINE 3.2L - Service Information - Cherokee

5. Excessive end play.	5. Check thrust washers for wear.
6. Crankshaft journal out-of-round.	6. Service or replace crankshaft.
7. Loose flywheel or torque converter.	7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: To perform a compression test on a MULTI-AIR equipped engine, the ignition **MUST** remain in the "key on" position. If the ignition is in the "off" position, the intake valves will not actuate and the result will be no compression.

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Be certain the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE**.
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
 - Leaks between adjacent cylinders or into water jacket.
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
 2. Start and operate the engine until it attains normal operating temperature.
 3. Turn the engine OFF.
 4. Remove the spark plugs.
 5. Remove the oil filler cap.
 6. Remove the air cleaner hose.
 7. **Calibrate the tester according to the manufacturer's instructions.** The shop air source for testing should maintain a regulated air pressure at 552 kPa (80 psi).
 8. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set the piston of the cylinder to be tested at TDC on the compression stroke.
 9. As each cylinder is pressurized, listen for the air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with **no more** than 25% leakage. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

OIL CONSUMPTION TEST AND DIAGNOSIS

The following diagnostic procedures are used to determine the source of excessive internal oil consumption, these procedures and tests apply to vehicles with 50,000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7,500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the Owner's Manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, be certain there is no external engine oil leaks present.

- Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.
- Verify that the engine has the correct oil level dipstick and dipstick tube installed.
- Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles. Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with oil consumption diagnosis.

OIL CONSUMPTION DIAGNOSIS

1. Check the positive crankcase ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a cylinder compression test and cylinder leak down test using the standard leak down gauge following manufacturers suggested best practices.

NOTE: **Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.**

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. Tapered and Out-of-Round Cylinders

The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. Distorted Cylinders

This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. Improper operation of "PCV "system

The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. Worn Piston Ring Grooves

For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will

pass around behind the rings into the combustion chamber.

5. Worn, Broken or Stuck Piston Rings

When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. Cracked or Broken Ring Lands

Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. Worn Valve Stems and Guides

When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. Bent or Misaligned Connecting Rods

Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. Fuel Dilution

If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

- Excess fuel can enter and mix with the oil via a leaking fuel injector
- Gasoline contaminated with diesel fuel
- Restricted air intake
- Excessive idling

10. Contaminated Cooling Systems

Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. Oil Viscosity

The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle Owner's Manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. Dirty Engine Oil

Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. Crankcase Overfull

Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. Excessively High Oil Pressure

A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. Aftermarket Performance Chips and Modification

Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. Lugging Engine

Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. Turbocharged Engines

There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. Restricted Air Intake

Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

19. Intake Manifold port seals

Engines that have a "V" configuration and a "wet valley" (3.3/3.8L) could draw oil into the intake ports due to improper sealing between the intake manifold ports and cylinder head. Causes may include improper torque of intake manifold bolts, corrosion (aluminum intake manifold) and or warped sealing surface.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings. Misaligned or damaged.	1. Replace as necessary.
	(a) Loose fasteners, broken or porous metal parts.	(a) Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear oil seal.	2. Replace rear crankshaft oil seal. Refer to <u>SEAL, CRANKSHAFT OIL, REAR, REMOVAL</u> .
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan. Refer to <u>PAN, OIL, REMOVAL</u> .
	5. Engine timing cover seal, damaged or misaligned.	5. Replace seal. Refer to <u>SEAL, CRANKSHAFT OIL, FRONT, REMOVAL</u> .
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sensor.	2. Replace sensor. Refer to <u>SENSOR, OIL PRESSURE, REMOVAL</u> .
	3. Low oil pressure.	3. Check main bearing clearance. Refer to <u>BEARING(S), CRANKSHAFT, STANDARD PROCEDURE</u> . 3. Check rod bearing clearance. Refer to <u>BEARING(S), CONNECTING ROD, STANDARD PROCEDURE</u> .
	4. Clogged oil filter.	4. Replace oil filter. Refer to <u>FILTER, ENGINE OIL, REMOVAL</u> .
	5. Worn oil pump.	5. Replace oil pump. Refer to

2014 Jeep Cherokee Trailhawk

		<u>PUMP, ENGINE OIL, REMOVAL.</u>
	6. Thin or diluted oil.	6. Change oil and filter. Refer to <u>OIL, STANDARD PROCEDURE</u> .
	7. Excessive bearing clearance.	7. Replace crankshaft bearings. Refer to <u>BEARING(S), CRANKSHAFT, STANDARD PROCEDURE</u> . 7. Replace rod bearings. Refer to <u>BEARING(S), CONNECTING ROD, STANDARD PROCEDURE</u> .
	8. Oil pump relief valve stuck.	8. Replace oil pump. Refer to <u>PUMP, ENGINE OIL, REMOVAL.</u>
	9. Oil pump pick-up tube loose, damaged or clogged.	9. Replace oil pump pick-up. Refer to <u>PICK-UP, OIL PUMP, REMOVAL.</u>
OIL PUMPING AT RINGS	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings. Refer to <u>RING(S), PISTON, STANDARD PROCEDURE</u> .
	2. Carbon in oil ring slots.	2. Replace rings. Refer to <u>ROD, PISTON AND CONNECTING, REMOVAL.</u>
	3. Worn valve guides.	3. Replace cylinder heads. Refer to <u>CYLINDER HEAD, REMOVAL.</u>
	4. Leaking valve guide seals.	4. Replace valve guide seals. Refer to <u>SEAL(S), VALVE GUIDE, REMOVAL.</u>

STANDARD PROCEDURE**DUST COVERS AND CAPS**

**Fig. 2: Covers/Caps**

Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

**Fig. 3: Opening Cover**

Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All of the sealants mentioned below are not used on every engine, they are listed as a general reference guide. See appropriate Service Information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers **must** be free of grease or oil. Surfaces should be cleaned with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, the parts should be assembled within 10 minutes.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued

between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® THREEBOND ENGINE RTV SEALANT is a unique gasket material that is specially made to retain adhesion and sealing properties when used to seal components exposed to engine oil.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Threebond Engine RTV Sealant gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. The gasket surfaces should be cleaned with isopropyl alcohol wipes in preparation for sealant application. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be assembled within 20 minutes and torqued in place within 45 minutes. The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

ENGINE GASKET SURFACE PREPARATION

Fig. 4: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

2014 Jeep Cherokee Trailhawk

2014 ENGINE 3.2L - Service Information - Cherokee

- 1 - ABRASIVE PAD
- 2 - 3M ROLOC™ BRISTLE DISC
- 3 - PLASTIC/WOOD SCRAPER

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper.
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (1).

NOTE: **Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (3).
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (2).

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

Bearing Journal Diameter - No. 2, 3, 4	23.977 - 23.996	0.9440 - 0.9447 in.
Bearing Clearance - No. 1	0.025 - 0.065 mm	0.00010 - 0.0026 in.
Bearing Clearance - No. 2, 3, 4	0.024 - 0.064 mm	0.0009 - 0.0025 in.
End Play	0.114 - 0.214 mm	0.004 - 0.008 in.

VALVE TIMING-INTAKE VALVES

Description	Specification
Opens	5.4° (ATDC)
Closes	79.4° (ABDC) or 259.4° (ATDC)
Duration	254°
Centerline	131.4°
Note: Units are in crank degrees, using 0.1524 mm (0.006 in.) valve lift as the threshold.	

VALVE TIMING-EXHAUST VALVES

Description	Specification
Opens	84° (BBDC) or 264° (BTDC)
Centerline	129°
Closes	11° (ATDC)
Duration	275°
Valve Overlap	56°
Note: Units are in crank degrees, using 0.1524 mm (0.006 in.) valve lift as the threshold.

*NEW FASTENER: Do not reuse these fasteners. If removed, a new fastener must be installed and tightened to the proper specification torque specification.

REMOVAL**REMOVAL**

CAUTION: If the original engine has experienced a catastrophic failure or an

individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

Fig. 5: Engine Cover & Ball Studs
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover (1).
2. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
3. Remove the battery. Refer to **BATTERY, REMOVAL** .

Fig. 6: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the pinch bolt (3) from the intermediate shaft (1).
5. Separate the intermediate shaft from the steering gear shaft (2).

Fig. 7: Identifying Power Distribution Z-Case Fuse Array, Tabs & Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the cover from the Power Distribution Center (PDC).
7. Remove the nuts (2) from Z case fuse array and move the eyelet connectors off and away from the Z case fuse array.

Fig. 8: PDC & Engine Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolt (2) that secures the engine harness connector to the PDC (1).
9. Release the plastic clips that secure the PDC to the lower cover.
10. Using care, lift the PDC away from the lower cover.
11. Separate the engine harness from the base of the PDC and position aside.

Fig. 9: PCM, Connectors, Strap & Nuts
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the Powertrain Control Module (PCM) harness connectors (2).
13. Remove the nut (3) that secures the ground strap (4) to the PCM.
14. Recover the refrigerant from the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE** .
15. Remove the purge control valve from the intake manifold (Refer to **VALVE, PURGE CONTROL** /Removal).

Fig. 10: IHX, Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

16. Remove the nut (3) and separate the suction/liquid line manifold (2) from the Internal Heat Exchanger (IHX) (1).
17. Separate the air cleaner body from the air cleaner tray. Refer to **BODY, AIR CLEANER, REMOVAL**.
18. Remove the air resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL**.

NOTE: Removal of the Intake Resonator will allow access to the rear O2 Sensors and the upper Catalytic Converter bolts.

Fig. 11: Removing/Installing Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

19. Disconnect both rear side O2 Sensor harness connectors (1, 2).

NOTE: The catalytic converter is removed from under the vehicle.

Fig. 12: Removing/Installing Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

20. Remove the rear side catalytic converter support bracket bolt (4).
21. Remove the catalytic converter upper flange bolts (5).

Fig. 13: Block Heater Electrical Cord Clip, Engine Harness Connector & Engine Wiring Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

22. If equipped, separate the block heater electrical cord clip (1) from the battery tray.
23. Separate the engine wiring harness retainer (3) from the battery tray.
24. Separate the engine harness connector (2) from the battery tray.

Fig. 14: Body Side Harness Connector & Engine Side Harness Connector
Courtesy of CHRYSLER GROUP, LLC

25. Disconnect the engine side harness connector (4) from the body side harness connector (1).

Fig. 15: Belly Pan & Bolts**Courtesy of CHRYSLER GROUP, LLC**

26. Remove the upper battery tray bolts (1, 2).
27. Raise and support the vehicle.
28. Remove the belly pan (3). Refer to **BELLY PAN, REMOVAL** .
29. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
30. Partially lower the vehicle.
31. Remove the front bumper fascia. Refer to **FASCIA, FRONT, REMOVAL** .
32. Remove both front wheel assemblies. Refer to **REMOVAL** .
33. Remove both axle shafts. Refer to **REMOVAL** .
34. Remove both front wheel house splash shields. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

**Fig. 16: Installing Lower Radiator Hose & Heater Core Return Hose****Courtesy of CHRYSLER GROUP, LLC**

35. Remove the heater hose (1) from the water pump.
36. Remove the lower radiator hose (2) from the water pump.

Fig. 17: Windshield Washer Reservoir-To-Battery Tray Bolt
Courtesy of CHRYSLER GROUP, LLC

37. Separate the wiring harness retainer (1) from the battery tray.
38. Remove the bolt (2) that secures the washer reservoir bottle to the battery tray.

0909005827

Fig. 18: Battery Tray & Bolt
Courtesy of CHRYSLER GROUP, LLC

39. Remove the outer battery tray bolt (2).

40. Raise and secure the vehicle.
41. Remove the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

**Fig. 19: Y-Pipe**

Courtesy of CHRYSLER GROUP, LLC

42. Separate the Y-pipe (4) from the rear catalytic converter.

**Fig. 20: Removing/Installing Lower Intermediate Shaft Support Bracket**

Courtesy of CHRYSLER GROUP, LLC

NOTE: FWD

intermediate shaft bracket shown in illustration.

AWD

intermediate shaft bracket similar.

43. If equipped, remove the Power Transfer Unit (PTU). Refer to **REMOVAL** .
44. Remove the catalytic converter from its mount and position aside.
45. Remove the bolts (2, 3) that secure the intermediate shaft support bracket (1).
46. Remove the rear catalytic converter from the vehicle.

NOTE: **If the transmission is to be separated from the engine, removal of the torque converter bolts and lower transmission mounting bolts are best accomplished at this time.**

Replacement Components

Fig. 21: Ground Strap & Bolt
Courtesy of CHRYSLER GROUP, LLC

47. Remove the bolt (2) that secures the ground wire (1) to the transmission.

Fig. 22: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

48. If required, remove the transaxle torque converter housing dust cover (2) and the lower rubber plugs.

Fig. 23: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

49. If required, remove the torque converter-to-flexplate bolts (1).
50. If required, remove the lower engine oil pan-to-transmission bolts.

Fig. 24: Transmission Cooler Lines

Courtesy of CHRYSLER GROUP, LLC

51. Disconnect the oil cooler lines (1) from transmission using the (special tool #9546, Disconnect Tool).
52. Remove the front suspension crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL**.

0909005826

Fig. 25: Identifying Battery Tray, Inner Frame Rail & Bolts

Courtesy of CHRYSLER GROUP, LLC

53. Remove the lower bolts (3) that secure the battery tray (1) to the upper frame (2).
54. Lower the vehicle.
55. Remove the battery tray from the vehicle.
56. If required, remove the electric vacuum pump and mounting bracket. Refer to **PUMP, ELECTRIC VACUUM, REMOVAL** .

Fig. 26: Coolant Bottle & Components
Courtesy of CHRYSLER GROUP, LLC

57. Remove the coolant return line (2) from the coolant bottle (3).

241070008

Fig. 27: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

- 58. Disconnect the heater core supply hose (2).
- 59. Disconnect the heater core return hose (3).

0911011292

Fig. 28: Radiator Inlet Pipe & Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

- 60. Separate the upper radiator hose (2) from the radiator inlet pipe (1).

Fig. 29: A/C-To-IHX Lines

Courtesy of CHRYSLER GROUP, LLC

61. Remove the nuts that secure the A/C lines (1) to the IHX.

Fig. 30: View Of Shift Cable Housing & Mount Bracket

Courtesy of CHRYSLER GROUP, LLC

62. Disconnect the shift cable end from the manual valve lever on the transmission.
63. Release the locks holding the shift cable housing (2) to the mount bracket (1) on the transmission.
64. Separate the shift cable from the mount bracket.
65. Disconnect the fuel line from the fuel rail inlet. Refer to **FITTING, QUICK CONNECT**.

Fig. 31: Ground Wire, Nut & Right Side Upper Frame
Courtesy of CHRYSLER GROUP, LLC

66. Remove the nut (2) that secures the ground wire (1) to the right side upper frame (3).

Fig. 32: Adapter, Engine Support Cradle, Power Train Dolly & Safety Straps
Courtesy of CHRYSLER GROUP, LLC

67. Raise and position vehicle height to allow the Dolly, Power Train (special tool #6135, Dolly, Power Train) (3) and the Cradle, Engine Support (special tool #6710A, Cradle, Engine Support) (2) to be installed under the engine/transmission assembly.
68. Loosen the cradle assembly from the power train dolly to allow for adjustment.
69. Position the Adapter (special tool #6848-3, Adapter) to the engine locating holes (1) on the engine block and oil pan rail.

70. Lower the vehicle and position the cradle/dolly fixture until the engine is resting on the adapters.
71. Tighten the engine cradle adapter to the cradle frame.
72. Secure the engine/transmission assembly to the dolly/cradle with safety straps (4).
73. Using care, lower the vehicle so that all of the weight of the engine and transmission is on the cradle/dolly fixture.

Fig. 33: Left Engine Mount-To-Transmission Mount Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

74. Remove the bolts (1) that secure the left engine mount to transmission mount bracket.

Fig. 34: Removing/Installing Right Engine Mount Assembly

Courtesy of CHRYSLER GROUP, LLC

75. Remove the bolts (2, 3) that secure the right engine mount to engine mount bracket.
76. Slowly raise the vehicle in small increments while inspecting each interval for potential engine or transmission contact to vehicle components.
77. Move the cradle/dolly fixture as necessary to allow for removal clearance.

NOTE: Perform the following steps to remove the transmission from the engine if required:

78. Position and secure a transmission jack under the transmission.
79. Remove the starter. Refer to **STARTER, REMOVAL**.

Fig. 35: Transmission Valve Body Solenoid Connector

Courtesy of CHRYSLER GROUP, LLC

80. Rotate the lock lever (1) counterclockwise on the transmission harness connector.
81. Separate the transmission harness connector from the transmission.

0909005836

Fig. 36: Removing/Installing Bellhousing
Courtesy of CHRYSLER GROUP, LLC

82. Remove the remaining transmission upper bellhousing-to-block bolts (3).
83. Separate the transmission (4) and the spacer plate (2) from the engine.
84. Remove the bolts that secure the drive plate (1) to the crankshaft.

NOTE: Perform the following steps to remove the engine from the cradle/dolly fixture if required:

0911034688

Fig. 37: Engine Assembly On Cradle/Dolly Fixture
Courtesy of CHRYSLER GROUP, LLC

85. If required, remove all the necessary components from the engine.
86. Position an engine hoist to the engine assembly (1).
87. Affix a chain to the engine.
88. Using care, separate the engine from the cradle/dolly fixture (2, 3).
89. Secure the engine to a engine stand.

INSTALLATION

INSTALLATION

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

NOTE: If installing a replacement engine, transfer all the components to the replacement engine.

Fig. 38: Adapter, Engine Support Cradle, Power Train Dolly & Safety Straps
Courtesy of CHRYSLER GROUP, LLC

1. Position the engine to the Dolly, Power Train (special tool #6135, Dolly, Power Train) (3) and the Cradle, Engine Support (special tool #6710A, Cradle, Engine Support).
2. If required, loosen the cradle assembly from the power train dolly to allow for adjustment.
3. Position the Adapter (special tool #6848-3, Adapter) post (2) to the engine locating holes (1) on the engine block and oil pan rail.

4. Lower the engine until it is resting on the posts of the adapters.
5. If required, tighten the engine cradle adapter to the cradle frame.
6. Secure the engine assembly to the dolly/cradle with safety straps (4).

NOTE: Perform the following steps to install the transmission to the engine if required:

0909005836

Fig. 39: Removing/Installing Bellhousing
Courtesy of CHRYSLER GROUP, LLC

7. If removed, position the flexplate (1) to the crankshaft. Tighten the bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
8. Position the spacer plate (2) to the engine.
9. Align the transmission (4) to the engine.
10. Install the upper transmission to engine bolts (3). Tighten the bolts to the proper specification. Refer to **SPECIFICATIONS**.
11. Position the engine/transmission assembly under the vehicle.
12. Slowly lower the vehicle in small increments while inspecting each interval for potential engine or transmission contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for clearance.

Fig. 40: Removing/Installing Right Engine Mount Assembly
Courtesy of CHRYSLER GROUP, LLC

13. Hand start the right side engine mount bolts (2, 3) to engine mount bracket. Tighten the bolt to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 41: Left Engine Mount-To-Transmission Mount Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Hand start the left side engine mount bolts (1) to transmission mount bracket. Tighten the bolt to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
15. Remove the dolly/cradle safety straps.
16. Raise vehicle enough to allow the dolly/cradle fixture to be removed from under the vehicle.

17. Lower the vehicle.

Fig. 42: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

18. Connect the transmission harness connector (1) into transmission.
19. Rotate the lock lever (1) clockwise on the transmission connector.

Fig. 43: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

20. Press the shift cable (2) onto the mount bracket (1).

21. Press the shift cable onto the transmission manual shift valve lever.
22. If removed, install the electric vacuum pump and mounting bracket. Refer to **PUMP, ELECTRIC VACUUM, INSTALLATION**.

Fig. 44: Ground Wire, Nut & Right Side Upper Frame
Courtesy of CHRYSLER GROUP, LLC

23. Install the ground strap (1) to right side upper frame (3). Tighten the nut (2) to proper specification. Refer to **TORQUE SPECIFICATIONS**.
24. Install the wiring harness retainers (2) to the lower air box housing.

Fig. 45: IHX, Suction/Liquid Line Manifold & Nut

Courtesy of CHRYSLER GROUP, LLC

25. Install the suction/liquid line manifold (2) to the Internal Heat Exchanger (IHX) (1) and install the nut (3). Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

0909005837

Fig. 46: Belly Pan & Bolts**Courtesy of CHRYSLER GROUP, LLC**

26. Install the battery tray. Tighten the bolts (1, 2) to the proper specification. Refer to **SPECIFICATIONS** .

0811032873

Fig. 47: Body Side Harness Connector & Engine Side Harness Connector
Courtesy of CHRYSLER GROUP, LLC

27. Connect the main engine harness connector (4) to the body side harness at the left front upper frame.

Fig. 48: Block Heater Electrical Cord Clip, Engine Harness Connector & Engine Wiring Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

28. Install the main engine harness connector (2) to the battery tray.
29. Install the engine harness retainer (3) onto the battery tray.
30. If equipped, install the engine block heater electrical cord clip (1) to the battery tray.

Fig. 49: PDC & Engine Harness Connector

Courtesy of CHRYSLER GROUP, LLC

31. Connect the engine harness to the Power Distribution Center (PDC) base. Hand tighten the bolt (2).
32. Install the PDC (1) into proper position on the lower cover.
33. Press down on the PDC until the tabs lock.

Fig. 50: Identifying Power Distribution Z-Case Fuse Array, Tabs & Nuts

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

1. Remove the screws that secures the air filter housing cover to the lower housing.

Fig. 72: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

2. Lift the cover and remove the air cleaner element (1).

CAUTION: Do not use compressed air to clean out the air cleaner housing without first covering the air inlet to the throttle body. Dirt or foreign objects could enter the intake manifold causing engine damage.

3. Remove any dirt or debris from the bottom of the air cleaner housing.

INSTALLATION

INSTALLATION

Fig. 73: Air Cleaner Element

Courtesy of CHRYSLER GROUP, LLC

1. Install the air cleaner element (1) into the air cleaner housing.
2. Seat the cover onto the housing and secure the screws.

BODY, AIR CLEANER

REMOVAL

REMOVAL

Fig. 74: Engine Cover & Ball Studs

Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover (1).

Fig. 75: Air Filter Body Cover & Breather Hose
Courtesy of CHRYSLER GROUP, LLC

2. Separate the breather hose (2) from the air filter body cover (1).
3. Loosen the clamp and remove the hose from the air cleaner body (1).

0909005826

Fig. 76: Air Cleaner Body
Courtesy of CHRYSLER GROUP, LLC

4. Pull the air cleaner body (1) straight up to disengage the locating pins from the rubber mount sockets (2).

INSTALLATION**INSTALLATION**

NOTE: Upper air filter body has been removed for clarity of the installation of the intake tube and seal to the air filter body.

Fig. 77: Air Filter Body, Seal & Air Filter Body
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the three rubber mount sockets (2) with Mopar® Rubber Bushing Installation Lube.
2. Install the air cleaner housing body.
3. Align the intake tube (3) to the air filter body (1) making sure the seal (2) is centered.
4. Engage the air inlet tube and install the air cleaner body straight down on the locating pins until the rubber mount sockets are fully seated.
5. Install the hose to the air cleaner body and tighten the clamp (3) to 5 N.m (44 in. lbs.).

Fig. 78: Air Filter Body Cover & Breather Hose
Courtesy of CHRYSLER GROUP, LLC

6. Connect the breather hose (2) to the air cleaner body cover (1).
7. Install the engine cover (1).

RESONATOR, AIR CLEANER

REMOVAL

REMOVAL

Fig. 79: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover (1).

Fig. 80: Air Cleaner Resonator & IAT Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the harness connector (2) from the Inlet Air Temperature (IAT) sensor (3).

Fig. 81: Intake Resonator
Courtesy of CHRYSLER GROUP, LLC

4. Separate the clean air hose from the resonator (1).

5. Remove the vapor line retainer (4) from the resonator.
6. Remove the push pin (3) that secures the resonator to the intake manifold.
7. Pull the resonator straight up off of the two locating pins on the right cylinder head cover. Disengage and remove the resonator from the throttle body inlet.

INSTALLATION**INSTALLATION**

0909005845

Fig. 82: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the rubber mount sockets on the resonator (6) with Mopar® Rubber Bushing Installation Lube.
2. Install the resonator to the throttle body inlet (3). Push the resonator down onto the locating pins until the rubber mount sockets are fully seated.
3. Install the clean air hose (5) to the resonator. Hand tighten the clamp (4).
4. Install the push pin (2).

Fig. 83: Air Cleaner Resonator & IAT Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Connect the harness connector (2) to the Intake Air Temperature (IAT) Sensor (1).

Fig. 84: Intake Resonator
Courtesy of CHRYSLER GROUP, LLC

Engage the vapor line retainer (4) to the resonator (1).

Fig. 85: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

6. Install engine cover (1).
7. Connect the negative battery cable and tighten nut to 5 N.m (44 in. lbs.).

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

Fig. 86: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. The cylinder head features four valves per cylinder with pressed in powdered metal valve guides. The valve guides are not serviceable. The DOHC valvetrain uses roller rocker arms with hydraulic lifters. The cylinder head's camshaft bearing caps are made of powdered metal and the location and direction of each cap is marked on the side of the caps. The spark plug tubes are pressed into the cylinder heads and sealed in place. The tubes are a thin wall design and caution must be taken when working in the spark plug tube area.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between the cylinders located next to each other, follow the procedures in Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE** . An engine cylinder head gasket leaking between the cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

Fig. 87: Cooling System Pressure Tester - 7700-A
Courtesy of CHRYSLER GROUP, LLC

WARNING: WITH THE COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT THE PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester (special tool #7700-A, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Fig. 88: Bloc-Chek-Kit - C-3685-A
Courtesy of CHRYSLER GROUP, LLC

Combustion leaks into the cooling system can also be checked by using a (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform the test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

4. Low oil pressure.
 5. The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.
 6. Air ingested into oil due to broken or cracked oil pump pick up.
 7. Worn valve guides.
 8. Rocker arm ears contacting valve spring retainer.
 9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
 10. Oil leak or excessive cam bore wear in cylinder head.
 11. Faulty lash adjuster.
- Check lash adjusters for "sponginess" while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel firm when pressed quickly. When pressed very slowly, lash adjusters should collapse.
 - Remove suspected lash adjusters, and replace.
 - Before installation, make sure adjusters are full of oil. This can be verified by little plunger travel when lash adjuster is depressed quickly.

REMOVAL

LEFT CYLINDER HEAD

Fig. 89: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
5. Drain the engine oil. Refer to **OIL, STANDARD PROCEDURE** .
6. Lower the vehicle.

Fig. 90: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

7. Remove the engine cover (1).
8. Recover the refrigerant from the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE** .
9. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL**.
10. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL**.
11. Remove the upper and lower intake manifolds and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL**.
12. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
13. Remove the PCM. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

090873114

Fig. 91: Identifying Engine Coolant Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the Engine Coolant Temperature (ECT) sensor harness connector (2).

3611100

Fig. 92: Electrical Connector, Mounting Bolt & Ignition Capacitor
Courtesy of CHRYSLER GROUP, LLC

15. Disconnect the ignition coil capacitor harness connector (1).

Fig. 93: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the main harness from the engine injection/ignition harness (1) at the rear of the left cylinder head.
17. Disconnect the main harness from the engine oil pressure/temperature harness (2) at the rear of the left cylinder head.
18. Remove the thermostat housing assembly. Refer to **THERMOSTAT, REMOVAL** .
19. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
20. Remove the generator. Refer to **GENERATOR, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

2661245

Fig. 94: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

21. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

22. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

Fig. 95: Resetting Left Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chains are removed and the cylinder heads are still installed, **DO NOT** rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

23. Reset the LH cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **VALVE TIMING - STANDARD PROCEDURE** .

Fig. 96: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

24. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
25. Loosen the intake oil control valve (6) and exhaust oil control valve (2).
26. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
27. Remove the oil control valve (2) from the left side exhaust cam phaser and pull the phaser off of the camshaft.
28. Remove the oil control valve (6) from the left side intake cam phaser and pull the phaser off of the camshaft.

2659731

Fig. 97: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Remove the LH cam chain tensioner arm (1).
30. Remove two T30 bolts (6) and the LH cam chain tensioner (5).
31. Remove two T30 bolts (4) and the LH cam chain guide (2).

2692295

Fig. 98: Cylinder Head Retaining Bolt Removal Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

32. Remove the left camshafts. Refer to CAMSHAFT, ENGINE, REMOVAL.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

33. Remove the rocker arms. Refer to ROCKER ARM, VALVE, REMOVAL.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

34. If required, remove the hydraulic lifters. Refer to LIFTER(S), HYDRAULIC, REMOVAL.
35. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

2800384

Fig. 99: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

36. Remove the cylinder head and gasket (1). Discard the gasket.

2876978

Fig. 100: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

37. If required, remove the Engine Coolant Temperature (ECT) sensor (4).
38. If required, remove the bolt (2) and the ignition coil capacitor (1).
39. If required, remove the bolt (3) and the engine wire harness retainer bracket (5).

RIGHT CYLINDER HEAD

2715130

Fig. 101: Magnetic Timing Wheels

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE**

PROCEDURE .

2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
5. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
6. Drain the engine oil. Refer to **OIL, STANDARD PROCEDURE** .
7. Remove the right side catalytic converter. Refer to **CONVERTER, CATALYTIC , REMOVAL** .
8. Lower the vehicle.

Fig. 102: Engine Cover & Ball Studs
 Courtesy of CHRYSLER GROUP, LLC

9. Remove the engine cover (1).
10. Recover the refrigerant from the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE** .
11. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
12. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
13. Remove the upper and lower intake manifolds and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL** .
14. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .

Fig. 103: Electrical Connector, Mounting Bolt & Ignition Capacitor
 Courtesy of CHRYSLER GROUP, LLC

15. Disconnect the ignition coil capacitor harness connector (1).
16. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

Fig. 104: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

17. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

18. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

Fig. 105: Resetting Right Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

19. Reset the RH cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

Fig. 106: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

20. Install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
21. Loosen the intake oil control valve (2) and exhaust oil control valve (7).
22. Remove the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
23. Remove the oil control valve (2) from the right side intake cam phaser and pull the phaser off of the camshaft.
24. Remove the oil control valve (7) from the right side exhaust cam phaser and pull the phaser off of the camshaft.

Fig. 107: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove the RH cam chain tensioner arm (6).
26. Remove two T30 bolts (4) and the RH cam chain tensioner (3).
27. Remove three T30 bolts (2) and the RH cam chain guide (1).
28. Remove the right camshafts. Refer to CAMSHAFT, ENGINE, REMOVAL.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

29. Remove the rocker arms. Refer to ROCKER ARM, VALVE, REMOVAL.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

30. If required, remove the hydraulic lifters. Refer to LIFTER(S), HYDRAULIC, REMOVAL.
31. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

2800384

Fig. 108: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

32. Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

Fig. 109: Ignition Coil Capacitor & Bolt
Courtesy of CHRYSLER GROUP, LLC

33. If required, remove the bolt (2) and the ignition coil capacitor (1).

CLEANING

CLEANING

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.

To ensure engine gasket sealing, proper surface preparation must be performed, especially with aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

1. Remove all gasket material from cylinder head and block. Refer to **ENGINE, STANDARD PROCEDURE**. Be careful not to gouge or scratch the aluminum head sealing surface.
2. Clean all engine oil passages.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

3. Clean out the cylinder head bolt holes in the engine block.

DO NOT USE any adhesives when installing the MLS head gaskets. The use of adhesives may cause the gasket not to seal properly and may leak. MLS gaskets are to be installed on a surface free of debris and oils.

INSPECTION

INSPECTION

Fig. 110: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

1. Check the cylinder head for warping with a straight edge (2) and feeler gauge (1).
2. Cylinder head must be flat within specification. Refer to **ENGINE SPECIFICATIONS**.
3. Verify that the valve tappets move freely in their bores and that they have been rotating.
4. Inspect camshaft bearing journals for scoring.
5. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
6. Inspect the following components and verify that they are within specification. Refer to **ENGINE SPECIFICATIONS**.
 - Camshafts
 - Valve Tappets
 - Springs
 - Valve Seats

- Valve Guides
- Valves

INSTALLATION

LEFT CYLINDER HEAD

Fig. 111: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 112: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the Engine Coolant Temperature (ECT) sensor (4) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
2. If removed, install the ignition coil capacitor (1). Tighten the bolt (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
3. If removed, install the engine wire harness retainer bracket (5). Tighten the bolt (3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 113: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

NOTE: Typical cylinder head bolt shown in illustration.

4. Check cylinder head bolts for necking by holding a scale or straight edge against the threads. If all of the threads do not contact the scale (2) the bolt must be replaced.

Fig. 114: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

5. Clean and prepare the gasket sealing surfaces of the cylinder head and block. Refer to **ENGINE, STANDARD PROCEDURE**.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

6. Clean out the cylinder head bolt holes in the engine block.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: The installation of the cylinder head gaskets are not interchangeable between the left and right cylinder heads. They are clearly marked (3) with "R" for right and "L" for left. They must be applied on a dry surface, without the use of any adhesives.

7. Position the new cylinder head gasket (1) on the locating dowels (2).

2692178

Fig. 115: Cylinder Head Retaining Bolt Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

8. Using care, position the cylinder head onto the engine block.

NOTE: Do not apply any oil to the bolt threads.

9. Install the eight head bolts finger tight.
10. Tighten the cylinder head bolts in the sequence shown in illustration, following this 9-step torque plus angle method. Tighten according to the following torque values:
 - Step 1: All to 30 N.m (22 ft. lbs.)
 - Step 2: All to 45 N.m (33 ft. lbs.)
 - Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
 - Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
 - Step 5: Loosen all fasteners in reverse of sequence shown in illustration
 - Step 6: All to 30 N.m (22 ft. lbs.)
 - Step 7: All to 45 N.m (33 ft. lbs.)
 - Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
 - Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

Fig. 116: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

11. If removed, install the hydraulic lifters. Refer to LIFTER(S), HYDRAULIC, INSTALLATION.

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

CAUTION: Do not rotate the camshafts more than a few degrees independently

of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

12. Install the rocker arms and camshafts. Refer to CAMSHAFT, ENGINE, INSTALLATION.

2659731

Fig. 117: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Install the LH cam chain guide (2) with two bolts (4). Tighten the bolts to the proper specification. Refer to TORQUE SPECIFICATIONS.
14. Install the LH cam chain tensioner (5) to the cylinder head with two bolts (6). Tighten the bolts to the proper specification. Refer to TORQUE SPECIFICATIONS.
15. Reset the LH cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to VALVE TIMING - STANDARD PROCEDURE.
16. Install the LH tensioner arm (1).

Fig. 118: Idler Sprocket, Plated Link & Arrow
 Courtesy of CHRYSLER GROUP, LLC

17. Press the LH intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

18. Drape the left side cam chain over the LH intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

Fig. 119: Aligning Timing Marks

Courtesy of CHRYSLER GROUP, LLC

19. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links (2) are aligned with the phaser timing marks (1, 3). Position the cam phasers so that the arrows (4) point toward each other and are parallel to the valve cover sealing surface. Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve.

Fig. 120: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

20. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (1) and tighten the oil control valves (2, 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

2661245

Fig. 121: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

21. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser).
22. Remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) from the LH cam chain tensioner.
23. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned the with the block/bearing cap junction (5).
24. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).

2714685

Fig. 122: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking

Courtesy of CHRYSLER GROUP, LLC

25. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
26. If the engine timing is not correct, loosen the timing chain by resetting the cam chain tensioner and repeat the camshaft alignment procedure. Refer to **VALVE TIMING - STANDARD PROCEDURE** .
27. Install the generator. Refer to **GENERATOR, INSTALLATION** .
28. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .
29. Install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .

Fig. 123: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness

33. Connect the Engine Coolant Temperature (ECT) sensor harness connector (2).
34. Install the lower and upper intake manifolds and insulator. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

35. Install the Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
36. Install the air resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.
37. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
38. Evacuate and charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE** .

Fig. 126: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

39. Install the engine cover (1).
40. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
41. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
42. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
43. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
44. Lower the vehicle.
45. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .
46. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT CYLINDER HEAD

Fig. 127: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 128: Ignition Coil Capacitor & Bolt

33. Evacuate and charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
34. Install the engine cover (1).
35. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer

to **OIL, STANDARD PROCEDURE** .

36. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
37. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
38. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
39. Lower the vehicle.
40. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .
41. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE

DESCRIPTION

DESCRIPTION

2812619

Fig. 141: Exhaust Phaser Assembly
Courtesy of CHRYSLER GROUP, LLC

The engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four phasers are located on the front of the camshafts, behind the VVT solenoids, inside of the engine timing cover. The exhaust phasers are identified with EXH and the intake phasers are identified with INT. The exhaust phaser has a clockspring, the intake phaser does not. The camshaft sprockets are integrated with the camshaft phaser and are serviced as an assembly. Do not attempt to disassemble the phasers, they are not serviceable. Phasers are interchangeable between the right and left cylinder heads but should be installed in the same location as removed.

The engine has an Oil Control Valve (OCV) for each phaser. The OCV also acts as a bolt for mounting the Phaser to the camshaft. The OCVs spool valve is spring loaded and should move freely within the OCV body. The four OCVs are identical but should be installed in the same location as removed.

OPERATION

OPERATION

2811799

Fig. 142: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
 Courtesy of CHRYSLER GROUP, LLC

Each phaser position is adjusted using regulated oil pressure through the Oil Control Valve (OCV) (3). To begin phaser movement, a voltage signal is applied to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forward and backward to direct oil flow.

2813724

Fig. 143: Phasers In Lock-Pin Position
Courtesy of CHRYSLER GROUP, LLC

At engine startup, system oil pressure overcomes spring pressure and unlocks the phaser lock-pin (1) in preparation for phasing. The phasers remain in this position until a PCM signal is given to pulse-width modulate the VVT solenoid. At engine shutdown, as oil pressure is reduced, both Phasers return to their lock-pin position.

Because the exhaust Phaser needs to travel to a position above and beyond the standard camshaft clockwise rotation, the assistance of a clock spring is required. The intake Phaser on the other hand, simply relies on the torsional resistance from the valvetrain to push it back towards lock-pin position.

2813615

Fig. 144: Spool Valve, Vanes, OCV & Advance, Hold Or Retard Position
Courtesy of CHRYSLER GROUP, LLC

The position of the spool valve (1) inside the OCV (2) determines which ports and chambers inside the phaser are being fed, either to advance (3), hold (4) or retard (5) the timing of the phaser sprocket relative to the camshaft. The spool valve also returns oil from the chambers to the sump (6). The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM. As oil pressure pushes against the vanes (6) of the phaser rotor, the rotor begins to move. Since this rotor is physically attached to the camshaft, rotor rotation causes the camshaft position to rotate relative to the standard sprocket (7) position.

REMOVAL

LEFT OIL CONTROL VALVES

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;

<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641418.vid1" into the "Search Channel" box.

Fig. 145: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

3821798

Fig. 146: Positioning Dial Indicator & Setting #4 Cylinder At Top-Dead-Center Compression Stroke
Courtesy of CHRYSLER GROUP, LLC

1. Remove the left cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Remove the right ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL**.

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the left camshaft position (CMP) sensor mount. Position the indicator probe into the number four cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number four cylinder piston at top-dead-center on the compression stroke and set the indicator dial to zero.

Fig. 147: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
 Courtesy of CHRYSLER GROUP, LLC

4. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2) when the number four cylinder piston is positioned at top-dead-center on the compression stroke.

Fig. 148: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

Fig. 149: Camshaft Phaser Lock, Oil Control Valves & Wrench
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
9. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).

Fig. 150: Pin, Rack & Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows engine timing cover removed for clarity.

10. Insert the (special tool #10200-3, Pin) (2) into to hole located on the side of the tensioner housing, lift the pawl off of the rack (3). While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head boss and the tensioner arm to force the rack and piston back into the tensioner body. The Timing Chain Holder remains in place while the phasers are removed.

Fig. 151: Pin, Rack, Timing Chain Holder & Oil Control Valves
Courtesy of CHRYSLER GROUP, LLC

11. If required, remove the oil control valve (4) and pull the left side exhaust cam phaser off of the camshaft.

12. If required, remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

RIGHT OIL CONTROL VALVES

A multimedia supplement to the instructions contained in this article is available.

then type "A00641418.vid2" into the "Search Channel" box.

2691700

Fig. 152: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 153: Positioning Dial Indicator & Setting #4 Cylinder At Top-Dead-Center Compression Stroke
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, right ignition coils and right cylinder head cover. Refer to **COVER (S), CYLINDER HEAD, REMOVAL**.
2. Remove the left ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL**.

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the number six cylinder ignition coil mount. Position the indicator probe into the number four cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number four cylinder piston at top-dead-center on the compression stroke and set the indicator dial to zero.

Fig. 154: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
 Courtesy of CHRYSLER GROUP, LLC

4. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the left side number four cylinder piston is positioned at top-dead-center on the compression stroke.

3817937

Fig. 155: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

Fig. 156: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
9. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).

Fig. 157: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not insert the Timing Chain Holder into position without first

compressing the tensioner. The Timing Chain Holder is not designed to compress the tensioner and excessive force can damage the timing chain tensioner arm.

10. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert (special tool #10369, Holder, Timing Chain) (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

Fig. 158: Timing Chain Holder, Trim Stick & Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the Timing Chain Holder (1) does not engage or slips from position, wedge a trim stick (2) or equivalent between the front cover and the tensioner arm (3) to push the tensioner arm towards the rear of the engine and then repeat the previous step.

Fig. 159: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

11. If required, remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.
12. If required, remove the oil control valve (2) and pull the right side intake cam phaser off of the camshaft.

INSTALLATION

LEFT OIL CONTROL VALVES

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641418.vid3" into the "Search Channel" box.

Fig. 160: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

3821798

Fig. 161: Positioning Dial Indicator & Setting #4 Cylinder At Top-Dead-Center Compression Stroke
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts.

1. Verify that the indicator dial (1) is set to zero when the left side number four cylinder piston is positioned at top-dead-center on the compression stroke.

Fig. 162: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.

- 2.
3. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

Fig. 163: Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted

by repeating Step 10 of the Removal procedure. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, REMOVAL.**

3821049

Fig. 164: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows

Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

4. Route the cam chain around the left intake cam phaser while aligning the paint mark with the phaser timing mark (1). Press the left intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (7).
5. While maintaining this alignment, route the cam chain around the exhaust cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (4).
6. The **SCRIBE LINES** (5) on the cam phasers should face away from each other and the **ARROWS** (6) should point toward each other and be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1).

Fig. 165: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the Camshaft Phaser Lock (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Tighten the oil control valves (2, 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
9. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.

Fig. 166: Chain Pins, Arrows, Scribe Lines, Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

10. Rotate the crankshaft clockwise two complete revolutions stopping when the left side number four cylinder piston is again positioned at top-dead-center on the compression stroke. To assure correct engine timing, verify the following;
 - The indicator dial is set to **ZERO** when the left side number four cylinder piston is positioned at top-dead-center on the compression stroke.
 - The **SCRIBE LINES** (3) on the left side cam phasers face away from each other.
 - The **ARROWS** (4) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface.
 - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
11. If the engine timing is not correct, repeat this procedure.
12. Install all of the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
13. Install the right ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .
14. Install the left cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
15. Install the upper intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
16. Connect the negative battery cable and tighten nut to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
17. Start the engine and perform the following Powertrain Verification Tests. Refer to appropriate Diagnostic Information .
 - Cam/Crank Variation Relearn
 - Target Coefficient Relearn

NOTE: **Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. For any DTCs that reset, refer to DTC INDEX article .**

RIGHT OIL CONTROL VALVES

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

2820031

Fig. 174: Dual Over Head Camshaft (DOHC) Configuration
Courtesy of CHRYSLER GROUP, LLC

The Pentastar engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design. Each camshaft has a pressed on magnetic timing wheel that is magnetically encoded. The two Camshaft Position (CMP) sensors are located between the timing wheels. Attached to the rear of the right exhaust camshaft is a centrifuge which is part of the crankcase ventilation system.

The centrifuge is used to separate oil droplets from the crankcase gases before they enter the PCV valve. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

OPERATION

OPERATION

2820145

Fig. 175: Right Hand Camshafts

Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshafts shown in illustration, LH camshafts similar.

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

STANDARD PROCEDURE

CAMSHAFT END PLAY

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

NOTE: Cylinder #1 or #4 must be used when checking for Top Dead Center (TDC).

NOTE: Right intake camshaft shown in illustration, other camshafts similar.

Fig. 176: Measuring Camshaft End Play Using Dial Indicator
Courtesy of CHRYSLER GROUP, LLC

2. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point at the front of the engine. Place the probe perpendicular against the Oil Control Valve of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **ENGINE SPECIFICATIONS**.

REMOVAL

LEFT

Fig. 177: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

1. Remove the upper intake manifold, all ignition coils, all spark plugs and left cylinder head cover. Refer to COVER(S), CYLINDER HEAD, REMOVAL.

Fig. 178: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

2. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2). The number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

NOTE: Graphic shows engine timing cover removed for clarity.

Fig. 179: Pin, Rack & Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

4. Using the (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body.

NOTE: The holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LH Camshaft/Phaser Lock.

Fig. 180: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

5. Install the (special tool #10202, Locks, Camshaft/Phaser) (4).
6. Remove the exhaust oil control valve (2) and the intake oil control valve (6).

091074341

Fig. 181: Alignment Marks
Courtesy of CHRYSLER GROUP, LLC

NOTE: The alignment marks located on the camshaft specifies the location of the drive pin in reference to the phaser alignment mark.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

NOTE: DO NOT REMOVE THE PHASER LOCK.

NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed with the notch forward.

2676491

Fig. 182: Camshaft Bearing Cap Bolts Removal Sequence - Left
 Courtesy of CHRYSLER GROUP, LLC

8. Rotate the camshafts counterclockwise to position the alignment holes (1) **approximately 30° before top-dead-center** . This places the camshafts in the neutral position (no valve load).
9. Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.

10. Remove the camshaft bearing caps and the camshafts.

RIGHT

2691700

Fig. 183: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

Fig. 184: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface

Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, all ignition coils, all spark plugs, right cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

Fig. 185: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

4. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert the (special tool #10369, Holder, Timing Chain) (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RH Camshaft/Phaser Lock.

Fig. 186: Camshaft Phaser Lock, Oil Control Valves & Wrench
Courtesy of CHRYSLER GROUP, LLC

5. Install (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).

6. Remove both the intake (2) and exhaust (3) oil control valves.

NOTE: Left side shown in illustration. Right side similar.

091074341

Fig. 187: Alignment Marks
Courtesy of CHRYSLER GROUP, LLC

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

NOTE: DO NOT REMOVE THE PHASER LOCK

2688694

Fig. 188: Camshaft Bearing Cap Bolts Removal Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

- Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed with the notch forward.

NOTE: Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.

- Remove the camshaft bearing caps and the camshafts.

INSPECTION

INSPECTION

2819808

Fig. 189: Inspecting Camshaft Bearing Journals & Cam Lobes
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH intake camshaft shown in illustration, other camshafts similar.

- Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
- Check the surface of the cam lobes (5) for abnormal wear (3). Measure and compare the unworn area (1) to the worn area (2). Replace camshafts that are not within specification. Refer to **ENGINE SPECIFICATIONS**.

INSTALLATION

LEFT

Fig. 190: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 191: Bearing Cap Retaining Bolts Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft journals with clean engine oil.

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

2. Install the left side camshaft(s) with the alignment holes (1) positioned approximately 30° before top-dead-center. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Verify the rocker arms are aligned to the cam lobe. Refer to **ROCKER ARM, VALVE, INSTALLATION**.
4. Install the camshaft bearing caps and hand tighten the retaining bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
5. Tighten the bearing cap retaining bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 192: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the camshafts clockwise to top-dead-center by positioning the alignment holes (1) vertically.

7. Install the timing chain tensioner holder.

Fig. 193: Marks On Timing Chain
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LT Camshaft/Phasers to the camshaft alignment pins.

8. Verify the cam phasers are aligned with the marks (2) made on the timing chain.
9. Install the camshaft phasers onto the camshafts.

Fig. 194: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft

phaser timing mark alignment (1).

11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, INSTALLATION**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

2691700

Fig. 195: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2668733

Fig. 196: Bearing Cap Retaining Bolts Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate camshaft journals with clean engine oil.

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

2. Install the right side camshaft(s) at top-dead-center by positioning the alignment holes (1) vertically. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

NOTE: Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Install the camshaft bearing caps and hand tighten the retaining bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
4. Verify the rocker arms are aligned to the cam lobe

Refer to **ROCKER ARM, VALVE, INSTALLATION**.

5. Tighten the bearing cap retaining bolts in the sequence shown in illustration to the proper specification.

Refer to **TORQUE SPECIFICATIONS** .

Fig. 197: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

6. Verify the alignment holes are vertical to the cylinder head surface.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RT Camshaft/Phasers to the camshaft alignment pins.

Fig. 198: Marks On Timing Chain
Courtesy of CHRYSLER GROUP, LLC

7. Verify the cam phasers (3 and 4) are aligned to the marks (2) made on the timing chain.
8. Install the phasers (3 and 4) onto the camshafts.

9. Install the oil control valves. Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 199: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft phaser timing mark alignment (1).
11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, INSTALLATION**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

COVER(S), CYLINDER HEAD

DESCRIPTION

DESCRIPTION

2819308

Fig. 200: Cylinder Head Covers**Courtesy of CHRYSLER GROUP, LLC**

The cylinder head covers are made of a carbon and fiberglass composite. The cylinder head covers are not interchangeable from side-to-side. The cylinder head covers are sealed with a press-in-place gasket that is designed to isolate the cover from the cylinder head for improved NVH. There are two dowel pins on the outboard side of the cover flange to locate the cover to holes in the cylinder head. RTV is used to seal the T-joint at the timing cover, cylinder head and cylinder head cover.

REMOVAL**LEFT**

Fig. 201: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

1. Remove the engine cover.
2. Evacuate the A/C system. Refer to **STANDARD PROCEDURE** .
3. Disconnect and isolate the negative battery cable.
4. Drain the cooling system.
5. Remove the air cleaner body, resonator and upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 202: Intake Ports, Insulator & Alignment Posts

Courtesy of CHRYSLER GROUP, LLC

6. Cover the open intake ports (1) to prevent debris from entering the engine.
7. Remove the insulator (2) from the LH cylinder head cover.

**Fig. 203: Wire Harness Retainers & Variable Valve Timing Solenoid Connectors**

Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

8. Disconnect the electrical connectors (2) from the variable valve timing solenoids on the left cylinder head cover.
9. Disengage three wire harness retainers (1) from the left cylinder head cover.

Fig. 204: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.
11. Remove the variable valve timing solenoids.

Fig. 205: Engine Coolant Temperature (ECT) Sensor Connector, Camshaft Position (CMP) Sensor & Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the left Camshaft Position (CMP) sensor (5).
13. Disengage one main wire harness retainer (2) from the cylinder head cover and one main wire harness retainer (4) from the cylinder head cover mounting stud.

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

14. Remove the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, REMOVAL** .

Fig. 206: Injection/Ignition Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

15. Disengage two injection/ignition harness retainers (1) from the left cylinder head cover.

Fig. 207: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL** .

Fig. 208: IHx, Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

17. Remove the nut (3) and separate the suction/liquid line manifold (2) from the Internal Heat Exchanger (IHx) (1).

Fig. 209: A/C-To-IHX Lines
Courtesy of CHRYSLER GROUP, LLC

18. Remove the nuts that secure the A/C lines (1) to the IHx.

Fig. 210: Support Nuts, Upper Radiator Hose & Heater Line
Courtesy of CHRYSLER GROUP, LLC

19. Remove the heater line (3) support nuts (1).
20. Disengage the wiring harness (2) and position aside.

Fig. 211: Radiator Inlet Pipe & Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

21. Separate the upper radiator hose (2) from the radiator inlet pipe (1).
22. Remove the front bumper fascia. Refer to **FASCIA, FRONT, REMOVAL**.
23. Raise the vehicle.

24. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
25. Remove the left side catalytic converter. Refer to **CONVERTER, CATALYTIC , REMOVAL** .

Fig. 212: A/C Line Support Brace Nut & Brace
Courtesy of CHRYSLER GROUP, LLC

26. Remove the A/C line support brace nut (1) and position the brace (2) away.

Fig. 213: Intake Manifold Left/Forward Support Bracket & Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

27. Remove the intake manifold left/forward support bracket stud bolt (2).

Fig. 214: Intake Manifold Left/Rearward Support Bracket & Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

28. Remove the intake manifold left/rearward support bracket stud bolt (2).

Fig. 215: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

29. Remove the A/C lines (2) at the A/C compressor (3).
30. Lower the vehicle.

NOTE: The intake manifold support brackets are fastened to the A/C line bracket

and is removed as an assembly.

Fig. 216: A/C Line

Courtesy of CHRYSLER GROUP, LLC

31. Using care. Remove the A/C line (1) from the vehicle.
32. Position the heater line and the cooling system pipe aside.

Fig. 217: Cylinder Head Cover Mounting Bolts & Studbolts

Courtesy of CHRYSLER GROUP, LLC

33. Loosen ten cylinder head cover mounting bolts (1) and two studbolts (2) and remove the cylinder head cover.

2776066

Fig. 218: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

34. Remove and discard the cylinder head cover gasket (1).
35. The spark plug tube seals (2) can be reused if not damaged.

2776075

Fig. 219: RTV Sealant Locations
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

36. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover

mating surfaces. Refer to **ENGINE, STANDARD PROCEDURE** .

RIGHT

2691700

Fig. 220: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2712055

Fig. 221: Upper Intake Manifold & Bolts

15. Loosen nine cylinder head cover mounting bolts (1) and three studbolts (2) and remove the cylinder head cover.

2776066

Fig. 233: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover is shown in illustration, the RH cylinder head cover is similar.

16. Remove and discard the cylinder head cover gasket (1).
17. The spark plug tube seals (2) can be reused if not damaged.

2776075

Fig. 234: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover T-joints are shown in illustration, the RH cylinder head cover T-joints are similar.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

18. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces. Refer to **ENGINE, STANDARD PROCEDURE** .

INSTALLATION

LEFT

Fig. 235: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 236: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.

Fig. 237: Spark Plug Tube Seal & Installer
 Courtesy of CHRYSLER GROUP, LLC

3. If required, install new spark plug tube seals (2) in the cylinder head cover:
 - Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
 - Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).
 - Push the seal into the cylinder head cover until the base of the seal is seated.
 - Remove the tool.

Fig. 238: RTV Sealant Locations
 Courtesy of CHRYSLER GROUP, LLC

4. Clean the timing engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown in illustration.

Fig. 239: Cylinder Head Cover Bolts & Double Ended Studs Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (1) to the cylinder head and install the cylinder head cover.
7. Tighten the cylinder head cover bolts and double ended studs in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
8. If removed, install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
9. Install the ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .

Fig. 240: Injection/Ignition Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

10. Engage two injection/ignition harness retainers (1) to the left cylinder head cover.

NOTE: If both RH and LH CMP sensors were removed, install them into their original locations.

11. Install the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, INSTALLATION**.

Fig. 241: Engine Coolant Temperature (ECT) Sensor Connector, Camshaft Position (CMP) Sensor & Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

12. Connect the electrical connector (5) to the left Camshaft Position (CMP) sensor.

13. Engage one main wire harness retainer (2) to the cylinder head cover and one main wire harness retainer (4) to the cylinder head cover mounting stud.

Fig. 242: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Refer to the markings made at disassembly and install the variable valve timing solenoids (2 and 4) in their original locations.

Fig. 243: Wire Harness Retainers & Variable Valve Timing Solenoid Connectors
Courtesy of CHRYSLER GROUP, LLC

15. Engage three wire harness retainers (1) to the left cylinder head cover.
16. Connect the electrical connectors (2) to the left variable valve timing solenoids.

Fig. 244: A/C Line

Courtesy of CHRYSLER GROUP, LLC

17. Position the A/C line into the vehicle.
18. Raise the vehicle.

Fig. 245: A/C Compressor, IHX Manifold Line & Fasteners

Courtesy of CHRYSLER GROUP, LLC

19. Install the A/C lines (2) onto the compressor (3). Tighten the bolt (1) to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 246: Intake Manifold Left/Rearward Support Bracket & Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

20. Install the intake manifold left/rearward support bracket stud bolt (2).

Fig. 247: A/C Line Support Brace Nut & Brace
Courtesy of CHRYSLER GROUP, LLC

21. Position the A/C line support brace (2) onto the stud bolt. Tighten the nut (1) to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 248: Intake Manifold Left/Forward Support Bracket & Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Install the intake manifold left/forward support bracket stud bolt (2).
23. Install the left side catalytic converter. Refer to CONVERTER, CATALYTIC , INSTALLATION .
24. Install the front bumper fascia. Refer to FASCIA, FRONT, INSTALLATION .
25. Install the belly pan. Refer to BELLY PAN, INSTALLATION .
26. Lower the vehicle.

Fig. 249: Support Nuts, Upper Radiator Hose & Heater Line
Courtesy of CHRYSLER GROUP, LLC

27. Position the heater pipe (3) and the cooling system pipe onto the A/C line support bracket. Tighten the nuts (1) to the proper specification. Refer to **SPECIFICATIONS**.
28. Position the wiring harness (2) to the cylinder head cover stud bolts.

Fig. 250: Radiator Inlet Pipe & Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

29. Install the upper radiator hose (2) to the cooling pipe (1).

Fig. 251: A/C-To-IHX Lines
Courtesy of CHRYSLER GROUP, LLC

30. Install the A/C lines (1) to the Internal Heat Exchanger (IHX). Tighten the nuts (2) to the proper

specification. Refer to **SPECIFICATIONS** .

Fig. 252: IHX, Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

31. Install the A/C lines (2) to the IHX (1). Tighten the nut (3) to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 253: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

32. Install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.
33. Install the upper intake manifold, support brackets, resonator and air cleaner body. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

34. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.
35. Install the engine cover.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

2691700

Fig. 254: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2776066

Fig. 255: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover is shown in illustration, the RH cylinder head cover is similar.

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.

2932247

Fig. 256: Spark Plug Tube Seal & Installer
 Courtesy of CHRYSLER GROUP, LLC

3. If required, install new spark plug tube seals (2) in the cylinder head cover:
 - Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
 - Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool

#10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).

- Push the seal into the cylinder head cover until the base of the seal is seated.
- Remove the tool.

2776075

Fig. 257: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover T-joint is shown in illustration, the RH cylinder head cover T-joint is similar.

4. Clean the engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown in illustration.

2719834

Fig. 258: Cylinder Head Cover Bolts & Double Ended Studs Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (1) to the cylinder head and install the cylinder head cover.
7. Tighten the cylinder head cover bolts and double ended studs in the sequence shown in illustration to 12 N.m (106 in. lbs.).

Fig. 259: Resonator Mounts
Courtesy of CHRYSLER GROUP, LLC

8. Install the two resonator mounts (1) to the studbolts.

250673866

Fig. 260: PCV Valve & Screws

15. Engage three main wire harness retainers (1) to the right cylinder head cover.

Fig. 266: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Refer to the markings made at disassembly and install the variable valve timing solenoids (2 and 4) in their original locations.

Fig. 267: Wire Harness Retainers & Variable Valve Timing Solenoid Connectors
Courtesy of CHRYSLER GROUP, LLC

17. Connect the electrical connectors (2) to the variable valve timing solenoids on the right cylinder head.
18. Engage two wire harness retainers (1) to the right cylinder head cover.

Fig. 268: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

19. If removed, install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

Fig. 269: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Install the upper intake manifold (1), support brackets, resonator and air cleaner body. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
21. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or

components.

LIFTER(S), HYDRAULIC

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC LIFTER(S) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of an NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur. Refer to the following chart for possible causes and correction of a lash adjuster (tappet) type noise.

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level-too high or too low. This may allow aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct the engine oil level.
2. Insufficient running time after rebuilding a cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in the lash adjuster (after 1 hour of run time).	3. See below: (a) Check the lash adjusters for sponginess while installed in the cylinder head. Press down on the rocker arm in a manner that could collapse the lash adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If the lash adjuster(s) are still spongy, replace the lash adjuster(s). Refer to LIFTER(S), HYDRAULIC, REMOVAL .
4. Low oil pressure.	4. See below: (a) Check and correct the engine oil level. (b) Check the engine oil pressure. Refer to LUBRICATION, DIAGNOSIS AND TESTING . (c) Check for excessive main bearing clearance and correct. Refer to BEARING(S), CRANKSHAFT, STANDARD PROCEDURE . (d) Check for a worn oil pump. Refer to PUMP, ENGINE OIL, INSPECTION . Check the camshaft journals and the bearing bores for abnormal wear patterns, scoring, grooving, fatigue, pitting or a foreign material. Refer to CAMSHAFT, ENGINE, REMOVAL .

5. A plugged oil restrictor in the oil passages to the cylinder head(s).	5. Check the cylinder head oil passages for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Measure the valve stem-to-guide clearance. Refer to VALVES, INTAKE AND EXHAUST, INSPECTION .
7. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.	7. See below: (a) Check the camshaft journal and lobe for abnormal wear patterns, scoring, grooving, fatigue, pitting or a foreign material Refer to CAMSHAFT, ENGINE, REMOVAL . (b) Check the rocker arm(s) for proper alignment to the camshaft lobe(s) and valve stem(s) Refer to ROCKER ARM, VALVE, REMOVAL . (c) Check the lash adjuster(s) for proper operation and replace as necessary Refer to LIFTER(S), HYDRAULIC, REMOVAL .
8. Air ingested into the engine oil due to a broken or cracked oil pump pickup tube.	8. Check the pickup tube and replace as necessary. Refer to PICK-UP, OIL PUMP, REMOVAL .
9. Faulty lash adjuster.	9. Replace the lash adjuster(s). Refer to LIFTER(S), HYDRAULIC, REMOVAL .

REMOVAL

REMOVAL

2742108

Fig. 270: Hydraulic Lifters

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to CAMSHAFT, ENGINE, REMOVAL.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s). Refer to ROCKER ARM, VALVE, REMOVAL.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

4. Remove the hydraulic lifter(s) (1).

INSTALLATION

INSTALLATION

2742108

Fig. 271: Hydraulic Lifters

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar. If the hydraulic lifters are being reused, reassemble them into their original locations.

1. Verify that the hydraulic lifters are at least partially full of oil. There should be little or no plunger travel when the hydraulic lifter is depressed.

2. Install the hydraulic lifter(s) (1).

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

3. Install the rocker arm(s). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
4. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
5. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.

ROCKER ARM, VALVE

DESCRIPTION

DESCRIPTION

2804759

Fig. 272: Rocker Arm

Courtesy of CHRYSLER GROUP, LLC

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

REMOVAL

2741091

Fig. 273: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to CAMSHAFT, ENGINE, REMOVAL.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s) (1).

INSPECTION

INSPECTION

80be4670

Fig. 274: Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

Inspect the cam follower assembly for wear or damage. Replace as necessary.

INSTALLATION

INSTALLATION

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641418.vid5" into the "Search Channel" box.

CAUTION: Proper inspection of the rocker arms is required to ensure proper installation. Inspection from the top and also side view is critical to verify the proper seated position of each and every rocker arm. Failure to install the rocker arms correctly may cause severe engine damage.

2741091

Fig. 275: Locating Rocker Arms

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

1. Lubricate the rocker arms with clean engine oil before installation.

NOTE: When placing the rocker arms. The valve stem should fit securely into the rocker arm guides.

2. Position the rocker arm(s) (1) onto the lifter(s) and valve stem(s).

210171394

Fig. 276: Rocker Arm & Lifter

Courtesy of CHRYSLER GROUP, LLC

3. Position the camshaft(s) onto the mounts and install the camshaft caps. Hand tighten the cap retaining bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

NOTE: **If any of the rocker arms are not installed properly. Loosen the camshaft caps and reposition the rocker arms.**

4. Verify that the rocker arm (3) is positioned over the lifter (4).
5. Verify that the rocker arm roller (2) is seated to the camshaft lobe (1).

091673879

Fig. 277: Camshaft Lobe, Rocker Arm Roller, Rocker Arm Guide & Valve Stem
Courtesy of CHRYSLER GROUP, LLC

6. Use a mirror to verify the valve stem (4) is centered between the rocker arm guides (3).
7. Verify the camshaft lobe (1) is centered over the rocker arm roller (2).
8. Tighten the camshaft caps. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

Fig. 278: Valve Stem Oil Seal, Valve Spring & Valve Guide
Courtesy of CHRYSLER GROUP, LLC

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.

REMOVAL

REMOVAL

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations.

1. Remove the valve spring(s) (2). Refer to SPRING(S), VALVE, REMOVAL.

Fig. 279: Valve Guide Seal & Valve Seal Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 5 cylinder exhaust valve guide seal shown in illustration, all other valve guide seals similar.

2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.

Fig. 280: Valve Spring Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 5 cylinder exhaust valve spring seat shown in illustration, all other valve spring seats similar.

3. If required, remove the valve spring seat (1).

4. If required, remove the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.

INSTALLATION**INSTALLATION****Fig. 281: Valve Spring Seat**

Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION**.

NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to **ENGINE SPECIFICATIONS** . Number 5 cylinder exhaust valve shown in illustration, all other valves similar.

2. If removed, install the spring seat (1) over the valve guide.

Fig. 282: Installing Valve Guide Seal
Courtesy of CHRYSLER GROUP, LLC

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

NOTE: If the valve springs are being reused, reassemble them into their original locations.

4. Install the valve spring(s). Refer to **SPRING(S), VALVE, INSTALLATION**.

SPRING(S), VALVE

DESCRIPTION

DESCRIPTION

2814925

Fig. 283: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

The valve springs are a beehive design and made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. Valve guide seals are rubber overmolded on a steel support cylinder with a garter spring at the seal lip. The seals are not integrated with the valve spring seat. The valve spring seat is a flat steel washer. The steel valve spring retainers are designed for use with beehive springs and the valve spring retainer locks are a three bead Butt type design.

REMOVAL

ON VEHICLE

2715130

Fig. 284: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to

the camshaft position sensor.

1. Disconnect and isolate the negative battery cable.
2. Remove both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

2741091

Fig. 285: Locating Rocker Arms

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

NOTE: Only remove the camshafts from one head at a time. The opposite head must remain assembled in order to lock the crankshaft against rotation.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s) (1). Refer to **ROCKER ARM, VALVE, REMOVAL**.

Fig. 286: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshaft phaser lock shown in illustration, LH camshaft phaser lock similar.

CAUTION: Air pressure applied to the cylinder holds the valves in place. This air pressure also has a tendency to force the piston down and rotate the crankshaft. Do not allow the crankshaft to rotate. Crankshaft rotation may damage the timing chain or front timing cover and affect camshaft timing.

4. If removing the LH camshafts, install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5) to lock the crankshaft against rotation. If removing the RH camshafts, install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) to lock the crankshaft against rotation.

Fig. 287: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

5. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
6. Install Valve Spring Compressor (special tool #MD998772A, Compressor, Valve Spring) (2) onto the cylinder head.

CAUTION: Air pressure must be maintained as long as the valve springs are removed to prevent the valves from dropping into the cylinders.

7. Install a spark plug adapter attached to a regulated shop air supply (1). Pressurize the cylinder being serviced to 620.5 - 689 kPa (90 - 100 psi) to hold the valves in place.
8. Using Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (3), compress valve spring (4) and remove valve retaining locks (5).

Fig. 288: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

9. Release the valve spring compressor and remove the valve spring retainer (1) and valve spring (2).
10. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

OFF VEHICLE

Fig. 289: Valve Spring Compressor Components
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.
2. Position the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1).

Fig. 290: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Compress the valve spring (3) and remove the valve retaining locks (4).

Fig. 291: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Release the valve spring compressor and remove the valve spring retainer (1) and valve spring (2).
5. If required, remove the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**.
6. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

Fig. 292: Testing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

When valves have been removed for inspection, reconditioning or replacement, valve springs should be checked against specifications for free-length, spring force and spring installed height. Refer to **ENGINE SPECIFICATIONS**.

Spring force can be measured with a test fixture (2). Follow the tool manufactures instructions. Replace any springs that do not meet specifications.

2756024

Fig. 293: Checking Valve Spring Installed Height

Courtesy of CHRYSLER GROUP, LLC

Installed height of the valve spring must be checked with the valve assembled into the cylinder head. Refer to **SPRING(S), VALVE, INSTALLATION**.

If the valves or valve seats have been refinished and the installed valve spring height (4) is greater than 40.0 mm (1.575 in.). Install a second spring seat (8) in the head counter bore under the original valve spring seat to bring the spring height within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

INSTALLATION

ON VEHICLE

1. If removed, install the spring seat and valve guide seal over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Make sure that the valve spring is intact around the top of the valve guide seal.

Fig. 294: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

2. Install the valve spring (2) and valve spring retainer (1).

Fig. 295: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Compress the valve springs (4) with the Valve Spring Compressor Adapter 10224 (3) mounted in the Valve Spring Compressor C-3422-D (2).
4. Install the valve retaining locks (5) and release the valve spring compressor.
5. Relieve the air pressure from the combustion chamber and remove the spark plug adapter (1).
6. Install the spark plug. Refer to **SPARK PLUG, INSTALLATION** .

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

7. Install the rocker arm(s). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
8. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

OFF VEHICLE

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION**.

NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to **ENGINE SPECIFICATIONS** .

2. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 296: Valve Spring & Valve Spring Retainer

Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

3. Install the valve spring (2) and valve spring retainer (1).

Fig. 297: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

4. Compress valve springs (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compression.

2756024

Fig. 298: Checking Valve Spring Installed Height

Courtesy of CHRYSLER GROUP, LLC

5. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).
6. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

TUBE, SPARK PLUG

REMOVAL

REMOVAL

2715130

Fig. 299: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 300: Spark Plug Tube Installer & Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the ignition coils. Refer to **COIL, IGNITION, REMOVAL**.
3. Using compressed air, blow out any dirt or contaminants from around the top of the spark plugs.
4. Remove the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
5. Install the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (1) into the spark plug tube to be removed (2).

Fig. 301: Locking Pliers & Spark Plug Tube

Courtesy of CHRYSLER GROUP, LLC

6. Using suitable locking pliers (1), remove the spark plug tube (2) from the cylinder head and discard the tube.
7. Clean the area around the spark plug tube mounting with Mopar® Parts Cleaner or equivalent.

INSTALLATION**INSTALLATION****Fig. 302: Magnetic Timing Wheels**

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 303: Spark Plug Tube Installer

Courtesy of CHRYSLER GROUP, LLC

1. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL**.
2. Install the lower half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (1) into the cylinder head and tighten to 17.5 N.m (13 ft. lbs.).

3309595

Fig. 304: Applying Stud & Bearing Mount Bead To Spark Plug Tube

Courtesy of CHRYSLER GROUP, LLC

3. Apply Mopar® Stud and Bearing Mount to the new spark plug tube approximately 3 mm (0.118 in.) from the end of the tube, in a 2 mm (0.078 in.) wide bead (1).

3309874

Fig. 305: Spark Plug Tube, Thrust Washers, Spark Plug Tube Installer & Bolt

Courtesy of CHRYSLER GROUP, LLC

4. Position the spark plug tube (3) on the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (2) and assemble the tool on the cylinder head. Make sure there are two thrust washers (4) installed.

CAUTION: Do not overtighten the bolt (1). Overtightening can damage the cylinder head spark plug threads.

5. Tighten the bolt (1) to draw the spark plug tube into position. When the top half of the tool contacts the bottom half of the tool, the tube is installed.

Fig. 306: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH cylinder head cover shown in illustration, RH cylinder head cover similar.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

6. Install the spark plug. Refer to **SPARK PLUG, INSTALLATION** .
7. If required, install a new spark plug tube seal (2).
8. Install the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**. Connect the negative battery cable and tighten the nut to proper specification. Refer to **SPECIFICATIONS** .

VALVES, INTAKE AND EXHAUST

DESCRIPTION

DESCRIPTION

2819682

Fig. 307: Intake Valve & Exhaust Valve Component Configuration
Courtesy of CHRYSLER GROUP, LLC

The intake valve (6) is made from a one piece forged heat resistant (martensitic) steel. The exhaust valve (7) is a two piece construction with a forged (austenitic) head welded to the (martensitic) stem. Both valves have a nitrided surface treatment to prevent scuffing except at the tip and lock grooves. The four valves per cylinder are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

STANDARD PROCEDURE

REFACING INTAKE AND EXHAUST VALVES

809c3e98

Fig. 308: Valve Face & Seat

Courtesy of CHRYSLER GROUP, LLC

- 1 - SEAT WIDTH
- 2 - FACE ANGLE
- 3 - SEAT ANGLE
- 4 - SEAT CONTACT AREA

The intake and exhaust valves have a 45.25 ± 0.25 degree face angle (1). The valve seats (2) have a 44.75 ± 0.25 degree face angle.

VALVES

2755802

Fig. 309: Inspecting Valve Margin

Courtesy of CHRYSLER GROUP, LLC

Inspect the remaining margin (5) after the valves are refaced. Refer to **ENGINE SPECIFICATIONS**.

VALVE SEATS

809c3e98

Fig. 310: Valve Face & Seat

Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| 1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA |
|---|

NOTE: When refacing the valve seats, it is important that the correct size valve guide pilot be used for the reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.050 mm (0.002 inch.) total indicator reading.

NOTE: Valve seats which are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

2. Check the sealing of the valve(s) to the valve seat(s) on the cylinder head(s):
 - Coat the valve seat (3) **LIGHTLY** with Prussian blue.
 - Install the valve into the cylinder head.

- Rotate the valve onto the valve seat using light pressure.
 - Using care not to wipe the Prussian blue. Remove the valve from the cylinder head.
 - If the blue is transferred to the center of the valve face (4), contact is within specifications.
 - If the blue is transferred to the top edge of the valve face, then lower the valve seat with a 15 degree stone.
 - If the blue is transferred to the bottom edge of the valve face, then raise the valve seat with a 65 degree stone.
3. When the seat is properly positioned. The width of the intake seat should be 1.0 - 1.2 mm (0.04 - 0.05 in.) and the exhaust seats should be 1.41 - 1.61 mm (0.055 - 0.063 in.).

VALVE AND SPRING INSTALLED HEIGHT

2756024

Fig. 311: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valves are being reused, reassemble them into their original locations.

1. Coat the valve stems (2) with clean engine oil and install the valves onto the cylinder head.
2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **ENGINE SPECIFICATIONS**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).
3. If removed, install the spring seat and valve guide seal over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Make sure that the garter spring is intact around the top of the valve guide seal.

Fig. 312: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Install the valve spring (2) and valve spring retainer (1).

Fig. 313: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

5. Compress the valve spring (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compressor.

Fig. 314: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

6. If the valves or valve seats have been refinished and the installed valve spring height (4) is greater than 40.0 mm (1.575 in.). Install a second spring seat (8) in the head counter bore under the original valve spring seat to bring the spring height within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

REMOVAL

REMOVAL

1. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations.

2. Remove the valve spring(s). Refer to **SPRING(S), VALVE, REMOVAL**.

2755802

Fig. 315: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing the valves, remove any burrs from the valve stem retainer lock grooves (2) and stem tip (1) to prevent damage to the valve guides.

3. Remove the valve(s) (3). Identify each valve to ensure installation in the original location.
4. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

VALVES

Fig. 316: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect the retainer lock grooves for wear or damage (2).
3. Inspect the valve face (4) for wear and pitting.
4. Measure the valve stems (3) and margins (5) for wear. Refer to **ENGINE SPECIFICATIONS** .

VALVE GUIDES

Fig. 317: Measuring Valve Guide Wear
Courtesy of CHRYSLER GROUP, LLC

1. Remove carbon and varnish deposits from inside of the valve guides with a reliable guide cleaner.

2. Measure valve stem-to-guide clearance as follows:
3. Install the valve (2) into the cylinder head so that it is 15 mm (0.590 inch.) off of the valve seat. A small piece of hose may be used to hold the valve in place.
4. Attach the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to the cylinder head and set it at a right angle to the valve stem being measured.
5. Move the valve to and from the indicator. Compare this reading to the specification. Refer to **ENGINE SPECIFICATIONS**.

NOTE: If stem-to-guide clearance exceeds specifications, you must measure the valve stem. If the valve stem is within specification or if the valve guide is loose in the cylinder head, replace the cylinder head.

INSTALLATION

INSTALLATION

Fig. 318: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **ENGINE SPECIFICATIONS**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).
3. If removed, install the spring seat and valve guide seal over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Reassemble the valves springs into their original locations. If the valves or valve seats have been refinished, verify that the valve spring installed height is within specification. Refer to **ENGINE SPECIFICATIONS** .

4. Install the valve spring(s). Refer to **SPRING(S), VALVE, INSTALLATION**.
5. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

2824104

Fig. 319: Cylinder Block & Main Bearing Caps
Courtesy of CHRYSLER GROUP, LLC

The cylinder block is a 60 degree high-pressure die cast aluminum design with cast steel cylinder liners. The leading side of the block is on the right side and houses cylinders 1, 3 and 5. The cylinder block is an open deck design with cut slots between each cylinder. Two knock sensors are located in the block valley. The cylinder block has three sets of piston cooling jets which are attached to the main oil gallery. The four powdered metal main bearing caps are a cross-bolted design and have directional arrows molded into the caps. The number 2 main bearing is the location for the two piece upper half thrust bearings. The thrust bearings are installed with the oil grooves facing outward. The main bearing caps are a 6-bolt design and cross-bolted for improved lower end strength. There are three oil drain back drillings located on each of the cylinder banks.

STANDARD PROCEDURE**MEASURING BEARING CLEARANCE USING PLASTIGAGE**

Fig. 320: Plastigage Placed In Lower Shell
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical crankshaft journal shown in illustration.**

Engine crankshaft and connecting rod bearing clearances can be determined by the use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove the oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Plastigage must not crumble in use. If brittle, obtain fresh stock.
3. Torque the bearing cap bolts of the bearing being checked to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

NOTE: **DO NOT rotate the crankshaft. Plastigage will smear, causing inaccurate results.**

801777cc

Fig. 321: Measuring Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod cap shown in illustration.

4. Remove the bearing cap and compare the width of the flattened Plastigage (2) with the scale provided on the package (1). Locate the band closest to the same width. This band shows the amount of clearance. Differences in readings between the ends indicate the amount of taper present or the possibility of foreign material trapped under the bearing insert.
5. Record all readings taken. Compare clearance measurements to. Refer to **ENGINE SPECIFICATIONS** .

Fig. 322: Checking Connecting Rod Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod journal shown in illustration.

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking. Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.

6. Install the proper bearings to achieve the specified bearing clearances.
7. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

CYLINDER BORE DEGLAZING

8086fd41

Fig. 323: Cylinder Bore Crosshatch Pattern
Courtesy of CHRYSLER GROUP, LLC

Before deglazing, mask the crankcase area to keep abrasive materials from entering the engine lower end. Tape off any openings to prevent abrasive material from entering the coolant and oil circuits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

1. Select an appropriate size flexible ball hone.
2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. About 20-60 strokes, depending on the condition of the cylinder bore, will be sufficient to provide a satisfactory surface. Use a light **honing** oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

3. Deglazing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should intersect at 30° to 60° inclusive angle for proper seating of rings.
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle (1). The number of up and down strokes per minute can be regulated to get the desired 30° to 60° inclusive angle (2). Faster up and down strokes increase the crosshatch angle.
5. After deglazing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting. Upon completion,

perform a visual inspection of the cylinder block passages to inspect for abrasive debris. If any debris is found, repeat the cleaning process.

NOTE: Cylinder bore diameter should not increase more than 20 microns during deglazing process from original nominal bore diameter, if the maximum of 20 microns is exceeded, the cylinder block must be replaced. If deglazing the cylinder bore cannot remove the light scratches and scuffs the cylinder block should be replaced.

INSPECTION

INSPECTION

2767936

Fig. 324: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CRANKSHAFT, STANDARD PROCEDURE**.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage the engine block must be replaced.

Fig. 325: Measuring Cylinder Bore Diameter
 Courtesy of CHRYSLER GROUP, LLC

9. Use the Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
12. Determine taper by subtracting the smaller diameter from the larger diameter.
13. Rotate the Cylinder Indicator 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specification. Refer to **ENGINE SPECIFICATIONS**.
14. Determine out-of-roundness by comparing the difference between A and B at each of the three levels. Verify that the maximum out of round is within specification. Refer to **ENGINE SPECIFICATIONS**.
15. If cylinder bore taper and out-of-roundness are within specification, the cylinder bore can be honed. Refer to **ENGINE SPECIFICATIONS**. If the cylinder bore taper or out-of-round condition exceeds the maximum limits, the cylinder block must be replaced.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

BEARING(S), CONNECTING ROD

STANDARD PROCEDURE

CONNECTING ROD BEARING FITTING

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.

2767957

Fig. 326: Crankshaft Main Bearing Journal Diameter Grade Markings & Connecting Rod Bearing Journal Diameter Grade Markings

Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings are "select fit" to achieve proper oil clearance. Connecting rod bearing journal diameter grade markings (2) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4, 5, 6. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal.

Connecting rod bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the three crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	58.9910 - 58.9969 mm (2.3225 - 2.3227 in.)
2	58.9970 - 59.0029 mm (2.3227 - 2.3229 in.)
3	59.0030 - 59.0090 mm (2.3229 - 2.3232 in.)

2789568

Fig. 327: Connecting Rod Bearing Shells & Bearing Size

Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

The connecting rod bearing shells (1) are marked with the bearing size (2) on the bearing lining surface. The bearings are available in three different sizes in order to achieve the desired oil clearance.

Rod bearing shells are available in three sizes. The chart below identifies the three bearing sizes.

Bearing Marking	Size mm (in.)
1	1.583 - 1.580 mm (0.0623 - 0.0622 in.)
2	1.580 - 1.577 mm (0.0622 - 0.0621 in.)
3	1.577 - 1.574 mm (0.0621 - 0.0620 in.)

CONNECTING ROD BEARING REPLACEMENT

2769568

Fig. 328: Connecting Rod Bearing Shells & Bearing Size
 Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings (1) can be serviced in-vehicle. They must be replaced one-at-a-time in order to prevent the pistons from contacting the valves. The connecting rod bearings are "select fit" to achieve proper oil clearances. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE** .

2778047

Fig. 329: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
3. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and

remove the windage tray (1).

811318c8

Fig. 330: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

5. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

Fig. 331: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. Inspect the rods and bearings for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining. Refer to **ENGINE BLOCK, INSPECTION**.
10. If required, check the connecting rod bearing clearances by the use of Plastigage or equivalent. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.
11. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
12. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the

rod. Lubricate the bearing surface with clean engine oil.

13. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

14. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

15. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
16. If required, check the connecting rod side clearance. Refer to **ROD, PISTON AND CONNECTING, STANDARD PROCEDURE**.
17. Repeat the previous steps for each connecting rod bearing being replaced.

Fig. 332: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

18. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 333: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.
20. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
21. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION**.
22. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
23. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.
24. Operate the engine until it reaches normal operating temperature.

BEARING(S), CRANKSHAFT

STANDARD PROCEDURE

MAIN BEARING FITTING

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.

2767957

Fig. 334: Crankshaft Main Bearing Journal Diameter Grade Markings & Connecting Rod Bearing Journal Diameter Grade Markings
 Courtesy of CHRYSLER GROUP, LLC

The upper and lower main bearings are "select fit" to achieve proper oil clearances. Crankshaft main bearing journal diameter grade markings (1) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Crankshaft main bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the five crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	71.9870 - 71.9905 mm (2.8341 - 2.8343 in.)
2	71.9906 - 71.9941 mm (2.8343 - 2.8344 in.)
3	71.9942 - 71.9977 mm (2.8344 - 2.8345 in.)
4	71.9978 - 72.0013 mm (2.8346 - 2.8347 in.)
5	72.0014 - 72.0050 mm (2.8347 - 2.8348 in.)

Fig. 335: Engine Block Main Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

Engine block main bearing journal diameter grade markings (2) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Engine block main bearing journal grade markings correspond to specific journal diameters. The chart below identifies the five engine block grade markings and their associated journal diameters.

Engine Block Marking	Journal Size mm (in.)
1	77.0055 - 77.0090 mm (3.0317 - 3.0318 in.)
2	77.0019 - 77.0054 mm (3.0316 - 3.0317 in.)
3	76.9983 - 77.0018 mm (3.0314 - 3.0316 in.)
4	76.9947 - 76.9982 mm (3.0313 - 3.0314 in.)
5	76.9910 - 76.9946 mm (3.0311 - 3.0313 in.)

For upper and lower main bearing selection, obtain the grade identification marks from the crankshaft and engine block. Main bearings are available in five sizes. Upper and lower sizes can be mixed on a journal in order to achieve the desired oil clearance. The chart below identifies the five sizes available and how they should be selected based on crankshaft and engine block grade markings.

Engine Block Marking	Crankshaft Marking				
	1	2	3	4	5
1	1/1	1/2	2/2	2/3	3/3
2	1/2	2/2	2/3	3/3	3/4
3	2/2	2/3	3/3	3/4	4/4
4	2/3	3/3	3/4	4/4	4/5
5	3/3	3/4	4/4	4/5	5/5
UPPER/LOWER Main Bearings to Achieve 0.024 - 0.050 mm (0.0009 - 0.0020)					

in.) Oil Clearance

2787936

Fig. 336: Main Bearing Inserts

Courtesy of CHRYSLER GROUP, LLC

The upper main bearing shell (2) and lower main bearing shell (1) are marked with the bearing size (3) on the bearing lining surface. The upper and lower bearings are available in five different sizes and can be mixed on a journal in order to achieve the proper oil clearance.

Upper and lower main bearing shells are available in five sizes. The chart below identifies the five bearing sizes.

Bearing Marking	Size mm (in.)
1	2.4951 - 2.4987 mm (0.0982 - 0.0984 in.)
2	2.4915 - 2.4951 mm (0.0981 - 0.0982 in.)
3	2.4879 - 2.4915 mm (0.0979 - 0.0981 in.)
4	2.4843 - 2.4879 mm (0.0978 - 0.0979 in.)
5	2.4807 - 2.4843 mm (0.0977 - 0.0978 in.)

MAIN BEARING REPLACEMENT

**Fig. 337: Main Bearing Identification**

Courtesy of CHRYSLER GROUP, LLC

The main bearings are serviced in-vehicle. They must be replaced one-at-a-time in order to properly support the crankshaft. The upper and lower main bearing shells are NOT interchangeable. The upper and lower main bearings are "select fit" to achieve proper oil clearances. Refer to **BEARING(S), CRANKSHAFT, STANDARD PROCEDURE**.

1. Disconnect and isolate the negative battery cable.

**Fig. 338: Main Bearing Cap Bolts From Windage Tray Removal Sequence**

Courtesy of CHRYSLER GROUP, LLC

2. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL,**

REMOVAL.

3. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

Fig. 339: Main Bearing Tie Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

4. Remove the eight main bearing tie bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

5. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one main bearing at a time while all other main bearing caps remain properly tightened. If all main bearing caps are removed, the weight of the unsupported crankshaft will damage the crankshaft oil seals.

NOTE: Replace the main bearings in the following order; 2, 3, 1, 4.

6. Remove the two cap bolts (2) and remove the main bearing cap (1).
7. When removing the No. 2 bearing cap, also remove the thrust washers (5).
8. Slide the upper main bearing half (6) out from between the crankshaft and the engine block.
9. Inspect the crankshaft and bearings for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining. Refer to **ENGINE BLOCK, INSPECTION** .
10. If required, check the crankshaft bearing clearances by the use of Plastigage or equivalent. Refer to **ENGINE BLOCK, INSPECTION** .
11. If required, select fit new main bearings to the engine block. Refer to **BEARING(S), CRANKSHAFT, STANDARD PROCEDURE** .
12. Lubricate the upper main bearing half (6) with clean engine oil and slide the bearing into position.

Fig. 341: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

13. When installing the thrust washers (1) at the No. 2 main bearing location, use the following procedure:
 - a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
 - b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

Fig. 342: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

14. Check the main bearing cap bolts for necking by holding a scale or straight edge against all of the threads. If all of the threads do not contact the scale (2) the bolt must be replaced.

Fig. 343: Main Bearing Caps, Bolts, Crankshaft & Engine Block
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

15. Lubricate and install the lower bearing half (3) onto the main cap (1).
16. Install the main bearing cap (1) with two inner main bearing cap bolts (2). Tightened to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
17. Repeat the previous steps for main bearings 3, 1 and 4.
18. Measure crankshaft end play. Refer to **CRANKSHAFT, STANDARD PROCEDURE**.

Fig. 344: Windage Tray With Main Bearing Cap Bolts Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

19. Position the windage tray on to the engine block.

20. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 345: Main Bearing Tie Bolts Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

21. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
22. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION** .
23. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION** .
24. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
25. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .
26. Operate the engine until it reaches normal operating temperature.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

2824124

Fig. 346: Crankshaft**Courtesy of CHRYSLER GROUP, LLC**

The crankshaft is a cast design and is constructed using ductile iron. The crankshaft is a three throw split pin design with counterweights for balancing purposes. The main journals are cross drilled for rod bearing lubrication. The crankshaft is supported by four select fit main bearings with number 2 serving as the thrust washer location. The rear counterweight has provisions for crankshaft position sensor target wheel mounting. Both the front and rear seals are a single piece design and are mounted to the timing cover and cylinder block.

STANDARD PROCEDURE**STANDARD PROCEDURE - END PLAY**

Fig. 347: Checking Crankshaft End Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine shown in illustration.

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the crankshaft.
2. Move the crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the crankshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **ENGINE SPECIFICATIONS**.

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

REMOVAL

REMOVAL

Fig. 348: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

1. Remove the engine. Refer to **REMOVAL**.
2. Remove the cylinder head covers, spark plugs, oil pan, engine timing cover, timing chain and sprockets. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.
3. Remove the flexplate and the rear crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.
4. Remove the oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

811318c8

Fig. 349: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

2778313

Fig. 350: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod caps (4). Discard the cap bolts.
8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

9. Push the connecting rod and piston into the cylinder until the connecting rod is clear of the crankshaft journal. Remove the guide pins. Repeat this procedure at each cylinder until all of the connecting rods are clear of the crankshaft.

Fig. 351: Main Bearing Tie Bolts Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

Remove the main bearing cross bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

10. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

Fig. 352: Main Bearing Cap Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

11. Remove the eight main bearing cap bolts in the sequence shown in illustration and remove the main bearing caps.

Fig. 353: Target Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rest the crankshaft on the target wheel (1). Damaged or bent

target wheel teeth will destroy the target wheels ability to correctly relay crankshaft position to the crankshaft position sensor.

12. Remove the crankshaft from the engine block.
13. If required, remove the four bolts (2) and the target wheel (1). Discard the four bolts.

INSPECTION

INSPECTION

Fig. 354: Measuring Crankshaft Journal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal measurements shown in illustration.

1. Clean the oil off the bearing journals.
2. Determine the maximum diameter of the journals with a micrometer. Measure at two locations 90° apart at each end of the journals.
3. Compare the measured rod journal diameter to the crankshaft connecting rod bearing journal diameter grade marking chart. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal that will provide the proper oil clearance.
4. Compare the measured main bearing journal diameter to the crankshaft main bearing journal diameter grade marking chart. Refer to **BEARING(S), CRANKSHAFT, STANDARD PROCEDURE**. Obtain the main bearing journal grade identification marks from the engine block and select the upper and lower main bearing sizes that will provide the proper oil clearance.
5. For connecting rod journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **ENGINE SPECIFICATIONS**.
6. For main bearing journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **ENGINE SPECIFICATIONS**.

INSTALLATION

INSTALLATION

2792895

Fig. 355: Target Wheel & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. If required, select and fit new crankshaft main bearings to the engine block. Refer to **BEARING(S), CRANKSHAFT, STANDARD PROCEDURE** .
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE** .
3. If removed, install the target wheel (1) to the crankshaft with four new bolts (2). Ensure the threaded holes in the crankshaft are free of residual thread lock adhesive. Tighten the bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

2792286

Fig. 356: Main Bearing Caps, Bolts, Crankshaft & Engine Block

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

4. If removed, lubricate and install the upper main bearing halves (6) into the engine block (7).

CAUTION: When installing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

5. Install the crankshaft (4) into the engine block (7).

Fig. 357: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

6. Installing thrust washers (1) at the No. 2 main bearing location, using the following procedure:
 - a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
 - b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

Fig. 358: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

7. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 359: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

8. If removed, lubricate and install the lower main bearing halves (3) onto the main caps (1).
9. Install the main bearing caps (1) with two inner main bearing cap bolts (2).

Fig. 360: Inner Main Bearing Cap Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the inner main bearing cap bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
11. Measure crankshaft end play. Refer to **CRANKSHAFT, STANDARD PROCEDURE**.

Fig. 361: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

12. If removed, install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
13. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install

the Guide Pins to the connecting rod.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

14. Pull the connecting rod and piston toward the crankshaft until the connecting rod is seated on the crankshaft journal. Remove the guide pins.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

15. If removed, install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

16. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
- 17.
18. If required, check the connecting rod side clearance. Refer to **ROD, PISTON AND CONNECTING, STANDARD PROCEDURE**.
19. Repeat the previous steps for the remaining connecting rods.

Fig. 362: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

20. Install the windage tray (1) with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 363: Main Bearing Tie Bolts Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

21. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
22. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
23. Install the rear crankshaft oil seal and flexplate. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION**.
24. Install the timing chain and sprockets, engine timing cover, oil pans, spark plugs and cylinder head covers. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.
25. Install the engine. Refer to **INSTALLATION**.
26. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
27. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .
28. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
29. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

DAMPER, VIBRATION

REMOVAL

REMOVAL

Fig. 364: Crankshaft Vibration Damper & Vibration Damper Holder
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

NOTE: **A force greater than 350 N.m (260 ft. lbs.) may be required to remove the crankshaft vibration damper bolt.**

2. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198, Holder, Vibration Damper) (2) and remove the crankshaft vibration damper bolt.
3. Pull the crankshaft vibration damper (1) off of the crankshaft.

INSTALLATION

INSTALLATION

2741078

Fig. 365: Front Crankshaft Seal Surface

1. Apply a light coating of engine oil to the front crankshaft seal surface (1).

2739215

Fig. 366: Crankshaft Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Align the crankshaft vibration damper (1) to the flywheel key on the crankshaft and install the damper. Seat the damper on the crankshaft sprocket.
3. Install and hand tighten the crankshaft vibration damper bolt (2).

Fig. 367: Crankshaft Vibration Damper & Vibration Damper Holder
 Courtesy of CHRYSLER GROUP, LLC

4. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198, Holder, Vibration Damper) (2) and tighten the crankshaft vibration damper bolt to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
5. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

FLEXPLATE

REMOVAL

REMOVAL

Fig. 368: Flexplate, Spacer Plate & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Remove the bolts (1) that secure the flexplate to the crankshaft.
3. Remove the flexplate (3).

INSTALLATION

INSTALLATION

Fig. 369: Flexplate, Spacer Plate & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate (3) onto the crankshaft.
2. Install the bolts (1) hand tight.
3. Tighten the flexplate retaining bolts to the proper specification in a criss-cross pattern. Refer to **TORQUE SPECIFICATIONS** .
4. Install the transmission. Refer to **INSTALLATION** .

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE-PISTON RING FITTING

Fig. 370: Measuring Piston Ring End Gap
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the cylinder bore clean.
2. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder to a position 12 mm (0.50 in.) from the bottom of the cylinder bore.
3. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.

Ring Position	Ring End Gap
No. 1 (top) Ring	0.22 - 0.37 mm (0.009 - 0.015 in.)
No. 2 (center) Ring	0.27 - 0.42 mm (0.011 - 0.017 in.)
Oil Control Ring (Steel Rail)	0.15 - 0.66 mm (0.006- 0.26 in.)

Fig. 371: Checking Piston Ring Grooves Clearances
Courtesy of CHRYSLER GROUP, LLC

4. Clean the piston ring grooves. Remove any nicks or burrs.
5. Measure the ring side clearance as shown in illustration. Make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.

Ring Position	Ring Side Clearance
No. 1 (top) Ring	0.025 - 0.033 mm (0.0010 - 0.0013 in.)
No. 2 (center) Ring	0.030 - 0.078 mm (0.0012 - 0.0031 in.)
Oil Control Ring (Steel Rails)	0.007 - 0.173 mm (.0003 - 0.0068 in.)

REMOVAL

REMOVAL

Fig. 372: Piston Ring Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. Remove the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, REMOVAL**.

CAUTION: To avoid damage to the piston rings, they must be removed in the following order:

- No. 1 (upper) piston ring (1)
- No. 2 (intermediate) piston ring (2)
- Oil ring upper side rail (3)
- Oil ring lower side rail (4)
- Oil ring expander (5)

Fig. 373: Removing/Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

2. Remove the No. 1 (upper) piston ring using a ring expander tool.
3. Remove the No. 2 (intermediate) piston ring using a ring expander tool.

Fig. 374: Removing/Installing Piston Ring Side Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to remove the oil ring side rails.

4. Remove the oil ring upper side rail.
5. Remove the oil ring lower side rail.
6. Remove the oil ring expander (1).

INSTALLATION

INSTALLATION

Fig. 375: Piston Ring Removal/Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. If required, fit new rings to the piston. Refer to **RING(S), PISTON, STANDARD PROCEDURE**.

CAUTION: To avoid damage to the piston rings, they must be installed in the following order:

- Oil ring expander (5)
- Oil ring lower side rail (4)
- Oil ring upper side rail (3)
- No. 2 (intermediate) piston ring (2)
- No. 1 (upper) piston ring (1)

Fig. 376: Removing/Installing Piston Ring Side Rail

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to install the oil ring side rails.

2. Install the oil ring expander (1).
3. Install the oil ring lower side rail by placing one end between the piston ring groove and the oil ring expander. Hold this end firmly and press down the portion to be installed until the side rail is in position.
4. Install the oil ring upper side rail in the same manner as the lower side rail.

2791400

Fig. 377: Dot Marks On Piston Rings

Courtesy of CHRYSLER GROUP, LLC

NOTE: The No. 1 (upper) piston ring (1) and No. 2 (intermediate) piston ring (3) have a different cross section. Install the rings with manufacturers I.D. mark (dot) (2) facing up, towards the top of the piston.

Fig. 378: Removing/Installing Upper & Intermediate Rings
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

5. Install the No. 2 (intermediate) piston ring using a ring expander tool.
6. Install the No. 1 (upper) piston ring using a ring expander tool.
7. Rotate the rings around the piston, the rings must rotate in the grooves with out binding.

Fig. 379: Piston Ring End Gap Position
 Courtesy of CHRYSLER GROUP, LLC

8. Position the piston ring end gaps as follows:
 - Oil ring expander gap (5)
 - Oil ring lower side rail end gap (4)
 - Oil ring upper side rail end gap (1)
 - No. 2 (intermediate) ring end gap (5)

- No. 1 (upper) ring end gap (2)
9. Install the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, INSTALLATION**.

ROD, PISTON AND CONNECTING**DESCRIPTION****DESCRIPTION**

0911009495

Fig. 380: Piston & Connecting Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are a lightweight design with ultra low tension piston rings for improved fuel economy. The pistons are made of a high strength aluminum alloy and the piston skirt has a Moly® coating. The top piston ring land has an anodized coating for improved wear. The piston is connected to the rod using a full floating pin with two locking clips. The connecting rod is forged steel with a bolted cracked cap design. The connecting rod bolts are not reusable. Pistons are available in two different diameters with grade markings for each bore indicated on the side of the cylinder block. The upper compression ring is a 1.2 mm steel ring with a spray coating. The intermediate compression ring is 1.2 mm micro Napier design. Both compression rings have a dot or a mark on the piston ring. The marked side of the ring must face the top of the piston. The 2 mm three piece oil control ring is very thin. These are chrome plated rings and have a stainless steel expander.

STANDARD PROCEDURE

PISTON FITTING

Fig. 382: Engine Block Main Bearing Journal Diameter Grade Markings
 Courtesy of CHRYSLER GROUP, LLC

The pistons are "select fit" to achieve proper oil clearance. Engine block cylinder bore diameter grade markings (1) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with cylinder number 1, 2, 3, 4, 5, 6.

Engine block cylinder bore diameter grade markings correspond to specific cylinder bore diameters. The chart below identifies the two engine block grade markings and their associated cylinder bore diameters.

Engine Block Marking	Cylinder Bore Size mm (in.)
1	90.995 ± 0.005 mm (3.58248 ± 0.0002 in.)
2	91.005 ± 0.005 mm (3.58287 ± 0.0002 in.)

Fig. 383: Piston Markings

Courtesy of CHRYSLER GROUP, LLC

The piston is marked with the piston size (1) on the piston crown. The pistons are available in two different sizes in order to achieve the desired oil clearance. Select the piston size that corresponds to the engine block cylinder bore diameter grade markings for each cylinder.

The chart below identifies the two piston sizes.

Piston Marking	Size mm (in.)	
	Metal to Metal	Metal to Coating
1	90.995 ± 0.005 mm (3.7793 ± 0.0002 in.)	90.970 - 91.000 mm (3.7783 - 3.7795 in.)
2	90.965 ± 0.005 mm (3.7781 ± 0.0002 in.)	90.980 - 91.010 mm (3.7787 - 3.7835 in.)

0911009492

Fig. 384: Piston Components

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

The coated pistons are serviced with the piston pin and connecting rod pre-assembled. The coating material (6) is applied to the piston after the final piston machining process. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

CONNECTING ROD SIDE CLEARANCE

DIAL INDICATOR

Fig. 385: Measuring Connecting Rod Side Clearance
 Courtesy of CHRYSLER GROUP, LLC

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point on the engine. Locate the probe perpendicular to and resting against the connecting rod cap being checked.
2. Move the connecting rod all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the connecting rod forward to the limit of travel and read the dial indicator. Compare the measured side clearance to the proper specification. Refer to **ENGINE SPECIFICATIONS**.
5. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

FEELER GAUGE

Fig. 386: Measuring Gap Between Connecting Rod & Crankshaft Journal Flange
 Courtesy of CHRYSLER GROUP, LLC

1. Slide a snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Compare the measured side clearance to the proper specification. Refer to **ENGINE SPECIFICATIONS**.
2. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

REMOVAL

REMOVAL

Fig. 387: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pans, engine timing cover and cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.
3. Remove the engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

#11318c8

Fig. 388: Connecting Rod To Cylinder Identification

Courtesy of CHRYSLER GROUP, LLC

5. If necessary, remove the top ridge of the cylinder bores with a reliable ridge reamer before removing the pistons from the engine block. **Be sure to keep the tops of pistons covered during this operation.** Pistons and connecting rods must be removed from the top of the engine block. When removing piston and connecting rod assemblies from the engine, rotate the crankshaft clockwise so that each connecting rod is centered in the cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

Fig. 389: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Remove the piston and connecting rod (1) from cylinder bore.
10. Repeat the previous steps for each piston being removed.
11. Immediately after piston and connecting rod removal, reinstall the bearing cap (4) on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
12. If required, remove the piston rings. Refer to **RING(S), PISTON, REMOVAL**.
13. Repeat the previous steps for each piston being removed.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

2789568

Fig. 390: Connecting Rod Bearing Shells & Bearing Size
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the inserts (1) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.

811318c8

Fig. 391: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

6. Inspect the connecting rod bearing bores for signs of scoring, nicks and burrs.

NOTE: Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment.

7. Replace misaligned, bent or twisted connecting rods.

NOTE: Connecting rods are serviced with the piston pre-assembled. The pistons are "select fit" to achieve proper oil clearance. Refer to ROD, PISTON AND CONNECTING, STANDARD PROCEDURE .

0911009492

Fig. 392: Piston Components

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

8. Inspect the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.
9. Check the piston for taper and out of round shape.

NOTE: The coating material (6) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY** . Refer to **ENGINE BLOCK, INSPECTION** .

10. Compare the measured cylinder bore diameter to the engine block cylinder bore grade marking chart. Select the piston size that corresponds to the engine block markings for each cylinder to provide the proper oil clearance. Refer to **ROD, PISTON AND CONNECTING, STANDARD PROCEDURE** .

NOTE: Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

NOTE: The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

INSTALLATION

INSTALLATION

1. If required, select and fit new piston and connecting rod assemblies to the engine block. Refer to **ROD, PISTON AND CONNECTING, STANDARD PROCEDURE** .
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE** .
3. If required, hone the cylinder bores. Refer to **ENGINE BLOCK, STANDARD PROCEDURE** .
4. If removed, install the piston rings. Refer to **RING(S), PISTON, INSTALLATION**.

RR09B48

Fig. 393: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

5. Position the piston ring end gaps as follows:
 - Oil ring expander gap (5)
 - Oil ring lower side rail end gap (4)
 - Oil ring upper side rail end gap (1)
 - No. 2 (intermediate) ring end gap (5)
 - No. 1 (upper) ring end gap (2)

Fig. 394: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

NOTE: Ensure the position of the ring end gaps does not change when installing the ring compressor.

6. Lubricate the piston rings with clean engine oil. Position Piston Compressor (special tool #C-385, Compressor, Piston) (2) over the piston and rings. Tighten the compressor (2).

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

7. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being installed.

Fig. 395: Piston Installation Position
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right cylinder bank shown in illustration, left cylinder bank similar.

9. The pistons crowns are stamped with a mark (1) indicating installation position. This mark must be positioned toward the front of engine on both cylinder banks.
10. Wipe the cylinder bore clean and lubricate with clean engine oil.
11. Rotate the crankshaft until the connecting rod journal is on the center of cylinder bore.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

12. Insert the piston and connecting rod into the cylinder bore and carefully position the guide pins over the crankshaft journal.
13. Tap the piston down in the cylinder bore using a hammer handle while guiding the connecting rod into position over the rod journal.

Fig. 396: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

14. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

15. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
16. If required, check the connecting rod side clearance. Refer to **ROD, PISTON AND CONNECTING, STANDARD PROCEDURE**.
17. Repeat the previous steps for each piston being installed.

Fig. 397: Checking Cylinder Head Bolts For Stretching (Necking)

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

18. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 398: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
20. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
21. Install the cylinder heads, engine timing cover and oil pans. Refer to **CYLINDER HEAD, INSTALLATION**.
22. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
23. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .
24. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
25. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

Fig. 399: Sleeve & Flywheel Key
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .
2. Remove the crankshaft vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.
3. Install the sleeve (2) from Seal Remover (special tool #8511, Remover, Seal) around the flywheel key (1) and onto the nose of the crankshaft.

Fig. 400: Seal Remover & Front Crankshaft Oil Seal
 Courtesy of CHRYSLER GROUP, LLC

4. Thread the Seal Remover (special tool #8511, Remover, Seal) (1) into the front crankshaft oil seal (2).

Fig. 401: Extractor Screw, Seal Remover & Front Crankshaft Oil Seal
Courtesy of CHRYSLER GROUP, LLC

5. Install the extractor screw (2) into the Seal Remover (special tool #8511, Remover, Seal) (1). Hold the seal remover stationary and tighten the extractor screw against the sleeve until the front crankshaft oil seal (3) is removed from the engine timing cover.

INSTALLATION

INSTALLATION

Fig. 402: Front Crankshaft Seal Installer & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the front crankshaft oil seal (3) to engine timing cover.
2. Align the Front Crankshaft Seal Installer (special tool #10199, Installer, Crankshaft Front Oil Seal) (1) to

the flywheel key on the crankshaft and against the front crankshaft oil seal (3).

CAUTION: Only tighten the crankshaft vibration damper bolt until the oil seal is seated in the cover. Overtightening of the bolt can crack the front timing cover.

3. Install and tighten the crankshaft vibration damper bolt (2) until the crankshaft oil seal is seated in the engine timing cover.
4. Install the crankshaft vibration damper. Refer to **DAMPER, VIBRATION, INSTALLATION**.
5. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

1. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.

CAUTION: Do not attempt to support the weight of the engine on the windage tray. The windage tray is a thin cast aluminum construction and can be easily damaged.

2. Support the rear of the engine with a screw-jack when removing the transmission. Position the support on the engine oil pan flange and not the windage tray.
3. Remove the transmission. Refer to **REMOVAL**.
4. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL**.

0913009538

Fig. 403: Seal Retainer & Attaching Screws

Courtesy of CHRYSLER GROUP, LLC

NOTE: The rear crankshaft oil seal is incorporated into the seal retainer (2) and can not be removed from the retainer. The rear crankshaft oil seal and seal retainer (2) are serviced as an assembly.

5. Remove the eight seal retainer attaching screws (1).
6. Remove and discard the seal retainer (2).

INSTALLATION**INSTALLATION**

2754463

Fig. 404: Rear Crankshaft Oil Seal, Retainer & Seal Protector

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rear crankshaft oil seal (2) and retainer (1) are an assembly. To avoid damage to the seal lip, DO NOT remove the seal protector (3) from the rear crankshaft oil seal before installation onto the engine.

CAUTION: Whenever the crankshaft is replaced, the rear crankshaft oil seal must also be replaced. Failure to do so may result in engine fluid leakage.

Fig. 405: Oil Seal Retainer Assembly & Seal Protector
 Courtesy of CHRYSLER GROUP, LLC

1. Inspect the crankshaft to make sure there are no nicks or burrs on the seal surface.
2. Clean the engine block sealing surfaces thoroughly.

NOTE: It is not necessary to lubricate the seal or the crankshaft when installing the seal retainer. Residual oil following installation can be mistaken for seal leakage.

3. Carefully position the oil seal retainer assembly (2), and seal protector (1) on the crankshaft and push firmly into place on the engine block (during this step, the seal protector will be pushed from the rear oil seal assembly as a result of installing the rear oil seal).

Fig. 406: Rear Seal Installed

Courtesy of CHRYSLER GROUP, LLC

4. Verify that the seal lip (2) on the retainer is uniformly curled inward toward the engine on the crankshaft (1).

0913009538

Fig. 407: Seal Retainer & Attaching Screws

Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure that the seal retainer flange is flush with the engine block oil pan sealing surface.

5. Install the eight seal retainer bolts (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
6. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION**.
7. Install the transmission. Refer to **INSTALLATION** .
8. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
9. Fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .

INSULATOR, ENGINE MOUNT, RIGHT

REMOVAL

REMOVAL

1. Remove the air filter body. Refer to **BODY, AIR CLEANER, INSTALLATION**.

Fig. 418: Clean Air Hose & Clamps
Courtesy of CHRYSLER GROUP, LLC

2. Remove the coolant return line retainer from the clean air hose.
3. Remove the clean air hose (2) from the resonator.
4. Remove the overflow bottle from the mount and position aside.
5. Raise the vehicle.
6. Remove the belly pan. Refer to **BELLY PAN, REMOVAL**.
7. Lower the vehicle.
8. Carefully position a floor jack under the engine for support.

Fig. 419: Removing/Installing Right Engine Mount Assembly
Courtesy of CHRYSLER GROUP, LLC

9. Remove the engine mount (1) to frame bolts (4).
10. Loosen the engine mount to strut tower bolt (5).
11. Remove the center engine mount to engine bracket bolt (3).
12. Remove the outer engine mount to engine bracket bolts (2).

Fig. 420: Engine Mount Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. If required, remove the engine mount bracket (1) to timing cover bolts (2).

INSTALLATION

INSTALLATION

Fig. 421: Engine Mount Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the right engine mount bracket (1) and tighten the bolts (2, 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 422: Removing/Installing Right Engine Mount Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Position the right engine mount isolator (1):
 - Align the engine so that the engine mount bracket is flush against the engine mount.
 - Hand tighten the center engine mount to engine bracket bolt (3).
 - Hand tighten the outer engine mount to engine bracket bolts (2).
 - Hand start the engine mount to strut tower (5).
 - Tighten the engine mount to frame rail bolts (4) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
 - Tighten the mount to strut tower bolt to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
 - Tighten mount to mount bracket bolts (2, 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
3. Remove the floor jack.
4. Raise the vehicle.
5. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
6. Lower the vehicle.

Fig. 423: Coolant Bottle & Components
 Courtesy of CHRYSLER GROUP, LLC

7. Install the overflow bottle (3). Tighten the bolts (4) to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 424: Clean Air Hose & Clamps
Courtesy of CHRYSLER GROUP, LLC

8. Install the clean air hose (2) to the air resonator. Hand tighten the clamp (3).
9. Install the coolant return line retainer to the clean air hose.
10. Install the air filter body. Refer to **BODY, AIR CLEANER, REMOVAL**.

INSULATOR, ENGINE MOUNT, REAR

REMOVAL

REMOVAL

1. Raise the vehicle.
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL**.

Fig. 425: Removing/Installing Rear Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

3. Remove the front transmission strut to pivot through bolt (1).
4. Remove the transmission strut to crossmember through bolt.

Fig. 426: Removing/Installing Rear Engine Mount Insulator

5. Loosen the strut cover bracket nuts (2).
6. Rotate the engine forward and remove the strut (3).
7. If required, remove the transmission pivot mount bracket from the transmission.

INSTALLATION

INSTALLATION

Fig. 427: Removing/Installing Rear Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the transmission pivot bracket to the transmission. Tighten the bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
2. Rotated the engine to allow the lower engine strut mount (3) to be installed.

Fig. 428: Removing/Installing Rear Engine Mount Insulator
Courtesy of CHRYSLER GROUP, LLC

3. Position the rear strut mount to the crossmember.
4. Install the torque strut (5) to pivot bracket through bolt (1). Tighten the nut (2) to the proper specification.

Refer to **TORQUE SPECIFICATIONS** .

5. Install the rear torque strut to cradle through bolt. Tighten the nut (3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 429: Rear Mount Bracket Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the strut cover bracket nuts (1, 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
7. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
8. Lower the vehicle.

LUBRICATION

DESCRIPTION

DESCRIPTION

The lubrication system is a full flow filtration, pressure feed type lubrication system. The oil pump is mounted to the bottom of the cylinder block and chain driven by the crankshaft sprocket. The oil pump pick-up tube is attached to the oil pump and supported at the windage tray. There are three oil gallery plugs installed in the engine block. A system oil pressure sensor allows oil pressure to be monitored with a diagnostic scan tool. The oil pressure and oil temperature sensors are located on the oil filter housing assembly which is mounted to the top of the engine block between the cylinder heads. The oil cooler is mounted to the oil filter housing. There is a pressure relief valve in the oil pump that is only activated on a cold start or for emergency relief since the oil pump output is self-regulating. There are three piston oil cooler jets mounted to the engine block. Each jet cools two pistons.

OPERATION

OPERATION

2825793

Fig. 430: Engine Lubrication Flow
 Courtesy of CHRYSLER GROUP, LLC

The oil from the oil pan is pumped by a vane type oil pump mounted to the bottom of the cylinder block that is chain driven by the crankshaft sprocket. The oil from the pump travels to the oil filter element and then to the oil cooler assembly. After the oil has been filtered and cooled, the oil enters the main oil gallery. The pressurized oil travels through the main gallery to the four main journals to lubricate the crankshaft main bearings. The pressurized oil travels through the crankshaft main journals to cross-drilling supplying oil to the connecting rod journals. From the number one main bearing gallery, oil travels to the right secondary chain tensioner and to the primary chain idler shaft. The main oil gallery also supplies oil to three sets of piston oil cooling jets. From the cylinder block, the oil flows through the galleys into the left and right cylinder heads. Left cylinder head oil is supplied to the left secondary timing chain tensioner, camshaft journals and hydraulic lash adjusters. Right cylinder head oil is supplied to the right camshaft journals and hydraulic lash adjusters. The camshaft valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Oil also flows through each of the four forward camshaft bearings into the camshafts and phasers.

DIAGNOSIS AND TESTING**ENGINE OIL LEAK**

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or de-grease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair in accordance to the Service Information.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat the inspection.

If the oil leak source is not positively identified at this time, proceed with the **AIR LEAK DETECTION TEST METHOD**.

AIR LEAK DETECTION TEST METHOD

1. Disconnect the make-up air hose from the cylinder head cover. Cap or plug the make-up air hose nipple.
2. Remove the PCV hose from the PCV valve. Cap or plug the PCV valve nipple.
3. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

4. Gradually increase air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected leak source. Adjust the regulator to a suitable test pressure within this range that provides the best bubble generation which will pinpoint the leak source. If the oil leak is detected and identified, repair in accordance with the Service Information.
5. If the leakage occurs at the rear oil seal area, follow the procedures for rear seal area leaks. Refer to **LUBRICATION, DIAGNOSIS AND TESTING** .
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and make-up air hoses.
7. Clean the oil off of the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

CHECKING ENGINE OIL PRESSURE

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pressure sensor from the oil filter housing. Refer to **SENSOR, OIL PRESSURE, REMOVAL**.

Fig. 431: Pressure Gauge Installed To Oil Pressure Port
Courtesy of CHRYSLER GROUP, LLC

3. Install Pressure Gauge (special tool #C-3292A, Gauge, Pressure) (1) to the oil pressure port. Tighten to 20 N.m (177 in. lbs.).
4. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
5. Connect the negative battery cable. Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .
6. Start and idle the engine. If oil pressure is 0 at idle, shut off the engine and consult the Engine Lubrication

and Diagnostic Table. Refer to **ENGINE, DIAGNOSIS AND TESTING**.

7. Run the engine until it reaches normal operating temperature.
8. Verify that the engine has acceptable oil pressure. Refer to **ENGINE SPECIFICATIONS**.

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Fig. 432: Torque Converter Housing Dust Cover & Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the torque converter dust shield (1).
4. Remove two rubber plugs (2) covering the rear oil seal retainer flange bolts.
5. Inspect the flexplate and rear of the block for evidence of oil. Use a black light to check for the oil leak:
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, rear oil seal retainer, oil galley pipe plug and rear seal retainer to oil pan mating surfaces.
6. If no leaks are detected, use the Air Leak Detection Method as outlined in Engine Oil Leak. Refer to **LUBRICATION, DIAGNOSIS AND TESTING**.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

7. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

8. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.

COOLER, OIL

DESCRIPTION

DESCRIPTION

2826514

Fig. 433: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil cooler is attached to the top of the oil filter housing which is located in the V of the cylinder block. The oil cooler is a plate style coolant-to-oil heat exchanger.

OPERATION

OPERATION

2826564

Fig. 434: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered it travels internally through the engine oil cooler and then to the main oil gallery (5).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL**REMOVAL**

2707169

Fig. 435: Oil Cooler & Fasteners

Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil cooler can not be cleaned out. In the event that the engine requires rebuilding or replacement, replace the oil cooler.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE**.
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the air cleaner housing assembly, upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, REMOVAL**.
5. Remove four bolts (2) and two screws (1) and (3).
6. Remove the oil cooler (4).

2710718

Fig. 436: Oil Cooler Seals & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

7. Remove and discard the oil cooler seals (1).

INSTALLATION

INSTALLATION

2710718

Fig. 437: Oil Cooler Seals & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use new dry seals (1) when installing the oil cooler. Do not lubricate the seals.

1. Clean and prepare the sealing surfaces of the oil cooler and the oil filter housing. Refer to **ENGINE**,

STANDARD PROCEDURE .

2. Install the new oil cooler seals (1) onto the oil filter housing (2).

2707169

Fig. 438: Oil Cooler & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Position the oil cooler (4) on the oil filter housing.
4. Install two screws (1) and (3). Tighten the screws to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
5. Install four bolts (2) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
6. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
7. Fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
8. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .
9. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
10. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

FILTER, ENGINE OIL**REMOVAL****REMOVAL**

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

Fig. 439: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

1. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter is attached to the oil filter cap.

2. Rotate the oil filter cap (1) counterclockwise and remove.

2725399

Fig. 440: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil filter (3) from the oil filter cap (2).
4. Remove and discard the O-ring seal (1).

INSTALLATION

INSTALLATION

2725399

Fig. 441: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

1. Lightly lubricate the new O-ring seal (1) with clean engine oil.
2. Install the O-ring seal (1) on the filter cap (2).
3. Install the new oil filter (3) into the oil filter cap (2).

Fig. 442: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

4. Thread the oil filter cap (1) into the oil filter housing and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
5. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks. Refer to **OIL, STANDARD PROCEDURE** .

HOUSING, OIL FILTER

DESCRIPTION

DESCRIPTION

2826514

Fig. 443: Oil Filter Housing**Courtesy of CHRYSLER GROUP, LLC**

The oil filter housing is located in the V of the cylinder block. The oil filter element is located within the housing and the engine oil cooler is attached to the top of the housing. Both the oil pressure and oil temperature sensors are located at the rear of the housing.

OPERATION**OPERATION**

2826564

Fig. 444: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered and then cooled it travels to the main oil gallery (5). An oil filter by-pass is built into the housing and is not serviceable. Removing the oil filter cap from the housing allows oil to drain from the oil filter cavity into to the crankcase (2).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL

REMOVAL

2707704

6. Install the heater hose (2) to the oil filter housing (1).
7. Position the oil filter housing (1) on the engine block.
8. Install five bolts and tighten in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

9. Connect the oil pressure sensor electrical connector (3).
10. Connect the oil temperature sensor electrical connector (4).
11. Install the lower intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
12. If required, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
13. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS**.
14. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
15. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE**.

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

2867027

Fig. 455: Engine Blocked-Mounted Oil Jets
Courtesy of CHRYSLER GROUP, LLC

The Piston Oil Cooler Jet (1) is used to aid in the cooling of the pistons and the cylinder walls. There are three Piston Oil Cooler Jets used. Each jet is supplied oil by the main oil gallery. The oil is sprayed upwards onto the bottom of the pistons and sides of the cylinder walls. A Piston Oil Cooler Jet is mounted to the engine block under each pair of opposing cylinders.

Each jet has a check valve that closes below 241 kPa (35 psi) to maintain ample oil pressure at idle. All three oil jets are identical and seal to the engine block using an O-ring and fastener.

REMOVAL

REMOVAL

Fig. 456: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.

1. Remove the crankshaft. Refer to **CRANKSHAFT, REMOVAL**.
2. Remove the bolt (1) and the piston oil cooler jet(s) (2) from the engine block.

Fig. 457: Piston Oil Cooler Jet O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the O-ring seal (1) from the piston oil cooler jet(s).

INSTALLATION

INSTALLATION

Fig. 458: Piston Oil Cooler Jet O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new O-ring seal (1) with engine oil and install on the piston oil cooler jet(s).

Fig. 459: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.**

2. Install the piston oil cooler jet(s) (2) into the engine block and tighten the retaining bolt (1) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
3. Install the crankshaft. Refer to **CRANKSHAFT, INSTALLATION**.
4. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
5. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
6. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .
7. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

ENGINE OIL SERVICE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Change the engine oil and filter at mileage and time intervals described in the Maintenance Schedule. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

1. Run the engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn the engine off.
3. Remove the engine cover.

Fig. 460: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

4. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter is attached to the oil filter cap.

5. Rotate the oil filter cap (1) counterclockwise and remove.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.

Fig. 461: Crankcase Drain Plug
Courtesy of CHRYSLER GROUP, LLC

7. Place a suitable drain pan under the crankcase drain plug (1).
8. Remove the drain plug (1) from oil pan and allow the oil to drain into the drain pan. Inspect the drain plug threads for stretching or other damage. Replace the drain plug and gasket if damaged.
9. Install the drain plug (1) in the oil pan and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
10. Lower the vehicle.

Fig. 462: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil filter (3) from the oil filter cap (2).

12. Remove and discard the O-ring seal (1).

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

13. Lightly lubricate the new O-ring seal (1) with clean engine oil.
14. Install the O-ring seal (1) on the filter cap (2).
15. Install the new oil filter (3) into the oil filter cap (2).

Fig. 463: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

16. Thread the oil filter cap (1) into the oil filter housing and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
17. Remove the oil fill cap. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
18. Install the oil fill cap.
19. Start the engine and inspect for leaks.
20. Stop the engine and check the oil level.
21. Install the engine cover.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle engine. Refer to WARNING under **ENGINE OIL SERVICE**.

PAN, OIL**DESCRIPTION****DESCRIPTION****ONE PIECE****Fig. 464: One-Piece Oil Pan****Courtesy of CHRYSLER GROUP, LLC**

The oil pan (2) is cast aluminum and also serves as the lower end structural support. The oil pan is sealed using Mopar® Threebond Engine RTV Sealant.

2830423

Fig. 465: Windage Tray**Courtesy of CHRYSLER GROUP, LLC**

The high pressure die cast aluminum windage tray is mounted to the main bearing caps and is designed to keep oil off of the connecting rods as the crankshaft rotates. When the oil is kept off the connecting rods, the engine rotates easier and oil foaming decreases. Like the oil pan, the windage tray is designed to stiffen the lower end of the engine. The tray is directional and the main bearing cap bolts hold it in place.

TWO PIECE

2830282

Fig. 466: Upper & Lower Oil Pan**Courtesy of CHRYSLER GROUP, LLC**

There is an upper and lower oil pan. The upper oil pan is cast aluminum and also serves as the lower end structural support. The lower pan is a stamped steel design. Both upper and lower oil pans are sealed using Mopar® Threebond Engine RTV Sealant. The lower oil pan must be removed in order to access all of the upper oil pan attaching bolts.

2830423

Fig. 467: Windage Tray**Courtesy of CHRYSLER GROUP, LLC**

The high pressure die cast aluminum windage tray is mounted to the main bearing caps and is designed to keep oil off of the connecting rods as the crankshaft rotates. When the oil is kept off the connecting rods, the engine rotates easier and oil foaming decreases. Like the oil pan, the windage tray is designed to stiffen the lower end of the engine. The tray is directional and the main bearing cap bolts hold it in place.

REMOVAL**ONE PIECE**

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the belly pan.
4. Drain the engine oil. Refer to **OIL, STANDARD PROCEDURE** .
5. Remove the crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

Fig. 468: Torque Converter Housing Dust Cover & Rubber Plugs
 Courtesy of CHRYSLER GROUP, LLC

6. Remove the oil pan to transmission bolts.
7. Remove the torque converter bolt access cover (1).
8. Remove two rubber plugs (2) covering the rear oil seal retainer flange bolts.

Fig. 469: Rear Oil Seal Retainer Flange Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Shown in illustration with transmission removed for clarity.

CAUTION: There are two hidden M6 bolts that must be removed from the rear of the upper oil pan flange. If these bolts are not removed, the rear oil seal retainer flange will be severely damaged.

9. Remove the bolts (1) from the rear oil seal retainer flange.

Fig. 470: Oil Level Indicator Tube & Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Remove the nut (2) that secures the oil indicator tube (1) to the cylinder head.

Fig. 471: One-Piece Oil Pan
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil pan mounting bolts (1).
12. Using the pry points, carefully remove the upper oil pan.
13. Remove all residual sealant (1) from the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces. Refer to **PAN, OIL, CLEANING**.

TWO PIECE

LOWER

Fig. 472: Lower Oil Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Drain the engine oil. Refer to **OIL, STANDARD PROCEDURE** .
3. Remove the front skid plate. Refer to **PLATE, SKID, FRONT, REMOVAL** .

NOTE: **The lower oil pan must be removed to access all of the upper oil pan retaining bolts.**

4. Remove sixteen bolts (2), two nuts (3) and two studs (4) from the flange of the lower oil pan (1).

CAUTION: Do not pry on the lower oil pan flange. There are no designated pry points for lower oil pan removal. Prying on only one or a few locations could bend the flange and damage the pan.

5. Using care, apply a side force to the lower oil pan in order to shear the sealant bond and remove the pan.
6. Remove all residual sealant from the upper and lower oil pans. Refer to **PAN, OIL, CLEANING**.

UPPER

Fig. 473: Oil Level Indicator Tube & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. **Loosen** the bolt (2) that secures the oil level indicator tube (1) to the cylinder head.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the front and middle skid plates. Refer to **PLATE, SKID, FRONT, REMOVAL** .
5. Drain the engine oil. Refer to **OIL, STANDARD PROCEDURE** .

Fig. 474: PTU Support Bracket & Bolts At Block & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

6. Remove the bolts (4) that secure the Power Transfer Unit (PTU) support bracket (2) to the engine block

and oil pan (3).

7. Remove the bolts (1) that secure the support bracket to the PTU.
8. Remove the PTU support bracket from the vehicle.
9. Remove the crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL**.

NOTE: The lower oil pan must be removed to access all of the upper oil pan retaining bolts.

10. Remove the lower oil pan. Refer to **PAN, OIL, REMOVAL**.

CAUTION: There are two hidden M6 bolts that must be removed from the rear of the upper oil pan flange. If these bolts are not removed, the rear oil seal retainer flange will be severely damaged.

Fig. 475: Torque Converter Housing Dust Cover & Rubber Plugs

14. Remove the five oil pan to transmission bolts (1).
15. Remove the bolts (2, 3) that secure the oil pan to the engine block.
16. Using the pry points, carefully remove the upper oil pan.
17. Remove all residual sealant (1) from the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces. Refer to **PAN, OIL, CLEANING**.

CLEANING

CLEANING

CAUTION: Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.

0913037017

Fig. 478: RTV Sealant

Courtesy of CHRYSLER GROUP, LLC

1. Clean the oil pan in solvent and wipe dry with a clean cloth.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

2. Remove all residual sealant (1) from the oil pan. Refer to ENGINE, STANDARD PROCEDURE .

INSTALLATION

INSTALLATION

3078081

Fig. 479: Locating Sealant On Upper Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

1. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the upper oil pan as shown in illustration in the following locations:
 - Oil pan to engine block flange (1)

- Two timing cover to engine block T-joints (2)
- Two rear seal retainer to engine block T-joints (3)

CAUTION: Make sure that the rear face of the oil pan is flush to the transmission bell housing before tightening any of the oil pan mounting bolts. A gap between the oil pan and the transmission could crack the oil pan or transmission casting.

Fig. 480: One-Piece Oil Pan

Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pan (2) to the engine block and flush to the transmission bell housing. Secure the oil pan to the engine block with the oil pan mounting bolts (1) finger tight.
3. Install the five oil pan to transmission bolts and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
4. Tighten the oil pan mounting bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 481: Rear Oil Seal Retainer Flange Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Shown in illustration with transmission removed for clarity.

5. Install the two bolts (1) to the rear oil seal retainer flange and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 482: Torque Converter Housing Dust Cover & Rubber Plugs
 Courtesy of CHRYSLER GROUP, LLC

6. Install the torque converter bolt access cover (1).
7. Install the two rubber plugs (2) covering the rear oil seal retainer flange bolts.
8. Install the crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .
9. Install the belly pan.

10. Lower the vehicle.

Fig. 483: Oil Level Indicator Tube & Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Install the oil level indicator tube (1) into the oil pan.
12. Tighten the nut (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
13. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
14. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.
15. Run the engine until it reaches normal operating temperature.

TWO PIECE

LOWER

Fig. 484: Lower Oil Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Clean the upper and lower oil pan mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the lower oil pan.
3. Install the two studs (4) into the upper oil pan flange.
4. Install the lower oil pan to the upper oil pan with sixteen bolts (2) and two nuts (3). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

CAUTION: Following assembly, the Mopar® Threebond Engine RTV Sealant must be allowed to dry for 45 minutes prior to adding oil and engine operation. Premature exposure to oil prior to drying may result in engine fluid leakage.

5. Install the front skid plate. Refer to **PLATE, SKID, FRONT, INSTALLATION** .
6. Lower the vehicle.

7. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
8. Run the engine until it reaches normal operating temperature.
9. Check the oil pan for leaks.

Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pick-up tube (1). Tighten the bolt (3) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
3. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
4. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
5. Connect the negative battery cable and tighten nut to. Refer to **SPECIFICATIONS** .
6. Run the engine until it reaches normal operating temperature.

PUMP, ENGINE OIL

DESCRIPTION

DESCRIPTION

2831052

Fig. 495: Oil Pump Chain**Courtesy of CHRYSLER GROUP, LLC**

The vane type engine oil pump is mounted to the underside of the cylinder block and is driven by the oil pump chain off the crankshaft at a 1:1 drive ratio. This pump location improves efficiency compared to an on-crankshaft location. The pump is driven with a silent chain which is tensioned using a spring loaded tensioner. The pump is not timed to the engine.

An internal mechanical ball and spring type relief valve prevents excess pressure in the engine by dumping oil into the sump and provides emergency protection at conditions such as a cold start with high engine speed.

The pump has a moving slide mechanism for variable displacement capability and an on-off solenoid for two-stage pressure regulation. The pump and the solenoid are not to be disassembled. Both are non-serviceable components and are to be replaced as a complete assembly.

OPERATION**OPERATION**

2632737

Fig. 496: Moving Element, On/Off Solenoid & Relief Valve
Courtesy of CHRYSLER GROUP, LLC

The engine oil pump features seven vanes and a moving element (1) that continuously adjusts to maintain a regulated oil pressure supply by varying the displacement of the pump. The pump has two regulated pressure stages of operation controlled by an on/off solenoid (2). Low pressure mode regulation (solenoid on) is approximately 200 kPa (29 psi) and high pressure mode regulation (solenoid off) is approximately 450 kPa (65 psi). The Powertrain Control Module (PCM) switches the pump between stages based on engine operating conditions, oil and coolant temperatures, speed and load. Under most typical conditions, the pump will run in low mode from idle up to around 3000 rpm, and switch from low to high mode between 3000 and 4000 rpm.

The maximum oil pressure in the engine is limited to 1000 kPa (145 psi) by the relief valve (3). Pressure in the main oil gallery of the engine can be monitored with diagnostic equipment through the oil pressure sensor mounted on the rear of the oil filter module. The minimum pressure for the engine is 41 kPa (6 psi) at any operating condition. Anything under this pressure could result in damage to critical moving parts.

2832771

Fig. 497: Moving Element, Main Gallery Oil Pressure, Spring Pressure & Pump Driveshaft
 Courtesy of CHRYSLER GROUP, LLC

In high pressure mode regulation (solenoid off) main gallery oil pressure (2) is applied to the moving element (1). The main gallery oil pressure works against spring pressure (3) to move the element to a more concentric location about the pump driveshaft (4) thus reducing displacement and pump output.

2832798

Fig. 498: Chamber & Spring
 Courtesy of CHRYSLER GROUP, LLC

In low pressure mode regulation (solenoid on) the energized solenoid opens an additional chamber (1) to main gallery oil pressure increasing the force on the spring (2) to further reduce displacement and output pressure.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.
3. Remove the oil pump pick-up. Refer to **PICK-UP, OIL PUMP, REMOVAL**.

Fig. 499: Oil Pump Solenoid Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the engine wire harness from the oil pump solenoid electrical connector (1).

Fig. 500: Oil Pump Solenoid Electrical Connector & Locking Clip
Courtesy of CHRYSLER GROUP, LLC

5. Remove the locking clip (1) from the oil pump solenoid electrical connector (2).

Fig. 501: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Push the oil pump solenoid electrical connector into the engine block, rotate the connector slightly CW, push it past the primary chain tensioner mounting bolt (1) and into the engine.

Fig. 502: Oil Pump Chain Tensioner & Retaining Pin
Courtesy of CHRYSLER GROUP, LLC

7. Push back the oil pump chain tensioner (2) and insert a suitable retaining pin (1) such as a 3 mm Allen wrench.

Fig. 503: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

8. Mark the direction of rotation on the oil pump chain (3) and sprocket (4) using a paint pen or equivalent to aid in reassembly.

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

9. Remove the oil pump sprocket T45 retaining bolt (2) and remove the oil pump sprocket (4).

Fig. 504: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
Courtesy of CHRYSLER GROUP, LLC

10. Remove the retaining pin (3) and disengage the oil pump chain tensioner spring (1) from the dowel pin (2).
11. Remove the oil pump chain tensioner from the oil pump.

Fig. 505: Oil Pump, Locator Pins & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the four oil pump bolts (1) and remove the oil pump (3).

INSPECTION

INSPECTION

2833271

Fig. 506: Solenoid Wires, Connector Retention Lock Tab & O-Ring Seal
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The Oil pump is released as an assembly. The assembly includes both the pump and the solenoid. There are no serviceable sub-assembly components. In the event the oil pump or solenoid are not functioning or out of specification they must be replaced as an assembly.

1. Inspect the solenoid wires (1) for cuts or chaffing.
2. Inspect the condition of the connector O-ring seal (3).

INSTALLATION

INSTALLATION

Fig. 507: Oil Pump, Locator Pins & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Align the locator pins (2) to the engine block and install the oil pump (3) with four bolts (1). Tighten the bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 508: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pump chain tensioner on the oil pump.
3. Position the oil pump chain tensioner spring (1) above the dowel pin (2).
4. Push back the oil pump chain tensioner and insert a suitable retaining pin (3) such as a 3 mm Allen wrench.

Fig. 509: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

5. Place the oil pump sprocket (4) into the oil pump chain (3). Align the oil pump sprocket with the oil pump shaft and install the sprocket. Install the T45 retaining bolt (2) and tighten to 25 N.m (18 ft. lbs.).
6. Remove the retaining pin (1). Verify that the oil pump chain is centered on the tensioner and crankshaft sprocket.
7. Rotate the crankshaft CW one complete revolution to verify proper oil pump chain installation.

Fig. 510: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Graphic shows the engine timing cover removed for clarity.

8. Position the oil pump solenoid electrical connector (2) into the engine block. Rotate the connector so that it can be pushed past the primary chain tensioner mounting bolt (1). Then rotate the connector slightly CCW and push it into the engine block until it locks in place.

Fig. 511: Oil Pump Solenoid Electrical Connector & Locking Clip
Courtesy of CHRYSLER GROUP, LLC

9. Verify that the oil pump solenoid electrical connector lock clip (1) is engaged to the electrical connector (2).

Fig. 512: Oil Pump Solenoid Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

10. Connect the engine wire harness to the oil pump solenoid electrical connector (1).
11. Install the oil pump pick-up. Refer to **PICK-UP, OIL PUMP, INSTALLATION**.
12. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
13. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
14. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.

CAUTION: A MIL or low oil pressure indicator that remains illuminated for more than 2 seconds may indicate low or no engine oil pressure. Stop the engine and investigate the cause of the indication.

15. Start and run the engine until it reaches normal operating temperature.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

2710795

Fig. 513: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
 Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor (2) is located on the oil filter housing (3). The oil pressure sensor is a three wire sensor with a tapered threaded sensor port. The sensor port is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil pressure sensor to the oil filter housing.

OPERATION

OPERATION

2867304

Fig. 514: Oil Pressure Sensor
 Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor is a silicon based sensing unit that measures the pressure of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensor. The input to the PCM

occurs on the signal return circuit. The oil pressure sensor is a linear sensor; as pressure changes, voltage changes proportionately and returns a voltage signal to the PCM that reflects oil pressure. The zero pressure reading is 0.5 volt and full scale is 4.5 volt.

REMOVAL

REMOVAL

Fig. 515: Lower Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the air inlet hose, upper intake manifold and lower intake manifold with the fuel injectors and fuel rail (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 516: Oil Temperature Sensor Electrical Connector, Oil Pressure Sensor Electrical Connector, Oil Filter Housing, Heater Hose & Bolts

Courtesy of CHRYSLER GROUP, LLC

5. Remove the oil pressure sensor (2) from the oil filter housing (3).

INSTALLATION

INSTALLATION

2710795

Fig. 518: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing

Courtesy of CHRYSLER GROUP, LLC

1. Install the oil pressure sensor (2) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

2710852

Fig. 519: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (3).
3. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
4. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

2710795

Fig. 520: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
 Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor (1) is located on the oil filter housing (3). The oil temperature sensor is a two wire sensor with a tapered threaded sensor probe. The sensor probe is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil temperature sensor to the oil filter housing.

OPERATION

OPERATION

2867292

Fig. 521: Oil Temperature Sensor
 Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor is a variable resistor that measures the temperature of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensors low reference signal circuit.

When the oil temperature is low, the sensor resistance is high. When the oil temperature is high, the sensor resistance is low.

REMOVAL**REMOVAL**

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the upper intake manifold and lower intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

2707704

Install the oil temperature sensor (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

2710852

Fig. 525: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Connect the oil temperature sensor electrical connector (4).
2. Install the upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
3. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

MANIFOLDS

MANIFOLD, EXHAUST

DESCRIPTION

DESCRIPTION

2793404

Fig. 526: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. If any damaged is found to the exhaust manifold portion, the cylinder head must be removed for repair or replacement. Refer to **CYLINDER HEAD, REMOVAL**.

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

UPPER INTAKE MANIFOLD

2809323

Fig. 527: Upper Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The upper intake manifold is an injection molded nylon composite design. The upper intake manifold is sealed to the lower intake manifold using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the upper intake manifold is removed from the engine. There is a silencer pad positioned between the upper and lower intake manifolds for improved noise, vibration and harshness (NVH). The left cylinder head cover has two alignment posts to aid proper installation of the silencer pad. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design. If the upper intake manifold is damaged or cracked, it must be replaced.

The Electronic Throttle Control (ETC) and Manifold Air Pressure (MAP) sensor are attached directly to the upper intake manifold. The upper intake manifold also provides vacuum ports for brake booster, positive crankcase ventilation (PCV) and emissions control.

LOWER INTAKE MANIFOLD

3510001

Fig. 528: Lower Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The lower intake manifold is an injection molded nylon composite design. The lower intake manifold is sealed to the cylinder heads using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the lower intake manifold is removed from the engine. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design.

The fuel injection fuel rail is also a composite design. The four fuel rail fasteners thread directly into the composite lower intake manifold and are a self-taping design. The lower intake manifold can be serviced without removing the fuel injector rail. The fuel rail and fuel injectors must be installed into the lower intake manifold as an assembly. Do not attempt to install the fuel rail when the injectors are in the manifold. Always install new O-rings on the fuel injectors.

If the lower intake manifold is damaged or cracked, it must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or

the fan. Do not wear loose clothing.

1. Start the engine.
2. Spray a small stream of water (spray bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

UPPER INTAKE MANIFOLD

Fig. 529: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover (1).
3. Remove the intake resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL**.

Fig. 530: MAP Sensor, ETC, PCV Hose, Brake Booster Vacuum Hose, EVAP Vapor Purge Line, Clip & Wire Harness Retainer

Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connectors from the Manifold Absolute Pressure (MAP) sensor (1) and the Electronic Throttle Control (ETC) (7).
5. Disengage the ETC harness from the clip (8) on the throttle body. Disengage the wire harness retainers (4 and 5) from the upper intake manifold near the MAP sensor and reposition the wire harness.
6. Disconnect the following hoses from the upper intake manifold:
 - Positive Crankcase Ventilation (PCV) (3)
 - vapor purge (6)
 - brake booster (2)

Fig. 531: Upper Intake Manifold Support Bracket, Stud & Fasteners

12. Remove two upper nuts (1).

Fig. 533: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The upper intake manifold attaching bolts are captured in the upper intake manifold. Once loosened, the bolts will have to be lifted out of the lower intake manifold and held while removing the upper intake manifold.

NOTE: Exercise care not to loosen the two fuel rail attachment bolts that are in close proximity of the upper intake manifold attaching bolts.

13. Remove seven manifold attaching bolts (1) and remove the upper intake manifold (2).

Fig. 534: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

14. Remove and discard the six upper to lower intake manifold seals (1).
15. Cover the open intake ports to prevent debris from entering the engine.
16. If required, remove the insulator (2) from the LH cylinder head cover.

LOWER INTAKE MANIFOLD

1. Release the fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the resonator and upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 535: Intake Ports, Insulator & Alignment Posts
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the insulator (2) from the LH cylinder head cover.

Fig. 536: Fuel Supply Line And Connectors
 Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fuel supply hose (2) from the fuel rail inlet. Refer to **FITTING, QUICK CONNECT**.
6. Disconnect the fuel injector electrical connectors (1).

Fig. 537: Injection/Ignition Harness Retainer & Main Wire Harness Retainer

INSPECTION

2869717

Fig. 540: Non-Repairable Damage To Lower Intake Manifold Due To Cross Threading Of An Upper Intake Manifold Attaching Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the upper intake manifold (3) and lower intake manifold (1) are not aligned properly, cross threading of the upper intake manifold attaching bolts can occur. The graphic shows non-repairable damage to the lower intake manifold (1) due to cross threading of an upper intake manifold attaching bolt (2).

Check both the upper and lower intake manifolds for:

- Damage and cracks
- Gasket surface damage or warping

Check the lower intake manifold for:

- Damaged fuel injector ports

If either the upper or lower manifold exhibits any damaged or warped conditions, replace the manifold.

INSTALLATION

UPPER INTAKE MANIFOLD

NOTE: Prior to installing the upper intake manifold, verify that the four fuel rail bolts were not loosened. Refer to RAIL, FUEL, INSTALLATION .

Fig. 541: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the sealing surfaces. Install new upper to lower intake manifold seals (1).

NOTE: Make sure the fuel injectors and wiring harnesses are in the correct position so that they don't interfere with the upper intake manifold

installation.

2. If removed, install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

Fig. 542: Upper Intake Attaching Bolts, Locating Posts & Holes
 Courtesy of CHRYSLER GROUP, LLC

3. Lift and hold the seven upper intake attaching bolts (1) clear of the mating surface. Back the bolts out slightly or if required, use an elastic band to hold the bolts clear of the mating surface.
4. Position the upper intake manifold (1) onto the lower intake manifold so that the two locating posts (2) on the upper intake manifold align with corresponding holes (3) in the lower intake manifold.

Fig. 543: Upper Intake Manifold Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

5. Install the upper intake manifold attaching bolts. Tighten the bolts in the sequence shown in illustration to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 544: Upper Intake Manifold Support Bracket, Stud & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

6. Position the support bracket (5) to the intake manifold studs.
7. Install the two nuts (1) to the upper intake manifold support bracket. Tighten the nuts (1) to the proper specification and tighten the studbolt (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
8. Install the wire harness retainer (3) to the studbolt (2).
9. Install the wire harness retainer (4) to the upper intake manifold support bracket (5).

Fig. 545: Nuts, Stud Retainers & Upper Intake Manifold Support Brackets
 Courtesy of CHRYSLER GROUP, LLC

10. Install the two upper intake manifold support brackets nuts (1). Tighten the nuts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 546: MAP Sensor, ETC, PCV Hose, Brake Booster Vacuum Hose, EVAP Vapor Purge Line, Clip & Wire Harness Retainer
 Courtesy of CHRYSLER GROUP, LLC

11. Connect the following hoses to the upper intake manifold:
 - Positive Crankcase Ventilation (PCV) (3)
 - vapor purge (6)
 - brake booster (2)
12. Connect the electrical connectors to the Manifold Absolute Pressure (MAP) sensor (1) and the Electronic Throttle Control (ETC) (7).
13. Secure the ETC harness to the clip (7) on the throttle body and engage the wire harness retainers (4 and 5) to the upper intake manifold near the MAP sensor.
14. Install the intake resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.

Fig. 547: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

15. Connect the negative battery cable and tighten nut to. Refer to **SPECIFICATIONS** .
16. Install the engine cover (1).

LOWER INTAKE MANIFOLD

Fig. 548: Lower Intake Manifold To Cylinder Head Seals
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the sealing surfaces. Install new lower intake manifold to cylinder head seals (1).
2. If removed, install the fuel injectors and the fuel rail to the lower intake manifold. Refer to **RAIL, FUEL, INSTALLATION** .

Fig. 549: Lower Intake Manifold Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Position the lower intake manifold (1) on the cylinder head surfaces.
4. Tighten the bolts to the proper specification in the sequence shown in illustration. Refer to **TORQUE SPECIFICATIONS**.

Fig. 550: Injection/Ignition Harness Retainer & Main Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Engage the main wire harness retainer (2) to the rear of the lower intake manifold.
6. Engage the injection/ignition harness retainer (1) to the rear of the lower intake manifold.

Fig. 551: Fuel Supply Line And Connectors

Courtesy of CHRYSLER GROUP, LLC

7. Connect the fuel injector harness connectors (1).
8. Connect the fuel supply hose (2) to the fuel rail. Refer to **FITTING, QUICK CONNECT** .

Fig. 552: Intake Ports, Insulator & Alignment Posts

Courtesy of CHRYSLER GROUP, LLC

9. Install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.
10. Install the upper intake manifold, support brackets and resonator. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
11. Connect the negative battery cable and tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .
12. Start the engine and check for leaks.

VALVE TIMING

DESCRIPTION

DESCRIPTION

Fig. 553: Valve Timing System Components
Courtesy of CHRYSLER GROUP, LLC

The timing drive uses four silent chains. The silent chain link design improves sprocket engagement and reduces noise, vibration and harshness (NVH). One chain (5) drives the oil pump (4) and three chains drive the camshafts in a two stage design. The left secondary camshaft chain (1) uses an oil pressure controlled chain tensioner (9) with a ratcheting device. The right secondary camshaft chain (8) uses an oil pressure controlled tensioner (7) without a ratchet. The primary chain (2) also uses an oil pressure controlled tensioner (6) without a ratchet. A spring loaded tensioner (3) takes up the slack in the oil pump chain (5). The chain guides and tensioner arms are made of glass filled nylon with nylon wear faces.

OPERATION

OPERATION

2873481

Fig. 554: Primary Chain, Idler Sprocket & Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

The primary timing chain is a silent type. The primary chain drives the 28 tooth idler sprocket directly from a 21 tooth crankshaft sprocket. This results in a 75% speed reduction to the idler sprocket. The idler sprocket assembly connects the primary chain drive and the secondary chain drive. The idler sprocket assembly consists of two integral 22 tooth sprockets a 28 tooth sprocket. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the bushings used in the idler sprocket assembly. Primary chain motion is controlled by a hydraulic oil damped tensioner and a fixed guide. The tensioner and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication.

2873502

Fig. 555: Secondary Drive Chains**Courtesy of CHRYSLER GROUP, LLC**

There are two identical secondary drive chains, both are silent type, one to drive the camshafts in each double overhead cam (DOHC) cylinder head. The secondary chains drive the 33 tooth camshaft sprockets directly from the 22 tooth idler sprockets. This speed reduction combined with the crankshaft to idler sprocket speed reduction produces the required 2:1 camshaft drive ratio. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The left hydraulic secondary chain tensioner is fed from the main oil gallery through the cylinder head. The right hydraulic secondary chain tensioner is fed from the number one main bearing journal. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Only the left tensioner has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The two secondary timing chains are lubricated by holes in the oil controlled tensioners that spray oil through an opening in the tensioner arms. The holes are protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

RESETTING LEFT CAM CHAIN TENSIONER

2661778

Fig. 556: Left Side Cam Chain Tensioner Ratchet Components
 Courtesy of CHRYSLER GROUP, LLC

The left side can chain tensioner used on the 3.6L engine is equipped with a ratchet. The ratchet consists of a rack (2) and a pawl (1). In use, the rack (2) extends with the piston (3) from the tensioner body. The pawl (1) will not allow the rack (2) to retract back into the tensioner body. In order to reset the tensioner, the pawl (1) must be disengaged from the rack (2) so that the piston (3) and rack (2) can be pushed back (4) into the tensioner body.

2661831

Fig. 557: Locating Slot In Rack & Allen Wrench
 Courtesy of CHRYSLER GROUP, LLC

WITH ENGINE TIMING COVER REMOVED

NOTE: The slot (2) in the rack provides an anchor point for a pin that holds the rack in

the retracted position.

1. Using a suitable tool, such as an allen wrench (1), lift the pawl off of the rack.
2. While holding the pawl off of the rack, push the rack and the piston into the tensioner body.

2681934

Fig. 558: Inserting Tensioner Pin To Hold Rack & Piston In Retracted Position

Courtesy of CHRYSLER GROUP, LLC

3. When the slot is aligned with the hole in the tensioner body, insert Tensioner Pin (special tool #8514, Pins, Tensioner) (1) to hold the rack and piston in the retracted position.

2685529

Fig. 559: Pin, Rack & Timing Chain Holder

Courtesy of CHRYSLER GROUP, LLC

WITH ENGINE TIMING COVER INSTALLED

NOTE: Graphic shows timing cover removed for clarity.

1. Using (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3).

Fig. 560: Positioning Timing Chain Holder To Force Rack & Piston Back Into Tensioner Body
Courtesy of CHRYSLER GROUP, LLC

2. While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder must remain in place during service to keep the rack and piston in the retracted position.

MEASURING TIMING CHAIN WEAR

Fig. 561: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.
2. To determine if the timing chains are worn, rotate the crankshaft clockwise until maximum tensioner piston extension (1) is obtained on the RH cam chain tensioner (2). Measure the distance between the secondary timing chain tensioner housing and the step ledge on the tensioner piston (1). Piston extension (1) must be less than 16 mm (0.630 in.).
3. Piston extension greater than 16 mm (0.630 in.) indicates that all timing chains are worn and require replacement. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

ENGINE TIMING VERIFICATION

Fig. 562: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

3821798

Fig. 563: Positioning Dial Indicator & Setting #4 Cylinder At Top-Dead-Center Compression Stroke
Courtesy of CHRYSLER GROUP, LLC

Correct timing is critical for the NON free-wheeling designed, 3.6L engine. Engine timing can be verified by using the following procedures:

1. Remove the upper intake manifold and both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL**.

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the left camshaft position (CMP) sensor mount. Position the indicator probe into the number four cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number four cylinder piston at top-dead-center on the compression stroke and set the indicator dial to **ZERO**.

Fig. 564: Arrows, Scribe Lines & Cam Phasers
 Courtesy of CHRYSLER GROUP, LLC

4. While maintaining this alignment, verify that the **ARROWS** (1) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (2) and that the right side cam phaser **ARROWS** (3) point away from each other and the **SCRIBE LINES** (5) are parallel to the cylinder head cover mounting surface (4).

Fig. 565: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. If the engine timing is not correct, proceed to Timing Chain and Sprockets for service procedures. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL**.

CHAIN AND SPROCKETS, TIMING**REMOVAL****REMOVAL**

Fig. 566: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 567: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chains are removed and the cylinder heads are still

installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

NOTE: The Variable Valve Timing (VVT) assemblies (Phasers) and Oil Control Valves (OCVs) can be serviced without removing the engine timing cover. Refer to ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, REMOVAL.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner housing assembly and upper intake manifold. Refer to MANIFOLD, INTAKE, REMOVAL.
3. Remove both cylinder head covers. Refer to COVER(S), CYLINDER HEAD, REMOVAL.
4. Remove the spark plugs. Refer to SPARK PLUG, REMOVAL.
5. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE.
6. Drain the cooling system. Refer to STANDARD PROCEDURE.
7. Remove the oil pan, accessory drive belts, crankshaft vibration damper and engine timing cover. Refer to COVER(S), ENGINE TIMING, REMOVAL.

NOTE: Take this opportunity to measure timing chain wear. Refer to VALVE TIMING - STANDARD PROCEDURE.

2661245

Fig. 568: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

8. Rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5).
9. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

Fig. 569: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

10. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

11. Mark the direction of rotation on the following timing chains using a paint pen or equivalent to aid in reassembly:
 - Left side cam chain
 - Right side cam chain

- Oil pump chain
- Primary chain

Fig. 570: Resetting Right Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

- Reset the right side cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

Fig. 571: Resetting Left Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

- Reset the left side cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **VALVE TIMING - STANDARD PROCEDURE**.

2662471

Fig. 572: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain

Courtesy of CHRYSLER GROUP, LLC

14. Disengage the oil pump chain tensioner spring (3) from the dowel pin (2) and remove the oil pump chain tensioner (1).
15. Remove the oil pump sprocket T45 retaining bolt (4) and remove the oil pump sprocket (5) and oil pump chain (6).

3817977

Fig. 573: Camshaft Phaser Lock, Oil Control Valves & Wrench

Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

16. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) with the tool number facing up.
17. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
18. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).
19. Remove the oil control valve (2) from the right side intake cam phaser.
20. Pull the right side intake cam phaser off of the camshaft and remove the right side cam chain.
21. If required, remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

Fig. 574: Camshaft Phaser Lock, Oil Control Valves & Wrench
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

22. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) with the tool number facing up.
23. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
24. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).
25. Remove the oil control valve (2) from the left side exhaust cam phaser.
26. Pull the left side exhaust cam phaser off of the camshaft and remove the left side cam chain.
27. If required, remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

Fig. 575: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

28. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Remove two T30 bolts (4) and remove the primary chain tensioner.
29. Remove the T30 bolt (1) and the primary chain guide (2).

Fig. 576: Timing Chain Plated Link At 12 O'Clock, Washer, Retaining Bolt, Block/Bearing Cap Junction & Dimple
 Courtesy of CHRYSLER GROUP, LLC

30. Remove the idler sprocket T45 retaining bolt (2) and washer (3).
31. Remove the primary chain, idler sprocket and crankshaft sprocket as an assembly.

2659731

Fig. 577: Left Cam Chain Tensioner, Arm, Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

32. If required, remove two T30 bolts (6) and the left side cam chain tensioner (5).
33. If required, remove two T30 bolts (4) and the left side cam chain guide (2) and tensioner arm (1).

2659678

Fig. 578: Right Cam Chain Tensioner, Arm, Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

34. If required, remove two T30 bolts (4) and the right side cam chain tensioner (3).
35. If required, remove three T30 bolts (2) and the right side cam chain guide (1) and tensioner arm (6).
36. Inspect all sprockets and chain guides. Replace if damaged.

INSPECTION

INSPECTION

Fig. 579: Piston Extension & RH Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

Prior to disassembly of the timing chains and sprockets, measure the timing chain wear (1). Refer to **VALVE TIMING - STANDARD PROCEDURE** .

Inspect the following valve timing components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

INSTALLATION**INSTALLATION**

Fig. 580: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 581: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Inspect all sprockets and chain guides. Replace if damaged.
2. If removed, install the right side cam chain guide (1) and tensioner arm (6). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
3. If removed, install the right side cam chain tensioner (3) to the engine block with two bolts (4). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
4. Reset the right side cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (5).

2659731

Fig. 582: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. If removed, install the left side cam chain guide (2) and tensioner arm (1). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
6. If removed, install the left side cam chain tensioner (5) to the cylinder head with two bolts (6). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
7. Reset the left side cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to **VALVE TIMING - STANDARD PROCEDURE** .

2605347

Fig. 583: Crankshaft Key, Dimple & Block/Bearing Cap Junction
Courtesy of CHRYSLER GROUP, LLC

8. Verify that the key (3) is installed in the crankshaft.

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts.

- 9.
10. Verify that the number one cylinder piston is positioned at top-dead-center by aligning the dimple (2) on the crankshaft with the block/bearing cap junction (1).

Fig. 584: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

- 11.
12. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

2588864

Fig. 585: Aligning Arrow With Plated Link On Primary Chain

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

13. Place the primary chain onto the crankshaft sprocket (3) so that the arrow (2) is aligned with the plated link (1) on the timing chain.

2589142

Fig. 586: Placing Idler Sprocket Into Timing Chain So That Dimple Is Aligned With Plated Link On Timing Chain

Courtesy of CHRYSLER GROUP, LLC

14. While maintaining this alignment, invert the crankshaft sprocket and timing chain and place the idler sprocket (4) into the timing chain so that the dimple (2) is aligned with the plated link (1) on the timing chain.

Fig. 587: Timing Chain Plated Link At 12 O'Clock, Washer, Retaining Bolt, Block/Bearing Cap Junction & Dimple

Courtesy of CHRYSLER GROUP, LLC

15. While maintaining this alignment, lubricate the idler sprocket bushing with clean engine oil and install the sprockets and timing chain on the engine. To verify that the timing is still correct, the timing chain plated link (6) should be located at 12:00 (1) when the dimple (5) on the crankshaft is aligned with the block/bearing cap junction (4).
16. Install the idler sprocket retaining bolt (2) and washer (3). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 588: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Install the primary chain guide (2). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
18. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3).
19. Install the primary chain tensioner (5) to the engine block with two bolts (4). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

Fig. 589: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

20. Press the left side intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (6).

Fig. 590: Idler Sprocket, Plated Link & Arrow
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side and right side cam chains are identical.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

21. Drape the left side cam chain over the left side intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

Fig. 591: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

22. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the cylinder head cover mounting surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

23. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (4) with the tool number facing up.
24. Tighten the oil control valves (2) and (6). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
25. Remove the Camshaft Phaser Lock (4).

Fig. 592: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

26. Press the right side exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

Fig. 593: Idler Sprocket, Dimple & Plated Link
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

27. Drape the right side cam chain over the right side exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.

Fig. 594: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

28. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that

the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the cylinder head cover mounting surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

29. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (5) with the tool number facing up.
30. Tighten the oil control valves (2) and (7). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
31. Remove the Camshaft Phaser Lock (5).

26B2471

Fig. 595: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain

Courtesy of CHRYSLER GROUP, LLC

NOTE: There are no timing marks on the oil pump gear or chain.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

32. Place the oil pump sprocket (5) into the oil pump chain (6). Place the oil pump chain onto the crankshaft sprocket while aligning the oil pump sprocket with the oil pump shaft. Install the oil pump sprocket T45 retaining bolt (4). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
33. Install the oil pump chain tensioner (1). Insure that the spring (3) is positioned above the dowel pin (2).

3090017

Courtesy of CHRYSLER GROUP, LLC

34. Install the timing gear splash shield (1). Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

2661245

Fig. 597: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke
Courtesy of CHRYSLER GROUP, LLC

35. Remove the Tensioner Pins (special tool #8514, Pins, Tensioner) (1) and (6) from the right side and left

side cam chain tensioners.

36. Rotate the crankshaft clockwise (as viewed from the front) two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).
37. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

Fig. 598: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

38. There should be 12 chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
39. If the engine timing is not correct, repeat this procedure.
40. Install the engine timing cover, crankshaft vibration damper, accessory drive belts and oil pan. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.
41. Install the spark plugs. Refer to **SPARK PLUG, INSTALLATION**.
42. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
43. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
44. Fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE**.
45. Connect the negative battery cable. Tighten to the proper specification. Refer to **SPECIFICATIONS**.
46. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
47. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

29. Remove all residual sealant from the timing chain cover, cylinder head and engine block mating surfaces. Refer to **ENGINE, STANDARD PROCEDURE** .

Fig. 617: Coolant Outlet Housing Gasket & Water Pump Gasket
Courtesy of CHRYSLER GROUP, LLC

30. Remove and discard the coolant outlet housing gasket (1) and the water pump gasket (2).

INSTALLATION

INSTALLATION

Fig. 618: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the coolant outlet housing (1) to the timing cover with a new gasket using only the four bolts (2) shown in illustration tightened to 12 N.m (106 in. lbs.).
2. If removed, install the water pump (3) to the timing cover using only the four bolts (4) shown in illustration tightened to 12 N.m (106 in. lbs.). Refer to **PUMP, WATER, INSTALLATION** .

Fig. 619: Coolant Outlet Housing Gasket & Water Pump Gasket
 Courtesy of CHRYSLER GROUP, LLC

3. Install the coolant outlet housing gasket (1) and the water pump gasket (2).

Fig. 620: Sealant At Cylinder Head Bosses, Right & Left Flanges, Cylinder Head-To-Engine Block T-Joints & Cover To Right Cam Chain Tensioner Gap
 Courtesy of CHRYSLER GROUP, LLC

4. Clean the engine timing cover, cylinder head and block mating surfaces with isopropyl alcohol in

preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the front cover as shown in illustration in the following locations:
- Three cylinder head bosses (1)
 - Right and left flanges (2)
 - Four cylinder head to engine block T-joints (3)
 - Cover to right cam chain tensioner gap (4)

Fig. 621: Engine Timing Cover(s) Bolts Removing/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins on the engine block to the engine timing cover and install the cover.
7. Install the M6 bolts (3). Tighten to 12 N.m (106 in. lbs.).
8. Install the water pump. Tighten the M6 bolts (3) to 12 N.m (106 in. lbs.) and the M8 bolt (2) to 25 N.m (18 ft. lbs.).
9. Install the M8 bolts (2). Tighten to 25 N.m (18 ft. lbs.).

10. Partially raise the vehicle.

2739171

Fig. 622: Crankshaft Vibration Damper & Vibration Damper Holder
 Courtesy of CHRYSLER GROUP, LLC

11. Install the crankshaft vibration damper (6). Refer to **DAMPER, VIBRATION, INSTALLATION**.

0708003949

Fig. 623: Removing/Installing Accessory Idler Pulley

20. Install the right engine mount assembly (1). Refer to **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION**.

NOTE: Left cylinder head cover shown in illustration, right cylinder head cover

similar.

Fig. 630: Cylinder Head Cover Mounting Bolts & Studbolts
Courtesy of CHRYSLER GROUP, LLC

21. Install the right and left cylinder head covers and upper intake manifold. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Fig. 631: Heater Core Supply Hose & Coolant Outlet Housing
Courtesy of CHRYSLER GROUP, LLC

22. Install the heater core supply hose (1) to the coolant outlet housing (2).

0911011291

Fig. 632: Removing/Installing Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

23. Install the thermostat housing (1) and upper radiator hose (2). Refer to **THERMOSTAT, REMOVAL** .
24. Fill the cooling system. Refer to **STANDARD PROCEDURE** .

2313011713

Fig. 633: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

25. If removed, install the cowl panel. Refer to **COVER, COWL PANEL, INSTALLATION** .
26. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL, STANDARD PROCEDURE** .
27. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

2014 Jeep Cherokee Trailhawk

2014 ENGINE 3.2L - Service Information - Cherokee

28. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

2014 ENGINE

Cooling System - Cherokee

DESCRIPTION

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, coolant bottle is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Electric cooling fan
- Radiator
- A coolant recovery system
- Thermostat
- Water pump
- Transmission oil cooler (ATX only)
- Radiator pressure cap
- Coolant
- Water pump
- Hoses and hose clamps
- A core support mounted coolant crossover tube (2.0L/2.4L only)
- Thermostat housing assembly
- After-run pump and hoses assembly (1.4L Turbocharged only)

Fig. 1: New Style Hose Clamps
Courtesy of CHRYSLER GROUP, LLC

A new style hose clamps called the CLIC E® and the CLIC R® are used to ensure a more even distribution of the clamping force.

Fig. 2: CLIC E® Clamp
Courtesy of CHRYSLER GROUP, LLC

CLIC E®

- Used for most applications that have a large variation of expansion and contraction. Equipped with a spring. The clamp is able to adjust while ensuring proper tension. If the clamp is removed for repairs. It can be reused.

NOTE: **Always use Special tool 10288 Pliers when removing and installing the hose**

clamps to avoid damaging the clamp. The Click E type clamp can be reused if the clamp is in serviceable condition.

3255971

Fig. 3: CLIC R® Clamp

Courtesy of CHRYSLER GROUP, LLC

CLIC R®

- Used for most applications that require a capacity reserve designed to compensate for the tolerance ranges of the hoses and spigots to be tightened. If the clamp needs to be removed for repairs. The clamp must be replaced to ensure proper fitting to that component.

NOTE: If the hose or the fitting is not replaced, the same Click R type clamp can be reused given it is installed in the same orientation and same location on the hose. If the fitting or the hose is replaced, the Click R type clamp **MUST** be replaced.

3021895

Fig. 4: CLIC® Style Pliers**Courtesy of CHRYSLER GROUP, LLC**

It is highly recommended that the use of a CLIC style pliers (Miller tool # (special tool #10288, Pliers, Hose Clamp)) be used for proper installation and removal of the CLIC® clamps. The use of specific tools for the clamp, will allow it to be reused.

The use of non CLIC® style pliers (screwdrivers, vice grips, channel locks, etc.) may damage the clamp and the clamp must be replaced.

OPERATION

OPERATION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a source of hot coolant for heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

- When engine is cold the thermostat is closed. The cooling system has no flow through the radiator. The coolant flows through the engine, water pump, and heater.
- When engine is warm the thermostat is full open. On the gas engine coolant flows through the engine, radiator, heater, and water pump.

An optional factory installed maximum duty cooling package is available on most models. This package will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures.

CLIC® HOSE CLAMP PLIERS - USAGE

When CLIC© style clamps are used. It requires that miller tool (special tool #10288, Pliers, Hose Clamp) for proper installation and removal.

3511532

Fig. 5: Flat Blade Of The Pliers

Courtesy of CHRYSLER GROUP, LLC

Installation of the hose clamp requires the flat blade of the pliers to rest against the latch lock side of the clamp. The notched end of the pliers will position to the protruded guide on the latch side. Squeeze the pliers until a **CLICK** sound is heard.

3515155

Fig. 6: Notched End Of The Pliers

Courtesy of CHRYSLER GROUP, LLC

Removal of the hose clamp requires the notched end of the pliers to rest against the latch side of the clamp. Squeezing the pliers will cause the hook of the latch lock to ride up the beveled edging of the notched side, releasing itself from the lock.

DIAGNOSIS AND TESTING

AERATION

If coolant level drops below a certain point, aeration will occur drawing air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Transmission oil will become hotter (automatic transmission equipped vehicles).
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause the above problems.

DEAERATION

As air is removed from the cooling system, it gathers in the coolant recovery container. This pressure is released into the atmosphere through the pressure valve located in the radiator pressure cap when pressure reaches 96 - 124 kPa (14 - 18 psi). This air is replaced with coolant from the coolant recovery container.

NOTE: Deaeration does not occur at engine idle, higher engine speeds are required. Normal driving will deaerate cooling system.

To effectively deaerate the system, multiple thermal cycles of the system may be required.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slow traffic
- Traffic jams
- High speed or steep grades
- Debris on front of the grill or the cooling module that is restricting airflow

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed up to 2000 RPM with transmission in park or neutral for more airflow is

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

recommended.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may affect the cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).
- Service to electrically controlled viscous fan clutch

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to the **COOLING SYSTEM**. Refer to **DIAGNOSIS AND TESTING**.

COOLING SYSTEM

CONDITION	POSSIBLE CAUSE	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Diagnostic Trouble Code (DTC) has been set indicating a stuck open engine thermostat.	1. Replace thermostat, if necessary. If a (DTC) has not been set, the problem may be with the temperature gauge.
	2. Engine Coolant Temperature Sensor.	2. Check connector at Engine Coolant Temperature Sensor. Repair as necessary.
	3. Inoperative temperature gauge.	3. Check gauge operation. Refer to <u>OPERATION</u> .
	4. Coolant level low during cold ambient temperature, accompanied by poor heater performance.	4. Check coolant level in the coolant recovery/reserve container and the radiator. Inspect the system for leaks. Repair as necessary. Refer to WARNINGS under <u>COOLANT</u> before removing pressure cap.
TEMPERATURE GAUGE READS HIGH OR ENGINE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST FROM SYSTEM.	1. Trailer being towed, a steep hill being climbed, vehicle being operated in slow moving traffic, or engine idling during high ambient (outside) temperatures with air conditioning on. High altitudes could also cause these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

	If the gauge does not return to the normal range, determine the cause of the overheating and repair.
2. Inoperative temperature gauge.	2. Check gauge operation. Refer to OPERATION .
3. Is temperature warning lamp (if equipped) illuminating unnecessarily?	3. Check warning lamp operation. Refer to INDICATORS, INSTRUMENT CLUSTER, OPERATION .
4. Coolant low in recovery/reserve bottle and radiator?	4. Check for coolant leaks and repair as necessary.
5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following step 6.	5. Tighten cap.
6. Poor seals at pressure cap.	6. (a) Check condition of cap and cap seals. Refer to CAP, RADIATOR, DIAGNOSIS AND TESTING . Replace cap if necessary.
	(b) Check condition of filler neck. If neck is warped or damaged, replace neck.
7. Coolant level low in radiator, but not in coolant recovery/reserve bottle. This indicates the radiator is not drawing coolant from the coolant recovery/reserve bottle as the engine cools. As the engine cools, a vacuum is formed inside the cooling system. If the pressure cap seals are defective, or the cooling system has a leak, a vacuum cannot be formed.	7. (a) Check condition of pressure cap and cap seals. Replace cap if necessary.
	(b) Check condition of filler neck. Replace if damaged.
	(c) Check condition of hose from filler neck to coolant container. It should be tight at both ends without any kinks or tears. Replace hose as necessary.
	(d) Check coolant recovery/reserve bottle and hose for blockage. Repair as necessary.
8. Freeze point of coolant not correct. Mixture ratio may be too rich.	8. Check coolant concentration. Refer to COOLANT, DIAGNOSIS AND TESTING . Adjust glycol-to-water ratio as required.
9. Coolant not flowing through	9. Check for coolant flow at filler

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

	system.	neck with some coolant removed, engine warm, and thermostat open. Coolant should be observed flowing through filler neck. If flow is not observed, determine reason for lack of flow and repair as necessary.
	10. Radiator air seals missing or improperly installed.	10. Inspect air seals. Correct as necessary.
	11. Radiator or A/C condenser fins are dirty or clogged.	11. Clean obstruction from fins.
	12. Radiator core is plugged or corroded.	12. Replace or clean radiator.
	13. Fuel or ignition system problems.	13. Refer to the appropriate ELECTRICAL DIAGNOSTICS article .
	14. Dragging Brakes.	14. Inspect brake system and repair as necessary. Refer to <u>BRAKES - DIAGNOSIS AND TESTING</u> .
	15. Bug screen or other aftermarket accessory is being used causing reduced air flow.	15. Remove bug screen or accessory.
	16. Thermostat partially or completely closed.	16. Check thermostat operation and replace as necessary. Refer to <u>THERMOSTAT, REMOVAL.</u>
	17. Cooling fan not operating properly.	17. Check electric fan operation and repair as necessary.
	18. Cylinder head gasket leaking.	18. Check cylinder head gasket for leaks. Refer to <u>DIAGNOSIS AND TESTING.</u>
	19. Heater core leaking.	19. Check heater core for leaks.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. The gauge may cycle up and down. This is due to the cycling of the electric radiator fan.	1. A normal condition. No correction is necessary. If gauge cycling is the hot zone, check electric fan operation and repair as necessary.
	2. During cold weather operation with the heater blower in the high position, the gauge reading may drop slightly.	2. A normal condition. No correction is necessary.
	3. Temperature gauge or Engine Coolant Temperature Sensor is defective or shorted.	3. Check gauge operation. Refer to <u>OPERATION</u> .
	4. Gauge reading rises when	4. A normal condition. No

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

	vehicle is brought to a stop after heavy use (engine still running).	correction is necessary. The gauge should return to normal range after vehicle is driven.
	5. Gauge reading high after restarting a warmed-up (hot) engine.	5. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	6. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	6. Check and correct coolant leaks.
	7. Cylinder head gasket leaking allowing exhaust gas to enter cooling system. This will cause thermostat to open late.	7. (a) Check for cylinder head gasket leaks using Tool C-3685- A Block Leak Tester or the equivalent. Repair as necessary. (b) Check for coolant in the engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary.
	8. Water pump impeller loose on shaft.	8. Check water pump and replace as necessary.
	9. Air leak on the suction side of water pump allows air to build up in cooling system. This will cause the thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT FLOWING INTO RECOVERY BOTTLE. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL, BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN RECOVERY BOTTLE.	1. Pressure relief valve in pressure cap is defective.	1. Check condition of pressure cap and seals. Refer to <u>CAP, RADIATOR, DIAGNOSIS AND TESTING</u> . Replace as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT.	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test cooling system and repair as necessary.
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH.	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct.	2. Check the freeze point of the coolant. Refer to <u>COOLANT</u> ,

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

		DIAGNOSIS AND TESTING. Adjust glycol-to-water ratio as required.
HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant recovery/reserve system.	1. (a) Pressure cap relief valve stuck. Refer to CAP, RADIATOR, DIAGNOSIS AND TESTING. Replace as necessary.
		(b) Hose between coolant recovery/reserve bottle and outlet connector is kinked. Repair as necessary.
		(c) Vent at coolant recovery/reserve bottle is plugged. Clean vent and repair as necessary.
		(d) Recovery/reserve bottle is internally blocked or plugged. Check for blockage and repair as necessary.
RADIATOR FAN OPERATES ALL THE TIME	1. Malfunctioning electrical component or circuit.	1. Refer to appropriate ELECTRICAL DIAGNOSTICS article . Repair as necessary.
	2. Check for low coolant level.	2. Repair as necessary.
RADIATOR FAN WILL NOT OPERATE, GAUGE READING HIGH OR HOT	1. Fan motor defective.	1. Refer to appropriate ELECTRICAL DIAGNOSTICS article for operation of the scan tool. Repair as necessary.
	2. Fan relay, powertrain control module (PCM) or engine coolant temperature sensor defective.	2. Refer to appropriate ELECTRICAL DIAGNOSTICS article for operation of the scan tool. Repair as necessary.
	3. Blown fuse in power distribution center (PDC).	3. Determine cause for blown fuse and repair as necessary.
NOISY FAN	1. Fan blade loose.	1. Replace radiator fan assembly.
	2. Fan blade striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condenser.	3. Remove obstructions and/or clean debris from radiator and/or A/C condenser.
	4. Electric fan motor defective.	4. Replace radiator fan assembly.
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED)	1. Electric radiator fan not operating when A/C is on.	1. Refer to appropriate ELECTRICAL DIAGNOSTICS article for operation of the scan tool. Repair as necessary.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

	2. Radiator and/or air conditioning condenser is restricted, obstructed or dirty.	2. Remove restriction and/or clean as necessary.
	3. Radiator air seals missing or improperly installed.	3. Inspect air seals. Repair as necessary.
	4. Engine is overheating (heat may be transferred from radiator to A/C condenser). High underhood temperature due to engine overheating may also transfer heat to A/C components.	4. Correct overheating condition. Refer to this Service Information.
INADEQUATE HEATER PERFORMANCE	1. Has a diagnostic trouble code (DTC) been set?	1. Refer to appropriate ELECTRICAL DIAGNOSTICS article Procedures.
	2. Coolant level low.	2. Check cooling system for leaks. Repair as necessary.
	3. Obstructions in heater hose fittings at engine.	3. Remove heater hoses at both ends and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area and repair as necessary.
	5. Water pump is not pumping coolant through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch.	5. Check accessory drive belt operation. Repair as necessary.
HEAT ODOR	1. Various heat shields are used at certain components. One or more of these shields may be missing.	1. Locate missing shields and replace or repair as necessary.
	2. Is temperature gauge reading above the normal range?	2. Check gauge operation. Refer to OPERATION .
	3. Is cooling fan operating correctly?	3. Repair as necessary.
	4. Has undercoating been applied to any unnecessary component.	4. Clean undercoating as necessary.
	5. Engine may be running rich causing the catalytic converter to overheat.	5. Refer to appropriate ELECTRICAL DIAGNOSTICS article for operation of the scan tool. Repair as necessary.
POOR DRIVEABILITY (THERMOSTAT POSSIBLY STUCK OPEN). GAUGE MAY BE READING LOW	1. Has a diagnostic trouble code (DTC) been set?	1. Refer to appropriate ELECTRICAL DIAGNOSTICS article for checking a DTC related to the thermostat.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILLE AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP, RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE.	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Check the freeze point of the coolant. Refer to COOLANT, DIAGNOSIS AND TESTING . Adjust the glycol-to-water ratio as required.
COOLANT LEVEL CHANGES IN COOLANT RECOVERY/RESERVE BOTTLE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the bottle was between the FULL HOT and ADD marks at normal engine operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

LEAK TESTING

ULTRAVIOLET LIGHT METHOD

Fig. 7: Leak Detection Using Black Light-Typical
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL BLACK LIGHT TOOL

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light) (1). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate the engine until the radiator upper hose is warm to the touch. Aim the commercially available black light tool at the components to be checked. If leaks are present, the black light will cause the additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during the warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove the radiator pressure cap from the filler neck and check the coolant level. Push down on the cap to disengage it from the stop tabs. Wipe the inside of the filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect the cams on the outside of the filler neck. If the cams are damaged, seating of the pressure cap valve and tester seal will be affected.

Attach pressure tester ((special tool #7700, Tester, Cooling System) or an equivalent) to radiator filler neck.

Operate the tester pump to apply 103.4 kPa (15 psi) pressure to the system. If the hoses enlarge excessively or bulges while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to following criteria:

Holds Steady: If the pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to **INTERNAL LEAKAGE INSPECTION**.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all of the connections for seepage or slight leakage with a flashlight. Inspect the radiator, hoses, gasket edges and heater. Seal the small leak holes with a Sealer Lubricant (or equivalent). Repair the leak holes and inspect the system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine the system for external leakage. Block side panels are embossed to highlight core plugs. Remove embossed noise panels to inspect and or repair core plugs. If leaks are not visible, inspect for internal leakage.

INTERNAL LEAKAGE INSPECTION

Remove the engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove the engine dipstick and inspect for water globules. Also inspect the transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 145 kPa (21 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if system is under pressure.

Operate the engine without the pressure cap on the radiator until the thermostat opens. Attach a Pressure Tester to the filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of the gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** short out cylinders to isolate compression leak.

If the needle on dial of the pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

Drain sufficient coolant to allow thermostat removal. Refer to THERMOSTAT, REMOVAL. Remove accessory drive belt. Refer to BELT, SERPENTINE, REMOVAL.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 RPM while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

STANDARD PROCEDURE

DRAINING

When servicing the cooling system, it is essential that coolant does not drip onto the accessory drive belts and/or pulleys. Shield the belts with shop towels before working on the cooling system. If coolant contacts the belts or pulleys, flush both with clean water.

WARNING: Make sure engine cooling system is cool before servicing. Do not remove any clamps or hoses, pressure cap, or open the radiator draincock. When the system is hot and under pressure serious burns from coolant can occur.

Fig. 8: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove fasteners (3) and the belly pan (2).
3. Position a drain pan under draincock location.
4. Open radiator draincock located at the lower left side of radiator. Turn draincock counterclockwise until it stops and allow to drain.
5. Remove coolant pressure cap.

REVERSE FLUSHING

CAUTION: The cooling system normally operates at 97-124 kPa (14-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

CHEMICAL CLEANING

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner (Mopar® Radiator Klean or equivalent) before flushing. This will soften scale and other deposits and aid the flushing operation.

CAUTION: Be sure instructions on the container are followed.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: The cooling system normally operates at 97-124 kPa (14-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain the cooling system. Refer to **STANDARD PROCEDURE**. Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

CAUTION: Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing. Refer to **THERMOSTAT, REMOVAL**. Install the thermostat and housing with a replacement gasket. Refer to **THERMOSTAT, INSTALLATION**. Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture. Refer to **STANDARD PROCEDURE**.

STANDARD PROCEDURE

COOLANT FILL - 2.4L

1. If using the universal fill funnel, special tool (special tool #8195A, Funnel) select the appropriate fitting extension, locking ring and attach to the fill neck of the cooling system.
2. Make sure the adapter seal fits firmly against the inside of the fill neck base to ensure a good seal. After the extension and locking ring are installed, make sure the extension can not be moved. This will confirm a good seal.

070974358

Fig. 9: Fill Funnel, Vent Outlet & Hose
Courtesy of CHRYSLER GROUP, LLC

3. Select a length of clear hose that is long enough to reach from the radiator fill vent outlet to the coolant bottle.
4. Attach the hose (2) to the radiator fill vent outlet (3) and place the other end in the fill funnel (1).

NOTE: **The hose attachment will aid in air removal.**

Fig. 10: Locating Funnel, Locking Ring, Fitting Extension & Stopper
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the coolant bottle return hose at the bottle end of the hose. Cap the coolant bottle nipple.
6. Attach the funnel (1) to the extension (3) and fill with coolant.

070974740

Fig. 11: Rotating Radiator Valve Counterclockwise
Courtesy of CHRYSLER GROUP, LLC

7. Rotate the radiator vent valve handle (1) counterclockwise approximately 180°.

NOTE: The valve will need to be opened enough to allow air and coolant to escape into the attached hose.

DO NOT

remove the valve (1) from the radiator (3).

8. Add coolant to the funnel.

NOTE: Make sure a sign of coolant is present in the clear hose. It may be necessary to add more coolant to the funnel to accomplish this.

NOTE: The higher the fluid level, the better the bleed results.

Continue to add coolant until it is free of bubbles and settles at a level.

NOTE: Make sure the funnel does not become empty during the fill and bleed procedure.

Fig. 12: Heater Core Return Hose Quick Connect
Courtesy of CHRYSLER GROUP, LLC

9. Release the heater core return hose quick connect (1) by squeezing the two release tabs. Wait until a stream of coolant is present.

NOTE: Venting air from the heater core return hose will help the water pump to prime.

10. Attach the quick connect.

Make sure the fitting is completely seated.

Fig. 13: Thermostat Housing, Drain Plug & Hex Wrench
Courtesy of CHRYSLER GROUP, LLC

11. Locate the cylinder head drain plug (3). It is located on the rear face of the head just forward of the thermostat housing (1).
12. Using a 6 mm hex wrench (2), loosen the drain plug 5 full turns.
13. Once fluid starts to seep from the area between the plug and the cylinder head, observe for fluid that is free of air bubbles. Once the fluid is clear of air, tighten the plug.

Fig. 14: Locating Funnel, Locking Ring, Fitting Extension & Stopper
 Courtesy of CHRYSLER GROUP, LLC

14. Install the stopper (4) into the funnel base. The stopper will prevent the fluid that is left in the funnel from spilling out when separated from the extension.

091274253

Fig. 15: Rotating Radiator Valve Clockwise
Courtesy of CHRYSLER GROUP, LLC

15. Rotate the radiator valve (1) clockwise to the closed position.
16. Fill coolant recovery container to the FULL mark.
17. Remove the funnel, extension and locking ring.
18. Remove the cap from the coolant bottle nipple.
19. Attach the coolant bottle return hose to the bottle with a

NEW

CLIC E® clamp.

20. Top off the coolant bottle to the FULL line and install the cap.
21. Start the engine and accelerate from idle to 3000 RPM while an assistant observes the coolant bottle return hose inlet at the top of the bottle.

CAUTION: If there is no flow present at the coolant bottle return hose inlet, you must repeat the procedure beginning at step 1 or engine damage may occur.

While the engine RPM's are up, the fluid will push through the hose and into the bottle. Once the fluid is free of air pockets/bubbles and the hose becomes warm, allow the engine to return to idle.

22. Run the engine until the thermostat opens, upper radiator hose will be warm to the touch.

23. Pinch off the upper radiator hose for a minimum of 30 seconds and as long as 1 minute while running the engine at 3000 RPM.

NOTE: Forcing coolant through the oil cooler will purge air trapped in the oil cooler lines.

24. Allow the engine to return to idle. Shut the engine off. Allow the cooling system to settle and cool down.
25. Remove the coolant bottle cap.

070974740

Fig. 16: Rotating Radiator Valve Counterclockwise
Courtesy of CHRYSLER GROUP, LLC

26. Open the radiator vent valve (1) until a solid flow of coolant is preset in the hose.

091274253

Fig. 17: Rotating Radiator Valve Clockwise
Courtesy of CHRYSLER GROUP, LLC

27. Once coolant is evident in the hose, close the valve (1).
28. Remove the clear hose from the fitting.
29. Fill the coolant bottle to the FULL line. Install the cap.
30. Check for leaks.

COOLANT AIR EVACUATION

CAUTION: Failure to purge air from the cooling system can result in an overheating condition and severe engine damage.

NOTE: The preferred way to remove air from the cooling system is to use Chrysler PSE (Pentastar Service Equipment) (special tool #399-550000, Tool, UView Airlift™ Cooling System Refill) If this tool is not available, Special tool 8195A MUST BE USED and the procedure addressing the proper use of that tool is described below.

Fig. 18: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.

NOTE: The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air

dryer system.

NOTE: For best results, the radiator should be empty.

1. Refer to the Chrysler PSE (Pentastar Service Equipment) (special tool #399-550000, Tool, UView Airlift™ Cooling System Refill) or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the reservoir tank neck.
3. Attach the adapter cone (2) to the vacuum gauge (1).

2321148

Fig. 19: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 psi/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the reservoir tank neck. Ensure that the adapter cone is sealed properly.

2321125

Fig. 20: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: If a strong vacuum is being created in the system, it is normal to see the radiator hoses collapse.

9. Close the vacuum generator/venturi ball valve.

2321184

Fig. 21: Vacuum Generator/Venturi And Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi (1) and airline from the adaptor cone/vacuum gauge assembly (2).
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.

2321168

Fig. 22: Suction Hose Ball Valve
Courtesy of CHRYSLER GROUP, LLC

View typical

12. Place the tool's suction hose (2) into the coolant's container.

NOTE: Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.

13. Pre-fill the tool suction hose (2) with coolant.
14. Connect the tool's suction hose (2) to the adaptor cone/vacuum gauge assembly (3).

Fig. 23: Suction Hose Ball Valve
Courtesy of CHRYSLER GROUP, LLC

NOTE: View typical

15. Open the suction hose's ball valve to begin refilling the cooling system.
16. When the vacuum gauge reads zero and the proper level is reached in the coolant bottle, the system is filled.
17. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
18. Remove the adaptor cone/vacuum gauge assembly from the coolant bottle neck.
19. Install the coolant bottle cap.
20. With heater control unit in the HEAT position, start the engine.
21. Run the engine at 3,000 RPM to help purge the air back to the bottle.
22. Look for flow at the coolant bottle return hose inlet.

CAUTION: If there is no flow present at the coolant bottle return hose inlet, you must repeat the procedure beginning at step 1 or engine damage

may occur.

23. After engine has reached normal operating temperature, shut engine off and allow it to cool. Use the radiator vent valve to purge any remaining air from the radiator.
24. Add coolant to the coolant bottle as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the FULL mark after each cool down period.
25. Once the appropriate coolant level is achieved, install the cap.

STANDARD PROCEDURE - COOLANT AIR EVACUATION

Fig. 24: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN

YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.

NOTE: The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.

NOTE: For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

2321148

Fig. 25: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 psi/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adaptor cone is sealed properly.

2321125

Fig. 26: Vacuum Generator/Venturi
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.

9. Close the vacuum generator/venturi ball valve.

Fig. 27: Vacuum Generator/Venturi And Air Line
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: **Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

Fig. 28: Suction Hose Ball Valve
Courtesy of CHRYSLER GROUP, LLC

NOTE: View typical

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

ADDING ADDITIONAL COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

2.4L - Coolant will normally be in the pressure chamber side of the coolant bottle. If additional coolant is to be added, use the indicators on the bottle as a guide. If the bottle was empty, perform the Deaeration procedure to properly remove any trapped air in the cooling system. Refer to **STANDARD PROCEDURE**.

3.6L - When additional coolant is needed, it should be added to the Pressurized Coolant Bottle. With the engine cold, add enough coolant to set the level between the add and full indicators on the bottle.

For the proper type of coolant. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION**.

ACCESSORY DRIVE

BELT, SERPENTINE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SERPENTINE BELT

Fig. 29: Serpentine Accessory Drive Belt Wear Patterns
 Courtesy of CHRYSLER GROUP, LLC

- 1 - NORMAL CRACKS, BELT OK
 2 - ABNORMAL CRACKS, REPLACE BELT

When diagnosing serpentine drive belts, small cracks (1) that run across ribbed surface of belt from rib to rib, are considered normal. These are not a reason to replace belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace belt if it has excessive wear, frayed cords or severe glazing.

SERPENTINE DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
BELT SEPARATION (ONE OR MORE RIBS HAS SEPARATED FROM BELT BODY)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt. Correct the root cause of the foreign objects in the belt/pulley system.
	2. Fluids contacting the belt.	2. Identify the source of the fluid and correct as necessary.
RIB OR BELT WEAR	1. Pulley(s) misaligned.	1. Align pulley(s).
	2. Fluid contamination.	2. Clean pulley(s). Replace belt if necessary.
	3. Rusted pulley(s).	3. Clean rust from pulley(s).
	4. Sharp or jagged pulley groove tips.	4. Replace pulley.
	5. Rubber deteriorated.	5. Replace belt.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Cooling System - Cherokee

LONGITUDINAL BELT CRACKING (CRACKS BETWEEN TWO RIBS)	1. Belt has clashed with the pulley grooves.	1. Replace belt. Align pulley(s), components as necessary.
	2. Pulley groove tip has worn away rubber to tensile member.	2. Replace belt.
BELT SLIPS	1. Belt slipping because of insufficient tension.	1. Replace automatic belt tensioner.
	2. Belt routed incorrectly.	2. Verify belt routing.
	3. Incorrect belt.	3. Replace belt.
	4. Belt or pulley subjected to substance (belt dressing, oil ethylene glycol) that has reduced friction.	4. Replace belt and clean pulleys.
	5. Driven component bearing failure.	5. Replace faulty component bearing.
	6. Belt glazed and hardened from heat and excessive slippage.	6. Replace belt.
"GROOVE JUMPING" (BELT DOES NOT MAINTAIN CORRECT POSITION ON PULLEY)	1. Belt tension either too high or too low.	1. Replace automatic belt tensioner.
	2. Belt routed incorrectly.	2. Verify belt routing.
	3. Incorrect belt.	3. Replace belt.
	4. Pulley(s) not within design tolerance.	4. Replace pulley(s).
	5. Foreign object(s) in grooves.	5. Remove foreign objects from grooves.
	6. Pulley misalignment.	6. Inspect pulleys and accessories. Inspect the mounting components. Apply chalk to the edges of the belt and rotate the engine 2-3 revolutions to transfer the chalk to the misaligned pulley. Adjust or replace as necessary.
	7. Belt cord line is broken.	7. Replace belt.
BELT BROKEN (NOTE: IDENTIFY AND CORRECT PROBLEM BEFORE NEW BELT IS INSTALLED)	1. Excessive tension.	1. Replace belt and automatic belt tensioner.
	2. Incorrect belt.	2. Replace belt.
	3. Tensile member damaged during belt installation.	3. Replace belt.
	4. Severe misalignment.	4. Check and replace.
	5. Bracket, pulley, or bearing failure.	5. Replace defective component and belt.
	6. Component failure/locked up pulley.	6. Inspect for smooth rotation of all component pulleys. Repair failed component.
NOISE (OBJECTIONABLE)	1. Belt slippage.	1. Replace belt or automatic belt

SQUEAL, SQUEAK, OR RUMBLE IS HEARD OR FELT WHILE DRIVE BELT IS IN OPERATION)

	tensioner.
2. Bearing noise.	2. Locate and repair.
3. Belt misalignment.	3. Replace belt.
4. Belt-to-pulley mismatch.	4. Install correct belt.

REMOVAL

2.0L DIESEL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the right side front wheel.

Fig. 30: Inner Fender Splash Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove fasteners and the inner fender splash shield (1).

CAUTION: Do not allow the tensioner to snap back to the unloaded position. Damage to the tensioner may occur.

Fig. 31: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

5. Using a wrench, rotate the belt tensioner until the locking pin can be installed.
6. Remove the accessory drive belt (1).

2.4L

Fig. 32: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover.
2. Remove the air cleaner body

Refer to **BODY, AIR CLEANER, REMOVAL** .

3. Release the tensioner (7) by rotating the center bolt counterclockwise.
4. Remove the serpentine belt (5).
5. Slowly release the tensioner to the fully extended position.

3.2L

Fig. 33: Installing Lower Radiator Hose & Heater Core Return Hose

Fig. 35: Accessory Drive Belt Routing

Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing accessory drive belt, be sure belt is routed around all accessories correctly.

1. Install belt over all pulleys.

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

2. Using a wrench, rotate the cam tensioner (5) until the locking pin can be removed from the tensioner (8).
3. Check the belt for proper alignment.

Fig. 36: Inner Fender Splash Shield
Courtesy of CHRYSLER GROUP, LLC

4. Install the lower belt splash shield (2).
5. Install the right side front wheel.
6. Lower the vehicle.
7. Connect the negative battery cable.

2.4L

Fig. 37: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Install the serpentine drive belt (5) by positioning the belt over all of the pulleys with the exception of the tensioner pulley.
2. Rotate the tensioner center bolt counterclockwise to allow the belt to be installed onto the tensioner pulley.
3. Slowly release the tensioner and allow it to adjust in a clockwise manner.
4. Visually inspect the belt to pulley alignment.
5. Start the engine and allow to run at idle momentarily. Shut the engine off and reinspect the belt alignment.
6. Install the air cleaner body Refer to **BODY, AIR CLEANER, INSTALLATION** .
7. Install the engine cover.

3.2L

0708003948

Fig. 38: Installing Accessory Drive Belt

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Position the serpentine belt (4) around the pulleys.
2. Rotate the tensioner (1) counterclockwise
3. Position the belt around the tensioner pulley.
4. Verify the belt is properly positioned around all of the pulleys.

Fig. 39: Installing Lower Radiator Hose & Heater Core Return Hose
Courtesy of CHRYSLER GROUP, LLC

5. Install the lower radiator hose (2).
6. Install the heater hose (1) to the water pump
7. Install the wheel well splash shield.
8. Lower the vehicle.
9. Fill the cooling system. Refer to STANDARD PROCEDURE.

TENSIONER, BELT

DESCRIPTION

DESCRIPTION

070870807

Fig. 40: Belt Tensioner**Courtesy of CHRYSLER GROUP, LLC**

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, loss of air conditioning performance, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension. The tensioner maintains correct accessory drive belt tension at all times.

OPERATION**OPERATION**

WARNING: The automatic belt tensioner assembly is spring loaded. Do not attempt to disassemble the tensioner assembly.

The automatic belt tensioner maintains correct belt tension using a coiled spring within the tensioner housing. The spring applies pressure to the tensioner arm pressing the arm into the belt, keeping the belt tight. The belt tensioner will maintain positive pressure on the back side of the belt at all times including engine load and engine speed changes. It is normal to observe torsional variances while the engine is running.

REMOVAL**2.0L DIESEL**

Fig. 41: Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
2. Remove bolt (1) and the belt tensioner (2).

2.4L

Fig. 42: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover.
2. Remove the air cleaner body

Refer to **BODY, AIR CLEANER, REMOVAL** .

3. Release the tensioner (7) by rotating the center bolt counterclockwise.
4. Remove the serpentine belt (5).
5. Slowly release the tensioner to the fully extended position.

3.2L

Fig. 43: Installing Accessory Drive Belt Tensioner
Courtesy of CHRYSLER GROUP, LLC

NOTE: The belt and tensioner can be removed from the bottom of the vehicle.

1. Raise the vehicle.
2. Remove the right front wheel well inner splash shield.
3. Rotate the belt tensioner (2) counterclockwise.

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

4. Remove the serpentine belt (3).
5. Remove the tensioner mounting bolt (1).
6. Remove the tensioner from the vehicle.

INSTALLATION**2.0L DIESEL**

Fig. 44: Tensioner Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the belt tensioner (2). Tighten bolt (1) to 50 N.m (37 ft. lbs.).
2. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

2.4L

Fig. 45: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Position the tensioner into place through the wheel well opening.

2. Loosely install the lower bolt.
3. Lower the vehicle.
4. Install the upper bolt. Tighten the upper and lower bolts to 28 N.m (21 ft. lbs)
5. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
6. Install the inner wheel splash shield.
7. Install the right front wheel.
8. Connect the negative battery.
9. Install the engine cover.

3.2L

Fig. 46: Installing Accessory Drive Belt Tensioner
Courtesy of CHRYSLER GROUP, LLC

1. Position the tensioner (2) into position.
2. Align the belt tensioner tabs to the holes on the accessory bracket.
3. Install the mounting bolt (1). Tighten bolt (1) to 50 N.m (37 ft. lbs.).
4. Rotate the tensioner pulley bolt (2) counterclockwise and install the accessory drive belt (3).

PULLEY, IDLER**REMOVAL****2.0L DIESEL**

Fig. 47: Idler Pulley - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
3. From under the vehicle, remove bolt (1) and the idler pulley (2).

2.4L

Fig. 48: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the serpentine belt (5).
2. Remove the idler pulley (3) center bolt.
3. Remove the idler pulley.

3.2L

Fig. 49: Installing Accessory Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt (5). Refer to **BELT, SERPENTINE, REMOVAL**.
2. If Required, remove the upper idler pulley (1) center bolt (2).
3. If Required, remove the lower idler pulley (5) center bolt (4).
4. Remove the pulley from the cover.

INSTALLATION

2.0L DIESEL

Fig. 50: Idler Pulley - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

1. Install the idler pulley (2) from under the vehicle. Tighten bolt (1) to 28 N.m (21 ft. lbs.).
2. Install the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
3. Connect the negative battery cable.

2.4L

Fig. 51: Accessory Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Position the idler pulley (3) into position.
2. Install the center bolt. Tighten the bolt to 28 N.m (21 ft. lbs).
3. Install the accessory drive belt (5). Refer to **BELT, SERPENTINE, INSTALLATION**.

3.2L

Fig. 52: Installing Accessory Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

1. If removed, position the lower idler pulley (5) into position.
2. If removed, position the upper idler pulley (2) into position.
3. Install the center bolt. Tighten the bolt to 27 N.m (20 ft. lbs.).
4. Install the accessory drive belt (3). Refer to **BELT, SERPENTINE, INSTALLATION**.

ENGINE**BOTTLE, PRESSURIZED COOLANT****REMOVAL****DIESEL**

Fig. 53: Coolant Bottle & Hose
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not remove cylinder block drain plugs, pressure caps, or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

1. Disconnect the negative battery cable.
2. Drain the coolant level below the pressurized coolant bottle. Refer to **STANDARD PROCEDURE**.
3. Remove the coolant hose (2) from top of coolant bottle (1).

Fig. 54: Coolant Bottle & Fasteners

Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolt and nut (1) securing the coolant bottle (2).

Fig. 55: Coolant Bottle & Lower Hose

5. Remove lower coolant hose (1) and the pressurized coolant bottle (2) from vehicle.

GAS

Fig. 56: Coolant Bottle & Components
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not remove cylinder block drain plugs, pressure caps, or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

1. Disconnect the negative battery cable.
2. Drain the coolant level below the coolant recovery bottle. Refer to **STANDARD PROCEDURE**.
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 2.4L or **BODY, AIR CLEANER, REMOVAL** for 3.2L.
4. Remove the return hose (2).
5. Remove the bolt (4).
6. Remove the body harness retainer (5) from the stud bolt.
7. Remove the stud bolt.
8. Remove the lower heater supply hose.
9. Remove the coolant recovery bottle from the strut tower.

INSTALLATION

DIESEL

Fig. 57: Coolant Bottle & Lower Hose
Courtesy of CHRYSLER GROUP, LLC

1. Install the lower coolant hose (1) to pressurized coolant bottle (2).

Fig. 58: Coolant Bottle & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Install the pressurized coolant bottle (2).
 - Tighten bolt (1) to 8 N.m (70 in. lbs.).
 - Tighten nut to 8 N.m (70 in. lbs.).

Fig. 59: Coolant Bottle & Hose
Courtesy of CHRYSLER GROUP, LLC

3. Install the coolant return hose (2) to top of pressurized coolant bottle (1).
4. Fill the cooling system. Refer to **STANDARD PROCEDURE**.

5. Connect the negative battery cable.

GAS

Fig. 60: Coolant Bottle & Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the lower heater supply hose. Tighten the clamp.
2. Position the coolant bottle onto the rubber mount located on the right upper engine mount.
3. Install the bolt (4) and stud bolt. Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS**.
4. Install the body harness retainer (5) onto the stud bolt.
5. Install the return hose (2). Tighten the clamp.
6. Fill the cooling system. Refer to **STANDARD PROCEDURE**.

CAP, RADIATOR

DESCRIPTION

DESCRIPTION

0911004876

Fig. 61: Radiator Cap**Courtesy of CHRYSLER GROUP, LLC**

All cooling systems are equipped with a pressure cap. For 2013 diesel engines, the pressure cap is located on top of the pressurized coolant bottle. The cap releases pressure at some point within a range of 145 kPa (21 psi). The pressure relief point (in pounds) is engraved on top of the cap.

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range of 145 kPa (21 psi).

Two O-ring gasket seals the pressurized coolant bottle. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

DIAGNOSIS AND TESTING

RADIATOR CAP

Fig. 62: Pressure Testing Radiator Pressure Cap-Typical
Courtesy of CHRYSLER GROUP, LLC

1 - PRESSURE CAP

2 - TYPICAL COOLING SYSTEM PRESSURE TESTER

Remove the cap from the radiator. Be sure that the sealing surfaces are clean. Moisten the rubber gasket with water and install the cap on the pressure tester (special tool #7700, Tester, Cooling System) or an equivalent.

Using the cooling system tester, bring the pressure up to the pressure prescribed on cap. If the pressure cap fails to hold pressure, replace the cap. Refer to the following **CAUTION**.

The pressure cap may test properly while positioned on tool (special tool #7700, Tester, Cooling System) (or equivalent). It may not hold pressure or vacuum when installed on the radiator. If so, inspect the radiator filler neck and radiator cap's top gasket for damage. Also inspect for dirt or distortion that may prevent the cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

INSPECTION

INSPECTION

0911004877

Fig. 63: Radiator Cap Components

Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| 1 - VENT VALVE
2 - LOWER O-RING SEAL
3 - MAIN SPRING
4 - UPPER O-RING SEAL |
|---|

The vent valve at bottom of cap should closed. A slight downward pull on the vent valve should open it. If the rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface.

COOLANT

DESCRIPTION

DESCRIPTION

CAUTION: Mopar® Antifreeze/Coolant, is a Lifetime of Engine Formula. IT MAY NOT BE MIXED WITH ANY OTHER TYPES OF ANTIFREEZE. Mixing of coolants other than specified (non-OAT or other OAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

To find the coolant needed. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

WARNING: ANTIFREEZE IS AN ETHYLENE-GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE-GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

COOLANT PERFORMANCE

CAUTION: Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol, but this is not suitable for use in a cooling system. Water also freezes at a higher temperature, boils at a lower temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

OAT coolant is a **Life of the Engine** coolant. Maintenance of the cooling system is not required unless a repair has been made with loss of coolant or the coolant has been contaminated.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant (glycol base coolant with corrosion inhibitors called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Check coolant concentration when any additional coolant is added to the system, or after a coolant drain, flush and refill. Use of a hydrometer or Refractometer Tool (special tool #8286, Refractometer), refractometer can be used to test coolant concentration.

A hydrometer tests the amount of glycol in a mixture by measuring the specific gravity of the mixture. The

higher the concentration of ethylene glycol, the larger the number of balls that will float, and the higher the freeze protection (up to a maximum of 60% by volume glycol).

A Refractometer Tool (special tool #8286, Refractometer) tests the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufacturers use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and are not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

FAN, COOLING

REMOVAL

4. Install the upper radiator mounts (1). Tighten mounting bolts (2) to 9 N.m (80 in. lbs.).

Fig. 95: Removing/Installing Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Install the wire harness connector to the cooling fan module (2).
6. Install the upper cooling fan module wiring harness (2).

Fig. 96: Transmission Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

7. Install the transmission oil cooler. Tighten mounting bolts (2) to 8 N.m (70 in. lbs.).

Fig. 97: Removing/Installing Transmission Cooler Line Support Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Install the transmission cooler lines support brace bolt (1). Tighten to 8 N.m (70 in. lbs.).

Fig. 98: Removing/Installing Upper Air Deflector
Courtesy of CHRYSLER GROUP, LLC

9. Install the upper air deflector (1).
10. Install the hood release cable (3).
11. Install the wiring harness (7).
12. Connect the ambient air temperature sensor (5).

Fig. 99: Cooling Fan Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

13. Connect the cooling fan wiring harness (1).
14. Install the engine cover and air intake assembly. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for 2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.

COOLER, EGR

REMOVAL

COOLER

The exhaust gas recirculation (EGR) cooler is not available separately and is serviced as part of the EGR manifold assembly, for removal. Refer to **COOLER, EGR, REMOVAL**.

EGR COOLER MANIFOLD

Fig. 100: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Drain the engine cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the engine air cleaner housing and inlet tube. Refer to **BODY, AIR CLEANER, REMOVAL** for 2.0L Diesel, **BODY, AIR CLEANER, REMOVAL** for 2.4L or **BODY, AIR CLEANER, REMOVAL** for 3.2L.
5. Remove the charge air cooler outlet tube from the Exhaust Gas Recirculation (EGR) flow control valve and position it out of the way. Refer to **COOLER AND HOSES, CHARGE AIR, REMOVAL**.

Fig. 101: Engine Oil Dipstick Tube Bolt & Wire Harness Connector

Courtesy of CHRYSLER GROUP, LLC

6. Remove the engine oil dipstick tube bolt (2) and carefully position the tube out of the way.
7. Disconnect the wire harness connector (1) from the EGR vacuum solenoid.

Fig. 102: Vacuum Supply Hose, Vacuum Hose & Vacuum Hose
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the radiator hose from the thermostat housing outlet and position the hose out of the way.
9. Disconnect the vacuum supply hose (1) for the vacuum reservoir.
10. If required, disconnect the vacuum hose (2) for the EGR valve solenoid.
11. Disconnect the vacuum hose (3) for the EGR vacuum valve solenoid.

Fig. 103: Clamp & Particulate Filter Intermediate Pressure Hose
Courtesy of CHRYSLER GROUP, LLC

12. Loosen the clamp (1) and disconnect the particulate filter intermediate pressure hose (2).

Fig. 104: Wiring Harness Connector, Clamp & Degassing Hose
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the wiring harness connector (1) from the engine coolant temperature sensor.
14. Loosen the clamp (1) and disconnect the degassing hose (2) from the thermostat housing.

Fig. 105: Clamp & Heater Hose
Courtesy of CHRYSLER GROUP, LLC

15. Loosen the clamp (2) and disconnect the heater hose (1) from the heater tube.
16. Remove the EGR tube. Refer to **TUBE, EXHAUST GAS RECIRCULATION (EGR), REMOVAL** .

Fig. 106: Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the wiring harness connector (1) from the EGR valve.
18. Disengage the retaining clip (3) and disconnect the coolant hose (2) to the engine oil cooler.

Fig. 107: Four Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Remove the four bolts (1, 2 and 3) that secure the EGR cooler manifold to the engine.
20. Remove the EGR cooler manifold and gasket from the engine and place the manifold on a workbench.
21. If required, remove the EGR valve from the EGR cooler manifold. Refer to **VALVE, EXHAUST GAS RECIRCULATION (EGR), REMOVAL**.
22. If required, remove the EGR vacuum solenoid from the EGR cooler manifold. Refer to **SOLENOID, EXHAUST GAS RECIRCULATION (EGR), 2.0L DIESEL, REMOVAL**.

23. If required, remove the thermostat housing from the EGR cooler manifold. Refer to **THERMOSTAT, REMOVAL**.
24. If required, remove the engine coolant temperature sensor from the EGR cooler manifold. Refer to **SENSOR, COOLANT TEMPERATURE, REMOVAL**.

INSTALLATION

COOLER

The exhaust gas recirculation (EGR) cooler is not available separately and is serviced as part of the EGR manifold assembly, for installation. Refer to **COOLER, EGR, INSTALLATION**.

EGR COOLER MANIFOLD

1. Clean all gasket mating surfaces.
2. If removed, install the engine coolant temperature sensor onto the EGR cooler manifold. Refer to **SENSOR, COOLANT TEMPERATURE, INSTALLATION**.
3. If removed, install the thermostat housing onto the EGR cooler manifold. Refer to **THERMOSTAT, INSTALLATION**.
4. If removed, install the EGR vacuum solenoid onto the EGR cooler manifold. Refer to **SOLENOID, EXHAUST GAS RECIRCULATION (EGR), 2.0L DIESEL, REMOVAL**.
5. If removed, install the Exhaust Gas Recirculation (EGR) valve onto the EGR cooler manifold. Refer to **VALVE, EXHAUST GAS RECIRCULATION (EGR), REMOVAL**.

Fig. 108: Four Bolts

Courtesy of CHRYSLER GROUP, LLC

6. Position the EGR cooler manifold and a new gasket to the engine.
7. Install the four bolts (1, 2 and 3) that secure the EGR cooler manifold to the engine. Tighten the bolts to 3 N.m (27 in. lbs.).

Fig. 109: Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Connect the wiring harness connector (1) to the EGR valve.
9. Connect the oil cooler coolant hose (2) and engage the retaining clip (3). Make sure the retaining clip and hose connector are fully engaged.
10. Using a new gasket, install the EGR tube. Refer to **TUBE, EXHAUST GAS RECIRCULATION (EGR), INSTALLATION**.

Fig. 110: Clamp & Heater Hose
Courtesy of CHRYSLER GROUP, LLC

11. Connect the heater hose (1) to the heater tube and tighten the hose clamp (2) securely.

Fig. 111: Wiring Harness Connector, Clamp & Degassing Hose
Courtesy of CHRYSLER GROUP, LLC

12. Connect the wiring harness connector (1) to the engine coolant temperature sensor.
13. Connect the degassing hose (2) to the heater tube and tighten the hose clamp (3) securely.

Fig. 112: Clamp & Particulate Filter Intermediate Pressure Hose
Courtesy of CHRYSLER GROUP, LLC

14. Connect the particulate filter intermediate pressure hose (1) and tighten the hose clamp (2) securely.

Fig. 113: Vacuum Supply Hose, Vacuum Hose & Vacuum Hose
Courtesy of CHRYSLER GROUP, LLC

15. Connect the vacuum hose (3) for the EGR vacuum valve solenoid.
16. If required, connect the vacuum hose (2) for the EGR vacuum solenoid.
17. Connect the vacuum supply hose (1) for the vacuum reservoir.
18. Connect the radiator hose to the thermostat housing outlet.

Fig. 114: Engine Oil Dipstick Tube Bolt & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

19. Connect the wire harness connector (1) to the EGR vacuum solenoid.
20. Reposition the engine oil dipstick tube and install the retaining bolt (2). Tighten the bolt to 2 N.m (18 in. lbs.).
21. Install the charge air cooler outlet tube to the EGR flow control valve. Refer to **COOLER AND HOSES**.

CHARGE AIR, INSTALLATION

22. Install the engine air cleaner housing and inlet tube. Refer to **BODY, AIR CLEANER, INSTALLATION** for 2.0L Diesel, **BODY, AIR CLEANER, INSTALLATION** for 2.4L or **BODY, AIR CLEANER, INSTALLATION** for 3.2L.
23. Fill the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 115: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

24. Install the engine cover (1).
25. Connect the negative battery cable.

HEATER, ENGINE BLOCK

DESCRIPTION

DESCRIPTION

The engine block heater is available as an optional accessory on all models. The heater is operated by ordinary house current (110 Volt A.C.) through a power cord located behind the radiator grille. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures. The heater is mounted in a hole in the engine block.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If the unit does not operate, possible causes can be either the power cord or the heater element. Test the power cord for continuity with a 110-volt voltmeter or 110-volt test light. Test heater element continuity with an ohmmeter or a 12-volt test light.

CAUTION: To prevent damage, the power cord must be secured in it's retainer clips and away from any components that may cause abrasion or damage, such as linkages, exhaust components, etc.

REMOVAL**2.4L**

Fig. 116: Removing/Installing Engine Block Heater
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover.
2. Unplug the power cord from block heater (1).
3. Pull the tab (2) away from the cylinder block.
4. Slide the block heater (3) to the right and out of the bore.
5. Remove the heater from the vehicle.

3.2L

0911005032

Fig. 117: Removing/Installing Generator
Courtesy of CHRYSLER GROUP, LLC

1. Remove the generator

Refer to **GENERATOR, REMOVAL** .

0909005830

Fig. 118: Removing/Installing Engine Block Heater

Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the power cord plug (2) from block heater (4).
3. Loosen the bolt (3) from the heater.

INSTALLATION

2.4L

091173146

Fig. 119: Removing/Installing Engine Block Heater
Courtesy of CHRYSLER GROUP, LLC

1. Insert the block heater (3) into the block bore.
2. Push the heater to the left until the tab (2) catches onto the block.
3. Plug the block heater cord (1) into the heater.
4. Install the engine cover.

3.2L

0909005830

Fig. 120: Removing/Installing Engine Block Heater
Courtesy of CHRYSLER GROUP, LLC

1. Clean block core hole (1) and heater seat.
2. Insert heater block (4) assembly.
3. With block heater seated, tighten bolt (3) to 12 N.m (106 in. lbs.) to assure a positive seal.
4. Install power cord plug to block heater (2).

Fig. 121: Removing/Installing Generator
Courtesy of CHRYSLER GROUP, LLC

5. Install the generator (2). Refer to **GENERATOR, INSTALLATION** .

PUMP, WATER

REMOVAL

2.0L DIESEL

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

NOTE: **Drain the fluid in a clean container, free of debris. Save the fluid for re-use.**

3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the timing belt. Refer to **BELT, TIMING, REMOVAL** .

Fig. 122: Water Pump Mounting Bolts & Water Pump
Courtesy of CHRYSLER GROUP, LLC

5. Remove the water pump mounting bolts (2).
6. Separate the water pump (1) and the gasket from the cylinder head.

2.4L

1. Raise and support the vehicle.

Refer to **HOISTING, STANDARD PROCEDURE** .

2. Remove the right front tire.
3. Remove the belly pan
4. Remove the front closeout panel.
5. Drain the coolant.

Fig. 123: Removing/Installing Front Splash Shields
Courtesy of CHRYSLER GROUP, LLC

6. Remove the 3 fender screws and the 3 push pins from the forward portion of the right front wheel liner. This will allow the liner to be positioned rearward to gain access to the accessory drive components.
7. Remove the serpentine belt.

Fig. 124: Water Pump Pulley, Adapter And Gasket

Courtesy of CHRYSLER GROUP, LLC

8. Remove the 3 water pump pulley bolts (1).
9. Remove the water pump pulley (2).
10. Remove the water pump bolts (3).
11. Remove the water pump (4) and the water pump gasket (8).
12. Inspect the water pump housing (6) for impeller contact.
13. Clean the mating surface.
14. Remove the water pump.

3.2L

The water pump on 3.2L engines is bolted directly to the engine timing chain case cover.

1. Disconnect and isolate the battery negative cable.

WARNING: Constant tension hose clamps are used on most cooling system hoses. When removing or installing, use only tools designed for servicing this type of clamp. Always wear safety glasses when servicing constant tension clamps.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.

2. Support the engine with an engine support fixture.
3. Remove the air cleaner body (1). Refer to **BODY, AIR CLEANER, REMOVAL** .
4. Remove the clean air hose from the intake resonator.
5. Remove the overflow bottle. Refer to **BOTTLE, PRESSURIZED COOLANT, REMOVAL**.

Fig. 125: Removing/Installing Right Engine Mount Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Remove the right side engine mount assembly (1).

Fig. 126: Engine Mount Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Using care, raise the engine to gain access to the right side engine mount bracket (1).
8. Remove the bolts (2, 3) that secure the bracket to the timing cover and cylinder head.
9. Raise the vehicle.
10. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .

11. Drain coolant into clean container for reuse. Refer to **STANDARD PROCEDURE**.
12. Remove the inner wheel housing splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL**.

Fig. 127: Installing Accessory Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

13. Remove the accessory drive belt (3). Refer to **BELT, SERPENTINE, REMOVAL**.
14. Remove the upper accessory drive belt idler pulley (1).

Fig. 128: Removing/Installing Water Pump
Courtesy of CHRYSLER GROUP, LLC

15. Remove the lower heater hose and the lower radiator hose from the water pump and position aside.

CAUTION: Do not pry on the water pump at the timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

16. Remove the remaining water pump mounting bolts (1, 2, 4). Take notice to the four water pump bolts (3) that mount directly to the timing chain cover.
17. Remove the water pump and discard the seal.

INSTALLATION

2.0L DIESEL

Fig. 129: Water Pump, New Gasket & Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

1. Position the water pump (3) with a new gasket (2) onto the cylinder head (1). Tighten the bolts (4) to 28 N.m (21 ft. lbs.).
2. Install the timing belt. Refer to **BELT, TIMING, INSTALLATION**.
3. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.
4. Connect the negative battery cable.
5. Check cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

2.4L

2109355

Fig. 130: Water Pump Pulley, Adapter And Gasket
 Courtesy of CHRYSLER GROUP, LLC

1. Position the water pump (4) into position with a new gasket (8).
2. Install the water pump bolts (3). Tighten the bolts to 24 N.m (18 ft. lbs.)
3. Install the water pump pulley (2).
4. Install the pulley bolts (1). Tighten the bolts to 9 N.m (80 in lbs.).
5. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
6. Install the belly pan and closeout panel

Refer to **BELLY PAN, INSTALLATION** .

Fig. 131: Removing/Installing Front Splash Shields
Courtesy of CHRYSLER GROUP, LLC

7. Install the 3 fender screws and the 3 push pins in the right front wheel liner.
8. Install the tire/wheel assembly.

3.2L

Fig. 132: Removing/Installing Water Pump
Courtesy of CHRYSLER GROUP, LLC

The water pump on 3.2L engines is bolted directly to the engine timing chain case cover.

1. Clean mating surfaces.
2. Using a new seal, position water pump and install mounting bolts (1, 2). Note the shorter bolts (3) bolt directly to the timing cover. Tighten the M6 water pump mounting bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS**. Tighten the M8 water pump mounting bolt (4) to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS**.
3. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover (1).
4. Install the lower radiator hose and the bypass hose.

Fig. 133: Installing Accessory Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

5. Install the idler pulley (1). Tighten the mounting bolt (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS**.

CAUTION: When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction.

6. Install accessory drive belt (3).
7. Install the inner wheel housing splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION**.
8. Install the belly pan. Refer to **BELLY PAN, INSTALLATION**.
9. Lower vehicle.

Fig. 134: Engine Mount Bracket & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. slightly raise the engine to install the engine mount bracket (1). Tighten the M8 mounting bolt (3) to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS** . Tighten the M12 mounting bolts (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS - GAS** .

Fig. 135: Removing/Installing Right Engine Mount Assembly
Courtesy of CHRYSLER GROUP, LLC

11. Install the right engine mount isolator (1) and tighten bolts:
 - Align the engine so that the engine is flush against the engine mount.
 - Hand tighten the center engine to engine bracket bolt (3).

- Hand tighten the outer engine to engine bracket bolts (2).
 - Hand start the engine mount to strut tower (5).
 - Tighten mount to frame rail bolts (4) to 65 N.m (48 ft. lbs.).
 - Tighten the mount to strut tower bolt to 65 N.m (48 ft. lbs.).
 - Tighten mount to mount bracket bolts (2, 3) to 72 N.m (53 ft. lbs.).
12. Install the overflow bottle. Refer to **BOTTLE, PRESSURIZED COOLANT, INSTALLATION**.
 13. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**.
 14. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.
 15. Remove the engine support fixture.
 16. Connect negative battery cable. Tighten the nut to the proper specification. Refer to **SPECIFICATIONS**.
 17. Check the cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

RADIATOR, ENGINE COOLING

REMOVAL

2.0L DIESEL

Fig. 136: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the battery negative cable.
2. Remove the engine cover (1).
3. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL**.

Fig. 137: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove fasteners (2, 3, 4) and the upper close out panel cover (1).
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
7. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
8. Remove the A/C condenser. Refer to **CONDENSER, A/C, REMOVAL** .
9. Remove the Charge Air Cooler (CAC). Refer to **COOLER AND HOSES, CHARGE AIR, REMOVAL** .

Fig. 138: Cooling Fan Module & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the cooling fan module (2) wire harness connector (1).
11. Disconnect the horn wire harness connector.
12. Remove the hood release cable from the air deflector.

Fig. 139: Ambient Air Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the ambient air temperature sensor wire harness connector (2).
14. Remove the left side radiator air deflector.
15. Remove the right side radiator air deflector.
16. Remove the washer reservoir. Refer to **RESERVOIR, WINDSHIELD WASHER, REMOVAL** .

Fig. 140: Removing/Installing Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

17. release clip (2) and remove the lower radiator hose (3).

Fig. 141: Removing/Installing Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

18. Remove the upper radiator hose (1).
19. Remove pushpin retainers securing wire harness and position aside wire harness.
20. Remove the isolators screws from the upper core support from the left and right mounting locators.

NOTE: The radiator and cooling fan should be removed from the top by slightly rotating the components down on the right while tilting the component rearward. The left end of the component should lead out of the vehicle.

21. Remove the radiator from the vehicle.
22. Remove bolts the cooling fan assembly from radiator.

2.4L

1. Disconnect the battery negative cable.
2. Remove the engine cover.
3. Raise the vehicle.

0909005829

Fig. 142: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lower belly pan.
5. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 143: Push Pins, Side Close Out Deflector & Lower Deflector
Courtesy of CHRYSLER GROUP, LLC

6. Separate the lower air deflector (2).

7. Separate the lower radiator hose at the radiator.

Fig. 144: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

8. Remove the upper close out panel cover (1).

20. Separate the upper radiator hose from the upper cross over pipe.
21. Remove the upper radiator mounts (1).

Fig. 160: Removing/Installing Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

22. Disconnect the electrical connector (1) at the cooling fan module (2).
23. Remove the radiator from the vehicle.

0709009309

Fig. 161: Fan Assembly & Components
Courtesy of CHRYSLER GROUP, LLC

24. Remove the upper radiator hose (2).
25. Remove the radiator fan assembly.

INSTALLATION

2.0L DIESEL

NOTE: Care must be taken not to damage the radiator cooling fins and tubes during installation.

1. Install the cooling fan onto radiator. Tighten fasteners to 6 N.m (55 in. lbs.).
2. Install the radiator fan/shroud assembly.
3. Install the left and right mounting isolators. Tighten bolts to 8 N.m (71 in. lbs.).
4. Position the wire harness and install the pushpin retainers to secure wire harness.
5. Install the two remaining lower radiator fan shroud fasteners to radiator. Tighten fasteners to 6 N.m (53 in. lbs.).

Fig. 162: Removing/Installing Upper Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

6. Lower the vehicle.
7. Connect the upper radiator hose (1).

Fig. 163: Removing/Installing Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

8. Connect the lower radiator hose (3) and lock clip (2).

Fig. 164: Cooling Fan Module & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. Install the washer reservoir. Refer to **RESERVOIR, WINDSHIELD WASHER, INSTALLATION**.
10. Install the right side radiator air deflector.
11. Install the left side radiator air deflector.

Fig. 165: Ambient Air Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

12. Connect the ambient air temperature sensor wire harness connector (2).
13. Install the hood release cable from the air deflector.

14. Connect the horn wire harness connector.
15. Connect the cooling fan module wire harness connector (1).
16. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
17. Install the A/C condenser. Refer to **CONDENSER, A/C, INSTALLATION** .
18. Install the Charge Air Cooler (CAC). Refer to **COOLER AND HOSES, CHARGE AIR, INSTALLATION** .
19. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
20. Lower the vehicle.

Fig. 166: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

21. Install the upper close out panel cover (1) and fasteners (2, 3, 4).

Fig. 167: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

22. Fill the cooling system with appropriate coolant. Refer to **STANDARD PROCEDURE**.
23. Install the battery tray. Refer to **TRAY, BATTERY, INSTALLATION**.
24. Install the engine cover (1).
25. Connect the negative battery cable.
26. Operate the engine until it reaches normal operating temperature. Check the cooling system for correct fluid level.

2.4L

1. Install the cooling fan onto the radiator. Tighten to bolts 8 N.m (70 in. lbs.)
- .
2. Install the upper radiator hose.

SENSOR, COOLANT TEMPERATURE

REMOVAL

2.0L DIESEL

Fig. 175: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

The Engine Coolant Temperature (ECT) sensor on the 2.0L engine is installed at the front of the cylinder head below the vacuum pump located on the EGR coolant control valve housing.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover (1).
3. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 176: Cooling Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the Engine Cooling Temperature (ECT) sensor wire harness connector (1).
5. Remove the ECT sensor (2) from the EGR coolant control valve housing.

2.4L

CAUTION: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

1. Remove the engine cover.
2. Disconnect and isolate the battery negative cable.
3. Raise and support the vehicle.
4. Remove the belly pan.
5. Drain the cooling system.
6. Lower vehicle.
7. Remove the battery

Refer to **BATTERY, REMOVAL** .

8. Remove the PCM

Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

0909005842

Fig. 177: Battery Tray, PCM Mount & Bolts

11. Disconnect the engine coolant temperature sensor harness connector.
12. Remove the engine coolant temperature sensor (2).

3.2L

090873114

Fig. 179: Identifying Engine Coolant Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The Engine Coolant Temperature (ECT) sensor on the 3.2L engine is installed into a water jacket at rear of the cylinder head on the left side of the engine.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Partially raise the vehicle.
2. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Lower the vehicle.
4. Slide the heat shield (1) away from the temperature sensor (2).
5. Disconnect the electrical connector from the temperature sensor.
6. Remove the sensor from the cylinder head (3).

INSTALLATION

2.0L DIESEL

Fig. 180: Cooling Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPAR® thread sealant with PFTE part number 04318034 to sensor threads.
2. Install the Engine Cooling Temperature (ECT) sensor (2) to cylinder head. Tighten sensor to 11 N.m (97 in. lbs.).
3. Connect the ECT sensor wire harness connector (1).

Fig. 181: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

4. Install the engine cover.
5. Replace any lost engine coolant. Refer to **STANDARD PROCEDURE**.
6. Connect the negative battery cable.

2.4L

Fig. 182: Thermostat Housing, Hose Outlets/Inlets & Coolant Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install the engine coolant temperature sensor (2).
2. Connect the connector.

Fig. 183: Battery Tray, PCM Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the PCM mount (3) to the battery tray (1).
4. Install the PCM mount bolts (2 & 4).
5. Install the PCM

Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .

6. Install the battery. Tighten the clamp nut to 5 N.m (44 in. lbs.).
7. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
8. Install the engine cover.

3.2L

090873114

Fig. 184: Identifying Engine Coolant Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPAR® thread sealant with PFTE to sensor threads.
2. Install sensor (2) to cylinder head (3).
3. Tighten sensor to 30 N.m (22 ft. lbs.).
4. Connect electrical connector to temperature sensor.
5. Replace any lost engine coolant. Refer to **STANDARD PROCEDURE**.

THERMOSTAT

DESCRIPTION

2.0L DIESEL

3387839

Fig. 185: Thermostat Housing Mounting Bolts & Lower Thermostat Support Brace Bolt
Courtesy of CHRYSLER GROUP, LLC

The thermostat for the 2.0L diesel engines is located on the left side of the engine by the EGR cooler manifold. The thermostat housing is equipped with an air bleed vent.

OPERATION

OPERATION

The engine cooling thermostat is a wax pellet driven, reverse poppet choke type. The thermostat is designed to provide the fastest warm up possible operating temperature of 88°C (190°F). The thermostat also will automatically reach wide open so it will not restrict flow to the radiator as temperature of the coolant rises in hot weather. Above this temperature the coolant temperature is controlled by the radiator, fan, and ambient temperature, not the thermostat.

REMOVAL

2.0L DIESEL

Fig. 186: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 187: Thermostat Housing & Hoses

Courtesy of CHRYSLER GROUP, LLC

4. Remove the coolant hose (2) from the thermostat housing.
5. Remove the upper radiator hose (1) from the thermostat housing.

6. Remove the left charge Air Cooler (CAC) hose. Refer to **COOLER AND HOSES, CHARGE AIR, REMOVAL**.

3387839

Fig. 188: Thermostat Housing Mounting Bolts & Lower Thermostat Support Brace Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove bolts (1) and the thermostat housing.

2.4L

CAUTION: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Remove the engine cover.
2. Disconnect and isolate the battery negative cable.
3. Raise and support the vehicle.
4. Remove the belly pan.
5. Drain the cooling system.
6. Lower vehicle.
7. Remove the battery.
8. Remove the battery tray assembly

Refer to **TRAY, BATTERY, REMOVAL**.

9. Remove the brake vacuum pump

Refer to **PUMP, VACUUM, REMOVAL** .

10. Remove the three bolts that attach the PDC to the body.
11. Position the PDC to the side to allow for thermostat housing removal.

091468958

Fig. 189: Intake Manifold Upper Support Bracket, Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the intake manifold upper support bracket (1) bolts (3).
13. Loosen but do not remove the bracket nuts (2).

NOTE: **The bracket can not be removed at this time, loosening the nuts allow the necessary movement for the thermostat housing to be removed.**

091072940

Fig. 190: Thermostat Housing, Hose Outlets/Inlets & Coolant Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

14. Remove the coolant recovery bottle return hose (1).
15. Disconnect the engine coolant temperature sensor harness connector (2).
16. Disconnect the forward most shift cable from the transmission lever.
17. Remove the heater core supply hose (4). (special tool #10288, Pliers, Hose Clamp)
18. Using Special Tool 10288, release the clamps at the heater core return (5) and thermostat outlet (7).
19. Remove the heater core return hose (5).
20. Remove the thermostat outlet hose (7).
21. Remove the thermostat housing bolts (3).
22. Remove the thermostat housing (6) from the engine.

3.2L

Fig. 191: Thermostat Housing & Thermostat
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

1. Disconnect negative battery cable at battery.
2. Remove the air intake assembly. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Drain cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 192: Removing/Installing Thermostat
Courtesy of CHRYSLER GROUP, LLC

4. Remove upper radiator hose (3) at thermostat housing (2).
5. Remove thermostat housing mounting bolts (4).

INSTALLATION

2.0L DIESEL

NOTE: Use coolant on the seals of the thermostat housing so the seals won't become damaged and to help aid in installation.

3387839

Fig. 193: Thermostat Housing Mounting Bolts & Lower Thermostat Support Brace Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Install the thermostat onto the EGR coolant flow control valve (3).
2. Install the thermostat housing mounting bolts (1). Tighten the bolts to 9 N.m (80 in. lbs.).
3. Install the lower thermostat support brace bolt (5). Tighten the bolts to 9 N.m (80 in. lbs.).
4. Install the left charge Air Cooler (CAC) hose. Refer to **COOLER AND HOSES, CHARGE AIR, INSTALLATION** .

Fig. 194: Thermostat Housing & Hoses
Courtesy of CHRYSLER GROUP, LLC

5. Install the upper radiator hose (1) onto the thermostat housing.
6. Install the coolant hose (2) onto the thermostat housing.
7. Fill the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 195: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

8. Install the engine cover (1).
9. Connect the negative battery cable.
10. Run engine to operating temperature, check for leaks and proper operation.

2.4L

Fig. 196: Removing/Installing Engine Block Heater
Courtesy of CHRYSLER GROUP, LLC

1. Insert the block heater (3) into the block bore.
2. Push the heater to the left until the tab (2) catches onto the block.
3. Plug the block heater cord (1) into the heater.
4. Install the engine cover.

3.2L

Fig. 197: Thermostat Housing & Thermostat
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Clean mating areas of timing chain cover and thermostat housing (1).
2. Install a new gasket on to the thermostat housing.

Fig. 198: Removing/Installing Thermostat
Courtesy of CHRYSLER GROUP, LLC

3. Position thermostat housing (1) on the water crossover.
4. Install two thermostat housing bolts (4). Tighten bolts to 12 N.m (106 in. lbs.).
5. Install upper radiator hose on thermostat housing (3).
6. Fill cooling system. Refer to **STANDARD PROCEDURE**.
7. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION**.
8. Connect negative battery cable to battery.
9. Start and warm the engine. Check for leaks.

TRANSMISSION

COOLER, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

The automatic transmission cooler is located in the front of the condenser and behind the front fascia. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler assembly is equipped with quick connect fitting for the transmission oil cooler lines.

OPERATION

OPERATION

Transmission oil is routed through the cooler where heat is removed from the transmission oil before returning to the transmission.

REMOVAL**REMOVAL**

0710008704

Fig. 199: Transmission Oil Cooler

Courtesy of CHRYSLER GROUP, LLC

1. Remove the cooler line bracket bolts (1, 3).
2. Release the lines from the cooler at the cooler quick connects (4, 5).

INSTALLATION**INSTALLATION**

Fig. 200: Transmission Oil Cooler

Courtesy of CHRYSLER GROUP, LLC

1. Position the transmission oil cooler (2) to the condenser.
2. Tighten the bolts (1, 3) to 9 N.m (80 in. lbs.).
3. Install the transmission cooler (4, 5) lines to the transmission cooler.
4. Check transmission fluid level, add as necessary.

2014 ENGINE

Exhaust System - Cherokee

DESCRIPTION

DIESEL

070969662

Fig. 1: Exhaust System Components
Courtesy of CHRYSLER GROUP, LLC

The exhaust system on the 2.0L diesel engine models consists of a Turbocharger, Diesel Particulate Filter (DPF), front exhaust pipe, resonator, muffler assembly, band clamp, and support isolators. The upstream oxygen sensor is located in the Diesel Particulate Filter (DPF).

DESCRIPTION

070969662

Fig. 2: Exhaust System Components

Courtesy of CHRYSLER GROUP, LLC

The exhaust system on the 2.4L exhaust engine models consists of a front mounted catalytic converter, resonator/pipe assembly, muffler/pipe assembly with two outlets, band clamps, and support isolators. The upstream oxygen sensor is located in the exhaust manifold. The downstream oxygen sensor is located in the catalytic converter.

The exhaust system on the 3.2L exhaust engine models consists of a front and rear mounted catalytic converter, cross under pipe, Y-pipe, resonator/pipe assembly, muffler/pipe assembly with a dual outlet, band clamps, and support isolators. The upstream oxygen sensor is located in the exhaust manifold. The downstream oxygen sensor is located in the catalytic converter.

Resonators, mufflers, and exhaust pipes are tuned to each powertrain combination.

DIAGNOSIS AND TESTING

EXCESSIVE EXHAUST SYSTEM NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.
	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. EGR Valve to manifold gasket leakage.	3. Tighten fasteners or replace gasket.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Exhaust System - Cherokee

	4. EGR Valve to EGR tube gasket leakage.	4. Tighten fasteners or replace gasket.
	5. EGR tube to manifold tube leakage.	5. Tighten tube nut.
	6. Exhaust flex-joint to manifold leak.	6. Tighten joint fasteners and/or replace gasket.
	7. Exhaust flex-joint.	7. Replace catalytic converter assembly.
	8. Pipe and shell noise from front exhaust pipe.	8. Characteristic of single wall pipe.
EXCESSIVE EXHAUST NOISE	1. Leak at exhaust pipe joints.	1. Tighten clamps at leaking joints.
	2. Burned or rusted out muffler assembly or exhaust pipe.	2. Replace muffler resonator tailpipe assembly or exhaust pipe with catalytic converter assembly.
	3. Burned or rusted out resonator.	3. Replace muffler resonator tailpipe assembly.
	4. Restriction in exhaust system.	4. Perform Exhaust System RESTRICTION CHECK . Replace component as necessary.
	5. Converter material in muffler.	5. Replace muffler and converter assemblies. Check fuel injection and ignition systems for proper operation.

RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the scan tool and PEP module pressure tester.

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Disconnect and remove the upstream (before catalytic converter) oxygen sensor. Refer to **SENSOR, OXYGEN, REMOVAL** for Gas or **SENSOR, OXYGEN, REMOVAL** for Diesel.
2. Install the Exhaust Back Pressure Fitting Adaptor (special tool #CH8519, Hose, Exhaust Back Pressure).
3. Connect the Low Pressure Sensor (15 psi) CH7063 to the back pressure fitting.
4. Following the PEP module instruction manual, connect all required cables to the scan tool and PEP module. Select the available menu options on the scan display screen for using the digital pressure gauge function.
5. Apply the park brake and start the engine.
6. With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on

the scan. Back pressure should not exceed specified limit. Refer to specification in table below.

NOTE: For applications with dual catalytic converters, repeat test on opposite converter using the previous steps.

7. If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures. Refer to **CONVERTER, CATALYTIC, INSPECTION**. Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) @2000 RPM	3.45 kPa (0.5 psi)

LEAK TESTING

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
 then type "A00641402.vid1" into the "Search Channel" box.

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Raise and support vehicle.

CAUTION: The air pressure must not exceed 4 psi, otherwise engine damage can occur.

2. Connect Tool (special tool #8404-ECT, Exhaust Cone, Truck), Exhaust Cone to an adjustable air pressure regulator.
3. Attach shop air to the air pressure regulator.
4. Adjust the air pressure regulator to 4 psi
5. Insert Tool (special tool #8404-ECT, Exhaust Cone, Truck), Exhaust Cone into the vehicle tail pipe.
6. If the vehicle is equipped with dual exhaust, use Tool (special tool #8404-ECT, Exhaust Cone, Truck), Exhaust Cone with equipped attached plug. Plug one side of the dual exhaust pipe. Pressurize the other as described.
7. Apply a mixture of liquid dish soap and water to the following areas:
 - All welded joints from 6 inches rearward of the downstream O2 sensor forward
 - O2 sensor seal points

2014 Jeep Cherokee Trailhawk

2014 ENGINE Exhaust System - Cherokee

- O2 sensor boss welds
 - Flange/joint connection(s)
 - Exhaust manifold to cylinder head connection(s)
 - EGR solenoid gasket base and tube seal points (if equipped)
8. Watch for the liquid/soapy water to bubble.
 9. Use the following definitions to help determine if system or component repair/replacement is necessary:
 - **Type 1 Leak** is defined as a leak where very small foam like bubbles 1mm (.039 in.) or less appear. Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.
 - **Type 2 Leak** is defined as a leak where larger bubbles 8mm (.315 in.) or greater appear. Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced.

Leak Location	Repair required if results at 4 psi reveal bubble size:
Welded joints	Type 1 - 1 mm (0.039 in.) or greater
O2 Sensor seal points	Type 1 - 1 mm (0.039 in.) or greater
O2 Sensor boss welds	Type 1 - 1 mm (0.039 in.) or greater
Flange/joint connections	Type 2 - 8 mm (0.315 in.) or greater
Exhaust Manifold to cylinder head connections	Type 2 - 8 mm (0.315 in.) or greater
EGR gasket and tube seal points	Type 2 - 8 mm (0.315 in.) or greater

If a leak is found that matches the above definition, repair or replace the component as necessary.

Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

ADJUSTMENTS

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

1. Loosen clamps and support brackets.
2. Align the exhaust system starting at the front, working rearward.
3. Tighten all clamps and brackets once alignment and clearances are achieved.

REMOVAL

REMOVAL

NOTE: Some service procedures require the removal of the entire exhaust system in order to gain better access to certain components for removal and installation. The following procedure explains how to remove the exhaust system from the crossunder pipe. Refer to specific procedures if replacing individual exhaust components.

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Raise and support the vehicle.
2. Apply penetrating oil to the fasteners that connect the exhaust system to the exhaust crossunder pipe

clamp.

3. Remove fasteners that attach exhaust system to exhaust crossunder pipe clamp.

CAUTION: Do not use any tools to remove the rubber isolators - remove by hand only. Soapy water may be used to assist removal/installation of isolators. DO NOT use a petroleum-based lubricant on the isolators, as damage to the rubber material can occur.

4. Remove all of the support isolators that support the exhaust system to the vehicle.
5. Remove the exhaust system from vehicle.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used for the following reasons:

- To insure proper alignment and size with other parts in the system.
- Provide acceptable exhaust noise levels.
- Does not change exhaust system back pressure that could affect emissions and performance.

INSPECTION

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

INSTALLATION

INSTALLATION

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used for the following reasons:

- To insure proper alignment and size with other parts in the system.
- Provide acceptable exhaust noise levels.
- Does not change exhaust system back pressure that could affect emissions and performance.

NOTE: Always work from the front to rear of the exhaust system when aligning and tightening exhaust system components.

1. Loosely install the fasteners that attach the exhaust system to the exhaust crossunder pipe.

2. Install the support isolators to exhaust system supports.
3. Align the exhaust system to maintain position and proper clearance with underbody parts.
4. Make sure that all of the support isolators have equal load on them.
5. Tighten the fasteners that attach exhaust system to exhaust crossunder pipe to the proper. Refer to **SPECIFICATIONS**.
6. Lower the vehicle.
7. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
8. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

CH8519 - Hose, Exhaust Back Pressure

CONVERTER, CATALYTIC

DESCRIPTION**DESCRIPTION****TURBO**

The catalytic converter is mounted between the turbocharger and the front exhaust pipe. The upstream O2 sensor boss is welded onto the inlet pipe.

The converter is mated to the turbocharger by way of a band clamp. The outlet pipe of the converter is secured by a two piece bracket and is attached to the front exhaust pipe by way of a flange. Both ends require gaskets.

NON TURBO

The gas engine exhaust system components consist of a maniverter, intermediate pipe, mufflers, and support isolators.

The catalytic converter is part of the exhaust manifold, called a maniverter. For removal of the maniverter, Refer to **MANIFOLD, EXHAUST, REMOVAL** for 2.0L Diesel of **MANIFOLD, EXHAUST, REMOVAL** for 2.4L.

REMOVAL**REMOVAL****FRONT CATALYTIC CONVERTER**

1. Disconnect and isolate the negative battery.
2. Remove the lower engine belly pan. Refer to **BELLY PAN, REMOVAL** .

Fig. 3: Oxygen Sensors, Harness Connectors & Catalytic Converter

Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the upstream (1) and down stream oxygen sensor harness connectors (2).

Fig. 4: Removing/Installing Cross Under Pipe
Courtesy of CHRYSLER GROUP, LLC

4. Separate the cross under pipe (4) from the front catalytic converter.

Fig. 5: Removing/Installing Front Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

5. Remove the converter to support bracket bolt (2).
6. Remove the catalytic converter to cylinder head flange upper bolts (1).
7. Remove the catalytic converter (3) by lifting and sliding the flange up and away from the cylinder head.

8. If required, remove the oxygen sensors.

REAR CATALYTIC CONVERTER

1. Disconnect and isolate the negative battery cable.
2. Remove the air intake resonator (1). Refer to **RESONATOR, AIR CLEANER, REMOVAL** .

Fig. 6: Oxygen Sensor Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the upstream (1) and the downstream (2) oxygen sensor harness connectors.

Fig. 7: Removing/Installing Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upstream (5) and downstream (3) oxygen sensors.

Fig. 8: Removing/Installing Upper Support Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the upper support bracket bolt (1).
6. If equipped with **FWD** , remove the right side intermediate shaft. Refer to **REMOVAL** .
7. Remove the lower engine belly pan Refer to **BELLY PAN, INSTALLATION** .

Fig. 9: Removing/Installing Lower Intermediate Shaft Support Bracket

Courtesy of CHRYSLER GROUP, LLC

8. Remove the lower intermediate shaft support bracket (1).
9. Remove the Y-pipe (Refer to **PIPE, EXHAUST**).
10. If quipped with **AWD** , remove the Power Transfer Unit (PTU) assembly. Refer to **REMOVAL** .

Fig. 10: Removing/Installing Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

11. Remove the catalytic converter to cylinder head upper flange bolts (5).
12. Remove the catalytic converter by lifting and sliding the flange up and away from the cylinder head.

INSPECTION

INSPECTION

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

Check catalytic converter for a flow restriction. Exhaust System Restriction Check for procedure. Refer to **DIAGNOSIS AND TESTING**.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most

catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information for test procedures.)

INSTALLATION

INSTALLATION

Fig. 11: Removing/Installing Front Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

FRONT CATALYTIC CONVERTER

1. If new gaskets need replacing, position new gasket onto the manifold flange. loosely install the lower bolt.
2. Position the catalytic converter (3) against the manifold.
3. Install the upper flange bolts. Tighten all the bolts (1) to 23 N.m (17 ft. lbs.).

Fig. 12: Removing/Installing Cross Under Pipe
Courtesy of CHRYSLER GROUP, LLC

4. Position the cross under pipe (1) to the catalytic converter. Tighten the nuts (1) to 26 N.m (19 ft. lbs.).
5. Install the support bolt (5). Tighten to 23 N.m (17 ft. lbs.).

NOTE: Using care, do not to twist or kink the oxygen sensor wires.

Fig. 13: Oxygen Sensors, Harness Connectors & Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

6. Reconnect the electrical connectors (1, 2).
7. If removed, install the oxygen sensors (3, 5). Tighten the sensors to 50 N.m (37 ft. lbs.).

0909005829

Fig. 14: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

8. Install the belly pans (1).
9. Lower the vehicle.
10. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
11. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

REAR CATALYTIC CONVERTER

10. Connect the O2 sensors electrical connectors.

Fig. 23: Intake Resonator
Courtesy of CHRYSLER GROUP, LLC

11. Install the air intake resonator (1).
12. Connect the battery negative cable.

13. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
14. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

MUFFLER, EXHAUST

REMOVAL

2.0L DIESEL

Fig. 24: Exhaust System - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Loosen the clamp at the muffler (2).
3. With the help of an assistant, remove the support bolts (3) from muffler supports.
4. Remove the muffler (4).

2.0L/2.4L

111068956

Fig. 25: Exhaust System Flanges, Isolators & Clamps

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used.

1. Raise and support the vehicle.
2. Remove the nuts (2) holding front to rear exhaust pipes together.

CAUTION: Do not use any tools to remove the rubber isolators-remove by hand only. Soapy water or silicone based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum based lubricant on the isolators, as damage to the rubber material can occur.

3. With the help of an assistant remove front (3) and rear (4) support isolators from muffler supports.
4. Remove the one muffler/resonator assembly.
5. Remove and discard the exhaust flange gasket.

3.2L

**Fig. 26: Exhaust System - 3.2L**

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used.

1. Raise and support the vehicle.
2. Loosen the holding clamp at the resonator exhaust pipe (1).

CAUTION: Do not use any tools to remove the rubber isolators-remove by hand only. Soapy water or silicone based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum based lubricant on the isolators, as damage to the rubber material can occur.

3. With the help of an assistant. Remove the support bolts (3) from muffler supports.
4. Remove the muffler (2).

INSTALLATION**2.0L DIESEL**

Fig. 27: Exhaust System - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

1. Position muffler (4) onto the resonator pipe (1).
2. Install the support isolator bolts (3). Tighten bolts to 22 N.m (16 ft. lbs.).
3. Align muffler and resonator assembly to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them.
4. Tighten the clamp nut (2) to 52 N.m (38 ft. lbs.).
5. Lower the vehicle.
6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

2.4L

Fig. 28: Exhaust System - 2.4L
Courtesy of CHRYSLER GROUP, LLC

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Support the resonator pipe (4) with a stand.
2. Position the muffler pipe (3) onto the resonator pipe (4).
3. Install the muffler isolator bolts (1).
4. Remove the stand.
5. Align muffler and resonator assembly to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them.
6. Tighten the isolator bolts to 19 N.m (168 in. lbs.).
7. Tighten the clamp (3) to 55 N.m (41 ft. lbs.).
8. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
9. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

3.2L

Fig. 29: Exhaust System - 3.2L
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

1. Position muffler pipe to the resonator pipe (1).
2. Install the support isolator bolts (3).
3. Align muffler and resonator assembly to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them.
4. Tighten the front to rear pipe clamp. Tighten the nut to 19 N.m (168 in. lbs.).
5. Lower vehicle.
6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

PIPE, EXHAUST CROSSUNDER

REMOVAL

2.0L DIESEL

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Raise the vehicle.
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL**.

0908009626

3. Remove the cross under pipe (1) rear flange nuts.
4. Remove the cross under center support bolt (5).
5. Remove the front cross under pipe flange nuts (6).
6. Remove the cross under pipe from the vehicle.

INSTALLATION

2.0L DIESEL

Fig. 35: Removing/Installing Resonator - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

1. Using a new gasket (2) install cross under pipe (4) to the Diesel Particulate Filter (DPF) and tighten nuts (3) finger tight.
2. Install the cross under pipe isolator bolts (5). Tighten bolts (5) to 22 N.m (16 ft. lbs.).
3. Tighten the cross under pipe to DPF flange nuts (3) to 26 N.m (19 ft. lbs.).
4. Install the exhaust resonator. Refer to **RESONATOR, EXHAUST, INSTALLATION**.
5. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

0908009626

Fig. 36: Middle Belly Pan
Courtesy of CHRYSLER GROUP, LLC

6. Install the middle belly pan (1) and securely tighten fasteners.
7. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
8. Lower the vehicle.
9. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

2.4L

0912009642

Fig. 37: Removing/Installing Resonator - 2.4L

Courtesy of CHRYSLER GROUP, LLC

1. Position a new flange gasket (5) into place.
2. Install the cross under pipe (2) to the catalytic converter outlet flange (6). Install the flange nuts (4) to hold the pipe in position.
3. Install the cross under pipe isolator bolts (1). Tighten bolts (5) to 22 N.m (16 ft. lbs.).
4. Install the exhaust pipe to oil pan support brace bolt (3).
5. Tighten bolt to 25 N.m (18 ft. lbs.).
6. Tighten the cross under pipe flange nuts (4) to 26 N.m (19 ft. lbs.).
7. Install the exhaust resonator. Refer to **RESONATOR, EXHAUST, INSTALLATION**.
8. Check for proper pipe to shield/component clearance.
9. Check for exhaust leaks. Repair exhaust leaks as necessary.

3.2L

Fig. 38: Removing/Installing Cross Under Pipe
Courtesy of CHRYSLER GROUP, LLC

1. Loosely install cross under pipe (4) to the front catalytic converter.
2. Connect the resonator pipe to cross under pipe (1). Tighten nuts (3) to 26 N.m (19 ft. lbs.).
3. Install the center support bolt (5). Tighten bolt to 25 N.m (18 ft. lbs.).
4. Tighten the 2 nuts (6) for cross under pipe to catalytic converter flange to 26 N.m (19 ft. lbs.).
5. Lower vehicle.
6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

RESONATOR, EXHAUST

REMOVAL

2.0L DIESEL

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the muffler (4). Refer to **MUFFLER, EXHAUST, REMOVAL**.

0908009784

Fig. 39: Removing/Installing Resonator - 2.0L Diesel
Courtesy of CHRYSLER GROUP, LLC

3. Loosen clamp (2) and remove resonator (3) from vehicle.

2.4L

0912009646

Fig. 40: Removing/Installing Resonator - 2.4L
Courtesy of CHRYSLER GROUP, LLC

1. Loosen the muffler clamp.
2. Loosen the resonator clamp.
3. Using a twisting motion, walk the resonator (1) off of the front exhaust pipe (2).
4. Walk the pipe out of the muffler inlet.

3.2L

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1114007106

Fig. 41: Exhaust System - 3.2L

Courtesy of CHRYSLER GROUP, LLC

3. Separate resonator (2) from the Y-pipe (1).
4. Remove resonator from vehicle.

INSTALLATION

2.0L DIESEL

Fig. 43: Removing/Installing Resonator - 2.0L Diesel

Courtesy of CHRYSLER GROUP, LLC

1. Install the resonator (3) onto the crossunder pipe (1). Tighten the clamp (2) to 52 N.m (38 ft. lbs.).
2. Install the muffler. Refer to **MUFFLER, EXHAUST, INSTALLATION**.
3. Lower the vehicle.
4. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
5. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

2.4L

**Fig. 44: Resonator & Y-Pipe**

Courtesy of CHRYSLER GROUP, LLC

1. Install the resonator (2) onto the front exhaust pipe outlet (1). Tighten the clamp (3) to 55 N.m (41 ft. lbs.).

**Fig. 45: Exhaust System - 2.4L**

Courtesy of CHRYSLER GROUP, LLC

2. Insert the resonator pipe (4) into the muffler (2). Tighten the clamp (3) to 55 N.m (41 ft. lbs.).
3. Start the engine and inspect for exhaust leaks.
4. Check for proper clearance between the exhaust and the surrounding components.

INSTALLATION

**Fig. 46: Resonator & Y-Pipe**

Courtesy of CHRYSLER GROUP, LLC

1. Install the resonator (2) into the Y-pipe (1). Tighten the clamp (3) to 55 N.m (41 ft. lbs.).

**Fig. 47: Exhaust System - 3.2L**

Courtesy of CHRYSLER GROUP, LLC

2. Install the resonator pipe (1) into the muffler (2) pipe. Tighten the clamp (3) to 55 N.m (41 ft. lbs.).
3. Lower the vehicle.
4. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
5. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

SHIELD, HEAT

DESCRIPTION

DESCRIPTION

The exhaust system heat shields are attached to the under body of the vehicle.

OPERATION

OPERATION

Heat shields are needed to protect both the vehicle and the environment from the high temperatures developed near the catalytic converter.

Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields on vehicles so equipped. Light over spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

PIPE, EXHAUST

REMOVAL

3.2L

0909005829

Fig. 48: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

1. Raise vehicle.
2. Remove the belly pan (1).

**Fig. 49: Resonator & Y-Pipe**

Courtesy of CHRYSLER GROUP, LLC

3. Using a jack or suitable stand. Position the stand under the resonator piping to help support and aid in removal from the cross under pipe.
4. Separate the resonator (2) from the Y-pipe (1).

**Fig. 50: Y-Pipe**

Courtesy of CHRYSLER GROUP, LLC

5. Remove the Y-pipe (4) support isolator bolts.
6. Separate the cross under pipe (1) from the Y-pipe.

7. Separate the rear catalytic converter from the Y-pipe.

INSTALLATION

3.2L

Fig. 51: Resonator & Y-Pipe
Courtesy of CHRYSLER GROUP, LLC

1. Install the Y-pipe (1) to the resonator (2). Tighten the clamp (3) to 55 N.m (40 ft. lbs.).

Fig. 52: Y-Pipe
Courtesy of CHRYSLER GROUP, LLC

2. Install the Y-pipe (4) isolator bolts.

3. If required, install new gaskets (2, 6).
4. Align the Y-pipe to the cross under pipe flange (1) and the rear catalytic converter flange. Tighten the nuts (3, 5) to 26 N.m (19 ft. lbs.).

0909005829

Fig. 53: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

5. Install the belly pan (1).
6. Lower vehicle.
7. Check for clearance of the exhaust to body.

FILTER, DIESEL PARTICULATE

DESCRIPTION

DESCRIPTION

A diesel particulate filter (DPF) is installed for exhaust gas after-treatment. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO₂ at exhaust temperatures over 600° C (1, 112° F).

OPERATION

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF, which is passive regeneration.

If the passive regeneration cannot keep up with the build up of soot in the DPF, the Powertrain Control Module (PCM) will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The PCM starts the regeneration of the DPF if the soot load exceeds a performance map value. The PCM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the PCM. During the regeneration process, the PCM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 °C (1, 022 °F). After regeneration, the PCM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the PCM determines the ash quantity inside the DPF.

REMOVAL

REMOVAL

Fig. 54: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time.

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 55: Upper Turbocharger Heat Shield & Mid Upper Turbocharger Heat Shield
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper turbocharger heat shield (1).

Fig. 56: Turbocharger Heat Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the upstream O2 sensor wire harness connector.
5. Remove the mid upper turbocharger heat shield (2).

3371951

Fig. 57: DPF, Heatshield & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the pressure differential tubing from the DPF (2) and position aside.
7. Disconnect the temperature and downstream O2 sensor wire harness connectors.
8. Remove the DPF heat shield (1).
9. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
10. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
11. Remove the crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL**.
12. Lower the vehicle.

3371927

Fig. 58: Clamp, Turbocharger & Two Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Loosen the band clamp (1) from the DPF pipe to turbocharger (2).
14. Remove the two attaching bolts (3) and remove DPF.

INSTALLATION

INSTALLATION

NOTE: When replacement is required on any component of the exhaust system, original equipment parts (or equivalent) must be used.

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.

Fig. 59: Clamp, Turbocharger & Two Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the DPF (2) onto the engine block.
 - Tighten the band clamp (1) to 25 N.m (18 ft. lbs.).
 - Tighten the DPF bolts (3) to 20 N.m (177 in. lbs.).

Fig. 60: DPF, Heatshield & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the DPF heat shield (1):
 - Tighten the bolts (4) to 12 N.m (106 in. lbs.).
 - Tighten the nuts to (3) 8 N.m (71 in. lbs.).
3. Install the differential pressure tubing into DPF.
4. Connect the temperature sensor and the downstream O2 sensor wire harness connectors.

Fig. 61: Turbocharger Heat Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the mid upper turbocharger heat shield:
 - Tighten the bolts (3) to 8 N.m (71 in. lbs.).

- Tighten the nut to 8 N.m (71 in. lbs.).
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
 7. Install the cross under pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION**.
 8. Install the belly pan Refer to **BELLY PAN, INSTALLATION** .
 9. Lower the vehicle.
 10. Start the vehicle and check for leaks. Repair as necessary.

Fig. 62: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

11. Install the engine cover (1).

SENSOR, DIFFERENTIAL PRESSURE

DESCRIPTION

DESCRIPTION

**Fig. 63: Differential Pressure Sensor**

Courtesy of CHRYSLER GROUP, LLC

The Differential Pressure Sensor (2) is located near the Powertrain Control Module (PCM). Two pressure tubes (4) measure pressure before and after the Diesel Particulate Filter (DPF)/Diesel Oxidation Catalyst (DOC). The sensor is critical for fail-safe of regeneration strategy, because it interprets high pressure drops as possible high soot loads.

REMOVAL

REMOVAL

**Fig. 64: Differential Pressure Sensor**

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the differential pressure sensor wire harness connector (3).
3. Disconnect the differential pressure sensor vacuum hoses (4).
4. Remove nut (1) and differential pressure sensor (2).

INSTALLATION

INSTALLATION

Fig. 65: Differential Pressure Sensor

Courtesy of CHRYSLER GROUP, LLC

1. Install the differential pressure sensor (2) and securely tighten nut (1).
2. Connect the differential pressure sensor vacuum hoses (4).
3. Connect the differential pressure sensor wire harness connector (3).
4. Connect the negative battery cable.

SENSOR, EXHAUST TEMPERATURE

REMOVAL

EXHAUST TEMPERATURE SENSOR 1/1

Fig. 66: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 67: Upstream Exhaust Temperature Sensor Connector

Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the upstream exhaust temperature sensor 1/1 wire harness connector (1).

Fig. 68: Upstream Exhaust Temperature Sensor, Wire, Bracket & Connector

NOTE: The heat shield is removed for clarity.

4. Detach the upstream exhaust temperature sensor 1/1 wire (1) from heat shield (2).
5. Detach the upstream exhaust temperature sensor 1/1 wire harness connector (3) from bracket (4).
6. Remove the upstream exhaust temperature sensor 1/1 (5).

EXHAUST TEMPERATURE SENSOR 1/2

Fig. 69: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 70: Downstream Exhaust Temperature Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the downstream exhaust temperature sensor wire harness connector.
4. Detach the downstream exhaust temperature sensor wire harness connector (1) from bracket.
5. Remove the downstream exhaust temperature sensor (2).

INSTALLATION

EXHAUST TEMPERATURE SENSOR 1/1

Fig. 71: Upstream Exhaust Temperature Sensor, Wire, Bracket & Connector

Courtesy of CHRYSLER GROUP, LLC

1. Install the upstream exhaust temperature sensor 1/1 (5) and tighten to 45 N.m (33 ft. lbs.).
2. Attach the upstream exhaust temperature sensor 1/1 wire harness connector (3) to bracket (4).
3. Attach the upstream exhaust temperature sensor 1/1 wire (1) to heat shield (2).

Fig. 72: Upstream Exhaust Temperature Sensor Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the upstream temperature sensor wire harness connector (1).

Fig. 73: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the engine cover (1).
6. Connect the negative battery cable.

EXHAUST TEMPERATURE SENSOR 1/2

Fig. 74: Downstream Exhaust Temperature Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the downstream exhaust temperature sensor 1/2 (2) and tighten to 45 N.m (33 ft. lbs.).
2. Attach the downstream exhaust temperature sensor 1/2 wire harness connector (1) to bracket.
3. Connect the downstream exhaust temperature sensor 1/2 wire harness connector.

2014 ENGINE Exhaust System - Cherokee

4. Install the engine cover (1).
5. Connect the negative battery cable.

2014 ENGINE

Fuel System - Cherokee

FUEL DELIVERY, GAS

STANDARD PROCEDURE

FUEL SYSTEM PRESSURE RELEASE PROCEDURE

Fig. 1: Removing/Installing Rear Seat
Courtesy of CHRYSLER GROUP, LLC

WARNING: The fuel system is under constant pressure even with engine off. Until the fuel pressure has been properly relieved from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area.

A separate fuel pump relay is no longer used. A circuit within the Body Control Module (BCM) is used to control the electric fuel pump located within the fuel pump module.

1. Remove fuel fill cap.
2. Remove lower rear seat cushion.

Fig. 2: Access Cover, Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the fuel pump module cover (1).

Fig. 3: Fuel Supply, Return & Vapor Lines
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect electrical connector from fuel pump module.
5. Start and run engine until it stalls.
6. Attempt to restarting engine a few times until the engine will no longer start.
7. Turn ignition key to OFF position.
8. Disconnect negative battery cable.
9. Place a shop towel below and disconnect the fuel line quick-connect fittings at the fuel pump module. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS**.

NOTE: After servicing the fuel system, one or more Diagnostic Trouble Codes (DTC's) may have been stored in Powertrain Control Module (PCM) memory due to disconnecting fuel pump module circuit. A diagnostic scan tool must be used to erase a DTC.

DRAINING FUEL TANK

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Remove the fuel pump module. Refer to **MODULE, FUEL PUMP, REMOVAL** .
3. Drain fuel from fuel tank with approved siphoning equipment, store fuel in approved fuel storage container.

SPECIFICATIONS

FUEL SYSTEM PRESSURE

DESCRIPTION	METRIC	STANDARD
Fuel Pressure	400 kPa $\pm$ 34 kPa	58 psi $\pm$ 5 psi

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Fuel Fill Tube Clamp	3	-	27
Fuel Rail to Intake Manifold	7	-	62
Fuel Tank Strap Bolts	48	35	-
Filler Tube Mounting Nut	12	-	106

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HARD TO FILL WITH FUEL

1. Disconnect the vapor recirculation tube at the fuel tank.
2. Attempt to refill fuel tank.
3. Does tank refill properly?
 - a. Yes >> Proceed to next step.
 - b. No > Proceed to step 8.
4. Reconnect the vapor recirculation tube at the fuel tank.
5. Disconnect the other end of the vapor recirculation tube at the fuel filler tube.
6. Attempt to refill fuel tank.
7. Does tank refill properly?
 - a. Yes >> Replace fuel filler tube.
 - b. No > Replace the vapor recirculation tube.

8. Disconnect the control valve to EVAP canister tube at the fuel tank.
9. Reconnect the vapor recirculation tube at the fuel tank.
10. Does tank refill properly?
 - a. Yes >> Replace fuel tank.
 - b. No > Proceed to step 11.
11. Reconnect the control valve to EVAP canister tube at the fuel tank.
12. Disconnect the control valve to EVAP canister tube at the EVAP canister.
13. Attempt to refill fuel tank.
14. Does tank refill properly?
 - a. Yes >> Blockage is in the EVAP Canister, or ESIM, or Clean air hose (ESIM vent hose), or filter. Diagnose appropriately.
 - b. No > Replace the control valve to EVAP canister tube.

9327, 9327CC, 9397, 9575.)

FILTER, FUEL

DESCRIPTION

DESCRIPTION

The fuel filter is combined within the fuel pump module assembly. It is not serviceable separately.

FITTING, QUICK CONNECT

STANDARD PROCEDURE

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. Some quick-connect fittings require the use of a special tool for disconnection and removal.

NOTE: Care must be used when separating fittings. Over-flexing may cause the tube to become deformed or damaged.

These are the quick-connect fittings:

- Redundant Latch Single Button Type Fitting
- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

DISCONNECTING

WARNING: On vehicles equipped with gasoline engines, the fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released.

CAUTION: Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

REDUNDANT LATCH SINGLE BUTTON TYPE FITTING:

Fig. 4: Redundant Latch & Push Button
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

Fig. 5: Redundant Latch & Internal Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

1. Pull the redundant latch (2) out away from the quick-connect fitting.
2. Press on the push button with your thumb, release the internal latches (1) and remove the quick-connect fitting from the fuel system component.

SINGLE BUTTON TYPE FITTING:

8120c64f

Fig. 6: Single Button Fitting

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

This type of quick-connect fitting is equipped with a single push button (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

8120c655

Fig. 7: Quick-Connect Fitting Latches

Courtesy of CHRYSLER GROUP, LLC

1. Press on the push button with your thumb, release the internal latches (1).
2. Remove the quick-connect fitting from the fuel system component.

2 BUTTON TYPE FITTING**Fig. 8: 2-Button Type Fitting**

Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two push buttons (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

1. Press on both push buttons with your thumb, release the internal latches.
2. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.

PINCH TYPE FITTING

Fig. 9: Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two finger tabs (2). Special tools are not required for removal.

1. Pinch both tabs (2) together and release the quick-connect fitting.
2. Remove the quick-connect fitting from the fuel system component.

SINGLE TAB TYPE FITTING

Fig. 10: Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed the quick-connect fitting can be separated from the fuel system component. Special tools are not required for removal.

Fig. 11: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
2. While pressing the release tab on the side of the quick-connect fitting use a screwdriver (2) to pry up the pull tab.
3. Raise the pull tab until it separates from the quick-connect fitting.
4. Remove the quick-connect fitting from the fuel system component.

TWO TAB TYPE FITTING

Fig. 12: Typical Two-Tab Type Quick-Connect Fitting
 Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (2) is equipped with tabs located on both sides of the fitting (1). These tabs are integral to the fuel system component. The plastic tabs will remain on the component being serviced after the quick-connect fitting is removed. The O-ring and spacer will remain in the quick-connect fitting. Special tools are not required for removal.

1. Squeeze the plastic tabs (1) against the sides of component being serviced with your fingers.
2. Remove the quick-connect fitting from the fuel system component.

PLASTIC RETAINER RING TYPE FITTING

Fig. 13: Plastic Retainer Ring Type Fitting
 Courtesy of CHRYSLER GROUP, LLC

This type of fitting can be identified by the use of a round plastic retainer ring (4) usually black in color. Special tools are not required for removal.

NOTE: The round plastic retainer ring must be pressed squarely into the quick-connect fitting body. If this retainer is cocked during removal it will be difficult to disconnect the quick-connect fitting. Use an open-end wrench on the shoulder of the plastic retainer ring to aid in disconnection.

1. Firmly push the quick-connect fitting (5) towards the component being serviced while firmly pushing the round plastic retainer ring into the quick-connect fitting (6). With the round plastic ring depressed, remove the quick-connect fitting from the fuel system component.
2. After removal the plastic retainer ring will remain with the quick-connect fitting.

LATCH CLIP TYPE 1 FITTING

Fig. 14: Latch Clip Type 1
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered (1) to fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Pry up on the latch clip (4) with a screwdriver (3).
2. Slide the latch clip away from the quick-connect fitting while lifting the screwdriver and position aside.

Fig. 15: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert the commercially available fuel line removal tool (1) into the quick-connect fitting and release the

internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the commercially available fuel line removal tool (1) still inserted, remove the quick-connect fitting from the fuel system component.

LATCH CLIP TYPE 2 FITTING

Fig. 16: Latch Clip Type 2

Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered to the fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after the latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Unlatch the small arms on the end of clip, swing away and separate from the fuel system component.
2. Slide the latch clip away from the quick-connect fitting while lifting with a screwdriver and position aside.

Fig. 17: Fuel Line Disconnection Using Special Tool
 Courtesy of CHRYSLER GROUP, LLC

3. Insert the commercially available fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

4. With the commercially available fuel line removal tool (1) inserted, remove the quick-connect fitting from the fuel system component.

WING TYPE FITTING

Fig. 18: EVAP Canister Vapor Hose

Courtesy of CHRYSLER GROUP, LLC

The wing type fitting is used on fuel system and emission components. The wing type fitting is most commonly used on the EVAP canister (3). Special tools are not required for removal.

1. Using two fingers, press both wings (2) and release the locking tabs.

NOTE: After removal the locking tabs will remain with the quick-connect fitting.

2. While holding the wings, remove the quick-connect fitting from the fuel system component.

CONNECTING

1. Inspect the quick-connect fitting body and fuel system components for damage. Replace as necessary.
2. Prior to connecting any quick-connect fitting to components, check condition of fitting and components. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert the quick-connect fitting onto the fuel tube or fuel system component until the built-in stop on the fuel tube or component rests against the back of fitting.
4. Continue pushing until a click is felt.
5. If Equipped:
 - **Redundant Latch Single Button Type Fitting:** Push redundant latch until it locks into position in the quick-connect fitting.
 - **Single Tab Type Fitting:** Push new tab down until it locks into position in the quick-connect fitting.
 - **Latch Clip Type Fitting:** Install latch clip (snaps into position). **If latch clip will not snap into position, this indicates the quick-connect fitting is not properly installed onto fuel system component, recheck the connection.**
6. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

REGULATOR, FUEL PRESSURE**DESCRIPTION****DESCRIPTION**

The fuel pressure regulator is located within the fuel pump module. It is serviced by replacing the fuel pump module assembly.

MODULE, FUEL PUMP**DESCRIPTION****DESCRIPTION**

The fuel pump module is mounted on the top of the fuel tank and contains the following components:

- Mounting flange
- Electric fuel pump
- Fuel pump reservoir
- Inlet strainer
- Fuel pressure regulator
- Fuel level sending unit
- Fuel filter

The fuel level sending unit is the only serviceable component of the primary fuel pump module. If the electric fuel pump, fuel pressure regulator or fuel filter requires service, the fuel pump module must be replaced as an assembly.

OPERATION

OPERATION

An electric fuel pump is located within the fuel pump module. The electric fuel pump is a positive displacement, immersible pump with a permanent magnet electric motor capable of creating 860 kPa (125 psi) of operating pressure. The fuel pressure regulator limits fuel pressure to 400 kPa (58 psi).

The fuel gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending unit on the module in the fuel tank.

The instrument cluster continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. This information is available to other vehicle control modules via the Controller Area Network (CAN) data bus. Fuel gauge diagnosis is conducted as part of the instrument cluster circuitry. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

NOTE: Fuel pump for the saddle style fuel tank shown in illustration. Single style similar.

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The fuel system is under constant high pressure even with engine OFF. Until the fuel pressure has been properly released from the system, do

not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Make sure the area in which the vehicle is being serviced is in a well ventilated area. Failure to comply may result in serious or fatal injury.

1. Perform the fuel system pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .

NOTE: The fuel pump module has to be properly located in the fuel tank for the fuel level gauge to work properly.

2. Disconnect and isolate the negative battery cable.
3. Remove the right side rear seat for the single fuel pump module. For the saddle style fuel tank. Remove the rear seat assembly. Refer to **SEAT, REAR, REMOVAL** .

Fig. 19: Carpeting, Screws & Fuel Module Cover
Courtesy of CHRYSLER GROUP, LLC

4. Cut along the perforated lines in the carpeting and position aside (1).
5. Remove the screws (2) that secure the fuel module cover (3) to the floor.

0909005834

Fig. 20: Fuel Module Access Covers & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Lift up on the fuel pump module access cover (3, 4) and disconnect the wire harness connectors (2, 6).
7. Use a marker and place a mark across the position of the fuel pump module lock-ring, fuel pump module and the fuel tank prior to removal.

2963857

Fig. 21: Fuel Supply, Return & Vapor Lines
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the fuel tank vapor line (1, 3) from fuel pump module.

9. Disconnect the fuel lines (2) from the fuel pump module.

Fig. 22: Fuel Pump Module, Locking Ring & Lock Ring Wrench
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

10. Position the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench) or into the notches on the outside edge of the lock-ring (3).
11. Install a 1/2 inch drive breaker bar into the lock-ring remover/installer.
12. Rotate the breaker bar (1) counterclockwise and remove the lock-ring (3).

WARNING: The fuel pump module reservoir does not empty out when the tank is drained. The fuel in the reservoir will spill out when the module is removed.

NOTE: Do not spill fuel into the interior of the vehicle.

13. Lift up and removed the fuel pump module out of the fuel tank using caution not spill fuel inside the vehicle or bend the float arm.
14. Tip the fuel pump module on its side and drain all fuel from the reservoir.

Fig. 23: Fuel Pump Module Seal
Courtesy of CHRYSLER GROUP, LLC

15. Remove and discard the rubber O-ring seal.

INSTALLATION

INSTALLATION

Fig. 24: Fuel Pump Module Seal
Courtesy of CHRYSLER GROUP, LLC

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective

clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

1. Clean the rubber O-ring seal area of the fuel tank and install a new rubber O-ring seal.
2. Lower the fuel pump module into the fuel tank using caution not to bend the float arm.

NOTE: The fuel pump module must be properly located in the fuel tank for the fuel level gauge to work properly.

3. Align the rubber O-ring seal and rotate the fuel pump module to the orientation marks noted during removal. This step must be performed for the fuel level gauge to work properly.

Fig. 25: Fuel Pump Module, Locking Ring & Lock Ring Wrench
Courtesy of CHRYSLER GROUP, LLC

4. Position the lock-ring (3) over top of the fuel pump module (4).
5. Position the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock-ring (3).
6. Install a 1/2 inch drive breaker bar (1) into the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
7. Rotate the breaker bar (1) clockwise until all seven notches of the lock-ring (3) have engaged.

Fig. 26: Fuel Supply, Return & Vapor Lines
Courtesy of CHRYSLER GROUP, LLC

8. Connect the fuel lines (1, 2) to the fuel pump module.
9. Connect the fuel tank vapor line (3) to the fuel pump module.

Fig. 27: Fuel Module Access Covers & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

10. Connect the fuel pump module wire harness connector (2, 6). Install the access cover (3, 4) and securely tighten the screws.

11. Install the rear seat. Refer to **SEAT, REAR, INSTALLATION** .
12. Connect the negative battery cable.
13. Use the Scan Tool to pressurize the system and check for leaks.

RAIL, FUEL

REMOVAL

2.4L

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Wrap shop towels around hose to catch any gasoline spillage.

1. Release the fuel system pressure.
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
4. Remove the purge control valve (Refer to **VALVE, PURGE CONTROL** /Removal).
5. Disconnect the fuel line from the fuel rail. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .

140169663

Fig. 28: Fuel Rail, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Unlock and disconnect the fuel injectors wire harness connectors (1)
7. Remove bolts (3) and the fuel rail (2).

Fig. 29: Fuel Injector & Rail
Courtesy of CHRYSLER GROUP, LLC

8. If necessary, remove fuel injectors from the fuel rail.

3.2L

CAUTION: When removing the fuel supply line from the fuel inlet tube at the fuel rail, care must be taken that the fuel inlet tube is not being over-flexed. Damage to the fuel rail inlet tube may occur.

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .

Fig. 30: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the insulator (2) from the LH cylinder head cover.

Fig. 31: Fuel Supply Line And Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fuel injector electrical connectors (1).
6. Disconnect the fuel supply hose (2) from the fuel rail. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .

3524834

Fig. 32: Bolts & Fuel Rail

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connector tube. Due to the design of this tube, it does not use any clamps. Never attempt to install a clamping device of any kind on the tube. When removing the fuel rail assembly for any reason, be careful not to bend or kink the tube.

7. Remove the four bolts (1) from the fuel rail (2).

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

8. Lift the fuel rail and the fuel injectors from the lower intake manifold.

Fig. 33: Removing Fuel Injector From Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

9. Remove any remaining fuel injectors (1) from the lower intake manifold.

Fig. 34: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

10. If required, remove the fuel injectors from the fuel rail. Refer to **INJECTOR(S), FUEL, REMOVAL**.
11. Remove and discard all fuel injector O-ring seals (1).

INSTALLATION

2.4L

Fig. 35: Fuel Injector & Rail
Courtesy of CHRYSLER GROUP, LLC

1. Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.
2. If necessary, install the fuel injectors into the fuel rail.

Fig. 36: Fuel Rail, Injector & Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, install the fuel injectors retaining clip (2) and check to ensure injector is properly captured.

140169663

Fig. 37: Fuel Rail, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the fuel rail (2). Tighten bolts (3) to 7 N.m (62 in. lbs.).
5. Connect and lock the wire harness connectors (1).
6. Connect the fuel line to fuel rail.
7. Install the purge control valve (Refer to VALVE, PURGE CONTROL /Installation).
8. Install the air cleaner resonator. Refer to RESONATOR, AIR CLEANER, INSTALLATION .
9. Connect the battery negative cable.
10. Use the Scan Tool Fuel System Test to pressurize the fuel system. Check for leaks.

3.2L

CAUTION: When removing the fuel supply line from the fuel inlet tube at the fuel rail, care must be taken that the fuel inlet tube is not being over-flexed. Damage to the fuel rail inlet tube may occur.

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

1. Release fuel system pressure. Refer to FUEL SYSTEM PRESSURE RELEASE PROCEDURE .
2. Disconnect and isolate the negative battery cable.
3. Remove the upper intake manifold. Refer to MANIFOLD, INTAKE, REMOVAL .

Fig. 38: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the insulator (2) from the LH cylinder head cover.

Fig. 39: Fuel Supply Line And Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fuel injector electrical connectors (1).
6. Disconnect the fuel supply hose (2) from the fuel rail. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .

3524834

Fig. 40: Bolts & Fuel Rail

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connector tube. Due to the design of this tube, it does not use any clamps. Never attempt to install a clamping device of any kind on the tube. When removing the fuel rail assembly for any reason, be careful not to bend or kink the tube.

7. Remove the four bolts (1) from the fuel rail (2).

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

8. Lift the fuel rail and the fuel injectors from the lower intake manifold.

Fig. 41: Removing Fuel Injector From Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

9. Remove any remaining fuel injectors (1) from the lower intake manifold.

Fig. 42: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

10. If required, remove the fuel injectors from the fuel rail. Refer to **INJECTOR(S), FUEL, REMOVAL**.
11. Remove and discard all fuel injector O-ring seals (1).

SENDING UNIT AND SENSOR, FUEL LEVEL

DESCRIPTION

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor.

The sending unit/fuel level sensor is not serviceable. If the fuel level sensor sending unit has failed, the fuel pump module will need to be replaced. Refer to **MODULE, FUEL PUMP, REMOVAL**.

TANK, FUEL

REMOVAL

REMOVAL

NOTE: Saddle style fuel tank shown in illustration. Standard fuel tank.

WARNING: The fuel system is under constant pressure even with engine off. Until the fuel pressure has been properly relieved from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area.

1. Perform the draining fuel tank procedure. Refer to **DRAINING FUEL TANK**.
2. Disconnect and isolate the negative battery cable.
3. Remove the rear seat. Refer to **SEAT, REAR, REMOVAL**.

0909005834

Fig. 43: Fuel Module Access Covers & Wire Harness Connectors

Courtesy of CHRYSLER GROUP, LLC

4. Remove screws and lift up on the fuel pump module access cover (3, 4) and disconnect the wire harness connector (2, 6).

Fig. 44: Fuel Supply, Return & Vapor Lines

Courtesy of CHRYSLER GROUP, LLC

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

5. Disconnect the fuel tank vapor line (1, 3) from fuel pump module. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .
6. Disconnect the supply line quick connect fitting (2) from fuel pump module. Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .
7. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
8. Remove the exhaust system. Refer to **REMOVAL** .
9. **AWD ONLY:**

Remove the rear propeller shaft assembly

Refer to **REMOVAL** .

140169664

15. Remove bolts (1) and the left fuel tank strap (3).
16. Remove bolts (1) and the right fuel tank strap (2).
17. Lower fuel tank from vehicle.
18. If fuel tank is to be replaced, remove heat shield from fuel tank.

INSTALLATION

INSTALLATION

1. If fuel tank was replaced, install heat shield to the fuel tank.

WARNING: Support the fuel tank with a transmission jack or equivalent. Use straps to secure the fuel tank to the jack. Failure to properly support and secure the fuel tank during removal may cause fuel to spill or the fuel tank to fall from the jack.

2. Position fuel tank onto a transmission jack or equivalent and raise the fuel tank into vehicle position.

140170152

Fig. 50: Fuel Tank Straps & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the right fuel tank strap (2). Tighten the rear bolt (1) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
4. Install the left fuel tank strap (3). Tighten the rear bolt (1) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

140170153

5. Install the right front fuel tank strap bolt (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

140170151

Fig. 52: Left Fuel Tank Strap Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the left front fuel tank strap bolt (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
7. Remove the transmission jack.
8. Install the fuel line shield. Tighten nuts to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

140169664

Fig. 53: Fuel Tank, Filler Tube & Hose Clamp
Courtesy of CHRYSLER GROUP, LLC

9. Install fuel filler tube (3) to the fuel tank (1). Hand tighten the clamp (2).
10. Install the exhaust system. Refer to **INSTALLATION** .
11. Lower the vehicle.

Fig. 54: Fuel Supply, Return & Vapor Lines
 Courtesy of CHRYSLER GROUP, LLC

12. Connect the fuel supply line (2) to the fuel pump module.
13. Connect the fuel tank vapor line (1, 3) to the fuel pump module.
14. Connect fuel pump/module electrical connector (2).

Fig. 55: Fuel Module Access Covers & Wire Harness Connectors
 Courtesy of CHRYSLER GROUP, LLC

15. Connect the fuel pump module wire harness connector (2, 6). Install the access cover (3, 4) and hand

tighten the bolts.

16. Install the rear seat assembly. Refer to **SEAT, REAR, INSTALLATION** .
17. Fill fuel tank and install fuel filler cap.
18. Connect the negative battery cable.
19. Use the scan tool to pressurize the fuel system. Check for leaks.

TUBE, FUEL TANK FILLER

REMOVAL

REMOVAL

0909005846

Fig. 56: Isolating Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable.
2. Remove fuel cap.
3. Remove the right rear wheel and tire assembly. Refer to **REMOVAL** .
4. Remove the inner splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

140169666

Fig. 57: Fuel Tube Vent Line & Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fuel tube vent line (1) quick connect fitting and detach from retainer (2). Refer to **STANDARD PROCEDURE - QUICK-CONNECT FITTINGS** .

140169665

Fig. 58: Filler Tube Mounting Bracket Nut

4. Attach line to retainer (2) and connect the fuel tube vent line (1) quick connect fitting.
5. Install the inner splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
6. Install the right rear wheel and tire assembly. Refer to **INSTALLATION** .
7. Install fuel cap.
8. Connect negative battery cable, tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

FUEL INJECTION, GAS

OPERATION

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Fuel System - Cherokee

- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

SPECIFICATIONS

INJECTOR(S), FUEL

REMOVAL

3.2L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .

Fig. 65: Battery & Cables

Courtesy of CHRYSLER GROUP, LLC

2. Disconnect and isolate the negative battery cable (3).

Fig. 66: Engine Cover & Ball Studs

Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

0909005845

Fig. 67: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
 Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp at the throttle body (3)
6. Loosen the clamp at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud.
8. Remove the air inlet hose assembly (5).

2714021

Fig. 68: Fuel Rail & Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

9. Remove the upper intake manifold.
10. Remove the fuel rail (2). Refer to **RAIL, FUEL, REMOVAL**.

2744672

Fig. 69: Removing Fuel Injector From Fuel Rail

NOTE: Number 2 fuel injector removal shown in illustration, all other fuel injectors similar.

12. Remove the fuel injectors (1) from the lower intake manifold.

**Fig. 71: O-Ring Seals**

Courtesy of CHRYSLER GROUP, LLC

13. Remove and discard all fuel injector O-ring seals (1).

2.4L

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

1. Release the fuel pressure, refer to the **FUEL SYSTEM PRESSURE RELEASE PROCEDURE**.
2. Disconnect the battery negative cable.
3. Remove the fuel rail. Refer to **RAIL, FUEL, REMOVAL**.

140269674

Fig. 72: Fuel Rail, Injector & Retaining Clip

4. Remove the fuel injector (3) retaining clip (2).
5. Remove the fuel injector (3) from fuel rail (1).

INSTALLATION

3.2L

2756756

Fig. 73: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the new O-ring seals (1) with clean engine oil and position the seals onto the fuel injector (2).

2756853

Fig. 74: O-Ring Seals & Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 2 fuel injector installation shown in illustration, all other fuel injectors similar.

2. Install the fuel injectors (1) into the fuel rail (2).

2756534

Fig. 75: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Install the fuel rail. Refer to **RAIL, FUEL, INSTALLATION** .

4. Install the upper intake manifold.

0909005845

Fig. 76: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
Courtesy of CHRYSLER GROUP, LLC

5. Position the air inlet assembly (5) onto the air cleaner housing.
6. Secure the air inlet resonator (6) retaining grommet onto the ball stud.
7. Install the air intake resonator support bolt (2). Tighten the bolt to 8 N.m (71 in. lbs.).
8. Tighten the clamp at the air cleaner housing to 5 N.m (44 in. lbs.).
9. Tighten the clamp at the throttle body (3) to 5 N.m (44 in. lbs.).
10. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

Fig. 77: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

11. Install the engine cover (1).

Fig. 78: Battery & Cables
Courtesy of CHRYSLER GROUP, LLC

12. Connect the negative battery cable (3) and tighten nut to 5 N.m (45 in. lbs.).
13. Start the engine and check for leaks.

2.0L

140269674

Fig. 79: Fuel Rail, Injector & Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

1. Apply a light coating of clean engine oil to the upper O-ring.
2. Install the fuel injector (3) into fuel rail (1).
3. Install the fuel injector retaining clip (2).
4. Install the fuel rail. Refer to **RAIL, FUEL, INSTALLATION** .
5. Connect the negative battery cable.
6. Use the scan tool to pressurize the fuel system. Check for leaks.

PEDAL, ACCELERATOR

REMOVAL

REMOVAL

Fig. 80: Wiring Loom & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Separate the wiring harness loom (3) from the accelerator housing (5).
3. Disconnect the accelerator pedal connector (4).

Fig. 81: Accelerator Pedal & Brake Pedal Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws (2) that secure the accelerator pedal to the brake pedal assembly.

INSTALLATION

INSTALLATION

Fig. 82: Accelerator Pedal & Brake Pedal Assembly
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The accelerator pedal and mounting nuts need to be torque in a mandatory torque sequence or damage could result to the pedal assembly.

1. Install the accelerator pedal (2). Tighten the screws to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

Fig. 83: Wiring Loom & Connectors
Courtesy of CHRYSLER GROUP, LLC

2. Connect the accelerator pedal (5) wire harness connector (4).
3. Connect negative battery cable, tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

4. Use a scan tool and perform the APPS RELEARN function.

SENSOR, AIR TEMPERATURE, INLET**REMOVAL****REMOVAL**

Fig. 84: Air Cleaner Resonator & IAT Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the air cleaner resonator (1). Refer to **RESONATOR, AIR CLEANER, REMOVAL** for 2.4L or **RESONATOR, AIR CLEANER, REMOVAL** for 3.2L.
3. Rotate the Inlet Air Temperature (IAT) sensor (3) 1/4 turn counter clockwise and remove sensor.

INSTALLATION**INSTALLATION**

140269672

Fig. 85: IAT Sensor O-Ring Seal

Courtesy of CHRYSLER GROUP, LLC

1. If necessary, inspect and replace the O-ring seal (1).

Fig. 86: Air Cleaner Resonator & IAT Sensor

Courtesy of CHRYSLER GROUP, LLC

2. Install the Inlet Air Temperature (IAT) sensor (3) and rotate 1/4 turn to lock in place.
3. Install the air cleaner resonator (1). Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for

2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.

4. Connect the negative battery cable.

SENSOR, CRANKSHAFT POSITION

DESCRIPTION

DESCRIPTION

The Crankshaft Position (CKP) sensor is located on the front engine block, left side. It is positioned and bolted into a machined hole.

OPERATION

OPERATION

Fig. 87: 4 Cylinder Cam & Crank Signals

Courtesy of CHRYSLER GROUP, LLC

NOTE: The graphic represents the relationship between camshaft and crankshaft sensors edges with camshafts in "lock pin" position (cam shafts are not "phasing"). This is normally seen during idle.

Depiction of good camshaft and crankshaft square wave signals for 4 cylinder engines.

REMOVAL

REMOVAL

140268955

Fig. 88: Crankshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the Crankshaft Position (CKP) sensor wire harness connector.
3. Remove bolt (1) and the CKP sensor (2).

3.2L

The crankshaft position (CKP) sensor is mounted into the right rear side of the cylinder block.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. If equipped with AWD, remove the PTU (1). Refer to **REMOVAL** .

Fig. 89: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the crankshaft position (CKP) sensor.

Fig. 90: Sensor Mounting Bolt & Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Remove the sensor mounting bolt (2).
6. Carefully twist the sensor (1) from the cylinder block.

2745956

Fig. 91: O-Ring

Courtesy of CHRYSLER GROUP, LLC

7. The CKP sensor O-ring (1) can be reused if not damaged.

INSTALLATION

INSTALLATION

140268955

Fig. 92: Crankshaft Position Sensor & Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Insert the Crankshaft Position (CKP) sensor (2). Tighten the bolt (1) to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
2. Connect the CKP sensor wire harness connector.
3. Connect the battery negative cable.

3.2L

2745956

Fig. 93: O-Ring

Courtesy of CHRYSLER GROUP, LLC

1. The crankshaft position (CKP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).

2745948

Fig. 94: Sensor Mounting Bolt & Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Clean out the CKP sensor mounting bolt hole in the engine block.
4. Install the sensor (1) into the engine block with a slight rocking and twisting action.

CAUTION: Before tightening the CKP sensor mounting bolt, be sure the sensor is completely flush to the cylinder block. If the CKP sensor is not flush, damage to the sensor mounting tang may result.

5. Install the mounting bolt (2) and tighten to 12 N.m (106 in. lbs.).

Fig. 95: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the electrical connector (1) to the sensor.
7. If equipped with AWD, install the PTU (1). Refer to **INSTALLATION**.
8. Lower the vehicle.
9. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SENSOR, MANIFOLD AIR PRESSURE (MAP)

REMOVAL

2.4L

1. Disconnect the negative battery cable.

2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .

140269673

Fig. 96: MAP Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the Manifold Absolute Pressure (MAP) sensor wire harness connector (2).
4. Rotate the MAP sensor 90° counter clockwise and remove sensor (1).

3.2L

3535428

Fig. 97: MAP Sensor Electrical Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Unlock and disconnect the electrical connector (1) from the MAP sensor.

Fig. 98: Rotating MAP Sensor 1/4 Turn Counterclockwise
Courtesy of CHRYSLER GROUP, LLC

3. Rotate the MAP sensor 1/4 turn counterclockwise and pull the sensor straight up and out of the upper intake manifold.

Fig. 99: O-Ring
Courtesy of CHRYSLER GROUP, LLC

4. The MAP sensor O-ring (1) can be reused if not damaged.

INSTALLATION

2.4L

140269670

Fig. 100: MAP Sensor O-Ring Seal

Courtesy of CHRYSLER GROUP, LLC

1. Inspect and replace the O-ring seal (1) as necessary.

140269673

Fig. 101: MAP Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

2. Install Manifold Absolute Pressure (MAP) sensor (1) and rotate 90° clockwise to lock in place.
3. Connect the MAP sensor wire harness connector (2).
4. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
5. Connect the negative battery cable.

3.2L

2748738

Fig. 102: O-Ring

Courtesy of CHRYSLER GROUP, LLC

1. The manifold air pressure (MAP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).

Fig. 103: Rotating MAP Sensor Rotate 1/4 Turn Clockwise
Courtesy of CHRYSLER GROUP, LLC

3. Install the MAP sensor (1) into the upper intake manifold and rotate 1/4 turn clockwise.

Fig. 104: MAP Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect and lock the electrical connector (1) to the sensor.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, OXYGEN**REMOVAL**

2.4L/3.2L

UPSTREAM OXYGEN SENSOR (1/1)

WARNING: The exhaust manifold, exhaust pipes and catalytic converter(s) become very hot during engine operation. Allow engine to cool before removing oxygen sensor. Failure to allow engine to cool before removal may result in personal injury caused by burns.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wires going into oxygen sensor (O2S). Damage to the oxygen sensor may occur.

140269669

Fig. 105: Harness Connectors & Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect O2S wire harness from retainer (3).
3. Disconnect O2S sensor wire harness connector (2).

140269668

Fig. 106: O2 Sensors & Wire Harness Protector
Courtesy of CHRYSLER GROUP, LLC

4. Remove the wire harness protector (1).
5. Remove the O2S (2) sensor.

DOWNSTREAM OXYGEN SENSOR (1/2)

WARNING: The exhaust manifold, exhaust pipes and catalytic converter(s) become very hot during engine operation. Allow engine to cool before removing oxygen sensor. Failure to allow engine to cool before removal may result in personal injury caused by burns.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wires going into oxygen sensor (O2S). Damage to the oxygen sensor may occur.

140269669

Fig. 107: Harness Connectors & Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect O2S wire harness from retainer (3).
3. Disconnect O2S sensor wire harness connector (1).

140269668

Fig. 108: O2 Sensors & Wire Harness Protector
Courtesy of CHRYSLER GROUP, LLC

4. Remove the O2S (3) sensor.

FRONT

Fig. 109: Up Stream Oxygen Sensor & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

The engine is equipped with four heated oxygen sensors:

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

1. Disconnect and isolate the negative battery cable.

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

2. Disconnect the heated oxygen sensor electrical connectors (1).
3. Remove the up stream oxygen sensor (2).
4. Raise the vehicle.

0909005829

Fig. 110: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan (1).

1114007109

Fig. 111: Oxygen Sensors, Harness Connectors & Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the heated oxygen sensor electrical connector (3).
7. Remove the down stream O2 sensor (3).
8. Clean the exhaust pipe threads using an appropriate tap.

REAR

The engine is equipped with four heated oxygen sensors:

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

1. Disconnect and isolate the negative battery cable.

Fig. 112: Intake Resonator

Courtesy of CHRYSLER GROUP, LLC

2. Remove the resonator (1)

Refer to **RESONATOR, AIR CLEANER, REMOVAL** for 2.4L or **RESONATOR, AIR CLEANER, REMOVAL** for 3.2L.

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

Fig. 113: Oxygen Sensor Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the heated oxygen sensor electrical connectors (1, 2).

Fig. 114: Removing/Installing Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oxygen sensors (3, 5).
5. Clean the exhaust pipe threads using an appropriate tap.

INSTALLATION

2.4L/3.2L

UPSTREAM OXYGEN SENSOR (1/1)

WARNING: The exhaust manifold, exhaust pipes and catalytic converter(s) become very hot during engine operation. Allow engine to cool before removing oxygen sensor. Failure to allow engine to cool before removal may result in personal injury caused by burns.

CAUTION: When Equipped: The oxygen sensor (O2S) pigtail harness must be clipped and/or bolted back to their original positions on engine or body to prevent mechanical damage to wiring.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT** add any additional anti-seize compound to threads of a new O2S.

140269668

Fig. 115: O2 Sensors & Wire Harness Protector
Courtesy of CHRYSLER GROUP, LLC

1. Install the O2S (2) sensor. Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
2. Install the wire harness protector (1).

140269669

Fig. 116: Harness Connectors & Retainer
Courtesy of CHRYSLER GROUP, LLC

3. Connect O2S sensor wire harness connector (2).
4. Connect O2S sensor wire harness to retainer (3).
5. Connect the negative battery cable.

DOWNSTREAM OXYGEN SENSOR (1/2)

WARNING: The exhaust manifold, exhaust pipes and catalytic converter(s) become very hot during engine operation. Allow engine to cool before removing oxygen sensor. Failure to allow engine to cool before removal may result in personal injury caused by burns.

CAUTION: When Equipped: The oxygen sensor (O2S) pigtail harness must be clipped and/or bolted back to their original positions on engine or body to prevent mechanical damage to wiring.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT** add any additional anti-seize compound to threads of a new O2S.

140269668

Fig. 117: O2 Sensors & Wire Harness Protector
Courtesy of CHRYSLER GROUP, LLC

1. Install the O2S (3) sensor. Tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .

140269669

Fig. 118: Harness Connectors & Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Connect O2S sensor wire harness connector (1).
3. Connect O2S sensor wire harness to retainer (3).
4. Connect the negative battery cable.

REAR

Fig. 119: Oxygen Sensors, Harness Connectors & Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.

2. Install the oxygen sensor (3). Tighten to 43 N.m (32 ft. lbs.).
3. Connect the electrical connector (2).

0909005829

Fig. 120: Removing/Installing Belly Pans
Courtesy of CHRYSLER GROUP, LLC

4. Install the belly pan.
5. Lower the vehicle.

0811005729

Fig. 121: Up Stream Oxygen Sensor & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Install the upper O2 sensor (2). Tighten to 43 N.m (32 ft. lbs.).

7. Connect the electrical connector (1).
8. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

REAR

1114007110

Fig. 122: Removing/Installing Oxygen Sensors
Courtesy of CHRYSLER GROUP, LLC

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**
2. Install the oxygen sensor and tighten to:
 - Rear upstream oxygen sensor (3), 43 N.m (32 ft. lbs.).
 - Rear downstream oxygen sensor (2), 45 N.m (33 ft. lbs.).

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.

3. Connect the heated oxygen sensor electrical connector (1, 2).

0909005845

Fig. 123: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
Courtesy of CHRYSLER GROUP, LLC

4. Install the air intake resonator (6). Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for 2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

THROTTLE BODY

REMOVAL

3.2L

Fig. 124: Battery & Cables

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (3).

Fig. 125: Engine Cover & Ball Studs

Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

0909005845

Fig. 126: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp at the throttle body (3).
5. Loosen the clamp at the air cleaner housing.
6. Lift the air inlet resonator assembly (6) off the ball stud.

CAUTION: Never have the ignition key in the ON position when checking the throttle body shaft for a binding condition. This may set DTC's.

Fig. 127: Electrical Connector, Electronic Throttle Control (ETC), Clip & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the electrical connector (1) from the Electronic Throttle Control (ETC) (2) and unfasten the ETC harness from the clip (4) on the throttle body.
8. Remove four throttle body mounting bolts (3).
9. Remove the throttle body from the upper intake manifold.
10. Check the condition of the throttle body-to-intake manifold seal. The seal can be reused if not damaged.

2.4L

Fig. 128: Throttle Body, Retainer & Connector

Courtesy of CHRYSLER GROUP, LLC

WARNING: DO NOT place fingers in or around the throttle body plate. If the throttle body is energized, the throttle plate could move causing personal injury. Always disconnect the negative battery cable prior to servicing the throttle body.

CAUTION: DO NOT move the throttle plate while power is connected to the throttle body. This may cause fault codes to set.

1. Disconnect and isolate negative battery cable.
2. Remove the air cleaner resonator assembly. Refer to **RESONATOR, AIR CLEANER, REMOVAL**.
3. Disconnect throttle body wire harness connector (1) and detach wire harness retainer (3) from throttle body (2).

081569489

Fig. 129: Throttle Body Support Bracket, Nut & Bolt

Courtesy of CHRYSLER GROUP, LLC

4. Remove nut (1), bolt (3) and the throttle body support bracket (2).

091468957

Fig. 130: Throttle Body, Gasket & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove four bolts (1, 2) and throttle body (3) from the intake manifold.
6. Inspect intake manifold to throttle body gasket (2) for damage, remove if necessary.

INSTALLATION

3.2L

2743429

Fig. 131: Throttle Body-To-Intake Manifold Seal
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of the throttle body-to-intake manifold seal (1). The seal can be reused if not damaged.
2. Clean the mating surfaces of the throttle body and intake manifold.

Fig. 132: Electrical Connector, Electronic Throttle Control (ETC), Clip & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

3. Position the throttle body (2) to the intake manifold.
4. Install the throttle body mounting bolts (3) and tighten in a crisscross pattern sequence to the proper specification. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
5. Connect the electrical connector (1) to the Electronic Throttle Control (ETC) (2) and secure the ETC harness to the clip (4) on the throttle body.

0909005845

Fig. 133: IAT Sensor Connector, Throttle Body & Air Inlet Hose Housing
Courtesy of CHRYSLER GROUP, LLC

6. Position the air inlet hose (5) onto the resonator housing (6). Hand tighten the clamp (4).
7. Secure the air inlet hose assembly retaining grommet onto the ball stud.
8. Hand tighten the clamp (3) at the throttle body.
9. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

0908008616

Fig. 134: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

10. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

Fig. 135: Battery & Cables
Courtesy of CHRYSLER GROUP, LLC

11. Connect the negative battery cable (3). Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

2.4L

140269667

Fig. 136: New Throttle-To-Intake Manifold Gasket
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, Install a new throttle-to-intake manifold gasket (1).

091468957

Fig. 137: Throttle Body, Gasket & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT OVER TORQUE. Over tightening can cause damage to the throttle body, gaskets, bolts and/or the intake manifold.

2. Install throttle body (3). Tighten four bolts (1, 2) finger tighten.

Fig. 138: Throttle Body Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The throttle body must be torqued in a mandatory torque sequence.
Tighten in a criss - cross pattern to specification.

3. Tighten the bolts in criss cross pattern to 8 N.m (71 in. lbs.).

Fig. 139: Throttle Body Support Bracket, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install throttle body support bracket (2), bolt (3) and nut (1). Tighten fasteners to:
 - Tighten the bracket nut (1) to 8 N.m (71 in. lbs.).
 - Tighten the bracket bolt (3) to 25 N.m (18 ft. lbs.).

140270054

Fig. 140: Throttle Body, Retainer & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Install wire harness retainer (3) to throttle body (2) and connect the throttle body wire harness connector (1).
6. Install the air cleaner resonator assembly. Refer to **RESONATOR, AIR CLEANER, INSTALLATION**.
7. Connect the negative battery cable. Tighten nut to 5 N.m (44 in. lbs.).
8. Use a scan tool and clear all fault codes then perform the ETC RELEARN function.

FUEL DELIVERY, DIESEL

WARNING

WARNING

WARNING: Under no circumstances should gasoline be mixed with diesel fuel (not even during winter). The high pressure pump is lubricated by diesel fuel. Immediate fuel system damage may occur causing replacement and flushing of the complete diesel fuel system. High pressure pump seizure will cause metal particles to spread through out the fuel circuit. All CDI

fuel system components connected to the fuel circuit will have to be exchanged and the lines flushed.

HIGH FUEL SYSTEM PRESSURE

WARNING: High pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

HIGH PRESSURE FUEL PUMP DELIVERY

RPM	PRESSURE
400	550 BAR (7977 PSI)
500	650 BAR (9427 PSI)
800	885 BAR (12836 PSI)
1000	1038 BAR (15055 PSI)
1173	1134 BAR (16447 PSI)
1340	1231 BAR (17854 PSI)
1750	1514 BAR (21959 PSI)
1860	1600 BAR (23206 PSI)
3200	1600 BAR (23206 PSI)
3700	770 BAR (11168 PSI)
4000	400 BAR (5802 PSI)
4200	400 BAR (5802 PSI)
4400	100 BAR (1450 PSI)

DIAGNOSIS AND TESTING

FUEL DELIVERY SYSTEM

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing serious or fatal injury. Inspect high-pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

CONDITION	POSSIBLE CAUSES	CORRECTION
	1. Contaminated Fuel	1. Drain, Flush and Refill Fuel

2014 Jeep Cherokee Trailhawk

2014 ENGINE Fuel System - Cherokee

		System
No Start/Hard Start/Start and Stall	2. Low Fuel Pressure Supply to Fuel Filter	2. Perform the Low Pressure Fuel Pump Test to check the fuel pump pressure of the in-tank electric fuel pump. Refer to <u>FUEL DELIVERY - STANDARD PROCEDURE</u> .
	3. High Pressure Fuel Injection Pump	3. Perform the Fuel Injection Pump Pressure Test / Replace necessary fuel line(s)
	4. Restricted Fuel Filter	4. Replace Fuel Filter
	5. Fuel Heater Inoperative	5. Test Fuel Heater and circuitry
	6. Restricted or Leaking Fuel Lines	6. Inspect / Replace necessary fuel line(s)
	7. Stored Diagnostic Trouble Codes	7. Refer to the <u>2.0L DIESEL - DIAGNOSTIC CODE INDEX</u>
Stalls Under Aggressive Maneuvers/Loss Of Fuel Pressure	1. Restricted or Damaged Fuel Pump Lower Filter	1. Test Fuel Pump Pressure
	2. Contaminated Fuel	2. Drain, Flush and Refill Fuel System
	3. Damaged Fuel Tank	3. Replace Fuel Tank
	4. Restricted Fuel Filter	4. Replace Fuel Filter
Cannot Refill Fuel Tank/Excessive Pressure in Fuel Tank When Cap Is Removed	1. Sticking or Damaged Fuel Tank Fill/Vent Valve	1. Replace Fuel Tank
	2. Restricted or Damaged Fuel Tank Fill/Vent Valve Filter or Hose	2. Replace Fuel Tank Vent Filter

AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock.

Inspect the fuel system from the fuel tank to the injectors for loose connections. Refer to **FUEL DELIVERY, DIESEL, WARNING**. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the fuel pump. Inspect the fuel tank module and fuel lines for damage that might allow air into the system.

With the scan tool connected to the vehicle, select Engine and the select Sensor Display. Page down to view Fuel Pressure Set Point and Actual Fuel Pressure. Start the engine and observe the Fuel Pressure Set Point and the Actual Fuel Pressure. If the Actual Fuel Pressure Oscillates above and below the Fuel Pressure Set Point in a regular cycle, inspect the fuel system for air intrusion.

If the Actual Fuel Pressure gradually drops below the Fuel Pressure Set Point then spikes well above the Fuel Pressure Set Point, replace the fuel pressure control valve and recheck.

HIGH PRESSURE FUEL LINES

WARNING: High-pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high-pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high-pressure fuel leaks with a sheet of cardboard placed in the suspected area while the engine is not running. Start the vehicle and allow the engine to run for a short period. Turn the engine off and inspect the piece of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

Fig. 141: Checking For Fuel Leaks
Courtesy of CHRYSLER GROUP, LLC

- | |
|--|
| 1 - HIGH-PRESSURE LINE
2 - CARDBOARD
3 - FITTING |
|--|

High-pressure fuel line (1) leaks can cause starting problems and poor engine performance.

- Turn the engine off.
- Place a piece of cardboard (2) in the suspected area.
- Start the engine and allow to run for a short period.
- Turn the engine off.
- Inspect the cardboard.

If a high-pressure line connection is leaking, counterhold and tighten the connection to specification then perform this procedure again. Replace any damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

STANDARD PROCEDURE

CLEANING FUEL SYSTEM COMPONENTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines, fuel rail, and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. **DO NOT** wire brush injector nozzles when cleaning. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

DRAINING FUEL TANK

CONVENTIONAL PROCEDURE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

Due to a one-way check valve installed into the fuel fill fitting at the tank, the tank cannot be drained at the fuel fill cap.

1. Disconnect the fuel supply line at the quick-connect fitting (2) at the fuel rail. Refer to **FITTING**,

QUICK CONNECT .

2. Install the appropriate Fuel Line Adapters / Fitting from the (special tool #8978A, Decay Tool, Fuel). Route the opposite end of this hose to an diesel fuel draining station.

NOTE: **Activation of the fuel pump module may time out and need to be restarted several times to completely drain the fuel tank.**

3. Using a diagnostic scan tool, activate the fuel pump module until the fuel tank has been evacuated.

ALTERNATIVE PROCEDURE

NOTE: **If the electric fuel pump is not operating, the fuel tank must be removed and drained through the fuel pump module opening of the fuel tank.**

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the fuel tank. Refer to **TANK, FUEL, REMOVAL**.

CAUTION: Do not allow the float arm of the fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

4. Remove the fuel pump module. Refer to **MODULE, FUEL PUMP, REMOVAL**.
5. Position a hose into the fuel pump module opening of the fuel tank.
6. Attach the opposite end of this hose to approved diesel fuel caddy.
7. Using the diesel caddy, evacuate the fuel tank.

DIESEL FUEL SYSTEM CONTAMINATION

NOTE: **Fuel system damage that was caused by incorrect or contaminated fuel that was introduced into the fuel system by the customer is not covered under warranty.**

IF THE ENGINE WAS NOT STARTED AFTER INCORRECT OR CONTAMINATED FUEL WAS USED DURING REFUELING

If the fuel system has been contaminated (with gasoline, water, etc.) AND the engine WAS NOT STARTED, the following procedure must be followed:

1. Drain the fuel from the fuel tank. Refer to **FUEL DELIVERY - STANDARD PROCEDURE** . Use an appropriate fuel container. Dispose of the contaminated fuel using the proper procedures.

CAUTION: Dispose of petroleum based products in a manner consistent with all applicable Local, State, Federal, and Provincial regulations.

2. Remove the fuel tank. Refer to **TANK, FUEL, REMOVAL**.
3. Ensure the swirl pot indentation below the in the fuel tank electric fuel pump inlet is completely drained of any contaminated fuel.
4. Completely drain the low pressure fuel lines, and install a new fuel filter.
5. Install the fuel tank, and fill with clean diesel fuel.
6. Road test the vehicle to verify normal operation.

IF THE ENGINE WAS STARTED AFTER INCORRECT OR CONTAMINATED FUEL WAS USED DURING REFUELING

If the fuel system has been contaminated (with gasoline, water, etc.) AND the engine WAS STARTED, the following procedure must be followed:

1. Remove all fuel from the fuel tank. Refer to **FUEL DELIVERY - STANDARD PROCEDURE** . Use an appropriate fuel container. Dispose of the contaminated fuel using the proper procedures.

CAUTION: Dispose of petroleum based products in a manner consistent with all applicable Local, State, Federal, and Provincial regulations.

2. Remove the fuel tank. Refer to **TANK, FUEL, REMOVAL**.
3. Ensure the swirl pot indentation below the in the fuel tank electric fuel pump inlet is completely drained of any contaminated fuel.
4. Completely drain the low pressure fuel lines, and install a new fuel filter.
5. Install the fuel tank, and fill with clean diesel fuel.
6. Lift up on locking retaining tab to unlock the lock the fuel injector return line from injector
7. Disconnect the low pressure fuel injector return line T-Fitting from fuel injector.
8. Connect a clean hose to the T-Fitting orifice, and place the other end in a suitable clean container.
9. Turn the ignition ON, and collect the fuel escaping from the T-Fitting orifice in a clean container. Check the fuel sample for metal chips, dirt, or other foreign matter.
10. If any dirt or metal chips are present in the fuel sample, completely clean the high pressure side of the fuel injection system, then install new the fuel injectors, and the high pressure fuel pump.
11. If there are no metal chips or dirt present in the fuel sample, the fuel system is OK. Reconnect the T-Fitting orifice, and road test the vehicle to verify normal operation.

FITTING, QUICK CONNECT

DESCRIPTION

DESCRIPTION

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

These are the different type quick-connect fittings:

- Redundant Latch Single Button Type Fitting
- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

STANDARD PROCEDURE

STANDARD PROCEDURE

DISCONNECTING

WARNING: On vehicles equipped with gasoline engines, the fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released.

CAUTION: Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. This will prevent unnecessary fitting or fitting latch breakage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

REDUNDANT LATCH SINGLE BUTTON TYPE FITTING:

Fig. 142: Redundant Latch & Push Button
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

Fig. 143: Redundant Latch & Internal Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

1. Pull the redundant latch (2) out away from the quick-connect fitting.
2. Press on the push button with your thumb, release the internal latches (1) and remove the quick-connect fitting from the fuel system component.

SINGLE BUTTON TYPE FITTING

8120c64f

Fig. 144: Single Button Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

1 - QUICK-CONNECT FITTING
2 - SINGLE PUSH-BUTTON

1. This type of fitting is equipped with a single push-button (2) located on the quick-connect fitting.

8120c655

Fig. 145: Fitting Latches
Courtesy of CHRYSLER GROUP, LLC

1 - LATCHES

2 - QUICK-CONNECT FITTING

2. The push-button is attached to two internal latches (1). To disconnect, press on push-button with your thumb and unlatch fitting from fuel line. Tools are not required for disconnection. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH BUTTON. LATCHES WILL BE BROKEN.**

TWO BUTTON TYPE FITTING

Fig. 146: 2-Button Type Fitting

Courtesy of CHRYSLER GROUP, LLC

1 - QUICK-CONNECT FITTING

2 - PUSH-BUTTONS (2)

1. This type of fitting (1) is equipped with a push-button located on each side of quick-connect fitting (2). Press on both buttons simultaneously for removal. Tools are not required for disconnection.
2. Press on both push buttons with your thumb, release the internal latches.
3. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.

PINCH TYPE FITTING

Fig. 147: Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

- | |
|----------------------------|
| 1 - QUICK-CONNECT FITTINGS |
| 2 - PINCH TABS |

1. This fitting (1) is equipped with two finger tabs (2). Pinch both tabs together while removing fitting. Tools are not required for disconnection.

SINGLE TAB TYPE FITTING

Fig. 148: Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

- 1 - PULL TAB
- 2 - QUICK-CONNECT FITTING
- 3 - PRESS HERE TO REMOVE PULL TAB
- 4 - INSERTED TUBE END

1. This type of fitting (2) is equipped with a single pull tab (1). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component. Tools are not required for disconnection.

Fig. 149: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

- 1 - PULL TAB
- 2 - SCREWDRIVER
- 3 - QUICK-CONNECT FITTING

2. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
3. While pressing release tab on side of fitting, use screwdriver (2) to pry up pull tab.
4. Raise pull tab until it separates from quick-connect fitting.

TWO TAB TYPE FITTING

Fig. 150: Two-Tab Type Fitting

Courtesy of CHRYSLER GROUP, LLC

1 - TAB(S)

2 - QUICK-CONNECT FITTING

1. This type of fitting (2) is equipped with tabs located on both sides of fitting (1). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.
 - a. To disconnect quick-connect fitting, squeeze plastic retainer tabs (1) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.
 - b. Pull fitting from fuel system component being serviced.
 - c. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

PLASTIC RETAINER RING TYPE FITTING

Fig. 151: Plastic Retainer Ring Type Fitting
 Courtesy of CHRYSLER GROUP, LLC

- 1 - FUEL TUBE
- 2 - QUICK CONNECT FITTING
- 3 - PUSH
- 4 - PLASTIC RETAINER
- 5 - PUSH
- 6 - PUSH
- 7 - PUSH
- 8 - PUSH

1. This type of fitting can be identified by the use of a full-round plastic retainer ring (4) usually black in color.
 - a. To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (6). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**
 - b. After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.
 - c. Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

LATCH CLIPS - TYPE 1

**Fig. 152: Latch Clip-Type 1**

Courtesy of CHRYSLER GROUP, LLC

- | |
|------------------|
| 1 - TETHER STRAP |
| 2 - FUEL LINE |
| 3 - SCREWDRIVER |
| 4 - LATCH CLIP |
| 5 - FUEL RAIL |

1. Depending on vehicle model and engine, three different types of safety latch clips are used. Types 1 and 3 (4) are tethered to fuel line and type 2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
2. Pry up on latch clip with a screwdriver (3).
3. Slide latch clip toward fuel rail while lifting with screwdriver.

Fig. 153: Fuel Line Disconnection Using Special Tool
 Courtesy of CHRYSLER GROUP, LLC

- | |
|--|
| 1 - SPECIAL FUEL LINE TOOL
2 - FUEL LINE
3 - FUEL RAIL |
|--|

- Insert the appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

- With the special tool still inserted, remove quick-connect fitting from fuel system component being serviced.

LATCH CLIPS - TYPE 2

Fig. 154: Latch Clip - Type 2

Courtesy of CHRYSLER GROUP, LLC

1 - LATCH CLIP

1. Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type 1 is tethered to fuel line and type 2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
2. Type 2: Separate and unlatch 2 small arms (1) on end of clip and swing away from fuel line.
3. Slide latch clip toward fuel rail while lifting with screwdriver.

Fig. 155: Fuel Line Disconnection Using Special Tool

Courtesy of CHRYSLER GROUP, LLC

- 1 - SPECIAL FUEL LINE TOOL
- 2 - FUEL LINE
- 3 - FUEL RAIL

4. Insert the appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

5. With the special tool still inserted, remove quick-connect fitting from fuel system component being serviced.

LATCH CLIPS - TYPE 3

Fig. 156: Latch Clips - Type 3
Courtesy of CHRYSLER GROUP, LLC

1. A special tool is not necessary to disconnect fuel line after latch clip is removed. The latch clip is used to join fuel lines together.
2. Type 3: Separate and unlatch 2 small arms on the end of clip and swing away from the fuel line.

CONNECTING

1. Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

2. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.
4. Continue pushing until a click is felt.
5. Redundant Latch Single Button Type Fitting: Push redundant latch until it locks into position in the quick-connect fitting.
6. Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.
7. Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**
8. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

HEATER, FUEL

DESCRIPTION

DESCRIPTION

The Fuel Heater is located in the fuel filter/water separator housing assembly and is located on the left-rear side of the engine compartment. The fuel heater is not a serviceable component. If diagnosis has lead you to replace the fuel heater then the whole fuel filter/water separator housing must be replaced.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Disconnect the fuel heater/temperature sensor wire harness connector.

3550984

Fig. 157: Bolts & Fuel Heater/Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove bolts (2), and the fuel heater/temperature sensor (1).
5. Remove and discard O-ring seal.

INSTALLATION

INSTALLATION

3550984

Fig. 158: Bolts & Fuel Heater/Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Clean the O-ring surface sealing area.

NOTE: Lubricate the O-ring seal with clean diesel fluid.

2. Using a new O-ring seal, install the fuel heater/temperature sensor (1). Tighten bolts (2) to 10 N.m (89 in. lbs.).
3. Connect the fuel heater/temperature sensor wire harness connector.
4. Lower the vehicle.
5. Connect the negative battery cable.

MODULE, FUEL PUMP

DESCRIPTION

DESCRIPTION

81924862

Fig. 159: Fuel Pump Module

Courtesy of CHRYSLER GROUP, LLC

The diesel fuel pump module contains a submersible permanent magnet electric fuel pump, fuel pump reservoir, fuel level sending unit, fuel pressure regulator and a fuel filter. The entire module except for the mounting flange is concealed within the fuel tank. The module is connected to the vehicle electrical system through a dedicated take out and connector of the underbody wire harness.

The fuel level sending unit is available for separate service replacement. Refer to **SENDING UNIT AND SENSOR, FUEL LEVEL, REMOVAL**. The remainder of the module is serviced only as a complete unit.

OPERATION

OPERATION

When the Powertrain Control Module (PCM) senses the ignition status is ON or START it provides an output to energize the Auto Shut Down (ASD) relay and the fuel pump relay in the underhood Power Distribution

Center (PDC). The PCM will also ground the fuel pump relay driver at this time, closing the fuel pump relay contacts, completing the fuel pump circuit to chassis ground. If the PCM senses the ignition in the ON position, without a engine crank signal for more than about 30 seconds, it will open the fuel pump driver circuit, shutting down the fuel pump.

The diesel fuel pump module draws fuel through a internal filter and pushes it through the motor to an outlet pipe. The fuel pump module contains two check valves. One valve relieves internal fuel pump pressure and regulates maximum pump output. The second valve, located within the pump outlet, maintains residual pressure during engine OFF conditions. The pressure regulated fuel pump will maintain constant fuel pressure to the fuel injection pump. The fuel pump pressure regulator contains a calibrated spring which forces a diaphragm against the fuel filter return port. When pressure exceeds the calibrated value, the diaphragm retracts, allowing excess fuel pressure in the fuel pump module to purge back into the fuel tank.

REMOVAL

REMOVAL

Vehicles equipped with a saddle style fuel tank system require two fuel pump modules due to the saddle-like design of the fuel tank, which is necessary to provide clearance for the rear axle drive shaft. The main fuel pump module is located in the left half of the fuel tank and the auxiliary fuel pump module is located in the right half.

REMOVAL

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The fuel system is under constant high pressure even with engine OFF. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Make sure the area in which the vehicle is being serviced is in a well ventilated area. Failure to comply may result in serious or fatal injury.

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY - STANDARD PROCEDURE** .

NOTE: The fuel pump module has to be properly located in the fuel tank for the fuel level gauge to work properly.

2. Disconnect and isolate the negative battery cable.
3. Remove the rear seat assembly. Refer to **SEAT, REAR, REMOVAL** .

Fig. 161: Carpeting, Screws & Fuel Module Cover

8. Disconnect the fuel tank vapor line (1, 3) from fuel pump module.
9. Disconnect the fuel lines (2) from the fuel pump module.

Fig. 164: Fuel Pump Module, Locking Ring & Lock Ring Wrench
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

10. Position the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench) or into the notches on the outside edge of the lock-ring (3).
11. Install a 1/2 inch drive breaker bar into the lock-ring remover/installer (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
12. Rotate the breaker bar (1) counterclockwise and remove the lock-ring (3).

WARNING: The fuel pump module reservoir does not empty out when the tank is drained. The fuel in the reservoir will spill out when the module is removed.

NOTE: Do not spill fuel into the interior of the vehicle.

13. Lift up and removed the fuel pump module out of the fuel tank using caution not spill fuel inside the vehicle or bend the float arm.
14. Tip the fuel pump module on its side and drain all fuel from the reservoir.

Fig. 165: Fuel Pump Module Seal

14. Remove and discard the rubber O-ring seal.

INSTALLATION

INSTALLATION

Vehicles equipped with saddle style fuel tank system require two fuel pump modules due to the saddle-like design of the fuel tank, which is necessary to provide clearance for the rear axle drive shaft. The main fuel pump module is located in the left half of the fuel tank and the auxiliary fuel pump module is located in the right half.

INSTALLATION

Fig. 172: Fuel Pump Module Seal

Courtesy of CHRYSLER GROUP, LLC

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

1. Clean the rubber O-ring seal area of the fuel tank and install a new rubber O-ring seal.
2. Lower the fuel pump module into the fuel tank using caution not to bend the float arm.

NOTE: The fuel pump module must be properly located in the fuel tank for the fuel level gauge to work properly.

3. Align the rubber O-ring seal and rotate the fuel pump module to the orientation marks noted during removal. This step must be performed for the fuel level gauge to work properly.

Fig. 173: Fuel Pump Module, Locking Ring & Lock Ring Wrench
 Courtesy of CHRYSLER GROUP, LLC

4. Position the lock-ring (3) over top of the fuel pump module (4).
5. Position the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock-ring (3).
6. Install a 1/2 inch drive breaker bar (1) into the lock-ring remover/installer (2) (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
7. Rotate the breaker bar (1) clockwise until all seven notches of the lock-ring (3) have engaged.

14. Use the Scan Tool to pressurize the system and check for leaks.

PUMP, FUEL INJECTION, HIGH PRESSURE**DESCRIPTION****DESCRIPTION**

Fig. 185: Fuel Injection Pressure Pump
Courtesy of CHRYSLER GROUP, LLC

The fuel injection pressure pump (1) is secured to a special cast support (3) that is attached to the front of the cylinder head and hangs out over the intake side of the engine. The support also serves as part of the timing belt cover. A molded rubber fuel return hose (2) is connected to a port near the front of the pump, while the fuel supply is secured to a port (4) near the back of the pump using a quick-connect fitting. The high pressure port (5) and the fuel pressure regulator are located on the rear of the pump.

The pressure pump shaft is equipped with a toothed drive sprocket that is driven and timed along with the camshafts by the timing belt on the crankshaft. The timing belt includes yellow reference marks for correct timing of the pressure pump and the camshafts to crankshaft rotation. The pump for this common rail injection system is known as a radial jet pump because pressure is achieved using three pistons arranged at equal 120 degree intervals in a radial orientation around the pump shaft rotation axis.

Most components of the fuel injection pressure pump are not serviceable. If any part of the pump is damaged or ineffective, the entire pump unit must be replaced. The pump support and the pump drive sprocket are available for separate service replacement.

OPERATION

OPERATION

The timed fuel injection pressure pump is driven by the crankshaft through a toothed belt and sprocket arrangement. The pump must be supplied fuel through the low pressure circuit with a minimum pressure of 3.5 bar and a minimum flow rate of 160 liters per hour to ensure correct operation. This supply is achieved by means of the low pressure electric fuel pump integral to the fuel pump module submersed within the fuel tank.

The three pump pistons are operated by the rotation of a triangular-shaped cam integrated with the pump input

shaft. This cam causes the movement of the three pistons in succession, through the movement of a mechanical interface (tappet) between the cam and the base of the piston. The contact between the cam and each individual tappet is maintained by means of a spring.

Each pumping unit is equipped with a plate type intake valve and a ball type supply valve. All three delivery valves of the pumping elements are united inside the pump and deliver the pressurized fuel to the common rail (manifold) through a single high pressure tube. A feature of this pump is that it is lubricated and cooled at the same time by the diesel fuel circulating inside it, via special ports.

The fuel quantity solenoid on the pump adjusts the supply pressure at the pump intake as needed to compress only the amount of diesel fuel needed to reach the pressure targeted by the Powertrain Control Module (PCM).

The pump is driven by the engine at a rotation speed equal to $\frac{2}{3}$ (4v) and $\frac{25}{43}$ (2v) of that of the actual engine, by means of a toothed belt transmission. The timing and injection duration are, in this injection system, tasks of the electronic control system; this pump only carries out the task of permanently maintaining the fuel contained in the manifold at the requested pressure level.

REMOVAL

REMOVAL

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver fuel under extreme pressure from the injection pump to the injectors. This may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system.

CAUTION: Cranking the engine for an extended time without a fuel supply may damage the fuel injection pressure pump.

NOTE: The fuel injection pressure pump must not be disassembled or opened. The only serviceable components are the sprocket and the support.

20. Connect the boost pressure wire harness connector.
21. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
22. Install the right front wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
23. Install the right front wheel and tire.
24. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
25. Lower the vehicle.

Fig. 210: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

26. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
27. Connect the negative battery cable.
28. Start the engine and inspect the fuel connections for leaks.
29. Install the engine cover (1).

RAIL, FUEL

DESCRIPTION

DESCRIPTION

Fig. 211: Fuel Rail**Courtesy of CHRYSLER GROUP, LLC**

A common fuel rail (1) (also known as a manifold) is secured by two screws to the camshaft housing on the intake side of the cylinder head. The fuel rail is a metal casting with six machined ports. A supply port connects the fuel rail to the high pressure fuel circuit through a single tube and fitting (4) from the outlet side of the fuel injection pump. An outlet port connects to each of the fuel injectors through a high pressure fuel tube and fitting (2). The fuel rail also has a threaded port on one end into which the fuel pressure sensor (3) is installed. The fuel rail cannot be adjusted or repaired. If damaged or ineffective, it must be replaced.

OPERATION**OPERATION**

The stored volume of high pressure fuel inside the fuel rail helps to stabilize and equalize pressure fluctuations which result because of pulsations in the supply from the injector pump as well as due to the brief and repetitive extractions of fuel injector firing. The rail primarily influences the atomization of fuel at the injector nozzle, and the accuracy of the injected fuel quantity during injection.

REMOVAL**REMOVAL**

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel rail and from the fuel rail to the fuel injectors. This pressure may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure circuits of the fuel system.

Fig. 212: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

4. Remove the high pressure fuel tubes. Refer to **TUBE(S), FUEL, HIGH PRESSURE, REMOVAL**.
5. Remove bolts (3) and the fuel rail (1).

INSTALLATION

INSTALLATION

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel rail and from the fuel rail to the fuel injectors. This pressure may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure circuits of the fuel system.

5. Connect the negative battery cable.
6. Start the engine and inspect all of the fuel rail connections for leaks.
7. Install the engine cover (1).

SENDING UNIT AND SENSOR, FUEL LEVEL

DESCRIPTION

DESCRIPTION

Fig. 218: Main Fuel Pump Module & Auxiliary Fuel Pump Module
Courtesy of CHRYSLER GROUP, LLC

Diesel vehicles are equipped with a saddle fuel tank configurations which have a main (1) and auxiliary (2) fuel level sending units.

The main fuel level sending unit located on the main fuel pump reservoir (1) and is serviceable.

The auxiliary fuel level sending unit (2) is integrated with the auxiliary fuel pump module. The auxiliary fuel pump module and the fuel level sending unit is serviced as an assembly.

OPERATION

OPERATION

Fig. 219: Main Fuel Pump Module & Auxiliary Fuel Pump Module
Courtesy of CHRYSLER GROUP, LLC

Operation of the main fuel pump module along with the addition of a auxiliary fuel pump module with a auxiliary fuel level sending unit and draws fuel from the base of the auxiliary fuel pump module (2) through an internal tube.

The auxiliary fuel pump module flow rate is greater than the vehicle fuel consumption rate so that the auxiliary side of the tank is emptied before fuel is depleted from the primary side.

REMOVAL

REMOVAL

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective

clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The fuel system is under constant high pressure even with engine OFF. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Make sure the area in which the vehicle is being serviced is in a well ventilated area. Failure to comply may result in serious or fatal injury.

1. Remove the fuel pump module from the fuel tank. Refer to **MODULE, FUEL PUMP, REMOVAL**.

2660162

2. Disconnect the fuel level sending unit and sensor pigtail wire connector (1) from the connector receptacle integral to the underside of the fuel pump module mounting flange.

Fig. 221: Pressing Fuel Level Sending Unit Snap Tab To Left
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch the terminals or the resistor card.

CAUTION: Do not pull the fuel level sending unit by the wires or the float arm.

3. Using your finger, press the fuel level sending unit snap tab to the left while gently pushing up on the bottom of the sending unit and sensor.
4. Remove the sending unit and sensor from the fuel pump module reservoir.

INSTALLATION

INSTALLATION

WARNING: Risk of injury to eyes and skin from contact with fuel. Wear protective clothing and eye protection. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked and approved containers. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The fuel system is under constant high pressure even with engine OFF. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Make sure the area in which the vehicle is being serviced is in a well ventilated area. Failure to comply may result in serious or fatal injury.

Fig. 222: Resistor Card
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch the terminals or the resistor card.

CAUTION: Do not handle the new fuel level sending unit by the float arm.

1. Position the new fuel level sending unit and sensor to the mount integral to the fuel pump module reservoir.

Fig. 223: Pushing Fuel Level Sending Unit Down Until Snap Tab Engages
Courtesy of CHRYSLER GROUP, LLC

2. Gently push the sending unit down until the latch tab engages.

Fig. 224: Fuel Level Sending Unit Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Ensure the fuel level sending unit wires are routed so they do not get pinched between the coils of the spring when the module is completely compressed.

3. Reconnect the sending unit pigtail wire connector (1) to the connector receptacle integral to the underside of the fuel pump module mounting flange.
4. Reinstall the fuel pump module into the fuel tank. Refer to **MODULE, FUEL PUMP, INSTALLATION**.

SENSOR, FUEL PRESSURE

DESCRIPTION

DESCRIPTION

3390906

Fig. 225: Fuel Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

The fuel pressure sensor is fitted at the end of the common rail and its function is to provide the injection control unit with a feedback signal to enable it to modulate injection pressure and regulate fuel injection duration.

The fuel pressure sensor cannot be adjusted or repaired. If damaged or ineffective, the sensor must be replaced.

OPERATION

OPERATION

The fuel pressure sensor receives voltage and ground from the Powertrain Control Module (PCM), then provides a return input to the PCM through a separate signal circuit. This input along with internal programming and numerous inputs from other sensors allows the PCM to modulate fuel injection pressure and regulate fuel injector pulse duration as appropriate.

The fuel pressure sensor control and signal circuits are continuously monitored by the PCM. If the PCM detects a problem in any monitored circuit, it will store a Diagnostic Trouble Code (DTC) in its memory circuits. Such a DTC can be retrieved from the PCM through the Controller Area Network (CAN) data bus using a diagnostic scan tool connected to the Data Link Connector (DLC).

The fuel pressure sensor and the hard wired circuits between the sensor and the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the fuel pressure sensor or the electronic controls or communication between other modules and devices that provide some features of the fuel injection system. The most reliable, efficient, and accurate means to diagnose the fuel pressure sensor or the electronic controls and communication related to fuel injection system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel rail and from the fuel rail to the fuel injectors. This pressure may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure circuits of the fuel system.

1. Install the fuel pressure sensor (2) into the fuel rail. Tighten the sensor to 70 N.m (52 ft. lbs.).
2. Connect the fuel pressure wire harness connector (1).

Fig. 229: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Connect the negative battery cable.
4. Start the engine and allow it to warm. Turn the engine OFF and inspect the fuel pressure sensor to fuel rail connection for leaks.
5. Install the engine cover (1).

SENSOR, FUEL TEMPERATURE

DESCRIPTION

DESCRIPTION

The Fuel Temperature Sensor is located in the fuel filter/water separator housing assembly and is located on the left-rear side of the engine compartment. The fuel temperature sensor is not a serviceable component. If diagnosis has lead you to replace the fuel temperature sensor then the whole fuel filter/water separator housing must be replaced.

REMOVAL

REMOVAL

1. The fuel temperature sensor is a combination fuel heater/temperature sensor which is a serviceable component. Refer to **HEATER, FUEL, REMOVAL**.

INSTALLATION

INSTALLATION

1. The fuel temperature sensor is a combination fuel heater/temperature sensor which is a serviceable component. Refer to **SEPARATOR AND FILTER, FUEL AND WATER, INSTALLATION**.

SENSOR, WATER IN FUEL

DESCRIPTION

DESCRIPTION

Fig. 230: Fuel (WIF) Sensor

Courtesy of CHRYSLER GROUP, LLC

The Water In Fuel (WIF) sensor (1) is located in the fuel filter housing. The WIF sensor (1) detects the presence of water in the fuel. If water is present in the fuel, a signal is sent to the Powertrain Control Module (PCM) and the PCM signals the instrument cluster, over the CAN bus, to illuminate the water in fuel warning.

OPERATION**OPERATION**

The non-dielectric properties of the water allow the sensors probes to close the electronic circuit when water is present in the system. When diesel fuel is present in the system, its dielectric (does not conduct electricity well) properties do not allow any electrical contact between the probes. A 12V power signal is always present in order to illuminate the indicator on the instrument cluster.

REMOVAL**REMOVAL**

Fig. 231: Drain Plugs

Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove any dirt and debris around the fuel filter assembly using a suitable solvent or compressed air. Area around the fuel filter assembly must be clean and dry.

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Loosen drain plug (1) and drain fuel filter/water separator into a suitable container.

4. Securely tighten drain plug (2).

Fig. 232: WIF Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the Water In Fuel (WIF) sensor wire harness connector (4).

Fig. 233: Fuel (WIF) Sensor

4. Connect the Water In Fuel (WIF) sensor wire harness connector (4).
5. Lower the vehicle.
6. Connect the negative battery cable.

SEPARATOR AND FILTER, FUEL AND WATER

DESCRIPTION

DESCRIPTION

The fuel filter/water separator housing is located on the left side of the vehicle in front of the fuel tank. The filter has the task of cleaning the fuel before it is fed to the high-pressure system and ultimately to the injector nozzles.

1. The fuel filter/water separator housing incorporates the following components:
 - Two 5 micron fuel filter element.
 - Water separator
 - Drain plug
 - Water In Fuel sensor (WIF)
 - Fuel heater/temperature sensor

Fig. 237: Drain Plugs

Courtesy of CHRYSLER GROUP, LLC

Fuel filtering is critical in common-rail systems. Small amounts of impurities may damage the precision mechanical components over time. Water entering the injection system can also lead to damage. Servicing the fuel filters (2) is done from the bottom of the fuel filter/water separator housing.

A water reservoir is located at the bottom of the filter to collect any water contained in the fuel. A drain plug (1) is located on the bottom of the filter housing. The filter housing should be drained if a Water-in-Fuel message is displayed in the instrument cluster. Water is drained by removing the drain plug.

OPERATION

OPERATION

The fuel filter/water separator protects the fuel injection pump by removing contamination from the fuel being supplied to the pump.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FUEL FILTER

This diagnostic will test for a restricted fuel filter.

1. CHECK THE LOW SIDE FUEL SYSTEM PRESSURE

1. Turn the ignition off.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and

appropriately marked containers. Wear protective clothing.

2. Disconnect the quick connect fitting between the Fuel Filter outlet and the High Pressure Fuel Pump and connect a fuel pressure gauge in-line.
3. Crank the engine or start the engine and observe the reading on the fuel pressure gauge.

Does the fuel pressure read between 4.0 bar (58 psi) and 5.5 (79.7 psi)?

No, pressure reading is below specification:

- Go To 2

2. CHECK THE FUEL SUPPLY PRESSURE AT FUEL FILTER INLET

1. Turn the ignition off.
2. Remove the fuel pressure gauge from between the Fuel Filter outlet and the High Pressure Fuel Pump. Reconnect the fuel line.
3. Disconnect the fuel supply line quick connect at the Fuel Filter inlet.
4. Connect the fuel pressure gauge in-line between the fuel supply line and the Fuel Filter inlet fitting.
5. Crank the engine or start the engine and observe the reading on the fuel pressure gauge.

Does the fuel pressure read 4.0 bar (58 psi) or above?

Yes

- Replace the Fuel Filter in accordance with the service information.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Perform the CHECKING THE FUEL DELIVERY SYSTEM test procedure. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

Fig. 238: Drain Plugs

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Loosen drain plug (1) and drain fuel filter/water separator into a suitable container.
4. Securely tighten drain plug (1).

Fig. 239: WIF Sensor Wire Harness Connector

Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fuel filter/water separator outlet fuel line (1). Refer to **FITTING, QUICK CONNECT**.

6. Disconnect the fuel filter/water separator inlet fuel line (2). Refer to **FITTING, QUICK CONNECT** .
7. Disconnect the Water In Fuel (WIF) sensor harness connector (4).
8. Disconnect the combination fuel heater/temperature sensor wire harness connector (3).

0709009921

Fig. 240: WIF Sensor Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolts (2) and the fuel filter/water separator assembly (1).

INSTALLATION

INSTALLATION

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

Fig. 241: WIF Sensor Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the fuel filter/water separator assembly (1). Tighten bolts (2) to 55 N.m (41 ft. lbs.).

Fig. 242: WIF Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the combination fuel heater/temperature sensor wire harness connector (3).
3. Connect the Water In Fuel (WIF) sensor wire harness connector (4).
4. Connect the fuel filter/water separator inlet fuel line (2).
5. Connect the fuel filter/water separator outlet fuel line (1).

Fig. 243: Drain Plugs

Courtesy of CHRYSLER GROUP, LLC

6. Make sure fuel filter drain port (2) is closed.
7. Lower the vehicle.
8. Connect the negative battery cable.
9. Start the engine and inspect for leaks.

SOLENOID, FUEL QUANTITY

DESCRIPTION

DESCRIPTION

Fig. 244: Fuel Quantity Solenoid, Connector & High Pressure Fuel Injection Pump
Courtesy of CHRYSLER GROUP, LLC

The Fuel Quantity Solenoid (FQS) (1) is mounted to the back of the High Pressure Fuel Injection Pump (HPFIP) (3). The FQS controls the quantity of fuel entering the HPFIP internal pumping chambers.

OPERATION

OPERATION

The Fuel Quantity Solenoid (FQS) controls the quantity of fuel entering the High Pressure Fuel Injection Pump (HPFIP) internal pumping chambers. The PCM determines the fuel pressure needs of the fuel injection system based upon internal programming and numerous sensor inputs. The PCM then controls the FQS as needed to maintain the appropriate injection system operating pressure by directing fuel pressurized by the pump into either the high pressure fuel circuit or the fuel return circuit.

The FQS and control circuits are continuously monitored by the PCM. If the PCM detects a problem in any monitored circuit, it will store a Diagnostic Trouble Code (DTC) in its memory circuits. Such a DTC can be retrieved from the PCM through the Controller Area Network (CAN) data bus using a diagnostic scan tool connected to the Data Link Connector (DLC).

The FQS and the hard wired circuits between the solenoid and the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the fuel quantity solenoid or the electronic controls or communication between other modules and devices that provide some features of the fuel injection system. The most reliable, efficient, and accurate means to diagnose the fuel quantity solenoid or the electronic controls and communication related to fuel injection system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Risk of injury to eyes and skin from contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing.

1. Clean sealing surfaces.
2. Install new O-ring seals onto the fuel quantity solenoid (1).
3. Install the fuel quantity solenoid (1) and securely tighten fasteners (2).

Fig. 250: Fuel Tube, Fuel Injection Pump & Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Counter hold union connections with a wrench and **DO NOT EXCEED** the recommended tightening torque in order to avoid also loosening the threaded connection between the union and the fuel injection pump.

CAUTION: **DO NOT** crimp or bend the high pressure fuel tubes.

NOTE: High pressure fuel tubes from the fuel injection pressure pump to the fuel rail or from the fuel rail to the fuel injector must be replaced with new units if removed.

4. Install new fuel tube (2) between the fuel injection pump (3) and the fuel rail (1). Tighten the union nuts to:
 - Step 1 Tighten the union nut (1) at fuel rail to 20 N.m (177 in. lbs.).
 - Step 2 Using a wrench to counter hold fitting, tighten union nut (3) at the fuel injection pump to 24 N.m (18 ft. lbs.).

140170152

Fig. 260: Fuel Tank Straps & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Remove bolt (1) and the left fuel tank strap (3).
17. Remove bolt (1) and the right fuel tank strap (2).
18. Lower the fuel tank far enough to access and disconnect the underbody wire harness connector from the fuel pump module.
19. Continue lowering the fuel tank for removal.
20. If the fuel tank is being replaced, remove the main and auxiliary fuel pump modules from the fuel tank for transfer to the new tank. Refer to **MODULE, FUEL PUMP, REMOVAL**.
21. If fuel tank is being replaced, remove the shield (1) from the fuel tank (2) for transfer to the new tank.

INSTALLATION

INSTALLATION

1. If a new fuel tank is being installed, transfer the shield (1) to the fuel tank (2) from the removed tank.
2. If a new fuel tank is being installed, install the fuel pump module (Front-Wheel Drive/FWD) or the main and auxiliary fuel pump modules (All-Wheel Drive/AWD) into the new fuel tank from the removed tank. Refer to **MODULE, FUEL PUMP, INSTALLATION**.
3. Position the fuel tank onto a transmission jack.
4. Raise the fuel tank close enough to the vehicle underbody to connect the fuel pump module harness connector.

140170152

Fig. 261: Fuel Tank Straps & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Complete raising the fuel tank (1) into position against the vehicle underbody.
6. Install the right fuel tank strap (3). Tighten rear bolt (1) to 22 N.m (16 ft. lbs.).
7. Install the left fuel tank strap (2). Tighten rear bolt (1) to 22 N.m (16 ft. lbs.).

140170153

Fig. 262: Right Fuel Tank Strap Bolt

8. Install the right fuel tank strap bolt (1) and tighten to 22 N.m (16 ft. lbs.).

140170151

Fig. 263: Left Fuel Tank Strap Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Install the left fuel tank strap bolt (1) and tighten to 22 N.m (16 ft. lbs.).
10. Remove the transmission jack.

140169664

Fig. 264: Fuel Tank, Filler Tube & Hose Clamp
 Courtesy of CHRYSLER GROUP, LLC

11. Connect the fuel filler tube vent line and the fuel tank recirculation line quick connect fittings.
12. Connect the fuel filler tube (3) to the fuel tank (1). Tighten clamp to 3 N.m (27 in. lbs.).
13. Install the left and right underbody shield.

0909005839

Fig. 265: Skid Plate

Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown in illustration, left side similar.

14. If equipped, Install the right and left fuel tank shields (3). Tighten bolts (2) to 55 N.m 41 ft. lbs.).
15. If equipped with All-Wheel Drive (AWD), reinstall the rear propeller shaft.
16. Install the exhaust pipes to the vehicle. Refer to **PIPE, EXHAUST, INSTALLATION** .

**Fig. 266: Fuel Supply, Return & Vapor Lines**

Courtesy of CHRYSLER GROUP, LLC

17. Connect the fuel line (2) and vapor line (1, 2) quick connect fittings.

0909005834

Fig. 267: Fuel Module Access Covers & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

18. Connect the fuel pump module wire harness connector (2, 6). Install the access cover (3, 4) and securely tighten the screws.
19. Install the carpet piece covering the access covers for fuel pumps.

0909005843

Fig. 268: Removing/Installing Rear Seat
Courtesy of CHRYSLER GROUP, LLC

20. Install the rear seat. Refer to SEAT, REAR, INSTALLATION .
21. Fill the fuel tank.
22. Connect the battery negative cable.
23. Use a diagnostic scan tool to pressurize the fuel system.
24. Check the fuel system carefully for leaks.

TUBE(S), FUEL, HIGH PRESSURE

REMOVAL

REMOVAL

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel rail and from the fuel rail to the fuel injectors. This pressure may be as high as 1600 bar (23, 206 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure circuits of the fuel system.

NOTE: High pressure fuel tubes from the fuel injection pressure pump to the fuel rail or from the fuel rail to the fuel injector must be replaced with new units if removed.

Fig. 269: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 270: High Pressure Fuel Tubes

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Counter hold union connections with a wrench at the fuel injectors. **DO NOT EXCEED** the recommended tightening torque in order to avoid also loosening the threaded connection between the union and the fuel injector.

CAUTION: DO NOT crimp or bend the high pressure fuel tubes.

NOTE: After removing high pressure fuel tubes from the fuel system, be certain to seal the connections to maintain and ensure system cleanliness.

3. Unscrew union nuts (1 and 3) and the discard high pressure fuel tubes (2).

Fig. 271: Fuel Tube, Fuel Injection Pump & Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Counter hold union connections with a wrench and **DO NOT EXCEED** the recommended tightening torque in order to avoid also loosening the threaded connection between the union and the fuel injection pump.

4. Unscrew union nuts (1) at the fuel rail.
5. Using a wrench to counter hold fitting, unscrew the union nut (3) from the fuel injection pump outlet port and discard the fuel tube (2).

INSTALLATION

INSTALLATION

WARNING: Observe the following precautions when working on fuel systems: No sparks, open flames or smoking. Avoid inhaling and swallowing fuel. Avoid eye and skin contact with fuel. Pour fuels only into suitable and appropriately marked containers. Wear protective clothing. Failure to observe these precautions may result in fire, explosion, property damage, and serious or fatal injury.

WARNING: High pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel rail and from the fuel rail to the fuel injectors. This pressure may be as high as 1600 bar (23, 200 psi). Use extreme caution when inspecting for high pressure fuel leaks. Fuel under this amount of pressure can penetrate skin causing personal injury or death. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing the high pressure circuits of the fuel system.

Fig. 272: Fuel Tube, Fuel Injection Pump & Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Counter hold union connections with a wrench and **DO NOT EXCEED** the recommended tightening torque in order to avoid also loosening the threaded connection between the union and the fuel injection pump.

CAUTION: **DO NOT** crimp or bend the high pressure fuel tubes.

NOTE: High pressure fuel tubes from the fuel injection pressure pump to the fuel rail or from the fuel rail to the fuel injector must be replaced with new units if removed.

1. Loosen the fuel rail mounting screws to ease the positioning of the new high pressure fuel tube.
2. Position the new fuel tube between the fuel injection pressure pump and the fuel rail. Tighten the union nuts to:
 - Step 1 Tighten the union nut (1) at fuel rail to 20 N.m (177 in. lbs.).
 - Step 2 Using a wrench to counter hold fitting, tighten union nut (3) at the high pressure pump to 24 N.m (18 ft. lbs.).

Fig. 273: High Pressure Fuel Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Counter hold union connections with a wrench at the fuel injectors. **DO NOT EXCEED** the recommended tightening torque in order to avoid also loosening the threaded connection between the union and the fuel injector.

3. Position the new fuel tubes (2) between the fuel injectors and the fuel rail. Tighten the union nuts to:
 - Step 1 Tighten the union nut at fuel rail (1) to 20 N.m (177 in. lbs.).
 - Step 2 Tighten the union nut at fuel injector (3) to 24 N.m (18 ft. lbs.).
4. Tighten the fuel rail mounting screws to 25 N.m (18 ft. lbs.).

Fig. 274: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

5. Connect the negative battery cable.
6. Start the engine and inspect all of the high pressure fuel tube connections for leaks.
7. Install the engine cover (1).

5. Install the fuel cap (1).
6. Connect the negative battery cable.

FUEL INJECTION, DIESEL

OPERATION

OPERATION

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an

2014 Jeep Cherokee Trailhawk

2014 ENGINE Fuel System - Cherokee

average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.

- **Keep tires properly inflated.** Under inflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

INJECTOR(S), FUEL

DESCRIPTION

DESCRIPTION

3458585

Fig. 281: Fuel Injectors**Courtesy of CHRYSLER GROUP, LLC**

There are four individual fuel injectors (1) for all four cylinders. These fuel injectors (1) are used to deliver atomized fuel into the combustion chamber. They also pressurize the fuel and meter the fuel.

OPERATION**OPERATION**

The Common Rail system makes it possible to carry out a pre-injection (pilot injection) before T.D.C. This has the advantage of reducing the pressure shift in the combustion chamber, thus reducing the combustion noise typical of direct injection engines. The control unit controls the quantity of fuel injected, regulating the line pressure and injection times.

The control unit processes the following information in order to control the quantity of fuel to inject:

- Engine RPM;
- Coolant Temperature;
- Turbocharging Pressure;
- Air Temperature;
- Aspirated Air Quantity;
- Battery Voltage;
- Diesel Pressure;
- Accelerator Pedal Position.

STANDARD PROCEDURE**STANDARD PROCEDURE - CLEANING FUEL INJECTORS**

NOTE: Before cleaning the injector recesses, seal the injector holes in the injector recesses with the appropriate pin to prevent debris from falling into the recesses and entering the motor.

1. Seal the injector holes inside the cylinder head recesses.

Fig. 282: Special Tool #9717 Injector Bore Brush
Courtesy of CHRYSLER GROUP, LLC

2. Clean the bottom of the cylinder recess with the Injector Bore Brush (special tool #9717, Brush, Injector Bore).
3. Blow out the recess and clean again with a non-woven cloth and cover over.
4. Perform these steps for each injector recess.

NOTE: DO NOT clean the tip of the injector with a wire brush. Use a non - woven cloth.

5. Clean injector body with a wire brush.
6. Clean injector tips with a non-woven cloth.

NOTE: Do Not apply antiseize lubricant to the injector nozzle area.

7. Grease injector body with anti seize lubricant.

NOTE: Always replace the seals that seal off the injectors at the cylinder head to the combustion chamber and replace the retaining screws.

REMOVAL

REMOVAL

CAUTION: PAY CLOSE ATTENTION TO THE FOLLOWING POINTS WHEN REMOVING FUEL INJECTORS:

- Injectors **MUST** be removed only using the special tools provided for this purpose.
- Injectors **MUST NOT** be disassembled.

- Before cleaning injector recesses, seal all injector holes in the injector recesses with a pin.
- Clean all injector recesses in the cylinder head with a non-woven cloth and then a cylinder brush.
- Carefully clean sealing surfaces of injector recesses with the round brush. **DO NOT** use a power brush.

Fig. 283: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 284: Fuel Return Lines & Injectors
Courtesy of CHRYSLER GROUP, LLC

3. Remove the retaining clips and the fuel return lines (1) from the fuel injectors (2) and position aside.

Fig. 285: High Pressure Fuel Tubes
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fuel rail to fuel injector fuel tubes must be replaced if remove.

4. Unscrew union nuts (1 and 3) and the discard high pressure fuel tubes (2).

Fig. 286: Oxygen Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the oxygen sensor wire harness connector (1) and detach the harness connector (2) from bracket (3).

Fig. 287: Upper Turbocharger Heat Shield & Mid Upper Turbocharger Heat Shield
Courtesy of CHRYSLER GROUP, LLC

6. Remove bolts (2) and the upper turbocharger heat shield (1).

Fig. 288: Turbocharger Heat Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Detach the exhaust manifold exhaust temperature sensor wire harness from the lower turbocharger heat shield.
8. Remove bolts (1), nut (3), and the lower turbocharger heat shield (2).

Fig. 289: Fuel Injector Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the Camshaft Position Sensor (CMP) wire harness connector.
10. Remove the seven bolts (2) securing the engine wire harness.
11. Disconnect the fuel injectors wire harness connectors (1) and position harness aside.

Fig. 290: Fuel Injector & Retaining Clamp
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Prior to removing the fuel injectors, use compressed air to remove any accumulated dirt and debris. If dirt and debris enter the engine, internal engine damage may result.

12. Using compressed air, remove any accumulated dirt and debris from around the fuel injectors.

NOTE: Record the location of each fuel injector removed so it can be installed in its original location.

13. Remove nut (1) the fuel injector retaining clamp (2) and remove the fuel injector (3).

Fig. 291: Removing Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

14. If the fuel injector can't be removed by hand then use the (special tool #10495, Remover, Fuel Injector) (2) with slide hammer C-3752 and install it on the fuel injector (1) and remove the fuel injector.

INSTALLATION

INSTALLATION

CAUTION: Pay close attention to the following points when installing fuel injectors.

- Blow out injector recesses, clean again with a non-woven cloth and then cover over. Fiber residues from woven cloths ARE NOT permissible.
- Carefully carry out a visual inspection of the sealing surfaces of the injector recesses.
- The length of the round brush can be adjusted and should be approximately 3 mm for cleaning the seal seat. Optimal cleaning is achieved only if a brush with a flat surface is used. If necessary the surface of the brush can be ground flat on a grinding stone.
- ALWAYS replace the seals which seal off the injectors at the cylinder head to the combustion chamber. It is important that no grease gets onto the seal. Any impurities on the seal, on the sealing surfaces at

the injector and cylinder head as a result of combustion residue or similar are absolutely not permissible.

- The nuts attaching the injectors must always be replaced.
- The tip of the injector nozzle **MUST NOT** be cleaned with a wire brush. Use a non-woven cloth.
- Clean entire injector with a non-woven cloth.
- Fiber residues from a woven cloths are not permissible.

Fig. 292: Fuel Injector & Retaining Clamp
Courtesy of CHRYSLER GROUP, LLC

NOTE: If a new fuel injector is being installed, there is a nine digit alphanumeric code on the injector that needs to be entered into the PCM using the scan tool.

1. Clean injectors and recesses. Refer to **INJECTOR(S), FUEL, STANDARD PROCEDURE**.
2. Coat injector body with clean diesel fuel and install new sealing washers.
3. Install the fuel injector (3) and retaining claw (2) to its original location as noted during the removal process and apply downward pressure to seat it. Install nut (1) and tighten to 28 N.m (21 ft. lbs.).

Fig. 293: Fuel Injector Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Connect the Camshaft Position Sensor (CMP) wire harness connector.
5. Position the engine wire harness and connect all four fuel injector wire harness connectors (1).
6. Install and securely tighten the seven bolts (2) securing the engine wire harness.

Fig. 294: Turbocharger Heat Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the lower turbocharger heat shield (2).
 - Tighten bolts (1) to 12 N.m (106 in. lbs.).
 - Tighten nut (3) to 8 N.m (71 in. lbs.).
8. Attach the exhaust manifold exhaust temperature sensor wire harness to the lower turbocharger heat shield.

Fig. 295: Upper Turbocharger Heat Shield & Mid Upper Turbocharger Heat Shield
Courtesy of CHRYSLER GROUP, LLC

9. Install the upper turbocharger heat shield (2). Tighten the bolts (1) to 12 N.m (106 in. lbs.).

Fig. 296: Oxygen Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

10. Attach the oxygen sensor wire harness connector (2) to the bracket (3) and connect the oxygen sensor wire harness connector (1).

Fig. 297: High Pressure Fuel Tubes
Courtesy of CHRYSLER GROUP, LLC

11. Install new fuel tubes (2). Refer to **TUBE(S), FUEL, HIGH PRESSURE, INSTALLATION.**

Fig. 298: Fuel Return Lines & Injectors
Courtesy of CHRYSLER GROUP, LLC

12. Install the fuel return lines (1) to the fuel injectors (2) and install the retaining clips.

Fig. 299: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

13. Connect the negative battery cable.
14. Using a diagnostic scan tool, entered the fuel injector nine digit alphanumeric code into the PCM.
15. Start the engine and check for leaks.
16. Install the engine cover (1).

SENSOR, ACCELERATOR PEDAL POSITION

DESCRIPTION

DESCRIPTION

The Accelerator Pedal Position Sensor (APPS) is a variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage). The signal represents throttle blade position. As the position of the accelerator pedal changes, the resistance of the APPS changes.

REMOVAL

REMOVAL

Fig. 300: Wiring Loom & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable at battery.
2. Separate the wiring harness loom (3) from the accelerator housing (5).
3. Disconnect the accelerator pedal wire harness connector (4).
4. Disconnect the brake switch wire connector (2).

Fig. 301: Accelerator/Brake Pedal Assembly & Nuts
Courtesy of CHRYSLER GROUP, LLC

5. Remove mounting nuts (1) and the accelerator/brake pedal assembly (2).

INSTALLATION

INSTALLATION

Fig. 302: Accelerator/Brake Pedal Assembly & Nuts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The accelerator pedal and mounting nuts need to be torque in a mandatory torque sequence or damage could result to the pedal assembly.

1. Install the accelerator/brake pedal (2). Tighten nuts (1) to 18 N.m (159 in. lbs.).

Fig. 303: Wiring Loom & Connectors
Courtesy of CHRYSLER GROUP, LLC

2. Connect the brake switch wire harness connector (2).

3. Connect the accelerator pedal wire harness connector (4).
4. Attach the wiring harness loom (3) from the accelerator housing (5).
5. Connect negative battery cable, tighten nut to 5 N.m (45 in. lbs.).
6. Use a scan tool and perform the APPS RELEARN function.

SENSOR, AIR TEMPERATURE, INTAKE

DESCRIPTION

DESCRIPTION

Fig. 304: Fuel Quantity Solenoid Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

The intake air temperature (IAT) sensor is integrated with the boost pressure sensor, which is located in the back side of the intake manifold. The IAT is used to monitor the intake air temperature. Refer to **SENSOR, BOOST PRESSURE, REMOVAL** and **SENSOR, BOOST PRESSURE, INSTALLATION** for removal and installation procedures.

OPERATION

OPERATION

The intake air temperature sensor is a negative temperature coefficient (NTC) thermistor (resistance varies with temperature). This means at cold air temperature its resistance is high, so the voltage signal will be high. As intake air temperature increases, sensor resistance decreases and the signal voltage will be low. This allows the sensor to provide an analog voltage signal (0.2-4.8 volts) to the Powertrain Control Module (PCM).

SENSOR, BOOST PRESSURE

DESCRIPTION

DESCRIPTION

3405406

Fig. 305: Fuel Quantity Solenoid Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

The boost pressure sensor (2) is integrated with the intake air temperature sensor, and mounted in the intake manifold. The sensor allows the PCM to monitor air pressure within the intake manifold.

OPERATION**OPERATION**

When the intake manifold pressure is low (high vacuum) sensor voltage output is 0.25-1.8 volts at the Powertrain Control Module (PCM). When the intake manifold pressure is high due to turbo boost, sensor voltage output is 2.0-4.7 volts. The sensor receives a 5-volt reference from the PCM. Sensor ground is also provided by the PCM. The PCM uses boost pressure combined with intake air temperature to determine the volume of air entering the engine. regulate the pressure of the variable geometry turbine in order to ensure optimum engine performance in all operating conditions. The boost pressure sensor is regulate the pressure of the variable geometry turbine in order to ensure optimum engine performance in all operating conditions and to regulate fuel injection duration.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - BOOST PRESSURE SENSOR**

If the boost pressure sensor fails, the PCM records a DTC into memory and continues to operate the engine in one of the three limp-in modes. When the PCM is operating in this mode, a loss of power will be present, as if the turbocharger was not operating. The best method for diagnosing faults with the boost pressure sensor is with a scan tool. Refer to the appropriate Diesel ELECTRICAL DIAGNOSTICS information for more information.

Refer to On-Board Diagnostics in Emissions Control System for a list of Diagnostic Trouble Codes (DTCs) for certain fuel system components. Refer to **2.0L DIESEL - DIAGNOSTIC CODE INDEX** .

SENSOR, CRANKSHAFT POSITION

DESCRIPTION

DESCRIPTION

Fig. 310: Crankshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Crankshaft Position Sensor (CKP) (1) is located near the rear main oil seal assembly. This sensor is used to generate a signal that corresponds to engine RPM. The Powertrain Control Module (PCM) also uses the CKP to detect when the engine is at TDC. The CKP is located on the backside of the engine near the starter.

OPERATION

OPERATION

The crankshaft position and engine speed are sensed with a contactless hall effect signal generated by the crankshaft position sensor. The distance between the crankshaft position sensor and the tone wheel inside the rear main seal assembly is fixed by the installation position.

When the crankshaft rotates, a pulse width modulated (ON/OFF) voltage signal is generated in the crankshaft position sensor by the tone wheel inside the rear main seal assembly.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .

3405642

1. Install the Crankshaft Position Sensor (CKP) (1). Tighten bolt (2) 9 N.m (80 in. lbs.).
2. Connect the CKP wire harness connector (3).

3. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
4. Lower the vehicle.
5. Connect the negative battery cable.

SENSOR, MASS AIRFLOW (MAF)

DESCRIPTION

DESCRIPTION

Fig. 313: MAF Sensor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

The miromechanical Mass Air Flow (MAF) sensor (2) is a hot film thermal flowmeter with an integrated temperature sensor which detects the intake air temperature. The sensor is designed for recording load on combustion engines with diesel fuel injection and has a cylinder size in accordance with the required air flow rate. The MAF Sensor is mounted inline in the air intake between the air filter and the Charge Air Cooler (CAC).

OPERATION

OPERATION

The Mass Air Flow (MAF) sensor sensing element consists of two temperature sensors symmetrical to a heating area sitting on a thin membrane. Up and down stream sensors see the same temperature when there is no air flowing through the sensor. With incoming flow, the upstream heating area is cooled down due to heat transfer, while the downstream area retains its temperature because the air has been heated up after it flows through the heating area. The characteristic of temperature change in relation to airflow at the upstream area is utilized to determine the mass airflow passing through the sensor. This signal voltage variation is used by the Powertrain Control Module (PCM) along with internal calibrations to coordinate the total mass air flow.

To reduce contamination during sensing, a partial air flow is directed at an angle with respect to the main flow in the measuring channel for the fact that moisture and other particles tend not to react in the same manner that air does after they hit the channel wall. The Diesel Power Relay supplies battery power the to MAF sensor, ground is provided by the PCM. The MAF sensor signal is provided by the PCM.

REMOVAL**REMOVAL**

SENSOR, OXYGEN

DESCRIPTION

DESCRIPTION

This sensor is used to measure the oxygen content and the Lambda value (ratio between quantity of intake air and theoretical quantity of air required for complete combustion of fuel injected) in automotive engine exhaust gases. When the mass of oxygen present coincides with the amount required to burn all the fuel, the mixture is known as stoichiometric and the ratio is 14.6. In this case the Lambda is at the unit value. The Lambda can be expressed as the ratio between the quantity of intake air and the quantity of air required for the combustion of the fuel injected. The Lambda sensor is located in the front of the engine in the diesel particulate filter.

2014 ENGINE**Ignition System - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensors. The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

OPERATION**OPERATION**

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

NOTE: The LH ignition coils are shown in illustration, the RH ignition coils are similar.

4. Position the ignition coil (2) into the cylinder head cover opening. Using a twisting action, push the ignition coil onto the spark plug.
5. Install the ignition coil mounting bolt (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
6. Connect the harness connector (1) to the ignition coil (2).
7. If removed, install the insulator and upper intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

Fig. 17: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

8. Install the engine cover.
9. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.

PLUG, GLOW

DESCRIPTION

DESCRIPTION

80c46a18

Fig. 18: Glow Plug**Courtesy of CHRYSLER GROUP, LLC**

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the cylinder head below the cylinder head cover.

OPERATION**OPERATION**

The glow plugs are used to preheat the combustion chambers in order to achieve the ignition temperature required for the fuel-air mixture.

The heating element is integrated in the glow rod. It consists of a heating winding and a control winding connected in series.

The glow plug system is a quick start type. This allows for immediate start in practically all weather conditions without long periods of pre-glowing; this works in conjunction with the injectors.

REMOVAL**REMOVAL**

RELAY, AUTO SHUT DOWN

DESCRIPTION

DESCRIPTION

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

OPERATION**OPERATION**

The ground circuit for the coil within the Automatic Shutdown (ASD) relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay powers a number of critical circuits through the Power Distribution Center (PDC). These circuits include:

- Four ASD feed circuits to the PCM
- Fuel Injectors
- Ignition Coils
- Upstream O2 Sensor Heater
- Downstream O2 Sensor Heater
- EVAP Purge (Control) Solenoid

One of the ASD feed circuits is used as an ASD sense so that the PCM can determine if the ASD circuit is powered or not.

REMOVAL**REMOVAL**

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Remove the power distribution center cover.
2. Remove the relay from the power distribution center.
3. Check the condition of the relay terminals and power distribution center connector terminals for damage or corrosion. Repair if necessary before installing the relay.
4. Check for pin height (pin height should be the same for all terminals within the power distribution center connector). Repair if necessary before installing the relay.

INSTALLATION**INSTALLATION**

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Install the relay to the power distribution center.
2. Install the cover to the power distribution center.

SENSOR, CAMSHAFT POSITION, 2.0L DIESEL

DESCRIPTION

2.0L-DIESEL

Fig. 25: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The camshaft position sensor (3) is mounted to the cylinder head cover. The hall effect sensor generates a signal that corresponds to the camshaft position of rotation. The Powertrain Control Module (PCM) uses the camshaft position sensor signal to detect the TDC position of cylinder 1. The PCM controls Injection timing and the duration of time each injector delivers fuel during an injection cycle based on the camshaft signal and the crankshaft signals.

OPERATION

2.0L-DIESEL

The signal circuit of the camshaft sensor has a voltage of approximately 5V. If the segment machined into the exhaust camshaft sprocket is positioned opposite the camshaft sensor, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.

REMOVAL

DIESEL

Fig. 26: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 27: Camshaft Position Sensor, Connector & Bolt

3. Install the engine cover (1).
4. Connect the negative battery cable.

SENSOR, CAMSHAFT POSITION

DESCRIPTION

DESCRIPTION

3119404

Fig. 30: Camshaft Position (CMP) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensor is a Hall effect type sensor and is used by the Powertrain Control Module (PCM) in conjunction with the Crankshaft Position (CKP) sensor and TDC signal to recognize the position of the cylinders and determine the injection and ignition point. The CMP sensor is located on the camshaft bearing housing and faces the camshaft.

OPERATION

OPERATION

A current-carrying semiconductor layer immersed in a normal magnetic field (force lines at right angles to current direction) generates a potential difference known as a Hall voltage at its terminals. If current intensity remains constant, the generated voltage depends on magnetic field intensity alone. Periodic changes in magnetic field intensity are sufficient to generate a modulated electrical signal with frequency proportional to the speed of magnetic field change. The distance between the sensor and the surface of the timing wheel on the cam axis is altered to produce this change.

REMOVAL

2.4L

081569481

Fig. 31: Connector, Mounting Bolt & Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Disconnect electrical connector at sensor (1).
3. Remove mounting bolt (2).

8181dc89

Fig. 32: Cam Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust cam sensor (3).

3.2L

Fig. 33: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 34: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers and are bolted to the cylinder head.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner resonator.

3. If removing the LH CMP sensor, first remove the upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 35: CMP Sensor & Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

4. Disconnect the electrical connector (1) from the CMP sensor.
5. Loosen the sensor mounting bolt (2).

Fig. 36: O-Ring Seal

Courtesy of CHRYSLER GROUP, LLC

6. Pull the sensor and mounting bolt from the cylinder head cover.
7. The O-ring seal (1) can be reused if not damaged.

INSTALLATION

2.4L

8181dc89

Fig. 37: Cam Sensor

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Install camshaft position (CMP) sensor utilizing twisting motion. Make sure CMP sensor is fully seated. Do not drive CMP sensor into the bore with mounting screw. This may cause CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

1. Lubricate sensor O-ring.
2. Install the exhaust cam sensor (3) and mounting bolt (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

081569481

Fig. 38: Connector, Mounting Bolt & Camshaft Position Sensor
 Courtesy of CHRYSLER GROUP, LLC

3. Connect electrical connector (1) to the camshaft position sensor.
4. Connect negative battery cable. Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2715130

Fig. 39: Magnetic Timing Wheels

Fig. 40: CMP Sensor Seal & Mounting Bolt Hole

Courtesy of CHRYSLER GROUP, LLC

1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.

Fig. 41: Installing CMP Sensor Seal

Courtesy of CHRYSLER GROUP, LLC

3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
 - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
 - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool

#10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).

- Push the seal into the cylinder head cover until the base of the seal is seated.
- Remove the tool.

Fig. 42: Gap & CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.

Fig. 43: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. The sensor mounting bolt O-ring (1) can be reused if not damaged.

5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).

Fig. 44: CMP Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The right CMP sensor is shown in illustration, the left CMP sensor is similar. If both right and left CMP sensors were removed, install them into their original locations.

6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to 9 N.m (80 in. lbs.).
7. Connect the electrical connector (1) to the sensor.

Fig. 45: Upper Intake Manifold Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

8. If required, install the upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
9. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SENSOR, KNOCK

DESCRIPTION

DESCRIPTION

3119433

Fig. 46: Knock Sensor

Courtesy of CHRYSLER GROUP, LLC

The knock sensor is the piezoelectric type and is fitted on the crankcase to detect the intensity of the vibrations caused by detonation in the combustion chambers. The phenomenon produces a mechanical repercussion on a piezoelectric crystal that sends a signal to the powertrain control module (PCM) and, on the basis of this signal, the PCM reduces the ignition advance until the phenomenon disappears. Later on, the advance is gradually restored to the basic value.

OPERATION

OPERATION

3119462

Fig. 47: Electrical Polarization Operation
Courtesy of CHRYSLER GROUP, LLC

The molecules of a quartz crystal are affected by electrical polarization. In rest conditions (A) the molecules are not arranged in a particular way. When the crystal is subjected to pressure or to an impact (B), the higher the pressure, the more marked their arrangement. This arrangement produces a voltage at the ends of the crystal.

REMOVAL

2.4L

081569693

Fig. 48: Knock Sensor Mounting Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the Intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
4. Remove the knock sensor electrical connector.
5. Remove the mounting bolt (1) and knock sensor.

3.2L

**Fig. 49: Knock Sensor 1 & Knock Sensor 2**

Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds and the oil filter housing. Refer to **HOUSING, OIL FILTER, REMOVAL** .
5. Remove the electrical connector (4).

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

6. Remove the mounting bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

INSTALLATION

2.4L

081569693

Fig. 50: Knock Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the knock sensor mounting hole.

CAUTION: Over or under tightening the knock sensor mounting bolt will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensor. Do not apply any adhesive, sealant or thread locking compound to the bolt.

2. Install the knock sensor with mounting bolt (1). Tighten the mounting bolt to the proper specification. Refer to **SPECIFICATIONS**.
3. Connect the electrical connector.
4. Install the Intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
5. Lower the vehicle.
6. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.

3.2L

Fig. 51: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Thoroughly clean the knock sensor mounting holes.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3) with mounting bolt (2). Tighten the mounting bolt to 20 N.m (15 ft. lbs.).
3. Connect the electrical connector (4).
4. Install the oil filter housing, upper and lower intake manifolds and air cleaner housing assembly. Refer to **HOUSING, OIL FILTER, INSTALLATION**.
5. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE**.
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
8. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE**.

SOLENOID, VARIABLE VALVE TIMING

DESCRIPTION

DESCRIPTION

2809261

Fig. 52: Variable Valve Timing Solenoid
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four VVT solenoids are located on the front of the cylinder head covers. The pintle should move freely within the solenoid body. Do not attempt to disassemble the solenoids, they are not serviceable. The solenoids are identical but should be installed in the same location as removed.

OPERATION

OPERATION

2811799

Fig. 53: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, OPERATION** .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this instance the procedure will be performed at the next key off cycle.

REMOVAL

LEFT

Fig. 54: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

NOTE: Mark the variable valve timing solenoid connectors (1) with a paint pen or equivalent so that they may be reinstalled in their original locations.

2. Mark the intake variable valve timing solenoid (4) and the exhaust variable valve timing solenoid (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.
3. Disconnect the electrical connector (1) from the variable valve timing solenoid.
4. Remove the variable valve timing solenoid mounting bolts (3).

2. Refer to the markings made at disassembly and install the intake variable valve timing solenoid (2) and the exhaust variable valve timing solenoid (4) in their original locations.
3. Install the variable valve timing solenoid mounting bolts (3) and hand tighten.
4. Connect the electrical connector (1) to the variable valve timing solenoid.

81a0047a

Fig. 63: Liquid And Suction Line Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Install the upper A/C liquid and suction line assembly (1). Refer to **LINE, A/C SUCTION, INSTALLATION**.
6. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for 2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.
7. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SPARK PLUG

REMOVAL

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

Fig. 64: Spark Plug Removed

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

Fig. 65: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

Fig. 66: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

2726572

Fig. 67: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

1. Remove the ignition coil (2). Refer to COIL, IGNITION, REMOVAL.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2733374

Fig. 68: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Prior to removing the spark plug, spray compressed air into the cylinder head opening. This will help prevent foreign material from entering combustion chamber.
3. Remove the spark plug from the cylinder head using a quality thin wall socket with a rubber or foam insert.
4. Inspect the spark plug condition.

INSTALLATION

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

Fig. 69: Spark Plug Removed

Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

Fig. 70: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

Fig. 71: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

Fig. 72: Gap Gauging Tool
Courtesy of CHRYSLER GROUP, LLC

1. Check and adjust the spark plug gap with a gap gauging tool (1). Refer to **SPECIFICATIONS**.

Fig. 73: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

3. Tighten the spark plugs to 17.5 N.m (13 ft. lbs.).

2726572

Fig. 74: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

4. Install the ignition coil (2). Refer to COIL, IGNITION, INSTALLATION.

SWITCH, IGNITION

DESCRIPTION

DESCRIPTION

The ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is

located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

REMOVAL

REMOVAL

1. Disconnect the and isolate the negative battery cable.
2. Remove the dash end cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
3. Remove the steering column opening cover.
4. Remove the HVAC control head. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
5. Remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
6. Disconnect the wire harness connector from the Ignition Node Module.

Fig. 75: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

7. Remove 4 screws from the I/P holding the Ignition Node Module in place.
8. Remove the Ignition Node Module from the backside of the I/P.

INSTALLATION

INSTALLATION

1. Install the Ignition Node Module into the Instrument Panel from the backside.
2. Pull the Ignition Node Module into place.

Fig. 76: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install 4 screws through the instrument Panel into the Ignition Node Module and tighten.
4. Connect Electrical harness connector into Ignition Node Module.
5. Install the Instrument Panel bezel and connect wire harness connectors. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
6. Install the HVAC control head and connect wire harness connectors. Refer to **CONTROL, A/C AND HEATER, INSTALLATION** .
7. Install the steering column opening cover and connect the wire harness connectors.
8. Install dash end cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION** .
9. Connect negative battery cable.
10. If Ignition Node Module is being replaced, program the module. Refer to **STANDARD PROCEDURE** . **This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.**

When the operator presses the Start/Stop Button on a KIN or cycles the FOB/K in a IGNM type ignition, the FOB/K is validated wirelessly by the RF Hub (Radio Frequency Hub Module). If the FOB/K is recognized as belonging to the vehicle and is inside the vehicle, the system allows the ignition state of the vehicle to be changed by the operator between the LOCK, ACCESSORY, RUN, and START ignition states.

LED Operation

The LEDs in the IGNM and Start/Stop Button provide visual indication of the ignition system and button use to aid the driver. The Logic for LED control is implemented in the IGNM and RF HUB. The IGNM and Start/Stop Button contain four LEDs:

- OFF Indication
- ACC Indication (Accessory)
- ON Indication (On or Run)
- Ignition Switch Indicator (button backlight)

The LEDs indicate the vehicle ignition position and are driven by the CAN bus signals related to the ignition position. The Center LED (Ignition Switch Indicator) will blink if there is a related concern.

The RF HUB will log a DTC indicating an incorrect Ignition status value is present; in this state the ignition status is unknown. This will continue until the correct signal is received by the RF Hub.

EVIC Operation

The Keyless Go feature requires the vehicle to be equipped with an EVIC display for prompts and status information. The display messages are:

- Service Keyless System
- FOB Not Detected
- FOB Left Vehicle
- Not in Park
- Push Brake Pedal and Push Button to Start
- Push Clutch Pedal and Push Button to Start
- Vehicle not in Park Warning

BCM/RF Hub Module Interaction

There are a few things that must take place before the starter relay can apply voltage to the starter. Below are some key points to check when diagnosing a no crank condition.

The BCM requires two signals from the RF HUB to verify the ignition is in the run or start position. The voltage on the F20 circuit is one of these signals. It can be monitored in both the RF HUB and BCM data display screens as the Ignition Run/Start under the "Sensor" value. The run or start position voltage on this circuit should be at or close to battery voltage.

Simultaneously the RF HUB busses the Ignition Run/Start status to the BCM. The BCM monitors the bussed input information as the secondary verification on the Ignition Run/Start status. The bussed messages can be monitored with the scan tool in both the RF HUB and BCM data display screens.

The F20 circuit voltage and the bussed ignition run/start status message received by the BCM must agree to enable starting. Once the vehicle is started, the loss of only one ignition signal will not cause the vehicle to cycle off as long as the other feed still indicates a "run status".

The RF HUB also requires an input from the Gated park switch (hardwired) and the OK to start CAN Bus message from the TCM (Crank Enable).

Diagnostic Aids

NOTE: **The No Crank Diagnostic serves as an aid in diagnosing the concern and is intended to be used as a general guide, since each no crank condition can be unique.**

The No Crank Diagnostic Test assumes all of the following to be true:

- The condition is currently present.
- The TCM, PCM, RF HUB, and BCM are at the latest calibration (part number) levels.
- There are no active DTCs.
- There are no applicable Recalls.
- There are no applicable TSBs.
- There are no PCM inhibits (i.e. RPM, Trans Range, Clutch).
- The FOBs complete function and operation is correct.
- All battery cables and connections are clean and tight.
- There are no open fuses.
- The battery is fully charged and can pass a load test from the GR8 tester.
- The engine rotates freely.
- Any aftermarket equipment/wiring that has been installed is operating correctly.

Starter Relay Operation

In a no crank condition the Starter Relay can be missing power at pin 85, feed at pin 30, controlled ground at pin 86 or output at pin 87. Further explanation of how a relay operates is listed below:

- Pin 85 receives power from the BCM once the parameters for the Ignition Switch position and status, and all inhibit monitors (i.e. clutch switch, RPM, etc.) are satisfied.
- Pin 30 is a constant B+ feed.
- Pin 86 is a controlled ground by a module (i.e. PCM or BCM). Once power is sent from the BCM to the pin 85 of the relay it passes through a coil and leaves the relay through pin 86 to the control module.
- Pin 87 is an output circuit to the Starter solenoid. Once the circuit on pin 86 is grounded by the control

module, the coil winding in the relay magnetically pulls the internal switch closed. When the internal switch is closed the power at pin 30 is sent to pin 87 of the relay.

DIAGNOSTIC TEST**1. STARTER RELAY CHECK**

1. When attempting to start the vehicle, listen and if needed feel for a click at the starter relay in the PDC.

NOTE: Some starter relays are internal to a module and may not be accessible, making it more difficult to hear, or feel the clicking response. It is possible for a poor ground or the Trans Range Sensor position to be lost causing the starter to click once.

Did you hear an audible click at the relay or starter?

Yes

- Go To 9

No

- Go To 2

2. STARTER RELAY INPUT CHECK

1. Use a 12 volt test light/DVOM to check for power at pin 85 of the starter relay.

Is there Power/12 volts at pin 85?

Yes

- Go To 8

No

- Go To 3

3. RF HUB OPERATION

1. Using the scan tool, confirm the ignition switch status changes in the RF HUB under the data display screen for the "Sensor" values.

Does the ignition switch status on the data screen match the physical position of the KIN/IGNM?

Yes

- Go To 5

No

- Go To 4

4. REMOTE START ANTENNA

NOTE: If the vehicle is not equipped with Remote Start, proceed to the next test step.

1. Cycle the ignition off.
2. Disconnect the Remote Start Antenna from the RF HUB.
3. Using one FOB/IK and sitting in the driver's seat, attempt to start the vehicle.

Did the vehicle start?

Yes

- Replace the Remote Start Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5

5. BCM IGNITION STATUS

1. Using the scan tool, confirm the ignition switch status changes in the BCM under the data display screen for the "Bussed Input" and "Sensor" values.

NOTE: The change of status in the BCM for the "Sensor" value validates the voltage activity (with very low amperage) of the F20 circuit.

In the BCM, do both values for the ignition switch status match; and do they match those in the RF HUB?

Yes

- Go To 6

No

- If the status of the Ignition Switch position is not changing under the "Sensor" value, check the F20 circuit at the BCM for battery voltage with a DVOM (not a test light).
- If there is Battery voltage **at the BCM on the F20 circuit** verify all power, ground and bus circuits are ok for the BCM. If no problem found replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- If there is **NO** Battery voltage **at the BCM** on the F20 circuit, then check for voltage on the

F20 circuit at the RF HUB.

- If there is Battery voltage **coming out of the RF HUB on the F20 circuit** , check the F20 circuit between the RF HUB and BCM for a short, open condition or high resistance.
- If there is **NO** Battery voltage **coming out of the RF HUB on the F20 circuit** verify all power, ground & communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- In the data screen, if the status of the Ignition Switch was not changing under the "Bussed Input" value, further diagnosis is needed between the RF HUB, (bus circuits, connections) and the BCM.

6. PCM IGNITION, TRANS RANGE/CLUTCH SWITCH STATUS VERIFICATION

1. Using the scan tool confirm there are no inhibits that have been triggered in the PCM (i.e. Ignition Switch, Trans Range or Clutch Switch) and any switch inputs (filtered states) relating to the starting system function and operate correctly under the data display screen.

Does the PCM show any inhibits (**not DTCs**) for starting (**not remote starting**)?

Yes

- Correct the inhibit reason listed.
- If no problem can be found, then verify all power, ground and bus circuits to the PCM and replace the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

No

- Go To 7

7. BCM TO STARTER RELAY POWER INPUT CHECK

1. At this time if all the correct inputs for the ignition switch status are correct in the RF HUB, BCM and PCM, verify both power feeds are present (pin 30 and 85) to the Starter Relay while in the crank position.

Are both power feeds present at the relay when the ignition is in the crank position?

Yes

- Go To 8

No

- If, there is no power to pin 30 or 85, no DTCs, TSBs, Recalls, or Inhibits replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

8. STARTER RELAY CONTROL CIRCUIT CHECK

1. Using a test light/DVOM determine if the Starter Control circuit at pin 86 of the relay is missing

ground (at the relay if equipped with a removable relay or wiring to the internal relay) when the ignition is in the crank position.

Was the Starter Control circuit for pin 86 being grounded when the ignition was in the crank position?

Yes

- Go To 10

No

- Verify the Starter Relay Control circuit from pin 86, has no shorts, opens or high resistance on the wiring going from the Starter Relay in the BCM (or PDC) to the PCM.
- Verify the cables do not have excessive resistance by performing a voltage drop on the battery cables.

9. STARTER RELAY OUTPUT CIRCUIT CHECK

NOTE: **At this point in the test, when the key is in the crank position power has been verified at Pin 30 & 85, along with the control circuit being grounded for pin 86.**

1. Remove the Starter Relay Output circuit connector from the Starter solenoid.
2. Using a test light/DVOM and ignition in the crank position check for power at pin 87 (If equipped with a removable relay or wiring to the internal relay) of the relay and at the connection to the starter.

Was there power at pin 87 for the output circuit?

Yes

- Go To 10

No

- If power is missing to pin 30 of the starter relay the BCM is suspect. Verify all power, ground, communication circuits and connections to the BCM before replacing in accordance with service information.
- If power is missing at pin 87 of the starter relay and the relay is replaceable, change out the relay and recheck the concern. If a known good relay causes no change, check the Starter Output circuit from pin 87 of the relay to the starter for an open, short, excessive resistance, or poor connections to the solenoid or starter.
- Verify and Inspect the Starter to ensure it is free of corrosion, oil, and there is no damage, or binding conditions.
- Verify that all wiring, cables and connections are clean and tight.

10. STARTER RELAY OUTPUT CIRCUIT LOAD TEST

1. Load test the Starter Relay output circuit going from the BCM to the Starter.

Does the starter relay output circuit pass the load test?

Yes

- Verify that all connections are clean, tight and there is no damage to starter when fully inspected. If no problem found then replace the Starter in accordance with Service Information. Refer to **STARTER, REMOVAL** .

No

- Adjust the shift cable in accordance with the Service Information. Perform the POWERTRAIN VERIFICATION TEST. Refer to appropriate ELECTRICAL DIAGNOSTICS article.

REMOTE START INOPERATIVE (BCM - RF HUB EQUIPPED)

For a complete wiring diagram, refer to **SYSTEM WIRING DIAGRAMS** article .

THEORY OF OPERATION

The customer may notice that the signal range of the Remote Keyless Entry (RKE) system is reduced. This condition may be due to the RKE antenna where the RKE key fob may need to be closer than 3 meters (10 feet) before the functions available on the key fob will operate. The diagnostic test is provided as a diagnostic aid for the dealer technician.

It is necessary to confirm the correct sales code(s) are present in the Standard and Optional Equipment sections of DealerCONNECT to determine if a factory or a Mopar® Accessory Remote Start kit was installed. If the vehicle has a Mopar® Accessory Remote Start kit, verify that at least 20 minutes has elapsed since the sales codes were added to DealerCONNECT. Once it has been confirmed that the proper sales codes have been added and the allotted time has passed, verify the vehicle has been configured properly using the scan tool. Also, make sure that the system shows as enabled in the BCM and that the temporary remote start override is set to disabled.

For any further assistance on diagnosing the installed Mopar® Accessory kit contact the Mopar® Accessories group at 800-84-MOPAR (66787).

DIAGNOSTIC TEST**1. REMOTE START FUNCTION**

NOTE: In some cases the vehicle will start then stall, indicating a fuel level concern (less than a quarter of a tank). Before proceeding verify there is enough fuel in the tank for the vehicle to start and run.

1. Attempt to start the vehicle with the FOBIK.

Does the vehicle start when using the FOBIK?

Yes

- At this time the Remote Start is functioning properly.
- Using the scan tool, check for any related Starting, Communication, or Ignition related DTCs that may inhibit the Remote Starting feature. Check the BCM for any previous Remote Start Inhibits and mileage that were stored. Inhibits may be found under the system tests or miscellaneous functions tab.

No

- Go To 2

2. REMOTE START VISUAL CHECK

1. While pressing the remote start button on the FOBIK, observe the exterior lights and the horn operation.

Does the horn sound and the exterior parking lights flash?

Yes

- Go To 3

No

- Go To 4

3. CHECKING BCM INHIBITS

NOTE: Since the horn sounds and the parking lights flash, this verifies the BCM is receiving the CAN BUS message from the RF HUB. It also verifies the RF signal for Remote Start from the FOBIK to the RF HUB is operating correctly.

1. Using the scan tool, check the Remote Start inhibits of the BCM or any ACTIVE DTCs listed in all modules.

NOTE: Inhibits may be found under the system tests or miscellaneous functions tab. The fuel level may not be a listed inhibit.

Are there any Remote Start inhibits or any ACTIVE DTCs listed in the entire vehicle?

Yes

- For any inhibits for a complete list of Remote Start inhibits. Refer to **DIAGNOSIS AND TESTING**.
- For any ACTIVE DTCs, perform the appropriate diagnostic procedure in **DTC INDEX** article.

No

- Check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL**.

4. RKE FUNCTION SHORT RANGE

1. While standing next to the Driver door and using the FOB/K, attempt to lock and unlock the doors.

Does the RKE function properly?

Yes

- Go To 5

No

- Go To 7

5. RKE FUNCTION MID RANGE

1. While standing 20 feet from the vehicle and using the FOB/K, attempt to lock and unlock the doors.

Does the RKE function properly at 20 feet?

Yes

- Go To 6

No

- Go To 7

6. RKE FUNCTION LONG RANGE

1. While standing 100 feet from the vehicle and using the FOB/K, attempt to lock and unlock the doors.

Does the RKE function properly at 100 feet?

Yes

- Go To 9

No

- Go To 7

7. FOBIK SIGNAL STRENGTH

1. Use the RF Tester 9001 to check the signal strength of the FOBIK.

Does the FOBIK pass?

Yes

- Go To 10

No

- Go To 8

8. CHECKING THE FOBIK

1. Replace the battery in the FOBIK with a known good battery and recheck the signal from the FOBIK with the RF Tester 9001.

Does the FOBIK pass?

Yes

- Go To 9

No

- Check for any related TSBs prior to replacing the FOBIK. If no related TSBs are found, then replace the FOBIK in accordance with the Service Information. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE** .

9. CHECKING FOR ACTIVE DTCs

NOTE: **The RKE portion of the FOBIK is operational, this verifies that the RF HUB is capable of receiving signals and communicating to operate the locks.**

1. Use the scan tool to check for ACTIVE DTCs.

Did the scan tool show any ACTIVE DTCs in the entire vehicle?

Yes

- Diagnose the DTCs in accordance with the Service Information before proceeding with the Remote Start Inoperative concern.

No

- Go To 10

10. CHECKING THE RF HUB

NOTE: Even though the RKE function of the system may work with no concern, the BCM is either not receiving a message or is receiving a corrupt message from the RF HUB for remote start operation.

1. While sitting in the driver seat and using the scan tool, monitor the RF HUB on the data display screen for changes when the Remote Start button of the FOBIK is pressed.

Did the status change when the Remote Start button of the FOBIK was pressed?

Yes

- Go To 11

No

- Go To 12

11. CHECKING BCM INHIBITS

NOTE: The parking lights flash and the horn are inoperative when using the FOBIK, this indicates a faulty BCM or "Inhibit" that may be preventing the start request from occurring.

1. Use the scan tool to check for any Remote Start inhibits listed in the BCM. This may be found under the system tests or miscellaneous functions tab.

Were there any Remote Start inhibits listed in the BCM?

Yes

- Perform the REMOTE START SYSTEM Diagnosing and Testing. Refer to **DIAGNOSIS AND TESTING** .

No

- If this has had a Mopar® Accessory kit installed verify the correct Sales Code for Remote Start has been added to Dealer Connect and a Restore Vehicle Configuration has been performed.
- Confirm the system is enabled; and the temporary Remote Start override is set to disabled in the BCM and contact the Mopar® Accessories group (800-84-Mopar) for further details before proceeding.
- If this has a factory installed Remote Start, check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service

Information.

12. CHECKING THE REMOTE START ANTENNA

1. Cycle the ignition off
2. Disconnect the Remote Start antenna from the RF Hub.
3. Using one FOB/K and sitting in the driver's seat, attempt to start the vehicle.

Did the vehicle start?

Yes

- Replace the Remote Start Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Verify all power, ground, communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

2014 ENGINE**Starting - Service Information - Cherokee****DESCRIPTION****STANDARD STARTING SYSTEM**

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Neutral Position Sensor (manual transmission with Stop/Start system integrated)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION**STANDARD STARTING SYSTEM**

When you press the Keyless Go button (KIN Button), a request is sent to RFHM via the private LIN. Once the RFHM receives the request from the KIN it then looks for the valid key via the Passive Entry Module (PEM) antennas. If the RFHM detects a valid key and if the brake is engaged, then the RFHM sets the ignition position to START/CRANK. The BCM then turns the Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. For an IGNM (Ignition Node Module) vehicle, when the customer turns the key to Start position the RFHM sets the ignition to START/CRANK. The brake pedal status is not required to start the IGNM vehicle but can be started with brake pedal engaged. The BCM then turns the

Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. The functionality is the same except it is not wirelessly detected. If conditions are correct to start the ECM turn on the high side of the ECM starter relay and turns the Crank Hold Signal to True. If the BCM is still in crank and the Crank Hold is true then the BCM turns on the Low side of the BCM Starter relay and the engine will start cranking. Once the engine started the ECM deactivates the double start over ride. The BCM will then deactivate the starter either when the engine starts or the maximum time has been reach for the tip start (10 sec for Gas and 25 sec for diesel). The RFHM changes the ignition position to RUN if the start type is TIP start or the 5 second time expires or the engine controller indicates the vehicle is not in park or neutral The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STANDARD STARTING SYSTEM

NOTE: **Note: All voltage measurements are with respect to Ground unless otherwise specified. All relay coils checking (between 85 and 86) must be conducted with the respective relays removed.**

No start trouble shooting:

1. Check battery voltage.
2. Check Fuel followed by Fuel pump fuse F21.
3. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the MM before turning the ignition to start.
4.
 1. Measure the voltage at pin 87 of the ECM relay.
 2. If not measured, remove the BCM and ECM relay. Connect test lamp between PIN 86 of BCM starter relay, PIN 85 of the ECM starter relay and start the car. Confirm the bulb lit up for 10 seconds. If the bulb is lit, the issue is either in starter motor, the starter solenoid, the wiring, loose connection or engine itself. If issue exists go to step 6.
 3. If the measured voltage equals Battery voltage then the Starting relays, BCM and ECM modules are working as designed, if there is no security key violation (The SKIM light will start flashing if there is security key mismatch and a DTC will be set by RFHM).
 4. Quick Check: Turn the radio on and turn the ignition to the start position, if the radio mutes and the car still doesn't start, then assume the issue is with the engine controller, or the engine itself.
5. If the above conditions are true, then issue is either in the starter motor, the starter solenoid, the wiring or can be a loose connection. Follow the procedure 6 to check the wiring from PIN 87 of the ECM relay and the starter solenoid. Go to step 6, If not go to step 11.
6. Connect a multi meter between the starter solenoid terminals and confirm the MM is measuring battery voltage.
7. If the voltage is equal to battery voltage, then the issue must either be in the solenoid, starter or the engine itself. If the issue cannot be identified go to step 8.
- 8.

1. Turn the ignition to OFF.
2. Check the voltage at terminal 30 of the RUN/START relay (T09). If not check for loose battery connection, wiring or the fuse feed to 30.
3. Turn the ignition to RUN and check the battery voltage at 87 of the T09 relay. If not measured go to step 9.
9. Check the BCM starter relay fuse feed and confirm it is intact.
10. Check BCM relay connections/feed.
11. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
12. Connect a 12V test lamp between 86 and 85 of the BCM start relay and confirm the blub lights up for 10 seconds. The MM may give a false reading because it is driven by a low side driver.
13. If the 12v test lamp does **not** stay lit for 10 seconds, turn the ignition to the start position and using a DVOM, measure between battery voltage (+) and PIN 86 (-) of the BCM relay. Should read equal to battery voltage.
14. Check ECM relay connections/feed.
15. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
16. Connect a 12V test lamp between 86 and 85 of the ECM start relay and confirm the blub lights up for 10 seconds.
17. If not start the car and measure them individually.
18. Measure the resistance between the ground and pin 85 of the ECM start relay.

Additional diagnostic checks

1. Check the Ignition sense start line from RFHM to BCM. The vehicle will not start if this line is not intact.
2. The RFHM must detect brake input (Normally Open) to start the KIN (Keyless Ignition Node) car in case of auto trans vehicle.
3. The RFHM must detect clutch input (Normally Open) to start the manual trans vehicle. Check also the clutch output from RFHM to ECM.
4. The RFHM must detect gated park switch to start the car.

CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections

- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- Disable ignition and fuel systems.

STARTER SOLENOID

WARNING: Check to ensure that the transmission is in the park position with the parking brake applied. This may result in personal injury or death.

1. Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests. Refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM**.
2. Perform Starter Solenoid test BEFORE performing the starter **RELAY TEST**.
3. Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.
4. Locate and remove the starter relay.
5. Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.
 - a. If engine cranks, starter/starter solenoid is good. Go to the Starter **RELAY TEST**.
 - b. If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid and from the battery positive terminal to starter post for loose or corroded connections. Particularly at starter terminals.
 - c. Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: Check to ensure that the transmission is in the park/neutral position with the parking brake applied. This may result in personal injury or death.

RELAY TEST

Remove the starter relay as described in this Service Information to perform the following tests:

1. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to 2. If not OK, replace the faulty relay.
2. Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to 3. If not OK, replace the faulty relay.
3. Connect a battery B+ lead to terminals 85 and a ground lead to terminal 86 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between

terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

86	PCM-CONTROLLED GROUND
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

1. The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to 2. If not OK, repair the open circuit to the PDC fuse as required.
2. The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to 3.
3. The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to 4. If not OK, repair the open circuit to the starter solenoid as required.
4. The coil battery terminal (85) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the **IGNITION SWITCH**.
5. The coil ground terminal (86) is connected to the electromagnet in the relay. It is grounded by the PCM if the conditions are right to start the car. For automatic transmission cars, the PCM must see Park Neutral switch low and near zero engine speed (RPM). For manual transmission cars, the PCM only needs to see near zero engine speed (RPM) and low clutch interlock input and see near zero engine speed (RPM). To diagnose the Park Neutral switch of the transmission range sensor refer to the **C635 MANUAL TRANSMISSION - SERVICE INFORMATION**. Check for continuity to ground while the ignition switch is in the start position and if equipped the clutch pedal depressed. If not OK and the vehicle has an automatic transmission verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 86. Repair open circuit as required. Also check the clutch interlock switch

operation if equipped with a manual transmission. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the appropriate Transmission article for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to **DIAGNOSIS AND TESTING** in the Clutch System article.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the **IGNITION SYSTEM - SERVICE INFORMATION** or **SYSTEM WIRING DIAGRAMS** article for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to **SYSTEM WIRING DIAGRAMS** article for more information.

FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

1. To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD).
2. Gain access to battery terminals.
3. With all wiring harnesses and components properly connected, perform the following:
 - a. Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.
 - b. Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.
 - c. Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading

- is still above 0.2 volt after correcting poor contacts, replace ground cable.
- Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.
 - Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.
 - If resistance tests do not detect feed circuit failures, replace the starter motor.

STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article .

WARNING: On vehicles equipped with airbags, refer to the **RESTRAINTS - SERVICE INFORMATION** article before attempting steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. Battery discharged or faulty.	1. Refer to <u>DIAGNOSIS AND TESTING - BATTERY SYSTEM</u> for more information. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to <u>FEED CIRCUIT RESISTANCE TEST</u> .
	3. Starter relay faulty.	3. Refer to <u>RELAY TEST</u> . Replace relay, if necessary.
	4. Ignition switch faulty.	4. Refer to ignition switch test, in the <u>IGNITION SYSTEM - SERVICE INFORMATION</u> or <u>SYSTEM WIRING DIAGRAMS</u> article. Replace switch, if necessary.
	5. Park/neutral position switch (auto trans) faulty or mis-adjusted.	5. Refer to <u>948TE AUTOMATIC TRANSMISSION - SERVICE INFORMATION</u> for more information. Replace switch, if necessary.
	6. Clutch interlock switch (man trans) faulty.	6. Refer to <u>DIAGNOSIS AND TESTING - CLUTCH PEDAL POSITION SWITCH</u> . Replace switch, if necessary.
	7. Starter solenoid faulty.	7. Refer to <u>STARTER SOLENOID</u> . Replace starter assembly, if necessary.
	8. Starter assembly faulty.	8. If all other starting system components and circuits check ok, replace starter assembly.
	9. Faulty teeth on ring gear.	9. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Starting - Service Information - Cherokee

	10. PCM double start override output failure.	10. Refer to CHECKING THE PCM POWER AND GROUND CIRCUITS . Check for continuity between PCM and terminal 85. Repair open circuit as required. If ok, PCM may be defective.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to the BATTERY SYSTEM - SERVICE INFORMATION for more information. Charge or replace battery as necessary.
	2. Starting circuit wiring faulty.	2. Refer to the FEED CIRCUIT RESISTANCE TEST . Repair as necessary.
	3. Starter assembly faulty.	3. If all other starting system components and circuits check ok, replace starter assembly.
	4. Engine seized.	4. Refer to the appropriate Engine Service Information article for diagnostic and service procedures.
	5. Loose connection at battery, PDC (Diesel Only), TIPM, starter, or engine ground.	5. Inspect for loose connections.
	6. Faulty teeth on ring gear.	6. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Broken teeth on starter ring gear.	1. Remove starter. Inspect ring gear and replace if necessary.
	2. Starter assembly faulty.	2. If all other starting system components and circuits check ok, replace starter assembly.
STARTER DOES NOT DISENGAGE.	1. Starter improperly installed.	1. Install starter. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to RELAY TEST . Replace relay, if necessary.
	3. Ignition switch faulty.	3. Refer to IGNITION SYSTEM - SERVICE INFORMATION . Replace switch, if necessary.
	4. Starter assembly faulty.	4. If all other starting system components and circuits check ok, replace starter assembly.
	5. Faulty teeth on ring gear.	5. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.

2014 Jeep Cherokee Trailhawk

2014 ENGINE Starting - Service Information - Cherokee

- **Transmission Range Sensor or Park/Neutral Switch** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect the starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.

SPECIFICATIONS

TORQUE-DIESEL

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Battery Cable Nut	9	-	80
Starter B+ Nut	10	-	89

4. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
5. Remove the battery cable nut and battery cable from the solenoid stud (2).

6. Remove the starter mounting bolts (4).
7. Remove the starter assembly (3) from the transmission.

INSTALLATION

2.0L DIESEL

3686929

Fig. 11: Lower Starter Mounting Stud Bolt, Center Starter Mounting Bolt & Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the starter (3). Tighten bolts (1, 2) to 24 N.m (18 ft. lbs.).

3686893

Fig. 12: B+ Cable Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Install the B+ on the starter solenoid stud. Tighten Nut (1) to 10 N.m (89 in. lbs.).
3. Install the ground cable onto bottom stud. Tighten nut (2) to 10 N.m (89 in. lbs.).
4. Install the cable bracket on upper stud. Tighten nut (3) to 10 N.m (89 in. lbs.).
5. Connect the solenoid connector to the starter.

Fig. 13: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

6. Install the belly pan (2) and securely tighten bolts (3).
7. Lower the vehicle.
8. Connect the negative battery cable.

2.4L

Fig. 14: Removing/Installing Starter

Courtesy of CHRYSLER GROUP, LLC

1. Install the starter into position.
2. Start the upper bolt by hand.
3. Start the lower bolt by hand.
4. Tighten the upper and lower bolts to 54 N.m (40 ft. lbs.).

081569491

Fig. 15: Electrical Connector, Battery Positive Cable Nut & Engine

1. Position the starter (3) inside the transmission.
2. Install the starter mounting bolts (4) and tighten to 55 N.m (41 ft. lbs.).
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten the nut to 10 N.m (86 in. lbs.).

1114007108

Fig. 17: Removing/Installing Catalytic Converter

Courtesy of CHRYSLER GROUP, LLC

5. Install the catalytic converter (3). Refer to **CONVERTER, CATALYTIC , INSTALLATION** .

6. Lower the vehicle.
7. Connect the negative battery cable and tighten nut to 5 N.m (4.5 in. lbs.).

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

The Remote Start Antenna Module Assembly consists of an electrical connection to the Radio Frequency Hub (RF Hub), a short length of coaxial cable with a connection to the RF HUB, two mounting clips, and the control module/antenna. The antenna is located in the rear cargo area next to the RF HUB assembly concealed by the headliner. The antenna which is printed on a circuit board in an enclosed plastic housing that is fed regulated 5v DC (+/-5%) via the attached coaxial cable pigtail. The Remote Start Antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the desired receiver/tuner.

OPERATION

OPERATION

The Remote Start Antenna is used for receive the signal from the remote key. The antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the Remote Frequency Hub Module (RFHUB).

REMOVAL

REMOVAL

Fig. 18: Removing/Installing Remote Start Antenna

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Lower the rear of the headliner. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the remote start antenna connector (3) from the Radio Frequency Hub (RF Hub) (4).
4. Remove the two fasteners (1) securing the remote start antenna (2) to the roof.

INSTALLATION**INSTALLATION****Fig. 19: Removing/Installing Remote Start Antenna**

Courtesy of CHRYSLER GROUP, LLC

1. Position the remote start antenna (2) to its mounting surface and secure the antenna using two fasteners (1).
2. Connect the remote start connector (3) to the RF Hub (4).
3. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
4. Connect the negative battery cable.
5. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

SYSTEM, START STOP

DESCRIPTION

STOP START SYSTEM

The Stop-Start system automatically stops and starts the engine when certain conditions are met to improve fuel economy and lower CO2 emissions.

The primary input for manual transmission vehicles to an autostop is zero vehicle speed with the transmission in neutral and the clutch pedal released, while the primary input to autostarting is depression of the clutch pedal. The primary input for an automatic transmission vehicle to gain an autostop is zero vehicle speed with the brake pedal depressed, while the primary input to autostarting is release of the brake pedal. Many secondary inputs determine if it is acceptable to autostop and autostart. A number of devices on the vehicle are added or improved to support the Stop-Start function.

- **Voltage Stabilization Module (VSM)**

- This component is required to maintain system voltage during Start events. This also provides a buffer for the vehicles ECU's when battery power is being sent to the starter for cranking.

- **InRush Current Relay (ICR)** - This component works in conjunction with the VSM in order to prevent voltage dips.
- **High Durability Starter** - This is a modified starter used for the Stop Start system. Changes are hardened gears with lead in chamfer, a spring pinion (Diesel), reinforced castings, a higher power motor, long-life brushes, precision bearings and motor shaft.
- **Advanced Glass Mat (AGM) Battery with High Durability Battery Cables** - The AGM type battery and the high durability cables are capable of withstanding the increased cycling that a stop/start vehicle will experience.
- **Generator** - A 220a generator that is up-sized specifically for use with the stop/start system.
- **Intelligent Battery Sensor (IBS)** - The IBS is responsible for measuring the state-of-charge. It will also predict voltage and capacity (ah) for future crank events. The IBS is also responsible for measuring battery temperature and alternator voltage current.
- **Transmission Neutral Sensor (MTX Only)** - This is located on the transmission selector cable.
- **Powertrain Control Module (PCM)** - The PCM monitors conditions for STOP/START.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliamperage ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

OPERATION

Primary Autostop Enablers - Brake pedal depressed (automatic transmission). Shifter/transmission in neutral and clutch pedal released (manual transmissions).

Secondary Autostop Enablers - Vehicle speed, coolant temperature, hood closed, doors closed, driver's seat belt latched, interior climate and settings, battery state and energy demand, steering wheel angle, steering wheel torque, ambient temperature, time and speed since last autostop, transfer case position, and ESC status, No stop-start related faults present.

Autostop Events

- Autostop state broadcast on CAN Buss
- Cluster telltale illuminates.
- EVIC displays message indicating autostop.
- Engine shutdown begins.

As the engine slows it passes through three phases:

- Fuel and spark restart permissible.
- Restart prohibited.
- Restart permitted, based on start system employed.

Autostart requests are evaluated throughout the autostop event.

When in autostop:

- Instrument cluster stop/start telltale remains illuminated.
- EVIC displays the autostop state message.
- Body controller starter relay is energized providing the engine controller with direct starter control.

Vehicle Function:

- Consumer electronics continue to function in a normal manner.
- HVAC fan speed and other setting adjusted to maximize cabin comfort and autostop duration (based on climate control settings and conditions).
- Electric Power Steering (EPS) maintained during autostop, possibly with reduced maximum assist.

System Requested Autostarts:

- Battery State
- Brake Vacuum
- Climate control stress
- Vehicle speed
- Steering wheel angle or torque
- Transmission selector position.

Stop-Start Disable (while autostopped)

- Vehicle systems monitored that may disable stop-start (requiring a key restart if in autostop) include: hood opened, occupant sensing indicating driver not present, unsafe gear shift position for autostart and critical system faults.

Autostart Decision:

- All autostart enablers present
- Brake pedal released or shifter place in reverse (automatic transmissions)
- Clutch pedal depressed past the up-stop position (manual transmission)
- Throttle pedal depressed

Autostart Events:

- Autostart state broadcasted on the CAN Bus
- instrument cluster stop/start telltale illumination cancelled
- EVIC display changed to previous EVIC message (outside temp and compass, etc.)
- VSMs are placed in voltage conditioning mode
- Hill Assist requested
- Starter relay commanded to initiate cranking
- Engine achieves idle speed

Launch Events:

- Automatic transmission clutches engaged
- Hill assist released
- Climate control returned to pre-autostop conditions
- Stop-Start Ready state broadcast on the CAN Bus
- Embedded EVIC stop-start message indicating "Stop/Start Ready"

Planned Autostart (Engine On) Enable Conditions:

1. Valid target gear and brake switch pressure condition
2. Completed initial engine key start

2014 Jeep Cherokee Trailhawk

| 21. Occupant sensing allow engine stop condition met |
| 22. OBD allow engine stop condition met |
| 23. Engine runtime greater than threshold |
| 24. Stop-Start "Off" switch not activated |
| 25. Flex fuel learn mode not active |
| 26. ABS brake event not present |

EVIC Pop Up Messages Displayed on the EVIC

- EVIC message states Stop/Start Autostop Active

- No Chime
- Normal Use
- Pop-up maintained for 5 seconds
- Displays with green hard telltale

Stop/Start To Restart Press

- Single Chime
- Driver put gear shift in gear without using Clutch; customer needs to return to Neutral or fully depress clutch pedal
- Pop up maintained for 5 seconds

Stop/Start Restart Required Fault Detected

- Single Chime
- MIL or ESS system fault preventing safe state confirmation during autostop.

EVIC Pop Up Messages Displayed within EVIC "Ring" menu**Stop/Start Ready**

- Stop-Start conditions met to enable engine stop.

Stop/Start Off

- Stop-Start turned off by the customer at the switch

Stop/Start Not Ready

- Stop-Start conditions are not met to enable engine stop (ex: HVAC settings, engine temperature, etc.)

Stop/Start Not Ready Steering Wheel Turned

- Stop-Start condition not met with steering wheel turned past calibratable angle

DIAGNOSIS AND TESTING**STOP START SYSTEM DIAGNOSIS**

For diagnostics of the starting system, refer to **DIAGNOSIS AND TESTING**.

For diagnostics of the Stop Start system, the scan tool can be used to review the inhibitor menu to help root cause a potential Stop Start concern.

Possible Reasons The Engine Does Not AUTO STOP

Prior to engine shut down, the system will check many safety and comfort conditions to see if they are fulfilled. In following situations the engine will not stop:

- Driver's seat belt is not buckled
- Outside temperature is less than 1°F (-17°C) or greater than 104°F (40°C)
- Actual cabin temperature is significantly different than temperature set on Auto HVAC
- HVAC is set to full defrost mode
- Engine has not reached normal operating temperature
- Battery discharged
- When driving in REVERSE
- Hood is open
- Vehicle is in 4LO transfer case mode

It may be possible for the vehicle to be driven several times without the STOP/START system going into a STOP/START READY state under more extreme conditions of the items listed above.

For a more technical and detailed explanation of AutoStop, review the following inhibitors.

When it comes to Stop Start, we allow AutoStop event if:

- Accelerator pedal is in the rest position.
- HVAC Control allows an auto stop event. The AC load can not be in a high demand mode of operation
- Battery state (charge 65%, function 8 volts, health 40 ampere hour) is within an acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control (ECS) is not requesting control.
- Fuel level is greater than the minimum fuel level threshold.
- Both hood switches indicate the hood is closed.
- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range. Barometric pressure is greater then a minimum of 605 kPa.
- Brake Booster is sufficient to maintain master cylinder pressure with current applied pedal force.
Minimum 205 kPa
- Starter motor engagement has not exceeded prescribed frequency use.
- Vehicle speed is 0
- Steering angle has not exceeded the prescribed range.
- Steering torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range (-10F - 110F).

- Catalyst temperature is within the prescribed range (150F - 950F)
- Coolant temperature is within the prescribed range.
- Engine oil temperature is within the prescribed range (40C - 110C).
- Anti-lock brake system is not active.
- Transfer case is not in 4WDLO
- Vehicle is not in tow haul mode.
- Vehicle is in valid target gear and brake switch combination.
- Threshold vehicle speed exceeded or timeout since last shift out of reverse.
- Transmission ready.
- Battery temperature is within the prescribed range (-256F - 256F).
- Engine speed is below a set threshold of 1000 RPM.
- Engine runtime is greater then threshold of 3 seconds.
- Start Stop disable switch is not active.
- Flex fuel learn mode is not active.
- Vehicle is not on a grade.
- Threshold vehicle speed exceeded since last engine start is 8 mph.

Conditions that will cause the engine to start automatically while in STOP/START AUTO STOP ACTIVE mode:

- Actual cabin temperature is significantly different than temperature set in Auto HVAC.
- HVAC is set to full defrost mode.
- STOP/START AUTO STOP TIME ACTIVE exceeds 5 minutes.
- Battery Voltage drops too low.
- Low brake vacuum e.g. after several brake pedal applications.
- Vehicle is moving faster then 3 mph (5 km/h)
- STOP/START OFF switch is pressed.
- 4WD is put into 4LO mode.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is in the "rest" position.
- HVAC Control is allows an Auto Stop event.
- Battery State (charge, function, health) is within acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control system is not requesting control.
- Fuel Level is greater than the minimum fuel level threshold.
- Both hood switches indicate hood is closed.

- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range.
- Brake Booster Pressure is sufficient to maintain master cylinder pressure with current applied pedal force.
- Starter motor engagement has not exceeded prescribed frequency of use.
- Vehicle speed is 0.
- Steering Angle has not exceeded the prescribed range.
- Steering Torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range.
- Catalyst Temperature is within the prescribed range.
- Coolant Temperature is within the prescribed range.
- Engine Oil Temperature is within the prescribed range.
- Anti-Lock Brake System is not active.
- Transfer Case Mode is not in 4WDLO.
- Vehicle is not in TOW-HAUL mode.
- Vehicle is in valid target gear and brake switch state combination
- Threshold vehicle speed exceeded or timeout since last shift out of reverse
- Transmission ready
- Battery temperature is within the prescribed range
- Engine speed is below a set threshold
- Threshold vehicle speed exceeded since last engine start
- Engine runtime greater than threshold
- Stop-Start disable switch is not Active
- Flex fuel learn mode not active
- Vehicle is not on a grade.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is not in the "rest" position.
- HVAC Control is active.
- Battery State (charge, function, health) is out of range.
- Current master cylinder brake pressure does not have enough HSA brake pressure.
- Electronic Stability Control system is requesting control.
- Fuel Level is lower than the minimum fuel level threshold.
- One or both hood switches indicate hood is open.
- Predefined OBD faults are present.
- Absolute Barometric Pressure is out of range.
- Brake Booster Pressure is insufficient to maintain master cylinder pressure with current applied pedal

force.

- Starter motor engagement has exceeded prescribed frequency of use.
- Vehicle speed is above 0.
- Steering Angle has exceeded the prescribed range.
- Steering Torque is more than the prescribed value.
- Ambient Air Temperature is outside the prescribed range.
- Catalyst Temperature is outside the prescribed range.
- Coolant Temperature is outside the prescribed range.
- Engine Oil Temperature is outside the prescribed range.
- Anti-Lock Brake System is active.
- Transfer Case Mode is in 4WDLO.
- Vehicle is in TOW-HAUL mode.
- Transmission not ready
- Battery temperature is out of the prescribed range
- Stop-Start disable switch is Active
- Flex fuel learn mode is active

The above conditions can restart the vehicle as long as:

1. Completed initial engine key start.
2. Occupant sensing allow engine start condition met.
3. OBD allow engine start condition met.
4. Vehicle hood closed.

System Malfunction:

If there is a malfunction in the STOP/START system, the system will not shut down the engine. A SERVICE STOP/START SYSTEM message will appear in the EVIC.

SENSOR, NEUTRAL POSITION

DESCRIPTION

DESCRIPTION

Fig. 20: Neutral Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Neutral Position Sensor (NPS) (1) is a component of the automatic stop/start feature on KL platform vehicles with manual transmissions. It is located on the transmission shift cable and it is only serviced by replacing the shift cable assembly.

OPERATION

OPERATION

The purpose of the Neutral Position Sensor (NPS) is to provide an output from the sensor to a controller concerning gear range position. On vehicles equipped with a manual transmission, the shift cable position is interpreted by the controller from the NPS to determine if the transmission is in neutral or in some gear range, for the purpose of determining when the stop/start system can safely restart the vehicle without the clutch pedal being depressed. The switch outputs a PWM signal whose percentage of duty cycle corresponds to the ranged denoted in Neutral, in a gear range, or as a fault value. The NPS is attached to shift cable such that it is nominally outputting 50% duty cycle at or when the vehicle is shifted to Neutral. Higher or lower duty cycle outputs are denoted as the magnet on the shift cable moves with respect to the NPS when the vehicle is shifted to gear range positions.

The NPS receives an Input of 5 volts excitation, has a common ground and outputs Pulse-width modulated signal to the controller.

Outputs reading less than 5% or more than 95% of duty cycle will trigger diagnostic trouble codes. Outputs reading between 5-25% or 75-95% represent in-gear positions and outputs readings between 25-75% represent Neutral position. Check that the sensor is attached properly to shift cable (inside the center console, at the shifter) and that wiring lead is attached to wiring harness coming up from rearward in vehicle from shifter. Check that the shift cable is properly attached to shifter and transmission ends to levers and load reaction points. With a jumper, voltages from the sensor input and output can be read with a voltmeter and compared with

The In-rush Current Reduction (ICR) Relay Module is intended to reduce the in-rush current drawn by the starter motor during the initial stage of the crank sequence, thus maintaining an adequate voltage level and allowing critical electrical/electronic systems to function without interruption, or reset. At the same time, the relay will allow sufficient current and voltage to reach the starter motor, to allow cranking the engine at an adequate speed, so that the engine can generate the air-fuel mixture necessary for self-sustained operation, even under adverse conditions.

This component is mounted to a bracket that mounts to the top of the starter assembly. The relay is serviceable and is shipped along with a bracket that secures the ICR.

OPERATION

OPERATION

In-Rush Current Reduction Relay.

Within the ICR relay, prior to the starter motor solenoid's contact closure, the shorting bar opens contacts, thus routing the starter motor current through a resistor bar (10 mOhm for V6 Pentastar). The increase in series resistance reduces/eliminates the initial current spike (or, inrush current) and reduces the consequent voltage drop. After a set time (185 msec), the power to the ICR relay is cut, the shorting bar closes the contacts, removing the resistor bar from the circuit and restoring full power to the starter motor. At this point, there is a rebound of the current surge and subsequent drop in voltage; however, neither is as intense as they would be would be without initial jump in resistance.

Circuit Testing Procedures - Non-DTC-Based Diagnostics - Cherokee

WARNING

GENERAL WARNINGS

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: Always wear safety glasses for eye protection.

WARNING: Use safety stands anytime a procedure requires being under a vehicle.

WARNING: Be sure that the ignition switch is always in the off position, unless the procedure requires it to be on.

WARNING: Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.

WARNING: Operate the engine only in a well-ventilated area.

WARNING: Keep away from moving parts when the engine is running, especially the fan and belts.

WARNING: To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.

WARNING: Do not allow flame or sparks near the battery. Gases are always present in and around the battery.

WARNING: Always remove rings, watches, loose hanging jewelry and avoid loose clothing.

2014 GENERAL INFORMATION Circuit Testing Procedures - Non-DTC-Based Diagnostics - Cherokee

CIRCUIT FUNCTIONS

All circuits in the wiring diagrams use an alpha/numeric code to identify the wire and its function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart.

NOTE: This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT CODE	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	MULTIPLE
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	MULTIPLE
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)
R	PASSIVE RESTRAINT
S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/ TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/WASHER
W	WIPERS
X	AUDIO SYSTEMS
Y	TEMPORARY
Z	GROUND

CIRCUIT INFORMATION

Each wire shown in the wiring diagrams contains a code which identifies the main circuit, a specific portion of the main circuit, gauge of wire, and color.

2014 Jeep Cherokee Trailhawk

2014 GENERAL INFORMATION Circuit Testing Procedures - Non-DTC-Based Diagnostics - Cherokee

As an example, circuit **A 2 18 LB/YL** is decoded in the following manner:

Circuit Type:	A (Battery Feed Circuit)
Circuit Level:	2 (Level Two)
Wire Size:	18 (Eighteen Gauge Wire)
Wire Color:	LB/YL (Light Blue with Yellow Tracer)

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

DIAGNOSIS AND TESTING

WIRING HARNESS TESTING

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below:

Voltmeter

The voltmeter is used to measure the electrical pressure or the voltage difference between two points. A voltmeter reads available voltages such as battery voltage, generator output voltage, and voltage drop across a component or conductor. A high voltage drop may indicate a high resistance in the circuit. The voltmeter can be used to locate an open circuit and circuits with an unintentional ground. Observing polarity, always connect a voltmeter in parallel to the existing circuit. If the leads are reversed on a digital multimeter, a minus sign

appears in the display.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

Ohmmeter

The ohmmeter is used to measure the resistance of a component or the resistance between two points in a circuit in ohms, and to check a portion of the circuit for continuity. Some meters have a built-in tone to indicate that the circuit has continuity. No resistance indicates a short circuit or unintentional ground whereas resistance that is higher than specification indicates a high resistance in the circuit such as a loose, dirty or corroded connection, or a defective component. An "OL" reading means that the circuit or component had infinite resistance; an open circuit or defective component is indicated. Ohmmeters have an internal battery and must never be connected to a power circuit. Connecting an ohmmeter to a powered circuit causes the meter fuse to blow and can damage its dry cell battery. Ohmmeters can be connected into a circuit without regard to polarity, unless the circuit contains a diode. When using an ohmmeter, the component or portion of the circuit must be isolated from other components or branches to avoid false readings.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

Ammeter

Amperage or current is the measure of the rate of electron "flow" in a circuit. It is measured in the unit of the Ampere, simply called an Amp (A). In order to measure current in a circuit, the circuit must be broken or opened, and an ammeter must be inserted in series (in-line) with the circuit so that all the current that flows through the circuit will have to go through the meter. When measuring current in this manner, it requires the meter be made part of the circuit, this type of measurement is more difficult than measuring either voltage or resistance.

When an ammeter is placed in series with a circuit, it ideally drops no voltage as current goes through it. In other words, it acts very much like a piece of wire, with very little resistance from one test probe to the other. Consequently, an ammeter will act as a short circuit if placed in parallel (across the terminals of) a substantial source of voltage. If this is done, a surge in current will result, potentially damaging the meter. Ammeters are generally protected from excessive current by means of a small fuse located inside the meter housing. If the ammeter is accidentally connected across a substantial voltage source, the resultant surge in current will "blow" the fuse and render the meter incapable of measuring current until the fuse is replaced.

Consult the owner's manual of the particular model of meter you own for details on measuring current.

CAUTION: Do not crank the engine or turn on any accessories that may draw more

than 10 Amps. You may open the protective fuse in the multimeter.

12-Volt Test Light

The 12-Volt test light when properly used, is one of the best and quickest pieces of test equipment available for troubleshooting 12-volt power systems. It's especially good for times when there are only two voltages, battery voltage and no voltage. For example, if you're checking to see if you have 12-volts on the Battery(+), the test light will immediately tell you if voltage is present or not.

With any test equipment, you should confirm that it's in good working order before you begin testing. For a test light, you have to have a voltage source. Connect the test light's ground clip to a good ground and touch it to a point where you believe that there is 12-volt supply. If the light doesn't light up, check the light by connecting it directly across the battery. Initially, make sure that you have the ground clip on the negative battery terminal. If you touch the probe to the positive terminal, the test light should light up. If it doesn't and the battery is not completely dead, the test light isn't working properly. The test light must be in proper working order before any circuit testing can occur.

Jumper Wire

The sole purpose of the jumper wire is to complete a circuit. It is nothing more than a suitable length of insulated wire with terminals or connectors on each end. Jumper wires may be bought or made with various sizes of wire and styles of terminals including alligator clips, spade lugs and pin plugs, and should include a fuse device of some type for circuit and component protection. A jumper wire is used to verify a faulty conductor by substituting a known good one. It is jumped across a suspicious conductor in the circuit. If the circuit works with the jumper, but not without, there is an open somewhere in the area being jumped. A jumper wire is **ONLY** used to bypass a faulty conductor (including switches and connectors). **NEVER** bypass a load device with a jumper wire. The circuit needs the resistance from the load device and shorting across it causes high current flow, which could damage other components.

WARNING: Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.

Fig. 1: Probing Tool

Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL 6801

2 - PROBING END

Probing Tools

These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package (special tool #6807, Terminal Tools), and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem.

Before condemning a component or wiring assembly, check the following items:

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

Perform the following Six Step Diagnosis Process:

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to **SYSTEM WIRING DIAGRAMS** .
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.

6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to **SYSTEM WIRING DIAGRAMS**.

NOTE: The Six Step Diagnosis Process used by Chrysler is a time proven process. The basic concepts of this process have been used by others for problem solving for many years. The successful application of this process requires a solid understanding of the conditions that affect each step, and when its time to advance to the next step. These conditions based on experience formulate what is known as "Best Practices".

STANDARD PROCEDURE

CHECK A 12-VOLT FUSED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 2: Checking 12-Volt Fused Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure(s) is to demonstrate how to check the voltage of a 12-volt fused battery B(+) circuit with a test light or voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT

Fig. 3: Checking 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.

5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

Does the test light illuminate brightly?

Yes

- The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER

Fig. 4: Checking Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 12-VOLT SWITCHED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 5: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 12-Volt switched battery B(+) circuit with a test light or voltmeter.

NOTE: **The circuit shown is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter

NOTE: **Perform the following test using a known good test light or functioning multimeter.**

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT

Fig. 6: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking

the engine.

Does the test light illuminate brightly?

Yes

- The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER

Fig. 7: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 8: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 5-Volt supply circuit with a voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing A 5-Volt Supply Circuit For Voltage
- Testing A 5-Volt Supply Circuit And Sensor Ground Circuit

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)
ELECTRONIC CONTROL MODULE (5-VOLT SUPPLY OUTPUT)

DIAGNOSTIC TEST

1. TESTING A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE

Fig. 9: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the sensor harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Turn the ignition on.
4. Set the multimeter to measure DC voltage.
5. Connect the negative lead of the multimeter to a known good ground.
6. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.7 and 5.2 volts?

Yes

- Go To 2

No

- Check the 5-volt supply circuit for an open or short to ground. For further assistance, perform the appropriate Sensor Reference Voltage DTC diagnostic procedure.

2. TESTING A 5-VOLT SUPPLY CIRCUIT AND SENSOR GROUND CIRCUIT

Fig. 10: Checking 5-Volt Supply Circuit And Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. With the multimeter set to measure DC voltage.
2. Move the negative lead of the multimeter to carefully probe the sensor ground or sensor return circuit in the harness connector.
3. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.7 and 5.2 volts?

Yes

- At this time the 5-volt supply and sensor ground circuit are working properly. Continue to measure the voltage between the wires, wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or excessive resistance in the Sensor Ground (Sensor Return) circuit.

CHECK A CIRCUIT FOR A SHORT TO GROUND

THEORY OF OPERATION

Fig. 11: Checking Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check a circuit for a Short to Ground.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Ground Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Short to Ground condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT TO GROUND USING AN OHMMETER

Fig. 12: Checking For A Short To Ground Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors from the module and component for the suspected circuit being shorted to ground.

NOTE: Check connectors - Clean/repair as necessary.

3. With the component wire harness connectors disconnected, use a meter set to measure Ohms (Ω), and measure the resistance between the circuit and a known good ground.
4. Use the negative lead of the meter and touch a known good ground.
5. Use the positive lead of the meter and carefully probe the circuit suspected of having the short.

Is the resistance to ground below 10k ohms ?

Yes

- Repair the short to ground. Use the wiring diagram as a guide to follow the path of the circuit.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to ground or the condition that originally caused the short may not be present at this time. Continue to measure the resistance, wiggle the wire harness and connectors while checking for an intermittent short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A CIRCUIT FOR A SHORT TO VOLTAGE

THEORY OF OPERATION

Fig. 13: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate different methods of checking for a short to voltage in a circuit. When diagnosing a DTC it might be necessary to verify that proper voltage is on a circuit or that a circuit is not shorted high.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Battery Voltage Using A Voltmeter
- Testing For A Short To Switched Battery Voltage Using A Voltmeter
- Testing For A Short To Battery Voltage Using A 12-Volt Test Light

- Testing For A Short To Switched Battery Voltage Using A 12-Volt Test Light

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a Short To Voltage condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. TESTING FOR A SHORT TO BATTERY VOLTAGE USING A TEST LIGHT

Fig. 14: Checking For A Short To Battery Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

Does the test light illuminate brightly?

Yes

- Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to **STANDARD PROCEDURE** and perform the **Check for a Short Between Multiple Circuits diagnostic procedure**.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

2. TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A TEST LIGHT

Fig. 15: Checking For A Short To Switched Ignition Voltage Using A Test Light
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

Does the test light illuminate brightly?

Yes

- Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to **STANDARD PROCEDURE** and perform the **Check for a Short Between Multiple Circuits** diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

3. TESTING FOR A SHORT TO BATTERY VOLTAGE USING A VOLTMETER

Fig. 16: Checking For A Short To Battery Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit that is suspected as having a short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for a short.

Is there any voltage present?

Yes

- Repair the short to battery voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to **STANDARD PROCEDURE** and perform the **Check for a Short Between Multiple Circuits** diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to

terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

4. TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A VOLTMETER

Fig. 17: Checking For A Short To Switched Ignition Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit suspected of having the short.
7. Ignition on, engine not running.

Is any voltage present?

Yes

- Repair the short to ignition voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to **STANDARD PROCEDURE** and perform the **Check for a Short Between Multiple Circuits** diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK FOR AN OPEN GROUND CIRCUIT

THEORY OF OPERATION

Fig. 18: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the operation of a generic ground circuit

with a test light.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing Ground Circuit With Test Light

NOTE: Perform the following test using a known good test light.

Possible Causes
OPEN GROUND CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRE)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING GROUND CIRCUIT WITH TEST LIGHT

Fig. 19: Checking Ground Circuit With Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the ground circuit suspected of

containing excessive resistance.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, connect the 12-volt test light to Battery(+).
5. Use the test light lead to lightly probe the ground circuit in the harness connector.

Does the test light illuminate brightly?

Yes

- The suspected ground circuit is not open or the condition that originally caused the open or excessive resistance is not present at this time. Another way to check for an open would be to use an ohmmeter and measure the resistance of the ground circuit. While continuing to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the ground circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.

CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS

THEORY OF OPERATION

Fig. 20: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check for a short circuit between multiple circuits.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short Between Multiple Circuits

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Multiple Short condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT BETWEEN MULTIPLE CIRCUITS

Fig. 21: Checking For A Short Between Multiple Circuits
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuits that are suspected of being shorted together.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to Ohms (Ω), and measure the resistance between the applicable circuits in one of the harness connectors.
5. Use one lead of the multimeter and carefully probe the circuit suspected of being shorted.
6. Use the other lead of the meter and one at a time, carefully probe the other circuits in the harness connector.

Is the resistance below 10k ohms when probing any two circuits?

Yes

- Repair the short between the circuits. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other

side of the in-line connector.

No

- The circuit is not shorted or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness and connectors while checking for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source that was causing the short.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK THE RESISTANCE OF A CIRCUIT USING AN OHMMETER

THEORY OF OPERATION

Fig. 22: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the resistance of a circuit with an ohmmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For An Open Circuit Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to an Open Circuit condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR AN OPEN CIRCUIT USING AN OHMMETER

Fig. 23: Checking For An Open Circuit Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit suspected of being open.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With the component wire harness connectors disconnected, use a multimeter set to Ohms (Ω), and measure the resistance of the circuit.
5. Use one lead of the meter and probe the circuit in one harness connector.
6. Use the other lead of the meter and probe the same circuit in the other harness connector.

Is the resistance in the circuit below 10k ohms?

Yes

- The circuit does not contain any excessive resistance or the condition that originally caused the excessive resistance may not be present at this time. Continue to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit between the two wire harness connectors. Using the wiring diagram as a guide, trace the circuit and check for any in-line connectors where the open or excessive resistance could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open or excessive resistance is not present, the open or excessive resistance is on the other side of the in-line connector.

CHECK FOR EXCESSIVE CURRENT DRAW

THEORY OF OPERATION

What is current draw?

Current draw, or parasitic draw is an electrical load that draws current from the battery when the ignition is turned off. Some are considered normal, some above normal. Normal draw comes from various electronic devices connected to battery positive at all times. Many vehicle modules draw a few mA (milliamps) as a means to "Keep Alive Memory". Whether it's the clock in the radio or the last known position of the memory mirrors, these tiny amounts of current typically will only add up to 20 or 30 mA. The vehicle can sit parked for days, even a few weeks without any problems of excessive battery drain that might prevent starting. As long as the vehicle is driven periodically in order for the alternator to recharge the battery there is no problem. A problem may occur, in situations such as new vehicles in dealer stock or long term airport parking situations.

Below are some examples of modules and components that require keep alive memory:

- Powertrain Control Module (PCM)
- Body Control Module (BCM)
- Memory Seat Module (MSM)
- Radio

What is excessive current draw?

Excessive current draw can be determined by an ammeter reading in excess of 50 mA. The typical "normal" current draw will not exceed 20 or 30 mA.

How to locate the problem?

Locating the problem involves a process of elimination. If the problem is not obvious, like the trunk light staying on, you will have to start troubleshooting:

- Start by removing one fuse at a time until you see the reading on the meter drop off (be careful to reinstall the fuses in their proper location).
- Once you've determined the high-draw circuit, there still may be a half-dozen loads, each individually drawing current from the battery.
- To zero in on that circuit or circuits, use the schematic diagram and disconnect each device on the circuit one-at-a-time and check the meter.
- When the milliamp reading drops off significantly, you've found the problem.

Perform the following test to determine where the cause of the draw is located.

Possible Causes
INSTALLED AFTERMARKET ACCESSORIES (AUDIO SYSTEMS, VEHICLE ALARMS, ETC.)
COURTESY LIGHTS REMAINING ON (INTERIOR, TRUNK, HOOD, ETC.)
BATTERY CHARGERS PLUGGED INTO THE CIGARETTE LIGHTER/POWER OUTLETS

DIAGNOSTIC TEST

TESTING FOR PARASITIC DRAW

NOTE: For a more accurate current draw reading, wait 20 minutes to make sure all modules have powered down before continuing. Some modules may stay powered up longer than others.

2923014738

Fig. 24: Checking For Parasitic Draw Using Multimeter
Courtesy of CHRYSLER GROUP, LLC

Turn the ignition off.

1. Disconnect the Negative battery cable (ground).
2. Using a multimeter, set the multimeter leads up to properly measure Amperage.
3. Connect the ground lead that is plugged into the COM port of the multimeter to the Negative battery post/terminal.
4. Connect the other lead of the multimeter that is plugged into the Amp port of the multimeter to the Negative battery cable.

CAUTION: Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.

5. While monitoring the amperage reading on the multimeter, begin to remove fuses (one at a time) from each fuse location on the vehicle and see if the amperage drops.

NOTE:

- Only remove one fuse at a time until the cause of the voltage draw is determined.
- Many vehicles have multiple fuse locations on the vehicle.

6. If the amperage does not drop, install the fuse you just removed and remove the next fuse.

Does the amperage drop to between 0.02 to 0.04 of an Amp when removing any fuses?

Yes

- Use the wiring diagram as a guide to help indicate what components or modules are powered by the fuse.
- At this point you can install the fuse and begin disconnecting the components powered by the fuse.
 - When the amperage drops after disconnecting a component this will indicate which component is at fault.
 - It is important to know how long some modules are designed to remain awake.
 - You don't want to replace a component that is operating normally.
 - The condition that originally caused the draw may not be present at this time.

No

- The condition that originally caused the draw may not be present at this time.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded ground terminals.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CIRCUIT LOAD TESTING PROCEDURE**THEORY OF OPERATION**

A circuit load test can be performed to test the ability of a circuit to carry the current required to operate a connected device. A circuit load test should be performed after a circuit has passed a resistance test using a DVOM and the circuit is still suspected of a failure.

- A single copper wire strand will carry enough current to light a test light bulb, while showing very low resistance using a DVOM.
- Some test lights are insufficient for load testing because of the very low resistance bulb being used.
- The Load Test tool listed below will require higher current flow to power the bulb; and this will test the ability of the circuit to carry a load.
- This test will indicate if the circuit being tested can carry the current required to operate a connected device.

WARNING: To avoid possible serious or fatal injury, **DO NOT** load test any air bag/restraint system components or circuits using the procedures listed here. Refer to **RESTRAINTS - SERVICE INFORMATION** for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: Depending upon the location of the circuit in question, this test may require jumper wires.

NOTE: Use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the circuit failure could occur intermittently. Look for any chafed, pierced, pinched, or partially broken wires. Look for broken, bent, pushed out or corroded terminals - clean/repair as necessary. Verify that there is good pin to terminal contact in the related wire harness connectors.

2923007887

Fig. 25: Load Test Tool
Courtesy of CHRYSLER GROUP, LLC

Here is an example of a simple tool you can build to test a circuit's ability to carry a load.

2923007888

Fig. 26: Load Test Tool Components

Courtesy of CHRYSLER GROUP, LLC

The following is a list of components required to build a load test tool:

1. 3156 Bulb
2. 3156 Bulb socket
3. Negative alligator clip with covers
4. Positive alligator clip with covers
5. 2 Amp mini fuse
6. Mini fuse holder
7. 2' to 4' of Black 16ga wire
8. 2' to 4' of Red 16ga wire
9. Approved back probe tool
10. Shrink tubing
11. Solder

LOAD TESTING A GROUND CIRCUIT**DIAGNOSTIC LOAD TEST (GROUND CIRCUIT)**

2923007883

Fig. 27: Performing Diagnostic Load Test (Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery.
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit

being tested at point (A).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY/IGNITION FEED CIRCUIT)

2923007884

Fig. 28: Performing Diagnostic Load Test (Battery/Ignition Feed Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.

2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Connect the negative lead of the load test tool to the negative side of the battery or ground.

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT AND GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY FEED & GROUND CIRCUIT)

2923007884

Fig. 29: Performing Diagnostic Load Test (Battery Feed & Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Test the circuits individually to determine which circuit is the cause of the test failure.
- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

DIAGNOSTIC LOAD TEST (OPEN/HIGH RESISTANCE CIRCUIT)

2923007886

Fig. 30: Performing Diagnostic Load Test (Open/High Resistance Circuit)

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all components from the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).
4. Using an approved connector back probe tool, connect a jumper wire to the circuit being tested at point (C).
5. Then connect the other end of the jumper wire to the negative side of the battery or ground (D).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

VOLTAGE DROP TEST PROCEDURE

THEORY OF OPERATION

Voltage drop is the reduction in voltage in an electrical circuit between the voltage source and load components. The wires and connectors of a circuit should contain almost no resistance and **all** the voltage should be consumed through the load. The "load" is the component using the power, such as a light, starter, or blower motor. If a circuit has excessive resistance, it prevents the wire from carrying sufficient current under high load conditions. A voltage drop test is an effective way to locate excessive resistance in connections and circuits.

To perform a voltage drop test, a Digital Volt Ohm Meter (DVOM) is used to measure the voltage drop across a live circuit or connection while it is under the load. If the circuit or connection being tested has excessive resistance, the DVOM will measure the voltage that the resistance is using. **Little or no voltage drop should be read, ideally less than 0.2 of a volt**, anything greater indicates excessive resistance and the circuit or connection should be inspected for cleaning or repair.

Possible Causes
EXCESSIVE CIRCUIT RESISTANCE (CHAFED, PIERCED OR CORRODED WIRES)
HIGH RESISTANCE WITH IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR VOLTAGE DROP

2923015567

Fig. 31: Testing for Voltage Drop
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Use the wiring diagram as a guide, trace the circuit being tested and locate the components related to the circuit.

3. Set the multimeter to measure DC voltage.
4. Carefully back probe the two component harness connectors of the circuit being tested.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: If you are testing the starting circuit, disable the engine so the engine does not start.

5. Crank the engine for five seconds if you are testing the starting circuit and monitor the multimeter voltage reading.
6. For circuits that don't require the engine running, turn the ignition on.
7. For circuits that require the engine running, start the engine.

NOTE: If the circuit you are checking needs to be operating, such as the Blower Motor or a Lamp, do so now.

8. Monitor the voltage reading.
9. The voltmeter will show the difference in voltage between the two points.

Is the voltage less than 0.2 of a Volt?

Yes

- At this time the circuit is functioning properly. Continue to measure the voltage between the components and wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the excessive resistance could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit.
- Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the excessive resistance may occur.
- Look for any chafed, pierced, pinched, or partially broken wires.

- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

80ce3d47

Fig. 32: Electrostatic Discharge Symbol
Courtesy of CHRYSLER GROUP, LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the component is ESD sensitive, assume that it is.

Perform the following procedure when handling ESD sensitive components:

1. Always touch a known good ground before handling the component. This should be repeated while handling the component and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the component, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the component from its protective packing until it is time to install the component.
5. Before removing the component from its package, ground the package to a known good ground on the vehicle.

WIRE SPLICING

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641526.vid1" into the "Search Channel" box.

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to **SYSTEM WIRING DIAGRAMS** for the original wire gauge size.

Fig. 33: Splice Band

Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 34: Crimping Tool

Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 35: Solder Splice

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using Rosin Core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 36: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

REMOVAL

CONNECTOR TERMINAL REMOVAL

Fig. 37: Removal Of Dress Cover
Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| <p>1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR</p> |
|---|

1. Disconnect battery.

2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).

80ca8902

Fig. 38: Connector Secondary Terminal Lock

- 9 - THOMAS AND BETTS CONNECTOR
- 10 - TERMINAL REMOVER
- 11 - CONNECTOR
- 12 - ELECTRICAL TERMINAL REMOVER

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

INSTALLATION

CONNECTOR TERMINAL INSTALLATION

1. Select a wire from the terminal repair kit that best matches the color and gauge of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see Wire Splicing procedure). Refer to **STANDARD PROCEDURE**.
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

2014 HVAC**Heating & Air Conditioning - Service Information - Cherokee****DESCRIPTION****DESCRIPTION**

The HVAC housing is mounted longitudinally in the vehicle, which means it doesn't follow the line of the bulkhead, but protrudes into the passenger compartment. The assembly is available in a single or dual zone configuration, and has a cabin compartment filter on all applications. See the Controls information for more information.

240968707

Fig. 1: HVAC Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

All vehicles use an HVAC housing (4) that combines heating, ventilating and A/C capabilities into a single housing. Based upon the mode selected, conditioned air can exit the HVAC housing through one, or a combination of, the panel (2), defrost (1) and floor (5 and 3) outlets. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the air outlets within the vehicle interior. See the Distribution information for more information.

The A/C system uses a variable displacement compressor, and an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. See the Plumbing information for more information.

To maintain the performance level of the HVAC system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems. The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. See **ENGINE COOLING**

SYSTEM for more information.

OPERATION

OPERATION

NOTE: Typical blend-air type HVAC system shown in illustration.

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER GROUP, LLC

The heating and A/C systems used in this vehicle are a single zone, blend-air type system. In this blend-air heating and A/C system, two blend-air doors (3) control the amount of conditioned air that is allowed to flow through, or around the heater core (2).

The system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the right side base of the windshield and into the air inlet housing, inside the passenger compartment. From there, the ambient air passes through the A/C evaporator (7) and is then directed either through or around the heater core. This is done by adjusting the position of the blend-air doors with the temperature control located on the A/C heater control in the instrument panel. Air flow is then directed out the floor outlets (8), instrument panel outlets (10) or the defroster outlets (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C heater control. The Automatic Temperature Control (ATC) system uses electric actuators to operate the blend and mode air doors. The Manual Temperature Control (MTC) system uses cables to operate the blend and mode air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C heater control.

The fresh air intake can be shut off by the Recirculation control, located on the A/C heater control. This will

operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6), located within the passenger compartment.

NOTE: It is important to keep the fresh air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter that enters the housing with the fresh ambient air provides an additional food source for the fungal spores. If the air intake opening is not kept clear of debris, objectionable odors created by growing fungi and decaying plant matter, as well as excess debris, can be discharged into the passenger compartment during heater and A/C operation.

The A/C compressor can be engaged by pressing A/C (snowflake) button on the A/C heater control. When equipped, the A/C compressor will automatically engage when the mode control is set in any Mix to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system.

A/C PERFORMANCE TEST

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

1. Make sure the following conditions are met in the area where this test is to be performed:
 - Maximum ambient temperature: 43.3°C (110°F)
 - Minimum ambient temperature: 15.5°C (60°F)
 - Maximum relative humidity: 90%
 - Minimum relative humidity: 20%
2. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the Controller Area Network (CAN) data bus, HVAC module, Body Control Module (BCM) and Powertrain Control Module (PCM). If no DTCs are found, go to Step 3. If any DTCs are found, repair as required, then proceed to **Step 3**.
3. Operate the heating and A/C system under the following conditions.
 - Engine at normal operating temperature
 - Engine at normal idle speed
 - No sun-load in the cabin of the vehicle
 - Vehicle doors and windows closed
 - Transmission in Park or Neutral with the park brake On.
 - A/C heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the **A/C SYSTEM DIAGNOSIS**.
 - All panel outlet vanes open and positioned straight rearward

NOTE: If the following step is not performed, the results of this test will not be accurate.

4. Using a scan tool, operate the engine cooling fans at high speed from the PCM View>Actuators.
5. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of five minutes.

NOTE: This procedure requires you to know what the temperature and relative humidity is in your location at the time of the test.

6. With the A/C clutch engaged, compare the observed panel outlet air temperature along with the ambient temperature of the work area and the relative humidity to the Maximum Panel Outlet Temperature chart.
7. If the air outlet temperature fails to meet the specifications shown in the Maximum Panel Outlet Temperature chart (see **Fig. 3**), refer to the A/C System Diagnosis table below.

3666574

Fig. 3: Maximum Panel Outlet Temperature
Courtesy of CHRYSLER GROUP, LLC

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks. Refer to PLUMBING, DIAGNOSIS AND TESTING . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks. Refer to PLUMBING, DIAGNOSIS AND TESTING . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Open fuse.	2. See appropriate Wiring Information. Check the fuses in the Power Distribution Center (PDC). Repair the shorted circuit or component and replace the fuse(s), if required.
	3. Inoperative A/C clutch.	3. See COMPRESSOR, A/C . Test the A/C clutch and coil and replace, if required.
	4. Improperly installed or inoperative evaporator	4. See SENSOR, EVAPORATOR TEMPERATURE . Test the sensor and

2014 Jeep Cherokee Trailhawk

2014 HVAC Heating & Air Conditioning - Service Information - Cherokee

	temperature sensor.	replace, if required.
	5. Inoperative A/C pressure transducer.	5. See <u>TRANSDUCER, A/C PRESSURE</u> . Test the sensor and replace, if required.
	6. Inoperative control module, CAN bus or wiring.	6. See the appropriate Electrical Diagnostic Procedures for testing of the modules and CAN bus, and see Wiring Information for compressor control circuit repair, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See <u>OIL, REFRIGERANT, STANDARD PROCEDURE</u> . Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator(s) improperly installed or inoperative.	2. See <u>ACTUATOR, BLEND DOOR</u> . Inspect the actuator(s) for proper operation and replace, if required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See <u>HOUSING, HVAC</u> . Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks. Refer to <u>PLUMBING, DIAGNOSIS AND TESTING</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See <u>EVAPORATOR, A/C</u> . Replace the restricted A/C evaporator, if required.
	3. Inoperative A/C compressor.	3. See <u>COMPRESSOR, A/C</u> . Replace the A/C compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. See <u>CONDENSER, A/C</u> . Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the A/C receiver/drier is restricted.	2. See <u>DRIER, A/C RECEIVER</u> . Replace the restricted A/C receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. See <u>ENGINE COOLING SYSTEM</u> . Test the radiator cooling fan and replace, if required.
	4. Refrigerant system overcharged.	4. See <u>R-134A REFRIGERANT SYSTEM CHARGE</u> . Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.

2014 Jeep Cherokee Trailhawk

2014 HVAC Heating & Air Conditioning - Service Information - Cherokee

	5. Air in the refrigerant system.	5. See Refrigerant System Leaks. Refer to <u>PLUMBING, DIAGNOSIS AND TESTING</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. See <u>ENGINE COOLING SYSTEM</u> . Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See <u>ENGINE COOLING SYSTEM</u> . Inspect the accessory drive belt condition and tension. Repair as required.
	2. Inoperative A/C expansion valve.	2. See <u>VALVE, A/C EXPANSION</u> . Replace the valve, if required.
	3. Inoperative A/C compressor.	3. See <u>COMPRESSOR, A/C</u> . Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line. Refer to appropriate procedure in <u>STANDARD PROCEDURE</u> . Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See <u>VALVE, A/C EXPANSION</u> . Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See <u>CONDENSER, A/C</u> . Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to **ENGINE COOLING SYSTEM** for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot. Failure to follow this instruction may result in serious injury.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to and from the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor

position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature		Minimum Floor Outlet Temperature	
Celsius	Fahrenheit	Celsius	Fahrenheit
16°	60°	54°	130°
21°	70°	56°	132°
26°	80°	57°	134°
32°	90°	58°	136°

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Restricted cabin air filter
- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative A/C-heater control
- Inoperative blend door actuator

- Inoperative, obstructed or improperly installed blend-air door

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control
- Inoperative blend door actuator
- Inoperative, obstructed or improperly installed blend-air door
- Improper engine coolant temperature

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C EVAPORATOR CLEANING

Some vehicle operators may experience a musty odor from the A/C system, primarily at start up in hot and humid climates. This odor may be the result of microbial growth on the cooling coil. During normal A/C system operation, condensation forms in and around the A/C cooling coil. When airborne pollutants mix with this condensation, bacteria and fungi growth begins and odor may result.

If the vehicle operator experiences a musty odor when operating the A/C system, perform the following procedure.

WARNING: Always use eye protection, rubber gloves and protective clothing when performing the following procedure. Avoid continuous breathing of vapors from evaporator coil cleaning and sealing fluids. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

1. On models equipped with a cabin air filter, remove the filter and inspect for dirt and debris. Refer to **FILTER, CABIN AIR, REMOVAL**. Discard the used cabin filter if required.
2. Remove the cowl panel cover. Refer to **COVER, COWL PANEL** for more information.
3. Clean any dirt and debris that may be present at the HVAC fresh air inlet screen and at the top of the cowl panel.
4. Install the cowl panel cover.
5. Raise and support the vehicle.
6. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may be blocking the drain and repair as necessary.
7. Once drain operation has been verified;
 - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
 - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or

plug and temporarily cap or plug the drain tube.

8. Lower the vehicle.
9. Place a protective cover over the front passenger side floor and seat area.
10. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
11. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
12. Clean any dirt and debris that may be present inside the HVAC blower motor housing and all readily accessible areas inside the HVAC housing. If necessary, use a vacuum with a small flexible hose, and take caution not to damage the evaporator core fins.
13. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with three bottles of Mopar® Cooling Coil Cleaner through the blower motor and power module or resistor openings. Be sure to use all of the coil cleaner in each container.
14. Allow the vehicle to sit for 30 minutes.
15. Raise and support the vehicle.

WARNING: Excess cooling coil cleaner will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil cleaning fluid. Avoid contact with skin and eyes. Failure to follow these instructions may result in possible serious or fatal injury.

16. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil cleaner to drain from the HVAC housing.
17. Lower the vehicle.
18. Refill the three empty coil cleaner bottles with clean tap water.
19. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely rinse the entire surface of A/C evaporator with the three bottles of clean tap water through the blower motor and power module or resistor openings. Be sure to use all of the water in each container.
20. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
21. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
22. Disconnect the wire harness connector from the A/C compressor to disable compressor operation. Refer to **COMPRESSOR, A/C, REMOVAL**.
23. Start the engine
24. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
25. Set the A/C-heater controls to the following:
 - air distribution to Panel and Recirculation mode
 - temperature to full heat
26. Allow the vehicle to run for 20 minutes.

27. Turn the engine off.
28. Raise and support the vehicle.
29. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may have blocked the drain during evaporator coil cleaning and repair as necessary.
30. Once drain operation has been verified;
 - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
 - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.
31. Lower the vehicle.
32. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
33. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
34. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with one bottle of Mopar® Cooling Coil Coating through the blower motor and power module or resistor openings. Be sure to use all of the coil coating in the container.

NOTE: Be sure to thoroughly clean out the spray delivery tool with warm water once coil coating is complete to prevent damage to the tool.

35. Refill the empty bottles with clean warm tap water and completely rinse out the PSE Flex Spray Delivery Tool 534-62637, or equivalent.
36. Allow the vehicle to sit for 30 minutes.
37. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
38. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
39. Raise and support the vehicle.

WARNING: Excess cooling coil coating will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil sealing fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

40. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil coating to drain from the HVAC housing.
41. Lower the vehicle.
42. Start the engine
43. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
44. Set the A/C-heater controls to the following:

2014 Jeep Cherokee Trailhawk

2014 HVAC Heating & Air Conditioning - Service Information - Cherokee

- air distribution to Panel and Recirculation mode
 - temperature to full heat
45. Allow the vehicle to run for 20 minutes.
 46. Turn vehicle off.
 47. Remove protective cover from front passenger side floor and seat area.
 48. On models equipped with a cabin air filter, install the filter. Refer to **FILTER, CABIN AIR, INSTALLATION**.
 49. Connect the wire harness connector to the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION**.
 50. Verify proper A/C-heater system operation.

CONTROLS

ACTUATOR, BLEND DOOR

DESCRIPTION

DESCRIPTION

Fig. 4: Connector, Blend Door Actuator, Mounting Tabs & Gears
Courtesy of CHRYSLER GROUP, LLC

The blend door actuator (2) used in the Automatic Temperature Control (ATC) heating and A/C system, is a reversible, 12 volt Direct Current (DC) servo motor, that is mechanically connected to the two blend-air doors. There is a blend door actuator located on both sides of the HVAC housing.

The blend door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (1). An output shaft with gears (4) connect it to the blend door linkage and integral mounting tabs (3) allow the actuator to be secured to the HVAC housing. The blend door actuator requires mechanical indexing to the blend door linkage and is electronically calibrated by the A/C heater control.

The A/C heater control must be recalibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

OPERATION

OPERATION

The blend door actuator used in the Automatic Temperature Control (ATC) heating and A/C system is connected to the A/C heater control by a dedicated five-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air doors in two directions. When the A/C heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend door actuator will move in one direction. When the A/C heater control reverses the polarity of the voltage to the motor, the blend door actuator moves in the opposite direction. Once the A/C heater control makes the voltage to both connections high or both connections low, the blend door actuator stops and will not move.

The blend door actuator contains a potentiometer which the ATC A/C heater control uses to monitor the _____

relative position of the blend-air doors. The A/C heater control learns the blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits. Refer to **DIAGNOSIS AND TESTING** .

The blend door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the left side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the left side center console closeout. Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 5: Blend Door Actuator - Left Side
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (2) from the blend door actuator.
5. Remove the two screws (1) that secure the blend door actuator to the left side of the HVAC housing.
6. Remove the blend door actuator from the HVAC housing.

RIGHT SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the right side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the right side center console closeout. Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 6: Blend Door Actuator - Right Side
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two screws (1) that secure the blend door actuator to the right side of the HVAC housing.
5. Disconnect the HVAC wire harness connector (2) from the blend door actuator.
6. Remove the blend door actuator from the HVAC housing.

INSTALLATION**INSTALLATION**

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

Fig. 7: Blend Door Actuator - Left Side
Courtesy of CHRYSLER GROUP, LLC

1. Install the blend door actuator onto the left side of the HVAC housing. If necessary, rotate the actuator slightly to align the teeth on the actuator output shaft with those on the blend door cam.
2. Install the two screws (1) that secure the blend door actuator to the HVAC housing and tighten to the proper. Refer to **SPECIFICATIONS**.
3. Connect the HVAC wire harness connector (2) to the blend door actuator.
4. Install the left side center console closeout. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Install the left side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

RIGHT SIDE

Fig. 8: Blend Door Actuator - Right Side
 Courtesy of CHRYSLER GROUP, LLC

1. Install the blend door actuator onto the right side of the HVAC housing. If necessary, rotate the actuator slightly to align the teeth on the actuator output shaft with those on the blend door cam.

Install the two screws (1) that secure the blend door actuator to the HVAC housing and tighten to the proper. Refer to **SPECIFICATIONS**.

2. Connect the HVAC wire harness connector (2) to the blend door actuator.
3. Install the center console closeout. Refer to **CONSOLE, FLOOR, INSTALLATION** .
4. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
5. Connect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, MODE DOOR

DESCRIPTION

DESCRIPTION

Fig. 9: Actuator Components

Courtesy of CHRYSLER GROUP, LLC

The mode door actuator (1) used in the Automatic Temperature Control (ATC) heating and A/C system, is a reversible, 12 volt Direct Current (DC) servo motor, that is mechanically connected to the three mode-air doors. The mode door actuator is located on the upper left side of the HVAC housing.

The mode door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (3). An output shaft (2) with splines connect it to the mode door linkage and integral mounting tabs (3) allow the actuator to be secured to the HVAC housing. The mode door actuator requires mechanical indexing to the mode door linkage and is electronically calibrated by the HVAC module.

The HVAC module must be calibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The mode door actuator is interchangeable with the actuator for the blend-air doors.

OPERATION

OPERATION

The mode door actuator used in the Automatic Temperature Control (ATC) heating and A/C system is connected to the A/C heater control by a dedicated five-wire lead and connector of the HVAC wire harness. The mode door actuator can move the mode-air doors in two directions. When the A/C heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode door actuator will move in one direction. When the A/C heater control reverses the polarity of the voltage to the motor, the mode door actuator moves in the opposite direction. Once the A/C heater control makes the voltage to both connections high or both connections low, the mode door actuator stops and will not move.

The mode door actuator contains a potentiometer, which the ATC A/C heater control uses to monitor the relative position of the mode-air doors. The A/C heater control learns the mode-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode

door actuator circuits. Refer to **DIAGNOSIS AND TESTING** .

The mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Illustration shown with instrument panel cut away for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the power inverter module. Refer to **MODULE, POWER INVERTER, REMOVAL** .

Fig. 10: View Of Mode Door Actuator At Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (2) from the mode door actuator.
4. Remove the two screws (1) that secure the mode door actuator to the air distribution housing.
5. Remove the mode door actuator from the air distribution housing.

INSTALLATION

INSTALLATION

NOTE: Illustrations shown with instrument panel removed for clarity.

Fig. 11: View Of Mode Door Actuator At Air Distribution Housing

Courtesy of CHRYSLER GROUP, LLC

1. Position the mode door actuator to the left side of the air distribution housing.
2. Install the two screws (1) that secure the mode door actuator to the air distribution housing. Tighten the screws to 0.8 N.m (7 in. lbs.).
3. Connect the wire harness connector (2) to the mode door actuator.
4. Install the power inverter module. Refer to **MODULE, POWER INVERTER, INSTALLATION** .
5. Connect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, RECIRCULATION DOOR**DESCRIPTION****DESCRIPTION**

Fig. 12: Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The recirculation door actuator (1) is a reversible 12 volt Direct Current (DC) servo motor. The recirculation door actuator is located on the bottom of the HVAC air inlet housing, behind the instrument panel.

The recirculation door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (4). Three mounting tabs (3) allow the actuator to be secured to the housing and output shaft (2) connects it to the recirculation air door.

The recirculation door actuator requires mechanical indexing to the recirculation air door.

OPERATION

OPERATION

The recirculation door actuator is connected to the A/C heater control or module (depending on heating and A/C system application) by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation air door in two directions. When the A/C heater control or module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation air door will move in one direction. When the A/C heater control or module reverses the voltage, the recirculation air door will move in the other direction. When the recirculation air door reaches its travel limit, the A/C heater control or module turns the voltage off.

The recirculation door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The recirculation door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column. Refer to COLUMN, REMOVAL .
3. Remove the pedal assembly. Refer to PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL .

NOTE: Illustration shown with instrument panel removed for clarity

Fig. 13: View Of Recirculation Door Actuator At Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the HVAC wiring harness connector and position to the side to gain additional clearance.
5. Disconnect the wire harness connector (1) from the recirculation door actuator.
6. Remove the screw (2) that secures the recirculation door actuator to the air inlet housing.
7. Rotate the recirculation door actuator to disengage it from the retaining clip (3) on the air inlet housing.
8. Separate the recirculation door actuator from the linkage.

INSTALLATION

INSTALLATION

Fig. 14: View Of Recirculation Door Actuator At Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the recirculation door actuator to the air inlet housing and align the actuator output shaft with the splines of the recirculation door linkage.
2. Rotate the recirculation door actuator to engage the retaining clip (3) on the air inlet housing.
3. Install the recirculation door actuator retaining screw (2) and tighten to the proper. Refer to **SPECIFICATIONS**.
4. Connect the wire harness connector to the recirculation door actuator (1).
5. Connect the HVAC wiring harness connector.
6. Install the pedal assembly. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, INSTALLATION** .
7. Install the steering column. Refer to **COLUMN, INSTALLATION** .
8. Connect the negative battery cable.
9. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

CONTROL, A/C AND HEATER

DESCRIPTION

AUTOMATIC TEMPERATURE CONTROL (ATC)

Fig. 15: Automatic Temperature Control (ATC) Panel
Courtesy of CHRYSLER GROUP, LLC

The Automatic Temperature Control (ATC) heating and A/C system maintains the interior comfort level desired by the vehicle operator. This is accomplished by use of air duct temperature sensors, located in the HVAC housing, that measure the temperature of the conditioned air leaving the HVAC housing and an in-car temperature sensor, that measures the temperature of the conditioned air within the vehicle. Based on the sensors inputs, the ATC system automatically adjusts the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions. All controls are identified by International Standards Organization (ISO) graphic symbols.

The ATC heating and A/C system uses electrically operated controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle and offers several manual override features such as fan speed and airflow distribution. When the outside air contains smoke, odors, high humidity, or if rapid cooling is desired, the interior conditioned air can be recirculated within the vehicle.

Prior to replacing the A/C heater control, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the Actuator Calibration function using a scan tool to verify that the concern is not an air door calibration issue. Refer to **STANDARD PROCEDURE** .

The A/C heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

MANUAL TEMPERATURE CONTROL (MTC)

Fig. 16: Manual Temperature Control (MTC) Panel
Courtesy of CHRYSLER GROUP, LLC

The A/C heater control for the Manual Temperature Control (MTC) heating and A/C system allows one temperature setting for the entire vehicle. The MTC heating and A/C system uses electronically operated controls to provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. All controls are identified by International Standards Organization (ISO) graphic symbols.

The MTC A/C heater control is located in center of the instrument panel.

The A/C heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.

1. Position the A/C heater control (3) to the instrument panel (4) and connect the HVAC wire harness connector (1).
2. Position the A/C heater control to the instrument panel and engage the retaining tabs (2). Make sure the retaining tabs are fully engaged into the instrument panel.
3. Reconnect the negative battery cable.
4. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

MODULE, POWER, BLOWER MOTOR

DESCRIPTION

DESCRIPTION

Fig. 19: Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

The blower motor power module consists of a molded plastic housing with integral wire connector receptacles (2) and mounting provisions. Concealed behind the housing is the power module electronic circuitry and a finned aluminum heat sink (1). The blower motor power module is located on the passenger side of the HVAC housing and is serviceable without removal of the HVAC housing.

OPERATION

OPERATION

A blower motor power module is used on the Automatic Temperature Control (ATC) system, and allows the microprocessor-based A/C heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming.

The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering

column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the power module, wait at least five minutes to allow the module heat sink to cool before performing diagnosis or service. Failure to take this precaution may result in possible serious injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the passenger side console closeout.

Fig. 20: Blower Motor Power Module And Blower Motor Wiring Harness Connectors

5. Remove the screws (1) that secures the blower motor power module to the blower motor and remove the power module.

INSTALLATION

INSTALLATION

1. Install the blower motor power module to the blower motor and install the retaining screws. Tighten the screw to 0.8 N.m (7 in. lbs.).
2. Connect the wire harness connectors to the blower motor power module.
3. Install the passenger side console closeout cover.
4. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION**.
5. Connect the negative battery cable.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 22: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the grille on the left side.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the Automatic Temperature Control (ATC) A/C heater module and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

Fig. 23: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (3) from the ambient air temperature sensor (2).
3. Remove the push pin (1) that secures the ambient air temperature sensor and remove the sensor.

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

1. Install the push pin (1) that secures the ambient air temperature sensor to the vehicle.
2. Connect the wire harness connector (3) to the ambient air temperature sensor (2).
3. Connect the negative battery cable.

SENSOR, EVAPORATOR TEMPERATURE

DESCRIPTION

DESCRIPTION

240969967

Fig. 25: Connector, Bracket & Electrical Thermistor
Courtesy of CHRYSLER GROUP, LLC

The evaporator temperature sensor measures the temperature of the conditioned air downstream of the A/C evaporator. The evaporator temperature sensor is an electrical thermistor (3) mounted on a molded plastic bracket (2) that is inserted into the A/C evaporator, near its coldest point. The evaporator temperature sensor is connected to the vehicle electrical system by use of a two wire lead and connector (1).

OPERATION

OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the A/C heater module. The A/C heater module uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C heater module through a sensor ground circuit and a 5 volt Direct Current (DC) reference

signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C heater module uses the monitored voltage reading as an indication of evaporator temperature. The A/C heater module is programmed to respond to this input by requesting the Powertrain Control Module (PCM) to cycle the A/C clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

When equipped with Automatic Temperature Control (ATC), the evaporator temperature sensor is diagnosed using a scan tool. Refer to the **DIAGNOSTIC CODE INDEX** .

When equipped with Manual Temperature Control System (MTC), the evaporator temperature sensor is diagnosed using a scan tool. Refer to appropriate DIAGNOSIS AND TESTING.

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the right side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the right side console closeout cover.

3. Rotate the evaporator temperature sensor forty five degrees to engage the locking tab (1) to the HVAC housing.

4. Position the right side console closeout cover, and engage the retaining tabs.
5. Install the right side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.

SENSOR, HUMIDITY

DESCRIPTION

DESCRIPTION

3180623

Fig. 30: Humidity Sensor, Bracket, Retaining Clip & Plastic Tabs
 Courtesy of CHRYSLER GROUP, LLC

A humidity sensor (1) is used on Automatic Temperature Control (ATC) models to detect humidity levels inside the vehicle to optimize the dehumidifying effect of the A/C system. The humidity sensor is attached to a plastic bracket (3) by a metal retaining clip (2). The sensor bracket is attached to the inside of the windshield by an adhesive. A cover is attached to the sensor bracket by four plastic tabs (4). The humidity sensor is connected to the Body Control Module (BCM) by a dedicated three wire lead and connector that protrudes out from under the front of the headliner.

CAUTION: Use care when servicing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

The humidity sensor can be serviced without the use of any special tools.

OPERATION

OPERATION

The humidity sensor detects humidity, dew point and windshield glass temperature, and sends this information

to the Body Control Module (BCM) over a Local Interconnect Network (LIN) data bus connection. The BCM then broadcasts the message over the Controller Area Network (CAN) data bus to the A/C heater module. The A/C heater module automatically adjusts A/C clutch operation, amount of recirculated air, blower motor speeds and outlet modes to prevent fogging on the inside of the windshield glass. If the humidity sensor message is not received by the A/C heater module, a Diagnostic Trouble Code (DTC) will set. The information the A/C heater module receives from the humidity sensor can be viewed using a scan tool.

The humidity sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING**.

The humidity sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

Fig. 31: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable

CAUTION: Use care when removing the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

2. Carefully disengage the four retaining tabs (2 and 4) that secure the cover (3) to the humidity sensor bracket (1) by pressing in on the right side of the cover, while rocking the left side of the cover off the bracket.

Fig. 32: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when removing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Using a small screwdriver or similar tool, carefully disengage the metal retaining clip (3) from the sensor bracket (2) and remove the humidity sensor (4) and the clip as an assembly.
4. Disconnect the wire harness connector (1) from the humidity sensor.
5. If the humidity sensor bracket is damaged and cannot be reused, replace the windshield. Refer to **WINDSHIELD, REMOVAL** .

INSTALLATION

INSTALLATION

Fig. 33: Wire Harness Connector, Humidity Sensor, Bracket & Clip
 Courtesy of CHRYSLER GROUP, LLC

1. If the humidity sensor bracket (1) is damaged and cannot be reused, install a new windshield. Refer to **WINDSHIELD, INSTALLATION**.
2. Connect the wire harness connector (1) to the humidity sensor (4).

CAUTION: Use care when installing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Position the humidity sensor to the sensor bracket (2) and engage the metal retaining clip (3) to the bracket. Make sure both sides of the retaining clip are fully engaged to the bracket.

Fig. 34: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when install the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

4. Carefully install the humidity sensor cover (3) onto the sensor bracket (1). Make sure the four retaining tabs (2 and 4) are fully engaged to the bracket
5. Reconnect the negative battery cable.

SENSOR, SUN

DESCRIPTION

DESCRIPTION

Fig. 35: Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical sun sensor assembly shown in illustration.

The Automatic Temperature Control (ATC) heating and A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates three sun sensors (2) within a molded plastic case with a clear lens (3), that protrudes through the center of the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

OPERATION**OPERATION**

The Automatic Temperature Control (ATC) Dual Zone heating and A/C system uses two sun sensors to balance the system in response to side-to-side variations of sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater module to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The sun sensor assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - SUN SENSOR**

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, check for the following:

- Any items laying on top of the instrument panel are not covering the sun sensor.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Confirm that the windshield wipers are properly adjusted.
- Confirm that the sun sensor is properly installed. Refer to **SENSOR, SUN, INSTALLATION**.
- Confirm that the defroster grille is properly installed. Refer to **GRILLE, DEFROSTER, INSTALLATION** .

The A/C heater module continually monitors the sun sensor circuits and will store Diagnostic Trouble Codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL**REMOVAL**

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

2. Align the tab on the sun sensor (1) with the slot in the opening in the defroster grille (2) and install the sensor onto the grille. Make sure that the sensor is fully engaged to the defroster grille.
3. Reconnect the negative battery cable.

SENSOR, TEMPERATURE, AIR OUTLET

DESCRIPTION

DESCRIPTION

Four air outlet temperature sensors are used in the Automatic Temperature Control (ATC) heating and A/C system to measure the temperature of the conditioned air leaving the HVAC housing. Each air outlet temperature sensor is an electrical thermistor located within a molded plastic case.

Fig. 40: Mode Case & Air Outlet Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

Each air outlet temperature sensor (2) is inserted into the mode case (1) near the top of the HVAC housing.

Each air outlet temperature sensor is connected to the vehicle electrical system through a separate wire lead and connector of the HVAC wire harness. The external location of the air outlet temperature sensors allow them to be removed or installed without removing the HVAC housing from the vehicle.

OPERATION

OPERATION

The air duct temperature sensors monitor the temperature of the conditioned air leaving the HVAC housing and

supplies an input signal to the A/C heater control, when equipped with the Automatic Temperature Control (ATC) heating and A/C system. The air duct temperature sensors change their internal resistance in response to the temperatures they monitor. The air duct temperature sensors are connected to the ATC A/C heater control through a sensor ground circuit and a 5 volt Direct Current (DC) reference signal circuit. As the temperature of the conditioned air leaving the HVAC housing decreases, the internal resistance of the temperature sensor increases. As the temperature of the conditioned air leaving the HVAC housing increases, the internal resistance of the temperature sensor decreases.

The ATC A/C heater control uses the monitored voltage readings as an indication of air outlet temperature. The A/C heater control is programmed to respond to this and other inputs by adjusting the blend and the mode air door positions, and by cycling the A/C clutch on and off as necessary in order to automatically adjust the heating and A/C system to the operator temperature preference setting.

The air duct temperature sensors are diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The air duct temperature sensors cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Automatic Temperature Control (ATC) heating and A/C system uses four air outlet temperature sensors, that are mounted on both sides and on top of the air distribution housing. Two are for the instrument panel outlets and the other two for the floor outlets.

1. Disconnect and isolate the negative battery cable.
2. Remove the radio. Refer to **RADIO, REMOVAL** .

2. Connect the HVAC wire harness (1) to the air duct temperature sensor (2).
3. Install the radio. Refer to **RADIO, INSTALLATION** .
4. Connect the negative battery cable.

SENSOR, TEMPERATURE, IN-CAR

DESCRIPTION

DESCRIPTION

2877494

Fig. 45: In-Car Temperature Sensor, Aspirator Motor & Thermistor
Courtesy of CHRYSLER GROUP, LLC

The in-car temperature sensor (1) is used in the Automatic Temperature Control (ATC) heating and A/C system only. The in-car temperature sensor consists of an aspirator motor (2) and a temperature thermistor (3). The in-car temperature sensor sends a resistance signal to the ATC A/C heater module and is attached to the instrument panel, below the steering column.

OPERATION

OPERATION

Air is drawn from the passenger compartment by the aspirator motor and flows over the temperature thermistor. The thermistor changes resistance with air temperature. The Automatic Temperature Control (ATC) A/C-heater control receives the resistance signal over hard-wired circuits and calculates the temperature of the air in the passenger compartment. The ATC system then automatically makes adjustments to maintain the optimum passenger compartment comfort.

The in-car temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - IN-CAR TEMPERATURE SENSOR

NOTE: For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the in-car temperature sensor and the A/C-heater control. If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** . If no DTCs are found, perform the two following tests. Replace the in-car temperature sensor if the sensor fails either

test.

ASPIRATOR MOTOR TEST

The in-car temperature sensor uses an aspirator motor to draw air from the passenger compartment and flow the air over the temperature thermistor. Test the motor as follows.

Fig. 46: Opening Grille & Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Place the ignition in the Run position.
2. Place a small piece of newspaper in front of the aspirator motor opening grille (1), located on the steering column opening cover (2). If the paper sticks to the grille, the aspirator motor is operating properly. The piece of paper should be only large enough to cover the opening.
3. If the paper does not stick to the grille, check the in-car temperature sensor electrical connections and wiring. If connections and wiring are OK, replace the in-car temperature sensor.

TEMPERATURE THERMISTOR TEST

The in-car temperature sensor uses a temperature thermistor to provide resistance values that correlate with temperature change. Test the thermistor as follows.

1. Remove the in-car temperature sensor and place it on a workbench. Refer to **SENSOR, TEMPERATURE, IN-CAR, REMOVAL**.
2. Note the current ambient air temperature of the work area.
3. Use an ohm meter and check the resistance between pins 1 and 2 of the in-car temperature sensor. Compare the temperature of the work area to the found resistance value. The resistance should be within specifications as listed in the **Resistance and Temperature** chart below. If not OK, replace the in-car temperature sensor.

RESISTANCE AND TEMPERATURE

2014 Jeep Cherokee Trailhawk

2014 HVAC Heating & Air Conditioning - Service Information - Cherokee

Air Temperature Range	Low Resistance Range (kohm)	High Resistance Range (kohm)
-21° to -15°C (-5° to 5°F)	292 ± 1.0	223 ± 0.9
-14° to -9°C (6° to 15°F)	198 ± 0.9	161 ± 0.8
-8° to -4°C (16° to 25°F)	144 ± 0.8	123 ± 0.8
-3° to 1°C (26° to 35°F)	111 ± 0.7	95 ± 0.7
2 to 7°C (36° to 45°F)	86 ± 0.7	70 ± 0.6
8 to 12°C (46° to 55°F)	64 ± 0.6	55 ± 0.5
13° to 18°C (56° to 65°F)	51 ± 0.5	42 ± 0.4
19° to 23°C (66° to 75°F)	39 ± 0.4	33 ± 0.3
24° to 29°C (76° to 85°F)	31 ± 0.3	26 ± 0.3
30° to 35°C (86° to 95°F)	24 ± 0.3	20 ± 0.3
36° to 40°C (96° to 105°F)	18 ± 0.3	16 ± 0.3
41° to 46°C (106° to 115°F)	15 ± 0.3	13 ± 0.3

REMOVAL**REMOVAL**

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.

Fig. 47: In-Car Temperature Sensor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws (2) that secure the in-car temperature sensor (1) to the steering column opening cover and remove the sensor.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

Fig. 48: In-Car Temperature Sensor & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Position the in-car temperature sensor (1) onto the steering column opening cover.
2. Install the two screws (2) that secure the in-car temperature sensor to the steering column opening cover. Tighten the screws securely.
3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.
4. Connect the negative battery cable.

TRANSDUCER, A/C PRESSURE

DESCRIPTION

DESCRIPTION

2998424

Fig. 49: A/C Pressure Transducer

Courtesy of CHRYSLER GROUP, LLC

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. The A/C liquid line fitting has an external O-ring seal and uses a Schrader-type valve that allows the A/C pressure transducer to be removed without recovering the refrigerant system. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

OPERATION

The internal resistance in the A/C pressure transducer changes in response to the pressures in the high side of the A/C refrigerant system. The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, and uses the output voltage of the transducer to determine

refrigerant high-side pressure. The PCM is programmed to respond to this and other sensor inputs by controlling the operation of the A/C clutch and the radiator cooling fan to help optimize A/C system performance and to protect refrigerant system components from damage.

The A/C pressure transducer is diagnosed using a scan tool. Refer to the **DTC INDEX** article .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

Fig. 50: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C pressure transducer shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) on the A/C discharge line (3).
3. Remove the A/C pressure transducer from the A/C discharge line and remove and discard the O-ring seal (4).

INSTALLATION

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

Fig. 51: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C pressure transducer shown in illustration.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the A/C discharge line (3).
2. Install the A/C pressure transducer (2) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT, DEFROSTER

DESCRIPTION

DESCRIPTION

240769580

Fig. 52: Defroster Duct**Courtesy of CHRYSLER GROUP, LLC**

The defroster outlets receive airflow from the HVAC housing through a molded plastic defroster duct (1) that is attached to the underside of the instrument panel cover.

The defroster duct is integral to the instrument panel cover and is not serviced separately.

DUCT, FLOOR DISTRIBUTION

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Driver side shown in illustration, passenger side typical.

1. Remove the front and rear floor carpet. Refer to **CARPET, FLOOR, REMOVAL** .

Fig. 53: Floor Duct Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

2. Using a small Flathead screwdriver or equivalent, disengage the retaining tabs securing the floor duct (1) at the HVAC housing.

Fig. 54: Floor Duct
Courtesy of CHRYSLER GROUP, LLC

3. Detach/remove the floor duct retainer from the stud in the floorpan.
4. Remove the floor duct (1).

INSTALLATION

INSTALLATION

NOTE: Driver side shown in illustration, passenger side typical.

3802144

Fig. 55: Floor Duct

Courtesy of CHRYSLER GROUP, LLC

1. Position the floor duct (1) into the vehicle.
2. Attach/install the floor duct retainer to the stud in the floorpan.

3802721

Fig. 56: Floor Duct Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

3. Push the duct up to engage the retaining tabs securing the floor duct (1) at the HVAC housing.
4. Install the front and rear floor carpet. Refer to **CARPET, FLOOR, INSTALLATION** .

OUTLET, AIR

REMOVAL

FRONT OUTER AIR OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Remove the Instrument Panel End Cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
2. Remove the lower trim panel in order to access the retaining screw.
3. Using trim stick or equivalent, carefully disengage the retaining tabs that secure the air outlet to the instrument panel.
4. After the retaining tabs have been disengaged, gently pull the top of the air outlet first and remove the air outlet from the instrument panel.

FRONT CENTER AIR OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage during this procedure.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (1) from the instrument panel and place it on a workbench. Refer to **INSTRUMENT PANEL** for information.

Fig. 57: Center Bezel & Front Center Air Outlets
Courtesy of CHRYSLER GROUP, LLC

3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the plastic retaining clips (1) that secure each air outlet to the center bezel.

INSTALLATION

FRONT OUTER AIR OUTLETS

1. Position the air outlet to the opening in the instrument panel and align the outlet to the instrument panel duct.
2. Engage the retaining tabs that secure each air outlet to the instrument panel. Make sure the retaining tabs are fully engaged.
3. Install the retaining screw.
4. Install the lower trim panel.
5. Install the Instrument Panel End Cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION**.

FRONT CENTER AIR OUTLETS

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage during this procedure.

Fig. 58: Center Bezel & Front Center Air Outlets
Courtesy of CHRYSLER GROUP, LLC

1. Position the center air outlet(s) to the back of the instrument panel center bezel and engage the outlet to the center bezel.
2. Carefully engage the plastic retaining clips (1) that secure each air outlet to the center bezel. Make sure the retaining clips are fully engaged.
3. Install the instrument panel center bezel. Refer to **INSTRUMENT PANEL** for information.
4. Connect the negative battery cable.

FILTER, CABIN AIR

DESCRIPTION

DESCRIPTION

240968706

Fig. 59: Label & Cabin Air Filter
Courtesy of CHRYSLER GROUP, LLC

All models are equipped with a cabin air filter (2) that helps purify the outside air entering the HVAC housing. The filter is mounted in the passenger compartment, on the right side of the HVAC housing.

The filter should be replaced at least once a year or every 24, 000 km (15, 000 miles) and checked if heating or A/C system performance seems lower than expected. The cabin air filter is labeled (1) to indicate the proper installation position.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL**.
3. Remove the passenger side console closeout.

240968704

Fig. 60: Filter Cover & Retaining Tab
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the retaining tab (2) and remove the filter cover (1).

240968705

Fig. 61: Air Filter Position Indicators, Cabin Air Filter & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

5. Remove the cabin air filter (2) from the right side of the HVAC housing (3) by pulling the filter element straight out of the housing. Take note of the air filter position indicators (1).

INSTALLATION

INSTALLATION

NOTE: The cabin air filter is labeled with an arrow to indicate proper filter position. Make sure to properly install the cabin air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

Fig. 62: Air Filter Position Indicators, Cabin Air Filter & HVAC Housing
 Courtesy of CHRYSLER GROUP, LLC

1. Install the cabin air filter (2) into the right side of the HVAC housing (3). Make note of the air filter position indicators (1).

240968704

Fig. 63: Filter Cover & Retaining Tab
 Courtesy of CHRYSLER GROUP, LLC

2. Install the cabin air filter cover (1) onto the right side of the HVAC housing.
3. Engage the retaining tab (2) into the HVAC housing.
4. Install the passenger side console closeout.
5. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.

HOUSING, HVAC

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

240769577

Fig. 64: Screws, Air Distribution Housing & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

2. Remove the seven screws (1) that secure the air distribution housing to the top of the HVAC housing (3).
3. Disconnect wiring harness connectors.

240769578

Fig. 65: Retaining Clips & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

4. Release the two retaining clips (1) that secure the bottom of air distribution housing (2) to the HVAC housing.
5. Remove the air distribution housing from the top of the HVAC housing.
6. If required, disassemble the air distribution housing. Refer to **HOUSING, HVAC, DISASSEMBLY**.

HOUSING-AIR INLET

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC,**

REMOVAL.

240969651

Fig. 66: Screws, Inlet Housing, Recirculation Door Actuator & HVAC Housing
 Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the wire harness connector from the recirculation door actuator (3).
3. Remove the three screws (1) that secure the air inlet housing (2) to HVAC housing (4).
4. Remove the inlet housing from the HVAC housing.
5. If required, disassemble the air inlet housing. Refer to **HOUSING, HVAC, DISASSEMBLY**.

HOUSING-HVAC

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The HVAC housing and instrument panel must be removed from the vehicle as an assembly.

NOTE: The HVAC housing must be removed from the instrument panel and disassembled for service of the A/C evaporator, air intake housing, and the heater core.

1. Remove the instrument panel and place it on a workbench. Refer to **PANEL, INSTRUMENT, REMOVAL**.

240970356

Fig. 67: Nuts, Bolts, Instrument Panel Support & HVAC Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the instrument panel wire harness connectors from the HVAC wiring harness.
3. Remove the 2 nuts (1) and the 2 bolts (4) that secure the HVAC housing assembly (3) to the center of the instrument panel support (2) and remove the housing from the support.

SCREEN-AIR INLET

NOTE: LHD model shown in illustration. RHD model similar.

Fig. 68: View Of HVAC Housing Air Inlet Screen
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the cowl grille screen. Refer to **COVER, COWL PANEL, REMOVAL** .
2. Disengage the three push-in retainers (1) that secure the HVAC housing air inlet screen (2) to the cowl panel (3) and remove the screen.

DISASSEMBLY

HOUSING-AIR DISTRIBUTION

1. Remove the air distribution housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

Remove the air temperature sensors. Refer to **SENSOR, TEMPERATURE, AIR OUTLET, REMOVAL**.

240969744

Fig. 69: Screws, Connector, Air Distribution Housing & Mode Door Actuator
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the wiring harness connector (2) from the mode door actuator.
3. Remove the two retaining screws (1).
4. Remove the mode door actuator (4) from the air distribution housing (3).

240969745

Fig. 70: Cam, Lever & Heater Link
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect heater link (3) from the cam (1) and lever (2).

240969746

Fig. 71: Mounting Bracket, Screws & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

6. Remove the three screws (2) from the mounting bracket (1).
7. Remove the mounting bracket from the air distribution housing (3).

240969747

Fig. 72: Mode Cam & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

8. Remove mode cam (1) from the air distribution housing (3).

240969748

Fig. 73: Levers & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

- Disengage the plastic retaining tabs (2) and remove the levers (1) from the air distribution housing.

HOUSING-AIR INLET

- Remove the air inlet housing from the HVAC housing. Refer to **HOUSING, HVAC, REMOVAL**.

240969652

Fig. 74: Air Inlet Housing, Foam Seal, Recirculation Air Door, Recirculation Door Actuator & Air Inlet Screen

Courtesy of CHRYSLER GROUP, LLC

- Remove the screw that secures the recirculation door actuator (4) to the air inlet housing (1) and remove the actuator.
- Remove air inlet screen (5) from air inlet housing.
- The recirculation air door (3) is serviced as an assembly with the air inlet housing.

NOTE: If the foam seal (2) on the air inlet housing is deformed or damaged, the seal must be replaced.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and heater core.

- Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
- Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR,**

REMOVAL.

3. Remove the evaporator temperature sensor. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL.**
4. Remove the HVAC wiring harness (1).
5. Remove the A/C evaporator. Refer to **EVAPORATOR, A/C, REMOVAL.**

ASSEMBLY**HOUSING-AIR DISTRIBUTION**

240969748

Fig. 75: Levers & Retaining Tabs

Courtesy of CHRYSLER GROUP, LLC

1. Install the two mode door levers (1) onto the air distribution housing. Make sure the lever retaining tabs (2) are fully engaged.

240969749

Fig. 76: Left & Right Mode Door Levers
Courtesy of CHRYSLER GROUP, LLC

2. Align the two mode door levers, the left lever (1) must be fully rotated clockwise and the right lever (2) must be fully rotated counterclockwise, gravity will allow them to stay in this position.

240969750

Fig. 77: Cam Lobe, Windows & Rib On Shaft
Courtesy of CHRYSLER GROUP, LLC

3. With the levers in position, the cam should be oriented with the lobe up (1), rib on shaft pointing to seven O'clock (3), then pressed into place. There are windows (2) in the cam to help see the pins on the levers.

240969751

Fig. 78: Cam & Heater Link**Courtesy of CHRYSLER GROUP, LLC**

4. To place the bracket on the top of the cam (1), push heater link (2) all the way to the left, move the lever counter clockwise and assembly to the heater link (3), press bracket onto cam.

240969746

Fig. 79: Mounting Bracket, Screws & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the three screws (2) that secure the mounting bracket (1) to the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

240969744

Fig. 80: Screws, Connector, Air Distribution Housing & Mode Door Actuator
Courtesy of CHRYSLER GROUP, LLC

6. Position the blend door actuator (4) onto the air distribution housing (3).
7. Install the two screws (1) securing the mode door actuator. Tighten the screws to 2 N.m (17 in. lbs.).
8. Connect the wiring harness connector (3) to the blend door actuator.
9. Install the air temperature sensors. Refer to **SENSOR, TEMPERATURE, AIR OUTLET, INSTALLATION**.
10. Install the air distribution housing onto the HVAC housing (1). Refer to **HOUSING, HVAC, INSTALLATION**.
11. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

240969652

Fig. 81: Air Inlet Housing, Foam Seal, Recirculation Air Door, Recirculation Door Actuator & Air Inlet Screen

Courtesy of CHRYSLER GROUP, LLC

1. Install the recirculation door actuator (4) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines of the actuator output shaft with those on the recirculation door pivot shaft adapter.
2. Install the retaining screw securing the recirculation door actuator to the housing. Tighten the screw to 2 N.m (17 in. lbs.).
3. Install the air inlet screen (5) onto the air inlet housing.
4. Install the air inlet housing onto the HVAC housing. Refer to **HOUSING, HVAC, INSTALLATION**.

NOTE: If the foam seal (2) on the air inlet housing is deformed or damaged, the seal must be replaced.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

1. Install the A/C evaporator. Refer to EVAPORATOR, A/C, INSTALLATION.
2. Install the HVAC wiring harness. Make sure the harness is routed through all wiring retainers.
3. Install the evaporator temperature sensor. Refer to SENSOR, EVAPORATOR TEMPERATURE, INSTALLATION.
4. Install the blower motor power module. Refer to MODULE, POWER, BLOWER MOTOR, INSTALLATION.
5. Install the HVAC housing assembly. Refer to HOUSING, HVAC, INSTALLATION.

INSTALLATION

HOUSING-AIR DISTRIBUTION

240769578

Fig. 82: Retaining Clips & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the air distribution housing (2) onto the top of the top of HVAC housing.
2. Fasten the retaining clips (1) that secure the bottom of the air distribution housing to the HVAC housing.
3. Fasten the wiring harness connectors.

240769577

Fig. 83: Screws, Air Distribution Housing & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

4. Install the seven screws (1) that secure the air distribution housing (2) to the HVAC housing (3). Tighten the screws to 1.2 N.m (10 in. lbs.).
5. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

240969651

Fig. 84: Screws, Inlet Housing, Recirculation Door Actuator & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet housing (1) to the left side of the HVAC housing (4).
2. Install the 3 screws (1) that secure the air inlet housing to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Connect the wire harness connector to the recirculation door actuator (3).
4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-HVAC

240970356

Fig. 85: Nuts, Bolts, Instrument Panel Support & HVAC Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the HVAC housing assembly (3) into the instrument panel support (1).
2. Install the 2 nuts (1) and the 2 bolts (4) that secure the HVAC housing assembly to the center of instrument panel support. Tighten to 4 N.m (35 in. lbs.).
3. Connect the instrument panel wire harness connectors to the HVAC wiring harness.

NOTE: **If the foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.**

4. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

SCREEN-AIR INLET

Fig. 86: Air Inlet Screen & Plastic Nuts
 Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet screen (1) to the cowl panel (3).
2. Install the two plastic nuts (2 and 4) that secure the air inlet screen to the cowl panel. Tighten the nuts securely.
3. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .

MOTOR, BLOWER

DESCRIPTION

DESCRIPTION

Fig. 87: Blower Motor**Courtesy of CHRYSLER GROUP, LLC**

The blower motor (4) is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel (1) within the HVAC air inlet housing at the selected speed.

The blower motor is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (3) and three mounting tabs (2). The squirrel cage-type blower wheel is secured to the blower motor shaft and is positioned within the air inlet housing on the passenger side of the HVAC housing.

OPERATION**OPERATION**

The blower motor controls the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

Both the Manual Temperature Control (MTC) heating-A/C system and the Automatic Temperature Control (ATC) heating-A/C system have an electronic blower motor power module to control blower motor speed. The power module uses a Pulse Width Modulated (PWM) input from the A/C-heater control and a feedback signal from the blower motor to regulate the blower motor ground path. On both systems, the blower motor receives battery current through the Power Distribution Center (PDC) whenever the ignition switch is in the Run position, and the blower motor control is in any position except Off.

The blower motor control system is diagnosed using a scan tool. Refer to **STANDARD PROCEDURE** .

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - BLOWER MOTOR**

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter. See Wiring Information for circuit descriptions and diagrams.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL**.
3. Remove the passenger side center console close out.
4. Remove the blower motor power module

Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.

Fig. 88: Blower Motor To HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the three screws (1) that secure the blower motor.
6. Remove the blower motor from the passenger side of the HVAC housing.

INSTALLATION**INSTALLATION**

1. Position the blower motor into the passenger side of the HVAC housing.
2. Install the three screws that secure the blower motor. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector.
4. Install the blower motor power module

Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.

5. Install the center console close out.
6. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION**.

7. Connect the negative battery cable.

PLUMBING

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent

leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: Use extreme care when working around a running engine. Keep hands and fingers clear of the radiator fan, accessory drive belt and all other moving components. Keep away when wearing loose clothing, jewelry or long hair that is not properly secured. Underhood components may become hot to the touch. Be careful not to come into contact with hot engine, A/C and engine cooling system components. Failure to follow these instructions may result in serious or fatal injury.

NOTE: Always conduct the A/C Performance Test as outlined in this group prior to searching for an A/C refrigerant leak. Refer to DIAGNOSIS AND TESTING.

NOTE: The A/C system in this vehicle comes equipped from the factory with fluorescent refrigerant leak detection dye installed in the refrigerant system.

When searching for a refrigerant leak in the A/C system, use an Ultra Violet (UV) light and an electronic leak detector that is designed for refrigerant used on this vehicle. It is important to use only high-quality refrigerant leak detection equipment to properly locate refrigerant system leaks, such as the equipment listed in the team PSE Service Equipment Catalog. When the use of additional leak detection dye is required, use only Chrysler LLC approved refrigerant leak detection dye, available through Mopar®.

LEAK TEST

1. Begin searching for refrigerant leaks using a high quality UV light to detect the fluorescent refrigerant leak detection dye.
 - Inspect all connections, plumbing fittings, brazed joints, hoses, hose crimps, service ports, compressor housing, pressure relief valve and A/C condenser for dye
 - Inspect the evaporator drain tube and condensate for presence of dye, which indicates a leak from the A/C evaporator
 - If equipped with rear A/C, inspect the underbody refrigerant lines, fittings, rear evaporator drain tube and condensate for presence of dye, which indicates a leak from the rear evaporator
 - If no leaks are found using a UV light, proceed to **step #2** .
2. If a leak is not found with the leak detection dye, operate the heating and A/C system with the engine at idle under the following conditions for at least 15 minutes, then proceed to **step #3** .
 - Doors or windows open
 - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
 - A/C and heater controls set to outside air, full cool, panel mode, high blower and A/C compressor engaged (If the A/C compressor does not engage, go to **LOW OR EMPTY REFRIGERANT SYSTEM**).
 - If equipped with rear A/C, set rear controls to full cool and high blower

3. Shut the vehicle off and wait at least 5 minutes.
4. Insert the leak detector into the evaporator drain tube and the instrument panel air outlets, to check for evaporator leaks. Check the evaporator tubes at the A/C expansion valve, for leaks not visible behind the expansion valve. Check around the front of the A/C compressor, for compressor shaft seal leaks. Check between the A/C condenser and radiator for condenser leaks not previously visible.
5. If equipped with rear A/C, insert the leak detector into the rear evaporator drain tube and rear air outlets. Check the underbody A/C lines and fittings, evaporator tubes and rear A/C expansion valve.

LOW OR EMPTY REFRIGERANT SYSTEM

NOTE: **This procedure should only be done after an A/C Performance Test has been conducted and a refrigerant system leak has NOT been found using the factory installed leak detection dye.**

Do the following if the A/C compressor will not engage and a refrigerant leak in the A/C system is suspected but cannot be found using the factory installed leak detection dye.

1. Recover, evacuate and recharge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Operate the heating and A/C system with the engine at idle under the following conditions for at least 15 minutes.
 - Doors or windows open
 - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
 - A/C and heater controls set to outside air, full cool, panel mode, high blower and A/C compressor engaged
 - If equipped with rear A/C, set rear controls to full cool and high blower
3. Shut the vehicle off and return to. Refer to **LEAK TEST**.

STANDARD PROCEDURE**R-134A REFRIGERANT SYSTEM RECOVERY**

Fig. 89: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

The R-134a refrigerant must be recovered from the A/C system prior to performing any repairs that require disconnection of an A/C refrigerant line.

When recovering the A/C refrigerant system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant

recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
5. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM RECOVERY

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

Fig. 90: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

When servicing the A/C system, an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard must be used. Per SAE standard, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: **A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.**

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant

recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
5. Reinstall the caps onto the refrigerant system service ports.

R-134A REFRIGERANT SYSTEM EVACUATE

Fig. 91: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-134a refrigerant.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-134a refrigerant recovery/recycling/charging station with a vacuum pump (1) that meets SAE standard J2788, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

R-134A EVACUATION PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.

2. Connect an R-134a refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2788 to the refrigerant system, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM EVACUATE

Fig. 92: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-1234YF refrigerant.

NOTE: **Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-1234YF refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard, or an R-1234YF compatible manifold gauge set and a stand-alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

EVACUATION PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each

time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.

2. Connect an R-1234YF refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard to the refrigerant system, or an R-1234YF compatible manifold gauge set and a stand-alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-134A REFRIGERANT SYSTEM CHARGE

Fig. 93: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station

Courtesy of CHRYSLER GROUP, LLC

After all A/C refrigerant system repairs have been completed and the refrigerant system has been evacuated, the A/C system can be recharged with R-134a refrigerant.

When charging the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

R-134A CHARGING PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. Refer to **REFRIGERANT, SPECIFICATIONS**. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the low and high side valves, then open the charge valve to allow the heated refrigerant to flow into the refrigerant system.
6. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing Step 7. Failure to follow these instructions may result in possible serious or fatal injury.

7. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
 - Open all of the windows in the vehicle.

- Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
 - Run the engine at a steady high idle (about 1400 RPM).
 - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
 - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
 - When the transfer of refrigerant has stopped, close the valves.
8. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
 9. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM CHARGE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

Fig. 94: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. Refer to **PLUMBING, STANDARD PROCEDURE**.

When charging the A/C system, use an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard. Per SAE standard, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use.

of this equipment.

CHARGING PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Open both the low and high side valves, then open the charge valve to allow the refrigerant to flow into the refrigerant system.
5. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing Step 7. Failure to follow these instructions may result in possible serious or fatal injury.

6. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
 - Open all of the windows in the vehicle.
 - Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
 - Run the engine at a steady high idle (about 1400 RPM).
 - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
 - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
 - When the transfer of refrigerant has stopped, close the valves.
7. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
8. Install the caps onto the refrigerant system service ports.

DRIER, A/C RECEIVER**DESCRIPTION****DESCRIPTION**

240970354

Fig. 95: A/C Condenser & A/C Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

The A/C receiver/drier (3) is mounted to the left side of the A/C condenser (2) and is on the high-side of the A/C system. The A/C receiver/drier helps remove moisture from the refrigerant, filters the refrigerant, stores any unnecessary refrigerant and retains any refrigerant vapor that may leave the A/C condenser, until it becomes a liquid.

The A/C receiver/drier is integral to the A/C condenser and must be replaced with the condenser as an assembly.

OPERATION**OPERATION**

The A/C receiver/drier performs a filtering action to prevent foreign material that may be in the refrigerant from contaminating the A/C expansion valve and the A/C compressor. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

The A/C receiver/drier is integral to the A/C condenser and has no serviceable parts.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

The A/C receiver/drier cannot be repaired and the A/C condenser and receiver/drier must be replaced as an assembly, if the receiver/drier is leaking or damaged, or if an internal failure of the A/C compressor has occurred.

COMPRESSOR, A/C

DESCRIPTION

VARIABLE DISPLACEMENT A/C COMPRESSOR

81df706a

Fig. 96: A/C Compressor, Control Valve & High Pressure Relief Valve
Courtesy of CHRYSLER GROUP, LLC

This A/C compressor has a total displacement of 170 cubic centimeters (10.37 cubic inches) and a control valve (2) and a high pressure relief valve (3) located on the back cover. The A/C compressor is secured to the engine with three bolts.

A label identifying the type of refrigerant and oil is located on the A/C compressor.

OPERATION

A/C CLUTCH

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch coil is energized, it magnetically draws

the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the Powertrain Control Module (PCM). Refer to the **DTC INDEX** article .

VARIABLE DISPLACEMENT A/C COMPRESSOR

Fig. 97: Cutaway View Of Variable Displacement A/C Compressor (Typical)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical variable displacement A/C compressor shown in illustration.

The Denso 7SBH17C A/C compressor is a Variable Displacement Compressor (VDC) which is driven by the engine through a LE40 Clutch (1) and pulley (2). This compressor uses an integral control solenoid (3) to reduce or increase the stroke of the pistons (4) within the compressor by automatically adjusting the angle of the swashplate (5).

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

The A/C compressor is controlled by the HVAC module. The HVAC module calculates compressor displacement required by A/C system load and demand by monitoring vehicle speed, A/C high side pressure, engine speed, evaporator temperature, accelerator pedal position, ambient temperature and A/C-heater request signals. The HVAC module then sends a Pulse Width Modulated (PWM) signal to the A/C compressor control solenoid to increase or decrease refrigerant flow. The amount of refrigerant allowed to pass through the compressor determines the head pressure which controls the angle of the swashplate, which in turn, determines

the amount of compressor displacement. When there is no demand for A/C, the swashplate is adjusted to nearly a zero degree angle, which removes compressor torque drag from the engine.

This A/C compressor will reduce the displacement of the compressor based on ambient air temperature. For example; as the outside temperature falls from 27° C (80° F) to 19° C (66° F), the amount of refrigerant flow required through the A/C orifice tube to keep the A/C evaporator cool becomes less, and the swashplate is adjusted to a lower angle, which reduces compressor displacement. However, due to the lower outside air temperature, panel air outlet temperature will not noticeably change.

The A/C compressor control system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING**.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with a variable displacement A/C compressor. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

DIAGNOSIS AND TESTING

A/C CLUTCH COIL

The A/C clutch coil electrical circuit is controlled by the Powertrain Control Module (PCM), through the Power Distribution Center (PDC). See Wiring Information for complete HVAC wiring diagrams. Begin testing of a suspected A/C clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for any Diagnostic Trouble Codes (DTCs). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required.
2. If the A/C clutch still will not engage, verify the refrigerant charge level by conducting the A/C Performance test. Refer to **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to **COIL RESISTANCE TEST** and **COIL CURRENT DRAW TEST**. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch coil connector.
3. Use an ohm meter and Back Probe Tool (special tool #6801, Terminal Probe) and measure the resistance of the A/C clutch coil at the coil connector terminals.
4. See A/C Clutch Coil Specifications table for acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).

- a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
- b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **BATTERY, DIAGNOSIS AND TESTING**.
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the A/C clutch coil feed terminal using Back Probe Tool (special tool #6801, Terminal Probe). Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the A/C clutch coil.
3. With the A/C heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately and the clutch coil supply voltage should be within two volts of the battery voltage. If the clutch coil supply voltage is OK, go to 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. See **A/C CLUTCH COIL SPECIFICATIONS** for acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
 - b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

PRELIMINARY-CHECKS**A/C CLUTCH COIL SPECIFICATIONS**

Coil Resistance	Coil Current Draw
4.0 ± 0.2 ohms	2.0 amps Max @ 12V ± 0.5V @ 21° C (70° F)

A/C SYSTEM NOISE

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this

procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the A/C clutch. Be certain that the clutch coil, clutch plate and pulley are mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the high side pressure does not exceed 3.53 Mpa (512 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises.
5. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise. If the noise is from the A/C compressor, conduct the A/C Performance test and verify refrigerant charge level. Refer to **DIAGNOSIS AND TESTING**.
6. If the A/C clutch and refrigerant charge level is OK, but the noise persists, replace the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL**.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C CLUTCH INSPECTION

81229afa

Fig. 98: Identifying Compressor Shaft, Clutch Plate & Shim
 Courtesy of CHRYSLER GROUP, LLC

Examine the friction surfaces of the pulley and clutch plate (2) for wear. The pulley and clutch plate should be replaced if excessive wear or scoring is found.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

REMOVAL

2.0L, 2.4L ENGINE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

250769715

Fig. 99: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove nut (2) and the A/C discharge line/suction line manifold (1) from the A/C compressor.
5. Remove and discard the O-ring seals.
6. Install tape or plugs into the opened refrigerant line fittings and the compressor ports.

9. Remove the bolts (1) and the A/C compressor (2).

3.2L ENGINE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to CONDENSER, A/C, REMOVAL.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

1. Recover the refrigerant from the refrigerant system. Refer to PLUMBING, STANDARD PROCEDURE.
2. Disconnect and isolate the negative battery cable.
3. Remove the accessory drive belt. Refer to BELT, SERPENTINE, REMOVAL.

Fig. 103: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolt (1) that secures the A/C suction line and A/C discharge lines (2) to the A/C compressor (3).
5. Disconnect the refrigerant lines from the A/C compressor and remove and discard the seals.
6. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

Fig. 104: Removing/Installing A/C compressor
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the engine wire harness (1) from the A/C compressor (2).
8. Support the A/C compressor and remove the three bolts (3).

9. Remove the A/C compressor from the engine compartment.

A/C CLUTCH

Fig. 105: Compressor Shaft Bolt, Clutch Plate & A/C Compressor
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the A/C compressor (3) and place it on a workbench. Refer to **COMPRESSOR, A/C, REMOVAL**.
2. Remove the compressor shaft bolt (1). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (2) from rotating during bolt removal.

Fig. 106: Identifying Compressor Shaft, Clutch Plate & Shim

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to misplace any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

3. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

3150574

Fig. 107: Compressor Pulley Snap Ring, Pulley And Bearing Assembly & A/C Compressor

Courtesy of CHRYSLER GROUP, LLC

4. Using snap ring pliers, remove the snap ring (1) that secures the pulley and bearing assembly (2) to the A/C compressor (3) and remove the pulley and bearing assembly.

Fig. 108: Compressor Clutch Coil Snap Ring, A/C Clutch Coil & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

5. Using snap ring pliers, remove the snap ring (1) that secures the A/C clutch coil (2) to the A/C compressor (3) and remove the coil.

INSTALLATION

2.0L, 2.4L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

250769718

Fig. 109: Bolts & A/C Compressor
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the A/C compressor. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

1. If the A/C compressor (1) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Install the A/C compressor (2) and tighten the bolts (1) to the proper. Refer to **SPECIFICATIONS**.

250769717

Fig. 110: A/C Compressor Clutch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Attach the A/C wire harness to the compressor and connect the A/C compressor clutch wire harness connector (1).

241070007

Fig. 111: A/C Compressor High Pressure Switch Wire Harness Connector

4. Connect the A/C compressor high pressure switch wire harness connector (1).

250769715

Fig. 112: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
6. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C discharge line/suction line manifold (1) to the A/C compressor (3) and tighten the nut (1) to the proper. Refer to **SPECIFICATIONS**.
8. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
9. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
10. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** **RESONATOR, AIR CLEANER, INSTALLATION** .
11. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** **BODY, AIR CLEANER, INSTALLATION** **BODY, AIR CLEANER, INSTALLATION** .
12. Connect the negative battery cable.

3.2L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to CONDENSER, A/C, REMOVAL.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets may result in a refrigerant system leak.

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Fig. 113: Removing/Installing A/C compressor
 Courtesy of CHRYSLER GROUP, LLC

2. Position the A/C compressor (2) to the engine and loosely install the three bolts (3) that secure the A/C compressor to the engine.
3. Tighten the A/C compressor retaining bolts to the proper. Refer to SPECIFICATIONS.
4. Connect the engine wire harness (1) to the A/C compressor.

Fig. 114: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the A/C compressor ports.
6. Lubricate new seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C suction line and the A/C discharge line (2) onto the A/C compressor (3).
8. Install the bolt (1) that secures the refrigerant lines to the A/C compressor and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to **CONDENSER, A/C, REMOVAL**.

10. Connect the negative battery cable.
11. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

A/C CLUTCH

Fig. 115: Compressor Clutch Coil Snap Ring, A/C Clutch Coil & A/C Compressor
 Courtesy of CHRYSLER GROUP, LLC

1. Align the dowel pin on the back of the A/C clutch coil (2) with the hole in the front of the A/C compressor (3) and install the coil onto the compressor.

CAUTION: The snap ring must be fully and properly seated in the groove or it may vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

2. Using snap ring pliers, install the snap ring (1) that secures the A/C clutch coil (2) to the A/C compressor (3). Be certain that the snap ring is fully and properly seated in the groove.

Fig. 116: Compressor Pulley Snap Ring, Pulley And Bearing Assembly & A/C Compressor
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the pulley and bearing assembly, **DO NOT** mar the friction surfaces of the pulley or premature failure of the A/C clutch may result.

3. Install the pulley and bearing assembly (2) onto the A/C compressor (3). If necessary, gently tap the pulley onto the compressor using a block of wood placed on the pulley friction surface.
4. Using snap ring pliers, install the snap ring (1) that secures the pulley and bearing assembly to the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

81229afa

Fig. 117: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim (s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

Fig. 118: Compressor Shaft Bolt, Clutch Plate & A/C Compressor
 Courtesy of CHRYSLER GROUP, LLC

6. Install the clutch plate (2) onto the A/C compressor (3).
7. Install the compressor shaft bolt (1) and tighten to the proper. Refer to **SPECIFICATIONS**.

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. If the air gap is not within, add or subtract shims as needed until the correct air gap is obtained. Refer to **SPECIFICATIONS**.
9. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION**.

CONDENSER, A/C

DESCRIPTION

DESCRIPTION

240970354

Fig. 119: A/C Condenser & A/C Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

The A/C condenser is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins (2), which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with tapping blocks for the A/C refrigerant lines (1). The A/C condenser has an integral A/C receiver/drier (3).

OPERATION

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts except for the O-ring seals and gaskets. The O-ring seals used on the connections are made from a special type of rubber not affected by R-1234YF refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

1. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.
3. Partially remove the radiator. Refer to **RADIATOR, ENGINE COOLING, REMOVAL**.

Fig. 120: Transmission Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

4. Unbolt the transmission oil cooler (2) if equipped and move to the side. Refer to **COOLER,**

TRANSMISSION OIL, REMOVAL .

Fig. 121: A/C Condenser, Liquid Line, Discharge Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the liquid line (3) and the discharge line (2) from the condenser.
6. Remove and discard the O-ring seals and gasket and install plugs in, or tape over the opened refrigerant line fittings and ports.
7. Remove the condenser from the vehicle.

INSTALLATION**INSTALLATION**

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: If only the A/C condenser is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime

a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. Position the condenser in the vehicle.
2. Install the radiator. Refer to **RADIATOR, ENGINE COOLING, INSTALLATION** .

Fig. 122: A/C Condenser, Liquid Line, Discharge Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the tape or plugs from the opened refrigerant line fittings and ports.
4. Connect the liquid line (3) and discharge line (2) to the condenser and tighten the bolts to the proper. Refer to **SPECIFICATIONS**.

0710008704

Fig. 123: Transmission Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

5. Install the transmission oil cooler (2) if equipped. Refer to **COOLER, TRANSMISSION OIL, INSTALLATION**.
6. Connect the negative battery cable.
7. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
8. If the condenser is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
9. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

CORE, HEATER

DESCRIPTION

DESCRIPTION

**Fig. 124: Heater Core**

Courtesy of CHRYSLER GROUP, LLC

The heater core is mounted in the HVAC housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of aluminum tubes and fins (1). The heater core is positioned within the HVAC housing so that only the selected amount of air entering the housing passes through the heater core, before being distributed through the heating and A/C system ducts and outlets. One end of the heater core is fitted with a tank that includes the fittings for the heater core tubes (2).

The HVAC housing must be removed from the vehicle for service of the heater core.

OPERATION

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

REMOVAL

REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle for service of the heater core.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

Fig. 125: Removing/Installing Heater Core Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the wire harness from the retaining clips (2) on the heater core cover.
3. Remove the retaining screws (1) from the heater core tubing cover and remove the heater core tubing cover from the left side of HVAC housing.

Fig. 126: Removing/Installing Heater Core
Courtesy of CHRYSLER GROUP, LLC

4. Remove heater core (1) from the left side of HVAC housing (2).

INSTALLATION**INSTALLATION**

2. Position the heater core tubing cover onto the left side of the HVAC housing and tighten the screws (1) to the proper. Refer to **SPECIFICATIONS**.
3. Fasten the wire harness into the retaining clips (2) on the tubing cover.
4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

CORE, SERVICE PORT VALVE

DESCRIPTION

DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports depending on the type of refrigerant system used to ensure the system is not accidentally contaminated with the wrong refrigerant or by service equipment used for another refrigerant.

- On the 2.0L and 2.4L engine, the high side service port is located on the A/C suction/distribution line in front of the engine by the A/C compressor.
- On the 2.0L and 2.4L engine, the low side service port is located on the Internal Heat Exchanger (IHx).
- On the 3.2L engine, the high side service port is located on the A/C suction line.
- On the 3.2L engine, the low side service port is located on the IHx.

Both the high side and low side A/C service port valve cores are serviceable.

NOTE: **The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

Fig. 129: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

INSTALLATION

Fig. 130: Identifying A/C Service Port Components
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

4. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
5. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

EVAPORATOR, A/C

DESCRIPTION

DESCRIPTION

240969970

Fig. 131: Tapping Block, Evaporator Fins, A/C Evaporator & A/C Evaporator Tubes
Courtesy of CHRYSLER GROUP, LLC

The A/C evaporator (3) for the heating-A/C system is mounted in the HVAC housing, which is located behind the instrument panel. The A/C evaporator and its insulator are positioned within the HVAC housing so that all air entering the housing must pass over the evaporator fins (2) before it is distributed through the heating-A/C system ducts and outlets.

A tapping block (1) and O-ring seals are used to connect and seal the A/C evaporator tubes (4) to the underhood refrigerant lines.

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on

the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-1234YF refrigerant.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle and disassembled for service of the A/C evaporator.

1. Remove the HVAC housing and place it on a workbench. Refer to HOUSING, HVAC, REMOVAL.
2. Remove the air inlet housing. Refer to HOUSING, HVAC, REMOVAL.
3. Remove the heater core. Refer to CORE, HEATER, REMOVAL.
4. Remove the blower motor. Refer to MOTOR, BLOWER, REMOVAL.
5. Remove the air distribution housing. Refer to HOUSING, HVAC, REMOVAL.
6. Remove the HVAC wiring harness.

240969658

Fig. 132: HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Remove the eight screws (1 and 3) that secure the left side of the HVAC housing to the right side of the HVAC housing (2) and remove the right side of the housing.

240969657

Fig. 133: HVAC Housing & Case Separator
Courtesy of CHRYSLER GROUP, LLC

8. Remove the case separator (1) from the HVAC housing (2).

240969653

Fig. 134: A/C Evaporator, HVAC Housing & Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

9. Remove the tubing cover (3) from the A/C evaporator tubing.
10. Carefully lift the A/C evaporator (1) out of the left side of the HVAC housing (2).

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

240969653

Fig. 135: A/C Evaporator, HVAC Housing & Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

1. Install the A/C evaporator (1) into the left side of the HVAC housing (2). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
2. Install the cover (3) onto the A/C evaporator tubing.

240969657

Fig. 136: HVAC Housing & Case Separator
Courtesy of CHRYSLER GROUP, LLC

3. Install the case separator (1) into the HVAC housing (2).

240969658

Fig. 137: HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the right side of the HVAC housing (2) onto the left side of the HVAC housing and install the eight screws (1 and 3) that secure the left and the right side of the HVAC housing together. Tighten the screws to 2.2 N.m (20 in lbs.).
5. Install the HVAC wiring harness. Make sure the harness is routed through all wiring retainers.
6. Install the air distribution housing. Refer to **HOUSING, HVAC, INSTALLATION**.
7. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
8. Install the heater core. Refer to **CORE, HEATER, INSTALLATION**.
9. Install the cabin air filter. Refer to **FILTER, CABIN AIR, INSTALLATION**.
10. Install the air inlet housing. Refer to **HOUSING, HVAC, INSTALLATION**.
11. Install the HVAC housing. Refer to **HOUSING, HVAC, INSTALLATION**.
12. If the A/C evaporator is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE, A/C DISCHARGE

REMOVAL**2.0L, 2.4L ENGINE**

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The lower portion of the A/C suction line is only serviced as an assembly with the A/C discharge line.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** .
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** **RESONATOR, AIR CLEANER, REMOVAL** .
4. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE** .

250769716

Fig. 138: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (3) and the A/C suction/liquid line manifold (2) from the A/C condenser.

250769722

Fig. 139: Seal, Discharge Line & Manifold
 Courtesy of CHRYSLER GROUP, LLC

6. Detach the suction line (2) from manifold (3). Remove and discard the seals (1).
7. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and suction line ports.
8. Remove the splash shield from the right side frame rail. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .
9. Remove nut (3) and disconnect the lower suction line (4). Remove and discard the seal (1).
10. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and suction line ports.

250769715

Fig. 140: A/C Discharge Line/Suction Line Manifold & Nut
 Courtesy of CHRYSLER GROUP, LLC

11. Remove the nut (2) and the A/C suction and discharge line (2) from the A/C compressor. Discard the O-ring seal and gasket.
12. Install plugs in, or tape over the opened discharge line fitting and the compressor port.

3.2L ENGINE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL**.
3. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Fig. 141: View Of Discharge Line, Liquid Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove nuts (3) and separate the A/C discharge (1) and liquid line (2) manifolds from the Internal Heat Exchanger (IHX).
5. Remove and discard the seals.
6. Install plugs in, or tape over the opened refrigerant line fittings.
7. Remove the engine belly pan.
8. Remove the upper radiator close out panel.
9. Remove the right side radiator air deflector.

Fig. 142: A/C Condenser, Liquid Line, Discharge Line & Fasteners

Courtesy of CHRYSLER GROUP, LLC

10. Remove the line bracket bolt (1) from the radiator.
11. Remove the bolt (3) and disconnect the liquid line.
12. Remove the bolt (2) and disconnect the discharge line.
13. Remove and discard the seals.
14. Install plugs in, or tape over the opened refrigerant line fittings and ports.

Fig. 143: A/C Service Port & Bracket
Courtesy of CHRYSLER GROUP, LLC

15. Remove the bolt (2) that secures the service port (1).
16. Disconnect the electrical connector (3) from the pressure switch.
17. Remove the discharge/liquid line assembly from the engine compartment.

INSTALLATION**2.0L, 2.4L ENGINE**

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

250769715

Fig. 144: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the line fittings and the compressor ports.
2. Lubricate a new rubber seal with clean refrigerant oil and install it and a new seal onto the discharge line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C suction and discharge line (1) to the A/C compressor and tighten the nut (2) to the proper. Refer to **SPECIFICATIONS**.
4. Remove the tape or plugs from the refrigerant line fittings.
5. Lubricate a new rubber seal with clean refrigerant oil and install it and a new seal onto the suction line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the lower suction line and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
7. Install the splash shield onto the right side frame rail. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .

250769722

Fig. 145: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

8. Remove the tape or plugs from the refrigerant line fittings and the condenser ports.
9. Lubricate a new seal (1) with clean refrigerant oil and install it and a new seals onto the discharge line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Attach the discharge line (2) to the liquid line manifold (3).

250769716

Fig. 146: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

11. Install the A/C discharge/liquid line manifold (2) to the A/C condenser and tighten the nut (3) to the proper. Refer to SPECIFICATIONS.
12. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

13. Evacuate the refrigerant system. Refer to PLUMBING, STANDARD PROCEDURE.
14. Adjust the refrigerant oil level. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.
15. Charge the refrigerant system. Refer to PLUMBING, STANDARD PROCEDURE.

3.2L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 147: A/C Service Port & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the discharge/liquid line assembly into the engine compartment.
2. Install the bolt (2) securing the service port (1) and tighten to the proper. Refer to **SPECIFICATIONS**.
3. Connect the electrical connector (3) to the pressure switch.

Fig. 148: A/C Condenser, Liquid Line, Discharge Line & Fasteners

Courtesy of CHRYSLER GROUP, LLC

4. Remove the tape or plugs from the line fittings and ports.
5. Lubricate a new rubber seal with clean refrigerant oil and install. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the vehicle.
6. Install the bolt (2) securing the discharge line to the A/C condenser and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
7. Install the bolt (3) securing the liquid line to the A/C condenser and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
8. Install the line bracket bolt (1) and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
9. Install the right side radiator air deflector.
10. Install the upper radiator close out panel.
11. Install the engine belly pan.

Fig. 149: View Of Discharge Line, Liquid Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Attach the discharge line (1) and liquid line (2) to the Internal Heat Exchanger (IHX) and tighten nuts (3) to the proper. Refer to **SPECIFICATIONS**.
13. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

14. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
15. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

16. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C LIQUID**REMOVAL****2.0L, 2.4L ENGINE**

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL** .
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL RESONATOR, AIR CLEANER, REMOVAL** .
4. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

7. Remove the nut (1) and separate the suction/liquid line manifold (3) from the expansion valve (2).

8. Remove and discard the seals.
9. Install plugs in, or tape over the opened refrigerant line fittings.
10. Remove the suction/liquid line assembly from the engine compartment.

INSTALLATION

2.0L, 2.4L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C liquid line must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C liquid line can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 159: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
2. Lubricate the new seals with clean refrigerant oil and install the seals onto the liquid (1) and suction line (5) fittings. Use only the specified seals as they are made of special materials compatible to the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C liquid (1) and suction line (5) assembly into the engine compartment.
4. Attach the A/C liquid and suction line assembly to the A/C evaporator (6) and tighten the nut (4) to the proper. Refer to **SPECIFICATIONS**.

241070012

Fig. 160: Nut, Liquid & Suction Line Bracket

5. Install the nut securing the liquid and suction line bracket (2) and tighten nut to the proper. Refer to **SPECIFICATIONS**.

241070010

Fig. 161: Pressure Transducer & Connector
Courtesy of CHRYSLER GROUP, LLC

6. If removed, inspect the O-ring seal and install the pressure transducer and securely tighten.
7. Connect the pressure transducer wire harness connector.

241070009

Fig. 162: Nut, Upper & Lower Suction Lines
Courtesy of CHRYSLER GROUP, LLC

8. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
9. Lubricate the new seals with clean refrigerant oil and install the seals onto the suction line fitting. Use only the specified seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Install the liquid and suction line bracket and tighten the nut (1) to the proper. Refer to **SPECIFICATIONS**.
11. Connect the lower suction line (4) to the upper suction line (2) assembly and install nut (3) and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

241070006

Fig. 163: Nut & Liquid Line

Courtesy of CHRYSLER GROUP, LLC

12. Install the front liquid line (1) support bracket and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

250769722

Fig. 164: Seal, Discharge Line & Manifold

Courtesy of CHRYSLER GROUP, LLC

13. Remove the tape or plugs from the suction and liquid line fitting and the condenser port.
14. Lubricate the new seals (1) with clean refrigerant oil and install it onto the suction and liquid line fitting. Use only the specified O-ring as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Attach the suction line (2) to the liquid manifold (3).

250769716

Fig. 165: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

16. Install the A/C suction (1) and liquid line manifold (2) to the A/C condenser and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
17. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

18. Evacuate the refrigerant system Refer to **PLUMBING, STANDARD PROCEDURE**.
19. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
20. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
21. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** .
22. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** and **BODY, AIR CLEANER, INSTALLATION** .

3.2L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C liquid line must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C liquid line can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 166: Suction/Liquid Line Manifold & Expansion Valve
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the refrigerant line fittings and the expansion valve ports.
2. Lubricate the new seals with clean refrigerant oil and install the seals onto the liquid and suction line fittings. Use only the specified seals as they are made of special materials compatible to the system. Use only refrigerant oil of the type recommended for the vehicle.
3. Position the suction/liquid line assembly into the engine compartment.
4. Attach the suction/liquid line manifold (3) to the expansion valve (2) and tighten the nut (1) to the proper. Refer to SPECIFICATIONS.

Fig. 167: Suction/Liquid Line Manifold & Internal Heat Exchanger (IHX)
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the refrigerant line fittings.
6. Lubricate the new seals with clean refrigerant oil and install the seals onto the suction/liquid line fitting.
7. Connect the suction/liquid line manifold (1) to the Internal Heat Exchanger (IHX) and tighten the nut (2) to the proper. Refer to **SPECIFICATIONS**.
8. Connect the negative battery cable.
9. Evacuate the refrigerant system Refer to **PLUMBING, STANDARD PROCEDURE**.
10. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
11. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
12. Install the engine cover.

LINE, A/C SUCTION

REMOVAL

2.0L, 2.4L ENGINE

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL BODY, AIR CLEANER, REMOVAL** .
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL RESONATOR, AIR CLEANER, REMOVAL** .
4. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

250769716

- 171

9. Remove and discard the O-ring seal and gasket.
10. Install plugs in, or tape over the opened refrigerant line fittings and ports.

Fig. 174: Coolant Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

11. Remove the nuts (1) securing the coolant tube (2) and reposition the tube to gain clearance.

Fig. 175: View Of IHX Line Bracket
Courtesy of CHRYSLER GROUP, LLC

12. Remove bolt (1) securing the IHX manifold (2) to the bracket.

13. Remove the Catalytic Converter. Refer to **CONVERTER, CATALYTIC [EHB], REMOVAL** .

Fig. 176: IHX Line Bracket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Remove the nut (1) securing the IHX bracket (2).

Fig. 177: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

15. Remove the fastener (1) securing the IHX manifold (2) to the A/C compressor (3) and detach the manifold from the compressor.
16. Remove and discard the seals and install plugs in or tape over the opened line fittings and ports.

17. Remove the IHX from the engine compartment.

INSTALLATION**2.0L, 2.4L ENGINE**

250769715

Fig. 178: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the suction line fitting and the compressor port.
2. Lubricate a new seal with clean refrigerant oil and install it and new seals onto the suction/discharge manifold. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the lower A/C suction/discharge manifold (1) to the A/C compressor and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

241070009

Fig. 179: Nut, Upper & Lower Suction Lines
Courtesy of CHRYSLER GROUP, LLC

4. Remove the tape or plugs from the upper suction line fitting.
5. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Install the lower A/C lower suction line (4) to the upper A/C suction line (2) and tighten the nut (3) to the proper. Refer to **SPECIFICATIONS**.

250769722

Fig. 180: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

7. Remove the tape or plugs from the upper suction line fitting.
8. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Attach the suction line (2) to the liquid line manifold (3).

250769716

Fig. 181: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C discharge/liquid line manifold (2) from the A/C condenser and tighten the nut (3) to the proper. Refer to **SPECIFICATIONS**.
11. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.

3.2L ENGINE

1. Remove the tape or plugs from the Internal Heat Exchanger line fittings and ports.
2. Lubricate a new seal with clean refrigerant oil and install it and new seals onto the suction/discharge manifold. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the vehicle.

Fig. 182: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Position the IHX in the engine compartment.
4. Install the IHX manifold (1) to the A/C compressor (3) and tighten the fastener (1) to the proper. Refer to **SPECIFICATIONS**.

Fig. 183: IHX Line Bracket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Position the IHX bracket (2) on the mounting stud and securely tighten the nut (1).
6. Install the catalytic converter. Refer to **CONVERTER, CATALYTIC [EHB], INSTALLATION**.

Fig. 184: View Of IHX Line Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Install the bolt (1) securing the IHX manifold (2) to the bracket.

Fig. 185: Coolant Tube & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Position the coolant tube (2) on the mounting studs and securely tighten the nuts (1).

Fig. 186: View Of Discharge Line, Liquid Line & Fasteners

12. Remove the tape or plugs from the upper suction line fitting.
13. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Install the bolt (1) securing the IHX manifold (2) bracket to the engine and securely tighten.
15. Attach the suction/discharge line to the IHX manifold (2) and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
16. Install the powertrain control module. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION**.
17. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
18. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
19. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
20. Install the engine cover.

OIL, REFRIGERANT

STANDARD PROCEDURE

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Drain the refrigerant oil from the A/C compressor using the procedures described below. Failure to properly drain the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

NOTE: Most reclaim/recycling equipment will measure the amount of refrigerant oil being removed during the recovery process. This amount of refrigerant oil should always be added back into the refrigerant system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level within the A/C refrigerant system or to add oil, unless there has been an oil loss. A refrigerant oil loss may occur due to component replacement or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak does occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant

oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C accumulator, A/C evaporator or A/C condenser is replaced. See Refrigerant Oil Capacities charts below.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. See COMPRESSOR OIL DRAIN PROCEDURES.

REFRIGERANT OIL CAPACITIES

Component	ml.	oz.
A/C Receiver/Dryer	30	1.0
A/C Condenser	30	1.0
A/C Evaporator	45	1.5
A/C Compressor - Denso 7SBH17C	130	4.6
	(See COMPRESSOR OIL DRAIN PROCEDURE -VARIABLE DISPLACEMENT)	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type specified for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. Refer to **COMPRESSOR, A/C, INSTALLATION**.

VALVE, A/C EXPANSION

DESCRIPTION

DESCRIPTION

Fig. 188: H-Valve Type Body & Thermal Sensor
Courtesy of CHRYSLER GROUP, LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1), with an integral thermal sensor (2). The A/C expansion valve is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

OPERATION

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant and converts it into a low-pressure, low-temperature mixture of liquid and gas, before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line or A/C expansion valve is disconnected. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING**DIAGNOSIS AND TESTING - A/C EXPANSION VALVE**

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The A/C expansion valve should only be tested after performing the A/C performance test. Refer to **DIAGNOSIS AND TESTING**.

NOTE: Liquid CO² is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO² is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode air door is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to 6. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO² or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO² or another suitable super-cold material. **Do not spray refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to 7. If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.

REMOVAL**REMOVAL**

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL**.
3. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

241070008

4. Remove the nut (4) and the A/C liquid line (1) and A/C suction line (5) manifold from the A/C expansion valve.
5. Remove and discard the seals.

250769721

Fig. 190: Bolts & A/C Expansion Valve
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two bolts (1) and the A/C expansion valve (2) from the evaporator.
7. Remove and discard the O-ring seals.
8. Install plugs in, or tape over, the opened refrigerant line fittings and evaporator ports.

250769719

Fig. 191: Expansion Valve & Insulating Foam
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, remove the insulating foam (2) from the expansion valve (1).

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the O-ring seals is required anytime a refrigerant line or A/C expansion valve is disconnected. Failure to replace the O-ring seals may result in a refrigerant system leak.

250769720

Fig. 192: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from all the opened refrigerant line fittings and evaporator ports.

2. Lubricate new O-ring seals (1) with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

250769721

Fig. 193: Bolts & A/C Expansion Valve
Courtesy of CHRYSLER GROUP, LLC

3. Install the A/C expansion valve (2) onto the evaporator and tighten the bolts to the proper. Refer to **SPECIFICATIONS**.

241070008

Fig. 194: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Install the A/C liquid line (1) and the A/C suction line manifold (5) to the A/C expansion and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
6. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
7. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
8. Charge the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
9. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** or **RESONATOR, AIR CLEANER, INSTALLATION**.
10. Connect the negative battery cable.

TUBE, CONDENSATION DRAIN

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag

system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the right side center console closeout from the center console.

Fig. 195: HVAC Housing, Condensation Drain Tube, Floor Panel & Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect clamp (4) and remove the condensation drain tube (2) from the HVAC housing (1).
4. Remove the condensation drain tube from the floor panel (3).

INSTALLATION

INSTALLATION

Fig. 196: HVAC Housing, Condensation Drain Tube, Floor Panel & Clamp
Courtesy of CHRYSLER GROUP, LLC

1. Install the condensation drain tube (2) into the floor panel (3).
2. Connect the condensation drain tube with clamp (4) to the HVAC housing (1).
3. Install the passenger side center console closeout.
4. Connect the negative battery cable.

2014 MANUAL TRANSMISSION**C635 - Service Information - Cherokee****DIAGNOSIS AND TESTING****COMMON PROBLEM CAUSES**

NEUTRAL GEAR RATTLE: Neutral gear rattle is not an indication of an internal transaxle fault. Neutral gear rattle is caused by the clutch disc springs loading and unloading under the weight of the geartrain in the transaxle. Usually, after releasing the clutch with the engine at idle, the geartrain will rotate quietly. When the engine operating system makes an idle alteration the transaxle geartrain will bounce causing the clutch springs to compress. Afterward, the spring release flinging the geartrain faster than the engine idle. When the engine idle catches up with the geartrain and the spring compress and the process repeats over and over causing the geartrain to rattle. Neutral gear rattle is most audible in enclosed areas, such as a garage or between other parked vehicles.

PRE-DIAGNOSTIC INSPECTION:

- Verify that the transaxle fluid level is at the proper cold fill level.
- Inspect the exterior of the transaxle for evidence of fluid leaks.
- Inspect the exterior of the transaxle for mechanical issues, such as improper shift cable routing or loose mounting bolts.

NOTE: If a fluid with anti-friction additive is used in a C-365 transaxle the synchronizers will fail, requiring synchronizer replacement.

SYMPTOM	POSSIBLE CAUSE	REPAIR
Neutral gear rattle.	Weak clutch disc springs.	No trans repair required. If rattle is excessive when vehicle is in an open area replace the clutch disc.
Tip in tip out clunk. No gear whine.	1. Excessively strong clutch disc springs. 2. Loose front hub nuts	1. If the condition is excessive replace the clutch disc. 2. Replace hub nut and tighten to proper torque specification. Refer to FRONT, SPECIFICATIONS.
Bearing whine.	1. Low fluid level. 2. Improper fluid.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to CAPACITIES AND

2014 Jeep Cherokee Trailhawk

2014 MANUAL TRANSMISSION C635 - Service Information - Cherokee

	3. Bearings in transaxle assembled to tight.	<u>RECOMMENDED FLUIDS, DESCRIPTION</u> . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Growl in neutral.	1. Low fluid level. 2. Improper fluid. 3. Bearings in transaxle assembled to loose.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to <u>CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION</u> . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Gear noise when driving in any gear range	1. Low fluid level. 2. Improper fluid. 3. Bearings in transaxle assembled to loose.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to <u>CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION</u> . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Gear clash going into 1st or reverse from neutral with clutch depressed for 3+ seconds.	1. Improper fluid or additives in fluid. 2. Faulty synchronizers.	1. If doubt exists, replace the transaxle fluid. Refer to <u>CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION</u> . 2. Disassemble transaxle to inspect. Replace synchronizers.
Fluid expelled from vent.	Transaxle is overfilled.	Adjust transaxle cold fill level.

HARD SHIFTING

Hard shifting may be caused by:

- Misadjusted crossover cable.
- If hard shifting is accompanied by gear clash, synchronizer drum, clutch stop rings or gear teeth may be worn or damaged.
- Mis-assembled synchronizer components also cause shifting problems.
- Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.
- Worn, damaged, mis-assembled or leaking hydraulic clutch release system/components can also cause difficult shifting or gear clash.

NOISY OPERATION

Transaxle noise is most often a result of :

- Worn or damaged internal components.
- Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings.
- Insufficient lubricant.
- Aftermarket additives can damage synchronizers.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by:

- Mis-aligned or damaged shift components.
- Worn teeth on the drive gears or synchronizer components.
- Incorrectly assembled geartrain.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of:

- Fluid leaks.
- Inaccurate fluid level check or refill method.
- Porosity in the transaxle castings.

NOTE: **For leaks that are difficult to pinpoint, tracer dye can be added to the lubricant to aid in detecting the origin of the leak. Tracer dye becomes luminous under black light.**

CLUTCH PROBLEMS

NEUTRAL GEAR RATTLE: Neutral gear rattle is not an indication of an internal transaxle fault. Neutral gear rattle is caused by the clutch disc springs loading and unloading under the weight of the geartrain in the transaxle. Usually, after releasing the clutch with the engine at idle, the geartrain will rotate quietly. When the engine operating system makes an idle alteration the transaxle geartrain will bounce causing the clutch springs to compress. Afterward, the spring release flinging the geartrain faster than the engine idle. When the engine

idle catches up with the geartrain and the spring compress and the process repeats over and over causing the geartrain to rattle. Neutral gear rattle is most audible in enclosed areas, such as a garage or between other parked vehicles.

SYMPTOM	POSSIBLE CAUSE	REPAIR
Gear clash shifting to reverse or neutral after clutch is depressed 3+ seconds.	Clutch disc hub spline seized to the transaxle input shaft.	Replace clutch disc and clean corrosion from input shaft.

ADJUSTMENTS

BEARING PRELOAD ADJUSTMENT

It is not necessary to reestablish preload shim thickness when new bearings are installed. It is only necessary to establish preload shim thickness when a transaxle housing component, gear shaft, or differential is replaced. This procedure is used to measure zero end play of the gear shafts and differential in the C635 (Manual or DDCT) Transaxle and establish the proper thickness of the select shims placed behind the bearing races in the transaxle housing to apply specific bearing preload to prevent bearing failure and gear rattle.

Transaxle Preparation

1. Clean the transaxle with suitable solvent.
2. Install new bearings on the gear shafts and the differential.

Fig. 1: Removing Preload Bearing Races
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bearing races (2) from the transaxle housing using tools 9664 Remover (1) (special tool #9664, Remover, Bearing Cup) and C-637 Slide Hammer (special tool #C-637, Slide Hammer,

Universal).

4. Remove the factory installed select shims from the transaxle housing. Mark the shims to identify the bore that they were removed from.
5. From the circumference of the original bearing races, grind 0.18 mm (0.007 in) material from the races to allow them to slip-fit into the transaxle housing.

NOTE: To ensure a flat uniform surface on the outside diameter (OD) of the bearing races, chuck them on a suitable (brake) lathe and remove material from the OD with a suitable die grinder.

6. Insert the, reduced OD, differential bearing race into the transaxle housing.

NOTE: No select shim is required to measure the differential zero end play.

Fig. 2: Starter Shims & Plastigauge®
Courtesy of CHRYSLER GROUP, LLC

7. Insert an 0.80 mm (0.031 in), or suitable thickness, starter shims (2) in each gear shaft bearing race bore in the transaxle housing. This will create measurable gear shaft end play after the transaxle cases are assembled.

NOTE: If the original shims are greater than 1.32 mm (0.052 in) thick, use a 1 mm starter shim.

8. Use RED Plastigauge®, cut in 6 mm (1/4 in.) lengths (1), placed 120 degrees apart around the side surface of the select shims.

NOTE: If the gear shaft end play is less than the RED Plastigauge® can accurately

measure, use GREEN Plastigauge®.

9. Install the reduced diameter bearing races in the bores in the transaxle to capture the Plastigauge®.

Fig. 3: Differential Assembly In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

10. Install the differential assembly in the bellhousing half of the transaxle housing.
11. Place the bearing race plate in position on the bellhousing half of the transaxle housing.
12. Install the bolts to hold the bearing race plate to the bellhousing. Tighten the bolts to torque specification.

Fig. 4: Three Gear Shafts In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

13. Install the three gear shafts in the bellhousing half of the transaxle housing.

14. Install the transaxle housing onto the bellhousing.

NOTE: If the reduced diameter bearing races slip out of the bearing bores, Door Ease® wax can be applied to the circumference of the race to adhere it to the bore.

211473912

Fig. 5: Transaxle Housing To Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install four bolts (1) to hold the transaxle housing to the bellhousing around the differential side of the transaxle. Tighten the bolts to 50% of the torque specification.
16. Turn the transaxle on its side to gain access to the inside of the bellhousing.
17. Install seven bolts (2), four above and three below the gear shafts, to hold the transaxle case halves together, Tighten the bolts to 50% of the torque specification.
18. Turn transaxle, bellhousing downward, on the work surface.

Measuring Differential End Play

1. Install (special tool #C-4995A, Tool, Differential Bearing Torque) (1) into the differential side gear (2).

Fig. 6: Installing Special Tool To Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

2. Clamp a typical vise grip pliers (4) on tool C-4995A (2).
3. Attach dial indicator C-3339A (1) (special tool #C-3339A, Set, Dial Indicator) to transaxle housing with the plunger placed on the end of tool C-4995A (2).

Fig. 7: Measuring Differential End Play
Courtesy of CHRYSLER GROUP, LLC

4. Zero the indicator dial (1).
5. Use a large screw driver (3) to pry upward on tool C-4995A (2) to take up the bearing free play.

6. While holding tool C-4995A (2) upward read the dial indicator (1).
7. Add 0.15 mm (0.006 in.) to the dial indicator reading.
8. The sum is the proper thickness of the differential preload shim.

Measuring Gear Shaft End Play

1. Turn the transaxle on its side to gain access to the inside of the bellhousing.

211473912

Fig. 8: Transaxle Housing To Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts (2) holding the bellhousing to the transaxle housing.
3. Turn transaxle, bellhousing downward, on the work surface.
4. Remove the remaining bolts (1) holding the bellhousing to the transaxle housing.
5. Place the transaxle housing on the work surface inside up.

Fig. 9: Bearing Race, Shim & Plastigauge®
Courtesy of CHRYSLER GROUP, LLC

6. Using a hook tool, remove the reduced size bearing races (4). Be careful not to damage the Plastigauge® (2).
7. Compare the thickness of the Plastigauge® (2) to the RANGE template on the Plastigauge® packaging (1).
8. Add the Plastigauge® RANGE thickness, plus 0.15 mm (0.006 in.) to the thickness of the starter shim used to create gear shaft end play.
9. The sum is the proper thickness to preload for each of the gear shaft bearings.
10. Install the closest thickness shims from the list provided by Mopar® Parts.

NOTE: If the measured thickness falls between the shim thicknesses provided by Mopar® Parts, install the shim that is slightly thicker.

After proper bearing preload is established, finish assembling the transaxle.

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Release the hood latch and open the hood.

3. Support the hood on the provided prop-rod.
4. Remove the engine cover.
5. Remove the upper radiator closeout panel.
6. Disengage the clips holding the wire harness to the battery tray.
7. Remove the battery and battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
8. Remove the pinch bolt holding the steering column to the steering gear.
9. Raise the vehicle to gain access to the front wheels.
10. Remove the front wheels. Refer to **REMOVAL** .
11. Raise the vehicle to gain access to the belly pan.
12. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
13. Release the clamp from the charge air outlet hose on the left side of the radiator support panel.
14. Remove the bolt holding the charge air hose to the side of the transmission.
15. Remove the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
16. Remove the right front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
17. Disconnect wire harness connector at the left side of the front fascia.
18. Release the retainer holding the wire harness to the front fascia.
19. Lower the vehicle to mid level.
20. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
21. Disconnect the charge air tube from the throttle body adapter.
22. Separate the charge air tube from the vehicle.
23. Raise the vehicle to gain access to the halfshafts.
24. Using a suitable punch tool, pry out the lock staking on the front hub nuts.
25. Install the front wheel bolts in the front brake rotor hub.
26. While holding a pry bar across the wheel bolts to prevent the wheel hub from rotating, remove the front wheel hub nuts.
27. Remove the front halfshafts. Refer to **REMOVAL** .
28. If equipped, remove the rear propeller shaft.
29. Remove the exhaust crossunder pipe.
30. Place a suitable drain pan under the transmission.
31. Remove the drain plug to allow the fluid to drain into the drain pan.
32. If equipped, remove the power transfer unit (PTU).
33. Lower vehicle to gain access to the shift cables.

Fig. 10: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

34. Using a suitable prying tool, pry the shift cable end from the lever ball stud on the transmission.

Fig. 11: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

35. Using a suitable prying tool, pry the select cable end from the select lever ball stud on the transmission.
36. Release the clips holding the shift cables housing ends to the bracket on the transmission.
37. Remove the exhaust heat shield from the exhaust manifold.
38. Disconnect the wire connector from the exhaust temperature sensor.

39. Disconnect the wire connector from the oxygen sensor.
40. Remove the oxygen sensor. Refer to **SENSOR, OXYGEN, REMOVAL**.
41. Remove the exhaust clamp holding the turbo charger to the catalytic converter.

Fig. 12: Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

42. Disengage the wire harness retainers (1) along the top of the bellhousing.
43. Position the wire harness out of the way.

Fig. 13: Locating Bolts Holding Upper Bellhousing To Engine Block
Courtesy of CHRYSLER GROUP, LLC

44. Remove the bolts (1) holding the upper bellhousing to the engine block.
45. Position a floor jack under the transmission and lift the transmission enough to take tension off the upper transmission mount.

Fig. 14: Locating Bolts Holding Upper Mount To Adapter Spacer & Adapter Spacer To Transmission

Courtesy of CHRYSLER GROUP, LLC

46. Remove the bolts (1) holding the upper transmission mount to the transmission mount adapter spacer (4).
47. Remove the bolts (3), (2= hidden) holding the transmission mount adapter spacer (4) to the transmission.

Fig. 15: Installing Block Of Wood Between Transmission & Left Load Beam

Courtesy of CHRYSLER GROUP, LLC

48. While holding a wood block (1) between the transmission and the left load beam, lower the transmission.
49. Remove the floor jack from under the vehicle.
50. Remove transmission mount spacer from the vehicle.
51. Raise the vehicle to gain access to the front suspension cradle.

Fig. 16: Positioning Transmission Jack, High Stand & Wood Block
Courtesy of CHRYSLER GROUP, LLC

52. Position a suitable transmission jack (1) under the transmission in a stable fashion and secure the transmission to the transmission jack cradle with a safety chain or strap.
53. Position a high stand (2) under the engine oil pan, use a wood block (3) to protect the oil pan.

Fig. 17: Locating Nut Holding Ground Cable To Transmission
Courtesy of CHRYSLER GROUP, LLC

54. Remove the nut (1) holding the ground cable to the transmission from above the left load beam.
55. Separate the ground cable from the transmission.

Fig. 18: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

56. Disengage the clutch hydraulic coupling (4) from the slave cylinder on the transmission.

57. Using a suitable cap-plug, seal the end of the hydraulic line to avoid losing hydraulic fluid.
58. Remove the catalytic converter from the engine. Refer to **CONVERTER, CATALYTIC, REMOVAL** .
59. Remove the starter motor. Refer to **STARTER, REMOVAL** .
60. Remove the front suspension cradle and load beams.

Fig. 19: Backup Lamp Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

61. Disconnect the wire harness connector (1) from the backup lamp switch.

Fig. 20: Locating Bolts Holding Engine To Bellhousing & Bellhousing To Oil Pan
Courtesy of CHRYSLER GROUP, LLC

62. On the backside of the engine, remove the bolt (1) holding engine to the bellhousing and the bolt (2) holding the bellhousing to the oil pan.

Fig. 21: Locating Bolts Holding Engine Block To Transmission Bellhousing & Bellhousing To Oil Pan

Courtesy of CHRYSLER GROUP, LLC

63. On the front of the engine, remove the bolts (1) holding the engine block to the transmission bellhousing and the bellhousing to the oil pan.

Fig. 22: Removing/Installing Transmission

Courtesy of CHRYSLER GROUP, LLC

64. Using a suitable pry bar, separate the transmission from the engine far enough for the clutch to clear the bellhousing (1).
65. Lower the transmission while avoiding obstacles and separate the transmission from the vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 23: Concentric Slave Cylinder Retention Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Release the retention tabs from the Concentric Slave Cylinder (CSC) (1).

Fig. 24: CSC Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the CSC bolts (2).

Fig. 25: Retention Clip & Connection
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the hydraulic connection at the case. Release the retention clip (1) then separate the connection (2).

Fig. 26: Hydraulic Fitting & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the hydraulic fitting (2) from the plastic retainer (1).
5. Remove the CSC.

3335848

Fig. 27: Mainshaft Oil Seal Plate
Courtesy of CHRYSLER GROUP, LLC

6. Remove the mainshaft oil seal plate (1).

3335883

Fig. 28: Gear Selector Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the gear selector assembly bolts (1).
8. Use a plastic hammer or the equivalent to loosen the assembly and remove from the case.

Fig. 29: Reverse Idler Gear Assembly Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

9. Remove the reverse idler gear assembly retaining bolt.
10. Remove the axle seals. Refer to **SEAL, AXLE DRIVE SHAFT, REMOVAL**.

Fig. 30: Long Case Bolts & Short Case Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. Remove the long case bolts (1) and the short case bolts (2).

Fig. 31: Studs

Courtesy of CHRYSLER GROUP, LLC

12. Remove the studs (1).

Fig. 32: Gear Side Half & Bell Housing Side Half

Courtesy of CHRYSLER GROUP, LLC

13. Separate the case halves by carefully prying on the gear side half (1) and the bell housing side half (2).

Fig. 33: Reverse Idler Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

14. Remove the reverse idler gear assembly (1).
15. Using a hydraulic press, remove the pin from the reverse gear mounting bracket.
16. Separate the reverse idler gear and the needle bearing.

Fig. 34: Shifter Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

17. Remove the shifter fork pivot pin (1).
18. Remove the 3-4-reverse gear shifter fork assembly (2).

2963780

Fig. 35: Shifter Fork Pivot Pin & 1-2-5-6 Gear Shifter Fork Assembly
Courtesy of CHRYSLER GROUP, LLC

19. Remove the shifter fork pivot pin (1).
20. Remove the 1-2-5-6 gear shifter fork assembly (2).

3336090

Fig. 36: Output And Main Shafts
Courtesy of CHRYSLER GROUP, LLC

21. Remove the output and main shafts (1) as a group.

Fig. 37: Bearing Race Plate Bolts
Courtesy of CHRYSLER GROUP, LLC

22. Remove the bearing race plate bolts.

NOTE: Use a screw drive or equivalent as an aid in releasing the plate from the locating bushings.

Fig. 38: Bearing Race Plate
Courtesy of CHRYSLER GROUP, LLC

23. Remove the bearing race plate.

Fig. 39: Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

24. Remove the differential assembly (1).
25. Remove the axle seals Refer to **SEAL, AXLE DRIVE SHAFT, REMOVAL**.

Fig. 40: Magnet
Courtesy of CHRYSLER GROUP, LLC

26. Remove the magnet.

Fig. 41: Removing Bell Housing Side Differential Bearing Race
Courtesy of CHRYSLER GROUP, LLC

27. Remove the bell housing side differential bearing race using (special tool #C-637, Slide Hammer, Universal) and (special tool #9664, Remover, Bearing Cup).

Fig. 42: Input Shaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

28. Remove shaft bearing cup (2) using a press and (special tool #10302, Installer, Bearing Cup).
29. Remove the input shaft bearing cup (2) using (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup).
30. Remove the output shaft bearing cup from the race mounting plate using a press and tools (special tool #D-111, Installer, Bearing Cup) (3), 10302.

Fig. 43: Removing Differential Bearing Race Cups & Shims

Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not discard the shim as it will be utilized as the starting point for the bearing preload adjustment process.

31. Remove the case side differential bearing race cups and shims (1) using (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup) (3).

Fig. 44: Removing Case Side Gear Shaft Bearing Race Cups & Shims

Courtesy of CHRYSLER GROUP, LLC

NOTE: Document the location of each shim as they will be utilized as the starting point for the bearing preload adjustment process.

32. Remove the case side gear shaft bearing race cups and shims (2) using a Slide Hammer (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup) (1).

Fig. 45: Lubricating Duct
Courtesy of CHRYSLER GROUP, LLC

33. Remove the lubricating duct by pulling upward.

Fig. 46: Shaft Oil Ducts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil ducts are staked to the case and may require some grinding before removal.

34. Remove the shaft oil ducts (1) from the case using a screwdriver or the equivalent.

CLEANING

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing. Do not use solvent to clean sealed bearings. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

ASSEMBLY

ASSEMBLY

NOTE: It is not necessary to reestablish preload shim thickness when new bearings are installed. It is only necessary to establish preload shim thickness when a transaxle housing component, gear shaft, or differential is replaced. Refer to **ADJUSTMENTS**.

Fig. 47: Right And Left Side Differential Bearing Races And Universal Driver Handle
Courtesy of CHRYSLER GROUP, LLC

1. Install the right and left side differential bearing races using (special tool #8866, Installer, Bearing Cup) and (special tool #C-4171, Driver Handle, Universal).

Fig. 48: Special Tool #8866

Courtesy of CHRYSLER GROUP, LLC

Fig. 49: Special Tool #C-4171

Courtesy of CHRYSLER GROUP, LLC

Fig. 50: Differential Assembly

Courtesy of CHRYSLER GROUP, LLC

2. Install the differential.

Fig. 51: Magnet
Courtesy of CHRYSLER GROUP, LLC

3. Install the magnet.

Fig. 52: Bearing Race Plate Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Install the bearing race plate and tighten the bolts in four steps using the sequence shown in illustration:
 - Step 1 - Tighten bolts 9-10-6-8-1 to 20 N.m (15 ft. lbs.) in order.
 - Step 2 - Tighten bolts 3-5-4 to 25 N.m (18 ft. lbs.) in order.
 - Step 3 - Tighten bolts 2-7 to 80 N.m (59 ft. lbs.) in order.
 - Step 4 - Tighten bolts 9-10-6-8-1 to 80 N.m (59 ft. lbs.) in order.

Fig. 53: Bearing Cup

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following tools are to be used in conjunction with (special tool #C-4171, Driver Handle, Universal).

5. Install the new bearing races to the race plate using the following tools:
- For the shaft bearing race use (special tool #10302, Installer, Bearing Cup) (2).
 - For the shaft bearing race use (special tool #D-111, Installer, Bearing Cup) (3).
 - For the main shaft bearing race use (special tool #C-4198, Installer, Axle Bearing) (1).

Fig. 54: Lubricating Duct

Courtesy of CHRYSLER GROUP, LLC

6. Install the lubricating duct (1).

Fig. 55: Oil Duct Locating Pin & Locating Hole
Courtesy of CHRYSLER GROUP, LLC

7. Ensure that the oil duct locating pin (1) is in the locating hole (2).

Fig. 56: Correct Shim
Courtesy of CHRYSLER GROUP, LLC

8. Install the correct shim (1) to the case.

Fig. 57: Output Shaft The Bearing Races To The Case Using Bearing Cup Installer
Courtesy of CHRYSLER GROUP, LLC

9. Install output shaft the bearing races to the case using (special tool #L-4520, Installer, Seal/Cup) and (special tool #6446, Installer, Bearing).

Fig. 58: Special Tool #L-4520
Courtesy of CHRYSLER GROUP, LLC

Fig. 59: Special Tool #6446
Courtesy of CHRYSLER GROUP, LLC

Fig. 60: Re-Staking Ducts To Case
Courtesy of CHRYSLER GROUP, LLC

10. Install the gear shaft oil ducts. Using an appropriate drift (1) re-stake the ducts (2) to the case.
11. Install the input shaft bearing race using (special tool #C-4171, Driver Handle, Universal) and (special tool #10305, Installer, Differential Bearing Cup).
12. Install the gear side differential bearing race using (special tool #C-4171, Driver Handle, Universal) and (special tool #8866, Installer, Bearing Cup).

Fig. 61: Special Tool #C-4171
Courtesy of CHRYSLER GROUP, LLC

Fig. 62: Special Tool #8866
Courtesy of CHRYSLER GROUP, LLC

Fig. 63: Output And Main Shafts
Courtesy of CHRYSLER GROUP, LLC

13. Install the output and main shafts (1) as a group.

Fig. 64: Shifter Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

14. Install the 3-4-R gear shifter fork assembly.

2963780

Fig. 65: Shifter Fork Pivot Pin & 1-2-5-6 Gear Shifter Fork Assembly
Courtesy of CHRYSLER GROUP, LLC

15. Install the 1-2-5-6 gear shifter fork assembly.

2964377

Fig. 66: Reverse Idler Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

16. Install the reverse idler gear and the needle bearing.
17. Using a hydraulic press, install the pin to the reverse gear mounting bracket.
18. Install the reverse idler gear assembly (1).

Fig. 67: Gear Side Case Half
Courtesy of CHRYSLER GROUP, LLC

NOTE: The case halves must be assembled within 15 minutes after the application of the anaerobic sealant. Do not allow transmission oil or any other lubricants to come in contact with the sealant for at least one hour after the case halves have been assembled.

19. Apply a uniform bead of LOCTITE®509™ Sealer or equivalent to the sealing surface of the case.
20. Install the gear side case half (1) to the bellhousing case half (2).

Fig. 68: Long Case Bolts & Short Case Bolts
Courtesy of CHRYSLER GROUP, LLC

21. Install the long case bolts (1) and the short case bolts (2) and tighten to 25 N.m (18 ft. lbs.) using a cross

sequence.

Fig. 69: Reverse Idler Gear Assembly Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Patch and install the reverse gear idler retaining bolt using the following process. Tighten to 10 N.m (89 in. lbs.).
 - Remove the remaining traces of the original locking patch with a wire brush or the equivalent.
 - Clean the threads with denatured alcohol and allow to dry.
 - Apply the locking patch using Mopar thread locker.

Fig. 70: Gear Selector Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Apply a uniform bead of LOCTITE®509™ Sealer or equivalent to the sealing surface of the case.

24. Install the gear selector assembly, tighten the bolts to 20 N.m (15 ft. lbs.).

3339240

Fig. 71: Uniform Bead Of Mopar® RTV Sealer
Courtesy of CHRYSLER GROUP, LLC

25. Apply a uniform bead of Mopar® Threebond RTV Sealer or equivalent to the sealing surface of the **new** input shaft sealing ring.

3339778

Fig. 72: Sealing Ring To The Transmission
Courtesy of CHRYSLER GROUP, LLC

26. Install the sealing ring to the transmission.

Fig. 73: Concentric Slave Cylinder (CSC) and Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the Concentric Slave Cylinder (CSC) and bolt to the transmission. Tighten the bolts to 10 N.m (89 in. lbs.) and engage the retention tabs.

Fig. 74: Hydraulic Fitting & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

28. Connect the hydraulic fitting (2) to the plastic retainer (1).

Fig. 75: Retention Clip & Connection
Courtesy of CHRYSLER GROUP, LLC

29. Connect the hydraulic connection at the case.
30. Install the axle seals.

Refer to SEAL, AXLE DRIVE SHAFT, INSTALLATION.

INSTALLATION

INSTALLATION

1. Raise the transmission while avoiding obstacles and until the transmission is in line with the engine.

Fig. 76: Removing/Installing Transmission
Courtesy of CHRYSLER GROUP, LLC

2. Push the transmission toward the engine far enough for the input shaft to engage the clutch.

Fig. 77: Locating Bolts Holding Engine To Bellhousing & Bellhousing To Oil Pan
Courtesy of CHRYSLER GROUP, LLC

3. On the backside of the engine, Install the bolt (1) to hold engine to the bellhousing and the bolt (2) to hold the bellhousing to the oil pan. Refer to **SPECIFICATIONS**.

Fig. 78: Locating Bolts Holding Engine Block To Transmission Bellhousing & Bellhousing To Oil Pan

Courtesy of CHRYSLER GROUP, LLC

4. On the front of the engine, remove the bolts (1) to hold the engine block to the transmission bellhousing and the bellhousing to the oil pan. Refer to **SPECIFICATIONS**.

Fig. 79: Backup Lamp Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness connector (1) to the backup lamp switch.
6. Install the front suspension cradle and load beams.
7. Install the starter motor. Refer to **STARTER, INSTALLATION**.
8. Install the catalytic converter on the engine. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION**.

210273640

Fig. 80: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

9. If Used, remove the cap-plug sealing the end of the hydraulic line used to avoid losing hydraulic fluid.
10. Engage the clutch hydraulic coupling (4) onto the slave cylinder on the transmission.

2101010606

Fig. 81: Locating Nut Holding Ground Cable To Transmission
Courtesy of CHRYSLER GROUP, LLC

11. Place the ground cable in position on the transmission.

12. Install the nut (1) to hold the ground cable to the transmission. Refer to **SPECIFICATIONS**.

Fig. 82: Positioning Transmission Jack, High Stand & Wood Block
Courtesy of CHRYSLER GROUP, LLC

13. Remove the high stand (2) from under the engine oil pan.
14. Remove the safety chain or strap and lower transmission jack (1) from under the transmission.
15. Lower the vehicle.

Fig. 83: Locating Bolts Holding Upper Mount To Adapter Spacer & Adapter Spacer To Transmission
Courtesy of CHRYSLER GROUP, LLC

16. Place transmission mount spacer in position on the transmission.
17. Install the bolts (3),(2= hidden) to hold the transmission mount adapter spacer (4) to the transmission. Refer to **SPECIFICATIONS**.
18. Position a floor jack under the transmission and lift the transmission enough to start the bolts in the upper transmission mount.
19. Install the bolts (1) to hold the upper transmission mount to the transmission mount adapter spacer (4). Refer to **SPECIFICATIONS**.

Fig. 84: Locating Bolts Holding Upper Bellhousing To Engine Block
Courtesy of CHRYSLER GROUP, LLC

20. Install the bolts (1) to hold the upper bellhousing to the engine block. Refer to **SPECIFICATIONS**.

Fig. 85: Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

21. Route the wire harness in proper position.
22. Engage the wire harness retainers (1) onto the top of the bellhousing bolts.
23. Install the exhaust clamp to hold the turbo charger to the catalytic converter.
24. Install the oxygen sensor. Refer to **SENSOR, OXYGEN, INSTALLATION** .
25. Connect the wire connector onto the oxygen sensor.
26. Connect the wire connector onto the exhaust temperature sensor.
27. Install the exhaust heat shield in position on the exhaust manifold.
28. Engage the clips to hold the shift cables housing ends to the bracket on the transmission.
29. Snap the select cable end in position on the lever ball stud on the transmission.
30. Snap the shift cable end in position on the lever ball stud on the transmission.
31. Raise the vehicle to gain access to the power transfer unit (PTU).
32. If equipped, Install the PTU.
33. Remove the fill plug and fill the transmission with the proper quantity and type fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
34. Install the fill plug.
35. Install the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .
36. If equipped, Install the rear propeller shaft. Refer to **INSTALLATION** .
37. Install the front halfshafts.
38. Install the front wheel bolts in the front brake rotor hub.
39. While holding a pry bar across the wheel bolts to prevent the wheel hub in position on rotating, Install the NEW front wheel hub nuts. Refer to **SPECIFICATIONS** .
40. Using tool (special tool #10287-1, Tool, Staking), stake the front hub nuts to lock them on the halfshaft

stub shaft.

41. Lower the vehicle to gain access engine compartment.
42. Place the charge air tube in position on the vehicle.
43. Connect the charge air tube to the throttle body adapter.
44. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
45. Engage the retainer to hold the wire harness to the front fascia.
46. Connect wire harness connector at the left side of the front fascia.
47. Install the right front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
48. Install the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
49. Install the bolt to hold the charge air hose to the side of the transmission.
50. Engage the clamp on the charge air outlet hose on the left side of the radiator support panel.
51. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
52. Lower the vehicle to mid level.
53. Install the front wheels. Refer to **INSTALLATION** .
54. Lower the vehicle to gain access to the engine compartment.
55. Install the pinch bolt to hold the steering column to the steering gear.
56. Install the battery and battery tray. Refer to **INSTALLATION** .
57. Engage the clips to hold the wire harness to the battery tray.
58. Install the upper radiator closeout panel.
59. Install the engine cover.
60. Close and latch the hood.
61. Road test the vehicle to verify the repair.

8418.)

BOOT, GEARSHIFT

REMOVAL

REMOVAL

1. Remove the gear shift knob.
2. Disengage arrowhead fasteners holding lower shifter boot escutcheon to the floor console.
3. Pull boot upward to gain access to the reverse lockout cable.
4. Pull the reverse lock out cable housing upward and sideways to disengage the cable from the shifter base.
5. Disengage the cable end from the lockout lever.

061069626

Fig. 86: Gear Shift Boot
Courtesy of CHRYSLER GROUP, LLC

6. Separate the shifter boot from the vehicle.

INSTALLATION

INSTALLATION

061069628

Fig. 87: Shift Boot & Reverse Lockout Cable End
Courtesy of CHRYSLER GROUP, LLC

1. Engage reverse lockout cable end (1) into the slot in the pass through opening under the shift boot (2).

061069626

Fig. 88: Gear Shift Boot
Courtesy of CHRYSLER GROUP, LLC

2. Place the shifter boot in position over the shift lever.
3. While holding the reverse lockout cable end in place, align the flat guide in the pass through opening in the boot with the flat on the gear shift lever.
4. Push the boot downward until it seats on the gear shift lever.
5. Engage the lower lockout cable end into the lock lever on the shifter base.
6. Pull upward on the lockout cable housing while guiding the lockout cable core into the slot on the shifter base.
7. Insert the lockout cable housing into the retaining hole in the shifter base.
8. Engage arrowhead fasteners to hold lower shifter boot escutcheon to the floor console.
9. Install the gear shift knob.

KNOB, GEARSHIFT

REMOVAL

REMOVAL

NOTE: The upper hemisphere of the gearshift knob is fastened to the lower hemisphere with polyurethane adhesive. The upper hemisphere must be destroyed to remove it.

061069622

Fig. 89: Gear Shift Knob & Internal Nut
Courtesy of CHRYSLER GROUP, LLC

1. To remove the gearshift knob:

- Using a 15 mm (5/8 in.) hole saw or drill bit, drill a hole (3) in the crown of the upper hemisphere of the gear shift knob (1) to gain access to an internal nut (2).
- **Alternate method:**

Using Channel-lock™ pliers, fracture the upper hemisphere and separate it from the gear shift knob lower hemisphere.

2. Using a suitable vacuum cleaner or regulated 3.4 kPa (50 psi) shop air, clean the access hole of debris.
3. Remove nut (2) holding the gear shift knob to the gear shift lever.
4. Separate the gear shift knob from the gear shift lever.

INSTALLATION

INSTALLATION

NOTE: The service replacement package should contain a small tube of adhesive.

1. Align the flat guide surface inside the center pass through hole in the lower hemisphere with the flat on the gearshift lever and push down until the gearshift knob seats.

061069621

Fig. 90: Gear Shift Knob & Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install the nut (1) to hold the gearshift knob (2) to the gearshift lever.

061069624

Fig. 91: Gear Shift Knob & Adhesive Locations
Courtesy of CHRYSLER GROUP, LLC

3. Apply 6 mm (1/4 in.) dabs of adhesive in three locations (2) next to the elongated slots on the lower gear shift knob (1).

061069625

Fig. 92: Upper & Lower Hemisphere
Courtesy of CHRYSLER GROUP, LLC

4. Align the longest lock-tab on the upper hemisphere (1) to the longest slot on the lower hemisphere (2).
5. Push the upper hemisphere (1) downward until it locks in place.

CABLE, GEARSHIFT CONTROL

ADJUSTMENTS

ADJUSTMENT/SELECT CABLE

NOTE: The select cable adjustment device is located at the transaxle end of the select cable.

1. Release the hood latch and open the hood.
2. Support the hood on the provided prop-rod.
3. Remove the engine cover.
4. Remove the upper radiator closeout panel.
5. Disengage the clips holding the wire harness to the battery tray.
6. Remove the battery and battery tray. Refer to **TRAY, BATTERY, REMOVAL**.

Fig. 93: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable prying tool, pry the select cable end from the select lever ball stud on the transaxle.
8. Manually hold the select lever into neutral/reverse position.
9. Using a suitable elastic strap, Push the shift handle to the right and fix the shift handle in the reverse/neutral location.

2102011231

Fig. 94: Disengaging Adjuster Slide Lock Button To Allow Select Cable End To Telescope
Courtesy of CHRYSLER GROUP, LLC

10. Disengage the adjuster slide (2) lock button (1) to allow the select cable end (3) to telescope.
11. Connect the select cable end on the select lever ball stud.

2102011232

Fig. 95: Engaging Adjuster Slide Lock Button To Set Select Cable End Length
Courtesy of CHRYSLER GROUP, LLC

12. Engage the adjuster slide (2) lock button (1) to set the select cable length.
13. Verify that the shifter operates properly.
14. Install the battery tray and battery.

15. Connect the wire harness retainers to the battery tray.
16. Install the upper radiator closeout panel.
17. Install the engine cover.
18. Close the hood.
19. Road test the vehicle to verify the repair.

REMOVAL

REMOVAL

NOTE: The transaxle shift cables are serviced as a set. The cable ends are too large to be drawn through the holes in the rubber floor plug.

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Remove the center console assembly. Refer to **CONSOLE, FLOOR, REMOVAL**.

Fig. 96: Disengaging/Engaging Retainers Holding Cable Housings To Shifter Base
 Courtesy of CHRYSLER GROUP, LLC

3. Disengage retainers holding cable housings to shifter base.
4. Pull the cable housing from the shifter base.

Fig. 97: Neutral Gate Cable End & Shifter Pin
Courtesy of CHRYSLER GROUP, LLC

5. Pry select cable (3) end to the left toward the driver's seat to disengage the cable end from the select lever (2) pin.

Fig. 98: Fulcrum Ball, Cable End & Spring-Clip
Courtesy of CHRYSLER GROUP, LLC

6. Release spring-clip (3) holding cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end upward to engage it.
7. Release the lock on the neutral sensor wire connector.
8. Separate the wire harness connector from the neutral sensor.
9. Unhook the wire harness retainer and position the harness out of the way.
10. Remove the nuts holding the shifter to the floor.
11. Separate the shifter from the vehicle.
12. Open the hood and support it on the prop-rod.
13. Remove the engine cover/air cleaner assembly to gain access to the top of the transaxle. Refer to **BODY, AIR CLEANER, REMOVAL**.

Fig. 99: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

14. Disengage retainer holding the shift cable to the transaxle bracket and lift the shift cable housing from the bracket.
15. Using a suitable pry bar (2), pry shift cable upward (1) to disengage it from the counterweighted gearshift lever ball stud.

Fig. 100: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

16. Disengage retainer holding the select cable to the transaxle bracket and lift the cable housing from the bracket.
17. Using a suitable pry bar (1), pry select cable (2) end to the left (driver side) to disengage the select cable end from the select lever ball stud.
18. Remove the locking retainers from the shift cable housing ends to avoid breaking them during removal.
19. Raise the vehicle to gain access to the underside of the vehicle.

Fig. 101: Exhaust Heat Shield, Exhaust Pipe & Rear Drive Shaft
Courtesy of CHRYSLER GROUP, LLC

20. Remove the bolts holding the exhaust heat shield (3) to the floor above the exhaust pipe (4) and if equipped, the rear drive shaft (2).
21. Roll the heat shield (3) to the right (passenger side) of the vehicle and separate the heat shield (3) from the vehicle.

Fig. 102: Shift Cables, Rubber Floor Plug & Floor Opening
Courtesy of CHRYSLER GROUP, LLC

22. Using a suitable prying tool, pry the rubber floor plug (3) downward, taking care not to tear the plug.
23. Pull the shift cables (1) through the opening in the floor (4) and under the floor pan.

Fig. 103: Shift Cables, Rear Propeller Shaft & Front Stabilizer Bar

Courtesy of CHRYSLER GROUP, LLC

24. If equipped, guide the shift cables (1) over the top of the rear propeller shaft (2) to the left side of the vehicle.
25. Guide the cables (1) rearward until the upper cable ends (1) are visible above the front stabilizer bar (3).
26. One at a time, pull the cable ends (1) through the gap above the stabilizer bar (3).
27. Separate the cables from the vehicle.

INSTALLATION**INSTALLATION**

NOTE: The transaxle shift cables are serviced as a set. The cable ends are too large to be drawn through the holes in the rubber floor plug.

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the underside of the vehicle.

Fig. 104: Shift Cables, Rear Propeller Shaft & Front Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

3. Place the cables in position on the vehicle.
4. One at a time, push the cable ends (1) through the gap above the stabilizer bar (3).
5. Guide the cables (1) forward until the upper cable ends (1) are in line with the retaining bracket on top of the transaxle.
6. If equipped, guide the shift cables (1) over the top of the rear propeller shaft (2) and in line with the opening in the floor.

Fig. 105: Shift Cables, Rubber Floor Plug & Floor Opening
Courtesy of CHRYSLER GROUP, LLC

7. Push the shift cables (1) through the opening in the floor.
8. Insert the rubber floor plug (3) upward until it seats properly.

Fig. 106: Exhaust Heat Shield, Exhaust Pipe & Rear Drive Shaft
Courtesy of CHRYSLER GROUP, LLC

9. Roll the heat shield (3) to the left in proper position on the vehicle.
10. Install the bolts to hold the exhaust heat shield (3) to the floor above the exhaust pipe (4) and if equipped, the rear propeller shaft (2).

11. Lower the vehicle to gain access to the top side of the vehicle.
12. Install the locking rings onto the shift cable housing ends.

Fig. 107: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

13. Place the select cable end on the select lever ball stud and snap the select cable (2) end onto the ball stud.
14. Place the cable housing in position on the bracket and engage the retainer to hold the select cable to the transaxle bracket.

Fig. 108: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

15. Place the shift cable end on the shift lever ball stud and snap the shift cable (2) end onto the ball stud.
16. Place the cable housing in position on the bracket and engage the retainer to hold the select cable to the transaxle bracket.
17. Install the engine cover/air cleaner assembly. Refer to **BODY, AIR CLEANER, INSTALLATION** .
18. Place the shifter in position in the vehicle.
19. Install the nuts to hold the shifter to the floor.
20. Place the harness in proper position and hook the wire harness retainer to the shift mechanism.
21. Engage the wire harness connector into the neutral sensor lead connector.
22. Engage the lock on the neutral sensor wire connector.

210268818

Courtesy of CHRYSLER GROUP, LLC

23. Engage spring-clip (3) to hold cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end upward to disengage it.

Fig. 110: Neutral Gate Cable End & Shifter Pin
 Courtesy of CHRYSLER GROUP, LLC

24. Engage the cable (3) end onto the select lever (2) pin.

Fig. 111: Disengaging/Engaging Retainers Holding Cable Housings To Shifter Base
 Courtesy of CHRYSLER GROUP, LLC

25. Engage retainers to hold the cable housings to shifter base (1).
26. If necessary, adjust the shift select cable.
27. Install the center console assembly.

28. Close the hood.
29. Road test the vehicle to verify the repair.

DIFFERENTIAL, TRANSAXLE

DISASSEMBLY

DISASSEMBLY

Fig. 112: Remove Pinion Side Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: This procedure will require the removal of the bearing cage and rollers. New bearings must be used upon reassembly.

1. Using (special tool #C-293-PA, Puller, Press) (1), (special tool #8353, Blocks, Adapter) (2), and (special tool #9676, Adapter Plug) (3) remove the pinion side differential bearing.

Fig. 113: Remove Ring Gear Side Bearing
 Courtesy of CHRYSLER GROUP, LLC

2. Using (special tool #C-293-PA, Puller, Press) (1), (special tool #8353, Blocks, Adapter) (2), and (special tool #9676, Adapter Plug), remove the ring gear side differential bearing.
3. Remove the ring gear bolts.
4. Remove the ring gear.

ASSEMBLY

ASSEMBLY

3807416

Fig. 114: Differential Bearing & Special Tool

Courtesy of CHRYSLER GROUP, LLC

1. Position the ring gear.
2. Install **new** ring gear bolts (1) and tighten to 83 N.m (61 ft. lbs.).
3. Install a **new** ring gear side differential bearing (1) using a suitable press and (special tool #C-4340, Installer, Bearing) (2).
4. Install a **new** Pinion gear side differential bearing using a suitable press and (special tool #C-4340, Installer, Bearing) (2).

FLUID**STANDARD PROCEDURE****FLUID DRAIN AND FILL**

NOTE: It is acceptable to top-off fluid level in the case of fluid loss due to service of halfshaft, seal, etc.

- Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole.
- The minimum acceptable fluid level is 23 mm (0.9 in) below the bottom of the fill hole.

To fabricate a fluid level dipstick, cut a 15 mm (0.6 in) wide strip, length wise, from a common business card. At 30 mm (1.2 in) from one end, fold the strip to 90°. The short end of the strip is the dipstick and the long end is the handle. Insert the paper dipstick into the fill hole and press the handle end against the flattened threshold so the dipstick end turns downward into the sump near the differential carrier. Remove the paper dipstick and immediately measure the distance from the fold crease in the paper to the top of the fluid line. As time passes the paper will absorb the fluid and the witness mark the fluid left in the paper will become invalid. The distance from the fold to the fluid mark is the fluid level.

1. Raise vehicle on a suitable jack or hoist.
2. Remove the belly pan.
3. Place a suitable drain pan under transaxle.

210268675

Fig. 115: Transaxle & Drain Plug Hole
Courtesy of CHRYSLER GROUP, LLC

4. Remove transaxle drain plug to allow the fluid to flow (1) into the drain pan until transaxle (2) is empty.
5. Install the drain plug and tighten to 25 N.m (18 lbs. ft.).

210268674

Fig. 116: Transaxle & Fill Plug

Courtesy of CHRYSLER GROUP, LLC

6. Using regulated 344 kPa (50 psi) compressed shop air or stiff bristle brush, clean the area around the fill plug to avoid contaminating the transaxle during the filling operation.
7. Remove the rubber fill plug (1) from the transaxle (2), located rearward and above the left halfshaft.
8. Fill the **COLD** transaxle with 1.7 l (1.8 qt.) of the proper fluid type. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
9. Install the fill plug.
10. Install the belly pan.

FLUID LEVEL INSPECTION

NOTE: The threshold of the fill hole opening extends 40 mm (1.5 in) into the transaxle before turning downward into the sump near the differential ring gear carrier.

NOTE: It is acceptable to top-off fluid level in the case of fluid loss due to service of halfshaft, seal, etc.

- Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole.
- The minimum acceptable fluid level is 23 mm (0.9 in) below the bottom of the fill hole.

To fabricate a fluid level dipstick, cut a 15 mm (0.6 in) wide strip, length wise, from a common business card. At 30 mm (1.2 in) from one end, fold the strip to 90°. The short end of the strip is the dipstick and the long end is the handle. Insert the paper dipstick into the fill hole and press the handle end against the flattened threshold so the dipstick end turns downward into the sump near the differential carrier. Remove the paper dipstick and immediately measure the distance from the fold crease in the paper to the top of the fluid line. As time passes the paper will absorb the fluid and the witness mark the fluid left in the paper will become invalid. The distance from the fold to the fluid mark is the fluid level.

Fig. 117: Transaxle & Fill Plug

Courtesy of CHRYSLER GROUP, LLC

1. Hoist the vehicle on a suitable hoist so the vehicle stays in a level position.
2. Remove belly pan.
3. Using regulated 344 kPa (50 psi) compressed shop air or stiff bristle brush, clean the area around the fill plug to avoid contaminating the transaxle during the filling operation.
4. Remove the rubber fill plug (1) from the transaxle (2), located rearward and above the left halfshaft.
5. Fill the **COLD** transaxle to:
 - Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Install the fill plug.
7. Install the belly pan.

1. Install the backup lamp switch (1) and tighten to 38 N.m (28 lbs. ft.).
2. Connect backup lamp switch connector (2).
3. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**
4. Connect battery negative cable.

2014 RESTRAINTS

Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use **ONLY** the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (<http://dto.vftis.com/mopar/disclaimer.asp>). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93°C (200°F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

SUPPLEMENTAL RESTRAINT SYSTEM

A Supplemental Restraint System (SRS) is standard factory-installed safety equipment on this vehicle. Available supplemental occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed. Additional details of each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position child seat upper tether anchors for the rear seating. Two anchors are integral to the back of the left (60 percent) rear seat back panel, and one is integral to the right (40 percent) rear seat back panel. Two lower anchors are also provided for each outboard rear seating position. The lower anchors are integral to each rear seat stanchion assembly on the rear floor panel and are accessed from the front of the rear seat where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing a lower B-pillar mounted inertia latch-type emergency locking retractor, a height-adjustable upper B-pillar mounted turning loop, a fixed lower seat belt anchor buckle secured to an anchor latch plate on the inner sill near the base of the B-pillar and a traveling end-release seat belt buckle secured to a bracket near the back of the upper inboard seat track. The driver and passenger side front seat belt buckles include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard rear seating position belts employ a C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed lower seat belt anchors secured to the lower C-pillars. The rear center seating position has an inertia latch-type emergency locking retractor that is secured within the left (60 percent) rear seat back. The rear center seating position belt lower anchor is secured to the traveling left rear seat cushion frame along with the left outboard and center end-release seat belt buckles. The right outboard seating position also has a end-release seat belt buckle secured to the traveling right rear seat cushion frame. In vehicles manufactured for certain export markets, each rear seat belt buckle includes an integral seat belt switch that detects whether the rear seat belts have been fastened.

PASSIVE RESTRAINTS

8098029e

Fig. 1: SRS Logo

Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Active Head Restraints** - Inertia activated Active Head Restraints (AHR) are standard equipment for both front seating positions in this vehicle.
- **Dual Front Airbags** - A multistage Driver AirBag (DAB) and front Passenger AirBag (PAB) are used in this vehicle. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the DAB trim cover in the center of the steering wheel and also into the PAB area on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) from four to six seconds as a bulb test each time the status of the ignition switch transitions to On. Pyrotechnic-type driver and passenger front seat belt retractors and anchor buckle tensioners also work in conjunction with the dual front and side curtain airbags.
- **Knee Airbags** - The front airbag system also includes driver and passenger front Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) that are located just below the lower instrument panel reinforcements. These airbags are also passive, inflatable, SRS components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the instrument panel trim just above each airbag location.
- **Front Seat Airbags** - Front seat integrated Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are standard equipment in these vehicles. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.
- **Rear Seat Airbags** - Rear seat integrated Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are optional equipment in these vehicles. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard sides of the rear seat cushion trim cover.
- **Side Curtain Airbags** - Side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC) are standard equipment in this vehicle. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a molded identification **SRS - AIRBAG**

logo located near the top of each B-pillar trim panel.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Head Restraints** - One Active Head Restraint (AHR) is located atop each front seat back unit.
- **Airbag Indicator** - The airbag indicator is integral to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag** - The Driver AirBag (DAB) is located in the center of the steering wheel, beneath the DAB trim cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of the Front End Module (FEM) carrier, just outboard of each side of the cooling module.
- **Knee Airbags** - This vehicle is equipped with Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB). The KAB are mounted below the lower instrument panel reinforcements on each side of the vehicle.
- **Occupant Classification System** - Vehicles manufactured for domestic markets have a Occupant Classification System (OCS). The OCS includes a Seat Weight Sensor (SWS) bladder, a pressure hose and an Occupant Classification Module (OCM) integral to the calibrated passenger front seat cushion.
- **Occupant Detection Sensor** - Vehicles manufactured for export markets have a Occupant Detection Sensor (ODS) located on the top of the seat cushion foam of the passenger side front seat.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on the floor panel transmission tunnel, between the dash panel and the instrument panel center stack support.
- **Passenger Airbag** - The Passenger AirBag (PAB) is located in the instrument panel, beneath the instrument panel cover and above the glove box on the passenger side of the vehicle.
- **Front Seat Airbag** - A front Seat AirBag (SAB) (also known as pelvic and thoracic airbag) is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Rear Seat Airbag** - The optional rear Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are secured to each outboard end of the rear seat cushion pan, where they are concealed beneath the seat cushion trim cover and foam.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractors and both front seat belt anchor buckle units. The seat belt retractor tensioner units are secured to each lower inner B-pillar and are concealed behind the lower B-pillar trim. The seat belt anchor buckle tensioner units are located on the inner sill near the base of the B-pillar and are concealed behind the inner sill trim.
- **Seat Track Position Sensor** - There are two Seat Track Position Sensors (STPS). One sensor is located on the inboard side of one of the seat adjuster tracks on both the driver and the passenger front seats.
- **Side Curtain Airbag** - A standard equipment side curtain airbag (also known as a Side AirBag Inflatable Curtain/SABIC) is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.
- **Side Impact Sensor** - Six side impact sensors are used on vehicles equipped with side curtain airbags, three on each side of the vehicle. One acceleration-type sensor is located behind the B-pillar trim near the

base of each B-pillar, and one acceleration-type sensor is located behind the quarter panel trim near the base of each C-pillar. One pressure-type sensor is located on each front door hardware carrier panel, concealed behind each front door inside trim panel.

The ORC, the IPC and the OCM each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IPC. Refer to **COMMUNICATION, DESCRIPTION**.

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

SUPPLEMENTAL RESTRAINT SYSTEM

The Supplemental Restraint System (SRS) is comprised of two primary subsystems: Active Restraints and Passive Restraints. Additional operational details on each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as Supplemental Restraint System (SRS) components because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components. In addition, each front seat occupant must have their Active Head Restraint (AHR) unit properly adjusted in order to obtain its maximum safety benefit.

The SRS electrical circuits are continuously monitored and controlled by a microcontroller and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) illuminates from four to six seconds as a bulb test each time the status of the ignition switch transitions to On or Start. Following the bulb test, the airbag indicator is turned

On or Off by the ORC to indicate the status of the SRS. If the airbag indicator comes On at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (also known as G forces) upon the acceleration-type impact sensors, or by a pressure wave within a door as measured by the pressure-type impact sensor. When an impact is severe enough, the microcontroller within the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions. The Occupant Classification System (OCS) monitors the passenger side front seat to determine whether or not the passenger side front seat is occupied and, if the seat is occupied, classifies the size of the occupant. The Occupant Classification Module (OCM) then provides an additional logic input that is used by the ORC to determine the appropriate force with which the Passenger AirBag (PAB) and seat belt tensioner should be deployed.

The front seat belt retractor tensioners, front seat belt anchor buckle tensioners, the front seat belt adaptive load limiters and the Knee AirBags (KAB) (also known as the Inflatable Knee Blockers/IKB) are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags (also known as the Side AirBag Inflatable Curtains/SABIC) and the Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the SABIC units, the SAB units and under certain conditions, will also actuate the front seat belt retractor and anchor buckle tensioners.

During a frontal vehicle impact, the KAB units work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The KAB units also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for a front airbag deployment. The adaptive load limiters for the front seat belts allow the ORC to control the belt pressure applied to the chests of the front seat occupants based upon the impact sensor inputs.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners and adaptive load limiter units, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the IC to turn On the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and

location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag

unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines **MUST** be observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC** - It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **If an active head restraint is deployed** - An inertia-based Active Head Restraint (AHR) unit that is undamaged following a deployment may be reset. These units are designed with the intention of reuse.
- **If the driver airbag is deployed** - If the Driver AirBag (DAB) has been deployed, the clockspring and the steering column must also be replaced.
- **If the knee airbags are deployed** - If the Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) have been deployed, the instrument panel steering column opening cover (left side) and the glove box (right side) must also be replaced.
- **If the passenger airbag is deployed** - If the Passenger AirBag (PAB) has been deployed, the instrument panel upper trim cover must also be replaced.
- **If a front seat airbag is deployed** - If a front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) has been deployed, the front seat back frame, the front seat back foam and the front seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.
- **If a rear seat airbag is deployed** - If a rear Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) has been deployed, the rear seat cushion foam and the rear seat cushion trim cover must also be replaced.

- **If a seat belt tensioner is deployed** - The seat belt retractor and anchor buckle tensioners as well as the adaptive load limiters are deployed in conjunction with the front airbags, but can also be deployed with front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) or side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC). The seat belt tensioners must be replaced if either front airbag has been deployed, and must be inspected if either front SAB or SABIC has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag (also known as a Side AirBag Inflatable Curtain/SABIC) has been deployed, the headliner as well as the deploy brackets on the upper B-pillars and the upper C and D-pillars and the trim on the upper A, B, C and D-pillars on the same side of the vehicle as the deployed airbag must also be replaced. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a SABIC deployment.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT DAMAGE

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The Driver AirBag (DAB) and Passenger AirBag (PAB) in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information

regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Transition the ignition switch to the On status.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **AIRBAG SQUIB STATUS** table to determine the status of both DAB squibs and both PAB squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	CONDITIONS	SQUIB STATUS
Driver or Passenger Squib 1 open	AND the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	AND Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.

CLEANUP PROCEDURE

918M-4

Fig. 2: Clean Up Safety Equipment
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.

918M-2

Fig. 3: Vacuuming Residual Powder
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior.

Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.

2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the AIRBAG SQUIB STATUS heading within this information. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the

service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

1. During the following test, the negative cable of the battery remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover and outboard of the steering column.
3. Transition the status of the ignition switch (also known as the Wireless Ignition Node/WIN, Keyless Ignition Node/KIN or IGnition Node Module/IGNM) to On and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the negative cable to the battery.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in Step 5 or Step 6, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.
9. Transition the status of the ignition switch to Off for about 15 seconds, and then back to On. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays On, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet:
(<http://dto.vftis.com/mopar/disclaimer.asp>).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.

Fig. 4: Splice Band

Courtesy of CHRYSLER GROUP, LLC

2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 5: Crimping Tool

Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 6: Solder Splice

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

**Fig. 7: Heat Shrink Tube**

Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

ADJUSTER, SEAT BELT TURNING LOOP

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

3783718

Fig. 8: B-Pillar, Height Adjuster, Screws, Nut, Seat Belt Turning Loop & Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper trim (6) from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
2. Remove the nut (4) that secures the seat belt turning loop (5) to the stud on the height adjuster (2).
3. Remove the seat belt turning loop from the height adjuster.
4. Remove the two screws (3) that secure the height adjuster to the upper inner B-pillar.
5. Remove the seat belt turning loop adjuster from the B-pillar.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

3783718

Fig. 9: B-Pillar, Height Adjuster, Screws, Nut, Seat Belt Turning Loop & Upper Trim
 Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt turning loop height adjuster (2) to the inside of the upper inner B-pillar (1).
2. Install and tighten the two screws (3) that secure the adjuster to the B-pillar. Tighten the screws to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop (5) onto the stud of the height adjuster on the B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
4. Install and tighten the nut (4) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).
5. Reinstall the upper trim (6) onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

1012006765

Fig. 10: Steering Wheel & Driver AirBag (DAB)
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic Driver AirBag (DAB) protective trim cover (2) is the most visible part of the DAB. The DAB is located in the center of the steering wheel (1), where it is secured by a spring wire retainer integral to the fixing plate to two hooks of the steering wheel armature within the hub cavity of the steering wheel. An injection molded, bright emblem with the Chrysler logo is applied to the center of the trim cover.

1012006766

Fig. 11: Driver AirBag (DAB) Components
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the DAB trim cover (1) are the folded airbag cushion, the airbag housing (3), the airbag inflator (5) and the retainers that secure the inflator to the housing. The airbag cushion, housing and inflator are secured within an integral receptacle molded into the back of the trim cover. The vertical walls of this receptacle have numerous integral window features that are engaged by numerous hook features around the perimeter of the DAB housing. Once the trim cover is fully seated onto the housing, it can only be removed by cutting it off. The DAB housing also has four well nuts, to which four screws (6) are fastened to secure the spring wire retainer (4) and the floating horn switch/mounting plate unit (2) to the back of the housing.

The DAB used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the airbag housing.

Keyed and color-coded connector receptacles on the two inflator initiators and a third, non-azide, pyrotechnic-type Micro Gas Generator (MGG) inflator for the DAB active vent are integral to the airbag housing. The three keyed and color-coded connector receptacles are connected to the vehicle electrical system through three jacketed, two-wire pigtail harnesses from the clockspring.

The DAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The DAB trim cover and the floating horn switch are serviced only as a unit with the DAB.

OPERATION

OPERATION

The multistage Driver AirBag (DAB) and the active vent (domestic market vehicles only) are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the DAB squib 1, 2 and 3 circuits to the two initiators in the airbag inflator and the active vent inflator. By using two initiators and an active vent, the airbag can be deployed at multiple levels of force. The force level is managed by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators and the active vent. The longer the delay between the initiator signals and the later the active vent is released, the less forcefully the DAB will deploy.

When the ORC sends the proper electrical signals to each inflator initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the DAB housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the DAB trim cover will split at predetermined breakout lines, then fold back out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through discrete vents within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

The active vent is like a small airbag cushion within the airbag cushion except the active vent cushion slows the deflation of the primary cushion by partially blocking the vents in the primary cushion. The ORC monitors a seat track position sensor on the driver front seat. The ORC signals the active vent Micro Gas Generator (MGG) to deploy in a manner that provides the optimal airbag deployment force to reduce the possibility of an airbag-induced injury.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to a Supplemental Restraint System (SRS) fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned during a deployment is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

The ORC monitors the condition of the DAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the DAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 12: Access Holes & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to **SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT**.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.

2. Locate the access holes (2) in the lower surface of the steering wheel (1) hub rear trim cover near each of the two horizontal spokes.

Fig. 13: Driver AirBag (DAB) Mounting/Horn Switch Plate, Retainer Spring, Hooks & Steering Wheel Hub Cavity

Courtesy of CHRYSLER GROUP, LLC

NOTE: The graphic for this procedure shows the Driver AirBag (DAB) mounting/horn switch plate (3) and the retainer spring (4) engaged under the hooks (2) of the armature within the steering wheel hub cavity (1) without the DAB trim cover, cushion, housing and inflator present. This was done to provide graphical clarity of the components involved in DAB retention. The DAB trim cover, cushion, housing and inflator can only be removed as a unit with the mounting/horn switch plate and retainer spring as outlined in the following procedure.

3. Insert an appropriately sized pin punch or Allen wrench through one of the steering wheel access holes. A guide and notch (5) integral to each side of the steering wheel hub rear trim cover (1) and the mounting/horn switch plate (3) will assist in directing the tool to the ends of the retainer spring (4).

Fig. 14: Special Tool, Groove, Retainer Spring & Hook
Courtesy of CHRYSLER GROUP, LLC

4. When the tool (3) makes contact with the retainer spring (2), push inward (toward the steering column) on the tool far enough to disengage the retainer spring from under the hook (1) of the steering wheel armature.

Fig. 15: Lower Rear Spoke Cover, Screws & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary, but may prove helpful to remove the two screws (2) that secure the lower rear spoke cover (1) to the back of the steering wheel (3) and remove the cover. It will then be possible to observe the Allen wrench or pin punch contacting and releasing the retainer spring.

5. Pull the released side of the DAB away from the steering wheel far enough to insert a trim stick or another long and thin obstacle between the released side of the DAB trim cover and the steering wheel hub cavity. This will help to prevent the released end of the retainer spring from becoming accidentally engaged again, while the opposite end of the retainer spring is being released.
6. Repeat Steps 3 and 4 for the opposite end of the retainer spring.

1012006767

Fig. 16: View Of DAB Wiring Connections
Courtesy of CHRYSLER GROUP, LLC

7. Pull the DAB away from the steering wheel far enough to access the clockspring pigtail wire connections to the horn switch (1), the active vent (2 - domestic market vehicles only) and the DAB inflator initiators (3).
8. Disconnect the clockspring pigtail wire connector from the floating horn switch plate connector on the back of the switch plate.
9. On domestic market vehicles only, the clockspring DAB pigtail wire connector insulator is secured by an integral Connector Position Assurance (CPA) lock to the active vent connector receptacle, which is located on the back of the DAB housing. Pull the lock straight back from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.

Fig. 17: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock

Courtesy of CHRYSLER GROUP, LLC

10. The clockspring DAB pigtail wire connector insulators (1) are secured by integral latches (3) and a CPA lock (2) to the airbag inflator connector receptacles, which are located on the back of the floating horn switch plate and the DAB housing. Pull the lock straight out from the connector insulator, then pull the insulators straight out from the connector receptacles to disengage and disconnect them.
11. Remove the DAB and floating horn switch plate from the steering wheel as a unit.
12. If the DAB has been deployed, the clockspring and the steering column must also be replaced. Refer to **CLOCKSPRING, REMOVAL**. Refer to **COLUMN, REMOVAL**.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

1012006767

Fig. 18: View Of DAB Wiring Connections
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to **SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT**.

1. Position the Driver AirBag (DAB) and floating horn switch unit close enough to the steering wheel to access the clockspring pigtail wire connections to the horn switch (1), the active vent (2 - domestic market vehicles only) and the DAB inflator initiators (3).
2. Reconnect the clockspring pigtail wire connectors to the airbag inflator initiator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. Be certain that each connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. For domestic market vehicles only, reconnect the clockspring pigtail wire connector to the DAB active vent connector receptacle on the back of the mounting and horn switch plate. Be certain that the connector is fully engaged in its receptacle, then slide the CPA lock straight into the connector to lock it into place.
4. Reconnect the clockspring wire harness connector to the floating horn switch connector on the back of the mounting/horn switch plate.

5. Carefully position the DAB and floating horn switch unit into the steering wheel hub cavity while tugging lightly upward on the clockspring pigtail wires for the airbag and tucking the wires into the upper hub cavity of the steering wheel. Be certain that none of the steering wheel wiring is pinched between the airbag housing or the horn switch and the steering wheel armature.
6. Using both hands, push firmly and evenly on both sides of the DAB trim cover until both ends of the spring retainer have snapped into place under the hooks within the hub cavity of the steering wheel.
7. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, KNEE BLOCKER

DESCRIPTION

DESCRIPTION

Fig. 19: Airbag Housing, Studs, Inflator Initiator & Protective Cover
Courtesy of CHRYSLER GROUP, LLC

Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) are used on both the driver and passenger sides of this vehicle when it is manufactured for domestic markets. Vehicles manufactured for export markets have only a driver side KAB. These airbags are passive, inflatable Supplemental Restraint System (SRS) components. Vehicles with this equipment may be readily identified by the **SRS - AIRBAG** logo located on the instrument panel steering column opening cover for the driver side and on the glove box door for the passenger side. The KAB units are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

The stamped metal airbag housing (1) is secured by four studs (4) with nuts to the stamped metal lower instrument panel reinforcement of the instrument panel support structure. A molded plastic protective cover (5) is secured over the folded airbag cushion by several hook formations stamped into the airbag housing that are engaged through window openings in tabs integral to the outer perimeter of the cover.

The airbag housing contains the airbag inflator and a heat shield. The airbag inflator is a single-initiator, non-azide hybrid-type unit that is secured to the housing by two studs (2) with nuts and sealed within the airbag housing. The airbags are connected to the vehicle electrical system through dedicated take outs and connector insulators of the instrument panel wire harness that connect directly to the inflator initiator (3) of each airbag.

The driver and passenger side KAB units are not interchangeable. The inflator initiators are on the opposite, inboard ends of the module housing and the mounting stud locations are offset to prevent each airbag unit from being installed in the improper location.

The KAB units cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the KAB units are deployed, the steering column opening cover and the glove box must also be replaced.

OPERATION

OPERATION

The Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) to which it is connected through a driver or passenger KAB line 1 (or squib) circuit to the initiator in the airbag inflator. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the KAB protective cover will split at predetermined tear seam lines concealed on the underside of the cover, then fold open and out of the way.

The cushion protects the lower extremities of the vehicle driver or front seat passenger and helps to keep the seat occupant properly positioned for the Driver AirBag (DAB) or Passenger AirBag (PAB) deployment during a frontal impact collision. Following an airbag deployment, the KAB cushion quickly deflates by venting the inert gas through the loose weave of the fabric used to construct the instrument panel side of the airbag cushion, and the deflated cushion hangs down loosely from the lower instrument panel.

The ORC monitors the condition of the KAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the KAB initiators and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

DRIVER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

1011006176

Fig. 20: View Of Knee AirBag (KAB) Fasteners LH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to

discharge before further service.

2. Remove the steering column opening cover from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.
3. Remove the four nuts (1) that secure the Knee AirBag (KAB) (2) to the lower reinforcement (3) of the instrument panel structural support.
4. Rotate the outboard end of the KAB downward so that the KAB is vertical and the instrument panel wire harness connection to the KAB faces upward.

Fig. 21: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock

Courtesy of CHRYSLER GROUP, LLC

5. The KAB connector insulator (1) is secured by integral latches (3) and a Connector Position Assurance (CPA) lock (2) to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
6. Remove the KAB from the vehicle.

PASSENGER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber

gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

1011006177

Fig. 22: Knee AirBag (KAB) Fasteners RH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to GLOVE BOX, INSTRUMENT PANEL, REMOVAL.
3. Remove the four nuts (3) that secure the Knee AirBag (KAB) (2) to the lower reinforcement (1) of the instrument panel structural support.
4. Rotate the outboard end of the KAB unit downward so that the KAB is vertical and the instrument panel wire harness connection to the KAB faces upward.

Fig. 23: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock

Courtesy of CHRYSLER GROUP, LLC

5. The KAB connector insulator (1) is secured by integral latches (3) and a Connector Position Assurance (CPA) lock (2) to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
6. Remove the KAB from the vehicle.

INSTALLATION

DRIVER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or

becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

1011006176

Fig. 24: View Of Knee AirBag (KAB) Fasteners LH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the Knee AirBag (KAB) (2) unit below the steering column opening of the instrument panel in a vertical orientation with the KAB inflator initiator connector receptacle facing upward.
2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the inflator initiator connector receptacle by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. Carefully position the KAB unit to the lower reinforcement (3) of the instrument panel structural support. **Be certain the instrument panel wire harness take out for the KAB is routed behind the KAB and is not pinched between the KAB housing and the lower reinforcement of the instrument panel structural support.**

4. Install and tighten the four nuts (1) that secure the mounting studs of the KAB unit to the lower reinforcement of the instrument panel structural support. Tighten the nuts to 9 N.m (80 in. lbs.).
5. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION**.
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

PASSENGER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 25: Knee AirBag (KAB) Fasteners RH Side
Courtesy of CHRYSLER GROUP, LLC

- NOTE:** The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to **SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT**.
1. Position the Knee AirBag (KAB) (2) unit below the glove box opening of the instrument panel in a vertical orientation with the KAB inflator initiator connector receptacle facing upward.
 2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the inflator initiator connector receptacle by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
 3. Carefully position the KAB unit to the lower reinforcement (1) of the instrument panel structural support. **Be certain the instrument panel wire harness take out for the KAB is routed behind the KAB and is not pinched between the KAB housing and the lower reinforcement of the instrument panel structural support.**
 4. Install and tighten the four nuts (3) that secure the mounting studs of the KAB unit to the lower reinforcement of the instrument panel structural support. Tighten the nuts to 9 N.m (80 in. lbs.).
 5. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.
 6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

1020006265

Fig. 26: Air Bag, Passenger (PAB)**Courtesy of CHRYSLER GROUP, LLC**

The horizontal surface of the instrument panel top pad (1) above the glove box (2) is the most visible part of the Passenger Airbag (PAB). The PAB door is integral to the top of the instrument panel top pad forward of and above the glove box on the instrument panel in front of the front seat passenger seating position.

Located below the PAB door area of the instrument panel top pad, the molded thermoplastic PAB retainer or chute is secured to the underside of the top pad. The retainer defines the PAB door breakout area of the top pad and serves as the receptacle for the PAB cushion and housing. Numerous small window openings on the forward and rearward flanges of the receptacle receive mating hook formations stamped into the airbag housing, which locate and secure the housing to the top pad.

**Fig. 27: PAB Unit Components**

Courtesy of CHRYSLER GROUP, LLC

The PAB unit is also secured by a mounting bracket (4) and two screws to the instrument panel structural support. The PAB unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The PAB unit consists of a stamped metal housing (3), the airbag cushion (1), a Micro Gas Generator (MGG) for the active vent (6) (domestic market vehicles only) and the two-stage airbag inflator (2). The PAB inflator, the mounting bracket and the airbag cushion are secured to the housing by four studs and four nuts. The airbag housing contains the folded airbag cushion and the cushion retainer (7). An approximately 66 centimeter (26 inch) wide by 76 centimeter (30 inch) high rectangular fabric cushion is used.

The PAB inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. Three dedicated take outs and yellow connectors of the PAB wire harness (5) with keyed, color-coded insulators connect the two inflator initiators and the active vent MGG to a yellow, 6 way connector secured to the mounting bracket. A dedicated take out and connector of the instrument panel wire harness connects the PAB to the vehicle electrical system.

The PAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The PAB door and chute or retainer are serviced only as a unit with the instrument panel top pad. If the PAB is deployed, the top pad must also be replaced.

OPERATION

OPERATION

The multistage Passenger AirBag (PAB) is deployed by electrical signals generated by the Occupant Restraint

Controller (ORC) through PAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator, and by a PAB squib 3 circuit to the initiator of the Micro Gas Generator (MGG) for the active vent (domestic market vehicles only). By using two initiators and an active vent, the PAB can be deployed at multiple levels of force. The force level is managed by the ORC to suit the monitored impact conditions by providing one of multiple delay intervals between the electrical signals provided to the two initiators and the tether release. The longer the delay between the initiator signals and the sooner the active vent is opened, the less forcefully the PAB will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the PAB door will split at predetermined tear seam lines concealed on the inside surface of the door, then the door will pivot up over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through a discrete vent in each fabric side panel of the airbag cushion.

The MGG inflates a small cushion within the primary cushion to control the active vent. The ORC monitors a seat track position sensor on the passenger front seat. If the seat is in the full forward position when an airbag deployment occurs, the ORC keeps the active vent open. With the active vent open the airbag deployment is less forceful, which reduces the possibility of an airbag-induced injury when the passenger is seated close to the deploying airbag. If the passenger front seat is not in the full forward position, the active vent is closed during airbag deployment.

Typically, all initiators are used during a PAB deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that all initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

The ORC monitors the condition of the PAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the PAB inflator, the active vent MGG and the squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in

accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

1020006267

Fig. 28: Removing/Installing Passenger AirBag (PAB)

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to GLOVE BOX, INSTRUMENT PANEL, REMOVAL.
3. Reach through and above the glove box opening (4) of the instrument panel to access and remove the two screws (5) that secure the Passenger AirBag (PAB) (2) lower mounting bracket to the instrument panel structural support (3).

4. Still reaching through the glove box opening, disconnect the instrument panel wire harness connector from the PAB pigtail wire harness connector (1).

Fig. 29: Chute, Housing & Top Pad
Courtesy of CHRYSLER GROUP, LLC

5. Remove the top pad (3) and PAB from the instrument panel as a unit. Refer to **PAD, INSTRUMENT PANEL, REMOVAL**.
6. Place the top pad on a suitable work surface with the top facing down. If the top pad will be reused, be certain to take the proper precautions to prevent the top pad from receiving cosmetic damage during the following procedures.
7. Disengage each of the hooks on one side of the PAB housing (2) from the windows in the forward or rearward vertical walls of the PAB retainer or chute (1) on the underside of the top pad. To disengage the hooks, use hand pressure to pull the adjacent edge of the PAB housing firmly and evenly upward out of the retainer receptacle, while at the same time pulling the upper edge of the receptacle wall outward far enough to disengage the hooks.
8. With all of the hooks on one side of the PAB housing disengaged from the retainer, rotate that side of the housing upward far enough to disengage the hooks on the opposite side of the housing from the retainer.
9. With all of the hooks disengaged, lift the PAB housing, inflator, and cushion as a unit from the receptacle of the PAB retainer or chute on the underside of the instrument panel top pad.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground)

cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 30: Chute, Housing & Top Pad
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Place the instrument panel top pad (3) on a suitable work surface with the Passenger AirBag (PAB) retainer or chute (1) receptacle facing up. Be certain to take the proper precautions to prevent the top pad

from receiving cosmetic damage during the following procedures.

2. Carefully position the PAB housing (2) to the PAB retainer or chute receptacle. The side of the PAB housing with 5 hooks faces rearward in the vehicle.
3. Engage all of the hooks on one side of the PAB housing through the windows on the same side of the PAB retainer or chute, then rotate the opposite side of the PAB housing downward into the receptacle.
4. Inspect around the perimeter of the PAB making certain each of the hooks on the PAB housing is fully engaged through the windows in the forward and rearward vertical walls of the PAB retainer or chute receptacle.
5. Reinstall the top pad onto the instrument panel. Refer to **PAD, INSTRUMENT PANEL, INSTALLATION**.

1020006267

Fig. 31: Removing/Installing Passenger AirBag (PAB)

Courtesy of CHRYSLER GROUP, LLC

6. Reach through and above the glove box opening (4) of the instrument panel to reconnect the instrument panel wire harness connector to the PAB pigtail wire harness connector (1). Be certain that the connector is fully engaged and locked.
7. Still reaching through the glove box opening, install and tighten the two screws (5) that secure the PAB (2) lower mounting bracket to the instrument panel structural support (3). Tighten the screws to 9 N.m (80 in. lbs.).
8. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.
9. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, SEAT

DESCRIPTION

FRONT

1011006269

Fig. 32: Front Seat Airbags (SAB)

Courtesy of CHRYSLER GROUP, LLC

The front Seat AirBags (SAB) (1) (also known as pelvic and thoracic airbags) are completely concealed beneath the seat back trim cover on the outboard sides of both front seat backs. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover. The folded SAB cushion is contained within a fabric wrap secured to the two airbag mounting studs. The airbag cushion is constructed of a coated nylon fabric. The airbags are inserted into a sewn pouch called an intensifier on the inside of the trim cover. The pouch is made of the same material as the airbag cushion.

The fabric wrap of the SAB also contains the airbag inflator and a heat shield. Two studs (3) are installed on the inflator within the fabric wrap and extend through the rearward side of the unit. The airbag is then secured to the seat back frame by nuts on those two studs. The SAB inflator is a single-initiator, pyrotechnic-type Micro Gas Generator (MGG) unit (2) that is secured to and sealed within the SAB. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the MGG initiator. The connector insulator is uniquely keyed and color-coded to ensure that it can only be connected to the initiator.

There are unique versions of the SAB for the various seat options available, and they are not interchangeable. Besides unique part numbers, the SAB for the standard seat is taller and narrower, while the SAB for the fold

flat (also known as the storage seat) is shorter and wider.

The front SAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the front SAB is deployed, the seat back frame, the seat back foam cushion, the seat back trim cover and the SAB jumper wire harness must also be replaced.

REAR

1011006270

Fig. 33: Rear Seat Airbags (SAB)
Courtesy of CHRYSLER GROUP, LLC

The available rear Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are completely concealed within the lower outboard ends of the rear seat cushion beneath the rear seat cushion trim cover and sandwiched between the outboard seat cushion frame (2) and the outboard seat cushion trim. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the rear seat cushion trim cover. The rear SAB cushion is constructed of a coated nylon fabric. The folded SAB cushion is contained within and protected by a soft fabric wrap (1) made of the same material as the airbag cushion. The airbags are inserted into a sewn pouch called an intensifier on the inside of the trim cover. The pouch is also made of the same material as the airbag cushion.

The open end of the SAB cushion is clamped over the outlet tube integral to the SAB inflator. Two studs (4) on the inflator are secured by nuts to a stamped metal bracket on the outboard side of the seat cushion frame, while a tether strap (3) on the loose end of the SAB cushion is secured by a screw to the rear corner of the seat cushion frame. The SAB inflator is a single-initiator, pyrotechnic-type unit. The SAB is connected to the vehicle electrical system through a dedicated take out and connector insulator of a rear seat cushion wire harness that connects directly to the inflator initiator (5). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.

The rear SAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If a rear SAB is deployed, the rear seat cushion foam, the seat cushion trim cover and the rear seat cushion wire harness must also be replaced.

OPERATION

FRONT

Each front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right front SAB line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the pyrotechnic-type Micro Gas Generator (MGG) inflator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which ignites chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the SAB cushion and a diffuser in the inflator directs all of the inert gas into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric wrap, the pouch (intensifier) integral to the seat back trim cover and the outboard side of the seat back trim cover. The cushion then expands into the area between the outboard side of the front seat and the front door to form a cushion to protect the front seat occupant during a side impact collision or a vehicle rollover incident.

Following the SAB deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and through a vent in the cushion. After venting is achieved, the deflated cushion hangs down loosely from the outboard side of the front seat back.

The ORC monitors the condition of the front SAB through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the front MGG SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REAR

Each rear Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right rear SAB line 1 and line 2 (or squib) circuits. Each SAB has a pyrotechnic-type Micro Gas Generator (MGG) inflator assembly.

When the ORC sends the proper electrical signal to the SAB inflator initiator, the electrical energy creates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas.

The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric wrap, the pouch (intensifier) integral to the seat cushion trim cover and the outboard side of the seat cushion trim cover, then expand into the area between the outboard side of the rear seat and the rear door to form a cushion to protect the rear seat occupant during a side impact collision or a vehicle rollover incident.

Following the rear SAB deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and through a vent in the cushion. After venting is achieved, the deflated cushion hangs down loosely from the outboard side of the rear seat cushion.

The ORC monitors the condition of the rear SAB through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the rear SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 34: Inflator Connector Receptacle, Jumper Wire Harness & Seat Airbag

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to SEAT, REMOVAL.

CAUTION: During removal of the seat back trim cover, be certain not to tear or damage the integral nylon pouch that contains the seat airbag. If the nylon pouch or the trim cover are torn or damaged, the entire front seat back trim cover must be replaced with a new unit.

4. Remove the trim from the front and back of the front seat back frame, but do not remove from the outboard side of the seat back until after the Seat AirBag (SAB) (3) has been detached from the seat. Refer to COVER, SEAT BACK, REMOVAL.

CAUTION: Do not pull on the seat airbag jumper wire harness (4) take out or pry on the connector insulator to disengage the connector from the seat airbag (1) inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.

5. Disconnect the seat wire harness connector (2) from the top of the SAB inflator (1). Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.

Fig. 35: Seat Back Frame, Nuts & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two nuts (2) from the inside of the seat back frame (1) that secure the SAB (3) to the outside of the seat back frame.
7. Disengage the SAB mounting studs from the outboard side of the seat back frame, then remove the trim cover and the SAB from the seat back frame as a unit.
8. Carefully disengage the two SAB mounting studs from the nylon pouch (intensifier) and slide the SAB out of the pouch. Be careful not to tear or damage the pouch or the trim cover.

REAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

1021006273

Fig. 36: Rear Seat Airbag (SAB) & Tether Anchor Clip
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to **SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT**.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the rear seat cushion from the vehicle. (Refer to **SEATS, REAR**).
3. Disengage the outboard end of the trim cover from the rear seat cushion.
4. Remove the screw (3) that secures the rear Seat AirBag (SAB) tether anchor clip (1) to the outboard rear corner of the seat cushion frame (2).

1021006271

Fig. 37: Removing/Installing Seat AirBag (SAB)
Courtesy of CHRYSLER GROUP, LLC

5. Remove the screw (3) that secures the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame (1).
6. Move the plastic SAB initiator cover far enough to access and disconnect the seat wire harness connector (5) from the rear SAB inflator initiator. Pull the Connector Position Assurance (CPA) lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
7. Remove the two nuts that secure the studs (2) of the SAB inflator to the bracket near the outboard front corner of the seat cushion frame.
8. Carefully disengage the SAB from the nylon pouch (intensifier) and slide the SAB out of the pouch. Be careful not to tear or damage the pouch or the trim cover.
9. Remove the SAB from the seat cushion frame.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: The seat airbag (1) must be installed into the nylon mesh pouch integral to the front seat back trim cover before the airbag or the trim cover are installed on the front seat back frame (2). Failure to do so will adversely affect the function of the seat airbag system.

Fig. 38: Seat Back Frame, Nuts & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Carefully slide the Seat AirBag (SAB) (3) into the nylon pouch (intensifier) integral to the outboard side of the front seat back trim cover and engage the two SAB mounting studs through the holes provided in the pouch. Be careful not to tear or damage the pouch or the trim cover.
2. Position the SAB and trim cover as a unit to the outboard side of the seat back frame (1) and insert the studs through the mounting holes in the seat back frame.
3. Install and tighten the two nuts (2) that secure the SAB to the inside of the seat back frame. Tighten the nuts to 10 N.m (88 in. lbs.).

Fig. 39: Inflator Connector Receptacle, Jumper Wire Harness & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

4. Reconnect the seat wire harness connector (2) to the top of the SAB (3) inflator (1). You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector snaps into place.
5. Push the Connector Position Assurance (CPA) lock firmly into the SAB connector insulator until it is flush with the upper surface of the insulator.

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the seat airbag system.

6. Reinstall the trim onto the front and back of the front seat back frame. Refer to **COVER, SEAT BACK, INSTALLATION**.
7. Reinstall the front seat into the vehicle. Refer to **SEAT, INSTALLATION**.
8. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

REAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 40: Removing/Installing Seat AirBag (SAB)
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Carefully slide the Seat AirBag (SAB) (3) into the nylon pouch (intensifier) integral to the outboard side of the rear seat cushion trim cover. Use care not to tear or damage the pouch or the trim cover.
2. Position the rear Seat AirBag (SAB) onto the bracket near the outboard front corner of the seat cushion frame (1).
3. Install and tighten the two nuts that secure the studs (2) of the SAB inflator to the bracket on the outboard front corner of the seat cushion frame. Tighten the nuts to 7 N.m (62 in. lbs.).
4. Reconnect the seat wire harness connector (5) to the SAB inflator. You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector snaps into place.
5. Push the Connector Position Assurance (CPA) lock firmly into the SAB connector insulator until it is flush with the upper surface of the insulator.

6. Position the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame.
7. Install and tighten the screw that secures the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame. Tighten the screw to 3 N.m (27 in. lbs.).
8. Reinstall the outboard end of the trim cover (4) onto the rear seat cushion frame.
9. Position rear SAB tether anchor clip (1) to the outboard rear corner of the seat cushion frame (2).
10. Install and tighten the screw (3) that secures the rear SAB tether anchor clip to the seat cushion frame. Tighten the screw to 5 N.m (44 in. lbs.).
11. Reinstall the rear seat cushion into the vehicle. (Refer to **SEATS, REAR**).
12. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

1011006175

Fig. 41: Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

Side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC) are standard factory-installed equipment for this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. The side curtain airbag system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident. Each side curtain airbag cushion provides full coverage of the side glass on the same side of the vehicle as the monitored impact.

Each vehicle is equipped with two individually controlled side curtain airbag units. These side curtain airbag units are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion is contained within a fabric wrap and suspended from plastic clamp hangers (3) that are spaced along the inner roof rail from the A-pillar at the front of the vehicle to near the D-pillar at the rear of the vehicle. A tether (2) extends down the A-pillar from the front of the side curtain airbag cushion, while a second tether (4) is secured above the D-pillar at the rear. A stamped retainer at the end of each tether is secured to a slot in the sheet metal. A nut secures the front tether retainer to a weld stud on the A-pillar, while a screw secures the rear tether to the inner roof rail.

The hybrid-type inflator (1) for each side curtain airbag is secured to the roof rail above the B-pillar and is connected to the airbag cushion by a long tubular manifold. The inflator bracket has an integral hook formation on one end. The inflator is initially hung from the roof rail by the hook formation, then plastic push-in fasteners secure the clamp hangers and the body of the airbag cushion to the roof rail and to stamped metal deploy brackets at the top of the B-pillar and above the C and D-pillars. Finally, the entire assembly is secured with screws to the inner roof rail.

The airbag inflator is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness near the top of the B-pillar. The body wire harness connects the side curtain airbag unit to the Occupant Restraint Controller (ORC).

The side curtain airbag units cannot be adjusted or repaired and must be replaced if deployed, ineffective or in any way damaged. Once a side curtain airbag has been deployed, the complete side curtain airbag unit, the deploy brackets, the headliner, the A-pillar trim as well as all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through the left or right SABIC line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded airbag cushion, causing the cushion to inflate. As the cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident. The cushion features large chambers that inflate adjacent to the head of each front and rear seat occupant.

The front and rear tethers keep the side curtain airbag cushion taut to the side of the vehicle. In addition, the deploy brackets at the top of each B-pillar and above the C and D-pillars guide the cushion past the upper B, C and D-pillar trim into the proper deployment position. Following the deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down

loosely from the roof rail.

The ORC monitors the condition of the side curtain airbags through circuit resistance, will illuminate the airbag indicator in the instrument cluster and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the side curtain airbag inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

1009005966

Fig. 42: Removing/Installing C&D-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the headliner from the vehicle. Refer to HEADLINER, REMOVAL.
3. Remove the screw that secures the Side AirBag Inflatable Curtain (SABIC) (1) rear tether to the inner roof rail (2).
4. Remove the two screws that secure the SABIC mounting tabs to the inner roof rail above the C (3) and D-pillars.
5. Disengage the plastic push-in retainers that secure the SABIC to the C and D-pillar deploy bracket (4) above the C and D-pillars.

NOTE: If the SABIC has been deployed, the C and D-pillar deploy bracket must also be replaced.

1009005965

Fig. 43: Removing/Installing A-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

6. Remove the nut (3) that secures the SABIC (1) front tether to the inner A-pillar (2) near the belt line.
7. Remove the two screws that secure the SABIC mounting tabs to the inner A-pillar and the inner roof rail above the A-pillar.
8. Disengage the plastic push-in retainers that secure the SABIC to the inner A-pillar and the inner roof rail above the A-pillar.

1009005964

Fig. 44: Removing/Installing B-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the body wire harness connector (3) from the connector receptacle at the rear of the SABIC inflator located on the inner roof rail (2) above the B-pillar (6). The SABIC connector insulator is secured by integral latches and a Connector Position Assurance (CPA) lock to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
10. Remove the two screws (5) that secure the SABIC mounting tab to the inner roof rail above the rear door opening and the inflator bracket above the B-pillar.

NOTE: If the SABIC has been deployed, the B-pillar deploy bracket (1) must also be replaced.

11. Disengage the plastic push-in retainers that secure the SABIC to the inner roof rail.
12. Disengage the metal hooks that secure the inflator mounting bracket from the slots in the inner roof rail.
13. Remove the SABIC and inflator from the vehicle as a unit.

B-PILLAR

1009005962

Fig. 45: Removing/Installing B-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Remove the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) from the vehicle. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL**.
2. Remove the three blind rivets (1) that secure the deploy bracket (3) near the top of the B-pillar (2).

3. Slide the bracket upward far enough to disengage the tabs at the top of the bracket from the locator holes in the inner B-pillar and roof rail.
4. Remove the deploy bracket from the vehicle and discard.

C AND D-PILLAR

1009005963

Fig. 46: Removing/Installing C&D-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Remove the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) from the vehicle. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL**.
2. Remove the three blind rivets (1) that secure the deploy bracket (2) near the tops of the C-pillar (3) and D-pillar.
3. Disengage the tabs at the top of the bracket from the locator holes in the upper inner C-pillar.
4. Remove the deploy bracket from the vehicle and discard.

INSTALLATION

AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 47: Removing/Installing B-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the Side AirBag Inflatable Curtain (SABIC) and inflator (4) into the vehicle as a unit.
2. Position the inflator mounting bracket to the inner roof rail above the deploy bracket (1) on the B-pillar (6) and engage the metal hooks on the inflator bracket into the slots in the inner roof rail (2).
3. Engage the plastic push-in retainers that temporarily secure the SABIC to the inner roof rail.
4. Install and tighten the two screws (5) that secure the inflator bracket above the B-pillar and the mounting tab to the inner roof rail above the rear door opening. Tighten the screw to 7 N.m (62 in. lbs.).
5. Reconnect the connector insulator (3) of the body wire harness take out for the SABIC to the inflator initiator connector receptacle at the rear of the inflator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.

1009005965

Fig. 48: Removing/Installing A-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

6. Engage the plastic push-in retainers that secure the SABIC (1) to the inner roof rail above the A-pillar and to the inner A-pillar (2).
7. Install and tighten the two screws (2) that secure SABIC mounting tabs to the inner roof rail above the A-pillar and to the inner A-pillar. Tighten the screws to 7 N.m (62 in. lbs.).
8. Install and tighten the nut (3) that secures the front tether to the inner A-pillar near the belt line. Tighten the nut to 7 N.m (62 in. lbs.).

1009005966

Fig. 49: Removing/Installing C&D-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

9. Engage the plastic push-in retainers that secure the SABIC (1) to the C and D-pillar deploy bracket (4) above the C (3) and D-pillars.
10. Install and tighten the two screws that secure the SABIC mounting tabs to the inner roof rail (2). Tighten the screws to 7 N.m (62 in. lbs.).
11. Install and tighten the screw that secures the SABIC rear tether to the inner roof rail. Tighten the screw to 7 N.m (62 in. lbs.).
12. Reinstall the headliner into the vehicle. Refer to **HEADLINER, INSTALLATION**.
13. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

B-PILLAR

1009005962

Fig. 50: Removing/Installing B-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the deploy bracket (3) near the top of the inner B-pillar (2).
2. Engage the tabs at the top of the bracket into the locator holes in the inner B-pillar.
3. Install three new blind rivets (1) to secure the bracket to the B-pillar.
4. Reinstall the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) into the vehicle.
Refer to **AIR BAG, SIDE CURTAIN, INSTALLATION**.

C AND D-PILLAR

1009005963

Fig. 51: Removing/Installing C&D-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the deploy bracket (2) near the tops of the inner C-pillar (3) and D-pillar.
2. Engage the tabs at the top of the bracket into the locator holes in the upper inner C-pillar.
3. Install three new blind rivets (1) to secure the bracket near the tops of the C-pillar and D-pillar.
4. Reinstall the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) into the vehicle.
Refer to **AIR BAG, SIDE CURTAIN, INSTALLATION**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

1009005960

Fig. 52: Child Seat Anchor/Tether
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for Children (LATCH) child restraint anchorage system for domestic markets. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors (also known as ISOFIX anchors) for child restraints in either the two outboard seating positions or for the right outboard and the center positions only. There should never be three child restraints installed in the rear seat at the same time. Vehicles manufactured for export markets are not equipped with the upper tether anchors, but do have the ISOFIX lower anchors.

The three upper tether anchors (3) are integral to the rear seat back panels. One anchor is integral to the back of the right rear panel (2), and two are integral to the left rear panel (1). These anchors are each constructed from short lengths of heavy-gauge steel wire that is securely welded to the seat back frames. A molded plastic trim bezel and cup provides a neat appearance to each of the anchor openings in the seat back panels.

These child restraint upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with their respective rear seat back panels. The trim bezels are available for separate service replacement.

100905961

Fig. 53: ISOFIX Lower Anchors

Courtesy of CHRYSLER GROUP, LLC

The ISOFIX lower anchors are integral to the left or right rear seat stanchion assembly located beneath the rear edge of the rear seat cushion. These anchors are each constructed from a heavy-gauge steel wire loop that is securely welded to the rear seat stanchion frame. The rear seat ISOFIX lower anchors are each accessed from the front of their respective seat, at each side where the seat back meets the seat cushion. Round marker buttons with a molded child seat icon help identify the ISOFIX anchor locations as they may be otherwise difficult to see with the seat back in the upright position.

The child restraint ISOFIX lower tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the rear seat stanchion assembly.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The second row seats in this vehicle have two pairs of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, one in each outboard seating position or one in the center and another in the right outboard position. There should never be three seats installed at the same time, or a seat in the center position in combination with a seat in the left outboard position.

With LATCH, child seats are secured by direct attachment to the vehicle seat structure, rather than by the seat belts. With LATCH-compatible child seats, lower (also known as ISOFIX) anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the second row seat back frames to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap. Vehicles manufactured for export markets are equipped with only the ISOFIX lower anchors, and have no upper tether anchor provisions.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

STANDARD PROCEDURE

STANDARD PROCEDURE - SEAT BELT ANCHOR RELEASE

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

102373189

Fig. 54: Lower Anchor Buckle, Allen Key Wrench & Lower Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

Use two Allen key wrenches and the following steps in sequence to disconnect the front seat belt lower anchor latch plate (3) from the lower anchor buckle (1).

1. Insert an Allen key wrench (2) of the appropriate size into the outer hole at the bottom of the anchor buckle housing far enough to compress and hold compressed the internal lock feature of the buckle.
2. While pushing the anchor buckle lightly downward to relieve the tension of the buckle latch mechanism on the latch plate, insert a second Allen key wrench (4) of the appropriate size into the hole in the side of the buckle housing far enough to compress the internal latch plate release feature of the buckle.
3. Pull the seat belt anchor latch plate out of the anchor buckle.
4. Remove both Allen key wrenches from the holes in the anchor buckle housing.

REMOVAL

FRONT ANCHOR TENSIONER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in

accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 55: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt anchor tensioner unit. If the front seat belt anchor tensioner is ineffective or damaged, but is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the seat belt anchor tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to **SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT**.

1. Position the front seat for easiest access to the front seat belt anchor tensioner buckle (2).
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to

discharge before further service.

3. Release the front seat belt anchor latch plate (3) from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

Fig. 56: Lower B-Pillar, Front Seat Belt Anchor Tensioner Unit, Screw & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Remove the trim from the lower B-pillar (1) and from over the front seat belt anchor tensioner unit (2) on the inner sill at the base of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
5. Disconnect the body wire harness connector (4) from the anchor tensioner initiator.
6. Remove the screw (3) that secures the anchor tensioner unit to the inner sill.
7. Remove the anchor tensioner unit from the vehicle.

FRONT SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 57: Front Seat Belt Buckle, Seat Belt Buckle Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the front seat from the vehicle. Refer to **SEAT, REMOVAL**.
3. Remove the screw (3) that secures the front seat belt buckle (1) lower anchor to the bracket near the back of the upper inboard seat track.
4. Reach under the seat cushion to access and disconnect the seat wire harness connector from the seat belt buckle switch pigtail wire (2) connector.
5. Remove the seat belt buckle from the front seat.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal

injury.

Fig. 58: Center Seat Belt Buckle And Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the right (40 percent) rear seat to the full forward position, and the left (60 percent) rear seat to the full rearward position.
2. Working from behind the rear seats, unsnap and remove the trim cover from the inboard hinge bracket of the left (60 percent) rear seat.
3. Still working from behind the rear seats, remove the screw (1) that secures the lower anchor for the rear center seat belt buckle (2) to the inboard side of the left (60 percent) rear seat cushion frame (3).
4. Remove the center seat belt buckle and anchor from the left (60 percent) rear seat.

REAR LEFT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 59: Rear Left Seat Belt Buckle And Anchor Plate (60 Percent)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the left (60 percent) rear seat from the vehicle. Refer to **SEAT, REAR, REMOVAL**.
2. Working beneath the rear of the left (60 percent) rear seat cushion, remove the screw (2) that secures the anchor plate of the rear left seat belt buckle (3) to the rear seat cushion frame (1).
3. Remove the rear left seat belt buckle and anchor plate from the left (60 percent) rear seat cushion as a unit.

REAR RIGHT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

0809008697

Fig. 60: Right Rear Seat Belt Buckle Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the left (60 percent) rear seat (4) to the full forward position, and the right (40 percent) rear seat (3) to the full rearward position.
2. Working from behind the rear seats, remove the screw (2) that secures the lower anchor for the right rear seat belt buckle (1) to the bracket at the back of the right rear seat upper inner adjuster track.
3. Remove the right rear seat belt buckle from between the rear seat cushions as a unit.

INSTALLATION

FRONT ANCHOR TENSIONER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper

installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 61: Lower B-Pillar, Front Seat Belt Anchor Tensioner Unit, Screw & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt anchor buckle tensioner unit. The front seat belt anchor buckle is secured to a seat belt anchor buckle tensioner. If the front seat belt anchor buckle tensioner is ineffective or damaged, but the tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt anchor buckle tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat belt anchor buckle tensioner unit (2) into the vehicle.
2. Install and tighten the screw (3) that secures the anchor tensioner unit to the inner sill. Tighten the screw to 45 N.m (33 ft. lbs.).
3. Reconnect the body wire harness connector (4) to the anchor tensioner initiator.
4. Reinstall the lower B-pillar trim panel over the front seat belt anchor tensioner unit on the inner sill at the base of the B-pillar. Refer to PANEL, B-PILLAR TRIM, INSTALLATION.

Fig. 62: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

5. Engage the front seat belt anchor latch plate (3) into the anchor buckle (2).
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

FRONT SEAT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 63: Front Seat Belt Buckle, Seat Belt Buckle Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt buckle (1) lower anchor to the bracket near the back of the upper inboard seat track.
2. Reach under the seat cushion to access and reconnect the seat wire harness connector to the seat belt buckle switch pigtail wire (2) connector.
3. Install and tighten the screw (3) that secures the buckle lower anchor to the bracket. Tighten the screw to 45 N.m (33 ft. lbs.).
4. Reinstall the front seat into the vehicle. Refer to **SEAT, INSTALLATION**.
5. Reconnect the negative cable to the battery.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 64: Center Seat Belt Buckle And Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear center seat belt buckle (2) and anchor plate to the left (60 percent) rear seat.
2. Working from behind the rear seats, install and tighten the screw (1) that secures the lower anchor for the rear center seat belt buckle to the inboard side of the left (60 percent) rear seat cushion frame (3). Tighten the screw to 55 N.m (41 ft. lbs.).
3. Still working from behind the rear seats, reinstall the trim cover onto the inboard hinge bracket of the left (60 percent) rear seat.
4. Adjust the left (60 percent) rear seat and right (40 percent) rear seat to their original positions.

REAR LEFT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal

injury.

Fig. 65: Rear Left Seat Belt Buckle And Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

1. Working beneath the rear of the left (60 percent) rear seat cushion, position the rear left seat belt buckle (3) to the rear seat cushion frame (1).
2. Install and tighten the screw (2) that secures the anchor plate of the rear left seat belt buckle to the rear seat cushion frame. Tighten the screw to 55 N.m (41 ft. lbs.).
3. Reinstall the left (60 percent) rear seat into the vehicle. Refer to **SEAT, REAR, INSTALLATION** .

REAR RIGHT

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

0809008697

Fig. 66: Right Rear Seat Belt Buckle Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Working from behind the rear seats, position the rear right seat belt buckle (1) between the rear seat cushions as a unit.
2. Position the lower anchor of the seat belt buckle to the bracket at the back of the right rear seat upper inner adjuster track.
3. Install and tighten the screw (2) that secures the buckle anchor to the bracket at the back of the right rear seat upper inner adjuster track. Tighten the screw to 55 N.m (41 ft. lbs.).
4. Adjust the left (60 percent) rear seat (4) and right (40 percent) rear seat (3) to their original positions.

CLOCKSPRING

DESCRIPTION

DESCRIPTION

1012006656

Fig. 67: Steering Column Control Module (SCCM) & Clockspring
Courtesy of CHRYSLER GROUP, LLC

The clockspring (4) for this vehicle is secured to the Steering Column Control Module (SCCM) mounting housing (2) near the top of the steering column below the steering wheel. The clockspring is contained within a flat, molded plastic case that includes four integral mounting tabs that secure the unit with screws to mounts integral to the outer circumference of the SCCM mounting housing. The clockspring also includes an integral turn signal cancel cam that is serviced as a unit with the clockspring. The SCCM mounting housing also supports the left (1) and right (3) multifunction switches and the Steering Control Module (SCM), which is internal to the mounting housing. The multifunction switches and the SCM are serviced only as a unit with the SCCM mounting housing, while the clockspring can be separated from and is serviced separately from the SCCM mounting housing.

Within the plastic clockspring case is a spool-like molded clear plastic rotor with an exposed hub. The upper surface of the rotor hub has a large center hole, three short pigtail wires with connectors and a connector receptacle that face toward the steering wheel. The inner surface of the clockspring rotor hub has keyway features that are engaged by lug features on the outer circumference of the steering wheel hub. These interlocking features allow the steering wheel to drive the clockspring and also unlock the clockspring rotor when the steering wheel has been properly installed.

Wound around the rotor spool within the case are long ribbon-like tapes that consist of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tapes terminate at the terminal pins that are housed within a connector receptacle integral to the SCCM mounting housing and face the instrument panel, while the inner ends of the tapes terminate at the pigtail wires and connector receptacle on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor spool hub within the clockspring case also has the integral lobes of the turn signal cancel cam.

The clockspring also has an interconnect with terminal pins that engage a mating interconnect receptacle integral to the SCCM mounting housing. This interconnect features several circuits which pass through the clockspring to connect the SCM to the vehicle electrical system.

The clear plastic clockspring rotor has an outer band that has a translucent or frosted appearance except for a small, clear inspection window area. The clockspring tape has several black squares that are only visible through the clear inspection window when the clockspring is properly centered. If these squares are not visible through the inspection window, clockspring centering has been compromised and the entire clockspring must be replaced with a new unit.

The service replacement clockspring is shipped with the clockspring pre-centered and with a yellow molded plastic locking tab installed. The locking tab secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the clockspring is installed on the steering column and before the steering wheel can be installed. The clockspring cannot be repaired. If the clockspring is ineffective, damaged, if clockspring centering is compromised or if the Driver AirBag (DAB) has been deployed the entire clockspring unit must be replaced. Refer to **CLOCKSPRING, STANDARD PROCEDURE**.

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the Driver AirBag (DAB), the horn switch and, if the vehicle is so equipped, the odometer switch pod or the Electronic Vehicle Information Center (EVIC) switch pod, the Local Interface Network (LIN) module, the speed control switch pod and the remote radio switches. The clockspring is positioned and secured near the top of the steering column. The fixed connector receptacle on the back of the fixed Steering Column Control Module (SCCM) mounting housing connects the clockspring to the vehicle electrical system through a take out with connector from the instrument panel wire harness.

The turn signal cancel cam is integral to the rim of the clockspring rotor hub within the SCCM mounting housing so it also moves with the rotation of the steering wheel. Three short, sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the DAB, while a steering wheel wire harness connected to the connector receptacle on the upper surface of the clockspring rotor completes circuits to the horn switch and, if the vehicle is so equipped, the odometer switch pod or the EVIC switch pod, the LIN module, the speed control switch pod and the remote radio switches.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits.

However, if the steering shaft is disconnected from the steering gear the clockspring rotor spool can change position relative to other movable steering components. Clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in

the inspection window, clockspring centering has been compromised and the entire clockspring must be replaced with a new unit.

Service replacement clocksprings are shipped pre-centered and with a yellow plastic locking tab installed. This locking tab should not be removed until the clockspring has been properly installed on the steering column. If the locking tab is removed before the clockspring is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, the clockspring must be replaced with a new unit.

The hard wired clockspring circuits may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between stationary electronic modules and devices in the vehicle and the rotating electronic modules and devices on or in the steering wheel. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to clockspring operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit **MUST** be replaced with a new unit.

101069467

Fig. 68: Clockspring Rotor, Inspection Window & Black Squares
Courtesy of CHRYSLER GROUP, LLC

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the steering shaft is disconnected from the steering gear, the clockspring rotor spool can change position relative to the fixed steering components.

Clockspring centering must always be confirmed by viewing the inspection window (2) on the clockspring rotor (1). If the black squares (3) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, REMOVAL**.

The service replacement clockspring is shipped pre-centered and with a yellow plastic locking tab installed. This locking tab should not be removed until the clockspring has been properly installed on the steering column. If the locking tab is removed before the clockspring is installed on a steering column, clockspring centering must be confirmed by viewing the black squares on the clockspring tape through the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, INSTALLATION**.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

1012006658

Fig. 69: Clockspring & Fasteners

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and be certain that the entire steering system is locked or inhibited from rotation.

1. Place the front wheels in the straight ahead position.
2. Disconnect and isolate the negative cable from the battery.
3. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
4. Disconnect the steering wheel wire harness connector from the upper clockspring connector receptacle.
5. Remove the steering wheel from the upper steering column shaft. Refer to **WHEEL, STEERING, REMOVAL**.
6. If the removed clockspring is to be reused, be certain that the clockspring rotor is secured to the clockspring case to maintain clockspring centering until the steering wheel is reinstalled on the steering

column. If clockspring centering is not maintained, the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, STANDARD PROCEDURE**.

7. Move the steering column to the fully lowered position and leave the tilt release lever in the released (down) position.
8. Remove the upper and lower shrouds from the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, REMOVAL** and **SHROUD, STEERING COLUMN, UPPER, REMOVAL** .
9. Disconnect the instrument panel wire harness connectors from the back of the Steering Column Control Module (SCCM) mounting housing (1).
10. Remove the four screws (2) that secure the clockspring to the outer circumference of the SCCM mounting housing.
11. Carefully pull the clockspring (3) away from the SCCM mounting housing far enough to disengage the interconnect terminal pins of the clockspring from the interconnect receptacle of the SCCM mounting housing.
12. Remove the clockspring from the steering column.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

1012006658

Fig. 70: Clockspring & Fasteners

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and be certain that the entire steering system is locked or inhibited from rotation.

1. Carefully slide the clockspring (3) down over the steering column upper shaft far enough to align and engage the interconnect terminal pins of the clockspring with the interconnect receptacle of the Steering Column Control Module (SCCM) mounting housing (1).
2. Install and tighten the four screws (2) that secure the mounting tabs of the clockspring to the outer circumference of the SCCM mounting housing. Tighten the screws securely.
3. Reconnect the instrument panel wire harness connectors to the back of the SCCM mounting housing.
4. Reinstall the upper and lower shrouds onto the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, INSTALLATION** and **SHROUD, STEERING COLUMN, UPPER, INSTALLATION**.
5. Move the steering column back to the fully raised position and move the tilt release lever back to the locked (up) position.
6. If a new clockspring is being installed, remove (break off) the yellow locking tab that secures the clockspring rotor to the clockspring case.
7. Reinstall the steering wheel onto the upper steering column shaft. Be certain to align and insert the rotational lugs on the steering wheel hub into the slots in the hub of the clockspring. Also, the steering wheel fastener **MUST** be tightened to the proper torque specification to ensure proper clockspring operation. Refer to **WHEEL, STEERING, INSTALLATION**.
8. Reconnect the steering wheel wire harness connector to the upper clockspring connector receptacle.

9. Reinstall the Driver AirBag (DAB) onto the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
10. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

INDICATOR, SEAT BELT REMINDER (SBR)

DESCRIPTION

DESCRIPTION

1022007446

Fig. 71: Seat Belt Reminder (SBR) Indicator
Courtesy of CHRYSLER GROUP, LLC

Vehicles manufactured for certain export markets are equipped with the Seat Belt Reminder (SBR) indicator (1), which is located within the overhead console. The SBR indicator consists of Light Emitting Diode (LED) units, a Local Interface Network (LIN) data bus communication microchip, an opaque overlay and a translucent outer lens.

The molded plastic indicator housing is secured to the inner surface of the overhead console housing by two spring clips (2) on each end of the housing. An integral connector receptacle on the back of the housing connects the SBR to the vehicle electrical system through a dedicated take out and connector of the overhead console wire harness.

The opaque overlay of the SBR includes five stencil-like cutouts of the International Control and Display Symbol icon for **Seat Belt** within the SBR indicator. Three of the icons in the center of the display are smaller and represent the three rear seating positions, while the two larger icons border the smaller ones and represent

the two front seating positions. An LED unit behind each icon causes that icon to appear in green or red through the translucent lens when it is illuminated from behind by the LED.

Some settings for the SBR feature may be programmable using a diagnostic scan tool and the appropriate commands through the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) Electronic Control Unit (ECU). The SBR indicator cannot be adjusted or repaired and, if ineffective or damaged the SBR indicator unit must be replaced.

OPERATION

OPERATION

The Seat Belt Reminder (SBR) indicator gives an indication to the vehicle operator and occupants of the status of the seat belt for each seating position of the vehicle. When a seat belt is buckled, the icon for that seating position is illuminated in green and when a seat belt is unbuckled, the icon for that seating position is illuminated in red. In the case of the larger icons representing the front seating positions, the indicator is illuminated in red only if the seat is occupied (the driver seat is assumed to be occupied while the status of the ignition is On) and the seat belt is unbuckled, while the smaller icons representing the rear seating positions are illuminated in red with the seat belt unbuckled regardless of whether that seating position is occupied.

The Occupant Restraint Controller (ORC) monitors the status of each of the seat belt switches and the Occupant Detection Sensor (ODS) for the passenger side front seat. The ORC then sends the appropriate seat belt switch status messages over the Controller Area Network (CAN) data bus to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). The IC uses internal hardware and programming to interpret the messages from the ORC and manage both the audible and visual features of the seat belt reminder function. The IC controls audible outputs related to the seat belt reminder through an on board transducer soldered onto its Printed Circuit Board (PCB). The IC is also a Local Interface Network (LIN) master node and uses a number of electronic command messages to control the visual output of the SBR indicator, which is a LIN slave node.

Besides the seat belt switch messages from the ORC, the IC also monitors vehicle speed and the Reverse (R) gear status in order to implement the various visual and audible outputs it controls. Besides the solid red or green indications, the SBR red indication may be flashed on and off, as dictated by the LIN bus message from the IC. All seat belt reminder audible and visual indications have several pre-programmed counters that will cause the indications to change or cease upon expiration of certain timed intervals or due to a change of an input status. Some of the feature programming is mandated by state, provincial, local and federal regulations.

The SBR indicator is completely controlled by the IC. The indicator receives a battery current input on a fused ignition (run) circuit and is connected to a path to ground at all times. Therefore, the SBR indicator will always be Off when the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) is anything except On.

The IC and the ORC will store Diagnostic Trouble Codes (DTC) for any malfunctions they detect. The hard wired circuits between the SBR indicator and the IC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SBR indicator or the electronic controls and communication between other modules and devices that provide some features of the SBR. The most reliable, efficient and accurate means to diagnose the SBR indicator or the electronic controls and communication related to SBR indicator

operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

1022007447

Fig. 72: Overhead Console & Seat Belt Reminder (SBR) Indicator Location
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the overhead console (1) from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.
3. If the vehicle is so equipped, remove the Ultrasonic and Antitilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) from the overhead console. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL**.
4. Disconnect the overhead console wire harness connector (2) from the Seat Belt Reminder (SBR) indicator (3) connector receptacle.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully and evenly pry each outboard end of the SBR away from the overhead console housing until all four spring clips are free.
6. Remove the SBR indicator from the overhead console.

INSTALLATION

INSTALLATION

1022007447

Fig. 73: Overhead Console & Seat Belt Reminder (SBR) Indicator Location
 Courtesy of CHRYSLER GROUP, LLC

1. Position the Seat Belt Reminder (SBR) indicator (3) to the overhead console (1) housing.
2. Align the SBR indicator to the opening in the overhead console housing.
3. Press the outboard ends of the SBR indicator firmly and evenly into the overhead console housing until the four spring clips are fully seated.
4. Reconnect the overhead console wire harness connector (2) to the SBR indicator connector receptacle.
5. If the vehicle is so equipped, reinstall the Ultrasonic and Antitilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) onto the overhead console. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, INSTALLATION**.
6. Reinstall the overhead console onto the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION**.
7. Reconnect the negative cable to the battery.

MODULE, OCCUPANT CLASSIFICATION

DESCRIPTION

DESCRIPTION

100868364

Fig. 74: Seat Cushion Foam, Insulator Pad, Occupant Classification Module, Pressure Hose & Bladder
 Courtesy of CHRYSLER GROUP, LLC

In vehicles manufactured for domestic markets, the passenger side front seat incorporates the Occupant Classification System (OCS). The OCS consists of a single factory-calibrated unit, which includes the following components:

- **Electronic Pressure Sensor** - The electronic pressure sensor is integral and internal to the Occupant Classification Module (OCM). Only the hose nipple for the pressure hose is visible on the outside of the OCM housing. The remainder of the sensor and the sensor circuitry are concealed and protected within the molded black plastic OCM housing.
- **Occupant Classification Module** - The Occupant Classification Module (OCM) (3) is located beneath the front of the passenger front seat cushion. Concealed within a hollow in the center of the molded black plastic OCM housing is the electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. A connector receptacle integral to the front of the OCM housing contains terminal pins that connect the sensor to the vehicle electrical system through a dedicated take out and connector of the passenger front seat wire harness. A hose nipple formation is integral to the OCM housing.

A slot integral to the top of the OCM housing snaps over a blade on a stamped metal bracket riveted to the inboard upper seat track on models with the base seat. On models with the optional storage seat, the OCM housing snaps over a blade on a molded plastic stanchion integral to the forward inboard underside of the seat cushion pan.

- **Pressure Hose** - Beneath the seat cushion a length of clear poly hose serves as the OCS pressure hose (4). The hose is securely clamped at one end to a hose nipple fitting that extends downward from the Seat Weight Sensor (SWS) (also known as the seat weight bladder), and at the opposite end to the hose nipple formation of the electronic pressure sensor integral to the outside of the OCM housing. The pressure sensor circuitry is internal and integral to the OCM. The pressure hose is filled with the same silicone fluid that fills the SWS.

- **Seat Cushion Foam** - The passenger front seat cushion foam (1) is an integral part of the factory-calibrated OCS. There are two unique foam configurations: one for the standard passenger front seat and another for the optional storage front seat. The storage front seat includes a small storage bin which is accessed by lifting the center insert of the seat cushion.
- **Seat Weight Sensor** - The Seat Weight Sensor (SWS) (also known as the seat weight bladder) is sandwiched between the seat cushion springs and the seat cushion foam. A heavy jute-like insulator pad (2) is installed between the lower surface of the bladder (5) and the seat cushion pan and springs. The bladder and pad are secured near the forward end to the seat cushion pan by two plastic push-in fasteners. There are two unique bladder configurations: one for the standard passenger front seat and another for the optional storage front seat. The storage front seat includes a small storage bin which is accessed by lifting the center insert of the seat cushion.

The bladder consists of two sheets of an elastomeric material and a molded plastic hose nipple fitting. The two sheets of elastomeric material are sealed together around their perimeter and joined at numerous specific intervals within their field. The hose nipple fitting is sealed to a small round hole in the lower surface of the bladder and is pointed downward where it passes through a clearance hole in the insulator pad and extends to just below the seat cushion springs. The bladder is filled with a silicone fluid to become a pliable, quilted, resistive mat and is connected to a pressure hose that connects it to the electronic pressure sensor within the OCM unit.

All of the components that make up the OCS are a factory-calibrated and assembled unit. The OCS components cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a calibrated unit. Any time the OCS is removed or replaced for any reason, the new OCS data must be configured within the Occupant Restraint Controller (ORC) using a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATION

OPERATION

In vehicles manufactured for domestic markets, the Occupant Classification System (OCS) provides electronic message inputs to other electronic modules in the vehicle indicating whether the passenger front seat is occupied and the relative size classification of the seat occupant. The microcontroller within the Occupant Classification Module (OCM) contains the OCS logic and communication circuitry. The OCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for OCS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The Seat Weight Sensor (SWS) (also known as the seat weight bladder) and the electronic pressure sensor integral and internal to the OCM allow the OCS logic circuits to sense the relative weight of a load applied to the passenger front seat cushion. When a load is applied to the seat cushion, silicone fluid within the bladder becomes pressurized. These changes in bladder fluid pressure are measured by the electronic pressure sensor circuitry through the OCS pressure hose. As the pressure within the bladder changes, the electronic pressure sensor input to the OCM microcontroller also changes. This electronic pressure sensor input allows the OCM to monitor the passenger front seat cushion by providing a weight-sensing reference to the relative load on the seat cushion.

Pre-programmed decision algorithms and OCS calibration allow the OCM microcontroller to determine the appropriate occupant classification based upon the seat cushion load as signaled by the pressure sensor. The OCM then sends the proper electronic **occupant classification status** messages over the CAN data bus to the Occupant Restraint Controller (ORC) and the ORC controls the deployment circuits for the passenger front supplemental restraints accordingly.

The OCM continuously monitors all of the OCS electrical circuits and components to determine the system readiness. If the OCM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the Occupant Restraint Controller (ORC) over the CAN data bus. Then the ORC sets a DTC and sends electronic messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to control airbag indicator operation.

The OCM receives battery current on a fused ignition output (run-start) circuit through a fuse in the Power Distribution Center (PDC). The OCM circuitry has a path to ground at all times through a ground circuit and take out of the instrument panel wire harness, which it shares with the ORC. This take out is secured to the body sheet metal. These connections allow the OCM to be operational whenever the ignition switch status is ON or START.

The Body Control Module (BCM) stores and compares vehicle configuration data with the OCM as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The hard wired inputs and outputs for the OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the OCM or the electronic controls and communication between other modules and devices that provide some features of the OCS. The most reliable, efficient and accurate means to diagnose the OCM or the electronic controls and communication related to OCS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

100868365

Fig. 75: Harness Connector, Blade, Stanchion & Occupant Classification Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Classification System (OCS) is used only in the passenger side front seat of vehicles manufactured for domestic markets. Vehicles manufactured for export markets use the Occupant Detection Sensor (ODS) instead of the OCS on the passenger side front seat.

NOTE: All of the components of the Occupant Classification System (OCS) including the Occupant Classification Module (OCM), the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad, the passenger seat cushion foam, the electronic pressure sensor and the OCS pressure hose are serviced only as a factory-calibrated and assembled unit. Any time any one of these components requires replacement for any reason, the entire calibrated OCS must be replaced and re-zeroed in the Occupant Restraint Controller (ORC) using a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger front seat from the vehicle. Refer to **SEAT, REMOVAL** .
3. Disconnect the seat wire harness connector (1) from the Occupant Classification Module (OCM) (4) beneath the inboard front corner of the seat cushion pan.
4. Using a small flat-bladed screwdriver or a small pick tool, carefully pry the latch tab integral to the OCM mount to release it from the blade (2) of the mounting bracket (base seat) or stanchion (3) (storage seat) beneath the inboard front corner of the seat cushion.
5. Remove the trim cover from the passenger front seat cushion. Refer to **COVER, SEAT CUSHION, REMOVAL** .

100868366

Fig. 76: Seat Cushion Foam, Seat Weight Sensor Pad & Seat Frame
Courtesy of CHRYSLER GROUP, LLC

6. Remove the foam (1) from the seat cushion.
7. Remove the two push-in plastic fasteners that secure the Seat Weight Sensor (SWS) (also known as the seat weight bladder) and the jute-like SWS pad (2) to the seat cushion pan (3).
8. Remove the SWS, the pad, the pressure hose and the OCM with integral electronic pressure sensor from above the front seat cushion as a unit.
9. If any of the OCS components requires replacement, discard the entire OCS unit. **Replace it with the entire contents of the factory-calibrated service replacement package, which includes an OCM with integral and internal electronic pressure sensor, a pressure hose, the SWS, the jute-like SWS pad and the seat cushion foam.**

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

100868366

Fig. 77: Seat Cushion Foam, Seat Weight Sensor Pad & Seat Frame
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Classification System (OCS) is used only in the passenger side front seat of vehicles manufactured for domestic markets. Vehicles manufactured for export markets use the Occupant Detection Sensor (ODS) instead of the OCS on the passenger side front seat.

NOTE: All of the components of the Occupant Classification System (OCS) including the Occupant Classification Module (OCM), the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad, the passenger seat cushion foam, the electronic pressure sensor and the OCS pressure hose are serviced only as a factory-calibrated and assembled unit. Any time any one of these components requires replacement for any reason, discard all of the removed OCS components including the OCM with integral and internal electronic pressure sensor, the pressure hose, the SWS, the jute-like SWS pad and the seat cushion foam and replace them with the entire contents of the factory-calibrated OCS service replacement package.

1. Position the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad (2), the Occupant Classification System (OCS) pressure hose and the Occupant Classification Module (OCM) with integral electronic pressure sensor to the top of the front seat cushion as a unit. Lift the back of the SWS and pad far enough to access and insert the OCM and pressure hose between the seat cushion springs to the underside of the seat cushion. Be certain the pressure hose is not pinched or kinked.
2. Install the two push-in plastic fasteners that secure the SWS and jute-like pad to the seat cushion pan (3).
3. Position the foam (1) onto the seat cushion.
4. Reinstall the trim cover onto the passenger front seat cushion. Refer to **COVER, SEAT CUSHION, INSTALLATION**.

100868365

Fig. 78: Harness Connector, Blade, Stanchion & Occupant Classification Module
Courtesy of CHRYSLER GROUP, LLC

5. From the underside of the seat cushion, snap the OCM (4) onto the blade (2) of the mounting bracket (base seat) or stanchion (3) (storage seat) beneath the inboard front corner of the seat cushion. Route the pressure hose away from sharp or moving objects and be certain the hose is not kinked.
6. Reconnect the seat wire harness connector (1) to the OCM beneath the inboard front corner of the seat cushion.
7. Reinstall the passenger front seat into the vehicle. Refer to **SEAT, INSTALLATION**.
8. If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.
9. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.
10. Following successful completion of the SRS Verification Test procedure, perform the OCM System Verification Test procedure found in the diagnostic scan tool under Miscellaneous Functions. Refer to the appropriate diagnostic procedures.

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

100868611

Fig. 79: Occupant Restraint Controller, Printed Arrow, Connector Receptacles & Mounting Flanges
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is secured by three nuts to three studs on the top of the floor panel transmission tunnel near the dash panel and beneath the instrument panel forward of the center stack in the passenger compartment of the vehicle. Concealed within a hollow in the center of the molded black plastic ORC housing is the electronic circuitry of the ORC which includes a microcontroller, an electronic impact sensor, an electronic safing sensor, a rollover sensor, a integral Electronic Stability Control (ESC) dynamics sensor (also known as the yaw sensor or sensor cluster) and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing to enclose and protect the internal electronic circuitry and components.

An arrow (2) printed on the label on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has integral mounting flanges (4) on the right and left front and the right rear corners. Two molded plastic electrical connector receptacles (3) exit the rearward facing side of the ORC housing. These receptacles connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the second from the body wire harness.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. In addition, there are unique versions of the ORC for vehicles with or without certain optional Supplemental Restraint System (SRS) components. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The microcontroller within the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag and seat belt indicators in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microcontroller continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the IC over the CAN data bus to turn On the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition cycle, while a stored fault causes a DTC to be stored in memory by the ORC. In the case of some faults which have not recurred for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition output (run) circuit through a fuse in the Power Distribution Center (PDC) and a fused ignition output (run-start) circuit through a second fuse in the PDC. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the status of the ignition switch (also known as the Keyless Ignition Node/KIN or the IGnition Node Module/IGNM) is Start or On.

The ORC also contains an energy-storage capacitor. When the ignition switch status is Start or On, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact event.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left sides of the Front End Module (FEM) carrier inboard of the headlamps near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from an internal rollover sensor, the seat track position sensors, the front seat belt switches, the rear seat belt switches (export markets only) and six additional remote side impact sensors located on the left and right front door hardware module carriers, on the right and left lower B-pillars and on the right and left lower C-pillars to control deployment of the side curtain airbag units, the front seat airbags (also known as pelvic and thoracic airbags) and, if equipped, the rear seat airbags. The ORC also uses electronic message inputs from the Occupant Classification Module (OCM) beneath the passenger front seat cushion pan and will send electronic messages to the IC to illuminate the seat belt indicator when appropriate.

The impact sensors within the ORC are electronic accelerometer sensors that provide an additional logic input to the ORC microcontroller. These sensors are used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. A separate impact sensor within the ORC

provides confirmation to the ORC microcontroller of side impact forces. The ORC uses this input to verify the need for side curtain airbags or seat airbag deployment. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

In most domestic markets this vehicle is also equipped with the Occupant Classification System (OCS). The ORC communicates with the Occupant Classification Module (OCM) over the CAN data bus. The ORC uses inputs from the OCM as an additional logic input for determining the appropriate level of airbag deployment force required for the front passenger seating position. The OCM notifies the ORC when it has detected a monitored system fault and stored a DTC in its memory for any ineffective OCS component or circuit, then the ORC sets a DTC and will send electronic messages to the IC to illuminate the airbag indicator as appropriate.

Pre-programmed decision algorithms in the ORC microcontroller determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection. Based upon the severity of the monitored impact as well as the seat track position sensor and the passenger front seat OCS inputs, the ORC logic determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the knee airbags, the front seat belt tensioners, either side curtain airbag and either right or left, front and rear seat airbag units.

The ORC also contains a integral Electronic Stability Control (ESC) dynamics sensor (also known as the yaw sensor or the sensor cluster). The ORC microcontroller energizes the ESC dynamics sensor, then relays the sensor outputs to the Antilock Brake Module (ABM) over the CAN data bus. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, OPERATION** .

The Body Control Module (BCM) stores and compares vehicle configuration data with the ORC as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The hard wired inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls and communication between other modules and devices that provide some features of the SRS. The most reliable, efficient and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event.

If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

100868612

Fig. 80: Nuts, Occupant Restraint Controller, Harness Connectors & Transmission Tunnel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the front side panels from the center floor console on both the right and left sides of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. Working from the left side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel (5) to access, unlatch and disconnect the body wire harness connector (4) from the Occupant Restraint Controller (ORC) (2) connector receptacle located on the rearward facing side of the module. To disconnect the wire harness connector from the ORC, depress the release tab and lift the lever arm on the connector.
4. Still working from the left side front floor panel, remove the nut (1) that secures the left front mount of the ORC to the stud on the top of the floor panel transmission tunnel.
5. Working from the right side front floor panel, remove the bracket that secures the lower instrument panel center stack structural support to the floor panel transmission tunnel. Refer to **PANEL, INSTRUMENT, REMOVAL**.
6. Still working from the right side front floor panel, reach around the forward edge of the instrument panel center stack support to access, unlatch and disconnect the instrument panel wire harness connector (3) from the ORC connector receptacle located on the rearward facing side of the module. To disconnect the wire harness connector from the ORC, depress the release tab and lift the lever arm on the connector.
7. Still on the right side, remove the two nuts (1) that secure the right front and rear mounts of the ORC to the studs on the top of the floor panel transmission tunnel.
8. Remove the ORC from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

100868612

Fig. 81: Nuts, Occupant Restraint Controller, Harness Connectors & Transmission Tunnel
 Courtesy of CHRYSLER GROUP, LLC

1. Working from the right side front floor panel, carefully position the Occupant Restraint Controller (ORC) (2) onto the front of the floor panel transmission tunnel (5), aligning the mounts of the ORC to the studs on the floor panel. When the ORC is correctly positioned, the bottom of the housing will fit flush with the floor and the orientation arrow on the label on top of the housing will be pointed forward in the vehicle.
2. Still working from the right side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel to install and tighten the two nuts (1) that secure the ORC to the studs on the floor panel transmission tunnel. Tighten the nuts to 8 N.m (71 in. lbs.).
3. Still on the right side, reconnect and latch the instrument panel wire harness connector (3) to the ORC connector receptacle located on the rearward facing side of the module. Be certain that the latch on the connector is fully engaged.
4. Still on the right side, reinstall the bracket that secures the lower instrument panel center stack structural support to the floor panel transmission tunnel. Refer to **PANEL, INSTRUMENT, INSTALLATION**.
5. Working from the left side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel to install and tighten the nut (1) that secures the ORC to the stud on the floor panel transmission tunnel. Tighten the nut to 8 N.m (71 in. lbs.).
6. Still working from the left side front floor panel, reconnect and latch the body wire harness connector (4) to the ORC connector receptacle located on the rearward facing side of the module. Be certain that the latch on the connector is fully engaged.
7. Reinstall the front side panels onto the center floor console on both the right and left sides of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION**.
8. If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool **MUST** be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM)

Miscellaneous Functions menu.

9. If this Electronic Control Unit (ECU) is being replaced with a new unit, the Initialize ORC Miscellaneous Function must be run using a diagnostic scan tool. Refer to **STANDARD PROCEDURE**.
10. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

RESTRAINT, ACTIVE HEAD

DESCRIPTION

DESCRIPTION

Fig. 82: Active Head Restraint (AHR) Units & Mechanical Components
Courtesy of CHRYSLER GROUP, LLC

Active Head Restraint (AHR) units (1) are standard equipment for both front seating positions in this vehicle. One inertia-activated AHR unit is located atop each front seat back. Outwardly, an inertia-activated AHR appears the same as a non-active head restraint. The mechanical components (2) that articulate the inertia-activated AHR headrest pad are all concealed within the front seat back frame assembly.

At the top of the seat back frame are two stamped steel headrest guide tubes. The guide tubes are each inserted through a molded plastic fulcrum bushing installed in the upper seat back frame member and are permanently fixed to a movable stamped steel armature bracket located just below the upper frame member near the top of the seat back. The armature bracket is secured to a stamped steel pivot link at each side that pivots on a screw threaded into a mounting bracket welded to each side member of the seat back frame.

The pivot links are each have a spring attached to a lever opposite the armature bracket attachment that is

anchored to the seat back frame side member below, which provides the spring-loaded return action of the inertia mechanism. The upper end of the static lumbar assembly is secured at each side to the base of the armature bracket. Each side of the lower end of the lumbar assembly is engaged in a ramp bracket riveted to the lower seat back frame member.

The inertia-activated AHR linkage cannot be repaired. If damaged or ineffective, it must be replaced as a unit with a new seat back frame assembly.

OPERATION

OPERATION

The inertia-activated Active Head Restraint (AHR) units are deployed automatically by the mechanism contained within each front seat back assembly. During a rear impact, inertia drives the seat occupant rearward into the seat back, loading the seat lumbar assembly. The ramp brackets at the base of the lumbar assembly translate this rearward travel into a vertical motion. The vertical motion of the lumbar assembly is then transmitted to the armature bracket.

Through the rotation of the pivot links at each side of the armature bracket, the vertical motion of the lumbar assembly is converted to a slightly forward and upward arc of the armature bracket, headrest guide tubes and headrest that is designed to reduce the space between the back of the head of the seat occupant and the head restraint pad. Closing this space catches the head of the seat occupant during a low speed rear impact collision event and is important in reducing or eliminating potentially debilitating cervical (also known as whiplash) injuries.

Unless damaged following the rear impact, the inertia-activated AHR can be reset by simply pushing the front seat headrests rearward to their normal positions.

STANDARD PROCEDURE

STANDARD PROCEDURE - ACTIVE HEAD RESTRAINT RESET

If the Active Head Restraint (AHR) units have been deployed, both the driver and passenger side units must be reset. You can recognize that an AHR has been deployed by the forward position of the head restraint cushion. If deployed, the AHR units can be manually reset by pressing the head restraint rearward.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

The seat belt retractors used in all seating positions include an inertia-type, Emergency Locking Retractor (ELR) mechanism as standard equipment. However, the ELR for all seating positions except the driver side front are mechanically switchable from an ELR to an Automatic Locking Retractor (ALR). Both front seat belt retractors also include a seat belt tensioner feature and an adaptive load limiting feature. Refer to

TENSIONER, SEAT BELT, DESCRIPTION.

The ELR mechanism, the ALR mechanism, the tensioner mechanism and the adaptive load limiting feature are all integral to the seat belt and retractor unit and are concealed beneath molded plastic covers located on the sides of the retractor spool. These features cannot be adjusted or repaired and if ineffective, damaged or deployed, the entire seat belt and retractor unit must be replaced.

OPERATION

OPERATION

The standard inertia-type Emergency Locking Retractor (ELR) will allow the seat belt webbing to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load is sensed. The retractor has an internal inertia latch mechanism that will lock the retractor spool once the predetermined inertia load is sensed. Locking the retractor spool prevents the seat belt webbing from being extracted from the retractor and firmly restrains the occupant wearing the seat belt. The retractor spool is automatically unlatched once the loading of the retractor inertia mechanism and the seat belt are relieved.

The primary function of the switchable ELR to Automatic Locking Retractor (ALR) feature is to securely accommodate an infant or child booster seat in any seating position of the vehicle except the driver side front seat without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type ELR in situations where the minimum inertia locking threshold has not been achieved.

The locked mode of the ALR is engaged and the retractor is switched from operating as a standard inertia-type ELR by first buckling the combination lap and shoulder belt buckle. Then all of the shoulder belt webbing is pulled out from the retractor. Once all of the belt webbing is extracted from the retractor spool, the retractor will automatically become engaged in the pre-locked ALR mode and will make a light, audible clicking or ratchet-like sound as the shoulder belt is allowed to retract onto the spool to provide an audible confirmation that the ALR mode is engaged. Once the ALR mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard ELR (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted back onto the retractor spool. The ELR mode is confirmed by the absence of the light, audible clicking or ratchet-like sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load threshold is sensed, or until the retractor is again switched to the ALR mode.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 83: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat for easiest access to the front seat belt anchor buckle (2).

2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Release the front seat belt anchor latch plate (3) from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

3800780

Fig. 84: B-Pillar, Height Adjuster, Nut, Upper Trim, Seat Belt & Web Guide
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper trim (4) from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
5. Remove the nut (3) that secures the seat belt (5) turning loop to the stud on the height adjuster (2).
6. Remove the seat belt turning loop from the height adjuster.
7. Unsnap the seat belt web guide (6) from the inside of the B-pillar.

1012006768

Fig. 85: Remove/Install B-Pillar Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

8. Remove the lower trim from the inside of the B-pillar (2) and from over the front seat belt retractor tensioner unit (6) near the base of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
9. Remove the screw (4) that secures the retractor lower bracket to the base of the inner B-pillar.
10. Pull the retractor out from the B-pillar far enough to access the yellow body wire harness (5) connectors on the retractor.
11. Disconnect the yellow body wire harness connector (3) from the retractor tensioner initiator. The connector insulator is secured by integral latches and a Connector Position Assurance (CPA) lock to the initiator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
12. Disconnect the yellow body wire harness connector (1) from the retractor adaptive tension limiter initiator. The connector insulator is secured by integral latches and a CPA lock to the initiator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
13. Remove the front seat belt and retractor from the vehicle as a unit.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor.

Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

0809008698

Fig. 86: Seat Belt Lower Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: All seat belt retractors except the driver side front and the rear center include a switchable automatic locking mechanism. Refer to **RETRACTOR, SEAT BELT, DESCRIPTION**.

1. Remove the left (60 percent) rear seat from the vehicle as a unit and place it on a suitable work surface. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures. Refer to **SEAT, REAR, REMOVAL**.
2. Working from behind the seat, remove the screw (2) that secures the seat belt lower anchor plate (1) to the bracket on the back of the seat cushion frame.

Fig. 87: Seat Belt Web Bezel & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws that secure the seat belt web bezel (1) to the top of the seat back and disengage the webbing through the slot in the bezel.
4. Remove the trim cover (2) and foam from the left (60 percent) seat back frame. Refer to **SEAT BACK, FRONT, DISASSEMBLY** .

Fig. 88: Seat Back Frame & Seat Belt Web Guide
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the two screws that secure the seat belt web guide (1) to the top of the seat back frame and disengage the webbing through the slot in the guide.

6. Disengage the push-in plastic fastener that secures the plastic scabbard (2) of the retractor (3) to the seat back frame.

Fig. 89: Rear Center Seat Belt Retractor Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Remove the screw (3) that secures the rear center seat belt retractor to the rear left (60 percent) seat back panel.
8. Disengage the T-tab (2) of the retractor bracket from the T-slot of the seat back panel.
9. Remove the rear center seat belt and retractor unit from the seat back panel.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

1012006769

Fig. 90: C-Pillar Seat Belt Webbing Lower Anchor Attachment
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the left or right rear seat to its most forward position for easiest access to the base of the C-pillar (4).
2. Disengage and slide the lower anchor cover (5) up the seat belt webbing (1) far enough to access the lower anchor attachment.
3. Unscrew the captive nut (3) on the lower anchor from the stud (2) at the base of the C-pillar.

1012006770

Fig. 91: Remove/Install Rear Outboard Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the upper quarter trim panel (3) from the upper C-pillar (1). Refer to **PANEL, QUARTER TRIM, REMOVAL**.
5. Unsnap the C-pillar belt opening bezel (4) from the upper quarter trim panel.
6. Feed the bezel, the belt webbing (6), the latch plate and the lower anchor through the upper quarter trim panel belt opening.
7. Remove the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar.
8. Remove the seat belt turning loop from the upper inner C-pillar.
9. Remove the screw (5) that secures the retractor (7) bracket to the inner C-pillar.
10. Lift the retractor upward far enough to disengage the retractor bracket tab from the keyed slot in the inner C-pillar.
11. Remove the rear outboard seat belt and retractor from the vehicle as a unit.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

1012006768

Fig. 92: Remove/Install B-Pillar Seat Belt Retractor

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to **HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS**. If the seat belt tensioner has been deployed,

review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the seat belt and retractor (5) into the vehicle as a unit.
2. Reconnect the yellow body wire harness connector (3) to the retractor seat belt tensioner initiator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. Reconnect the yellow body wire harness connector (2) to the retractor adaptive tension limiter initiator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the CPA lock straight into the connector to lock it into place.
4. Position the retractor lower bracket to the inner B-pillar (1).
5. Install and tighten the screw (4) that secures the retractor to the inner B-pillar. Tighten the screw to 58 N.m (43 ft. lbs.).
6. Reinstall the lower trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.

Fig. 93: B-Pillar, Height Adjuster, Nut, Upper Trim, Seat Belt & Web Guide
Courtesy of CHRYSLER GROUP, LLC

7. Snap the seat belt web guide (6) onto the inner B-pillar (1). Be certain that the seat belt webbing (5) between the retractor and the web guide is not twisted.
8. Position the seat belt turning loop onto the stud on the height adjuster (2). Be certain that the seat belt webbing between the web guide and the turning loop is not twisted.
9. Install and tighten the nut (3) that secures the turning loop to the bracket. Tighten the nut to 45 N.m (33 ft. lbs.).
10. Reinstall the upper trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.

Fig. 94: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

11. Be certain the seat belt webbing between the turning loop and the lower anchor buckle (2) is not twisted.
12. Insert the lower anchor latch plate into the anchor buckle until it latches into position.
13. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

REAR CENTER

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 95: Rear Center Seat Belt Retractor Fastener
Courtesy of CHRYSLER GROUP, LLC

NOTE: All seat belt retractors except the driver side front and the rear center include a switchable automatic locking mechanism. Refer to **RETRACTOR, SEAT BELT, DESCRIPTION**.

1. Position the rear center seat belt and retractor unit onto the left (60 percent) seat back panel (1). Be certain to engage the T-tab (2) on the retractor frame into the T-slot in the back panel.
2. Install and tighten the screw (3) that secures the retractor to the seat back panel. Tighten the screw to 55 N.m (41 ft. lbs.).

Fig. 96: Seat Back Frame & Seat Belt Web Guide

Courtesy of CHRYSLER GROUP, LLC

3. Engage the push-in plastic fastener that secures the plastic scabbard (2) of the retractor (3) to the seat back frame.
4. Engage the seat belt webbing through the slot in the seat belt web guide (1) and position the guide to the top of the seat back frame. Be certain the seat belt webbing between the retractor and the guide is not twisted.
5. Install and tighten the two screws that secure the seat belt web guide to the top of the seat back frame. Tighten the screws securely.

Fig. 97: Seat Belt Web Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Reinstall the foam and the trim cover (2) onto the seat back frame. Refer to **SEAT BACK, FRONT, ASSEMBLY**.
7. Engage the seat belt webbing through the slot in the seat belt web bezel (1) and position the bezel to the top of the seat back.
8. Install and tighten the two screws that secure the seat belt web bezel to the top of the seat back frame. Tighten the screws securely.

0809008698

Fig. 98: Seat Belt Lower Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

9. Working from behind the rear seat, position the rear center seat belt lower anchor plate (1) to the bracket at the back of the seat cushion frame. Be certain the seat belt webbing between the bezel at the top of the seat back and the lower anchor plate is not twisted.
10. Install and tighten the screw (2) that secures the rear center seat belt lower anchor plate to the bracket at the back of the seat cushion frame. Tighten the screw to 55 N.m (41 ft. lbs.).
11. Reinstall the left (60 percent) rear seat into the vehicle. Refer to **SEAT, INSTALLATION SEAT, REAR, INSTALLATION**.

REAR OUTBOARD

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

1012006770

Fig. 99: Remove/Install Rear Outboard Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt and retractor unit (7) onto the inner C-pillar (1). Be certain to engage the retractor bracket tab into the keyed slot in the inner C-pillar.
2. Install and tighten the screw (5) that secures the retractor bracket to the inner C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop onto the upper inner C-pillar. Be certain the seat belt webbing (6) is not twisted between the retractor and the turning loop.
4. Install and tighten the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
5. Feed the seat belt lower anchor, the latch plate, the seat belt opening bezel (4) and the belt webbing (6) through the upper quarter trim panel (3) belt opening. Be certain the seat belt webbing is not twisted between the turning loop and the upper quarter trim panel belt opening.
6. Snap the C-pillar belt opening bezel into the upper quarter trim panel.
7. Reinstall the upper quarter trim panel onto the upper C-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

1012006769

Fig. 100: C-Pillar Seat Belt Webbing Lower Anchor Attachment
Courtesy of CHRYSLER GROUP, LLC

8. Position the rear outboard seat belt lower anchor to the stud (2) at the base of the C-pillar (4). Be certain the seat belt webbing (1) is not twisted between the upper C-pillar belt opening bezel and the lower anchor.
9. Install and tighten the captive nut (3) that secures the rear outboard seat belt lower anchor to the stud at the base of the C-pillar. Tighten the nut to 45 N.m (33 ft. lbs.).
10. Slide the lower anchor cover (5) down the seat belt webbing and engage it over the lower anchor attachment.
11. Restore the left or right rear seat to its rearward position.

SENSOR, IMPACT

DESCRIPTION

IMPACT SENSORS

Remote or satellite impact sensors are mounted in various strategic locations of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, seat airbags and the seat belt pretensioners. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail elsewhere within this service information.

ACCELERATION TYPE

Fig. 101: Acceleration-Type Impact Sensor, Metal Sleeve, Connector Receptacle & Latch
Courtesy of CHRYSLER GROUP, LLC

Remote or satellite acceleration-type impact sensors (1) are mounted in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the ORC to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and the seat (also known as pelvic and thorax) airbags.

Although the front and side acceleration-type impact sensors are similar in appearance and construction, they may not be interchangeable. The front impact sensors may monitor acceleration forces on a different axis than those monitored by the side impact sensors. Each sensor is secured to its mounting location by a single screw or by a nut and a weld stud. The front sensors are located on each vertical support member of the Front End Module (FEM) carrier between the cooling module and the front lamp unit. A side sensor is located on each inner B-pillar and each inner C-pillar and concealed behind the interior trim.

Each sensor housing has an integral connector receptacle (3), an integral locator pin with a latch feature (4) and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the housing, which is laser welded to seal and protect the internal electronic circuitry and components.

The front impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the Front End Module (FEM) wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

Fig. 102: Pressure-Type Front Door Side Impact Sensors
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type front door side impact sensors (2) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws and is sealed by a resilient gasket (1) to the front door hardware module carrier on the front door inner panel. The sensors are concealed behind the front door trim panel within the passenger compartment.

The right and left front door side impact sensors are identical in construction and calibration. The impact sensor housing has an integral connector receptacle (3), two integral mounting tabs, and an integral hood-like water shield (4). The water shield extends through a hole in the front door module carrier into the interior of the door cavity and protects the sensor orifice from contamination.

A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the pressure sensor. The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness.

The pressure-type side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION**IMPACT SENSORS**

Two types of impact sensors are used in this vehicle. They are the acceleration-type and the pressure-type. Additional operational details of each of these sensor types is described in further detail elsewhere within this service information.

ACCELERATION TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide some features of the SRS. The most reliable, efficient and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PRESSURE TYPE

The pressure-type front door side impact sensors recognize a side impact in the front door area by monitoring changes in pressure within the front door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type front door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL**FRONT**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front supplemental restraint deployment.

1014006016

Fig. 103: Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. For the left impact sensor only, remove the battery tray from the left side of the engine compartment.

Refer to **TRAY, BATTERY, REMOVAL** .

3. For the right impact sensor only, remove the engine air cleaner housing from the right side of the engine compartment. Refer to **BODY, AIR CLEANER, REMOVAL** -2.0L, **BODY, AIR CLEANER, REMOVAL** -2.4L, or **BODY, AIR CLEANER, REMOVAL** -3.2L.
4. Locate the front impact sensor (2) located on the engine compartment side of the Front End Module (FEM) carrier (3), below the upper radiator cross member and just outboard of the cooling module.
5. Disconnect the FEM wire harness connector (4) from the right or left front impact sensor connector receptacle.
6. Remove the screw (1) that secures the sensor to the back of the FEM carrier.
7. Gently pry the sensor away from the FEM carrier far enough to disengage the latch feature of the locator pin on the back of the sensor from the locator hole in the FEM carrier.
8. Remove the right or left front impact sensor from the vehicle.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006354

Fig. 104: B-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are **NOT** interchangeable.

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL**.
4. Disconnect the body wire harness connector (2) from the side impact sensor (3) connector receptacle.
5. Remove the nut (4) that secures the sensor to the weld stud on the lower B-pillar.
6. Gently pry the sensor away from the inner B-pillar far enough to disengage the latch feature of the locator pin from the locator hole.
7. Remove the sensor from the inner B-pillar.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006014

Fig. 105: C-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower C-pillar (1). Refer to **PANEL, QUARTER TRIM, REMOVAL**.
3. Disconnect the body wire harness connector (4) from the side impact sensor (3) connector receptacle.
4. Remove the nut (2) that secures the sensor to the weld stud on the inner C-pillar.
5. Gently pry the sensor away from the inner C-pillar far enough to disengage the latch feature of the locator pin from the locator hole.
6. Remove the sensor from the inner C-pillar.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006015

Fig. 106: Front Door Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left front door. Refer to **PANEL, DOOR TRIM**,

REMOVAL .

3. Disconnect the front door wire harness connector (3) from the side impact sensor (2) connector receptacle.
4. Remove the two screws (1) that secure the side impact sensor to the front door hardware module carrier panel (4).
5. Remove the side impact sensor from the vehicle.

INSTALLATION**FRONT**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

1014006016

Fig. 107: Front Impact Sensor

Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are **NOT** interchangeable.

1. Position the right or left front impact sensor (2) to the back of the Front End Module (FEM) carrier (3) just outboard of the cooling module.
2. Be certain to engage the locating pin integral to the back of the sensor into the locating hole in the FEM carrier.
3. Install and tighten the screw (1) that secures the sensor to the back of the FEM carrier. Tighten the screw to 11 N.m (97 in. lbs.).
4. Reconnect the FEM wire harness connector (4) to the sensor connector receptacle.
5. For the left impact sensor only, reinstall the battery tray into the left side of the engine compartment. Refer to **TRAY, BATTERY, INSTALLATION**.
6. For the right impact sensor only, reinstall the engine air cleaner housing into the right side of the engine compartment. Refer to **BODY, AIR CLEANER, INSTALLATION** -2.0L, **BODY, AIR CLEANER, INSTALLATION** -2.4L, or **BODY, AIR CLEANER, INSTALLATION** -3.2L.
7. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006354

Fig. 108: B-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the side impact sensor (3) onto the weld stud on the inner B-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner B-pillar.
2. Install and tighten the nut (4) that secures the sensor to the inner B-pillar. Tighten the nut to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (2) to the sensor connector receptacle.

4. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION**.
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006014

Fig. 109: C-Pillar Side Impact Sensor

Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the side impact sensor (3) onto the weld stud on the inner C-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner C-pillar.
2. Install and tighten the nut (2) that secures the sensor to the inner C-pillar. Tighten the nut to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the C-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

1014006015

Fig. 110: Front Door Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

- NOTE:** Be certain that the gasket between the pressure-type side impact sensor and the front door hardware module carrier panel is in good condition and positioned on the back of the sensor. There **MUST** be a good seal between the sensor and the hardware module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.
1. Position the side impact sensor (2) to the right or left front door hardware module carrier panel (4). When the sensor is correctly positioned, the sensor connector receptacle will be pointed toward the bottom of the door.
 2. Install and tighten the two screws (1) that secure the side impact sensor to the door hardware module carrier panel. Tighten the screws to 2.4 N.m (21 in. lbs.).
 3. Reconnect the front door wire harness connector (3) to the sensor connector receptacle.
 4. Reinstall the trim panel onto the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, INSTALLATION**.
 5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SENSOR, OCCUPANT DETECTION

DESCRIPTION

DESCRIPTION

1014006355

Fig. 111: Occupant Detection Sensor (ODS)
Courtesy of CHRYSLER GROUP, LLC

Vehicles manufactured for export markets have an Occupant Detection Sensor (ODS) as standard equipment. The ODS is located directly below the passenger side front seat cushion trim cover. This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature.

The ODS consists of a flexible clear plastic sensor mat (2) containing several resistive membrane, force sensing resistor cells that is secured by an adhesive strip (1) to the top surface of the seat cushion foam. The adhesive patch on the ODS is a one time only material and cannot be reactivated or reused if removed.

A short, two-conductor pigtail wire and connector (4) connect the sensor to the vehicle electrical system through a dedicated take out and connector of the seat wire harness. A hot melt adhesive block (3) encapsulates and protects the connections between the electrical conductors in the tail of the sensor mat and the pigtail wires as well as a diagnostic resistor.

The ODS cannot be adjusted or repaired, and must be replaced if damaged or ineffective.

OPERATION

OPERATION

In vehicles manufactured for export markets, the Occupant Detection Sensor (ODS) acts as a simple switch to detect loads placed upon the passenger side front seat cushion. The sensor circuits are connected to and monitored by the Occupant Restraint Controller (ORC) whenever the status of the ignition switch (also known as the Keyless Ignition Node/KIN or the Ignition Node Module/IGNM) is On. The ORC uses an algorithm logic in monitoring the changing states of the sensor input to determine whether the seat cushion load is static or

dynamic.

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system status and readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC). However, because the ODS input is only used for control of the passenger belt alert feature, which has no effect on SRS component features or functions, the airbag indicator is **NOT** illuminated in response to a detected ODS circuit fault.

The ODS receives source current and a clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC then sends the appropriate sensor status information over the Controller Area Network (CAN) data bus to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), which uses this information as an additional logic input used for control of the seat belt indicator and the passenger belt alert feature.

The hard wired circuits between the ODS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ODS or the electronic controls and communication between other modules and devices that provide some features of the passenger belt alert feature. The most reliable, efficient and accurate means to diagnose the ODS or the electronic controls and communication related to the passenger belt alert feature operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1017009895

Fig. 112: Base (Non-Storage) Seat
Courtesy of CHRYSLER GROUP, LLC

1017009896

Fig. 113: Storage Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Detection Sensor (ODS) is used only in the passenger side front

seat of vehicles manufactured for export markets. Vehicles manufactured for domestic markets use the Occupant Classification System (OCS) instead of the ODS on the passenger side front seat.

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, REMOVAL**.
4. Remove the trim from the front seat cushion foam (1) and frame. Refer to **COVER, SEAT CUSHION, REMOVAL**.
5. If equipped, remove the heater and/or ventilation elements from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL**.
6. Reach under the seat cushion pan to access and disconnect the Occupant Detection Sensor (ODS) pigtail wire harness connector from the seat wire harness.
7. Carefully disengage the adhesive patch (2) of the ODS mat (3) from the top surface of the seat cushion foam.

NOTE: Care must be taken not to pull off any of the seat cushion foam along with the ODS mat. If part of the seat cushion foam is removed with the mat, the entire seat cushion foam should be replaced.

8. Extract the tail of the ODS and the sensor pigtail wire harness from the clearance hole in the seat cushion foam.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become

inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21° and 38° C (between 70° and 100° F). Application of the ODS to surfaces below 10° C (50° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

1017009895

Fig. 114: Base (Non-Storage) Seat
Courtesy of CHRYSLER GROUP, LLC

1017009896

Fig. 115: Storage Seat

Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Detection Sensor (ODS) is used only in the passenger side front seat of vehicles manufactured for export markets. Vehicles manufactured for domestic markets use the Occupant Classification System (OCS) instead of the ODS on the passenger side front seat.

1. Carefully inspect the Occupant Detection Sensor (ODS) (3) to be certain that it is in good condition.
2. Insert the ODS pigtail wire harness and the tail of the ODS through the clearance hole near the back (with base, non-storage seat) or near the center (with storage seat) of the seat cushion foam.
3. Carefully position and center the ODS mat onto the seat cushion foam (1). On a base (non-storage) seat, the distance (A) from the rear edge of the trench in the foam to the rear edge of the sensor mat should be 145 millimeters (inches). On a storage seat, the distance (A) from the rear edge of the trench to the front edge of the sensor mat should be 70 millimeters (inches).
4. Remove the release paper from the adhesive patch of the ODS mat.

NOTE: The release paper should not be removed from the adhesive patch of a new ODS mat until just prior to application to the seat cushion foam.

5. Apply hand pressure (0.8 bar or 12 psi) over the adhesive patch of the ODS for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
6. Reach under the seat cushion pan to access and reconnect the ODS pigtail wire connector to the seat wire harness.
7. If equipped, reinstall the heater and/or ventilation elements onto the seat cushion foam.

Refer to **PAD, HEATER, INSTALLATION** .

8. Reinstall the trim onto the front seat cushion foam and pan. Refer to **COVER, SEAT CUSHION, INSTALLATION** .
9. Reinstall the passenger side front seat into the vehicle. Refer to **SEAT, INSTALLATION** .
10. Reconnect the negative cable to the battery.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

Fig. 116: Identifying Seat Track Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Seat Track Position Sensor (STPS) (2) is a Hall Effect-type sensor used on some vehicles. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The STPS housing has a mounting slot containing an integral latch feature (1) and slides and latches onto a stamped metal blade-type bracket located on the inboard side of the upper inboard seat adjuster track near the rear of both the passenger and driver front seats. A molded connector receptacle (3) integral to the STPS housing is connected to the vehicle electrical system through a connector and take out of the seat wire harness beneath the front seat cushion frame.

The STPS cannot be adjusted or repaired and, if ineffective or damaged, the entire STPS unit must be replaced.

OPERATION

OPERATION

The Seat Track Position Sensor (STPS) is designed to provide a seat position data input to the Occupant Restraint Controller (ORC) indicating whether the driver or passenger front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate force to be used when deploying the multistage Driver AirBag (DAB) or Passenger AirBag (PAB).

The STPS receives a nominal five volt supply from the ORC. The STPS communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the STPS circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC sends messages over the CAN data bus to control the illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC).

The hard wired circuits between the STPS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the STPS or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the STPS or the electronic controls and communication related to STPS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 117: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the rear edge of the front seat cushion to access the Seat Track Position Sensor (STPS) (2) on a bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Using a small screwdriver, hold the latch feature (3) depressed while sliding the connector end of the STPS off of the bracket.
4. Disconnect the seat wire harness connector (5) from the STPS connector receptacle.
5. Remove the STPS from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 118: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the rear edge of the front seat cushion to reconnect the seat wire harness connector (5) to the Seat Track Position Sensor (STPS) (2) connector receptacle. Be certain that the latch on the connector is fully engaged.
2. Align the open end of the STPS mounting slot to the blade of the STPS bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Push the STPS firmly onto the bracket until the latch feature (3) snaps into place with an audible click.
4. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SWITCH, SEAT BELT

DESCRIPTION

DESCRIPTION

Fig. 119: Seat Belt Buckle, Pigtail Wire & Connector
Courtesy of CHRYSLER GROUP, LLC

Both the driver and passenger front seat belt switches for this vehicle are actually Hall Effect-type sensors. These sensors consist of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that are integral to the front seat belt buckles (1). The front seat belt buckles are located on a molded plastic scabbard and secured by a screw to a bracket near the back of the upper, inboard seat adjuster track. The front seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire and connector (2) on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness. A one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

Vehicles manufactured for certain export markets also have seat belt switches for each of the rear seating positions. The rear seat belt switches are small, normally open, single pole, single throw, mechanical leaf contact, momentary switches. These switches are integral to the buckle of each rear seat belt buckle-half. The rear seat belt switches are connected to the vehicle electrical system through a two-wire pigtail wire and connector on the seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness routed beneath the rear seat cushions in the passenger compartment.

The front and rear seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front or rear seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The driver front seat belt switch is designed to control a hard wired sense input to the Occupant Restraint Controller (ORC), while the passenger front seat belt switch controls a similar input to the Occupant Classification Module (OCM). A spring-loaded slide with a small window-like opening is integral to each buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall-effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced

current as an output to the ORC or the OCM. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing the output current from the seat belt switch to be reduced. The front seat belt switches receive a supply of current from the ORC or the OCM, and the ORC or OCM senses the status of the front seat belt switch through its connection to the seat wire harnesses.

In vehicles built for certain export markets equipped with rear seat belt switches, the seat belt switches are designed to control a path to ground for the seat belt switch sense inputs of the ORC. When the rear seat belt tip-half is inserted into the seat belt buckle, the switch closes the path to ground; and, when the rear seat belt tip-half is removed from the seat belt buckle, the switch opens the ground path. The switch is actuated by the latch mechanism within the seat belt buckle. The seat belt switch is connected in series between ground and the seat belt switch sense input of the ORC. The seat belt switch receives ground at all times through its pigtail wire connection to the seat wire harness from a take out of the body wire harness. An eyelet terminal connector on the body wire harness ground take out is secured to the body sheet metal.

The ORC or the OCM provides electronic **seat belt switch status** messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus. The IC uses these messages as an additional logic input for control of the seat belt indicator. In vehicles built for certain export markets equipped with rear seat belt switches, the IC reads the messages received from the ORC then controls the Seat Belt Reminder (SBR) indications in the overhead console using Local Interface Network (LIN) data bus communication. The ORC and OCM monitor the condition of the seat belt switch circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the seat belt switches and the ORC or OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switches or the electronic controls and communication between other modules and devices that provide some features of the seat belt reminder system. The most reliable, efficient and accurate means to diagnose the seat belt switches or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TENSIONER, SEAT BELT

DESCRIPTION

SEAT BELT TENSIONERS

The seat belts for both front seats in this vehicle incorporate dual tensioners. One tensioner is integral to the seat belt retractor, and one tensioner is integral to the seat belt lower anchor. Each of these tensioner types is described in further detail elsewhere within this service information.

ANCHOR TENSIONER

Fig. 120: Anchor Latch Plate, Gas Generator, Metal Cylinder Tube & Bracket
Courtesy of CHRYSLER GROUP, LLC

A seat belt anchor tensioner supplements the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt anchor units, which are secured to the inside of the sill at the base of the B-pillar outboard of each front seat. The anchor tensioner consists of the anchor latch plate (1), a cable and piston, a cable guide and bracket (4), a metal cylinder tube (3) and a small pyrotechnically activated Micro Gas Generator (MGG) (2). The anchor tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through dedicated take outs of the body wire harness by keyed and latching yellow molded plastic connector insulators to ensure a secure connection.

A special procedure requiring two small Allen key wrenches is used to disconnect the seat belt anchor latch plate from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

The anchor tensioners cannot be repaired and, if ineffective or damaged, the entire anchor tensioner unit must be replaced. If the front airbags have been deployed, the anchor tensioners have also been deployed. The anchor tensioners are not intended for reuse and must be replaced following any front airbag deployment. Refer to **BUCKLE, SEAT BELT, REMOVAL**.

RETRACTOR TENSIONER

Fig. 121: Seat Belt Retractor Unit & Connector Insulator
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt retractor units (1), which are secured near the base of the inner B-pillar on the right and left sides of the vehicle. The retractor is concealed beneath the molded plastic inner B-pillar trim. The retractor tensioners are controlled by the Occupant Restraint Controller (ORC). Each retractor tensioner has an initiator connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator (2) to ensure a secure connection.

An adaptive load-limiting device is also integral to the front seat belt retractor to supplement the anchor and retractor tensioners. The adaptive load limiter is also controlled by the ORC. Each adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator (3) to ensure a secure connection.

The retractor tensioners and adaptive load limiters cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the retractor tensioners and adaptive load limiters have also been deployed. The retractor tensioners and adaptive load limiters are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the retractor tensioner and adaptive load limiter have been deployed and require replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners and adaptive load limiter are deployed in conjunction with the dual front airbags by

signals generated by the Occupant Restraint Controller (ORC) through the individual driver or passenger retractor (or sill end), pretensioner (or anchor) or adaptive load limiter line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioner and adaptive load limiter initiators, the electrical energy generates enough heat to initiate a small pyrotechnic Micro Gas Generator (MGG).

In sequence, the ORC activates the retractor tensioner, followed by the anchor tensioner. The adaptive load limiter on the retractor is activated only after both the retractor and anchor buckle tensioners. The retractor tensioner gas generator drives the seat belt retractor spool causing slack to be removed from the front seat belt. The anchor tensioner gas generator pulls the buckle downward, causing the slack to be removed from the front seat belt. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front seat occupant, reducing the potential for injuries.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seats might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield.

The ORC monitors the condition of the seat belt tensioners and adaptive load limiter through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner and adaptive load limiter initiators and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

2014 STEERING

Steering System - Cherokee

DESCRIPTION

DESCRIPTION

This vehicle comes with Electric Power Steering (EPS) as standard equipment and it is the only steering system available. The power steering system consists of these major components:

- Rack and Pinion Steering Gear with EPS assist
- Steering Column
- Inner and Outer Tie Rod Ends

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING DIAGNOSIS CHARTS

NOTE: There are two diagnosis charts following that cover PERFORMANCE ISSUES and NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES.

NOTE: For any performance issues, check for DTCs related to the steering system. Verify the correct software and calibration files are loaded in the Electric Power Steering (EPS) system.

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL IS OFF CENTER	1. Front toe is out of adjustment.	1. Perform wheel alignment. Refer to <u>WHEEL ALIGNMENT, STANDARD PROCEDURE</u> .
VEHICLE PULLS LEFT OR RIGHT	1. The center position of the column does not match the center position of the vehicle alignment.	1. Perform wheel alignment. Refer to <u>WHEEL ALIGNMENT, STANDARD PROCEDURE</u> .
	2. Suspension components are bent and/or damaged.	2. Inspect suspension components for damage.
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH/LOOSENESS	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt with thread locker patch and tighten to specifications.

2014 Jeep Cherokee Trailhawk

2014 STEERING Steering System - Cherokee

(CLUNKING OR RATTLING)		
	2. Steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Excessive free-play or noise from steering column bearings.	3. Replace steering column. Refer to COLUMN, REMOVAL .
	4. Excessive intermediate (steering) shaft coupling U-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace the column as necessary. Refer to COLUMN, REMOVAL .
	5. Loose or worn inner tie rod or outer tie rod.	5. For evaluation and correction, refer to TIE ROD, STEERING, DIAGNOSIS AND TESTING .
	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint/lower control arm as necessary.
	7. Excessive lash inside steering gear.	7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL)	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
	2. Excessive engine vibration.	2. Ensure that the engine is tuned properly.
	3. Loose tie rod end jam nut.	3. Check torque and tighten the inner to outer tie rod jam nut to specifications.
	4. Grounded, damaged or loose engine mount.	4. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace or realign as necessary.
	5. Loose or worn outer tie rod.	5. For evaluation and correction, refer to TIE ROD, STEERING, DIAGNOSIS AND TESTING .
	6. Steering gear noisy.	6. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions

2014 Jeep Cherokee Trailhawk

2014 STEERING Steering System - Cherokee

	7. Steering gear has instability, shudder, etc.	and verify that the noise follows the steering input. Check TSBs for any known issues. Replace steering gear as necessary. 7. Perform EPS calibration procedures. If this does not fix the issue, replace the steering gear.
INCREASED STEERING EFFORT/STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	1. Tire(s) not properly inflated. 2. Lack of lubrication in lower ball joint or ball joint is damaged.	1. Check and inflate tires to the specified pressure. 2. Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
	3. Steering knuckle binding.	3. Disconnect the outer tie rod end from knuckle and then rotate knuckle. Refer to <u>TIE ROD, STEERING, REMOVAL</u> . If the knuckle does not rotate freely separate the strut from the knuckle to determine if the ball joint or strut mount bearing is the cause of the binding and replace components as necessary or refer to <u>STRUT, SUSPENSION, ASSEMBLY, REMOVAL</u> .
	4. EPS steering not functioning.	4. Perform EPS calibration procedures. If this does not fix the issue, replace the steering gear.
	5. Steering column internal issue.	Do not turn past two revolutions. Damage to the clockspring may occur. Always rotate steering column back to initial position. Steering column is equipped with an absolute position sensor that has a unique zero position. 5. Disconnect the intermediate shaft and rotate steering column. If condition is still present, replace steering column. Refer to <u>COLUMN, INSTALLATION</u> .
	6. Binding outer tie rod.	6. For evaluation and correction, refer to <u>TIE ROD, STEERING, DIAGNOSIS AND TESTING</u> .
	7. Improper front wheel alignment.	7. Check and adjust wheel alignment as necessary.
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Steering gear loose on cradle/crossmember.	1. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	2. Steering column, coupling or intermediate shaft worn or loose.	2. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column if necessary. Refer to <u>COLUMN, REMOVAL</u> .

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

--	--	--

2014 Jeep Cherokee Trailhawk

2014 STEERING Steering System - Cherokee

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
RATTLE OR EXCESSIVE CLUNK*	1. Steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
	3. Excessive play in inner or outer tie rod.	3. For evaluation and correction, refer to <u>TIE ROD, STEERING, DIAGNOSIS AND TESTING.</u>
	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
	5. Wheel mounting (lug) bolts loose.	5. Inspect wheel mounting (Lug) bolts and repair as necessary. Tighten bolts to specifications.
	6. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	6. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
	7. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	7. Check control arm mounting bolts and tighten to specified torque.
	8. Loose intermediate shaft or column.	8. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
	9. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	9. Inspect bushings for wear and replace lower control arm as necessary.
	10. Internal steering gear noise.	10. Drive vehicle on rough road listening for noises. Also, steer rapidly back and forth when stopped listening for noises. Replace steering gear as necessary.
	11. Loose inner or outer tie rod.	11. For evaluation and correction, refer to <u>TIE ROD, STEERING, DIAGNOSIS AND TESTING.</u>
	12. Damaged engine cradle/crossmember.	12. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
	3. Loose intermediate (steering)	3. Make sure coupling is fully seated on gear

2014 Jeep Cherokee Trailhawk

2014 STEERING Steering System - Cherokee

	shaft coupling at gear input shaft.	input shaft. Retighten or re-seat as necessary.
	4. Worn tie rod (outer or inner).	4. For evaluation and correction, refer to <u>TIE ROD, STEERING, DIAGNOSIS AND TESTING</u> .
	5. Worn axle half-shaft.	5. For evaluation and correction, refer to <u>DIAGNOSIS AND TESTING</u> .
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
	4. Steering gear inner or outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary. Refer to <u>DIAGNOSIS AND TESTING</u> .
	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.

NOTE: * A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This

2014 Jeep Cherokee Trailhawk

2014 STEERING Steering System - Cherokee

movement may be felt in the steering components during steering wheel reversal.

COLUMN

WARNING

WARNING

WARNING: Safety goggles should be worn at all times when working on steering columns.

WARNING: Before beginning any service procedure that involves removing the air bag: Remove and isolate the negative (-) battery cable (ground) from the vehicle battery. This is the only sure way to disable the air bag system. Failure to do this could result in accidental air bag deployment and possible personal injury.

WARNING: The air bag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the air bag system components you must first disconnect and isolate the battery negative (ground) cable. Failure to do so could result in accidental deployment of the air bag and possible personal injury. The fasteners, screws, and bolts, originally used for the air bag components, have special coatings and are specifically designed for the air bag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books. Before servicing a steering column equipped with an air bag,

WARNING: When handling an undeployed air bag during servicing of the steering column, the following precautions should be observed:

- At no time should any source of electricity be permitted near the inflator on the back of the air bag.
- When carrying a live air bag, the trim cover should be pointed away from the body to minimize injury if the air bag should accidentally deploy.
- If the air bag is placed on a bench or other surface, the plastic cover should be face-up to minimize movement, in case of accidental deployment.

CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

DESCRIPTION

DESCRIPTION

81a63f65

Fig. 1: Identifying Steering Column
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a tilt/telescoping type steering column (1). When the lever is in the released position, the column can be tilted or telescoped manually.

The steering column is designed to be serviced only as a complete assembly if an internal component is found to be defective. The shaft, bearings and intermediate shaft are all serviced with the column.

The major components on the steering column assembly are:

- Clockspring (Integral part of Steering Column Control Module (SCCM))
- Driver Airbag
- Multi-Function Switches
- Tilt Lever
- Shrouds
- Steering Wheel

These components can be serviced without removal of the steering column from the vehicle. Refer to the appropriate Service Information for servicing these components separately.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN

NOTE: Refer to **DIAGNOSIS AND TESTING** .

If the vehicle is involved in a front end collision or the air bag has deployed or both, the steering column must be replaced.

REMOVAL

REMOVAL

WARNING: When an undeployed airbag module is to be removed from the vehicle, first disconnect the battery ground cable and isolate it. Allow the system capacitor to discharge for a minimum of two minutes before starting any removal.

NOTE: Before proceeding, refer to COLUMN, WARNING.

1. Disconnect the negative cable from the battery and isolate the cable.
2. Position the column tilt at the full-downward position.

Fig. 2: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove upper and lower (2) shrouds from the steering column. Refer to SHROUD, STEERING

COLUMN, LOWER, REMOVAL and SHROUD, STEERING COLUMN, UPPER, REMOVAL.

4. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL**.
5. Remove the screws to the steering column trim ring.
6. Remove knee blocker air bag, if equipped. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL**.
7. Remove the driver air bag. Refer to **AIR BAG, DRIVER, REMOVAL**.
8. Disconnect the wiring harness connectors at the Steering Column Control Module (SCCM).
9. Disconnect all other wiring harness connectors at column components.

Fig. 3: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

10. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.

190968837

Fig. 4: Steering Column Mounting Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the two mounting bolts (1) and nuts (2) attaching the steering column to the instrument panel.
12. Remove the steering column from the vehicle.

190968836

Fig. 5: Plastic Bracket & Screws

Courtesy of CHRYSLER GROUP, LLC

13. If replacing the column, remove the mounting screws (2) and transfer the plastic bracket (1) to the new column.

INSTALLATION

INSTALLATION

190968836

Fig. 6: Plastic Bracket & Screws

Courtesy of CHRYSLER GROUP, LLC

1. If the column was replaced, position the plastic bracket (1) and install and securely tighten the screws (2).

190968837

Fig. 7: Steering Column Mounting Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the steering column with the steering column trim ring, through the steering column opening.
3. Raise the column onto the mounting studs and install the two mounting nuts (2) on the studs and install the mounting bolts (1).

NOTE: **Verify that the tilt lever is in the unlocked position prior to tightening the steering column fasteners.**

4. Install two column mounting bolts (1). Tighten all 4 column fasteners to 24 N.m (18 ft. lbs.).

Fig. 8: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new pinch bolt (3) must be installed every time the pinch bolt is removed.

5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Slide the intermediate shaft (1) onto the steering gear pinion shaft (2).
7. Install a **NEW** pinch bolt (3) and tighten the bolt to 30 N.m (22 ft. lbs.).
8. Confirm that:
 - a. The front wheels are in the STRAIGHT-AHEAD position.
 - b. The turn signal stalk is in the NEUTRAL position.
9. Connect wiring harness connectors at the Steering Column Control Module (SCCM).
10. Connect any other wiring harness connectors at the steering column components.
11. Install knee blocker air bag, if equipped. Refer to **AIR BAG, KNEE BLOCKER, INSTALLATION** .
12. Install the driver air bag. Refer to **AIR BAG, DRIVER, INSTALLATION** .
13. Install the screws to the steering column trim ring.
14. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

Fig. 9: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

15. Install the upper and lower (2) shrouds on the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, INSTALLATION** and **SHROUD, STEERING COLUMN, UPPER, INSTALLATION**.

WARNING: Do not connect the battery ground cable without following the proper procedure as indicated in the following step. Personal injury or death may result if the Airbag System Test is not performed first.

16. Reconnect the battery ground terminal following the air bag system test found in restraints. Refer to **DIAGNOSIS AND TESTING**.
17. Perform Vehicle Trim Procedure. Refer to **STANDARD PROCEDURE**.
18. Test the operation of all column mounted components.
19. Road test the vehicle to ensure proper operation of the steering system.

SHROUD, STEERING COLUMN, LOWER

REMOVAL

REMOVAL

Fig. 10: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Push the column tilt lever downward.
2. Remove the screws (3, 1) attaching the lower shroud (2) to the column.
3. Separate the lower shroud (2) from the upper shroud by pressing on the edges of the shrouds.
4. Remove the lower shroud from the column.

INSTALLATION

INSTALLATION

Fig. 11: Identifying Lower Shroud & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Install the upper shroud onto the column and position the keys (1) into the steering column trim ring.

Fig. 15: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Push the column tilt lever downward.
3. Install the lower shroud (2) into the upper shroud, snapping the shrouds together.
4. Install the screws (3, 1) attaching the lower shroud (2) to the column.

WHEEL, STEERING

REMOVAL

REMOVAL

WARNING:

- Do not place a non-deployed airbag face down on a hard surface. The airbag will propel into the air if accidentally deployed. Failure to follow this instruction may result in possible serious or fatal injury.
- Disconnect and isolate the battery negative (ground) cable before beginning steering wheel removal or installation. This will disable the airbag system. Failure to follow this instruction may result in accidental airbag deployment and possible serious or fatal injury.
- Allow the airbag system capacitor to discharge for two minutes before removing the steering wheel or any airbag system component. Failure to follow this instruction may result in accidental airbag deployment and possible serious or fatal injury.

Fig. 16: Identifying Steering Wheel & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the steering wheel so that the tires are in the STRAIGHT-AHEAD position.
2. Disconnect and isolate the negative battery cable.
3. Remove the driver airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
4. Disconnect the wiring connector at the clockspring.

CAUTION: Do not bump or hammer on the steering wheel or steering column shaft when removing the steering wheel.

CAUTION: Do not attempt to rotate the clockspring rotor once the steering wheel is removed. The clockspring must remain centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should remain in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before installing the steering wheel.

5. While holding the steering wheel (1) firmly in place, remove the nut (2) that secures the steering wheel to the steering column shaft.
6. While holding the steering wheel firmly in the STRAIGHT-AHEAD position, remove the steering wheel from the steering column shaft splines.

INSTALLATION

INSTALLATION

CAUTION: When installing the steering wheel, the clockspring must be centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should be in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before proceeding.

Fig. 17: Identifying Steering Wheel & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Confirm that:
 - a. The front wheels are in the STRAIGHT-AHEAD position.
 - b. The turn signal stalk is in the NEUTRAL position.
2. Install the steering wheel retaining nut (2). Tighten the steering wheel retaining nut to 50 N.m (37 ft. lbs.).
3. Connect the wiring connector at the clockspring.
4. Install the driver airbag. Refer to **AIR BAG, DRIVER, INSTALLATION** .

WARNING: Do not reconnect the battery without first performing the Airbag System Test procedure. Failure to perform the Airbag System Test may result in accidental airbag deployment and serious or fatal injury.

5. Reconnect the battery using the Airbag System Test procedure. Refer to **DIAGNOSIS AND TESTING** .
6. Verify vehicle and system operation.

GEAR

DESCRIPTION

DESCRIPTION

191069437

Fig. 18: Steering Gear

Courtesy of CHRYSLER GROUP, LLC

The steering gear is the rack-and-pinion type with Electric Power Assist (EPS). It is mounted on the front suspension crossmember, and the front crossmember must be removed from the vehicle to service the steering gear. The only serviceable parts of the steering gear are the inner tie rods, outer tie rods, and the inner tie rod bellows.

The EPS system is only serviced as an assembly, including the Steering Angle Sensor (SAS). If the SAS requires replacement, the entire steering gear must be replaced.

NOTE: If a **NEW** steering gear is installed, programming is required. Refer to **STANDARD PROCEDURE** .

OPERATION**OPERATION**

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by an electric motor and control unit connected to the steering gear. The Electric Power Steering (EPS) system provides variable assist for steering maneuvers based on several inputs:

- Steering wheel position and rate of movement from Steering Angle Sensor (SAS)
- Steering wheel torque from torque sensors in the EPS Gear
- Vehicle speed

No components of the EPS system can be serviced separately. If any component of the EPS requires service, the entire steering gear must be replaced. The only serviceable parts are inner and outer tie rods, and tie rod bellows.

The EPS system communicates over the CAN network, including broadcasting the Steering Angle Sensor (SAS) position.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **FRONT, WARNING** .

NOTE: If equipped, removal of the power transfer unit may be necessary in order to remove the steering gear . Refer to **REMOVAL** .

Fig. 19: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect battery negative cable.
2. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This keeps the

clockspring in the proper orientation.

3. Remove pinch bolt (3) and separate intermediate shaft (1) from steering gear shaft (2).

1715005812

Fig. 20: Identifying Steering Link, Outer Tie Rod End & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
5. Remove the wheel mounting bolts, then the tire and wheel assembly.
6. Remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**.

NOTE: Repeat STEP 7 to STEP 14 on opposite side of vehicle.

7. While holding the stabilizer bar link stud stationary, remove the nut securing the link (1) to the stabilizer bar.

Fig. 21: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer tie rod end (8) from the knuckle. Refer to **TIE ROD, STEERING, REMOVAL**.
9. Remove the ball joint to control arm retaining nut (4). **Discard the nut; it is not to be reused.**
10. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 22: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.

11. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
12. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.

020568625

Fig. 23: Crossmember To Fascia Support Beams Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the four bracket retaining bolts (1) from the cross member to fascia support beams bracket, then remove the bracket.

Fig. 24: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Remove the fasteners (2) securing the lower bumper reinforcement (1) and front fascia support beams to the frame/front end module.

Fig. 25: Front Fascia Support Beams
Courtesy of CHRYSLER GROUP, LLC

15. Remove the front fascia support beams.

191069435

Fig. 26: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the downstream oxygen sensor harness connector.
17. Remove the exhaust extension pipe.
18. Disconnect the harness connectors (2) at the steering gear control module (1).

191069436

Fig. 27: Steering Gear Connector & Tie Strap

Courtesy of CHRYSLER GROUP, LLC

19. Disconnect the steering gear connector (1) from the body harness connector at the bottom of the dash panel.
20. Separate the steering gear harness from the crossmember by removing the tie strap (2) from the crossmember.
21. Remove the rear engine mount.

NOTE: Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

22. Mark the position of the cross member with a grease pencil or equivalent.

020568633

Fig. 28: Upper Crossmember Mounting Bolt

Courtesy of CHRYSLER GROUP, LLC

23. Support the crossmember with a transmission jack, or equivalent.
24. Remove the upper mounting bolt (1) from each side of the crossmember.

020568626

Fig. 29: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove the four rear mounting bolts (1, 3) that secure the crossmember (2) to the vehicle
26. Slowly lower the crossmember with the jack and remove from the vehicle.

14. Install the crossmember to fascia support beam bracket and install the four retaining bolts (1) and tighten to 95 N.m (70 ft. lbs.).

Fig. 39: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

15. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia

support beam.

16. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

Fig. 40: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

17. Install a **NEW** ball joint to control arm retaining nut (4) and tighten to 25 N.m plus 175° (18 ft. lbs. plus 175°).
18. Install the outer tie rod end (8) into the knuckle. Refer to **TIE ROD, STEERING, INSTALLATION**.

1715005812

Fig. 41: Identifying Steering Link, Outer Tie Rod End & Nuts
Courtesy of CHRYSLER GROUP, LLC

19. Install the stabilizer link stud into the stabilizer bar. Refer to **LINK, STABILIZER BAR, INSTALLATION** .
20. Install the engine belly pan. Refer to **BELLY PAN, INSTALLATION** .
21. Install the tire and wheel assembly. Refer to **INSTALLATION** .
22. Lower the vehicle.

1722015735

Fig. 42: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft

Courtesy of CHRYSLER GROUP, LLC

NOTE: The intermediate shaft has a block teeth design and can only be installed in the correct direction. Do not force the shaft onto the pinion shaft.

23. Install the intermediate shaft (1) to the steering gear pinion shaft (2).
24. Install a **NEW** pinch bolt (3) and tighten to 30 N-m (22 ft. lbs.).
25. Remove the steering wheel holder.
26. Connect the battery negative cable.
27. If a **NEW** steering gear is installed, programming is required. Refer to **STANDARD PROCEDURE** .

TIE ROD, STEERING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIE ROD

Tie rod free-play can be measured using the following hand methods:

OUTER TIE ROD

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheels. Refer to **REMOVAL** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.

Fig. 43: Magnetic Dial Indicator (2)
Courtesy of CHRYSLER GROUP, LLC

4. Attach a magnetic dial indicator (2) to the inside or outside of the brake rotor, then align the dial indicator's contact pointer (1) with the direction of the stud axis and touch the outer tie rod.

5. Zero the dial indicator. (3)

2094103

Fig. 44: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: When checking free-play, **DO NOT** rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.

If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod check the inner tie rod for free-play. Refer to the following procedure.

INNER TIE ROD

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

81896138

Fig. 45: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. If no free-play is felt, install the front wheels. Refer to **INSTALLATION**.
3. Remove support and lower the vehicle.

REMOVAL

OUTER TIE ROD END

Fig. 46: Identifying Tie Rod End, Jam Nut, Knuckle & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: When unscrewing the outer tie rod from inner, count the number of revolutions to take it off. This action will aid in installation, getting the toe close to where it needs to be when setting the wheel alignment.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the front wheel mounting bolts and remove the front wheel.
3. Loosen the jam nut (4) from the tie rod end (1).
4. Remove the retaining nut (2) from the outer tie rod end (1).

Discard the nut; it is not to be reused.

5. Separate the outer tie rod end (1) from the knuckle (3) using (special tool #C-3894-A, Puller, Tie Rod) and remove from the inner tie rod.

INNER TIE ROD

Fig. 47: Bellows Clamps

Courtesy of CHRYSLER GROUP, LLC

1. Remove the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. Remove the tie rod jam nut from the inner tie rod.
3. Remove the clamp (2) securing the bellows (1) to the steering gear body.
4. Remove the clamp (3) from the small end of the bellows and remove the bellows (1) from the gear.

Fig. 48: Travel Restrictor, O Ring & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the inner tie rod cannot be removed using the specified tools, do not use a hammer or heat to loosen. Damage to the steering gear will occur. Replace the entire steering gear.

5. Install an appropriate inner tie rod removal tool on the flats of the inner tie rod.
6. Unthread and remove the inner tie rod from the steering gear (1).
7. Inspect the inner portion of the gear for corrosion, contamination, and damage. If any is found, replace the steering gear.

INSTALLATION

OUTER TIE ROD END

Fig. 49: Identifying Tie Rod End, Jam Nut, Knuckle & Nut
Courtesy of CHRYSLER GROUP, LLC

1. If it is not already installed, install the jam nut (4) on the inner tie rod threads.
2. Thread the outer tie rod (1) onto the inner tie rod approximately the same amount of revolutions as the original was installed.
3. Thread the jam nut (4) down the inner tie rod far enough to hold the outer tie rod. Do not tighten the jam nut at this time.
4. Install the outer tie rod end (1) stud into the hole in the knuckle arm (3). Start a **NEW** tie rod retaining nut (2) on the stud. While holding the tie rod end stud with a wrench, tighten the nut (2) to 30 N.m Plus 90° (22 ft. lbs. Plus 90°).
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Adjust the front wheel toe setting. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
7. Tighten the tie rod jam nut (4) to 70 N.m (52 ft. lbs.) once wheel toe is set.
8. Lower the vehicle.

INNER TIE ROD

Fig. 50: Travel Restrictor, O Ring & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

1. Apply Mopar® Lock AND Seal Adhesive or equivalent medium thread locker adhesive to the inboard end threads of the inner tie rod.
2. Install the inner tie rod onto the gear (1) using an appropriate inner tie rod installation tool on the flats. Tighten the inner tie rod to 110 N.m. (81 ft. lbs.).

Fig. 51: Crimping Pliers On Bellows Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Loosely place a NEW clamp over the large end of the NEW bellows.
4. Using crimping pliers (1), crimp the large clamp (2) securing the bellows to the gear body.

Fig. 52: Bellows Clamps

Courtesy of CHRYSLER GROUP, LLC

5. Install small end of bellows into groove and secure with clip (3).
6. Thread the tie rod jam nut onto the inner tie rod far enough to install the outer tie rod.
7. Install the outer tie rod. Refer to **TIE ROD, STEERING, INSTALLATION**.

2014 SUSPENSION**Front Suspension & Wheel Alignment - Cherokee****STANDARD PROCEDURE****STANDARD PROCEDURE - LUBRICATION**

There are no serviceable lubrication points on the front or rear suspension. The ball joints and tie rod ends are sealed for life and require no maintenance.

SPECIAL TOOLS**SPECIAL TOOLS**

FRONT

WARNING

WARNING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

WARNING: Do not remove the strut rod nut while strut assembly is installed in vehicle, or before the coil spring is compressed with a compression tool. The spring is held under high pressure.

CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt, or other metal fastener be installed in the shock tower to take the place of an original plastic clip. It may come into contact with the strut or coil spring.

CAUTION: Wheel bearing damage will result if after loosening the axle hub nut, the vehicle is rolled on the ground or the weight of the vehicle is allowed to be

2014 Jeep Cherokee Trailhawk**2014 SUSPENSION Front Suspension & Wheel Alignment - Cherokee**

supported by the tires for any length of time.

SPECIFICATIONS**SPECIFICATIONS****SPECIFICATIONS**

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.

ARM, LOWER CONTROL**DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - LOWER CONTROL ARM**

Inspect the lower control arm for signs of damage from contact with the ground or road debris. If the lower control arm shows any sign of damage, look for distortion. Do not attempt to repair or straighten a broken or bent lower control arm. If damaged, the lower control arm is serviced only as a complete component.

Inspect both lower control arm isolator bushings for severe deterioration and replace the lower control arm as required.

REMOVAL**REMOVAL**

NOTE: Before proceeding, refer to **FRONT, WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 1: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the lower ball joint nut (1).
4. Using (special tool #C-3894-A, Puller, Tie Rod), separate the lower ball joint stud from the control arm.

Fig. 2: Identifying Pry Bar & Control Arm

Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the ball joint boot does not get cut when separating the ball joint stud from the control arm.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.

5. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
6. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.
7. Remove the Lower Load Beam. Refer to **REMOVAL** .

Fig. 3: Identifying Front Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove and discard the front lower control arm nut (1). Then remove the bolt attaching the lower control arm to the front suspension crossmember.

Fig. 4: Identifying Rear Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove and discard the rear lower control arm nut (1). Then remove the lower control arm bolt.
10. Remove the lower control arm from the crossmember.

INSTALLATION

INSTALLATION

1. Position the lower control arm in the front suspension crossmember.

Fig. 5: Identifying Rear Lower Control Arm Nut

Courtesy of CHRYSLER GROUP, LLC

2. Install a **NEW** rear lower control arm bolt and a **NEW** rear lower control arm nut (1). Do not tighten to specification at this time.

Fig. 6: Identifying Front Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

3. Install a **NEW** front lower control arm bolt and a **NEW** front lower control arm nut (1). Do not tighten to specification at this time.

Fig. 7: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

4. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
5. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.
6. Lower the vehicle and install a floor jack under the control arm. Raise the jack until the lower control arm is at ride height. Tighten the bolts:
 - Front lower control arm bolt: 100 N.m Plus 135° (74 ft. lbs. Plus 135°).
 - Rear lower control arm bolt: 75 N.m Plus 90° (55 ft. lbs Plus 90°).
7. Raise the vehicle back up to the original position.
8. Install the Lower Load Beam. Refer to **LOAD BEAM, LOWER, INSTALLATION** .

0508034419

Fig. 8: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install a **NEW** ball joint nut (1) and tighten to 25 N.m plus 175° (18 ft. lbs. plus 175°).
10. Install the wheel and tire assembly. Refer to **INSTALLATION** .
11. Lower the vehicle.

BALL JOINT, SUSPENSION, LOWER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER BALL JOINT

1. Raise the vehicle allowing the front suspension to hang.
2. Remove the tire and wheel assembly.
3. Using Dial Indicator (special tool #C-3339A, Set, Dial Indicator), or equivalent, attach the dial indicator

mount to the knuckle and align the dial indicator's plunger with the direction of the stud axis, touching the end of the ball joint stud in the lower control arm.

4. Push up on the lower control arm and zero the dial indicator.

NOTE: **Use care when applying load to the knuckle as to avoid damaging the ball joint seal boot.**

5. From the front of the vehicle, insert a pry bar between the knuckle and lower control arm, resting it on the lower control arm. Use lever principle to push the knuckle up from the lower control arm. Apply the load until the needle of the dial indicator no longer moves.
6. Record the ball joint movement. The end play is acceptable if no more than 1.0 mm (0.039 in.) of end play is achieved back-to-back.
7. Perform this procedure on each side of the vehicle as necessary.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: **The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.**

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART**, should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: **Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING.**

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.

2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING**.
6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable) 2. Worn Tires and/or Incorrect Wheel Alignment 3. Defective Wheel Bearing 4. Wrong Power Steering Fluid (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid) 2. Replace Tires, Check And Reset Wheel Alignment 3. Replace Wheel Bearing 4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts 2. Engine Mount Grounding Against Frame Or Body Of Vehicle 3. Worn Tires and/or Incorrect Wheel Alignment 4. Defective Wheel Bearing 5. Worn or Broken C/V Joint 6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	1. Verify Wheel Lug Nut Torque 2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required 3. Replace Tires, Check and Reset Wheel Alignment 4. Replace Wheel Bearing 5. Replace C/V Joint 6. Center the Engine

2014 Jeep Cherokee Trailhawk

2014 SUSPENSION Front Suspension & Wheel Alignment - Cherokee

POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque 2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	1. Torque Hub Nut to Spec 2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

REMOVAL

NOTE: Before proceeding, review all Warnings and Cautions. Refer to **FRONT, WARNING.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 9: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) in the hub nut. Use care not to damage the half-shaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3). **Do not reuse hub nut.**
5. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
6. Remove the four hub and bearing bolts.

NOTE: **The bolts are one time use. Discard the bolts.**

Fig. 10: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

7. Slide the hub and bearing (1) off the half shaft and out of the knuckle.

INSTALLATION

INSTALLATION

0508034417

Fig. 11: Identifying Hub & Bearing

Courtesy of CHRYSLER GROUP, LLC

1. Position the halfshaft into the hub and bearing. Install the hub and bearing (1) in to the knuckle.
2. Install four **NEW** hub and bearing bolts and tighten to. Refer to **FRONT, SPECIFICATIONS**.
3. Install the front brake rotor and caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION**.
4. Install a **NEW** hub nut and while a helper applies the brakes, tighten to specification. Refer to **SPECIFICATIONS**.

NOTE: Do not use air tools on staking tool while staking hub nut.

3112889

Fig. 12: Correct Hub Nut Staking

Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

5. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked (1) as shown in **Correct Hub Nut Staking**. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

NOTE: Do not stake the hub nut as shown (2).

6. Install the wheel and tire assembly. Refer to **INSTALLATION**.

KNUCKLE, STEERING**DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - KNUCKLE**

The front suspension knuckle is not a repairable component of the front suspension. It must be replaced if found to be damaged in any way. If it is determined that the knuckle is bent when servicing the vehicle, no attempt is to be made to straighten the knuckle.

REMOVAL**REMOVAL**

NOTE: Before proceeding, review all Warnings and Cautions. Refer to **FRONT, WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 13: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) on the hub nut. Use care not to damage the half-shaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3). **Do not reuse the hub nut.**
5. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

Fig. 14: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

6. Remove the four hub and bearing to knuckle bolts and slide the hub and bearing (1) off the half shaft and out of the knuckle.

7. Remove the front brake rotor splash shield.

Fig. 15: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Remove the wheel speed sensor (1) and position it aside.

Fig. 16: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

9. Remove the outer tie rod end (1) from the knuckle. Refer to **TIE ROD, STEERING, REMOVAL** .

Fig. 17: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

10. Remove and discard the lower ball joint nut (1).
11. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 18: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the ball joint boot does not get cut when separating the control arm from the knuckle.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.

12. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
13. Pry down on the control arm (2) until the ball joint stud is clear of the control arm. Position the knuckle assembly to the side until it is clear of the ball joint stud. Slowly release the control arm.

Fig. 19: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

14. Remove the knuckle to strut pinch bolt and nut (1).

Discard the nut and bolt.

NOTE: Do not allow the half shaft to hang by the inner C/V joint. Support the half shaft to keep the joint from separating.

15. Remove the knuckle.

INSTALLATION

INSTALLATION

1. Position the half shaft into the knuckle and slide the strut into the knuckle.

Fig. 20: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install a **NEW** strut pinch bolt and nut (1). Tighten the pinch bolt to specification.

Fig. 21: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

3. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
4. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

Fig. 22: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install a **NEW** lower ball joint nut (1). Tighten the lower ball joint nut to specification.

Fig. 23: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

6. Install the outer tie rod to the knuckle. Refer to **TIE ROD, STEERING, INSTALLATION** .

Fig. 24: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Install the wheel speed sensor. Tighten the wheel speed sensor bolt to specification.
8. Install the front brake rotor splash shield.

Fig. 25: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

9. Position the half shaft into the hub and bearing. Install the hub and bearing (1) to the knuckle. Install four **new** hub an bearing bolts. Tighten the hub bolts to specification.
10. Install the front brake rotor and brake caliper. Refer to **CALIPER, DISC BRAKE, FRONT, INSTALLATION** and **ROTOR, BRAKE, INSTALLATION**.

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

- 11.
12. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to 200 N.m (148 ft. lbs.)

NOTE: Do not use air tools on staking tool while staking hub nut.

3112889

Fig. 26: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

13. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked (1) as shown in Correct Hub Nut Staking. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

NOTE: Do not stake the hub nut as shown (2).

14. Install the wheel and tire assembly. Refer to **INSTALLATION**.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **FRONT, WARNING.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 27: Identifying Upper & Lower Nut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the stabilizer bar link studs stationary and remove the upper nut (1) and the lower nut (2).
4. Remove the stabilizer bar link.

INSTALLATION**INSTALLATION**

Fig. 28: Identifying Upper & Lower Nut
Courtesy of CHRYSLER GROUP, LLC

1. Position the stabilizer bar link to the strut and install the stabilizer bar link nut (1).
2. Position the stabilizer bar link to the stabilizer bar and install the stabilizer bar link nut (2).
3. Hold the stabilizer bar link studs stationary and tighten the Stabilizer Bar Link Nuts to Specification.
4. Install the tire and wheel assembly and the lug bolts. Refer to **INSTALLATION** .
5. Lower the vehicle.

STABILIZER BAR, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **FRONT, WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL** .

020468825

Fig. 29: Stabilizer Bar Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the four stabilizer bolts (1, 3) and separate the stabilizer bar (2) from the crossmember.

INSTALLATION

INSTALLATION

NOTE: **Inspect the brackets, insulators and links for wear or damage. Install new components as necessary.**

1. Install the stabilizer bar (2) to the crossmember.

020468825

2. Install the four stabilizer bar mounting bolts (1, 3). Tighten the to Stabilizer Bar Mounting Bolts to Specification.
3. Install the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, INSTALLATION** .

STRUT, SUSPENSION, ASSEMBLY

DESCRIPTION

DESCRIPTION

020468822

Fig. 31: Front Strut Components

Courtesy of CHRYSLER GROUP, LLC

A Macpherson type design strut assembly is used in place of the traditional front suspension upper control arm and upper ball joint. The bottom of the strut mounts directly to the steering knuckle using a "shark fin" and pinch bolt going through the knuckle. The top of the strut mounts directly to the strut tower of the vehicle using a retaining clip on the strut assembly upper mount.

The strut assembly includes the following components:

- Strut (damper) (1)
- Dust shield (2)
- Strut rod nut (3)
- Bearing and upper spring seat (4)
- Upper spring isolator (5)
- Coil spring (6)
- Lower spring isolator (7)

Each component is serviced by removing the strut assembly from the vehicle and disassembling it.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If a coil spring requires replacement, be sure that it is replaced with a spring meeting the correct load rating for the vehicle and its specific options.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STRUT ASSEMBLY

Inspect the strut assembly for the following conditions:

- Inspect for a damaged or broken coil spring.
- Inspect for a torn or damaged dust shield.
- Lift the dust shield and inspect the strut assembly for evidence of fluid running from the upper end of the strut fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut shaft and strut shaft seal is not unusual and does not affect performance of the strut assembly.
- Inspect the jounce bumper for signs of damage or deterioration.
- Inspect the clearance between the shock tower and the coil spring. Make sure no fasteners are protruding through the shock tower possibly contacting the coil spring and strut. Because of the minimum clearance in this area, installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

REMOVAL**REMOVAL**

NOTE: Before proceeding, refer to **FRONT, WARNING.**

NOTE: Removal of the strut assembly is the same for both sides.

NOTE: If both strut assemblies are removed, label the strut assemblies right or left. Keep the other strut parts separated with right or left as well. Not all parts of the strut assembly are interchangeable side-to-side.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 32: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) on the hub nut. Use care not to damage the halfshaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3). **Do not reuse the hub nut.**
5. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

Fig. 33: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the wheel speed sensor (1) and remove the wire harness from the strut. Position the wire harness aside.

7. Remove the stabilizer bar link. Refer to **LINK, STABILIZER BAR, REMOVAL**.

Fig. 34: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer tie rod end from the knuckle (1). Refer to **TIE ROD, STEERING, REMOVAL**.

Fig. 35: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove and discard the lower ball joint nut (1).
10. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 36: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the ball joint boot does not get cut when separating the control arm from the knuckle.

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.

11. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
12. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.
13. Separate the axle from the knuckle and support the axle.

Fig. 37: Identifying Strut & Clips
Courtesy of CHRYSLER GROUP, LLC

14. Insert the ball joint back into the control arm to support the strut during upper strut clip removal.
15. Lower the hoist until a floor jack can be used to raise the strut (1) to relieve tension on the upper strut clip.
16. Using two screwdrivers, pry the two ends (2) of the strut clip in opposite directions to separate and break the clip. **Discard the clips after removal.**

Fig. 38: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

17. Remove the knuckle to strut pinch bolt and nut (1). **Discard the nut and bolt.**

18. Remove the strut from the vehicle.
19. To disassemble the strut, refer to **STRUT, SUSPENSION, ASSEMBLY, DISASSEMBLY**.

DISASSEMBLY

DISASSEMBLY

Fig. 39: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: The strut assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to **STRUT, SUSPENSION, ASSEMBLY, REMOVAL**.

For the disassembly and assembly of the strut assembly, use strut spring compressor, teamPSE tool 223-7400, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: Do not remove the strut rod nut before the coil spring is properly compressed. The coil spring is held under pressure. The coil spring must be compressed, removing spring tension from the upper mount and bearing, before the strut rod nut is removed.

050870143

Fig. 40: Spring Compressor & Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

1. If both struts are being serviced at the same time, mark both the coil spring and strut assembly according to which side of the vehicle the strut is being removed from.
2. Position the strut assembly (2) in the strut coil spring compressor (1) following the manufacturer's instructions and set the lower and upper hooks of the compressor on the coil spring. Position the strut clevis bracket straight outward, away from the compressor.
3. Compress the coil spring until all coil spring tension is removed from the upper mount and bearing.

050870144

Fig. 41: Hex Head Wrench & Special Tool #9362
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

4. Once the spring is sufficiently compressed, install (special tool #9362, Wrench, Strut Nut) (2), on the strut rod nut. Next, install a hex head wrench (1) into the strut rod internal hex. While holding the strut rod from turning, remove the nut using the strut nut wrench.
5. Remove the clamp (if installed) from the bottom of the coil spring and remove the strut (damper) out through the bottom of the coil spring.
6. Remove the lower spring isolator from the strut seat.
7. Remove the dust shield.
8. Remove the upper strut mount from the top of the bearing and upper spring seat.
9. Remove the upper spring seat and isolator from the top of the coil spring.
10. Release the tension from the coil spring by backing off the compressor drive completely. Push back the compressor hooks and remove the coil spring.
11. Inspect the strut assembly components for the following and replace as necessary:
 - Inspect the strut (damper) for shaft binding over the full stroke of the shaft.
 - Inspect the jounce bumper for cracks and signs of deterioration.
 - Inspect the dust shield for cracks and tears.
 - Check the upper mount for cracks and distortion and its retaining studs for any sign of damage.
 - Check the bearing and upper spring seat for any binding.

- Inspect the upper and lower spring isolators for material deterioration and distortion.
- Inspect the coil spring for any sign of damage to the coating.

NOTE: For reassembly, refer to **STRUT, SUSPENSION, ASSEMBLY, ASSEMBLY.**

ASSEMBLY

ASSEMBLY

Fig. 42: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

1. Place the coil spring in the spring compressor following the manufacturer's instructions. Before compressing the spring, rotate the spring so the end of the bottom coil is at approximately the 9 o'clock position as viewed above (or to where the spring was when removed from the compressor). This action will allow the strut (damper) clevis bracket to be positioned outward, away from the compressor once installed.
2. Slowly compress the coil spring until enough room is available for strut assembly reassembly.
3. Install the bearing and upper spring seat, and isolator on top of the coil spring.
4. Install the upper mount on top of the bearing and upper spring seat.
5. Install the lower spring isolator on the spring seat on the strut (damper).
6. Slide the jounce bumper and dust shield onto the strut rod.

7. Install the strut up through the bottom of the coil spring and upper spring seat, mount, and bearing until the lower spring seat contacts the lower end of the coil spring. Rotate the strut as necessary until the end of the bottom coil comes in contact with the stop built into the lower spring isolator.
8. While holding the strut in position, install the (special tool #10140-2, Receiver) nut on the end of the strut rod.

050870144

Fig. 43: Hex Head Wrench & Special Tool #9362
Courtesy of CHRYSLER GROUP, LLC

**CAUTION: Never use impact or high speed tools to remove the strut rod nut.
Damage to the strut internal bearings can occur.**

9. Install (special tool #9362, Wrench, Strut Nut) (2) on the strut rod nut. Next, install an hex head wrench (1) on the end of the strut rod. While holding the strut rod from turning, tighten the strut rod nut to 68 N.m (50 ft. lbs.) using a torque wrench on the end of Special Tool (special tool #9362, Wrench, Strut Nut).

050870143

Fig. 44: Spring Compressor & Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Slowly release the tension from the coil spring by backing off the compressor drive completely. As the tension is relieved, make sure the upper mount and bearing align properly. Verify the upper mount does not bind when rotated.
11. Remove the strut assembly (2) from the spring compressor (1).
12. Install the strut assembly on the vehicle. Refer to **STRUT, SUSPENSION, ASSEMBLY, INSTALLATION**.

INSTALLATION

INSTALLATION

NOTE: Installation of the strut assembly is the same for both sides.

Fig. 45: Identifying Strut Mount Slot & Forward Hole
Courtesy of CHRYSLER GROUP, LLC

1. Install the strut into the vehicle. When installing the strut, align the slot in the strut mount (2) with the forward hole (1) in the body of the strut tower.

NOTE: The strut retaining clip must be fully closed and the serrations fully engaged after installation.

Fig. 46: Identifying Strut & Clips
Courtesy of CHRYSLER GROUP, LLC

2. Install the cover (1) and each half of the upper strut clip (2).

3. Press each side of the strut clip (2) toward each other to assemble the clip. Make sure that the clip is fully closed and the serrations fully engaged.
4. Install the strut into the top of the knuckle.

Fig. 47: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the **NEW** knuckle to strut pinch bolt and nut (1). Tighten the Knuckle to Strut Nut to Specification.
6. Install the axle into the knuckle.

Fig. 48: Identifying Pry Bar & Control Arm

Courtesy of CHRYSLER GROUP, LLC

7. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
8. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

0508034419

Fig. 49: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install a **NEW** lower ball joint nut (1). Tighten the Lower Ball Joint Nut to Specification.

0205035183

Fig. 50: Identifying Outer Tie Rod End

Courtesy of CHRYSLER GROUP, LLC

10. Install the outer tie rod end into the knuckle (1). Tighten the Outer Tie Rod End Nut to Specification. Refer to **TIE ROD, STEERING, INSTALLATION** .
11. Install the stabilizer bar link. Refer to **LINK, STABILIZER BAR, INSTALLATION**.

Fig. 51: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

12. Install the wheel speed sensor (1) and connect the harness to the strut. Tighten the Wheel Speed Sensor Bolt to Specification.
13. Install the front brake rotor and caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .
14. Install the **NEW** hub nut and while a helper applies the brakes, tighten the Hub Nut to Specification.

NOTE: **Do not use air tools on staking tool while staking hub nut.**

3112889

Fig. 52: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

15. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on the axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked as shown (1) in Correct Hub Nut Staking. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

NOTE: Do not stake the hub nut as shown in Correct Hub Nut Staking (2).

16. Install wheel and tire assembly. Refer to INSTALLATION.
17. Perform alignment procedure. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

WHEEL ALIGNMENT

STANDARD PROCEDURE

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment.

Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: Do not apply the electric park brake (EPB) during ride height and alignment measurements.

NOTE: Prior to reading the curb height measurement, the front and rear of the vehicle must be jounced to settle the suspension. Induce jounce by pushing down on the center of the bumper (fascia), using care not to damage the vehicle, moving the vehicle up and down, gradually increasing the suspension travel with each stroke. Release the bumper at the bottom of each stroke, repeating this action several times. Perform this to both front and rear suspensions an equal amount of times.

Measure curb height as follows:

1. Jounce the vehicle. Refer to above note.

0207014766

Fig. 53: Identifying Distance Measurements
Courtesy of CHRYSLER GROUP, LLC

NOTE: On some vehicles it may be necessary to remove an engine belly pan in order to gain access to the cradle bolt.

2. FRONT - On each side of the vehicle, measure the distance (1) from the center of the front cradle bolt head to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge placed from lift runway to runway to get an accurate measurement.
3. FRONT - Measure and record the distance (3) from the center of the spindle to the same surface or straight edge used to measure from the vertical pivot bolt.
4. Subtract the cradle bolt height (1) from the spindle height (3) to obtain the curb height value (2). Compare the curb height value (2) to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart. **Maximum left-to-right differential is not to exceed 10 mm (0.39 in.).**

Fig. 54: Mounting Bolt Height, Spindle Height & Curb Height Value
 Courtesy of CHRYSLER GROUP, LLC

5. REAR - On each side of the vehicle, measure and record the distance (1) from the bottom of the cradle toe link mount to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge placed from lift runway to runway, to get an accurate measurement.
6. REAR - On each side of the vehicle, measure and record the distance (3) from the center of the rear spindle to the same surface that was used to measure the cradle toe link mount.
7. REAR - Subtract the cradle toe link mount height (1) from the spindle height (3) to obtain the curb height value (2). Compare the curb height value (2) to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart. **Maximum left-to-right differential is not to exceed 10 mm (0.39 in.).**
8. If curb height is found to be out of specification and there is no sign of excessive body damage, curb height can be changed by replacing the applicable spring with a spring offering a different check load. Refer to **STRUT, SUSPENSION, ASSEMBLY, REMOVAL**.

CURB HEIGHT SPECIFICATIONS

		FWD	AWD	Lifted
Center of Spindle to Front Cradle Attachment Bolt	Front	130 mm (5.12 in.)	117 mm (4.61)	88 mm (3.46 in.)

2014 Jeep Cherokee Trailhawk

2014 SUSPENSION Front Suspension & Wheel Alignment - Cherokee

Center of Spindle to Rear Cradle	Rear	106 mm (4.17 in.)	105 mm (4.13 in.)	92 mm (3.62 in.)
All curb height tolerances +/- 10 mm (0.39 in.) with full tank of fuel.				

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to the vehicle to ensure proper alignment.

1. This vehicle is equipped with an Electronic Power Steering (EPS) system. Make sure there are no faults or problems with the EPS system before diagnosing an alignment issue.
2. Verify the fuel tank is full of fuel. If the fuel tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment specifications.
3. The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.
4. Check the tires on the vehicle. The tires are to be inflated to the recommended air pressure. All tires must be the same size and in good condition with approximately the same tread wear.
5. Check the front tire and wheel assemblies for excessive radial runout.
6. Inspect all suspension component fasteners for looseness and proper torque.
7. Inspect the lower front ball joints and all steering linkage for looseness and any sign of wear or damage.
8. Inspect the rubber bushings on all the suspension components for signs of wear or deterioration. If any bushings show signs of wear or deterioration, they should be replaced prior to aligning the vehicle.
9. Check vehicle curb height to verify it is within specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle, per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

REAR CAMBER

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

The rear toe link mounting location to the cradle is slotted with a cam bolt to adjust the camber.

FRONT CAMBER AND CASTER

Front camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles but some adjustment can be made. Camber and caster should be checked to ensure they meet vehicle specifications. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

If individual front camber or caster is found not to meet alignment specifications, the only adjustment available is shifting the front crossmember.

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

ADJUSTMENT BY SHIFTING CROSSMEMBER

CAUTION: Always use care when shifting crossmember to avoid damaging other components on the vehicle.

1. Loosen the bolts fastening the front crossmember to the frame just enough to allow movement of the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL**.

CAUTION: When shifting the front crossmember, keep in mind that the front and rear engine mounts are attached to the front crossmember and fore/aft crossmember and should be inspected following the crossmember shift to make sure they are properly aligned.

2. Shift front crossmember as necessary (See following charts) to bring camber or caster into specifications. When shifting crossmember, use care not to move other angles (camber or caster) that are within specifications, out of specifications.

FRONT CAMBER ADJUSTMENT BY SHIFTING CROSSMEMBER*	
Left Camber Below Specification	Move crossmember to the right
Left Camber Above Specification	Move crossmember to the left
Right Camber Below Specification	Move crossmember to the left
Right Camber Above Specification	Move crossmember to the right
Cross Camber Below Specification	Move crossmember to the right

2014 Jeep Cherokee Trailhawk

2014 SUSPENSION Front Suspension & Wheel Alignment - Cherokee

Cross Camber Above Specification

Move crossmember to the left

* For every move to adjust one side of the vehicle, a countermove on the opposite side will occur.

FRONT CASTER ADJUSTMENT BY SHIFTING CROSSMEMBER

Left Caster Below Specification	Move left side of crossmember forward
Left Caster Above Specification	Move left side of crossmember rearward
Right Caster Below Specification	Move right side of crossmember forward
Right Caster Above Specification	Move right side of crossmember rearward
Cross Caster Below Specification	Move left side of crossmember forward and right side rearward
Cross Caster Above Specification	Move left side of crossmember rearward and right side forward

3. Tighten all previously loosened fasteners (bolts) securing the crossmember to the vehicle to specifications. Refer to **CROSSMEMBER, FRONT SUSPENSION, INSTALLATION**.
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to TOE. If camber and/or caster cannot be brought into specifications, check for bent or damaged components.

TOE

NOTE: When setting toe, make sure to set rear toe to the preferred specifications before setting front toe to the preferred specifications

1. Center the steering wheel and lock it in place using a steering wheel clamp.

REAR TOE

NOTE: Perform the following at each rear wheel as necessary.

1. While holding the cam bolt head stationary, loosen the spring link mounting cam bolt nut.
2. Rotate the cam bolt head left or right until the rear wheel toe for that rear wheel is set to the preferred specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
3. While holding the cam bolt head stationary, tighten the spring link mounting cam bolt nut to specifications. Refer to **SPECIFICATIONS**.

FRONT TOE

NOTE: Perform the following at each front wheel as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boot (bellows) while turning the inner tie rod during front toe adjustment. It may be necessary to remove the clamp where the boot meets the inner tie rod.

2014 Jeep Cherokee Trailhawk

2014 SUSPENSION Front Suspension & Wheel Alignment - Cherokee

1. Loosen the tie rod adjusting jam nut. Grasp the inner tie rod and rotate it one way or the other until the front wheel toe is set to the preferred specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
2. Tighten the tie rod adjusting jam nut to specifications. Refer to **FRONT, SPECIFICATIONS**.
3. Make sure the inner tie rod-to-steering gear boot is not twisted. If removed, reinstall the clamp where the boot meets the inner tie rod.
4. Remove the steering wheel clamp.
5. Remove the alignment equipment.
6. Perform the Clear Steering Pull Compensation Procedure. Refer to **STANDARD PROCEDURE**.
7. Road test the vehicle to verify the steering wheel is straight and the vehicle does not pull or wander.

SPECIFICATIONS

SPECIFICATIONS

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set with the vehicle at curb height. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

2014 SUSPENSION**Rear Suspension - Cherokee****WARNING****WARNING**

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on this vehicle. It cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

NOTE: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

10. Remove the trailing link (3) from the knuckle. Refer to **LINK, TRAILING, REAR, REMOVAL**.

1710009334

Fig. 5: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the toe link (1) from the knuckle. Refer to **LINK, CAMBER, REMOVAL**, **LINK, TOE, REMOVAL** and **LINK, SPRING, REMOVAL**.

0508006463

Fig. 6: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the lower shock (1) from knuckle. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.
13. Remove the rear knuckle from vehicle.
14. If necessary, remove the hub from the knuckle. Refer to **HUB AND BEARING, REMOVAL**.

INSTALLATION

INSTALLATION

1. If necessary, install the hub/bearing in the knuckle. Refer to **HUB AND BEARING, INSTALLATION**.

1710009331

Fig. 7: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the knuckle to the trailing arm link (3) and install fasteners (4). Refer to **KNUCKLE, REAR, INSTALLATION**.

1710009334

Fig. 8: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the toe link (1) to the knuckle. Refer to **LINK, CAMBER, INSTALLATION**, **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION**.

1715005823

Fig. 9: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the camber link (2) to the knuckle. Refer to **LINK, CAMBER, INSTALLATION**, **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION**.
5. Install the spring. Refer to **SPRING(S), INSTALLATION**.
6. Remove the support from the spring link.
7. Install the brake rotor and brake caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION**.

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

8. If equipped with halfshaft, install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

3112889

Fig. 10: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools on staking tool while staking hub nut.

9. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle as shown (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked so that it looks similar to. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

0508006463

Fig. 11: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Connect the lower shock (1) from knuckle. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.

1715005817

Fig. 12: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

11. Install wheel speed sensor (5) into knuckle.
12. Install the retaining bolt (6) and tighten to specifications. Refer to **SPECIFICATIONS** .
13. Install the wheel and tire assembly. Refer to **INSTALLATION** .
14. Remove the supports and lower the vehicle.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: **The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.**

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART** , should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: **Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .**

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.
2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE,**

DIAGNOSIS AND TESTING .

6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable) 2. Worn Tires and/or Incorrect Wheel Alignment 3. Defective Wheel Bearing 4. Wrong Power Steering Fluid (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid) 2. Replace Tires, Check And Reset Wheel Alignment 3. Replace Wheel Bearing 4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts 2. Engine Mount Grounding Against Frame Or Body Of Vehicle 3. Worn Tires and/or Incorrect Wheel Alignment 4. Defective Wheel Bearing 5. Worn or Broken C/V Joint 6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	1. Verify Wheel Lug Nut Torque 2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required 3. Replace Tires, Check and Reset Wheel Alignment 4. Replace Wheel Bearing 5. Replace C/V Joint 6. Center the Engine
POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque 2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	1. Torque Hub Nut to Spec 2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub

		Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

030369423

Fig. 13: Hub Nut & Halfshaft
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas in the hub nut to avoid damaging the halfshaft (if equipped).
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (1) from the halfshaft

(if equipped) (2) and discard it.

The used hub nut is not reusable.

5. Access and remove the rear brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

1715005817

Fig. 14: Removing/Installing Rear Wheel Speed Sensor

Courtesy of CHRYSLER GROUP, LLC

6. Remove the rear wheel speed sensor retaining bolt (6) and remove the sensor (5) from the knuckle.

1715005821

Fig. 15: Removing Caliper Bracket Mounting Bolts And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Remove the four bolts (1) fastening the hub and bearing to the knuckle.

NOTE: **The bolts are one time use and need to be discarded.**

8. Slide the hub and bearing off the halfshaft (if equipped) and out of the knuckle.

INSTALLATION

INSTALLATION

1715005821

Fig. 16: Removing Caliper Bracket Mounting Bolts And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Slide the hub and bearing onto the half shaft (if equipped) and install into the knuckle.
2. Install four **NEW** mounting bolts (1). Refer to **SPECIFICATIONS** and tighten to specifications.

1715005817

Fig. 17: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Install the rear wheel speed sensor (5) in the knuckle.
4. Install the retaining bolt (6) and tighten to specifications. Refer to **SPECIFICATIONS** .

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

5. Install the rear brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

3112889

Fig. 18: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools on staking tool while staking hub nut.

7. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle as shown (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked so that it looks similar to **Fig. 2**. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

8. Install the wheel and tire assembly. Refer to **INSTALLATION** .
9. Lower the vehicle.
10. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

1715005823

Fig. 19: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Hold the stabilizer bar link stud stationary and remove the lower nut (5) securing the link.

1715005806

Fig. 20: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the stabilizer bar link stud stationary and remove the upper nut (1) securing the link (2).
4. Remove the stabilizer bar link (2).

INSTALLATION

INSTALLATION

1715005806

Fig. 21: Identifying Stabilizer Bar Link & Upper Nut
 Courtesy of CHRYSLER GROUP, LLC

1. Install the stabilizer link (2) upper stud in the end of the stabilizer bar from the outboard side. Install the nut (1) on the upper stud and while holding the stabilizer link stud stationary, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

1715005823

Fig. 22: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Attach the stabilizer bar link to the spring link (6). Install the nut (5) and while holding the stabilizer bar link lower stud stationary, tighten the nut (5) to specification. Refer to **SPECIFICATIONS**.
3. Lower the vehicle.

SHOCK ABSORBER, SUSPENSION

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to **WARNING**.

0508006463

Fig. 23: Identifying Lower Shock, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts, then the rear tire and wheel assembly.
3. Remove the wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL**.
4. Support the rear suspension with a jack stand or equivalent.
5. Remove the bolt (4) securing the lower end of the shock assembly (1) to the lower knuckle assembly.

171868833

Fig. 24: Upper Shock Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the upper shock mounting bolts (1) and remove the shock from the vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 25: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: View is typical

NOTE: The shock assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.

171069591

Fig. 26: Retaining Nut, Upper Shock Mount, Dust Shield & Shock Body
Courtesy of CHRYSLER GROUP, LLC

1. Remove the retaining nut (1) using the appropriate shock absorber tool kit.
2. Remove the upper shock mount (2).
3. Remove the dust shield (3) from the shock body (4).
4. Perform the inspection procedure below:
 - Inspect the shock absorber (damper) (4) for shaft binding over the full stroke of the shaft.
 - Inspect the dust shield (3) for cracks and tears.
 - Check the upper mounting bracket (2) for cracks and distortion
5. For reassembly, refer to **SHOCK ABSORBER, SUSPENSION, ASSEMBLY**.

ASSEMBLY

ASSEMBLY

Fig. 27: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: View is typical

171069591

Fig. 28: Retaining Nut, Upper Shock Mount, Dust Shield & Shock Body
Courtesy of CHRYSLER GROUP, LLC

1. Place the dust shield (3) over the shock body (4).
2. Install the upper shock mount (2) and install the retaining nut (1). Using the appropriate shock absorber tool kit, tighten the nut to 30 N.m (22 ft. lbs.).
3. Install the shock in the vehicle. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.

INSTALLATION

INSTALLATION

171868833

Fig. 29: Upper Shock Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Use a jack stand or equivalent to raise the suspension into position.
2. Install the shock upper mount to the body and install the upper mounting bolts (1) and tighten to specifications. Refer to **SPECIFICATIONS**.

0508006463

Fig. 30: Identifying Lower Shock, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

3. Position the lower end of the shock (1) to the knuckle assembly.
4. Install the lower retaining bolt (4) and tighten to specifications. Refer to **SPECIFICATIONS**.
5. Install the wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.
6. Install the tire and wheel assembly. Refer to **INSTALLATION**.
7. Lower the vehicle.

SPRING(S)

REMOVAL

REMOVAL

1715005806

Fig. 31: Identifying Stabilizer Bar Link & Upper Nut

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to **WARNING**.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts, then the rear tire and wheel assembly.
3. Hold the upper stud stationary and remove the stabilizer link nut (1).
4. Separate the stabilizer link (2) from the stabilizer bar.

1715005823

Fig. 32: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Support the suspension with a jack stand or equivalent.
6. Remove the spring link bolt (4) and separate the spring link (6) from the knuckle.

1715005820

Fig. 33: Identifying Coil Spring

Courtesy of CHRYSLER GROUP, LLC

7. Slowly lower the jack stand and remove the coil spring (1).
8. If replacing the spring, remove the spring isolators from the top and bottom of the spring.

INSTALLATION

INSTALLATION

Fig. 34: Identifying Lower End Of Spring & Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the spring, the lower end of the spring (1) and the spring isolator orientation feature (2) must be aligned as shown. The lower end of the spring is always outboard.

NOTE: The label on the spring is always closest to the top isolator.

1. If spring isolators were removed or a new spring is being installed, place spring isolator on each end of spring.

1715005820

Fig. 35: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

2. Place the coil spring (1) on top of the spring link perches.

1715005823

Fig. 36: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Use a jack stand or equivalent to raise the suspension into place.
4. Position the spring link (6) in the installed position and install the bolt (4). Do not tighten to specification at this time.

1715005806

Fig. 37: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the stabilizer link (2) stud to the stabilizer bar and install the retaining nut (1).
6. While holding the stabilizer link stud stationary, tighten the nut to specifications. Refer to **SPECIFICATIONS**.
7. Install the tire and wheel assembly. Refer to **INSTALLATION**.
8. Lower the vehicle to normal ride height and tighten the spring link to the lower knuckle assembly bolt to specifications. Refer to **SPECIFICATIONS**.
9. Check for proper vehicle curb height. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

1715005806

Fig. 38: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to **WARNING**.

NOTE: The stabilizer cushions are not serviced separately. If they require replacement, the entire stabilizer bar must be replaced.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On each side of the vehicle, while holding the stabilizer bar link studs stationary, remove the nuts (1) securing the link (2) to the stabilizer bar.

0508006461

Fig. 39: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. On each side of the vehicle, remove the screws (1) securing the brackets (3) to the crossmember and remove brackets.
4. On each side of the vehicle, remove the upper and lower screws (5) securing the stabilizer bar (2) to the crossmember.
5. Remove the stabilizer bar (2) from the vehicle.

INSTALLATION

INSTALLATION

0508006461

Fig. 40: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the stabilizer bar (2) on the rear crossmember.
2. Install the upper and lower retaining screws (5) in the mounting holes. Do not tighten the screws at this time.

1715005806

Fig. 41: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

3. On each side of the vehicle, install the stabilizer link (2) studs, one in the in the end of the stabilizer bar and one in the lower mounting location. Install the nut (1) on each end and while holding the stabilizer link stud stationary, tighten each nut to specifications. Refer to **SPECIFICATIONS**.
4. On each side of the vehicle, tighten the stabilizer bar to crossmember retainer screws (1). Refer to **SPECIFICATIONS**.

0508006461

Fig. 42: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. On each side of the vehicle, install the brackets (3) and the screws (1) securing the brackets to the crossmember.
6. Lower the vehicle.

LINK, CAMBER

DESCRIPTION

DESCRIPTION

1710009334

Fig. 43: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

The camber link (1) is connected between the cradle and the front of the knuckle with a bonded bushing on each end. The bushings are serviced with a new link only. On the knuckle side of the link, the bushing is not between two parts of a bracket. Because of this the bolt (2) has a captive washer that will hold the bushing/link in place if the bonding were to separate from the link. Make sure that the proper bolts and nuts are used when servicing.

REMOVAL

REMOVAL

1710009334

Fig. 44: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the camber link to cradle bolt/nut (2), the camber link to knuckle bolt/nut (2) and remove the camber link (1) from the vehicle.

INSTALLATION

INSTALLATION

1710009334

Fig. 45: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the camber link (1) and install the camber link to knuckle bolt/nut (2) and camber link to cradle cam bolt/nut (2). Do not tighten.
2. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
3. Tighten the camber link to knuckle bolt/nut to specifications. Refer to **SPECIFICATIONS**.
4. Tighten the camber link to cradle bolt/nut to specifications. Refer to **SPECIFICATIONS**.
5. Remove the spring link holding fixture.
6. Lower the vehicle.

LINK, TOE

DESCRIPTION

DESCRIPTION

1715005823

Fig. 46: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

The toe link (2) is connected between the cradle and the middle of the knuckle with a bonded bushing on the cradle side end. The bushing is serviced with a new link only. On the cradle side of the link a cam bolt (1) is used for alignment purposes. On the knuckle side of the link, the bushing is on the knuckle and is between the two parts of the toe link. Make sure that the proper bolts and nuts are used when servicing.

REMOVAL

REMOVAL

1715005823

Fig. 47: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel.

NOTE: Mark the position of the cam nut/bolt on the cradle side for installation.

3. Remove and discard the toe link to cradle bolt/nut (1) and the toe link to knuckle bolt/nut (3) and remove the toe link (2) from the vehicle.

INSTALLATION

INSTALLATION

1715005823

Fig. 48: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the toe link (2) and install a **New** link to knuckle bolt/nut (3). Do not tighten.

NOTE: Always use new fasteners

2. Install a **New** toe link to cradle cam bolt/nut (1). Do not tighten.
3. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
4. Tighten the toe link to knuckle bolt/nut (3) to specifications. Refer to **SPECIFICATIONS**.

NOTE: Position the cam as close to removal marking as possible to aid in alignment.

5. Tighten the toe link to cradle cam bolt/nut (1) to specifications. Refer to **SPECIFICATIONS**.
6. Remove the spring link holding fixture.
7. Install the wheel. Refer to **INSTALLATION**.
8. Remove the supports and lower the vehicle.
9. Perform an alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, SPRING

REMOVAL

REMOVAL

A multimedia supplement to the instructions contained in this article is available.

To view the multimedia example of the condition described go to;
<http://www.youtube.com/user/Mitchell1Tips>
then type "A00641397.vid1" into the "Search Channel" box.

1715005823

Fig. 49: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: On four wheel drive models, the spring link to cradle bolt (7) will contact the rear differential unit when attempting to remove it. To remove it, partially remove the bolt, cut it in half, then remove the remaining portion of the bolt. Install the new bolt and cam nut in the opposite direction from which it was removed.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts then the tire and wheel assembly.
3. Support the spring link with a jack stand or equivalent.
4. While holding the lower stud stationary, remove the lower stabilizer link nut (5) and separate the link from the spring link.

NOTE: Mark the location of the outer mounting bolt (4) with a grease pencil or equivalent to mark the position to help during installation and rear wheel alignment.

5. Remove and discard the bolt/nut (4) from the spring link (6).

1715005820

Fig. 50: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

6. Slowly lower the jack stand or equivalent and remove the rear spring (1) from the vehicle while separating the spring link from the knuckle.

1715005823

Fig. 51: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the location of the inner mounting bolts (7) with a paint marker or equivalent. The marked location will be used during installation to make sure the rear alignment is not changed.

7. Remove and discard the spring link bolt/nut (7) from the spring link.

INSTALLATION

INSTALLATION

Fig. 52: Identifying Lower End Of Spring & Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the spring, the lower end of the spring (1) and the spring isolator orientation feature (2) must be aligned as shown. The lower end of the spring is always outboard.

NOTE: The label on the spring is always closest to the top isolator.

Fig. 53: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Position the spring link (6) to the mount.

NOTE: On four wheel drive models, install the spring link to cradle bolt in the opposite direction from which it was removed.

2. Install a **NEW** bolt/nut (7), but do not tighten to specification at this time. Support the spring link with a jack stand or equivalent.

1715005820

Fig. 54: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

3. Install the rear spring (1) into the vehicle.

1715005823

Fig. 55: Identifying Spring Link, Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

4. While raising the jack stand or equivalent, attach the spring link (6) to the knuckle.
5. Install a **NEW** bolt/nut (4) but do not tighten to specification at this time.

1715005823

Fig. 56: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

6. Install the stabilizer link to the spring link.
7. Hold the stabilizer stud stationary and tighten the retaining nut to specifications. Refer to **SPECIFICATIONS**.
8. Install the tire and wheel assembly. Refer to **INSTALLATION**.
9. Lower vehicle to normal ride height. Tighten the spring link to knuckle and the spring link to cradle fasteners to specifications. Refer to **SPECIFICATIONS**.
10. Perform wheel alignment as necessary. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, TRAILING, REAR

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1710009331

Fig. 57: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the routing clips attached to the trailing link (3).
4. Remove the three bolts (4) securing the knuckle to the trailing link (3).

1710009335

Fig. 58: Identifying Trailing Link & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two bolts (1) fastening the leading end of the trailing link (2) to the body.
6. Remove the trailing link.

INSTALLATION

INSTALLATION

1710009331

Fig. 59: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Position the trailing link (3) and install the three bolts (4) securing the trailing link to the knuckle. Tighten the mounting bolts to specifications. Refer to **SPECIFICATIONS**.

1710009335

Fig. 60: Identifying Trailing Link & Bolts
 Courtesy of CHRYSLER GROUP, LLC

2. Position the forward end of the trailing link (2) on the body and install the two mounting bolts (1). Do not tighten the bolts at this time.
3. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
4. Tighten the two mounting bolts (1) fastening the leading end of the trailing link (2) to the body to specifications. Refer to **SPECIFICATIONS**.
5. Remove the lower control arm holding fixture.
6. Install the routing clips attached to the trailing link.
7. Install tire and wheel assembly. Refer to **INSTALLATION**.
8. Lower the vehicle.

2014 SUSPENSION**Tires & Wheels - Service Information - Cherokee****DIAGNOSIS AND TESTING****DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION**

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.

NOTE: If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to a powertrain concern. Refer to **DIAGNOSIS AND TESTING** for additional information.

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

NOTE: Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.

NOTE: Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.

NOTE: If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.

NOTE: Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.

2480193

Fig. 1: Balancing Wheels Using Cone/Collet

Courtesy of CHRYSLER GROUP, LLC

NOTE: Use of the proper collet will prevent potential damage to the Chrome Clad wheels.

NOTE: Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended balance equipment.

- Dual-taper collet type (1)
- High-taper cone type (2)
- Possible obstruction (3)
- May not seat properly (4)
- No obstruction (5)
- Properly seated (6)

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

**Fig. 2: Dynamic Balancing**

Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

Fig. 3: Static Balancing

Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (?) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning, or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE AND WHEEL ROTATION

NOTE: Refer to the Owner's Manual for rotation schedules.

NON-DIRECTIONAL TREAD PATTERN TIRES

Fig. 4: Forward-Cross Tire Rotation Method

Courtesy of CHRYSLER GROUP, LLC

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in this graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

CAUTION: Only the four-tire rotation may be used on vehicles equipped with tire pressure monitoring (TPM) due to sensors being present in the four road wheels and not in the spare.

NOTE: Only the four-tire rotation method may be used if the vehicle is equipped with a compact or temporary spare tire.

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles may be fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

When being installed, extra care is needed to ensure that this direction of rotation is maintained.

REMOVAL

REMOVAL

1. Raise and support the vehicle so that tire and wheel assembly clears ground level. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the five wheel mounting (lug) bolts.
3. Remove the tire and wheel assembly from the hub.

INSTALLATION

INSTALLATION

WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) bolts. This could adversely affect the safety and handling of the vehicle.

1. Never use oil or grease on studs or wheel mounting (lug) bolts.

Clean the wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between the wheel and vehicle.

2. Install and lightly snug all five wheel mounting (lug) bolts. **Do not tighten at this time** .
3. Remove the support and lower the vehicle.
4. Progressively tighten all the wheel mounting (lug) bolts in a star pattern to the proper specification. Refer to **SPECIFICATIONS** .

TIRE PRESSURE MONITORING

DESCRIPTION

DESCRIPTION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is monitored in case of a matching spare with sensor. Sensor transmissions occur if there is significant change in pressure. RFHM has to be awake when sensor transmits to monitor spare pressure.

The TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, an electronic display, and an indicator lamp. The system communicates through the RF Hub Module.

The receiver circuit for the TPM system is integrated into the RF Hub. The RF Hub decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the RF Hub will send a request to the module that controls the indicator lamp and the text display via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The RF Hub will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The RF Hub will store all wheel sensor IDs and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor shall be stored in the RF Hub memory.

The RF Hub automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 20 mph (32 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: **A new sensor ID can also be programmed directly into the RF Hub by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the sensor.**

OPERATION

OPERATION

TIRE PRESSURE MONITORING

The tire pressure monitoring system (TPMS) is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Radio Frequency (RF) Hub. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM system detects that the tire pressure in any road tire is low, beyond the Low Pressure (lamp) ON threshold (see placard table below), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds, then remain on solid.

If the RF Hub detects a warning or fault condition at ignition key "on", the display module will request a chime once per ignition cycle for the first "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The RF Hub shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "on" and key "off" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the RF Hub non-volatile memory during the initial

2014 Jeep Cherokee Trailhawk

2014 SUSPENSION Tires & Wheels - Service Information - Cherokee

Manufacturing Plant Process, or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the placard. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven; this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the RF Hub receives a valid transmission from that sensor location.

TPM THRESHOLD PRESSURES

The recommended "Placard Pressure" for the tires installed on the vehicle, are stored in the RF Hub non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), proceed to **LOW PRESSURE**.
- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Proceed to **SYSTEM FAULT**.

LOW PRESSURE

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, refer to **TIRES, STANDARD PROCEDURE**.

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

If a system fault is detected, a chime will sound, and the TPM indicator lamp will flash for 75 seconds, then remain on solid. For vehicles with TPM Systems, a "SERVICE TIRE PRESSURE MONITORING SYSTEM" (Highline IPC) or "SERVICE TIRE PRESSURE SYSTEM" (Midline IPC) message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. A system fault can occur by many scenarios, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same Radio Frequencies as the TPM sensors.
- Installing some form of aftermarket window tinting that affects radio wave signals.
- Accumulation of snow or ice around the wheels or wheel housings.
- Using tire chains on the vehicle.
- Using wheels not equipped with TPM sensors.

Refer to the appropriate diagnostic information.

SENSOR, TIRE PRESSURE MONITORING (TPM)**CAUTION****CAUTION**

CAUTION: The Tire Pressure Monitoring (TPM) system has been optimized for the original equipment tires and wheels. TPM system pressures have been established for the tire size equipped on the vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with TPM, as damage to the sensors may result.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for

the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be installed in a wheel, it is necessary to install a new sensor-to-wheel seal, metal washer and valve stem nut, to ensure air tight sealing.

CAUTION: When installing the valve core, be sure to tighten the core to specifications. Overtightening by a little as three or four inch pounds can damage the sensor.

DESCRIPTION

DESCRIPTION

Fig. 5: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.

One tire pressure sensor (1) is mounted to a valve stem (3) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (3) looks similar to a standard valve stem with the tire mounted on the wheel.

NOTE: This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues.)

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below:
- Valve stem (3), including screw (2).
- Valve stem core (not shown).
- Valve stem cap (4)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the

vehicle. Use original size tires only to maintain system accuracy.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 20 minutes continuously above 20 m.p.h. (32 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more than 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

REMOVAL**REMOVAL**

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

Fig. 6: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
 - a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
 - b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem $\pm 10^\circ$, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 7: Tire Pressure Sensor & Components
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (2) and remove the sensor (1) from the valve stem (3).
5. Remove the valve stem (3) from the wheel.

INSTALLATION

INSTALLATION

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.

Fig. 8: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

NOTE: When installing a new valve stem, tire bead lubricant should be used for proper installation.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

2. Insert valve stem (3) through wheel and pull through to seat with standard valve stem installation tool.
3. If replacing the valve stem (3) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (5) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension (5), install the retainer screw (2) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

1433873

Fig. 9: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

- a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

80cib382

Fig. 10: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

- b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is

located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

- c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
- d. Install tire and wheel assembly on the vehicle.
- e. Remove the support and lower the vehicle.
- f. Perform one of the following to make the system learn the new sensor ID.
- g. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the RF Hub module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE**.
- h. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE**.

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TIRES

DESCRIPTION

TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in **TIRE AND WHEEL ROTATION**. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. An All Season type tire will also have either M + S, M AND S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall.

Fig. 11: Tire Aspect Ratio

Courtesy of CHRYSLER GROUP, LLC

For example purposes, tire size P225/60 R 16 97 T is used in the Tire Identification chart. P stands for Passenger tire. Sectional width (1) is 225mm. Sectional height (2) is 60 percent of sectional width. R represents Radial construction. 16 is the wheel diameter in inches. 97 T is the tire manufacturers load and speed ratings.

TIRE IDENTIFICATION

Reading Tire Codes		
P	TIRE TYPE (Not present on all tires)	P - Passenger
		T - Temporary
		C - Commercial
		LT - Light Truck
225	SECTIONAL WIDTH	SHOWN IN MILLIMETERS
60	ASPECT RATIO	SHOWN IN PERCENTAGE
R	CONSTRUCTION TYPE	R - RADIAL
		B - BIAS BELTED
		D - DIAGONAL (BIAS)
16	WHEEL DIAMETER	SHOWN IN INCHES
97	LOAD INDEX	*
T	SPEED RATING	*
* Consult the tire manufacturer regarding any questions on tire specifications or capabilities.		

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

REPLACEMENT TIRES

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

WARNING: In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire and wheel assembly is standard equipment on this vehicle.

Some vehicles are equipped with a Tire Inflator/Sealant tire repair kit as standard equipment in place of a spare tire. It is to be used to repair small punctures in the tire as necessary. For additional information, refer to the Owners Manual.

The compact spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact spare tire. Refer to the Owner's Manual for complete details.

DIAGNOSIS AND TESTING

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, refer to **DIAGNOSIS AND TESTING**. For irregular tire wear issues, refer to **TIRES, DIAGNOSIS AND TESTING**.

812014d7

Fig. 12: Identifying Tire Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

Fig. 13: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening (B-pillar) or rear shutface of driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride

- The vehicle to drift.

WARNING: Over or Under inflated tires can affect vehicle handling. The tire can fail suddenly, resulting in loss of vehicle control.

Fig. 14: Under Inflation

Courtesy of CHRYSLER GROUP, LLC

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

Fig. 15: Identifying Over Inflated Tire

Courtesy of CHRYSLER GROUP, LLC

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

TIRE PRESSURE FOR HIGH SPEED OPERATION

Refer to the vehicle's Owners Manual Package.

TIRE LEAK REPAIRING

Fig. 16: Identifying Tire Repair Area
Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle. Refer to **INSTALLATION**.

CLEANING

CLEANING

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

REMOVAL

REMOVAL

 then type "A00641393.vid2" into the "Search Channel" box.

IF REMOVING THE TIRE FROM THE WHEEL, PERFORM THE PROCEDURE BELOW:

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

Fig. 17: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
 Courtesy of CHRYSLER GROUP, LLC

- 1.
2. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
 - a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
 - b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem $\pm 10^\circ$, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 18: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
4. Remove the valve stem (2) from the wheel (4).

INSTALLATION

INSTALLATION

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.

Fig. 19: Sensor Mounting To Wheel

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

IF THE TIRE WAS REMOVED FROM THE WHEEL, PERFORM THE PROCEDURE BELOW:

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

NOTE: A new valve stem is pre-lubricated for proper installation with a standard tool.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

Fig. 20: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

2. Insert valve stem (3) through wheel and pull through to seat with standard valve stem installation tool.
3. If replacing the valve stem (3) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (3) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension (5), install the retainer screw (2) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

Fig. 21: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

- a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

80dbf382

Fig. 22: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

- b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.
- c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
- d. Install tire and wheel assembly on the vehicle.
- e. Remove the support and lower the vehicle.
- f. Perform one of the following to make the system learn the new sensor ID.
- g. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the RF Hub module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE**.
- h. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the

system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

WHEELS

DESCRIPTION

DESCRIPTION

Fig. 23: Identifying Wheel/Rim Design
 Courtesy of CHRYSLER GROUP, LLC

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: **Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.

WARNING: Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death. For clarification:

- Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit (93 degrees Celsius).
- Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure.
- Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.
- Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.

CLEANING

CLEANING

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

2014 TRANSFER CASE

Power Transfer Unit - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

ONE SPEED PTU

The one Speed Power Transfer Unit (PTU) is a **service as an assembly component** when mechanical faults are evident. The shift actuator is a serviceable component, and if leaking, the input shaft seal(s), drive pinion seal, and case gasket can be serviced. Special tools have been developed to service the seals in the one speed PTU.

NOTE: There are two one speed PTU's in use, one for the automatic transmission and one for the manual transmission, they have unique mounting provisions, and are not interchangeable. The manual transmission version also has two opposed seals on the input shaft, the automatic transmission version has a single seal on the input shaft.

TWO SPEED PTU

The two Speed Power Transfer Unit (PTU) is a **service as assembly component** when mechanical faults and some oil leaks are evident. The shift actuator, rear output seal, right halfshaft outer seal, and the plug are serviceable. Special tools have been developed to service the seals in the two speed PTU. If hypoid fluid is leaking from the weep-hole between the transaxle and the PTU, the two speed PTU must be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - PTU FLUID FILL

1. Raise vehicle on hoist. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Position a drain pan under the fill plug.
3. Remove the Power Transfer Unit (PTU) fill plug. The fill plug is located on the right side of the case.
4. Fill the PTU to the bottom of the fill plug hole using the specified fluid.

Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.

NOTE: It may take several minutes for the fluid to equalize in the PTU before a final fluid level check can be determined.

5. Install fill plug and tighten to the proper specification. Refer to **SPECIFICATIONS**.
6. Lower vehicle.

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transaxle in neutral. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Disconnect the battery negative cable clamp from the battery.
3. Remove the right front wheel. Refer to **REMOVAL**.
4. Remove the right front halfshaft. Refer to **REMOVAL**.
5. If equipped with a 2.4L, remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
6. Remove the rear propeller shaft. Refer to **REMOVAL**.
7. Remove the bolts holding the rear maniverter to the cylinder head. Refer to **MANIFOLD, EXHAUST, REMOVAL**.
8. Separate the rear catalytic converter from the cylinder head and wire it up and out of the way.
9. Remove the crossunder exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL**.

Fig. 1: Heat Shield & Bolts

Courtesy of CHRYSLER GROUP, LLC

10. Remove the bolts (2) holding the heat shield (1) to the PTU.
11. Separate the heat shield (1) from the PTU.

Fig. 2: PTU Support Bracket & Bolts At PTU

Courtesy of CHRYSLER GROUP, LLC

12. Remove the bolts (2) holding the PTU support bracket (1) to the PTU.

Fig. 3: PTU Support Bracket & Bolts At Block & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

13. Remove the bolts (4) holding the PTU support bracket (2) to the engine block and the oil pan (3).
14. Separate the PTU support bracket (2) from the PTU (5).

Fig. 4: PTU & Bolts At Transaxle
Courtesy of CHRYSLER GROUP, LLC

15. Remove the bolts (1) holding the PTU (2) to the transaxle.

Fig. 5: Shifting PTU To Right Away From Transaxle
Courtesy of CHRYSLER GROUP, LLC

16. Shift the PTU (1) to the right away from the transaxle (2) and separate the spline shaft from the transaxle output shaft.

Fig. 6: Removing/Installing PTU
Courtesy of CHRYSLER GROUP, LLC

17. Push the PTU (1) to the right side of the vehicle and tip the left side downward and out of the vehicle.

DISASSEMBLY

ONE SPEED PTU DISASSEMBLY

NOTE: **The PTU is a service by replacement component. If the PTU is leaking fluid, the lip seals can be replaced.**

1. Remove the Power Transfer Unit (PTU) from the vehicle.
2. Place the PTU on a suitable, clean and stable work surface.
3. Drain the fluid from the PTU into a suitable drain pan.

Fig. 7: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws holding the shift actuator to the PTU and discard screws.
5. Remove the PTU shift actuator.

2103012347

Fig. 8: Locating PTU Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the intermediate shaft from the PTU to service the seals.

6. Remove the bolts (1) holding the PTU housing halves together.

2103012350

Fig. 9: Prying PTU Housing Halves Apart
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable pry bar, pry (1) the PTU housing halves apart.

2103012349

Fig. 10: Separating/Installing Right Housing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When separating the housing, bearings and preload shims may dislodge. Make note of bearing cup and shim location for proper reassembly.

8. Carefully separate the right housing (1) from the PTU housing (2).

2103012348

Fig. 11: PTU Housing & Gasket
Courtesy of CHRYSLER GROUP, LLC

9. Remove the gasket (1) from the groove in the PTU housing (2).

Fig. 12: Removing/Installing Input Gear & Output Ring Gear At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

10. In unison, pull the input gear (1) and output ring gear (2) from the PTU housing.

Fig. 13: Locating Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

11. Remove the dog clutch sleeve (1) from the input shaft.

NOTE: Note the orientation of the tapered splines in the dog clutch sleeve for reassembly.

Fig. 14: Removing/Installing Input Shaft & Bearing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

12. Remove the input shaft (1) and bearing from the PTU housing.

Fig. 15: Removing Seal(s) From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

13. Using a suitable screw driver, remove both the inner and outer input shaft seals if a manual transmission vehicle, or the single seal if an automatic transmission equipped vehicle from the PTU housing (1).

NOTE: The inner lip seal keeps PTU fluid from entering the transmission, the outer lip seal keeps transmission fluid from entering the PTU when

equipped with a manual transmission. There is a weep hole in the cavity between the two seals.

Fig. 16: Removing Seal(s) From Input Shaft
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable screw driver, remove the inner and outer seals if a manual transmission vehicle, or the single seal if an automatic transmission equipped vehicle from the inside of the input shaft (1).

NOTE: The inner lip seal keeps PTU fluid from entering the transmission, the outer lip seal keeps transmission fluid from entering the PTU when equipped with a manual transmission. There is a weep hole in the cavity between the two seals.

ASSEMBLY

ONE SPEED PTU ASSEMBLY

Clean the Power Transfer Unit (PTU) components using a suitable solvent. Blow the components dry using regulated 344 kPa (50 psi) shop air. Inspect all sealing surfaces for excessive wear or scratches the may cause damage to new seals. If damage is evident replace the PTU assembly.

Fig. 17: Installing Outer Seal In Input Gear
Courtesy of CHRYSLER GROUP, LLC

1. If a manual transmission equipped vehicle, using tool (special tool #10517, Installer, Seal) (1), with the long side (4) toward the seal (2), install the outer seal (2) in the input gear (3) with the tension spring facing outward. The shoulder on the tool will stop against the input shaft (3) roller bearing.
2. For both automatic and manual transmission equipped vehicle, using tool (special tool #10517, Installer, Seal) (1), with the short side (4) toward the seal (2), install the inner seal (2) in the input gear (3) with the tension spring facing the tool. The shoulder on the tool will stop against the input shaft (3) roller bearing.

Fig. 18: Installing Outer Seal Into Housing
Courtesy of CHRYSLER GROUP, LLC

3. If a manual transmission equipped vehicle, using tool (special tool #10515, Installer, Seal) and (special tool #C-4171, Driver Handle, Universal), with the long side (2) toward the seal (1), install the outer seal (1) in the housing (4) with the tension spring facing outward. The shoulder on the tool will stop against the top of the bore in the housing (4).
4. For both automatic and manual transmission equipped vehicle, using tool (special tool #10515, Installer, Seal) and (special tool #C-4171, Driver Handle, Universal), with the short side (2) toward the seal (1), install the inner seal (1) in the housing (4) with the tension spring facing the tool. The shoulder on the tool will stop against the top of the bore in the housing (4).

Fig. 19: Removing/Installing Input Shaft & Bearing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the input shaft (1) and bearing into the PTU housing.

Fig. 20: Locating Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Install the dog clutch sleeve (1) onto the input shaft

Fig. 21: Ensuring Proper Orientation Of Tapered Splines On Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: Ensure that the dog clutch sleeve is oriented so that the tapered splines (1) are facing the input gear (towards the interior of the case).

Fig. 22: Removing/Installing Input Gear & Output Ring Gear At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

7. In unison, install the input gear (1) and output ring gear (2) into the PTU housing.

Fig. 23: PTU Housing & Gasket
Courtesy of CHRYSLER GROUP, LLC

8. Install the gasket (1) into the groove in the PTU housing (2).

2103012349

Fig. 24: Separating/Installing Right Housing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, install the bearing cups and shims into their proper bores of the right PTU housing. Use a light grease to retain the cups in their bores.
10. Place the right housing (1) onto the PTU housing (2).

2103012347

Fig. 25: Locating PTU Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) to hold the PTU housing halves together. Refer to **SPECIFICATIONS**.
12. Lubricate the intermediate shaft splines.

13. Install the PTU in the vehicle.
14. Fill the PTU to the proper level with Mopar® 75W-90 fluid.
15. Road test the vehicle to verify the repair.

INSTALLATION

INSTALLATION

1. If manual transmission equipped, install a new O-ring in the groove around the outside of the Power Transfer Unit (PTU) input shaft housing.

Fig. 26: Removing/Installing PTU
Courtesy of CHRYSLER GROUP, LLC

2. Tip the right side upward and into the gap over the suspension cradle and align the PTU (1) with the transaxle output shaft.

Fig. 27: Shifting PTU To Right Away From Transaxle
Courtesy of CHRYSLER GROUP, LLC

3. Shift the PTU (1) to the left onto transaxle (2) and engage the spline shaft into the transaxle output shaft adapter.

Fig. 28: PTU & Bolts At Transaxle
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolts (1) to hold the PTU (2) to the transaxle. Refer to **SPECIFICATIONS**.

Fig. 29: PTU Support Bracket & Bolts At Block & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: The PTU to block bracket has a sleeve that slides in the bracket, if the sleeve is seized in the bracket, the bracket must be replaced.

5. Place the PTU support bracket (2) in position on the PTU (5).
6. Install the bolts (4) to hold the PTU support bracket (2) to the engine block (3). Refer to **SPECIFICATIONS**.

Fig. 30: PTU Support Bracket & Bolts At PTU
Courtesy of CHRYSLER GROUP, LLC

7. Install the bolts (2) to hold the PTU support bracket (1) to the PTU. Refer to **SPECIFICATIONS**.

Fig. 31: Heat Shield & Bolts

Courtesy of CHRYSLER GROUP, LLC

8. Place the heat shield (1) in position on the PTU.
9. Install the bolts (2) to hold the heat shield (1) to the PTU. Refer to **SPECIFICATIONS**.
10. Install the crossunder exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION**.
11. If equipped with a 3.2L, place the rear catalytic converter in position the cylinder head.
12. Install the bolts holding the rear maniverter to the cylinder head. Install the rear propeller shaft. Refer to **INSTALLATION**.
13. If equipped with a 2.4L, install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

NOTE: The right halfshaft passes through multiple seals in manual transmission equipped vehicles, use care when installing the halfshaft.

14. Install the right front halfshaft. Refer to **INSTALLATION**.
15. Install the right front wheel. Refer to **INSTALLATION**.
16. Verify that the PTU and transaxle are filled to the specified fluid level. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
17. Lower the vehicle.
18. Connect the battery negative cable clamp to the battery.
19. Road test the vehicle to verify the repair.

ACTUATOR, SHIFT

REMOVAL

ONE SPEED PTU

1. Remove the Power Transfer Unit (PTU) from the vehicle.
2. Place the PTU on a suitable, clean and stable work surface.
3. Drain the fluid from the PTU into a suitable drain pan.

Fig. 32: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws (2) holding the shift actuator (1) to the PTU. Discard the screws.
5. Separate the shift actuator from the PTU.

Fig. 33: Shift Actuator, Shift Fork & Gasket
Courtesy of CHRYSLER GROUP, LLC

6. Remove the gasket (2) from the groove in the shift actuator (1).

TWO SPEED PTU

NOTE: If the PTU actuator is functional and is being removed to correct a fluid leak, the PTU should be placed in the 2WD mode before removing the PTU from the vehicle. If the actuator is not functional the actuator can be removed when the PTU is not in the 2WD mode, but it will be difficult to install the shift forks on the shift sleeves.

1. Remove the PTU from the vehicle.
2. Place the PTU on a suitable work surface

Fig. 34: Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screws (2) holding the shift actuator (1) to the PTU housing. Discard the screws.

Fig. 35: Removing/Installing Shift Actuator At PTU
Courtesy of CHRYSLER GROUP, LLC

4. Separate the shift actuator (2) from the PTU (1).

Fig. 36: Locating Gasket At Shift Actuator Sealing Surface Groove
Courtesy of CHRYSLER GROUP, LLC

5. Remove the gasket (2) from the groove in the shift actuator sealing surface (1).

INSTALLATION

ONE SPEED PTU

NOTE: If installing a new actuator, there are two locating dowels that may have stayed in the case, remove them from the case as the dowels will come installed in the new actuator.

Fig. 37: Shift Actuator, Shift Fork & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Using a clean lint free cloth, wipe the sealing surfaces clean.

NOTE: Do not use solvent to clean the PTU components.

2. Install a NEW gasket (2) in the groove on the shift actuator.
3. Place the shift actuator in position on the PTU.
4. Engage the shift fork in the groove on the shift sleeve in the PTU and align the locating dowels.

Fig. 38: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the actuator mounting screws.

5. Install **NEW** screws (2) to hold the shaft actuator to the PTU. Refer to **SPECIFICATIONS**.
6. Install the PTU in the vehicle.
7. Verify that the PTU is properly filled with Mopar® 75W-90 fluid.
8. Road test the vehicle to verify the repair.

TWO SPEED PTU

NOTE: If the actuator was inoperative and was not in the 2WD mode before it was removed, the shift forks can be aligned by placing a large plastic loom tie between the shift fork and the actuator housing to position the fork closer to the center of the actuator. Do not attempt to join the ends of the loop tie around the shift mechanism. The loom tie will serve as a shim and can be pulled out after the actuator is in position on the PTU.

NOTE: If installing a new actuator, there are two locating dowels that may have stayed in the case, remove them from the case as the dowels will come installed in the new actuator.

1. Using a clean lint free cloth, wipe the sealing surfaces clean.

NOTE: Do not use solvent to clean the PTU components.

Fig. 39: Locating Gasket At Shift Actuator Sealing Surface Groove
Courtesy of CHRYSLER GROUP, LLC

2. Install a NEW gasket (2) in the groove in the sealing surface of the shaft actuator (1).

Fig. 40: Actuator, Shift Forks, Shifts Sleeves & PTU
Courtesy of CHRYSLER GROUP, LLC

3. While carefully guiding the shift forks (3 and 4) into the PTU housing, align the grooves in the shift forks (3 and 4) to the rails on the shift sleeves (5 and 6).

Fig. 41: Removing/Installing Shift Actuator At PTU
Courtesy of CHRYSLER GROUP, LLC

4. Push the actuator (2) downward until the sealing surfaces mate and the locating dowels line up with the PTU (1).
5. If a loom tie was used as a shim, pull the loom tie out from under the actuator.

Fig. 42: Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the actuator mounting screws.

6. Install **new** screws (2) to hold the shift actuator to the PTU housing. Refer to **SPECIFICATIONS**.

NOTE: Prior to fully installing the PTU in vehicle, use the scan tool to actuate the actuator to all positions to verify the shift forks properly engaged the hubs in the PTU. It may be necessary to manually manipulate the output shafts to allow the actuator to engage in all positions.

7. Install the PTU in the vehicle. Refer to **INSTALLATION**.
8. Fill the PTU to the proper level with the specified fluid.
9. Road test the vehicle to verify the repair.

PLUG, RING GEAR SHAFT

REMOVAL

REMOVAL

1. Remove the PTU from the vehicle.
2. Place the PTU on a suitable work surface.

Fig. 43: Piercing Hole In Center Of Plug Using Chisel
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable sharp chisel (1), pierce a hole in the center of the plug (2).

Fig. 44: Driving Chisel Side Ways To Lever Plug Out Of PTU
Courtesy of CHRYSLER GROUP, LLC

4. Drive the chisel (1) side ways to lever the plug (2) out of the PTU.

Fig. 45: Separating Plug From PTU
Courtesy of CHRYSLER GROUP, LLC

5. Separate the plug (1) from the PTU.

INSTALLATION

INSTALLATION

Fig. 46: Placing New Plug Into Hole In PTU
Courtesy of CHRYSLER GROUP, LLC

1. Using the clean lint free cloth, wipe the circumference of the plug hole free of debris and oil.
2. Place a NEW plug into the hole in the PTU.

Fig. 47: Driving New Plug Into Hole In PTU
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #6342, Installer, Seal), drive the new plug into the hole in the PTU until the lip of the plug is flush against the outer surface of the PTU.
4. Install the PTU in the vehicle.

5. Verify that the PTU fluid is at the specified level.
6. Road test the vehicle to verify the repair.

SEAL, AXLE DRIVE SHAFT, OUTER

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Place a suitable drain pan under the PTU to catch fluid that may spill when the seal is removed.
3. Remove right halfshaft. Refer to **REMOVAL** .

Fig. 48: Removing Output Shaft Seal From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable screw driver (1), remove the output shaft seal (3) from the PTU housing (2).

INSTALLATION

INSTALLATION

1. Using a clean lint free cloth, wipe the seal cavity clean of oil and debris.
2. Inspect the seal bore for scratches or cracks. If damage is evident replace the PTU.

Fig. 49: Placing New Lip Seal Into Position On PTU Housing
Courtesy of CHRYSLER GROUP, LLC

3. Place the new lip seal (1) in position on the PTU housing (2).

Fig. 50: Installing New Lip Seal Into PTU Housing
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #9684, Installer, Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (3), install the new seal in the PTU housing (1).
5. Install the right side halfshaft. Refer to **INSTALLATION** .
6. Remove the drain pan from under the vehicle.

7. Fill the PTU with the proper fluid.
8. Lower the vehicle.
9. Road test the vehicle to verify the repair.

SEAL, REAR OUTPUT SHAFT

REMOVAL

ONE SPEED PTU

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the rear drive shaft. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the rear drive shaft from the vehicle. Refer to **REMOVAL** .

Fig. 51: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the c-clip (2) from the groove in the rear output shaft (1).

Fig. 52: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove the O-ring seal (1) from the groove in the rear output shaft (2).

Fig. 53: Dust Deflector & Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable prying tools, pry the dust deflector from the rear output shaft.

NOTE: It may be necessary to punch a hole in the metal deflector to enable removal.

7. Place a suitable drain pan under the PTU output shaft to catch fluid that may spill from PTU when the seal is removed.

Fig. 54: Removing Seal From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

8. Using tool (special tool #9082A, Remover, Bearing), remove the seal from the PTU housing.

NOTE: It may be necessary to squeeze the spring fingers on tool (special tool #9082A, Remover, Bearing) with suitable pliers to lock the jaws into the shoulder on the lip seal.

9. Clean and inspect the sealing surface and the seal bore, if any damage is present, it will be necessary to replace the PTU.

TWO SPEED PTU

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the rear drive shaft. Refer to **HOISTING, STANDARD PROCEDURE**.
3. Remove the rear drive shaft from the vehicle. Refer to **REMOVAL**.

Fig. 55: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the circlip (2) from the groove in the rear output shaft (1).

Fig. 56: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove the O-ring seal (1) from the groove in the rear output shaft (2).

Fig. 57: Dust Deflector & PTU Housing
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable prying tools, pry the dust deflector (2) from the rear output shaft.

NOTE: It may be necessary to punch a hole in the dust deflector to enable removal.

7. Place a suitable drain pan under the PTU output shaft to catch fluid that may spill from PTU when the seal is removed.

Fig. 58: Removing Seal From PTU Lower Housing
Courtesy of CHRYSLER GROUP, LLC

- Using tool (special tool #9082A, Remover, Bearing) (2), remove the seal (1) from the PTU lower housing (3).

NOTE: It may be necessary to squeeze the spring fingers on tool (special tool #9082A, Remover, Bearing) with suitable pliers to lock the jaws into the shoulder on the lip seal.

- Clean and inspect the sealing surfaces and the seal bore, if any damage is present it will be necessary to replace the PTU.

INSTALLATION

ONE SPEED PTU

Fig. 59: Placing New Seal In Position On PTU Output Shaft
Courtesy of CHRYSLER GROUP, LLC

- Apply assembly lube on the lip of the seal to aid installation onto the output shaft.
- Place the NEW seal (1) in position on the PTU output shaft.

Fig. 60: Installing New Seal Into PTU Housing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (2) (special tool #10117, Installer, Seal), install the NEW seal (1) into the PTU housing
4. Remove the drain pan from under the PTU output shaft.

Fig. 61: Dust Deflector & Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Place the dust deflector (1) in position on the rear output shaft (2).

Fig. 62: Installing Dust Deflector
Courtesy of CHRYSLER GROUP, LLC

6. Using tool (special tool #10518, Installer, Oil Slinger) (1), install the dust deflector (2).

Fig. 63: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Install the O-ring seal (1) in the groove in the rear output shaft (2).

Fig. 64: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

8. Install the circlip (2) in the groove in the rear output shaft (1).
9. Install the rear drive shaft in the vehicle. Refer to **INSTALLATION**.
10. Fill the PTU to the proper level with the Mopar® 75W90 fluid.
11. Lower the vehicle.
12. Road test the vehicle to verify the repair.

TWO SPEED PTU

Fig. 65: Placing New Seal In Position On PTU Rear Output Shaft

Courtesy of CHRYSLER GROUP, LLC

1. Apply assembly lube on the lip of the seal to aid installation onto the output shaft.
2. Place the NEW seal (1) in position on the PTU (2) rear output shaft.

Fig. 66: Installing New Seal Into PTU Lower Housing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (3) (special tool #10117, Installer, Seal), install the NEW seal (2) into the PTU lower housing (1).
4. Remove the drain pan from under the PTU output shaft.

Fig. 67: Dust Deflector & PTU Housing

Courtesy of CHRYSLER GROUP, LLC

5. Place the dust deflector (2) in position on the rear output shaft (1).

Fig. 68: Installing Dust Deflector
Courtesy of CHRYSLER GROUP, LLC

6. Using tool (special tool #10518, Installer, Oil Slinger) (1), Install the dust deflector (2).

Fig. 69: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Install the O-ring seal (1) in the groove in the rear output shaft (2).

Fig. 70: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

8. Install the Circlip (2) in the groove in the rear output shaft (1).
9. Install the rear drive shaft in the vehicle. Refer to **INSTALLATION** .
10. Fill the PTU to the proper level with the Mopar® 75W90 fluid.
11. Lower the vehicle.
12. Road test the vehicle to verify the repair.

CHANGE OIL/OIL LIFE MONITOR RESET - PROCEDURE 1

1. Turn ignition on, with engine off.

NOTE: On vehicles with Keyless Enter-N-Go™, push the ENGINE START/STOP button and cycle the ignition to the ON/ RUN position.

2. Fully depress the accelerator pedal, slowly, 3 times within 10 seconds.
3. Turn ignition switch to OFF/LOCK position.

NOTE: On vehicles with Keyless Enter-N-Go™, push the ENGINE START/STOP button once to return the ignition to the OFF/LOCK position.

4. If indicator message illuminates when engine is started, repeat the reset procedure.

EMISS MAINT INDICATOR LIGHT

2014 Jeep Cherokee Trailhawk**REMINDER INDICATOR RESET PROCEDURES Jeep - 1988-14**

NOTE: To determine the appropriate reset procedure, refer to **EMISS MAINT INDICATOR LIGHT RESET INDEX**.

Wrangler	
1988-90	<u>Emiss Maint Indicator Light Reset - Procedure 1</u>

EMISS MAINT INDICATOR LIGHT RESET - PROCEDURE 1

1. Vehicles are equipped with a EMISS MAINT indicator light on the instrument cluster. This light will come on one time at 82,500 miles to alert driver that emission service is required. At this time, oxygen sensor and PCV valve must be replaced and all other emission components should be inspected, and serviced or replaced as necessary.
2. The Service Reminder Indicator (SRI) timer is located under dash, near accelerator pedal or to right of steering column. Timer cannot be reset. To turn off light, timer must be replaced or disconnected. Since timer and sensor are interdependent, if timer should fail prematurely, oxygen sensor should be replaced at same time to preserve correct replacement interval.
3. To replace timer on Cherokee, Comanche and Wagoneer models, remove cruise control module (if equipped). Remove timer mounting screws. Disconnect electrical connector. On Wrangler models, remove timer mounting screws. Disconnect electrical connector. To install, reverse removal procedure.

MAINT REQD INDICATOR LIGHT

NOTE: To determine the appropriate reset procedure, refer to **MAINT REQD INDICATOR LIGHT RESET INDEX**.

Maint Req'd Indicator Light Reset - Procedure 1

MAINT REQD INDICATOR LIGHT RESET - PROCEDURE 1

Vehicles may be equipped with a MAINT REQD on the instrument cluster. This light will come on one time at 82,500 miles to alert driver that emission service is required. At this time, oxygen sensor must be replaced and all other emission components should be inspected, and serviced or replaced as necessary. Chrysler's Diagnostic Readout Box (DRB-II) tester is required to reset the service reminder indicator system.

Using DRB-II tester, access SELECT SYSTEMS. Select appropriate engine. Select with or without A/C. Select FUEL & IGNITION. Select ADJUSTMENTS. Select RESET SRI LIGHT. Reset SRI light. When DRB-II is finished resetting light, DRB-II display will read SRI LIGHT IS RESET.

PERFORM SERVICE MESSAGE

NOTE: To determine the appropriate reset procedure, refer to **PERFORM SERVICE MESSAGE RESET INDEX**.

PERFORM SERVICE MESSAGE RESET INDEX

Model & Year	Reset Procedure
Grand Cherokee	
1994-98	<u>Perform Service Message Reset - Procedure 1</u>
1999-07	<u>Perform Service Message Reset - Procedure 2</u>
Liberty	
2003-07	<u>Perform Service Message Reset - Procedure 2</u>

PERFORM SERVICE MESSAGE RESET - PROCEDURE 1

This vehicle may be equipped with an optional Vehicle Information Center (VIC). A PERFORM SERVICE message is displayed when "miles/kms to service" is zero, indicating that regular service and maintenance is due. To reset counter, turn ignition on, then press SELECT button momentarily, then press and hold SET button for at least 2 seconds.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 2

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be

2014 Jeep Cherokee Trailhawk

REMINDER INDICATOR RESET PROCEDURES Jeep - 1988-14

reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last previous message.

4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to TPMS RESET INDEX.

2007-14	<u>TPMS Reset - Procedure 1</u>

TPMS RESET - PROCEDURE 1

NOTE: There is no formal retraining procedure necessary. Each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the WCM can monitor the state of each of the sensors on the 4 rotating road wheels. The WCM automatically learns and stores the sensor's ID while driving after a sensor has been replaced.

Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID.

TPMS RESET - PROCEDURE 2

NOTE: Use the following procedure to retrain all 4 road wheel tire pressure sensors. No attempt should be made to retrain individual sensors.

1. Retrieve Relearn Magnet (8821).
2. Press MENU Button on EVIC until "RETRAIN TIRE SENSORS - NO" is displayed.
3. Press STEP button to select "YES".

NOTE: There is a 60-second timer for training the first sensor, and a 30-second timer between training the remaining sensors. If either of these timers expire, the EVIC will abort the training procedure.

NOTE: If at any time the EVIC display reads "TRAINING ABORTED", move the vehicle ahead at least one foot and repeat the entire retraining procedure.

4. Press MENU button to start retraining. Display will read "TRAIN LEFT FRONT TIRE". The order for retraining all 5 sensors is:
 - Left Front.
 - Right Front.
 - Right Rear.
 - Left Rear.
 - Spare (if so equipped).
5. Starting at left front tire, place relearn magnet over valve stem. See **Fig. 1**. Within approximately 5 seconds, vehicle horn will chirp indicating training complete at that particular sensor. Remove the magnet.
6. Repeat this step on remaining sensors as indicated by EVIC until all TPM sensors positions are trained.
7. Once EVIC displays "TRAINING COMPLETE", pressing either STEP, C/T, RESET or MENU button will exit training routine.
